MICROFICHE COLLECTION OF DOCUMENTS REPORTED IN ABSTRACTS OF INSTRUCTIONAL MATERIALS IN VOCATIONAL AND TECHNICAL EDUCATION, SUMMER 1968.

OHIO STATE UNIV., COLUMBUS, CENTER FOR VOC. EDUC.

PUB DATE 68

EDRS PRICE MF-$43.00 HC NOT AVAILABLE FROM EDRS. 14,813P.

DESCRIPTORS- *INSTRUCTIONAL MATERIALS, *VOCATIONAL EDUCATION, *TECHNICAL EDUCATION, BUSINESS EDUCATION, AGRICULTURAL EDUCATION, DISTRIBUTIVE EDUCATION, HEALTH OCCUPATIONS EDUCATION, HOME ECONOMICS EDUCATION, INDUSTRIAL ARTS, TRADE AND INDUSTRIAL EDUCATION, INDEXES (LOCATERS), CLEARINGHOUSES,

DOCUMENTS ANNOUNCED IN THE SUMMER 1968 ISSUE (VT 005 759) OF "ABSTRACTS OF INSTRUCTIONAL MATERIALS IN VOCATIONAL AND TECHNICAL EDUCATION" (AIM), WITH MINOR EXCEPTIONS, ARE INCLUDED IN THIS MICROFICHE SET. THE MICROFICHE SET IS ARRANGED IN THE FOLLOWING SEQUENCE--(1) A VOCATIONAL TECHNICAL (VT) NUMBER INDEX TO DOCUMENTS IN THE MICROFICHE COLLECTION, (2) A VT NUMBER LIST OF 12 DOCUMENTS WHICH WERE LISTED IN AIM BUT ARE NOT IN THE MICROFICHE COLLECTION, WITH A LIST OF ADDRESSES FROM WHICH THESE DOCUMENTS ARE AVAILABLE, (3) THE AUTHOR AND SUBJECT INDEX FROM AIM, AND (4) THE FULL TEXT OF DOCUMENTS LISTED IN THE VT NUMBER INDEX. THE TEXTS ARE FILMED CONTINUOUSLY IN VT NUMBER SEQUENCE. (DS)

Microfiche Collection of Documents Reported in Abstracts of Instructional Materials in Vocational and Technical Education

(AIM)

Compiled and Indexed by The ERIC Clearinghouse
on Vocational and Technical Education

Summer 1968

The Work Presented or Reported Herein was
Performed Pursuant to a Grant from the U. S.
Office of Education, Department of Health,
Education and Welfare.

ERIC Clearinghouse
The Center for Vocational and Technical Education
The Ohio State University
980 Kinnear Road, Columbus, Ohio 43212

INTRODUCTION

This collection of microfiche includes the documents announced in the Summer, 1968 issue of Abstracts of Instructional Materials in Vocational and Technical Education (AIM) with minor exceptions. The microfiche set is arranged in the following sequence:

1. Vocational Technical (VT) Number Index to Microfiche Collection of Documents Reported in AIM, Summer 1968.

2. VT Number List of Documents Not in Microfiche Collection.

   Copies of these documents may be obtained from the sources indicated in the citations on page 5.

3. Source List of addresses for documents cited on page 4.

4. Selected indexes from AIM, Summer 1968.

   a. Author Index

   b. Subject Index

   The page numbers shown in these indexes refer to the location of the abstracts in AIM, Summer 1968.

5. The full text of documents listed in the VT Number Index on pages 1-2.

   The documents are arranged in numerical order according to VT numbers. The texts of materials in this microfiche set have been filmed continuously in VT number sequence thereby facilitating the purchase of the texts of all documents on microfiche with one order. This filming method also lowers the cost of the entire set as contrasted to the purchase of individual titles on separate microfiche. The frame immediately preceding each document is used to identify the document by VT number, and to present the resume for that document.

The documents identified in this collection of microfiche with an ERIC Document (ED) number are also available as separate documents from ERIC Document Reproduction Service (EDRS) by using the ED number. The documents identified in this collection of microfiche with a Manpower (MP) number are also available as separate documents from ERIC Document Reproduction Service (EDRS) by using the MP number. Items with the ED symbol but without the six numerical digits are unavailable from EDRS at the time of filming until an ED number is assigned and published in Research in Education (RIE). The issue of RIE in which the abstract is scheduled to appear follows the ED prefix in the index on pages 1 and 2. This will enable the reader to easily locate the appropriate six digit ED number by checking the specified issue of RIE. At the time the ED number appears in RIE, individual microfiche of the document will be available from EDRS.

The documents identified in this collection of microfiche without an ED number are titles in the local clearinghouse collection. Microfiche of these items is obtainable only through purchase of this set or from agencies who have this set, and who have the capability of reproducing microfiche.

Selected Lists of References and Aids in Teaching Landscaping, Floriculture, Ornamental Horticulture, Suburban Gardening.

New York State Coll of Agr, Ithaca. Dept of Rural Educ.
Pub Date - Jan64
MF AVAILABLE IN VT-ERIC SET 32p.

*AGRICULTURAL EDUCATION, FLORICULTURE, LANDSCAPING, REFERENCE MATERIALS, *INSTRUCTIONAL MATERIALS, *ORNAMENTAL HORTICULTURE, *TEST CONSTRUCTION, HIGH SCHOOLS, *BIBLIOGRAPHIES,

Bulletins, circulars, textbooks, films, filmstrips, slides, and commercial materials for use in teaching landscaping, floriculture, ornamental horticulture, or suburban gardening are listed in the first section of the document. Commercial materials and textbooks, United State Department of Agriculture and university publications are included. The source, cost, and other information are given for each item. The second section is a guide for preparing objective-type test questions for examinations in agriculture. It is intended for classroom teacher use and discusses purpose, classification of the question, difficulty level, item construction, the problem, answers, group questions, multiple choice, master list, matching, and general precautions. Examples are included. (RW)

Acknowledgements

The materials appearing in this list were reviewed by Donald Burgett, Part-time Instructional Materials Specialist in the Division of Agricultural Education.

The suggestions of staff members in the Department of Floriculture and Ornamental Horticulture of the New York State College of Agriculture were considered. The list was also reviewed by a practicing landscape gardener. The final list was checked by Prof. Joe P. Bail, Agricultural Education Division, and reproduced by the Instructional Materials Staff in Agricultural Education.

Suggestions for additions to the list are invited from teachers of agriculture.

A GUIDE FOR THE PREPARATION OF OBJECTIVE-TYPE TEST QUESTIONS FOR EXAMINATIONS IN AGRICULTURE

A Guide for the Preparation of Objective-Type Test Questions for Examinations in Agriculture

Purpose

This guide is intended to help New York State classroom teachers to develop objective-type test questions that will efficiently measure important goals of the course in agriculture.

As all teachers know, an examination must be made up of good test questions if it is to provide a fair and reliable measure of that portion of the course that can be measured by paper and pencil tests. Conversely, questions that test trivial material or that operate inefficiently are unfair to both pupil and teacher, because they provide confusing and misleading measures of the pupil and the course.

It is undeniable, too, that the content of any test tends to influence study habits and, consequently, to have an effect on teaching practices. Good test questions that stress understandings and applications encourage pupils to go beyond the mere accumulation of unrelated facts. To the extent that such an examination contains poor questions, however, it has an adverse effect on learning.

As instructional tools, examinations are a very direct way of telling the pupil what is expected of him. This year's examination, thus, has an impact on next year's pupil. This is true of any examination, regardless of its source. To quote from a speech made by Leo Nedelsky at an Educational Testing Service Conference a few years ago:

> "It is an incontestable truth that tests are valuable tools of instruction. What the student is likely to learn from a test, however, is not an isolated fact or generalization, for the test is encompassed in a few pages and a few hours as compared to the hundreds of pages of the text studied over a period of months. The most effective role of the test as a teaching instrument is rather to let the student know in an emphatic manner what the objectives of the course are."

The development of good questions is demanding and time-consuming. Nevertheless, it is well within the capabilities of any teacher who knows his subject well and who is conversant with question-writing techniques.

"Genius," the old cliché tells us, "is an infinite capacity for taking pains." In no task is the statement more pointedly appropriate than in the writing of efficient examination questions.

The Question

Every "item" in a test starts with a question or with instruction addressed by the examiner to the examinee. This is true whether the item actually ends up in question form, as an incomplete sentence to be completed, as a complete sentence to be corrected, or as a series of premises and responses served up as a matching problem.

Usually, therefore, the best way to start constructing the item is to write the question in exactly the same way you would address it to a pupil in your class. Then, below the question, write the correct answer as you would hope to receive it.

At this point, examine the question to determine whether the material it measures is <u>important</u> or <u>trivial</u> within the context of the course and its objectives. Below are a few rules-of-thumb that may help in making this decision:

1. Is the question within the scope of the course and its objectives?

2. In what way will knowing the answer be of value to the pupil?

3. If the question under scrutiny were the entire test, would you be willing to accept it as a measure for discriminating among your pupils? (Bear in mind that, if used in a final examination, the question will probably for some pupils mean the difference between passing and failing.)

If the question survives this kind of scrutiny, it can be said to measure truly important material and is worth the time and effort necessary to complete it in the format (multiple choice, completion, matching, etc.) in which it will be used in the examination.

The question is now ready for classification.

Classification of the Question

Classification will be simplified if we think of test questions as falling generally into either of two categories:

<u>Factual Knowledge</u>: questions emphasizing recall or recognition. These questions deal with knowledge of specific facts, terminology and methods. The material tested is often stated directly in the text, or is commonly taught in the classroom in virtually the same language as the test question.

<u>Understanding</u>: questions requiring the pupil to establish relationships, analyze situations, make judgments, and solve new problems. These questions require that the pupil must not only recall specific facts but must have understood the underlying concept or principle so that he can make use of what he has learned in dealing with unfamiliar situations.

These two classifications (factual knowledge and understanding) refer to increasing levels of refinement in testing on the same materials. They are intended as a convenient means of distinguishing among questions, not as fixed absolutes. The classification of some questions will be readily apparent; others will be borderline cases. Often the classification varies from one group of pupils to another. A question that offers a new problem to one group is simple recall to another group where the teacher has already presented and solved the problem. Sometimes the classification is dependent on the pupils involved. A question that tests factual knowledge for the best pupil may measure understanding for the average or below-average pupil, and one that requires application of knowledge to a new situation early in the course may become rote memory after a period of instruction and discussion.

The relative importance of a question is not necessarily determined by its classification. The emphasis often put on the need for "understanding" questions may appear to imply that "knowledge" questions measure only trivial material. This, of course, is not the case. Many questions of the knowledge type meet the criteria of importance and serve very efficiently as tests of the fundamental knowledge essential to understanding.

Similarly, a question does not automatically become a measure of suitable material because it has been classified as an "understanding" question. This kind of question, too, must be scrutinized carefully to exclude the trivial and inappropriate. It will, of course, be obvious that fact questions are more likely to err by being trivial and understanding questions to err by being inappropriate to the specific subject-matter area being tested.

To put the point in simplest terms, questions asking for knowledge of specific facts are fair to the pupil if knowing these facts is important to the course or to realizing the broad objectives of the course. However, in attempting to construct a challenging test, it is all too easy to include obscure facts that the pupil will know only by chance or by dint of last-minute cramming with passing the test as the primary goal. Facts learned in this way are forgotten soon after the examination is over.

Questions that require understanding of basic concepts, on the other hand, must be so constructed that they test for understanding based on subject-matter knowledge. Too often questions purporting to test understanding are actually tests of reading ability or other general abilities and can be answered by intelligent pupils who have little or no specific knowledge of the subject.

Difficulty Level

Obviously, a final examination should consist of questions of varying degrees of difficulty. In general, the range of difficulty should be such that the more difficult questions will be answered correctly by most of the above-average pupils, and the easier questions will be answered correctly by almost everyone except the pupils whose performance in general has been unacceptable.

Questions that measure understanding will usually be somewhat more difficult than those measuring knowledge, because they require knowledge plus something more. Nevertheless, the question writer must take care not to equate difficulty and quality. The difficulty of a question should, ideally, be based on the difficulty of the concept or the problem, but more often than one might wish it is difficult only because it is measuring obscure or trivial materials, or is written in such a manner that it is ambiguous or misleading for the pupil.

The difficulty of the "factual knowledge" question depends directly on what is stressed in class or in the text. On the other hand, the difficulty of an "understanding" question depends to a large extent on the pupil's ability to deal with an apparently unfamiliar problem but one that can be solved by proper use of what he has learned in class.

Item Construction

So far we have discussed the acceptability of questions primarily from the point of view of the subject-matter specialist, who decides if a question is proper and fair with relation to the course. How the question is presented should be decided from the point of view of the pupil. This is the very heart of the whole study of item-writing techniques. Every test question should be presented in a way that is fair to the pupil and to the purpose that the question is expected to serve in the test.

Appropriate Format: The first step is to decide which format is appropriate to the question and to the examination in which it is to be used. Most questions lend themselves readily to the four-choice format, and the subsequent discussion will, to a great extent, apply most specifically to this format. It must be borne in mind, however, that some questions have only three possible answers: increases, decreases, remains the same; less than, more than, equal to. Still other questions are most appropriately set in the matching question format, if the lists of premises and responses are sufficiently homogeneous and if identifying of relationships is the factor to be tested.

Fortunately, an inappropriate format will usually become apparent early in the writing process. When there are only three possible plausible answers (such as greater than, less than, equal to) the writer will soon become aware that he cannot find a fourth incorrect response without overlapping one or more other answers, or saying the same thing using different words, or contriving a completely implausible distractor. The experienced item writer quickly learns to conserve his energy by switching to the appropriate format or writing the question in a different way, instead of trying futilely to provide an effective fourth response.

The Problem

Each question should have a single central problem, which is clearly and immediately stated in the simplest possible language. It should be so worded that the pupil will know what is expected of him before he reads the suggested answers.

In other words, every pupil qualified to take the course should understand what the question is, even if he has not the vaguest notion what the answer is.

Let us examine the following item, for instance:

Stubble-mulch farming is

1) used in growing wheat
2) a method of draining off excess water
3) a means of killing weeds
4) used to destroy harmful insects

Here is an item that has no clear-cut problem, but is really a slightly disguised collection of four true-false questions about stubble-mulch farming.

What did the examiner have in mind in asking this question? Did he want to find out if the pupil knows for which farm product stubble-mulch farming is used? If so, why not ask? For example:

Stubble-mulch farming is often used to prepare land for growing

1) wheat
2) cotton
3) hay
4) fruit

Or did the examiner want to find out if the pupil knows what stubble-mulch farming is? If so, why not the following:

Stubble-mulch farming is a method of preparing land for seeding by

1) leaving the residue from past crops on the surface of the ground
2) planting short ground-cover shrubs to serve as a wind break for the crops
3) leaving unseeded terraces of plowed soil between the seeded rows
4) draining excess water from one area and diverting it to another drier area

The Correct Answer: Each question should have one and only one correct answer. This is an obvious point, of course. Nevertheless, item-writers do occasionally prepare items with more than one answer.

Let us go back to that stubble-mulch problem again. Suppose we had asked:

Stubble-mulch farming is used in order to

1. improve soil moisture conditions
2. prevent wind erosion
3. yield bigger wheat crops
4. reduce raindrop splash

Here all the answers are correct, but one is more inclusive than the other three. This type of question is tricky and unfair, and does little to evaluate the pupil's knowledge of the subject.

Suggested Wrong Answers: The efficiency of an item is a function not only of the question and the correct answer, but also of the plausibility of the suggested wrong answers. The correct answer should not be outstanding in any way to the pupil who lacks the information or ability supposedly being measured by the question.

Suggested answers may accidentally provide many clues to lead the pupil to the correct answer, especially if he is at all testwise. A few of these are listed below:

a. The correct answer is the only one that is plausible.

For example:

How many gallons of maple sap must be evaporated to obtain one gallon of maple syrup?

1) 0.11
2) 2.2
3) 40
4) 4

b. The correct answer stands out because it is noticeably longer or shorter or more precisely written that the other suggested answers.

c. A "clue" word or phrase appears in both the question and the correct answer, but not in the distractors.

For example:

Stubble-mulch farming is a method of preparing land for seeding by

1) leaving the stubble of past crops on the surface of the soil

d. The correct answer is the only one so expressed that it answers the question.

For example:

Which action results in the formation of carbonic acid?

1) Ground water dissolves the carbon dioxide in certain kinds of rock.
2) Carbon dioxide is not soluble in water.
3) Carbonic acid cannot form unless oxygen is present.
4) The amount of carbon dioxide varies in various kinds of rock

Only alternative 1, the key answer, is a statement of an action. The remaining three alternatives are not actions and, therefore, are irrelevant to the question.

e. The suggested but incorrect answer does not follow grammatically from the question or incomplete sentence.

f. Words such as "never," "only," "must," "always" appear in the incorrect answers, and "may," "usually," "seldom" in the correct answer. It is a good guess that the correct answer is the one that is stated cautiously and recognizes the possibility of an exception to the general rule.

INDUSTRIAL CRAFTS SAFETY

General

Report to the teacher any defective equipment, unsafe conditions, or violations of safety rules.

Report to the teacher immediately any injury, no matter how slight. Infection may result from uncared for minor cuts, scratches, and burns.

Work with tools, machines, and equipment only after having received necessary safety instructions.

Do not lift any equipment or materials that cannot be handled easily. Obtain help of another pupil when carrying long pieces of material six feet or more in length.

Make certain that there are no obstacles in the path when carrying materials or equipment.

Keep aisles and passageways clear of materials and equipment.

Do not allow tools and materials to project over the edges of work benches.

Obtain the teacher's permission before using compressed air.

Walk about the shop carefully.

TOOLS, EQUIPMENT AND MATERIALS

Hand Tools

Always inspect hand tools before using them. Make certain that there are handles on all tanged tools, such as files, wood chisel, scrapers, and soldering irons.

Keep handles of all tools clean and free of oil and grease.

Avoid holding material in the hand while using a screwdriver. Hold material being assembled in a vise or a support if on a bench.

Select screwdriver of proper size to fit the screw slot. Keep hands back of the screwdriver blade.

Kiln

Use asbestos gloves and long-handled tongs to remove hot pieces of enameled material.

Place hot pieces of enameled material on well-insulated surfaces, such as asbestos or transite board.

Do not look into the kiln for a long period.

Do not place moist items in the kiln.

Make sure that kiln is clean before firing.

Keep face and body clear when opening kiln.

Be sure that kiln is turned off and cord unplugged before leaving room.

Lapidary Equipment

Obtain the teacher's approval of the setup before using the slab saw.

PLASTICS

General

Follow the manufacturer's safety instructions carefully to prevent injuries in the use of various plastic products.

Never taste or sniff at an open bottle of chemicals, or at a can of liquid resin or a curing agent, to determine their nature. This is an extremely dangerous practice.

Use protective clothing and rubber gloves to prevent chemical burns or toxic reactions with contacting fumes, chemicals.

Wear heat protective gloves while handling hot molds or hot plastic.

Wear gloves that are rubber or plastic coated and cotton lined. When using liquid resin or solvents, also apply hand cream before putting on the gloves.

Wash gloves daily while still on the hands, using soap and warm water. Do not use solvents.

Avoid contaminating the inside of the gloves when removing them. The safe way is to remove the gloves by pulling at the fingers. Do not put gloves on over dirty hands.

Wear coveralls, or shirt with long sleeves, and change at once if soiled or spilled on.

Avoid wearing rings and wrist watches. The accumulation of chemicals will cause moisture and heat beneath them and contribute to the development of skin irritation.

Do not use plastic materials if you have allergies or skin eruptions.

Be extremely cautious to avoid skin contact with epoxy resins. Precautions should include the wearing of aprons, coveralls, and gloves; adequate washing and use of show facilities; and the use of protective creams and adequate ventilation.

Remove resins, catalysts, curing agents, solvents, uncured mixtures, or fiberglass promptly and thoroughly from the skin to prevent serious skin irritations.

Use special hand creams and cleaners before and after working with fiber glass.

Protect the skin from released glass fibers while sanding cured fiber glass or reinforced plastic.

Wear eye shields or safety glasses.

Wash hands thoroughly, without waiting for the regular wash-up period, immediately after any hardener, caustic material, or resin has touched the skin and after every lay-up job.

Obtain instructions from the teacher regard-

c. Over-Testing of Auxiliary Skills: It is usually impossible, of course, to construct examination questions that do not test the pupil's skills in some factors other than those for which the test is primarily intended. In any written examination, it is taken for granted that the pupil can read, has at least a working vocabulary, has some quantitative ability, and can follow simple directions. Otherwise it would be impossible to give him a written test at all.

Unless testing one or more of these skills is a primary purpose of the written test, however, it is essential that they be "toned down" as much as possible by avoiding unfamiliar words, by using direct, uncomplicated sentences, and by giving clear directions. Care exerted in this area is at least a partial guarantee that these auxiliary skills are not being measured at a level higher than should be expected of any pupil qualified to take the course for which the examination is written.

This is not intended to prohibit testing of the pupils' ability to read, to compute, and to follow directions when these abilities are appropriately required within the discipline being tested.

Group Questions

For the purpose of this guide, the term "group questions" is used to refer to any test exercise in which two or more questions are based on a central theme or concept.

The group of questions is preceded by an introductory statement establishing the central theme and explaining the situation on which the questions are based.

Below are a few rules essential to successful construction of this type of exercise:

a. The central theme should be selected very carefully. Make sure that it is appropriate to the course and to the general level of ability of the pupils, and that it does not demand too much knowledge more properly tested in the mathematics or English class.

b. Each question should refer to the central idea. Solving each problem presented should require reference to the chart or diagram or whatever other uniting device is used. Any question that can be answered without reference to the information provided is not properly a member of the group, and such questions, if included, serve to penalize and perhaps confuse the pupil who is led to look for relationships that do not exist.

c. Each question should be independent of the other questions in the group. That is, the correct answer to one question should not furnish a clue or provide a basis for correctly answering any succeeding question in the group. Failure to observe this rule places the pupil in double jeopardy.

d. All the incorrect answers to each question should be answers that could be arrived at by a misinterpretation of or an erroneous conclusion drawn from the information provided.

e. The central theme should be used as fully as possible in the questions based on it. Before beginning to develop questions, the examiner should study the theme carefully and determine what he would expect it to mean to his pupils at various levels of ability. It is wasteful to spend time selecting and presenting a good chart or table, for instance, and then to use this material as a basis for testing the trivial, the obvious, or the irrelevant.

f. In groups of questions based on a central theme, it is important to know when to stop. If the information provided is a source of four or five good questions but no more, it is inefficient to insist on writing five more questions of indifferent value.

g. Within a group of questions, the format should be consistent. That is, all the questions should be multiple choice, or modified true-false, or completion. To change from one format to another within a group will inevitably confuse some pupils.

h. In a group of questions, the directions are an essential part of the central theme. If the directions are confusing or incomplete, the results may reflect the pupil's confusion rather than the pupil's knowledge.

I <u>Multiple-Choice</u>: This type is based on a central theme set by such devices as a table, graph, chart, diagram, technical reading selection, or description of an experiment.

For example:

<u>Directions</u> (1-3): Write the <u>number</u> preceding the word or expression that best answers each question. Base your answers on the information in the chart below and on your knowledge of agriculture. Assume that the slope is 2% and short, the soil is clay loam, and the organic matter rating is medium for each land use.

	Annual Loss (by Run-Off) per Square Mile	
Kind of Land Use	Tons of Soil	Percent of Rainfall
Woods	0	.12
Pasture	.04	6.9
Small Grains	11.4	16.9
Plowed, Fallow	69.0	48.8
Row Crops	73.2	41.95

1 For which of the following land uses would the loss of rainfall be smallest?

1) pasture
2) corn
3) plowed, fallow
4) small grains

2 With which land use would you expect to have the greatest dust storms?

1) forests
2) grazing land
3) wheat
4) corn

3 Which generalization can be made from studying the chart?

1) Run-off is dependent on the amount of soil cover.
2) The greater the loss of rainfall, the greater is the loss of soil.
3) The amount of run-off is in proportion to the amount of use the soil gets.
4) The less the land is disturbed from its original condition, the greater is the loss of water.

II <u>Master List</u>: This is accually another form of the multiple-choice group. Usually, four possible answers are suggested for a group of five questions. An example follows:

Directions (1-5): Each of these questions consists of a statement concerning reproduction of certain organisms. For each statement, select from the list of four organisms below the organism with which that statement is most closely associated, and write on your answer sheet the <u>number</u> preceding that organism in the list. (A number may be used more than once.)

(1) ameba
(2) frog
(3) horse
(4) robin

1 Fertilized eggs develop completely within the parent's body.

2 With parental care, fertilized eggs develop chiefly outside the parent's body.

3 With no parental care, fertilized eggs develop chiefly outside the parent's body.

4 The parent does not produce eggs.

5 Cross-breeding is used to combine several desirable traits in one organism.

In general, the same rules apply to this format as to the multiple-choice group. There is, of course, no difficulty with overlapping suggested answers, as it is obvious that at least one of the four suggested answers will have to be used more than once in answering five questions.

It is essential, however, that all four suggested answers be plausible, and at least three of them and preferably all four of them, should be a correct answer at least once. A group of questions in which only half of the master list is operative is generally inefficient and often gives the completely uninformed pupil a 50-50 chance to guess the right answer, while the better pupil may be led to the wrong answer because he suspects a "catch" in the questions.

III Matching: This type, as its name implies, presents the pupil with the task of matching five premises to five of seven (or eight) suggested responses. A straightforward example of this type is the following:

Directions (1-5): Column A lists recommended preventions and treatments for certain common cattle ailments. Column B lists seven such ailments. For each prevention or treatment in Column A, write on your answer sheet the number preceding the ailment for which that treatment or prevention should be used.

Column A

1 Fence off stagnant waterholes

2 Keep visitors out of feed alley.

3 Inject glucose.

4 Inject calcium gluconate.

5 Vaccinate.

Column B

(1) bloat
(2) brucellosis
(3) ketosis
(4) leptospirosis
(5) mastitis
(6) milk fever
(7) winter dysentery

You will have noticed that two essential points in matching questions are that, as in other grouped questions, there is a central theme to which all of the material relates, and that there is homogeneity within each list of premises and each list of responses.

Suppose, for instance, that the list in Column B were not limited to ailments of cattle, or even to ailments of animals. Immediately the pupil would have been provided with extraneous clues in eliminating some of the suggested answers and, in effect, factors other than knowledge of the problem would enter into the test.

In writing matching questions, the following rules should be observed:

a. Always have at least two more suggested responses than there are questions.

b. Limit the group to a minimum of five questions with seven responses and a maximum of ten questions with twelve or thirteen responses. If the numbers of questions and responses are too lengthy, it is almost impossible to maintain homogeneity, the pupil's task becomes largely one of finding the right response from a long list, and usually more credit than is desirable must be assigned to a specific area of knowledge.

c. If possible, keep the suggested responses short and arrange them in some logical order, so that the pupil will not be unnecessarily penalized because he is a slow reader or makes clerical errors during the stress of taking the examination.

d. If relationships are to be determined, make it clear to the pupil what kinds of relationship he is to look for. Do not ask him to guess what you have in mind.

A FEW GENERAL PRECAUTIONS

Keep the purpose in mind. Every question in the written test should contribute efficiently to the overall measurement of the pupil's knowledge of the subject for which the test is constructed. The question fails of its purpose if it is poorly written, or measures factors outside the subject, or emphasizes trivialities. And the efficiency of the written test is only as good as the questions that are in it.

Keep the pupil in mind. It is the examiner's responsibility to communicate effectively with the pupil taking the test (assuming, of course, that the pupil is reasonably attentive), so that the pupil has no doubt about what is expected of him. The language of the test should be clear, direct, and as simple as possible. The pupil should be told how many questions he is to answer, how much time he is allowed, how many credits are assigned to each question, and any other information that will help him to understand the task presented by the test.

Finally, the examiner should constantly bear in mind that a written test is not a contest between the examiner and the pupil, in which one wins only as the other loses. The examiner must approach his task with an honest desire to produce a fair measure of the pupil's achievement.

Note:

An internal examination of a fowl after death for the purpose of diagnosing poultry diseases, determining the presence or absence of internal parasites, or finding of other facts is called

1) pre-mortem
2) post-mortem
3) unsex
4) cull

This question breaks many of the rules of good item construction. For instance:

a) The stem is too wordy and even misleading. The same basic question could have been asked as: "Internal examination of an animal after death."

b) Suggested responses 1 and 2 cover all possibilities to the vocabulary-wise students, even if they know nothing about agriculture, and, to the pupils who know what "post" means, there is a definite clue provided by "after death" and suggested response 2.

c) Suggested responses 3 and 4 are not parallel to suggested responses 1 and 2.

d) Suggested response 1 is a contrived word, and suggested responses 3 and 4 are implausible.

For more detailed information about question writing, we recommend a study of "Improving the Classroom Test," a publication of the New York State Education Department.

Ohio State Dept. of Education, Columbus
Pub Date - Aug66
MF AVAILABLE IN VT-ERIC SET 75p.

*SAFETY, *INDUSTRIAL ARTS, *TRADE AND INDUSTRIAL EDUCATION,
*RESOURCE UNITS,

Industrial arts and vocational education teachers may use this loose leaf notebook as resource material on shop safety. Safety suggestions are listed for the areas of (1) automotive power and mechanics, (2) drafting, (3) electricity and electronics, (4) general safety, (5) graphic arts, (6) industrial crafts, (7) metals, and (8) wood shop. Also included are a student injury report form, six sample safety posters, and a copy of "Monitor," the Commission's monthly publication. (EM)

THE INDUSTRIAL COMMISSION OF OHIO
COLUMBUS, OHIO 43215

M. HOLLAND KRISE
CHAIRMAN

Teachers and Instructors:

The Division of Safety and Hygiene of The Industrial Commission of Ohio, together with a committee representing the Ohio Industrial Arts Teachers and the Ohio Department of Education have developed the enclosed safety manual and collateral material.

Its purpose is two-fold since it is designed to aid in instructing students in on-the-job safety, thus protecting them while they are learning, and also to create an awareness and concern for safety which will follow them into industry later.

The Commission is confident that much good can be derived from the information and instruction contained in this material, and is certain the effect of the program will be more evident as your students become a part of Ohio's work force.

It has been our experience that similar programs developed for use by industry have reduced the disabling injury rate in Ohio, and we recommend the study and use of this safety manual and the other material related to it.

Very truly yours,

M. Holland Krise, Chairman,
The Industrial Commission of Ohio

[illegible] 7, 1966

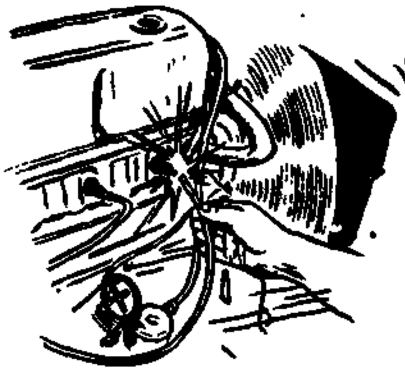
AUTOMOTIVE POWER AND MECHANICS

General

Oil or adjust moving parts only if authorized by instructions and your teacher.

Exercise caution around the fan and belts.

Guard against automatic response. Touching a spark plug or high tension leak may cause you to jerk away and into the fan.



AUTOMATIC RESPONSE

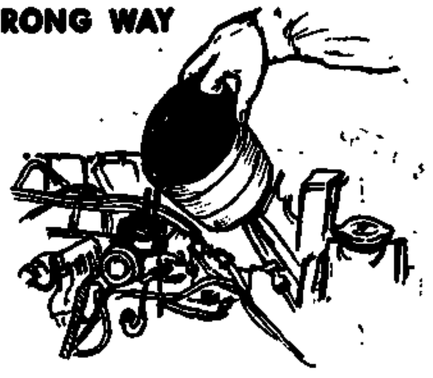
As much as possible work with the engine switch OFF.

Tighten fan belt with the engine stopped.

Exercise caution when disassembling spring loaded parts.

Consider the exhaust system, engine and radiator to be hot until checked and found to be otherwise.

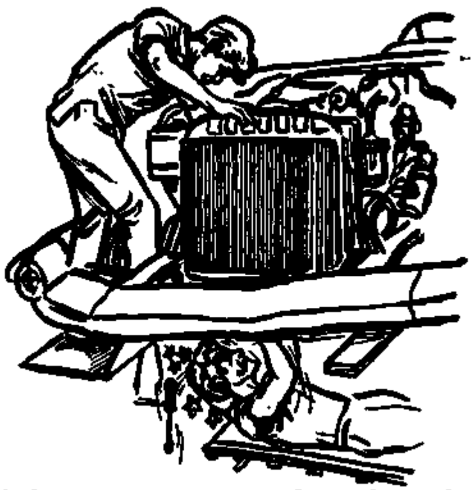
WRONG WAY



Do not pour gasoline from an open container into carburetor throats.

Exercise extreme care when using welding equipment around vehicles.

Use care when working around broken glass, broken headlamps, etc.



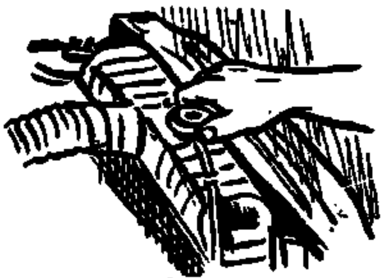
When one person is working above the engine and another below, the former should be careful to avoid dropping parts or tools from above.

Use new lock washers on parts which may shake loose and cause an accident.

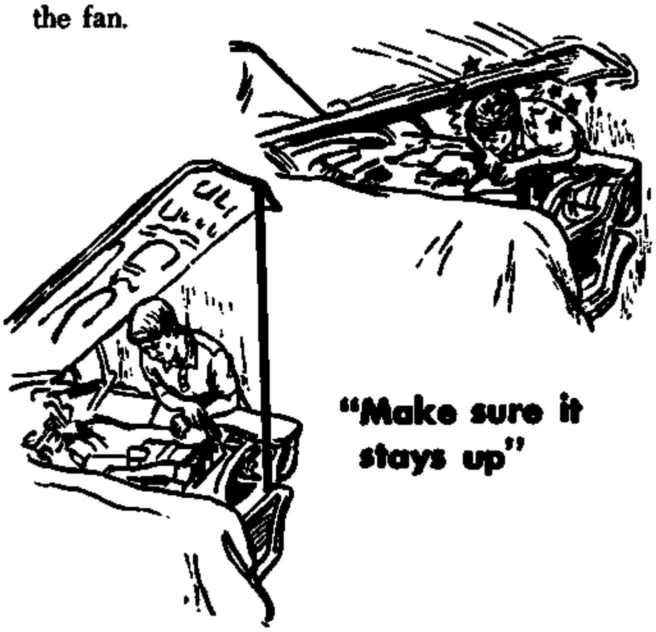
Always tighten immediately those nuts and bolts which may become lost if screwed up finger tight and then forgotten. Steering apparatus could fall apart and cause serious consequences.

Double check for tightness at important points. Make certain cotter pins are replaced as appropriate.

Wait for hot radiators to cool before removing caps.



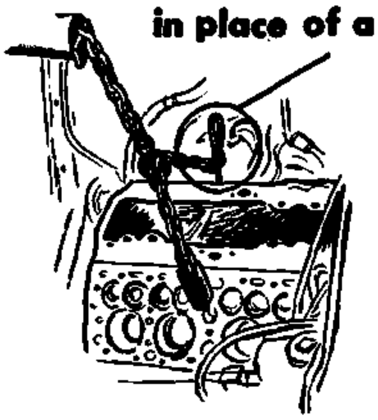
When using strobosopic timing lights, plug scopes and other such electrical apparatus, make sure the wiring does not become entangled in the fan.



"Make sure it stays up"

Make sure hoods and boot lids will stay up before working under them.

When walking between cars, beware of legs and feet of workers under the vehicles.



Never use a screwdriver in place of a bolt!

When pulling engines, make certain the ropes, chains or brackets used to connect the hoist to the engine are adequate. Arrange to prevent slipping. Avoid placing hands in areas where they may be injured.

Personal Health Hazards

Wear respirators while spray painting.

It is a dangerous practice to wash hands in gasoline or thinners. Not only may explosive and toxic fumes result, dermatitis may occur since the natural oils of the skin will be removed and replaced with harmful acids.

Avoid placing your abdominal muscles under excessive strain when removing cylinder heads or when lifting heavy parts or equipment. Know the proper position to lift, placing the load on legs whenever possible.

Never place hands in front of a high pressure greaser. The force of the gun will press grease into and under the skin.

Avoid breathing vapors, exhaust, spray paint mist, fuels, thinners, etc.

Keep your clothing tidy, neat and clean. Accidents "look" for a place to happen around untidy people and equipment.

Keep open wounds properly dressed and covered while working with dirty parts, tools, etc.

Jacking, Hoisting, and Lowering

Do not jack up one end of the car if a person is under the opposite end.

Avoid the use of blocking of questionable safety.

Jack stands should always be placed on flat, level, firm surfaces ONLY. Jack stand bases should be positioned to give maximum stability in the forward-rearward direction and the sideways direction.

Avoid shaking or pulling on long handled wrenches or parts to the extent that the vehicle rocks and may upset off the jack stands.

Hoists must be properly adapted to the kind of vehicle being raised with all cups and lifters firmly in place.

Automobile type jacks are not adequate means of supporting cars under which someone is to work. (The bumper jack is particularly dangerous – others also are not recommended for under-car work). Use heavy duty jack stands capable of handling loads well in excess of your intended load. Allow a safety factor.

Get your instructor's approval on any questionable lifting procedure. Get another person to double check your jacked up car before going under. This way he too shares for its being firmly on jack stands.

Long jack handles constitute a serious tripping hazard. Lift, blocade, or otherwise safeguard any such hazard.

Heavy duty garage type floor jacks are not recommended for under-car work. A bump of the trip mechanism by a fellow student can cause a serious accident. Cement blocks likewise are not recommended.

Operate hoists in strict accordance with manufacturers instructions. Find out the correct operating methods prior to an accident, not afterwards.

Know the lifting capacity of your jack or hoist and do not exceed the safe limit.

Do not run an engine with the car on the hoist.

Make certain no one is under a car at the time it is lowered.

Driving and Locating Vehicle for Work

Do not wear glasses with restricting vision side shields while driving vehicle within the shop or congested areas.

Only licensed drivers may drive vehicle into or out of the shop.

No vehicle should be moved except on the instructor's command.

Licensed drivers should not attempt to drive standard shift cars if they are familiar only with non-standard or automatic shift cars. They will not drive trucks or tractors or other such vehicles if they are not familiar with the operating of same.

Work will never be performed within the street area or even at the curb of a travelled street.

No towing or pushing is recommended. Learn what is wrong and fix it in the shop. A "tight" engine is too tight if it must be towed.

It is good practice to lock the vehicle after it is located if the battery is not disconnected and work is to be done under the car. Someone accidentally engaging the starter (with car in gear) can cause the car to move forward and fall from jack stands. Same accident is possible with someone working in the engine compartment and touching the solenoid with a wrench or part. Rule: Avoid working on an engine or under a vehicle while someone occupys the vehicle.

When parking cars in shop bays or stalls, make certain you do not run over the protruding legs or feet of boys who may be working under adjacent cars. Vision is limited and drivers should use a buddy who directs them from the front or rear outside.

Always move in or out of the shop area with the front windows rolled down in order that the outside buddy directing your movement can talk freely with the driver.

Excessive driving within the shop to locate only creates excessive carbon monoxide within the shop. Use the floor jack to roll the car into any desired tight spot rather than to overdrive.

Greases, Oils, Fuels, Thinners, Vapors

Keep spilled oils, greases, fuels or thinners cleaned up. Ventilate at once.

Wash area with solvent after cleaning oil or grease from a floor.

Use safety solvents for cleaning, never gasoline or other low flash point liquids. Parts may strike together causing ignition.

Dump dirty oil, fuel or solvent a safe distance from buildings, preferably where wastes are burned. Never dump such liquids on hot coals.

Clean parts in the assigned cleaning area. If there is no specific area, avoid indoor areas where vapors may travel thru cold air returns to a furnace room, areas where sparks occur, or areas where other dangers may lurk according to your particular shop situation.

Visitors, customers, other students or adults entering the shop must not smoke or occupy hazardous work areas. Students should request cooperation. (Example: Visiting student standing near a boy at work with a fender grinder and without safety glasses).

Exhaust fumes from operating engines to the outside. If no exhaust system is provided, extend the exhaust outdoors via flexible or solid piping. Take this into account when positioning the car. Make certain tripping hazards are not created.

Remember that fuel will be pumped when the engine is turned over to disconnect rods. Because the carburetor has generally been removed at this point, the fuel line to the carburetor area will spurt fuel. Cold fuel falling down on a hot work light bulb can break the bulb and cause a fire next to a person working under the car – one who often is laying on his back on a creeper.

Avoid using gasoline in open top containers.

Do not pour gasoline from open cans into carburetor throats.

Use caution with hot work light bulbs around fuel or hydraulic leaks.

Gasoline contains dangerous tetraethyl lead. Siphoning with a hose may cause a mouthful of this harmful poison. Obtain fuel in a safe manner.

Brake fluids often spurt from the master cylinder when the cover is removed for manual bleeding. Avoid placing eyes over cylinder during pumping.

Remove oil or fuel soaked clothing. A spark can make a fuel of you!

Follow state codes with regard to storage of fuels, thinners and other similar liquids.

Use only small working quantities of fuels in the shop. If priming an engine, never place a container with fuel on a battery.

Use a flashlight, not a match or lighter to check radiator level. Vapors emitted from radiators are flammable and explosive.

Always check fuel connections for leakage immediately when starting an engine. Fuel leakage on a hot exhaust manifold creates a serious fire hazard.

Air Pressure

Never fill tires by guess. If working with truck type snap ring rims, exercise extra caution to make certain rings are fully seated and secure.

Use caution with air hose so it is never aimed toward another person. Hoses generally throw air line residue in the form of rust, metal particles, water condensate and other materials.

When blowing out spark plugs make certain in the air blast which reflects out of the well does not carry up into the eyes of a person often working on the opposite side of the engine.

If the pressure is unknown, assume it to be high and use caution accordingly.

Batteries

Avoid contact with electrolyte. If acid get on hands, flush and wash before touching fac

Use rubber gloves and face protection whe filling dry charge or wet batteries. Rubber apron are also recommended.

Keep acid from splashing on clothing b pouring slowly.

Never permit sparks or fire to occur around battery. Vapors are explosive.

When connecting or disconnecting, do n permit the wrench to cause a short circuit.

Remove finger rings. A short circuit from th wrench through a ring can cause the ring to heat red hot. Fingers have been lost as a result.

When making electrolyte, always pour ACID INTO WATER, not vice versa.

Disconnect battery for electrical work and where turning the engine could impair the safety of the student mechanic. Inadvertent touching of certain solenoids or wiring can cause starter engagement as well as the starter switch.

Never permit unused electrolyte to sit around where it may be spilled.

Avoid breathing acid vapors.

When charging, turn the charger OFF before disconnecting the cables.

Avoid placing metal objects on a battery or shorting across terminals.

Wrenches and Tools

Grease on a hammer handle may cause it to be thrown unintentionally. Avoid excessively dirty or greasy hands and tools.

Use pertinent safety precautions when grinding, welding or using equipment uncommon to auto shops.

Keep tools and parts off floors. Stepping on a socket can cause a serious fall.

Creepers should be stood on end when no one is on them.

Use the correct tool for the job. Makeshifts of questionable safety should not be used.

Report skinned, frayed or otherwise defective electrical cords to your instructor.

Do not drive over tools or equipment when bringing autos into the shop.

Never pry with a file. Never use a file without a handle.

Grind mushroom heads from chisels or punches.

Remove burrs found on tools or objects being worked upon.

Avoid hammering on wrenches unless designed for this purpose.

Use the correct size wrench for the job. Do not use pipe to extend the leverage.

Make certain the wrench fits properly. Some rusted belts may have to be dressed to allow the wrench to slide on.

Hammers with loose handles should be turned in for repair.

Deposit oily rags in covered metal containers.

Avoid hammering on hardened surfaces with hard faced hammers.

Exercise caution when using hot muffler heater elements. (Tool used to expand the lap where tail pipe or exhaust pipe enters muffler.)

Use care when splitting sheet metal to avoid tearing hands if the chisel slips off the work.

Test — General

Multiple Choice

1. Fan belts should be tightened with the motor
   a. Stopped
   b. Running
   c. Either running or stopped
2. Dirty parts should be cleaned in
   a. Gasoline
   b. Kerosene
   c. High flash point solvent
   d. None of the above answers are correct
3. Work may be performed at the curb
   a. If work is of minor nature
   b. If major or minor
   c. Never
4. When you spray paint, it is best to
   a. Use a face shield
   b. Wear a wet handkerchief "bandit style" over nose and mouth
   c. Wear nose plugs and keep the mouth shut
   d. Use a respirator
   e. None of the above answers are correct
5. If uncertain regarding fuel to an engine
   a. Pour some into the carburetor throat while the engine is cranking, ignition ON
   b. Pour some into the throat of the carburetor, then try to start
   c. Look into the carburetor throat
   d. Look into the carburetor throat and work accelerator pump by means of the throttle linkage.
   e. Any of the above answers are correct
   f. None of the above answers are correct
6. If the radiator is very hot and you wish to add water
   a. Remove the cap at once
   b. Allow the engine to cool somewhat, then remove cap cautiously
   c. Hose down the radiator and engine
   d. None of the above answers are correct
7. Washing hands with gasoline, paint, or lacquer thinner, or solvents, is considered to be
   a. Poor practice because dermatitis may result
   b. Permissible
   c. Permissible except for gasoline, because of low flash point
   d. None of the above answers are acceptable
8. To check the level of fluid in the radiator, use a
   a. Match
   b. Flashlight
   c. Cigarette lighter
   d. Any of the three would be acceptable

9. Dirty oils,
   of by
   a. Pouring them into the street at the curb
   b. Pouring down the floor drain or sink drain
   c. Pouring into an incinerator which is not burning
   d. Asking the teacher for a place to dump it
   e. None of the above answers are correct
10. Visitors, janitors and other personnel coming into the shop and who are unaware of the shop safety rules should
    a. Be permitted to do as they wish since they are guests
    b. Not be permitted to smoke or enter potentially dangerous areas
    c. Be advised of shop rules at once
    d. Be given eye protection and a set of safety rules
    e. Be banished from the shop
    f. None of the above answers are correct

Test – Batteries

Explanation

1. Sparks and flames around batteries are not recommended because
2. Pour acid slowly to prevent splashing. This is important because
3. Rings should not be worn in shop. Under what circumstances could they cause injury when working with batteries?
4. Why is it poor practice to lay wrenches, set oil cans or place other metallic objects on a battery in the engine compartment when working on an engine?
5. Why is it considered good practice to remove a battery cable when working on an engine for an extended period of time, or for some major or minor repairs.

NOTE: Refer to the listed pages for safety instructions concerning machines and equipment:

DRAFTING ROOM SAFETY

Students will carefully remove the excessively sharp tip from pencils. Hard lead points will not only puncture the paper, but on break-off can fly with a possible strike in the eye.

Sharp tools such as compass points will be laid in positions out of the way when not in use.

Keep thumb tacks, pencils and other items out of mouth.

Raise or lower adjustable bench tops carefully to avoid pinching fingers.

Avoid placing fingers into openings of machines where paper is normally fed.

Work the board in a position that does not endanger your elbow. Excessive leaning on one elbow will cause inflammation of the bursa or bursitis.

Make certain light is adequate. Avoid shadows and bright sunlight. Reflect artificial light when such light is required. Avoid eyestrain.

Pencils or sharp objects will be handled carefully when they must be passed from one student to another. Never throw such objects.

Sharpen pencils on one end only, a double point pencil can be dangerous to the eyes.

Do not tilt stool

Students will not lean back or tilt stools or chairs. Falls can result in serious head or back injury.

Pick up immediately any small items, such as pencils or thumb tacks that fall on to the floor.

Drawers in drafting tables should always be kept closed to avoid falls.

Provide adequate aisles and working space.

Fasten file cabinets to avoid tipping when only top drawers are open.

Maintain proper usage and spring tension on all paper cutters.

Recognize the inherent dangers of the reproducing equipment.

- a. adequate ventilation (ammonia vapor)
- b. storing and handling ammonia
- c. always cut master power switch when cleaning or maintaining machine or bulb.

Do not permit ink to enter any open cuts or scratches.

Avoid infections and complications. Treat and report all injuries immediately. EVERY ITEM HAS ITS PLACE – EVERY ITEM IN ITS PLACE.

Test – Drafting

1. Why is good lighting essential when you make a drawing at home or away from school?
2. How can you avoid skin rash from blueprinting chemicals?
3. In what way can a sharp pencil cause an injury to you or others?
4. What condition may arise from excessive leaning on one elbow? Why?
5. What other safety measures can you cite which drafting students must be aware of?
   a.
   b.
   c.
   d.
   e.
   f.
   g.
   h.

ELECTRICITY AND ELECTRONICS SAFETY

This is the time and place to teach the students to think safety. Even though they may be using low voltages for their experiments, they should be required to turn off the power before making any changes in the circuit. This learning will help them in the future when they might be working on a high voltage circuit. The wise technician always checks to see if the power is shut off before beginning his work.

Listen to instructions before using any of the equipment.

Use the least amount of current possible for the experiments.

Complete the circuit before the power is turned on.

Turn the power off before making a change in the circuit.

SAFETY RULES FOR ELECTRICITY AND ELECTRONICS

1. All electrical equipment should have a third wire, or be properly grounded with a wire from the equipment to the ground.
2. The electrical cord attached to the equipment should have moisture-proof insulation.
3. All extension cords should have moisture-proof insulation, and the wire size should be no less than AWG No. 12.
4. Do not overload, or stall the power tool. Serious damage to the equipment may be the results. Heat can cause the insulation to break down and bring about an electrical flash.
5. There is danger of an electrical flash at any time and glasses will help protect the eyes against flash burns and from hot metal sparks.
6. Use conduit to eliminate the danger of hanging wires and the possibility of cutting into them.
7. High voltages are frequently measured in electronic circuits. Make sure your meter connections do not short or touch other parts of the circuit. Use a well insulated test prod to reach difficult and obstructed test points in the circuit.
8. Use no test instrument until you have been properly instructed in its use.
9. Use the test instrument for only the purpose for which it was designed.
10. Transformers may be extremely dangerous. Proper respect and extreme caution must be practiced at all times when working with or measuring voltages.
11. Unknown voltages are measured from the highest range down to the proper range necessary for the most accurate reading.
12. Check and double check any project that you have completed before you energize it. Then, if you aren't still completely sure, have the instructor check it.
13. Take your time. Do not endanger yourself or others by being too hasty.
14. If the power switch for a circuit is remote from the source of trouble, it should be turned off by the electrician. He should hang a tag on the switch warning others to leave the switch in the off position.
15. The operator should be responsible for turning the power on and off on all electrical equipment he is using.
16. Do not have open flames near charging batteries.▼

Do not have open flames near charging batteries.

17. Charge only in a well ventilated room.▼

Charge only in a well ventilated room.

18. Batteries should be first connected to the charger before it is turned on.
19. When mixing acid and water, ALWAYS POUR ACID INTO THE WATER. This is often done when making cut acid for etching printed circuit boards and also when preparing dilute electrolyte for wet cells.
20. Use rubber gloves and a face shield when you are handling acids.
21. Exercise extreme caution when installing radio and TV aerials. Never put them close to power lines.
22. If there is an electrical storm, do not work on TV s or radios that have the lead-in wires still connected to the set. Observe this rule even though the line has a lightning arrester hooked into it.

23. Keep fingers from the "live" metal parts of the test probes while making tests.

24. Never experiment with circuits unless you know what you are doing.

25. When working on TV's or radios, be extremely careful when working in the area of the power supply especially with TV.

ELECTRICITY

Never block safety type switches in the ON position.

Disconnect electricity before working on defective power equipment.

Never substitute for a fuse, using a penny or an oversize fuse.

Hook electrical cords to outlets wired for such use, not to light sockets.

Lamp cords will not be placed under rugs, over thresholds, near hot radiators or other places where insulation may be impaired.

Know how and where to shut off the current on any device you are going to work on.

Use power tools (portable and stationary) only when such equipment is properly grounded and you have dry footing.

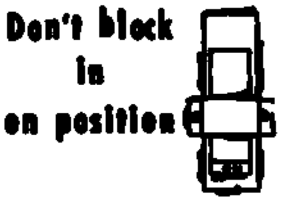
Check out circuits with low voltage; why use 110 volts if six will do the job?

Use a flashlight where it is impossible to replace fuses or operate open type switches with regular illumination.

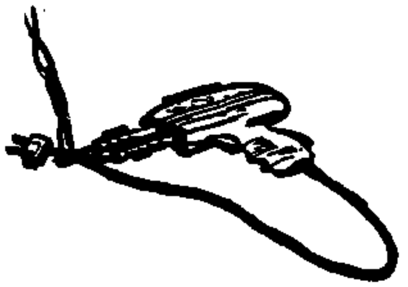
Check for overheating of appliances.

When testing generators, proper guards should be in place for belt drives before starting.

When purchasing an electrical appliance, select tools equipped with the third ground wire and items approved by the Underwriters Laboratory.



Avoid overloading circuits with numerous appliances. Remember – number 14 wire can carry 15 amperes while number 12 wire can carry a maximum of 20 amperes.



Avoid placing a soldering gun on a working surface and allowing the HOT tip to come in contact with the cord.

Always pick up soldering irons by the handle, even when cool.

Treat cuts and burns immediately.

In the event of electrical shock from high voltage make certain the victim is not charged before touching him, lay him on ground, loosen all tight clothing, wrap in warm blanket and call a doctor.

Keep all flammable material away from all electrical devices.

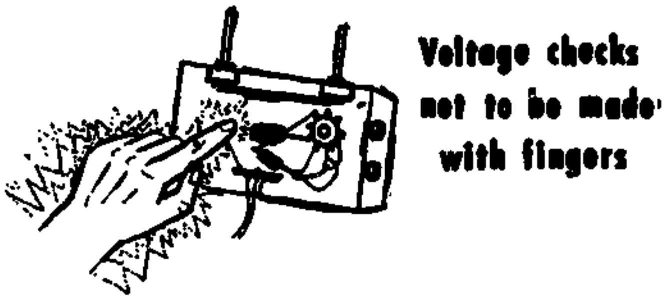
Carbon dioxide (CO_2) fire extinguishers are used for electrical fires since they do not provide conduction back to the user.

Students will not handle or operate radio transmitting equipment which requires U.S. Government F.C.C. license without first securing such documents as required by federal law.

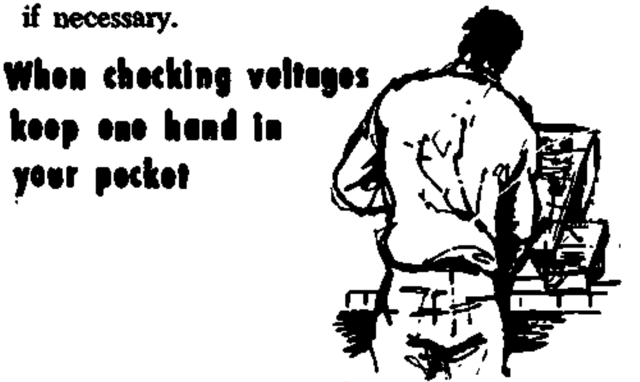
No wiring is to be done in the home or away from school using the teacher or the school as a source of authority for such work.

Never skimp of tape or other insulating materials where safety is involved.

Use pliers, not fingers, to straighten heavier gauge wires.



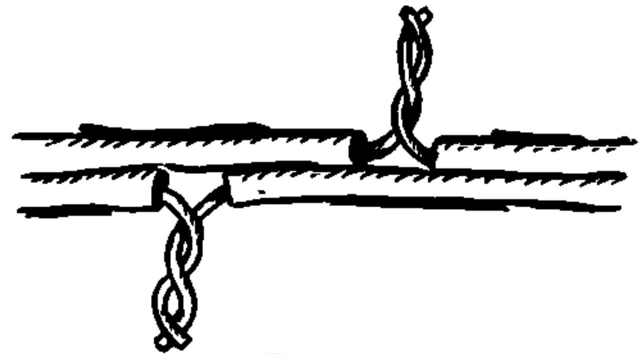
Insulate skinned or frayed wires and replace if necessary.



Disconnect electric cords by pulling the plug, not the cord.

All splices and solder joints must be made without protruding sharp points.

▼ In splicing a duplex cord, stagger the splices.



UNDERWRITERS' KNOT

Use the Underwriters' knot where possible in sockets and plugs.

When removing insulation from wires, do not cut into the wire and always cut away from your body.

Never touch anything electrical which is not known to be safe. DO NOT TAKE ANYONE ELSE'S WORD – check it yourself.

Always treat unknown wires as HOT until proven otherwise.

Do not "jump" across terminals to determine hot or cold conductors.

Voltage checks will not be made by touching charged wires or apparatus with bare hands.

Do not cut "live" wires.

Never operate a switch or electrical tools while one hand is resting on a metal stand, pipe or other metal ground.

When checking voltages, keep one hand in your pocket. (An insulated clip on one test lead is a good safety factor.) All test leads are to be held by insulated handles.

Make certain the AC input line is hooked to the primary side of the transformer when working with transformers.

Beware of transformers with low voltage primaries and a high voltage secondary.

Avoid hooking low voltage equipment to high voltage sources and vice versa.

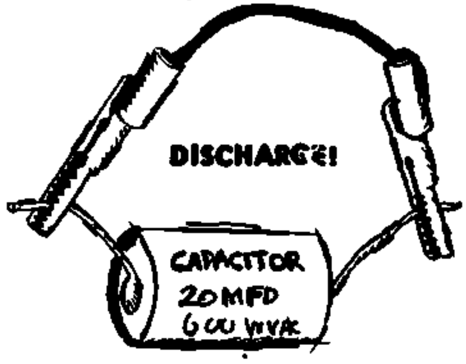
Exercise caution when working with AC radio equipment and television equipment constructed without transformer power supplies.

Voltage checks should not be made by touching charged wires or apparatus with fingers.

Always check circuits with a voltmeter or similar equipment to determine values and dangers involved.

Use the test instrument for only the purpose for which it was designed.

Avoid working around capacitors unless they have been discharged or shorted.



Danger zones on TVs – #1 high voltage anodes; #2 high voltage cage.

Discharging the picture tube properly: the, picture tube has a capacitive nature and can hold a high voltage charge for a rather extensive period of time.

ELECTRICITY TEST

Completion Questions:

The....................type fire extinguisher is the safest kind to use on electrical fires.

A person should first....................the circuit before starting to work on an electrical powered device.

Splices should be....................on a duplex electrical cord.

The ....label is associated with products which have been tested and found to be of safe design and construction when new.

Capacitors should be ....or..................before handling.

Number 14 gauge wire may safely carry a .... ampere load.

All portable and stationary power tools should be.................... to dispose static electricity.

All splices and solder connections must be made without protruding....................

Briefly explain the following:

Why does the Underwriters' knot contribute to safety when used in a standard socket or plug?

GENERAL SAFETY

Conduct and Procedure:

Walk – don't run – in shop areas.

Remain ALERT – report the accident that is "looking for a place to happen."

Remember, horseplay has no place in the shop.

Request teacher approval of special machine set-ups.

Be considerate of the safety of others.

Safety rules pertinent to the specific shop, instituted by the school safety committee or instructor, should be adhered to unless altered or revised by the instructor.

No student should use equipment, including power tools or hand tools, until he has had instruction relative to the safe handling of it by proper authority.

Make adjustments before power is turned on and remove all wrenches, materials and objects not tied down and used for the operation.

Persons not operating power tools or instructed to observe the operation thereof, should keep clear of operators.

Never start or stop a machine for another person except in an emergency.

Machines will be operated by one person only.

Respect human weakness and watch out for others. Report unsafe conditions to the teacher.

Avoid dangerous operations when overtired or ill.

Form correct habits under normal conditions so you will automatically do the correct thing if required to work under pressure.

Read and follow the precautions and information from safety posters.

Don't use machines for trivial operations, or whenever hand tools would best accomplish the task.

Girls working in shop areas must confine their hair and avoid wearing apparel subject to catching on or in machinery. Rings, bracelets, watches, etc., should not be worn.

Never throw object in shop. Distraction or injury can result.

Students will not tamper with adjustments or otherwise play with machinery at any time. Serious accidents have been caused by such action.

Do not lean on machines; you may press a switch or throw a control which, upon starting, could endanger the safety of the operator or the machine.

Wear gloves to handle raw materials such as rough boards, metal subject to burrs or sharp edges, glass and other materials in the rough.

Tools, Equipment and Materials:

Eye protection is mandatory and appropriate eye safety devices must be provided for all students in accordance with the regulations as stipulated in the Ohio Law relating to compulsory eye protection (House Bill No. 492, Section 3313.643 of the revised code).

Compressed air must never be used for [illegible]r than the specific purpose. Never use for cleaning clothes or machinery.

Stop all power machinery to oil, adjust or clean.

Allow revolving machinery to stop on its own. Resist the desire to grab chucks, spindles or other rotating parts with the hand.

Use power tools only when an instructor is present in the room.

Set up shields to stop flying chips, sparks, or particles.

Replace grinding wheels showing cracks, those out of balance or those worn too small to allow proper clearance (not more than ⅛") between tool rest and stone.

Keep cutting tools sharp.

Oily rags and other highly combustible materials must be kept in a closed metal container.

Ground all portable and stationary power tools.

Keep hoses and electrical cords trip-free.

Never mount a grinding wheel unless the speed of the motor and the speed of the wheel are known and the two are appropriate.

Store flammable liquids in approved safety containers.

Avoid using electric drills or other electrical apparatus while standing on wet floors.

Make certain your hands are free of oil or grease and that hammer, screwdriver, chisel, etc., handles are free of oil and grease.

When starting a machine, allow it to reach its proper operating RPM before using.

When finished with a tool, clean and then replace it so it cannot fall.

Disconnect cords when portable tools are not in use.

Vice handles should hang free when not in use.

Know and follow the specific requirements of the kind and type of machine you are going to operate.

Use the correct tool for the job.

Check for frayed electrical cords and for chafed or worn air hoses.

Shop Environment and Housekeeping:

Floors should be of a non-skid type and kept free of accumulation of materials or scrap.

The area should be swept daily and cleaned thoroughly periodically.

Work stations should be cleaned at the end of each class period.

The shop should have a neat and orderly appearance at all times.

Shops which are dirty, cluttered and unsanitary places are good sites for accidents. By helping eliminate these conditions, you promote safety, morale, health, fire prevention, efficiency and good public relations.

Aisles should be kept clear by putting stock away promptly after using.

Ventilating systems must be installed. Serious disorders can be caused by uncontrolled vapors, mists, gases and fumes.

Light is essential for sight. Sight is essential for safety. Keep windows, light bulbs, reflectors and walls bright but without glare. Replace burned out bulbs at once.

Floors must be kept free of objects or materials which may cause falls. This includes oil, grease, bolts, wood blocks, shavings, etc.

Fire extinguishers must be kept handy. Know how to use them.

Fire regulations pertinent to the shop should be studied and familiarized so you can assist in closing windows, make proper exit, etc.

Clothing and Personal Protection:

Wear protective clothing and equipment for the use intended for its wear.

Avoid wearing anything or wearing gloves which may be pulled into machinery.

Keep sleeves rolled up, shirt tails in, long ties and jewelry removed.

Aprons should be secured snugly. They should be able to tear free if accidentally caught.

Hair nets should be worn by those students with long hair.

Wear eye protection as defined under Tools, Equipment and Materials.

Beware of any suspicious fumes or gases which may be toxic and report to proper authority.

A person feeling ill should not operate a machine – report to instructor.

Use proper lifting technique when moving heavy objects.

First Aid and Health Hazards:

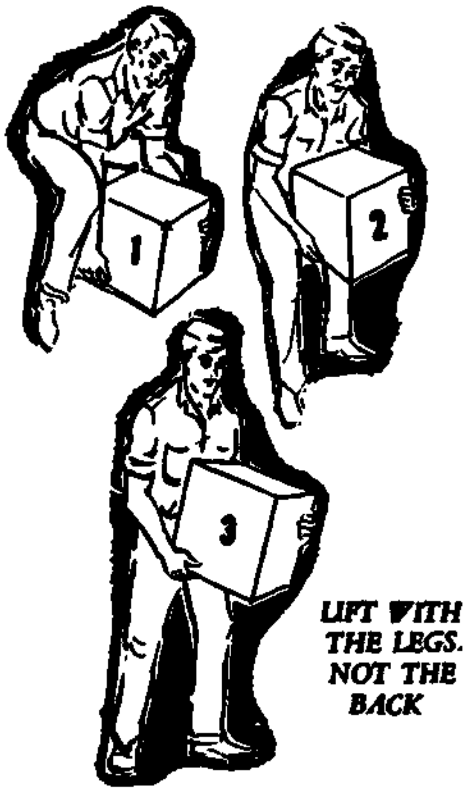
Have cuts, burns or bruises, however minor, treated immediately by the school nurse or another qualified person designated by the school administration.

Report any injuries to instructor immediately.

Neither teachers nor students are to treat or remove particles from the eye.

If the job subjects you to eyestrain, provide additional light. Eyestrain is a frequent cause of accidents.

Avoid placing hands to mouth or eyes while working.



Complete "Student Injury Report" form on each accident and send to Division of Safety and Hygiene, The Industrial Commission of Ohio.

GRAPHIC ARTS SAFETY

Hand Typesetting

Students will not lean back or tilt stools or chairs. Falls can result in serious head or back injury.

A student should stand when setting type.

Do not force type into composing stick. Type can cut your thumb.

Do not throw type.

Secure assistance rather than risk a hernia when carrying heavy type cases.

Grip type case and other apparatus properly when carrying to avoid dropping and causing foot injuries.

Avoid running the fingers or hand over edges of lead, brass or steel rules to test or clean. Sharp edges will cut fingers.

Do not run fingers over perforating or cutting rules.

Discard ink can covers with jagged edges. Open ink cans with care.

Keep hands from mouth and eyes when working with lead or ink.

Clean type cases with vacuum. Do not blow manually or use compressed air.

Keep hands off the proof press track. One person should operate the proof press with no others close. Leave handle up when not in use.

Do not use tweezers with attached bodkin. Bodkins are sharp and can cause injuries.

Pick up type or other objects which may fall to the floor. Small items can cause slipping hazards.

Machine Typesetting and Maintenance

Operate typesetting machine only after you have been properly checked out and understand the procedure.

Lock vise securely; loosely locked handles will break off. A front squirt may also result.

Make certain the vise-automatic is working properly. The vise-automatic will stop the machine if the first elevator is not fully seated.

Advise the instructor of defects. Do not attempt to make repairs unless told to do so.

Never remove a guard. It is placed on the machine to protect you.

If the glass front is not securely locked when raised for removal of the matrix, it may drop, causing an injury.

Remove the plunger pin if the machine stalls just before casting a line to prevent a double squirt.

If hot metal squirts, do not attempt to shut off machine. Get out of the way and call the instructor.

If the machine stops, push on the control lever and do not open it until the problem is corrected by the instructor.

Wrong adjustments may cause injury to you. Make only those changes requested by your instructor.

Never hold the pump-stop lever open to cast a line. If the machine casts, you may be dangerously burned from a squirt (front).

Make certain the space band transfer pawl is locked before making a line transfer by hand.

Over filling the metal pot may cause the heating element to overheat, creating a fire hazard. Avoid over filling.

If a line jams when the assembler is raised, do not open the gate.

Exercise caution in lifting magazines and pigs of metal.

Make-up

Deep painful wounds may be inflicted by running fingers over rule edges.

Keep hands away from mouth and eyes.

Use care to protect fingers when operating the lead cutter.

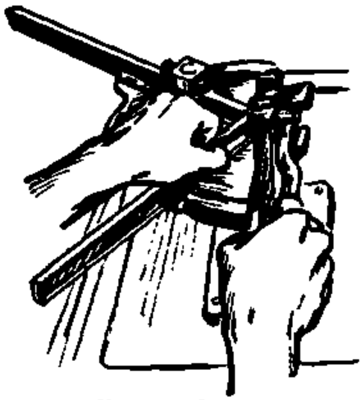
Cut away from the body when using the knife or other sharp objects.

Keep make-up room aisles clear of tripping hazards.

Get assistance to lift heavy forms.

Avoid placing fingers near gears or bearers on a proof-press.

Keep fingers away from mitering machine's blade.



Tweezers will not be carried in trouser pockets.

Only one student at a time will work at the proof press, others will keep clear.

Bend at the knees when lifting heavy forms.

Stonework and Imposition

Always replace a chase when finished with it to avoid tripping hazards. Replace chase carefully so others do not upset it.

Cut away from the body always when using a knife.

Handle ruled forms with care to avoid cuts.

Tighten forms properly. Over-tightening may cause a wedge to buckle or the chase to snap, injuring hands or face.

Secure assistance in lifting heavy objects.

Never carry a job over your head.

Presswork

Never work near a press if you have loose or dangling clothing.

Injury often results from attempts to retrieve misfed sheets.

Keep flammable solvents in fireproof containers and enclosures.

Never attempt to ink the press while it is in motion.

Always shut off the power when putting the form in the press. If the press is started accidentally, you can be injured.

Guards must always be securely in place any time the machine is used.

Always turn off the power to a machine when you are through using the machine.

Wipe up oils which may spill on the floor.

Store oily or dirty rags in proper type containers.

Use care in opening ink cans.

Do not lift heavy forms by yourself. Get help if required.

Use make-ready knife for the purpose intended only.

Store heavy forms so they will not fall on someone's feet.

Avoid paper cuts by using care in handling.

Do not talk to others when you feed the press. Do not talk to others when they are feeding.

Paper Cutter

Never work on the cutter unless safety devices are present and in working condition.

Eye or facial injury may occur if tools or objects left lying on the table surface are cut into with a snap-up resulting.

Arrange paper on the bed with the clamp slightly lower than the blade.

Avoid handling paper by the edges.

Cut material within the capacity of the cutter.

Cut materials within the operator's ability.

The cutter is a one man machine.

Avoid dropping blades during removal or reinstallation.

Do not let a sharp edged blade lie where others may be injured.

Do not over-exert or assume improper positions while pulling cutter handle.

Handle and floor must be free of oils and greases.

Operate power cutters through by hand for one complete revolution.

Double check to make sure all bolts holding the blade are properly tightened after reinstallation.

While cutting, keep both hands on the handle until the knife has come to rest on the top stroke.

Avoid touching the blade at any time, except for replacement.

Before reaching for the cut paper, make sure the handle is in its farthest backward position.

Power cutters must be off when cleaning, oiling or adjusting.

Use care and a jogging blade when jogging stock against back gauge and side so as to avoid cuts by the paper.

Do not use metal rules on the paper cutter.

Proof Press

Only one student may operate the proof press at one time.

Keep hands off the track.

Leave the handle in an upright position when not in use.

Power Stapler

Make certain power is off before cleaning, oiling or adjusting.

Keep fingers away from movable parts of the stapler.

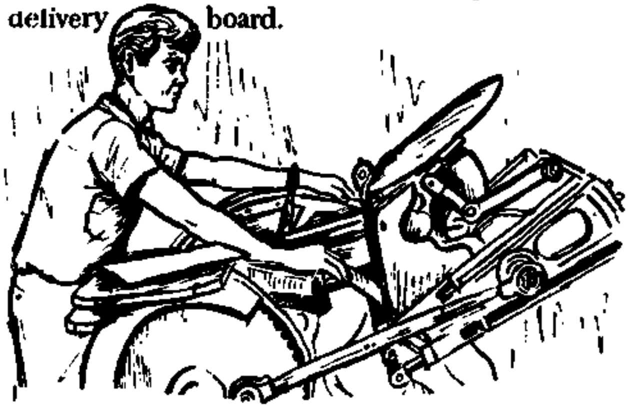
Platen Press

Only one person will operate a press at one time.

Acquire proper stance while operating. Stand erect.

Stop the press any time you are not in the operator's zone.

Stop the press before attempting to retrieve stock that has fallen between the platen and delivery board.



The press must come to a dead stop before oiling is attempted.

Stop the press dead to wash the ink rollers and disc.

Stop the press to apply ink to the disc.

Never talk to an operator or talk to others when you are the operator. Distracting the paper feeder places him in a very dangerous situation.

Stop the machine to remove paper picked up by the ink rollers.

If stock needs adjusting against the gauge pins after the platen has started to close, the operator should use the throw-off lever and make proper adjustments the next time the platen opens.

Gauge the speed of the press according to your ability to feed. Frequent tripping of the press increases your chance of an accident.

Exercise caution around flywheels and other open mechanisms such as those at the right of the platen.

Make certain the form is locked securely in the bed.

Silk Screen Work

Use razor blades only in safety holders.

Wear eye protection to keep splash of paint from causing injury.

Should oils or paints spill on floor, clean up at once.

Materials will not be tested to determine nature or content. Lead in the paint can cause lead poisoning and other ingredients can create other harmful effects.

Exercise particular care in handing sharp edged objects to others or while moving about the shop with some in hand.

Keep flammable liquids in approved containers and enclosure.

True-False – Use Plus for True, Zero for False:

Test – Hand Typesetting

1. ( ) Fingers and hands must be kept from the face when type is handled.
2. ( ) Avoid running hands over perforating or cutting rules.
3. ( ) It is best that one person handle very heavy type cases because his control will be better.
4. ( ) Force type into composing sticks with the thumb if it does not slide freely into place.
5. ( ) Type cases may be best cleaned with high air pressure.

Test – Machine Typesetting and Maintenance

6. ( ) Over-filling the metal pot may cause the heating element to overheat, creating a fire hazard.
7. ( ) Never hold the pump-stop lever open to cast a line.
8. ( ) Guards should be removed whenever they appear to be in the way or are not really necessary.
9. ( ) Remove the plunger pin if the machine stalls just before casting a line to prevent a double squirt.
10. ( ) Use caution when lifting pigs of metal.

Test – Make-up

11. ( ) Tweezers should be carried in trouser pockets so they do not puncture your shirt pockets.
12. ( ) Two students should cooperate while operating the proof press.
13. ( ) Always cut toward the body when trimming with a knife.
14. ( ) Fingers should be kept clear of the mitering machine blade.
15. ( ) Run the finger over the rule to check for sharp edges.

Test – Stonework and Imposition

16. ( ) Carry work as high as possible to avoid bumping into others.
17. ( ) Always return a chase when you are finished with it to its proper place.
18. ( ) Tighten forms to your maximum ability so lead will not fall out on your feet.
19. ( ) Secure assistance when lifting heavy work.
20. ( ) Handle ruled forms carefully.

Test – Presswork

21. ( ) Never work near a press with loose or dangling clothing.
22. ( ) Store oily rags in proper type closed metal containers.
23. ( ) Avoid talking to others when you feed a press; avoid talking with others when they are feeding the press.
24. ( ) Handle paper by the edges whenever possible.
25. ( ) Ink the press when it is in motion.

Test – Paper Cutter

26. ( ) Arrange paper on the bed with the clamp slightly lower than the blade.
27. ( ) Before reaching for the paper, make certain the handle of the cutter is in the closest forward position.
28. ( ) When cutting, keep both hands on the handle.
29. ( ) Cut beyond the capacity of the paper since most tools have an overload designed into the tool.
30. ( ) Clean, oil and adjust with the machine operating if it is power actuated.

Test – Silkscreen Work

31. ( ) Razor blades should be used only in safety razors.
32. ( ) Taste materials to determine contents of paint.
33. ( ) Keep oily or paint soaked rags and flammable liquids in appropriate safe containers.

Folding Machine

Never attempt to remove a misfeed or jammed sheet while the machine is running.

Turn off power when making changes.

Keep all tools off the tables of the folder.

Stitcher (Stapler)

Never attempt to adjust or clear machine with power on.

Keep fingers away from moving parts.

Use caution when removing spool of wire from machine. The end could spring out of the fitting and whip around.

Darkroom

Identify the contents of bottles and containers by label, never trust taste or smell.

When using dry mounting press, to avoid burns, draw the tacking irons away from the hand that is holding the print.

Do not touch electrical switches or equipment with wet hands.

Because there is a danger of explosion, never shake a bottle containing a strong acid or alkali.

Be sure exhaust fan is on and is in proper repair.

Wear rubber gloves when handling chemicals.

BENCH SHEARS! Use safelight when cutting orthochromatic film to protect against cutting fingers. Coat cutting edge with fluorescent or luminescent paint for cutting panchromatic film in total darkness.

Wash sink and trays after using.

Dry hands completely before using darkroom camera, enlarger, dryer, lights, or other powered equipment.

Pour acid into water, never reverse the procedure.

All electrical equipment should be kept dry.

Make sure of formula and mixing procedure before handling chemicals.

Offset Press

Use caution when applying ink to machine. Fingers could be pulled into rollers.

Press should be operated by one student at a time.

Do not try to clean any part of the press while running.

Do not lean on machine when the machine is running.

DON'T LEAN!

ADVOID LOOSE CLOTHING

CLEANING. . .

IS MACHINE OFF?

Keep fingers out of moving parts of press.

Make sure press is disconnected when making major repairs.

Check dampness of water rollers when machine is off.

Roll up sleeves, take off rings, tuck in loose clothing.

General

Do not operate any power equipment or cutting device when the instructor is not in the shop.

If you haven't been instructed in a machine's use, don't use it.

Use tool only for purpose for which it was designed.

Stripping, Layout Table

Use standard stripping knives, or tape unused edges of razor blades.

Use level-type tape dispenser.

Make sure adhesive wax machines are full before heating.

Do not lean on glass table.

Lead-Slug Cutter

Never put fingers on the cutting edges.

Be careful when cutting small sizes.

Cleaning Solvents and Cleaning Rags

Never use a solvent with a flash point of less than 100°.

Keep all solvents labeled.

Keep all cleaning rags in approved safety cans.

Platemaker — Carbon Arc

Disconnect power before adjusting or replacing carbon electrodes.

Vacuum should be drained before lifting glass lid for adjustments.

Exhaust fan should be working and properly vented.

Warn all persons in the area to protect eyes or look away when sparking carbons.

INDUSTRIAL CRAFTS SAFETY

General

Report to the teacher any defective equipment, unsafe conditions, or violations of safety rules.

Report to the teacher immediately any injury, no matter how slight. Infection may result from uncared for minor cuts, scratches, and burns.

Work with tools, machines, and equipment only after having received necessary safety instructions.

Do not lift any equipment or materials that cannot be handled easily. Obtain help of another pupil when carrying long pieces of material six feet or more in length.

Make certain that there are no obstacles in the path when carrying materials or equipment.

Keep aisles and passageways clear of materials and equipment.

Do not allow tools and materials to project over the edges of work benches.

Obtain the teacher's permission before using compressed air.

Walk about the shop carefully.

TOOLS, EQUIPMENT AND MATERIALS

Hand Tools

Always inspect hand tools before using them. Make certain that there are handles on all tanged tools, such as files, wood chisel, scrapers, and soldering irons.

Keep handles of all tools clean and free of oil and grease.

Avoid holding material in the hand while using a screwdriver. Hold material being assembled in a vise or a support if on a bench.

Select screwdriver of proper size to fit the screw slot. Keep hands back of the screwdriver blade.

Kiln

Use asbestos gloves and long-handled tongs to remove hot pieces of enameled material.

Place hot pieces of enameled material on well-insulated surfaces, such as asbestos or transite board.

Do not look into the kiln for a long period.

Do not place moist items in the kiln.

Make sure that kiln is clean before firing.

Keep face and body clear when opening kiln.

Be sure that kiln is turned off and cord unplugged before leaving room.

Lapidary Equipment

Obtain the teacher's approval of the setup before using the slab saw.

PLASTICS

General

Follow the manufacturer's safety instructions carefully to prevent injuries in the use of various plastic products.

Never taste or sniff at an open bottle of chemicals, or at a can of liquid resin or a curing agent, to determine their nature. This is an extremely dangerous practice.

Use protective clothing and rubber gloves to prevent chemical burns or toxic reactions with contacting fumes, chemicals.

Wear heat protective gloves while handling hot molds or hot plastic.

Wear gloves that are rubber or plastic coated and cotton lined. When using liquid resin or solvents, also apply hand cream before putting on the gloves.

Wash gloves daily while still on the hands, using soap and warm water. Do not use solvents.

Avoid contaminating the inside of the gloves when removing them. The safe way is to remove the gloves by pulling at the fingers. Do not put gloves on over dirty hands.

Wear coveralls, or shirt with long sleeves, and change at once if soiled or spilled on.

Avoid wearing rings and wrist watches. The accumulation of chemicals will cause moisture and heat beneath them and contribute to the development of skin irritation.

Do not use plastic materials if you have allergies or skin eruptions.

Be extremely cautious to avoid skin contact with epoxy resins. Precautions should include the wearing of aprons, coveralls, and gloves; adequate washing and use of show facilities; and the use of protective creams and adequate ventilation.

Remove resins, catalysts, curing agents, solvents, uncured mixtures, or fiberglass promptly and thoroughly from the skin to prevent serious skin irritations.

Use special hand creams and cleaners before and after working with fiber glass.

Protect the skin from released glass fibers while sanding cured fiber glass or reinforced plastic.

Wear eye shields or safety glasses.

Wash hands thoroughly, without waiting for the regular wash-up period, immediately after any hardener, caustic material, or resin has touched the skin and after every lay-up job.

Obtain instructions from the teacher regarding the proper type of soap. Low alkaline soap must be used. Never use skin defatting solvents.

Use protective creams after washing. Apply cream to the hands, forearms, neck and face.

Always be sure that there is adequate ventilation when using solvents.

Make certain that all grinding and finishing operations of cured plastic products are done in down-draft ventilated areas.

Conduct the curing of epoxy and similar resins in the exhaust ventilated area.

Mix catalysts and resins under the direct supervision of the teacher. Incorrect mixtures may be explosive or constitute a fire hazard.

Avoid spilling solvents. Vapors may flow along the floor, become ignited and flashback, causing serious burns.

Use chemicals only from labeled bottles and containers.

Isolate and control irritant or hazardous materials in their respective working areas.

Always have a great respect for chemicals, liquid resins, and solvents. Never handle them carelessly.

Thoroughly clean all equipment and tools in areas containing hazardous materials before sharing them with other pupils in other areas.

Store unstable plastic ingredients, such as catalysts, in a cool place. In a location where the temperature is high, they are likely to react chemically.

Spread disposable paper on work benches and on the floor around the working area and replace as soon as it is soiled.

Use clean rags, and discard as soon as soiled, into metal-covered containers.

Use disposable containers while mixing epoxy, liquids and resins; then discard after use into metal-covered containers.

Dispose of used or dried plastic and other combustible waste products into covered metal containers.

Never pour contaminated solvents down a drain or sewer. Used solvents should be carried in a closed container to a safe deposit area.

MACHINES AND EQUIPMENT

Transfer and Compression Presses

Never open or close operating valves or controls without proper instruction.

Keep hands away from a closing press.

Handle hot molds and plaster parts with heat protective gloves.

Do not attempt to close a press until mold alignment has been checked by the teacher.

Injection and Extrusion Presses

Ask teacher to verify that molds are correctly mounted and aligned before operating a press.

Be sure that safety guards are in place and operating properly on the press.

Make certain that cycling valving, temperature control adjustment and press operation are done under the supervision of the teacher.

Scrap Grinder

Check all materials for metal pieces before putting them into machine.

Feed material into hopper only.

Rolls or Plastic Mill

Operate machines under the direct supervision of the teacher.

Keep hands away from operating rolls.

Never attempt to pull out or hand onto material while passing it through the rolls.

Keep tripping devices and safety guards in place and check for proper functioning before using these machines.

Molding

Exercise care when "blow forming" plastics by being sure that material and forms are securely clamped before applying air pressure.

BASIC LEATHER CRAFT

The usual careful use of the several tools used for cutting leather, such as level point knife, sloyd knife, head knife, razor-blade knife and draw gauge knife should be noted and observed.

SHEET METAL WORK SAFETY

General

Large sheets can be unwieldy. Use C-clamps for handles.

Remove slivers, commonly called fish hooks, from edges of sheets.

Keep the work area and floor free of slippery cuttings.

Hold snips and seamers so flesh is not pinched between handles.

When chiseling, riveting, grooving or hand punching, strike the tool squarely with the hammer.

Use care in carrying and using the scriber.

Avoid sliding sheet metal through the hands.

Use corner guards or other devices to protect people using aisles or work areas where large sheets protrude. Beware of corners and edges.

Never wear gloves around rotary machinery.

Guard against shooting the rivet gun by accident. Point to floor.

Use appropriate safe methods when using hand tools, soldering equipment, grinders or other tools.

Punch rather than drill large holes in sheet stock.

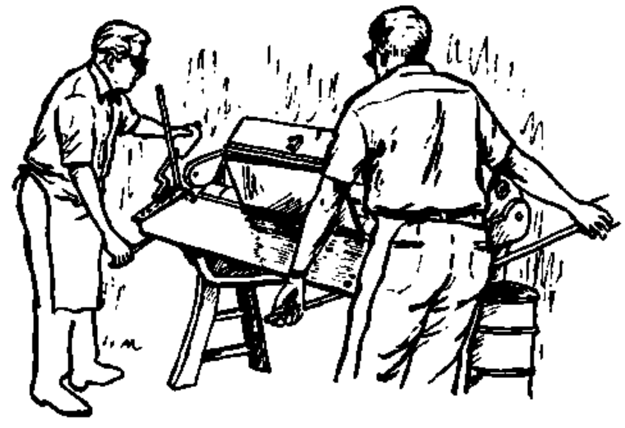
Sheet Metal Brake

Keep fingers clear of the mouth of the machine when closing down on the metal.

Use care when inserting or removing sharp edged sheets.

Make certain counterweight bars do not strike others while working.

Get assistance when bending large thick material to avoid backstrain.



Keep fingers out of the pinch area as the metal is bent, especially on maximum capacity bends.

Shear and Punch

Fingers must be kept out of the cutting or punching area.

Keep your attention on the job; avoid distractions while working.

Always use properly installed guards.

The shear and punch will be operated normally by one person only.

Roll Former

Keep fingers and clothing out of the rolls.

The same person feeding the metal normally turns the crank.

Keep your eyes and your mind on the work; avoid distractions.

Test – Sheet Metal Work – Sheet Metal Brake, Sheet Metal Rolls, Shear and Punch

Completion:

1. The same person who feeds the rolls also operates the ....
2. Always keep your .... out of the cutting and punching area when operating the shear and punch.
3. Small slivers and pieces of metal can create ....hazards if left on the floor.
4. Large holes in sheet metal should be made by..............................
5. Fish hooks often occur along the.................... of sheet stock and should be removed at once.
6. ....are useful when sheet metal must be carried because they form good handles.
7. Backstrain may result if heavy sheet stock is bent in a..............................without the assistance of another person.
8. Counterweights must not be permitted to ....when using the brake.
9. When large sheets of thin sheet are protruding from a bench, make sure others do not become injured by using..............................
10. Always try to hold snips or seamers so flesh is not..............................between the handles.

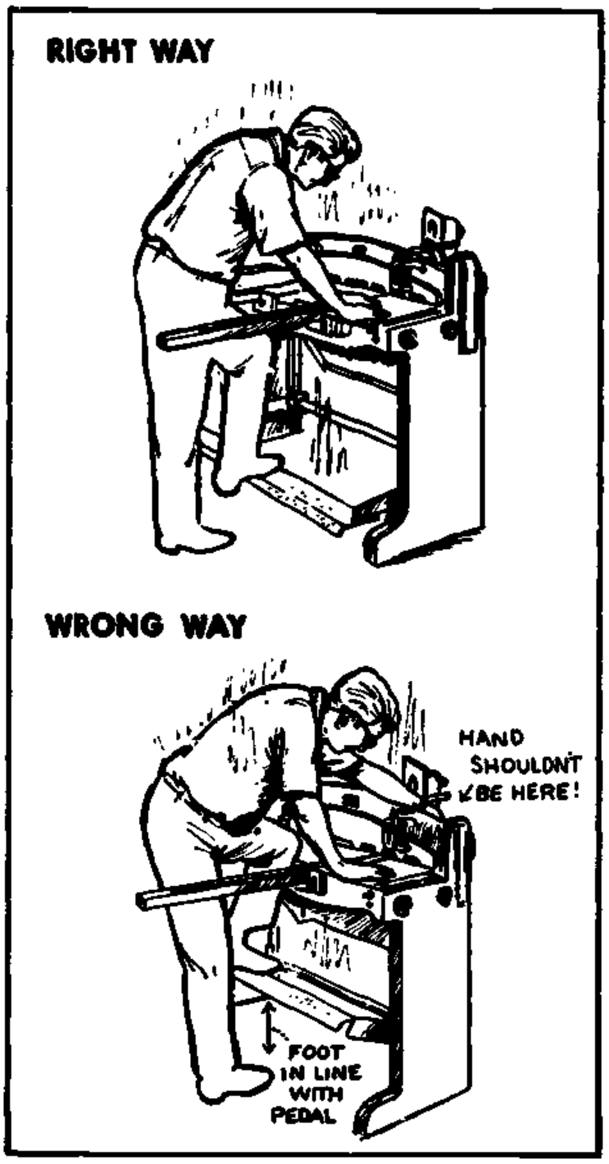
Squaring Shear

Keep fingers clear of the blade and never under the hold down bar.

Never reach behind the shear to support metal. This places you in an awkward position, subject to a fall and puts fingers in a blind area.

To avoid crushing toes, keep feet clear of the pedal.

Use care in handling sheared razor sharp metal.



Never cut excessively small pieces on a shear. Use hand snips.

Allow a portion of the hand to overlap onto the machine so you can prevent sheet from slipping forward toward blade.

The shear is a one man machine; use accordingly.

In leaning forward as blade is depressed, people tend to keep balance by grasping the top of the large outer casting. After the blade has descended, it is possible to insert a finger inadvertently into the slide. As the blade returns, a very serious crush can result.

Test – Squaring Shear

Multiple Choice:

1. Reaching behind the shears to catch a piece of metal as it is cut is
   a. Permissible if the piece is three inches wide
   b. Permissible if the same person who reaches also operates the treadle
   c. Permissible if a and b are both adhered to explicitly
   d. Dangerous at any time and is a violation of safety rules
   e. None of the above answers are correct
2. Squaring shears can injure only the
   a. Hands
   b. Feet
   c. Either hands or feet, or both
   d. None of the above answers are correct

True-False – Use Plus for True, Zero for False:

3. ( ) Use care in handling sheared metal because edges are razor sharp.
4. ( ) The shear has the advantage of being able to safely cut very large or extremely small work.
5. ( ) The shear is best operated by two people one to depress the pedal, the other to adjust the sheet stock.
6. ( ) Allow the hand to overlap onto the machine so you can prevent the stock from slipping forward.
7. ( ) It is poor practice to jump on the treadle.
8. ( ) Never reach forward enough to permit fingers under the hold down bar.

Buffer

Always buff using the bottom half of the wheel (below center).

Use extra care around openings, corners or other areas where the wheel can grab and throw the work.

Exercise caution to avoid overheating and burns on the hands.

Avoid allowing the work to become cramped between the wheel and the machine, the wall or some other object. Freedom of movement is essential to avoid catching.

Make sure the wheel diameter is appropriate for the job.

Never use a rag because the work heats up. Rags catch in revolving arbors.

Always stand to one side of wheel when applying compound.

Test – Buffer

True-False – Use Plus for True, Zero for False:

1. ( ) Always buff on the lower part of the wheel.
2. ( ) Rags should be used to hold hot objects.
3. ( ) Use a wheel of the proper diameter.
4. ( ) Work the buffer well into inside corners, grooves and other confining areas for good buffing action.
5. ( ) Freedom of movement is essential.

Power Hack Saw

Make sure the action of the saw cannot crowd or injure those in front of the moving frame. Stand clear.

Do not reach under the frame or blade when in the raised position.

Make file cuts on sharp edged objects or angular material so blade may proceed into work properly.

Keep blades and stock right.

Support end of long stock in a positive manner so blade will not be pinched.

Do not bear down on the saw frame.

Keep hands clear of the mechanism while in operation.

Clean, oil and adjust when machine has fully stopped.

Do not attempt to cut small pieces in one side of the vise jaws unless a piece of equal size is in the opposite end of the vise, keeping jaws parallel.

Never use a new blade in an old saw kerf.

Install new blades with teeth pointing in the proper direction.

Lower the frame slowly on the work. A sudden drop can shatter a blade.

Test – Power Hack Saw

Completion:

1. Avoid reaching under the saw blade when the frame is in the....................position.
2. Clean, oil and adjust the machine only when it is....................
3. Avoid blade breakage by lowering the ....slowly on the work.
4. Bearing down on the frame during operation is not good practice because the.................... may break, causing ends to flail or small pieces to fly.
5. Clamp or draw the vise tight to prevent .... from tearing loose.

Explanation:

6. Why is it unsafe to use a new saw blade in an old saw kerf?
7. What may happen if a small piece is placed in the saw vise next to the blade without placing a small piece of stock of equal width at the opposite side of the vise?
8. Explain why it is necessary to file off sharp corners before starting the saw.

Soldering

When using gas furnaces, keep flammables away from area.

Do not carry hot soldering coppers around in the shop.

Keep hands away from eyes and mouth.

Avoid overheating the soldering copper. Red hot is too hot.

Never leave hot soldering coppers unattended in the furnace.

Put hot soldering copper and objects where others cannot be burned.

Keep soldering flux in an area where it is safe from spilling.

Use good ventilation and avoid breathing fumes.

Exercise special care when filing a hot soldering copper. Use a vise to hold when filing.

Lay coppers down only on insulated nonflammable surfaces.

Grasp copper by the handle well so hand cannot slip down on metal.

Do not allow molten solder to be placed in or near wet or moist surfaces.

Paste flux cannot splash and is preferable to liquid for general use.

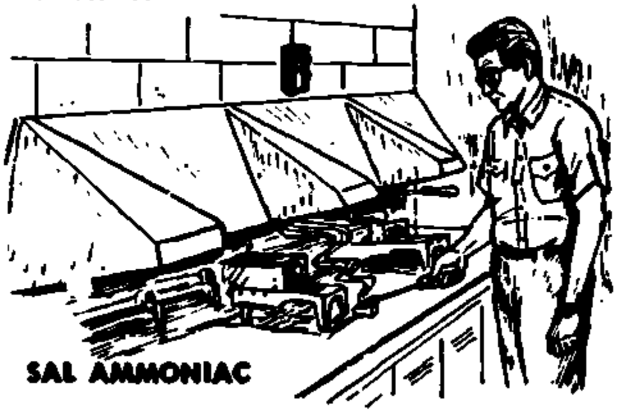
When using sal ammoniac avoid inhaling the fumes.

Report any indication of escaping gas.

If hot soldering equipment is to be returned to the tool room, allow it to cool in a safe place and advise tool room man of its condition.

Never immerse the hot tool in water to cool it.

Check with teacher for permission to light the furnace.



Test – Soldering

True-False – Use Plus for True, Zero for False:

1. ( ) It is dangerous to use molten lead or solder where parts or materials are wet or moist.
2. ( ) It is not harmful to breathe the gasses which result from the soldering process or from cleaning the copper on sal ammoniac.
3. ( ) It is not necessary or wise to heat the copper bright red.
4. ( ) It is well to breathe through the mouth while soldering so vagrant fumes do not irritate sinus membranes.
5. ( ) Cool the soldering iron after use by immersing it in water. to prevent others from being burned
6. ( ) Paste flux or flux core solder is preferable to liquid type for general use.
7. ( ) Good ventilation in the soldering area is desirable.
8. ( ) Carry the soldering copper downward, watching and warning others nearby.
9. ( ) If soldering coppers are returned to the tool room, warn the tool room man when leaving them there.
10. ( ) It is not harmful to touch the mouth or eyes with your hands while performing a solder operation because fluxes are non-toxic.

Hand Tools, General

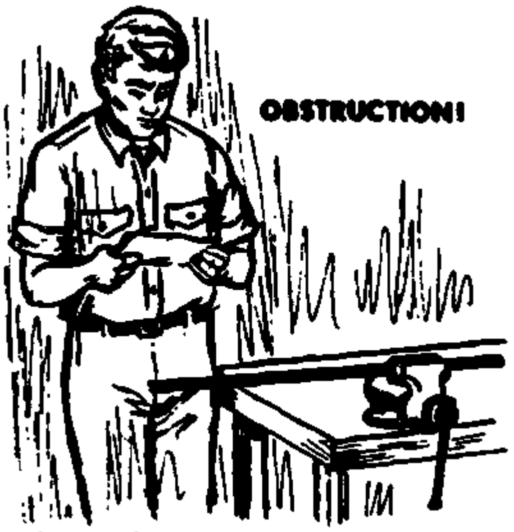
Clamp work securely in vises, but do not hammer on vise handles.

Remove filings and chips from benches with a brush, not the hands.

Do not allow work to project from vise or bench and cause obstructions.

Use the corréct size of wrench for the job.

When using cutting tools, direct the cutting action away from you.



Mushroom heads on chisels, punches, etc., should be eliminated continuously.

All angled hand tools must have handles.

Avoid carrying tools in pockets. Screwdrivers, etc., can injure you if you fall.

Inspect hand tools before using.

When using tin snips or other similar tools, avoid letting flesh come between the handles. Pinches and blisters generally result.

When using a chipping hammer, chip toward wall or shield to protect others from flying chips.

Bench Work

Keep bench drawers closed.

Keep bench dogs flush when not in use.

Avoid piling up tools.

Do not blow dust from bench tops, use a brush.

Hammers

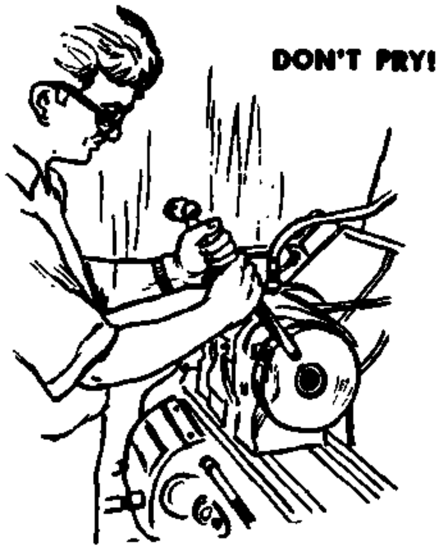
Use the correct size hammer for the job.

Use rawhide, plastic, copper, lead, brass or rubber hammer on hardened surfaces, or where most appropriate.

Report handles which are loose, split, splintered, broken or otherwise defective.

Never use when handles or hands are greasy.

Avoid prying with hammer handles.



Use claw hammers only for pulling nails and driving nails, never for use on metal surfaces.

If hammer has a plastic or soft tip, check tips for tightness.

Screwdrivers

Use the correct size and type.

Avoid placing hands so a slip-off can injure.

Handles should not be splintered or split.

Use for the intended purpose, not as a pry, chisel, drift or punch.

Keep the shank vertical to the screw head while using.

For electrical work, use insulated screwdrivers.

Get correct alignment when using offset screwdrivers.

Avoid the use of pliers or vise grips on general purpose screwdrivers.

Remove burrs from screws or screwdrivers.

Grind screwdriver blade so the end is not wedge-shaped. If sides are parallel, slip-off will not occur.

Do not hold items in your hand when using a screwdriver on them.

Files

Make certain file is tight with the handle.

Files are brittle so should not be dropped, used as prys or otherwise mistreated.

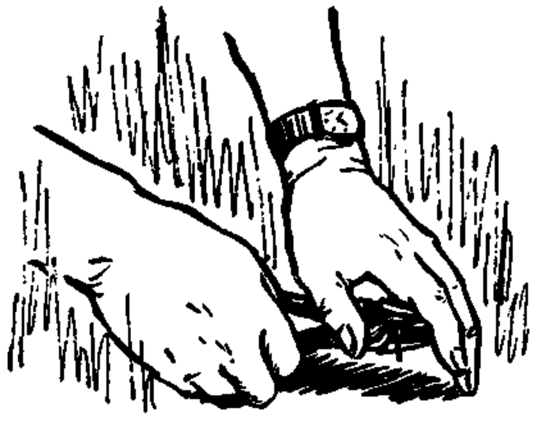
Do not use old files for substitute cutting tools, knives, etc.

Make certain the work to be filed is securely mounted.

Pliers

When using pliers, keep hands clear of the pinch area. This may be at the rear of the bolt as well as ahead.

Place hands over short wire pieces, cotter pins or other small items being cut. Such items tend to fly and may cause eye injury.



Make certain power is off before cutting through live wires.

Keep handles free of grease or oil.

Handles of pliers used for electrical work should be insulated.

Remove any burrs caused by pliers which would cause injury.

Wrenches

Avoid using a wrench as a hammer.

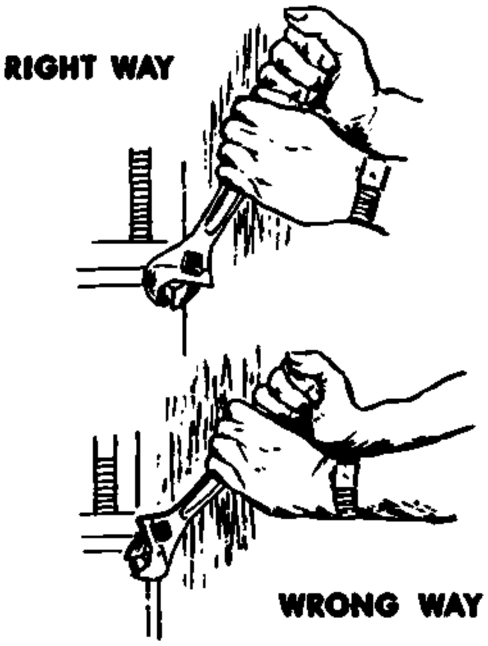
Pull rather than push whenever possible.

Always be prepared in event wrench slips or bolt breaks. Acquire a good stance, especially for hard pulls and in confined areas.

Select socket or box wrenches as first choice and open type wrenches as second choice for work with hex nuts.

Use the adjustable wrench only when others are inappropriate.

Pull on adjustable wrenches so the force is mostly on the stationary jaw. Set the jaws for a close fit.



Do not extend the handle of a wrench by using pipe or other means.

Keep wrenches as free of oil and grease as possible. Slippery wrenches cause skinned knuckles.

Never use wrenches on machine parts which are in motion.

Avoid excessive pressures on ratchets or wrenches not designed to take hard pulls.

Hammer only on striking wrenches which are designed for this use.

Avoid the use of distorted or excessively worn wrenches.

Knives

Cut by pushing away from the body.

Do not stand in front of someone using a knife.

Never throw or play with knives.

When passing knives, give the other person the handle, keeping the blade outward and away from either person.

Use care in checking for sharpness.

Test – Hand Tools

1. ( ) All "T" angled tools must have
2. ( ) When chipping, protect others by setting up a
3. ( ) Never use a hard faced hammer on a
4. ( ) Force on a wrench should be by a steady
5. ( ) Hammering on vise handles, wrenches and handles in general causes injury because
6. ( ) Constantly check and dress chisels and punches to remove
7. ( ) Files and screwdrivers should not be used as
8. ( ) Handles of screwdrivers and hammers must not be
9. ( ) Hand a knife to another by holding so the blade is
10. ( ) Slip-off can be prevented if screwdrivers are
11. Why is it important to make sure current is off before cutting through (a) single wires, and (b) duplex wires?
12. Why is proper stance necessary for hard pulls?
13. Why are socket or box type wrenches preferable to most open type wrenches (open end, adjustable jaw, etc.)?
14. Hammer and wrench handles which are greasy or hands which are oily will contribute to possible injury. Explain.
15. How would you check the cutting edge of a wood chisel, a knife or other sharp tool without cutting yourself?

a. Shield
b. Outward and away from each person
c. Pull rather than a push
d. Burrs will cut hands
e. Prybars
f. Mushroom heads
g. Handles
h. You may strike yourself
i. Hardened surface
j. Sharp cutting edge
k. Hollow ground or ground with sides parallel rather than wedge shaped
l. Push rather than a pull
m. Soft faced surface
n. Inward and toward the other person

Explanation:

Loose

FOUNDRY SAFETY

Good Housekeeping

1. All flasks, weights, metal, bottom boards and jackets should be piled in a neat, orderly and safe manner, so that they will not fall.
2. Aisles between molds must be ample in width so they do not present a hazard in transporting ladles of molten metal to these molds.

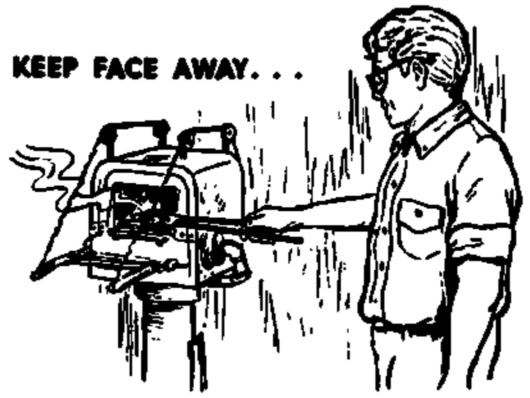
3. Students should know the location of the nearest fire extinguisher and fire blanket, and be instructed in their use.
4. Molding floors should be kept clean and sand heaps shovelled up into neat piles at all times.

Safe Practices on the Molding Floor

1. Advise students at the beginning of the semester to report any physical ailments (hernia, weak heart, allergy, etc.).
2. Lifting – don't overlift. Get additional help.
3. Heavy copes – should be anchored and secured in such a manner that they will not tip over or fall. Do not crawl under a cope!
4. Hoisting equipment – periodic inspection of all cables, chains, hooks and links should be made.

Safe Practices in Melting

1. Keep crucibles in a warm, dry place so they will not gather moisture.
2. To cure a crucible, bring it up to heat gradually and let it cool in the furnace to room temperature before using.
3. Don't pack metal tightly in the crucible when charging. The metal will expand and may break the crucible.
4. In handling a crucible with hand tongs, be careful not to fracture the crucible or spill the metal.
5. When a crucible has been in use for some time it becomes thin and dangerous. Discard it and "break in" a new one.
6. Be sure the crucible fits its shank
7. If crucible tongs are used, be sure they fit the crucible perfectly.
8. A small cast iron ladle may be used to melt such metals as tin, lead, babbitt and aluminum.
9. When charging cold metal into a molten bath of metal, in a crucible, it is well to let the cold metal heat up a little before dropping it into the molten bath.
10. Be sure all ladles and crucibles are free from moisture before pouring molten metal into them.



KEEP FACE AWAY. . .

Lighting Gas-Fired Melting Unit

1. Light a piece of paper and place it in the furnace near the orifice where the gas enters the furnace.
2. Keep the face away from the furnace and turn on the gas.
3. When the gas is burning turn on the air valve gradually until the proper air and gas mixture is obtained.
4. When shutting down a gas furnace shut off the gas first.

Safe Practices in Pouring

1. Inspect all ladles to be used in pouring, and make needed repairs or reline them if necessary.
2. All ladles that have been freshly daubed should be thoroughly dried out before using.
3. All ladles are made to fit the shank in which they are carried. The shank should be turned with the side of the taper up when inserting the ladle. Lips of the ladle should be at right angles to center line of shank.
4. All students who are pouring molten metal should wear approved goggles, gloves and leggings.
5. All hand ladles should be equipped with metal shields when pouring.
6. Bull ladles and hand ladles should not be filled too full.
7. Do not run with a ladle of metal and don't walk backward.

Cleaning and Grinding Castings

1. Always wear goggles when snagging castings on abrasive wheels.
2. Rests should be adjusted within ⅛" of the wheel. Do not adjust rest when wheel is in motion.
3. Don't put the entire weight against a casting when grinding; the casting may slip from the wheel and throw the hand and arm against the wheel.
4. Don't grind on the side of the wheel; a casting may get jammed between the guard and the wheel.
5. Do not adjust the rest below the center of the wheel.

WEAR THAT EYE PROTECTION!

SCHOOL MACHINE SHOP SAFETY

Safety Precautions in the School Machine Shop

Learning safe practice in the school machine shop is as important as learning to run a lathe or any other machine tool.

Safety is an attitude; that is, it is a frame of mind. If the student's attitude toward safety is a good one, he will accept the idea that safe working habits are the ones to learn and practice for the rest of his working life.

A student must also keep in mind that he will not always be working alone, but will constantly be working with other people, and to keep himself, as well as those working with him, free from accidents at all times.

No trade can be learned well until safe working habits have been established and practiced, day in and day out. Safe working habits cannot be bought or manufactured, they must be learned through practice.

Rules and regulations, mechanical guards and devices placed around machinery, posters and lectures are very important, but they will never take the place of intelligent safety procedures and precautions taken by the person doing the work.

The hazardous nature of machine tools, including the mechanical power transmission driving them, has long been recognized. Even with the great effort demonstrated in guarding belts, pulleys and gears in making machines less dangerous, there are still many injuries occurring to those working around machine tools.

Injuries from machine tools may be either from the point of operation or the mechanical power transmission. Injuries to machine tool operators may also occur from other sources, such as handling materials, falls, or difficulties that may be attributed to the job, but not necessarily to the machine.

So, let us look at some of the do's and don'ts that will help to make us safe workers in our school machine shop classes.

Safety Equipment and Clothing in the School Machine Shop

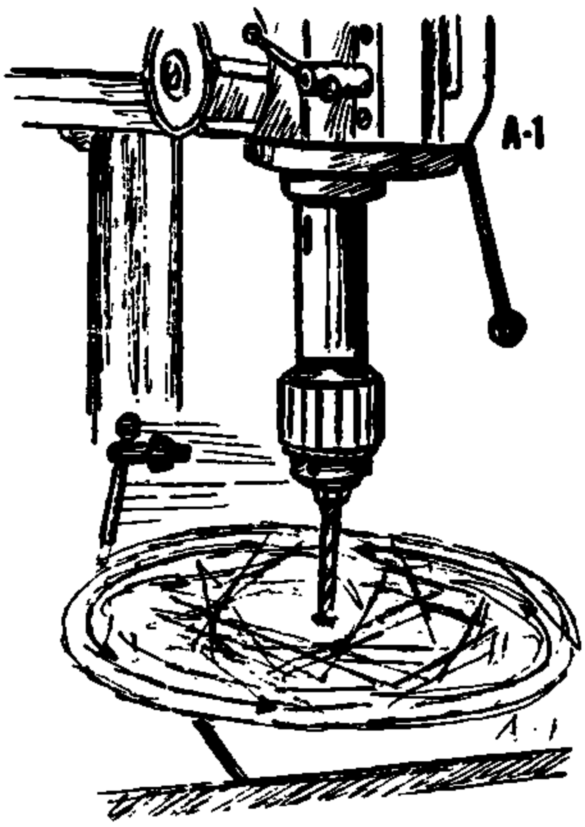
1. Wear safety goggles, or face shields, at all times, which have been specifically designed for the type of work being done.
2. Wear clothing that will give maximum protection, such as asbestos gloves for welding or asbestos leggings around legs, thick shoes when lifting heavy objects, and shirts with sleeves cut off or rolled above elbows. Never wear loose or torn clothing.
3. Do not wear rings, neckties, watches or bracelets that may be caught in moving machinery.

Housekeeping in the School Machine Shop

1. Keep floors free of oil, grease, or any other liquid.
2. Store materials in such a fashion that they cannot become tripping hazards.
3. Do not leave tools on table of machine even though the machine is not running. Tools may fall off and cause foot or toe injuries, and if the machine is running, tools may fall into revolving machinery.
4. Have a place for every tool and every tool in its place, when tools are not in use.

Drill Press

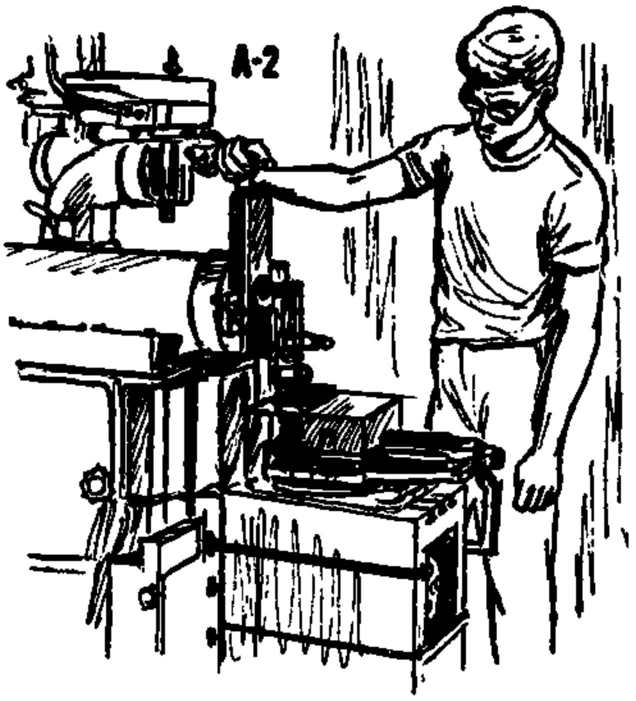
1. Wear goggles at all times.
2. Be thoroughly familiar with all the switches and levers that are used to operate the machine.
3. Remove neckties and tuck in loose clothing so there is no chance of their becoming entangled with the rotating drill.
4. See that all safety guards are in place.
5. Use sharp and properly ground tools or drills at all times.
6. Clamp the work solidly. Do not hold it in your hands. Should the drill break through, a merry-go-round effect may set up, causing serious and painful injuries. Illustration A-1.



7. Always use a wood block beneath the drill being removed to avoid damaging small drills, or to prevent large drills from dropping through on your foot.
8. Remove chuck key immediately after tightening drill in drill chuck.
9. Permit the drill to stop of its own accord after the power has been turned off. Do not try to stop it with your hand.
10. Do not have rags of any kind near drill press while drilling. Rags may get caught in revolving spindle setting up potential hazards that may cause serious injuries to operator.
11. Place all oily and dirty rags in a closed container when the job is finished.
12. Never use bare hands to remove chips from drill press. Always use a brush.
13. Do not reach around or in back of revolving drill.
14. Change belt or speed regulation only when power is off and machine has come to a dead stop.
15. Small drills should revolve at high speed, large drills at low speeds. Reduce speed about 50 per cent when drilling cast iron.
16. Keep your head back and well away from any moving part of the drill press while operating the drill press.

Metal Shaper

1. Wear safety goggles at all times.
2. Before starting the machine—be sure that check ram, tool head, tools, work, table support clamping screws and vise are properly secured in place or position and that the tool head and tool clear the work
3. Do not run the ram at high rate of speed on long strokes.
4. Do not run the ram back into the column with the tool slide at an angle. Check this movement while the tool head is in a vertical position; when adjusted, then turn tool head into angular position. When you have finished, be sure to return tool head to vertical position.
5. Keep your hands away from moving tool. Injuries are frequently caused by getting fingers caught between the tool and work piece.
6. Don't permit chips to accumulate around machine. When this occurs, stop the machine and clean away all chips by means of a brush.
7. Always stand parallel to the direction of stroke of the ram when the machine is running. Illustration A-2.



A-2

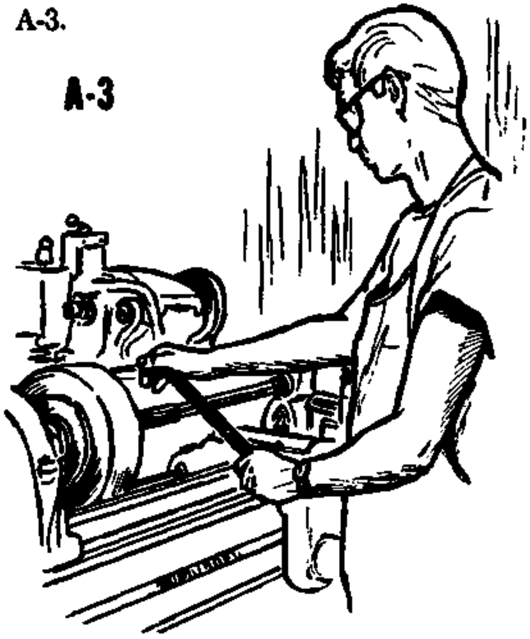
8. Use a heavy wire mesh screen or metal shields over the tool to prevent chips striking you or striking a nearby fellow workman.
9. Do not leave the shaper unattended while it is running.
10. Be sure that your tool bit is sharp at all times. Many accidents occur resulting directly or indirectly from dull tool bits.

Metal Lathe

1. Do not attempt to operate the lathe until you have been checked out on it and are thoroughly familiar with its operation.
2. Remove necktie, sweater, wrist watch and rings. Wear an apron, and by all means wear properly fitted safety goggles.
3. Check to see that all safety guards are in place.
4. Before turning on the power, check to see that the tailstock, toolholder and job are properly clamped.
5. Use hand power only when putting on or taking off chuck or faceplate. Do not use the power that operates the lathe to perform this task.
6. Never leave the chuck wrench or any other tool in the chuck. If the machine is turned on, wrench may fly out and injure the operator or other persons.
7. Do not use wrench on revolving work or parts. This can prove to be a very dangerous urge or temptation which may result in the loss of eye or result in other bodily injuries.
8. When filing, be sure tang of file is protected by a strong wooden handle. File left handed so that no portion of your body is over

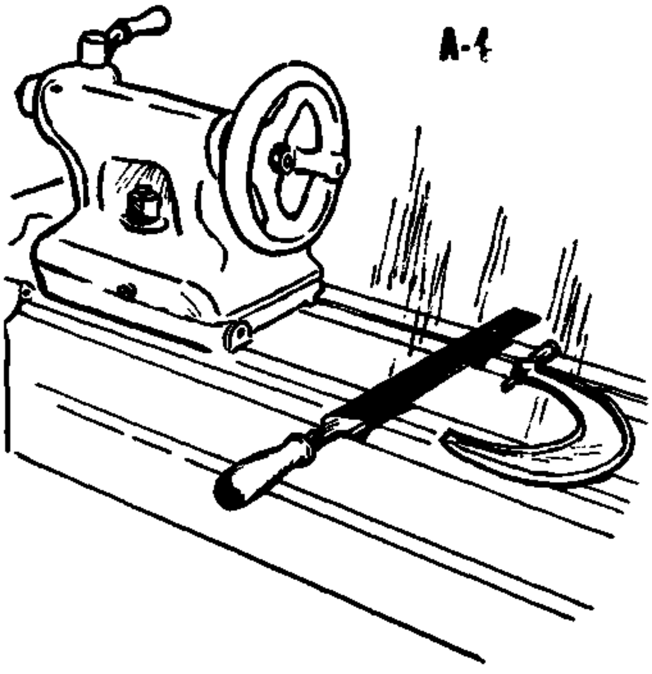
chuck or faceplate as would be the case in right hand filing. Stand to one side so that, if the file is forced upward, it will go past the body rather than against it. Illustration A-3.

A-3



9. Do not attempt to remove chips with fingers. Remember that the chips are razor sharp.
10. Stop the machine before making any measurements or adjustments.
11. Do not permit anyone to start your lathe for you.
12. Do not permit small diameter work to project too far from the chuck without supporting from the tailstock center. Deviating from this particular principle has caused many injuries in school machine shops.
13. Never leave the lathe unattended.
14. Remove all sharp edges and burrs from the piece before removing it from the lathe.
15. Tools must not be placed on the bed ways. Illustration A-4.

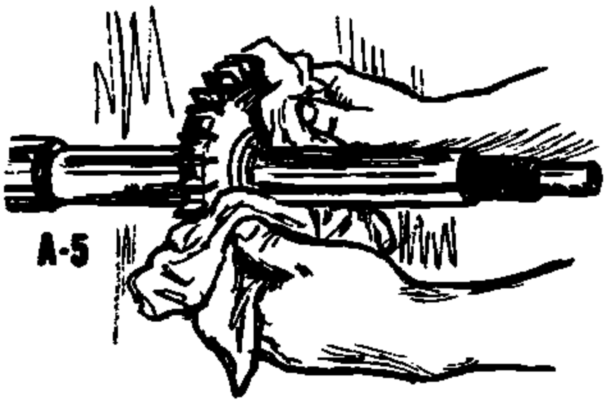
A-4



16. Where air has been installed for cleaning purposes; each student should be instructed as to its proper use. At no times should air be directed toward any person or persons.
17. As a general rule, do not shift gears while the lathe is running.
18. If the work must be removed from the lathe, or repositioned in the chuck, always move the cutting tool clear of the work or reverse it in the toolpost to prevent it from cutting you accidentally.

Milling Machine

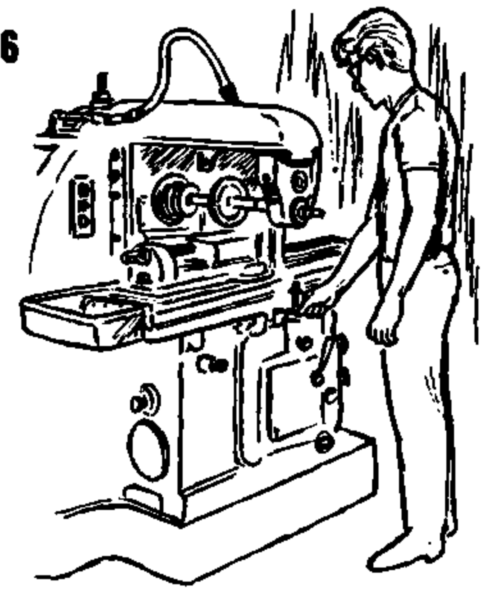
1. Wear safety glasses while operating the milling machine.
2. Do not attempt to operate the milling machine until you are thoroughly familiar with it.
3. Check thoroughly to see if the milling cutter and arbor are secure and that the cutter and arbor are clear of the work before starting the machine.
4. Use only wrenches that properly fit the nut or bolt head. This will obviate the possibility of striking hand against the cutter or other objects, caused by the improper use of wrenches.
5. Never put on the cutter with bare hands. Always use a heavy cloth around the teeth of the cutter. Illustration A-5.



A-5

6. To avoid striking the hands on the cutter while setting up, move the table with the work as far away from the cutter as possible.
7. Never reach over or near the rotating cutter.
8. Stop the machine before removing chips. Never attempt to remove chips with bare hands. Always use a brush.
9. Treat any small cuts and skin punctures immediately as potential infections.
10. Remove all tools from milling machine table before starting machine.
11. Make no adjustments while the cutter is rotating.
12. Never stand in line of the rotating cutter. Always stand erect, parallel with the table. Illustration A-6.

A-6



13. Keep the floor around the machine clear of chips and wipe up spilled cutting fluid immediately.
14. Permit no one to turn-on your machine for you.
15. Keep your mind on your job, and be ready at all times for any emergency.
16. Never attempt to remove heavy milling machine vises or heavy fixtures by yourself. Always solicit the aid of another person in performing this task.

Surface Grinder

1. Always wear goggles or an eye shield when performing any grinding operation.
2. Become thoroughly familiar with all electrical and mechanical equipment necessary for the operation of the machine.
3. Do not attempt to use the grinder unless the wheel guard is in place and well secured.
4. Always check the grinding wheel for soundness before mounting it on the spindle.
5. For all dry grinding operations, be sure to use a good dust collecting system.
6. If a magnetic chuck is used make sure the magnetic chuck is holding the work securely before starting the machine.
7. Never attempt to remove work from magnetic chuck or table of machine until the grinding wheel has come to a complete stop.
8. Keep all tools clear of work table.
9. Do not permit grinding wheel to become too badly loaded or glazed before dressing it.
10. Avoid grinding on the side of wheel. Side pressure may break the wheel.
11. Stop grinder if grinding wheel chatters or vibrates excessively. This may be a signal that the wheel is not balanced properly or is loose on the spindle.
12. Use clamps or vise when grinding small or short pieces on a magnetic chuck.
13. Move the table, using hand wheel for table movement, to see that work clears the wheel before starting the machine.
14. Never operate a grinding wheel at speeds exceeding that recommended by the manufacturer.

Bench Grinder

1. Stand to one side out of line of wheel when starting it, especially if the wheel is new.
2. The face of the wheel should be flat and free from grooves.
3. Work should be fed slowly and gradually to avoid sudden or abrupt pressures on the grinding wheel.
4. Be sure that the tool rest is only ⅛" from the face of wheel. Too much clearance may cause work to jam the wheel and break it, thereby inflicting injuries to operator.
5. Do not adjust the tool rest while the machine is running.
6. Always wear goggles while operating the grinder even though the machine is equipped with protective glass shields.

Metal Saws

1. Wear goggles while operating any type of metal saw.
2. Follow the manufacturer's instructions for tensioning the blade. Too much tension could shatter blade causing particles of steel to fly off that could injure you or some one near by.
3. When turning on power, stand to one side of saw frame to protect yourself in the event of saw breakage.
4. In using the power hack saw, mount work only when the saw is stopped. Be sure to mount work securely.
5. Do not remove chips while the machine is in motion.
6. Support protruding end of long stock so that material being cut will not fall and injure someone.
7. Saws should be installed in such a manner that in cutting long stock the stock will not become a tripping hazard.
8. Keep hands clear of all moving parts.
9. Be sure blade is in good condition before using.
10. Always feed the blade slowly and gradually into the work.
11. If blade breaks in work, stop the machine at once, then remove the blade.
12. Burrs on cut pieces are sharp. Handle the pieces with care until burrs are removed.

WELDING SAFETY

Electric Arc Welding

1. Avoid looking at the arc or flash unless equipped with appropriate dark glasses.
2. Helmets and welding goggles must be free of cracks or holes permitting penetration of intense light.
3. Wear protective clothing to help protect the skin from intense rays.
4. Always wear gloves. Leather gauntlet type that can be thrown off are recommended.
5. Where necessary, wear leather aprons, arm coverings or other protection to protect from molten metal or hot sparks.
6. Where a helper is used, he must be protected the same as the welder.
7. Lenses designed for eye protection during oxy-acetylene welding or cutting are not dependable protection against electric arc rays. (Safety lenses in all goggles and helmets are prescribed in Rule 154 (c), Safety Code for the Protection of Heads, Eyes and Respiratory Organs, American Standard 72.1-1959.)
8. Lenses appropriate to the ampere setting will be used:

Lens Shade	Ampere Range
No. 8	30-75
No. 10	75-200
No. 12	200-400
No. 14	over 400

9. Wear high type shoes rather than undercut shoes.
10. Always wear eye protection when chipping. Never chip if there is a possibility someone nearby without glasses will be struck by flying chips.
11. Keep sleeves and pants cuffs rolled down and collar buttoned up.
12. Never touch a piece of metal in the welding area if uncertain about the temperature.
13. Mark hot metal to read "HOT."
14. Where small work must be handled, have pliers, tongs or other appropriate tools handy. Do not handle excessively hot metal with leather gloves unless cool area beyond the hot spot permits safe handling.
15. Clamp work well so you do not tear it apart and then grab at the hot work.
16. Keep hands off the work until cool.
17. Exercise good judgment in selecting welding jobs. Automotive work is especially hazardous due to fuel tank, fuel line, hydraulic lines, flammable upholstery, etc.
18. Special metals require the use of respirators to protect welders from harmful fumes. Adequate ventilation is always desirable, especially when welding galvanized materials.
19. Toxic gas, phosgene, is formed when the ultraviolet rays of an electric arc come in contact with chlorinated degreasing solvents. Metal cleaned with carbon tetrachloride and trichloroethylene should not be welded until thoroughly dried.
20. Never strike an arc on compressed air cylinders.
21. Gasoline tanks will never be welded in school shops.
22. Oils, greases or other agents which may ignite and splatter will be cleaned from surfaces before welding.
23. Tanks which contained flammable materials will not be welded unless all danger from residue and fumes has been resolved. Check with instructor.
24. Learn the rules pertinent to the type of welder you are using.
25. Work in a dry area.
26. Work in booths or other shielded areas wherever possible.
27. Sparks may fly 25 feet. Make sure there are no open doors or windows through which they may travel to other flammables.
28. Don't get wound up in your work! Keep cables free from your body so you can move freely, especially should your clothing ignite or some other such accident occur.
29. Ground the work before turning on the welder.
30. Where there is a danger of fire. protect flammable surface adequately by wetting thoroughly, protecting with asbestos cloth, sand, sheet metal or other non-flammable materials.
31. Don't change polarity or connections when a welder is being used.
32. Avoid looking directly at the arc. Concentrate on the pattern to be followed and that which was followed, beyond the center of illumination.
33. Keep the floor free of electrodes once you begin to weld. They could cause a slip or fall.
34. Place stubs in a metal container.
35. Do not allow electrode to freeze to the work, bench or other apparatus. Shut off welder if electrode sticks.
36. Internal pressure in a jacketed container or an object with hollow spaces can act like a bomb when heated. Make sure hollow spaces are vented.

37. Never tack weld without the helmet.
38. Stop the welder (pull the plug if AC) to clean oil, adjust or repair.
39. Replace the cables by coiling them to eliminate tripping hazards.
40. Keep clamps and other tools off the floor and put away. They can cause a fall.
41. Be especially cautious of hot metal when cutting with electric arc.
42. Keep splices, frayed or worn places on the cable taped well.
43. Gasoline engine powered welders will only be used where exhaust fumes do not impair the health and safety of personnel in the area.

Oxy-Acetylene Welding

1. Obtain permission from the instructor before using welding equipment.
2. Before attaching a regulator to a cylinder valve, "crack" the valve to blow out dust and dirt.
3. Do not use oil on the torch, blowpipe, valves, regulators or any other portion of the equipment.
4. Check for leaks whenever you change tanks or suspect a leak.
5. Leaks around equipment should be checked with soapy water, never a flame.
6. Should you suspect a leak in any equipment, stop at once and notify the instructor.
7. Avoid the use of pliers on apparatus. Use the torch wrench and turn right for oxygen connections and left for gas connections.
8. Keep the cylinders in an upright position. If they must lay in a horizontal position, keep the valve end raised to keep acetone from running out.
9. Open cylinder valves gradually.
10. Open the oxygen valve wide to prevent leakage.
11. Open acetylene valve only one-eighth of a full turn, approximately and never more than a quarter of a full turn.
12. Keep the wrench on the acetylene tank so it can be shut off quickly if necessary.
13. Under no circumstances will acetylene pressure exceed 15 pounds. If used in excess of this amount, an explosion may result.
14. Make sure connections are tight when you change tips or other apparatus. Do not overtighten or use wrenches on hand tightening devices.
15. Use the maximum amount of gas for a given size welding tip. Cutting down the amount of gas will cause popping and hot metal will be thrown around.
16. Do not weld or cut for at least 15 minutes after contamination of clothing with oxygen.
17. Goggles should be adjusted to fit the welder's face to give maximum protection.
18. Always use the correct type of eye protection to reduce light and provide shielding.
19. Keep your equipment in good, clean, dry condition.
20. Keep the welding area neat, clean and dry.
21. Use ventilating system or means of ventilation provided.
22. Make certain the fire extinguisher is in place and that you know how to use it.
23. Do not permit autos or equipment to be run over the hoses. Protect them from sharp objects, kinks, etc.
24. Keep the hose out of the way so it does not become a tripping hazard.
25. Make certain you do not drag the hose over hot metal scrap when cutting.
26. Use flint spark lighters, never matches or cigarette lighters.
27. Purge oxygen and acetylene lines before lighting.
28. The tip should be pointed away from personnel, equipment and flammables when being lit.
29. Weld small pieces on a fire brick welding table.
30. Clamp or otherwise secure pieces which may fall or tumble from the welding table.
31. Keep the tip out of heat reflecting areas or holes.
32. Keep the end of the tip out of the molten metal while welding or cutting.
33. Never weld or cut into a container that had gasoline, oil or other explosive, combustible or toxic fumes in it. Such work should be done only under direct supervision of your instructor.
34. Use special care when cutting so hot pieces do not fall or tumble onto the feet. Do not stand with feet so close to the cutting that they are subject to intense heat, sparks and molten metal.
35. Exercise extreme caution when working around automotive type vehicles or machinery. Hydraulic tanks and lines, fuel lines, flammable upholstery, oil and grease covered parts all create fire hazards. Secure teacher's permission and advice before working on such projects.
36. Avoid using filler rods that are too short.
37. Never work from both ends of a rod. Use the same end to work from so you will not have to guess which end is the cool end when you pick up the rod after laying it

down. The squared-off end will always be cool.

38. Never leave the tip of a lighted torch inserted in a tank or barrel.
39. Always have pliers or tongs handy when small pieces must be handled hot. Tidy up hot pieces used for blocking or set-up work so others are not burned while attempting to clean up your work area.
40. When a torch backfires or pops out with a screeching sound, shut off the oxygen valve immediately. Then shut off the acetylene valve and relight and adjust the flame.
41. Never lay down or hand up a lighted blowpipe or torch.
42. Always shut off the equipment at the tank, regulator and hose valve.
43. Hot metal should be marked HOT with chalk or soap stone.
44. Avoid confined areas and positions, so you can work freely without endangering others or yourself, or from loss of balance.
45. Adjusting screws on the regulators should always be released when not in use. Turn the screw out counter clockwise.
46. Never allow a cylinder to fall. They are under high pressure internally and can explode if ruptured by a sudden shock. Secure cylinder to a stationary object.
47. Screw the proper protective cover on the tank intended. Place on tank when not in use to protect the valve.
48. Warm water, never boiling water or a flame, must be used to thaw a frozen outlet valve.
49. Never use oxygen or acetylene directly from the tanks without the use of regulators.
50. Never "crack" a cylinder in the vicinity of an open flame or fire source.
51. Never use oxy-acetylene directly from the tanks without the use of regulators.
52. Cylinders should not come in contact with electric wires.
53. Never tamper with the fusible safety plugs.
54. Acetylene piping, hoses and fittings should be color coded red.
55. Oxygen piping, hoses and fittings should be color coded green.
56. If you have reason to believe equipment may be defective, advise your teacher.

Forge and Forging

1. Never light the furnace without knowledge of proper procedure and without the instructor's permission.
2. Light the furnace by first turning the air blower on to eliminate any accumulation of gas; use a lighting rod or torch long enough to keep the face and hands out of danger.
3. Stand to one side of the furnace opening. Never look directly into the fire box while lighting a gas-fired furnace.
4. When turning off the furnace always turn off the gas first and then the air.
5. Use the correct type tongs and grip securely to prevent slipping.
6. Wear gloves to protect hands from heat.
7. Wear dry gloves to handle cyanide. Instructor must approve use of cyanide.
8. Be sure that a properly located and well-covered annealing pan is near the heat-treating furnace.
9. Exercise care while quenching hot metal in oil. Plunge the metal quickly below the surface, and keep it there. Raising it to the top may cause the hot oil vapor to ignite.
10. Make sure that the quenching oil container has enough oil to cool off the work without permitting the oil to overheat. Repeat quenching in the same oil may overheat the oil, causing it to foam and boil over. This creates an extreme fire hazard.
11. In working with cyanide solutions, use rubber gloves.
12. Never permit cyanide to touch open wounds or skin abrasions.
13. Wash hands thoroughly after handling cyanide.
14. Place parts being case-hardened in the pot before the furnace is lit.
15. Prevent moisture from coming into contact with the case-hardening compound and causing an explosion.
16. Remember that case-hardening materials are dangerous chemicals. Use them with extreme caution under the direct supervision of the teacher.
17. To avoid burns or injury resulting from the stock's slipping, fit tongs properly to the piece being forged.
18. Use caution in hammering hot or cold metal on stakes or anvil.
19. Use care in cutting hot metals with the hardy, blacksmith chisel, or other means so cut stock does not fly or fall on feet.
20. Keep the anvil clear of scraps and flakes of metal oxide.
21. Never strike a hard hammer on the face of the anvil. Chips may fly at bullet speed.
22. Knock oxide off metal before attempting to forge. In this way you prevent hot particles from flying.
23. Keep mushroom heads from forming by constant attention to tools.
24. Mark all hot metal "HOT" if within range

of others who may touch it.

25. Be especially careful when handling pipe or tubing that is being heated. Flame may travel through the tube.
26. Be sure that anvils are mounted securely to base mounts so as to prevent them from falling or upsetting.
27. Quench hot tongs before putting them away.
28. Keep your work area free of clutter.
29. Make certain no flammables are near the area.
30. Warn others in the work area when walking with a hot piece of metal.
31. Give the operation your full attention. Avoid distractions.

WOODWORKING SAFETY

Sanders – Spindle, Horizontal or Vertical Belt, Portable Belt, Disc, Drum, Flat Vibrating or Oscillating and Metalworking Fender Grinder.

General Safety Precautions:

Clean, oil and adjust only when the machine is at a dead stop.

Clamp all work pieces securely; never attempt to hold with your hands.

Make certain the switch is off when plugging portable sanders to outlet.

Shut off the machine if you must leave the work area.

Be sure the machine has stopped running when you set it down.

Use dust control measures.

Keep your hands at least two inches from the abrasive materials.

Use belts or abrasive pieces that are not torn. Run the belt in the proper direction and track it before operating the machine.

Do not work with pieces that are too thin or too short or can't be controlled. Use jigs or fixtures for small objects.

Be careful that the tool does not "get away" and fall on the feet or floor.

Use a brush, not the hands, to remove dust and chips.

Keep your mind and your eyes on the operation. Avoid distractions.

Keep loose aprons, loose or torn clothing, rags, etc., away from the work area.

Make certain your hands are dry. Operate the sander only when you are standing on a dry floor.

Know the special requirements of the make and model of the machine you are using.

Do not permit equipment to run over portable sander cords.

Arrange cord to eliminate tripping hazards.

When using table equipped sanders, keep table within ⅛ inch of the abrasive. Use guides, fences and other assists.

Permit sander to reach full operating speed. Keep moving to avoid burning the sheet, belt or disc.

If a piece of material becomes caught in a machine, do not try to save the stock, but stop the machine.

Disc Type Sanders

All previous considerations.

Sand only on the downward travel.

Keep a firm grip on the sander to avoid losing control.

Avoid allowing portable disc type tools from getting near your clothing.

Spindle Type Sanders

Select the proper size spindle for the job.

To spindle sand the inside of a hole, take a firm grip with both hands on the work piece and work slowly. Have the instructor check your set-up before starting.

All previous general safety precautions.

Horizontal Belt Sanders

All previous general safety precautions.

Do not sand any material unless it is at least six inches long.

Sand on the downward travel of the belt only.

Make certain the stock is against the end stop before starting.

Use a wooden trowel type holder to hold material against the belt.

Allow the belt to come to a stop before removing the stock.

Test – Sanders

Multiple Choice:

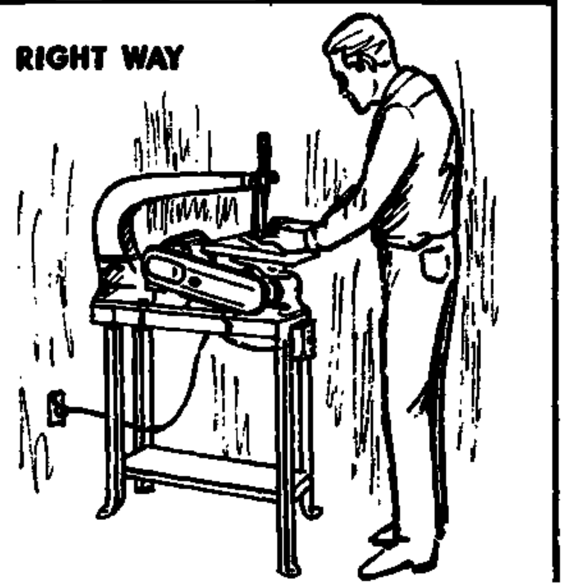
1. It is well to have the work being sanded
   a. Held securely so it cannot move
   b. Held by hand
   c. Held loosely
   d. None of the above answers are correct
2. It is well to keep the hands at least
   a. 12 inches from the abrasive
   b. 2 inches from the abrasive
   c. ½ inch from the abrasive
   d. None of the above answers are correct
3. Sawdust should be removed from benches and projects with
   a. Rags
   b. Bench brush
   c. The hand
   d. Either of the above answers are correct
4. If a piece becomes caught in a machine, you should
   a. Try to release the work from the machine at once
   b. Try to control the sander so the work will be thrown clear
   c. Stop the machine without trying to save the stock
   d. Either of the above answers are correct

5. It is best to start sanding
   a. As soon as the machine is turned on
   b. After the motor has reached its maximum RPM
   c. Neither of the above answers are correct
   d. Either a or b would be correct

True-False – Use Plus for True, Zero for False:

1. ( ) It is permissible to run sanders over electric cords since such cords are designed to be indestructible.
2. ( ) Always track the belt before using the machine.
3. ( ) It is unwise to work material which is small or which is difficult to control with the type of sander being used.
4. ( ) Electric cords can be tripping hazards and must be placed in a manner that is not hazardous to others.
5. ( ) Portable disc type sanders must be kept well away from your body and clothing.

JIG SAW



1. Jig Saw
   a. good stance c. hands clear of cutting area
   b. eyes on work d. guard properly adjusted

Jig Saws

Use the proper blade for the job at hand.

Make all adjustments, clean, oil, etc., before turning on the power.

Keep your eyes and mind on the work being performed.

Your hands should be kept well beyond the intended or possible cutting path.

Keep a firm grip on the wood; do not crowd or turn without cutting.

Plan your cuts to avoid back-cuts as much as possible.

Keep hold-down rest firmly on the stock.

The belt guard should be in place.

The proper blade speed should be selected and the table locked securely in place.

The table should be free of all objects except the material being cut.

Clear scraps from the table only after the machine has made a dead stop.

Acquire the proper stance for operation of the jig saw.

Cut cylindrical stock only with approved jigs and set-ups.

Get the instructor's approval for all special set-ups.

Test – Jig Saw

True-False – Use Plus for True, Zero for False:

1. ( ) It is well to back out of the cut wherever possible.
2. ( ) Cutting speed is of minor importance.
3. ( ) Keep the tilt-top table loose so quick adjustments may be made while cutting.
4. ( ) It is permissible to have wrenches and other items on the saw table as long as they do not strike the blade when the saw is in operation.
5. ( ) The hold-down rest should be placed well above the stock.
6. ( ) Keep hands and fingers well beyond the intended or possible cutting path.
7. ( ) Special set-ups are required for cylindrical stock to be cut.
8. ( ) It is important to keep your eyes and mind on the job being accomplished.
9. ( ) Hold wood lightly with finger tips for good control.
10. ( ) Get the approval of your instructor for special set-ups or when in doubt about the way to perform a certain operation.

Mortising Machine

Clean, oil and adjust only when the machine has come to a complete stop.

Clamp or secure work in position firmly.

Check bit and chisel for proper and secure setting. Use sharp bits.

Hand turn machine one complete revolution before turning on the power.

Keep hands away from chisel while machine is operating.

All mortising machines, except hollow mortisers, should have thumb stops at each side of the chisel.

Operators should not leave the machine while the power is on.

Do not brush chips or cuttings away with the hand.

Give your full attention to the operation Avoid distractions.

Test – Mortising Machine

Matching:

1. ( ) Clean away chips with
2. ( ) Hand turn machine one revolution before
3. ( ) Never leave the machine
4. ( ) Clamp or secure the
5. ( ) All mortising machines except hollow mortisers should be equipped with
6. ( ) Give the machine your
7. ( ) Always make sure the bit and chisel are

a. turning on the power
b. stock before cutting
c. thumb stops at each side of chisel
d. a brush
e. machine is operating
f. the hand
g. full attention
h. before stopping the machine
i. mounted securely
j. loose for maximum freedom
k. machine to the bench

Portable Router-Shaper

Clean, oil and adjust machine only when it is at a dead stop. Disconnect the cord.

Fasten stock securely in a vise or clamp.

Tighten all of the bits and cutters with proper wrenches.

Ask the instructor to approve your set-up.

Make certain the switch is off when connecting cord to the outlet.

Keep a firm grip on the machine.

Do not allow your fingers or body to come near the revolving cutter.

Exercise caution around knots or irregular hard spots.

Place the machine in a safe place when it is not in use.

Avoid using the machine if it has a frayed or defective cord.

Keep cords from becoming a tripping hazard.

Keep the students observing the operation clear of the work area.

Test – Portable Router-Shaper

True-False – Use Plus for True, Zero for False:

1. ( ) Always disconnect the cord before cleaning, oiling or adjusting the tool.
2. ( ) Have the switch turned OFF when connecting the cord.
3. ( ) Feed rapidly into the material, especially through knots and hard spots.
4. ( ) Do not allow fingers or body near the revolving cutter.
5. ( ) Material must be mounted loosely in a vise to allow for movement while cutting.
6. ( ) Grip the machine firmly while using it.
7. ( ) The instructor must approve your set-up before working.
8. ( ) Small pipe wrenches and vise grips are generally well suited for making adjustments.

Shaper – Wood

Use a ring guard around and over knives to help protect your fingers. This may not be less than the maximum diameter of the cutter.

Use safety cutters (three lip, solid).

Utilize hold-down clamps to secure work to the table. They help reduce chatter and the chance of kick-back.

Use guide pins, collars, jigs, etc., where appropriate.

Use a pusher stick when necessary.

Do not attempt to shape stock that is too short or extra thin.

Make certain that knives are correctly seated before tightening lock nut.

Knives must be correctly balanced and sharpened.

Run all material against direction of rotation of spindle.

Use the fence and pressure bar whenever possible.

Examine all wood for knots, splits, checks, warp or wind, surly or cross-grain or other minor defects. Any of these situations can cause dangerous working conditions.

Do not use short knives because collars will not get sufficient bearing to hold knives securely. Knives must extend back at least two-thirds the length of the grooves.

Acquire good footing and a good physical stance.

Keep your mind and your eyes on the operation. Don't become distracted.

Remove all blades from the shaper spindle if one must be removed. (If machine is started accidentally, remaining blades will not be hurled out.)

Set up the shaper so the wood covers the blade.

Remove all loose objects from the table and machine area.

Allow no one else inside the operators area.

Keep hands well away from revolving cutters. Use spring guard wherever possible.

Hold the board down against the guide with the palms of hands, not extended fingers. Your fingers should be together lying on the board out of the path of the cutter.

End grain of boards less than eight inches in width should not be run unless the shaper is equipped with a sliding guide with a board clamp.

Avoid deep cuts and do not feed rapidly.

Never back up the work. If necessary, stop the machine dead, remove the material and start over.

Get the instructor's approval and then test your set-up on a piece of material which is of a safe size.

Stay with the machine when the power is on.

Remove and store the cutter-head when the operator is finished using the machine.

Clean, oil and make adjustments only when the machine is stopped.

Never start on a corner on a collar job.

Cover guards should be used whenever possible.

Bring the spindle speed up to a safe operating speed in a series of short starts and listen for chatter. Watch for signs of the knives being out of balance.

Make sure that the cutters rotate in the proper direction.

Double spindle shapers should have individual switches so one may be started at a time.

Only precision ground blades and collars may be used. They apply uniform pressure on all knife blades, thus helping to eliminate breakage. When thrown, steel blade segments travel with force great enough to kill a man.

Test – Shaper

True-False – Use Plus for True, Zero for False:

1. ( ) Use the fence and pressure bar whenever possible.
2. ( ) Keep hands close to the revolving cutters for good control.
3. ( ) Run all material "against" direction of rotation of spindle.
4. ( ) Work should be held down with palms of hands, not fingers.
5. ( ) Avoid deep cuts, but feed the material rapidly.
6. ( ) Clean, oil and adjust the machine while it is running.
7. ( ) Start the machine at top speed, then reduce to required operating speed.
8. ( ) Only precision ground blades and collars may be used.
9. ( ) Use a push stick when necessary.
10. ( ) Because of the speed of the machine, knots, splits, warped wood, cross grain and other defects are not very important.

Complete the sentence, explaining the procedure:

1. Never back up the work. If necessary to remove material we must ....
   ....
2. Utilize hold-down clamps to secure the work on the table. This is necessary because ....
   ....
3. Make certain the line of work is clear of others. Why is this important?......................
   ....
4. What should be done when a cutter is removed from a spindle?..............................
   ....
5. Why must knives extend back at least two-thirds the length of the grooves? ....
   ....

Planer or Surfacer

Use only clean wood, free of sand, paint, nails or other materials.

Inspect for cracks, loose knots, warp, wind or other defects.

The minimum length of stock run through the planer must be equal to the distance between the center of the feed and delivery rools. Ordinarily this should be not less than 18 inches in length.

The wood must be planed "with the grain" never against the grain.

For most work it is not necessary to remove more than 1/16" at a time.

Always allow the planer motor to reach full speed before starting to plane.

If a board stalls, never look into either end of the planer. Serious eye and face injury can result from a flying splinter or kickback. Turn off the machine and allow it to come to a complete stop before adjusting.

Always keep any guards in place over cutting heads, belt drives, etc.

Never reach into the machine.

Avoid feeding work of different thicknesses at the same time. Kickback will probably result.

Operators will not stand in-line with board travel.

Make certain no one is opposite the machine and that the area is free for the board to travel out of the machine.

Make sure the machine is at a dead stop to clean, oil or adjust.

"Walk" boards hand-over-hand rather than sliding them in your hands.

Avoid pinched fingers under or at the side of the board by giving the process your undivided attention.

Have a helper assist with long pieces, but only to hold and support a board at the proper height. Never reach over the machine.

Shut off the machine when you are not in the operator's zone.

Use the correct feed speed and always start the feed rolls after the planer has started.

Do not wear gloves.

Harder woods require lighter cuts.

Adjust cut to measurements taken on thickest part of the board.

Make certain you are the only person in the operator's safety zone.

Allow the material to proceed all the way through the machine before making any additional depth of cut adjustment.

Turn off the power and call the instructor if the machine does not seem to operate correctly.

Test – Planer or Surfacer

Multiple Choice

1. Ordinarily the minimum safe length of stock is
   a. 6 inches
   b. 12 inches
   c. 18 inches
   d. 24 inches
   e. None of the above answers
2. Planning may be done as soon as
   a. Power is turned on
   b. The machine has warmed up to room temperature
   c. The motor has reached full speed
   d. None of the above answers are correct
3. Feeding boards should be done by
   a. Sliding boards through by your hands
   b. Walking the boards hand over hand
   c. Either above method but wear gloves
   d. Neither of the above answers are correct
4. Work should always be planed
   a. With the grain
   b. Across the grain
   c. Either with or across, but never diagonal
   d. None of the above answers are correct
5. Harder woods require
   a. Heavy cut machine settings
   b. Light cut machine settings
   c. Neither of the above answers is correct
6. It is advisable to
   a. Reach into the machine if work sticks
   b. Reach over the machine if you wish
   c. Clean, oil and adjust the machine while it is running
   d. Let material proceed all the way through the machine before making an additional depth of cut adjustment
   e. None of the above answers are correct
7. Should the work stick in the machine, you should not
   a. Look into the machine from either end
   b. Press the reverse button to back out the stock
   c. Stop the machine, release pressure on feed rolls and remove work
   d. None of the above answers are correct
8. The operator must avoid
   a. Feeding two pieces of different thicknesses at one time
   b. Standing beside the board; he should be in-line with board travel
   c. Taking cuts of less than 1/16 inch
   d. Feeding two pieces of equal thickness at one time
   e. None of the above answers are correct

Wood Lathe

Make certain the wood is free of checks, cracks, loose knots, metallic substances or other defects.

Inspect glued work to see that the glue is thoroughly dry and the work will withstand turning.

Mount the work correctly and securely in the lathe.

Clean, oil and adjust only with the lathe at a dead stop.

Cutting tools should be sharp and have tight fitting handles.

Never use a file or rasp for cutting; never use a tool without a handle.

Avoid top speeds. Select the correct speed by the size and condition of the object being turned.

Stand to one side when power is first turned on.

Grasp the turning tool firmly but not excessively tight with both hands when cutting stock.

Keep fingers and hands away from revolving stock.

Use the correct amount of tool pressure against the stock.

Stop the lathe to use inside or outside calipers.

Keep the tool rest as close to the stock as reasonably possible by making frequent adjustments. Adjust the tool rest only when the lathe is completely stopped. After adjustment of the tool rest give the stock a trial spin with the power off.

Remove the tool rest for sanding and finishing operations.

Use only a small rag folded into a pad for polishing.

Allow only the operator in the work area when the lathe is in operation.

Turn off the power any time you must leave the lathe.

Check occasionally to see if the stock has loosened between centers. Do not tighten enough to burn or split the wood.

Keep the lathe bed free of miscellaneous objects – wood, tools, etc.

Rough down stock to cylindrical form before using higher speeds.

Cut stock to circular shape on the band saw or jig saw where possible.

Place the turning chisels in racks when not in actual use to prevent their falling.

Keep rags, waste, loose clothing, etc., away from lathe areas.

All unusual set-ups should be checked by the teacher.

Advise your teacher if the machine vibrates unnecessarily, if the tool seems to grab or other peculiar conditions exist.

Always make certain no one else operates the switch or the speed control.

Make all adjustments and check them every time you set-up. Don't rely on others or on yesterday's adjustments. Start all work at the slowest speed and increase as it is necessary.

Remember that table tops of considerable size have a high periphery speed. Make certain you do not exceed the safe operating spindle speed.

Make certain the tailstock is securely locked to the lathe bed before turning on the power.

The gouge is dangerous when used on the inside of a cup-shaped faceplate job and should not be used.

Avoid finger burns when sanding by exercising patience.

Keep the rear end of the tool below the center of the work.

Lubricate the dead center.

When using faceplates:

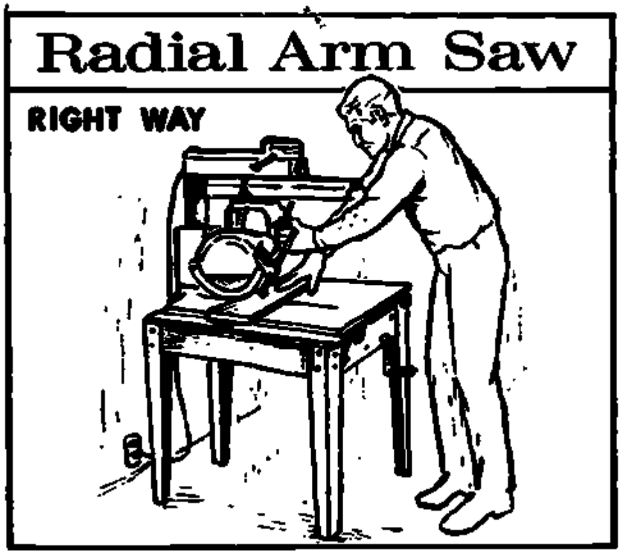
1. Use screws large enough to hold the work securely.
2. Keep an accurate check on the depth of cut to avoid striking the faceplate screws.
3. Inspect work frequently to see that the screws have lot loosened.
4. Use the correct type and size of faceplate.

Test – Wood Lathe

Multiple Choice

1. Before turning on the power, the operator must
   a. Make certain the lathe will come on at top speed
   b. Remove miscellaneous items from the lathe bed
   c. Place the tool rest as far from the work as possible
   d. None of the above answers are correct
2. To polish or sand, always
   a. Leave the tool rest close to the work
   b. Use loose rags or waste to apply polish
   c. Use light pressure to avoid finger burns
   d. None of the above answers are correct
3. Which of the following would not disqualify a piece of material as being suitable for turning
   a. A piece of clear stock
   b. Stock with loose knots, cracks, nails, etc.
   c. A long warped piece of wood
   d. None of the above answers are correct
4. While you are turning, you should always
   a. Permit others in the operator's area
   b. Use excessive tool pressure against the stock
   c. Turn OFF the lathe if you must leave the operator's zone
   d. None of the above answers are correct
5. When starting a job, make certain you
   a. Stand to one side when power is first turned on
   b. Permit considerable play at the tailstock end
   c. Rough down at high speed
   d. None of the above answers are correct
6. It is always recommended that you should
   a. Use inside or outside calipers with the lathe operating
   b. Clean, oil and make adjustments with the lathe operating
   c. Inspect glued work to make certain it will withstand turning
   d. Grip the turning tool up close to the cutting end
   e. None of the above answers are correct
7. It is necessary for the
   a. Cutting tool to have a handle
   b. Operator to check occasionally to see if stock has loosened between centers
   c. Operator to revolve the work by hand to check for obstructions before starting
   d. Teacher to check unusual or special set-ups

   e. Stock to be cut to a circular shape on the band or jig saw where possible
   f. None of the above answers are correct
8. When doing faceplate turning, make sure to
   a. Use small screws for large work
   b. Use nails for small work
   c. Use the correct type and size of faceplate
   d. None of the above answers are correct



Radial Arm Saw c. stock held firmly against fence
a. good stance d. hands clear of cutting path
b. eyes on work e. work area clear around saw path

Radial, Swing and Cut-Off Saw

Keep hands out and away from the direction of the saw. Cut only one piece at a time.

Hold stock solidly against the fence.

Get the instructor's approval before working special set-ups.

Stay at the machine when it is running.

Do not force the saw into the material faster than the saw is able to cut, maintaining normal operating RPM. Go slow through hard wood, knots and tough spots.

Inspect wood first to make certain there are no nails or foreign objects imbedded in the material.

Cut along stock only; the radial or swing saw is not intended for short pieces.

At the completion of each cut, return the saw to its position behind the fence. Lock it there to prevent its moving forward on starting.

Do not use the saw for wood with warp or wind, or which would be best cut with a hand saw.

Never reach into the track to remove scraps, sawdust, etc. Stop to clean, oil or adjust.

Secure the instructor's approval for work requiring other than a normal 90° swing, for radial saws.

Maintain proper physical and mental stance. Avoid nearby distractions while saw is running. Make certain no one working nearby can bump you and cause an accident. Look out for others in handling long pieces for sawing.

Keep all guards in proper positions.

Swing cut-off saws will be restricted by use of chain to stop the forward motion at the desired point. Chain will be inspected for wear and replaced when worn.

Avoid a tendency to measure boards with the saw running.

Allow the blades to coast to a stop. Cutting with power off may crack or warp the blade or cause it to heat and lose its temper.

Beware of the "bounce back" tendency. Return saws to rearward position slowly and carefully.

Clean, oil or adjust behind the saw only if the blade is stopped completely.

Always have the straight edge against the fence.

Hazards Pertaining Specifically to Radial Saws

Improper alignment of machine may cause binding, creeping or excessive vibration. Continuous inspection for correct alignment is recommended.

When using a dado head, ripping or crosscutting thick stock, the saw has a tendency to "ride up" or move forward without pulling. To cut thick hardwood, guide saw slowly and return carriage in the same manner.

When ripping, rabbeting or grooving, the blade is exceptionally open to the hands of the operator. If possible, rip, rabbet or groove thin stock (less than three inches) in some other way.

When making a second cut for a rabbet, a strip of wood cut loose may shoot back at the operator. To eliminate this hazard, hold down with a pusher board and always stand to the side of the cut being made.

Anti-kickback designs are not yet totally satisfactory (especially for student operation). When questionable, use jigs or other means to assist.

Make certain you have a thorough knowledge of saw operation, use of antikickback devices and safety guards.

When cutting large panels, the operator may tend to take a position which is in improper relationship with the saw. In this event, have a helper and an extended work surface so you are not placed in jeopardy.

Use of the shaper cutter is a dangerous operation. Use extreme caution and never back up the work or it may be thrown from your hands. Do not force the work or cut too deeply.

To rip, make certain the saw is locked into position.

Test – Radial, Swing and Cut-Off Saw

Multiple Choice

1. The cut-off saw is used after
   a. Inspecting the wood for nails or other foreign materials
   b. Removing the guard
   c. Unlocking the saw from its normal position
   d. None of the above answers are correct

2. Chips, scraps and sawdust are removed from the table by
   a. Use of compressed air
   b. A brush
   c. The hand or fingers
   d. A stick
   e. A rag
   f. Stopping the saw, waiting for the blade to stop turning and then brushing away the waste
   g. None of the above answers are correct

3. The radial or swing saw is intended for
   a. Long pieces
   b. Short pieces
   c. Both long and short pieces
   d. None of the above answers are correct

4. It is permissible to
   a. Cut more than one loose piece at a time
   b. Measure while the saw is running
   c. Apply more pressure to cut fast through knots, hard spots, etc.
   d. Keep the straight edge of the stock against the fence
   e. None of the above answers are correct

5. It is incorrect to
   a. Clean, oil and adjust while the saw is stopped
   b. Leave the machine while the saw is turned on
   c. Keep hands out and away from direction of saw travel
   d. None of the above answers are suited to the question

6. It is recommended procedure to
   a. Cut with the power turned off and the saw coasting
   b. Reach into the track to remove chips or small blocks
   c. Saw badly warped boards with a radial saw
   d. Seek instructor's approval for unusual, other than 90° cuts
   e. None of the above answers are correct

BAND SAW

Band Saw
a. good stance
b. hands in proper position
c. safety goggles in place
d. floor area clear
e. guard adjusted
f. apron neat

Band Saw

Students will not permit their hands to be placed "in line" with the intended cut or a possible cut.

Never allow fingers to come within two inches of the saw blade while cutting.

The saw guide should be adjusted when the blade is stopped to within ⅛ inch of the stock. Upper and lower guides must be properly adjusted. Cylindrical stock will not be cut unless a special jig is made and approved by the instructor.

Stock will always be supported against the downward thrust of the saw blade. Do not saw into toe of a long bevel unless the toe is on the table.

If the blade should break or bend, an adjustment loosen, or any other such occurrence, shut off the power and advise the instructor.

Do not stand to the right of the band saw machine. A broken blade can cause serious injury.

Restrain the urge to clean off small blocks with the machine in motion. If you must, use a long stick.

If the work binds, stop the saw and back out.

Keep your eyes and mind on the operation. Don't allow minor disturbances to distract you.

Beware of blades that "click." This is often a sign of a cracked blade which obviously must be repaired or replaced. This can also be a poorly ground weld.

Don't try to stop the machine by putting a block against the moving blade or make excessively tight cuts which may pinch or snap the blade.

Make certain there are no nails or other objects imbedded in the wood which the blade may strike.

Have proper light, good stance and sufficient elbow room to work.

Do not use band saws at temperatures of less than 45°.

For safe and efficient operation, keep the band saw wheels clean and free of sap, rum or resins.

Keep extra blades stored where they cannot fall or be otherwise injurious to persons coming into contact with them.

Stop the machine slowly when using the brake.

When stopped, check to see that the blade has proper tension.

Stand clear of the machine to start.

Use proper blade for work to be done; make certain the work is within the capacity of the machine.

Door type guards will be closed, all other guards in place.

Guard against the temptation to reach across, behind or in some peculiar relation with the blade.

Use flat wood rather than pieces with warp, wind, projecting knots, etc.

Make certain the table is free of all wrenches and objects other than the material being worked.

Adjust guides and other parts only when the machine is stopped and the power is off

Stop the machine when you leave.

Maintain a good hold on the stock. Don't tail the piece with only a thumb or finger.

Allow saw to reach its effective and proper operating RPM before cutting.

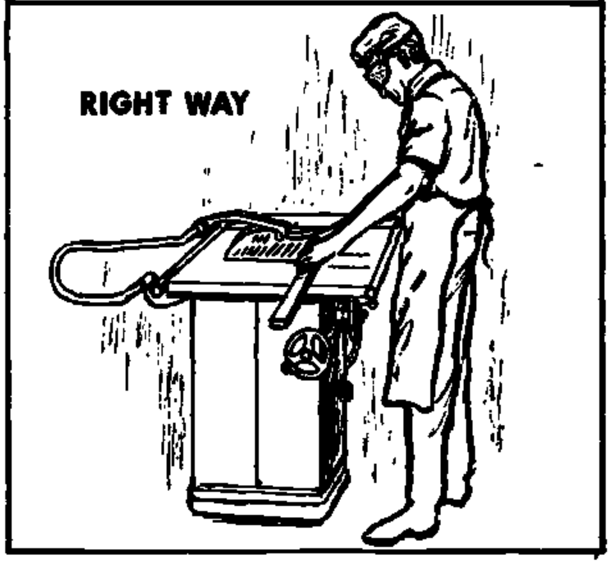
Band Saw
a. guard not properly adjusted
b. hands in line of cutting path
c. safety goggles not in place
d. floor safety zone cluttered up with wood

Test – Band Saw

Multiple Choice

1. When using the band saw, adjust the upper guide and guard before turning on the power to
   a. Just allow the stock to pass through
   b. Well above the stock so sawdust can escape up and out
   c. In the position it was last used by the instructor
   d. Either up or down, its position is not very important
2. To avoid possible injury from broken blades never stand
   a. To the right of the saw
   b. To the left of the saw
   c. Directly behind the saw
   d. None of the above answers are correct
3. The band saw adjustments should never be played with because
   a. Tampering causes unnecessary wear on threads
   b. It is a waste of your time
   c. The machine will be improperly adjusted when next used, with a possible accident as a consequence
   d. None of the above answers are correct
4. Irregular based stock and cylindrical stock will be
   a. Cut only after devising proper holding jigs or supports
   b. Cut only after completing "A" and securing instructor's approval
   c. Cut by adjusting the tilt-top table
   d. Cut by other means – not on the band saw
   e. None of the above answers are correct
5. To back out of a saw cut, always
   a. Stop the saw and then remove the stock
   b. Saw forward making an arc and proceed outward by cutting forward
   c. Back out slowly with the saw in motion
   d. None of the above answers are correct
6. If you hear a "click" it is a sign that
   a. The cutting operation is normal
   b. The blade is cracked and should not be repaired or replaced
   c. The teeth are cutting on the table insert
   d. None of the above answers are correct
7. Band saws should be stopped by
   a. Sawing into scrap
   b. Pinching the blade by sawing a sharp arc
   c. Use of the brake if so equipped, with gradual pressure
   d. By a sudden heavy foot on the brake
   e. None of the above answers are correct

Circular Saw



Circular Saw
a. good stance
b. apron very neat
c. eye protection in place
d. guard in proper position

Table Saw (Universal Rip and Crosscut)

You must secure permission unless authorized to do general sawing.

Always ask the instructor's advice for special work (dadoing, grooving, etc.).

The saw guard must always be in place on the saw except when the teacher has authorized its removal for special set-ups.

Adjust saw so the blade cuts through the stock but does not extend upward more than ⅛ inch through the stock.

Stop the saw and allow it to make a dead stop before adjusting, oiling or cleaning.

The splitter guard must be in place and raised above the table at least as high as the saw blade when you are ripping stock.

Use a push stick for ripping pieces 4 inches or less in width.

Freehand sawing (ripping without the fence or crosscutting without the sliding crosscutting fence) is forbidden.

Never stand directly behind the blade, stay to the left.

To rip short stock, the salvage should be to the left of the blade to reduce the possibility of kickback.

Never have your fingers in line with the saw cut. Develop safe habits.

Arch your fingers when feeding stock instead of laying your hands flat.

Reaching over the saw or passing wood over the saw blade is prohibited.

Saw blades with holes larger than the arbor will not be used.

Students will not clear scrap from the saw with fingers or hand. Use a stick approximately 24 inches long or a brush, after the saw has stopped rotating.

Do not cut cylindrical stock or other objects subject to rolling unless special cutting jigs are made and authorized.

Students with work to be lowered on a rotating saw will secure approval before engaging in this hazardous operation.

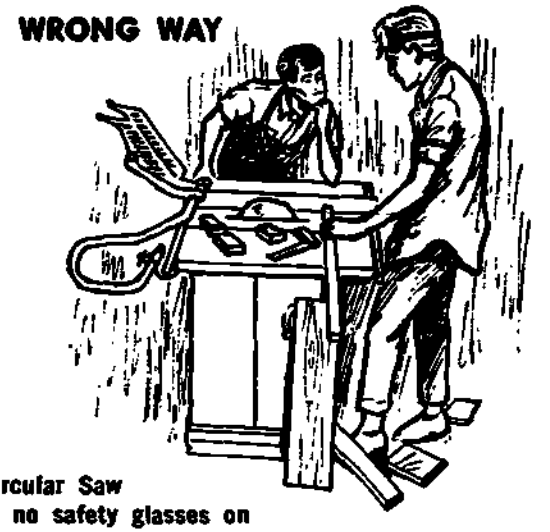
Make certain no fence, jig or other tool is in line with the saw cut before turning on the power.

Sliding or hinged tables will be kept locked except when being adjusted.

When helping to "tail-off" a helper will support and help maintain alignment; he will not pull the stock. The operator will push the stock.

Stop the saw if you must back out the work. To do so while running will tend to throw the wood toward you.

Make certain wood is in suitable condition for sawing, free of warp, wind, nails, paint, sand, etc.



Circular Saw
a. no safety glasses on
b. shirt tail out
c. apron not tied
d. guard not in place
e. blade too high
f. floor work area cluttered
g. eyes not on work
h. talking to friends
i. saw table cluttered

Inspect blade to locate cracks or other defects. Report any defects found. Check for wobble.

Fasten a clearance block to ripping fence when multiple cutting stock to length (when ripping fence is used as a gauge).

Stop the saw and move out of the operating zone before responding to anyone who seeks your attention.

Feed stock only as fast as the saw will freely cut.

Reset saw adjustments to a normal position when completing an operation requiring a special set-up.

Use the correct saw blade for the operation you wish to accomplish.

Don't make the power saw do a job that would best be done with a hand saw.

Make sure the edge which runs against the rip fence is smooth and true when ripping.

Make sure you know exactly what you want to do and how you are going to do it before starting the cut.

To rip narrow stock, cut half way from one end, turn the board around and rip from the opposite end.

Balance your weight evenly on both feet when sawing; proper stance helps avoid accidents.

Never operate a saw other than its rated speed. Belt tension should be correct. A correct sharp saw will sing through its work.

Store spare blades where there is no danger of accidental contact with other blades or students.

Avoid sawing pieces so small that you cannot exercise proper control.

Adjust the fence only when the saw is at a complete stop.

Be careful not to bump others at potentially dangerous machines in person or with materials you are sawing.

Be aware of others around you, but keep your mind on your work.

Grip long pieces firmly and press on short pieces enough to eliminate a chance of the stock "getting away."

Never have the hand above the blade – as in grooving.

Allow the saw to reach its operating RPM before starting the cut.

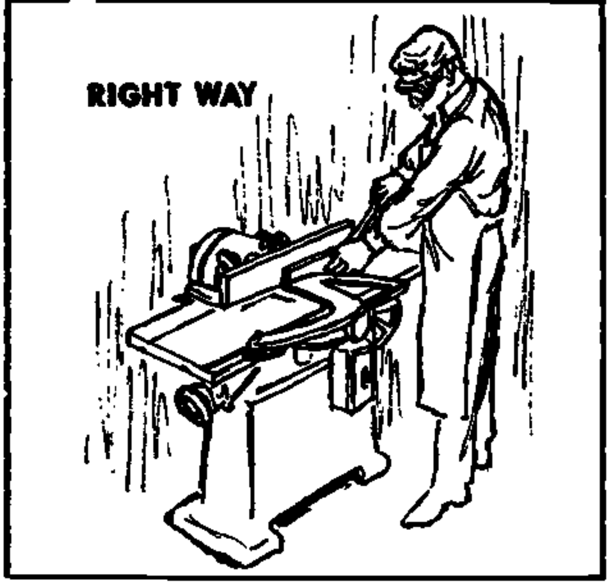
Fasten a clearance block to the fence when cutting off short pieces of block.

Test – Table Saw
Multiple Choice

1. When sawing the circular saw blade should not reject through the stock more than
   a. 1 inch
   b. ½ inch
   c. ¼ inch
   d. ⅛ inch
   e. None of the above answers are correct
2. A push stick should be used when you are
   a. Removing scrap
   b. Ripping short or narrow pieces
   c. Turning the switch on or off
   d. making adjustments
   e. None of the above answers are correct
3. Freehand cutting (cutting without the aid of a rip fence or crosscut guide) is
   a. Permitted when stock is too large for the table
   b. Permitted if the operator has assistance
   c. Never permitted because it is dangerous
   d. Generally accepted practice because it is fast
   e. None of the above answers are correct
4. Assistants who help with "tailing off" should remember
   a. To support the work from underneath but not to grasp it
   b. To pick up all tailings which might cause an accident
   c. To hold the stock firmly and gently pull it through the saw
   d. To hold the two pieces close together as you pull
   e. None of the above answers are correct
5. We never back the work out of the saw
   a. Without first making sure chips and sawdust behind the wood has cleared away
   b. Without first turning off the power and waiting for the saw to stop turning
   c. Without first removing the fence or crosscut guide
   d. Without giving a signal for assistance
   e. None of the above answers are correct
6. The saw guard must always be in place over the saw except
   a. When cutting large stock
   b. When short pieces tend to get caught under the guard
   c. When the teacher has authorized its removal for special set-ups
   d. When using wide dado heads
   e. None of the above answers are correct
7. When you crosscut pieces of equal length
   a. A clearance block must be fastened to the rip fence
   b. Use care to insure all pieces are of equal length
   c. Use the crosscut guide and the fence to guide the stock
   d. Measure and mark each piece individually and cut separately
   e. None of the above are correct
8. When using the saw, the operator will stand to the
   a. To the rear of the saw
   b. Right of the saw
   c. Left of the saw
   d. In any of the above positions
   e. In none of the above positions
9. When you are ripping, the waste shall be
   a. Toward the ripping fence
   b. To the left of the blade
   c. On either side

10. If it is necessary to clear the table of lumber scraps while the saw is revolving, you must
    a. Use the brush
    b. Use the hand
    c. Use the push stick
    d. Use a stick about two feet long
    e. Not use any of the above listed items

JOINTER



Jointer
a. good stance
b. work area clear
c. using pusher stick
d. stock at least 12" long
e. apron neat
f. eye protection in place

Jointer

Use only clean wood, free of sand and paint, nails or other materials.

Inspect for cracks, loose knots, warp, wind or other defects.

Always see that a guard covers the knives.

Never use the jointer for work which is less than four times the width of the bed opening and never less than 12 inches in length.

Take a smaller cut for hardwood than for softwood and never over ⅛ inch.

Use a push stick, wooden mitten or pusher block which is appropriate to the job.

Seek approval from your instructor for set-ups involving stop-cuts, beveling, tapering, chamfering, rabbeting or other unusual work.

Keep hands and fingers at a safe distance from the revolving knives.

Hands must be above the material; fingers or hands will never extend down over the top of the fence when the push stick is not being used.

Feed the stock slowly – consider the grain, depth of cut and kind of wood.

No stock less than ¾ inch should be faced on the jointer.

Allow the material to pass the knives far enough so the guard will close before you pick up the stock.

Clean, oil and adjust with the power off and the knives stopped.

Students will not adjust the rear table unless authorized.

End grain jointing is dangerous, especially for small pieces. Use a plane and work by hand. For large panels, get instructor's approval.

Acquire the proper stance. Keep your mind and eyes on your work.

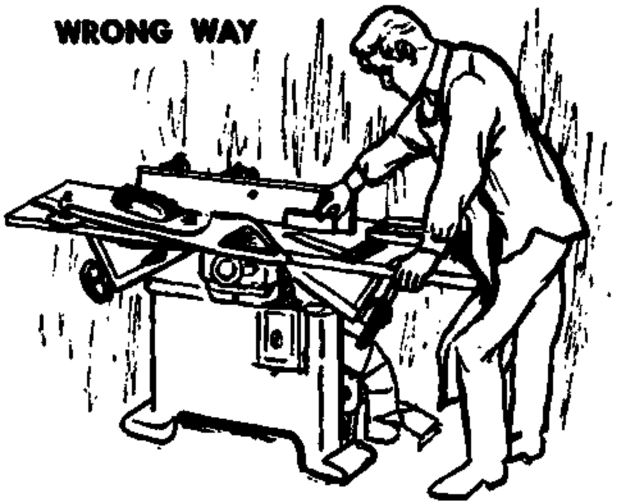
Stand to the left of the machine when turning on the power. Allow the machine to reach full operating speed for a few moments before starting the work.

Advise the instructor if the machine vibrates. Dull knives or improper balance can cause kickback or other unsafe conditions.

Avoid standing directly behind the stock. Stay to the left.

Never lean things against a jointer or pile wood or other tools on the table.

Make certain you have good control of the material you are handling.



Jointer
a. shirt tail out
b. apron sloppy
c. tools on table
d. Standing in wrong position
e. stock too short
f. no pusher stick

Scrapers

Scrapers in the hands of inexperienced students can be hazardous.

Keep scrapers sharp so they cut instead of slipping.

Place in racks where corners or edges are covered.

Hand Saws

Keep saw teeth when not protected in use so they do not cut others.

Use proper cutting techniques when using hand saws or hack saws.

Test – Jointer

Multiple Choice

1. Always set the fence
   a. As close to the operator as the stock will permit
   b. As far from the operator as possible
   c. At any position on the table
   d. None of the above answers are correct
2. The operator should keep hands
   a. On top and at the rear edge of the board
   b. At the top and sides of the piece being pushed
   c. Above material, without extending fingers or hands down over front or rear edge of the material
   d. None of the above answers are correct
3. The operator will
   a. Travel with the work, when feeding long boards
   b. Stand to the right of the machine to feed the work
   c. Clean, oil and adjust with the machine in operation
   d. Not travel with the work, but will work from a position beside the front table to the left of the machine
   e. None of the above answers are correct
4. Before picking up the finished stock, always
   a. Shut off the power and wait for the machine to stop running
   b. Put on gloves
   c. Allow work to pass the knives far enough to permit guard to close
   d. Make the next adjustment for depth of cut
   e. None of the above answers are correct
5. It is poor practice to
   a. Run material less than two inches thick
   b. Allow at least two fingers to ride over the top of the fence
   c. Advise the instructor because the machine vibrates
   d. Joint the end grain on small pieces
   e. None of the above answers are correct
6. When you are facing work, you should
   a. Exercise caution
   b. Use a feather board for safety
   c. Take a light cut and use a mitten
   d. Remove the guard
   e. None of the above answers are correct
7. Material to be faced which is warped must
   a. Not be worked on the jointer
   b. Be free of knots, cracks, sand, paint, and nails
   c. Be at least ¾ inch thick and 12 inches long
   d. Be worked only by your instructor
   e. None of the above answers are correct
8. The out-feed table or rear table adjustment is made
   a. Only by the teacher
   b. Whenever thickness of cut is to be changed
   c. When the machine is operating
   d. None of the above answers are correct

Scrapers

Scrapers in the hands of inexperienced students can be hazardous.

Keep scrapers sharp so they cut instead of slipping.

Place in racks where corners or edges are covered.

Hand Saws

Keep saw teeth when not protected in use so they do not cut others.

Use proper cutting techniques when using hand saws or hack saws.

STUDENT INJURY REPORT

NOTE TO SCHOOL SHOP INSTRUCTOR

The purpose of this injury report is to enable the Industrial Commission of Ohio, Division of Safety and Hygiene, to compile injury statistics on a state-wide level, for all students sustaining personal injury while in the course of school shop activities.

This report is not intended to pinpoint the shop injury experience of any particular school unit, but rather, to enable those charged with the responsibility of accident prevention in this particular field to evaluate the over-all effectiveness of the Ohio school shop accident prevention program.

GENERAL INSTRUCTIONS

1. Complete this report for all school shop accidents that are reported to the Industrial Arts Teacher and result in personal injury to the student involved, regardless of whether or not the student was absent from school as a result of the injury.
2. When a pupil is still absent at the end of the first semester as a result of accidental injuries, this report should be retained until the student returns to school, recording the number of school days lost in the space provided.
3. When a pupil is still absent at the end of the school year as a result of accidental injuries, the report should then be submitted counting the school days lost to the end of the school year.
4. Please be specific and complete every phase of this report.
5. The completed "Student Injury Report" should be submitted as soon as possible following the accident to—The Industrial Commission of Ohio, Division of Safety and Hygiene, 700 W. Third Avenue, Columbus 12, Ohio.

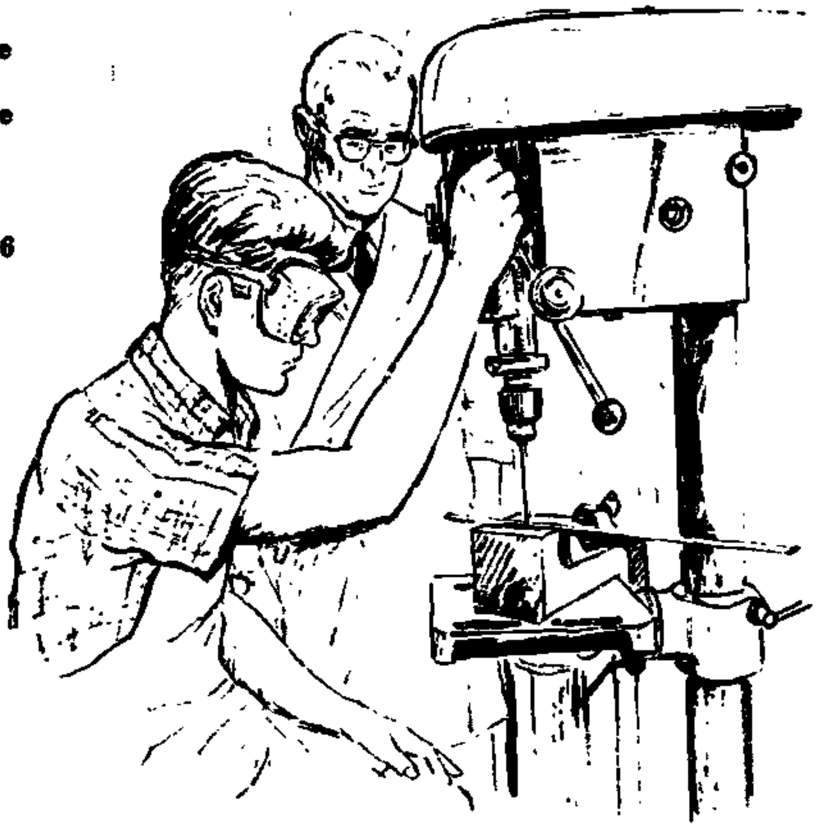
TABLE OF CONTENTS

THE WAY THEY SHOULD GO

"Train up a child in the way he should go and when he is old he will not depart from it."

Proverbs 22:6

by M. Holland Krise, Chairman, The Industrial Commission of Ohio



An Editorial . . .

Ohio's Division of Safety and Hygiene believes that in order to establish an attitude of safety awareness in its people, indoctrination must begin early. The first step in this direction is being taken.

New Shop Safety Program Ready

A new Industrial Arts and Vocational Education Safety Program at the high school level will be ready for distribution to Ohio schools before the fall term. The new program consists of a Manual, with illustrations, covering on-the-job safety in the following areas:

1. Drawing
2. Graphic Arts
3. Wood Shop
4. Industrial Crafts
5. Electricity and Electronics
6. Automotive
7. *Metals*:
    - Welding & Forge
    - Sheet Metal
    - Machine Shop
    - Foundry
8. General Safety

Some 3,000 teachers and instructors concerned with the above courses will be furnished the program.

Appropriate Wall Posters Supplement Manual

A series of six attractive shop wall posters has been designed to provide constant safety reminders related to information in the manual. The colored posters are done in a style to appeal to students.

Safety Carry-Over To Industry Is Goal

Not only is the program designed to provide an immediate benefit but also to carry safety awareness over to industry later.

Students will know, right from their first jobs, if safe practices are being followed, if proper guarding and personal protective equipment are provided and if there is adequate fire safety. Further, the job of safety orientation for new employes will be lighter on the employer.

How the Program Was Created

In past years the Division of Safety and Hygiene conducted a shop safety poster contest for schools but it was felt that, while certain benefits were derived, there was not sufficient continuity nor solid safety information being distributed in an effective and organized manner. In view of this, a Committee composed of some 25 instructors from over the state, members of the Division of Safety and Hygiene and Ohio Department of Education was formed to develop, write and produce an effective, continuing program.

Ohio's Program Is First In the Nation

The results of the work of this Committee have made Ohio's school shop safety program unique and first of its type in the nation. It will be furnished to schools in Ohio without charge.

The Division's next step is to develop similar effective programs for all educational levels.

LET US TRAIN THEM IN THE WAY THEY SHOULD GO!

For further information contact:

Division of Safety and Hygiene
700 West Third Avenue
Columbus, Ohio 43212

You wipe the perspiration from your forehead, shield your eyes from the blinding sun and take a long soothing swallow of tangy, iced soda pop. You stare through the store window at a beautiful body. A gleaming red and white beverage truck pulls in and a uniformed driver starts unloading more cases of pop. You inquire where the body beautiful is from—Timmons Metal Products Co.—Timpco—845 Harrisburg Pike in Columbus.

You get permission, and start to enter the plant. A gray-haired man wearing glasses stops you, points to a white, red-lettered sign on the plant entrance door and hands you a pair of safety glasses. The sign reads: DON'T FORGET SAFETY GLASSES.

Inside there is a flurry of activity—truck beds and huge metal bars being hoisted, grinding of metal, spewing of blow torches and foremen giving instructions above the din. You smell burning metal and welding fumes. You watch them take drab sheet metal and transform it into a beverage truck body that is a work of art.

"Tremendous" Accident Rate Cut "65%" in 13 Months

The thing that impresses you most—next to this incredible transformation—is the amazing number of workers who are wearing eye protection. "Do all these men have bad eyes?" you ask a blond young foreman. "No, most of them are wearing safety glasses, prescription safety glasses, or glasses with snap-on safety lenses."

Administrative Assistant E. W. Burwell says: "From March 1, 1965, when we started our Safety Program, to the end of March, 1966 we reduced our accident rate more than 65 per cent. We had the necessary guards on machines and other equipment, but we were having a tremendous amount of eye injuries—flash burns from welding; getting pieces of slag in the eye, or steel from the grinding-down operation, etc.

"Our president, Mr. K. K. Timmons, one of the founders who started the business about 20 years ago, is a humanitarian. He feels that when a man is hurt it affects the whole family; he's very much behind our Safety Program."

Issuing Eye Protection A Big Step In Stairway to Safety

"So we issued eye protection, free of charge," Mr. Burwell continues, "to all employes who needed it—safety glasses, special goggles, etc. And we insisted that they wear the eye protection, not only on the job, but when they went near other work areas in the plant."

You want to know how they got such good cooperation from the employes.

"We told our foremen or lead men it was their responsibility to see that their men wore eye protection, and that other safety conditions were met.

In well lighted area, cutoff saw operator A. Dempsey holds metal bar securely by pressing pedal with his foot—pedal is attached to one end of heavy chain; the other end of chain is securely fastened, and hooked over metal bar he is cutting. Cutoff saw is well guarded; Dempsey is wearing prescription safety glasses, plastic face shield, gauze mask and protective gloves and apron. Sign in upper left corner reads: "NO ONE PERMITTED TO USE TNIS MACHINE UNLESS SO DESIGNATED."

W. Booker, wearing coveralls with upturned collar, gauze mask, safety glasses and head covering, undercoats beverage-truck body, a Timpco product.

The plant displays many safety signs and slogans. Here is one example.

Fred Blackburn, wearing safety glasses, uses remote-controlled cable hoist to move stacks of sheet metal.

Paint-storage building is kept locked when not in use, and is a "NO SMOKING AREA," as indicated by red-and-white sign above door.

"The Union was more than willing to cooperate in our Safety Program," Burwell says. "We met monthly with a Union Safety Committee.

"We have our men work in teams, not alone."

Getting Some Employes To Work Safely Requires Pressure, Work on Emotions

Burwell explains that the same people were having accidents; that when an employe had two accidents "we would have our plant superintendent write to the foreman to watch the employe—also to say to the man, 'Look, you've got to be more careful; you don't want your family to suffer because you lose an eye, or both eyes.'

"We also advised the Union to watch him. The Union Stewards would say to him, 'You be careful, because the fellow working next to you might get hurt.'

"And we saw that the man who worked with him told him, 'I want you to be careful, because I don't want anything to happen to me.' "

Burwell says Timpco's Safety Program "represented a concentrated effort—every day we concentrated on it . . . and we're still pushing constantly."

Timpco insisted that ALL accidents be reported, and that accident reports be filled out completely. The company found out *why* and *how* the accidents occurred, and took measures to prevent similar occurrences.

"We had to watch our men carefully," says Burwell, "because they did not want to report a slight scratch on the hand, for example."

New Employes Need Training In ABC's of Safety

Burwell brings up another safety problem: "Our personnel has increased about 100 per cent—we have some 246 employes now—but the new employes are the ones we have to worry about.

"We use the Division of Safety and Hygiene's safety programs and signs, also the Kelly Reed Program; we plastered the place with safety signs and slogans."

Regarding fire safety Burwell says, "We haven't had any fires but we're ready for them. We watch constantly that things which cause fires don't develop."

Employes Rewarded For Accident-Free Work

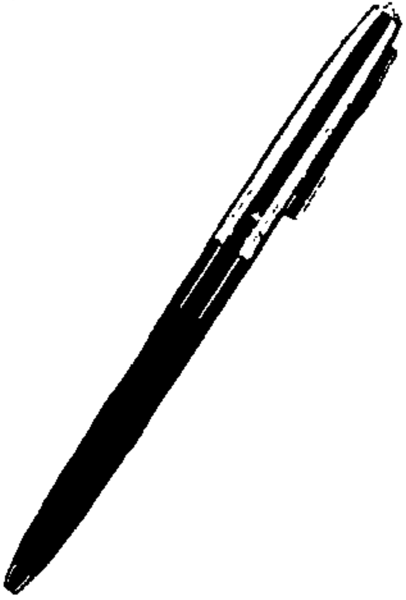
In an effort to keep employes constantly aware of safety, and to help motivate them safety-wise, Timpco started a Safety Award Program. Some of the employes wear eye-catching, half-dollar size green, white and silver "SAFETY AWARD" badges—with a white cross in the center; several have attractive gold and maroon "SAFETY AWARD" pens.

(Continued on next page)

Acetylene cylinders and oxygen cylinders are chained to wall.

Oxygen and acetylene tanks are capped and stored outside the building, chained to the wall; full tanks are kept separated from empties.

When employes at Timpco see something that can cause accidents, they correct it immediately. Here Harold Seymour cleans up paint that has just been spilled—so no one will slip and fall.



Gold-engraved, maroon and gold ball-point pens were given to employes who worked for one year, from the time the Safety Program was started, without an accident.

Employes who worked six consecutive accident-free months received green, white and silver badges like this one—safety awards that they would be proud to wear at work.

At Timpco's First Annual Safety Award Dinner, "SAFETY AWARD" pens are presented to oldest employes, from point of service; they have worked there for a combined total of more than 80 years. The pens are awarded for having worked one year without an accident—from March 1, 1965 to March 1, 1966. Plant Superintendent Carl Helmbrecht (second from left), is presenting the awards. From left to right are Bob Stump, Sup't Helmbrecht, Ray Harris, Dick Mathews and Bill Timmons.

(Continued from page 5)

Also at Safety Award Dinner, K. K. Timmons, Timpco President (extreme right), has just presented "SAFETY AWARD" pens to some of the other employes who have worked the previous year without an accident. From left to right: Odas Nelson, Herman Westfall, Ben Sparks, Carl Smith and President Timmons.

Any employe who worked six months without having a reportable accident received one of the safety-award badges; if he worked safely for one year he was awarded the gold-engraved ball-point pen.

Employes who worked one year accident-free were also treated to a buffet dinner—they could bring their wives. Fine door prizes were given.

Timpco plans to reward safe-working employes with even nicer gifts, and more buffet dinners in the future.

Now the only thing the rapidly growing plant needs is space, Burwell says, and a new plant is going to be built.

Quick Action Prevents Accidents

On your tour of the plant with Personnel Manager Irvin Taylor, you freeze in your tracks, in spite of the heat. A man is bent over a lake of blood-red liquid on the floor. What a terrible accident! you think. But as you approach you see him mopping up just-spilled red paint with a rag, so no one will slip and fall.

One of the many safety signs in the plant is illustrated, and reads "FUNNY? JOKES THAT CAN INJURE OTHERS ARE NO JOKE."

Another—a green, black and white pictorial sign on machine guarding: "ON GUARD—MEANS SAFETY"; still another shows how to "LIFT SAFELY."

Mr. Taylor points out guards on machinery, and workers wearing various types of personal protective equipment. "Now, everyone is pretty conscientious about our Safety Program," he says. "Nobody wants to get hurt.

"When a machine breaks down we put a ('DO NOT USE') red tag on it; nobody uses it until it is repaired, OKd and the red tag removed.

"Also, for safety, our chain hoists are inspected at least twice a week by the Maintenance Department."

If Someone Stops Breathing . . .

Just inside the plant entrance door, in a closed container is a Brook Airway "for use in emergency mouth-to-mouth resuscitation without mouth-to-mouth contact—on victims over four years of age." Taylor explains that the airway is for use in cases of "stoppage of breath due to heart attacks, shock, etc.," and that Timpco has six of these airways in the plant. Civil Defense left them for the plant after giving a three-day resuscitation course to three foremen and nine safety men at Timpco—using a "Resusci-Anne" manikin. Those who took the course were "all enthused" about it; it might enable them to save lives, maybe the lives of their children.

Another Beautiful Body

"Our project engineers design Timpco products from the ground up," says Taylor. "Very low chassis go through here—low for driver comfort and safety—and to facilitate loading and unloading; the driver does not have to climb up so high or down so far."

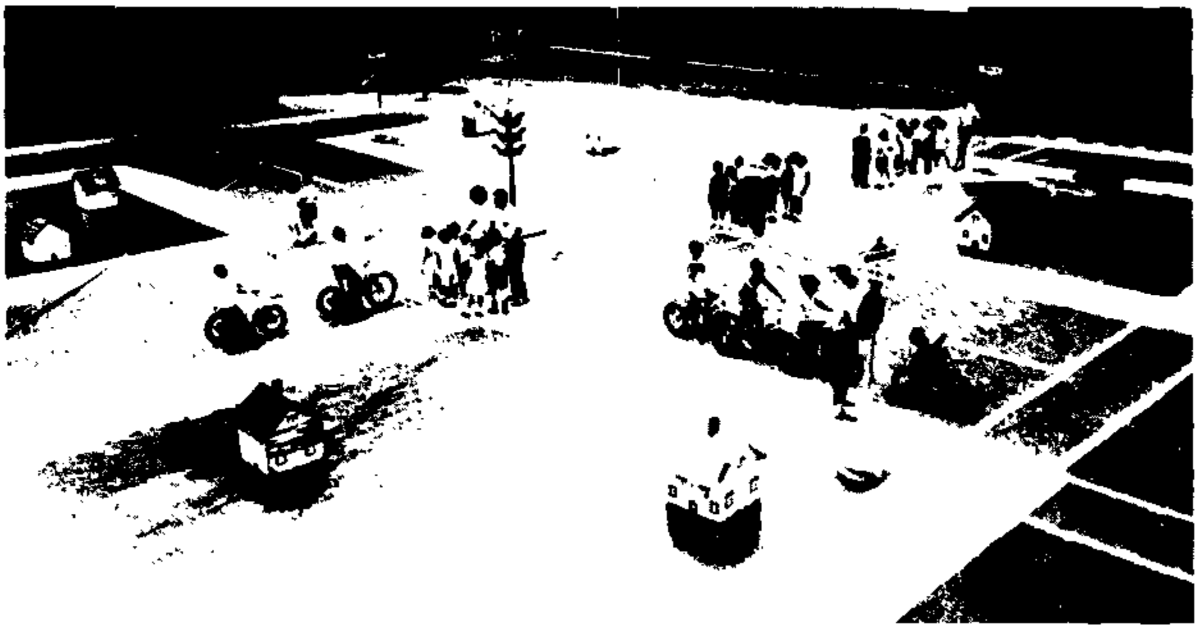
Once more you admire a long, low, shiny fire-engine red beverage truck body with yellow wheels—thankful that Timpco workers are able to create such beauty in safety.

You leave the burning-torch artists and walk once more under the blazing sun to the grocery store. As you drink another bottle of bubbly ice soda pop, a long wolf whistle comes from the young clerk. You look out the window and see . . . another beaooooh! tiful body!

A.S.S.E. CONFERENCE SET

The American Society of Safety Engineers will hold its 5th Annual Conference Monday, Oct. 24 at the Sheraton-Chicago Hotel, Chicago, Ill. The Society's Annual Meeting and Awards Luncheon will also be held on the same day in the Sheraton-Chicago Hotel. For details write to A. C. Blackman, Managing Director, American Society of Safety Engineers, 5 N. Wabash Ave., Chicago, Ill. 60602.

TINY DRIVERS AND WALKERS IN 'SAFETY TOWN' WILL HELP CUT TRAFFIC ACCIDENT TRAGEDIES



In Mansfield's "Safety Town," some prospective first-graders learn traffic safety as they ride tricycles—simulating motor vehicles—through a miniature town; other tots are taught pedestrian safety. Mansfield started "Safety Town" in 1937, and has helped other cities and towns start similar projects.

In the never-ending attack to cut traffic-accident tragedies, a different approach to traffic safety must be used with pre-school and kindergarten children—an approach that is both didactic and demonstrative, to bring full dramatic focus on the young mind.

Ingenuity in its citizens, its police department and its schools has placed Mansfield in the forefront in the nation, in providing a tangible plan to meet the particular approach and needs of these younger children. It is called "Safety Town."

Traveling to and from school is a big part of a child's school day. It is therefore essential for children to learn safety rules *before* they attend school.

"Just as the twig is bent, the tree's inclined" (Pope, in "Moral Essays") . . . this quotation could be said to be the theme and basis for "Safety Town." It is set up to teach or school prospective first graders in traffic safety and safety in general. The school authorities, health department and the city police department cooperate in the project, with the Police Traffic Department operating the school.

With the officers in uniform, the children soon learn that a policeman is their friend and guardian.

The school creates interest and imparts safety knowledge and training that will be valuable to the children for a good while to come. It is basic training that comes when the recipient is eager, alert, learns fast and retains what has been taught. Also, he has not acquired habits that must be corrected.

Taken from

A Guide for a Program to Meet the Needs of Traffic Safety for Ohio's Younger Children . . .

Advanced by Ohio Department of Highway Safety

James A. Rhodes — *Governor*
Warren C. Nelson — *Director*

History of "Safety Town"

"Safety Town" was founded in 1937 in Mansfield by Frend Boals, the first mounted traffic police officer there, and has been operated every summer since. It is now an established function of the city and its government. It is still open for improvement suggestions. It is amply financed by grants from city funds, Police Recreation Club donations and other sources.

Officer Thomas C. Hempfield, of the Mansfield Police Department, was in charge of "Safety Town" there for the 15 years prior to his retirement in 1965. Captain James J. Goldsmith has been in charge since last December.

Captain Goldsmith says that "Safety Town" has definitely contributed to the reduction of traffic accidents involving Mansfield's school children.

Dedication and Credits

Citizens of Mansfield say: "We are proud of and grateful for our 'Safety Town.' We have helped others in starting ones in their communities, and are only sorry that more towns and cities don't have them. We want only to share."

Warren C. Nelson, Director of the Ohio Department of Highway Safety, says: "Our state, this Department . . . all citizens of 'This Wonderful World of Ohio' are proud of this pioneering and pace-setting program of Mansfield and its agencies and leaders, who have helped develop 'Safety Town.' We are therefore proud to have a part in disseminating information of this vital traffic safety program through this preparation.

"So, to the citizens of Mansfield, to other 'Safety Town' cities in Ohio, to all little children everywhere . . . our state and Department dedicate this preparation as a guide to 'Safety Towns' in all of our communities.

"For information and material about Mansfield's 'Safety Town,'" Director Nelson continues, "we are indebted to Frend Boals and Thomas C. Hempfield and the city's Police Department; to the Honorable Paul Bush, its Mayor; and particularly to George H. Calhoun, Retired Field Representative of The Industrial Commission of Ohio's Division of Safety and Hygiene, member of national Veterans of Safety, and an indefatigable worker for a vital public cause."

Suggestions for Successful "Safety Town"

Since "Safety Town" is usually operated on school and public playgrounds during the summer, schools

(Continued on page 14)

STUDENTS WORKING IN SCHOOL
AND SAFER IN INDUSTRY LATE

Ohio schools will have a new, effective Industrial Arts and Vocational Education Safety Program at the high-school level, starting this fall.

Last October 22 a Committee—consisting of Ohio teachers, and members of the Ohio Department of Education and the Division of Safety and Hygiene—met in Columbus to start work on this Safety Program. The material illustrated here is the result of their combined efforts. Most of the members of that Committee are pictured above. Present for the meeting were:

Edgar Hare—State Department of Education, Columbus; Ray Mangus and Howard C. Ater—Chillicothe High School; .Frank Darling—Mt. Logan Junior High, Chillicothe.

Stan Spring—Circleville High School; Glenn Botdorf—Bedford Senior High School; George Swindell and Eugene P. Rannigan—Canton Public Schools; Dorwin J. Laessle—Sandusky Public Schools; Robert Poling—Lancaster Public Schools; John C. Vair and Robert A. Banzhaf—Kettering Fairmont East High, Kettering; Wallace Barry—South High School, Akron; Jerry M. Froebe—Kenmore High School, Akron.

James Reynolds—Dayton Public Schools; Ted Wiley—Paul Laurence Dunbar High, Dayton; Joseph Sposato—West Junior High School, Youngstown; Dennis Zinz—Volney Rogers Junior High, Youngstown; William Jas. Burns—Toledo Bowsher High School, Toledo. The following members from the Division of Safety and Hygiene are also in the picture: William S. Coulter and Arthur W. Moon.

The purpose of the Safety Program is two-fold in that it is designed to aid in instructing students in on-the-job safety and thus protect them while they are learning, and to create and instill an awareness and concern for safety that will carry over into industry later on.

The Safety Program will consist of an illustrated Manual covering safety on-the-job in the following areas—those who prepared the different sections are also listed:

(1) DRAWING
Frank Darling and Joseph Sposato
(2) GRAPHIC ARTS
Robert Banzhaf, George Swindell and Eugene Rannigan
(3) WOOD SHOP
Wallace Barry and Jerry Froebe
(4) INDUSTRIAL CRAFTS
Glenn Botdorf and Howard Ater
(5) ELECTRICITY and ELECTRONICS
William Burns, John Vair and Ray Mangus
(6) AUTOMOTIVE
William Harsh of Hilliard, and Stan Spring
(7) METALS
Welding & Forge, Robert Poling
Sheet Metal, Dennis Zinz
Machine Shop, Ted Wiley
Foundry, Dorwin Laessle
(8) GENERAL SAFETY
James Reynolds

A series of six colorful, eye-catching shop safety posters, pertaining to material in the Manual, will also be distributed to all Industrial Arts and Vocational Education teachers in Ohio.

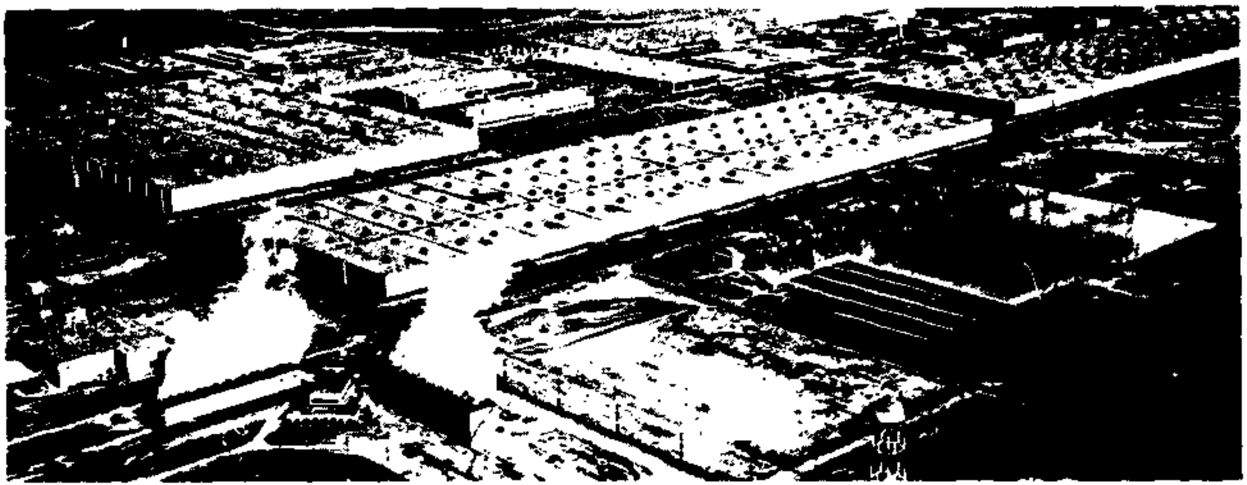
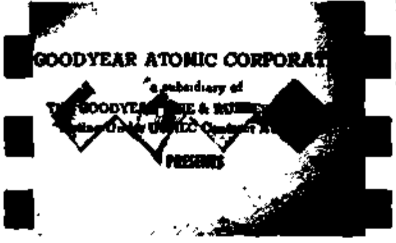
GOODYEAR ATOMIC WAR ON ACCIDENTS CAPTAINED BY COMPANY-UNION SAFETY REVIEW COMMITTEE

The following narrated sound-slide presentation, developed for Goodyear Atomic Corp. employes, may serve as a guide for your business.



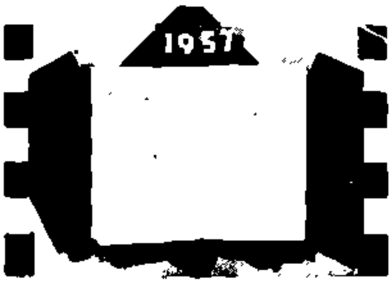
AERIAL VIEW OF GOODYEAR ATOMIC CORPORATION'S PLANT AT PIKETON



(5 SECONDS OF MUSIC)

THIS PROGRAM HAS BEEN DEVELOPED TO REMIND YOU OF A UNIQUE UNION-MANAGEMENT AGREEMENT—WHICH AT THE TIME OF ITS CONCEPTION REPRESENTED ONE OF THE FIRST ATTEMPTS OF UNION AND MANAGEMENT IN AN ATOMIC ENERGY COMMISSION-OWNED CONTRACTOR-OPERATED PLANT WORKING TOGETHER COLLECTIVELY IN THE AREA OF SAFETY—WITH THE PRIMARY GOAL OF MAKING THIS AN ACCIDENT-FREE PLANT.

WE AT GOODYEAR ATOMIC FEEL THAT THE CREATION OF THE "SAFETY REVIEW COMMITTEE" INAUGURATED A PROGRAM WHICH MAY ONE DAY BECOME COMMONPLACE IN INDUSTRY—ONE WHICH WILL FURTHER THE ALL IMPORTANT GOAL OF REDUCING INDUSTRIAL ACCIDENTS TO A MINIMUM.

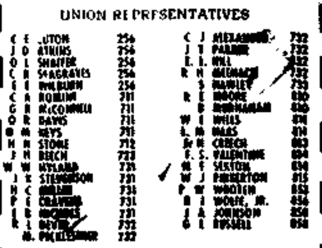


IN 1957—NINE YEARS AGO—IN THE AGREEMENT BETWEEN GOODYEAR ATOMIC CORPORATION AND THE OIL, CHEMICAL AND ATOMIC WORKERS UNION, PROVISIONS WERE MADE FOR A JOINT SAFETY REVIEW COMMITTEE, UNDER ARTICLE XIV, SECTION 4, WHICH READS AS FOLLOWS:

"... A SAFETY REVIEW COMMITTEE SHALL BE ESTABLISHED CONSISTING OF SEVEN (7) MEMBERS: THREE (3) MEMBERS TO BE SELECTED BY THE COMPANY, THREE (3) TO BE SELECTED BY THE UNION FROM THE FIVE SHIFT SAFETY REPRESENTATIVES (WITH THE REMAINING TWO ACTING AS ALTERNATES), AND A NON-VOTING CHAIRMAN TO BE SELECTED BY THE COMPANY ..."

AS A RESULT, C. L. STEWART, SUPERINTENDENT OF THE SAFETY AND FIRE PROTECTION SUBDIVISION, WAS DESIGNATED BY THE COMPANY TO SERVE AS THE NON-VOTING CHAIRMAN. THE UNION PRESIDENT APPOINTED REPRESENTATIVES FROM A, B, C, D and O SHIFTS—R. L. DEVER AND W. W. HYLAND REPRESENTING THE 700 DIVISION; R. E. MOORE AND P. W. WOOTEN REPRESENTING THE 800 DIVISION; AND C. E. EUTON FROM THE 200 DIVISION. REPRESENTATIVES APPOINTED BY THE COMPANY WERE C. L. JENKINS OF THE 400 DIVISION; W. F. CULP OF THE 700 DIVISION; AND J. B. MITCHELSON OF THE 800 DIVISION.

THE FIRST MEETING WAS HELD ON OCTOBER 18, 1957 IN THE OLD TRAINING BUILDING. A TENTATIVE SCHEDULE OF MEETING DATES WAS SET TO AFFORD SHIFT SAFETY REPRESENTATIVES EQUAL OPPORTUNITY TO ATTEND MEETINGS WHEN THEIR SHIFT WORKED DAYS.



UNION REPRESENTATIVES

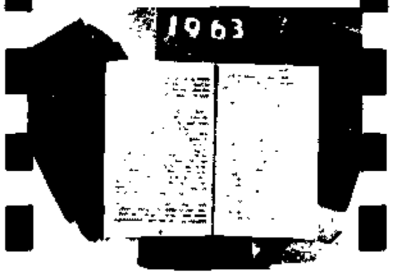
[illegible]	731		

COMPANY MEMBERS



THE 1963 AGREEMENT ALTERED THE COMPOSITION OF THE COMMITTEE'S REPRESENTATION. ARTICLE XIV, SECTION 4 WAS CHANGED TO READ AS FOLLOWS:

"... A SAFETY REVIEW COMMITTEE SHALL BE ESTABLISHED CONSISTING OF SIX (6) MEMBERS: THREE (3) MEMBERS TO BE SELECTED BY THE COMPANY, THREE (3) TO BE SELECTED BY THE UNION FROM THE FIVE SHIFT SAFETY REPRESENTATIVES (WITH THE REMAINING TWO ACTING AS ALTERNATES) . . ."

CURRENT UNION REPRESENTATIVES ARE JIM FOSTER OF THE 200 DIVISION; BILL FARLEY, BUCK MILLER AND EDGAR NICHOLS OF THE 700 DIVISION; AND HUGH BURNETT OF THE 800 DIVISION. REPRESENTING SUPERVISION ON THE PRESENT SAFETY REVIEW COMMITTEE ARE: CLYDE FRENCH OF THE 200 DIVISION; JERRY ALTHOUSE OF THE 700 DIVISION; AND BOB ZEEK OF THE 800 DIVISION.

MEETINGS ARE SCHEDULED TO BE HELD MONTHLY. THE ONLY TIME A MONTHLY MEETING IS NOT HELD AS SCHEDULED IS WHEN NEW MEMBERS ARE BEING TRAINED, SUCH AS IS SHOWN HERE. EACH NEW SHIFT SAFETY REPRESENTATIVE APPOINTED TO THE COMMITTEE IS GIVEN BRIEF TRAINING BY THE SAFETY DEPARTMENT, BY FIRE PROTECTION, AND BY THE INDUSTRIAL HYGIENE AND HEALTH PHYSICS DEPARTMENT. THESE TRAINING SESSIONS ARE INFORMAL AND AFFORD NEW MEMBERS OF THE COMMITTEE THE OPPORTUNITY TO ASK QUESTIONS AND OFFER SUGGESTIONS. THE FIVE PRESENT MEMBERS HAVE RECENTLY RECEIVED TRAINING.

1957-1965 MEMBERS

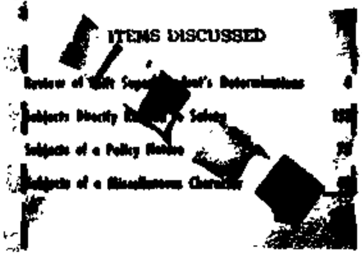
UNION		SUPERVISION
200- 5		200- 3
700- 18		400- 4
800- 12		700- 6
		800- 8
35	Total 56	21

SINCE 1957—56 EMPLOYES HAVE SERVED ON THE COMMITTEE EITHER AS REGULAR OR ALTERNATE MEMBERS —35 AS SHIFT SAFETY REPRESENTATIVES AND 21 MEMBERS OF SUPERVISION.

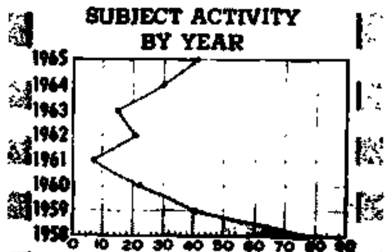
GENERALLY—SUBJECTS, PROBLEMS, OR INCIDENTS WHICH ARE PRESENTED FOR DISCUSSION BY THE COMMITTEE FALL INTO TWO CATEGORIES—THE REVIEW OF SAFETY RELATED DECISIONS, AND SAFETY RELATED OBSERVATIONS OF COMMITTEE MEMBERS OF REFERRED INCIDENTS OR OBSERVATIONS BY EMPLOYES.

(Continued on next page)

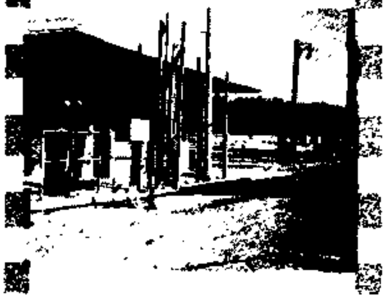
(Continued from page 11)



TO DATE, THE COMMITTEE HAS DISCUSSED AND ATTEMPTED TO RESOLVE 273 QUESTIONS, PROBLEMS, AND/OR INCIDENTS PRESENTED IN REGULAR MEETINGS. THESE QUESTIONS, PROBLEMS, ETC., INVOLVED THE FOLLOWING: (a) REVIEW OF SHIFT SUPERINTENDENT DETERMINATIONS—4; (b) SUBJECTS DIRECTLY RELATED TO SAFETY—153; (c) SUBJECTS OF A POLICY NATURE—73; AND (d) SUBJECTS OF A MISCELLANEOUS CHARACTER—43.

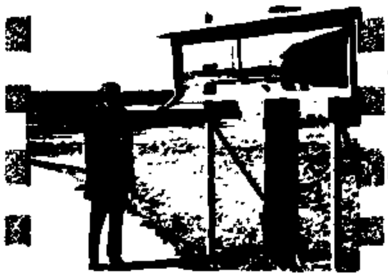


ITEMS DISCUSSED BY THE COMMITTEE THROUGH THE YEARS HAVE FLUCTUATED CONSIDERABLY, WITH THE PEAK YEAR BEING 1958 FOLLOWED BY 1959 AND 1965. WE FEEL THIS GRAPH CLEARLY INDICATES THE ACTIVITY OF THE SAFETY REVIEW COMMITTEE.



THERE ARE MANY, MANY EXAMPLES OF AN INFINITE VARIETY WHICH COULD BE SHOWN TO ILLUSTRATE THE FINE WORK THE SAFETY REVIEW COMMITTEE HAS DONE. A GOOD EXAMPLE IS THE GUARD RAIL INSTALLED AT THE X-108A PORTAL AND VEHICLE ENTRANCE TO SAFEGUARD PEDESTRIANS.

ANOTHER SIGNIFICANT CONTRIBUTION HAS BEEN ADDITIONAL GUARDING OF ROTATING EQUIPMENT IN THE X-600 FACILITY AND THE GUARDING OF THE SHAFT OF THE SLUDGE PUMP AT X-611.

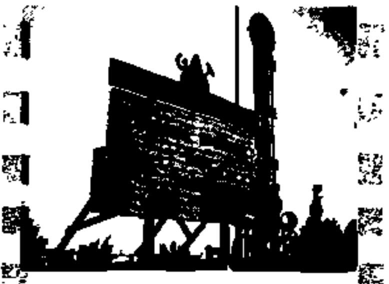


VEHICLE AND TRAFFIC SAFETY REPRESENTS A NATIONAL PROBLEM. THE NORTHWEST CORNER OF X-746 HAD A BLIND SPOT FOR TRAFFIC HEADING NORTH AND SOUTH AROUND THE BUILDING. THIS WAS CORRECTED WITH THE USE OF A MIRROR.

GOOD, SOUND SAFETY PRACTICES NEVER LEAVE ANYTHING TO CHANCE OR LUCK. THEREFORE, THE COMMITTEE FELT IT WISE TO LOWER THE BOOMS OF ALL MOBILE CRANES NOT IN FREQUENT USE.

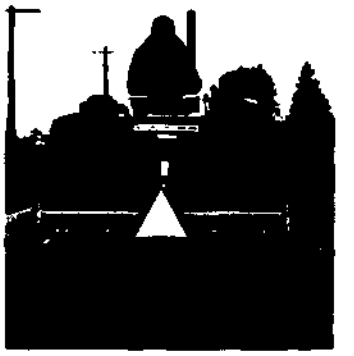
TRAFFIC AGAIN—AFTER THE RESURFACING OF THE 108-A AND 108-B PARKING AREAS, MANY CHANGES WERE MADE. AS A RESULT, THE COMMITTEE'S ATTENTION WAS IMMEDIATELY CALLED TO THE FACT THAT A "STOP HERE ON RED" SIGN WAS NEEDED AT THE INTERSECTION OF THE RAMP AND NORTH EXIT LANES.

WHEN RE-MARKING THE PARKING AREA, THE COMMITTEE ALSO RECOMMENDED AN INCREASE IN THE WIDTH OF PARKING SPACES.



IN THESE PAST YEARS AT GOODYEAR ATOMIC, WE HAVE SEEN MANY ACCOMPLISHMENTS AND MUCH PROGRESS IN ALL AREAS. WE, AT ONE TIME, REPRESENTED THE SAFEST GOODYEAR PLANT WORLD-WIDE. BUT—RECORDS ARE MADE TO BE BROKEN. WE SIMPLY HAVE TO ESTABLISH OTHERS. WE HAVE RISEN TO EVERY OCCASION. THE BLOODMOBILE—WE GIVE MORE BLOOD PER VISIT THAN MOST SURROUNDING CITIES—THE UNITED FUND—YOUR EFFORTS ALWAYS REPRESENT A MAJOR CONTRIBUTION IN YOUR COMMUNITIES. ALL THESE THINGS CAN BE ATTRIBUTED TO BUT ONE THING—THE DESIRE AND WILLINGNESS TO COOPERATE AND WORK TOGETHER. ALL IN ALL—WE FEEL THAT THESE THINGS EXEMPLIFY THE SAFETY REVIEW COMMITTEE.

THIS SMV EMBLEM MAY SAVE YOUR LIFE



New slow-moving vehicle emblem is displayed on this farm tractor and disc to alert motorists approaching from behind. The fluorescent, reflecting triangle can be seen from a great distance, day or night. It was developed and designed at OSU under a grant from the Automotive Safety Foundation.

Motor vehicle (MV)-slow moving vehicle (SMV) collisions are a 'round-the-clock problem. They occur mostly on good, open highways, during daylight, nice weather, and *without* the motorist's view being obstructed. *Rear-end collisions predominate*, and account for most of the fatalities, injuries and property damage. Positive recognition of the SMV by the motorist at a safe distance will reduce the number of such accidents.

The foregoing was taken from "Pertinent Facts Regarding the Slow-Moving Vehicle Emblem" by W. E. Stuckey, Leader, Safety and Emergency Preparedness, Cooperative Extension Service, The Ohio State University and K. A. Harkness, Instructor, Agricultural Engineering, OSU. The bulletin was prepared in cooperation with the U. S. Department of Agriculture, Cooperative Extension Service, Roy M. Kottman, Director.

The bulletin further stated that, to establish an effective and practical means of identifying SMVs, research was conducted by OSU's Department of Agricultural Engineering and the Ohio Agricultural Experiment Station. The project was sponsored by the Automotive Safety Foundation. Research consultants included professional staff of: National Safety Council; Ohio State Highway Patrol; Ohio Bureau of Motor Vehicles; OSU's Institute for Research in Vision, Department of Civil Engineering, Department of Industrial Engineering and Cooperative Extension Service.

The product of this research was a unique, triangular SMV emblem which communicates to motorists the lurking danger through *unique color and shape recognition.*

According to the Ohio Farm & Home Safety Committee, Inc., during daylight, when most of the MV-SMV collisions occur, the bright fluorescent orange of the SMV emblem is the most visible color available; at night the reflective red border of the emblem glows brilliantly in the path of approaching auto headlamps.

The 106th General Assembly of the State of Ohio enacted legislation requiring the use of this SMV emblem. The legislation was effective starting April 1 of this year.

The use of this emblem is restricted to slow moving (25 mph or less) vehicles —farm machinery, other machinery and horse-drawn vehicles—and its use on any other type of vehicle or stationary objects on the highway is prohibited.

As a result of the Ohio research, the Stuckey-Harkness bulletin continues, many adult and youth organizations have "organized SMV safety programs, and are working to gain adoption of the emblem throughout the United States and Canada. Everyone's support is needed. . . .

"Whether we are MV or SMV operators, the (SMV) emblem is an important safety aid which some day, or night, may save our life."

CHILPACO SETS RECORD, SETS SIGHTS ON ANOTHER ALL-TIME SAFETY MARK

When employes of the Chillicothe Paper Co. recently surpassed two million manhours without a lost-time injury, officials of The Mead Corporation offered a new challenge—"Why not break the all-time safety mark for the entire corporation?" That was set several years ago by Mead's Chillicothe Division, some 2,863,186 manhours without a lost-time injury. Holding a sign acknowledging that mark is Chilpaco Operations Manager O. C. Christiansen. He is flanked (left to right) by Corporate Director of Safety Francis Wagner; Area Manager Warren Henricks; Plant Security Manager Ralph Myers; John McHarg and Dale Shoemaker, representatives of the plant Safety Committee. On the table are awards earned by Chillicothe Paper Co. recently, including two from The Industrial Commission of Ohio.

RECORD-SMASHING OHIO SAFETY CONGRESS SET

Here are miniature samples of many of the excellent pictures taken by Division of Safety and Hygiene photographers Don Eddie and Dennis Cherry—at the 36th All-Ohio Safety Congress and Exhibit in Columbus, and published in the June MONITOR.

Some 4,400 people attended the section meetings at this year's bigger-than-ever Safety Congress, sponsored by the Division of Safety and Hygiene.

However, 5,000 are expected at the 37th Annual All-Ohio Safety Congress—to be held next May 2, 3 and 4—at the Sheraton-Columbus Motor Hotel in Columbus.

Also, several new section meetings will be added, the exhibit area will have a new look and will again be jammed to capacity.

Over the past several years the following conferences and sections have been added to the Congress:

Conferences—

All-Ohio Industrial Fire Prevention Conference; Annual Meeting of Ohio Committee for Highway Safety in Cooperation with Ohio Department of Highway Safety.

Sections—

Plastics; Campus Health and Safety; Machine Shop; Printing and Publications; Tree Services; Hospitals.

The outstanding success of the All-Ohio Safety Congress is due to the excellent cooperation between labor, management, trade groups and associations concerned with on-the-job safety.

(Continued from page 7)

and city playground departments are the most likely groups to sponsor the activity. However, other civic organizations might well sponsor it.

"Safety Town" seems to be most suited for children about ages 4-8. Programs are carried on chiefly for children 4½ to 6 years of age.

Since "Safety Town" is usually held out of doors, the weather must be favorable. Aside from that, the activity can be carried on during any period of the year. Class periods should be short.

The space used should be away from traffic. The ground must be hard and smooth. School playgrounds are the most satisfactory. The setup might also be laid out on a gymnasium floor during inclement weather.

Staff

At Mansfield's "Safety Town" two supervisors are needed. A patrolman is responsible for the transportation, equipment and teaching on "Safety Town." A second supervisor, with teacher training, is needed to work with the teachers.

A classroom teacher is needed for every 30 children.

"Safety Town" personnel, who should be young, are trained by the patrolman in charge.

Layout

Mansfield's "Safety Town" layout includes grass plots, sidewalks, streets, together with the standard method of marking crosswalks, intersections and traffic lanes. A standard traffic light, at the main center intersection, operates in the proper sequence. Miniature buildings are placed at various spots to provide a realistic appearance. This is laid out to represent a segment of a modern city's streets and associated traffic pattern.

Sample Schedule

Mansfield's training program includes the use of tricycles simulating motor vehicles, pedestrian training and other traffic safety measures.

1:30 p.m. Group A outside on "Safety Town." Part of the children on "Safety Town" while the teacher has the rest of the group playing games. Group B inside the building has roll call, safety lesson, safety songs, art work and a story period.

2:30 p.m. Group B outside
Group A inside

On rainy days the lesson must be emphasized since there is no practical application of that day's work on "Safety Town." Quiet games, stories, drama and finger plays replace outside activities unless you have access to an activity room or gym.

Safety talk given by police officer on week of graduation.

Objectives

Children are taught how to behave as pedestrians and as drivers; they are taught the basic attitudes toward living and working with people and caring for things. These attitudes are important in helping them later when they are taught to drive.

For realism, cars must be brought into the picture in the same manner traffic is found on city streets.

One group of children can take the part of motorists to drive the cars or tricycles back and forth between intersections. The rest of the group remain on the sidewalks and act out the part of pedestrians in crossing the streets at the proper time.

What They Should Learn

Before any of the acting takes place it is desirable to discuss with the children the proper way to cross the street, the meaning of signs, signals, and certain courteous habits which should be formed by drivers and pedestrians. A discussion of these points should cover completely the following:

- The meaning of the red, amber and green in a traffic signal and what drivers and pedestrians should do when they see these signals. Illustrate with lights or colored cardboard.
- Drivers should stop before they get to the crosswalk.
- Drivers should always yield the right-of-way to the pedestrian. Even when the pedestrian is going against the red light, the driver should be careful not to hit him.
- Pedestrians, when waiting for cars to go by, should wait on the curb.
- Pedestrians should cross only in the crosswalk.
- Pedestrians should watch for cars in both directions when crossing.
- Children operating cars as drivers should stop for a red or caution light back of the crosswalk.
- Children as drivers making turns on green should wait for pedestrians to cross.
- Children as drivers making turns or stopping should give proper hand signals.

The more realistic the adventure is made, the greater will be the interest of the children and the more likely they are to learn.

Awards and punishment may be used to a certain extent. Those who follow best the traffic rules taught should be permitted to operate the toy cars. Those who are driving cars and violate any of the rules should have the privilege of driving taken away from them while other children who have been pedestrians should then be allowed to drive.

When tricycles or cars tangle, teachers should point out why they upset and explain how other people have rights and each driver must be aware of them. Instilling in the children that they must be responsible for their own actions is one of the most important principles of "Safety Town."

Children can be taught at "Safety Town" to play out the rules they should have been taught at home about riding in the family car. They should be taught to respect a parent who must have complete freedom to handle the car and who should not have to be preoccupied with disciplining children. Children can be taught how to play the old game of "I See." And they should always be strapped into seat belts or harnesses.

Equipment Necessary

Much of the instruction can be given by means of a few lines on the ground and some wheel toys brought by the children from home. A lack of money need not hinder the putting on of a very effective program. If toy cars are to be used, at least six or eight should be obtained.

About half-size replicas of standard street and highway signs should be used.

The children should be taught the meaning of each sign and they should act out situations which would show that they know what the various signs mean.

It is important to have a traffic signal. The complete signal cycle should be shortened to about 30 seconds. If an electrical traffic light cannot be obtained or made, a square cardboard box, two opposite sides of which are painted red and the other two green, can be mounted on a 4-foot stick. A traffic light can be simulated by having a person stand and hold the box, turning it a quarter of a turn about every 15 seconds.

Stage settings which represent buildings and store fronts add realism to the setting.

GRADUATION DAY
Parents of "Safety Town" Children Invited

1. The classroom supervisor gives a brief talk on the origin and purposes of "Safety Town."
2. Under the direction of their teachers the children give the safety rules and sing safety songs. The art work is displayed in the classroom.
3. Introduction of the staff.
4. Certificates of attendance are presented by a member of the Police Department.
5. A demonstration on "Safety Town" of the children riding and walking.

QUESTION & ANSWER

Division of Safety and Hygiene
Gentlemen:

Under your Bulletin No. 202 for "Specific Safety Requirements Relating to Building and Construction Work," dated Jan. 2, 1953, Section 331, I am inquiring whether a portable step ladder with two sections used in painting a house and placed upon a concrete base requires safety shoes surfaced with cork, etc., material with equivalent friction.

The "Exception" is step ladders.

I would be pleased to be informed as to this particular ladder. Awaiting the courtesy of your response, I am

very truly yours,
Oscar B. Scherrer

Dear Mr. Scherrer:

This is in reply to your letter regarding step ladders, and referring to the requirements of State of Ohio Bulletin No. 202: "Specific Safety Requirements Relating to Building and Construction Work," Section 331, on portable step ladders. I presume you have reference to the standard step ladder as mentioned in our Section 332.

Section 332 states that "All ladders with spreading bases such as step and trestle ladders shall be equipped with spreaders to hold bases rigid when in open position." If such is the case, then it is not a requirement that they be equipped with safety shoes as per Section 331.

The stability of a step ladder which would be used on a concrete base, as you state, will depend upon the operating mechanism and the tightness of these points rather than safety shoes. However, if a step ladder would be used on soft ground, then safety shoes would distribute the load on the ground a bit better and would not be so apt to tip in the direction of a soft spot in the ground. This is merely an opinion and is not a requirement. It is just plain common sense.

Yours very truly,
John F. Ridenour, Chief
Engineering and Hygiene

HOME TRAINING, SCHOOL SAFETY PATROL CAN REDUCE DANGER TO CHILD FOR LIFE

by Warren C. Nelson, Director,
Ohio Dep't of Highway Safety

Safety education is the best "preventive medicine" against your child having an accident. Safety isn't "inborn"; it must be taught.

The trip to and from school is a big part of a child's school day. It can be dangerous if the child has not received proper instruction in safety practices.

Parents have the responsibility to teach their children basic safety practices *before* they begin school. Crossing properly at intersections, obeying signals and police officers and being orderly are important—for your child's safety and your own peace of mind.

The School Safety Patrol, sponsored by the American Automobile Association since 1922, provides an invaluable service to your community. Patrol members make travel to and from school safer for your child. At the same time, they remind schoolmates of safe walking rules by constantly setting good examples. The rules of safe walking are formed and become automatic for the other school children.

In many communities, our State Highway Patrolmen assist in the formation and training of School Safety Patrol members. The prestige of being selected a Patrol member encourages children to know and practice pedestrian safety.

The School Safety Patrol benefits not only the child and school but also every person in the community. Studies show that traffic accidents involving children ages 5-14 decrease where there is a School Safety Patrol in operation.

Encourage your child to follow the example set by Patrol members. The lessons he learns will last a lifetime.

PERSONALITY PROFILE

Wilfred L. Wilson

Wilfred Wilson of Columbus is a Division of Safety and Hygiene Representative on Schools and Villages for 25 counties in southern and north-central Ohio.

Wilfred was educated in the Smithfield public schools. He was an outstanding football player at Steubenville High School.

After graduating from the Curtis-Wright Training Program in Labor and Industrial and Public Relations in Aircraft, Wilfred was promoted to Foreman and remained for a period of six years. He supervised instructions for employes in the various phases of Aircraft Assembly from start to completion involving many departments of the plant.

A congenial fellow with a strong interest in human relations, Wilfred joined the Division in 1951—to assist Industrial Arts Instructors in Pupil Safety.

He has two daughters and 12 grandchildren. He enjoys athletics and sports, particularly football and baseball.

Farm Business Management, A Sample Procedure for Organizing
Course Outlines.

Fuller, Gerald R.
Illinois Univ., Urbana. Div. of Agricultural Education
Pub Date - Jul63
MF AVAILABLE IN VT-ERIC SET 23p.

*FARM MANAGEMENT, *CURRICULUM GUIDES, *CURRICULUM PLANNING,
*VOCATIONAL AGRICULTURE, INSERVICE TEACHER EDUCATION,

The purpose of this material is to stimulate thinking in inservice teacher education courses, and to illustrate one way in which the subject area could be organized. It was developed by a teacher educator for use in a 3-day course for 10 vocational agriculture teachers. Guiding principles in organizing a course emphasize good objectives, teaching procedures, and learning experiences. The degree of emphasis placed on farm business management instruction in the total vocational agriculture program increases from beginning to advanced groups. Emphasis changes from the individual farming program to the total farm business. The organizational approach is related to the financial aspects and profit motive of farming. The sample 4-year course outline is arranged by years, and the units or problem areas include management abilities, resource inventory, efficiency measurement, data gathering, business analysis, business inventory, accounts, account summarization, alternative income possibilities, credit, success measurement, budgeting, property transfer, and insurance. A sample outline for adult farmer classes covers similar material more briefly. (JM)

FOREWORD

The author prepared this material for use in a three-day course on farm business management conducted at the University of Illinois for ten teachers of vocational agriculture. Each of these teachers then conducted a similar one-day course which was attended by teachers of vocational agriculture in Illinois. This material was presented as a sample procedure for organizing course outlines in the area of farm business management. The main purposes of this material were to: (1) stimulate thinking and (2) provide a guide which illustrated one of the many possible ways in which farm business management instruction could be organized.

TABLE OF CONTENTS

FARM BUSINESS MANAGEMENT

A SAMPLE PROCEDURE FOR ORGANIZING COURSE OUTLINES

INTRODUCTION

The need for systematic instruction in farm business management is greater today than it has ever been. The farmer, off-farm agricultural worker, and agricultural leader of the future must know more than just how to raise livestock, grow crops, or operate and maintain farm machinery. These people must also know how such technical knowledge and ability can be organized for the most efficient operation of a farm business. As you look at farmers today, it is often possible to identify several individuals who possess about the same amount of technical "know how," but the farmer who is best able to understand and apply sound farm business management decisions is the most successful farmer.

This sample procedure is presented as a guide and should not be considered as a complete plan for a course outline. However, teachers should find this material helpful in planning course outlines for their communities.

GUIDING PRINCIPLES

The development of guiding principles for teaching farm business management is essential in planning a course outline. The identification of such principles gives purpose and direction to the farm business management phase of the vocational agriculture program.

Good guiding principles take into account both educational procedures and subject matter content. The following principles illustrate one possible guide for developing the farm business management phase of a course outline.

Instruction in Farm Business Management Should:

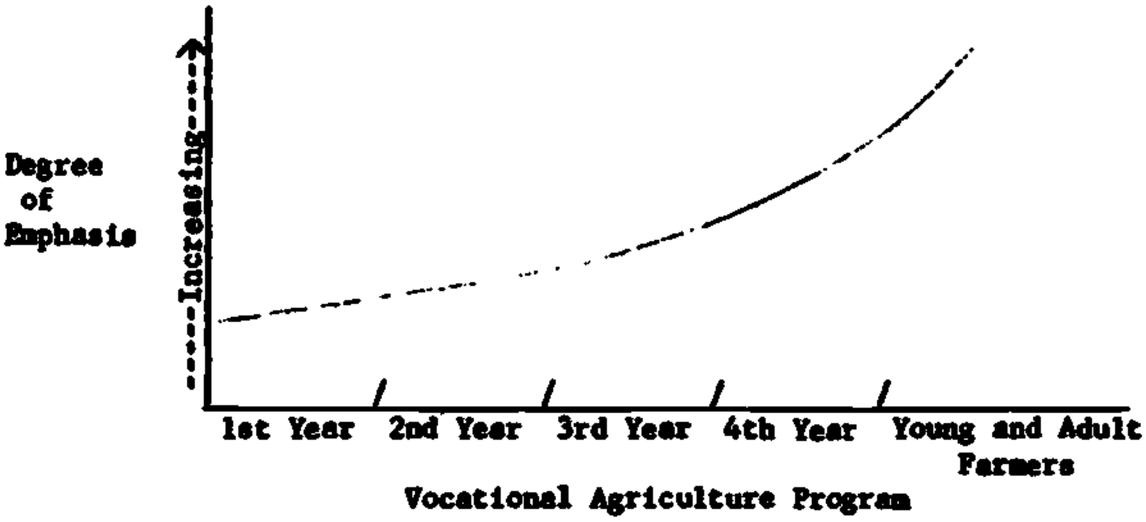
1. Contribute to the training of future farmers, future off-farm agricultural workers, future students of post high school agricultural education institutions, and present farmers.
2. Be continuous throughout the total vocational agriculture program, developing basic knowledge and abilities during the four year in-school program and advanced knowledge and abilities in the adult and young farmer phases of the program.
3. Be organized by years, taking into account the needs, abilities, readiness, and opportunities of in-school students, young farmers, and adult farmers.
4. Be taught in terms that in-school students, young farmers, and adult farmers can understand and relate or apply to their own situation.
5. Be integrated into the farm production and farm mechanics phases of the vocational agriculture program.
6. Provide for learning experiences by starting with the "simple" and progressing in a logical sequence to the "complex."
7. Provide for learning experiences through farming program productive enterprises and planned agricultural experiences related to the home farm business.
8. Relate the farming program productive enterprise to the study of the home farm business.
9. Use the study of farm business management at the adult and young farmer level as the basis for identifying problems of management, production, and farm mechanics.
10. Place emphasis on educational outcomes rather than on providing service to students and farmers.

DEGREE OF EMPHASIS

The degree of emphasis placed on farm business management instruction would vary throughout the total vocational agriculture program. The following two charts illustrate this idea.

Figure 1

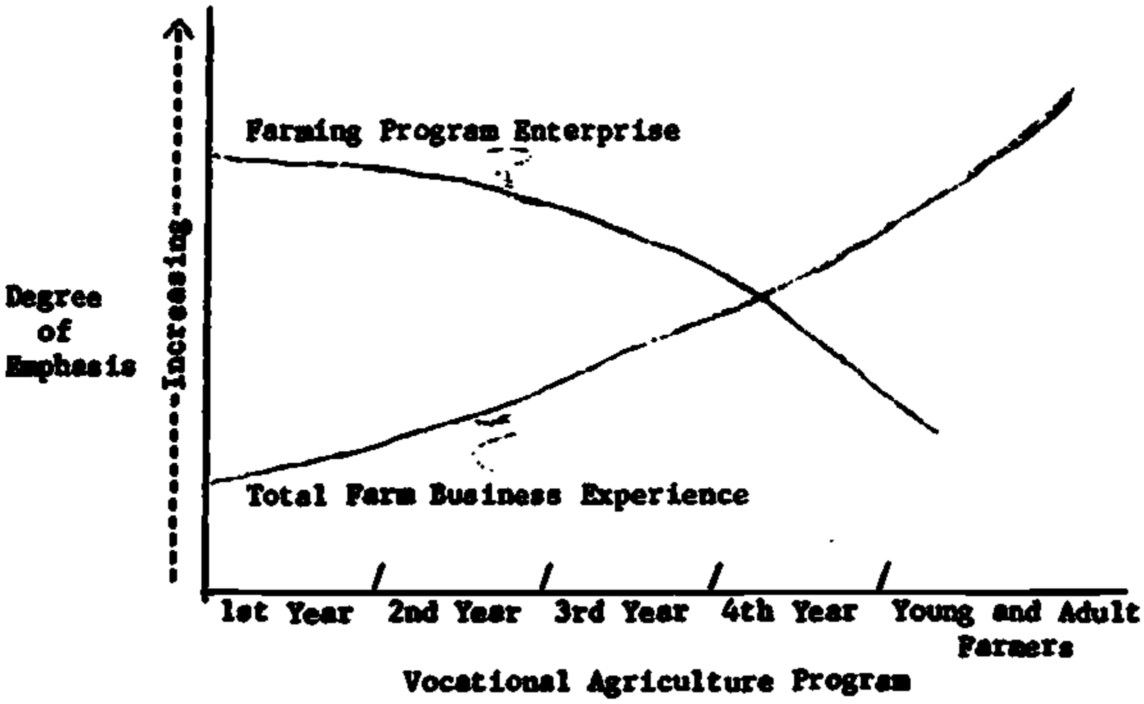
DEGREE OF EMPHASIS PLACED ON FARM BUSINESS MANAGEMENT INSTRUCTION THROUGHOUT THE TOTAL VOCATIONAL AGRICULTURE PROGRAM



Farm business management instruction should be included throughout the in-school phase of the vocational agriculture program. As students develop the needed knowledge and abilities through classroom instruction and agricultural experiences, the emphasis on farm business management should increase (see Figure 1). The greatest emphasis on farm business management instruction should occur when students are most closely associated with the management of a farm business, i.e. the adult and young farmer programs.

Figure 2

DEGREE OF EMPHASIS PLACED ON FARM BUSINESS MANAGEMENT INSTRUCTION THROUGH FARMING PROGRAM PRODUCTIVE ENTERPRISES AND THE TOTAL FARM BUSINESS



Instruction in farm business management should be most closely related to the student's farming program productive enterprises during the early phases of the vocational agriculture program. An introduction to the management of the whole farm business should begin early in the program as part of the planned agricultural experiences of the student. As the student progresses, farm business management instruction should increasingly emphasize the total farm business and its relationship to the farming program productive enterprise. Young and adult farmer farm business management instruction should be primarily concerned with the total farm business.

ORGANIZATIONAL APPROACH

Farm business management has been defined as, "The ability to organize a farm business to provide high continuous profits consistent with family welfare." The success of a farm business is usually measured in terms of financial prosperity. Farmers are in business to make money, and the degree to which they accomplish this goal usually indicates to them how well they are operating their farms. Financial success is the core around which instruction in farm business management can be developed.

A farmer generally approaches the problem of farm business management by considering:

1. What there is to work with (business resources).
2. How well these resources are being managed (business efficiency).
3. Where the money came from (business receipts).
4. Where the money went (business expenses).
5. How successful the farm business was (financial success).
6. How the farm business can be improved (business analysis).

This approach is well adapted to farm business management instruction in the total vocational agriculture program. The use of this approach provides the basis for developing problem areas in farm business management appropriate to the learner's level of knowledge, ability, and opportunity. Furthermore, it is possible to logically integrate farm business management instruction with farm production and farm mechanics.

SAMPLE FOUR-YEAR COURSE OUTLINE

The following sample four-year course outline is provided as a means for further clarifying the foregoing materials. Some samples of content have been included, but they are not complete. Teachers should develop their course outlines to meet their local situations and to be compatible with their methods of teaching. This sample is but one way in which instruction could be organized.

The problem areas listed in this sample course outline attempt to provide for learning through agricultural experiences. The student's experiences with farming program productive enterprises and the total farm business have been integrated. An attempt has been made to provide for the integration of business management instruction with production agriculture and farm mechanics. The four-year program begins at the student's level and progressively develops to the point where he has the knowledge, abilities, and opportunities to relate instruction to the home farm business. A student who has limited or no opportunity to relate the instruction to a home farm should be helped to make arrangements so these experiences will become available on a cooperating farmer's farm.

There are several problem areas which are listed but once in this outline. This does not mean the students would not continue to gain these experiences. Rather, these experiences would be gained as part of other problem areas, through farming programs, and the like.

First Year (Voc. Agr. I)

Problem Area: Determining the farm business management abilities a farmer or off-farm agricultural worker must possess.

1. What is farm business management?
    a. Definition: The ability to organize a farm business to provide high continuous profits consistent with family welfare.
    b.
2. How can a knowledge of farm business management help us?
    a. Combination of crops to grow.
    b. Kinds of livestock to produce.
    c. Level of crop yield and animal production to attain.
    d. Size of enterprise.
    e. Efficient use of labor and machinery.
    f. Buildings to fit the farm business.
    g. Soil conservation program for the farm.
    h. Use of farm business capital.
    i. Insurance protection for the farm business.
    j.

3. What do we need to know about the farm business?

    a. What farm business resources are available (what there is to work with),
    b. How well these resources are being used (business efficiency).
    c. How much money is being received (business receipts).
    d. How much money is being spent (business expenses).
    e. How much money the business is making (financial success).
    f. How the business might be improved (business analysis).
    g.

4. What farm business information do we need?

    a. Resources (land, buildings, livestock, machinery, labor, capital).
    b. Management (rates of production, size of business, labor efficiency).
    c. Receipts (crop, livestock and livestock products, other).
    d. Expenses (crop, livestock, machinery, labor, capital, other).
    e. Financial success (farm income, labor income, return on capital).
    f. Business analysis (strengths, weaknesses).
    g.

5. How can this information be obtained?

    a. Inventory of farm resources.
    b. Crop and livestock production records.
    c. Farm receipt and expense accounts.
    d.

6. When will we obtain this information for our productive enterprise?

    a. Inventory of enterprise resources--begin winter, freshman year.
    b. Production records--begin winter, freshman year.
    c. Receipts and expenses--begin winter, freshman year.
    d. Enterprise analysis--begin fall, sophomore year.
    e.

7. When will we obtain this information for the home farm?

    a. Partial farm inventory--fall, freshman year.
    Total farm inventory--winter, sophomore, junior, senior years.
    b. Simple measures of farm business efficiency--fall, freshman year.
    Additional measures of farm business efficiency--winter, sophomore year.

Advanced measures of farm business efficiency--winter, junior and senior years.

c. Partial record of farm business receipts and expenses--begin spring, sophomore year.
Total record of farm business receipts and expenses--begin spring, junior year.

d. Simple analysis of home farm business--fall, freshman year.
Additional analysis of home farm business--winter, sophomore year.
Advanced analysis of home farm business--winter, junior year.
Complete analysis of home farm business--winter, senior year.

e.

<u>Problem Area</u>: Taking a partial inventory of the home farm business resources.

1. What resources should we inventory?

   a. Acres and use of land.
   b. Numbers and kind of livestock.
   c. Amount, kind, and condition of machinery.
   d. Size, type, use, and condition of buildings.
   e. Farm labor force.
   f.

2. What forms should we use?
   a.

3. How should we record this information?
   a.

4. How can we use this information to plan our productive enterprise?
   a.

<u>Problem Area</u>: Determining simple measure of the home farm business efficiency.

1. What information do we need this year?

   a. Crop production.
   b. Livestock production.
   c. Number of farm workers and months worked.
   d.

2. Where can this information be obtained?
   a.

3. How can this information be recorded?
   a.

4. What does this information show?

a. Size of business.
b. Rates of production.
c. Labor efficiency.
d.

5. How can we use this information to plan our productive enterprise?
a.

Problem Area: Gathering data for the analysis of a productive enterprise.

1. What do we need to know about the livestock enterprise?

a. Size.
b. Rate of production.
c. Returns and feed costs.
d. Marketing data.
e. Feeding efficiency.
f. Death loss.
g.

2. What do we need to know about the crop enterprise?

a. Soil class.
b. Yield per acre.
c. Fertilizer cost per acre.
d. Labor costs.
e. Machinery cost.
f. Crop return per acre.
g. Value of product per acre.
h. Average price per unit.
i.

3. What records do we need to keep?

a. Inventory.
b. Record of receipts and expenses.
c. Record of production.
d. Record of labor.
e.

4. How can we record this data?

a. Farming program record book.
b. Illustrations of entries.
c.

5.

Second Year (Voc. Agr. II)

Problem Area: Analyzing the productive enterprise.

1. How do we summarize the inventory?

a. Depreciation schedules.
b. Total returns.
c.

2. How do we summarize expenses?

   a. Total expenses.
   b.

3. How do we summarize receipts?

   a. Total income.
   b.

4. How do we complete the financial summary?

   a. Expenses.
   b. Receipts.
   c. Summary.
   d.

5. How do we analyze our productive enterprise?

   a. Size of enterprise.
   b. Rates of production.
   c. Labor efficiency.
   d. Cost control.
   e. Marketing.
   f. Feeding efficiency.
   g. Death loss.
   h. Strong and weak points.
   i. Problems to study.
   j.

6. How can we use this information to plan and improve the productive enterprise?
   a.

<u>Problem Area</u>: Taking an inventory of the home farm business.

1. How can we use a farm inventory?

   a. Capital investment.
   b. Increase or decrease in inventory.
   c. Net worth.
   d. Business efficiency factors.
   e. Financial summary.
   f.

2. What information do we need?

   a. Same as for partial inventory.
   b. Land class.
   c. Values.
   d. Depreciation.
   e.

3. How can we obtain this information?
   a.

4. How can we use this information to plan and improve the productive enterprise?
   a.

Problem Area: Determining additional measures of home farm business efficiency.

1. What measures can we determine, using the information we have?
    a. Livestock numbers, crop acres, products sold, man equivalent, capital investment.
    b. Milk per cow, eggs per hen, yield per acre.
    c. Products sold per man, crop acres per man, livestock per man.
    d.

2. What does this information indicate?
    a. Size of business.
    b. Rates of production.
    c. Labor efficiency.
    d.

3. How can we use this information to plan and improve the productive enterprise?
    a.

4. What additional information do we need for further analysis?
    a. Crops sold during year.
    b. Livestock sold during year.
    c. Receipts and expenses.
    d. Feed used during year.
    e.

5. How can we obtain this information?
    a. Partial record of receipts and expenses.
    b. Production records.
    c.

Problem Area: Determining partial receipts and expenses for the home farm business.

1. What information do we need?
    a. Feed costs for livestock.
    b. Machinery costs.
    c. Prices paid and received for livestock.
    d. Value of products sold.
    e.

2. How can we obtain this information?
    a. Select an important home farm enterprise.
    b. Cash account of receipts and expenses.
    c. Production record.
    d. Begin in January.
    e.

3. What form should we use?
    a.

4. How do we make entries?
    a. Refer to productive enterprise record.
    b.

<u>Problem Area</u>: Continuing the analysis of the home farm business.

1. What information do we have?
    a. Size of business.
    b. Rates of production.
    c. Labor efficiency.
    d. Farm inventory.
    e.

2. What do these figures indicate?
    a. Compare with other farms.
    b. Strong and weak points.
    c. Problems to be studied.
    d.

3. How can this information be used in planning and improving the farming program productive enterprise?
    a.

<u>Third Year</u> (Voc. Agr. III)

<u>Problem Area</u>: Summarizing the partial record of receipts and expenses for the home farm business.

1. How do we summarize the expenses?
    a. Refer to farming program productive enterprise record.
    b.

2. How do we summarize the receipts?
    a. Refer to farming program productive enterprise record.
    b.

3. What do these figures show?
    a. Where the money came from.
    b. Where the money went.
    c. Use in calculation of measures of business efficiency.
    d.

4. How can this information be used to plan and improve the farming program productive enterprise?
    a.

Problem Area: Determining advanced measures of the home farm business efficiency.

1. What measures can we determine from the information we have?

   a. Livestock, crop acres, man equivalent, capital investment, total production.
   b. Milk per cow, eggs per hen, pigs per litter, livestock gain, crop yield.
   c. Animals per man, products sold per man, crop acres per man, work units per man.
   d. Returns per $100 feed cost, feed cost per unit, crop expense per acre, fertilizer cost per acre, machinery cost per man.
   e.

2. What do these measures show?

   a. Size of business.
   b. Rates of production.
   c. Labor efficiency.
   d. Cost control.
   e. Feeding efficiency.
   f.

3. How can this information be used to plan and improve the farming program productive enterprise?
   a.

4. What additional information do we need to further analyze the home farm business?

   a. Complete receipts.
   b. Complete expenses.
   c. Production records.
   d.

5. How can we get this information?

   a. Begin cash account and production records in January.
   b.

Problem Area: Continuing the home farm business analysis.

1. What information do we have?

   a. Two farm inventories.
   b. Business efficiency measures for three years.
   c. Pertial record of receipts and expenses.
   d.

2. What do these figures show us?

   a. Compare with other farms.
   b. Strong and weak points.
   c. Problems to be studied.
   d.

3. How can this information be used to plan and improve the farming program productive enterprise?
   a.

Problem Area: Keeping more complete records of home farm business receipts and expenses.

1. Why do we need this information?

    a. Advanced measures of business efficiency.
    b. See where the money came from.
    c. See where the money went.
    d. Determine financial success.
    e.

2. What information do we need?

    a. Complete farm business expenses.
    b. Complete farm business receipts.
    c.

3. How can we obtain this information?

    a. Keep cash account.
    b. Record information from farm accounts.
    c. Begin in January.
    d.

4. How do we make the needed entries?

    a. Refer to farming program enterprise records.
    b.

Problem Area: Comparing income possibilities of the home farm crop and livestock system with an alternative system.

1. What home farm information do we need?

    a. Information already collected.
    b.

2. What are the present long range income possibilities of the home farm business?

    a. Complete necessary forms using home farm date.
    b.

3. How does this income compare with other farms?
    a.

4. What possible alternatives might be selected?

    a. Review strong and weak points.
    b. Consider logical alternatives.
    c. Compare alternative plan with present program.
    d.

5. What farm business adjustments might be made?

   a. Fertility.
   b. Cropping.
   c. Livestock.
   d. Labor.
   e. Conservation.
   f. Buildings.
   g. Machinery and equipment.
   h.

Problem Area: Determining how to secure money for making home farm business adjustments.

1. When should we borrow money?
   a.

2. Where can we borrow money?
   a.

3. How much money should we borrow?
   a.

4. How much does it cost to borrow money?
   a.

5. What laws apply to borrowing and lending money?
   a.

Fourth Year (Voc. Agr. IV)

Problem Area: Summarizing the receipts and expenses for the home farm business.

1. How do we summarize the expenses?

   a. Refer to previous instruction.
   b. Advanced instruction.
   c.

2. How do we summarize receipts?

   a. Refer to previous instruction.
   b. Advanced instruction.

3. What do these figures show?

   a. Where the money was spent.
   b. Where the money was earned.
   c. Measures of business efficiency.
   d. Financial success.
   e.

4. How can this information be used to help improve the home farm business?
   a.

Problem Area: Determining the financial success of the home farm business.

1. What are the common measures of financial success?

   a. Farm income.
   b. Labor income.
   c. Return on capital.
   d.

2. What information is needed to determine these measures?

   a. Farm receipts.
   b. Farm expenses.
   c. Farm inventory.
   d.

3. How do we calculate these measures?
   a.

4. How do these measures compare with other farms?

   a. All farms.
   b. Similar enterprise.
   c. Similar size.
   d.

5. How can this information be used to improve the home farm business?
   a.

Problem Area: Determining the efficiency of the home farm business.

1. What measures of efficiency can we determine?

   a. Refer to previous instruction.
   b. Advanced instruction.
   c.

2. What do these measures show?

   a. Refer to previous instruction.
   b. Advanced instruction.
   c.

3. How can this information be used to help improve the home farm business?
   a.

Problem Area: Completing the analysis of the home farm business.

1. What information do we have?

   a. Three farm inventories.
   b. Business efficiency measures for four years.
   c. Account of farm receipts and expenses.
   d.

2. What do these figures show?

    a. Compare with other farms. c. Problems to be studied.
    b. Strong and weak points. d.

3. How can this information be used to help improve the home farm business?
    a.

<u>Problem Area</u>: Determining a budget for the home farm business.

1. What information do we need?

    a. Refer to records. b.

2. How should the money be budgeted?

    a. Business efficiency factors.
    b. Proposed plan (third year).
    c. Budget form.
    d.

3. How does this compare with the present budget?
    a.

4. How can this information be used to improve the home farm business?
    a.

<u>Problem Area</u>: Planning for the transfer of the home farm.

1. How can real estate and personal property be transferred?
    a.

2. How do we prepare for transferring real estate?
    a.

3. How do we prepare for transferring personal property?
    a.

4. When should these preparations be made?
    a.

5. What plans should we have for our home farm?
    a.

<u>Problem Area</u>: Planning an insurance program to protect the home farm business and the family.

1. Why do we need insurance?
    a.

2. What types of insurance are available?
    a.

3. What should we consider when planning an insurance program?
    a.

4. Where can we buy insurance?
    a.

5. What insurance program would be suitable for our home farm and our family?
    a.

SAMPLE COURSE OUTLINE FOR

YOUNG AND ADULT FARMER CLASSES

Young and adult farmers are making business management decisions which effect the financial success of their businesses. These men are interested in determining which decisions would most likely improve their farm businesses. Programs of instruction in farm business management should have as their goal the development of the knowledges and abilities needed to analyze the farm business, make sound management decision, and implement those decisions. Farm record keeping ability is necessary if this goal is to be reached.

Farm business management instruction in the vocational agriculture young and adult farmer programs should emphasize analyzing the farm businesses, determining how the businesses might be improved, examining possible alternative decisions, developing knowledges and abilities needed in implementing the final decisions, and evaluating the results of the actions taken. Farm record keeping then becomes a part of the total instructional program and the record keeping experiences are directly related to the farmer's own situation.

The course outline presented here is only a sample of one of the many ways farm business management instruction could be organized. This outline immediately involves the farmers in the study of their businesses. Record keeping instruction begins where the farmers are and progresses as the farmers develop the needed knowledges and abilities. Emphasis is placed on a record keeping experience program similar to the high school farming program.

Farmers are sometimes reluctant to reveal the dollar and cent figures for their businesses. It should be made clear that no one but the teacher will know these figures without their approval. The only figures published will be averages, thus no individual farmer could be identified.

Teachers might develop individual workbooks in which each farmer could enter from his records the figures needed to analyze his business. These workbooks would provide the teacher with the figures required for the group summary as well as organizing the information in a useful form for the farmer.

This outline would allow teachers to initiate and conduct a new beginning class each year. As the farmers completed the first year, they would then enter the advanced classes. If a beginning class was not conducted each year, a few new farmers could be enrolled in the advanced class if they were interested.

Beginning Farm Business Management (First Year)

Problem Area: Identifying the facts and information I will need in order to analyze my farm business.

1. What do I have to work with?
    - a. Land
    - b. Buildings.
    - c. Livestock.
    - d. Machinery and equipment.
    - e. Labor.
    - f. Capital.
    - g.
2. Where did the money come from?
    - a. Farm business receipts.
    - b.
3. Where did the money go?
    - a. Farm business expenses.
    - b.
4. How much money did the business make?
    - a. Farm income.
    - b. Labor income.
    - c. Return on capital.
    - d.
5. How efficiently did I manage the business?
    - a. Size of business.
    - b. Labor efficiency.
    - c. Rates of production.
    - d. Cost control.
    - e. Feeding efficiency.
    - f. Marketing.
    - g. Death loss.
    - h.
6. How can I obtain this information?
    - a. Farm inventory.
    - b. Cash account.
    - c. Production records.
    - d.

Problem Area: Determining what I have to work with in my farm business.

1. How should land be inventoried?
2. How should buildings be inventoried?
3. How should livestock be inventoried?
4. How should machinery and equipment be inventoried?
5. How should labor be inventoried?
6. How should capital be inventoried?

Note: Each farmer should have a beginning inventory and an ending inventory for the past year. There may be farmers who have some type of inventory record. Those who have no organized record should make an ending inventory and then estimate what the beginning inventory would have been. The second year of this program each member would have a more complete and accurate record as a result of this instruction.

Problem Area: Determining where the money came from in my farm business.

1. What are the receipts I need to record?
2. How should these receipts be grouped?
3. How should these receipts be recorded?

Note: Each farmer should have a record of receipts for the past year. Those who have no organized record should use their income tax information to estimate the needed receipts. The second year of this program each member would have a more complete and accurate record as a result of this instruction.

Problem Area: Determining where the money went in my farm business.

1. What expenses do I need to record?
2. How should these expenses be grouped?
3. How should these expenses be recorded?

Note: Each farmer should have a record of expenses for the past year. Those who have no organized record should use their income tax information to estimate the needed expenses. The second year of this program each member would have a more complete and accurate record as a result of this instruction.

Problem Area: Determining how efficiently I managed my farm business.

1. What is the size of my farm business?
2. What were the rates of production?
3. What was the labor efficiency?
4. How well did I control costs?
5. How well did I manage feeding efficiency?
6. How well did I manage my marketing?
7. How well did I control death losses?

Note: Each farmer should have sufficient information to calculate the measures of business efficiency for last year's operation. Those who lack complete information might estimate the figures from the limited data they have. The second year of this program each member would have a more complete and accurate record as a result of this instruction.

Problem Area; Analyzing my farm business.

1. What are the strong points?
2. What are the weak points?
3. What additional information do I need for next year?
4. What problems need to be studied this year?

Note: The important inventory, receipt, expense, and efficiency data could be averaged for this group and a report prepared by the teacher. The farmers could then compare their individual farms with the averages for the class, county, and other appropriate groups of farms. By using the group average, no individual farmer would have to disclose his business information to others unless he so desired. This analysis would provide the necessary information for developing a series of classes to study the most important problem identified by the farmers.

Advanced Farm Business Management (Following Years)

Problem Area: Preparing to analyze my farm business.

1. What do I have to work with (inventory)?
2. Where did the money come from (receipts)?
3. Where did the money go (expenses)?
4. How well did I manage the business (efficiency)?

Note: It would be possible to have a few new students in the class. These farmers would need some individual assistance in getting started.

Problem Area: Analyzing my farm business.

1. What are the strong points?
2. What are the weak points?
3. What changes have occurred since last year?
4. What might account for these changes?
5. What additional information do I need for next year?
6. What problems need to be studied this year?

Note: Again, important information could be averaged and a report prepared by the teacher. The farmers could then compare their individual farms with the averages for the class, county, and other appropriate groups of farms. A series of classes could be developed to study the most important problem or problems identified by the farmers.

Pub Date - Jul64
MF AVAILABLE IN VT-ERIC SET 29p.

*FARM MANAGEMENT, *CURRICULUM GUIDES, *VOCATIONAL AGRICULTURE, *TEACHING GUIDES, HIGH SCHOOLS, ADULT VOCATIONAL EDUCATION, CREDIT,

The course was developed for high school and adult farmer classes by a teacher educator. Specific course objectives are related to 10 problem areas--(1) financial analysis, (2) operating credit, (3) expansion credit, (4) consumer credit, (5) credit and marketing, (6) lender selection, (7) acquiring loans, (8) managing credit and taxes, (9) business insurance, and (10) personal insurance. Unit areas in the course parallel the problem areas. Teacher objectives, interest approaches, anticipated questions, possible activities, references, and teaching aids are listed for each problem area or unit. The units are planned for young and adult farmer groups in greater detail with modifying suggestions for classes of high school students and agricultural businessmen. Sources of references and teaching aids are listed. (JM)

ACKNOWLEDGMENTS

During the summer of 1964, the writer assisted in conducting a three-day workshop on agricultural business management for ten Illinois teachers of vocational agriculture. These teachers, in turn, served as instructors for one-day courses attended by teachers of vocational agriculture throughout Illinois. This publication was prepared to aid teachers in organizing and presenting, through systematic instruction, the subject matter of these one-day courses to farmers, non-farm agricultural businessmen and high school students enrolled in agricultural education courses.

Much credit must be given to Professor John Herbst, Vocational Agriculture Service, College of Agriculture, for his assistance in the preparation of this publication. Also, acknowledgment must be given for the helpful suggestions of Professors Lloyd J. Phipps, A. H. Krebs, Paul E. Hemp and J. R. Warmbrod of the Division of Agricultural Education, College of Education, and Professor John W. Matthews, Vocational Agriculture Service, College of Agriculture.

TABLE OF CONTENTS

FARM BUSINESS MANAGEMENT

Financing Production Agriculture

Source Materials for Providing Systematic Instruction to Farmers, Agricultural Businessmen and High School Students

INTRODUCTION

Financing the production of crops, livestock and livestock products is a critical aspect of farm business management. Financial management is often the "weak link" in an otherwise sound farming operation. Farmers, businessmen, and high school students interested in a career in agriculture all need to understand the most advantageous methods of financing production agriculture. Systematic instruction provided by teachers of agriculture can help meet this need.

These source materials are presented as a detailed guide for teaching adult farmers and young farmers. Suggestions have been included to aid the teacher in modifying these materials for use with agricultural businessmen and for use with high school students. Each of these three groups has a different background of knowledge and experience thus each requires a somewhat different instructional approach.

The materials presented are suggestions only and should be used as a guide. Teachers will need to develop a program of systematic instruction appropriate for the group they have in class and the community in which they teach.

COURSE OBJECTIVES

The course objectives for systematic instruction in financing production agriculture might include:

A. Adult Farmers and Young Farmers

1. Develop an appreciation for conducting a sound program of financial management.

2. Develop the ability to analyze a financial management program.
3. Develop an understanding of the place of credit in a farm business.
4. Develop the ability to use available financial resources most advantageously for the operation, improvement, and/or expansion of a farm business.
5. Develop the ability to select the most advantageous source of cash loans and/or credit.
6. Develop an understanding of the relationship of family financial management and business financial management.
7. Develop an understanding of the need for protecting the business and family against financial loss.
8. Develop the ability to plan a marketing program which is financially advantageous.
9. Develop an understanding of the relationship of income taxes and financial management.
10.

B. Agricultural Businessmen

1. Develop an appreciation for the need to analyze a prospective customer's financial management program.
2. Develop the ability to analyze a financial management program.
3. Develop the ability to determine whether the financial success of the farm business will be sufficiently improved as a result of a purchase and/or the extension of credit.
4. Develop the ability to assist the farmer in advantageously managing family and business finances.
5. Develop an understanding of the farmer's need for protection against financial loss.
6.

C. High School Agriculture Students

1. Develop an appreciation of the need for sound financial management.
2. Develop an understanding of how a financial management program can be analyzed.

3. Develop an understanding of how a farmer can determine whether credit will be of advantage in the operation, improvement, and/ or expansion of a farm business.

4. Develop an understanding of the process involved in securing a cash loan or credit.

5. Develop an understanding of the need for protection against financial loss.

6. Develop an understanding of the relationship between family financial management and business financial management.

7. Develop an understanding of the affect marketing has on financial management.

8.

ADULT FARMERS AND YOUNG FARMERS

This section of the materials has been developed in detail and should serve as a guide for planning systematic instruction for adult or young farmer courses. The materials have been designed to meet the course objectives previously stated.

Problem Areas

Some of the problem areas which may be appropriate for an adult farmer or a young farmer class are:

I. Determining the success of the farm business financial management program.

II. Determining whether money can be borrowed to advantage for operating a farm business.

III. Determining whether money can be borrowed to advantage for expanding operations or establishing improved methods of operation.

IV. Determining whether money can be borrowed for family activities and/or home improvements without unduly interfering with the farm business financial program.

V. Adjusting the marketing program to take maximum advantage of credit.

VI. Selecting an appropriate lender or lending agency.

VII. Obtaining cash loans or credit.

VIII. Managing credit in relation to income tax regulations.

IX. Protecting the farm business through an insurance program.

X. Protecting the family's welfare through a personal insurance program.

XI.

Teacher Objectives, Possible Interest Approaches, Anticipated Problems, Possible Activities and Partial List of References

A list of possible teacher objectives for each of the above problem areas is presented to aid the teacher in developing a suitable lesson plan. Examples of possible interest approaches have been included to assist the teacher in developing proper student motivation; a critical aspect of planning. Anticipated problems and possible class activities are also included to help guide the teacher. A partial list of references appropriate for each problem area has also been included to facilitate planning.

I. Determining the success of the farm business financial management program

A. Teacher objectives: Develop in the students an affective ability to--

1. Interpret farm business financial records

2. Complete a net worth statement

3. Analyze a net worth statement

4. Complete a profit and loss statement or farm business summary

5. Analyze a profit and loss statement

6.

B. Possible interest approaches

1. Distribute a farm business financial summary which provides the information needed to calculate profit, loss and net worth (See pages 16 and 17, Farm and Family Business Management--Part IV). Lead a group discussion to determine the different conclusions arrived at concerning the financial success. Use this example as a source of information for teaching the problem area; <u>and/or</u>

2. Ask such questions as: (a) Has your financial management increased or decreased your business profits? (b) How much? (c) Has your financial management program been successful? (d) How successful?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated questions, problems and concerns:

1. How can you determine whether the total farm business is financially successful?

2. How does financial management affect the rate of financial growth of the farm business?

3. What is a net worth statement?

4. How do you determine net worth?

5. What do net worth statements tell about financial management of a farm business?

6.

D. Possible activities:

*1. Have each class member complete a profit and loss statement (or farm business summary) from his records.

*2. Have each class member complete a net worth statement using his farm business records.

3. Provide class with a summary of continuous net worth statements for a three year period and discuss the interpretations.

4. Provide class with sample profit and loss statements or farm business summaries. Using charts or chalkboard as a visual aid, discuss the interpretations of these business records.

5. Provide class with one year's entries for a net worth statement and have each member calculate the net worth.

6. Use an overhead projector to illustrate the making of entries on a net worth statement.

7.

E. Partial list of references and teaching aids:

Farm and Family Business Management - Part IV. Farm Business Adjustments, Alternative plans, . . .

Our Net Worth Statement

VAS Unit 2008a, Record Keeping on the Farm

---

*Possible activity for individual on-farm instruction

VAS Unit 2024, The Use of Credit to Increase Farm Earnings
VAS Unit 2025, Credit Needs on the Farm
VAS Unit 2026, Farmer Jones' Plans for Repayment of Loans

Annual Summary of Farm Business Records, 1962. Cir. 874

II. Determining whether money can be borrowed to advantage for operating a farm business

A. Teacher objectives: Develop in the student an affective ability to--

1. Identify decisions to be made

2. Select proper farm business records

3. Complete a partial and/or total budget

4. Analyze a partial and/or total budget

5. Determine a repayment program

6. Identify needed management adjustments

7.

B. Possible interest approaches

1. Using the same farm business as in I, distribute a summary containing the information needed to complete several partial budgets (see pages 18 and 19, Farm and Family Business Management - Part IV). Lead a group discussion to determine the class members opinions as to whether the proposed changes will increase net income "sufficiently." Use the example as a source of information when teaching; <u>and/or</u>

2. Ask such questions as: (a) How much money do you need to borrow? (b) When should you borrow it? (c) When should you pay it back?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated questions, problems and concerns

1. What important decisions need to be made when borrowing money for operating expenses?

2. What farm business records are needed as a basis for making a sound decision?

3. Does the complete (or partial) budget show if money can be borrowed to increase net income?

4. What adjustments need to be made to make the farming operation more profitable?

5. How much money will be needed to meet expenses?

6. When will the money be needed?

7. When will the money be available for repayment?

8.

D. Possible activities:

1. With the aid of a flannel board, identify the important decisions needed when borrowing money.

2. Refer to 1963 course material on record analysis and develop a list of farm business records needed plus the reasons for keeping these records.

*3. Have each class member develop a complete budget for his farm business or a partial budget for changes in the business. (Use Income Possibilities form or Partial Budget form)

4. Have class analyze sample budgets and determine where adjustments can be made to improve profits.

5. Provide class members with sample entries for a cash flow budget and have them determine how much money is required, when the money will be needed, and when the money can be repayed.

6.

E. Partial list of references and teaching aids:

Farm and Family Business Management - Part IV (also in I - E)
   Farm Business Adjustments for Improved Efficiency
Farm Management Manual
Income Possibilities Form
Partial Budget Form
Farm and Family Financial Budget form
Farm and Family Financial Planning Problem

III. Determining whether money can be borrowed to advantage for expanding operations or establishing improved methods of operation.

A. Teacher objectives: Develop in the students an affective ability to--

---

*Possible activity for individual on-farm instruction

1. Determine optimum size of expansion
2. Estimate capital expense for expansion
3. Estimate operating expense as a result of expansion
4. Estimate capital expense for establishing an improved method
5. Estimate operating expense as a result of an improved method
6. Plan a repayment program
7.

B. Possible interest approaches

1. Lead a group discussion to determine the opinions of the class members concerning expansion or improvement; <u>and/or</u>
2. Ask such questions as: (a) Which would be most profitable for you, expanding an enterprise or improving an enterprise? (b) Would increased returns justify the change?
3. Develop a list of class objectives and problems to be studied

C. Anticipated questions, problems and concerns:

1. How much volume is needed for an improved method to be economical?
2. How much capital will be needed to establish the improved method?
3. How much capital will be needed for changing the corn harvesting method?
4. How much capital will be needed for expanding the size of a hog enterprise?
5. How much capital will be needed for expanding the size of a beef enterprise?
6. Will the change be profitable?
7. When will the money be needed?
8. When will the money be repaid?
9.

D. Possible activities:

*1. Have each class member determine the capital expenses and major operating costs for improving or expanding the major farm enterprise. (ex. Changing the corn harvesting method for 15,000 bushels, adding facilities for 100 steers or 120 litters.)

*2. Have each class member estimate the returns for the increased volume and how long it will take him to repay the borrowed money.

3. Using a large chart, illustrate some of the differences in capital outlay and operating expenses for different enterprises.

4.

E. Partial list of references and teaching aids:

AERR-63, Economic Considerations in Choosing a Corn Harvesting Method
Problem: How Much Capital is Needed to Change the Method of Harvesting Corn?
Sheet: Costs of Alternative Corn Harvesting Methods
AE-3971, Guides for Use in Planning Beef Feeding Systems
AE-3973, Guides for Use in Planning Hog Production Systems

IV. Determining whether money can be borrowed for family activities and/or home improvement without unduly interfering with the farm business financial program.

A. Teacher objectives: Develop in the students an affective ability to--

1. Plan a family budget

2. Plan a home improvement budget

3. Coordinate business and family expenses

4. Plan a repayment program

5.

B. Possible interest approaches:

1. Prepare a large chart, perhaps on wrapping paper, to illustrate examples of family expenses and home improvement

---

*Possible activity for individual on-farm instruction

expenses. Using a sample business as an illustration, lead a group discussion to obtain opinion of class members concerning the effect of these expenses on the farm business; and/or

2. Ask such questions as: (a) Do you give as much consideration to family expenses as you do to business expenses? (b) Which come first, business expenses or family expenses?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated questions, problems and concerns

1. What are family consumption loans and home improvement loans?

2. How do these loans affect the farm business financial program?

3. What factors need to be considered when planning for these loans?

4. How much money will be needed?

5. When will the money be needed?

6. When will the money be available for repayment?

7.

D. Possible activities:

*1. Have each class member determine the "esential" family consumption and home improvement expenses.

*2. Have each class member determine the "needs" and "wants" for the family's consumption and for home improvements.

*3. Have each class member plan a family budget to determine how much money is needed, how much money will be available, what loans are needed, and when the money can be repaid.

4. Invite the wives to attend the class.

5. Provide samples of budgets for family living needs and home improvement needs.

6.

---

*Possible activity for individual on-farm instruction

E. Partial list of references and teaching aids:

Money Management Library
Illinois Family Incomes and Expenditures
Illinois Family Account Book

V. Adjusting the marketing program to take maximum advantage of credit.

A. Teacher objectives: Develop in the students an affective ability to--

1. Anticipate seasonal price variation in determining future income

2. Anticipate price cycles of swine and beef in determining future income

3. Plan an advantageous marketing program

4. Decide whether to sell or store corn

B. Possible interest approaches:

1. Outline an example of a marketing program for hogs, (see Feeder Pig Problem), on the chalkboard. Have class determine returns based on seasonal prices. Lead discussion to obtain class members opinions about the program; and/or

2. Ask such questions as: (a) Does a good marketing program increase the availability of credit? (b) Does a good marketing program reduce the amount of credit needed?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions, and concerns

1. How does a marketing program affect credit?

2. How does a marketing program affect loan repayment?

3. What seasonal price variations can be advantageous?

4. What additional costs are necessary to get higher prices?

5. What changes in procedures may be advantageous in the marketing program being followed?

6. How can hedging be used to advantage?

7.

D. Possible activities:

1. Have class examine the sample budget form (Problem Area II) to determine how marketing affected the credit program.

2. Have class determine if the sample marketing program takes best advantage of the seasonal marketing variations.

*3. Have each class member consider his marketing situation to see if it is advantageously organized.

4. Use a large chart to illustrate how seasonal price variations affect income.

5. Show hedging filmstrip and discuss.

6.

E. Partial list of references and teaching aids:

Some Reference Materials on Marketing (a list of over 20 references and their sources)

VI. Selecting an appropriate lender or lending agency

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Identify the type of loan needed

2. Calculate interest rates

3. Compare lenders or lending agencies

4. Select an appropriate source of credit

5.

B. Possible interest approaches

1. Illustrate, using a chalkboard, how the amount of interest actually paid differs when secured from a "low cost" source and from an "expensive" source. Lead a group discussion to determine class members opinions of different sources of credit; <u>and/or</u>

2. Ask such questions as: (a) Do you know how much interest you actually pay? (b) How much money can you save by

---

*Possible activity for individual on-farm instruction

careful selection of lenders or lending agencies?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions, and concerns:

1. What types of cash loans and credit are available to farmers in this area?

2. What are the loan policies of these lenders or lending agencies?

3. What interest rates are common?

4. How do you calculate interest rates?

5. What characteristics should a lender or lending agency possess?

6.

D. Possible activities:

1. Have class members discuss types of loans available.

2. Secure and distribute policy brochures for local lending agencies.

3. Calculate a simple interest rate problem with the class.

4. Distribute "interest calculators" and have class members check the interest rate calculated in 3.

5. Use VAS Unit 2027, Securing Farm Credit, as a teacher guide, lead a group discussion on characteristics of a lender.

6. Use a flannel board as a visual aid and develop a list of important characteristics of lenders or lending agencies.

7.

E. Part. list of references and teaching aids:

Folders from PCA and FHA
Your Illinois Banks
Farm and Family Business Management - Part V. Financing the Farm Business
Michigan State, Interest Rate Calculator
VAS Unit, 2027, Sources of Farm Credit

VII. Obtaining cash loans or credit

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Provide necessary farm business information

2. Provide necessary personal information

3. Complete necessary legal papers

4. Become a good credit risk

5.

B. Possible interest approach:

1. Have the class role play a situation where a farmer wants to secure a loan and the class must make the decision. The teacher takes the role of the farmer. Provide, using charts or chalkboard, a minimum amount of business and personal information. Have the class decide if the loan should be made; <u>and/or</u>

2. Ask such questions as: (a) What makes you a good credit risk? (b) What information can you provide a lender?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions and concerns:

1. What farm business information should be available?

2. What personal information should be available?

3. What characteristics would the lender or lending agency seek in a potential client?

4. What legal papers are usually completed?

5. What are the purposes of the legal papers?

6.

D. Possible activities:

1. Lead a class discussion about the information needed to secure a loan. Emphasize the use of farm business records.

2. Using VAS Units as teacher references, lead a discussion on characteristics of a borrower.

3. Use a flannel board to develop a list of appropriate characteristics of borrowers.

4. Use a banker, PCA fieldman, or FHA fieldman as a resource person to discuss how to obtain a loan.

5. Collect samples of common legal papers related to credit and distribute to class.

6. Using VAS Unit 2034, Credit Instruments, as a teacher reference, lead class discussion.

7.

E. Partial list of references and teaching aids:

VAS Unit 2027, Sources of Farm Credit (also in VI - E)
VAS Unit 2028, Factors Involved in the Borrowing Process
VAS Unit 2034, Credit Instruments
AE - 3796, The New Illinois Commercial Code and Farm Financing
Common credit instruments obtained locally

VIII. Managing credit in relation to income tax regulations

A. Possible teacher objectives: Develop in the students an affective ability to:

1. Take advantage of end-of-year credit

2. Take advantage of depreciation regulations

3.

B. Possible interest approach:

1. Illustrate, using the chalkboard, how the cost of borrowing money for certain purchases can be reduced by taking advantage of tax regulations. Lead a group discussion to determine the opinions of class members as to the need for tax management in relation to credit; and/or

2. Ask such questions as: (a) Is it possible to borrow money and by taking advantage of tax regulations, pay the loan off sooner than would normally be possible? (b) Can you reduce the cost of credit by taking advantage of tax regulations?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions and concerns:

1. What tax regulations apply to borrowed capital?

2. How can credit be used to take advantage of income tax regulations?

3. What income tax regulations can help improve your credit standing?

4. What farm business information is needed to plan a tax management program?

5. What adjustments in the farm business are in line with good tax management?

6.

D. Possible activities:

1. Discuss the major depreciation methods, especially the straight line method. Also, include investment credit and additional first year depreciation in the discussion

2. Discuss the use of Schedule D for breeding stock and stock held for 12 months or more.

3. Use a large chart or overhead projector to show how to fill in Schedule D for a sale of sows.

4.

E. Partial list of references and teaching aids·

Farmer's Tax Guide
North Central Regional Publication on Income Tax Management
(Being revised at this time)
1964 Revenue Act -- Provisions of Significance to Farmers

IX. Protecting the farm business through an insurance program

A. Possible teacher objectives: Develop in the students an affective ability to:

1. Identify major business risks affecting financial success

2. Select appropriate methods for protecting against loss

3. Select the most advantageous protection program

4.

B. Possible interest approach:

1. Lead a group discussion to determine class members opinions of business risks which need to be covered, how the risks can be covered and the cost of securing the needed protection; <u>and/or</u>

2. Ask such questions as: (a) How have you protected business against an "act of God" that would reduce your ability to meet credit obligations? (b) Would your farm business recover from a major loss of buildings, livestock, crops, or equipment?

3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions and concerns:

1. What business risks need to be insured?
2. What are the major ways in which these risks can be covered?
3. Why are these procedures effective?
4. What are the common types of insurance policies available to cover these risks?
5. What important points should be checked in an insurance policy?
6.

D. Possible activities

1. Invite wives to the meeting.
2. Use a flannel board to develop a list of major farm business risks.
3. Use the same flannel board and add ways in which risks may be protected.
4. Collect samples of common insurance policies and use in class as references.
5. Show film strip(s) about the major types of insurance for the farm business.
6. Have a good insurance agent serve as a resource person to discuss policies available to meet the major risks (be sure agent knows what questions you want him to discuss.)
7.

E. Partial list of references and teaching aids:

Slidefilm, Insurance in the Farm Business
Teacher's Manual for Insurance in the Farm Business (available with filmstrip)
Ill. Circ. 832, Insurance for Farmers -- Property, Liability, Medical

X. Protecting the family's welfare through a personal insurance program

A. Possible teacher objectives: Develop in the students an affective ability to:

1. Identify the major risks which would affect family welfare

2. Select appropriate methods for protecting against these risks
3. Selecting the most advantageous protection program
4.

B. Possible interest approaches:

1. Lead a group discussion to illustrate how an "act" of God" such as serious illness could affect the business financial program and family welfare; <u>and/or</u>
2. Ask such questions as: (a) Where would money be obtained to pay doctor and hospital bills if you had no personal insurance? (b) How would this affect the business?
3. Develop class objectives and a list of problems to be studied.

C. Anticipated problems, questions and concerns:

1. Is the family protected against major farm business losses?
2. What family risks need to be insured?
3. What are the major ways in which the family can be protected against these risks?
4. How much protection is needed?
5. What common types of insurance policies are available?
6. What major points should be checked in an insurance policy?
7. How can an insurance program be evaluated?
8. How can insurance be used for saving money or getting a loan?

D. Possible activities

1. Invite wives to the meeting.
2. Use a flannel board to develop a list of family risks which need to be protected.
3. Use the same flannel board as above and add ways the risks may be protected.
4. Collect samples of common insurance policies and use in class as references.
5. Show film strip(s) on personal insurance.

6. Have a good insurance agent serve as a resource person to discuss available forms of personal insurance (be sure the agent knows what questions you want him to discuss).

E. Partial list of references and teaching aids:

AGRICULTURAL BUSINESSMEN

This section of the materials has been developed to guide a teacher in planning systematic instruction for agricultural businessmen. Most of the subject matter included in the young and adult farmer outline would be appropriate for businessmen. However, agricultural businessmen have a different interest in the subject. They would primarily be interested in identifying the credit capacity of potential customers and how credit supervision might be provided. A large group of agricultural businessmen could be best taught by offering a course designed specifically for them. A small number of agricultural businessmen would probably be best taught in the young or adult farmer course.

A list of possible problem areas has been developed to aid the teacher. Interest approaches, anticipated problems, teaching activities, and references mentioned in the young and adult farmer section can be adapted for use in teaching agricultural businessmen.

Problem Areas

I. Determining the financial success of a farm business.

II. Determining whether a farm business will be improved through extending credit to meet operating expenses.

III. Determining whether a farm business will be improved through extending credit for expanding or changing an enterprise.

IV. Determining whether a farm business and the family will be benefited through the extension of credit.

V. Understanding how income tax regulations affect farmers use of credit.

VI. Determining a minimum insurance program for a farm business.

VII. Determining a minimum insurance program for a farmer's family.

VIII.

HIGH SCHOOL STUDENTS

This section of the materials has been developed to guide the teacher in planning systematic instruction for high school students. Problems related to the financial management of an entire farm business are generally of no immediate concern to high school students. It would appear that emphasis should be placed on developing basic understandings at the junior or senior level. More detailed instruction would be provided later through young farmer courses, adult farmer courses or courses for agricultural businessmen.

A list of possible problem areas and teacher objectives has been prepared to aid the teacher in planning. Interest approaches, teaching activities and references included in the younger farmer and adult farmer section should provide ideas that can be adapted for use with high school students. Anticipated problems, questions and concerns would need to be developed based upon the students experiences and knowledge of their home farm and/or farming program. Problem areas I, V, and VI are explained in more detail in the publication Farm Business Management, A Sample Procedure for Organizing Course Outlines, distributed at the 1963 summer workshop on farm management.

Problem Areas and Teacher Objectives

I. Determining the financial success of the home farm business

    A. Possible teacher objectives: Develop in the students an affective ability to--

        1. Calculate measures of financial success

        2. Analyze a profit and loss statement

        3. Analyze net worth statements

        4.

II. Determining whether it would be profitable to borrow money to operate a particular farm enterprise on the home farm

    A. Possible teacher objectives: Develop in the students an affective ability to--

        1. Analyze operating expenses

        2. Complete a budget

        3. Plan a repayment program

        4.

III. Determining whether it would be profitable to borrow money to expand operations on the home farm

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Analyze projected costs and returns based on new volume

2. Recognize major capital expenses

3. Recognize major changes in operating expenses

4. Plan a repayment program

5.

IV. Determining whether it would be profitable to borrow money to improve a particular enterprise on the home farm

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Analyze projected costs and returns based on new method

2. Recognize major changes in operating expenses

3. Recognize major changes in capital expense

4. Plan a repayment program

V. Determining how to secure money for making home farm adjustments

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Calculate interest rates

2. Identify important characteristics of lender or lending agency

3. Identify important characteristics of a borrower

4. Recognize important legal documents

5.

VI. Planning an insurance program to protect the home farm business and family

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Appreciate the need for protection

2. Recognize major business risks

3. Recognize major risks affecting family welfare

4. Identify appropriate insurance programs

5. Understand important parts of insurance policies

6.

VII. Determining how family and home improvement expenses affect the farm business financial program

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Determine fixed personal expenses

2. Plan a personal budget

3. Recognize where the money comes from to meet family expenses

4.

VIII. Determining how the marketing program followed on the home farm affects the farm business financial program

A. Possible teacher objectives: Develop in the students an affective ability to--

1. Understand seasonal price variations

2. Understand long run price cycles

3. Recognize influence of marketing on income

4.

SOURCES OF REFERENCES AND TEACHING AIDS

This section of the material contains a listing of all references and teaching aids mentioned previously and where they may be obtained. This list supplements Farm Business Management, Partial List of Sources of References and Teaching Aids distributed at the 1963 summer short courses.

*TEXTBOOKS, *HEALTH OCCUPATIONS EDUCATION, *EMERGENCY SQUAD PERSONNEL, FIRST AID, MEDICAL SERVICES, *RESCUE, ADULT VOCATIONAL EDUCATION,

Designed for training emergency squad personnel in rescue procedures and victim care beyond basic first aid, this textbook was developed by a committee of squadmen, doctors, nurses, firemen, and state trade and industrial personnel to be used in adult training classes of full-time or volunteer squadmen. The instructional material includes 26 chapters with photographs and drawings. New medical findings regarding closed-chest heart compression, artificial respiration, first aid for laryngectomy victims, and other phases of first-aid work including the most recent rescue procedures and techniques are presented. Representative chapter titles are (1) Childbirth, (2) Common Squad Emergencies, (3) Oxygen Therapy, (4) Electrical Emergencies, (5) Waterfront Operations, (6) Records and Reports, (7) Post-Mortem Conferences, and (8) Legal Aspects. Each chapter provides an introduction to the emergency, defines terms, lists symptoms, and explains the equipment, methods, and procedures needed to adequately handle the situation. The course should be taught by a qualified squadman. An instructor's manual (VT 004 066) is available. This textbook is available for $4.15 from Ohio Trade and Industrial Education Service, Instructional Materials Laboratory, The Ohio State University, 1885 Neil Avenue, Columbus, Ohio 43210. (HC)

Describe Emergency Victim Care and Rescue Instructors Manual

Source (agency) Instructional Materials Laboratory
(address) 1885 Neil Avenue, Columbus, Ohio 43210

PREFACE

The Trade and Industrial Education Service within the Division of Vocational Education, The State Department of Education, has assisted public schools to provide training in Trade and Industrial occupations to the citizens of Ohio since 1918. Its purpose has been to prepare young men and women for employment in all types of industrial and service work, as well as to upgrade adult workers for greater efficiency in their chosen field.

Ohio can be truly proud of the vocational instruction provided to local communities in fire service training. This training has undoubtedly been responsible for saving many lives and preventing much property loss in the state. Emergency rescue training has been developed to further serve the citizens of Ohio by providing well-qualified persons to deal with emergency situations. The personnel trained may be members of fire departments, police departments, or other agencies who are involved in the emergency treatment and rescue of people.

This revised and expanded volume is designed to serve as a text for emergency rescue training and includes the latest information on sound practices in emergency squad work.

E. E. Holt, Superintendent of
Public Instruction

Byrl R. Shoemaker
Director of Vocational Education

FOREWORD

The importance of adequate training for emergency squad personnel, in rescue procedures and victim care beyond basic first aid, has been obvious for some time. International as well as national medical and rescue associations have expressed a dire need for a solution to this training problem.

The Ohio Trade and Industrial Education Service, Division of Vocational Education, of the State Department of Education has taken an active part in the training of fire department personnel since 1939. Through the training and utilization of part-time instructors, the Trade and Industrial Education Service has been able to make fire service training available to all fire departments in the state. This training has given assistance to paid departments, and has been of particular help to volunteer departments. More recently a similar program has been developed for training emergency squad personnel in victim care and rescue procedures. Some of these emergency squads are parts of local fire departments and some are not.

In 1959 the Ohio Trade and Industrial education Service published an Emergency Rescue Squad Manual as a part of its training program. This comprehensive text was a pioneer in its field. A survey of literature had failed to disclose adequate materials for a complete training program. The materials available were fragmentary; each omitted vital phases of emergency and rescue squad work. The Emergency Rescue Squad Manual therefore filled a critical need. It has been widely distributed and has been reprinted every year since its publication.

Meanwhile new medical findings about closed-chest heart compression, artificial respiration, first aid for laryngectomy victims, and other phases of first-aid work have been introduced into Ohio's training program for emergency squadmen, along with the most recent rescue procedures and techniques. These new materials have been incorporated in this major revision of the original manual for squadmen titled "Emergency Victim Care and Rescue."

It is sincerely hoped that this revised text will become a part of all training programs for emergency squads within the State of Ohio.

Harry F. Davis, Supervisor
Trade and Industrial Education Service

ACKNOWLEDGMENT

This revised textbook has been a cooperative effort involving many persons concerned with emergency squad training.

The State Fire Service Advisory Committee for Trade and Industrial Education has given its support toward providing for an adequate training program. The organizations represented on this committee are: The Ohio Fire Chiefs' Association; The Ohio State Fire Marshal's Office; The Ohio State Firemen's Association; The Ohio Association of Professional Fire Fighters; The International Association of Fire Fighters; The Ohio Inspection Bureau; and The International Fire Chief's Association.

The first emergency rescue squad manual (1959 edition) was developed by the Ohio Fire Service Training Coordinators and a registered nurse with much rescue experience. The new text was prepared by Jack B. Liberator, R.N., former Emergency and Rescue Squad Training Coordinator for Trade and Industrial Education.

The present staff of Fire Service Training Coordinators are: C.J. Getz, Harry Ohlrich, Joe Heinzen, Frank Potts, and Rocco Morando, Emergency and Rescue Squad Training Coordinator.

A Medical Advisory Committee has given assistance on the chapters dealing with victim care, in order to provide the latest recommendations for care by squadmen. The committee consisted of the following: C. Joseph Hatfield, M.D., and Vol K. Philips, M.D., Internal Medicine; Walter Haynes, M.D., and Jack Tetirick, M.D., General Surgery and Chest Surgery; Charles R. McClave, M.D., and William Baldock, M.D., Pediatricians; John G. Boutselis, M.D., and William Merryman, M.D. Obstetrics; William Hamelberg, M.D., Anesthesiology; Robert R. Kessler, M.D., Orthopedic Surgery. All are staff members or chairmen of departments of the College of Medicine of the Ohio State University.

The Trade and Industrial Education Service also wishes to acknowledge the following persons, institutions, associations, and manufacturers for permission to use pictures, illustrations and certain other material used in this manual: Abbott Laboratories; American Druggist; American Heart Association, Inc.; Blackhawk Manufacturing Company; A.B. Chance Company; E & J Manufacturing Company; The Gerstenslager Company; Greenfield Township Fire Department; Linde Company; Division of Union Carbide Corporation; J.B. Lippincott Company; Loudonville Fire Department; Lynhurst Fire Department; McKesson Appliance Company; Maryland Civil Defense Agency; Mifflin Township Fire Department; Mine Safety Appliances Company; Motorola, Inc.; National Board of Fire Underwriters; National Welding Equipment Company; Northern Hills Fire Department; Ohio State Highway Patrol; Pleasantville Fire Department; Prairie Township Fire Department; Safety Clothing and Equipment Company; W. H. Salisbury & Company; Scott Aviation Corporation; Superior Coach Corporation; Sylvania Township Fire Department; Toledo Fire Department; White Rubber Company; Columbus Fire Department Emergency Squads; Franklin County Firemen's Association; Licking County Firemen's Association; Fairfield County Firemen's Association; Ohio State Fire Marshal's Office; International Rescue and First Aid Association; Medical Advisory Committee; Trade and Industrial Education Services, for Emergency and Rescue Squad Training; St. Anthony Hospital, Columbus; Mount Carmel Hospital, Columbus; Sharon Township Fire Department; Eastern Greyhound Lines; Convaire Aviation Corporation; Dr. Robert M. Reese for photography; Lost Cord Club of Columbus; Clinton Township Fire Department; Yorkville Fire Department; Dr. R. L.Dickinson; Dr. G. P. Shears; Zabriski-Eastman.

CHAPTER I

EMERGENCY AND RESCUE VEHICLES

INTRODUCTION

Many of the residents of our communities today are the unfortunate and innocent victims of tragedies and disasters which, needless to say, are increasing in alarming numbers. As more and more traffic accidents, drownings, fires, explosions, tornadoes, floods, airplane crashes, and many other misfortunes occur, there is a tremendous need for well trained men and special equipment to handle these situations. It is a recognized fact that saving lives is of paramount importance where these emergencies occur. But it also must be recognized that the necessary equipment must be on hand to do the job. Emergency rescue units are being organized in steadily increasing numbers throughout the nation, to cope with these new demands. Encouragement to groups of men trying to organize such units is of vital importance. One way to do this is to make certain they are provided with the best training and the best equipment to make them into an efficient life-saving and rescue unit.

LOCAL NEEDS

Local needs for equipment will vary in accordance with the present as well as the future physical and financial conditions and circumstances in each community. It is well to analyze the local situation, to avoid jumping to any hasty conclusions. A number of important preliminary factors must be taken into consideration before attempting to organize an emergency rescue unit which is to provide the facilities normally relevant to its operation. Some of these factors are as follows:

1. Present and potential needs of community or area to be served
2. Topography of land and condition of roads
3. Terrain to be covered, including lakes and rivers
4. Number and availability of personnel to complement apparatus
5. The present and future road and industrial hazards
6. Financial situation relative to buying, maintaining, and providing necessary and additional tools and equipment
7. Continuing future community support of this operation
8. Type of service to be provided
9. Kind and amount of equipment to be carried on vehicles

After determining which of these factors are pertinent to the service you plan to offer the community, it can tentatively be decided what kind of apparatus and equipment is desired.

Now, what further information is needed which might influence a choice in this selection? Here are a few examples which will explain the thinking in this respect.

Where transportation to a hospital is to be carried out for victims of accidents, possibly an apparatus in the ambulance classification might be considered. If, however, local police, fire, or other sources provide such transportation, a greater need might exist for a light panel-type vehicle.

When bodies of water are present in the area to be served, it would be well to consider the possibility of towing or carrying a boat. This would also have some bearing on the size and type of vehicles to be selected.

Busy highways, expressways, turnpikes where major traffic accidents are apt to occur involving heavy tractors, trailers, and various large trucking operations, would probably indicate the need for a heavy rescue vehicle equipped with heavy rescue tools and appliances.

TYPES OF EMERGENCY AND RESCUE VEHICLES

Now let us assume that the need for a vehicle has been tentatively decided, and the selection of a vehicle is in order. What is available? In brief, here is a collective description and explanation of the potential units to choose from, to satisfy local needs.

There are three main styles of vehicles used by emergency and rescue units. Each style is suited for a particular emergency or rescue operation.

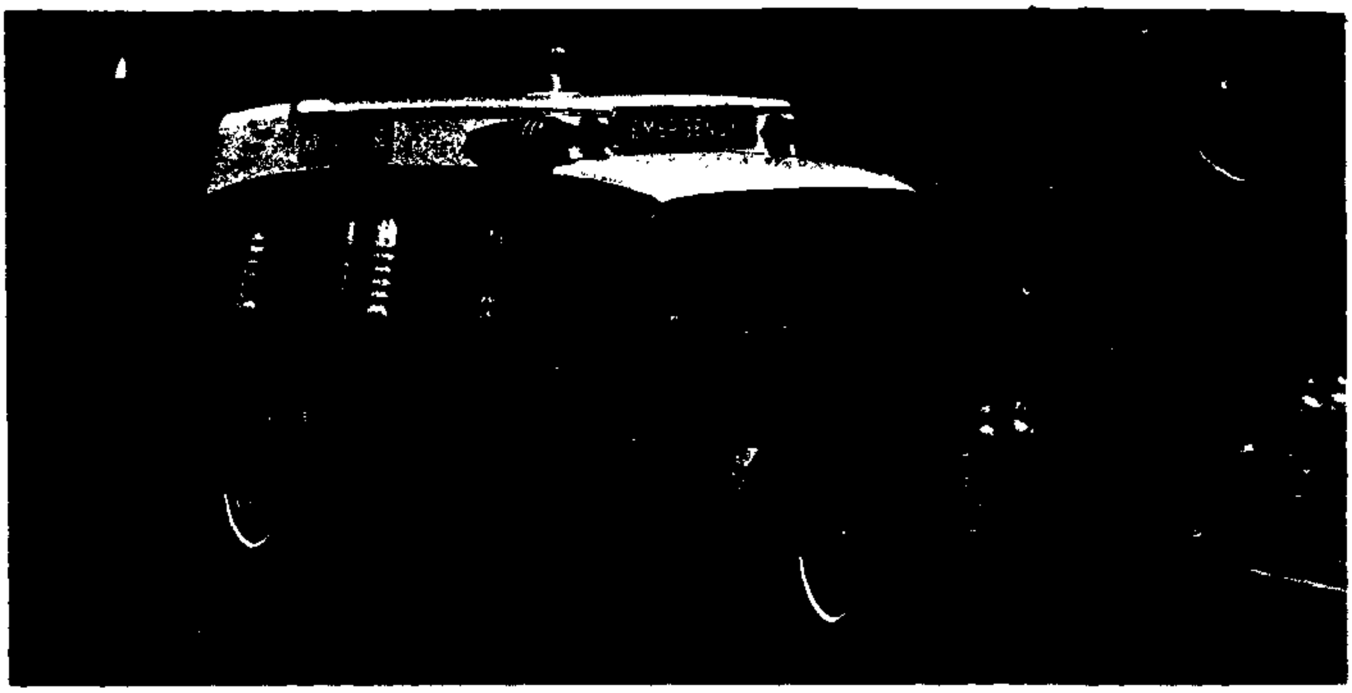
AMBULANCE

The ambulance is used almost entirely for transportation, but it may be designed for light rescue work.

There are various designs of ambulances built today by reputable manufactures. Many of these are "stock models". but others are built according to a buyer's specifications. Before a rescue squad decides which ambulance is best suited for their needs, the expected use of the vehicle must be established, along with the necessary tools and accessories which will be included. Although ambulances are used primarily for transportation, many of them carry first aid appliances, supplies and accessories including oxygen bréathing apparatus. (See Figures 1 and 2.)

Figure 1

Small ambulance



Courtesy Superior Coach Corp.

Figure 2
Large ambulance

This equipment is generally arranged to permit its use as follows:

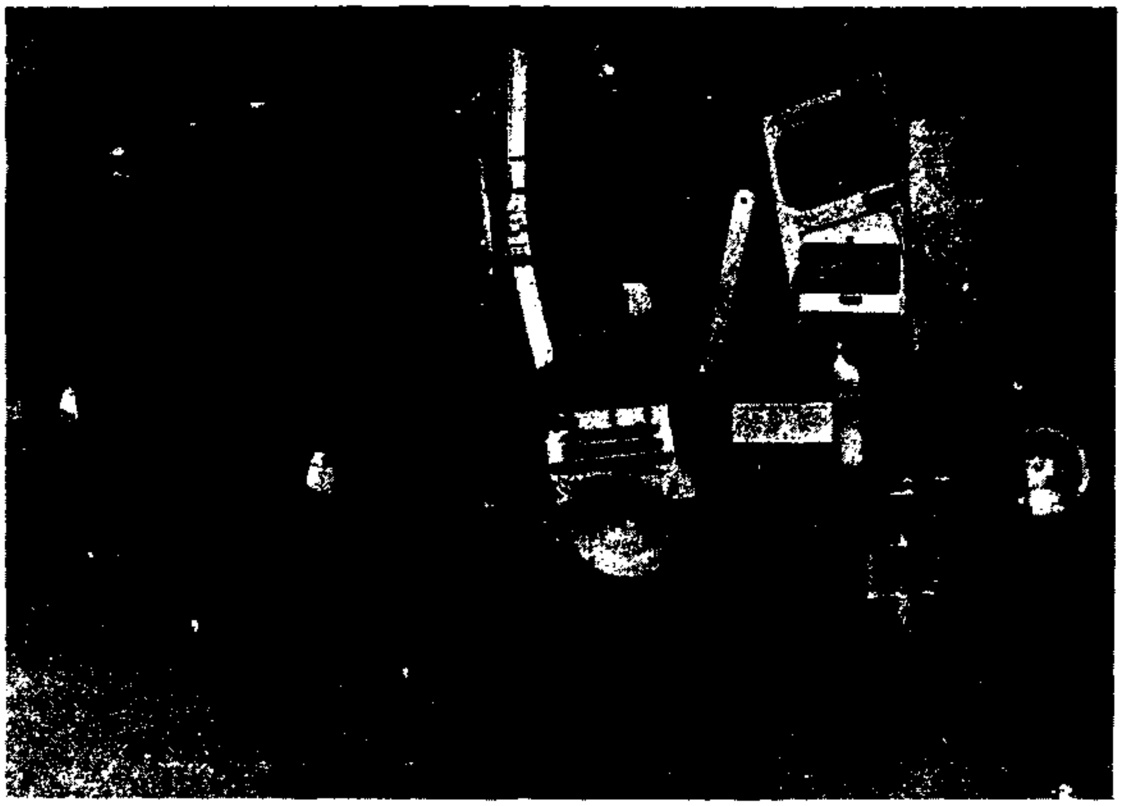
1. At the scene of an accident
2. Enroute to a hospital
3. While transporting a victim to or from the ambulance

It is important, however, that the buyer make a careful study to determine exactly what is needed. This will aid in drawing up the specifications which subsequently can be presented for bids. It is equally important to select the proper automotive chassis, in order to satisfactorily fulfill the needs in respect to safety, ease of handling, and the terrain to be traveled.

LIGHT RESCUE

The light rescue vehicle is adapted mainly for light rescue operations because of its restricted carrying capacity. However, in some instances these units are designed so they may also be used for transporting a victim or victims if necessary.

This type of equipment is generally built along the "panel" or "semi-panel" design, having a road capacity from one-half to one and one-half tons. One of the many functions it must often perform is to transport a boat, either on the top of the truck or by the aid of a trailer. In either case such an arrangement demands careful planning. These trucks are also designed to carry light rescue tools and equipment such as forcible-entry tools, jacks, breathing apparatus, masks, protective clothing, etc., plus the normal first aid supplies. In selecting this type of equipment for a rescue unit, prime consideration must be given to load limits so that the vehicle will not be overloaded beyond the weight for which it was built. (See Figure 3.)



Courtesy Doylestown F.D.

Figure 3
Light rescue vehicle

HEAVY RESCUE

The heavy rescue vehicle is designed primarily for heavy-duty operations where a maximum carrying capacity is required, to transport all the tools, appliances and equipment to perform such operations. Some carry portable generators that operate saws, drills, hammers, and forced-air ventilating systems. Many of these heavy-duty units are equipped with a winch and cable for pulling heavy objects and/or "frame hooks" to be used with a tow-chain. Where these "straining" operations are to be demanded of the equipment, specifications should so state these provisions and include the necessary power units to perform such functions. (See Figures 4 and 5.)

Such a truck normally carries three to five tons above the weight of the truck itself. It is well to have a 20 per cent to 25 per cent weight allowance above the total weight of present equipment and men, because as time goes on, new and additional tools will be added and only a few will be discarded. Specifications should present instruction to the manufacturer to build a heavy-duty rescue truck having an engine and correlated parts designed to produce safe road-speed performance at safe engine revolutions per minute on the terrain it will normally travel. An extensive study of rescue trucks should be made before arriving at a final decision. Heavy-duty rescue trucks are not used for transportation of victims except in extreme emergencies.

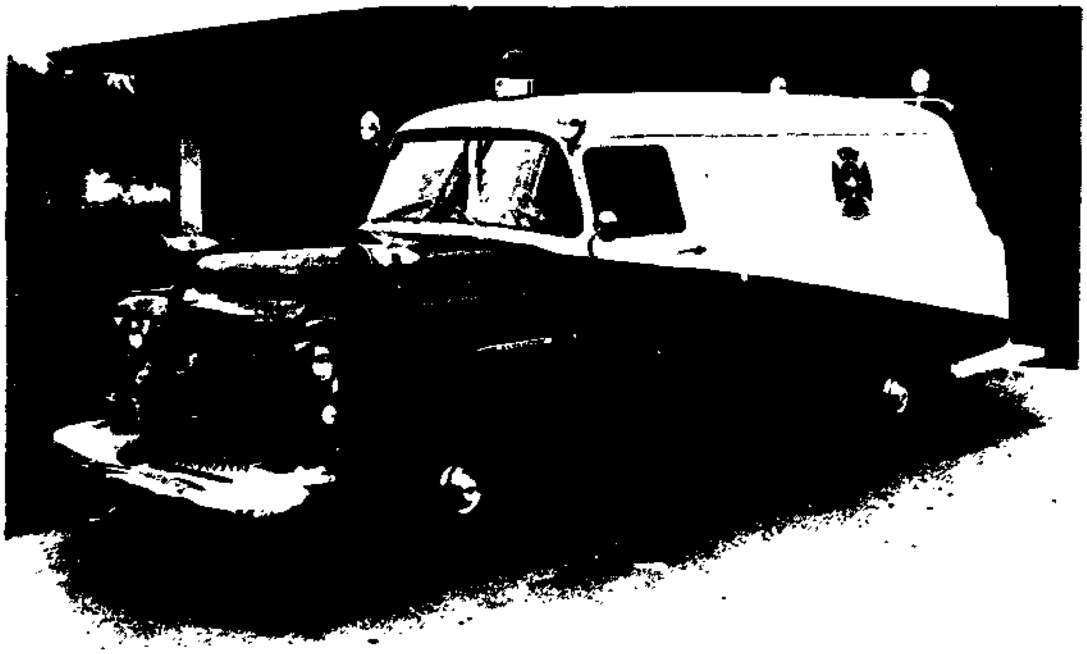
Figure 5

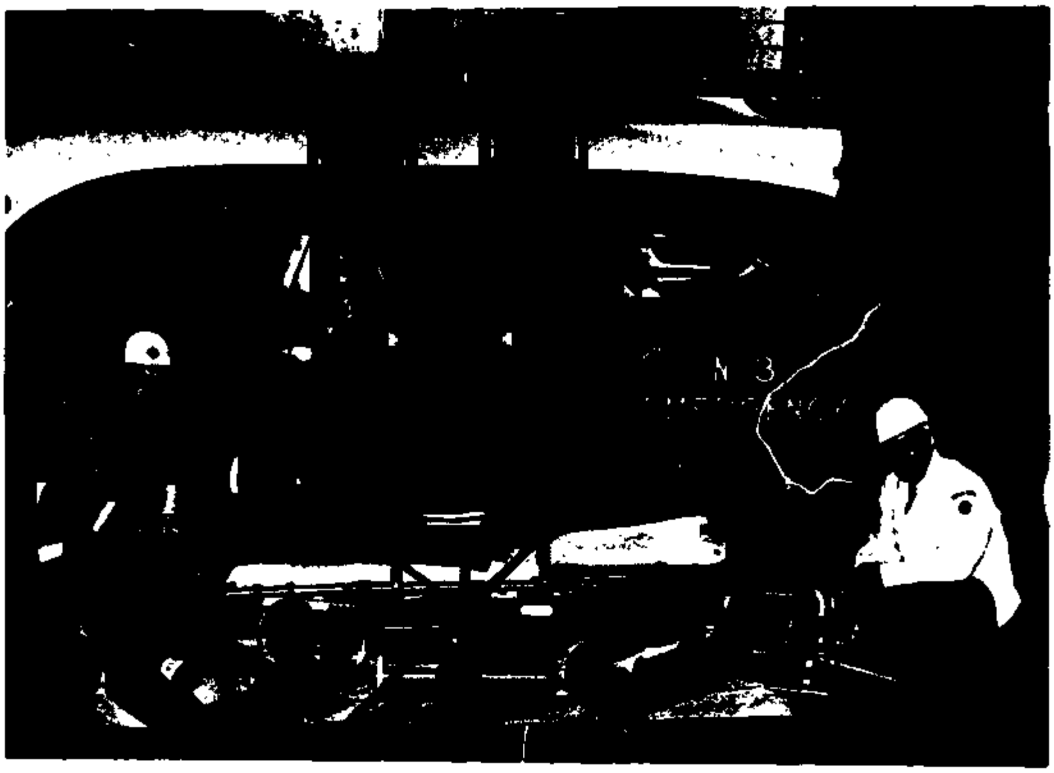
Heavy rescue vehicle



Courtesy Moorefield F.D., Piedmont, O.

Figure 6

A unique squad vehicle. It can transport, carry rescue tools, and also carry a tank of water for fire-fighting or stand-by. The vehicle shown above has all of these features plus a 500 g.p.m. front-mount pump. It can play many roles in emergency service.



Courtesy Canton Twp. F.D., Canton, O.

Figure 7

One might think that an ambulance is too small to do a proper emergency rescue squad job. As this photo shows, a great deal of equipment can be carried in an ambulance.

CONCLUSION

In conclusion it may be well to emphasize certain points which should be considered in the specifications before the selection and purchase of any vehicle, regardless of its classification:

1. Weight of chassis
2. Weight of equipment
3. Hauling weight (trailer and boat)
4. Horsepower
5. Type of wheels (single or dual)
6. Load limit established by manufacturer
7. If a used vehicle is considered, what is its mechanical and physical condition?

Overloaded vehicles result in breakdowns which render the unit unusable and unable to provide the service for which it was intended. Do not make the mistake of attempting to haul three tons of equipment on a one-ton truck.

CARE AND MAINTENANCE OF A VEHICLE

The care and maintenance of any emergency unit and every piece of equipment it carries is the direct responsibility, function, and obligation of those assigned to carry out this duty. Such responsibility should be delegated to dependable and reliable officers or men. But, regardless of who performs the clean-up operation, the officer in charge should direct the work and inspect the results. This procedure is not meant to infer that the men who did a clean-up job cannot be relied upon, but rather it places the different levels of responsibility where they belong. After all it is the officer's duty to see that this unit is ready to respond at all times.

Therefore, in order to insure instant and efficient performance by an apparatus, it is imperative that certain items be checked and inspected after each run. The following list can be used as a guide to direct this inspection service. Other items can be added by the local department in accordance with existing policies, rules, and regulations.

The following items should be checked after each run for defects and services needed:

1. Brakes and their related parts
2. Gasoline and oil levels - Replenish if necessary and look for leaks.
3. Tires - Check for foreign bodies, for cuts, and for air pressure.
4. All gauges and instruments of the dash board
5. Battery, especially on radio-equipped vehicles
6. Radiator - Check water level of cooling system.
7. Safety belts, if so equipped
8. Lights - Head, tail, stop, directional, dash, dome, and warning lights
9. Steering mechanism
10. Mirrors - Rear and side(s)
11. Siren - Check for proper operation.

While on the subject of care and maintenance, one very important factor in this respect which must not be overlooked is CLEANLINESS. It has been very well established that one of the trademarks of any good emergency unit is its appearance. The squad truck must be kept clean inside and out, to protect patients as well as squadmen. The handling of contagious diseases is a good example of a reason for keeping the squad unit clean.

In addition to the routine inspection, it is advisable to have a complete and thorough periodic check of the automotive equipment. It is recommended that this be made on at least a monthly basis. An inspection record should be maintained on a report form, which will be filed for reference. The driver, a mechanic, or whoever is qualified or detailed to do this work as stipulated by local policy, should be held responsible for this job. Figures 8 and 9 are copies of forms used at the present time by some departments. Please note that only the signature of the person making the inspection is included on one of these, while on the other an additional signature by the officer is required. The latter definitely indicates to the officer the defects reported and his signature certifies he is aware of them. However, local policy shonld determine the procedure to be followed.

CHAPTER II

EQUIPMENT

INTRODUCTION

No greater service can be provided by any emergency or rescue squad than the saving of human lives. When an emergency occurs in which life is in danger, it is the duty of the emergency unit to be so equipped and trained that it will be able to render efficient and effective service.

To meet this obligation, squadmen must carry in their vehicle sufficient rescue and life-saving equipment to meet these situations. The equipment must be maintained in first class condition at all times, and everyone assigned to the rescue unit must be thoroughly trained in and familiar with its use.

Basic tools and equipment can be divided into two categories: those used for life saving and those used for rescue work.

NOTE: The following list of tools and equipment, although very comprehensive in nature, does not include every piece of equipment that might be used. Additional items pertinent to this operation can be added in accordance with local needs. The items chosen, and the quantities, must be in keeping with the type and size of vehicle.

LIFE-SAVING TOOLS AND EQUIPMENT

These include appliances necessary to save life and/or sustain life until the arrival of medical assistance or while enroute to a hospital.

FRACTURE EQUIPMENT

Fracture kit
- 12 Triangular bandages
- 6 Large safety pins
- 6 4 x 4 sterile compresses
- 6 4 x 12 inch splint boards
- 1 Roll 1-inch tape
- 6 Wooden tongue blades
- 1 Roll 2-inch gauze

This equipment should be assembled and carried in a container marked "Fracture Kit."

Additional equipment
- 2 Traction splints
- 4 Straps (5' x 4") to secure the patient to stretchers or backboards

OXYGEN - ADMINISTERING EQUIPMENT

Straight inhalator

Combination resuscitator, inhalator, aspirator with 50 ft. extension

Two extra tanks for each

FIRST AID KITS

Squad first aid kit (See Figure 1)
Large commercial first aid kit
(See Figure 2)

Courtesy Shaton Twp. F.D.

Figure 1

Many squads use a physician's bag or one similar as their first aid kit. These bags are durable and convenient. Note that one compartment holds emergency supplies for a physician. These supplies can be chosen on the recommendations of your local physician. The remaining part of the kit is filled with first aid supplies.

BLANKET ROLL SPLINT

This is made with a small blanket folded until it is 12 inches wide. It is then rolled from each end to the middle. It should be rolled very tight. Three cravat bandages can be tied around it to keep it in place. (Pictures on page 59.)

BLANKETS

Wool blankets should be available, to place under a victim or to wrap around him.

Courtesy Mine Safety Appliances Co.

Figure 2

Large commercial first aid kit

STERILE SHEETS

These sheets should be of white cotton material and be kept sterilized. Note: Local hospitals in some areas cooperate in providing sterilization service. Sheets can also be purchased pre-sterilized.

RUBBER SHEETS

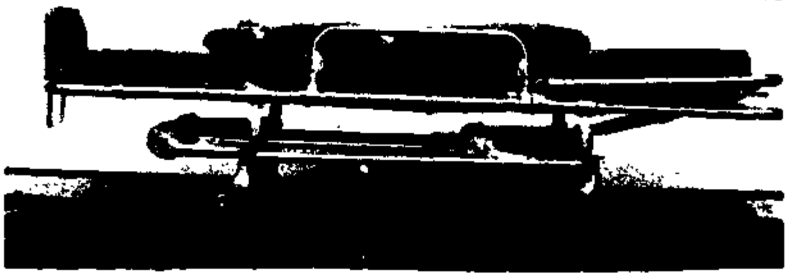
These sheets are used for protection of blankets, cots, etc.

O.B. (OBSTETRICAL) KIT

4 Hemostats (straight)
2 Foot-long pieces of umbilical tape
3 Pairs of sterile gloves
(assorted sizes)
1 Pair of sterile scissors
1 Ear syringe
Sterile towels
Soft baby blankets
Silver nitrate for installation into eyes
(Pictures on page 43.)

STRETCHERS

Ambulance-type (See Figure 3 and 4)
Collapsible stretcher (See Figure 5)
Adult backboard (See Figure 6)
Child backboard (See Figure 7)
Backboard foot rests (See Figure 6)



Courtesy Sharon Twp. F.D.

Figure 3

Courtesy Sharon Twp. F.D.

Figure 4

The newest type of stretcher is adjustable. It can be carried in the squad vehicle as shown in Figure 3. Upon arrival at the hospital, this stretcher can be raised to the height of the hospital cart, table, or bed, as shown in Figure 4. This permits transferring the patient with a minimum of movement, and eliminates lifting.

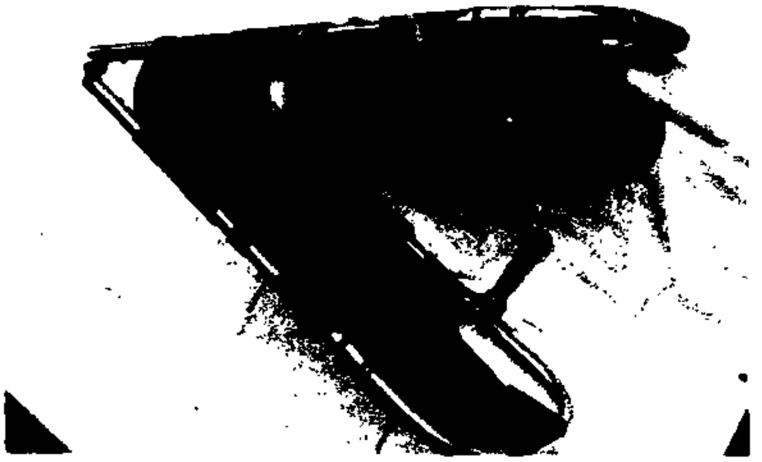


Figure 5

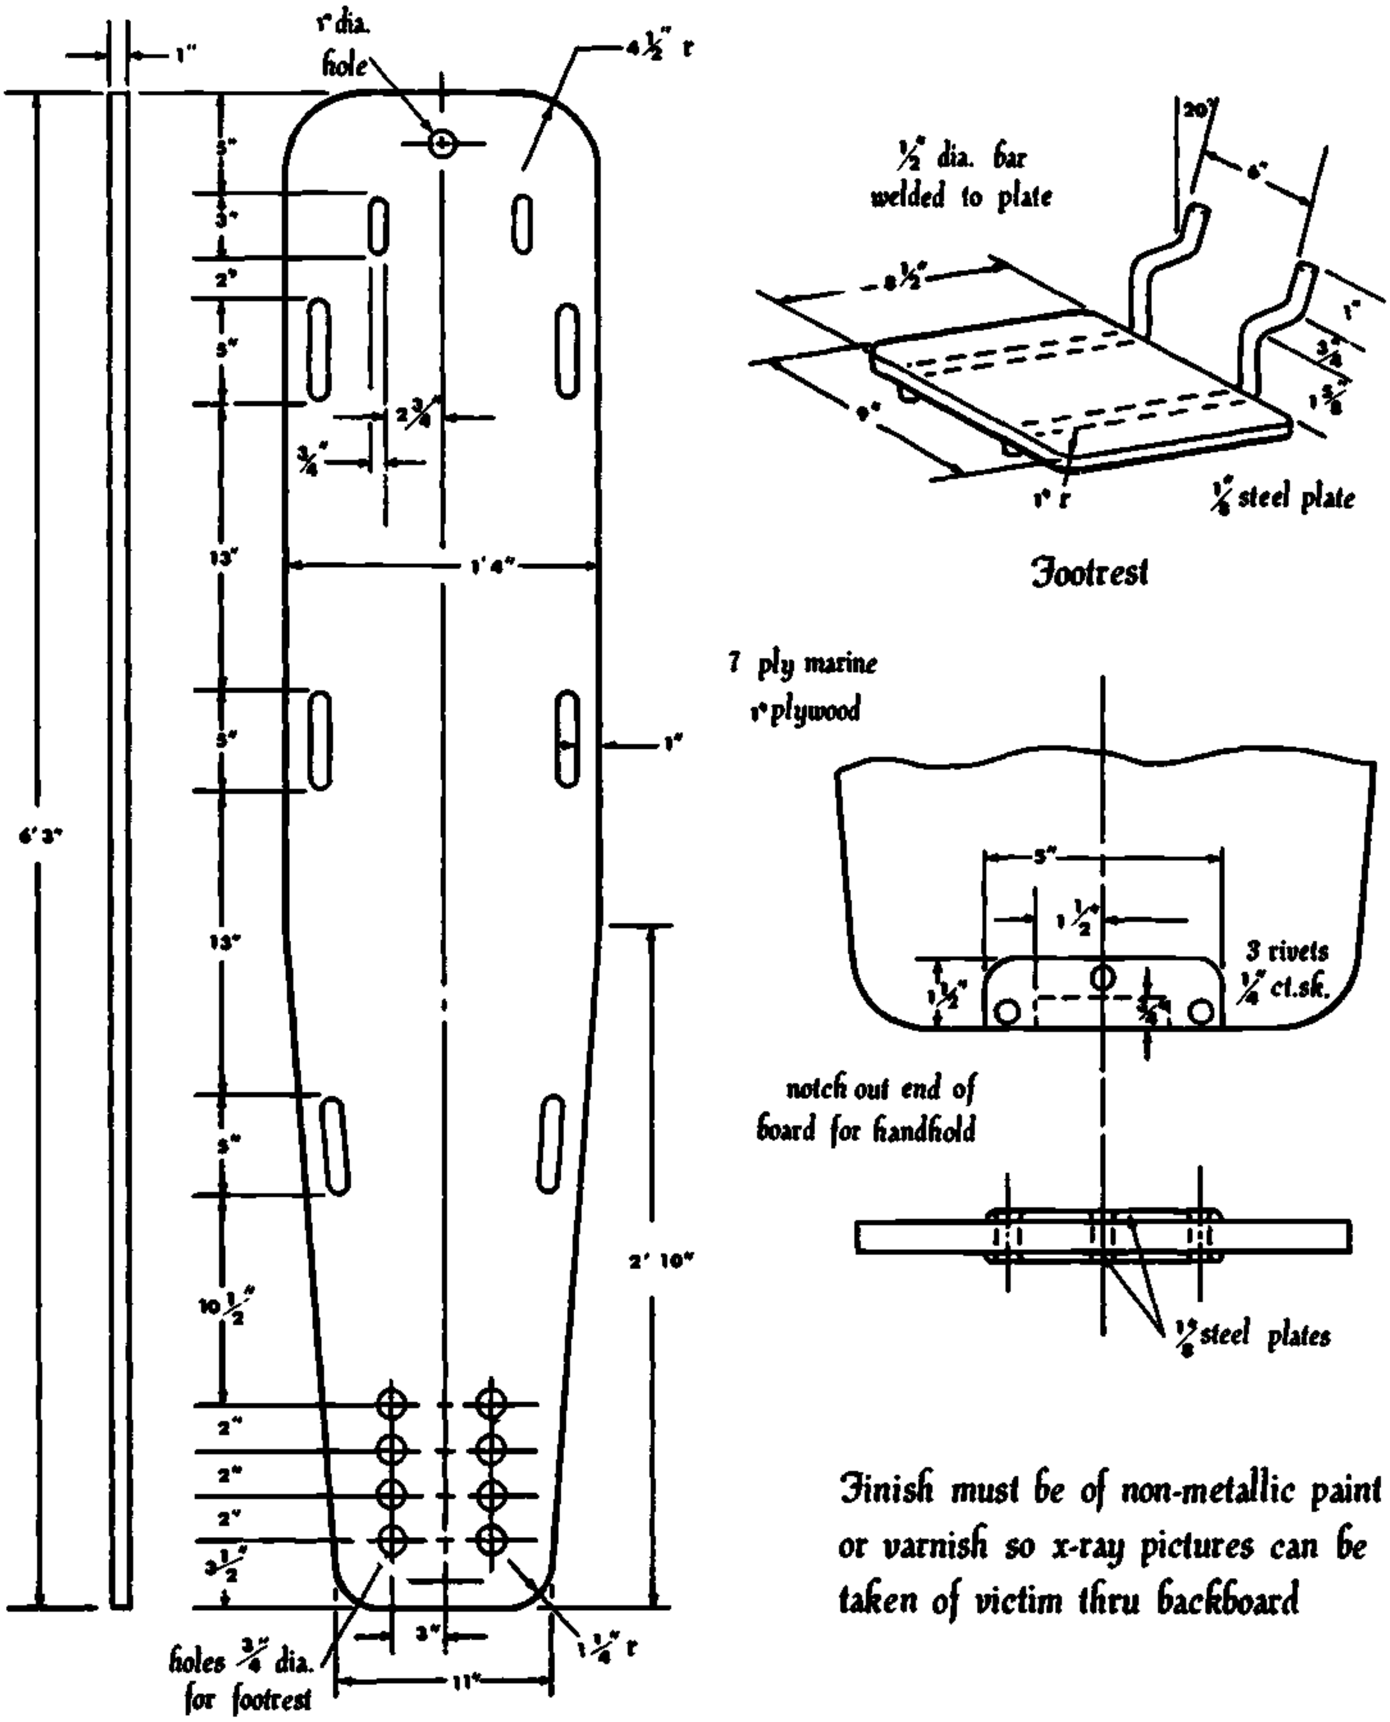
Courtesy Sharon Twp. F.D.

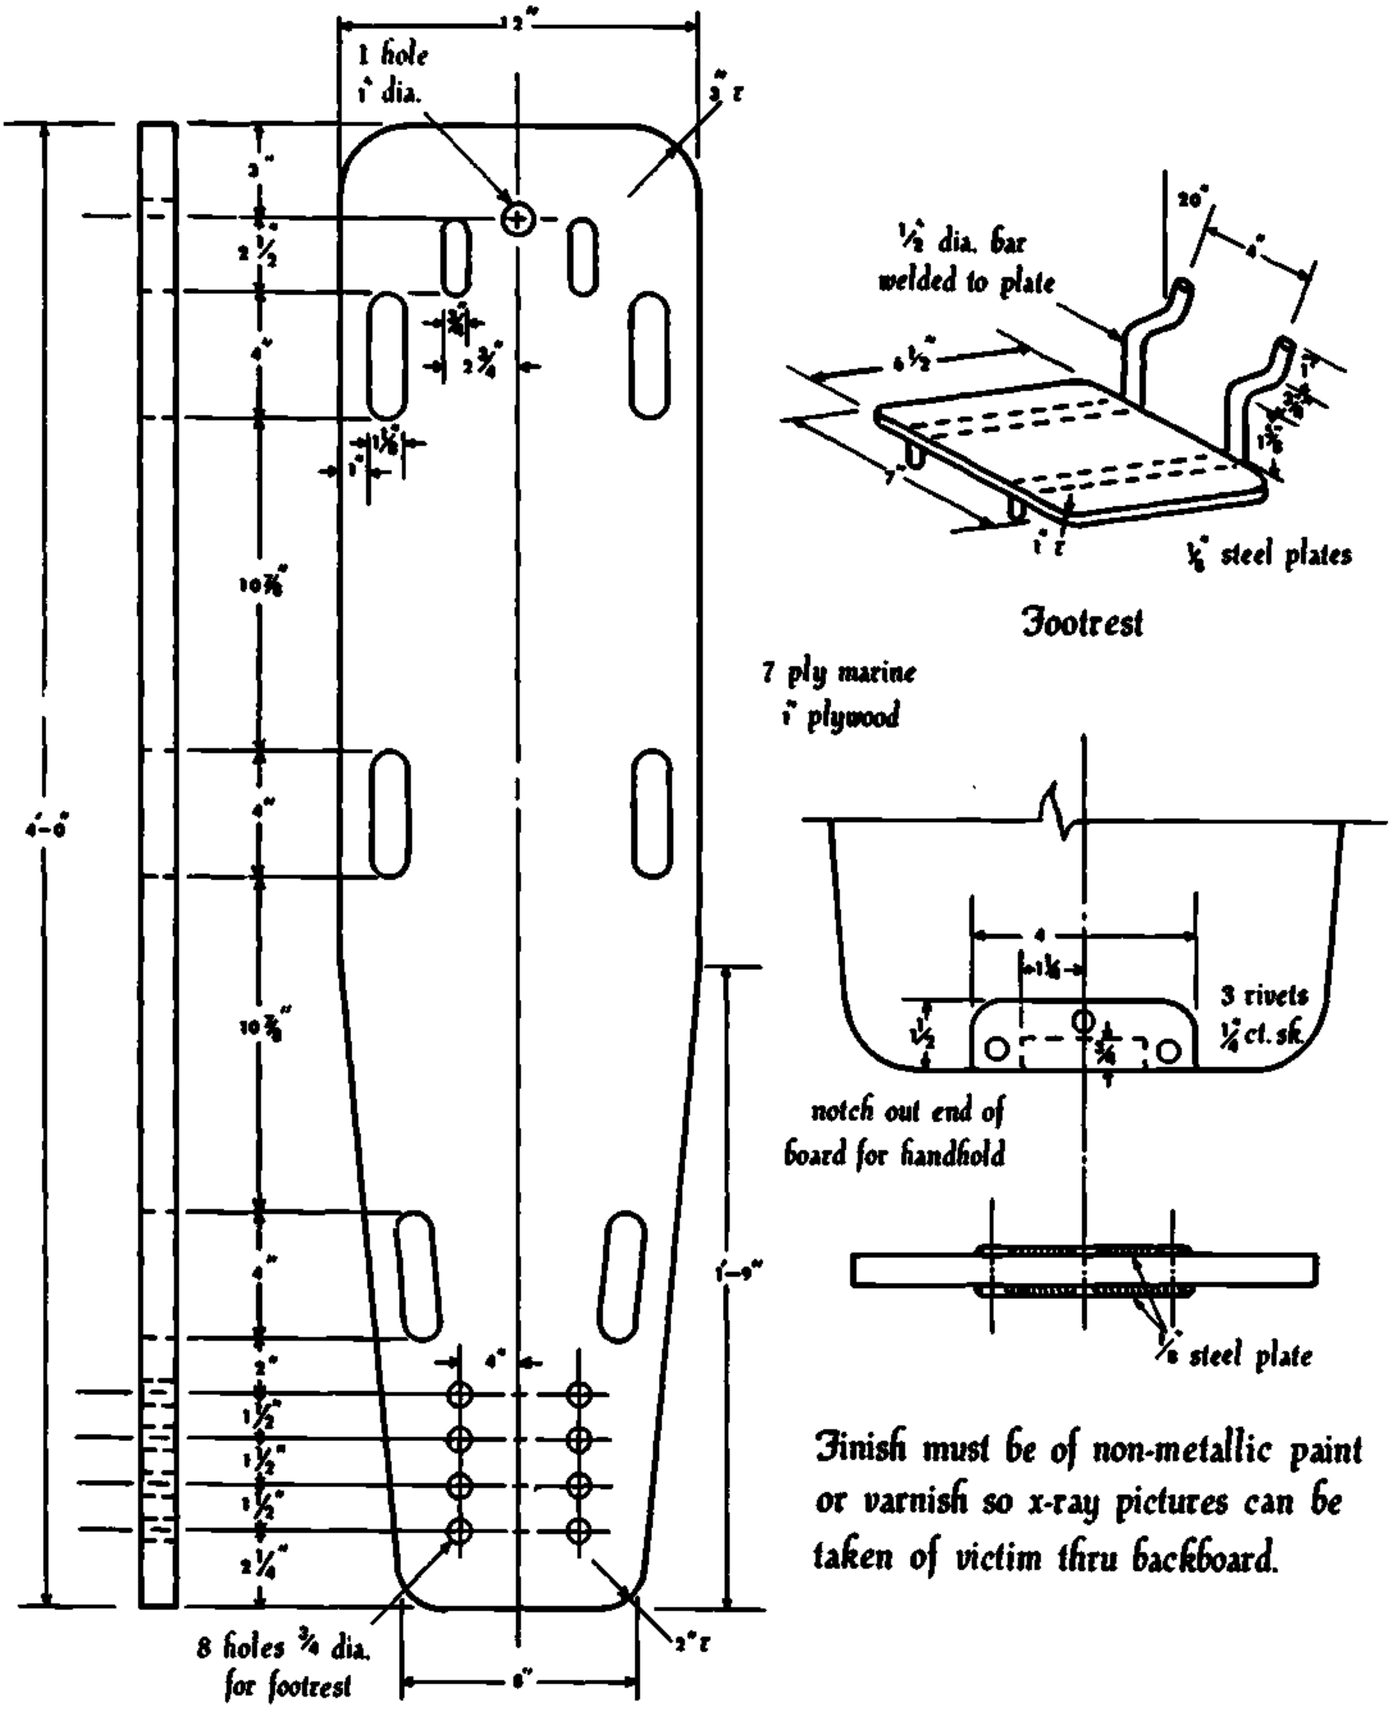
It is good practice to have an additional stretcher available on the squad truck. Multiple-injury accidents require the squad to transport more than one patient. The stretcher shown here is collapsible; it can be stored in the squad truck until needed.



Finish must be of non-metallic paint or varnish so x-ray pictures can be taken of victim thru backboard

Figure 6

Adult backboard



Finish must be of non-metallic paint or varnish so x-ray pictures can be taken of victim thru backboard.

Figure 7

Child backboard

FIRE BLANKETS

These are primarily for the protection of a victim: for example, during the use of a cutting torch. (See Figure 8)

Courtesy Safety Clothing & Equip. Co.

Figure 8

Fire blanket

MASKS

Self-contained (demand, supplied air, or oxygen generating)

SPECIAL PROTECTIVE CLOTHING

Asbestos or heat-resistant suits
Asbestos or heat-resistant gloves and mittens
Ammonia suit

ARM BANDS, COATS, ETC.

These serve not only as a means of identifying the squadmen, but also afford protection for the squadmen and the victim. When protective cover-alls, shop coats, or jackets are worn, it should be mandatory that they be kept clean.

BODY STRAPS

These can be made of leather or of webbing. They are used to lash the victim to the stretcher during rescue or to restrain the victim when such action becomes necessary.

CLOTH FACE MASKS

These are used for protection against contagious diseases.

LINEN SUPPLY

Storage at headquarters for extra blankets, sheets, coats, cloth face masks, etc. will facilitate replacement of materials in the emergency or rescue units.

RESCUE TOOLS AND EQUIPMENT

These involve appliances used to rescue people trapped in various critical circumstances, such as automobile accidents, drownings, cave-ins, explosions, etc.

ELECTRICAL SAFETY EQUIPMENT

Rubber gloves and protectors
    (See Figures 9 and 10)
Wire cutters (See Figure 11)
Firemen's cutters (insulated)
Wire holding stick (See Figure 12)
Pipe wrench (large)

Figure 12

Wire-holding stick

STRIKING TOOLS

Axes (pick head, flat head, hand axe, etc.)
Hammer (sledge, rubber head, mallet, etc.)
Picks (hammer head, mattock, plain, etc.)

CUTTING TOOLS

Wood cutting (electric or manual saw, air hammer, chisel)
Masonry cutting (electric or manual saw, air hammer, chisel, star drill, etc.)
Metal cutting (electric saw, hack saw, cold chisel, tin roof cutter, bar cutter, oxy-acetylene torch, tin snips, finger-ring cutters, bolt cutters)

BATTERING TOOLS

Battering ram
Ball on chain

PRYING AND LIFTING TOOLS

Claw tool
Door opener
Hux bar
Crow bar

BORING AND DRILLING TOOLS

- Electric
- Breast
- Brace and bit
- Metal and wood drills in assorted sizes

HOISTING, PULLING AND LIFTING EQUIPMENT

- Rope (½" to 1")
- Block and tackle
- Sheave block
- Assorted rope
- Pike pole
- Ratchet jack
- Hydraulic jack (See Figure 13)
- Log chain
- Cable
- Hydraulic rescue kit (See Figure 14)

FIRST AID FIRE-FIGHTING APPLIANCES

- Pressure-type water extinguishers
- Soda and acid
- Foam
- Carbon dioxide
- Dry powder

MISCELLANEOUS TOOLS AND EQUIPMENT

The following is a list of tools and equipment which do not fall directly into previous classifications, but which may be important in equipping your emergency or rescue squad.

Salvage covers
Pike poles
Fire helmets
Rubber body wrapper
Ditch jacks
Rescue harness
Life jackets
Small hose roller
Small folding ladder
Large screwdriver
Long and short-handled shovels
Walkie-Talkie radios (See Figure 16)

Courtesy Motorola Inc.

SPECIAL EQUIPMENT

Some rescue operations require use of the heavy-duty mobile equipment designed for earthmoving or wrecking jobs: power shovels, scrapers, bulldozers, cranes, dump trucks, highway wreckers, etc. Specially qualified, trained men operate these machines. A squadman cannot be expected to be familiar with their use and operation, unless he is employed in these areas on a full-time basis.

It is wise to contact the owners or operators of such equipment, in the squad's area of service, asking for their cooperation in the event that a sudden emergency creates a need for their services.

In communities that maintain service departments, or where the service departments of the State, County, Township, or public utilities are available, it is well to enlist their equipment and manpower in developing a local program. This creates a sound public relations bond among all parties concerned, for the safety, good, and welfare of the citizens in the area.

The control of a cooperative rescue operation is important and must not be overlooked at the development stage. It must be established at the inception that the person who commands the department or emergency unit will have complete authority to request and command auxiliary equipment when it is needed. There is no time for "red tape" during an accident or disaster, when life depends on efficient dispatching and control of equipment.

For equipping a squad that must serve a waterfront area, see Chapter XXII.

CHAPTER III

PERSONNEL

INTRODUCTION

The successful operation of an emergency or rescue squad unit depends on every man assigned to it. Only when this is recognized and accepted can satisfaction and efficiency be obtained. The saving of life is a serious business in itself and it should be handled by trained and qualified personnel. A small amount of first aid knowledge is not enough to assure the safety and welfare of a victim, under many circumstances. It should be mandatory that only personnel who have successfully completed the Advanced First Aid Course offered by the American Red Cross, or any other similarly qualified agency, and have passed the state emergency rescue training course, be considered for this important duty.

Good public relations are extremely important in any department. The services of the squad must sell themselves through the conduct and efficiency of individual squadmen. Therefore, it is imperative that squadmen be selected with great care in order that they will obtain respect from the public. Following are more specific recommendations to be used in the selection of personnel.

QUALIFICATIONS

Note: The following items are not listed in any special order of importance. They are to be used comprehensively and collectively and will merely serve as a guide to determine the over-all capability of each person to be considered as a squadman.

1. He must have volunteered for the job. This is primarily an indication that the person wants to take part in the performance of this particular duty at his own request. As a rule, no one cares to do a job, or carry out the duties of a job, if he has a physical or mental aversion to the obligation involved.
2. He must be available. There is no point in having a man assigned to lifesaving units when it may be questionable as to whether he will, or will not be in a position to respond to the alarm. For example, a man whose private work takes him out of the community would not be a good choice here. However, if there are a number of men involved in the same situation, it might be well to give some thought to the idea of organizing the personnel on a so-called day or night platoon basis. Thus squad personnel would be available on a round-the-clock basis.
3. He must be dependable. Dependability is of the utmost importance. This virtue gives assurance that the squadman will carry out assignments to the best of his ability.
4. He must have a good reputation. A person's good name and standing in public esteem must definitely fit into the analysis. This type of public work will present many delicate situations, especially when the confidence of the victim in his benefactor is sorely needed. (In short, is he a good citizen?)

5. He must present a good appearance. A slovenly, dirty and unkempt individual will immediately cause the victim, as well as the general public, to look with disfavor on his benefactor. Even a stranger, when carefully groomed, is an asset when dealing with others. Many emergency and rescue units have a type of white shop coat available to their squadmen. Such a coat is easily donned and gives the men that look of neatness and cleanliness which is always so desirable.
6. He must have a pleasant personality. Arrogance and superiority will be quickly resented. Courtesy and understanding will always open the door for a better relationship with the victim. The public will also react and cooperate more favorably when treated in a firm but courteous manner.

7. He must be cooperative. This is a characteristic which calls on a person's ability to harmonize, pull together, work shoulder to shoulder, and go along with others. It may be said that people do not think together, but under emergency situations, they should act together. There is no time for bickering at the scene of an emergency. Orders and methods must be carried out even if they are not to individual liking. As a rule the end result is the same.

8. He must be definitely interested in the job. This is fundamentally a specialized field. Consequently, there will always be new and different approaches, techniques and procedures offered on the subject. If the enthusiasm is there to learn, study, and keep abreast of the times, such an individual will definitely be an asset to the squad. Then again, it must be realized that each person's interests are different. There are many firemen who are happy just to be good firemen because they love firefighting. On the other hand, the same answer is also applicable to squadmen. Personnel once placed on emergency units often make it their life's work. Whichever job it may be, however, the deciding factor is controlled by the man's interest in the job at hand.

9. He must have initiative. The ability of a person to determine for himself what has to be done, and then having the capability of going ahead and doing it, is an important qualification in this line of work. The necessity to deal with unusual situations, conditions and circumstances, makes it imperative that squad and emergency personnel have this qualification.

10. He must be cool, level-headed and have the ability to exercise common sense. Emergency situations call upon the individual to use these qualities because of the turmoil which exists during the time of an emergency. The situation, when handled wisely and properly, will make matters easier for everyone concerned.

11. He must have an aptitude for training. The study and training time involved in learning to be a good squadman is in substance not a long-term indoctrination of practice and knowledge. First aid and life saving courses are outlines to supply the utmost in information and training in a practical and reasonable length of time. Therefore, the ability to learn quickly and have natural talent to apply this training is an important factor in personnel selection.

12. He must have leadership ability. "As ye lead, so shall they follow", may be a safe axiom in this case. These emergency situations always call for

an immediate show of authority and command. When used wisely, this quality will make it easier to control the emergency.

13. He must be in good health and physical condition. One never knows, when responding to an emergency alarm, exactly what is involved. A man may be called upon to climb, run, dig, pull, push, etc. Therefore, it is very important that a selectee have the normal good health and recognized physical abilities to perform his duties in a manner that is not detrimental to victims, his fellow squadmen, or himself.

COMPLEMENT OF EMERGENCY AND RESCUE UNITS

Determining the number of officers and men who are to man an emergency squad is somewhat controversial. The number of squad members often is based on the size of the area served and/or the available manpower. It must be borne in mind that not all of a department's personnel should be deployed in an emergency, in view of the possibility of another call.

There are basically three different types of equipment, namely Ambulance, Light Rescue, and Heavy Rescue. These recommendations are based on the absolute minimum requirements for operating them safely and efficiently.

AMBULANCE

Officers - At least one officer, or a man in charge, must be assigned to respond to an alarm with this unit at all times.

Squadmen - A minimum of two men should be assigned to respond with the apparatus. This number can include the man as stipulated in the preceding paragraph. If, however, the department is large enough to be able to detail more than two, without sacrificing its fire fighting strength, well and good. However, in order to secure the minimum of two for response, additional personnel should be delegated and available to meet this requirement.

LIGHT RESCUE

Officers - At least one officer, or a man in charge, must be assigned to respond with the apparatus on every alarm.

Squadmen - A minimum of three men should be assigned to respond with this apparatus. This number can include the man stipulated in the preceding paragraph. As the unit will be larger and carry more life saving equipment, tools and appliances, a larger complement of men will be necessary. With this in mind, additional personnel should be delegated and available for duty.

HEAVY RESCUE

Officers - Compliance with the obligation of having a minimum of one officer with the apparatus on every alarm is recommended. As a much larger unit with more manpower is included, an appointed officer should be in command.

Squadmen - This full-scale life saving operation with large and heavy equipment, many more tools and appliances, calls for a minimum complement of five men to respond with the apparatus. This number can include the officer as stipulated in the preceding paragraph. It is imperative, however, that more men be actually assigned and delegated for duty in order to assure a minimum crew of five.

CHAPTER IV

OPERATIONS

INTRODUCTION

It is advisable to give some thought to an efficient and practical method of alerting emergency and rescue squad units. The nature of this particular operation certainly calls for a somewhat different approach than the customary notification to signify an alarm of fire.

ALERTING SYSTEM

Our goal can be achieved by keeping several factors in mind, namely (1) The emergency must be identified so that both fire-fighting and emergency personnel will immediately recognize its nature; (2) Response must be rapid, only by the personnel assigned to the rescue units; (3) Unnecessary confusion and disorder which delay response to this type of alarm must be avoided.

As a rule, in paid departments these problems are circumvented by having a coded alarm system on their fire-house bell. By merely changing the number of rings, the personnel can immediately ascertain the type of alarm, and report to the apparatus floor accordingly. The problem is not that simple in volunteer fire departments. In some cases, a siren mounted on the top of the fire station or on a nearby pole is the only type of general alarm which can be given. These are set in action by telephones, relays, or manual controls. A series of wails is emitted which signifies the alarm of fire or emergency. If, however, these wails can be controlled to definitely distinguish a difference in the nature of the alarm, our purpose is accomplished. This problem should be discussed with local agencies involved in the installation of the alerting system to determine whether or not this is possible.

An alerting system that is used by many squads today employs a transmitter and individual home receivers. A receiver is placed in the home of each squad member.

The transmitter is located where the squad alarms are received. The dispatcher can immediately transmit a particular tone that opens all home receivers. The dispatcher can then alert the squad members as to the location and type of emergency.

There are many types and styles of notification systems now in operation. We recommend that a study be made of the situation from the standpoint of local needs, conditions, and circumstances. Expert advice and information will be offered by representatives of the various firms in this field.

Regardless of the kind of system which is finally selected, it is deemed advisable to give additional thought to establishing a "stand-by" routine for alarms involving only the emergency and rescue squad units. This is where the extra men mentioned in Chapter III fit into the picture. Thus, a call from the squadmen at the scene for additional equipment, apparatus, doctors, nurses, etc., can be expedited immediately, instead of going through the entire alarm routine a second time.

RESPONSE

The main concern here is to facilitate an efficient and orderly "all out" by the personnel assigned to the emergency and rescue apparatus. There is no point in cluttering highways and adding confusion to local traffic with excess private vehicles trying to reach the scene, or the apparatus headquarters. If only the members assigned to these units respond, it is apparent that many of these problems will be eliminated. In addition, valuable seconds will be saved, thus enabling the apparatus to leave the station more quickly. There is bound to be a greater degree of delay when waiting for a larger complement of personnel to arrive for duty.

Here, again, the possible need is for response by the "stand-by" or extra men assigned to these units. Their availability at headquarters in the event of additional calls on the same alarm will aid tremendously in expediting efficiently any type of emergency service.

COMMUNICATIONS

It is recommended that some type of communication system be incorporated in the over-all operation of emergency and rescue squad units. In many instances, when arriving at the scene, it is necessary to call back for additional equipment and personnel, contact the sheriff's office, call the State Highway Patrol, etc. When this can be done directly from the unit, much valuable time can be saved by squadmen. Furthermore, there is nothing more discouraging or inopportune, especially when in the public eye, than a situation in which men and equipment stand by helpessly because circumstances demand additional apparatus or manpower, and nothing can be done about getting it there. Modern emergency squads utilize two-way radio communications to a great advantage. In many cases, this equipment is installed on every emergency vehicle in operation in the department, to take care of unexpected situations.

CODING CALLS

It is a good practice to code most information transmitted over a two-way radio. This is especially true when the condition of the patient is involved. For example, if the patient's condition is critical this fact might be communicated over the radio as "code signal 95." If the patient were to hear the squadmen state that his condition was critical, it might cause his shock to become more severe.

Additional code signals can be used for many other patient conditions. These coded messages might include:

a. Have hospital prepare oxygen
b. An O.B. case
c. Condition fair
d. Condition good
e. Condition critical
f. Severe bleeding, uncontrolled

Using this type of coding, the squad can notify the dispatcher, who in turn can call the hospital to be prepared. This procedure will result in better reception of the patient at the hospital.

It must be emphasized that this system of alerting the hospital should not be abused, but used only for critical patients.

CHAPTER V

SAFE DRIVING PRACTICES

INTRODUCTION

Most drivers possess a natural inclination to drive at excessive speeds. Sound thinking should tell us it is better to drive slower, and arrive safely at a given destination, than not to arrive there at all.

When dealing with the problem of "safe speeds" vs. "excessive speeds", definite facts must be included, such as: (1) a person's physical and mental ability to drive the vehicle; (2) the condition and type of motor vehicle used; (3) the weather; (4) the road condition.

It can be said that a speed considered to be a safe speed for one driver may be an excessive speed for another. Inexperienced and excitable drivers often become overzealous, a characteristic which will cause them to drive at unreasonable and unsafe speeds.

RESPONDING TO THE EMERGENCY

DRIVER'S RESPONSIBILITY

The driver of an emergency vehicle is responsible for the safe operation of that vehicle; therefore it is necessary for him to understand the limitations involving the use of red warning lights and sirens, mounted on the emergency equipment.

RED LIGHT

The flashing red light is of more value as a warning device to oncoming traffic than it is when used to alert drivers of vehicles being approached from the rear. When no visual obstruction exists, a red flasher-light mounted on the emergency unit is often more effective than a siren as a warning device, because it can attract the attention of oncoming drivers from a greater distance straight ahead. A small red light is ineffective.

SIREN

The siren is an excellent warning device, but it too has limitations caused by high noise levels, closed automobile windows, and the fact that sound waves created by a vehicle-mounted siren are directional. In certain instances, test results proved that the sounds could be heard approximately three times as far to the front as was possible to either side or to the rear. When ideal conditions prevail, a person with normal hearing and seated in an automobile with only the driver's window open, will hear the siren at a position approximately 1,000 feet to the front of the emergency vehicle. This distance, of course, is subject to changes due to the variation of street noises from trucks, buses, and other sound-producing obstacles. However, the approximate distance that the sound waves of a siren may be heard is reduced roughly by two-thirds when the listener's position is at right angles to the path of the emergency vehicle.

There are also some techniques and precautions which, if observed, will result in a more effective use of the siren and reduce the danger of accidents to emergency vehicles.

When the siren is not automatically controlled, it should be turned on and off alternately in such a manner as to utilize the full range of sound from the lower to the highest pitch. The varying sound pitch will attract attention more effectively. Many persons are deaf to high or low pitches but can hear other tones adequately.

In some states totally deaf persons are issued driving licenses. This is true in Ohio.

DRIVING AN EMERGENCY VEHICLE

The driver of any emergency vehicle cannot depend on the flashing of the red light or the sound from a siren on the emergency vehicle to guarantee safe passage or "right of way" through any intersecting street or cross roads. There is a greater danger of accidents at intersections where traffic control lights are in operation than at intersections with "Stop" or "Yield Right of Way" signs, or where intersections have no controls at all.

The public has a right to expect the emergency siren to be used only when a genuine emergency exists. The use of the siren for escorts of distinguished persons, caravans, parades, and other non-emergency uses can lead to resentment and eventual disregard. These practices are becoming less prevalent. They should be not only discouraged but prohibited.

To gain the "right of way" over other vehicles traveling in the same direction, a siren should be actuated sufficiently in advance before overtaking the vehicle so that the driver will have had adequate warning of the approach. The sudden use of a siren immediately behind another vehicle may cause an excited motorist to stop suddenly or swerve so abruptly that his car may be struck by the emergency vehicle, or possibly it may strike other automobiles or pedestrians.

When an emergency vehicle is preparing to pass another vehicle, it must be done with caution, especially when it is necessary to drive across the center line of the roadway. In such cases when a motorist is alerted to the situation he should, if possible, drive to the nearest curb or roadway limit and stop. Such results cannot be expected from all motorists in all situations; therefore, the safety of these people rests in the hands of the emergency unit driver.

No emergency vehicle should pass another emergency vehicle while responding to an alarm except when an "all clear" signal has been received from the driver or the officer in charge of the first vehicle, and then only when in the judgment of the second vehicle's driver it is safe to proceed. A safe distance of five hundred feet should be maintained between emergency vehicles when two or more units are responding together to the same alarm.

The careful selection of sound-thinking and intelligent drivers, properly trained, will help solve this problem; however, it is essential that all drivers understand speed in relation to "reaction distance", "braking distance", and "stopping distance", explained herein:

Speed: The miles per hour a vehicle travels.

Reaction Distance: The distance a vehicle will travel while a driver is transferring his foot from the accelerator to the brake pedal after he perceives danger.

Braking Distance: The distance a vehicle will travel from the place where the first application of the brake was made to the place where the vehicle stopped.

Stopping Distance: The sum of the reaction distance plus the braking distance

These distances will vary due to the physical and mental alertness of the driver, the speed, type and condition of the vehicle, the number, type and condition of the brakes, the tire sizes, and the weight of the vehicle when fully equipped, plus the type and condition of the road surface.

For example, at 40 m.p.h. a vehicle is traveling approximately 59 feet per second. This requires a distance of 44 feet (reaction distance) for the average driver to react and apply the brakes. In most cases the vehicle will have traveled an additional 88 feet (braking distance) before it stops. This adds up to a total of 132 feet (stopping distance) which is the approximate total number of feet required to halt the vehicle. At speeds lower than 40 m.p.h., it is possible to control the apparatus with some degree of safety. With higher speeds, such as 60 m.p.h., the stopping distance increases to an approximate 264 feet.

Drivers should remember that they are responsible for the lives of their fellow squadmen, the victims, and others.*

TRANSPORTING VICTIM TO THE HOSPITAL

Few, if any, emergencies require the need for excessive road speeds when transporting the victim. Along with this, poor driving practices such as swerving, fast turns, and sudden changes often increase the extent of the injury and create an adverse effect on the victim.* This action is improper in all respects.

Another major danger associated with a speeding or carelessly operated rescue squad vehicle is the possibility of being in a traffic accident. Such a situation would cause a delay in assisting those involved in the original emergency, plus the possibility of obtaining more victims and often destroying services for which the rescue vehicle was purchased.

The safe speed for any emergency run must be established while the run is being made, and it must be based on the weather, streets, traffic, the driver, and the victim's condition. Because of the seriousness of this situation, there must be adequate planning and wholehearted cooperation of all persons concerned in order to make any rescue squad a successful operating unit.

---

* Chapter XXVI covers legal aspects of operating emergency vehicles in more detail.

CHAPTER VI

CONTROLLING THE SITUATION

INTRODUCTION

A squadman's first responsibility in any emergency is to the victim. However, since squadmen are often the first trained personnel to arrive at an emergency, it is sometimes necessary for them to do other things which are not, strictly speaking, victim care, in order to perform their function adequately without endangering their own safety and the safety of others.

HIGHWAY ACCIDENTS

In certain situations a victim should receive "on the spot" emergency care before being moved for any purpose. Often immediate assistance to a highway victim is essential before adequate warning signals are set out to alert oncoming traffic. In such instances, the warning lights on the rescue vehicles can be used to excellent advantage. They will provide some protection to the victim and the squad personnel against injuries or death. When it is permissible to move a victim safely a short distance from the danger zone, the traffic situation will be less serious. The procedure to follow must be decided for each individual case by the squadman-in-charge at the accident. Squadmen should not deviate from the "victim care", outlined elsewhere in this manual, when considering whether to move the victim to safer area.

Unless some plan of action is set up, practiced, and understood by squad personnel, there may be confusion at the scene of a highway emergency. Figure 1 shows efficient, pre-planned handling of a highway accident.

FLAGS AND FLARES

Section 4513.28 R.C. of Ohio states that in case of a highway emergency, warning signals shall be placed forty paces or approximately one hundred feet both to the front and to the rear of the vehicle.

If the spot of emergency is near a curve, crest of a hill, or place where the vision of oncoming traffic may be obstructed, the warning signals should be placed to give ample warning.

This code directs all emergency squad units to provide for the protection of all persons directly or indirectly concerned with highway emergencies. These warning devices must be used with due regard for the common hazards each may present in a particular situation. For example, open flames, lights, or non-vapor-proof lanterns must not be used in an area filled with gasoline or other flammable vapors.

When the job of caring for the victim demands the squad members' entire personal attention, it is then necessary for the squadman in charge to direct some other person to set out whatever signaling device is suitable for the existing condition.

CLEAN - UP

The Ohio Driver's Manual states, "Any person removing a wrecked or damaged vehicle from a highway shall remove any glass or other injurious substance dropped upon the highway from such vehicle."

The above quotation is not to imply that the rescue squad members are responsible for the removal of such substances dropped upon the highway, but rather to point out with whom this responsibility lies. Some of the most common substances found in a clean-up situation are:

Gasoline: This must be flushed from the highway with large quantities of water. Consideration must be given to where the gasoline and water will run and what additional action, if any, is necessary. For example: Should the gasoline be flushed to a nearby creek, what are the potential dangers and what lies within its path? When the gasoline is flushed into a sewerage system that leads to a sewage disposal plant, the person on duty at the disposal plant should be notified immediately. When it is flushed into a sewerage system in a closely populated area, it is wise to inspect these buildings for gasoline fumes and advise the occupants to discharge water into their floor drains to assure having adequate water in the "trap". This will close off a drain and lock the fumes out of a house.

Both a powder and a liquid are available for use on gasoline to reduce the fire danger. The powder is spread on the gasoline and then flushed with water. The liquid is sprayed over the gasoline and then flushed away. Either of these materials will make a nonflammable emulsion that is easily flushed away.

Glass: Broken glass in most cases presents no special hazard in having it removed from the highway but, as in many other highway situations, a constant watch for approaching vehicles must be maintained. A reasonable signal such as those previously mentioned should be given in advance to stop or slow down the traffic, to prevent injury or possible death to members of the clean-up crew.

Blood: This provides a somewhat different problem than that encountered in similar situations. Removing the blood from the highway is a simple operation when done by flushing. But the difficulty arises when a "weak-stomached person" is an unwanted spectator who must get all the details first hand. Then just about the time the job is completed, this person "passes out" and a new problem is encountered.

Miscellaneous Situations: There are numerous situations that could be described here, such as one where a large milk supply transport truck overturned and spilled the entire contents over the highway. Another is where a farm produce truck was involved in an accident and most of the contents were distributed across the highway. Regardless of the situation there are many factors to be considered, such as the substance involved, where it occurred, and how it can be corrected. Weather conditions also play an active part in deciding on a course of action. During freezing weather a method not involving water may be neccessary. But when water is necessary to do the job, a supply of salt, sand or other like substance may be needed to make the area safe for both motorists and pedestrians. This, as previously stated, is not a direct function of a rescue squad but it is their responsibility to request assistance through certain local authorities by stating the need for additional personnel and supplies.

COOPERATION BY PREPLANNING

A rescue squad will, in many cases, request cooperation from the local police department, county sheriff's office, State Highway Patrol, and the highway department. Rescue squad personnel should attend to the emergency as it concerns first-aid and rescue, and let the law enforcement agency handle the other people and traffic problems.

Rescue squad personnel supervisors should seek cooperation through preplanning with the local police, county sheriff, State Highway Patrol and the highway department. Each has a definite place and each group should cooperate with the other to develop a plan, before the emergency rather than at the scene of the emergency. To best accomplish the desired cooperation, it is suggested planning be done with the top officials of the organizations concerned. At this level, definite agreement can be made which will not be contradicted later. (See Figure 1.)

Figure 1

Cooperation at an accident scene. The police agency was notified of the accident and requested an emergency squad to respond. At the scene, the victims are being cared for by the squadmen while police officers are controlling the bystanders and traffic. Note that one squadman is examining a victim on the road and another is examining a victim in the car. The other squadmen are preparing equipment that probably will be needed. Only by good preplanning between the squad officers and the local police agencies will such effective handling of an accident be possible.

HOME SITUATIONS

Squadmen must have the ability to handle the relatives and friends of the victim, to the end that they will not interfere with the victim's care or the squadmen. This responsibility might be delegated to one member of the squad while the others proceed with the care of the victim. Hysterical mothers, wives, sisters, and grandmothers always create an added problem for the squadmen. This problem is important and in some cases must be eliminated before the squadmen can give attention to the victim. If this problem is not eliminated, it is very possible to have two victims in place of one. There is no set rule for the squadmen to use to cope with this problem; however, the following situation will present an example which may be helpful.

EXAMPLE

Husband has heart attack. His wife is hysterical.

PROCEDURE

1. Take wife to another room.
2. Ask her questions, to keep her mind occupied.
   a. Has your husband had these attacks before?
   b. Is he taking medicine? (If so, ask to see it.)
   c. What is his medical background?
   d. Who is his doctor?
   e. What is his parents' medical background?
   f. How many children do you have?
   g. How old are they and are they away? (Army, college, etc.)
   h. What is your husband's age?

Little help will be required by the relative who remains calm in the face of an emergency; however, a word of sympathy and encouragement is well worth while.

Do not blame or ridicule a person for feeling as he does. Your job is to help him cope with his feeling.

COOPERATION OF THE VICTIM

Every effort must be made to secure the cooperation of the victim. Often a problem is the additional embarrassment to the victim caused by curious bystanders. It is to the best interest of the squad and the victim to protect the victim from these prying eyes.

For example, if a woman should break her leg in a crowded area, she should be covered with a blanket. The examination should be made and the splint put in place by feeling under the blanket. With practice, this can be readily accomplished.

If possible, the area in which the victim or victims are located should be blocked off and shielded from the sight of onlookers.

COOPERATION WITH HOSPITAL PERSONNEL

Giving the best possible care to victims is of primary importance in emergency squad work. One means of doing this is to establish good relationships with the hospital personnel with which the squadmen come in contact, and most especially the emergency-room personnel.

If there is a working agreement between the emergency squad and the regular personnel in the emergency room, the care of the patient from the time he is seen by the squadmen until the time he is admitted to the hospital will not be disrupted. This can only be accomplished if all people who come in contact with the patient work as a team.

The officer in charge of the emergency squad or the chief of the department should meet periodically with the supervisors of the emergency rooms with which his squad comes in contact. This will lead to a better understanding of the objectives of both groups. The emergency-room supervisors are most willing to cooperate with those who transport victims to the hospital.

Figures 2 and 3 and their captions show how squadmen can bring about good rapport with emergency-room personnel.

Courtesy St. Anthony Hosp.

Figure 2

Upon arrival at the hospital emergency room, tell the nurse just what type of emergency you have and the suspected injuries. In the above case, the victim has a suspected fracture. He is left on the backboard and placed on a movable stretcher. Good rapport with the 'entire team' means working well with all who come in contact with the victim, especially the emergency room personnel.

Courtesy St. Anthony Hosp.

Figure 3

After the victim is made as comfortable as possible and after any lifesaving procedures are carried out, squadmen should give the emergency room nurses all possible information:

1. The exact location from which victim was taken.
2. The type of accident.
3. The victim's condition from the time squadmen arrived until victim arrived at hospital.
4. The care given by the squad.
5. Whether the proper law enforcement agencies were notified.

CHAPTER VII

CHILDBIRTH

INTRODUCTION

A growing problem confronting the emergency and rescue squad service is emergency childbirth. The squadmen often have to decide whether to transport the expectant mother to where medical help is available, or whether to keep the mother in her home and attend the birth of the child. Because squadmen must solve this problem, it is of the utmost importance that all squadmen have at least some fundamental knowledge about the conditions surrounding childbirth.

NORMAL DELIVERIES

A woman in labor and/or a new-born child can certainly present many difficult situations. Unless the squadmen have proper knowledge and training in this particular area of emergency care, great harm may be done to the mother and/or the child.

Although it is not the intention of this book to perfect the squadmen in the art and science of obstetrics, there is a real need to give such personnel a working knowledge of what to expect. Because lives may be in the balance, the squadmen must decide quickly either to transport or not to transport a mother to a hospital. The decision should depend upon certain evidence which the squadman has to evaluate at once.

The expectant mother is to be transported only before the evidence of crowning is apparent. If crowning is apparent, childbirth will follow soon after. In such a case, the mother should not be moved at all, unless the squadmen are otherwise directed by a physician.

The squadmen must have some concept of what takes place before, during, and after labor to be able to best care for the mother and child. However, this material will deal mainly with the period during labor since this is usually the period in which victim care arises. Therefore, the squadmen should have some knowledge of what is normal and abnormal in childbirth.

DEFINITIONS

Obstetrics: The care of the childbearing woman and her new-born baby. Obstetrics deals basically with three distinct periods:

1. Pregnancy: The period from conception through the period of labor to birth of the child.
2. Labor: The period during which the baby and the placenta are expelled from the mother's body into the outside world.
3. The Puerperium (Post Delivery): The period during which the organs of reproduction are restored to approximately their former size and condition. This usually takes about six weeks.

Internal Organs: The internal organs of reproduction are: (a) the ovaries, (b) the fallopian tubes, (c) the uterus, and (d) the vagina.

Ovaries: The ovaries are the glands in the female producing the reproduction cell known as the ovum.

Fallopian Tubes: The fallopian tubes are two thin, trumpet-shaped, flexible muscular tubes, about four and one half inches long and somewhat thinner than a lead pencil. They have two openings, one into the uterine cavity and the other into the abdominal cavity. The abdominal opening is somewhat larger and is surrounded by a large number of fringes; hence the term "fimbriated end". The fallopian tubes act as a passage from the ovaries to the uterus.

Uterus: The uterus, or womb, is a thick-walled, muscular, hollow, pear-shaped organ. Fully developed, in nonpregnant state, it is approximately three inches long, two inches wide, one inch in thickness, and weighs from one to two ounces. It is composed of involuntary muscle fibers, running in different directions, making its expansion possible up to the size of a pumpkin. At termination of pregnancy it weighs about two pounds. The muscles of this organ are arranged so as to make it able to expel its fetus (infant) by contraction at the termination of normal labor. (See Figure 1.)

Amnion (Bag of Waters): The thin transparent sac which holds the fetus suspended in the fluid called amniotic fluid. This sac is lined with a smooth, slippery, glistening membrane. The space, or the amniotic cavity filled with fluid, is often called "the bag of waters." Here is where the child floats and moves. At full-term pregnancy this cavity normally contains from one half to one quart of water. The important functions of this fluid are:

1. To protect the fetus from blows
2. To allow the fetus freedom of motion
3. To keep the child at an even temperature
4. To help to enlarge the vaginal canal during labor so the child may be born more easily.
5. When membranes rupture, to flush the birth canal, thereby cleansing, lubricating, and disinfecting it

Placenta (Afterbirth): By the third month another important structure, the placenta, has formed. The placenta is a fleshy, dish-like organ. Late in pregnancy it measures about eight inches in diameter and one inch in thickness. It receives its name from a Latin word meaning cake, which this structure resembles somewhat in shape.

A tree or a plant sends its roots into a bed of earth for nourishment, and when the plant is removed a certain amount of the earthy bed clings to the interlocking roots.

Similarly, a thin layer of the uterine bed clings to the branching projections and together they make up this organ, which supplies food to the fetus as the roots and the earth provide nourishment for a plant. At term a placenta weighs about one pound. Its surface is smooth and glistening, and beneath this membrane may be seen a number of large blood vessels.

The placenta and the child are connected by means of the umbilical cord. This cord is fastened to the center of the placenta and from there enters the abdominal wall of the child. It is usually about twenty inches in length and three quarters of an inch in diameter. It contains two arteries and one large vein, which are twisted upon each other and are protected from pressure by a transparent, bluish-white, gelatinous substance called jelly.

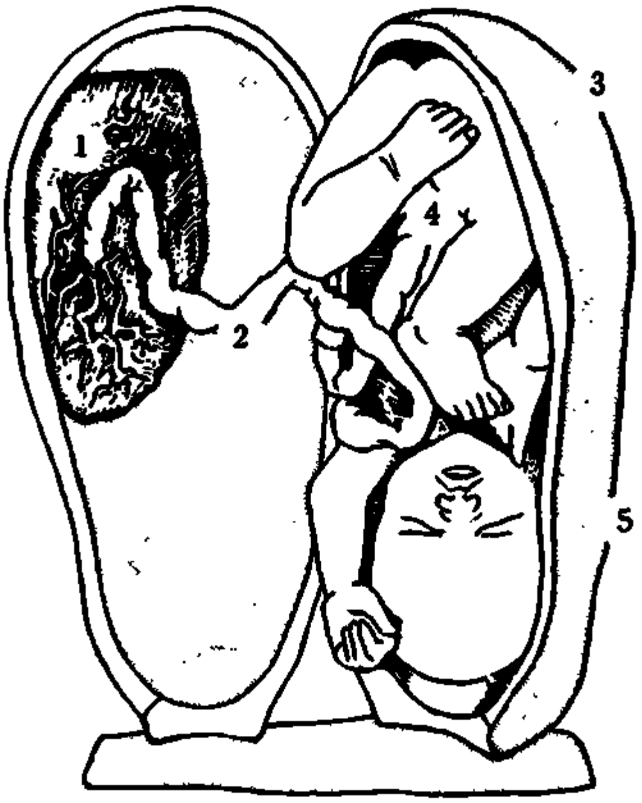
LABOR

Labor is the process by which the child is expelled from the uterus. It is divided into three stages: dilation, expulsion, and placental.

First Stage - The first stage of labor (dilating stage) begins with the first symptoms of true labor and ends with the complete dilation of the vaginal canal.

Squadmen's Care

1. Encourage the victim. The squadman should display an attitude of cheerfulness, sympathy, and encouragement toward the expectant mother.
2. Observe the character of the pains. The frequency, the duration, and the intensity of the pains should be watched closely and recorded. The presence of "show" in substantial amounts (bloodstained



1. **Placenta: usually attached on rear wall**
2. **Umbilical cord: it is about 20 inches long**
3. **Fundus of uterus**
4. **Infant's navel**
5. **Front wall of uterus**

Figure 1

Unborn child

mucus, not actual bleeding) suggests that rather rapid progress may be taking place and should be reported, particularly if associated with frequent severe pains.

3. Urge the victim not to bear down. During the first stage of labor, uterine contractions are involuntary and uncontrolled by the victim. Not only is it futile for her to bear down, this leads to exhaustion and may tear parts of the birth canal.

If the squadman determines that the mother is in the first stage of labor, preparation should be made to transport her to the hospital.

Second Stage - Watch for signs of the second stage. These signs are as follows:

1. The victim begins to bear down on her own accord.
2. There is a sudden increase in vaginal discharges; sometimes there may be slight actual bleeding. This indicates that the child's head is passing through the completely dilated birth canal.
3. The victim thinks that she needs to evacuate; this symptom is due to pressure of the head on the perineal floor and consequently against the rectum.
4. The membrane ruptures with discharge of fluid. This, of course, may take place at any time but occurs most frequently at the beginning of the second stage.
5. The vaginal opening begins to bulge and the anal orifice to dilate. This is a late sign, but if 1, 2, 3, and 4 occur, the appearance of the infant should be watched for, with every pain. Only the appearance of the head (crowning) can definitely confirm this suspicion. Vomiting at this time is not unusual. If vomiting occurs, take precautions against strangulation.

Crowning - The vaginal opening will bulge and the top of the child's head will actually be seen. This is called crowning. Crowning is the very last symptom before the head and then the child are actually delivered. (See Figure 2.)

Courtesy After Bumm, Robert L. Dickinson, M.D.

Figure 2

Crowning

If examination of the birth canal during labor pain reveals that the mother is crowning, this will indicate that the infant may be born almost immediately. In this case, squadmen should not attempt to transport the mother to a hospital, but should be prepared to deliver the baby in the next few minutes, If she is not crowning during a labor pain, squadmen will probably have time to reach a hospital. In such case, the mother should be transported.

Care at Delivery - If it is established that the squad must help in the delivery, one squadman should obtain the following equipment from the squad vehicle: (a) O. B. kit, (b) first aid kit, (c) combination resuscitator-aspirator. This equipment should be brought to the delivery area and made ready. (See Figures 3A and 3B.)

Figure 3A

An open O.B. kit. The gloves (in the back) are separate so that the squadmen may put them on without contaminating the other sterile materials.

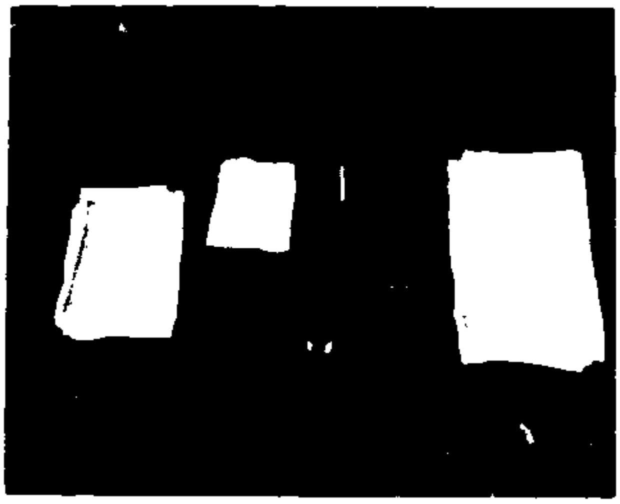


Figure 3B

Materials needed in an O.B. pack:

1. 4 towels
2. 12 gauze compresses, 4 x 4 size
3. cord tape or ties
4. soft rubber ear syringe
5. 4 large, straight hemostats
6. 3 pairs of rubber gloves
7. 1 pair of scissors

Towels are used to protect the area. The 4 x 4 compresses are used to absorb any liquid materials. The ear syringe is used to suction the child's nose and mouth.

Figures 4 through 9 show stages in the normal delivery of an infant's head. The head usually is delivered with the face toward one of the mother's legs. It should be supported by the rubber-gloved hand of a squadman. Gloves should be sterile if possible.

Figure 8

Be prepared to support the baby's head as soon as it is delivered.

While supporting the head, check to find out if the cord is wrapped around the neck. If it is, run your finger between the cord and the child's neck to loosen the cord. If the cord is too tight, clamp it twice and cut between clamps.

After the head is delivered, contraction of the uterus will continue until the shoulders are delivered. Do not pull. The mother sometimes has difficulty delivering the shoulders because of their width. The top shoulder is usually the first one to present itself. Slight traction on the head toward the floor will help deliver the upper shoulder: see Figure 8. Slight traction on the head toward the ceiling will help deliver the bottom shoulder: see Figure 9. Then apply slow, straight outward traction very gently on the head. Continue to support the child and be ready for sudden expulsion. After both shoulders are delivered, the baby will follow very quickly. Guard the cord so as not to tear it.

Figure 9

Delivery of bottom shoulder. Note that sterile gloves are worn.

Care of the Child - The child is now on his own and should be able to start to breathe. To safeguard the child, the squadmen should:

1. Turn the child on his side across the mother's abdomen. This will facilitate the flow of mucus out of his mouth.

2. Pull the tongue forward. This can be done by grasping the tongue, top and bottom, and pulling out to the lower lip.

3. Clear his air passage. Wipe his mouth inside and out with a gauze bandage (4 x 4). By placing another gauze compress (4 x 4) over your index finger and placing your finger in the child's mouth, gently clean out all foreign bodies and mucus.

All three of the above should be carried out in all deliveries whether the child breathes immediately or not.

4. If the child starts to breathe, your attentions should then be turned to the mother and the cord.

IF THE NEWBORN DOES NOT BREATHE - If 30 seconds to one minute have elapsed without the newborn breathing, and steps 1, 2, and 3 above have been completed, the squadman must start some type of resuscitation.

5. Stimulate the child. This can be done by rubbing the child with your hand. Do not slap the child. You may also snap him on the bottom of his feet with your index finger. The child should be left on his side for this.

6. Use manual artificial respiration. Leave him on his side and aerate him by mouth-to-mouth breathing. This should be done once or twice. If the child is able to breathe on his own he will. If he does not:

7. Use mechanical artificial respiration. This is done by using a commercial resuscitator. Put the mask in place using the resuscitator stage of the machine. Let the machine breathe for the child once or twice and discontinue. If he is able to breathe on his own, he will. If he does not, it is evident that he is not able to do so.

8. Keep up the mechanical resuscitation. This must be kept up until the child starts to breathe or until he is pronounced dead by a physician. Transport him as soon as possible.

The Cord - After the child is breathing, attention should be turned to the cord. The squadmen need to know the procedure for cutting the cord, as a safety measure when the mother must be moved under awkward conditions. Those who have tried to carry a new mother down three flights of stairs with a newborn balanced on her abdomen know the safety problem. There are instances when the child should be separated from the mother.

1. Milking the cord - Before cutting the cord, the squadman must "milk" it. At approximately nine inches from the child, grasp the cord between index finger and thumb of one hand. With the index and second finger of the opposite hand grasp the cord in a scissors fashion. Milk the cord toward the baby for only two inches. It is in these two inches that the cord will be cut.

2. Tying the cord - Place a sterile clamp (hemostat or tie) approximately six to nine inches from the baby's abdomen. Cord ties can be purchased through drug stores or hospital supply companies. Each tie is 1/8" x 12". Ties are made of cotton and can be purchased sterile.

Approximately one inch further away from the tie or clamp, place another tie or clamp. When tying the cord, use square knots and put at least three knots in place.

3. Cutting the cord - Between these two clamps or ties, cut the cord with sterile scissors. This physically separates the living and breathing child from the mother.

Put the child in a soft blanket and place him in the care of some competent person. The child should be kept on his side with his head slightly lower than his body.

The emergency squad should check with local physicians as to the desired procedure to be carried out when cutting the cord in an emergency delivery.

Third Stage - From the time the child is delivered until the placenta is delivered is the third stage of labor. The placenta usually appears within 30 minutes. There will be one to two cups of blood delivered with the placenta. This is a normal amount.

After the after-birth (or placenta) is delivered, it should be preserved in some type of container or wrapped in a newspaper. This must be kept and brought into the hospital with the mother and child, so that it can be examined to see if any particles have been left in the uterine cavity.

A sterile sanitary napkin can be placed in position at this time. Be sure it is sterile. A squad should not carry an open box of sanitary napkins and use these at this time. Individually wrapped sterile napkins should be carried. If they are included in the O. B. pack, they will be sterile.

FINAL STEPS IN EMERGENCY CHILDBIRTH

The mother and child must be in the hands of medical personnel before the squadmen leave them, for the following reasons:

1. The child must have a physical examination.

2. The mother must have a physical examination including the checking of her birth canal for lacerations.

3. The newborn's eyes must be cared for, to prevent any serious eye infection. (This is a state law in Ohio.) Silver nitrate is usually used and this function is to be performed only by the experienced and trained squadman; usually it is done by a physician.

4. The cord must be checked by competent medical personnel.

5. Baby and mother must be observed for a period of time.

If the physician should ask the squadman to make out the birth certificate, he may do so. Many times the physician may ask that this be done because the squadman was present at the actual delivery.

Birth certificates can be obtained at the local county health office. They must be made out as soon as possible after the birth and be filed with the proper registrar in the county health office.

UNUSUAL DELIVERIES

DEFINITION

The term "Breech", in connection with childbirth, refers to the birth of the infant in a reverse position, as contrasted with normal head-first delivery.

In normal childbirth, the child will usually start to breathe as soon as his chest is exposed, or shortly afterwards. Because of the nature of the breech type of birth, the child's chest is delivered before his head. It is impossible for the child to take in air, as his air passages are blocked; his head is still within the vaginal canal.

SQUADMEN'S CARE

As soon as the squadman finds that it is going to be a delivery in a breech position, he must be ready to support the child. This can be done by letting the child rest on the squadman's hand and arm, thus allowing the infant's legs to straddle the squadman's arm.

The legs, hips, stomach, and chest will be delivered at this point. Sometimes it will be harder for the mother to deliver the head, and in more severe cases, the delay is quite long. If this happens, the child may suffocate, as the result of a poor air passage.

An air passage may be created by the squadman supporting the body of the infant with one hand and inserting the index and second finger of his other hand into the vaginal canal in such a way that the palm faces the baby. He should run his fingers around the child's neck until the chin is found. At this point the two fingers should be run between the child's chin and the vaginal canal. As the child's nose is reached, the squadman should separate his fingers enough so as to run one on each side of the child's nose. When in this position the squadman's fingers should be pushed away from the infant's face, in turn, facilitating a good air-way. The squadman should keep his fingers in this position until the entire head is delivered.

This is the only time the squadman should touch the vaginal area. The squadman should have sterile gloves on for this procedure.

OTHER CHILDBIRTH EMERGENCIES

On arrival, squadmen may find that the cord, a foot, or a hand is protruding from the birth canal. Transport this mother at once, taking special care not to injure the prolapsed part. Do not try to replace the prolapsed part in the vaginal canal!

If a hand or foot is protruding, cover it with a sterile towel or as clean a piece of material as is available.

If the cord should be protruding, the child may be in danger. This danger is caused by the cord being under direct pressure due to its position between the head and the birth canal. While the cord is in this position, the child might not be receiving an adequate amount of blood and oxygen.

SQUADMEN'S CARE

Transport this mother at once! In case the cord is protruding, place the mother on her back with her hips elevated on two or three pillows or folded blankets. This will cause the child to drop a little into the uterus. If the mother can be maintained in a knee-chest position, balance supported by squadman, it is preferred to elevated-hip position. However, this is a very difficult position to maintain during transport, and special precautions must be taken to safeguard the mother if this position is used. These positions will relieve some of the direct pressure pinching the cord.

ABORTION OR MISCARRIAGE

DEFINITION

This is the giving off of the membranes and the unborn child before the child is able to live on its own. This usually occurs before twenty-eight weeks of pregnancy have passed. Such an abortion or miscarriage can take place any time between conception and the time just before the child is able to live on his own. Although the outward symptoms may vary, the following symptoms will be present.

SYMPTOMS

1. Fast pulse
2. Perspiration
3. Pallor (pale skin)
4. Weakness - inability to stand
5. Cramping pain in the abdomen
6. Moderate to severe vaginal bleeding
7. Discharge of large or small particles from the vaginal canal

In other words, there will be all the symptoms of shock, plus, in most cases, bleeding from the vagina.

SQUADMEN'S CARE

1. Place victim in shock position.

2. Conserve body heat.

3. Squadmen may moisten the patient's lips if she requests it.

4. Do not touch the vaginal area, as the victim is prone to infection.

5. Squadmen may put sterile towels or vaginal pads (sanitary napkins) at the vaginal opening.

6. Keep any particles that are discharged and take them to the hospital with you, since this fleshy material may have form.

CHAPTER VIII

COMMON SQUAD EMERGENCIES

INTRODUCTION

This chapter will deal with victim care. It is slanted specifically toward the squadmen's care of a victim, not treatment which will be given by a physician. For the most part, therefore, the material presented here presupposes that the reader has had adequate training in first aid.

The squadman's responsibility in the area of victim care is a great one. His ability to give emergency care may often mean the difference between life and death to the victims. Very difficult rescues may be in vain if adequate emergency care is not carried out during and after the rescue.

For these reasons, the material in this chapter goes far beyond that found in advanced first aid texts. Where applicable, each section follows the pattern of giving the symptoms of the condition, and the preferred squadmen's care.

The procedures given follow the recommendations of a competent medical committee which is listed in the acknowledgment pages of this book. However, if squadmen should find that local medical personnel in the area in which the squad operates recommend a different procedure, we urge that their recommendations be followed. Squadmen should take every opportunity to increase their knowledge in victim care and should rely heavily on local medical personnel for assistance in keeping up to date on the latest procedures recommended locally.

BURNS

DEFINITIONS

Burns are injuries to the skin and/or underlying tissues and may be the results of such causes as the following:

1. Heat: This may be moist (steam or boiling water) or dry, such as flame, hot metals, or hot water bottles.
2. Chemicals: Strong acids or alkalies can cause burns. Acid burns may be caused, for example, by sulfuric or nitric acid. Alkali burns may be caused by lye or caustic soda.
3. Electricity: The effects of electricity vary widely, depending on the type, the voltage and the amperage of the current. Burns are usually noted where the current enters and leaves the body. In addition to these local effects, changes may be produced in the respiratory, circulatory and central nervous system.
4. Radiation: Sources of radiation burns include ultraviolet rays, X-rays and radium. Sunburn and burns from ultraviolet lamps usually are superficial and produce short-lived effects.

CLASSIFICATION OF BURNS

First Degree: Only redness of the skin
Second Degree: Blistered tissues or destruction of the same. Blisters may be broken.
Third Degree: Charred tissues or destruction of the same.

SQUADMEN'S CARE

First degree - Apply a bland ointment and a snug dressing.
Second degree - Sterile dry dressing; snug bandage; do not open blisters.
Third degree - Sterile dry dressing. This can be accomplished with 4 x 4 gauze dressing kept in place by a wide roller bandage. The use of a sterile burn sheet is also indicated. (See Figures 1, 2, and 3.)

Courtesy St. Anthony Hosp. & Pleasantville F.D.

Figure 1

The squadmen on this call are confronted with a burn of all three degrees which involves the entire left side of the back. The victim is being treated for shock by one squadman as the other man readies the burn sheet.

Courtesy St. Anthony Hosp. & Pleasantville F.D.

Figure 2

The outside wrapper having been opened, the burn sheet is very carefully unfolded. Notice that the squadman is touching only the very corners of the sheet. This will make for a sterile area covering the burns. The sheet is handled in the same manner as when removing a sterile compress from its wrapper.

Courtesy St. Anthony Hosp. & Pleasantville F.D.

Figure 3

With the utmost care, cover the burn area and wrap the rest of the sheet around the victim. Do not use ointments or sprays of any kind on second-degree or third-degree burns.

Chemical - In most cases, dilution by flushing with large amounts of water is the best emergency care.

Electrical - Treat the local burn the same as above, depending on the degree. Watch the victim for stoppage of breathing and treat for severe shock.

Do not apply ointments to second- and third-degree burns. Remember, pain induces more shock. Physicians usually remove all ointment that has been previously applied. Removing this ointment will cause the victim to have more pain and in turn make his shock more severe.

A victim's family (or others) may apply ointment to a second- or third-degree burn before the squad arrives. If this happens, a squadman should notify the emergency room nurse as to who applied the ointment. This is important because the hospital medical team otherwise may wrongly think the ointment was applied by the squad.

If a person is burned extensively and will require surgery to dress the burns, it is wise to have his stomach empty while giving an anesthetic. So do not give liquids by mouth to a patient who has extensive burns.

The extent of a burn is estimated as a percentage of the victim's whole skin surface. The total care of a burn patient in a hospital is carried out according to the amount of the body burned.

The "Rule of Nines" is heard often in the care of burns. Figure 4 shows how the percentages are established. Squadmen should know this method so they can estimate the extent of a burn by the time the patient arrives at the hospital, and can inform emergency room personnel.

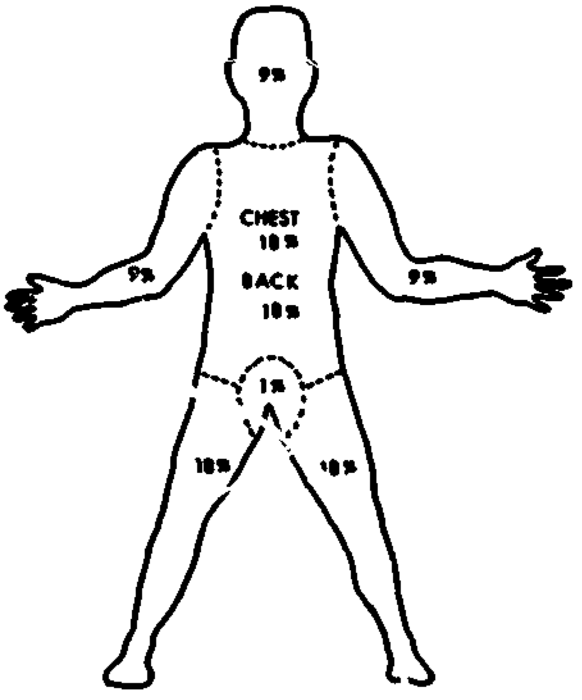

Figure 4

Body burns expressed in percentage of total skin surface.

COMPLICATIONS

The two major complications of burns are shock and infection. Shock is caused by any of the following:

1. Loss of body fluids from the denuded area. This loss is usually in the form of plasma.
2. Electricity. Brain or heart damage, seen particulary in electric shock, will disturb or destroy the breathing or blood-pressure regulating organs of the body.
3. Pain due to the burn.
4. Psychological distress.

To help prevent infection, sterile materials should be applied next to burns.

In the prevention of shock, heat is the first consideration. Conserve the victim's body heat and elevate his feet.

PENETRATING WOUNDS OF THE EYE

DEFINITION

Penetrating wounds of the eye include any wounds in which the eyeball has been cut or penetrated.

SQUADMEN'S CARE

The eyeball contains a vital fluid. If this fluid is lost, the eyeball will collapse and the victim may lose his sight in that eye. Therefore squadmen should do whatever is possible to prevent the escape of the vital fluid from an injured eye.

1. If there is an object penetrating the eyeball, do not remove it.
2. If the object is protruding from the eye, support it by wrapping and tying bandages carefully.
3. If there is no object protruding from the injured eye, cover it with a metal eye shield. Do not put compresses or cotton eye patches on the injured eye; they might cause harmful pressure.
4. Cover the good eye. This will help the victim to keep his eyes at rest.
5. Keep the victim on his back. This will help to keep the fluid in the injured eye.
6. Explain all procedures to the patient.

ABDOMINAL INJURIES

DEFINITION

The abdomen is the cavity in the body between the diaphragm and the pelvis. Care of abdominal injuries is usually of considerable magnitude and often requires emergency surgery. The time element between injury and operation is vital in maintaining a minimal mortality rate. This time element is called a <u>time lag</u>. Speed of transport to the place of definitive treatment is of utmost importance. Speed should be used, but not with lost motion or at the sacrifice of safety.

If there is a large catastrophe with many injured, transport priority should be given to the victim with an abdominal wound. Abdominal, head, and chest injuries are given priority over all other injuries, even though the patients may not appear to be seriously wounded at the time. Often the goriest of the injured or the obvious fracture are sent on, while the abdominal injury is detained. This mistake contributes to needless deaths.

SYMPTOMS

1. Shock
2. Difficult breathing
3. Protruding organs
4. Fast, weak pulse
5. Hemorrhage (arterial or venous)

EMERGENCY CARE

For protruding of the bowel or other organs through abdominal wounds, the care depends upon the facilities at hand. At the scene of the accident the care should be similar to that of a compound fracture. Do not return the organs manually, but cover them with sterile gauze or linen. If this is not available, use clean cloths.

If sterile water, plasma, or some other non-irritating sterile or "reasonably" sterile liquid is available, moisten the cloth and keep it moist. If water can be boiled for fifteen minutes, it can be used to moisten the cloths, after it returns to room temperature. If transportation will take over thirty minutes, it is worthwhile to spend the time to boil water and keep the dressing moist. The wet dressings are then covered with a large sterile (or clean) pad. This is not pulled tight, but is kept snug.

If this care is carried out in an emergency room, sterile materials will be on hand; they should and will be used. The dressings can be moistened with a sterile salt solution or sterile water. Bleeding is rarely severe and is best not cared for at a first aid station unless a spurting artery is present. More harm than good is done by manipulation.

Time should be taken to put a compression bandage over the abdomen before transporting the victim. This can be done with the so-called scultetus or "many-tailed" binder (Figure 5).

Figure 5

The scultetus binder or many-tailed binder can be used for several kinds of emergencies.

The binder consists of a square of heavy muslin or flannel material about twelve inches square, to which a series of straps, each two inches wide and eighteen inches long, have been sewn on two opposite sides. The square is placed over the injury on top of the dressing. The straps are then alternately brought around the victim and tied. The straps are pulled snug, each strap overlapping the previous one, to hold it and the moist dressing in place. This will prevent any additional loop of intestines, or other organs, from protruding.

Binders can be made by a squad auxiliary and sterilized by a local hospital. If no binders are available, an ordinary bath towel will serve as a fairly effective substitute. The towel is placed around the abdomen, and the ends, one upon the other, are pinned loosely together.

Some kind of binder should be applied as soon as an abdominal injury is suspected by the squadman. This type of bandage also may be of service to victims who have sustained rib fractures, because it serves to immobilize the chest.

If the victim is having difficulty in breathing, he will be most comfortable in a semi-sitting position. On the other hand, if shock is present, the best position is with the head lowered and the feet elevated with knees bent. In general, if the victim's skin is dry and warm and if his pulse is strong, it is advisable to put him in a position with head and chest slightly elevated. The victim should be kept warm by the use of blankets, rather than with hot water bottles or heating pads, to prevent possible burning.

Don't give the victim anything by mouth.

In summary, we may say that the care of abdominal injuries consists of:

1. Discovering that an abdominal injury may exist
2. Caring for shock
3. Caring for any protruding organ
4. Applying moist dressing
5. Applying a snug binder
6. Securing surgical aid as rapidly as possible, by priority of transport, so that definitive care (consisting particulary of operative treatment) may be carried out.

OPEN CHEST WOUNDS

DEFINITIONS

A chest wound is any opening into the chest cavity from the outside.

CAUSES

Chest wounds may be the result of an opening caused by any object that has penetrated through the soft tissues of the chest, such as: (1) a bullet, (2) a knife, (3) any other cutting object.

SIGNS AND SYMPTOMS

In a normal chest the lung remains in a position of expansion. Any leak of air through the chest wall results in collapse of the lung. If this air pressure from the outside is not stopped as soon as possible, the lung collapse will cause the area around the heart to shift. If this shift occurs, the large blood vessels leading from the heart will be twisted, causing them to shut off the supply of blood from and to the heart. This condition can cause a type of heart failure.

A sucking sound may or may not be heard in chest wounds. These wounds are usually called "sucking chest wounds." This is because a sucking sound is sometimes made by the air rushing into the chest cavity from the outside each time the victim breathes.

These factors point out the absolute necessity for instantaneous emergency care by the squadmen in such chest wound cases,

SQUADMEN'S CARE

The squadman's first step should be to seal off the open wound to the outside air. Tape a large piece of wide adhesive over the opening. Be sure the surrounding area is well covered to prevent seepage in breathing. (All squads should carry wide tape, 4" to 6", in their supplies.)

Any non-porous material, (i.e. plastic) may be placed over the opening and sealed with tape. If the opening is large, there may be need to apply more than one piece of tape in order to close the wound completely. Have tape extend two or three inches beyond the edge of the wound on all sides. If gauze is used before taping, be sure it is large enough so that there is no danger of the gauze being sucked into the wound.

Be sure to have the victim take a deep breath before applying the tape.

Where too much time is needed to get equipment ready, the squadman should place his hand directly over the wound.

Place the victim in a sitting position if possible, or on his injured side, if nothing is protruding. Supportive treatment before and during transport is the administration of oxygen.

NOTE: If there is an open chest wound from which there protrudes a foreign object of some kind, <u>do not remove the object</u>.

Review of pertinent points to remember:

1. Seal the wound from the outside as quickly as possible.
2. Place the victim in a sitting position, or on his injured side.
3. Apply oxygen therapy.
4. Transport the victim to area of definitive treatment.

FRACTURES

DEFINITION

A fracture is any break in the continuity of a bone.

VARIETIES OF FRACTURES

1. The break may be incomplete with only a line in the bone. This type is frequently found in the skull.
2. The break may be part-way through the bone, splintering the fibers on one side and bending them on the other as with a green twig. This is common in children at any age where the bones are soft and pliable.
3. There may be a completely broken bone, broken transversely or in a spiral direction, and very often it is broken into several fragments.

If the fractured surfaces are protected from contamination with the outside air, or the skin remains intact, it is called a simple or closed fracture. On the other hand, if an open wound occurs at the time of the fracture so that air and bacteria may be admitted, it is called a compound or open fracture. There is a connecting wound to the outside.

A compound fracture is more difficult to treat than a simple fracture because of the open wound, since the possibility of infection must be considered as well as the fracture itself.

A complicated fracture is one in which other structures or organs such as nerves, blood vessels, joints, lungs, or bladder are injured by the force or by the fracture fragments, such as a broken rib puncturing a lung.

An impacted fracture is one in which the bone is broken and one end is wedged into the interior of the other.

SYMPTOMS

The signs and symptoms of a fracture may be visualized easily by picturing what happens when a bone is broken:

1. When a break occurs, it allows an unnatural movement of a normally rigid part.
2. The displacement of the fragments of the fracture area causes a deformity of the limb.
3. There is loss of power of movements. The limb cannot function properly because normal function of a muscle is dependent upon the bones to which it is attached.
4. Upon examination of the injured part, a grating sensation is imparted to the fingers; this is due to the rubbing of the fragments one upon the other. Correct terminology for this sign is crepitus.
5. There may be shortening of the bone at the site of the fracture.
6. Pain occurs with acute tenderness over the site of the fracture.
7. Swelling and discoloration of skin develop, due to the injury causing the fracture and the hemorrhage which follows into the tissue.

All of these symptoms are not necessarily present in every fracture. The signs observed will indicate the type of fracture present.

SQUADMEN'S CARE

The fractured part should be rendered as immobile as possible by the temporary application of well-padded splints held firmly in place by bandaging. This type of emergency care will help decrease pain and additional injury associated with a fractured bone by the immobilization of the joints above and below the fracture.

Figure 6 depicts the proper care of a patient with a severe fracture.

Courtesy Prairie Twp. F.D.

Figure 6

These squadmen are properly applying a traction splint. The patient has been treated for shock; blankets have been placed over and under her. A backboard is ready to be placed. Also, notice that a soft object has been placed under her head to make her comfortable. It is only through an examination such as that carried out in this emergency that squadmen can be sure of finding fractures.

In case regular splints are not available, other materials can be used: well-padded pieces of wood, magazines, blankets or any other materials that will immobilize the injured part. Figures 7 through 20 show various ways of improvising splints.

If a compound fracture is present, the wound should be covered with a sterile dressing. No attempt should be made to reduce the fracture, even though one of the bone fragments is protruding through the skin. Splints should be applied as in any other type fracture. A pressure dressing should be applied over the wound to control bleeding.

As a rule, victims with fractures should not be moved until the injured part has been supported by temporary splints. There are times, however, when moving is necessary. In those cases the limb should be supported both above and below the site of the fracture, and traction should be applied in the direction of the long axis of the bone in order to prevent rotation as well as angular motion.

Victims with fractures can best be transported on a backboard. See Chapter XIII for detailed information on the use of the backboard.

THE FRACTURE LESION

DEFINITION

A lesion is any change in tissue formation. Fracture lesions may vary from a simple crack in the bone with mild disturbance of surrounding tissues to severe lesions with marked displacements of the fragments and much damage to all of the neighboring tissues.

The actual conditions at the site of the fracture are of the greatest importance, since they will help establish the general principles of care to be used by the squadman. In examining the victim the squadman should observe (1) the character of fracture and nature of soft-part damage, and (2) the stage of changes present.

Ordinarily when a bone is broken, the covering of the bone is torn and the surrounding soft parts are damaged to some extent. Blood vessels and glands are ruptured and the tissues become swollen and engorged with blood, lymph, and waste products. This causes swelling, pain and circulatory disturbances, all of which are increased by handling of the extremity and movement of the bone fragments.

The blood, lymph, and waste rapidly begin to form a clot at the site of the injury. The bone ends at the fracture site and some of the soft tissues are killed by the injury, and in their disintegration they yield chemicals that break up the dead cells resulting in their being removed from the dead and dying bone. Later this calcium is used in the formation of a callus at the fracture site, a type of body-made splint.

The swelling and inflammation of the soft parts increases rapidly during the first eight to twelve hours. By the end of this time the muscles and other soft parts have lost their elasticity and have become waterlogged. Reduction by a physician at this late stage is more difficult to accomplish, and results in more damage to surrounding tissues. The fluid in the tissues occurs as the result of circulatory disturbance due to pressure from swelling.

At the scene of an emergency, the squadman should not only give emergency care to the obvious fracture lesion. He should be on the alert for symptoms of any other injury and must consider that a fracture may cause severe pain and hemorrhage with complicating shock.

The fracture lesion description was presented here to show the seriousness of fractures. It has become an increasing problem in squad training to impress on the squadman the importance of good fracture care.

The old expression, "We are close to a hospital and do not need to splint," is absolutely senseless. A person who falls within a hospital is splinted first and then taken to the emergency room. Splint all suspected fractures.

Figure 7

Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 8

Board splints should be padded before they are put into service. See Figure 7. This small arm or leg splint will be more comfortable when applied, due to its being padded. After a padded splint board is in place, it is tied securely. See Figure 8. Splint boards should go beyond the adjacent joints: in this case, the elbow and wrist.

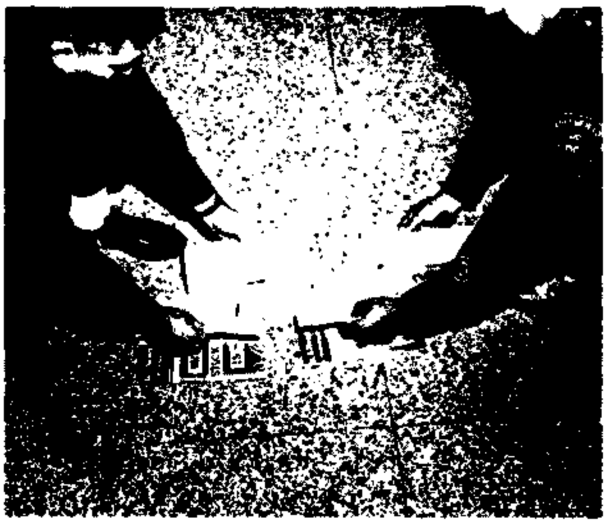
Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 9

Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 10

A splint can be improvised from household or squad pillows. Figure 9 shows one squadman supporting the victim's foot, while the other applies a two-inch roller bandage to secure the splint. After securing a pillow splint, the foot must be supported. Pinning the overlap of the pillow case, as shown in Figure 10, keeps the foot in an upright position and in the best alignment for transportation.



Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 11

Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 12

Improvised splints may be made from large magazines, interwoven as shown in Figure 11. An entire leg or arm could be immobilized this way and might require many magazines. Large magazines should be carried in all fracture kits. Figure 12 shows a magazine splint being applied. The knot is tied on one side, so as to make the splint as comfortable as possible for the victim. The splint runs above and below the joints adjacent to the fracture: in this case, the ankle and knee.

BLANKET ROLL SPLINT

Many things can be used for improvising splints. A blanket roll is one of the most common. Figures 13 through 20 deal with making and applying blanket roll splints.

Two sizes should be carried on the squad truck: a short roll (12" to 16") for possible neck fractures, and a long roll (22" to 26") for arm and leg fractures.

Figure 19

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 20

The cravats are pushed under the blanket with a flat, thin blade (Figure 19.) They can be brought down the splint from the top. Figure 20 shows the splint in place. It is positioned tightly against the victim's shoulders and head, to immobilize his head and neck.

CONVULSIONS IN CHILDREN

DEFINITION

A convulsion is a loss of consciousness with a generalized twitching of the muscles.

CAUSES

General convulsions in children have various causes.

In very young infants (two to four months) convulsions may be due to birth injuries. In older infants and young children a convulsion may mark the onset of an infectious disease, epilepsy, drug poisoning, or a nutritional disease. The cause may be unknown.

In children that the squadman will see, the usual cause of a convulsion is a high fever. (This is true 95% of the time.) This can be determined by just the touch of your hand on the child's skin.

SQUADMEN'S CARE

If a high fever is the cause of the convulsion, the cause must be eliminated. The child's temperature must be lowered.

This can be accomplished by sponging the child's body with cold applications. The solution used should be tap water, not ice water.

The proper way to "sponge" or cool a child's body is:

1. Obtain two large bath towels.
2. Fill a basin with cold tap water.
3. Take off all of the child's clothing.
4. Submerge towel in cold water and apply completely open, on one side of the child's body. (Front or back of the child).
5. Pat the towel; do not rub it. When the towel becomes warm, remove it and place a cold one under the child.
6. Repeat this procedure during transportation to a hospital or until a physician arrives.
7. An airway should be inserted to keep the victim's tongue forward. which will maintain a good exchange of air.

Remember to cool only one side of the body at a time. An ice bag can be placed on the child's head if desired. Also some physicians recommend the addition of an ounce of 70% alcohol (rubbing alcohol) to the water. Add this only on a physician's order.

The squadman should start this entire procedure as soon as possible and continue it until the convulsion stops or a physician arrives. He will probably recommend that this work be continued.

These children should be in the hands of medical personnel before the squadmen leave them.

CONTAGIOUS DISEASES

NEED FOR SPECIAL CARE

Sometimes, after an emergency squad has answered a call, has had direct contact with the victim, and has transported him to the hospital, it is found that the patient suffers from a contagious disease. Since there are many ways in which contagious diseases are transmitted, it is a must for all squadmen to take certain special care not only of their person and personal clothing, but of their equipment, apparatus, and vehicle.

PRECAUTIONS

The special precautions that must be taken, to prevent the spread of common communicable diseases, are listed in Table 1.

Some of the statements in the chart should be defined. When the squad truck is to be "aired for 12 hours" it should be out of service for that time. All windows and doors of the vehicle should be opened.

To "boil linens" means that the water should boil before adding the linens and the water should boil for at least 20 minutes after adding them. Be sure to tell the laundry that the linens you are having washed have already been boiled.

To "scrub car" means to wash the inside of the squad vehicle and any equipment with which the patient came in contact. Soap and warm water should be used. After washing, wipe down the vehicle with aqueous Zephiran solution 1:750. This solution can be bought at any drug store. Just moisten a cloth with this solution and go over all the parts that were washed.

LOCAL AUTHORITY

If there is any question at all about the contagious disease patient, you should call your county or city health physician. He is your local authority on contagious diseases.

All squadmen should wash their hands at the hospital after each run.

Table I HANDLING OF CONTAGIOUS DISEASES

COMMON NAME	MEDICAL SYNONYMS	INCUBATION PERIOD	MODE OF TRANSMISSION	CARE OF SQUAD VEHICLE AND LINENS *	CARE OF PERSONNEL **
Diphtheria	Membranous croup	1 to 7 days	Droplet infection and direct contact with cases or with a healthy carrier.	Air car 12 hours. Launder linens.	Schick test. Immunize.
Scarlet fever	Scarlatina	1 to 7 days	Droplet infection, fomites, carriers, pets occasionally.	Air car 12 hours, and scrub. Boil linens.	Dick test. Shower. Change and boil clothes.
Measles	Rubeola or Red measles	7 to 18 days; usually 9 to 11 days	Secretions from respiratory tract and eyes, droplet infection.	Air car 12 hours. Launder linens.	Wash hands.
German measles	Rubella	5 to 21 days	Direct contact, droplet infection from nose and mouth.	Air car 12 hours. Launder linens.	Wash hands.
Whooping cough	Pertussis	2 weeks	Droplet infection, carriers.	Air car 12 hours and scrub. Isolate and boil linens.	Shower. Change and boil clothes.
Mumps	Parotitis epidemic	12 to 24 days; usually 16 to 18 days	Direct contact, droplet infection from nose and mouth.	Air car 12 hours. Air and change linens.	Wash hands.
Chicken pox	Varicella	10 to 20 days; usually 14 days	Droplet infection from nose and mouth; direct or indirect contact.	Air car 12 hours and scrub. Boil linens.	Shower. Change clothes.
Smallpox	Variola	3 to 18 days; usually 10 to 12 days	Direct or indirect contact.	Scrub car. Burn linens.	Burn clothes. Re-vaccinate all exposed persons immediately.
Spinal meningitis or Cerebro-spinal fever	Meningococcus meningitis	3 to 7 days	Droplet infection from nose and mouth of patients or carriers.	Air car 12 hours. Launder clothes.	Shower. See M.D. for possible medication.
Typhoid fever	Enteric fever	10 to 15 days	Fecal contamination of food, water, or milk.	Air car 12 hours. Boil linens if contaminated with urine or feces.	Wash hands and face.
Tuberculosis	Koch's disease or TB	Varies	Infected sputum.	Use sputum cups and burn. Scrub car. Boil clothes and linens.	Avoid close facial contacts.
Syphilis	Lues VD	3 weeks	Usually sexual contact.	Air and launder linens. (No special car care.)	Wash hands. If scratched call M.D.
Infantile paralysis	Poliomyelitis	7 to 14 days	Uncertain: possibly nose and throat.	Air car 12 hours. Launder linens. Wash equipment with soap and warm water.	Shower. Change clothes.
Hepatitis	Serum hepatitis or Infectious hepatitis	10 to 14 days	Infected blood.	Air car 12 hours. Boil linens if contaminated with blood or feces.	Wash hands.

* When a car is being "aired," it is not to be in service. To "scrub car" means to wash the entire inside of the squad car with soap and water.

** In all of these conditions, except syphilis, the squadmen should use cloth, contagious-disease masks.

POISONS

DEFINITIONS

Demulcent: An agent that will soothe a part. (Olive oil, glycerin, milk)

Emesis: Act of vomiting

Emetics: Materials that produce vomiting

Extremities: Usually refers to the arms and legs

Gastric: Pertaining to the stomach

Lavage: To wash out a cavity (stomach)

Stomach tube: Refers to a stomach pump. Squadmen never use these.

SQUADMEN'S CARE

The United States Pharmacopeia (U.S.P.) encourages all manufacturers of poisonous material to print the antidote on the container. Look for such information first and carry out instructions if possible.

Figure 21 lists telephone numbers for centers in Ohio that provide emergency information about poisons. Figure 22 describes counterdoses for many poisons.

If a victim is unconscious, do not try to give fluids. If he is even a little dizzy or resistive, be cautious in trying to dilute the stomach contents.

If you are to dilute the substance in the stomach and cannot obtain the antidote, use water. Dilution, or washing out of the stomach, can be carried out enroute to the hospital. Have the radio dispatcher notify the hospital that you are coming.

Squads should carry a carbon dioxide-oxygen mixture, but the mixture should be used only on a physician's prescription. He can prescribe in person, in writing, or by phone.

These centers have agreed to cooperate in a program to extend their services to any physician requesting information from them. When a center is called the physician should have four basic facts in mind (1) The full name or brand of the product ingested or inhaled; (2) An accurate estimation of the amount of the particular agent ingested; (3) The time of ingestion; (4) The age and weight of the patient.

LOCATION	FACILITY	TELEPHONE
AKRON	Children's Hospital W. Bowery and W. Bechtel	BL 3-5531, EXT. 246

DO THIS FIRST

- **Send for a doctor — immediately.**
- **Keep the patient warm.**
- **Determine if patient has taken**
  - ***(1) A POISON***
  - ***(2) AN OVERDOSE***
- **While waiting for physician, give appropriate counterdose below.**
- **But do not force any liquids on the patient — if he is unconscious.**
- **And do not induce vomiting if patient is having convulsions.**

To Find the Correct Counterdose

- **In one of the lists printed at left, find substance causing the trouble.**
- **Next to that substance is a number. This refers to counterdose bearing same number in the section below.**

Keep all poisons and medicines out of reach of children

1

Induce vomiting with an emetic such as
- Finger in throat, or
- Tablespoon of mustard in half glass of water, or
- Syrup of ipecac, or
- Salt & warm water.

2

- Give glass of milk, or give "universal antidote" (obtain from drug store and keep on hand at home)
- Induce vomiting. (See #1)

3

- Induce vomiting. (See #1)
- Give 2 tablespoons epsom salt in 2 glasses of water.
- Then give large quantities of hot coffee or strong tea (instant or regular).

4

- Give 2 ozs thick starch paste. Mix cornstarch (or flour) with water.
- Then give 2 ozs salt in quart of warm water. Drink until vomit fluid is clear.
- Finally, give glass of milk.

5

- Induce vomiting. (See #1)
- Then give 4 oz mineral oil. Positively do NOT give vegetable or animal oil.
- 4 oz hydrogen peroxide.
- 1 tablespoon sodium bicarb in quart of warm water.

6

- Give glass of milk or universal antidote. (See #2)
- Induce vomiting. (See #1)
- 1 ounce of epsom salts in a pint of water.

7

- Induce vomiting. (See #1)
- Give 2 teaspoons of sodium bicarb in a glass of warm water.

8

- Give a glass of milk.
- Hot coffee or strong tea plus white of raw egg.

9

- Give a glass of milk.
- Induce vomiting. (See #1)
- Tablespoon sodium bicarb in quart of warm water.

10

- Give 2 tablespoons vinegar in 2 glasses of water.
- Give white of 2 raw eggs or 2 ounces of olive oil.
- Do NOT induce vomiting!

11

- Induce vomiting. (See #1)
- Give 2 tablespoons epsom salt in 2 glasses of water.

12

- Induce vomiting. (See #1)
- Then give 2 ounces of castor oil.
- Next give glass of milk or whites of 2 raw eggs.

13

- Give glass of milk or universal antidote. (See #2)
- 2 tablespoons epsom salt in 2 glasses of water.
- Keep patient awake.

14

- Give 2 tablespoons of milk of magnesia.
- Give glass of milk.
- Induce vomiting. (See #1)

15

- Give glass of milk or universal antidote. (See #2)
- Induce vomiting. (See #1)
- Give artificial respiration.
- Keep patient quiet.

16

- Carry victim into fresh air.
- Make patient lie down.
- Hot coffee or strong tea.

17

- Give water or milk.
- Give 2 oz vegetable oil.
- Do NOT induce vomiting.

18

- Give 1 oz milk of magnesia in large quantity of water.
- Do NOT induce vomiting!

Courtesy American Druggist

Figure 22

Counterdoses for common poisons and overdoses.

PROPER EXAMINATION

People who have not been trained sometimes wrongly think that a victim is under the influence of alcohol, when actually he needs medical care. Squadmen should not accept the opinion of a casual bystander that a victim is "drunk" but should examine carefully for symptoms of diabetes, epilepsy, and other conditions.

UNCONSCIOUS PERSONS

DEFINITION

Unconsciousness is the state of being insensible or without conscious experiences.

CAUSES

To describe here all the causes of unconsciousness in not feasible; they are too many and too complex.

ESSENTIAL POINTS TO REMEMBER

1. The air passage is usually poor at some time during the illness.
2. The inhaling of any foreign material may cause death.
   a. Check closely for any foreign material in the patient's mouth.
   b. Check closely for any vomiting which may bring foreign material to the mouth from the stomach.
3. Since a state of unconsciousness means that all body functions are impaired, respiration may be slower.
4. Always remember that the unconscious person is breathing, while the asphyxiated person is unconscious and not breathing.

SQUADMEN'S CARE

Check the victim for any difficulty in air exchange. If difficulty is noted, you must do the following:

1. Check his air passage. If a good air passage is needed, the squadman must insert a plastic, hard rubber, metal or improvised airway immediately. This will keep the paralyzed tongue out of the way of the windpipe. The unconscious person can still have a gag reflex.
   If there should be any sign of gagging on the airway, remove it immediately. Do not cause the complication of vomiting with the airway. The squadman can then lift up on both sides of the angle of the jaw to create a good air passage.

2. If there is any sign of vomiting or coughing up of any foreign material, the victim must be turned on his side immediately. This will facilitate the flow of any foreign materials out of the mouth.

3. It is always a safe practice to support these people with a flow of oxygen. If they should stop breathing, resuscitate them.

DIABETES

DEFINITION

Diabetes is a chronic disorder of the metabolism, the basis of which is an inability of the cells to use sugar. This defect probably is due to a deficiency of insulin production by the cells of the pancreas. The diabetic can go into either of two conditions: diabetic coma or insulin shock.

(A) DIABETIC COMA

This condition is caused by the incomplete oxidation of fatty acids, which produces acetone bodies and is common in uncontrolled diabetes.

Clothing of any person in a coma should be checked for a card which states that he is a diabetic. Relatives or friends may volunteer the information.

SIGNS OR SYMPTOMS

1. The victim can be confused and unable to cooperate.
2. Nausea and vomiting may be present.
3. The breathing is characterized by very deep, yet not labored respiratory movements. There is no evidence of obstruction of the air passages or any blueness.
4. The skin is dry and cold.
5. The breath has a sweetish or fruity odor which is acetone.

SQUADMEN'S CARE

Since this victim needs insulin and the squadmen are not permitted to administer it, transport him to a hospital immediately. He requires careful, expert, and immediate attention from a physician.

(B) INSULIN SHOCK

Insulin shock is likely to occur in a diabetic when, for any reason, the blood sugar falls. It results usually from the omission of a meal or the vomiting of a meal after taking insulin. Some attacks follow undue exertion. The majority of attacks occur in the morning and in the early evening. An individual whose store of blood sugar is depleted as a result of emotional excitement, exertion or exposure to cold has an increased sugar tolerance and reacts to insulin with a comparatively greater blood-sugar drop than would otherwise be the case. He is, therefore, a candidate for insulin shock; that is, he is temporarily insulin-sensitive.

These reactions begin in five to twenty minutes following an injection of regular insulin, but not for several hours after other types are given. The symptoms and signs should be familiar to every squadman.

SIGNS OR SYMPTOMS

1. General muscular weakness, together with mental confusion
2. Restlessness
3. Profuse sweating
4. Dizziness
5. Pallor or flushing of the face
6. Trembling
7. Hunger pangs in the upper stomach

The victim may lapse into a coma. Some victims' blood sugar lowers so rapidly that the symptoms progress almost without warning to those of epileptiform convulsions.

SQUADMEN'S CARE

When the warning symptoms appear, the victim should take a drink containing sugar or consume a piece of candy at once. All persons taking insulin should carry sugar in some form in their pockets. Such sugar checks the reaction within a few minutes. If the sudden attack progresses to convulsions, care for the victim as you would any convulsing person.

If untreated, a reaction may result in death, but this seldom occurs. These people should be transported as soon as possible to the closest emergency room.

CRITICAL QUESTIONS

Two questions that can be asked of the diabetic to determine which state he might be entering are as follows:

1. Have you eaten today?
2. Have you taken your insulin today?

If the person has taken his insulin and has not eaten, he is going into insulin shock. If he has eaten and has not taken his insulin he is entering diabetic coma. These two questions should be memorized and be ready for use at any time by the squadman.

EPILEPSY

DEFINITION

Epilepsy is a disease characterized by attacks of loss of consciousness, with or without convulsions. Some of the most pronounced epileptics have few convulsions - possibly none at all - while violent convulsions, in every way similar to those of epilepsy, may be due to other conditions. The mildest cases of true epilepsy also may have no true convulsions, but merely attacks of momentary unconsciousness, although these have the same significance as the most violent seizures.

The epileptic attack should be called a <u>seizure</u> - never a "fit."

SQUADMEN'S CARE

Cool presence of mind and prompt action are important in caring for any type of convulsion. One of the first steps indicated is to insert some object between the victim's teeth to prevent him from biting his tongue. This cannot be done during a seizure, but should be carried out when it appears that the victim will be entering a seizure momentarily. If the victim is experiencing a series of seizures, the mouth gag can be inserted during the relaxed state between seizures.

An effective mouth gag can be fashioned quickly by binding together several tongue depressors with adhesive tape, wrapping one end with gauze. (See Figures 23 and 24.) This gag should be placed between upper and lower teeth at the back of the mouth. <u>Never put your fingers in an epileptic's mouth</u>.

Figure 23

To make a padded tongue blade, tape two large tongue blades together with ½-inch tape. Also needed is a 4x4 compress.

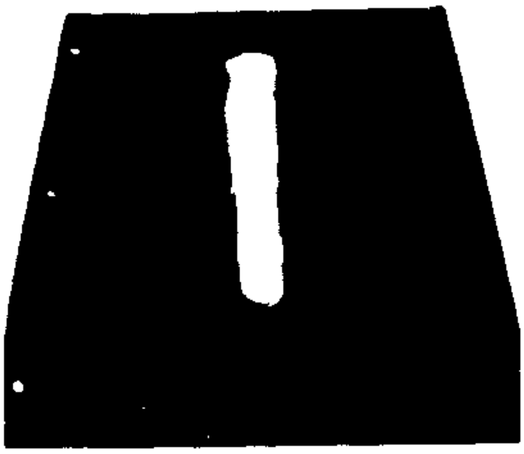

Figure 24

The compress is wrapped completely around one end of the tongue blades and made secure with two pieces of ½-inch tape.

The victim should be stretched out full-length on the floor or a bed. The clothing around his neck and chest should be removed or loosened. His movements should be guided to prevent him from injuring himself.

Victims sometimes become quite blue and may not breathe for long periods. This is not usually a problem, as they will start to breathe as soon as the relaxation period starts after the initial attack.

The head of the epileptic should be protected at all times. This can be accomplished by placing some soft material under his head. It is not at all uncommon for an epileptic to receive a fractured skull during his seizure due to striking his head on hard objects.

Never apply restraint. The duration of the convulsion and the general reaction following it should be observed and included in the notes for the doctor. Most epileptic victims following a seizure will go into a deep sleep. Close observation should be kept for the few who will have maniacal or homicidal tendencies.

The squadmen should make a victim comfortable and move him as needed. He should then be taken to medical attention.

STROKE

DEFINITIONS

A stroke is loss of consciousness and paralysis due to hemorrhage into the brain or spinal cord which forms a clot cutting off the blood supply. It is often called apoplexy or a stroke of paralysis.

Cerebral hemorrhage (escape of blood into the tissues of the brain) generally occurs in elderly victims who have had high blood pressure for some time.

Arteriosclerosis (hardening of the arteries) with a low blood pressure often leads to a cerebral thrombosis (a blood clot obstructing a blood vessel) in which the onset is gradual. There may be a feeling of numbness in one extremity, mental confusion, and inability to concentrate. Later the victim may lapse into unconsciousness with or without paralysis.

SQUADMEN'S CARE

1. Elevate the victim's head slightly.
2. Place cold cloths or ice bag on victim's head.
3. Do not move the victim any more than is necessary.
4. Do not attempt to give the victim anything by mouth and do not give stimulants.
5. Give oxygen by mask as an inhalator; if the victim should stop breathing, the use of the resuscitator should immediately be initiated.
6. Constant watch by the squadmen must be maintained at the side of any breathing, unconscious victim. You must especially facilitate a good air-way in a stroke victim, as they are prone to accidental asphyxiation.
7. Transport as soon as possible. If the hemorrhage is massive the victim may die within a short time.

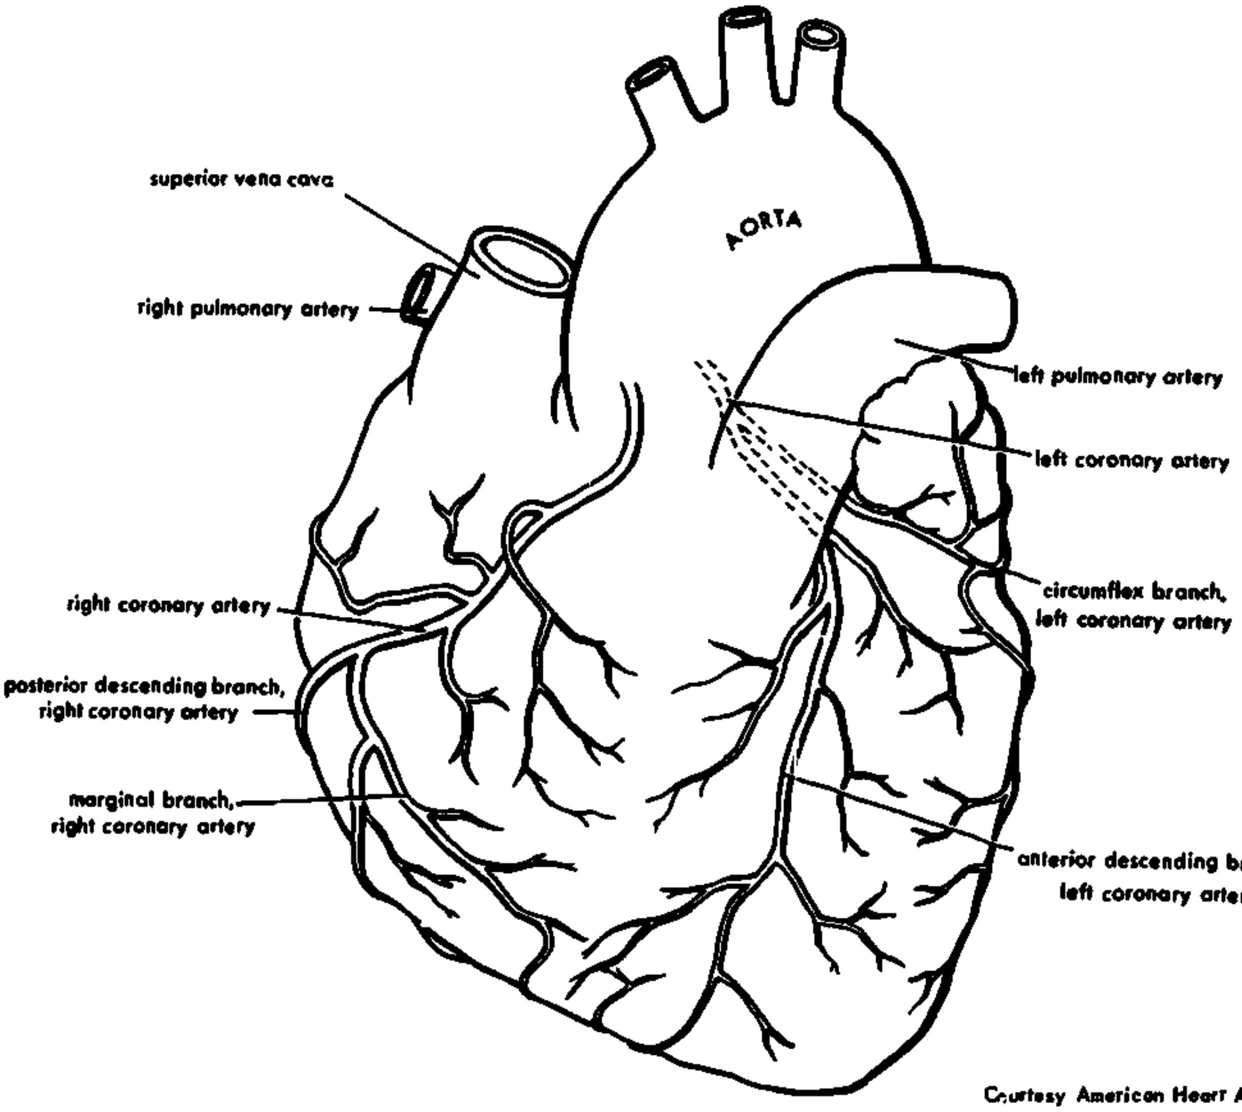
GENERAL INFORMATION ABOUT HEART ATTACK

CORONARY THROMBOSIS

Usually a "heart attack" means an acute condition that doctors call coronary thrombosis. It is a sudden blocking of one of the coronary arteries: the arteries that supply the heart muscle with blood.

(See Figure 25.)

Although a heart attack itself is sudden, it is the result of atherosclerosis: a slowly developing disease process of the coronary arteries. Atherosclerosis causes most heart attacks and the chest pain called angina pectoris. It is a form of arteriosclerosis (hardening of the arteries).



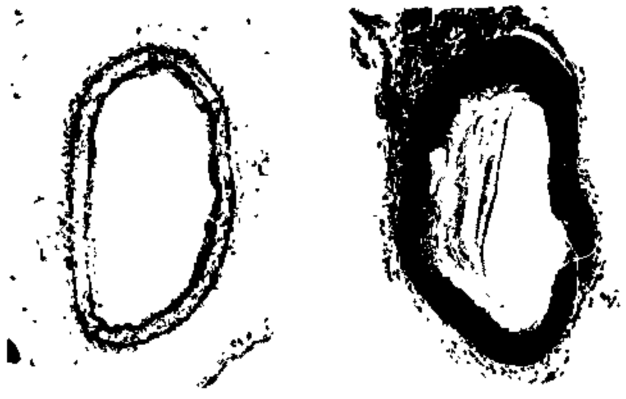
Courtesy American Heart Assoc.

Figure 25

The main coronary arteries with their many branches come down over the top of the heart like a crown (corona) and send tinier branches or twigs down into all parts of the heart muscle to supply it with oxygen-carrying blood.

In atherosclerosis, the passageway through the arteries becomes roughened and narrowed by fatty deposits that harden into patches along the inner lining of the artery. This process has been compared to the formation of lime deposits in a water pipe. Around the patches scar-like fibrous tissue forms in the artery wall so that the channel is narrowed and there is less room for blood to flow through.

(See Figures 26A and B.)



Courtesy American Heart Assoc.

Figure 26A **Figure 26B**

Figure 26A shows a cross-section of a normal artery greatly enlarged. Figure 26B shows deposits found in the inner lining.

A blood clot can form in an artery narrowed by atherosclerosis. This blocks the channel and cuts off the blood flow to the part of the heart supplied by the artery. (See Figures 27A and B.)

Courtesy American Heart Assoc.

Figure 27A **Figure 27B**

Deposits harden, then a blood clot blocks the narrowed channel.

When a clot (thrombus) cuts off the blood supply to a section of heart muscle, the result is a heart attack. Physicians call it a coronary thrombosis, coronary occlusion, or myocardial infarction. The usual symptoms are:

1. Severe painful sensation of pressure under the breastbone, often lasting for hours. (Mild attacks are sometimes mistaken for acute indigestion.)
2. Sudden intense shortness of breath
3. Sweating
4. Loss of consciousness (occasionally)

COLLATERAL CIRCULATION

Luckily the coronary artery system has a life-saving method of growth and repair. When some of the coronary arteries become narrowed by the gradual development of atherosclerosis so that they cannot carry enough blood to the heart muscle, nearby arteries get wider and even open up tiny new branches to deliver blood to the area of muscle that needs it. This is called collateral circulation.

This collateral or substitute circulation often develops while the main coronary arteries are becoming narrowed. This explains why many of us who have narrowed arteries are not troubled with angina pectoris or heart attacks. Once a heart attack occurs, the development of the collateral circulation may help the heart to mend itself.

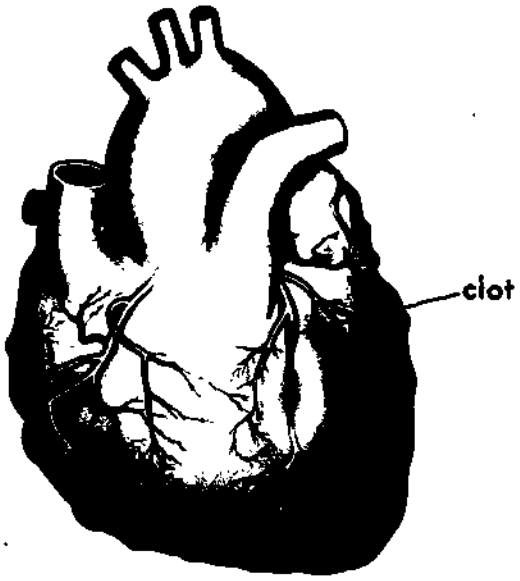
RECOVERING FROM CORONARY THROMBOSIS

When a clot suddenly shuts off the supply of blood to a part of the heart muscle, the central part of the area deprived of blood may die. The affected area must heal to form strong scar tissue. At the same time, a new blood supply to the area develops by means of the collateral circulation just described. (See Figures 28 and 29.)

Treatment is aimed at giving the heart time to mend itself. Even though the patient feels well after the first week, he must continue to rest in bed or chair to give the heart time to heal.

The time required for the patient to get back on his feet will depend on the extent of the heart injury, the rate of healing, and whether or not complications develop. Although medicines are helpful, the patient's cooperation and understanding play a large part in his recovery.

Coronary Heart Disease



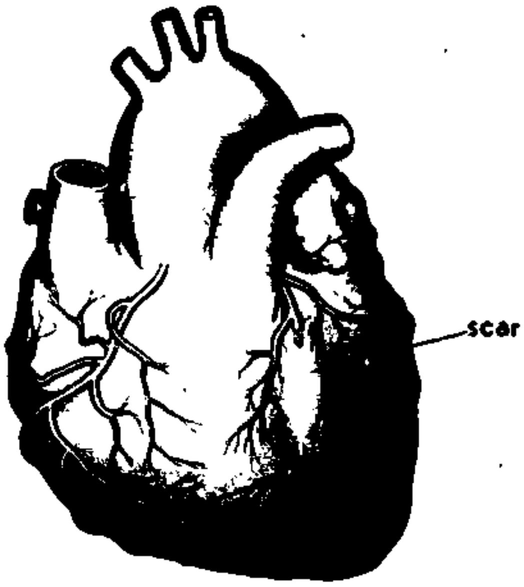
4 days after the attack

Courtesy American Heart Assoc.

Figure 28

White cells are clearing away the dead tissue. Scar tissue is beginning to form at the edges of the damaged area (just below the clot). The patient must remain quiet because during the first two weeks or so there is danger that this weak spot will rupture.

Coronary Heart Disease



8 weeks or so after the attack

Courtesy American Heart Assoc.

Figure 29

Tough scar tissue has formed. The patient begins to resume activities. He must keep his weight down, avoid severe mental and physical strain. Moderate physical activity is encouraged.

MOST PATIENTS RETURN TO WORK

Most patients are able to continue with their usual job once they have recovered from a heart attack. Some may have to make job adjustments and changes in their manner of living. The patient who has had a heart attack is advised to:

1. Keep his weight down.
2. Eat frequent small meals rather than a few heavy meals. (Digesting a heavy meal makes heavy demands on the heart.)
3. Get plenty of rest and take moderate exercise.
4. Avoid overexertion and overexcitement.

Sometimes a patient who has recovered from a coronary heart attack has anginal pains. (See below.) This is a signal for him to consult his doctor.

HOW TO HELP IN CASE OF A HEART ATTACK

1. Call the doctor at once.
2. Help the patient take the position that is most comfortable for him. (This will probably be halfway between lying and sitting. He usually cannot breathe comfortably if he lies flat.)
3. Do not attempt to carry or lift a patient without the physician's supervision.
4. Loosen tight clothing such as belts and neckties.
5. See that the patient does not become chilled, but do not induce sweating with too many blankets.
6. Do not give stimulants such as whiskey or brandy.

ANGINA PECTORIS

Angina pectoris is a severe chest pain that signifies that the heart muscle is not getting enough oxygen through its blood supply. It usually means that some of the coronary arteries have become so narrowed by atherosclerosis that they do not let enough blood through to supply the demands of the heart muscle.

The individual may complain of severe chest pain with a sensation of oppression under the breastbone or strangling. The pain may be accompanied by numbness and often spreads to the left shoulder, arm, or hand. This is a typical anginal attack or episode. It is usually brought on by effort or excitement, or after a heavy meal. The pain does not last long. As a rule, it is relieved within a short time by rest or by nitroglycerine tablets.

Sometimes anginal pains occur in persons who have recovered from a heart attack. Sometimes they occur in people who never had a heart attack and who may never have one. However, chest pain may be due to other causes. It should always be reported to a physician.

LIVING WITH ANGINA PECTORIS

The same process of collateral circulation that increases the blood supply to the heart muscle after a heart attack can also come to the aid of the patient with angina pectoris. Given time, some branches of the coronary arteries may enlarge and new branches open to deliver enough blood to the heart muscle to enable the individual to carry on his usual activities.

That is why most persons can be comfortable and lead productive lives even though they must cope with angina pectoris. Each case is individual; only the patient's own doctor can determine the course he should follow and the medicine he should take.

Regulating habits of life is important in controlling anginal attacks. Physician and patient must work out a program together.

As a rule, patients who have had angina pectoris should avoid overexertion, rushing, worrying, intense cold, and overweight. They are advised to eat four small meals daily rather than three heavy meals, and should rest twenty minutes or so after eating.

Certain drugs are helpful, too. The physician almost always prescribes nitroglycerine tablets. The patient is told to let a tablet dissolve under the tongue to relieve the pain of angina. Often, if he expects to be in a difficult or exciting situation, the patient is told to take a tablet beforehand to avoid an attack of anginal pain.

TECHNICAL INSTRUCTIONS FOR SQUADMEN CONCERNING CORONARY ATTACK

THE TISSUES INVOLVED

The bloodvessels of the body are made up of three layers: (1) an outer protective layer, (2) a muscular center layer and (3) a smooth inner layer. The center muscular layer is the one which is most highly involved in the coronary heart attack.

BLOOD SUPPLY SHUT OFF

A person who experiences fear or pain becomes very tense; all his muscles tend to tighten. The pain that a victim experiences due to the formation of a clot within the coronary artery, and associated fear, cause the muscular layer of the blood vessels around the clot to clamp down. If this muscular layer does not relax, blood will be unable to pass the affected area. The part of the heart that is involved will die.

It follows then that it is of the greatest importance to do everything possible to help a victim to relax.

SYMPTOMS

The following symptoms will be exhibited by a heart attack victim.

<u>Severe Pain</u> - This pain will be over the front of the chest. It may radiate to the shoulder, arm, and hand. The victim may complain of pain or just a numbness in the above-mentioned parts.

<u>Shortness of Breath</u> - This is a usual symptom for any heart victim. Shortness of breath is due to the diminished supply of blood to the lungs. This is a very dramatic and severe symptom.

<u>Apprehension or Fear</u> - This is due to the pain and the thought of impending death. The face will show fright, and the eyes will be opened wide.

<u>Activity and Restlessness</u> - The victim will continuously try to move about and will try to get up. If he is able to be up, he will pace up and down.

<u>Shock</u> - All of the symptoms of shock may be evident. Actually, some victims are in shock during the entire attack.

<u>Passing Out</u> - This may occur in the beginning or later in the attack. It sometimes is the first sign and will be followed by the other symptoms mentioned.

SQUADMEN'S CARE

Severe Pain - For heart attack victims, physicians administer medicine which not only relieves pain but which also relaxes the victim as well as the muscle layer of the blood vessel around the clot. Squadmen are not permitted to give medication. However, if the patient is under medical care the squadmen may assist in administering prescribed medicine which is carried by the victim or is in the household. The squadman can alleviate coronary attack pain by carrying out the steps described in the following paragraphs.

Shortness of Breath - The victim should be given oxygen in the highest concentration possible. The coronary victim is often so afraid and desperate that he will fight the squadman who approaches with the mask, since the victim feels that the mask will smother him. Do not fight with the victim. This only causes the victim's fear to become greater, and in turn, his condition more critical.

If the victim will not take oxygen by mask, disconnect the mask from the outlet and hold the outlet under the victim's chin or in front of his nostrils. In this way the victim will be given a high concentration of oxygen which will tend to make him rest more easily.

Apprehension or Fear - The three big words in squadman care at this time are, "Talk to him." Tell him exactly what will be done and why. Understanding what is being done will tend to alleviate his fear and thus make him relax. The result for which one should strive is the relaxation of the muscular layer of the involved coronary artery.

Activity and Restlessness - There are three words to remember in the care of the victim in this condition: "Do for him." Every effort should be made to keep a heart victim from being active or restless. Being active will put additional stress on his heart. The squadman must not allow the victim to move more than is absolutely necessary. The victim must be kept at rest.

Shock - The care of a heart victim under shock is somewhat different than usual. The three important words to remember are (1) heat, (2) position, and (3) fluids.

1. Heat - Conserve body heat by use of a blanket, but do not make the victim too warm. If the victim experiences a smothering effect from the blanket, do not put the blanket further up than is comfortable. Do not fight the victim.

2. Position - The victim should be placed in the most comfortable position possible. Some victims will feel best lying flat, others in a partial or definite sitting position. Do not fight with them. Care for and transport the victim in the most comfortable position possible.

3. Fluids - Give only small amounts of water to sip, or just moisten the victim's lips. If a victim is given too much fluid, it may cause him to vomit. This in turn will place an additional strain on his heart. The water should not be ice water.

Passing Out - If this should occur during care of the victim, keep a careful watch of the victim's air passage. If the victim should stop breathing, apply artificial respiration immediately, unless mechanical respiration equipment is set up ready to be used. If artificial respiration is applied, it should be replaced by mechanical respiration as soon as the equipment can be checked and put in service.

TRANSPORTATION

In the care of coronary victims it has been stressed that everything possible should be done to make the victim comfortable and to keep him at rest. Transportation of a victim should be carried out at a moderate speed with no siren. It is obvious that a fast trip to the hospital with a blaring siren would not contribute to the well-being of the victim, since it would probably cause him additional fear. The use of oxygen during transportation of heart victims is often very desirable, since it makes breathing easier.

CHRONIC HEART FAILURE

CAUSES

Chronic heart failure is usually due to old age or to a former heart condition that has weakened the heart. Actually, the condition is a weak heart.

The heart is unable to do its usual work. With the lessened supply of blood and poor blood pressure, the victim will have the following symptoms:

1. Wet respiration (noisy)
2. Swollen feet and hands caused by fluid in the tissues
3. Continuous fatigue

The swollen feet and hands are due to the poor circulation. The waste products or materials given off by the body are not carried away from the feet and hands, since the blood pressure from the weakened heart is too poor to push these waste products back up to the heart. These products are then pooled in the tissues of the feet and hands.

With the continual pooling of this waste material, the circulation is further impaired and causes more strain on the heart. The heart tries to pump faster and harder and, then, actually tires out or fails.

SYMPTOMS

Severe Fatigue - The victim may hardly be able to move around. He may be scarcely able to talk. He may look like a person who has just run a long distance.

Shortness of Breath - The shortness of breath is due to congestion in and poor circulation to the lungs by the heart in failure. Since it does not pump enough blood to the lungs, enough oxygen is not supplied to the body. Therefore, the body has a constant need for adequate oxygen. The victim will have long inspirations and long expirations. They will be slow at times and fast at other times. The victim will also have "noisy" respirations due to the poor circulation to and congestion in the lungs.

Swelling of Hands, Ankles, and Feet - This swelling is due to the accumulation of the body waste products in the tissues.

Shock - The victim will be in a condition of shock during the attack; he will exhibit extreme perspiration.

SQUADMEN'S CARE

Severe Fatigue - Since any activity on the part of the victim will cause the attack to become worse, the squadman should attempt to anticipate the victim's every need so that it will be unnecessary for the victim to move.

Shortness of Breath - Oxygen should be used. This type of victim will exhibit oxygen hunger rather than fear or avoidance of it.

Noisy Respiration - This condition can be overcome somewhat by the squadman using the following procedure if the inhalator in service contains a breathing bag.

1. When giving the victim oxygen, let the inhalator bag fill to its capacity.
2. On the next inspiration, squeeze the inhalator bag, keeping the face piece snug to the victim's face.
3. Keep up this procedure, if possible, until the victim is under medical care.

This practice will cause the oxygen to push the excess fluid in the air sacs of the lungs back into the circulating blood. If the inhalator does not contain a breathing bag, it will be impossible to carry out the procedure.

Shock - The usual shock care must be varied for this particular condition.

1. Heat - Because of the usual old age of the victim, do not chill him. Cover the victim and conserve body heat. Do not over-heat him.
2. Position - The victim will want to stay in a position in which his chest is elevated, or in an actual sitting position. Do not force him to lie down; the fluid in his lungs can cause him to drown.

The chronic heart failure victim usually has lived with his condition for years. He may even sleep in a chair, so that his chest will be elevated at all times.

3. Fluids - Give only small amounts of water. The victim will usually want his lips moistened.

After the victim is prepared for transportation, try to keep him comfortable at all times. If his head and chest must be lowered for a short time to carry out transportation, explain this before doing it.

CHAPTER IX

THE MENTALLY DISTURBED PATIENT

INTRODUCTION

Many mildly disturbed persons are about us daily. It is only when their actions are especially unusual that attention is brought to them.

On many occasions the emergency squad is called to attend someone who is behaving oddly. It is paramount that the squadman remember he is to assist disturbed people and not judge or punish them.

This chapter will be divided into two sections. One describes the care of victims who are emotionally disturbed because of disasters and accidents. The other describes victim care for the more usual emotional disturbances that the squad might see.

CARE OF EMOTIONALLY DISTURBED PEOPLE IN LARGE-SCALE EMERGENCIES

The American Psychiatric Association has divided the reactions to large-scale emergencies into 5 categories: (1) normal reaction, (2) individual panic or blind flight, (3) depressed reaction, (4) overly active response, and (5) bodily reaction. Each squadman must understand these individual reactions to an emergency and how to cope with them.

NORMAL REACTION

Symptoms - The experienced squadman has often seen this reaction to emergencies. In fact, a squadman himself may have a normal reaction to an emergency. The signs of this reaction are trembling, profuse perspiration, nausea, and weakness. A victim may be confused. He may experience what is sometimes called "temporary state of shock."

Squad Care - Reassure these people. If you encourage them often, they usually will recover in a short time. They then may be able to assist the squadmen, in the case of a large-scale emergency.

BLIND FLIGHT OR INDIVIDUAL PANIC

Some laymen describe this disturbance as "running wild."

Orderly Exit - It is not thought to be panic if a person or group remove themselves in an orderly way from a dangerous or supposedly dangerous situation. A good example of proper control of panic is fire-drill practice in schools. If children did not practice orderly exits, many might panic in a real emergency, causing the whole class or school to panic. But because of practice drills there is a quick, orderly, normal reaction.

Symptoms - There are a variety of symptoms of individual panic. The victim may attempt to flee from the scene. Squadmen have found uninjured persons running about a scene or away from it. The victim may lose all judgment. He may want to do unreasonable things at the scene which could be done later. He may weep uncontrollably. This sign may come on with little stimulus. For example, at the scene of a home accident someone may be running about wildly and weeping. It may later be found that this victim is not part of the family, but a distant neighbor who happened by and reacted to the injured person in this way.

Squad Care - Be firm but gentle at first. If the victim is so upset that he might cause other people to panic, he should be isolated. This may require the effort of several people.

A panic-stricken victim sometimes can be isolated in the emergency squad vehicle or a police car. If there are injured persons involved, another squad should be called to take the person suffering from individual panic to the hospital. To put this victim in the same vehicle with severly injured people could increase the shock of the injured.

To bring the person with individual panic under control upon your arrival may have a reassuring or calming effect upon many other people. This will contribute to better patient care for all concerned.

Do not strike the panicky victim, or slap him, or throw cold water on him. These methods have been found to be of little help.

DEPRESSED REACTIONS

Symptoms - In the midst of a bad accident scene or disaster, this victim may behave as though there is no one around him. He seems to be "in another world". This behavior has been witnessed many times at large-scale accidents such as explosions, tornadoes, train and bus accidents, etc.

The accident is more than the victim can take mentally, so he shuts the outside world out. He may have a vacant expression, showing no emotions. He may sit or stand without moving or talking.

Squad Care - Do not rush this victim of depression. Your contact must be gentle. Try to get the victim to talk. Ask him what happened.

Finding a routine, simple job for him might help to bring him back to normal. He might help you with simple jobs in caring for patients, such as holding a flashlight, bandages, reports, etc. In a short time he may realize that the disaster is not as great as it seemed, or that he is making a positive contribution by helping the squadmen.

Do not tell the victim to "snap out of it." Do not feel resentful toward him or show resentment. Do not pity him verbally.

OVERLY ACTIVE RESPONSE

Symptoms - This person will be exploding with energy and ideas at the scene. He cannot sit or stand still. He will jump from job to job, hardly ever finishing one. He may joke inappropriately, talk very rapidly, and be argumentative.

Upon arrival, the squadmen may at first think this person is being helpful, but in a short time it will be found that his activities are useless.

By insisting on their own ideas and going from one place to another, these acutely active victims may be a source of opposition to your sound, practiced rescue and emergency procedures.

Squad Care - Under proper supervision these victims can become somewhat composed.

Do not agree with them. Tell them that the rightness or wrongness of your order can be dealt with later. These persons are the first to find fault with anything, and may be very disturbing to the squad members if not supervised.

Their need for physical activity is very urgent. Find jobs for them that use physical activity.

Give them some personal attention. Talk with them for a short time. If they think they are "on your side", they will be of some help to you.

Do not tell them that they "should not feel the way they do."

BODILY REACTIONS

Symptoms - These reactions are different from the normal reactions described in this section. The symptoms include severe nausea and vomiting. Victims may also lose the ability to move their limbs. Loss of sight, hearing, or speech may also occur. These are forms of conversion hysteria: the victims sub-consciously convert their anxiety to a part of their body.

Do not assume that someone who shows symptoms of conversion hysteria is not physically injured, until he has been examined thoroughly.

Squad Care - If a victim believes that a part of his body is injured, treat it as though it is. A splint or other measures may help temporarily.

Show the victim that you are interested in helping him.

Sometimes having a job will help him to forget his disability, and this may lead to recovery and use of the part.

Do not blame or ridicule the victim. Conversion hysteria is not under conscious control.

Do not tell him that there is nothing the matter with him. A victim can be functionally blind or paralyzed, even though the involved structure is uninjured.

SUMMARY

In dealing with any of the five described kinds of reactions, the squadman must establish an effective contact with the disturbed person. Once this contact is made it is reasonably easy to help him.

A victim may exhibit one reaction, and later another. The squadmen must be able to care for all reactions exhibited.

The following general approaches should produce positive results:

1. Accept every person's right to have his own feelings. People do not always act as we want them to.
2. Accept a casualty's limitations (or reactions) as real.
3. Size up a casualty's potentialities as accurately and as quickly as possible.
4. Accept your own limitations in disaster or accident situations.

COMMON MENTAL DISTURBANCES

There are medical conditions commonly seen by squadmen, pertaining to the mentally disturbed patient, and not necessarily related to an accident. Delirium tremens, hysteria, and amnesia are among the most common.

DELIRIUM TREMENS

Delirium tremens is a mental disorder, involving hallucinations both visual and in hearing, commonly called "D. T.s."

This acute type of insanity may be brought on by (1) a prolonged alcoholic drinking spree or a sudden withdrawal of alcohol, (2) an acute infectious disease, or (3) trauma (injury), especially fractures and severe crushing injuries.

Symptoms - The victim usually experiences depression, uneasiness, and insomnia for a day or two. Then coarse shaking develops along with hallucinations, usually involving nonexistent things "seen".

Squad Care - Transport the victim to medical as well as psychiatric care at once, so as to protect him and those with whom he may come in contact. He may see or hear things that are not actually present, and may strike out at these imaginary objects or start to run from them. Squadmen should remember this and not assume that the victim is striking at them.

Try to engage the victim in general conversation. While talking with him, get him into the squad vehicle and transport him. If violence is encountered, you may be forced to restrain him for his own protection as well as that of the squadmen.

HYSTERIA

Symptoms - Hysteria is manifested in many ways. It may be as mild as a headache, or so violent that it brings on self-destruction or personal injury.

The causes of hysteria stem usually from nervous disorders or a sudden psychological shock. Persons in a state of hysteria are usually not aware of their actions. The arrival of an emergency vehicle and the squadmen may cause hysteria to become much worse. Because of this, the proper approach to hysterical patients is most important.

Squad Care - In your speech and movements try to convey a reassuring calmness.

1. Your actions should not be hasty, but deliberate and meaningful.

2. Talk to the victim softly and slowly. All motions should be slow and deliberate.

3. After talking to the hysteria patient in order to win his confidence, arrange to transport him to medical help.

4. Many times, the victim will not consent to ride in a squad car, but will go with members of the family in a private car. If the victim is quiet and acts normally, letting him go with members of the family might be the best move.

5. If the victim is violent upon the squadman's arrival, the squadman must take precautions to prevent harm to himself or the victim. The method of approach described above may be used to get close to the victim. As soon as the squadman is able to grasp the victim, he should do so, but he should first make sure there is plenty of additional help at hand. Some feel it is better to approach the violently ill in numbers from the very beginning.

6. The squadman should try to get these people to medical help quickly.

AMNESIA

Symptoms - The true amnesia victim will act very much like an unconscious person who has been suddenly awakened. The victim may be able to give his name, but he will not remember anything about his past. Some victims will obviously be dazed and will recall neither their names nor their whereabouts. Furthermore, the victim will be slow to move.

The cause of amnesia may be either physical or psychological shock. Usually it is the latter.

Squad Care - Transport the victim to the nearest medical help. He may need psychological care. A physician will be able to arrange appropriate treatment for him.

CHAPTER X

RESUSCITATION

INTRODUCTION

There are two basic methods for administering artificial respiration: manual artificial respiration and the use of mechanical breathing apparatus.

MANUAL ARTIFICIAL RESPIRATION

Over the years, different types of manual artificial respiration have been used. The most common reason for artificial respiration not working is due to the victim's tongue dropping back in the throat or the chin dropping down. These two problems are overcome with the mouth-to-mouth method of artificial respiration. Research has proven that the mouth-to-mouth method is the best type to use. The reason for this is that attention is continually given to the mouth, tongue, and throat area.

MOUTH-TO-MOUTH AND MOUTH-TO-AIRWAY RESUSCITATION

This method of resuscitation is not new. However, it has received acceptance by other than hospital personnel only in recent years. The text and illustrations that follow have been adapted from "A Manual For Emergency Artificial Respiration" by Peter Safar, MD, Chief, Department of Anesthesiology, Baltimore City Hospitals, and Martin C. McMahon, Captain, Baltimore Fire Department, Ambulance Service. The manual was based on research conducted at the Baltimore City Hospital's Department of Anesthesiology, which was supported by the Research and Development Division of the Surgeon General's Office, Department of the Army.

The following information was obtained from recent experiments:

1. The first consideration in any method of artificial respiration is that the air passageway be open; otherwise it is impossible for any air to get into the lungs, regardless of the method used. The air passageway of the unconscious victim is blocked when the neck is bent (chin on chest). The air passageway can be maintained open by holding the chin extended ("sniffing position") and by holding the lower jaw forward.

2. Mouth-to-mouth breathing is superior to all other manual methods of artificial respiration.

3. A pocket-sized S-shaped breathing tube (mouth-to-mouth airway) eliminates the direct mouth-to-mouth contact, and makes mouth-to-mouth breathing more effective, easier, and more acceptable.

4. Mouth-to-mouth and mouth-to-airway breathing can move breaths of 1000 to over 2000 cc of air because (a) the rescuer's hands can hold the victim's head in the "sniffing position" and can support the victim's lower jaw, thus providing an open air passageway, (b) the rescuer can watch the victim's chest and listen to the victim's expirations from which he can determine with each breath whether or not any air is entering the lungs, and, (c) the air can be moved with enough force so that adequate amounts can be moved into the lungs even in obese victims or in a victim whose chest is stiff.

5. Untrained rescuers can perform mouth-to-mouth and mouth-to-airway breathing successfully if certain technical details, described in this manual, are observed.

Some people may wonder how air which has been "used" by the lungs of one person will be any good in artificial respiration. Although the air which the rescuer exhales after a normal breath has slightly less oxygen and more carbon dioxide than the air which he inhales, there is enough oxygen remaining in the rescuer's exhaled air to keep the non-breathing victim alive. During mouth-to-mouth breathing, however, the rescuer is breathing more deeply than normally. As a result of this deep breathing (1) the air which the rescuer blows into the victim's lungs is as good as room air and (2) in addition, the victim receives breaths of a greater volume than he normally breathes. When the rescuer sees the victim's chest move during mouth-to-mouth or mouth-to-airway breathing, the breaths are usually so large that the oxygenation of the victim and the removal of carbon dioxide from the victim are better than when he is conscious and breathing on his own.

RESCUE OF THE UNCONSCIOUS VICTIM

OUTLINE OF METHOD

When the unconscious victim does not breathe, or when he appears to be breathing but his air passageway is blocked (for instance, because his head is not held in the "sniffing position"), his brain dies from oxygen lack within minutes. Therefore, when a victim is found, act within a matter of seconds as follows:

1. Positioning the Victim and Clearing His Throat - Place the unconscious victim on his back, as you must be able to see his face. Move an injured victim cautiously. If there is foreign matter (for instance vomit) visible at the mouth, clear the mouth and throat. (See Figure 1.)

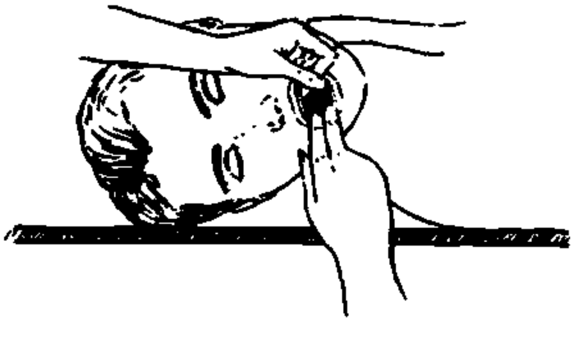


Figure 1

Clearing the victim's mouth and throat.

If no foreign matter is visible, proceed immediately to 2.

2. Opening the Air Passageway (Figure 2 or 3) - Place the victim's head in the "sniffing position" and hold his lower jaw upward. Figure 2 shows the method that is preferred. Figure 3 is the alternate method to be used when the victim's mouth cannot be opened for insertion of the thumb.

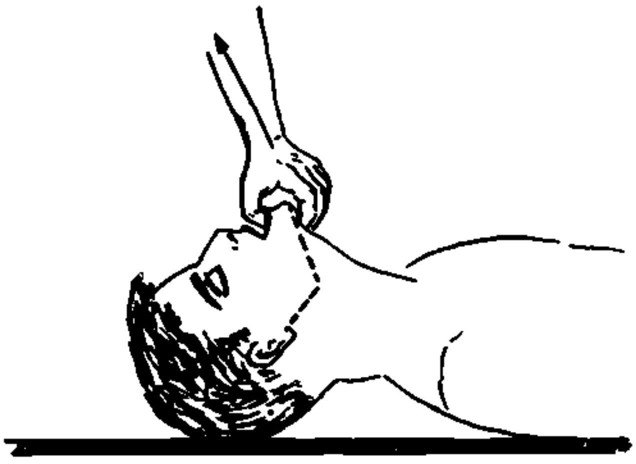

Figure 2

Bringing jaw forward (preferred)

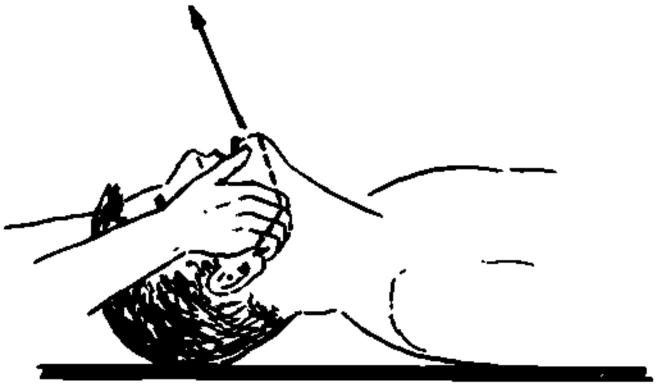

Figure 3

Bringing jaw forward (alternate)

If the victim appears to be breathing naturally, maintain the support of his air passageway until he wakes up. (See Figure 3). When he appears to be breathing naturally, but his tongue is blue or gray rather than pink, start mouth-to-airway or mouth-to-mouth assisted breathing immediately.

3. Artificial Respiration - When the victim is not breathing (chest and abdomen not moving) start mouth-to-airway or mouth-to-mouth breathing immediately and continue until the victim starts breathing naturally or a doctor declares him dead.

If you are carrying a mouth-to-mouth airway, use mouth-to-airway breathing in both child and adult.

If you are not carrying a mouth-to-mouth airway, use the preferred mouth-to-mouth method as shown in Figure 4.

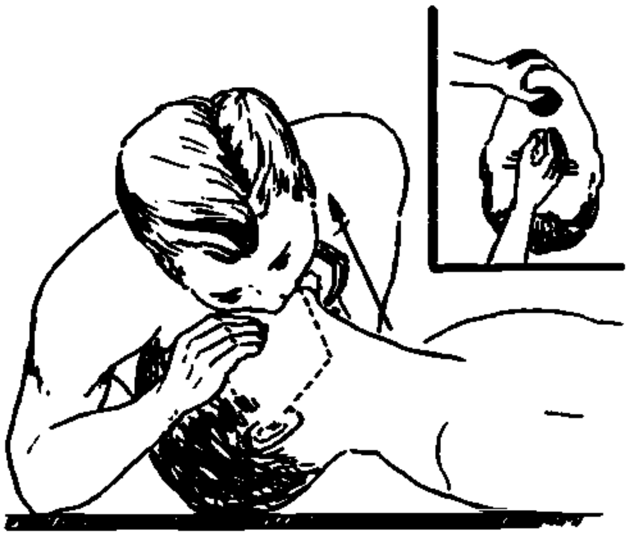

Figure 4

Position of rescuer's hands and mouth on the victim (preferred)

Exceptions - The preferred mouth-to-mouth method cannot be used in the following two instances:

a. In a child less than 3 years in whom your thumb would interfere with mouth-to-mouth contact, because of the small size of the child's mouth.

b. In an adult whose mouth you cannot open for insertion of your thumb.

In these two instances use the alternate mouth-to-mouth method (Figure 5).

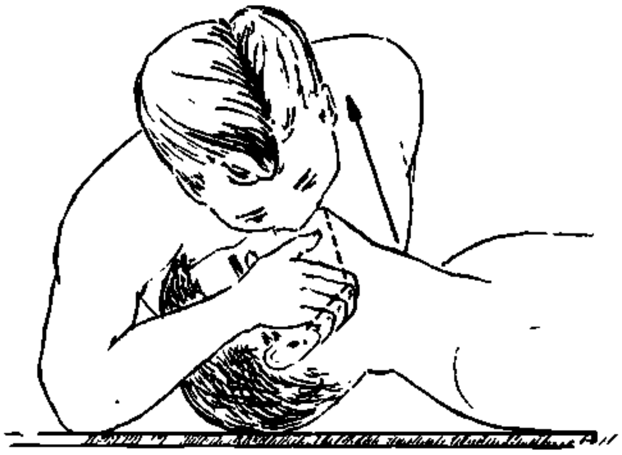

Figure 5

Position of rescuer's hands and mouth on the victim (alternate)

POSITIONING THE VICTIM AND CLEARING HIS THROAT

1. Place the victim on his back (supine). Move injured victim cautiously.

2. Remove foreign matter from the throat. If foreign matter (vomit, blood, phlegm, etc.) is visible in the victim's mouth, turn his head to the side, force his mouth open, and quickly wipe out his mouth and throat with your fingers or a piece of cloth (Figure 1).

You should not spend more than a few seconds doing this, as little time should be lost in getting air into the victim's lungs. If the mouth appears clean, start mouth-to-airway or mouth-to-mouth breathing at once. Whenever it seems necessary, you may repeat the cleaning procedure after either mouth-to-airway or mouth-to-mouth breathing has been started.

OPENING THE AIR PASSAGEWAY

<u>Preferred Method</u>

1. Place the head in the "sniffing position" (Figure 2). Place the head as far back as possible, so the neck is extended. The chin must "lead" and the front of the neck must be stretched.

2. Hold the lower jaw up (Figure 2).
   a. Approach the victim's head from his left side.
   b. Insert the thumb of your left hand between the victim's teeth and grasp his lower jaw at the midline.
   c. Lift the lower jaw forcefully upward so that the lower teeth are higher than the upper teeth.
   d. Hold the jaw in this position as long as the victim is unconscious.

<u>Alternate Method When The Victim's Mouth Cannot Be Opened</u>

1. Place the head in the "sniffing position" (Figure 3). Place the head as far back as possible, so the neck is extended. The chin must "lead" and the front of the neck must be stretched.

2. Hold the lower jaw up (Figure 3).
   a. Approach the victim's head from his left side.
   b. With both hands grasp the angles of the lower jaw just beneath the ear lobes.
   c. Lift the lower jaw forcefully upward so that the lower teeth are higher that the upper teeth.
   d. If the lips are shut, pull the lower lip down gently with the thumbs, but never drop the chin.
   e. Hold the jaw in this position as long as the victim is unconscious.

MOUTH-TO-MOUTH BREATHING

Preferred Method

1. Open the air passageway as shown in Figure 2.

2. Blow air into the lungs (Figure 4).
   a. Close the victim's nose with your right hand (Insert for Figure 4).
   b. After taking a deep breath, place your mouth over the victim's mouth with airtight contact. Do not hold the victim's mouth open widely, as you must take the entire mouth of the victim inside your lips.
   c. Blow into the victim's mouth. Blow forcefully into adults and gently into children.
   d. While blowing, watch the victim's chest. When the chest rises, stop blowing and quickly remove your mouth from the victim's mouth.
   e. Let the victim exhale passively by the elasticity of his lungs and chest.
   f. When the chest does not rise, improve the support of the air passageway (1) and blow more forcefully.
   g. Repeat these inflations 15 to 20 times per minute.

Alternate Method

(For children under three years or for any victim whose mouth cannot be opened.)

1. Open the air passageway as shown in Figure 3.
2. Blow air into the lungs (Figure 5).
   a. After taking a deep breath, place your mouth over the victim's mouth with airtight contact. Cover the nose with your right cheek in order to prevent air leakage. In a baby, cover both the mouth and nose with your mouth.
   b. Blow into the victim's mouth. Blow forcefully into adults and gently into children. In a baby, blow only with small puffs from your cheeks, not from your lungs, to prevent damage to the baby's lungs.
   c. While blowing, watch the victim's chest. When the chest rises, stop blowing and quickly remove your mouth from the victim's mouth.
   d. Let the victim exhale passively by the elasticity of his lungs and chest.
   e. When the chest does not rise, improve the support of the air passageway (1) and blow more forcefully.
   f. Repeat these inflations 15 to 20 times per minute.

MOUTH-TO-AIRWAY BREATHING

This is the method of choice if you are carrying mouth-to-mouth airways. There are two sizes of airways available:

a. Combined child-infant size

b. Combined adult/large-child size

The size of the victim determines which one to use and which end is inserted into the mouth (Figure 6).

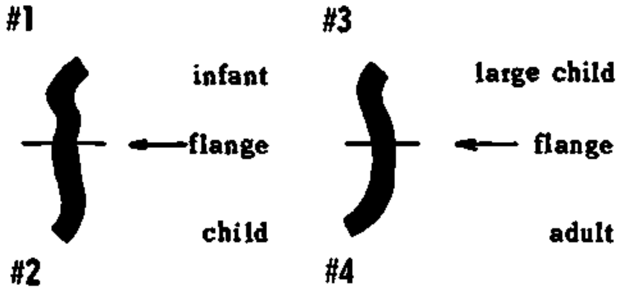

Figure 6

Mouth-to-mouth airways. Note two sizes on each.

Basic Method

1. Insert the airway (Figure 7).

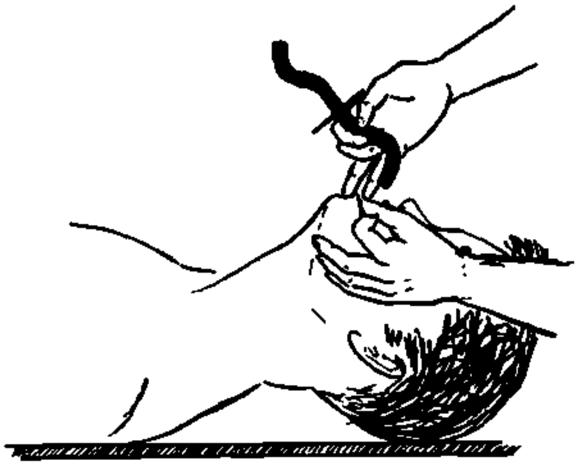

Figure 7

Inserting the airway

a. Approach the victim from the top of his head (vertex).

b. Force the mouth open with one hand.

c. Insert the proper end of the airway along the curve of the tongue with the other hand until the flange comes to rest at the victim's lips. Do not push the tongue back into the throat. If the tongue is in the way, push its base forward with the finger. If the victim is an adult, insert the long end of the large airway (#4); if he is a large child, insert the short end of the large airway (#3); if he is a small child or a baby, insert the short end of the small airway (#1). The part of the airway which remains outside serves as a mouthpiece for the rescuer.

2. Place the head in the "sniffing position" and prevent air leakage (Figures 8,9).

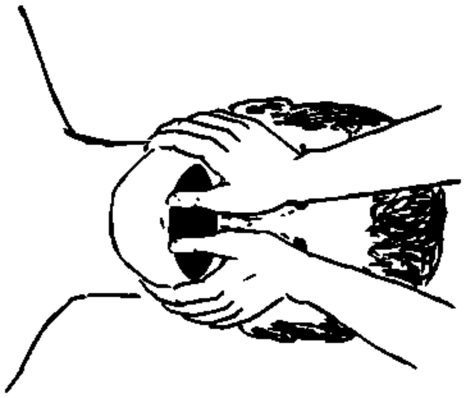

Figure 8

Flange over victim's lips

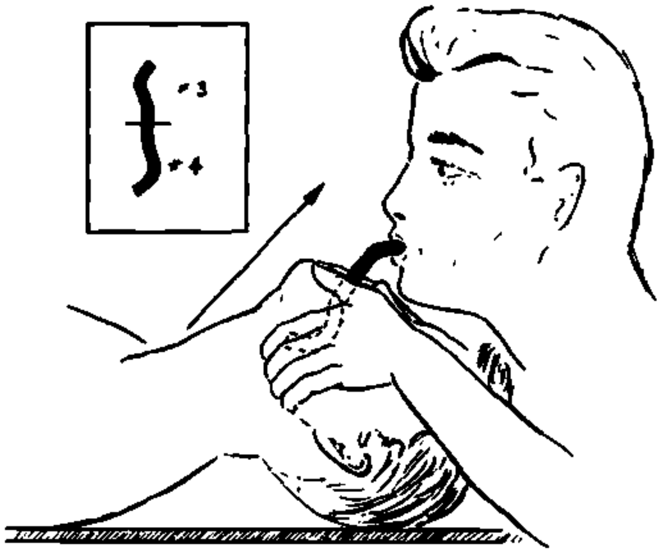

Figure 9

Rescuer is (a) holding victim's jaw up, (b) holding flange airtight, and (c) applying mouth-to-airway breathing.

a. Grasp the jaw with both hands firmly and pull upward (Figure 9). This must extend the neck so the chin is "leading" and the front of the neck is stretched.

b. Close the victim's nostrils by pressing them together with the large part of your thumbs (Figure 8).

c. Close the corners of the victim's mouth by pressing the flange firmly against the victim's lips with your thumbs (Figure 8).

You may prevent air leakage through the victim's nose and through the corners of the victim's mouth by any other desired position of your thumbs and fingers, as long as the victim's head is held in the "sniffing position", so the front of the neck is stretched.

3. Blow air into the lungs (Figure 9).

a. After taking a deep breath, blow into the mouthpiece of the airway. Blow forcefully into adults and gently into children.

In a baby, blow only small puffs from your cheeks, not from your lungs, to prevent damage to the baby's lungs. In a premature baby, insert the #1 end of the baby airway only partially.

b. While blowing, watch the victim's chest. When the chest rises, stop blowing and quickly remove your mouth from the mouthpiece of the airway.

c. Let the victim exhale passively by the elasticity of his lungs and chest.

d. When the chest does not rise, improve the "sniffing position", prevent air leakage, and blow more forcefully. If the chest still does not rise, readjust the position of the mouth-to-mouth airway.

e. Repeat these inflations 15 to 20 times per minute.

FURTHER CONSIDERATIONS

When Air is Blown Into the Stomach - After either mouth-to-airway or mouth-to-mouth breathing has been performed for a period of time, the victim's stomach may be bulging. This bulging is due to air which is blown not only into the victim's lungs but also into his stomach. Air inflation of the stomach rarely occurs when the correct technique is applied, but rather will occur more frequently (1) if the air passageway is blocked by improper support of the head and lower jaw, and (2) if the blowing is too forceful.

Air inflation of the stomach is not dangerous, but inflation of the lungs is easier when the stomach is empty. Therefore, when the rescuer sees the stomach bulging, he should interrupt blowing for a few seconds and press with his hand between the victim's navel and breastbone which causes the air to be "burped". Since this maneuver may also make the victim vomit, the rescuer must be ready to clear the throat at once, as shown in Figure 1.

Infection - Experience has shown that there is very little danger of the rescuer becoming infected by the victim. Rescuers who consider direct mouth-to-mouth breathing not to be "sanitary" should use the mouth-to-airway method.

Apparent Natural Breathing

a. The victim may only appear to be breathing naturally by movements of his chest and abdomen, while actually no air may be moving into his lungs due to complete blockage of the air passageway from improper positioning of the head and jaw. Therefore, it is most important to determine whether or not there is any movement of air in and out of the mouth and nose by listening closely or feeling with the fingers in front of the victim's mouth and nose.

b. The victim may breathe noisily (snoring), which indicates partial blockage of the air passageway.

Therefore, even if the unconscious victim appears to be breathing naturally, the rescuer must hold the victim's head in the "sniffing position" and hold the jaw upward at all times (Figures 2 or 3). If an artificial airway is available (for instance the mouth-to-mouth airway), it should be inserted provided that the victim can tolerate it without gagging or coughing (Figure 7). The victim's head must still be held in the "sniffing position". If the victim vomits, the rescuer must clear the throat and mouth swiftly with the fingers (Figure 1). It is extremely important that the rescuer remains at the victim's head during transportation at all times, in order to keep the victim's air passageway open by the methods described above and to start mouth-to-airway or mouth-to-mouth breathing at once when the victim ceases to breathe.

Shallow Breathing and Assisted Breathing

When the victim breathes shallowly, he may not be getting sufficient amounts of air into his lungs. His lips and tongue may appear blue or gray instead of pink. In such cases, the rescuer may deepen the victim's shallow breaths by blowing into the mouth-to-mouth airway or directly into the mouth immediately after the victim starts inspiring. This is called "assisted respiration". The rescuer uses deep inflations of short duration and removes his mouth from the airway or from the victim's mouth rapidly, so as not to interfere with the victim's natural exhalation.

MECHANICAL RESUSCITATION

MAJOR CLASSIFICATIONS OF MECHANICAL BREATHING APPARATUS

Resuscitator

Action - Positive and negative pressure on the inside of the lungs and air passages, accomplished by air-tight circuit with mask and resuscitator.

Used - Only on victims who have stopped breathing.

Inhalator

Action - A steady flow of oxygen from a tank through a reducing valve by way of a mask, catheter or prongs.

Used - Usually (a) on the victim who is just having trouble breathing, or (b) following the use of a resuscitator, when the patient is able to breathe on his own. This inhalator does not breathe for the victim.

Respirator (Iron Lung)

Action - Positive and negative pressure on the outside of the chest. Usually a tank iron lung with pressure on the entire chest wall. It is portable.

Used - Usually on victims who are unable to breathe on their own.

Aspirator (Suction Machine)

Action - As an aid in the use of mechanical breathing apparatus.

Used - To suction out liquids and foreign materials from the victim's mouth and upper respiratory tract. Many times, resuscitation cannot be accomplished without this machine.

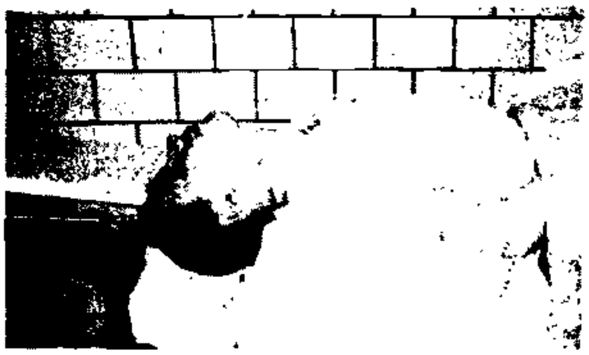
USING THE RESUSCITATOR

Although resuscitators may vary in their operation, the manufacturers are in agreement as to the techniques to be used in applying mechanical artificial respiration.

If manual artificial respiration is being applied at the scene, do not stop until a squadman checks the mechanical resuscitator to see if it is operating properly.

The operation of most machines may be checked by placing the hand over the face piece to see if the blockage signal is obtained.

After the machine has been checked and found to be operating properly, proceed to place the proper size face piece over the nose and mouth of the victim. Stop manual artificial respiration then, and put the machine into service. It is of the utmost importance to place the victim in a position that will tend to keep fluids and other materials out of the breathing passages. This position should allow the operator of the resuscitator to have full access to the victim's face. The inside of the mouth and back of the throat should also be visible so they can be examined easily. To accomplish this, place the victim in a supine position with the head held back and the chin in the "sniffing position". A pillow, folded blanket, or some other object placed under the victim's shoulder blades will help facilitate a satisfactory position for mechanical resuscitation (Figure 10).



Courtesy St. Anthony Hosp.

Figure 10

Position of victim for receiving mechanical resuscitation

Be sure that the victim's mouth and throat are clear. Remove all foreign matter, such as gum, chewing tobacco, loose dentures, or other materials that could block his air passage. If considerable mucus is present, aspirate it immediately to provide a clear air passage.

The efficiency of mechanical resuscitation depends on the successful maintenance at all times of the so-called "closed circuit". This means that an air-tight connection must be maintained between the machine and the victim's lungs. This, in turn, means that there must be air-tight connections within the machine itself, that the mask valves must be closed, and that the mask be air-tight to the victim's face. If the face piece is the type that can be inflated, it should be kept so at all times.

Since most commercially made resuscitators have rubber cushion face pieces, it is relatively easy to create an air-tight connection, provided the position of the squadman's hands upon this mask and the victim's face is the correct one. The thumb and index finger of each hand should encase the mask on the victim's face. This is done by placing them on their respective sides of the mask. (See Figure 11.)

Figure 11

Position of operator's thumbs and index fingers on mask

The other three fingers of each hand grasp the victim's chin from beneath, thus creating a good air passage by opening the windpipe. (See Figure 12.)

Courtesy St. Anthony Hosp. & Millersport F.D.

Figure 12

Position of operator's hands on victim during resuscitation

If the victim has such an injury that parts of the face are missing, or the person's face is sunken from illness or age, or possibly the victim may have his false teeth out at the time of the emergency, the squadman is confronted with a problem. The face piece will not fit tightly against the face, and a closed circuit cannot be obtained. In this case the squadman can secure a closed circuit by applying a moist hand towel or cloth around the face piece. After it is in place, the squadman will put his hands in the usual position, placing them around the cloth and mask. The most desirable position for the operation is, then, at the head of the victim directly behind his forehead.

PROPERLY WORKING MACHINES

If the machine is breathing adequately for the victim, a series of two separate clicks will be audible to the operator. There will be a click from the machine when the oxygen goes in, and another click when the carbon dioxide is pulled out. This positive and negative pressure going in and out of the lungs is called an interval. A regular rhythm of intervals results after the machine begins to breathe for the victim. This is the same kind of rhythm maintained during manual artificial respiration. This rhythm of intervals is the clue which lets the operator know that the machine is working properly, accomplishing the life-saving purpose for which it was manufactured.

BLOCKAGE

Oftentimes when mechanical respiration is first started, there may occur a fast tripping or clicking sound instead of the regular rhythm. This is caused by blockage. As soon as the blockage signal is heard, remove the face mask and look into the mouth for the possible cause of the blockage. Such blockage or obstruction of the positive and negative pressure may be due to one or more of four things.

A. Presence of Foreign Bodies (Solids) - This includes broken dental plates, gum, chewing tobacco, broken teeth, sea-weed, or any other foreign object in the breathing passages.

It is imperative that such foreign bodies be removed immediately. Since a non-breathing victim is unable to bite, the easiest procedure is to introduce the thumb and index fingers into the victim's mouth to pull out the foreign body. Many squads carry some type of small narrow clamp or forceps that can be used to pick out foreign bodies from the throat (curved Kelly forceps).

B. Presence of Liquids - This includes any form of liquid material that may be in the mouth or breathing passages. It may be blood, water, clear liquid vomitus, or any other liquid material.

As soon as the presence of liquids is noticed in the air passages, the mechanical apparatus should be turned to aspiration if the resuscitator is provided with an aspirator. When suctioning mucus out of a victim's mouth, the suction catheter must be moved about so as to include all areas of the mouth, and so that it will not attach itself by means of suction to the inside of the victim's mouth, thus preventing it from fulfilling its purpose. (See Figure 13.)

Courtesy St. Anthony Hosp. & Greenfield Twp. F.D.

Figure 13

When suctioning a victim, you should have proper lighting (as shown). The victim's mouth should be open wide. The suction catheter should be held securely between the index and second fingers. The catheter should be moved around so it will get all materials and not attach itself against the inside of the mouth.

Different sizes of suction catheters should be carried by all squads as additional equipment for resuscitators. A good practice exercise is to use a glass of water and have each squadman practice suctioning water by holding the catheter between the thumb and index finger. The catheter should be held in the same way when suctioning mucus from a victim.

A soft rubber ear syringe may be used instead of a catheter. By squeezing out all the air from the syringe, inserting the tip in the victim's mouth and releasing the bulb, suction is produced and the syringe will act as an improvised aspirator.

C. Tongue - When a person is unconscious or has stopped breathing, he becomes so relaxed that the tongue drops further back in the throat than usual. A common example of this is when a sleeping person snores. The tongue has dropped back in the throat causing a poor air passage which is denoted by a loud sound. In asphyxia victims the tongue actually falls back over the air passage and prevents oxygen from entering the lungs.

To alleviate this blockage, the squadmen must be able to keep the tongue elevated in the mouth, so as not to block the windpipe. This can be accomplished by inserting an airway. (See Figure 14.)

To install an airway properly, the victim's mouth is opened, and the tongue is grasped firmly top and bottom and gently pulled out beyond the lower lip. With the mouth open and the tongue out, the proper size airway is inserted into the victim's mouth. A tongue clamp is a good instrument to use in extracting the tongue; furthermore, the clamp can be carried right in the resuscitator box. In the event a tongue clamp is unavailable, the squadman can pull the tongue out with his fingers.

Courtesy St. Anthony Hosp. & Millersport F.D.

Figure 14

Proper insertion of airway

The best way to ascertain the correct size of an airway is to hold the airway to the side of the face. The lower tip should touch the angle of the chin (just below the ear lobe) and the other end should extend beyond the lips.

The best way to insert an airway is to put its tip against the roof of the mouth, just behind the upper teeth, and slide it down a distance determined by the size of the victim's throat. All airways should be inserted according to the contour of the victim's air passage. Always remember to keep the victim's tongue out of the way while inserting the airway. If the type of airway available is one without lips, tie a six- to eight-inch string or gauze to the end of it.

As soon as the airway is in place, resuscitation should be started.

D. Spasm of the Throat - The vocal cords, which are encased in the "Adam's Apple", are very delicate muscles. Consequently, all respiration problem victims are prone to spasms of the vocal cords. These spasms are known as laryngeal spasms.

Even hospital personnel are at a loss when a patient goes into a laryngeal spasm, and they are forced to take drastic measures by inserting a tube below the vocal cords. This, of course, cannot be carried out by emergency squadmen, and the only last measure that can be used is to give life-saving oxygen to those victims by applying the face mask and leaving the machine on resuscitation. If this is done, a continuous blockage signal will be heard. While holding the face piece in place and receiving the blockage signal, the squadman should pull the head into a backward position and turn it from side to side very slowly. As soon as the machine is able to get past the spasm, it will indicate so by returning to the normal resuscitation sounds. The head position mentioned should be maintained until the victim begins to breathe on his own.

Continual attempts should be made to resuscitate the victim until the victim is pronounced dead by a physician.

SUMMARY

Blockage Cause	Squad Care
Foreign bodies	Pull them out with finger or clamp.
Liquids	Suction with aspirator.
Tongue	Insert an airway.
Spasm of the throat	Turn victim's head slowly from side to side.

USING THE INHALATOR

After the victim starts to breathe on his own, the machine should be turned to inhalation. (See Figure 15.)

Courtesy Northern Hills F.D.

Figure 15

Fire department emergency squadmen administering oxygen by means of an inhalator to young victim of a near drowning. The mask is held snug to the face and the apparatus is set to administer a sufficient amount of oxygen.

The squadman must watch the victim very closely at this time. If there is an inhalator bag on the apparatus, watch it closely. The rise and fall of the bag will denote the size and rate of the victim's respirations. If there is no bag on the machine, you must watch the victim's respirations by the rise and fall of his chest and abdomen. (See Figure 16.)

Courtesy St. Anthony Hosp. & Millersport F.D.

Figure 16

This picture illustrates the use of an inhalator after resuscitation. The mask is held lightly but not too tightly on the face. Notice that the squadman is watching the victim closely and has the machine in a position to reach and to watch.

As the victim's pulse, respirations, color, and general condition improve, wean him from the oxygen. This can be done by turning the flow of oxygen down slowly. Let the victim breathe for two or three minutes, then turn the flow down further. If the victim's pulse does not increase, his color stays the same, and his respirations do not increase, the squadman may continue the same routine until the flow of oxygen is nearly off. Take the mask away from the face slightly. This will allow the outside air to mix with the resuscitation oxygen, so that the victim becomes adjusted to breathing outside air.

After he is breathing normally, the victim should be kept prone and remain under observation until he is transferred to the care of a physician or of hospital personnel. (See Figure 17.)

Courtesy St. Anthony Hosp. & Millersport F.D.

Figure 17

After resuscitation, inhalation, and aspiration, the victim is put in a flat positior and watched.

EMERGENCY CARE OF THE LARYNGECTOMY VICTIM

The victim who has had his larynx (voice box, also "Adam's Apple") removed requires special emergency care. In Ohio alone there are 2000 people who have undergone laryngectomy. These are people who because of some disease, accident, or other medical condition, have had surgery performed on their voice box with the end result of its being partially or totally removed.

From the time of surgery, these people will never again breathe through their mouths. At the time of the removal of the "Adam's Apple", an opening is made at the lower part of the neck, just above the breast bone. It is through this opening that the "laryngect" must breath for the remainder of his life. They are commonly referred to as "the neck breathers".

As shown in Figure 18, a patient's neck is exposed and the "stoma" (permanent opening in the neck to the windpipe) is visible.

If his shirt were closed, or he had on a T-shirt or a shirt and tie, the stoma would not be easily seen.

Women with stomas wear high necklaces. These partially cover the opening and unless closely investigated, it might be overlooked.

A side view of this man (Figure 19) shows that he does not have an "Adam's Apple". This is one good way to tell a "neck breather". You could obstruct this man's mouth and nose for hours and it would not disturb him, as he does not breathe through them.

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 18

After laryngectomy, man receives air into his lungs through neck opening (stoma).

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 19

The absence of an "Adam's Apple" indicates that this man may be a neck breather.

RESUSCITATING THE VICTIM

If this type of victim should stop breathing, the squadman would use the manual or mechanical artificial respiration that is used routinely, but it must be applied over the stoma.

As shown in Figure 20, the squadman must give mouth-to-stoma resuscitation with the victim on his back and the chin up out of the way of the stoma. Placing his mouth over the stoma, he would give mouth-to-stoma resuscitation following the procedure he has learned for the mouth-to-mouth method.

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 20

Mouth-to-stoma resuscitation is given.

There is no problem of air going into the stomach because the squadman breathes directly into the windpipe. The tongue cannot obstruct the air flow, as the stoma is below it.

If the mechanical resuscitator is readily available, the use of the BABY mask over the stoma followed by mouth-to-mask resuscitation will aerate the victim adequately. The squadman in Figure 21 is carrying out this procedure until the resuscitator can be readied.

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 21

A baby-size mask must be used over the neck opening for mechanical resuscitation.

If the mask will not fit airtight, a moistened towel can be placed around the mask to seal off any openings. All face pieces of your resuscitation equipment should be inflated at all times.

When the resuscitator is put into service, it should be held over the stoma as it is over the face, with the index fingers and thumbs. A folded blanket can be used under the shoulder blades. The blanket or other material helps to keep the windpipe straight and the head back.

Elevation of the chin by use of the blanket under the shoulder blades will also make the procedure easier. The squadman in Figure 22 has the victim positioned correctly and is holding the mask properly.

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 22

The resuscitator breathes for the patient.

This type of victim is much easier to aspirate (suction) than the average resuscitation victim. If the resuscitator gives the blockage signal, mucus will be the usual cause.

The squadman must be sure to rotate the catheter as he suctions. The squadman in Figure 23 is doing so by rotating the aspirator tube between his thumb and index finger. The catheter should be pinched off as it is inserted into the stoma preventing damage of it.

Courtesy Clinton Twp. F.D. & Franklin Co. Cancer Soc.

Figure 23

An aspirator tube, inserted through the stoma, will remove mucus.

There are clubs throughout the nation called the "Lost Cord Clubs". These clubs are sponsored by the American Cancer Society. They are very interested in each squadman being keenly aware of their problem. When patients are released from the hospital with stomas, they are told to make themselves known to their local squad.

When a laryngectomy victim is released from the hospital, he may be cured and live a normal life. The victim who posed for these pictures has had a stoma for many years.

There is always the additional problem of visitors to your area who might be "neck breathers". The theme for the squadmen is becoming "CHECK THE NECK FOR THE LARYNGECT".

ADJUNCTS TO RESUSCITATION

BAG RESUSCITATOR

Figure 24 shows a new type of resuscitator. It is light in weight and reinflates itself. A flow of oxygen can be added to the tip on the end of the bag. It can be brought into use quickly.

Figure 24

Bag resuscitator

MOUTH-TO-MASK RESUSCITATOR

An adjunct to mechanical resuscitation is shown in Figure 25. This type of apparatus does away with the direct contact in mouth-to-mouth breathing. It is light and can be put into use before the larger mechanical resuscitator can be brought to the victim.

Figure 25

Mouth-to-mask resuscitator

EXTRA EQUIPMENT

There are six extra items of equipment that should be carried with each resuscitator:

1. Flashlight - A light is needed to examine the victim's throat when blockage is encountered.
2. Suction Catheters - Each resuscitator should carry a variety of whistle-tip suction catheters. The recommended sizes are: 12, 14, 16, 18 and 20 French. With these sizes the squadman should be able to handle all problems of suctioning.

3. Airways - Each resuscitator should be provided with seven airways, as follows: Large, medium, and small adult; large medium, and small child; and the newborn size. Measuring from the edge of a victim's mouth to the end of his jawbone (under the ear) will indicate the needed size. Plastic or rubber airways are preferred. (See Figure 26.)

Figure 26

Airways: three adult sizes, three child sizes, and a newborn size.

4. Cloth hand towel - A small tea towel or hand towel should be available (not a turkish towel.) The towel can be used as a seal around the face mask of the resuscitator, for cases when the mask will not fit tight around the face. Moisten the towel and fold it; then fit it between the mask and the rescuer's hands.

5. Curved Kelly Hemostat - When the squadman cannot remove a foreign body in a victim's throat with his fingers, an instrument should be available for reaching into the throat to grasp the object. The curved Kelly Hemostat (sometimes called Kelly clamp) is the proper instrument. (See Figure 27.)

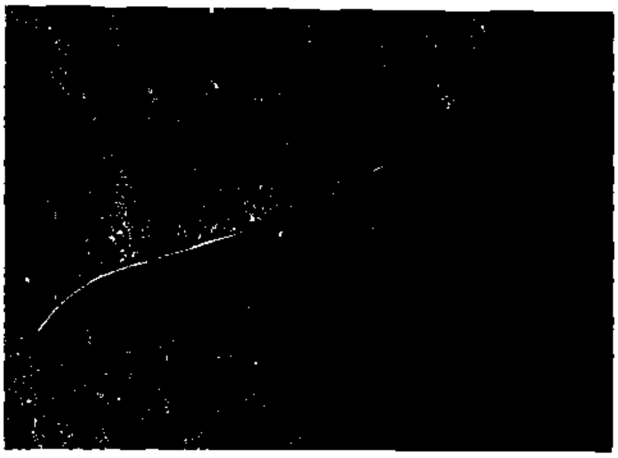


Figure 27

Each resuscitator should have a medium curved Kelly Hemostat or clamp. This instrument is curved to match the contour of the throat. It will easily grasp a foreign object so that it can be pulled out.

6. Aspirator Bottle - One extra aspirator bottle should be carried on the squad vehicle at all times, in case the bottle that is in use should crack or break.

RESUSCITATION WHILE TRANSPORTING

If all the appropriate steps in resuscitation, as previously described, are carried out properly, the patient can be resuscitated during transportation without difficulty. (See Figure 28.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 28

Squadmen continue resuscitation while victim is being loaded into vehicle for transportation to hospital.

CHAPTER XI

OXYGEN THERAPY

INTRODUCTION

Among the most basic equipment to be placed in the average emergency squad vehicle is the apparatus for administering oxygen. Many of the victims cared for by squadmen have a great need for highly concentrated oxygen. Alone or in support of other measures, it is important in emergency care of such conditions as heart attacks, severe burns, loss of blood, respiratory distress and shock. Oxygen administered with an inhalator or resuscitator can prevent the condition of victims from being much worse, or may even ward off death.

BASIC PROCEDURE

SETTING UP THE APPARATUS

In preparing a cylinder of oxygen for use, the protective cap must be removed (Figure 1). Then, with the valve outlet pointed away from the operator and with a firm grip on the cylinder, open the valve slightly (Figure 2), then close it quickly (Figure 3). This is called "cracking" the valve. In this manner dust which has lodged in the valve opening is cleaned out, so it will not enter the regulator.

Courtesy Linde Co.

Figure 1

Remove protective cap.

Courtesy Linde Co.

Figure 2

Open valve slightly.

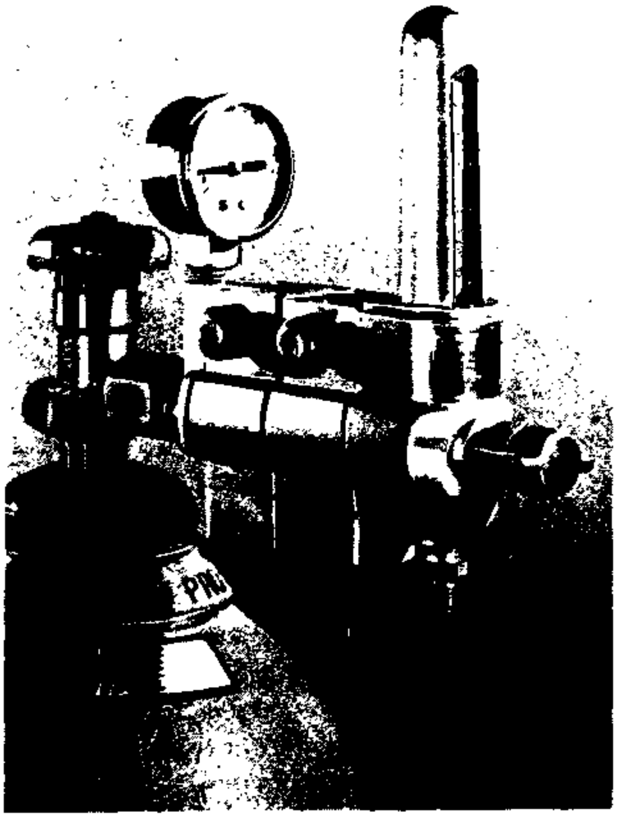
Courtesy Linde Co.

Figure 3

Close valve quickly.

Reducing Pressure - When an oxygen tank is full, it is under a pressure of more than 2,000 pounds per square inch. Before we may use it safely, a pressure-reducing regulator must be attached to the tank. This will permit giving oxygen to the victim at a much lower pressure.

Controlling Flow - Figure 4 shows one widely used type of regulator. After the oxygen leaves the pressure-reducing valve, it flows through an adjustable flowmeter (Figure 4). This permits administering oxygen to a victim at the rate desired.

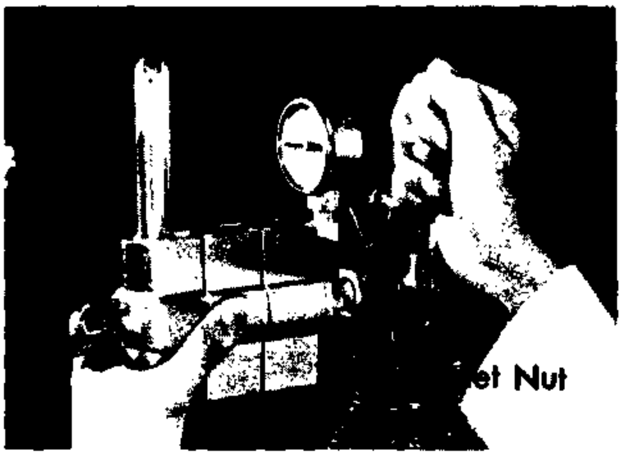


Courtesy Linde Co.

Figure 4

A pressure-reducing regulator must be attached to the cylinder before oxygen can be administered to the patient.

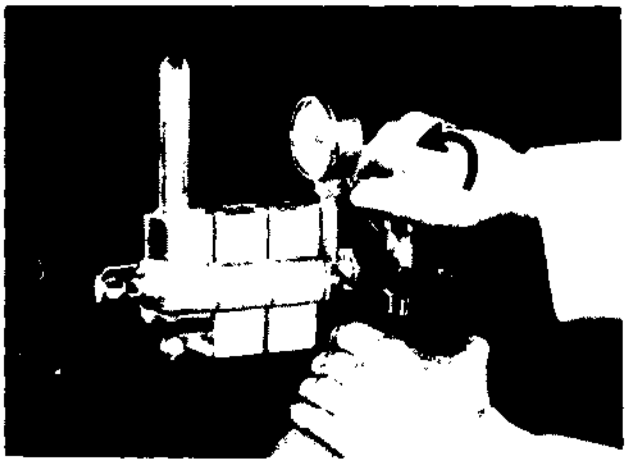
Figure 5 shows the regulator-flowmeter being attached to an oxygen tank. Figure 6 shows the regulator ready for use.



Courtesy Linde Co.

Figure 5

Insert regulator inlet in cylinder valve outlet and tighten the inlet nut with a wrench.

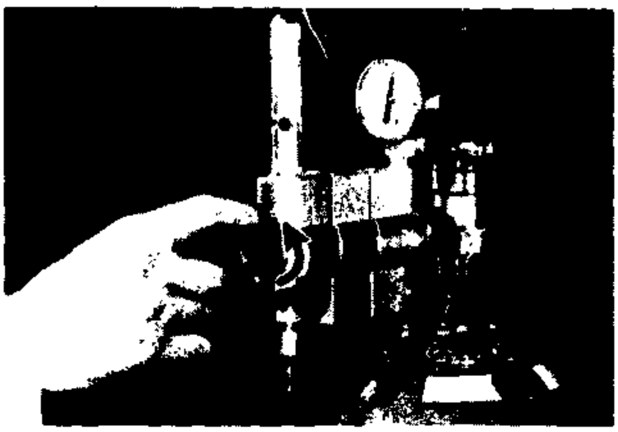


Courtesy Linde Co.

Figure 6

Stand to one side of the regulator—opposite relief valve—not in front or in back of it. Open cylinder valve very slowly—the slower the better—until needle on cylinder-contents gauge stops moving. The ball float will rise in the tube for a moment and then quickly return to zero. This indicates that oxygen has entered the flow indicator tube.

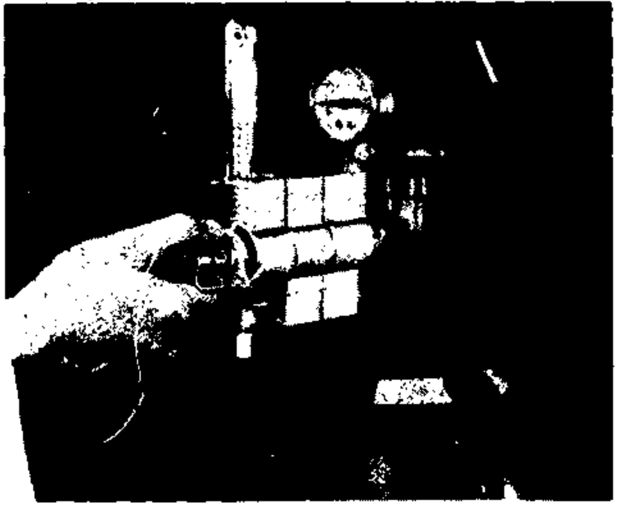
To administer oxygen, attach the administering apparatus to the regulator outlet and adjust the oxygen flow (Figure 7) to produce the desired concentration. To stop the flow for short periods - less than one-half hour - simply close the flow adjusting valve (Figure 8). Cylinder content will continue to register.



Courtesy Linde Co.

Figure 7

Open the flow-adjusting valve. The ball float will rise in the tube. The position of the top of the float indicates the rate of flow in liters per minute.

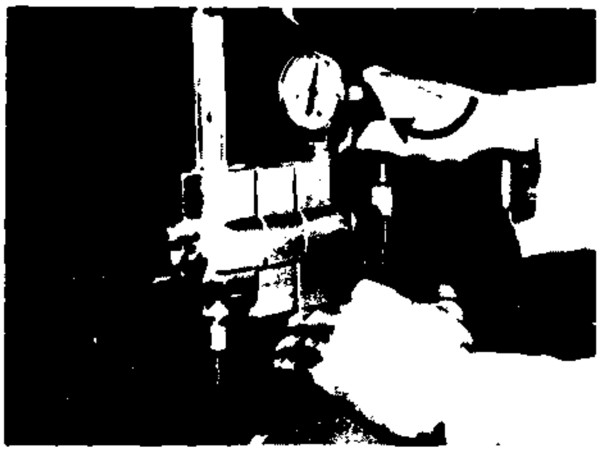


Courtesy Linde Co.

Figure 8

Stop flow by closing the flow-adjusting valve. The float will drop to zero.

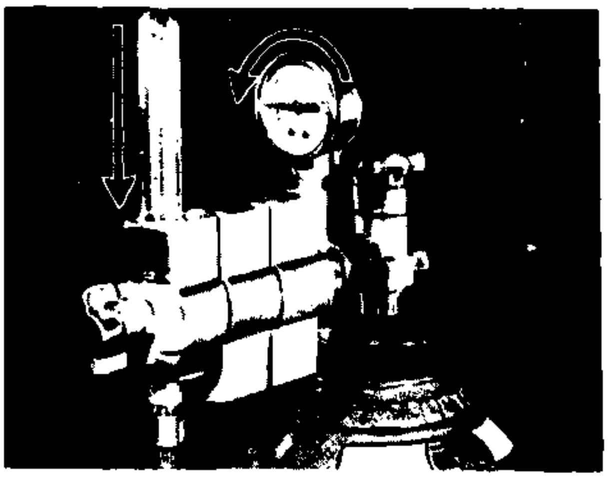
When the flow of oxygen is to be discontinued for one half hour or more, or when the regulator is to be disconnected from the cylinder, follow the steps outlined in Figures 9 and 10. Then close the flow-adjusting valve as in Figure 8.



Courtesy Linde Co.

Figure 9

Close the cylinder valve tightly. Then open the flow-adjusting valve.

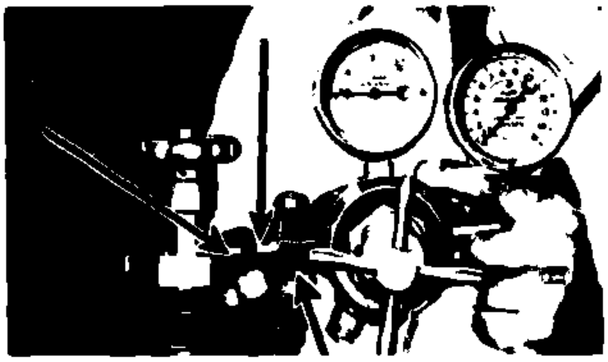


Courtesy Linde Co.

Figure 10

Wait until both cylinder-contents gauge and liter-flow indicator have returned to zero. Then close flow-adjusting valve.

Cross-Arm Regulators - Another type of regulator in wide use operates somewhat differently. It has two gauges; one shows cylinder contents and the other shows the rate of flow. Figure 11 shows how to install one of these regulators on a tank.

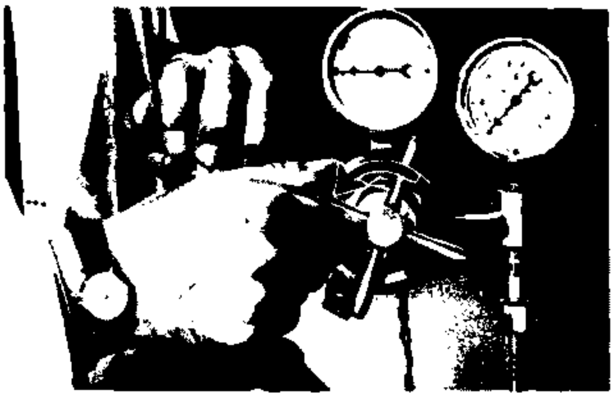


Courtesy Linde Co.

Figure 11

Insert regulator inlet into cylinder outlet and tighten inlet nut with a wrench.

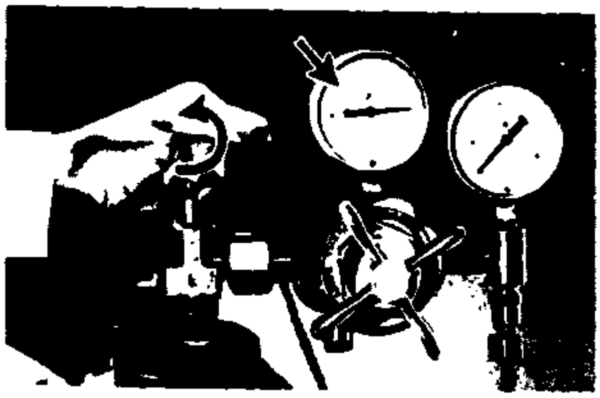
Before oxygen is administered, the flow-adjusting handle must be loosened (Figure 12), and the cylinder valve must be opened very slowly (Figure 13).



Courtesy Linde Co.

Figure 12

Loosen regulator flow-adjusting handle. This is important and should be done before opening the cylinder valve.

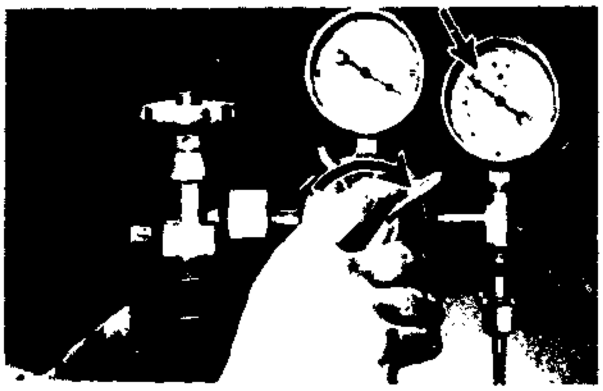


Courtesy Linde Co.

Figure 13

Stand on side of cylinder opposite regulator side. Do not face either front or back of regulator. Open cylinder valve very slowly until needle on cylinder-contents gauge stops moving.

To administer oxygen as needed, follow the directions under Figure 14.



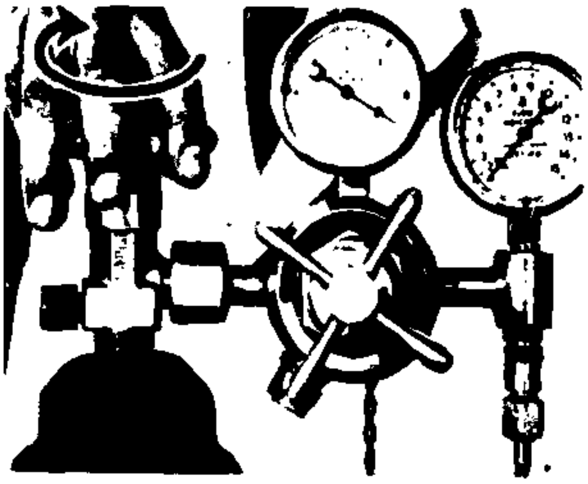
Courtesy Linde Co.

Figure 14

Tighten flow-adjusting handle by turning it to the right until the flow-indicator gauge registers the desired rate of flow in liters per minute.

To stop the flow of oxygen for short periods - less than one-half hour - simply loosen the flow-adjusting handle by turning it to the left until the flow indicator returns to zero. Cylinder contents will continue to register.

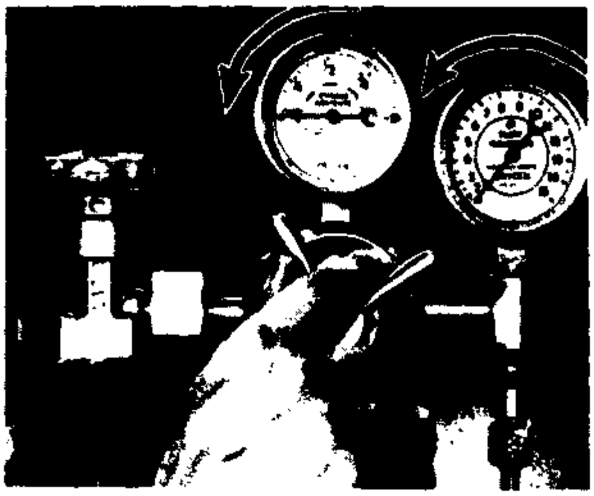
When the oxygen flow is to be cut off for $\frac{1}{2}$ hour or more, or when the regulator is to be disconnected from the cylinder, proceed as in Figures 15, 16, and 17.



Courtesy Linde Co.

Figure 15

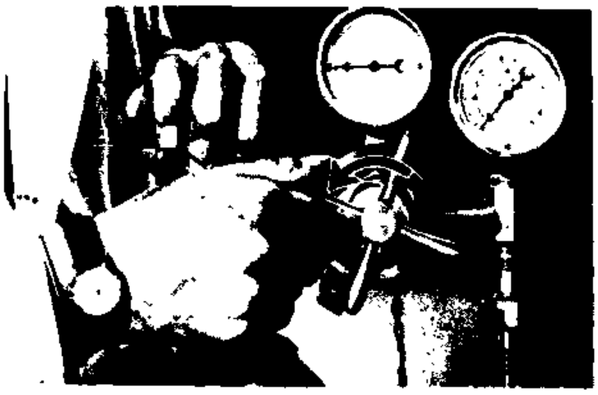
Close cylinder valve tightly. Then ope the flow-adjusting valve.



Courtesy Linde Co.

Figure 16

Wait until both cylinder-contents and liter-flow needles have returned to zero.



Courtesy Linde Co.

Figure 17

Loosen regulator flow-adjusting handle. This is important and should be done before opening the cylinder valve.

ADMINISTERING OXYGEN

Methods - Oxygen may be given in four ways: (1) full face mask, (2) catheter, (3) nasal prongs, or (4) tent.

The preferred method of administration by a squad is by mask. The reason is that a mask gives the highest possible concentration to the victim. A problem in the use of this method is that some victims have fear of the mask.

The next preference is the catheter. This method is being used more frequently by squads today that in the past. The catheter does not provide the highest concentration of oxygen, but the victim is more comfortable and is not frightened, as he may be by a mask.

Another method sometimes used is the nasal cannulas or prongs. This method is least desirable due to the low percentage of oxygen the victim can receive.

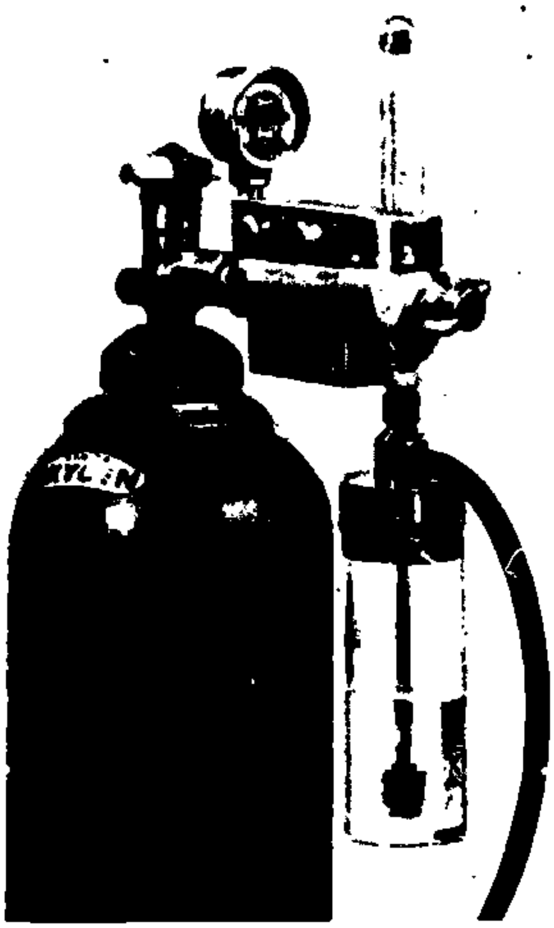
Few squads use tents. This method lends itself to use over long periods of time and needs close supervision; therefore it is seldom used by squadmen.

The concentration of oxygen possible with each type of administering apparatus is as follows:

Mask - approaching 100% concentration
Catheter - 40% to 60% concentration
Nasal Cannulas - 30% to 50% concentration
Tent - 40% to 60% concentration

It can readily be seen that the use of a mask is the best method, since it provides the highest concentration of oxygen. An emergency squad need have no fear of over-oxygenating an acute victim.

Humidity - Since squads give oxygen for relatively short periods of time, they are not required to use humidifiers. However, when oxygen is given over a prolonged period, it has a tendency to dry the membranes of the nose and throat. If oxygen is to be administered for many hours by squadmen, it is a good idea to run the oxygen through water to humidify it (Figure 18). Membranes will not dry as fast this way and the victim will remain more comfortable.

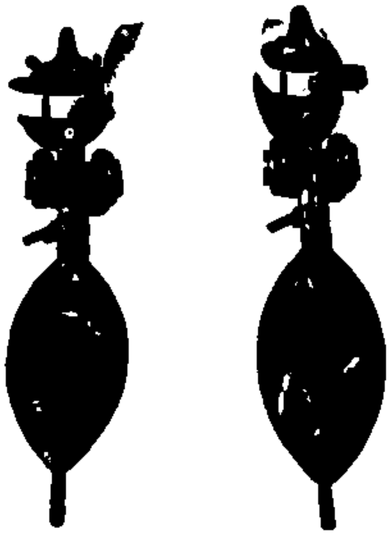


Courtesy Linde Co.

Figure 18

A humidifier with a diffuser head.

Face Masks - Figures 19 through 22 show how to choose a mask, connect it, set the oxygen flow, and apply the mask.



Courtesy Linde Co.

Figure 19

Choose a mask of the correct size. There are two sizes each, of the nasal and oronasal type (small or large). If the patient is unconscious, uncooperative, or a mouth breather, use the oronasal type facepiece.

Courtesy Linde Co.

Figure 20

Leave the hose connection and nut on the flowmeter outlet. Attach rubber tubing from the partial-rebreathing mask to the outlet of the flowmeter.

Courtesy Linde Co.

Figure 21

Set oxygen flow at 6 to 8 liters per minute. If the patient is large or is breathing heavily, 10 to 12 liters may be necessary at first to keep the bag from collapsing. Otherwise the patient may have difficulty in completing his first few inhalations.

It is important to overcome fear before a mask is applied. This can be done by letting the patient put the mask on himself or by letting him breathe a few times with it and then a few times without it.

After the mask is in place, the oxygen should be started at a high rate so as to give the victim an ample amount to overcome the acute need for oxygen in the blood.

When a victim is inhaling oxygen, the breathing bag should never completely collapse. If it does, the amount of oxygen flow should be increased.

Courtesy Linde Co.

Figure 22

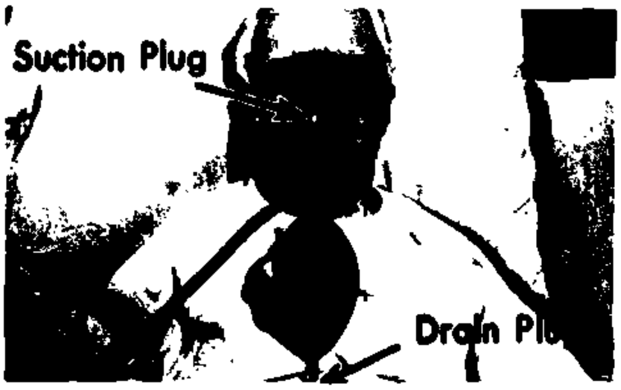
Have the patient exhale into the mask as it is applied. Adjust the headband so that the mask is snug but not tight. Clip the tubing to the bed clothes.

Courtesy Linde Co.

Figure 23

The sponge rubber disks at either side of the facepiece act as inhalation as well as exhalation valves. If these disks become moist or obstructed, air will not move freely through them and the mask will not function properly. The patient will usually complain of increased resistance to breathing. When this happens, remove the sponge rubber disks and replace them with dry ones. Or, rinse them thoroughly, squeeze them dry in a towel, and reinsert them.

Figure 23 shows how to remove and replace the sponge rubber disks if they become moist or obstructed. Figure 24 shows where to attach a suction tube and where to drain off accumulated moisture.



Courtesy Linde Co.

Figure 24

A partial-rebreathing mask usually has two plugs. One in the facepiece permits the use of a suction tube and the other, at the bottom of the breathing bag, allows drainage of accumulated moisture. Except for the purposes mentioned, these plugs must not be removed unless the mask is being washed.

A victim who is receiving oxygen by mask must be attended constantly (Figure 25).

Courtesy St. Anthony Hosp.

Figure 25

A squadman watches to see that the victim breathes freely and that the breathing bag does not collapse completely during inhalation.

Disposable Masks - Disposable face masks, such as that shown in Figure 26, are now available. There are partial-rebreathing and non-rebreathing types that operate in the same way as similar permanent masks. There are also face pieces without any rebreathing features. In all cases follow the manufacturer's instructions. These light-weight plastic masks can be discarded after each use. Therefore, the time ordinarily required for cleaning and sterilizing is saved.

Courtesy Linde Co.

Figure 26

One of the many types of disposable masks now available.

Nasal Cannulas - These are pronged metal or plastic tubes, the ends of which are inserted a short distance into the nostrils (Figure 27). Oxygen should be administered by this method only when the other methods described herein are not deemed advisable. The concentration of oxygen possible by this method is relatively low.

Courtesy Linde Co.

Figure 27

Metal nasal inhaler with adjustable headband for self-administration.

Nasal Catheters - The equipment needed for giving oxygen by nasal catheter is shown in Figure 28.

Courtesy Linde Co.

Figure 28

Set-up for deep catheter technique. (Glass of water, flashlight, and tongue depressor not shown.)

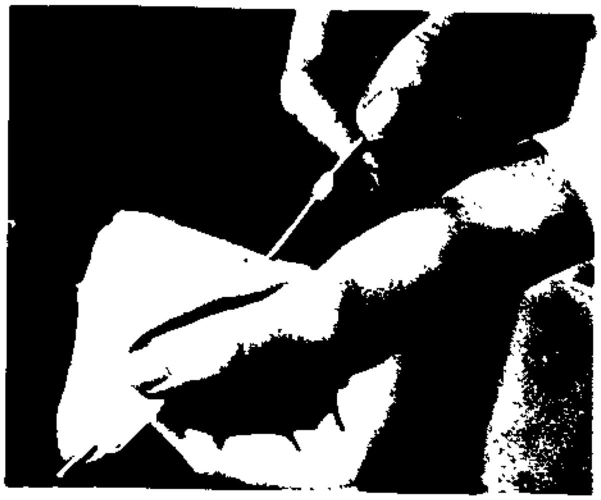
The two methods of nasal catheter administration are the shallow and the deep techniques. The shallow method (nasal catheter inserted just inside the nostril) is seldom used by squads.

Figures 29 through 35 with their captions show and describe the techniques of inserting a deep nasal oxygen catheter.

Courtesy Linde Co.

Figure 29

Determine the approximate depth to which the catheter will be inserted by measuring the distance from the tip of the nose (external nares) to the ear lobe (tragus). Mark this point on the catheter with a small piece of tape.



Courtesy Linde Co.

Figure 30

While oxygen is flowing, lubricate the catheter sparingly. Latex catheters should be lubricated with a water-soluble lubricant. Oil or fatty substances should not be used since these are a safety hazard. Also they may cause latex rubber to deteriorate. A water-soluble lubricant can be used with plastic catheters, although they are sometimes lubricated with water alone.

Courtesy Linde Co.

Figure 31

Hold the tip of the catheter in a glass of water, to be sure that the discharge holes are not plugged with lubricant.

Courtesy Linde Co.

Figure 32

Determine the direction of the natural droop of the catheter by holding the taped part with thumb and forefinger and then slowly rotating it until its tip hangs at the lowest level.

Courtesy Linde Co.

Figure 33

Hold the catheter in the position of its greatest droop, then WITH OXYGEN FLOWING, insert it slowly to the measured depth. It is easier to insert the catheter if you elevate the tip of the patient's nose. Observe the position of the catheter through the patient's open mouth. The tip should rest approximately opposite the uvula. Set the liter flow to deliver the desired concentration.

Courtesy Linde Co.

Figure 34

To assure that the catheter is in the correct position, insert it beyond the measured depth until the patient swallows oxygen; then withdraw it to a point where swallowing stops. This procedure can be followed only when the patient is conscious.

Courtesy Linde Co.

Figure 35

Tape the catheter firmly at the end of the nose; then bring it across the cheek and tape it to the temple. Be sure to tape it so that it lies on the inner 'floor' of the nose and cannot loop up inside, causing discomfort to the patient.

MAINTENANCE OF EQUIPMENT

Masks - Soak all parts in a detergent-disinfectant solution for twenty minutes. Then rinse thoroughly and dry.

Catheters - Rubber catheters should be washed thoroughly, with care given to the holes on the tip. These should not be obstructed. Catheters can then be left for twenty minutes in detergent-disinfectant solution. After twenty minutes, rinse and dry. Wrap them in clean materials to be ready for later use.

The preferred catheter for squads is the plastic disposable type. Since it is used only once, the cleaning problem is eliminated. It is also inexpensive.

Hospital emergency-room personnel are very co-operative in that they will often exchange a clean rubber nasal catheter for a soiled one. They have the proper facilities to sterilize rubber goods.

Nasal Prongs - The same care should be given to these as to a face mask.

SAFE PRACTICES

For safety, never use oil or grease on or in a cylinder valve, oxygen regulator or any oxygen connection.

All tanks should be held secure in the apparatus. The constant motion of the squad vehicle during calls will cause a dangerous situation if oxygen tanks are not held in place by straps, tank wells, blocks, or some other type of fixtures.

Smoking should be prohibited during the entire time oxygen is being administered. Oxygen does not burn, but it supports combustion.

The cushion of the face mask should be inflated at all times.

The resuscitator control valve should be set in the resuscitation position at all times when not in use.

All oxygen tanks must have a pressure test (hydrostatic test) at least once every five years. All tested tanks have the date stamped into them. Oxygen distributors will test tanks at a minimal cost.

Many squads fill smaller tanks from larger tanks. These smaller tanks must have the hydrostatic tests within a five-year period.

MASS OXYGEN THERAPY

In a special emergency oxygen in substantial quantities may be required, to care for large numbers of victims. It is not expected that local hospitals or squads will have on hand enough oxygen-therapy equipment or oxygen to take care of such an emergency. Therefore, supplemental equipment and oxygen will be required.

COMMERCIAL SOURCES

Oxygen is available from distributors of oxygen, oxygen-producing plants, industrial plants, welding shops, automobile repair shops, scrap yards, and oxygen-therapy rental services. See the yellow pages of your telephone directory under "Oxygen".

NOTE: Cylinders of oxygen obtained from the above sources may not be as clean outwardly as cylinders prepared especially for medical use, but their contents will be U. S. P. oxygen unless stated differently on the cylinder. Be sure that the word "oxygen" is on the cylinder. Cylinders of similar size, shape, and color might contain other gases that would be harmful.

Pressure-reducing regulators must be used on all high-pressure cylinders of oxygen. Hospital-type regulators and other oxygen-therapy equipment, such as tents, masks, and catheters, can be obtained from the manufacturers of such equipment and oxygen-therapy rental services. Regulators of the industrial type can be obtained from most of the places where oxygen is available. See the yellow pages of your telephone directory under "Oxygen".

NOTE: Industrial-type regulators differ from hospital-type regulators in that they do not have a restricted outlet and are calibrated in pounds per square inch instead of liters per minute. However, such regulators can be used in an emergency by opening the control valve very slightly, or by attaching a liter-flow adapter to the regular outlet. Liter-flow adapters can be obtained from suppliers of hospital regulators.

IMPROVISED EQUIPMENT

1. Oxygen can be administered by inserting a piece of tubing or welding hose through the bottom of an ordinary paper bag and holding the top of the bag over the victim's face. Use a generous flow of oxygen.
2. Make a cone of cardboard, old X-ray film, stiff paper, or similar material. Insert the oxygen hose through the bottom of the cone and hold the top over the victim's face.
3. In a cardboard carton about twenty inches square, cut a hole about nine inches in diameter in the center of the bottom. Slide the victim's head through the hole. Insert the oxygen hose through the side of the carton opposite the victim's head. Leave the top of the carton open or cut the top off entirely.

EMERGENCY HELP

Persons familiar with oxygen and equipment can be located at any of the places where oxygen is available. These persons are not necessarily familiar with oxygen-therapy techniques but they should understand the mechanics of attaching a regulator to a cylinder.

CHAPTER XII

CLOSED-CHEST HEART COMPRESSION

INTRODUCTION

For years the physicians of our nation were coping with heart stoppage by opening the chest wall and actually massaging the heart by hand. This was done in all situations, even outside of hospitals.

Then a group of researchers found that applying pressure with the hands on the outside of the chest could create the same results. This led to a whole new technique for resuscitative procedures. It was a technique that did not necessarily need a physician on the spot to carry it out. A well trained emergency squad can carry out this new procedure until the patient can be brought to definitive care in a well equipped hospital emergency room.

Some persons are concerned about the possibility of causing injuries by this technique. Close investigation has shown that no damage to victims resulted when emergency personnel who applied this technique had received formal classroom instructions, including correct demonstrations.

An emergency squadman is usually the first trained person to reach the heart-stoppage victim, except in a hospital. It is imperative that each and every squadman be completely trained in this new technique.

The following text and series of pictures with captions deal with this life-saving procedure. However, studying the chapter is not sufficient. Each step must be practiced and carried out many times, so that all members of the squad are proficient in all maneuvers.

SYMPTOMS

Upon arrival at an emergency scene, the squadman must be able to establish whether the victim is in need of closed-chest heart compression. The need can be established by the three following findings:

1. The victim is not breathing.
2. The victim does not have a carotid, or neck pulse.
3. The pupils of the victim's eyes do not react to light.

EXAMINATION

To determine whether the victim is breathing, place one hand over his abdomen in the area of the diaphragm (just below the chest.) If there is no motion, no air is being exchanged.

To establish whether a neck pulse is present, place the four fingers of one hand between the large muscle at the side of the neck and the windpipe. (See Figure 1.) If the heart is not beating, there will not be a pulse.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 1

Examining for a neck pulse.

The pupils of the eyes usually constrict (get smaller) if a light is directed on them. This is normal. If the heart is not beating, the pupils will not react to light: they will be dilated (enlarged) and stay dilated.

To examine the pupil, raise the eyelid quickly and direct the light of a flashlight, for a few seconds, at the pupil. If the pupil does not react, closed-chest heart compression is indicated. (See Figure 2.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 2

Examining for pupil action.

With these three symptoms present, the victim must be given closed-chest heart compression immediately.

PROCEDURE

For this technique to be successful, the victim <u>must</u> be on a firm or hard surface. If he is left on a soft surface, the rescuer will be pushing the victim into this soft surface and not compressing the heart. Lay the victim on a floor or any other hard surface. While he is in transport, place him on a backboard especially if there is a mattress on the squad stretcher.. It may even be necessary to place the victim on a board and then place the board on the floor of the squad vehicle, to be able to give successful closed-chest heart compression.

Mouth-to-mouth resuscitation and closed-chest heart compression must be given together. As soon as it is found that closed-chest heart compression must be given, four or five breaths of mouth-to-mouth resuscitation should be administered.

If two rescuers are present, one can give the mouth-to-mouth while the second measures the chest. If only one is present, the initial mouth-to-mouth breathing must be performed first. Then the squadman proceeds to measure the victim's chest region.

LOCATING THE HEART

The heart lies directly under the sternum or "chest bone".* Pressure on this bone will compress the heart and force the blood out of it. Relieving the pressure will allow the heart to refill.

To locate the region where pressure is to be applied, place a finger of one hand, (preferably the index finger) at the top of the chest bone and a finger (index) of the other hand at the bottom. (See Figure 3.) The lower half of the chest bone is the exact area wanted.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 3

Measuring the sternum, or chest bone.

PLACING THE HANDS

Kneel beside the victim. Place the butt or heel of one hand on the lower half of his chest bone. (See Figure 4.) The butt of your hand should lie along his chest bone, with fingers extending toward his ribs.

Place the second hand over the first. The direction of the second hand is whichever is comfortable to the rescuer.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 4

Placing the hands

APPLYING THE PRESSURE

With hands on the victim's chest bone, straighten your arms until the elbows hurt. Bend forward until your shoulders are directly over your hands. Now begin to apply pressure: Push directly down until the chest bone moves 1½ to 2 inches. (See Figure 4.)

---

* Although squadmen commonly call it the "chest bone", in medical terminology it is the sternum or breastbone.

Hold your fingers up off the victim's chest. This will help to keep your hands in the proper place.

The rate is 60 compressions per minute. Practice this procedure alone, and also with another rescuer, until you are sure of maintaining your rate at 60 times per minute.

If the rate is too slow, not enough blood will be pumped out of the heart to sustain the victim's life. If the rate is too fast, the heart will not fill properly. Each squadman should develop a technique that will sustain the right rhythm and rate.

METHOD FOR TWO RESCUERS

There is a definite ratio that must be maintained between heart compressions and lung inflations. For two squadmen working together it is five closed-chest heart compressions and one mouth-to-mouth inflation. As one rescuer's hands are coming up at the end of the fifth compression, the second rescuer should be inflating the victim's lungs. The chest will rise as the hands come up. Close cooperation will maintain a rhythm and will also save time. (See Figure 5.) If the two rescuers tire, they can change positions.

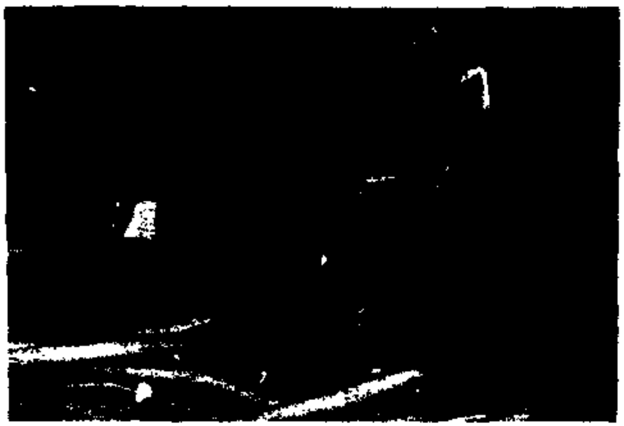
Courtesy Sharon Twp. F.O., Worthington, O.

Figure 5

Two rescuers working together. The rhythm is five closed-chest heart compressions and one mouth-to-mouth resuscitation.

METHOD FOR ONE RESCUER

One squadman working alone should maintain a ratio of 15 chest compressions followed by two mouth-to-mouth resuscitation breaths. When working alone, the squadman cannot take time to place his thumb in the victim's mouth, to extend the chin and head. Air should be given as shown in Figure 6.



Courtesy Sharon Twp. F.O., Worthington, O.

Figure 6

One rescuer working alone. With one hand under the victim's neck, he supports the head in proper position for mouth-to-mouth breathing.

USE OF THE RESUSCITATOR

If a mechanical resuscitator is available, it should be put into play as soon as possible. In this procedure the rescuers give ten closed-chest heart compressions and then one inflation with the resuscitator. Hold the mask as described in Chapter X of this text. Put it on the face but not airtight. At the tenth compression push on the mask to make it airtight and it will inflate the lungs. The 10 - 1 ratio can be continued even during transport. (See Figure 7.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 7

Use of the resuscitator during closed-chest heart compression.

MANUAL OVER-RIDES

Mechanical resuscitators that incorporate the negative and positive pressure manual over-rides can be used to assist in ventilation of the victim's lungs in conjunction with closed-chest heart compression.

This manual over-ride feature permits the operation to manually resuscitate with pressures higher than the normal, but not high enough to injure the victim's lungs.

Other resuscitation devices can be used, such as the mouth-to-mask resuscitator (Figure 10) or bag-mask resuscitator.

CARTILAGE SEPARATION

In older persons (60 and older) there may be a separation of the cartilage between the ribs and the chest bone due to the pressure of closed-chest heart compression. This is not unusual and is not considered a complication.

CHILD VICTIMS

This technique is the same for children, except that the use of one hand on a child's breastbone, or two fingers for an infant, is adequate. The compression rate for children should be 80 to 100 times per minute.

TRANSPORTATION

With the victim on a backboard, closed-chest heart compression and resuscitation can be carried out and continued while loading into the squad vehicle, and while en route to the hospital. (See Figures 8 through 11.)

The hospital to which the squad is en route should be notified of the patient's pending arrival. This will allow time for the emergency room team to prepare equipment and drugs before the victim arrives.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 8

With the victim on a backboard, both life-saving procedures can still be carried out.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 9

Loading the victim into squad ambulance.

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 10

Both procedures being continued in the squad ambulance.

CONCLUSION

This newest resuscitation procedure can not be learned just by reading material in a text. Continual practice and experience are necessary. The procedure should be reviewed often.

CHAPTER XIII

USE OF BACKBOARDS

INTRODUCTION

The backboard is a versatile tool. Its primary purpose is the immobilization of fractures of the neck and back. But this rigid board is also ideal for moving victims of other conditions such as fractures of the pelvis or both legs.

To carry a large unconscious patient down three flights of stairs is a real job. Strapping the patient securely to a backboard makes the job much easier.

After using the backboard for a short time, squadmen will recognize many other types of situations in which it is useful.

Victims should be moved onto a backboard by the method known as "logrolling".

LOGROLLING

DEFINITION

Logrolling is the turning of a victim's body by several people working in unison. Its purpose is to protect a victim who must be moved onto (or off of) a backboard or stretcher, when his back or neck may be injured.

The procedure has been used for many years in hospitals. It should always be used by squadmen on accident victims with suspected neck and back injuries.

Logrolling is also a wise practice whenever squadmen are preparing to transport an unconscious victim.

Figures 1 through 12 and their captions show logrolling procedures. The position of the squadman's hands should always be, as nearly as possible, that shown in the pictures. When a victim is to be removed from a car or truck, these same hand positions can be used.

PREPARING TO ROLL

Emergency care should be given to the victim before he is logrolled.

After emergency care, when you are ready to move the victim onto a backboard, establish on which side he is to be rolled: it should be his least injured or non-injured side. Next, raise the victim's arm, on the side onto which he is to be rolled, above his head. (See Figure 1.)

Figure 1

Raising the victim's arm prior to rolling. In this case he will be rolled onto his right side.

POSITION OF HANDS

The exact position of each squadman's hands on the victim is very important in logrolling.

1. The top man's top hand is to be under the neck, supporting the head. His bottom hand grasps the clothing (or skin) at the shoulder (See Figure 2.)
2. The center man's top hand is to be around the victim's distant arm and grasping the clothing. His bottom hand grasps the clothing at the belt region.
3. The bottom man's top hand grasps the victim at the hip region. His bottom hand grasps the distant leg at the calf.

ROLL

At a signal from the top man, all three roll the victim toward them. (See Figure 3.) Note that four of the six hands of the squadmen are grasping the trunk of the victim's body. Also note that the victim's head is supported by the top squadman. All squadmen should be on the same knee.

Figure 2

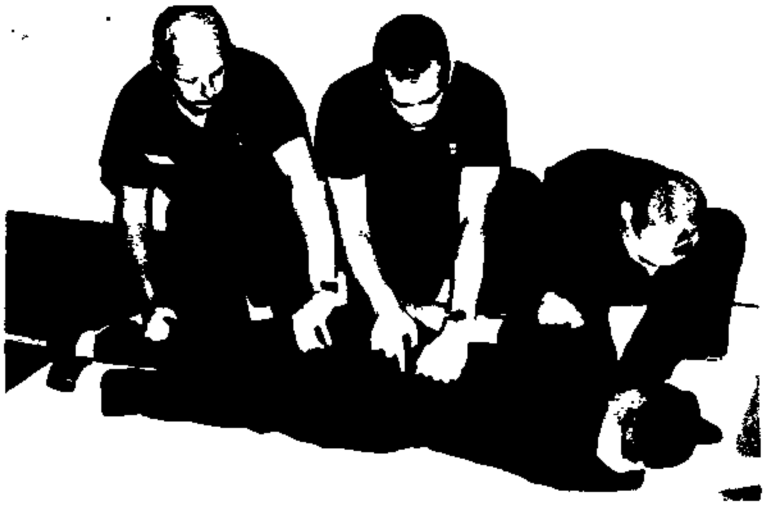


Figure 3

Figure 2 shows the location of each squadman's hands on the victim before logrolling. In Figure 3 the victim has been logrolled onto his side.

PLACING THE BOARD

While the victim is held on his side, the board is placed flat on the ground or floor next to the victim. (See Figure 4.)

Again on a signal from the top man, the victim is lowered on the board. His arm is returned to his side.

SLIDING THE VICTIM

The victim usually is centered when placed on the board. If he is not centered on the board, he can be slid over by the rescue team, working in unison. While the man who placed the board holds it, the other three squadmen remain where they were and place their hands on the victim's body, in the same positions, but on the opposite side. (See Figure 5.)

At the signal of the top man, the victim is slid over with a gentle, even motion.

Figure 4

Figure 5

A backboard is placed behind the victim (Figure 4). After he is lowered onto the board he can be slid gently toward the center if necessary (Figure 5).

BOARD WITH FOOTREST

If it is determined a footrest will be needed on the backboard, insert it prior to logrolling the victim.

The squadman who will place the board should measure the board by placing the board and footrest as shown in Figure 6. The board is then placed on the floor and the victim is logrolled as previously described.

Figure 6

If a footrest will be needed, place it against the victim's feet with the backboard in place.

POSSIBLE NECK INJURY

If a neck injury is suspected, one squadman must attend the head and neck at all times until it is immobilized.

Figures 7 and 8 show the proper way to logroll a neck injury.

Note that the squadman caring for the neck is applying slight traction, supporting the chin and keeping the nose in line with the "belly button" at all times. Also note that the man at the shoulder uses only one hand during this procedure. The man caring for the neck should give all signals. The victim's neck should then be immobilized with a blanket-roll splint as shown in Chapter VIII.

Figure 7

Figure 8

Four men logroll a suspected neck-injury victim.

ROLLING VICTIM FACE DOWN

When a victim is found face down and should be transported that way (severe bleeding at the face, secretions and mucus from the mouth, vomiting, etc.) the procedure is much the same.

Figure 9 shows the placement of the hands for this procedure.

Figure 10 shows the same victim on his side.

Figure 11 shows the placing of the board.

Figure 12 shows the victim, face down on the board.

Figure 9

Figure 10

Squadmen's hands are placed for logrolling a victim face down (Figure 9). Then the victim is rolled onto his side (Figure 10).

Figure 11

Figure 12

The board is placed in front of the victim (Figure 11). After he is lowered to a face-down position he can be slid gently to the center of the board (Figure 12).

HANDLING OF BACKBOARDS

The following series of pictures (Figures 13 through 20) illustrate how to use backboards.

Specifications for two backboards, child and adult sizes, can be found in Chapter II of this manual.

STRAPPING A VICTIM TO A BOARD

If a victim must be carried for some distance on a backboard, he should be strapped to it.

Placing Straps - The positions of the three straps on the victim are most important.

1. The bottom strap must be placed around the board and around the victim just above his knees. This will prevent him from raising his legs off the board.
2. The middle strap must be placed around the board, and across the victim's hip region. His hands should be at his sides; the strap passes over his wrists.
3. The top strap must be placed around the board and across the victim's chest region, just below the shoulders.

All three of these strap positions can be seen in Figure 13. Note the straps do not go through the holes in the board, but around the board. The straps would not be located properly if they were put through the board holes.

Securing Feet and Head - If the victim must be carried up or down any distance, a footrest must be put in place and his feet must be tied to it with a cravat. The victim's head can be kept secure with a cravat. Figure 14 shows how the cravats are tied.

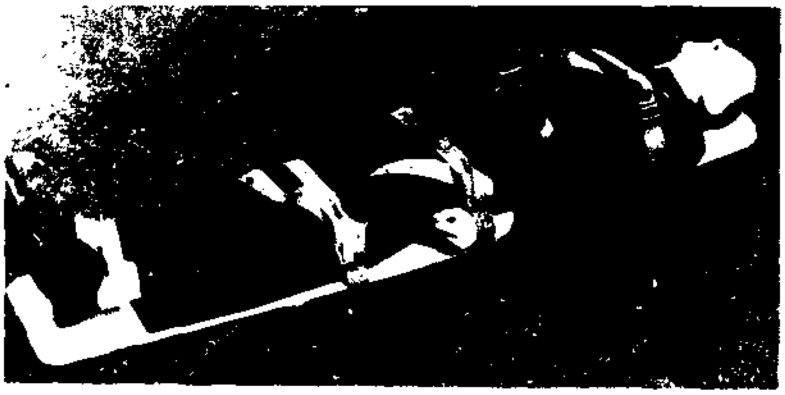

Figure 13

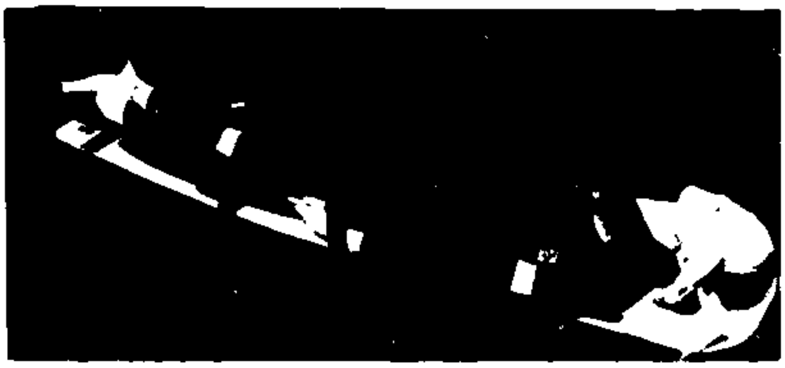

Figure 14

Figure 13 shows proper strap placement. The bottom strap passes just above the knees; the middle strap passes across the thighs and over the wrists; the top strap passes across the upper chest. Figure 14 shows proper placement of straps, footrest, and cravat bandages.

Figure 15

Squadman places one hand on board handhold.

RAISING THE BOARD

To raise a backboard, one squadman places four fingers of one hand into the handhold in the bottom of the board. (See Figure 15.) He then lifts the board and places it on one foot. (See Figure 16.)

Then he takes hold of the board with both hands, bends his knees, and lifts with his legs, not his back. He lifts the board just to his knees. (See Figure 17.)

Figure 16

Squadman places board on his foot.

The top man places himself at the top of the board. He stoops, places each hand on one edge of the board, and slides his hands along the board toward him until they touch the ground. (See Figure 17.)

He then straightens his legs and lifts with his leg muscles, not his back. If both men keep their arms straight, the board can be carried easily. (See Figure 18.) Squadmen should not bend their arms while carrying a patient on a backboard, as it is very tiring.

Figure 17

Figure 18

Figure 17 shows the proper first step in raising the board. Figure 18 shows the proper way to carry the board.

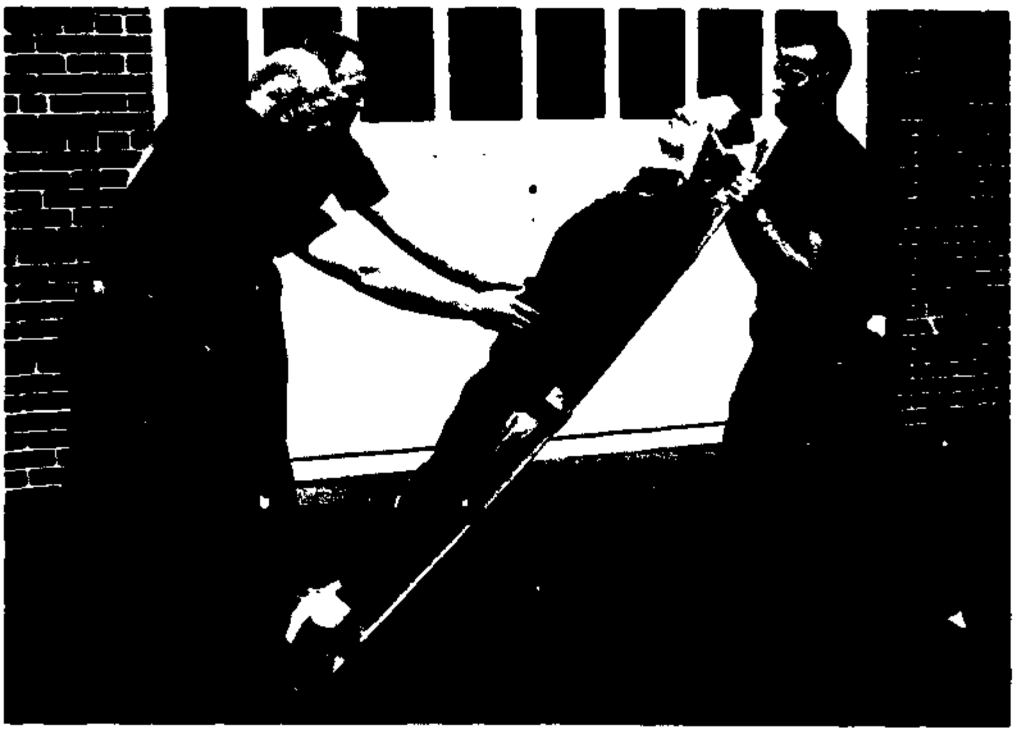

Figure 19

Squadmen raise the victim to a vertical position.

<u>Raising Victim's Head</u> - If the victim must be carried in a vertical position while strapped to the board he must be raised properly:

1. After the board is lifted to the normal (horizontal) carrying position, the foot end of the board is lowered again.

2. Two squadmen then "foot" the board; that is, each braces it with a foot.

3. The top man then raises the board to his chest, places it on his chest, changes the direction of his hand position, and pushes away.

4. The bottom two men then receive the board. (See Figure 19.)

The victim who is properly secured to a backboard can safely be raised to a vertical position using this procedure. He will not slide off or fall away from the board (See Figure 20.)

Figure 20

The victim is secure in a vertical position.

REMOVING VICTIMS FROM AN AUTOMOBILE

Victims of auto accidents are especially likely to have head, neck, and back injuries. Moving these victims carelessly has resulted in needless deaths and permanent paralysis. Every squadman should learn the procedure for removing a victim from a car: (1) from the driver's seat, (2) from under the dashboard, (3) from a prone position on the front seat, and (4) from the back seat.

PRELIMINARY STEPS

All emergency first aid--control of bleeding, the splinting of all fractures, etc.--must be carried out before the victim is removed. (If danger of explosion or uncontrolled fire is imminent, the victim should be pulled from the car by the long axis of his body.)

The squadmen's hand positions on a victim in a car are the same---or as close as possible to the same---as in regular logrolling.

The victim should not be moved until all are ready, and then only on the directions of one man.

Some of the procedures shown here require more men than usually are on a squad run. Other persons---policemen, family, or bystanders---could quickly be shown how to help. Do not hesitate to call for more help, if it is needed to carry out these procedures.

In the following pictures removal of a victim from each of the four locations is described and shown. The pictures do not show first aid treatment because they were posed: in an actual accident, the victim would have been splinted, etc.

REMOVAL FROM THE DRIVER'S SEAT

Rescuers often forget to make as much room as possible to work. Sliding the front seat back gently will give the squad more room. (See Figure 21.)

Figure 21

A car seat can be slid back.

A squadman positions himself behind the victim, in the back seat. (See Figure 22.) He slides his hands under the victim's armpits, grasps the victim's wrists, and crosses the victim's arms.

Figure 22

The victim is grasped by his arms.

As this is being done, one squadman stands ready with the backboard and another squadman stands at the opposite door.

The squadman in the car then arches his back against the car roof, and raises the victim just enough to slide the board under the victim. (See Figure 23.)

Figure 23

One squadman slides the board.

The victim is then pivoted on the board. Both his feet are kept together at all times. The squadman in the back seat then "gives" the victim to the squadman at the opposite door, who lowers him to a horizontal position. (See Figure 24.)

All three squadmen then come to the driver's side. Together they slide the victim out of the car. (See Figure 25.) He can then be transferred to the squad stretcher.

Figure 24

The victim is pivoted.

Figure 25

The victim is removed.

REMOVAL FROM UNDER DASHBOARD

A victim might typically be found in the position shown in Figure 26. Four squadmen will be needed, to remove him.

After the victim is given first aid, a board is placed on the front seat. (See Figure 27.)

Figure 26

Figure 27

Figure 26 shows a victim lying under the dashboard of an auto. Squadmen, after giving him first aid, will place a backboard on the front seat as in Figure 27.

Then the rescuers prepare to roll the victim onto the board, as follows:

1. One squadman places himself so that he can support the victim's head. He controls its movement at all times during the maneuver.

2. One squadman places himself where he can support the victim's legs.

3. Two squadmen get into the back seat, reach over the front seat, and grasp the victim's clothing at the shoulder, chest, belt, and thigh. (See Figure 28.)

Figure 28

Squadman at left is attending the victim's legs. Squadman at right, reaching from the back seat, is grasping the victim's belt and thigh.

On a signal all four squadmen gently lift the victim, keeping his back and hips against the front of the front seat. (See Figure 29.)

Figure 29

Four rescuers lift the victim from the car floor. One man in back, not visible here, holds the victim's chest and shoulder. Another is outside the car on the opposite side.

The victim is then placed on the board. (See Figure 30.)

The victim on the backboard is slid out of the car. (See Figure 31.) He can be transferred to the squad stretcher.

Figure 30

The victim is slid on a backboard.

Figure 31

The victim, on the board, is removed from the car.

REMOVAL FROM FRONT SEAT

Many times a victim is injured and falls across the front seat.

Four men are also needed for this rescue procedure, as follows:

1. Two men get into the back seat. The top man supports the victim's head and grasps the clothing at the shoulder. The second man grasps the victim's clothing at the belt and thigh. (See Figure 32.)
2. One man outside the car prepares to guide the victim's feet.
3. One man handles the board. Later he will attend the victim's head.

Figure 32

Rescuers are preparing to move the victim. Note positions of each squadman's hands.

The victim is rolled slightly away from the back of the seat, and the board is slid behind him. (See Figure 33.)

After the board is in place, the man who handled it becomes top man. He supports the head of the victim against the board with his arm, and grasps the bottom edge of the board. (See Figure 34.)

The two men in the back seat then reach across the victim, grasping his clothing under the ribs, waist, hip, and thigh. Together they hold the victim snugly against the board (See Figure 34.)

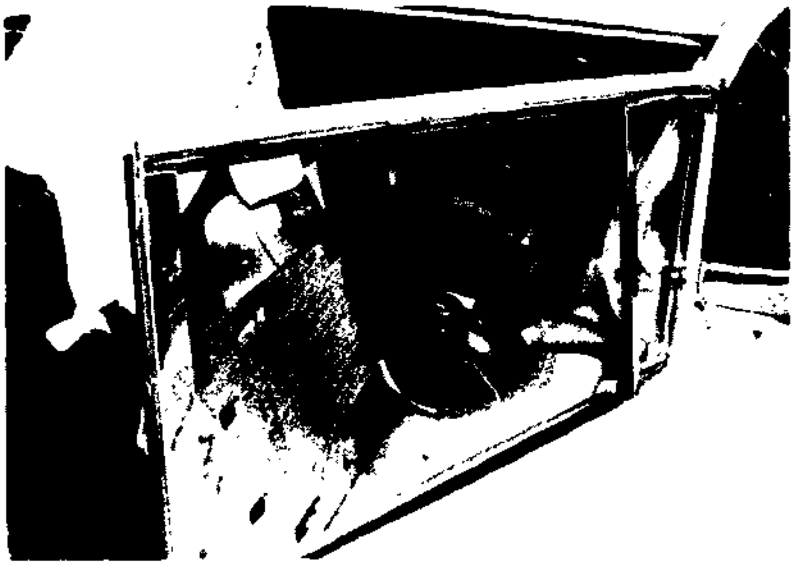

Figure 33

Figure 34

The victim is slightly rolled while one man places a board behind him (Figure 33). One squadman holds the victim's head against the board with his lower arm, as his hand grasps the backboard edge (Figure 34).

The bottom man (on the outside of the car) grasps the top of the board with his top hand. He reaches around the victim's ankles and grasps the board at its bottom edge, at the same time keeping the victim's feet against the board. (See Figure 35.)

On a signal all four men turn the board, keeping the victim tight against the board. (See Figure 36.)

The board is now resting on the front seat. The victim can be removed as previously shown.

Figure 35

Figure 36

With his left hand another squadman grasps the backboard below the victim's ankles (Figure 35). His right hand grasps the hand hole. Lowering the board onto the car seat is a joint maneuver (Figure 36).

REMOVAL FROM THE BACK OF CAR

People riding in the rear seat of a car can as easily be injured in a wreck as those in the front seat. They sometimes are found in the position shown in Figure 37.

To remove this victim, four squadmen grasp him using the same hand position as those shown in Figure 32. However, the two squadmen in the car are in the front seat. These two men grasp the victim as shown in Figures 38 and 39.

Figure 37

Figure 38

A victim lies on the floor between the front and back seats (Figure 37). Two squadmen, working from the front, grasp the victim as in Figure 38.

Figure 39

Squadmen place their hands on the victim as shown.

A board is placed on the seat and the victim is raised to the board. His back should be kept against the front of the back seat as support. His head, neck, legs, and back must be continually supported.

The back seat can be removed and the board put on the floor. The victim can then be supported and logrolled onto the board more easily. (See Figure 40.)

Figure 4C

Rescuers place the victim on the board. In this view, the back seat has been removed from the car.

CONCLUSION

Other uses of the backboard---raising, lowering, aerial-ladder rescue, etc.---are shown in other parts of this text.

This versatile tool should be handled frequently in squad practice sessions, so that it will become an intrinsic part of your team operation.

A wrecked car should be obtained by every squad, and it should be used often at drills to practice removal of victims. The car can be turned on its side or top, and the victims can be brought out through side windows, and through the windshield or back window.

All pictures in this chapter, except Figure 20, were taken in cooperation with the Sharon Township Fire Department, Worthington, Ohio.

CHAPTER XIV

RESCUE CARRIES AND DRAGS

INTRODUCTION

Earlier chapters of this text have dealt with first aid. The next several chapters will describe rescue procedures.

An important aspect of rescue work is the successful removal of victims in situations where a stretcher or backboard cannot be used. Squadmen must be able to carry and drag victims quickly to safety in a variety of emergency situations, with minimum risk to the victims and to themselves. They must be prepared to rescue people who are injured or unconscious. This chapter describes rescue carries and drags.

RESCUE PRINCIPLES, PRACTICES AND EQUIPMENT

THE RESCUE SCENE

Rescue is the removal of humans from places involved in fire or other disaster. The factor of life saving or "life hazard" decides the first or immediate operating procedure at a fire or other emergency. Rescue is the first action to be taken on arrival at a scene. Therefore, each officer and squadman should thoroughly understand the principles governing rescue.

In case of emergencies within a building, the first questions to be considered regarding rescue are as follows:

1. Are there any people in the building?
2. If so, are they in danger?
3. Have there been cries for help?
4. Can the people be rescued?
5. How can they be rescued?
6. Has any information been given by persons who have escaped from the building regarding persons in the involved building?
7. Has any information been given by neighbors or bystanders regarding persons in the involved building?

The officer in charge should determine whether anyone is trapped in the building. The information secured from answers to the questions above will help greatly in making rescue.

Children may try to escape from flames or smoke by hiding in closets, under beds or furniture. Persons may be found beneath a window which they have tried to open. A careful search should be made when there is any chance of anyone having failed to escape from the involved building. It must be remembered that it only takes a small amount of heated air, smoke or gases to render a person unconscious.

PREVENTING PANIC

In such places of public assembly as schools, churches, hospitals, dormitories, theaters, factories and stores, the actual emergency is not the only factor causing a serious rescue problem. Panic has been the major cause of death in places of public assembly. A false shout of fire, the discovery of smoke, some incident such as an explosion, collapse of part of the building, or any other unexpected event can cause the necessary spark of excitement which can cause panic. The best method of panic prevention is for the assembled people to be trained to perform a well disciplined emergency exit drill. This is the reason that systematic emergency exit drills should be conducted. Where it is not possible or practical to train occupants in emergency exit drills, the only safeguard against panic is for the buildings to have adequate exits. All exits should conform with accepted standards.

COMPLICATING FACTORS

Weather conditions at the time of the emergency have an important bearing on the problem of rescue. Zero weather accompanied by snow and ice will slow up rescue operations. Low temperature, plus exposure, may endanger the health of persons who have been removed from the building.

The use of the new type metal window frames in buildings has increased the difficulty of bringing occupants out through window openings.

The time and nature of occupancy has a direct relationship to the problem of rescue. A hotel fire is a more serious problem in the early morning hours than at any other time. In the early morning, most of the occupants are asleep and a fire may have made considerable headway before discovery. A school building presents an entirely different problem during the time classes are in session than when they are not. So, time and nature of occupancy must be given proper consideration in rescue.

The age, sex and physical condition of the inhabitants of the involved building will also enter into the problem of rescue. Women, children, and the physically disabled will make operations more difficult.

BEING READY

Squadmen should make community surveys to determine where disasters or grave emergencies are most likely to strike. A complete record should be kept at all times as to location of homes for the aged, children's homes, jails, hospitals and other institutions.

Squadmen must know the life hazards found in public, commercial and apartment buildings under their protection. Squadmen should know the construction, interior layout, nature of contents, number of persons likely to be found in the building, location of interior and exterior stairways, other avenues of escape, and any other information of value in conducting rescue operations.

Squadmen should also know the exact location of all exits from the involved building and the openings in the roofs of the adjoining buildings which could be used in an emergency. Porch roofs, balconies, and in many instances, the roof of the involved building may provide a means of temporary escape from immediate danger for the occupants.

Periodic surveys of the area squadmen are to protect should be made by both officers and men to determine the type of rescue tools and equipment that would be required for any emergency that may arise.

Rescue equipment will vary in different locations. For instance, an area with railroad tracks creates the possibility of a train wreck. The presence of lakes, ponds, and other bodies of water may indicate the chance of future drownings. Asylums, jails, etc., constitute places of confinement where iron bars would have to be removed from the windows. All of these would pose different problems in attempting rescue. Discussions should be held regarding these possible rescue problems.

Squadmen must be trained in the use of rescue equipment such as ladders, ropes, and gas masks in order to protect their own lives and the lives of others. A knowledge of the chemistry of fire, gases, ventilation and first aid is a must for the squadman.

There can be no set rules for rescue, as conditions may differ from case to case. Generally the time factor is always pressing, for people must be rescued quickly and taken to a place of safety. The methods used may employ one or a combination of rescue practices.

In order to be ready for any emergency, squadmen must be drilled regularly to develop teamwork in rescue practices.

CARRIES AND DRAGS

Persons who have been subjected to intense heat, heavy smoke, gases, or falling materials may become injured or unconscious. Squadmen should know the methods for carrying and dragging people to safety in such emergencies. Some common methods are described here.

Chair Carry - This is a good method. It is even better than a stretcher in places where sharp turns must be made or where steep stairways are encountered. The chair should be tested before use, to make sure it is solid and will support the victim. After the victim is placed in the chair, the man in the rear tilts the chair back to enable the man in front to get into his position. Carry as shown in Figure 1.

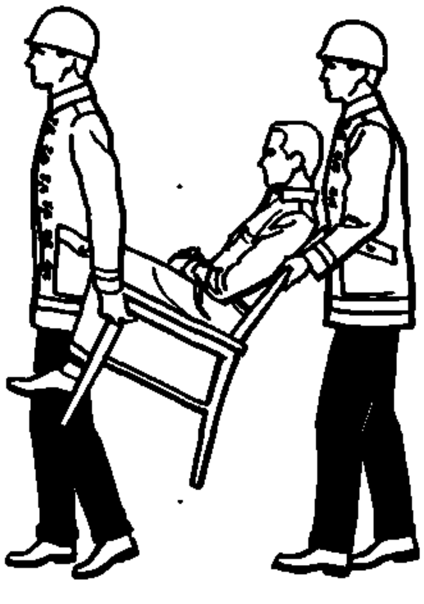

Figure 1
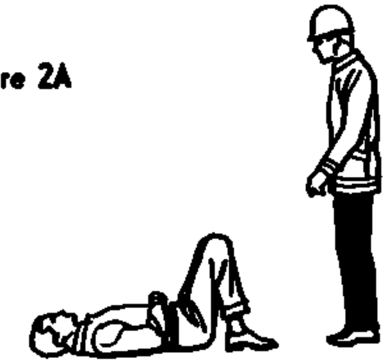
Chair carry

Fireman's Carry - To get the victim on the shoulder for this carry, balance and coordination of movement are very important. With this method, a squadman can raise any victim that he is able to carry. He places the victim on his back, knees up, and feet against buttocks, as shown in Figure 2a.

Figure 2A



He then grasps the victim's wrists with his palms down. See Figure 2b.

Figure 2B

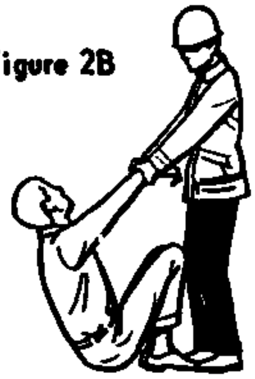


Figure 2C

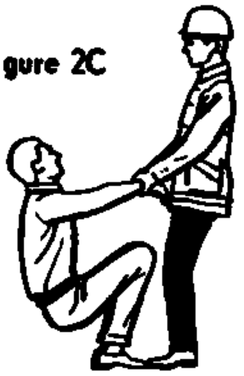

The rescuer places his feet and legs against the victim's feet and legs, as shown in Figure 2c. Then, by leaning back and pulling the victim forward and up at the same time, he enables the victim to fall across his shoulder. See Figures 2d and 2e.

Figure 2D

Figure 2E

Fireman's carry

Carrying in Arms - To carry a patient in the arms, lift him, if he is unconscious, to an erect position as described in the fireman's carry. Support the patient with one arm about the body. Kneel on one knee and allow him to rest on your other knee. Pass your other arm under his thighs. Roll the patient into the hollow of the elbows and rise. See Figure 3.

Figure 3

Carrying in arms

Carrying Astride Back - Carrying astride the back is a comfortable one-man method of transportation, but is limited to carrying a conscious victim who can at least partially stand alone. The rescuer assists the victim to a standing position. Standing in front of the victim, he turns his back to him, taking the victim's arms over his shoulders and crossing them. He then bends forward until the victim rests on his back. He grasps each thigh, and with a humping motion, raises him well upon his back. Passing the forearms under the victim's legs, the rescuer then takes a wrist in either hand and the victim is loaded. This carry is so secure that the victim may become unconscious and yet be carried safely and easily. See Figure 4.

Figure 4

Carrying astride back

Pack Strap Carry - The pack strap method is a one-man carry that has two applications, one for a conscious and one for an unconscious victim. For a conscious victim, the loading is done exactly as described in the first part of the "astride back" method. See Figure 5a. When the victim is on the rescuer's back, the rescuer grasps his crossed arms at the wrists, bends forward, humping the victim well up on his back and proceeds in the manner shown in the illustration. Note that the rescuer has one hand free.

If the victim is unconscious, the loading is more difficult, likewise the carry. To make the carry, an improvised "pack strap" is used. The carry gets its name from the pack strap used. The pack strap consists of a loop of some type of material. A rope hose tool is excellent for this purpose, but a bed sheet or any other similar material may be used. The rescuer turns the victim on his back and passes the loop through, under his shoulders at the arm pits. He then places his body on that of the victim with his face up, slipping each arm through an end of the loop. The rescuer then rolls himself and the victim over, gets to his knees, then to his feet and from this squatting position rises to an erect position. See Figure 5b. Since both hands are free, the rescuer may proceed down a ladder or through difficult passages. Although the dangling legs of the victim are awkward, he cannot slip from the load. Also, the rescuer can shift the load from his back to leg muscles by bending forward.

Figure 5A

Figure 5B

Pack strap carry (conscious and unconscious)

Front Piggy Back - This one-man carry is excellent for carrying a conscious victim. To get the victim in position, face him and place hands under his arm pits. Lift as he jumps up putting his legs around your midriff, above the hips. The victim wraps his arms around the rescuer's neck. The rescuer has both hands free to climb or descend a ladder, open a door, etc. If trouble develops while descending a ladder, the rescuer can pin the victim against the ladder until help arrives or the trouble is eliminated. See Figure 6.

Figure 6

Front piggy back

Two-Man Seat Carry - The seat carry seen in Figures 7a and 7b is a two-man means of carrying an injured or unconscious person. It consists of making a seat rest of one pair of arms and a back rest of the other pair. Figure 7a shows how the arms are arranged when completed. The rescuers kneel, one on either side of the victim near the hips, and raise him to a sitting position steadying him with the arm nearest his head around his neck.

Each rescuer then slips his other arm under the victim's thighs, clasping the wrist of the other rescuer. Both arise slowly, in unison, lifting the victim from the ground. When erect, they adjust their upper arms to form a comfortable back rest and to make the victim secure. See Figure 7b. If conscious, the victim assists the rescuers by grasping them around the necks with either or both arms.

Figure 7A

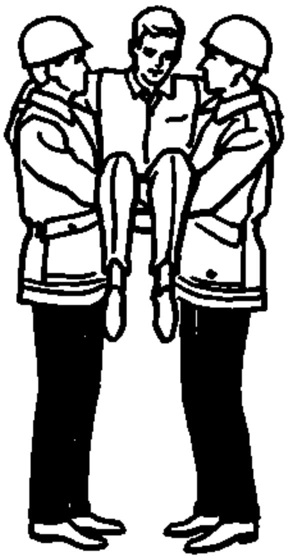

Figure 7B

Two-man seat carry

Carrying By the Extremities - This is a good method, but should not be used if the victim has any fractures. The victim is laid straight on his back, feet apart. One rescuer takes his place between the victim's legs and the other at his head, facing each other. The rescuer at the victim's feet turns his hands palms down, grasps the victim's wrists, and pulls him to a sitting position. The man at the victim's head assists in raising him to a sitting position by lifting his shoulders. See Figure 8a.

Figure 8A

The rescuer at the head position kneels on one knee and supports the victim's back with the opposite knee and leg. Then he extends his hands, palms down, under the victim's armpits from back to front. The rescuer at the victim's feet, who has been holding the victim's wrists, places them in the extended hands of the other rescuer, who grasps them firmly. See Figure 8b.

Figure 8B

The rescuer at the victim's feet turns his back to the victim, kneels on one knee, and passes his hands under the victim's knees from the outside. The rescuer at the head position gets into a baseball catcher's position, keeping his back vertical. At the order "Rise", by either of the two rescuers, both rise by straightening their legs, and move forward. See Figure 8c.

Figure 8C
Carrying by the extremities

Three-Man Carry - The three-man carry is used for badly injured persons. See Figures 9a , 9b and 9c . The carry is accomplished as follows: Three men line up on one side of the victim and the leader gives the command, "Prepare to lift." Each man kneels on the knee nearest the victim's feet, so that one man is at his shoulders, one at his hips, and one at his knees. Without further orders, they pass their hands and forearms under the victim, as shown in Figure 9a . The one at the head places his hands under the victim's neck and back, the second under the pelvis and hips, and the third under the knees and ankles. At the command, "Lift," they raise the victim and place him on their knees, but without releasing their hands. See Figure 9b.

Figure 9A

At the command, "Prepare to rise," they slowly turn the victim on his side, toward them, until the victim rests in the bend of their elbows. At the command, "Rise," all rise to a standing position, holding the victim against their chests, as in Figure 9c. To move directly forward, the command, "March," is given and all three step off on the left foot and continue until the command, "Halt" is given. To move sideways, the command, "Side step left", (or "... right",) is given. The rescuers step off with the foot according to the command, bringing the other foot up to it in even, short steps. The victim is then lowered by reversing the operations but always at the command of the leader.

Figure 9B

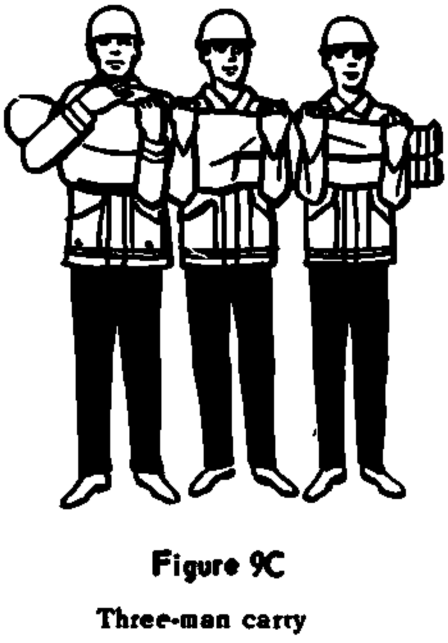

Figure 9C

Three-man carry

In actual practice, however, it should not be necessary to give detailed commands. The men should be so well trained that they can move and act in unison with a minimum of commands.

Clothes Drag - When a squadman must rescue a victim who is too heavy to be carried, other means must be used to get the victim to safety. The clothes drag, Figure 10, is one method that can be used. The rescuer's hand should grasp the victim's collar with the victim's head resting on the rescuer's arm for protection.

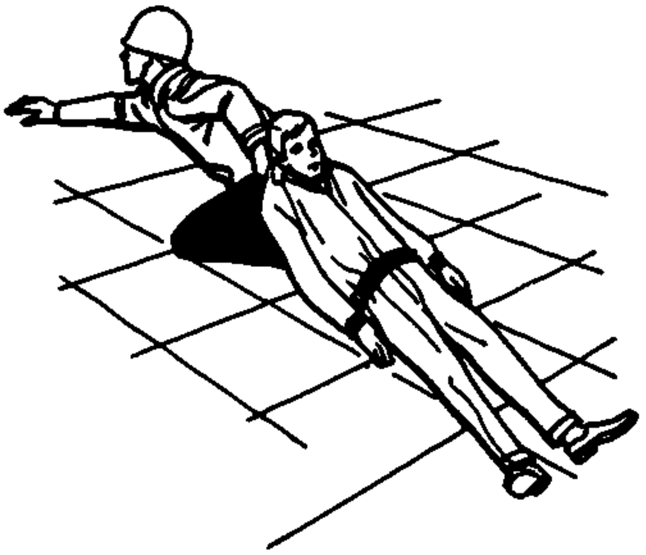

Figure 10
Clothes drag

Fireman's Drag - In making a fireman's drag, the victim's wrists are tied together with a square knot as shown in Figure 11.

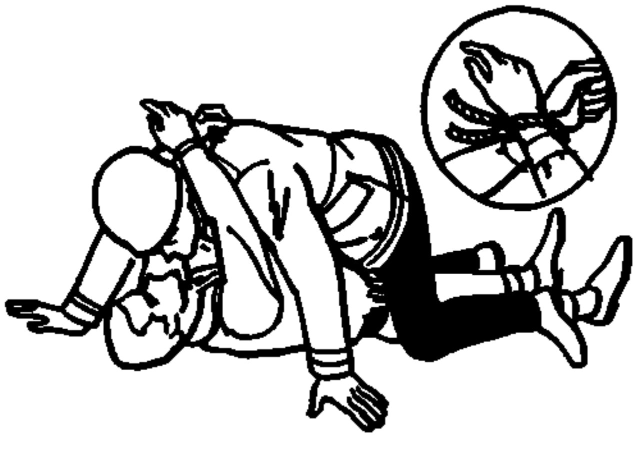

Figure 11
Fireman's drag

The rescuer then straddles the victim and passes his head between the arms, raises the victim's head and shoulders just off the floor, and then, by crawling, drags the victim out.

For descending a stairway when using the fireman's drag, the rescuer's position is reversed and he descends the stairs backwards. This prevents the victim's head from hitting the steps.

The Blanket Drag - The blanket drag can be used in place of the clothes drag when the victim is nude or the clothing being worn is too flimsy to be used to drag the victim. Place a blanket on the floor and roll victim onto the blanket. The victim can then be removed to safety as shown in Figure 12.

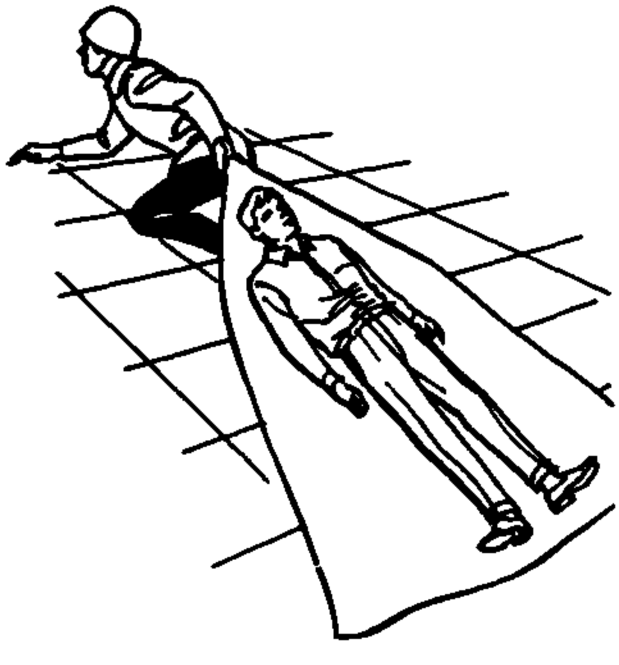

Figure 12
Blanket drag

LADDER RESCUES

SLIDING AN UNCONSCIOUS VICTIM DOWN A LADDER

Generally this evolution, illustrated in Figure 13, is started from a crotch-hold position. The rescuer unlocks his own leg, works up until his arms are beneath the victim's armpits, grasps the rungs in front of the victim's face, while the rescuer's knee is beneath the victim's crotch. The victim's feet are positioned outside the beams and he is slowly slid down the ladder. The rescuer should be backed up by an extra man.

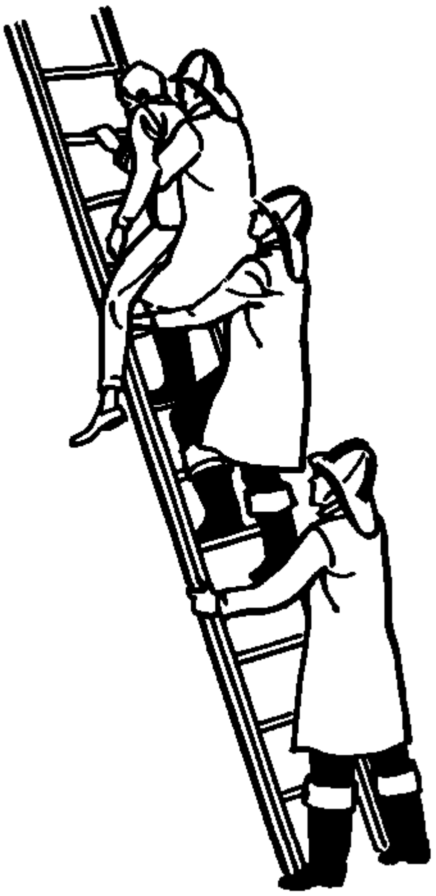

Figure 13

Sliding an unconscious victim down a ladder

WALKING A VICTIM DOWN A LADDER

As shown in Figure 14, this evolution is executed by taking a position immediately behind and parallel to the victim, but one rung below him. Place the arms around the victim's body below the armpits and grasp a rung. Using one rung at a time, descend slowly. As a precautionary measure the rescuer should keep one knee between the victim's legs to prevent him from sliding through.

Figure 14

Walking a victim down a ladder

WALKING A WOMAN OR CHILD DOWN A LADDER

This evolution differs from the preceding method because the rescuer's knee is not placed between the legs of the woman or child. The rescuer's arms are placed around the victim's body below the armpits. The resucer graps the rung immediately below the rung the victim is grasping. He comes down slowly, descending one rung at a time.

Figure 15 shows the proper way to walk a victim down an aerial ladder.

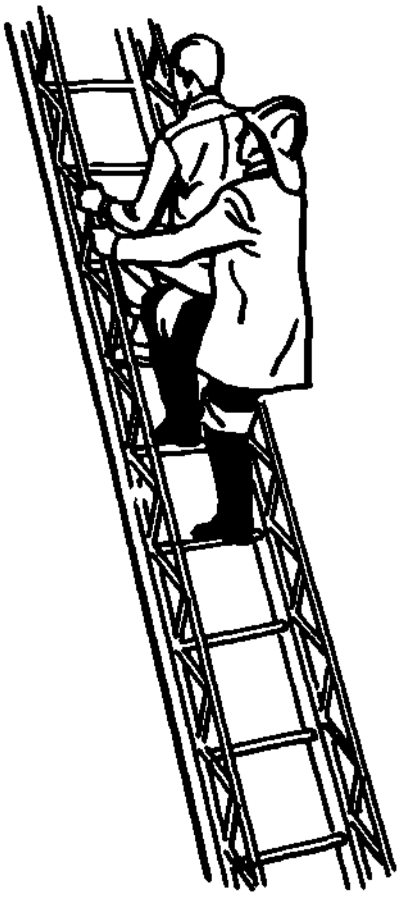

Figure 15

Walking a victim down an aerial ladder

SLIDING A VICTIM DOWN A LADDER)ER ACROSS ARMS

The rescuer who is to slide the victim down the ladder stands on the ladder just below the door, window, or roof, grasping the ladder with both hands on the underside of the beams. The other rescuer places the victim across the first rescuer's arms, as shown in Figure 16a. The first rescuer then descends the ladder one step at a time with the victim's buttocks resting on each rung of the ladder during descent. The rescuer's hands are slid along the underside of the beam. The rescuer on the ladder should be backed up by an extra man. See Figure 16b.

Figure 16A

Figure 16B

Sliding a victim down a ladder across arms

CARE OF VICTIMS AFTER RESCUE

NEED FOR SPECIAL CARE

The persons referred to in this section are those taken from or removed from danger who are not injured. Care should be taken to prevent persons who have escaped from a burning building from re-entering to obtain clothing or other possessions left in the building if the conditions are such as to endanger their lives or interfere with fire-fighting operations. Many times, rescue is a difficult and dangerous operation even for trained and experienced firemen or squadmen. Therefore, care must be exercised by squadmen to prevent untrained persons from exposing themselves to unnecessary danger

The duty of the rescue squad does not always end after persons are brought to a place of safety. Infants, children, the sick and the aged all need care and supervision after being brought to safety.

CARE OF INFANTS

When infants are subjected to a sudden drop in temperature after being removed from a heated building, they are likely to incur pneumonia or some other illness. The rescuer should protect them by being sure that they are properly covered and their face protected. They should, if possible, be delivered to some competent person who will see that proper care is given to them.

CARE OF CHILDREN

If left on their own, children may wander around a fire area and become injured. They may even re-enter a burning building seeking a toy or something left behind. For these reasons, they should always be placed in the custody of a competent person who will give them proper care and protection.

CARE OF THE SICK

People taken from a sick bed may suffer a relapse causing the illness to become worse. If the illness is not contagious, refuge for them may be found in a neighbor's home. If the sickness is contagious, provisions must be made as soon as possible to have the patient sent to a hospital. A heated garage may provide temporary shelter, but attendance and care must be given to the patient until removed to the hospital. As a precaution, as few squadmen as are absolutely necessary should expose themselves to a contagious disease. Those squadmen that were exposed should receive a doctor's attention and their clothing should be treated to prevent the spread of the disease. Since not all hospitals will admit contagious cases, the squad should prepare itself for this emergency by listing hospitals or agencies that will accept such cases. Refer to section on contagious diseases on page 62.

CARE OF THE AGED

On many occasions, aged people have lost their lives after being taken to safety. Not realizing the danger, they re-enter the involved building for their possessions which might have been only a picture, the contents of a dresser drawer or some other object they have had for a long period of time. If possible, squadmen should bring these cherished objects out with the person. In every case, however, after rescue the person should be placed in the custody of competent persons.

ROPE SLIDE

On some occasions ladders or other tools are not available and the squadman must use a rope slide to save himself and/or the victim.

PLACING THE SLIDING ROPE IN SERVICE

The rope is either carried to the roof or upper story of a building or pulled up with the aid of a small line such as used on the life gun which shoots the line to the upper story or roof.

Fasten one end of the sliding rope to some solid object within the building or on the roof. It should be tied at the same level as the edge of the roof or window sill over which it is passing, and directly above the center of the window from which the slide is to be made. Place a pad, such as a coat, under the rope where it passes over these edges to prevent damage to the rope. Be positive that the sliding rope is long enough to reach the ground or a place of safety. The following method is used to slide the rope with the hands and feet.

1. Stand erect in window if possible.
2. Grasp the rope with both hands high above the head and pull on rope. This will test the rope and take the slack and stretch out of it.
3. Still pulling with the hands, and with the lower part of the rope hanging down in front of the body between the legs, pass the right leg forward on the right side of the rope, backward on the left side of the rope, and forward on the right side again, far enough that the rope is hanging down on the inside of the instep of the right foot. See Figure 17a.
4. Extend the right leg out of the window just below the sill and suspend the full body weight with the hands and at the same time pass the left foot under the right foot and press it tightly to the outside of the right foot. Elevate toes of the left foot and lower toes of the right foot. See Figure 17b.
5. By pressing the feet together enough friction is created to hold a man stationary. By releasing the pressure slightly he can slide slowly and safely down the rope. Do not slide hands on rope but use hand-over-hand method. If the rope slips out from between the feet while sliding, suspend the body by the hands and work the rope back to proper position with the feet.
6. When getting on a sliding rope from the level where the rope is secured, as from a roof top, grasp the rope with both hands and lie on the stomach, over the rope, with the lower part of the body hanging down over the roof ledge. Work the rope into position as shown in Figure 17b and then lower yourself over the edge with the hands until you are in proper position for the slide.

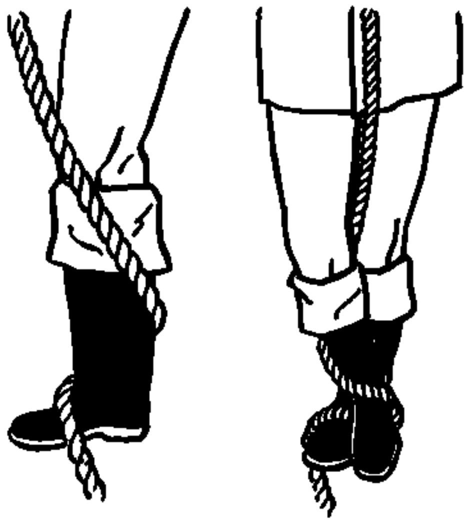

Figure 17A **Figure 17B**

Foot positions on sliding rope

TO SLIDE ROPE WITH A LIFE BELT-ONE MAN

Strap a life belt snugly about the waist (not so tight as to cause discomfort) with the buckles on the left side and the hook hanging directly in front. Put a leather sliding glove on the right hand. Stand erect in the window, facing the outside. Grasp the sliding rope with both hands, above the head, and pull down hard to test the rope for security and to take out some of the stretch.

Reach down with the gloved hand (right) and take hold of the rope just above the knees and raise it to about the level of the waist to give enough slack to work with. Hold the rope in the palm of the right hand, thumb up. Raise the life belt hook with the left hand so that it is pointing upward. Still holding the rope in the palm, grasp the base of the hook with the right hand and hold them firmly together just above the waist. The hinged or opening part of the hook should be on the left. Grasp the rope a bit above the hook with the left hand, thumb pointing down. See Figure 18a.

Looking at the left hand from underneath, wrap the rope clockwise one and a half turns around the hook, forcing the rope to the inside of the hook through the hinged part each time. The rope will be entwined one complete turn about the hook on its right side. See Figure 18h.

Hold the left side of the hook with the left hand and, with the right hand on the rope below the hook, pull the rope through until all the slack is out of the rope above.

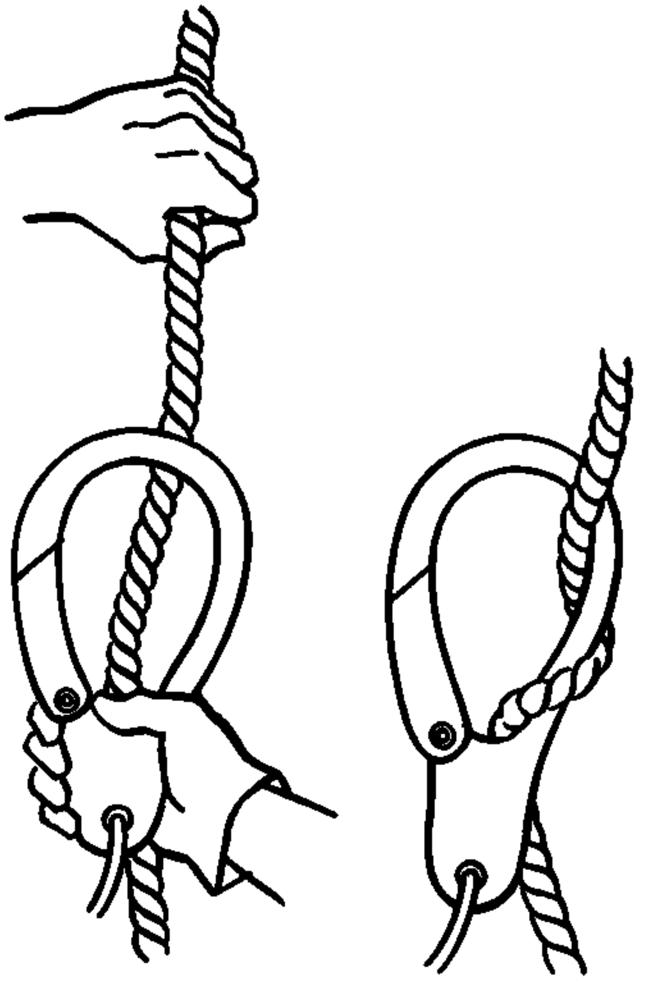

Figure 18A **Figure 18B**

One-man slide

Grasp the rope with the gloved right hand, thumb up; straighten the right arm and move it around to the rear of the body and hold the hand (thumb side toward the body) pressed firmly against the center of the buttocks. Have the rope gripped tightly and pulled taut around the right hip.

Remove the left hand from the hook. Bend slightly at the knees and allow the rope to suspend part of the body weight. Turn to the right until the back is to the outside and at the same time ease down until the body is suspended entirely by the rope and the legs are holding the body out from the building with the feet resting against the edge of the sill.

When ready to descend, kick out away from the building slightly and ease the right hand grip on the rope just enough to allow the rope to slide through the hand. The speed of descent is controlled by the amount of friction created by the righthand grip. To slow up or stop sliding it is only necessary to grip the rope more tightly.

During the slide keep facing the building. Keep the left hand off the rope and hook. Use the left hand and the feet to keep from striking the building during the descent. It may be necessary to kick out from the building several times on the way down, depending on the length of the slide and speed of descent.

Should the right hand become dislodged from its position in the rear of the body and be pulled up to or near the hook, stop at the most convenient place, such as the next lower sill, and work it back into position.

When the ground is reached, bend at the knees and allow the hook to slide down the rope as low as possible; then stand erect. By holding the hinged part of the hook open with the right hand, the rope is removed from the hook with the left hand, in reverse of the manner of putting it on.

Not more than one sliding life belt can be in use on one rope at one time.

TO SLIDE ROPE WITH A LIFE BELT - TWO MEN

Although no more than one life belt can be in use on the rope at one time, it is possible for two men to descend the rope at the same time. This is performed as follows:

They can both start the slide from the same window, or one man can start from above and pick the other man up at a lower level.

If both men are to slide from the same window, the first man wraps the rope two and a half turns around the hook instead of one and a half. See Figure 19. This extra turn is necessary to create enough friction for the added weight of the second man. He then gets into position with his back toward the outside and his feet holding himself out away from the building the same as in the one-man slide.

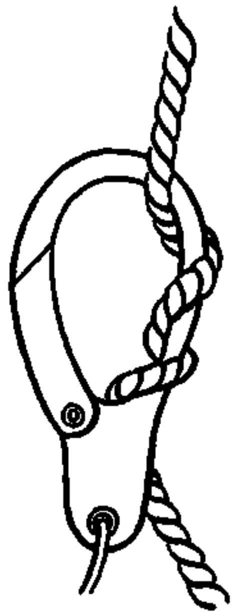

Figure 19

Two-man slide

When the first man is in position, the second man sits on the sill with his legs out the window and between the legs of the first man.

The second man holds onto the first man's belt toward the front with his left hand; with his right hand he snaps his own life belt hook into the ring at the base of the first man's hook. Then he holds onto the first man's belt with his right hand and holds his head and shoulders in close to the first man's waist.

He then eases himself out the window, off the sill, until he is entirely suspended by his hook from the first man.

As he eases himself out off the sill, the first man kicks out away from the building and they descend to the ground in the same manner as in the one-man slide. The second man may also assist in protecting both of them from striking the building during descent if necessary.

If the first man is to pick the second man up at a lower window, he gets on the rope and slides down to that window the same as in the one-man slide. He stands erect in that window, facing the outside, gets the necessary slack in the rope, places the extra turn around the hook, and takes the position with his back to the outside again. The second man then hooks onto the first man as previously described and they descend to the ground.

Upon reaching the ground the second man unhooks from the first man; then the first man stands erect and removes the rope from his hook.

A 5/8" cotton braided rope is recommended for this evolution.

RADIATION RESCUE

The atomic age promises many benefits to man, but with these benefits come added responsibilities and dangers to the squad service -- namely, to protect the public and squadmen from the dangers of radiation and contamination. More information on this subject will be found in Chapter 26 of the Ohio Fire Service Training Manual.

In case of an emergency where radioactive material is present, the victim must be removed from the area with as little contact with the rescuer as possible. The rescuer may use the clothes drag, a pike pole, or a rope effectively to remove the victim to a safe place. He should take any necessary measures to save life, but carry out a minimum amount of first aid until a doctor can be called to the scene. A squadman's protections against radiation are time, distance, shielding, and gas masks.

CHAPTER XV

AERIAL LADDER RESCUE PROCEDURES

INTRODUCTION

There are rescues in which the squadmen are unable to bring the victim up from a low place or down from a high spot in the usual way. Roofs of buildings and the bottoms of cliffs are two examples of such locations. In many such situations, where conventional rescue procedures are unsafe, the skillful use of an aerial ladder and appropriate rigging will permit squadmen to reach and rescue a victim with minimum risk.

If on arrival squadmen find that an aerial ladder will be needed, it should be sent for immediately. The squad should be prepared for this kind of emergency by learning the location of all aerial ladders that can be summoned to the area that the squad serves.

EQUIPMENT

The equipment needed for aerial ladder rescue includes:

1	Backboard and footrest
2	Long web belts (7-foot)
3	Leather straps
1	Blanket
2	Triangle bandages
1	Hose roller
2	1/4-inch or 1/2-inch ropes
1	5/8-inch rope

Some departments carry all this special equipment in a particular part of their rescue truck or ladder truck. Some even make a special container for the equipment, so it can be taken up a ladder easily and quickly.

Figure 1 (next page) shows the basic equipment. Figure 15 at the end of this chapter shows specifications for a rescue belt.

Figure 1

Equipment needed for aerial ladder rescues

PROCEDURE

One squadman should be in charge of the whole rescue procedure. In the case of a roof-top operation, he directs from the roof.

PREPARING THE VICTIM

Any needed first aid should be given to the victim immediately. Then he should be logrolled onto a backboard, as shown in Chapter XIII of this text. He must be strapped to the board before the ladder rescue procedure is carried out, with his feet secured to the footrest. Figure 14 in Chapter XIII shows a patient properly secured to a backboard.

USING THE LADDER

The use of an aerial ladder rescue truck for both horizontal and vertical rescues is described and pictured on the pages that follow.

When the ladder truck arrives, the turntable should be lined up with the center of the victim's body. This can be directed by a squadman who places himself where he can be seen easily by the truck driver. All obstacles such as wires, trees, etc. should be observed by both the squadman in charge on the roof and the officer in charge of the ladder truck.

As soon as the truck is positioned, the outriggers should be placed. The fly of the ladder should be extended four rungs while still in the bed.

The hose roller is then secured to the top rung of the ladder as shown in Figure 2.

One end of the large rope is tied to the top rung of the ladder with a clove hitch. (See Figure 3.) The remainder of the rope is brought down the center of the ladder and put on the turntable or ground.

Figure 3

Hose roller and large rope in place on top rung.

At the direction of the man in charge (on the roof in this example) the ladder is extended to him. (See Figure 4.) The top rung of the ladder is brought directly over the victim. Meanwhile, squad members are preparing the victim on the board. (See Figure 5.)

Figure 5

The man operating the ladder cannot see the victim. He must be completely directed from above. Figure 4 shows the ladder fly as he extends it toward the man in charge. The ladder is directed up until it is positioned squarely over the middle of the victim. (See Figure 5.) Note the squadmen preparing the victim.

After the victim is secured to the board, the two large web belts are put through the top and bottom holes on the side of the board. (See Figure 6.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 6

Large belts in place. In order to show all straps and their placement, the victim in this posed picture was not wrapped in a blanket as he would have been in an actual rescue.

The large rope is now removed from the top rung, placed over the hose roller, and put through all four "D" rings of the large web belts. (See Figure 7.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 7

Large rope placed through "D" rings.

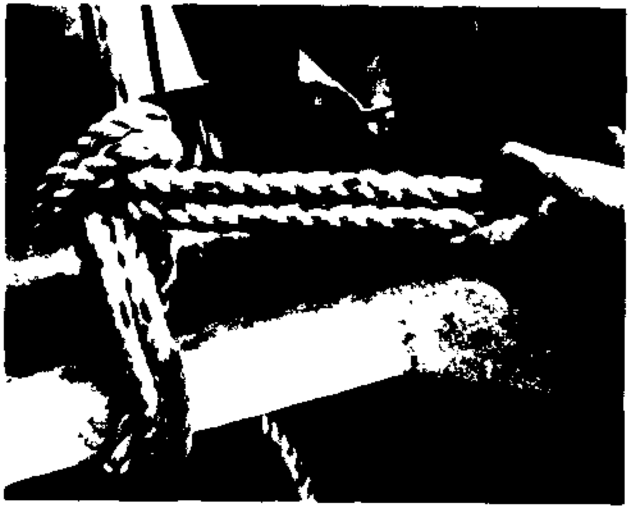
A bowline and a half hitch are then placed in the rope. (See Figure 8.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 8

Bowline and half hitch

The men of the ladder company then pull up all the slack possible and tie the rope doubled to the metal foot bar or plate at the bottom of the ladder. (See Figure 9.)



Courtesy Sharon Twp. F.D., Worthington, O.

Figure 9

Tie at bottom bar or plate

Then the fly is extended or the ladder is raised, whichever is best for the particular rescue. This is continued until the victim is lifted three to four feet from the surface. (See Figure 10.) Then the lifting procedure is stopped. This is to test all knots.

The two small ropes are put through the same holes as the large belts, and are thrown over the side of the building to two laddermen. (See Figure 10.) These ropes guide the board and prevent undue movement. The ladder is retracted or the turntable is rotated, or both, until the victim is free of the building and all obstacles. (See Figure 11.)

Figure 10

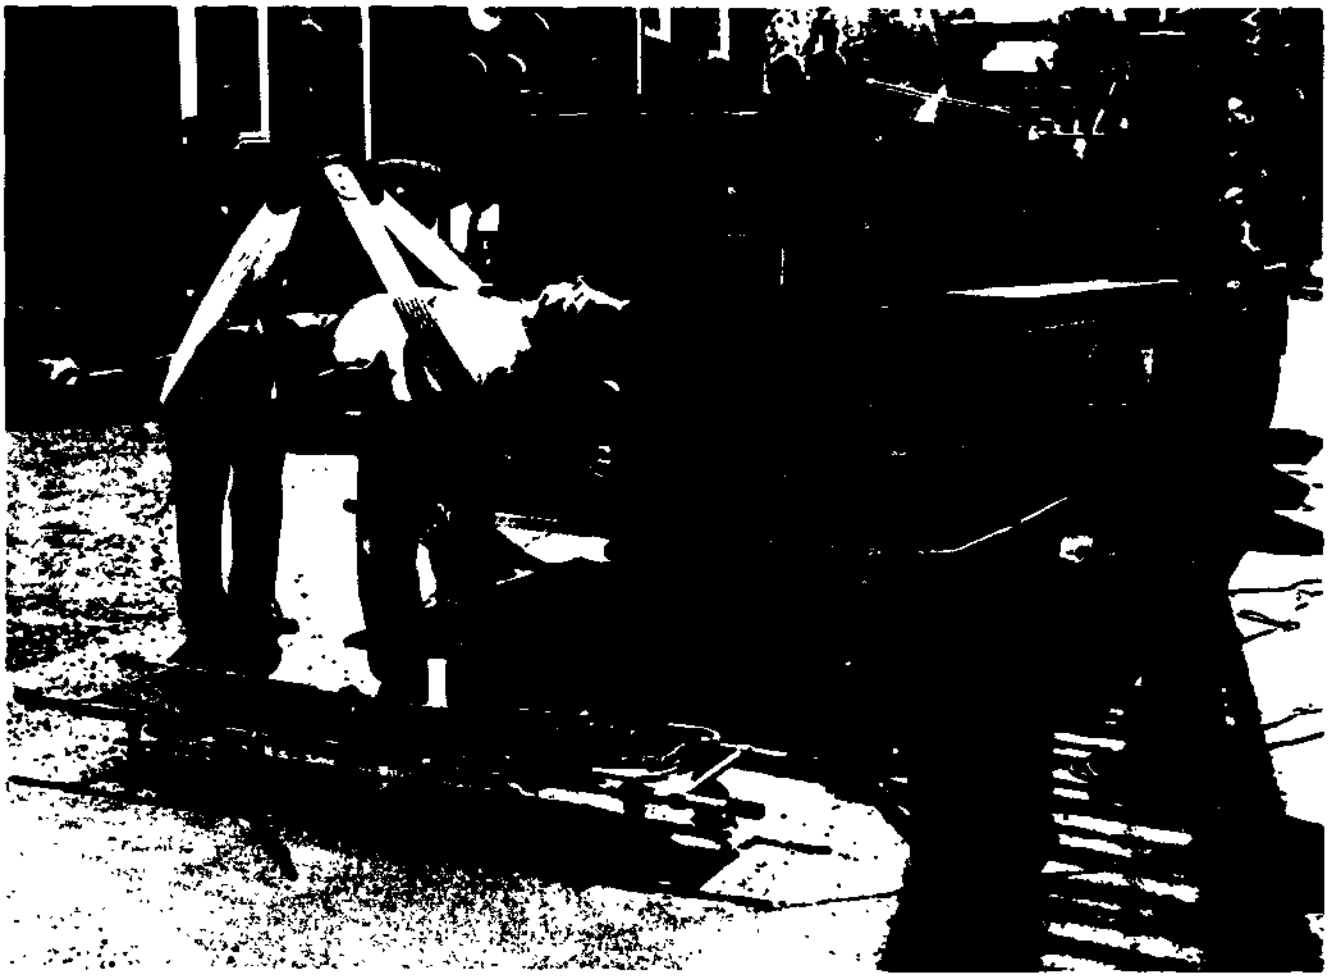
Testing knots and placing guide ropes

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 11

Victim is lifted free of all obstacles and lowered toward the ground.

The procedure can become so smooth with practice that the stretcher can be placed on the ground and the ladder operator can deliver the victim to it. (See Figure 12.)



Courtesy Sharon Twp. F.D., Worthington, O.

Figure 12

Experienced rescue team lowers victim directly onto waiting stretcher.

VERTICAL RESCUE POSITION

Sometimes in an aerial ladder rescue a victim must be removed in a vertical position. In this case first aid is given and the victim is strapped to a backboard, as previously described. The ladder crew prepare as they would for a horizontal rescue procedure. The rope placement is different. After the fly is brought to a position over the victim, the large rope is put through the top two hand holes in the board. It is most important that the rope is placed with the knot to the front of the board. (See Figure 13.)

Courtesy Sharon Twp. F.D., Worthington, O.

Figure 13

Correct knotting of large rope for moving victim in vertical position

After the board is raised three to four feet off the surface, guide ropes are placed at the bottom holes of the board. The two truck men can then control the board. (See Figure 14.)

Figure 14

Guiding descent of victim by means of ropes through bottom backboard holes

RESCUE BELT

Figure 15 shows specifications for a rescue belt that an emergency squad can make.

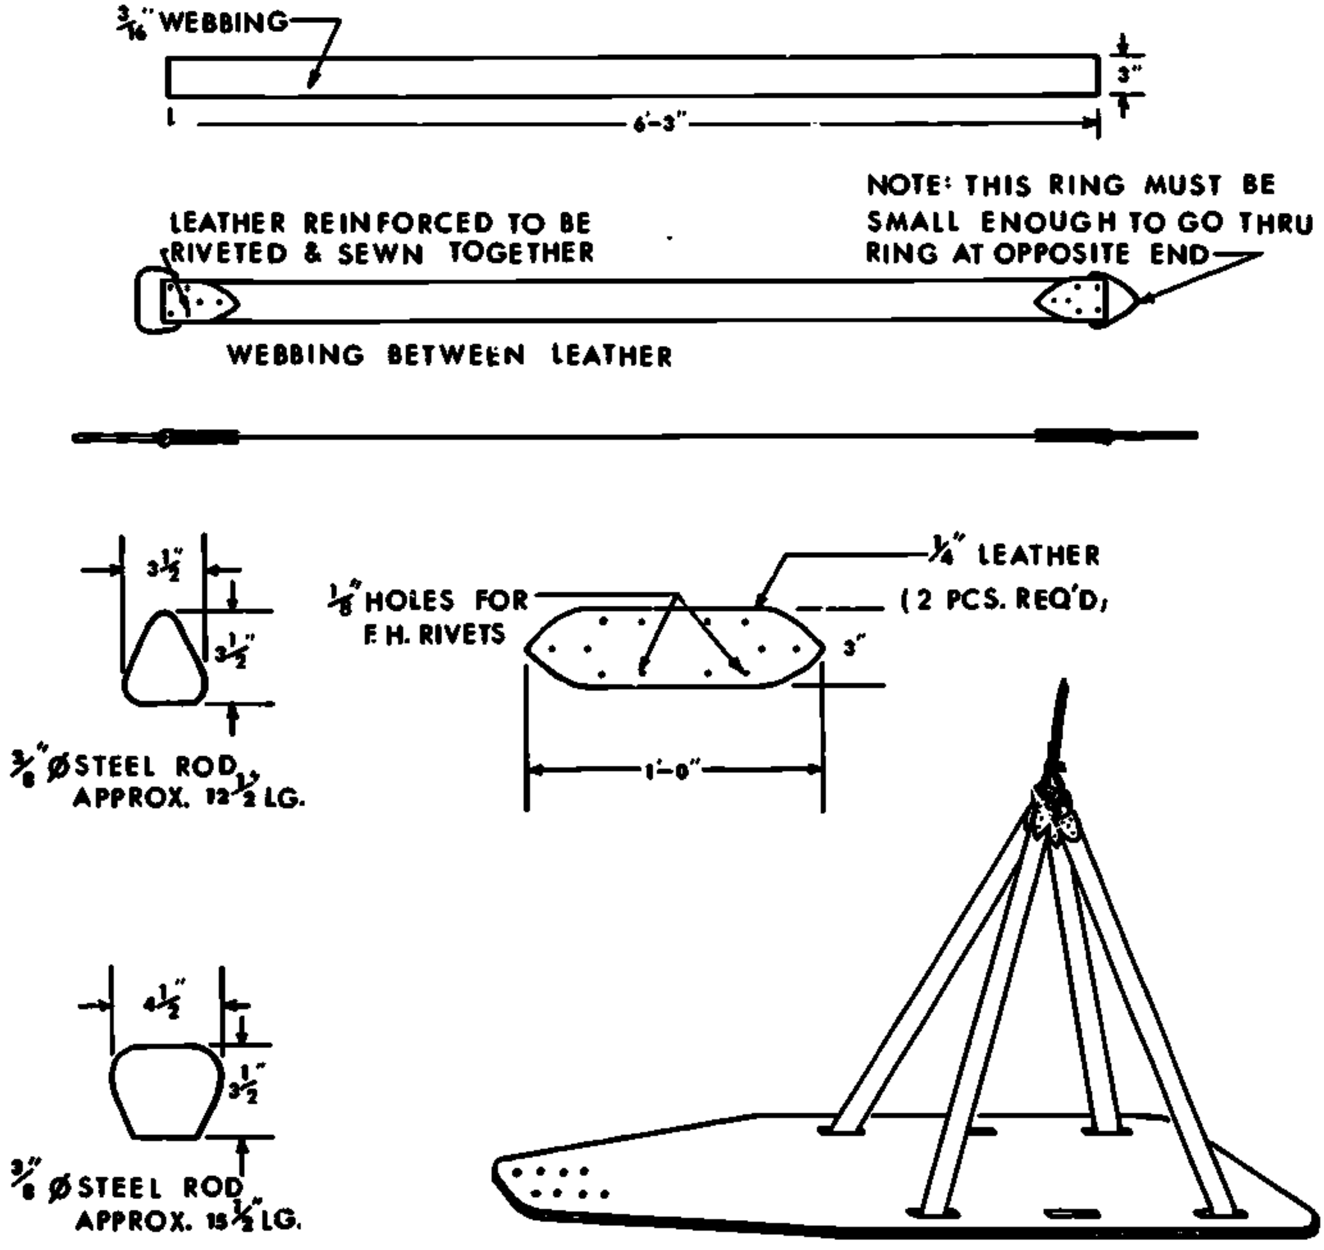

Figure 15

Rescue belt

PRACTICE

Both these procedures must be practiced often. Your squad and ladder companies can become proficient to the point of being able to complete them in just a few moments.

If your squad does not have a ladder company, you should practice with the ladder company nearest you so that victims will receive prompt, safe care.

CHAPTER XVI

FORCIBLE ENTRY

INTRODUCTION

Squadmen must have means of getting into a building that is closed and locked. Admission sometimes must be gained by forcible entry. A building is entered forcibly only when all accessible doors and windows are locked and it is impossible to enter the building through normal means. This chapter explains the different methods of forcible entry and the ways of using the tools of the rescue squad in making a forced entry. The knowledge of how to use them is invaluable when the squadmen, upon arrival, find the normal entrance into the building either blocked or locked. Efficient methods of forcible entry can save property, reduce hazards to life, and create good public relations. Forcible entry tools are a "must" for every emergency or rescue squad.

MAKING ENTRY BY BREAKING GLASS

Glass in either a door or window may be broken easily by using the flat side of a fire axe. The man breaking the glass should stand to one side and strike the upper part of the glass first, as shown in Figure 1. In this way, broken glass cannot slide down the axe bandle and cut the hands.

After the glass is broken out, all jagged pieces should be removed from the sash starting at the top to avoid injury. This may be done with the pick end of the axe. Removing all pieces will avoid cutting the man who enters through the sash and will prevent damage to hose, ropes or other material that may be passed through the opening. This procedure is recommended where any difficulty is encountered in opening windows, whether in a factory, residence, or commercial building. When encountering wire glass, cut at the edge of the sash with the cutting edge of the axe.

Figure 1
Making entry by breaking glass

MAKING ENTRY THROUGH VARIOUS TYPE OF DOORS

Doors are constructed of various materials and are of various types. Examples of some types are the ledge panel, slab, double sliding, single sliding, overhead lift, overhead roll and revolving doors.

Some types of steel doors offer great resistance to forcible entry. Every squad should know, by previous inspections, where these types of doors are located; the men should be instructed as to how to open them. It is often advisable to find other means of entry if possible. It should be emphasized that in gaining entrance, glass is the most easily broken material and, in most cases, the most easily replaced.

Single-hinged doors that open out may be opened from the swing side with an axe, as shown in Figure 2. The blade of the axe is inserted between the jamb and the door, just above or below the lock. By prying with the handle to one side away from the door, the jamb can usually be sprung enough to let the lock bolt pass under the keeper. The Kelly tool may also be used for this purpose (Figure 3). The Buster bar or Hux bar may be used for prying open a door in a manner similar to the Kelly tool. Either the straight or the cross head of this tool may be used where a door is near a partition, permitting a better leverage with the tool.

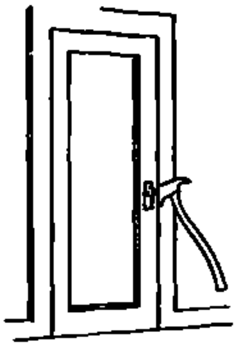

Figure 2
Opening door with axe

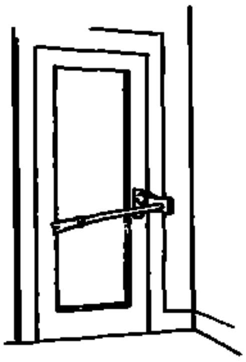

Figure 3
Opening door with Kelly tool

In opening a door that swings in from the operator, greater difficulties are presented. If the door is in a stopped frame, the straight head of the Kelly tool may be inserted between the door and the jamb (Figure 4). Then prying toward the door should spring it past the lock bolt.

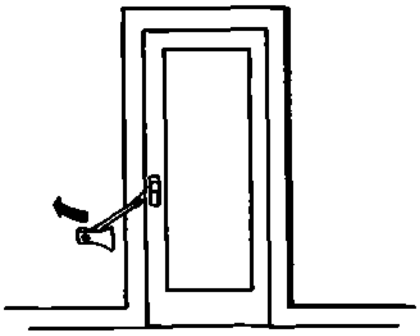

Figure 4
Kelly tool used for door that swings in

If the door is in a rabbeted frame, there is little chance of springing the frame. The cross head of the Kelly tool may be inserted between the door and the jamb as shown in Figure 5; prying against the door will break the door, the jamb or the lock. <u>If the door has glass in it, it is better to break the glass and manipulate the lock from the inside</u>.

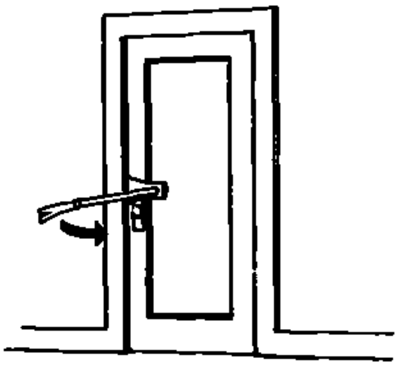

Figure 5
Kelly tool used for rabbeted jamb

The Detroit door opener may be used for forcing doors in, as shown in Figure 6, by either breaking the door or spreading the jambs. Double-hinged doors may be opened either with an axe or with the Kelly tool, as shown in Figure 7.

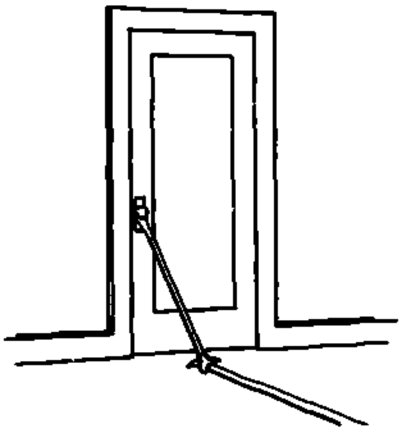

Figure 6

Using "Detroit" door opener

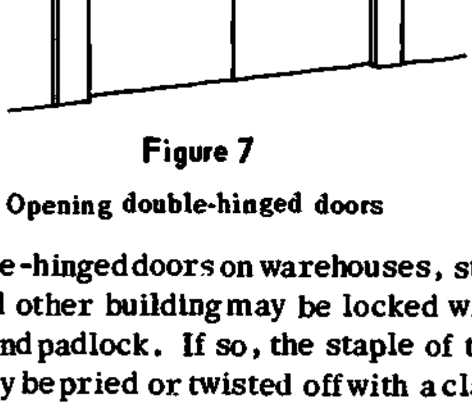

Figure 7

Opening double-hinged doors

Single-hinged doors on warehouses, stables and other building may be locked with a hasp and padlock. If so, the staple of the hasp may be pried or twisted off with a claw tool such as shown in Figure 8. The point of the claw is inserted in the staple end and if a pry will not remove it, it may be twisted off, taking the lock with it.

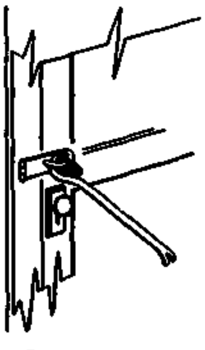

Figure 8

Prying off staple

Overhead lift doors are easily operated once the lock is released. Generally, they are locked with sliding bars that must be broken or sprung to release the door. Overhead lift doors may be forced by prying upward at the bottom of the door with a crow bar, claw tool, or other good prying tool. Once the lock bar is broken, the door will open easily. Overhead rolling doors are made of steel and offer the greatest resistance of all to forcible entry. Since an overhead door is operated with a worm gear, the door cannot be raised except by operating the worm with the chain which is provided. Prying the door is liable to spring it so that it cannot be operated even with the worm gear. The only alternative is to knock out bricks along side of the door, making a hole large enough to operate the chain.

If doors are locked so securely that no other method of forcing them is successful, they should be battered in. This may be done with a battering ram. Use the blunt end of the ram and see that it strikes just below the lock, on the rail or solid portion of the door.

The only means of forcible entry through a solid glass door is a sharp pointed tool, such as an axe point. Using this point, hit the lower corner of the door a hard blow. This will cause the door to shatter and permit entry. Caution must be taken to protect the eyes and other exposed portions of the body from the shattering glass. It is a good practice to back up to the door.

MAKING ENTRY THROUGH VARIOUS TYPES OF WINDOWS

Residence windows are of these general types: sliding, awning type, double hung, casement and basement. The double hung window consists of two sashes that meet horizontally. If the sashes are hung with weights, they will be locked at the center of the check rail; that is, the upper and lower sash will be locked together. If the window has no weights, the sash will be locked with bolts in the window sill.

Casement sash are hinged to the window jambs and meet vertically. They are either locked together or each is locked to the window frame. Basement sash generally are hinged at the top and locked at the bottom, or vice versa. Factory-type windows are generally constructed with metal sash. The sash is set solidly in the frame and only part of it may be opened (Figure 9). The movable part is generally pivoted at the center and latched on the inside.

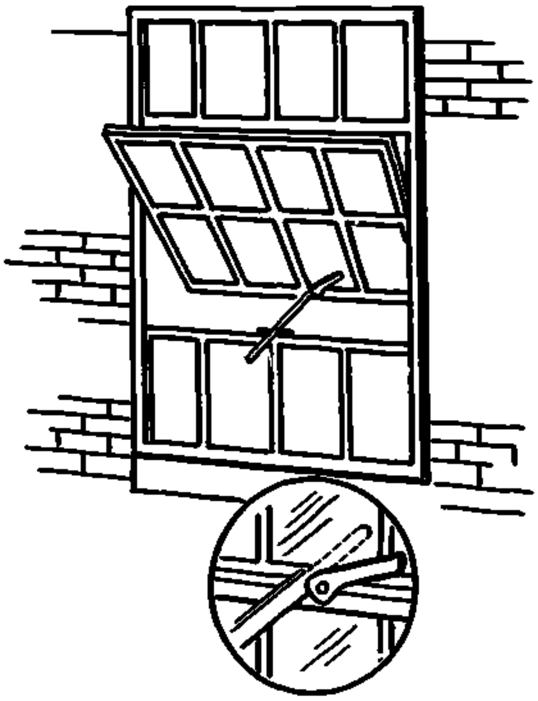

Figure 9

Factory-type windows

Double-hung windows may be opened by prying upward on the lower sash rail. See Figure 10. If they are locked on the check rail, the screws of the lock will give and the sash will operate. If they are locked with bolts, the bolts must be broken or bent before the sash will rise. Caution should be taken that the prying is done at the center of the sash, or else the glass may be broken.

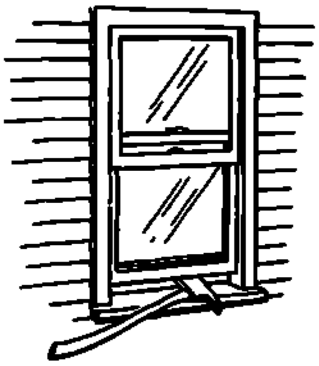

Figure 10

Opening double-hung windows

Casement windows may be opened in the same manner as double doors. See Figure 11. Generally, they are locked quite securely and it may be necessary to break the glass.

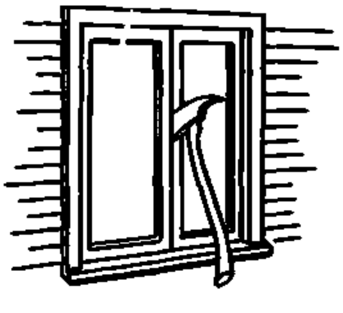

Figure 11

Opening casement windows

Casement windows may be opened with a Kelly tool, much the same as a door in a rabbeted frame. If the prying is done at the center of the lower rail, the lock may be pulled off or sprung. Any of the prying tools such as the Buster Bar or Hux Bar may be used. Chisels, spanners, etc., can be used for prying in this same manner.

FACTORY WINDOWS

It is practically impossible to open factory-type windows from the outside and, since they are glazed with small size glass, it is easier and less destructive to break a glass near the latch and reach in to unfasten it.

STORM DOORS AND STORM WINDOWS

There has been much discussion on the proper procedure to follow when encountering locked storm doors and windows. The wooden doors or windows, in most instances, can be pried open without too much difficulty and little or no damage to the wood itself. When encountering metal storm doors or windows, the general procedure is to break the glass to open the locked door or window. In this instance, remember to remove the broken glass from the frame before putting the hand through to unlock the door or window. It is not recommended that the metal storm door or window be pried open because of the costly damage to the metal framing.

MAKING ENTRY FROM ROOF

Quite often this means of entry becomes necessary. If the roof covering is of tin, the rotating or can-opener type of roof cutter is used. After the metal has been cut and rolled back, the squadman proceeds with his cutting of roof boards to gain entrance. Tar paper, tar and/or gravel should be removed before the cutting procedure. Any hole, whether it be in a floor, roof or wall, should be cut properly --- as though it had been done by a mechanic --- by a squadman who knows how to do the job.

When cutting with a fire axe, the axe should not be swung as a wood cutter would use it, but with short quick strokes. Figure 12 shows the method of holding the axe when cutting. By using this method, danger of hitting other men, catching the axe in overhead obstructions, and other such hazards will be avoided and the axe will be under complete control at all times.

Figure 12

Holding the axe to cut floor hole

When cutting flooring, roofing or sheathing, the cut should be made diagonally to the grain of the wood of each board, rather than straight across. Figure 13 shows the method to use.

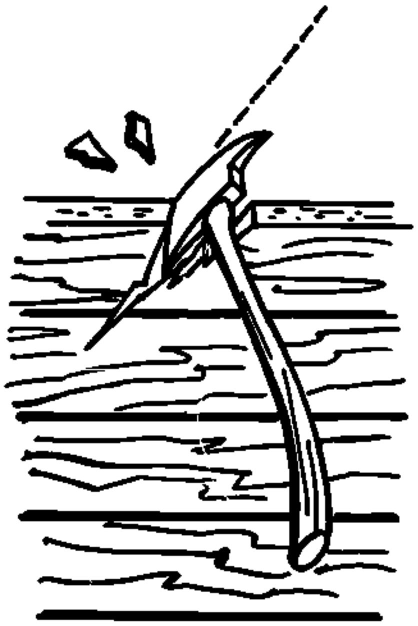

Figure 13
Cutting across wood grain diagonally

Diagonal sheathing should be cut when possible in the direction toward which it runs. When cut in this manner, the chips have a tendency to split out, while if the cutting is done across the grain of the sheathing, the axe is apt to bind and extra effort will be required to achieve results. Wherever possible, the cutting should be sloped at an angle of 45° to the board instead of vertically. This will provide a firmer base to cut against. Also. cut as close to a joist or rafter as possible.

In cutting roof boards always stand on the windward side of the boards to be cut, then cut along the inside edge of the roof rafter. In cutting holes to a size wider than one span of rafters, the center rafter or rafters will hold the boards in place until all cuts are completed. All cutting must be completed before any boards are removed. When the cutting has been completed, again standing on the windward side, use the pick end of the axe or pike pole to rip up the boards, starting at a point farthest away from you.

A squadman should be able to cut either right- or left-handed. Cutting in difficult corners and under obstructions can be done in a workmanlike manner by men who have been trained in the proper way to use a fire axe. Good axes and good axemen are important to efficient squad operations.

In some cases a pike pole may be needed to remove plaster and lath from the ceiling below the place at which the hole has been cut in the roof. (Figure 14).

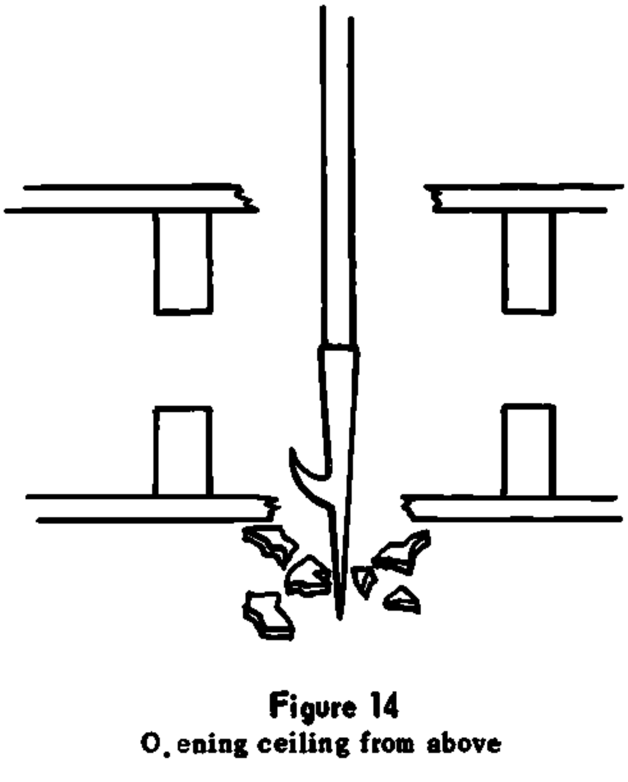

Figure 14
O,ening ceiling from above

MAKING ENTRY THROUGH SKYLIGHT, COCK LOFT, OR SCUTTLE HOLE COVER

In making forcible entry through a skylight a pick-headed axe is often used. The point is placed beneath the edge of the frame (Figure 15). Prying action produced by pulling on the axe handle exerts pressure to raise the edge of the frame. If the skylight is not raised readily, it is advisable to break the glass, remove broken glass, reach inside, and release hooks or bolts. For removal of cock loft cover or scuttle hole cover, the same prying procedure is used. If the cover does not remove readily, it must then be cut open by use of the cutting edge of the axe.

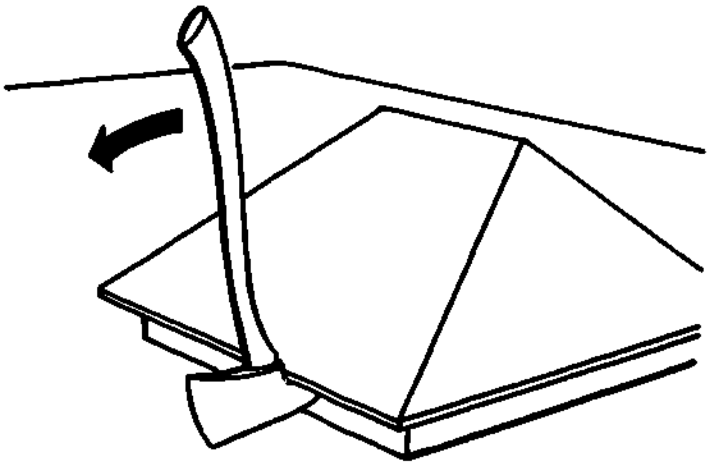

Figure 15
Making entry through a skylight

MAKING ENTRY THROUGH GRATINGS, DEAD LIGHTS, AND BARRED WINDOWS

Iron gratings may be fastened in several different ways. They may be merely held in position by friction of the grating against the sill or they may be pivoted on hinges at the rear. They may also be set in masonry and locked in position with hasp and padlock. They may be opened by using the pick end of the axe, forcing it between the sill and the grating and prying up, care being exercised not to break the axe handle.

Dead lights are placed in sidewalks under which basements extend. They serve both as a sidewalk and as a ceiling for that part of the basement. They contain heavy glass discs which permit light to enter and are sealed into a steel framework with waterproof material. The steel framework is likewise sealed into the concrete, and to remove the dead light the seal must be broken. Any good, sharp prying tool may be used for this purpose. After the seal is broken the dead light may be lifted and removed.

Iron bars on windows are usually set in masonry. The sledge hammer can be used to free bars set in masonry by striking the bar with the sledge about ten inches above the sill until the bar is sufficiently bent for removal. Another method is to strike the masonry sill with the sledge directly in front of the bar, breaking away the masonry.

MAKING ENTRY BY BREACHING WALLS

To breach brick walls with the battering ram, (Figure 16), first remove one brick with the hammer head pick, pick-headed axe, sledge or other suitable tool. After the first brick has been removed, two men grasp the handles on each side of the ram, with the forked end toward the wall. They swing the ram back at arm's length, then quickly thrust it against the wall, giving it a slight lifting motion just as it strikes the brick. Remove the bricks one at a time, starting just below where the first brick was removed. The hole should be made diamond-shaped as this does not weaken the wall.

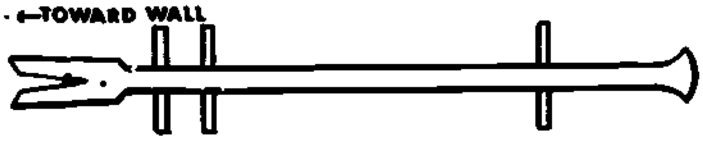

Figure 16
Battering ram

MAKING ENTRY THROUGH OPENINGS IN PARTITIONS AND CEILINGS

When cutting a hole in a partition, care should be taken to make it as neat as possible. Spread a tarpaulin on the floor beneath the place where the hole is to be made; then, with the blade of an axe, cut down along the stud. Do not tear off the lath, as this will make a ragged edge and ruin the plaster on both sides of the hole. See Figure 17.

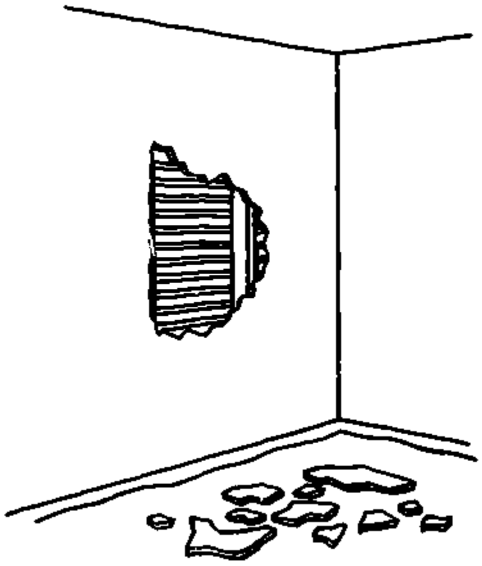

Figure 17A
Cutting through partition walls: correct method

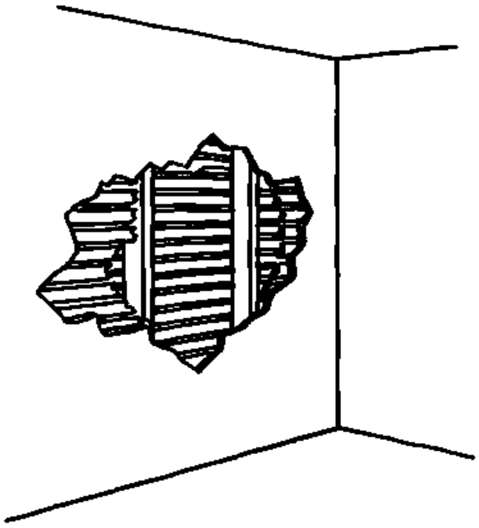

Figure 17B
Incorrect method

To open ceilings from below, the pike pole or the plaster hook (Figure 18) is used.

Figure 18
Plaster hook

When pulling down lath and plaster from ceilings and walls with a pike pole, never stand directly beneath the hook after the point and hook have been driven through the plaster. The hook on the pike pole should be pointed down and away from the squadman while pulling down the ceiling. This will prevent the lath and plaster from falling on the squadman. See Figure 19.

When metal lath has been used in the construction of a room or office, the operation of pulling down the plaster with a pike pole is often extremely hazardous. The metal lath is usually suspended from the rafter by means of soft iron wire, and when a portion of the plaster is pulled with the pike pole, the weight of the plaster will often cause a whole section, or sometimes several sections, to drop. For this reason it is important that a squadman, when pulling plaster from a ceiling known to be plastered on metal lath, be close to an open door or window that will enable a hasty, unobstructed retreat from the room if necessary. Several cases of injury have occurred because this precaution was not observed.

In pulling down metal ceilings, the pike pole is particularly effective. The point is driven through the ceiling with the hook pointing downward and the operator standing well away from beneath the section of metal to be torn down (Figure 20).

Figure 19
Pulling down lath and plaster from ceiling with pike pole

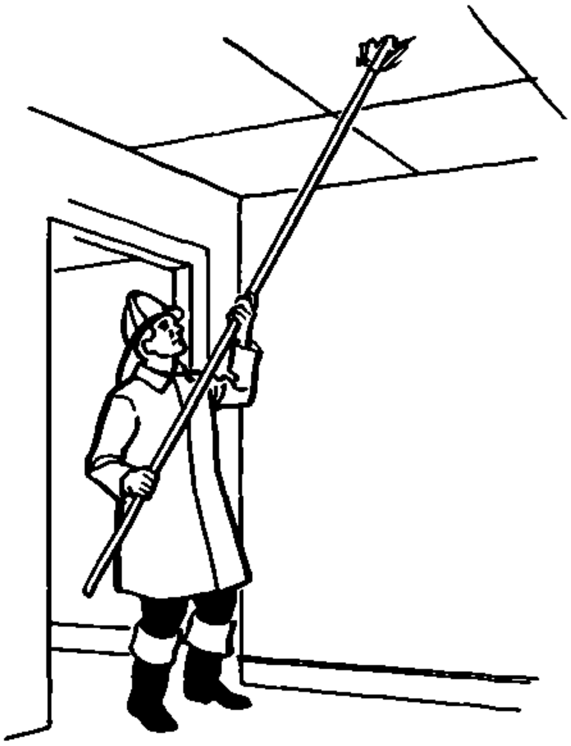

Figure 20
Pulling down metal ceiling: the pike pole can be used like a can opener to cut through sheet metal

When removing sheet metal from a ceiling with a pike pole, if the metal holds tight, the hook part of the pole can be used as the fulcrum for prying the metal loose. The same principle can be applied in removing sheet metal from roofs.

The point of a pick-headed axe or a hammer-headed pick can also be used for pulling off lath and plaster from walls in an emergency.

CHAPTER XVII

GAS MASKS

INTRODUCTION

Although a gas mask is not the most commonly used piece of equipment carried on an emergency vehicle, it can without reservation be considered the most important. Too often the life of a rescuer has been sacrificed in an effort to rescue someone trapped or overcome in a gas-filled area because the rescuer did not protect his respiratory system while attempting the rescue. In this modern age of chemicals, plastics, refrigerants, industrial processes, and developments, protecting those who must operate in these atmospheres during emergencies is a fundamental duty.

It would be impossible to list or discuss every hazardous gas encountered today. A few of the most common with which the squadman may come in contact are described in chart form on the following pages. (See Figure 1.) This chart indicates certain properties, characteristics, effects, and treatment with which the squadman should become familiar.

In addition to the hazard caused by a poisonous gas, squadmen must be aware of the possible explosion hazard. If there is doubt as to whether or not the gas involved is explosive, every precaution must be taken to prevent a spark. Light switches should not be turned on or off. Equipment or tools made of ferrous metals should be handled so as not to make sparks.

It is suggested that emergency squad personnel survey the industrial, manufacturing, and commercial areas of their community, to determine whether any additional hazardous gases may be encountered.

In cooperation with the chemists, engineers, or other responsible persons in charge of these operations, a supplementary chart can be prepared and used for reference. This is an excellent way to gain good public relations with the people in your community. They will be pleased to help when they learn of your interest in their safety and welfare.

Section 3737.31 of the Ohio Revised Code requires self-contained oxygen breathing apparatus in each fire department operated by a political subdivision. The applicable section of the law is reproduced below:

> (A) "Gas mask" means any self-contained oxygen breathing apparatus using oxygen or air in suitable containers that enable their wearers to live in atmosphere containing less than sixteen percent oxygen and poisonous gases in excess of two percent by volume and having been approved by the United States Bureau of Mines for use in irrespirable atmosphere.
>
> (B) Every political subdivision which operates a fire department shall provide at least two gas masks for each fire station and shall further provide that the chief of the fire department give adequate instructions to each member of the fire department in the use of such gas masks.

GAS AND RADIATION HAZARDS

One of the fundamental rules of squad work should be that no one, unless equipped with self-contained or self-generating air supplying apparatus, be allowed in an involved area. The ordinary filter-type mask will stop the passage of toxic fire gases such as ammonia or carbon monoxide not exceeding 2% by volume, but the masks are definitely not suitable for conditions where a deficiency of oxygen exists.

Providing for the life and safety of squadmen should be a paramount responsibility of the officers in charge. In addition to the duty of training the men in the use of respiratory equipment, the officers should see that squadmen use this equipment whenever and wherever necessary.

In recent years, another hazard has been added to the problem; that is, the use of atomic energy in the various areas of our industrial, commercial and educational structure. It is predicted that this problem will become more and more complicated because of the widespread use of radioactive materials.

Instructions from the U.S. Atomic Energy Commission relative to radiation hazards state, "Masks should be worn from the time of arrival at the emergency where radiation contamination hazard exists, until the hazard no longer exists." Preference indicated as to the type of mask to be worn in such a situation is the self-contained unit.

POISONOUS GASES

It would be impossible to list or discuss every hazardous gas encountered today. A few of the most common with which squadmen may come in contact are shown on the chart, Figure 1. This chart indicates for each gas its specific properties, characteristics, effects, and treatments with which squadmen should become familiar.

It is suggested that squads make a survey of the community to determine any additional hazardous gases which could be encountered in industrial, mercantile or commercial areas. Then in cooperation with the chemists, engineers or other responsible persons in charge of these operations, a supplementary chart can be prepared and also used for reference. This would be an excellent method by which to gain good public relations with the people in the community. The community will be pleased to cooperate when informed that the emergency squad is interested in the community's safety and welfare.

THE EXPLOSION HAZARD

In addition to the hazard caused by a poisonous gas, squadmen must also be aware of the potential explosion hazard involving some of these gases. If in doubt as to whether or not the gas is explosive, every precaution must be taken to prevent a spark. Light switches should not be turned on or off. Equipment and tools made of ferrous metals should be handled carefully so as not to create sparks.

TYPES AND USES OF GAS MASKS

In general, respiratory protective equipment is classified as follows: (1) the filter-type canister mask, (2) mask supplied with air or oxygen from an outside source, and (3) self-contained breathing apparatus. Each of these types of masks is designed for protection of the respiratory tract. It should be kept in mind, however, that for many gases protection of the respiratory tract is not enough, since some gases may harm the body on contact. For these gases it is necessary to wear protective clothing in addition to the proper respiratory protection.

GAS	WHERE FOUND OR USED	WEIGHT COMPARED WITH AIR	VISIBLE?	ODOR	TASTE?
Acetylene	Welding shops and factories	Lighter	No	Sweet	No
Ammonia	Large cooling plants	Lighter	No	Yes	Yes
Carbon Monoxide	Result of incomplete combustion	Lighter	No	Usually not noticed	No
Chlorine	Purification plants laundries	Heavier	Yes: greenish-yellow	Pungent	Yes
Hydrogen Cyanide	Exterminating buildings	Lighter	No	Bitter almond	Yes
Hydrogen Sulphide	Cesspools	Heavier	No	Rotten eggs	Yes
Methyl Chloride	Refrigeration	Lighter	No	Yes	No
Natural and Bottled Gas	Home and industrial use	Lighter	No	Yes	No
Nitrous Oxide Fumes	Fires and electrical welding	Heavier	Yes: deep orange	Pungent	Yes
Phosgene	Dry cleaners and fires	Heavier	No	New hay	No
Sulphur Dioxide	Bleaching and fumigating	Heavier	No	Bitter	Acid

FILTER-TYPE CANISTER MASKS

The filter-type canister mask is designed to provide protection against some kinds of smoke and poisonous gases, including carbon monoxide. Models are manufactured by several firms. It should be borne in mind, however, that all filter-type models have definite limitations. They can be worn only in atmospheres containing sufficient oxygen to support life.

The best way to detect a dangerous deficiency of oxygen is to observe the flame of a safety lamp. The flame will go out when the oxygen content of the atmosphere falls below sixteen percent. A man should not enter or remain in an atmosphere in which a flame will not burn unless he is protected by a self-contained or supplied-air or oxygen breathing apparatus. Although the use of the flame safety lamp is recommended, active combustion is an indication of sufficient oxygen to support life.

Another limitation of the filter-type masks is that they cannot be worn in atmospheres containing more than two percent by volume of poisonous gases. In addition, heavy-bodied smoke, such as that given off from burning plastic, will clog or gum the intake and interior of the canister. This causes the mask to be inoperative.

CANISTER MASK WITH TIMER

The major parts of a filter-type canister mask with a timer are: (1) the canister, with harness and carrying case; (2) the facepiece, with headbands and flexible tubing; and (3) the timer. See Figure 2.

Courtesy Mine Safety Appliances Co.

Figure 2

All-service mask

Canister - The smoke-type canister is painted red. A canister painted any other color is designed for a definite and specific group of gases. The red canister is approved for two hours of constant or intermittent use for protection from carbon monoxide. When working where carbon monoxide is present, there is a tendency for the canister to become warm. The degree of warmth will depend upon the concentration of the gas. This is due to the fact that while the chemical is acting as a catalyst in changing the carbon monoxide to carbon dioxide, heat is formed. Canisters should be stored in a cool, dry place. Seals should never be removed from a canister until it is put into service. After a canister has been put into service, it should be replaced at least once a year, even though never used.

When the mask is to be assembled, the canister is prepared for service by removing the seals. The canister can be tested by inhaling and exhaling; remember that inhalation is possible only from the top opening and exhalation into the bottom opening. An audible click will indicate that these valves are opening and closing properly.

Facepiece - The facepiece must be cleaned after wearing. The inside should be sterilized by cleaning thoroughly with a germicidal solution such as aqueous Zephiran P.750 solution, or Staphene solution.

Headbands must be maintained in good working order. Broken or defective bands must be replaced. A facepiece with a defective band should not be used; it can not be adjusted to fit the wearer's face properly.

The flexible tubing must be examined carefully for cuts or breaks. Any impairment or defect in this tubing may jeopardize the safety and protection of the wearer.

Timer - This device indicates approximately how long the mask can be worn safely. It is actuated by the respirations of the user. The pointer rotates on a dial face. It makes a complete revolution in approximately two hours of continuous or intermittent service. After the pointer has made one complete revolution, the canister must be removed and a fresh one inserted.

The timer is connected to the canister, and the facepiece is connected to the timer. In assembling the mask, it must be made certain that the gaskets are in place at both couplings. The facepiece is then fitted to the wearer by adjusting the headbands. At this point it should be tested for airtightness by holding a hand over the opening in the bottom of the canister and inhaling. If there is no leakage the facepiece will collapse and the mask is ready for use.

In the past, the timer has been used as an indicator to show approximately two hours of breathing time. This period coincided with the Bureau of Mines requirement that the canister must contain enough drying agents to adequately protect the catalyst (Hopcalite) from water vapor during a two-hour period of use. Since the life of the canister for protection against carbon monoxide is directly related to the ability of the canister to remove water vapor, it follows that the canister will protect against carbon monoxide for a two-hour period.

Although the Bureau of Mines test for two hours of protection against water vapor is a realistic test, there are extreme conditions which will render an approved canister ineffective against water vapor absorption in less than two hours. Some of these conditions are as follows:

1. Relative humidity exposure greater than 85%, particularly at elevated temperatures.
2. Extended periods of high demand (over 25 liters per minute) of continuous breathing by a person having a large breathing capacity and performing strenuous work in atmosphere of high relative humidity.
3. Exposure of the canister to modern techniques of fire fighting where "Wet Water" and fog are used. These techniques greatly increase the amount of water vapor dispersed in the air compared with that encountered by previous techniques.
4. Accidental introduction of water into the canister by a fire hose, squadmen crawling through water on a floor, failure to completely dry the facepiece and breathing tube prior to assembling the breathing tube to the canister, or failure to replace the top and bottom seals of the canister after each use.

CANISTER MASK WITH WINDOW INDICATOR

The major parts of a window-indicator type of filter canister masks are: (1) the canister, with harness and carrying case; (2) the facepiece with headbands and flexible tubing; and (3) the check valve.

One model contains a round glass window located in the center of the canister, approximately one-third of the way down from the top of the canister. See Figure 3.

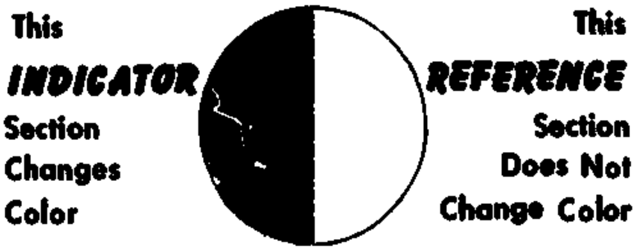

Figure 3

Indicator paper inside glass window of the canister

Inside the glass window are two half circles of paper. The right half, stamped "R" (facing the canister) is the reference color and is a very light blue. The left half is the indicator paper which is a darker blue. When the indicator half of the paper fades to a blue which approaches the color of the reference half, the canister is to be discarded since it will no longer effectively oxidize carbon monoxide to carbon dioxide. The color difference between the panels will exist as long as the canister has not absorbed enough water vapor to render the "Hopcalite" ineffective against carbon monoxide. Once excessive moisture has penetrated the "Hopcalite" the colors of the panels will match and the canister must be discarded. The color match should be observed under fluorescent lights or natural daylight when possible.

In the window-indicator canister a check valve fits into the assembly formerly occupied by the timer. The check valve assembly is threaded top and bottom to provide a positive attachment to the canister and the breathing tube. The valve will provide an effective seal at all times against moisture entering the canister from the top. It closes automatically after each inhalation, regardless of the position of the canister. It remains closed, regardless of the position of the mask, in storage or maintenance. The threaded fitting at the top of the valve provides for disassembly of the breathing tube and facepiece for cleaning, while the valve remains on the canister guarding it against moisture penetration from the top. If all the water is not drained from the facepiece and tube after cleaning, the valve prevents the entry of the water into the canister.

The window-indicator type of canister will more accurately indicate the actual service time than will the timer type. It is imperative that the canister be kept as free of moisture as possible to obtain maximum service life. The check-valve assembly eliminates the necessity of replacing the rubber formerly used.

PUTTING ON THE FILTER TYPE CANISTER MASK

Suspend the mask on the chest by means of the neck strap. Next, tighten the body strap so that the canister is drawn snugly against the chest. Check to make sure the headband straps are fully extended. Then grip the facepiece between thumb and fingers as illustrated in Figure 4.

Courtesy Mine Safety Appliances Co.

Figure 4

Putting on mask

Insert chin well into lower part of facepiece, and pull headbands back over the head. To obtain a firm and comfortable fit against the face at all points, adjust headbands as follows:

1. See that straps lie flat against head.
2. Tighten lower or "neck" straps.
3. Tighten the "side" straps. (Do not touch forehead or "front" straps).
4. Place both hands on headband pad and position it on the crown of the head.
5. Repeat operations 2 and 3.
6. Tighten forehead or "front" straps as needed.

PRECAUTIONS AND PRACTICES

1. Do not enter any contaminated atmosphere with this mask unless you know all of the following are true:
   a. Canister is of a filter type, Bureau of Mines approved.
   b. Concentration of the contaminants does not exceed the concentration for which the canister is approved.
   c. Amount of oxygen is sufficient; that is, at least 16% oxygen.
   d. Mask does not leak.
   e. Canister does not need replacing.
2. Register the date the canister is placed in service.
3. Keep a record on the time the mask is used.

NOTE: There is a popular misconception that filter-type canisters will afford two hours of protection against 2% concentrations of all kinds of gases; this is not true. The statement applies only to protection against carbon monoxide. The Bureau of Mines Approval Schedule #14 E requires a man-test service life of only 25 minutes in 2% concentrations of organic vapors, and only 15 minutes for 2% concentrations of acid gases or 3% concentrations of ammonia. Naturally, in lower concentrations longer life can be expected. However, the filter-type smoke canister, just like the filter-type industrial canister, must be replaced as soon as organic vapors, acid gases or ammonia penetrate the facepiece and are detected by the senses.

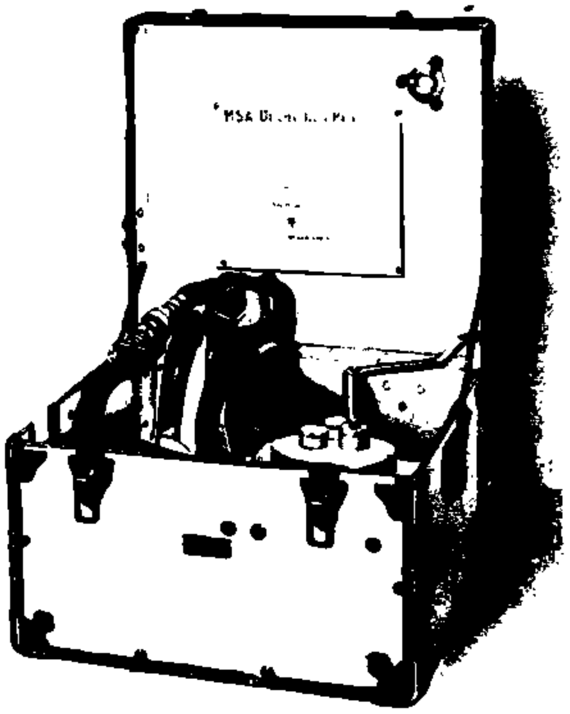
4. The top and bottom seal on the timer-type canister, and the bottom seal only on the window-indicator-type canister, should be replaced after each use.
5. Squadmen using masks should always work in pairs.
6. It is more difficult to breathe when wearing this mask because the filter restricts the rate of air flow to the facepiece.

FRESH AIR OR HOSE MASKS

The fresh-air or hose mask is suitable for respiratory protection against all atmospherical contaminants. The air-line mask belongs to this category. Air-line masks depend entirely upon a mechanical air supply which is not carried by the wearer of the mask; therefore, the failure of such an air supply would prevent escape from deadly atmospheres.

The facepiece of the air-line mask is attached to an air system by a hose. Clean air is fed to the facepiece in sufficient quantity to provide the wearer with an adequate air supply. There is little or no resistance to inhalation, and surplus air usually provides a cooling and refreshing effect. The only disadvantage is the necessity of trailing the hose which is connected to the facepiece from the air source.

Figure 5 illustrates a typical hose-mask unit. The facepiece, harness, air hose and blower are usually packed in a trunk which serves to transport the equipment and to provide the blower operator with a convenient seat. The air hose must be highly resistant to petroleum liquids and vapors, and be able to withstand crushing weight. Heavy wire reinforcing is incorporated into the construction of the hose for this purpose. Up to 150 feet of hose can be used on this type of equipment. The air hose connection is supported on the body by means of a heavy-duty harness. The facepiece is of the full-face type and is connected to the air hose by means of flexible corrugated tubing.



Courtesy Mine Safety Appliances Co.

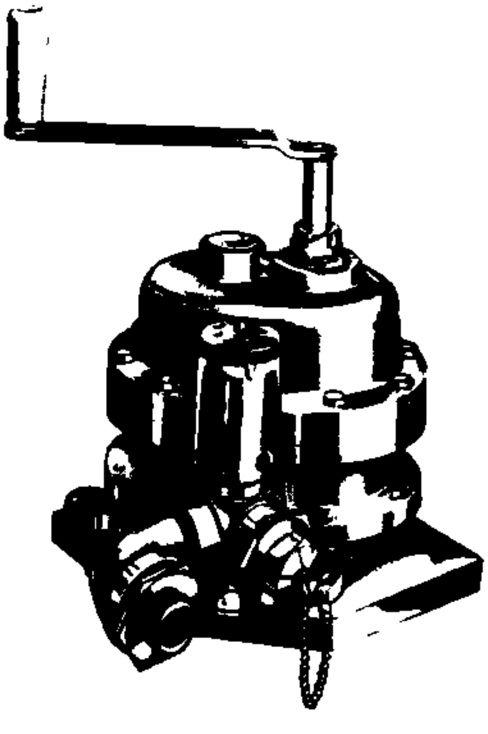
Figure 5

Typical hose mask assembly

There are two methods for supplying air to the mask. In the "constant flow" type, the breathable air is continuously fed to the facepiece. By this method there is always a slight positive pressure present in the facepiece to assure against inward leakage. Pressure is maintained by a compressor-system operated "blower". The blowers are of a low-pressure type, mostly of centrifugal design, and are available in various sizes depending upon the number of masks to be operated at any one time. The pressure on the air line should be maintained at respirable levels as recommended by the equipment manufacturer.

On U.S. Bureau of Mines approved air-line respirators, the manufacturer may specify any range of operating pressure up to a maximum of twenty-five pounds per square inch, as long as a sufficient amount of air is fed to the facepiece within the range specified. Pressure-reducing valves, as well as relief or blow-off valves, are used to control this factor. Precautions must be taken to make sure that a supply of clean air is available at the blower.

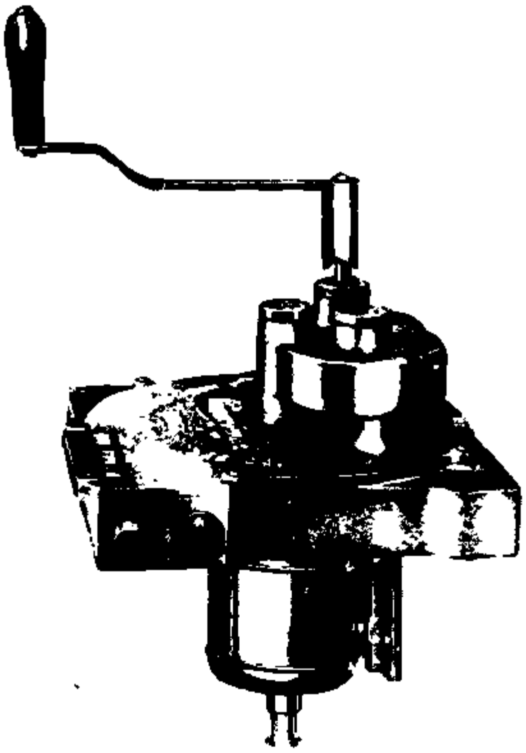
Figures 6 and 7 show two different styles of centrifugal blowers used to supply fresh air to the facepiece. Although combined motor and hand operated blowers are available, this type of unit is not approved by the U.S. Bureau of Mines.



Courtesy Mine Safety Appliances Co.

Figure 6

Centrifugal blower for fresh air mask



Courtesy Mine Safety Appliances Co.

Figure 7

Centrifugal blower for fresh air mask

In the "demand flow" type, a cylinder of compressed air or oxygen is used in place of the blower. By the inclusion of a small demand regulator, air is fed to the facepiece only upon inhalation of the wearer. The flow ceases upon exhalation. This conserves the air supply and permits one man several hours of service from a standard 220 cubic foot cylinder of air.

SELF-CONTAINED BREATHING APPARATUS

Self-contained breathing apparatus provides complete respiratory protection against any concentration of toxic gases, under any condition of oxygen deficiency. The wearer's breathing is independent of the surrounding atmosphere, since the wearer is breathing in a system in which no outside air is admitted, and the oxygen or air supply of the apparatus itself takes care of all respiratory requirements. Such devices enable men to work in places where they normally would not be able to stay alive. Self-contained breathing apparatus are divided into three basic types: (1) oxygen cylinder rebreathing apparatus, (2) demand-type apparatus, and (3) self-generating-type apparatus. Only two of these will be discussed here.

DEMAND-TYPE APPARATUS

All demand-type apparatus use the same principle of operation. However, some use compressed oxygen while others use compressed air.

Several different models are available. A man wearing the demand-type mask never inhales the atmosphere in which he is working. The man breathes oxygen or air supplied by a cylinder carried on the person. (See Figure 8) The flow of oxygen or air, regulated by the wearer's breathing, always assures sufficient protection. A pressure gauge indicating the amount of oxygen in the cylinder is generally provided within the wearer's view. The U.S. Bureau of Mines has issued approvals for the use of compressed air or oxygen in the different makes of masks. All are listed as one-quarter-hour and one-half-hour self-contained breathing apparatus, which indicates the length of time that the cylinders may be expected to last. The detailed instructions or information accompanying each type of mask must be carefully studied and followed before attempting to use it.

Figure 8

Scott air pack

PUTTING ON DEMAND-TYPE APPARATUS

The following consecutive steps should be followed in putting on the apparatus before entering a toxic atmosphere:

1. Check the pressure gauge on the cylinder valve to insure that the cylinder is full (1800 p.s.i. on small units, 1980 on large units).

2. Put on the apparatus using either of the following methods; in either case caution must be used at all times to protect the regulator assembly from damage:
   a. Connect chest-strap buckle, leaving side strap unhooked; swing the apparatus over the head; and snap the side strap to the "D" ring. Fasten the waist belt snugly; pull the side straps until the apparatus is supported comfortably; and then tighten the chest strap as much as desired.
   b. Leaving the chest strap unbuckled, snap the side strap in place and put the apparatus on like a vest. First the left arm is inserted in the harness, then the right arm. Fasten the chest-strap buckle and the waist belt as securely as desired, then adjust the side straps snugly.

3. Open the cylinder valve handwheel fully (at least three turns) and close the bypass (red) handwheel on the demand regulator.

4. Open fully and lock open with the locking lever the main line (yellow) handwheel. Observe the pressure gauge on the demand regulator. The gauge indicates continually the pressure in the cylinder; it should read approximately 1800 p.s.i. on small units and 1980 p.s.i. on large units if fully charged. If there is less pressure in the cylinder, the service life will be reduced accordingly. Turn off the cylinder valve and watch the pressure gauge on the regulator. There should be no drop in pressure if the equipment is leak-tight. If there is noticeable deflection of the needle, the equipment should be checked and the leak corrected before entering a toxic atmosphere. Again open the cylinder valve handwheel fully and lock in place with the locking lever.

5. Put on the facepiece using the following method: Check to make sure the headband straps are fully extended. Then grip the facepiece between thumb and finger. Insert the chin into the facepiece and pull headbands back over the head. To obtain a firm and comfortable fit against the face at all points, adjust headbands as follows:
   a. See that straps lie flat against the head.
   b. Tighten lower or "neck" straps.
   c. Tighten side straps (do not adjust forehead or "front" straps).
   d. Place both hands on headband pad and position it on the crown of the head.
   e. Repeat operations b and c.
   f. Tighten forehead or "front" strap as needed.

   Check the tightness of the facepiece by sealing the breathing tube with the palm of hand and inhaling gently. The facepiece should collapse on the face if the seal is satisfactory. Connect mask hose to regulator before entering contaminated area. If the facepiece is left disconnected until ready to enter the toxic area, the breathing supply will be conserved to some extent. However, if the ambient temperature is low, the facepiece will tend to fog, but will not if connected to the demand regulator.

6. Breathe normally, as the apparatus automatically satisfies any breathing requirement.

PRECAUTIONS AND PRACTICES

The apparatus furnishes complete respiratory protection for a period of time governed by the amount of exertion, but approximately 15 minutes (small units) and 30 minutes (large units), at hard work. Therefore, it is necessary periodically to check the pressure gauge on the demand regulator, as it continually indicates the pressure in the cylinder. When the needle approaches the solid-colored section of the pressure gauge, always return to fresh air because the remaining 300 p.s.i. will last only two or three minutes in the small units, and only four minutes in the large units. During normal use the by-pass (red) valve is closed; it is used only if the automatic demand regulator becomes inoperative. It provides a continuous flow and should be opened first, the main line (yellow) handwheel closed, and the by-pass valve adjusted to provide the flow desired.

REMOVING THE MASK

1. Disconnect the mask hose from the regulator.
2. Remove the facepiece by grasping the snout, pulling down and out. then up over the head.
3. The headstraps should then be fully extended and the facepiece should be adequately cared for.
4. Unlock the lever on the cylinder valve and close the valve using normal pressure. This valve closes leak-tight with little effort.
5. Remove the apparatus from the body and place properly in carrying case.
6. Place facepiece in the proper place in the carrying case.

CARE OF BREATHING APPARATUS AT STATIONS

1. Sterilize facepiece by cleaning thoroughly with a germicidal solution such as aqueous Zephiran 1:750 solution or Staphene solution.
2. Replace cylinder:
   a. Disconnect the coupling nut of the high-pressure hose from the cylinder valve, using the open-end wrench provided with the apparatus.
   b. Release the cylinder clamp drawbolt and remove the cylinder.
   c. Replace cylinder with a fully charged one and connect the apparatus high-pressure hose, making certain that the regulator is positioned properly.
   d. Before putting in case, make sure the pressure is released from the regulator and hose by opening and closing the by-pass valve, making sure the main line (yellow) handwheel is locked open.
3. Place the apparatus in the case with the back plate flat at the bottom, folding the harness over the cylinder. Arrange the high-pressure hose so that it is not distorted, and put the facepiece on the side.
4. NEVER USE ANY LUBRICANT ON ANY PART OF THE APPARATUS, AND ALWAYS KEEP ALL PARTS ENTIRELY FREE FROM OIL AND GREASE.

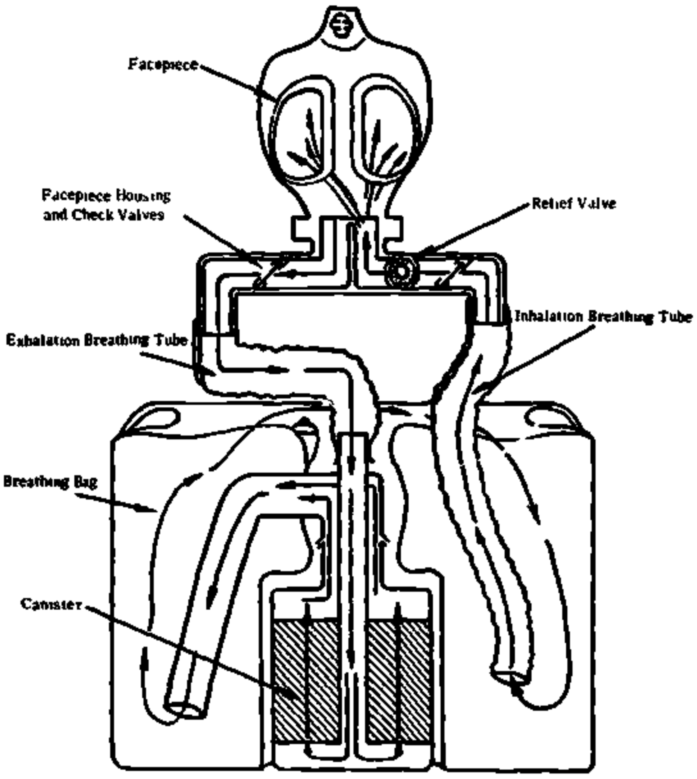
SELF-GENERATING OXYGEN MASK
FORTY-FIVE MINUTE

Unlike the conventional type of breathing apparatus which employes cylinders of oxygen or compressed air under high pressure, this apparatus evolves or generates its own oxygen. It operates independently of the outside air and provides complete respiratory protection in oxygen-deficient or highly gaseous atmospheres. The wearer breathes into the facepiece through the exhalation tube into the canister. The exhaled breath is purified of carbon dioxide and replenished with oxygen as it passes through the canister, and is then rebreathed. This mask provides protection for forty-five minutes. (See Figures 9 and 10).

Courtesy Mine Safety Appliances Co.

Figure 9

Chemox 45-minute mask



Courtesy Mine Safety Appliances Co.

Figure 10

Cross-section diagram of Chemox 45-minute mask

The apparatus consists of a facepiece, breathing tubes, breathing bag, breastplace, canister holder, harness straps and a manual timer, all focalized around a central casting just above the canister. The facepiece valve assembly, located immediately below the facepiece, is equipped with a pressure-relief valve. This is a one-way valve that acts as a manual pressure-release valve when the breathing bag becomes over-inflated. This assembly also contains the exhalation and inhalation valves which control the directional flow into and out of the breathing bag. The breathing bag serves as a reservoir for the evolved oxygen, and at the same time acts as a cooler for the air coming from the canister.

The chemicals in the canister purify the exhaled breath by absorbing the carbon dioxide and generating fresh oxygen for breathing. The resultant chemical action liberates considerable heat in the canister. The wearer is protected from this heat by insulation on the breastplate.

The chemicals in the canister are capable of releasing a high percentage of oxygen when they become damp from the moisture in the breath. The rate of release is governed by the amount of moisture introduced by breathing. For breathing purposes, the water vapor in the exhaled breath is sufficient to liberate enough oxygen for comfortable breathing. Any excess moisture that enters the canister will cause a sudden reaction and rapid liberation of oxygen. Therefore, do not introduce water into either a used or unused canister except to dispose of it, and then only in a manner which will be described later.

Courtesy Mine Safety Appliances Co.

Figure 11

Putting on apparatus

PUTTING ON SELF-GENERATING OXYGEN MASK

The following are the consecutive steps in putting on the apparatus before entering a toxic atmosphere. The apparatus must always be put on in fresh air.

1. Unfasten and straighten all harness straps.
2. With one hand, grasp the apparatus by the central casting and drop the facepiece over the hand holding the apparatus. With the other hand, grasp the D-ring assembly where the two large web straps join; place the breastplate of the canister holder on the chest and slip the head through the V-shaped opening formed by the two web straps. See Figure 11.
3. Continue to hold the apparatus on the chest with one hand, and with the other reach around the body at one side and grasp the free end of the web strap on that side. Bring the end of the strap under the arm and snap into the D-ring located on the top side of the breastplate. Repeat this procedure for the other strap.
4. Adjust the position of the apparatus on the body by means of metal slides located on the web harness straps. This adjustment can also be accomplished by twisting the straps to obtain the proper length. The position of the apparatus on the body should be such that when the facepiece is put on the breathing tubes will permit free head movement.

5. Attach the waist strap to the small D-ring located on the lower corner of the breastplate and pull to a snug fit. Then tuck in the waist strap loop.

6. Remove the metal tear-off cap of the canister by pulling the metal tab straight out, then straight back across the top of the cap, exposing the copper foil seal which is the air-tight seal for the canister. Make sure that the metal and cardboard discs are removed exposing the copper foil seal. (See Figure 12).

   Screw the handwheel down far enough for the bail to be swung outward, swing the bail outward and swing the canister fully into the canister holder with the smooth side toward the front. The canister should be inserted sufficiently so that the cooper foil seal is punctured and the rubber gasket fits snugly against the V-shaped recess in the plunger casting. Screw the handwheel clockwise until it is tight against the canister. The canister must be inserted with the smooth side to the front. See Figure 13.

Courtesy Mine Safety Appliances Co.

Figure 13

Inserting canister in apparatus

7. Pull out the facepiece straps so that the ends are at the buckles; grip facepiece between thumb and fingers. Insert chin well into the lower part of the facepiece and pull the headbands back over the head. See Figure 14.

Figure 14

Putting on facepiece

Courtesy Loudonville, O., F.D.

Figure 15

Adjusting headband pad

To obtain a firm and comfortable fit against the facepiece at all points, adjust headbands as follows:

a. See that straps lie flat against head.
b. Tighten lower or "neck" straps.
c. Tighten the "side" straps. (Do not touch forehead or front straps).
d. Place both hands on headband pad and push it toward the neck. See Figure 15.
e. Repeat operations b and c.
f. Tighten forehead or "front" strap a few notches if necessary.
g. Check the tightness of the facepiece fit by squeezing the breathing tubes and inhaling. The facepiece should collapse on the face if the seal is satisfactory.

8. Squeeze both breathing tubes with one hand, and break the seal of the facepiece against the cheek with fingers of the other hand. Inhale; then releasing facepiece with breathing tubes, exhale into the apparatus. See Figure 16. <u>This must be done in fresh air</u>. Repeat this procedure until the breathing bag is inflated. In order to be certain the canister is generating oxygen, depress the pressure-relief valve and force the air from the breathing bag; then reinflate the breathing bag by the method described above. In cold weather, starting the proper chemical reaction in the apparatus will require more inhalations from the outside air, with exhalations into the canister. The best procedure is to continue alternately inflating the breathing bag fully, then deflating it with the elbows, until a total of about 15 exhalations have been put through the canister.

Courtesy Mine Safety Appliances Co.

Figure 16

Starting apparatus

9. To check the complete apparatus for tightness:

   a. Grasp the lower end of the inhalation (left) breathing tube and squeeze it tightly. Inhale. If the facepiece collapses the facepiece seal is tight enough and the exhalation valve is functioning properly. This will also test the upper part of the inhalation breathing tube for leaks.

   b. Continue to squeeze the lower end of the inhalation (left) breathing tube. Depress the pressure-relief valve button. It should then be possible to exhale through the valve. While holding the button down, inhale; if the facepiece collapses as above, the relief valve is functioning properly.

   c. Release the inhalation (left) tube and squeeze the lower end of the exhalation (right) breathing tube. Inhale and then exhale forcibly. The exhaled air should be forced out between the face and the facepiece only; this will indicate that the inhalation valve is functioning properly and the upper end of the exhalation tube is free of leaks.

   d. With the bag well inflated, grasp the upper ends of both breathing tubes and depress both sides of the breathing bag with the elbows. If the breathing bag does not deflate, the complete apparatus is airtight.

IF A LEAK OR DEFECT IS INDICATED IN ANY PART OF THE APPARATUS, IT SHOULD BE CHECKED AND THE CONDITION CORRECTED BEFORE USE.

10. Breathe normally; the apparatus will furnish enough oxygen to meet most breathing requirements.

11. Since the apparatus has a forty-five minute service life at hard work in an irrespirable atmosphere, it will be necessary to determine the length of time required to return to fresh air from the working place and set the timer accordingly. The timer dial is calibrated in minutes. Turn the pointer clockwise to the number of minutes left after deducting the time for exit; the timer will then be properly set. For example, if it will take ten minutes to return to fresh air, deduct ten minutes from forty-five and set the timer at thirty-five. The bell on the timer will ring when the pointer returns to zero, at which time the wearer has ten minutes to return to fresh air.

PRECAUTIONS AND PRACTICES

1. There is no need to purge nitrogen manually from this apparatus, since more oxygen is produced than will be used. To relieve excess pressure, depress the pressure-relief valve on the valve housing at the bottom of the facepiece.

2. In addition to the timer there are two other indications that the canister is becoming expended: fogging of the lenses on inhalation and increased resistance on exhalation. These two indications will not normally appear until after forty-five minutes of use, but under conditions of extreme hard work may become noticeable. The lenses will clear on inhalation until the canister is almost expended; then the lenses will begin to fog. Do not confuse excess breathing-bag pressure with canister resistance. If the pressure-relief valve relieves excess breathing-bag pressure, and exhalation resistance is still present, the canister is about expended. If either of these two indications appear, return to fresh air.

Courtesy Loudonville, O., F.D.

Figure 17A

AFTER USE

As soon as it is safe to remove the facepiece, this should be done by grasping it at the "snout" with the hand and pulling forward and upward off the head and face. (See Figures 17a and 17b.)

To remove the canister, turn the handwheel down, swing bail outward and remove the canister with the hand suitably protected by a glove or other covering, since the canister may be hot.

Courtesy Loudonville, O., F.D.

Figure 17B

Removing mask

Upon return to quarters, after the mask has been in service, the used canister may be disposed of as follows:

1. Allow the canister to cool. Ordinarily this will take place while returning to quarters.

2. Place the canister on the floor, smooth side up, and gash it with an axe that has been wiped clean of oils, greases or other materials. Two cuts can be made with the axe, one on each side of center. Keep your face away from the open canister; it contains caustic chemicals.

3. Place the canister in a bucket 2/3 full of clean water. When the chemical reaction or agitation stops, rinse the canister off with clean water. Pour the bucketful of water carefully down a sewer or drain. This water will now be a caustic solution and will irritate the skin if allowed to come into contact with it.

After use, the facepiece of the apparatus should be sterilized using a germicidal solution such as aqueous Zephiran 1:750 solution or Staphene solution. Allow the facepiece to hang down while cleaning, so no liquid enters the valve assembly or tubes. Immediately after sterilization, wipe the facepiece dry and replace on the apparatus for service.

GENERAL CARE

A canister should not be carried in the canister holder while it is in the carrying case. Each carrying case should contain two canisters and the mask at all times. When a canister has been removed from the canister holder it should not be used again. Care should also be taken that canisters do not come in contact with oils and greases: The chemicals in a canister are capable of generating and releasing highly concentrated oxygen that could start combustion.

Do not tie a rope to the D-ring on the harness strap of the mask.

The inhalation and exhalation check valves can be removed from the facepiece and breathing tube by disconnecting the toggle clamps, removing the breathing tubes, and sliding the valves out. The valves should be checked periodically for corrosion and replaced if necessary, These valves are marked "in" for inhalation and "ex" for exhalation, and should be inserted in the respective openings in reassembly.

This type of breathing apparatus should not be used under water, such as in pools, lakes or ponds.

As a part of the general care, there should be a periodic check of the plunger and plunger casting (the part which pierces the canister) for cleanliness and free movement of the plunger. The tightness of the apparatus should also be checked periodically, using the procedure outlined in 9 under "Putting On Self-Generating Oxygen Mask".

When any part shows evidence of failure, it should be replaced immediately with a new part. Damaged apparatus should be returned to the factory for repair.

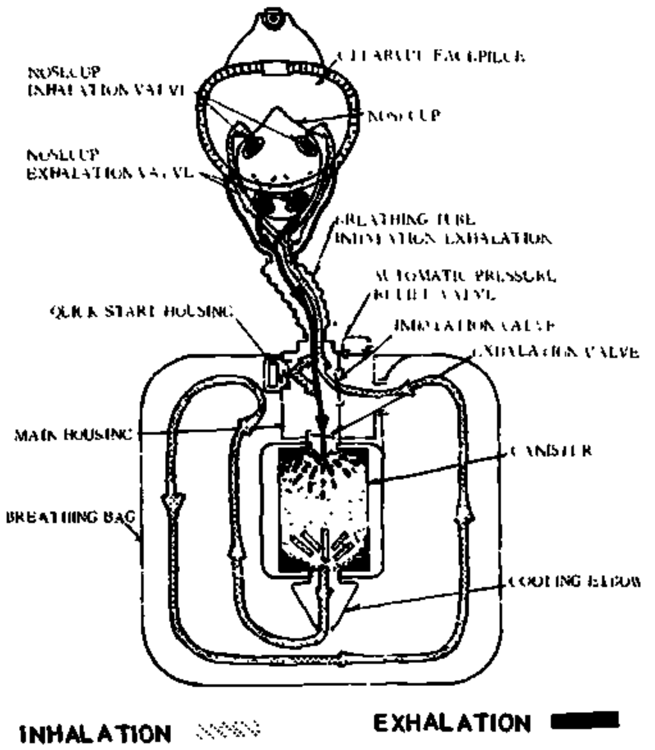
SELF-GENERATING OXYGEN MASK
THIRTY MINUTE

This mask, like the one previously described, is a canister type which evolves or generates its own oxygen. (See Figure 18.) Thus it is independent of the outside air. The wearer's breath passes into the facepiece and through the exhalation tube, into the canister. The exhaled breath is purified of carbon dioxide and replenished with oxygen as it passes through the canister and is then rebreathed. (See Figure 19.) This mask will provide respiratory protection for thirty minutes.

Courtesy Mine Safety Appliances Co.

Figure 18

Chemox 30-minute mask



Courtesy Mine Safety Appliances Co.

Figure 19

Cross-section diagram of Chemox 30-minute mask

The apparatus consists of a facepiece, breathing tube, (both the inhaled and exhaled air pass through this one tube), breathing bag, breastplate canister holder, manual timer, and harness straps, all focalized around a central housing just above the canister. An automatic pressure-relief valve is located in the central housing on the inhalation side of the breathing bag. This is a one-way valve; it operates automatically when the breathing bag becomes over-inflated. Also located in the central housing are the quick-starting housing -- a unit that activates the apparatus instantly in low temperatures -- and the exhalation and inhalation valves which control the directional flow into and out of the breathing bag. The breathing bag serves as a reservoir for the evolved oxygen.

The timer, located in the central housing, is a safety device to inform the wearer how long the canister has been in service. Since the mask is good for thirty minutes, the timer dial is calibrated in minutes from one to thirty. Turning the timer knob clockwise to thirty winds it. If left untouched in this position it will automatically unwind with a continuous movement to zero. This will indicate the end of thirty minutes and the bell will ring continuously for 17 seconds. The timer is entirely independent of the apparatus and will continue to unwind even though the apparatus is not in use.

The canister on this mask is different in appearance than the canister used on the regular self-generating type in that it is cylindrical in shape and has an opening on each end. The chemical in this canister is the same as in the other canister, so the same precautions should be taken as to introduction of water or moisture into the canister.

The chemical in the canister purifies the exhaled breath by absorbing the carbon dioxide and generating fresh oxygen for breathing. This chemical action generates considerable heat in the canister. The wearer is protected from this heat by insulation on the breastplate and by a cooling elbow incorporated in the canister holder to cool the evolved oxygen before it enters the breathing bag.

PUTTING ON THE MASK

The following are the consecutive steps in putting on the apparatus before entering a toxic atmosphere:

1. Unfasten and straighten all harness straps.
2. Grasp the apparatus at the top of the canister holder with one hand. With the other hand grasp the harness D-ring assembly where the two large nylon straps join. Place the breastplate canister holder over the chest and slip the head through the V-shaped opening formed by the straps.
3. Continue to hold the apparatus on the chest with one hand and with the other reach around the body and grasp the free end of one strap. Bring the end of the strap under the arm and snap into the D-ring located on the top side of the breastplate. Repeat this procedure for the other strap.
4. Adjust the position of the apparatus on the body by means of the metal slides located on the harness straps. This adjustment can also be accomplished by twisting the straps to obtain the proper length. The position of the apparatus on the body should be such that when the facepiece is put on, the breathing tube will permit free head movement.
5. Attach the waist strap to the small D-ring located on the lower corner of the breastplate and pull it up to a snug fit, tucking in the loose ends.
6. Open the canister holder by pressing on both the pawls at the top and pulling the lever arms outward.
7. Remove the two canister caps by inserting each end in the opener at the bottom of the canister holder and pulling upward (as in removing a bottle cap).
8. Make sure the canister-holder lever arms are fully at their bottom position and insert the canister in the canister holder with the top of the canister at the top of the canister holder. Note: The canister label has an arrow pointing to the top and reads: This end up.
9. Close the canister lever arms securely.
10. Connect the coupling nut on the facepiece tube to the mating thread on the upper main housing.

11. After the facepiece has been donned, check the tightness of the fit by squeezing the breathing tube tightly and inhaling gently. The facepiece should collapse on the face if the seal is satisfactory.

12. The apparatus is started by one of two methods, depending upon whether a quick start cartridge is used. For either method leave the automatic pressure-relief valve (on side of upper main housing) in the normal starting position.

    Without a quick-start cartridge proceed as follows in fresh air.

    a. Squeeze breathing tube with one hand, break the seal of the facepiece at the cheek with a finger of the other hand, and inhale deeply.
    b. Release facepiece, then breathing tube, and exhale into the apparatus.
    c. Repeat a. and b. until the automatic pressure-relief valve dumps air.
    d. Force the air from the breathing bag through the pressure-relief valve by squeezing the bag with both hands.
    e. Repeat operations a., b., and c. until breathing bag is fully inflated.

    If normal starting is to be used, the apparatus should be stored and started at temperatures above 32° F. When the apparatus is stored and started at temperatures above 32° F., the wearer may enter and wear the apparatus down to a temperature of -20° F. When starting the apparatus at temperatures near freezing, more inhalation from the outside air, with the exhalation into the canidter, may be required to produce the proper chemical reaction. The best procedure is to keep fully inflating and deflating the bag until a total of about 15 exhalations have been put through the canister.

The quick-start cartridge may be used with the following procedure:

a. Remove cartridge from metal container.
b. Remove cartridge-holder cover from front of main housing by unscrewing it.
c. Insert cartridge: the solid side with the brass percussion cap goes to the front (away from body).
d. Replace cover, screwing it in tight.
e. With facepiece well fitted, strike the cartridge cover a sharp rap with the heel of the hand. (See Figure 20.) Oxygen will evolve automatically to inflate the bag fully, and some excess will vent automatically. Nothing further is necessary to start the apparatus.

Courtesy Mine Safety Appliances Co.

Figure 20

Starting the half-hour Chemox

13. Regardless of the starting method, a tightness test should be performed on the unit as follows:

    a. Set relief valve in the test position. This closes the valve so that automatic venting does not take place.
    b. With the bag fully inflated, grasp the breathing tube tightly and depress both sides of the breathing bag with the elbows. If the bag does not deflate, the complete apparatus is tight.

IF A LEAK IS DETECTED, IT SHOULD BE CORRECTED BEFORE USE IN A TOXIC ATMOSPHERE.

    c. Reset relief valve to normal position.

14. Breathe normally; the apparatus will furnish enough oxygen to meet any breathing requirements.

15. Set the knob of the timer at 30. When the pointer end of the knob returns to zero, the bell will ring continually for 17 seconds. The wearer should then return to fresh air.

16. The facepiece of this mask contains a speaking diaphragm permitting communications.

PRECAUTIONS AND PRACTICES

The proper care of this apparatus and safe disposal of the canister are the same as with the regular self-generating oxygen mask previously described.

AUDIBLE COMMUNICATION WITH RESPIRATORY PROTECTIVE EQUIPMENT

Most facepieces on respiratory protective equipment of late manufacture are furnished with a speaking diaphram. Without such a speaking diaphragm, audible communication between wearers of respiratory equipment is inadequate at best, and at times may be impossible. Facepieces with an exhalation valve provide some measure of voice transmission through this valve, and even those without exhalation valves permit an extremely limited transmission through the rubber facepiece. However, a greater degree of audible transmission is provided by modern scientifically designed speaking diaphragms.

TRAINING SUGGESTIONS

1. Wear mask for a short period in fresh air, and do some work or exercise. This will allow you to become accustomed to the mask and learn the breathing technique.

2. Wear mask in gas and smoke to become familiar with conditions where gas and smoke exist.

3. While wearing mask in gas and smoke, do some work. It is under these conditions that the mask will be used.

4. Practice donning mask with helper and without helper.

SUMMARY

It is recommended that squadmen using gas masks always work in pairs and be in constant audible communication with each other.

The squadman who needs a mask should not run to the truck for it; the mask should be brought to him if possible. A mask should not be donned when a person is short of breath.

The harness straps, on all masks, should be previously extended to fit the largest man who may wear the apparatus. Masks having the slower type of adjusting harness strap can be quickly adapted to fit a smaller man by twisting these straps.

After working in areas of highly toxic chemicals, gases or radioactive material, it is advisable not to remove the mask upon return to fresh air until the contaminant has been removed from the clothing.

In donning the facepiece of any mask the headband straps should be tightened by pulling these straps straight back as shown in Figure 21, and not outward from the side of the head as shown in Figure 22.

Extra tanks and/or canisters should be carried on emergency apparatus. A guide line or rope should not be tied to the harness or D-ring of the mask. When a guide line is used, it should be fastened around the squadman's body before the mask is donned.

Where gas masks are not in regular use, they should be removed from their carrying cases periodically and donned by personnel. This will prevent the materials in the mask assembly from becoming stiff or hardened from lack of use, and keep them pliable.

CHAPTER XVIII

ELECTRICAL EMERGENCIES

INTRODUCTION

A squadman is not presumed to be an electrician nor an electrical lineman, but his duties may require him to face situations involving electrical equipment or wiring. Therefore he should be able to recognize electrical hazards and should know the proper action to take.

Saving property alone never justifies the risk of a man's life. Where life is involved, the urgency is greater; necessity prompts the squadman to act in the face of great danger. However, he should THINK before he ACTS. Moreover, unless he KNOWS what he is doing, he should seek help from a qualified person. Electric power has become so common that facilities for supplying electricity are present in almost every part of every community. Emergency and rescue squad personnel can prepare themselves to deal with electrical hazards by learning methods for handling electrical equipment and wiring.

The information in this chapter is merely suggestive. It is the responsibility of the department head, or the emergency squad officer, to reach an agreement with the appropriate officials of the local power company as to procedures to be followed in an emergency involving the company's property and equipment, or any other property where electrical equipment or wiring is concerned. All squadmen, and all power-company employees who are subject to call when an emergency occurs, should be thoroughly familiar with whatever procedure has been mutually approved. In many cities a power-company unit responds to each emergency where electrical hazards may be encountered. Regardless of this policy, someone must call the power company immediately when any emergency involves electrical hazards within the company's area. The squadman requesting assistance from the power company must clearly inform the receiver of the call as to the electrical equipment involved (transformer, overhead wires, underground cables, etc.) and its location. This will facilitate service and make for maximum cooperation.

RECOGNIZING THE DANGER

All wires are potentially dangerous. Fallen, energized wires are an extreme hazard to anyone who is not familiar with electrical behavior in wires under the stress of a ground or short circuit. The actual threat to life is determined by the amount of current or amperage that flows through a person's body.

The pressure applied to cause a current or amperage to flow is called voltage. Under some circumstances, a very low voltage can send enough current through a person's body to cause serious injury or death. This is particularly true if the person is standing on the ground or on a well-grounded structure. The flow of current is from a wire to the ground. Anything or anyone within this path may become the conductor for the current from the point of contact on the wire or electrically charged object to the point of contact on the ground.

CHARGED GROUND NEAR A FALLEN WIRE

It is dangerous even to approach a fallen wire. Distribution or transmission wires, in particular, may energize the ground for a considerable area around the point where they make contact. It is impossible to give specific rules or distances, since the danger area will vary with the voltages involved and with ground conditions. The hazard is much greater during damp or rainy weather.

CIRCUIT BREAKERS

Wires lying on the ground may be de-energized one moment and energized the next. While energized they may whip around, and this is an additional hazard. Self-operating devices protect most power systems from surges and grounds. These devices open a circuit when it is overloaded or shorted and then, in a matter of seconds, automatically close the circuit. The setting on this equipment may vary from one to four seconds.

INVISIBLE DANGER

Energized wires lying on the ground or across a vehicle may show no evidence of being live, yet touching the wire or the vehicle may be fatal. If an electric wire should fall across a fence or telephone wire, they are as dangerous as the live wire itself and the same precautions must be taken.

ACTING IN AN EMERGENCY

The only completely safe thing to do with fallen wires is to stay clear of them and call the power company. In some cases, however, waiting for the power company crew may mean the difference between life and death. Therefore, it is essential for rescue squad personnel to have a reasonable working knowledge of the electrical hazards and emergency situations that may confront them in each community they service.

If wires are down, on arrival at an emergency proceed as follows:

Radio for the power company and move the crowd back from the danger zone (at least one span each way from the break or the sagging wire.) This is necessary for several reasons.

1. The spans of wire adjacent to the trouble may have been weakened.

2. Any movement of the wires in trouble, caused by the wind or rescue work, may burn other wires down.

3. Wires on the ground may burn through at some point and the ends may curl up, roll along the ground, and cause injury to someone.

4. Burns, electric shocks, or eye injuries from electric flashes may occur even though a person is not in direct contact with the wires. Therefore, do not permit anyone to stand near weak or broken wires.

EMERGENCIES INVOLVING VEHICLES

In case of a motor vehicle, the rubber tires may insulate the vehicle from the ground, so that although the vehicle itself may be charged, there will be no current flowing from the vehicle to the ground. In such case, passengers in the vehicle will be relatively safe if they remain in it. A person touching the vehicle while standing on the ground will complete the circuit from the vehicle to the ground, creating a path of current flow through his body which can often prove fatal.

An example is that of a woman whose car became energized from a fallen wire as the result of hitting a light pole. In her fright, she jumped out of her car. After moving away from the car, she realized she had left her purse in the seat of the car. She returned to the car and, upon touching the door, was instantly electrocuted.

Charged Emergency Apparatus

If either metal or wood aerial ladders come in contact with overhead electric wires, or should these wires fall across the apparatus, a person will be relatively safe providing he DOES NOT make contact with the apparatus and the ground at the same time. If the equipment is believed to be in contact with a live wire, and you must get off, DON'T STEP OFF - JUMP OFF. Your hands, feet, and body must clear the vehicle completely before you touch the ground. From the moment that you contact the ground, you must not again touch the vehicle.

HANDLING ENERGIZED WIRES

If a dry rope is thrown from a reasonable distance over wires carrying high voltage, the person throwing it will not be harmed. If the rope is wet when placed in contact with energized wires, the man can receive a shock which may prove fatal.

Polypropylene rope is completely non-conductive. It will not absorb moisture. This type of rope is ideal for use with electrical hazards.

ROPE-AND-WEIGHT TOOL

If action is necessary to remove a wire from a victim, a rope-and-weight tool can provide a means to handle wires safely in any weather. However, the squadmen must be thoroughly trained in its use. Men who can throw the weights efficiently will be able to pick up a live wire with relative safety, regardless of the position in which it falls.

This rope tool consists of two weights, each weighing approximately one-half pound, attached one to each end of a 100-foot, one-quarter-inch rope. (See Figure 1.) The rope must be free of any metallic substance, to be safe in use. Any emergency unit can make this devices for little cost. It is recommended that one be in service on each unit in operation.

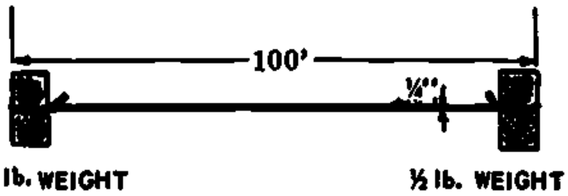

Figure 1

Tool made with rope and two weights, for handling live wires

USING THE ROPE

Emergency squadmen should be trained in the use of the weighted rope. Only practice can make them proficient in handling live wires safely in this manner.

Figure 2

Hot stick

With this tool a squadman can gain control of a fallen wire without getting near the wire. After the rope is in contact with the wire, approved and adequate insulating equipment will allow him to move the wire by pulling on the rope. A pair of approved lineman's rubber gloves and glove protectors, and a lineman's "hot stick", tested for use on high voltage, are required. (See Figure 2.) With this equipment the wire may be moved as follows:

1. Clear all persons out of the danger area, as described earlier.

2. Put on lineman's rubber gloves and glove protectors.

3. Stand opposite the point to which you want to move the wire and approximately thirty feet from the wire.

4. Toss one end of the weighted rope under the wire to a point about equal to your distance from the wire, on the other side. (See Figure 3.)

5. Toss the other end over the wire so that it lands near the first weight thrown.

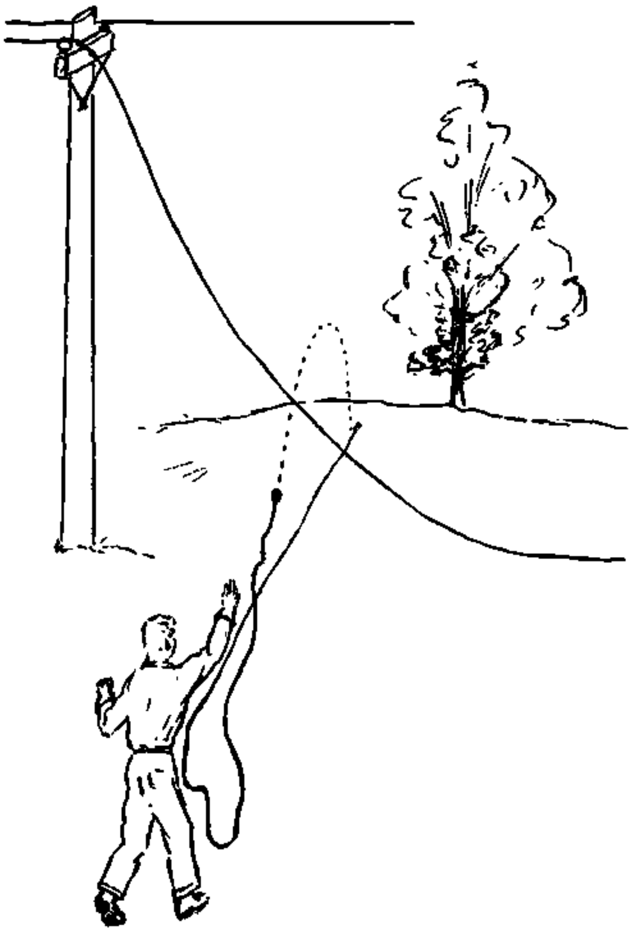

Figure 3

Man throwing rope with weights

6. Pick up the two weighted ends with the hot stick, and drag the wire out of the way. (Be sure the wire is guarded.)

7. Keep in mind at all times that the ground may be energized for some distance around the fallen conductor.

It must be remembered that any fallen wire is dangerous and that it can mean instant death to the poorly trained emergency rescue squadman. However, when a human life is involved, squad personnel will have to take immediate rescue action. In such situations the action taken will be founded on past experiences and training. Here every second counts, yet caution must be exercised so that the seriousness of the original emergency is not increased because of the over-zealous action taken by a squadman or other person nearby.

HOT STICKS

Hot sticks are specially designed tools used principally by electric company linemen to manipulate energized conductors into a desired position. They are specially treated by the manufacturer to prevent moisture from penetrating the wood. They should be kept in a compartment or other container on the rescue truck to prevent damage while in storage. They should be inspected at regular intervals by someone who knows their construction even if they have not been used since the last inspection.

REMOVING VICTIM FROM WIRE

When a person is found lying on an energized wire, and the wire is not entangled around the victim, a quick method to rescue him is to employ a hot stick to push or pull him from the wire. While the victim is being removed from an energized line he may receive additional burns, but this is not as serious as having him remain in contact with the energized conductor.

The rescue worker should stay as far away from the victim or the wire as the hot stick will permit. If additional help and another hot stick are available, they may be employed in the rescue operation. One man may hold the live wire immobile while the other man moves the victim from contact with the wire. This additional assistance can prevent the end of a live wire from whipping in a manner similar to that of an unattended garden hose that is discharging water from an open nozzle. Also, by keeping the wire in contact with the ground, the exposure of a victim to additional shock and burns is kept to a minimum.

In cases where hot sticks are not available, an alternate procedure may be applied.

Use a long, dry rope (of a type referred to in Figure 1) to loop around some part of the victim's body in a manner that will permit dragging the victim from the danger area. This alternate procedure may require the squadman to perform the rescue operation from a position much closer to the victim and/or the wire than the maximum distance allowable when hot sticks are employed. Here the rescue worker must perform this act, taking all necessary precautions to prevent his body or clothing from making contact with the victim's body, or clothing, or the wire itself. These precautions are necessary until the victim has been removed from the danger area. Bystanders should be ordered to remain at least a minimum of one hundred feet away from the victim. This will prevent them from coming into contact with anything which may be energized, thus eliminating the chance of additional victims.

FIRST AID AFTER RESCUE

In cases where artificial respiration is required, it should be started at once after the victim has been released from contact with the wire. Resuscitation should continue until the victim has recovered or until a member of the medical profession has pronounced him dead. The treatment of any burns from electric shock should be the same as that described for any burn case.

Closed-chest heart compression may also be needed. The signs that establish when to start this procedure are described in Chapter XII, "Closed-Chest Heart Compression".

CHAPTER XIX

CUTTING TORCHES

INTRODUCTION

On many occasions, rescue and emergency squads are called upon to rescue victims trapped or confined by metal. The cutting torch provides a method of making an effective rescue. In view of the evident importance of this tool, it is essential that every squadman be familiar with its correct use, with its limitations, and with its care. The following paragraphs provide this information.

CUTTING TORCHES AND EQUIPMENT

The oxy-acetylene cutting torch can be used for cutting steel, wrought iron, and other ferrous metals. The equipment is usually portable. It includes two separate tanks: one for oxygen and one for acetylene. Hose, regulators, gauges, cutting torch, lighter, goggles, extra tips, tip cleaners, wrench, leather gloves, and yellow and white chalk must be included in the equipment.

There are several companies which manufacture good cutting torches and equipment. However, since space is limited, this manual cannot list all of them.

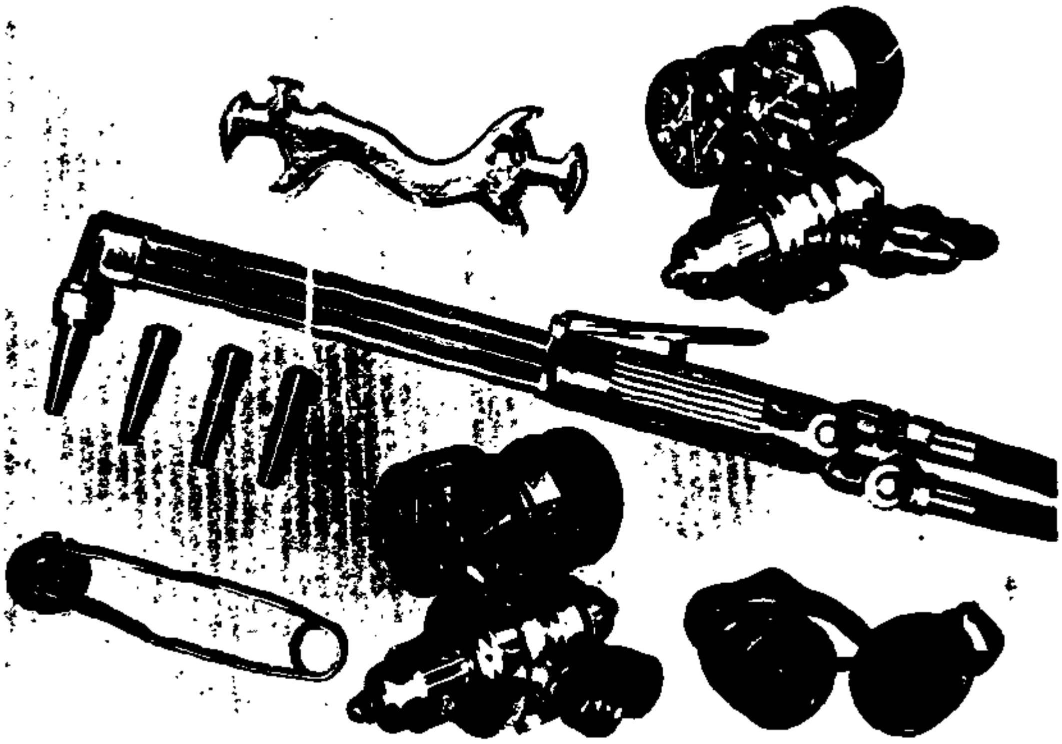
In selecting cutting equipment for the emergency squad, it is advisable to obtain one similar to the assembly shown in Figure 1. This is a sturdy outfit which will cut efficiently and economically. Its tough construction gives it a long life, and it can be used with the small portable tanks.

The complete outfit includes:

1 Cutting Torch (90° head)
4 Cutting Tips, sizes 1, 2, 4, and 6
1 Two-Stage Oxygen Regulator (0-200 lb. and 0-3000 lb., with 2-$\frac{1}{2}$-inch gauges)
1 Two-Stage Acetylene Regulator (0-30 lb. and 0-400 lb., with 2-$\frac{1}{2}$-inch gauges)
1 Wrench (5-way)

RECOMMENDED ACCESSORIES

1 Pair of Goggles
1 Flint Lighter
25' 1/4" Twin Line Hose
4 Hose Connections (2 oxygen and 2 acetylene.)
4 Hose Ferrules



Courtesy National Welding Equipment Co.

Figure 1

Cutting outfit

ASSEMBLING CUTTING TORCH AND HOSE

The cutting torch consists of a handle, or torch body, to one end of which may be attached any one of the various cutting tips, which range in size from 0 to 8. (See Figure 1). On the opposite end are two valves which control the rate of flow of oxygen gas and acetylene gas into the torch. The rubber hoses supplying the two gases are attached to these valves.

The acetylene tanks and hose connections of all makes of torches have left-hand threads. Oxygen connections have right hand threads.

A good wrench should always be used to tighten torch parts and hose connections; never use pliers. It is important to keep the packing nuts fairly tight on the torch valves so that the valve setting does not change while the torch is in use. Always use an open-end wrench. Valves that turn too easily are likely to be accidentally thrown out of adjustment when they brush against something.

OPERATING PRESSURE REGULATORS

The rubber hoses from the torch fasten to two pressure regulators, one regulating the pressure of the acetylene gas in the acetylene hose, and one regulating the pressure of the oxygen gas in the oxygen hose. It is necessary to keep the pressures of the two welding gases constant at all times and low enough not to overload the nose. It must be remembered that the pressure of gases in the cylinders decreases constantly while in use.

By turning the cross bar or handle of either pressure regulator, the desired hose pressure can be obtained. The usual pressures are 10 lbs. of acetylene and 30 lbs. of oxygen. This pressure is shown on the pressure gauge on the regulator. Screwing the cross bar in (clockwise) increases the hose pressure. Both oxygen and acetylene regulators have cross bars with right-hand threads.

Regulators connect directly on the oxygen and acetylene cylinders; a second pressure gauge on each cylinder indicates the pressures within the cylinders.

Some manufacturers of welding regulators provide a small storage space in the center of the cross bars in which are kept extra seats, to be used as replacements as wear occurs inside the regulators.

Two rules, if followed, will greatly prolong the life of regulators. It should be stated here that if the torch "acts up" it is quite possible that the regulators are at fault. First, always screw the cross bars out until they are loose, before opening the cylinder valves which are located on the tops of the oxygen and acetylene cylinders. This prevents the suddenly released pressure from overloading and damaging the delicate valve mechanism inside the regulator. Second, lubricate the threads on the cross bars with beewax occasionally. Never use oil or grease anywhere around a gas welding outfit, that is, on any of the parts of the apparatus itself. Oxygen under pressure will occasionally cause oil to ignite if conditions are just right. Oxygen alone does not burn.

SAFE HANDLING OF OXYGEN AND ACETYLENE CYLINDERS

THE OXYGEN CYLINDER

Commercial oxygen used in cutting is stored in steel cylinders. The manufacture of all commercial oxygen is controlled by the United States Department of Commerce to insure safety. The cylinders are made of seamless steel with a fusible plug near the valve at the top. This plug allows the gas to escape at a safe rate in the event that the cylinder should be subjected to a dangerously high temperature. Oxygen gas is pumped into the steel cylinders to a pressure of about 1800-2000 poinds to the square inch. Cylinders are made in various sizes, the two most common having a capacity of 110 and 220 cubic feet of gas, respectively. The shut-off valves mounted on the tops of the cylinders are of special design because of the extremely high pressure they have to hold. They have a right-hand thread, and when opened should be turned as far as they will go. This prevents leakage by causing the valve to seat in the top of the valve body. Commercial oxygen is usually obtained from air and seems much like air in many ways, since it is odorless, harmless to breathe, and non-inflammable.

THE ACETYLENE CYLINDER

Acetylene gas is stored safely by pumping it into special steel cylinders. It is also controlled in its manufacture by the Department of Commerce. Unlike the oxygen cylinders which have no liquid or solid material whatever inside, the acetylene cylinders are loosely filled with an asbestos absorbent which is saturated with a liquid called acetone. Acetone has the ability to dissolve acetylene gas under pressure. The result is that when 220 cubic feet of acetylene gas is pumped into a cylinder of approximately the same size as the one used for oxygen, the pressure is only 250 pounds to the square inch. This greatly increases the safety of handling and transporting compressed acetylene. The acetone remains in the cylinder as the acetylene is allowed to escape during welding, and is used repeatedly with practically no loss. Fusible plugs in both the bottom and the top of each cylinder are an additional safety factor. The acetylene cylinder valves are not subjected to as much pressure as the oxygen valves and do not require the special sealing feature - the packing used in the valves being ample to prevent leakage. These valves have right-hand threads and should be opened only one and one-half turns to allow for rapid shutting off in an emergency. They require a special square socket wrench which can be obtained from the firm supplying the gas. The diameter of the threaded outlet for the regulator is smaller than that on the oxygen cylinder.

ATTACHING CYLINDERS

Before attaching fresh cylinders of gas to the welding outfit, the valves should be opened slightly and a small amount of each gas allowed to escape. This is called "cracking" a tank. Oxygen will not burn but acetylene will. One should be certain that no open flame is near when the acetylene valve is opened. The escaping gas blows out any dust or particles of grit that may have lodged in the valves during shipment. All fitting must be perfectly clean before screwing them on the cylinders.

As before mentioned, be sure all regulators are in the "off", or loose, position before turning the gas on at the cylinders.

In turning the gas off at the cylinders extreme care should be exercised to make certain the valves are completely closed. The two torch valves should then be opened to "bleed off" the remaining gas in the hose. The pressure regulators should then read zero.

USING THE CUTTING TORCH

All types of cutting torches operate on the same principle and are provided with tips of various sizes for cutting metals of different thicknesses.

In contrast with the welding torch which has a single orifice at the tip, the cutting torch has five or more. The center orifice is for oxygen only, and is supplied with a quick-acting oxygen valve. This central oxygen orifice is surrounded by four or more orifices for the oxy-acetylene preheating flames. These pre-heating flames are adjusted independently of the oxygen cutting valve and, once adjusted, keep burning steadily regardless of whether the oxygen cutting valve is opened or closed.

One can use the oxygen cutting torch with excellent results on any kind of steel or wrought iron. Cast iron is somewhat more difficult to cut.

First select a cutting tip of suitable size for the thickness of metal which is to be cut. A tip with an oxygen orifice drilled at the factory with a No. 66 drill is suitable for cutting steel one quarter of an inch in thickness; No. 52 for one inch, and No. 48 for three inch. The larger the wire gauge drill size number, the smaller the orifice.

The torch, valves, and connections should be checked for leaks before the torch is lighted. This can be done by passing the face near and around the torch, valves, and connections. If an acetylene gas leak is present it can be detected by smell. If any oxygen gas leak is present it can be heard or felt blowing upon the face.

Next, adjust the acetylene hose pressure as for cutting.

The oxygen hose pressure required depends upon the tip used and the thickness of the steel being cut, and varies from 10 pounds to 150 pounds. Tables supplied with torches indicated oxygen and acetylene pressure for each tip and thickness of metal to be cut. These pressures vary with different makes of torches and sizes of tips. (See Figure 2)

The oxygen valve on the torch body should be opened far enough to give full oxygen pressure through the torch for cutting. This is an important point for beginners.

Adjust the pre-heating flames to neutral and try the cutting valve to see that full oxygen pressure is feeding through to the oxygen orifice in the tip. It is important also to keep the orifice clean and round.

Cutting TIP SELECTOR CHART—including tip drill sizes

(1) IF . . . . the metal thickness you want to cut is as shown below. . . . .

(2) THEN . . . . select the cutting tip size shown on the same line for your model of torch. . . .

(3) SET YOUR REGULATOR . . working pressures as indicated below, in pounds per square inch. . . . .

(4) TO KEEP YOUR TIPS CLEAN . . . . use tip cleaners of the correct drill size for each hole or orifice of the various tip types as shown below. . . . .

In Inches	400	300 310	210	28	Oxygen	Acetylene	Center Hole All Types	Preheating Holes for Types: AA-D	AS	SC	Others
1/16 to 1/2	0	0	0	0	10-20	3	60	73	66		63
1/8 to 3/4	1	1	1	1	15-30	3	57	72	68		62
1/4 to 2	2	2	2	2	15-50	5	54	70	64		61
1/2 to 4	3	3	3	3	20-60	5	51	68	63	66	60
2 to 6	4	4	4		30-70	5	46	66		61	59
4 to 8	5	5	5		60-80	8	42	64			58
6 to 10	6	6			70-100	8	37	61			57
8 to 12	7				100 and up	10	32	58			56
10 to 14	8				150 and up	10	30	56			55

(1) The most desirable metal thickness to be cut by any given tip size will depend partially upon the condition of the metal surface and how advanced your skill in flame cutting.

(2) Select that cutting tip size and type which gives YOU the best results. Do not use larger tip size than that recommended for your model of torch.

(3) The wide latitude of suggested Oxygen pressures for each tip size is related to the thickness to be cut. The highest pressure, of course, for the thickest metal. Here, too, the oxygen pressure will depend greatly upon your skill, surface condition and type of ferrous metal to be cut, and how WELL you handle the cutting starting time.

(4) A clean cutting tip will do much better work for you than a neglected one. Suitable tip cleaners will keep your tips at top operating efficiency. Wire and make shift methods may damage the tip ports. Make your tips cut cleaner over a longer period by taking good care of them. Neglect costs money.

Figure 2

Courtesy National Welding Equipment Co.

Cutting tip selector chart

Tip cleaners of correct size should be used. Slag that sticks to the end of the tip can be loosened with pocket knife without damaging the tip. If the flames do not burn properly, shut them off and clean the tip. Figure 3 shows tip cleaners.

With the luminous pre-heating cones of the cutting tip just touching the steel to be cut, heat the edge or other point where the cut is to begin. Be sure to have the torch well supported and pointed at the work.

When the steel begins to melt, the cut can be started by slowly pressing down the cutting-oxygen-valve lever.

During the cut the tip of the torch should be kept at a constant distance from the work. This will vary from 1/16 inch to 3/16 inch depending upon the thickness of the metal. This gap should not change as the torch is moved along the cutting line. The bottom of the kerf or cut should be kept a little ahead of the top.

It is important to move the torch at a uniform speed and at a speed which is slow enough to allow the oxygen to cut all the way through. In turning off the gas at the cutting torch, the acetylene should be turned off first.

Figure 3

Tip cleaners

CARE OF CUTTING TORCHES

Following is a list of safety precautions in using and maintaining the equipment:

1. Always use a good wrench to tighten torch parts and hose connections.
2. Never use oil or grease on any part of the torch or tanks.
3. Always check tank, hose and torch for acetylene leaks before lighting torch.
4. Be sure all regulators are in off position before turning on the gas cylinders.
5. Hose and equipment should be kept free of oil or dirt.
6. Caution should be taken to protect hose from being cut by glass, sharp metal, or hot molten metal.
7. Keep torch in box provided for its storage.
8. Check hose for deterioration.
9. See that goggles are not broken and are clean.
10. Inspect tanks frequently for leaks, and also to see that pressure is maintained.

RESCUE PROCEDURE

Care must be taken to protect the victim from the dangers of heat, smoke, and burns which he might receive from the flame, torch, molten metal or sparks. A fire-resistant, or wet blanket is very useful for protecting the victim from these dangers.

The operator of the cutting torch should wear heavy leather gloves for protection.

A squadman should be assigued to stand by with the proper extinguisher (do not use carbon tetrachloride) or hose line, during cutting operation, to protect people and property.

Thorough inspection should be made after the victim has been removed, to make sure all fire and sparks have been extinguished.

As portable tanks will contain only enough gas to cut for a limited time, it is a good policy to have a list of owners of larger tanks that can be made available for long cutting operations.

The following staged pictures show steps and proper precautions in the use of oxy-acetylene cutting equipment for freeing accident victims.

SITUATION

There is an automobile wreck and the victim's left foot is trapped in the wreckage. Figures 4 through 7 show the rescue procedure.

Figure 4

A compress has been applied to the victim's head to stop bleeding.

Figure 5

A portable cutting torch is obtained from the squad car.

Figure 6

The victim is covered with an asbestos blanket and a chalk mark is drawn where the cut is to be made.

Figure 7

Squadman No. 1 cuts with the torch. Squadman No. 2 stands by with an extinguisher. Squadman No. 3 holds a blanket over the victim's head to prevent breathing of fumes and smoke. Squadman No. 4 supervises the operation.

CHAPTER XX

ROPE AND RIGGING

INTRODUCTION

Rigging is essential to many rescue operations which necessitate lifting or hoisting. It is imperative that rescue personnel know how to use ropes, cables, blocks, ladders, gin poles, and other rigging equipment in rescue operations. Mastery in the use of ropes and rigging can come only after much practice and drill. This chapter describes basic rigging equipment and explains some applications.

Rescue equipment is always carried on heavy rescue vehicles. However, light rescue vehicles also should carry the basic equipment for hoisting and lowering victims.

ROPE

Although rope is made of different fibers, manila, sisal and hemp are used most extensively. In rope-making, fibers are first twisted together to make a yarn. The yarns are then twisted together to make a strand and the strands are twisted together to make a rope. Reversing the twist in every step of building up a rope locks it together. The twist in one direction offers an equal resistance to the twist in the opposite direction, which balances the rope and keeps it in proper shape. The direction of twist is indicated by the terms "left hand" and "right hand" or, "with the sun." To determine the direction of twist, face and point a portion of the yarn or strand of rope toward the sun. If the direction of twist is the same as that of the sun's motion it is said to be "right hand" or "with the sun," but if it is in the opposite direction it is said to be "left hand."

Rope has a tendency to untwist and lengthen if a weight is suspended from its end. Because of this tendency, it is recommended that new rope be hung from a tower for several days with sufficient weight attached to stretch it before use. This stretching can be done by fastening the top end with a clamp, then attaching a weight to a clamp at the lower end of the rope. This does away with the kinking that would result if knots were tied in the rope itself.

See Figure 1a and 1b. Rope may also be straightened by having a man walk back and forth around two stationary poles, dragging the rope until it straightens out. See Figure 1c.

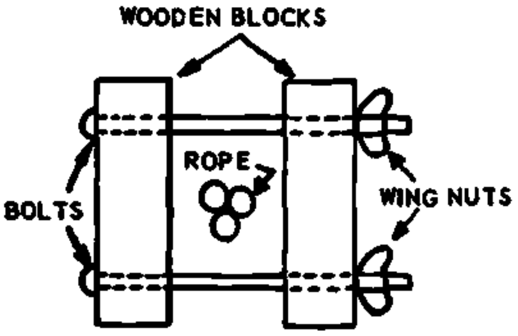

Figure 1a

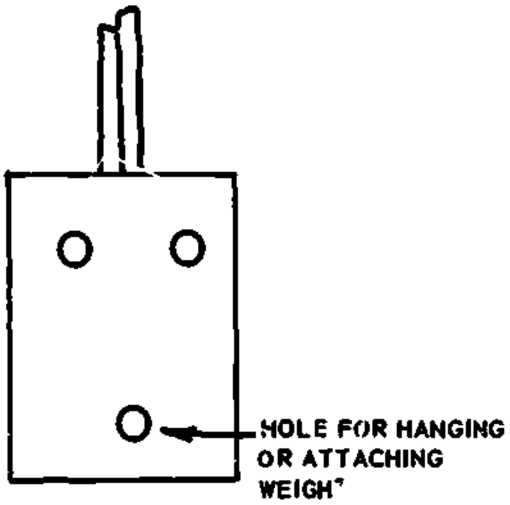

Figure 1b

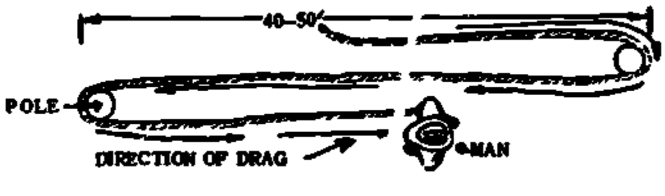

Figure 1c

Straightening and stretching the rope

A rope so treated will handle much easier when put into actual service. Figure 2 shows the manner in which this tendency to untwist and lengthen is overcome. A number of fibers are twisted in a "right hand" direction as shown at C. From two to twenty yarns are formed "left hand" into a hawser-laid rope as shown at A. In each of these successive steps, the twisting has been in opposite directions. As soon as the rope, as a whole, begins to untwist, the individual strands forming it are twisted tighter. The rope can untwist only far enough to bring those opposing forces to an equilibrium.

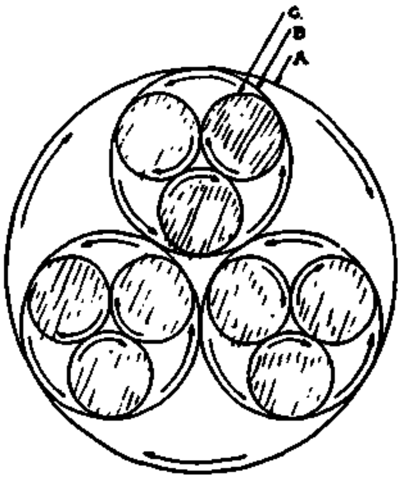

Figure 2

Twisted rope

TYPES OF ROPE

Three strands laid up in a "right hand" direction, as shown in Figure 3, form a hawser-laid rope. Four strands laid up in a "right hand" direction, having a central core as illustrated in Figure 4, form a shroud-laid rope. Three hawser-laid ropes laid up in a "left hand" direction form a cable-laid rope.

Most of the rope used in rescue work is hawser-laid. The principal use of shroud-laid rope is for power transmission. Larger ropes used in well drilling and mining are cable-laid.

Figure 3
Hawser laid rope

Figure 4
Shroud laid rope

SIZE OF ROPE

Rope of all kinds is usually described by giving its diameter in inches. Rope is purchased by giving the diameter and the number of feet desired but is sold by the pound. The size of a given type of rope is varied by changing the number of yarns in a strand.

STRENGTH OF ROPE

In choosing rope for a given purpose, a large measure of safety should be used. As an example, to elevate 775 pounds at a time, do not select a rope with a maximum or breaking strength of 775 or even 1,000 pounds but rather one with about seven times this amount of breaking strength.

Figure 5 shows the breaking strength of a new 7/8" manila rope to be 5,440 pounds. One-seventh of 5,440 pounds is 777 pounds, or about the same as the load to be lifted. Therefore, a 7/8" rope is the proper size for the present problem.

For a new manila rope, the breaking strength in pounds may be roughly calculated as follows: Square the diameter in inches and multiply the product by 7,200. The safe load can be found by dividing the breaking strength by seven.

Exposure and wear are the most important factors in deteriorating the strength of rope and a liberal allowance should be made for both when estimating the strength of old rope for any purpose.

Diameter, in inches	Circumference, in inches	Weight of 100 feet, in pounds	Length of Each Pound in feet & inches		Safe Load, in pounds	Breaking Load, in pounds	Diameter of Pulley, in inches
3/16	9/16	2	50	0	35	230	1-1/2
1/4	3/4	3	33	4	55	400	2
5/16	1	4	25	0	90	630	2-1/2
3/8	1-1/8	5	20	0	130	900	3
7/16	1-1/4	6	16	8	175	1240	3-1/2
1/2	1-1/2	7-2/3	13	0	230	1620	4
5/8	2	13-1/3	7	6	410	2880	5
3/4	2-1/4	16-1/3	6	1	520	3640	6
7/8	2-3/4	23-2/3	4	3	775	5440	7
1	3	28-1/3	3	6	925	6480	8
1-1/8	3-1/2	38	2	7	1260	8820	9

3	9	262	0	4-1/2	8100	66700	24

Figure 5
Facts about three strand manila rope

INSPECTION OF ROPE

A length of rope may appear badly worn on the outside and still be much better than another length which looks good on the surface. Chafing occurs in rope; the inner fibers rub or chafe against each other, especially where a rope bends when going through a pulley. Many of the central fibers become broken into dust and short pieces. Because of this, rope should be checked each time after being used, for this check may save a life. In view of the many conditions that can affect the strength of rope, and since only a part of the rope may be affected, an examination of the entire length should be made at least once every six months.

If, upon examination, any of the following conditions are found to exist, and if the condition of the rope is such that there is any doubt as to its being safe to use, the condition should be reported to a superior officer.

On the surface of the rope:

1. Abrasions (broken fibers)
2. Cuts
3. Extreme softness (badly worn rope is extremely soft and has lost its stretch)
4. Decay or burns (caused by high temperatures or chemicals)

To examine the inside of rope, separate the strands at three-foot intervals and observe the inner parts for:

1. Broken fibers
2. Fine powder (indicates the presence of grit)
3. Mildew or mold
4. Change in color of the fibers

Rope should not be carried in a truck compartment that is damp or contains sharp-edged tools. It must always be carried coiled, ready for use.

USE OF ROPE

Because rope is such a necessary and important item of equipment, it should be carried on all apparatus. The number of ropes, and size, will vary according to the squad's requirements. Generally, the sizes vary from one-quarter inch to one inch and the length from 100 to 150 feet.

Among the purposes for which rope can be used to good advantage are:

There are a number of purposes for which rope can be used to good advantage, some of which are:

1. To hoist ladders, tools and appliances
2. As a life line in rescue work
3. To aid in maintaining bystander lines
4. To lash ladders together to extend the length
5. For wrecking operations
6. As guy lines when hoisting equipment or patients

KNOTS, BENDS AND HITCHES

A knot is a knob in a piece of rope which serves as a stopper or a button and is formed by interweaving the rope. A bend is a method of fastening one rope to another, to a ring or to a loop, etc., by passing the rope through a loop and fastening it back upon itself. A hitch is a temporary knot or noose with which a rope is fastened around a timber, pipe, or post in such a manner that it can be easily untied. These definitions or distinctions are very loose in their application, and it should be remembered that most of the knots ordinarily used are, strictly speaking, bends.

Knots stay tied due to the frictional resistance of the rope which prevents its parts from slipping and thus untying the knot. A knot or hitch must be so devised that the taut part of the rope bears on the free end in such a manner as to pinch and hold. In a knot, the free end is held against another part of the rope; in a hitch, against the object to which the rope is attached.

The usefulness of a knot should be judged by the following essential factors:

1. Rapidity with which it can be tied
2. Ability to hold fast when pulled tight
3. Ease with which it can be undone

In forming knots, bends and hitches, the rope used assumes the following shapes which are described as the "round turn," the "open bight" or "loop," and the "bight" as shown in Figures 6, 7, and 8, respectively.

Figure 6
Round turn

Figure 7
Open bight
or loop

Figure 8
Bight

EFFECT ON THE STRENGTH OF ROPE E

Rope has its maximum strength when the strain from a load is applied evenly to all fibers. When a knot is tied in a length of rope, the weakest part of the rope is at the knot. In all knots, some more than others, the rope is cramped or has a very short bend which throws an overload on those fibers that are on the outside of the bend. This causes the fibers to break, and the rope may eventually part. The shorter the bend, the less the tensile strength of the rope.

The following list shows the decrease in tensile strength according to various knots:

1. Square knot - 50% loss
2. Bowline - 40% loss
3. Clove hitch - 35% loss
4. Short splice - 20% loss

WHIPPING THE END OF THE ROPE

The end of a rope that is to pass through pulleys or other small openings should be finished by whipping. The whipping is done with a very stout linen or cotton cord as follows: Make a loop in one end of the cord, hold the loop along the rope as shown in Figure 9a, and wrap the long end B of the cord tightly around the rope in the same direction in which the strands are twisted, as in Figure 9b. When within about ½ inch of the end of the rope, slip the end of B cord through the loop, as shown in Figure 9c. With the end A, pull the loop beneath the whipping as far as possible, as shown in Figure 9d. Both ends may now be cut close to the rope. The finished end is shown in Figure 9e.

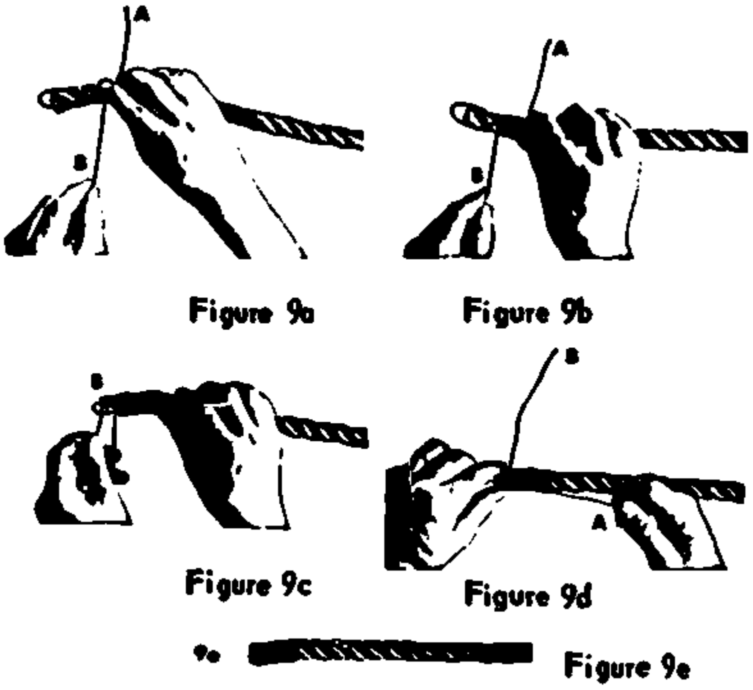

Figure 9a
Figure 9b
Figure 9c
Figure 9d
Figure 9e

Whipping the end of the rope

THE HALF HITCH

Of all the hitches, the "half-hitch" is most widely used, both alone and in combination with a variety of other knots. It is very easy to make. As shown in Figure 10, the rope is fastened to a timber by a single half-hitch. In tying the half-hitch, the free end of the rope is brought around the tension end and then brought under itself.

Figure 10
Half hitch

THE SQUARE KNOT

The square knot is used in tying two ropes of the same size together. It will not slip when drawn tight and is easily untied. It is tied as follows: Bring the two ends together and cross them as shown in Figure 11a. Place end A across B as shown in Figure 11b, and then move A around B as shown in Figure 11c. Care should be taken that the knot is tied and assumes a final shape as shown in Figure 11d; otherwise a granny knot rather than a square knot will result. See Figure 12. Be sure to observe this difference.

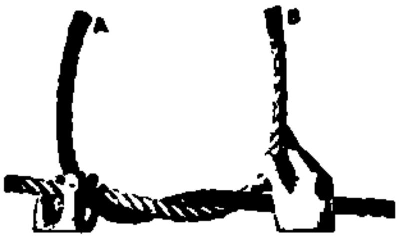

Figure 11a
First step in tying a square knot

Figure 11b

Figure 11c **Figure 11d**
Completing a square knot

Figure 12
Incorrect square knot (granny knot)

THE CLOVE HITCH

The clove hitch is used to fasten a rope to a stake, pipe or post. It is a hitch commonly used for raising or lowering small equipment. It may be tied by using either of the following two methods:

First Method - Give one end of the rope two turns around the post, cross over the long portion and place the short end beneath the second turn, as shown in Figures 13a and 13b.

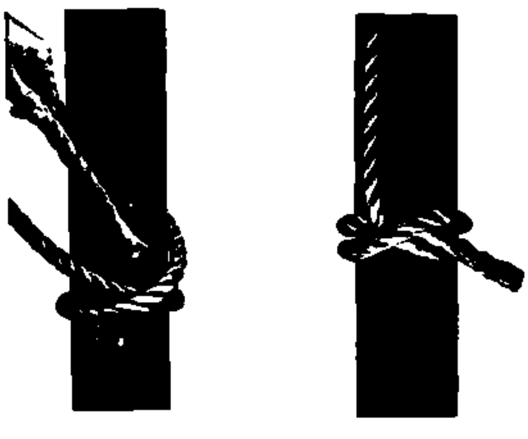

Figure 13b **Figure 13a**
Clove hitch around post

Second Method - Throw one bight in the rope to the right and another to the left, as shown in Figure 14a. Move bight A over on bight B as indicated by the arrow and shown in Figure 14b. Place the hitch over the end of the object and pull the long end in any direction.

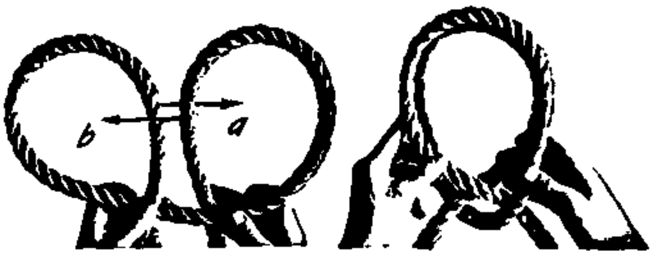

Figure 14a Figure 14b

Slip-over clove hitch

THE BOWLINE

The bowline has been rightfully called the king of knots. See Figures 15a - 15e. This knot is probably used more than any other, for it never slips and is always easily untied. It can be used wherever a loop is desired in the end of a rope. It may be tied as follows: Place the end of the rope through a ring or around an object. Throw a bight, having the long portion of the rope on the side of the bight nearest you, as shown in Figure 15a. Move the end of the rope through the bight in the direction shown in Figure 15b. Bring the end of the rope around the long portion, as shown in Figure 15c. Next, push the end of the rope up through the bight, as illustrated in Figure 15d. The finished knot is shown in Figure 15e.

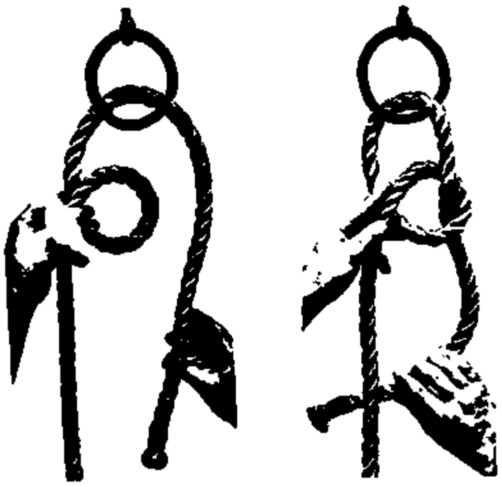

Figure 15a Figure 15b

First steps in tying a bowline knot

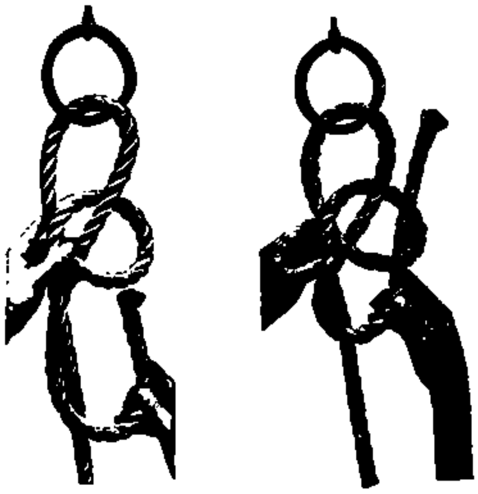

Figure 15c Figure 15d

Completing a bowline knot

THE BOWLINE ON A BIGHT

The bowline on a bight is used to form a loop at some point on a rope other than at the end. Like the ordinary bowline, it is easily untied. It is made as follows: Tie an overhand knot in a doubled portion of the rope, as shown in Figure 16a. Bring the loop back over the knot, as shown in 16b, and then pull the loop out through the knot as shown by the hand in 16c. The finished knot is shown in 16d. This knot is extensively used for rescue work and also to form a saddle sling for lowering men into manholes and similar places.

Figure 16a

Figure 16b

Figure 16c

Figure 16d

Bowline on a bight

THE CHIMNEY HITCH

The chimney hitch, shown in Figure 17, is used to obtain a tight line, or to rescue objects. It is made as follows: After the free end of the rope is passed around an object, it is brought back alongside the standing line. The free end is then passed over the standing line and between the lines. This is repeated, but on the third time around, the free end is cinched in behind the first turn. A "safety" or "binder" is then put out in front on the single line. The entire knot, thus formed, can be slipped along the main rope to take in or let out slack; it will hold its position wherever it is set.

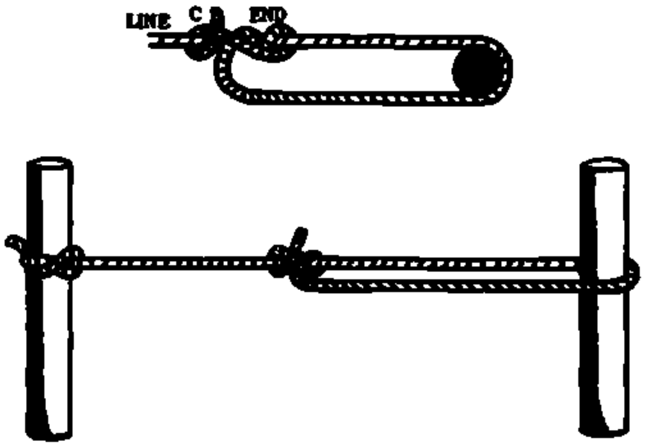

Figure 17

Chimney hitch

THE SHEEP SHANK

The sheep shank, shown in Figure 18, is a hitch used to temporarily shorten or strengthen a defective section of rope. It is tied in the following manner: Make two loops in the rope as shown in Figure 18a. Make a bight in the main part of the rope near the loop A. Push A through this bight, as shown in Figure 18b. Likewise, make a bight in the main part of the rope near loop B, and push B through this bight. The complete hitch is shown in Figure 18c.

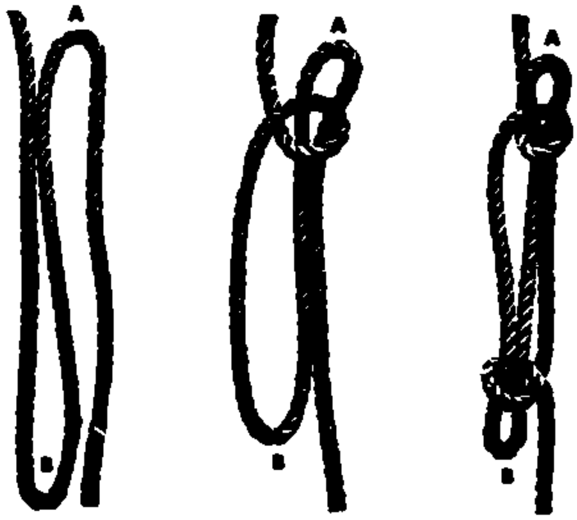

Figure 18a Figure 18b Figure 18c
Sheep Shank

THE BECKET KNOT

This tie is usually used to fasten two ropes of different sizes together. The procedure is shown in Figure 19. Make an open bight with large rope A. Take small rope B around back of rope A, bring rope B over rope A, and pass beneath original rope B. Draw knot tight.

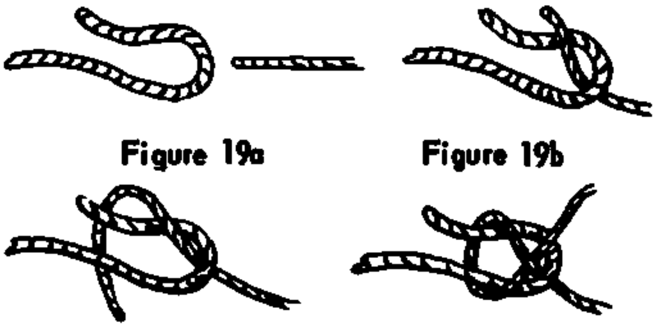

Figure 19a Figure 19b
Figure 19c Figure 19d
Tying a Becket knot

ROPE SPLICING PRINCIPLES AND TECHNIQUES

It has been found that a rope that breaks usually has weak spots other than at the point at which it broke. Rope that has become weakened in small areas can be reclaimed by removing the weak portion and splicing the remainder together. Only in case of dire need should a rope be spliced for use in the rescue service. For general use, other than for emergencies, ropes may be spliced.

This section describes how to follow the principles of rope splicing:

1. Unlaying the strands
2. Placing the ends together
3. Tucking the ends of the strands

In the short splice, the long splice, and spliced crown, the ends of the strands are tucked in exactly the same way. Therefore if the making of one splice is mastered, the others are easily learned.

THE SHORT SPLICE

Where it is not necessary for a rope to pass through a small pulley, or where only a small amount of rope can be spared for making a splice, the short splice is very satisfactory as it is as strong as the long splice. The method of making it is as follows: Count seven turns of the strands from the ends to be spliced and tie strings around the ropes at these points. One turn of a rope is that part shown in Figure 20a at A. Unlay the ends back to the points where the strings are tied, as shown in Figure 20a.

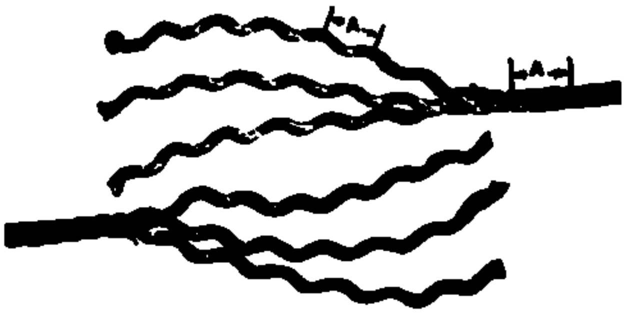

Figure 20a

Before placing the two parts together, be sure to open each end as shown in Figure 20b and not as shown in Figure 20c.

Figure 20c

Figure 20b

Bring the two parts together so that each strand of one part alternates with a strand of the other as shown in Figure 20d.

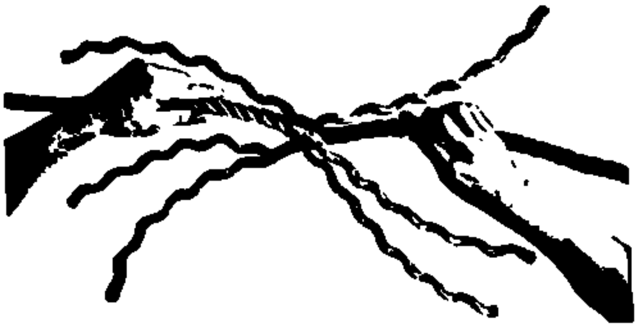

Figure 20d

With a string, tie one set of strands around the rope, as shown in Figure 20e at A.

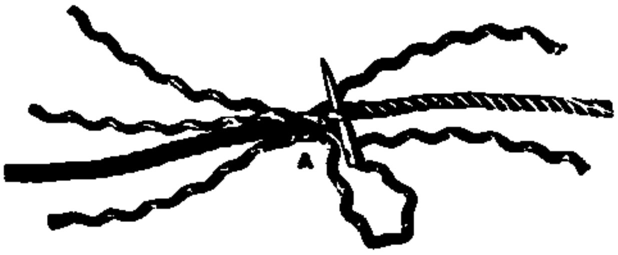

Figure 20e

Next, begin tucking the strands from the left side by bringing a strand from the right side down under the next, as shown by the marline spike in Figure 20e. The tucking should be done at right angles to the direction of twist in the rope.

Give each of the other two strands from the left side one tuck in exactly the same manner. The splice should now appear as shown in Figure 21a.

Figure 21a

Next, cut the string shown in Figure 21a at A and give each strand from the right side one tuck, just as was done with the strand from the left.

Figure 21b shows all the strands tucked once. Give each of the six strands two more tucks, always remembering to bring the strand to be tucked over the one nearest to it and under the second, in a direction about at right angles to the direction of the twist in the rope.

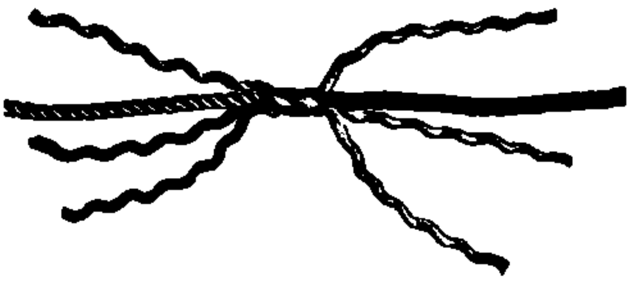

Figure 21b

Next, divide each strand into two parts, as shown in the left of Figure 21c. Give one part of each strand two more tucks.

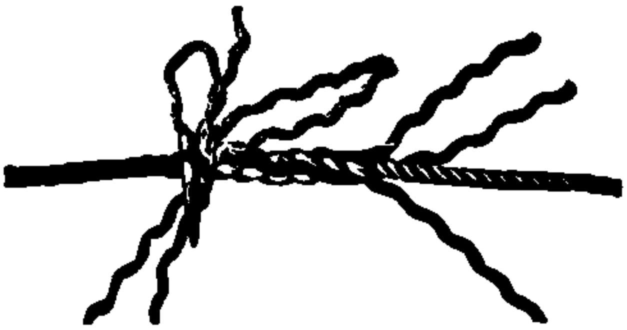

Figure 21c

Cut all the ends off and roll the splice beneath the foot on the floor or between boards to give it a smooth appearance. The finished splice should appear as shown in Figure 21d.

Figure 21d

THE LONG SPLICE

The long splice is more desirable than the short splice when it is necessary for the rope to pass through small pulleys. It also has a neater appearance. To make a long splice in a three-strand rope, count fifteen turns from the ends to be spliced and tie strings around the rope at the points thus determined. Unlay the strands back to the strings, as shown in the lower part of Figure 22a.

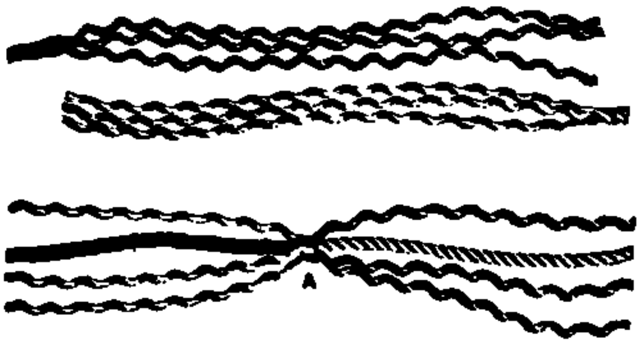

Figure 22a

Long splice

Before bringing the two parts together, be sure to open each end as shown in Figure 21b of the short splice and not as shown in Figure 21c; that is, no strand should cross between the other two.

Bring the two parts together, making each strand from one end alternate with a strand from the other, as shown in Figure 22a at A.

Next, beginning at the point where the two parts are placed together, unlay one of the strands to the right. Lay carefully in its place the corresponding strand from the left. This latter operation should follow closely the unlaying of the strands to the right. Stop at five turns from the end of the strand from the left, as shown in Figure 22b at B.

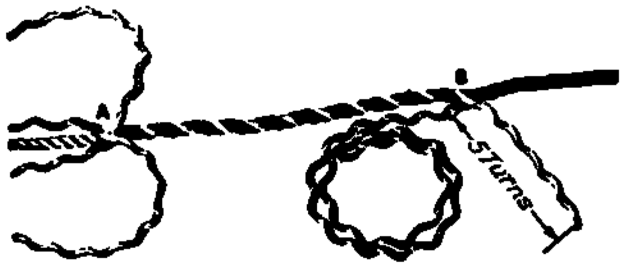

Figure 22b

There are still two pairs of strands left at point A where the two ends were placed together. Run one of these pairs to the left exactly as the first pair was run to the right. This is shown in Figure 22c at C.

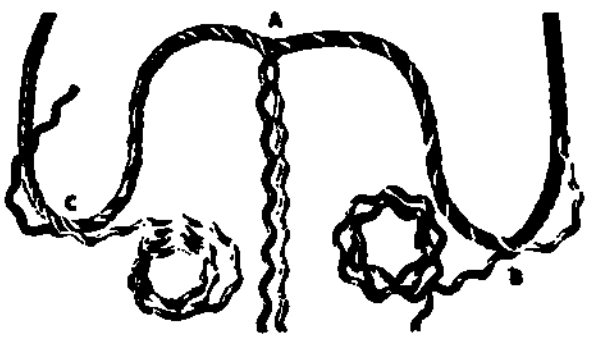

Figure 22c

Before starting to unlay toward C, Figures 22c and 22d fit together as a pair. Next, cut off all the long ends of the strands about five turns from the main rope, as shown in Figure 22d.

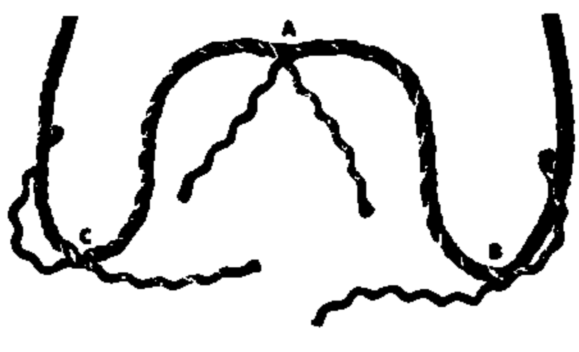

Figure 22d

The next part of the splicing consists of tucking the ends of the strands. There are three strands. All are tucked in exactly the same way, which is as follows: Be sure that the ends of the strands pass each other as illustrated in Figure 22e at A and not as at B.

Figure 22e

Bring the strand from the right up over the nearest strand from the left and under the next strand, as in Figures 22f and 22g.

Figure 22f

Figure 22g

Give the strand from the left one tuck, as shown by the marline spike in the upper part of Figure 22h.

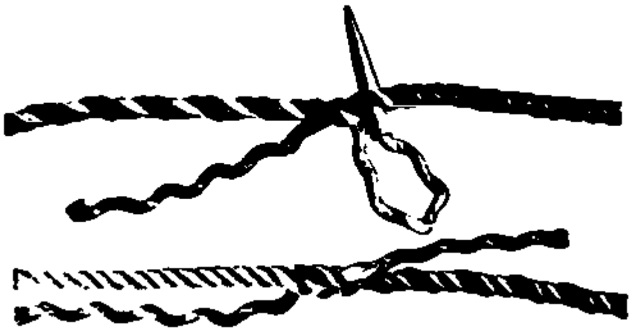

Figure 22h

Each strand should now be given two more tucks in a direction almost at right angles to the direction of twist in the rope as shown in Figure 22i.

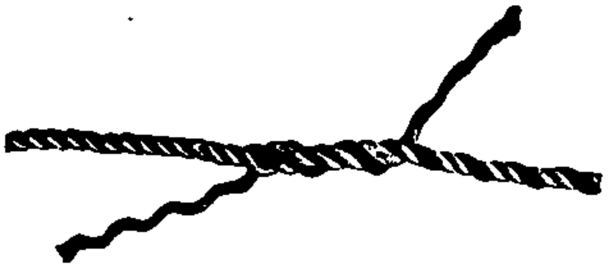

Figure 22i

When all three pairs of strands have been tucked, cut the ends off and smooth by rolling beneath the shoe or between two boards. The finished splice should appear as shown in Figure 22j.

Figure 22j

THE SPLICED CROWN

Where a slight enlargement is not objectionable, the spliced crown is a desirable way to finish the end of a rope. See Figure 23. It is made as follows: Unlay six turns of the rope. Form a loop in strand A, bringing the end between strands B and C, as shown in Figure 23a. Next, move strand C between the loop in strand A and strand B, as shown in Figure 23b. Pull strand B through the loop in strand A, as indicated in Figure 23c. Draw up tight the crown thus formed, as in Figure 23d. Give each strand one tuck by bringing it over the strand nearest to it and under the second as in rope splicing. This is shown in Figure 23e. Figure 23f shows the first tuck complete. Give each strand two more tucks and cut off the ends of the strands. Smooth the crown by rolling beneath the foot on the floor. The finished crown is shown in Figure 23g.

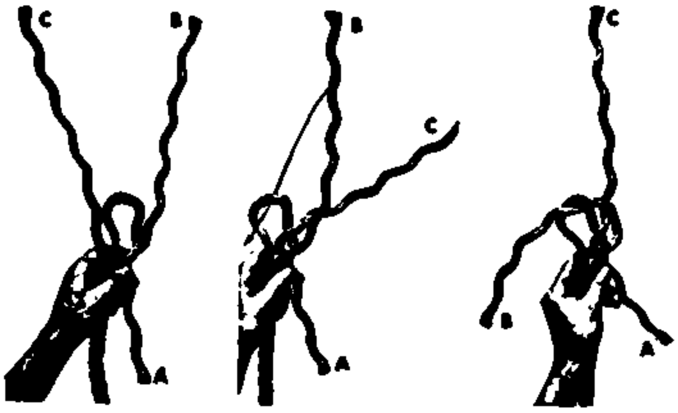

Figure 23a Figure 23b Figure 23c

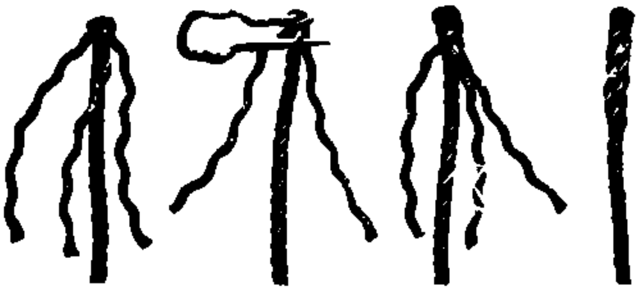

Figure 23d Figure 23e Figure 23f Figure 23g

Spliced crown

ROPE COILS

In the rescue service, a knowledge of how to coil a rope correctly is essential. Many times an improperly coiled rope may result in the failure of an evolution. A rope coiler should be made and should be in service at squad headquarters at all times. Figure 24 shows a method of making a convenient rope coiler. However, any type of coiler may be used.

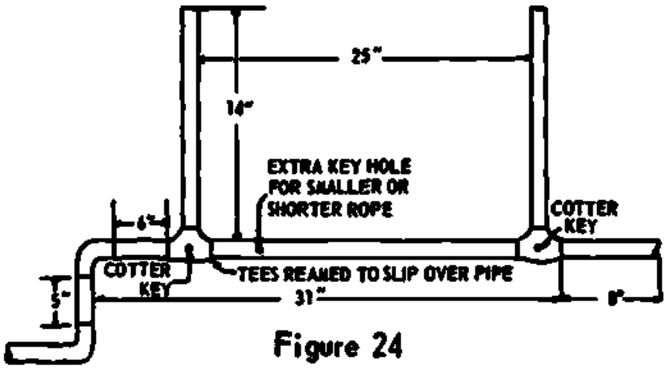

Figure 24

Detail of rope coiler

In starting the coil, face the "coiler," but somewhat to the right. See Figure 25. Hold a short length of the free end of the rope inside the left coiler shaft with the heel of your left hand resting on the shaft. Take one short turn around the left shaft, then make long loops over and under both shafts.

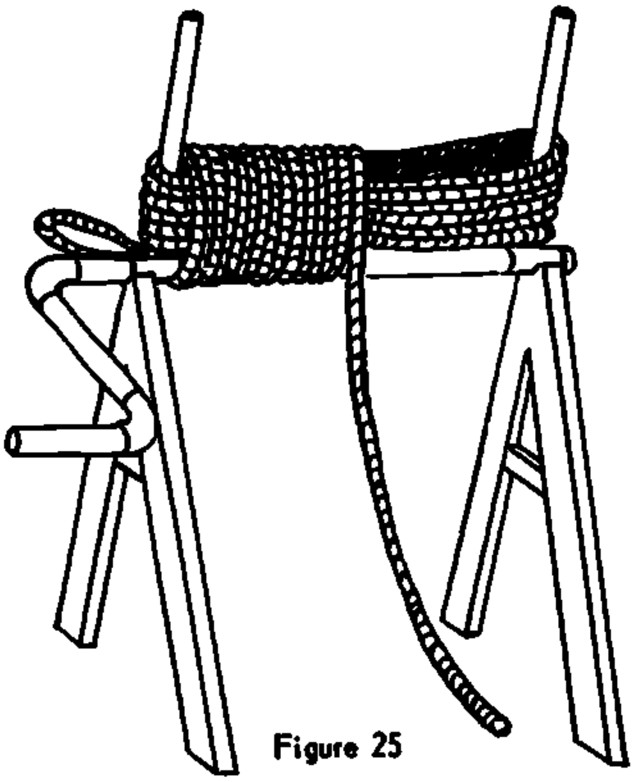

Figure 25

Rope coiler

Coil the rope around the shafts of the coiler until a sufficient amount of rope is used. See Figure 26. This amount can be determined only by trial.

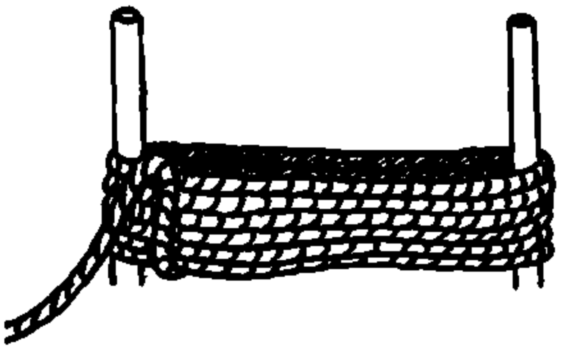

Figure 26

Begin to coil

Next, coil the rope in the opposite direction, as shown in Figure 27, by turning the coiler in the frame.

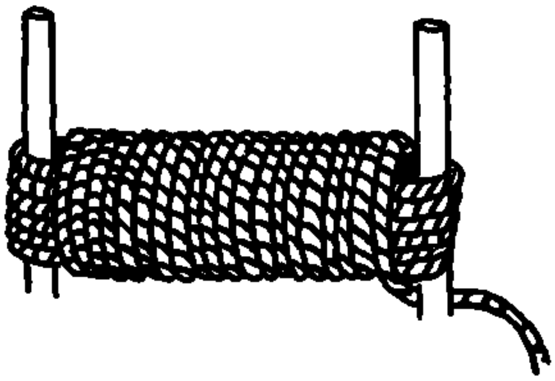

Figure 27

Coil in opposite direction

When the wrap is finished, as shown in Figure 28, remove the coiler shafts, handling the coil with care. Now double the remainder of the rope and pass the loop through the opening in the end of the coil, as shown in Figure 28, then through the opposite end of the coil.

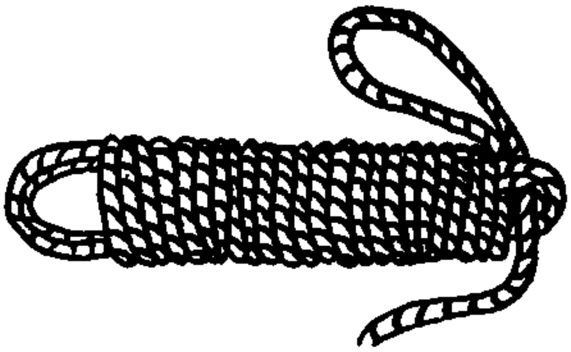

Figure 28

Finished coil

Next, insert the loose ends of the rope through the loop and pull the loop up tight. See Figure 29.

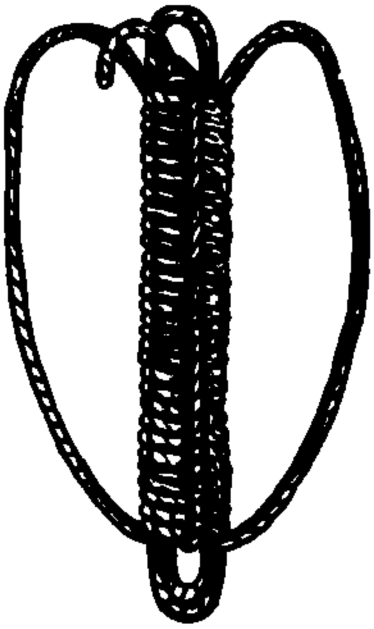

Figure 29

Coil finished and ready for carrying

If the lengths are right, the loops formed will be large enough to permit a man to load the coil on his shoulders, as shown in Figure 30. The shoulder loops may be adjusted by shortening the loose end of the rope. To undo the shoulder loops quickly, grasp the free end near the center of the coil and pull away from the coil, thus unlocking the end, and continue pulling until the shoulder loops come clear of the coil. This long end is dropped with the coil.

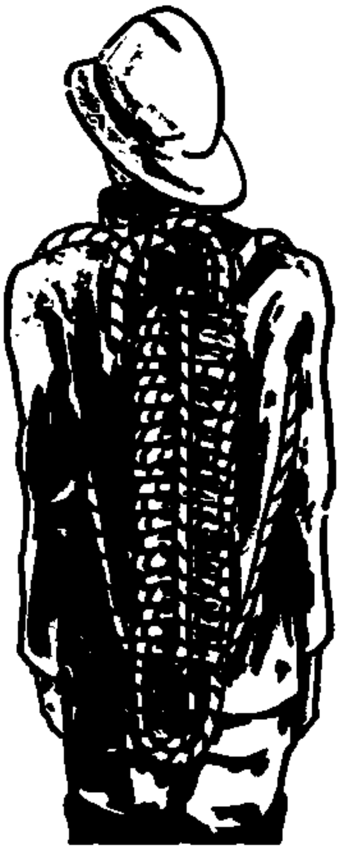

Figure 30

Carrying coil

When dropping the coil from a height, grasp the inside free end and pull several feet out from the core. Retain this aloft. When pulling out on the ground, also pull out the core first.

COIL FOR THROWING ROPE

At times it becomes necessary to throw a rope from a roof, upper story, or over an object. There are several ways in which rope can be coiled for throwing. A good method is as follows: Coil several loops not over 18 to 20 inches long, like A in Figure 31. Carry the next loop through the slack and up to make loop B. Then hold loop B in the right hand with loop A hanging in loop B at D. Next, coil a series of small loops about 12 inches in diameter on top of loop B in the right hand. The rope is now ready to throw. Practice is necessary to throw accurately and to determine the amount of coiled rope necessary for the distance to be covered. Rope will straighten out completely on the throw.

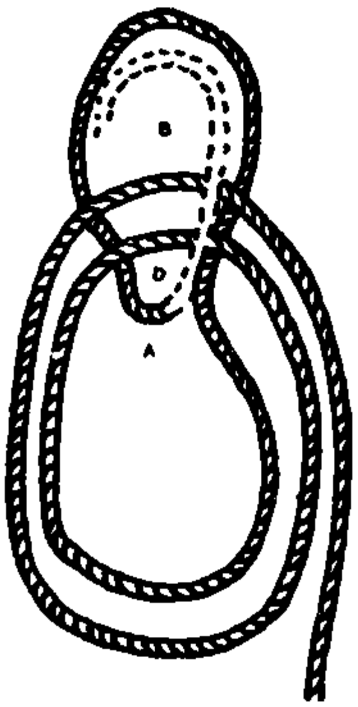

Figure 31
Coil for throwing rope

SUPPLEMENTARY ILLUSTRATIONS OF KNOTS AND HITCHES

In the preceding section, detailed instructions were given on tying the various knots and hitches used in rescue service. Very little information was given, however, as to their actual use. Figures 32 to 38 illustrate actual usage of several of the knots and hitches as well as additional ways of making some of them.

Figure 32
Hoisting uncharged line with running bowline

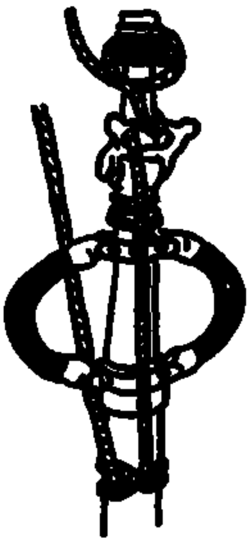

Figure 33
Hoisting charged line with clove hitch & half hitch - Method 1

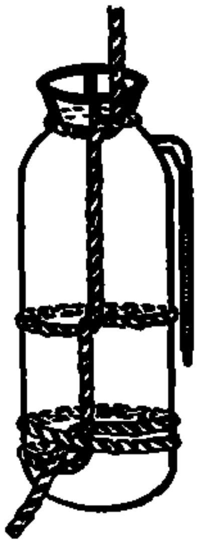

Figure 35
Hoisting extinguisher

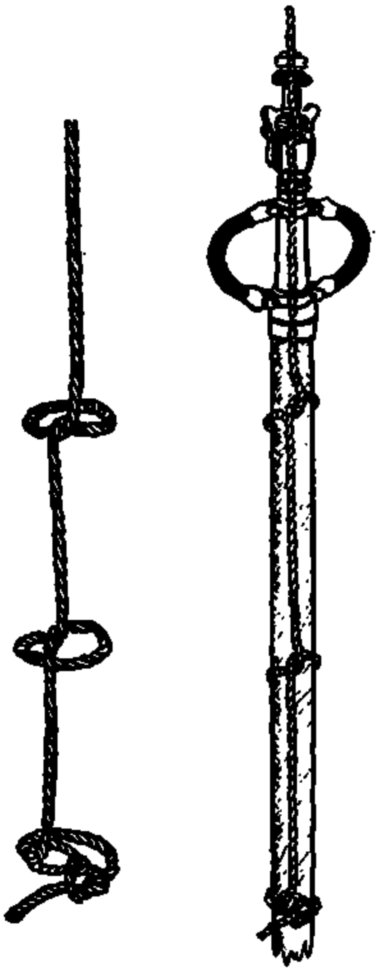

Figure 34
Hoisting charged line with bowline and half hitches - Method 2

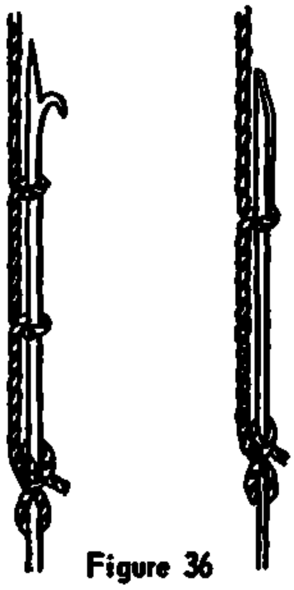

Figure 36
Hoisting pike and bar

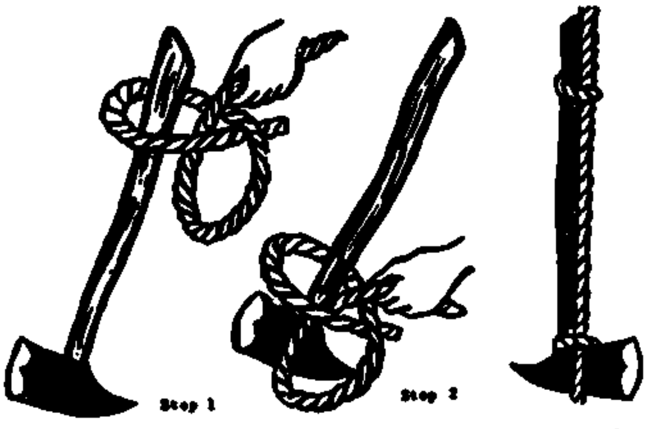

Figure 37
Hoisting axe

The tackle knot shown in Figure 38 is a hitch used for pulling operations when blocks are not available, or for stretching a tight line. If used for the latter purpose, the pull rope should be taken back and tied around both parts A and B using the chimney hitch.

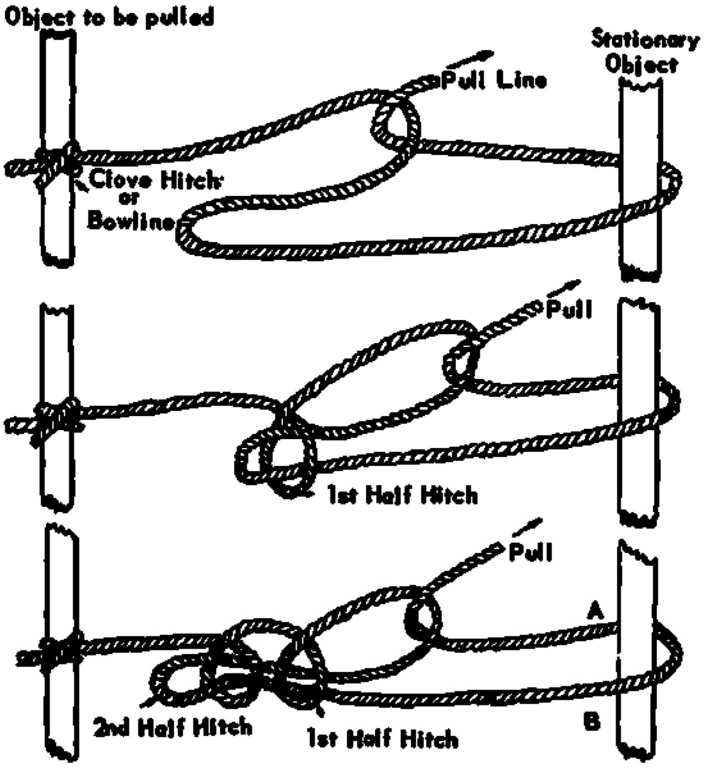

Figure 38

Tackle knot

For hoisting ladders with a bowline, follow the procedure in Figure 39. The tie is made at about one-third of the length of the ladder from the top end. Start rope around beam and out the front side and continue with rope around opposite beam, bringing it out behind the cross rope.

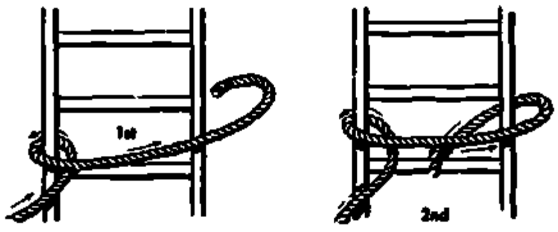

Figure 39a Figure 39b

First steps in hoisting ladder using bowline

Next, a bowline is made with the hand next to the ladder while facing the top.

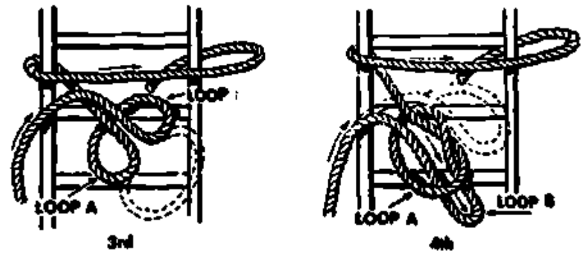

Figure 39c Figure 39d

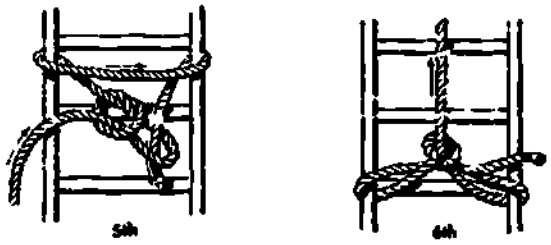

Figure 39e Figure 39f

Completing hoisting ladder using bowline

Pull the knot taut. It will lie just above the cross rope. When using this hoist, turn the ladder over so the knot is between the ladder and the building. When hoisting roof ladders the tie should be made on the third rung above center.

CABLE

Cable, sometimes called "wire rope", is usually made of iron or steel. To obtain the maximum usefulness, economy, and safety from a cable, several simple rules must be observed.

It is normal for iron or steel to corrode or rust when exposed to the air for long periods. Therefore it is necessary to take precautions to protect iron cable from the elements. Some manufacturers do this by galvanizing and other coating processes, which make the cable less susceptible to atmospheric conditions.

Although lubrication is applied to cable during fabrication, it is not sufficient to last during the cable's entire useful life. A good grade of oil or grease, free from acids and alkalies, should be applied periodically.

A wire cable is a machine of many moving parts. Each time the cable bends or straightens, the wires in the cable slide on each other. The lubricant must be able to penetrate between these strands. A rusty cable is a liability; therefore cables should be kept clean and free of rust by the use of scrapers and wire brushes.

Contact with chemicals, alkalies, and acids which destroy the metal or internal core, should be avoided. Cable should be stored in a dry place and must be inspected periodically for breaks, damage, weakness, and wear.

BLOCK AND TACKLE

This equipment is used in rescue work to provide a mechanical advantage in raising or moving heavy objects. A block and tackle consists of two blocks, usually connected together by as many strands, or reeves, of rope as there are sheaves in the blocks. (See Figures 40 and 41 .)

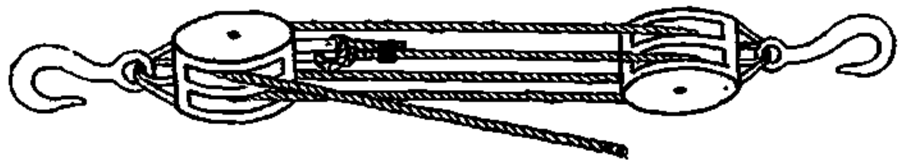

Figure 40
Block and tackle with double-to-double reeving

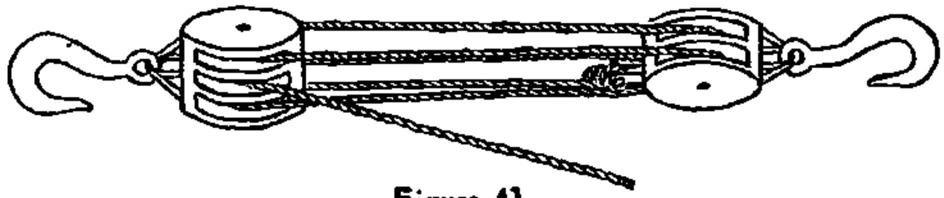

Figure 41
Block and tackle with triple-to-double reeving

The number of strands of rope which support the weight or load determine the mechanical advantage ratio. For example, to raise a 500-pound load, the effort required on the pull line of a three-and-two combination tackle (excluding friction) is 100 pounds.

An ordinary or straight block and its component parts are shown in Figure 42.

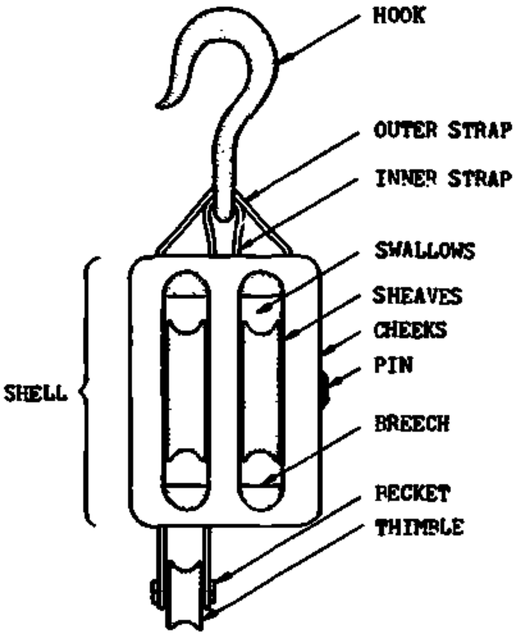

Figure 42
Straight block

Figure 43 shows a snatch block, generally used in rigging operations to achieve a change of direction in pulling. It consists of a single block with an opening and locking device on one side to permit the rope to be inserted.

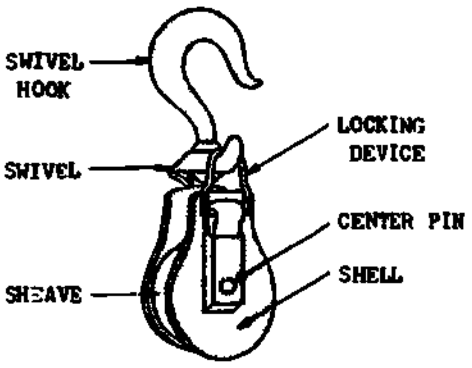

Figure 43
Snatch block

Often additional precautions must be taken to prevent a rope or sling from slipping or jumping out of a hook. Precautions are needed when a person is being raised or lowered, when his weight might surge during an operation, or while he is being supported temporarily before beginning the operation. This safety practice is called "mousing" a hook. A piece of cord or heavy twine is wrapped around the opening in the hook and is secured by a square knot. (See Figure 44.)

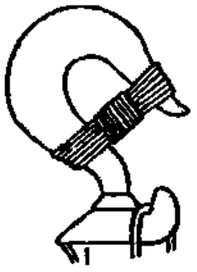

Figure 44
Moused hook

POLES

GIN POLE

The lifting of heavy loads or victims in rescue operations is often accomplished by the use of a gin pole. (See Figure 45.)

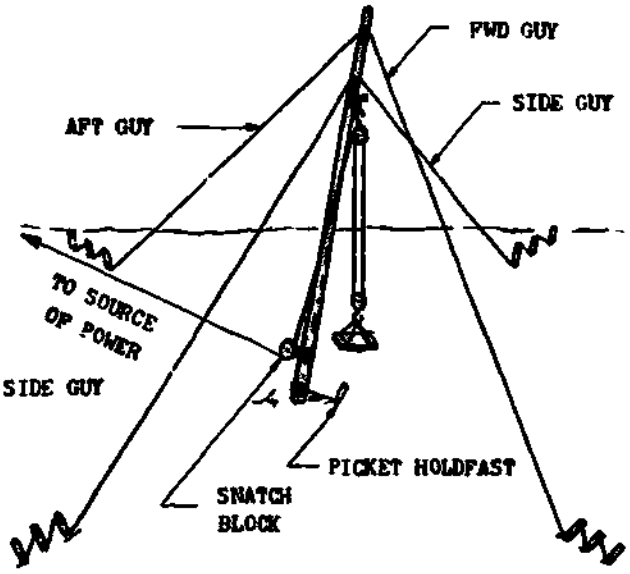

Figure 45
Gin pole

A gin pole usually consists of a single pole held in a nearly upright position by four guy lines. The tackle is attached to the single pole. The pole may be made from any timber, which must be chamfered at the top or designed in some other manner for the attaching of the tackle. In general, the shorter the length of the pole bearing the load, the greater will be its capacity.

A block and tackle is lashed to the top of the pole. The hauling part of the tackle leads through a snatch block at the base of the pole to the source of power. Details of typical lashings are shown in Figures 46 through 48.

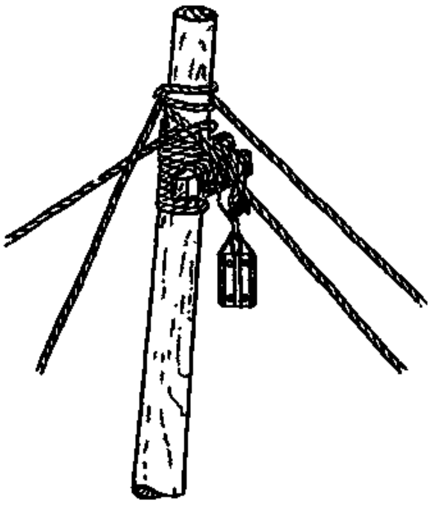

Figure 46
Square lashing top of gin pole

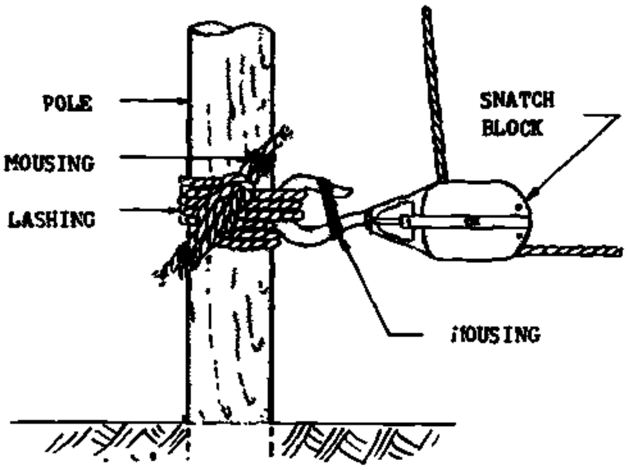

Figure 47
Round lashing base of gin pole

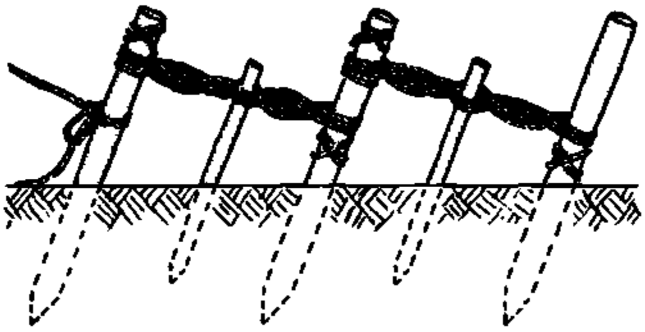

Figure 48
Pickets or holdfasts

LADDER GIN POLE

When suitable poles and timbers are not available, ladders may be used to rig gin poles and sheerlegs.

Figure 49 shows a ladder gin pole. It can be set up as follows:

1. Attach a rope or sling around the rails near the top of the ladder to support a block and tackle.
2. Fasten two guy lines to the ladder, one on each rail where the sling is secured.
3. Raise the ladder to the desired position, and anchor the guy lines. (See Figure 49.) If necessary, anchor the ladder at the bottom to keep it from slipping.

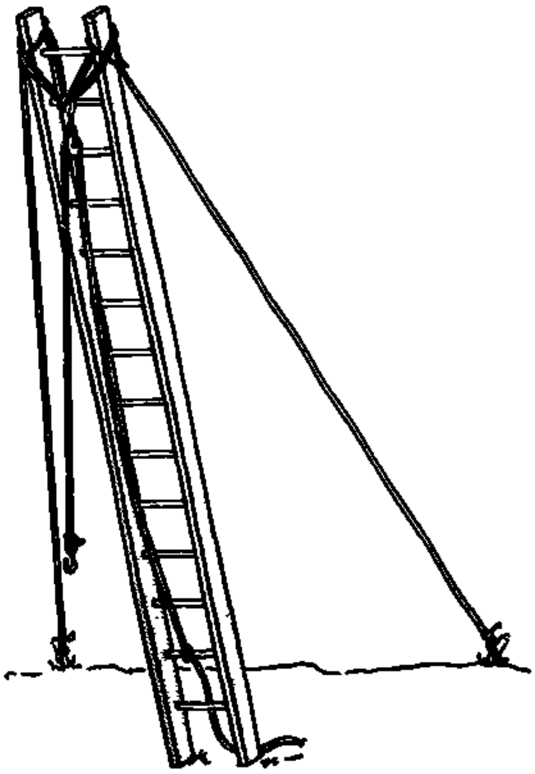

Figure 49

Ladder gin pole

LADDER SHEERLEGS

To erect sheerlegs with ladders, as shown in Figure 50:

1. Place one ladder on top of another and lash the beams together loosely at the top.
2. Turn the ladders on their beams and spread the unlashed ends to form a "V".
3. At the lashings, attach a sling to support the block and tackle, and fasten guy lines at the lashing around the beams on each side.
4. Raise the ladders and anchor the guy lines. Anchor the ladders at the bottom to prevent spreading.

Sheerlegs constructed with ladders cannot be drifted and, like tripods, they are restricted to vertical lifting.

In both of these operations, if speed is of importance, the lines need not be staked out as shown. Men could be assigned to hold the guy lines.

A stepladder can be easily and quickly assembled by tying two straight ladders together, as shown in Figure 51. A tie line must be used at the bottom to keep the ladders from spreading. The rope should be attached to the bottom rungs of each ladder and fastened securely with clove hitches at each end.

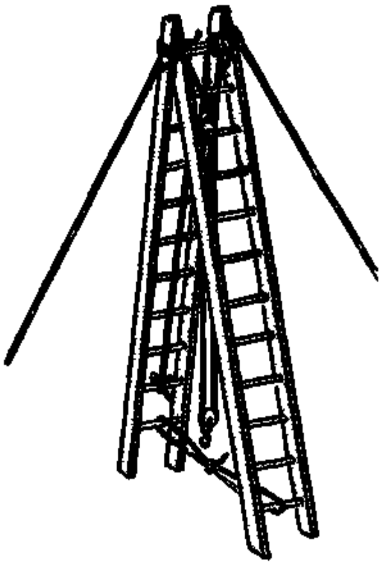

Figure 50

Ladder sheerlegs

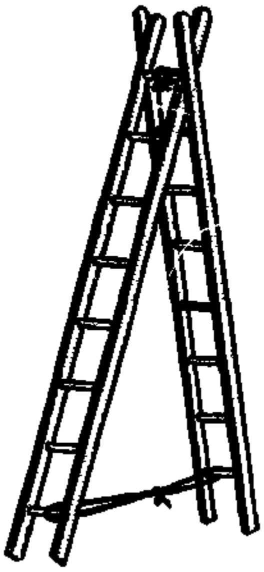

Figure 51

Assembling stepladder

VICTIM RESCUE

BODY TIE AND HARNESS

A good method for securing a victim, when he is to be either raised or lowered, during rescue, is the "Approved Body Tie". (See Figure 52.)

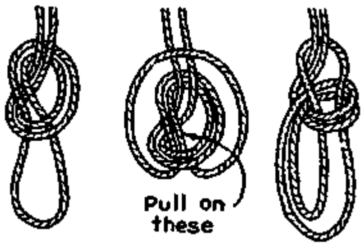

Figure 52a

Bowline on a bight adapted for body tie

This tie is an adaptation of the bowline on the bight. In tying it, about three feet of free end must be left outside the knot. Either loop of the bowline is slipped over each leg of the victim to be rescued. Take care to draw these loops as far up to the crotch as possible. Then, throw a half-hitch under the arms. Throw a bight in the standing line in front of the chest. Then pass the loose end of the rope through the bight. The line is then drawn tight, making a firm knot.

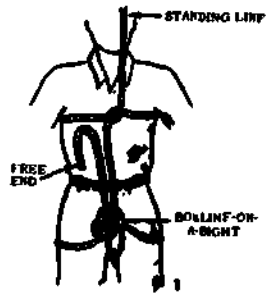

Figure 52b

Start of body tie

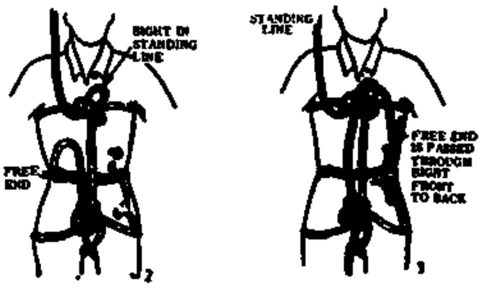

Figure 52c **Figure 52d**

Body tie complete

Another method for raising or lowering victims is by the use of a body harness. The harness has the advantage of being easier and less time-consuming to place on the victim. Figure 53 shows a sketch of one type of harness. Figure 54 shows the harness in place.

SUSPENDING VICTIM HORIZONTALLY ON STRETCHER

A victim on a stretcher may be raised or lowered while in a horizontal position, using either a one-point suspension method or a four-point suspension method. The first method is especially useful when lowering or hoisting victims several floors, and when using lifting devices such as derricks and gin poles. (Fire department aerial ladders can sometimes be used for this purpose. A separate section on aerial ladder rescue can be found in this manual.) The four-point method is more useful for shorter distances.

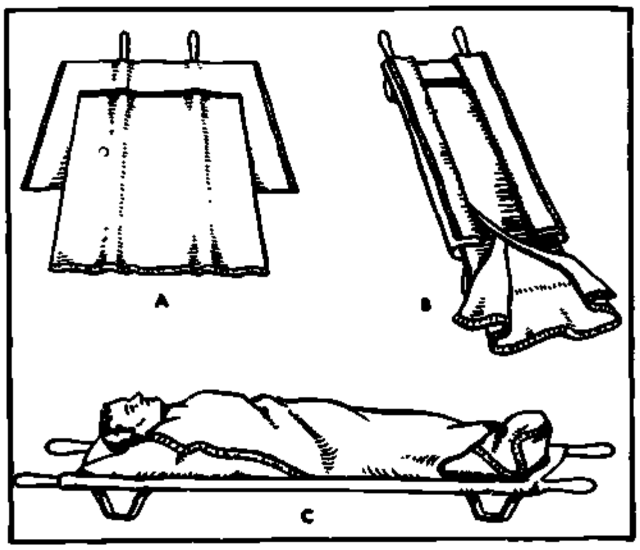

Figure 55

Method of wrapping victim

In preparing to lower a victim horizontally, first wrap him in a blanket or salvage cover. (See Figure 55.) Lash him securely to the stretcher, starting with a clove hitch on one of the handles near the head. Then pass the rope partway down one side of the stretcher, taking a complete turn underneath and back over the victim's chest, and making a half-hitch at the side. Extend the rope on down the side of the stretcher, making at least two more turns, one just above the knees and one just at the wrists with hands at side. Then pass the rope around the victim's feet, bring it up on the opposite side of the stretcher, and secure it with a clove hitch. (See Figure 56.)

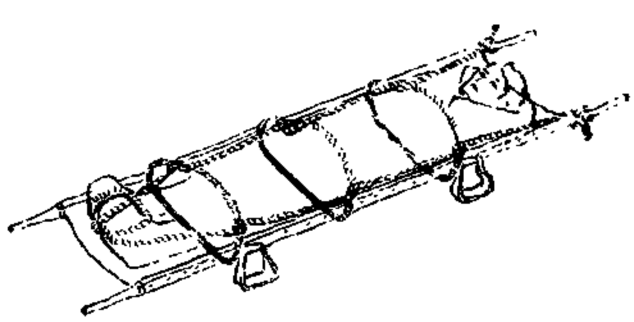

Figure 56

Victim tied on stretcher

After a victim is securely lashed, he may be moved by the one-point suspension method using another rope. Measure three times the length of the stretcher, plus one arm's length. Double the rope and tie a bowline on a bight. Lay the rope on the middle of the stretcher and draw the two loops even. Then pass the large loops over each end of the stretcher and put smaller loops over each handle. Secured in this manner, the stretcher may be raised or lowered without tilting. Guide lines may be attached to the stretcher when necessary. (See Figure 57.)

To use the four-point suspension method, first lash the victim as previously explained. Instead of using the bowline on a bight, fasten a lashing line to each handle of the stretcher with a half-hitch and secure the line to the "D's" with a bowline. Four men are needed in hoisting or lowering, one man to control each line. Men should wear gloves to prevent the ropes slipping or burning their hands. Where a stretcher is to be hoisted or lowered only a short distance, forty-foot lashing lines may be used. (See Figure 58.)

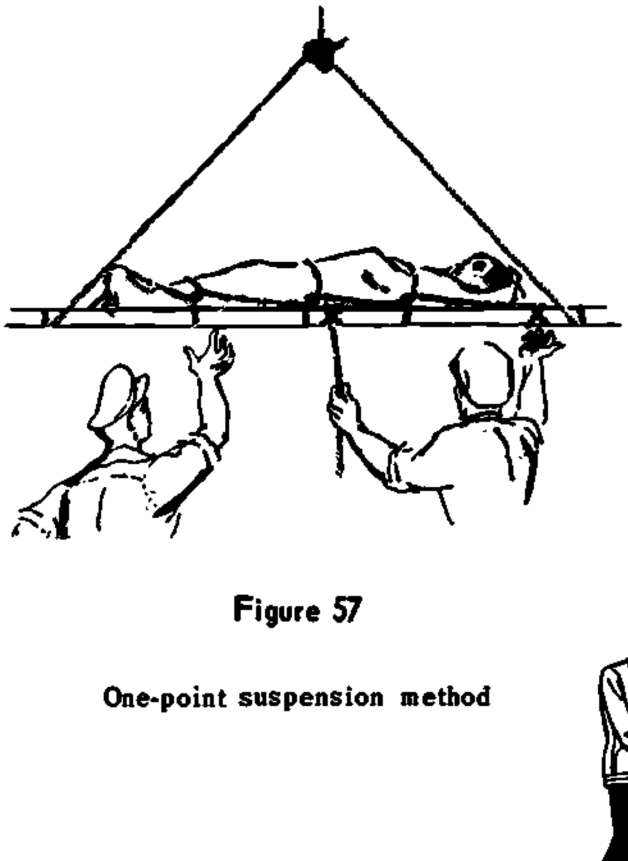

Figure 57

One-point suspension method

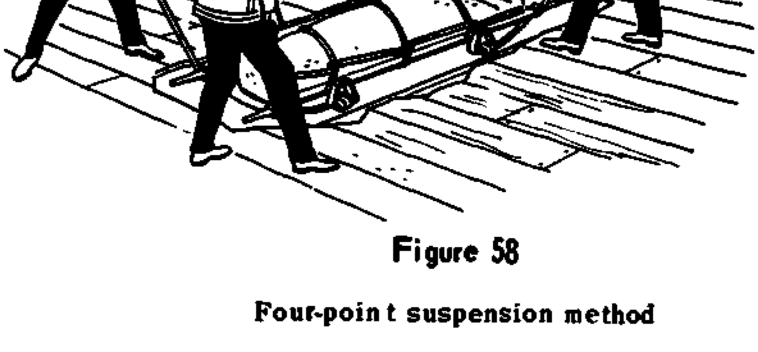

Figure 58

Four-point suspension method

If a ladder is substituted for a stretcher, either the one-point or four-point suspension method may be used. In either case, the victim must be lashed securely, as shown in Figure 59.

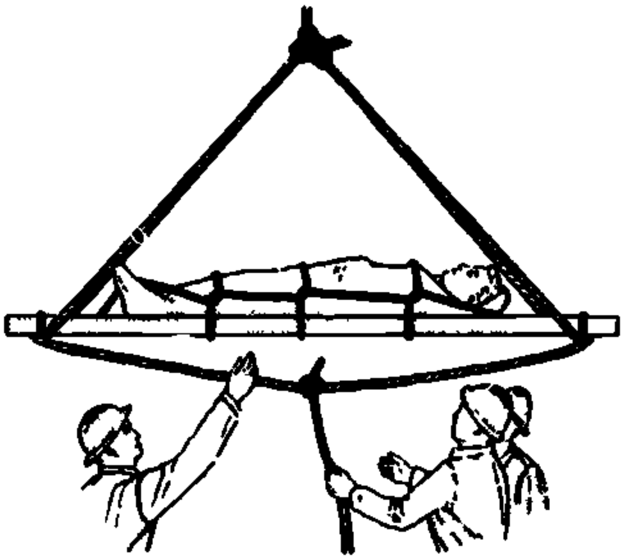

Figure 59

Secure lashing of victim

SUSPENDING VICTIM VERTICALLY

Frequently victims must be lowered feet first because the only available opening is narrow. Several methods may be used to raise and lower victims in a vertical position. The backboard is best for this type of rescue, since the victim can be secured in it and a lowering rope fastened to the head end. When lowering a backboard, attach a guide rope to the lower end sufficient in length to reach the ground.

To lower a victim vertically, first lash him to a backboard as described in Chapter XIII. Secure the lowering line to the hand holds at the head of the backboard by tying a bowline. Attach a guideline to the hand holes at the foot of the backboard.

Figure 60 illustrates the use of a ladder in place of a backboard for lowering a victim vertically.

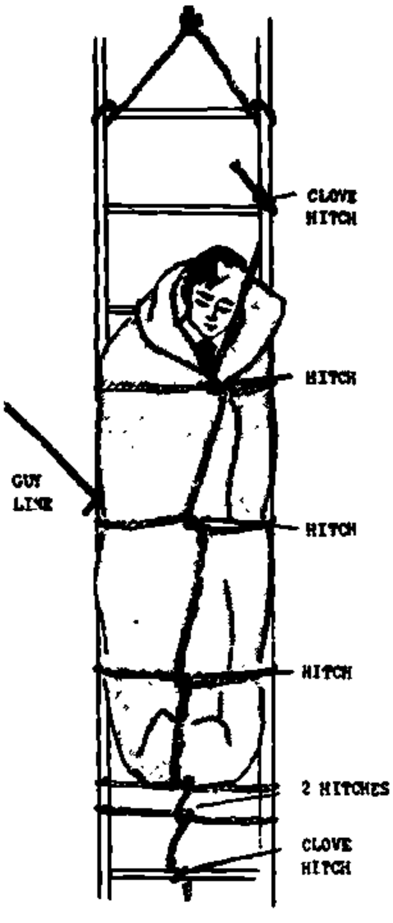

Figure 60

Use of a ladder

Figure 61 shows how a ladder can be used in connection with the vertical method of lowering a victim on an army stretcher. Two poles are run through the "D's" to serve as skids on the ladder beams. Stakes should be driven into the ground at the base of the ladder, and the beams should be lashed to these stakes.

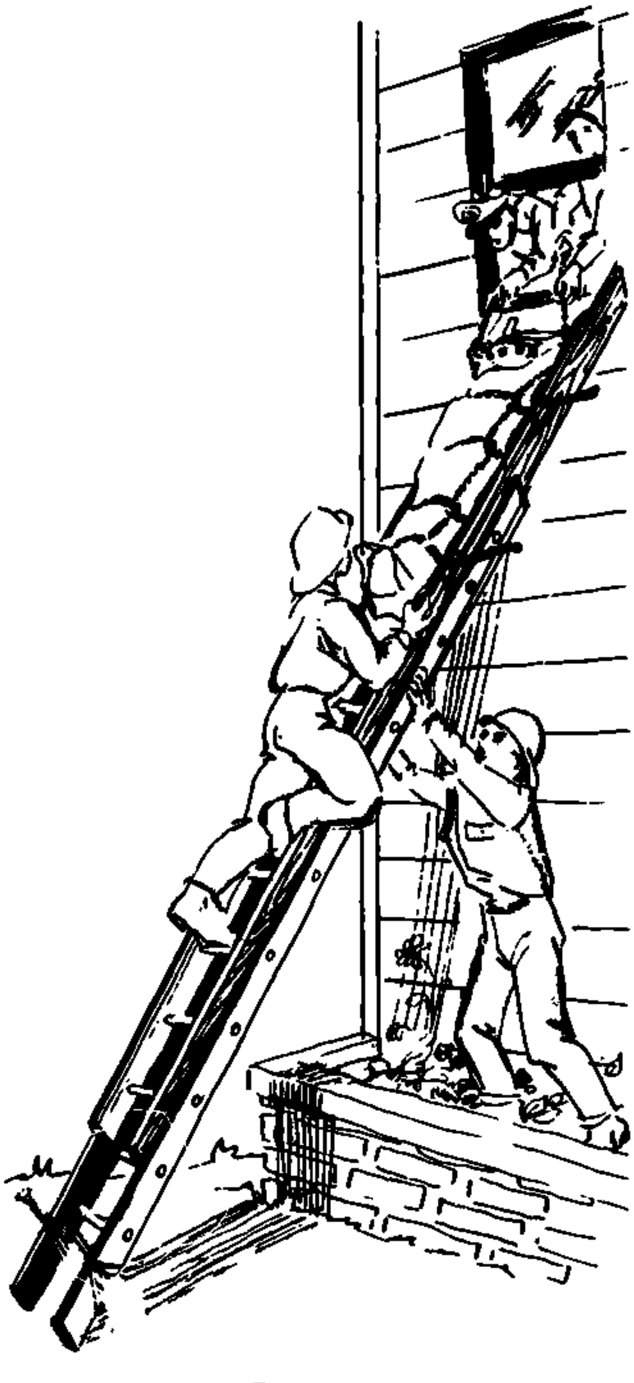

Figure 61

Using a ladder in connection with lowering a victim vertically

MAKING A WIRE RESCUE

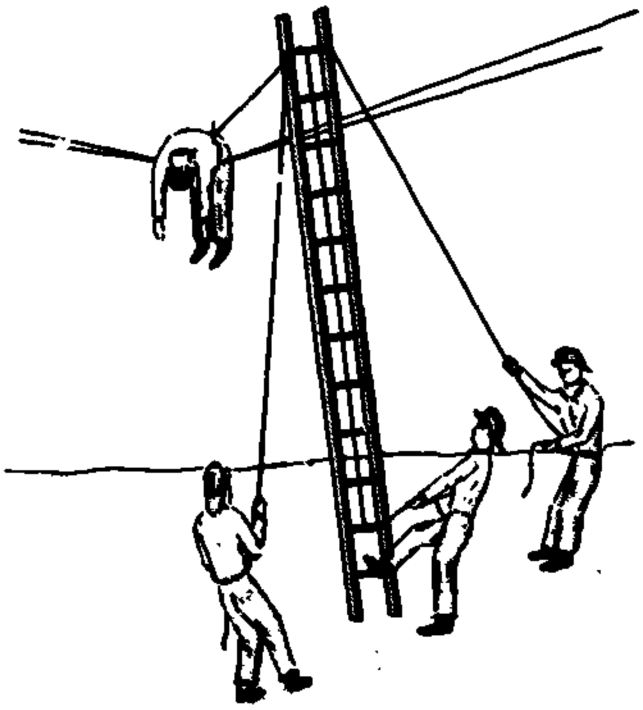

Figure 62

Making a wire rescue

To take an unconscious man off overhead wires, as shown in Figure 62, use a ladder that extends at least five feet above the victim. The ladder is placed climbing side down, with the heels some distance out from the spot directly below the victim. One man doubles a long rope and places the middle of it across the top of the ladder, then tucks it under the top rung, pulls through some slack, and nakes a partial cat's paw over each top end of the ladder beams. Trailing ends of the rope then come off outside of the beams. The rope should be spread to make an angle of about ninety degrees, and the ladder top should be laid in toward the victim. Two squadmen heel the ladder. A third man passes another rope beneath a low rung, pulls it back through at the second rung above, ties a running bowline in the end, and throws this over his shoulder. He climbs above the victim, leg-locks in, passes the rope over a high rung, then drops a lasso loop over the victim. The rescuer then rapidly descends. While he is coming down, the ladder is laid in as closely as possible to the victim. The rescuer pulls the slack out of the rescue rope and snubs it on a low rung. The other rope men slowly pull back on the top of the ladder until the victim is pulled clear of the wires. Care should always be taken so that the ladder does not go past the vertical position.

A metal ladder should not be used for this operation because of the danger of touching the conductor or the possible arcing from a live line.

LOWERING VICTIM FROM A HEIGHT

Emergencies sometimes occur which make it necessary to lower victims from high places. Figure 63 shows one satisfactory method for doing this which is used particularly when the base of the structure is not suitable for lowering the victim vertically. In this method, a sheave block is used on a rope or wire cable sloping from a high part of a building and anchored at or near the ground. A backboard, with the victim, is suspended from the running pulley. A backboard with footrest is the most desirable type for this operation because it facilitates the lashing of the victim securely. Two guide lines are attached at the lower hand holes at the ends of the backboard during its descent. This technique is sometimes referred to as a "breeches buoy" or "Telfar line".

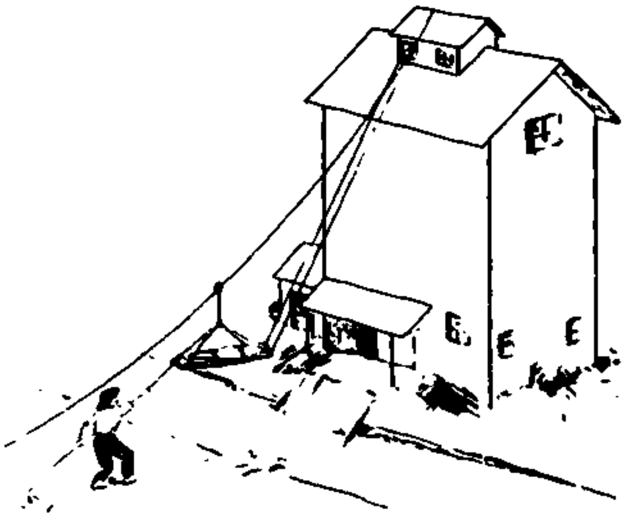

Figure 63

Lowering victim from high places

ACTUAL RESCUE OPERATION

The following is an account of an actual rescue operation as reported by the Chief of the Sylvania Fire Department, Sylvania, Ohio.

On September 7, 1956, the Sylvania Township Fire Department received a call from an elevator company. When we arrived we were told that three men were in a grain pit. The elevator was approximately seventy-five feet high, and the trapped men were about forty feet below the top of the elevator which was also the level of the grain. We had to use a vertical belt conveyor to arrive at the floor. A long five-eighths-inch rope, self-contained masks, and three resuscitators were taken immediately to the floor. A squadman was lowered into the pit by use of a body tie. Since it was suspected, and later verified by test, that there was not enough oxygen to support life in the pit, the squadman wore a self-contained mask.

Another line was used with a body tie to raise the men out of the pit. As we got them out of the pit, we used resuscitators on them. The first two men responded satisfactorily, and were fastened to the belt conveyor and lowered to the ground floor where they were taken to a hospital.

We were unable to bring the third man around. A physician had arrived and was working with firemen on the third victim while the others were being lowered. The victim was strapped on an army stretcher with two-inch-wide webbing. The physician in the meantime, cut an opening into the victim's windpipe to induce breathing. A one-tank resuscitator was strapped on him.

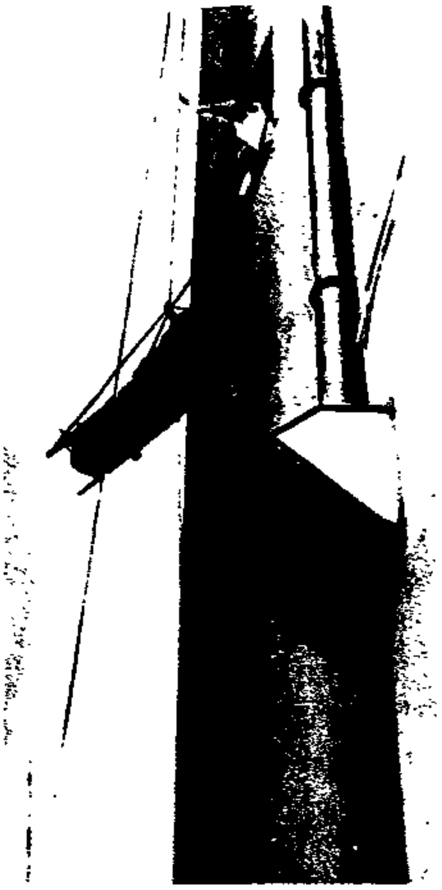

Figure 64

Victim being lowered from grain elevator

To lower him by use of the belt conveyor would mean having to lower him in a vertical position. Therefore, we placed a snatch block to the side, and above a window a three-eighths-inch steel cable about two hundred feet long was placed in the block. A stretcher tie was used on the stretcher and this was attached to the cable. Using one-half-inch and five-eighths-inch, one-hundred-foot lengths of rope as guide lines, the victim was lowered to the ground from this elevator. (See Figures 64 and 65.)

Figure 65

Victim lowered to ground level with improvised rig

The victim was placed in the ambulance, accompanied by the physician, and taken to the hospital. He was pronounced dead-on-arrival. The other two survived.

CHAPTER XXI

SHORING AND TUNNELING

INTRODUCTION

In emergency rescue operations it sometimes is necessary to support a damaged structure or a cave-in, or to provide bracing for walls and ceilings. A squad may have to construct tunnels to rescue trapped victims. The shoring or tunneling must be done rapidly, but safety must not be sacrificed for speed.

Only the amount of shoring or tunneling required for the safe removal of victims and workers should be carried out by a rescue squad. No attempt should be made to restore any structure to its original position; restoration should be left to the guidance of skilled craftsmen

SIZING UP AN EMERGENCY

At a cave-in the squadman may be confronted with two types of rescue problems:

(1) The head of the victim is not covered.

(2) The victim is completely covered by some type of material. In either case care must be taken to protect the victim from added injury. Size up the situation and plan your approach before action is taken.

When a victim is partially buried with his head exposed, start administering oxygen. Use the inhalator if he is breathing. Use the resuscitator if he is not breathing.

If a victim is completely buried (e.g. under loose gravel), the man in charge of rescue must, if able, find the approximate location of his head and chest. A squadman should be prepared to begin administering oxygen as soon as the victim's head is exposed.

APPROACHING A VICTIM

When you approach a cave-in victim on foot, be sure to distribute your weight over the largest area possible. Do not increase the amount of weight that is already present on the victim's chest cage. It may be necessary to crawl on your hands and knees or stand with your legs wide apart. Long-handled shovels are of great assistance in this situation, since the material covering the victim can be removed and at the same time the squadman can stand at a distance away from the victim. All squads should be equipped with long-handled shovels.

Many times, a squadman will be required to lie flat on his stomach and reach the victim with just his hands. The squadman should approach the victim from behind to administer oxygen, if possible, so that other personnel can relieve pressure from the victim's chest.

SHORING

When a victim is under loose debris it may be necessary to clear a path slowly and carefully to him, shoring with the progress of the path, as is done in mining operations.

Shoring is also necessary sometimes after traffic and railroad accidents. Heavy weights must sometimes be supported while cutting through metal wreckage; or the wreckage must be raised by means of jacks, and then supported, so that progressive access can be made to where the victim is pinned or trapped.

To brace a wall that is bulging or in danger of collapse, a raked shore can be built. (See Figure 1.) Raked shoring is usually built up from ground level.

A flying shore can be used to brace one wall from another support across a space. (See Figure 2).

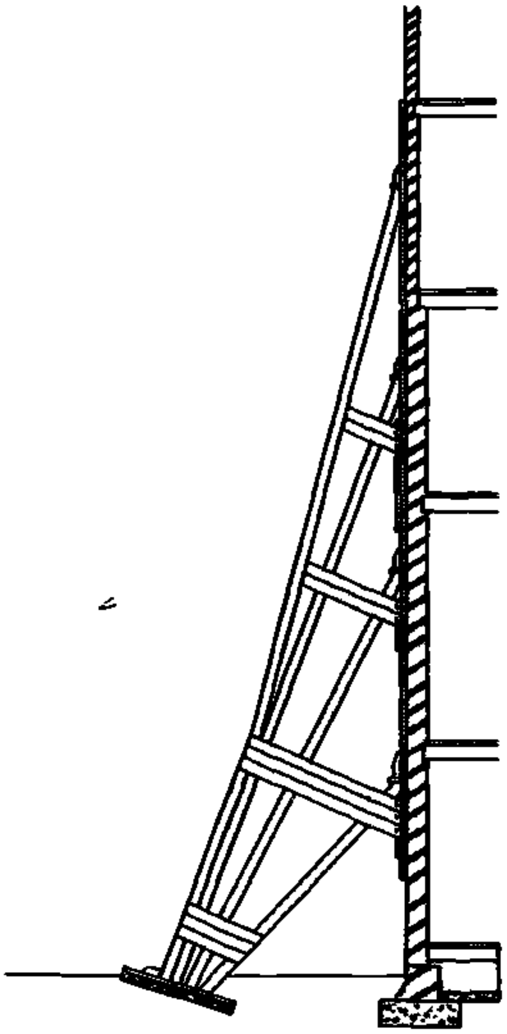

Figure 1

Raked shore

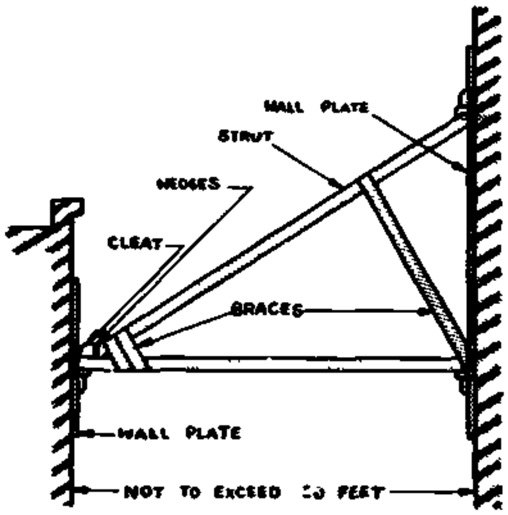

Figure 2

Flying shore

BULKHEADS AND COFFERDAMS

In cave-in accidents involving ditches or wells, and in other similar accidents, it is sometimes necessary to sink bulkheads or cofferdams for shoring.

TUNNELING

Tunneling becomes necessary when the rescue workers must remove victims trapped either near the surface or in voids underneath collapsed structures or ditches, or under sand, gravel, coal, grain, etc. (See Figures 3 and 4.) In these rescue operations, tunneling requires exceptional skill and should be guided by trained personnel.

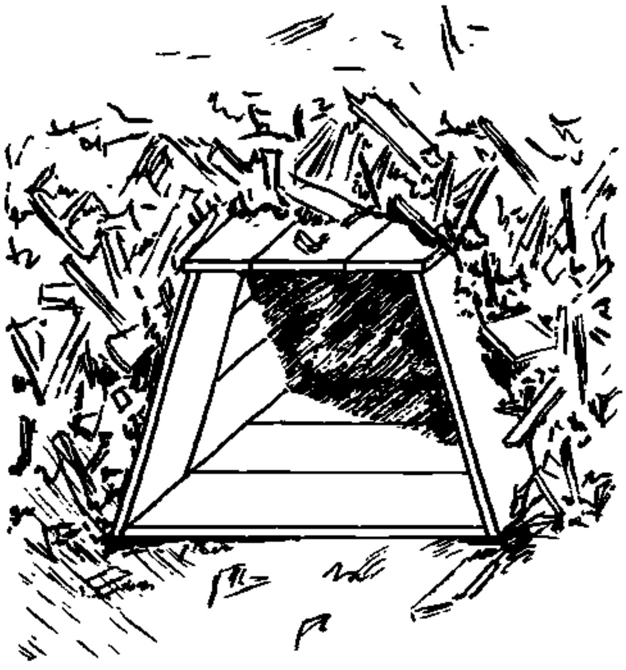

Figure 3

Tunneling through debris

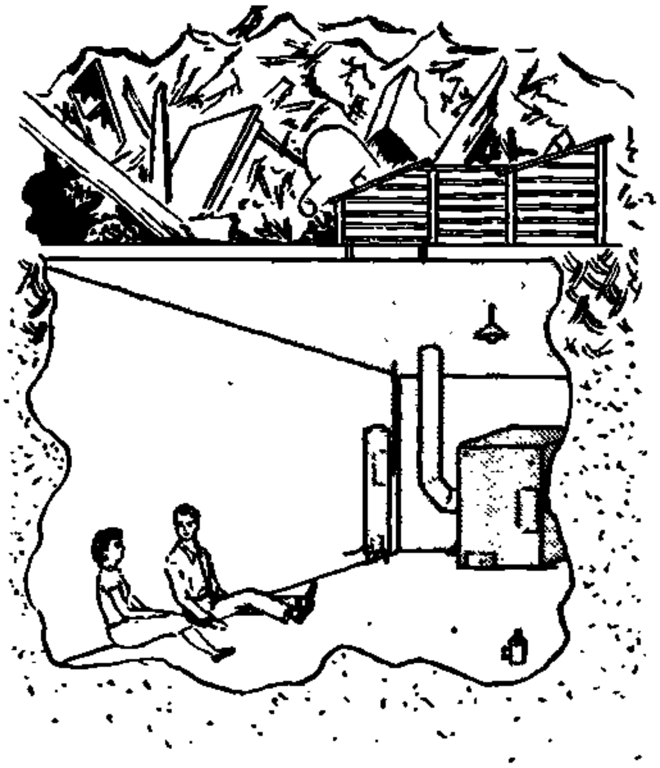

Figure 4

Rescue from a basement where ceiling remains almost intact

TECHNIQUES AND TOOLS

Shoring and tunneling are best accomplished with the use of timbers and wedges. The construction work sometimes has to be done gently and without jarring, to prevent further collapse. Figure 5 shows a damaged wall supported by a shoring of heavy timber.

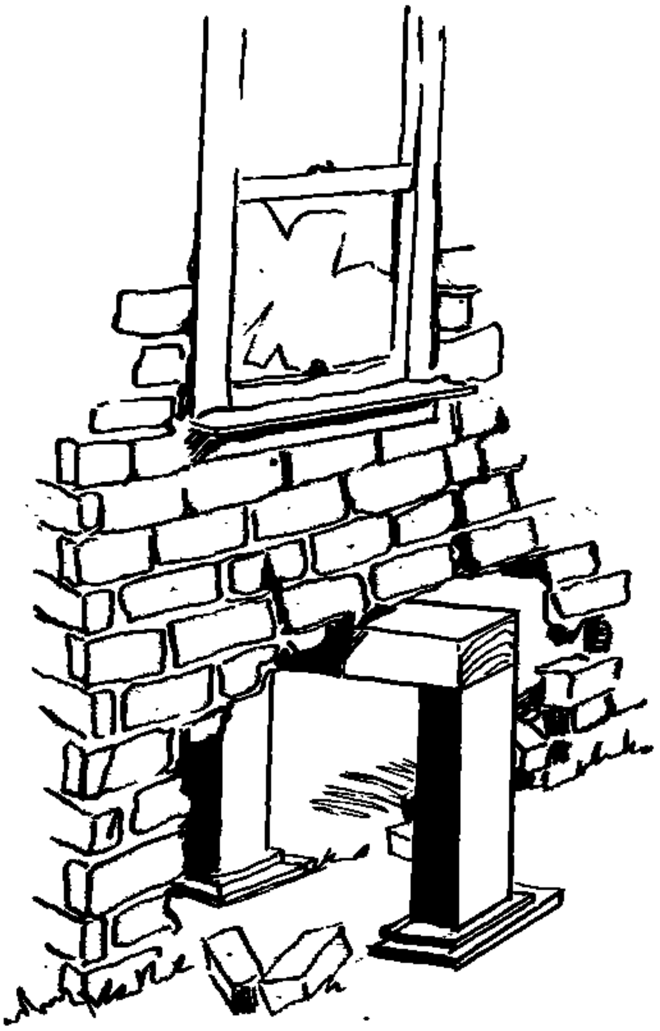

Figure 5

Use of heavy timber for shoring

Cut the supporting timbers short, then make them fit snug with wedges. Unnecessary jarring can be avoided, yet a snug fit can be accomplished when this method is used.

Shoring and tunneling should, of course, be safe and secure, to protect both the victim and rescuers. It is often necessary for rescue teams to work in relays. This may require several trips in and out.

Minor accidents may involve only the use of rope, shovels, pails and carpentry tools needed for shoring. Accidents of major proportions and those involving large buildings may demand the use of bulldozers, power shovels, drag-lines, trucks, and other heavy-duty equipment, with skilled operators. At the scene of a rescue if the squad leader finds conditions that require the use of heavy equipment, he should not hesitate to request the services of such equipment. In many communities this means putting into effect a pre-arranged plan to meet such situations, prepared long before the emergency arises.

DANGER OF FURTHER INJURY

When a victim is buried, extreme care must be exercised in the use of power equipment. The rescue activities could injure the victim further, or kill him. Speed is important for many reasons, but not important enough for over-zealous digging. Squadmen and operators should be constantly alert to observe any part of the victim's body as it is revealed. When observation reveals the body of a victim, the rescue operation should proceed cautiously and carefully with a minimum use of power tools.

AVOIDING CAVE-INS

When raising victims from cave-ins, ditches, or voids, it is important to prevent the edges from caving in under the weight of squadmen or equipment. A tripod (Figure 6) a ladder laid horizontally, or an aerial ladder can be used very successfully and safely in this operation.

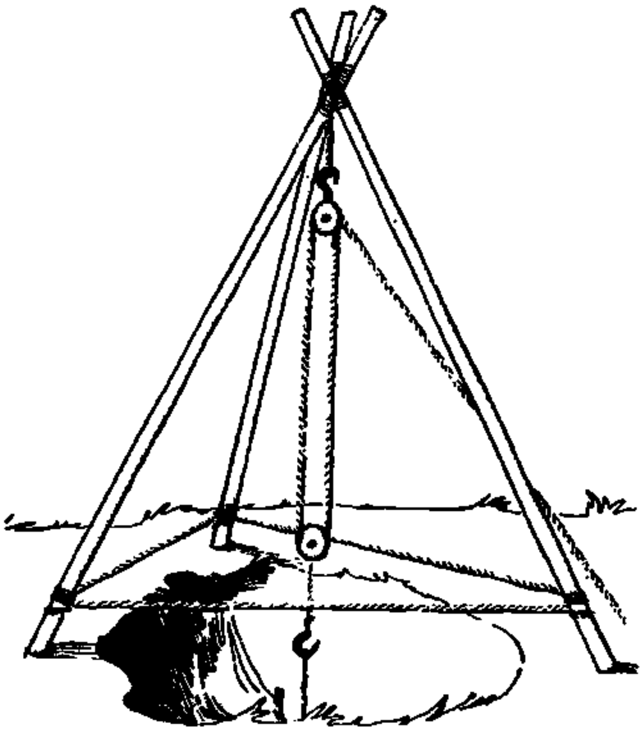

Figure 6

Use of tripod

HAZARDS TO THE SQUADMAN

In cave-in situations where gas lines may have been broken, rescue personnel must consider their personal safety. Accumulated toxic or asphyxiating gases can render squadmen helpless and unable to perform the rescue operations. Self-contained gas masks are indicated.

In emergency situations where hazards from utilities exist or may exist, call the utility company's emergency service for proper handling.

VICTIM CARE

Victims may require resuscitation, first aid, or professional attention before being moved. Also some trapped victims may request spiritual assistance.

Figures 7 through 12 show a typical rescue operation involving a victim nearly buried under loose dirt.

Courtesy Loudonville Vol. F.D.

Figure 7

Two men were working in a trench. As one man climbed out to get a drink of water, the side of the ditch came rolling in, covering the man working at the bottom of the ditch. A workman ran to a nearby home and called the emergency squad.

Courtesy Loudonville Vol. F.D.

Figure 8

As the resuscitator could not be placed near the victim, the extension unit was set up. In this picture Squadman No. 1 opens the tank valve and connects the extension unit to the resuscitator. Squadman No. 2 turns the unit to resuscitation and places a face mask on the victim. (Squadman No. 2 is standing with feet apart, and to the rear of the victim, so he will not add more weight to the dirt covering the victim.) Squadman No. 3 starts removing the dirt from above the victim's chest area so the victim can breathe for himself. Squadman No. 4 brings a backboard and other equipment from the squad car.

The victim is carried up out of the ditch. He was transported to a hospital, at a slow and careful speed.

CHAPTER XXII

WATERFRONT OPERATIONS

INTRODUCTION

Authoritative information tells us that most drowning victims must be brought to the surface within ten minutes if they are to have a reasonable chance to survive. Beyond that time, the efforts of the squadmen will be largely devoted to the matter of recovering the victim's body. Past records indicate that this is usually the case in most of the responses to this type of rescue emergency.

If, however, recovery is made within a reasonable length of time, manual or mechanical respiration should be started at once. It must be continued until the victim is either revived or pronounced dead by a physician or coroner. Such practice should not be treated lightly, as it has been reported that a man was revived after being submerged for thirty minutes.

It is a perfectly natural trait to persist in trying to recover the body of a drowned person, even though all hope of revival may be gone. However, the squadmen's responsibility stops when all hope of life is gone! The officer in charge should not lose sight of the fact that squadmen occupied in body recovery operations are not available to serve the living public.

All operations at the scene of a drowning should be directly in the charge of the emergency squad. This includes not only the recovery operations but the physical control of the scene as well.

Proper education and training will help to insure a maximum degree of safety for squadmen who must participate in waterfront operations. The material in this chapter is based on the assumption that its reader has had an approved course in water safety, sponsored by a nationally recognized authority or agency. Such instruction is absolutely essential to emergency rescue squad work. The following pages will describe some of the equipment and methods used in waterfront operations.

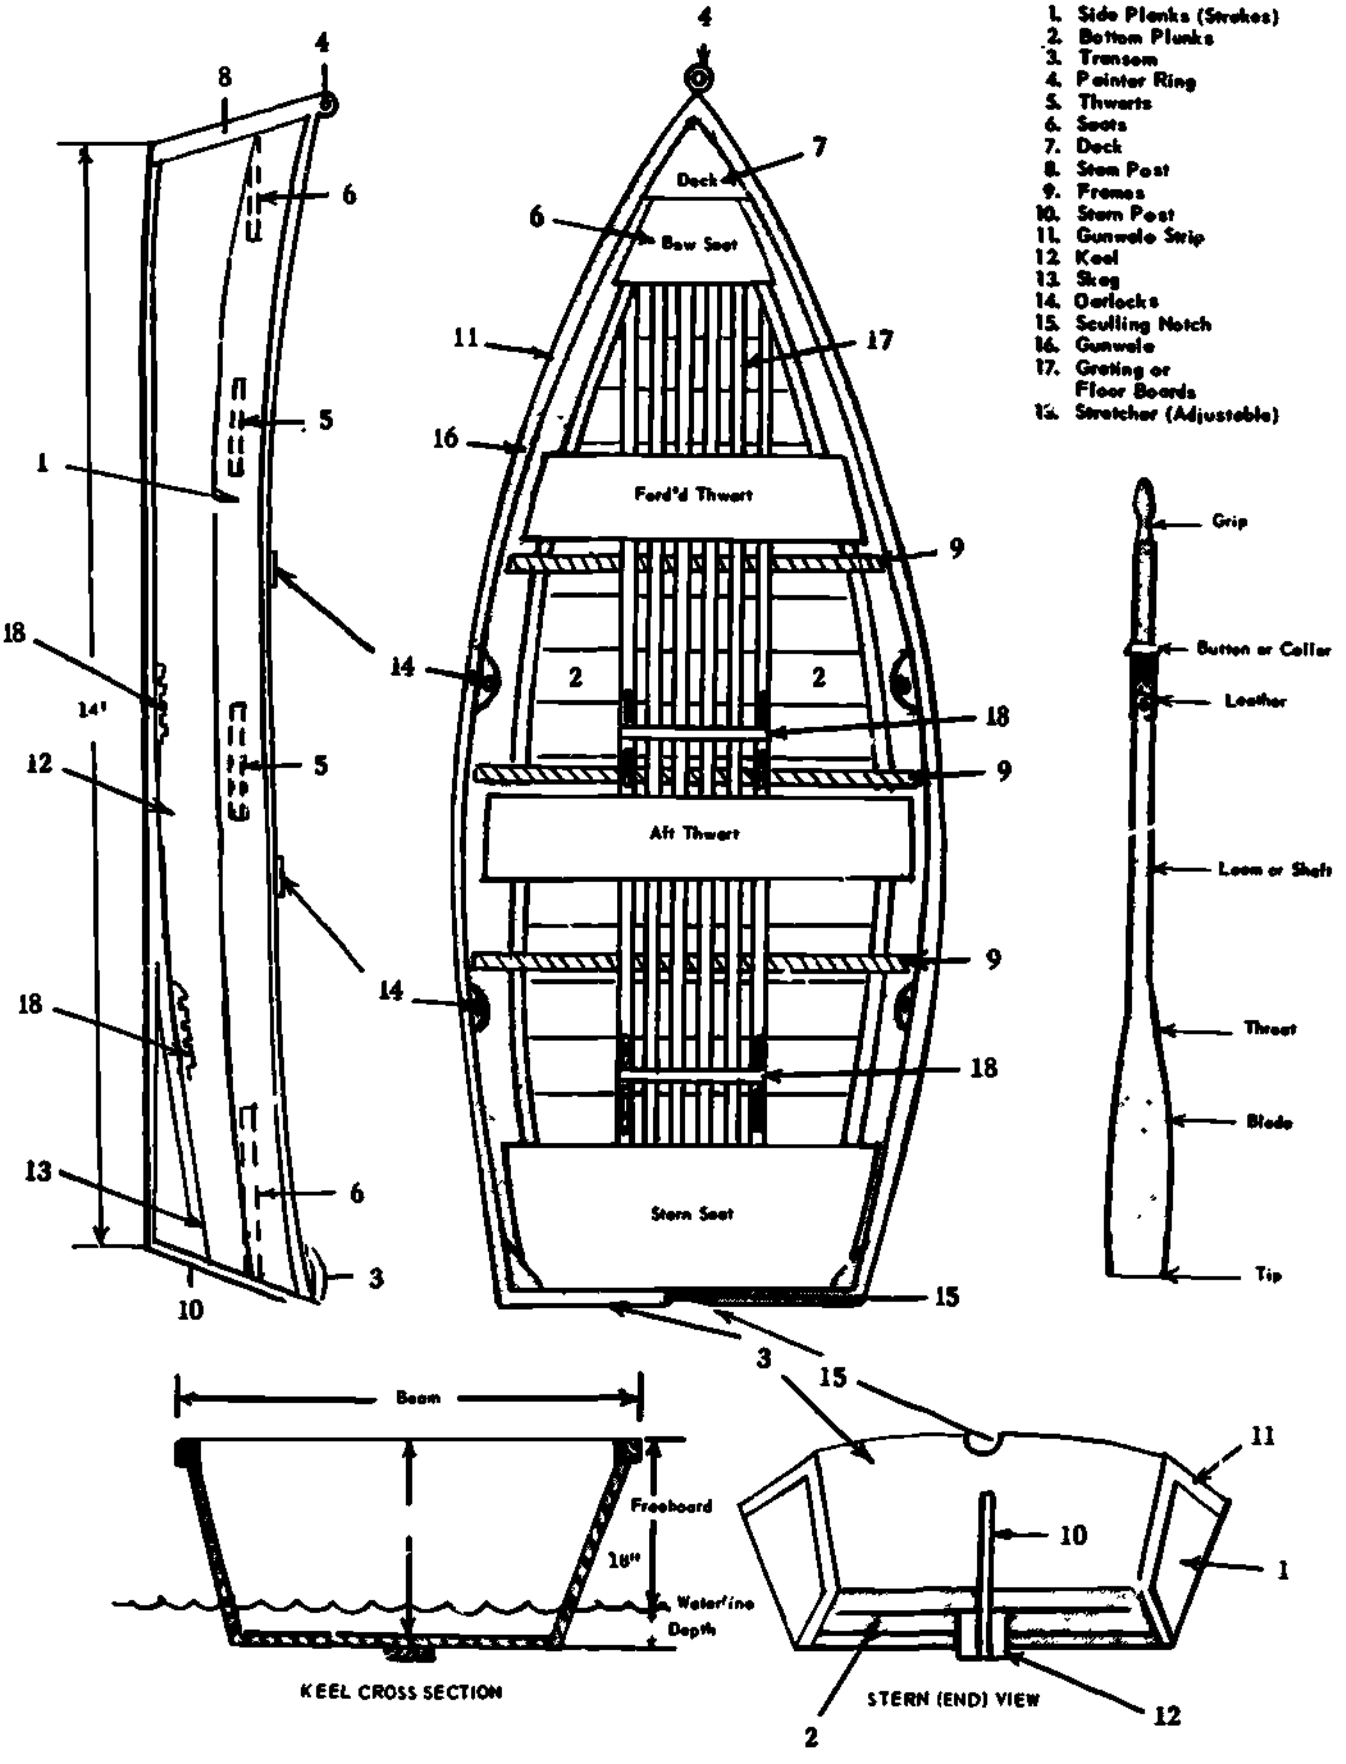

Figure 1
Parts of a rowboat and an oar

BOAT HANDLING

Elementary boat handling is important to emergency squads. They are called upon to rescue stranded victims in time of floods as well as other emergencies where the only means of rescue is by the use of a boat.

While there is much material available on small boat construction, there is not a great deal to be found on the safe handling of small boats. This section, then, is intended to give some brief, basic information on boat handling and boating safety.

PARTS OF A ROWBOAT

Bow: The front, or forward part, of the hull.

Deck: The small triangular filling of wood at the bow of the boat, fitting level with and between the gunwales.

Frames: The narrow cross-sections, placed edgewise in the boat from gunwale to gunwale, down the sides and across the bottom, to hold the shape of the boat and to provide the form over which it is built; there are usually three or four frames.

Grating or Floorboards: Wood slats, cleated together in sections, to form a false flooring. They serve to protect ribs and planking and also to keep occupants' feet dry in a leaky craft.

Gunwales: (Pronounced gun'ls.) The top edges of the hull, on either side, from bow to stern.

Keel: The main backbone of the boat, extending along the bottom from the stem (at the bow) to the stern post.

Oarlocks: The metal crutches, pivoted in metal sockets on the gunwales of the boat, in which the oars rest in rowing; accepted patterns are either U-shaped or ring-shaped, with a metal shank to which a chain and toggle are attached to prevent loss.

Painter: The line, usually about 6 feet long, spliced to a ring in the bow and used for towing or for tying up the boat. A similar line in the stern is a sternfast.

Planking: Long narrow boards (also called strakes), laid up and fastened tightly to the ribs, edge to edge, and running lengthwise from bow to stern; they form the watertight outside covering of the hull, including the bottom.

Port: The left-hand side of the boat as you face forward.

Ribs: The narrow flat strips, usually steamed and bent to shape, spaced between the frames to aid in holding the shape of the boat; they also provide a foundation on which the outside planking can be fastened.

Risings: The strips of wood, secured to the frames and ribs, upon which the ends of the thwarts are secured.

Sculling notch: The half-round notch or depression in the upper edge of the transom, to hold the loom of a long oar for propelling the boat by sculling.

Seats: The small platforms or seats built into the stern and the bow of the boat.

Skeg: The small triangular piece of wood which fills the space between the end of the straight keel and the upsweeping stern of the hull; it serves to hold the stern on a steady straight course when the boat is rowed.

Starboard: The right-hand side of the boat as you face forward.

Stern: The back, or aft, part.

OARS AND THEIR PARTS

Oars: The flat-ended wooden levers by which a rowing boat is propelled.

Blade: The wide flat portion that is dipped in the water, when rowing.

Button: A ridge, built up of leather, at the inboard end of the leather, to prevent the oar sliding through the oarlock.

Grip: The handle portion held in the rower's hand.

Leather: A protective collar of horsehide attached to the loom at the point where the oar rests in the oarlock.

Loom: The long tapering shaft between the grip and the blade.

Throat: The narrowest part of the loom where it joins the blade.

Stretcher: A short crossbar held by two parallel cleats attached to the gratings or directly to the ribs, at suitable distance from each rowing position, to provide necessary foot-bracing for the oarsmen; crossbars are usually adjustable in any one of three notched positions, for length of legs.

Thwarts: The wide boards extending across the boat, located lower than the gunwales, for the oarsmen to sit on; there are usually a midship thwart, and f'wd thwart.

Transom: The broad flat plank, or planking, fitted to the extreme aft ends of the side and bottom planking, to close the stern end of the boat.

Figure 2 shows a rowboat in which rescue and first aid gear have been stowed, ready for emergency use.

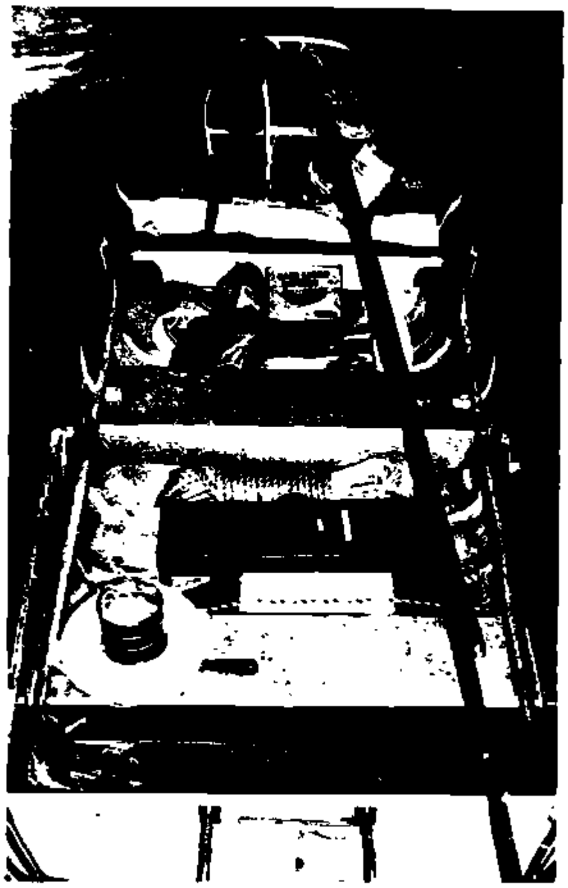

Figure 2

Rowboat equipped with rescue and first aid gear

BOARDING AND ROWING A BOAT

Making Ready - If at a shore, push the boat afloat by partially lifting the beached end. Before boarding it, make certain that the bottom is not resting on a stone or anything sharp that might injure the planking; also make certain that the bow is not so far ashore that you cannot "shove off" when your weight is aboard, and that the bow is not resting on anything that will make the boat "teeter" as you board it.

Before shoving off, the painter should be neatly stowed in the bow or on the bowseat, oars lying fore and aft along the outer ends of the thwarts, with blades aft; oarlocks unshipped and hanging inside below the gunwales by their chains. Be sure all gear is neatly stowed and in its proper place.

If at a landing stage or dock, cast off and stow the painter, and bring the boat parallel alongside the front of the pier, holding it by the gunwale.

Boarding - Board the boat by stepping in the middle, on the bottom boards or on the gratings; do not step on the seats or thwarts. Keeping your weight low and with at least one hand constantly touching a gunwale, move to your position and seat yourself in the center of the seat or thwart. Passengers sit facing forward, oarsmen face aft. If rowing alone and the boat has two rowing positions, use the aft one.

Seating the Oars - Adjust the stretcher in the proper notch to suit the length of your legs. Ship the oarlocks by raising them until the chain feeds downward through the socket and until the shank of the lock itself is firmly seated in the socket. Lift each oar at its balancing point, drop the loom into the oarlock and slide the oar outboard until the button bears against the oarlock; or, if there is no leather or button, until the oar feels "balanced" in the lock. If oars are of correct length for the boat, the ends of the grips will be very near touching, or they may actually overlap up to 2 or 3 inches when the oars are held horizontally.

Rowing Position - The correct rowing position is important for efficiency and endurance. Seated erect, face squarely astern. Head should be up, feet together and braced against the stretcher, knees together and slightly bent. It the boat has no stretcher, feet may have to be somewhat spread to brace against a frame or rib; knees would be correspondingly spread and slightly bent. Hands grasp the oar grips with the knuckles uppermost; thumbs may encircle the underside of the grips, or may cap the ends, but should not rest on the upper surface of the grips alongside the fingers. (See Figure 3.) Elbows should hang close to the body, without strain.

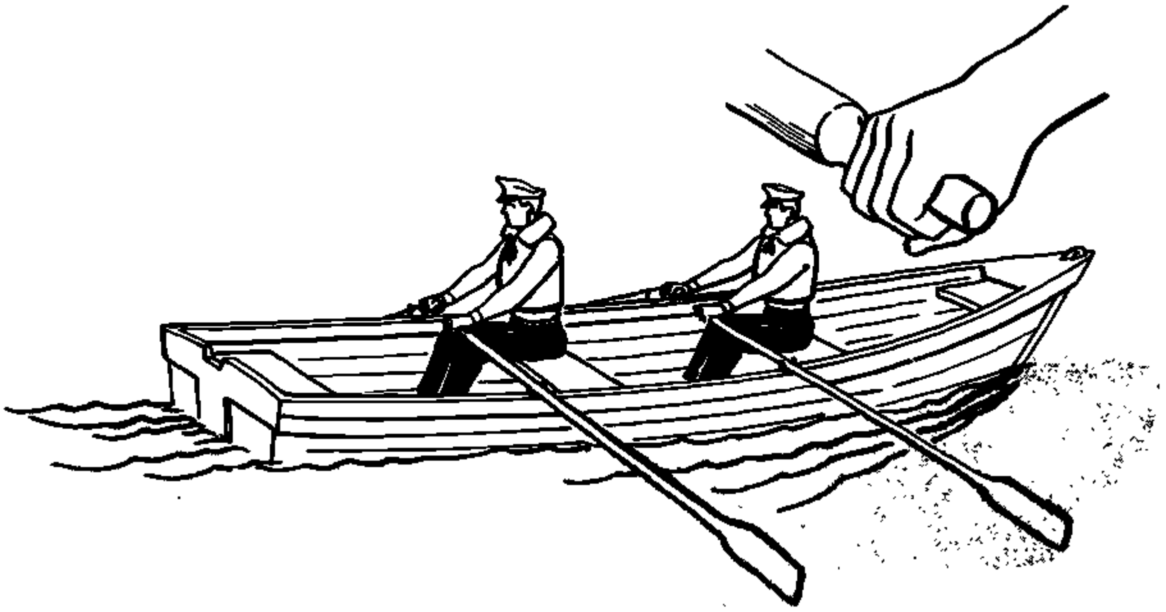

Figure 3

Rowing position and grip

With both oars resting horizontally in the oarlocks and their length at right angles to the centerline of the boat, turn them until the plane of the blades is absolutely vertical. Then adjust your hand grasp without disturbing the vertical setting of the blades, so that your wrist joint is absolutely straight in a horizontal plane with your forearm. This is your basic grip of the oars.

Without relaxing or shifting your grip, bend your wrists in a manner that will cause your hands and knuckles to rotate upward and toward you; (in rowing parlance this action is termed "dropping" the wrists.) This will tip the oar blades about 30 degrees into "feathered" position, with the forward edge of the blade higher than the aft edge. If you now raise your hands slightly to lower the blades until they are skimming just an inch above the water, you are in the position "Rest Oars" or "Oars."

To prepare for rowing, glance over your shoulder toward the bow, to make certain that the way is clear ahead of you.

The Stroke - Move the oar blades forward close to the water in feathered position, by extending your arms as you sway your body aft toward your knees. Sway from the hips, keeping your back erect. As you approach the limit of your reach, gradually straighten your wrists; then pause in this position. The flat of the blades is thus returned slightly past the vertical setting, close to the water and everything is in readiness to make the "catch", which starts the power portion of the stroke. This position is that of "ready".

Do not shift your grip or release control of the oars, but relax the downward pressure of your hands until the blades drop into the water as far as their own weight will immerse them. (See Figure 4.) As you feel the blades "catch" begin to apply power by moving your whole upper body, from the hips, toward an upright position. Use the full combined strength of your leg and back muscles to apply maximum pulling power smoothly, without jerk or splash. While your body moves, your arms should be maintained extended. Let the oar blades float at their own normal depth; never force them deeper.

Figure 4

The catch

When your body has passed the vertical position sufficiently to tighten abdominal muscles perceptibly, you have reached the maximum desired degree of "layback". At this point the arms smoothly start their contribution of power. Arms are drawn powerfully toward you, with elbows comfortably close to your body, until your hands are practically touching your chest. (See Figure 5.)

Figure 5

Pull nearly completed

Figure 6

The recovery: blades are feathered

The oars now are slanted toward the stern at such an angle that the blades have slipped clear of the water without tossing any of it in a spurt or splash. This is the completion of the "power portion" of the stroke.

The recovery is the final phase of the stroke cycle. This is done with the blades in "feathered" position, to reduce wind resistance; also to assure the blade gliding over the crests of whitecaps in choppy water. (See Figure 6.) As the "pull" or "power" portion of the stroke is completed, drop your wrists smartly to flip the blades into feathered position. Smoothly and simultaneously with the dropping of your wrists, extend your arms. As the arms approach their full extension, start the sway of your body from the layback position, through the vertical position and toward your knees. Level your wrists as you attain your maximum reach without rounding your back. You are now in the "ready" position, poised with blades facing squarely for the "catch" of the next stroke.

Correcting Course - The oarsman should correct his boat's course by pulling somewhat harder on one oar than on the other, without any interruption in the smooth rhythm of the stroke.

A more drastic correction can be made --as when a heavy gust of wind or a sudden cross-current veers the bow off course-- by poising one oar in "rest" position, or by "trailing" it, while one or more strong pulling strokes are taken with the other oar.

Hold - To stop a boat, drop the blades into the water at the end of a stroke. Then sit upright, hold one knee beneath the thwart (as a purchase), press firmly toward the stern with your hands, and thus gradually force the blades forward in the water against the forward motion of the boat.

Stern All - To propel the boat astern, after stopping it, repeat and continue the sternward pushing action with your arms, adding the weight of your body to the final portion of each push. In choppy water the blades should be feathered on the recovery portion of each of these "backwater" strokes, but this feathering is done by raising the wrists, instead of dropping them.

Turning - When it is necessary to make a sharp turn and at the same time retard the progress of the boat, the action is opposite to the foregoing. The turn is made by executing a backwater stroke with one oar, while "resting" or "trailing" the other.

Approaching a Landing - The turning technique is used when coming alongside a landing. The approach and momentum are judged by looking continuously over one shoulder. At the right moment the oar on the landing side is deftly unshipped and boated; the other oar then is used for backing water to just the degree necessary to slide the boat to a broadside, motionless position at the landing.

Pivoting - Turns are executed by backing water with one oar, while simultaneously pulling with the other.

ADVICE TO THE BEGINNER

Beginning oarsmen often have trouble with one oar: it repeatedly fails to grip the water, or slices too deep and jumps out of the oarlock. Either occurence is termed "catching a crab". An incorrect grip on the oar may be the cause. Check your grip while holding the plane of the blades absolutely vertical; if necessary, readjust your hand grip. A "crab" may also be caught because of tenseness and consequent failure to level your wrists equally, as you make the "catch".

As you become an experienced oarsman, you will develop the ability to check your grip during each pulling stroke, by the "feel" of the blade as it bites the water; any slight adjustment is then made during the rowing rhythm.

The good oarsman periodically glances over one shoulder, without breaking the rowing rhythm, to make certain that the course ahead is clear of any other traffic.

Take your time. Think out each move before attempting it. Then move slowly, easily, in a relaxed manner. With persistent practice you will become an excellent oarsman. Keep your full attention on what you are doing. Don't dip the blades too deep: the water should not wet the shaft above the throat. Keep your hands low. Don't lift the blades too high on "recovery"; they should just clear the water. Keep your head up. Get a full breath of air every stroke. Pull evenly; a zig-zag course is caused by uneaven pulls.

BOATING SAFETY

All boats out on the water should be under watch of a guard at all times. This guard should remain on shore.

At night always carry a bright flashlight or lighted lantern visible all around if rowing on a waterway where other vessels or boats are used. The light should be shown at the approach of other boats.

Keep out of the way of power boats of all kinds in ordinary water traffic. Power boats carry white lights in the stern only or in bow and stern; sailboats do not. Green lights are on the starboard, red lights on the port side.

Waves from a large power vessel can upset a small craft that is not being handled properly. Keep at least 300 feet away from such vessels until the stern has passed. Head your boat into an approaching wash and remain stationary until it subsides.

Any boat equipped with a motor or other sinkable dead weight should have airtight compartments capable of supporting this weight.

All metal craft should have airtight compartments to float their occupants if swamped. Metal boats should be swamped and tested every two weeks for pin-hole leaks in their airtight compartments.

If two squadmen must exchange seats away from shore, first "boat the oars". Then one man sits forward on the bottom; the other crouches with one hand on each gunwale, passes alongside, and is seated. Then the man on the bottom moves to the vacated place.

When dropping or retrieving the anchor, a squadman should be sitting in the boat. If he is standing, he may lose his balance.

Two small persons can row in unison sitting in the same seat (double banked). Each pulls one oar. A better way is single-banked sweep rowing, with one man in each seat, pulling one oar.

Whether they use one or two oars each (called "pair-oar rowing"), the two oarsmen should keep absolutely together. The aft oarsman or "stroke" sets the rhythm.

In waves or choppy water row with regular, steady strokes. If possible take the waves at a slight angle rather than directly bow-on or stern-on. Keep a level boat by spreading weight evenly. In a high wind, seat passengers flat on the bottom and keep the bow headed into the wind.

If one oar is lost, face the bow and use the other as a paddle or scull.

It is a violation of good seamanship and unwise to do the following:

1. Overload a boat by taking more people than its marked capacity.
2. Abuse an oar by splashing water with it, digging in the sand with it, or using it as a fender.
3. Expose yourself to injury by standing in a boat, rocking it, or skylarking in a boat.
4. Deliberately or carelessly allow your boat to bump another or crash the landing.
5. Create a false alarm by needlessly calling "HELP", or by making a sound that can be thus interpreted.
6. Risk being run down through failure to carry a light, if out at night on waters used by other craft.

OPERATION AT SCENE OF DROWNING

SQUAD SAFETY

It is well at this point to stress certain factors pertinent to the safety and welfare of the squadmen. Diving into the water is indicated when the victim can be seen and is moving, or when there is substantial evidence that the victim has been under the water only a few minutes. It is obvious that only trained and qualified water-safety men should be selected for this assignment.

The use of life jackets should be emphasized. They are standard equipment for squadmen to wear during all boating operations. This rule should apply to swimmers as well as non-swimmers, especially when entering swift or rough waters.

A squadman should be assigned to shore duty, and should remain there, as long as squadmen are working in boats. His main responsibility will be to keep the occupants of the boats under surveillance. In the event they run into trouble or encounter some difficulty, he can quickly secure help to assist them. He can also gather information from witnesses on shore which can aid the boatmen in their size-up and search.

SIZE-UP

Proper size-up at the scene of a drowning, before and during the operation, will be of great assistance in making a rapid and successful recovery. In making the size-up, the squadman in charge should consider the following factors:

1. How long the victim has been submerged
2. Where he was last seen
3. How the victim was dressed (in swim suit or clothed)
4. Survey of the body of water as to:
    - Character of bottom
    - Currents
    - Snags and obstructions
    - Depth and width of water
    - Conditions of banks (undergrowth, trees, etc.)
    - Direction of wind

GENERAL INFORMATION ON DROWNED BODIES

A body will remain in the immediate vicinity of where the drowning occurred. Even though there is a strong current on the surface of the water, the body will not move very far from the spot where the victim was last seen. It has been noted that a body in a swimming suit, when sinking, will not be more than 1-1/2 times the depth of the water from the spot.

Example: Water is 20 feet deep.
1-1/2 x 20 = 30 feet from the spot.

Sometimes bodies of victims who are very fat and bodies of small children do not sink after drowning, but remain floating on the surface. A body will rise to the surface when enough gas is formed in the intestinal tract to make the body buoyant. The time needed to generate the necessary gas will depend on the temperature of the water and the content of the victim's stomach when drowned. In summer, the average time is from 18 to 24 hours. However, in winter, or when the water is very deep and cold, the time will be much greater. A body will not rise suddenly from the bottom, but gradually as more gas is formed and the body becomes buoyant. After the body rises to the surface, its movement is affected by the current or wind; it may be found several miles downstream.

A victim drowning in a rapids probably will be carried to the first deep hole downstream. If manpower is available, it is advantageous to send one detail downstream to search the eddies and center of the stream.

Equipment carried in Rescue Boats

- Oars (2 sets)
- Anchor
- Life jackets
- Ring buoy
- Torpedo buoy
- Flashlight with extra batteries
- Pike poles
- Drag hooks
- 3/4-inch rope, 100 feet
- 3/8-inch rope, 100 feet
- Life gun and extra line

DRAGGING

In the early stages of any body search, dragging and probing with grappling irons, grappling hooks, and pike pole irons are the usual means employed. Even under the best circumstances, dragging is a blind operation.

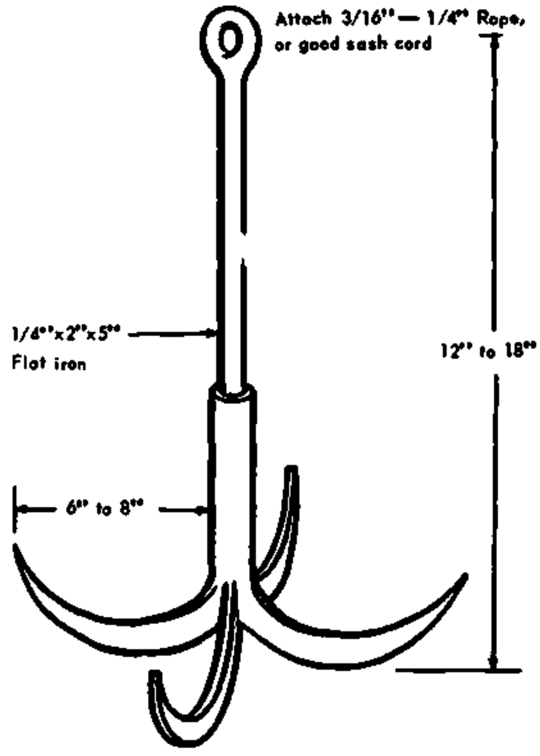

Figure 7
Grappling iron

Very useful types of grappling equipment can be made by a squad. These include: grappling irons, pike pole irons, and grappling hooks.

The grappling iron shown in Figure 7 is not too practical for rescue work, but may be used in very deep water, not only for body recovery but for equipment, etc. The iron weighs from five to ten pounds.

The pike pole iron is the only type that can be used in waters with stumps. (See Figure 8.) The pole should be in four-foot sections and not to exceed twenty to twenty-five feet in length.

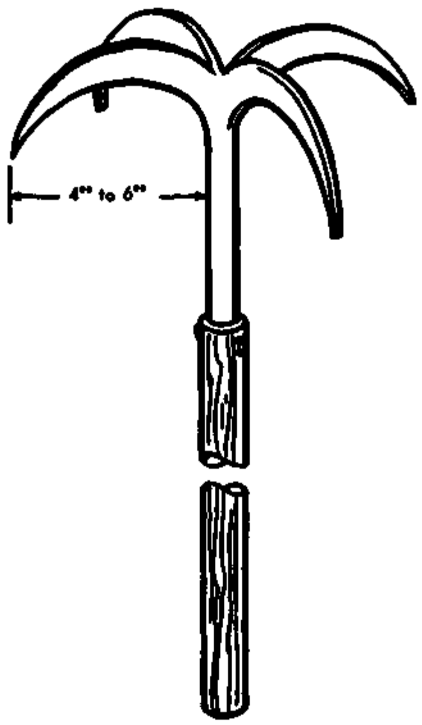

Figure 8
Pike pole iron

Grappling hooks are made of No. 9 iron wire. Two pieces 18" long are bent in half and twisted as four strands, forming an eye at one end and four prongs at the other end. Space the hooks along lines and attach the lines to a tow bar as illustrated in Figure 9, on the next page.

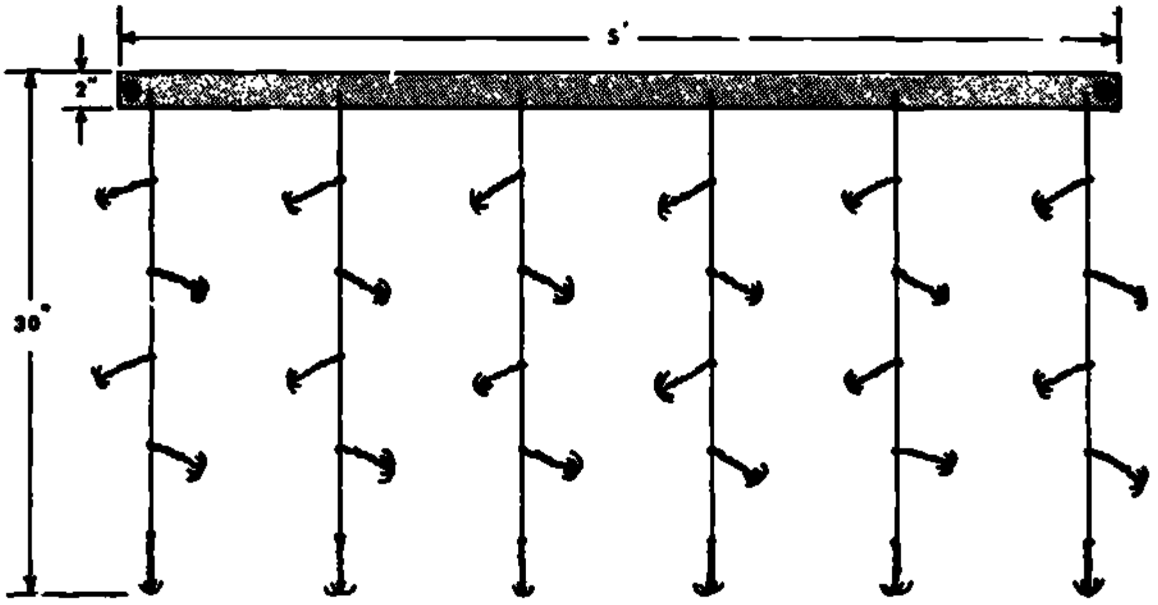

Figure 9

Grappling hooks on a towbar. A cable or chain attaches to each end of the towbar, for dragging operations.

LOCATING A BODY FOR GRAPPLING PURPOSES

A witness at point "A" last saw victim in line with tree "X". (See Figure 10.)

A witness at point "B" last saw victim in line with tree "Y".

Then, by "drawing" imaginary lines between point "A" and landmark "X", and between point "B" and landmark "Y", the squadman can locate the point where the lines cross or intersect. Search for the body should focus on that point.

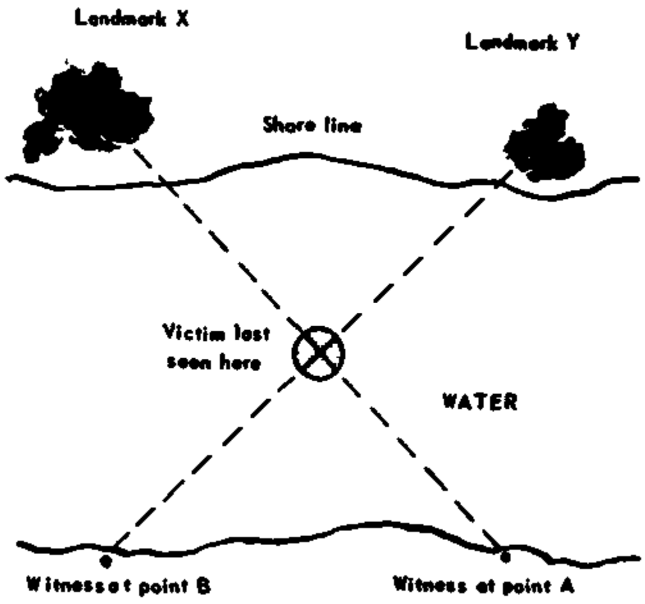

Figure 10
Locating a body

DRAGGING METHODS

There are many dragging methods which may be used; some of the more successful ones are described here. Grappling may be done from shore to shore, dock to dock, boat to shore, or boat to boat.

The following procedure is used in shore-to-shore grappling. (See Figure 11.)

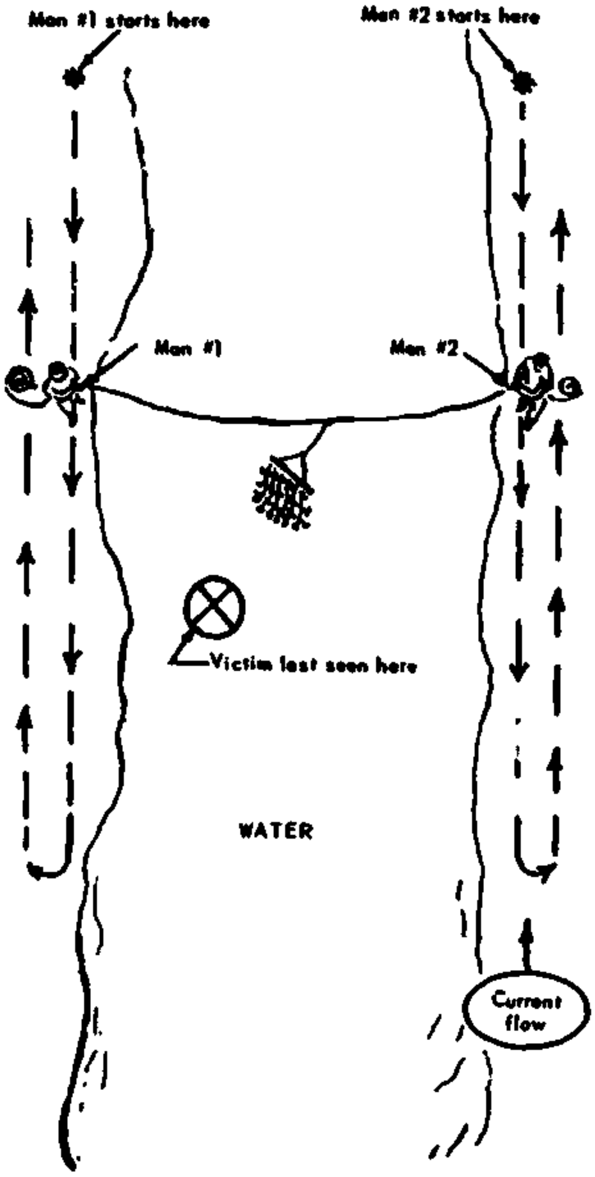

Figure 11

Shore-to-shore grappling. In flowing water a body may be carried with the current a short distance, Note that the dragging operation here starts downstream from where the victim was last seen.

Shore-to-Shore Grappling -

1. The rope should be more than twice the width of the area to be covered.
2. Secure hooks to center of rope.
3. Squadman #1 will drop hooks straight down until they hit bottom. He then signals #2 squadman to draw hooks slowly toward him, allowing them to drag the bottom across the entire width of the body of water.
4. If nothing is hooked, #2 side-steps one-half the length of the grappling bar in the direction the victim was last seen.
5. #1 then side-steps the same distance in the same direction.
6. #2 then lowers the hooks straight down to the bottom, and signals #1 to pull hooks slowly to him.
7. This procedure is continued until the entire area is covered. Procedure is then reversed so area will be covered twice.
8. If the body is not then recovered, the area should be extended in both directions, and the procedure repeated.

Boat-to-Shore Grappling - Figure 12 shows the recommended procedure.

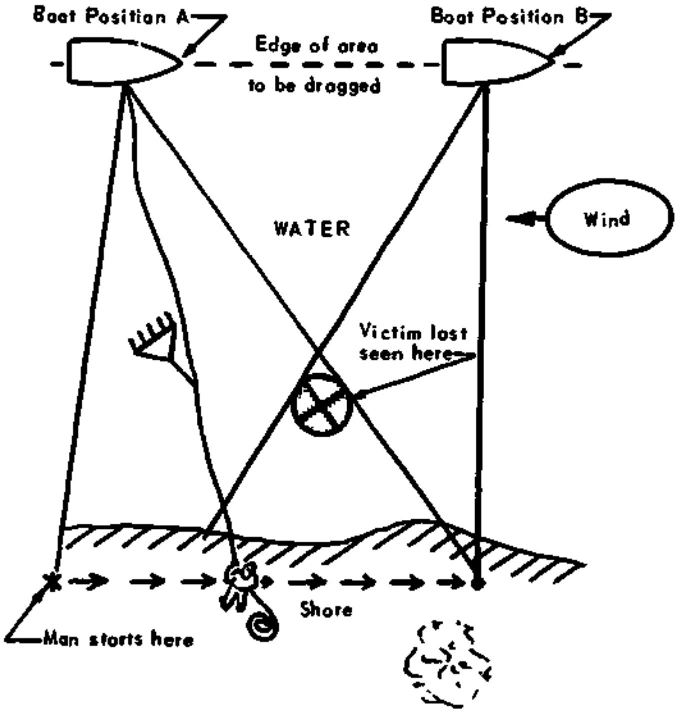

Figure 12

Boat-to-shore grappling

1. The boat must be anchored securely.
2. The man on shore does all the moving, side-stepping one-half the length of the grappling bar.
3. If the victim is not hooked after procedure from boat position A, the boat should then be moved to position B, and anchored securely. The procedure is then repeated from this new position.

Dock-to-Dock Grappling - The procedure is the same as in shore-to-shore grappling. (See Figure 13.)

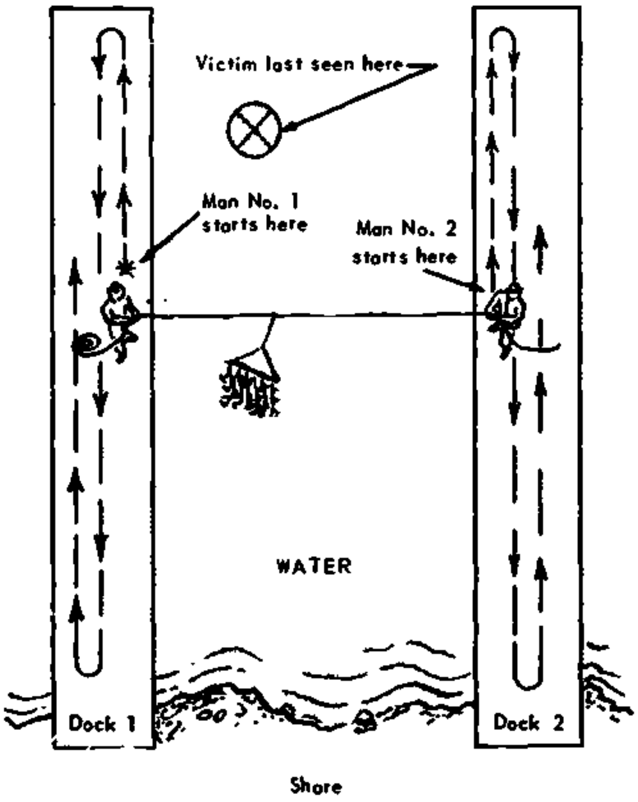

Figure 13

Dock-to-dock grappling

Boat-to-Boat Grappling - The following procedure is recommended. (See Figure 14.)

1. Place four buoys to mark the area to be covered.
2. Boats should be anchored from bow and stern.
3. Boats should be headed in the same direction.

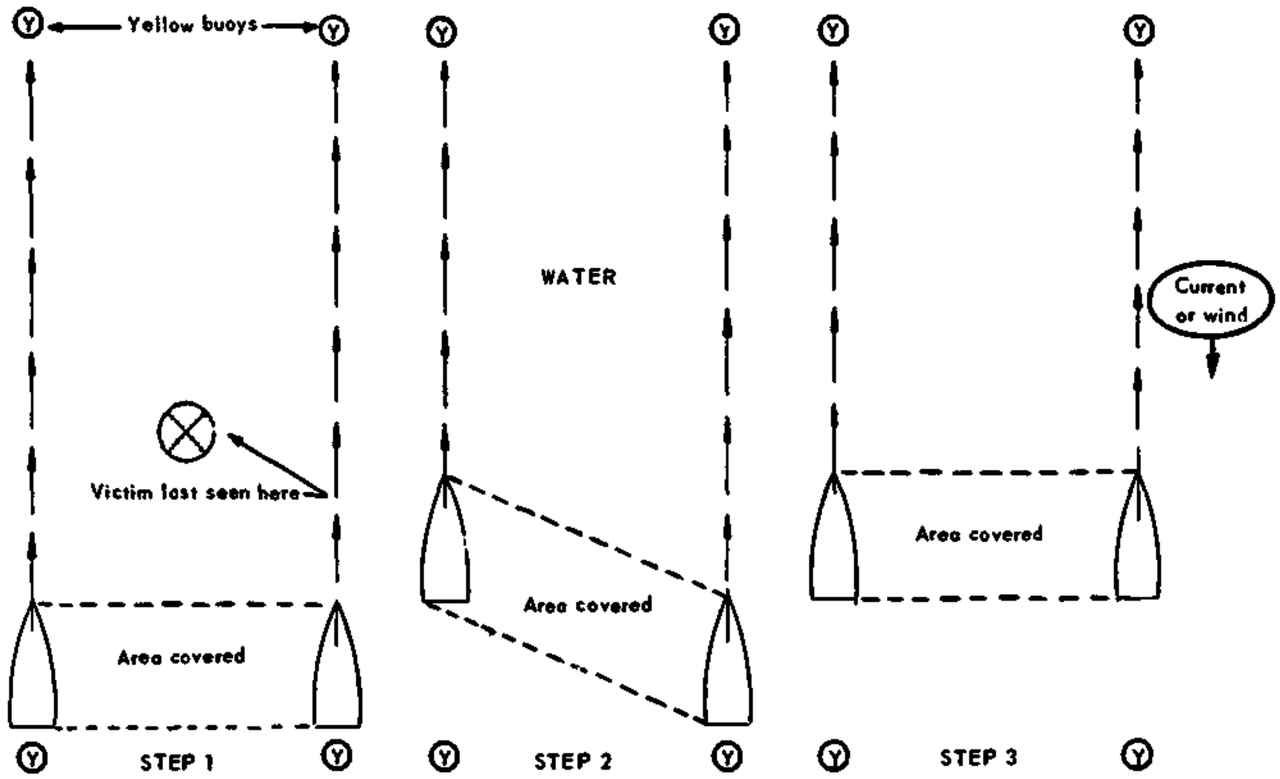

Figure 14

Boat-to-boat grappling

4. Boats should be broadside to the area being dragged at all times.
5. The entire length of the boat is grappled. Boat #1 moves forward one boat length. Then boat #2 moves in line with boat #1.

GRAPPLING FROM A MOVING BOAT

The least advantageous method of grappling is from a moving boat. The movement of the boat cannot be controlled perfectly, so the entire bottom of the area may not be covered.

When grappling from a moving boat, it is best to move with the current. This will keep the hooks on the bottom. If the current is very strong the oarsman should back water; otherwise the movement of the boat will be so swift that it may pull the hooks off the bottom.

The squadman using the hooks should kneel on the stern seat of the boat and operate the hooks over the stern of the boat.

In rough waters a motor may be used. It is best to use the motor to move the boat upstream with hooks out of the water. The boat should then be allowed to float slowly downstream with hooks on bottom.

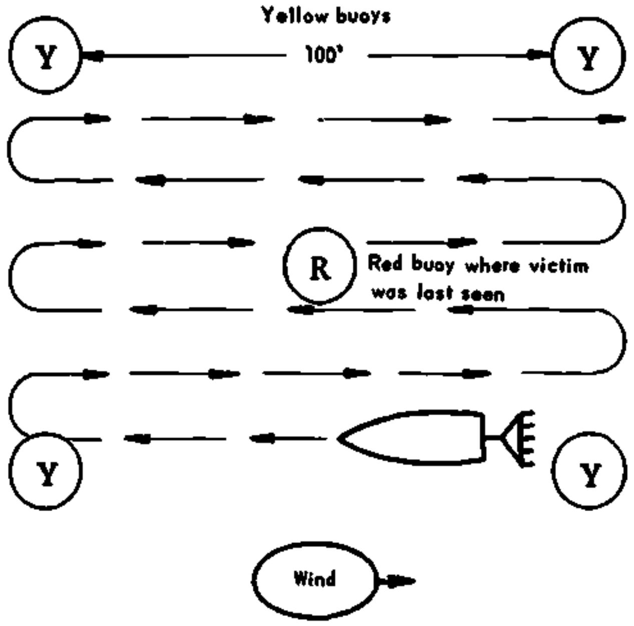

Figure 15
Dragging from a moving boat

Figure 16
Grappling hooks correctly used. They should drag the bottom.

For dragging from a moving boat, the following procedure is recommended. (See Figures 15 and 16.)

1. Upon arrival at the scene, remove all equipment from the boat that is not needed to start operations.
2. Launch boat (with two men).
3. Place red buoy where victim was last seen and start dragging at once.
4. If body is not recovered within one hour, place four yellow buoys in a square approximately 100 feet apart, and start systematic dragging operations.
5. Row boat into the wind; it is easier to keep on a straight course.
6. Do not start rowing until hooks hit the bottom.
7. Hold the dragging rope in your hand at all times, so you can feel when an object is hooked. The slack end of the rope should be tied to the boat as a precaution against losing hooks if the rope is pulled from your hands.
8. Boat must be rowed slowly and must not get too far ahead of the hooks.

OUTBOARD MOTORS

While the use of a motor on a boat is not recommended for dragging operations, it can be used successfully by squadmen under certain conditions.

Advantages

1. Time and effort are saved in getting to the spot to start dragging operations.
2. Time and effort are saved in rescue of victims stranded in flood waters.

Disadvantages

1. Motor gets in the way of dragging operations.
2. Motor moves boat too swiftly for dragging, pulls hooks off bottom.
3. Motor is sometimes difficult to start.
4. Time is lost refueling motor.
5. Mechanical failures occur, such as shearing off of the pin or motor stoppage.

DRAGGING WITH SEVERAL BOATS

Sometimes several boats are used in a dragging operation. Figure17shows a recommended procedure.

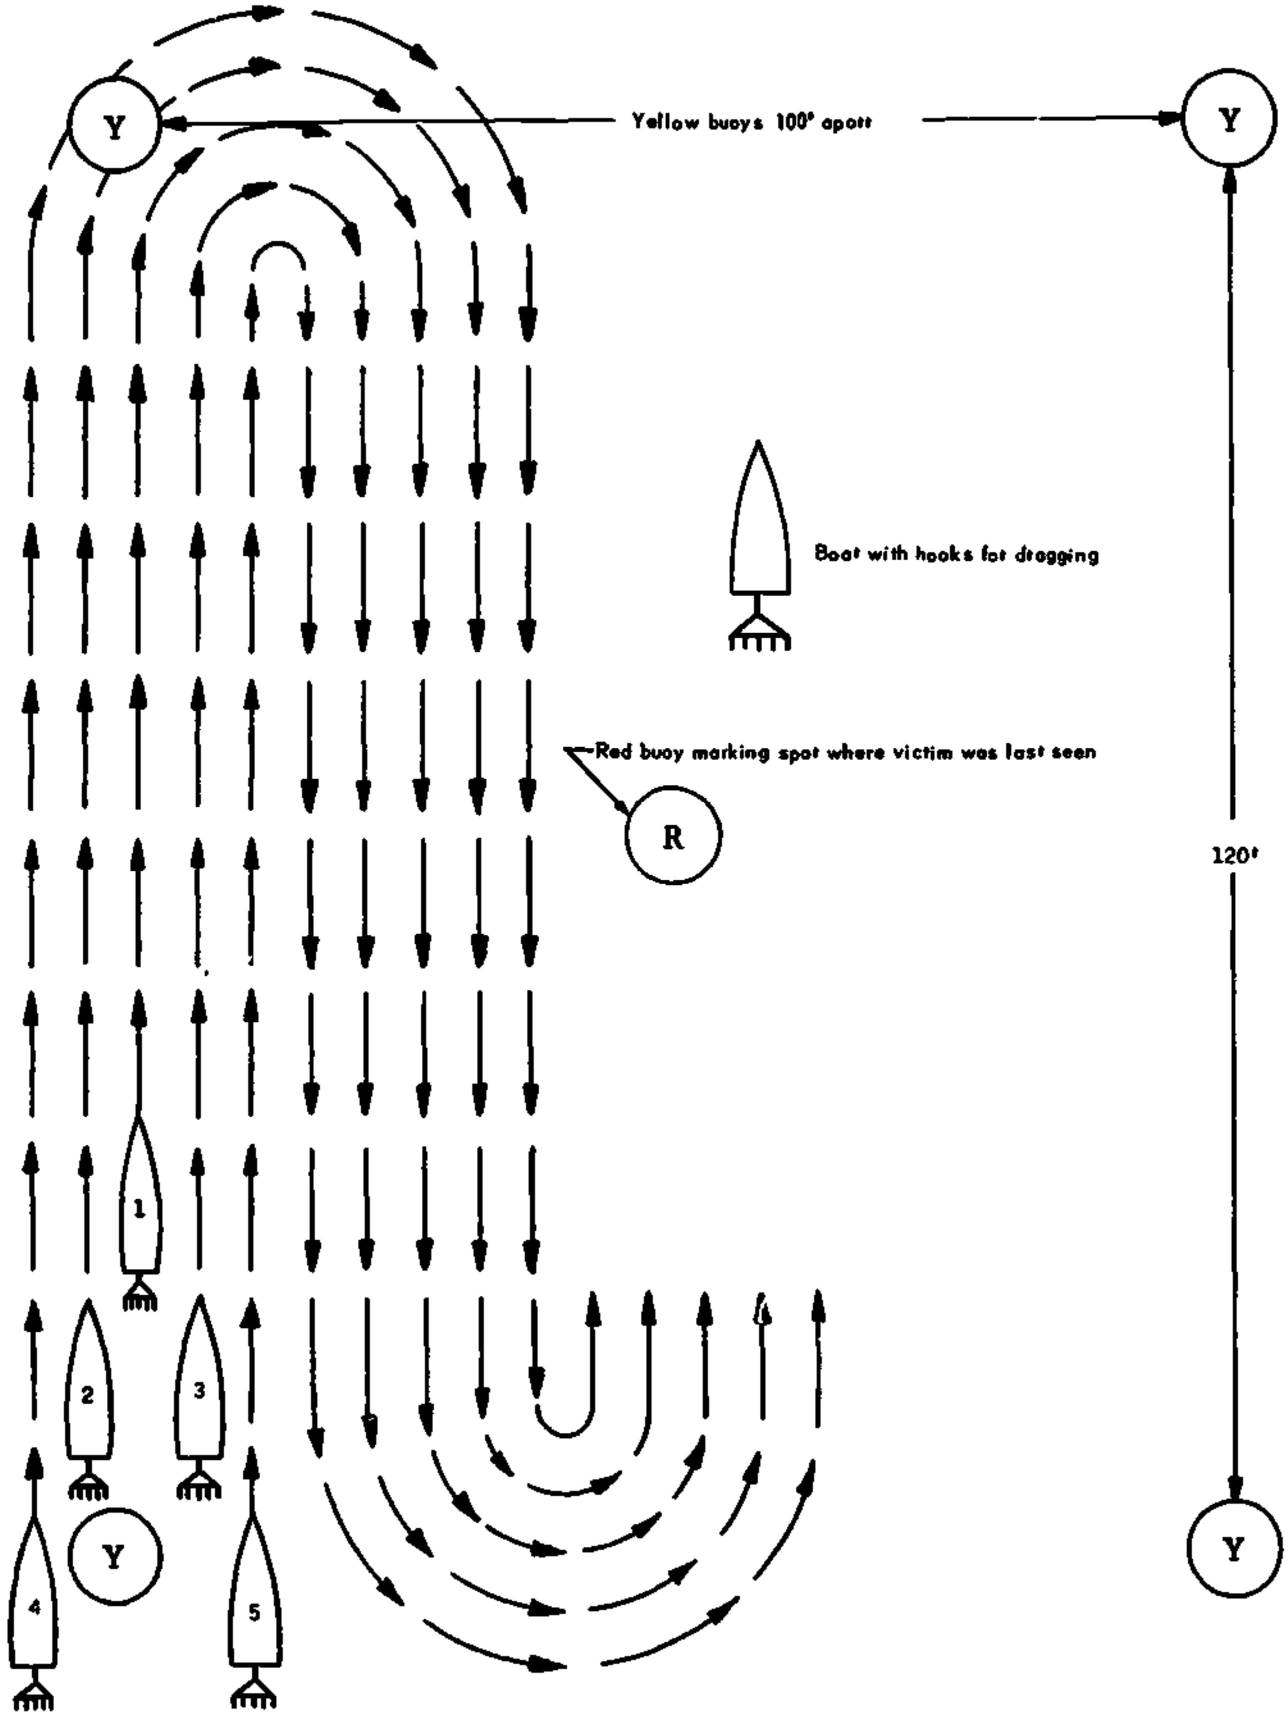

Figure 17

Dragging operation, using more than one boat

GRAPPLING WITH PIKE POLE IRON

Use the method shown in Figure 15 to cover the area. This method is very good when the bottom is full of tree stumps and heavy brush.

Grappling for a body with pike pole irons differs somewhat from the actual dragging methods usually associated with a body recovery operation. Pike pole irons are not dragged or pulled along the bottom. The squadman holds the pole in a vertical position and tamps the bottom with quick up-and-down strokes while the boat is moved along. (See Figure 18.) This probing action enables the operator to feel or determine what is being struck, on the bottom, by the end of the pole. This action also eliminates the possibility of the iron becoming fouled with debris on the bottom. The boat must continue to move very slowly during the searching operation until the entire area has been thoroughly covered. When the body is "struck" or located, the boat must be stopped and held stationary until the body has been securely hooked and raised to the surface.

SITUATIONS

Situation #1

A boy starts to swim a large lake on a dare; about one-quarter mile offshore he tires and sinks. He is noticed by his pal who calls the life guard and lake manager. The manager calls the emergency squad at once. They arrive within four minutes and start dragging at once. (Time was not taken to set out buoys.) See Figures 20 through 24.

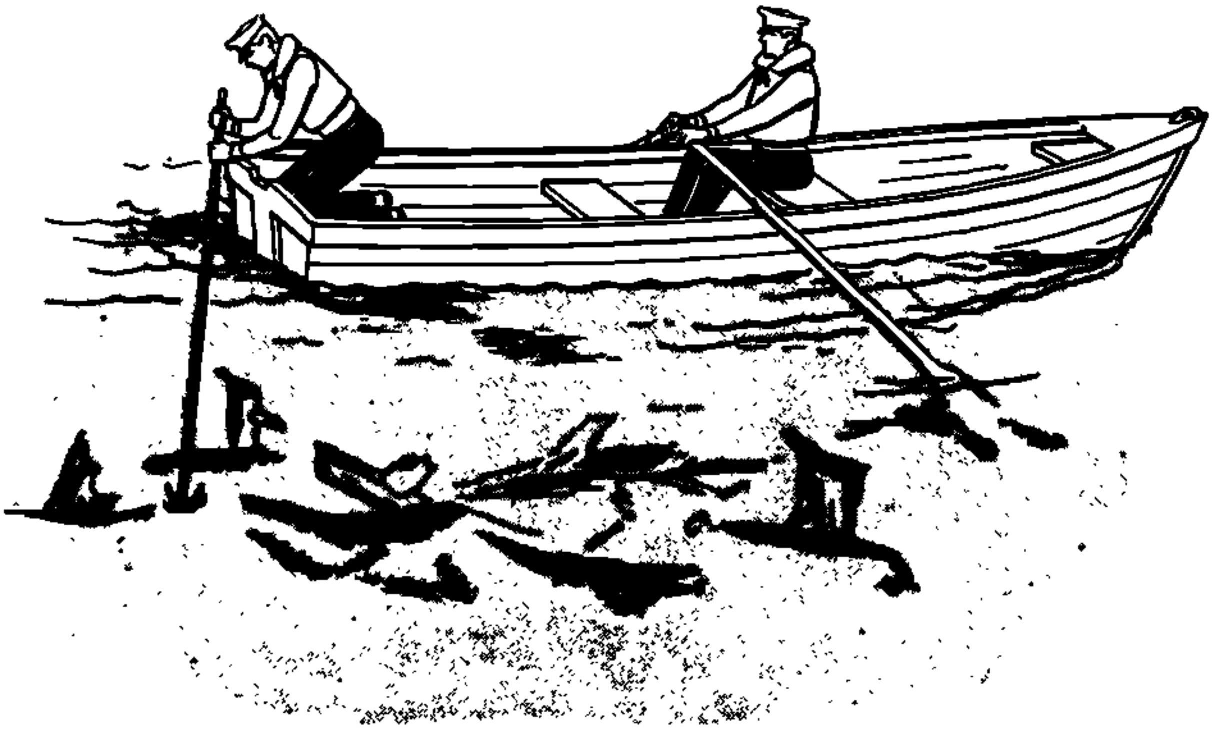

Figure 18

Grappling with pike pole iron

Courtesy Yorkville Vol. F.D.

Figure 19

On the second pass over the area the boy's arm is hooked by the grappling equipment. The squadman gently raises the boy to the surface and lifts him over the stern into the boat.

Courtesy Yorkville Vol. F.D.

Figure 20

Artificial respiration is started at once. With two rescuers and the victim in the boat, rowing would be awkward. Therefore another boat, manned by a squadman and a lifeguard, will tow the rescue boat to shore.

Courtesy Yorkville Vol. F.D.

Figure 21

On shore the body is covered with a blanket and mechanical resuscitation is started.

Courtesy Loudonville Vol. F.D.

Figure 22

The boy recovers after 20 minutes. Although he feels fully recovered, squadmen load him into the ambulance for transportation to a hospital. He remains there for 24 hours under careful observation, then is released. This is the happy ending of a serious situation.

Situation #2

Fisherman rents a boat from a park manager at 11 p.m., for all-night use. When the manager arrives at the park at 7 a.m. he sees the empty boat and investigates. Evidence indicates the fisherman fell into the lake.

The manager calls the sheriff and the highway patrol. After one hour of consultation, they call the emergency squad and the coroner.

Courtesy Loudonville Vol. F.D.

Figure 23

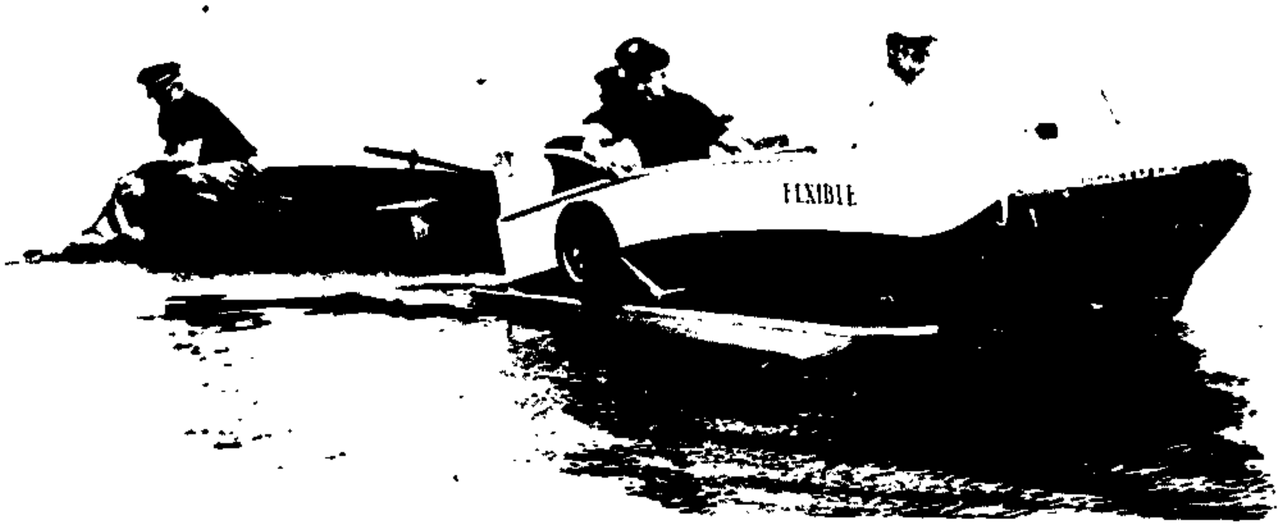
As the boat is still anchored it is not necessary to place a red buoy; the boat serves as a marker. The victim's wife arrives. The squadmen start to drag at once. After twenty-five minutes of dragging, they are about to take the time to use the systematic method when the body is hooked by the right leg.

Courtesy Loudonville Vol. F.D.

Figure 24

Squadman #1 secures the body with rope under the arms, as Squadman #2 removes hooks.

* In these posed pictures squadmen did not wear life jackets. In an actual rescue men would be wearing life jackets during the boating operation.



Covrtesy Loudonville Vol. F.D.

Figure 25

As it is a long distance to the shore, the coroner in his boat tows the boat and body to shore. (Note body is not pulled into boat, but is floated to shore.)

Figure 26

The body is wrapped in a blanket to conceal it from onlookers, With the assistance of squadmen, the coroner makes his examination. He takes charge of the body.

SUMMARY OF OPERATIONS AT SCENE OF DROWNINGS

Authority

An emergency squad should be in charge of the scene and operations.

Procedure

In most instances, rescue operations should be based on use of a boat and other equipment. NO ONE SHOULD ENTER THE WATER UNLESS HE IS A QUALIFIED RED CROSS WATER SAFETY MAN, SENIOR LIFE SAVER OR INSTRUCTOR. Personal entry into the water is indicated when the victim can be seen and is moving and when there is substantial evidence that the victim has been in the water for only a few minutes.

Life jackets must be worn by any non-swimmer working in a boat. In swift water EVERYONE who works in the boats must wear life jackets. Remove all equipment from the rescue boat except that needed to start operations, before launching it.

In a two-man boat, one man should row while the other uses the dragging equipment. The man who is dragging should kneel on the stern seat and use the equipment over the stern of the boat.

If recovery is made within a reasonable length of time, artificial respiration should be started immediately. The resuscitator should be put into service as soon as possible.

If at all possible, recovered bodies should be put into body wrappers while in the water.

In the event of a drowning, the coroner and the police must be notified.

SKIN DIVING

Skin diving should be limited to experts who have approved aquatic equipment.* It is recommended that the local skin diving club be contacted, and an emergency plan of operation be set up with club members so that squadmen may call for their services in an emergency. After a plan is agreed upon, the telephone numbers of the club members should be available at all times.

---

* As is taught in other areas, when a special situation arises, call in a specialist. Utility companies are frequently called in for the use of their special skills. The same policy should be followed when rescue work involves skin diving.

WATER RECOVERY PROCEDURES DURING ICE CONDITIONS

The following information is included as a guide to the rescue squad in supervising efficient recovery operations during ice conditions. The skin divers called in will do the actual recovery, but the squad may have to supply much equipment, to enable divers to work swiftly and safely.

Keep everyone off the ice until the safety factor has been ascertained.

The point of entrance of the victim into the water probably will be readily ascertainable. Any current of water movement should be noted.

Special Equipment

The following equipment should be available:

- Ice chisels
- Ice saws or chain saws
- Crowd-control ropes, with stakes
- Creepers
- Pike poles
- Ice tongs
- Skidway for sliding chunks onto ice or shore
- Power megaphones
- Anchor and ring on line
- Five-foot snap and ring lines for divers underwater

This equipment can be kept together at squad headquarters for use when needed.

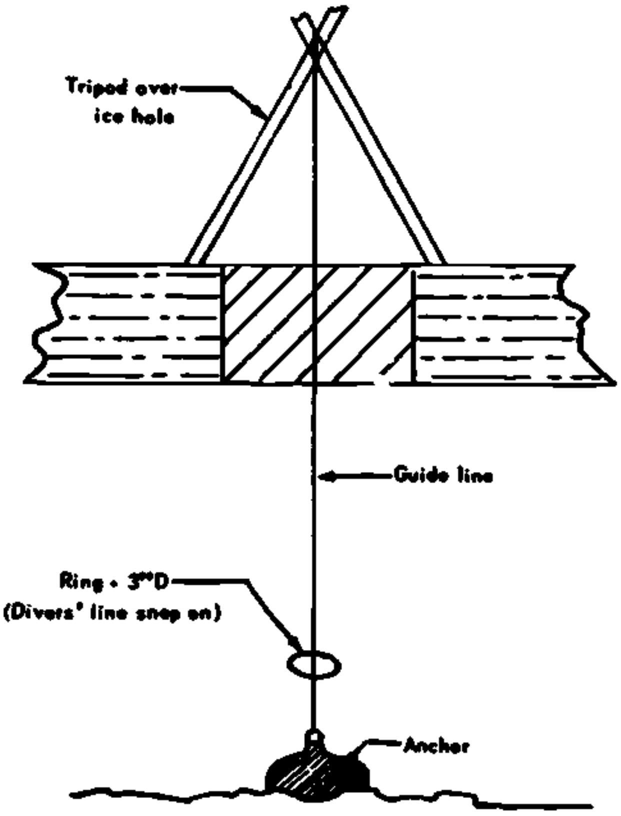

Figure 27

Guide line with ring attached, connected to tripod and anchor.

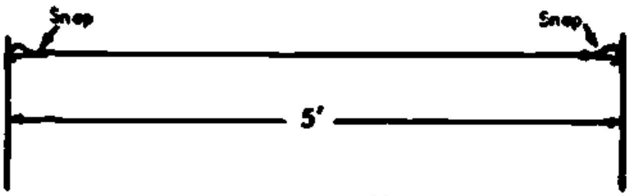

Figure 28

Five-foot snap line or distance line. Diver snaps one end of line onto ring and other end onto his gear.

Use of Divers

In a pond or lake, if divers are to be used and the ice is sufficiently thick to sustain man's weight, the chief preparation will be the opening of a four-foot-square hole at the point of entrance. Anchor line, ring and tripod should be gathered and set in place. Preparations for arrival of divers should then be started. All pertinent information (water movement, etc.) should be available to them on their arrival.

Adequate dressing facilities must be arranged. These must be warm and comparatively near to the scene.

Hot coffee and/or chocolate should be available for divers at all times, at the water area and in the dressing room. Hot chocolate is preferable to coffee in many instances, as it is a very rapid body-heat builder.

As soon as manpower permits, the diving area should be roped off so that bystanders or sightseers will not be endangered or hamper the operations of the crew.

Because of the danger involved, nighttime operations should be limited.

The resuscitator should be kept standing by, during the time men are on or near the ice or water.

A recommended pattern of search is shown in Figure 27. Note that all areas are searched twice when this pattern is followed. Divers underwater on any one hole should be limited to a maximum of three. For each of these divers there should be a tender at the surface, manning the safety line.

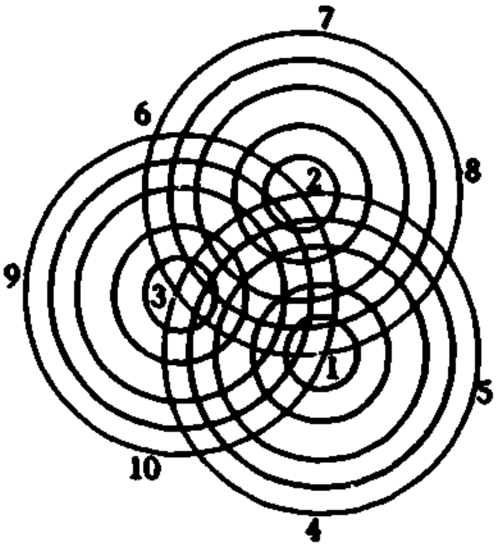

Figure 29

Pattern for under-ice search. The holes are 5 feet apart. Divers enter holes No. 1, No. 2, and No. 3 first. If the body is not recovered, additional holes for searching can be made at locations No. 4 through No. 10, and the same recovery procedures followed.

Opening Ice

If ice is less than two inches thick, it probably will be better to break a channel with the boat. The boat proceeds in the channel and the divers fan out underwater (not more than five to cover an area on both sides of the channel. There should be no problem in adequately running parallel lines on this type of operation.

Methods of opening the ice will depend on thickness. Ice between one and three inches thick may be cut with a chain saw off the side of a boat or other support. Ice thicker than three inches may be cut with a chain saw while walking on the adjacent ice. Under one inch it will be more practical to break the ice with axes or chisels.

Initially as much ice as possible should be removed from the critical area, and pulled a safe distance away by the use of ropes and tongs. This will allow working space. This could be done as much as possible by the squad before the arrival of the divers.

Operations in Flowing Current

A barrier of snow fence, goat fence, chicken wire, etc., should be placed well downstream (one-half mile) from the point of entrance. Search operations should start at this barrier and proceed back upstream toward the point of entrance.

Approximately 50 feet of the river or stream should be cleared of ice, and the bottom thoroughly searched. Be sure to search the underside of this removed ice. Than the ice upstream may be cut into small manageable chunks and floated down into the cleared area. Again the bottom should be searched as the removal of ice progresses upstream.

If sufficient searchers are available and the water depth is not too great, a solid line of men can be formed across the stream. By slow prodding and removal of ice, the entire stream should be adequately covered back toward the point of entrance.

CHAPTER XXIII

UNUSUAL SITUATIONS

INTRODUCTION

Previous chapters have explained various rescue techniques, giving in many instances examples and illustrations of their use. This chapter describes unusual situations which could not be classified with material in previous chapters. In each example a problem is presented and appropriate procedures are suggested.

It is not practical to attempt to show or discuss in this manual every possible type of accident, or the unlimited number of circumstances which might surround an accident. However, from examples shown, squadmen should foresee many of the situations in which they may find themselves. In this way the necessary plans can be made not only within their squad, but with cooperating agencies and individuals, to meet situations which may arise.

HIGHWAY ACCIDENTS

Figure 1 shows a truck and automobile which collided on a very busy highway. Before the emergency squad arrived, some motorists removed the injured truck driver from his truck and placed him on the ground near his vehicle. Gasoline leaked from the damaged tank of the truck, contaminating the immediate area. Just before the emergency squad arrived a "non-thinking" bystander lit a cigarette and carelessly tossed his match to the ground.

The area was immediately engulfed in flames. The victim died of severe burns. It was later found that he had suffered only fractured wrists in the accident.

There are several lessons to be learned from this unfortunate event. The following precautions should have been taken:

1. The victim should have been removed a safe distance from the spilled gasoline.
2. A fire department should have been called to eliminate the hazard caused by spilled gasoline.
3. Bystanders should have been kept back from the contaminated area.

Courtesy Northern Hills F.D.

Figure 1

Highway accident

HOME EXPLOSIONS

Figure 2 shows a home which has been ripped by an explosion. Squadmen on arrival must take the following action.

1. Give first aid to victims with burns, cuts, and puncture wounds.
2. Give care for shock and hysteria.
3. Transport victims who need medical attention.
4. Check neighboring homes for persons who may also have been injured.
5. Notify law enforcement agencies so that property will be protected from vandals and so that help will be available to control possible crowds.
6. See that utilities are cut off, and that utility companies are notified.

If a fire department responds to the call, firemen may assume responsibility for Items 5 and 6, and may assist squadmen in Item 4.

Courtesy Mifflin Twp. F.D.

Figure 2

Home explosion

STORE BUILDING EXPLOSIONS

In a public building or store explosion the problems will be quite different from those resulting from a home explosion, for the following reasons:

1. The building will be larger and usually will be located near other large buildings. Since the debris will be confined by other buildings, it will fall back, covering victims who are in or near the building at the time of the explosion.
2. The number of victims probably will be greater.
3. The problem caused by spectators will be more difficult, due to the greater number of them and the crowded surroundings.
4. When utility services to the building are cut, large numbers of people in the area will be affected.
5. To cope with a disaster of this type, preplanning is essential. Heavy-duty equipment will be needed to remove debris, so that trapped victims can be rescued. It may be desirable to call neighboring squads, and local and neighboring ambulance services.

Figure 3

Store building explosion

In Figure 3 note the following:

1. A fire truck and charged hose line are on location to extinguish smoldering embers when they are encountered.
2. Emergency squads are standing by to transport the injured.
3. A high-lift loader is available to help in moving debris.
4. A truck and personnel from a utility company are on the scene.

SPECIAL EQUIPMENT

Figure 4 shows a large clam shovel being operated by a construction company. Preplanning made it possible to acquire the services of this piece of equipment rapidly.

In Figure 5, a bulldozer has been put into service. In the foreground, firemen are removing the cable from the shovel so that the hook may be used to remove a steel beam.

Figure 4

Clam shovel

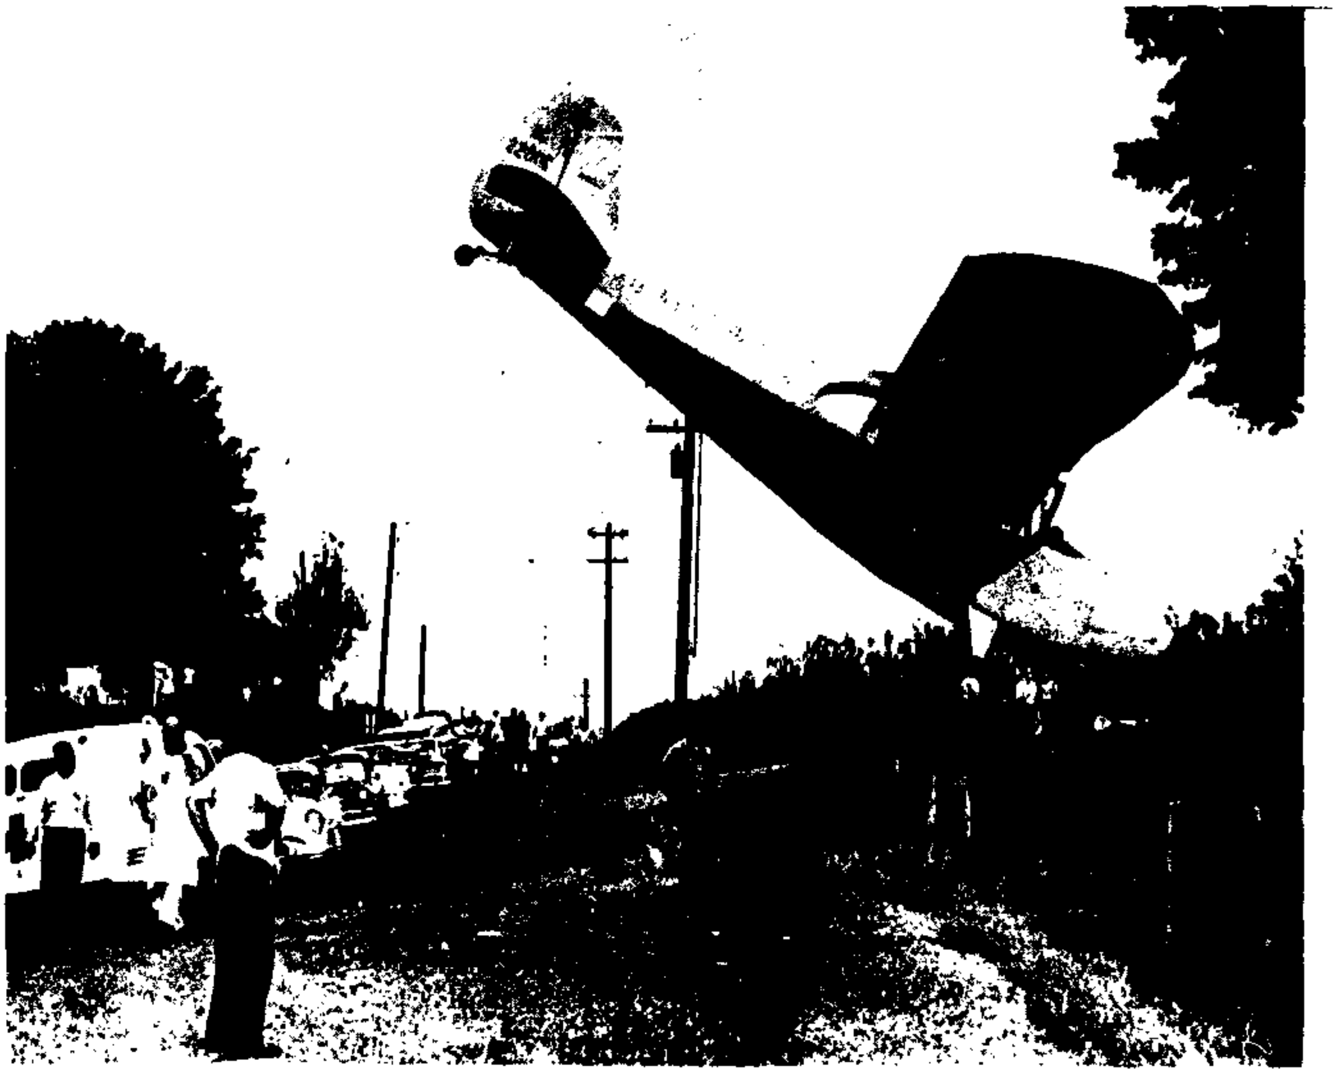
Figure 5

Bulldozer

AIRPLANE ACCIDENTS

Figure 6 shows another unusual situation. Squadmen acted wisely by taking the following action:

1. Passengers and pilot were told to remain in plane. Victims and rescuers might have been electrocuted if a rescue was attempted without having power disconnected.
2. The power company was contacted, to have electric lines de-energized. Due to pre-planning, the company responded rapidly.
3. Occupants of the plane were then rescued by use of a short ladder carried on the rescue squad vehicle.
4. Even though no injuries were apparent, victims were treated for shock.
5. Victims were then transported to the hospital.



Courtesy Ohio State Highway Patrol

Figure 6

Airplane accident

It appears that not all proper precautions were taken, since cars and pedestrians were allowed to move into the danger area caused by the electric lines. The lines could break or be burned down at any moment, turning the situation into a major disaster.

NOTIFYING AUTHORITIES

In Ohio the law requires the squad dispatcher to notify the Ohio State Highway Patrol of all airplane accidents, regardless of the size of the plane.

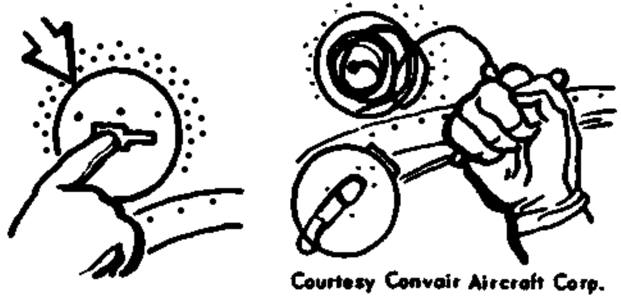
JET COCKPIT ENTRY PROCEDURES

All emergency squadmen should know what to do when confronted with the task of rescuing an injured pilot from a jet plane that is down. Squadmen who have not been trained to extract pilots properly have been killed because of their improper approach to a downed jet plane.

CANOPY EJECTION

WARNING: When fumes are present do not use the canopy ejection mechanism.

1. Remove access door on left side of fuselage, just forward of wing leading edge. Press with thumb or finger on center of circular door to open. (See Figure 7A.)
2. Reach inside, grasp exposed lanyard handle, and extend about six feet, and jerk. (See Figure 7B.)

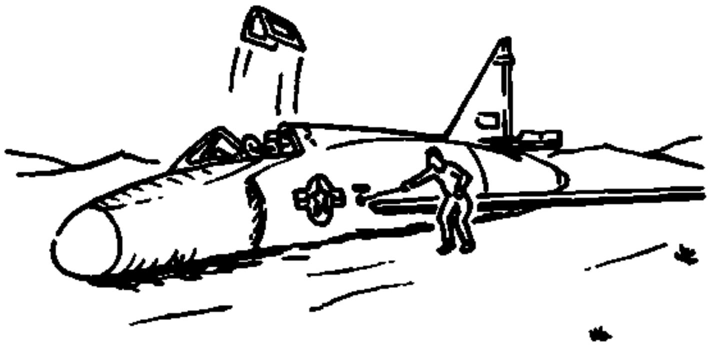


Courtesy Convair Aircraft Corp.

Figure 7a **Figure 7b**

Opening access door and ejecting canopy

3. Watch path of canopy during ejection to avoid being hit. Canopy will normally fall adjacent to tail section. (Figure 8.)



Courtesy Convair Aircraft Corp.

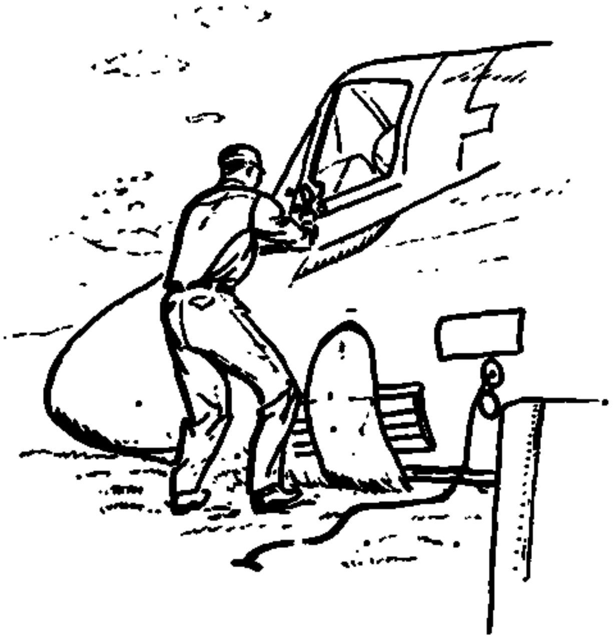
Figure 8

When lanyard is jerked, canopy usually ejects toward tail of plane.

4. Caution all rescue personnel to avoid area around tail section during canopy ejection.

Canopy Break-In - If canopy does not eject, proceed as follows:

1. Break canopy glass in lower forward corner on either side of the airplane. Use heavy (approximately eight-pound) maul. (See Figure 9 .)



Courtesy Convair Aircraft Corp.

Figure 9

Breaking canopy glass

2. Strike blows close to canopy frame.

3. Break out sufficient glass to permit removal of pilot.

4. CO_2 from a fire extinguisher can be applied to the canopy to facilitate a faster entry. This causes the material to break more easily.

PILOT RELEASE PROCEDURE

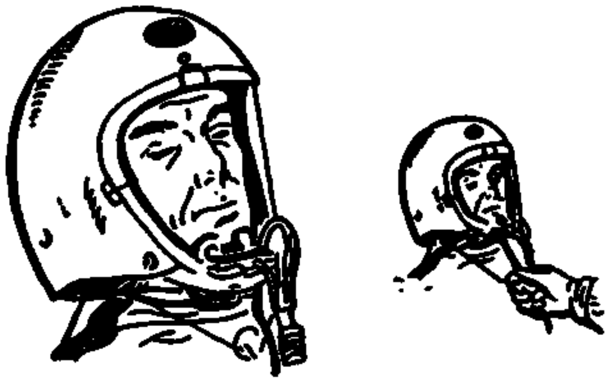
Seat Ejection Mechanism - Disarm ejection seat by cutting tube behind pilot's head. Cut all tubes to the rear of the pilot's head. Some trainers and newer aircraft have more than one tube. (Figure 10.)

Courtesy Convair Aircraft Corp.

Figure 10

Disarming seat ejector mechanism

Helmet Face Plate - Remove pilot's face plate by pulling downward on green cord beneath his chin and lifting face plate free. This must be done before detaching the oxygen supply hose. (Figure 11.)

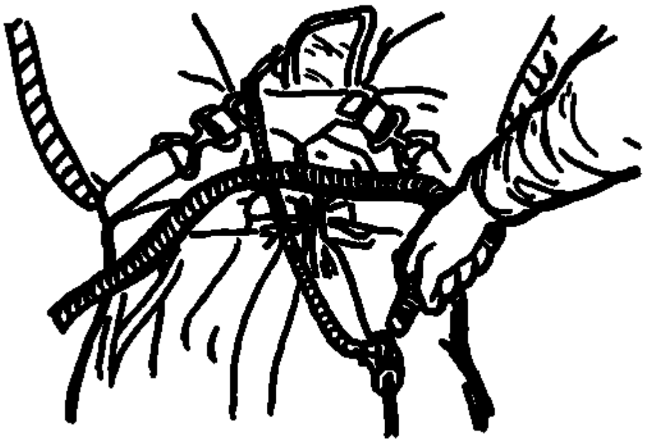


Courtesy Convair Aircraft Corp.

Figure 11

Removing pilot's face plate

Oxygen Supply Hose - Detach or cut oxygen hose which is attached to pilot's suit. (Figure 12.)

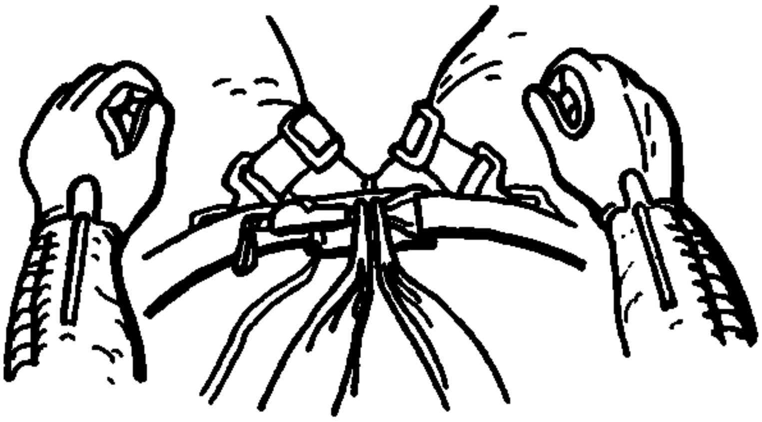


Courtesy Convair Aircraft Corp.

Figure 12

Cutting oxygen supply hose

Seat Belt and Shoulder Harness - Release pilot's seat belt and shoulder harness by unlocking buckle at pilot's waist. (Figure 13.)



Courtesy Convair Aircraft Corp.

Figure 13

Releasing seat belt and shoulder harness

Removing Victim - The victim should be lifted out by the shoulders. The squadmen should stand on the plane just behind the pilot to lift him out.

PREPLANNING FOR AIRPLANE ACCIDENTS

Because many commercial, military, and private planes are continually in the air, all squads should have a well defined plan to execute in case of aircraft accidents.

The latest military transport plane is believed to be able to carry 700 to 800 personnel on board. Does your squad have pre-plans to meet such an accident?

BUS ACCIDENTS

Modern buses have special construction features which must be understood by emergency squadmen for the successful rescue of trapped bus occupants, as well as their own safety. Critical design features of a typical modern cross-continental bus* are described here.

RESCUING PASSENGERS

This bus is 10 feet, 11½ inches high and 40 feet long. The coach weighs 30,000 pounds empty and 40,000 pounds loaded. Forty-three passengers can be seated in the coach: thirty-three on the upper deck and ten on the lower level.

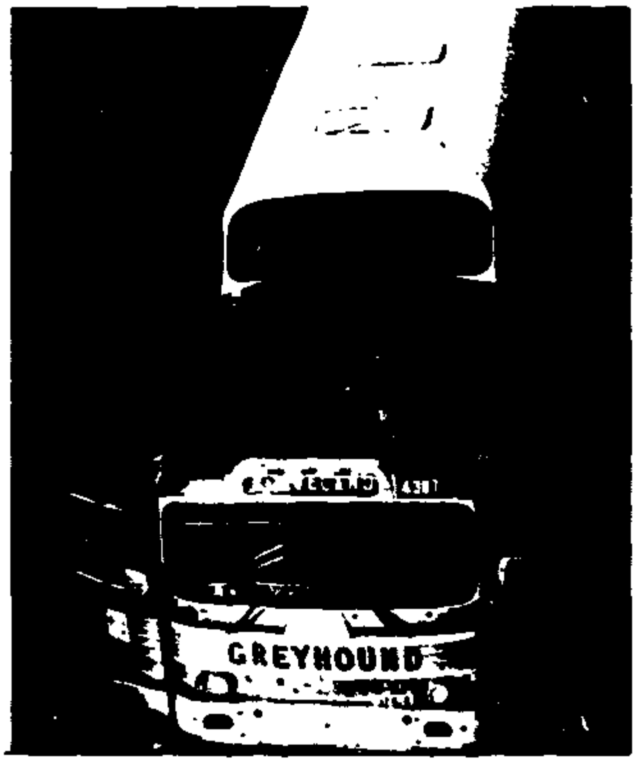
There is no emergency door. In case of an accident damaging the entrance door, rescue must be effected through the windows or the skylights. The windows are marked on the inside by a metal plate and the skylights by decals.

The windows are held in place by a metal frame, and are hinged at the top. To open a window from the outside, place a large screwdriver or pinch bar at the bottom of the metal frame and force the window out. To open the front windshield and skylights, take out the rubber locking strip which runs around the windshield and the skylights. The windshield, frame, and glass will all come out, leaving a smooth opening for the removal of any injured passengers. (See Figures 14 and15)

Courtesy Eastern Greyhound Lines

Figure 14

To remove a window, pry out the locking strip.



Courtesy Eastern Greyhound Lines

Figure 15

The skylights can be removed without breaking them.

---

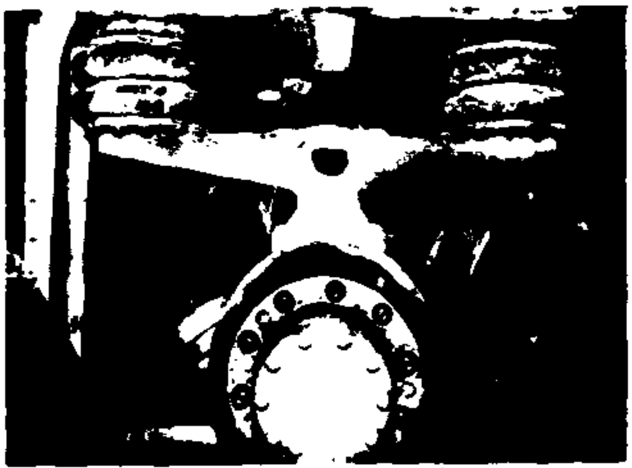
* This is a description of the Greyhound Scenicruiser, adapted from information supplied by Eastern Greyhound Lines.

This coach is equipped with a rest room located on the lower level next to the steps on the driver's side. In case of an emergency in the rest room, it may be entered from the outside by opening the large window on the driver's side. It will be necessary to prop or hold the window open, as it is hinged from the top.

BLOCKING THE COACH BODY

In case of a fire or an accident, NO PERSONNEL SHOULD BE ALLOWED TO GO UNDER THE COACH OR TO PUT THEIR HEAD OR SHOULDERS UNDER THE WHEEL HOUSING WITHOUT FIRST BLOCKING THE BUS BODY SECURELY.

The coach uses an air-suspension system for flotation, rather then metal springs. This air-suspension system consists of rubberized nylon bellows at each wheel. (See Figure 16) The bellows use from forty to fifty pounds of air, depending on the load on the coach and the road conditions; they are inflated through air chambers from the compressor. The coach is kept on an even keel by the use of leveling valves.



Courtesy Eastern Greyhound Lines

Figure 16

Nylon bellows support the weight of the coach body.

When a bellow is damaged, a coach can drop without warning to within three to three and one-half inches of the ground. Therefore the body must be blocked before anyone goes underneath, or puts his head or shoulders under a wheel housing.

This coach has no frame; it is equipped with jack plates located under the body behind the rear wheels. If it is necessary to jack or block under the body of the coach, jack under a solid bulkhead. These bulkheads are located in front and rear of the wheels. You may also jack under the short engine supports. Always place a support under the body before jacking, because these bodies are made of aluminum, which will tear easily.

DISCONNECTING BATTERIES

The individual circuits of the electrical system are protected by circuit breakers. However, if it is necessary to disconnect the batteries from the electrical system, push up on the battery-disconnect switch handle which is located at the rear of the battery compartment. Access to the switch is through the center engine door. (See Figure 17) To connect batteries, lower the switch handle to a horizontal position.

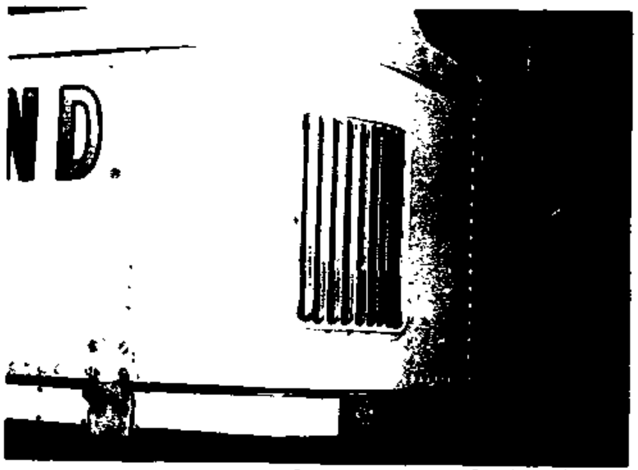
Courtesy Eastern Greyhound Lines

Figure 17

This switch will disconnect the batteries.

ENGINE AND FUEL

This coach is equipped with an eight-cylinder diesel engine which does not need electrical current to keep it running after it is started. In case of an accident, if fire department or rescue personnel arrive on the scene and find the engine running, it can be shut off with an emergency stop button located on driver's left switch panel. If for any reason the engine does not stop when the button is pushed, it may be stopped by discharging CO_2 into the air intake located at the right rear corner of the coach. (See Figure 18) This method should be used ONLY after all other procedures have failed. It is important that ONLY CO_2 be used, as other extinguishing agents may damage the engine and may cause injury to personnel.



Courtesy Eastern Greyhound Lines

Figure 18

Discharging carbon dioxide into this air intake will stop an engine that cannot be shut off manually.

IT IS VERY IMPORTANT TO BE CAREFUL when opening the rear engine compartment doors. There are no safety guards around the fans, and speed of rotation makes them difficult to see.

The fuel tank holds 180 gallons of diesel fuel. The tank is located back of the front wheels, running across the coach. The filler cap is located on the right side. The tank has no shut-off controls. There is no gasoline carried on the coach.

EXTINGUISHING FIRES

The most vulnerable places for fires to start in this coach are the brakes on the trailing axle, the transmission, and the engine compartment. In extinguishing a fire around the transmission, attack the fire over the rear wheels on either side with fog. Make sure that fire or rescue personnel do not place their head or shoulders between the wheels and the body of the coach. An applicator is desirable.

This coach is equipped with two fire extinguishers. The Dugas extinguisher is mounted behind the glass door to the right of the operator's seat. The other fire extinguisher is located in the heater compartment. It is a liquid type, intended for use with tire fires.

Safety flares and flags are carried in a tube at the left of the operator. A fire axe is mounted inside the dash compartment. A first-aid kit is mounted in front of the operator, above the left windshield.

AIR-SUSPENSION SYSTEMS IN OTHER VEHICLES

Air-suspension systems of flotation are being used now on many inter-city buses, city-type buses, trucks, trailers, and on one type of train. Air suspension will be used more and more as time goes on, because of the lower cost of repairs on body parts and springs, and the smoother riding qualities. Squad members should become thoroughly familiar with the operation of air-suspension systems in all the types of vehicles based in their area, as well as those which may pass through their area.

FARM ACCIDENTS

Squads that operate in rural areas are often involved in farm accident rescues. Figures 7 through 12 show the steps taken to rescue a man whose hand was caught in a corn picker when he attempted to unclog it.

Figure 24

This victim will be covered with one more blanket, and transported to the hospital. Since the tourniquet and injury will be concealed under the blanket, the letters TK are written on the victim's forehead with an iodine swab.

OPERATIONS AT A CRIME SCENE

The following information should be of help to all squads. The outlined procedure should be followed at all suspected crime scenes.

Emergency care should not be jeopardized or sacrificed at any time. If there is any thought whatsoever that life may still be present, the care of the patient must take precedence over all other things.

Protecting The Scene

The scene of any unusual death such as at a fire, accident, explosion, unnatural death, etc., should be treated as a crime scene until proven otherwise. If squadmen arrive ahead of any law officers, they should assume the responsibility of protecting the scene.

1. The primary object to be guarded may be a body, an automobile, a room, or an entire building.
2. An area around the primary object may also require protection, depending on the type of crime.

Authority should be turned over to the police agency as soon as a representative arrives. If a patient must be transported to a hospital, one squadman could be left at the scene to await the arrival of the police agency.

Typical Procedure

All crime scene investigations more or less follow the same general pattern. The example treated here is a possible homicide. Parts of this procedure, of course, are not applicable in other types of crime.

The following information should be obtained promptly and transmitted to a police agency.

1. Name of deceased, if possible.
2. Exact address and location of the body.
3. Telephone number where squadman can be reached or is calling from.
4. Apparent cause and time of death, if known.
5. What assistance, if any, is needed.

Duties of the first squadmen at the scene are as follows:

1. If the victim must be moved for emergency care, mark in some manner an outline of the body.
2. KEEP THE SCENE INTACT--AS IS. Never touch, change, or alter anything until investigators arrive.
3. Get the names and addresses of witnesses and persons at the scene.
4. Get the name and address of the person who summoned the squad.
5. Note the weather condition at the time of your arrival.
6. Note the exact position of the body and the condition of the victim's clothing.
7. Note the condition of the victim's hands and any objects in his hands.
8. Note the size and condition of blood stains, if any.
9. If a weapon is found, do not touch it - push it aside or pick it up with a cloth. The weapon should be touched only in the most extreme emergency.

10. All persons found on the scene should be detained for examination, and no unauthorized persons should be admitted to the scene.

11. Do not remove a dead body unless so authorized by the coroner or officer in charge of squad.

12. At least one squadman should reamin with the body at all times, until he is relieved by a police agency.

13. Squadmen should not theorize or gossip with citizens about facts of the case. All such information should be given to investigating officers.

14. Note the time of arrival at scene and the names of squad officers present.

Records

All pertinent information should be kept on the squad report at squad headquarters. It may be subpoenaed later, as evidence.

CHAPTER XXIV

RECORDS AND REPORTS

INTRODUCTION

Proper reporting and record keeping are extremely important in the operation of an emergency or rescue squad. This chapter discusses important items of information that should be included on reports for successful operation and future reference. Sections of a squad report sheet are shown one at a time, and important items are discussed. Each section extends across both columns with the explanatory text running consecutively from column to column. The complete report form is shown on page 313, together with several other sample run reports and a typical monthly summary report. (Figures 1 through 6 .)

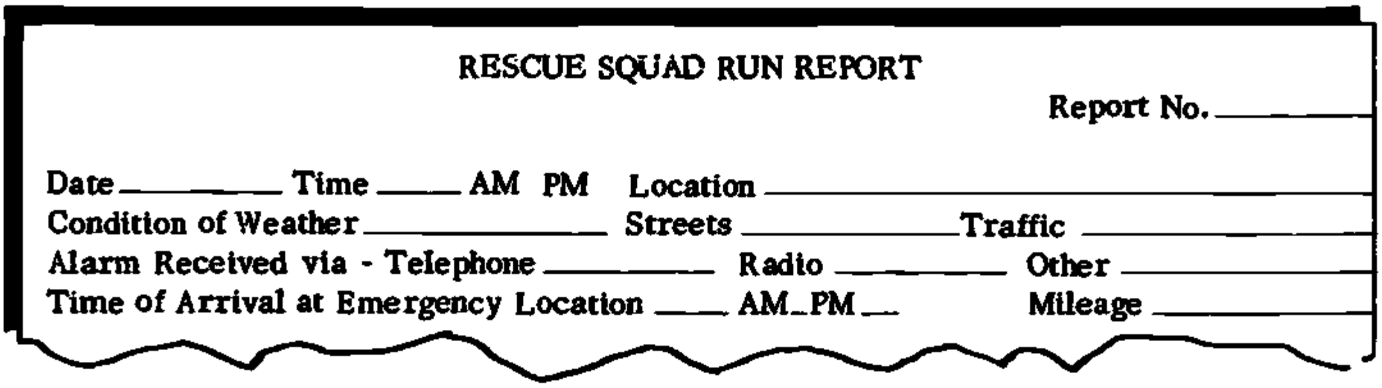
RESPONSIBILITY FOR REPORTS

The responsibility for reports is determined by local authority, such as the squad chief or fire chief. It is his duty to designate who is to be responsible. In many rescue squad organizations the chief responds to most calls. If this is the practice, the chief will usually complete the necessary reports. In any case it should be established who is responsible for filling out a complete squad report.

IMPORTANT ITEMS ON SQUAD REPORTS

RECEIVING AND RESPONDING TO ALARM

The date, time of receiving alarm, and location should be placed at or near the top of the report. Many squad reports provide a place to record "How the Alarm Was Received", that is, by telephone, messenger, police, radio, alarm system, etc. Some rescue squad run reports include "Time of Arrival at Emergency Location" and "Mileage".



RESCUE SQUAD RUN REPORT

Report No. ________

Date _______ Time ____ AM PM Location ________________

Condition of Weather __________ Streets _________ Traffic _________

Alarm Received via - Telephone _______ Radio _______ Other _______

Time of Arrival at Emergency Location ____ AM_PM __ Mileage _______

OBSERVING THE CONDITION OF A VICTIM WHEN FOUND

Space should be provided for the name and address of the victim, plus a brief but complete explanation of the squadman's initial observation of the situation.

Space should also be provided to record the names and addresses and important information received from persons who were at the scene before the squad's arrival.

On many report forms the back of the sheet is blank, allowing ample room to include additional information. If data are recorded on a separate sheet of paper, it should be securely attached to the report form for reference.

____

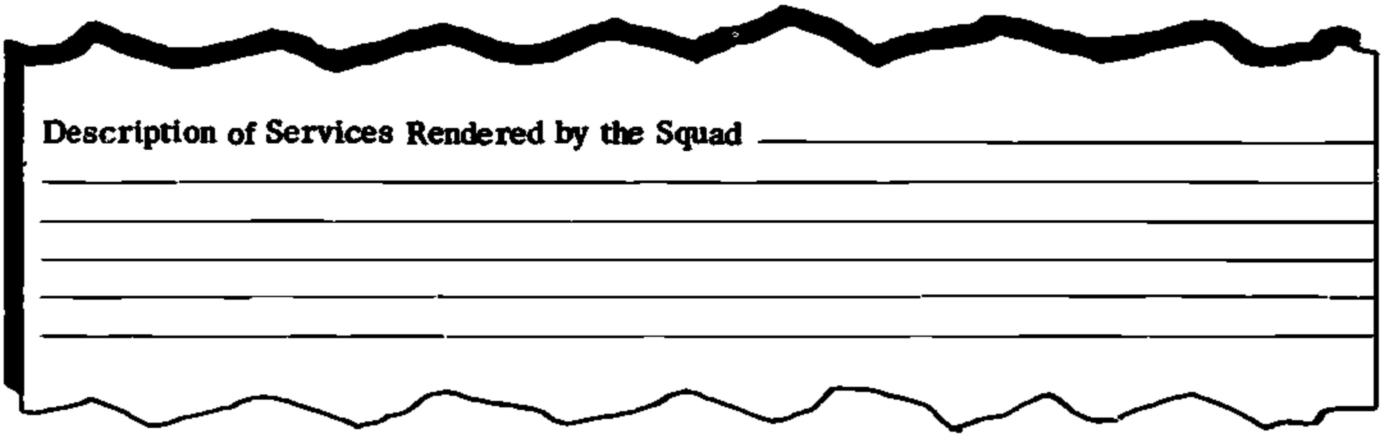
FIRST AID GIVEN BY THE SQUAD

A description of the first aid and other important services given by the squad should be included on the report. Here too, the reverse side of the report or a separate sheet of paper may be used.



Description of Services Rendered by the Squad ____________________
____
____
____
____
____

MEDICAL SERVICES PROVIDED BY A PHYSICIAN AT THE SCENE

This information should be requested from the attending physician and be entered on the report. Space should be provided for the attending physician's name and address, the services he provided, and his instructions or suggestions either to the squad or to hospital personnel. Presenting a scratch pad with pencil to the physician at an appropriate time may assist a squadman to obtain this information.

Name of Attending Physician ____________________ Address ____________________

Services Administered ____

____

____

Physician's Instruction: ____

____

____

HANDLING OF VALUABLES

Proper handling of valuables at an emergency is extremely important, and all personal items should be treated as valuable. An item which has little monetary value may be regarded by someone as extremely valuable because it is a gift or keepsake.

It is very important to make out an itemized list, properly signed and witnessed, when valuables are put in the trust of a squadman or others. Usually valuables are not taken from victims who are conscious. (Usually this is left up to the police or hospital.)

Valuables and their Disposition: ____

____

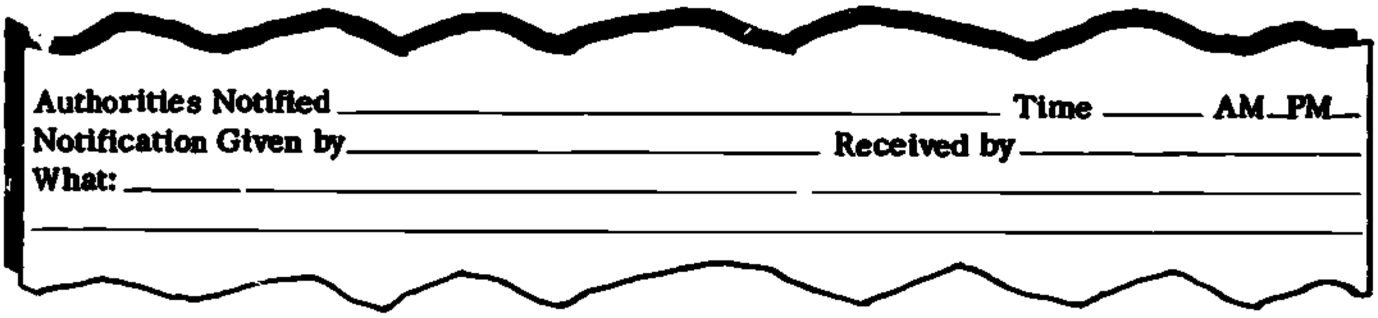
Receiver's Signature ____________________ Address ____________________

Witnesses Signature ____________________ Address ____________________

Witnesses Signature ____________________ Address ____________________

NOTIFYING PROPER AUTHORITIES

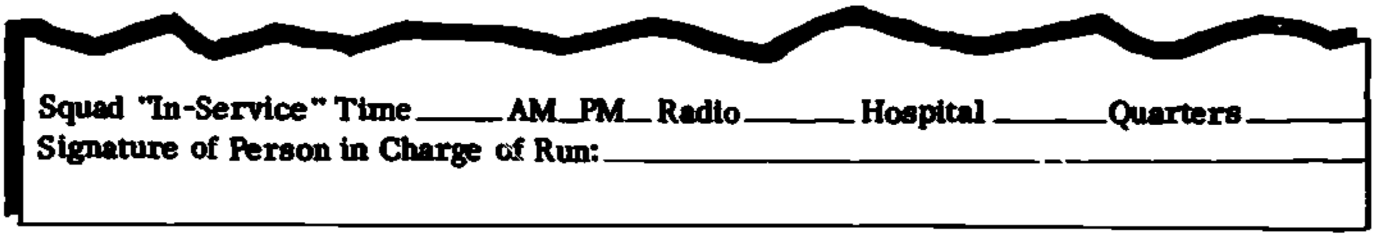
In some situations squadmen may be required to notify the coroner, a police agency, or the state fire marshal's office. In this case the name and title of the person receiving the information should be requested and made a part of the report, along with the hour of the day when he was notified. Sometimes the dispatcher obtains this information, rather than the squadman at the scene. Whatever action is taken, it must conform with the local, state, and federal laws.



Authorities Notified ______________________________ Time ______ AM__PM__
Notification Given by ______________________ Received by ______________
What: ____
____

SIGNATURE OF PERSON MAKING REPORT

No report is complete without the signature of the person who made it. Local department rules may require more than one signature.



Squad "In-Service" Time ______ AM__PM__ Radio ______ Hospital ______ Quarters ______
Signature of Person in Charge of Run: ______________________________________

SAMPLE REPORTS

Several sample reports are shown here to assist rescue squad officers in selecting or developing a report best suited to their needs. Some of these samples ask for additional kinds of information, which various squads have found to be helpful.

SUMMARY

Gathering data and completing a report must not take priority over victim care or transportation of victims to a hospital. There may be occasions when information for a report must be obtained after the victim has been removed from the scene. The need for accurate and complete reports should never be minimized; however, reports must never take precedence over victim care.

Rescue squad records can be subpoenaed into court. A complete and accurate report reflects the efficiency and professional competence of the squad.

CHAPTER XXV

POST MORTEM CONFERENCE

INTRODUCTION

A post mortem conference is an evaluation of what has taken place during the course of an emergency.* It will point out what can be done in the future to expedite procedures and achieve a more efficient operation.

A definite pattern for scheduling post mortems cannot be established for all emergency and rescue units, as methods of operation within each department may differ.

WHY CONDUCT A POST MORTEM CONFERENCE?

In emergency squad work a second chance to save a life is never guaranteed. However, an evaluation of past performance often yields information that will make the handling of future problems more efficient. Emergencies are not always routine, and squad procedures cannot always be spelled out in detail, in advance. If during an emergency something happens for which the squadman's training and instructions have not prepared him, he should not "pass the buck" afterward. Rather, he should welcome constructive criticism, opinions, advice, and ideas. He should treat this phase of squad work as one involving "fact finding", not "fault finding".

Pre-planning has been emphasized and referred to many times in this text. A combination of pre-planning and post mortems is essential to efficient operation. If a squad carries out post mortems conscientiously mistakes made in the past will be the stepping stones to success in the future.

HOW TO CONDUCT THE CONFERENCE

Post mortems must be based on facts, not hearsay. The report on the case in question should always be used. Such a report should indicate action taken from the time the squad left the station until it returned to service. A review of this action should form the basis for the post mortem discussion. As materials are reviewed, new ideas which may be of value on future calls may be introduced for consideration and evaluation.

These discussions must not reflect on the judgment of the squadmen involved. The officer in charge must stress the importance of honest, constructive criticism if he wishes to obtain the full cooperation of his men. The post mortem must be treated open-mindedly by all concerned.

---

* The term post mortem as used in emergency squad work refers to a conference held to discuss any completed squad operation. It does not imply a death, as in the more restrictive medical use of the term.

SCHEDULING A CONFERENCE

The time for conducting a post mortem must be arranged in compliance with the rules, regulations and methods of operation of the squad. In general, however, post mortems should be held as soon after the run as practical so that the facts will still be fresh in the minds of those who were involved in the emergency. In a paid department, it is usually possible to hold discussions immediately after the run is completed. The informal discussion which often takes place in both paid and volunteer squads, while equipment is being checked and cleaned, can be of much value. In paid departments post mortems may be held at the time of the change of shifts. Often run reports are reviewed by officer personnel going on and off duty.

Some volunteer squads have regular meetings where matters of interest and importance are thoroughly discussed. This is an excellent time to conduct the post mortem. Thus, personnel not on duty when the emergency took place can be filled in and briefed on the situation; their opinions and ideas can be evaluated.

In setting up a plan for carrying out post mortems, the results will justify the efforts expended.

Post mortems held in conjunction with training sessions are excellent proving grounds for technique and methods which can be tried and practiced.

RESPONSIBILITY AND PARTICIPATION

The responsibility for post mortems rests with the person who is in charge of the squad or its operation.

The underlying purpose of a post mortem is to gain the most benefits for all personnel. At one time the usual procedure was to include only the officer personnel in a squad. However, no officer is any more efficient - in a general sense - than the degree of efficiency of his men. Enlisting the cooperation of all personnel creates a feeling of trust and confidence resulting in a mutual net gain to all concerned. The surest way to gain a person's cooperation is to ask for his help. If a satisfactory conclusion or evaluation is to be expected, all personnel involved should have a part. They will be affected by most decisions regarding policy change or the need for training.

ITEMS TO BE EVALUATED

A pattern should be established and followed in conducting such a session. The following items should be covered:

1. Receiving the call
    - a. Was there anything unusual about it?

2. Answering the call
    - a. Was a different route taken?
    - b. Was there an unusual traffic problem?
    - c. Is there a better route?

3. On arrival
    - a. Were there any unusual circumstances?

4. Care given victim
    - a. What?
    - b. When?
    - c. How?
    - d. Reaction of victim?
    - e. Results of care?

5. Equipment
    - a. What equipment was used?
    - b. Was equipment in place?
    - c. Was it in good working order?

6. Control of family and/or public
    - a. Outstanding difficulties
    - b. Action taken to handle difficulties in control

7. Medical assistance
    - a. Was physician called?
    - b. Family or other physician?
    - c. Success or failure in obtaining a physician

8. Transportation
    - a. Problems encountered

9. Hospital
    - a. Condition of victim
    - b. Problems encountered at hospital

10. Law-Enforcement agencies
    - a. Were they notified?
    - b. Were there any problems with officers?

11. Actions that merit special praise
    - a. Were there any regular personnel (medical, hospital, police) who made any extra or special effort to help the squad in meeting the emergency?
    - b. Did the squad receive special help from a utility company, heavy equipment operator, etc.?
    - c. Have any such personnel been thanked for their special cooperation?

CHAPTER XXVI

LEGAL ASPECTS

INTRODUCTION

This chapter contains statutes taken from the Revised Code of Ohio having reference to emergency squads. It is by no means complete; many more can be found in the index to the Revised Code of Ohio.

Whenever there is a question of legal interpretation involved in a particular case, such legal interpretation should be left to the county prosecutor or city solicitor.

NOTE: References are keyed as follows:

R. C. - Refers to the Revised Code of Ohio

G. C. - Refers to the Ohio General Code which antedated the Revised Code. References to the General Code are for historical purposes only.

STATUTES

DEFINITIONS OF EMERGENCY VEHICLES

R. C. Section 4511.01 (D)

(G. C. Section 6307-2)

"Emergency Vehicle" means fire department, police, and state highway patrol vehicles, vehicles of salvage corporations organized under Sections 1709.01 to 1709.07, inclusive, of the Revised Code, emergency vehicles of municipal or county departments or public utility corporations when identified as such as required by law, the director of highways, or local authorities, motor vehicles when commandeered by a police officer, ambulances, and motor vehicles when used by volunteer firemen responding to emergency calls in the fire department service when identified as required by the director.

To make the identification of a vehicle complete, a windshield decal is necessary. A list of all men who are entitled to receive decals, to get the protection given to an "emergency vehicle", should be prepared and certified by the association secretary or fire chief and mailed to the State Fire Marshal's Office in Columbus, Ohio. The decal is to be placed in the lower right-hand corner of the windshield. If the auto is exchanged, a new registration is required and the decal must be removed from the old car. Only men who are members of fire departments may obtain decals.

EMERGENCY VEHICLES HAVE RIGHT OF WAY

R. C. Section 4511.45

(G. C. Section 6307-44)

Upon the approach of an emergency vehicle, equipped with at least one flashing red light visible under normal atmospheric conditions from a distance of five hundred feet to the front of such vehicle and the driver is giving audible signal by siren, exhaust whistle, or bell, the driver of every other vehicle shall yield the right-of-way, immediately drive to a position parallel to, and as close as possible to, the edge or curb of the highway clear of any intersection, and stop and remain in such position until the emergency vehicle has passed, except,when otherwise directed by a police officer.

Upon the approach of an emergency vehicle, as stated in the first paragraph of this section, the operator of every street car or trackless trolley shall immediately stop such car clear of any intersection and keep it in

This section does not relieve the driver of an emergency vehicle from the duty to drive with due regard for the safety of all persons and property upon the highway.

EMERGENCY VEHICLE TO PROCEED CAUTIOUSLY PAST RED OR STOP SIGNAL

R. C. Section 4511.03

The driver of any emergency vehicle, when responding to an emergency call, upon approaching a red or stop signal or any stop sign shall slow down as necessary for safety to traffic, but may proceed cautiously past such red or stop sign or signal with due regard for the safety of all persons using the street or highway.

EMERGENCY VEHICLE EXCEPTED FROM SPEED LIMITATIONS

R. C. Section 4511.24

(G. C. Section 6307.24)

The prima-facie speed limitations set forth in section 4511.21 of the Revised Code do not apply to emergency vehicles when they are responding to emergency calls, and when the drivers thereof sound audible signals by bell, siren, or exhaust whistle. This section does not relieve the driver of an emergency vehicle from the duty to drive with due regard for the safety of all persons using the street or highway.

HORNS, SIRENS, AND WARNING DEVICES

R. C. Section 4513.21

(G. C. Section 6307-93)

Every motor vehicle or trackless trolley when operated upon a highway shall be equipped with a horn which is in good working order and capable of emitting should audible, under normal conditions, from a distance of not less than two hundred feet.

No motor vehicle or trackless trolley shall be equipped with, nor shall any person use upon a vehicle, any siren, whistle, or bell. Any vehicle may be equipped with a theft alarm signal device which shall be so arranged that it cannot be used as an ordinary warning signal. Every emergency vehicle shall be equipped with a siren, whistle, or bell, capable of emitting sound audible under normal conditions from a distance of not less than five hundred feet and of a type approved by the director of highways. Such equipment shall not be used except when such vehicle is operated in response to an emergency call or is in the immediate pursuit of an actual (or) suspected violator of the law, in which case the driver of the emergency vehicle shall sound such equipment when it is necessary to warn pedestrians and other drivers of the approach thereof.

LIABILITY OF MUNICIPAL CORPORATIONS FOR OPERATION OF VEHICLES

R. C. Section 701.02

(G. C. Section 3714-1)

Any municipal corporation shall be liable in damages for injury or loss to persons or property and for death by wrongful act caused by the negligence of its officers, agents, or servants while engaged in the operation of any vehicles upon the public highways of this state, under the same rules and subject to the same limitations as apply to private corporations for profit, but only when such officer, agent, or servant is engaged upon the business of the municipal corporation.

The defense that the officer, agent, or servant of the municipal corporation was engaged in performing a governmental function, shall be a full defense as to the negligence of:

(A) Members of the police department engaged in police duties;

(B) Members of the fire department while engaged in duty ay a fire, or while proceeding toward a place at where a fire is in progress or is believed to be in progress, or in answering any other emergency alarm.

Firemen shall not be personally liable for damages for injury or loss to persons or property and for death caused while engaged in the operation of a motor vehicle in the performance of a governmental function.

Policemen shall not be personally liable for damages for injury or loss to persons or property and for death caused while engaged in the operation of a motor vehicle while responding to an emergency call.

Opinions of the Attorney General

#1043 - Year, 1933

1. The proviso of section 3714-1, General Code enacted by the 90th General Assembly, operates to limit the general liability which is imposed upon municipalities by section 3714-1, General Code.

2. A municipal corporation is liable for the negligence of members of the fire department in operating fire apparatus when returning from a fire or other emergency alarm.

PURCHASE OF FIRE FIGHTING EQUIPMENT

R. C. Section 505.37

(G. C. Section 3298-54)

The board of township trustees may establish all necessary regulations to guard against the occurrence of fires, protect the property and lives of the citizens against damage and accidents and may, with the approval of the specifications by the prosecuting attorney, purchase or otherwise provide such fire apparatus, mechanical resuscitators or other equipment, appliances, materials, fire hydrants, and water supply for fire fighting purposes as seems advisable to the board....

Opinions of the Attorney General

#2416 - year 1953

Under the provisions of Section 3298-54, (R. C. Section 505.37) township trustees, in addition to being authorized to guard against the occurrence of fires, are further authorized to protect property and lives against damages and accidents; and under such authority may acquire and operate emergency vehicles or "rescue cars" for such purposes.

Township trustees may enter into an agreement with a volunteer fire company for the operation of any such equipment as the township itself is authorized to operate, designed to protect against fires, damages and accidents.

CONTRACTS FOR FIRE PROTECTION; STATUS OF MEMBERS OF FIRE DEPARTMENT

R. C. Section 505.44

(G. C. Section 3298-60) (G. C. Section 3298-60a)

In order to obtain fire protection, or to obtain additional fire protection in times of emergency, any township may enter into a contract, for a period not to exceed three years, with one or more townships, municipal corporations, or private fire companies, upon such terms as are agreed to by them, for services of fire departments, or the use of fire apparatus, or the interchange of the service of fire departments or use of fire apparatus, within the several territories of the contracting subdivisions and private fire companies, if such contract is first authorized by the respective boards of township trustees or other legislative bodies.

Section 701.02 of the Revised Code, as far as it is applicable to the operation of fire departments, applies to the contracting political subdivisions and fire department members when such members are rendering service outside their own subdivision pursuant to such contract.

Such contract may provide for a fixed annual charge to be paid at the times agreed upon and stipulated in the contract, or for compensation based upon a stipulated price for each run, call, or emergency, or the number of members or apparatus employed, or the elapsed time of service required in such run, call, or emergency. Such contract may provide for compensation for loss or damage to equipment or apparatus while engaged outside the limits of the subdivision or private fire company owning and furnishing it, and for the reimbursement of the subdivision or private fire company, in which the fire department members are employed, for any pension or indemnity award or premium contribution assessed against the employing subdivision or private fire company for workmen's compensation benefits or casualty insurance premiums for injuries or death of its fire department members occurring while engaged in rendering service pursuant to such contract.

As used in this section, "private fire company" means any group or organization not for profit owning and operating fire-fighting equipment not controlled by any township or municipal corporation.

Under R.C. Section 717.02, municipal corporations may similarly enter into contracts for services and for the use of apparatus.

NOTIFICATION IN CASE OF DEATH BY VIOLENCE OR SUICIDE

R. C. Section 313.11

(G. C. Section 2855-12)

Any person who discovers the body or acquires the first knowledge of the death of any person who died as a result of criminal or other violent means, or by casualty, or by suicide, or suddenly when in apparent health, or in any suspicious or unusual manner, shall immediately notify the office of the coroner of the known facts concerning the time, place, manner, and circumstances of such death, and of any other information which is required by Sections 313.01 to 313.22, inclusive, of the Revised Code.... No person shall willfully refuse to report such a death, or shall, without an order from the coroner, willfully touch, remove, disturb the body of any such person, or disturb the clothing or any article upon or near such body.

NOTIFICATION BY PHYSICIAN IN CASE OF DEATH BY VIOLENCE OR SUICIDE

R. C. Section 313.12

(G. C. Section 2855-5)

When any person dies as a result of criminal or other violent means, or by casualty, or by suicide, or suddenly when in apparent health, or in any suspicious or unusual manner, the physician called in attendance shall immediately notify the office of the conorer of the known facts concerning the time, place, manner, and circumstances of such death, and any other information which is required pursuant to Sections 313.01 to 313.22, inclusive, of the Revised Code.

The first responsibility of a squadman is to care for the living. If he finds, on arriving at an emergency, that death or injury is apparently due to unnatural causes, he should take precautions not to touch anything except to take charge of the emergency so far as the injured are concerned. In Chapter XXIII, the section "Operations at a Crime Scene" gives further suggestions for procedures in this kind of situation.

LIABILITY FOR EMERGENCY CARE THE "GOOD SAMARITAN" LAW

R. C. Section 2305.23

No person shall be liable in civil damages for administering emergency care or treatment at the scene of an emergency outside of a hospital, doctor's office, or other place having proper medical equipment, for acts performed at the scene of such emergency, unless such acts constitute willful or wanton misconduct.

Nothing in this section applies to the administering of such care or treatment where the same is rendered for remuneration or with the expectation of remuneration.

A LIST OF TEACHING MATERIALS

The publications listed below are available from the Department of Agricultural Education at the prices quoted. Each price <u>includes</u> a small charge to cover handling and postage. Use this list for placing your order, and another copy will be mailed to you when your order is filled and returned.

Orders totaling less than $10 must be accompanied by a check or money order made payable to The Pennsylvania State University. For larger orders a bill will be mailed to the school district or other authorized office or person. Please indicate to whom the bill should be sent. Orders should be placed on school stationery and preferably in the form of a purchase order. Prices may change without notification.

Forestry, Two-Year High School Course in Vocational Agriculture--Competencies, Course Outline, Tools, and Equipment, Consumable Supplies, and References.

Clemson Univ., S.C. Dept. of Agricultural Education
South Carolina State Dept. of Education, Columbia
Pub Date - Jul65
MF AVAILABLE IN VT-ERIC SET 13p.

*CURRICULUM GUIDES, HIGH SCHOOLS, *VOCATIONAL AGRICULTURE, JOB SKILLS, *FORESTRY, *FORESTRY AIDES,

The purpose of the guide is to assist vocational agriculture teachers plan a course to prepare high school juniors and seniors for occupations in forestry. It was prepared by a teacher educator in consultation with state forestry commission personnel, teachers, and other teacher educators upon the basis of a survey. The 360-hour course includes units on--(1) occupational opportunities, (2) the importance of forests, (3) relation of forestry to other natural resources, (4) the importance of good management practice, (5) forestry educational programs in South Carolina, (6) forest land ownership, (7) tree reproduction and growth, (8) forest environment, (9) tree and wood identification, (10) hand tool and small equipment maintenance and use, (11) artificial reproduction of forests, (12) natural reproduction of forests, (13) fire protection, (14) intermediate cuttings, (15) harvest cuttings, (16) estimates and measures, (17) insect control, (18) protection against disease and other enemies, (19) power equipment operation, (20) chart, map, and tracing preparation and interpretation, (21) mathematics, and (22) forestry employment. Each unit includes a brief outline of subject matter. Competencies needed in forestry aide training, suggested tools, equipment, and references are listed. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (JM)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Agricultural Education Department, Clemson University
Address Clemson, South Carolina 29631
Limitation on Available Copies 1 per teacher Price/Unit no charge
(quantity prices)

(2) Means Used to Develop Material:
Development Group State Forestry Commission, Teachers & Teacher Educators
Level of Group State and usable by other states
Method of Design, Testing, and Trial based on survey of teachers of forestry Agricultural Education

(3) Utilization of Material:
Appropriate School Setting Designed for occupational courses in forestry
Type of Program High School classes
Occupational Focus Preparation for a cluster of jobs below the professional level.
Geographic Adaptability Southeastern United States
Uses of Material for course planning
Users of Material for teachers

(4) Requirements for Using Material:
Teacher Competency Qualified Agricultural teachers
Student Selection Criteria for 11th and 12th grade boys who desire employment in forestry
Time Allotment 360 hours plus laboratory work

COMPETENCIES NEEDED IN FORESTRY-AIDE TRAINING

FORESTRY	Extent the Competency is Desirable (check the appropriate column)		
Knowledge and Understanding of:	Very Desirable	Helpful	Little or No Value
1. Job opportunities in forestry			
2. Organizations which employ forestry workers			
3. Importance of our forests			
4. Relationship of forests to other nat.resources			
5. The importance of good management practices			
6. Basic enemies of the forest			
7. Forest land ownership in the U.S. and S.C.			
8. Educational programs in forestry in S.C.			
9. Organization of S.C. StateForestry Commission			
10. Services rendered by professional foresters			
11. Forest products industries and uses of wood			
12. Tree growth			
13. Soil requirements and adaptation of trees			
Develop the Ability to:			
1. Identify common trees			
2. Harvest and store tree seeds			
3. Grow seedlings from seed			
4. Set out seedlings			
5. Carry out natural reforestation			
6. Use and maintain hand tools & small equipment			
7. Construct firebreaks			
8. Prevent and control forest fires			
9. Determine the rate of growth of timber			

FORESTRY (continued)

	Very Desirable	Helpful	Little or No Value
10. Thin a stand of timber			
11. Improve a stand by making cuttings			
12. Mark trees for selective cutting			
13. Make harvest cuttings			
14. Control of weed trees			
15. Estimate vol. bd. ft. in standing timber			
16. Estimate vol. bd. ft. in logs			
17. Measure lumber and pulpwood			
18. Recognize and control forest insects			
19. Recognize and control forest diseases			
20. Operate trucks, tractors, plows, planters, etc			
21. Work math problems related to forestry			
22. Read, interpret, & make tracings, maps & charts			
23. Apply for a job			
24. Accept job responsibilities			

Course Outline

A suggested course of study for Forestry-Aide training is presented on the following pages. This includes the major topics to be taught in the two-year course. This outline is based on the competencies which the students should acquire. The proposed teaching time is listed as "number of days" for each major topic. Much laboratory or field work will be needed in addition to classroom instruction. When one hour class periods are followed, the teacher should arrange for the necessary laboratory time.

FORESTRY-AIDE COURSE OUTLINE

(Two-year Course)

Approximate No. Days

I. Exploring Occupational Opportunities in Forestry 15

- A. Types of employment in forestry
  - 1. Professional foresters, technicians, aides, clerical workers, skilled workers, laborers
  - 2. Duties and responsibilities
  - 3. Training and experience requirements
  - 4. Work conditions
  - 5. Salary potential
- B. Major sources of employment
  - 1. U. S. Forest Services
  - 2. State Forestry Commissions
  - 3. Pulp and paper companies
  - 4. Lumber companies
  - 5. Recreational agencies
- C. Employment available (non-professional)
  - 1. Local employment
  - 2. Employment outside of training area

II. Importance of Our Forests 15

- A. Importance in South Carolina (detail)
  - 1. Land use
  - 2. Economic value
  - 3. Employment
  - 4. Recreational value
- B. Importance in the U. S. (general)
  - 1. Percentage of land in forests
  - 2. Location of major forest lands
  - 3. Economic value
  - 4. Recreational value

III. Relationship of Forests to Other National Resources 10

- A. Inter-dependence of natural resources
  - 1. Forests
  - 2. Soils
  - 3. Water
  - 4. Wildlife

IV. The Importance of Good Management Practices 15

- A. Present conditions of timberland in South Carolina
  - 1. Types of forests
  - 2. Trends in timber production

3. Trends in reforestation

B. Need for improved practices
1. Reforestation
2. Control of diseases and insects
3. Cutting practices
4. Fire prevention and control
5. Marketing

C. Results of improved practices

V. Educational Programs in Forestry in South Carolina 15

A. S. C. State Commission in Forestry
1. Organization
2. Duties and responsibilities

B. Extension Foresters
1. Organization
2. Duties and responsibilities

C. Wood-using industries
1. Services

D. Consulting foresters

E. Vocational Agriculture teachers
1. Forestry program

F. Soil conservation Service Foresters

VI. Forest Land Ownership 10

A. Ownership in the U. S.
1. National and state
2. Individual owners

B. Ownership in S. C.
1. National and state
2. Wood-using industries
3. Farmers
4. Others

VII. How Trees Grow and Reproduce 15

A. Parts of a tree and functions
1. Roots
2. Trunk
3. Crown

B. How growth takes place

C. How trees reproduce

VIII. The Forest Environment 15

A. Growth factors
  1. Moisture
  2. Soil
  3. Temperature
  4. Light
  5. Tolerance and hardiness

B. Tree and forest classification
  1. By size
2. 2. By composition
  3. By stand density

C. Location of various species in South Carolina

IX. Identifying Trees and Wood (common trees) 15

A. Methods of identifying trees
  1. Leaf
  2. Twig
  3. Bark
  4. Fruit

B. Wood identification
  1. Softwoods and hardwoods
  2. Identifying features

X. Using and Maintaining Hand Tools and Small Equipment 10

A. Hand tools
  1. Kind and use
  2. Safety practices
  3. Maintaining

B. Small equipment
  1. Sprayers
  2. Chain saws

XI. Reproducing Forests Artificially 15

A. Method of reproduction
  1. Direct seeding
  2. Using natural seedlings
  3. Planting nursery seedlings

B. Growing seedlings
  1. Collecting and storing seed
  2. Preparing seed beds
  3. Planting seed
  4. Caring for nursery stock
  5. Lifting seedling
  6. Care for seedling until setting

C. Planting seedlings
   1. Preparing site for seedlings
   2. Hand planting of various kinds of seedlings
   3. Using a tree planter

D. Studying the Tree Improvement Program

XII. Reproducing Forests Naturally 15

A. Selection of seed trees
   1. Type, size and number per acre

B. Preparing soil
   1. Clearing
   2. Weed trees
   3. Furrowing
   4. Scarifying

C. Care and management of young seedlings
   1. Fire prevention
   2. Grazing control
   3. Logging

XIII. Protecting Forests Against Wild Fires 20

A. Damage caused by fires
   1. Effects of fire in woodlands
   2. Prevalence of woods fires and damage in S. C.

B. Fire prevention

Steel tape	75'	2	10.00
Tree and log scale stick	(International Rule)	6	10.00
Tree injector		1 (see S.C. State For. Com.)	30.00
Tree marking gun	1 qt.	2	7.00
Triangular scale		6	5.00
Total			$577.00

Certain tools and equipment needed in teaching forestry may be obtained from--Forestry Supplies, Inc., 205 Rankin Street, Jackson Mississippi 39202 --or--The Ben Meadows Company, 1423 Dutch Valley Place, Atlanta 24, Georgia.

CONSUMABLE SUPPLIES

Item	Quantity	Approximate Total Cost
Weed (tree) killer	2-4, 5 T and others	$20.00
BHC	15-20 lbs.	3.00
Paint (marking trees)	1 gal.	5.00
Insect repellant		2.00
Files, flat	several	5.00
Aerial photos, tracing paper, and mapping sheets		5.00
Tables for estimating board-feet volumes of timber (Supt. of Documents, U. S. Government Printing Office, Washington, D. C.		.30
Total		$35.30

REFERENCES

The teacher of the forestry occupational course will need teaching materials for himself and the students. Ample materials for the students will encourage reading and study of this subject. It is suggested that one copy of each publication (students reading level) be made available for each student.

*HOMEMAKING EDUCATION, HIGH SCHOOLS, HOME MANAGEMENT, *INSURANCE, *TEACHING TECHNIQUES,

One of the 12 competencies described in 1959 by American home economists as fundamental to effective homemaking, to establish long range goals for financial security and to work toward their achievement, is the foundation for this booklet. Suggestions are presented for including family finances in the homemaking curriculum. The outlined material covers (1) the areas, the units, and the problems within the program where life and health insurance might be appropriately taught, (2) the objectives which might be adopted, (3) the concepts suitable for grades 7 to 12, (4) techniques for motivation, concept development, and evaluation, (5) a glossary of terms, and (6) a list of references. (MS)

TIPS
FOR TEACHING LIFE AND HEALTH INSURANCE

SUGGESTIONS AND IDEAS
FOR THE BEGINNING HOME ECONOMICS TEACHER

Developed with the Assistance of
DR. ALEENE CROSS, Chairman
Home Economics Education
University of Georgia
Athens, Georgia

Revised, 1963

Prepared by:
Educational Division, INSTITUTE OF LIFE INSURANCE
488 Madison Avenue, New York 22, N. Y.
with the cooperation of: HEALTH INSURANCE INSTITUTE

TIPS
FOR TEACHING
LIFE AND HEALTH INSURANCE

WHAT THIS IS ABOUT

- This material, designed for the teacher-in-training and the beginning teacher, is an example of how one problem in family finance – namely personal insurance – might be included in the homemaking curriculum.

- In ***New Directions,*** the AHEA report released in June, 1959, twelve competences are described as fundamental to effective living. These goals are shaping the homemaking curriculum to an increasing degree. Our immediate concern is the sixth competence: *"To establish long-range goals for financial security and to work toward their achievement."* The report concludes: "As home economists we can measure the success of our work by the extent to which we contribute to the development by individuals and families of these competences."

- The reason for this booklet, therefore, is to give you some help in developing this sixth competence insofar as life and health insurance are related to it.

- Much of your teaching will be devoted to the use of family income. You will deal with it in foods, clothing, housing, equipment, and management units. The financial security of the family rests on how effectively it uses income. At some point, you will wish to consider what alternatives the family has if its income is cut off. This is a risk common to every family. Income can suddenly be stopped by illness or disability, by death, or by retirement.

- To protect families economically against this risk and to provide the family with at least a degree of financial security, we have insurance. Because six out of seven American families now own some type of life insurance, and more than four out of five families own health insurance, it is apparent that most families today rely on personal insurance for at least some financial security. What can these families expect personal insurance to do for them? What family needs will be met through insurance? In what way does life insurance help families achieve certain goals? These are questions you and your pupils may want to explore.

- The material that follows will outline for you:

  1. the areas, units, and problems within your program where life and health insurance might have meaning;
  2. the objectives you and your class might adopt;
  3. the concepts that may be suitable at each grade level;
  4. techniques for motivation, development of concepts and evaluation;
  5. glossary of terms;
  6. references.

AREAS, UNITS, AND PROBLEMS WITHIN THE HOMEMAKING PROGRAM WHERE LIFE AND HEALTH INSURANCE MAY BE INCLUDED

No two curriculum guides are identical, but they do share much in common. After examination of a representative collection of state and city homemaking guides, a list was prepared, by grade levels, of those units of instruction in which can be incorporated material on personal insurance. On the following pages several units are suggested; however, only one unit at any grade level would include insurance subject matter. For logic and ease in teaching and learning, keep discussions of life and health insurance in context with discussions of money management and family finance.

OBJECTIVES FOR TEACHING LIFE AND HEALTH INSURANCE

Also on the following pages are set forth some intermediate objectives which might be suitable for each grade level, 7th through 12th. In listing these objectives we recognize that teaching goals must be based on the interests, needs, and abilities of pupils. Perhaps some of the objectives will be representative of your pupils' needs. If not, our list may suggest other objectives more suitable for your particular group. We have related each objective to the problem listed in the previous column.

Our ultimate objective for teaching about life and health insurance is the sixth competence: *"To establish long-range goals for financial security and to work toward their achievement."* You can see from the chart on pages 6 and 7 how each area, unit, problem, and intermediate objective leads toward the accomplishment of this ultimate objective.

SUGGESTED AREAS, UNITS, PROBLEMS, AND OBJECTIVES

Grades and Areas	Typical Units	Problems
7th & 8th: Family Relationships	Understanding My Place in the Family	How is family income used?
9th: Family Relationships	Getting Along with My Family	What is my place in the financial set-up of the family?
10th: Family Relationships	Achieving Personal Maturity	What responsibilities do I have in helping manage our family money?
Home Management	Managing Family Resources	What are some financial obligations of the family?
Home Nursing	Caring for the Sick	How can the family meet the costs of illness?
11th & 12th Family Relationships	Preparing for Marriage	What should an engaged couple understand about buying protection against financial loss?
Home Management	Planning and Maintaining a Functional Home	Why should the family be prepared for the unexpected?
Family Living	Planning to be a Better Consumer	How can financial protection be purchased?
	Making Marriage a Success	How can the family secure satisfaction from use of family income?
Child Care and Guidance	Planning for Parenthood	How much does it cost to have a baby?

FOR TEACHING ABOUT LIFE AND HEALTH INSURANCE

Intermediate Objectives	The Ultimate Objective
To develop an understanding of why financial security must be planned. To develop an understanding of the need for insuring family income if family goals are to be achieved.	The sixth competence: *"To establish long-range goals for financial security and to work toward their achievement."*
To develop an understanding of the financial needs of the family that insurance is designed to meet.	
To develop an appreciation for the concept of thrift which is basic to financial security.	
To develop an appreciation for the services performed by the life insurance and health insurance agent in helping families plan and carry out long-range financial programs. To develop an understanding of the dual role of life insurance: a. as protection for the family in case of the death of the breadwinner, b. as savings which are available for emergency use or for some special need or purpose.	
To develop an awareness of the costs of sickness and accident, and how most families prepare to meet these costs through insurance.	
To develop an appreciation for the role of life and health insurance in the family economy, and its relationship to the whole financial structure of the family.	
To develop an understanding of the kinds of health insurance and how each meets a particular need.	
To develop a recognition that each family's needs for life and health insurance differ.	

CONCEPTS ABOUT LIFE AND HEALTH INSURANCE AT SUGGESTED GRADE LEVELS

Here are suggested some concepts about life and health insurance which may be suitable at varying grade levels as we have indicated. We are suggesting that the concept be at least introduced during the earliest mentioned grade level. Any concept or idea suitable for the 7th and 8th grades will naturally be carried through the 12th, and the concept will be broadened and deepened as the students gain increased ability to understand. In addition, the teacher may want to add new concepts as the students' learning progresses.

	GRADES					
	7	8	9	10	11	12
1. Effective money management involves meeting everyday needs and providing for long-range goals.	✓	✓	✓	✓	✓	✓
2. Families own insurance in order to protect themselves financially against the unexpected.	✓	✓	✓	✓	✓	✓
3. Good money management makes provision for periods when income is stopped.	✓	✓	✓	✓	✓	✓
4. Life and health insurance are an important part of the modern American family's financial security program.	✓	✓	✓	✓	✓	✓
5. Both life and health insurance are purchased on the basis of the needs of the particular family.			✓	✓	✓	✓
6. Families may create greater financial security for themselves by budgets, savings and investments, and carefully planned insurance programs.			✓	✓	✓	✓
7. In planning a personal insurance program, the family needs the services of a reliable agent.				✓	✓	✓
8. To fit the needs of the family, there are a variety of life insurance policies to choose from.				✓	✓	✓
9. Life insurance is designed to furnish necessary funds when family income is cut off by death or retirement. It also provides a source of emergency funds.				✓	✓	✓
10. Health insurance is designed to pay bills incurred by illness or accident and to provide for loss of income during the period of illness and convalescence.				✓	✓	✓

	GRADES					
	7	8	9	10	11	12
11. Health insurance is available from three kinds of organizations: insurance companies; hospital-and-doctor affiliated groups, such as Blue Cross and Blue Shield; and independent groups. It may be obtained by buying an individual policy or by participating in a group plan.				✓	✓	✓
12. In planning a health insurance program, it is wise to budget for the minor illnesses and to insure against the more serious or financially crippling losses.				✓	✓	✓
13. Life insurance is available in three forms: ordinary, industrial, and group.					✓	✓
14. A family's life insurance program may contain four basic kinds of life insurance policies: term, straight life, limited payment, and endowment.					✓	✓
15. Changing family needs and changing economic conditions may require a re-examination of established life insurance programs.					✓	✓

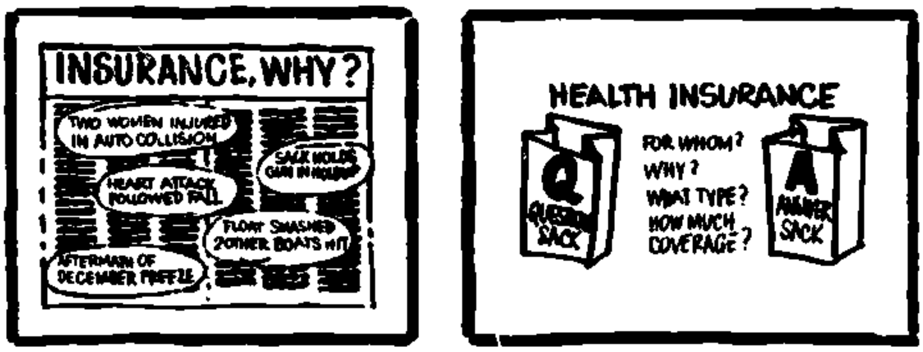
TECHNIQUES FOR MOTIVATION, DEVELOPMENT OF CONCEPTS, AND EVALUATION

MOTIVATION

In brief, creating interest and motivating learning is simply a matter of guidance. You are guiding your pupils toward a choice of objectives or goals, and in so doing you are focusing attention on a new problem. The method of motivation you choose will depend on your class, the maturity of your pupils, their needs and concerns, their previous experience (and yours). Here are some suggestions, however, to stimulate your own thinking.

Bulletin Boards or Exhibits: Several days before you plan to introduce the topic of family financial security, create a bulletin board display designed to arouse curiosity. In Figure I (p. 10) are two suggestions:

FIGURE I. TWO IDEAS FOR BULLETIN BOARDS:



Relating Insurance and Family Security to a Previous Unit: In the course of your teaching, many opportunities will present themselves to integrate much information about family finance into your program. At the point where you have been examining the family income and how it is used, for instance, you can raise some questions: What will happen if the income stops? What things other than unemployment might cause the family income to stop? What can the family do to protect itself against such an emergency?

Self-rating (opinionnaire or some form of checklist). This technique readily lends itself to family finance topics, and is a quick means of determining student attitudes and background experience. Here are some statements typical of an opinionnaire on life and health insurance. Other ideas may be found in the teaching aids listed on pages 22 and 23.

Directions: Circle A if you agree, D if you disagree, and U if you are undecided.

A D U 1. A person should buy life insurance only if he has dependents.

A D U 2. If a person owns life insurance, he would not need health insurance.

A D U 3. Health insurance pays for only the expenses incurred in a hospital.

A D U 4. Newly married couples can postpone planning for their financial security until they get their home and furnishings paid for.

A D U 5. Life insurance is one of the most important assets a family owns.

A D U 6. If a family has a long history of no illnesses or accidents, that family would have no need for health insurance of any kind.

A D U 7. A person can decide how much personal insurance he needs by duplicating what his neighbor owns.

A D U 8. A family needs more personal insurance as the number of children increases.

A D U 9. A good program of financial security is planned early in family life and is developed gradually over the years.

A D U 10. Life insurance should be purchased only on the life of the father.

Visual Aids: There are several motion pictures and filmstrips that will present situations for class discussions and will involve pupils in cases typical of their own experience. Following the presentation of the films, the class can help plan the next steps in developing learning experiences. [*Note:* We list only those visual aids that have been developed by the Institute of Life Insurance. However, there are other filmstrips and motion pictures which will serve the same purpose. We suggest that you consult film catalogs. An especially useful bibliography is available from the National Committee for Education in Family Finance. See reference on page 22.]

Motion Pictures

Life Insurance – What It Means and How it Works: A film showing the flexibility and diversity of life insurance through a variety of animation techniques and live action. Several illustrations show how people, of differing ages and occupations from various parts of the country, have used life insurance to meet their individual financial needs. A basic film for all audiences. 13 min., color.

Measure of a Man: A dramatic study in human relationships, attitudes, and personal values, contrasting the characters and personalities of two men. Throughout the story are sketched the living benefits of life insurance which show how the use of life insurance has helped one family realize goals and meet responsibilities. 27½ min., black and white.

The above pictures may be secured on a free loan basis by writing to:

Association Films, Inc.
347 Madison Avenue
New York 17, New York

Filmstrips

Marriage and Money: a new filmstrip showing how a young married couple learns to manage financial affairs. Defines the goal-setting and decision-making processes in case study approach. Illustrates principles of money management as developed in Educational Division publications. 67 frames, 15 min., color.

The Dollar Series: three 35 mm. filmstrips designed especially to motivate pupil interest. Each filmstrip provides problem material for class discussion as developed in cooperation with educators. Series consists of *Directing Your Dollars,* describing the money management problems of typical teenagers; *Dollars for Health,* showing how family medical costs affect the lives of three high school students, and *Dollars for Security,* the story of three high school pupils whose lives have been intimately touched by life insurance.

These filmstrips may be secured on a FREE LOAN BASIS or purchased from the Educational Division, Institute of Life Insurance.

Using sources within the community may provide a starting place. Here are some suggestions:

Parents' Committee

With your pupils, select several parents to serve as a committee to work with the class on development of an insurance unit. This will be of value in providing the class with an authentic picture of family insurance programs, why families own insurance, what benefits can be expected, etc. It might add real interest if one person in the group has received the benefits of either health or life insurance, and can tell his own story.

Community Leaders

Select a committee of representative community leaders whose work brings them into contact with peoples' financial problems and needs. The committee may include a social worker, a banker, insurance man, hospital administrator, and possibly others. Invite this group to meet with the class if possible. Or gain their permission to be interviewed by pupil committees who in turn will report to the class. With their help, the pupils may gain an insight into some of the problems they can prepare themselves to meet. The question can then be raised, "How can life and health insurance help families meet some of these problems?"

DEVELOPMENT OF CONCEPTS

If you are successful in motivating interest, the development of concepts will be relatively simple. Your pupils will work with you in planning projects which will lead to their adopted goals. Here are a few suggested projects and activities which can be adapted to the individual interests and abilities of your pupils. Each project is related to certain concepts as listed earlier and to the suitable grade level.

ACTIVITIES

Class Discussion

List on the blackboard some of the hazards a family may encounter which can be covered by insurance. Informally check the members of the class to find out which of these hazards are actually covered by insurance in their families. (concepts 2, 3 – grades 7 & 8, 9)

Guest Speaker

Have a committee investigate your school's insurance plan and the benefits it provides, or invite the principal of your school to discuss it with the class. (concept 2 – grades 7 & 8, 9)

Study of Application Forms

Have students obtain blank life insurance and health insurance application forms from local agents and bring to class for examination and discussion. (concepts 4, 7 – grades 10, 11 & 12)

Interview

Obtain information about the available Blue Cross and Blue Shield services in your community. (concepts 10, 11 & 12)

Survey

Ask a group of students to survey local business firms to find out whether they have:

a. group life insurance for employees
b. an employee pension plan
c. group health insurance for employees.

(concepts 3, 4 – grades 10, 11 & 12)

The Case Study Method

In using case studies, you may first want to refer students to *A Date With Your Future* or some other resource material for definitions and descriptions of the "basic four" types of life and health insurance policies. After students are familiar with the various types of policies, simple case studies, such as the following examples, may be used for discussion.

Alice Young is 25 years of age and earns $65 a week as a typist-secretary. She buys a $2,500 endowment policy which will mature when she is 65. Whether she marries or not, Alice knows this sum will be useful when she reaches retirement age. Until that time, she is insured for the full $2,500 which will take care of final expenses and any debts she might leave.

1. Why is an endowment policy better for Alice than a term policy?
2. What should Alice do with her policy when she gets married?
3. In what other situations would a policy similar to Alice's be of particular help?

The Bill Smiths have two children. Bill, age 30, has just been advanced to foreman in an electronics plant and will be earning $125 a week. The Smiths already own $10,000 worth of life insurance. Bill and his wife talk about this promotion and they decide that they now can afford more life insurance protection. They want long range protection for their young family, so they buy a $5,000 straight life insurance policy.

1. Why should Bill buy straight life instead of an endowment policy?
2. Do the Smiths have adequate life insurance at the present time?

Joan Wilson is 24 years of age. Recently she moved to Middletown and is teaching home economics in the Middletown High School. Her salary is $4,800 per year. Joan has no relatives there and so far, few friends. She wants some type of health insurance protection in case she should become ill.

1. What health insurance policies would you suggest for her and why?
2. Because Joan is new in the community, how would you suggest that she get in touch with a health insurance agent who could give her sound advice?

Another way to use the case study method, and perhaps a more meaningful way, is to have the class develop its own case problems. One advantage in this approach is that case problems will be devised that are more nearly typical of families in your community. In addition, it will be a means of further studying your community.

One way to obtain material for case studies is through student interviews. Have students interview representative single adults, young married couples with no children, families with one or more preschool-age children, families with school-age and adolescent children, and families whose children are now independent.

The purpose of the interview will be to learn what kind of life and health insurance is owned, and if possible to find out why, in each case, a particular policy was selected. The interview teams will report their findings to the class and from these you and the students can develop a case study situation for each of the categories of families mentioned above. If several classes use this same case study writing approach, it may be helpful to exchange the case studies among the several classes.

You may need to help students select whom they will interview and what approach they will use. Several role playing situations may help them develop their interview skills. Also, make it clear to students that this assignment is *not* to find out how much insurance the various families own. Rather it is to determine *what kinds* of insurance policies each family has and why they chose these particular types of coverage.

PROJECTS

Individual Report

Discuss the reasons for buying life insurance while young. Have a student report on individual and family needs for insurance. (concepts 10, 15 — grades 10, 11 & 12)

Group Report

Divide the class into small groups and ask each group to prepare a report on the following situations:

a. The life insurance needs for a young career girl, with no dependents, who is just starting out on her first job.

b. The life insurance needs of a young married couple, both of whom are working. They rent their home; they are paying for furniture and for the husband's law school training.

c. The life insurance needs of a family of four — the parents in their early 30's and two children, ages four and seven. They own their own home; the father is a dentist and earns about $7,500 a year; he has two life insurance policies for a total of $11,000 of protection. He is covered by Social Security. He has made no provision for retirement, nor for sending his children to college. (concepts 5, 8 — grades 11 & 12)

Interview and Report

Invite an insurance agent to speak to the class on "Planning for Family Security through Insurance." If this is not possible, perhaps a committee of pupils could interview the agent and then report to the class. (concepts 9, 10, 11, 12, 13, 14, 15 — grades 11 & 12)

Bulletin Boards

Bulletin boards can make valuable contributions to the learning experiences of a class, but as with an effective lesson plan, an effective bulletin board must present only a *single* important idea or theme. It should be offered as a learning experience in which the students participate actively, and is particularly useful in providing work and study opportunities for less articulate class members. The bulletin board project, either assigned by the teacher or suggested by students, is geared to specific lesson needs. It can be used to:

1. Pretest or test student attitudes and understandings.
2. Serve as a springboard for lecture-discussion.
3. Spark classroom discussion.
4. Present a problem to be solved.
5. Record committee reports.
6. Communicate each of several student-committee reports.
7. Record results of interviews.
8. Make student assignments.
9. Evaluate student progress.
10. Summarize major points in an area of study.

Some ideas for bulletin boards are:

- Collect several kinds of insurance policies. On each policy, outline in crayon:
    1) the agreement between the company and the policyholder.
    2) the general policy provisions. (concept 2, grades 11 & 12)
- Suggest title "After 65 – Where's Your Money Coming From?" Include income from Social Security, life insurance, pension, annuity, savings and investments. (concept 10, grades 10, 11 & 12)
- Illustrate the benefits of the 5 types of health insurance policies. Suggested title might be "Meeting the Costs of Medical Care." (concept 9, grades 10, 11 & 12)
- Plan a board on "The Uses of Life Insurance" to show such uses as a life income for a widow, a fund for a college education, protection for a mortgage, etc. (concept 10, grades 10, 11 & 12)
- Use title "The Best Way to Meet Trouble is to be Prepared for It." Show family group with savings and essential insurance protection, including a health insurance program. (concepts 1, 2, 3, 6; grades 7, 8, 9, 10, 11 & 12)

EVALUATION

Evaluation is part of the learning process and is effective only when it is related to those goals or objectives with which you began the unit.

There will be times when you will wish to use conventional paper and pencil tests. And there will be times when less formal techniques for evaluating growth, progress, and changes in attitudes are in order. Here are some *sample questions* for conventional tests which are often helpful in determining pupil strengths and weaknesses and in measuring growth. However, they cannot do the total job of evaluation.

Discussion or essay questions:

Slow learners have trouble with essay questions, but questions of this type do provide the better student with opportunities for practice in organizing his thinking and in communicating his ideas.

1. What are some occasions in family life which might make desirable some changes in the family insurance program?
2. Why does a life insurance program have to be tailor-made? Why couldn't a standard program be devised which would fit everybody?
3. In buying health insurance, which expenses are most important to insure against? Why?

Open-end questions:

1. Some new things I have learned about uses for family income are: ____________________
____________________.

2. It is wise for a family to have a plan for financial security because ____________________
____________________.

3. Families can protect themselves against financial loss due to illness, accident, death or retirement by____________________
____________________.

Multiple choice questions:

Read each statement and place an X before each phrase that will correctly complete the statement. One or more answers may be correct.

1. The most widely used type of health insurance is:

_______ a. loss of income
_______ b. surgical expense
_______ c. hospital expense
_______ d. major medical expense

2. The main reason most families own life insurance is to provide:

_______ a. credit at the bank so that they can borrow money
_______ b. protection against the loss of income, whether by death or retirement
_______ c. a fund for the future college education of the children
_______ d. a continued source of ready cash

3. When your life insurance agent helps you plan an insurance program, he takes into consideration:

_______ a. the needs for which your life insurance must provide
_______ b. the assets you already own
_______ c. the amount you can afford to pay for insurance
_______ d. your ability to handle money wisely

Matching questions:

Read the column of statements, select the correct answer, and write the number of the answer in the space given.

1. Annuity	_______	a. A fund to call on in case of serious need
2. Cash values	_______	b. Pays the costs of doctor's calls, either at home, hospital or his office
3. Emergency fund	_______	c. Savings element of a life policy
4. Endowment	_______	d. Life and health insurance covering the employees of a company or members of a union
5. Face value	_______	e. A savings plan which also provides life insurance protection while the plan is in force
6. Group plans		
7. General medical expense policy		

Another matching question, more suitable for the 7th and 8th grade level, might be as follows:

Match the need for insurance protection, in column A, with the kind of insurance designed to meet that need in column B. Write your answer in the space given.

A	B
1. Your father's car is damaged in a collision.	______ a. Crop insurance
2. Smith's house burns down.	______ b. Life insurance
3. A farmer's wheat field is destroyed by a storm.	______ c. Burglary insurance
4. Mr. Brown dies and leaves his wife and three young children.	______ d. Health insurance
5. Jerry has to be in the hospital for several days because he was seriously burned.	______ e. Fire insurance
6. Mrs. Sullivan's silverware and jewelry are stolen from her house.	______ f. Automobile insurance
7. Rain cancels the concert in the park.	

Situational questions:

Tom and Mary Webb are both 27 years old and have been married for five years. Tom is a teller in the local bank, where he earns $480 a month. Mary stays at home to take care of their two-year-old boy. They have finally saved enough money to make a down payment on a house which will cost $12,500. Their insurance agent comes in one evening to help them plan their insurance program. At present, Tom belongs to the bank's group health insurance plan which pays hospital expenses for a limited period for the family. He also has a $5,000 straight life insurance policy which his parents started for him and a $5,000 family income policy which he purchased when their son was born. Mary has no insurance. She believes that it isn't necessary for her to have any. "Insurance is only necessary for the breadwinner of the family," she says.

Do you agree with Mary's point of view? Why?

Which members of this family should be insured?

Should Tom have more health insurance than his bank's hospitalization plan? What factors will he have to consider in making his decision?

What type of life insurance policies might the insurance agent recommend to Tom and Mary? Why?

GLOSSARY OF TERMS

Accidental Death Benefit A provision added to a life insurance policy for payment of an additional death benefit in case of death as a result of accidental means. It is often called "Double Indemnity."

Actuary A technical expert on insurance and related fields, particularly on the mathematics of insurance, including the calculation of premiums, policy reserves, and other values.

Agent A sales and service representative of an insurance company.

Annuitant The person during whose life an annuity is payable, usually the person to receive the annuity.

Annuity A contract that provides an income for a specified period of time, such as a number of years or for life.

Application A statement, signed by the applicant, requesting life insurance. It gives information used by the insurance company to determine the acceptability of the risk and the basis of the policy contract.

Automatic Premium Loan A provision in a life insurance policy that any premium not paid by the end of the grace period (usually 31 days) be automatically paid by a policy loan if there is sufficient cash value.

Beneficiary The person named in the policy, to whom the insurance money is to be paid at the death of the insured.

Cash Surrender Value The amount available in cash upon surrender of a policy before it becomes payable by death or maturity.

Convertible Term Insurance Term insurance which can be exchanged, at the option of the policyholder and without evidence of insurability, for a permanent plan of insurance.

Disability Benefit A provision added to a life insurance policy for waiver of premium, and sometimes payment of monthly income, if the insured becomes totally and permanently disabled.

Double Indemnity An accidental death benefit providing for payment of double the face amount of the policy in case of death as a result of accidental means.

Endowment Insurance A plan of insurance payable after a specified number of years if the insured is then living. If the insured dies during the endowment period, payment is made to a beneficiary.

Extended Term Insurance A form of insurance available as a nonforfeiture option. It provides the original amount of insurance for a limited period of time.

Face Amount The amount stated on the face of the policy that will be paid in case of death or at maturity.

Grace Period A period (usually 31 days) following the premium due date, during which a premium may be paid. The policy remains in force throughout this period.

Group Life Insurance Life insurance issued, usually without medical examination, on a group of persons under a master policy. It is usually issued to an employer for the benefit of employees. The individual members of the group hold certificates as evidence of their insurance.

Industrial Life Insurance Life insurance issued in small amounts, usually not over $500, with premiums payable on a weekly or monthly basis. The premiums are generally collected at the home by an agent of the company.

Insured The person on whose life an insurance policy is issued.

Level Premium Insurance Insurance for which the cost is distributed evenly over the period during which premiums are paid. The premium remains the same from year to year, and is more than the actual cost of protection in the earlier years of the policy and less than the actual cost in the later years. The excess paid in the early years builds up the reserve.

Limited Payment Life Insurance A plan of whole life insurance with premiums payable for a specified number of years or until death if death occurs before the end of the specified period.

Nonforfeiture Option The value, if any, either in cash or in another form of insurance, available to the policyholder upon failure to continue the required premium payments. The other forms of insurance available are extended term insurance and reduced paid-up insurance.

Non-Participating Insurance Insurance on which no dividends are payable. The premium is calculated to cover as closely as possible the anticipated cost of the insurance protection.

Ordinary Life Insurance Life insurance usually issued in amounts of $1,000 or more with premiums payable on an annual, semiannual, quarterly, or monthly basis. The term is also used to mean the straight life plan of insurance.

Paid-Up Insurance Insurance on which all required premiums have been paid. The term is frequently used to mean the reduced paid-up insurance available as a nonforfeiture option.

Participating Insurance Insurance on which the policyholder is entitled to share in the surplus earnings of the company through dividends which reflect the difference between the premium charged and actual experience. The premium is calculated to provide some margin over the anticipated cost of the insurance protection.

Policy The printed document issued to the insured by the company stating the terms of the insurance contract.

Policy Dividend A refund of part of the premium on a participating life insurance policy representing its share of the surplus earnings apportioned for distribution. It reflects the difference between the premium charged and actual experience.

Premium The payment, or one of the regular periodical payments, a policyholder is required to make for an insurance policy.

Reduced Paid-Up Insurance A form of insurance available as a nonforfeiture option. It provides for continuation of the original insurance plan, but for a reduced amount.

Settlement Option One of the several ways, other than immediate payment in a lump sum, in which the insured or beneficiary may choose to have the money from a policy paid.

Straight Life Insurance A plan of whole life insurance with premiums payable until death.

Term Insurance A plan of insurance payable at death provided death occurs within a specified period.

Waiver of Premium A provision that under certain conditions an insurance policy will be kept in full force by the company without the payment of premiums. It is used most often as a disability benefit.

Whole Life Insurance A plan of insurance for the whole of life payable at death. It may be either straight life or limited payment life.

Pub Date - Oct64
MF AVAILABLE IN VT-ERIC SET 9p.

*VOCATIONAL AGRICULTURE, *ADULT FARMER EDUCATION, *TEACHING GUIDES, *CURRICULUM GUIDES, *TRACTORS, REPAIR, MAINTENANCE,

The purpose of the guide is to assist vocational agriculture teachers to plan and conduct 20- to 30-hour tractor operation and maintenance courses for adult farmers. It was developed by a committee of agriculture teachers. Outlines are included for units on (1) servicing and lubricating the tractor, (2) maintaining the cooling, hydraulic, ignition, electrical, fuel system, and the chassis, (3) locating and repairing malfunctions, and (4) operating cleaning, and storing the tractor. Each unit contains suggestions for discussions, demonstrations, practice, and materials. Suggested references are listed. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29731. (JM)

TABLE OF CONTENTS

Note to Teacher:

The ten teaching jobs presented in this outline are intended for a course of 20 to 30 hours. The jobs and hours allotted as well as the sequence of teaching the jobs can be easily changed by the instructor if he so desires.

Each job or lesson is broken down into: (1) What the teacher should do (discuss and demonstrate); (2) What the student or trainees should do (practice); and (3) Materials needed for the lesson.

Every effort should be made to provide practice (experience) for the students. Discussion by teacher should be based on "showing" through the use of objects, charts and other aids. This type of teaching will necessitate several tractors on hand as teaching aids.

JOB I -- SERVICING AND LUBRICATING THE TRACTOR -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Explain and discuss how to use the service manual
2. Point out moving parts of tractor to be lubricated
   (a) Importance of regular maintenance of tractor
3. Explain oil system
4. What, how and where to use: crankcase oil, gear oil, hydraulic oil and greases
5. Crankcase oil: purpose, grade and classification
6. Selecting gear oil, hydraulic oil and grease
7. Explain oil filter: purpose, when and how to change
8. Crankcase breather: purpose, types and cleaning

B. Practice:

1. Check need for lubricating various parts
2. Drain oil (used) and examine
3. Replace oil filter
4. Check and replace gear oil
5. Check hydraulic oil
6. Use manual
7. Clean breather cap

C. Materials Needed:

1. Several tractors that need servicing
2. Oil filters - new and old
3. Various types of oils
4. Grease guns
5. Dope guns
6. Solvent
7. Rags

JOB II -- MAINTAINING THE COOLING SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Use charts to explain details and importance of the cooling system
2. Importance of proper engine temperature
3. Causes of overheating
4. Systems of water cooling
5. Check: hose, radiator cap, temperature, water pump and fan belt tension
6. Use of anti-freeze and rust inhibitors
7. Demonstrate action of thermostat and water pump

B. Practice:

1. Check cooling systems

2. Clean dirty systems - use commercial or home-made cleaning mixture

C. Materials Needed:

1. Several thermostats
2. Hose fittings - new and old
3. Cleaning materials for radiator
4. Pressure caps

JOB III -- MAINTAINING THE HYDRAULIC SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Types of hydraulic systems
2. How system operates - demonstrate use
3. Use of manual
4. How to service hydraulic systems

B. Practice:

1. Operate various systems
2. Check manuals for servicing systems
3. Follow manual: remove drain plug, remove oil and filter
4. Clean and re-install

C. Materials Needed:

1. Hydraulic fluid
2. Rags
3. Solvent

JOB IV -- MAINTAINING THE IGNITION SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Explain and illustrate battery and magneto systems
2. Functions of coil, distributer and spark plugs
3. Check condition of distributor - points and condensor
4. File or replace points
5. Examine and service cam and adjust points
6. Re-assemble distributor
7. Importance of timing the ignition
    (a) breakter-point method
    (b) timing light method
8. Spark plugs: construction, types, checking, cleaning and adjusting

B. Practice:
1. Remove parts of distributor and examine

2. Service and re-assemble
3. Practice timing ignition
4. Clean and adjust spark plugs

C. Materials Needed:

1. Various spark plugs - used, new, hot and cold
2. Rags
3. Solvent
4. Points for different tractors
5. Ignition file
6. Feeler gauge
7. Spark plug tester

JOB V -- MAINTAINING THE ELECTRICAL SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Parts of system and functions (battery, starter, generator, voltage regulator, switches and lights)
2. Battery: service, check with hydrometer and test
3. Check starter and generator and lubricate
4. Replace worn brushes on starter and generator
5. Clean commutator

B. Practice:

1. Explain functions of all parts of the electrical system
2. Test batteries
3. Service batteries
4. Replace brushes in starters and generators

C. Materials Needed:

1. Battery syringe
2. Baking soda and vaseline
3. Hydrometer
4. Sandpaper (No. 00)

JOB VI -- MAINTAINING THE FUEL SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Systems in gasoline and diesel engines
2. Types of fuels and storage
3. Importance of clean fuel
4. Service the sediment bowl
5. Service fuel line and screen

6. Parts and functions of carburetor
7. Adjust carburetor
8. Diesel fuel system - filters and injection pumps
9. Clean filters - bleed air from fuel line
10. Examine and service air cleaner

B. Practice:

1. Disassemble and clean sediment bowls and filters
2. Make adjustments of carburetor
3. Service the air cleaner

C. Materials Needed:

1. Solvent
2. Rags
3. Several carburetors
4. Air cleaners
5. Oil filters
6. Hose and fittings

JOB VII -- MAINTAINING THE CHASSIS AND OTHER PARTS OF THE TRACTOR -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Manual steering gear
   (a) check steering, adjust gears and check front end
2. Power steering
   (a) check lubricant, refill and check front end
3. Clean and repack front wheels
4. Check rear wheel bearings
5. Tires - under and over inflation
6. Tire and wheel weights
7. Brakes - adjusting and replacing lining
8. Frame - inspect and tighten

B. Practice:

1. Check both types of steering
2. Clean and repack front wheels
3. Adjust brakes
4. Replace brake lining

C. Materials Needed:

1. Screws and bolts
2. Grease
3. Air guage

JOB VIII -- TROUBLE SHOOTING EXERCISE -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Failure to start
2. Overheating
3. Missing and backfiring
4. Lack of compression
5. Engine knocks

B. Practice: (Note: Several tractors should be available to give trainees actual experience (practice) in determining and correcting common troubles.)

1. Have tractors prepared (fixed) to give trouble before class begins
2. Assign several trainees to each tractor
3. Allow time for trainees to:
   (a) locate trouble
   (b) correct trouble
   (c) report to group
4. Rotate small groups

C. Materials Needed:

1. All tools and equipment essential for determining and correcting troubles.
2. A tractor for each two or three trainees.

JOB IX -- TROUBLE SHOOTING EXERCISE -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Low oil pressure
2. Defective ignition
3. Lack of fuel
4. Smoky exhaust
5. Excessive fuel consumption

B. Practice: (Note: Several tractors should be available to give trainees actual experience (practice) in determining and correcting common troubles.)

1. Have tractors prepared (fixed) to give trouble before class begins
2. Assign several trainees to each tractor
3. Allow time for trainees to:
   (a) locate trouble
   (b) correct trouble
   (c) report to group
4. Rotate small groups

C. Materials Needed:

1. All tools and equipment essential for determining and correcting troubles.
2. A tractor for each two or three trainees.

JOB X -- OPERATING THE TRACTOR SAFELY, CLEANING AND STORING -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Safety
    - (a) highway operation
    - (b) night operation
    - (c) stopping, speed, towing and refueling
    - (d) Hitches and overloading
    - (e) operating near ditches and on steep slopes
    - (f) power take-off and pulleys
2. Clean and store (where tractors will not be used for at least two or three months)

B. Practice:

1. Clean tractor (steam cleaner if available)
2. Prepare for storage
    - (a) remove plugs and oil cylinders
    - (b) oil valve stems and tappets
    - (c) cooling system
    - (d) Service oil and air cleaner

C. Materials Needed:

1. Rags
2. Solvent (kerosene)
3. De-grease
4. Steam cleaner
5. Putty knives

Learning Experiences in Agricultural Occupations for Students of Vocational Agriculture, Poultry Processing Plants.

Clemson Coll., S.C. Dept. of Agricultural Education
South Carolina State Dept. of Education, Columbia
Pub Date - Apr64
MF AVAILABLE IN VT-ERIC SET 5p.

*VOCATIONAL AGRICULTURE, *POULTRY PROCESSING OCCUPATIONS, HIGH SCHOOLS, *COOPERATIVE EDUCATION, *LEARNING EXPERIENCE, *JOB SKILLS,

Designed for use by high school teachers as course planning material in vocational agriculture, this publication contains a list of learning experiences and activities needed by employees in poultry processing plants. It was developed by an individual author from a survey of poultry processors. Major divisions are (1) Experiences in Producing Broilers which includes selecting breeds for broilers, preparing brooder houses, maintaining proper temperature, following sanitary practices, and feeding before marketing, and (2) Experiences in Poultry Processing which includes killing chickens, sizing and weighing, packing for marketing, taking orders, and keeping records. Space to check performance of each activity is provided. The suggested time allotment is 160 hours. Qualified agriculture teachers may use this material with students interested in poultry processing. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (WB)

FOREWORD

This publication contains a list of learning experiences and activities which a student of vocational agriculture may get in poultry processing plants. Since some processing plants grow out their own chickens these experiences are listed: Part One - Experiences in Producing Broilers; and, Part Two - Experiences in Poultry Processing.

For these activities to be real learning experiences, the student must give some thought and study to each job he performs. In poultry processing, employees usually perform the same job each day. For the most learning, the student should get experience in as many activities as possible. After he has learned to do one job well, he should, with employer's permission, learn another one.

Experiences in producing broilers will vary according to the size and scope of the enterprise. Here the student has an opportunity to learn much by reading and studying as he performs the various jobs in growing out broilers.

The right column: "Check Performance" should be used by the employer to check the jobs as they are satisfactorily completed.

PART ONE - PRODUCING BROILERS

Kind of Experiences	Check Performance
1. Selecting breeds for broilers	
2. Locating sources of baby chicks	
3. Procuring baby chicks	
4. Preparing brooder house	
a. Cleaning house	
b. Providing clean litter	
c. Determining needed floor space	
d. Determining needed equipment	
e. Arranging equipment	
f. Checking brooder	
g. Operating brooder	
5. Placing chicks in brooder house	
6. Maintaining the proper temperature	
7. Feeding	
a. Feeding baby chicks	
b. Feeding growing chicks	
c. Methods of feeding	
d. Kinds of feeds	
8. Following sanitary practices	
a. Waterers and feeders	
b. Litter	
9. Symptons of common diseases	
10. Preventing diseases	
11. Controlling diseases	
12. Preventing cannibalism	
13. Feeding before marketing	

PART TWO - POULTRY PROCESSING

Kind of Experiences	Check Performance
1. Hauling chickens to processing plant	
2. Hanging chickens by feet on shackles (conveyer)	
3. Killing chickens	
4. Reversing the position on conveyer for picking	
5. Scalding	
6. Automatic picking	
7. Removing pin feathers by hand	
8. Singeing	
9. Cutting around vent and abdomen	
10. Removing viscera	
11. Removing head, feet, crops, lungs and kidneys	
12. Washing carcass	
13. Removing gizzard, heart, liver and neck	
14. Splitting and skinning gizzards	
15. Wrapping giblets	
16. Hanging carcass on shackles for inspection	
17. Stuffing giblets into carcass	
18. Placing carcasses in chilling vats	
19. Icing chilling vats	
20. Sizing and weighing	
21. Cutting fryers	
22. Assembling packing boxes	
23. Packing for marketing	
24. Placing in storage	
25. Delivering to retailers	

	Check Performance
26. Taking orders	
27. Collecting money	
28. Record of deliveries and sales

Electricity on the Farm, Special Course in Vocational Agriculture for Adults, Suggested Course Outline for Teachers of Agriculture in South Carolina.

Clemson Univ., S.C. Dept. of Agricultural Education
South Carolina State Dept. of Education, Columbia
Pub Date - Nov64
MF AVAILABLE IN VT-ERIC SET 8p.

*VOCATIONAL AGRICULTURE, *ADULT FARMER EDUCATION, *TEACHING GUIDES, *CURRICULUM GUIDES, *ELECTRICITY,

The purpose of this teaching guide is to assist vocational agriculture teachers in planning and executing a 30-hour course in farm electricity. It was developed by a committee of teachers and electricians for use in adult farmer and high school vocational agriculture classes. Outlines are included for the units (1) electrical fundamentals and terms, (2) homestead wiring system planning, (3) circuit installation, (4) electrical system maintenance, (5) farm motor selection, and (6) other uses of electricity. Each unit contains suggestions for discussion, demonstration, practice, and teaching materials. References and teaching aids are listed. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (JM)

ELECTRICITY ON THE FARM

SPECIAL COURSE IN VOCATIONAL AGRICULTURE
FOR ADULTS

Suggested Course Outline for Teachers of Agriculture

TABLE OF CONTENTS

Note to Teacher:

It is suggested that at least 30 hours of instruction be devoted to these ten sessions or lessons. If three-hour sessions are not convenient for the class, the number of sessions should be increased.

Each session in this suggested outline is divided into three parts: A - What the Teacher Should Do; B - What the Students Should Do; and C - What Materials Are Needed. Any part of any session or the teaching sequence may be easily changed.

For effective teaching of this course, considerable teacher preparation is necessary. Teaching aids - objects, charts, diagrams, etc. for each session should be obtained well in advance of the class meeting. These aids are essential for effective discussion and demonstration, by the teacher, and for meaningful practice or experience by the student.

If the filmstrips, listed on the reference page, cannot be purchased, the use of the four manuals (a, b, c, and d) from the Coordinator's Office, SAAE & VA, University of Georgia, Athens. Georgia, should be emphasized.

SESSION I -- FUNDAMENTALS OF ELECTRICITY AND ELECTRICAL TERMS -- 2-3 HOURS

A. Discuss and Demonstrate:

1. The atom, protons and electrons
2. Circuits, conductors and resistance
3. Volts, amperes, watts and grounds
4. AC and DC currents
5. Single phase and 3 phase
6. Nameplates on electrical equipment
7. Calculating cost of using electrical equipment
8. Reading a meter
9. Safety rules with electricity

B. Practice:

1. Learn electrical terms
2. Explain relationship of: volts, amperes and watts
3. Explain nameplates on electrical equipment
4. Read a meter
5. Calculate costs of using certain equipment

C. Materials Needed:

1. Volt, ampere and watt meter
2. Nameplates
3. Posters and charts

SESSION II -- PLANNING THE HOMESTEAD WIRING SYSTEM -- 2-3 HOURS(1)

A. Discuss and Demonstrate:

1. Use of electricity in each room or part of the home
2. Locating outlets and switches -- kind and number
3. Number of branch circuits needed
4. Size of service panel and service entrance
5. Distribution panel
6. Size of wire and load

B. Practice:

1. Use house floor plans to:
    (a) Locate outlets and switches
    (b) Determine number of branch circuits
    (c) Size of wire

C. Materials Needed:

1. Floor plans of homes or other buildings
2. Symbol rules
3. Chalkboard or flannel board
4. Wire - size board

(1) It may require two sessions, 4-6 hours, for this lesson

SESSIONS III and IV -- INSTALLING A CIRCUIT -- 4-6 HOURS

A. Discuss and Demonstrate:

1. Installing lighting circuit
2. Installing outlets
3. Installing a 3-way and a 4-way switch

B. Practice:

1. Have students install lighting circuit and outlets
2. Have students install different kinds of switches

C. Materials Needed:

1. Wiring board or panel
2. 30-ampere switch - different types
3. Outlet boxes, receptacle and light sockets
4. 2-wire and 3-wire cable
5. Switches - 2, 3, and 4-way

SESSION V -- MAINTAINING THE ELECTRICAL SYSTEM -- 2-3 HOURS(2)

A. Discuss and Demonstrate:

1. Making a test lamp
2. Replacing service cords, plugs and sockets
3. Repairing cords

B. Practice:

1. Make and use a test lamp
2. Replace cords, plugs and sockets
3. Repair cords

C. Materials Needed:

1. Water-proof sockets (two per test lamp)
2. Electrical cord, plugs, sockets and bulbs

3. Tape and solder

(2) For practice in Sessions V and VI -- Maintaining the Electrical System -- students could bring from their homes electrical appliances which need checking and repair.

SESSION VI -- MAINTAINING THE ELECTRICAL SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Fuses -- types and use
2. Replacing fuses or resetting a circuit breaker
3. Splicing broken wires
4. Replacing heater plugs
5. Removing sag from wires between buildings
6. Grounding procedures for safety

B. Practice:

1. Splice wires
2. Replace heater plugs
3. Have students check and repair home appliances

C. Materials Needed:

1. Tape and solder
2. Wire nuts
3. Squeeze-on connectors
4. Various kinds and sizes of fuses

SESSION VII -- SELECTING FARM MOTORS(3) -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Advantages of electric motors
2. Types of motors
3. Sizes of motors
4. Construction of motors
5. Motor protection and controls
6. Dual - voltage and reversing
7. Types of pulleys, belts and drives

B. Practice:

1. Determine size of motor for various jobs
2. Ways of mounting motors
3. Determine belt length and adjustment
4. Determine speed adjustment

C. Materials Needed:

1. Pulleys, belts and drives
2. Different types of motors

    (a) Split-phase induction
    (b) Capacitor-start
    (c) Repulsion-start

(3) Electric motors, if available, in the local farm shop can be used in this session.

SESSIONS VIII and IX -- CARE AND REPAIR OF FARM MOTORS(4) -- 4-6 HOURS

A. Discuss and Demonstrate:

1. Disassemble motor

    (a) Remove pulley
    (b) Loosen bolts and end plates
    (c) Avoid breaking leads between starting switch and windings

2. Remove all dirt and gum - (use carbon tetrachloride on cloth to remove gum - use air hose to blow out dust
3. Check contact points on split-phase and capacitor motors
4. Check commutator brushes on repulsion-induction motors
5. Clean air and oil passages
6. Check bearings and shaft for grit and we
7. Re-assemble

B. Practice:

1. Have students disassemble motors
2. Clean and check for needed repairs
3. Make repairs
4. Reverse direction of motor
5. Change from 120 volt to 240 volt operation if applicable

C. Materials Needed:

1. Each student should have a motor to work on for practice. (Students could bring these from their homes)
2. Rags
3. Test lamps
4. Carbon tetrachloride

(4) To effectively teach this lesson it will likely require two sessions totaling four to six hours.

SESSION X -- OTHER USES OF ELECTRICITY ON THE FARM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Electric hotbeds
   - (a) Use and advantages
   - (b) Materials needed, voltage
   - (c) Establishing a bed
2. Home-farm shop
3. Feeding equipment
   - (a) Cattle
   - (b) Poultry
   - (c) Swine
4. Crop drying and curing
5. Unloading equipment

B. Practice:

The practice or doing phase of this session would depend on the interest and needs of the class. Some might be interested in constructing an electric hotbed, others in establishing a farm shop, etc.

C. Materials Needed:

1. Materials for constructing a hotbed
2. Diagram of the home-farm shop
3. Charts of other uses of electrical equipment on the farm

Pub Date - Apr64
MF AVAILABLE IN VT-ERIC SET 4p.

*VOCATIONAL AGRICULTURE, *COOPERATIVE EDUCATION, *NURSERY WORKERS (HORTICULTURE), *JOB SKILLS, *LEARNING EXPERIENCE, HIGH SCHOOLS,

The purpose of this guide is to assist the vocational agriculture teacher and student in planning and evaluating work experiences in plant nurseries. It was developed by a teacher educator for use in a 150-hour placement experience. Listed are 26 experiences common to work in a plant nursery such as propagating plants, preparing and maintaining cold frames, preparing and maintaining hot beds, sterilizing soil, taking soil samples for testing, applying plant nutrients, operating a greenhouse, growing plants in the open, maintaining ornamentals, marketing plants, landscaping, and establishing a lawn. Space to check the performance of each activity is provided. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (JM)

FOREWORD

To The Teacher:

Plant nurseries should be considered when attempting to provide supervised practice in agricultural occupations for agriculture students. In certain areas of the State it is likely a good number of boys, who have limited home-farm resources, can find profitable part-time employment and obtain valuable training in plant nursery work.

You should carefully review -- "Teacher's Guide, Supervised Practice in Agricultural Occupations for Students of Vocational Agriculture," October 1963, when placing students in this type of training. Be sure to have students keep the records as suggested in this guide.

To The Student:

You have probably studied many things in your agriculture class about plant growth. This will help you in your work in the nursery with plants. In each of your jobs or responsibilities, you should be interested in the why as well as the how. You will have an opportunity to make good use of study materials, books, bulletins, etc. in learning more about the many phases of plant nursery work.

This publication lists some of the learning experiences you may have in the nursery. Attempt to learn to do well as many activities as possible. These should be checked (✓) in the right-hand column by your employer.

PLANT NURSERIES

Kind of Experiences

Check Performance

1. Propagate plants
    - a. Seeds
    - b. Cuttings
    - c. Layering
    - d. Budding
    - e. Grafting
2. Preparing soil for pots and flats
3. Sterilizing soil
4. Prepare cold frames
5. Maintain cold frames
6. Prepare hot beds
7. Maintain hot beds
8. Soil requirements of ornamental plants
9. Moisture requirements of ornamental plants
10. Need and use of organic matter
11. Need and use of shade
12. Fertilizer requirements of ornamentals
13. pH requirements of ornamentals
14. Taking soil samples for pH testing
15. Interpreting soil test reports
16. Maintain desirable pH
17. Apply needed plant nutrients
18. Greenhouse operation
    - a. Understand types of structure
    - b. Heating systems
    - c. Maintaining temperature
    - d. Maintaining moisture
    - e. Controlling humidity
    - f. Controlling diseases and insects
    - g. House arrangements

Check Performance

19. Growing plants in the open
    - a. Select site
    - b. Provide drainage
    - c. Prepare soil
    - d. Use of fertilizer
    - e. Control nematodes
    - f. Control weeds
    - g. Use of shade
    - h. Setting out plants
    - i. Moving large plants
    - j. Irrigate plants

20. Maintaining ornamentals
    - a. Prune evergreens
    - b. Prune deciduous plants
    - c. Fertilize ornamentals
    - d. Use and value of mulches
    - e. Care of plants during the winter
    - f. Care of plants during the summer
    - g. Recognize common insects
    - h. Know and use insecticides
    - i. Recognize common diseases
    - j. Know and use fungicides

21. Marketing plants
    - a. Balling and burlapping
    - b. Labeling and tagging
    - c. Prices and discounts
    - d. Displaying for sale
    - e. Selling plants
    - f. Shipping regulations

22. Identify common evergreen plants

23. Identify common deciduous plants

24. Know growth habits of nursery plants

25. Landscaping
    - a. Know uses of various plants
    - b. Set out plants
    - c. Care for after setting

26. Establishing a lawn
    - a. Prepare soil
    - b. Fertilize and lime
    - c. Select grasses
    - d. Seed lawn
    - e. Maintain lawn

FOREWORD

To The Teacher:

This publication contains a listing of some of many learning experiences in which a vocational agriculture student may participate while employed in a farm supply business or what we commonly speak of as a feed and seed store. The nature of the business, goods handled and services rendered, of such stores varies considerably and determines the kind and scope of experiences available for the student.

You should carefully study -- "Teacher's Guide, Supervised Practice in Agricultural Occupations for Students of Vocational Agriculture," October, 1963, when planning to place students in farm supply stores. You may also be of considerable help to student-employees by providing needed study materials and familiarizing them with this outline.

Each section has some blank spaces where additional experiences may be inserted. This list of experiences, if accurately kept, would be a valuable record and should be maintained as a part of the students' permanent record.

To The Student:

For satisfactory employment in a farm supply store you will need a rather broad knowledge of agriculture. This outline includes many of the learning experiences which will be available for you. These experiences include (1) the things you must learn to do, and (2) the things you must study and learn about.

For example: let's take No. 2 a., "Functions of Nutrients." To be able to intelligently discuss and sell the kind of feed your customer needs you must know something about what carbohydrates, fats, proteins, etc. do for the animal and why they are needed.

Another example: look at No. 3, "Power Equipment," under the Hardware Section. The more you know about lawn mowers and garden tractors the better service you will be able to render to both your employer and customer.

Most likely you will not be able to take full responsibility for all of these experiences. You should learn as much as possible about as many experiences as your employer will allow.

The right hand column, "Check Performance," is for keeping a record of your completed jobs and experiences. Your employer should discuss the progress of your work and check (✓) the activities which you have satisfactorily completed.

FEEDS

Check Performance

Kind of Experiences

1. Animal requirements for feed nutrients
    a. Beef cattle
    b. Dairy cattle
    c. Swine
    d. Poultry
    e. Others

2. Composition of mixed feeds
    a. Functions of nutrients (carbohydrates, fats, proteins, minerals, vitamins)
    b. Sources of various nutrients
    c. Feed additives (trace elements, parasite control, etc.)
    d. Sources of proteins
    e. Importance of mineral mixtures and salt
    f. Understand and explain feed tags

3. Methods of feeding
    a. Dry-lot and pasture
    b. Hand and self-feeding
    c. Breeding or fattening
    d. Protein supplements in home mixtures
    e. Balancing grains and proteins

4. Quantities needed for certain animal units

5. Storage of grains and feeds

6. Having feeds analyzed

7. Checking feed deliveries

8. Arranging feed for sale

9. Sale prices for different size purchases

10. Inventory of feeds on hand

SEEDS (GARDEN AND FIELD)

1. Packaging and displaying seeds

2. Weights of various seeds

3. Recommended varieties

4. Rates of seeding for different crops (plots, acres)

FEEDS

Check Performance

Kind of Experiences

1. Animal requirements for feed nutrients

    a. Beef cattle
    b. Dairy cattle
    c. Swine
    d. Poultry
    e. Others

2. Composition of mixed feeds

    a. Functions of nutrients (carbohydrates, fats, proteins, minerals, vitamins)
    b. Sources of various nutrients
    c. Feed additives (trace elements, parasite control, etc.)
    d. Sources of proteins
    e. Importance of mineral mixtures and salt
    f. Understand and explain feed tags

3. Methods of feeding

    b. Hand and self-feeding
    c. Breeding or fattening
    d. Protein supplements in home mixtures
    e. Balancing grains and proteins

4. Quantities needed for certain animal units

5. Storage of grains and feeds

6. Having feeds analyzed

7. Checking feed deliveries

8. Arranging feed for sale

9. Sale prices for different size purchases

10. Inventory of feeds on hand

SEEDS (GARDEN AND FIELD)

1. Packaging and displaying seeds

2. Weights of various seeds

3. Recommended varieties

4. Rates of seeding for different crops (plots, acres)

Check Performance

5. Chemical treatments of seeds
6. Noxious weeds
7. Germination tests
8. Seed laws for South Carolina
9. Common cultural practices in seeding crops
10. Purchasing seeds (sources, prices, terms)
11. Storage of seeds

PESTICIDES

1. Use of insecticides
    - a. Household
    - b. Field crops
    - c. Livestock
2. Use of fungicides
3. Use of weed killers
4. Control of livestock parasites
5. Safety precautions in using pesticides
6. Insecticides in fertilizer
7. State Experiment Station recommendations
8. Storing and handling pesticides
9. Laws governing use of pesticides

BABY CHICKS AND POULTRY SUPPLIES

1. Caring for baby chicks
2. Breed recommendations
3. Quantities of feed necessary for chicks
4. Equipment, feeders, waterers, etc., needed
5. Disease prevention
6. Methods of feeding

Check Performance

PET SUPPLIES

1. Feeds for: cats, dogs, birds, fish
2. Equipment for: cats, dogs, birds, fish
3. Disease and parasite control

FERTILIZER AND LIME

1. Know major plant nutrients
2. Know minor plant nutrients
3. Fertilizer recommendations for field crops
4. Fertilizer recommendations for garden crops
5. Special fertilizer for plant beds, ornamentals, etc.
6. Economic value of fertilizer
7. Explanation of fertilizer tags
8. Liming recommendations
9. Applying fertilizers and lime
10. Custom rates
11. Storage of fertilizers

HARDWARE AND OTHER ITEMS

1. Farm tools and use
2. Fencing: types, cost, etc.
3. Power equipment: mowers, garden tractor, etc.
4. Water pumps and plumbing fixtures
5. Irrigation equipment
6. Roofing and sheet metal
7. Paints and wood preservatives
8. Sporting supplies and equipment
9. Dynamite

Check Performance

10. Lawn equipment
11. Seasonal plants

ADVERTISING AND SELLING

1. Receiving and storing supplies
2. Pricing: mark-up and discounts
3. Displays: window dressing
4. Advertising: radio, television, mail, etc.
5. Handbills and printed matter
6. Sales policies: guarantee, exchange, etc.
7. Handling "shopworn" merchandise
8. Knowledge of all merchandise sold
9. Putting on sales demonstrations
10. Maintaining mailing lists
11. Ability to sell
12. Ability to collect

SERVICING

1. Manufacturer's warranty
2. Local dealer's responsibility for servicing
3. Registering sales with manufacture
4. Use of service manuals
5. Servicing and adjusting equipment before selling
6. Use of catalogue for parts
7. Maintaining needed parts for repair

KEEPING RECORDS

1. Maintaining inventories
2. System of handling invoices, sale slips, etc.

	Check Performance
3. Posting ledger	
4. Mailing statements	
5. Record of equipment -- serial and model number

Small Gas Engines--Maintenance and Repair, Special Course in Vocational Agriculture for Adults. Suggested Course Outline for Teachers of Agriculture in South Carolina.

Clemson Univ., S.C. Dept. of Agricultural Education
South Carolina State Dept. of Education, Columbia
Pub Date - Oct64
MF AVAILABLE IN VT-ERIC SET 8p.

*ADULT FARMER EDUCATION, HIGH SCHOOLS, *VOCATIONAL AGRICULTURE, *TEACHING GUIDES, MECHANICS (PROCESS), *ENGINES,

The purpose of the guide is to assist vocational agriculture teachers in planning and conducting a 30-hour course on small gasoline engines for high school students or adult farmers. It was developed by a teacher educator in consultation with a committee of teachers and mechanics. Units in the course include (1) Use, Kinds, and Types of Small Gasoline Engines, (2) Fundamentals of Internal Combustion, (3) Fuels and the Fuel System, (4) The Ignition System, (5) Lubrication and Cooling Systems, (6) Valves, Pistons, Rings, and Crankshaft, (7) Trouble Shooting--Ignition Trouble, (8) Trouble Shooting--Carburetor and the Fuel System, (9) Trouble Shooting--Lack of Compression and High Oil Consumption, (10) Trouble Shooting--Overheating and Engine Noise. Each unit is divided into discussion and demonstration by the teacher, and practice by the students. Suggested books, materials, and slides are listed. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (JM)

SMALL GAS ENGINES

MAINTENANCE AND REPAIR

SPECIAL COURSE IN VOCATIONAL AGRICULTURE

FOR ADULTS

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Agricultural Education Department, Clemson University
Address Clemson, South Carolina 29631
Limitation on Available Copies 1 upon request Price/Unit No Charge
(quantity prices)

(2) Means Used to Develop Material:
Development Group Committee of teacher educators & Mechanics
Level of Group N/A
Method of Design, Testing, and Trial Based on experience in area

(3) Utilization of Material:
Appropriate School Setting Vocational agriculture departments & area vocational Ctr
Type of Program Adults and high school
Occupational Focus Specific - small engines
Geographic Adaptability United States
Uses of Material Course outline
Users of Material Teachers

(4) Requirements for Using Material:
Teacher Competency Agriculture teachers or mechanics
Student Selection Criteria High school & adults

Time Allotment 30 hours

Supplemental Media --

TABLE OF CONTENTS

Note to Instructor:

The ten jobs, or lessons, as suggested in this outline are intended for a 20 to 30 hour course. Since the maintenance of small gas engines is rather simple, considerable time may be spent on repairs which are not too complicated.

Each job is divided into two parts: Discuss and Demonstrate by the instructor and Practice by the trainees. The instructor should make full use of charts, drawings and objects in his demonstrations. Parts and service manuals from various manufactures of small engines should be on hand.

The Practice session is probably the most important learning period. Here the instructor should carefully observe and guide the learners. How to: locate the trouble, disassemble, lay out machine parts, use proper tools, use service manuals and re-assemble are problems which require close supervision. Insist on and encourage high quality of work at all times. For the Practice period to be most meaningful, a number of small engines must be available for the "trouble shooting" lessons. There should be little difficulty in obtaining the needed number of lawn mowers, chain saws and other engines.

JOB I -- USE, KINDS AND TYPES OF SMALL ENGINES -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Uses of small gasoline engines on the farm
2. Kinds and types of small engines
3. Component parts and functions of each
4. Tools and equipment needed for maintenance and repair
5. Use of service manuals

B. Practice:

1. Have trainees name parts and explain functions of each
2. Allow trainees to disassemble engine
3. Hold question session as to functions and relation of all parts

JOB II -- FUNDAMENTALS OF INTERNAL COMBUSTION -- 2-3 HOURS

A. Discuss and Demonstrate:

1. The 2 stroke cycle
2. The 4 stroke cycle
3. Intake, compression, power and exhaust
4. Comparison of the 2 and 4 stroke engines
5. Piston and cylinder design
6. Fuel, lubrication, cooling and valve action
7. Crankshaft, bearings and flywheel

B. Practice:

1. Have trainees illustrate differences in 2 and 4 cycle engines
2. Have trainees (in groups) to disassemble engines
3. Study parts: identify, functions and relationships
4. Assemble engines

JOB III -- FUELS AND THE FUEL SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Principles and parts of the fuel system
2. Types of fuels
3. Mixtures of gasoline and oil
4. Types of carburetors
5. Functions of carburetor parts
6. Icing and vapor lock of carburetors
7. Air cleaner
8. Adjustment of carburetor
9. Fuel pumps

B. Practice:

1. Allow trainees to disassemble fuel system
2. Disassemble different types of carburetors

3. Discuss functions of parts and re-assemble
4. Make carburetor adjustments
5. Service air cleaner

JOB IV -- THE IGNITION SYSTEM - 2-3 HOURS

A. Discuss and Demonstrate:

1. Systems - battery and magneto
2. Types of magnetos
3. Parts of ignition system (coil, distributor, armature, switch, plugs and wiring)
4. Functions of each part
5. Maintaining the system
6. Timing the system
7. How to check: plugs, points, condenser and flywheel

B. Practice:

1. Have trainees explain ignition system
2. Check spark; clean and adjust plugs
3. Check or replace points
4. Replace condenser
5. Service and time the magneto

JOB V -- LUBRICATION AND COOLING SYSTEMS -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Types of oil systems
2. Principles of operation
3. Component parts of the system
4. Types of oil pumps
5. Types of friction in small engines
6. Use of oil and grease
7. Types of cooling systems
8. Maintaining different cooling systems

B. Practice:

1. Change oil and service filters
2. Check (water) cooling system
3. Clean (air) cooling system

JOB VI -- VALVES, PISTONS AND RINGS AND CRANKSHAFT -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Kind of valves
2. Checking valves
3. Removing and seating
4. Adjusting tappets

5. Timing
6. Checking compression
7. Checking pistons
8. Checking connecting rods
9. Checking and installing rings
10. Checking end play of crankshaft
11. Removing and replacing crankshaft

B. Practice:

1. Allow trainees to check engine that needs repair
2. Practice in checking: valves, timing, compression and rings

JOB VII -- TROUBLE SHOOTING: IGNITION TROUBLE -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Bad plugs
2. Correct armature setting
3. Breaker point gap
4. Points dirty or burned
5. Sheared flywheel key
6. Ground wire shorted
7. Condenser and armature failure

B. Practice:

1. Have several engines on hand for this lesson. These engines should be prepared, before class starts by instructor, to illustrate the more common ignition troubles.
2. Have trainees: identify trouble, explain and make needed corrections

JOB VIII -- TROUBLE SHOOTING: CARBURETOR AND THE FUEL SYSTEM -- 2-3 HOURS

A. Discuss and Demonstrate:

1. How to disassemble a carburetor
2. Carburetor adjustments
3. Common troubles
4. Governor adjustments

B. Practice:

1. Have trainees to disassemble different types of carburetors
2. Explain parts and functions and re-assemble
3. Have several engines prepared with carburetor trouble
4. Allow trainees to: identify trouble, explain and correct

JOB IX -- TROUBLE SHOOTING: LACK OF COMPRESSION AND HIGH OIL CONSUMPTION -- 2-3 HOURS

A. Discuss and Demonstrate:

1. Lack of compression:

    (a) Loose spark plug
    (b) Loose cylinder head bolts
    (c) Head gasket blown
    (d) Damaged valves
    (e) Worn bores or worn rings
    (f) Warped cylinder head
    (g) Broken connecting rod

2. High oil consumption:

    (a) Damaged rings
    (b) Worn cylinders
    (c) Worn or loose bearings
    (d) Damaged crankshaft
    (e) Broken oil line
    (f) Cracked crankcase
    (g) Leaking gaskets

B. <u>Practice</u>:

1. Have one or more engines which illustrate lack of compression and high oil consumption.
2. Allow trainees in groups to identify trouble
3. Make needed repairs as time will allow

JOB X -- TROUBLE SHOOTING: OVERHEATING AND ENGINE NOISE -- 2-3 HOURS

A. <u>Discuss and Demonstrate</u>:

1. Overheating:

    (a) Scale and rust in cylinder head and in water passages
    (b) Head gasket blown
    (c) Incorrect timing
    (d) Overload
    (e) Dirt and trash on cooling fins
    (f) Loose fan belt
    (g) Worn fan belt
    (h) Extreme high speed
    (i) Valves not properly functioning

2. Engine noise

    (a) Loose connecting rods
    (b) Loose piston pins
    (c) Worn timing gears
    (d) Valve noise
    (e) Loose flywheel

B. **Practice**:

1. Have one or more engines which illustrate overheating and making noises
2. Allow trainees to identify trouble
3. Make needed repairs

List of Recent Bulletins Selected for Use in Arizona Departments of Vocational Agriculture.

Arizona Univ., Tucson. Dept. of Agricultural Education
Service Bull-5
Pub Date - Jun65
MF AVAILABLE IN VT-ERIC SET 25p.

*VOCATIONAL AGRICULTURE, *BIBLIOGRAPHIES, *INSTRUCTIONAL MATERIALS,

An annual service to vocational agriculture teachers, this list includes 179 bulletin titles from 47 sources. Bulletins are classified by the filing system for the state's vocational agriculture departments, and the probable usefulness in vocational agriculture classes is indicated for each one. Some of the general subjects are meats, animal disease, beef, sheep, dairy, agricultural mechanics, and vegetables. The source for each bulletin is keyed to a master list. (JM)

Agricultural Education
University of Arizona
Tucson, Arizona

June 1965

FOREWORD

This publication is the fifteenth annual number in the series of selected bulletins for Arizona departments of vocational agriculture. Lists of U. S. Government publications, state agricultural experiment station and extension bulletins and circulars were used as the main sources of bulletins in compiling the list.

Although publications from the best known sources were reviewed in making the selections for the list, it obviously does not contain all bulletins which would be useful in a department library. Teachers should therefore supplement this list with any other appropriate references available.

The asterisk has been used to indicate the probable usefulness of the bulletins in classes of vocational agriculture. The list has been classified into three groups as follows:

1. Bulletins that should be in every department library in sufficient quantities for student use are marked with two asterisks (**).
2. Those of value as a single copy reference for teacher and student are marked with one asterisk (*). Multiple copies of bulletins marked with one or no asterisk may be needed if the content is of particular importance in the community.
3. Bulletins with no asterisk are not considered as an essential part of the minimum library for a department. They are useful bulletins and may be used to enrich and expand the scope of the library. In some cases these bulletins are of value as teacher references only.

The numbers listed under the first column in the bulletin list "File No." refer to the decimal system used in the latest revision of the Arizona bulletin filing system, dated June 1957.

This department maintains copies of all publications in the list, filed according to the bulletin filing systems for Arizona departments of vocational agriculture. Copies of recent bulletins are also displayed at teachers' conferences and during the visits of staff members to departments of vocational agriculture in the state.

Suggestions concerning bulletins which should be included in the next edition of this list will be appreciated.

R. W. Cline, Head
Department of Agricultural Education
The University of Arizona

SELECTED AGRICULTURAL BULLETINS

Classified according to the filing system for Arizona Departments of Vocational Agriculture, and evaluated on the basis of their use in these departments.

* * * * * * * * * * * * * * * *

File No.	Publication No.	Title	Source
1.03	Tech. Bull. 160	Advertising Meat, Poultry and Fish at the Retail Level (1964) 29 pp.	7
1.03	Tech. Bull. 164	*Relevance of Livestock and Meat Imports to the United States (1964) 32 pp.	7
1.03	Stations Circular 440	Your Money's Worth of Fryers and Red Meat (1964) 8 pp. This publication includes information on nutrient values of various meats and a slide rule for buying meat.	45
1.1	Farmers Bull. 2198	*Automatic Feeding Equipment for Livestock and Poultry (1964) 28 pp. Drawings and plans as well as pictures of existing feed mills and rather complete descriptions are included in this publication.	42
1.21	Special Circular 94	*Rabies in Animals (1964) This circular is very thorough in describing the disease rabies and how to handle live and dead animals. Although this publication is written for Wisconsin, many of the general principles apply to Arizona.	7
1.22	Leaflet 392	Fleas--How to Control Them (revised 1964) A general leaflet on kinds of fleas, development, and control with insecticides (contains guide for mixing).	42
1.22		**The Screwworm (1965) 8 pp.	7
1.3	Bulletin A-36	*A Survey of the Production and Marketing of Cattle Manure in Arizona (1964) 14 pp.	7
1.41	Farmers Bull. 2031	*Raising Rabbits (1964) 24 pp. Included in this bulletin are: Selecting a breed; Housing and equipment; Feeds; Feeding, Breeding, Herd Management; and Marketing of Rabbits.	42

File No.	Publication No.	Title	Source
1.51		*American Brahman Cattle (1964) 15 pp. A general booklet written by a breed association indicating the advantages of their particular breed of beef cattle	2
1.51	Ag.Info. Bull. 286	**Beef Cattle Breeding (1964) 43 pp. This publication deals with the selection and mating of beef cattle and also includes a short course in genetics.	10
1.51		*The Brahman Handbook (1964) 19 pp. This booklet describes the history, characteristics, judging, selecting, managing, and use in crossbreeding of Brahman cattle.	2
1.51		*The Brahman Hybrid (1964) 23 pp. This booklet discusses hybrid vigor and its advantages in the beef cattle industry. Brahman crosses are stressed.	2
1.51	Bulletin 523-S	*Goals and Methods in Beef Cattle Improvement (1965) 22 pp. A general bulletin on beef cattle improvement.	10
1.51		**Plan and Profit with Hereford (reissue) 48 pp. This booklet is a complete outline of all phases of beef cattle production. Very good for management units.	4
1.53	Series P-3	*Arizona Cattle Feeders' Day--Tucson (1965) 56 pp.	7
1.53	Farmers Bull. 2196	**Finishing Beef Cattle (1964) 30 pp. This bulletin explains cattle feeding systems, kinds of cattle to feed, when to buy feeder cattle, roughages and pasture, feeding procedures and getting cattle on feed, finishing feeds, cattle supplements, feed additives, preparing feeds and balancing rations.	42
1.55	Ag. Res. Bull. 15	*Cattle and Calves--Where They're Raised and Beef is Eaten (1965) 16 pp. A good illustrated booklet on beef cattle production and marketing.	36

File No.	Publication No.	Title	Source
1.56	Leaflet 527	How to Control Cattle Grubs (1965) 8 pp. (Supersedes Farmers Bulletin 1596, Cattle Grubs and Heel Flies with Suggestions for Their Control.) This little leaflet covers the life cycle of the grub and methods of controlling the grub.	42
1.7	Educ. Phamphlets 1-9	**Educational Pamphlets--American Sheep Producers Council (no date) 9 separate leaflets. This set of 9 pamphlets includes wool and fabric terms, history of sheep, breeds, grades of wool, and sheep production in the United States. They are factual, well-written pamphlets, and contain some pictures.	5
1.7		Sheep in America--The Story of Wool and Lamb (no date) 14 pp. This booklet is a general story of the sheep industry in America.	5
2.11		**The DeLaval Handbook of Milking (revised 1963) 39 pp. This booklet presents in a concise manner some important considerations in the care and handling of dairy cows, milking machines, and other dairy tools essential to the farmer.	13
2.11	Special Circular 97	Milking Machine Care (1964) folded sheet. This little circular discusses operation of milking machines in regard to vacuum pump, line, controller, pulsator, and inflations.	47
2.12		Arizona Dairy Herd Improvement Association's Annual Summary (1963-1964) 39 pp. Gives results of tests conducted by DHIA in cooperation with dairy herdsmen in Arizona. Gives information about amount of milk and butterfat produced by each dairy in the test as well as results on individual cows.	7
2.13	Farmers	**Feeding Dairy Cattle (1962) 32 pp. (Supersedes Farmers Bulletin 1626, Feeding Dairy Cows.) Explains the feeding needs of dairy cattle, the types of feeds, and methods of feeding both forage and concentrates.	42

File No.	Publication No.	Title	Source
2.14		*Judging Registered Holstein-Friesian Cattle (1963) 24 pp. This publication includes a scorecard for judging dairy cows and bulls, with pictures to illustrate important points.	18
2.15	Bulletin A-37	**A Milker's Manual (1965) 56 pp.	7
2.15		*Milking for Profit (1964) 19 pp. (35¢ each) This booklet points out 18 ways to profitable "cowmanship." These rules involve the actual milking procedures needed for good management.	27
2.23	Tech. Bull. 86	Cost Analysis of Fluid Milk Processing and Distribution in Colorado (1964) 30 pp. The bulletin deals with the relationship between size of plant and unit processing costs, the unit distribution costs for both a wholesale and retail delivery route, and the total costs of dairy products delivered to the customer.	10
3.11		**Disston Saw, Tool and File Manual (1963) 63 pp. This booklet describes briefly some of the more important tools used by the craftsworker, how to use these tools to the best advantage, and how to care for them and keep them in good serviceable condition.	30
3.11		*Educational Charts (no date) 6 charts. The charts include information on how to use a hand saw, how it cuts, hack saw chart, choosing and using a file, turning chisels, and special all-purpose saws. Although these charts are commercial, they contain excellent pictures.	30
3.11		How to Select and Apply Steel Roofing on Farm Buildings (no date) 28 pp. Illustrated booklet explaining how to select, lay, care for, and paint steel roofing material. Also shows safety practices.	33

File No.	Publication No.	Title	Source
3.13	Home and Garden Bull. 100	Equipment for Cooling Your Home (1964) 8 pp. This bulletin discusses four ways to cool a house, i.e., with fans, water, air conditioner, and a heat pump.	42
3.13		*Planning Water Systems for Farm and Home (revised 1963) 105 pp. ($2.60 single copy) Combines practical information from several different specialized fields into one book for those interested in the overall problem of a properly installed farm water system. Includes information on water needs, possible water cources, purification, water conditioning, selecting a water system to meet particular needs, where to place water outlets, how to meet pollution problems, what weather protection to provide, what size and type pipe to use, and what wiring to use. Film strip available.	34
3.15		*Building Farm Fences (revised 1962) 36 pp. (80¢ single copy) Gives step-by-step procedures for building woven-wire fences, barbed-wire fences, movable fences (including electric), and board fences. Shows how to provide lightning protection, and fence across gullies, streams, and marshes. Each step is illustrated so instructions can be easily followed. Film strip available.	34
3.16	Circular 213	*Home Storage of Vegetables (1965) 8 pp.	7
3.16	Circular 233	How to Process Your Ripe or Green Home-Grown Olives (revised 1965) 7 pp.	7
3.17		Plans for Four Projects on Your Farm (1965) folded sheet. This folder contains plans for used baler-twine back-rubber, salt and mineral feeder, covered feedlot bunks, and livestock shade.	27
3.2		*What You Should Know About Farm Tires A general booklet about tire fundamentals, proper tire maintenance, safety, with load and inflation tables.	17

File No.	Publication No.	Title	Source
3.21	Misc. Pub. 810	Farm Silos (1964) 28 pp. This bulletin deals with the various types of silos, general construction methods for each type, including foundations, walls, roofs, chutes, and wall treatment.	42
3.24	Leaflet 470	Mr. Field Crops Producer: It Pays to Use Chemicals Safely (slightly revised 1964) This leaflet tells the reasons for using chemicals and how to use them safely.	42
3.25	Farmers Bull. 2177	**Single-Phase Electric Motors for Farm Use (1964) 24 pp. Explanation about all types of single-phase motors. Selection, installation, motor protection and servicing are all included.	42
3.25		*Standby Electric Power Equipment for the Farm (1965) 8 pp. Discusses standby electric power equipment (generator) for the farm--type, size, installation, and operation.	42
3.27		*Tune-Up Manual (1962) 36 pp. ($1.00 single copy) A well-illustrated manual describing fundamental principles and troubleshooting of ignition and carburetion systems. Testing equipment and tune-up procedures are explained.	19
3.28		*Farm Tractor Tune-Up and Service Guide (revised 1964) 19 pp. ($1.85 single copy) A complete reference for on-the-farm tractor maintenance, giving critical adjustment data and lubrication recommendations. Includes maintenance information for gasoline, diesel, and LP Gas standard farm tractors built since 1948.	34
3.31	Tech. Bull. 83	Evaluation of Colorado Clay for Sealing Purposes (1964) 36 pp. This bulletin's purpose is to evaluate 321 samples of clay and 132 clay installations in canals and ponds. Various methods are expounded, with complete cost data for evaluation.	10
3.34	Popular Bull. 522-S	*Weed Seed and Trash Screens for Irrigation Water (1964) 18 pp. Excellent bulletin for those who are interested in removing trash and weed seed from irrigation water. Explains the many different possible ways of accomplishing this job.	10

File No.	Publication No.	Title	Source
3.51		Farm Welding Electrodes (1964) This chart gives the description of different Lincoln electrodes and how they are used.	23
3.52		*Cement and Concrete Reference Book (1964) 137 pp. A complete handbook on how to make and use concrete, whether you are building a bridge or a sidewalk.	31
3.52		**Recommended Practices for Laying Concrete Block (1963) 16 pp. This booklet illustrates and describes some practices in building a concrete block wall which experienced masons are following and which will result in the highest type of workmanship.	31
3.54		*Electrical Equipment You Can Build (no date) 31 pp. This booklet illustrates more than 50 suggested pieces of farm and home electrical equipment which can easily be constructed.	47
3.54	Circular 142	**Household Equipment--Its Care and Repair (reprinted 1965) 40 pp.	7
3.56	Farmers Bull. 2202	**Simple Plumbing Repairs for the Home and Farmstead (1964) 16 pp. This bulletin explains repair of water faucets, valves, leaks in pipes and tanks, and water closets. It also explains how to handle "water hammer," frozen pipes, and clogged drains. Tools and spare parts are listed.	42
3.59	Farmers Bull. 2130	**Rope on the Farm (1964) 16 pp. A revised edition. Very little change	42
3.60		*How to Use Hand Tools (no date) 36 pp. This booklet contains information on mechanical hand tools with useful how-to-do-it ideas, proper selection, use, and care of tools.	11
3.61		*Manual of Carpentry (1958) 65 pp. This manual provides a quick-reference source of fundamental carpentry, tools, and materials knowledge. In addition, useful information is incorporated in various tables.	43
4.1		*Fact Book of U.S. Agriculture (revised 1965) 169 pp. This book was designed as a reference for anyone who talks about agriculture. Chapters include agriculture and changing times, use of agricultural land, farm production, income and cost, etc.	42

File No.	Publication No.	Title	Source
4.11	Bulletin A-38	**Arizona Agriculture 1965 (1965) 30 pp.	7
4.2	Educ. Circ. 18	*How to Start a Cooperative (1965) 18 pp. This circular is intended to be a simple guide t groups interested in a step-by-step approach to organizing a cooperative.	38
4.3	Misc. Pub. 705	*A Graphic Summary of World Agriculture (1964) 63 pp. Includes maps and charts showing the worldwide distribution of vegetation, cropland, population, food crops, livestock, and oil crops.	42
4.3	Ag. Ec. Report 49	Our 100,000 Biggest Farms and Their Relative Position in American Agriculture (1964) 28 pp. Filled with charts, graphs, and tables. Information is for period 1949-59.	42
4.4	Ag. Info. Bull. 290	The Balance Sheet of Agriculture 1964 (1964) 24 pp. This bulletin brings together the assets and liabilities of agriculture as though it were one large enterprise.	40
4.4	Statistical Bull. 233	Changes in Farm Production and Efficiency (revised 1964) 50 pp. This is an annual publication designed specifically to present major statistical series on farm production, production inputs, and efficiency.	42
4.4	Tech. Bull. 154	*Farm Machinery Cost in the Western States (1964) 91 pp.	7
4.4		**Tables for Estimating Costs of Owning and Operating Farm Machinery (published by U.A. & U.S.D.A. March 1965)	7
4.42	Farmers Bull. 2137	**Insurance Facts for Farmers (slightly revised 1963) 20 pp. This bulletin describes fully the types and kinds of insurance available and when and what to buy.	42
4.44	Leaflet 510	Zoning for Rural Areas (1962) folded sheet. This folder explains why, when, and how to zone rural areas.	42
4.5	Tech. Bull. 161	Political Interest in Agricultural Exports Surplus Disposal Through Public Law 480 (1964) 60 pp.	7
5.0	Bulletin A-35	*Arizona Range Resources--II Yavapai County (reprint 1964) 55 pp.	7

File No.	Publication No.	Title	Source
5.0	Farmers Bull. 2180	Equipment for Clearing Brush From Land (slightly revised 1963) 12 pp. This bulletin describes some common types of equipment used to clear brush--small, medium, or large--from areas of various sizes.	42
5.0	Bulletin A-34	*Forage Production on Arizona Ranges--III Mohave County (1964) 77 pp.	7
5.1		*From Brush to Grass (1963) 8 pp. This booklet points out some ways mechanical brush control gets water management off to a good start, making such programs a practical answer to reclaiming depleted range.	9
5.2	Special Circ. 93	Pest of Young Conifers (1964) folded sheet Contains names, clues, identification, injury, and controls of insect, disease, and animal pest of young conifers.	47
5.5	PA-637	*What Is a Ranch Conservation Plan? (1964) 8 pp. A general bulletin outlining the essential steps of planning: appraisal of resources, physical problems, alternative practices, and evaluation of treatments. Gives an example of a western ranch conservation plan.	41
6.0	Bulletin A-4	**Field Crop Varieties for Arizona (1965) 23 pp.	7
6.02	Bulletin 460-A	*Guide to Chemical Control of Plant Diseases in Colorado (1965) 24 pp. General guide to controlling plant diseases by the use of chemicals, including seed treatment, foliage protectants, soil treatment, and chemicals for flowers.	10
6.10		*Field and Seed Crops: Usual Planting and Harvesting Dates by States in Principal Producing Areas (1965) 84 pp. This report contains information on the usual planting and harvesting dates for major field and seed crops. Information is arranged by states. In addition, dot maps show major areas of production and isomaps show periods of planting and harvesting.	42
6.10	Farmers Bull. 2201	Growing Ginseng (1964) 11 pp. A general cultural breakdown of another crop for cool areas.	42

File No.	Publication No.	Title	Source
6.11	Farmers Bull. 2211	*Controlling Dodder in Alfalfa (1965) 16 pp. An extensive bulletin on controlling dodder in the seed and hay crop with suggested cultural practices.	42
6.112	Leaflet 529	The Pea Aphid on Alfalfa--How to Control It (1964) This leaflet describes the damage to alfalfa, appearance and development, and control with insecticides of the pea aphid.	42
6.12	Bulletin A-15	**Barley in Arizona (revised 1965) 19 pp.	7
6.13		Cotton Production--Mechanization (1965) 28 pp. This publication contains the proceedings of the 1965 Beltwide cotton production-mechanization conference. Much of this information could be used for reference.	25
6.132	Bulletin A-28	**Chemical Control of Annual Weeds in Cotton (revised 1963) 12 pp.	7
6.132	Misc. Pub. 310	*The Classification of Cotton (1965) 53 pp. An excellent bulletin on the grading of cotton; very complete.	42
6.134	Farmers Bull. 2207	*Controlling the Pink Bollworm on Cotton (1965) 12 pp. This bulletin presents the occurrence, development and habits, nature of damage, and control measures of pink bollworms on cotton.	42
6.134		**Cotton Diseases and Their Control (1965) 15 pp. A very colorful bulletin on cotton disease, including most of the prevalent diseases attacking cotton.	25
6.134		*1965--Cotton Pest Control Guide (1965) 33 pp. This publication contains information on insect control, cottonseed treatment, chemical weed control, and harvest-aid chemicals.	25
6.134	Tech. Bull. 166	Lygus Bug Injury to Presquaring Cotton (1964) 28 pp.	7
6.134	Bulletin A-26	**Protect the Cotton Plant From Insect Injury (revised 1965) 20 pp.	7
6.135		Western Cotton Production (1965) 24 pp. Summary of the proceedings of the Western Cotton Production Conference held in Lubbock, Texas, in 1965.	25

File No.	Publication No.	Title	Source
6.21	Ag. Handbook 253	*Insects Affecting Sugarbeets Grown for Seed (1963) 29 pp. A comprehensive booklet containing pictures and descriptions of foliage feeders, seed feeders, and virus vectors.	37
7.0	Leaflet 445	*Electric Heating of Hotbeds (1964) 8 pp. A good general bulletin on the hows and whys of heating hotbeds with electricity.	42
7.01	Circular 122	**Control Vegetable Garden Insects (revised 1964) 15 pp.	7
7.01	Home and Garden Bull. 67	**Insects and Related Pests of House Plants (slightly revised 1964) 16 pp. Tells how to recognize and control the most common insects and related pests that attack plants in homes and home greenhouses.	42
7.01	Home and Garden Bull. 61	**Lawn Diseases--How to Control Them (revised 1964) 16 pp. This bulletin will help solve lawn disease problems. Only the most common diseases are discussed. Illustrated with color pictures.	42
7.02	PNW Bull. 62	**Grafting Fruit Trees (1965) 18 pp. An excellent bulletin which discusses grafting tools and these grafts: cleft, side, bridge, inarch, veneer, whip, and budding. Contains pictures and illustrations.	45
7.02	Leaflet 220	Storage of Vegetable Seeds (slightly revised 1964) 8 pp. This leaflet explains the general principles of seed storage, moisture content of seeds, and the viability of seed under various storage conditions.	42

7.12	Circular 282	**Home Citrus in Arizona (revised 1964) 16 pp.	7
7.14	Bulletin A-33	**Growing Grapes in Arizona (1964) 24 pp.	7
7.15	Circular 247	**Pecans in Arizona (revised 1964) 15 pp.	7
7.16	Farmers Bull. 1897	Establishing and Managing Young Apple Orchards (1964) 29 pp. This is a slight revision of a previous bulletin. Includes importance of young orchards, selection of site planning and planting, and pruning.	42

File No.	Publication No.	Title	Source
7.2	Circular 130	**Arizona Home Gardening (revised 1964) 40 pp.	7
7.2	Home and Garden Bull. 9	**Suburban and Farm Vegetable Gardens (1964) 46 pp. A good general bulletin on vegetable gardening, including material on site, preparation, equipment, planning, seed, plants, care, time of planting, and culture of special crops.	42
7.23	Farmers Bull. 2060	Sugarbeet Culture in the North Central States (revised 1964) 41 pp. A complete bulletin on sugarbeet culture, many of which principles will apply to Arizona.	42
7.25	USDA Ag. Res. Svc. Handbook 267	*Commercial Potato Production (1964) 59 pp. This publication covers the production of potatoes from the history of potatoes through potatoes for special purposes.	37
7.27	Farmers Bull. 2200	*Controlling Tomato Diseases (1964) 12 pp. This bulletin describes the most common diseases that affect tomatoes and the four general control methods used. Pictures are used to illustrate disease symptoms.	42
7.28	Leaflet 528	*Watermelons for the Garden (1964) 8 pp. This leaflet explains varieties, fertilizers, cultural practices, and pest control of watermelon.	42
7.3		**Your Best Guide to Better Gardening--Pocket Garden Guide (1963) 72 pp. This comprehensive booklet includes information on classes of plants, soils, fertilizers, pests and diseases, propagation, seasonality, flowers and flowering shrubs, lawns and ground covers, and fruit trees. It includes detailed cultural practices of specific western landscaping plants.	14
7.31	Ag. Handbook 270	Evaluation of Bermuda Grass Varieties for General Purpose Turf (1964) 54 pp. A good general bulletin on Bermuda grass, including classification, description of species, establishing a turf, and fertilizing.	42
7.31	Circular 242	*Flowers for Northern Arizona (revised 1964) 24 pp.	7
7.31	Leaflet 199	Gardenia Culture (slightly revised 1965) 8 pp. A general leaflet about outdoor, greenhouse, and home culture of gardenias. Includes common pests and controls.	42

File No.	Publication No.	Title	Source
7.31		**<u>1964 Report on Turfgrass Research</u> (1964) 28 pp.	7
7.32	Bulletin A-29	**<u>Native Trees and Shrubs for Landscaping for Use in Southern Arizona</u> (reprinted 1964) 15 pp.	7
7.32	Bulletin A-8	**<u>Pruning Hedges, Shrubs and Trees</u> (revised 1964) 20 pp.	7
7.32	Folder 103	<u>Rose Varieties for Arizona--1965</u> (1964) 6 pp.	7
8.11	Leaflet 530	*<u>Shade and Water for the Honey Bee Colony</u> (1964) 8 pp. This leaflet describes different types of shades and watering devices for bees raised under high temperature conditions.	42
8.11	Station Circ. 442	<u>Using Alkali and Leafcutting Bees to Pollinate Alfalfa</u> (1964) 8 pp. This bulletin explains life history and management of wild bees.	45
8.13	Farmers Bulletin 2204	*<u>Selecting and Operating Beekeeping Equipment</u> (1965) 24 pp. This bulletin indicates the main items of equipment needed in the honey house and apiary. Commercial and homemade equipment is discussed.	42
8.2	USDA Leaflet 430	*<u>Cockroaches--How to Control Them</u> (1964) 8 pp. This leaflet gives general control measures for cockroaches.	42
8.2	Ext. Bull. 472	**<u>Household Insects and Their Control</u> (1964) 19 pp. This bulletin deals with the common household pests; it includes black and white drawings of external features; lists general methods of control.	45
8.4	Bulletin A-14	**<u>Arizona Insect Control Recommendations</u> (1964) 67 pp.	7
8.4	Bulletin A-18	**<u>Control Insects of Flowers, Shrubs and Shade Trees</u> (revised 1964) 16 pp.	7
8.4		<u>Diazinon Handbook</u> (1965) 128 pp. This handy guide will be useful in making recommendations about control measures to fruit growers, vegetable growers, dairymen, lawn spraymen, nurserymen, pest control operators, and all others interested in insect control.	10

File No.	Publication No.	Title	Source
8.4	Farmers Bulletin 2193	Grasshopper Control (1964) 12 pp. A general bulletin which discusses control measures, rates, and application procedures. Companion to Ag. Info. Bull. 287.	42
8.4	Pamphlet 309	*Use Farm and Home Chemicals Safely (1964) 16 pp. Good general pamphlet on safe use of chemicals, including methods of treatment, toxic dosage, how sold, type of carrier, common usage, and type of chemical.	21
8.51	Ag. Info. Bull. 287	Grasshoppers--Their Habits and Damage (1964) 28 pp. This bulletin was designed to assist agricultural leaders. It describes the damage grasshoppers do; what different species look like; how they develop and where and how they live; explains how outbreaks occur so that effective controls may be found.	42
9.1	Farmers Bull. 2197	**Farm Poultry Management (1964) 32 pp. A comprehensive bulletin explaining profitability, farm laying flock, housing, equipment, feed snd water, brooding, pullets, egg and meat production, diseases, parasites, and pests of farm poultry. Well written, with practical information for starting and maintaining a poultry enterprise. Supersedes Farmers Bulletin 1524.	42
9.14	Leaflet 402	*Intestinal Coccidiosis of Chickens--How to Control It (slightly revised 1964) folded sheet. This leaflet explains how chickens get intestinal coccidiosis, what to look for, getting a diagnosis, handling an outbreak, and prevention.	42
9.14	Leaflet 383	Poultry Mites--How to Control Them (revised 1964) folded sheet. A leaflet with specific controls and methods of application.	42
10.0	Bulletin A-39	**Minimum Tillage in the Southwest (1965) 16 pp.	7
10.0	Ag. Info. Bull. 283	**Salt Tolerance of Plants (1964) 23 pp. A semitechnical bulletin explaining salinity, how it is measured, its effect on plants, tolerance data, effects on crop quality and composition, and management in relation to control.	42
10.0	Bull. A-11	**Soil Management (revised 1964) 18 pp.	7
10.21	Folder 107	*Fertilizer Recommendations for Arizona (1964) folded sheet.	7

File No.	Publication No.	Title	Source
10.22	Bulletin A-40	**Soil Organic Matter (1965) 20 pp. Replaces Bulletin 240.	7
10.4		*Soils of the Western United States (1964) 69 pp. This publication reports on the occurrence and distribution of soils in the 11 western states. It consists of a generalized soil association map and an explanatory text. The text describes 36 great soil groups and 8 miscellaneous land types which occur in the Western Region. Their occurrence and distribution and their relationships to physiography, climate and vegetation are discussed.	45
11.1	Bulletin A-1	**Chemical Weed Control Recommendations for Irrigated Areas of Arizona (revised 1965) 18 pp.	7
11.1	Bulletin 514-S	*Weeds of Colorado (1964) 218 pp. This bulletin is very similar to the one published at University of Arizona (Circular 265).	10
11.2	Farmers Bull. 2158	*Chemical Control of Brush and Trees (1964) 23 pp. Contained within this bulletin are kinds of herbicides, ways to kill plants, methods of application, selecting herbicides, cleaning spray equipment, and susceptibility of plants to herbicides.	42
11.3	Farmers Bull. 2106	**Sixteen Plants Poisonous to Livestock in the Western States (slightly revised 1964) 49 pp. This is a revision of a bulletin by the same name. It has color pictures showing the 16 poisonous plants, how they affect livestock, and some general preventative measures.	42
12.1		Youth Leadership and Group Effectiveness (1961) 14 pp. An illustrated monograph describing actions of groups and patterns of positive leadership.	22
12.3	PNW Ext. Pub. 61	Family Communication (1964) 12 pp. This pamphlet discusses word and action communications and how to improve them.	28
12.5		**The Future Farmers of America Organization--Questions and Answers (1965) 23 pp. This publication is a compilation of questions and answers about the FFA program.	35
13.0	Ag. Info. Bull. 175	*More Wildlife Through Soil and Water Conservation (slightly revised 1963) 15 pp. Tells how farmers and ranchers can, through conservation, produce more of a wildlife "crop."	41

File No.	Publication No.	Title	Source
13.0		New Opportunity in Soil and Water Conservation for Farmers and Contractors (no date) 23 pp. Pictures and words are used to explain conservation activity in the Small Watershed Program, contracting and farming practices. The use of heavy equipment is stressed.	1
13.1		Agriculture Conservation Program--Summary by States (1964) 71 pp. This is the annual summary of the Conservation Program by States.	42
13.2	U.S.D.A. PA-348	**Soil and Water Conservation Activities for Boy Scouts (1964) 30 pp. This publication is a good teacher-helper as it explains a number of simple classroom demonstrations in soil conservation.	42
13.5	Leaflet 452	*Replenishing Underground Water Supplies (1964) 8 pp. A general leaflet explaining some of the methods being used to recharge underground water supplies.	42
14.1		*American Welding Society--Publication Order Form (1964) folded sheet. A list of publications available in fundamentals, inspection, process, and industrial applications of welding.	1
14.1		*Arc Welding Education (no date) folded sheet. Contains list of teaching aids and film strips that would be helpful in teaching arc welding.	23
14.1	Folder 68	**Arizona Farm and Home Publications (revised 1965) 16 pp.	7
14.1		Available Reports and Publications of the Agricultural Stabilization and Conservation Service (1964) 7 pp. Latest list of ASCS related publications and films.	42
14.1	Misc. Pub. 959	*A Consumer's Guide to U.S.D.A. Services (1964) 49 pp. Contains general information about the U.S.D.A. services to the consumer in food shopping, cooking, health, clothing, house and home, pest control, gardening, recreation, family finances, and emergencies. It provides a list of bulletins available in each area.	42
14.1		*Free Booklets and Films (1963) 10 pp. Selected list of industry and company literature and films by Swift & Co. Also contains list of teaching material offered by American Meat Institute and National Livestock and Meat Board.	36

File No.	Publication No.	Title	Source
14.1		*How to Obtain General Motors Educational Aids (no date) folded sheet. A list of booklets, charts, and films on vocational, economic, and guidance aspects of mechanics.	16
14.1		*Publication and Film Catalog of Meat (1964) 25 pp. Complete price list of teaching aids on meats.	26
14.1		*Southern Association for Agricultural Engineering and Vocational Agriculture--Publications and Filmstrips (1965) 20 pp. A list of up-to-date farm mechanics booklets and filmstrips with their descriptions and prices.	34
14.2		*Catalog of Educational Material on Cotton and Cotton Products (1964) 37 pp. Charts, pamphlets, booklets, books, motion pictures, and other visual aids on cotton and cotton products are described in this catalog which is published annually.	25
14.2	Ag. Handbook 275	*Handbook of Agricultural Charts (1964) 164 pp. This lists available charts from U.S.D.A. It states that the charts are in the form of black and white slides and glossy prints only.	42
14.2		Teaching Aids (1964) single sheet. Contains a list of A-C teaching aids. Commercial products is the main theme.	1
14.3	.	*Educational Film Service (1964) 3 pp. A list of current product films--good for agricultural mechanics and plant science courses.	1
14.3		Educational Materials (no date) folded sheet. A list of filmstrips, movies, and teaching aids available from DeKalb.	12
14.3	U.S.D.A. Handbook 14	*Films of the U.S.D.A. (1964) 87 pp. Here, in a catalog of more than 300 titles, is a film on almost every important subject in agriculture.	42
14.3		**16mm Sound Motion Picture Available From Farm Film Foundation (1965) 14 pp. This publication contains a list of films on agriculture. All are free of charge except for return postage.	15
14.3		*A Treasure Chest of Audio-Visual Ideas (1961) 22 pp. Presents steps in skillful use of films, ways to use films, how to train projectionists, and sources of A-V information.	44

File No.	Publication No.	Title	Source
14.4		*Farm Safety Check List (no date) folded sheet. Check lists on ladders, animals, machinery, hand tools, trees, home, vehicles, and work areas.	20
14.4	Farmers Bull. 2156	*Safe Use and Storage of Flammable Liquids and Gases on the Farm (slightly revised 1964) 16 pp. How to use various flammable liquids, their proper storage, and how to extinguish small fires is the theme of this bulletin.	42
14.41	Circular 632	*Plan to Meet Emergencies (1964) 14 pp. A good general bulletin explaining how to protect yourself against fires, tornadoes, fallout, and other emergencies.	47
14.42		**Your Guide for the Safe Use and Care of Hand Tools (1963) 30 pp. This is a brief booklet on safe practices for wood and metal hand tools.	8
14.42		*Your Guide to Safety in Woodworking Shops (1963) 27 pp. Illustrates safety procedures on hand and power woodworking tools.	8
14.6		Feed Manufacturing Industry (1964) 21 pp. Explains the growth, service, and importance of the feed industry.	3
14.6		*Fifty Million Tons of Opportunity in Tomorrow's Animal Agriculture (no date) 15 pp. This bulletin presents seven major career areas of the feed industry.	3
14.6	Misc. Pub. 843	*A Job With the Forest Service--A Guide to Nonprofessional Employment (1964) 13 pp. Contains description, qualification, schooling, and salaries of nonprofessional forestry personnel. Also furnishes addresses for further information.	39
14.6		*Let's Talk About a Poultry Science Career (no date) folded sheet. This folder indicates the career opportunities in poultry genetics, nutrition, pharmaceuticals, engineering, production, and agri-business.	32

File No.	Publication No.	Title	Source
14.6		**Opportunities for You in Agricultural Education (1965) folded sheet. (5¢ per copy) Explains the qualifications, training, and opportunity for individuals in Agricultural Education. Very good for guidance.	29
14.6		*Opportunities in the Welding Industry (revised 1963) 23 pp. This publication describes the education needed, wages received, and opportunities in various jobs in the welding industry. This would be good for guidance.	6
14.6		**Threads of Life (1964) 16 pp. A well-illustrated booklet on the career field of agricultural science. It contains a series of research questions and the biological scientist's answers to them. Job opportunities and preparation for them through the land-grant college system is the major theme of this publication.	24

Introduction to the Fundamentals of Fire Behavior.

Forest Service, Washington, D.C. Div. of Fire Control
Pub Date - 64
DOCUMENT NOT AVAILABLE FROM EDRS 44p.

*PROGRAMED UNITS, *FORESTRY, *FIRE PROTECTION, *FIRE FIGHTERS,

This programed course was designed for training forest fire fighters by providing knowledge of fire behavior. The use of the programed material is explained. Units covered in 158 frames include (1) The Fire Triangle, (2) Ignition Temperature, (3) Sources of Heat, (4) Heat Transfer, (5) Weather Factors, (6) Forest Fuel Factors, and (7) Topography. Most of the program frames are illustrated by line drawings. A summarized reference of the seven units which reviews the essential points presented in the program is included. The time required to complete the course is 1½ to 2 hours. This document is available as A13.2--F51/45 for 45 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (JM)

INTRODUCTION

INTRODUCTION TO FUNDAMENTALS
OF
FIRE BEHAVIOR

This introductory course is designed to teach you, the fireman, fundamental fire behavior terms and concepts. This is important to you because successful firefighting is based on a knowledge of fire behavior. Why does a fire burn fast? Why does it slow down? Why does it burn intensely at times? Why does it burn faster in one direction than another? You must know the answers to questions such as these to be an effective firefighter.

There are many reasons for fires acting as they do. When you finish this course you will know the primary factors which influence the start and spread of fire. You will learn about combustion, the fire triangle, heat transfer, and how weather, fuel, and terrain affect fire behavior. Keep in mind, however, this is only a beginning course; it needs to be followed with additional fire behavior training.

The information presented here makes use of a powerful new training approach, programed learning. Small amounts of information are presented in logical sequence and you will make frequent written responses.

It will take you about 1½ to 2 hours to complete this course. Before starting, keep in mind the definition of fire behavior, "the manner in which fuel ignites, flame develops, and fire spreads."

Merle S. Lowden
Director, Division Fire Control
U.S. Forest Service

HOW TO USE THIS BOOK

This is a programed course which allows each person to learn at his own individual rate. It is presented in a series of small steps called "Frames." Each frame will present information and ask a question. The answer to the question will appear on the next page.

1. To use this book, read the information and question, and look at the illustration.

2. Write your answer to the question on the answer sheet or on a different piece of paper. Your answer must be written. If there is a blank, write the missing word. If you are asked to make a choice of several answers, write the letter of your choice. Follow all instructions in answering the questions.

3. After you have written your answer, turn the page to reveal the correct answer in the shaded portion of the next page.

4. Compare your answer with the correct answer.

5. Now continue with the next frame.

6. There are five frames per page. Read through the top frames of each page, then through to second row of frames and continue until you finish the bottom row of frames.

7. Each frame is numbered. The correct answer to the frame (on the next next page) bears the same number. To be sure that you are reading the frames in the proper order, start with Frame 1 and continue to Frames 2, 3, 4, etc., until the course is complete.

A Summarized Reference is provided at the end of this course. It may be readily referred to as a review when you have completed the course.

CONTENTS

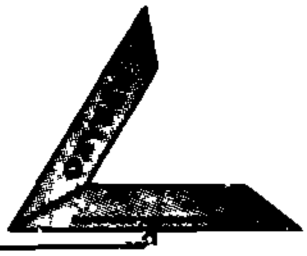
8

oxygen

9

And, as we have said, oxygen alone cannot produce combustion --- there must be some ________ present.

(also print it here)



40

41

We will first discuss DIRECT APPLICATION OF FLAME.

A lit match is an example of a DIRECT APPLICATION OF ________.

72

141

Let's concentrate now on hill and canyon fire behavior, since the Forest Service is responsible for many large areas which are not flat or built-up with man-made structures.

Fires burn about _____ times faster upslope than down.

13

14

The Fire Triangle consists of FUEL, OXYGEN and HEAT. Combustion is produced when all three are present. After the fire has started, from where does the additional HEAT come? Select one answer from those shown.

CIRCLE THE LETTER WHICH YOU BELIEVE BEST ANSWERS THE QUESTION:

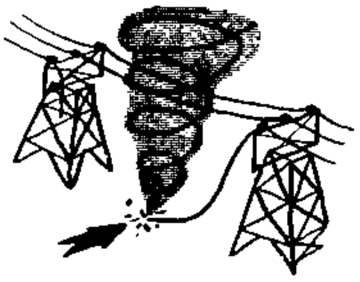
a. heat comes from surrounding atmosphere.
b. heat comes from the fire itself.
c. heat comes from some outside source.
d. heat comes from the oxygen.
e. none of these.

45

APPLICATION
EMBERS

46

The third SOURCE OF HEAT can occur when a high tension power line has snapped and is dangling on the ground. This demonstrates fire caused by ______________ ARCING.



77

78

If WIND blows sparks ahead to areas of unburned _______, then it is likely that small ______ fires will start.

109

(a) log
(b) stumps
(d) large limbs

110

FOREST FUELS

(a) Light fuels are ______-burning. A log is an example of a ______-burning fuel.
(b) Slow-burning fuels produce _______ amounts of ________ during combustion.
(c) Dry leaves are ______-burning and are ________ fuel.
(d) Large limbs are ______-burning and are ________ fuel.

141

16

142

The actual speed of fire on a slope will depend upon the SIZE of fuel: _______ fuel will burn faster than _______ fuel. It will also depend upon CONTINUITY: fuel which is patchy will burn more _______ than fuel which is _________.

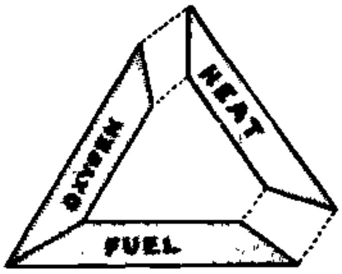
14

the most correct answer is

ⓑ heat comes from the fire itself.

15

Fire results from the proper combination of FUEL + OXYGEN + HEAT. By breaking the Fire Triangle, we can stop combustion. One way to do this is to reduce HEAT.



GO TO NEXT FRAME

46

ELECTRICAL

47

We often think of electric-powered equipment in connection with electrical arcing. However, LIGHTNING produces heat and causes many fires.

Lightning is a form of ____________ energy and it produces heat and causes ____________

78

fuel
spot

79

In this case, the Forest Service has established the control line show .

Suddenly a WIND increases over the burn. Write what you believe could happen.

____
____
____
____

110

(a) fast, slow
(b) large, heat
(c) fast, light
(d) slow, heavy

111

So far we have talked about the speed that forest fuels burn.

Light fuels burn ______ while heavy fuels burn ________.

142

[illegible]

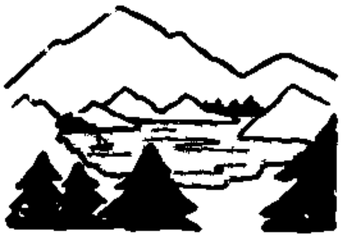
143

In addition to SIZE and CONTINUITY of fuel, we must also consider the COMPACTNESS. If the fuel is ________ arranged it will have a small amount of ________ mixed with it, but if it is ________ arranged, then much more ________ will be available for rapid burning.

15

16

To reduce HEAT, the Forest Service often uses a liquid which is available in most places and is used for washing and drinking. __________ is used on fires to reduce the HEAT.



47

48

So far we have discussed three SOURCES OF HEAT; (1) direct application of __________, (2) direct application of __________ and (3) ______________ arcing. The fourth is heat caused by FRICTION. Moving machinery which is not lubricated or properly cooled will produce heat.

79

[illegible] and embers [illegible] over the control [illegible] spotting [illegible] fires.

80

WIND can cause embers to produce ______ fires. When the control line is jumped by these fires, then __________ has occurred.

fast
slowly

112

② ARRANGEMENT

The second FOREST FUEL FACTOR that we will consider is the ARRANGEMENT of the fuel. By arrangement we mean:

1. GROUND OR AERIAL . . . 2. CONTINUITY . . . 3. COMPACTNESS

GO TO NEXT FRAME

tightly
oxygen
loosely
oxygen

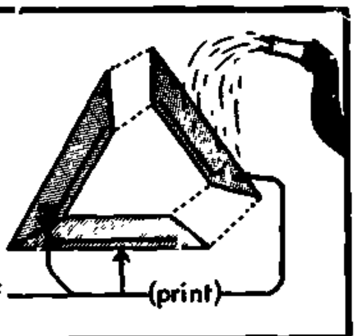
Also, the position will have some control over the speed of the fire. Ground fuels will burn ________ than ________ fuels which have a greater oxygen supply.

16

water

17

One way to reduce HEAT and break the Fire Triangle is by applying water. The effect of water is to COOL the fuel and lower its temperature. The diagram illustrates reduction of heat by the process of ________. The FIRE TRIANGLE consists of ——(print)

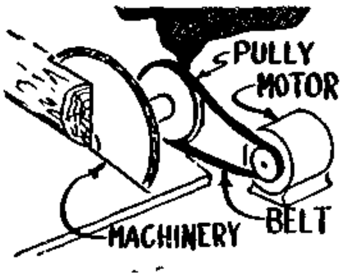


48

flame
embers
electrical

49

Suppose that a belt drive is used to run a piece of machinery. The belt slips on the pulley. Heat is produced due to ________ and a fire can be the result.



80

spot
spotting

81

The Forest Service halts a fire along a ________ line. However, if a ______ comes up suddenly over the burn, it is possible for ______ and ________ to be blown over the ________ line causing ________. This produces _______ fires.

112

113

ARRANGEMENT (1. Ground or Aerial)

Fuel on the ground is called GROUND fuel.

GROUND fuel does not have much movement of air around and through it.

123

heat
increase

124

Now, combine all of these ideas on FOREST FUELS to complete this: When we talk of fast-burning fuel we also mean ______ fuel. If fuel is connected continuously it is __________, while if it is separated it is ________. A compact fuel is called __________ because it has very little __________ mixed with it. If a large ________ of fuel is available, the fire will enlarge.

155

lightning

156

At very high elevations, smaller fires usually occur because:

(a) fuel is uniform.
(b) fuels there are less likely to combust because they hold moisture.
(c) not true -- larger fires occur.
(d) none of the above.

28

29

IGNITION TEMPERATURE is when FUEL ___ ______ and continues to ______ without adding ______ from an outside source.

60

61

If air is warm and it moves to another location --- then gives off some heat to the surrounding area, this is heating by ____________.

92

moisture

93

Air which has little water vapor has a low __________ content. It is dry air.

124

light
uniform
patchy
tightly arranged
oxygen
volume

125

TOPOGRAPHY

The last topic in this INTRODUCTION TO THE FUNDAMENTALS OF FIRE BEHAVIOR will deal with the physical features of the earth's surface . . . this is known as topography. This is easy to remember since it refers to the "top of" the earth --- topo-graphy = topography.

GO TO NEXT FRAME

156

(b)

157

VERY HIGH ELEVATION

(a) The size of fires at very high elevations is ________.
This is due to the _____ which holds its __________.

(b) The main cause of fire at very high elevations is ______________.

29

burns
burn
heat

30

From the chart, what can you conclude about the IGNITION TEMPERATURES of different FUELS? (write) ____________

____

____

____

FUEL	IGNITION TEMPERATURE *
Woolen Blanket (roll)	400° F
Short-Leaf Pine (shavings)	440° F
Spruce (shavings)	500° F

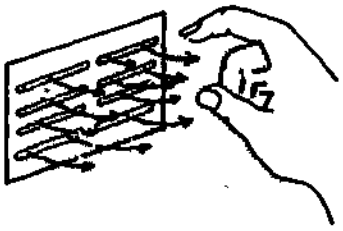
(* approximate)

61

convection

62

The hot air heater you see is transferring heat by ____________.



93

water (or moisture)

94

The measuring of the amount of water vapor in the air is called finding the relative humidity. It is in % (PERCENT).

"INTRODUCTION TO THE FUNDAMENTALS OF FIRE BEHAVIOR"

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Respiration

OBJECTIVE: To learn about the process of respiration and to study its relation to photosynthesis

INTRODUCTION: All cells must carry on respiration in order to stay alive. Most of us understand less about the process of respiration in the plant as compared to our knowledge of respiration in the animal. Yet the processes are very similar in the animal and plant cell.

EFERENCE: Required:
Crop Production in the South, Klingman, pp 29-32

QUESTIONS or ACTIVITIES

1. Define respiration
2. What two materials are formed when food is decomposed with the addition of oxygen?
3. How much do the chemical equation for photosynthesis and respiration differ?
4. What gas do plants release at night?
5. What are the raw materials needed for respiration?

31

different

32

Woody fuels of the forest have different ______ temperatures.

63

conduction

64

HEAT TRANSFER:

(a) from a far-away object, such as from the sun, is transfer by ______.
(b) due to a heated substance moving, such as heated air, is by ______.
(c) inside an object, such as from the hot end of a log to the cool end, is by ______.

95

dry
water

96

If the relative humidity is 80%, the air is ______ and has considerable ______.

127

exposure
west

128

A common term for "side" of a hill or of a canyon is SLOPE.

A SLOPE is the ______ of a hill. The side of a canyon is also the ______.

SUMMARIZED REFERENCE

1. THE FIRE TRIANGLE

The act of burning is called COMBUSTION.

In order to have combustion, FUEL, OXYGEN and HEAT are needed.

Needed for Combustion	Breaking the Fire Triangle
Fuel	Constructing a fire line
Oxygen	Apply dirt
Heat	Cool by applying water

2. IGNITION TEMPERATURE

The IGNITION TEMPERATURE is the temperature of a substance at which it will ignite and continue to burn without adding heat from an outside source.

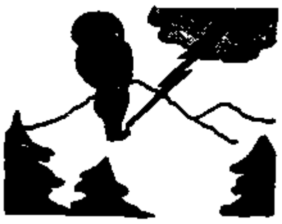
Different fuels have different ignition temperatures.

3. SOURCES OF HEAT

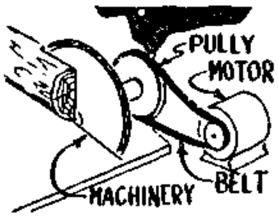
(1) Direct Application of Flame
(matches, blowtorch)

(2) Direct Application of Embers
(lighted cigarette, cigar ashes)

(3) Electrical Arcing
(snapped high tension power line, lightning)



(4) Friction
(slipping pulley on machinery, moving machinery)

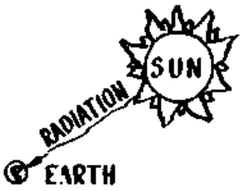


(5) Spontaneous Combustion
(pail of oily rags)

4. HEAT TRANSFER

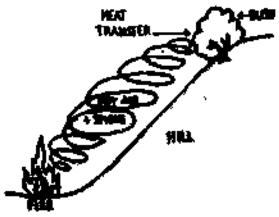
(1) Radiation

Heat is transferred from its source, through the air, to an object.



(2) Convection

Heat is transferred by the movement of hot air and smoke rising and heating the fuel above.



(3) Conduction

Heat is transferred within the fuel, or from one fuel to another, by direct contact (from the hot point to the cold point).

5. WEATHER FACTORS

(1) Wind

Wind is a movement of air. This air contains oxygen which supports combustion.

Wind pressure can increase burning in one direction or another.

Wind can blow sparks and embers ahead of the main fire into unburned fuel. This is called SPOTTING. Such new fires are called spot fires.

(2) Temperature

The sun or a hot wind can heat the forest fuel and cause its temperature to increase. As the fuel temperature approaches the ignition temperature, less heat is required to start a fire.

(3) Humidity

Humidity is moisture.

Relative humidity is the amount of moisture in the air.

Moisture in the air is called Water Vapor.

The measuring of the amount of water vapor in the air is called finding the relative humidity. It is in % (PERCENT).

Wind blowing across forest areas will dry out the forest fuel by causing the moisture in the fuel to leave by evaporation. This makes the forest fuel more susceptible to burning.

b. FOREST FUEL FACTORS

(1) Size of Fuel

In the Forest Service we think of size of Fuel as being light or heavy.

a. Light fuel is fast burning.
(examples: dry leaves, dry grass, tree needles)

b. Heavy fuel is slow burning.
(examples: logs, tree stumps, large limbs)

(2) Arrangement

The arrangement of fuel also determines how fast the fuel will burn due to the oxygen in the air around it. The more oxygen around the fuel, the faster it will burn.

a. Ground or Aerial

1 Ground fuel will burn slower. (less air around it)

2 Aerial fuel will burn faster. (more air around it)

b. Continuity - by continuity we mean, is the fuel:

1 Uniform (fuel connected) - fast burning.

2 Patchy (fuel not connected) - slow burning.

c. Compactness - by compactness we mean, is the fuel:

1 Tightly arranged - slow burning.

2 Loosely arranged - fast burning.

(3) Volume

With a large amount of fuel available, the fire will burn with large amounts of heat.

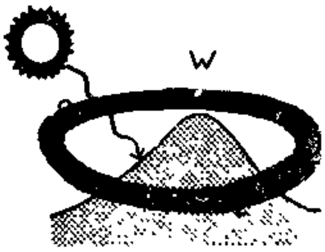
7. TOPOGRAPHY

Topography deals with the physical features of the earth's surface.

SLOPE - is the "side" of a hill or canyon.

(1) <u>Exposure</u>

The southwest exposures receive most of the sun during the year. It is the most hazardous exposure, since it also receives the most heat.

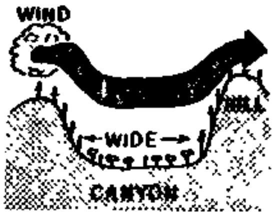


(2) <u>Steepness</u>

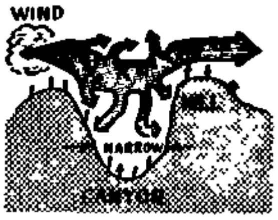
On a steep slope, fires burn about 16 times faster upslope than down.

(3) <u>Canyon fire behavior</u>

Wind across a wide canyon is normally steady and the violent up and down drafts are absent.



Wind across a narrow canyon causes turbulent, or confused, drafts.



If wind blows along and through a narrow canyon, the currents are similar to water currents in a river of the same shape. The air currents will be turbulent and a fire on a slope will have large amounts of oxygen fed to it and probably produce sparks and then spot fires.

(4) Very High Elevation

The main cause of fire at very high elevation is lightning.

Usually the size of fires at very high elevations is small. This is due to the fuel which holds its moisture.

*STUDY GUIDES, *VOCATIONAL AGRICULTURE, *COOPERATIVE EDUCATION, *GROUNDS KEEPERS, TESTS, ANSWER KEYS, *ORNAMENTAL HORTICULTURE, GRADE 11, GRADE 12, LANDSCAPING,

The purpose of this document is to provide a study guide for vocational agriculture cooperative education students preparing to become assistant groundskeepers. It was prepared by vocational agriculture teachers in consultation with subject matter specialists. Sections in the guide include (1) introduction to horticulture, (2) plant growing media, (3) plant growth and classification, (4) plant propagation, (5) nursery plant production, (6) floral crop production, (7) lawn establishment and care, (8) plant insect, disease, and pest control, (9) equipment operation and maintenance, and (10) landscape development and maintenance. Each section includes information sheets, assignment sheets, assignment answer sheets, topic tests, and topic test answer sheets. A qualified vocational agriculture teacher may use the material as a 180-hour course of study with junior and senior boys with occupational goals as assistant groundskeepers. Necessary supplementary materials are cited in the document. This document is available for $4.50 from Agricultural Education Teaching Materials Center, Texas Agricultural and Mechanical University, College Station, Texas 77843. (JM)

ACKNOWLEDGEMENT

This course of study is designed for the Texas vocational agriculture student who is enrolled in a Cooperative Part-Time Program in agriculture

Appreciation is expressed to the members of the Texas Nurserymen's Association who assisted in developing the course outlines for the horticultural occupations.

Front, left to right Tom Shelton, Bill Fritzpatrick, Bill Fullingim, Carroll Wilson; Back, left to right: L C House, Steve Dodd, Albert Biggio, Raymond Tate

Credit for the material contained herein is largely due to James Fitts, Vocational Agriculture Teacher, Victoria, Texas, and Johnny M Johnson, Subject Matter Assistant, Texas A&M University,

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Constructing, Maintaining, and Using Structures That Aid Plant Growth

TOPIC. Humidity and Watering

OBJECTIVE To become familiar with the effect of humidity on the development of plants and to learn how to determine water requirements

INTRODUCTION Humidity, moisture found in the air, and the amount of soil water can greatly affect the growth of plants Overwatered plants will be stunted, yellow in color, and defective in root development The amount of humidity can reduce the food production process of the plant or cause excessive wilting

QUESTIONS or ACTIVITIES

1 What means of watering is best for commercial pot plant crops?
2. How are the majority of bedding plants watered?
3 What are three disadvantages of an overhead watering system in a greenhouse?
4 Explain how a Rainbird-type nozzle system operates?
5. Explain how the Skinner irrigation system operates.

COURSE OUTLINE

DEVELOPED BY STATE ADVISORY COMMITTEE
ORNAMENTAL HORTICULTURAL OCCUPATIONS

Unit I	Introduction to Horticulture	1. Horticulture as an Industry
		2. Exploring Occupational Opportunities
Unit II	Plant Growth and Classification	1. Introduction
		2. Photosynthesis
		3. Respiration
		4. Water Absorption and Loss--Nutrient Absorption--Movement of Water and Nutrients in the Plant
		5. Plant Food
		6. The Plant Kingdom
Unit III	Constructing, Maintaining, and Using Structures that Aid Plant Growth	1. Types of Greenhouses
		2. Size and Arrangement of Greenhouses
		3. Cooling the Greenhouse (Summer and Winter)
		4. Heating the Greenhouse (Space and Bench Heating)
		5. Winter Protection Structures
		6. Structures for Summer Heat Protection
		7. Humidity and Watering
		8. Ventilation
		9. Lighting
		10. Wiring and Electrical Controls
Unit IV	Plant Growing Media	1. Origin, Composition and Importance of the Soil
		2. Soil Moisture
		3. Soil Mixtures
		4. Mulches and Their Use
		5. Fertilizer Nutrients
		6. Soil Organisms
		7. Soil Sterilization
		8. Growing Media Other Than Soil

Unit V	Plant Propagation	1. Introduction to Propagation 2. Propagation from Cuttings 3. Propagation by Layering 4. Propagation by Division 5. Propagation by Grafting and Budding 6. Propagation from Seed 7. Developing a Plant Breeding Vocabulary 8. Plant Selection and Fundamentals of Plant Breeding 9. Heredity 10. General Breeding Techniques
Unit VI	Nursery Plant Production	1. Transplanting Ornamental Trees and Shrubs 2. Care and Maintenance of Plants
Unit VII	Floral Crop Production	1. Introduction to Floral Crop Production 2. Growing Annuals 3. Perennials 4. Bulbs 5. Characteristics, Identification, and Use of Important Pot Plants 6. Poinsettia 7. Chrysanthemum 8. Geranium 9. Hydrangea
Unit VIII	Establishing and Caring for Lawns	1. Turf Grasses for Texas 2. Establishing a New Turf 3. Managing an Established Turf 4. Turf Problems
Unit IX	Controlling Plant Insects Plant Diseases, and Other Pests	1. Causes of Plant Diseases 2. Identifying Plant Diseases 3. Application and Safety Precautions of Horticultural Chemicals 4. Controlling Stem, Branch, and Trunk 6. Controlling Root Diseases 7. Controlling Diseases Affecting the Entire Plant

Unit IX	Controlling Plant Insects, Plant Diseases, and Other Pests (continued)	8	Controlling Lawn and Turf Diseases
		9	Identifying Plant and Soil Insects and Methods of Control
		10	Nematodes
		11	Control of Moles, Gophers, Birds, Deer, and Ants
		12	Controlling Weeds
Unit X	Operating and Maintaining Horticultural Equipment	1	Principles Used to Prevent Personal Injury and First Aid Principles
		2	Selecting and Maintaining Horticultural Hand Tools
		3	Maintaining Small Power Equipment
		4	Operating and Maintaining Lawn Mowers Safely and Effectively
		5	Operating Rotary Tillers Safely and Effectively
		6	Operating Garden Tractors Safely and Effectively
Unit XI	Developing and Maintaining the Landscape	1	Introduction to Home Landscaping
		2	Selecting the Site
		3	Scheduling Landscape Development and Beginning Plans
		4	Analyzing Problems and Determining Needs
		5	Developing the Landscape Plan
		6	Selecting Plants
		7	Grading, Drainage and Landscape Structures
Unit XII	Merchandising Horticultural Plants and Supplies	1	Developing Personal Traits
		2	Displaying
		3	Advertising
		4	Labeling and Pricing
		5	Understanding Customers and Making Sales

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Introduction to Horticulture

TOPIC Horticulture as an Industry

OBJECTIVE To become aware of the importance of Horticulture and to develop an understanding of the fields of study involved

INTRODUCTION. Horticulture is an important branch of agriculture The first definition of horticulture limited the field to cultivation of gardens Flowers. vegetables. fruits and ornamentals that were grown primarily in gardens soon acquired the name of "horticultural plants" in contrast to "field crops" such as corn and cotton We now think of horticulture as the production of flowers, vegetables. fruits. and ornamentals in the garden on a large scale basis It also includes the many services which are auxiliary to the production and marketing of horticultural crops.

REFERENCES Required

1 Information Sheet. "Horticulture as an Industry"

QUESTIONS or ACTIVITIES

1 With what type of crop is the olericulturist concerned?
2 With what type of crop is the pomologist concerned?
3 What four major types of crops are included in horticulture?
4 In which group of fruits do grapes belong?
5 In which group of fruits do apples belong?
6 What caused the expansion of vegetable growing?

Information Sheet
on
HORTICULTURE AS AN INDUSTRY

There are three major fields of horticulture Floriculture is the cultivation and management of ornamental and flowering plants Landscaping has also become an important function of the floriculturist Pomology is the science and practice of fruit growing Olericulture is the production, processing and distribution of vegetable crops

Floriculture was well developed thousands of years ago by the civilizations of Asia Their beautiful gardens required much knowledge and skill A landscape designer must have a knowledge of the principles of design along with a thorough understanding of plants Plant breeding has become very popular in the floriculture field. Patience and care are needed in this tedious task of developing new and improved plants

Pomology is a very demanding field Fruit trees are under constant attack from diseases and insects The fruit producer must be able to control these pests effectively. The pomologist also has to have a thorough understanding of plant growth There is a great deal of specialization in the field of fruit growing Many choose to work only with citrus, others concentrate on small fruits such as grapes. and still others deal with deciduous tree fruits such as apples There are countless jobs to be found in the field of pomology

Olericulture is a gigantic enterprise that is quite distinct from any other phase of plant production The annual farm value of vegetable crops in the United States is well over a billion dollars The big expansion in the vegetable industry was due primarily to an increase in production of out-of-season vegetables in the South and West The production, processing, and marketing of this huge crop requires a great number of personnel

As we can readily see, horticulture is a giant industry. If you are interested in plant growing and are willing to work hard in gaining new knowledge. a good future awaits you

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Introduction to Horticulture

TOPIC: Exploring Occupational Opportunities

OBJECTIVE: To develop an understanding of the requirements of some specific occupations and to determine the factors to consider in selecting an occupation

INTRODUCTION: This lesson is designed to help you decide upon an occupation in the field of horticulture In this lesson we will explore only five major occupations, all of which are available to cooperative part-time students in agriculture. In addition, instructional materials have been prepared for these occupations to assist you in developing into a skilled worker with potential for advancement in your chosen occupation

In recent years the need for trained workers in these occupations has increased greatly. If you like the work and apply yourself on the job and in your studies a world of opportunity awaits you

REFERENCES: Required.

1 Information Sheet, "Exploring Occupational Opportunities"

Supplemental

2 Handbook of Agricultural Occupations", Hoover

QUESTIONS or ACTIVITIES:

1. List the steps of advancement in a horticulture career
2 If possible, what is the best way to answer self appraisal questions concerning a certain job?
3 If you wanted a horticultural job which allowed you to work both inside and outside, which would you choose?
4 Prepare a list of businesses in your community which raise or sell horticultural products
5. Study the 18 factors to consider in selecting a job and be prepared to apply these factors in selecting your occupation

Information Sheet
on
EXPLORING OCCUPATIONAL OPPORTUNITIES

The selection of a vocation in horticulture is similar to that of other fields Basic questions arise in the mind of the person who is trying to select a vocation These questions or factors must be dealt with before a satisfactory selection can be made The following list points up some of these questions

Factors One Should Consider in Selecting a Job

1 What is the nature of the work? What kind of jobs will I be expected to do?
2 Does the occupation require chiefly mental or physical effort? Will my health allow me to do this work?
3 Is the work inside or outside work, or both?
4 What are the working conditions? With whom will I be working?
5 What personal qualifications are required for entry into the occupation?
6 What are the educational and training requirements for the job?
7 Is there opportunity for doing a variety of jobs?
8 Will the work require considerable travel and time away from home?
9 What financial earnings can one expect?
10. Are any fringe benefits provided by the business?
11 Is there a great deal of risk involved in performing the job?
12. What security and benefits are offered in the occupation?
13 Are there opportunities for advancement and self-betterment?
14. Is the employment on a regular or seasonal basis?
15. Does one work regular hours? Eight ten, or twelve hour day? Day or night shift?
16. Is there stability of residence or must one make frequent moves?
17 Will the job necessitate that one get along well with others or will one work pretty much alone?
18 How much personal expense is involved in clothing. transporation and meals?

Another very important question in the selection of a vocation is that of advancement Usually a person who cannot advance in his chosen field will become unhappy and fail to do his best. This question should be investigated before choosing a vocation in the field of horticulture.

The opportunity for advancement is fairly good in this field The following sketch demonstrates an example of the possible steps in the advancement of the horticulturist who applies himself to his work

Advancement in Horticultural Occupations

1 Laborer
2 Foreman or Supervisor
3 Assistant Manager
4 Manager or Owner

Exploring Occupational Opportunities
(Information Sheet continued)

As you can see from this example, application. education and experience can determine the speed and degree of advancement

Probably the most important question of all is, "am I personally suited for a career in horticulture"? It can only be answered after you have investigated the field and have a good knowledge of what it is and what it offers The answer probably lies in self appraisal

This self appraisal can be achieved by asking yourself the following questions.

1 Do I prefer working with things?
2 Do I prefer working with facts, figures, and ideas?
3. Do I have a love for growing things?
4 Do I like to work with people?
5 What kind of work experiences have been most enjoyable to me?
6 What kind of work would I like to be doing five, ten, or fifteen years from now?
7 Will my health permit me to make the choice I want?

Probably the best way to determine the answer to these questions is by actually working on a job for a while However, this cannot always be done Circumstances do not always permit this

There are other good ways to determine some answers Your fondness for certain subjects in school, your interest in certain activities, study of the field of horticulture, talks with your teachers, guidance counselors and others may indicate interests and abilities that will help you to partially answer the questions Such things as cooperativeness, willingness to work, dependability, willingness to assume responsibility resourcefulness and self-reliance are all basic qualifications that you will need in ornamental horticulture as well as other occupations

A close look at some of the jobs in horticulture will reveal many opportunities and requirements As you look at each job try to decide if you are interested and qualified

Job Title - Greenhouse Worker

Job Description

A greenhouse worker grows plants in an artificially heated glass or plastic greenhouse. The plants grown may be vegetables or flowers, and the work may include the propagation of trees or ornamental shrubs from seeds of cuttings Greenhouse specialties include producing out-of-season vegetables such as tomatoes. cucumbers. or leaf lettuce, producing cut flowers or pot plants, growing bedding plants for sale. or starting plants for outdoor nursery beds In many cases a greenhouse is a part of a nursery operation In such cases, a worker may be performing the duties of a nursery worker as well as

Exploring Occupational Opportunities
(Information Sheet continued)

those of a greenhouse worker An employee in the greenhouse screens, mixes, sterilizes soil, and places it in growing containers He sows seeds, starts cuttings, and transplants seedlings and plants He waters, feeds, weeds, thins prunes, and sprays growing plants He may control the greenhouse temperature and humidity. He also maintains the greenhouse structure and equipment He should know the names and the culture of the plants with which he works.

Job Title - Nursery Worker

Job Description

A nursery worker grows seedlings and plants for landscaping, fruit farming, and forest replanting. He may work in one of several kinds of nurseries. Some nurseries specialize in producing fruit trees and small fruit transplants, some in ornamental trees and shrubs, and some in forest replanting materials Some nurserymen operate greenhouses and produce their own seedlings and plants from cuttings Some produce planting stock of two or more major lines of plants, trees, or shrubs

A nursery worker prepares seedbeds, plants seedlings, weeds, cultivates, fertilizes, waters, prunes, and performs other cultural practices such as spraying and grafting He digs, grades and packs plants for shipment He may cut, lift, and lay sod He transplants shrubs and trees, and in a tree nursery, gathers and processes forest tree seeds He helps with the maintenance and repair of buildings and equipment

A nursery employee assists customers in selecting plants for home landscaping He also makes recommendations on maintenance to the customer and may work at a nursery where he will be required to make periodic checks on customer's lawns and to maintain the beauty of the landscape

Job Title - Garden Center Employee

Job Description

A garden center employee performs many jobs including caring for ornamental plants, moving plants and supplies into selling areas, arranging plants and supplies for display purposes, and selling the various products handled by the garden center A garden center may be part of a large retail store, a part of a nursery or greenhouse operation, or a retail establishment separate from any other business

Exploring Occupational Opportunities
(Information Sheet continued)

The work of a garden center worker includes cleaning, stocking, and arranging garden supplies on shelves, counters, and in windows He cares for ornamental plants by watering, feeding, trimming, spraying, and controlling temperatures The worker unloads and unpacks supplies as they arrive from wholesalers, loads orders on trucks, makes deliveries, and loads orders into customer's cars He gives information to customers on care of plants, care of lawns, plant varieties, and merits of different garden supplies and equipment

Job Title - Assistant Groundskeeper

Job Description

An assistant groundskeeper cares for the area surrounding an industry or business, church, school, airport apartment building, private estate, cemetery, or shopping center. The employee plants and cares for lawns and ornamental plants. The work involves mowing grass, reseeding, controlling weeds, and planting and spraying ornamental plants He rakes and disposes of leaves and other refuse Year round employment is provided through maintenance and repair of walks, drives, and equipment The work may also involve making minor repairs to buildings

Job Title - Parks and Landscape Employee

Job Description

A parks and landscape employee performs the work necessary for proper maintenance of landscapes and park area

The work of this occupation includes mowing grass, trimming, the edges of walks and driveways, planting, pruning and caring for trees, shrubs, hedges, lawns, and flower beds; controlling insects, diseases, and weeds; and caring for the soil The work may also include such jobs as removing trash or snow, maintenance of swimming pools, care of boating facilities, general maintenance of buildings and equipment, and repair of roadways and drives.

Material for this information sheet was partially taken from Ornamental Horticulture for Vocational Agriculture in Alabama

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Introduction

OBJECTIVE: To develop an understanding of the importance of studying the properties and life phenomenon exhibited by a plant

INTRODUCTION. There are over 350,000 different kinds of plants in the world No one person can know all of them. but he can learn the characteristics that are common to all of them Without a knowledge of botany a plant grower is lost If he does not know how plants grow, how can he possibly be successful in raising them?

REFERENCE: Required·
Crop Production in the South, Klingman, pp. 13-19

QUESTIONS or ACTIVITIES.

1. What is botany?
2. How many different kinds of plants are known to exist?
3. Name two carbohydrates.
4. What is the major difference between plants and animals other than the ability to move and to think?
5. What was the wrong conculsion that Van Helmont made after his experiment concerning plant growth?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classificati

TOPIC: Photosynthesis

OBJECTIVE: To learn how plants produce their food.

INTRODUCTION: Van Helmont failed in his experiment to determine why plants grow. He thought that water alone was responsible for the growth. Van Helmont did not know about photosynthesis; so his conclusion was wrong.

REFERENCES: Required:
Crop Production in the South, Klingman, pp. 19-24

QUESTIONS or ACTIVITIES:

1. What does photo mean?
2. Define synthesis.
3. What is a more complete definition of photosynthesis?
4. What is a calorie?
5. What is a molecule?
6. What is the term used to describe the movement of gas or liquid from an area of high concentration to an area of low concentration?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Respiration

OBJECTIVE. To learn about the process of respiration and to study its relation to photosynthesis.

INTRODUCTION: All cells must carry on respiration in order to stay alive Most of us understand less about the process of respiration in the plant as compared to our knowledge of respiration in the animal. Yet the processes are very similar in the animal and plant cell

REFERENCE. Required:
Crop Production in the South, Klingman, pp 29-32

QUESTIONS or ACTIVITIES

1 Define respiration
2 What two materials are formed when food is decomposed with the addition of oxygen?
3. How much do the chemical equation for photosynthesis and respiration differ?
4. What gas do plants release at night?
5 What are the raw materials needed for respiration?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Water Absorption and Loss- Nutrient Absorption- Movement of Water and Nutrients in the Plant

OBJECTIVE: To understand how water and nutrients are absorbed by the plant to understand how water is lost, and to study the transportation system of the plant

INTRODUCTION: One of the necessary functions of plants is to absorb water and nutrients from the soil For proper management one must understand these absorption processes and also the transporting of these materials by the plant

REFERENCES: Required
<u>Crop Production in the South</u>. Klingman pp 32-35

QUESTIONS or ACTIVITIES

1 What will happen to a plant if its inside pressure is greatly reduced?
2 What is the term used to describe cells that are filled tight and result in plants standing straight?
3 Explain how an over supply of fertilizer around a plant's roots affect its water absorption process
4 What is transpiration?
5 What are nutrients?
6 What two conductive tissues make up a vascular bundle?
7 Explain why girdling a tree causes it to die

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC: Plant Food

OBJECTIVE: To learn the different plant foods and their functions.

INTRODUCTION A food is any substance which can be used as a source of energy for carrying on the life processes. To really understand plant growth, one must understand the basis for life --- food

REFERENCE. Required.
<u>Crop Production in the South</u>. Klingman, pp. 24-29

QUESTIONS or ACTIVITIES:

1. What is food?
2. What are the 3 foods used for energy and growth?
3. What elements make up carbohydrates?
4. What is the primary function of fats?
5. Where in the plant are fats most commonly found?
6. What is the process called by which hydrogen is added to oils?
7. What are the components of protein?
8. What 4 elements make up aroung 97% of the dry weight of most plants?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC. The Plant Kingdom

OBJECTIVE. To become familiar with the system used to classify plants.

INTRODUCTION People in West Texas may call a certain plant "dove weed" while an East Texas farmer may call it "croton" Names vary with localities. The only way to solve this problem was to develop a unified method of classification

REFERENCE Required.
<u>Crop Production in the South</u>, Klingman, pp 35-40

QUESTIONS or ACTIVITIES

1 What is taxonomy?
2 What are the four divisions of plants?
3. In which division do we find most of the disease causing plants?
4. What are some examples of beneficial bacteria?
5. What plant causes smut, rust, mildew. and scab?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Types of Greenhouses

OBJECTIVES To learn how greenhouses are constructed, used, and maintained.

INTRODUCTION Greenhouse production of horticultural plants is an enormous industry Driving a few miles across Texas. one can usually count several greenhouses that are in full operation It is interesting to note the various shapes of these structures and the different materials used in construction.

REFERENCES Required:
Flower and Plant Production in the Greenhouse, Nelson,pp 19-32

QUESTIONS or ACTIVITIES

1 What are the two most used materials for greenhouse coverings?
2 What time of year is best for repairing or replacing slipped or broken glass?
3 What properties should an ideal greenhouse plastic possess?
4 What are some of the advantages and disadvantages of polyethylene and vinyl?
5 How is the ventilation problem handled in greenhouses where there are no ventilators?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Size and Arrangement of Greenhouses

OBJECTIVE: To learn how to select the proper size and arrangement before constructing the greenhouse

INTRODUCTION: A careful study of greenhouse arrangement should be made before construction begins. The bench arrangement for the crops to be grown should be considered first Then the greenhouse that fits this arrangement should be built. If these factors are done in reverse and a structure is erected before working out bench plans, many inconveniences and headaches will be the result

REFERENCE: Required.
Flower and Plant Production in the Greenhouse, Nelson, pp 33-38

QUESTIONS or ACTIVITIES:

1 What should be considered first in deciding the size and type of greenhouse?
2 Why should boiler rooms be centrally located?
3 What are the requirements of good greenhouse benches?
4. What is the best height for pot plant benches?
5 What should be the minimum depth of cut flower benches?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Constructing. Maintaining. and Using Structures that Aid Plant Growth

TOPIC. Cooling the Greenhouse

OBJECTIVE To learn the different methods of cooling the greenhouse and how to use these methods most effectively

INTRODUCTION The weather in Texas during the summer months is usually very hot This presents a problem to the greenhouse owner A successful producer must have an effective cooling system or he may well lose every plant he owns

REFERENCES Required.

1 "Greenhouse Cooling". Texas Agricultural Experiment Station, MP-163

Supplemental

2 Flower and Plant Production in the Greenhouse, Nelson, pp 44-48

QUESTIONS or ACTIVITIES

1 What is plant respiration?
2 How many CFM should be exhausted for a greenhouse which is 40' wide and 70' long?
3. How many square feet of pad area would be needed in the above greenhouse? (nearest tenth)
4 How can debris and trash be kept out of the drip conductor and return gutter?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining and Using Structures that Aid Plant Growth

TOPIC Heating the Greenhouse

OBJECTIVE. To become aware of the problems involved in heating the greenhouse and how to handle these problems

INTRODUCTION There are two major systems of heating a greenhouse Each system has its advantages All factors involved should be considered before a choice is made

REFERENCES: Required

1 Information Sheet. "Heating the Greenhouse"
2 <u>Flower and Plant Production in the Greenhouse,</u> Nelson. pp 39-44

QUESTIONS or ACTIVITIES.

1. What is the oldest and most conventional type of greenhouse heating system layout?
2. What are the two sources of heat used in this system?
3. Where are the coldest spots in a greenhouse?
4. What are the two classifications of heaters according to the type of heating unit?
5. What are the two classes of heaters based on direction of air flow?

Information Sheet
on
HEATING THE GREENHOUSE

A dependable heating system is second only in importance to the efficient design and structural soundness of a greenhouse Any heating system employed in a greenhouse must be economical, efficient, and of sufficient size to maintain desirable greenhouse temperatures during anticipated extremes in outdoor temperatures.

An important consideration for any greenhouse operation is to operate the heating system at the lowest possible cost consistent with maintaining the temperature desired This requires that the heating system be designed correctly for the purposes intended, that it be operated properly and that careful and intelligent maintenance of the system be provided

GREENHOUSE HEATING DESIGN STANDARDS

The standard practice followed in the past has been to specify the design of a greenhouse heating system on the basis of a requirement to maintain a given temperature within the greenhouse at some given outdoor winter temperature It is comparatively simple to specify such a differential

Today the temperature required for the production of various crops grown in the greenhouse is general knowledge and is usually readily available

Recorded temperatures in historical records in nearly every climatic area are available and will provide considerable information on the outdoor winter temperatures, including both the extreme winter temperatures that have occurred in that particular area, and those that should be considered in regard to the type of design that is economically feasible for the greenhouse heating system

The acceptable standard for the design of a greenhouse heating system should go beyond this basic requirement, however A clarification of the greenhouse temperature requirements of the crop to be grown is very necessary

Greenhouse temperature requirements for the crop should not mean the temperature prevailing in the aisle space

The common practice that now prevails in determining the temperature requirements of the crop is to measure the temperature at the point where the crops are growing. One of the requirements of a well-designed greenhouse heating system should be the provision of a uniform temperature within allowable variations throughout the plant-growing area.

These requirements are rather complex and the average greenhouse operator is usually not well enough versed in heat engineering to make sure he is going to have the type of heating system that meets his requirements In most cases he does not have the skill, nor the time to plan such a system and he should depend upon someone well versed in this field

Heating The Greenhouse
(Information Sheet continued)

The most logical approach to the installation of a modern, up-to-date, economical and dependable greenhouse heating system is to seek the knowledge and experience that is available from a dependable greenhouse manufacturer Heating greenhouses is a specialized field which varies greatly from heating standards used for other type buildings

The National Greenhouse Manufacturers Association, a newly formed organization comprised of most of the major greenhouse manufacturers in the country has recognized this need on the part of the average greenhouse operator, and has been spending considerable time, effort, and funds and utilizing the best knowledge and experience available from it's various member organizations, to establish standards of design that will insure the greenhouse owner of the proper installations to meet his particular requirements

GREENHOUSE HEATING LAYOUTS

Pipe Coil Systems

The most conventional and the oldest type greenhouse heating system layout and the one most commonly accepted by greenhouse growers is the pipe coil system

This system employs the use of standard pipe which carries either steam or hot water The pipes are laid out around the greenhouse in various patterns to distribute the heat

In recent years the use of extended surface pipe has been introduced This pipe is commonly referred to as "finned pipe" This uses the extended surface or fins on the pipe for greater heat transfer from any given length of pipe The pattern of behavior, however, is similar to that of plain pipe coils, which makes the layout patterns fall into the same category

The proper layout of a pipe coil heating system is dependent upon an understanding of the basic laws of natural air movement to insure uniform temperature distribution throughout the greenhouse Any pipe coil system supplies the heat from a concentrated heat source in the immediate area of the pipe. and depends upon convection currents of air moving past the pipe to pick up this heat and convey it to all parts of the greenhouse

The coldest spots in the greenhouse are the gable ends and the exterior side walls, so pipe coils are suspended in these areas The warm air emitted from the pipe coils raises and sweeps along the glass, conteracting the rapid loss of heat through the glass This movement sets up the basic convection pattern of warm-air movement throughout the greenhouse for uniform heat distribution

A finned pipe has the concentrated heat effect of several lines of bare pipe so that any restriction of air movement or reduction of temperature difference is magnified.

Unit Heater Systems

In recent years the use of unit heaters for heating greenhouses has increased considerably. Most of these unit heaters are so designed that they not only take care of the heating requirements but air movement as well

One reason for the increase in popularity of unit heaters has without a doubt been the increasing interest in air movement within greenhouses Many greenhouse operators are of the opinion that the movement of air in the plant zone in the greenhouse (providing that the air moves at a low velocity) has the effect of preventing the building of excess humidity within the foliage that leads to the development of certain conditions. Air movement brings in and replenishes the supply of carbon dioxide At the present time also, there is considerable interest in installations to activate air movement and break up air stratification.

Many types of unit heaters are available Basically they all contain some type of heating device and a fan to force the air across the heating surface and out into the area to be heated.

These heating units are classified as direct-fired or indirect-fired, dependent upon the type of the heating unit Direct-fired units are those which contain a combustion unit right in the unit itself in which fuels such as oil or gas are burned Then this type of unit is used for greenhouse heating, the combustion chamber should be totally enclosed and should be vented to the outside air for the products of combustion

Indirect-fired unit heaters utilize steam or hot water circulated through coils as the heating elements.

Unit heaters are also classified according to the direction of air flow. This flow is designated as vertical blow or horizontal blow

In vertical blow heaters the shaft is vertical and the fan blade is horizontal and the warm air is blown downward. Deflectors suitable for this purpose spread the air out in a horizontal direction in a complete circle. Normally these units are mounted up near the peak of the sidewalls. This of course is against the natural direction of warm air flow, and the distance of flow is limited. Frequently the warm air does not move down along the side walls where it is required When this type of unit heater is installed a line or two of perimeter piping along all walls exposed to the outside should be installed to insure uniform heat distribution.

Heating The Greenhouse
(Information Sheet Continued)

In narrow greenhouses coils located on the side and end walls may be sufficient to provide the uniformity needed In wider houses however, additional piping is required across the house.

Experience over the years has proven that pipe coils suspended overhead provide the uniform temperatures required

The standard practice followed is to suspend the pipe coil overhead, with one line of pipe running lengthwise over each bench The coil should be placed high enough so that the tips of the tallest plant to be grown will not come in direct contact with the pipes. The rule of thumb standard used by most greenhouse operators. is to suspend one third of the number of lines of pipe required overhead and one third of the number along each side. In general this has given a satisfactory uniform heat distribution

An older method of installation, still preferred by many commercial growers, is to distribute the cross house piping by installing the pipe lines under the benches. Such installations keep the soil in the benches warmer, and for this reason may be desirable for those crops which require warm soil for optimum growth.

The amount of heat provided by a pipe coil depends in part upon the temperature difference between the air and the pipe surface and the rate of air movement past the pipe. These basic facts should always be kept well in mind when pipe coils are suspended along greenhouse side walls. The pipe should be suspended far enough away from the wall so that air can move up freely on both sides of the pipe. When side benches are installed in the greenhouse they should be spaced at least six inches from the wall to allow free upward movement of the warm air without "boxing" it in under the bench.

The bottom pipe of a pipe coil should be placed a minimum distance of four to six inches above the ground to permit the free flow of the cooler air in and under the coil. A pipe buried in the ground or covered with soil is practically ineffective as a heating unit.

When pipe coil heating systems are installed it is usually necessary to stack the pipes vertically to obtain the necessary number of coils This installation makes each pipe less effective than it would be if installed separately or alone. This, of course, results in less temperature difference between the air and the pipe surface for transmitting heat. Therefore, when the pipes can be spaced as far apart as possible in the coils this reduction of heating effect can be kept at a minimum.

When finned, or extended surface pipe is installed these rules of spacing, height of pipe from the ground surface, and spacing of side benches from the walls become even more important.

Heating The Greenhouse
(Information Sheet continued)

In horizontal blow heaters the shaft is horizontal and the fan blades are in a vertical position. The air is blown out of the face of the heater in a horizontal direction. When several of these units are used in the same greenhouse they should be mounted so they are suspended overhead near the side walls of the greenhouse. The units on one side should face toward one end and those on the other side should face toward the opposite end This will establish a pattern of air movement around the greenhouse. Adjustable horizontal louvres should be installed on the face of each heater so the direction of air movement can be adjusted upward or downward to prevent direct drafts or air blasts on the plants and to provide proper warm-air distribution.

Temperature control with unit heaters in the greenhouse is normally accomplished by leaving the fans operating continually and turning the heat on and off so that there is a continuous movement of air. Whenever the fans are operated only intermittently when the fans are off the air can become stratified. This will result in conditions detrimental to good plant growth.

Automatic Control Systems

The trend toward the use of automatic controls in greenhouse operations to reduce costs and increase efficiency has led to the wide-spread adoption of automatic controls on greenhouse heating systems.

Automatic systems also perform better than manual controls since they control temperature constantly rather than intermittently.

To perform the job effectively, however; the control system must be properly designed to fit the individual heating system or they may do more harm than good. Therefore, in any installation the location of automatic valves and thermostats should be left to the discretion of a greenhouse engineer who has the competence to adjust the controls to the system being employed.

HEATING ACCESSORIES

The accessories installed are important features in properly operating and maintaining an efficient heating system.

Pipe hangers should be installed so that the proper grade can be maintained in the pipes to prevent pockets or sags that reduce the flow of steam or hot water.

Traps of the proper size and located in the correct place are essential to the efficient operation of a steam heating system.

Heating The Greenhouse
(Information Sheet continued)

Air vents must be strategically located in the system to prevent air locks.

The more extensive the heating system the more the list of accessories could be extended. When automatic controls are used the importance of proper accessories and their location increases

EFFICIENCY AND MAINTENANCE

Unless a sound, sensible and almost constant program of proper maintenance is installed as soon as a greenhouse is put into operation, all of the time and money invested in the design and the installation of an efficient greenhouse heating system may be lost Maintenance of heating systems is an item of greenhouse operation that is most often neglected. Traps must be kept in working order, pipe hangers kept tight to prevent pipe sagging and air vents must be kept cleaned out or operating costs will increase and the heating system will become very inefficient. A sound maintenance program should be instituted in the overall greenhouse operation program and should be adhered to in a very consistent manner.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Winter Proctection Structures

OBJECTIVE: To learn the various techniques involved in protecting plants from winter damage.

INTRODUCTION: A hard freeze can ruin a whole year's work. Plants that have been cared for and protected all year can be killed in just a short period of time by the freezing winds of winter.

REFERENCES: Required.
<u>Basic Gardening Illustrated</u>, pp. 72-73

QUESTIONS or ACTIVITIES:

1. What should you notice during the first couple of light frosts?
2. Why should soil be kept damp during a frost?
3. How do notcaps work?
4. How do you arrange outdoor heaters in a small orchard?
5. What are four telltale signs of a coming frost?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Constructing. Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Structures for Summer Heat Protection

OBJECTIVE. To learn how to protect plants from damage by summer heat.

INTRODUCTION. The subject of shade for plants is often neglected by beginning horticulturists. Many people who are said to have a "green thumb" are excellent plant producers because they properly care for their plants during the summer months.

REFERENCE. Required.
<u>Basic Gardening Illustrated,</u> pp 70-71

QUESTIONS or ACTIVITIES

1 What are the 3 main functions of shades?
2. Which direction should a permanent shade structure face in hot summer areas?
3. What are 2 good materials that can be stretched over lath frames to lean against walls to protect seedlings in flats?
4 What direction should the laths run on a sunscreen?
5 How can you stiffen the frame when making a lath screen?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Constructing, Maintaining, and Using Structures That Aid Plant Growth

TOPIC. Humidity and Watering

OBJECTIVE To become familiar with the effect of humidity on the development of plants and to learn how to determine water requirements

INTRODUCTION. Humidity, moisture found in the air, and the amount of soil water can greatly affect the growth of plants Overwatered plants will be stunted, yellow in color, and defective in root development The amount of humidity can reduce the food production process of the plant or cause excessive wilting

QUESTIONS or ACTIVITIES

1 What does U L indicate?
2. What should be the maximum number of outlets per circuit on general lighting circuits?
3 Which tables in the required reference would you use to determine the proper wire size? (Indicate your answer by listing the table numbers.)
4 How many two-horsepower motors should be put on one circuit?
5 What are the basic requirements of any well-planned wiring system?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growing Media

TOPIC: Origin, Composition, and Importance of the Soil

OBJECTIVE: To develop an understanding of how soil is formed, what it is made up of, and its importance to horticultural plants

INTRODUCTION: From ancient times man has strived to understand more about soil. No doubt the reason for this is that man's very existence depends upon the soil. Look around you. Probably you will see that not many items in your room came from anywhere other than the soil. Even this sheet of paper you are now reading is a product of the forestry industry which depends on soil for tree growth.

Once we take time to learn how soil is formed, what it is made up of, and how it affects plants, we can do a better job of making it work for us.

REFERENCES: Required:

QUESTIONS or ACTIVITIES:

1. Name the three layers of soil
2. What causes these three horizons to develop?
3. Which of the three layers is usually darker in color?
4. When does young soil begin to collect its plant nutrients?
5. What factors are responsible for the difference in soil colors?
6. What three components does a good soil provide to plants?
7. What are the three types of soil in regard to particle size?
8. Which is the largest of the three soil particles?
9. What governs the rate of soil development?
10. What is organic matter?

Information Sheet
on
ORIGIN COMPOSITION AND IMPORTANCE OF SOIL

The climate, especially rainfall and temperature indirectly controls the rate of soil development The climate acts slowly taking thousands of years for the soil to reach a stage of balance with its environment

A soil that has reached this degree of development usually has three distinct layers of horizons. As you dig downward in soil you can notice differences in color structure and texture of the soil This is especially noticeable along road cuts

The topsoil is the first layer It is usually richer and is of greater importance to plant growth This layer contains most of the organic matter and is usually darker in color

Next, we come to the subsoil This layer does not contain as many nutrients as topsoil, but it is still important because of root development

The third layer is the parent material and is generally less important to plant growth It usually is below the area of heavy root growth and is seldom tilled.

These three layers are developed from weathering or wearing down of rocks. Wind water, and ice break and crush the rocks Eventually a small plant begins to grow in this young soil. When the plant dies, it decays and gives the soil its first nutrients,

Other plants begin to grow and finally a rich soil is developed Once the soil becomes productive, it provides three important components to a plant These are fertilizer elements air for the roots, and an adequate water supply

You have noticed probably that there are several different soil colors These are caused by different amounts of air being present as the soil is formed, the amount of organic matter, (decayed plant or animal matter), and the types of rocks from which the soil is formed.

You may have also noticed the different textures in soil This is caused by the size of the soil particles Sand is the largest and therefore, is course to the touch Silt and clay are the other two with clay being the smallest. It feels like flour when rubbed between the fingers.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Soil Moisture

OBJECTIVE To understand the importance of moisture to plants and how this moisture becomes available from the soil

INTRODUCTION Soil moisture can be a limiting factor in plant growth No matter how many minerals the soil contains, it will not be productive unless it holds an adequate supply of water for optimum (best) plant development It should be kept in mind that too much moisture can be as harmful as too little By learning more about soil moisture, one can use his knowledge to change the environment of plants in small areas such as in the horticulture industry

REFERENCES Required

1 Information Sheet, "Soil Moisture"

Supplemental

2 Soil Yearbook of Agriculture, 1957, USDA, pp 49-60

QUESTIONS or ACTIVITIES

1 What part of the plant takes in water from the soil?
2 The process by which water leaves the plant in the form of vapor is called what?
3 What material helps soil hold water?
4 When is water holding capacity of vital importance?
5 What affects the speed at which capillary water can move through the soil?
6 Why does it harm soil to work it when it is wet?
7 What can be added to soil to make it hold more water?
8 Why will overwatering a plant kill the root system?
9 What happens to rainfall which falls to the earth's surface?

Information Sheet
on
SOIL MOISTURE

The moisture in the soil represents an important part of the plant environment It is common knowledge that many plants tend to wilt when lacking in water. If water is not supplied to the plants soon after the wilting point is reached, they often die. Water is used by the plant in many ways The needed water is taken from the soil by the roots If plants are to remain healthy and grow well, water must be made constantly available to the plants The type of soil in which the plants grow has a definite influence upon the frequency of watering

Soil water is very important

1 Large amounts of water lost by plants in transpiration must be replaced. (Transpiration - loss of water in the form of vapor)
2 Water acts as a solvent for dissolved minerals
3 Water affects soil aeration (Movement of air through the soil.)
4. Water affects soil temperature

What happens to rain which falls to the earth's surface?

1 Runs off
2 Soaks in
3 Evaporates

Water absorption is very important to the growth of plants

Rain water is absorbed and rapidly passes downward through a porous soil. When the upper surface of the subsoil has a slope, much of the water flowing over its surface seeps out of the hillsides in springs and quickly contributes to stream flow.

Why do different soils have different capacities to hold or "soak up" water? When organic matter is used up. soil packs together Thus a cloddy soil has fewer air spaces, its particles do not cling together in granules, and the lack of organic matter means that it weighs more than an equal volume of crumbly soil from a well-managed plot

A crumbly soil can take in water faster than a cloddy one, and it can hold more water The thoroughly decomposed soil organic matter (humus) in a crumbly soil, can hold lots of water Organic matter acts as a sponge in holding water In addition, to the water held by the organic matter itself, is the water held in the pores between the soil particles and between the soil granules Hundreds of very fine soil particles are glued together by the organic matter to form granules or crumbs

The increased water-holding capacity of soils high in organic matter under natural conditions makes a big difference in the intake of water This is extremely important during droughty seasons

Soil Moisture
(Information Sheet continued)

Moisture moves through the soil in all directions even against gravity by capillary movement This movement is caused by the attraction water molecules have for each other as well as the attraction between water molecules and soil particles Water molecules cling together and form droplets in the air or on a greasy surface where there is nothing to interfere But when a drop of water falls on soil particles, it spreads out as a thin film over the soil particles, because the attraction between the soil particles and the water molecules themselves Water that moves through the soil in this way is known as capillary water

How far and how fast capillary water will move in a soil depends on the size of the soil particles and the condition of the soil If the spaces around the soil particles are large. the attraction between the water molecules and the soil particles will not be enough to overcome the weight of the water and it will not rise too much The movement that does take place however. will be rapid because there is little friction This is true in sandy soils

In fine-textured soils, the particles are closer together and the attraction between soil and water is greater Water may be expected to rise more slowly, but higher in soils of fine texture

Under field conditions, moisture moves from wetter soil to drier soil The difference is not always great, therefore, capillary water moves slowly and not far Even so, even moisture moves a short distance to the roots of growing plants to make it an important plant-soil relationship

Much soil moisture can be lost when capillary water moves to the surface and evaporates

All living cells carry on respiration Roots are made of living cells In order for respiration to occur, oxygen must be present Oxygen is normally formed in the air occupying the pore space of soils having good aeration As water fills the pore space of these soils, however, the air is forced out (no two things can occupy the same space at the same time) and consequently. the supply of oxygen in the soil is lost This means that root cells die and the root system decays away

Some principles of understanding of soil-water relationships for the horticulture service worker:

1 Many soils cannot be worked when wet except at the expense of desirable soil structure. This is more true for heavy clay-like soils, and is less important for sandy soils Structure is the arrangement of the soil particles
2 Plants can be easily overwatered or underwatered Sandy soils require more frequent waterings than heavy clay soils especially during periods of prolonged sunny days.
3 If soils do not have desirable moisture-holding capacities. they should be modified to make them more desirable

Soil Moisture
(Information Sheet continued)

4 It is more critical to overwater plants growing in heavy soils during periods of prolonged cloudy weather than it is to overwater plants growing in light soils, during this type of weather condition Soil type and the amount of sunlight affect plant-watering practices

5 Loose, porous soils having a good structure soak up and hold more water than hard, compact soils. This has an important influence on plant-watering practices

6 Overwatering causes decreased aeration and subsequent root decay and death of the plant

7 Underwatering causes wilting, dehydration, and subsequent death of the plant.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Growing Media

TOPIC. Soil Mixtures

OBJECTIVE To learn some of the most widely used soil mixtures and to become familiar with the methods used to produce soil mixes for growing horticultural plants.

INTRODUCTION. Not all plants grow best in the same type of soil mixture. Water-holding capacity, aeration, and drainage of the soil often determines a plant's value. By studying the different types of soil and how to increase their productivity, we can grow healthier and more profitable plants

REFERENCES: Required.

1 Information Sheet, "Soil Mixtures"

Supplemental.

2 Plant Propagation. Hartman & Kester, Prentice Hall, N.J., 1959, pp 26-30

QUESTIONS or ACTIVITIES.

1 What are the advantages of mixing organic matter and other soil "lightening" materials with loam soils?
2 Name the characteristics of an ideal soil mix.
3 Why is soil screened before mixing?
4 What equipment is required for large scale mixing operations?
5 What would be a good mixture for general container-grown nursery stock?

Information Sheet
on
SOIL MIXTURES

The Significance of Soil Mixtures

1 Loam soils by themselves are generally unsatisfactory for growing plants for various reasons
  - a Often "heavy"
  - b Often poorly aerated
  - c Often tend to become sticky after watering
  - d Often have a low moisture-holding capacity
  - e Often tend to shrink upon drying

2. Advantages of incorporating organic matter and soil "lightening" materials with loam soils include
  - a Better aeration
  - b Greater ease of working
  - c. Better drainage
  - d Better moisture-holding capacity

Some Typical Soil Mixtures

1 For potting rooted cuttings and young seedlings:
  1 or 2 parts sand
  1 part loam soil
  1 part peat moss (or leaf mold)

2. For general container grown nursery stocks:
  1 part sand
  2 parts loam soil
  1 part peat moss or leaf mold
  1/2 part dried or well-rotted manure

3 For plants which do best under acid soil conditions:
  2 parts sand
  2 parts loam soil
  2 parts peat moss
  1 part leaf mold
  1/2 dried or well-rotted manure

4 The University of California (U C) mix
  50% sand
  50% peat moss
  Fertilizer additives (a or b)
  - a If the mix is to be stored for an indefinite period before using. This furnishes a moderate supply of available nitrogen, but the plants will soon require supplemental feeding To each cubic yard of the mix add:

4 oz	potassium nitrate	2-1/2 lb.	single superphosphate
4 oz	potassium sulfate	7-1/2 lb	dolomite lime
2-1/4 lb	calcium carbonate lime		

Soil Mixtures
(Information Sheet continued)

b if the mix is to be planted within one week of preparation, This furnishes available nitrogen as well as moderate nitrogen reserve. For each cubic yard of the mix add

2-1/2 lb	horn and hoof or blood meal (13% nitrogen)
4 oz	potassium nitrate
4 oz	potassium sulfate
2-1/2 lb	single superphosphate
7-1/2 lb	dolomite lime
2-1/2 lb	calcium carbonate lime

5 In making the U C mix for,
  a Bedding plants and nursery container-grown stocks use --75% sand, --25% peat moss
  b Potted plants use --50% sand, --50% peat moss
  This mixture, including the fertilizer, can be safely sterilized by steam or chemicals without resulting in the subsequent harmful effects to the plants that often occurs when other soil mixes are sterilized.

The Ideal Soil Mix has These Characteristics.

a Uniformity
b. Freedom from disease
c. Low soluble salts
d. Good drainage
e. Good moisture retention
f. No shrinkage
g. Ease of preparation and storage
h Complete availability

Equipment Used in preparing Soil Mixtures Includes.

1 Soil screen (may be a powered rotary screen)
2. Soil shredder (either gas or electric powered)
3 Wheel barrow
4 Scoop shovel
5 Cement mixer
6. Water hose

Steps in Preparing Soil Mixture:

1 Screen the soil to make it uniform and to eliminate large particles.
2 Slightly moisten extremely dry materials (especially peat)
3 Mix smaller quantities by putting the ingredients in a pile in layers, and turn the pile with a shovel until uniformity of the mixture is attained.
4 For large scale mixing operations, use a power driven cement mixer or shredder.
5 Prepare the mixture at least one day in advance of use so that the moisture will tend to become equalized throughout the mixture. The soil mixture should be slightly moist at the time of use so that it forms a ball when squeezed in the hand at the time of use.

HORTICULTURAL OCCUPATIONS

UNIT. Plant Growing Media

TOPIC Mulches and Their Use

OBJECTIVE To learn more about the kinds of mulches and how they are used. Also, to learn some common mulches and how to apply them.

INTRODUCTION. There are many places in the landscape where mulches can and should be used Rose and flower beds, trees and shrubbery, and newly seeded lawn areas are good examples of where mulches are needed

REFERENCES Required.

1 Information Sheet, "Mulches"

Supplemental

2 Soil, 1957 Yearbook of Agriculture, U.S.D.A., pp. 151-156

QUESTIONS or ACTIVITIES

1 What are two basic kinds of mulches?
2 What is the disadvantage of asphalt paper mulch?
3 What fertilizer should be added to corncob mulch?
4 When should mulches be applied to established garden plants?
5. What is the most common mulch?
6 What can be used as a mulch in areas where organic material is scarce?
7 List the effects of mulches in the soil mix.
8. What is a mulch?
9 What is the disadvantage of straw mulch?

Information Sheet
on
MULCHES AND THEIR USE

The landscape or greenhouse worker needs to know how to use mulching materials. What kinds of materials are used as mulches? Which kinds of materials make the best mulches? What are mulches used for? How deep should mulches be applied? When should mulches be applied? A mulch is any material applied to the surface of a soil primarily to conserve moisture, maintain a uniform temperature, and to help control weeds

Effects of mulches in soil mix

Dilutes the soil and usually increases root growth
Promotes soil granulation
Improves and stabilizes structure (surface mulch)
Affects soil pH slightly
Adds some fertilizer materials
Leads to nitrogen deficiency in cases where carbonaceous materials are added
Serves as food to micro-organisms
Introduces weed seeds in the soil in some cases

Two basic kinds of mulches.

Inorganic or processed
Organic

Inorganic or processed mulch material

1 Aluminum Foil - Used to some extent in vegetable planting Research work shows that growth of plants is increased markedly
2. Asphalt - A light spray is used commonly by landscape contractors to hold soil in place on steep banks.
3 Asphalt Paper - May be used but hard to keep in place Can become unsightly.
4 Crushed Stone - Gravel Chips - Pebbles - This is a common mulch in areas where organic mulch is scarce Good in plantings for effect. May be colored to blend in with the features or the home, patio or landscape.

Black Polyethylene - Becoming a popular mulch especially in areas which are not part of the foundation planting This mulch is used in commercial vegetable plantings

Organic Mulch Material

1 Crushed Corncobs - Excellent mulch material May be colored for use in landscape plantings Usually quite inexpensive Additional nitrogen should be applied.
2 Corncobs (whole) - Used to limited extent in farm gardens where the material is available Can be used in utility gardens where appearance is not the main objective
3 Lawn Clippings - This material is used to a limited extent. It should be applied loosely because it mats Heat must be produced during decomposition
4 Leafmold - Obtained from compositing fallen leaves in the fall of the year This partially decomposes by the spring. Good mulch but hard to apply evenly and is not particularly neat looking

Mulches and Their Use
(Information Sheet continued)

5 Leaves - Used rather extensively in areas with many trees The most inexpensive material available.
6 Peanut Hulls - Can be obtained in some garden centers or in areas where peanuts are processed This is an excellent mulch and usually quite attractive.
7 Peat Moss - This is probably the most common mulch. It is quite rich looking when used correctly. The cost of this material is usually prohibited when large areas are mulched.
8. Sawdust - Very commonly used in areas where readily available. Nitrogen deficiency is almost certain if fertilizer is not applied regularly. Reports of toxic materials have not been substantiated by experiment stations.
9. Shredded Bark - In recent years, this material has become a popular item in garden stores. The material makes an excellent mulch and is very attractive in landscape plantings. Shredded bark lasts as long or somewhat longer than peat moss and adds valuable organic matter to the soil
10 Straw - Used for winter protection and as a summer mulch. This material is highly inflammable so should not be used where a cigarette could be carelessly flipped into the material
11. Wood Chips or Wood Shavings - In recent years this material has become available in large quantities. Wood chips decompose slowly and may be the cause of nitrogen deficiency if additional fertilizer is not applied

When to Apply Mulch

The time to apply mulch to the garden on established plants is in mid-spring when the soil has warmed up sufficiently for active root growth If it is applied before this time, the mulch will keep the ground too cool and root growth may be slow. If you are applying mulch to newly planted material, do so after the plants are put into place and watered in well. If you are planting material in the late summer or early fall, apply the mulch immediately after watering so that the soil temperature will be kept warmer in the cool nights of autumn. It is important that there is sufficient root growth in fall planted stock so that the material does not heave due to freezing and thawing during the winter months

How Deep to Apply Mulch

For best results, the mulch should be at least 2-3" deep over the whole area during spring, summer, and early fall. Tender plants which need winter protection may require an additional 1-2" during the winter months around the crown or base of the plant. In the spring this additional material should be fanned out away from the stems or crowns of the plants before additional material is added for summer mulching.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Growing Media

TOPIC: Fertilizer Nutrients

OBJECTIVE. To learn about the fertilizer requirements of plants, the function of different minerals, and how to apply these minerals

INTRODUCTION Many of the materials used for mulching require an addition of fertilizer to reduce the chance of nitrogen deficiency or starvation of the growing plant material. Whodchips, sawdust, crushed corncobs and shredded bark need additions of nitrogenous fertilizers. A report from the U S D A suggests that 1/2-1lb. of ammonium nitrate or ammonium sulfate be added to each bushel of mulch material added to the plants. Remember, without the proper amounts of fertilizer, a lot of hard work can go to waste Plants can not thrive with an improper balance of nutrients

REFERENCES Required.

2 *Soils and How to Improve Them.* Texas Agricultural Extension Service Bulletin B-189

QUESTIONS or ACTIVITIES.

1 What are the three primary elements?
2 What primary element gives the dark green color to plants?
3 What primary element is missing when leaves become mottled, spotted, streaked, and curled?
4. What are three sure ways of mis-using fertilizer?
5 When is the best time to fertilize a lawn?
6 What are the three nutrients obtained mostly from air and water?
7 What are the two lime elements?

Information Sheet
on
FERTILIZER NUTRIENTS

NUTRIENTS USED BY PLANTS

Large Amounts Needed		Rather Small Amounts Needed	
Nutrients Obtained Mostly From Air & Water	Nutrients Obtained From Soil	Nutrients Obtained From Soil	
Carbon Hydrogen Oxygen	Nitrogen Phosphorus Potassium Calcium Magnesium Sulfur Hydrogen Oxygen	Iron Manganese Boron Copper	Zinc Chlorine Molybdenum

SOME CONVENIENT NUTRIENT GROUPINGS

Grouping	Nutrients
Primary Elements	Nitrogen Phosphorus Potassium (Potash)
Secondary Elements	Calcium Magnesium Sulfur
Fertilizer Elements	Nitrogen Phosphorus Potassium (Potash)
Lime Elements	Calcium Magnesium
Trace Elements or Micro-nutrients	Iron Copper Zinc Boron Chlorine

Fertilizer Nutrients
(Information Sheet continued)

HOW PLANT NUTRIENTS AFFECT PLANTS

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Nitrogen (N)	NH_4^+	Gives dark green color to plants	A sickly yellowish green color
	NO_2^-	Induces rapid growth Improves quality of leaf crops	A distinctly slow and dwarfed growth
	NO_3^-	Increases protein content of food and feed crops A constituent of all proteins (Note an over abundance of nitrogen leads to rank vegetative growth and tends to retard the date of plant maturity)	Drying up or firing of leaves which starts at the bottom of the plants and proceed upward. The firing starts at top of the bottom leaves and proceed down the center along the mid-rib
Phosphorus (P)	PO_4^- HPO_4^- $H_2PO_4^-$	Stimulates easy root formation and growth Gives a rapid and vigorous start to plants Hastens maturity Stimulates blooming and aids in seed formation Essential to the transformation of insoluble carbohydrates to soluble carbohydrates a constituent of all proteins	Purplish leaves, stems, and branches. Slow growth and maturity
Potassium (K)	K^+	Imparts increased vigor and disease resistance to plants. Increases plumpness of grain and seed Essential to the formation and transfer of starches, sugars, and oils Imparts winter hardiness	Mottling, spotting, streaking or curling of leaves. Leaves are scorched or burned on the margins and tips. Firing starts at tip of leaf and proceeds down

Fertilizer Nutrients
(Information Sheet continued)

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Calcium(Ca)	Ca++	Promotes early root formation and growth Improves general plant vigor Influences the intake of other plant nutrients.	Young leaves in terminal bud become hooked in appearance and then die at the tips and along the margins Leaves have a wrinkled appearance In cases the young leaves remain folded There is a light green band along the margin of the leaves. Roots are short and much branched
Magnesium(Mg)	Mg++	A component of the chlorophyll molecule Essential to the formation of fats, aids in the transport of phosphorous from older or younger parts of the plant Essential to fruit production Influences uptake of other plant nutrients Plays a role in the translocation of starch	A general loss of green color which starts in the bottom leaves and later moves up the stalk The veins of the leaf remain green The plant stem is slender and weak with long branched roots Leaves are mottled or chlorotic with dead spots The leaf tips are turned or cupped upwards
Sulfur(S)	$SO_4^=$ $SO_3^=$	Essential to the formation of proteins Essential to all divisions and fruit development Promotes root growth Stimulates seed production Encourages more vigorous plant growth	The young plant leaves are light green in color and have even lighter veins The stalks are short and slender Plant growth is slow and stunted. Fruit is immature and light green in color

Propagation From Cuttings
(Information Sheet continued)

.....

Material for this information sheet was partially taken from.

1 State Department of Education. Agricultural Education Service, Montgomery. Alabama. Ornamental Horticulture for Vocational Agriculture in Alabama.

2. The Center for Research and Leadership Development in Vocational And Technical Education The Ohio State University "Propagating Horticultural Plants"

Fertilizer Nutrients
(Information Sheet continued)

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Manganese (Mn)	Mn^{++}	This element functions in enzyme systems which are necessary for important reactions in plant metabolism The element is also essential for certain nitrogen transformations in plants	Spots of dead tissue are scattered over the leaf. The smallest veins tend to remain green producing a checkered effect
Molybdenum (Mo)	Mo_4	Acts as an electron carrier in enzyme systems which bring about oxidation reduction reactions in plants Oxidation reduction reactions are essential to plant development and reproduction and do not take place in the absence of micro-nutrients The element is also essential to certain nitrogen transformations in plants	

If plant nutrient elements are to be available to plants, three basic conditions must be met.

1 The nutrient must be in a chemical form that the plant root can absorb.
2 The nutrient must be in a position where it can be absorbed by the plant root
3 The nutruent must occur in the soil in proper proportions

Soil fertility then, does not depend only upon the supply of nutrients in the soil, but upon the form in which the nutrients are found

Some fertilizers harm seeds and foliage if the material is placed in direct contact with them Inorganic fertilizers harm plant foliage more than organic fertilizers. Often organic fertilizers are called non-burning fertilizers

Fertilizer Nutrients
(Information Sheet continued)

If you are to avoid harming seeds and foliage with fertilizers:

DO NOT

1. Apply dry fertilizers (particularly inorganic fertilizers when the foliage is wet).
2. Plant seeds directly on a band or layer of fertilizer.
3. Spill the container of fertilizer contents and fail to remove the material from the foliage by scattering or leaching. (Many times lawn spreaders are filled on the lawn and spillage is not properly cared for. It is best to fill the spreader on the sidewalk.)

DO

1. Fertilize just before a rain. (Lawns for example)
2. Place the fertilizer below and to the side of the seed.
3. Mix fertilizer materials thoroughly in the soil before planting.

Fertilizers can be applied to the soils of the greenhouse or the landscape as:

1. Liquid fertilizers
   a. Hozon proportioners or fertilizer injectors (foliar or base application)
   b. Applied in water solution with a sprinkling can (foliar application)
   c. Applied as a water solution around the base of the plant
2. Dry fertilizers
   a. Broadcast over the soil surface by means of a spreader.
   b. Broadcast over the soil surface by hand (for small quantities). This is not the most accurate method for applying fertilizers. however.
   c. Deep drilling
   d. Side dressing
   e. Banding along the row

HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC. Soil Organisms

OBJECTIVE To learn some of the major soil organisms, their importance, and their effect on soils

INTRODUCTION Soils are composed of broken and weathered rocks, organic matter, water, and air This material serves as a home for many kinds of plant and animal life These plants and animals are both large and small in size. Some of these plants and animals are even so small that a microscope must be used to see them. Even though these organisms are small, they play a vital role in the health of our plants.

REFERENCES Required

1. Information Sheet, "Soil Organisms"

Supplemental

2. Soil, 1957 Yearbook of Agriculture, U S D A

QUESTIONS or ACTIVITIES

1 Name three small forms of plant life that are found in the soil.
2 How much of the soil consists of organisms?
3 What damage to plants can a nematode cause?
4 What harm to a plant may fungus cause?
5 In what way do bacteria help supply the plant with fertilizer nutrients?

Information Sheet
on
SOIL ORGANISMS

Small plant life in the soil may be bacteria, fungi, or algae. The small animals in the soil include one-celled animals, and tiny, round worms called nematodes. The larger animals in the soil include worms, ants, snails, spiders, and insects. Some of these animals, especially the earthworms, help to make the soil better by burrowing through the soil, mixing it and making it possible for water and air to move easily through the soil. Also, some of the organisms in the soil are able to take nitrogen from the air and change it into a form that plant roots can absorb. Other organisms in the soil are not so helpful and actually do harm to plants by eating parts of the plant and causing various plant diseases.

Soil organisms make up about 1/1000 of the weight of an acre foot of soil. The living things in the soil use soil minerals for living activities. The minerals available to the plant then, are those that remain after the soil organisms have consumed a certain quantity for their life processes.

THE SIGNIFICANCE OF SOIL ORGANISMS

Organism	Major Activity	Beneficial to Plant Growth	Harmful to Plant Growth
Earthworm	Mixes soil. Increases the availability of plant nutrients. Especially nitrogen; Increases aeration. Promotes drainage	X	
Nematode	Penetrates plant tissue, especially roots and causes extensive damage		X Only about 50 of the thousands of nematodes known are harmful to plants.
Algae	Aid bacteria and fungi in the decomposition of plant tissue, in making nutrients available to plants, and in the synthesis of humus	X	

Soil Organisms
(Information Sheet continued)

Organism	Major Activity	Beneficial to Plant Growth	Harmful to Plant Growth
Fungi	Decompose organic residues. Promotes the formation of humus. Causes many plant diseases	X	X
Actinomycetes	Decompose organic matter releasing plant nutrients, especially nitrogen. Causes plant disease	X	X
Bacteria	Decomposes organic matter releasing plant nutrients; convert nitrogen from the air into a form available to plants (only certain bacteria are able to do this). Cause many plant diseases	X	X

The soil organisms which are beneficial to plant growth can be encouraged by adding organic matter, lime, and moisture to the soil

The soil organisms harmful to plants need to be controlled. It has been estimated that the yearly loss in farm crops in the United States is five billion dollars. The cost of pesticides and required application of these expenditures is used to control harmful soil organisms.

Basically, there are three ways to control soil organisms which are harmful to seeds and plants:

1. Soil sterilization with steam
2. Soil fumigation or drenching with chemicals
3. Seed treatment

• • • • •

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC: Soil Sterilization

OBJECTIVE To learn the advantages and disadvantages of steam sterilization (pasteurizing) and chemical treatment

INTRODUCTION. The soil organisms harmful to plants need to be controlled. It has been estimated that the yearly loss in farm crops in the United States is five billion dollars The cost of pesticides and required application equipment amounts to almost $350 million a year A considerable amount of these expenditures are used to control harmful soil organisms

REFERENCES. Required.

1 Information Sheet, "Soil Sterilization"

Supplemental:

2 Soil, 1957 Yearbook of Agriculture, U S D. A. . pp. 157-164

QUESTIONS or ACTIVITIES.

1 Why are soils treated?
2 What are four sources of steam
3 Why will soil that is too dry heat up slowly?
4 What is used to measure the soil temperature?
5 How can ammonia build-up in the soil affect plants?
6 What are the seven factors to consider when fumigating soil?
7 What are the three precautions to observe in using soil fumigants?
8 What is the cheapest method of sterilizing soil?

Information Sheet
on
SOIL STERILIZATION

This control measure is highly effective and is widely used in the greenhouse for controlling the various soil-borne pests. Steam sterilization is also used to some extent in outdoor areas and for steaming bulk soils prior to use in growing plants.

Why are soils steamed?

1. To kill soil-borne insects
2. To kill all of the bacteria, fungi, and virus organisms that are harmful to commercial crops
3. To destroy weeds
4. To promote soil granulation

Sources of steam.

1. Existing steam boilers
2. Portable oil-fired steam boilers
3. Package steamers
4. Bricked in permanent-type boilers

Preparing the soil for steaming.

1. Add humus or organic matter.
2. Water the soil lightly Soil that is too dry will heat up slowly because of poor heat conduction and distribution Soil that is too wet will also heat up slowly because it requires considerable heat to heat a large quantity of water.
3. Keep the soil moist a week prior to steaming so as to encourage weed-seed germination This will make the weeds easier to kill
4. Rototill or otherwise loosen the soil Be sure all soil is loosened and that all lumps are broken up
5. If soil in raised benches is being sterilized, unroll the canvas steaming hose down the length of the bench (Ground beds may have buried tile for steaming purposes.)
6. Cover the bench with a suitable cover. The cover may be draped over the bench, weighted down with pipe or held in place with "C" clamps.

The soil should be steamed at 180°F for thirty minutes.

Soil Sterilization
(Information Sheet continued)

KILLING TIME FOR VARIOUS SOIL ORGANISMS WHEN USING STEAM STERILIZATION

Organism	Time to Kill	Temperature
Nematodes	Instantly	140°F
Soil Insects	Instantly	140°F
Soil Fungi	10 minutes	140° - 160°F
Soil Bacteria	10 minutes	140° - 160°F.
Weed Seeds	10 minutes	140° - 160°F
Soil Virus	30 minutes	180°F

The soil temperature during steaming is registered on a soil thermometer.

After steaming. it is often found that there are other problems which could develop.

1 Nitrifying and other beneficial soil organisms are killed
2 Ammonia build-up in the soil which may cause root burn

Solving after-steaming problems

1 Use high quality, long lasting kinds of peat such as German or Canadian sphagnum, peats or other forms of organic matter that break down slowly
2 Avoid sterilizing in hot water
3 Don't feed the previous crop after it shows color, and leach it during the last waterings.
4 Keep soils cultivated during critical periods to encourage air to enter the lower soil.
5 Keep soils medium dry when steaming· sterilizing wet soils encourages the build-up of ammonia
6. Adding 4 lbs of gypsum or 40% superphosphate per 100 sq. ft. of soil immediately after steaming seems to help tie up free ammonia
7 Leach heavily after steaming

Soil Fumigation

Conditions under which chemicals are most extensively used for soil pasteurization.

1. Situations in which overhead costs are so low that the time required for aeration is not expensive
2. Situations where weeds and soil-borne insects are the main reasons for sterilizing.
3. Situations in which steam boilers are not available for sterilizing.

Chemical fumigants effective against fungi, bacteria, and nematodes are:

1. Chloropicrin (Tear Gas)
2. Methyl bromide
3. Mylone
4. Vapam or VPM
5. Vorlex
6. Trizone
7. Formaldehyde

Chemical fumigants effective against nematodes are:

1. Dichloropropene-dichloropropane mixtures
2. Ethylene di-bromide

Other fumigants include

1. Bedrench
2. Zinophos
3. Trapex
4. Nemes
5. Brozone

Factors to consider in fumigating soil.

1. Soil temperature
2. Soil moisture
3. Organic matter content
4. Soil Texture
5. Seals needed
6. Soil type
7. Depth of application

Forms in which chemical fumigants are applied.

1. Tractor-mounted equipment which lays a plastic film and injects the fumigant under the plastic cover.
2. Liquid water-miscible materials which are metered into sprinkler irrigation systems.
3. Granules, liquids, and powders which can be worked into the soil from equipment mounted in front of a rototiller
4. Tractor-mounted chisel-tooth injection shands can be used.
5. Materials in pressure cylinders can be released under plastic covers.
6. Hand-operated needle point injection guns can be used.

No plants should be planted into a fumigant-treated soil for a period of two to three weeks.

Precautions to be observed in using soil fumigants

1. Avoid inhaling the material
2. Avoid contact of the fumigant with the skin.
3. Allow sufficient time for aeration after the material is applied.

Soil Sterilization
(Information Sheet continued)

ADVANTAGES AND DISADVANTAGES OF STEAM AND CHEMICAL SOIL STERILIZATION

Treatment	Advantages	Disadvantages
Steaming	A very effective job Cost of treatment is less per acre than for chemicals ($350 - 500 per acre)	High initial cost Edges of benches and growing areas may not receive steam. After steaming, problems frequently occur
Fumigation	Useful when a source of steam is not available Gives good control of insects, weeds, and nematodes	Cost of treatment per acre is high. Not very effective against hard-to-kill organisms. A great deal of time is required for aeration after treatment.

HORTICULTURAL OCCUPATIONS

UNIT. Plant Growing Media

TOPIC: Plant Growing Media Other Than Soil

OBJECTIVE To become familiar with growing media other than soil, to study their merits, and to learn how to use these media in growing horticultural plants.

INTRODUCTION. Every plant grower has his own opinion on which plant growing media is best. There are several very good additives and experience is the best method of selection.

REFERENCES Required

1 Information Sheet, "Plant Growing Media Other Than Soil"
2 "Horticulture Perlite for Texas Gardens", Bulletin TAP 256, Texas A&M Extension Service

QUESTIONS or ACTIVITIES:

1 What is the most widely used media for reproduction of plants?
2 What type of peat is most widely used in the United States?
3 How much water will sphagnum moss absorb?
4 What happens to vermiculite when heated?
5 What leaves, when in a molded state, make the best growing media?
6 What three media are probably the most readily available for use by the horticulturist in the South?
7 Why have many people witnessed failures in plant growth in a medium of sawdust?
8. What are the advantages of perlite?

Information Sheet
on
PLANT GROWING MEDIA OTHER THAN SOIL

Many different growing media may be used for rooting cuttings taken from desired plants. These may be used alone or in mixtures with soil

SAND

Sand is probably one of the most widely used growing media in the reproduction of plants. It consists of small grain or rocks ground into a fine texture by weathering. This sand must be of a good quality and must not contain silt. The recommended sand for use in rooting cuttings is of the quartz type and should be washed It can be the same quality sand used in masonry.

PEAT

Peat, commonly referred to as peat moss, is a material that has resulted from the decaying of the remains of thick vegetation in wet, marsh, swamp areas. It has been preserved over the years by being under water in a partially decomposed state. Peat varies widely in its state of decomposition, acidity. mineral content and origin. Light brown peat has been normally produced by a type of vegetation that results in a quite acid state. Brown to black peat is of the type that is alkaline. This is the type that is desirable and most used in the United States it has a very high water-holding capacity and contains approximately 1% nitrogen. This nitrogen assists in the decomposition process which results after peat has been placed in use When peat is used, it should be broken apart and moistened well before adding to the growing media or mixture

SPHAGNUM MOSS

Commercial sphagnum moss is a material that has been produced by dehydrating certain acid-bog plants. The dehydrating results in a relatively sterile material. It is very light in weight and has a very high water-holding capacity. It has been said that it will absorb 10 to 20 times its weight in water After dehydrating the plant materials have been shredded in order to make it more usable This material contains such small amounts of minerals that plant growth in it for any length of time will need additional fertilizer.

VERMICULITE

This is a material that is micaceous in nature and is therefore a mineral. It is composed of thin layers that expand or explode when heated. It is heated in order to dehydrate it for use in horticultural mixtures. It is light in weight and has a very high-water-holding capacity. Expanded vermiculite should not be pressed or compacted in any way when wet. If this is done the desired porous structure of the material will be destroyed.

Plant Growing Media Other Than Soil
(Information Sheet continued)

LEAF MOLD

Certain leaves can be decayed and placed into a growing media or mixture and will serve a very good purpose Maple, oak sycamore, and elm are among the most suitable leaves for this purpose. In preparing such a compost the layers of leaves should be alternated with thin layers of soil Small amounts of nitrogenous fertilizer should be used between the layers of leaves and soil This nitrogen assists in the decomposition of the leaves The mixture should be protected from the weather so that leaching of the mineral elements will not result during heavy rain storms To prepare suitable leaf mold, 12 to 18 months should be allowed for proper decaying of the leaves A disadvantage of leaf mold is that it may contain nematodes, weed seed or noxious insects and diseases. It should be sterilized before being used as a growing media for horticultural plants.

SHREDDED BARK SAWDUST AND WOOD SHAVINGS

In the South these materials are probably the most readily available for use by the horticulturist They are by-products of the lumber industry and can be obtained readily at very low cost They are usually of the hardwood or pine variety Decomposition of these materials is slow and one should be sure that they are decomposed before using them for plant propagation Usually it is advisable to add nitrogenous fertilizer to these materials during the decaying process

USING SAWDUST

Sawdust may be used to improve the physical conditions of soils and as a mulch. As a mulch it insulates the soil against wide fluctuations in temperature, discourages weed growth and reduces evaporation of soil moisture However, there is a difference of opinion as to its merit Some operators have long used this easy-to-get forest by-product in large quantity with complete success Others have had unfortunate experiences with sawdust and have discarded it as unsuitable to their needs

Possibly a lack of understanding as to how to handle sawdust has caused some of these failures. When sawdust is incorporated with the soil--used in place of peat--it requires large quantities of nitrogenous fertilizer if the plants growing in the soil are not to suffer from nitrogen starvation The organisms in the soil which break down cellulose require appreciable amounts of nitrogen and will use up all available supplies of this element

It has been estimated that 24 lbs of nitrogen are required per ton of sawdust from some species of pine to bring the nitrogen content up to 1 2 to 1 5%, the values needed for decomposition witl out inducing nitrogen deficiency in plants This would equal 115 lbs of ammonium sulphate or 72 lbs of ammonium nitrate per ton of sawdust during the period of its decomposition, which may be 2 or 3 years A 4inch layer of loose dry sawdust over a space 20X30' weighs a little over a ton A bushel of sawdust (10 to 15 lbs) requires 0 8 lbs. of ammonium sulphate or 0.5

lb of ammonium nitrate When the sawdust is used as a mulch, nitrage fertilization is not required to the extent that it is when the material is incorporated with the soil.

Sawdust is widely employed as a plunging material in heel beds in retail sales yards, for which it has unanimous approval, despite the fact that research showed that it is very poor for this use vastly inferior to peat The need for frequent watering is the chief disadvantage of sawdust as a filler for nursery heel beds Because of the rapidity with which it dries, it is necessary to soak thoroughly and often

INTRODUCTION TO PROPAGATION

Plant propagation is the controlled reproduction of plants in order that man can have selected plants which are of specific value to him.

Plants may be propagated by two methods -- sexual or asexual.

Seed reproduction in plants is basically a sexual process because it involves the union of sperm and egg cell before the seeds are formed. The seed has a supply of food sufficient for establishing a plant in a new location

The vegetative methods of propagation such as layering, division, cutting, grafting, and budding are the asexual types of plant propagation.

There are a number of types of facilities and propagating structures for the reproduction of plants

Many stypes of greenhouses are used. they are usually made of glass, plastic, or similar material.

The hotbed is used for propagating, but it is generally smaller and less expensive Heat is provided by fermenting manure or electric heating cables

Many growers use a propagating case made of plastic to start young plants. This case may have mist spray in it to control the environment.

The ideal structure for plant propagation should have the proper amount of ventilation, temperature, and shade or light

There are several media and mixtures used in propagation. All media should be loose and of a light mixture so that the excess water will drain It should be free from seeds, nematodes, and disease organisms

Some common types of media are sand, peat, sphagnum moss, vermiculite, and perlite.

If soil is used, sterilization is a must It may be treated by steam or chemicals. If chemicals are used methyl bromide is an excellent chemical to use.

Flats are small rectangular containers used for germinating seeds or rooting cuttings. Many types of containers such as clay pots, peat pots, and plant bands are used.

Many plant propagators use a synthetic plant hormone to promote rooting of cuttings. Various methods are used in applying these root-inducing substances, but the most common is to dip the cutting in the hormone powder, which is a chemical mixed with powdered talc at suitable concentrations. Many of the rooting hormones contain a fungicide to give protection against diseases

HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation from Cuttings

OBJECTIVE. To develop an understanding of the methods of reproducing plants from cuttings

INTRODUCTION Cutting is one of the most important methods of propagating ornamental plants Many plants can be started from cuttings in a limited amount of space. This is an inexpensive rapid. and simple method of starting plants.

Cutting may be defined as the process of propagating plants by the use of vegetative parts which when placed under suitable conditions, will develop into complete plants

8 What are the requirements of a good rooting medium?
9 Give four types of rooting media
10 When are cuttings ready to transplant?

Information Sheet
on
PROPAGATION FROM CUTTINGS

T ducing plants from cuttings is often cheaper and faster than producing them from seed by budding or by grafting The use of cuttings also helps maintain the characteristics of the original plant Many types and varieties of plants will not produce the same quality or type of plant from seed and must be reproduced by cuttings budding. or grafting

Commercial plant producers use cuttings to secure large numbers of plants faster than securing the same plants from seeds Cuttings are also used because they are easier and simpler to make than various budding or grafting operations

Cuttings are classified and named according to the part of the plant from which they come: stem cuttings leaf cuttings or root cuttings

Stem cuttings are most important and more commonly used They are made by cutting a segment or piece of a growing limb or shoot from the parent plant These cuttings are further classified or named by the type of wood or growth period from which the cuttings are made

1 Hardwood cuttings are usually made in the winter months (or dormant stage) from plants or trees which shed their leaves. Plants propagated by hardwood cuttings include Junipers and Yews
2 Semi-hardwood cuttings are usually made from evergreen plants and are cut from newer growth on the plant after it has finished the rapid summer growth. Plants propagated by semi-hardwood cuttings include euonymus, evergreen azaleas and holly
3 Softwood cuttings are made from new growth in spring or early summer while that part of the plant is growing rapidly Plants propagated by softwood cuttings include pyracantha, magnolia and spirea
4 Herbaceous cuttings are made from plant materials which are soft, rapidly growing and relatively high in water content Plants propagated by herbaceous cuttings include coleus, chrysanthemum geranium. and carnation.

The following environmental conditions are necessary for rooting cuttings; high humidity, air temperature of 60° to 70° at night and 75° to 85° during the day. The temperature of the rooting medium should be as close to 70 to 75° as possible Others are adequate light and a good rooting medium

After cuttings have been made and placed under environmental conditions favorable for rooting a callus layer may develop at the basal end of the cutting The callus serves as a protective layer which retards the development of decay on cuttings that are fairly slow to root The formation of callus and the formation of roots are independent of each other, although they often occur at the same time

Propagation From Cuttings
(Information Sheet continued)

The plant from which cuttings are taken should be healthy and moderately vigorous The cuttings should come from average growth from portions of the plant in full sun The cuttings are usually three to five inches long with two or more nodes The cuttings should be made with a sharp knife, making the basal cut at about a 45° angle just below a node It is best to take cuttings in the early morning and keep them moist, cold and turgid (swollen) by wrapping in damp burlap or plastic bags until they are stuck in the propagating bed

The lower 1/3 to 1/2 of the leaves should be removed from the cuttings. Dip the base of the cutting in a rooting hormone and insert in the rooting medium. spacing so that the leaves barely overlap The depth of sticking the cuttings is generally 1/3 of their length. After the cuttings are stuck. the medium should be thoroughly watered to wash the particles closely around the base of the cuttings

During rooting the medium must be kept uniformly moist, but never soggy Until the cuttings begin to root, they should be kept under partial shade After rooting, the shade should be removed for increasing periods of time until it is left off completely

A good rooting medium is one which can be kept uniformly moist. but which also provides good drainage and aeration. Some satisfactory ones are clean sharp sand (builders grade), vermiculite (horticultural grade). sand and peat moss mixture, equal parts of each, peat moss and perlite. equal parts of each

The propagation box should be at least three to four inches deep. Usually they are wooden boxes or flats with slatted bottoms Standard size nursery flats are usually about 15" wide by 22" long by 3-1/2" deep This size is convenient to handle when filled with the rooting medium and cuttings

To maintain the high humidity needed for rooting softwood cuttings, the top of the flat may be covered with plastic This may be done by placing a wire or wooden frame over the flat to support the plastic 8 to 12" above the rooting medium. After the cuttings have been stuck and thoroughly watered. the flat is covered with a sheet of plastic, which should be tucked under the bottom of the flat or tacked to the sides and ends to hold it in place

Cuttings should be properly managed after they have rooted When the cuttings have roots 1/2 to 1" long, they are ready to transplant either into pots or directly to outdoor beds. If transplanted into pots, 2-1/4 to 3" pots are used The potting mixure should contain about 1/3 organic matter such as peat or leaf mold, and 2/3 sandy loam soil The cuttings should be partially shaded for 7 to 14 days after the cuttings are established By fall the cuttings will be ready to plant in the field to grow to a size suitable for landscape use If they were rooted late in the season, they should be carried over the first winter in a covered cold frame

1 Why do we wound plants that are to be layered?
2. What type of plants can be layered in a simple way?
3. What type of plants are air layered?
4. Why do we air layer plants?
5 What materials are used in air layering plants?
6 When is the best time to air layer plants?

Information Sheet
on
PROPAGATION BY LAYERING

The production of a new plant by layering is one of the surest methods It is commonly used to propagate plants which are difficult to root

A simple way of layering is performed by bending a branch of a plant to the ground and covering it with soil or a rooting medium, but leaving the terminal end exposed.

It is usually best to wound branches that are to be covered with soil This helps to induce root formation Many plants such as ivy, philodendrons, blackberries, and strawberries will root by this method.

Air layering is a method used to increase many plants such as croton, hibiscus dracaena, and rubber plants Many tropical plants get "leggy" and shed their lower leaves; they cannot be sold as choice plants This is a method of securing good plants at a minimum cost

Air layering is an excellent way to produce plants which do not come true from seed In some cases, a layered plant can be produced in a shorter time than by other methods of propagation

One method of air layering is to select a spot just below the joint or node of the plant to be propagated It may be necessary to remove a few leaves in order to do this. Make a slanting cut upward Be careful not to cut all the way through Take a toothpick or other small piece of wood and place it in the upper end of the slit to keep it from sealing Then sprinkle the area which is to be propagated with a hormone This will stimulate the root growth. Wrap a small handful of moist spahgnum moss around this area to keep the roots moist while in formation Cover the moss with a small piece of plastic film, polyethylene, or kitchen-grade aluminum foil to seal in the moisture Tie the plastic with two pieces of garden wire or plastic tie In a few weeks, under ideal conditions, the roots should be in formation and the stem may be cut from the parent plant and placed in a pot

Air layering is best practiced during the spring and summer months when high temperatures and high humidity contribute toward quicker rooting

Assignment Sheet

Supplemental.

3 Propagation of Ornamental Plants. Texas Agriculture Extension Service, pp. 816
4 Plant Propagation Principles and Practices, Hartmann and Kester, pp. 419

QUESTIONS OR ACTIVITIES

1 List four plants that can be propagated by division.
2 When is the best time to divide shrubs?
3. Why do you divide perennials?
4. When should you divide perennials?
5 How should you divide a daylily or other bulbous plants?

Information Sheet
on
PROPAGATION BY DIVISION

Division is a simple form of plant propagation. Some plants which can be propagated by division are daylilies, iris, chrysanthemums, geraniums, sanservieria, and shrubs such as primrose, jasmine and fig trees

Most of these plants can be dug and shaken free of soil Then the clumps can be divided into units or small plants. each having roots stems, buds, and leaves They can be planted in containers or as individual plants where they are to grow permanently.

Plants are best divided after their season of blossoming, but with care they may be so increased at any season of the year Larger shrubs may be divided in the same method as smaller plants, but in most cases they will have to be separated with a shovel or hatchet. They should be divided when the shrubs are dormant for best results.

HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation from Seed

OBJECTIVE To develop an understanding of producing plants from seeds.

INTRODUCTION The production of plants from seed is commonly used by horticulturists Many ornamental plants are produced by planting seeds in flats or other containers using the proper cultural methods.

Producing good plants from seed requires great skill and knowledge The grower must be able to determine the requirements for many different plants He must know when seeds should be planted. how much space should be allowed for each type of seed how deep to plant them and the proper cultural methods

QUESTIONS OR ACTIVITIES

1 Where does the average grower secure good seed?
2 What characteristics does a good growing media possess?
3 What is the proper temperature to germinate seeds?
4 What will happen when a grower attempts to germinate seeds at a cool temperature?
5 What is the best temperature to grow plants?
6 Why do you use a sterile moisture-holding material in planting seeds?
7. What information should the label on a seeded flat contain?

Information Sheet
on
PROPAGATION FROM SEEDS

There are several basic principles that the grower must observe if he is to get good germination of his seeds and thereby be successful in producing new plants These are

1 Use good seeds For the average grower good seeds can be obtained from the commercial producer of seeds These are growers who are not growing plants for the purpose of getting a flower but for the purpose of collecting and processing the seeds for sale to plant propagators
2 The grower must always use the best of growing media for germinating the seeds A wide variety of materials can be obtained for this purpose The media, whatever his choice must possess certain characteristics it must be finely screened porous loose and have a good water-holding capacity It should be sterilized and in most cases low in nutrients necessary for plant growth These nutrients can be added after germination and after the plant begins its growth
3. The germinator or grower must maintain the proper temperature if the seeds are to germinate properly Different plant seeds require different temperatures. however there are general principles that will be helpful to the grower that will apply to most plants Most of the common plants that the retail grower will deal with require a minimum of 65° for proper seed germination In most cases the temperature should be about 70°F This is very important because the grower who attempts to germinate seeds at a cool temperature will find that the seed will rot before having a chance to germinate
4 The proper moisture level must be maintained and must be kept uniform. If this is not done after the seed germinates or sprouts the plant will die
5 After germination occurs most species of plants grow better in a slightly lower temperature and in a cooler house The best temperature is usually between 50 to 60°

To sum up these general principles you could say that if you start with good seeds sow them in a good growing medium keep them warm and moist until after germination success is most likely to occur

Reasons For Failures In Germination

If the seed is good and there are proper amounts of heat moisture and air, nearly all the seed will germinate However some factors are responsible for seeds not germinating The more important factors are

1 Damaged Seed - Seeds with broken seed coats insect or rodent damage or heat damage will not germinate properly or else will fail to germinate at all
2 Old Seed - Seeds which are more than one year old will not germinate as well as fresh seed especially if the old seed was not stored properly.
3 Soil or Media Too Wet Too much water keeps air (oxygen) from moving around the seed causing it to rot before the plant can emerge

Propagation From Seeds
(Information Sheet continued)

4 Temperatures Too Cold - When soil and/or air temperatures are low, the emerging plant develops slowly and uses up the stored food before it can manufacture its own food Cold temperatures also slow down the absorption of water needed to start the germination process
5. Hard Seed - Some plants produce seed with a tough coat which will not allow moisture to enter the seed In such cases, it is necessary to use a special process to weaken the outer seed coat This special process is called scarification , and is used to weaken the outer seed coat so that water may be absorbed to begin the process of germination
6 Disease - Many diseases which affect plants are caused by bacteria or fungi carried to the young plant by air, water, or insects These pests are present on the seed itself or are present in the soil Damping off is one of the more common diseases affecting new plants Many of these diseases can be controlled by using various seed treatments and through sterilization of the soil or media in which the seeds are planted
7 Drying Out Of Soil Or Media - It is necessary to keep the soil or media well watered after seeds are planted Care must be taken to keep the soil or media moist enough so that the seed have a continuous supply of moisture, but not so much as to encourage damping off or reduced aeration of the media
8 Planting Too Deep - Seeds which are placed too deep in the soil or media may fail to produce a plant. These seeds will use all of their stored food and energy before reaching the surface and die before they can begin to make their own food A good rule to follow is to plant seed no deeper than 3 times the smallest thickness or size of the seed Most small seeds should be planted from 1/8" to 1/4" deep with a covering of a loose moisture-holding medium

Seeding In Flats

Starting plants by seeding thickly in flats is a common practice The seed may be broadcast or planted along marked rows The seed should be placed at a depth which allows for easy emergence of the seedling If the seeds are broadcast, little covering is needed Some propagators may use a layer of a sterile moisture-holding material such as sphagnum moss as a seed bed to reduce the chances of damping off developing However, care must be taken that the sphagnum moss is not soggy wet

A flat 2" x 4" board made to fit inside the flat or a brick can be used for firming the top of the soil In general, the smaller the seed, the less covering is needed For example, celery seed would require less covering than either bean or corn

Small seeds are often hard to handle and plant To help distribute the smallest seed, you can mix them with a small amount of sand or other inert material

Propagation From Seeds
Information Sheet continued

After the seed are planted in the bed and covered. water the seedbed gently To prevent washout of fine and small seeds use fine misting nozzles, sub--surface irrigation or place burlap bagging over the seedbed and soak the bed thoroughly When misting nozzles or sub-surface irrigation is used to moisten the seed and media. the usual practice is to cover the flat with a piece of glass or place the entire flat in a plastic bag to converse moisture until germination occurs After the initial watering no additional watering is usually required prior to germination

All seeded flats should be labeled The label should include the following information.

1 Name of plant or variety
2 Date seeded
3 Student's name
4 Special treatment if any

Using pot labels

1. Always start entries at the blunt end of the label
2 Allow the lower 1/3 of the label to remain free of entries for insertion into the soil of the flat or pot This will permit reading of the information on the label without lifting and wiping off the label
3 The students should be taught that the seeding job is not complete until the label containing the required information pertaining to the seeding is in place in the container

3. When planting a bareroot shrub or tree, how much of the top should be pruned?
4. What does the nursery term B&B mean?
5 What size tree usually needs guy wires?

Information Sheet
on
TRANSPLANTING ORNAMENTAL TREES AND SHRUBS

Proper planting will benefit both the plants and you. If they are worth planting, they are certainly worth the time and trouble to do it correctly. Care and attention from the very beginning will be of value.

Container grown plants and those balled and burlapped (BB) can be planted anytime. Early fall is a good time to plant as they should be well established before summer.

Bareroot plants such as pecan and fruit trees, some shrubs, and roses need to be planted as soon as they begin to arrive at the nurseries. This is usually in late fall or early winter.

The size of the hole into which the plant is to be placed is very important. It should be at least one to two feet wider and at least six inches or a foot deeper than the roots of the plant.

The soil in the bottom of the hole should be worked well and mixed with organic matter. Unless barnyard manure is well rotted, avoid using it. Do not fertilize newly set out plants, especially bareroot (BR) ones.

After the hole has been dug, you can fill it with water and allow it to soak into the surrounding soil. Place some of the soil mixed with organic matter into the bottom of the hole; set the plant on this. Fill in around the roots with more topsoil and pack well. You could water again and complete filling the hole with soil. The plant should be placed at the same level at which it was originally growing.

If the shrub was bareroot, you can prune about one-third of the top to compensate for the roots lost in digging. Generally, balled and bagged will need some pruning also, but container grown do not.

If the plant was in metal, paper, or plastic container, this should be removed before planting. If it was wrapped in burlap, this does not need to be removed. It can be loosened around the top near the base of the plant. Plants in containers may need to be watered before removing to prevent the soil from crumbling.

Newly planted trees or very tall shrubs will usually need to be staked especially if they are in a windy area. A stake can be placed on the side of the prevailing wind. This stake can be put in before planting if the plant is bareroot.

Transplanting Ornamental Trees and Shrubs
(Information Sheet continued)

If the tree is over five inches in diameter, it may need guy wires The wooden stakes would be placed some distance from the base of the tree and driven about 18" into the ground. Wires can be used from the tree to the stakes. The wire should not be tied directly to the plant Rubber hose protectors may be used around the wires If the plant is not too large, plastic ties may be used

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Nursery Plant Production

TOPIC Care and Maintenance of Plants

OBJECTIVE To develop an understanding of the modern methods of pruning ornamental shrubs and trees

INTRODUCTION. Pruning of plants is the cutting off or cutting back of parts of a plant for better shape or more fruitful growth

Trees and shrubs may need to be pruned in order to remove dead, diseased, or injured wood Pruning may be needed to remove a branch that overlaps another or to remove foliage right after plants are transplanted in order to make up for the loss of roots

Pruning also helps to improve the shape of the plant and makes it fit into the general pattern of the landscape

QUESTIONS or ACTIVITIES

1 What is the cardinal rule to follow in pruning ornamental plants?
2 Give three characteristics of pruning tools
3. When can trees be pruned?
4 What two factors are important in pruning ornamental shrubs and small trees?
5 How much top growth should be removed from bareroot dug plants?
6. Why do rose plants need to be pruned?
7 When should deciduous plants be pruned?
8. When is the proper time to prune shrubs which bloom in the spring?
9 When should climbing roses be pruned?
10 Why is a rounded or pointed top hedge preferred over a flat top hedge?

Information Sheet
on
CARE AND MAINTENANCE OF PLANTS

Take stock of your yard and check on an important chore - pruning Are your sidewalks and driveways covered by overgrown. sprawling shrubs? Are your doorways crowded and your windows hidden? Then you should do some pruning

Pruning the removal of surplus or undesirable parts of the plant to improve the remaining parts reduces the leaf surface or buds that grow into leafy shoots This diverts the plant food from root production to shoot production and increases the leaf growth

Deciduous plants, those which lose their leaves during cold weather, should be pruned between leaf drop and first spring growth The skeleton is exposed and the plant is easier to work with After pruning, the plant should have a framework of well-shaped uncrowded branches

Many evergreen shrubs need annual pruning These might include wax-leaf ligustrum pittosporum, eleagnus, yaupon, and viburnum They may be pruned into midsummer as they have no dormant period

Sometimes coniferous evergreens such as arborvitaes need to be pruned to keep them within a certain size This can be done by shearing the main branches and end branches with sharp hedge shears Gradually clip from the outside to almost where the brown foliage begins This foliage will turn green when the light reaches it

The average pruning is from about one-fifth to one-third of the entire shrub Many shrubs should be pruned by thinning out rather than be severe pruning If a shrub is badly out of proportion to its surroundings. you can cut it back to within a foot of the ground Fertilized, watered, and allowed to grow naturally, you will have an attractive shrub again

Shrubs grown for formal hedges need frequent cutting to keep them closely sheared within definite dimensions If a hedge is informal, it can be allowed to grow more or less at will: it can be controlled to some extent

Shrubs which bloom in the spring should not be pruned until after their flowering Severe pruning can be done then as the flowers are produced on wood grown the year before the blooms

Pyracantha or other berry-bearing shrubs should be pruned before the blooms appear in the spring The berries for next fall and winter will be lessened by late or severe pruning

Care and Maintenance of Plants
(Information Sheet continued)

Rose bushes produce flowers on wood formed the same season. Therefore, the more of last year's wood you prune, the better for your rose bushes. Cut back old, non-productive canes. Remove any dead or diseased wood.

Climbing roses should be pruned after flowering. Flowers this spring will be produced on canes grown last season; they will be much greener looking and not as old appearing as the canes produced the season before. Branches which are too long may be cut back about one-third of their total length.

Use the proper tools when pruning. Be certain they are clean and sharp. Make a clean, smooth cut and leave no jagged edges, bruised bark, or stubs.

Always remove any dead, diseased, or broken branches from plants. If branches are rubbing, crowded, weak, or growing downward, they should be removed.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Introduction to Floral Crop Production

OBJECTIVE To develop an understanding of the field of floriculture and to learn about sources of information on the subject

INTRODUCTION Floral crop production in the United States is a comparatively young business which probably started during the early part of the nineteenth century in Pennsylvania At that time, Philadelphia was considered the social center of the country The need for floral arrangements for special occasions brought about the beginning of the production of floral crops Today the production of flowers is one of America's largest industries.

REFERENCES Required
<u>Flower and Plant Production</u>, Nelson, pp. 3-15

QUESTIONS or ACTIVITIES

1 Why is it necessary for flowers to be produced throughout the year?
2 What are the three most widely grown cut flowers?
3 Where do most retailers of pot plants acquire their plants?
4 What is the motto of the Society of American Florists?
5 What magazine on the floriculture industry is available to the southern producer and can be obtained from Ft. Worth, Texas?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Perennials

OBJECTIVE To develop an understanding of how to successfully produce perennial flowering plants

INTRODUCTION Perennials are long-time favorites of gardeners everywhere. Unlike annuals, they continue to flower year after year. During the winter the plant goes into a period of rest called dormancy. The following season it begins growth and starts to bloom

REFERENCES Required
Basic Gardening Illustrated, Sunset pp. 100-101

QUESTIONS or ACTIVITIES

1 What is probably the best plant for a new gardener to grow?
2 What is one of the most common uses of the large mum?
3 How often should primrose clumps be divided?
4 How can one cause polyantha primroses to repeat bloom in the fall?
5. If peonies are properly planted, how often will they need dividing?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Bulbs

OBJECTIVE To develop an understanding of how to properly use bulbs in the floriculture industry

INTRODUCTION A bulb is an underground bud that sends down roots and has a very short stem covered with leafy scales such as lilies and onions.

It is both interesting and rewarding to plant a bulb and obtain a beautiful flowering plant

REFERENCES Required:
Basic Gardening Illustrated, Sunset, pp. 104-107

QUESTIONS or ACTIVITIES

1. When do tuberous begonias bloom?
2. Why should first foliage not be cut until it turns yellow?
3. What can be used to protect bulbs from soil insects and rot?
4. What is a true bulb?
5. What is a rhizome?
6. Study the terms on page 107.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Characteristics Identification, and Use of Important Pot Plants

OBJECTIVE To learn the characteristics identification. and use of twenty important pot plants

INTRODUCTION. This assignment contains an information sheet with some of the characteristics, uses, and cultural requirements of twenty plants that are grown in many greenhouses and garden centers in Texas A student studying for a horticultural occupation should be able to identify the important pot plants and give their characteristics and uses

REFERENCES Required

1 Information Sheet on "Important Pot Plants"
2 Seed catalogues

QUESTIONS or ACTIVITIES

1 Locate pictures in catalogues and other references and study the picture as you study about each plant listed on the information sheet
2 As you study each plant. list it on the attached form and determine its most important identifying characteristics and use

Information Sheet
on
IMPORTANT POT PLANTS

1. AZALES --------Bright flowering plant from mid-December through May Requires acid soil or peat moss as growing medium, ample moisture but good drainage 60-65° temperature.

2 BEGONIA --------Grown for foliage and flowers. Grown in soil that is porous and slightly acid. Top soil should become dry before watering Water thoroughly. In winter requires full sunlight, in spring and summer place in filtered sunlight.

Thrive in humid air and do well in a temperature of 60-70° Keep foliage dry

3 BROMELIAD------Exotic looking plant with showy spikes of blooms which may be attractive for several months. Most store an emergency supply of water within a natural vase-shaped center formed by their durable foliage in leaf base cups. They are easy to grow and do well in shade or sunny locations. The color patterns in the foliage and unusual growth habits make the Bromeliad an excellent and interesting plant for the home or office.

4 CALADIUM-------Colorful decorative foliage plant grown from tubers which are sold in grades expressed in inches of diameter

Plant in loose, well-drained soil. Need high humidity and ample water 80-85° best temperature to start Caladiums.

Require light but not full sun. Fertilize with complete plant food about once a month

The fancy-leaved Caladiums offer a variety of form color, and leaf patterns that few plants can match. Grow to 2 - 2-1/2'. Can be used as house plants or for outdoor planting

5 CHENILLE -------Bright green. broad foliage. Flowers in hanging cattails up to a foot long of a deep red color. Needs semi-light and ample moisture

6 DIEFENBACHIA --Large decorative foliage plant. Needs well-drained soil high in organic matter. Filtered light. Commonly propagated by cutting stems into sections containing one or more eyes.

Important Pot Plants
(Information Sheet continued)

7. **CHRYSANTHEMUM** - (Mum) - Grows best in porous, well-drained sterilized soil. Rooted cuttings should be planted as shallow as possible. They are heavy feeders and need a regular supply of fertilizer. Disease and insect control is very important. They have special requirements such as timing, pinching, lighting, and shading. Disbudding produces larger flowers.

8. **COLEUS** -------- Outstanding foliage plant which is tender; requires frequent pinching during growing season to produce attractive, compact plant.

   Needs loose, well-drained woil with ample moisture Requires partial shade in hot, dry areas of Texas. Occasionally threatened with aphids and mealy bugs. Easily rooted from cuttings

9. **CROTON** ------ - Bright glossy leaves of many different colors on a single plant. Leaves are various shapes. Require strong sunlight to retain their color Needs high humidity. Propagated usually by air-layering.

10. **DEVIL'S IVY** ---- Variegated yellow-splashed green leaves Filtered light for best coloring Requires high humidity, but do not keep constantly wet. If on totem, moisten for humidity Needs rich loam soil. Feed with complete fertilizer about once a month

11. **DRACAENA** ----- A versatile plant of various types. Most varieties are large and showy; most have leaves that are long and striped Shade or filtered light Moderately moist, but good drainage, and high temperatures

12. **FERNS** --------- Various assortments usually called table ferns. All like cool, moist shady conditions. Rich compost soil and moisture, but well drained Will provide cool greenery background for other plants

    Many varieties excellent for basket growing.

13. **FICUS** ---------- (RUBBER PLANT) - Commonly used as large specimen plants, so they do need space. Have glossy green foliage Will tolerate dry air, and do well at 70 to 80°. Do not overwater.

    Filtered light ideal, but will take a great deal of sun

    Propagated mostly by air-layering.

Important Pot Plants
(Information Sheet continued)

14. GERANIUM-----Dusty, green foliage, succulent stems Large clustered flowers in many colors Require plenty of sun to bloom properly Allow to become quite dry between waterings Sandy loam high in organic matter is best Temperature from 60-70° is ideal

15 GLOXINIA------Showy, velvety foliage and large bell-shaped blooms in assorted colors Light high humidity, moisture, rich, well-drained soil Water spots foliage and flowers, so avoid getting water on them They need filtered light, and proper spacing

16. HYDRANGEA----Showy broad dark green foliage Long lasting flowering plant commonly grown for Easter and Mother's Day Flowers in pink blue, or white Plant requires regular water during flowering and likes high humidity

17 PHILODENDRON-Most important tropical decorative plant family Tropical conditions best, but will tolerate dry air and low lighting in homes Needs loose, porous soil, sufficient water to keep soil moist Many varieties and types Some used on totems and are strong climbers

18. POINSETTIA----Seasonal plant most popular at Christmas Small yellow flowers surrounded by striking colorful bracts in red, pink or white Keep warm, chills easily Requires moisture and strong light

19. SANSEVIERIA---(Snake Plant or Mother-in-law's tongue) - Among the sturdies of the foliage plants Will do well in shade areas or in sunlight Do need porous soil, adequate drainage Do not overwater

20 SCHEFFLERA---Attractive, fast growing umbrella-shaped foliage plant Glossy green foliage Filtered light Needs good drainage, and don't overwater Large plant, needs space Usually propagated from seed.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Floral Crop Production

TOPIC. Poinsettias

OBJECTIVE. To develop an understanding of the cultural procedures in Poinsettia production

INTRODUCTION. The Poinsettia is an important blooming plant which is very popular at the Christmas season They are a native of Mexico and the tropical American countries

The beauty of Poinsettias lies in the brilliant bracts below the cluster of flowers They are now being produced as reds. whites, and pinks.

Cultural practices are more important in growing Poinsettias than most crops because they have to be timed for the Christmas season only. The day after Christmas the prices decline rapidly

REFERENCES.

Required.

1 Flower and Plant Production in the Greenhouse, Nelson, pp. 272-279

Supplemental.

1. The Ball Red Book, pp 299-310

QUESTIONS OR ACTIVITIES

1 What nutrient should be supplied if cuttings are made under a mist
2 List three poinsettia colors
3 What is the most common pest on Poinsettias?
4 What are the most common causes of leaf drop on Poinsettias?
5 What is the reason for poor root development in Poinsettias?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Chrysanthemums

OBJECTIVE To develop an understanding of some important cultural practices in chrysanthemum production

INTRODUCTION. The Chinese began hybridizing or crossing varieties of Chrysanthemums, or mums as they are more commonly called, over 2,500 years ago. In the years since, plant breeders from many lands have done much to improve existing varieties. The Oriental growers tried to win the approval of royalty; European growers concentrated on magnificent showblooms; the American hybridizers have improved mums for florist trade.

In recent years, much has been done to cause mums to flower on a year round basis. This is accomplished in greenhouses by controlling temperatures, shading, lighting, diseases and insects.

REFERENCES

Required:

1 Flower and Plant Production in the Greenhouse, Nelson, pp. 237-244

QUESTIONS OR ACTIVITIES

1 What is the natural blooming season for mums?
2 What is the most persistent pest of pot mums?
3. What is the correct night temperature for raising mums?
4. What is the most popular color in mums?
5 Why is black cloth placed over mum plants?
6. How and when do you pinch mums?
7 What may happen when mums are planted 2 to 3" deep?
8. What is the proper schedule for misting of mums?
9 How long does the mum season last?
10 What should be done to the soil before planting mums?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Geraniums

OBJECTIVE To develop an understanding of the cultural procedures in geranium production

INTRODUCTION Few plants can equal the geranium for color, long period of bloom, and simple care They make a fine showing as a pot plant or as a bedding plant

Geraniums were once considered an old-fashioned plant; today they are one of the most popular plants for gardeners, indoors or outdoors

REFERENCES Required

1 Flowers and Plant Production in the Greenhouse, Nelson pp 256-264

Supplemental

2 The Ball Red Book, pp 247-251

QUESTIONS or ACTIVITIES

1 Why must geraniums be shipped so rapidly?
2 What is done to the plant several weeks before the cutting harvest is to start?
3 What color of geraniums is most in demand?
4 What system of watering has proved to be excellent for geraniums?
5 Give two good management activities in the sanitation program to prevent diseases from developing and spreading
6 What is the second most popular color in geraniums?
7 What is the night and day temperature preferred by geraniums?
8 How are most geraniums shipped from California?
9 In what size pot are most geraniums produced?
10 Why have geraniums not been widely grown from seed?

HORTICULTURAL OCCUPATIONS

UNIT Establishing and Caring for Lawns

TOPIC Turf Grasses for Texas

OBJECTIVE To develop an understanding of planning the lawn and the proper selection of turf grasses for Texas

INTRODUCTION A beautiful lawn is the foundation for a pleasant home landscape No matter how expensive the home, how beautiful the trees shrubs, and flowers, they will not show up to the best advantage with an unattractive lawn

A lawn is a living thing consisting of thousands of tiny living plants or grasses Each plant needs food, water, sunshine and soil It is largely dependent upon you for many of these

The lawn is a valuable part of the landscape design and should provide the proper setting for the house, trees shrubs and other buildings It should be established properly in order to provide a beautiful area which will be easy to keep attractive

REFERENCES Required
"Home Lawns", B-203, Texas Agricultural Extension Service, pp 1-3

QUESTIONS or ACTIVITIES
1 Give five factors to consider in the selection of a turf grass
2 List two ways turf grasses are classified
3 Give three points about Bermuda as a turf grass
4 Give six points about St Augustine grass as a turf grass
5 Why does Zoysia grass make an excellent turf?

Agricultural Education
Teaching Materials Center

for
HORTICULTURAL OCCUPATIONS

UNIT Establishing and Caring for Lawns

TOPIC Establishing a New Turf

OBJECTIVE To develop an understanding of the principles in the establishment of a new turf

INTRODUCTION The lawn is a valuable part of the landscape design and should provide the proper setting for the house trees, shrubs, and other buildings It should be established properly in order to provide a beautiful area which will be easy to keep attractive

REFERENCES Required
"Home Lawns" B-203 Texas Agricultural Extension Service pp 5-7

QUESTIONS or ACTIVITIES

1 List three distinct steps necessary in the establishment of turf
2 List five types of organic matter which can be added to a new turf
3 How should fertilizer applications be determined?
4 What are the factors to consider in determining whether a yard will be seeded sprigged or sodded?
5 Why is the frequency of watering reduced as the lawn begins to take root and grow?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Establishing and Caring for Lawns

TOPIC Managing an Established Turf

OBJECTIVE To develop an understanding of the principles and practices involved in managing an established turf

INTRODUCTION After the lawn has been properly established it is important to know the time and rate of fertilization when to water and to have a working knowledge of keeping a lawn beautiful

REFERENCES Required
"Home Lawns" B-203 Texas Agricultural Extension Service pp 8-12

QUESTIONS or ACTIVITIES

1 List four major factors involved in maintaining turf
2 Why is Nitrogen the key element in turf production?
3 Why is Phosphorous important to the lawn?
4 Explain what a lawn looks like when it has a nitrogen deficiency
5 What does a plant look like when it has a phosphorous deficiency?
6 Describe an iron deficiency in the turf
7 When should the turfed areas receive an application of complete fertilizer?
8 How may chlorosis be corrected?
9 Why are light frequent sprinklings harmful?
10 Why is the aeration of the soil in a turf important?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Turf Problems

OBJECTIVE To develop an understanding of the problems which occasionally arise in the management of a lawn.

INTRODUCTION. Many problems may arise in the successful management of beautiful. well-kept lawns. The horticulturist should be able to identify the important lawn diseases and insects and have a working knowledge of the control of these problems.

REFERENCES: Required

1. "Home Lawns". B-203. Texas Agricultural Extension Service. pp 12-14.
2. "Texas Guide for Controlling Insects on Ornamental Plants" Texas Agricultural Extension Service. L-199.

Supplemental

3. "Lawn Insects. How to Control Them". B-53. U S. D A

QUESTIONS or ACTIVITIES.

1. List four problems which occasionally arise in the production of a turf.
2. What is the best way to control weeds?
3. What chemical is commonly used to control broad-leaved annual weeds in the lawn?
4. Describe the appearance of a lawn which has Brownpatch.
5. What is a good fungicide for controlling Brownpatch?
6. List eight dusts or sprays which are effective for controlling most lawn insects
7. Why is renovation of old lawns necessary?
8. List four dusts that are recommended for the control of chiggers.
9. Give three good sprays for the chinch bug.
10. Give the mixture for controlling the Bermuda grass mite.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Causes of Plant Diseases

OBJECTIVE: To learn what causes plant disease and to learn to recognize these diseases

INTRODUCTION: There are probably about as many diseases as there are plants. Man must constantly strive to ward off these diseases. If all research stopped, it is possible that man would be living in a world of famine and hardship

REFERENCES: Required.

1. "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

Supplemental:

2. "Texas Guide for Controlling Insects and Diseases", L-245, Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES:

1. What are the four most important causes of plant disease?
2. What is photosynthesis?
3. What is a vector?
4. What is the best approach to controlling canker disease?
5. What are fungi?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC: Identifying Plant Diseases

OBJECTIVE: To learn to identify plant diseases and to become familiar with the terminology used in connection with plant diseases.

INTRODUCTION: Better quality and higher yields at lower cost are possible with better disease control Diseases cost producers millions of dollars each year A large part of this expense can be prevented by learning more about diagnosing and checking plant disorders

REFERENCES: Required

1 "Identifying Plant Diseases" MP-512, Texas Agricultural Extension Service.

Supplemental

2 "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES.

1 What is the key to effective control of plant disease?
2. What is meant by blasting?
3. What is exudate?
4. What is the best way to check nematode damage?

Activity:

1 Study the terms that describe plant diseases on page 7 of reference no 1
2 Collect all the publications on plant diseases from your county agent.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Application and Safety Precautions of Horticultural Chemicals

OBJECTIVE: To learn the safe use of the important horticultural chemicals and procedures for effective application

INTRODUCTION: There are numerous methods of applying pesticides, fungicides and other horticultural chemicals The purpose is to completely cover the plant or pest with the proper amount of control material The first factor to consider is the welfare of the people using the material, second is the welfare of the plants and then the effectiveness of the material in controlling the pest or diseases

REFERENCES: Required

1 <u>Flower and Plant Production</u>, Nelson pp 302-311
2 <u>Basic Gardening Illustrated</u> page 81

QUESTIONS or ACTIVITIES:

1 What is the first factor to consider when using chemicals?
2 What is the second factor to consider?
3. What is the third factor?
4 What is one of the most common means of applying pest or disease control materials in the greenhouse?
5. How should you store a water hose to prevent spreading of diseases?
6. What are the safety rules that should be followed when a person is working with pest control chemicals?
7. Why should a plant be completely covered with contact poisons?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC Controlling Leaf Diseases

OBJECTIVE To learn how to identify and control the major leaf diseases.

INTRODUCTION A customer who wishes to buy a plant is usually looking for one which has a lot of healthy leaves A plant will not sell if its leaves have wilted and turned brown This will result in decreased profits on the part of the producer.

REFERENCES Required

1 "Texas Guide for Controlling Diseases on Ornamental Plants" MP-574 Texas Agricultural Extension Service. pp. 10-13

Supplemental

2 "What You Should Know About Plant Diseases", B-995 Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES

1 How does one treat leaf scorch or scald?
2 What causes sooty mold?
3 What causes oedema?
4 What two chemicals are good for treating mosaic or leaf curl?
5 When do you spray azaleas and camellias for galls?
6 How often would one spray to control bacterial leaf spots?
7 What usually causes chlorosis?
8 What type of disease is anthracnose?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Stem, Branch, and Trunk Diseases

OBJECTIVE: To learn the major diseases that affect stems, branches, and trunks of horticultural plants and how to control these disorders.

INTRODUCTION: The stems, branches, and trunks of plants are necessary for plant growth. They are the transportation system for the plant since water and food move through them. A disease affecting these systems can cause a definite decrease in plant vigor.

REFERENCES: Required

1. "Diseases on Ornamental Plants", MP-574, Texas Agricultural Extension Service. pp. 14-16

Supplemental

2. "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES:

1. How does a person treat a plant that has gall?
2. What is the control for a dodder infestation?
3. How does moss damage a plant?
4. What part of a plant does green scurf attack?
5. What causes wood rot?
6. What is the treatment for slime flux?
7. How is mistletoe spread?
8. What causes lichens?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Root Diseases

OBJECTIVE: To learn to detect root diseases and how to control them

INTRODUCTION: Roots are the storage organs of plants. If a disease is present in the roots of a plant, growth and vigor will be greatly affected.

REFERENCES: Required.
"Diseases on Ornamental Plants", MP-574, Texas Agricultural Extension Service. pp 17-21

QUESTIONS or ACTIVITIES:

1. What is a good treatment for mushroom root rot?
2. What is a good treatment for crown gall and hairy rot?
3. What is the first step when planning to fumigate for mushroom root rot?
4. What is the minimum distance from live plants that it is permissible to use carbon bisulfide as a soil fumigant on mushroom root rot?
5. In what sections of Texas is southern blight most common?
6. What temperature is required for southern blight development?

Agricultural Education
Teaching Materials Center

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC: Controlling Diseases Affecting the Entire Plant

OBJECTIVE To learn the causes symptoms and control of diseases affecting the entire plant

INTRODUCTION Many diseases are not localized in the stems, roots, or leaves, they damage the plant in all parts There are various controls for these diseases but one must first be able to make a proper diagnosis. Never assume that because a plant shows a symptom of a known disease that you have diagnosed the disease properly Many diseases have some common symptoms Don't make the mistake of diagnosing a plant disease without studying all symptoms of all diseases common to the particular plant

REFERENCES

Required

Supplemental

2 <u>Basic Gardening Illustrated</u> page 80

QUESTIONS or ACTIVITIES:

1 What symptoms would a chrysanthemum exhibit that had aster yellows that would not be present if it was affected by verticillium wilt?
2 What is an effective control for aster yellows?
3. What is an effective control for verticillium wilt?
4 In what section of Texas is verticillium wilt most common?
5 Who are the only people that should handle chloropicrin?
6 What is a chemical called that controls mites?
7 What are two effective treatments for botrytis blight?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Lawn and Turf Diseases

OBJECTIVE: To learn the major lawn and turf diseases and how to control them

INTRODUCTION: It has been said that a landscape can be no better than the appearance of its lawn. A house can be made into a beautiful home by maintaining a nice green lawn. There are several diseases which can severely damage the appearance of the turf if they are not controlled

REFERENCES Required.
"Texas Guide for Controlling Diseases on Ornamental Plants".
MP-574 Texas Agricultural Extension Service, pp. 24-26

QUESTIONS or ACTIVITIES:

1. What is the control for fairy rings or mushrooms?
2. What is the treatment for chlorosis?
3. What are the symptoms of fading out?
4. What is the treatment for slime mold?
5. What is the treatment for Piricularia leaf spot?
6. When should treatment for brownpatch be applied?
7. When should treatment for rust on bluegrass be applied?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant and Soil Insects and Methods of Control

OBJECTIVE: To learn how to recognize the major insects of horticultural plants To understand the various controls for these insects

INTRODUCTION: On any given day, a producer may walk through his plants and see numerous insects. Some of these insects and pests are taking money from his pockets by damaging his crop. A person who is depending on the proper growth and development of plants needs to know which insects are of economic importance and how to control them.

2. Information Sheet, "Identification of Plant Insects and Methods of Control"
3. "Texas Guide for Controlling Insects on Ornamental Plants", L-199, Texas Agricultural Extension Service (Study list of insects, descriptions, and types of damage.)

Supplemental:

4. "Texas Guide for Controlling Insects and Diseases", L-245, Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES:

1. What is the difference between a snail and a slug?
2. At what time of year do grasshoppers hatch?
3. What are the best methods of controlling borers?
4. What part of the plant do grubs damage?
5. In what type of soil are nematodes most active?

Information Sheet
on
IDENTIFYING PLANTS AN SOIL INSECTS AND METHODS OF CONTROL

Eternal vigilance and timely applications of effective controls will reduce losses to a minimum Weeds in aisles or under benches are breeding places for a number of pests and cleanliness is imperative A generally overlooked area is that outside the greenhouse Weeds harbor many pests which can enter through side or top vents and open doors at the ends of the greenhouses Cleanliness and proper attention to the outside areas as well as under glass will reduce the sources of infestation

Great changes have occured in the field of insecticides and there is a wide array of materials which are useful in combating pests New materials are constantly being added and the horticulturist must keep informed as better insecticides are introduced

Aerosol bombs have radically changed certain pest-control practices Specific directions for their use cannot be given in general terms because they vary and directions on the bombs should be followed closely Alternation in the use of materials is suggested to avoid the rapid build-up of resistant strains of pests

Resistance of mites to insecticides is believed to occur by mutation which establishes populations that survive normal effective doses This resistance is inherited and does not retrogress Purchasing plants or cuttings infested with resistant mites can lead to considerable trouble

Sprays and dusts are still used because in many instances they are just as effective as aerosols and may be cheaper for local applications Many insecticides are deadly poisons. and precautions regarding their use will be found on the container and should be followed

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC Nematodes

OBJECTIVE To develop an understanding of nematodes as a serious pest

INTRODUCTION. When leaves of plants are wilting, drying, and falling off for no apparent reason, nematodes may be the cause. Nematodes are small, slender, worm-like parasites which cannot be readily seen by the naked eye. These pests are small, but they can completely destroy a plant.

REFERENCES. Required.

1 "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service, page 3, pp. 13-14
2 "Identifying Plant Diseases", MP-512, Texas Agricultural Extension Service

QUESTIONS or ACTIVITIES.

1 List the steps involved in preparing a small plant specimen as illustrated in bulletin MP-512.
2 What is the most common type of nematode?
3. What should be determined before a large amount of money is spent on nematodes?
4. Knots and galls found on plant roots do not always indicate root knot nematodes. Give at least two exceptions.
5. Name two plants that are very good hosts for root knot nematodes.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Control of Moles Gophers. Birds. Deer, and Ants

OBJECTIVE: To become familiar with animals and birds that are a nuisance to the producer of horticultural plants

INTRODUCTION: Plant damage by animals and birds can become quite costly. The rural nurserymen usually have a big problem with animals, and the small town producers are plagued by flocks of birds

REFERENCES: Required
Basic Gardening Illustrated, page 82

QUESTIONS or ACTIVITIES:

1 How can a person detect the presence of moles?
2 What are the two most effective means of destroying moles?
3 Why should traps be used with caution?
4 How do gophers and moles differ in their digging habits?
5 How do many gardeners who live in the country protect plant roots from gopher damage without using poisons or traps?
6. What birds have no friends and should be eliminated?
7 What is the best way to protect young seedlings from birds?
8. What is the best long term control for deer?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC Controlling Weeds

OBJECTIVE: To learn how to get rid of weeds and to prevent their recurrence.

INTRODUCTION: Weeds grow well without proper water and fertilizer. If you add these two ingredients. they will flourish and this produces a great deal of trouble. If not controlled, they can crowd out annuals and perennials and even small shrubs. Chemical. hand. and mechanical methods of control are all effective if you start early and are persistent

REFERENCES Required
<u>Basic Gardening Illustrated</u>, pp 84-86

QUESTIONS or ACTIVITIES:

1 If you are planning to pull up weeds in a bed, what should you do to the soil several days before starting?
2 What has been the gardener's most useful tool for over 4,000 years?
3 What is a good device for weeding between paving blocks?
4 How does encouraging shrub growth reduce weed population?
5 After weeds have been cleared, what can be done to prevent recurrence?
6 What precaution should be taken when mixing and applying chemical solution where handling is required?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Principles Used to Prevent Personal Injury

OBJECTIVE: To learn the techniques and principles involved in horticultural work that will prevent personal injury.

INTRODUCTION: Gardening and growing horticultural plants can be hard work. In many instances a little time spent constructing a labor saving device can save several hours of back-breaking work.

REFERENCES: Required:
Basic Gardening Illustrated, pp. 90-93

QUESTIONS or ACTIVITIES:

1. What part of the body should do the lifting when you are picking up an object from the ground?
2. What effect does one pulley have on the force when you are attempting to straighten up a tree?
3. What can be used to remove a stump if no heavy equipment is available?
4. What preparation should be made to clay soils before attempting to do a lot of digging?
5. Tell how to make a handy device for blasting post holes and planting holes.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Selecting and Maintaining Horticultural Hand Tools

OBJECTIVE: To learn to select the right tools for a job and to keep these tools in good repair.

INTRODUCTION. No situation is quite as distressing as trying to complete a job when the proper tools are not at hand

REFERENCES: Required:
<u>Basic Gardening Illustrated</u>, pp. 88-89, 94

QUESTIONS or ACTIVITIES:

1 Why will asking different gardeners for a suggested tool list be of little value?
2. What type of shovel is effective for moving sawdust, manure, and other light materials?
3 What is the most common size of hoe?
4. How often should one sharpen a hoe if the cutting is not too hard?
5 What type of hoe is used by a pushing motion rather than a chopping motion?
6. What are the two most common shapes of lawn rakes?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Maintaining Small Power Equipment

OBJECTIVE: To develop the ability to maintain small power equipment.

INTRODUCTION: Value of small power equipment quickly decreases if proper maintenance practices are not diligently followed. Preventing a breakdown is usually much easier than repairing one

REFERENCES: Required
Information Sheet, "Maintaining Small Power Equipment"

QUESTIONS or ACTIVITIES:

1. What are the two factions of preventive maintenance?
2. What should an operator of equipment do at the end of each work day?
3. Why should the fuel tank be filled at the end of the day?
4. What may be used to clean the air filter?
5. What two factors should be considered when checking a belt?

Information Sheet
on
MAINTAINING SMALL POWER EQUIPMENT

Small. engine-powered equipment quickly loses its value if it is not carefully maintained Profitable use of the equipment depends on trouble-free operation on the job. While no equipment, no matter how well maintained. can be guaranteed not to break down on the job. "down time" can be extremely short if a careful maintenance program is followed. Human and livestock health care is of a preventative nature Equipment maintenance should be similar

Preventive maintenance can be described as consisting primarily of two things

1 Periodic equipment inspection to discover situations which may lead to equipment breakdown
2 Upkeep to minimize wear or to remedy potential trouble

Regularly used equipment should always be checked by the operator Should he notice any slight malfunction. he should correct it before further trouble develops. The operator should see that field maintenance is carried out regularly.

Usually not enough horticultural equipment is operated by a horticultural business to warrant hiring a full-time field mechanic or serviceman The operator has the responsibility to check oil. apply grease. and perform other maintenance when needed In some instances. this may be required every few hours At the end of the day, the operator should make an overall check and properly service his equipment. This will make the equipment ready to use the next day or on any future date it may be needed.

A regular program of shop maintenance should be carried out on each piece of small, engine-powered equipment Small engines have prescribed periods of operating time after which oil should be drained and replaced At that time a general check of the equipment is in order

Before beginning operation of a small, engine-powered piece of equipment, the following should be checked

1 Fuel
2 Engine oil level
3 Oil level and air filter
4 Belt tension
5 Chains, oil if necessary
6 Moving parts requiring frequent applications of grease or oil
7 Gearboxes
8 Implement adjustments

Maintaining Small Power Equipment
(Information Sheet continued)

During operation, the operator should constantly watch for any slight malfunction Often a change in the sound of the machine when in operation will indicate the beginning of trouble A skilled operator can tell by the sound of the machine if everything is in good working order If equipment is used for long periods during the day regular shutdowns for preventive maintenance practices are advisable

When equipment has been shut down for the day, it should be carefully checked and readied for the following day's operation

1 Fuel - Fill the fuel tank Moisture condenses more rapidly in a partially empty tank as the air cools
2 Oil - Check the oil level and add oil as required The oil should be changed periodically
3 Transmission case - Check the lubricant level, adding or changing the lubricant as necessary
4 Oil filter - Clean and check the oil level
5 Chains - Apply oil to chains at regular intervals Check the condition of the links
6 Belt condition - Check belts for excessive wear and for proper tension.
7 Moving parts - Grease all moving parts
8 Cutting surfaces - Clean and check cutting surfaces of plows, cultivator tines, mowers for sharpness Cover cutting surfaces with used oil or grease if the machine is to sit out in the weather or not be used over a period of time
9 Adjustment - Check machine to be sure that all operating parts are in correct adjustment
10 Bolts - Inspect the machine for missing and/or loose bolts
11 Damaged or broken parts - Determine if any parts have been damaged to the extent that machine operation will be impaired Replace these and all broken parts to insure proper operation
12 Machine cleanliness - Clean off accumulated dust and dirt regularly

When small, engine-powered equipment is put away for the off-season, give special care to provide the maintenance necessary to insure rapid starts the following season.

Small, engine-powered equipment is most valuable when operating properly. Proper preventative maintenance helps insure proper operation

The following general procedure should be used However, check the operator's manual for specific maintenance procedures which may be needed for a particular piece of equipment

Maintaining Small Power Equipment
(Information Sheet continued)

1. Before beginning the check, disconnect spark plug wire to eliminate a possible accident.
2. Using wire brushes, scrapers, rags, and chemical de-greasers clean the entire machine. Use chemicals only outdoors.
3. Clean air filter. Rinse with gasoline or other solvent, wipe dry, and refill with oil. If the air filter has a dry element, replace with new element according to manufacturer's recommendations.
4. Check carburetor for sediment. Remove and check if necessary.
5. Re-connect spark plug wire and run engine for five minutes. Stop the engine remove the spark plug wire, and drain the crankcase oil. Fill with new oil as recommended by the manufacturer.
6. Drain gas tank. Reconnect spark plug wire, start the engine, and run until the tank and carburetor are free of gasoline.
7. Remove spark plug and pour a teaspoonful of oil into the cylinder. Turn the flywheel to distribute oil. Replace the spark plug with a new one.
8. Adjust and/or sharpen any blades or implements.
9. Grease or oil any moving parts.
10. Wipe a light coating of oil over bare metal parts.
11. Store in a protected, dry place

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating and Maintaining Lawn Mowers Safely and Effectively

OBJECTIVE: To learn how to properly operate and to care for a lawn mower.

INTRODUCTION: A well mowed lawn can greatly increase the beauty of a home. There is more to operating a lawn mower than filling it with gasoline and mowing the grass.

REFERENCES Required

1. *Basic Gardening Illustrated*, page 94, "Lawn Mowing"
2. Information Sheet, "Operating and Maintaining Lawn Mowers Safely and Effectively."

QUESTIONS or ACTIVITIES:

1. What are the three general categories of power mowers?
2. What is meant by scalping a lawn?
3. What is the first step in adjusting the cutting height of a power mower?
4. A sickle bar mower consists primarily of what two parts?
5. Why should extremely long grass clippings be removed from the lawn?
6. Explain why grass leaves should never be clipped too short.

Information Sheet
on
OPERATING AND MAINTAINING LAWN MOWERS SAFELY AND EFFECTIVELY

Power mowers can be divided into three general categories (1) reel (2) rotary, or (3) sickle bar

Reel Mowers A reel mower is basically a common hand push mower powered by a small gasoline engine As the mower moves forward the revolving blades slide past the bed knife and cut the grass blades

Reel mowers used on bluegrass and similar grasses have five revolving reel blades Reel mowers used on the bent type grasses have seven or nine blades to provide a smooth even cut on these fine-bladed grasses

Reel mowers minimize the tendency of scalping or extremely close cutting on the high spots of an uneven lawn Repeated scalping will result in a weak turf at those spots

The procedure for adjusting height of cut varies for each make of reel mowers In general, the following procedures apply

1 Disconnect the spark plug wire from the spark plug and place it in a position where it is impossible for a spark to jump an air gap to the plug possibly causing accidental starting
2 Place mower on a perfectly flat hard surface such as a concrete walk or solid workbench
3 Adjust the bed knife to the proper height by manipulating the height adjusting set screws or by adjusting the wheel height
4 Check to see that the adjustment procedure has not distorted the bed knife Rotate the reel and check the clearance between reel blades and bed knife for the entire length of each of the reel blades This clearance should be uniform along the length of each blade If this cannot be achieved through adjustment, it will be necessary to utilize special equipment to grind the blades to obtain the desired clearance

Rotary Mowers Rotary mowers have a vertical shaft engine mounted on a housing which encloses a horizontally revolving blade The blade may be mounted on the engine shaft or one or more blades may be mounted on vertical jackshafts As the mower moves forward, the blade revolves at very high speeds lifting and cutting off the grass blades Rotary mowers are generally simpler in construction than reel mowers

Scalping, or extremely close cutting of high spots on uneven turf, can easily occur through careless operation Because the rotary mower is relatively square in design, the wheels may pass over a high spot and drop into a lower area during mowing and cause the blade to crop near to or hit the soil surface Excessive scalping may severely damage the turf

Rotary mower adjustment varies in detail according to the make, but the following general procedures usually apply

1 Place mower on a perfectly flat hard surface. such as the concrete walk or a solid workbench Remove spark plug wire so as to prevent the possibility of accidental starting which might result in serious injuries
2 Adjust mower blade to proper height by adjusting wheel height in relation to the housing Be sure to check the blade height and not the housing height since the blade is not level with the lower edge of the housing
3 Adjust mower handle height to suit operator

Rotary mower blades should be sharpened regularly since a dull blade rips instead of cutting the grass Before removing the blade for sharpening, disconnect the spark plug wire The blade may be sharpened by grinding or by filing Prior to remounting, the blade must be balanced The blade is mounted on a rod which is the same diameter as the hole in the blade Place the ends of the rod on a hard perfectly flat surface with room for the blade to revolve freely Two short pieces of 2" x 4" hardwood would work After resting the ends of the rod on the 2 x 4's the blade should remain level If the blade is not balanced grind or file the heavier end until perfect balance is achieved

Individual knives mounted on a base plate should be weighed after grinding to check their balance If necessary, metal may either be ground off the back of the knife or holes may be drilled in the back of the knife to remove excess weight so that perfect balance can be achieved

Sickle Bar Mowers Sickle bar mowers are used to cut overgrown turf or heavy weeds They generally do not cut neatly enough for use on home industrial. or recreational lawns

Sickle bar mowers consist primarily of a cutter bar and knife The knife is a narrow steel bar to which several triangular-shaped, sharp knife sections are riveted The knife is driven by a pitman rod through a series of guards and over numerous wear plates As the cutter bar moves forward grass blades are cut by a scissor-like action as the knife moves rapidly back and forth over the wear plates The sickle cutter bar is usually mounted on and powered by a garden tractor or is permanently mounted and powered by a specially designed power unit

Operating and Maintaining Lawn Mowers Safely and Effectively
(Information Sheet continued)

Height-of-cut adjustment is not present on some sickle bar mowers. On other makes, height adjustment is made by raising or lowering a steel "foot" which rides on the ground and keeps the mower at a set level.

Correct mowing techniques greatly influence the health, vigor, and appearance of a lawn. Leaves of the grass plant are essential to producing food for plant growth. When cut off too low, the food producing section of the leaf is lost and turf vigor quickly declines. Grasses similar in height to the bluegrasses should be cut to a height of 1 1/2 to 2 inches. Low growing grasses of the creeping bent types should be mowed to a height of about 1/2 to 3/4 inches.

If the lawn is mowed frequently enough clippings need not be removed. They filter down to the surface of the soil and act as a beneficial mulch for the turf. If the clippings are excessively long, they must be removed since they may smother the grass. Under certain conditions, some lawns develop excessive "thatch", dense mats of dead grass and clippings, at the soil surface. Under such circumstances all clippings should be removed.

The mowing pattern should be varied each time the lawn is mowed to eliminate low spots, corrugations, and some matting. The changed lawn pattern created by changing mowing directions also enhances the overall landscape appearance.

Overlapping each opposing cut improves the lawn appearance. Mowing in the opposite direction of the previous cut and overlapping past the wheel mark of the previous cut can raise grass that may have been matted down by the wheels and permit it to be cut.

Safety should be foremost in the mind of any equipment operator. He should know his mower and its capabilities and should attempt only jobs for which the equipment is designed. Except for adjusting the carburetor, he should never place his hands in or near moving parts nor allow anyone else, especially children, to be nearby when the engine is running. When the engine is stopped for cleaning or repairs, the spark plug wire should be removed to eliminate the hazard of accidentally starting the engine. The operator of a rotary mower should be constantly on guard against running over articles such as glass or stones which could be thrown by the blades of the mower, since such debris can cause severe injury to people or pets.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating Rotary Tillers Safely and Effectively

OBJECTIVE: To learn the different types of tillers and how to properly operate them.

INTRODUCTION: A rotary tiller can be a handy piece of equipment. It can also be dangerous. One should exercise extreme caution in the operation of these machines. If cautions are heeded, a tiller can be used by even the inexperienced gardener to loosen soils and in preparing soil mixtures.

REFERENCES: Required:
Information Sheet, "Operating Rotary Tillers Safely and Effectively"

QUESTIONS or ACTIVITIES:

1. What are the two categories of rotary tillers?
2. Which type is used only for light work?
3. On front tine tillers, what moves the tiller forward?
4. If the front tine tiller digs too far into the ground and does not move forward, what should you do?
5. What should be done before starting any tiller?

Information Sheet
on
OPERATING ROTARY TILLERS SAFELY AND EFFECTIVELY

Rotary tillers are classified into two categories according to the arrangement of the tilling tines. Front tine tillers are those which have the tines located in front of the wheels. Rear tine tillers have the tines located behind the wheels.

Front tine tillers are generally designed for light-duty work and are often used for cultivating. In a loose soil they may do a satisfactory job of tilling to a depth of several inches. The machines usually are not heavy enough to till deeper on loose soils or to till heavy clay-packed soils with heavy vegetative cover.

Front tine tillers do not have power wheels The rotation of the tines causes the tiller to move forward. Some control can be exerted over rate of forward motion by adjusting the depth bar. If the tiller must be held back to do a proper job of tilling, the depth bar should be lowered to cause the tines to dig deeper and slow the rate of forward speed. If the tiller digs deeply and does not move forward, determine the adjustment of the depth bar.

Rear tine rotary tillers are designed for medium to heavy work. Excellent tilling can be done to depths of about eight inches in a variety of soils having various amounts of vegetation or organic matter. This type of tiller can thoroughly mix organic matter into the soil.

Rear tine tillers have powered wheels and usually a reverse gear. Power can be transferred to either the wheels or the tines Rate of forward speed is controlled by selection of proper gear and throttle setting.

Tilling depth on rear tine tillers is also adjusted by a depth bar which is usually located behind the tines. The bar is raised for increased tilling depth and lowered for decreased depth.

Since rear tine tillers are often used on heavy or packed soils, several points of operation should be noted. The following operational procedures should be observed:

1. Rotary till when soil moisture is correct Use standard method of squeezing a handful of soil to determine moisture content. When the soil ball flakes and cracks, soil has the correct moisture content for tilling.
2. First run tilling depth should be no more than one to two inches. Increase depth for each additional pass.
3. Final tilling passes should be at right angles to previous ones to break down lumps further.

Operating Rotary Tillers Safely and Effectively
(Information Sheet continued)

The handling procedures for front and rear tine tillers are considerably different. Each type can pose safety hazards to careless operators Before starting any tiller. check to see that all clutches or belt tension pulleys are disengaged. The load on the engine may be great enough to prevent the engine from starting if these clutches were engaged If the engine should start while the clutch is engaged, the machine may get away from the operator and cause personal injury or property damage Even if the engine does not start while the clutch is engaged, a sharp pull on the starting rope may upset the machine or injure the operator

Rear tine tillers present added hazards to the operator Power to the tiller tines should be disengaged whenever the tiller is not being used for tilling. This includes turning the machine around when moving it from one site to another.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating Garden Tractors Safely and Effectively

OBJECTIVE: To learn how to operate a garden tractor safely and effectively.

INTRODUCTION: The sale of garden tractors has increased steadily in the past few years. These tractors are used in a number of horticultural enterprises as well as by homeowners and hobby gardeners

REFERENCES: Required·

1. Information Sheet, "Operating Garden Tractors Safely and Effectively"

Supplemental:

2. Literature from manufacturers of garden tractors

QUESTIONS or ACTIVITIES:

1. If one is planning to buy a garden tractor and a sickle bar, what should he keep in mind in regard to tractor size?
2. What is the usual horsepower range of small riding tractors?
3. Where should one attach pulled equipment to avoid tipping a tractor backwards?
4. What is the major difference between small riding type garden tractors and riding lawn mowers?
5. What are the two most widely used types of transmissions on garden tractors?

Information Sheet
on
OPERATING GARDEN TRACTORS SAFELY AND EFFECTIVELY

The small walking or riding type garden tractor is used in a number of horticultural enterprises as well as by homeowners and hobby gardeners

Walking type tractors have had the same basic design for a number of years, but moderate improvements such as rubber tires have been introduced

The basic design consists of a small gasoline engine mounted on a set of wheels attached to a pair of handles Power is usually transmitted from the engine through a reduction gear arrangement to a jackshaft An idler or belt tension pulley, is mounted for the belt between the gear box and jackshaft This provides the clutch for the tractor The power is transmitted from the jackshaft to the wheels by a chain or belt arrangement.

Extra pulleys may be mounted on either the gearbox shaft or the jackshaft to permit the use of implements requiring power A number of implements are available for walking tractors Those requiring power such as sickle bars or snow blowers, demand engines of high horsepower and tractors of heavier design Many implements are simply pulled or pushed by the tractor and often can be used with tractors of lower horsepower and lighter weight

Implements are attached to the walking tractor in two basic ways with minor modifications according to the various manufacturers Implements which are pulled are attached by a vertical rod or "pin" which secures the tool to the tractor frame behind the engine. Implements which are pushed by the tractor are rigidly secured to the frame in front of and under the engine with several bolts or pins

The following implements are available for most walking tractors

Cultivator
Plow
Disc
Reel mower
Sickle bar mower
Cart
Seeder
Fertilizer spreader
Lawn roller
Rotary roller
Sulky
Grader blade

The tractor engine can also be used to power a number of other stationary pieces of equipment, such as a small rotary cement mixer, saw, compressor, compost or soil shredder, and others.

The walking tractor is a versatile piece of equipment which, in many horticultural enterprises can supplement heavy equipment Operators of small walking tractors should, however, be familiar with the equipment since too often the tractor is damaged and the operator injured where it is used for too heavy work Quite often the walking tractor is not properly maintained since it is relatively inexpensive and possibly not used as often as larger equipment Because regular maintenance schedules are often neglected, premature equipment failure may result

Operating Garden Tractors Safely and Effectively
(Information Sheet continued)

Within the past decade, a small type of riding tractor has been developed Most are scaled-down versions of the larger types Horsepower ranges from 3 1/2 to 10. Due to the heavier weight of the machine and the added rider weight, the unit can handle somewhat heavier jobs than most walking tractors

While all small riding tractors can handle mower attachments they are not riding mowers Riding mowers are quite different from small garden tractors in that riding mowers are built to be used for mowing grass only The high interest in small riding tractors by homeowners with large lots has resulted in scores of different models produced by various manufacturers

The construction varies considerably in type as well as quality For example, some models have automotive type clutches. some centrifugal clutches. and others a belt-pulley type clutch Transmissions also vary considerably; some have an automotive type while others have a belt type

The teacher should obtain a variety of manufacturers' literature giving detailed specification of the various types of tractors

The list of equipment available for small riding tractors is the same as that listed for small walking tractors

Since the small riding tractors are basically a small-scale, standard tractor, several similar rules of operation should be kept in mind All pulled equipment should be attached properly below the rear axle level to avoid tipping the tractor backwards if the load is too great Care should be taken when operating the tractor on uneven or sloping ground to avoid turning over The operator of a walking tractor can usually move out of the way quickly in the event of an upset. but the operator of the riding tractor is in a more precarious position

Both walking tractors and small riding tractors can be valuable tools for a horticultural business or for the homeowner with a large lot For maximum value. however, they should be used only to the rated capacity of the unit, on jobs for which implements are available, and in situations where their use can be justified economically

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Introduction to Home Landscaping

OBJECTIVE To develop an understanding of why landscaping has become important and to learn sources of information available to the beginner

INTRODUCTION By properly landscaping a home its value can be greatly increased. The landscaping industry has grown in leaps and bounds during recent years. This growth is probably caused by the great number of people moving to the urban and suburban areas. It seems that everyone tries to have a better landscaped lawn than his neighbor. Another factor which has contributed much to the landscaping business is the greater amount of leisure time now enjoyed by American people. Many have found that working in a flower garden or watering the lawn is quite enjoyable and provides a form of relaxation which is very refreshing in this hurry-up world in which we live

REFERENCES: Required.

1. "Home Landscaping", B-980, Texas Agricultural Extension Service. pp 3-4

Supplemental:

2. Approved Practices in Beautifying the Home Grounds, Hoover

QUESTIONS or ACTIVITIES:

1. What are the three basic fields of endeavor involved in landscaping?
2. List the four main types of homeowners.
3. Why can gardens no longer be entirely naturalistic?
4. Why do landscaping plants vary so greatly from one side of Texas to the other?
5. How do some large nurseries which provide "free" landscape plans get their money back for the time and expense which they provide?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting a Site

OBJECTIVE: To develop an understanding of the considerations to make when purchasing a home

INTRODUCTION: Many people forget about landscape design when they are shopping for a new home. After the house is purchased, the owner then looks at his landscape potential. Many times, to his dismay, the landscaping will present special problems which require considerable expense

REFERENCES: Required.
"Home Landscaping", B-980. Texas Agricultural Extension Service, pp. 4-5

QUESTIONS or ACTIVITIES:

1. What should be the first consideration as to homesite?
2. What is meant by zoning?
3. Can most families afford to spend one-half of their annual income on a lot?
4. List some disadvantages of a corner lot.
5. List two disadvantages of sites that are too far above the street.
6. What direction should outdoor living areas face? Why?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Developing and Maintaining the Landscape

TOPIC Scheduling Landscape Development and Beginning Plans

OBJECTIVE To develop an understanding of how to schedule your landscape development and to learn how to begin the landscape plan.

INTRODUCTION Successful landscapes are a result of proper scheduling and planning Few beginners can see all of the problems which will arise in landscaping a lawn It is wise to spend considerable time in reading materials written by specialists before drawing the plans.

REFERENCES Required
"Home Landscaping". B-980. Texas Agricultural Extension Service, pp 5-9

QUESTIONS or ACTIVITIES

1 Describe a well-planned garden.
2 What are the most essential elements of the plan that should be constructed first?
3 Why are trees so important in Texas landscapes?
4 What are the purposes of hedges, screens, walls, and fences?
5 What are the two important steps involved in solving a landscape problem?
6 What is meant by "site"?

Agricultural Education
Teaching Materials Center

for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Analyzing Problems and Determining Needs

OBJECTIVE: To develop an understanding of the specific problems which will be encountered on certain sites and to become aware of the four basic considerations which should be included in successful landscape development.

INTRODUCTION: Four basic considerations should be included in successful landscape development. These are suitability, function, economy and beauty.

REFERENCES: Required:
"Home Landscaping", B-980 Texas Agricultural Extension Service, pp. 9-12

QUESTIONS or ACTIVITIES:

1. List the four basic considerations which should be included in successful landscape development.
2. What is the basic step in the preparation of a program?
3. What three questions should you ask yourself in regard to outdoor surroundings?
4. What are the three economies to keep in mind in the development of a homesite?
5. What two factors determine beauty?
6. Can a beginner usually obtain simplicity in a landscape design?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Developing the Landscape Plan

OBJECTIVE: To develop an understanding of the steps involved in developing the landscape plan

INTRODUCTION: Planning is the means of accomplishing an objective through an arrangement of steps. A properly designed and executed plan will result in a landscape of a desirable nature.

REFERENCES: Required:
"Home Landscaping". B-980 Texas Agricultural Extension Service pp 12-15

QUESTIONS or ACTIVITIES:

1. When should planning begin?
2. What scale is used on the sketch survey on page 13?
3. What are the four main functions that all homesites and farmsites must provide?
4. What area should occupy the largest portion of the property?
5. Around which area of the house should private areas be developed?
6. What were the two approaches to landscaping which were followed in years past?

Activity:
Study the areas in Texas where plants vary.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting Plants

OBJECTIVE: To develop an understanding of how to select the proper plants to be used in a landscape

INTRODUCTION: One must be very careful in selecting plants for a landscape. Otherwise, he may plant a monument to his ignorance. An example would be planting a tree that would grow high enough to damage the roof of the house.

The completed plantings are the final mark of distinction in any landscape. These are the elements that provide beauty and enrichment to the solution of the landscape problem

REFERENCES: Required
"Home Landscaping", B-980, Texas Agricultural Extension Service, pp. 20-26

QUESTIONS or ACTIVITIES:

1. How tall are large shrubs or small trees when they are full grown?
2. How tall do medium shrubs get?
3. How are shrubs classified that do not grow higher than three feet?
4. What is the danger involved in planting trees with deep, wide-spreading roots?
5. What type of tree is desirable for the warmer regions of Texas where year-round shade is needed?
6. What duties are required for proper lawn maintenance?
7. Give two examples of fast growing hedges that require frequent clipping

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Grading, Drainage, and Landscape Structures

OBJECTIVE To develop an understanding of the grading and drainage factors and to learn how landscape structures should be constructed.

INTRODUCTION Every homesite will require some grading to permit proper drainage. There are many factors to be considered before grading. It must be kept in mind that water directed to certain areas could cause damage to plants

The construction of sidewalks and drives is expensive. Be sure of your planning before the concrete is poured

REFERENCES. Required
"Home Landscaping". B-980 Texas Agricultural Extension Service pp 27-30

QUESTIONS or ACTIVITIES:

1 Although not the most desirable, what is the most inexpensive way of preventing water from downspouts from washing away soil?
2. Does lowering the grade around existing trees damage trees as much as filling in around them?
3 When you need to save a valuable tree, what method will least disturb the tree?
4. What is the most common mistake when constructing sidewalks?
5. What should be the minimum width of a front entrance sidewalk?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Merchandising Horticultural Plants and Supplies

TOPIC: Developing Personal Traits

OBJECTIVE: To understand how to increase sales. To develop the proper personal habits and techniques required to make a sale.

INTRODUCTION: No salesman is better than his personality. Act enthusiastic and you will be enthusiastic. Think happy thoughts and you will be cheerful. Smile, even though you don't feel like it Before long these will become habits and your percentage of sales will increase.

on
DEVELOPING PERSONAL TRAITS

The three basic ingredients of salesmanship are knowledge of self knowledge of people and knowledge of the product to be sold A person who wants to become a salesman must learn to use each of these basic divisions to its fullest potential Before anyone can understand others fully, he must have a good understanding of himself and how he relates to others Then it is necessary to understand the product or service fully

There are two basic ways of learning to sell after you have studied the basic knowledge of the product First, and probably the best, is to apply some FFA training and learn by doing This means learning from experience To do this, it is necessary to gain employment in a retail store such as a feed seed, and horticultural supply store and make direct sales to the customers

The second way to learn to sell is to learn from others This makes it necessary to observe very closely the methods used on you while you are having a product sold to you Observe what the salesman says during the sale He will get your interest by saying or doing certain things Observe how well he knows his product Observe his mistakes These can be very valuable to you

A salesman must develop a good sales attitude This is very important It involves knowing oneself It means knowing if you have the "mind" for selling.

A good attitude means that the salesman recognizes his responsibility to the company It means becoming a part of the company and growing progressively more loyal to it as time goes on

A good attitude means proving that you are growing and coming up with new ideas for the company. This involves keeping up to date on new developments Agricultural supplies are changing each day and a good salesman keeps up with these things

A good attitude means good sales habits Old habits must be changed. When the salesman learns good habits, they are his alone No one can share them Good habits pay off in promotions and dollars

A good attitude means selecting the right learning methods. These methods are study experience, and a combination of the two Study means lessons at school or constant review of materials in the business Experience means practice With each successful sale, the salesman grows When study and experience are combined, the result is a good salesman with a good attitude

Constant analysis of the sale makes a "scientific salesman" This analysis is done by getting the facts, analyzing the facts, drawing conclusions from the facts and applying the conclusions This means planning and executing the sale inch by inch It means reviewing the sale after it is made It means applying what you have learned to the next sale.

A good salesman realizes that salesmanship provides a mutual benefit to himself and his customer This makes it necessary to get the customer's viewpoint and help him get the most for his money A good salesman speaks the customer's language If possible, he determines the customer's needs, problems, business, and what the product will do for him This is easily done by a salesman of agricultural products.

Developing the Right Sales Personality

In salesmanship as in any field of work the personality of the salesman is of utmost importance. His ability to sell himself will be directly related to his ability to sell a product. Even before selling himself to others he must sell himself to himself This means being sure of what he can do Strong sales personality enables the salesman to apply scientific training to the sale of the product.

Diligence and perseverance are necessary for a would-be salesman to become a tough, aggressive, and effective salesman

There are several qualities that make up the sales personality Each will be discussed briefly

1. Sincerity - Sincerity is a quality that creates an atmosphere of confidence on the part of the customer in the salesman Insincerity does just the opposite Sincerity is, in the final analysis, the total of the salesman's attitude toward his work The correct attitude causes the salesman to apply himself to his training and do his job

2. Tact - When a salesman meets a customer the opportunity for conflict or differences of opinion is great Tact is the quality of personality that can smooth out these conflicts and bring about the proper atmosphere for making a sale. It means that the salesman will not contradict. The injured pride of a customer will prevent him from making a purchase. If the salesman wins an argument, he will still lose.

3 Enthusiasm - This is the quality of the personality that means putting everything you have into it. It involves the whole body - the face, the voice, and the actions To have enthusiasm, a salesman must be thoroughly familiar with the merchandise to be sold and he must appreciate

it. The more the salesman knows about the product. the more enthusiastic he will become

4. Courtesy - One could never say too much about the importance of courtesy to the salesman Courtesy is simply good behavior and good manners It is the quality that gives good first impressions Many times that good first impression makes the sale.

5. Cheerfulness - It has been said that we are what we think we are If we think cheerful thoughts, we are cheerful The cheerful salesman will meet his customers with a smile, whether he feels like smiling or not Cheerfulness can be measured in important sales.

6 Initiative - This characteristic is most vital to the sales personality of the successful salesman The alert mind of the salesman who possesses this quality will cause him to get new sales on his own and will cause him to operate without any prodding from his employer.

7, Friendliness - Many a sale has been won by the friendly salesman His friendly personality puts the customer at ease. The feeling of the customer can be described as a certain good friendly feeling. The unfriendly salesman can be sure that his customers will never buy his products.

8. Persistence - This quality can suggest that in some cases a salesman can become obnoxious This is not what is meant by being a persistent salesman This quality causes a salesman to try again after failing to sell a potential customer. He does not admit defeat quickly. It simply means trying again to make a sale, using a different method

9. Memory - A quick memory of the information involving the product is very important to the good salesman. A quick memory involving the name and other facts about the potential customer is also very important It has been said that forgetting a person's name may mean the loss of a sale To gain memory, the salesman will practice concentration, association. and repetition. Concentration on the facts association of these facts to something familiar, and the repetition of these facts will cause the mind to grasp them.

Developing Personal Traits
(Information Sheet continued)

10. Application - Nothing is ever truly learned until it is put into practice. The applying of any idea to making a sale is putting that idea into practice. The only sales idea that is important is the one that works. The wise salesman will try hard to improve himself by applying what he has learned. Other attributes that help a salesman make a sale are a good vocabulary, a pleasant voice, shaking hands with the customer, and being vigorous and poised. All good salesmen are recognized as having these qualities.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Merchandising Horticultural Plants and Supplies

TOPIC: Displaying

OBJECTIVE: To learn how to increase sales of horticultural plants and supplies.

INTRODUCTION: A grower may have an outstanding selection of plants and supplies; but if the public does not see these items, profits will be greatly reduced. No business will succeed without a market In most cases, the grower must create or improve his market. One of the more effective ways of increasing sales is to properly display items and create a desire on the part of the buyer.

REFERENCES: Required:
Information Sheet, "Displaying"

QUESTIONS or ACTIVITIES:

1. Where should point-of-purchase displays be placed?
2. What is the basic reason for displays?
3. What types of items are handled best in bin displays?
4. What items should be placed at eye level?
5. What are three characteristics of a good floor display?
6. What is the purpose of a sales floor window display?
7. Why should a single item not be displayed?
8. What should one consider when arranging different displays around the store?
9. What is the most practical way to display nursery stock?
10. What should be the maximum width of a display bed?

Information Sheet
on
DISPLAYING HORTICULTURAL PLANTS AND SUPPLIES

Point-of-purchase displays normally consist of tri-plane and peg board tables. special display racks, bins. display floor windows and floor displays These must be located where they will be seen by the greatest number of customers The basic reason for displays is to put merchandise where customers can see it and serve themselves

Special racks, tri-plane and peg board tables are excellent for displaying impulse items and other small competitive items Much of the fast turnover merchandise is adaptable to display selling Customers like to handle the merchandise they buy; they find it interesting These displays are easy to set up and maintain They enable the salesman to handle a larger volume of sales

Bin displays are more successful when used for familiar products, bulk seeds, and other seasonal items It is a good idea to put reminder items where they command the customer's attention The items that are to be pushed should be placed on shelves at eye level

Most businesses find floor displays are best for large items such as barrels of special fertilizer packages or for large quantities of small items in a special promotion. A floor display should be well stocked, safe. and at a convenient height.

Sales floor window displays have one definite purpose This is to stop customers and bring them into the place of business They must be appealing and attract attention by action. This necessitates the use of special signs, background, lighting, and display cards Window displays are most effective for whole goods or for tie-ins with advertised promotions

Some Proven Principles of Effective Displays

In point-of-purchase display merchandising

1. Display in quantity - A single item does not attract customers. Bulk attracts attention and gives the impression of demand

2 Use proper arrangement - Consider the traffic pattern Locate displays where the greatest number of people will pass them Each table and shelf should have a relation to the others Establish a "theme" for the entire area Keep all displays well stocked; remove a few items from the cartons and do not make the display so orderly that it will discourage the customer from picking up items

Displaying Horticultural Plants and Supplies
(Information Sheet continued)

3 Change display frequently - As customers need change, so do displays. Many dealers establish a rule to change displays after a given number of weeks. This practice permits more items to be displayed and helps keep them current with the season. Even displays of non-seasonal items should be changed because customers do not like to see the same thing on each visit. The change takes very little time, but it improves the appearance of the department and pays off in additional sales.

4 Keep displays clean and neat - This is a problem in many businesses, but all agree that good housekeeping is necessary

Point-of-sale display advertising takes advantage of the customer's presence in the store. Plant displays so that they will act as silent salesmen

Displaying Plants To Be Sold

The most practical way to display nursery stock or other plants to be sold is to arrange them in beds. This should be done whether the plants are under a lathhouse for shade or whether they are in the open. The beds should be rectangular in shape and not more than eight feet wide. A walkway adjoining the bed should be at least three feet wide. The plants in the beds should all be the same type. They are arranged according to size and the balls are covered to prevent drying out.

When arranging merchandise other than plants in the sales room, use the same principles involved in displaying plants. Small displays of similar items should be arranged. The customer should have access to these displays at all times. He should be encouraged to browse. Above all, these displays should be kept neat and stocked with merchandise

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Merchandising Horticultural Plants and Supplies

TOPIC: Advertising

OBJECTIVE: To learn the different methods of advertising horticultural plants and supplies. Also, to learn the effective use of each method and to become aware of the importance of advertising.

INTRODUCTION: If a business is making money, it can afford to advertise. If it is losing money. it cannot afford to under advertise. This statement is often made to show the importance of advertising. It has been said that advertising is the key to sales. If customers are not motivated to buy, sales will drop and profits will decrease.

Supplemental.

2. <u>Fundamentals of Advertising</u>, Rowse and Nolan

QUESTIONS or ACTIVITIES:

1. What is the most rewarding type of advertising?
2. In most cases, what type of advertising will take up most of the advertising budget?
3. In what section of the newspaper will advertising do the most effective job?
4. What is the most important factor in direct mail advertising?
5. What three factors should be considered in selecting a method of advertising?

Information Sheet
on
ADVERTISING

Experience has shown that most salesmen get the most out of their advertising budget through point-of-purchase advertising, outside advertising. and special promotions

Point-of-Purchase Advertising consists of displays within the place of business Items well displayed are half sold Impulse buying results in millions of dollars' worth of sales annually as the growth of supermarkets shows Good displays remind the customer of things he wants If properly grouped they will often result in sales of related items There should always be a tie-in with the various specialties and service sales programs and seasonal items should be displayed several weeks ahead of season

The trend in modern retailing is increasingly toward self-service merchandising on a supermarket scale People are naturally interested in products if it is easy for them to satisfy their curiosity, it will also be easy for them to buy Farm businesses have always used bins tri-plane tables windows counters and peg boards to display items Now however it is realized that these devices deserve to be the central theme in merchandising planning Businesses who have tried self-service merchandising have been highly successful Originality and ingenuity in displaying merchandise will be reflected in increased sales and profits

Outside Advertising, in most cases. will take up the bulk of the advertising budget It includes newspaper radio. T V handbills direct mail. and road signs The basic problem is selecting the most effective media to use The medium that is selected must produce noticeable results in the cash register Don't be satisfied with anything less

In selecting the media, consider effectiveness. cost and coverage The salesman must have knowledge of all media, including their advantages and limitations

Newspaper Advertising includes both the display and classified When you prepare display ads, make sure that the layout is attractive and that the headline will arouse interest Usually. the most successful advertising is done in the classified section. A skillfully prepared personalized classified ad in the newspaper will get results because classified readers are a voluntary audience Be sure to identify the business so there is no doubt who is doing the advertising Many equipment dealers include in all their newspaper advertising a "Special for the Week" This is a promotion in which one item is featured at a special price This takes very little space in an ad. and the results are gratifying

Advertising
(Information Sheet continued)

Direct Main Advertising can be directed toward a given group of prospects. The key is the mailing list It must be up to date and broken down by specific groups interested in specific items New names must be steadily added and old names dropped when mail pieces are returned undelivered Salesmen should feed the list with names and addresses of new prospects and customers

In a letter. postcard. leaflet, or sales flyer, personalize the message to the customer. Make the story as detailed as you wish because space is not a factor.

Radio and T V. have some definite advantages They convey fast, hard-hitting messages T. V. is high in cost but has the advantage that a machine or plant can be demonstrated to the viewers For both radio and T. V. the time of presentation is vitally important It should be when a large percentage of the prospects may be listening or viewing; it should be tied into weather and news forecasts, or other home audience programs Many businesses use spot announcements and obtain good results.

Road Signs on main roads leading to the store help in picking up transient business Signs should be erected in a solo location and kept clean and well painted.

Many dealers have found handbills to be an effective, low-cost way to advertise promotions. and parts and service specials A handbill must have an eye-catching layout and a timely interesting message

Special Promotions is an area of merchandising that is almost unlimited. Use the imagination and you will promote sales In planning these slow-season specials. consider advertising through the newspaper, by direct mail, or with handbills. The purpose is not only to announce the special but also to use reduced pricing to get the customer to purchase immediately.

Again, these specials must be tied into promotional advertising and put on display to get attention. Even though a special event is held primarily to advertise whole goods, there is no reason why you can't advertise parts and accessories at the same time.

Plan your merchandising program so it will attract buyers. Make them come to your store Include displays that will act as "sales clinchers". Finally. broaden your market with special promotions

Advertising
(Information Sheet continued)

Selling Plants

We have discussed what is needed by the salesman in the way of personal knowledge of the product and his own personal ability to sell. These are just as important in selling plants as in any other field. In selling, first of all, the customers must be induced to call upon you. This is commonly called "getting traffic".

Many methods have been used to "get traffic". Advertising is one of the best ways. Of course, advertising also takes many forms. One of the best ways of advertising to sell plants is by the use of attractive well-placed signs. They should be placed along the approaches to the sales yard. These signs should be kept in good repair and the paint job should be fresh. In some cases these signs may be landscaped themselves. Remember the principle involved in the use of signs is that too much information will not be helpful.

Another practice used by salesmen in nurseries or retail rooms where plants are sold is for the salesmen to be dressed in attractive uniforms.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Merchandising Horticultural Plants and Supplies

TOPIC Labeling and Pricing

OBJECTIVE To learn how to effectively label and price horticultural plants and supplies

INTRODUCTION: The very best of plant growing techniques and practices will not pay off unless items are properly labeled and priced A short time studying this phase of merchandising could pay off in larger profits to the plant and supply businessman.

REFERENCES Required:
Information Sheet, "Labeling and Pricing"

QUESTIONS or ACTIVITIES:

1. What is the common fault of most beginners when pricing plants?
2. What costs are involved in producing plants?
3. What percent mark-up do most nurserymen use?
4. What items will not sell at a high percentage mark-up?
5. Upon what is the percentage mark-up based?

Information Sheet
on
LABELING AND PRICING

All plants should be well-labeled so that the customer can tell what it is without asking questions Tags of various shapes and sizes have been used for this These are attached to the plants or plant containers by the use of small wires When plants can be grouped together the variety and size may be identified by the use of a single sign placed in a conspicuous spot By all means if possible use color photographs on the labels The price of the merchandise may also be placed on these descriptive labels

When pricing plants and other merchandise for the first time, the beginner normally prices his plants too low Much of the cost of production is hidden in the production of plants, transplanting, salesman's salary unsold stock shrinkage in volume, and overhead These costs must be absorbed in the selling price

There is no rule to follow in pricing nursery stock but to understand the proper method of determining the mark-up on the plant will be helpful The percentage mark-up is based on the selling price not on the cost For example if an item costs the operator 75¢ and is sold for $1 50, the mark-up would be 50% rather than 100% This common misconception has caused many retailers to sell their plants too low Normally a mark-up of 50% on plants is too low An average mark-up used by many retailers is 66 2/3% However high-priced merchandise will not sell at this high percentage An example of this is that a $1 00 item that costs only 30 or 40¢ will sell and a $15 00 item will not sell if it is priced at $30 or $40

1 What is the first thing for a salesman to think about after losing a sale?
2 Which party should bring up the subject of financing?
3 Why do customers buy products?
4 Why should high pressure not be used in making sales?
5. What is the first problem of a salesman when dealing with a customer?

Information Sheet
on
UNDERSTANDING THE CUSTOMER AND MAKING SALES

We generally come in contact with two distinct types of customers. The first type is the customer who first has to be sold on the item or need for the product you are selling. He may be a potential buyer of a piece of equipment or a new and different type of fertilizer or a new and different service which your organization can perform for him.

The second type of a prospective customer differs from the first type in only one aspect, he has already decided he needs your type product. He may be undecided about buying your brand or buying a similar product from another salesman. In a case of this kind the customer must be sold on the superior features of your product. This can be done by pointing out a person in the area who is successfully using the product which you are selling. Seeing is believing

The buying interests that cause customers to buy products are.

1. Owner's comfort and convenience
2. Performance
3. Safety - This implies safety of the operator and protection of the equipment or product.
4. Appearance
5. Length of life
6. Economy - This implies saving time, money, and labor.
7. Service
8. Prestige - This interest implies that a new owner is proud of his purchase.

Making the Approach to the Sale

Before a sale can be made, a plan has to be developed for getting the attention of the potential customer in point-of-purchase selling. This approach is not as difficult as it is in making a sale outside of the store. Farmers who come into your store are normally in search of a particular product; and if given the chance by a salesman with a pleasing personality, he will ask about the product he has in mind. If he comes in with no particular product in mind but just to browse, the salesman will need to make a sales approach if he hopes to make a sale.

A salesman should put first things first. His first problem is to get the attention of the customer. This is done in many ways and it is usually done at the same time the salesman is selling himself. It is not enough to say that the salesman must get a customer's attention, he must get his "favorable attention". A salesman who is friendly, alert, courteous, and has a confident approach to the customer will usually get his favorable attention immediately. However, his personality must be bolstered with a reasonably conservative and well-groomed appearance. This appearance should never be underestimated in getting the attention of the customer especially in the agricultural business. It is true appearance does not make the man but it does make that part of the man that the customer sees first. Many times this forms the total impression that the customer has of the salesman

Enthusiasm plays a definite part in making a successful approach and sale. It has been said that enthusiasm is contagious. If the salesman displays the idea that he is "sold" on the product, this enthusiasm is likely to carry over to the customer.

The first few seconds of the sale are very important. In getting the attention of the customer, the salesman has only obtained his temporary interest. During these first few seconds the salesman in some way should reach the customer by indicating what the product can do for him. If this is done, the customer's attention or interest is aroused. You are then in a good position to hold his interest long enough to present your product.

Holding the customer's attention or interest can be done in several ways. Usually the best way is by doing something. This means showing the product or demonstrating the product to him. The customer's normal reaction is to look, to listen, and, if pleased with the product and presentation, to buy

Making and Closing a Sale

Although most salesmen would like to close every sale, it isn't possible to get that high a batting average. After losing a sale though, a salesman should become concerned about the reason he failed. Some of the reasons for his failure to close may be found in this section on the do's and don'ts of closing sales.

Be Sincere

Make certain that statements and actions are sincere when dealing with prospects. If you make factual statements during your sales presentation, your customers will have confidence in your recommendations and will be more inclined to buy.

If you believe a customer is purchasing equipment or supplies that will not perform his job satisfactorily, you are obligated to tell him so. Part of your job as a salesman is to recommend to the customer the equipment that is matched to the job. Customer satisfaction will result from sincere opinions and efforts on your part in leading him to a wise and correct buying decision. He will gain confidence in what you say only if you are sincere.

Don't High Pressure

People object to being pressured into buying They like to believe that they make up their own minds Closing a sale without using high pressure tactics is one of the greatest challenges of salesmanship

It is easy to fall into the habit of speaking quickly, concentrating on key points, and then attempting to force the prospect to make up his mind There is such a note of urgency in presentations of this type that the prospect feels he is being high-pressured into something he is not sure about His natural reaction is to feel that something is wrong or that he should be cautious

Most people will buy when the salesman has convinced them sufficiently that the product will fill their needs The prospect must be led to believe that the decision is entirely his own The skilled salesman implants his ideas carefully He presents his proposition in such a way as to give the impression that he is helping the prospect solve his problems

Sell When the Customer is Ready to Buy

In any favorable sales presentation, there are certain times when it is logical to obtain the order Experience indicates that there are certain times when an opportunity to close seems to present itself naturally One of these times is the point when the salesman and the prospect have reached substantial agreement and the prospect appears to be reasonably satisfied with the product At this time a "psychological moment" exists and the salesman should ask for the order

Don't Oversell

Many salesmen have talked themselves out of an order because they continued to sell after the prospect has decided to buy Many times silence is the best tool

Certain questions or reactions will indicate that the prospect is seriously considering the proposal These indications are signals for the salesman to try to close regardless of when they occur in the sales presentation Here are some typical indications that the prospect is ready to buy

Understanding the Customer and Making Sales
(Information Sheet continued)

1. Favorable response to the reasons given for buying now.
2. Favorable attitude toward the benefits described on a special trade allowance that is about to expire
3. When he asks, "Is this the best price you can give me?" or "Do you have a machine already set up and ready to go?" or "Can you supply this product in a large enough quantity?"

Recognizing these and similar indications and answering to the prospect's satisfaction may induce him to buy. Don't be so absorbed in the sales presentation that you miss buying signals Remember, many a salesman has lost an order because he didn't know when to stop presenting features and ask for the order.

Be Honest About All of Your Commitments

The surest and quickest way to lose a sale is to misrepresent the facts. You can make this mistake without being conscious of doing so. For this reason, you need to have a thorough knowledge of both your product and your competitor's product so that the possibility of error or misrepresentation will be reduced to a minimum.

If you come to points in your feature-by-feature selling and the customer asks you a direct question to which you do not know the answer, don't bluff your way through. Bluffing will kill any confidence he may have in you regardless of how superior your product may be The proper thing to do is to be perfectly frank with your prospect. Tell him that you are not too sure about the information he is requesting, but that you will obtain it for him immediately. Make sure you answer the prospect's questions as soon as possible The answer can skillfully be used as a reason for calling back on a customer who is offering stiff sales resistance

Don't let a question keep you from continuing your feature-by-feature selling.

Be Persistent

Many sales have been lost because the salesman was not persistent Sales Management magazine, March 2, 1962, in an article entitled, "Giving Up Too Quickly", states

1. Almost half of all salesmen - 48 percent - quit cold after a single call on a prospect.
2. Another 20 percent make two calls before quitting.
3. Seven percent make three, and five percent make four calls.
4. The remaining 20 percent make five calls or more, and these are the men who get from 75 percent to 80 percent of the business

Understanding the Customer and Making Sales
(Information Sheet continued)

This same article points out that. "Discouragement is a luxury no salesman can afford "

It is necessary to qualify each prospect and "sense" in your own mind how near you are to closing the sale If you feel an individual is going to buy stay with him until you sell him Many sales are lost because the salesman quits too soon Customers admire a salesman who has developed a degree of persistence Persistence quite often wears down resistance Persistent salesmen make it easier for customers to buy

Don't Sell Price Sell Benefits and Advantages

A dangerous practice that many salesmen fall into is trying to arouse interest by overstressing price The weak salesman will quote price argue price and cut price at the drop of a hat What he fails to realize is that many customers are interested only in a fair price and that more times than not they are more concerned with quality and service than price

Your job is to convince your prospects of the true value of your product People will buy the most expensive items if they are convinced that they will receive their money's worth If you sell a high quality product that is priced higher than that of competition. take every opportunity to describe the features in a way that justifies the higher price Sell the benefits that make your product worth its price

Make It Easy for Prospects to Buy

There are many things you can do during the selling process that will make it easy for the prospect to buy You should practice all of them while making a sales presentation. A few methods of making it easy for the prospect to buy are

1 Know your product so that you are not required to secure additional information The lack of product information may cause you to make an extra trip to see the prospect By that time he may be out of the mood to buy

2 Know your prospect so that you can fill his needs and anticipate the sales resistance you think he might bring up during your sales story

3 Offer available financing Do not make him ask for financing arrangements In addition. offer him a payment schedule that is possible for him to complete

Understanding the Customer and Making Sales
Information Sheet continued)

4. Summarize all agreements of the sale with him so that there will be no misunderstanding on the part of either you or the buyer.

5. Lead the prospect to a decision or an agreement at every opportunity. Many prospects need assistance in making a decision. you can guide them into making a decision in your favor.

6. Stay with your equipment and the prospect while demonstrating to make certain the equipment is working properly. You can answer any questions he might have while using it. It is important when making a demonstration to have the prospect operate the equipment as soon as possible. Let him operate it and he will soon feel that the equipment is his or that he would have a difficult time getting along without it.

7. Make sure that you always have order forms. finance charts, literature, and other pertinent facts that you will need to close the sale.

8. Be ready to close at any time during your sales presentation.

There are many more techniques that make it easy for the prospect to buy. Avoid statements questions, or procedures that make it difficult for him to buy.

HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Water Absorption and Loss--Nutrient Absorption--Movement of Nutrients and Water in the Plant

1 The plant will wilt.

2. Turgid

3. If you add too much fertilizer around the roots, water absorption is slowed down because most fertilizers, chemically speaking, are salts. This can cause the plant to wilt

4. Loss of water from the plant as a vapor

5. Elements, or groups of elements, needed for plant growth

6. Xylem, Phloem

7. If you girdle a tree properly, you remove the phloem and leave the xylem intact In this way water and soil nutrients continue to move up to the top of the tree. but you prevent the movement of plant foods from the leaves to the roots. After six months to two years, the tree will usually have used up its stored food supply in the roots and it will die.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Plant Food

1 Any substance which can be used as a source of energy for carrying on the life process

2 a. Carbohydrates
  b Fats
  c. Proteins

3 a Carbon
  b. Hydrogen
  c. Oxygen

4 Energy

5 Seeds

6. Hydrogenation

7 a Carbon
  b Hydrogen
  c. Oxygen
  d. Nitrogen
  e. Sulfur
  f. Sometimes Phosphorous

8 a. Carbon
  b Hydrogen
  c. Oxygen
  d. Nitrogen

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC: The Plant Kingdom

1 Study of the classification and naming of plants

2 a. Thallus plants
  b Mosses and liverworts
  c. Ferns and club mosses
  d. Seed plants

4 Thallus plants

5. The helpful soil organisms and the nitrogen-fixing organisms found in legume nodules

6 Fungus

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Types of Greenhouses

1 Glass
Plastic

2 Fall

3. a. The clarity of glass
b. Easily installed
c. Inexpensive
d. Last for several years

4. Advantages: a Inexpensive
b. Easily installed

Disadvantages: a. Not too durable
b. Moisture collects on underside and a vibration or gust of wind makes the drops fall into the greenhouse

5 Exhaust fans

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing Maintaining and Using Structures that Aid Plant Growth

TOPIC Size and Arrangement of Greenhouses

1 Bench arrangement

2. So that the minimum lengths of mains and returns are needed between the greenhouses and the boilers

3 Provide nearly level but freely draining units that can be sterilized efficiently not be recontaminated, and be the right height and width for working with the crop

4. 2-1/2 feet

5. At least 6"

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC. Cooling the Greenhouse

1. Breaking down of the foods manufactured by the plant

2. 19.600 CFM needed for this greenhouse.
'70' x 40' = 2800 sq ft. in greenhouse, 2800 x 7CFM needed per sq. ft =19.600 CFM

3. 130.6 sq ft. of pad area
'19.600 - 150. 1 sq ft of pad area needed for each 150CFM

4. Screens can be used

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC: Heating The Greenhouse

1. Pipe coil system

2. Hot water and steam

3. Gable ends and exterior side walls

4. a. Direct-fired
   b. Indirect-fired

5. a. Vertical blow heaters
   b. Horizontal blow heaters

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining. and Using Structures that Aid Plant Growth

TOPIC Winter Protection Structures

1 You should notice where the frost will do the most damage by checking the pattern of nipping

2. Damp soil holds and releases more heat than dry soil

3 Allows sun to penetrate soil in daytime and traps this heat

4 Every side of a tree should "see" a heater

5 a Trees are still (no wind)
  b Stars out
  c Temperature around 45°
  d Dry windshields or windows

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC. Structures for Summer Heat Protection

1 a Protect foliage
  b Keep roots cool
  c Consume moisture

2 East

3 Cheesecloth, Saran

4 North and South

5. Nail each lath to a diagonal brace beneath.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing Maintaining. and Using Structures That Aid Plant Growth

TOPIC Humidity and Watering

1. Mechanical (Chapin)

2. Hand watered

3. a All plants get watered
   b Personnel will get wet
   c May ruin colored displays

4. This equipment mechanically rotates itself around a continuously 360° circle. so that each nozzle with fair pressure, will adequately cover an area with a diameter of roughly 20 feet

5. Skinner's system is a long line of pipes with nozzles drilled at regular intervals. The pipe rotates from right to left and back to right again thus covering an area the length of the pipe and a width of 15 to 25 square feet, depending on pressure

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing. Maintaining, and Using Structures That Aid Plant Growth

TOPIC Ventilation

1 Because of danger of damaging plants with the direct cold outside air.

2 Should produce a uniformly distributed. non-turbulent, air flow pattern without cold drafts on the plants in winter

3 Prevents condensation and dripping of moisture

4 May be used in winter in connection with convection tubes

5 a Cuts down on the problem of excessive humidity
  b Decreases the disease problem

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining, and Using Structures That Aid Plant Growth

TOPIC Lighting

1 Roots grow away from the light Stems grow toward light

2 16 to 18 Hours

3 Chlorophyll is destroyed

4 a Red bands
  b Blue bands

5 Length of day or period in which light is present

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

1. U L means "Underwriters' Laboratories, Inc "

2 Eight

3 II, III, IV

4. One

5. a Safe
   b Adequate
   c Expandable
   d. Efficient

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC. Origin, Composition, and Importance of the Soil

1 Topsoil
Subsoil
Parent layer

2 Climate

3 Topsoil

4 When its first plant grows, dies. and decays

5 a Different amounts of air present when soil is formed
b Amount of organic matter present
c Types of rock from which soil is formed

6 a Fertilizer elements
b Air
c Adequate water

7 a Sand
b Silt
c Clay

8 Sand

9 Climate. especially rainfall and temperature

10 Decayed plant or animal material

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Soil Moisture

1 Roots

2 Transpiration

3 Organic matter

4 During droughts

5 Size of soil particles and condition of the soil

6 Structure of soil particles is damaged

7 Organic matter

8 Air cannot get to the roots

9 Soaks in, runs off, evaporates

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC. Soil Mixtures

1. a Better aeration
   b. Greater ease of working
   c Better drainage
   d Better moisture-holding capacity

2 a Uniformity
  b Disease free
  c Low soluble salts
  d Good drainage
  e Good moisture retention
  f No shrinkage
  g Ease of preparation and storage
  h Complete availability

3 To make it uniform and to eliminate large particles

4 Power driven cement mixer or shredder

5 1 part sand
  2 parts loam soil
  1 part peat moss or leaf mold
  1/2 part dried or well-rotted manure

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPOC Mulches and Their Use

1 a Inorganic or processed
  b Organic

2 Hard to hold in place and can become unsightly

3 Nitrogen

4 Mid-spring

5 Peat moss

6 Crushed stone, gravel chips, pebbles

7 a Dilutes the soil and usually increases root growth
  b Promotes soil granulation
  c Improves and stabilizes soil structure
  d Affects pH slightly
  e Adds some fertilizer materials
  f Leads to nitrogen deficiency in cases where carbonaceous materials are added
  g Serves as food for micro-organisms
  h Introduces weed seeds in the soil in some cases

8 Any material applied to the surface of a soil primarily to conserve moisture, maintain a uniform temperature, and to help control weeds

9 Highly inflamable

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Fertilizer Nutrients

1 Nitrogen
  Phosphorus
  Potassium (Potash)

2 Nitrogen

3 Potassium

4 a Applying dry fertilizers when leaves are wet
  b Planting seeds directly on a layer of fertilizer
  c Spilling fertilizer in heaps on the lawn

5 Before a rain or watering

6 a Carbon
  b Hydrogen
  c Oxygen

7. a Calcium
  b Magnesium

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Soil Organisms

1 a Bacteria
  b Fungi
  c Algae

2 1/1000 of the weight of an acre foot of soil

3. Penetrate plant tissue and cause root damage

4 Causes a great number of diseases

5 Convert nitrogen in the air to available nitrogen for plants (only certain bacteria)

6 a Add organic matter
  b Add lime
  c Add moisture

7. a Soil sterilization with steam
  b Soil fumigation or drenching with chemicals
  c. Seed treatment

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growing Media

TOPIC. Soil Sterilization

1 a. To kill soil-borne insects
  b. To kill harmful bacteria, fungi, and virus organisms
  c. Destroy weeds
  d. Promote soil granulation

2. a. Existing steam boilers
  b. Portable oil-fired steam boilers
  c. Package steamers
  d Bricked in permanent type boilers

3. Because of poor heat conduction and distribution

4. Soil thermometer

5. Burns roots

6. a. Soil temperature
  b. Soil moisture
  c. Soil texture
  d. Organic matter content
  e. Seals needed
  f. Soil type
  g. Depth of application

7. a. Avoid inhaling the material.
  b. Avoid contact to the skin.
  c Allow sufficient time for aeration after the material is applied.

8. Steam

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growing Media

TOPIC: Plant Growing Media Other Than Soil

1. Sand

2. Brown to Black

3. 10 to 20 Times its own weight

4. Expands or Explodes

5. a Maple
   b. Oak
   c. Sycamore
   d Elm

6 Shredded bark, sawdust, and wood shavings

7. They failed to add nitrogen

8 a Safe and easy to use
   b Chemically inert
   c. Completely sterile
   d Excellent water retention
   e. Long lasting
   f. Specially graded

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC. Introduction To Propagation

1 Plant propagation is the controlled reproduction of plants in order that man can have selected plants which are of specific value to him

2. Sexual or asexual

3. Greenhouses, hotbeds. and propagating case

4. Ventilation, temperature, shade and light

5 Loose, light, free from seeds. nematodes and disease organisms

6 Sand, peat, sphagnum moss, vermiculite and perlite

7 Methyl bromide

8. Clay pots, peat pots. and plant bands

9 To promote rooting of cuttings

10 Small rectangular containers used for seed germination

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC Propagation From Cuttings

1. Cheaper, faster, maintains the characteristics of the original plant

2. Winter months or dormant seaso..

3. Coleus, chrysanthemum, geranium, and carnation

4. From new growth in spring or early summer

5 60-70° at night, 75-85° during the day
Rooting medium 70-75°

6. a Should come from a healthy and moderately vigorous plant
   b Should come from average growth from portions of a plant in full sun
   c. Should be 3 to 5" long with 2 or more nodes

7. Serves as a protective layer which retards the development of decay on cuttings that are fairly slow to root

8. One which can be kept uniformly moist. provide good drainage and aeration

9 a Clean-sharp sand
   b. Vermiculite
   c. Sand and peat moss mixture, equal parts of each
   d Peat moss and perlite, equal parts of each

10. When they are 1/2 to 1" long

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC: Propagation by Layering

1 To induce root formation

2 Ivy, philodendrons, blackberries, and strawberries

3. Plants such as crotons, hibiscus, dracaenas, and rubber plants

4 To produce plants which do not produce true from seed, also they may be produced quicker

5 Knife, toothpick or small piece of wood, growth hormone, spahgnum moss, and plastic film or aluminum foil

6. Spring and summer months when high temperatures and high humidity contribute toward quicker rooting

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC. Propagation by Division

1. Primrose Jasmine Chrysanthemums
Fig Trees Sansevieria
Iris Geraniums

2. Dormant season

3. They get too big for their space or they become weakened due to competition.

4. Divide in autumn or early spring when plants are dormant

5. Divide with a hand fork, knife, or hatchet, if clumps are large. Some can be soaked in water to loosen dirt from around roots Pull apart and cut old leaves back about 1/2 and be careful with young growth

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation by Grafting and Budding

1 Stock is the name for the plant on which you graft The scion the piece of stem which is grafted to the stock and becomes the new plant

2 It is the soft layer of tissue on a stem or root that lies between the bark and the wood

3 Any time during the growing season
Usually it is more satisfactory if done before buds begin to swell in late winter or early spring

4 A sharp knife makes a clean slice thereby insuring maximum contact of cambium layers

5 "T" budding and Patch-budding

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Propagation

TOPIC: Propagation From Seed

1. From commercial producers of seeds

2. It must be finely screened, porous, loose, and have a good water-holding capacity. Also, it should be sterilized and in most cases low in nutrients.

3. In most cases 70°F.

4. The seed will rot.

5. 50-60°

6. To reduce damping off

7. a. Name of plant or variety
   b. Date seeded
   c. Student's name
   d. Special treatment, if any

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC. Developing A Plant Breeding Vocabulary

1. Emasculation

2. A flower having both stamen and pistil

3. Stigma
   Style
   Ovary

4. Ovary

5. F_1, F_2, etc

6. Anther

7. Yes

8. Style

9. Ask the student what he has learned about D. N. A. (desoxyribonucleic acid)

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC. Plant Selection and Fundamentals of Plant Breeding

1. The process that occurs in nature whereby strong and well-adapted plants survive while weak and poorly adapted plants eventually die out.
2. Asexually and sexually
3. Flower
4. Stamen
5. Staminate flowers
6. Pollination is the transfer of pollen. Fertilization is the union of the germ cells. In other words, pollination is the trip over and fertilization is the actual joining of the male and female germ cells

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Propagation

TOPIC: Heredity

1. Dominant

2. Cross-pollination

3. One

4. No

5. When a self-pollinated plant produces plants unlike itself

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC General Breeding Techniques

1 List of equipment
Magnifying glass (10 or 15 power)
Tweezers
Small sharp-pointed scissors
Camel-hair brush
Small containers or vials
Tags
Alcohol
Rubber bands
Soft wire
Paper or cellophane bags
Paper clips
Notebook

2. Just before the flower opens

3 Morning, as it is cooler

4. Stamens must be removed

5. Steps in labeling
Write a. The number that you have assigned or the variety name of the seed parent.
b The letter X.
c The number or variety name of the pollen parent.
d. The date the cross was made.
Example on page 19 of reference

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Nursery Plant Production

TOPIC· Transplanting Ornamental Trees and Shrubs

1 As soon as they begin to arrive at the nurseries or in late fall or early winter

2 It should be at least one to two feet wider and at least six inches to a foot deeper than the roots of the plant

3 One-third

4. Balled and burlapped

5. One which is over five inches in diameter

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Nursery Plant Production

TOPIC Care and Maintenance of Plants

1 If you have no good reason for pruning a plant, put the tools away without using them

2. High quality, sharp, and well adapted to the job on hand

3 At any time

4. Growth habit and blooming characteristics of the plant

5. About one-third

6. To tidy up their appearance, to control size and to improve their health, growth habits, and blooms

7. They should be pruned between leaf drop and first spring growth.

8. After they flower

9 After they flower

10 A flat top hedge is more difficult to maintain and clip and is more easily broken down by weather and other causes

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Floral Crop Production

TOPIC: Introduction to Floral Crop Production

1. Flowers cannot be stored for long periods of time.

2. a. Chrysanthemum
   b. Rose
   c. Carnation

3. Directly from the producer

4. "Say it with flowers."

5. <u>Southern Florist and Nurseryman</u>

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC. Growing Annuals

1. Summer

2. Alyssum

3. a. Marigold
   b. Nasturtium
   c Zinnia

4. Water annuals enough to keep the roots from drying out, but do not "drown" them.

5. Pulled up and thrown away

6. Summer

7. No

8. Fiery red

9. Rock gardens, banks

10. Often subject to wilt

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Perennials

1. Chrysanthemum

2. Corsages

3. Every two years

4. Cut them back after spring bloom and give them a feeding.

5. About every twenty years

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Bulbs

1. Summer

2. The foliage is needed to restore energy to the bulb.

3. Fungicides and insecticides

4. Short underground stem on solid basal plate, surrounded by fleshy leaves that store food for future growth

5. A creeping underground stem often thick with stored food

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Poinsettias

1 Nitrogen

2 Red, white, and pink

3 White Fly

4 Lack of nitrogen or lack of water

5 Poorly aerated soil

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Chrysanthemums

1 Fall

2 Aphids

3 60° (Some varieties need 65°)

4. Yellow

5. To make a short day which helps regulate blooming

6 All pinches must be made into the soft growth, usually 7 days after planting.

7 A slow start. often trouble with rotting of cutting

8 They should be sprayed overhead lightly the first 3 or 4 days.

9 Entire year with proper day length control

10 Sterilized

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Geraniums

1 They are poor shippers and will lose foliage

2 Pinched

3 Red

4 Plastic tube system

5 a Use a fungicide on cutting
  b Sterilize propagating materials
  c Use disease-free cuttings
  d Sterilize soil

6 Light pink

7 60 degrees night. 65-70 degrees day

8 Air freight

9 Four inch

10 The seed for most desirable varieties has not been available.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Hydrangeas

1 Two spotted mite (red spiders)

2 Wilt severely

3 March to May

4 Easter. Mother's Day

5. Bud rot

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Establishing and Caring for Lawns

TOPIC Turf Grasses for Texas

1 Geographic location the amount of water available for irrigation. the degree of shade present the time and money the home owner is willing to spend for establishment and the expected usage

2. Warm-season and cool-season

3. a Does not grow in shade
   b Turns brown after frost in the fall
   c Is more of a nuisance than other turf grasses

4 a Is susceptible to certain diseases
   b Is more susceptible to iron chlorosis
   c Is attacked by insects
   d Needs more water for survival
   e Will not survive at as low temperatures as will Bermuda
   f Is a broad-leaved coarse-textured plant

5 a Is attractive and wear-resistant
   b Is not invaded by weeds
   c Is subject to little damage from insects and diseases

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Establishing a New Turf

1. Preparation of the soil, establishment of the grass, care and maintenance.

2. Peat, compost, gin trash, sawdust, and leaf mold.

3. Fertilizer applications should be made at rates and in combinations suggested by soil tests.

4. The type of grass used and the rapidity of cover desired.

5. In order to develop a deep root system.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Managing an Established Turf

1. Feeding, watering, aerating, and moving
2. It produces vegetative growth and gives the plant a deep green color.
3. It stimulates development of a good root system.
4. Stunted growth of the entire plant. The leaves are relatively small, thin, and yellowish-green to yellow. They show yellow to brown color at the tip of the leaf and down to the midrib.
5. Slow growth of the entire plant. leaves are an unhealthy dark green, roots are stunted.
6. Pale, bleached leaves
7. Spring and early fall
8. Applying iron sulfate or iron chelate
9. Produce shallow, weak root systems, which does not allow efficient utilization of plant food or moisture in the soil.
10. It allows air or oxygen to get into the soil, water to move into and through the soil, and the soil to hold more water.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Turf Problems

1. a. Weed
   b. Disease and insect control
   c. Clover in the turf
   d. Renovation of old lawns

2. By proper turf grass management

3. 2-4-D

4. Brownpatch occurs as irregularly shaped brown areas, usually circular, 4 to 48 inches in diameter. The fungus gives the grass a blue, water-soaked appearance. As the disease spreads, the dark areas turn light brown.

5. A fungicide containing PCNB

6. a. Chlordane
   b. Dieldrin
   c. D. D. T.
   d. Toxaphene
   e. Malathion
   f. Aldrin
   g. Heptachlor
   h. Lindane

7. When the old turf is run down, weedy, and in a generally undesirable condition, or when a new species is to be introduced.

8. a. Chlordane
   b. Lindane
   c. Sulfur
   d. Toxaphene

9. a. Diazinon
   b. Ethion
   c. Trithion

10. Five gallons of spray mixture per 100 square feet of lawn area.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects Plant Diseases. and Other Pests

TOPIC. Causes of Plant Diseases

1. a. Fungi
   b. Bacteria
   c. Viruses
   d Nematodes

2. The manufacture of sugars from carbon dioxide and water with the aid of sunlight and chlorophyll

3 An agent that transmits disease-producing organisms.

4 Prevention by careful pruning

5. Tiny, thread-like plants, commonly called molds

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC: Identifying Plant Diseases

1. Proper identification.

2. Failure to produce seed or fruit.

3. Liquid discharge from diseased tissues.

4. Microscopic examination of roots.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC Application and Safety Precautions of Horticultural Chemicals

1 Welfare of the people

2 Welfare of the plant

3 Effectiveness of the material in controlling the pest or disease

4 Hydraulic sprayers

5 Hang the hose on a rack with nozzle pointing upwards

6 a Read label precautions
  b Keep chemicals locked up when not in use
  c Keep children away while using
  d Don't smoke while spraying
  e. Don't spill material on skin or clothing
  f Wash exposed areas of skin immediately after job is completed
  g Never spray when windy
  h. Spray edible plants with great caution

7 The chemical must touch the insect before death occurs.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC. Controlling Leaf Diseases

1. Water and fertilize properly and remove dead limbs

2. Caused by fungi which live on secretions from aphids and immature stages of white fly

3 Caused by excess rain or over watering

4 a Malathion
  b Lindane

5. Just before buds open and after flowering

6 Two to four weeks or as needed

7 Most often caused by lack of iron

8 Fungus disease

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC: Controlling Stem, Branch, and Trunk Diseases

1. Prune infected portions sterilizing shears between each cut.
2. If little dodder is present remove by hand Destroy badly infected plants
3. Reduces the amount of sunlight for trees
4. Twigs and limbs
5. Fungi
6. Install in the infected parts of tree to drain the excess fluid and relieve pressure.
7. By birds
8. Fungi and algae

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Root Diseases

1. Carbon bisulfide soil fumigation
2. Methyl bromide soil fumigation
3. Removing and destroying diseased roots
4. Ten (10) feet
5. East and southeast Texas
6. 75-95 degrees

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC: Controlling Diseases Affecting the Entire Plant

1. Symptoms exhibited by aster yellows that are not exhibited by verticillium wilt:
   a. Bushy with numerous secondary shoots
   b. Leaves may develop a slightly reddish, brownish, or purplish tinge in later stages.
   c. Flower parts may develop into leafy structures.

2. DDT

3. Chloropicrin

4. West

5. Commercial growers or trained personnel

6. Miticide

7. Zineb, CM-19

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Lawn and Turf Diseases

1. Handpick and destroy mushrooms or toadstools.
2. Iron sulfate or iron chelate
3. Irregular-shaped dead areas from a few inches to more than several feet in diameter
4. Wash off with water applied as a spray with 20 to 30# pressure.
5. Zineb, Captan
6. One to two weeks before disease usually appears and a second application after disease appears. Then apply as needed.
7. Apply chemicals as needed in early stages of disease.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant and Soil Insects and Methods of Control

1. Slugs have no shells

2. Spring

3. Spray before eggs hatch and prune

4. Roots

5. Sandy soils

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Nematodes

1. a. Select a plant that is partly alive
   b. Dig the plant instead of pulling it.
   c. Wash the soil from the roots and allow a few minutes for drying.
   d. Place the specimen in a polyethylene container and tie it securely.
   e. Fill out form D-418, available from your county extension agent.
   f. Place bag and D-418 in a box and send it to the research center.

2. Root knot nematode

3. Before spending a large amount of money for chemicals, determine if nematodes are causing a significant amount of damage to justify the expense and labor.

4. a. Crown gall
   b. Nodules from nitrogen fixation

5. Tomato, okra

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Control of Moles, Gophers, Birds, Deer, and Ants

1. By conical mounds of dirt pushed up from their main run
2. Baiting and trapping
3. Serious injury might occur to small children or dogs.
4. Gophers open their tunnels; moles do not.
5. Place chicken wire at the bottom and sides of planting holes.
6. Starlings
7. Portable bird protectors made of scrap lumber, chicken wire, or cheesecloth.
8. Fencing

for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects Plant Diseases. and Other Pests

TOPIC. Causes of Plant Diseases

1. a. Fungi
   b. Bacteria
   c. Viruses
   d Nematodes

2. The manufacture of sugars from carbon dioxide and water with the aid of sunlight and chlorophyll

3 An agent that transmits disease-producing organisms

4 Prevention by careful pruning

5. Tiny, thread-like plants. commonly called molds

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC: Identifying Plant Diseases

1. Proper identification.

2. Failure to produce seed or fruit.

3. Liquid discharge from diseased tissues.

4. Microscopic examination of roots.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC Application and Safety Precautions of Horticultural Chemicals

1 Welfare of the people

2 Welfare of the plant

3 Effectiveness of the material in controlling the pest or disease

4 Hydraulic sprayers

5 Hang the hose on a rack with nozzle pointing upwards

6 a Read label precautions
  b Keep chemicals locked up when not in use
  c Keep children away while using
  d Don't smoke while spraying
  e. Don't spill material on skin or clothing
  f Wash exposed areas of skin immediately after job is completed
  g Never spray when windy
  h Spray edible plants with great caution

7 The chemical must touch the insect before death occurs.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Leaf Diseases

1. Water and fertilize properly and remove dead limbs

2. Caused by fungi which live on secretions from aphids and immature stages of white fly

3 Caused by excess rain or over watering

4 a Malathion
  b Lindane

5 Just before buds open and after flowering

6 Two to four weeks or as needed

7 Most often caused by lack of iron

8 Fungus disease

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Stem, Branch, and Trunk Diseases

1. Prune infected portions sterilizing shears between each cut.

2. If little dodder is present, remove by hand. Destroy badly infected plants.

3. Reduces the amount of sunlight for trees

4 Twigs and limbs

5 Fungi

6. Install in the infected parts of tree to drain the excess fluid and relieve pressure.

7. By birds

8. Fungi and algae

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Root Diseases

1. Carbon bisulfide soil fumigation
2. Methyl bromide soil fumigation
3. Removing and destroying diseased roots
4. Ten (10) feet
5. East and southeast Texas
6. 75-95 degrees

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects. Plant Diseases, and Other Pests

TOPIC: Controlling Diseases Affecting the Entire Plant

1. Symptoms exhibited by aster yellows that are not exhibited by verticillium wilt:
   a. Bushy with numerous secondary shoots
   b. Leaves may develop a slightly reddish, brownish, or purplish tinge in later stages.
   c. Flower parts may develop into leafy structures.

2. DDT

3. Chloropicrin

4. West

5. Commercial growers or trained personnel

6. Miticide

7. Zineb, CM-19

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Lawn and Turf Diseases

1. Handpick and destroy mushrooms or toadstools.

2. Iron sulfate or iron chelate

3. Irregular-shaped dead areas from a few inches to more than several feet in diameter

4. Wash off with water applied as a spray with 20 to 30# pressure.

5. Zineb. Captan

6. One to two weeks before disease usually appears and a second application after disease appears. Then apply as needed.

7. Apply chemicals as needed in early stages of disease.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant and Soil Insects and Methods of Control

1. Slugs have no shells

2. Spring

3. Spray before eggs hatch and prune

4. Roots

5. Sandy soils

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT · Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC Nematodes

1. a Select a plant that is partly alive.
   b. Dig the plant instead of pulling it
   c. Wash the soil from the roots and allow a few minutes for drying.
   d. Place the specimen in a polyethylene container and tie it securely.
   e Fill out form D-418, available from your county extension agent
   f. Place bag and D-418 in a box and send it to the research center.

2. Root knot nematode

3 Before spending a large amount of money for chemicals, determine if nematodes are causing a significant amount of damage to justify the expense and labor

4. a. Crown gall
   b. Nodules from nitrogen fixation

5. Tomato, okra

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Control of Moles, Gophers, Birds, Deer, and Ants

1. By conical mounds of dirt pushed up from their main run
2. Baiting and trapping
3. Serious injury might occur to small children or dogs.
4. Gophers open their tunnels; moles do not.
5. Place chicken wire at the bottom and sides of planting holes.
6. Starlings
7. Portable bird protectors made of scrap lumber, chicken wire, or cheesecloth.
8. Fencing

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Weeds

1. Water should be applied.

2. Hoe

3. Ice pick or screwdriver

4. Shrubs form a shade in which weeds do not thrive.

5. Apply organic mulch two to three inches deep.

6. Wear gloves.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC Principles Used to Prevent Personal Injury

1. Legs

2. One pulley only changes direction of force

3. Jack

4 Wet the soil 4 to 5 days before digging

5 Hook a 1/2" pipe onto a hose and beat the bottom end into a flattened or pointed opening. This will enable you to stick the pipe down into the hole where the force of the water through the small opening will loosen the soil

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Operating and Maintaining Horticultural Equipment

TOPIC: Selection and Maintenance of Horticultural Hand Tools

1 Tools are very personal pieces of equipment and all experienced gardeners have their favorites

2. Scoop

3. 6"

4. Sharpen the hoe each time you take it into the garden.

5. Scuffle hoe

6. a Fan-shaped
   b Rectangular

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Maintaining Small Power Equipment

1. a. Periodic equipment inspection to discover situations which may lead to equipment breakdown
   b. Upkeep to minimize wear or to remedy potential trouble

2. Make an overall check and properly service equipment.

3. Water condenses more rapidly in a partially filled tank.

4. Gasoline or other solvents

5. Tension and wear

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC Operating and Maintaining Lawn Mowers Safely and Effectively

1. a. Reel
   b. Rotary
   c. Sickle bar

2. Mowing too close

3. Disconnect the spark plug wire so that a spark cannot jump

4 Cutter bar and knife

5 The clippings will smother the grass

6. Leaves produce food for the plant If leaves are cut too short, the health and vigor of the lawn will be greatly reduced

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Operating and Maintaining Horticultural Equipment

TOPIC: Operating Rotary Tillers Safely and Effectively

1 a Front tine
  b Rear tine

2 Front tine

3 Rotation of the tine

4 Raise the depth bar

5 Check to make sure that all clutches and belt tension pulleys are disengaged

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Operating and Maintaining Horticultural Equipment

TOPIC Operating Garden Tractors Safely and Effectively

1 The tractor must have enough horsepower to operate the power sickle bar

2 3 1/2 – 10 horsepower

3 Below the rear axle level

4 Riding lawn mowers are designed only for mowing. Small tractors are designed for several types of attachments

5 a Automotive
  b Belt type

Answer Sheet

HORTICULTURAL OCCUPATIONS

UNIT Developing and Maintaining the Landscape

TOPIC Introduction to Home Landscaping

1 a Art
  b Engineering
  c Horticulture

2 a Homeowners who purchase subdivision or housing development homes
  b Families who buy new homes already designed and constructed with no specific client in mind
  c Families who purchase a lot. have their home especially planned and constructed for them on the lot
  d Families who now live in older homes and desire to remodel or redesign their gardens

3 They do not fit into our mechanized way of living

4 Climate varies

5 The cost is included in the price of plants

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting the Site

1. General location

2 Zoning prevents businesses from moving into a residential section.

3. No

4. a. Privacy is difficult
   b Require installation of additional utilities, walks, and drives.
   c. Outdoor space is limited.
   d. More noise from traffic

5. a Drives and sidewalks are too steep.
   b Lawn is more difficult to keep.

6. South. Sunlight can be better controlled

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Developing and Maintaining the Landscape

TOPIC Scheduling Landscape Development and Beginning Plans

1. A well-planned garden is one that is livable, interesting, beautiful, easy to maintain, and where relationships between outdoor and indoor areas are coordinated properly

2. Drives and walks

3. Trees are essential for shade in Texas.

4. Provide privacy and assist in temperature control

5. a There must be a program for site and landscape development.
   b There must be a plan

6. A piece of real estate which may be merely a lot or one with a home on it.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Analyzing Problems and Determining Needs

1. a. Suitability
   b. Function
   c Economy
   d. Beauty

2. Deciding and analyzing specific problems of a chosen site

3. a. Do you prefer them to be beautiful and pleasant?
   b. Do you want them to make you feel comfortable?
   c. Do you care whether they fit together well and serve their purpose?

4. a Space
   b. Garden development
   c. Maintenance

5. a. Individual taste
   b. Past environment

6. No. It is even hard for professionals.

  d Place for private living

4 General living area

5 Bedroom area

6 a Formal
  b Informal

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting Plants

1. 12-25 feet

2. 6-8 feet

3. Dwarf shrubs

4. The roots may clog drain pipes.

5. Broadleaf evergreen

6. a. Watering
   b. Mowing
   c Edging
   d. Clipping
   e. Weeding
   f. Fertilizing
   g. Controlling insects

7. a. Privets
   b. Arborvitae

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Developing and Maintaining the Landscape

TOPIC: Grading, Drainage, and Landscape Structures

1. Using splash blocks
2. No
3. Building a wall around it and leaving the grade unchanged in the immediate area
4. Making them too narrow
5. 4 feet

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Merchandising Horticultural Plants and Supplies

TOPIC: Developing Personal Traits

1. a. Knowledge of self
   b. Knowledge of people
   c. Knowledge of product

2. a. Experience
   b. Observing others

3. a. Promotions
   b. Dollars (profits)

4. Analysis of sales

5. Diligence and perseverance

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Merchandising Horticultural Plants and Supplies

TOPIC: Displaying

1. Where they can be seen by the greatest number of people

2. To put merchandise where customers can see it and serve themselves

3. Familiar products, bulk seeds, or other seasonal items

4. Items that are to be "pushed"

5. a Well stocked
   b Safe
   c At a convenient height

6. To stop the customer and bring him into the place of business

7. It does not attract customers

8. The traffic pattern of the customers

9. In beds

10. Eight feet

INTRODUCTION

Student: ______________________ School: __________________________

Date: ________________________ Score: ___________________________

Fill in the blanks.

1. ____________ is the study of plants.

2. There are over _______________ kinds of plants found in the world.

3. ______________ and ___________ are carbohydrates.

4. Van Helmont did an experiment to determine what made plants grow. His conclusion was that _______________ alone produced growth.

5. Plants differ from animals in that they produce food from _______________ and _______________.

Topic Test
on
PHOTOSYNTHESIS

Student: ______________________________ School: ________________________________

Date: ________________________________ Score: _________________________________

Fill in the blanks:

1. ______________________ is the process by which liquids and gases move from an area of high concentration to an area of low concentration.

2. ______________________ means light.

3. All substances are made up of_________.

4. Photosynthesis requires four components. They are ____________________________,
_______________________, ______________________, and ____________________.

5. When atoms are combined, we call them a ____________________.

Topic Test
on
RESPIRATION

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

Fill in the blanks:

1. Raw materials for respiration are ______________ and ______________.

2 Energy is ______________ during photosynthesis.

3. Respiration ______________ dry weight. (increases or decreases)

4 Plants release ______________ at night. (what gas?)

5 ______________ is the release of chemical energy.

Topic Test
on
WATER ABSORPTION AND LOSS--
NUTRIENT ABSORPTION--
MOVEMENT OF WATER AND NUTRIENTS IN THE PLANT

Student: ______________________ School: ________________________

Date: ________________________ Score: _________________________

Fill in the blanks:

1. __________ are elements, or groups of these elements, needed for plant growth.

2. Eash vascular bundle has two types of conductive tissues called the ____________ and ____________

3 ________________ occurs from plant injuries.

4. __________________ is the loss of water from the plant as a vapor.

5 The principal water-absorbing structure is the _____________ _____________.

Topic Test
on
PLANT FOOD

Student: ____________________ School: ____________________

Date: ____________________ Score: ____________________

Fill in the blanks:

1. Examples of the carbohydrates include the sugars, starches, and ____________.

2 A pound of __________ has about 2-1/4 times as much stored energy as a pound of sugar

3. ____________ is the principal part of lean meat.

4. ____________, ____________. ____________, and ____________ make up about 97% of the dry weight of most plants.

5 The "____________ elements" are those which the plant must have in order to survive.

Topic Test
on
THE PLANT KINGDOM

Student: ____________________ School: ____________________

Date: ____________________ Score: ____________________

Fill in the blanks:

1. ____________ plants cause many diseases of higher plants by attacking, multiplying, and living in or on the higher plants.

2. The botanist classifies the seed-producing plants according to their ____________ ____________.

3. Helpful soil organisms and the nitrogen-fixing organisms found in legume nodules are examples of ____________ bacteria.

4. ____________ forms a green scum on ponds and lives in both fresh water and sea water.

5. The plant world has been divided into ____________ divisions.

Topic Test
on
TYPES OF GREENHOUSES

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

PART I: Fill in the blanks:

1. ______________ ____________ handles the ventilation problem in greenhouses with no ventilators.

2. The ________ is the season for repairing greenhouse coverings.

3. It is necessary to provide a good means of exchanging the greenhouse air with outdoor air in order to regulate the greenhouse temperature. Adjust the __________, provide air movement around the plants, and introduce new supplies of __________ and carbon dioxide.

PART II. True or False

________ 1 Vinyl film is more durable than polyethylene.

________ 2 The exterior of a greenhouse does not need to be painted more often than seven years.

________ 3 Film plastic eliminates the problem of dripping water in the greenhouse.

Topic Test
on
SIZE AND ARRANGEMENT OF GREENHOUSES

Student. ______________________ School. ________________________

Date. ________________________ Score ________________________

True or False.

__________ 1 The depth of a bench for cut flowers needs to be at least twelve inches

__________ 2 The best height for pot plant benches is 2-1/2 feet

__________ 3 Before the type of greenhouse is chosen and built, a careful study should be made of the best bench arrangement for the crops to be grown

__________ 4. Wood contracts when it is wet; so boards must be fitted close together when making wooden benches

__________ 5 One of the best bench making materials for drainage and air circulation is one inch by one inch welded wire fabric.

on
COOLING THE GREENHOUSE

Student: ______________________________ School: ______________________________

Date: ______________________ . ____ Score: ______________________________

Problems:

1. If a greenhouse was 100 feet long and 40 feet wide, how many square feet would it contain? ____________________ (answer)

2 How many CFM would need to be exhausted for a greenhouse containing 1000 square feet? __________________ (answer)

3. How many square feet of padded area will be needed in a greenhouse that requires 7500 CFM to be exhausted? ____________________(answer)

Work here

Topic Test
on
HEATING THE GREENHOUSE

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

<u>True</u> or <u>False</u>:

________ 1. In vertical blow heaters the shaft is vertical and the fan blade is horizontal.

________ 2 Direct-fired units are those which contain a combustion unit right in the unit itself

________ 3 In recent years the use of unit heaters for heating greenhouses has decreased considerably.

________ 4. The oldest and most conventional heating system is the pipe coil.

________ 5. The coldest spots in the greenhouse are the exterior side walls and gable ends.

Topic Test
on
WINTER PROTECTION STRUCTURES

Student. ______________________ School: ______________________

Date. ______________________ Score ______________________

Fill in the blanks:

1 ____________ gardens often have definite thermal belts and artic regions.

2 The most dangerous spots for frost damage are stretches of open ground exposed on all sides, particularly to the ____________ sky

3 Regardless of what kind of shelter you use. keep soil ____________ around plants

4 ________ soil holds and releases more heat than ________ soil.

5 ____________, made of double strength glass and available in several sizes, are set side-by-side to protect large areas.

Topic Test
on
STRUCTURES FOR SUMMER HEAT PROTECTION

Student ______________________ School ______________ ___________

Date ________________________ Score ________________________

Fill in the blanks.

1 A lath sunscreen should be placed so the laths run in a _____________ and _______________ direction

2 If you like to grow ________________ loving flowers such as tuberous begonias and cyclamens, you may want a permanent display structure

3 From sunrise to __________ o'clock in the morning there is very little heat accumulation

4 The subject of ___________ in the garden is frequently ignored or misunderstood - particularly by the beginner.

5 A structure facing an _____________ direction is ideal, especially if you live in a hot summer area

Topic Test
on
HUMIDITY AND WATERING

Student ______________________ School ______________________

Date ______________________ Score ______________________

True or False

________ 1 The majority of bedding plants are hand watered

________ 2 There is no equipment available for the purpose of watering pot plants

________ 3 Watering of greenhouse cut flower crops by mechanical means is a well-established, proven practice

________ 4 Rainbird-type nozzle systems consist of long lines of pipe with holes drilled in each end

________ 5 Most growers use pipe systems for watering bedding plants

Topic Test
on
VENTILATION

Student. ____________________ School. ____________________

Date. ____________________ Score ____________________

True or False

_________ 1 The disadvantage of using humidistats to control fans is that the problem of excessive humidity becomes greater

_________ 2 Thermostatically-controlled systems respond quickly to changing outdoor temperatures

_________ 3 The thermostat controlling the first stage fans should be set several degrees above the setting of the heating thermostat

_________ 4 Motorized roof ventilators can be controlled automatically

_________ 5. Exhaust fans in cooling systems may be used during the winter months if a convection tube is attached

Topic Test
on
LIGHTING

Student: ____ ____________________ School: ________________________

Date: ____________________________ Score: ________________________

True or False:

_________ 1 Certain kinds of seed require light in order to germinate.

_________ 2 Plants are classified into two groups in regard to light intensity, low-energy and high energy.

_________ 3. Long day plants require from 8 to 12 hours of light per day.

_________ 4. Research studies show that plants utilize chiefly three different wave length regions of radiant energy, the green, orange, and yellow.

_________ 5. White light is a mixture of all colors but white light of incadescent lamp is rich in red.

Topic Test
on
WIRING AND ELECTRICAL CONTROLS

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

Fill in the blanks:

1. The basic requirements of any well-planned wiring system are that it shall be ____________, ____________, ____________, and efficient.

2. Only the first requirement, ____________, will be achieved by compliance with the National Electric Code. The others depend on careful planning.

3. General lighting circuits should have a maximum of ________ outlets per circuit

4. Provide individual circuits for motors ____________ horsepower and larger

5. Minimum wire size for general purpose circuits should be ________ with 15 ampere protection.

Topic Test
on
ORIGIN, COMPOSITION, AND IMPORTANCE OF SOILS

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

PART I: Fill in the blanks:

1. The largest of the soil particles is __________.

2. Decayed plants and animal material is called ______________.

3. ______________ and ______________ determine the rate of soil formation.

4. Clay feels like ____________ rubbed between the fingers.

5. The difference in texture of soils is caused by the different sizes of soil __________.

PART II: List:

1. Three (3) layers of soil from top to bottom:

   a. ______________________

   b. ______________________

   c. ______________________

2. Three (3) factors that are responsible for differences in soil color:

   a. ____

   b. ____

   c. ____

Topic Test
on
SOIL MOISTURE

Student: ______________________________ School: __________________________________

Date ________________________________ Score: __________________________________

PART I: Fill in the blanks:

1. Moisture moves through the soil in all directions, even against gravity by _______________ movement.

2. In _________ textured soils, the particles are closer together and the attraction between soil and water is greater.

3. Much soil moisture can be lost when capillary water moves to the surface and _____________________.

4. All living cells carry on __________________________.

5. Movement of air through the soil is called _________________________.

PART II: Check T for true or F for false:

T	F	
____	____	1. Soils should be worked while in a wet condition.
____	____	2. It is possible to change water-holding capacity of soil.
____	____	3. Underwatering causes decreased aeration.
____	____	4 Sandy soils require more frequent watering than heavy clay soils.
____	____	5. Oxygen must be present for respiration to occur.

Topic Test
on
SOIL MIXTURES

Student: ____________________ School: ____________________

Date: ____________________ Score: ____________________

Fill in the blanks:

1. ______________ soils are a mixture of sand, silt, and clay.
2. ______________________ increases aeration of soil.
3. Loam soils become ________________ after watering.
4. For large scale mixing operations, use a power driven cement mixer or ____________________.
5. Loam soils often ______________ after drying.

List:

6. The characteristics of a good mixture:

a. ______________________________

b. ______________________________

c. ______________________________

d. ______________________________

e. ______________________________

f. ______________________________

g. ______________________________

h. ______________________________

Topic Test
on
MULCHES AND THEIR USE

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

PART I: Fill in the blanks:

1. The most common mulch is ______________.

2. The time to apply mulch to the garden on established plants is in ____________.

3. Additional ______________ should be applied to a crushed corncob mulch.

4. ________ may be produced during decomposition of lawn clippings.

5. A light spray of ____________ may be used by contractors to hold soil in place on steep slopes.

PART II: Multiple choice:

____ 1. The cost of this material is usually prohibited when large areas are mulched.
a. crushed corncob b. peat moss c. wood chips

____ 2. This material should not be used in areas where a cigarette may be dropped.
a. corncobs b. asphalt c. straw

____ Any mulch should be at least this deep:
a. 1/4" - 1/2" b. 1" - 2" c. 2"-3"

Topic Test
on
SELECTING PLANTS

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

Fill in the blanks:

1. ____________ and ______________ flowering shrubs are not as permanent as woody plant materials and usually do not provide as good covering for garden areas.

2. Most native plants require little ____________ or other care when they have become established after transplanting.

3. Plants from the Mediterranean regions and ______________ often have similar cultural and moisture requirements to our native plants.

4. Large shrubs or small trees are ____ to ____ feet tall when full grown.

5. ______________ shrubs attain a height of 6 to 8 feet at maturity.

Topic Test
on
GRADING, DRAINAGE, AND LANDSCAPE STRUCTURES

Student: ______________________________ School: ______________________________

Date. ______________________________ Score. ______________________________

Place a check under T for true or under F for false for each of the following statements:

T F

_____ _____ 1. The minimum width for an entrance sidewalk is eight feet.

_____ _____ 2. Walks should always be as direct as possible.

_____ _____ 3. Landscape planners with a minimum of design experience should avoid curved walks

_____ _____ 4. The use of splash blocks is the most desirable method of preventing downspouts from eroding soil

_____ _____ 5. Lowering the grade around existing trees does not disturb their normal functioning nearly so much as does filling.

Topic Test

DEVELOPING PERSONAL TRAITS

Student. ______________________ School. ______________________

Date ______________________ Score: ______________________

1. What are the three basic ingredients of a salesman?

   a. ______________________

   b ______________________

   c ______________________

2 What are two ways in which good habits pay off?

   a ______________

   b ______________

3 What are the best two ways to learn selling?

   a ______________________

   b ______________________

4 How can a person become a "scientific salesman"?

5. What is required for a would-be salesman to become a tough, aggressive, and effective salesman?

   a. ______________

   b ______________

Topic Test
on
DISPLAYING

Student: ____________________ School: ____________________

Date: ____________________ Score: ____________________

Fill in the blanks:

1. ______________ displays are designed to stop the customer and bring him into the store.

2. _____ attracts attention and gives the impression of demand.

3. Each table and shelf should have a ____________ to the others.

4. Special racks, tri-plane and peg board tables are excellent for displaying ________ items and other small competitive items.

5. ____ displays are more successful when used for familiar products.

Topic Test
on
ADVERTISING

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

PART I: Fill in the blanks:

1. ________________ advertising consists of displays within the place of business.

2. ____________ buying results in millions of dollars' worth of sales annually, as the growth of supermarkets shows.

3. ______ advertising is high in cost but is effective because the product can be demonstrated.

PART II: List:

1. Three factors to consider when selecting an advertising medium are:

   a. ______________

   b. ______________

   c. ______________

2. Three methods of "outside of the store" advertising are:

   a. ______________

   b. ______________

   c. ______________

Topic Test
on
LABELING AND PRICING

Student: ______________________ School: ______________________

Date: ______________________ Score: ______________________

Problem:

What would be the percent mark-up of a plant if the production cost was $1.00 and selling price was $2.00?

Work:

Answer: ________

Topic Test
on
UNDERSTANDING THE CUSTOMER AND MAKING SALES

Student: ______________________________ School: ____________________________

Date: ________________________________ Score: ____________________________

Fill in the blanks:

1. The first problem of a salesman is getting the _________________ of the customer.
2. A dangerous practice that many salesmen fall into is trying to arouse interest by overstressing __________.
3. _____ percent of all salesmen quit cold after a single call on a prospect.
4. "___________________ is a luxury no salesman can afford."
5 The surest and quickest way to lose a sale is to ____________________________ ___________.

Answer Sheet for Test
on
HORTICULTURE AS AN INDUSTRY

True or False:

1 False
2 True
3 True
4 False
5 False
6 False
7 False
8 True
9 True
10 False

Answer Sheet for Test
on
EXPLORING OCCUPATIONAL OPPORTUNITIES

1 Refer to the 18 factors listed in the information sheet The student should have listed at least 10 factors in his own words, which should be considered when evaluating the desirability of an occupation

2 a Greenhouse Worker
  b Nursery Worker
  c Garden Center Employee
  d Assistant Groundskeeper
  e Parks and Landscape Employee

Answer Sheet for Test on INTRODUCTION

1. Botany
2. 350,000
3. Sugars, starches
4. Water
5. Carbon dioxide and water

Answer Sheet for Test on PHOTOSYNTHESIS

1. Diffusion
2. Phot
3. Atoms
4. (In any order)
    a. Carbon Dioxide
    b. Water
    c. Chlorophyll
    d. Light
5 Molecule

Answer Sheet for Test
on
RESPIRATION

1. Food, oxygen
2. Stored
3. Decreases
4. Carbon dioxide
5. Respiration

Answer Sheet for Test
on
WATER ABSORPTION AND LOSS--NUTRIENT ABSORPTION--MOVEMENT OF WATER AND NUTRIENTS IN THE PLANT

1. Nutrients
2. Xylem, phloem
3. Bleeding
4. Transpiration
5. Root hair

Answer Sheet for Test
on
PLANT FOOD

1. Cellulose
2. Fat
3. Protein
4. a Carbon
   b Hydrogen
   c. Oxygen
   d. Nitrogen
5. Essential

Answer Sheet for Test
on
TYPES OF GREENHOUSES

Fill in the blanks:	True or False:
1. Exhaust fans	1. True
2. Fall	2. False - It needs to be painted about every two years.
3. Humidity, oxygen	3. False - It is difficult to prevent dripping in houses constructed from film plastic.

Answer Sheet for Test
on
SIZE AND ARRANGEMENT OF GREENHOUSES

1. False - 6 inches
2. True
3. True
4. False - Wood expands when wet.
5. True

Answer Sheet for Test
on
COOLING THE GREENHOUSE

1. 4000 sq. ft. (100' x 40')
2. 7000 sq. ft. (1000 sq. ft. x 7 CFM)
3. 50 sq. ft. (one square foot of padded area needed for each 150 CFM)
   $\left(\frac{7500\text{ CFM required}}{150\text{ CFM}}\right)$

Answer Sheet for Test
on
HEATING THE GREENHOUSE

1. True
2. True
3. False
4. True
5. True

Answer Sheet for Test

WIRING AND ELECTRICAL CONTROLS

1. a. Safe
   b. Adequate
   c. Expandable

2. Safety

3. Eight

4. One-half

5. No. 14

Answer Sheet for Test
on
ORIGIN COMPOSITION AND IMPORTANCE OF SOILS

PART I

1 Sand
2 Organic matter
3 Temperature and rainfall
4. Flour
5. Particles

PART II

1 a Topsoil
  b Subsoil
  c. Parent layer

2 a Different amounts of air present when soil is formed
  b. Different amounts of organic matter
  c Different rocks from which soil is formed

Answer Sheet for Test
on
SOIL MOISTURE

PART I:

1 Capillary
2 Fine
3 Evaporates
4. Respiration
5. Aeration

PART II.

1. False - This would tear down structure
2 True - By adding organic matter
3. False - Overwatering does this.
4. True
5. True

Answer Sheet for Test
on
SOIL MIXTURES

1. Loam
2. Organic matter
3. Sticky
4. Shredder
5. Shrink

List:

a. Uniformity
b. Disease free
c. Low soluble salts
d. Good drainage
e. Good moisture retention
f. No shrinkage
g. Ease of preparation and storage
h. Complete availability

Answer Sheet for Test
on
MULCHES AND THEIR USE

PART I:

1. Peat moss
2. Mid-spring
3. Nitrogen
4. Heat
5. Asphalt

PART II:

1. b
2. c
3. c

Answer Sheet for Test
on
FERTILIZER NUTRIENTS

1. Nitrogen
2. Calcium
3. Wet
4. Below
5. Broadcast

List:

1. a. Nitrogen
   b. Phosphorus
   c. Potassium
2. a. Calcium
   b. Magnesium
   c. Sulfur

Answer Sheet for Test
on
SOIL ORGANISMS

1. Bacteria
2. Organic matter
3. Protozoa
4. Fungi
5. Earthworm

List:
6. a. Soil sterilization with steam
   b. Soil fumigation or drenching with chemicals
   c. Seed treatment

Answer Sheet for Test
on
SOIL STERILIZATION

PART I:

1. Steam
2. Nematodes
3. Two to three weeks
4. Root burn
5. Instantly

PART II:

1. a. To kill soil-borne insects
   b. To kill harmful bacteria, fungus
   c. To destroy weeds
   d. Promote soil granulation

2. a. Avoid inhaling the material.
   b. Avoid contact of fumigant with skin.
   c. Allow enough time for aeration after material is applied.

Answer Sheet for Test
on
PLANT GROWING MEDIA OTHER THAN SOIL

1. Sand
2. 10 to 20
3. Vermiculite
4. Southern
5. Nitrogen
6. Acid
7. Peat

Answer Sheet for Test
on
INTRODUCTION TO PROPAGATION

PART I

1 Sexual or asexual
2. Ventilation, temperature. shade. and light
3. Methyl bromide
4 Seeds, nematodes, and disease organisms
5. Clay pots, peat pots, and plant bands

PART II:

1. True
2. False
3. True

Answer Sheet for Test
on
PROPAGATION FROM CUTTINGS

PART I:

1. True
2. False
3. True
4 False
5 False

PART II:

1. 70-75 degrees
2. a One which can be kept uniformly moist
    b. Provide good drainage
    c. Aeration
3. When roots are 1/2 to 1 inch long
4. From new growth in spring or early summer
5. Soggy

Answer Sheet for Test
on
PROPAGATION BY LAYERING

PART I

1 False

2 True

3. True

4. True

5. False

PART II

1. a Croton
   b. Hibiscus
   c Dracaenas
   d. Rubber plants

Answer Sheet for Test
on
PROPAGATION BY DIVISION

1 True
2. True
3. True
4. False
5. True

Answer Sheet for Test
on
PROPAGATION BY GRAFTING AND BUDDING

PART I:

1. Stock is the name for the plant onto which you graft.

2. The cambium layer is the soft layer of tissue on a stem or root that lies between the bark and the wood.

3. "T" budding and patch-budding

PART II:

1 True

2. True

Answer Sheet for Test
on
PROPAGATION FROM SEEDS

PART I:

1. True

2. False

3. False

PART II:

1. Sphagnum moss
2. Flat 2" x 4" board or brick
3. Sand or other inert material
4. a. Name of plant or variety
   b. Date seeded
   c. Student's name
   d. Special treatment, if any

VT 001 143
National Standard Check List for Teaching Home Safety.

Joint Saf Comm of the Amer Vocat Assn and Nat Saf Counc.
Pub Date - Jun65
MF AVAILABLE IN VT-ERIC SET 6p.

*SAFETY, *ACCIDENT PREVENTION, *HOMEMAKING EDUCATION, *CHECK LISTS, UNITS OF STUDY (SUBJECT FIELDS), TEACHING AIDS,

This checklist is designed to be used by students in evaluating safety practices in the homemaking laboratory under the sections (1) When I Sew, (2) When I Iron, (3) When I Wash Clothes, (4) When I Cook, (5) When I Use Electric Appliances, (6) For Safe Wiring, (7) For Safety Underfoot, (8) For Safe Storage Areas, (9) To Avoid Fire Hazards, (10) In Case of Fire, (11) Miscellaneous Safety Tips, and (12) For Safe Use of Products. Each sentence in each section is stated as a correct procedure to which the student responds, I do always, sometimes, never, or no opportunity by circling the letter A, S, N or O. Spaces are provided at the end of each section for adding other practices or conditions which will improve safety. (FP)

NATIONAL STANDARD CHECK LIST FOR TEACHING HOME SAFETY

Prepared by the Sub Committee of the Joint Safety Committee of the AMERICAN VOCATIONAL ASSOCIATION and NATIONAL SAFETY COUNCIL

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

(Name)

(Date)

HOW DO YOU FEEL TODAY?

Are you relaxed? Rested after a night of adequate sleep? Are you free from anger, resentment or worry? Do you think through jobs before beginning them, and organize working materials efficiently? If so, you are well on the way toward being an effective worker wherever you are — and more likely to finish your job without having an accident.

There are approved methods of working and safe procedures for using space and equipment in the rooms of homemaking departments. These practices have application in the home. This check list has been designed to help you evaluate your safety practices as you work together in acquiring homemaking skills in your homemaking courses.

CHECKING PROCEDURE

Draw a circle around the appropriate letter, using the following letter scheme:

In the spaces provided at the end of each section, add other practices or conditions which will make your department and home a safer place.

A — Always
S — Sometimes
N — Never
O — No opportunity

WHEN I SEW

I DO

A S N O 1. Put pins and needles in pin cushions — never in my mouth, clothes or in furniture.

A S N O 2. Keep sharp objects out of my lap.

A S N O 3. Pass sharp objects to others with the handle first — never toss them.

A S N O 4. Store scissors and other sharp objects in holders or in a secure place.

A S N O 5. Keep fingers away from the path of the sewing machine needle.

A S N O 6. Use slow speed on electric sewing machine while learning to operate it.

A S N O 7. Know how to operate emergency release on electric sewing machine.

A S N O 8. Make sure cord is placed so it does not rub against motor belt when sewing machine is in use (unless machine has concealed belt).

A S N O 9. Use care not to touch hot light bulb (if it is not shielded).

A S N O 10. Arrange electric cord of machine on the floor so it will not cause anyone to stumble.

A S N O 11. Turn off motor when sewing machine is not in use.

A S N O 12. Close sewing machine carefully to avoid damaging electric cord.

A S N O 13. Keep drawers and door of sewing machine closed to avoid bumping.

A S N O 14. Avoid putting excessive weight or pressure on sewing machine leaf.

A S N O 15.

A S N O 16.

WHEN I IRON

I DO

A S N O 1. Use a well-balanced, rigid ironing board.

A S N O 2. Keep my hands away from the hot area of the iron.

A S N O 3. Place hot steam iron on its heel when not in use.

A S N O 4. Use non-combustible or treated ironing board.

A S N O 5. Know how to operate safety release on ironer.

A S N O 6. Check safety release on ironer before starting to iron.

A S N O 7. Have safety release repaired immediately if it is not operating.

A S N O 8. Disconnect iron or ironer at the outlet when called away from ironing.

A S N O 9. Release ironer roll when equipment is not in use.

A S N O 10. Position iron firmly, when rearranging clothes, to avoid dropping on the floor.

A S N O 11.

A S N O 12.

WHEN I WASH CLOTHES

I DO

A S N O 1. Wear rubbers or rubber-soled shoes if floors are damp when using electric laundry equipment.

A S N O 2. Know how to operate emergency releases on laundry equipment.

A S N O 3. Check safety release on wringer before starting to wash, and have it repaired immediately if not operating.

A S N O 4. Make sure hands are dry before connecting or disconnecting electrical laundry equipment or touching light switches.

A S N O 5. Check to see if safety lid shuts off washer when lid is raised (if automatic washer has this feature).

A S N O 6. Check to see if safety door shuts off dryer when door is opened (if dryer has this feature).

A S N O 7. Test temperature of hot water from faucets cautiously before putting hands in it.

A S N O 8. Avoid carrying loads of clothes so hig I cannot see where I am walking.

A S N O 9. Make sure appliance cords do not get damp under normal use.

A S N O 10. Follow manufacturer's directions for proper removal of lint from dryer.

A S N O 11. Have motors of laundry equipment cleaned if they have collected lint and oil.

A S N O 12. Make sure permanently connected electrical laundry equipment was properly grounded at the time of installation (before using it the first time).

A S N O 13. If circuit breaker on automatic washer operates to stop automatic washing, wait for motor to cool before starting.

A S N O 14. Check to see if load of clothes is evenly balanced in washer.

A S N O 15. Make sure washer is not subjected to below freezing temperature as water in valves and pump can freeze and cause damage.

A S N O 16. Turn off water on inlet hose when automatic washer is not in use. This avoids pressure which, in time can freeze and cause hose to burst.

A S N O 17. Have a light over washer so I don't work in a shadow.

A S N O 18.

A S N O 19.

WHEN I COOK

I DO

A S N O 1. Use flat-bottomed and well-balanced cooking utensils.

A S N O 2. Handle enamelware carefully — if cracked or chipped, flakes of the vitreous enamel can get into food.

A S N O 3. Never set hot glassware on cold or wet surfaces.

A S N O 4. Avoid using ceramicware if the glaze is cracked — dirt, fat and moisture may be absorbed and create an unsanitary condition.

A S N O 5. Avoid using inexpensive sheet tin-plated utensils which have sharp corners and raw edges exposed.

A S N O 6. Turn handles of cooking utensils inward on top of range (but not projecting over other lighted burners or pilot light) and on work areas so they will not be knocked off and contents spilled.

A S N O 7. Handle hot pans with dry pot holders or mitts — never a dish towel.

A S N O 8. Check handles of utensils to be sure they are securely attached.

A S N O 9. Drain cooked foods by holding kettle with one dry pot holder and the cover with another holder.

A S N O 10. Remove lid from hot cooking utensil by lifting the far side first so steam is directed away from me.

A S N O 11. Avoid carrying pans filled with hot food or liquid across the kitchen.

A S N O 12. Have working area on each side of surface units for easy serving — also to avoid tipping and spilling contents of utensils while cooking.

A S N O 13. Reduce heat under utensils as soon as cooking temperature has been reached.

A S N O 14. Fill pan only one-third full of fat when deep-frying.

A S N O 15. Dry food thoroughly before deep-fat frying so water will not cause fat to spatter.

A S N O 16. Use kitchen tongs to turn frying food or to remove food from hot water.

A S N O 17. Watch fat carefully, or set thermostat when frying to prevent over heating.

A S N O 18. Keep knives sharp so strong pressure is unnecessary.

A S N O 19. Use knife with sharp edge away from body.

A S N O 20. Wash and dry knives separately, never leaving them in the dishpan or under water.

A S N O 21. Store knives carefully, preferably in slotted racks.

A S N O 22. Use proper opener for cans, jars and other containers — never a knife.

A S N O 23. Use a can opener that leaves a smooth edge.

A S N O 24. Work slowly when opening a vacuum can with a key to prevent snapping of the sharp metal band.

A S N O 25. Dispose of sharp metal and broken dishes or glasses in well-wrapped package.

A S N O 26. Follow manufacturers' directions carefully when using pressure cooker, bakeware, electrical appliances, etc.

A S N O 27. Use a rubber scraper in the electric mixer bowl when the mixer is operating, never a metal or wooden spoon, fork or spatula.

A S N O 28. Use a stomper, not my fingers, for pressing food into chopper.

A S N O 29. Keep a vent tube of a pressure cooker open — if clogged, use a cleaning wire to open it.

A S N O 30. Stand to one side when lighting a gas oven — first opening the oven door for a few minutes, then lighting match before turning on the gas.

A S N O 31. Have the oven thermostat checked if cakes do not bake in the time specified by the range manufacturer.

A S N O 32. Have kitchen arranged so large appliances and equipment do not protrude and cause bruises or falls.

A S N O 33. Keep work surfaces orderly during preparation of food.

A S N O 34. Close cupboard doors and drawers carefully, and keep them closed when not in use.

A S N O 35. Read directions before using pressure canner.

A S N O 36. See that gauge, safety valve and petcock of pressure canner are operating properly.

A S N O 37. Use standard glass containers especially made for home canning.

A S N O 38. Pack jars loosely in pressure canner or water bath canner.

A S N O 39. Always lift far side of cover of pressure cooker or canner to allow steam to escape safely.

A S N O 40. Use tongs when removing jars from canner. (Check tongs first to be sure they are in good condition.)

A S N O 41. Never can by oven method because of danger of explosion.

A S N O 42. Melt paraffin in a double boiler to prevent overheating.

A S N O 43. Wear well-fitted tailored garments when cooking — never loose-fitting clothes with flowing sleeves or ties, or projecting pockets and bows which might catch on equipment.

A S N O 44.

A S N O 44. Wear canvas work gloves when rearranging the freezer or handling dry ice.

A S N O 45. Have adequate lighting over all work centers.

A S N O 46.

A S N O 47.

A S N O 48.

WHEN I USE ELECTRIC APPLIANCES

I DO

A S N O 1. Choose equipment which complies with the safety standards of Underwriters' Laboratories.

A S N O 2. Check type of current recommended for operating equipment before connecting it the first time to avoid overheating and damaging appliance.

A S N O 3. Dry hands thoroughly before connecting or disconnecting electrical equipment.

A S N O 4. Never plug in more than one appliance with a heating element on the same circuit unless an electrician has certified that the wires are large enough to accommodate the current of both appliances.

A S N O 5. Never connect electric appliances when standing on a wet surface or if perspiring excessively.

A S N O 6. Plug cord in appliance first, then in wall outlet — to prevent sparks and arcing of terminal pins, and to lengthen the life of the appliance.

A S N O 7. Arrange cord so there is no danger of stumbling over it while appliance is connected.

A S N O 8. Always disconnect cord from wall outlet before removing from appliance — otherwise a "hot" plug will be exposed.

A S N O 9. Grasp plug rather than cord when removing from outlet or appliance, holding plug firmly and pulling gently.

A S N O 10. Avoid using small appliances in area where they could accidentally fall into a sink while connected.

A S N O 11. Disconnect small appliances when not in use to avoid danger of shock or of accidentally touching "on" switch.

A S N O 12. Never let cord dangle — appliance might be pulled off working area.

A S N O 13. Replace electric cords when noticeably worn.

A S N O 14. Never plug appliances into light sockets — lighting wiring is not made to carry current necessary to operate appliances.

A S N O 15. Consult appliance instruction book for special safety precautions and directions for use.

A S N O 16. Always disconnect any appliance with exposed coils before cleaning.

A S N O 17. Never put heating unit, motor or cord of electric appliance in water as this may cause a short. (Electric skillets indicate up to what point they may be immersed in water).

A S N O 18. Always unplug an electric pressure pan before putting it in water.

A S N O 19. Disconnect at outlet appliances with exposed coils and allow to cool before cleaning.

A S N O 20. Allow hot appliances to cool before storing.

A S N O 21. Never knot appliance cord or bend sharply.

A S N O 22. Cool waffle and sandwich grills open.

A S N O 23. Never use an electric cord if the plug is loose or a screw or bolt has fallen out.

A S N O 24. Avoid getting batter or liquid into mixer mechanism.

A S N O 25. Make sure refrigerator operating mechanism is kept clean. (Check directions provided by manufacturer).

A S N O 26. Keep forks out of electric toaster.

A S N O 27. Avoid shaking toaster upside down — remove crumbs from bottom by emptying crumb tray.

A S N O 28. Have defective appliances repaired before next use.

A S N O 29. Inspect all cords regularly for frayed or cracked insulation and replace promptly.

A S N O 30. Have adequate storage space for small appliances when not in use.

A S N O 31.

A S N O 32.

FOR SAFE WIRING

I DO

A S N O 1. Avoid overloading of circuits.

A S N O 2. Protect all electric circuits with proper sized fuses (usually 15 ampere) or circuit breaker.

A S N O 3. Never use a penny to replace a fuse temporarily — the fuse is a safety valve and blows out to warn of dangerous overloading in the wiring system.

A S N O 4. Keep spare fuses of proper size on hand.

A S N O 5. Keep a candle or flashlight near the fuse box to supply handy working light.

A S N O 6. Know how to change a fuse. (Cut off electricity with main switch; stand on a dry board; be sure hands are dry.)

A S N O 7. Connect at one time lights and appliances totaling no more watts than fuse is rated (15 ampere fuse for 1800 watts — 20 ampere for 2300 watts).

A S N O 8. Know how to reset a circuit breaker, if used instead of a fuse.

A S N O 9. Keep door closed on fuse or circuit breaker box to avoid bumping and to keep dust from collecting inside box.

A S N O 10. Have wiring repaired when lamps flicker, plugs loosen in wall sockets, or switches fail.

A S N O 11. Have wiring checked before installing new appliances which draw heavy current.

A S N O 12. Make sure any wiring addition, repair or alteration is done by a reliable electrician who will arrange for inspection and produce a certificate of approval.

A S N O 13. Connect each major plug-in appliance to its own branch circuit for best operating results.

A S N O 14. Locate electrical outlets so cords cannot drop into sink or bathtub.

A S N O 15. Avoid using extension cords whenever possible; if this is necessary, check to be sure extension is the correct gauge wire for appliance used. (Asbestos-insulated cord for heating appliances, heavy-duty cords for tools, moisture-resistant cords for equipment in damp locations).

A S N O 16. Use cords listed by Underwriters' Laboratories.

A S N O 17. Never string cords across work areas or traffic lanes, across radiator, over pipes or hooks, through doors or under rugs, or in any exposed place where they are subject to wear or damage.

A S N O 18. Never run cord over a steam pipe or wrap around a warm appliance because the insulation may become scorched and eventually crack.

A S N O 19. Avoid using frayed cords or making temporary tape repairs on cords.

A S N O 20. Never twist or knot a cord as there is danger of breaking the wire or the insulation.

A S N O 21. If electric cords are stored in a drawer remove sharp-edged tools or knives which might damage the insulation.

A S N O 22. Never tack cords to the wall — use insulated staples.

A S N O 23. Have defective light switches repaired promptly.

A S N O 24. Keep cover plates on outlets and switches.

A S N O 25. Keep water away from electrical outlets.

A S N O 26. Never stick anything (such as a hairpin) into a wall socket.

A S N O 27. Never turn on lights or a motor switch while touching a metal stand, pipe or other grounded metal.

A S N O 28. Use weatherproofed wire, sockets and outlets for all outdoor electrical equipment — never household extension cords.

A S N O 29.

A S N O 30.

FOR SAFETY UNDERFOOT

I DO

A S N O 1. Keep bare floors in good repair and free from uneven or rough areas, loosened tiles, wide cracks, etc.

A S N O 2. Repair or replace floor coverings which have tears or holes, or loose frayed or curled edges.

A S N O 3. Wipe up spilled liquids, foods, grease, etc. from floors promptly.

A S N O 4. Keep floor cloths or paper towels near all work centers where liquid may be spilled.

A S N O 5. Pick up hairpins, rubber bands, paper clips and other articles dropped on floors.

A S N O 6. Keep out of traffic lanes any objects which are likely to tip or be stumbled over.

A S N O 7. Keep toys, sewing boxes and other small articles off the floor so they will not cause anyone to stumble or trip.

A S N O 8. Always rinse floors before applying self-shining water-base wax so wax will not become soft and smeary from traces of soap, detergent or other cleaners.

A S N O 9. Follow directions when using wax — for example, apply polishing wax in a very thin coat and buff thoroughly. A bright shine is a safety sign!

A S N O 10. Apply a good quality wax made by a dependable company.

A S N O 11. Use a dry dust mop, never an oiled or chemically treated one because oil softens wax and makes it smeary.

A S N O 12. Use a non-slip device under small rugs — rubber pads, a rubberized coating, etc.

A S N O 13. Provide adequate and permanent lighting in dark storage areas.

A S N O 14.

A S N O 15.

FOR SAFE STORAGE AREAS

I DO

A S N O 1. Store heavy objects on lower shelves.

A S N O 2. Store equipment and supplies as close as possible to work area in which they will be used to avoid unnecessary carrying of heavy articles.

A S N O 3. Have sturdy stepladder or safe stepstool handy for reaching high places.

A S N O 4. Close cupboard doors and drawers immediately after use.

A S N O 5. Keep food in tightly covered containers and in racks or bins off the floor away from insects and rodents.

A S N O 6. Clearly label any poisonous materials or dangerous compounds such as lyes, bleaches, insecticides, etc. and store in locked cupboard or on shelf away from other supplies and out of reach of children.

A S N O 7. Have shelves sufficiently strong to hold stored material without sagging or collapsing.

A S N O 8. Fasten shelves securely to walls.

A S N O 9. Keep all questionable materials out of reach of small children. Many common household products are dangerous when inhaled, absorbed through the skin, and some even poisonous when swallowed.

A S N O 10. Never store aerosol containers near a heat source or in an unusually warm area as container can burst.

A S N O 11. Store household cleaning and maintenance products away from food items.

A S N O 12. Medicines should be kept in a cabinet, locked and out of reach of children.

A S N O 13. Separate medications used externally from internal medicines in the cabinet, or place in separate cabinets.

A S N O 14.

A S N O 15.

TO AVOID FIRE HAZARDS

I DO

A S N O 1. Keep storage areas free of flammable fluids, paper, rags, etc.

A S N O 2. Store flammable fluids, such as kerosene and gasoline, outside in clearly labeled and approved fire-safe metal containers (never in glass).

A S N O 3. Discard oily rags or oily furniture polish cloths in covered metal containers.

A S N O 4. Remember never to leave rubbish, kindling, paints, turpentine, etc. near furnace or stove.

A S N O 5. Provide covered metal cans for ashes from furnace or stove — never wood or paper boxes.

A S N O 6. Wrap up dust from vacuum cleaner or dustpan, flour, or uncooked cereals and dispose of in garbage — never throw into open fire because dust is explosive.

A S N O 7. Never use flammable cleaning fluids indoors.

A S N O 8. Never allow even a small amount of gasoline to be exposed in a room or other confined space.

A S N O 9. Start wood and coal fires without the use of kerosene.

A S N O 10. Never quicken fires with kerosene.

A S N O 11. Keep wicks and burners clean and in good condition on kerosene lanterns, heaters, stoves, etc. (An explosion may result from a defective wick that does not fill the wick-tube section).

A S N O 12. Use quick drying paints containing volatile solvent only in well-ventilated rooms.

A S N O 13. Burn paint rags or place in a covered metal can immediately.

A S N O 14. Never place a can of paint on a stove to heat — put it in a pan of hot water.

A S N O 15. Use a paint remover only in well-ventilated areas.

A S N O 16. Keep lighter-fluid in a closed container of not more than four ounces.

A S N O 17. Store and use lighter-fluid away from sources of ignition.

A S N O 18. Never pour gasoline in an enclosed space. Use a funnel when pouring from one container to another to prevent spillage.

A S N O 19. Never filter gasoline through a chamois.

A S N O 20. Keep grease containers away from the range.

A S N O 21. Store matches in a tightly-closed metal container.

A S N O 22. Put out lighted matches and place in ash tray or non-flammable receptacle — never in a waste basket or rubbish container.

A S N O 23. Locate towel racks away from range so towels cannot fall on heating units or burners.

A S N O 24. Have gas range located away from window to avoid danger of curtain blowing over burners and catching fire.

A S N O 25. Clean oven and broiler pan regularly to prevent accumulation of grease.

A S N O 26. Have repairs made promptly on defective equipment, chimneys, stovepipes, etc.

A S N O 27. Use hot water to thaw frozen pipes, never a blow torch or open flame.

A S N O 28. Make sure small stoves and electric heaters are not placed where they can tip over.

A S N O 29. Keep electric lamp bulbs (when lighted) away from walls, stored clothing, curtains, or flammable material of any kind.

A S N O 30. Never cook or work around a fire when wearing a fluffy sweater or other flammable garments.

A S N O 31. Keep fire extinguishers in homemaking departments and choose those recommended for all types of fires (wood, oil, live electrical equipment, etc.) and tested by Underwriters' Laboratories.

A S N O 32. Have fire extinguishers inspected at least once a year and follow manufacturers' instructions for refilling.

A S N O 33.

A S N O 34.

IN CASE OF A FIRE

I DO

A S N O 1. Know the location of the nearest fire alarm box.

A S N O 2. Know how to phone for the Fire Department.

A S N O 3. Remember the location of the quickest exits.

A S N O 4. Close any door which will tend to confine the fire.

A S N O 5. See that everyone is out of danger.

A S N O 6. Know where fire extinguisher is located and how to operate it.

A S N O 7. Never try to fight a fire in a room filled with smoke — the fumes and lack of air are dangerous.

A S N O 8. Never try to enter a room where much fire is in evidence.

A S N O 9. Remember that a woolen blanket or other heavy covering will help to smother a small fire.

A S N O 10. Keep pound boxes of inexpensive baking soda ready for use in the kitchen.

A S N O 11. Use soda instead of water for grease, oil, paint, varnish, and similar fires because water spreads such a fire. (Instead, dust on soda, which smothers the flames physically and chemically with carbon dioxide gas).

A S N O 12. Smother grease fires in cooking utensils with a pan cover handled by a long fork, or by throwing soda on the blaze.

A S N O 13. Fight broiling pan fire by first turning off oven and then throwing handfuls of soda on the blaze.

A S N O 14. Throw soda on fire in ash tray, waste basket, upholstered furniture,, etc.

A S N O 15.

A S N O 16.

MISCELLANEOUS SAFETY TIPS

I DO

A S N O 1. Know the location of water, gas and electric supply shut-offs.

A S N O 2. Have a first aid kit available with supplies constantly replenished.

A S N O 3. Know elementary first aid.

A S N O 4. Avoid indoor use of toxic cleaning fluids such as carbon tetrachloride.

A S N O 5. Remember never to use a lighted match to find a gas leak — instead call the gas company, extinguish all flames, open windows — and get out of the building if the odor of gas is very strong.

A S N O 6. Use lead-free paint on indoor surfaces.

A S N O 7. Wear low heels when working in and around the home.

A S N O 8. Do household reaching and climbing on a steady, sturdy stepstool or ladder with treaded steps.

A S N O 9. Remember never to put hand inside a radio or television set.

A S N O 10. Avoid allowing water from the shower to splash on a bare light bulb.

A S N O 11. Use a pronged prier for removing nails or tacks.

A S N O 12.

A S N O 13.

FOR SAFE USE OF PRODUCTS

A S N O 1. Always read label before using household cleaning products, insecticides and medicines. Follow directions on the label.

A S N O 2. Always return products to safe storage area after use.

A S N O 3. Keep poisonous products in their original containers with labels intact.

A S N O 4. Do not combine cleaning agents unless label directions indicate that it is safe to do so.

A S N O 5. Before discarding an aerosol container, hold the valve open until all contents and gas have escaped. Place empty container in the trash, never in a fire or incinerator.

A S N O 6. Dispose of empty containers and unused portions. Flush unused portions down the drain, rinse out containers and put them in the trash.

A S N O 7. When using insecticides remove or cover food and water containers. Avoid inhaling sprays or dusts, wash immediately if spilled on the skin, and thoroughly wash hands when finished.

A S N O 8. Never spray aerosols near an open flame.

A S N O 9.

A S N O 10.

Learning Experiences in Agricultural Occupations for Students of Vocational Agriculture, Milk Processing Plant.

Clemson Coll., S.C. Dept. of Agricultural Education
South Carolina State Dept. of Education, Columbia
Pub Date - Apr64
MF AVAILABLE IN VT-ERIC SET 4p.

*VOCATIONAL AGRICULTURE, *COOPERATIVE EDUCATION, *MILK, *LEARNING EXPERIENCE, *LIVESTOCK PROCESSING OCCUPATIONS, JOB SKILLS,

The purpose of this guide is to assist vocational agriculture teachers and students in planning and evaluating work experiences in milk processing businesses. It was developed by a teacher educator in consultation with a dairy science professor for use in a 50-hour placement activity. Forty-two learning experiences are listed under ice cream, cheese, milk, and butter processing. A space is provided for the employer to check satisfactory completion of each experience. Single copies of this document are available without charge from Agricultural Education Department, Clemson University, Clemson, South Carolina 29631. (JM)

FOREWORD

This outline consists of some of the experiences the student may get in milk processing plants which make ice cream, cottage cheese, creamery butter and market fluid milk. Some plants may also manufacture other products such as whipping cream and coffee cream.

Just how much the student learns through these experiences will depend on his interest in the technical aspects of the various processes. If it's a matter of putting in so many hours in an ice cream plant he will likely learn little. On the other hand, if he observes, asks questions, gathers information and studies, his experience will likely be profitable.

The student should have his employer or plant superintendent to check (✓) the experiences and activities as they are satisfactorily completed.

MAKING ICE CREAM

Kind of Experiences

Check Performance

1. Preparing ingredients (mix) for making ice cream
2. Pasteurizing the mix
3. Freezing the mix
4. Packaging
5. Storing or hardening
6. Marketing ice cream
7. Sanitation and maintaining equipment

MAKING COTTAGE CHEESE

1. Pasteurizing skim milk
2. Cooling to desired temperature
3. Adding culture to form curd
4. Cutting curd
5. Heating curd to desired firmness
6. Determining firmness
7. Draining whey
8. Washing and draining
9. Packaging
10. Sanitation and maintaining equipment

MARKETING MILK

1. Hauling milk
2. Examining for flavor and odor
3. Testing for butterfat, etc.
4. Filtration and clarification
5. Cooling
6. Standardization

Check Performance

7. Homogenization
8. Pasteurization
9. Cooling
10. Bottling (paper container)
11. Storing
12. Retailing
13. Cleaning equipment

MAKING CREAMERY BUTTER

1. Separating milk to cream with approximately 40 % butterfat
2. Checking cream for acidity and adding neutralizer if needed
3. Pasteurizing cream
4. Adding color to cream if needed
5. Cooling cream
6. Churning
7. Draining buttermilk and washing fat with water
8. Adding salt
9. Testing for moisture, butterfat and curd
10. Washing, chilling, and crystallizing butter
11. Wrapping and packaging
12. Cleaning equipment

Spice up Your Teaching with Variety.

Kelsay, Evangeline
Kentucky Univ., Lexington

Pub Date - Aug64
MF AVAILABLE IN VT-ERIC SET 72p.

*TEACHING TECHNIQUES, *TEACHING METHODS, *PROBLEM SOLVING,
*AUDIOVISUAL AIDS, *HOMEMAKING EDUCATION,

Teaching techniques and suggestions for their use are presented to improve home economics teaching. They were compiled by graduate supervision class members and resource persons. Content areas are (1) Understanding and Using Problem Solving, (2) Understanding and Using Teaching Techniques, (3) Understanding and Using Audio-Visual Aids, (4) Teaching Techniques, (5) Audio-Visual Aids, and (6) Factors to Check in Evaluating Depth Teaching. Specific techniques such as group dynamics, case studies, interview, anecdotal record, demonstration, field trip, dramatics, games, and supervised study are presented with description, organization, appropriate use areas, examples, advantages, and disadvantages for each arranged in parallel columns. A bibliography is included. (MS)

Table of Contents

II. Understanding and Using Problem Solving

III. Understanding and Using Teaching Techniques

IV. Understanding and Using Audio-Visual Aids

V. Teaching Techniques

  A. Group Dynamics

    1. "Warm-up Techniques"

L. Dramatization

b. Role Playing Follow-up

VI. <u>Audio-Visual Aids</u>

A. Three-Dimensional Materials

B. Flat Material

Introduction

"Spice Up Your Teaching With Variety" is a publication which has been developed by classes in supervision under the leadership of Mrs. Evangeline Kelsay during the summer session at the University of Kentucky in 1958, 1959, and 1964. It is directed to those who guide student teachers, to those who teach homemaking and to college students who plan to be teachers. The publication includes some suggested guides to techniques and visual aids which can be used to improve the teaching of home economics. Improving the quality of teaching can have a great influence in preserving our democratic way of life.

It has been the desire of all these groups to share the valuable experiences gained in this class to all who are engaged in the challenging and satisfying task of training young people as home economists.

Class Members

Education 261, Summer 1958

Betty Aldridge	Clark County High School
Cleota Bolling	Franklin County High school
Agnes Foster	Hartford High School
Ester Kalb	Bracken County High School
Lucy T. Lisanby	Georgetown High School
Mary T. Poe	Lees Junior College
Margie S. Roberts	Morehead High School
Sarah Tabb	Scott County High School
Inez Toohey	Erlanger-Lloyd High School
Elizabeth Watson	Winchester High School

Education 261, Summer 1959

Gertrude Hauselman	Campbell County High School
Wilma Holland	Bristow High School
Pauline Jones	Ventura, California
Edith H. Merritt	Tollesboro High School
Mary D. Pierce	Clinton County High School
Risse Sharpton	Bellefontaine, Ohio
Marie Young	Christian County High School

Education 687, Summer 1961

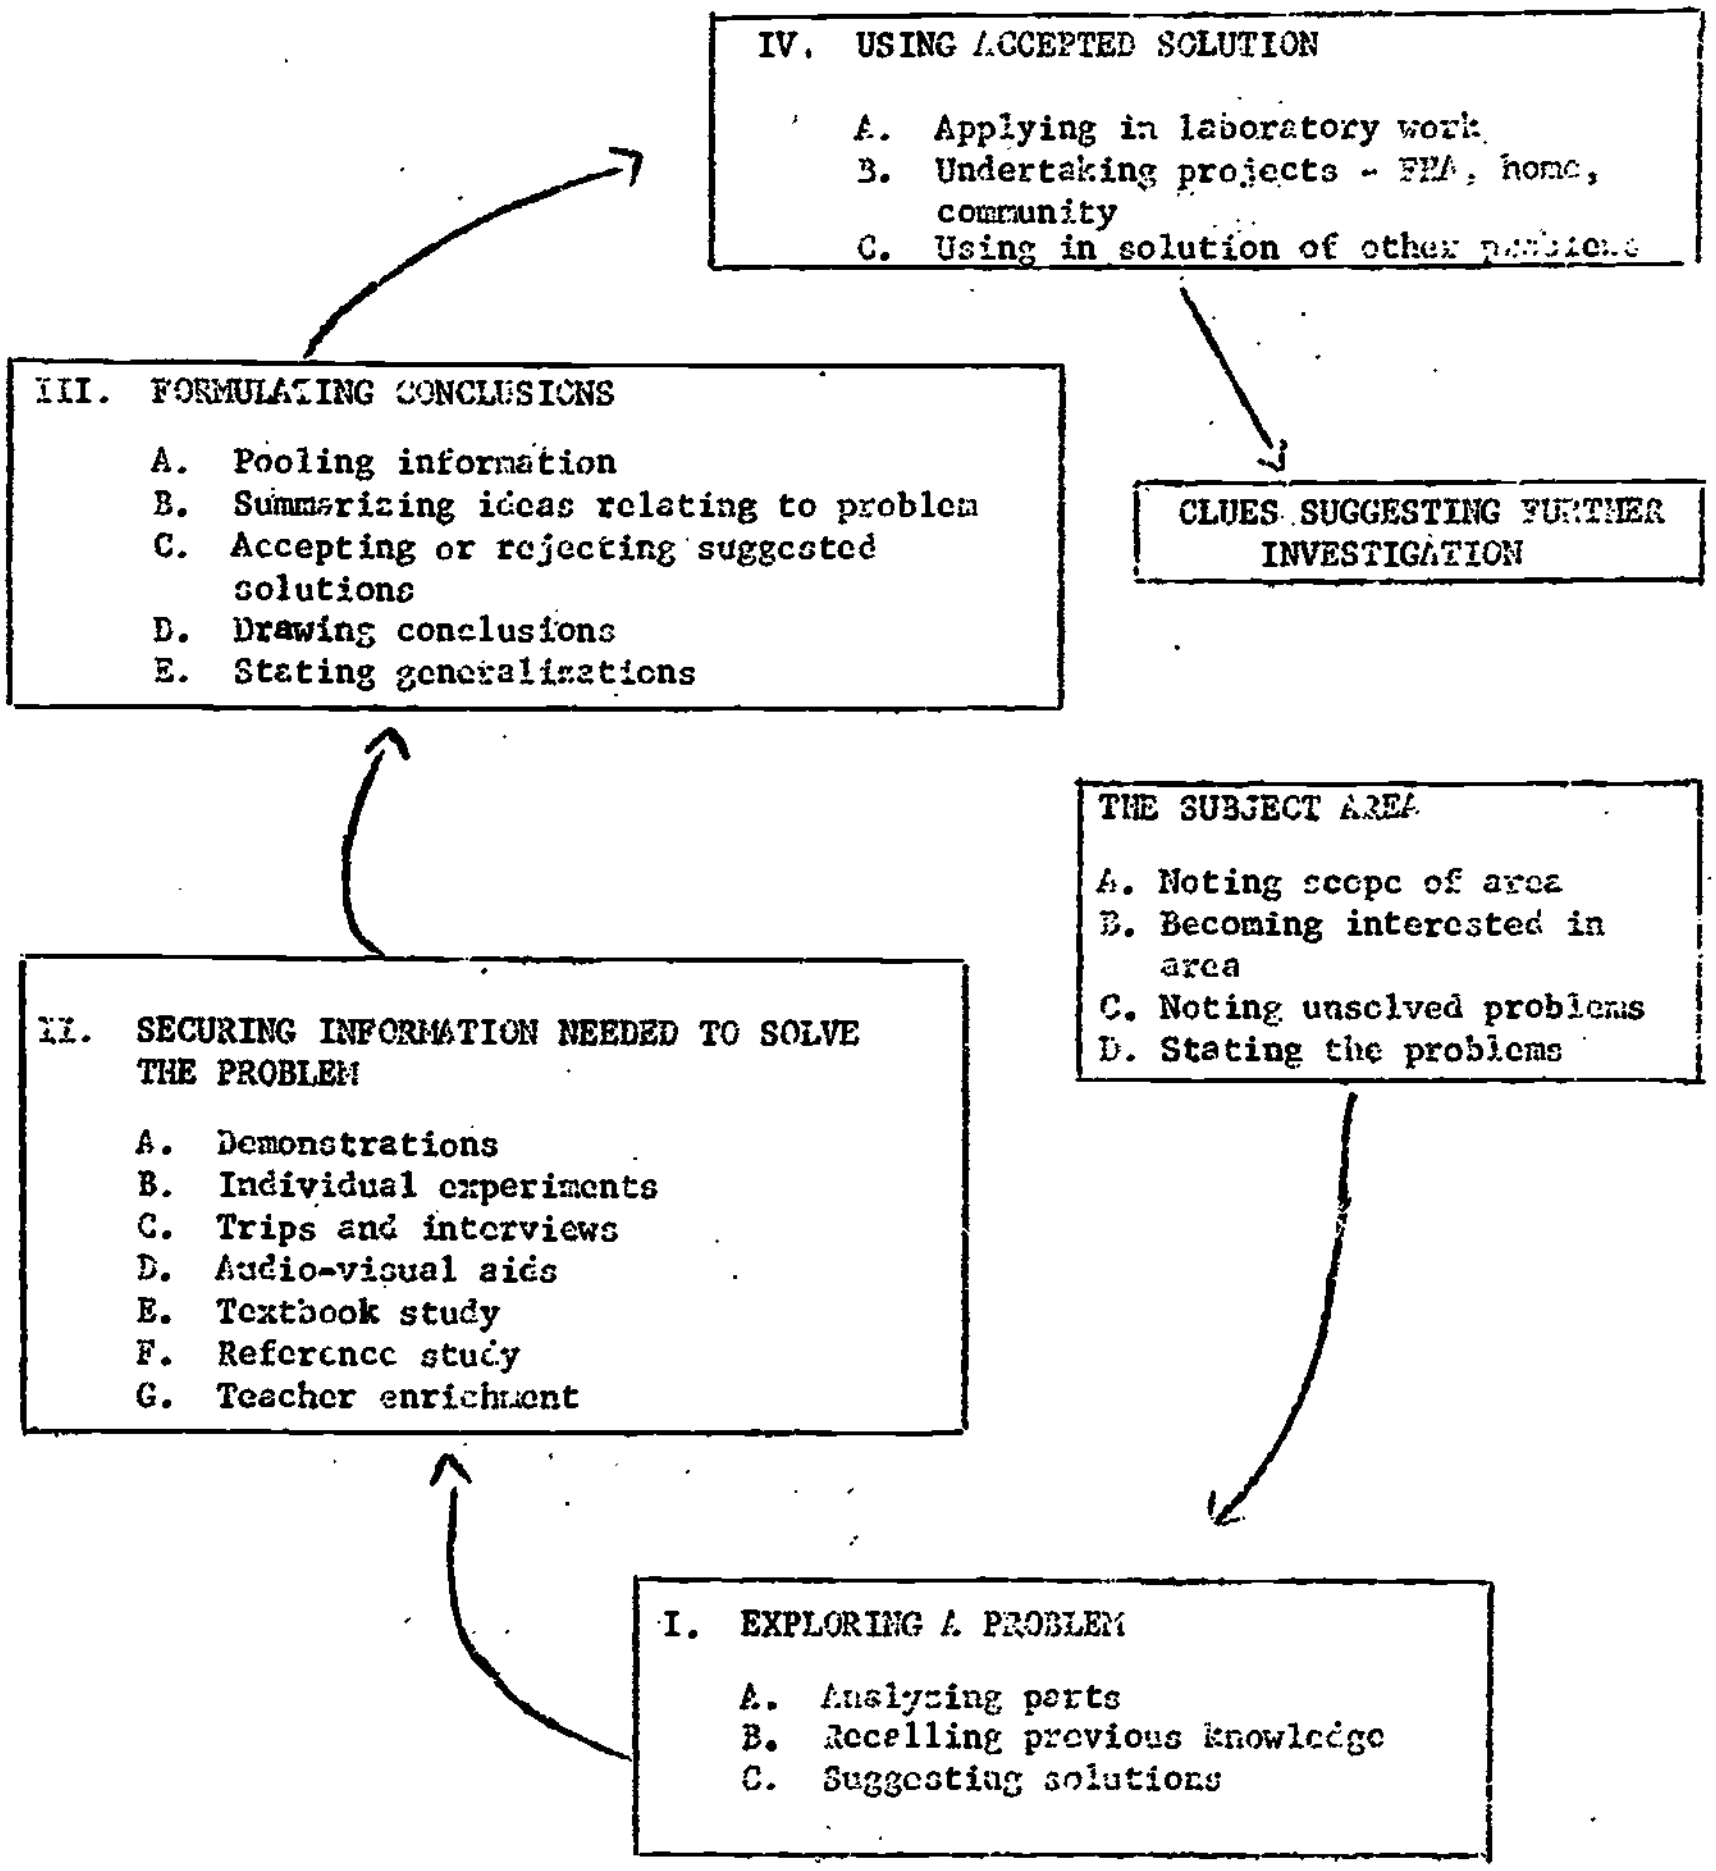
Barbara A. Carlisle	Leestown Jr. High School

Education 687, Summer 1964

Louise Alton Bennett	North Hardin County High School
Mary Alice Lay	Union College

Home Economics State Conference
Kentucky - August 1964

CYCLES OF ACTIVITIES IN PROBLEM SOLVING



THE SUBJECT AREA

- A. Noting scope of area
- B. Becoming interested in area
- C. Noting unsolved problems
- D. Stating the problems

I. EXPLORING A PROBLEM

- A. Analyzing parts
- B. Recalling previous knowledge
- C. Suggesting solutions

II. SECURING INFORMATION NEEDED TO SOLVE THE PROBLEM

- A. Demonstrations
- B. Individual experiments
- C. Trips and interviews
- D. Audio-visual aids
- E. Textbook study
- F. Reference study
- G. Teacher enrichment

III. FORMULATING CONCLUSIONS

- A. Pooling information
- B. Summarizing ideas relating to problem
- C. Accepting or rejecting suggested solutions
- D. Drawing conclusions
- E. Stating generalizations

IV. USING ACCEPTED SOLUTION

- A. Applying in laboratory work
- B. Undertaking projects - FHA, home, community
- C. Using in solution of other problems

CLUES SUGGESTING FURTHER INVESTIGATION

NOTE: These "Cycles" are an adaptation of ones presented at the State Conference for Home Economics Teachers, August, 1963.

State Conference - Home Economics
Kentucky - August 1963

SOME GUIDES FOR USING "CYCLES OF ACTIVITIES IN PROBLEM SOLVING"

GENERAL

Pupils should be involved in carrying out all of the cycles. Guiding pupils through the cycles of problem solving will vary in length of time needed - sometimes it may take less than a period and often it may require more than one class period. More than one cycle may be carried out at the same time.

SUBJECT AREA

Problems selected should be limited in scope in accordance with the level of the class, the needs and interests of the pupils, and the time available. When setting up the unit the major problems to be considered should be identified cooperatively by teachers and pupils.

EXPLORING A PROBLEM

1. A problem may be explored by guiding pupils to think of smaller problems or questions on which they need to work in solving the greater problem.
2. A problem may be explored by thinking of goals to accomplish in solving the problem, or by setting up objectives for the unit.
3. Recalling previous knowledge may be accomplished by the use of a pretest, or by pooling ideas gained from other units, other classes, and prior experience.
4. Formulating hypotheses means suggesting possible solutions to the problems. (An hypotheses is a hunch, a tentative explanation assumed to be correct but not proven.)
5. Additional information needed, how and where to obtain information should be jointly planned by the class and the teacher. (Some of the techniques included in this bulletin will aid one in selecting ways to go about gathering this additional information.)

GATHERING EVIDENCE TO SOLVE THE PROBLEM

1. Gathering evidence to solve the problem may be accomplished by the pupils using a variety of ways to secure the needed information. The teacher guides and enriches this activity.
2. The methods used for gathering evidence should be appropriate and purposeful and recognized as such by the pupils.

FORMULATING CONCLUSIONS

1. Recall of evidence may be accomplished by guiding class to pool and organize information found, and determine its relevancy and use it in determining a solution to the problem.
2. Accepting or rejecting hypotheses includes comparing evidence obtained with their original hypotheses (or tentative solution) and formulating accepted hypotheses.
3. State some generalizations by guiding the pupils to state the findings they may use in other situations when information justified it. (Do not generalize on too little evidence)

USING ACCEPTED HYPOTHESES (laboratory work, home experiences)

GENERALIZATIONS

DEFINED

A "generalization" is a complete thought which expresses an underlying truth, has an element of universality, and usually indicates relationships.

LEVELS OF DIFFICULTY IN GENERALIZATIONS

The first level is likely to be either a description, definition, analogy, identification, or classification. Statements are simple and may relate to personal experiences.

The second level shows relationships among ideas. They may make comparisons and include more ideas than on the first level.

The third level usually explains, justifies, interprets, or predicts. Generalizations at this level may be more remote in time or space. They often suggest a direction for behavior.

SEQUENCE OF GENERALIZATIONS

The three levels of generalizations might be developed during the year or they might be one basis for sequence from year to year. The maturity of the students determines whether they are likely to be ready for the various levels of generalizations in any given topic.

WHY TEACH GENERALIZATIONS

We can only transfer what we learn from one situation to another when we generalize. Generalizations can help us to integrate learnings and give pupils a feeling of continuity from one unit to another as generalizations are applied. In home economics we teach a few general concepts and apply them in many places.

If the pupils are taught to verbalize generalizations in the summary of the classroom experience, they are more likely to remember what they have learned and to apply their learning to other situations.

STEPS IN TEACHING PUPILS TO GENERALIZE

1. After you have planned the generalizations that need to be developed for a specific class you can guide the thinking of pupils through questions.
2. Lead pupils to point out the differences the similarities among the factors in a situation - begin to draw conclusions.
3. Ask pupils to state conclusions orally or in writing to determine areas needed to be corrected or re-taught. These conclusions may be tentative as generalizations must be based on my experiences.
4. If students have misconceptions, plan and present additional experiences to clarify concept.
5. Ask for the conclusions of students and accept the kind of statements that students are ready to make. The generalizations they state may not be stated as you did when you planned. They may not be as broad.
6. Provide experiences in applying the generalizations. This will increase the understanding of them and develop ability to use them.

GENERALIZATIONS IN TEACHING HOME ECONOMICS
State Department of Education, November, 1960

UNDERSTANDING AND USING TEACHING TECHNIQUES

What is a Teaching Technique

A technique is a teaching method or procedure used to promote pupil learning. In homemaking education we know that several types of learning(s) take place in every classroom and laboratory. Learning of facts, skills, attitudes toward people and self, are among some of the important learnings to be achieved by students of homemaking. The presentation of each type of learning deserves special consideration if it is to be effective, meaningful, applicable and result in changed behavior--the ultimate objective of learning.

The Importance of a Technique

It is therefore the responsibility of teachers of homemaking to incorporate into their teaching, certain techniques or procedures which will help them uphold high standards of learning experiences. These should, in turn, become applied abilities in an improvement in home and family living for the pupils.

Criteria for Selection and Use of Techniques

A wise and resourceful homemaking teacher will select a technique which is appropriate to her instructional area and to her own personality and philosophy. A technique must help a student acquire basic concepts and understandings, skill in thinking, and a knowledge of facts and principles, as well as to motivate learning and develop and maintain interest.

Before selecting a technique these questions should be asked:
- Will the technique meet the purposes, goals, and interests of the group?
- Does the group have the ability to preform the technique?
- Do I have the ability to direct this technique?
- Will this technique develop initiative and self-direction?
- Will it create individual and group thinking?
- Will it contribute to the achievement of a goal?
- Will it help an individual to work with others?

All techniques will not meet all of the questions, but each one should meet some of the questions if it is going to be useful to a particular group.

No technique can be used with success one hundred percent of the time, however, it should be evaluated each time that it is used. The evaluation will be valuable when selecting a technique according to the purposes, goals, interests and abilities of the group.

Evaluation Check List
for Use of Techniques

	Good	Fair	Poor	Does not apply
1. Were the goals and purposes of the technique clear?				
2. Did the technique help the students reach the goal?				
3. Was preparation made in advance and all materials ready for the class?				
4. Was the technique well presented?				
5. Did the technique stimulate interest and imagination?				
6. Did the entire group participate?				
7. Was it used at a strategic point in a unit or at a time when interest was high?				
8. Did it lead to further discussion and study?				
9. Were ways shown of applying principles to other situations?				
10. Was time well managed?				
11. Was it suitable for the group?				
12. Did the summary following the technique bring out all important points.				

UNDERSTANDING AND USING AUDIO VISUAL AIDS

A. Definition of audio-visual aids

Audio-visual aids are the materials and devices used in learning situations to supplement the written or spoken word in the transmission of knowledge, attitudes and ideas.

B. Values of audio-visual aids

1. Can be used with almost any type of teaching method to increase the learning that results from its use. (Enrich teaching)
2. Contribute to longer retention of learning
3. Help to give correct first concepts or impressions. (Clarify information)
4. Can give new concepts of things outside of the range of ordinary experience
5. Stimulate interest
6. Motivate students, the slow learner
7. Stimulate discussion
8. Challenge independent thinking
9. Influence attitudes
10. Summarize what has been learned
11. Add variety to teaching techniques
12. They tend to reduce verbalizm or the repetition of words without knowing their meanings

C. Summary Statement

Audio-visual materials can never substitute for good teaching but they can be very effective tools in the hands of a well-prepared teacher. The teacher must learn to select materials carefully, preview materials, plan and use them effectively, and aid the students in developing generalizations from the use of these audio-visual aids.

Barton Morgan, Glen E. Holmes, and Clarence Bundy, Methods in Adult Education (Danville: The Interstate Printers and Publishers, Inc., 1960, p. 134.)

D. Suggested check-list for selecting audio-visual aids

<u>Directions</u>: Place a check (✓) in the column at the right under yes if you can answer yes to the questions. If your answer is no, place a check (✓) under the no column.

	Yes	No
1. Is it the best means available to realize the goal		
2. Will this material make the learning situation more realistic and concrete		
3. Is it appropriate for the age, intelligence, interests, and experience of the students		
4. Will it make learning easier and quicker		
5. Does it present information in an interesting manner?		
6. Does it stimulate the students to think critically?		
7. Does it encourage the integration of subject matter		
8. Does it help the students to develop and improve skills		
9. Will it stimulate the development of responsibility and cooperation among the students		
10. Does it present an up-to-date picture of ideas and information		
11. Is it worth the time, expense, and effort involved in its use		
12. Are its physical qualities satisfactory		
13. Does it stimulate emotional as well as intellectual experience		
14. Does it challenge students to engage in self-expressive, constructive activities		
15. Will it be available at the proper time to fulfill the class objectives		

Olive A. Hall and Beatrice Paolucci, *Teaching Home Economics* (New York: John Wiley and Sons, Inc., 1961) p. 221.

TEACHING TECHNIQUES

GROUP DYNAMICS: "Warm-up Techniques"

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
The following techniques are used to stimulate interest in spontaneous discussions.	Adaptable to a variety of learning situations			
Radioscopics A flexible teaching technique Paper cut-outs or symbols of a child's toy, a change purse, or household tool, that symbolizes the subject and problems to be discussed. A question related to the discussion topic is written on the face of each symbol. The answer is written on the back or concealed under a fold of the device. Devices are given out, questions or problems are read, possible answers given and then compared with the concealed answer.	Used to dramatize problems Used to clarify pertinent facts Adaptable to almost any learning situations at any one level Can be used in all areas of homemaking Any age group from primary to adults, civic organizations and clubs	Child Care: Folded diaper, principles of baby sitting Laundry symbols for review Clothing: Symbols of equipment, why and when they are used, care of, etc. Foods: Symbols of a cover Health: Band-aids to discuss the treatment of wounds	Contributes to the stimulation of group interest Adds variety to assignments Triggers group discussion Develops a permissive learning atmosphere Draws out reticent group members Stimulates individual contributions Facts are retained longer	Takes time to find models and make the radioscopics Hard for the teacher that has little originality Discussion must be carefully guided to bring out points relating to subject
Matching Partners Picture or card (holding problem, quotation or picture) is cut into two pieces. Student finds partner and the two discuss implications of a particular problem.	Very good for child care, family life, consumer education and safety;	"Spare the Rod/ Spoil the Child" (Partners begin discussion of necessity of spanking as punishment)	Divides group into twos and breaks up cliques.	Takes time May require much thought to get ideas for specific discussion to use in matching partners

GROUP DYNAMICS: "Warm-up Techniques"

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Reaction to Specific Words Using words that will bring a picture to the mind, have the students give the word that first comes to them.	Foods, grooming, relationships, management	Nibble - Students may think of calories, T.V., lonesome or tired	Get variety of reactions Stimulates majority of group to contribute Opens discussion with very short answers	May result in silliness May be hard to work in to a real learning situation
Projective Techniques Used to encourage spontaneity, and prevent inhibition in discussions of personal, social, and real-life situations. Select stimuli, determine points to be made in discussion following, plan for summary.	Use to help change attitudes and beliefs, and help solve personal and social problems	Pictorial technique- Students make story about picture, giving background, what is happening, how the characters feel, and outcome. Word Association- Series of disconnected words presented, respond with first word to come to mind. Sentence completion- Opening words given on selected topic and pupils complete ending. Story completion- A brief description of dramatic incidents, unfinished plot, or conflicting situation about which student is to write. Pupil may be asked to answer "What did she do",	Reveals characteristic ideas and feelings not obtained easily in any other manner Diverts attention from student's own problems Pupils express freely Imagination is encouraged	If specific goals are not used becomes "play" Someone might inadvertently ridicule a revealing statement Stimulus must be high caliber to be effective

GROUP DYNAMICS: "Warm-up Techniques"

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Projective Techniques Continued		"How did they feel?" (Good for religious, and moral beliefs, relationships with the opposite sex and friendships) Argument completion Pupils given cards on which is printed brief description of beginning of an argument between two or more persons. Pupils continue argument to termination using realistic dialogue. (Good for controversial subject)		
Challenging Questions Four ways to carry out technique 1. Class sets up questions to be answered by class 2. Class sets up questions to be answered by resource person 3. Leader introduces questions prepared in advance to be answered by class 4. Leader introduces questions and answers personally or calls on resource person to answer	All discussion areas With any group Less stimulating with lower ability students May use to discover pupil interest, may be used to review	Questions set up previous to discussion of child observations Questions about banking, loands, use of credit - class wishes to ask banker Questions on prenatal care to ask nurse when she speaks to class	Stimulates thinking Useful when clarification is necessary Answers concise and easily assimilated Resource person will know the needs of the class Helps pupils interpret material Emphasizes important relationships	May be difficult to capture and hold interest of a all group members Group members of limited ability may not understand or retain information Requires advance preparation of some detail

GROUP DYNAMICS: "Warm-up Techniques"

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Question Cards During class, pass out cards to each member on which questions can be written down as they occur to him during the presentation. Each question should be written on a separate card so the cards can be sorted after the meeting. This gives the audience a chance to get questions down before they have forgotten. Breaks can be scheduled at times so questions may be written.	Good for a discussion period or for an outside speaker in most all areas	An outside speaker may be talking on a controversial subject which brings out many questions	Clarifies facts Add variety to assignments Trigger group discussion Draws out reticent group members Stimulates individual contributions	Repetition of questions Chance of getting off subject May last too long May be unable to answer all questions

GROUP DYNAMICS: Discussion (Entire group)

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
An informal group exchanging ideas, facts, feelings and questions under the guidance of a leader Taking things over to solve common problems Socialized recitation Discussion group members need: A sense of belonging A share in planning group goals A feeling of contribution to the group A clear picture of what is expected Definite signs of progress Confidence in leaders based on fair treatment, due recognition and security Functions of a leader: 1. Stimulate discussion 2. Guide along the channel of thought 3. Keep a happy balance between freedom and control 4. Draw into discussion all members of the group 5. Use authoritative sources for basic material 6. Suggest resources 7. Have a recorder 8. Summarize	Discussion occurs: Whenever a group of people gathers to discuss a problem Whenever a decision or a plan is to be made by a group Where the purpose is to stimulate the thinking of the members Small informal groups Particularly in groups discussing family relations, personal development, child guidance Classroom Workshops and conferences Leadership training committees	The discussion topics and suggesttions offered in textbooks are a general guide Problems brought up by students themselves offer specific clues for developing the discussion in light of their own needs interests, and concerns Discussion as method of setting up hypothesis to problem and/or determining the way to gather evidence on solution of the problem	To illustrate an important concept, or to help "break the ice" on occasions when the group seems reticent Opens the way for active group participation Contributes to meeting the needs and interests of each member Stimulate group thinking Leaves each one free to make his own decision Develops skill in use of democratic problems solving techniques Easiest and most familiar technique	With unskilled leadership can become a one sided conservation, debate or argument Unless purposeful may be meaingless and leave group feeling dissatisfied and frustrated May be boring to some members unless the leader keeps things moving May be dominated by the leader or by an aggressive

GROUP DYNAMICS: Discussion (cont'd)

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
9. States questions and problems clearly and in a language all will understand				
10. Avoid questions that can be answered with yes or no without reasons; ask questions that invite opinions				
11. Avoid talking too much				
12. Arrange seating of group so everyone can see and hear				
Steps in group discussion:				
Beginning the discussion Keeping the discussion going Closing the discussion				

GROUP DYNAMICS: Panel discussion

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A group of not more than eight persons, with a leader discuss a problem. They are usually seated at the front of the room around a table or in a semicircle. The leader, who remains neutral, functions much the same as a discussion leader. When the panel members have sufficiently established their view, the chairman briefly summarizes and invites audience participation. Audience contributions may be directed to the panel as a whole or to any member on the panel.	Suitable for Jr. high Sr. high, and adults. Also suitable for groups too large for general participation Radio programs Television Conventions Conferences	Topic: "What should teen-agers and their parents expect of each other?" Panel Members: 1. 4 teen-agers 2. 2 parents 3. a moderator Moderator states the topic to be discussed. He introduces each panel member and gives the viewpoint of each. Moderator guides the panel and summarizes after all members h have participated. Group develops generalizations	Panels are particularly appropriate at Jr. and Sr. high level because they are techniques that capitalize on teen-agers' eagerness to do things in a "grown-up" way. Develops leadership Valuable practice in self expression Several aspects of a problem can be presented Allows for some participation from the audience Resource people bring fresh ideas to the group	Only a few can participate One or two may take the spot-light No one may want to talk Time required for preplanning can outweigh the value of the panel if topic and panel members do not keep interest of the audience Panel scheduling may be difficult May present opinions rather than facts

GROUP DYNAMICS: Opposing Panel

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Use of two panels, one to ask questions and one to answer. Divide group, designate one half as question raisers and the remainder as question answerers. Announce topic, allow time for preparation (question raisers get down questions, question answerers anticipate kinds of questions and get answers) teacher should participate as question answerers. Supervise preparation. Pool questions Have group raise best questions first, if answer is not satisfactory, allow question raisers to contribute also. Repeat process for time allotted. Summarize. (Groups may be reversed in class period)	As review or evaluation technique May be more useful with better students as their questions will call for more use of relationships and transfer of learning.	Review for Foods I class on food preparation techniques. Evaluation technique on demonstration, lecture, field trip or discussion. May be review of completed unit or before six-week or semester test.	Avoids overworked materials Introduces a friendly competitive element Both groups must think of questions and possible answers May cover a wide range	May encourage students to trap each other on obscure information Better students tend to do the thinking for both sides of the panel

GROUP DYNAMICS: Forum

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Two or more speakers present talks on the same subject. Some audience participation, questions, challenges, contributions. Organization: Chairman acts as median between audience and speakers 1. introduces speakers 2. explains question period 3. follows leaders' remarks 4. watches reactions of leader and group 5. following lecture, acts as a discussion leader, takes command 6. makes a brief summary 7. concludes meeting 8. chairman may rule out questions that have no bearing on subject	Presents opposing sides Good for dealing with controversial issues Politics Social problems Educational problems Religious issues Good in all areas	Good in relationship on such problems as what time to get in from a date, should a high school student go steady, marriage while in school	Speakers given opportunity to present material without interruption Audience enabled to clear up obscure points by questions and to obtain further information Slight audience participation Willingness for free speech on all sides of questions; fair play; look at problem objectively Usually interesting to the audience since material is controversial Change of speakers on same subject adds variety and covers diverse ideas	More forceful personality may unduly influence the thinking of the reticient person Apt to degenerate into a debate Few take part Little opportunity to answer own questions or look at own beliefs Success largely dependent upon ability of speaker (May not have opposite views presented equally as effective)

GROUP DYNAMICS: Symposium

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Series of short talks on different aspects of a given topic Chairman requests 3 or 4 persons to prepare brief talk of 10 or 15 minutes on an assigned topic Each speaker talks in turn Chairman summarizes the main contributions of each speaker at the close of the series (May be composed of selected members following group discussion to give views expressed in groups)	Disseminating information to a large group Approaching a central theme from several different angles May be used in all areas of homemaking	Selection of meat Selection of fabric Good eating habits Getting along with brothers and sisters What it takes to like and be well-liked The effect of good equipment on time management Housing conditions	Presents several view points of a question Comprehensive analysis of a given subject Applicable to wide range of subject matter May introduce a wider variety of experience and knowledge Helps hold attention and interest by changing speakers and breaking up time span	No opportunity for group questions, contributions, challenges during the talks May lack unity because talks are prepared separately May consist of opinions rather than facts unless members are well informed May not provide thorough coverage of the topic

GROUP DYNAMICS: Debate and Colloquium

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
<u>Debate</u> Used to present topics which lend themselves to "pro" and "con" positions The "pro" side begins by pointing out reasons for favoring the issue in question, a member of the opposing team gives reasons for being against the issue. Other members of each team have opportunity to present new evidence or to answer arguments presented by their opponents.	Gifted students can delve more deeply into literature and be challenged by this technique Appropriate when there are two definitely opposite views More usable in groups who understand thoroughly the technique	Debates on going steady, getting allowances, working mothers, spanking as a form of discipline, or to build or buy a home	Teaches pupils to think critically, to admit when evidence is only a probability, and to expose fallacies in the thinking of opposite team Promotes competition	May result in "successful persuasion" rather than "sound evidence" May become argumentative
<u>Colloquium</u> Two panel groups, one consisting of resource persons; the other, class members Class representatives ask questions of experts. Moderator encourages general audience participation when it is desirable	Use when class is interested in a broad or controversal topic and could benefit from knowledge and opinions of various resouce persons	Gaining information on health services available in the community, in marriage preparation unit on divorce problems from a legal standpoint, on moral standards including social drinking, smoking and on the unit on selecting a vocation	Permits audience participation on equal footing with the experts Motivates experts to consider more closely the needs of the audience Gives more than one side of a controversal question	Resource persons may have different opinions When several resource persons are needed it is difficult to schedule

GROUP DYNAMICS: Buss Sessions (Variety - Split group plan: 66 plan, 88 plan, etc.)

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A method to have active participation of every member of a large group by breaking down small groups and reporting back to large groups for purpose of collecting and pooling of individual ideas Break your audience into small groups--6 or 8 members either by asking members sitting near each other to move chairs into a circle or by asking 3 or 4 members in one row to turn and talk to 3 or 4 members behind them. One person from each group will be recorder or chairman and report the conclusions of group back to large group	When group is large enough to divide When decisions are to be made When next steps are to be planned When summary and conclusion are needed When there are major group problems to be discovered Used with all types of discussion groups at all age levels May be used as the basis of entire class May be used following film or filmstrip	1. Large group breaks up into groups of6 members each 2. Chairman is informally assigned 3. Small group of "6" is given a limited number of minutes for discussion 4. The discussion centers around a specific question or situation agreed upon by large group 5. After discussing reassemble as a large group 6. Chairman or secretary of small groups report group recommendations, ideas and questions to large group 7. Leader records comments 8. Meeting progresses in line with suggestions	Each member of the audience gets a chance to participate It contributes to an informal interchange of ideas even in large groups Gives time for each group member to react to certain situations Helps leader to gear meeting to problems of large group Allows maximum participation in minimum time Quick means of pooling ideas, questions, or problems of group members	Meeting time is short Loss of time in breaking down and bringing group together again Difficult to bring groups back into large group again unless skillfully handled Poor leadership may result in biased opinion Might not stay on the subject

GROUP DYNAMICS: Brainstorming

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A technique of creative thinking for getting useful ideas through imagination rather than through reasoning. Four Basic Rules 1. Weighing idea before it is presented is ruled out 2. Free Wheeling is welcomed 3. Quantity is wanted 4. Combination and improvement are sought but criticism is ruled out Preparation for Chairman 1. Select a suitable problem 2. State the problem 3. Think through ideas to stimulate discussion	Use brief brainstorming sessions in introductory meeting as an attention getter Problem should be simple, familiar, particular and must have a number of possible solutions Use at conclusion of meeting or a series of meetings to stimulate thinking on ways of applying information learned Ideal for committee work such as F.H.A. Best suited to use for small groups Best suited to use with high school students and adults To select a project	Order of Procedure: 1. Chairman states problem 2. Group members offer suggestions 3. Idea collector records and number suggestions 4. Chairman stimulates production of ideas and ring a bell when any member offers criticism 5. Chairman closes the discussion when the ideas run out Ways to set the table, prepare food, or ways to make money	Use to get new ideas Used to release individual potentialities of thinking up ideas To change attitudes towards ideas of others Promotes creative thinking Group does not sit in judgment on ideas Avoids the predictable dullness of many small meetings Originality is encouraged Accumulates a quantity of alternative ideas	Possible to continue too long The minds of members of group may wander Can degenerate into "horseplay" Technique must be thoroughly mastered to be effective Often successful with only the more able students

GROUP DYNAMICS: Circular Response - Chain Reaction

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A technique in which a group learns to think discuss a common problem, and individually give personal views Group members are seated in a circle The leader proposes the question The discussion begins with the individual at the leader's right. This person has a chance to speak concerning the problem for one minute (keep time).. Discussion continues around circle until every member has a turn. Record contributions. Summarize. No member of a group can speak a second time until his time comes again	Suitable for small groups desiring to become skillful in using discussion suitable for mixed age groups Where aim is reflection not fireworks Where the purpose is to get all member participation In classroom At conferences To open topic or unit for evaluation	Question: "How much homework should be required of a high school pupil?" This group includes people of various ages two parents, two teachers, ten pupils and a leader The leader proposes the question The person sitting at the right of the leader speaks first He may talk until his view is established Turns are then taken until each person in group has spoken A member can speak a second time when his turn comes again	Mechanics alone does much to remedy the bad manners and monopoplistic practices that mar many small group discussion Timid person speaks more freely Individuals speak freely as members of the group, not as individuals segregated because of their age Can arrive at a concensus understanding Persons participate	Can be pooling of ignorance Limited number can participate May be substituted for reading and thinking May stifle spontaneous contributions by some group members May exhaust problem before end of circle if group is large or problem is too narrow

GROUP DYNAMICS: Swing Around and Popcorn

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Swing Around A technique in which the teacher gives a point and asks a question, stating the student that is to answer the question. That student answers the question and asks one of her own to another student in the room. The process is continued until all students are challenged, questions run out, or time limit is reached.	Good summary technique All areas calling for factual answers	Summarizing factors influencing selection of clothing Characteristics of good sewing equipment Factors to determine in meal planning Nutrition terms	Challenges students to think through questions they expect to be asked Good form of repetition for slower students	Some students may be called on too much to the exclusion of other students Time consuming
Pop-corn Members "pop-up" and rapidly give suggestions and ideas 1. Chairman presents question 2. Members "pop-up" quickly giving ideas 3. Secretary lists ideas and summarizes them for use by committee or the group to do further thinking on the topic May be used as summary	With any size group to get as many ideas from the group in as short a time as is possible Best used with younger groups Good summary technique	Summary points Factors to be considered in toy selection Terms related to food preparation Factors to consider in selecting fabric for beginning sewing project	Possible to pool large number of ideas in small time Promotes friendly competition Prevents lengthy discussion on any one point until all ideas are given	May go so fast students can not understand points given Few students may monopolize Students may delay asking for explanation

Case Studies, Case Situations, Case Problems

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Presentation of a problem based on a specific situation Steps in use: 1. Explain problem - present case situation containing several problems being considered in the class 2. Outline points to consider 3. Allow time for presentation of problem 4. Discuss possible solutions 5. Weigh and evaluate facts presented 6. Draw conclusions carefully 7. Summarize	Use to stimulate the discussion of an intimate social relationship in an impersonal way As introduction For evaluation Useful tool for teacher-pupil planning May be used throughout a unit	Case studies: 1. Young career girl in management 2. College girl in clothing selection 3. Child's day in child development 4. Family for housing foods, or management 5. Embarrassing situation for relationship, manners, or clothing selection	Makes it possible to discuss intimate situation in impersonal manner Can guide students in seeing complexity of decision making and to more realistic solutions	Loss of interest if case isn't closely related to problems of the group Some students may not be able to understand procedure and may have difficulty in gaining real knowledge through the use of the technique

INTERVIEWING

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A technique students may use to obtain information outside the classroom that is related to current classwork How to use the technique 1. Make advance arrangements 2. Prepare questions to ask in advance 3. Conduct interview singly, in pairs, or in groups of not more than three 4. Plan greetings, introductions appropriate dress, correct manner to obtain information, and courtesy to follow termination of interview 5. Set moderate time limit 6. Plan with student for immediate summary to prevent loss of impressions and facts 7. Arrange for report of the essential points to class	Desirable to use when pupils need to find out how people feel or think regarding a particular situation or how and why they follow certain procedures Day school-all areas Adult work F.H.A. Best used with more able students	May interview: 1. Young mother on what she expects of a babysitter 2. Older students on dating etiquette 3. Homemakers on cleaning schedules and procedures 4. Grand-parents on past experiences (marriage-dating customs) 5. Mothers and fathers on the responsibilities of a teenager 6. High school boy on qualities he most admires in girls 7. Teachers in school on characteristics of a good school citizen	May be valuable contribution when used with people of different ages and from different walks of life Students gain helpful information Students develop poise and self-assurance in meeting people	Often requires quick thinking and ability to ask clear and concise questions Scheduling the interview may prove difficult Reporting time consuming

RECORDING ANCEDOTES, ANCEDOTAL RECORD, OBSERVATION CASE STUDY

Description and Organization	Appropriate Uses Areas - Groups	Examples	Advantages	Disadvantages
A written description, report, or diary of incidents that have occurred in connection with a specific aspect of classwork Characteristics: 1. Recording should be done individually 2. There should be a clear, brief description of a single situation over a specified period of time 3. Should be recorded while incidents are still vivid 4. Must relate to what happened and what students did 5. Should not include at time of recording any personal appraisal or interpretation	Used in all areas To best used general guides should be set up to facilitate recording and analyzing	Child care observation Clothing - Buying wearing apparel Relationships: 1. Loss of control of temper 2. Feelings of insecurity and shyness 3. Making friends Food-Preparation of Meals Housing-Caring for my room General: 1. Developing a skill 2. Learning a hobby 3. Planning better use of time	Gives teacher and pupils insight into cause and effect of behavior Pupils learn to express themselves objectively and accurately Gives teacher and pupil basis for effective conferences	Sampling does not represent complete record of person's behavior Students must be assisted in viewing sample as indicative only of typical behavior Slower students tend to record trivial information and miss more important observations Analyzing records is difficult until pupils have had experience using technique

DEMOMSTRATION

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Demonstration is used to provide information, create interest, or develop standards of work by showing how the process is done. Presentation of procedures or processes to be learned The three stages of a demonstration are: 1. the preparatory 2. the demonstration itself 3. the follow-up or evaluation Characteristics: 1. Steps will be developed in a consecutive order 2. Explanation will accompany the demonstration 3. Materials will be like the ones the pupils will use 4. All pupils will be able to see and hear	Demonstration: Provide information Create interest Illustrate procedures in a process Develop standards of work A demonstration may be used with any age group May be given by teacher, students, or by a resource person or by a combination of the three Only one process should be shown at a time Learning is strengthened if practice is soon and under supervision	Foods - All phases Clothing - Construction processes Housing - All phases Care of sick First Aid Care and use of equipment	Economical teaching device to stretch limited budget Encourages the desire to repeat same thing in laboratory or at home Lessens chances of making errors in trying new skills Presents high standards of workmanship, careful planning and procedure and good management of time Opportunity to ask questions as process is seen Builds confidence in self(Demonstrator and Pupils) Stimulates interest and curiosity Simpler to show how to do something than to tell how Students can see how to apply certain principles	May be too long for short class period May not hold attention of class if demonstrator does not have confidence or is inexperienced Limits students' participation Difficult to turn out a perfect product every time Need to know reason for many techniques In a large class it may be hard for all pupils to see and hold attention Takes much time for preparation and cleaning up afterwards

DEMONSTRATION

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Demonstration continued			Gives opportunity to set up criteria or standards Showing how something is done is most effective	Difficult to obtain equipment Too many techniques shown at once May confuse student

SILENT DEMONSTRATION, OBSERVING TEAMS, LISTENING TEAM

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Silent Demonstration Complete demonstration done silently. All directions are printed and given to each student. Each student given a sheet with specific questions to watch for and write answers Following demonstration discuss, answer questions. Summarize	Especially good for foods	Making muffins Giving a manicure Using a buttonhole attachment	Group is looking for answers to specific questions Everyone is taking part and must be very alert Demonstration not interrupted by questions and discussion	Pupil must wait until demonstration is complete before asking questions Pupil may miss step which necessarily precedes following steps. Can not understand remainder of demonstration May be answering specific questions so carefully the full meaning and importance of demonstration is lost
Observing Teams, Listening Team If you are presenting a situation, dramatizing a conflict, demonstrating a skill, or anything in which the audience may be divided into a number of sections, and each group given a particular thing to watch for or listen for Reporting may be done individually, or by groups, then one person reports	Good to use if the presentation has several points to bring out Good in class demonstrations, especially for management Good in some FHA activities For adult groups	Teacher might have a motion study demonstration and divide class into teams and watch for certain things - as one group watch for certain steps, one group watch for right hand motion, another for left hand and another for location of supplies	Keep group attention better if they must watch or listen for particular point Everyone can take part Bring out certain points better, as different groups concentrate on certain items	Reporting could be time consuming Difference in attention given could cause inaccuracy in reporting

LABORATORY

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Practical application of principles and methods A workroom situation in which individuals or small groups do (1) productive (2) experimental or (3) observational work toward a goal or goals set up by the group, under the supervision of the teacher who moves from group to group The experimental work should solve a problem, and/or lead to generalizations. The goal in observational work is to develop abilities or draw conclusions There are 4 parts 1. understanding the purpose 2. making out a plan for achieving the purpose 3. carrying out the plan 4. evaluating the work done, and summarizing It is important that students help with each of the above steps, doing as much as possible for themselves Regular care of the laboratory should be routinized early in the year, so laboratory work will be facilitated	All areas of the day school program Adult work FHA Very good to reinforce learning from demonstration Good for all levels and with the slow learner as there is supervision	Productive: Preparing a meal Making a dress Making simple Puppets for child care class Experimental: Finding a good way to remove stains Finding the best way to remove finish from a desk Determining the best window cleaner to use in the kitchen Deciding on the easiest way to keep the department clean Observational: Examining fabrics or comparing canned goods in order to recognize quality or develop judgment	Provides for steps in manipulative and managerial skills Can help to develop resourcefulness, independence, and creative thinking Allows for variety in use of equipment and materials Gives each student responsibility May provide for individual differences Students learn by "doing" and enjoy class more Develops manipulative and managerial skills under guidance Students can correct mistakes when they make them Gives opportunity for personal help and guidance for each pupil	Can be a waste of time if purpose is not understood and/or if poor plans made Can be noisy Students can socialize too much May be expensive to provide supplies and equipment Clearing-up requires time Time management very difficult if experience requires lengthy time to complete If group large, some pupils may not get actual experience

LABORATORY

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Laboratory continued "Rules of the game" should be set up under teacher guidance, tried out, revised, and tried again, so that students take responsibility for their conduct in the freer atmosphere			Allows teacher to determine ability to pupils to effectively and efficiently apply generalizations or principles Holds interests	

LECTURE

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Teacher or another person presents information to the group. He should know the class's background, the subject, and questions the class has asked that he answer. A guest speaker, a class member or teacher introduces the person. If a series of lectures have been given, a summary may be given before the lecture of the day it is given. Variations: Lecture alone Lecture followed by discussion Lecture with question-and-answer period Talk interspers with discussion Illustrated lecture Speaker with panel Speaker may divide audience into 4 groups and ask each group to observe certain aspects of the talk Actual lecture time should not be too long so that group gets restless or bored.	Used to expose large group to new knowledge to report new discoveries, events, and experiences; to arouse interest; to introduce present new subject or area; to explain policies; answer questions raised in class Can give special information and study (if references are scarce) For all areas Adult work F.H.A. Ten to twenty minute lectures are more acceptable to secondary school groups Lectures should be planned to include illustrations or more discussion with slow learners	A lawyer is asked to discuss laws affecting the family One of the class tells of a visit he made to a summer camp for retarded children The County Health Nurse may furnish data on unsanitary conditions in many homes or services rendered by health department The teacher might lecture occasionally (part of a period) to give certain information, as in Child Development for senior girls, or Looking Toward Marriage	Saves time Gives people a chance to see and hear a noted individual or specialist in a certain field People who are shy or mentally tired may prefer a speaker Can be entertaining Can be relaxing Good for facts Good way to present certain materials difficult for pupils to understand or discuss, and for new information	No participation--just listening Audience has no opportunity for expression of agreement or disagreement Speaker sometimes "talks over the head" of group May not be used to best advantage unless students feel a need, and have prepared properly May be difficult to schedule resource person when desired

REPORTS

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A subject is chosen or assigned to one or more individuals to be studied and a verbal or written account given Information may be obtained through various readings and/or resource persons who can give needed information Characteristics: Well-organized, shows clear thought, has meaning to the speaker, and also to the audience Committee work may sometimes come under this classification if the results of committee work are presented in report form, either by the chairman or other members or by various members who give certain parts (This is especially applicable in F.H.A. as well as class work)	When further information is needed to solve a problem Questions are raised and information should be sought All areas Adults (occasionally) F.H.A. groups if problem is one which needs such study	Information needed for all, such as tests for certain man-made fabrics or how to alter a skirt Information to broaden horizons, e.g., a report on various flours the differences in sources, characteristics, and uses in cooking A report on different persons' views about the need for supervised recreation for teenagers.	May be used for the same purposes as an outside speaker, and may be easier to obtain Students learn to work independently or cooperatively to solve their own problems Students are taught to use the library and other materials and resources; to compare different ideas and opinions; to organize a logical presentation May be an opportunity for co-operation between the department and the English department	Report may be poorly presented for example: 1. Reading instead of telling 2. Poorly written 3. Difficult to understand 4. Presented in a voice too low to be heard May be repetitious if several are working on the same topic (class will lose interest) Reports lose value when assigned as "busy work" Broad field may be covered superficially

COMMITTEE WORK

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Committee work is a technique whereby groups work together for the solving of problems, reporting on topics of interest, completing project, etc. Group work with a committee is frequently desirable. A committee techniques serves two purposes. Sometimes and entire class is divided into committees to carry through a large activity. Sometimes a committee is set up to do a special piece of work for tthe entire class. Committees should be used only when they are an outgrowth of the work going on. Duties of a committee are: 1. Organize the work 2. Set up a plan 3. Decide upon a division of labor 4. Set a time for meeting 5. Complete the job 6. Reports should be the result of group thinking Those on the committee should know definitely what their duties are.	P. T. A. groups, club groups, assembly programs, entertainment, extra-curricula events, home room guidance All seven areas of homemaking	Committees for a tea, banquet, buffet, etc in foods work Committee to delve more into a problem brought up in discussion	Very desirable when big project is to be done Can give whole class a chance to take part if whole class is divided into groups Gives opportunity for additional knowledge on subjects if committees are doing research on many phases of a subject Gives an opportunity for people to get acquainted and work co-operatively Give experience and confidence to the less aggressive person Encourages student to express themselves freely	Often question is not settled on merit but by personal preference Domineering member can sway a group Often times committee will not carry thru to completion Too often members are chosen by popular vote Can be teacher controlled Takes a lot of work for the teacher to delegate tasks to a committee May be just "busy work"

FIELD TRIP

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
"Observing someone else's doing" It is a planned visit to a point outside the regular classroom It is a serious educational study with important planned purposes An opportunity for first-hand experience The teacher should plan: 1. With students A. use appropriate motivation and develop background B. help them understand purposes clearly C. raise questions to be answered; suggest things to observe; make plan for follow-up D. Guide class in setting up rules of courtesy and thoughtfulness E. Discuss appropriate attire to be worn F. Plan to write note of appreciation	All areas for the day school program Adult work FHA program	A visit to the grocery store for information needed for successful marketing, or to see cuts of meat, prices of foods, etc. A trip to a furniture store or stores in a study of furnishings for the girl's room A trip to the local nursery school during a study of child care Field trip to utility company to demonstrate kitchen planning Visit to museum for textile, period costume or furniture exhibit	Opportunity for first-hand experience May be used to: 1. stimulate new interest 2. motivate study 3. examine familiar scenes 4. develop good public relations Side benefits are the opportunities the field trip provides for the teaching of etiquette, shopping ethics, courtesy, and the personal traits of cooperation and dependability Students are challenged by new ideas and impressions they receive Critical thinking may be developed Classwork related to real-lfe situation.	Can be an "outing" unless carefully planned Can develop poor relations if good manners and conduct are not used Legal aspects: Teachers are responsible for any negligence on their part when working with students

Discription and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Field trip continued 2. With others A. arrange with administrators B. contact place to visit (May make preliminary survey) C. secure written permission for students to attend D. arrange for financing if necessary E. select transportation that carries liability insurance The plan to use this technique should grow out of class experience, and be a procedure which the group selected				

RESOURCE PERSON

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Someone other than the teacher or class members who presents or contributes to the class.	Resource person may: 1. Lecture or talk 2. Participate in symposium or panel 3. Give demonstration 4. Be consultant to class 5. Participate in informal class discussions	Cake decorating, making cookies demonstrated by baker	Contacts with different people stimulate pupils and foster appreciation	Resource person not effective unless experience is carefully planned
May be experts, persons from the community with practical knowledge, other faculty or school personnel, or student from other area		Home demonstration agent give illustrated lecture on lighting	Resource persons may contribute ideas not in print	Guest may not cover points expected
Steps: 1. Obtain information to know what to expect in the presentation 2. Teacher or pupils extend invitation 3. Let guest know size of class, age level, when, where met, and how long class meets 4. Outline points you want covered 5. Prepare class 6. Have class do preliminary work on the subject 7. Have class prepare a list of questions to ask 8. Have class assistant to introduce speaker, aid in presentation, and lead discussion that follows		Doctor lectures on affect of diet on body shape and skin appearance	Students have some information clarified	May be difficult to find experienced persons for some areas
		Physical education person on panel discussing how hobbies benefit a teenager	Technique futhers understanding and helps develop good relationships between school and community	Pupils may not be responsive to guest
		Guidance counselor as consultant when class discusses choosing a vocation		May be overused

DRAMATIZATION: Role Playing, Sociodrama

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A technique in which people spontaneously act out problems of human relations, and analyze the enactment with the help of other role players and observers No script, no memorization of lines, no rehersals Psychodrama should be avoided by the untrained, since it deals with unique problems of an individual. Socio-drama deals with interactions of individuals having problems similar to those of the majority of the group. Consists of specific parts: 1. The warm-up (short setting, or a "problem story," which presents a tense situation lacking a conclusion 2. Selecting participants (leader may let anti-social group present its ideas first) 3. Preparing audience to observe alertly, and participate through observation 4. Enactment, about 5 minutes 5. Discussion and evaluation Shared experiences and generalizing	Used to gain insight and skill in human relations problems Permissive atmosphere very important both in the enactment and the shared experience and generalizations Adult class Day school F.H.A. Health Child Care Relationships Clothing Dress and Grooming	Understanding Teens Child care - Guidance Understanding Others Improving Personality Parliamentary Procedure Growing Up- Posture Discipline Behavior Social Know-How First Date Budgeting Time Family Budgeting	Helps group to gain insight and skill in human relations Helps explore feelings about life situations which shape their attitudes values Promotes empathy Helps pupils see their own problems are not unique May break down prejudices Present emotional subject material in impersonal way Provides a realistic and interesting way to handle a problem situation Permits growth of concepts from simple incidents Develops communication skills	Requires some skill, especially with certain problems Requires much tact to prevent pupil's self-exposure or the arousal of guilt feelings If discussions cut into painful areas, group will shrink away defensively, and the session comes to to a halt Leader should not indicate what actors are to do or say, nor what he thinks is a good solution Pupil may feel he will be condemned for acting a "disapproved" role Can be overused, but must be familiar to to be most effective

DRAMATIZATION: Roleplaying Follow-up

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
<u>Roleplaying Follow-up</u>				
<u>Re-enactment</u> Role playing acted out with same players or with a different sets of actors using suggestions of the class to solve problem or improve handling of the problem	Relationships	Manners to use when eating out	Application of new learnings (Immediate)	Students may be bored with repetition if acting is not good
<u>Role Reversals</u> Begin role-playing scene by player taking role of persons different from himself to help him understand how that person may feel. Later the roles reverse so each will play own role	dating Teen Problems	Boy take role of girl, girl play part of boy Parent play role of teen and teen take the part of the parent	Gain insight of others	May find part hard to play effectively or realistically
<u>Soliloquy</u> Actors have opportunity to step out of roles to tell audience about real feelings	Relationships	Family council	Usually a dynamic experience as audience shares experience and feelings	Time consuming

DRAMATIZATION: Minute Drama, Skit-Script

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
An acting situation in which 1 to 3 class members are given very short scripts to read and to give appropriate action. (may be memorized or rehearsed) Dialogue(s) may contrast two or more methods or procedures Used to teach or emphasize a principle May follow, or be followed by, discussion Should conclude with a statement or review of principle or principles	All seven areas Day school and adults F.H.A. 1. Meetings 2. Degree work	To show different ways of meeting problems and working out solutions as follows: Behavior of children: Eating problems Agressiveness Independence Sensitivity Competition Family disagreements on use of car, hours for dating, freedom Selection of: Balanced diet Clothing Furnishings Pictures Doctor Methods of working and organizing time	It is objective; hurts no one's feelings May give shy students self-confidence Saves time (short) Interesting method of approach or review Easy Stimulates discussion by students May be prepared by students' groups or by teacher	Takes thoughtful preparation and skill to bring out principles Persons may not portray character most effectively Can be over-used Some skits may have ready-made answers or be merely sugar-coated subject matter

DRAMATIZATIONS: Pantomine

Description and Organization	Appropriate Use Area - Groups	Examples	Advantages	Disadvantages
A variation of role-playing, differing in that characters do not talk and gestures, facial expressions, and vivid action takes place of words in the portrayal of situations and character roles	All areas - to some extent		Can express one's feelings and actions without words Adds variety to role playing Requires little pre-preparation after the narration is written	Situations may not be clearly understood and might become boring If narration is required it does require some skill to write interestingly
Two types:				
1. Brief pantomine requiring 2 or 3 characters in a carefully selected situation	Relationships	Demonstration of "Do's" and "Don't's"		
2. Longer pantomine requiring unobserved announcer who briefly describes action		Pantomine of some dating types as: Clinging Cleo Beauteous Betts Glamorous Gus Made-up Matty Needlesome Ned Jealous Jed Amorous Art Boisterous Bob		

GAME PLAYING AND JINGLE WRITING

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Game Playing Competition among individuals or groups of individual to facilitate learning Determine whether individuals or teams will compete Set up rules of game Plan subject matter to cover Explain game, divide into teams (if needed), play game Summarize material	Use to add interest to certain aspects of classwork, such as learning new terminology, or modifying undesirable work habits To summarize or review information previously covered All areas	Card Games 1. What would you do? cards describing situation, student tells what she would do 2. Matching questions and answers or terms and definitions Team or Group Games 1. Football or Baseball 2. Relays 3. Spelling Bees	Provides student with opportunity to see familiar material in a new light Sometimes motivates and sustains interest and increases retention Everyone likes to play games	Bright students may surpass others in class One wrong answer eliminating games defeat purpose Time involved may overbalance learning that takes place Values of competition as motivation for learning questioned
Jingle Writing Creative writing of rhymes Steps in using: 1. Assign topics that jingles might cover 2. Encourage practice 3. Explain that no special organization, structure, or talent is needed	Used to emphasize important points in a lesson and to develop creativity in students	When grandma washed she used a board That's where automation scored Where she did rub, and scrub, and squeeze Now we push buttons with great east. (Laundry Unit) If the old woman who lived in the shoe Had taken home economics she would have known what to do (Time Management)	Helps students remember important points Helps students develop a sense of rhythm and the ability to manipulate words Provides personal satisfaction	May be difficult to motivate students to write May take more time than is warranted by the value received

SUPERVISED STUDY

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Students work under supervision on teacher-made assignments, student-initiated activities, or individaul projects Types in Use: Common Assignment - where level of achievement is relatively equal, silent reading guided by questions, study guides, or points to look for. When pupil encounter difficulties teacher gives aid (diagnostic and evaluative help) Achievement-level Assignment Organizing assignments at three or four levels of difficulty. Requires thorough familiarity with students and materials. Flexible individual assignments Students responsible for choosing among various activities. To be effective assignment must incorporate a broad range of activities and must provide for student initiative to operate in selecting them. Minimum core may be required from all.	Used when class does not do homework effectively, when references are scarce and when the search for information needs guidance Any area where references are used and where written information must be used to gather facts	Studying the characteristics of children from one to six Using references to determine the chemical nature of man-made fabrics Studying the influence of history on costume Determining factors necessary in selecting flatware, glassware, dinnerware and table linens Studying how individuals differ	Meets varying needs and interests of students Helps pupils acquire individual skills and work methods Give students help when they need it	Loses its value unless well planned Some teachers do not really supervise or direct study

THREE - DIMENSIONAL MATERIALS: Exhibits

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
An exhibit is a planned display which either teaches subject matter to students or which communicates something of interest to others outside the classroom	Effective when used with day-school program for all ages and groups	Display in store window interpreting total homemaking program or one phase such as FHA	Tells others about work being done in homemaking education	May be time and space consuming to construct
There are several types of exhibits: school-made displays and exhibits that are already available such as one previously made by students, teachers or ones borrowed.	Placed in a prominent place in the school, in store windows, museums, county fair	Exhibit of items depicting the home economics program for adult groups such as P.T.A.	Gives publicity when promotion is needed, such as for an adult class	Tendency is to leave exhibit up too long, thus becoming stale
Audience participation in exhibits is important. This might be anything from answering a question, pushing a button which changes lights or taking literature made available at the exhibit	May be used to introduce a unit, to cause interest, for summarizing and fixing in students' mind things that have been done	Display of items essential for home medicine chest	May help break down misunderstanding of things school is doing	Some commercial materials may be below the educational standard
The 3-dimensional effect of exhibits is important and interest is increased if participants can pick up or examine things	May be used by speakers to illustrate a talk and to emphasize points	Exhibit of toys suitable for various ages of children	Helps students in organizing their thinking into concrete illustrations	Tendency toward more emphasis on attractiveness than value of information exhibited.
	May be set up by committees growing out of any unit of instruction	Display of essential sewing equipment	Effective means of teaching especially when objects are left up for close observation	However, both are important
	Used to set up standards of work	Exhibit showing examples of work done by students	When used by a speaker, helps him to communicate because his audience can see as well as hear his message	
	Used to show finished products	Exhibit of safe storage of kitchen utensils		

THREE - DIMENSIONAL MATERIALS: Exhibits

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	isadvantages
Exhibits continued			Exhibits or movable displays give a 3-D perspective May help increase interest of girls in homemaking classes May be a means through which girls develop initiative, creativeness, responsibility, poise, ability to meet people	

THREE - DIMENSIONAL MATERIALS: Mobile, Dioramas

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A mobile is a group of objects or pictures suspended from an elevated point that illustrate a particular objective or objectives	All areas Any grade level	For which vocation am I suited Vitamin display Wardrobe selection Safety Hints Daily time schedule Suggestions for family recreation	Provides for pupil participation Adds interest and variety	May take too much time to prepare May not be placed to show to best advantage Requires a certain amount of artistic ability
In a diorama, models and objects are arranged against a background painting, to create a three-dimensional effect, giving the illusion of a natural setting.		Dioramas will adapt to areas of food home furnishings home care of sick clothing	Excellent for exhibits, fairs, clinics or classrooms Gives illusion of reality Conveys information	

THREE - DIMENSIONAL MATERIALS: Puppets, Boxed Lessons

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A puppet is a doll representing a human being, animal, or fictional character. These figures are manipulated or moved by wires or strings or by hand	Especially in Child Care and Relationship units Adult Education Best suited to brief crisp playlets, full of action	Characteristics of children Social and Family Relationship experiences.	Flexible enough to suit the experience and abilities of students Teacher can tailor the puppet show to fit the requirements of the learning situation Give students an opportunity to project inner emotions Stimulates interest and is very enjoyable	Takes time to make Requires a certain artistic ability
Boxed lessons consist of all the materials required for the complete teaching of a lesson or unit	Boxed lessons best used for all areas requiring extensive materials	Selecting books for for a child Fabric selection Selection floor coverings	An effective way to store three-dimensional materials related to specific lessons or units Saves time collecting dittoed tests, study guides, printed references, and visual aids related to lesson or unit Increased efficiency in teaching procedures due to organized thinking and development of scope and sequences.	Difficulty in storing many boxed lessons Requires time to set up the plan Unless detailed labeling is done, a specific item may be difficult to locate.

FLAT MATERIALS: Graphics

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages of Graphics	Disadvantages of Graphics
Graphics refers to the arts by which we express ideas in lines, pictures, sketches, diagrams.	Graphics are used in all areas and with all groups, but simple graphics are especially effective with the slow learner.		Promotes correlation of information Promotes organization of past experiences	May be poorly done and reused May require more time than teacher feels desirable
Diagram is a drawing which makes use of lines and conventionalized and geometrical symbols, has no pictorial elements, and portrays the structure of its subject.		Commercial clothing construction pattern guides are examples of diagrams	Accurate and brief presentation of data May substitute for real articles Create interest and attracts attention	May not be used effectively May be hard to store and keep attractive
Graphs use dots, lines, or pictures to present interrelated statistical information	Graphs are effective means of presenting: factual information in condensed summary form		Clarifies ideas Illustrates facts which might otherwise be unnoticed	May lose effectiveness if displayed for long period of time
Types of graphs				
Line graphs are used in recording continuous data. Lines may be drawn to connect each point where measurements are indicated.	Quantitative information Clarification of words or symbols	Line graph of food consumption trends		May require too much explanation Commercial ones may contain too much advertising and may not be suited to the problem
Bar graph consists of a simple series of vertical or horizontal bars of unequal length but constant width	Steps in a process Relationships Classifications Organization of information	Bar graph showing percent of students who include major food groups in their diet over 7-day period		

FLAT MATERIALS: Graphics

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages of Graphics	Disadvantages of Graphics
Graphs continued- Circle or pie graph - the entire area of the circle is divided into segments representing a percentage of total area.		Circle Graph representing family's food expenditures		
A poster is a relatively large illustrated card or sheet of paper	Used when desirable to			
	Show relation of parts to the whole	Poster showing cuts from side of beef or pork		
	To show inside of objects and how they operate	Poster showing working parts of refrigerator		
	Show enlargement of small parts that cannot be easily seen	Poster showing layers in a grain of wheat		
	Show finished products	Poster showing house plans		
	Stimulate action	Poster showing safety rules		
	Attract attention or advertise	Poster showing 7 areas of vocational homemaking program		

FLAT MATERIALS: Graphics

Description and Organization	Appropriate Areas - Groups	Examples	Advantages of Graphics	Disadvantages of Graphics
Charts combine drawings, words and pictures in an orderly and logical manner.			Continued from advantages of graphics	Continued from disadvantages of graphics
Types of Charts				
Progress chart show consecutive steps of progress and indicates how many steps an individual has completed.		Progress chart for clothing construction classes		
Flow chart shows sequence of time or a process.		Flow chart showing correct procedure for making a bed.		
Tabular chart illustrates sequence in development of a process or arguments for and against something.		Tabular chart on home ownership		
Tree Chart using roots or branches representing parts of the tree trunk.		Branches of tree represents various home economics professions		

FLAT MATERIALS: Flip Charts or Cards, Cartoons

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
<u>Flip charts</u> or cards are opaque material of uniform size which are hinged, placed on easel, and flipped in succession.	All areas, especially in the home furnishing units for mounting samples of draping and upholstering fabrics.	Selection of clothing Proper arrangement of storage space	It adds interest and variety by telling a story in pictures when presenting information.	May be difficult to find appropriate pictures Require room to store
May use discarded wallpaper sample book, or a large note book set up like an easel or a map head on a stand inserting large sheets of paper.			A good way to store charts Presentation of a sequence	
<u>Cartoons</u> use pictorial representation, often in exaggerated form, to get a message across quickly and in good humor.	Can be adapted to all levels of learning Slow-learners enjoy easy-to-understand cartoons	Using Dennis the Menace in Child Care Many cartoons would be good in relationship areas	Are compact and have attention-getting qualities Presenting human relations situations in an impersonal manner Can illustrate good and poor techniques	Cartoon may require interpretation May oversimplify May appear to represent the attitudes of all members of a group

FLAT MATERIALS: Photographs and Pictures, Duplicated Materials

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Photographs and pictures are exact copies of object, people, and events. Black and white pictures and photographs are good but colored pictures and photographs bring out more detail and depth	All seven areas of homemaking Adult classes Especially good for bulletin boards, food and clothing illustrations Pictures explain better than readings for slow reader	Child care: Show size of Children Food: Good foods in color China, linens, silver Housing: Furniture arrangement Styles of housing	Inexpensive, plentiful Close-up view for study Large group can see same picture at same time Concentrate group attention	Does not allow for individual study May not present one clear idea
Duplicated materials are made on a machine used to create an exact copy of a drawing, a printed page, etc.	Duplicated materials are especially good for the slower student	Assignments Summary sheets Tests Information sheets Forms Reports of group work	Saves time Each pupil may have his own copy for study and future reference May be used in place of reference books if none available May be used to summarize learnings	Could be expensive Might be used in place of a technique that could result in more real learning Additional copies might be inconvenient to store

FLAT MATERIALS: Bulletin Board or Tackboard, Flannel Board, Magnetic Board, Chalkboard

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Bulletin boards or tackboards are usually made of cork, soft wood, cellotex or similar material. Is used to display visual material.	A good board display is used to arouse student interest, to develop efficiency, and follow up other teaching aids	How to set the table properly Importance of color in the home	Arouses student interest Develops subject matter	Lack of pertinent illustration Material may not be changed frequently enough
A flannel board may be made from a lightweight board or other rigid material that is covered with flannel or another fuzzy-surfaced fabric. Materials such as felt, flannel, sandpaper, and suede adhere to the surface. Illustrative objects may be cut directly from such material or a small sensitizing strip may be attached to the back of other materials.	May be used in all areas of home economics FHA, adult work, and home project.	Appropriate wardrobe for high school girl Room arrangement Wise use of time for a high school girl Selecting a vocation	Used for follow-up Students may make contributions Presents opportunity to help pupils to show initiative; cooperativeness, creativeness, and responsibility Develops good art principles	Poor if unattractive and unorganized May be poorly located or lighted
Magnetic boards have a metallic base. Pictures and objects pasted or mounted on small magnets will adhere to the board and can easily be moved about.				
A chalkboard is a board, the surface of which may be made of slate or plastic or treated wood, upon which one may write or draw with chalk		The chalkboard may be used for: explanations drawings summary		

PROJECTION MATERIALS: Filmstrips, Slides, Opaque Projection

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
A filmstrip is a series of transparencies mounted to be shown in sequence.	Used for all grade levels and all areas	Baby sitting Toy selection	A large group can see the same picture at the same time	The fixed sequence in the filmstrip makes it less useful than slides or opaque picture for certain teaching aids
A slide is a singly mounted transparency.	Used to: Stimulate discussion	Food Dishes Kitchen arrangements	A picture can be retained on the screen as long as it is wanted	
Filmstrips and slides may be accompanied by script or record	Introduce or review a lesson or unit Give detailed instructions Promote retention of knowledge Reinforce, supplement, or introduce a demonstration or a field trip Heighten interest Gain insight into the problem under study		The details of the enlarged picture can be readily studied Since the room is darkened, attention is focused on the projected pictures. Relatively inexpensive	Adequate darkening of the room may be difficult to achieve Pupils may not be able to take notes There is not always time for individual study Filmstrips and slides are subject to damage by use
An opaque projection is a projection of any flat nontransparent visual material.	Opaque projector can transfer outline material to the chalkboard or a large sheet of paper.	A diagram showing parts of sewing machine Management of family income		The opaque projector is not universally available

PROJECTION MATERIALS: Overhead Projections

Description and Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
An overhead projector, which consists of an open glass plate with a mirror above it, permits a teacher to face her class while illustrating a point.	Could be used in all homemaking classes Used to: Present information Analyze and review Prepare quick exercises in evaluation Learn identification of symbols Listing summary points	Furniture arrangement Arrangement of wall accessories Window styles and parts of window Nutritional value of foods	Teacher can face the class while using the overhead Normal classroom lighting can be used Identification of important items easily done with a pencil as a pointer Complex ideas can be shown in various parts or stages by use of overlays Can write directly on transparency during presentation Colors can be used Teacher can select, design and arrange his own material for a given lesson before class Transparencies can be saved and used again Marks can be removed and transparencies can be re-used	Expensive May be difficult to prepare transparencies Projector may be inaccessible Need a screen for best results Teacher may feel insecure if lacking in ability to write and draw artistically

PROJECTION MATERIALS: Motion Pictures

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Motion picture is a continuous length of film containing sound and motion.	Used in all areas and at all levels. Used to: Awaken or strength interest Develop broader understanding Awaken desirable attitudes Supply information needed for problem solving Develop first stages of manipulative or judgment ability Provide common experiences as a basis for discussion	Care of the Hair Safety in the Home Quick meals from a freezer Learning to understand Children	Provides more learning in less time and better retention of what is learned Stimulates other learning activities Facilitates thinking and problem-solving Communicates facts or demonstrates procedures Compels attention Can bring distant past and present into the classroom Arouses interest Can present a process that cannot be seen by the human eye Provides an easily reproduced record of any event or operation	Incorrect and undesirable concepts may be obtained May be expensive unless borrowed or rented Not always possible to preview a film Problems may arise in operating the projector

OTHER AUDIO - VISUAL AIDS: Tape Recording

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Tape recording is a recorded sound on a magnetic tape.	Used to: Suggest standards Collect data (can use for absent students) Develop listening ability Provide vocational and professional guidance by recording advice of leader of a profession Improve speeching ability Used for giving directions Used for group discussions	Areas especially relationships child care management Could be very challenging for gifted student	Can be played over and over Can be pre-edited and evaluated Adaptable to large and small audiences Conserves resources of qualified instructors Motivates student through a new approach or a different voice Tape recorders are simple to operate Can record programs for use in class	Limited to the audience's understanding of words Equipment cost relatively high

OTHER AUDIO-VISUAL AIDS: Television

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Television is a device which projects pictures on a television screen for educational purposes.	Any age and all grade levels can use it	Foods demonstrations can be given	Partial solution for the teacher shortage	Television sets are not available to all
Television programing has for its goal the meeting of community needs in and out of school.	Excellent for demonstrations, appropriate styles of clothing or child care	Arrangement of equipment and step by step procedure may be observed	An effective educational medium	Expensive to put on programs
Television stations are locally owned and operated by educational institutions and organizations.	Can be used in all areas of homemaking	Summary charts may be given with recipes or other information to be copied by the viewer	Time and talents of classroom teachers is redistributed over a wide area	Classes are limited
			Adds variety	Difficult to plan for classes
			Can teach a larger number with fewer teachers	

OTHER AUDIO - VISUAL AIDS: Programed Learning

Description & Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Programed learning is a fusion of learning and testing through a series of questions and answers presented by teaching machines or programed textbooks	Used when groups are large and individual ability is varied Very effective for slow learner since program can be prepared to give clues to answers	Learning of equivalents in measuring food	Presents material in small, simple steps and logical order Requires student participation Informs student if answer is right or wrong By immediate confirmation of student's work gives him pride in his work and helps him retain the right answers Encourages student to give right answer at first try Allows each student to progress at his own pace Teacher can devote more attention to individuals since he is freed from tiresome routines Helps prevent cheating since answer can not be changed	Limited areas of learning can be used Better suited to certain fields of subject matter than to others Preparation of programed materials is time consuming Can not handle human element of teaching

READING MATERIAL

Description &Organization	Appropriate Use Areas - Groups	Examples	Advantages	Disadvantages
Reading is one of the main channels for obtaining information Text and reference books provide a carefully organized, common core of experience for a class. Magazines contain current information on a variety of subjects. A local newspaper contains information about community affairs Many supplementary reading materials have accurate and diversified information. Library materials in school and public facilities are good sources of information.	Can be used for all areas The gifted student will often enjoy reading, understand what he reads and read faster A slower student is more dependent on a textbook for ideas and expression Select references for different levels of ability	Determining food preparation terms Reading implication of new textile labeling law Overnight assignment	Aid to teacher Aid to student Different reading materials can be supplementary Written by an authority Can be used to gather information to solve problems Pupils are in the habit of using references for studying A text is an organizing and unifying influence Saves time for the teacher	Can become a crutch and narrow curriculum if followed rigorously from day to day Reading material may not be on level of student Home Economics library may not have up-to-date reading materials Not sufficient reading materials in department Expensive (especially textbooks) Often used ineffectively Single point of view expressed

FACTORS TO CHECK IN EVALUATING DEPTH TEACHING

Agreed on by University of Kentucky, Education 687, Summer 1964.

Factors	Yes	No	Evidences
1. Are pupils working toward a recognized goal which is based on individual experiences and needs?			
2. Are pupils of all levels challenged?			
3. Are pupils developing good work habits and using time and energy wisely?			
4. Are pupils applying previous learnings?			
5. Are all pupils participating in activities			
6. Do pupils develop and apply generalizations			
7. Are pupils using up-to-date resource materials in line with their abilities?			
8. Are pupils continually evaluating progress?			

We achieve greater depth when we teach for an understanding of not only the "how" and the "what" but also the "why."

Efficiency Factors and Production Goals for Vocational Agriculture Enterprises in West Virginia.

McGhee, Claude
West Virginia Univ, Morgantown. Dept of Agricultural Educ
Pub Date - Jan63
MF AVAILABLE IN VT-ERIC SET 38p.

*VOCATIONAL AGRICULTURE, *FARM MANAGEMENT, *AGRICULTURAL PRODUCTION, *FARM ACCOUNTS,

The efficiency factors and production goals presented are for use by vocational agriculture teachers and other agricultural personnel. They may be used at high school, young farmer, and adult farmer levels because all three groups are concerned with farm management and agricultural production. The author consulted with agricultural college staff members in developing the material. Suggestions for using the information, setting production goals, and analyzing the records, and a definition of terms are provided. Efficiency factor tables and other information are given for the following enterprises--baby chick and laying hen, broiler, beef cattle, sheep, dairy cattle, crop, and potato. A list of factors affecting different enterprises, a comparative analysis of enterprises, an analysis of the 1959 county agriculture census, and instructions for a farm comparison analysis are included. LIST OF TABLES

ACKNOWLEDGMENT

I would like to give credit and express my appreciation to the staff members of the various departments of the College of Agriculture for their assistance in providing portions of the information contained herein.

Also, to the West Virginia Crop Reporting Service for their assistance in supplying certain requested information.

Purpose

Efficiency may be defined as "effectiveness in production." Many factors must be considered when determining effeciency in the production of farm commodities.

This material has been developed for the use of vocational agriculture teachers and other agricultural personnel in West Virginia. We normally associate efficiency factors with both farm management and production, which to many people, are combined into the term "operation of a successful farm business". Since day, young, and adult farmer groups are vitally concerned with both phases, the material presented herein may be used with the three instructional programs.

Many times people must be properly motivated before a sound program can be launched. These efficiency factors, when properly used, can often serve as a motivating stimuli for improved farming programs among the students.

SUGGESTIONS FOR USING EFFICIENCY FACTORS

1. Be thoroughly familiar with the terms and measurements used in the various enterprises.
2. Do not attempt to completely analyze an enterprise for efficiency factors with first and second year students. Work into it gradually.
3. Stress the importance of setting a high goal. Vocational agriculture students should be able to double or triple many existing production averages.
4. Show class members how specific efficiency factors will affect profit or loss on a given enterprise.
5. Use production records of former outstanding vocational agriculture students as a means of encouraging increased scope and increased production of present students and other class members.
6. Approach efficiency factors from a positive standpoint. Don't feel that it's a necessary evil. Students appreciate knowing what will be expected of them in order to reach certain prescribed goals. If students are shown practices that will lead to success, they are more apt to direct their efforts in paths that will bring them close their anticipated goals. If one uses efficiency factor analysis properly, his teaching will be easier and more effective.
7. Encourage class members to discuss their production goals and accomplishments with their parents, fellow students, and neighbors. Much good can come from comparative analysis with fellow students and other farmers in the community. If a student has done a good job, he is proud of it and works for even greater achievements. Then, too, it has a desirable effect on other students who have fallen short of their expectations. On pages 29, 30, 31, and 32 you will find farms that may be used for comparative analysis of certain vo-ag enterprises.

It has been the feeling of many that the young and adult farmer groups would be hesitant about a comparative analysis. However, some states (Maryland)have found that the adults are just as eager to locate their place on the profit "totem pole" as the day students. Maryland has not particulary encouraged this comparison but has found that they automatically find themselves comparing dollar results for various farm enterprises.

For complete suggestions concerning the use of other vocational agriculture forms, see "Suggestions For Using Vo-Ag Record Book" by W. H. Wayman, 1954 State Department of Education, Charleston, West Virginia. Mimeo 10 pp.

INTRODUCTION

Today we think of farming as a business as well as a way of life. A good farmer will also be a good business man. The farm has experienced many changes during the past two decades. Thes changes have brought enrichment to those farmers that accepted them as a trend toward better living by demonstrating their ability to make sound managerial and productive decisions that would improve their farm income.

Too often the students success is measured solely in terms of yield per acre or the production per animal without regard to certain other factors that contribute to the labor income. There may be practices that could very easily be applied to an enterprise which would increase the profit a student would receive. Then, too, there may be practices that could be eliminated thus improving production and labor income.

We must first get the student interested in his business. We should never assume that all farmers should produce 100 bushels of corn per acre. This depends on the farmer himself - what he is doing, his management ability, etc. These practices can make the difference. For teaching purposes, we need to know exactly what he is doing. Through comparative analysis, the student can discover his weaknesses and through action on the part of the student and teacher, specific corrective measures can be employed to improve the productive income of the farm business.

The problem of making decisions faces the farmer constantly. Some problems are easy to solve based upon past experience. Other problems, due to existing circumstances and the lack of past experience, are more difficult. Sometimes the farmer is forced to make a decision and take action.

The above reasons furnish sufficient evidence that certain goals and efficiency factors are needed to serve as a guide in analyzing farm enterprises. It is the opinion of the writer that the standards set for the various efficiency factors enable the student to make a critical comparison of the results obtained from his enterprise with those of "superior" and "good" farmers in his community.

All businesses should have a goal, and the business of farming is no exception. Also, all business people should establish an index, above which we find profits and personal satisfaction. The different rates of production are herein set up to give you an index for your production. You will find three columns in which is listed the superior, good, and state average production. The "superior" figure is representative of the production received by the leading farmers of the state and the "good" column is designed to show the production of the above average farmer. State averages are all taken from census data or from other sources that may not be available in your school. The state average in many cases, is below what you would expect in your community or county. For that reason, a column has been provided for county averages, which should serve as a more reliable figure for local conditions. The next two columns are left blank for the student to calculate his anticipated production goal and his final achievement. This information is recorded on Form 8 of the West Virginia Vocational Agriculture Record Book.

SETTING PRODUCTION GOALS

The teacher must be sure that all students understand the importance of setting high production goals and by the use of superior practices be able to approach or surpass them. The teacher must, also, have a sound philosophy of superiesory farm visits and practice this philosophy at critical times for a given enterprise, which will help the student to realize the value of setting goals and working toward their accomplishment through recommended practices.

In order to make the production goals realistic as well as challenging, some class time should be devoted to a discussion of the production records of former students and of successful farmers in the area. These figures may be obtained by consulting the records of former students and by talking with leading farmers in the community. A chart might be prepared dividing production records into three groups; high third, middle third, and lower third. From these groupings, students should be able to determine their own production goals, taking into consideration their home conditions.[1]

---

1. Bail, Joe P. - Efficiency Factors and Production Goals for Vocational Agriculture Enterprises in West Virginia - 1956

ANALYZING THE RECORDS

In vocational agriculture, we realize the importance of accurate record keeping. Record keeping, however, will not have served its full value unless some work is done in the area of record analysis. Then, as a follow-up for the analysis, the teacher and student must agree on suggestions for improvement. These suggestions will help the student to realize the importance of using superior practices to obtain high production goals. When properly used, efficiency factors will assist you to discover the strong and weak points involved in the "doing" stage of production. This process should also help the vocational agriculture teacher to discover some of his own strong and weak points. Just as the student is alert to discover areas of strength and weakness, so must the teacher be alert and observative for those areas where he can bolster his instruction whether on the farm or in the classroom to enrich the student's learning through every day's satisfying experiences.

It would be well for the teacher and students to provide charts and tables that will show production standards for certain enterprises carried in the past five years. This would provide the student with a basis for formulating his own goals. It seems to be advisable to start the freshman class out with only a few goals and progress into the more technical phases as the students advance in the vocational agriculture work. However, some first year students may have progressed sufficiently to work on more advanced efficiency factors. If you find this to be the case, then these pupils should be encouraged to do so.

DEFINITIONS OF TERMS[1]

Efficiency Factors - A designated measurement of specific factors which affects the rate, amount or the economy of production of a particular enterprise. These should be tangible and specific measurements, such as per cent of chicks raised to 10 weeks; weight of pigs at 56 days; pounds of feed per pound of gain; etc.

Efficiency Standard - A set rate of production, determined on the basis of experience or reasearch, which sets a maximum or minimum production rate for a given efficiency factor. Again a tangible statement of quality, quanitiy, proportion, or time. An example would be 200 lb. hog at 170 days (time), 350 lb. feed per 100 lb. pork (proportion), 200 eggs per hen per year (quantity), etc.

Production Goals - Goals set for each efficiency factor for a given enterprise. These should be based on the home farm situation and should be goals that are within reach yet challenging to the student.

Pupil Goal - The goals set by the pupil for his enterprise based on his home farm conditions.

Pupil Achievement - The goal which the student achieved for a given efficiency factor.

---

[1] Joe P. Bail - Efficiency Factors and Production Goals For Vocational Agriculture Enterprises in West Virginia.

Table 1

Efficiency Factors For Swine Enterprise

Efficiency Factor	Efficiency Standard		W. Va. Average	County Average	Pupil's Goal	Pupil's Achievement
	Superior	Good				
No. of pigs farrowed						
Sows	12	10	9			
Gilts	10	8	8			
% of pigs raised to weaning age	95	85	74			
Wt. of pigs at 2 wks.	10	8.5	7			
Wt. of pigs at 8 wks.	50	40	30			
No. days required to reach market wt. of 200 lbs.	140	170	220			
Lbs. feed per 1 lb. gain	3.0	3.50	5.00			
Average gain per pig per day after weaning (56 days)	1.6	1.3	1.0			

Swine Enterprise

The efficient swine herdsman has breeding sows that farrow 9 or more pigs per litter. At two weeks of age, pigs should weigh 9 lbs. each if the sow is producing well. He also raises 90% of these pigs to weigh an average of 45 lbs. per pig at 56 days (8 wks.). These same pigs may be made to gain at the rate of more than 1.5 lbs. per day to reach a desired market weight of 200 lbs. at 140 days of age. This will require efficient feeding as it will take approximately 3.50 lbs. of feed to produce 1 lb. of pork. In order to meet these standards, approved practices of feeding and management must be followed, plus starting out with well-bred animals. Records must be kept if these factors are to be figured accurately.

Table II

Sample Records of a Swine Enterprise

Efficiency Factor	Efficiency Standard		W. Va. Average	Community Average*	Pupil Goal*	Pupil Achievement**
	Superior	Good				
No. of pigs farrowed						
Sows	12.0	10.0	9			
Gilts	10	8	8	9.5	9	9
% of pigs raised to weaning age	95	85	74	80	90	100
Wt. of pigs at 2 wks.	10	8.5	7.0	7.5	--	--
Wt. of pigs at 8 wks.	50	40	30	35.0	40	42
No. days required to reach market wt. of 200 lbs.	140	170	220	200	180	174
Lbs. feed per pound grain	3.0	3.5	5.0	4.0	3.0	3.75
Average gain per pig per day after weaning (56 days)	1.6	1.3	1.0	1.1	1.2	1.40

* Filled out by pupil at the beginning of the enterprise.
** Filled out by pupil when the enterprise was summarized.

The figures in the table above, taken from a vocational agricultural record book, show the results obtained for a swine enterprise. The columns which are starred were completed by the pupil.

When Tom chose swine as one of his enterprises, he decided to talk to his neighbors about it. He found that the average litter size was between 9-10 pigs and that most farmers raised 7 pigs to weaning age. Although the farmers didn't weigh their pigs at weaning age, they judged them to weigh about 35 pounds at this time. They also indicated that it required about 200 days to reach 200 pounds. This figured out to be a gain of 1.1 pounds per day. The pounds of feed per pound of gain was estimated at 4.0. Tom recorded these figures under the column entitled "Community Averages."

This figure may also be taken from the census figures on a county basis rather than to use the community average. Usually, there will be little variation between different sections of a county. You will discover that most of the material presented in this paper will use "County Average".

Tom's next step was to set goals for his enterprise. He decided that his gilt should probably farrow 9 pigs and that he should raise 8 to weaning age, and all if possible. He set a goal of 40 pounds per pig at 56 days, and a goal of 200 pounds at 170 days. This would be at the rate of gain of 1.2 pounds per day. He further decided that he would try to make a pound of gain on 3.0 pounds of feed. He did not use weight at two weeks as a measure of efficiency.

When Tom analyized his final records, he found that his gilt farrowed and raised all 9 pigs in the litter. The average weight was 42 pounds by actually weighing the pigs at 56 days. At 130 days his shoats weighed 210 pounds, or 10 pounds over his goal. The rate of gain was 1.4 pounds per day or .1 pound more than his goal. From his actual records of feed, he was able to determine that it required 3.5 pounds of feed per pound of gain.

In the final summary of his records, Tom decided that next year he would have to push his pigs a little harder to make the 200 pounds at 150 days. He further decided that he could lower his cost of production by improving his feeding practices, especially with regard to pasture and minerals. He would also have to continue all the approved practices used during the past year.

Efficiency Factors For Baby Chick and Laying Hen Enterprise

Efficience Factor	Efficiency Standard		W.Va. Average	Community Average	Pupil Goal	Pupil Achievement
	Superior	Good				
No. of chicks raised to 10 wks.	100	97	95			
Wt. of birds at 10 wks. (lbs.)						
Light breeds	2.5	2.25	2.0			
Heavy Breeds	3.0	2.75	2.5			
Lbs. feed per lb. gain to 10 wks.	2.8	3.0	3.6			
% desirable pullets kept for layers (Pullets housed)	97	95	90			
No. eggs per hen housed	250	200	196*			
Total % of mortality (laying house)	6	12	16			
Rate of Lay (%) (hen day)	85	70	60			
Lbs. of feed per doz. eggs						
Light breeds	4.0	4.5	5.0			
Heave breeds	4.2	6.0	7.5			
% Grade A eggs produced	95	90	80			

* Eggs produced per layer per year. Not hen-housed basis.

Baby Chick and Laying Hen Enterprise

For efficiently conducting the baby chick enterprise, good breeding stock, free from disease should be secured. With proper brooding, 97% of the chicks can be raised to 10 wks. of age. For light breeds, they should weight 2.5 lbs. and heavy breed 3.0 lbs. at 10 wks. of age. Efficient production is secured when 3 lbs. of feed are used per lb. of gain; approximately 25-30 lbs. of feed to 6 months of age. Ninety-five per cent of the pullets should be suitable for housing at 20 wks. of age. They should lay well in the fall and winter months and a yearly total of 200-250 eggs per hen. Mortality should not exceed 8% with good management, and culling will take out approximately 30% of the birds during the first laying year.

(Price of feed, eggs, etc. will determine this.) Approximately 4.5 lbs. of feed will be required to produce a dozen eggs. Eggs should be gathered twice daily and stored in a suitable place to maintain high quality until used.

Table IV

Efficiency Factors For Broiler Enterprise

Efficiency Factor	Efficiency Standard		W. Va. Average	Community Average	Pupil Goal	Pupil Achievement
	Superior	Good				
% chicks raised to 9 wks	100	98	98			
Wt. per bird at 9 wks	4.22	3.7	3.4			
Lbs. feed per lb. of gain	2.2	2.4	2.4			
% birds marketed in highest grade (quality)	99.5	97	96			

Broiler Enterprise

The efficient broilerman will raise 99% of his chicks to 10 wks. of age These birds should weigh 3.5 lbs. and should be of high enough quality to insure reasonable profits. The broiler industry is highly competitive and the individual producer must have sufficient scope to weather unusual market conditions. He must be efficient in his feeding practices, and should produce a pound of meat to every 2.4 lbs. of feed consumed. Fast growing birds of a desirable breed or crossbred strain should be selected, keeping in mind the market preferences. For each 0.1 lb. improvement in feed conversion, the income over all cash costs goes up $17.50 per 1000 broilers. Also, for each 0.1 lb. improvement in feed conversion the value per ton of feed goes up $5.00 or $.25 per 100 lbs. of feed.

Table V

Efficiency Factors For Beef Cattle Enterprise

Efficiency Factor	Efficiency Standard		W. Va. Average	Community Average	Pupil Goal	Pupil Achievement
	Superior	Good				
No. of live calves per year	1.0	.8	.85			
Wt. of calf at 205 days	475	425	420. *			
Lbs. protein supplement fed per yr. (cows)	100	240	——			
Lbs. gain per day (feeder calf)	2.25	2.0	1.7			
Grade of calf	Fancy	Choice	Good			

* Average of 6416 steer calves and 4447 heifer calves sold through demonstrational sales (W.Va.) 1961. State average would probably be lower.

Beef Cattle Enterprise

For the development of an efficient beef cattle enterprise; short, thick, heavy-set, blocky animals of the beef breeds should be selected. The use of good purebred sires will help to ensure calves that will develop into the highest grade. A cow should produce one calf per 365 days, dropped between February 15 and April 15 to receive best market prices. The feeder calf must be dehorned, castrated, weaned, and broken to lead in order to qualify for the state shows and sales.

The demonstrational sales throughout the state have provided a much needed outlet for many feeder calves. This system of marketing has greatly enhanced the beef industry in the state by providing a sound marketing system where the cattle are sold according to grades with the better grades commanding the better prices.

Proper feeding will ensure efficient gains of 2 lbs. per day, and a total weight of 425 lbs. at 6 months. A calf being creep fed, will eat about 4 lbs. per day. Feeder calves should grade choice or above. Dams must give sufficient milk to get calves off to a good start. Good pasture and creep feeding of grain will ensure a high quality animal. The kind of hay available will determine the amount of protein supplement needed for wintering breeding stock.

Table VI

Efficiency Factors For Sheep Enterprise

Efficiency Factor	Efficiency Standard		W. Va. Average	Community Average	Pupil Goal	Pupil Achievement
	Superior	Good				
Wt. of lamb at 5 mos.	90	80	75			
Lambs raised per ewe	1.5	1.3	1.0			
% of lambs raised	95	88	83			
Wt. of fleece:						
Corriedale cross	10	8				
Western type ewe	10	8				
Southdown	7	6				
Dorset	8	6	5.4*			
Hampshire	8	6				
Suffolk	7	6				
Average gain per lamb per day	.6	.5	.4			
% lambs grading choice (blue)	90	75	60			

*Average of all breeds in the state

Sheep Enterprise

The superior shepherd will keep ewes that average 1.5 lambs raised to weaning time, and which average 90 lbs. at marketing age of 5 months. This can be done if good pasture is provided and adequate concentrates fed to ensure a gain of .5 lb. or more per day. The weight of fleece in an efficient flock should be 7 lbs. per ewe.

The use of large ewes and good purebred rams along with good management practices including adequate parasite control are essential to meet these standards. Shelter should be provided in order to assure success with early lambing. Dock and castrate at an early age to maintain a quality product. These factors should assure the production of choice lambs with at least 80% of them grading blues.

Table VII

Efficiency Factors For Dairy Enterprise

Efficiency Factors	Efficiency Standards Superior	Efficiency Standards Good	W. Va. Average	Community Average	Pupil Goal	Pupil Achievement

U.S.D.A. Bureau of Dairy Industry

Dairy Cattle Enterprise

The height at the shoulders and the weight of the animal are the factors generally used in the determination of growth in the dairy heifer. An accurate guide for the growth of the individual animal may be obtained by comparison to the standards for each breed, given in table VIII. The measurement of the heart girth is often used in determining the weight of an animal. A tape may be used very satisfactorily for this purpose using figures in table IX.

The efficient herdsman maintains an average of 375 lbs. of butterfat per cow in his herd. A total milk yield of 7,000 lbs. for Jerseys, 7,500 lbs. for Guernseys, 9,000 lbs. for Ayrshires, and 11,000 lbs. for Holstein will give this total butterfat production. Good breeding stock, the use of proven dairy sires, good feeding and management practices are essential if this high rate of production is to be reached and maintained.

The proper feeding of silage, high quality legume, and concentrates (according to production) should maintain this flow of milk, Replacements for the herd should generally be raised rather than purchased, because of the possibility of bringing in diseases and also to help assure a long-range breeding program.

For all practical purposes, greater improvement in herd production will be achieved through artifical breeding. The dairyman can secure the service of proven sires or those from a high producing line at a moderate cost, thus eliminating the necessity of locating and purchasing a new herd sire every two years.

The expenses connected with the breeding program will probably be reduced, and at the same time, the dairyman will be elevating the quality of his breeding program.

Animals should be bred to calve at intervals of 365 days, with emphasis placed on production during the late fall and winter months. This will generally mean more profits since milk is at its highest price during these months.

CROP ENTERPRISES

The use of efficiency factors for crop enterprises is perhaps somewhat more limited than in the case of livestock enterprises. The differences in the soil fertility, climatic conditions, and topography of the land, to name only a few, cause great differences in production per acre. The costs per acre of production are also variable as the scope and mechanization of the enterprise increases or decreases.

In the main, however, the selection of high quality seed of the proper variety, correct rate of seeding and fertilization, and proper management of the growing crop determine whether the enterprise will be financially successful. The marketing of a high quality, properly graded product is an important factor if the greatest income per acre is to be secured. Attention should be given to maintaining the quality by proper handling and marketing. The public is demanding more and more a standardized product rather than simply a dozen of eggs or a bag of potatoes. In other words, superior practices in carrying out the enterprise will determine whether you make a profit or loss.

Since climatic conditions have a decided affect on yields and quality of crops, no definite figures could be given that would be applicable in every situation. However, average yields over a long period of time should be a reliable index to judge yearly production standards. Prices, too, are very changeable and would be of limited value in judging present day costs.

The efficiency standards for crops are for average conditions of soil fertility, average rates of seeding, etc., and may or may not be applicable to your situation.

You are urged to keep up to date on new practices and recomendations for the various enterprises in your community. For a digest on this information, you may refer to "Revised List of Superior Practices for Selected Crop Enterprises", 1960. Other pertinent material should also be evaluated for use in setting production goals and determining efficiency standards. Included here is the table of production standards for several crops. Only one efficiency factor, the yield per acre, is given. Because of the variable factors listed on the preceding page, it was felt that any others listed would be of limited value in most instances. However, additional factors that might be of value would include; cost of production per acre or unit, percentage of crop grading in highest grade, per cent of moisture at harvest time, and per cent of stand.

Table X Crop Production Standards

Crop	Production	Efficiency Standard Superior	Efficiency Standard Good	W.Va. Average*	Co. Ave.	Pupil Goal	Pupil Achievement
Cultivated

* Based on 10 yr. average 1944-53, West Virginia State Department of Agriculture, Charleston, West Virginia

** Estimated figures-based on conferences with College of Agriculture, Staff

*** Since crop yields vary from year to year, an adjusted yield may be more accurate for judging pupil achievement. This may be figured by comparing the current yield with the community average. For example, if the pupil goal has been set at 60 bu. as compared to a community average of 45 bu., and he only achieves 48 bu. as compared to a community average of 36 bu. for the year, he has still reached his goal based on an adjusted yield.

**** Rotating pastures so that pasture is grazed intensively once every 3 to 4 weeks.

***** Using nitrogen fertilizer (100-175 lb. N/A)

(a) Estimated

Table XI

Sample Records Of A Potato Enterprise

Efficiency Factors	Efficiency Standards		W. Va. Average	County Average*	Pupil Goal*	Pupil Achievement **
	Superior	Good

Cost of production, per bu.	***	***	**	1.00	.75	.81
% of crop grading No. 1	95	85	65	75	90	88

* Filled out by pupil at the beginning of enterprise.
** Filled out by pupil during the course of the enterprise or when it was summarized.
*** Figures are too variable to be of value.

The figures in the above table were taken from a vo-ag student's record book. His enterprise consisted of ½ acre of potatoes. By checking records of former students he found that the average production was about 200 bushel per acre, although some farmers in the community were getting over 425 bushels per acre. He set his goal at 425 bushels.

During the growing season, which was reasonably favorable to potatoes, he carried out the practices indicated on Form 8 for the 1st year in vo-ag. When the crop was harvested, it measured 175.0 bushels, or on an acre equivalent, 350 bushels. Of the 175 bushels, 154 bushels were estimated to be U.S. No. 1 or better. This was about 82.2 per cent.

On checking the cost sheet, Form 9, it was noted that the Irish Cobbler variety was used. Several of the students who were getting higher yields, were using newer varieties. It was decided to try a different variety next year. He also decided to put in a cover crop and to use it as green manure the following year.

It was not possible to grade the potatoes mechanically, but there was some class discussion of the merits of doing this possibly as an activity of the F. F. A. Chapter.

Some geographical areas of the state stress the importance of packaging potatoes in attractive bags that will meet the demands of the consumer. Some departments have found this system to be quite successful and would recommend it for use in areas where loose potatoes are difficult to sell. The writer has had considerable experience with this activity and would be glad to discuss the practices involved.

The cost of producing a bushel of potatoes was .81¢. This was higher than anticipated. The only place where high cost was noted was for spray material. This was bought in relatively small lots, and not in bulk quantities. Rainy weather also required more spraying than usual.

Success can be measured, to a degree, by certain factors that affect these different enterprises.[1]

A. Dairy Cows
  1. Milk and butterfat sold per cow.
  2. Total dairy income per cow.
  3. Returns per dollar of feed fed.
  4. Price received per 100 pounds of milk.
  5. Pounds of milk per pound of concentrates fed.
  6. Number of cows in the herd.
  7. Per cent fall freshening.
  8. Per cent digestible protein in feed fed.
  9. Pasture days per cow.

B. Beef Breeding Herd
  1. Number of cows in herd.
  2. Average weight of calves sold.
  3. Pounds of beef sold per cow.
  4. Total returns from herd.
  5. Total returns from cow.
  6. Feed costs per cow.
  7. Price received per 100 pounds of calves sold.
  8. Pounds of feed per cow or calf.
    a. Grain
    b. Protein and minerals
    c. Hay
    d. Silage
  9. Pasture days per animal unit.
  10. Percent calf crop.
  11. Percent fall dropped calves.

C. Feeder Cattle
  1. Total pounds sold.
  2. Feed cost per 100 pounds of beef sold.
  3. Average price received per 100 pounds.
  4. Average price paid per 100 pounds.
  5. Returns per dollar of feed fed.
  6. Pounds of feed per 100 pounds of beef produced.
    a. Grain
    b. Protein and minerals
    c. Silage
    d. Hay
  7. Average daily gain.

D. Hogs
  1. Pigs farrowed per litter.
  2. Pigs weaned per litter.
  3. Pigs sold per sow or litter.
  4. Number of sows.
  5. Number of spring and fall litters and total per year.

---

[1] Chastain, E.D., Joseph H. Yeager, E.L. McGraw. Farm Business Management Auburn Printing Company: Auburn, Alabama-1962.

6. Price received per 100 pounds sold.
7. Feed cost per 100 pounds sold.
8. Return per dollar of feed fed.
9. Average weight per head sold.
10. Death losses (weight and number).
11. Hogs marketed by months.
12. Amount of feed fed per 100 pounds sold.
    - a. Grain
    - b. Protein supplement and minerals.

E. Sheep
1. Number of ewes in flock.
2. Lambs raised per 100 ewes.
3. Lambs sold per 100 ewes.
4. Gross income per ewe.
5. Weight of wool per animal shorn.
6. Death losses (weight and number)
7. Feed cost per ewe.
8. Feed cost per 100 pounds of sheep sold.
9. Price received per 100 pounds of wool.
10. Price received per pound of wool.
11. Return per dollar of feed fed.
12. Pounds of feed per 100 pounds of sheep sold.
    - a. Concentrates
    - b. Hay
    - c. Silage
13. Per cent lamb crop.
14. Lambs marketed by months.

F. Poultry (laying flock)
1. Number of hens.
2. Number of hens per man equivalent.
3. Eggs sold per hen per year.
4. Receipts per hen per year.
5. Per cent of eggs sold in October, November, December.
6. Price received per dozen eggs.
7. Feed cost per dozed eggs.
8. Return per dollar of feed fed.
9. Per cent death loss of hens.
10. Pounds of feed per dozen eggs.
11. Cost of raising a replacement pullet.

G. Broilers
1. Number sold per year.
2. Number sold per man equivalent.
3. Feed conversion ration.
4. Average weight per bird sold.
5. Average number of weeks to market weight.
6. Price received per pound.
7. Per cent mortality.
8. Feed cost per pound of gain.
9. Return per dollar of feed fed.
10. Price paid per chick.

A LOOK AT YOUR FARM BUSINESS 1/

This mimeograph is designed to compare your farm business with similar situations on other farms in West Virginia. It is also designed to compare the relative ranking of one part of your business with another part of the business. The total mimeograph or any part of it may be used.

Farms are changing. Are you ahead of the change? Farms are getting larger, organizations are improving, rates of production are rising and efficiencies increasing. How do you compare?

Successful farms rank above most farms in a community; low income farms rank down. Your relative positions can be compared with other farmers in West Virginia. Make the comparison; then determine the direction for your business.

The first 11 tables in this mimeograph are arranged for summarizing certain activities on your farm and for making selected calculations. The summary of these can be used in Tables 12 thru 16 to make comparisons among different parts of your business and to rank your business with other farms.

The first task in working Table 1 is to record the amount of income producing enterprises on your farm. Livestock information is recorded in numbers; when the unit is described as "average", record the average number kept during the year; when the unit is "raised", record the number sold plus number used in the home. An extra line is provided to record other productive stock kept for sale, such as ponies, goats, mink and sometimes horses. Horses and mules kept for work stock are not included in figuring work units. Unweaned stock are not recorded because the factor for the dam includes the labor. Crop information generally is recorded in acreages harvested. Work off the farm for income is expressed in days. Part-time work is reported in terms of ten hour days.

The second task in working Table 1 is to calculate the size of business in productive man work units. This is done by multiplying the number of head or acreage by the work unit factor. A productive man work unit is the amount of work usually done by a man in a ten-hour day on crops, productive livestock and work off farm for pay. The work unit factors represent the average labor used on commercial farms in West Virginia. For example, farmers with dairy cows average 120 hours or 12 days of work on each dairy cow. The work unit factors serve as a conversion for different enterprises so that they can be compared in terms of labor needs or so that they can be added to get one measure of size of business.

The third task is to determine the animal units of livestock that use forage and pasture. This is done by completing Table 2. The same numbers of livestock reported in the first form may also be used in the second one providing all animals in the group are fed forage or pasture. The second table includes young stock to weaning age and work animals which are not recorded in Table 1.

Animal units of stock is figured to determine forage and pasture feeding per unit of livestock.

1/ Prepared by G. E. Toben, Department of Agricultural Economics and Rural Sociology.

TABLE 1. YOUR SIZE OF BUSINESS

Kinds of Livestock and Crops	Unit of Measure	Number of Head or Acres	Productive Man Work Units	
			Per Unit	Total on Your Farm
Dairy Cows	Average		12.	
Beef Cows	"		3.	
Herd Bulls	"		5.	
Other cattle, beyond weaning	"		2.2	
Ewes and rams	"		0.4	
Lambs beyond weaning	"		0.2	
Sows and Boars	"		3.0	
Hogs beyond weaning	Raised		0.7	
Hens	Average		0.16	
Pullets for replacement	"		0.04	
Broilers	Raised		0.005	
Turkey hens and toms	Average		0.3	
Turkey poults	Raised		0.06	
Corn for grain or silage	Acres		2.7	
Small grains for grain	"		1.4	
" " " forage	"		1.5	
Soybeans for any use	"		2.0	
Other hay & silage - first cutting	"		0.6	
" " & " - later "	"		0.4	
Potatoes and cabbage	"		6.	
Tomatoes for canning	"		6.	
Other truck	"		15.	
Tobacco	"		37.	
Apples harvested	"		8.	
Peaches "	"		9.	
Fruit not of bearing age	"		3.	
Managed woodlot	"		3.	
	"			
Work off farm for income	Days		1.	
Total productive man work units (add last column)				

TABLE 2. LIVESTOCK USING HAY AND PASTURE

Kind of Livestock	Unit of Measure	Number	Animal Units Per Head	Animal Units Total
Dairy Cows	Average	____	1.0	____
Beef Cows and Bulls	"	____	0.9	____
Feeder Calves to Weaning	Total	____	0.15	____
All other Cattle	Average	____	0.7	____
Ewes & Rams	"	____	0.17	____
Lambs to Weaning Age	Total	____	0.02	____
Other Sheep	Average	____	0.08	____
Horses and Mules	"	____	1.	____
Ponies and Colts	"	____	0.7	____
____				____
Total animal units using hay and silage (add last column)				____
Sows and boars, if pastured	Average	____	.23	____
Other hogs, if pastured	Raised	____	.01	____
Turkey poults, if pastured	"	____	.002	____

Total animal units using pasture (include animal unit total above) ____

Acres hay & silage per animal unit (____ acres ÷ ____ animal units using hay & silage) ____

Acres pasture per animal unit (____ acre permanent and rotation pasture ÷ ____ animal units using pasture) = ____

TABLE 3. YIELDS OF CROPS

In order to compare yields of crops on your farm with those on other farms, yields per acre need to be determined. These yields may be recorded directly in the form below or may be figured by dividing total production by the acreage. If a hay field is harvested as hay and silage, divide silage production by three and add to production of hay.

Kind of Crop	Unit of Measure	Total Production		Number of Acres		Yield Per Acre
Corn grain	Bu. shelled	____	÷	____	=	____
Oats grain	Bu.	____	÷	____	=	____
Wheat grain	Bu.	____	÷	____	=	____
Barley grain	Bu.	____	÷	____	=	____
Alfalfa & mixtures	tons hay	____	÷	____	=	____
Other hays	tons	____	÷	____	=	____
Corn silage	tons	____	÷	____	=	____
Tobacco	lbs.	____	÷	____	=	____
Potatoes	hundred lbs.	____	÷	____	=	____

TABLE 4. MONTHS OF WORK

Determine the work available on the farm in the table to the right. If you, as the operator, are a full-time farmer, record 12 months of work; time away from your farm for income is shown in Table 1. Amounts of regular hired labor may be recorded in months. Labor hired for short periods is reported in months after dividing the total days by 25 working days per month. Include the time for other members of the family that is used for farm work outside the house and home garden. Adjust this work to man equivalents in terms of the percent of a man the person replaces. A convenient conversion is an hour a day during the year is equal to a month.

Worker	Months of Work
Operator	____
Regular hired	____
Irregular hired	____
son	____
daughter	____
wife	____
____	____
Total months of work	____
Man equivalent in years (divide total month by 12)	____

Work units per man (total work units in Table 1 ____ ÷ man equivalents ____ = ____

Dairy cows per man (Dairy cows in Table 1 ____ ÷ man equivalents ____ = ____

Beef cows per man (Beef cows in Table 1 ____ ÷ ____ man equivalents = ____

TABLE 5. MILK PER COW

If Dairy Herd Improvement Association Records, Way-A-Day-A-Month Records or other similar records are kept, copy the average production per cow from that record to this. If regular records are not kept, use the following form for figuring milk per cow.

Milk sold ____ lbs

Milk used in house ____ "

Milk for hired help ____ "

Milk fed livestock ____ "

Total milk from herd ____

Milk per cow (total ÷ average number of cows in Table 1) ____

TABLE 6. FEEDER CALF WEIGHT

If Beef Cattle Performance Testing Records are kept, copy from that record the average weight of calves at 205 days of age to this form. If regular records are not kept, approximate the average weight at about 7 months of age. Frequently sales occur near 7 months of age. Summarize with the following form.

Steers sold ____ head ____ total lbs.

Heifers sold ____ head ____ " "

Heifers kept ____ head ____ " "

Other calves kept ____ head ____ " "

Total calves ____ head ____ " "

Weight per calf (total pounds ÷ total head) ____ lbs.

TABLE 7. WOOL PER SHEEP CLIPPED

If records are kept in the Master Shepherd's Project, copy the average pound of wool per ewe bred from that record. Otherwise, check your records for total pounds and number sheared.

Pounds clipped ____ ÷ Head sheared ____ = ____ lbs. per head.

TABLE 8. PER CENT LAMB CROP

If Master Shepherd's Records are kept, copy the lamb crop from those records. Otherwise, figure with the form.

Lambs sold ________
Lambs kept ________
Total lambs raised ________
Ewes bred last yr. ________
Percent lamb crop
(Lambs raised ÷
ewes bred x 100) ________

TABLE 9. EGGS PER HEN HOUSED

If W. Va. On-the-Farm Performance Test records are kept, copy the hen-housed production from that record. If records are not kept, summarize production on this form.

Eggs sold ________doz.
Eggs used in home ________"
Eggs furnished labor ________"
Total eggs produced ________"

Hens housed ________
Eggs per hen
(Doz. produced
x 12 ÷ hens
housed) ________

TABLE 10. PER CENT OF HENS DIED

If On-the-Farm Performance records are kept, copy percent laying house losses from that record. Otherwise, figure losses in the following form. The year may be the period from the date of housing rather than calendar year.

Hens sold during year ________
Hens butchered during year ________
Hens kept for following year ________
Total accounted for ________

Hens at first of year ________
Hens accounted for (on left) ________
Hens died (subtract) ________
Percent of hens died
(hens died ÷ hens at first
of year x 100) ________

TABLE 11. PER CENT CHICK LOSS FOR PULLETS INTENDED FOR LAYING

Calculate losses with the following table.

Pullets placed in laying house ________
Pullets sold ________
Pullets used in home ________
Pullets furnished labor ________
Total accounted for ________

Chicks bought ________
Total accounted for (on left) ________
Chicks died (subtract) ________
Percent death loss
(chicks died ÷ chicks bo
x 100) ________

DEPARTMENT OF AGRICULTURAL EDUCATIO
COLLEGE OF AGRICULTURE
WEST VIRGINIA UNIVERSITY
MORGANTOWN, W. VA.

HOW YOUR FARM RANKS WITH OTHERS

You can rank your farm performance with other farms in West Virginia in the appropriate columns below. Each column contains 10 amounts. The figure at the top of each column represents the average for the 10 percent of the best commercial farmers concerned with the specific activity. The next figure down the column is the average for the second best ten percent. The last figure is the average for the 10 percent of the poorest commercial farmers.

The preceeding pages provided tables for calculating the amounts to be used in the table below. As in the previous section, complete only those columns that are for activities important on your farm.

Draw a heavy line in each appropriate column that most nearly represents your farm situation. For example, if yoursize of business figured in Table 1 was 600 work units, draw a line in the column headed "Total Work Units" and between 700 and 550. Such a location would indicate that your size of business is above average and similar to the bottom of the top third.

At the top of each column is a number which indicates the table in which you made the calculation for the item.

Data for the various columns came from many sources. This includes production records referred to in earlier tables, U. S. Census of Agriculture, and research data.

CROP YIELDS PER ACRE
A COMPARISON AMONG CROPS ON YOUR OWN FARM WITH A COMMON BASIS

The chart on the next page is designed to compare the yields among different crops. The basis used for the comparison is digestible energy.

Different kinds of crops are listed at the top of the columns. Two conversions are listed below each kind of crop. The first is digestible energy in therms per pound of food. The second is total digestible nutrients in percentages. The data on digestible nutrients were taken from Morrison, Feeds and Feeding, 22nd edition, Appendix Table 1. The digestible energy conversion was obtained by multiplying the constant 2.0185 times the digestible nutrient percentage. Calculations were made with digestible energy carried to two places beyond the decimal point, even though only one figure is shown for some feeds.

Along the left side of the table is an array of production in thousands of therms of digestible energy per acre. The scale changes twice. Above the 10,000 level the ranges are one thousand. Between the 5,000 and 10,000 levels the ranges are 500. Below the 5,000 level the ranges are 200 pounds.

The method of preparing yield levels is illustrated with good quality hay. Divide 12,000 therms of digestible energy by 1.11 therms per pound to get 10,811 pounds of T.D.N. Divide 10,811 by 2,000 pounds per ton to get 5.4 tons per acre.

In most all instances, yields are reported in two figures. Because of the reporting of only two figures, a few yields are rounded to the same number at different levels of digestible energy; for example, 12 is repeated under corn silage.

Yields for each crop are listed within the most common ranges of production.

In the appropriate column, draw a heavy line that most nearly corresponds with the yield on your farm. After this is done for each crop, the yields can be observed on a comparative basis.

In the case of hay, six columns are provided with two for each of three kinds of hay. Select the column that most nearly reflects the quality. Write the kind of hay above the appropriate column. Good quality hay is cut early and leaves are kept at harvest. In the case of corn grain, decide whether the crop will be fed as grain without the cob or ground and fed as corn and cob.

If a particular crop is not shown on the next page, another can be used. For example, a silage of sorghum, sudan, soybeans, or combinations of them have about a 15 percent TDN and 0.30 D.E. Use the column for hay-silage without wilt and increase the field yield of the sorghum, sudan or soybeans to 107 percent of its yield. For example: Sudan and soybeans in a field yielded 20 tons. Then 20 tons x 107 = 21.4 tons equivalent in the hay-silage with no wilt column.

COUNCIL FOR DISTRIBUTIVE TEACHER EDUCATION

PROFESSIONAL BULLETIN SERIES

NUMBER 7

Selected Instructional Materials for Distributive Education

J. C. Levendowski
Researcher and Teacher Educator
Bureau of Business Education
California State Department of Education

This bulletin was produced and distributed by:

Bureau of Business Education
California State Department of Education
Sacramento
1966

FOREWORD

The Council for Distributive Teacher Education was organized in 1961. Membership in the organization consists of teacher educators and other distributive education personnel with an interest in advancing distributive teacher education. The primary interests of the Council are research and publication.

These selected instructional materials were compiled with the hope that they will be valuable to distributive teacher educators, adult instructors, and teacher coordinators. The publications listed are mainly free or inexpensive brochures, bulletins, pamphlets, and paperback books. The purpose of the list is to supplement Bulletin No. 5, Distributive Education Library List, a compilation of text materials for distributive teacher education which was published by CDTE in 1964.

This report was compiled by J. C. Levendowski, Researcher and Teacher Educator, Department of Education, State of California. It was edited by the charter president of CDTE and published through the courtesy of the Bureau of Business Education, California State Department of Education. Requests for copies should be addressed to the author.

Reno S. Knouse
Charter President, CDTE
State Teacher Educator for Distributive Education

TABLE OF CONTENTS

INTRODUCTION

Distributive education teachers have recognized the increasing value of using free and inexpensive instructional materials to supplement basic textbook materials in their teaching.

The purpose of this bibliography is to list the instructional materials that distributive education teachers may secure and evaluate for possible use in the instructional program. A number of the materials listed should prove particularly valuable to distributive education teachers in curriculum development.

The assistance of staff members of the Bureau of Business Education and Carol Stafford, secretary, for her work in preparing the final copy, is deeply appreciated. The author is also very grateful for the cooperation of the publishers, business firms, and governmental agencies who made their materials available for review.

Related Instruction in Agricultural Occupations and Employment Experience, Report of the Workshop in Agricultural Education (Ames, June 7-24, 1966).

Iowa State Univ of Sci and Tech, Ames. Dept of Education
Pub Date - 66
MF AVAILABLE IN VT-ERIC SET 112p.

*CURRICULUM GUIDES, *OFF FARM AGRICULTURAL OCCUPATIONS, UNITS OF STUDY (SUBJECT FIELDS), *VOCATIONAL AGRICULTURE, EMPLOYMENT OPPORTUNITIES, *COOPERATIVE EDUCATION, AGRICULTURAL SAFETY, HUMAN RELATIONS, SALESMANSHIP, BUSINESS SKILLS,

Twenty-six vocational agricultural teachers, following state guidelines for agricultural occupations and employment experience programs in vocational agriculture, developed the nine modules included in this report. The modules are (1) an overview of agricultural industry, (2) career opportunities, (3) occupational experience program orientation, (4) safety, (5) human relations, (6) agricultural salesmanship, (7) business organization and functions, (8) business procedures, and (9) new agricultural technology developments. Each module consists of an introduction, objectives, recommended time allotment, competencies to be taught, followup and evaluation techniques, references, instructional materials, subject matter content, and special teaching-learning activities. (JM)

RELATED INSTRUCTION IN AGRICULTURAL OCCUPATIONS AND EMPLOYMENT EXPERIENCE

Report of the
1966 WORKSHOP IN AGRICULTURAL EDUCATION
June 7-24, 1966
Department of Education
Iowa State University of Science and Technology
Ames, Iowa

PREFACE

The guidelines for agricultural occupations and employment experience programs in vocational agriculture were presented to Iowa instructors in November and December 1965. They specify that a minimum of 275 minutes per week of related classroom or individual instruction be provided parallel to employment experience. A minimum of 180 hours of employment experience during the senior year was recommended.

It was further recommended that from 8 to 12 percent of the total instructional time during the four years of high school be allotted to a study of agricultural occupations. It was suggested that approximately three-fourths of this instruction be provided in the senior year course preceding or parallel to employment experience.

This report consists of nine separate modules developed by separate workshop committees. Each module consists of an introduction, statement of objectives, recommended time allotment, list of competencies to be taught, follow-up and evaluation techniques and a list of references and instructional materials for one specific phase of the related instruction program. Subject matter content, special teaching-learning activities and a list of suggested instructional materials are also provided.

The success of the employment experience program in agricultural occupations is to a large degree dependent upon the effectiveness of the instructor in providing needed related instruction. Much of the subject matter content in the modules is new to most instructors. It was new to most workshop participants.

It is hoped that these modules will serve as instructional guides. Instructors should feel free to delete or add sections as necessary in adapting the materials for local use.

Duane L. Blake and
Clarence E. Bundy,
Agricultural Education

AN OVERVIEW OF THE AGRICULTURAL INDUSTRY IN THE LOCAL COMMUNITY, STATE, NATION AND WORLD.

Prepared by: J. H. Cairns
D. D. Kent
C. E. Perdue

I. Introduction

In our form of American industry, agriculture is dynamic and constantly changing. It is dynamic because the role of agriculture contributes to our nation's financial economy and democratic stability. On the other hand, the constant changing picture of agriculture provides a challenge to the activities of the competent and dedicated rural work force of our nation. This challenge enables those who do not intend to become engaged in production agriculture--called farming--to pursue non-farming agricultural occupational employment experiences. These experiences in turn help to provide the supplies, services, transportation and marketing sources which farmers need.

AUDIO-VISUAL PRESENTATION -- "A Step Ahead"....film--13 minutes

II. Major Objectives

A. To develop an understanding of the importance of agricultural industry in the local community, state, nation and world.

B. To develop an understanding of the opportunity to become employed in agricultural industry in the local community, state, nation and world.

C. To provide new training and retraining opportunities in equipping persons with skills and abilities to become established in agricultural industry in the local community, state, nation and world.

III. Time Allotment 8% _____ days.

IV. Competencies to be Taught

A. To develop an understanding of the need for agricultural industry and training in an agricultural occupations employment experience program locally.

B. To develop an understanding of the need for agricultural industry and training in an agricultural occupations employment experience program on a state level.

C. To develop an understanding of the need for agricultural industry on a national scope.

D. To develop an understanding of the need for agricultural industry on an international scope.

- - - - -

A. To develop an understanding of the need for agricultural industry and training in an agricultural occupations employment experience program locally.

1. Subject matter content:

(available only on local level[1]; Mahaska County illustrated[2])

a. Available skills and abilities of the people in TENCO--(a geographic area of ten contiguous counties in southeast

---

[1] United States Department of Commerce, U.S. Census Report, preliminary report, 1964.

[2] Ronald Powers, The Economic Base of TENCO, RAD--31. (Iowa State University Cooperative Extension Service, April 1964.)

Iowa)--are not matched to job opportunities, locally or nationally.

b. Net out-migration from TENCO, 1950-1960, 17.4%.

c. Farm population decreased 21% in TENCO, 1950-1960. (In Mahaska County the farm population decreased 17% during this same period)

d. Farm population projected decline of 7.8% in TENCO by 1970.

e. Farm numbers decreased by 11% in TENCO, 1955-1960, while farm size increased 10% to an average size of 196 acres.

f. Retail sales in feed, seed and fertilizer increased in 2/3 of TENCO county area, 1954-1962. This is projected to increase continually.

g. New basic jobs in industry and/or recreation will slow migration.

h. Agriculture produces 2/3 of the total TENCO income.

i. Total farmers working 100 or more days off the farm[3] in TENCO increased from 9.6% in 1940 to 21.3% in 1959.

j. Evidence shows that educational programs need to offer more vocational and technical courses in high schools.

2. Special teaching-learning activities:

   a. Follow-up past graduates. Migration and present employment.

   b. List vacant houses within rural school district or by townships.

   c. List neighbors who have part-time off-farm employment.

   d. Review "The Population Change of Eight Southern Counties" pamphlet.

---

[3] TENCO Agriculture Sub-Committee, Agriculture in TENCO of Iowa. (Iowa State University Cooperative Extension Service, 1964.)

3. Suggested instructional materials and references:
    a. Audio-visual transparency made from footnote 1, 2 and 3.
    b. Develop slide set for local area.

B. To develop an understanding of the need for agricultural industry and training in an agricultural occupations employment experience program on a state level.

1. Subject matter content:
    a. Two-hundred thousand Iowans (1966) work in farming, producing 3 billion dollars annually in raw food materials.
    b. Four-hundred thousand Iowans (1966) work in business, services, transportation and marketing branches which serve the farmer. These agricultural industries add in excess of 560 million dollars to the states industrial output.
    c. Iowa's industry (1966) includes 132 packing plants, 11 flour mills, 19 manufacturing and oilseed crushers, 48 poultry processing plants and 542 plants producing butter, cheese and ice cream and in excess of 500 fluid milk processors.
    d. Coupled with Iowa's agricultural industry, in 1966, are 26 wholesale food warehouses and 3,800 retail food stores. This combination employs 27,000 Iowans. Nine-thousand, six-hundred business firms in farm equipment, producing seed and gasoline deliveries, are keyed directly to farm purchasing.
    e. Farmers spend nearly 300 million dollars each year with 12,800 transportation firms.
    f. Iowa's farmers (1966) own 35,000 tractors; 106,000 trucks; 92,000 combines; 65,000 hay balers; 113,000 corn pickers

and picker-shellers and 45,000 milking machines.

g. Iowa's agriculture attracts industry to process our raw material, supply our machinery, fertilizer and general production needs. Agriculture interrelates to nearly every segment of our economy.

2. Special teaching-learning activities:

   a. Review pamphlet on "Iowa, Where Industry and Agriculture Meet".

   b. Review the following thought providing questions:

      (1) How does the income potential of agribusiness compare with farming on the state averages?

      (2) What are the conditions which exist in our state that challenge the opportunity of becoming a farmer?

      (3) What opportunity exists in our state for a boy to become established in an agricultural related occupation?

      (4) What similarities exist in our state regarding the problems encountered in agriculture related occupations and farming?

3. Suggested instructional materials and references:

   a. Flannel or bulletin board presentation on farming, (numbers and amount of dollars invested), as nucleus of agricultural atom and agricultural related occupations, (numbers and dollars of gross income), as surrounding electrons within the structure. Refer to reference 1, bulletins and pamphlets.

   b. Develop slide set for state area on related agricultural occupations.

c. Data in this competency is referred to reference number 5 under bulletins and pamphlets, use entire booklet.

4. Evaluation:

a. Research paper written by each student on his interest in one phase of agricultural related occupational opportunities within Iowa.

C. To develop an understanding of the need for agricultural industry on a national scope.

1. Subject matter content: United States

a. Between 1966 and 1975, the projected job opportunities nationally[4] are as follows: (employment increase)

65%....professional people and technicians
50%....service workers
45%....clerks and other office workers
34%....sales people
31%....managers and proprietors
29%....craftsmen, foremen and other skilled workers
17%....operators of machines and other semi-skilled workers
No change....laborers and other unskilled workers: miners
Some decline....farmers and farm workers

b. The 41% decline[5] in farm operators and workers from 1950-

---

[4] Ibid., TENCO study.

[5] C. A. Peterson and Norbert K. Norpel, Iowa Employment Trends, 1947-1960, Research series 24 (University of Iowa, Iowa City, Iowa: Bureau of Labor and Management), page 11.

1960 is projected to continue.

c. Early 1900's 1 out of 3 in the U.S. labor force was engaged in farming. (By 1960, ratio changed to 1 in 18 engaged in farming)

d. Agriculture is the nations largest industry with 3/4 of the assets of all corporations combined.

e. Three out of every ten jobs in private employment are related to agriculture. Some requirements are: (1966 data)

(1) 120,000 employees are needed for supplying tractors and machinery to the agricultural market.

(2) 300,000 employees are needed for processing meat.

(3) 258,000 employees are needed for processing dairy products.

(4) 282,000 employees are needed to convert wheat to bread and related products.

(5) 208,000 employees are needed to convert raw cotton into fabrics.

2. Special teaching-learning activities:

a. Distribution of "Agriculture Is More Than Farming" pamphlets.

3. Suggested instructional materials and references:

a. Two bulletin board displays; one on amounts of national agricultural purchases by farmers and the other on the amounts of U.S. food consumption annually, pages 7 and 11, reference number 5, bulletins and pamphlets.

D. To develop an understanding of the need for agricultural industry on an international scope.

1. Subject matter content:
    a. From 1900 to 1965 the annual rate of world population increase has been about 2% which represents doubling of the world population.
    b. World population:
        (1) 1965................. 3.2 billion people
        (2) 1975................. 3.9 billion people
        (3) 2000................. 6 billion people
    c. By the year 2000, Asia will have 2/3 of the world population.
    d. Throughout the world, soils with climates favorable for production of the principal grain crops are located in the more sparsely populated areas.
    e. With the growing world population each year more food will be consumed and the food producing areas of our world will be pressured for greater yields and efficiency. These food producing areas may become over-worked and coupled with the imbalance in the distribution of world population and productive soils; this may cause serious problems by the year 2000.
2. Special teaching-learning activities:
    a. Use of overlays in pointing out food producing and population regions of the world to the students.
3. Suggested instructional materials and references:
    a. Reference bulletin number 2, pages 6 and 7.

AUDIO-VISUAL PRESENTATION -- "Dynamic Careers Through Agriculture"....film, 28 minutes

V. Follow-up and Evaluation

Summarize briefly through essay and/or bar-graph or curve, the opportunities which exist in agricultural industry in our community.

CAREER OPPORTUNITIES IN AGRICULTURAL OCCUPATIONS

Prepared by: R. V. Fransen
R. P. Halsted
J. D. Tillman

I. Introduction

Students should be led to recognize immediately that agriculture is not a declining industry. The number of persons engaged in producing raw agricultural products is decreasing, but the number of persons engaged in processing and marketing food and fiber, providing agricultural supplies and services, agricultural research, education, etc. is increasing.

The image of agriculture has been tarnished in the eyes of many of our youth by erroneous information. Students need to be told that agriculture has many fascinating and challenging careers. Salaries in agriculture compare favorably with positions elsewhere which require the equivalent qualifications. Job opportunities in agriculture exist everywhere.

There is a bright future in agriculuure. The future belongs to those who prepare for it.

II. Major Objectives

To develop an understanding of the broad field of agriculture and the many vocations open to young men with interest in agriculture.

III. Time Allotment 13% _____ days

IV. Competencies to be Taught

A. To understand the basic changes in farming and the opportunities in farming today.

B. To understand the opportunities and challenges for young men in agricultural businesses and industry.

C. To understand the opportunities for agricultural college graduates and to help the student to decide whether to go to college.

D. To understand the criteria on which a sound choice of an agricultural occupation is attained.

- - - - -

A. To understand the basic changes in farming and the opportunities in farming today.

1. Subject matter content
    a. Farming as a whole is one of the most efficient operations in our economy.
        (1) The U.S. Census reported in 1961 that some 5 million workers were employed in producing food and fiber among the total work force of 65 million persons, which means that about 8% were feeding 100% of the population.
        (2) Due largely to modern power equipment, the amount of labor used on our farms declined 41% between 1949 and 1961. Today, one hour of farm labor produces four times as much as it did in 1919-21.
        (3) In the past 15 years the increase in output (total and per man-work hour) from farming has exceeded that of industry.
        (4) Comparison of farming in America, in terms of yields

and of how many persons one agricultural worker feeds, with that in other agricultural countries.

b. Farming is our most important industry.

   (1) It is the nation's largest single industry.

   (2) Total investment in farming and farm business is nearly $220 billion -- an amount equal to 2/3 of the assets of all the corporations in the United States.

   (3) Farmers buy some $27 billion of goods and services each year to produce their crops and livestock. They are large users of petroleum products, fertilizers, motor vehicles, machinery, equipment, etc.

   (4) Farming provides products for aiding undeveloped countries, and helps in the struggle to keep independent nations of the world free of Communism.

   (5) Abundant food is a deterrent of war. Most great conflicts of man arise from the need for necessities of life which come from the soil.

c. Farming creates many jobs in related businesses and industry.

   (1) Perhaps 40% of all workers in the U.S. owe their employment, at least in part, to farming.

   (2) Processing, transporting and marketing food for about 200,000,000 people is an enormous operation.

   (3) Businesses, farming occupations, and industries are dependent upon each other.

d. Farming is a changing, but not a declining industry.

   (1) By 1980, the U.S. must increase its agricultural production by 70% if we are to maintain our present stan-

dard of living due to increase in population.

(2) Farm sizes are increasing. Compare U.S. and Iowa farm sizes.

(3) Investment in farming increases. Present capital investment per farm in the U.S. averages $36,000 to $43,000. The investment in agriculture represents an average of $21,300 for each farm employee.

(4) Fewer people live on farms.

(5) Farming demands a higher qualified worker. When workers are improving and are becoming more efficient in an occupation, we say that occupation is on the move.

2. Special teaching-learning activities
   - a. Field trip to an outstanding and successful livestock farmer in the community. Farmer needs to explain his farm management pointers.
   - b. Show film, "Agriculture, USA" or "A New Word for Farming".
   - c. Show charts, slides or transparencies on agricultural labor, farm output, farm sizes, farm investment, etc.
3. Suggested instructional materials and references
   - a. An Introduction to Agricultural Business and Industry
   - b. Careers in Agribusiness and Industry
   - c. Course of Study in Nonfarm Agricultural Occupations
   - d. Fact Book of U.S. Agriculture
   - e. Farming As An Occupation
   - f. Films - "Agriculture, USA" and "A New Word for Farming"
   - g. Handbook of Agricultural Occupations
   - h. Iowa Agriculture, World Food Needs and Educational Response

i. Iowa Annual Farm Census

j. Iowa Employment Trends

k. Iowa Farm Outlook Charts

l. Occupational Characteristics of the Iowa Labor Force

m. United States Census of Agriculture

B. To understand the opportunities and challenges for young men in agricultural businesses and industry.

1. Subject matter content

a. Careers in agriculture, other than farming, are becoming more important.

(1) In many states there are two or three nonfarm jobs to one in farming. Many of these jobs require post-high school specialized training.

(2) Agriculture is served by about 500,000 scientists and research workers.

(3) About 18 million people produce products or provide services to the farmer and process and distribute products from farms.

b. Occupations in farm machinery sales and services.

(1) Identification of job titles with level of employment.

(2) Descriptions of titles, duties, salaries and opportunities in farm machinery occupations.

(3) Methods of entering and advancing from each level of employment.

(4) Kinds of farm machinery dealers in the community and the levels of employment.

c. Occupations in farm supplies and equipment

  (1) Identification of job titles with level of employment.

  (2) Description of titles, duties, salaries and opportunities in farm supplies and equipment occupations.

  (3) Methods of entering and advancing from each level of employment.

  (4) Kinds of farm supply and equipment centers in your local community.

d. Occupations in the livestock industry

  (1) Identification of job titles with level of employment.

  (2) Descriptions of titles, duties, salaries and opportunities in the livestock industry.

  (3) Methods of entering and advancing from each level of employment.

  (4) Kinds of livestock related businesses in the community.

e. Occupations in crops, forestry, and soil conservation.

  (1) Identification of job titles with level of employment.

  (2) Descriptions of titles, duties, salaries and opportunities in occupations related to crops, forestry, and soil conservation.

  (3) Methods of entering and advancing from each level of employment.

  (4) Kinds of businesses related to crops, forestry, and soil conservation in the community.

f. Occupations in ornamental horticulture, wildlife, and recreation.

  (1) Identification of job titles with level of employment.

(2) Descriptions of titles, duties, salaries and opportunities in occupations related to ornamental horticulture, wildlife, and recreation.

(3) Methods of entering and advancing from each level of employment.

(4) Kinds of businesses related to ornamental horticulture, wildlife, and recreation.

2. Special teaching-learning activities
   - a. Take a field trip to an agricultrual business and have students interview the manager to get answers to questions and get better acquainted with this type of employment.
   - b. Show the film, "Meat on the Move" or "A New Career--The Science of Feed Technology".
   - c. Have a dealer or personnel director speak to the class.
3. Suggested instructional materials and references
   - a. Careers in Agribusiness and Industry
   - b. An Introduction to Agricultural Business and Industry
   - c. Course of Study in Nonfarm Agricultural Occupations
   - d. Films - "Meat on the Move" and "A New Career-The Science of Feed Technology".
   - e. Handbook of Agricultural Occupations
   - f. Iowa Employment Trends
   - g. Job Opportunities for Iowa's Youth
   - h. Occupational Characteristics of the Iowa Labor Force

C. To understand the opportunities of agricultural graduates and to help the student to decide whether to go to college.

1. Subject matter content

a. Surveys show that 15,000 positions open annually in agricultural industry to young men being graduated from agricultural college curriculums. Graduates totaling only 1/2 of this number are available for placement.

b. Workers with more education are employed in better positions.

c. Professions and other white collar occupations are growing the fastest.

d. Expected lifetime earnings from various levels of education.

Finished	Lifetime Earnings
Grade School	$184,000
High School	247,000
1-3 years of college	293,000
4 years of college	417,000

e. Types of professional work available upon graduation.

(1) Business
(2) Communications
(3) Education
(4) Farming
(5) Industry
(6) Research
(7) Specialized Services

f. A beginning student in college does not choose a career, but a curriculum or course of study. Curriculums available at Iowa State University in agriculture are:

(1) Agricultural Business
(2) Agricultural Education
(3) Agricultural Engineering

(4) Agricultural Journalism

(5) Agronomy

(6) Animal Science

(7) Dairy Science

(8) Dairy Industry and Food Technology

(9) Entomology

(10) Farm Operations

(11) Fish and Wildlife Management

(12) Forestry

(13) Horticulture

(14) Landscape Architecture

(15) Plant Pathology

(16) Poultry Science

(17) Rural Sociology

(18) Veterinary Medicine

2. Special teaching-learning activities

   a. Students need to check entrance requirements for the different curriculums.

   b. Have each student who can meet college requirements interview a professional person and report to the class.

   c. Show film, "Agricultural Engineering-The Profession with a Future".

   d. Agricultural college career day.

3. Suggested instructional materials and references

   a. An Introduction to Agricultural Business and Industry.

   b. Charts - "Manpower Needs of the Future"

   c. Film - "Agricultural Engineering - The Profession with a

Future

d. Handbook of Agricultural Occupations

e. Occupational Outlook Quarterly

D. To understand the criteria on which a sound choice of an agricultural occupation is attained.

1. Subject matter content
   - a. Interest area in specialized field.
   - b. Value of experiences in agriculture as a background for vocations.
   - c. Factors to consider in choice of an agriculuural occupation.
2. Special teaching-learning activities
   - a. Film - "Planning Your Career"
3. Suggested instructional materials and references
   - a. An Introduction to Agricultural Business and Industry
   - b. Film - "Planning Your Career"

V. Follow-up and Evaluation

A. Have each student use the information gathered in his notebook to line himself up with one occupation. Have a private conference with each student to check out the work he has done and counsel him concerning his choice of occupation.

VI. Titles and Sources of References and Instructional Materials

A. Books:

1. Bindley, Harold, Course of Study in Nonfarm Agricultural Occupations, Department of Agricultural Education, University of Kentucky, Lexington, Kentucky, August, 1965.

2. Hoover, N. K., Handbook of Agricultural Occupations, Interstate Printers and Publishers, Danville, Illinois, 1963. Price $4.27 (single copy)

ORIENTATION TO OCCUPATIONAL EXPERIENCE PROGRAM

Prepared by: Keith P. Schmidt
Gerald E. Sutton
Lewis L. Webster

I. Introduction

The proper orientation of the students is very important as a part of the pre-job preparation of those who will participate in the occupational experience program. The student should understand the purpose of the program and what is expected of him. The boy should be encouraged to analyze himself to determine if he has the right attitude, qualifications, interest and ability for the job. He should also be instructed in the legal implications of occupational experience programs.

Since many schools will be initiating this program for the first time, it is most important to select, carefully, individuals who are likely to succeed. Proper orientation can aid in this screening process and help to insure the success of the program.

II. Major Objective

To develop in the student an understanding of, and a wholesome attitude toward, the supervised occupational experience program which will prepare him for employment in one or more agricultural occupations.

III. Time Allotment 13% _____ days

IV. Competencies to be Taught

A. Understanding of specific job requirements

B. Understanding of personal qualifications needed

C. Ability to obtain a job

D. Understanding of importance of job ethics

E. Understanding of legal implications

F. Understanding of importance of good housekeeping and maintenance

- - - - -

A. Understanding of specific job requirements

1. Subject matter content
    a. Importance of an agricultural background
    b. Occupations requiring a college degree
    c. Occupations requiring less than a college degree
    d. Health and physical requirements
    e. Importance of related experience
    f. Variations in aptitudes required
    g. Jobs requiring motor vehicle driving
    h. Differences in need for ability to meet public
    i. Willingness to put out a good day's work
2. Special teaching-learning activities
    a. Use an overlay showing the triangle of the supervised occupational experience program. (Reference B8)
    b. Have the student develop a check list of values to be expected in a supervised occupational program (References A3, A4 and A8)
    c. Divide class into groups according to agricultural supply, sales and service occupations, etc. Have each team observe and evaluate a particular experience program in progress. (References A3, A4 and A8)

d. Use an agricultural businessman in the community, who is a cooperating employer, to explain the program.

3. Suggested instructional materials and references

a. Refer to references No. A3, Chapter 1; No. A8, Chapter 4; No. A7, Pages 16-24; No. B9, Pages 44-46; No. A4, Chapter 1, and entire reference No. B8.

B. Understanding of personal qualifications needed

1. Subject matter content

a. Good scholastic and attendance records

b. A genuine interest in the occupation

c. Extra-curricular activities

d. Curiosity

e. Analytical ability

f. Loyalty to superiors, associates and to the business

g. Proper grooming

h. Adequate education

i. Importance of punctuality and dependability

j. Courage, not easily discouraged

k. Desirable personality

l. Be a good listener

m. Sense of humor and pleasant disposition

n. Ability to adjust to change

o. Be systematic, orderly and a good housekeeper

p. Have clean habits and maintain good health

q. Be impartial and fair in all dealings

r. Be thrifty with time and funds.

s. The ability to make decisions quickly and correctly

        - t. The ability to accept honors and advancements gracefully
    - 2. Special teaching-learning activities
        - a. Organize a panel presentation, "What Student Qualities Are Necessary in a Supervised Occupational Experience Program." Ask an employer, principal, parent and a senior student to serve on this panel. (References B8, A3, A4 and A8)
        - b. Divide the class into groups to develop a list of desirable qualities, questions for self-analysis, and to make presentations to the class. Each group should be encouraged to develop a bulletin board display. (Reference A7)
    - 3. Suggested instructional materials and references
        - a. Refer to references No. A6, Chapter 1; No. A9, Unit I, Pages 3-20; and entire reference No. B8.

- C. Ability to obtain a job
    - 1. Subject matter content
        - a. Letters of application
        - b. Applications for employment
        - c. The job interview
        - d. Personal data sheet
    - 2. Special teaching-learning activities
        - a. Have a local agricultural businessman participate in a short role-playing situation. Select a good pupil to act as the interviewee. Have the agricultural businessman ask the pupil some questions which typically are asked during the job interview.
        - b. Discuss with students the possible questions a personnel manager of an agricultural business will ask.

c. Obtain application blanks from several agricultural firms and determine information desired.

d. Discuss possible ways of determining how one finds a job opening.

e. Discuss with students and have them write letters of application to various agricultural businesses to develop letter writing skill and to decide where each student would like to work.

f. Determine by discussion the desirable actions and attitudes during an interview.

g. Determine proper and desirable dress and personal appearance for the interview.

h. Discuss what may be done after the interview to improve chances of employment.

i. Lead discussion on what and how to obtain letters of recommendation.

j. Develop with students a personal data sheet.

3. Suggested instructional materials or references

a. Sample application blanks

b. Sample letters of application

c. Sample follow-up of interview letters

d. Desirable employee traits list

e. Newspaper job lists

f. Sample personal data sheets

g. References Nos. A7, A9, B9, A5, A1 and A2)

D. Understanding of importance of job ethics

1. Subject matter content

- a. Ethics defined
- b. Ethics in applying for a job
- c. Ethics on the job
- d. Ethics when changing jobs

2. Special teaching-learning activities
    - a. Have each student give his own definition of ethics and find definition in dictionary.
    - b. Determine through discussion the different types of ethics
    - c. Determine through discussion, possible unethical practices in getting a job and while on the job.
    - d. Interview an employment agency manager to further explore unethical practices in job procurement.
3. Suggested instructional materials and references
    - a. Dictionary and school guidance materials on ethics
    - b. Bibliography references Nos. A1 and A5.

E. Understanding of legal implications

1. Subject matter content
    - a. Minimum age laws
    - b. Hazardous occupations
    - c. Certificates to employ student learners
    - d. Penalties for violation of laws
    - e. State labor laws
    - f. Safety laws
    - g. Assumption of risks
    - h. Tax and social security laws
    - i. Wage laws
    - j. Physical examination

k. Hours of employment

l. Civil liability

m. Civil rights law

2. Special teaching-learning activities

   a. Attorney speak to group on case histories related to employment of students

   b. Study recent labor laws of Iowa and United States

3. Suggested instructional materials and references

   a. Articles about legal cases

   b. Bibliography references Nos. B1, B2, B3, B4, B5, B6, B7 and B9.

F. Understanding of importance of good housekeeping and maintenance

1. Subject matter content

   a. Student keep tools in good repair and clean

   b. Keep machinery in good repair, clean, and orderly

   c. Keep floor reasonably clean

   d. Well painted attractive surroundings

   e. Properly store or dispose of oily rags and other waste material.

   f. Proper care of supplies to keep out contaminants

   g. Proper cleaning and use of bedding around livestock

   h. Proper use of disinfectants and disease prevention

   i. Proper use of rodent and pest control

   j. Keep advertising materials fresh and attractive.

   k. Keep stock supply neat, clean and orderly.

   l. Keep orderly desk and records.

   m. Attractive lighting

2. Special teaching-learning activities
    a. Have students give experiences in entering businesses where good and poor housekeeping is practiced.
    b. Businessman speak to class on why good housekeeping is needed.
3. Suggested instructional materials
    a. Flannel board and cut outs to demonstrate good and poor arrangements

V. <u>Follow-up and Evaluation</u>

A. Tests over material studied

B. Check both employer and employee on regular supervisory visits

C. Administer personality tests

D. Have each student analyze and evaluate his own personal qualifications.

E. Have employer fill out a check list evaluating the employee's personal qualifications early in the experience program.

F. Teacher use check list in evaluating students.

G. Discuss with students their progress toward employment, e. g. discuss with students how an interview went or what questions were asked and procedures were used by those successful in securing employment.

H. Grade application letters, personal information blanks, and after-interview letters, on basis of structure, neatness and grammar.

I. Draw upon experience of students and from actual examples in the business world concerning good and poor ethical practices.

J. Develop essay questions which illustrate opportunities for unethical job procurement and have students outline their course of action.

K. Check to see that student meets legal requirements for occupation.

L. Check for proper insurance coverage.

M. Be sure proper certificates for age and student learner permit are completed.

N. Have employer fill out check list on housekeeping habits of employee.

O. Have student report on general housekeeping habits in business.

VI. Titles and Sources of References and Instructional Materials

SAFETY IN AGRICULTURAL RELATED OCCUPATIONS

Prepared by: Ed Faselt
J. M. Risdal

I. Introduction

In almost any line of activity there are hazards. Industry and business are concerned about time and production losses due to accidents as well as costs involved in accident prevention. Coupled with this is human suffering and loss of income. In spite of this, safety awareness comes slowly, meeting a passive attutude among many people.

II. Major Objectives

A. Develop in the students a philosophy of safety awareness.

B. Develop a mental attitude conducive to the integration of safety procedures in all activities related to the job situations.

III. Time Allotment 6% _____ days

IV. Competencies to be Taught

A. Understanding the need for safety

B. Understanding hazards

C. Understanding of types of accidents

D. Understanding methods of prevention of accidents

E. Understanding of first aid

- - - - -

A. Understanding the need for safety

1. Subject matter content
    a. Present accident records of the community and the state.
    b. Time loss from accidents
    c. Personal financial loss
    d. Physical suffering, handicaps, and injuries
    e. Other
2. Special teaching-learning activities
    a. Use news articles on accidents
    b. Use film-strip or movie on working safety
    c. Statistical data overlay sheet
3. Suggested instructional materials and references
    a. "Safety is No Accident" Ref. 9
    b. Office of Health, Education and Welfare statistical data, Ref. 12.
    c. Safety in the Shop Ref. 7.

B. Understanding of hazards
1. Subject matter content
    a. Housekeeping
    b. Health
    c. Clothing
    d. Identification
    e. Fatigue
    f. Methods and techniques
    g. Other
2. Special teaching-learning activities
    a. Make demonstration of hazards related to reflexes and fatigue.
    b. Call in outsider (Insurance or similar) to point out hazards and their importance.
    c. Have students check training station for hazards and prepare

a list.

3. Suggested instructional materials and references.
    - a. "Find the Hazards" Ref. 17
    - b. Industrial materials used locally.

C. Understanding of types of accidents.

1. Subject matter content
    - a. Electrical
    - b. Chemical
    - c. Falls
    - d. Mechanical
    - e. Strains
    - f. Fire
2. Special teaching-learning activities.
    - a. Develop a list of accidents by type.
    - b. Discuss characteristics of types
3. Suggested instructional materials and references
    - a. "How to Avoid Muscle Strains" Ref. 3
    - b. "Safety in the Shop" Ref. 7 (film)

D. Understanding methods of prevention of accidents.

1. Subject matter content
    - a. Discuss importance of physical condition.
    - b. Develop appreciation of importance of clothing and protective devices.
        - (1) Snug fitting clothing
        - (2) Safety shoes
        - (3) Safety glasses
        - (4) Safety helmet
        - (5) Respiratory masks
        - (6) Shields and guards
        - (7) Fire extinguishers
        - (8) Non-skid floors
        - (9) Fuses and switches
        - (10) Warning devices
    - c. Identifying dangers

(1) Visible signs
(2) Color coding
(3) Danger area markings
(4) Identify traffic areas
(5) Warning devices

d. Understanding the use of proper work habits and handling techniques.

2. Special teaching-learning activities.

   a. Have school nurse or doctor discuss importance of health in avoiding accidents.

   b. Tour of industry to point out identification of dangers.

   c. Have students develop list of identifying aids.

   d. Discuss importance of good work habits and handling techniques.

   e. Bring in fire chief to discuss fire prevention.

3. Suggested instructional materials and references.

   a. Display of safety clothing and protective devices.

   b. Films - "Its Up To You", about safety glasses, Ref. 4
   "The Warning Bell", Ref. 8
   "Safety in the Shop", Ref. 7
   "How to Avoid Muscle Strains", Ref. 3

   c. Bulletins - "Safety is No Accident", Ref. 9
   "Ten Steps to Safety", Ref. 4
   "Safe Grounding Electric Equipment", Ref. 14
   "Fire Extinguishers and First Aid Kits", Ref. 18
   "Why Safety Glasses", Ref. 19
   "First Aid", Ref. 24

E. Understanding of first aid.

1. Subject matter content

- a. What is first aid?
    - (1) Extent
    - (2) Limitations
- b. Methods and procedures
    - (1) By kind of injury
        - (a) cuts and burns
        - (b) fractures
        - (c) strains
        - (d) unconsciousness
        - (e) poisoning
        - (f) electric shock
    - (2) Techniques
        - (a) artificial resuscitation
        - (b) bandages, splints and tourniquets
        - (c) antidotes
        - (d) moving the patient
- c. Equipment and supplies
    - (1) Contents of the first aid cabinet
    - (2) Location of first aid station
- d. Agencies
    - (1) Emergency phone numbers
        - (a) doctor
        - (b) ambulance
        - (c) hospital
        - (d) family
        - (e) fire department
        - (f) police
        - (g) civil defense

2. Special teaching-learning activities
    - a. Discussion of principles of first aid
    - b. Demonstrations
    - c. Films
3. Suggested instructional materials and references
    - a. Displays

(1) Well stocked cabinet

b. Films - "First Aid Now", Ref. 1

c. Bulletins - "First Aid Guide for USDA Employees", Ref. 2

"Confusion Can be Fatal", Ref. 1

"Fire Extinguishers and First Aid Kits", Ref. 13

"First Aid Booklet", Ref. 24

V. Follow-up and Evaluation

A. Use testing devices

B. Have student develop a safety program for the job situation

C. Conference with employer

VI. Titles and Sources of References and Instructional Materials

A. Publications

HUMAN RELATIONS

Prepared by: F. C. Baldus
C. K. Morrow
A. L. O'Neal

I. Introduction

Human relations is how one gets along with other people. How important is it that one be able to get along well with others in order to operate a successful agricultural business? Could one be so intelligent and so well trained in his business that he would be successful no matter how well he got along with others?

The Carnegie Foundation made a startling statement in saying "On the basis of our studies we find that technical training counts for only 15 percent in the success of an individual, while personal qualities count for 85 percent."

The Harvard Bureau of Vocational Guidance found in a study of 4,400 persons who were discharged from jobs that personality factors were the cause of failure in 66 percent of the cases. Lack of technical knowledge was the basis for only 34 percent of the cases.

II. Major Objectives

A. To develop an understanding of the personal traits necessary for successful employment and advancement in agricultural occupations.

B. To encourage improvement in the ability to get along with others.

C. To develop an understanding of the importance of human relations in successful employment in an agricultural occupation.

III. Time Allotment

8% _____ days

IV. Competencies to be Taught

A. To develop an understanding of the personal qualities desired in employees.

B. To develop an understanding of desirable employer-employee relations.

C. To develop an understanding of desirable supervisor-employee relations.

D. To develop an understanding of desirable relations among co-workers.

E. To develop an understanding of desirable relations between the customer and employee.

- - - - -

A. To develop an understanding of the personal qualities desired in employees.

1. Subject matter content

a. Desirable personal traits

(1) Accurate
(2) Agreeable
(3) Appreciative
(4) Alert
(5) Careful
(6) Confident
(7) Cooperative
(8) Conscientious
(9) Dependable
(10) Energetic
(11) Enthusiastic
(12) Efficient
(13) Humble
(14) Honest
(15) Kind
(16) Loyal
(17) Mature
(18) Patient
(19) Realistic
(20) Responsible
(21) Tactful
(22) Tolerant

b. Objectionable personal traits

(1) Argumentative
(2) Artificial
(3) Antagonistic
(4) Boastful
(5) Critical
(6) Defensive
(7) Domineering
(8) Greedy
(9) Inattentive
(10) Militant
(11) Moody
(12) Rebellious

(13) Sarcastic
(14) Selfish
(15) Sensative
(16) Sulky
(17) Timid
(18) Untrustworthy
(19) Vague
(20) Vulgar
(21) Vicious

2. Special teaching-learning activities
    a. Use personality evaluation check list.
    b. Use film strip "Your Attitude is Showing". C-3
    c. Have students write a personality sketch of themselves.
    d. Have students debate the factors which have the most bearing on successful employment.

3. Suggested instructional materials and references
    a. Personal evaluation check list.
    b. Film strip "Your Attitude is Showing". C-3
    c. Human Relations in Agricultural Occupations, Ohio State University, pp. 7 and 8. B-3
    d. Course of Study in Nonfarm Agricultural Occupations, pp. 55-60, B-2
    e. "How to Win Friends and Influence People", Dale Carnegie A-1
    f. Refer students to guidance counselor for special personality tests.

B. To develop an understanding of desirable employer-employee relations.

1. Subject matter content
    a. Be regular in attendance
    b. Be punctual
    c. Obey rules and policies
    d. Respect authority
    e. Possess good personal characteristics

f. Be dependable

g. Show initiative

h. Accept criticism

i. Don't pass the buck

j. Be loyal

k. Seek raises and promotions on merit.

2. Special teaching-learning activities

a. Invite a successful businessman to speak to class on personal traits desired by employers and of objectionable traits which often result in dismissal.

b. Have students compile a list of personal traits of an employee which would be desirable for a good employer-employee relationship.

c. Have students consider someone they know without mentioning names who finds difficulty in securing and/or holding a job, and consider his personal traits which make this so.

3. Suggested instructional materials and reference

a. Personal grooming check list

b. "Salesmanship Fundamentals" Ernest and Devall, p. 335, A-3

c. "Human Relations in Agricultural Occupations", B-3, Ohio State University, pp. 7 and 8.

d. "Course of Study in Nonfarm Agricultural Occupations", pp. 55-60, B-2

C. To develop an understanding of desirable supervisor-employee relations.

1. Subject matter content

a. Be sold on aims of business

b. Accept and use constructive criticism

c. Be loyal

d. Be responsible

e. Respect authority

f. Contribute new ideas

g. Recognize supervisor as an individual

2. Special teaching-learning activities

a. Have students list factors which would effect an employee's ability to get along with his supervisor.

b. Have students consider the effect of age, tenure, and education on human relations in an agricultural business.

c. Have students consider a comparison of the supervisor-employee relation and the co-worker relationship from the standpoint that the supervisor-employee relationship is a direct command relationship and the co-worker relationship is one of informal communication.

d. Have students describe how the following concepts fit into the relationship between a supervisor and an employer.

(1) Loyalty
(2) Respect for authority
(3) Willingness to learn
(4) Cooperation
(5) Honesty
(6) Responsibility
(7) Leadership
(8) Morale

3. Suggested instructional materials and references

a. "Salesmanship Fundamentals" Ernest and DaVall

b. "Human Relations in Agricultural Occupations", Ohio State University, pp. 18-33.

c. "Course of Study in Non-farm Agricultural Occupations", pp.55-60

D. To develop an understanding of desirable relations among co-workers.

1. Subject matter content

a. To maintain good human relations

(1) Treat people as individuals

(2) Don't pass the buck

(3) Be loyal to fellow workers

(4) Be cheerful

(5) Help others

(6) Seek promotion on basis of own merits

(7) Be honest, patient and sincere

(8) Learn the line of authority

(9) Develop a "stick-to-it" attitude

(10) Be resourceful

(11) Do more than is expected

(12) Approach job with enthusiasm

(13) Be friendly

(14) Be responsible

(15) Be complimentary

(16) Learn names of fellow workers

(17) Do not join cliques

(18) Study your fellow worker

(19) Develop good personality traits

b. Avoid undesirable traits

(1) Using (exploiting) other people

(2) "Politicing" - curring favors

(3) Running down others

(4) Taking credit for others' ideas

(5) Gossip, tale bearing

(6) Being jealous

(7) Being indifferent

(8) Ignoring rights of others

(9) Apple polishing

(10) Griping

(11) "Stealing" sales or easy jobs from others

(12) "Acting" as a supervisor

2. Special teaching-learning activities

   a. Show film, "Getting along with Others"

   b. Ask students to define or explain each personality trait and tell what effect it would have on getting along with a co-worker.

   c. Have students rate one another on personality traits.

3. Suggested instructional materials

   a. Film - "Getting Along With Others", C-1

   b. List of personality traits

   c. References: What Employers Want, B-5

      Human Relations in Agricultural Occupations, B-3

      Course of Study in Nonfarm Occupations, B-2

      An Introduction to Agricultural Business and Industry, B-4

E. To develop an understanding of desirable relations between employee and customers.

1. Subject matter content

   a. Treat people as individuals

   b. Recognize that human behavior is unpredictable

c. Develop a winning personality

(1) Enthusiasm
(2) Friendly
(3) Sharp
(4) Complimentary
(5) Sincere
(6) Tactful
(7) Confident
(8) Patient
(9) Considerate
(10) Sympathetic
(11) Understanding
(12) Alert
(13) Optomistic
(14) Modest

d. Avoid undesirable traits

(1) Tactless
(2) Argumentative
(3) Diffident
(4) Sullen
(5) Obstinate
(6) Conceited
(7) Sarcastic

2. Special teaching-learning activities

a. Role playing

b. Film, "Improve Your Personality".

c. Ask home economics teacher to talk on proper grooming.

d. Ask students to think of a businessman that their parents patronize because of his personality. Have them list the qualities they especially like about him.

e. Ask them to make a list of undesirable traits their parents have observed in certain businessmen they no longer patronize.

3. Suggested instructional materials and references

a. Film, "Improve Your Personality, C-2

b. Grooming charts

c. Plans for role playing

d. References: Your Personality and Your Job, B-1
Human Relations in Agricultural Occupations, B-3

Course of Study in Nonfarm Occupations,

pp. 56-58, B-2

An Introduction to Agricultural Business and

Industry, B-4

V. Follow-up and Evaluation

A. Quiz on desirable and undesirable character traits.

B. Visit training center to check on human relations of students.

C. Compare personality rating of students at the end of the course with their rating at the beginning of the course.

VI. Titles and Sources of References

A. Books

1. Carnegie, Dale, How to Win Friends and Influence People, Pocket Books, Inc., New York, New York, 1965 Edition, $.50.

2. Davis, Human Relations in Business, McGraw-Hill Publishing Company, Chicago, Illinois.

1. Getting Along With Others, 16mm film, 29 minutes. Business Education Film, 5113 16th Avenue, Brooklyn, New York.

2. Improve Your Personality, 10 minutes. Coronet Industrial Films, Coronet Building, Chicago, Illinois.

3. Your Attitude is Showing, 35mm sound filmstrip, 13 minutes, Charles Steadman, Teacher-trainer in Distributive Education, University of Pittsburg, Pittsburg, Pennsylvania.

AGRICULTURAL SALESMANSHIP

Prepared by: Larry Statler
Lloyd Tindall
Paul Vincent

I. Introduction

Salesmanship is a broad term. A simplified definition states that salesmanship includes "The acts of personal persuasion employed by the seller to induce others to buy what he wishes to sell." One might say that nothing happens in the American economy until something is sold. Even though this is a strong statement, agricultural sales must be a very important part of any business in which you will eventually become involved. With this in mind, we certainly can justify time in our related instruction program of agricultural occupations experience program. Production of efficient salesmen that understand rural America is one of the main purposes of this module. Efficient salesmen certainly understand that customers are lost mainly because of:

Poor services rendered

Discourteous treatment received

Indifferent attitudes exhibited on the part of the salesman.

II. Major Objectives

A. Understanding the importance of personality in agricultural sales.

B. Develop the ability to enter selling occupations in agricultural supply.

III. Time Allotment 15% _____ days.

IV. Competencies to be Taught

- A. Sales personality
- B. Meeting customers
- C. Presenting supplies and services
- D. Overcoming sales resistance
- E. Closing and recording sales
- F. Displays and advertising
- G. Business communications - terminology
- H. Time budgeting - sales planning

- - - - -

- A. Sales personality
  - 1. Subject matter content
    - a. Personality planning
      - (1) First-have good reason for wanting to improve
      - (2) Second-determine which habit, attitude, trait to work on
      - (3) Third-develop specific plan for improvement
      - (4) Fourth-evaluate periodically to see if improvement is made
      - (5) Fifth-select next personality flaw and proceed.
    - b. Sales assets
      - (1) Alertness: being wide awake, keeping your "eye on the ball"
      - (2) Cheerfulness: being in good spirits, happy disposition
      - (3) Cooperation: working with others willingly, for the group
      - (4) Courtesy: politeness, consideration for others

(5) Dependability: reliable, trustworthy, able to be counted upon

(6) Enthusiasm: showing a keen interest, being sold yourself

(7) Honesty: open and above board, upright, honorable

(8) Industry: finding work without being told, keeping busy

(9) Initiative: self-starting, working on own, self-reliance

(10) Interest in customer: sincere desire to help others

(11) Intelligence: ability to meet a new situation, comprehensive

(12) Loyalty: faithfulness, constancy, stand up for business

(13) Memory: quick recall, remembrance

(14) Orderliness: systematic, keeping things "ship shape"

(15) Patience: self-possession, keeping cool, wait calmly

(16) Personal appearance: well-groomed, dressed appropriately

(17) Poise: mental balance, self-possession, handle self correctly

(18) Sense of humor: can see funny side of problem too

(19) Sincerity: being genuine, uprightness

(20) Tact and diplomacy: working smoothly in difficult situations

c. Sales liabilities

(1) Annoying mannerisms: personal habits attracting attention

(2) Familiarity: over-stepping social conventions, boldness

(3) Giving excuses: passing the buck, not facing facts

(4) Indifference: lack of concern and interest

(5) Jealousy: suspicion, not giving credit where due

(6) Procrastination: putting things off till tomorrow

(7) Rudeness: hunting other fellow's feelings, discourtesy

(8) Tendency to argue: taking opposite point-of-view

(9) Tendency to complain: fault finding, taking dark side

2. Special teaching-learning activities

a. Discuss each of the assets and liabilities as a case-conference, introducing it with a pertinent lead question.

b. Ask class to analyze the best and the poorest salesman they have encountered. Draw out the personality factors.

3. Suggested follow-up and evaluation

a. Each student prepare a personality plan, involving at least one personality fault. Discuss plan with student individually, during a particular class period.

B. Understanding how to meet a customer

1. Subject matter content

The impression of the agricultural business that the customer carries away often results from his first contact with the employee. Appearance and actions play an important part in forming this impression.

A well groomed employee attracts customers and inspires their confidence. Undivided attention on the job is essential to good salesmanship. Salesmanship is demonstrated through promptness, alertness, and interest in the customers problems.

a. Preapproach preparation

(1) Information needed about the customer

Name-address, personal characteristics, mental make-up and hobbies

(2) Sources of this information

Participate in community activities and events

Chamber of Commerce information

Comments made by other members of civic clubs

A personal notebook on customers

Past sales records, credit department records

Interview with people in the community

Local newspaper

(3) Check of the facilities and surroundings

General appearance, lighting, equipment, merchandise arrangement, and personal

(4) Knowledge of the benefits the customer will receive from merchandise sold

Design or appearance, quality of the source-trade-name, composition and construction, and special features

(5) Preparation by the employee

Neatness of appearance, knowledge of contents of merchandise, preparation of an appealing display, and knowledge of contents of newspaper advertisments, knowledge of names, backgrounds, and interest of customers, preparation of a few selling sentences, knowledge of the competitors products, and preparation of a record of common customer objections and development of methods of meeting them

b. Timing the approach

(1) Importance of the impression created by the salesman's appearance and actions

Promptness, alertness, and interest in customers' problems

c. The proper approach

(1) Types of salutations

Conventional, question, and stating a fact about the merchandise

(2) Elements of a good salutation

Courteous, short, requires no mental decision, affirmative and emphasize the desire to serve

(3) Tone of voice - pleasant, enthusiastic, distinct, articulate, and ordinary

(4) Facial expressions

A pleasant smile and cheerful expression

2. Special teacher-learning activities

a. Develop with the students a list of attitudes and actions of a good agricultural salesman.

b. Invite the manager of a successful agricultural business to discuss with the class do's and don'ts of good salesmanship he has observed.

3. Suggested instructional materials and references

a. "The Approach," 10 minute film

b. <u>Fundamentals of Selling</u>, Wingate, Nolen S.W. Publishing Company, Cincinnati, Ohio

c. Center for Voc. Tech. Education, Ohio State University, Columbus, Ohio

4. Follow-up and evaluation

   a. Have the students analyze themselves regularly

   b. Discuss the training center experiences in the classroom with the students

C. Understanding how to present supplies and services

1. Subject matter content

Successful selling requires a careful presentation by the seller. An employee must recognize the importance of each of the psychological steps in a sale. He must gain the attention, develop the interest, kindle desire, and induce action on the part of the customer.

   a. Draw attention of customers to a supply or service

   Examples

   (1) oReading an advertisement about a beef concentrate

   (2) Seeing a new herbicide on a TV commercial

   (3) Talking to a neighbor about his new five plow tractor

   (4) Mailing a circular on early fertilizer purchase discount

   (5) Meeting a new petroleum delivery truck on the road

   (6) Viewing an attractive display of seed at a supply center

   b. Develop interest in a product

   Examples

   (1) Talking to the customer about the new features of this new planter

   (2) Showing him the results of this product in test trials

   (3) Inviting him to a field day where the effectiveness of

newly developed herbicide will be shown

(4) Demonstrating how simple it is to mount this new corn picker

c. Desire for a product may be attained by relating it to a need of the customer

Examples

(1) Explain how this feed will increase net income by improving the animal's rate of gain

(2) Show him, with proof from variety trials, how the new oat variety will stand

(3) Show him that the chemical weed spray will reduce cultivation

(4) Sell the merits of the tractor seat, not its cost

(5) Provide opportunity for the customer to try the product on a trial basis.

d. Know your product

(1) Know the features of the item

(2) Be able to answer all questions about the item

(3) Demonstrate its use, operation, value, advantages and disadvantages

2. Special teaching-learning activities

a. Have students demonstrate methods of getting and holding interest

3. Sugeested instructional materials and references

a. <u>Store Salesmanship</u> textbook

b. <u>Retail Merchandising</u> textbook

c. <u>Fundamentals of Selling</u> textbook

4. Follow-up and evaluation

D. Overcoming sales resistance

1. Subject matter content

a. True motives for buying

(1) The desire to feel superior

(2) The desire for health and comfort

(3) The desire for the parent to protect the offspring

(4) The desire for amusement

(5) The desire for food and drink

(6) The desire to earn money

(7) The desire to save time and improve efficiency

(8) The desire to save energy

b. Dealing with sincere objections

(1) Turn objections into selling points

(2) Agreeing with customer and presenting another angle

(3) Requesting the customer to explain the objections thus analyzing his position

(4) Admitting the objections and giving a superior point

(5) Asking a question that when answered, overcomes the objection

c. Handling common objections and excuses

(1) Need - objections to need are overcome by stressing the usefulness and benefits of the product

(2) Quality - objections to quality are overcome by showing a better quality, and pointing out a specific feature.

(3) Source - objections to source are met by providing

names and experiences of satisfied customers, providing information about the company or by reference to national advertising.

(4) Price - objections to price are overcome by revealing hidden values, building up values, emphasizing the quality, providing an article that is not as expensive

(5) Time - objections to time are overcome by making future appointments, inviting the customer to look at additional materials, continuing to show a positive interest in him whether he is busy or not, not trying to close a sale before all objections have been satisfied

(6) Thing - objections to thing are overcome by showing more suitable goods, admitting the validity of objections but showing another feature to offset the objection, changing the objection into a selling point

2. Special teaching-learning activities
   a. Divide class in half, one group arriving at sincere objections and the other group arriving at excuses. Contrast methods of handling these two types.
   b. Ask students to list objections they would have to purchasing a product within their occupational center. Work out methods of correcting these deficiencies. Role play, as the class prescribes methods.

3. Suggested instructional materials and references
   a. Self experiences
   b. Center for Vocational and Technical Education, The Ohio State University, "Agricultural Supply-Sales and Service

Occupations", Agricultural Salesmanship module.

c. Retailing Principles and Practices textbook, p. 232-234

4. Suggested follow-up and evaluation

E. Closing and recording sales

1. Subject matter content

a. Establish prestige with the customer

(1) Be friendly

(2) Talk customers language

(3) Show you are not motivated by selfish reasons

(4) Respect his opinions and beliefs

(5) Know your business, your product

(6) Present your thoughts clearly

(7) Be a good listener

(8) Compliment him sincerely

(9) Show by doing that you mean what you are saying

(10) Remember appearance, be well groomed

b. Understand the buying cycle

(1) Recognize the problem

(2) Strong desire for solution

(3) Decides on best solution

(4) Purchases (help customer buy NOW)

c. Planning for the close

(1) Fixing or finding the problems of the customer

(2) Maintaining positive attitudes

(3) Assume customer will buy during the close and all through the talk

d. Know when client is ready to buy
  (1) Customer shows interest and desire in product
  (2) Relationship between need and merchandise is established
  (3) All objections are overcome
  (4) Product meets customer approval
  (5) Customer has power to make the purchase

e. Methods of closing
  (1) Trial close - ask leading questions calling for decision
  (2) Assumptive close - assume purchase, write up order
  (3) Action close - ask yes or no question
  (4) Inconvenience close - let prospect feel he is putting you to some trouble
  (5) Summary close - review sales talk
  (6) Pro and con close - show advantages of your product
  (7) SRO or standing room only close - last one left, first one in town
  (8) Suggesting or decision close - most people prefer this
  (9) Time payment close - can be bought on time, tell advantages of this
  (10) Premium close - offer a premium if he buys now

f. Dealing with stalls and excuses
  (1) Don't let objections distress you
  (2) Avoid argument and contradictions
  (3) Answer briefly and clearly
  (4) Turn objections into selling points
  (5) Don't pause in answering, go on selling

g. Recording results of sales
    (1) How much volume, gross, dollars, etc. did you sell in day, week, etc.
    (2) How many units did you sell per call made or customer seen
    (3) How many contacts or customers did you see to make a sale

2. Special teaching-learning activities
    a. Have students prepare a weekly plan schedule
    b. Have students explain how they would use a center of influence
    c. Have students prepare a budget to determine sales goals.
    d. Discuss ways to raise income without working more hours

3. Titles and sources of references
    a. Salesmanship Fundamentals textbook
    b. How to Apply Modern Selling Methods textbook
    c. Personal experiences

F. Understanding how to do advertising and make displays

1. Subject matter content

Advertising

a. Attract attention
    (1) Illustrations, vivid colors, decorations, preferred positions, unusual lettering, clever spacing, strong headlines, and short forceable sentences at beginning

b. Develop interest
    (1) Tie up the merchandise with the customers needs

c. Create desire

(1) Appeal to the emotions

(2) Appeal to reason

Displays

a. Attract attention

(1) Props, background, and lights

b. Develop interest

(1) Timeliness, and human interest

c. Create desire

(1) Appeal to the emotions

(2) Appeal to reason

d. Points in making a good display

(1) Decorate from customers viewpoint

(2) Select merchandise setting that is timely

(3) Have one central theme or idea only

(4) Keep the window merchandise clean

(5) Use background lights to attract attention and accent

(6) Make clever use of emphasis and balance

(7) Make original pleasing use of color and harmony

(8) Have window reflect the character of the store

(9) Display the merchandise as it can be used

(10) Change the display often

2. Special teacher-learning activities

a. Have students collect materials and make displays in the classroom. One student create display each week

b. Have students bring to class advertisements that they consider good and discuss the good and bad points of these advertisements.

3. Suggested instructional material and references

a. <u>Store Salesmanship</u> textbook

b. <u>Retail Merchandising</u> textbook

c. <u>Retailing Principles and Practices</u> textbook

d. Business Education Department in school

4. Follow-up and evaluation

a. Entire class to evaluate the self-created displays in class, as to predetermine scorecard.

G. Business communications - terminology

1. Subject matter content

a. Terminology of individual businesses (directly sales-related)

(1) Bulk rates
(2) Car load lot
(3) Commission buyer
(4) December wheat
(5) Dockage
(6) Dressing percentage
(7) F.O.B.
(8) Franchise
(9) Futures market
(10) Hedging
(11) Shrinkage
(12) Terminal market
(13) Warehouse receipt
(14) Capital investment
(15) Capital turnover
(16) Carrying charges
(17) Discount
(18) Hardware goods
(19) List price
(20) Margin
(21) Inventory
(22) Reserve fund
(23) Depreciation charges
(24) Registered check
(25) Mark-up
(26) Perishables
(27) Price leader
(28) Retail price
(29) Sale price
(30) Seasonal demand

(31) Wholesale price

(32) Bill of lading

(33) Demurrage

(34) Fishyback

(35) Piggyback

(36) Net profit

(37) Fixed costs

(38) Variable costs

(39) Gross sales

(40) Net worth statement

(41) Assets

(42) Liabilities

(43) Accounts payable

(44) Accounts receivable

(45) Check

(46) Money order

(47) Traveler's check

(48) Telegraphic money order

2. Special teaching-learning activities

   a. Ask students to define the above sales terminology by giving an example of how it would be used in their business. This would be done individually, using the experience center resources.

3. Suggested instructional materials and references

   a. Self experiences

   b. Individual experience stations

   c. Occupations experience program personnel

4. Suggested follow-up and evaluation

   a. Ask students to accumulate answers to this material as they witness their occupational experience programs. Instructor will need to check periodically if progress is being made, and an understanding of application is being developed.

H. Sales planning - time budgeting

1. Subject matter content

   a. How to organize your weekly work

      (1) Decide how much production you need per week. Decide

production by figuring a personal and business budget for the year. Find how much production your company wants per week if on a salary.

(2) Decide how many clients or customers you will need to see to meet your goal.

(3) Decide how many prospects to see each day and which ones

(4) Organize prospects into geographic areas for each day and decide on the best time for each.

(5) Have a goal in mind for each prospect.

(6) Set aside time to service clients, keep records, office work, study and plan to put in a full day everyday.

b. Planning for future sales

(1) Determine your longtime sales goals (how much needed money)

(2) Keep a good prospecting system at all times

(3) Develop centers of influence from your present customers

(4) Service your old prospects

(5) Eliminate all the deadwood from your prospect file

(6) Study new materials and goods for future sales, know your business.

(7) Improve your efficiency ratio (number of calls to make a sale or dollars)

(8) Continue to improve your work habits

(9) Keep records to show where improvement in procedure

is needed.

2. Special teaching-learning activities
    a. Have students learn and explain the buying cycle
    b. Have students practice different closes on each other and have class rate each closing attempt.
    c. Have students construct sales chart for class use.
3. Titles and sources of references
    a. Salesmanship Fundamentals textbook
    b. How to Apply Modern Selling Methods textbook
    c. Personal experiences and Business Education Department

V. Follow up and Final Evaluation

A. Since this module is made up of a complex of different competencies, we have included the suggested follow-up activities at the end of each competency.

B. Suggested oral examination for grading, plus employer evaluation.

VI. Titles and Sources of References and Instructional Materials

A. Textbooks

1. Wingate, Fundamentals of Selling, Southwest Publishing Company, Cincinnati, Ohio
2. Robison, Blackler, Logan, Store Salesmanship, Prentice Hall, Inc.
3. Wingate, Retail Merchandising, Southwest Publishing Company, Cincinnati, Ohio
4. Richard, Meyer, Hayes, Retail Principles and Practices, McGraw Hill Company.
5. Maguire, How to Apply Modern Selling Methods, Area Vocational and Technical School, Somerset, Kentucky.
6. Ernest and DaVall, Salesmanship Fundamentals, Gregg Publishing Company, Division of McGraw-Hill Company.

B. Bulletins and Pamphlets

1. Center for Vocational and Technical Education, The Ohio State University, Agricultural Salesmanship, module, Agricultural Supply-Sales and Services Occupations.

2. Human Relations Module, found as part of this series of modules.

3. Business Education Department, Division of Distributive Education, curriculum in local high school-numerous publications.

C. Films

1. The Approach, I.S.U., Visual Education Services, 10 minute film.

2. Distributive Education Department, Has access to records, visuals, etc., all contributing to successful teaching of this module.

ORGANIZATION AND FUNCTIONS
OF AGRICULTURAL BUSINESSES

Prepared by: L. L. Reding
G. C. Miehe
D. E. Wahlstrom

I. Introduction

We are concerned with the organization and functions of agricultural businesses because as a member of a business you will want to know what pattern your business uses in its organization. There are several types of businesses involved in the service and processing of agricultural products. These are all brought under a number of governmental regulations to prevent unethical operations. Thus, we must be concerned with these business functions and their organizations.

The teacher should also encourage open-mindedness to avoid reinforcing individual prejudices during the study of controversial business organizations and practices such as cooperatives, patronage dividends, and liability.

II. Major Objectives

To understand the functions and organizational patterns of agricultural businesses.

III. Time Allotment 12% _____ days

IV. Competencies to be Taught

A. To understand the functions of agricultural businesses.

B. To understand the various types of agricultural businesses.

C. To understand how agricultural businesses are established.

D. To understand governmental regulations affecting agricultural businesses.

- - - - -

A. To understand the functions of agricultural business

1. Subject matter content

a. Capitalism and/or free enterprise

(1) Capitalism offers profit incentive

(2) Define terms: business, utility, production.

b. Nature of American business

(1) Geographical area covered

(2) Types of people served

(3) Services rendered

(4) Functions: time, form, place, and price problem

(5) Define terms: eminent domain, private property, labor, capital, management.

c. Competition, profits, and risks

(1) A merchant should receive a fair rate of interest on his total investment in same way as a farmer.

(2) Competition brings about new inventions, changes in products, and other changes in technology.

(3) In business, as returns increase risks also may increase.

(4) Price is determined by quality and competition.

(5) Define terms: economic activity, monopoly, "fad item," false advertising, fair trade, credit regulations.

d. Who owns American business?

(1) American business is owned by people.

(2) Fathers of class members own stock in businesses and are members of cooperatives.

(3) Stockholders actually own the business.

2. Special teaching-learning activities

   a. Show a chart listing several forms of government and associated practices in comparison with capitalism and its practices

   b. Take class to brokerage firm and a board of trade subsidiary

   c. Have banker and investment representative speak to class

   d. Make certain class members understand following terms: government ownership, stock markets, futures, board of trade, mutual funds, speculator, hedger, "bull and bear" system

3. Suggested instructional materials and references

   a. Self-experience

   b. How do We Organize to do Business in America, Ref. B-1

   c. General Business for Everyday Living, Ref. A-2

   d. Youth Wants to Know About Business Organization, Ref. B-5

   e. Film - It's the Farmer's Business, Ref. D-2

   f. An Introduction to Agricultural Business and Industry, Ref. A-1

B. To understand the various types of agricultural business

1. Subject matter content

   a. Individually owned business

      (1) Point out why this type of organization has flexibility, why it is likely to be in a convenient location, and

why the operator is apt to associate with other merchants in obtaining buying power and promotional aids with which to compete with large scale operations.

- b. Partnership
  - (1) Illustrate businesses that started as individually owned and later combined into partnership. Reasons.
  - (2) Define terms: silent partner, secret partner, limit partnership.
- c. Ordinary corporation
  - (1) Individual business may be combined into corporations.
  - (2) Legal characteristics of corporation.
    - (a) Charter
    - (b) Seal
    - (c) Address
- d. Cooperative corporation
  - (1) Importance of cooperatives
  - (2) Role of cooperative corporations to farmers
  - (3) Types of cooperatives other than agricultural cooperatives

2. Suggested instructional material and references
   - a. How do we Organize to do Business in America?, Ref. B-1
   - b. 4 Ways of Doing Business, Instructor's guide, Ref. B-1
   - c. Do you Know Your Cooperative? Ref. B-1
   - d. Film - You and Your Cooperative, Ref. D-1

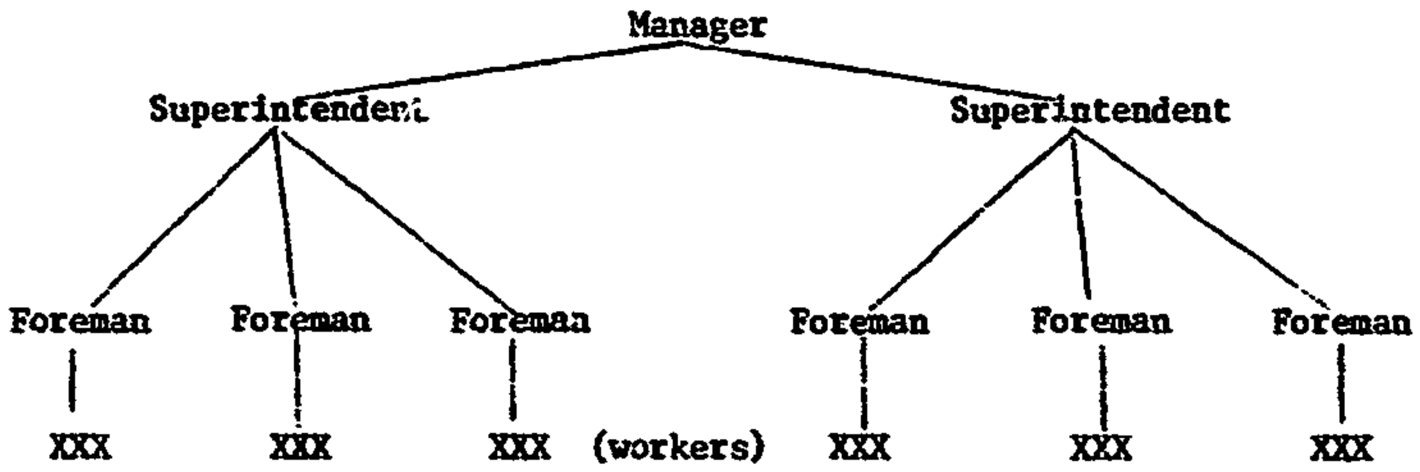
C. To understand how agricultural businesses are established.

1. Subject matter content
   - a. Location

COMPARISON OF FOUR METHODS OF DOING BUSINESS UNDER PRIVATE ENTERPRISE

	Types of Business			
FEATURES COMPARED	INDIVIDUALLY OWNED BUSINESS	PARTNERSHIPS	BUSINESS CORPORATION	COOPERATIVE CORPORATION
1. Who uses the services?	Non-owner customers	Generally non-owner customers	Generally non-owner customers	Chiefly the owner-patrons
2. Who decides policy?	Owner	Partners agree	Board of directors	Member-patrons & board of directors
3. Who manages?	Owner	One or both partners	Officers and assistants	General manager and staff
4. How is voting done?	NONE necessary	Partners agree	Each shareholder 1 vote per share	Usually one member one vote
5. Who owns business?	Individual	The partners	The stockholders	The member-patrons
6. How is business financed	Personal capital & loans	Partners' capital & loans	Stocks, bonds, & loans	Members capital, borrowing from banks and individuals
7. Returns on invested money?	Unlimited	Unlimited	Unlimited	4% to 6% (normal interest rate)
8. How may net margins be used?	As owner desired	As agreed by partners	Dividends, reserves and surplus	Interest on stock, patronage dividends, reserves, and surplus
9. What is owner's liability?	All property of owner	All property of partners	Limited to assets of corporation	Limited to his investment in cooperative

    (1) In choosing a location, explain why the number of people who pass a proposed site is less important than the nature of this traffic.
    (2) Planned shopping centers challenge downtown shopping districts for share of consumer's money.
b. Building requirements
    (1) What are the desirable types of materials for construction?
    (2) How many entrances should be provided and where should they be?
    (3) How much can a business afford to pay for housing?
    (4) What are the principle legal points in connection with the leasing and/or the purchase of property?
c. Equipment and layout
    (1) Difficulty of accurate visualization and good arrangement of store equipment.
    (2) Consider the customer when planning the business layout.
    (3) Desire of convenience - provide parking area
d. Chain of command of personnel
    (1) Line or military pattern

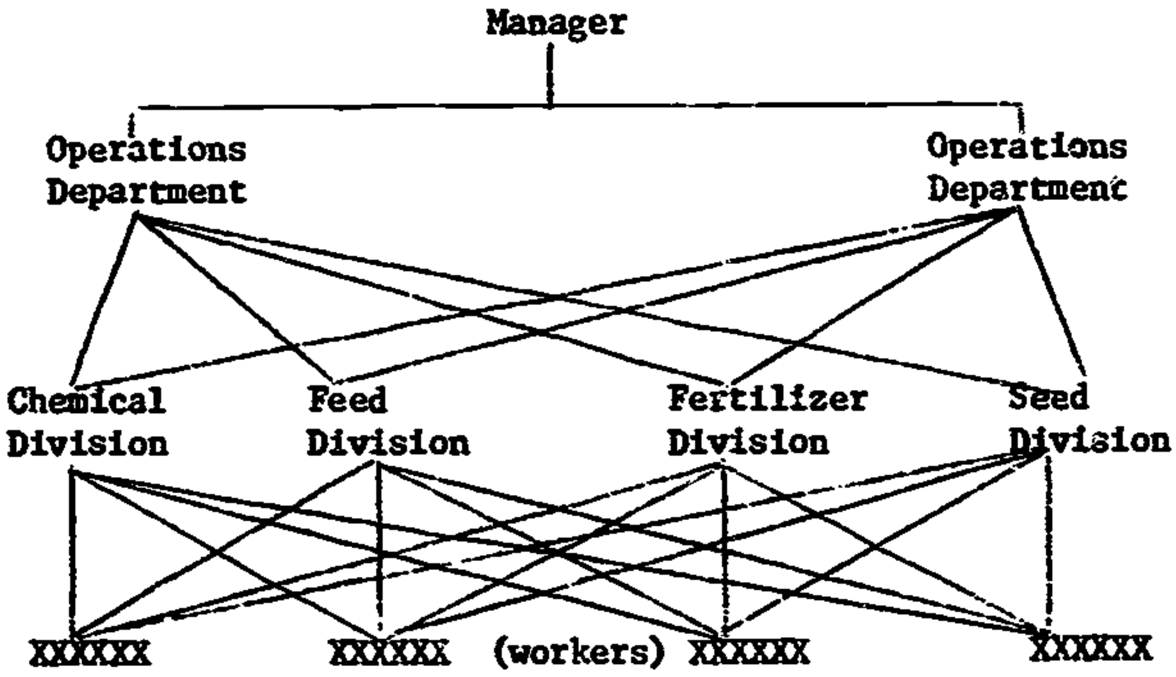


(2) Every person in the organization, except the lowest employees, has one or more subordinates to supervise. No person has more than one supervisor; top official has none - common in small business.

(3) Functional pattern

(a) Used by some agricultural supply businesses

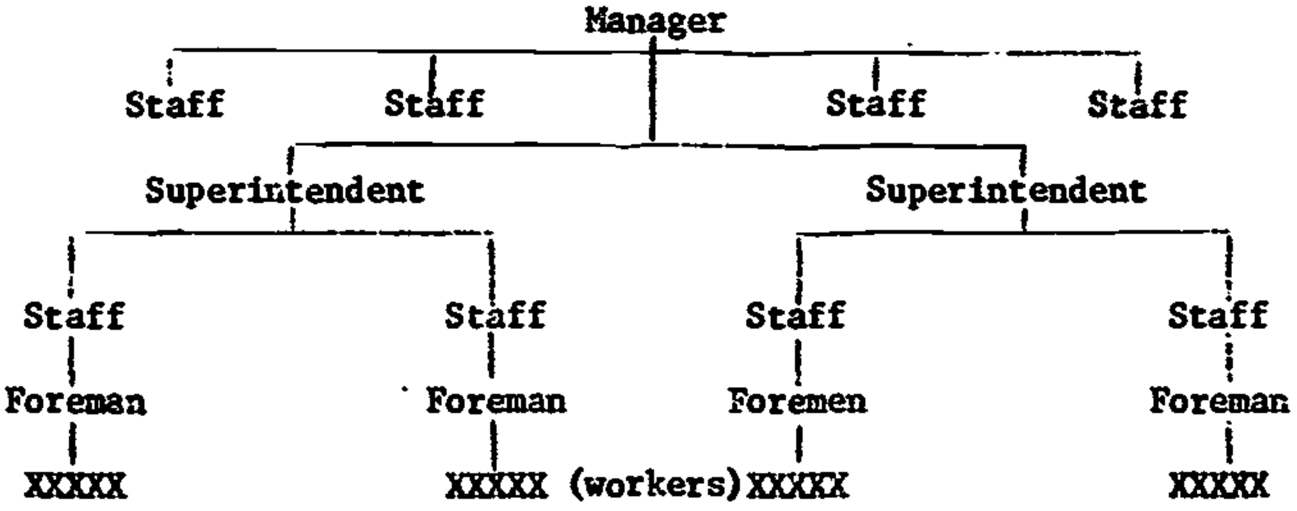
(b) Increased efficiency resulting from changing all-around supervisors into specialist supervisors



e. Line or staff

(1) Most widely used in today's business

(2) Any number of superintendents, foreman. staff officers, and workers in this pattern.



2. Special teaching-learning activities
    a. Have a construction representative or lumber yard man talk to class about materials used in construction.
    b. Visit various businesses in community and survey materials, location in regards to traffic, display of products, interior and exterior appeal, etc. (physical characteristics)
    c. Obtain a lease form used in business for students to study
    d. Have students diagram the organizational pattern of a local business
    e. Have students diagram organizational pattern of local school district, church, FFA organization.
3. Suggested instructional material and references
    a. Module 5 - Organization and Functions of Agricultural Businesses, Ref. B-4
    b. Use of local personnel in community

D. To understand governmental regulations affecting agricultural businesses

1. Subject matter content
    a. Intra & interstate commerce
        (1) Intrastate commerce - state regulation of business within its boundary.
        (2) Interstate commerce - regulations of commerce between states by the Federal government.
        (3) No state can impose duties on imports and exports.
    b. Agricultural businesses would be regulated by each.
    c. Labor regulations
        (1) State regulations are formulated as to number of hours

employees may work

(2) Most states have maximum weekly hours a person can work under set wage.

(3) Restrictions as to types of jobs - minors

(4) Minimum wage law.

(5) State laws setting standards - state regulations on employee occupational compensation

(6) Social Security Act and old age benefits

d. Price regulations

(1) Functions of a discount house

(2) Prevent monopolies

e. Fair trade laws

(1) State regulations as to manufacture - dealer price setting

(2) Fair trade item and non-signer's clauses

f. Unfair practice laws

(1) State law prohibiting dealers from selling below cost

(2) Give-away sales

g. Price discrimination laws

(1) Prevent manufacturers from giving buyers unfair price advantages

(2) Common law - contract entered under bribery illegal

h. Credit regulations

(1) Prevent inflation - declared illegal by Congress

i. Merchandising regulations

(1) Products only sold by licensed holders (drugs)

j. Choice of customers and employees
    (1) Discrimination laws
k. Advertising and selling regulations
    (1) False advertising, unfair methods of competition, and deceptive acts are unlawful
l. Mergers and combinations
    (1) Federal Trade Commission regulations
    (2) Monopolistic activities
m. Tax regulations
    (1) Purpose - to raise reserves needed by federal, city, or state governments and services
    (2) Business use of tax expert

2. Special teaching-learning activities
    a. Visit a discount house to compare price and quality of product to name brand store
    b. Have local fertilizer dealer discuss price cutting
    c. Organize a Junior PCA in FFA Chapter
    d. Have nearby manufacturer discuss product pricing with reference to price regulations
    e. Have small business administration representative discuss business laws and regulations with class
3. Suggested instructional materials and references
    a. Instructor must realize that these are ever changing laws and regulations.
    b. Retail and Service Enterprises and Establishments, Pub. 1135 Ref. B2
    6. Child Labor Provisions, Pub. 1096, Ref. B2

d. Labor Laws of State of Iowa, Bulletin 21, Ref. B-3

V. Follow-up and Evaluation

A. Field trips.

B. Testing over materials.

C. Utilize committee reports and surveys.

D. Check membership of students and parents in organizations, stockholders.

E. Have students check and analyze actual government regulations and business organizations in his work experience training center.

VI. Titles and Sources of References and Instructional Materials

A. Books

1. Weyent, J. T. etal., Introduction to Agricultural Business and Industry, Interstate Printers and Publishers, Danville, Illinois, 1965.
2. Price, Musselman, Weeks, General Business for Everyday Living, McGraw Hill Book Co. Inc., Chicago, Illinois.

B. Pamphlets

1. Do You Know Your Cooperative, Farmer Cooperative Businesses in Iowa, How Do We Organize to do Business in America, all in the Vo-Ag Instructor's Notebook on Farm Cooperatives, Iowa Institute of Cooperation, N. 9th Street, Ames, Iowa
2. Publications 1135, 1096, 1122, 1007 from the Federal Regulations Information on Labor Laws, U.S. Department of Labor, 2000 Federal Office Building, 911 Walnut Street, Kansas City, Missouri.
3. The State Labor Laws and Regulations, Bulletin 21, The labor Commissioner, Bureau of Labor, State House, Des Moines, Iowa.
4. Teaching Module for Organization and Functions of Agricultural Businesses, Center of Vocational and Technical Education, The Ohio State University.
5. Youth Wants to Know About Business Organizations, Minneapolis Grain Exchange, 4th St. and 4th Ave., Minneapolis, Minnesota.

C. References

1. Examples of leases obtained from an attorney, bank, or court house.
2. Business Education Department - local school.
3. Chamber of Commerce - local community

D. Films

1. You and Your Cooperatives, NS164, $.75, Audio-visual Instruction Service, I.S.U., Ames, Iowa
2. It's the Farmer's Business, Farm Credit Bank, Omaha, Nebraska.

BUSINESS PROCEDURES

Prepared by: M. R. Hoskey
R. R. Rinderknecht
E. F. Schroeder

I. Introduction

An important part of a successful business is the ability to keep complete and accurate records and carry out correct business procedures. Some businesses hire a full-time employee to do this while at other businesses this is done by all or certain employees. In your occupational experience you may or may not have much responsibility as far as business procedures but this module will help you better understand the business part of the organization in which you may be employed.

II. Major Objectives

To develop in students the effective ability to use the ordinary business procedures common to agricultural businesses.

III. Time Allotment 15% _____ days

IV. Competencies to be Taught

A. To develop the understanding of the importance of complete and accurate records in the conduct of business.

B. To develop the understanding and ability of using business mathematics.

C. To develop the ability to use correct bookkeeping procedures.

D. To develop the understanding of credit and credit policies.

E. To develop the understanding and ability of using budgets.

F. To develop the ability to understand and take different kinds of inventories.

G. To develop the understanding and ability of using efficiency factors.

H. To develop the understanding of taxes.

I. To develop the ability to receive and store merchandise.

J. To develop the understanding and ability of properly stocking merchandise.

- - - - -

A. The understanding of the importance of complete and accurate records in the conduct of business.

1. Subject matter content

a. Records are important to:

(1) Know the financial picture of the business at a given time.

(2) Give proper information to board of directors, stockholders, and others involved.

(3) Satisfy legal requirements.

(4) Plan desirable changes in management and procedures.

b. An important record is the operating statement--sometimes called profit and loss statement.

(1) May be done annually, biennially, quarterly, or monthly.

(2) Shows profit or loss for that period of time.

(3) May be broken down by departments.

c. Another important record is the balance sheet

(1) Shows assets, liabilities, and net worth at any time.

(2) Liabilities plus net worth must balance with assets.

d. Balance sheet and operating statement make up financial report for business.

e. Daily, weekly and monthly records help make up financial reports.

f. A record of cash sales should be kept and compared with cash in register.

g. Charge sales should be correctly made and entered in appropriate place.

h. All costs must be kept correctly, this includes:

(1) Purchases	(6) Taxes
(2) Payroll	(7) Supplies
(3) Property expense	(8) Services
(4) Advertising	(9) Interest
(5) Depreciation	(10) Others

i. Reducing expenses is as much of a value as increasing sales.

2. Special teaching-learning activities

a. Have students fill out operation statements and balance sheets.

3. Suggested instructional materials and references

a. Copies of operating statements, balance sheets etc. (can usually be obtained from Co-ops easier than other businesses).

B.. The understanding and the ability of using business mathematics.

1. Subject matter content

a. Figuring what the customer pays

(1) Writing up sales checks

    - (2) Ringing up sales
    - (3) Adding several items
    - (4) Figuring number of similar units at the same price. (8 items x 40 cents/item)
    - (5) Combinations of add, subtract, and multiply.
- b. Discounts
    - (1) Figuring trade discounts to allow retailer to make profit.
    - (2) Figuring quantity and cash discounts.
    - (3) Figuring the complement of the discount. (100 - % discount=complement discount)
    - (4) Figuring by equivalents.
- c. Comparison of percentage
    - (1) Changing percent to decimal in figuring cost.
    - (2) Aliquot parts of 100. (8 1/3 is 1/12 of 100; 1/12 of $18 = $1.50)
    - (3) Percents that should be changed to fractional form rather than using decimals are:

Change 8 1/3 to 1/12
12 1/2 to 1/8
16 2/3 to 1/6
33 1/3 to 1/3
66 2/3 to 2/3

- d. Costs as percentages of profit
    - (1) Comparing expenses and costs to sales
    - (2) $\frac{\text{Sales}}{\text{Costs}} = $ Profit or margin

e. Costs as percentages of sales

(1) $$\frac{\text{Expenses}}{\text{Sales}} = \text{\% expense rate}$$

(2) $$\frac{\text{Selling cost}}{\text{Sales}} = \text{\% selling cost}$$

(3) $$\frac{\text{Profit}}{\text{Sales}} = \text{\% profit}$$

(4) $$\frac{\text{Dollar reduction in price}}{\text{Sales}} = \text{\% markdown}$$

(5) Comparisons of % are more significant than comparing dollars.

f. Stockturn

(1) $$\frac{\text{Sales}}{\text{Ave. stock}} = \text{Stockturn}$$

Example:

$$\frac{\text{100,000 gal. gas sold/year}}{\text{1,000 gal. on hand}} = 100$$

(2) Importance of stockturn

g. Average Sale

(1) $$\frac{\text{Dollar Sales}}{\text{No. of transactions}} = \text{Average Sales}$$

(2) Importance of high average sale

h. Pricing goods

(1) Difference between cost and selling price.

(2) Overhead expenses such as rent, insurance, and taxes take from the above difference.

i. Markups

(1) The difference between cost and selling price is markup.

(2) Percent of markup needed to make a reasonable profit.

(3) What customers will readily pay for a product.

(4) $\frac{\text{Retail price - cost}}{\text{Retail price}} = \%\text{ markup}$

(5) Figuring retail price from known % markup.

(6) Figuring wholesale price from known % markup.

j. Profits

(1) Importance of figuring profits.

(2) Gross income - total expenses = profit.

2. Special teaching-learning activities

a. To speed up the ability of students to work problems, add and subtract items, and work efficiently, students could be divided up into teams in the class room, and compete for points.

b. Use a cash register in the classroom to give students familiarity of using it.

3. Suggested instructional materials and references

a. Agricultural Occupations Institute

b. Arithmetic in Agriculture

c. Fundamentals of Selling

d. Preparing Students for Employment in Agriculture

C. The ability to use correct bookkeeping procedures

1. Subject matter content

a. Balance sheet

(1) Purpose - to summarize the records of the business at a given point in time to evaluate net worth.

(2) Items found on balance sheet

(a) Current assets

(b) Fixed assets

(c) Current liabilities

(d) Deferred liabilities

(e) Common stock

(f) Preferred stock

(g) Reserves

(h) Surplus

(i) Net worth

b. Income statement

(1) Purpose - to summarize the records at the end of a period to determine profit or loss for that period.

(2) Items found on income statement

(a) Sales receipts

(b) Other income

(c) Sales expenses

(d) General expenses

(e) Cost of goods

(f) Beginning and ending inventory

(g) Depreciation

(h) Fixed expenses

(i) Income tax

(j) Net income

c. Sales tickets procedures

(1) Enter correct date

(2) Be sure to get correct name and address for individual or firm.

(3) Give complete description of each article sold.

(4) Enter both price and amount as retail price and discount by giving discount under description and subtracting.

(5) Make sub-total of amount column.

(6) Calculate sales or other taxes.

(7) Give other instructions (mixing, delivery date, etc.)

(8) Make grand total

(9) Indicate method of payment

(10) If method of payment is a check in an amount other than the amount of sale indicate so on ticket.

(11) Have customer sign ticket.

(12) If employee ruins a ticket, void the ticket by writing void and keep tickets. Tickets are numbered consecutively and should be accounted for.

(13) Initial the ticket.

(14) Write legibly.

2. Special teaching-learning activities

   a. Have boys acquire a few different types of sales tickets and fill them out.

3. Suggested instructional materials and references

   a. Any accounting book.

   b. Ohio State's <u>Business Procedures Module</u>.

D. The understanding of credit and credit policies

1. Subject matter content

   a. Cost of modern agriculture is so high that farmers must borrow money or use a business' credit plan for purchases.

   b. Credit from businesses usually lasts less than a year, like a growing season or fattening season.

   c. Most businesses must charge 1 to 1 1/2% per month to cover additional bookkeeping costs, etc.

   d. Interest costs may be figured 3 ways, (explain)

   (1) Flat rate basis

   (2) Discounted

(3) Interest on the unpaid balance

e. Give formula for finding actual cost of interest.

2. Special teaching-learning activities

a. Have students fill out notes and other forms used in obtaining credit.

3. Suggested instructional materials and references

a. Credit policies of local firms.

E. The understanding and ability of using budgets

1. Subject matter content

a. Definition

(1) Budgeting provides a means of systematically assembling and organizing the expected costs and returns of alternatives so that they can be carefully weighed by management.

b. Purposes

(1) To predict future events-a budget of the costs and revenues of next year's operation for a business.

(2) To guide future events-a budget to guide how disposable income will be spent over a specified future period.

(3) To establish or clarify goals-a budget to establish the estimated operating volume in the case of a particular product or business to cover anticipated operating costs and provide a desired net income.

(4) To consider the advisability of a possible future course of action-a budget to evaluate the possibility of business expansion, reduction, diversification, or integration.

      (5) To evaluate alternatives-a budget to evaluate different wage policies, mark-ups and prices, products and services, inventory policies, credit policies, uses of labor and capital, etc.

  2. Special teaching-learning activities

    a. Divide class into five groups and have the students prepare a budget for the FFA using a different budget purpose for each group.

  3. Suggested instructional material and references

    a. Managing for Greater Returns

F. The ability to understand and take different kinds of inventories.

  1. Subject matter content

    a. An inventory is a correct count, including the value of goods on hand in a business.

    b. They are important for several reasons

      (1) An accurate value is necessary for year-end or periodic analysis of the business.

      (2) Periodic counts enable the business to determine the freshness of its stocks, and to decide whether some items are going out of date.

      (3) Inventory counts will show the extent to which items are moving. They will show whether items are overstocked or understocked.

      (4) Physical count inventories are necessary to determine possible losses (difference from book inventories).

    c. Types of inventories

      (1) Perpetual inventories

   - (a) An inventory giving the number of items on hand all the time
   - (b) Done by adding purchases to and subtracting sales from inventories
   - (c) This is a "book" inventory and must be checked against an actual inventory regularly.
- (2) Physical inventory
   - (a) An actual count of all items on hand.
   - (b) Must be done at end of year and can be done at other times also.
   - (c) Procedure may include the following steps
      - 1' Arrange stock in an orderly fashion
      - 2' Check stock for condition, inventoring only that of salable quality.
      - 3' Count and record every item, listing the cost price unless local business prefer that the selling price be used.
      - 4' Keep inventories separate for different departments and type of goods.
      - 5' Compute totals.

d. Businesses may have special forms to use in taking the inventory.

e. These forms may include
   - (1) Location of merchandise
   - (2) Department to which merchandise is charged
   - (3) Names of persons taking the inventory
   - (4) Information concerning age and/or quality of merchandise

2. Special teaching-learning activities
    a. Have students inventory shop tools or reference books.
    b. Have them inventory their room at home, stress neatness, accuracy, and completeness.

G. The understanding and ability of using efficiency factors

1. Subject matter content
    a. Return on capital investment--total net earnings divided by total assets (investment)
        (1) Figured for the business as a whole and compared with other like businesses.
        (2) Figured for departments within a business and compared with other departments either within the business or the same department in another business.
    b. Inventory turnover--total sales divided by average inventory
        (1) This factor indicates the number of times the inventory was turned over in a month or other period.
        (2) This factor is used in figuring a suggested gross margin for a business--turnover times (X gross margin) = 100
    c. Labor recovery
        (1) Maximum based on 40 hour week

40 hrs. per week for 52 weeks = 2080 hrs.	per year
Two weeks vacation with pay (2x40)	80 hours
Five paid holidays at 8 hrs. per day	40 hours
Personal reasons 5 days at 8 hrs.	40 hours
Total	160 hours

$\frac{2080 - 160}{2080} = 92.3\%$ maximum that could be recovered

        (2) Percent work recovery and shop break even point.

Direct labor cost + shop's share of general operating expenses = Total shop expenses

$$\frac{\text{Total shop expenses}}{\text{Customer's rate per hour}} = \text{hours to break even}$$

$$\frac{\text{Hours to break even at customer rate}}{\text{Hours paid to employee}} = \text{\% work recovery needed to break even}$$

(3) A recommended level is 2.2 x mechanics hourly wage = customer rate. This assumes 65% work recovery.

(4) Items affecting recovery rate

(a) Coffee breaks

(b) Loafing between jobs

(c) Time to clean up

(d) Time to get to work

2. Special teaching-learning activities

a. Have students calculate returns to capital on a few businesses using their balance sheet and operating statement.

b. Have students calculate inventory turnover for a few products in some business by having them ask the businessman for his average inventory and total sales for the product.

c. Have students keep track of the exact time they are working on either a shop project or class problem discounting time to get materials and return materials plus time required to re-do some portion and then divide by total class time to get percent work recovery assuming they are paid for class time and someone is paying for their actual work time. Then let them assume a wage for themselves and have them calculate what someone else must pay for actual time at work to break even.

3. Suggested instructional material and references

   a. <u>Managing for Greater Returns</u>

   b. <u>Business Procedures Module</u>

H. The understanding of taxes

1. Subject matter content

   a. Basic reasons for taxes

      (1) To raise needed revenue

      (2) To restrict certain types of distribution (oleomargerine and butter)

      (3) To restrict sales of chain stores that compete with independent stores.

   b. Kinds of taxes

      (1) Real estate and property taxes

      (2) Occupational license tax - to handle a certain type of goods

      (3) Merchandise tax - % of cost value of merchandise carried

      (4) Excise tax - tax on each unit of certain articles handled (example - jewelry)

      (5) Sales tax - tax on all sales, paid by customer

      (6) Social Security taxes - unemployment insurance and Old Age benefits

      (7) Chain store taxes - increases with number of store units in chain

      (8) Income tax

2. Special teaching-learning activities

   a. Interview an agricultural businessman as a class to determine kinds of taxes paid by him each year, and the percentage paid for each tax.

   b. Have a lawyer or accountant visit class and explain different kinds of taxes.

3. Suggested instructional materials and references
   - a. <u>Retail Merchandising</u>
   - b. <u>Teaching Taxes</u>
   - c. <u>An Introduction to Agricultural Business and Industry</u>

I. The ability to receive and store merchandise

1. Subject matter content
   - a. Developing a plan for receiving merchandise
     - (1) Consider who is to do the work
     - (2) How merchandise is to be handled (hand, fork lift, etc.)
     - (3) How and where it is to be stored
   - b. Checking for damage or breakage as unloading proceeds.
     - (1) Note damaged or broken merchandise on receiving form
     - (2) Damaged merchandise should be destroyed, returned, or kept and sold at a reduced price.
   - c. Checking for shortage at time of receiving merchandise.
     - (1) Take an exact count
     - (2) Weigh the merchandise
     - (3) Quantity of goods received must agree with goods signed for on shipping record.
   - d. Checking invoice and goods against substitutions
     - (1) Check merchandise received with purchase order <u>before</u> signing <u>delivery slip</u>.

      - (2) Use duplicate copy of purchase order to check against merchandise received.
    - e. Checking quality of merchandise
      - (1) By visual examination
    - f. Signing for merchandise
      - (1) By employee receiving merchandise
      - (2) On receiving report form, accurate count, condition, and description of merchandise are listed.
  - 2. Special teaching-learning activities
    - a. Give the class several assumed situations concerning the receipt of merchandise by a business. Assume certain flaws in the merchandise.
    - b. Have the students complete receipt forms.
  - 3. Suggested instructional materials and references
    - a. Business Procedures Module
    - b. Retail Merchandising

J. The understanding and ability of properly stocking merchandise.

  - 1. Subject matter content
    - a. Two problems in stocking merchandise are:
      - (1) How much to stock
      - (2) When to stock it
    - b. Questions which must be answered which will help solve the above two problems are:
      - (1) Will this merchandise have a slow or fast turnover?
      - (2) Will it keep if some remains unsold?
      - (3) What will be the probable demand for this product this year or this season?

      - (4) When will the demand come?
      - (5) How long will it take to get replacement merchandise after it is ordered?
      - (6) How much money may we have tied up in inventory stocks?
      - (7) Where can we secure quality merchandise at the lowest cost?
    - c. If each employee isn't responsible for ordering merchandise he should tell the one who is responsible when he sees low stocks.
  - 2. Special teaching-learning activities
    - a. Let students check about restocking some shop supplies like welding electrodes.
  - 3. Suggested instructional material and references
    - a. Ohio's Business Procedure Module

V. Follow-up and Evaluation

- A. Business math test
- B. Have students work problems
- C. Have students fill out forms, such as sales tickets, inventories, budgets, tax forms, etc.
- D. Check with employer in his business procedures.

VI. Titles and Sources of Reference and Instructional Materials

- A. Books
  - 1. Agricultural Occupation Institute, Preparing Students for Employment in Agriculture, Oklahoma State University.
  - 2. Fenske, Drake, Edson, Arithmetic In Agriculture, Interstate Printers and Publishers, Danville, Illinois, Price $2.92 (single copy)

3. Hoover, N. K., *Handbook of Agricultural Occupations*, Interstate Printers and Publishers, Danville, Illinois, 1963, Price $4.27 (single copy)

NEW DEVELOPMENTS IN AGRICULTURAL TECHNOLOGY

Prepared by: C. E. McLaughlin
P. B. Swank
G. L. Barth

I. Introduction

Technological advances made in the field of agriculture have far surpassed all expectations of the experts in recent years. This, coupled with the present rate of acceleration in knowledge since the birth of computers, forces agricultural leaders to become constantly aware of changes as they develop, to be able to analyze and interpret these changes, and to adapt the feasible and practical ones with actual situations or they will ultimately fall by the wayside.

Importance of a constant awareness to these advances in agriculture is unquestionable; but, to remain current to new developments will require a trained mind--one that can sift the opinions from the facts using a realistic approach--and then use the information to achieve the desired goals.

II. Major Objectives

A. To appreciate the new developments in agricultural technology.

B. To develop the ability to recognize, interpret and utilize new developments in agriculture.

III. Time Allotment 10% _____ days

IV. Competencies to be Taught

A. An understanding of the vast amounts of agricultural information available on new developments.

B. The ability to identify and recognize the need for application in agri-business

C. To understand the value of increased knowledge.

D. The ability to obtain new information.

E. The ability to separate reliable information from sensational information.

F. The ability to analyze, evaluate, interpret, and utilize new knowledge.

- - - - -

A. An understanding of the vast amounts of agricultural information available on new developments.

1. Subject matter content

   a. Main sources of agricultural information.

      (1) Radio and television

      (2) Newspapers. (Daily, weekly, and monthly)

      (3) Farm magazines

      (4) Agricultural business employees

      (5) Agricultural colleges and universities

      (6) Governmental agencies

      (7) Agri-business educational programs

      (8) Farm organizations

      (9) Public libraries

      (10) Agri-business leaders

2. Special teaching-learning activities

   a. Have students write a letter to one of the sources to obtain a list of available materials.

3. Suggested instructional materials and references.

    a. Stockman's Handbook, section XV, XVI, XVII.

B. The ability to identify and recognize the need for application in agri-business.

1. Subject matter content.

    a. Factors which create a need for new developments in agriculture.

        (1) Cost-price squeeze.

        (2) Population explosions.

        (3) Increase in agricultural efficiency.

        (4) New agricultural products.

        (5) New agricultural equipment and machinery.

        (6) Consumer demands.

    b. Better communications techniques to offer accurate and credible data to citizens.

    c. Improvement of approved practices to coincide with production efficiencies.

2. Special teaching-learning activities

    a. Divide the class into committees to report on one of the factors listed above.

3. Suggested instructional materials and references.

    a. Self-experience.

C. To understand the value of increased knowledge.

1. Subject matter content.

    a. The benefits to you, the employer; the community, etc.

        (1) Advancement

        - (2) Increased reliability as a source of information.
        - (3) Self-improvement
        - (4) Increased production for a business
        - (5) Improves company-customer relations
        - (6) Improves the morale of the business
        - (7) Improves economic conditions
        - (8) Better placement of the individual
  - 2. Special teaching-learning activities
    - a. Use case studies citing examples of up-to-date employee vs employee lacking sufficient product knowledge.
    - b. Develop a questionnaire in class that a farmer or employer could use to emphasize the value of new agricultural technology in the business.
  - 3. Suggested instructional materials and references.
    - a. Instructor's experiences
    - b. Book, <u>Media for the Millions</u>

- D. The ability to obtain new information
  - 1. Subject matter content
    - a. Methods of obtaining new information
      - (1) Reading (Newspapers, magazines, bulletins, etc.)
      - (2) Listening (Radio, television, agri-business leaders, etc.)
      - (3) Attending (Clinics, workshops, commercial meetings, adult schools)
      - (4) Corresponding (Specific questions to agricultural experts)
      - (5) From advertisements

            (6) From instruction manuals

            (7) Consulting commercial businesses

        b. The steps in the flow of the idea from the source to the user.

            (1) The awareness stage

            (2) The interest stage

            (3) The evaluation stage

            (4) The adoption stage

    2. Special teaching-learning activities

        a. Have students prepare a radio and television farm news time-table.

        b. Have students prepare a list of addresses of reliable sources of agricultural information.

        c. Have students list agencies holding special or seasonal meetings in the area.

    3. Suggested instructional materials and references

        a. <u>The Diffusion Process</u>, booklet

        b. Instructor's experiences

E. The ability to separate reliable information from sensational news information

    1. Subject matter content

        a. Definition of <u>reliable</u> - Trustworthy. Tested, proven and approved.

        b. Definition of sensational - Intended for great interest or emotion. Insufficient facts or evidence for approved adoption.

        c. Reasons for separating reliable information from sensational information.

(1) To determine economic efficiency if the new idea is applied.

(2) People are interested in sensational happenings and ideas, even at the expense of sound judgment.

(3) An agricultural leader will want to establish and maintain a desirable agricultural reputation.

d. The process of separating the reliable information from the sensational ideas.

(1) Accept ideas and new technology with an open mind.

(2) Gather as much information as possible.

(3) Compare the information and facts from the new idea with approved practices and basic principles.

2. Special teaching-learning activities.

a. Have students rate an agricultural news article.

b. Have students list approved practices and principles from a news article.

3. Suggested instructional materials and references.

a. Dictionary

b. Instructor's experience

F. The ability to analyze, evaluate, interpret and utilize new knowledge.

1. Subject matter content

a. Human problems encountered in the analysis of an idea.

(1) Ease of conforming to accepted ideas.

(2) Restrictions created in our minds by past acts through habit.

(3) Inability to define or isolate

(4) Failure to secure all the facts available

(5) Failure to use many sources of information

(6) Insufficient knowledge of basic principles, approved practices, research techniques.

(7) Inability to distinguish between cause and effect

(8) The fear of making a mistake

(9) Difficulty of narrowing the idea or problem too much

(10) Overemphasis on competition or cooperation

b. Factors which affect the utilization of new technological information.

(1) The idea should pay

(2) It should improve efficiency

(3) It should be relatively simple to understand and use

(4) It should be easily grasped mentally or demonstrated

(5) It should be able to fit into existing operations

(6) The idea along with its necessary supplies, tools, or equipment should be available

(7) It should be feasible and practical

(8) Be able to file the information for future reference

(9) Time, labor, and/or capital should be available to follow-up the idea

2. Special teaching-learning activities

a. Visit or write a report on an agricultural business that originated and grew as the result of some new technological information.

b. Prepare a budget of expenses and income data as related to the adoption of a new idea in agriculture.

c. Have each student set-up a file for future reference to new ideas in agricultural technology.

3. Suggested instructional materials and references

a. The Diffusion Process, booklet

b. Instructor's experiences

V. Follow-up and Evaluation

A. Keep students aware of new developments in agricultural technology by bringing the ideas before the class regularly and discussing them.

B. Discuss new technology with the student while making supervisory visits.

C. Encourage students to budget about 15 minutes each day to read and study new developments.

D. The instructor should develop a file regarding "New Developments in Agricultural Technology".

E. Devise a simple rating sheet to study the value of a new idea.

VI. Titles and Sources of References and Instructional Materials

A. Books

Extending Instruction in Vocational and Technical Education in Agriculture to Off-Farm Agricultural Occupations, Report of a Workshop in Agricultural Education.

Taylor, W.T. * Hamilton, J. Roland
Mississippi State Univ., State College. Dept of Agr Educ.
Mississippi State Board for Voc Ed, Jackson. Voc Agr Div.

Pub Date - Feb66
MF AVAILABLE IN VT-ERIC SET 140p.

*COOPERATIVE EDUCATION, *VOCATIONAL AGRICULTURE, *PROGRAM DEVELOPMENT, AGRICULTURAL MACHINERY OCCUPATIONS, ORNAMENTAL HORTICULTURE OCCUPATIONS, AGRICULTURAL SUPPLY OCCUPATIONS, *OFF FARM AGRICULTURAL OCCUPATIONS, STUDENT PLACEMENT, *CURRICULUM GUIDES,

Utilizing the approach which assumes that education in the science and technology of modern farming is basic to preparation for related occupations, the teachers and consultants in a 3-week workshop type course developed the materials in this report. The purposes and justification for instruction in off-farm agriculture occupations are explored. The advantages to students, schools, employers, and communities of extending vocational agriculture to off-farm agricultural occupations are listed. Outlines of steps and detailed procedures are provided for initiating, organizing, and establishing programs. Areas of instruction and training activities are outlined for (1) garden center, nursery, greenhouse roadside development, and landscaping in the ornamental horticulture curriculum, (2) managerial, mechanical, sales and service jobs in the agricultural mechanics curriculum, and (3) feed mill, farm store, chemical, and service jobs in the agricultural supply curriculum. Sections are included on providing occupational experiences, teaching related instruction, selecting training stations, and selecting students for training station placement. A summary of the Mississippi Child Labor Law, standards and provisions for student-learner certificates, a list of agricultural occupations other than farming and ranching, and various forms to be used in training programs are included. (JM)

PREFACE

INTRODUCTION

PARTICIPATING PERSONNEL

PREFACE

Technological change in the agricultural sector of our economy has major implications for those engaged in the field of vocational education in agriculture. The major concern is with the kind of vocational training needed to fit personnel to work in all phases of our modern agricultural economy. After much consulting together, the State Supervisor of Vocational Agriculture and his staff and the teacher training staff in agricultural education at Mississippi State University agreed that an intensive study should be made of the problem. Therefore, a three-week workshop type of course resulted. This publication presents the materials developed in this workshop.

It is believed that the materials presented in this publication will serve as a reminder to those who participated and as a stimulus to the many who could not attend the workshop. Also, it is believed that some new policies and many expanded programs of vocational agriculture will result from the materials presented in this publication which will more nearly train personnel to meet the needs of the agricultural economy of Mississippi.

All members of the agricultural education staff at Mississippi State University and the supervisory staff in vocational agriculture showed an interest in and participated in the workshop. Special recognition is given to Mr. W. T. Taylor, Assistant Supervisor of Vocational Agriculture, and Dr. J. Roland Hamilton, Professor of Agricultural Education, Mississippi State University, for their contributions in helping get the material in shape for publication.

The various committees borrowed heavily from materials prepared by The Center for Research and Leadership Development in Vocational and Technical Education at The Ohio State University.

E. E. Gross, State Supervisor
Vocational Agriculture
Jackson, Mississippi

Obed L. Snowden, Professor and Head
Agricultural Education Department
Mississippi State University

INTRODUCTION

The mention of off-farm agricultural occupations training as a function of secondary school vocational agriculture does not imply that the emphasis will be lessened in teaching individuals who are preparing to farm or to pursue an on-farm occupation. Moreover, to attempt to structure vocational education programs in agriculture without focusing attention on occupational training in farming would be worse than folly. We have evidence that skills and subject matter learned in courses designed for farmer training are basic to entering many of the off-farm agricultural occupations. Some observers have pointed out that up-grading farming (production agriculture) by the establishment of adequately trained intelligent individuals on economically sound farm business units is basic to the need for offering training in off-farm agricultural occupations. Indeed, we can be sure that without profitable agricultural production, there will be no farm-based, related, or agribusiness occupations. Dr. Milo J. Peterson, Head, Department of Agricultural Education, University of Minnesota, and one of the Nation's foremost advocates of farm management teaching in vocational agriculture courses, has champoined this concept for years.

The extension of vocational agriculture instruction to off-farm agricultural occupations will necessitate an extension of our thinking concerning the supervised experience phase of the vocational agriculture program. The following is taken from an article written by Dr. Milo Peterson.* "...In considering a transition from "supervised farming" to "supervised agricultural practice" four essentials may be postulated. They are: (1) mastery of principles and practices

---

*Peterson, Milo J., An Approach to Training for Agricultural Occupations, The Visitor, Volume XLIX, July 1962, Ag-Ed. Dept., University of Minnesota.

in mechanized agriculture and farm mechanics, in agronomy and soil science, in animal science, in management and marketing, and in other agricultural disciplines; (2) making the farm or other agricultural business and the home more convenient and pleasant places in which to live and work; (3) financial self-reliance including the ability to manage money and credit wisely through earning, saving, investing, record keeping, and maintaining sound credit; (4) production and marketing of crops, livestock and livestock products or services and commodities utilized in agriculture.

Preparation for entrance into the related occupations must evolve from a degree of education in the science and technology of modern farming. Only after training and experience in the basic occupation of farming will a student have the insight and understanding to "relate" the related occupation to farming in proper perspective. This suggests that specialized study and work experience in the chosen related occupation may be introduced during the junior and/or senior years.

This approach appears to have certain advantages over vocational agriculture programs as presently structured. It provides an opportunity for the public schools to more effectively serve students interested in all aspects of modern agriculture. It does no discriminate by either place of residence or sex; supervised agricultural practice programs may be appropriately planned for boys and girls whether they reside on farms or elsewhere. It recognizes the interdependence between modern farming and related occupations resulting from the dramatic proliferation in number and kind of purchased inputs utilized in farming today. It provides for occupational mobility in the preparatory stage of vocational education. Finally, it creates, by deliberate planning, a link between high school and post-high school education whether it be at the vocational-technical or collegiate level."

The responsibility for meeting the training needs for individuals who may work in the diversity of off-farm agricultural occupations is now placed upon vocational agriculture. It is the responsibility of vocational agriculture to serve all segments of the agricultural economy.

The material in this publication is to be used as a guide in extending vocational agriculture instruction to meet the needs of those preparing to work in off-farm agricultural occupations. It is hoped that it will help answer questions which usually come up when a vo-ag teacher starts planning for expanding his program of instruction. School administrators, school counselors, personnel of business establishments, members of the advisory committee as well as the vocational agricultural teachers should find this material helpful in bringing about a correct understanding of the expanded program of vocational agriculture instruction.

SECTION I

THE PURPOSES AND JUSTIFICATION OF VOCATIONAL AGRICULTURE INSTRUCTION IN OFF-FARM AGRICULTURAL OCCUPATIONS

The primary aim of the off-farm agricultural occupations training program is to provide classroom instruction and supervised experiences for individuals enrolled in vocational agriculture courses preparing to enter off-farm agricultural employment.

In the past, vocational agriculture has not openly structured training programs designed to prepare individuals to work in off-farm agricultural occupations. This was due primarily to stated policies interpreting the intent and purposes of the Smith-Hughes Law as passed in 1917. The 1963 Vocational Education Act removes any doubt concerning the legal restrictions on the scope of training which may be given in training for any agricultural occupation.

The following quotation is taken from the Occupational Outlook Handbook, 1961 Edition, United States Department of Labor. ". . . The number of farm workers has declined, but there has been a sharp increase in the number who work off the farm in jobs closely related to agriculture. These include the workers in feed mills, fertilizer plants, the farm machinery industries, farm supply stores, food processing plants, and many other businesses that process, distribute, or transport farm products and farm supplies. This whole complex of activities on and off the farm is often called "Agri-Business". It has remained a relatively constant proportion of the total economy. The total number of trained persons needed in fields related to agriculture is constantly rising . . . "

A partial list of some of the agricultural occupations not considered farming or ranching is given in Appendix K. It is realized that this list represents a diversity of knowledge and skills. Moreover, it is inconceivable that training for all of these occupations would become a part of any single vocational agriculture program. Each teacher contemplating off-farm agricultural occupations training programs should evaluate the need for such programs before attempting to initiate such training.

SECTION II

ADVANTAGES OF EXTENDING VOCATIONAL AGRICULTURE INSTRUCTION TO OFF-FARM AGRICULTURAL OCCUPATIONS*

To The Student

1. Provides an opportunity to become trained for a payroll occupation while completing the requirements for a high school diploma.
2. Helps in the choice of occupations in agriculture other than farming.
3. Arouses the student's interest in the field of agriculture as a whole.
4. Provides supervised training on the job under actual working conditions.
5. Helps provide an opportunity for students to make an intelligent choice of their life's work.
6. Lends encouragement to stay in school until graduation.
7. Provides opportunity to receive individual instruction in the chosen field of interest at a relatively low cost.
8. Develops definite work habits, attitudes, and responsibilities.
9. Offers opportunity to realize the necessity of cooperation with others.
10. Offers opportunity to learn the technical information of a trade as well as the manipulative skills.
11. Provides a foundation for post-high school studies.
12. Provides opportunity to establish a reputation on the job through experience.

---

*Most of these were taken from Handbook for Developing and Operating Agricultural Occupations Programs, Colorado State Board for Vocational Education.

13. Motivates interest in other school subjects.

14. It will help students to get a higher beginning wage.

To The School

1. Helps meet the training needs of the community without over-training for any one trade or occupation.
2. Provides a terminal course for students who do not continue their education beyond high school.
3. Increases community interest in school activities and causes the school administration to see vocational agriculture in a broader sense.
4. Promotes good public relations between the school and community. It will bring new clientele into the vo-ag program; namely, agricultural businessmen.
5. Offers a program for a school to place its graduates in payroll occupations.
6. Provides opportunity for the school to cooperate in other fields of agriculture.
7. Lessens the disciplinary problems at the school and the drop-out problem.
8. Provides opportunity for school to share in decreasing the number of unemployed.
9. Provides a qualified staff member to assist in vocational guidance work.
10. Helps in the establishment of young and adult farmer classes.

To The Employer

1. Provides opportunity to increase the interest of young people in the field of agriculture in which the employer is established.
2. Employers have an opportunity to have direct contact with the school program.

3. Provides a selection of future employees who are interested and qualified for the field in which the employer is engaged.
4. Trainees may be able to take over when key men are sick, on vacation, etc.
5. A better trained employee is available.
6. Trainee efficiency and alertness is maintained and increases through the counsel and cooperation of the agricultural occupations teacher-coordinator.
7. Helps reduce training problems and expense.
8. Increases efficiency of regular employees and makes them more alert.
9. Offers opportunity to participate in an educational enterprise which has not been available before.
10. Enables employer to receive more direct returns from school tax dollars.

To The Community

1. Encourages young people to remain in the community after graduation.
2. Improves economy by providing additional income to the citizens of the community.
3. Helps improve citizenship in the community.
4. Lessens the unemployment problem.
5. Promotes closer cooperation between the school and community.
6. Helps to eliminate the idea that everyone must get a college degree in order to get a good and satisfying job.

Summary

The advantages that have been suggested probably do not include all that might possibly come as a result of an extended program of vocational agriculture. This is not to imply that each advantage listed would be applicable in each school and community. Since each student, training center, school, and community may differ due to the nature of the agriculture occupations program offered, it is natural to assume that the particular advantages to those concerned will also differ.

SECTION III

OUTLINE OF STEPS TO TAKE IN INITIATING AND ORGANIZING OFF-FARM AGRICULTURAL OCCUPATIONS TRAINING PROGRAMS.

1. Teachers of vocational agriculture should become thoroughly familiar with all sections of this publication; then acquaint school administrators and other school officials with possibilities and potentials of such a program.
2. Contact State Supervisor of Vocational Agriculture for assistance in initiating any off-farm agricultural training program. A member of the state staff will meet with the local school officials to explain the State's reimbursement policies and standards and provide any other available service which the local school may desire.
3. Make a detailed survey of the school service area for potential employment opportunities in off-farm agricultural occupations.
4. If there is a significant need, and potentials exist for off-farm agricultural occupations training programs, set up an advisory committee. (See Section IV B for suggestions in setting up advisory committee).
5. With the assistance of the advisory committee get the school board to adopt the proposed program as an intergal part of the public school vocational agriculture program. Formulate and adopt necessary regulations, policies, and standards as an operational guide for the program.
6. The public should be informed (through adequate public relations coverage) about the program and its potentials. (See Section IV C for suggestions in informing the public about the program).
7. Develop training programs for the occupations in which training is to be offered and select training sites.

8. Select prospective trainees and acquaint trainee and parents with the off-farm agricultural occupations program.

9. After trainees have been selected, establish a detailed understanding among the trainees, parents, training site, and the school as to what regulations ect., will affect the cooperative-work experience phase of the off-farm agricultural program (this will require that written agreements be executed).

10. Evaluate on a continuous basis the progress made by off-farm agricultural occupations trainees.

SECTION IV

DETAILED PROCEDURE IN GETTING THE OFF-FARM AGRICULTURAL OCCUPATIONS TRAINING PROGRAM STARTED

A. Study The Community

One of the first and most essential things to do in inaugurating off-farm agricultural occupations training programs is to survey the area to determine opportunities for employment in off-farm jobs in which agricultural skills and knowledge of agricultural subjects are essential or helpful in successfully performing the duties of the job.

If a vocational agriculture teacher has been in the community for any length of time, he should be familiar with most of the agricultural firms, business establishments, and agricultural organizations. Where there is doubt about the completeness or accuracy of his knowledge, the vocational agriculture teacher should get assistance. There are several sources of occupational information available to the vocational agriculture teacher. In the large metropolitan areas, perhaps the most readily available source of ag-related businesses is the yellow pages of the local telephone directory. However, it must be recognized that not all ag-related businesses are listed in the yellow pages of the telephone directory. Other sources such as local civic clubs, local chambers of commerce, local employment security office, and professional organizations will be available in making a complete list.

After the list of agriculturally related businesses, organizations, agencies, etc. has been completed a survey from should be developed for obtaining occupational job titles and training possibilities from the establishments listed. The form shown on pp.11-13 is an acceptable form to use in making the survey.

3. Proprietors and managers
4. Supervisors and foremen
5. Sales
6. Clerical
7. Skilled
8. Semi-skilled
9. Service(unskilled)

E. Who makes the decision as to training needs?____________________

III. Procedure for hiring employees

A. ( ) Use State Employment Service

B. ( ) Use College Placement Service

C. ( ) Use high school principals or superintendents

D. ( ) Advertise vacancies

E. ( )

IV. Pre-employment educational program believed to be most beneficial to those who might work with company, firm, or agency (Check one)

A. ( ) General high school education with courses in basic principles of agriculture, supplemented with directed work experience in production agriculture and agricultural mechanics

B. ( ) Special courses in vocational education to develop needed manual skills to work in a variety of agricultural occupations

C. ( ) Special technical training beyond the high school level to be provided by technical institutes or junior colleges

D. ( ) A college degree with suitable major for working with company, firm, or organization

E. ( )

V. Company's, firm's, or agency's willingness to cooperate in providing supervised work experiences for prospective employees who are enrolled in vocational agriculture training (Check one)

A. ( ) Not willing

B. ( ) Employ students for specific jobs during periods when school is not in session

C. ( ) Employ students for specific jobs on a part-time basis during the school year

D. ( ) Allow students to work a few hours each day in specific jobs on a non-pay basis during the school day

E. ( )

VI. Company's, firm's, or agency's willingness to assist in preparing suitable training programs for individuals to enter specific job titles (Check all that apply)

A. ( ) Not interested

B. ( ) Will work with school personnel in preparing training programs for specific job titles

C. ( ) Will release key employees to give specialized instruction to trainees when requested by the regular teacher

D. ( ) Will allow students to come to company, firm, or agency for special instruction by your personnel

After the surveys are made, summarized, and evaluated, and it is decided that there is ample evidence that there is need for off-farm agricultural occupations training programs, an advisory committee should be appointed to help in further activities of getting the program started.

B. The Vocational Agriculture Advisory Committee

A local vocational agriculture advisory committee can help in giving effective direction to off-farm agricultural occupations training. Such a committee can provide a useful link between the activities of the school and the agricultural business interest of the community. It must be kept in mind that the function of the advisory committee is to advise and council with school personnel in educational programs. The administration of any school program must remain with the school board. In some situations the local school board may act as an advisory council. This, of course, will depend on the composition of the board.

Purposes of the Advisory Committee.

1. To secure ideas and advice of representative key people in agricultural businesses in the school district.

2. To help study community situations and determine community ideas.
3. To clarify the relationship of the vocational agriculture department with the community.
4. To explain the vocational agricultural program to the public and help improve public relations.
5. To cooperate with the teacher and give him encouragement and support.
6. To help evaluate the work of the agriculture department.
7. To serve as a sounding board for advice on program operating procedure.

Advantages of an Advisory Committee.

1. Provides a link between the school and community.
2. Gives prestige to the school, community, and vocational program.
3. Gives the school an opportunity to explain the objectives of the total educational program.
4. Brings about a closer relationship between management and labor.
5. Provides an opportunity to study the real training needs in a community.
6. Provides a sounding board for new ideas from many sources.

Functions to Be Performed By Advisory Committee.

1. Assist in the selection of training centers.
2. Render services in developing employment opportunities.
3. Assist in setting standards for trainee selection.
4. Give advice on development of instructional material.
5. Provide guidance in wage and hour problems.
6. Help publicize the program.
7. Recommend local training standards on a cooperative basis between training stations and school.
8. Render services in conducting community surveys.

9. Assist in the selection of subjects, course content, and the determination of emphasis that should be included in the training plans, as well as resource personnel for related classroom instruction

Qualifications Of Committee Members.

1. Members should be well-known leaders in their occupational field.
2. They should express an interest in the problems of the school system.
3. They should be representatives of the general opinion of: management, labor, agriculture, and public.
4. They should have the necessary time to devote to committee work.
5. They should not be persons who will exploit the work of the committee for their own personal benefit.

Size Of Committee.

1. A good working committee should consist of seven to twelve members, depending upon what is considered as an effective size for the job to be done. It is suggested that the members be representative of the following:

EDUCATION:
    Superintendent
    Principal
    Guidance personnel
    Teacher-Coordinator (If one is employed in the school)
    Vocational agriculture teacher (ex officio member)

BUSINESS: BUSINESS-ED. PERSONNEL
    Chamber of Commerce
    Civic or professional clubs
    Ag. business-owners, managers, etc.
    Ag. association personnel

LABOR:
    Organized labor (If present in the community)

NEWS MEDIA:
    Local editor, local radio manager, etc.

How To Appoint (Suggestions).

1. Involve the superintendent of schools and the school board. Go over the list of prospects and ask them to assist you in making the selections.
2. The superintendent can then send out a letter explaining the purpose of the committee to those selected to serve. He can also give the time and place of the first meeting.

Term Of Appointment.

About one-third of the committee should be appointed for a one-year term, one-third for a two-year term, and one-third for a three-year term. All subsequence appointments should be for a three-year term.

C. Informing The Public

Correct public understanding of the program is essential if we expect complete public support. The first phase of informing the public about the off-farm agricultural occupations training program is to publicize the objectives, benefits, and operating procedures of the program. All public relations media available in the area should be used. In many situations this will involve the newspapers, radio, and television. In addition, the teacher of vocational agriculture and others interested in the program should seek parts on the programs of civic clubs, chamber of commerce meetings, P.T.A. meetings, etc. After the program is in operation, the vocational agricultural teacher-coordinator should keep the public informed so that their interest and support is kept at its maximum.

There should be a follow-up story about the program. For example, if the press is used to announce that the school has inaugurated an off-farm agricultural occupations training program, a news article should follow within a reasonable length of time, giving enrollment, training cneters, and other information of interest to the general public.

CAUTION: Do not "ballyhoo" the off-farm agricultural occupations training program. Do not mislead the public into expecting that this program is a guarantee for good jobs, or that it is replacing the farmer-training program. All of your public relations activities should adhere to school policy concerning the release of information.

The following example of a skeleton news story may be helpful in constructing news articles. All news stories should be adapted to meet local conditions.

FOR IMMEDIATE RELEASE

Off-Farm Agricultural Occupations Training Program
Mr. John Doe
Vocational Agriculture Instructor
Union High School

Introductory Article

A new on-the-job training program for high school students will be launched this fall at ______________________ High School, according to __________, Superintendent of Schools.

An off-farm agricultural occupations curriculum has been developed by ______________________, vocational agriculture teacher. This program will give some students an opportunity to spend some time in on-the-job training with local agricultural business and industrial firms during periods when they are not in school. In some cases they may spend part of their school time under supervision with an employer in the training center.

Trainees who qualify for cooperative occupational training will be enrolled in regular high school courses, including one period of related instruction, during which time they will study information related to their particular on-the-job training. They may spend some time each weekday on the job, learning the skills and management practices involved, under the guidance of a skilled instructor selected from the firm in which the trainee is working.

The off-farm agricultural occupations training program is designed to offer training to all high school students who have an interest in an agricultural occupation other than farming or ranching. Without such a program we are not realizing the full potential of the vocational agriculture department. Such training can lead to in-school employment and immediate employment after completion of their high school program.

A survey recently conducted indicated there are______________ ag-related
(Number)
businesses in the________________________ area. ________________ of these
(town) (Number)
have indicated an interest in taking student trainees. The off-farm agricultural occupations program was provided for by the Vocational Education Act of 1963.

SECTION V

ORGANIZATION OF COURSES

The present plans for the inclusion of the off-farm agricultural occupations training phase of vocational agriculture in Mississippi are primarily for high school junior and senior students, (third-and fourth-year vocational agriculture) and post-high school students. We have no intention of de-emphasizing vocational agriculture for ninth and tenth grade students. Indeed, it is here that the basic scientific principles of modern farming are taught and experienced. Moreover, it is in these two grades (9th and 10th) that the student is given vocational guidance, broad-fields instruction and supervised experience in fundamentals of production agriculture which is essential or helpful in pursuing many of the off-farm agricultural occupations and absolutely essential for effectively studying agricultural technology as it is applied to modern farming and ranching.

Perhaps we will find that in many of our secondary school districts there will not be a sufficient number of off-farm agricultural occupations job opportunities to justify organizing the program into separate classes with a separate teacher, curriculum. etc. Therefore, it will be necessary to teach these students in the same class with students studying production agriculture, using individual and small group instruction to meet the needs of students involved. However, where the need justifies, separate classes and curriculums with a special teacher may be organized. Procedure for doing this will need much study.

The diagram of courses in vocational and technical education in agriculture in secondary schools on page 21 shows how the course organization for most of our schools can develop.

DIAGRAM OF COURSES IN VOCATIONAL AND TECHNICAL EDUCATION IN AGRICULTURE IN SECONDARY SCHOOLS -- MISSISSIPPI

FIRST YEAR

EXPLORING AGRICULTURAL OPPORTUNITIES
BASIC PRINCIPLES OF PRODUCTION AGRICULTURE
BASIC PRINCIPLES OF AGRICULTURAL MECHANICS
DIRECTED SUPERVISED EXPERIENCE

SECOND YEAR

DIRECTED SUPERVISED EXPERIENCE IN SPECIALIZED OCCUPATIONS

POST-SECONDARY SCHOOL

ADVANCED AGRICULTURAL PRODUCTION TECHNOLOGY
ADVANCED AGRICULTURAL MECHANICS
FARM BUSINESS MANAGEMENT
DIRECTED SUPERVISED EXPERIENCE

ADVANCED AGRICULTURAL SERVICES PROCESSING AND DISTRIBUTION, TECHNICIAN LEVEL
DIRECTED SUPERVISED EXPERIENCE IN SPECIALIZED OCCUPATIONS

First Year-basic principles of production agriculture, with primary emphasis on basic principles of plant science, animal science, agricultural mechanics, exploring agricultural opportunities, etc. In addition there must be directed work experience on a farm, or in an agricultural occupation legally permissable. (see Appendix for legal restrictions)

Second Year-continued study of basic production agriculture, expanding to basic principles not taught in the first year. Our state program of the scope of basic principles to be taught in vocational agriculture is outlined in "The Teacher's Handbook for Vocational Agriculture." It is mandatory that there be directed or supervised work experience provided for each student enrolled.

Third Year-at the beginning of the third year, those who remain in vocational agriculture would begin a more intensified type of training. For the most part, third-year students will be Juniors. It is at this time that teachers begin guiding the student into more specific occupational training, whether this be for production agriculture, or for an off-farm agricultural occupation.

It is anticipated that two types of training courses will be offered:

A. The vocational agriculture course for those preparing to farm or work in production agriculture. This program will give more emphasis to agricultural practices, advanced technology, farm management and agricultural mechanics. The emphasis will be on the development of abilities necessary for successful operation of a modern farm, or ranch. The enrollees for this course will be those who are definitely on their way to an establishment in farming or ranching, or who are preparing to continue their training in farming beyond the high school. Supervised experience on a farm is essential for successfully completing the course.

B. Specialized agricultural training programs for employment in off-farm agricultural occupations which require knowledge and skills in agricultural subjects. In most situations, it will not be feasible to have a separate class for each occupation. Every effort will be made to cluster the occupations around units of subject matter. In some occupations the units in production agriculture and units in off-farm occupations can be taught in the same class. This would be especially true in agricultural mechanics.

The biggest difference in the training programs will be brought about by the differences in the supervised experience programs. In the third year class, all the students would have developed a supervised work experience program. The kind and extent would be governed by the occupational objective. One group may have supervised farm experienced programs, or farm placement for experience much as we have had in the past. Another group would have supervised work experienced programs in off-farm agricultural occupations of their choice. It is conceivable that the group of students who are looking to schooling beyond the high school could have a supervised work experience program in agriculture with professional agriculture workers. For example, if a student definitely planned to be a veternarian or a veterinary technician, he would have a work experience program with the locel veterinarian.

Making arrangements for supervised work experiences in off-farm agricultural establishments is discussed in detail in Section VIII.

Fourth Year-the fourth year is to be a continuation of the third year with increased emphasis on business managements and advanced technology.

Post-Secondary School-a post-secondary school program in vocational and technical agriculture is being developed in our Mississippi Junior College system. Post-secondary training may also be given at secondary schools. This is in keeping with the State plan.

In all of the foregoing courses, supervised work experience will apply, whether it is on the home farm, placement for farm experience ; school laboratories, cooperative work experience, job placements in agricultural establishments, or other work experience programs which can be helpful to the student in reaching his occupational goal.

DEVELOPING COURSES OF STUDY FOR TRAINING IN ORNAMENTAL HORTICULTURE OCCUPATIONS

There are various types of ornamental horticulture training programs which can be developed and carried on as a phase of the vocational agriculture program of the secondary school. These programs may vary in length from two to four or more years, depending upon the needs and interests of the students to be served.

In Mississippi it is not contemplated that we will have courses designated as horticulture I for first year, horticulture II for second year, etc. It will be recalled that the diagram of courses in vocational agriculture shows first year and second year agriculture. These two years are to be introductory, exploratory, and preparatory in the broad fields of basic production agriculture. However, those who show an interest in preparing to enter training for horticultural occupations should be encouraged to carry out supervised experience programs relating to ornamental horticulture even during the first and second years of vocational agriculture.

<u>THIRD AND FOURTH YEARS, OR ELEVENTH AND TWELTH GRADE COURSES</u>

The suggested areas of instruction and training activities for eleventh and twelth grade, or third-and fourth-year vocational agriculture outlined is rather comprehensive. It is suggested that the vocational agriculture teacher, in consultation with an advisory committee and the school administration, use these suggestions as a guide in determining those areas of instruction and training activities that fit the local conditions. It is not expected that every local program would include all areas of instruction listed unless the local program or circumstances warranted giving some attention to each of them. The opportunities for field experience will, in most cases, be the determining factor in what areas to include in the course of study. In any event, practical judgement will have to be exercised by the teacher in determining what to teach.

SUPERVISED WORK EXPERIENCE

In addition to instruction given in the classroom and laboratory, each trainee is required each year to carry on an approved supervised work experience program. The Mississippi State plan for vocational education, which is an agreement between the Mississippi State Board for Vocational Education and the U.S. Office of Education, requires that the number of hours devoted to work experience shall not be less than that devoted to the in-school vocational instruction. The supervised work experience may be carried on during time school is in session or when school is not in session. In some cases it might be advantageous to permit the trainee to obtain some of his supervised work experience at a school land laboratory, a nursery farm, a greenhouse on the school campus, outside regular class hours. This is presupposing that these facilities can be provided on or near the school campus.

ORNAMENTAL HORTICULTURE IS A PART OF THE TOTAL CURRICULUM IN THE SECONDARY SCHOOL

Ornamental horticulture as used herein refers to the production, care, management, and marketing shrubs, trees, bulbs, turf grasses, flowers, etc. The instruction given is vocational agriculture and will be an integral part of the students' curriculum leading toward a secondary school diploma.

For students who can not, for one reason or another, keep pace with those in the regular vocational agriculture course, a special course for the appropriate level of training may be offered. Where such a situation exists, the vocational agricultural teacher should contact the State Supervisor of Vocational Agriculture for directions.

ORNAMENTAL HORTICULTURE OCCUPATIONS

The course of training in ornamental horticulture outlined in this section will prepare individuals for entry jobs with landscape service companies, greenhouses, nursery stock growers, roadside and park maintenance, etc. The level of achievement attained will be governed by the ability of the individual.

Competencies Required to Succeed in Ornamental Horticultural Occupations

A. As a beginning trainee

1. Pleasing personality, able to work with others
2. Good morals, honest, dependable
3. Good attitude, willing to learn
4. Industrious, willing to work
5. Dexterous
6. Reasonable amount of versatility, ability to adapt to changing situations
7. Safety conscious

8. Knowledge of basic plant science

9. Knowledge of basic soil science

B. As a trained employee

1. (Numbers 1, 2, 3, 4, 5, 6, 7, above)

2. Some mechanical skills in using hand and power tools

3. Reasonable functional knowledge of horticultural plants

4. Ability to grade plants

5. Ability to read planting plans

6. Ability to care for plants and plant material

7. Ability to plant, or set out, trees, shrubs, and other plants correctly

8. Know proper use of fertilizer, mulching, preparation of soil

9. Know how to prune plants correctly

10. Ability to design a planting plan

11. Ability to recognize and control weeds (including chemicals)

12. Ability to merchandize ornamental horticultural plants and supplies.

COURSE OF STUDY FOR ORNAMENTAL HORTICULTURE OCCUPATIONS
(11th, 12th grades, and post-secondary)

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nursery	Green house	Rd.-Side Devel.	Landscaping Devel.	Landscaping Main.
1. Exploring occupations in horticulture	1. Through investigation of the present situation, determine employment opportunities in horticulture, including salaries, working conditions, etc.	x	x	x	x	x	x
	2. Through visitation to businesses, etc., determine qualifications for entry in horticultural occupations.	x	x	x	x	x	x
	3. Through study and analysis, determine opportunities for growth in horticultural occupations. (Correlate with Section II, Area One; V in the Teachers Handbook.)	x	x	x	x	x	x
II. Identifying horticultural plants and determining their characteristics	1. Use specimens to familiarize students with the common and scientific names of commonly used horticultural plants.	x	x	x	x	x	x
	2. Student make and bring to class a collection of species of horticultural plants; identify and note general characteristics.	x	x	x	x	x	x
	3. Through field trips or on-the-job training, familiarize student with important characteristics of horticultural plants. (Size,	x	x	x	x	x	x

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nursery	Greenhouse	Rd.-Side Devel.	Landscaping	
						Devel.	Main.
	color, shape, growth, habits, berries, flowers, special adaptation.) A. Trees. B. Shrubs. C. Herbacious, annuals and Perenials.						
III. Developing a landscape plan. (This area to be for advanced students only.)	1. Through classroom procedure and field trips, familiarize student with the basic principles of landscaping for: a residence, including public, private, and service areas, same activities for parks and other public areas.	x	x	x	x	x	x
	2. Student read and interpret blueprints of buildings.					x	
	3. Student make list of errors in a home landscape.	x	x	x		x	x
	4. Student develop landscape plan for a residence. A. Make a sketch of existing features, then draw to scale outlines of buildings, border lines, walks, drives, etc. B. Designate plants to be left or relocated.					x	x
	5. Make plantings according to the landscape plan for a residence.	x				x	x
	6. Student develop other landscape plan for: A. A neighbor.	x				x	x

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden center	Nursery	Green house	Rd. Side Devel.	Landscaping	
						Devel.	Main.
	B. School. C. Church. D. Other.						
IV. Developing and maintaining lawn and turf-grass areas.	1. Student, through classroom and laboratory procedure, prepare soil for lawn and turf-grass areas. A. Selecting sutiable grass. B. Establishing sod. C. Maintenance of lawn and turf-grass areas. (Fertilizing, controlling pest and diseases, and mowings.) D. Watering.	x	x		x	x	x
	GREENHOUSE						
V. Constructing and maintaining horticultural structures and facilities.	1. Through classroom, laboratory, and field procedures, student engage in the following.						
	A. Select site for greenhouse.		x	x			
	B. Study greenhouse designs.		x	x			
	C. Select materials (plastic or glass).		x	x		x	x
	D. Select and install heating and ventilation system.		x	x		x	x
	E. Select and install irrigation system.		x	x		x	x
	F. Select and install electrical system.		x	x		x	x
	3. Construction of greenhouse and installation of above systems.		x	x		x	x
	4. Maintenance of structures and above systems,		x	x		x	x

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nur-sery	Green house	Rd. Side Devel.	Landscaping Devel.	Landscaping Main.
	LATH HOUSE						
	1. Through classroom, laboratory, and field procedures, student engage in the following:	x	x	x		x	x
	A. Select site for lath house.						
	B. Study lath house designs.						
	(1) Select materials for lath house.						
	(2) Select and install irrigation system.						
	C. Construction of lath house and above systems.						
	D. Maintenance of lath house and above systems.						
VI. Selecting, preparing, and using growing media.	1. Through classroom, laboratory, and field procedures, student engages in the following:	x	x	x		x	x
	A. Determine characteristics and suitability of various growing media (ratio of materials. Ex. 1/2 peat; 1/2 sand, etc.)						
	B. Selection, perparation, and use of growing media.						
	C. Study of soil origin and composition and its importance as applied to production of horticultural plants.						
	D. Determine suitability of various soils for growing horticultural plants.						
	E. Evaluate and use effectively soil conditioners						
	F. Determine how soil structure effects watering practices.						
	G. Evaluate and use effectively soil mulches.						

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nursery	Green house	Rd. side Devel.	Landscaping Devel.	Landscaping Main.
	H. Recognize and maintain proper fertility level (fertilization) of plant growing media as required for good plant growth.						
VII. Propagating horticultural plants.	1. Through classroom study, laboratory and field procedure, develop in student the ability to:	x	x	x			
	A. Produce various plants from seed.						
	B. Produce plants from cuttings.						
	C. Produce plants from layerage.						
	D. Propagate by budding and grafting.						
	E. Select or build suitable propagating containers and equipment.						
VIII. Planting a landscape plan.	1. Through classroom study and directed work experience, each student develop the ability to select site and prepare soil for setting plants (including fertilization soil tests.)	x	x		x	x	
	2. Through on-job-training each student develop skills as follows:						
	A. Select suitable plants.	x	x	x	x	x	x
	B. Dig hole to proper depth and width.	x			x	x	x
	C. Place plant in hole and position it correctly.	x			x	x	x
	D. Fill hole with soil.	x			x	x	x
	E. Pack soil and other media.	x			x	x	x
	F. Water plant after hole has been filled.	x			x	x	x
	G. Mulch plant.	x			x	x	x
	H. Other						

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nursery	Greenhouse	Roadside Devel.	Landscaping	
						Devel.	Main.
	3. Through classroom study and directed work experience maintain landscape: A. Pruning, fertilization, mulching, and irrigation. B. Cultivating different plants.	x	x	x	x	x	x
	4. Through classroom study and directed work experience student will: A. Make a collection of bulbs, rhizomes, and corms suitable for putting in a landscape plan. B. Become familiar with principles and procedures involved in planting by planting a collection of bulbs, rhizomes, and corms.	x	x		x	x	x
IX. Controlling insects and diseases in horticultural plants.	1. Through classroom study, laboratory procedure, and on-the-job training student will:						
	A. Make collection and identify insects harmful to shrubbery and flowers. Also identify diseases that attack horticulture plants.	x	x	x	x		x
	B. Learn the effect of various chemicals on different shrubs and flowers.	x	x	x	x		x
	C. Formulate various spray solutions for insect and disease control.	x	x	x	x		x
	D. Make list of hazards involved in use of chemicals.	x	x	x	x		x

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN					
		Garden Center	Nursery	Greenhouse	Roadside Devel.	Landscaping	
						Devel.	Main.
	E. Make a list of safety precautions to observe in use of chemicals.	x	x	x	x	x	x
	F. Make contact with State Plant Board to secure policies, and laws regulating the control of diseases in ornamental horticultural plants.	x	x	x	x	x	
	G. Practive insect and disease control on plants at home and on the job.	x	x	x	x	x	x
X. Selection, use , and care of horticultural equipment.	1. Through classroom procedures, familiarize student with basic principles, characteristics, and cost of various horticultural equipment.						
	2. By cooperative arrangements and on-the-job experience, have student learn to operate and maintain the following:						
	A. Cultivating equipment.	x	x		x	x	x
	B. Digging equipment.		x		x	x	x
	C. Dusting and spraying equipment.	x	x	x	x	x	x
	D. Irrigating equipment.	x	x	x	x	x	x
	E. Mowing and mulching equipment.	x	x	x	x	x	x
XI. Harvesting and preparing ornamental horticultural plants for market.	1. Through on-the-job training familiarize students with the following:						
	A. Balling and burlapping field-grown plants.		x				
	B. Grading plants.	x	x	x			
	C. Labeling plants by their correct name.	x	x	x			
	D. Caring for plants after balling and burlapping.	x			x	x	x

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN

	G. Trade organizations and government agencies.	x	x	x	x	x	x

DEVELOPING COURSES OF STUDY FOR TRAINING IN AGRICULTURAL MACHINERY---SERVICE OCCUPATIONS

There are many different types of work in the broad area of agricultural machinery for which vocational agriculture instruction can make a worthwhile contribution. Agricultural mechanics instruction has been, over the years, an integral part of the basic instructional program for vocational agriculture.

In Mississippi the secondary school vocational agriculture program will, as it has in past years, give broad field-training in basic agricultural mechanics which relates to the diversity of mechanical activities with which the modern farmer has to cope. The diagram of courses shown on Page__21_shows that we plan to continue as we are now doing, to teach basic principles of ag-gricultural mechanics to first-and second-year students. It is realized that not all of the basic principles of agricultural mechanics can be taught during these two years. However, it is the consensus of those who have given thought to the problem, that knowledge and skills in agricultural mechanics are essential preparation for those who are preparing to farm, and for those who will enter many off-farm agricultural occupations.

Since supervised experience is mandatory in any vocational agriculture training program, it is usged that the teacher of vocational agriculture plan for and make extensive use of agricultural mechanics experience during these first two years. Opportunities can be provided for supervised experience in agricultural mechanics on students' home farms, placement on farms as workers, in school shop, and agricultural machinery and equipment dealer establishments. (See Appendix__A__for legal limitations). In any case, a student who is anticipating employment in agricultural mechanics-service occupations will find this basic knowledge and experience useful.

THIRD AND FOURTH YEARS, OR ELEVENTH AND TWELFTH GRADE COURSES

Knowledge and skills needed by workers in agricultural machinery service occupations are varied. The degree of competency needed by individuals will also vary. The suggested areas of instruction and training activities outlined for third-and fourth-year vocational agriculture is rather comprehensive and is more than can be adequately taught in two years. Perhaps it will be advisable for the vocational agriculture teacher, in consultation with personnel from the farm machinery industry, to determine what can best be dealt with on each grade level, including post-high school.

SUPERVISED WORK EXPERIENCE

By and large the supervised work experiences for those in training to enter agricultural machinery service occupations will be cooperative training programs worked out with farm machinery dealers. More details concerning cooperative training programs are given in Section VI.

AGRICULTURAL MACHINERY-SERVICE OCCUPATIONS TRAINING IS A PART OF THE TOTAL CURRICULUM IN THE SECONDARY SCHOOL

Agricultural machinery as used herein refers to tractors and power units, land preparation equipment, planting equipment, cultivating or tillage equipment, harvesting equipment, and spraying and dusting equipment.

The instruction given is vocational agriculture and will be an integral part of the students' curriculum leading toward a secondary school diploma.

As in the case of many other fields of study, there will be some individuals who can not keep pace with others and may be potential dropouts. For these individuals a special course for the appropriate level of training in agricultural machinery occupations may be offered. Before taking action on such a course, check with the State Supervisor of Vocational Agriculture,

AGRICULTURAl MACHINERY---SERVICE OCCUPATIONS JOB TITLES

The course of training outlined here will prepare individuals for entry in the following job classifications:

1. Agricultural machinery set-up and deliveryman.
2. Agricultural machinery mechanics.
3. Agricultural machinery mechanics helper.
4. Agricultural machinery parts man.
5. Agricultural machinery service supervisor, or shop foreman.
6. Agricultural machinery assistant shop foreman.
7. Agricultural machinery firm manager.

The level of achievement attained will be governed by the persistence and ability of the individual. For many of those who finish high school, the technical courses being set up at Jr. Colleges in agriculture machinery offers an opportunity to further training in this field to attain a higher level of competency.

COMPETENCIES REQUIRED TO SUCCEED IN AGRICULTURAL MACHINERY--SERVICE OCCUPATIONS

1. Have an appreciation of the job.
2. Recognize and understand the need for profit in business.
3. Ability to accept responsibility and make decisions.
4. A functional knowledge of local production agriculture.
5. Ability to think creatively and positively and communicate effectively.?
6. Have a high ethical standard and have wholesome attitudes toward the agricultural machinery industry.

7. Ability to merchandize agricultural machinery and services.

8. Recognize and follow safety practices at all times.

9. Ability to cope with competitive practices.

10. Functional knowledge of agricultural machinery.

11. Competencies in the respective job title involved in as an individual--in other words be good in what you do.

12. Have a wholesome attitude toward the free enterprise system.

13. Have efficient work habits.

14. Ability to appraise, to a reasonable degree, the economic outlook as it effects the agricultural machinery business.

It is not expected that every worker would possess a high degree of training level in each of these responsibilities. For example, individuals holding job titles calling for managerial, or sales responsibilities would need a high level of training in all competencies with the exception of high mechanical skills, while those in the service, or mechanical jobs would need a high level of training in mechanical skills. It is suggested that the vocational agriculture teacher work closely with competent agricultural machinery personnel in developing individual training programs.

COURSE OF STUDY FOR AGRICULTURAL MACHINERY--SERVICE OCCUPATIONS
(11th, 12th, grades, and post-high school)

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
I. Exploring opportunities in agricultural machinery occupations.	1. Through classroom study and visitation to agricultural machinery establishments, student will determine job opportunities in this field. A. Qualifications for entry. B. Opportunities for advancement, etc. (Correlate with Section II, Areas one and five in teachers handbook.)	X	X	X	X
II. Understanding tractors and tractor systems.	1. Through classroom study and on-the-job work experience in agricultural machinery dealerships, student will: A. Develop an understanding of the basic principles of the operation of an internal combustion engine, including a study of the function of each major component of the engine.	X	X	X	X
	B. Develop an understanding and working knowledge of: (1) The power train (2) The fuel system (3) The cooling system (4) The electrical system (5) The hydraulic system (6) Lubrication system (7) Traction system (ex. wheels, steering, tire case, etc.) (8) Clutch (9) Brakes	X	X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
III. Tractor tune-up and maintenance.	1. Through classroom study, school shop practice, and supervised work experience in agricultural machinery dealer establishments, student will develop competency in:		X		X
	A. How to check and correctly adjust valve clearance.		X		X
	B. How to check, adjust and tune tractor ignition system.		X		X.
	(1) Timing distributor				
	(2) Timing magneto				
	(3) Battery service				
	(4) Checking, cleaning, and adjusting spark plugs.				
	(5) Checking, installing and adjusting breaker points.				
	(6) Checking and repairing lighting system				
	C. How to check, adjust, and maintain air, fuel, and exhaust systems.		X		X
	(1) Checking and servicing air filter.				
	(2) Checking, cleaning and adjusting carburetor.				
	(3) Checking and cleaning sediment bowl.				
	(4) Checking, cleaning, and repairing fuel lines.				
	(5) Checking manifold and exhaust system.				
	D. How to check and service cooling system.		X		X
	(1) Flushing radiator.				
	(2) Replacing and adjusting fan belt.				

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
	(3) Selecting and adding coolant.				
	(4) Checking for and stoping leaks.				
	(5) Checking grill and exterior parts of radiator.				
	(6) Checking, replacing, and adjusting thermostat.				
	E. How to maintain and adjust tractor power train.		X		X
	(1) Checking and adjusting clutch (hand and foot operated)				
	(2) Checking and servicing the drive train-transmission, differential, and final drive.				
	F. How to check, replace parts, and adjust braking system.		X		X
	G. How to maintain steering mechanism and wheels.		X		X
	(1) Checking wheel alignment.				
	(2) Checking tires.				
	(3) Checking and servicing front-wheel bearings.				
	H. How to maintain the lubricating system.		X		X
	(1) Checking oil level, draining and flushing engine crankcase.				
	(2) Checking and replacing oil filter.				

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
	(3) Selecting proper lubricants. (4) Servicing pressure-type grease fittings and other points of lubrication.not specifically covered under other systems. NOTE: IF THE STUDENT HAS NOT BEEN TAUGHT BASIC PRINCIPLES OF LUBRICATION AS OUTLINED IN TEACHERS' HANDBOOK (Area ten, V.B,2, P. 87, Greases and Oils Used in Agricultural Machinery), HE SHOULD BE TAUGHT THAT COMPETENCY AT THIS TIME. SUGGESTION TO THE TEACHER-It is suggested that each student be required to demonstrate that he can correctly perform a complete engine tune-up and perform the maintenance functions of all sys-				

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
	tems outlined above. Where dynamometer is available, the student should be taught how to use it in performing the tune-up operation.				
IV. Assembly, adjustment, maintenance, and repair of land preparation equipment.	1. Through classroom study, school shop practice, and work experience in agricultural machinery dealers' establishments, student will become familiar with: A. Types of land preparation equipment and their component parts. B. Purposes for which equipment is used and factors governing use. C. Procedure for adjusting and operating land preparation equipment safely and efficiently.		X	X	X
	2. Through school shop practice and directed work experience in dealer establishments student will: A. Assemble, adjust and operate: (1) Trailor-hitch moldboard plows. (2) Mounted tractor-operated moldboard and disk plows. (3) Two-way mold board plows.		X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
	(4) Multiple-bottom plows. (5) Multiple-disk plows. (6) And other land preparation equipment used in the area.				
	B. Learn servicing and maintenance procedure on all land preparation equipment used in the area.	X	X	X	X
	C. Assist in the repair of all land preparation equipment brought into the shop for repair.		X		X
V. Assembly, adjustment, maintenance, and repair of crop planting equipment.	(The same general training activities as suggested under IV above will apply to areas V, VI, VII, VIII, and IX.		X	X	X
VI. Assembly adjustment, maintenance, and repair of cultivating equipment.			X	X	X
VII. Assembly, adjustment, maintenence and repair of harvesting machinery.			X	X	X
IX. Assembly , adjustment, and repair of spraying and dusting equipment.			X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
X. Tractor engine overhaul	1. Through classroom study student will become famaliar with construction of tractor engine (gasoline) parts and component parts. A. Crankcase B. Cylinders C. Cylinder head D. Crankshaft E. Flywheel F. Pistons G. Connecting rods H. Camshafts I. Valves and valve operating mechanisms.		X		
	2. Through school shop practice and supervised work experience, student will develop competencies in tractor engine overhaul by assisting in overhauling tractor engines which are brought into the school and dealer service shops. For the more advanced students a complete overhaul job may be assigned the student with head mechanic supervising. NOTE: When the opportunity is available, and the local conditions warrant, the same study and practice procedure will be followed for desel engines.		X		

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
XI. Organization and management of agricultural machinery dealerships.	1. Through classroom study and work in agricultural dealership firms, student will develop an understanding of:	X		X	
	A. How a dealership is organized.				
	B. The importance of the retail agricultural machinery dealerships.	X		X	
	C. How the agricultural machinery and parts are ordered and how they are moved from manufacturer to customers.				
	D. Job titles and job functions in the organization of a retail agricultural machinery dealership. (1) Areas of operations (examples, management, parts, sales, service, etc.) (2) Duties of persons working in each job title.	X		X	
	E. How agricultural machinery dealerships are financed. (1) Credit sources. (2) Financing time sales.	X		X	
	(3) Discounts, etc.			X	
	F. Policy regarding selecting, training, and compensating employees. (1) How selected. (2) Training policy (3) Compensating employer. Fringe benefits. (4) Employer-employee relationships.	X			

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
XII. Service department operating procedure.	1. Through classroom study and work experience in agricultural machinery dealerships, student will develop and understanding of: A. Service shop organization, personnel organization, etc. B. How charges for services are determined. C. Efficient shop layout. D. Shop safety practices. E. Service shop cost factors. F. Policies governing the providing of field service for customers.	X	X	X	X
XIII. Parts department operating procedure.	1. Through classroom study and work experience in agricultural machinery dealerships, student will develop competencies in: A. Classifying parts. B. Inventorying parts. C. How to lay out a parts department. D. How to control parts inventory. 2. Through work experience in parts department of a dealership, become familiar with: A. How parts are ordered. B. Principle policies on parts. C. Kinds of records kept. D. Procedure concerning obsolescence. E. Discount procedures. F. Working relationships with service department.	X	X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Managerial Job Titles	Mechanics	Sales	Service
XIV. Merchandizing agricultural machinery.	1. Through classroom study and work experience in an agricultural machinery dealership, student will become familiar with:	X	X	X	
	A. The selling program of the establishment.	X	X	X	
	B. Competencies needed by salesmen.	X		X	
	C. Personal characteristics of effective salesmen.	X		X	
	D. Sales approaches made by salesmen.	X		X	
	2. Through classroom study and work experience with a salesman, student will learn:				
	A. How attitude influences sales.	X		X	
	B. How to determine the kind of machinery used in the area.				
	C. How to appraise machinery traded in.				
	D. How prospects are located.	X		X	
	E. How salesmen overcome price resestance.				
	F. When to cut prices.				
	G. How to hold old customers and add new ones.	X		X	
	H. Things, or characteristics that customers don't like about salesmen.	X		X	
	I. How to put on an effective sales demonstration.	X		X	
	J. How to prepare a sales report.				
	K. The pricing policy of the establishment.	X		X	X
	L. How salesmen are compensated.	X		X	
	M. Company policy on machinery rentals, rental contracts, etc.	X		X	X

DEVELOPING COURSES OF STUDY FOR AGRICULTURAL SUPPLY--SALES AND SERVICE OCCUPATIONS

The purposes of the agricultural supply--sales and aervice occupations training programs are:

1. To prepare individuals for employment in businesses which distribute agricultural supplies and equipment.
2. To prepare individuals for employment in providing services connected with agricultural supplies and equipment.

There is a diversity of occupations in the agricultural supply and service sector of the agricultural economy for which a basic knowledge of production agriculture is at least useful, if not essential. In Mississippi's secondary school vocational agriculture program, the instruction in basic principles of animal science, soil science, plant science, agricultural mechanics, etc., will be taught during the first and second years, or 9th and 10th grade vocational agriculture. (See diagram, page 21).

AGRICULTURAL SUPPLIES--SALES AND SERVICE OCCUPATIONS TRAINING PROGRAM IS A PART OF THE TOTAL CURRICULUM IN THE SECONDARY SCHOOL

The term agricultural supplies--sales and services as used herein refers to the industries and businesses which are oriented to supplying and servicing those engaged in production agriculture. There is a diversity of businesses and industries classified as being oriented to supplying and servicing farmers. Some of these are firms engaged in the manufacturing and distributing of feed; firms engaged in manufacturing and distributing fertilizers and agricultural chemicals; businesses engaged in supplying farmers with seed, small equipment, miscellaneous, supplies, etc.; and businesses which cater to providing custom service tocfarmers.

The instruction given will be vocational agriculture and will be an integral part of the students' curriculum leading to a secondary school diploma. As in the case of all vocational courses, there will be those who can not keep pace with regular high school standards and may be candidates for school drop-outs. For these individuals a special course may be organized on a lower level of training in agricultural supply--sales and service. Before taking action on such a course, check with the State Supervisor of Vocational Agriculture.

AGRICULTURAL SUPPLY--SALES AND SERVICE OCCUPATIONS JOB TITLES

The kinds of businesses and industries oriented to agriculture differ, and in many cases overlap with other firms. For example, one type of industry may be designated as feed manufacturing and that is exactly what the firm does. In the same area or elsewhere a firm may be advertised as a feed mill, and sell not only feed, but fertilizers, chemicals, etc.

Some of the more common occupational titles associated with agricultural supplies--sales and service are:

1. Product salesmen outside (in field).
2. Store sales clerk.
3. Serviceman for store, feedmill, fertilizer plant, etc.
4. Foreman in mill or plant.
5. Feedmill operator.
6. Plant worker in fertilizer and feed mill manufacturing firms.
7. Mechanics, welders, electricians, etc.
8. Store managers.
9. Quality control technician.

As in all occupational training, the level of achievement will be governed by persistence and ability of the individual. In this occupational area, many of these who finish high school, will find that they are prepared to and need to pursue more technical training in order to attain a higher level of competency.

COMPETENCIES REQUIRED TO SUCCEED IN AGRICULTURAL SUPPLY--SALES AND SERVICE OCCUPATIONS

1. Have an appreciation for and like this type of work.
2. Absolutely honest. (Some of these job titles require the handling of large sums of money).
3. Have a wholesome attitude toward service. Pleasing personality, etc.
4. Willing to work at many different activities.
5. Basic understanding of production agriculture.
6. Basic knowledge of and some skills in agricultural mechanics.
7. Understanding of and skills in business operation. (Recognition of profit philosophy).
8. Ability to appraise economic factors and their effect on businesses.

It is not reasonable to expect that all of those of secondary school age would be able to attain a high degree of competency in all responsibilities and areas of knowledge needed in this area of agriculture. In all probability individual differences in those enrolled in the vocational agriculture classes will take care of this.

SUPERVISED WORK EXPERIENCE

Those individuals enrolled in vocational agriculture and have some phase of agricultural supply--sales and service as their occupational objective will need work experience in the occupation for which they are preparing. In some schools this may be difficult due to lack of training centers. Unless on-the-job training centers can be provided for the students, this course should not be undertaken. However, the enterprising teacher of vocational agriculture will not let any opportunity to train his students pass.

Some suggestions of places where supervised work experience in this occupational area may be provided:

1. Feed mills.
2. Farm supply stores.
3. Federated cooperative stores.
4. Seed, feed and fertilizer dealers.
5. Fertilizer and agricultural chemical firms.
6. Farm services including:
    a. Artificial inseminator
    b. Auctioneer
    c. Country butcher
    d. Crop duster
    e. Custom farm machine worker
    f. Farm building repairman
    g. Mobile repair shop operator

Whenever any of the above occupations are available in the community, the vocational agriculture teacher should acquaint the owners or proprietors of the businesses with the vocational agriculture program and enlist their cooperation in providing work experience for those students who are interested. Perhaps some of the businesses can be used as cooperative training centers. (See section X for details).

COURSE OF STUDY FOR AGRICULTURAL SUPPLY--SALES AND SERVICE OCCUPATIONS

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
I. Exploring occupational opportunities in agricultural supply--sales and service.	1. Through investivation of existing conditions, student will determine kinds of employment available in agricultural supply--sales and service, including salaries, working conditions, etc.	X	X	X	X
	2. Through visitation with owners and proprietors, student will determine qualifications to enter employment on various levels of employment.	X	X	X	X
	3. Through classroom study and analysis, student will determine opportunities for growth in agrecultural supply--sales and service occupations. (Correlate with Section II, Area One, V. In Teachers Handbook.)	X	X	X	X
II. Understanding human relations in the area of agricultural supply--sales and service.	1. Through classroom study student will become familiar with different personality traits of people.	X	X	X	X
	2. Through work experience in some business firm or agricultural industry, determine to what extent the employees have to deal with the public.	X	X	X	X
	3. Through classroom study and work experience in Ag. business, Ag. industries, etc., student will develop ability to communicate effectively with prospective employers.	X	X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem Industry	Service Jobs
	4. Through interviews with owners, personnel directors, etc. or Ag. businesses and Ag. industries, student will determine what personal traits are desired in employees. Student will rate himself and a few volunteer members of the class on these traits.	X	X	X	X
	5. Through activities in student organizations, the student will develop personality traits which will be helpful in meeting and dealing with the public.	X	X	X	X
III. Understanding business procedures.	1. Through study and work experience in a business establishment, a student will develop an understanding of: A. Kinds of records kept in the business establishments. B. The importance of complete and accurate records in the efficient operation of a business. C. Kinds of sales tickets in use. D. The importance and use of credit in a business operation. E. Discount policies. F. Mark-ups for retail sale. G. Kinds of business forms used in ordering and receiving merchandise. H. Kinds of reports that have to be made to government and other agencies.	X	X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
	2. Through work experience in a business establishment, student will develop ability to: A. Make a business inventory. B. Receive and store merchandise properly. C. Properly mark items for sale. D. To keep business stocked properly. E. Ability to make sales ticket effectively.	X	X	X	X
IV. Agricultural salesmanship.	1. Through classroom study and observation of salesmen, student will learn: A. What attributes are possessed by good salesmen. B. The correct sales approach. C. How to handle customer complaints. D. What employers expect from their salesmen.	X	X	X	X
	2. Through work experience in a sales establishment, student will become proficient in selling.	X	X	X	X
V. The organization and functions of agricultural businesses.	1. Through classroom study and interviews with agricultural business managers, student will determine: A. How the various agricultural businesses are organized. B. Differences between private ownership, cooperative, and corporations. C. Functions performed by different types of agricultural businesses.	X	X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
VI. Feed businesses sales and services.	1. The student, through classroom study and work experience in a feed business developes: A. An understanding of the basic economics of a feed business and live-stock feeding programs. B. An understanding of live-stock feeds and their value. C. An understanding of basic animal nutrition. (If not adequately covered in years 1 and 2). D. The ability to formulate a grain ration for different kinds of livestock. E. An understanding of the different methods used to prepare feeds. F. An understanding of the methods used and trends in mechandizing feeds. G. An understanding of the regulations governing the formulating, labeling and using of feeds.	X	X		
VII. Fertilizers sales and service.	1. Through classroom study, interviews with agricultural leaders, students will determine: A. The economic importance of fertilizer in the area. B. The kinds of soils in the area and the common soil deficiencies. C. The fertilizer practices of farmers in the area.		X	X	X

		APPLICABLE TO TRAINEES WORKING IN			
AREA OF INSTRUCTION	TRAINING ACTIVITIES	Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
	D. The recommended fertilizer practice for the area. NOTE: Some of this should have been taught during first and second year vo-ag. If not, a study of basic principles of soil and fertilizers should be provided for here.				
	2. Through classroom study and work experience in a business establishment, student will become familiar with: A. How fertilizer is sold. B. Kinds of fertilizers commonly used, meaning of analysis, etc. C. How price is determined. D. How fertilizer is inventoried. E. Pricing procedure, margin of profit, discounts,etc. F. Kinds of records kept. G. With regulations governing the labeling of fertilizers. H. With methods and trends in merchandizing fertilizers.		X	X	X
VIII. Agricultural chemicals--sales and service	1. Through classroom study and work experience in an establishment where agricultural chemicals are sold, student will: A. Determine the economic importance of agricultural chemicals in modern agriculture.		X	X	X

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
	B. Develop ability to properly identify pests that are prevalent in the area and the damage done by each. (See teacher's handbook-Vocational Agriculture, Area Six, VI and VII.) NOTE: This subject matter is absolutely essential for this unit. If this subject matter has not been taught, it should be included here.)				
	C. Identify areas of responsibilities of the sales personnel in determining the correct pesticide used for different pests.				
	D. Determine the hazards in incorrect use of pesticides, and legal restrictions.				
	E. Determine the importance of correct application of pesticides.				
	F. Develop and understanding of the safe handling, storage, and use of all agricultural chemicals sold through the firm.				
	G. Develop ability to understand literature and labels pertaining to pesticides.				
	H. Develop ability to effectively merchandise agricultural chemicals.				

AREA OF INSTRUCTION	TRAINING ACTIVITIES	APPLICABLE TO TRAINEES WORKING IN			
		Feed Mill	Co-op or Farm Store	Ag.-Chem. Industry	Service Jobs
IX. Miscellaneous agricultural supplies-sales and service.	Around metropolitan areas there are opportunities for working in agricultural supply firms dealing with seed distribution for lawn, garden, small packaged fertilizers, small items of equipment, etc. Developing effective training activities for these should be approached in much the same manner as has been suggested under other occupations.				

SECTION VI

PROVIDING OCCUPATIONAL EXPERIENCES IN OFF-FARM AGRICULTURAL OCCUPATIONS IN VOCATIONAL AGRICULTURE

Schools, through programs of vocational education in agriculture, are charged with the responsibility for preparing students for gainful employment in all occupations involving knowledge and skills in agriculture. Traditionally, programs of vocational agriculture in the secondary schools have emphasized the importance of integrating classroom and laboratory instruction with supervised occupational experience. Over the years, it has been emphasized that classroom and laboratory instruction provide students with basic knowledge and skills needed to perform well on the job. But the competency in performing on the job is developed by work experience in a real-life situation. This has been true over the years and it must always remain so.

It is the consensus of all that some form of occupational experience appears to be vital in all programs preparing individuals for employment in off-farm agricultural occupations. The nature, amount, and complexity of such training will vary with the occupation involved. Programs at the junior or senior high school level will serve more as exploratory courses than post-high school programs. Following are some of the most important objectives of occupational experience programs.

1. To arouse in the student interest in one or more specific expanding and rewarding fields in agriculture.
2. To acquaint students with specific job titles or classifications in agricultural occupations.

3. To help students learn the various responsibilities associated with specific job titles in off-farm agricultural occupations.

4. To give students an opportunity to learn to get along with and work efficiently with employers.

5. To provide background training for students planning to enroll in an agricultural technical school or agricultural college for more technical training.

6. To provide students with some specific job skills and experiences needed in off-farm agricultural occupations.

7. To provide employers with employees who have had some training and experience for specific job responsibilities.

The extent to which these objectives will be met in a local situation will depend primarily upon the effectiveness of the administrator and instructor in planning and carrying out the program. A number of questions must be answered before satisfactory programs may be undertaken. The decision must be made in regard to who will provide the occupational experience and where it will be provided. Consideration must be given to the school, employer, labor, and other inter-relationships. The amount of time allotted to occupational experience must be determined. There are many legal questions that must be answered. Administrative policies must be worked out. Evaluative criteria and devices must be worked out. Lastly, since most teachers of vocational agriculture have had little or no experience in this type of endeavor, some in-service training needs must be met by workshop-type courses.

Who Shall Provide the Occupational Experience?

The occupational experience provided at the high school level in the main must be provided outside the high school in the place of business or industry. It is assumed that many understandings and abilities will be developed in advance of the experience training period in the high school or developed in the high school at the time that the student is obtaining employment experience.

It is the consensus of most vocational educators that carefully selected personnel of agricultural businesses and industries will have the major responsibility of providing occupational experience. These individuals must be selected very carefully. Not all applicants for this type of training will profit from the training. The applications of some should be rejected. Not all employers, managers, or supervisors of these businesses and industries have potential as teachers. The success of the program will depend upon the ability of the administrators and teachers to bring together business and industrial personnel who have the ability to teach and students with the interest, desire, and need for training. Perhaps a few sessions with personnel of industries and businesses who are to work with trainees in their firms would need a few sessions in effective teaching techniques.

Businesses and industries selected to provide occupational experience should have a physical plant, personnel, safety regulations, labor relationships, and employment possibilities necessary to reach the objectives outlined for the program. Pilot studies indicate that facilities and personnel are available in most communities for many learning situations. The instructors of vocational agriculture in extremely small schools and communities may find it necessary to transport students to neighboring cities for the experiences. To do this means special scheduling of classes, and may be the most difficult phase of providing experience.

Interrelationships Between School, Employers, Labor, and Student.

While the public school will assume major responsibility in initiating and conducting the training program, it is very important that prospective employers, labor leaders, and others involved in the program have a part in the planning and developing of the program. Policies concerning the conditions under which the trainee will be working must be agreed upon by all persons concerned. In most cases it appears logical to use an advisory committee or council in developing desirable interrelationships.

In certain occupations the experiences are both agricultural and trade related. It is important that trade and industry personnel be involved in the planning and coordinating of these programs. In other occupations, the experiences, while agricultural, are also related to business, or with distributive occupations. Representatives of these educational services should be participants on an advisory council or other means provided for participation of trade and industry, distributive education, and business personnel in the planning and conducting of the experienced program.

Amount of Time for Occupational Experience.

Occupational experience programs at the high-school level largely for exploratory purposes will require much less experienced time than programs at the post-high school level which lead directly to the establishment of students in specific and perhaps complex occupations. The allocation of time should be determined after careful consideration of the objectives outlined for the program. It is possible that one semester of time may be sufficient for certain students' work experience while in training, but others will need the equivalent of one-half time devoted to work experience for the two-year period. The allotment of time cannot be done until the complete program has been planned and the specific objectives have been determined and subdivided by interests, attitudes, understandings, skills, and abilities to be attained. Sufficient time should be allotted for occupational work experience, but care should be taken to avoid unnecessary repetition or dull routine activities which have no training value. The Mississippi State Plan requires that cooperative work experience programs be developed for non-farm occupations related to agriculture, and the time devoted to occupational work experience shall not be less than that devoted to the in-school vocational instruction.

The question arises as to whether the training should be provided in one business or industry or in two or more locations. Where wide differences exist in responsibilities, it may not be advisable for trainees to receive experience in more than one location. Continuity of the training program, however, is facilitated by having the program in one location, and under one instructor. It may be necessary to increase the allotment of time in case the experience is to be had in more than one location.

Wide variations in the amounts of time allotted to occupational experience are found among post-high school programs. In some cases arrangements are made to have the students in the classrooms for a half-day period and approved agricultural businesses and industries during the remaining half-day period. In some cases the formal classroom work is completed during one semester and the students are placed with businesses and industries for full-time employment during the second semester. The plan is repeated in case of two-year programs. Since the complexity of the occupation determines the amount of time to be allotted for employment training, it is important that each individual occupation be considered and evaluated separately. The lack of uniformity among training programs from the standpoint of allotment of time for occupational experiences may be an asset rather than a liability.

Legal Aspects.

There are federal and state laws concerning labor that must be considered in planning occupational experience programs in certain kinds of businesses and industries. Most states have child labor laws. (See Appendix A.)

Those agricultural occupations that are closely related to trade organizations or trade unions must be coordinated so that occupational experiences would be provided in such a manner to meet the standards of organizations involved.

In some cases, it will be necessary to have the licensing of wage earners. It is not likely that trainees will need to be licensed. They, however, should become familiar with the process.

Each wage earner will need to obtain a social security number and report this number to his employer. In most cases the employer must also withhold social security and income tax payments.

Workmen's compensation laws provide for some income protection for workers during periods of unemployment and for workers who are injured. It is important that employers as well as trainees are familiar with the provisions of these laws.

Since the trainees will be employed outside the school facilities and in many cases will be transported from the school to the places of employment, certain legal questions may arise concerning responsibility in case of accident of individuals going to or coming from employment. There may be questions also concerning the status of insurance purchased by the school or by the student, as applied to students who are engaged in occupational experience programs.

Administration of Occupational Experience Programs.

The administrative setup will vary greatly with the size of the school district and the number of occupational experience programs sponsored. In large high schools, a director of vocational education may be directly responsible to the superintendent and school board for the administration of the occupational experience program in off-farm agricultural occupations. He, in turn, may delegate certain responsibilities to a coordinator of occupational experience programs, or to the teacher of vocational agriculture or both. In some cases the distributive education, trade and industry, and vocational agriculture coordinators may administer the program jointly. As mentioned previously, it would be very desirable to have an advisory committee or council to serve in providing advice related to policies and program development. In most schools in Mississippi for the present, the regular vocational agriculture teacher will have this responsibility.

The number of trainees should be limited to the demand for persons in the occupations available and to persons who are most likely to qualify for placement in the available occupations. In some cases, a selection committee may be advisable. In other cases, a teacher of vocational agriculture may assume this responsibility. While in other cases, the trade and industry, distributive education, and/or business education personnel may jointly make the selection.

Carefully designed job-operation sheets, carefully selected texts, and training outlines should be made available during the occupational experience period of the training. Some competencies may be developed in the school at the same time the individual is developing other competencies in the place of agricultural business and agricultural industry. The program should be conducted in such a manner that a student at all times will be cognizant of the progress that he is making and the opportunities that lie ahead.

A very important function of administration will be the providing of on-job supervision. Periodic visits to the training station to coordinate the related class instruction; to evaluate training progress; to improve relationships between the school and the coordinator; and to develop better on-job training must be provided for. In some occupations, this supervision may logically be done by the vocational agriculture instructor. In other occupations, all or part of the supervisory visits may be made by the coordinator for occupational experience programs or by instructors in trade and industry, or distributive education. In most cases the teacher of vocational agriculture is best qualified to do this job. In other cases, however, it will be advantageous to use the services of personnel in other areas of vocational education.

One visit per week may be a desirable goal. In some cases, visits may be necessary more often, particularly if problems between the trainee and the employer arise. In most cases, visits made at two-week intervals are sufficient for most training programs. The more efficient the instructor in the place of business is, the less often supervisory visits may be needed by the school personnel. The amount of time allotted for each visit will vary greatly with the type of training station, the competence of the instructor, and the competence of the trainee.

Sufficient time should be available for the vocational agriculture instructor or other supervisory personnel to evaluate the job that the individual is doing and to help the trainee in the solution of problems that exist. Some time should be available for use in developing relationship between the school and the employer. The supervisor should inspire both the cooperating teacher in the employing establishment and the trainee. The supervisory visits should provide inspiration to the vocational agriculture instructor also.

Careful records should be kept by both the student and the employer of the progress of the trainee. These records should involve not only a record of time arrival, time of leaving the business, total hours of employment, specific jobs completed, but also some measure of the quality of work done by the trainee. The French-Bray Printing Company publication, "Records of Supervised [illegible] [illegible]

Occupational Experience and Training in Vocational Agriculture", has much potential for student use or may serve as a guide in developing a record book for use in our State. A recent publication by Interstate Printers and Publishers of Danville, Illinois entitled "A Study Guide for Placement Employment Programs in Agricultural Businesses and Industry" also has much potential. These publications or other publications developed to meet our specific needs will aid materially in administering and implementing the occupational experience program.

Evaluation.

Evaluation is very important in all educational programs. It is especially important in agricultural occupational experience programs since in most cases, the programs being established are in a sense pilot programs. We have had very little experience in evaluating this type of training in vocational agriculture. As a result, we will need to evaluate carefully these programs as they are being conducted so that changes can be made to make them more effective. Evaluative instruments will need to be developed in order to have evaluations of the program made by the cooperating employers, the students, the administrators, and perhaps by members of the advisory committee. Evaluative criteria established should be in line with the objectives of the program. Instruments can be developed to determine the extent to which each of the interests, attitudes, understandings, skills, and abilities are developed by the trainee. In part, the evaluation of the program can best be made in terms of the percentage of the trainees who complete the course and the occupational training of the effectiveness of the program would involve the success and progress of these trainees in their new position.

Evaluation must be done continuously. The vocational agriculture [illegible] instructor will need to maintain a close follow-up of the individuals who finish over a period of years.

In addition to evaluation of the effectiveness of the program in the training of prospective employees, evaluation needs to be made of the specific methods and procedures used in conducting the agricultural occupational training program. The amount, length, and type of experiences included in the program should be evaluated as well as the use of team teaching. The question of course content in vocational agriculture one, two, and three should be answered. Information concerning the possibilities of having farm and non-farm trainees in the same classes should be determined. The FFA program of work, as related to the occupational experience program must be carefully evaluated. In communities where the major objective of vocational agriculture will be to prepare individuals as workers in production agriculture, the effect of the occupational experience program on the preparation of students for this phase of agriculture should be carefully evaluated. Factors causing enrollment to increase or decrease should be determined as well as factors related to drop-outs of students who enroll. Careful evaluation will need to be made concerning the effectiveness of advisory committies and councils.

SECTION VII

TEACHING RELATED INSTRUCTION

Related instruction will be of two types: A core of common general related instruction which will be presented to all students regardless of the occupation in which they are working, and instruction related to each specific job on which the different students will be working.

In the teaching of general related instruction all the various methods and techniques common to the teaching of regular vocational agriculture may be used. Following is a list of possible topics that could be taught in the core of common general related instruction. In most instances additional topics will be covered.

1. Becoming familiar with the agricultural occupations training program.
2. Determining the importance of agriculture in the community.
3. Choosing a career.
4. Applying for a job.
5. Developing desirable personal traits.
6. Parliamentary procedure.
7. Budgeting your income.
8. Saving and investing.
9. Taxes.
10. Labor Unions.
11. Employer-employee relationships.
12. Your personality.

13. Business forms and documents.

14. Social and business etiquette.

15. Business ethics.

16. Social security, income tax, witholding, fringe benefits, etc.

The <u>specific related instruction</u> has to do with the information and knowledge needed for competency in skilled occupations. Since each student will be covering different material involving different occupations, group teaching techniques may be more difficult to employ. Individualized instruction must be used more frequently so that the needs of each student can be met. Most of this will done through individualized supervised study. Since vocational agriculture instructors are familiar with the use of this technique, no further explanation is needed.

The material which a trainee studies during the specific related instructional period will be determined from the training plan and should be correlated with the on-the-job work in which the student is engaged.

A student study guide should be developed for each occupation in which training is offered. In some cases these have been developed by other states and are available for a nominal fee. Perhaps the best source for training program guides is "The Center for Research and Leadership Development in Vocational and Technical Education," The Ohio State University, 980 Kinnear Road, Columbus, Ohio 43212.

The trainee study guide should contain key questions, problems and other assignments to enable the trainee to become familiar with the information which the training plan lists as being pertinent to the on-the-job training. The study guide should also list the references and, in some cases, present basic information so that the trainee may comprehend the material by working on an individual study basis.

DEVELOPING TRAINING PLANS FOR COOPERATIVE OCCUPATIONAL EDUCATION PROGRAMS

The employment of a student in a job does not necessarily insure that the student will receive training and that the experience will be educational in nature. A desirable cooperative occupational experience program consists of deliberate efforts to prepare a student for specific job competence. It includes a direct progression of job experiences, operations, or processes. The vocational agriculture teacher-coordinator has the responsibility of seeing that the work accomplished by students placed in cooperative-occupational experience programs is educational in nature and not mere work experience. To insure that the student's on-the-job experience will be truly educational, a training plan must be developed.

The training plan consists of a listing of the activities in which the student should be engaged while working at the training station. Opposite this there should be a listing of the subject matter that should be dealt with in the related instruction at school. Space is provided so that a record of progress can be kept of the on-the-job experiences and a grade or completion mark can be recorded for the related instruction. All activities considered essential to the occupational training should be included in the training plan.

Purpose and value of training plans

The primary purpose in developing a training plan is to determine in advance of the training program what activities the student is to participate in while on the job. This then serves as a guide to those involved in the training to see that these experiences are provided. The vocational agriculture teacher coordinator and employer should refer to the training plan frequently, making certain that the student-learner is receiving the experiences previously agreed upon.

The training plan is especially valuable to the teacher-coordinator. It enables him to understand job requirements and specifications; to determine the value of a training station; to help select students for specific occupations; and to compare the proposed on-the-job experiences with those actually being practiced.

Through the training plan the trainee knows what will be expected of him. He can then better understand the objectives and scope of his chosen occupation.

Training plans remind employers of the breadth and depth of training that is to be provided the trainee. It is also most valuable to an employer to know what related instruction is being provided for the trainee at the school.

Developing individual training plans

A training plan should be developed for each student placed in cooperative occupational experience. This plan should be based upon the ability of the student, the type of occupation, the conditions at the training station, and the length of the occupational experience period.

Training plans should be developed cooperatively between the teacher-coordinator and the employer. In some cases, experience may be gained by students in occupations which are not completely familiar to the teacher-coordinator. The necessary information should be obtained through personal interviews with the employer or the person responsible for the on-the-job instruction. When developing training plans, the following procedures should be kept in mind:

1. Thoroughly explain the need and value of training plans before involving the employer in their development.
2. Let the employer look at samples of training plans which have been completed.
3. Do not expect the employer to prepare the actual plan. The teacher-coordinator should assume the responsibility for the preparation of the final plan after suggestions and recommendations have been made by the employer.

Some examples of training plans for farm tractors and farm machinery job titles are shown on pages 76-81.

FARM TRACTORS AND MACHINERY AREAS OF OFF-FARM AGRICULTURAL OCCUPATIONS

PLANNING AN ACTIVITY PROGRAM FOR DIFFERENT JOB TITLES

JOB TITLE: Mechanics Helper

A. Outline of instruction to be given in school.

1. Basic principles of internal combustion engines.
2. Fuel system, basic components and function.
3. Lubrication and its essentials.
4. Functions and parts of cooling systems.
5. Basic principles of the electrical system.
6. Basic principles of welding.
    a. Gas
    B. Electric
7. Shop safety.
8. Identification and use of hand tools.
9. Disaasemble and clean parts to be overhauled.

B. Outline of instruction to be given in the business establishment.

1. Identify, recognize, and observe component parts of the engine and their functions.
2. Observe construction and operation of the engine.
3. Servicing air cleaner.
4. Clean and adjust carburetor.
5. Check and service fuel lines.
6. Flush crank case.
7. Service oil filter.
8. Selection of lubricants and use.
9. Flushing and cleaning radiator.
10. Adjust and replace fan belt.
11. Selection of coolant and use.
12. Check for leaks and repair.
13. Check thermostat.
14. Adjustment, maintenance, and repair of small gasoline engines.
15. Welding
    a. Gas
    b. Electric
16. Practice shop safety.
17. Clean, store, and proper use of handtools.

JOB TITLE: Utility Man

A. Outline of instruction to be given in school.

1. Importance of clean working conditions.
2. Importance of good personal appearance.
3. Hand-tool identification and correct use.
4. Preparation and cleaning of equipment for major overhaul.
5. Importance of the appearance of the building and grounds.

6. Shop safety.
7. Basic fundamentals of welding.
   a. Gas
   b. Electric

B. Outline of instruction to be given in the business establishment.

1. Clean building and working area.
2. Dress appropriately for work.
3. Clean and store handtools in proper place.
4. Steam clean tractors and equipment.
5. Care for grounds and outside equipment.
6. Clean and arrange equipment on display.
7. Practice safety.
8. Welding simple jobs.
   a. Gas
   b. Electric

JOB TITLE: Set-up and Delivery Man

A. Outline of instruction to be given in school.

1. Interpretation of set-up diagrams and set-up manuals.
2. Importance of proper delivery.
   a. Contact with customer and importance.
   b. Effective communication.
3. Hand-tool identification and use.
4. Selection and use of proper lubricants.
5. Importance of proper tire inflation.
   a. Air.
   b. Liquid.
6. Shop safety.
7. Basic fundamentals of welding.
   a. Gas
   b. Electric

B. Outline of instruction to be given in business establishments.

1. Use set-up manual in setting up equipment.
2. Proper assembly.
   a. Double check all bolts, cotter pins, etc. for secureness.
3. Make delivery with proper instructions.
4. Use hand-tools properly
   a. Clean and store hand-tools properly
5. Refer to operator's manual for checking the following:
   a. Crankcase oil
   b. Front-wheel grease
   c. Transmission and differential grease
   d. Hydraulic system oil
   3. Check and service air cleaner
6. Check tires for proper inflation.
7. Practice safety.

8. Welding
    a. Gas
    b. Electric

JOB TITLE: Mechanic

A. Outline of instruction to be given in school.

1. Basic principles of internal combustion engines.
2. Fuel system and basic components and function.
3. Lubrication and its essentials.
4. Functions and parts of cooling system.
5. Functions and parts of electrical system.
6. Functions and breaddown of geartrain.
7. Proper adjustment of brakes.
8. Proper adjustment of clutch.
9. Welding.
    a. Gas
    b. Electric
10. Shop safety.

B. Outline of instruction to be given in business establishment.

1. Completely overhaul one engine.
2. Check clutch assembly and overhaul.
3. Check and repair or install cooling system.
4. Check electrical system, repair and install.
    a. Generator
    b. Starter
    c. Battery
    d. Distributor
    e. Voltage regulator
    f. Wiring layout.
5. Check and install spark plugs and wires.
6. Check and replace coil.
7. Clean, check, and install fuel system.
8. Clean, service, and install air cleaner.
9. Check transmission and differential, replace parts, etc.
    a. Bearing wear
    b. Gear wear
    c. Check and repair brakes
10. Replace oil and grease according to operator's manual.
    a. Front wheels
    b. Crank case
    c. Transmission
    d. Hydnaulic system
    e. Rear axle bearing and seals
11. Check and reapir hydraulic system.
12. Welding.
    a. Gas
    b. Electric
13. Practice safety.

JOB TITLE: Shop Foreman and Assistant Shop Foreman

A. Outline of instruction to be given in school.

1. Acquaint student with working knowledge of the following:
    a. Utility engineer
    b. Set-up man and delivery
    c. Mechanic trainee
    d. Mechanic
2. Importance of service to the customer.
3. Importance of making work order.
4. Importance of supervision to all shop personnel.
5. Importance of planning and organizing jobs.
6. Importance of acquiring knowledge of the operating policies of the business.

B. Outline of instruction to be given in business establishment.

1. Meet customer and make job order.
2. Scheduling of work for all personnel.
3. Practice and promote safety.
4. See that jobs are completed on schedule.
5. Check all completed jobs before delivery is made to customer.
6. Be a good service salesman.

JOB TITLE: Parts Trainee

A. Outline of instruction to be given in school.

1. Importance of clean and orderly working conditions.
2. Importance of good personal appearance.
3. Importance of quick and efficient service to customer.
4. Importance of parts inventory.
5. Importance of knowledge of parts and correlated parts.
6. Importance and use of parts book and price book.
7. Importance of writing legibly.
8. Be honest.

B. Outline of instruction to be given in business establishment.

1. Keep parts and area clean and orderly.
2. Dress appropriately.
3. Give quick and efficient service.
4. Keep inventory of parts and order as needed.
5. Learn to use parts and price book.
6. Make display of fast-moving parts.
7. Check incoming parts and properly store.
8. Check and order parts ahead of seasonal work.
9. Make all tickets legibly.
10. Practice honesty.

JOB TITLE: Parts Man

A. Outline of instruction to be given in school.

1. Acquaint student with same knowledge as parts trainee.
2. Importance of a correct inventory.
3. Importance of work experience.
4. Importance of training trainee.
5. Importance of reporting customer complaints.
6. Importance of assuming all responsibilities.
7. Honesty.

B. Outline of instructions to be given in the business establishment.

1. Responsible for keeping parts and area clean and orderly.
2. Responsible for quick and efficient service.
3. Responsible for adequate inventory.
4. Responsible for correct use of parts and price book.
5. Responsible for advertising and displaying parts to increase sales.
6. Responsible for all parts orders.
7. Responsible for parts sales and receipts.
8. Maintain good public relations.
9. Practice safety.
10. Practice honesty.

JOB TITLE: Sales Trainee and Salesman

A. Outline of instruction to be given in school

1. Importance of personal appearance.
2. Importance of knowledge of product.
3. Importance of knowledge of adaptability of equipment to a farm.
4. Importance of evaluating farmer's present machinery inventory.
5. Importance of keeping prospect list up-to-date.
6. Importance of staying in touch with the farmers.
7. Importance of quality prospects.
8. Importance of mechanical background.
9. Importance of salesman and other employees relationship.
10. Importance of price quotation to prospective buyer.
11. Importance of salesmen and owner relationship.
12. Importance of personal qualifications.
    a. Honesty and dependability
    b. Leadership
    c. Self-control
    d. Business-like attitude
    e. Service minded

B. Outline of instruction to be given in business establishment.

1. Dress appropriate.
2. Know the products to be sold.
3. Work with experienced personnel to observe equipment for proper adaptation.
4. Make inventory of equipment on several farms.

5. Make prospect list and keep up-to-date.
6. Make visits to farmers periodically.
7. Observe all prospects and their financial responsibility.
8. Improve mechanical knowledge.
9. Maintain good relationship with owner.
10. Study and keep up-to-date on price books.
11. Observe and practice these quality traits:
    a. Honesty and dependability
    b. Leadership
    c. Self-control
    d. Business-like attitude.
    e. Service minded.

SECTION VIII

SELECTING TRAINING STATIONS FOR COOPERATIVE WORK EXPERIENCE

One of the most important factors in determining the success of the cooperative work experience program is the adequacy of the training station at which a student is placed for on-the-job instruction and experience. It is imperative, therefore, that definite consideration be given to the selection of training stations before students are placed for occupational experience. The survey of the agricultural businesses and firms in the community, explained earlier, should provide a good list of possible training stations. Information gained from the personal interviews or knowledge already possessed by the vocational agriculture teacher-coordinator and consulting committee members should provide sufficient basis for determining whether possbile training stations meet the desired criteria.

Criteria for Selecting Training Stations

The following items should be used as criteria in selecting training stations:

1. Type of occupation. The training station should provide experience in an occupation that requires some knowledge, understanding, and skill in agricultural subjects.
2. Opportunities for rotation. The training station should provide a wide variety of experiences associated with the occupation for which the student is training. It should not ne just a routine work experience of a repetitive nature.

3. On-the-job supervision. The training station should provide someone capable of serving as an on-the-job instructor. This should be someone who is thoroughly competent in the skills and technical aspects of the occupation. He should be someone who is interested in the program and who will enjoy cooperating in the training program.

4. Working conditions. The working conditions of training stations should be safe and clean, with a good record of accident prevention. It should also present few, if any, conditions that might impair the health of the workers.

5. Reputation. The training station personnel should have a good reputation and be respected by the community as reliable business people. It should be a business that the community is glad to have within its boundaries.

6. Business climate. The personnel in the training station should use ethical business practices and leave a favorable impression with the student. The firm should have a record of participation in civic affairs, and a favorable attitude toward the welfare of its employees.

7. Stability of employment. The training station should have a reputation of continuous operation. It should have a record of few or no lay-offs, lock-outs, close-downs, or extensive periods of curtailment.

8. Hours of employment. The training station should be able to provide for a sufficient number of training hours at a time which is conducive to the employment of student workers.

9. Facilities and equipment. In order to provide adequate training, the training stations should possess adequate facilities and equipment and use up-to-date methods.

10. Employer-employee relationship. The training station should maintain a good employer-employee relationship. Firms that make it a policy to train

and promote their own personnel score high on this point.

11. Accessibility. Training stations should be within a reasonable distance from the school or accessible to the trainee. In some cases, the training station may be outside the normal limits of the school area if the student has adequate transportation to and from work, and the training station rates high on other factors. In some cases where students are attending area schools, they can be placed in their local community for occupational experience.

12. Wages. The training station should be able to pay a minimum wage for student workers based on that paid other employees of similar experiences and training. Wages of regular employees should be at least comparable to those paid in similar occupations in the community.

Training Station Check Sheet

The final selection of training stations can be facilitated by the use of a check sheet. The purpose of this sheet is to obtain a comparative rating of possible training stations. This sheet should list criteria to be considered when making the selection. The consulting committee can be very helpful in completing the check sheets on the different firms.

Careful consideration should be given to each item on the check sheet. Any unusual situations should be listed at the bottom of the sheet under "Remarks." If a prospective training station is not selected, the reasons may be listed in this space and relayed to the employer. This may help correct deficiencies in the prospective training station so that it may be used in the future if needed.

(An example of a training station check sheet is shown in Appendix D.)
(An example of a cooperating employer appraisal is shown in Appendix E.)

SECTION IX

SELECTION OF STUDENTS FOR PLACEMENT IN TRAINING STATIONS

It must be realized that the student is the most important element in a cooperative occupational experience program. Much of the success of the program will depend upon the calibre of the students enrolled. Students termed "of high calibre" do not necessarily mean those with outstanding grades, but refers to those students who possess the aptitude and qualifications required for success in a given occupation. The objectives of this program can be attained only when the student is capable and desires to receive training. There may be a tendency among some educators to gear the program toward students with low academic and occupational abilities, while the training for many occupations to be entered requires students to have desirable personal traits and above-average aptitudes.

With the above considerations in mind, the need for a sound system for screening and selecting students besomes evident. The vocational agriculture teacher-coordinator should plan a system that utilizes numerous activities and procedures in selecting students.

Procedures for Selecting Students

The following steps are suggested as a guide to follow in the selection of students:

1. Make a general announcement concerning the program to all eligible students at least two months before pre-registration for courses.
2. Have all interested students complete an "application for enrollment form." A sample form is shown in Appendix F.

3. Make arrangements with the school counselor to obtain various test scores and other confidential information that is not reported on the application form.
4. If sufficient tests have not been administered, the teacher-coordinator may wish to administer commercial tests or in some cases special interest surveys. These can determine the student's interest and abilities in specialized areas such as sales and mechanics. Contact your school guidance counselor for obtaining this type of information.
5. In most cases the teacher-coordinator will be familiar with the personal characteristics of possbile stydents, since he would most likely have them in previous vocational agriculture classes. In some cases, however, the teacher-coordinator may have very little contact with interested students. If this be the case, it may be advantageous to have other teachers more familiar with the student, evaluate the personal characteristics of the student. A sample teacher's rating form is shown in Appendix G.
6. Record the information obtained from the previoux steps on a "Student Information Sheet." (See Appendix H.)
7. Interview each candidate personally. This will help obtain information that has not been obtained in any of the precious steps.

Criteria for Selecting Students

After the above steps have been completed, sufficient information should be available to make a final selection. The following criteria are suggested as possible points to be kept in mind when selecting students.

Occupational objectives. Students selected should have an interest in agricultural occupations for which the training program is designed, and in which adequate training stations will be available.

Parents' approval. Students selected should have their parents' approval to participate in the program.

Ability and willingness to work. Students selected should have demonstrated that they are able and willing to work.

Age. Most states have minimum age laws (usually 16) and, therefore, this must be considered when students are selected. Students selected should be able to meet the age requirements specified by local, state, and federal labor laws. (See Appendix A.)

Scholarship. Students selected should have done well in school subjects related to the occupation in which they will be trained.

Attendance records. Students selected should have a minimum number of absences and tardinesses on their school records.

Hours available for work. Students selected should be able to work the minimum required hours per week for the total training period.

Transportation. Students selected should be able to have transportation to and from their training station.

Handicaps. Students selected should not possess any handicaps which would prevent them from being hired by any employers in the available training stations.

Personal characteristics. Students selected should have desirable personal characteristics. This would include such items as character, loyalty, initiative, attitude, and personality.

Placement of Trainees in Training Stations

Perhaps the placement of qualified trainees in selected training stations is a rewarding climax to the vocational agriculture teacher's effort up to this time.

After a list of qualified trainees and suitable training stations have been made, the next important step is matching trainees to jobs for the most effective training. It is believed that the final selection of the trainee for a particular training station should be made by the employer. However, there are certain things that the teacher-coordinator can do to assist in getting trainees properly placed in desirable training station, these are:

1. Give the qualified trainees instruction on job classifications, employer-employee relations and procedure in applying for job.
2. Rate the eligible trainees for suitability for each particular job.
3. Give the list to the proper employer and let him select the students he wants to interview.
4. If some jobs require an application form, guide the student in completing this form, but let the student gain the experience of actually completing such a form.
5. In some cases, the teacher-coordinator may wish to go with the student and introduce him to the employer. However, this depends upon the individual student. The teacher-coordinator may wish to go with the student and introduce him to the employer. However, this depends upon the individual student. The teacher-coordinator from his knowledge of the student should know whether to use this procedure or not.
6. After the employer has had an opportunity to interview the students, the teacher-coordinator should assist him in his selection by furnishing him all the information available about each student being considered. This can best be done by letting him review the Student Information Sheet. The teacher-coordinator should refrain from giving his personal recommendations or arbitrarily assigning a trainee to a training center. Remember, the final selection of the trainee should be made by the employer, unless circumstances are such that a cooperative arrangement be worked out for selecting trainees for certain establishments.

PLACEMENT OF STUDENTS IN TRAINING STATIONS

A concerted effort should be exerted by the vocational agriculture teacher-coordinator to insure that the interest of both the student and the employer is considered when placing a student in a training station. Also parents should show their interest.

One mistake the teacher-coordinator should avoid is arbitrarily assigning a student to a training station without involving the employer. Past experiences of some have shown that this may lead to an undesirable situation. First of all, students do not receive the actual experience of applying for a job under realistic circumstances, and secondly, if for some reason the student does not do well at the training station, the teacher-coordinator must assume full responsibility.

When Should Students be Placed?

Due to the variety of programs which offer training in off-farm agricultural occupations, it is difficult to say when students should be placed in cooperative occupational experience programs. Some students will need to be placed in the summer before entering a class where related instruction is to be offered, while others will need to be in the class for a considerable period of time before they are placed in on-the-job training.

Although it is sometimes difficult to accompolish, students should receive formal instruction in as many areas as possible before they are placed for cooperative occupational experience. The type of employment will determine to some extent the previous instruction needed. For most occupations it is desirable for students to be acquainted with the procedures of applying for a job, employer-employee relations, and a general knowledge of the nature and scope of the occupation for which they are preparing before they begin their on-the-job experience.

How Should Students Be Placed?

Although there are no definite procedures in placing students in training stations, there are certain practices that should be followed. The following practices are recommended as desirable procedures for the teacher-coordinator use:

1. Have more than one student apply for a job at a training station. This will enable the employer to have a choice and it will enable students to encounter a more realistic situation in that he knows that he is competing for a position. Fair competition is the "spice of life."
2. Have the student write a letter of application. This gives practical experience to the student and at the same time enables the employer to determine if he wants to give the student's application further consideration by having him complete an application form or attend a personal interview. An example of a student's letter of application is shown on page 92..
3. Help the student complete the application forms that the employer requires. If the employer does not require application forms, the teacher-coordinator may construct a sample form which students may complete for practical experience. These forms plus a personal data sheet may be given to an employer if he requires information in addition to that obtained during an interview. An example of an application form is shown in Appendix I. An example of a personal data form is shown in Appendix J.
4. Ask the employer to conduct a personal interview with those students that meet his minimum requirements. This is excellent experience for the student and it enables the employer to determine which student he feels is best suited for the position available. Some specific helps concerning student-employer interviews are found on pages 93 and 94.
5. As pointed out before, the final selection of the student to be placed in the training station should be made by the employer. This will enable the employer to have the same freedom and responsibility in the hiring of student-learners as for a regular employee. In many cases

the employer works directly with the teacher-coordinator in that the teacher-coordinator will supply information concerning the students if the employer so desires.

6. If a student is not selected for a job in one training station, he should then apply at another approved station which can provide training in an occupation that is available. This being realistic to live situations.

_______________ High School
Vocational Agriculture Department

(Sample Letter of Application)

Box 100
Farmville, U. S. A.
September 20, 1965

Mr. John McAhee, Manager
Brown Farm Implement Co.
340 Main Street
Farmville, U. S. A.

Dear Mr. McAhee:

Mr. Andrews, vocational agriculture teacher-coordinator at Farmville High School, has informed me of a vacancy in the teacher and machinery parts department of your firm. I would like to submit my name for consideration for this position.

At present, I am a student enrolled in the vocational agriculture occupations training program at Farmville High School and, therefore, will be availabl for employment after 2:00 p. m. on school days, and the entire day on Saturdays and during the summer. I do not plan to go to college, and I plan to seek full-time employment in an agricultural firm when I graduate.

I have lived and worked on a farm all my life. Last summer I worked in the parts division of the Farmville Tractor and Equipment Co. I have served as secretary of the local FFA Chapter and scholastically, I rank in the upper fourth of my high school class.

I am interested in a career in agricultural machinery sales and recognize the value of being associated with a firm of your reputation. I would appreciate a personal interview with you at your earliest convenience so you may become better acquainted with my qualifications. I will be available for an interview after 2:00 p. m. on school days and any time on Saturdays.

I may be contacted at the above address or through Mr. Andrews at the high school. I am looking forward to your reply.

Sincerely,

John Jones

Some Helps Regarding Interviews*

The following is a sample of the type of information the teacher can give to help prepare students for interviews.

Planning the interview

Planning for a successful interview usually begins long before the interview. After the trainee knows the firm where he is to get his work experience, he is in a position to do a little research. He should find out where the company is located, who the manager is, what the company sells (including "brand name" products), its policies and organization. The trainee should ask himself how he can fit into the firm best.

The teacher should emphasize the following in talking with the trainee about interviews. Before you leave for the interview, check your personal appearance. Dress smartly and neatly. Above all, be clean. Carry with you a portfolio or references and your personal data sheet.

When you enter the interview office, smile, and act naturally. The interviewer is interested in the real you. He will usually be an experienced person and will take the initiative throughout the interview. If he gives you a chance, offer special information about your interests and desires and your interest in the firm. Ask questions. Show interest and aggressiveness.

Before the interview

The following questions should be answered by the trainee before the interview:

1. What kind of training do you really want?
2. Where can you go to find such training?
3. What qualifications are necessary to obtain such training?
4. Does the firm hire persons without experiences for the kind of job

---

*Adapted from the material for conducting pilot programs in off-farm agricultural occupations in Kentucky.

5. How can you best get the kind of experience you need?

6. What do you know about the firm?

7. Who is the one who does the employing?

8. Are you positive on the training you want?

9. What kind of clothes should you wear for the interview?

10. What references should you carry with you to the interview?

11. Why is it important to arrive on time for your interview?

12. Where is the exact location the interview will take place?

During the interview

The trainee should keep the following questions in mind and know what to do when the interview takes place:

1. Should you shake hands with the interviewer?
2. Should you smile?
3. If you are introduced to the interviewer, what should you say?
4. Should you sit down immediately?
5. How should you sit?
6. Where should you put your materials that you have carried with you?
7. If the interviewer sits waiting for you to speak, what should you say?
8. If the interviewer asks questions, how should you reply?
9. If the interviewer makes no offer of a training position, what should you do?
10. If the interviewer makes an offer of a training position, what questions should you ask?

After the interview

Every interview should be followed with a letter of appreciation, thanking the interviewer for his consideration and reaffirming your desire to have the training position. The follow-up letter may express your interest in the company, its products, or the kind of work involved. Remember that a prospective employer has more to decide than whether or not the applicant will fit in with his firm; he must decide who will fit the job best.

YOU MUST STAND OUT FROM THE REST. This fact alone should be enough to convince you that you must be "on your toes" and sell yourself every minute of the time you spend with a prospective employer. Remember that you are not only competing with other applicants, but you are also competing with the standards of quality that every firm establishes.

SECTION X

SUMMARY COOPERATIVE OCCUPATIONAL EDUCATION IN AGRICULTURE

1. Age of Trainees

The trainees must be 16 years of age or older to meet the requirements of labor laws for many occupations. Trainees who will be 16 during the first 6 weeks after the beginning of school may be enrolled. They can not, however, be employed under a student-learner certificate until they are 16 years of age. (See Appendix A and B.)

2. Hours of Training

Trainees employed in occupations governed by the U. S. Fair Labor Standards Act may spend as many hours at the trianing center as approved, provided these hours, plus the hours spent in regular classes in school do not exceed 40 hours per week. Sufficient time in training on the job is needed for instruction, observation, and practice to learn the various phases of the job. Normally, the trainees will spend five hours per day in school and three hours per day at the training center. When school is not in session on any school day, the trainee may work more hours than the student-learner's certificate authorizes, provided, however, the total hours shall not exceed eight hours per day. During the school term when school is not in session the entire week, the trainee may work additional hours, not to exceed 40 hours. The trainee must spend as many hours on the job as he does in the vocational agriculture class.

3. Selection of Trainees

Trainees should be selected who are interested in preparing for occupations which require knowledge and skills in agriculture. Trainees must be employable; therefore, it is essential that selection be based on a carefully designed procedure which takes into consideration such things as aptitude, interest, personality, work habits, etc.

4. Wages Paid Trainee

Trainees must be paid for the time spent on the job at the training center at the same rate as other employees of the same age or experience. The local Advisory Council may recommend minimums if not covered by minimum wage laws. Employers may obtain a Student-Learner Certificate allowing them to pay 75 percent of the minimum wage for a portion of the training period.

5. Length of Employment of Trainees

Trainees must be employed in an occupation at the training center for enough time to justify the program. This may vary according to occupation, and the amount of training available at the centers.

6. Travel of Trainees

Trainee must be responsible for his own travel to and from the training center. Any training center approved should be within a reasonable travel distance from the school and the home of the trainee in order to reduce the amount of travel required.

7. Individual Training Plan

An individual training plan must be developed for each trainee. Both a course-of-study for his classroom related instruction and a training outline for his occuaptional on-the-job training at the training center is necessary.

8. F.F.A.

Boys enrolled in the agricultural occupations program are leigible for membership in the Future Farmers of America.

RELATED CLASSROOM INSTRUCTION IN AGRICULTURAL OCCUPATIONS

1. Length of Time

A minimum of one hour per day for related classroom instruction is required.

2. Course Content

a. Instruction applicable to all agricultural occupations regardless of occupation pursued, will be provided. Such instruction will include such areas as:

(1) Applying for a job
(2) Employer relations
(3) Ethics
(4) Labor laws
(5) Workman's Compensation laws
(6) Social Security
(7) Other

b. Instruction will also be provided which is applicable to the individual trainees occupation which he is engaged. This instruction will be primarily individual study under the supervision of the vocational agriculture teacher.

3. Size of Classes

Since the related occupations program is new and will probably require more time by the teacher than the regular program, it is suggested that fewer students be enrolled per class where related occupations students are enrolled. A good many teachers are overloaded at present. In some schools consideration should be given to the employment of an additional teacher or teachers to assist with the expanded program.

4. Class Schedule

Cooperative occupations trainees may meet with the vo-ag classes as scheduled.

5. Facilities and Instructional Material

a. The school must provide satisfactory classroom facilities for this program. In most cases, the vocational agriculture department will be adaptable to provide the necessary facilities.

b. The school must also be responsible for providing sufficient instructional materials for the students.

ON-THE-JOB TRAINING AT THE TRAINING STATION

1. The length of training period will vary, according to the type of occupation and offerings of the Training Station.
2. The amount of time spent at the station can not exceed the difference between the total hours in school and 40 hours per week.
3. On-the-job training must not be less than that spent in the vocational in-school classes.

TRAINING PLAN

1. The Training Plan should be developed cooperatively by the person directly responsible for training the student and the agricultural teacher.
2. The Training Plan should contain the basic knowledge, manipulative skills, and abilities that the trainee shoald learn on-the-job and in the classroom.

SUPERVISION OF TRAINEES AT THE TRAINING CENTER

1. By the employer

The employer, or a person designated by the employer, will be responsible for training the student at the place of business. He should assist in the developing of the training plan in order that no step, job, operation, or procedure is omitted. He is to provide instruction at the center in such a manner or method that will be understandable to the trainee.

2. By the teacher of vocational agriculture

The primary role of the teacher will be to work closely with the employer and/or the person directly responsible for training the student. He will make periodic visits to the training center to check with the business personnel and observe the student in training. The local school district should provide ample time for the coordination of the program.

3. Start of training

The occupations program cannot be started the day school opens like the usual vocational agriculture courses. Unless the students are placed at the training centers during the summer, there will be a considerable amount of confusion in starting both the regular Vo-Ag classes and the occupations program at the beginning of the school term. On this basis, it is recommended that students commence their training on-the-job during the summer months. This will allow the students to be observed for a period of time to determine if the training at the center makes a suitable beginning and indicates progress. It will permit changes where it is evident that changes should be made before the regular school term begins.

APPENDIX A SUMMARY OF MISSISSIPPI CHILD LABOR LAW--1960

MINIMUM AGE

The minimum age is 14 to work in any mill, cannery (except fruit or vegetable cannery), workshop (interpreted by Attorney General to include stores, factory, or manufacturing establishments.

CERTIFICATES

No employment-certificate system. (For work in establishments listed above, employer must be secure from a child between 14 and 16 parents' affidavit and certificate of school superintendent or principal stating place and date of birth, school grade attended, name of last school sttended, and teacher in charge.)

AGE CERTIFICATES

No provision. (For the purposes of the child-labor provisions of the Fair Labor Standards Act, Federal certificates of age are issued upon request by the Federal Issuing Officer, Wage and Hour and Public Contracts Divisions, U. S. Department of Labor, 145 Amite Street, Jackson.)

HOURS

8-hour day, 44-hour week, for children between 14 and 16 in any mill, cannery (except fruit or vegetable cannery), workshop, factory, or manufacturing establishment, or (by interpretation) in any store. Railroads and public service corporations are exempted.

10-hour day for all employees 16 and over in any mill, cannery (except fruit or vegetable cannery), workshop, factory, or manufacturing establishment, with the following exemptions: (1) Cases of emergency; (2) Where public necessity requires; (3) Railroads or other public service corporations; (4) Establishments handling or converting perishable agricultural products in season, and which use adult male labor only; (5) Overtime permitted to make one shorter workday per week (30 minutes daily for the first 5 days of the week, such additional time to be deducted from the last day of the week. Persons employed at night only may work 11 1/4 hours the first 5 nights of the week and 3 3/4 hours on Saturday night but 60 hours shall constitute a full week's work for such employees). 10-hour day, 60-hour week, for females in any laundry, millinery or dressmaking store, office, merchantile, establishment, telegraph or telephone office, or in any other occupation not herein enumerated except (1) cases of emergency, (2) where public necessity requires, and (3) domestic service.

NIGHTWORK

Prohibited from 7 p.m. to 6 a.m. for children under 16 in any mill, cannery (except fruit or vegetable cannery), workshop, factory, or manufacturing establishment, or (by interpretation) in any store. Railroads and public service corporations are exempted.

STREET TRADES

No provision.

MEAL PERIOD

No provision.

AGENCY AUTHORIZED TO ENFORCE CHILD-LABOR LAW

Division of Occupational Health and Factory Inspection, State Board of Health, Jackson, Mississippi.

STATUS OF ILLEGALLY EMPLOYED MINORS UNDER THE WORKMEN'S COMPENSATION ACT

Illegally employed minors are covered by the State compensation act, and the double compensation is provided in case of injury to minors under 18 employed in violation of the State child-labor law. The employer alone and not the insurance carrier shall be liable for such increased compensation.

LEGAL REFERENCES. Miss. Code 1942 Ann., Recompiled 1952, Supp. 1958. Child Labor: secs. 6985-6993. Workmen's Compensation: secs. 6968.02, 6998.54. School Attendance: secs. 6221 through 6228 repealed by ch. 26, Laws 1953; sec. 6225-03.

APPENDIX B

STANDARDS AND PROVISIONS FOR STUDENT-LEARNER CERTIFICATES*

The following section is taken from the information guide and instructions for completing applications for student-learner certificates and from title 29, part 520-Employment of Student-Learners.

Under regulations established pursuant to both the Fair Labor Standards Act and the Walsh-Healey Public Contracts Act, student-learners may be employed at wages below the minimum wages established under those acts in accordance with certificates issued by the Wage and Hour and Public Contracts Divisions of the U. S. Department of Labor. The employment of student-learners at special minimum wages is subject to Regulations, part 520, issued under authority of section 14 of the Fair Labor Standards Act. Section 50-201.1102 of the general regulations under the Walsh-Healey Public Contracts Act recognizes the standards and procedures of Regulations, part 520, as applicable to the ussuance of certificates permitting employment of student-learners at special minimum wages in the performance of government contracts.

1. Coverage

The Fair Labor Standards Act applies to all employees (including student-

---

*Adapted from the Arkansas Manual on Supervised Training for Agricultural Employment.

learners) engaged in interstate commerce or in the production of goods for interstate commerce, including any closely related processes or occupation directly essential to such production, unless specifically exempt by some provisions of the act. The act also applies to employees (including student-learners) who are not themselves engaged in or producing goods for commerce but who are employed in certain large enterprises engaged in commerce or in the production of goods for commerce. Popularly known as the Federal Wage and Hour Law, this act establishes minimum wage, child labor, and maximum hours and overtime standards for employment subject to its provisions.

The Walsh-Healey Public Contracts Act applies in general to all contracts entered into by the government for the manufacture or furnishing of materials, supplies, articles or equipment in any amount in excess of $10,000. This act requires the payment to employees engaged in the performance of such contracts of not less than the minimum wage determined by the Secretary of Labor to be prevailing for the industry. In addition, the Public Contracts Act contains special provisions for safety and health standards, restrictions against the use of child labor and convict labor, and special provisions for the payment of overtime for work subject to the act.

Special situations which may arise under these two acts are explained in section 2 cf "On Completing Student-Learner Certificates." The Wage and Hour and Public Contracts Division have available upon request bulletins on the coverage of these acts. If in doubt as to whether either or both of these acts apply to a particular type of employment, a letter explaining your situation should be sent to the regional office of the division serving your area.

2. Who Is A Student-Learner?

As defined in the regulation, a student-learner is a student who is receiving instruction in an accredited school, college or university, and who is employed on a part-time basis pursuant to a bonafide vocational training program administered by his school. A bonafide vocational program is one authorized and approved by a State Board of Vocational Education or another recognized educational body. These programs <u>must</u> provide for part-time employment training supplemented by and integrated with a definitely organized plan of instruction designed to teach technical knowledge and related industrial information which is given as a regular part of the student-learner's course of study in the educational institution he attends. Such programs may be either retail and service occupations or in trade and industrial skills.

3. <u>Who May File?</u>

Whenever it is believed necessary in order to prevent curtailment of employment opportunities, application may be made for a certificate authorizing an employer to pay student-learners special minimum wages below the applicable statutory (or wage order) minimum wage under the Fair Labor Standards Act or below a minimum wage determination under the Walsh-Healey Public Contracts Act. A separate application on official forms furnished for the purpose must be filed by the employer for each such student-learner. Parts of this application are best completed by a school official, other parts by the employer. The appropriate school official, the employer, and the student-learner must sign the application. Before a certificate can be issued, the conditions specified in section 520.5 of the regulation must be met. (See section 4 on "Completing Student-Learner Certificates" for these conditions.)

4. <u>Where To File</u>

Applications must be made on official forms supplied by the Divisions. The original of the completed application must be filed with the regional offices of these Divisions serving your area. The regional office serving Mississippi is:

U.S. Department of Labor
W. H. P. C. Division
Birmingham, Alabama

A copy must be retained in the employer's files. Additional copies may be made available to school officials and to the student-learner.

The field office for Mississippi is located at Jackson, Mississippi.

5. When To File

Applications should be filed 15 to 30 days in advance of the date the student-learner begins his employment so that the Divisions can take action on the application before employment begins. Certificates Cannot Be Issued Retroactively.

When the student's employment opportunity might be lost by delay in obtaining a certificate, section 520.6 (c) (2) if the regulation establishes a procedure for a temporary authorization. A description of this procedure appears at the top of the face of the application.

6. Age and Proof of Age

Minors under 16 years of age are not eligible for student-learner certificates. Furthermore, in occupations declared to be hazardous by the Secretary of Labor, the student-learner must be at least 18 years of age. (Hazardous Occupations Nos. 5, 8, 10, 12, 14, 16, and 17, permit student-learner employment at 16 and 17 years of age under certain specified conditions.) For information concerning child-labor provisions of the Fair Labor Standards Act, see Child-Labor Bulletin No. 101.

For employment subject to the Walsh-Healey Public Contracts Act, male employees must be at least 16 years old and female employees must be at least 18 years old.

In addition to entering the student-learner's birthdate in item 3 of the application, the employer should obtain and keep on file an employment or age certificate showing the student-learner to be at least the minimum age for the occupation in which he is employed. In 45 states, the District of Columbia, and Puerto Rico, State employment and age certificates are accepted as proof of age under the child-labor Provisions of the Fair Labor Standards Act. (Such certificates also provide assurance that the employment is in compliance with the requirements of the state child-labor law.) In four states, Mississippi, Idaho, South Caroline, and Texas, where state age and employment certificates are not available, federal certificates of age may be obtained within the state from the Wage and Hour and Public Contracts Divisions. Special arrangements have been made in Guam and Alaska. For information concerning proof of age in these areas consult the nearest office of the Wage and Hour and Public Contracts Division.

7. Period of Employment Training At Special Minimum Wages.

A certificate may be issued only for that portion of employment training period for which special minimum wages below the minimum wages under the Fair Labor Standards Act or the Walsh-Healey Public Contracts Act are necessary. This period may not exceed the length of one school year unless a longer period is found to be justified by extraordinary circumstances which must be explained in detail at the time of the application. No certificate shall authorize employment training beyond the date of graduation of the student-learner.

Employment training at special minimum wage rates during the summer vacation period will not generally be authorized. However, in exceptional cases summer employment training may be authorized when it is an integral part of the vocational training program. Requests for summer vacation employment must be accompanied by a statement explaining the extraordinary circumstances justifying this employment, including the number of hours per week for which special minimum wages are requested.

In item 16 of the application, show only the number of weeks of employment during which special minimum wages will be paid. The beginning and ending dates of employment shown in items 8 and 9 should coincide with this period.

8. Hours of Work and School Instruction

The term "hours of school instruction" applies to all hours spent by the student-learner in actual classes of school instruction and does not include school hours spent in study hall, homeroom, and activity periods for which no academic credit is given.

The combined hours of school instruction and employment training authorised under a certificate may not exceed 40 hours a week unless justified by extraordinary circumstances. Such extraordinary circumstances must be explained in detail in a statement submitted with the application. Hours at special minimum wages in addition to those authorized on a certificate may be worked provided that the total hours worked do not exceed:

(a) 8 hours on any school day when school is not in session;

(b) 40 hours in any week during the school term when school is not in session for the entire week.

The employer shall note in his records the number of such additional hours and that they were worked because school was not in session. A Student-Learner May Not Be Employed In Any Week At Special Minimum Wage Rates For Hours In Addition To Those Authorized In The Paragraph Above.

In item 17 of the application, show only those hours of employment during a week for which you intend to pay wages below the wage determination minimum applicable under the Public Contracts Act.

9. Wage Rates

The hourly wage rate shall not be less than 75 percent of the applicable statutory minimum wage under the Fair Labor Standards Act. It is suggested that consideration be given to the payment of a progressive wage schedule, particularly if a full year of employment training at special minimum wages is requested. If a progressive wage schedule is proposed, the special minimum starting rate must not be less than 75 percent of the applicable statutory minimum. In item 18, show only those wages which are below the applicable minimum wage under the Fair Labor Standards Act. (This paragraph also applies to work subject to Public Contracts Act Wage Determinations.) See section 2 below.

APPENDIX C

STUDENT-LEARNER CERTIFICATES

1. Certificates

The original copy of the student-learner certificate will be mailed directly to the employer. Two copies will be mailed to the appropriate school official, one to be retained for his records and the other to be presented to the student-learner. Applications Which Do Not Contain All Requested Information May Be Returned For Completion Before Action Is Taken. Student-learner certificates can be issued with a minimum of delay where the application provides the details requested. For additional information or application forms, communicate with the regional office of these Divisions which serves your area.

2. Special Situations Under the Walsh-Healey Public Contracts Act

The general provisions of this act are explained in Appendix B, Standards and Provisions for Student-Learner Certificates. The general regulations under the Public Contracts Act permit the employment of Student-Learners at wages below prevailing minimum wage determinations made under this act in accordance with the same standards and procedures as are prescribed for their employment at wages below the minimum wage applicable under the Fair Labor Standards Act. The provisions of Regulations, part 520 and the instructions in this guide apply to student-learners employed in the performance of Government contracts subject to the Public Contracts Act.

An employer who holds or who obtains a student-learner certificate issued in order to prevent curtailment of opportunities for employment under the Fair Labor Standards Act may employ the named student-learner in the performance of a Government contract subject to the Public Contracts Act at the authorized special minimum wage and in accordance with the terms specified in that certificate.

An employer may not need a student-learner certificate in order to prevent the curtailment of employment opportunities under the Fair Labor Standards Act or his employees may not be subject to that act. In either case, an employer performing a Government contract subject to a minimum wage determination under the Public Contracts Act may, upon proper application be issued a certificate authorizing a special minimum wage rate not less than 75 percent of the minimum wage determination applicable to the contract being performed. Employment under such certificates is subject to the standards and procedures of Regulations, part 520.

3. Compliance

Certificates may not be issued if there are serious outstanding violations of a student-learner certificate previously issued to the employer or if there are serious violations of other provisions of the Fair Labor Standards Act by the employer which provide reasonable grounds to conclude that the terms of the certificate would not be complied with, if issued. Moreover, no certificate permitting a wage lower than the statutory minimum under the Fair Labor Standards Act or a Public Contracts Act minimum wage determination will excuse non-compliance with the child-labor, overtime, or other provisions of these acts or the regulations issued thereunder.

A certificate may be withdrawn if it is no longer necessary to prevent curtailment of opportunities for employment or if the employer fails to comply with the limitations in the certificate or otherwise violates the act.

4. Conditions Governing Issuance of Special Student-Learner Certificates

The following conditions must be satisfied before a special certificate may be issued authorizing the employment of a student-learner at subminimum wages:

(a) Any training program under which the student-learner will be employed must be a bonafide vocational training program;

(b) The employment of the student-learner at subminimum wages authorized by the special certificate must be necessary to prevent curtailment of opportunities for employment;

(c) The student-learner must be at least 16 years of age (or older as may be required pursuant to paragraph (d) of this subsection);

(d) The student-learner must be at least 18 years of age if he is to be employed in any activity prohibited by virtue of a hazardous occupation order of the Secretary of Labor, (See Hazardous Occupations.);

(e) The occupation for which the student-learner is receiving preparatory training must require a sufficient degree of skill to necessitate a substantial learning period;

(f) The training must not be for the purpose of acquiring manual dexterity and high production speed in repetitive operations;

(g) The employment of a student-learner must not have the effect of displacing a worker employed in the establishment;

(h) The employment of the student-learners at subminimum wages must not tend to impair of depress the wage rates of working standards established for experienced workers for work of a like or comparable character;

(i) The occupational needs of the community or industry warrant the training of student-learners;

(j) There are no serious outstanding violations of the provisions of a student-learner certificate previously issued to the employer, or serious violations of any other provisions of the Fair Labor Standards Act of 1938, as amended, by the employer which provide reasonable grounds to conclude that the terms of the certificate would not be complied with, if issued;

(k) The issuance of such a certificate would not tend to prevent the development of apprenticeship in accordance with the regulations applicable thereto or would not impair established apprenticeship standards in the occupation or industry involved;

(l) The number of student-learners to be employed in one establishment must not be more than a small proportion of its working force;

(m) The special minimum wage rate shall be not less than 75 per cent of the applicable minimum under section 6 of the Act;

(n) No special student-learner certificate may be issued retroactively.

5. Employment Records To Be Kept

In addition to any other records required under the record-keeping regulations, the employer shall keep the following records specifically relating to student-learners employed at subminimum wage rates:

(a) Any worker employed as a student-learner shall be identified as such on the pay roll records, with each student-learner's occupation and rate of pay being shown;

(b) The employer's copy of the application, which is serving as a temporary authorization must be available at all times for inspection for a period of 3 years from the last date of the employment of the student-learner;

(c) Notations should be made in the employer's records when additional hours are worked by reason of school not being in session.

6. Duration of Certificates

A special student-learner certificate may be issued for a period not to exceed the length of one school year unless a longer period is found to be justified by extraordinary circumstances. No certificate shall authorize employment training beyond the date of graduation.

Questions Pertaining To The Application For and Certification Of Student-Learners

Note: The reference in parenthesis refers to the section of Title 29 part 520 of the code of Federal Regulation--"Employment of Student-learners"

1. In the average situation, for what period of time is a student-learner certificate issued?

   Ans. - for one school year only. (Section 520.8.) This is an appropriate 36 week period, consisting of 15 to 25-hour work-weeks.

2. What rate of pay is applicable to the student learner's employment?

   Ans. - 75 percent of the applicable minimum wage, i.e., $1.25 per hour = - $.94 (Section 520.6 (b)).

3. Does the application for the certificate constitute a temporary certificate?

   Ans. - Yes, if the application is correctly filed. The temporary authorization becomes effective the date the application is postmarked. Section 520.6 (c) (2)

4. Can a student learner under 18 years of age work in some of the occupations declared as particularly hazardous for minors?

   Ans. - Yes. (Section 520.5 (d)). If a written agreement is on file as described in the Child Labor Bulletin No. 101, Page 9.

5. May student learners work in any of the Hazardous Occupations without the exemption being granted?

   Ans. - No. There is no provision for this.

6. Who does the Wage and Hour Division hold responsible for compliance with the Hazardous Occupations Orders and the terms of the certificate?

   Ans. - the employer.

7. When school is not in session, how many hours may a student work, under the provisions of a certificate?

   Ans. - When school is not in session, the student may work a number of hours in addition to the weekly hours granted by the certificate: provided, the total hours do not exceed 8 hours in any one day or 40 hours in any week. (Section 520.6 (d) and (3)).

8. How many copies of the application are necessary and who gets them?

   Ans. - Four copies are made. One is given to the student, one is given to the employer, one is given to the school, and the original is sent to the regional labor office.

9. How many hours may a student-learner work at his occupation?

Ans. - The number of hours at work plus the number of hours spent in class at school must not exceed 40 hours per week.

10. May a student-learner work under the provisions of a certificate during the summer months?

Ans. - Yes. For example: if a student learner begins his employment at the beginning of the spring semester (approximately January 1), his training may continue through the summer months, provided he has not graduated and provided the summer work is under the auspices of the teacher-coordinator.

11. May a student-learner ride as a passenger in a vehicle getting from job site to job site?

Ans. - Yes. If the student is not primarily engaged in loading or unloading the vehicle or as a driver or driver's helper, he may ride the vehicle.

12. Is a student-learner under 18 subject to the Hazardous Occupations Orders, whether or not the employer is paying the minimum wage?

Ans. - Yes--and if a student-learner is to be employed in a hazardous occupation that carries an exemption (i.e. Hazardous Occupations Orders No. 5, 8, 10, 12, 14, 16, and 17,) there must be a written agreement on file as described in "II" under the heading "Student-Learner" of the Child Labor Bulletin No. 101 pp. 7-8.

APPLICATION FOR A CERTIFICATE TO EMPLOY A STUDENT-LEARNER

The certification of the appropriate school official on the reverse side of this application shall constitute a temporary authorization for the employment of the named student-learner at less than the statutory minimum wage applicable under Hazardous Occupations Orders of the Fair Labor Standards Act of 1938, as amended, or at wages below the applicable Walsh-Healey Public Contracts Act minimum wage determination, effective from the date this application is forwarded to the Divisions until a student-learner certificate is issued or denied by the Administrator or his authorized representative, provided the conditions specified in Section 520.6 (c) (2) of the Student-Learner Regulation (29 CFR 520) are satisfied.

PLEASE READ CAREFULLY THE INSTRUCTIONS FOR COMPLETING THIS FORM

PRINT OR TYPE ALL ANSWERS

1. Name and address of establishment making application:
3. Name and address of Student-Learner:

Date of Birth:

2. Type of business and products manufactured, sold, or services rendered:
4. Name and address of school in which student-learner is enrolled:

INFORMATION ON SCHOOL INSTRUCTION

5. Number of weeks in school year
6. Total hrs. of school instruction per week
