
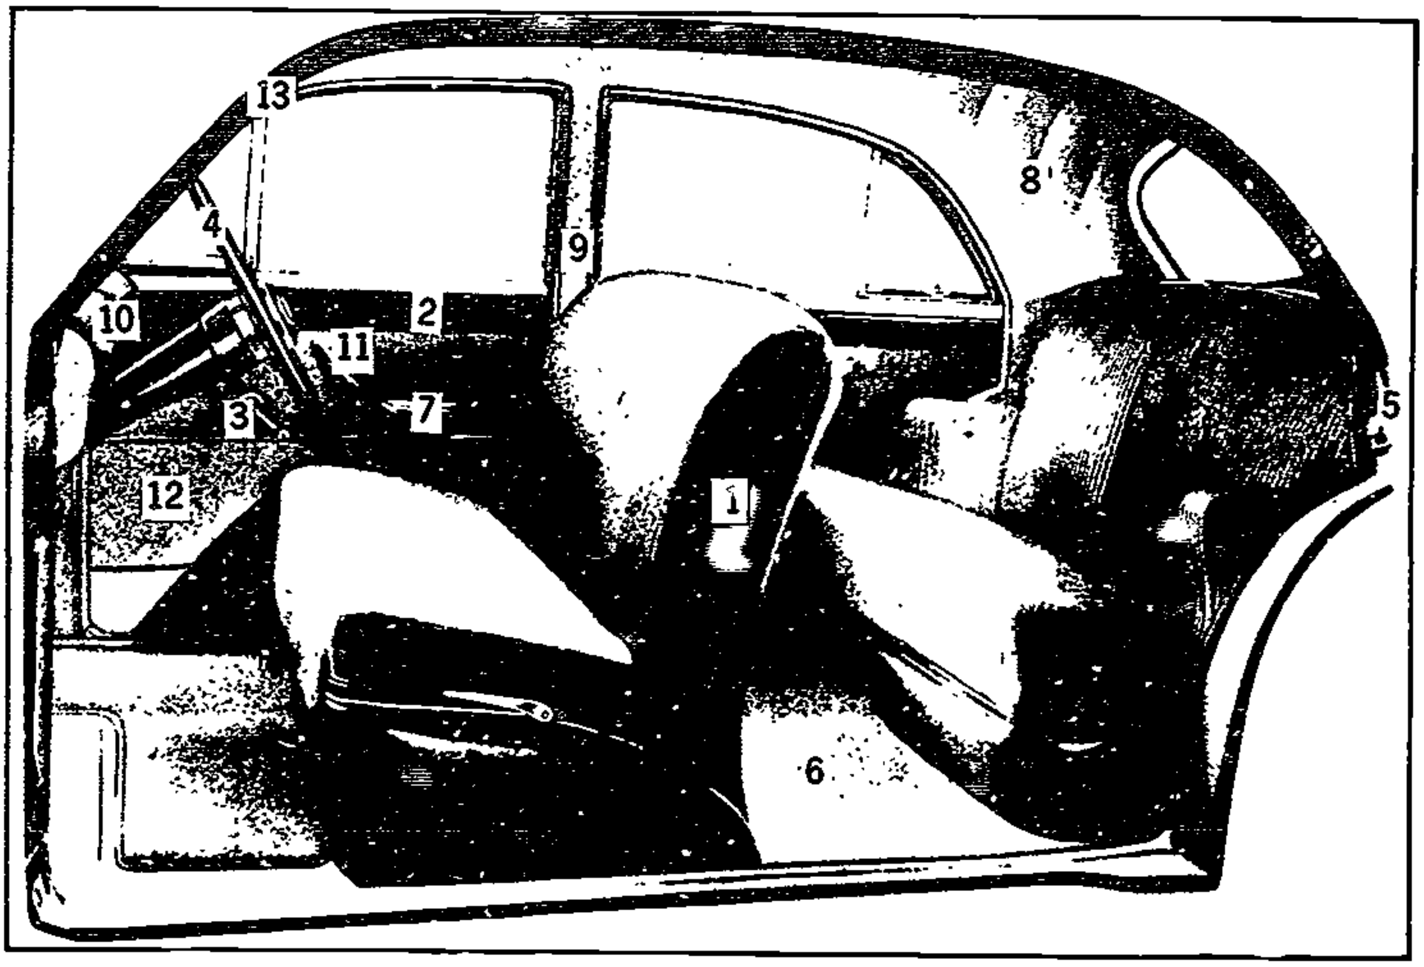
EXTERIOR BODY

FIG. III-10

2. Using the picture below and the following names, write the correct number of the part in front of the word which names the part.

(   ) seats
(   ) steering wheel
(   ) arm rest
(   ) instrument panel
(   ) sun visor
(   ) garnish moulding

(   ) door jamb
(   ) headlining
(   ) door handle
(   ) window regulating handle
(   ) rugs
(   ) center post
(   ) trim panel



INTERIOR BODY

FIG. III-11

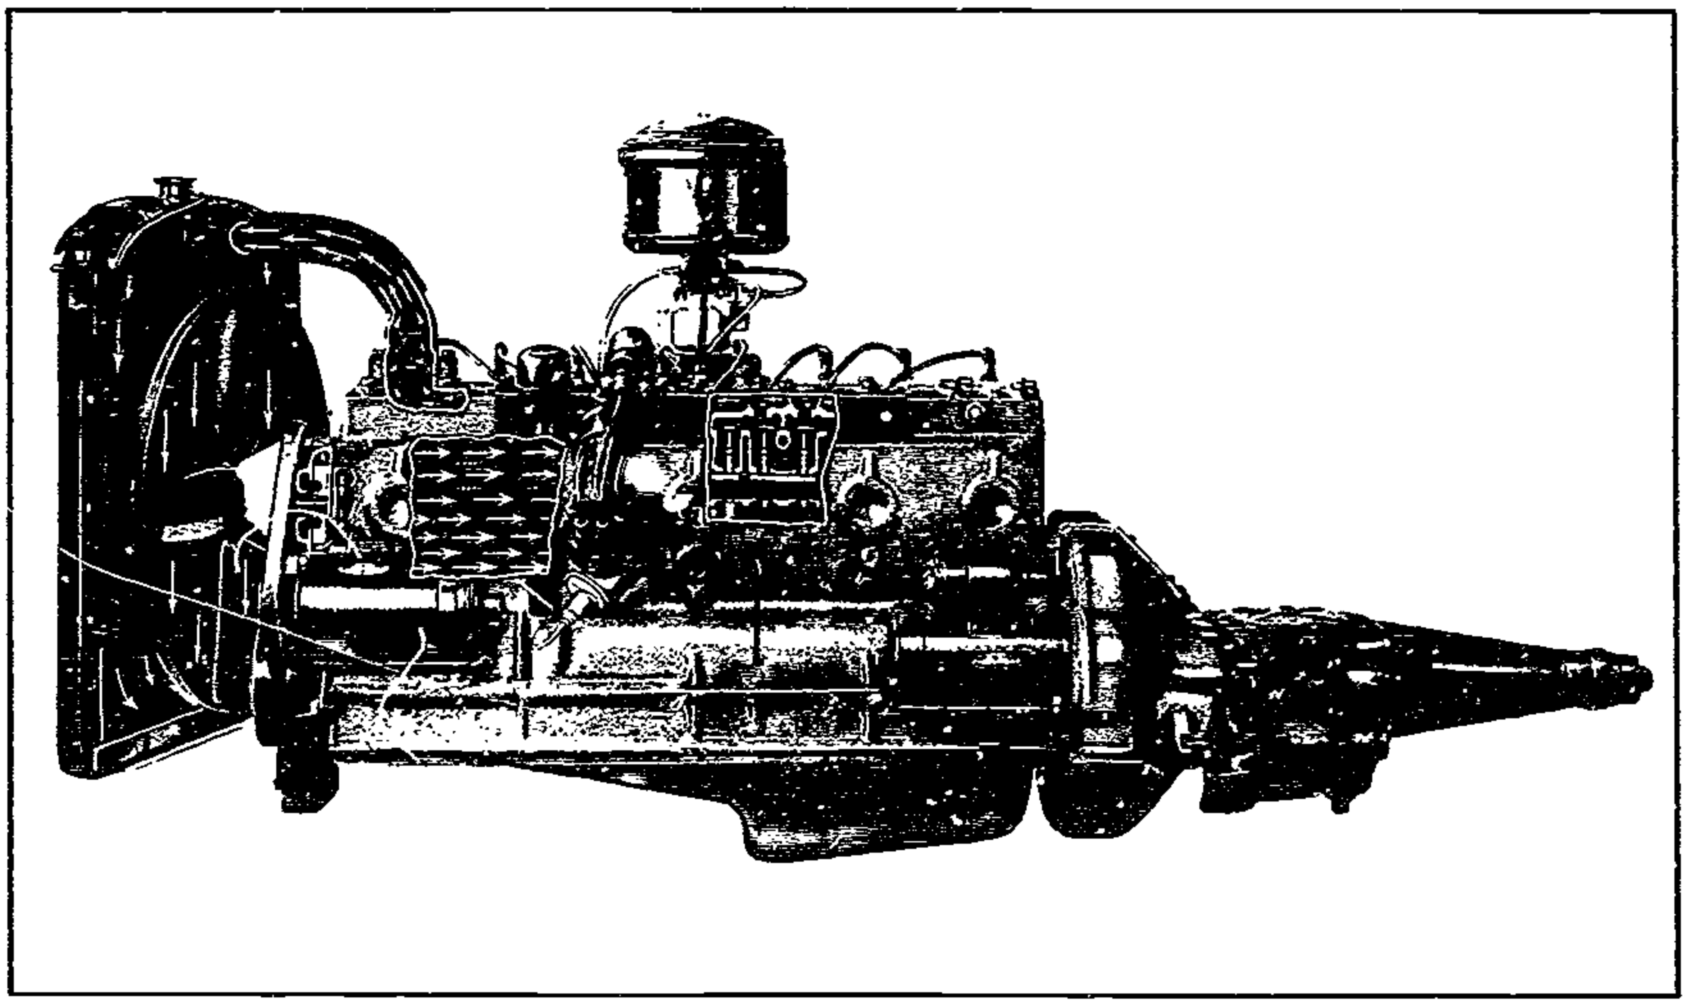
3. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVES: To learn the purpose of the cooling system.
To learn the parts of the cooling system.
To learn how to drain the cooling system.

INFORMATION:

One of the most important parts on the car is the cooling system. The motor cannot run when it becomes overheated. The job of the cooling system is to keep the engine cool.

The cooling system is made up of the radiator, water pump, fan assembly, the water jacket of the engine, and the hoses. (Fig. III-12)



COOLING SYSTEM

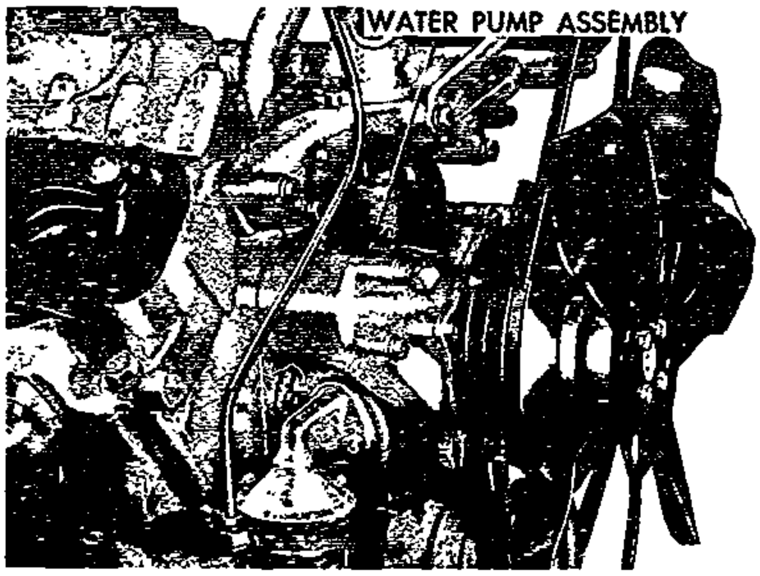
FIG. III-12

Merely placing water into the water jacket of the engine is not enough to cool the motor as it runs. More water is required, plus circulation by which the hot water leaves the engine, is cooled off, and then re-enters the engine

The RADIATOR, which is the heart of the cooling system, serves two purposes. It is a reservoir for more water and is the means for cooling off the hot water as it comes from the engine. Generally the radiator is made of brass and copper and made up of the upper and lower tank and a series of tubes and fins.

RADIATOR

FIG. III-13



WATER PUMP AND FAN ASSEMBLY

FIG. . I-14

The WATER PUMP is the part that circulates the water through the cooling system. Mounted on the shaft of the water pump is the FAN BLADE ASSEMBLY (Fig. III-14) which is driven by the engine by means of the fan belt. The blades are bent, so that as it runs, it draws air through the radiator, cooling off the water which is being pumped through the tubes of the radiator. The cooled water is then pumped back into the water jacket of the engine which thereby can maintain an even temperature and overheating is prevented. The HOSES are used to carry the water from the engine to the radiator and back again.

The cooling system must always be tight. By this we mean that it must not have any leaks, for if the water is lost, the motor will overheat. In the winter when temperatures drop to freezing, it is necessary to place into the cooling system a material which will not freeze. This is called anti-freeze. Consult the charts which give you the correct amount of anti-freeze to be added to the different size cooling systems. To drain the cooling system you will need the following:

drain pan
pliers
extension light

Place the drain pan on the floor under the radiator.

ALWAYS BE CAREFUL WHEN THE MOTOR IS HOT. Most cooling system are under pressure. To release this pressure, first VERY SLOWLY loosen the radiator filler cap. STAND BACK, so that if the pressure blows the cap off, you will not be burned. With the cap removed, loosen the petcock, which is found at the bottom of the radiator, by turning it to the left. To determine right and left, picture yourself in the driver's seat. Use the pliers to loosen the winged part of the petcock. After the water has been drained, close the petcock by turning it to the right and tightening it slightly with the pliers. Do not tighten it too much for the petcock can be broken.

CAUTION: Always check to see if you have drained out plain water or anti-freeze. If it is plain water, always replace it with fresh water. If it is anti-freeze, find out if it is to be put back or replaced with new solution.

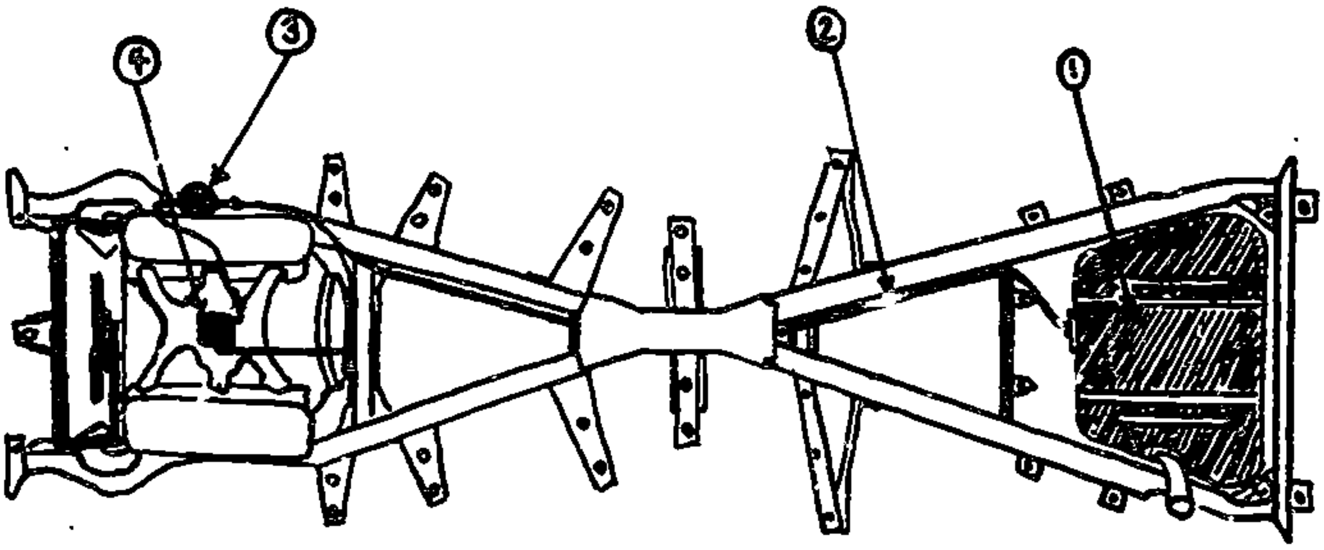
ASSIGNMENT:

1. Name the major parts of the cooling system.
2. How is the water pump operated? What does it do?
3. What is the radiator for?
4. What is the radiator made of? Why?
5. Why must we have a cooling system?
6. How does the fan help to cool the water?
7. What must be true about a cooling system?
8. Demonstrate to your instructor the way you would drain the cooling system.
9. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVES: To learn the main parts of the fuel system.
To learn how they function.
To learn how to drain the gas tank.

INFORMATION:

We all know that the automobile is powered by the gasoline engine. Just how is the gasoline stored, and how does it get into the motor? First let us look at the picture and locate the parts and identify them. (Fig. III-15)



FUEL SYSTEM

FIG. III-15

The gasoline is stored in the GAS TANK (1) which is located under the floor of the trunk (for cars with front engines). From the tank there is the FUEL LINE (2) which carries the gas to the FUEL PUMP (3), which is located on the side of the motor. The motor drives the fuel pump and creates a suction which draws the gas from the tank. The gas is taken from the fuel pump by another fuel line and is directed into the CARBURETOR (4) which in turn feeds it to the engine as it is needed.

One of the most important things about the fuel system is that it must not leak. Any leaks which may develop must be repaired immediately.

To drain the gas tank we will need the following tools:

drain pan
set of open end wrenches

The instructor will have the car placed on a hydraulic lift and raise it to its proper height. On the bottom of the gas tank you will notice a plug. Some plugs are in the center while others are in one corner toward the front of the car. Place the drain pan under the plug and remove the plug carefully. Allow the gas to drain completely into the pan. Remove the gas cap from the filler neck so that air can enter the tank to help the gas drain out more quickly. (CAUTION: Be sure windows are open for ventilation to remove some of the fumes as the gas is being drained. Check with the instructor as to the place to store the gas.) Generally gasoline is not stored in the shop because of the fire hazard. The can should be covered and placed outside the shop in a cool place until needed.

To refill the tank, replace the plug and tighten securely. Pour the gas back into the tank through the filler neck. AGAIN, whenever working with gasoline, always make sure that windows are open for ventilation.

ASSIGNMENT:

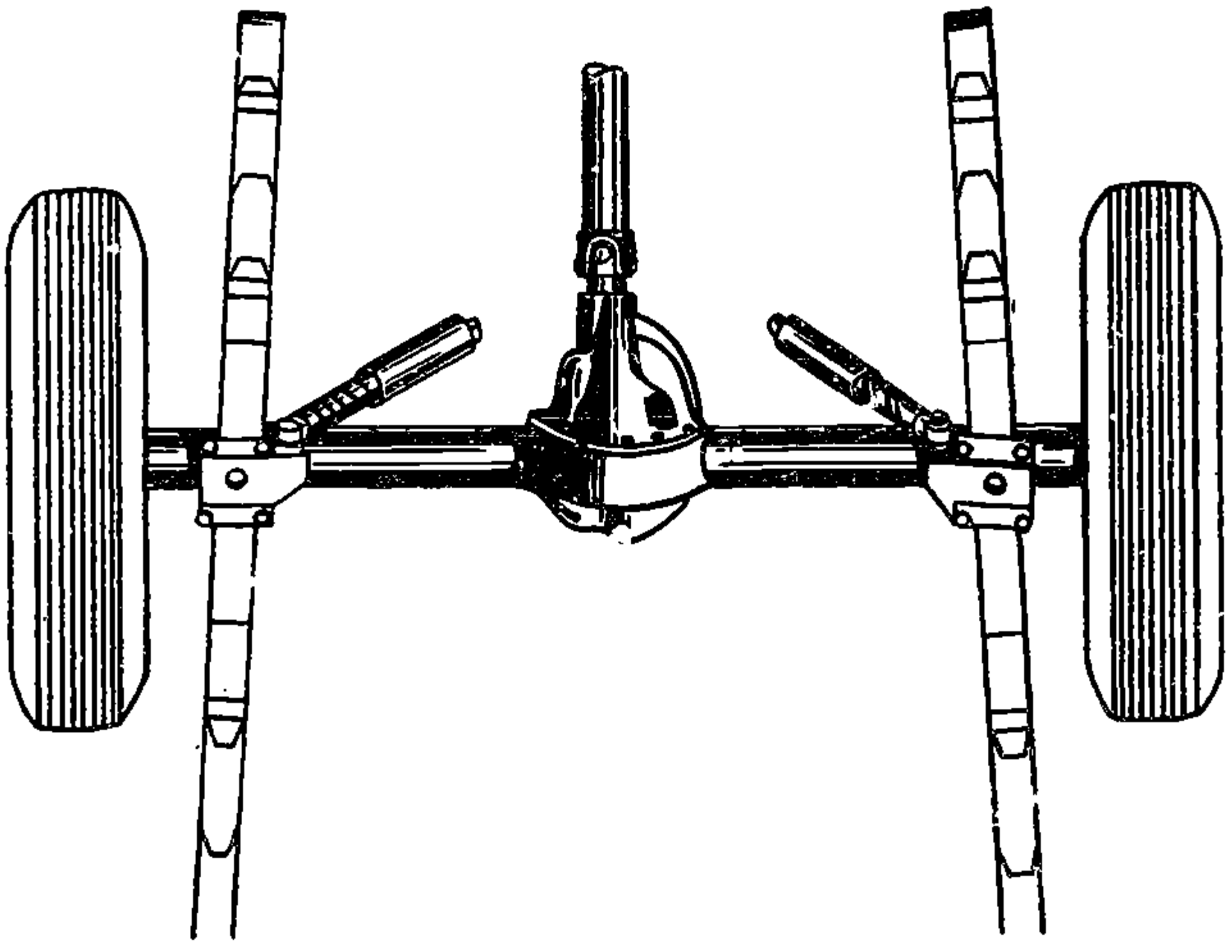
1. Where is the gasoline stored?
2. Which part takes the gas out of the tank? How?
3. How is the gasoline fed into the engine?
4. What connects the major parts of the fuel system together?
5. Are all gas tanks located in the back of the car?
6. Demonstrate to the instructor how you would drain the tank. What tools are required? What safety precautions must be taken while draining and after the tank is emptied?
7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVES: To become familiar with the different types of suspension systems.
To learn some of the basic parts and their function.

INFORMATION:

As a boy you must have played with a wagon the wheels and axle of which were fastened directly to the body. Perhaps you will remember that it rode very rough and inside, all the bumps could be felt. Another feature of the wagon that you probably recall was that it tipped over very easily when it hit a bad bump or was turned too sharply.

The original horse-drawn wagons were built much the same as the toy wagons. As horse-drawn carriages developed, springs were placed between the axle and the body to help make rides smoother and cut down on the chance of upsetting. As the automobile was introduced, the same principles carried through with regard to the suspension. The most conventional type of suspension uses the leaf spring. (Fig. III-16)

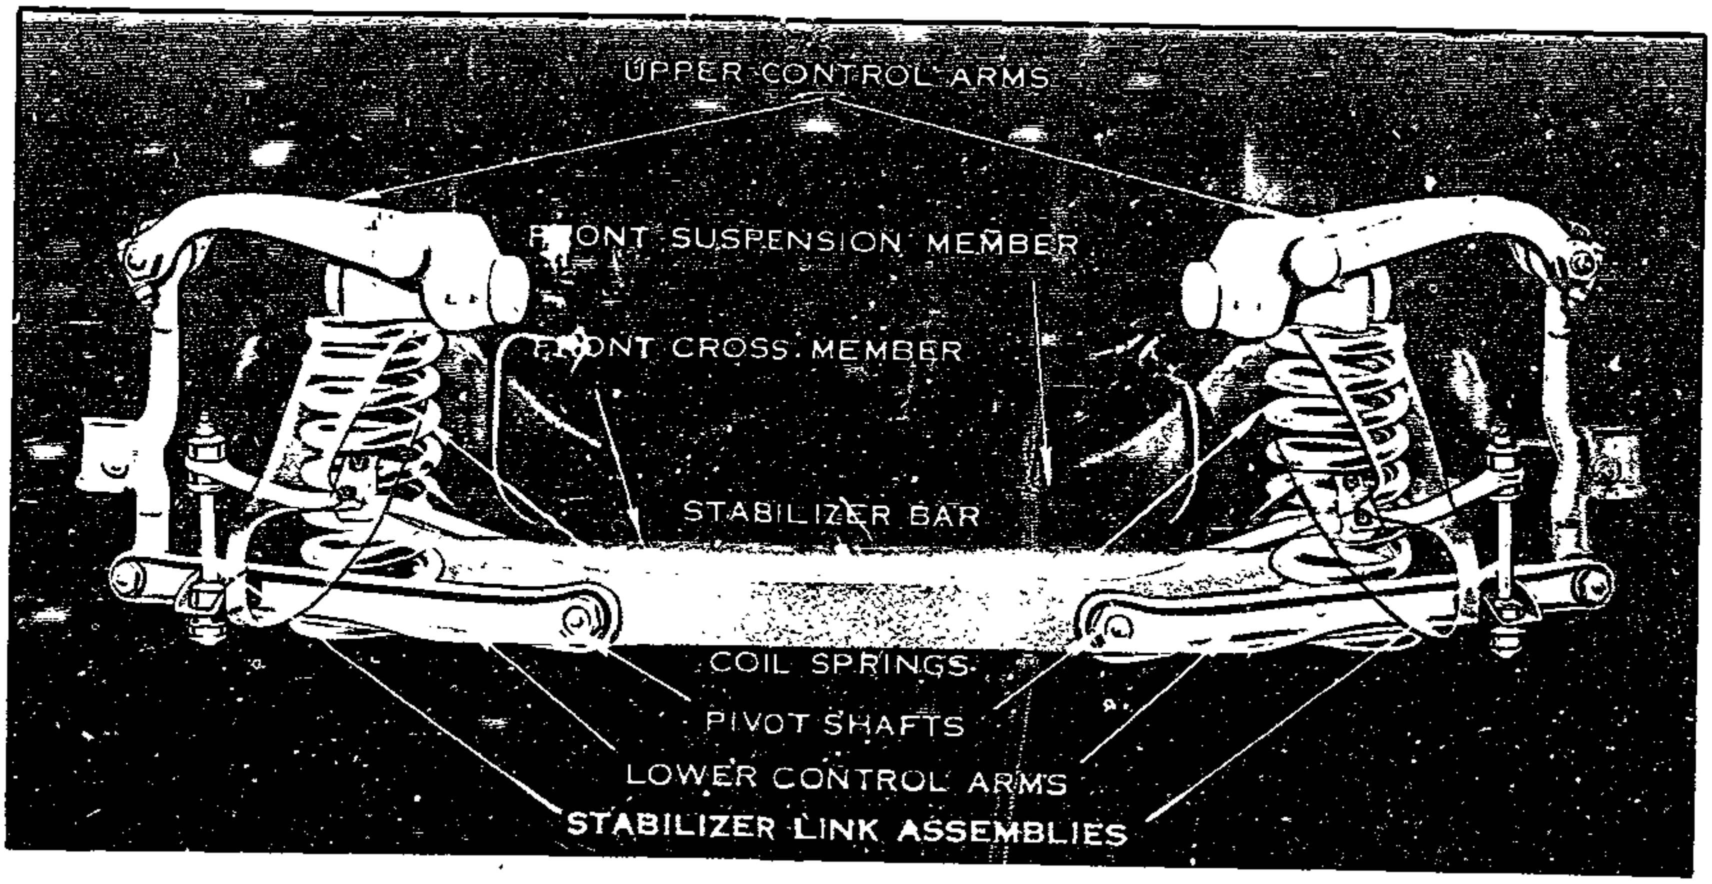


LEAF SPRING

FIG. III-16

The leaf spring system has been with us for many years; some cars still use it.

As the automobile companies looked for ways to improve the suspension system so that a smoother ride could be accomplished, they developed what is known as the knee action or coil spring suspension. (Fig. III-17)

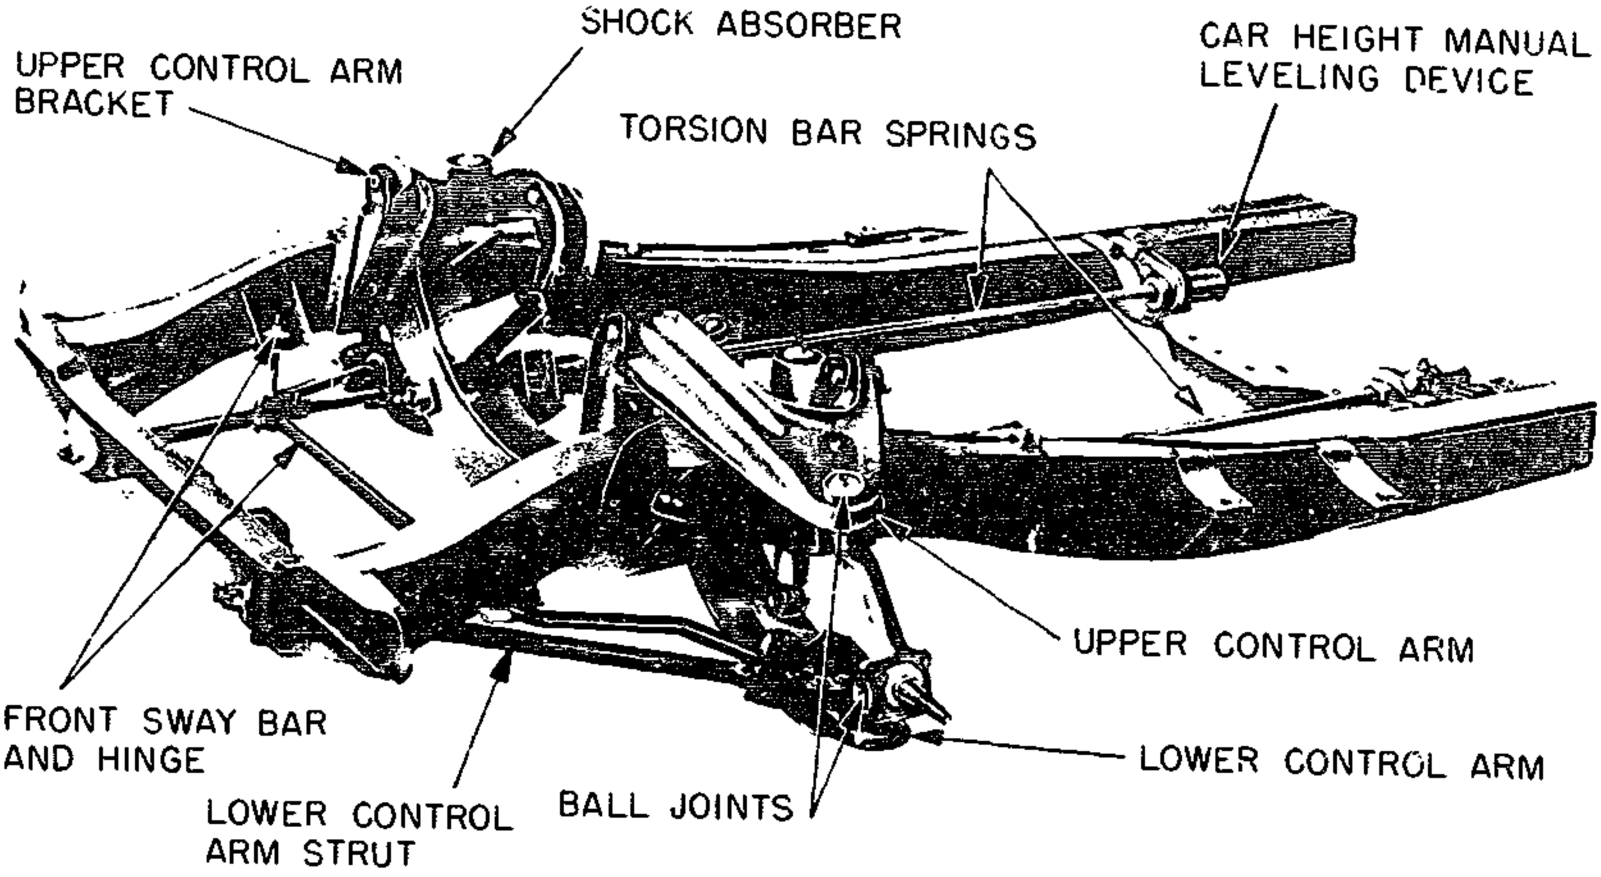


COIL SPRING

FIG. III-17

This system, instead of using the leaf spring, makes use of the coil spring. Most American autos today use the coil spring system because of the smoother ride it affords. Some cars use coil springs in the front and leaf springs in the rear.

The latest change in the suspension system is the elimination of the coil spring and the introduction of the torsion bar type of spring. (Fig. III-18)



TORSION BAR

FIG. III-18

Regardless of the type of suspension system used, all must have other parts such as shock absorbers, stabilizers, and bushings.

The shock absorbers help to prevent bounce. The stabilizer keeps the car from leaning to one side, especially when making turns. The bushings are used at pivot points where one section is fastened to another and motion takes place. Bushings are made so that they can be replaced as they become worn.

ASSIGNMENT:

1. What type of suspension system did the original wagons use?
2. What is the most conventional type of spring?
3. Name two other types of springs used on autos today.
4. Is the shock absorber necessary? Why?
5. What is the purpose of the stabilizer?
6. Why is the suspension system important?
7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Bolts, Nuts and Fasteners

Lesson 6

OBJECTIVE: To become familiar with the different types of fastening devices available.

INFORMATION:

You can see that the automobile is not made of one piece. It is made up of thousands of separate parts, that are put together or assembled. One of the major problems faced by the auto manufacturer is determining the way the various parts are fastened together. The company must keep in mind that its fasteners must be strong, economical to buy or produce and must be easy to install so that time is saved in production. The earliest cars used the bolt and nut method of fastening parts together. (Fig. III-19) This was very good because it was strong and long lasting.

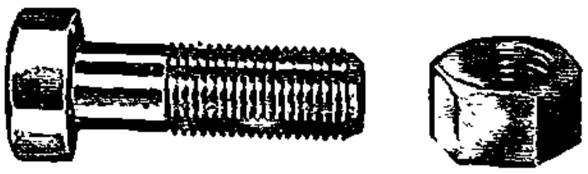


FIG. III-19

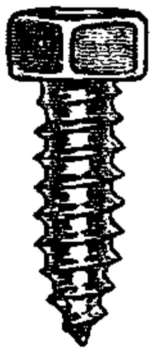

FIG. III-20

In certain places where the nut could not be reached, the nut was clamped inside the body. As the cars changed their shape and design, it became difficult to use bolts and nuts in certain places. Also the auto producers were looking for ways by which the cars could be assembled more quickly and easily. One variation of the bolt and nut method was the metal screw (Fig. III-20). This method eliminated the need for the nut as this screw was self tapping and could be screwed through a piece of metal with a hole in it. It was found, however, that when these screws were taken out and replaced they would not hold well. A clip of spring steel was then developed. The metal screw goes through the two pieces to be fastened and into the spring clip. This method has proved very effective and is used widely today.

In the early days there was very little chrome trim on the car. As the chrome was added, there had to be found ways of fastening these parts to the car. The "T" bolt is the most common of these. (Fig III-21) This bolt is inserted in the moulding or trim and the nut is placed on the underside where it does not show. Where it was difficult to put a nut, a spring was developed which could be snapped into place. (Fig. III-22)

"T" BOLTS

FIG. III-21

SPRING CLIP

FIG. III-22

There is now a great variety of clips and fastening devices in use in the automotive field. Each year as the mouldings and trim are changed, new clips are developed to suit the needs of production. Each company uses the type which it feels is best for the purpose, so there is no universal type of fastening device. Pictured are some of the different types of clips and devices for holding things together. Familiarize yourself with them. (Fig. III-23)

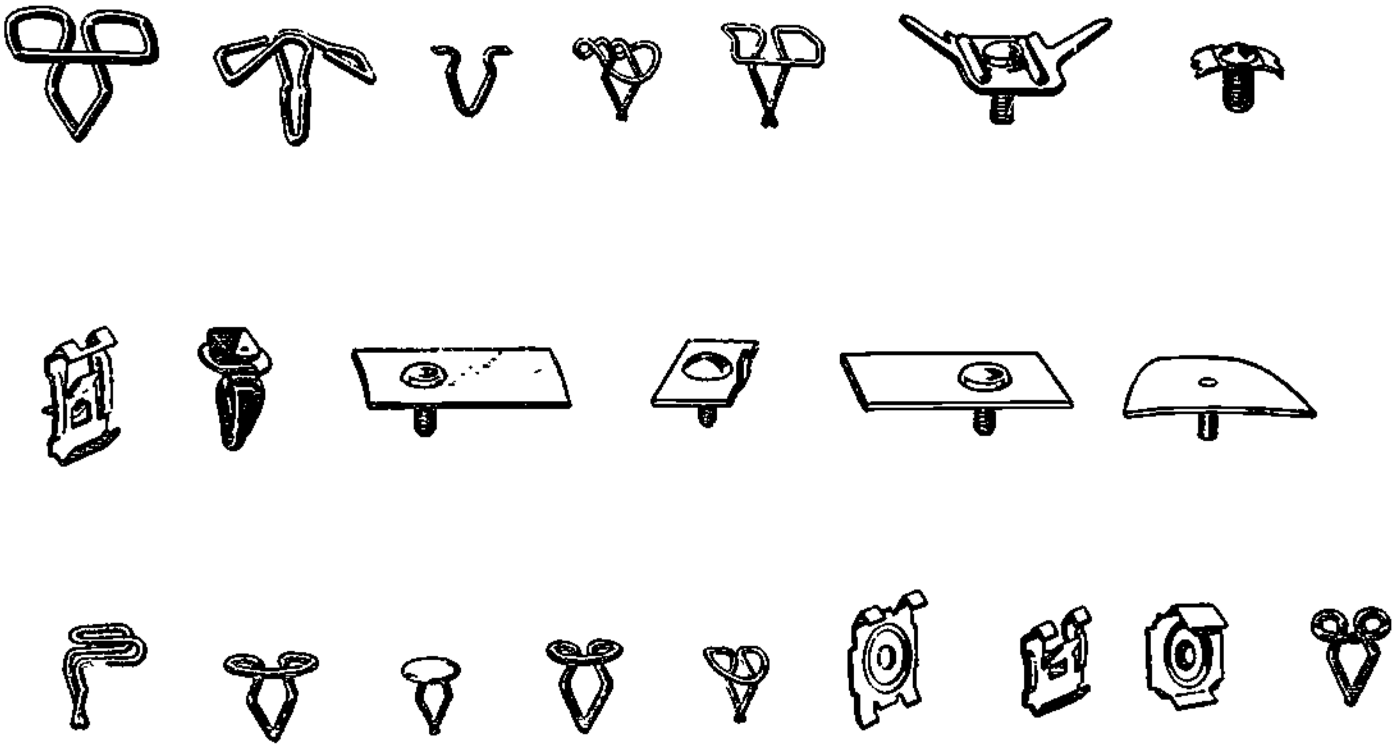

FIG. III-23

ASSIGNMENT:

1. Why are bolts, nuts, and clips important?

2. What are the most common ways of holding two things together?

3. What is a metal screw? How does it differ from a bolt?

4. What are clips generally made of?

5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT III - MATERIALS AND PARTS OF THE AUTOMOBILE

Materials in an Automobile (Non-Metal) Lesson 7

OBJECTIVES: To learn about the various products that go into the automobile.
To learn where such products are used.

INFORMATION:

When thinking about automobiles, people generally think in terms of metals such as steel, aluminum, copper, brass, lead, white metal and their related alloys, but actually an automobile is made up of a combination of many products which contribute to the American economy.

The modern auto includes such items as: glass, plastics, rubber, felt, upholstery fabrics (wool, cotton, nylon), leather, leatherette, asbestos, insulating materials such as rockwool or spun glass, tar, ceramics, adhesives, greases and oils, and paints. It may seem unbelievable to have so many things in one automobile, but let us look at some of the parts of the car carefully.

Very evident of course is the glass in the windows. However, glass is also used in lights for bulbs and lenses, and covers for instruments.

Plastics are used more and more. For example, trim on the instrument panel, steering wheel, lenses on some lights are plastics, as are parts of door locks and on some cars the whole body, although this is still mostly experimental.

Rubber is widely used on the automobile. There are tires, radiator hoses, fuel and hydraulic hoses, weatherstripping, floor mats, rubber bumpers on the body between the doors, and rubber shackles in the suspension system. These are only a few uses.

The upholstery on the car is made up of various types of cloth or material such as wool, nylon, cotton, leather, leatherette, and felt. Felt is also used in the window channels to guide the glass.

The brake linings are made of a composition consisting mainly of asbestos. Asbestos is also used in the making of engine gaskets and insulation in the firewall. Insulators of rock wool and spun glass are used under the turret tops and hood and firewall to keep the heat out of the car. Tar is used as a protective coating and sound deadener throughout the entire car.

Ceramics are found in the spark plugs, and electric switches and controls. Adhesives are used to hold many things such as weatherstripping and upholstery, in place.

The motor, transmission, rear, and steering column use grease and oil for lubrication purposes, and of course, the car cannot run without gasoline. The finish on the car is a result of paint and its various products.

No doubt you will find many more places where these basic materials are used on the car. It is interesting to see how many people are employed because of the American automobile.

ASSIGNMENT:

1. List the basic materials that were covered and under each one list as many items as you can think of that use this basic material.

2. Can you think of reasons why each of these is used? Discuss this with your teacher.

3. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT III - MATERIALS AND PARTS OF THE AUTOMOBILE

ACHIEVEMENT TEST

1. Name three basic metals used in an automobile.

2. Name as many exterior parts of the car as you can.

3. Name as many interior parts of the car as you can.

4. Why does a car have a cooling system?

5. Name three parts of the fuel system.

6. What is the suspension system? Name the main part of the suspension system.

7. Name as many different types of fasteners as you can.

8. Name five basic non-metal products used in an automobile.

9. List five new words that you have learned in this unit. Use each one in a sentence.

UNIT IV - REMOVAL AND ASSEMBLY

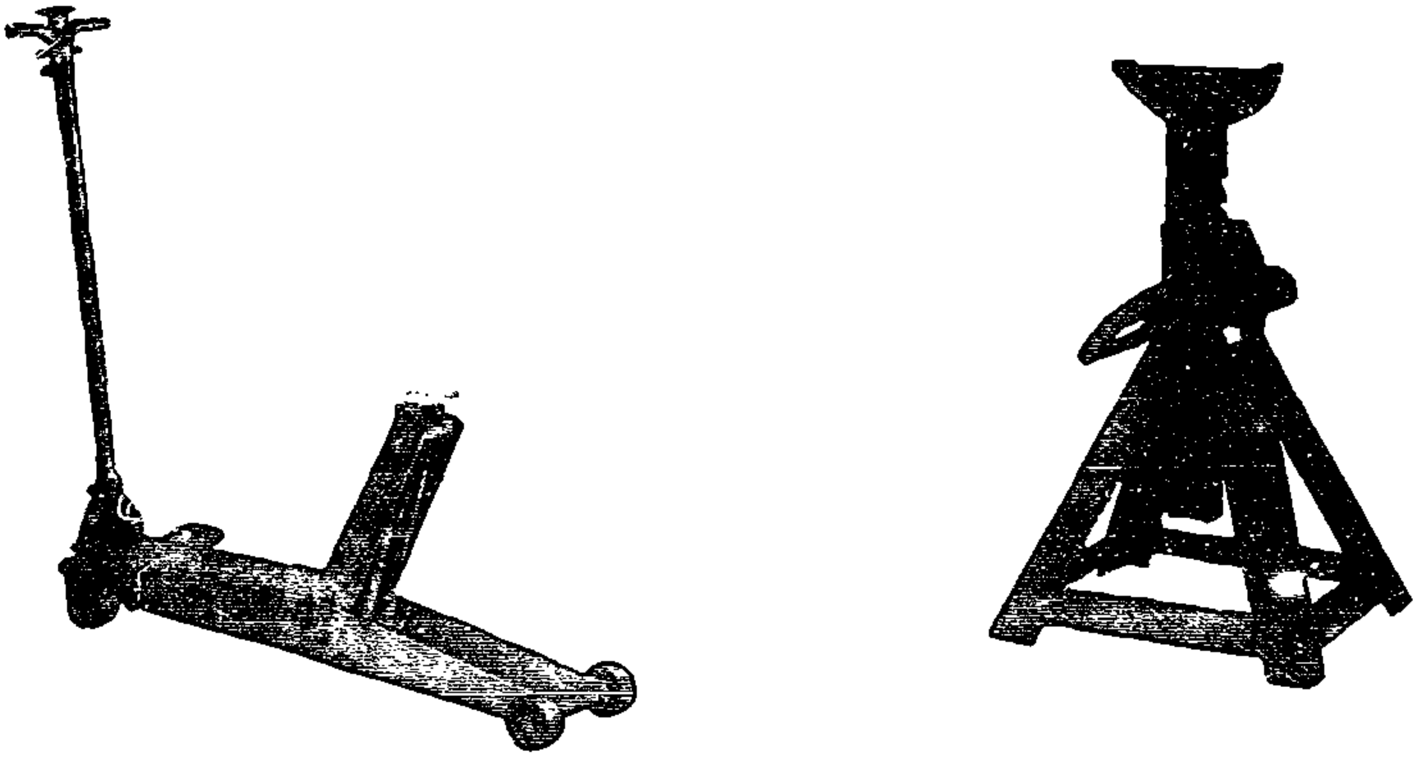
Wheels Lesson 1

OBJECTIVES: To learn how to remove and replace wheels.
To learn what precautions must be taken in doing this job.

INFORMATION:

The removal and replacement of wheels is one of the basic jobs in the body shop. It is not difficult, yet the safety of the passengers in the car depends upon the person who does this job. Care must be used, because there are dangers if safety procedures are not followed in any work on wheels.

EQUIPMENT: Hydraulic jack, lug wrench, standing jacks, and a screwdriver (Fig. IV-1)



HYDRAULIC JACK STANDING JACK

FIG. IV-1

PROCEDURE:

Begin with the rear wheel. Roll the hudraulic jack under the rear of the car and center it under the differential housing. (Fig. IV-2)

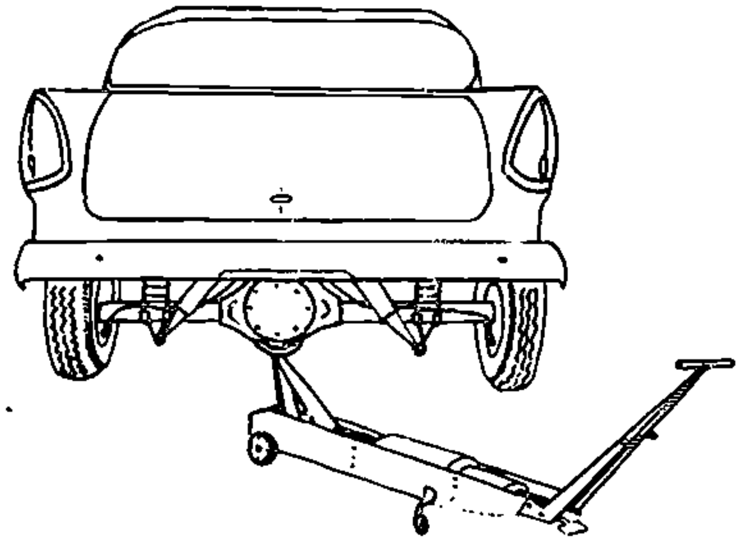


FIG. IV-2

Raise the car by pumping the handle of the jack up and down. To prevent the car from slipping off the hydraulic jack you must now place standing jacks under the housing. (Fig. IV-3)

Adjust the jack so that when the weight is lowered the wheel does not touch the floor.

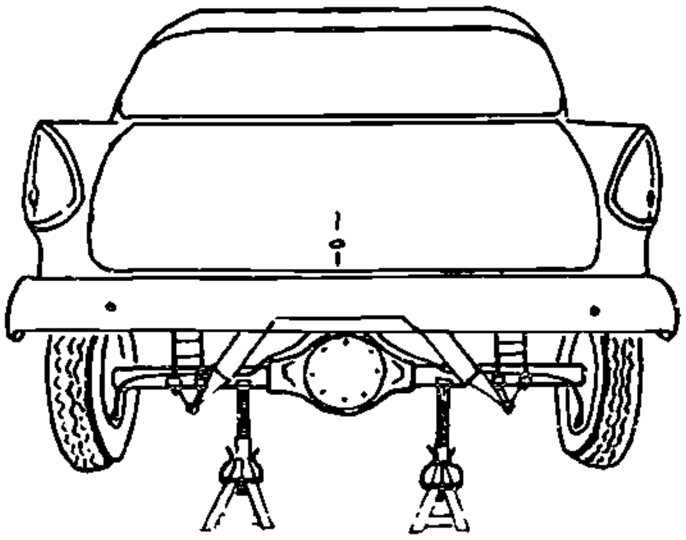

FIG. IV-3

Slowly lower the hydraulic jack so that the rear housing will rest on the jack stand. Next look at the wheel and see if the wheel will clear the fender or the quarter panel. If the quarter panel has a large overhang, then the standing jack must be moved to the chassis just forward of the rear wheel. (Fig. IV-4)

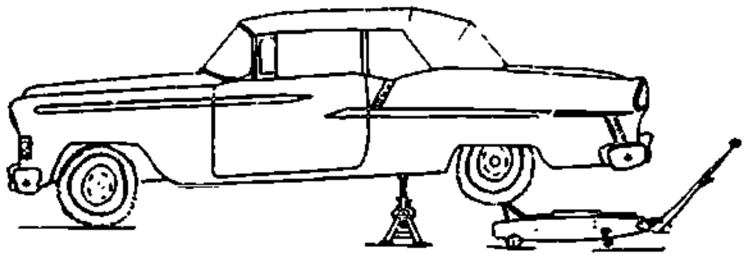

FIG. IV-4

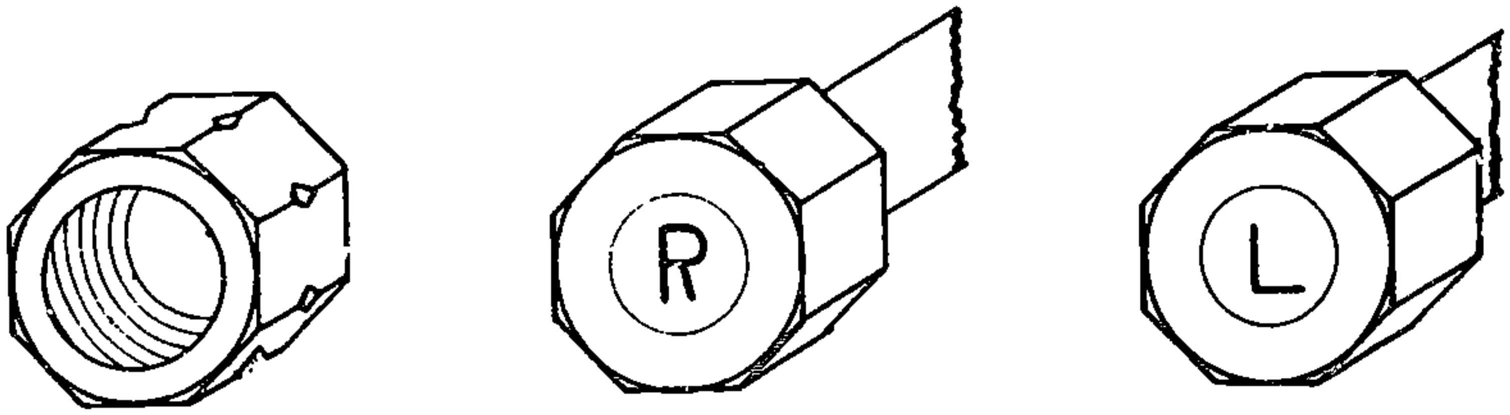
With the screwdriver remove the hubcap or wheelcover. With the lug wrench loosen all the lugs, then remove them. You must look at the lug very carefully to determine which way to turn it. If there are no marks or letters of any kind, then it it counter-clockwise (this is called right-handed thread). If there are small notches on the side of the nut, then turn the nut clock-wise (this is called left-handed thread). (Fig. IV-5) Certain cars have the letters "L" or "R" stamped on the lugs. (Fig. IV-5) The letter means left or right-handed thread. REMEMBER, when we speak of left and right-handed thread we mean the way it is turned to tighten it. therefore to remove the lug reverse this direction.



NOTCHED NUT

LUG
"R"

LUG
"L"

FIG. IV-5

After all the nuts or lugs have been removed, lift the wheel off the car and put it in a safe place.

To replace the wheel, merely lift the wheel into place and replace the nuts or lugs and tighten them evenly, a little at a time until they are all equally tight. Replace the wheel cover by pushing it into place, but make sure that the valve stem is centered.

Finally, raise the hydraulic jack, remove the standing jacks, and lower the car to the floor.

To remove the front wheels, follow the same procedure, but be sure that when you put the hydraulic jack into place, you raise the car by either the coil spring or the center of the cross frame. NEVER ALLOW THE JACK TO COME IN CONTACT WITH THE MOTOR, RADIATOR OR TIE RODS. If you do, this could cause a great deal of damage to the car. The standing jack can be placed under the coil spring or the chassis, whichever seems to be better.

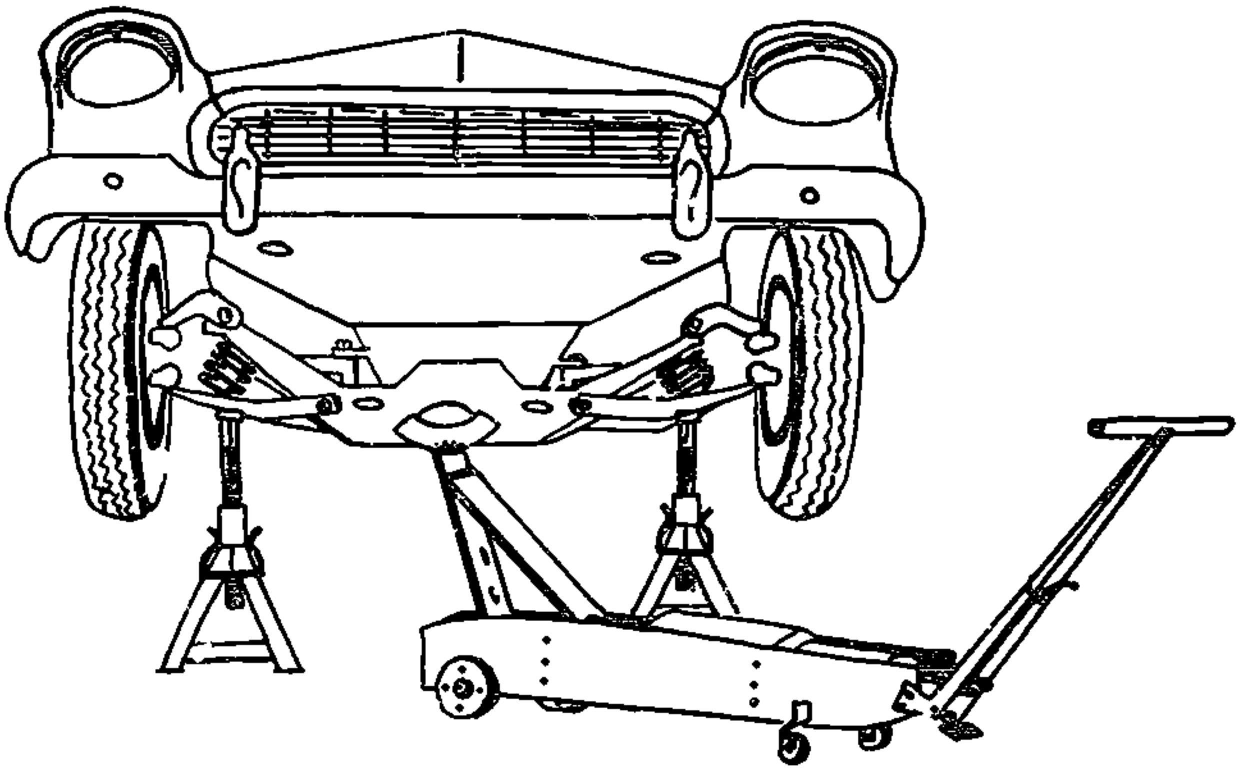


FIG. IV-6

ASSIGNMENT:

1. When raising the rear of the car, where is the best place to position the hydraulic jack?

2. Why must standing jacks be used at all times?

3. If the quarter panel has a large overhang, where should the standing jack be placed?

4. Name the threads of the following nuts and lugs.

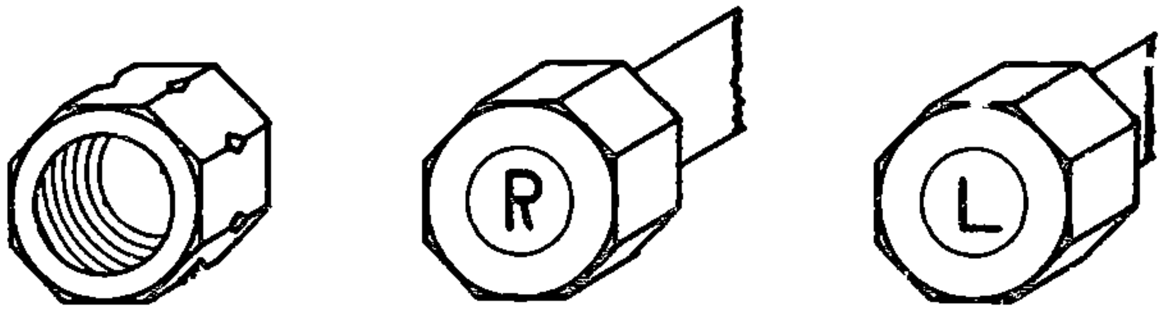

FIG. IV-6A

5. When we say right-handed thread, what do we mean?

6. Demonstrate to the instructor how you would remove and replace a wheel.

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT IV - REMOVAL AND ASSEMBLY

Seats (Front) Lesson 2

OBJECTIVE: To learn the correct procedure in the removal of the front seat and back rest.

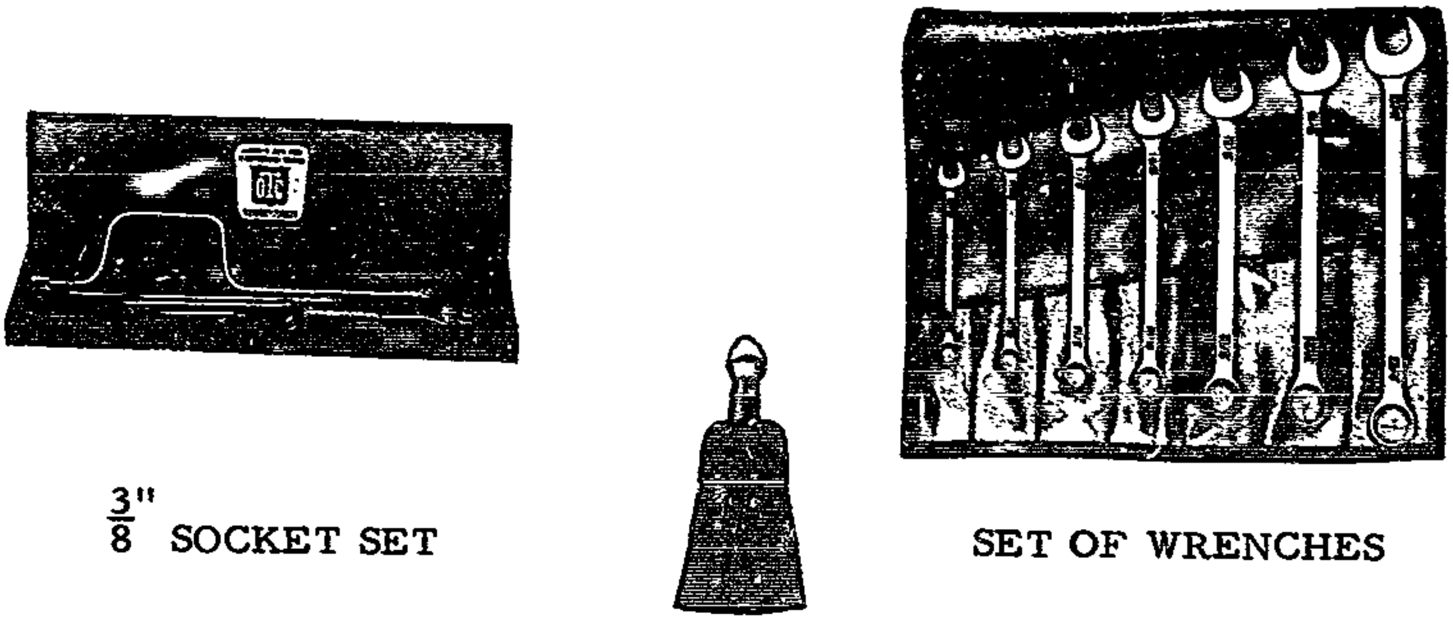
INFORMATION:

As you begin your work on automobiles you will notice that for each car you may need to have a different method of assembling parts. Basically, they all use the same principles, but they may vary in types of clips or fasteners used, and their location. The best rule to remember is always to note the way that something comes apart, and usually it can be reassembled in the opposite order.

The front seat assembly is a movable unit. All front seats move back and forth, some even move up and down. To permit this, the seat is fastened to a track which is fastened to the floor.

TOOLS AND EQUIPMENT:

$\frac{3}{8}$" socket set, set of wrenches, screwdriver, extension light, and a whisk broom. (Fig. IV-7)



$\frac{3}{8}$" SOCKET SET

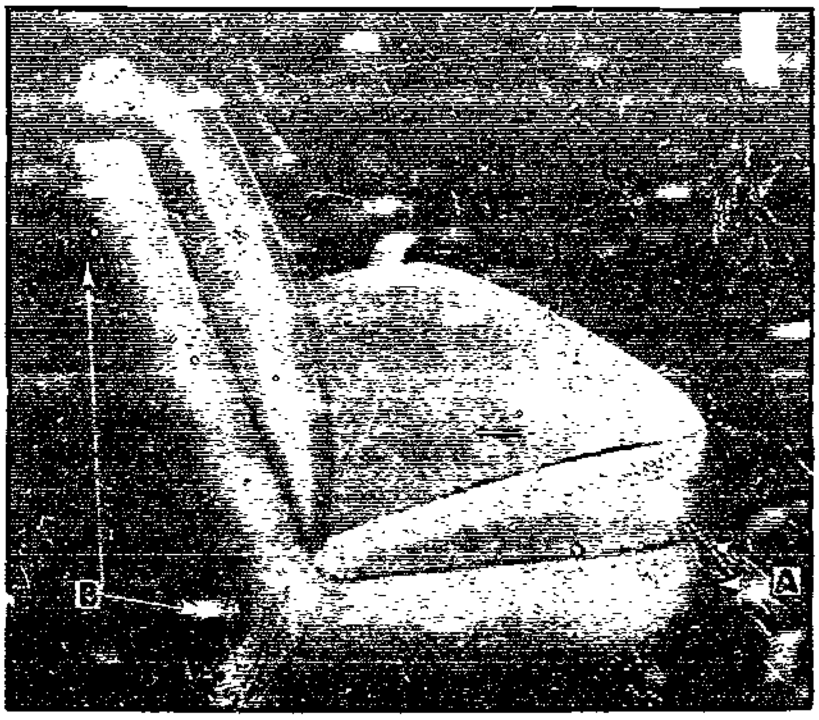
WHISK BROOM

SET OF WRENCHES

FIG. IV-7

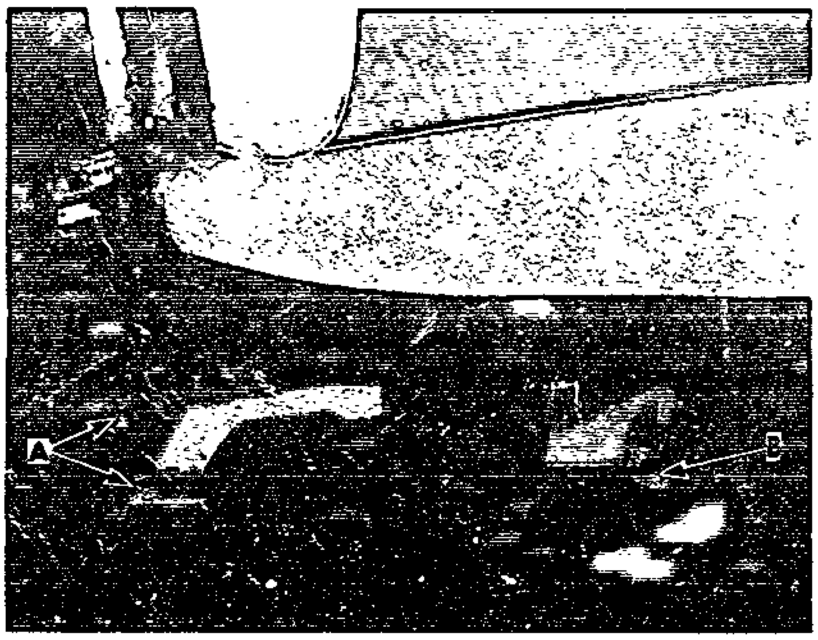
PROCEDURE:

All seat tracks are fastened to the floor by bolts. If you cannot reach them, then the trim cover on the side of the seat must be removed first. (Fig. IV-8) You will see chrome screws which must be removed with a screwdriver. Now the bolts that hold the seat track to the floor are visible. (Fig. IV-9)



SEAT ASSEMBLY

FIG. IV-8



ASSEMBLY WITH SIDE REMOVED

FIG. IV-9

Remove these bolts on both sides, being sure to place the parts into the can that you have provided. (Approximately four bolts on each side.)

The seat is now ready to be lifted out of the car. DO NOT TRY TO DO THIS BY YOURSELF. Front seats are heavy and two people are needed to lift them out of the car. Place the seat in a safe place and cover it with a clean cloth to protect it against soiling.

To replace the seat assembly, follow the same procedure in reverse. Place the seat in the car, replace the bolts in the floor, and replace the side trim panels. BE SURE TO TIGHTEN ALL BOLTS SECURELY.

On some older cars, the front seat cushion can be lifted out by raising the front and pulling forward. You will then see the bolts that hold the seat track to the floor.

ASSIGNMENT:

1. What allows the front seats to move?

2. Where do you place all bolts and screws?

3. When you cannot reach the bolts that hold the track to the floor, what must you do?

4. What do you do with the seats after they are taken out of the car?

5. Demonstrate to the instructor the proper way to remove the front seat.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Seats (Rear) **Lesson 3**

OBJECTIVE: To learn the correct procedure in the removal and assembly of rear seats.

INFORMATION:

The rear seat and back rest differs from the front in the way it is fastened to the body because it is in a fixed position and is not adjustable as is the front seat.

TOOLS AND EQUIPMENT:

Screwdriver, socket set (¼"), extension light, and a whisk broom

PROCEDURE:

Place your fingers under the front of the rear seat cushion. Raise it up and pull forward slightly. Remove the cushion from the car and put it in a safe place. (Fig. IV-11)

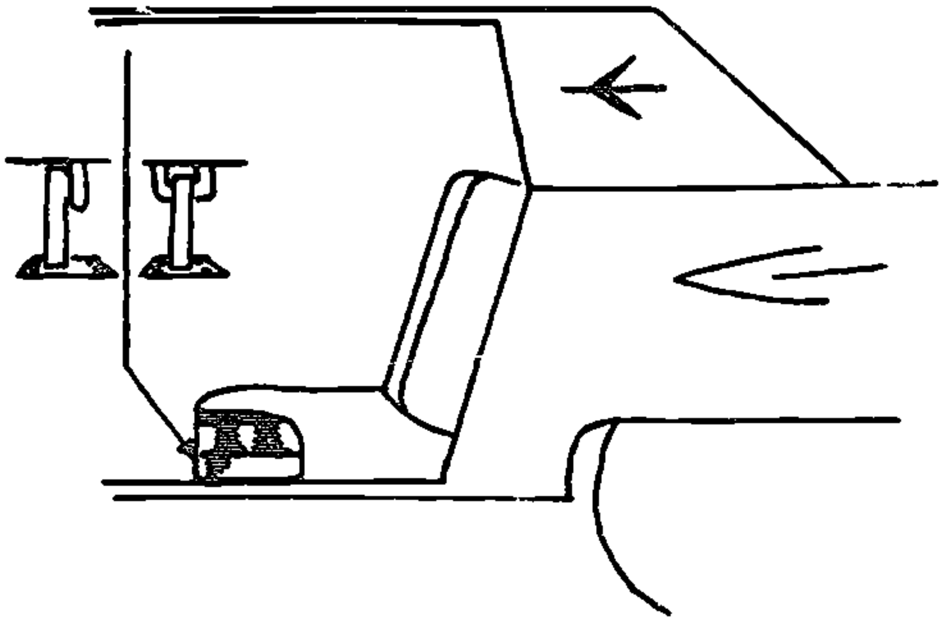


FIG. IV-11

Next look under the back rest with the extension light and you will see two little tabs hanging down from the back rest. Some cars have a bolt or screw holding the tabs to the body, while others have a piece of metal bent over. Remove the screws or straighten the metal that is bent over. Place your fingers under the bottom of the back rest and slowly pull forward, then raise the entire back rest off the hooks that are located at the top of the back rest. (Fig. IV-12) Remove the back rest from the car and store with the seat. BE SURE TO COVER THE SEAT WITH A CLEAN CLOTH.

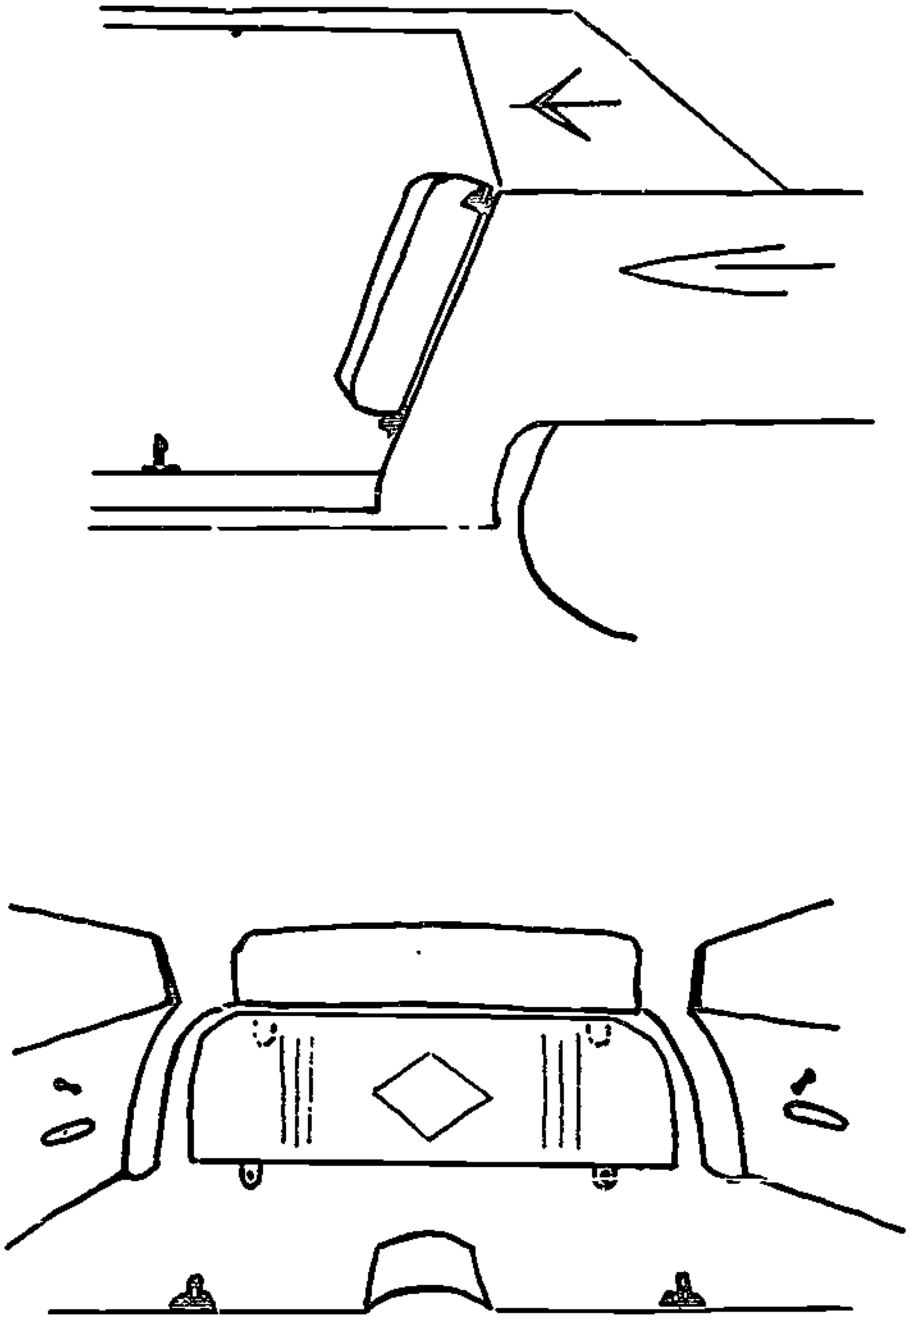

FIG. IV-12

To replace the rear seat, begin with the back rest and place it in the car. Hook the top of the back rest on the hooks that you will see on the body and <u>gradually</u> push the back rest into place. (Be sure the hooks are caught.)

Replace the screws or bend over the metal tabs that hang down from the back rest. Now place the rear seat cushion into place by pushing towards the back. Then raise it slightly and make sure it is caught on the small brackets that stand up from the floor.

When you have finished, use a whisk broom and clean out the rear seat area.

ASSIGNMENT:

1. What is the main difference between the front and back seats?
2. Why is the rear seat fastened in a different manner from the front seat?
3. What prevents the rear seat cushion from moving forward?
4. What prevents the top of the back rest from falling forward?
5. Show how you would remove the rear seat cushion and back rest from the car.
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Upholstery Panels

Lesson 4

OBJECTIVE: To learn how to remove and replace upholstery trim panels.

INFORMATION:

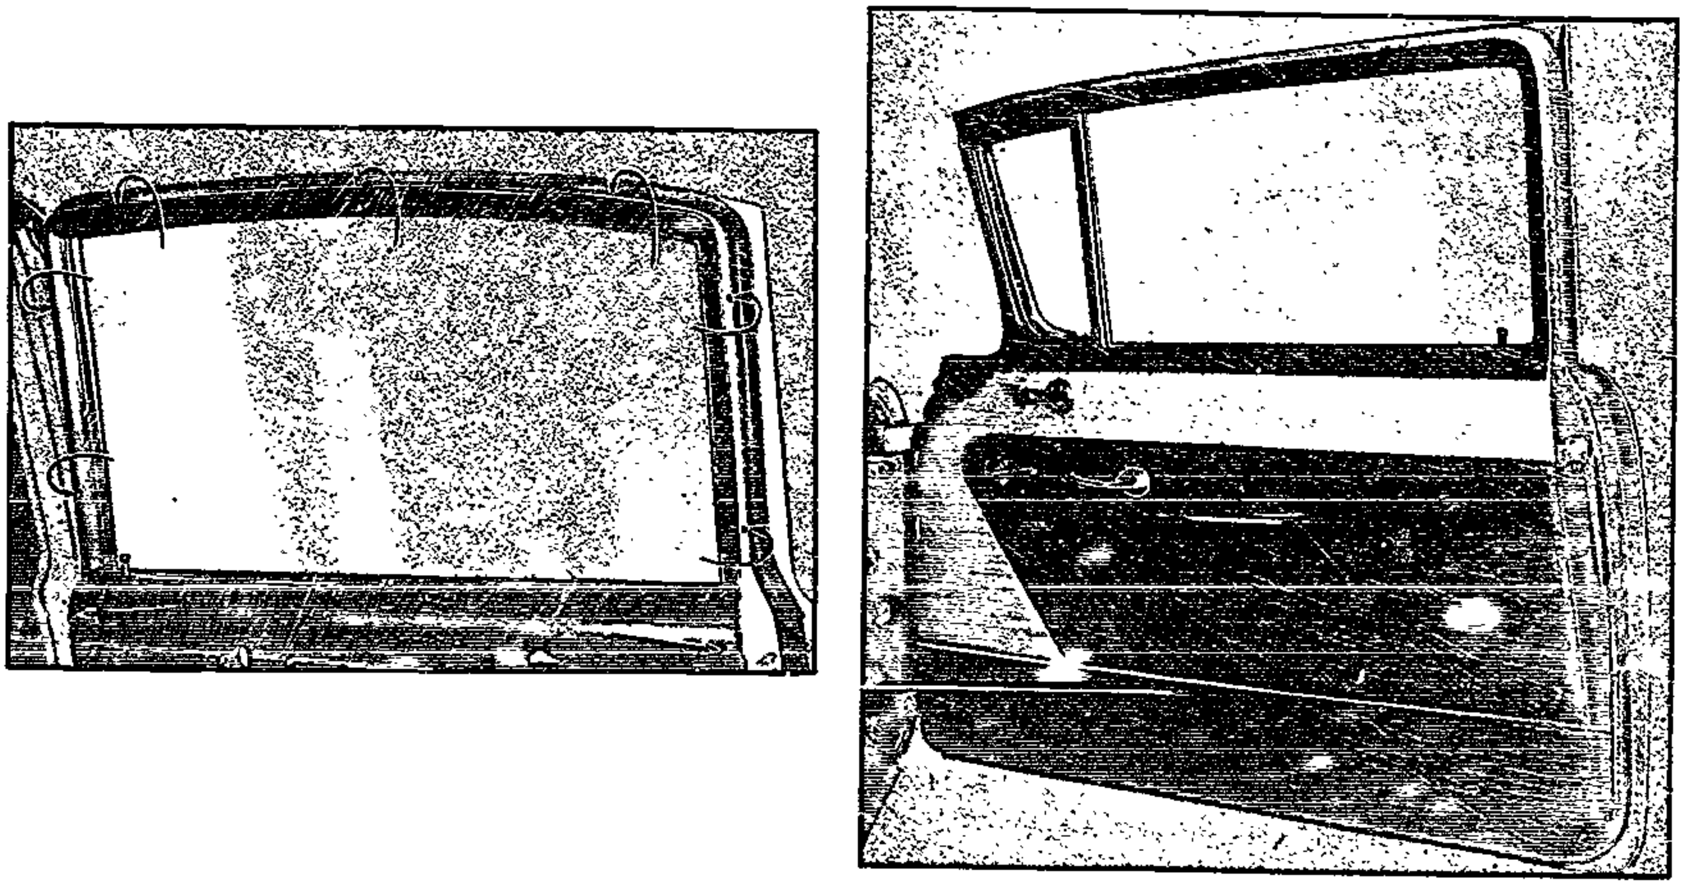
Whenever you begin to work with upholstery of any kind, remember that it was put there to make the inside of the car more attractive. CLEAN HANDS are one of the most important things to remember. Even though your hands may look clean, wash them before you begin. In this way you will be sure that the upholstery will not become soiled. There are many special tools that are available for use in trim work in order to simplify the operation. However, we will start with the basic ones and others will be introduced as needed.

TOOLS AND EQUIPMENT:

Small and medium screwdrivers (straight and Phillips head), mallet, door handle removing tool, pick or awl, and a whisk broom

PROCEDURE:

Begin by removing the screws that hold the garnish moulding in place. There are two types, one has screws through the face of the moulding, the other has the screw head coming through the door jamb. (Fig. IV-13)



TWO TYPES OF GARNISH MOULDINGS

FIG. IV-13

Look under the arm rest, if there is one. You will notice two screws which hold it in place. (If none are visible, then the arm rest is built into the trim panel.) Remove the two screws and place the screws and arm rest in a clean container.

Door handles are fastened in several ways. When removing the door handles, we must remember that there are two spring types and one that uses a pin. All General Motors cars and most Ford products use a horseshoe clip. (Fig. IV-14) Chrysler Corporation cars use another type of spring which requires a special tool. (Fig. IV-15) Whenever you use tools of this type remember that great force is not necessary. You must feel your way along. Some of the older cars have a straight pin through the handle, which is pushed out with a pin pick.

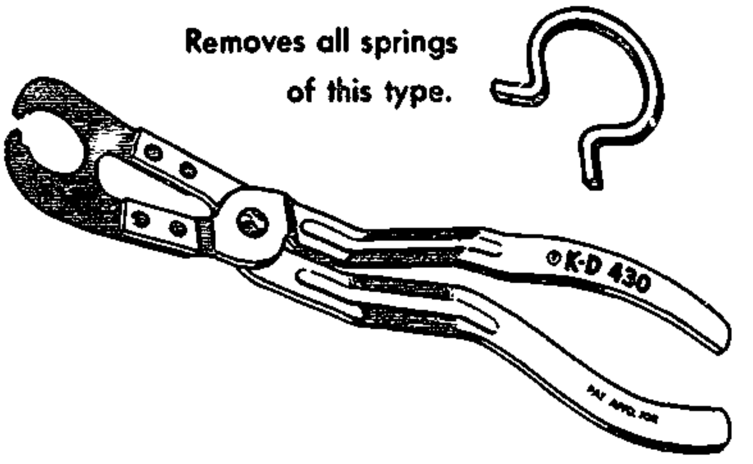


FIG. IV-14

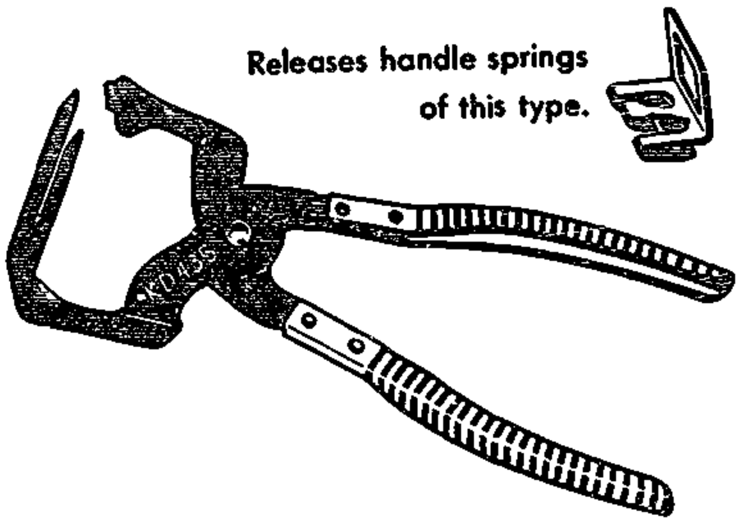

FIG. IV-15

TWO TYPES OF SPRING REMOVING TOOLS

Next, look for screws in the face of the trim panel, and remove any which are visible. Observe the length of the screws as you remove them. Some are made shorter to prevent glass breakage.

Insert a medium sized screwdriver or other tool with a wide face between the trim panel and the door shell. Gently pry the panel away from the door (keep the tool as close to the nail or clip as possible to prevent tearing it away from the trim panel). Pry on both sides, but not on the bottom, because some cars have a metal guide instead of clips or nails. Pull the panel slightly away from the door to check this. If it is the guide type, then merely raise the trim panel to unhook it; if it does have clips, then use your tool to release them. As the trim panel is removed, look for springs that may be under the handles. Be sure to PLACE ALL THE PARTS IN A CONTAINER. Store the trim panel in a safe place and cover it with a clean cloth to prevent soiling.

To replace the trim panel, first bring all the parts to the job and lay them out on a clean flat surface. Try to identify each part and its location. If you have forgotten, you can check yourself by looking at the door panel and locating the parts in this manner. Particularly with regard to screws, you can count the holes in the door and observe the size, thereby identifying the hole in which each belongs. Be sure that you know where all the parts belong before you begin the job. When replacing the trim panel, use a mallet to tap the clips back into place, using care not to break them. Next replace the handles by inserting the springs into the handle and pushing them into place. Follow this with the arm rest and the garnish moulding, making sure that no screws are left out.

ASSIGNMENT:

1. What is the purpose of the upholstery?
2. What must be done before starting a job with upholstery?
3. What must be done with the parts as they are removed?
4. How would you find out if the bottom of the trim panel has a metal guide or clips?
5. Demonstrate the proper way of removing the trim panel.
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Bumpers (Front and Rear) Lesson 5

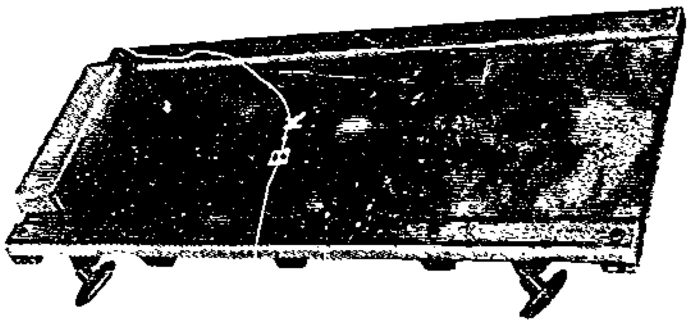
OBJECTIVE: To learn how to remove the bumper from the car in one unit.

INFORMATION:

On most cars you will find that to remove the bumper <u>assembly</u> you must work from underneath the car. To do this, follow the same procedure as used when removing wheels. Raise the car with the hydraulic jack, place the jack stands into position, and lower the car on the stands. Have the stands adjusted so that the car is high enough for you to slide under with a creeper. If a hoist is <u>available</u>, then you can work standing up. DO NOT operate the hoist until you have been instructed in its use.

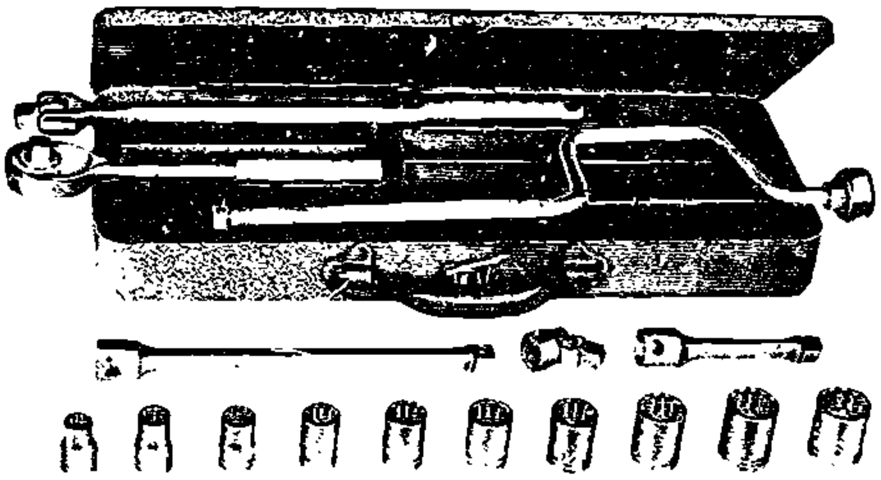
TOOLS AND EQUIPMENT:

Floor jack and stands, extension light, set of ½" drive sockets, set of wrenches, creeper and a can of penetrating oil



CREEPER

FIG. IV-16



½" DRIVE SOCKETS

FIG. IV-17

The first thing you must do when using the creeper, is to look under the car and examine it carefully for bolts that hold the bumper to the car. Do not lie on the floor. Always use a creeper as it protects your clothes and keeps your body off the damp floor. The best way to do this job is by starting at the bumper face bar and following the back bars to the chassis. Do not remove the bolts in the face bar. Remove only those that hold the bumper to the chassis.

Place a few drops of oil on each bolt on the nut side. Proceed to loosen all the bolts that you have located. Remove the nuts, but leave the bolts in place as this will keep the bumper from falling off. If there are only bolts that are threaded into the chassis, then leave at least two bolts to hold the bumper (one on each side).

Now you will need someone to help you to keep the bumper from falling as you remove the final bolts. Most of the new bumper assemblies are large and heavy and you should not attempt to do this by yourself. Carefully remove the bumper and store it in a place where it will not become scratched or damaged. If necessary, cover it.

On some cars, the grilles and parking lamps are fastened to the bumper. If such is the case, be sure that all wires are disconnected and remove the assembly in one piece. (Fig. IV-18)

Bumper Assembly including Grille and Lamps

FIG. IV-18

To replace the bumper assembly, bring all the parts to the car and make sure you know where each part belongs. Lift the bumper into place (someone must help you with this) and insert the bolts, but do not tighten them, just draw them up snug.

It is now important that you look at the assembly from the top and check it for level and for equal spacing on the ends. Once the bumper is set into its proper place, tighten all bolts securely.

With a soft, clean, cloth remove all smudges and finger prints from the area where you were working.

ASSIGNMENT:

1. Why should you place oil on the bolts and nuts?

2. Give some reasons for using a creeper.

3. What must be done before you slide under a car that is jacked up?

4. What must you do before you tighten the bumper securely?

5. Demonstrate the proper procedure to follow in the removal and assembly of the bumper.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT IV - REMOVAL AND ASSEMBLY

Hardware and Trim — Lesson 6

OBJECTIVES: To learn to identify some of the hardware and trim.
To learn how to remove and replace some of the basic pieces of hardware and trim.

INFORMATION:

The hardware and trim of a car serves two purposes. First, it is useful and second, it adds beauty to the car. The hardware that is useful we call functional, because it is used to assist another part of the car. Such items may be hinges, regulators, handles, locks. The hardware which is visible is chrome-plated most of the time to give long wear and additional beauty.

The trim of the car is primarily used for adding attractiveness to the final product. It can be used to hide seams, edges, openings in construction and for ornamental purposes. Generally, the trim is also chrome-plated for lasting beauty.

Since there are so many different types of hardware and trim, there are many different ways of holding them to the body. One rule we should remember is always to look in the service manuals which cover that particular car and model. If manuals are not available, then see if you can reach behind the part to be removed and look for a nut or screw. If it is impossible to get to the back of a part, then it is correct to assume that a clip of some type is used.

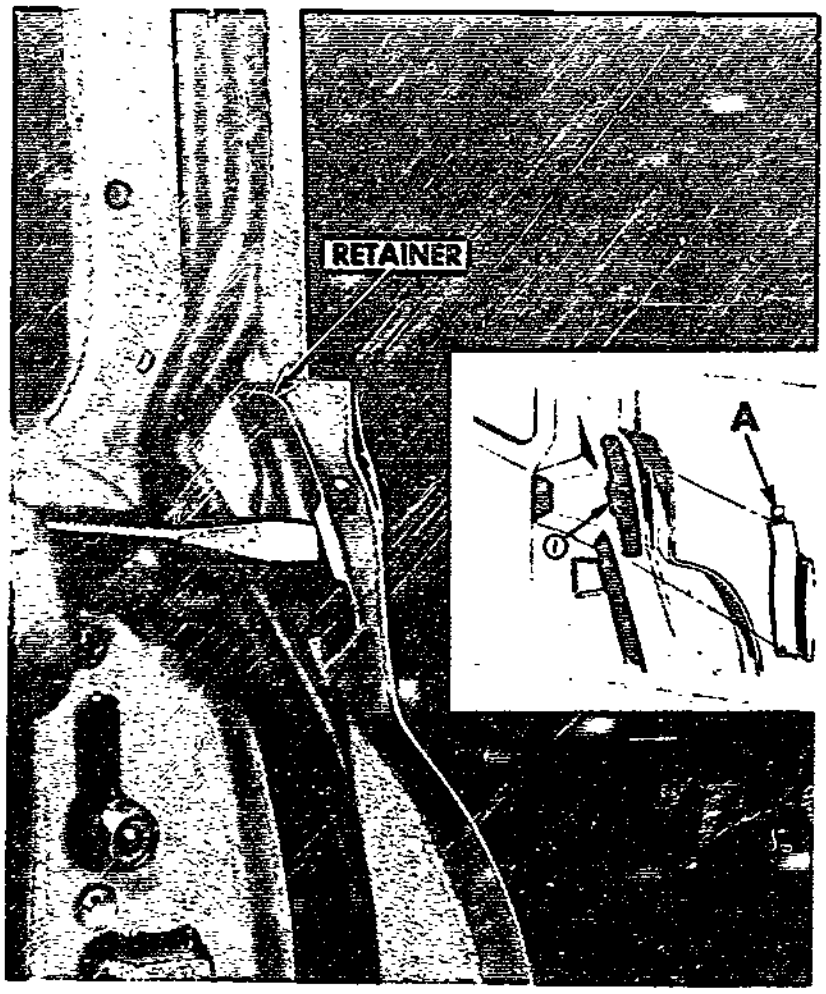
TOOLS AND EQUIPMENT:

There are many special tools which are devised for special fastening devices, but most of the time if care is used, a screwdriver, $\frac{1}{4}$" socket set, and pliers, are all that will be required.

Let us take for example the door handles which are to be removed. Most late model General Motors cars have a spring clip which holds the door handle in place. (Fig. IV-19) Carefully loosen the weather-stripping on the door jamb near the handle. You will see a small tab, about $\frac{1}{4}$" wide and 1" long. Place a screwdriver under this tab and pry outward evenly until it is out about $\frac{1}{2}$". Now remove the handle from the outside.

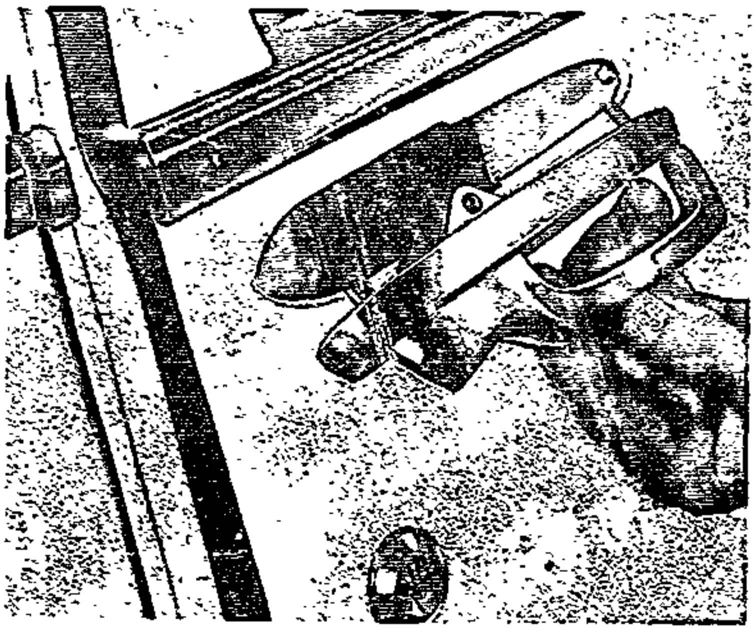
On Chrysler Corporation cars it is necessary to remove the upholstery trim panel in order to reach the screws from the inside of the door. (Fig. IV-20) Remember, if there is any question, refer to the service manual that is put out by the manufacturer.

To replace hardware, generally use the reverse procedure of the removal. It is a good idea to lubricate moving parts when they are apart before you proceed to reassemble them.



G. M. HANDLE

FIG. IV-19



CHRYSLER HANDLE

FIG. IV-20

Each car has its own type and style of mouldings and ornaments. One good rule is to look in the service manuals for the method used to fasten a part to the car. If this cannot be done, always look behind the part to see if there are nuts or screws which can be removed. If you cannot reach behind the part then probably clips are used to fasten it.

Some clips are fastened to the body and the moulding is snapped on (Fig. IV-21). Some clips are put into the moulding and snapped into the body (Fig. IV-22). In prying a moulding off a clip, always use great care, for the moulding can be bent or the surface of the body can be scratched, or nicked with the prying tool.

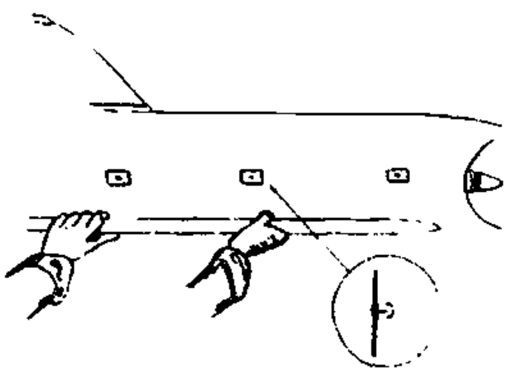


FIG. IV-21

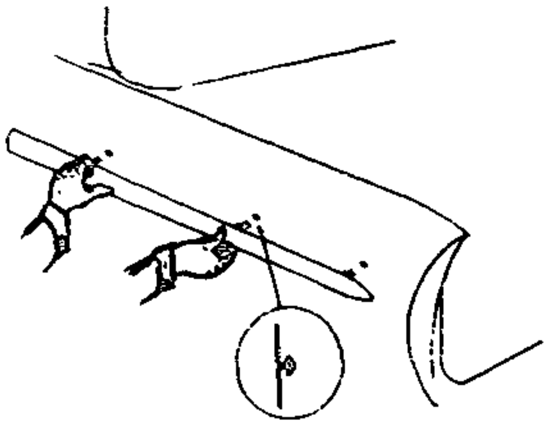

FIG. IV-22

TWO TYPES OF MOULDING CLIPS

You must also be very careful on some mouldings as they have clips in the middle but a bolt and nut on the end. Here the nut or screw must be removed first. Whenever trim is removed, always store it in a safe place, so that it does not get damaged.

To replace trim, make sure you know where all the parts go and reverse the removal procedure, always being careful not to scratch or mar the paint, or chrome.

After you have finished installing a part, wipe off the area that you have worked on with a clean, soft cloth.

ASSIGNMENT:

1. List some examples of hardware on the automobile.

2. Why is trim used on the automobile?

3. What is the first rule when you are not sure of how a piece is fastened?

4. How would you find out how a piece is fastened to the car?

5. What do you do with chrome parts when they are removed?

6. Demonstrate how you would remove the handle of a General Motors car and a Chrysler Corporation car.

7. Demonstrate how you would remove the hood ornament from a car.

8. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVE: To learn how to remove and replace the radiator.

INFORMATION:

Radiators are made of a combination of copper and brass (Fig. IV-23). This makes the radiator one of the most expensive single pieces on the car, therefore extra care must be used whenever you work on this section.

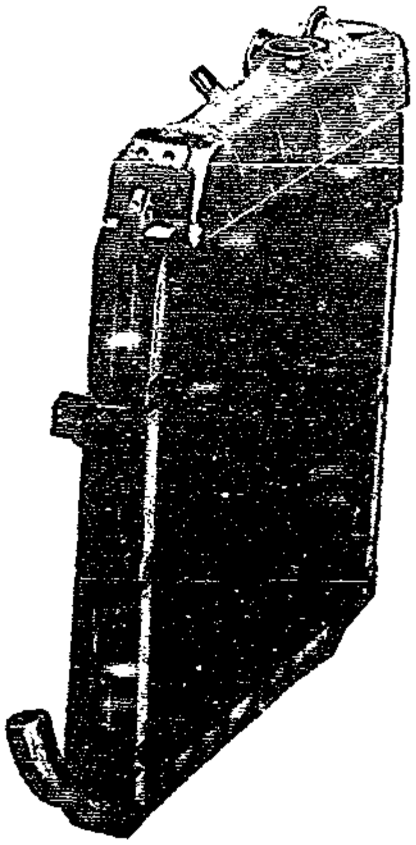

FIG. IV-23

There are many reasons why radiators must be removed. Many times the radiator is damaged in an accident and must be replaced. There are times when radiators develop leaks. These radiators should be removed, repaired, tested, and replaced. There are times when work is required on the motor or chassis which can only be done after the radiator is removed.

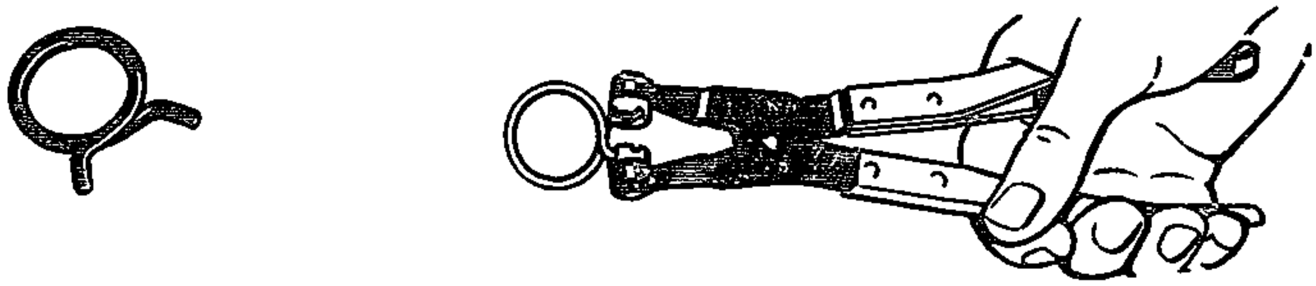
TOOLS AND EQUIPMENT:

3/8" socket set, straight screwdriver, pliers, drain pan, extension light, and possibly a creeper.

PROCEDURE:

First, place the drain pan on the floor under the radiator and position it under the drain plug or petcock. Remove the radiator cap with caution. Most radiators operate under pressure. Therefore, the cap must be removed very slowly when the radiator is hot. Loosen the drain plug. On some cars this can be done by reaching down in front of the motor. On others it may be necessary to use a creeper and loosen the drain from the bottom of the car. After all the water has drained into the pan, check the color for the presence of anti-freeze. If it is only water, it may be disposed of. Anti-freeze should be poured into a container and stored in a safe place. To be absolutely sure of the contents of the radiator, use a hydrometer.

Loosen the screws that hold one end of the radiator hoses. One end should be left tight. There are different types of hose clamps. Most of them have screws which tighten them, but some now use a spring type clamp (Fig. IV-24) which requires a special tool for removal.



SPRING TYPE HOSE CLAMP

FIG. IV-24

It does not make much difference which end is removed, but always pick the end which you can reach more easily. With the clamps loosened, begin to twist the hoses off, with a back and forth twisting motion. Often these can be very stubborn, so be careful not to damage the hoses.

Remove all the bolts that are found on both sides of the radiator (generally there are from two to four on one side). The radiator is now ready to be lifted out of the car. You must use care so that the radiator is not damaged by scraping it against the fan blade. On some cars there is a large round pan that covers the fan blade. This must be removed before you attempt to remove the radiator.

When replacing the radiator, bring all the parts to the car and make sure that you identify and locate all the parts. Lower the radiator into place and insert all the bolts but do not tighten them. Next, hook up the hoses and tighten them securely. Now tighten the bolts on the side of the radiator. Replace the pan if there is one. Check the drain plug and make sure that it is shut off. Proceed to refill the radiator. Check for leaks around the hoses and the drain. When you are finished with your job, wipe up the area in which you were working to remove dirt, grease, and hand marks.

ASSIGNMENT:

1. Why must the radiator cap be loosened slowly when the radiator is hot?

2. How are the radiator hoses removed after the clamps are loosened?

3. Where is the radiator drain plug located?

4. What are most radiators made of?

5. Demonstrate the way to remove the radiator from the automobile.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT IV - REMOVAL AND ASSEMBLY

ACHIEVEMENT TEST

1. Demonstrate the following operations. All involve removal and replacement.

    a. front and rear wheel
    b. front seat assembly
    c. rear seat
    d. trim panel
    e. rear bumper
    f. front bumper
    g. outside door handle
    h. radiator

2. List ten new words that you have learned in this unit. Use each in a sentence.

UNIT IV - REMOVAL AND ASSEMBLY

ACHIEVEMENT TEST

1. Demonstrate the following operations. All involve removal and replacement.

   a. front and rear wheel
   b. front seat assembly
   c. rear seat
   d. trim panel
   e. rear bumper
   f. front bumper
   g. outside door handle
   h. radiator

2. List ten new words that you have learned in this unit. Use each in a sentence.

UNIT V - REFINISHING

Enamels and Lacquers Lesson 1

OBJECTIVES: To learn about the different types of paint.
To learn how to identify paint.
To learn why finishes were developed.

INFORMATION:

Painting something, whether it be a car, refrigerator, toys or furniture, is done for two reasons. First of all paint protects the surface, and second, it adds beauty to the finished product. For automobile paint, the weather is the chief enemy. Cars are exposed to sun, rain, snow, wind, heat and cold with little or no protection. The major part of the automobile is made of steel. Steel, as you know, is strong and very useful in the auto, but a disadvantage is that it will rust when exposed to the weather. So then, the primary purpose of using paint is to protect the steel from rusting and make it last longer.

The automobile of today is made more beautiful by the wide range of colors that are available. Therefore, the automobile is not only a useful means of taking you from place to place, but becomes something which you can enjoy looking at and be proud to own.

In the beginning, automobile makers used the slow drying varnishes and paints which we call ENAMELS. These are satisfactory, but they had one big disadvantage, they dried too slowly. Because of its slow drying, the paint would accumulate a great deal of dust and dirt while it was tacky. In addition a long time was needed to complete one job.

The paint companies then began to develop a paint which would be just as good as the enamel, but would dry faster. This fast drying paint we now know as LACQUER. Now we have a paint which can be sprayed on the car and in a few minutes is dry enough to touch. But it differs from enamel in that it must be polished and waxed in order to make it shine.

Now let us look at each one a little more closely. The enamels are slow drying paints which develop a hard glaze on the surface. This hard glaze is the heart of the finish. If the surface wears off, there is very little possibility of regaining the original shine and lustre. The lacquers on the other hand are uniform throughout the entire paint film. The shine and brilliance, however, is acquired through rubbing, polishing, and waxing If the color goes dull from the weather, it can readily be polished and waxed to its original color and brilliance.

The various paints are made heavy in form. For this reason paint must be reduced in order to be usable in a spray gun. This reduction is made possible by the use of lacquer thinners and enamel reducers. On each can, you will see the directions for mixing the paint. Follow these directions carefully and NEVER mix enamel and lacquer products together. Each product is made up of its own special ingredients and the inter-mixing of them will result in curdling or jelling of the paint.

ASSIGNMENT:

1. What are two reasons for painting something?

2. Name the two basic types of auto paint. Which was used first?

3. Why was the second paint developed?

4. Give some of the differences between the two basic types of paint.

5. What must be done to paint before it can be sprayed? What products are used?

6. Is it permissible to mix the different types of paint together? Why?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Materials for Undercoating Lesson 2

OBJECTIVES: To learn the reason for using undercoating materials. To learn how to identify different paint products and their uses.

INFORMATION:

When we speak of materials for undercoating, we mean primers, surfacers, sealers, and putties. At first it was required to apply a coat of PRIMER to all bare metal. The primer is the bonding agent that holds all the other coats of paint in place. This operation was followed by at least two or three coats of SURFACER to fill in all the scratches and imperfections on the surface of the metal. Generally, surfacers are heavier and fill more readily than any other material. Now if there were still spots which had scratches or nicks, it became necessary to apply GLAZING PUTTY with a rubber squeegee or a flexible putty knife. By this time the surface was well prepared for the finish color. However, in order to prevent the color coats from sinking into the undercoats, a SEALER is used. This seals the surface so that the color will not penetrate and also acts as a bonding agent between the color and the primers

As new paints and products were developed, the manufacturers combined the primer and surfacer into one paint. We now have what is called PRIMER SURFACER. In most instances this can be used on bare metal or old paint to act as a bonding agent. It can also be used to fill in the scratches and imperfections.

It must be remembered that there are many different kinds of paint products being made for various uses. One type of primer or primer surfacer may not be good for all types of jobs. It is important that we refer to the catalogues from the paint company to learn about each type of paint. We want to know what it was developed for, and which of our needs will it meet. Each paint manufacturer has his own brand names and numbers by which their paints can be identified.

The reduction of primers is very important. Always read the label on the can thoroughly. Usually primer surfacers are made heavier than the color coats. This is done so that there will be more body to the paint for filling purposes. Some primers which are meant for bare metal are thinned more than usual. This is merely to allow them to act as a bonding agent. Some sealers require no reduction at all, so be sure always to refer to the label for instructions on reduction.

ASSIGNMENT:

1. What is meant by the word primer?

2. What is meant by the word, surfacer?

3. Why is glazing putty used?

4. Why are sealers used?

5. What is the best way to find out what a certain paint is meant to do?

6. Are primers reduced in the same way as colors? Why?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVES: To become familiar with the different types of solvents available.
To learn the purposes of these products.

INFORMATION:

In painting, one problem with which you will be faced from now until you complete your last paint job is cleanliness. This is a never-ending problem. Without cleanliness you can never be successful. It applies to everything in the paint field: the job, the shop, tools, equipment, materials, and you. Paint manufacturers have developed materials called solvents to help you maintain this cleanliness. Here again we must refer to the manufacturers' catalogues to see what types of solvents have been developed to do certain things.

WAX AND GREASE REMOVERS

Let us begin with wax and grease removers. Some of the biggest enemies of the painter are wax, oil, or grease. Paint that is applied over any one of these agents will not stick to the surface. One sure indication of this is the failure of the paint to dry. Generally, the first thing a good painter will do before he starts sanding, is to use a good cleaner and wash the entire surface to remove any trace of wax, grease, or oil.

METAL ETCH

Another common enemy of the painter is the formation of rust on the metal surface to be painted. In certain kinds of repair work, solder is used, with acid as a flux. This acid must be neutralized or rust will begin to form under the painted surface. To neutralize this acid there are many metal cleaners on the market which will dissolve rust, neutralize acid, and etch the metal to be painted. Remember to refer to the catalogues, because there are different cleaners for steel, aluminum, and galvanize.

GUN CLEANERS

Your spraying equipment must always be kept clean and in good operating condition if you expect to do a good job. Right after you have finished spraying, is the best time to clean the gun. If you put the gun down and allow the paint to dry on the gun, it will be much harder to do a good cleaning job on it.

In some shops, thinners are used in place of a gun cleaner. This is acceptable practice, but it is recommended that for best results a gun cleaner be used.

It might be mentioned here that there are many cleaners for other purposes which are not in the refinishing line. For example, if upholstery is soiled by grease and dirt, carbon-tetrachloride is very helpful in removing stains. If paint happens to get on the upholstery, clean it immediately with the proper thinner (if the paint is lacquer, use lacquer thinner; if it is enamel, use reducer).

One word of caution about using solvents. Many solvents are highly flammable. This material must be kept away from fire and stored properly when not in use. Also, many of the solvents of today are highly asphyxiating and injurious to the skin. Whenever solvents are used there must be sufficient ventilation. Never close yourself into a room when using solvents. Always open doors and windows to allow air to circulate around you. When solvents are spilled on some part of your body, always wash immediately with soap and warm water.

ASSIGNMENT:

1. What is the first thing you must do before starting to sand a job?

2. How can rust be removed from the metal surface?

3. When is the best time to clean a spray gun?

4. What can you use to clean a spray gun?

5. Name two common hazards in using solvents.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT V - REFINISHING

Sanding Materials Lesson 4

OBJECTIVES: To learn the reasons for sandpapering a surface.
To learn the different types of sandpaper.

INFORMATION:

After we are sure that the surface of the job is thoroughly cleaned, our next problem is to prepare the surface for the first coat of primer surfacer. This is done by sandpapering. In the sanding operation there are two things that must be done. First, we must sand all rough spots smooth and eliminate imperfections as much as possible. This will reduce the amount of filling that must be done. Second, we must take a smooth painted surface and provide tiny scratches for the paint to grab into and thus make a perfect bond between the old and new paint.

These two steps can be accomplished best through the wise choice of sandpaper. The grit of the paper means the roughness of the abrasive. The thing to remember is that we are trying to make less work and not more. If we use a sandpaper that is too coarse, the result will be unnecessary scratches which must be filled in with paint. On bare metal the average grit that is used is 180 or 100. This will cut fast and yet leave the surface smooth. When working with painted surfaces we must consider the condition of the old finish. If it is a new car with a good finish then we can sand with #320 grit paper. If the finish is old and has many defects which must be eliminated, then we must use a coarser paper, perhaps #220 or $180. On very bad surfaces sometimes we use #100 grit paper. Another important thing to remember is that there are two types of paper, the wet or dry type. The wet paper should be used with water. This helps to keep the abrasive in the sandpaper from becoming clogged with the paint that has been sanded off. By flushing water with a sponge over the sandpaper the particles of paint that have been sanded off are washed away. With the use of water, the sandpaper can be used much longer. Usually dry paper is used on bare metal. However, sometimes when the old paint is very bad it is faster to use dry paper instead of wet.

ASSIGNMENT:

1. Give two reasons for using sandpaper.

2. What are the two types of sandpaper?

3. What does grit mean in relation to sandpaper?

4. Name four different grit sandpapers.

5. Why is water used with sanding?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Sanding

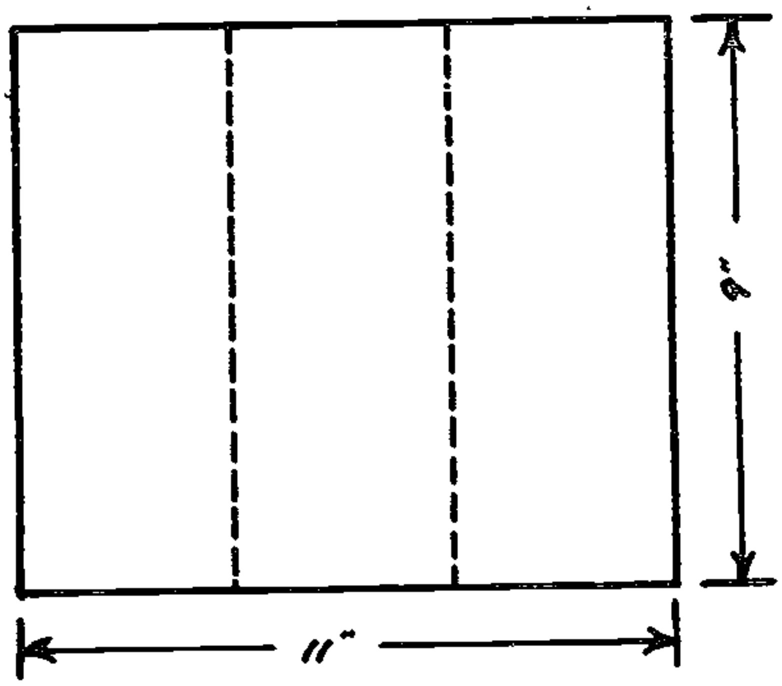
Lesson 5

OBJECTIVE: To learn how to sand a job properly by hand or with a machine.

INFORMATION:

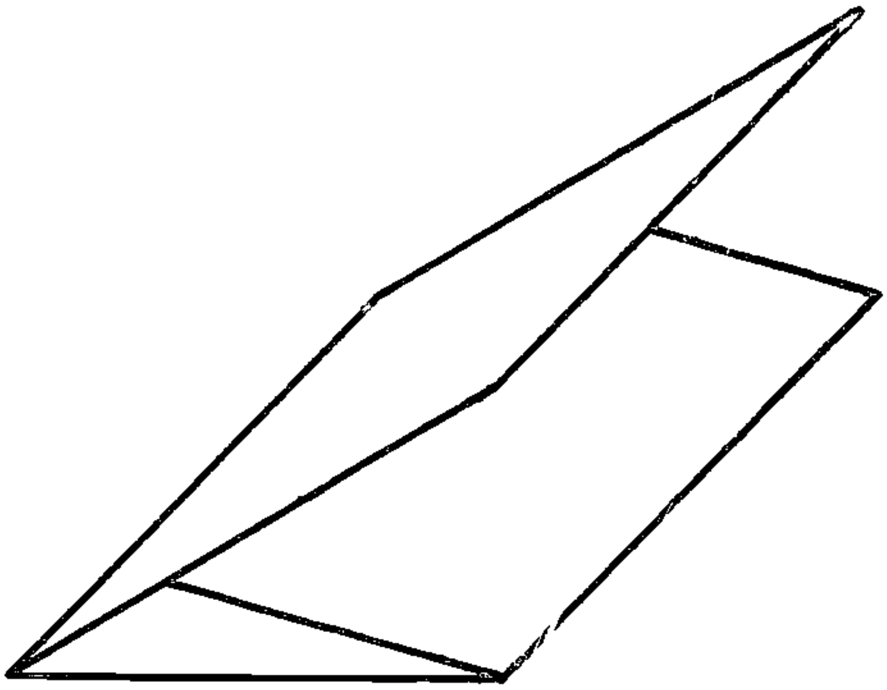
After you have selected the proper sandpaper grit to use, the next thing is to cut the sheet so that there is no waste. Divide it into three sections and cut evenly (Fig. V-1). Sometimes an old paper cutter is good for this purpose.

Cut on dotted lines



CUTTING THE SANDPAPER

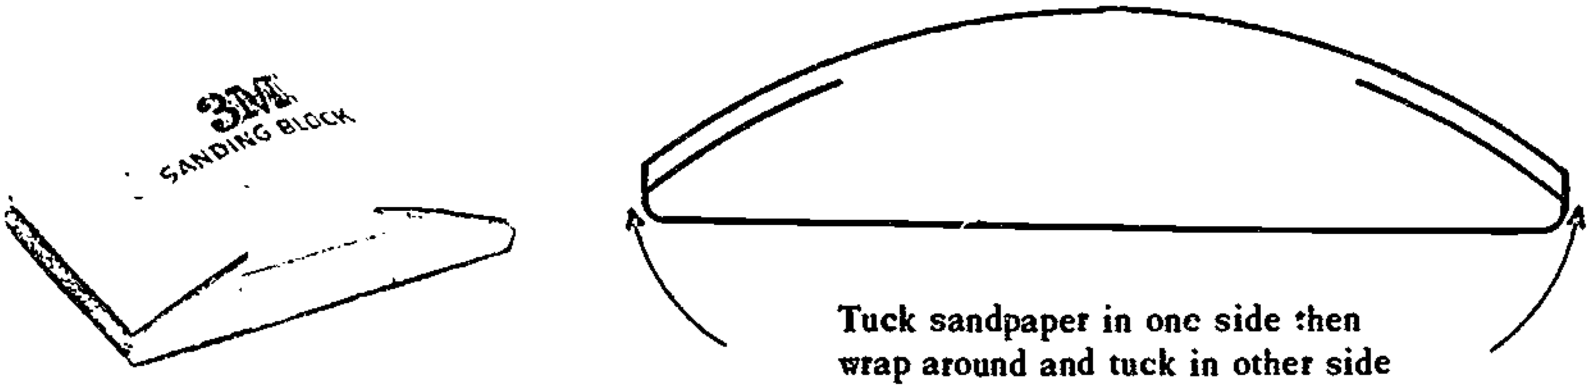
FIG. V-1



FOLDING THE SANDPAPER

FIG. V-2

By cutting the paper in this method, you will find that it can be used for both hand and machine sanding. When doing hand sanding, fold the paper into three sections (Fig. V-2). If you use a block sander, attach the ends of the sandpaper in the block as shown (Fig. V-3).



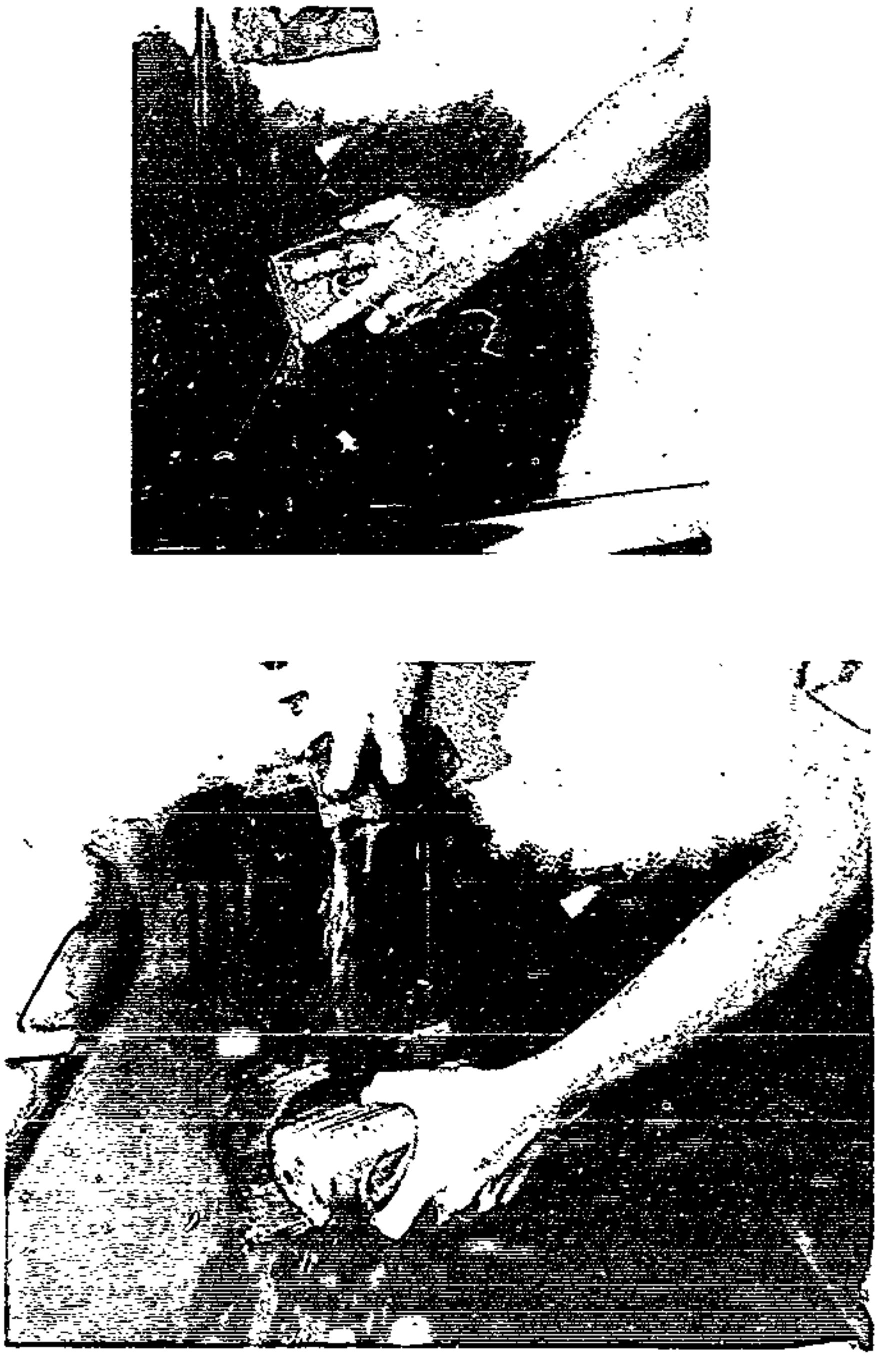
Tuck sandpaper in one side then
wrap around and tuck in other side

FIG. V-3

When sanding by hand grasp the corner of the sandpaper between the thumb and the index finger and lay the fingers flat on the sandpaper (Fig. V-4). Apply a slight pressure as you sand and always sand in the longest direction. This will help you sand faster and more evenly. NEVER, NEVER sand with the finger tips. Always use the palm of the hand. This will give you a smooth and level surface when you are finished. The use of the finger tips will cause small holes to show through the finish. See example of sanding with block and machine (Fig. V-5).

HAND SANDING

FIG. V-4



BLOCK AND MACHINE SANDING

FIG. V-5

Feather edging is a term applied to the tapering off of an edge of paint where you have a chip or a repair spot (Fig. V-6). The amount of feather edging is determined by the condition of the surface. If there are only a few coats of paint, then you do not have to sand very far from the bare metal area. If there are many coats of paint, then it becomes necessary to sand a larger area. On the average, to feather edge you will sand away from the metal from 1" to 3". Feather edging can be done by hand, with a block, air sander, or electric sander (Fig. V-7).

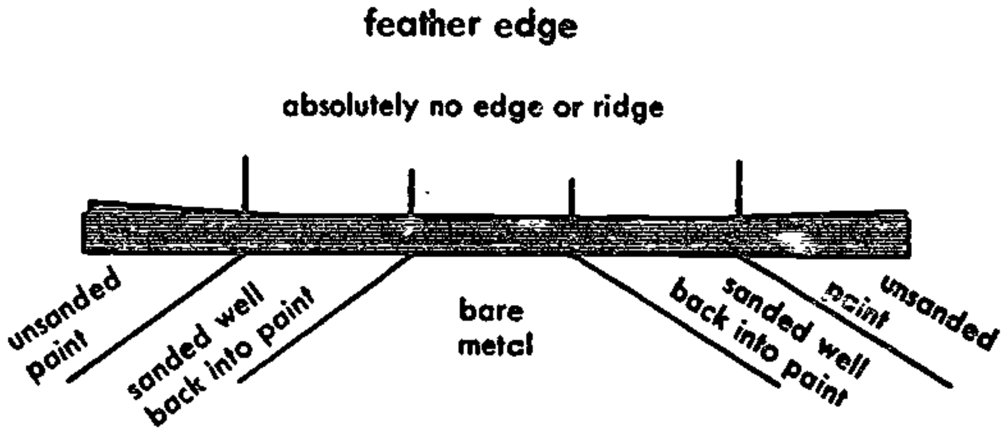


FIG. V-6

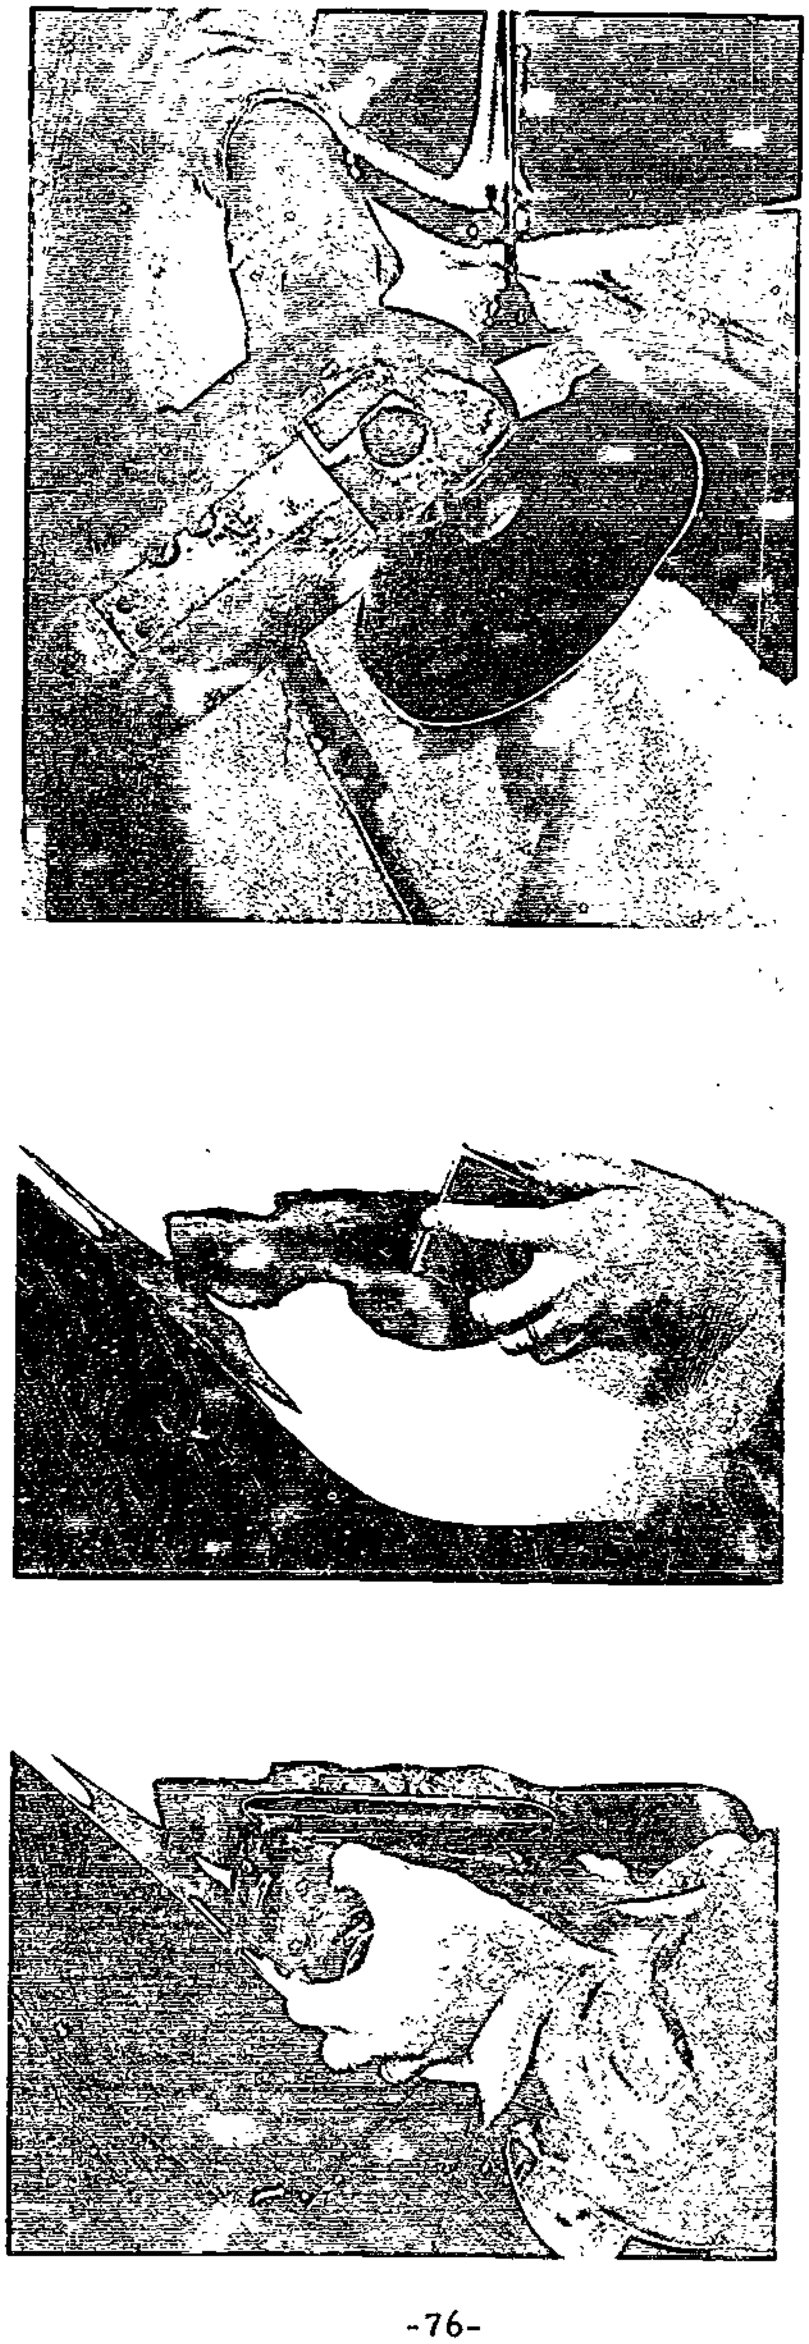

FIG. V-7

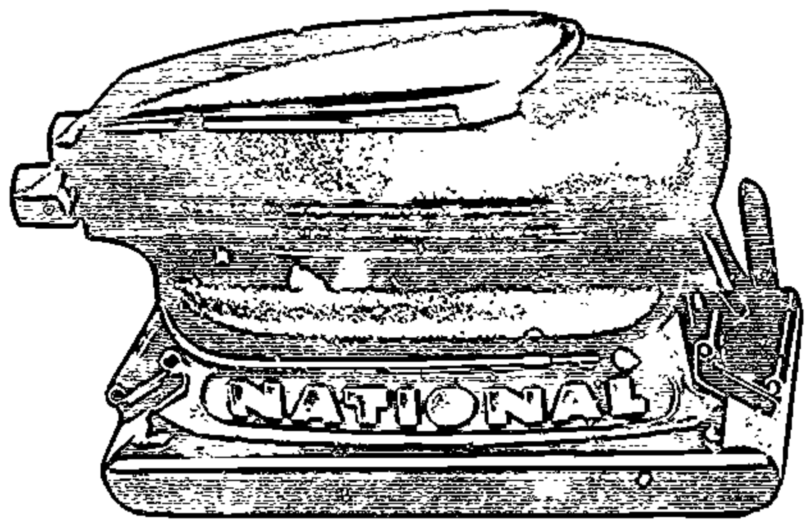


AIR SANDER

FIG. V-8

When using a machine sander (Fig. V-8), the same basic principles apply as do to hand sanding. Always use the longest stroke and hold the machine flat on its pad. The air pressure that is required to operate a pneumatic sander should be from 65 to 80 pounds. Be sure that all connections are tight because the vibration of the sander will tend to loosen the connections. One thing to remember is not to inter-mix hoses between the spray gun and the sander. The sander uses oil through the hose for lubrication and generally the hose has an accumulation of oil which could get into the spray operation.

To operate the sander, hook up the connections securely to the main line of the regulator and sander and turn on the air. IMPORTANT - never lay the sander on a bench or table with the hoses hanging over. It is very possible for someone to trip over the hose and knock the sander off causing it to break. Always hold the sander by the body of the machine and not the hoses. It is very possible for the connector to break off if a strain is put on it by holding it by the hose connection.

Holding the machine in one hand, squeeze the handle at the top to start the machine. If you are using water, hook up the water line to the outlet next to the air outlet. This will operate at the same time that the air goes on.

You will have to use your own judgment as to which method would be the best to use. If the spot is small or curved, then the hand method is the best. If you have a panel that is not too large, then perhaps the block sander is the best. If the area to be sanded is larger, then perhaps the machine sander would be better to use.

Whether sanding by hand, machine or block, always be careful of glass and chrome parts. They can become scratched very easily and are very expensive to replace.

ASSIGNMENT:

1. Show the instructor how you would divide and cut a sheet of sandpaper for use.

2. Show the instructor how you would fold the piece of sandpaper to sand a job.

3. What is feather edging?

4. Where would you use a block sander?

5. What must you be careful of when using the machine sander?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

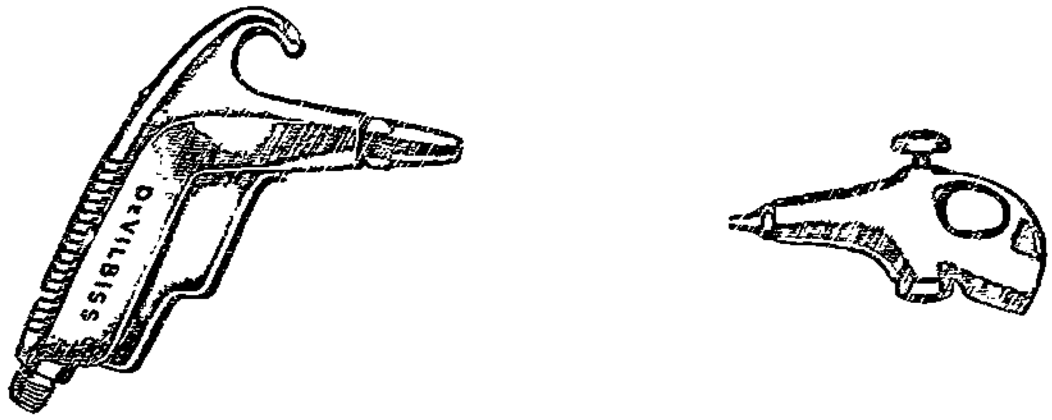
UNIT V - REFINISHING

Use of the Dusting Gun — Lesson 6

OBJECTIVES: To learn the proper method of dusting.
To learn the reasons for using the dusting gun.

INFORMATION:

Whenever we discuss any part of refinishing we must emphasize cleanliness. This lesson deals directly with the cleaning of particles of dirt from the painted surface. You can wash and wipe over and over again and clean the surface, but there are some places where your cloth will never reach. These are in the openings, cracks, and joints. The dusting gun is the only way to clean these places. You will need the dusting gun, air hose, and a clean piece of cloth (Fig. V-9).



DUSTING GUNS

FIG. V-9

The following procedure applies, whether you are preparing a small touch-up job or a complete refinishing project. Always remember where you start, and work in a pattern. Do not go from place to place without a definite pattern, as there will be places that you may miss and these will show up when it is too late.

Let us start with the refinishing of the front fender. Starting between the hood and the front fender, put the point of the dusting gun between the opening of these two parts, and with full force blow the air and move the gun towards the back of the car. (The higher the pressure the better - 60-80 lbs.) Now do the same thing between the door and the fender, working from the top down. Be sure that the air is being forced into the opening with full force, and hold the gun as close to the opening as possible.

Next start at one point between the headlight rim and the fender and work around the rim. This spot might take more than one operation as a great deal of dirt is caught there. Next work around the grille and here again thoroughly clean this area. If there are any mouldings or trim on the fender, do this last. To test to see if you are actually blowing something out or not, place your hand in front of the dusting gun as you move it along and you will feel the dust and dirt coming out. If this operation is not done properly, later as you are spraying with paint, the pressure of the spray gun will blow the dirt out and it will settle on the fresh paint. Remember, always follow a pattern so that you can remember what has been done and what remains to be done.

When preparing for a complete paint job, start at one point on the car and move systematically around the car until all joints, openings, and cracks have been cleaned thoroughly. Be sure to do all trim and mouldings. If once is not enough, then go over it until you can feel that there is no dirt coming out in front of the gun.

ASSIGNMENT:

1. Why is it necessary to use a dusting gun?

2. How much pressure should be used with the dusting gun?

3. Show the instructor how you would blow the areas around the front fender.

4. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Masking

Lesson 7

OBJECTIVE: To learn the methods of masking.

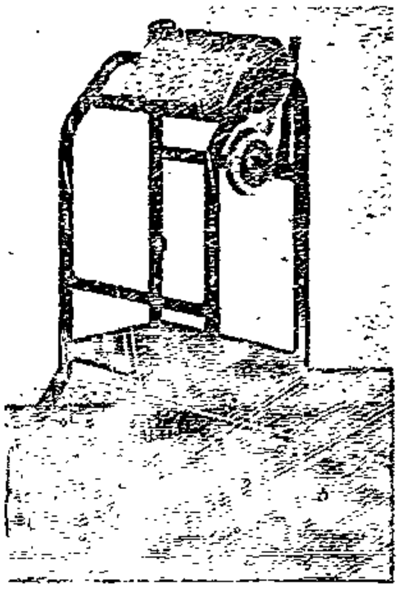
INFORMATION:

Included in the program of cleanliness is the covering of the parts of the car that are not to be refinished. This is called MASKING. It is done with masking tape and paper. The masking tape is available in sizes from ½" to 2" wide. It is a waterproof paper with a gum adhesive on one side.

Masking paper is available in 3", 6", 12", 24" and 36" widths. Pictured is a typical type of masking machine in common use (Fig. V-10). If masking paper is not available, then ordinary newspaper will do.

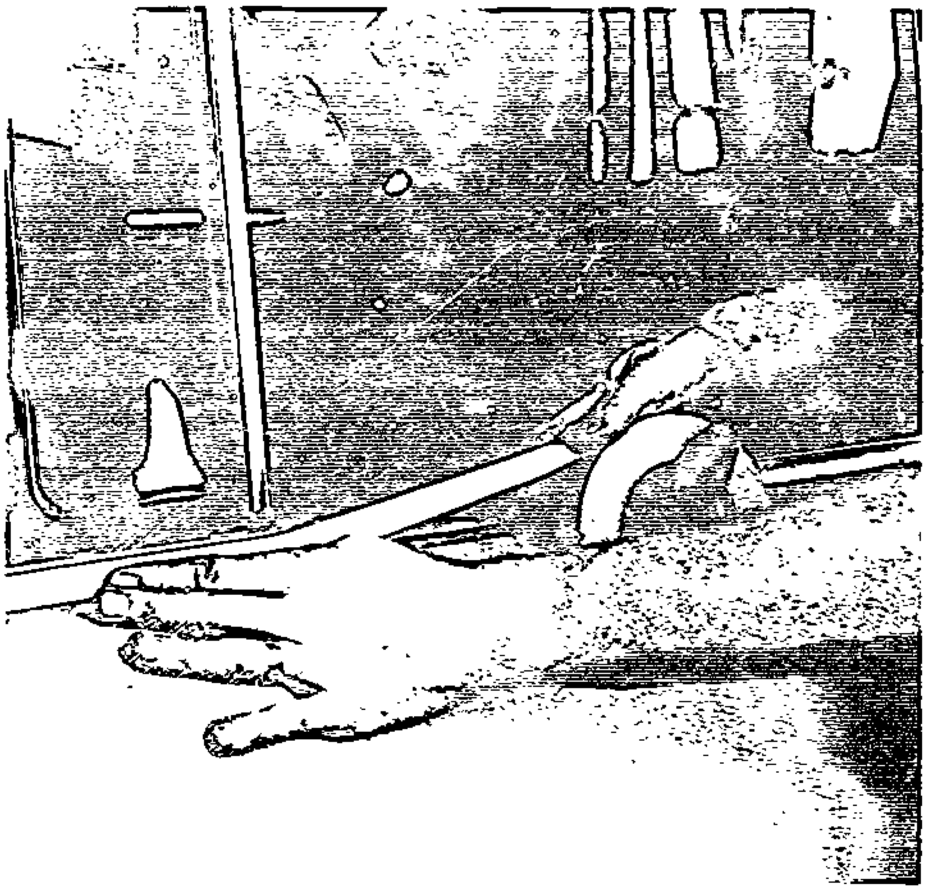
Before starting to mask a job, see how much area needs to be covered. This will tell you what size tape and paper to use.

Follow the pictures of various parts being masked and notice the size of the tape and paper, as well as the method used.



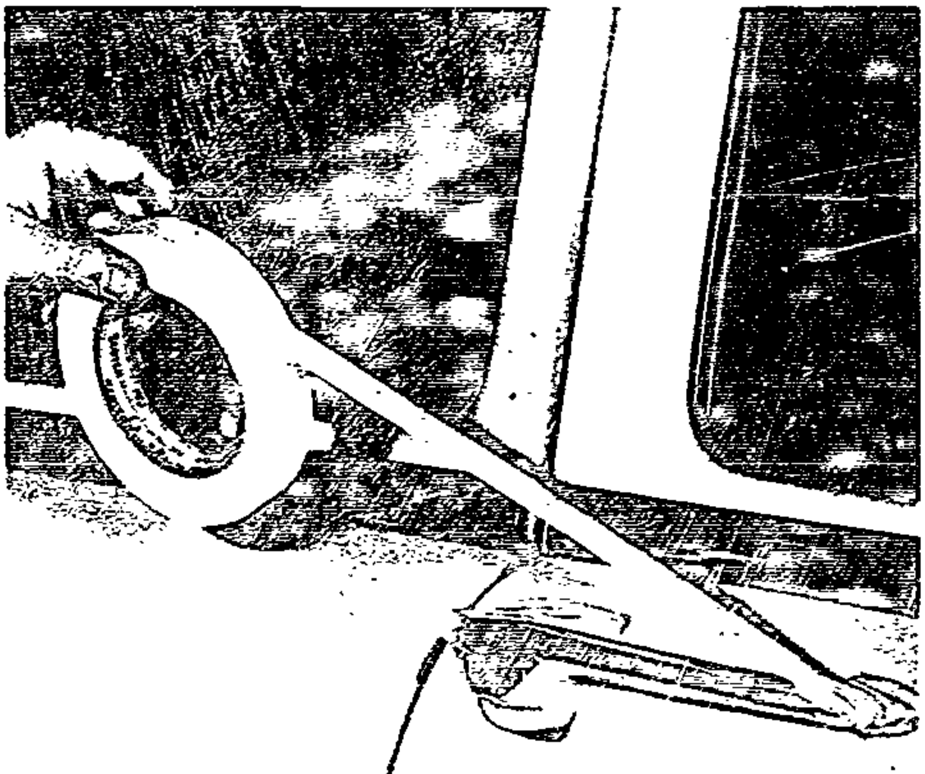
MASKING MACHINE

FIG V-10



MOULDINGS

FIG. V-11



HANDLES

FIG. V-12

When masking, NEVER STRETCH the tape. Lay it on as it comes off the roll. Hold the roll of tape in one hand and guide the strip of tape with the other hand. Always mask the edges first and fill in the spaces in the center last.

When masking windows or areas where there are many curves, always use $\frac{1}{4}$" masking tape on the edge first. This is easier to maneuver. Then proceed to use the tape and paper. Going around curves, the tape or paper should always be held loosely, pressing it down with one hand and steering it with the other hand. Always tape down all edges of the paper, as this will prevent paint from being blown under the paper.

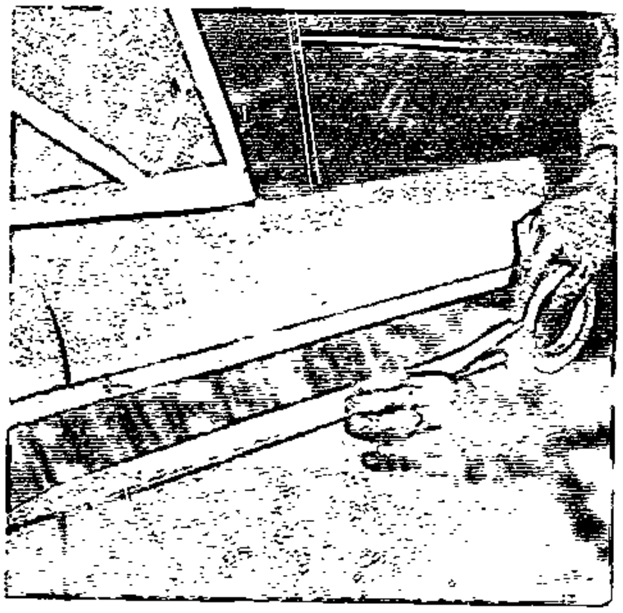


FIG V-13

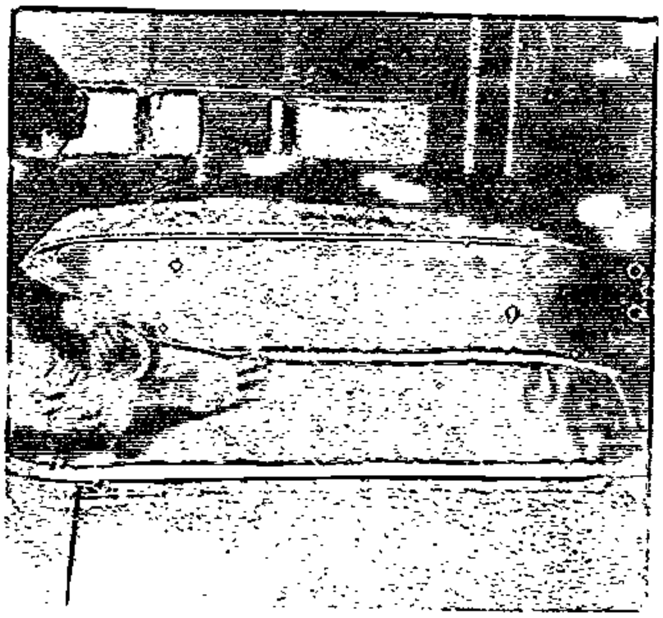

FIG. V-14

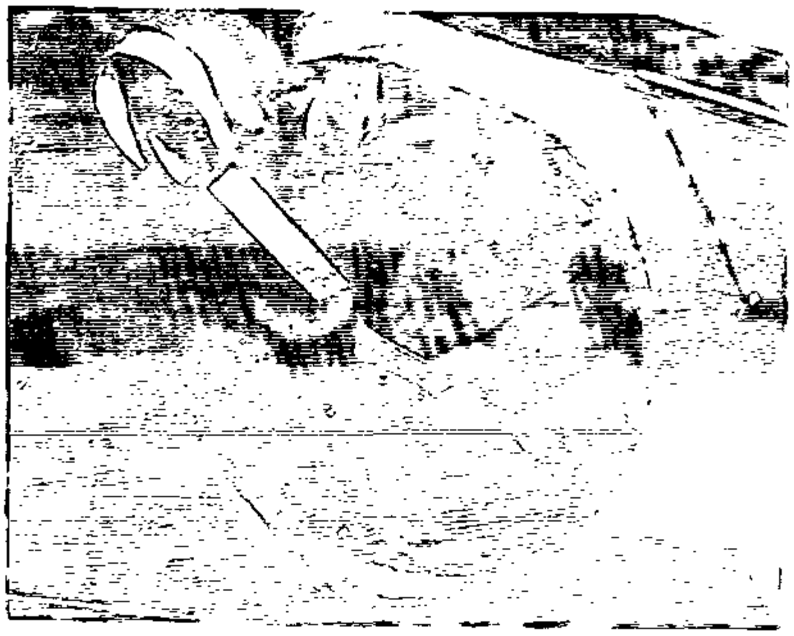

FIG. V-15

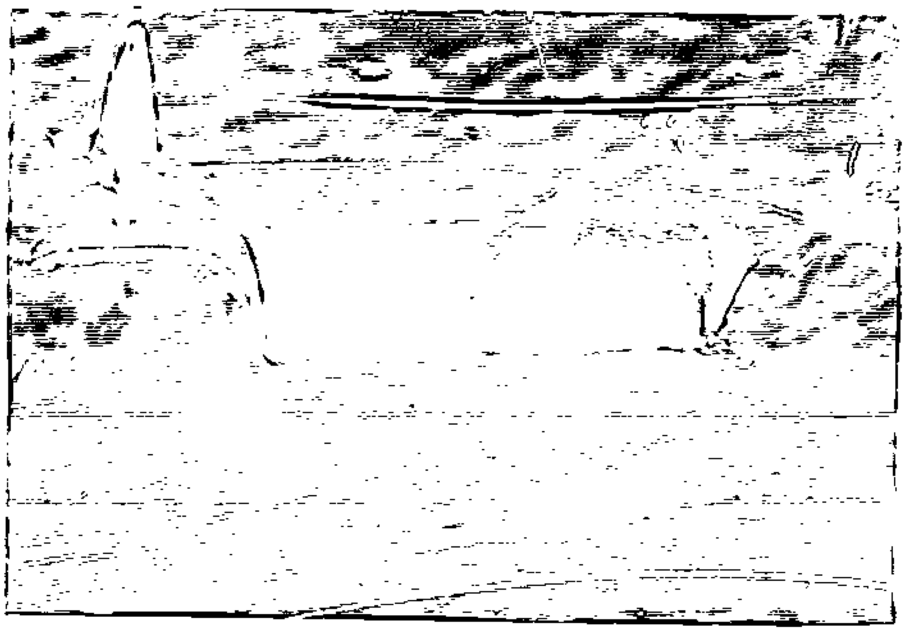

FIG. V-16

TYPES OF MASKING JOBS

When there is a continuous curve to be taped, it is helpful to pleat the paper every 4" to 6". This will help the tape and paper to fit the curve tightly (Fig. V-17). Note how door jams are masked (Fig. V-18).

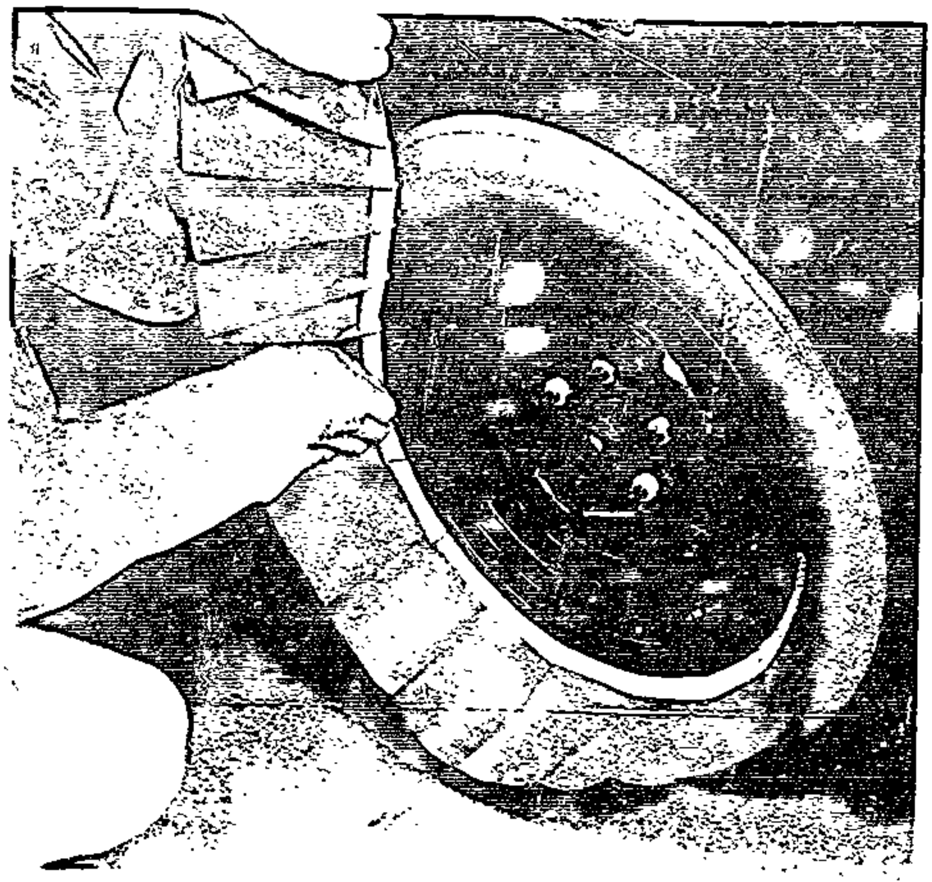

FIG. V-17

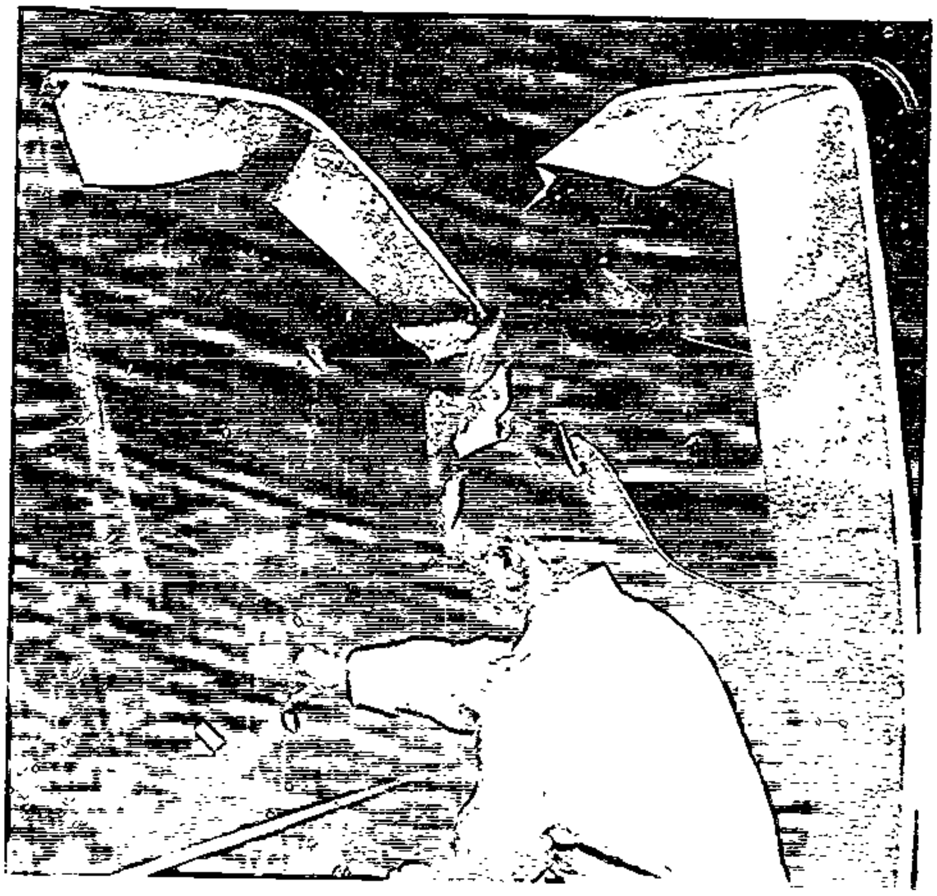

FIG. V-18

Masking in preparation for a two-tone job can be very easily done with the use of a large piece of clean soft cloth. The cloth is draped over the general area and the edges folded under near the edge (Fig. V-19). The edge is then masked with tape and paper over the cloth (Fig. V-20).

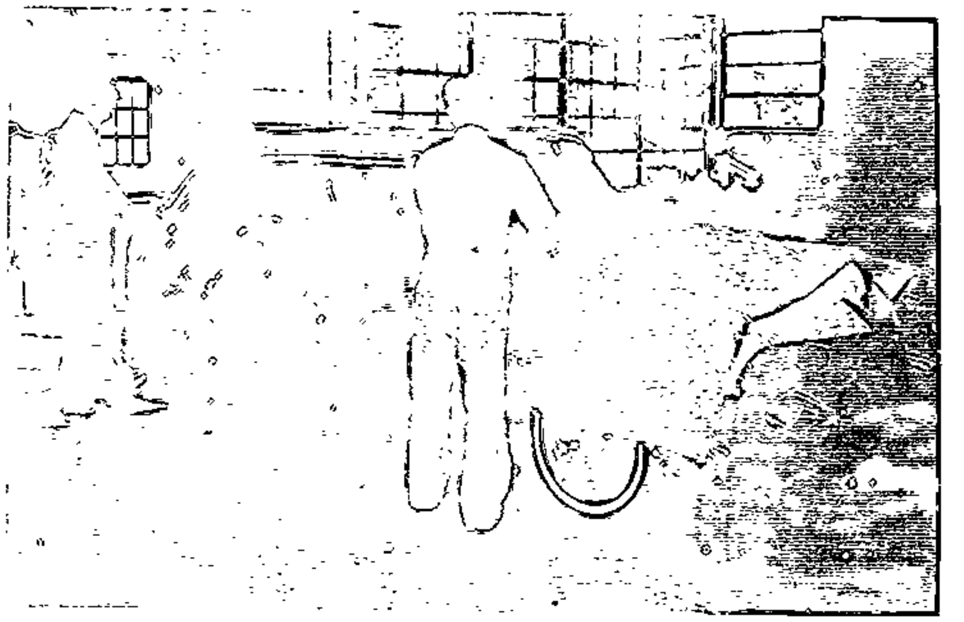

FIG. V-19

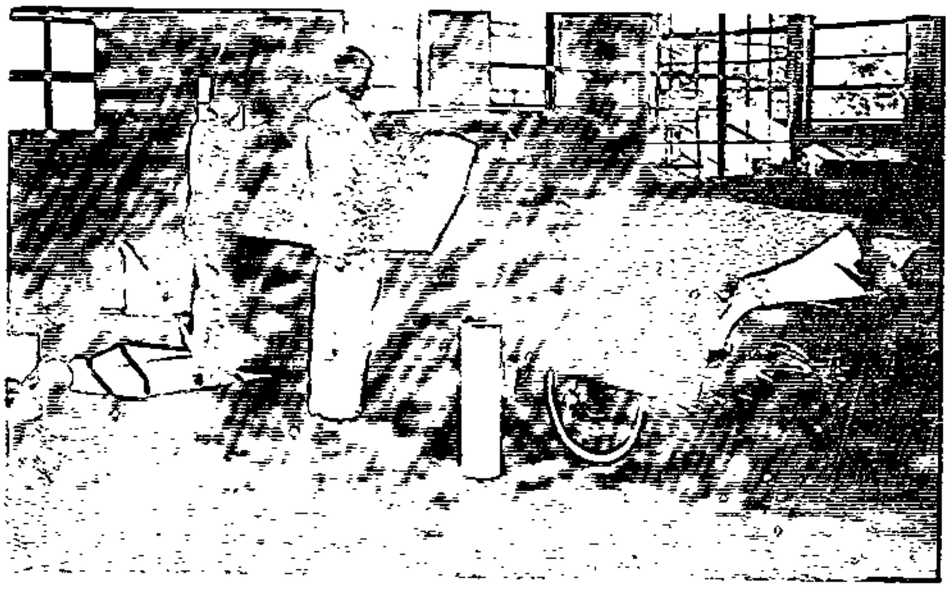

FIG. V-20

The important thing to remember is that it is always easier and better to mask properly, than to remove the paint after the job is finished.

ASSIGNMENT:

1. What is masking? Why is it done?

2. What materials are used in masking?

3. Where should you always begin to mask a part?

4. As you are masking, how should you hold the tape?

5. What is the best method of masking long curves?

6. How can two-tone jobs be masked quickly and easily?

7. Demonstrate to the instructor how you mask the following parts:

    mouldings
    handles
    windows
    windshields
    bumper
    grille
    tires
    two-tone (top covered)
    two-tone (bottom covered)

8. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVE: To learn the proper method of metal conditioning.

INFORMATION:

Earlier we spoke about metal conditioning. Now we will go into a little more detail and actually prepare a job. Let us assume we are going to repaint a fender or a quarter panel. The repairs are finished, the job has been washed to remove wax and grease and has been sanded and masked off. Now take some form of metal-etch (metal prep or something similar) and mix it following the directions on the label. Generally this material comes full strength and must be reduced with water before using.

With the reduced solution, soak a piece of cloth and rub the metal vigorously. Do not allow it to dry, but wipe it off immediately with a clean dry cloth (Fig. V-21). If you are working with a metal other than steel, follow the same procedure, but be sure to refer to the materials catalogue, which tells you what kind of cleaner to use. Each type of metal has its own cleaner.

If you are preparing the car for complete refinishing, always start at the top and work down. First, complete the turret top on both sides, then do one half of the hood, cowl, front fender, doors on one side, rear quarter panel, trunk and trunk panels, the opposite quarter panel, doors, front fender and the remaining half of the hood.

FIG. V-21

REMEMBER, always wipe the metal etch off while it is still wet; it will be much easier to remove then, than after it has dried. You will have to use your own judgment as to how much you can do at one time. It is not necessary to wash the painted part of the surface, only the bare metal must be etched.

ASSIGNMENT:

1. Why is it important to condition the metal before applying the paint?
2. Do you use the same kind of cleaner on all kinds of metal?
3. When should you wipe off the metal etch? Why?
4. If you are cleaning the whole car, in what order should you proceed?
5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Cleaning with Solvents

Lesson 9

OBJECTIVE: To learn the proper procedure for doing the final washing before refinishing.

INFORMATION:

Again we are dealing primarily with cleanliness. This cleaning operation is the final one and it is important that no spot be overlooked. The materials needed are: can of cleaning solvent (you will have to learn the trade names as each company makes its own), and two pieces of lint free cloth about eighteen inches square.

Soak one of the cloths well with the solvent and work from the top of the section to the bottom. Before the solvent has had time to dry, wipe it off with the second cloth. This operation must be done quickly, because solvents generally evaporate very fast. Remember, wipe it off while the surface is still wet. As in the dusting operation, always follow a pattern so that you will not miss a section. If the whole car is to be cleaned, start with the turret top and do one side, follow around the quarter panel, trunk, the other side, and finish with the front end. You will have to use your own judgment as to how big a section to wash at one time. Generally the top can be done in four sections, the hood in two, fenders and quarter panel in two or three depending on their size and the trunk in about two. If you notice that the solvent is drying before you have time to wipe it off, then you are trying to do too much at one time, so you must try a smaller section.

Study the diagram (Fig. V-22) which shows you the order to follow in washing the entire car.

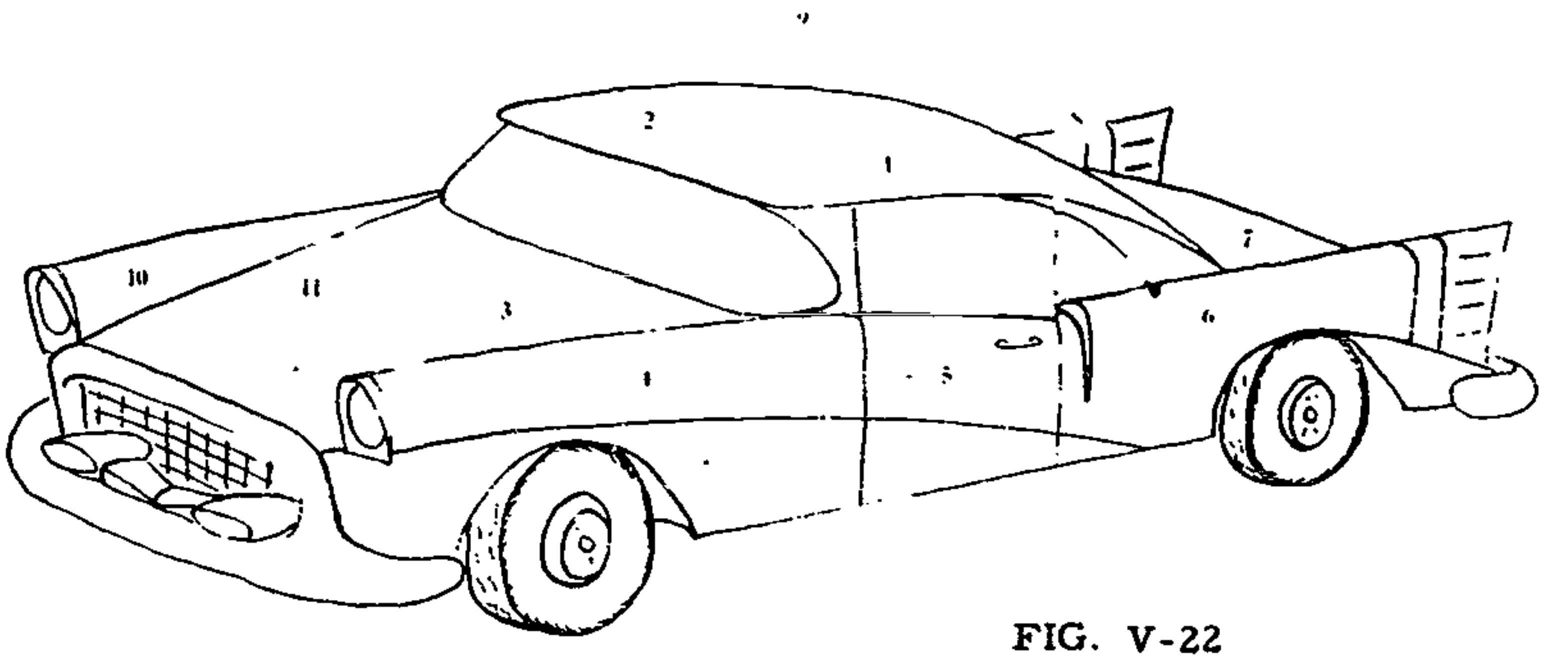

FIG. V-22

ASSIGNMENT:

1. What are the brand names of solvents used in your shop?
2. Do you have to follow a pattern when you clean the car? Why?
3. What must you do if the solvent begins to dry before you can wipe it off?
4. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Equipment - Compressor Lesson 10

OBJECTIVES: To understand the importance of a compressor.
To learn to take care of a compressor.

INFORMATION:

What is an air compressor and why do we need it? This machine takes air out of the room and forces it into a tank under pressure. Once we have air in the tank we can use it for many things, dusting under pressure, spraying paint, or operating power equipment.

A good compressor must not have any leaks and it should be large enough to provide all the air that is needed in the shop. Study the different parts which are shown in the photograph (Fig. V-23).

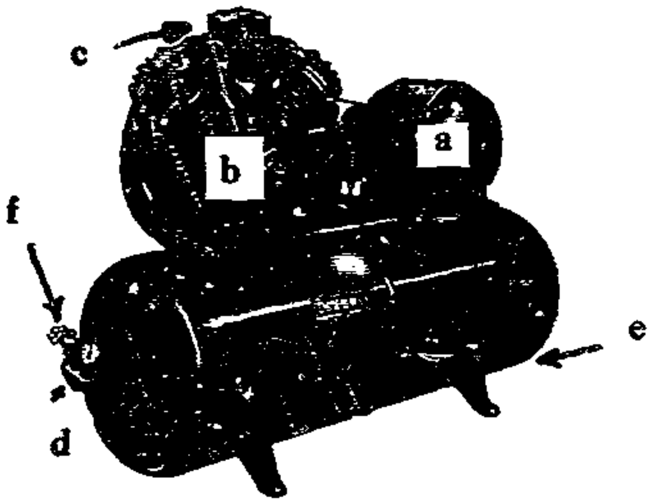

FIG. V-23

a. the motor which drives the machine.

b. the compressor unit, which pumps air into the tank.

c. the air intake where the machine draws air from the room.

d. the pressure gauge which tells how much air pressure is in the tank.

e. the drain cock which allows water to be drained.

f. the shut off valve which stops air from leaving the tank.

Generally the compressor unit has an oil gauge which should be checked regularly. This tells us whether or not there is oil in the pump. Some machines have motors that are packed in grease; others have fittings which need regular greasing. The air intake has a screen which needs cleaning regularly, and finally the water in the tank must be drained, usually each morning before the machine is started.

ASSIGNMENT:

1. What does an air compressor do?

2. What can you do with compressed air?

3. List some of the points on the compressor which require care and tell what you must do.

4. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Equipment - Air Transformer Lesson 11

OBJECTIVES: To learn why the transformer is used.
To learn to maintain the transformer.

INFORMATION:

The air that is stored in the tank of the air compressor is piped into the air transformer (Fig. V-24). Some people refer to this as the air regulator or separator. This piece serves two purposes; first it separates moisture and oil from the air; and second, it regulates the amount of air pressure that goes into the spray gun.

Most transformers have two sets of gauges and outlets. One set is called the regulated line while the other is the main line. The regulated line is used for all spraying operations, and the main line is used for operating air equipment. The part of the transformer that separates the moisture and oil from the air is connected only with the regulated line, so for this reason these are the only outlets which should be used for spraying.

In order to do good painting, it is necessary to use different pressures for different types of materials. This can be done on the regulated line only. We have already learned that the major enemies of a good paint job are oil and grease. The next major problem is moisture or water. Water is formed when air is taken from the room and compressed into a tank. This water can be carried from the tank to the spray gun by the hose, and later cause the paint to peel. These destructive substances are eliminated by the use of the transformer.

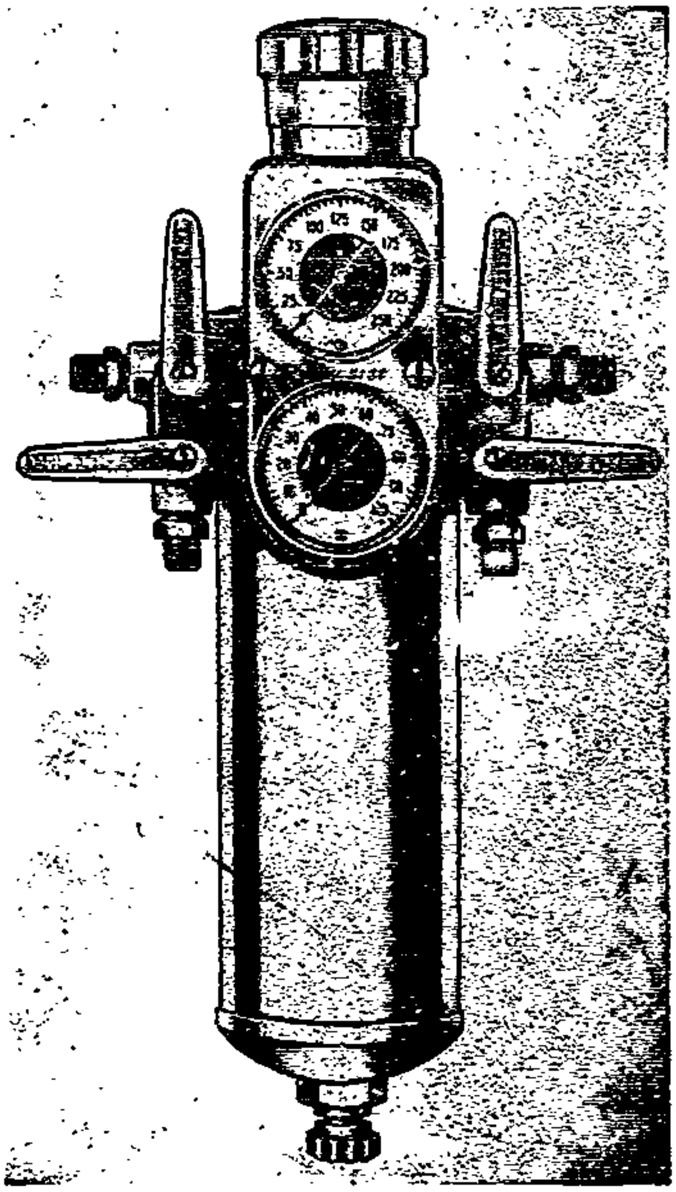

FIG. V-24

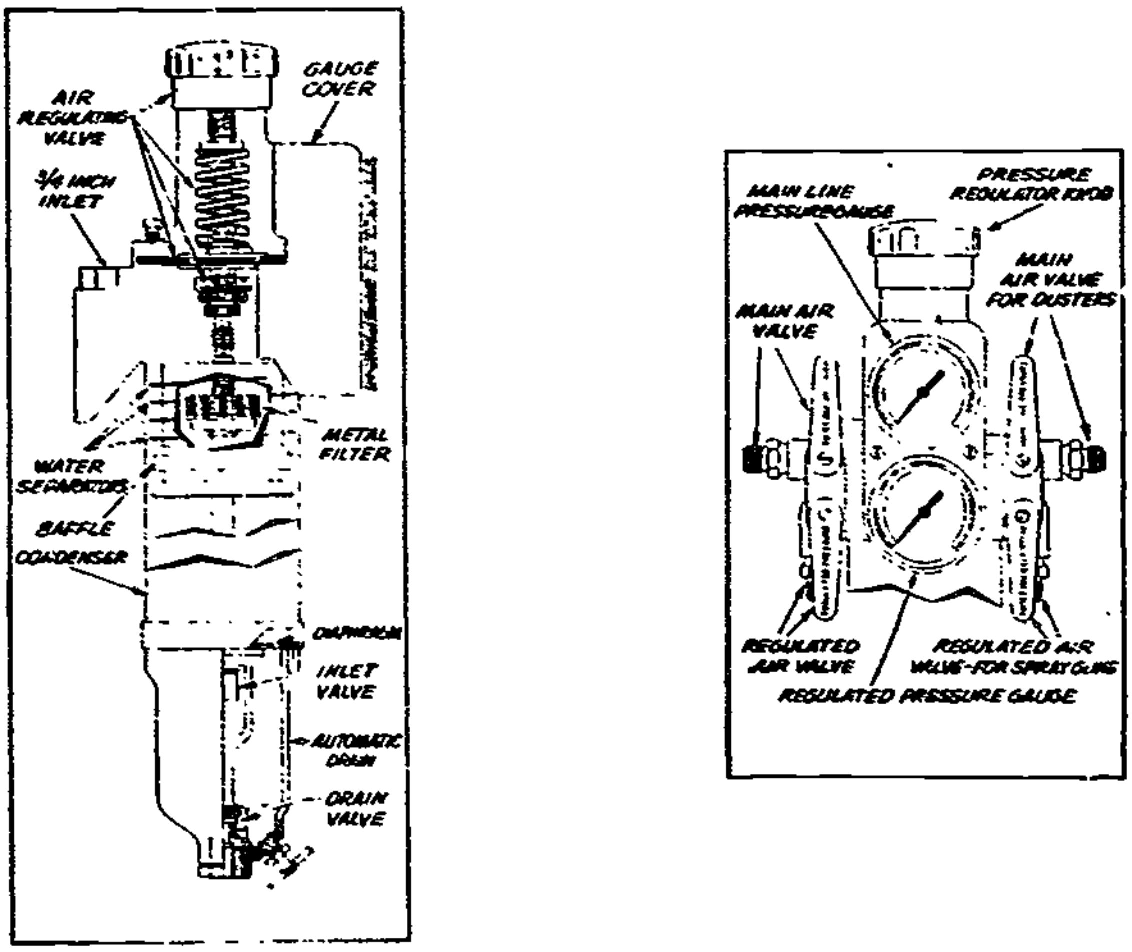
Periodically the transformer must be cleaned. This can be done by taking it apart, cleaning it, and replacing the element. Some are merely cleaned by draining at the bottom of the transformer (Fig. V-25). The best time to drain the transformer is in the morning before the air compressor is turned on. Generally this is done at the same time that the compressor is drained. When hooking up for spraying, REMEMBER, always use the regulated line.



AIR TRANSFORMER

FIG. V-25

ASSIGNMENT:

1. Where is the air transformer located?

2. What does the transformer do?

3. What are two other names commonly used for the transformer?

4. When should the transformer be drained? Why?

5. Which line should be used for spraying?

6. What is the other line for?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

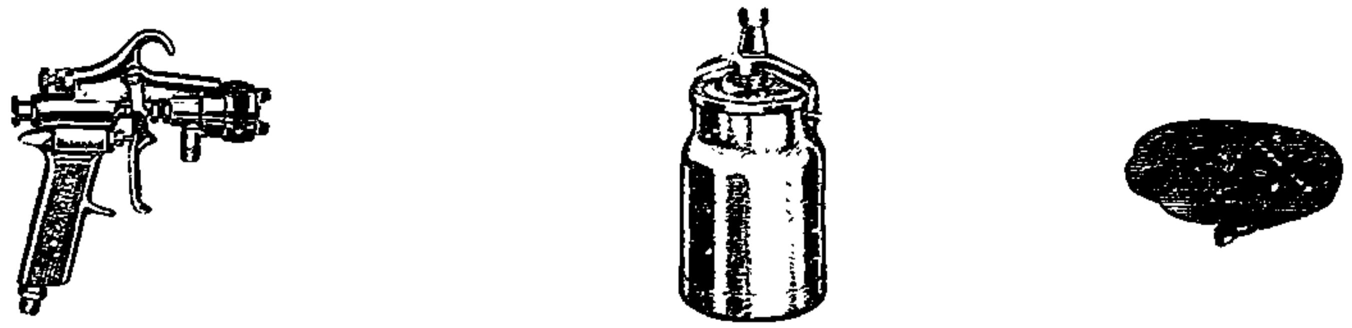
UNIT V - REFINISHING

Equipment - Air Hose and Spray Gun — Lesson 12

OBJECTIVES:
- To learn the use of the hose and gun assembly.
- To learn the parts of the spray gun (general).
- To learn the care necessary with a spray gun.

INFORMATION:

After the air has been compressed, stored, cleaned and regulated, it must be combined with paint to give us the desired finish. This is done by using the air hose and the spray gun (Fig. V-26).



SPRAY GUN — PAINT CUP — AIR HOSE

FIG. V-26

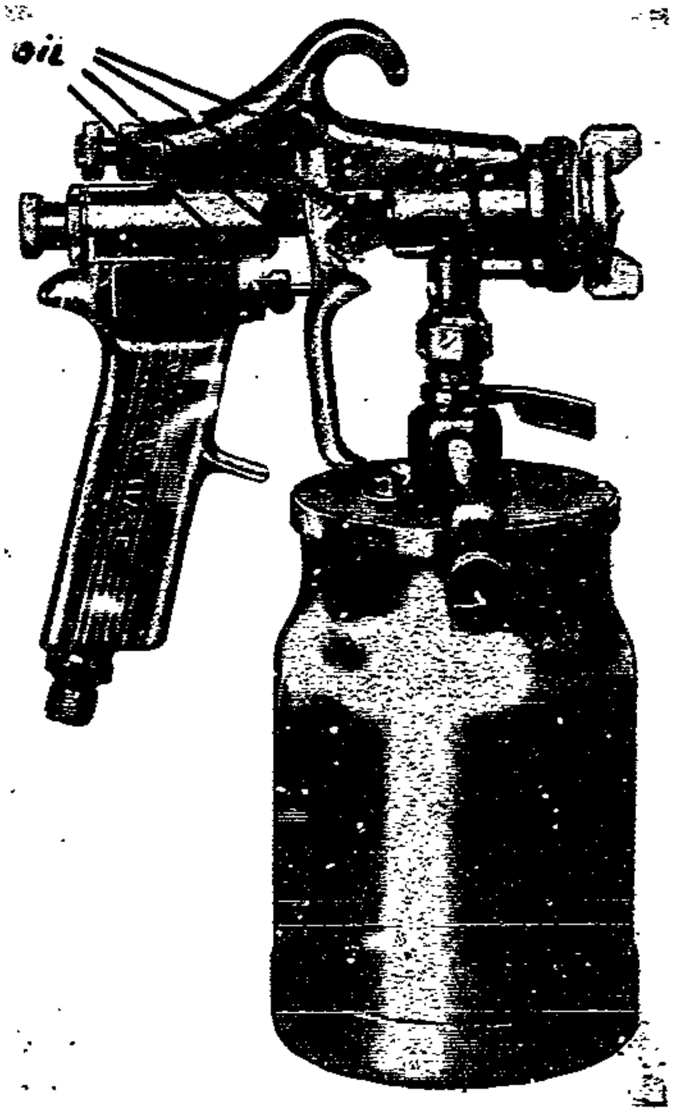
First of all, the hose that is used for spraying must never be used for any other purpose. Pneumatic machines use oil for lubrication. This oil gets into the hose. It can get into the spray gun and mix with the paint and cause many headaches. For the best results the hose size should be at least $\frac{5}{16}$" inside diameter.

The guns that are used in most body shops are the syphon or suction feed guns. There is another type used in factories called the pressure feed. (Fig. V-27)

FIG. V-27

The spray gun is a precision tool and must be treated carefully because a good spray job depends upon a good gun. The most important care which must be given the gun is proper cleaning.

As soon as you are finished painting, remove the paint that is left and pour about a half pint of gun cleaner into the cup. Move the gun in a swirling motion so that the cleaner will remove the paint from the walls of the cup, then spray some of the cleaner through the gun by pulling the trigger. Wipe off the outside of the gun and cup, then remove the cup and clean the inside by wiping. Next pour a little more cleaner into the cup and spray again. This time leave a little in the cup. Remove the air cap and, holding it up to an air outlet, blow it out thoroughly and replace it on the gun. NEVER dip the gun into the cleaner, because of the leather washers which will then dry out and leak. Occasionally a few drops of oil should be placed on the leather washers in order to keep them soft. Use light oil and follow the diagram for lubrication points (Fig. V-28).



LUBRICATION POINTS OF A SPRAY GUN

FIG. V-28

ASSIGNMENT:

1. What type of gun is used in most body shops?
2. What type of gun is used in factories?
3. When should a gun be cleaned?
4. Is it a good idea to dip the gun into cleaner? Why?
5. Should a spray gun be oiled? Where?
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT V - REFINISHING

Equipment - Respirators and Spray Booths — Lesson 13

OBJECTIVES: To learn the reasons for using a spray booth and respirator. To learn how to use and care for this equipment.

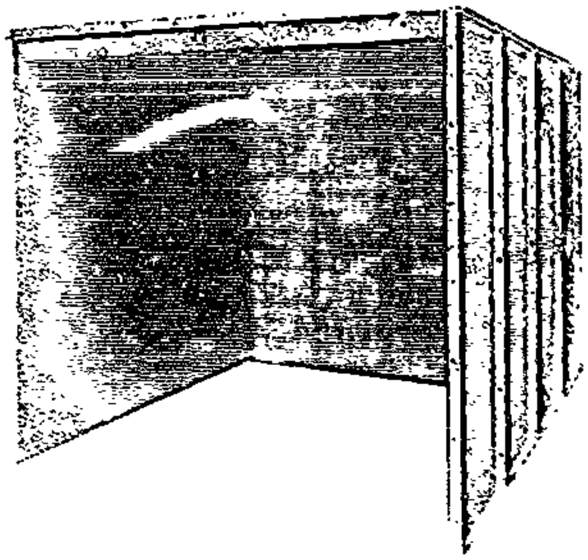
INFORMATION:

The respirator is a safety device that was developed to protect the painter from inhaling fumes while working. The mask, as it is called, must be worn whenever spraying is being done. There are many different types used. Some are pictured here (Fig. V-29).

TYPES OF RESPIRATORS

FIG. V-29

Respirators should be kept in a clean place when not in use and should be cleaned right after using, by wiping with a clean cloth. The replaceable filters should be changed whenever necessary to make them most effective. The respirator is a very personal tool and each person should have his own. If properly used it should have a long life.



FLOOR TYPE BOOTH

TYPE V-30

The spray booth is an ideal place of equipment for use by the painter (Fig. V-30). By placing a job in a booth, much dust and dirt can be prevented from settling on the freshly painted job. The booth also keeps the paint fumes from annoying other workers. There are many different types of booths, but all must have a good exhaust system, lighting, and a system for purifying the air that enters the booth (this applies to the closed booth). The most important care that is required is cleanliness. When necessary the booth should be washed down from top to bottom, so that there will be no accumulation of dust and dirt inside it. The air filters which purify the air that comes into the booth must be cleaned or replaced regularly. If the air filters become too dirty, dust and dirt particles will be drawn into the booth by the fan. This can ruin the paint job. The important thing to remember is to keep it clean. The inside of the spray booth should be painted a light color so that the light is reflected onto the job.

ASSIGNMENT:

1. What is a respirator? What does it do?

2. Should a respirator be shared with others? Why?

3. Give two reasons for using a spray booth.

4. What is the most important thing to do with a spray booth in order to have good results?

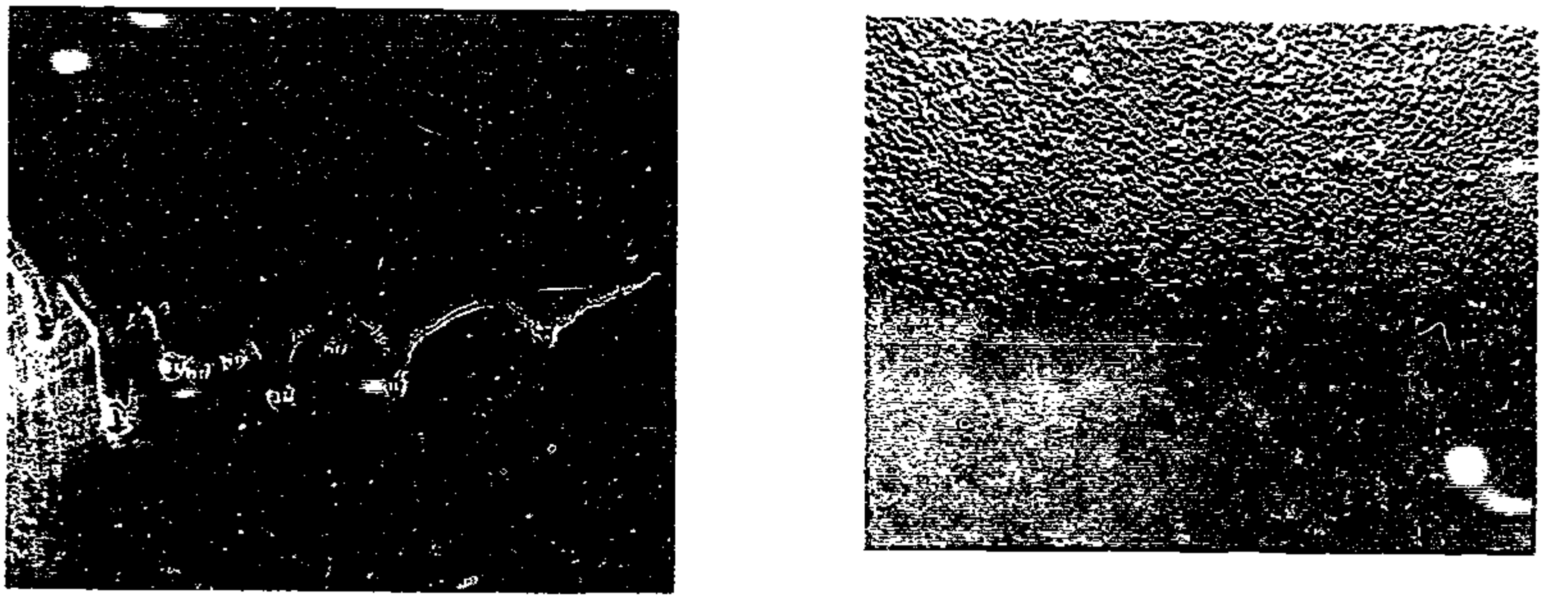
5. How often should air filters be changed?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVE: To learn the proper procedure in spraying various shapes.

INFORMATION:

When spraying, whether it be a car, filing cabinet, box or a cylinder, the same basic principles apply. First, mix the paint thoroughly, following the directions on the can, and fill the paint cup. Set the air pressure as recommended on the paint can. There are certain ways to spray different shapes to avoid runs, sags, and dry spots. If the gun is moved too slowly, then runs and sags will appear. If the gun is moved too fast, then dry spots will result (Fig. V-31).

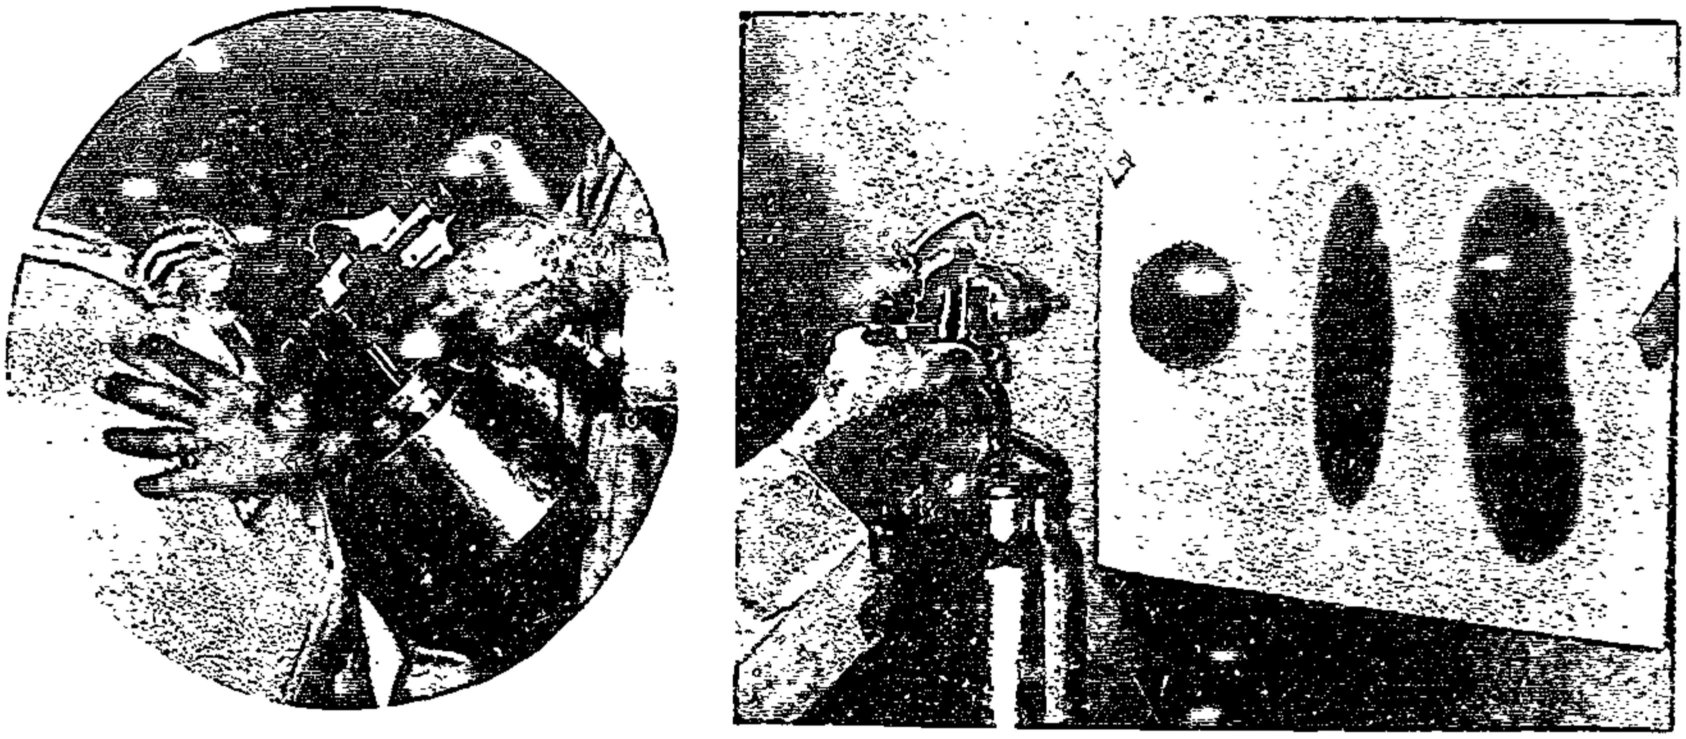


RUNS OR SAGS

DRY SPRAY

FIG. V-31

The spray gun must always be held level, about 6-8 inches away from the job, and must be moved at a moderate rate of speed. The spray gun must be set to the job that you are doing (Fig. V-32).



DISTANCE FROM JOB

SPRAY PATTERN

FIG. V-32

If your project is a flat, wide surface, then you must use the fan spray. This can be done by opening the air regulating knob (A) wide (Fig. V-33).

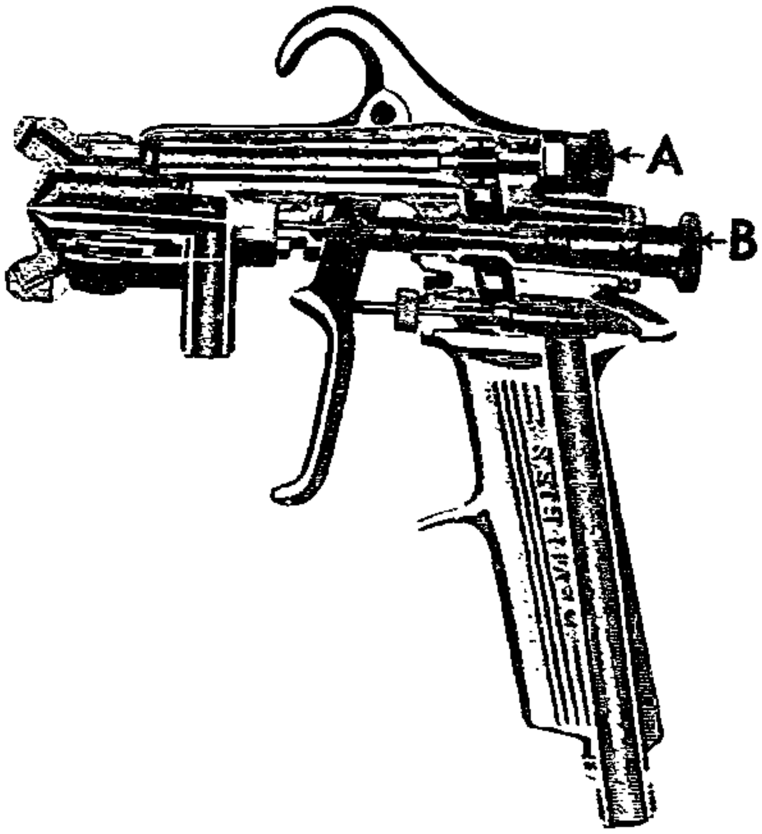


FIG. V-33

If your project is a long, narrow shaped object, then you should you use the round spray. This can be done by closing the air regulating knob (A). By doing this you will cover all that is necessary and yet save paint and reduce overspray. By adjusting the air regulating knob you can obtain the proper spray pattern for the job.

The paint that leaves the gun is regulated by the fluid control knob (B), (Fig. V-33). By turning the knob clockwise you can reduce the amount of paint that comes out of the gun. This is generally done when using the round spray. Turning the knob counter-clockwise will cause more paint to leave the gun. This is generally used when the fan pattern is desired. Study the diagrams carefully with regard to different shapes and methods of procedure (Fig. V-34).

Another small but important detail in spraying is the TRIGGERING of the gun. This means that every time the gun reaches the end of a panel or section, the trigger must be released. When starting on the next stroke, pull the trigger to start spraying again. This is very important to stop runs at the end of a section and also save a great deal of paint. Get into the triggering habit early and your paint jobs will turn out much better.

ASSIGNMENT:

1. What are the two adjustments which control your spraying?

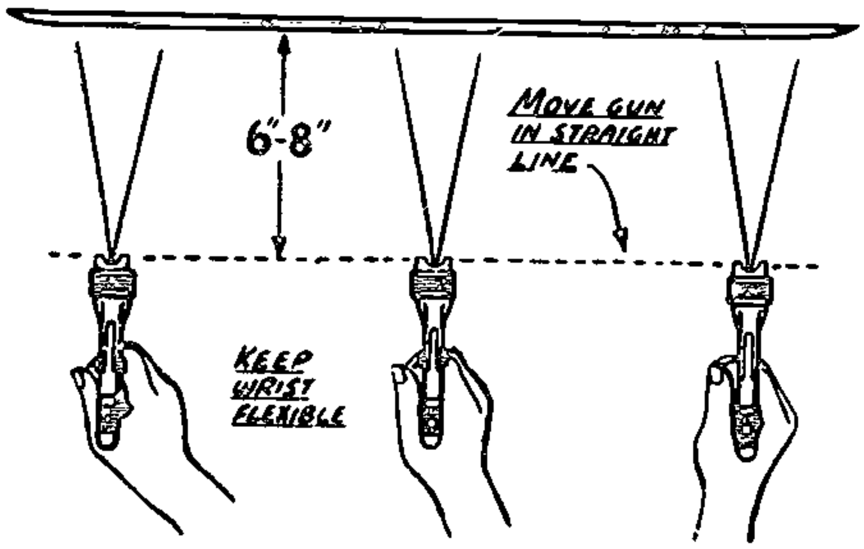
2. How far should the gun be held from the job?

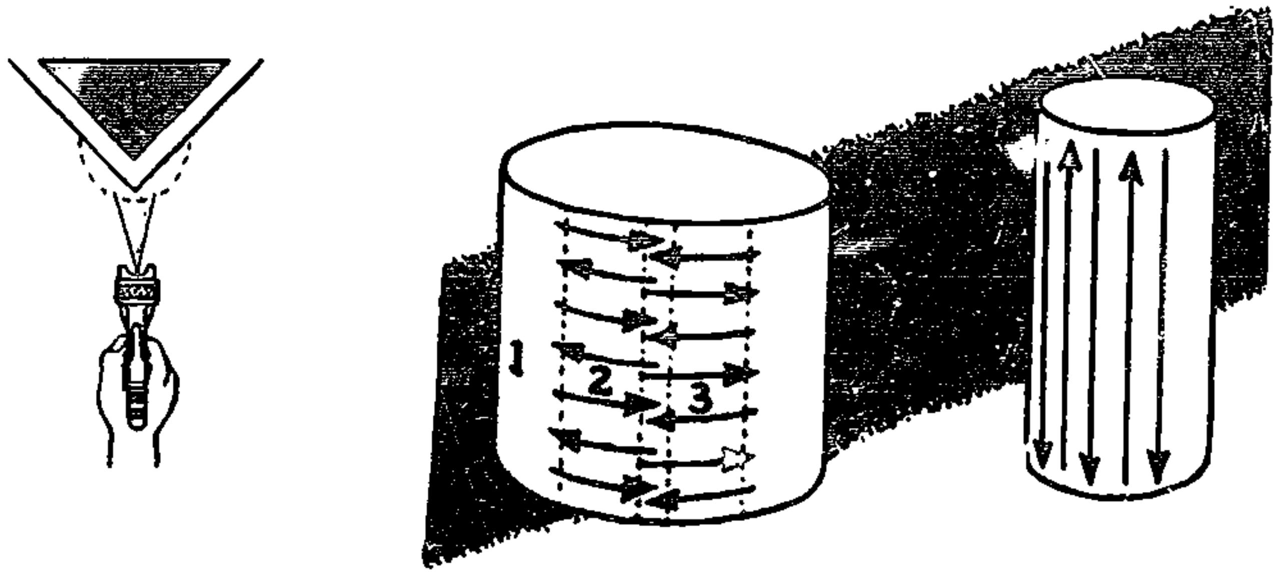
3. When should you use the fan spray pattern?

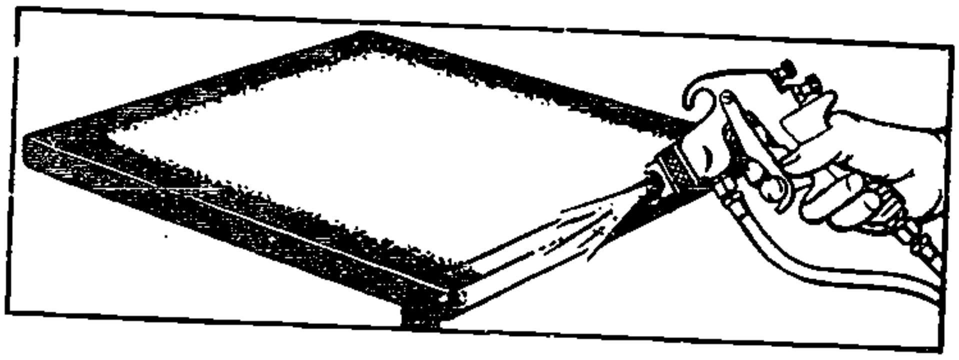
4. When should you use the round spray pattern?

5. What does it mean to trigger the gun?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.







SPRAY DIFFERENT SHAPES

FIG. V-34

Lacquer Spraying (Primer) Lesson 15

OBJECTIVES: To learn the proper procedure in spraying lacquer primers. To review the steps of preparation.

INFORMATION:

You have covered the lesson on how the spray gun works and what you must do to produce satisfactory results. This lesson deals with the specific job of applying the lacquer primer in preparation for the color coats. Be sure that you are familiar with all the material in Lessons #1, 5, 6, 7, 8 and 9.

MATERIALS AND EQUIPMENT:

All the necessary materials and equipment are the same as those for Lessons #1, 5, 6, 7, 8 and 9.

Briefly, let us review the steps of preparation. First, begin by de-waxing the area to be painted by using a solvent which is meant for this purpose. Wash and wipe off with a clean cloth, making sure that more surface is cleaned than the part to be painted. Always clean well into the surrounding areas. Sandpaper the job well, making sure that broken paint areas are feather-edged. Clean the entire area by blowing with the dusting gun and wiping with a clean cloth.

The masking operation is next. All areas that are next to the painted panel, whether they be chrome, glass or other painted panels should be covered. (When spraying lacquer, it is not necessary to cover the whole car.) Wash the bare metal with a metal conditioner (e. g., metal prep) and allow it to dry. Blow out all the corners with the dusting gun and again wash the whole area to be painted with a cleaning solvent (e. g., prep-sol, or klix), and dry off with a clean cloth. The surface is now ready to be sprayed with primer surfacer.

The next step is the preparation of the paint for spraying. Probably the best rule to remember is to read the directions on the can and mix the paint and thinner according to the factory recommendations. With the paint properly mixed, pour it into the cup through a strainer. ALWAYS USE A STRAINER. It is inexpensive and will stop dirt or lumps of pigment from being sprayed on your job. Lock the gun body on the cup and you are ready to begin. Connect the air hose on the gun and to the regulated line on the air transformer, adjusting the pressure for 45 lbs. If you have properly mixed the paint and the temperature is normal in the room (approximately 70°), this is the proper pressure to use with lacquers.

Follow the instructions given in Lesson 14 on the proper adjustment of the gun. Spray the first coat light and allow it to dry. The drying time will depend on the temperature and humidity in the room. When the first coat is dry to the touch, apply a second coat. This time spray it medium and allow it to dry. When the second coat is dry to the touch, apply the third coat (medium) and allow to dry.

Finally, clean the gun as instructed in Lesson #12.

ASSIGNMENT:

1. List the steps in the preparation of the surface.

2. How can you find out about paint reduction?

3. What pressure is generally used for lacquers?

4. What should you do when pouring paint into the cup?

5. When you have finished spraying, show the instructor what you should do.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Application of Glazing Putty

Lesson 16

OBJECTIVES: To learn the reason for applying putty.
To learn the proper method of application.

INFORMATION:

After the surface has been coated with primer-surfacer and allowed to dry, it is necessary to look it over carefully. You must look for deep scratches or imperfections in the surface. If such spots show, then we must use a glazing putty to fill them in. Actually putty is a heavy surfacer and is used in place of spraying many coats on the job. Also the putty can be applied to a small spot to eliminate the need for spraying a large area.

MATERIALS AND EQUIPMENT:

Can of putty, flexible steel putty knife (approximately 4" wide), or a rubber squeegee.

The putty can be applied with a steel knife or a rubber squeegee. If the surface is flat, the steel knife is probably better. However, if the surface is curved, a squeegee should be used.

Never apply too much putty at one time. It is better to apply two light coats than one heavy one. It should be remembered that only enough putty should be used to fill the imperfections. If too much is applied, the excess must be removed in order to make it smooth, so remember, apply only as much as is necessary. If you use a steel knife, hold it as shown in the diagram (Fig. V-35).

KNIFE APPLICATION OF PUTTY

SQUEEGEE APPLICATION OF PUTTY

FIG. V-35

First, lay the putty on heavy in one spot with a corner of the knife, then use a wiping motion with the knife to spread and to remove the excess. Do not go over the material more than two or three times, as this material dries fast and it will get rougher each time you go over it. If the surface is curved and you use a squeegee, use the same procedure as with the knife (Fig. V-35).

Immediately after you are finished, wash the knife or the squeegee with thinner so that the putty will not dry on it.

ASSIGNMENT:

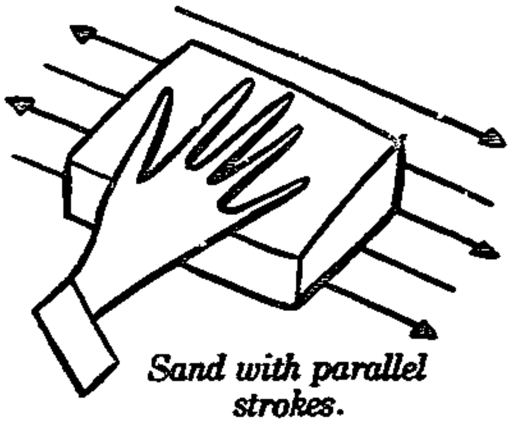
1. What is putty?
2. Why is it used?
3. Name two tools for applying putty.
4. How should putty be applied for best results?
5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

OBJECTIVES: To learn how to prepare the surface for color spraying.
To learn the proper procedure in spraying lacquer colors.

INFORMATION:

Before the color operation can begin, we must be sure that the primer surfacer is thoroughly dry. The tools and equipment needed are: pail of clean water, sponge, squeegee, sandpaper grit #320, cut and folded as previously shown, and a tack rag.

Sand the entire surface to be painted using parallel strokes in one direction (Fig. V-36). ALLOW THE SANDPAPER TO DO THE WORK. Do not apply too much pressure on the sandpaper and constantly use the water and sponge to flush away the paint particles that have been sanded off. Do not attempt to sand all the primer off. The idea is to leave the primer on, so that the scratches are filled in.



Sand with parallel strokes.

FIG. V-36

After sanding about four to six strokes on one spot, check the area by pulling the squeegee over the sanded part and look at it very carefully. If no scratches appear, then move on to the next spot. If you see scratches, then you must sand a few more strokes and check again, doing this until the whole area is smooth.

When you are satisfied that the sanding is finished, wash the area with the sponge and dry it off. Using the dusting gun, blow out all the joints, especially around mouldings, for this is where water is trapped. Now check the masking to see that it is still in good condition and re-tape where necessary. The surface is now ready to receive the color coats.

Open the can of paint and stir it vigorously until there are no solids remaining on the bottom of the can. Reduce the paint according to the instructions on the can and strain the reduced paint into the spray cup, then lock the cup into place. Hook up the air hose to the gun and the regulated line and set the pressure for 45 lbs. The gun is now ready for use.

Just before spraying, take the tack rag and unfold it. Then make a loose ball and holding it in your hand, wipe off the whole area to be painted. Do not miss any spots as this will show later. The tack rag will pick up all dust and lint leaving the surface perfectly clean. After using the tack rag, do not touch the part that is to be painted.

Use the same procedure as in applying primers and first apply a light coat. Be sure that you do not spray dry as this will leave a rough finished job. After the first coat has set for a few minutes, begin to apply the second coat (medium) and allow time to set. After a few minutes, apply the third coat (medium). Finally, mix about ten parts thinner and one part paint and again coat the entire area with a full wet coat. This will bring a gloss to the area, but be careful not to make runs by applying too much. It will take a little practice to get the feel of the paint and to know how much to apply.

ASSIGNMENT:

1. What grit sandpaper is generally used before applying the color?

2. Why is water used with sandpaper?

3. How is the squeegee used when sanding a job?

4. Why is it important to use a tack rag?

5. How much pressure do you use when spraying lacquer colors?

6. Why do you thin out the last coat?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Spraying - Enamel Colors on Panels Lesson 18

OBJECTIVE: To learn the proper procedure in spraying enamels.

INFORMATION:

In order to spray enamels, the same basic preparation holds true as in lacquer spraying. The equipment will be the same as for lacquer work. The surface must be clean, well sanded and masked properly. With regard to masking, however, there is a different pattern which must be followed. The reason for this is that lacquers dry in the air before they land on another surface. Thus they do not stick. However, enamels are slow driers and the paint particles in the air are wet, and as they settle on another surface, they stick and dry. This presents a major problem of removal. The best policy to follow when spraying enamel is to use a large cloth to cover an area, so that the whole car can be covered, leaving only the area to be refinished exposed. Most important, put the cloth on first and use the masking paper on the edge and over the cloth. Cloths must be kept in a clean place when not in use.

With respect to paint preparation, be sure to follow the instructions on the can. Generally the reduction is one part of reducer to three or four parts of paint. Some of the more modern enamels are reduced 50%. Therefore, it is important to read the directions on the paint can. The air pressure is important again; usually the pressure that is recommended is from 45 to 55 lbs. Some enamels are heavier than others and thus need more pressure. It must be remembered, however, that the higher the pressure, the more overspray and the greater the loss of paint. Use only as much pressure as is necessary.

Again, the use of the tack rag is emphasized to eliminate the dust and dirt problem. Always unfold the tack rag and hold it loosely. Wipe in a pattern so that no area is missed.

The application of most enamels require one medium coat and a sufficient amount of time to become tacky. You can tell by touching the paint in a place where it will not show. When the paint does not stick to the finger, it is ready for re-coating. Some of the new enamels require a medium wet coat, which is followed immediately with another medium wet coat.

Always clean the equipment, such as the spray gun and cup, immediately after the spray operation is completed. Do not allow time for it to dry on the gun as this makes it more difficult to clean off.

ASSIGNMENT:

1. What is the difference when masking for enamels and lacquers? Why is there a difference?
2. Are all enamels reduced in the same way?
3. What is the best way to cover a large area on the car?
4. How much air pressure is generally used on enamels?
5. How many coats of enamel do you generally apply?
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT V - REFINISHING

Brush Painting — Lesson 19

OBJECTIVE: To learn the proper procedure in brush painting.

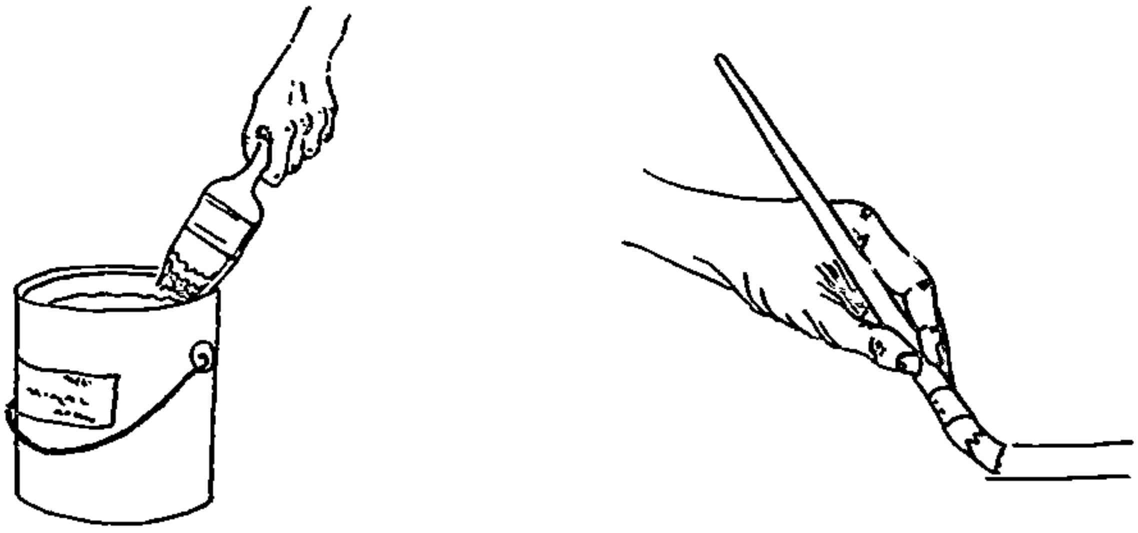
INFORMATION:

When automobiles were first built, they were made of wood. After the car was built, it was taken to the paint shop to be painted. In the early days, there were no spray guns and all the painting was done by hand brush. In fact, there was very little color used. Most of the car was shellacked and varnished. As paints were developed and improved, the makers began to apply color to cars, but still by using the hand brush method. There were very few chrome parts on the car so most of the trim was done by striping with a bright color. This, too, was done by hand.

Today, the brush is used sparingly because of the time involved. However, some paint shops use the brush for door jambs, cowl sections under the hood, or underneath the trunk section. The small camel hair striping brush is used for touching up some small nicks which do not require spray painting.

When used for brushing, the paint must have the proper viscosity. It should be heavier than when being sprayed, but not as heavy as when it comes in the can from the factory. Use your own judgment on the reduction, but generally the amount of thinner used is only half of what is required in the spray operation. Dip the brush into the paint so that half the brush is covered with paint. Then wipe off one side on the inside edge of the can. Place the side of the brush with more paint on it, against the surface and without pushing too hard, pull the brush slowly along the surface and then work it back and forth about three or four times. The brush should be held at a 45° angle to the surface being painted (Fig. V-37). When the paint has been worked out of the brush, dip it into the paint as before and proceed until the entire surface is finished.

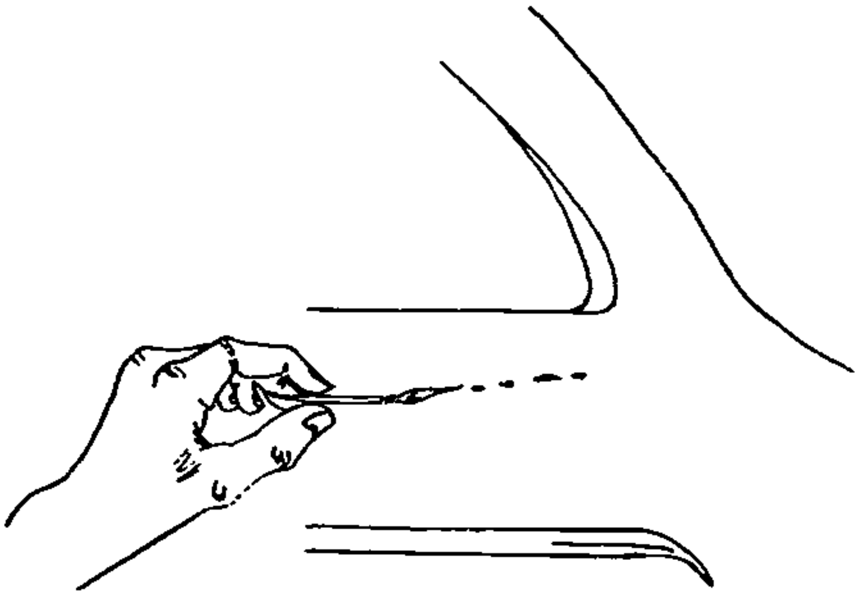
Always be careful not to put paint on any chrome part or upholstery. A little practice and you will be able to work to the edge without any trouble. At first, however, take your time and stay away from the edge. Gradually work over to it, until you feel confident that you will not smear the other parts. As in spraying, when you are finished with your job, always clean the brush immediately with thinner or reducer.



PAINTING WITH A BRUSH

FIG. V-37

When doing touch-up work, use a camel hair striping brush and work with the tip of the brush, applying only enough paint to cover the spot. Do not use a brush motion on small chips. Just dab it lightly with the tip and if too much paint is applied, wipe it off and do it again (Fig. V-38).



TOUCHING UP CHIPS

FIG. V-38

ASSIGNMENT:

1. How were cars painted before the spray gun was invented?

2. Where is the brush used today?

3. At what angle should the paint brush be held when painting?

4. What kind of brush do you use for touch-up work?

5. What part of the brush is used for touch-up work?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT V - REFINISHING

ACHIEVEMENT TEST

1. Name the fast drying paint. slow drying paint.

2. Name three materials that are put under the color coat.

3. Name three solvents used in automobile refinishing.

4. Give two reasons for sandpapering.

5. Demonstrate to the instructor the following operations:

   Cutting and folding a sheet of sandpaper
   Feather-edging
   Using a dusting gun
   Masking a front fender
   Masking a door window
   Masking a chrome trim
   Metal conditioning

6. Name the three most important parts of the spray outfit.

7. Give some reasons for using a spray booth and respirator.

8. Demonstrate to the instructor the following operations:

   Spray a square box or cabinet
   Spray a cylindrical object
   Spray primer on a fender
   Apply glazing putty on a small area
   Wet-sandpaper a primed area
   Spray a small area using lacquer color
   Spray a small area using enamel color

9. Give ten new words that you have learned in this unit.
   Use each in a sentence.

UNIT VI - CARE OF THE FINISH

Polishing — Lesson 1

OBJECTIVES: To learn the reasons for polishing.
To learn the proper method to use in polishing.

INFORMATION:

The automobile and paint manufacturers realize the amount of time and money that is spent on the preservation of the finish and are constantly trying to perfect finishes which will eliminate the need for polishing.

The enamels used today on most cars require little or no polishing. However, as the car is exposed to weather and road conditions, a haze forms over the surface which must be removed periodically. This can best be done by using a non-abrasive polish (e.g., liquid). Abrasive polishes will tend to dull the finish of enamels and should not be used.

The lacquers that are used today on most General Motors cars require some polishing in order to brighten the finish. As lacquer is exposed to the weather, the surface tends to become chalky. This condition must be removed with abrasive polish (e.g., rubbing compound).

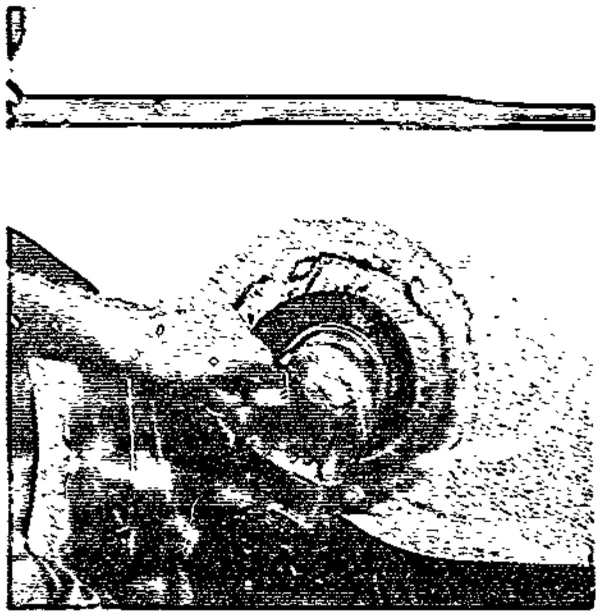
The latest type of paint, the acrylic lacquers, supposedly need very little polishing. However, here again as the finish is exposed, it will tend to dull. A cleaning with a good grade of polish will restore its original appearance.

The materials and equipment needed for this operation are: an abundant supply of soft, clean rags; a good grade of polish or compound, and an electric buffer.

When using compound always work from the top down. Do only a small section at one time so that the polish will not dry too soon (approximately two to three feet square). Apply polish to the cloth and rub it on the surface in one direction only. At all times be sure that the cloth does not become wrinkled. If you have wrinkles on the cloth, as you rub, marks will appear in the finish. Rub evenly all over, but stay away from the edges and corners as a very small amount of rubbing at these points will take the paint off and then the primer will show through. You must continue to rub and burnish until most of the polish has been worked off, then you will see a shine building up on the paint. Next, turn your cloth over or take a clean piece and wipe it clean, always rubbing in one direction. Proceed in this manner until the entire surface has been completed.

To complete the job, use the buffer with a lamb's wool bonnet and shine the whole car working from top to bottom following the directions given next. (Fig. V-39)

When using liquid polish it is much faster to use an electric buffer.



ELECTRIC BUFFER

FIG. V-39

First, fill the machine with a machine polish and plug it in. (Machine switch must always be off.) Make sure that there is no water on the floor when using an electric tool. If you stand in water you can get a severe shock. Always hold the buffer securely with two hands and keep your attention on the job. Apply the polish and spread it over the section. Keep the bonnet flat until all the polish has been rubbed off. Then tilt the buffer slightly so that the clean part of the bonnet will shine the paint. As you use the buffer, remember to stay away from corners as at these points the buffer can very quickly remove the paint. Follow the same pattern as with hand rubbing, working from the top down and doing a small section at a time. When the whole car is finished, wipe it off with a clean soft cloth.

ASSIGNMENT:

1. What is the difference between a rubbing compound and a liquid polish?
2. Which polish do you use for enamels?
3. Which polish do you use for lacquers?
4. Why should you stay away from corners and edges?
5. When polishing, where should you start?
6. What must you be careful of when using the buffer?
7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VI - CARE OF THE FINISH

Waxing Lesson 2

OBJECTIVES: To learn the reason for waxing.
To learn the proper procedure when waxing.

INFORMATION:

After a car has been thoroughly cleaned and polished, it is best to preserve the finish by applying a coat of wax. If you were to look at the finish under a microscope, you would see that some paint surfaces are porous. In order to seal this type of surface and protect it from the elements, wax should be used.

There are many types of auto wax on the market. Some are liquids, some are in a paste form, some are sprayed on while others are applied with a piece of cheesecloth. Whichever type is to be used, be sure to follow the directions on the can. You will need a good grade of wax and a good supply of cheesecloth or other soft rags.

Perhaps it might be mentioned here that the car should be examined carefully and all nicks and chips in the paint should be touched up with a camel hair brush before the waxing is started. Follow the same procedure as in polishing and work from the top down and do a small section at one time (approximately two to three feet square). If a paste wax is used, first apply the wax in a circular motion (approximately 6" circles) and cover the section you are working on. Then without waiting, wipe it off with a clean soft rag. After you have most of the wax off, take another piece of soft rag and finish wiping and shining. Proceed in this manner until the whole car has been waxed. Be sure not to miss any spots. As you wax, coat the chrome mouldings, too. Finally, clean the windows with clean water and rags, being careful not to smear the waxed surface.

ASSIGNMENT:

1. What does wax do to the finish?

2. When should the chips and nicks be touched up?

3. Where should you start to wax a car?

4. When should you clean the windows?

5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VI - CARE OF THE FINISH

Interior Care Lesson 3

OBJECTIVES: To learn what care is to be given to the interior.
To learn the proper procedure for cleaning the interior.

INFORMATION:

The interior of an automobile contains many different types of basic materials. The floor rugs are made of rubber or wool, the seats are covered with fabric or plastic, the instrument panel is primarily steel with some plastic and leather, the trim panels on the doors are fabric, plastic, or leatherette, and the garnish mouldings are generally steel.

All of these materials require different care. The painted steel can be cleaned and waxed. The leather should be cleaned with a mild soap and warm water, the fabric upholstery and rugs can be brushed or vacuumed.

Generally we begin by brushing and vacuuming the seats and upholstery thoroughly. Next we wash the leatherette with mild soap and warm water, clean and wax the instrument panel and garnish mouldings, and finally clean the glass with clean water and rags.

For grease stains on the upholstery, probably the best cleaner is carbon-tetrachloride. If you use this cleaner, be sure that the doors of the car are open for ventilation. The fumes of carbon-tetrachloride can overcome you if you are in a closed car. When you are working on the inside of the car, always be sure that your clothes and hands are clean. . It is wise always to use a cover over the seats so that the upholstery is not stained.

ASSIGNMENT:

1. Name some of the basic materials used in the interior of an automobile.
2. What can you use to remove grease stains from upholstery?
3. Why must you open doors of the car when using this cleaner?
4. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VI - CARE OF THE FINISH

ACHIEVEMENT TEST

1. Name examples of abrasive and non-abrasive polishes.

2. What kind of polish is used on lacquers? enamels?

3. Why is wax used on the automobile?

4. Demonstrate to the instructor the following operations:

   Polish a fender with a lacquer surface

   Polish a fender with an enamel surface

   Polish a fender using a buffer and liquid polish

   Clean the interior of a car

   Remove spots from trim panel

5. List five new words that you have learned in this unit. Use each of these words in a sentence.

UNIT VII - METAL REPAIR

Basic Body Repair Tools — Lesson 1

OBJECTIVES: To identify the basic tools used in the auto body shop.
To learn how to care for hand tools.

INFORMATION:

The tools of the modern body repair shop have been developed over the years to meet the needs of collision work. From year to year, changes in the design of the auto make it necessary for new tools to be developed which will suit the needs of the body repairman. Actually there is no set of tools which can be considered essential. A great deal depends upon the mechanic and how much he can do. This will determine how many tools he should have. You will find listed here the most common tools and the ones used most often. As operations become more complex, additional tools will be introduced (Fig. VII-1).

1. dinging hammer
2. pick hammer
3. combination spoon
4. bumping hammer
5. spoon dolly
6. combination dolly
7. heel dolly
8. toe dolly
9. body file (flat)
10. body file (convex)

With respect to the care of hand tools, the most important item is the proper storage when they are not in use. Hand tools have a long life if they are used properly. Most of the time small hand tools become lost or are misplaced. You will find that tools are expensive and replacement is an expense. The working surfaces of metal repair tools are the most important parts. They must be kept smooth and shiny at all times. If there are any marks or nicks on the face of the hammer or dolly, these will be transferred to the metal that is being hammered. You must constantly check the face of the dinging hammer and dolly blocks to see if any marks are apparent. The best way to remove these marks is to use a piece of 100C sandpaper. Holding it in the palm of your hand, rub the face of the hammer against the paper with a circular motion. You must try to keep rust from forming on the steel faces of the tools as it will cause pits in the steel and leave marks on the surface that is being straightened.

FAIRMOUNT
7
8
9
FAIRMOUNT NO.1120
FAIRMOUNT NO.1127
10

FIG. VII-1

The body file is another important tool which must be handled very carefully. NEVER drop the file, for if it is dropped small chips will be knocked out of the teeth and then scratches will be made on the metal as you are filing. On tools that are not used frequently, a thin film of oil will protect the steel from rusting.

ASSIGNMENT:

1. Match the following names with the tools that are pictured:

   ( ) body file (convex)
   ( ) dinging hammer
   ( ) bumping hammer
   ( ) combination dolly
   ( ) pick hammer
   ( ) spoon dolly
   ( ) combination spoon
   ( ) body file (flat)
   ( ) heel dolly
   ( ) toe dolly

2. What is most important with regard to hand tools?

3. How can nicks be removed from the face of the hammer and dolly?

4. What damages the body file more than any other thing?

5. How do you prevent rust from forming on tools?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence

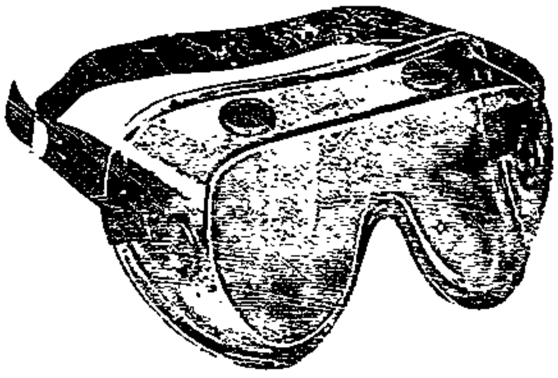
UNIT VII - METAL REPAIR

Operation of the Electric Sander — Lesson 2

OBJECTIVES: To learn the proper method of using the electric sander. To learn the safety procedures to follow when using the sander.

INFORMATION:

One of the most dangerous machines in the shop is the one that you will use the most often. This is the electric sander. Do not be afraid of this tool, but at the same time never become overconfident and careless. Whenever you use a sander you must wear safety goggles (Fig. VII-2). The machine must be held firmly but not so tight that you are tense. When using the sander never allow yourself to become distracted, for it takes only a fraction of a second to have an accident. Observe the illustration showing you how to hold the sander at all times (Fig. VII-3).



SAFETY GOGGLES

FIG. VII-2

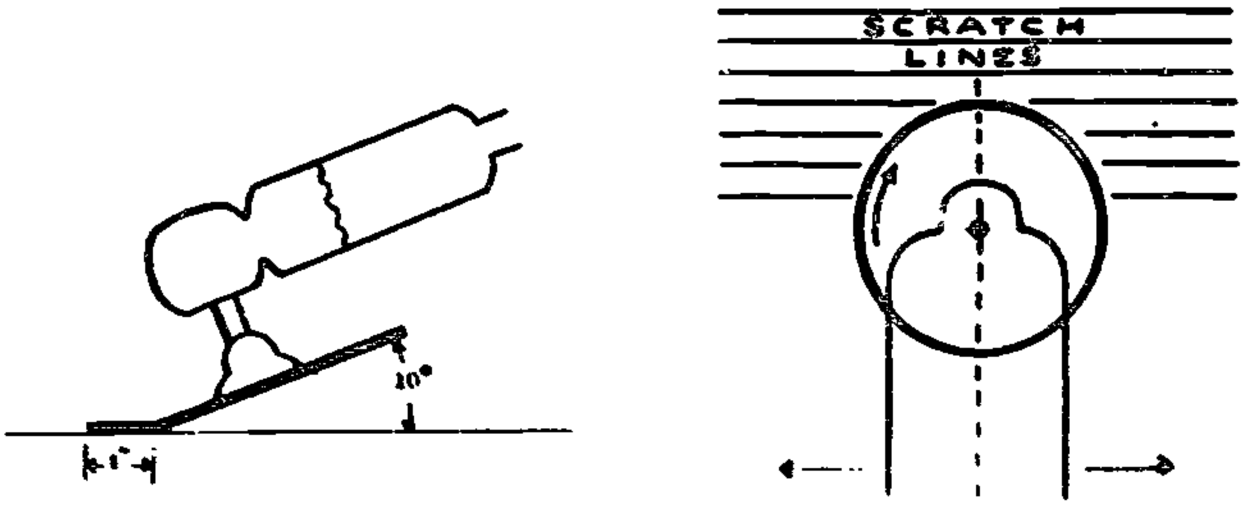
USING THE ELECTRIC SANDER

FIG. VII-3

You must always be conscious of the electrical wire and never allow it to become entangled with the disc. NEVER stand in water when using the sander, as you can receive a severe electrical shock if you do.

The discs that are available for the electric sander must be selected to suit the job that you are doing. The most common grits used are the #24, #36, and #50. After an average repair job you should start with a #24 or #36 and finish off with a #50 disc to give your job a smooth finish. If you are trying to remove paint from a surface, use open coat discs made for this purpose. Open coat discs will not clog as easily as will the metal cutting discs. These also come in various grits. Study the books and pamphlets issued by the manufacturers and they will tell you what discs are sold and the way they are to be used.

As in filing, always use a long stroke and never cross the stroke unless the shape of the panel makes it necessary. Look at the illustration which shows you the proper method of sanding. Also be very careful of any glass or chrome parts that may be near. If the disc strikes any of these parts, they can be ruined (Fig. VII-4).



PROPER METHOD OF SANDING

FIG. VII-4

When sanding, always stand behind the machine so that the sparks will fly away from your body. Remember, the main purpose of the sanding operation is to remove deep scratches and slight irregularities in the metal so that the surface may be prepared for painting more easily and more quickly.

ASSIGNMENT:

1. What must you always wear when using the electric sander?
2. Why must you always be careful of the wire?
3. Should you use the electric sander if you are standing in water? Why?
4. Name some of the grits and discs used in the shop.
5. Which way should the sparks be going if you hold the machine properly?
6. What is the main purpose of sanding?
7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

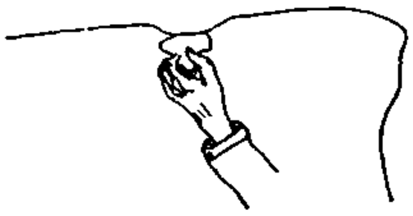
Fenders (Curved Surfaces) Lesson 3

OBJECTIVE: To learn the proper way to remove a small dent in a fender with a curved surface.

INFORMATION:

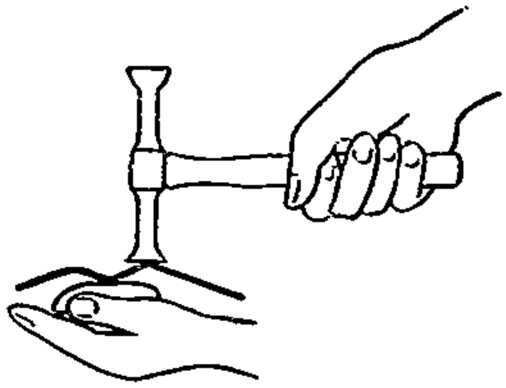
Probably the most important phase in automotive collision work is the proper technique applied to the straightening of dents in the metal. The rule that should never be forgotten is that we should remove the dent with as little hammering as possible. The more times the surface is hammered, the more chance there is that stretching will take place. Before starting to hammer a dent, always study it and try to determine how the dent went in. This is very important because it should be removed in the reverse way from which it went in. The tools that you will need are: dinging hammer, the three basic dolly blocks (combination, flat, and heel), body file, scraper, and wire brush.

With the help of the wire brush and scraper, clean the underside of the dent to be straightened. Now take the combination dolly and hold it at its smallest end and slowly tap out the dent with the flattest side of the dolly from underneath (Fig. VII-5). Do not try to knock it all out at one time, but tap it gently at first and if it does not move, then tap it harder until it comes out. Be careful not to put more dents into the metal because every dent will tend to stretch the metal. With the dent roughed out, take the dinging hammer and lightly begin to tap the high spots, while you hold the dolly under the low spots (Fig. VII-6).



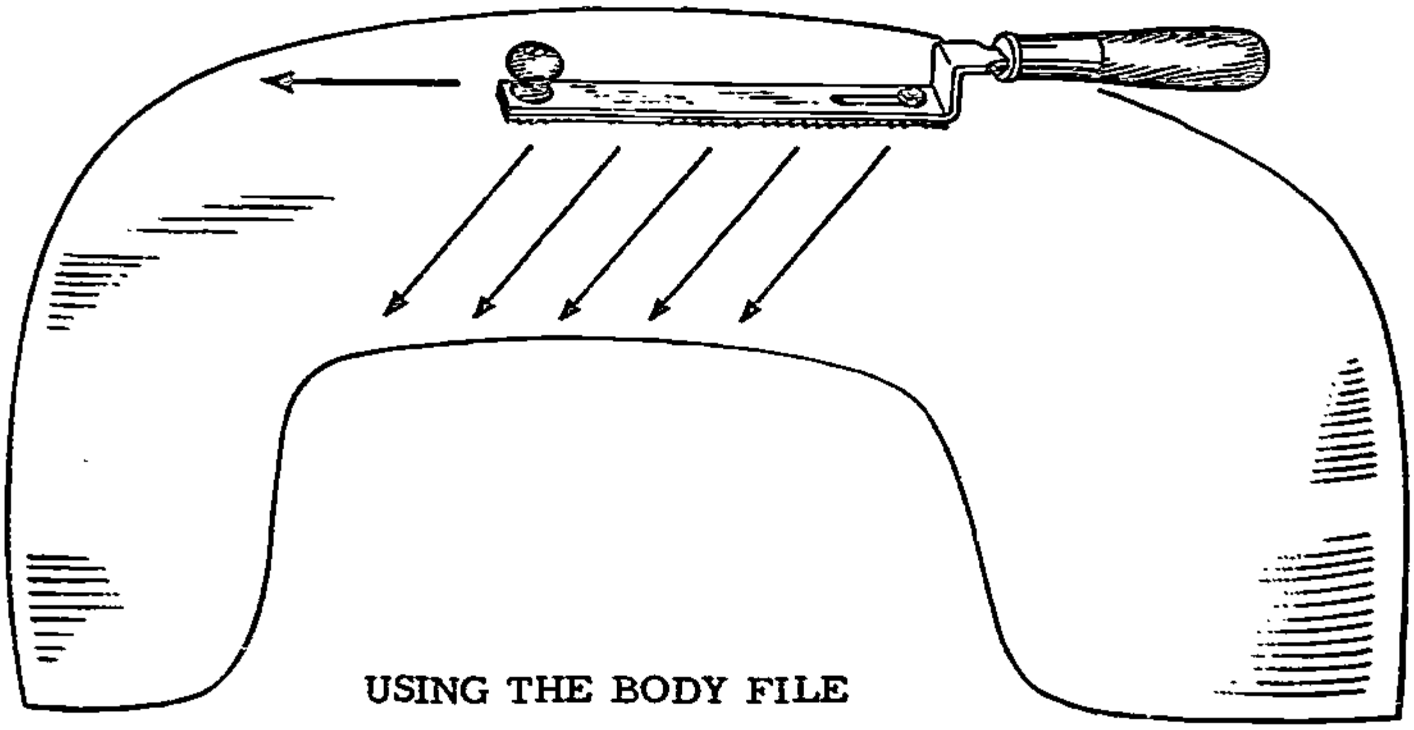
ROUGHING OUT THE DENT

FIG. VII-5



EQUALIZING THE DENT

FIG. VII-6



USING THE BODY FILE

FIG. VII-7

The hammer must always hit the surface squarely so that nicks are avoided. Doing this will equalize the surface to a minimum of high and low spots. Next select the dolly that best fits the surface in its original form and slowly begin to tap with the dinging hammer, holding the dolly directly under it. As has been mentioned, do not hammer too much or too hard because every blow of the hammer will stretch the metal more and more. Continue tapping directly over the dolly until the surface feels reasonably smooth in your hands. In checking the surface with your hands, always use the palm of the hand and not the finger tips. Keep checking frequently and tap more as it is needed. REMEMBER, the secret lies in how little you hammer, not how much.

When the surface feels fairly smooth, take the flat body file and begin to file in long, even strokes, filing only once in each spot (Fig. VII-7).

When the whole dented area has had a once over, look at it carefully. The places where the paint has been taken off are the high spots and the areas where paint remains are the low spots. Take one of the dolly blocks and using one of the corners or points, gently tap up on the low spots. How hard you must strike it, depends upon the depth of the low spot. Obviously, if the low spot is slight, a mere tap will be enough. This can be checked by running the file over the adjusted spot. If the paint comes off then it is just right. If the paint still remains, then you must tap and file again. Be very careful on this operation as it is very easy to stretch the metal by hitting it too hard. Proceed with this process until the dented area has had all its paint removed. Now you have equalized the high and the low spots. CAUTION: Do not file repeatedly in one spot. It is possible to file a hole in the metal quite quickly.

After the metal has been filed, it is ready to be sanded with the electric sander. First, use a #36 disc and follow the directions in the previous lesson. When you have done this, go over the area with a #50 disc. Remember to hold the sander in the proper manner and always use safety goggles.

ASSIGNMENT:

1. Is it true that the more you hammer on the job the better it will be? Why?
2. Before you start to straighten a dent, what should you do?
3. Which hammer do you use to remove dents?
4. After knocking out the dent, where do you hold the dolly in order to equalize the dent?
5. After knocking out the dent, where do you strike the hammer in order to equalize the dent?
6. What does the file tell you?
7. How do you correct the high and low spots?
8. Which disc would you use first on the sander? Which second, and why?
9. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Fender (Flat Surface)

Lesson 4

OBJECTIVE: To learn the proper way to remove small dents in a fender with a flat surface.

INFORMATION:

After you have repaired a dent in a curved surface, you will be given a dent to repair in a flat surface. The same basic principles apply. However, with a flat surface you must be extra careful because of the stretching. A flat surface will stretch much more easily than a curved surface, and more important, it is more noticeable.

The same tools will be required as in the previous lesson: dinging hammer, three basic dolly blocks, scraper and wire brush, body file, and the electric sander. Start by cleaning off the underneath side of the surface to be straightened. Begin to bump out the area as shown in the diagram (Fig. VII-8). When the dent has been roughed out, proceed to tap down the high spots with the hammer while you hold the dolly underneath the low spots (Fig. VII-9). You must always select the dolly that fits the shape of the panel because as you hammer the surface, it will take the shape of the dolly.

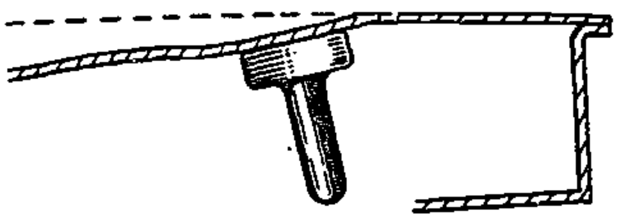


FIG. VII-8

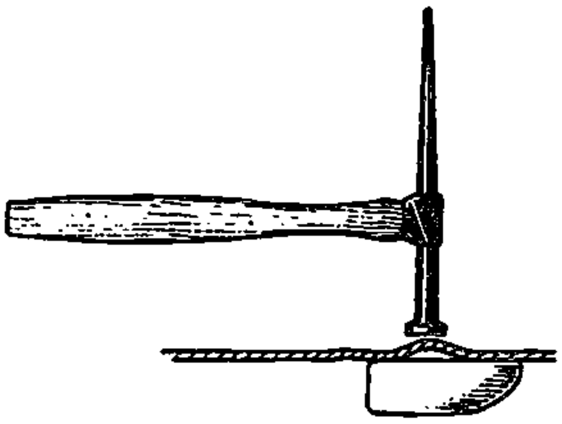

FIG. VII-9

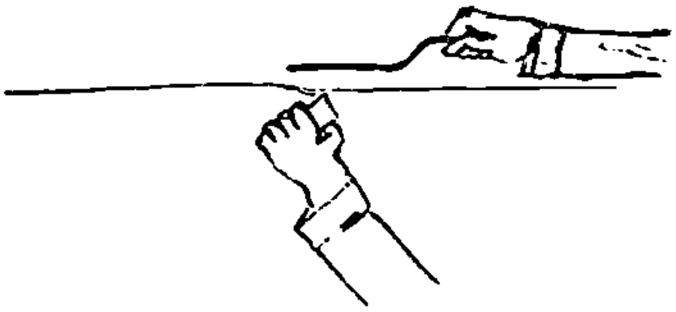
Check the surface with your hands often, and when you feel that it is smooth, begin to use the body file and find all the low spots. Now you must adjust the low spots and re-file until all of the low spots have been eliminated. On flat areas you may prefer to use the fender slapper. This can be used for raising low spots instead of tapping them up with a dolly or hammer. Hold the point of a dolly block under the low spot and tap the top with a fender slapper once or twice.

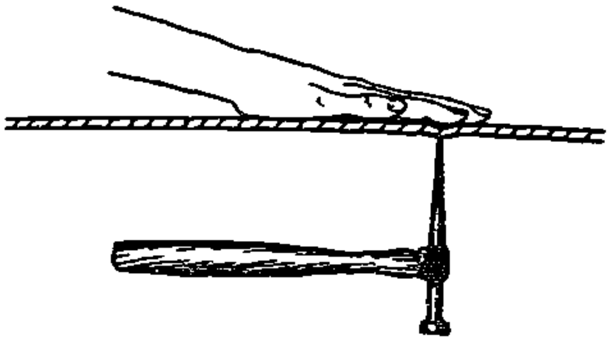
Upon checking with the file you will see that this raises the low spot (Fig. VII-10).



RAISING A LOW SPOT WITH THE SLAPPER

FIG. VII-10

Another method of raising low spots is to use the pick hammer. By lightly tapping the surface underneath the low spot, it can be raised easily (Fig. VII-11).



RAISING A LOW SPOT WITH A PICK HAMMER

FIG. VII-11

When you have finished filing, follow the directions given in the preceding lesson and use the electric sander until the area is smooth. Again, be careful with the sander and do not bump into chrome, glass, or painted area which does not need painting.

ASSIGNMENT:

1. Is the flat surface easier or harder to repair than a curved surface?

2 Name three ways of raising a low spot.

3. How do you select the proper dolly?

4. What can happen if you file in one spot too much?

5. Name two new tools introduced in this lesson.

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Use of Hydraulic Jack Lesson 5

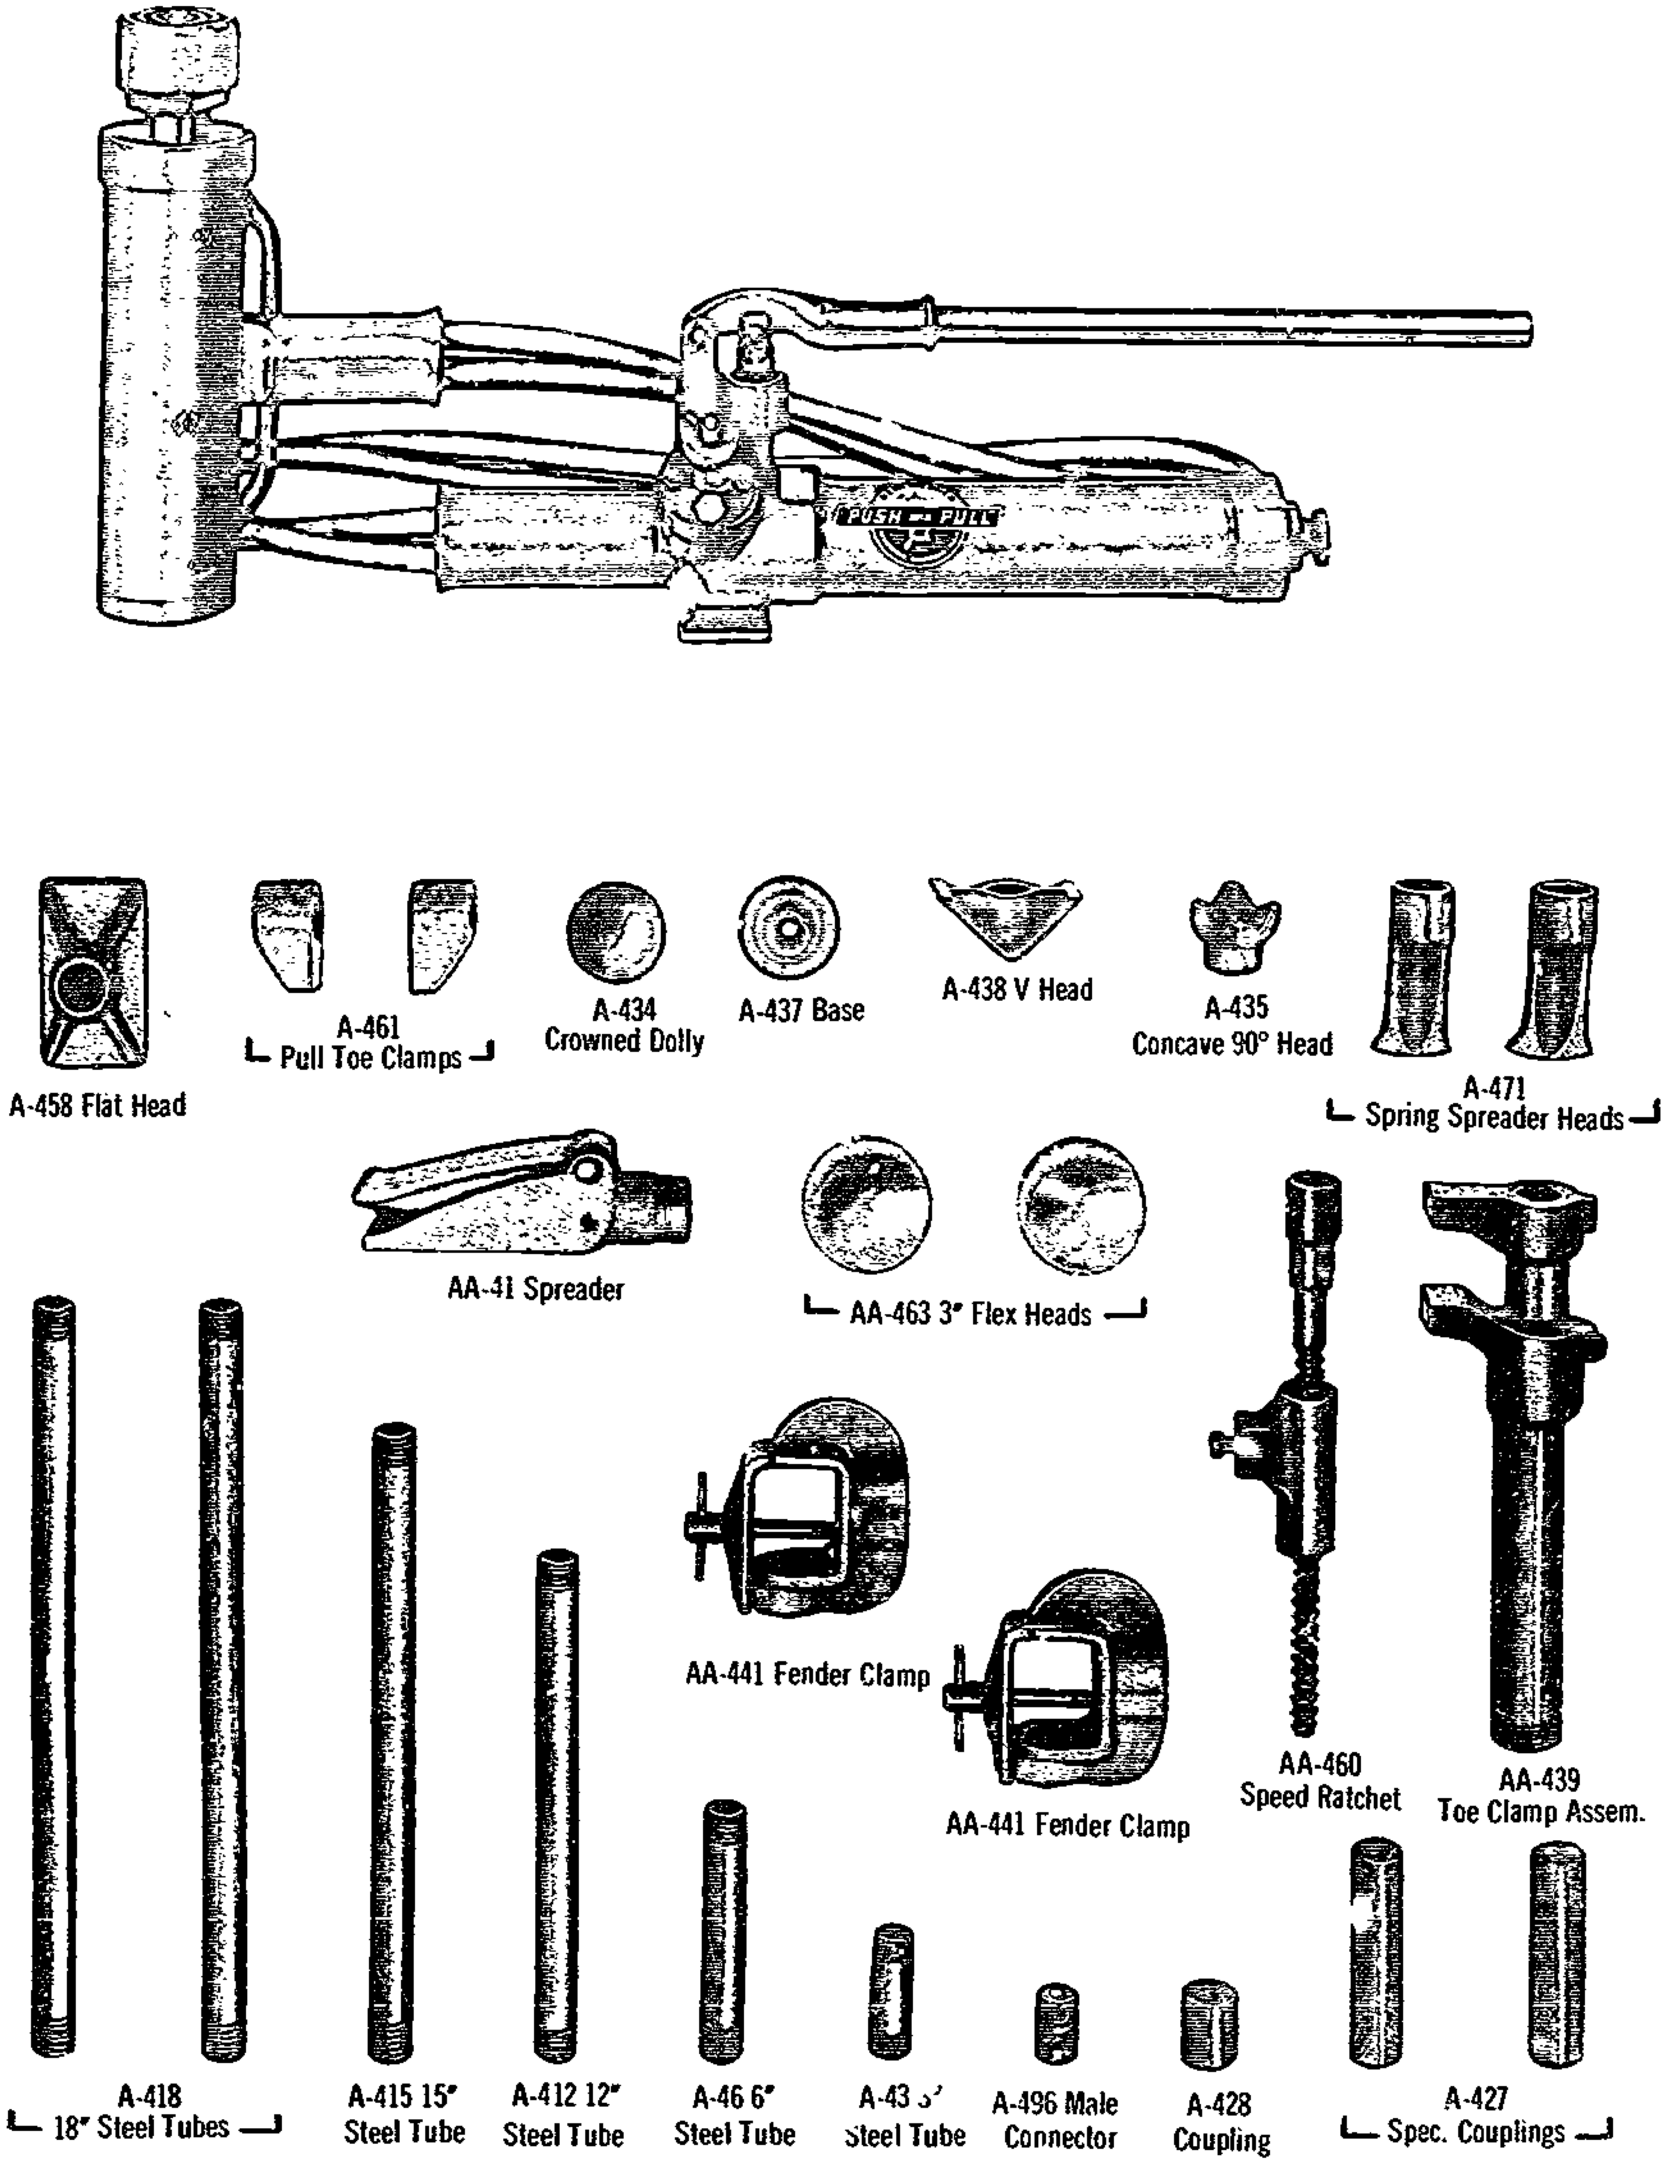
OBJECTIVES: To learn why hydraulic jacks are used in repair work.
To learn how to operate the hydraulic jack.
To learn how to care for this piece of equipment.

INFORMATION:

As collision repair jobs become more difficult, it is necessary to use tools which can help the body man to do things which ordinarily would be extremely difficult by hand. The hydraulic jack is this type of tool (Fig. VII-12).

It is an expensive tool and must receive careful use. The most important thing to remember about a hydraulic jack is not to overload it. This means that if a jack is a three ton type, you cannot expect to move ten tons with it. There are heavier duty jacks which can do bigger and heavier jobs. Another important thing to remember when using the jack, is to be sure that the pipes and attachments are screwed together all the way. If this is not done, when strain is applied it is possible that the threads will become stripped. Careful storage is another important factor. When the tool is not being used, all the parts should be put into the stand and put into the storeroom. Periodically the oil level should be checked and refilled with hydraulic jack oil if necessary.

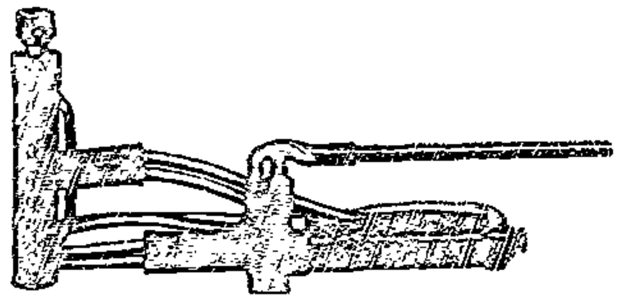
As you can see in the picture, there are many parts to the hydraulic jack assembly. Basically, however, the major parts are: the pump, ram, and connecting hose (Fig. VII-13). All of the other parts help to make it fit a special need. The pipes, nipples and couplings make the jack longer. There are different types of ends that can be used to make it fit against the job better. All the threads are right hand and the jack is assembled by screwing the parts together. The jack that is illustrated is a push-pull type. This means that it can be hooked up to push against something or pull it together.



HYDRAULIC BODY JACK SET

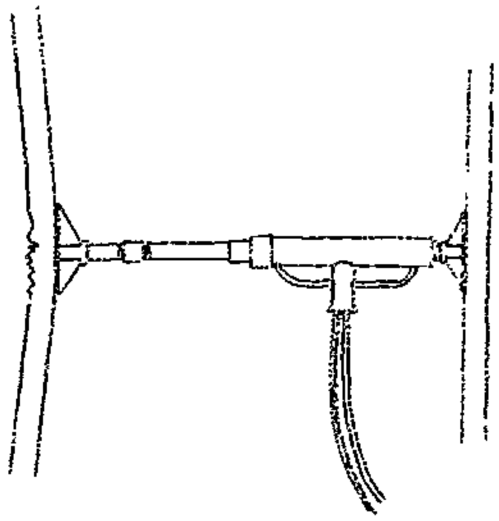
FIG. VII-12

It will take practice to know exactly what to use, where, and how, but the way to learn is by beginning with the most simple pushing operation, which requires little extending. When selecting the end, always select the piece that best fits the surface you are jacking against without doing damage to it. When pumping the ram out in a pushing operation, first close the valve all the way. (Turn it in a clockwise direction (Fig. VII-14).) Then proceed to pump as much as is needed.



HYDRAULIC, PUMP, RAM AND HOSE

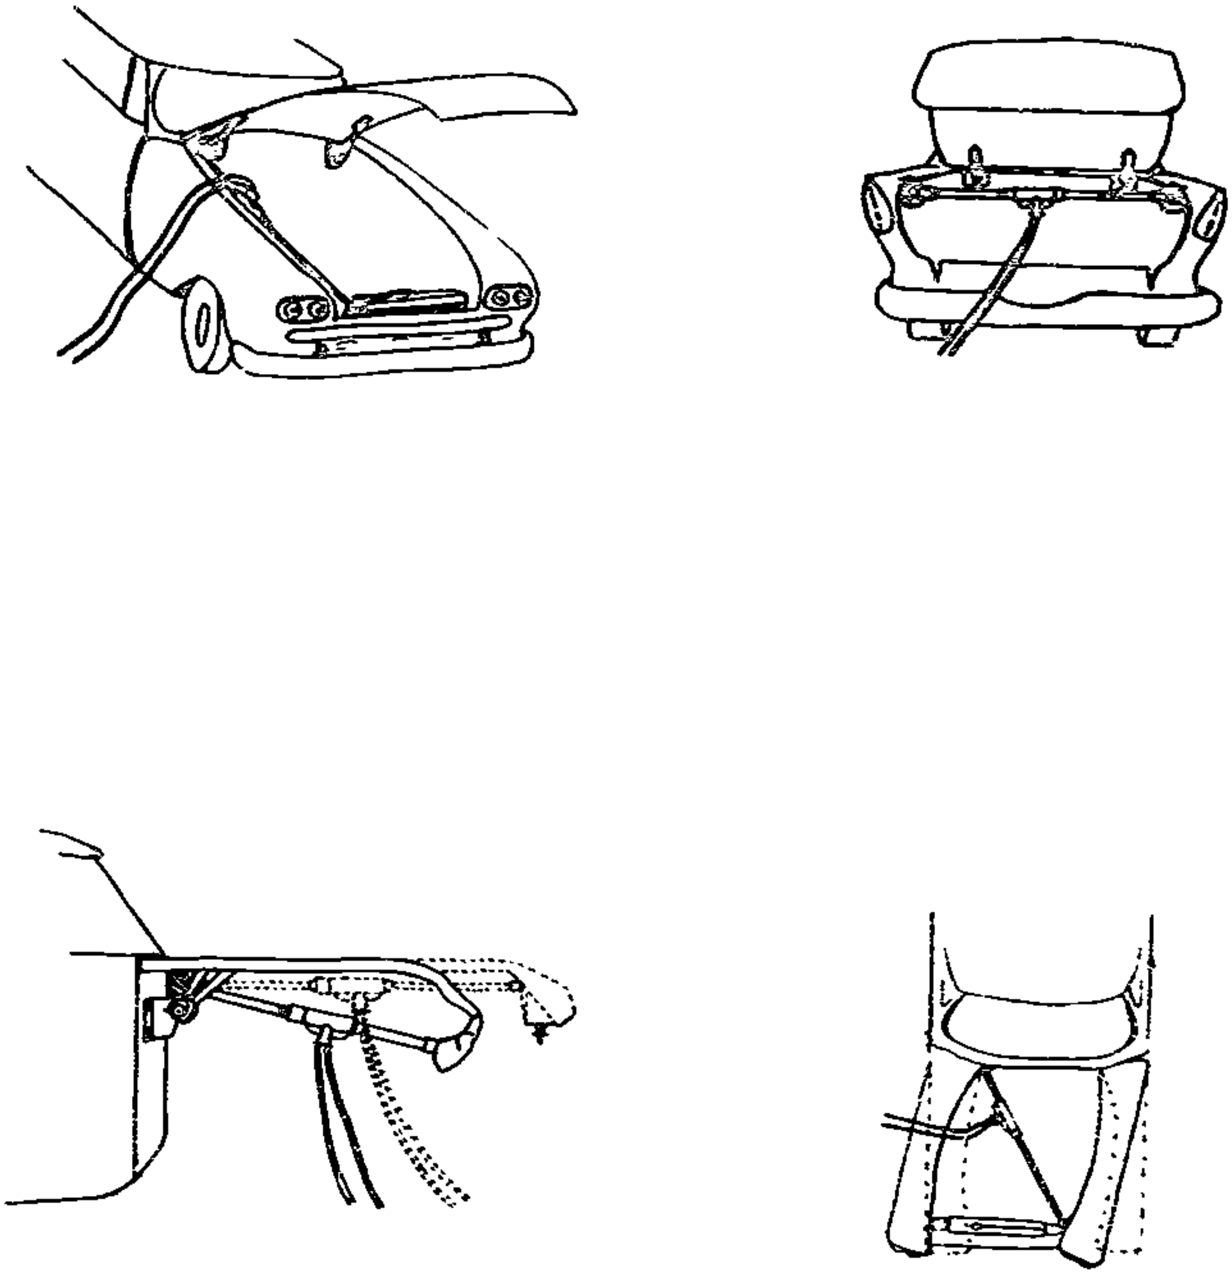
FIG. VII-13



A SIMPLE PUSH OPERATION

FIG. VII-14

In order to pull the jack together again when you are finished, first turn the valve all the way in a counter-clockwise direction and pump until the cylinder has returned inside the ram. Study the picture of all the parts and familiarize yourself with the names of the pieces. Also study the pictures which show some sample hookups which illustrate the ways it can be used. Study these carefully and when doing the next job requiring the hydraulic jack, refer to this page (Fig. VII-15).



SAMPLE HYDRAULIC JACK HOOKUPS

FIG. VII-15

ASSIGNMENT:

1. Name the three most important parts of the hydraulic jack.

2. What are all the pipes, nipples, and couplings for?

3. How is the jack assembled for use?

4. What kind of thread does the jack have?

5. Which way do you turn the valve in order to push the cylinder out of the ram?

6. Which way do you turn the valve in order to pull the cylinder back into the ram?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Fenders (Flanges) Lesson 6

OBJECTIVE: To learn the proper way to repair damage to the flanged edge of a fender.

INFORMATION:

When a fender receives a hard blow, usually the edge buckles and is knocked out of shape. This rolled edge is called a flange and is designed to give strength to the fender. If put back into the proper position, strength can be regained, as can the proper shape of the fender.

The tools that are required are the same as listed for Lessons #1 and #2, plus the small hydraulic jack.

Begin the job by scraping off the dirt and tar from the underside of the fender and bump out the worst of the impact point. Next place the hydraulic jack between the fender and a solid part of the car. By a solid part of the car we mean either the frame or some part of the front system or section of the body which is stronger than the fender. There are many parts and attachments to the hydraulic jack from which you must select the proper hook up. Refer to Lesson #5 for some sample hook ups.

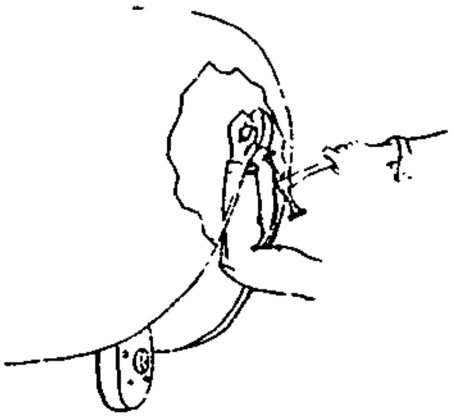
Slowly pump the cylinder out of the ram until the fender moves forward pulling in the side of the fender and the flanged edge (Fig. VII-16).

DAMAGED FLANGE

HYDRAULIC JACK HOOK UP FOR REPAIRING FLANGE DAMAGE

FIG. VII-16

Leave the jack in position and begin to straighten the flange with the dinging hammer and dolly that best fits the shape of the flange. First rough out the area and then hammer it smooth as in previous operations (Fig. VII-17).



STRAIGHTENING THE FLANGE WITH HAMMER AND DOLLY

FIG. VII-17

After the flange has been repaired, slowly release the pressure of the hydraulic jack and remove it. If the flange has been properly straightened, it will hold in place after the jack has been removed. Now proceed to repair the rest of the damage as you have been previously taught; file and sand with the electric sander.

ASSIGNMENT:

1. What is the flange? Draw a sketch of a flange.
2. Why is the flange used?
3. Where should the jack be placed when straightening a flange? Draw a sketch.
4. When do you remove the hydraulic jack?
5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VII - METAL REPAIR

Soldering Iron   Lesson 7

OBJECTIVES: To learn the materials that are used in soldering with coppers.
To learn how to solder with coppers.

INFORMATION:

In the automotive trade, soldering is done with both copper and the torch. In order to learn the principles of soldering we will first use the copper. In most shops the soldering copper is commonly called the soldering iron. The tools that are needed are: gas furnace, soldering coppers, wire brush, muriatic acid, killed acid, acid brushes, and sal-ammoniac.

When working with acid, it is most important to remember not to splash, as this can cause a burn on the skin. Be especially careful of your eyes. Acid in the eye can cause blindness. Acid can also ruin your clothes. If some is spilled on a piece of cloth a hole through the fabric will result. If, at any time, acid is spilled or splashed, use large amounts of water to wash the area.

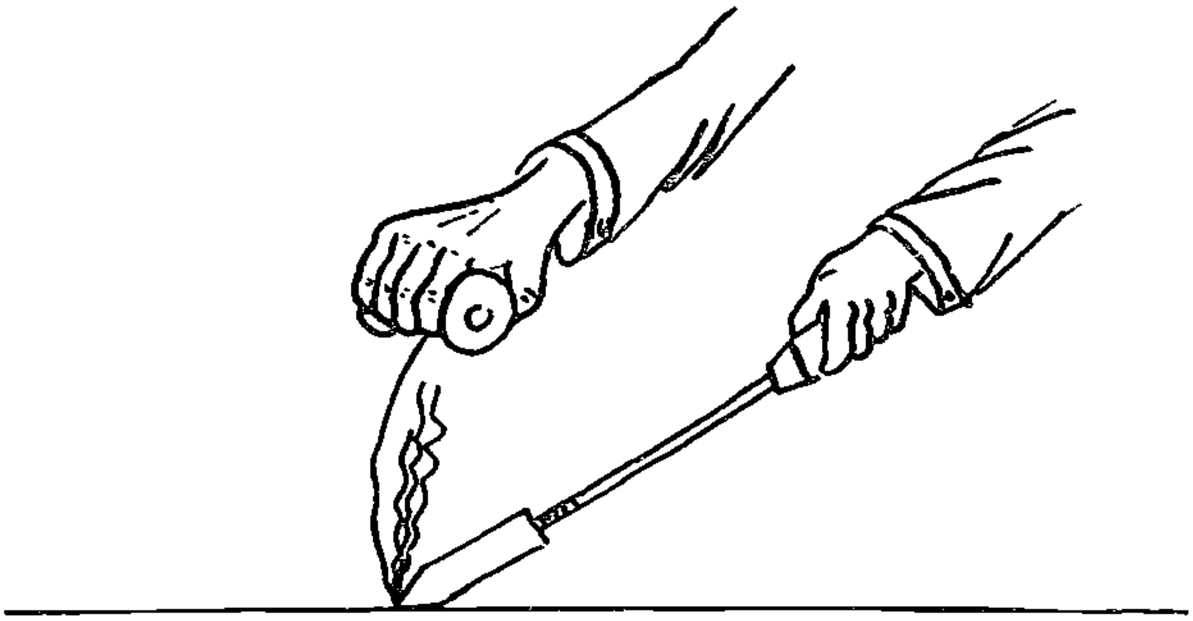
The secret of good soldering is the proper preparation of the surface. This operation is called "tinning." First of all thoroughly clean the area to be soldered. There should be no paint, dirt or scale present. If there is, remove it with a wire brush, or sandpaper. Next we must light the furnace to heat the coppers. Using a flint lighter, first open the top of the furnace, then as you turn the jet on, squeeze the lighter. If you use a match, be sure to strike the match first, and then turn on the gas jet.

Place the coppers into the burning furnace and let them heat. The amount of heat can be tested by dipping the copper into a jar of killed acid for a second. When you remove the copper it should have a small amount of solder added to the tip. If it sticks and flows, then the iron is the proper temperature. You will have to experiment with this until you can tell whether the heat is enough.

When the iron is hot, apply some killed acid to the surface to be soldered with an acid brush. Killed acid is muriatic acid that has been neutralized by adding zinc.

Now lay the hot copper or iron on the surface to be soldered and allow the surface to become heated. Add a small amount of wire solder, slowly moving the iron and adding solder at the same time. This is the tinning operation and the <u>object</u> is to leave a thin film of solder on the surface. As the copper begins to cool, replace it in the furnace and reheat it. Never allow the copper to become red hot as this will burn it. When the surface has been tinned properly, you may begin to solder. Be sure that both surfaces have been tinned and coated with killed acid.

Dip the hot copper into the killed acid and lay it on the surfaces to be soldered together and allow it to heat the area (don't hurry this) and gradually add a little solder. This time move the copper slowly and allow a bead of solder to be built up (Fig. VII-18).



SOLDERING WITH A COPPER

FIG. VII-18

To keep the tip of the copper clean, rub the hot iron on a sal-ammoniac block and add a little solder. When you are finished with your job, very carefully wire-brush the copper to remove any burnt particles and allow the copper to cool before storing.

ASSIGNMENT:

1. What are two ways of soldering?

2. What types of acid are used in soldering?

3. What does tinning mean?

4. Where do you heat the irons or coppers?

5. What happens when a copper becomes red hot?

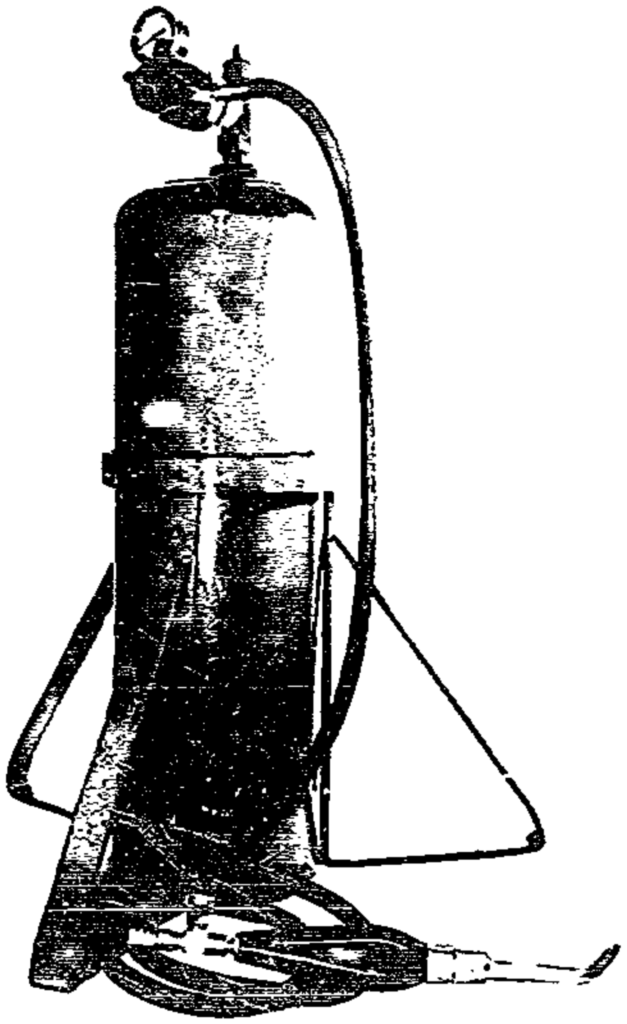
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Soldering (Torch) Lesson 8

OBJECTIVES: To learn what equipment is used in torch soldering.
To learn what care is required by this equipment.
To learn how to solder small dents.

INFORMATION:

You have done some soldering with the copper. The basic principles of torch soldering are the same as with the copper. The main difference is the sending of heat through a flame instead of a heat conducting metal. The equipment that is needed is the Prest-O-Lite tank unit, soldering paddle, beeswax, wire brush, a flint lighter, and steel wool (Fig. VII-19).



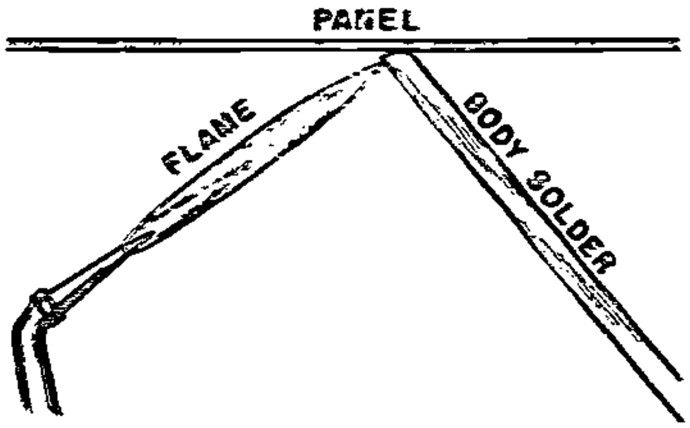
PREST-O-LITE TORCH UNIT

FIG. VII-19

The surface must be prepared in the same way as for soldering with a copper. Remove paint, dirt and scale so the bare metal shows.

Let us begin with the lighting of the torch. Open the regulator at the top of the tank with one or two turns. Hold the torch in the left hand and open the valve with the thumb and first finger of the left hand. Strike the lighter with your right hand. Adjust the flame so that it is about 6" long. Pre-heat the section to be done and apply killed acid or flux with an acid brush. As the surface becomes warm, add a little wire solder (50-50) by playing the flame on the metal and the wire solder. Now rub vigorously with steel wool while the surface is hot. When the metal cools off reheat it again with the torch and again rub it with the steel wool until the whole area has a thin film of solder on it. This is called the tinning operation. Always tin more than the actual spot that is to be soldered.

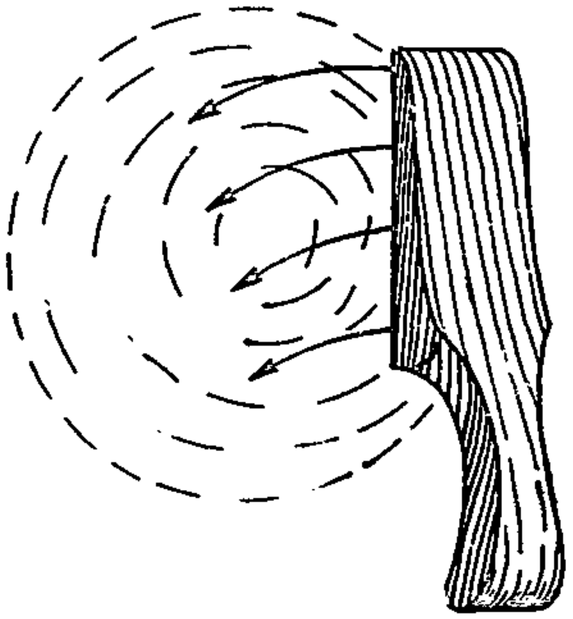
Now you will need the bar of body solder (60-40) (this is 60% lead and 40% tin). Slowly heat the panel, then add the solder to the panel by heating both the metal and the solder bar (Fig. VII-20).



ADDING BAR SOLDER

FIG. VII-20

Add enough solder to fill the dent. Coat the soldering paddle with beeswax. This is done by heating the wax with the flame of the torch and dipping the face of the paddle into it. With the coated paddle in the right hand, heat the solder and the metal until it becomes soft. This you can tell by the color. Do not overheat as all the solder will run off. When the solder is soft, press the paddle against it pushing it into the dent. Then gradually using a circular motion, even it off (Fig. VII-21).



SMOOTHING THE SOLDER WITH A PADDLE

FIG. VII-21

If the solder cools, re-heat it and keep working it until it is fairly smooth. You will have better results if you do not let the metal and solder cool. Keep it warm. When you are finished, the solder should be a little higher than the surface to allow for filing and sanding. Flush off the area with clean water and dry off the water. This will neutralize the acid on the surface.

ASSIGNMENT:

1. What kind of a torch do you use for torch soldering?
2. What is the paddle used for? beeswax?
3. What kind of wire solder is used for tinning?
4. What kind of solder is best for body work?
5. Why is it necessary to flush off the surface of the solder job with water?
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VII - METAL REPAIR

ACHIEVEMENT TEST

1. Show the instructor where the wire hangs when you use the electric sander.

2. Demonstrate to the instructor the following types of jobs:

    a. straighten a small dent on a curved surface.

    b. straighten a small dent on a flat surface.

    c. eliminate a side buckle on a fender.

    d. solder together two pieces of metal using the soldering copper.

    e. tin and fill in a dent on a curved surface using the Prest-O-Lite torch.

3. Review with your instructor the names of the basic tools used in the above operations.

4. List five new words that you have learned in this unit. Use each in a sentence.

UNIT VIII - ACETYLENE WELDING

Equipment

Lesson 1

OBJECTIVES: To become familiar with the different parts of the welding unit.
To learn how to care and operate the equipment.

INFORMATION:

Welding is the joining together of two pieces of similar metal with heat and a rod. On some occasions two pieces of metal can be fused together with heat alone, but most of the time for a strong job a filler rod should be used. The equipment involved in acetylene welding is the tanks (one for oxygen, and one for acetylene), the regulators, the hoses, the torch unit, tips, lighter, wrench, and the goggles. Study the picture and learn to identify the various parts of the welding unit (Fig. VIII-1).

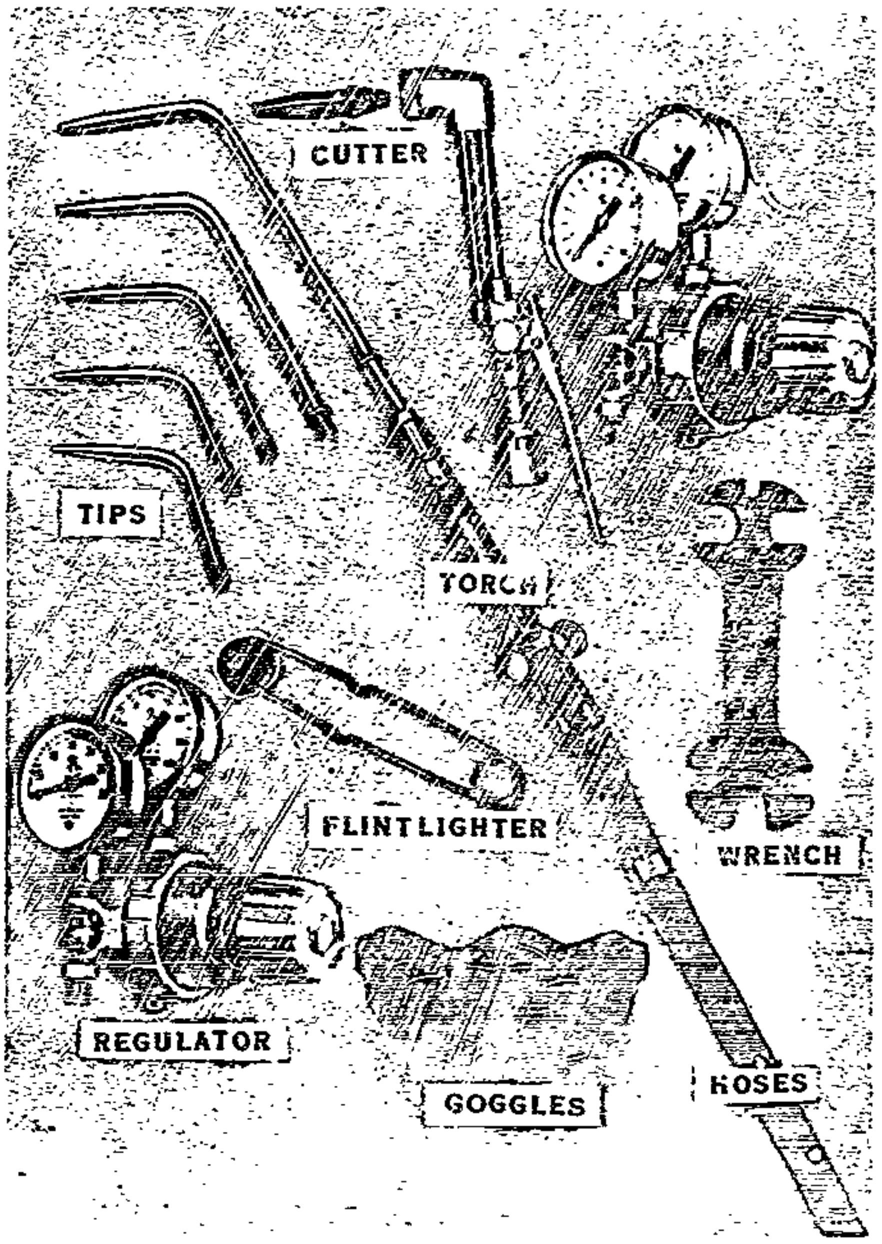


FIG. 8-1

Let us look at the basic principles that make the acetylene unit work. In order to produce a flame we must first have acetylene or gas. This is always in the tank that has the red markings on it. At the top of the tank is the acetylene regulator which is painted red. This controls the pressure of the gas leaving the tank. From the regulator, a hose carries the gas to the torch. This hose is also red. On the torch the left hand valve is the one that controls the amount of gas that leaves the torch. This takes care of one side of the welding unit. Remember, the gas side is indicated in red, which means danger. This gas is highly flammable and care must be used so that the hose is not broken or punctured.

With the gas we now have a flame, but in itself it is not usable, so we add air or oxygen to blow the flame and increase the intensity of the torch. The air is stored in the oxygen tank which is painted green or blue. At the top of the tank is the air regulator which is usually painted green. The hose which carries the air to the torch is also green or black. The valve on the torch controls the amount of air that leaves the tip.

It is the combination of the acetylene and oxygen passing through the tip which enables the flame to be used to fuse metal together.

You should always use goggles when welding to protect your eyes from injury. When they are not in use, be sure to hang the goggles in a place where they will not be broken. Usually the best place to hang them is on the regulator of the torch unit.

Remember, the torch is a dangerous tool. It must never be pointed at anyone or anything that can burn. A lighted torch must always be treated like a loaded gun (Fig. VIII-2).

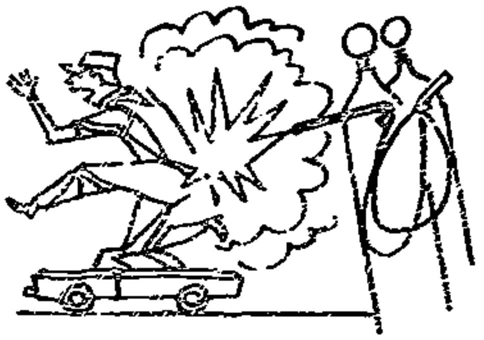

FIG. VIII-2

ASSIGNMENT:

1. What are the two types of tanks used in a welding outfit?

2. Why is the acetylene side always marked in red?

3. Which valve on the torch controls the air?

4. What is the reason for the regulator at the top of the tank?

5. How are your eyes protected from the welding operation?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VIII - ACETYLENE WELDING

Steel (Without Rod) Lesson 2

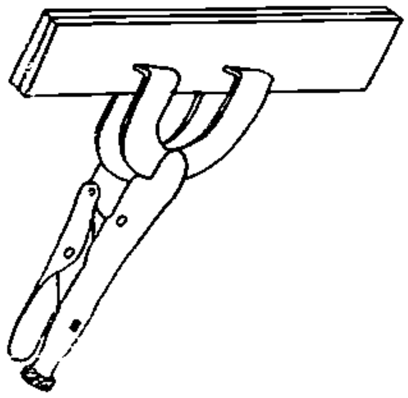
OBJECTIVE: To learn how to weld steel without using a filler rod.

INFORMATION:

In order to gain an understanding of what welding involves, we will begin to weld without the filler rod. This will give us an opportunity to master the torch and to see how metals are fused together.

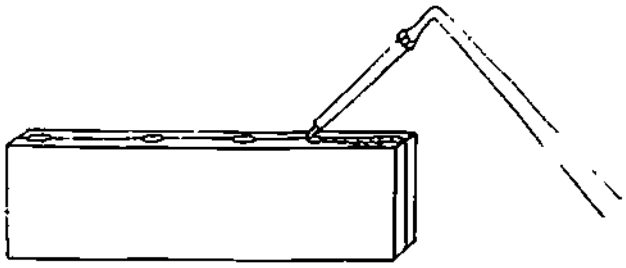
The equipment that will be needed is the welding torch with the smallest tip, #1 or #2, welding goggles, flint lighter, two pieces of 20 gauge steel (approximately 6" x 2").

Begin by clamping together two pieces of steel (Fig. VIII-3).



CLAMPING THE METAL TOGETHER

FIG. VIII-3



FUSING METAL TOGETHER

FIG. VIII-4

Light the torch and adjust the flame so that the deep blue portion of the flame is about $\frac{1}{4}$" long. Now lower the goggles over your eyes and lay the flame next to the edges of the two pieces of metal (Fig. VIII-4).

Apply the heat to both pieces of metal evenly, holding the tip of the flame about $\frac{1}{8}$" away until the metal begins to turn red. If one turns red before the other, then you are applying too much heat to one side. Move the tip a little so that they will both turn red evenly. Very quickly after the metal turns red you will notice that it turns white in color and the steel will start to melt together. Slowly move the torch forward and keep melting the two pieces together as you move, trying to make it as smooth as possible. At first you will not be able to do the entire length of the metal, but this is what you should strive for.

When finished, turn the metal over and begin to fuse together the opposite edge, following the same directions. Complete the project by fusing together the ends in the same manner. The idea is to melt together the two pieces of metal into one, with a smooth edge.

When leaving the welding outfit for any length of time, it is best to release the tank pressure on the gauges by closing the tank with the special wrench kept on the torch, and by unscrewing the regulator until it is free. This will keep the tank from leaking when the torch is not in use. The instructor will tell you when this should be done.

ASSIGNMENT:

1. How long should the deep blue portion of the flame be for proper welding of 20 gauge steel?

2. How far away from the metal should the tip be?

3. What are you doing when you weld without a filler rod?

4. What color is steel at its melting point?

5. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence

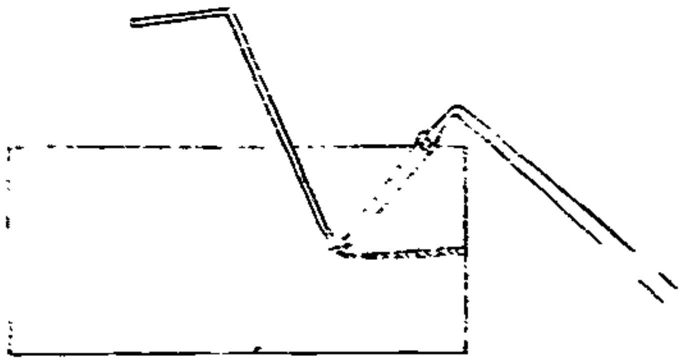
OBJECTIVE: To learn how to puddle with the use of the filler rod.

INFORMATION:

Welding skill rests on a basic understanding of temperature control and manipulation of the rod and flame. With the basic principles in mind, you must practice in order to be able to weld quickly and leave a weld that is smooth and strong.

The equipment necessary for this lesson is the welding unit, goggles, flint lighter, one piece of 20 gauge steel and some $\frac{1}{16}$" copper-coated steel rod.

Lay the steel on a fire brick. Light the torch and adjust the flame so that the tip of the flame is about $\frac{1}{4}$" long. Take the rod in one hand and the torch in the other as shown (Fig. VIII-5), and at the same time lay the rod close to the piece of steel.



ACETYLENE PUDDLING

FIG. VIII-5

Hold the tip of the flame about $\frac{1}{8}$" away from the metal and be sure the rod is the same distance from the tip of the flame. Begin to heat them and carefully watch the color. This will tell you where to concentrate the flame. When they both begin to turn white and melt, lightly touch the rod against the metal and then raise the rod slightly. Keep adding the rod and moving the torch in a forward position until you have left a bead on the metal. This will help you to learn how to add wire to the job to be welded.

The object of this lesson is to learn to lay a bead on the piece of metal and make a weld which is uniform and has no holes in it. If the rod sticks to the metal, then you are not applying enough heat to the wire. Merely turn the torch slightly toward the rod. This will burn it away and release it from the metal. This will require practice, so keep laying beads one after the other until you can go the entire length of the metal without burning holes through it.

ASSIGNMENT:

1. What are the basic principles of welding?

2. What happens if you hold the torch too far away from the job?

3. What are you doing when you puddle?

4. If the rod sticks to the job, what is wrong?

5. What must you do to eliminate sticking of the wire?

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VIII - ACETYLENE WELDING

Acetylene Welding Steel With Filler Rod — Lesson 4

OBJECTIVE: To learn how to weld with steel filler rod.

INFORMATION:

After you have had a considerable amount of practice in fusing two pieces of metal together and puddling, you will be ready to add another piece of metal. This time you will weld two pieces of steel together with the help of a steel filler rod. The principle is the same as before. Remember, the secret is melting both pieces of steel and the wire at the same time.

The equipment needed is the same as before: welding unit, welding goggles, flint lighter, two pieces of steel (20 gauge) approximately 6" x 2", and some $\frac{1''}{16}$ copper coated steel welding rod. Set up the project as shown in the diagram (Fig. VIII-6).

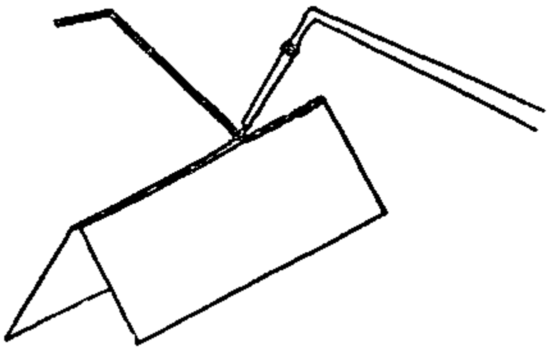


FIG. VIII-6

Light the torch and adjust the flame. Lower the goggles over your eyes. Lay the tip of the flame near the edges of the metal. At the same time, with your other hand, add the rod so that it is about the same distance away from the flame as the two pieces of metal. Watch the color very carefully and make sure that the two pieces of metal and the rod all turn red at the same time. As all three pieces begin to turn white, touch the filler rod to the two pieces of metal and move it slightly away. Then touch again and take away again. This is the procedure that must be followed on the entire length of the metal. If the wire sticks to the metal, merely turn the torch and point it at the wire and this will burn it loose. You will see that a slight touch of the wire on the metal leaves a small amount of molten metal on the job and this fuses the two together.

When you have completed this project, add another piece of metal (Fig. VIII-7) and begin to weld again.

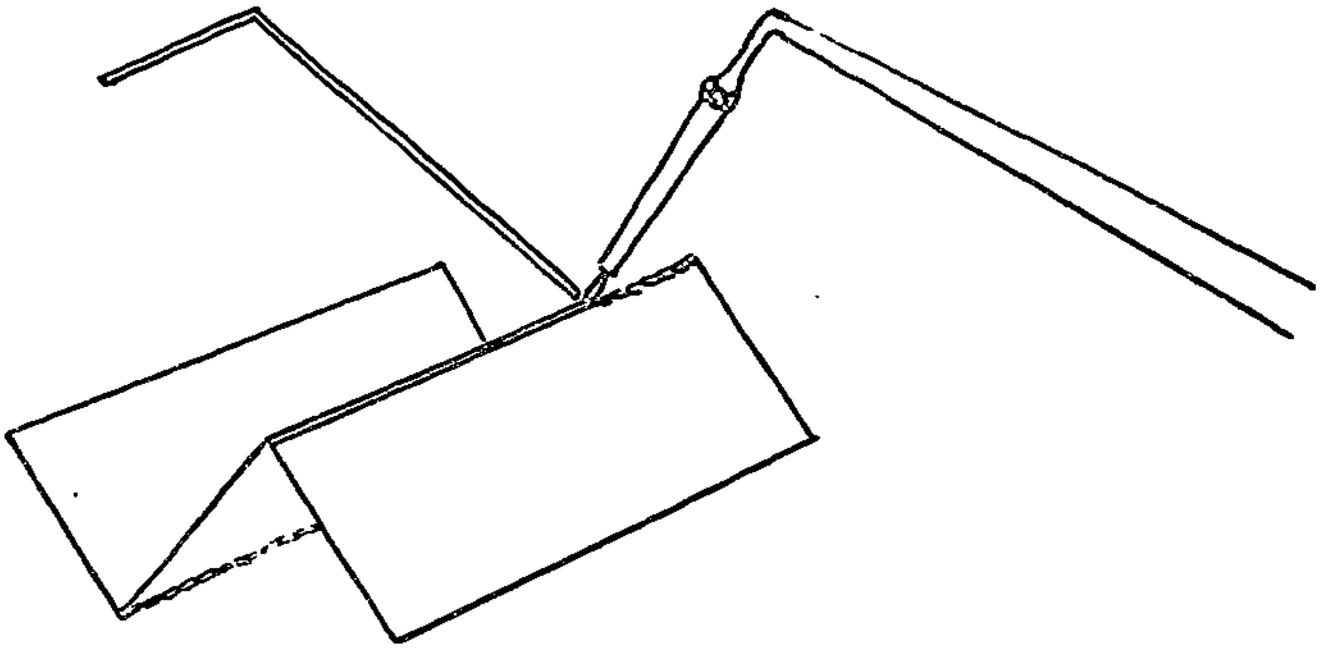

FIG. VIII-7

ASSIGNMENT:

1. Demonstrate to the instructor how to adjust the regulators on the two tanks for welding 20 gauge steel.

2. Show the instructor the proper way of lighting the torch.

3. Set up a project using two pieces of 20 gauge metal and weld together using a piece of $\frac{1''}{16}$ rod.

4. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT VIII - ACETYLENE WELDING

ACHIEVEMENT TEST

1. Name and point out the principal parts of the acetylene welding outfit.

2. Show the instructor the proper way to light and adjust the torch.

3. Demonstrate to the instructor the following projects:

   a. Fuse together two pieces of 20 gauge metal without welding rod.

   b. Using a piece of 20 gauge steel, puddle a uniform bead.

   c. Weld together two pieces of 20 gauge steel using a $\frac{1}{16}$" mild steel rod.

4. How do you leave the torch when leaving the shop for the day?

5. List five new words you have learned in this unit. Use each in a sentence.

assembly	-	ă sĕm′ blĭ	a group of parts put together
assist	-	ă sĭst′	to help or aid
assure	-	ă shŏŏr′	make sure, tell positively, make safe against loss
attach	-	ă tăch′	to fasten, to join together
attachment	-	ă tăch′ mĕnt	a thing added to the main part
attempt	-	ă tĕmpt′	to try, an effort
attractive	-	ă trăk′ tĭv	nice or pretty
available	-	ȧ vāl′ ȧ bl	usable; at hand
avoid	-	ă void′	to keep away from
basic	-	bās′ ĭk	fundamental, something important in the beginning; a foundation
bonding agent	-	bŏnd′ ing ā′ jĕnt	something that holds one thing to another
brand	-	brănd	a certain kind
brilliance	-	brĭl′ yăns	brightness, shine
brittle	-	brĭt′ l	something that will break easily
buckle	-	bŭk′ l	a bend or a wrinkle
careless	-	kâr′ lĕs	not careful, sloppy, inexact
catalog	-	kăt′ ȧ lŏg	a book showing pictures or describing something; tells you about something
caution	-	kô′ shŭn	carefulness
circular	-	sûr′ kū lẽr	round
circulation	-	sûr′ kū lā shŭn	the act of going or moving around
circumstance	-	sûr′ kŭm stăns	the way things are
clockwise	-	klŏk′ wīz	the direction in which the hands of the clock move

assembly	-	ă sĕm′ blĭ	a group of parts put together
assist	-	ă sĭst′	to help or aid
assure	-	ă shŏŏr′	make sure, tell positively, make safe against loss
attach	-	ă tăch′	to fasten, to join together
attachment	-	ă tăch′ mĕnt	a thing added to the main part
attempt	-	ă tĕmpt′	to try, an effort
attractive	-	ă trăk′ tĭv	nice or pretty
available	-	ȧ vāl′ ȧ bl	usable; at hand
avoid	-	ă void′	to keep away from
basic	-	bās′ ĭk	fundamental, something important in the beginning; a foundation
bonding agent	-	bŏnd′ ing ā′ jĕnt	something that holds one thing to another
brand	-	brănd	a certain kind
brilliance	-	brĭl′ yăns	brightness, shine
brittle	-	brĭt′ l	something that will break easily
buckle	-	bŭk′ l	a bend or a wrinkle
careless	-	kâr′ lĕs	not careful, sloppy, inexact
catalog	-	kăt′ ȧ lŏg	a book showing pictures or describing something; tells you about something
caution	-	kô′ shŭn	carefulness
circular	-	sûr′ kū lẽr	round
circulation	-	sûr′ kū lā shŭn	the act of going or moving around
circumstance	-	sûr′ kŭm stăns	the way things are
clockwise	-	klŏk′ wīz	the direction in which the hands of the clock move

clog	-	klŏg	to become filled up, or choked (stops something from working)
collision	-	kŏ lĭzh′ ŭn	coming together with force; accident
combine	-	kŏm bīn′	to join together
combination	-	kŏm′ bĭ nā shŭn	something made of more than one thing
complex	-	kŏm plĕks′	hard to understand, difficult, containing many parts
composition	-	kŏm pȯ zĭsh′ ŭn	the union of more than one thing
compressor	-	kŏm prĕs′ ẽr	a machine that pushes air together, gives force to air
concentrate	-	kŏn′ sĕn trāt	pay attention; to bring together
concern	-	kŏn sûrn′	to have to do with, belong to
condition	-	kŏn dĭsh′ ŭn	the way something is, its present state
conditioning	-	kŏn dĭsh ŭn′ ĭng	preparing or getting ready
confident	-	kŏn′ fĭ dĕnt	sure, certain
connection	-	kŏ nĕk′ shŭn	a way of fastening things together
considerable	-	kŏn sĭd′ ẽr ȧ bl	important, not a little, much
consideration	-	kŏn sĭd ẽr ā′ shŭn	careful thought
consistency	-	kŏn sĭs′ tĕn sĭ	the amount of firmness
constant	-	kŏn′ stănt	the same
constantly	-	kŏn′ stănt lĭ	always the same, not changing
constructed	-	kŏn strŭkt′ ĕd	made or built
contain	-	kŏn tān′	to hold something, to hold
container	-	kŏn′ tān′ ẽr	a box, can, or jar used to hold something
contents	-	kŏn′ tĕnts	that which is inside something
continuous	-	kŏn tĭn′ ū ŭs	connected; without a stop; unbroken

contribute	kŏn trĭb′ ū̇t	to give to
control	kŏn trōl	to have the power to do something; to be able to handle something
convenience	kŏn vēn′yĕns	comfort; advantage
conventional	kŏn vĕn′ shŭn ăl	ordinary; usual
correct	kŏ rĕkt′	right
counter clockwise	koun′ tẽr klŏk′wīz	opposite from the direction in which the hands of the clock move
curdling	kûrd′lĭng	thickening
cylinder	sĭl′ĭn dẽr	a hollow or solid body shaped like a roller
depend	dē̇ pĕnd′	to rely on
depth	dĕpth	distance from the top to the bottom
design	dē̇ zīn′	a certain style
desire	dē̇ zīr′	a strong wish, something you want
deteriorate	dē̇ tē′rĭ ō̇ rāt	become worse; spoil
determine	dē̇ tûr′mĭn	to find out; to decide
develop	dē̇ vĕl′ŭp	to grow; to make; become better, bigger, or more useful
device	dē̇ vīs′	a tool or machine
differ	dĭf′ẽr	not the same; to vary
difficult	dĭf′ĭ kŭlt	hard to do or understand
directly	dĭ rĕkt′lĭ	exactly, straight
dispose	dĭs pōz′	to get rid of; give away; throw away
dissolve	dĭ zŏlv′	to do away with; break up
distance	dĭs′tăns	space between
discard	dĭs kärd′	to throw away

distract	dĭs trăkt′	to disturb or bother someone so that he takes his mind off his work
drain	drān	to take out or remove liquids
durability	dū′rȧ bĭl′ĭ tĭ	lasting a long time
economical	ē kŏ nŏm′ĭ kăl	not too expensive
effective	ĕ fĕk′tĭv	the way we want it; acting the way it is supposed to
efficiently	ĕ fĭsh′ĕnt ly	quickly, without wasting time
eliminate	ē lĭm′ĭ nāt	to get rid of; leave out; omit
elimination	ē lĭm ĭ nā′shŭn	removing; getting rid of
entangle	ĕn tăng′gl	to wrap up in, to get mixed and caught
entire	ēn tīr′	the whole; everything
equal	ē′kwăl	the same
equalize	ē′kwăl īz	to make the same
essential	ĕ sĕn′shăl	needed; important; necessary
evaporate	ē văp′ō rāt	disappear; turn into vapor; turn to gas
evident	ĕv′ĭ dĕnt	easy to see or understand; plain; clear
experience	ĕks pēr′ĭ ĕns	practice; what we learn by doing; what happens to a person
expose	ĕks pōz′	uncover
extensive	ĕks tĕn′sĭv	large; far reaching
factor	făk′tẽr	a thing, a cause, something that must be considered
familiar	fȧ mĭl′yẽr	well known, something which a person knows or recognizes

familiarize	fȧ mĭl′yẽr īz	make well known; to get to know about something
fascinating	făs′ĭ nāt ĭng	very interesting
fasten	fȧs′n	to attach, lock, connect or tie
feature	fē tūr	a special part, whatever makes one thing different from another
final	fī′năl	the last, end, closing
firmly	fûrm′li	solidly, strongly
flammable	flăm′ȧ bl	burns easily; able to catch on fire easily
flexible	flĕk′sĭ bl	bends without breaking
flux	flŭks	a material used to help metals stick together when welded
form	fôrm	a shape; to shape or make something
formation	fôr mā′shŭn	a structure; the act of making or shaping
frequently	frē kwĕnt li	happens often; many times
functional	fŭngk′shŭn ăl	acting, operating
furnish	fûr′nĭsh	to give; provide, or supply
fuse	fūz	to join together by melting as in welding
generally	jĕn′ẽr ăl ĭ	most of the time; usually
gently	jĕnt′tlĭ	softly, or easily
glaze	glāz	a smooth covering; a shiny coating
gradually	grăd′ū ă li	slowly, easily
grasp	grȧsp	to grab or hold
guide	gīd	to direct, lead, help, show the way

hazardous	-	hăz′ẽr dŭs	dangerous
humidity	-	hŭ mĭd′ĭ tĭ	dampness, amount of water in the ai
ideal	-	ī dē′ăl	perfect; just the way you would like it
identify	-	ī dĕn′tĭ fī	to recognize something or someone
ignorance	-	ĭg′nō răns	lack of knowledge
illustrate	-	ĭ′lŭs trāt	to explain by using pictures or drawings
immediately	-	ĭ mē′dĭ ĭt li	right away, without delay
impact	-	ĭm păkt′	the hitting of one thing against another; the coming together; striking
impractical	-	ĭm prăk′tĭ kăl	not very useful, not commonly used
imperfection	-	ĭm′pẽr fĕk shŭn	something wrong; a defect
include	-	ĭn klōōd′	to count in the total; contain
ingredient	-	ĭn grē′dĭ ĕnt	one of the parts of a mixture
inhaling	-	ĭn hāl′ĭng	breathing in
injurious	-	ĭn jo͝o′rĭ ŭs	harmful
injury	-	ĭn′jẽr ĭ	harm, hurt, or damage
insert	-	ĭn sûrt′	to put in, set into place
install	-	ĭn stôl′	to put on
instance	-	ĭn′stăns	an example
instructor	-	ĭn strŭkt′tẽr	teacher
intensity	-	ĭn tĕn′sĭ tī	amount of strength; amount of concentration
interior	-	ĭn tēr′ĭ ẽr	inside, inner side
introduce	-	ĭn trō dūs	to bring in, insert, put in
involve	-	ĭn vŏlv′	to include or take in

irregularity	ĭ rĕg ū lăr′ ĭ tĭ	lack of evenness or smoothness
item	ī′tĕm	a thing, a piece, an article
jelling	jĕl′ĭng	becoming lumpy and turning into a solid mass
judgment	jŭj′mĕnt	the way you think is best; good sense, common sense
knowledge	nŏl′ĕj	what someone knows
lint	lĭnt	tiny bits of thread from cloth
livelihood	līv′lĭ hŏŏd	a way of making a living
locate	lō′kāt	find, to show where something is
lubrication	lū brĭ kā shŭn	oiling, greasing
major	mā′jĕr	greater; large; most
maneuver	ma noo ver	a movement; a way of moving; to steer; to move
manipulation	mȧ nĭp ū lā shŭn	handling something with skill; doing something with your hands
master	mȧs′tẽr	to be skillful; an expert
material	mȧ tēr′ĭ ăl	what something is made of
means	mēnz	a way of doing something
mention	mĕn′shŭn	to talk or speak about
mere	mēr	nothing else than, only, something slight
method	mĕ th′ŭd	a way of doing something
moisture	mois′tūr	dampness, water in the air

molten	-	mōl′tĕn	melted through heat
motion	-	mō′shŭn	movement, a change of position
moderate	-	mŏd′ẽr ĭt	not too fast, not too slow; in between; fair
movable	-	mo͞ov′a bl	something that can be moved or carried
necessary	-	nĕs′ĕ sĕr ĭ	needed, important
neutralize	-	nū′trăl īz	to make neutral, counter balance
noted	-	nōt ed	specially noticed
notice	-	nō′tĭs	give attention to; take heed
noticeable	-	nō′tĭs ȧ bl	easily seen
object	-	ŏb′jĕkt	a thing or a part
obnoxious	-	ŏb nŏk′shŭs	harmful; unpleasant
observe	-	ŏb zûrv′	to see and notice, examine, study
obtain	-	ŏb tān′	to get
occasionally	-	ŏ kā′zhŭn ăl lĭ	once in a while, sometimes, not regularly
operation	-	ŏp ẽr ā′shŭn	the way something works, movement, doing; an act
opportunity	-	ŏp ŏr tū′nĭ tĭ	a chance; possibility of doing something
ordinarily	-	ôr′dĭ nĕr ĭ lĭ	most of the time; usually
original	-	ō rĭj′ĭ năl	the first; earliest; new
ornamental	-	ôr nȧ mĕn′tăl	something which adds beauty; decorative; for show
outlet	-	out′lĕt	a way of letting something out; a place for plugging in an electric wire
over-confident	-	ō′vẽr kŏn′fĭ dĕnt	too sure of oneself, too certain of oneself.

parallel	-	păr′ă lĕl	two lines exactly the same distance apart at all points (like two pieces of railroad track)
particle	-	pär′tĭ kl	a very little piece of something
particular	-	pẽr tĭk′ú lẽr	different from other; unusual; something special
particularly	-	pẽr tĭk′u̇ lẽr lĭ	especially
passenger	-	păs′ĕn jẽr	rider in a vehicle
pattern	-	păt′ẽrn	a model, guide, example
perfect	-	pûr′fĕkt	just right, no mistakes
periodically	-	pēr ĭ ŏd′ĭ kăl lĭ	every now and then; once in a while; with regularity
permanent	-	pûr′má nĕnt	something that lasts a long time
permit	-	pûr′mĭt	to let or allow
personal	-	pûr′sŭn ăl	something that belongs to a person
phase	-	fāz	one part (of a job)
pivot	-	pĭv′ŭt	the spot on which something turns
pliable	-	plī′ȧ bl	bendable; flexible
pneumatic	-	nū̇ măt′ĭk	worked by air; filled with air
position	-	pō zĭsh′ŭn	a place where something or someone is
potential	-	pō̇ tĕn′shăl	something which could be; not actual
precious	-	prĕsh′ŭs	something very dear; of great value
precision	-	prē̇ sĭzh′ŭn	exactness; accuracy
preparation	-	prĕp ȧ rā′shŭn	getting ready
presence	-	prĕz′ĕns	being present; being in a place
present	-	prĕz′ĕnt	not absent; now
preservation	-	prĕz ẽr vā shŭn	keeping safe

preserve	-	prē zûrv	to protect; to keep from harm or change
preferably	-	prĕf′ẽr ȧ bli	by choice, what you think is best
pressure	-	prĕsh′ẽr	force
prevent	-	prē vĕnt′	to stop from happening
previous	-	prē′vĭ ŭs	comes before; first; happened earlier
primarily	-	prī′mĕr ĭ lĭ	at first, originally
primary	-	prī′mĕr ĭ	first in importance, time, and order
principle	-	prĭn′sĭ pl	an important idea
probably	-	prŏb′ȧ blĭ	maybe; likely to happen
proceed	-	prō sēd	to go ahead, continue
procedure	-	prō sē′dūr	a way of doing things
process	-	prŏs′ĕs	a special way; a set of actions
product	-	prŏd′ŭkt	something which is made
project	-	prō jĕkt′	a job, plan; to stick out
properly	-	prŏp′ẽr lĭ	the right way, correctly
protective	-	prō tĕk′tĭv	serving to keep safe
provide	-	prō vīd′	to supply or furnish, take care of
puncture	-	pŭngk′tūr	to make a hole; a hole made by something sharp
purify	-	pū′rĭ fī	to make clean or pure
purpose	-	pûr′pŭs	a plan; aim; intention
quantity	-	knŏn′tĭ tĭ	amount

readily	-	rĕd′ĭ lĭ	quickly or easily
realize	-	rē′ăl īz	to understand
reasonably	-	rē′zn ȧ blĭ	in a sensible way; not foolishly
reassemble	-	rē ă sĕm′ bl	put back together again
recommend	-	rĕk ŏ mĕnd′	advise; speak in favor of; suggest
reduce	-	rḗ dūs′	to make less or smaller
reduction	-	rḗ dŭk′shŭn	a decrease; a cutting down
reflection	-	rḗ flĕk′shŭn	shine or image, as in a mirror
regain	-	rḗ gān′	to get back again
regard	-	rḗ gärd′	look closely at; to think of
regularly	-	rĕg′ū̇ lẽr lĭ	over and over, at the same time, steady
regulate	-	rĕg′ū̇ lāt	to control
regulator	-	rĕg′ū̇ lā tẽr	a part that controls something, (on a welding torch it controls air and gas)
refer	-	rḗ fûr′	turn for information or help; look for help (from a book)
related	-	rḗ lāt′ẽd	belonging to the same family
release	-	rḗ lēs′	to let go
remain	-	rḗ mān′	to stay in same place
remaining	-	rḗ mān′ĭng	what is left; not used
removal	-	rḗ mo͞ov′ăl	taking off or taking away
remove	-	rḗ mo͞ov	to take off or take away
replace	-	rḗ plās′	to put back in place again
replaceable	-	rḗ plās′ă bl	something that can be changed or re-newed
replacement	-	rḗ plās′mĕnt	a new part
require	-	rḗ kwīr′	need, demand

requisite	rĕk′wĭ zĭt	needed
reservoir	rĕz′ẽr vwôr	a place where something is stored
respect	rē̇ spĕkt′	show honor for; show care for someone or something
respirator	rĕs′pĭ rā tẽr	a tool used to stop a person from breathing harmful fumes, cleans the air we breathe
return	rē̇ tûrn′	to put back; go back; or reply
reverse	rē̇ vûrs′	backwards; opposite; to turn the other way
rough	rŭf	not smooth; not level or straight
ruin	rōō′ĭn	to spoil or destroy
section	sĕk′shŭn	a part or piece of something
secure	sē̇ kūr′	to fasten firmly
select	sē̇ lĕkt′	to pick, choose
separate	sĕp′ȧ rāt	keep apart; not together
serve	sûrv	be useful; satisfy
severe	sē̇ vēr′	very bad; difficult or serious
similar	sĭm′ĭ lẽr	almost the same, alike
slightly	slīt′lĭ	a little; very little
solid	sŏl′ĭd	not a liquid; not hollow; hard or firm
solvent	sŏl′vĕnt	a liquid that dissolves other materials, often used for washing surfaces
sparingly	spâr′ĭng lĭ	very lightly, without using too much
specific	spē̇ sĭf ĭk	exact, definite, particular
spread	sprĕd	to lay out, or stretch or move apart
storage	stōr′ĭj	keeping safe, a place to keep things

strive	strīv	to try, attempt
suction	sŭk′shŭn	drawing up liquids (as through a straw)
sufficient	sŭ fĭsh′ĕnt	enough; as much as is needed
suit	sūt	to make fit, to agree with
surface	sûr′fĭs	the outside of anything; a face or side of a thing
surroundings	sŭ round′ingz	things around you
suspension	sŭs pĕn′shŭn	holding something in place as if by hanging
swirling	swûrl′ĭng	a circular motion; moving in a circle quickly
syphon	sī′fŏn	to draw up a liquid through a hose
systematically	sĭs tĕm ăt′ĭk lĭ	according to plan

tab	tăb	a small piece; flap or loop
technique	tĕk nēk′	a special way or skill in doing something
temperature	tĕm′pẽr á tūr	amount of heat or cold measured in degrees
transmit	trăns mĭt′	to pass along; to send; or let through
thorough	thûr′ō	complete, everything that is needed

uniform	ū′nĭ fôrm	the same; not different; all alike
universal	ū nĭ vûr săl	general
unnecessary	ŭn nĕs′ĕ sĕr ĭ	not needed
unobstructed	ŭn ŏb strŭkt′ĕd	not blocked; clear
usable	ūz′ă bl	can be used

valuable	-	văl′ū̇ ȧ bl	worth a great deal
variation	-	vâr ĭ ā′shŭn	change, a different way
variety	-	vȧ rī′ĭ tĭ	different kinds
various	-	vâr′ĭ ŭs	different
vibration	-	vī brā′shŭn	rapid motion to and fro
vigorous	-	vĭg′ẽr ŭs	forceful; strong; active
viscosity	-	vĭs kŏs ĭ tĭ	thickness of a liquid such as paint
visible	-	vĭz′ĭ bl	can be seen
vital	-	vī′tăl	important, necessary

A Guide for Use in Developing Training Programs in Vocational Automotive Mechanics.

Mississippi State Univ., State College. Curriculum Lab.
Mississippi State Dept. of Vocat. Educ. State College

Pub Date - Aug66
MF AVAILABLE IN VT-ERIC SET 98p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO MECHANICS (OCCUPATION), *MOTOR VEHICLES, HIGH SCHOOLS,

The purpose of this curriculum guide is to encourage the development of a more efficient instructional program in automobile mechanics for the secondary school by assisting the instructor in making lesson plans for lectures and demonstrations and in planning shop activities. A statewide curriculum committee of trade instructors used findings from a trade analysis as a basis for developing the materials. The purpose of the course is to prepare the student to meet beginning employment standards. The major divisions are (1) Orientation, Basic Operations, Welding, (2) Engine Rebuilding, (3) Electrical System, (4) Fuel System, (5) Cooling System, (6) Power Train, (7) Suspension System, (8) Steering System, (9) Brakes, and (10) Heating and Air Conditioning. Each division includes a topical outline of trade principles, selected descriptions of trade practice, an equipment list, and a supplies list. The course is designed for a 2-year program with 1,080 hours of group instruction and with time designations for group shop activity within each division. The teacher should be occupationally up-to-date with at least 2 years of work experience beyond the learner's level. The students should have made a definite vocational choice for the trade. Topic outlines are included for related mathematics and science. The appendixes contain a bibliography, trade analysis, student rotation plan, and proficiency chart. This document is available for $2.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

FOREWORD

Because the modern automobile is a highly complex machine resulting from our most advanced engineering and manufacturing skills, both routine and major services must be performed by knowledgeable, skilled, trained personnel. There is no reason to believe that automobiles, or other private transportation vehicles, which the beginning mechanic will find in his work life, will present simple problems or can be serviced by any but a well-trained, capable person.

Accordingly, the course of study presented here for the vocational automotive mechanic has several characteristics. First, the automobile chassis is studied as a series of systems. Each system has a purpose and operates according to certain physical science fundamentals. It is a complex of component parts, each of which performs a given function and is serviced in a specific fashion. The outline is designed to encourage teaching that employs a systems analysis approach.

Second, skill in the use of basic hand tools, special-purpose tools, and precision instruments is required for repair and overhaul. While most automobiles have similar components, each manufacturer uses some variation. Therefore, frequent reference is made to the manufacturer's manual and specifications.

Third, accurate diagnosis is the hallmark of the competent mechanic. It comes with knowledge of the fundamentals of the physical sciences as applied in the automotive systems. The outline which follows identifies many of these diagnostic measures. The instructor is encouraged to involve advanced students in these activities.

Fourth, the future promises more change. However, whatever the nature of the change, it will be based on present knowledges and practices. Innovations will consist of new applications and extensions of presently known fundamentals. This fact re-emphasizes the need for strong instructional sessions in basic science in addition to skill-building activities.

Finally, the major areas of instruction, or systems, carry time designations. These are not to be taken literally, but are listed as a guide to the relative emphasis placed on each system and to encourage planning and scheduling by the instructor.

ACKNOWLEDGMENTS

A Curriculum Committee for the development of instructional materials in vocational automotive mechanics convened on March 10, 11, 12, 1966. The members developed a job analysis and a basic course of study, which includes a topical outline of trade principles, selected descriptions of trade practices, an equipment list, and a supplies list. The following men and their institutions are to be commended for contributing their efforts, abilities, and time in initiating this this basic program.

Gerd Beetz	Northwest Mississippi Junior College
William A. Bowman	East Central Junior College
Jesse Lee Boyd	Temple High School, Vicksburg
C. Rex Coker	Ross Collins High School, Meridian
Jesse C. Davis	Hunt High School, Columbus
Dwight A. Harris	Copiah-Lincoln Junior College
Richard Jeansonne	Jones County Junior College
Hoyt B. Phillips	Iuka High School, Iuka
Houston Richey	Northeast Mississippi Junior College
Clarence E. Smith	Lanier High School, Jackson
Elwyn Wheat	Biloxi High School
Bondy A. Welch	Gulf Coast Junior College District

Also in attendance and making significant contributions were Roy C. Watson and F. O. Woodard of the State Department of Vocational Technical Education, Trade and Technical Section.

Following the conference, the staff of the Curriculum Materials Laboratory compiled, edited, and duplicated the materials developed. The staff added the portions on instructional materials, characteristcs of trade training, the rotation plan, and the progress chart.

TABLE OF CONTENTS

TO THE INSTRUCTOR

Introduction

The purpose of trade training is to prepare persons for entry into a specific trade. To accomplish this, the instructor guides each trainee in the development of knowledges and skills of his trade. The instructor uses teaching methods and instructional materials as tools, much as he uses the tools of his trade to perform specific tasks. His skill as a teacher and as a tradesman depends upon his ability to use these tools.

A full treatment of the role of the Curriculum Materials Laboratory in implementing the foregoing process is contained in the Operational Plan. Simply stated, the Laboratory provides technical assistance to state and local educators in improving instruction through the development of instructional materials, and communicates with industry about training being offered.

The first step

Since the accepted practice in trade training is the identification of the knowledges and the skills of the trade, the Laboratory asked Mississippi trade instructors to supply information. The process described in the FOREWORD was used in arranging the information in a teachable form. It is an instructional base and is usually referred to as a course outline or guide. Its proper use requires skillful applications of teaching methods as tools in presenting the content of the outline. The end result is a trainee who is skilled and knowledgable.

Since this publication is the instructional base for the teaching of a specific trade, all future work will be planned around this base. Workshops will be held to develop supplementary insstructional materials for use by the trade instructor in enriching his program.

Characteristics of this publication

First, its scope, in terms of content, is broad and applicable in all parts of the state. The instructor, who directs his class in becoming proficient with each of these knowledges and skills, assists each student in meeting beginning employment standards. The student is prepared to take advantage of opportunities for gainful employment in any part of the state.

Second, while the scope of the program is broad and there is depth, an effort was made to confine the content of the outline to those knowledges and skills essential to occupational entry. This policy allows the local instructor to supplement his program with additional experiences. By identifying only essentials, this publication encourages local institutions to seek and to offer the special instruction which will meet regional industrial needs.

Third, a serious effort has been made to arrange the content in a usable form. The elementary knowledges and easiest tasks precede more difficult ones. Assignments are written in a step-by-step fashion. All content has been carefully sequenced. Time for instruction in class and in shop is listed in approximate terms.

Fourth, as indicated by certain items in the format, this publication is designed for the Type B Shop found in Mississippi secondary schools. However, it should not be inferred that this is its only valid use. The content and sequence are equally applicable to trade training in junior colleges and in MDTA programs or in any preparatory program.

The impact of this publication

What then should be the impact of this publication on the local program? Since the purpose is to encourage a planned, orderly, more efficient instructional program, it must be used and evaluated by the instructor. He should give this publication his best efforts in light of the principles and practices of trade training. Examination, evaluation, and recommendation during preparation of instructional materials and while teaching from them will assist in continued program development. Using this publication as a guide, the instructor should make lesson plans for lectures and demonstrations and should prepare shop activities. In some instances, the instructor will likely find more information and greater detail than he is presently using. There may be more than one job assignment. In other instances, the development of an idea may appear too shallow or a job may be absent. It is at this time that the instructor can be most helpful in the following ways: (1) by suggesting which areas can be effectively covered in a shorter time, (2) by identifying areas requiring greater emphasis which would involve additional detail and an extended-time allocation, (3) by extending the instructional content to reinforce or clarify ideas, (4) by preparing additional or alternate jobs, (5) by listing references, texts, and instructional aids at appropriate places, and (6) by suggesting additions and deletions. Some of the suggestions listed above may require only marginal notes, others may call for development of completely new and more comprehensive materials. The result will be realistic evaluation of content, organization, and time allotment for each unit.

Purposes and characteristics not inferred

As previously stated, this publication is intended to assist in improving instruction. It is planned, items are sequenced, and time limits are set because these characteristics are the heart of a strong instructional program, and for no other purpose. Consequently, it should not be inferred that this publication is an exact image of any given program. As noted earlier, local institutions go well beyond these minimum requirements to enrich their programs.

Also, it is not expected that every institution's program be exactly like every other program, that hour allotments be rigidly adhered to, or that students be rotated on a clockwork or calendar basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods in certain areas. These students may gain only the minimum proficiencies while more able students will progress rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and allotting are not designed to standardize programs, but to assist local teachers in planning more carefully and conducting their instruction more effectively.

Evaluation

Finally, recent vocational-technical legislation contains provision for follow-up and program evaluation. The day is coming when vocational-technical education will be held accountable for its actions in training youth and adults and for the millions of dollars it has spent. The Curriculum Materials Laboratory will, no doubt, be involved in developing suitable instruments and evaluative criteria at that time. This publication, representing the combined efforts of Mississippi education and industry and containing the material these groups feel is appropriate, may well serve as one basis for making such a study.

DESCRIPTION OF THE AUTOMOTIVE MECHANIC

The all-around automotive mechanic is highly capable in two areas: he is knowledgeable in the diagnosis of malfunctions within the automobile chassis; he is skilled in the repair and overhaul of all chassis components. To provide these services, he examines the vehicle and discusses the nature and extent of the malfunction or damage with customers and other service men. He may assist in further diagnosis and planning.

His diagnostic abilities require keen insight into electrical and mechanical fundamentals as applied to the automobile chassis. He understands each system, such as the electrical, fuel, suspension, etc., the role of each component in the system, and the contribution of each system to the total chassis. He makes audio and visual inspection as well as precision measurements with gages, such as the micrometer, calipers, depth gages, and dial indicators, and with instruments, such as the ammeter, voltmeter, and oscilloscope.

His skill as a repair man is extensive. He disassembles, cleans, inspects, and repairs or replaces as judgment dictates. He rewires lighting circuits, panels, and ignition circuits. He relines and adjusts brakes, aligns suspension members, and repairs or replaces carburetors, generators, distributors, starters, and pumps. He installs accessories, such as heaters.

CHARACTERISTICS OF TRADE TRAINING

Introduction

Training for various trades without on-the-job experience can be and is being given effectively by simulating, in locales other than industrial plants, an on-the-job environment. The industrial environment is achieved in an educational institution by performing jobs of fabrication and service using industrial techniques and industrial-type equipment and facilities. The additional requirements placed upon the training as a result of its operating within an institution have been successfully met. It has proved advantageous to all concerned to provide preparatory training to qualified students and extension training to employed tradesmen.. Characteristics of institutional training are briefly described in the following paragraphs.

Physical Facilities, Equipment, and Supplies

As previously stated, trade training facilities must be designed and constructed so that they lend themselves to fabrication and service operations found in industry. Built-ins are provided with adequate floor space, lighting, climate control, power sources, entrances, equipment, storage for supplies, finished-product handling, waste-disposal systems, etc.--each of which is duty-rated to serve its purpose in an industrial manner. That costs and floor-space requirements per pupil are higher than those for general education are facts that must be recognized because they are intrinsic in the nature of the training and cannot be side-stepped. Equipment and supplies must meet the standards of quality and variety used in industry, and they must be maintained and replenished.

Instructor Qualifications

Of equal importance is the caliber of the instructor. Past experience has assisted in establishing the requirement of at least two years of work experience beyond the learner's level, in the specific training being given, and of broad experience in the major areas of the industrial occupation. The instructor must be adept in selecting, organizing, and presenting trade information and skills--a fuller treatment of which may be found in later paragraphs. The trade teacher must also keep himself occupationally up to date through study and association with industrial activities.

Student Screening and Selection

The State Plan states that any student who wants, needs, and is able to profit by instruction is eligible for enrollment in vocational training. His ability to profit by the instruction depends, in large measure, on his making a definite vocational choice, his desire to gain the knowledges and skills of the trade, and his educational background. These qualifications are evaluated, insofar as is possible, by a vocational-guidance process which includes an examination of the applicant's school record, a personal interview, a check of references, and tests for interests, motivations, and learning rates; and, in the absence of adequate guidance facilities and a screening process, it is reasonable to expect that a considerable number of those accepted for training will need remedial instruction in science, mathematics, and communication skills.

In Mississippi, preparatory training is offered in the Type B Shop located in the comprehensive high school. Trade training is carried on 180 days per year. Normally, the course is elected for both the junior and the senior years. In two years a student receives 1080 hours of instruction. However, some students enroll for the senior year only. Although these students receive no more than minimal experiences, instruction on a planned rotational basis will provide them with knowledges and skills in the basic blocks of the trade and will render them employable.

Teaching Techniques

Trade training uses most, if not all, of the conventional teaching techniques and adapts them to the information to be presented. The "tell-show-do-check" method has been found highly effective and is the one most commonly used. The instructor "tells" by informally lecturing on a given topic. Open periods of discussion allow the student to clarify points not initially grasped. The instructor may choose to stimulate thought or to spot-check comprehension by questioning. The "show" method is employed when a demonstration can more vividly present a principle or the steps of trade procedure. Specially prepared audio-visual aids may be involved to "show". The major investment of time is on the "do", where the student is engaged in useful and productive work in typical trade jobs. He uses tools, equipment, and materials common to the trade. Thus he learns by doing. At predetermined intervals, a "check" of the student's progress serves to evaluate command of knowledge and skill learned to date. Deficiencies identified are retaught through additional, individual instruction, through reading, shop practice, etc., until an acceptable level of learning and performance is reached.

Related Instruction

The value of scientific principles and mathematical applications for the tradesman is unquestioned. Indeed the caliber of his work in these areas is determined by the quality of his foundation and his ability to apply and adapt the principles. However, trade trainees, characteristically, react to mathematics and science with disinterest when these subjects are presented on the academic level with the usual academic approach. But these subject areas become much more acceptable when they are applied to the job in which the trainee expects to develop skill and earn a living.

In the Type B Shop, no outside instruction related to the trade is given. The shop teacher is expected to meet the need. Upon him rests the responsibility of supplying any and all necessary teaching of trade mathematics, trade science, trade drafting, etc. This information is also correlated with trade practice and given as needed by the student.

Group instruction and group shop activity are encouraged when space and equipment are available, for it is generally conceded that instruction of the typical class as a group is an advantage for the progress of the class. Extensive preparation prior to group instruction and keen observation of individual behavior are necessary to meet the variety of need and speeds in a heterogeneous class. The volume of trade tools, equipment, and materials, as well as adequate space and shop facilities, required for the instruction of large groups, makes the costs prohibitive in many instances; and a scheduled rotational process must be employed. A suggested plan is found in the appendix.

Instructional Content

The source of the instructional content of a given trade program can come only from the trade itself, from the knowledges and the skills of the master. Usually the trade analysis is used to identify this content. Following the analysis, there is much need for proper organization and preparation prior to presentation of the material. An extension of this characteristic of the program is the establishment and maintenance of an up-to-date reference library in the classroom-shop. Materials housed here would be in many forms, such as textbooks, technical manuals, trade periodicals, manufacturer's catalogs, safety bulletins, etc. All of them would be shelved in a systematic arrangement with a careful record kept for ready reference.

Safety Instruction

The place and value of safety instruction cannot be over emphasized. The instructor is morally and legally responsible for introducing safety instruction prior to performance, for using safe techniques in demonstrations, and for tactfully, but firmly, pointing out each violation.

Summary

In summary, trade training can be characterized as instruction in trade practices given by an occupationally competent teacher. Related information is carefully correlated with shop activities and is given by the trade teacher as it is needed by the trainee. Students who have made a vocational commitment, and who are able to profit by the instruction are engaged in productive learning experiences. Successful completion of such a program prepares a student for employment at an advanced-learner level.

COURSE OF STUDY

INTRODUCTION

The content of this course of study for vocational automotive mechanics was developed for use in the Type B Shop as found in the secondary school. A student having average mental and manipulative abilities should develop proficiency in all the blocks, or major divisions, in the allotted 1080 hours. The blocks, or major divisions, listed below carry varying emphasis as indicated by the contact time.

MAJOR DIVISIONS

	Contact Hours
Orientation; Basic Operations; Welding	90
Engine Rebuilding	210
Electrical System	108
Fuel System	102
Cooling System	30
Power Train	180
Suspension System	150
Steering System	75
Brakes	75
Heating and Air Conditioning	60
Total Contact Hours	1080

I. ORIENTATION; BASIC OPERATIONS; ACETYLENE & ELECTRIC ARC WELDING

General Safety

1. Treat all injuries regardless of how small
2. Clean up all spills as quickly as possible
3. Maintain orderly work and storage areas
4. Avoid rushing: work at your own best speed
5. Use the proper tool for each job
6. Use care and proper technique when lifting
7. Wear appropriate safety clothing and use safety equipment
8. Gather and study safety information on each job
9. Examine each job for potential hazards
10. There is no substitute for: information, judgement, action!

Contact hours <u>90</u>

Trade principles	Trade practice
1. Orientation a. School requirements b. Occupational requirements c. Occupational opportunities	Tour the shop; identify areas; emphasize order and cleanliness; point out hazards; indicate lines of travel.
2. Basic tools and operations a. Cutting b. Holding c. Measuring d. Layout e. Fastening f. Marking g. Other	Demonstrate the correct use and care of the basic hand tools. Demonstrate the procedure for performing basic operations and explain the reasons for each step. Assign jobs to each trainee and distribute appropriate instructional sheets.
3. Acetylene welding a. Types of joints b. Equipment c. Position d. Procedures e. Hazards	Light and adjust a torch. Run a fusion bead; run a bead using filler rod; run a bead using a filler rod and join two pieces of heavy gage sheet metal. Give special attention to safe practices in use of equipment.

4. Arc welding a. Types of joints b. Equipment c. Positions d. Procedures e. Hazards	Strike an arc and maintain the proper arc length. Run beads in downhand position using mild steel plate and small electrode. Give special attention to safe practices. Use proper rod and machine setting on an arc welder to build up worn parts.

II. THE AUTOMOTIVE ENGINE

Trade principles	Trade practices Contact hours: 210
A. The four-stroke cycle 1. Intake stroke 2. Compression stroke 3. Power stroke 4. Exhaust stroke	
B. General description of the engine 1. Block and head assembly 2. Electrical system 3. Fuel system 4. Cooling system 5. Lubricating system	
C. Block and head assembly	
1. Components a. Head b. Block c. Piston d. Valves e. Spark plug f. Rods g. Crankshaft h. Camshaft	Remove and replace a broken stud. "Back out" and clean old threads or drill out and tap new threads. Apply thread lubricant and install new stud.
2. Combustion chamber configurations a. Wedge b. Hemisphere c. Other	Clean carbon deposits from combustion chamber; inspect all head surfaces
D. The head 1. Metal composition 2. Types by valve location a. L b. I c. F	

3. Types by service

   a. Removable
   b. Nonremovable

Replace a head gasket. Refer to appropriate shop manual. Drain coolant if necessary. Remove, clean, and inspect cylinder head(s) using special tools such as carbon scrapers, carbon brushes, straight edges, magnaflux, etc. Remove old head gasket, clean cylinder surface, install new gasket, re-install cylinder head observing proper torque procedures. Replenish oil and coolant as necessary.

4. Sealing techniques

   a. Gaskets
   b. O-rings

5. Specification

   a. Gasket surface condition
   b. Combustion chamber
   c. Tightening sequence
   d. Torque specs

E. The valves

1. Location
2. Types

   a. Poppet
   b. Sleeve
   c. Other

3. Valve train components

   a. Valve
   b. Seat
   c. Spring
   d. Seal
   e. Retainer
   f. Rocker arm
   g. Pushrod
   h. Tappet
   i. Cam

4. Metal composition

5. Valve specifications

   a. Face and seat angles
   b. Spring tension and height
   c. Valve length
   d. Tappet clearance
   e. Allowable wear on stem

Position vehicle properly in bay, cover finders, and drain coolant. Refer to shop manual. Use hand tools and special tools to remove, inspect, and clean the head(s). Grind valves and seats. Reassemble making necessary inspection, replacements, measurements, and adjustments.

6. Cooling techniques

    a. Metal-to-metal conduction
    b. Sodium filled stems
    c. Water cooling of seats and guides

F. The block

1. Metal composition

    a. Cast iron
    b. Aluminum

2. Block features

    a. Head surface
    b. Water passages
    c. Core holes
    d. Cylinders
    e. Valve chamber
    f. Main bearing surfaces
    g. Cam bearing surfaces
    h. Oil pan surface
    i. Accessory mounting

3. Cylinder layout

    a. In-line
    b. Vee
    c. Opposed
    d. Other

4. Cylinder features

    a. Bore
    b. Length
    c. Wall thickness
    d. Metal composition
    e. Alignment

Remove oil pan and cylinder head(s). Cut cylinder ridge using ridge reamer. Remove connecting rod and piston assembly. Clean cylinder bore. Check for wear according to specifications. Bore if necessary

5. Main bearings

    a. Function
    b. Number
    c. Composition

6. Oil pump

G. The crankshaft assembly

1. Components

    a. Crankshaft
    b. Pistons and rod assembly
    c. Bearings

2. Crankshaft features
    a. Bearing surfaces
    b. Counterweight
    c. Oil passages
    d. Flywheel flange
    e. Nose

3. Metal composition
    a. Cast iron
    b. Cast steel
    c. Forged steel

4. Specifications
    a. Sizes and important dimensions
    b. Clearances
    c. Alignment

H. The piston and rod assembly

1. Piston, pin, rings
    a. Function
    b. Features
    c. Metal composition

2. Rod and bearing
    a. Function
    b. Features
    c. Metal composition

3. Alignment of rod and piston: specifications
    a. Sizes and important dimensions
    b. Clearances

4. Alignment technique

After piston and connecting rod assemblies have been removed, they are disassembled for cleaning, inspection, and repair or replacement. Remove old rings, clean, inspect, and repair if necessary the pistons, including ring grooves. Inspect, bore, ream, or rebush piston pin boss. Reassemble connecting rod, pistons, piston pins. Check ring gap clearance. Install rings on piston and check the assembly for alignment using rod-aligning jig. Using ring compressor, reinstall assembly in cylinder bore. Fasten rod to crankshaft. Replace cylinder head and oil pan. Refill engine with proper oil and coolant.

I. The camshaft

1. Function and features
2. Types by location
    a. In the block
    b. In the head

3. Metal composition

4. Drive mechanism a. Chain b. Gear	Referring to appropriate shop manual, remove radiator, lower fan pulley and timing gear cover. Remove gear(s) or chain, clean and inspect all components as necessary. Align timing marks when installing new gear and/or chain. Install new oil seal and gasket in cover. Replace cover pulley, fan belt and radiator. Replenish coolant.
5. Timing techniques a. Aligning mark or dots b. Strobe light c. Degree wheel	Referring to appropriate manufacturers literature, remove all components necessary to give access to the camshaft. Inspect camshaft and bearings for wear. Replace camshaft bearings if necessary, using special bearing remover and replacer tool. Replace camshaft and all components previously removed.
6. Camshaft and valve train parts a. Camshaft b. Camshaft bushings c. Tappets: solid and hydraulic d. Pushrods e. Rocker arms f. Valve assembly	Refer to manufacturer's specifications to adjust value tappets or rocker arms using feeler gage or dial indicator.
J. Oil pump 1. Location 2. Function 3. Replacement techniques	Securely place vehicle on stands or lift. Consult shop manual. Drain oil and remove oil pan. Remove oil pump assembly from engine for cleaning and inspection. Determine wear and repair or replace oil pump as applicable. Thoroughly clean oil pan and oil lines. Replace pan gasket and pan. Refill crankcase with oil. Start engine and test oil pressure.
K. Engine-chassis connections 1. Electrical connections a. Primary ignition b. Generator or alternator c. Dash gages d. Starting circuit e. Other	

2. Mechanical connections	
a. Motor supports	Remove engine hold-down bolts and nuts on old supports. Raise engine high enough to provide sufficient space to remove supports. Blocking engine securely in place, remove and replace supports as necessary. Lower engine; tighten all nuts and bolts.
b. Throttle linkage	
c. Engine to clutch	
d. Transmission linkage	
e. Exhaust	Check the exhaust manifold butterfly for free and proper movement; lubricate if necessary. Replace faulty unit.
	Replace any part of the exhaust system as required (manifold, header pipe, resonator, muffler, tailpipe.
3. Fluid connections	
a. Fuel lines	
b. Oil lines	
c. Other	
	Depending upon type of automobile, and consulting appropriate shop manual, remove necessary accessories to provide safe working conditions. Remove power plant as outlined in manual by using overhead hoist or shop crane with proper sling firmly secured. Replace engine mounts, clean chassis, and install new power-plant. Reconnect cables, wires, hoses, and lines. Make necessary adjustments and test run.
L. Diagnostic methods	Use appropriate tools to make diagnostic tests. Check compression, cylinder pressure, manifold vacuum, oil pressure, etc. Determine nature of malfunction such as faulty rings, valves, bearings, gaskets, etc.

III. THE FUEL SYSTEM

Trade principles	Trade practices Contact hours <u>114</u>
A. Principle: To supply clean fuel and to mix for optimum combustion B. System components 1. Tank 2. Lines 3. Filters, fuel 4. Pumps 5. Carburetor 6. Filters, air 7. Manifolds: intake, exhaust	
C. Fuel tank 1. Location and mounting 2. Features a. Filler b. Outlet c. Drain d. Filter element e. Baffles f. Sending unit g. Coating 3. Repair techniques	Prepare automobile on jack stands, disconnect sending unit wire and filler tube; remove fuel tank. Remove sending unit and test for open circuit, test float. Inspect tank for cracks, dents, and rust. Replace tank, inspect fuel cap gasket and vent hole.
D. Fuel lines 1. Composition a. Steel b. Copper c. Neoprene 2. Fittings a. Compression b. Flared 3. Repair and replacement technique	Repair or replace fuel lines and hoses. 1. Replace: Remove damaged line. Install new line and connect fittings . 2. Repair: Cut out damaged piece and install a compression fitting and sleeve on each end of the line. Connect the fitting together with a coupling. Repeat for a flared-type fitting.
E. Fuel filters 1. Principle of operation 2. Types	Replace fuel filter on line between fuel pump and carburetor. Disconnect clamps at each end of filter with clamp pliers. Remove filter and install new filter in reverse operation.

    a. Porous bronze
    b. Disc, metal
    c. Ceramic
    d. Other

  3. Cleaning and replacement techniques

F. Fuel pumps

  1. Principle of operation and fuel flow
  2. Types

    a. Mechanical-diaphragm
    b. Electric-diaphragm
    c. Electric-bellows

  3. Fuel-vacuum pump combination
  4. Disassembly technique

Make sure that the fuel tank has sufficient amount of fuel. Check pump pressure. Check lines for loose connections. If the fuel supply is satisfactory, disconnect fuel line at carburetor, crank engine with switch off, allowing fuel to go into a small container. If the pump is in good condition, strong spurts will flow out. If not, the pump is probably defective. Remove and replace new or rebuilt pump.

G. Carburetor

  1. Operating principle

    a. Venturi effect
    b. Fuel atomization
    c. Mixture ratio

  2. Types by flow direction

    a. Updraft
    b. Downdraft
    c. Side draft

  3. Types by valve

    a. Vane or butterfly
    b. Rotary
    c. Other

  4. Systems

    a. Float system
    b. Idle system
    c. Main system
    d. Power system

  5. Disassembly, cleaning and reassembly

Service or replace carburetor.

Remove and disassemble carburetor; clean all parts and repair or replace as necessary; make adjustments specified; complete assembly and install carburetor.

6. Adjustments

a. Float level
b. Main meter jets
c. Accelerator pump
d. Idle mixture
e. Idle speed
f. Centering butterflies
g. External throttle linkage
h. Other

7. Choke

a. Components

(1) Butterfly
(2) Piston
(3) Bimetal spring
(4) Fast idle cam
(5) Heating tube
(6) Linkage

H. Intake manifold

1. Passages

a. Fuel-air
b. Water
c. Vacuum
d. Exhaust heat

2. Other features

Inspect manifold for cracked, warped, or broken studs. Clean surface on manifold and on block, install gasket required

a. Carburetor pad
b. Head-to-manifold mating surface
c. Other

(1) Distributor
(2) Fuel pump
(3) Generator pad
(4) Power-steering pump pad

d. Types of gaskets

I. Air cleaner

1. Purpose and operation

a. Filter incoming air
b. Direct cool air
c. Silence

2. Types by service a. Oil bath b. Oil dip c. Paper element	Remove air cleaner from carburetor, service according to type oil bath, wet or dry.
J. Positive crankcase ventilation systems 1. Types of systems 2. Types of valves a. Metering valve b. Flow restricting valve c. Closed d. Dual action	Refer to manufacturer's handbook to service the major types of PCV systems. Inspect all valves, hose, and connections.
IV. ELECTRICAL SYSTEM	
A. Fundamental electrical data	Contact hours <u>120</u>
1. The electron theory and the structure of the atom a. Electron b. Proton c. Neutron 2. Current flow in a conductor: the flow of electrons 3. Characteristics of conductors and insulators 4. Principles of magnetism	
a. Types of magnets	Examine several types of permanent and nonpermanent, natural and artificial magnets
b. Polarity of magnets	Make artificial magnets by rubbing iron and steel bars against strong magnets, by striking with a hammer, and by electrical induction. Demagnetize in a similar manner.
c. Attraction and repulsion of poles	Use iron filings and magnets to show the lines of force around magnetic poles. Note the effect of changing position of like and unlike poles. Note the effect on filings of strong and weak magnets.

d. Simple magnetic induction	Set up a galvanometer to record induced current and direction of current flow when a conductor cuts the lines of force of a magnet. Note the variation in strength of current flow caused by speed of cutting lines of force and strength of magnet.
5. Basic electrical terms	
a. Volt b. Ampere c. Ohm d. Watt	
6. The use of instruments in making simple measurements	
a. The voltmeter	Connect electrical instruments into circuits in proper manner. Make measurements of volts, amps, and ohms.
b. The ammeter c. The ohmmeter d. The wattmeter	
7. Electrical circuits	
a. Series b. Parallel c. Series-Parallel	
8. Ohm's law	Apply Ohm's law to simple circuits. Note the effect on circuit values caused by varying each of the following: voltage, amperage, and resistance.
9. Kirchhoff's law	Apply Kirchhoff's law to simple parallel circuits. Explain "splitting" effect.
10. The electric storage cell: the conversion of chemical to electrical energy	
a. The primary cell b. The secondary cell	Make electrical measurements of single primary and secondary cells. Combine cells in series and parallel fashion and make electrical measurements. Explain readings.

B. The Starting circuit

1. Components
    - a. Battery
    - b. Starting motor
    - c. Starting solenoid
    - d. Starting switch
    - e. Ignition switch
    - f. Wiring

2. Major parts of the battery
    - a. Cell
    - b. Case
    - c. Cell connectors
    - d. Terminate posts
    - e. Vent cap
    - f. Electrolyte

3. Principles and operation of the battery
    - a. Energy conversion
    - b. Volts available
    - c. Amperes available
    - d. Typical types

4. Tests for operation
    - a. Electrolyte gravity
    - b. Light load
    - c. Full load

Use a hydrometer and a voltammeter to gage the condition of fully charged, partially charged, and discharged batteries. Slowly charge a discharged cell while taking hydrometer and voltammeter reading. Make similar measurements for cells under warm and cold conditions.

5. Maintenance and service
    - a. Cleaning
    - b. Discharge and slow charge
    - c. Proper connections

Develop a procedure for servicing a battery including charging, cleaning poles and cable ends and battery case, and fastening in position.

6. Major parts of the starter
    - a. Case
    - b. Field coils
    - c. Armature
    - d. Brushes
    - e. Drive mechanism

Disassemble and reassemble a starter and solenoid for cleaning and inspection. Identify points of wear and parts requiring frequent replacement.

7. Operating principle
8. Typical internal arrangements

   a. Four-pole, two-field
   b. Four-pole, four-field
   c. Six-pole, six-field

9. Starter motor service

   a. Disassembling and cleaning
   b. Replacing brushes
   c. Checking armature with growler
   d. Turning commutator
   e. Making continuity check of field coils

Examine a wiring diagram of a starter and circuit. Make continuity checks according to the diagram.

10. Starter motor switches

    a. Manual-operated
    b. Vacuum-operated
    c. Solenoid-operated
    d. Solenoid-and-relay-operated

11. Solenoid test techniques
12. Solenoid repair methods
13. Control switches and circuit

    a. Ignition switch
    b. Starter button
    c. Wiring in circuit

Use a kit to repair a faulty solenoid. Explain operation.

14. Battery-solenoid-starter circuit analysis

    a. Ignition switch
    b. Starter button
    c. Wiring in circuit

Make an electrical analysis and diagnosis of a faulty starter on a live automobile. Make the necessary repairs.

C. The charging system

1. Introduction

   a. Description: a mechanically driven electro-magnetic device used to generate electricity

   b. Principles

      (1) Generation of a magnetic field
      (2) Cutting of lines of force by conductors

2. D-C generators

   a. Principles of operation

      (1) Rotating conductors
      (2) Fixed magnetic field

   b. Construction features

      Disassemble a generator. Identify each part, its function, and its proper operation. Reassemble and note any special adjustments

      (1) Housing
      (2) Field coil
      (3) Pole shoes
      (4) Armature
      (5) End plates
      (6) Brushes
      (7) Pulley
      (8) Fan

   c. Circuits

      (1) Externally grounded
      (2) Internally grounded

   d. Service techniques

      Disassemble a starter for overhaul and inspection. Replace the brushes and check holder spring tension. Turn the commutator. Check the armature with a growler. Make electrical checks of circuit.

      (1) Replacing bearings and brushes
      (2) Testing and or replacing the armature
      (3) Turning the commutator
      (4) Replacing field coils
      (5) External electrical
      (6) Adjusting the belt

      Adjust the drive belt to manufacturer's specifications on a generator.

3. D-C regulators

   a. Principle: vary resistance in the field circuit
   b. Methods

      (1) Externally-grounded field
      (2) Internally-grounded field
      (3) Cutout relay

   c. Circuits

      Use a schematic diagram to explain the paths of current and operation of the mechanisms within a regulator.

      (1) Cutout relay
      (2) Current regulation
      (3) Voltage regulation

   d. Temperature compensation

e. D-C regulator checks

(1) Cutout relay
(2) T-C regulator
(3) Current-and-voltage regulator

(a) Autolite
(b) Delco-Remy
(c) Ford

Test cutout relay closing voltage, test current relay and voltage relay, if not satisfactory remove for servicing and adjusting service points with proper tools, replace on automobile, start engine, run until normal operating temperature. Using tester adjust to manufacturer's specifications.

4. A-C generator: alternator

a. Principles of operation

(1) Rotating magnetic field
(2) Fixed conductors

b. Construction features

Disassemble an alternator. Test the parts, explain the function of each, and describe the proper operation. Reassemble and note special precautions or adjustments.

(1) Rotor

(a) Field winding
(b) Pole pieces
(c) Slip rings and brushes
(d) Shaft

(2) Stator

(a) Winding
(b) Laminations

(3) Housing

(a) Mounting lugs
(b) Heat sink
(c) Diodes
(d) Capacitor
(e) Through bolts

c. Circuit within alternator

(1) Within rotor
(2) Within stator

(a) Delta connected
(b) Wye connected

d. Service techniques

  (1) External checks

    (a) Adjusting drive belt
    (b) Checking output

  (2) Internal checks

Disassemble an alternator for rebuilding. Check all windings in stator for opens, grounds, and excessive resistance. Turn slip rings in a lathe; replace brushes, check diodes. Reassemble, install, and check.

    (a) Turning slip rings and replacing brushes
    (b) Checking the field rotor
    (c) Checking the stator
    (d) Checking diodes
    (e) Checking bearings

5. A-C regulators

  a. Principle: varying resistance in field circuit
  b. Types

    (1) Conventional

      (a) Single-unit
      (b) Two-unit
      (c) Three-unit

    (2) Transistorized

      (a) Partially
      (b) Fully

6. Testing techniques for the charging circuit

  a. Polarity check

    (1) Positive-ground systems
    (2) Negative-ground systems

  b. Mechanical contact check of terminals and connections
  c. Electrical checks of the charging circuit using meters

    (1) Excessive resistance
    (2) Grounds
    (3) Open circuit

Test armature and field circuits for grounded or open circuits.

D. Ignition system

1. Introduction
   - a. Purpose: to ignite the fuel-air charge at a predetermined moment
   - b. Principles of operation
     - (1) Generation of a high-voltage charge
     - (2) Timed sequence for discharge
     - (3) Spark gap in cylinder

2. Ignition coil
   - a. Construction

     Test the coil for proper output.

     - (1) Primary windings
     - (2) Laminated core
     - (3) Secondary winding
     - (4) Case
   - b. Operational principles
     - (1) Electromagnetism
     - (2) Mutual induction
     - (3) Self-induction
     - (4) Build-up time

3. Condenser
   - a. Construction

     Test the capacitance of the condenser.

     - (1) Sheet foil
     - (2) Insulating sheets
     - (3) Case
     - (4) Lead
   - b. Operating principle: storage of electrons

4. Distributor
   - a. Operational principles

     Examine distributor points for color and pitting. Check lubricant and condition of rubbing block.

     - (1) Closes primary circuit to charge coil
     - (2) Opens primary circuit to discharge secondary voltage

(3) Properly sequences and directs secondary voltage

(4) Varies the above with engine conditions

b. Construction

(1) Drive mechanism
(2) Cam
(3) Points
(4) Breaker plate
(5) Rotor button
(6) Cap
(7) Advance mechanisms

(a) Centrifugal
(b) Vacuum

Use a dwell meter to set the points in the distributor while installed in the car.

Remove the distributor from the car and place in a test and adjustment stand. Check the advance curve and modify as necessary to meet manufacturer's specifications.

Use a timing light to set ignition in correct time sequence with a running engine.

5. Spark plugs

a. Purpose: To maintain a set gap for secondary discharge and ignition

b. Construction

(1) Electrodes
(2) Insulators
(3) Seals
(4) Shell

c. Features

(1) Thread
(2) Reach
(3) Heat range
(4) Gap adjustment

d. Cleaning techniques

(1) Abrasive
(2) Solvent

Remove a set of spark plugs. Inspect for proper heat range and engine condition. Clean, gap, and reinstall or replace.

6. High-tension leads

Examine all secondary wiring for damage and shorts.

a. Purpose: Transport high voltages

b. Construction

- (1) Center lead
    - (a) Solid
    - (b) Strand
    - (c) Other
- (2) Insulator
- (3) Terminals

Comprehensive test

Use an oscilloscope to analyze the entire ignition system. Match images on the screen with those in manual. Explain deviations observed from the pattern, and recommend corrective steps.

E. ELECTRICAL ACCESSORIES

1. Manual switches
    - a. Head light
    - b. Dimmer
    - c. Directional signal
    - d. Backup light
    - e. Windshield wiper
2. Fuses and circuit breakers
    - a. Cartridge fuses
    - b. Fuse panel
    - c. Bimetallic breaker
3. Relays
    - a. Current limit
    - b. Horn
    - c. Light
    - d. Telltale

File the points, adjust the gap, and check the closing voltage on each type of relay.

4. Sending units and gages
    - a. Fuel units and gages
        - (1) Electromagnetic-type
        - (2) Bimetallic-type

Make electrical tests on an electromagnetic unit using grounding methods and continuity checks.

- b. Temperature units and gages
    - (1) Bourdon-type
    - (2) Temperature-sensing-type

c. Oil pressure units and gages

(1) Bourdon type
(2) Diaphragm-type
(3) Bimetallic-type
(4) Indicator light

d. Ammeters

(1) D'arsonval-type
(2) Other types

5. Horns

a. Major components

(1) Driver
(2) Diaphragm
(3) Horn

b. Operation

(1) Electromagnetically-driven diaphragm
(2) Compression and rarefaction of air

Use a voltmeter to determine the potential delivered to an automobile horn. Refer to manufacturer's specifications

c. Adjustment of the contact point air-gap

Adjust the air-gap between the contact points on a horn. Use a feeler gage for the proper gap and a screw driver on the adjusting screw

6. Windshield wiper assembly

a. Components

Check the electrical requirements of a windshield wiper switch and examine the circuit breaker

(1) Switch
(2) Wiper motor
(3) Linkage
(4) Blade

b. Adjustments

7. Interior lights

a. Types

Run a new wire to an interior light. Use both solder and solderless connections. Note the grounding technique on the light fixture. Replace the bulb according to manufacturer's specifications.

(1) Dash
(2) Dome
(3) Courtesy
(4) Other

b. Replacement

8. Headlights

    a. Components

        (1) Sealed beam unit
        (2) Mounting body
        (3) Adjusting screws
        (4) Wiring

    b. Aiming and adjusting

        Use available equipment to properly adjust headlights

        (1) One unit per side
        (2) Two units per side

    c. Voltage and current requirements

        (1) Single units
        (2) Dual units

    d. Causes of poor lighting

        (1) Low battery
        (2) Poor connection
        (3) Faulty or wrong size wire
        (4) Cracked sealed-beam
        (5) Improper adjustment

9. Directional signals

    a. Components

        (1) Selector
        (2) Blinker unit
        (3) Wiring
        (4) Light: front or rear

    b. Operation

        (1) Selector
        (2) Blinker

        Analyze problems in a directional indicator system by checking the bulbs, wiring connections, flasher, and selector

10. Other lighting circuits

    a. Light units
    b. Wiring
    c. Switches

V. COOLING SYSTEM

A. Purpose: to maintain engine temperature at an acceptable level

B. Principles of operation

1. Properties of liquids
   - a. As a coolant
   - b. As a lubricant
   - c. As a corrosive agent
   - d. As a volatile agent
2. Heat transfer
   - a. Conduction
   - b. Convection
   - c. Radiation
3. Circulation
   - a. Thermo-syphon
   - b. Forced
4. Other
   - a. Pressurized system
   - b. Cold-weather protection

C. Service of major components

1. Coolant a. Water b. Alcohol c. Air d. Other	Test freezing point of coolant using a hydrometer.
2. Coolant pump	Consult manufacturer's shop manual. Drain coolant, remove fan belt, fan, and waterpump. Inspect water pump and rebuild or replace waterpump assembly. Replace fan, fan belt, and hoses. Adjust belt tension, replace coolant.
3. Radiator	Drain coolant, remove radiator hoses; transmission cooling lines if applicable; radiator mounting bolts, remove radiator. Replace radiator, reconnect hoses, refill cooling system with proper coolant, pressure test.

	Locate leak either by visual inspection or by immersion method. Minute leaks may be corrected with liquid compounds. Larger leaks should be soldered. After radiator has been replaced in car, it should be pressure tested.
4. Thermostat a. Bellows b. Bimetallic	Refer to manufacturers shop manual. Drain coolant, remove thermostat. Inspect visually and by hot water immersion method if necessary. Reinstall or replace as required. Replenish coolant.
5. Connecting hoses	Inspect waterhoses visually for cracks, leaks, cuts, and wear. Replace if necessary.
6. Pressure cap	
7. Fan	Consult appropriate shop manual. Inspect, repair, or replace fan unit as required.
8. Fan belt	Consult manufacturers shop manual for specifications. Using straight edge and ruler or tension gage, check for proper tension and adjust if necessary. Inspect for cracks, wear, etc., and replace if necessary.
9. Heat indicator	Consult applicable shop manual and/or wiring diagram. Check vapor pressure sending unit for overheated tube. Check electric sending unit for shorts and/or grounds. Replace sending unit, gage and/or wiring as needed.
D. System service	Consult manufacturers shop manual. Prepare vehicle for reverse flushing procedure. Use specified cleaning agent. Clean and flush system. Inspect all components and replace if needed. Pressure test the system using pressure tester.
E. Comparison of water-cooled and and air-cooled engines	Consult appropriate manufacturer's shop manual. Visually inspect blowers, belts, air ducts, and thermostatic controls for wear, proper adjustment and proper operation. Check for obstruction of fins due to foreign matter, cleaning them with compressed air if necessary.

VI. POWER TRAIN

A. Components

1. Clutch
2. Transmission
   - a. Manual
   - b. Automatic
3. Overdrive
4. Propeller shaft
5. Differential
   - a. Housing
   - b. Gears
   - c. Axles

B. The clutch

1. Purpose: to engage and disengage engine to drive train
2. Types
   - a. Positive
   - b. Friction
     - (1) Dry
     - (2) Wet

3. Components in a dry-clutch a. Clutch pedal	Disassemble a good clutch and examine position and operation of each part. Check the spring pressure of a good pressure plate and note the movement of centrifugal weights.
b. Linkage a. Manual b. Hydraulic	Examine clutch pedal play. Check for excessive wear in countershaft, outer bracket, pedal rod, clevis pin, clutch fork. Replace worn parts.
	Remove slave cylinder from automobile. Disassemble; inspect for wear and pits in cylinder wall.
	Hone cylinder. Do a thorough cleaning job after honing. Assemble in reverse order. Replace cylinder on vehicle and fill unit with brake fluid. Bleed air from cylinder. The same operations apply to master cylinder

c. Throwout fork
d. Throwout bearing
e. Pressure plate assembly
f. Flywheel
g. Clutch disc

Use a dial indicator to check runout of a clutch disc.

4. Operation

a. Spring action
b. Centrifugal weight action
c. Disengaging mechanism

Diagnose clutch malfunctions [illegible] binding, chatter, slipping, harsh operation, and lack of operation. Disassemble and replace faulty parts or adjust, as necessary.

C. Syncromesh transmission

1. Purpose: To provide a selection of gears to multiply engine torque

2. Types

a. Three speeds forward; one reverse
b. Four speeds forward; one reverse
c. Three speeds forward with overdrive; one reverse

3. Components

Disassemble a good standard transmission and identify the components. Reassemble. Make each gear shift by hand and explain the flow of power and torque multiplication.

a. Case
b. Gears

(1) Drive pinion (input)
(2) Main shaft (output)
(3) Others

c. Shift linkage

Examine the shift linkage on a manual transmission for excessive wear and slack; check bushings and lubricate and/or replace; operate linkage to assure proper selection of all four in-gear positions, as well as neutral position; adjust linkage as required by lengthening, bending, or shortening.

4. Operation

a. Alignment of gears with shift mechanism
b. Synchronization of rotational speed of gears to be meshed

c. Multiplication of torque

5. Power flow and gear position

   a. Reverse
   b. Low
   c. Intermediate
   d. High

D. Overdrive

1. Purpose: To reduce engine to drive ratio
2. Types

   a. Transmission-mounted
   b. Differential-mounted

3. Components

   a. Case
   b. Transmission mainshaft (input)
   c. Planetary gear
   d. Freewheeling mechanism
   e. Overdrive mainshaft (output)
   f. Shifting mechanism

4. Power flow

   a. In direct drive
   b. In overdrive

Diagnose malfunctions of a transmission in a car. Identify the nature of the problem (for example: hard shifting, gear clash, slipping out of gear, no power transmission, noisy gears, etc.) and reason for problem (for example: improperly adjusted linkage; worn bearing, gears, or linkage; broken gears; lubricant leaks, etc.).

Make an electrical check of the overdrive circuit. Prepare the overdrive for removal from car by disconnecting speedometer cable, electrical wires, and propeller shaft; drain lubricant. Remove from car and place on work bench. Disassemble and inspect for wear and breaks. Clean thoroughly with solvent. Reassemble using new parts and gaskets as required. Reinstall.

E. Automatic transmissions

1. Purpose: automatic selection of gearing to meet automobile load and speed requirements
2. Principles

    a. Incompressibility of fluids
    b. Fluid transmission of force
    c. Planetary gear operation
    d. Clutch disk operation

3. Major components

    a. Fluid pump(s)
    b. Fluid coupling
    c. Drive clutches
    d. Planetary gear system
    e. Final drive or output shaft
    f. Hydraulic control mechanism or body
    g. External linkage

4. Fluid couplings and torque converters

    a. Drive member
    b. Driven member
    c. Stator (optional)

5. Fluid or oil pumps

    a. Engine driven
    b. Propeller shaft driven

6. Drive clutches

    a. Servo-engaged
    b. Spring-released

7. Planetary gear system

    a. Sun gear
    b. Planetary gears
    c. Ring gear

8. Final drive or output shaft

9. Hydraulic control mechanism or valve body

10. External linkage a. Mechanical b. Vacuum c. Fluid	Adjust the linkage on each type of automatic transmission. Make electrical check of circuitry; vacuum check of lines, and linkage position check. Adjust to manufacturer's specifications for idle, slow, road, and stall.
11. Power flow a. Low b. Intermediate(s) c. Direct or final d. Reverse	
12. In-car transmission service	
a. Diagnostic testing	Check fluid for proper level and for foaming. Try transmission in all shift lever positions to determine whether or not the car moves. Drive car over road of varying terrain and check behavior of transmission. Lift car and go underneath and make a close visual check. Effect one or more pressure gages as required. Consider evidences to determine whether an adjustment, in car repair or removal for complete overhaul, is in order.
b. Linkage adjustment	Adjust automatic transmissions external linkage. Apply parking brake and place selector lever in neutral. Adjust the engine idle speed to specifications with a tachometer. With the engine hot, adjust the anti-stall dashpot clearance. Check the starter circuit in all selector lever positions, the circuit must be open in all positions except N. & P. apply parking brake to prevent operation of the rear pump and install pump pressure gage. Check pressure adjustment at idle and stall speeds. Adjust the throttle linkage, selector lever and starter neutral switch. Follow manufacturer's specifications

c. Replace gaskets and seals	Place car on stands as high as possible. Replace rear seal by removing drive shaft as directed. Use suitable puller. Remove old seal and drive in new seal with proper driving tool. Replace drive shaft as directed.
	Remove governor housing, retainer bolts and gaskets. Replace gaskets, reinstall cover and bolts.
	Remove oil pan and filler tube retaining bolts. Replace old gaskets and filler tube seal, reinstall filler tube and oil pan retaining bolts.
d. Other	
(1) Band adjustment (2) Valve body replacement (3) Governor replacement	Make external adjustment of bands on automatic transmissions of this design; use manufacturer's specifications.
	Place car on high lift for easy access to underside of car. Clean area along gasket joint of pan or cover to be removed. (Scrape with putty knife, wash, and blow off with compressed air as required to thoroughly clean; or steam clean). Remove pan or cover from opening where work is to be done. Clean all parts removed by submerging (when allowable) in a clean solvent. Do not wipe any internal parts with a cloth. Make repair. Reassemble and fill with new fluid as recommended. Pressure test after any jobs involving the governor, valves, body pressure, regulator, or other hydraulic control mechanisms.
13. Out-of-car transmission service	
a. Front seal replacement	Remove dust covers from torque converter housing and take out torque converter to flywheel bolts. Remove linkage and wiring. Remove motor supports and rear cross members where required. Remove drive shaft as directed.

Lower transmissions to floor with transmissions jack. Remove torque converter from housing. Remove and replace front seal with proper tools; replace torque converter in housing slowly to prevent damage to front seal. Raise transmission into place and replace housing to engine bolts. Replace torque converter to fly wheel bolts and dust covers. Reinstall [illegible], linkage, etc. Reinstall filler tube and drive shaft.

Check oil level, fill if necessary. Operate and check for leaks, lower car and road test.

b. Minor or major rebuild

F. Propeller shafts

1. Purpose: connect transmission to differential
2. Types

   a. Enclosed or open
   b. One-piece or two-piece
   c. Hollow or solid

3. Features

   a. Drive angle
   b. Concentric running
   c. Balance
   d. Slip joints

Raise the automobile on a lift. Start engine, place in high gear, and run at highway speed (note: rear tires must be in balance). Check the propeller shaft for running concentric and for balance. Refer to manufacturer's manual for corrective action.

G. Universal joints

1. Purpose: to transmit motion between two parts without a common center line
2. Types

   a. Cross
   b. Ball-and-trunnion

3. Features

Place vehicle on safety stands or lift. Remove propeller shaft and universal joint assembly. Remove old U joint using arbor or hydraulic press. Clean, lubricate, and install universal joint or constant velocity joint. Replace transmission output seal and differential pinion seal if necessary. Re-install propeller shaft assembly, and test drive vehicle.

4. Lubrication requirements	Refer to manufacturer's manual to select proper lubricant in servicing both types of universal joints.
H. Rear axles	
1. Purposes	
a. Support automobile weight b. Support the rear brakes, wheels, and tires c. House the differential	
2. Types	
a. Full-floating b. Three-quarter-floating c. Semi-floating	
3. Components	
a. Axle housing	
(1) Brakes	
(2) Seals and gaskets	Place vehicle securely on stands. Refer to shop manual. Remove wheel, brake, drum, and anchor plate assembly. Remove axle using slide-hammer puller. Remove bearing using hydraulic press. Clean and inspect rear axle. Install new bearing on axle shaft. Replace axle shaft in housing. Install new axle seal. Replace anchor plate, brake drum, and wheel. Refill differential with lubricant, adjust brakes. Test drive vehicle.
(3) Bearings	
b. Axle shafts	
c. Differential carrier	Referring to shop manual, place vehicle on safety stands. Place stands under frame, let axle assembly rest on floor jack. Remove shock absorbers, U bolts, and torque bars when required. Disconnect brake line. Remove axle assembly. Clean and inspect all U-bolts, etc. Install new axle assembly. Connect all lines, hoses, and suspension components. Check differential lubricant, bleed and adjust brakes. Install wheels and test drive.

I. Differential, standard

1. Purposes:
    - a. To multiply torque of the engine
    - b. To change direction of motion
    - c. To permit variation between the speed of the rear wheels
2. Types
    - a. Spur
    - b. Spur bevel
    - c. Hypoid
    - d. Other
3. Components
    - a. Pinion gear
    - b. Ring gear
    - c. Differential case
        - (1) Spider gears
        - (2) Bearings
        - (3) Case
    - d. Differential carrier
4. Action of the differential

Refer to applicable shop manual. Remove drive shaft and rear axles. Drain differential housing and remove differential assembly for cleaning and inspection. Replace worn components and adjust clearances using dial indicator and feeler gage. Reinstall differential in axle housing, install new seals and gaskets. Refill differential with lubricant. Install axles and drive shaft. Test drive.

VII. SUSPENSION SYSTEM

A. Introduction

1. Purposes
    - a. To absorb road shock
    - b. To maintain contact between road and tire
    - c. To maintain alignment with the chassis

2. Requirements
    a. Elasticity: to flex and to return to original state
    b. Flexibility: to be adaptable to many road conditions
    c. Acceptable ride: to have a favorable sprung-to-unsprung-weight ratio
    d. Strength: to be able to carry overloads on rough surfaces

3. Components
    a. Wheels and tires
    b. Axles or A-arms
    c. Springs
    d. Shock absorbers
    e. Control members

4. Lubrication of chassis suspension components

Follow a lubrication guide to select proper lubricant type and application point. Lubricate the front and rear suspension on an automobile chassis

B. Tires

1. Construction
    a. Cord body
    b. Rubber tread
    c. Wire bead

2. Types
    a. Tube
    b. Tubeless

3. Balance
    a. Static
    b. Dynamic

Balance tires both statical and dynamically. Give a full explanation of the need for both types of balance

C. Wheels

1. Features
    a. Offset
    b. Drop center
    c. Bead-lock flange

- d. Flange width
- e. Bolt patterns

2. Tolerance

   - a. Lateral runout
   - b. Radial runout

Measure the runout of both a wheel and a tire; compare with manufacturer's allowable tolerances

D. Springs

1. Purposes

   - a. To absorb road shock
   - b. To align axle-to-frame

2. Types

   - a. Leaf
   - b. Coil
   - c. Torsion bar

3. Mounts

   - a. Rigid
   - b. Shackles

4. Service

   - a. Lubrication of spring
   - b. Lubrication of mount
   - c. Replace one leaf or entire unit

Replace rear coil springs. Jack up car and support front or rear end at the frame side rails. Remove front wheels, stabilizer, shock absorber, lower control arm to floor and remove coil spring. CAUTION: clean and inspect all parts for damage and replace worn or broken parts. Reassemble using proper spring for specific automobile.

E. Shock absorbers

1. Purpose: to absorb and dissipate road shock
2. Types

   - a. Direct acting
   - b. Cam-operated piston
   - c. Rotary vane

3. Mounting methods

   - a. Position
   - b. Brackets and bushings

Place stands under lower suspension arms or axle. Remove retaining nuts or bolts at upper end of shock absorber. Remove bolts at lower end, then lower the shock absorber. Lubricate rubber bushings with rubber lube to prevent squeaks. Remount and torque nuts to specifications.

F. Other control members

1. Purpose: to maintain alignment of the chassis in reaction to unequal road conditions, crosswinds, etc.

2. Types

   a. Stabilizer bars

   Place car carefully onto stands. Disconnect strut and bar mounts in a safe manner. Replace worn and broken metal and rubber bushings. Apply rubber lubricant to all rubber parts to prevent squeaks. Do not try to weld.

   b. Anti-sway bars
   c. Others

   Place car carefully onto suitable hoist such as a twin post, or drive on ramp-type lift. Lift car and support to relieve the pressure at the control arm pivots. Remove control arm pivot attaching bolts in a safe manner and in the sequence that facilitates easy removal. When replacing arm, first assemble all pivots loosely. Then with everything in place, tighten securely. Check drive line angle to be certain of alignment.

G. Rear suspension

1. Types

   a. One piece axle housing
   b. Independent

2. Components

   a. Axle housing or control arm
   b. Spring
   c. Shock absorbers
   d. Others

3. Service

   a. Checking alignment

   Check the alignment of the rear suspension. Make recommendation for adjustment and proceed under instructor's supervision.

   b. Replacing spring, shock absorber, control arm, etc.

H. Front suspension

1. Features

   a. Beam axle

b. Independent

(1) Kingpin
(2) Ball-joint

2. Components

a. Axle or A-arms
b. Springs
c. Shock absorbers
d. Stabilizer bar

3. Replacement of components
4. Alignment by adjustment

a. Caster
b. Camber
c. Toe-in

Lift car from floor; support on stands at outer end of lower control arms. Check ball joints and/or kingpins and bushing for wear, replace if necessary. Adjust front wheel bearings and equalize pressure in front and rear tires. Check tie rod ends, tie rods, front and rear control arms and other components, repair or replace it if needed. Lower car to floor and position on wheel alignment rock. Balance front and rear wheels. Adjust caster, camber, toe-in and rear wheel alignment. Follow manufacturer's procedures and instructions for car involved.

5. Alignment by bending

VIII. STEERING SYSTEM

A. Introduction

1. Purpose: to direct the travel of an automobile

2. Components

a. Steering gear
b. Linkage
c. Spindles

3. Operation

a. Mechanical advantage of steering box and linkage
b. Steering geometry
c. Hydraulic power assist

B. Steering gears or boxes

- 1. Manual
  - a. Components
    - (1) Steering shaft
    - (2) Coupling
      - (a) Worm and roller
      - (b) Recirculating ball
      - (c) Cam and lever
    - (3) Sector shaft
    - (4) Pitman arm
    - (5) Box, housing, bearings, etc.
  - b. Operation
    - (1) Reduces turning effort
    - (2) Multiplies turning force
    - (3) Change plane of motion
  - c. Adjustments
    - (1) Worm bearing pre-load
    - (2) Sector shaft end play
    - (3) Center load adjustment

Place stands under car and cover fenders. Remove pitman arm and loosen sector lash adjusting screw. Adjust worm bearing to specific clearance. With steering at center position, make sector lash adjustment and replace arm. Lower car and test.

- 2. Integral-type power-steering boxes
  - a. Components
    - (1) Hydraulic pump
    - (2) (a) Vane-type
      - (b) Rotor-type
    - (2) Relief valve
    - (3) Lines
      - (a) Delivery
      - (b) Return
    - (4) Integral-type steering box
      - (a) Constant-control
      - (b) Coaxial

      - (c) Saginaw
  - b. Operation
    - (1) Hydraulic pressure assist
    - (2) Precaution: avoid entry of dirt
  - c. Adjustments
    - (1) Thrust-bearing preload
    - (2) High-point

C. Steering linkage

- 1. Components of typical system
  - a. Pitman arm
  - b. Relay rod
  - c. Idler arm
  - d. Tie rods and adjustment sleeves
  - e. Pivot joints
    - (1) Ball-and-socket
    - (2) Tie-rod ends
- 2. Variant linkages
  - a. Drag link and intermediate steering arm
  - b. Center pitman
- 3. Linakge-type power steering: power cylinder
- 4. Spindles and steering arms
  - a. Kingpin type
  - b. Ball-joint type
- 5. Adjustments
  - a. Manual
    - (1) Pitman arm
    - (2) Adjusting sleeves
    - (3) Ball-and-socket joints
  - b. Power: control valve

D. Hydraulic pumps and lines

  1. Hydraulic pumps

    a. Vane-type
    b. Rotary-type
    c. Other

  2. Hydraulic lines

    a. Pressure delivery
    b. Return

E. Lubrication

  1. Manual- and power-steering boxes
  2. Hydraulic pumps and power cylinders
  3. Linkage pivot points

Place stands under car and cover fenders. Remove small hose from gear housing and start engine. Turn steering wheel from lock to lock until all fluid is removed from system. Replace hoses and tighten nuts. Refill reservoir and bleed system by starting engine and turning steering wheel from one extreme to the other. Check and test for leaks (pressure test).

F. Service

  1. Rebuilding steering boxes

Remove, rebuild, and replace steering box. With car on stands, disconnect steering coupler and pitman arm. Remove steering box and place on a clean work surface. Disassemble box and clean, air dry and inspect all parts. Use a magnifying glass where needed for a minute inspection. Replace worn bushings and seals. Reassemble, using lubricants to hold parts in position and lubricate as required. Adjust and remount box. Reconnect coupler and pitman arm.

Remove, rebuild, and replace power steering unit. Remove power steering unit in same manner as conventional box. Overhaul procedures vary greatly. Always refer to shop manual. Place unit on a work bench having a large clean work space. To keep parts in proper reassembly order, lay them out as in an exploded view. Clean parts of one subassembly at a time. Air dry (no rags). Inspect parts for wear,

	straightness, interfering nicks, and breakage. Do not attempt to straighten or weld any steering parts. Reassemble, using recommended special tools, fluid to coat internal parts, sequence and work practices. Adjust to proper torque and clearance specifications. Remount unit and reconnect hoses. Refill with new fluid and recheck for safety.
2. Replacing pivot points	Position car in bay and place on jack stands so that all steering linkage may turn free. Replace complete idler arm or use kit as needed. Draw nuts to specified torque and replace cotter pins. Inspect, remove, and replace tie rods and tie rod ends as needed. Remove tie rods with suitable puller. Note overall length and manufacturer's specifications. Replace, using lock nut or puller.
3. Rebuilding hydraulic pumps	Drain all fluid from pump and reservoir. Disconnect hoses from pump and plug to prevent drainage of hoses. Remove pump belt pivot bolt and mounting bolt and lift off pump and reservoir. Clean pump and reservoir and install repair kit following manufacturer's schematics and instructions for type of pump being repaired. Replace pump on engine; install and adjust pump belt. Check for leaks and check pump pressure.
4. Rebuilding power cylinders	Remove the two hydraulic lines connected to the power cylinder and drain fluid into a container. Remove the power cylinder from the vehicle and inspect seals, brass fitting, hose, and other parts. Remove piston and rod. Reassemble by reversing the disassembly procedure
5. Adjusting the pitman arm and the adjusting sleeves	
6. Replace kingpin and bush spindles	Lift car so as to remove weight from front wheels and spindles. Check kingpins for wear and replace if necessary.

7. Replace ball joints

Remove ball joints as in directions. Service or replace spindle as required. Reinstall components as directed in applicable section.

IX. BRAKING SYSTEM

A. Introduction

1. Purpose: to slow or stop vehicle
2. Principles

    a. Friction; conversion of force to heat
    b. Mechanical advantages of levers
    c. Relationship of pressure, volume, and force of cylinder of various sizes
    d. Characteristics of fluids

        (1) Incompressibility
        (2) Force and pressure transmission
        (3) Corrosiveness
        (4) Lubrication
        (5) Coolant

3. Requirements

    a. Dependability
    b. Duty-rated for overload
    c. Heat dissipation
    d. Ease of operation
    e. Low maintenance

4. Types

    a. Bendix duo-servo
    b. Lockheed
    c. Chrysler centerplane
    d. Disk
    e. Other

5. Major components of the system

    a. Individual wheel brakes
    b. Master cylinder and distribution lines
    c. Emergency brake and linkage
    d. Power booster

B. Drum-type brake

1. Components

a. Drum
b. Backing plate
c. Shoes
d. Wheel cylinder
e. Shoe return spring
f. Wear-adjustment mechanism

2. Operation

a. Hydraulic pressure in wheel cylinder
b. Shoe action against drums
c. Self-energization
d. Return action

3. Adjustment

a. Lockheed-type
b. Bendix-type
c. Chrysler-type

Adjust the brakes on all wheels on each type of drum brake. Evaluate the life remaining before relining.

4. Service

a. Replace shoes
b. Repair cylinders
c. Turn drums

Rebuild the brake on a wheel by replacing shoes, repairing the wheel cylinder, and turning the drum.

C. Disk-type brake

1. Components

a. Pressure plates
b. Wheel cylinders
c. Lining or pucks
d. Housing or brake disk

2. Operation

a. Disk-and-housing type
b. Disk-and-puck type

3. Adjustment

a. Disk-and-housing type
b. Disk-and-puck type

D. Master cylinder

1. Components

- a. Housing
  - (1) Cylinder chamber
  - (2) Reservoir chamber
- b. Piston
- c. Cup and spring
- d. Pedal rod
- e. Boot

2. Operation
   - a. Foot pedal activated
   - b. Pressure developed in the master cylinder
   - c. Equal distribution
   - d. Effect of varying size wheel cylinders

3. Service
   - a. Maintaining fluid level
   - b. Replacing boot
   - c. Rebuilding the master cylinder

Rebuild a master cylinder. Hone the cylinder, measure for wear tolerance, install a repair kit, and remount on the chassis. Fill with fluid and adjust the pedal-to-cylinder linkage.

E. Emergency brake

Adjust the linkage and/or replace the brake band or shoes on an emergency brake.

1. Purpose: to provide an independent, mechanically accentuated brake for parking and emergencies
2. Types by operation
   - a. Externally contracting
   - b. Internally expanding
3. Adjustment
   - a. External
   - b. Internal

F. Vacuum booster

1. Purpose: to reduce pedal effort and raise braking force
2. Types by manufacturer
   - a. Bendix
   - b. Kelsey-Hayes
   - c. Other

3. Sources of trouble

   a. Leakages
   b. Clogged filter
   c. Linkage maladjustment or wear

X. HEATING AND AIR CONDITIONING

A. Introduction

1. Purpose: temperature and humidity control of passenger compartment
2. Types of control

   a. Heaters
   b. Air conditioners

B. Heaters

1. Purpose: elevate temperature for passenger comfort
2. Operation: absorption of heat from engine coolant; blow heated air throughout passenger compartment
3. Components

   a. Heater core
   b. Heater hoses and clamps
   c. Blower fan
   d. Defroster hoses
   e. Radiator
   f. Engine coolant pump
   g. Heater controls

4. Service

   a. Repair or replace heater core
   b. Replacement of heater hose
   c. Replacement of defroster hose
   d. Check and repair electrical circuit and blower motor
   e. Change engine thermostat

C. Air conditioning

1. Purpose

completely disassemble and rebuild a vacuum-boost unit. Carefully follow manufacturer's literature and use recommended procedures, specifications, and parts.

Troubleshoot inoperative heater.

Install a heater in a car. Remove plugs from firewall or drill holes. Mount heater unit; insert fitting on water pump and block; run water line and electrical circuit with switch. Fill with coolant and check for leaks and proper operation.

   - a. To reduce air temperature in passenger compartment
   - b. To reduce humidity in passenger compartment

2. Operation
   - a. Absorption of heat from air and direct a flow of cooled air
   - b. Transport heat to the outside where it is dissipated
   - c. Reduction of moisture by cooling, then heating the air to be circulated

3. Service of system components

a. Condenser	Discharge system of replacement, disconnect and plug hoses, remove and replace condenser and connect hoses. Evacuate the system and recharge with freon 12. Test the system for leaks and check for proper operation.
b. Compressor	Replace or repair air conditioning compressor unit. Discharge system of refrigerant. Disconnect and plug lines. Remove compressor belt and mounting bolts. Disassemble compressor being careful with the valve plates. Determine worn parts and reassemble. Evacuate and recharge system; check evaporator temperature for proper operation.
c. Expansion valve	Discharge refrigerant from system, disconnect hoses, remove and replace expansion valve, being careful with capillary tube. Connect hoses, insulate capillary bulb; evacuate and charge system, check for leaks and proper operation.
d. Evaporator core	Discharge system of refrigerant. Disconnect and plug hoses; remove and replace evaporator. Connect hoses. Evacuate and charge system with Freon 12. Test for leaks, check compression oil and check system for proper operation.

e. Heating core	Discharge refrigerant from system, disconnect hoses, remove and replace dehydrator being careful of sight glass when applicable. Connect hoses, evacuate and charge system with Freon 12. Test compression oil for leaks and check for proper operation.
f. Blower and motor	Disconnect motor to switch wire connection. Remove and replace or repair heater motor following specific manufacturer's service manual.
g. Sight glass	
h. Pressure relief valve	Discharge system of freon, disconnect hoses, vacuum hose and manual control cable. Remove and replace manual control valve or diaphragm. Connect hoses, manual control cable and vacuum hose. Evacuate and recharge system. Check for leaks and proper operation of system.
i. Filter	
j. High-pressure lines and hoses	
k. Air hoses and outlets

AUTOMOTIVE MECHANICS

JOB ANALYSIS OF THE TRADE

Automotive mechanics is a service trade, and the services rendered include both the diagnosis of automotive malfunctions and the repair, overhaul, or replacement of components. These components may be major units such as engines and transmissions, or they may be minor ones such as electrical solenoids and mechanical linkages. Furthermore, adequate service may range from engine replacement to linkage adjustment. Almost all services involve inspection.

The following job analysis of the automotive mechanics trade may appear repetitious because the terms "inspect", diagnose", "repair", or "replace" occur frequently. The use of these terms may seem to convey the idea that the trade is one of limited scope; this is not the case. Each of the jobs listed is distinctive because its makeup consists of numerous operations, some of which are found in no other trade, and all of which are sequenced exactly like no other job. In addition, the ability to know what to look for and when to do things contributes to the uniqueness of each job. For these reasons, automotive mechanics is a complex, multiskilled, knowledgeable trade. It cannot be successfully pursued by those whose only assets are procedural abilities.

TRADE ANALYSIS

AUTOMOTIVE MECHANICS

I. BASIC SHOP PROCESSES

1. Layout patterns with straight edges, scribes, center punches, combination sets, rules, etc.
2. Make non-precision, semi-precision, and precision measurements
3. Cut stock with acetylene torch
4. Cut stock and parts with saws, snips, chisels, files, etc.
5. Hold materials with vises, pliers, wrenches, clamps, etc.
6. Join similar metals with acetylene torch
7. Join similar metals with electric welder
8. Join dissimilar metals with brass
9. Fasten materials with bolts, nuts, screws, rivets, etc.
10. Drill stock with hand drill, drill bits, drill press, etc.
11. Thread stock with tape and dies

II. ENGINE

A. Head assembly

   1. Replace head gaskets
   2. Grind valves and seats
   3. Repair valve train (except camshaft)
   4. Diagnose valve train and head malfunctions

B. Block assembly

   1. Fit and install pistons, pins, and rings
   2. Inspect the crankshaft and connecting rod assembly
   3. Replace timing chains and gears
   4. Replace camshaft and/or camshaft bushings

5. Replace engine and/or transmission supports

6. Service the engine breathing system

7. Diagnose malfunctions in the block assembly for each of the above

III. ELECTRICAL SYSTEM

A. Cranking system

1. Service the battery

2. Repair cables, wiring, switches, relays, and solenoids

3. Repair the cranking motor and/or solenoid

4. Analyze malfunctions in the cranking system

B. Charging system

1. Service the generator

2. Repair wiring

3. File points within the regulator and make necessary adjustments

4. Analyze malfunctions in the charging system

C. Ignition system

1. Inspect and repair the switch, resistor, wiring, coil, points and condenser of the primary circuit

2. Inspect secondary circuit leads, distributor, cap and/or rotor

3. Clean and test spark plugs

4. Test ignition timing and advance units on a test stand

5. Set the timing of the ignition to the engine

6. Determine the reasons for weak or no spark at the plug.

D. Accessories

1. Clean and adjust horns and switches

2. Inspect and test windshield-wiper motors, blades, and arms

3. Test and repair turn-signal units

4. Diagnose and repair lighting circuits

5. Test and rewire dash units

IV. FUEL SYSTEMS

A. Tank and lines

1. Inspect, service, or replace gas tank, cap, and sending unit
2. Repair or replace fuel lines and hoses

B. Pumps and filters

1. Test and repair fuel pump vacuum
2. Clean or replace filter units
3. Measure fuel flow and pressure

C. Carburetors

1. Test and clean choke unit (automatic and manual)
2. Inspect, service, or replace carburetor air cleaner
3. Clean and/or adjust the carburetor

D. Exhaust

1. Service heat-control valve on exhaust manifold
2. Replace exhaust manifold header pipe, muffler, tail pipe, and brackets

V. COOLING SYSTEM

A. Water-cooled engines

1. Test thermostat
2. Adjust fan belt
3. Chemically clean and flush cooling system
4. Replace expansion plugs
5. Inspect water hoses
6. Test antifreeze
7. Test heat-gage sending unit
8. Replace water-distribution tubes
9. Inspect and replace variable-speed fan
10. Replace water pump

    11. Remove and install radiator
    12. Solder minor leaks in radiator
  - B. Air-cooled engines
    1. Adjust fan or blower belt
    2. Test heat-gage sending unit
    3. Clean oil and dirt accumulations on engine

VI. POWER TRAIN

- A. Manual clutch
  1. Replace and or adjust mechanical-type clutch linkage
  2. Repair hydraulic-type clutch bearing
  3. Replace clutch assembly and pilot bearing
  4. Replace flywheel
- B. Conventional transmission
  1. Adjust external shift linkage
  2. Replace gaskets and seals (in-car repairs)
  3. Lubricate and/or replace speedometer cable, drive gear and housing
  4. Rebuild manual transmission (major repairs)
- C. Automatic transmission
  1. Adjust linkage from steering column to transmission
  2. Adjust linkage from engine to transmission
  3. Replace external seals, gaskets, and lines
  4. Make external adjustment of bands
- D. Overdrives
  1. Analyze and repair electrical control circuit and components
  2. Rebuild overdrive unit
- D. Propeller shaft
  1. Replace universal joint

    2. Balance drive shaft (in-car)
    3. Test and replace out-of-round shaft
  - F. Differential and housing
    1. Replace pinion seal
    2. Replace rear-axle shaft, bearing and/or seal
    3. Rebuild differential

VII. SUSPENSION SYSTEM

  - A. Component service
    1. Lubricate the front and rear suspension
    2. Replace shock absorbers and/or mounting
    3. Replace stabilizer bars and/or mounting
    4. Replace springs and/or mountings
    5. Replace control arms and/or bushings
    6. Replace ball joints
  - B. Alignment service
    1. Check frame and axle alignment
    2. Adjust caster
    3. Adjust camber
    4. Adjust toe-in

VIII. STEERING SYSTEM

  - A. Manual
    1. Adjust worm and sector
    2. Rebuild manual steering box
    3. Replace pivot points on steering linkage
    4. Lubricate the steering box and linkage

B. Power-assist

1. Rebuild power-steering box

2. Replace hoses

3. Rebuild power cylinder

4. Rebuild pump

5. Replace pivot points on linkage

6. Lubricate the power steering

IX. BRAKING SYSTEM

A. Hand brake

1. Adjust and/or replace linkage

2. Adjust and/or replace exteraal band

B. Foot brake

1. Replace brake-shoe lining and/or shoes

2. Repair wheel cylinder

3. Re-flare or replace line and/or hose

4. Repair master cylinder

5. Replace grease seal (front)

6. Adjust wheel bearing (front)

7. Replace stop-light switch

8. Rebuild vacuum-assist unit

9. Replace pucks (disc-type brake)

10. Repair disc brake

11. Bleed and adjust brakes

12. Diagnose improper brake operation or leakage.

X. HEATING & AIR CONDITIONING

A. Heating

1. Check coolant temperature
2. Inspect and replace defroster hose
3. Remove/replace heater core
4. Service heater controls
5. Install hot-water heater
6. Analyze heating system malfunction

B. Air Conditioning

1. Repair and/or replace compressor
2. Replace condenser
3. Replace evaporator
4. Replace dehydrator
5. Replace expansion valve
6. Replace freon control valve and/or diaphragm
7. Service control cables and switches
8. Replace fan motor
9. Diagnose air conditioning malfunction

ROTATION PLAN

The rotation plan presented on the following pages is premised on the assumption that first year students will be scheduled in separate classes from second year students. The instructor will then teach the fundamentals of automotive mechanics to the first year students as a group, both in class and in shop. Students successfully completing the first year may be enrolled in second year.

The class is broken into two or more subgroups, depending on the enrollment and nature of the trade. At any given time, each subgroup is engaged in a different block of the trade; the instruction is unique for that block; the jobs are a part of that specific block. During rotation, all subgroups are routed through all blocks and perform all jobs before their training is completed. This teaching technique makes use of instructional sheets such as job sheets, information sheets, operation sheets, and assignment sheets. Records of progress and proficiency are kept for each student.

The following page is an example of the rotation plan as it may apply to the teaching of automotive mechanics. Strict adherence to the plan will likely be difficult, and rigid compliance with it is not recommended. The hours assigned to each automotive system indicate the relative emphasis given to each by the curriculum committee. Preplanning is encouraged for the entire training period. On the other hand, preplanning for the entire training period, with due consideration of student loads; of space, equipment, and supplies capabilities; of unscheduled interruptions; and of the content of the trade program, will result in an improved and more effective learning environment. Such planning assists the teacher in being aware of the proficiency and progress of each student. It also promotes teacher direction of individual activities.

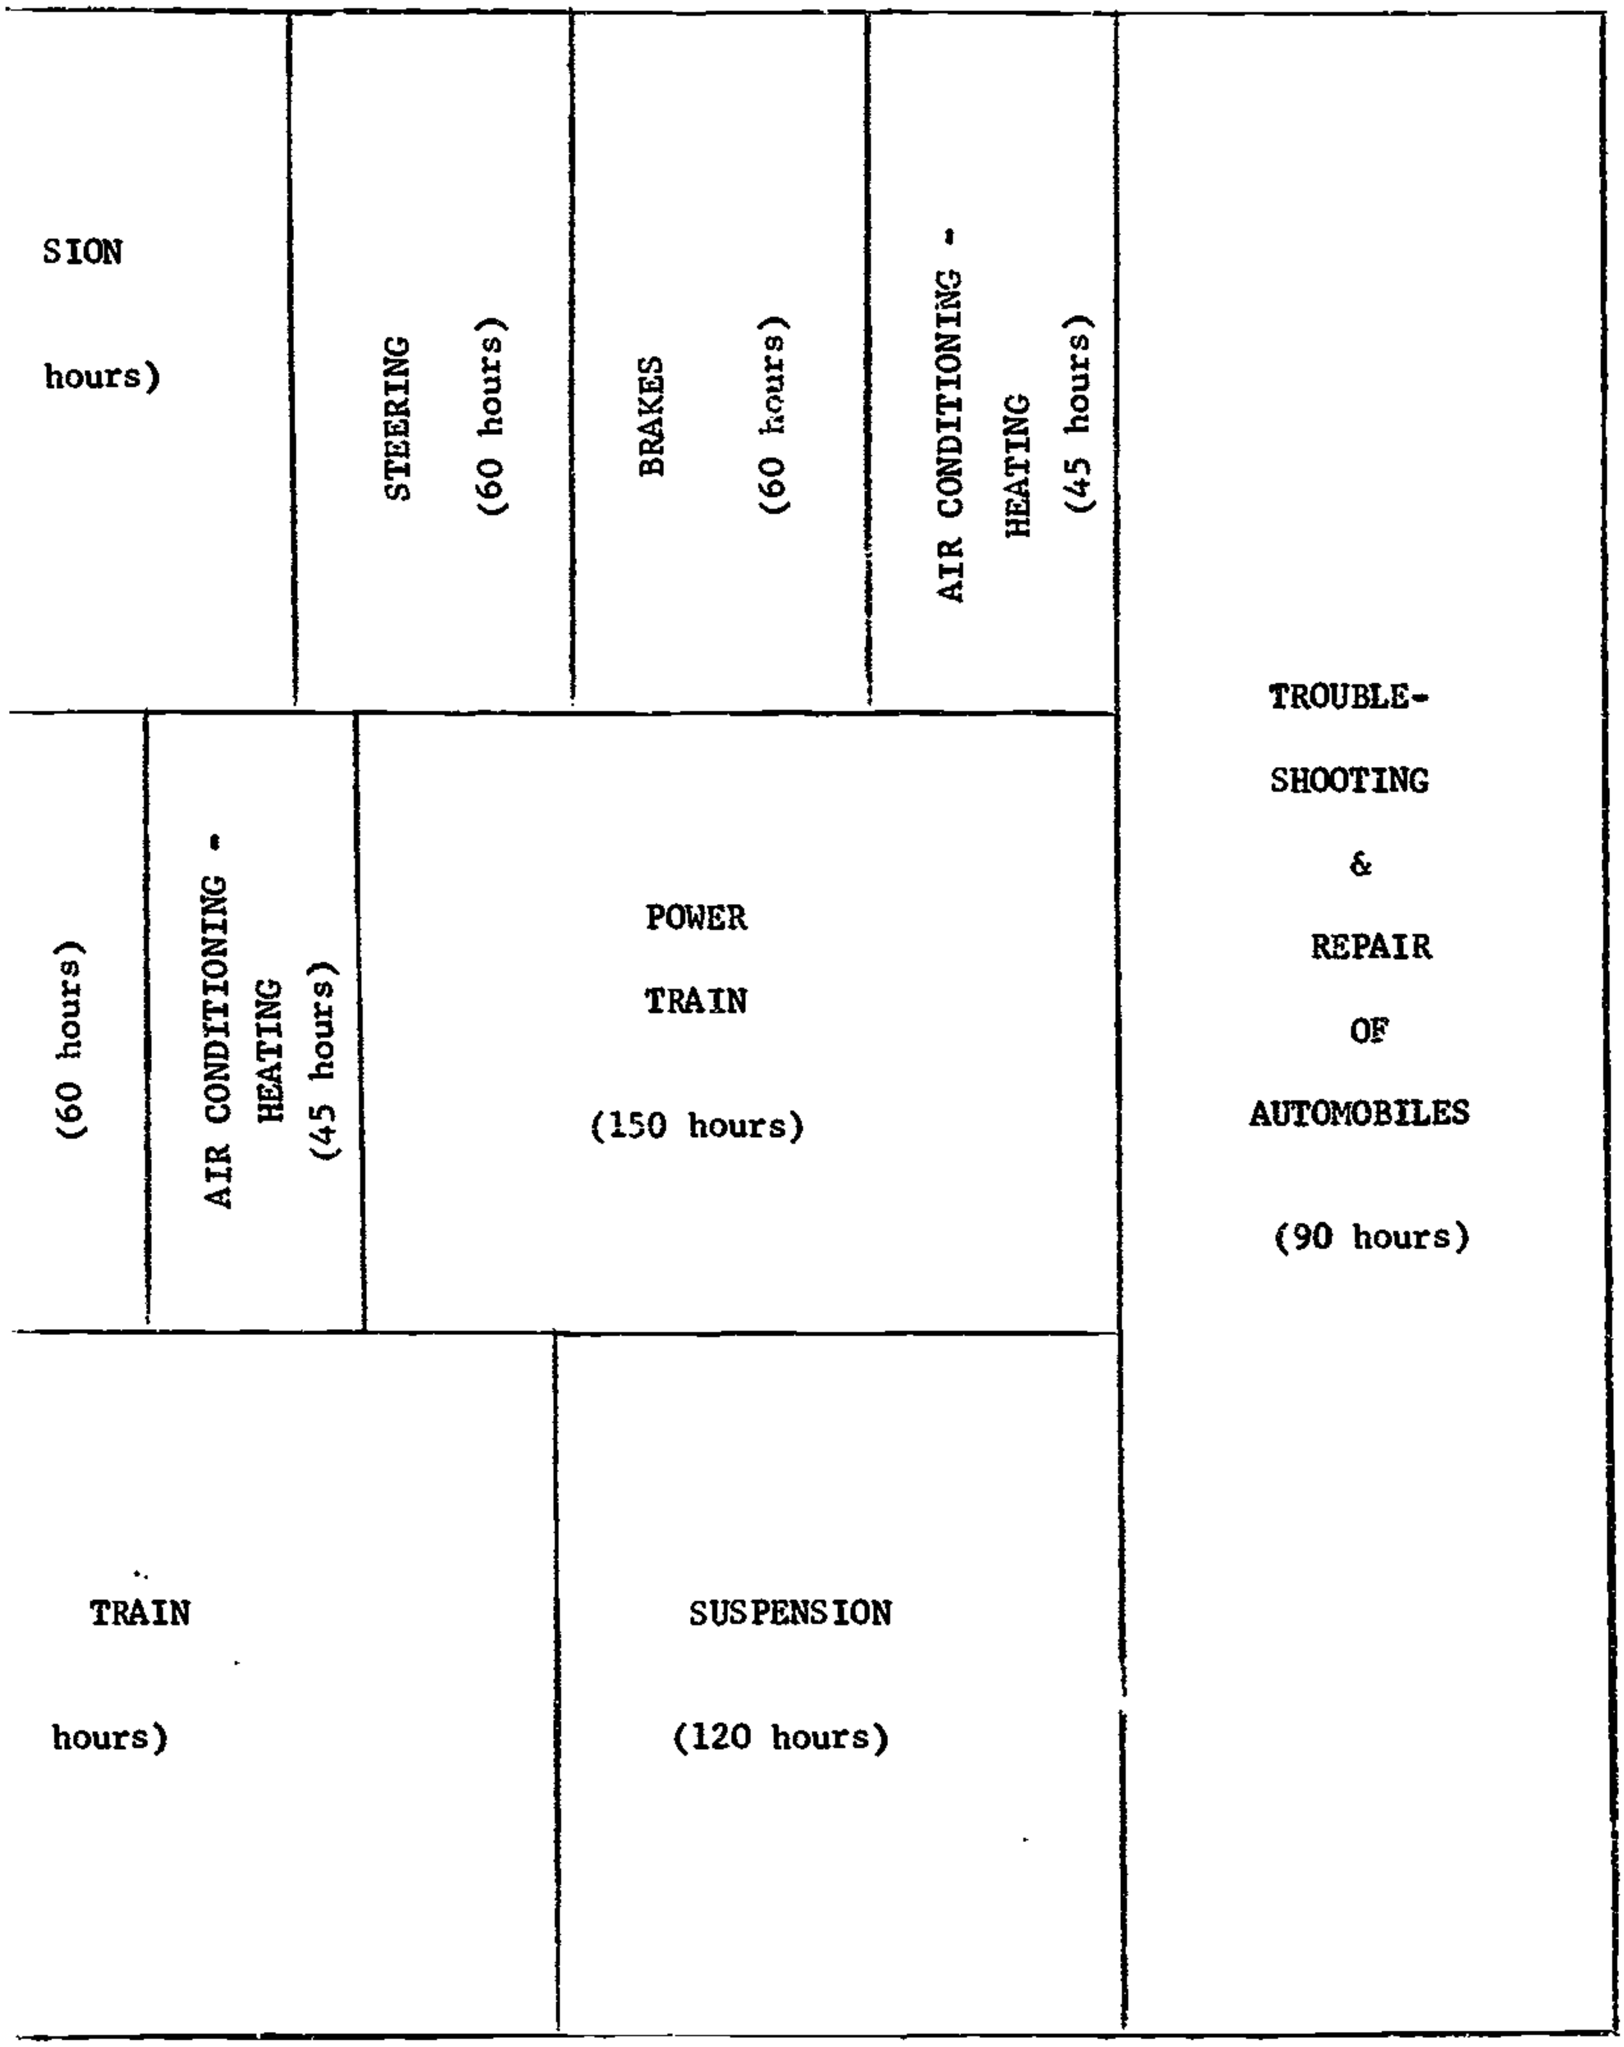
ROTATION PLAN ---- SECOND YEAR STUDENTS



PROGRESS CHART

Progress in trade training is based on proficiency in knowledges and skills, not on hours or days of exposure in class or shop. For this reason, a progress chart is found on the following page. When the student begins a given task, the instructor places a diagonal in the block corresponding to the task and the student's name. For example: ⧄ When the student evidences proviciency in a given task, the instructor places a second diagonal in the block corresponding to the task and the student's name. For example: ☒ The student is then directed into the next task.

While the chart shown lists only manipulative tasks, the instructor will find it advantageous to prepare similar charts for reading assignments, tests, and other shop activities.

AUTOMOTIVE MECHANICS

APPLIED SCIENCE

Objectives

1. To develop an interest in science and its role in the metal trades
2. To learn basic scientific facts and principles as they apply to the automotive mechanics area
3. To solve problems encountered in automotive mechanics practices, as they are related to scientific facts and principles

UNIT I. SCIENCE, MATTER, AND MEASUREMENTS

A. Basic principles
    1. Science and the scientific method
    2. Matter
        a. Properties of solids
        b. Properties of liquids
        c. Properties of gases

B. Measurements
    1. English
    2. Metric
    3. Linear
    4. Area
    5. Volume

UNIT II. USE OF PRECISION INSTRUMENTS

A. Combination square

B. Calipers
    1. Inside
    2. Outside
    3. Hermaphrodite

- C. Micrometers
  - 1. Inside
  - 2. Outside
  - 3. Depth
- D. Verniers

UNIT III. SIMPLE MACHINES

- A. Levers
- B. Inclined plane and wedge
- C. Wheel and axle
- D. Screw threads
- E. Speed and force as related to gear trains

UNIT IV. FRICTION

- A. Causes of friction
- B. Types of friction
  - 1. Starting
  - 2. Sliding
  - 3. Rolling
- C. Principles of reducing friction
  - 1. Types of bearings
    - a. Roller
    - b. Ball
    - c. Needle

UNIT V. PRINCIPLES OF LUBRICATION

Simplifying Farm Work.

Illinois Univ., Urbana. Vocational Agriculture Service
VAS-2036
Pub Date - May63
MF AVAILABLE IN VT-ERIC SET 17p.

*WORK SIMPLIFICATION, *TEXTBOOKS, REFERENCE BOOKS, UNITS OF STUDY (SUBJECT FIELDS), *VOCATIONAL AGRICULTURE, *FARM MANAGEMENT,

Textual and reference material is provided on the simplification of farm work for high school vocational agriculture and adult farmer classes. It was prepared by a teacher educator in consultation with subject matter specialists, teacher educators, supervisors, and teachers. The material covers (1) reasons for simplifying farm work, (2) the work simplification procedure, (3) illustration of farm work simplification, (4) labor reduction in silage feeding and egg production, and (5) investment in labor-saving equipment. The material is to be used for 1-4 hours by teachers with agricultural competency and students who have average ability, agricultural interest, and occupational goals in production agriculture. Concepts are illustrated with graphs, tables, and photographs. Copies are available for 20 cents from the Vocational Agriculture Service, 434 Mumford Hall, Urbana, Illinois 61801. (JM)

SIMPLIFYING FARM WORK

1. Why Are We Interested in Simplifying Farm Work?
2. What Is the Work Simplification Procedure?
3. Illustrations of Farm Work Simplification.
4. Reducing Labor in Silage Feeding and Egg Production.
5. When Does It Pay to Invest in Labor-Saving Equipment?

In the preceding unit, we discussed the problem of balancing the labor supply and the farm business. Farm labor, an important resource in any business, is a costly agent of production. We must use it effectively in carrying out farm operations.

Considerable emphasis has been placed on getting jobs done with less effort, increasing the productivity of workers, and reducing the labor cost per unit of product. This procedure is referred to as work simplification. We shall discuss its advantages, the procedure to follow, its application to farm jobs, and a method of determining whether the purchase of labor-saving equipment is economical.

1. WHY ARE WE INTERESTED IN SIMPLIFYING FARM WORK?

Most of us are interested in taking advantage of ways of reducing labor or making work easier to do. The final results of effective work simplification may show up as lower costs, greater labor accomplishments, or higher earnings. Any or all of these are worthwhile goals.

A means of reducing costs

Costs in farming have increased ever since the depression of the 1930's. The increase was very great during and following World War II. Labor is an important cost item because the value of the operator's labor, unpaid family labor, and hired labor must all be included.

Farm costs have increased. Total costs have increased greatly since 1940. These costs, including cash operating expenses, new machinery purchases, unpaid labor, and interest on investment, amounted to about $27 an acre on northern Illinois farms in 1940. Hog farms of about 220 acres in northern Illinois had total costs of $64 per acre in 1951 and $85 per acre in 1960. These figures indicate that total costs per acre were about 3 times as high in 1960 as in 1940.

Prices paid for farm-cost items also show large increases since 1940 (Fig. 1). Wage rates were 4.9 times as high in 1960 as in 1940. Farm machinery was 2.5 times as high, farm supplies were 1.8 times as high, and fertilizer 1.5 times as high in 1960 as compared with 1940. With costs increasing over a period of time, it is very important that we keep them at reasonable levels without decreasing production.

Labor is a major farm cost. In all the common systems of farming in Illinois, labor is one of the three major cost items. The data in Table 1 indicate its importance for four systems in northern Illinois.

Labor makes up about 17 to 22 percent of the total farm costs in most of the common systems of farming. It is exceeded in importance by only the interest charge on the investment and by machinery and equipment costs. Work simplification deals with an important phase of the cost side of the farm business.

Labor accomplishment varies. The higher your labor costs in relation to production, the more important it is for you to use methods that will reduce these costs. The variations in labor accomplishments from farm to farm are so great that they are almost amazing,

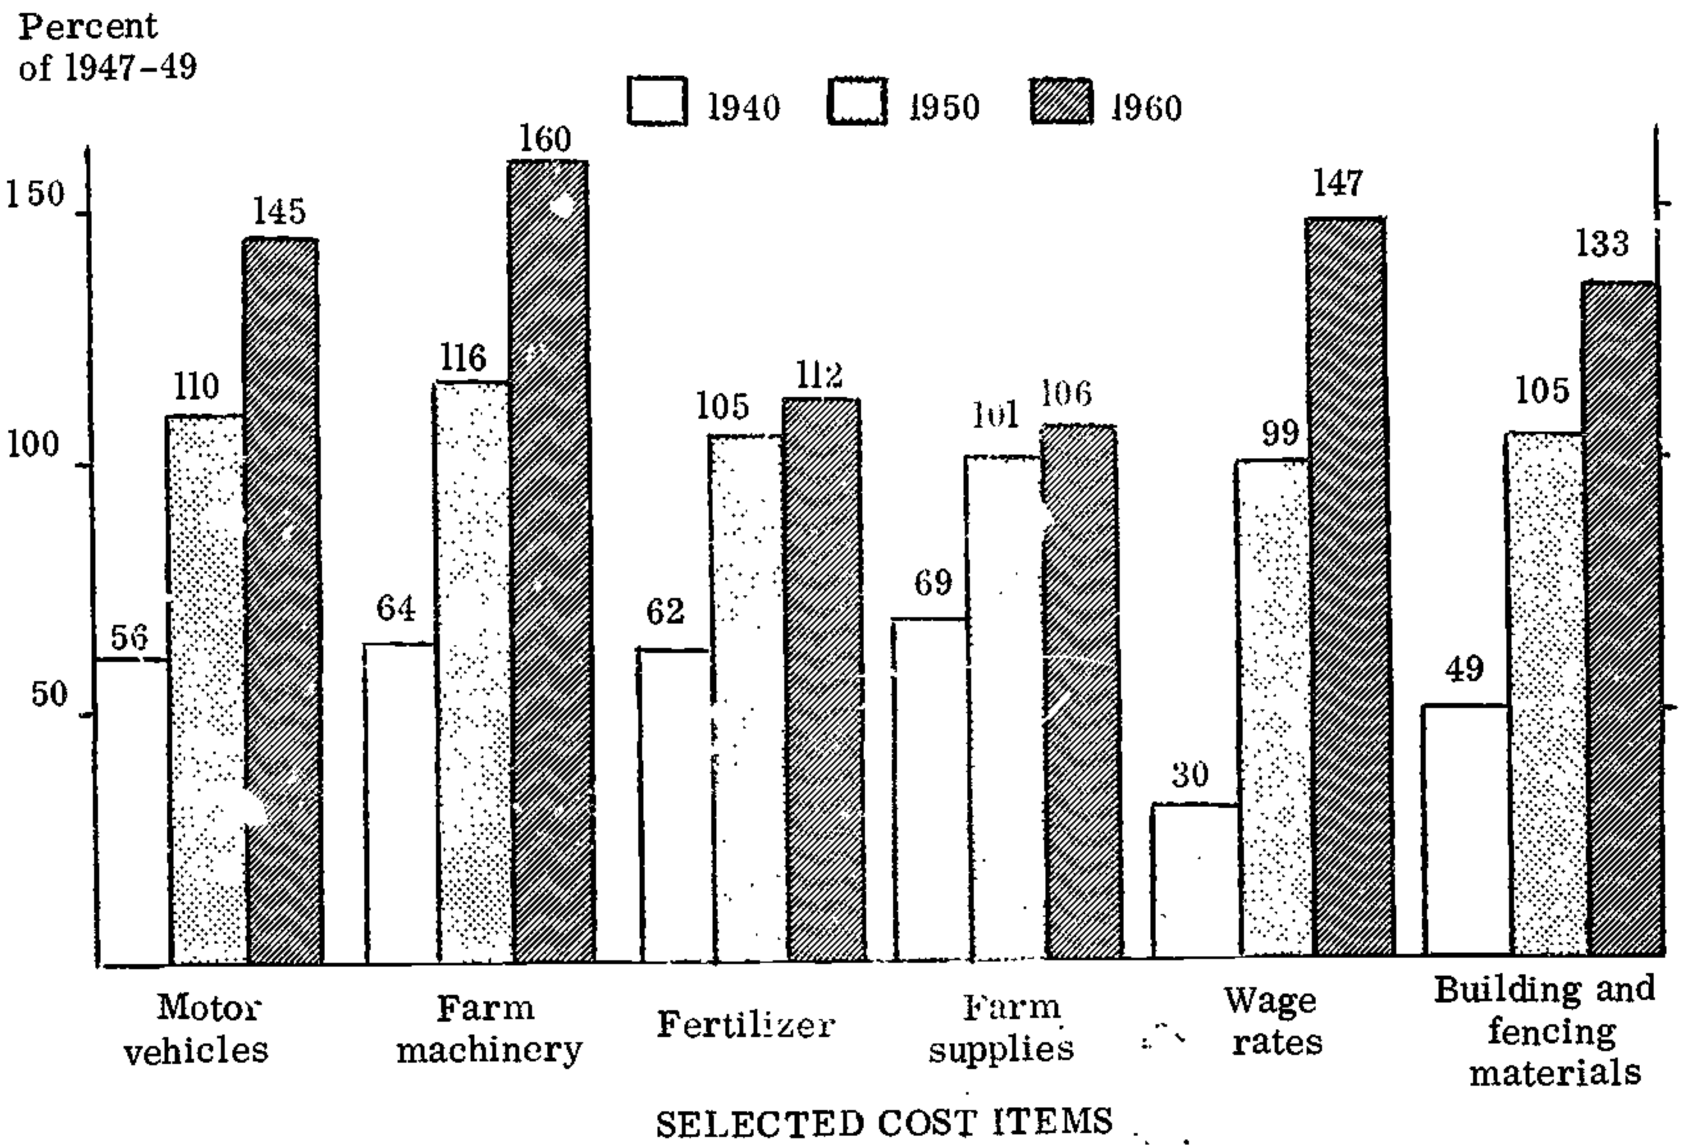

Fig. 1. Cost rates of selected items used by farmers in 1940, 1950, and 1960 (Reported by U.S. Dept. Agr.).

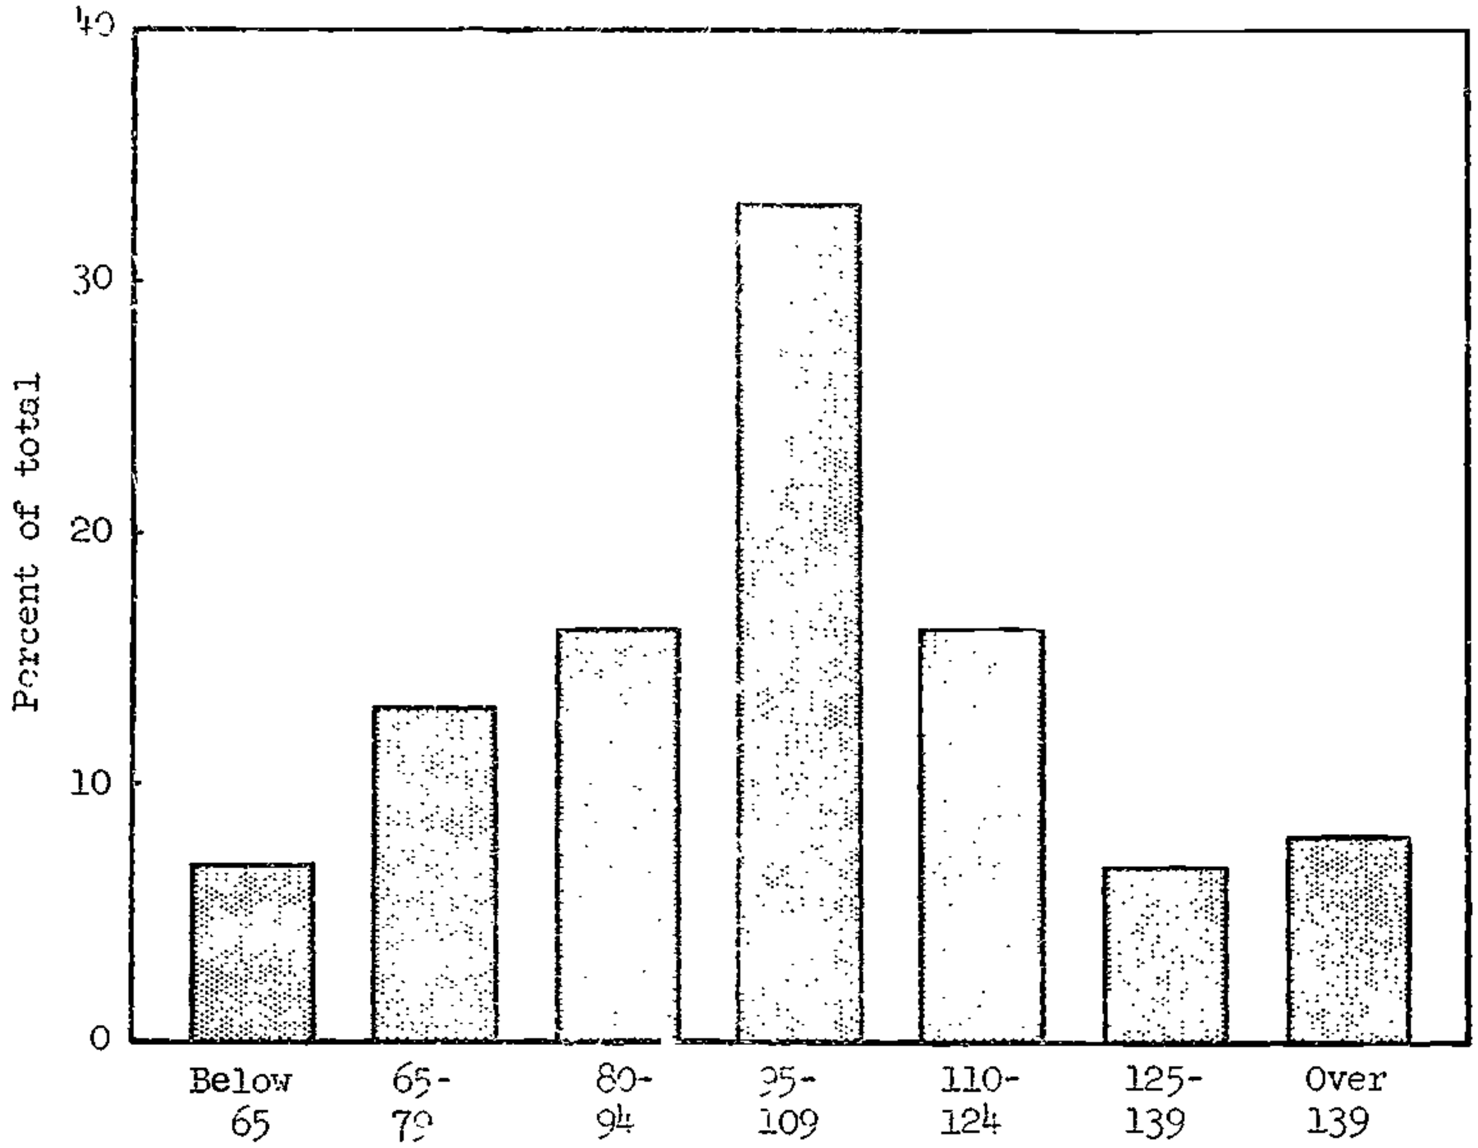

Fig. 2. Index of labor accomplishment on 45 Illinois farms on which hogs were produced in confinement, 1959-60.

but they show up every year. The data in Fig. 2 give an indication of the amount of variation in labor costs on a sample of 45 hog farms on which the hogs were produced in confinement. The indexes of labor accomplished were based on labor standards for pasture production.

The figures show that these farmers as a group did not use labor more efficiently than the standards for pasture production; thus most of those farmers should be able to improve their labor efficiency. An index of 100 indicates the same accomplishment as indicated by the pasture production standards. Notice th-, there was a great deal of difference between the top group and the bottom group. The top group accomplished over twice as much as the bottom group, as shown by an index of 139 as compared with an index of 65.

In any study of farm records, great differences show up. Many farms using labor inefficiently could surely simplify their jobs and work methods to either reduce labor costs or to produce more with the same labor.

Good hired farm workers are scarce. The importance of high labor accomplishment is further emphasized when a farmer tries to hire a worker. High wages paid by industry, shorter work days, and modern conveniences have drawn large numbers of farm workers away from farms.

Good farm workers must possess many skills. They must be good mechanics in order to operate and adjust farm machinery and equipment; they must be able to feed, manage, and care for livestock on livestock farms: they must understand crop production; and they must be able to do a host of other miscellaneous jobs. Then they must be willing to work long hours when it is necessary.

Farm workers who possess the necessary skills and are willing to work for farm wages are becoming harder and harder to find. Most workers prefer industry and the city in spite of certain benefits of living in the country. The trend in sources of farm workers is indicated in Table 2.

During the 1949-1961 period total farm employment in the United States decreased 30 percent. The number of hired workers declined 16 percent while the number of operators and family workers declined 34 per-

Table 2. Farm Employment: Average Number of Persons Employed in the United States for Selected Years, 1949-1961 1/

Year	Total employment	Operators and family workers	Hired workers
		(1,000 persons)	
1949	9,964	7,712	2,252
1951	9.546	7,310	2,236
1953	8,864	6,775	2,059
1955	8,364	6,347	2,017
1957	7,577	5,682	1,895
1959	7,384	5,459	1,925
1961	6,990	5,104	1,886
Decrease from 1949 to 1961	2,974	2,608	364
Percent decrease	30	34	16

1/ From the Farm Cost Situation, November 1962, U.S.D.A.

cent. If farmers are going to maintain production with a smaller labor force and higher wages for hired workers, work simplification will continue to be important to them.

A means of increasing production and earnings per worker

The value of work simplification as a means of increasing the productivity of farm workers has been mentioned several times. Let us consider this in more detail.

Large variations in production per worker. We have examined and compared farm labor costs and showed that there were great variations in these costs from farm to farm. These costs, however, do not necessarily reflect the amount of production or the labor accomplishments per worker.

The variations in labor accomplishment are probably as great as the variations in costs. Labor accomplishment is illustrated in Table 3 with figures taken from "Planning Your Farm Business." The standards shown were based primarily on results obtained from groups of farms keeping detailed labor records.

Notice that even within the same enterprise size group, the number of hours per unit was doubled in comparing low mechanization and poor work methods with high mechanization and efficient work methods. Only about one-third as much labor per unit is needed on the average for the larger enterprises with high mechanization and efficient work methods as compared with smaller enterprises carried on with poor work methods and low mechanization. These figures were based on averages of groups of farms. Individual farm situations would show still more variation. Truly there are large variations in work accomplishment per worker. Simplifying farm work can help farmers make more efficient use of their time.

Greater production per worker usually means higher earnings. The wage a farmer can afford to pay depends on the work accomplished by the employee. Simplifying work makes greater accomplishment possible and a farmer can pay a higher wage without decreasing his earnings. He can then better compete with industry in keeping hired workers. Another important consideration is that the hired worker receives higher wages and improves his economic position.

Most of the labor in farming is furnished by farm operators and members of their families. These persons are unpaid workers in the sense that they do not receive a check every month. At the end of the year the earnings remaining after paying all other costs

Table 3. Annual Direct Labor Requirements for Crop and Livestock Enterprises

Enterprise	Unit	Annual hours of labor per unit		
		Average	High mechanization, efficient work methods	Low mechanization, poor work methods
Dairy herd:				
1-10 cows	1 cow	140	110	200
10-24 cows	1 cow	110	80	160
25 cows or more	1 cow	100	70	140
Hogs:				
1-14 litters	1 litter	35	25	50
15-29 litters	1 litter	25	18	35
30 litters or more	1 litter	20	15	27

of production are considered to be earnings of unpaid labor. The production per worker is an important item affecting the earnings that will remain for the unpaid workers.

Besides having higher earnings, workers may have more leisure time if they are able to maintain their earnings with less physical effort or by working fewer hours.

2. WHAT IS THE WORK SIMPLIFICATION PROCEDURE?

The primary objective of work simplification is to accomplish more with less effort during a given period of time. Farmers often overlook some simple things they can do to reduce labor needs on the farm. Using a little time to plan will frequently save time. Machines often substitute for labor but sometimes the investment in machinery is too large for the size of business. You may be able to reduce considerably the amount of labor needed by replanning the work operations without much additional investment in equipment.

A standard procedure for simplifying farm work has been worked out. It is applicable to many farm jobs varying from very simple tasks to complicated ones.

Break the job down into parts. Analyze the particular job to be studied. List every phase in detail, step by step, so you can get a picture of all the things you do in completing the job.

Compare your methods and accomplishments with others. Compare methods and results with those of your neighbors or friends. It often pays well to visit several farms to observe how others are doing the farm jobs you have to do. The average time requirements for various enterprises are available in such publications as Planning Your Farm Business.

Question the details of your work methods. Be critical of your own methods. Can parts of the job be eliminated? Can certain operations be changed or combined to save time and effort? Can travel be reduced? Can better tools and equipment be used? Can someone else do the job to better advantage? These questions indicate the purpose of this step.

Develop an improved method. Use the ideas you have gathered, along with the analysis of your work methods, to develop an improved method of doing the job. The improved plan should make more effective use of your labor.

Use the improved method. Put the new, improved plan into effect. Only then will you reap the benefits of lower costs, greater accomplishments, less exertion, and higher profits.

3. ILLUSTRATIONS OF FARM WORK SIMPLIFICATION

We will review an actual case to illustrate the procedure used in work simplification. You can follow this same general procedure for numerous jobs on your farm and reap the benefits of reduced labor and higher earnings. We will also give examples of some of the benefits that have resulted. The job illustrated is the one of getting water to hogs on pasture. The following material is adapted from a study made by Purdue University.

Step 1. Break the job down into parts.

A detailed outline of everything done from beginning to end of the job is illustrated in Table 4. In this particular study the distance traveled and the minutes required were recorded.

What impresses you when you read through the list of operations performed? Several operations are repeated a number of times. How many times did the farmer mount and dismount his tractor or open and close the gate? The job routine sounds rather ridiculous as you read it, but you may find something just as ridiculous on your own farm.

How do you compare with others who have the same jobs to do? Do the methods differ?

Do you accomplish more or less than they in the same time? How does the quality of work compare? Make a habit of observing how other farmers do field and chore work, arrange buildings, and care for livestock. It may be easier to find workable ideas already in use than to develop your own.

Several other methods of watering the hogs could be suggested for the job breakdown shown in Table 4. Alternatives include the use of permanent pipe lines, field well with automatic engine shut-off, field well without automatic engine shut-off, water hauled in tank wagon, and water hauled by two rather than one 100-gallon fountain.

Step 3. Question the details of your work methods.

Be critical of your operation performed. Ask yourself the following questions and relate them to the job breakdown (Table 4).

Can the job be done in fewer steps, leaving out some of the details? Is this part of the job absolutely necessary? Is it necessary to make two trips to and two trips from the field? Can it be arranged so the tractor does not have to be mounted and dismounted so many times? If some of the trips could be eliminated, travel, mounting and dismounting, and opening and closing of gates would be greatly reduced. Perhaps other methods and devices could be used to eliminate some of these details of the operations.

Can some of the details or parts of a job or jobs be combined? In our illustration there is little that can be done along this line. There may be opportunity for combining other jobs with watering the hogs. Can feed be taken to the hogs at the same time? Could the fountain be filled with a hose so the farmer could be doing something else while it is being filled?

Can the chore routine be changed? Is the order in which things are done the most logical or can the procedure be reversed to save time and travel? For the single job we are considering and the equipment used, not much improvement can be accomplished. The order of doing the operations is pretty much dictated by the job itself. If more than one job were considered, it is entirely possible that the procedure could be changed.

Are feeds, supplies, and equipment so located that foot travel as well as machine travel is kept at a minimum? In this illustration the location of the water supply is a limiting factor. Can water be made available from a field well, stream or pond? If so, labor requirements may be greatly reduced.

Can buildings, lots, doors, or gates be rearranged for greater convenience? This is an extremely important consideration for livestock operations. Building rearrangement sometimes becomes a major expense. As agriculture has progressed, many farm buildings have become out-of-date. They need to be remodelled if they are to be used in the future. In our illustration, opening and closing gates uses up a considerable amount of time and effort.

Is the equipment adequate and suitable for the job? Proper machines and equipment substitute for labor. Can more equipment be used on the hog watering job to reduce labor? Can another fountain be used to save time? How much would it cost?

Can hand jobs be made less tiring? Some farm jobs such as harvesting fruits and vegetables are repetitive hand jobs. They may become very monotonous and tiring. Methods of doing hand jobs are important in determining how much time is required and how tiring the job becomes. There is little hand work in the job of watering hogs in our illustration.

Step 4. Work out an improved method of doing the job.

After analyzing the job, comparing your methods and results with those of others, and questioning the details of your methods, you should be ready to work out an improved method for doing the job to save labor and cost. You may wish to test the method on paper first.

The operator of the farm used in our illustration decided to change to a method that requires very little purchase of additional equipment but reduces time and travel. He considers the permanent pipe lines and a field well impractical for his conditions.

His decision is the very simple change of buying an additional water fountain. One fountain will be kept in the field and one at the water tank. This reduces the number of round trips to the field from two to one. He

Summary: Requires 2 trips to field, 47 steps, 5730 feet of travel, and 26.3 minutes per 100 gallons of water.

will simply take a full fountain to the field and bring the empty one to the tank each time he waters the hogs.

Step 5. Put your plan into use.

The advantages of a new or improved plan mean nothing until it is put into effect. The job breakdown for watering hogs for the new plan is shown in Table 5.

This new plan involves purchasing a second 100-gallon fountain and using an electric motor and a piece of hose on the pump so he can be doing other chores while the water fountain is being filled.

Table 5. A Job Breakdown of an Improved Method of Hauling Water to Hogs on Summer Pasture -- Two 100 Gallon Fountains Used.

Order of Operations	Operations performed	Feet traveled	Minutes required
1	Turn on electric pump

Results of Applying Work Simplification

We will show some of the savings in time, effort, and costs made possible by work simplification.

Improved method of watering hogs. Summaries and comparisons of the old and the new method of watering hogs are shown in Table 6.

Table 6. Comparison of the Original and the Improved Method of Watering Hogs

	No. of operations	No. of trips	Time (min.)	Travel (ft.)
Original method	47	2	26.3	5730
Improved method	35	1	14.7	2900
Savings	12	1	11.6	2830

The savings shown are for one watering only. If it were necessary to water the hogs twice a day while on pasture for 140 days there would be a total saving of 54 hours of time and 150 miles of travel---all as a result of the purchase of an inexpensive fountain and a change in the method of filling the fountains.

Alternative methods of watering hogs. Purdue University reported time, travel, and estimated costs for six methods of watering and inspecting 100 hogs on summer pasture 80 rods from the farmstead. The data, adjusted for changes in price levels, are shown in Table 7.

Table 7. Time, Travel, and Costs of Watering Hogs on Pasture

Method of watering	Seasonal requirements (140-days)			
	Man hours	Miles walking	Miles riding	Labor and equip. cost[1/]
1. Permanent pipe lines	14.0	40.3	--	$67
2. Field well, engine, automatic shut-off	15.1	40.3	--	49
3. Field well, engine, no automatic shut-off	27.5	75.3	--	61
4. Haul in tank wagon	36.3	2.6	42.9	101
5. Haul in one 100-gallon fountain	94.4	8.0	225.8	210
6. Haul in two 100-gallon fountains	65.3	8.0	115.1	157

1/ Costs recalculated at $1.00 per hour for labor and 30 percent increase since 1949 in costs of machinery, equipment, and supplies

From Table 7 we can see that the use of two fountains is cheaper than one when we consider labor cost. The table also shows that some other methods are still more economical when labor costs are considered.

Work simplification in dairy production

Work simplification has an important place in dairy production. Studies of labor used show a great deal of variation, even among dairy herds grouped according to size. Records of 105 herds in Indiana showed the following results:

Average number of cows	Hours of labor per cow	
	Average	Range
10	132	75-307
16	115	65-300
23	96	48-235

Even though the labor needed per cow was lower for the larger herds, the work method on individual farms was a much more important factor than size of herd in determining unit labor needs. The range in the data give us that information.

Some dairy farmers cut down substantially on the labor needed per cow by carefully studying the entire job of feeding, milking, and handling the milk. You may be interested to know that the study previously reported was made before pipeline milking and bulk tanks came into general use. Studies showed even then that farmers were able to reduce labor requirements by changing the internal arrangement of the barn to improve efficiency; using improved equipment, even a simple grain cart; improving the work routine, such as using rapid milking practices; and improving the positioning of equipment and supplies, such as establishing a work center for milking separate from the one used for general dairy chores.

Some farmers were able to care for, milk, and feed a cow with 75 hours of labor per year without pipelines and bulk tanks when now we still consider 100 hours per cow to be a reasonably good average! By careful planning and the use of better equipment, we should be able to reduce labor needs substantially from today's averages on many dairy farms.

After observing the variations in time and travel for accomplishing certain jobs, it is not surprising that many farmers complain about long hours and hard work. Farm jobs, even though they are small, should be given thought in an effort to improve them and thereby save time, travel, and expense. The procedure outlined is applicable to jobs on all farms. Your farm is no exception.

4. REDUCING LABOR IN SILAGE FEEDING AND EGG PRODUCTION

You should have many opportunities to reduce labor spent in livestock feeding and egg production. Labor efficiency has not increased as much in livestock operations as in crop production. Output per man hour in crop production was about 4 times as high in 1960 as in 1930 but only twice as high in livestock production.

Dairy cattle and poultry require a large amount of labor. This often amounts to 18 or 20 percent of total feed, labor, and capital inputs for these enterprises. Labor in beef production is usually less but silage feeding can consume a great deal of time.

Labor in feeding silage

In the past this job has required a great deal of labor. Several tons of silage may be fed per animal; this means that the total weight of material will be quite high for a medium or large herd of cattle. The method of handling the silage can be very important in determining the total hours required.

According to methods of removal, silage is stored in two major types of silos, vertical silos and horizontal silos.

Vertical silos. Three methods of silage removal will be considered: hand forking, mechanical unloading from the bottom, and mechanical unloading from the surface.

An Illinois study showed the time required for hand forking to be about 190 pounds per minute or 11 minutes per ton, plus any time required to climb up and down the silo and to unloosen frozen silage. Of course, no special equipment is needed with this method. If you have no alternative use for your labor, hand forking may be your most economical method. However, if your labor has value in another use, you may be able to justify spending money for mechanical equipment. The mechanical equipment may also enable you to handle more animals and increase gross income. If the annual cost of the additional equipment is less than the increase in gross income, you will have a higher net income by adding the equipment.

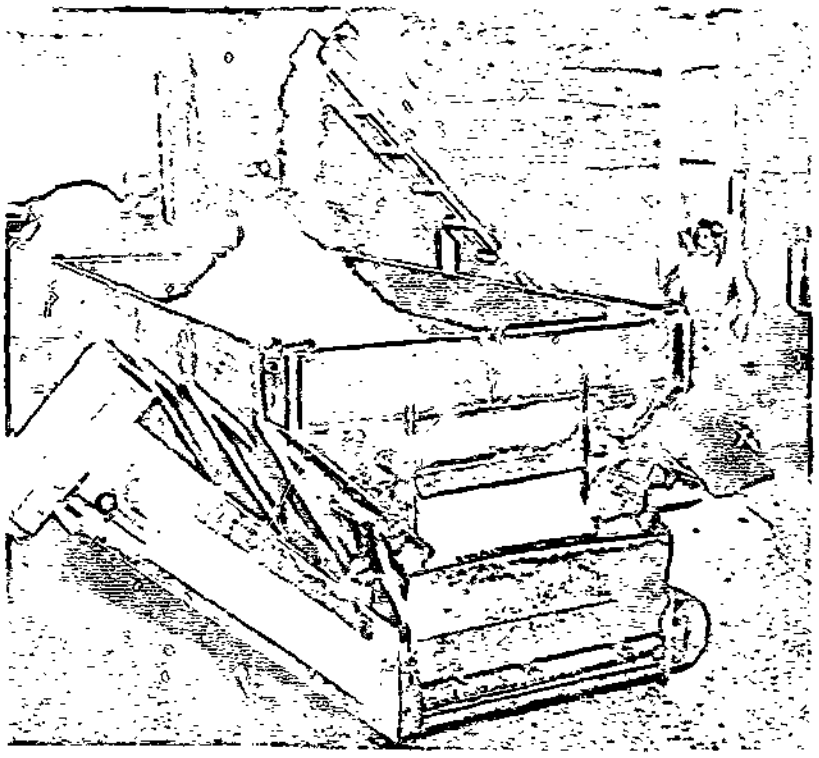

Fig. 3. Self-unloading wagon being filled with silage by a mechanical silo unloader and elevator.

Fig. 3 shows a self-unloading wagon being filled with silage by the use of a mechanical silo unloader and elevator. Such equipment removes corn silage at the rate of 170 pounds per minute or about 12 minutes per ton. The rate of removal may be no greater than for hand forking but the operator is usually free to do something else during part of the time that the machinery is running. Also, considerable back-breaking work is saved. Equipment costs, including fixed costs, spread out over 300 tons of silage, plus operating costs are usually about $1.25 per ton by this method.

Fig. 4 shows a mechanical surface unloader. This equipment unloads silage at the rate of about 200 pounds per minute and requires an attendant for only a few minutes per day. Here again, the operator is usually free to do something else during part of the time that the machinery is running. The costs may be somewhat less than for the equipment shown in Fig. 3.

Sometimes augers or other mechanical devices carry the silage to the feed bunks. Even when such equipment is not used, careful planning in arranging feed bunks can reduce time required in feeding. Arranging feed bunks along the fence and using a self-unloading wagon can contribute to labor efficiency. Such an arrangement is shown in Fig. 5.

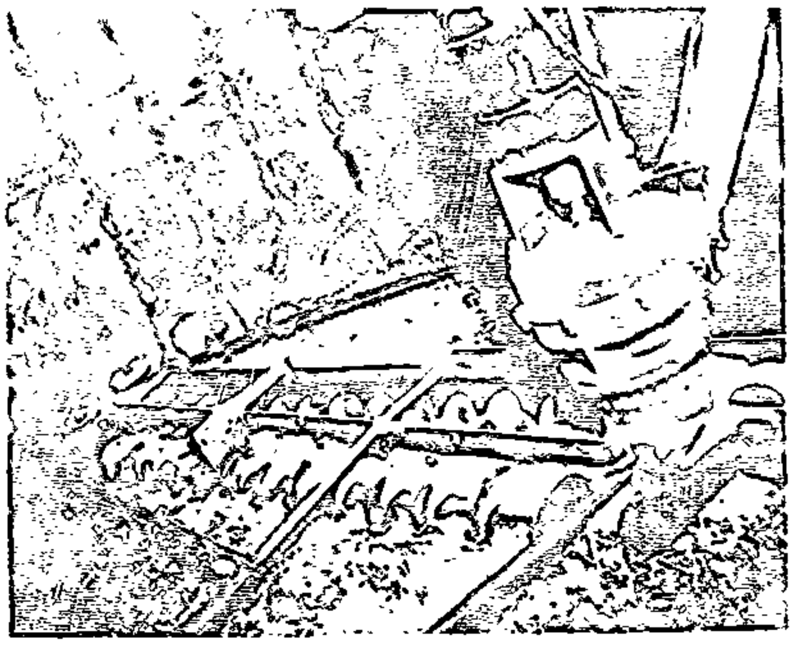

Fig. 4. Mechanical surface unloader for unloading silage.

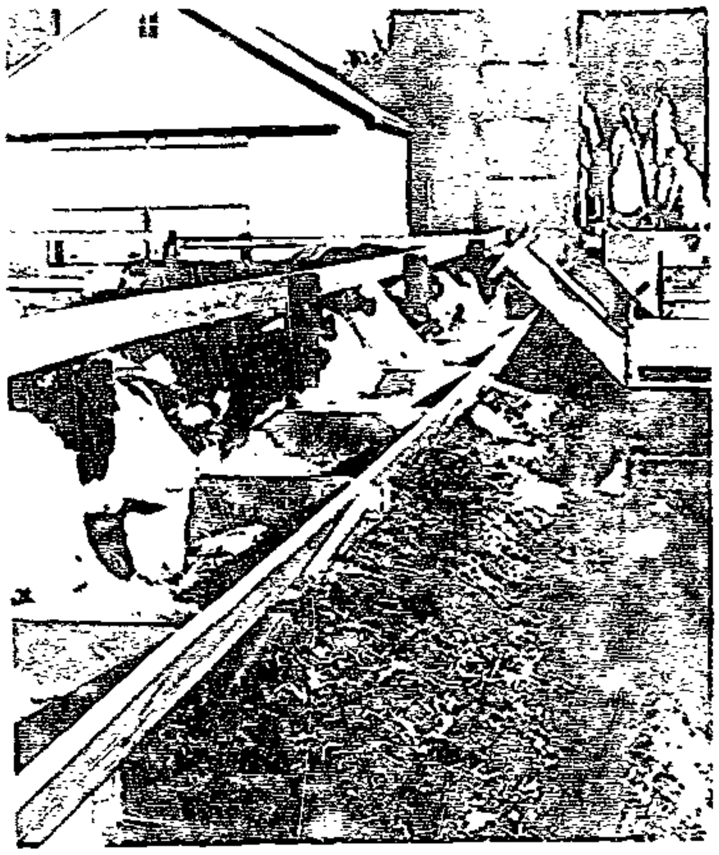

Fig. 5. Arrangement which enables self-unloading wagon to deliver feed into the fence bunks from outside the lot.

Horizontal silos. Removing silage by hand forking from a horizontal silo requires a lot of hard work. A power scoop can be used to much advantage when you move silage to the feeding area. Spreading the cost of such equipment over 200 tons of silage, for example, can keep the removal cost low on the basis of a ton handled. Then, too, the equipment can be used for other farm jobs.

You can save still more time and expense if you construct the silo in such a location that the animals can be self-fed directly from the silo. Fig. 6 shows a movable gate that

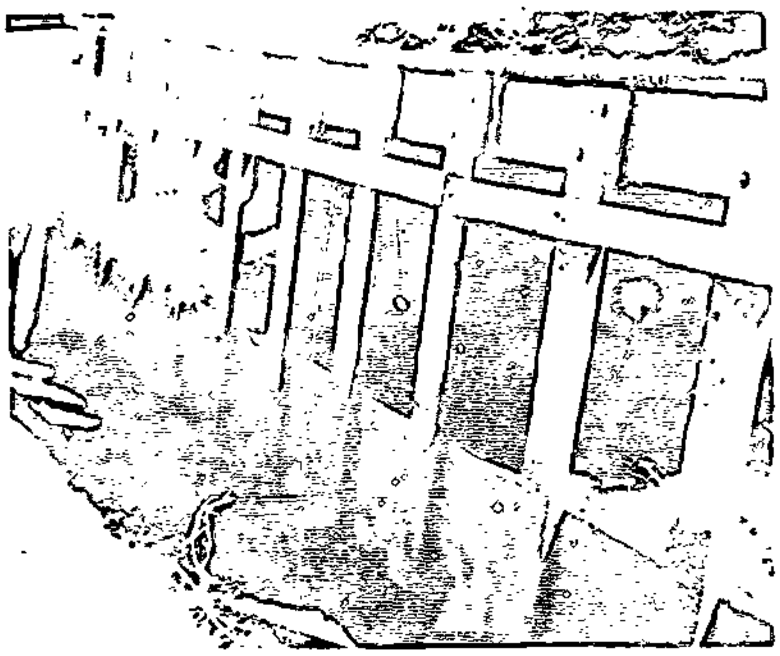

Fig. 6. Movable gate with individual feeding partitions and a solid-panel base.

can be used to allow the animals to eat with a minimum of waste. The time spent in building the gate is not very great and the time required for maintaining and moving it is very small.

A suspended gate, such as shown, is usually built of 2" by 6" material; bolts are recommended for fastening. Poles or iron pipe with the equivalent strength of a 6-inch wooden pole should be satisfactory for suspending the gate from the side walls of silos up to 30 feet wide. Steel cables, chains, or tripled strands of No. 9 wire can be used to attach the gate to the support pole. Gates are usually 5 or 6 feet high and are hung so the bottom just clears the silo floor.

Labor in egg production

The laying flock enterprise serves as another excellent example of possibilities in reducing labor. Some of the jobs that will be considered are: feeding and feed processing; watering; gathering, cleaning, and processing eggs; and cleaning the house.

Feeding and feed processing. Each 100 hens requires that about 5 tons of feed be distributed per year; this job often affords an opportunity to save labor. The labor needed will depend on the number of feedings and different kinds of feed, storage of feed, arrangement of the feeders, and the use of mechanical equipment.

Some poultrymen feed as often as 5 times per day; others fill self-feeders only once a week. Some feed several kinds of feed; others feed an all-mash ration handled in bulk. Scratch grain may be fed in addition but this does not require much time if the feed is conveniently stored and if done during a trip to the henhouse to gather eggs. Oyster shell and grit can be fed by using large capacity hoppers that do not need to be filled often.

Feed should be stored inside the henhouse, especially when hand-feeding is practiced. The storage volume should be large enough that the feed does not have to be brought in too often. A bin with a volume of 90 cubic feet holds a 10-day supply for 1,000 hens. Overhead storage permits quick and easy filling of hoppers or the supply bin of a mechanical feeder (Fig. 7).

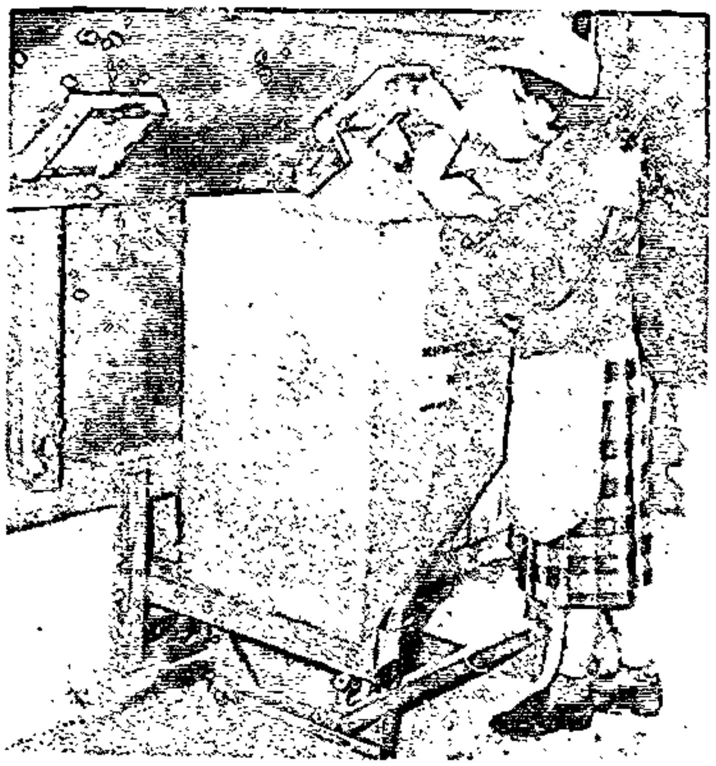

Fig. 7. Supply bin of a mechanical feeder being filled from an overhead bin.

With hand-feeding, careful planning in arrangement of hoppers and in working out the feeding routine is important. Self-feeders reduce feeding time considerably even though checked daily. Self unloading wagons or carriers on an overhead track may be used to carry feed to the hoppers.

A mechanical feeder should be a paying proposition for a larger operation. Fig. 8 shows that a mechanical feeder costs only a few dollars more than hand-feeding for 500 hens but almost twice as much as hand-feeding for 250 hens. (Labor was charged at $.90 an hour and interest at 5 percent.) The cost of mechanical feeding was the same as the cost of hand-feeding at a flock size of 650 hens. With labor at $2.00 an hour, mechanical feeding would cost the same as hand-feeding for a flock size of 350 hens.

Watering. Each 100 hens requires 6 to 9 gallons of water per day. An Illinois study showed that poultrymen who did this job by hand worked 27 hours and walked an additional 28 miles per year.

Piping water to the henhouse and carrying it to the fountain reduced labor to about 8 hours per 100 hens. A few extra feet of pipe and automatic fountains reduced labor for watering to a little more than one-half hour per year. The use of shallow waterers can reduce the time required for cleaning watering equipment.

Equipment for automatic watering is very inexpensive. If you already have a water system of adequate capacity, the added equipment for automatic watering will be economical even if the flock is small and labor is valued at only 25 cents an hour.

Gathering, cleaning, and processing eggs. Studies show that it pays to gather eggs three times a day in commercial flocks. However, proper arrangement of the nests and planning the travel routes can keep the time required to a minimum.

The use of clean nests means less time spent in cleaning eggs. Placing soiled eggs in a separate portion of the container saves time in sorting. If the eggs are cleaned by hand, you can save time by cleaning only the soiled areas of the egg.

Machines for washing eggs save considerable time and are considered economical for

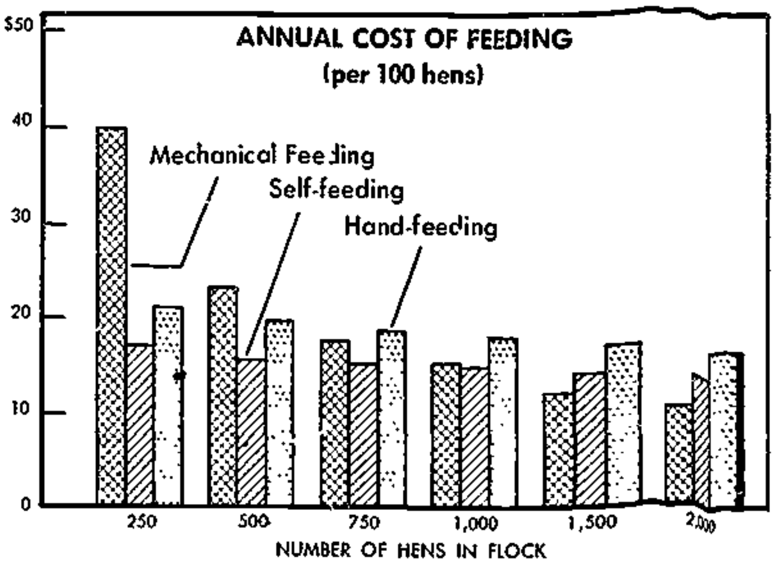

Fig. 8. Annual cost of feeding hens.

flocks of 300 hens or more. Cleaning should be done carefully and according to the manufacturer's recommendations. Hand-cleaned eggs must be packed one at a time because the cleaning and packing jobs are combined. Several machine-washed eggs may be packed at one time, speeding up the job of packing.

Time can be saved in candling or grading eggs by providing plenty of work space and keeping materials in a convenient location.

Cleaning the henhouse. Modern methods of cleaning reduce the time spent on this job. With a deep litter system, the house may be cleaned only once a year if the dropping pits are cleaned two or three times. Cleaning may be done with the use of tractor equipment. Mechanical cleaners are used in some hen houses to simplify the cleaning job.

A recent development on a very few poultry farms is the use of lagoons to collect the manure, thus reducing the cleaning job to a minimum. Time will tell how satisfactory this method is over a period of years.

Other examples

We have shown how labor can be reduced in hauling water to hogs, in dairying, in feeding silage, and in producing eggs. You can undoubtedly think of other ways of reducing labor on your farm.

The use of pipelines for transporting milk from the cows to a bulk tank is a good example. The use of a proper work routine is also important. We touched briefly on these items earlier in the unit.

When individual hog houses are used, the proper arrangement of the houses is important In confinement feeding, the arrangement of the farrowing and feeding quarters and provisions for disposal of manure are all important. Mechanical feeding of concentrates to cattle and hogs saves much labor.

A large increase in labor efficiency has already occurred in crop production. Minimum tillage can reduce further the hours required in producing crops.

Think of methods you can use to reduce the labor needed on your farm. Some methods may require little, if any, new investment in equipment. Planning, as explained in Sections 2 and 3, is very important.

5. WHEN DOES IT PAY TO INVEST IN LABOR-SAVING EQUIPMENT?

We will discuss the items to consider in making the decision and then give an example of the use of a partial budget as an aid in doing so.

Points to consider

Some of the items that should be considered are: 1) fixed costs of the equipment, 2) operating costs, 3) added returns, and 4) other uses for your labor and capital.

Fixed costs. The annual fixed costs are those costs that remain the same, regardless of the amount of use you have for the equipment. Fixed costs are sometimes referred to as "overhead" costs. Depreciation is usually considered to be a fixed cost, along with interest, taxes, insurance, and sometimes shelter. (Depreciation is not entirely a fixed cost if the machine is used so much each year that it wears out more rapidly and needs to be replaced sooner as a result of its use.)

The fixed cost per unit of use depends on the amount of use you have for the equipment and on its initial cost. You determine the fixed cost of handling a ton of feed by dividing the annual fixed costs by the tons of feed handled during the year.

For example, a silage unloader costs $1,500 and is expected to last for 10 years. Interest amounts to 3 percent of the new cost (the same as 6 percent of the remaining cost in the equipment at the beginning of each year); and other fixed costs, such as taxes and insurance, amount to about 2 percent of the new cost. The total fixed cost per year then is 15 percent: 10 percent for depreciation, 3 percent for interest, and 2 percent for other items. The total fixed costs of the silage unloader amount to $225 per year (15 percent of $1,500).

If the silage unloader is used for 100 tons of silage per year, the fixed cost per ton will be $2.25; if used for 200 tons it will be $1.12.

Operating costs. The annual operating costs vary in proportion to the amount of use for the equipment; thus the operating cost per unit of use will be the same regardless of the amount of use. The operating costs per ton handled by the silage unloader will be the same, regardless of whether we handle 100 tons, 200 tons, or some other amount.

The fuel or electricity needed to operate a piece of equipment is an excellent example of an operating cost. We use the same amount per hour, no matter how many hours we operate the equipment. The greater the use per year, the higher will be the annual operating cost.

Repairs are usually thought of as an operating cost because the greater the use, the higher will be the repairs. Sometimes rusting calls for repairs even though the equipment is not used; however, here we will think of repairs as being in proportion to the amount of use.

Labor is sometimes thought of as an operating cost in connection with equipment. However, you may be able to do other work while labor-saving equipment is in operation. You probably have less total work as a result of having the equipment and may want to consider the reduction in total labor rather than the amount or cost of labor needed to operate the equipment. We will do so in this example.

We will assume that operating costs, including repairs and electricity, will amount to 20 cents per ton for the silage unloader, regardless of the amount of use per year.

Added returns from the equipment. Sometimes new equipment will result in extra gross returns. An example is equipment that permits a dairy farmer to sell Grade A milk. For a small herd of 20 cows producing 10,000 pounds of milk per cow, 65 cents more per hundred for Grade A milk amounts to added returns of $1,300. In our first example about deciding on the purchase of a silage unloader, we will not figure any added returns from the use of the equipment.

It is possible that some equipment could reduce gross returns. If the quantity or quality of the product would be lower with the use of the equipment, this would, of course, result in reduced returns. We would need to consider this item in our decision regarding purchases even though the equipment would save much labor. We will assume here that most equipment to reduce labor will not reduce the value of production.

Other uses for your labor and capital. Other uses for labor and capital will determine the value you should place on them in making the decision to purchase equipment. Of course, you may want to place a value on time you could use for leisure, even though you have no other use for your labor. In other words, you may feel that it is worth $1 an hour not to have to work!

If no value is assigned to leisure time and you have no other use for your labor, you should figure its value at zero when deciding whether the purchase of labor-saving equipment is economical. On the other hand, if the saved labor will return $2 an hour in another use, that figure is valid in figuring the value of labor saved by the machine.

In our example we will first assume labor to be worth the same as the prevailing wage rate for hired farm workers in Illinois, or about $1 an hour. We will assume that the silage unloader saves about 25 minutes of labor for each ton of silage removed; thus .4 hour of labor, or 40 cents worth, is saved for every ton of silage handled with that equipment. If the equipment handles 100 tons per year, you save $40 worth of labor; if it handles 200 tons, you save $80 worth, and so on. If we assume that the labor saved is worth $2 an hour, the silage unloader will save $80 for every 100 tons of silage handled.

Other uses for your capital are also important. For example, you can invest money in fertilizer, in breeding stock, in buildings, or in off-farm investments. We figured interest at the rate of 6 percent of the average remaining cost at the beginning of each year, or 3 percent of the new cost of the equipment. If you have another use for your money that will return more than 6 percent, you should allow a higher percentage of the new cost as interest. The same is true if you have to pay more than 6 percent for borrowed money.

Use of a partial budget

A partial budget will help determine whether it will pay you to make a change in a part of the farm business. Such a budget is helpful in deciding whether the purchase of an item of labor saving equipment is economical.

We will work out a partial budget based on preceding information about the use of a silage unloader. First, we will add the additional costs and any reduced returns that will result from the purchase of the equipment. Second, we will add any additional returns (increase in gross income) and reduced costs that will result. Then we will subtract the first figure from the second to determine whether there is an advantage in buying the equipment. We will assume that 200 tons of silage will be handled and that labor is worth $1.00 per hour. The budget is shown as Table 8.

Table 8 Partial Budget to Determine Whether to Buy Equipment

	Item	Value
1.	Additional costs	
	Fixed costs of the silage unloader, 15% of $1,500	$225
	Operating costs, 20 cents per ton times 200 tons	40
	Total annual additional costs	$265
2.	Reduced returns (assume none in this example)	0
3.	Total annual additional costs and reduced returns	$265
4	Additional returns (assume none in this example)	0
5.	Reduced costs	
	Saving of labor, 80 hours at $1.00 per hour	$80
6.	Total annual additional returns and reduced costs	$80
7.	Net change in income with new equipment (6 - 3)	-$185

According to the budget, it will not pay to buy the additional equipment because the added annual costs will be higher than the labor saved, the difference amounting to $185 per year. If we value labor at $2 an hour, the silage unloader would still cost $105 more per year ($265 - $160) than the value of labor saved. It would take about 370 tons of silage, with labor valued at $2 an hour, before the use of the unloader would be economical.

With 370 tons of silage and labor worth $2.00 an hour, the budget would appear as follows:

Additional costs

Fixed costs	$225
Operating costs 370 x .20	74
Total costs	$299

Reduced costs

370 tons x .4 = 148 hours 148 hours labor @ $2	$296
Net change in income	-$3

Additional returns made possible by equipment can have an important effect on the outcome of the partial budget. Let us assume, for example, that we have the buildings, equipment, and funds needed for extra steers for which labor is now available. With the 200 tons handled by the silo unloader in Table 8, 80 hours of labor will be saved. At 8 hours of labor for each additional steer, we can now feed 10 more steers. If each steer returns $30 above feed and purchase costs, we will have additional returns of $300 after buying the silage unloader (Table 9). The annual additional returns are $35 more than the annual costs of the equipment.

Table 9 Partial Budget Showing Additional Returns After Purchase of Equipment

	Item	Value
1	Additional costs	
	Fixed costs of the silage unloader, 15% of $1,500	$225
	Operating costs, 20 cents per ton times 200 tons	40
	Total annual additional costs	$265
2	Reduced returns (assume none in this example)	0
3	Total annual additional costs and reduced returns	$265
4	Additional returns	
	Income above feed and purchase costs, $30 times 10 steers	$300
5.	Reduced costs (The labor saved was used to feed steers to bring in additional returns)	0
6	Total annual additional returns and reduced costs	$300
7	Net change in income with new equipment	+$35

You can adapt this illustration to your own situation to help determine whether new equipment is likely to pay for itself. Compare the total of the "additional costs and reduced returns" portion of the budget with the total of the "additional returns and reduced costs" portion to find whether the equipment will return more than its cost. A form you can use for your partial budget is shown on page 16 of this unit.

Partial Budget

Additional costs	$	Additional returns	$
Reduced returns	$	Reduced costs	$
A. Total annual additional costs and reduced returns	$	B. Total annual additional returns and reduced costs	$

Net change in income (B minus A) $________

Pruning and Training Bramble Fruits and Highbush Blueberries.

Illinois Univ., Urbana. Vocat Agriculture Service
VAS-4048
Pub Date - Dec65
MF AVAILABLE IN VT-ERIC SET 8p.

*TEXTBOOKS, REFERENCE BOOKS, *VOCATIONAL AGRICULTURE, *PRUNING, *FRUITS, UNITS OF STUDY (SUBJECT FIELDS),

The purpose of this document is to provide high school vocational agriculture and adult farmer students with textual and reference material on the training and pruning of small fruits. It was developed by a teacher educator in consultation with subject matter specialists, teacher educators, supervisors, and teachers. The sections are (1) Pruning Tools, (2) Supporting the Canes, (3) Pruning Red and Yellow Raspberries, (4) Pruning Black and Purple Raspberries and Erect Blackberries, (5) Pruning Semi-Erect and Trailing Blackberries, and (6) Pruning Highbush Blueberries. Photographs and drawings illustrate the textual material. Teachers with agricultural competency and students of average ability with interest in production agriculture may use the material over a period of 1 to 2 hours. This document is available from Vocational Agriculture Service, 434 Mumford Hall, University of Illinois, Urbana, Illinois 61801. (JM)

PRUNING AND TRAINING BRAMBLE FRUITS AND HIGHBUSH BLUEBERRIES

1. Pruning Tools
2. Supporting the Canes
3. Pruning Red and Yellow Raspberries
4. Pruning Black and Purple Raspberries and Erect Blackberries
5. Pruning Semi-Erect and Trailing Blackberries
6. Pruning Highbush Blueberries

In order to intelligently prune any plant, it is essential to understand its growth and fruiting habits. Bramble fruits (raspberries and blackberries) have biennial canes and perennial roots and crowns. All brambles send up new shoots during each growing season from the crown and some (erect blackberries and red or yellow raspberries) develop new shoots from both the crown and roots. These shoots, regardless of origin, grow vigorously during the summer, initiate flower buds in the fall, over-winter, and bear fruit the following season. The fruit is borne terminally on leafy shoots arising from lateral buds on one-year-old canes. The canes then gradually dry up and die shortly after harvest while new shoots are developing to repeat the cycle, thus providing fruiting canes each year.

Fig. 1. Typical purple raspberry plant properly trained.

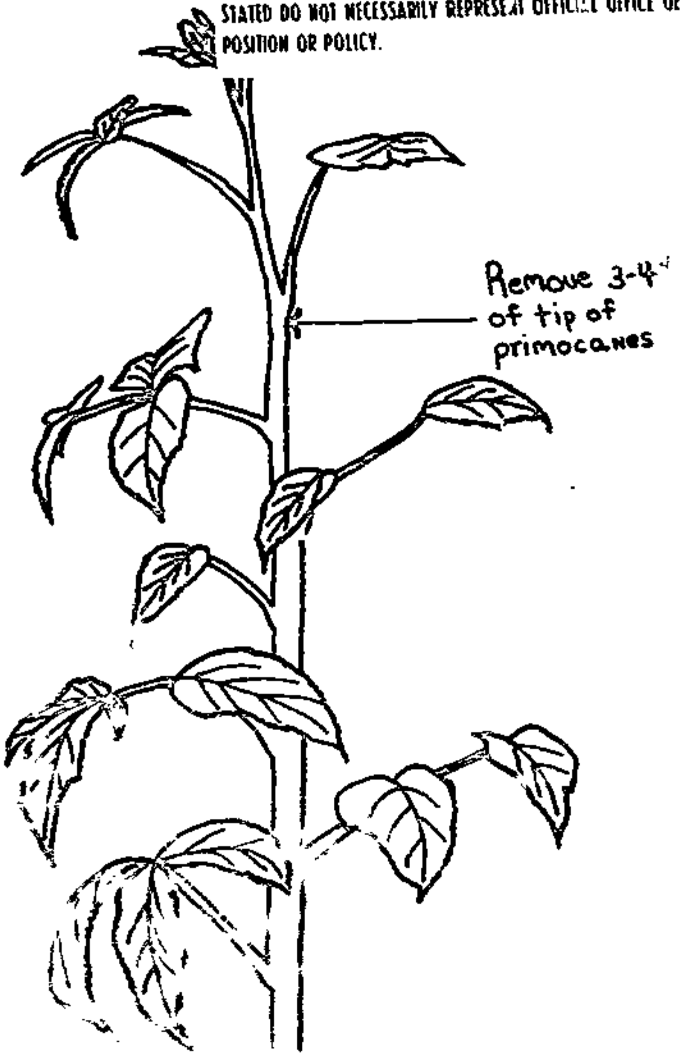

Fig. 2. Black and purple raspberries and erect blackberries should be pinched or topped during the growing season.

The everbearing types bear fruit twice on the same cane. The new shoots bear a crop at the tips in the fall and again the next season farther down on the canes. The fruited canes of such types should not be pruned after the fall crop since this would remove the fruiting wood for the spring crop. However, since the everbearing varieties produce fruit abundantly on primocanes (canes of the current season's growth), it is possible to grow them solely for the fall crop by mowing all of the canes to within 2-3 inches of the ground in the spring before growth begins. Then only the abundant crop on the primocanes is harvested in the fall. This practice eliminates all labor of hand pruning and the problems associated with winter injury to the overwintered canes. Common fungus diseases may also be held to a minimum.

Variation in the development of lateral branches must also be considered in order to properly prune the bramble fruits. Black raspberries, purple raspberries, and erect blackberries usually develop strong lateral branches if the new shoots are headed back early in the growing season. This characteristic is responsible for the practice of pinching or summer topping which consists of snapping off or cutting with shears the top 3 to 4 inches of the new shoots at the proper time (Fig. 2). This practice has no advantages and may be detrimental when used on red raspberries, yellow raspberries, semi-erect blackberries, and trailing blackberries. With red and yellow raspberries the resulting new laterals are generally weak, often break away from the cane when fruiting the following year, and are easily winterkilled. Topping also tends to induce more sucker plants than desired.

1. PRUNING TOOLS

The tools needed for training and pruning the brambles are neither expensive nor complex (Fig. 3). The three types generally used are the small hand pruning shears, the long-handled or lopping shears, and the bramble hook The small shears are used for cutting back the laterals and summer topping. Either the lopping shears or the bramble hook may be used to remove entire canes at the ground level in thinning or removing fruited canes. Care must be taken not to pull or break the cane out of the crown when using the hook.

Maintaining pruning tools in good cutting condition is an essential part of pruning. After use, all tools should be cleaned and their cutting surfaces wiped with an oily cloth to retard rust Cutting surfaces must be kept sharp to make smooth, rapid-healing cuts.

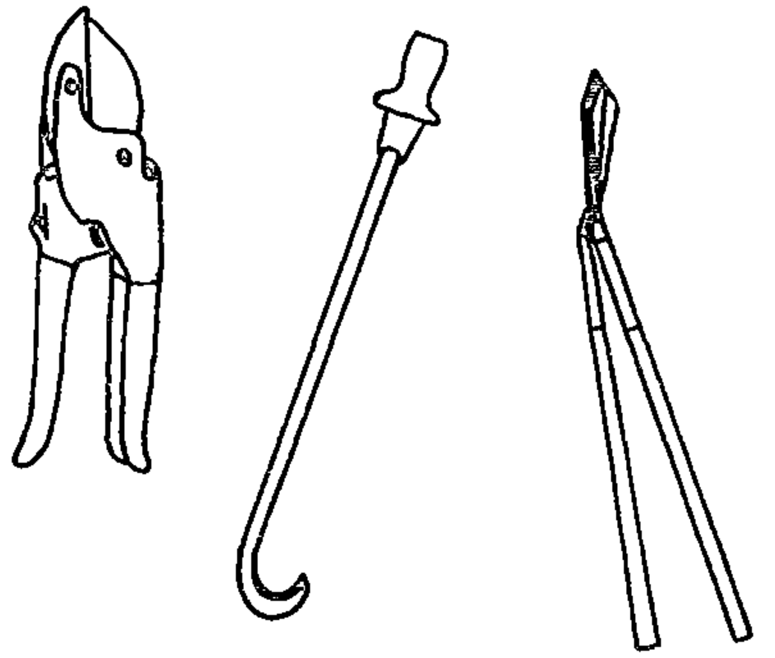

Fig 3. Pruning tools include (A) hand pruning shears, (B) bramble hook, and (C) long-handled or lopping shears.

2. SUPPORTING THE CANES

Although all brambles, except possibly the trailing blackberries may be grown without support, some type of trellis is desirable. Fruit on supported canes is clean and a minimum of the crop is lost due to breakage of the canes by wind, cultivation, and picking. Supports also facilitate harvesting and other cultural practices and in the long run will pay for themselves.

Many types of trellises and methods of training are in use by bramble growers. The following are some of the simplest methods of satisfactory trellis construction.

Describe

Source (agency)
(address)

The hill system of culture may be used for any of the bramble fruits (Fig. 4). Support is provided by a single stake, 2 to 4 inches in diameter, driven into the ground close to the plant. Five to eight fruiting canes are tied in one or two places to the stake each spring following dormant pruning. This system is most useful in home garden plots where a small power cultivator can be used. The plants are usually set 6 feet apart each way and restricted to a clump. Very little hand hoeing is needed and the fruit is easy to pick.

Wire trellising systems are the most practical for large scale plantings (Fig. 5). Posts may be either metal or wood. If wood posts are used, the underground parts should be treated with a wood preservative to extend their life. Pentachlorophenol, one gallon (50%) in 10 gallons of kerosene, stove oil, diesel oil (#400), or other light oil is a satisfactory preservative. The posts should be soaked for as long as seven days in a 50-gallon drum containing enough of this solution to cover 3 or 4 inches of the post above ground level. Posts should be spaced 25 to 30 feet apart in the row with the end posts braced or anchored. The wire supports to which the canes are tied are 12-gauge galvanized wires attached to the posts or to the cross-arms. Wire clips used between the posts in the horizontal-type trellis will keep the wires from spreading.

The horizontal-type trellis is used with the hedgerow system, the most common system of training. The plants form a solid row that is kept about 18 inches wide. Each spring the canes within the row are thinned to about 4-8 inches apart. No tying of canes is necessary with this system.

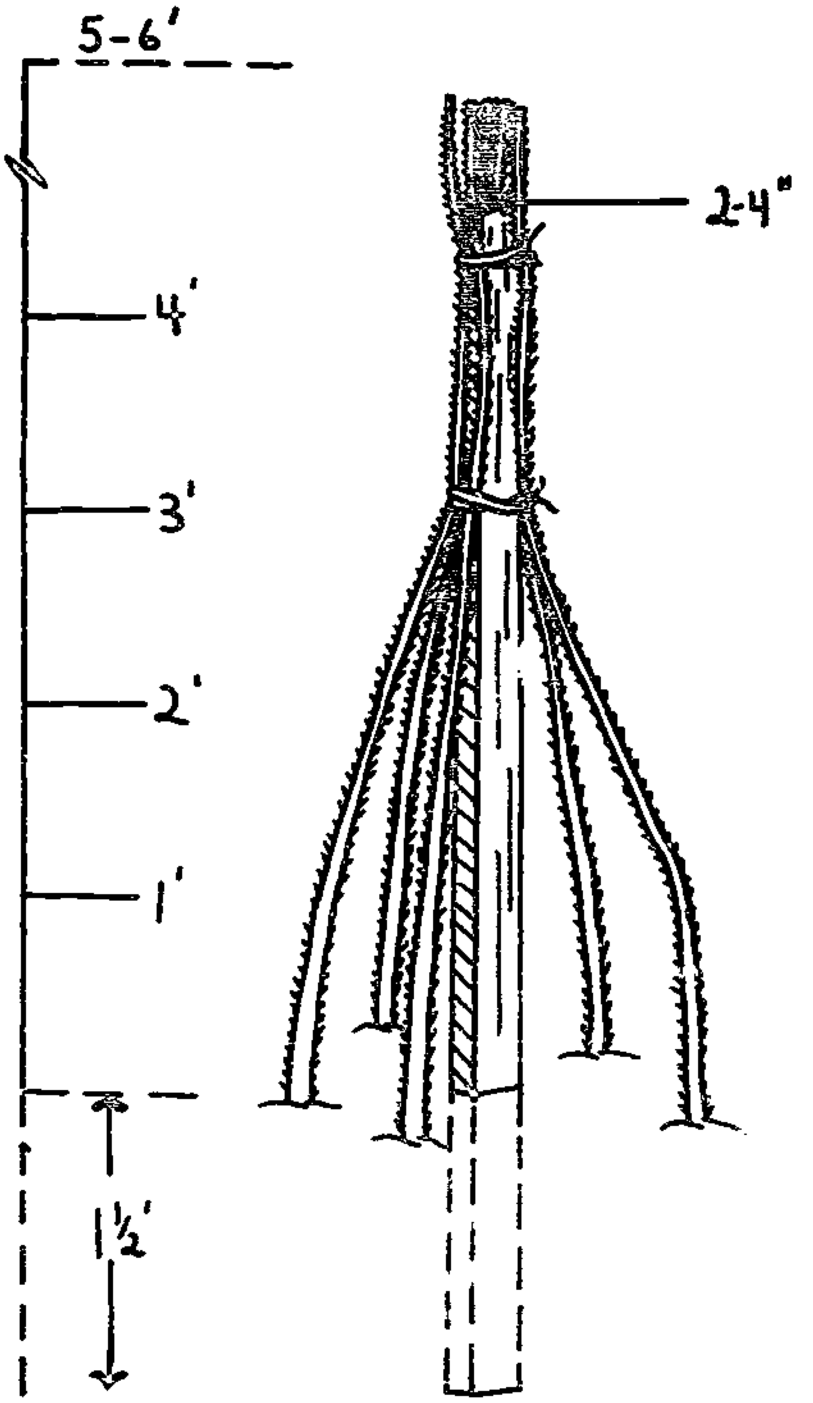

Fig. 4. Red raspberries trained and pruned to the staked-hill system.

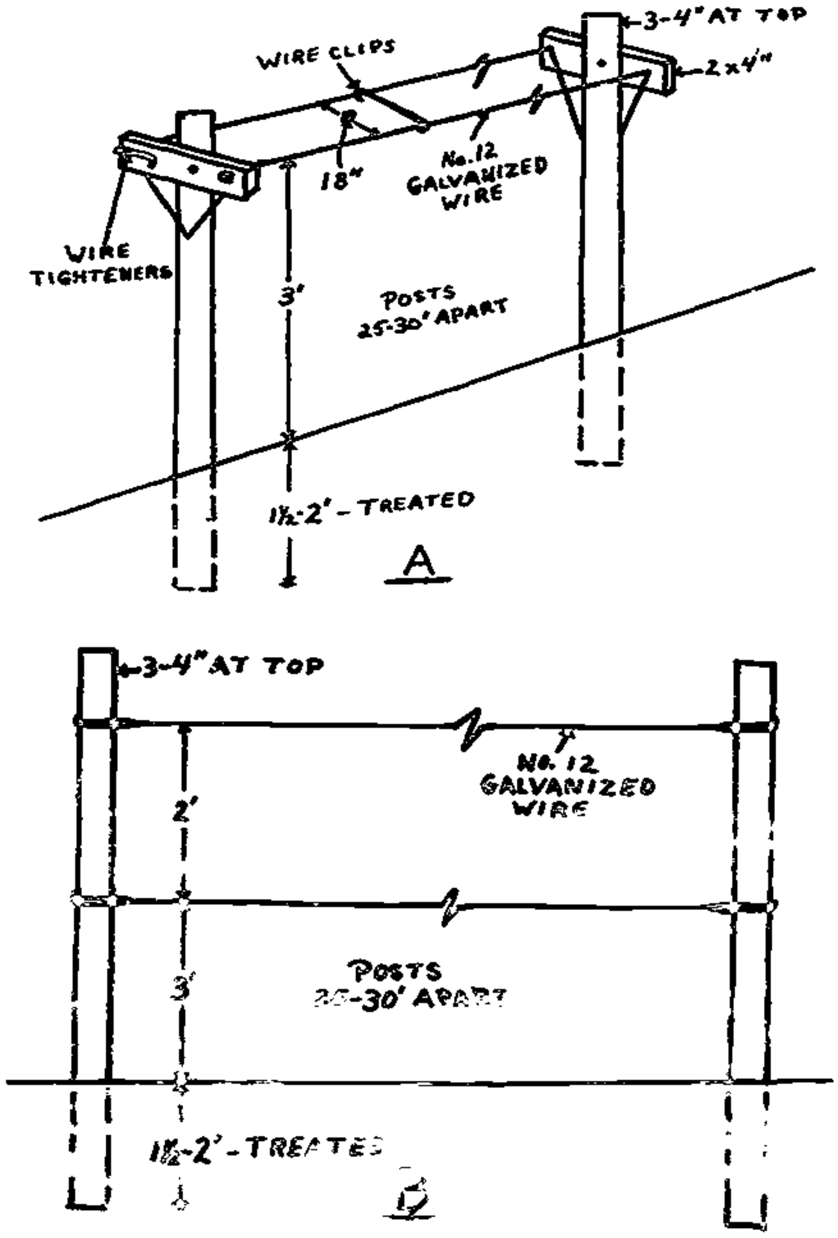

Fig. 5. Trellises are desirable. (A) Horizontal type, no tying necessary. (B) Vertical type, canes tied to each wire.

The vertical-type trellis is used with the linear system, a modification of the hedgerow system that allows better control of weeds, diseases, and insects. Plants are maintained in a narrow row and are tied to the wires. This system is most useful with red or yellow raspberries and trailing blackberries.

3. PRUNING RED AND YELLOW RASPBERRIES

Regardless of the training system being used, these types should be pruned twice each year, once in early spring and again as soon as possible after fruiting. New shoots of red and yellow raspberries should not be summer topped.

Spring pruning should be done early before the buds begin to swell but after danger of severe cold is past. All short and weak canes should be removed and the remaining healthy, vigorous canes should be thinned to 5-8 canes per stake in the hill system (Fig. 4), or spaced 4-8 inches apart in other systems (Fig. 6). Only the largest canes as indicated by diameter and length should be saved as these are the most fruitful. The remaining canes should be headed back moderately to 5-6 feet from the ground level. Canes shorter than 5-6 feet should not be headed back unless winter injury extends below this height. Where no support is provided, canes should be cut to about 3-4 feet regardless of original height.

Fruited canes may be removed any time after harvest since they die soon after fruiting. Although this pruning may be delayed until the following spring, cutting these canes off at the ground level as soon as possible after harvest is preferred since their removal at this time facilitates growth of the new shoots and reduces possible infestation of diseases and insects. These prunings should be removed from the planting and burned.

The canes of the everbearing varieties are pruned the same way as ordinary varieties in the spring and following the summer harvest. The shoots that fruit in the fall at the tip bear fruit again the next spring farther down, thus these canes should not be removed after the fall harvest.

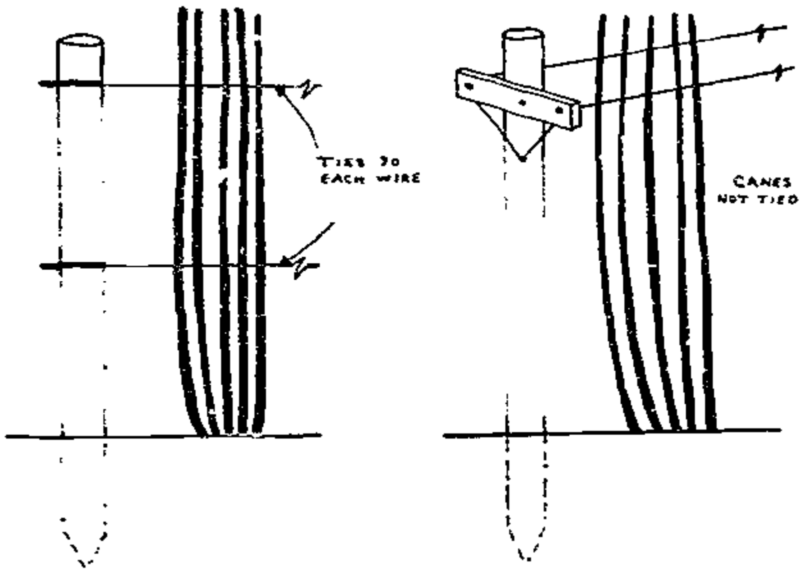

Fig. 6. Dormant pruned red raspberries. Vertical trellis left and horizontal trellis right. Canes should be 4-8" apart.

4. PRUNING BLACK AND PURPLE RASPBERRIES AND ERECT BLACKBERRIES

These brambles should be pruned three times each year, during the summer, early spring, and after fruiting.

Summer pruning is an essential step in the production of these brambles. All new shoots should be pinched back 3 to 4 inches as they develop (Fig. 2). If grown without supports, black raspberries are pinched when the new shoots are about 24 inches high while purple raspberries and erect blackberries are pinched when they reach 30-36 inches. If grown with supports, the shoots may be allowed to grow 6 to 8 inches more before pinching. This operation usually coincides with harvest and the plantings should be gone over several times as the new canes develop over a period of several weeks.

Dormant pruning is best done in early spring before the buds begin to swell. All weak canes should be cut out at the ground level leaving 4 or 5 of the most vigorous canes (at least half an inch in diameter) per plant (Fig. 7). The lateral branches on the remaining canes are thinned out and shortened. All weak or dead laterals (usually 1/4-inch diameter or less) should be removed and the remaining ones shortened. With black raspberries, the laterals are shortened to 8-10 inches of growth or 8-12 buds per lateral. Purple raspberries and erect blackberries are more vigorous, thus the laterals may be left 12-18 inches long or about 15 buds per lateral.

Erect blackberries send up root suckers in addition to the new canes that grow from the crown. If these have all been allowed to grow during the previous season, they should be thinned out during the dormant pruning to about 3 or 4 canes per lineal foot of row. A better practice is to remove the excess suckers during the summer between and in the rows, leaving only those desired for fruiting next season. The suckers should be pulled out if possible since they do not regrow as quickly as those that are cut off at the ground level.

Fruited canes of black and purple raspberries and erect blackberries are handled the same way as red raspberries.

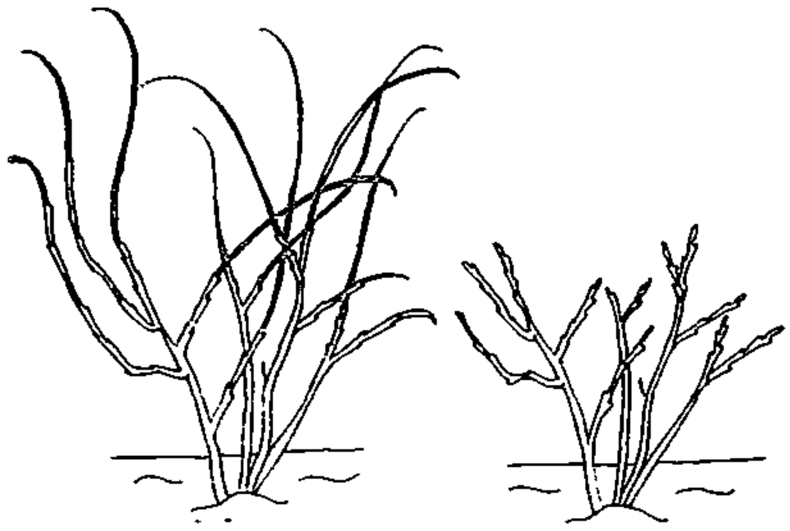

Fig. 7. Dormant pruning black and purple raspberries and erect blackberries. The number of buds to leave on laterals depends upon the vigor of the plants.

5. PRUNING SEMI-ERECT AND TRAILING BLACKBERRIES

These brambles are pruned twice, once in early spring and again after harvest. Pinching the new shoots as they develop is not practical.

Spring pruning these brambles consists of selecting the best canes for tying to some support and removing the remaining ones. The best 4 to 8 canes of semi-erect varieties and 8 to 16 canes of trailing varieties are selected. If stakes are used for support, the selected canes are wound around the stake, tied at two or three places, and cut to about the height of the stakes. On a horizontal trellis the canes are wound around the wires and tied at intervals. On vertical trellises the canes are tied to the wires without being wound around them (Fig. 8).

Fruited canes are handled as described for red raspberries.

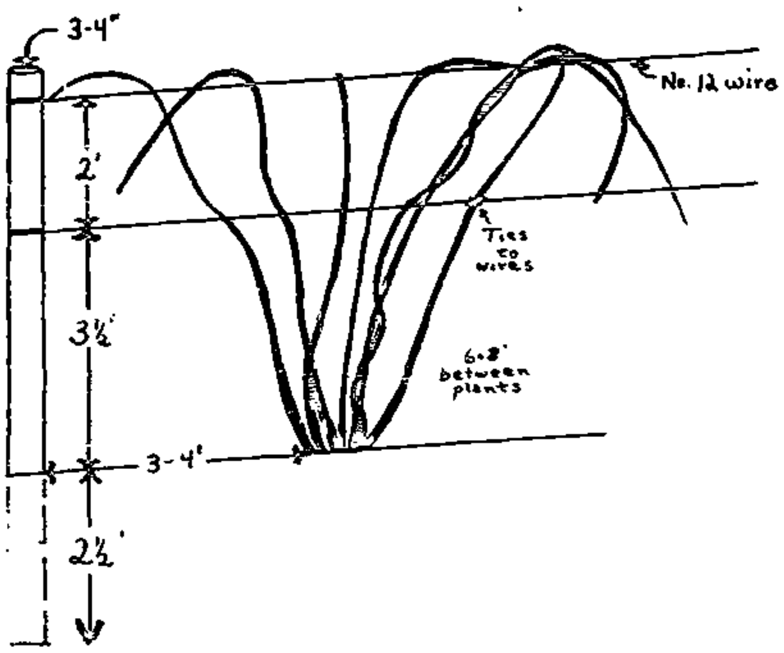

Fig. 8. Dormant pruned trailing blackberries.

6. PRUNING HIGHBUSH BLUEBERRIES

Highbush blueberries are woody perennial shrubs that produce fruit clusters from lateral and terminal buds located on the previous season's growth. This type of fruiting habit requires rather moderate annual pruning of mature plants to maintain an adequate fruiting surface, namely, the vigorous new growth produced each year. Although considerable variation in growth habit occurs among varieties, none require support.

The plants are usually 2 or 3 years old when planted and have several branched stems. At planting time, any broken roots should be cut off and the top reduced to two or three of the most vigorous stems. All fruit buds (Fig. 9) should be removed. The objective at this time is to produce a strong bush and the development of a fruit crop will be at the expense of vigorous shoot development. Following this initial pruning, the plants need not be pruned until the end of the third year in the field except for removal of dead and broken branches and the small bushy growth near the base of the plant.

At the end of the third year in the field and annually thereafter, the blueberry plants should be pruned moderately to maintain a vigorous and productive bush (Fig. 10). This annual pruning may be done any time during the dormant season, but early spring just before

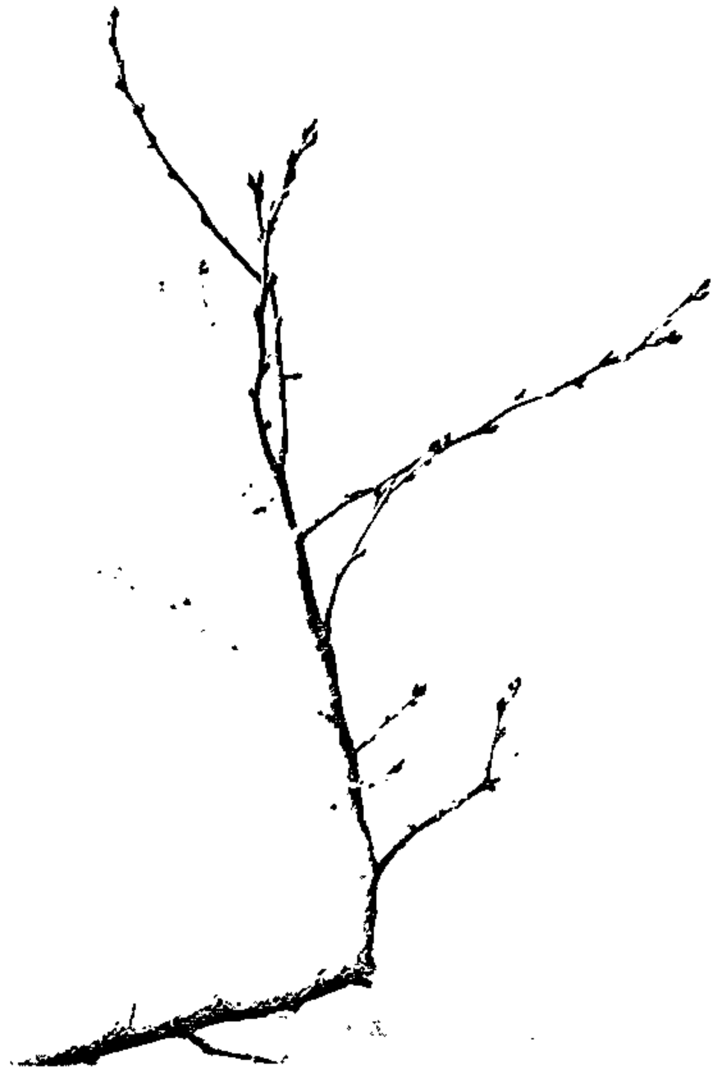

Fig. 9. Branch of the highbush blueberry as it looks during the dormant season. Note plump fruit buds on twigs produced the previous season.

Fig. 10. Highbush blueberry plant before pruning (A) and after pruning (B). Oldest stems have been removed at the crown and remaining ones thinned to 8 of the most desirable in regard to age, vigor, and spacing. Bushy growth also thinned out. This plant was not pruned for two years so pruning was more severe than normal for a plant pruned annually as recommended.

growth starts is preferred in order to avoid possible injury from extreme cold.

Varietal and individual plant differences require some adjustment in the pruning of mature plants but the following may be used as a general guide:

1. Remove bearing branches near the ground. Berries produced on these branches usually get dirty and are in an inconvenient position for harvesting.

2. Remove any old stems in excess of 3 or 4 by cutting them off at the crown. These older stems have grayish-black bark and are easy to identify. Remove the ones that have the fewest fruit buds.

3. Remove the weaker younger stems and suckers arising from the crown, leaving a total of 6 to 8 stems per plant. The objective is to replace the old, less productive stems systematically with vigorous younger ones, maintaining 6 to 8 of the best available on each plant. Some of the new vigorous stems grow very rapidly in a single season and remain unbranched. Such stems should be headed back, removing about the terminal 1/4 to 1/3 to induce branching.

4. Thin out the fruiting branches on the 6 to 8 stems selected. Remove a large part of the very thin, bushy wood that accumulates in mature plants. The aim is to remove about 50% of the fruit buds by taking off the weaker shoots, those less than 3 inches long which generally make poor fruiting wood. A general rule is to leave one fruit bud for each 3 inches of new shoot growth formed during the previous season.

5. Keep this basic principle in mind when pruning mature blueberry plants: The heavier the pruning the lower the yields, the larger the berries, and the higher the percentage of berries maturing early. Thus pruning should be heavy enough to obtain large-sized berries, light enough to provide a good crop the current year, and heavy enough to stimulate the growth of new fruiting wood for the next crop year.

PRODUCING OATS

1. What Variety of Spring Oats Should I Grow?
2. What Practices Are Recommended for Growing Spring Oats?
3. Can Winter Oats Be Grown Successfully in Illinois?
4. What Diseases Attack Oats?

Of all farm crops grown in Illinois, oats rank fourth in acreage, with corn first, soybeans second, and wheat third. The number of acres of oats harvested in Illinois has steadily decreased from 3,708,913 acres in 1950 to 1,413,000 acres in 1963.

Oat yields, however, have shown just the opposite trend. The average yield was 43 bushels per acre for 1951-1956; 48 bushels for 1957-1961; and 57 bushels in 1963 (Fig. 1).

Fig. 1. Oats continues to be an important farm crop in Illinois.

1. WHAT VARIETY OF SPRING OATS SHOULD I GROW?

Improved varieties of oats are continuously being developed and tested by plant breeders and research workers. They prepare a list of recommended varieties and their characteristics. From this list you can select a variety that is best adapted to your farm.

Observation of variety demonstration plots in your area will also help you to decide which of the recommended varieties to grow. Results from these demonstrations may be found in the "Oat Yield and Variety Trials" report published annually by the Agronomy Department of the University of Illinois. If you do not have a copy, your agriculture instructor may have one available or you may obtain one from the College of Agriculture.

When selecting a variety of oats, take into account climate, farm management practices, market acceptability, and seed supplies, as well as plant characteristics. Each variety has its strong and weak points, but you will need to select the variety which best meets your farming conditions.

The most common oat varieties of Illinois, as reported by the Illinois Cooperative Crop Reporting Service, are listed in Table 1.

Table 1. Percent of Spring Oat Varieties Seeded in Illinois

Variety	1963
Newton	42
Clintland	10
Nemaha	10
Goodfield	9
Clintland 60	6
Minhafer	5
Shield	2
Others	16

Newton has been the most popular variety for the past few years. Varieties mentioned in the table for "others" include Beedee, Putnam 61, Clinton, Garland, Dodge, Bonham, and a number of other varieties reported in small amounts.

Most farmers when selecting a variety look for the following characteristics:

1. High yielding
2. Suitable maturity
3. Heat tolerance
4. Strong, stiff straw
5. Disease resistance
6. High-quality grain

High yielding

Oat varieties should be selected primarily on their ability to yield well on your particular soil type, climatic conditions, and management practices (Table 2). Varieties listed in Fig. 2 have proven their ability to yield well and are currently recommended for Illinois.

Table 2. Possible Yield of Recommended Varieties

Variety	Yield
Brave	Exc.
Beedee	Good
Clintland 64	Good
Dodge	Good
Garland	Exc.
Goodfield	Good-Fair
Minhafer	Good
Newton	Good
Putnam 61	Fair
Shield	Exc.

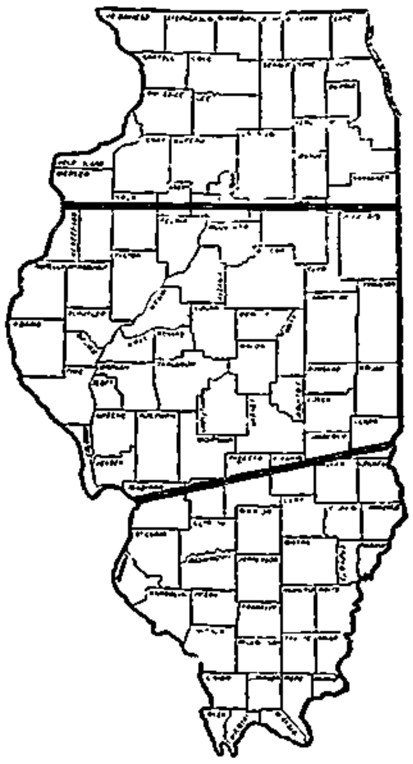

Fig. 2. Recommended varieties for Illinois in 1965 are: Northern -- Beedee, Brave, Clintland 64, Dodge, Garland, Goodfield, Minhafer, Newton, and Shield. Central -- Brave, Clintland 64, Garland, Goodfield, Minhafer, Newton, and Putnam 61. Southern -- Brave, Minhafer, Newton, and Putnam 61.

It is usually advisable to obtain new pure seed every 2 or 3 years to maintain high yields. Be sure to store seed oats in a clean bin separate from other varieties. Seed kept year after year tend to decrease in yield. This decline in yield may be due to mixing of varieties in storage or to such factors as variations in soil fertility, climate, diseases, or insects. Reduction in yield of a variety is rarely due to hereditary changes occurring naturally, since oats are self pollinated.

Suitable maturity

In southern Illinois use only varieties like Putnam 61, or Newton that will usually fill and mature in time to escape hot, dry weather. In central Illinois varieties like Newton and Garland are recommended. In northern Illinois Shield and Garland have made top yield records for the past several years. They have a chance to mature normally before hot weather which aids in producing good yields. Table 3 illustrates the usual maturity of the recommended varieties.

Table 3. Normal Maturity of the Recommended Varieties

Variety	Maturity
Brave	Early
Beedee	Medium
Clintland 64	Medium
Dodge	Medium
Garland	Medium
Goodfield	Medium
Minhafer	Early
Newton	Medium
Putnam 61	Very Early
Shield	Early

Heat tolerance

Although heat tolerance and early maturity are two separate characteristics, use of a variety which will tolerate heat may help to avoid heat damage especially in southern and central Illinois.

Some varieties such as Putnam 61 or Newton are better than others in being able to tolerate heat and finish filling the kernels in hot weather.

Strong, stiff straw

A stiff straw as shown in Fig. 3 is becoming increasingly important, especially in

Describe

Source (agency)
(address)

cropping systems with legumes, because the legumes increase the available nitrogen, which in turn, tends to increase lodging (Fig. 4).

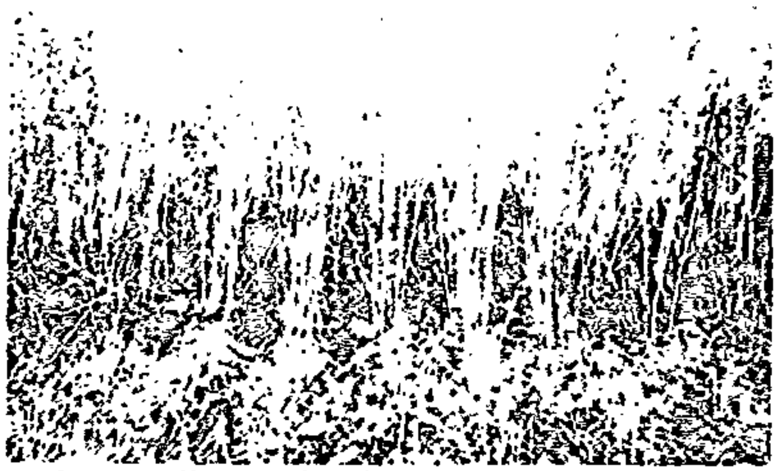

Fig. 3. A stiff-strawed early-maturing variety, is easy to harvest, high yielding, and an excellent nurse crop for clovers.

Fig. 4. A variety that lodges, yields low, and is difficult to harvest. It also tends to smother the clover when it is used as a nurse crop.

When oats lodge before the grain is filled, the supply of moisture and nutrients going through the conducting system of the plant to the top is shut off (as in the case of bending a drinking straw) and the grain is not filled normally.

Considerable loss of grain also occurs in a field where the oats are down because of the inability to harvest all of the seed. Oats which are lodged also tend to smother the young growing legumes. Table 4 shows the normal straw strength of the recommended varieties. If you have lodging problems, stiff-strawed Goodfield may be your choice.

Table 4. Normal Straw Strength of the Recommended Varieties

Variety	Straw Strength
Brave	Fair
Beedee	Fair
Clintland 64	Good
Dodge	Good
Garland	Good
Goodfield	Exc.
Minhafer	Good
Newton	Good
Putnam 61	Fair
Shield	Fair

Disease resistance

For highest yields, the oats you select should be resistant to diseases. Four of the most important diseases of oats in Illinois are: crown rust, stem rust, Septoria disease, and yellow dwarf. These diseases will be discussed in greater detail later in this unit. Information in Table 5 will aid in selection of disease resistant varieties.

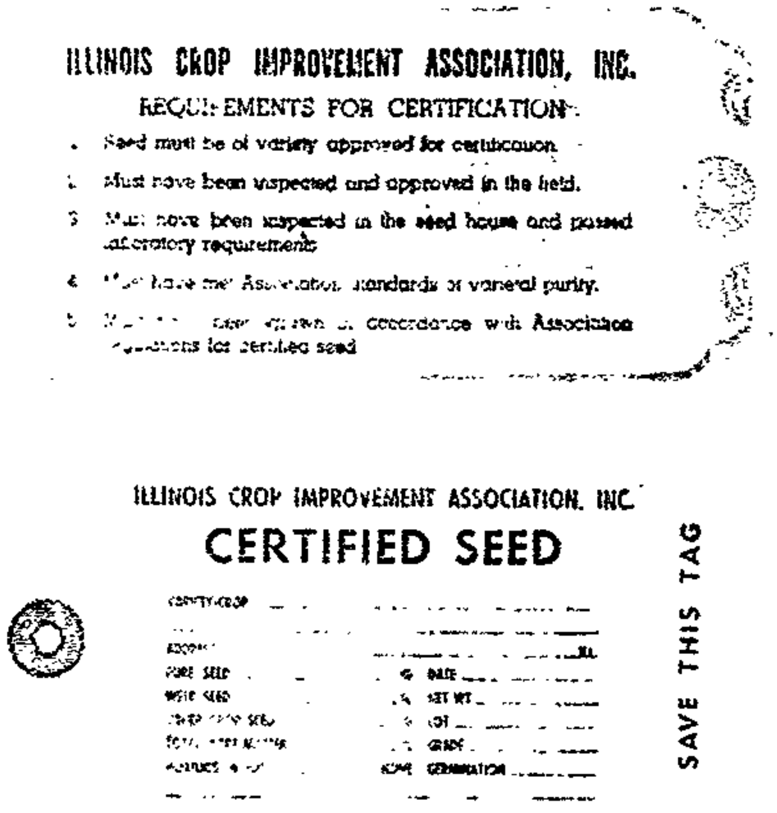
Table 5. Normal Disease Resistance of the Recommended Varieties

Variety	Crown Rust	Stem Rust	Septoria Disease	Yellow Dwarf
Brave	Good	Good	Good	Tolerant
Beedee	Fair	Fair	Fair	Susc.
Clintland 64	Exc.	Exc.	Good	Susc.
Dodge	Exc.	Exc.	Fair	Susc.
Garland	Good	Exc.	Fair	Susc.
Goodfield	Good	Exc.	Fair	Susc.
Minhafer	Good	Exc.	Fair	Susc.
Newton	Fair	Fair	Poor	Tolerant
Putnam 61	Good	Exc.	Fair	Tolerant
Shield	Fair	Good	Fair	Susc.

High-quality grain

The variety of oats selected should have bright, plump, uniform kernels and a high feeding value. Oats with excessive hulls usually have a low test weight (below 32 pounds per bushel) and do not make high-quality feed. Table 6 will aid in selecting a variety with a high test weight. Brave and Clintland 64 are not included in this table because seed will not be available to farmers until 1965.

Buying and handling seed. High prices and unknown varieties and sources should be avoided when buying seed oats. A good motto is, "if you do not know your seeds, know your seedsman." Certified seed gives the best results. A high germination rate is characteristic of good seed. It should be free of weed seed, other varieties of oats, other grains, and inert material. See Fig. 5 for a sample certified seed tag. Cleaning and treating seed oats are profitable practices. Seed treatment of smut-free seed will increase yields from 3 to 5 bushels over untreated seed (see VAS Unit 4021). You can afford to pay more for seed which has been cleaned and treated. Remember, certified seed is your best guarantee that you are getting what you pay for. Buy from a reputable seed dealer, one who takes pride in the quality of his seed, not in its low price.



ILLINOIS CROP IMPROVEMENT ASSOCIATION, INC.

REQUIREMENTS FOR CERTIFICATION:

1. Seed must be of variety approved for certification.
2. Must have been inspected and approved in the field.
3. Must have been inspected in the seed house and passed laboratory requirements.
4. Must have met Association standards of varietal purity.

2. WHAT PRACTICES ARE RECOMMENDED FOR GROWING SPRING OATS?

Preparing the seedbed

Spring oats usually follow corn in the cropping system. While the seedbed is normally prepared by disking, plowing usually increases yields about 3 bushels per acre. This increase in yield may not pay for the additional cost of plowing, but the difference in cost may be justified by the better control of insects and diseases. If plowing is not practical, you'll get better oat yields by shredding the stalks before disking the ground. Where oats follow soybeans, the land need not be plowed for oats.

The number of times the seedbed is disked will depend on the residue on the field, the condition of the soil, and the method of seeding. Usually one to three diskings are necessary.

When to sow

Seed spring oats early, as soon as the ground is dry enough in the spring to be worked properly. Oats are a cool-weather crop. Spring oats do well in northern Illinois when seeded any time during the last half of March to April 20. In central and southern Illinois, spring oats should be seeded in March or early April. Seeding too late usually reduces yields and quality more than seeding too early. Fig. 6 shows yield trend curves taken from many years of experience in seeding spring oats in central Illinois. Tests in several states show that you may lose roughly one bushel per acre for every day that you delay seeding.

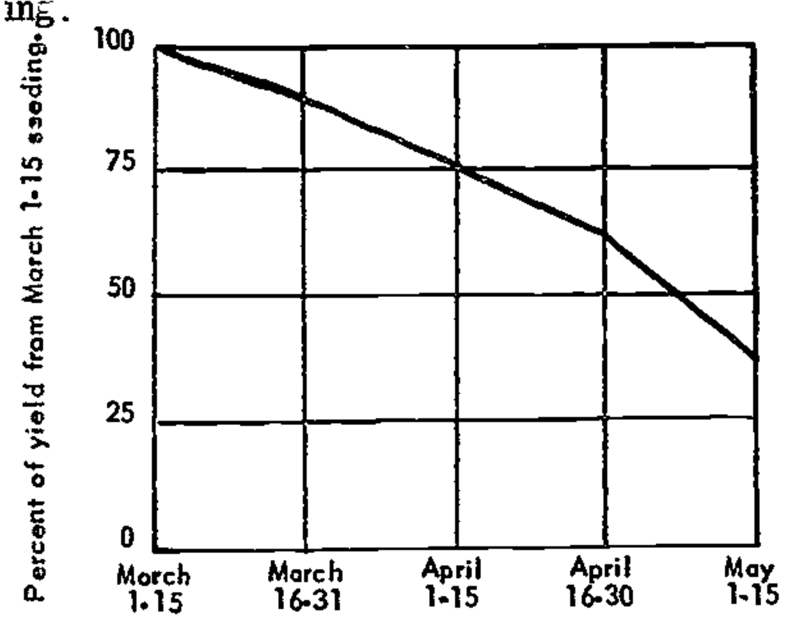

Fig. 6. Early planting of spring oats increases yields considerably.

Fertilizing

Too often oats get only the leftovers. They have to live on plant food left by the corn crop -- or by soybeans. However, there is no prescription for fertilizing oats that will fit every situation. Reliable soil tests show which nutrients and how much are needed for high yields. Establishing good stands of forage grasses and legumes in oats depends on having adequate amounts of phosphate and potash in the soil and liming if the soil is acid. Basic amounts of phosphate, potash, and limestone, indicated as being necessary by soil tests, may be plowed down or disked in. In addition to these basic requirements, starter fertilizer may be used to meet maintenance requirements and at the same time provide nutrients for getting seedlings off to a good start. Oats need phosphorus early. They can use soluble phosphorus to insure a faster start in the spring (Fig. 7).

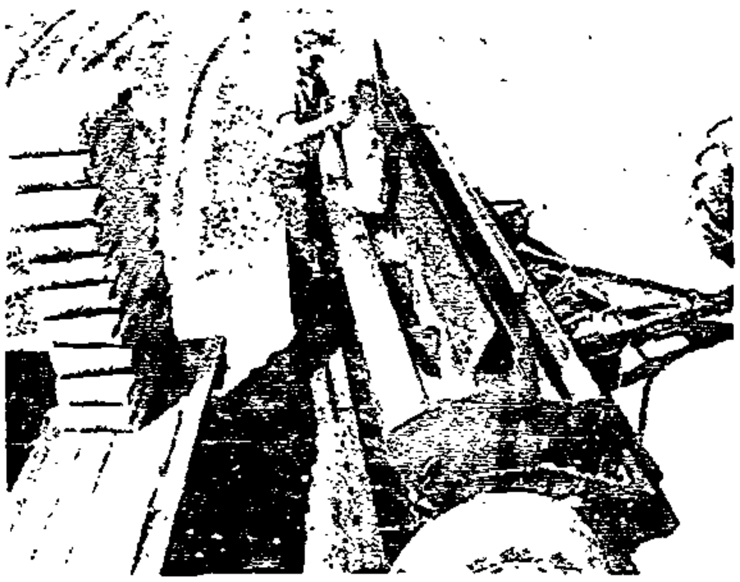

Fig. 7. Starter fertilizer helps insure a faster start, if applied at seeding time (courtesy International Harvester Co.).

If oats follow corn which received heavy applications of fertilizer, residual effects will usually reduce the amount needed for the oats. Excessive applications usually do not pay. In fact too much nitrogen is likely to cause severe lodging or excessive straw growth at the expense of seed production. However, moderate amounts of nitrogen often boost your returns. New varieties have stiffer straw, stand better, and respond more to nitrogen than the older varieties.

As mentioned previously, it is always best to use soil-test results as a basis for deciding what and how much fertilizer to apply. However, if you don't make any soil tests, the following may serve as a guide. A 60-bushel oat crop, where only the grain is removed, would remove roughly 37 pounds nitrogen, 15 pounds of P_2O_5, and 11 pounds of K_2O. (One bushel of grain removes - .61 lb. N., .25 lb. P_2O_5, and 18 pounds of K_2O.)

Nitrogen. Apply 20 to 30 pounds of actual nitrogen per acre on dark-colored, fertile soils. On lighter-colored and less fertile soils, use 30 to 50 pounds of nitrogen. If you are farming timber soils and have applied little or no manure, then 40 to 60 pounds of nitrogen should give you a profitable yield boost. However, if you are on a prairie soil, have included legumes in your cropping system, and have used manure continuously, then it is doubtful if nitrogen will pay.

Where oats follow heavily fertilized corn, you probably should use the 20- to 30-pound rate. When only a moderate application or no nitrogen has been applied to corn, use 30 to 50 pounds. Where oats follow a legume in the cropping system, such as soybeans, use about 20 pounds less than you would if they followed corn.

Phosphorus. As mentioned previously, oats need phosphorus in a hurry, and soluble forms are more readily available than rock phosphate. A minimum of 25 to 35 pounds of soluble phosphate will probably satisfy the requirements for the oat crop. In most cases, however, a legume is seeded with oats; therefore, an application of 55 to 60 pounds of P_2O_5 may be more realistic.

Potassium. Potash levels in most Illinois soils are usually adequate, except on poorly drained soils, for high oat yields. However, you may wish to apply at least 20 to 30 pounds for the new legume seeding.

Remember the above are to be used only as a guide. There's no substitute for soil test.

Amount to sow

The recommended rate of seeding is: 2 to 2 1/2 bushels of well-cleaned seed per acre when drilled and 2 1/2 to 3 1/2 bushels when broadcast. The lower rate (2 bushels for drilling and 2 1/2 bushels for broadcasting) should be used when oats are used as a nurse crop for grasses and legumes. These lower rates will give the grass and legume seedlings a better start.

Plant treated seed

As mentioned previously, seed treatment is a recommended practice in growing oats. Chemical seed treatment not only helps to kill off diseases carried on the seed, but they also protect the germinating seed in the soil. Tests show that you may get better stands from treated seed and may expect an average of three bushels per acre more grain than untreated plots.

Method of seeding

Drilling. Seed with a drill if possible (Fig. 8). A drill puts the seed in the ground at a uniform depth and allows the plants to establish good root systems. The plants grow more evenly and therefore mature more evenly, resulting in higher yields and higher-quality grain.

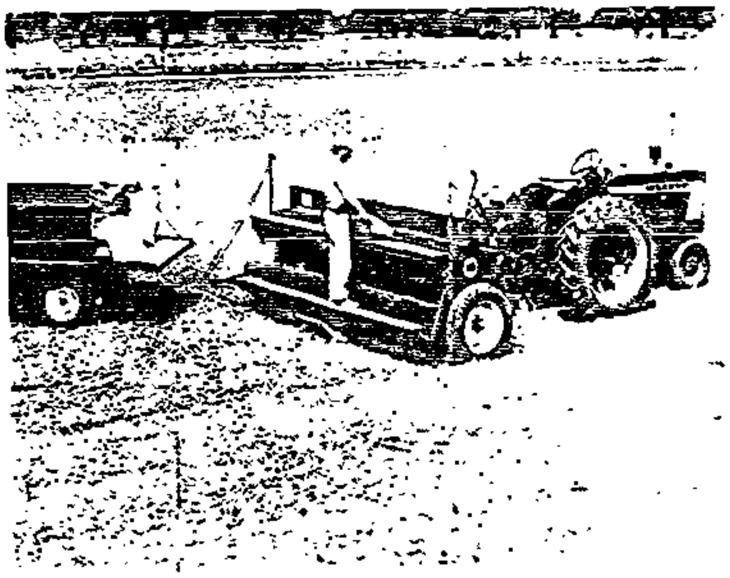

Fig. 8. Seed with a drill if possible (courtesy International Harvester Co.).

Using a grain drill with a fertilizer attachment as shown in Fig. 9 makes possible efficient use of fertilizer, placing it down in the furrow near the seed, which cannot be accomplished in broadcast seedings. Drilling with a drill as in Fig. 10 also permits seeding of the grass-legume crop at the same time as the oats and no further working of the seedbed is necessary.

Broadcasting. If legumes and grasses are not to be seeded with the oats, the oats may be broadcast in the corn stalks or soybean stubble with a broadcast seeder and the seed covered by double disking and harrowing. When legumes and grasses are to be seeded, the oats should be broadcast and disked in first, then the legumes and grasses broadcast and covered lightly with the use of a harrow or roller (Fig. 11).

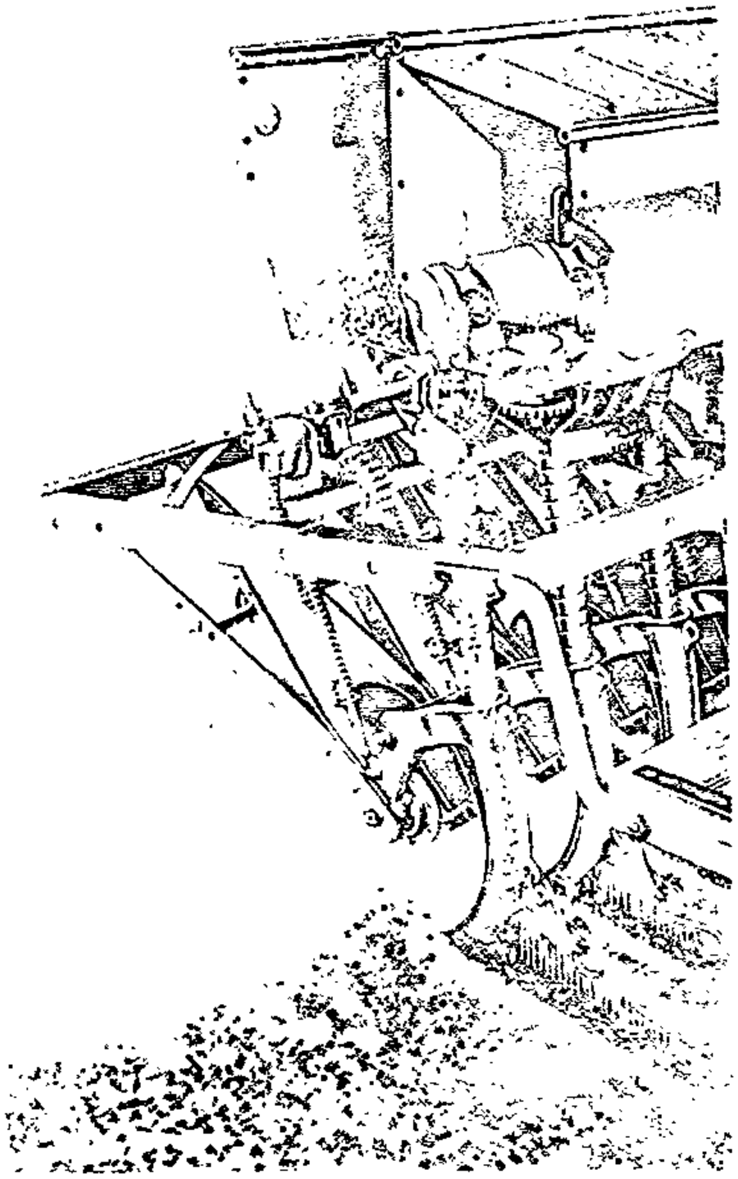

Fig. 9. Drilling in the fertilizer, with the seed oats, gives more efficient use of the fertilizer than just broadcasting it on top of the ground.

Oats should be planted deep enough to be covered with moist soil, but not too deep--3/4 to 1 1/2 inches is usually adequate.

The major advantage of broadcast seeding is the lower investment in machinery. In tests at the Illinois Station, drilled oats outyielded broadcast oats by 5 to 10 bushels per acre. Whether the advantages of drilling will justify the investment in a drill will depend largely upon the acreage of small grain on the farm. For example, if a grower averaged 40 acres of oats and the price averaged 60 cents

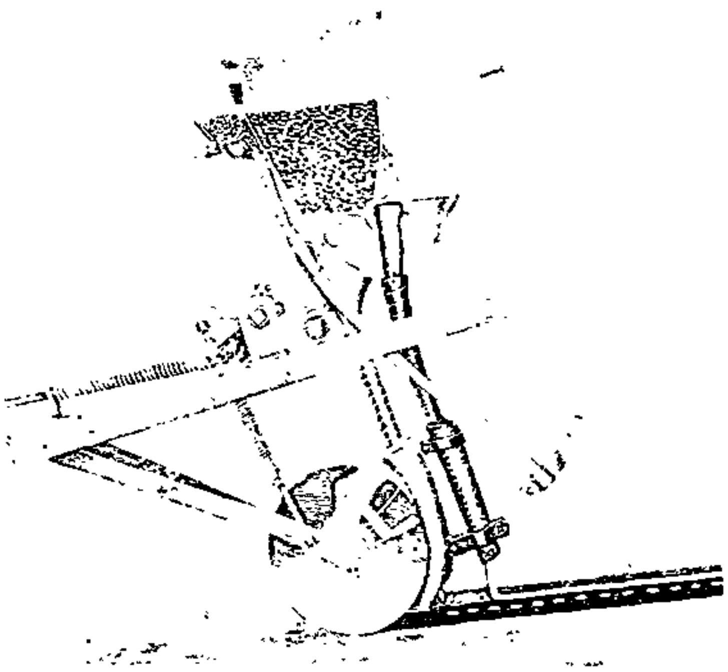

Fig. 10. This type of drill may be used to seed oats, sow the grass-legume seed, and apply the fertilizer in one operation.

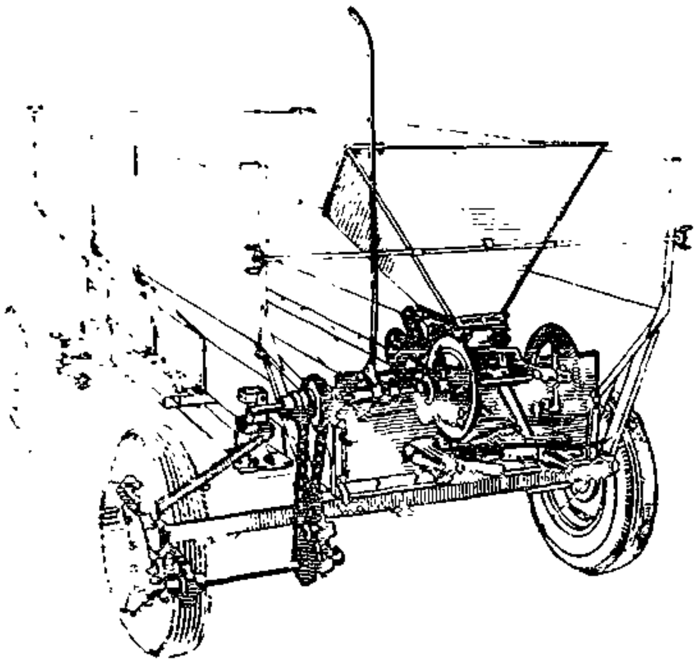

Fig. 11. Broadcast endgate seeder.

a bushel, he would have approximately 200 extra bushels, or $120, to apply to the cost of a drill each year.

40 acres x 5 bu. per acre increase=
200 bushel extra yield

200 bu. x 60¢ = $120.00

Weed control

Weeds may be pulled by hand or hoed off to remove them from the grain field if they are not too widely distributed over the field. If they are widely distributed, spraying with chemicals may be necessary or preferable.

Two chemicals--2,4-D and MCP are recommended for use in small grains. MCP is not as effective as 2,4-D in controlling some weeds, but is less injurious to legume seedings. Both chemicals, however, may seriously damage legumes, and should not be used where there are legume seedings unless the weed hazard is serious.

Apply the amine type of either 2,4-D or MCP. If there are no legumes in the oats, use up to 1/2 pound of acid per acre, although this maximum amount should be used only when necessary as it may reduce grain yields somewhat. Where there are legumes, do not use more than 1/4 pound per acre. Apply after the grain has passed the five-leaf stage, but before the plants get over 5 to 8 inches tall. This is after the grain tillers and before the boot stage, but after small grain and weeds form a canopy over the legumes. An application of either spray to small grains with legumes may reduce the legume stands.

Harvesting

Oats are usually harvested for grain with the combine (Fig. 12) although an occasional field may still be cut with a binder and threshed. Oats are less suited for harvesting with the combine than other small grains because they lodge and shatter badly once the crop is ripe. Most of the newer recommended varieties have stiffer straw and will stand longer after ripe than the older varieties, but even these newer varieties will shatter if harvesting is delayed very long. Losses can easily range up to 10 to 12 bushels per acre.

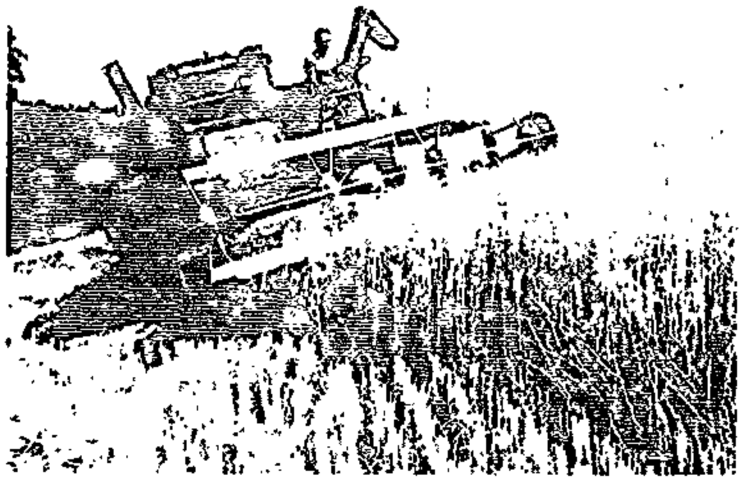

Fig. 12. Oats being harvested with the combine.

Much of the loss from lodging and shattering may be avoided by cutting and windrowing the oats and allowing them to dry before combining them (Fig. 13). This practice is also profitable when the field is heavily infested with weeds, or if there is a vigorous growth of the new seeding. Otherwise, the weed seeds and succulently green material may provide sufficient moisture for the grain to heat excessively during storage. The moisture content of the grain may also be excessive if it is combined too early in the morning or too late in the day.

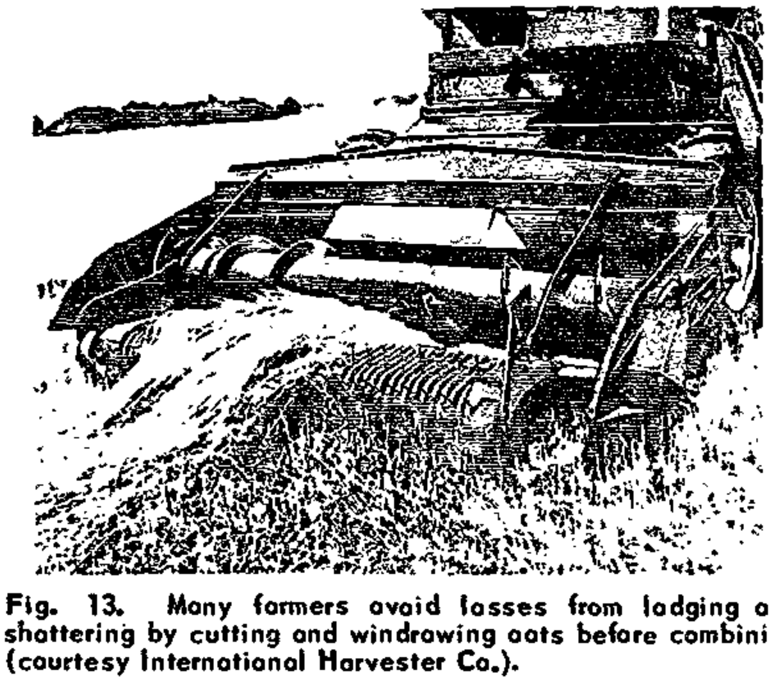

Fig. 13. Many farmers avoid losses from lodging and shattering by cutting and windrowing oats before combining (courtesy International Harvester Co.).

Harvesting oats as silage rather than as grain has shown some promise in recent tests. You may be able to increase your returns from oats by harvesting them for forage and improve your legume seeding. In 1963, Illinois agronomists harvested nearly 10 tons of oat silage--cut in the early dough stage. This silage produced almost twice as much TDN per acre as oats from nearby plots that averaged 110 bushels of grain per acre. With oats cut this early, the alfalfa came on despite dry weather and gave a fine hay cutting in September. In addition, the alfalfa stands appeared better where the oats were cut for forage than where they were left for grain.

3. CAN WINTER OATS BE GROWN SUCCESSFULLY IN ILLINOIS?

Data from variety tests conducted at the Illinois Station indicate that winter oats can be grown successfully south of highway U. S. 50, which runs from St. Louis, Missouri, to Vincennes, Indiana. North of that they are very dependent on a mild winter. However, if winter oats fail, a spring-seeded crop like spring oats or soybeans can be seeded in the same field.

Advantages of winter oats in southern Illinois

1. When winter oats survive the winter, they can be expected to give higher yields than the spring varieties.
2. Winter oats mature several weeks earlier than spring oats and usually escape many oat diseases and the hot, dry weather.
3. Winter oats can serve as late-fall pasture, as a companion crop for legumes and grasses, and as an erosion-control crop.
4. Winter oats may be used to replace winter wheat when this is desirable for compliance with government programs.

Disadvantage of winter oats

1. Winter oats are more susceptible to winter injury than winter wheat, rye, or barley.

Date of seeding

Late seeding is often the cause of failure of winter oats. The crop must be planted early enough to become well established before freezing weather. This is normally in early September, about one week earlier than winter barley seeding and about three weeks earlier than winter wheat. If the area is to be grazed, the seedings may be made during the latter part of August. Most of the adapted varieties of winter oats can be fall grazed. Since Hessian fly does not readily attack winter oats, seedlings need not be delayed to conform with the fly-free date for winter wheat. An early-planted, well-established seeding of winter oats will often ripen two or three weeks earlier than spring oats.

Rate of seeding

Two bushels of winter oats per acre, drilled, seems to be the minimum seeding rate for Illinois. Three bushels per acre may be better toward the northern limit of adaptation. Experimental data indicate that early seeding is more important than seeding rate. Seeding with a grain drill will give a uniform depth and covering for the seed and thereby insure a uniform stand. Broadcasting the seed is not recommended.

Seedbed preparation

The seedbed should be prepared in the same way as for spring oats.

Varieties

Winter hardiness is the most important characteristic to be considered in choosing a winter-oat variety. The recommended variety is Norline.

4. WHAT DISEASES ATTACK OATS?

Rusts

There are two common types of rusts that attack oats in Illinois — crown rust, with a hundred different races, and stem rust, with twenty different races. Crown rust is the most prevalent and causes a greater loss of yield and grain quality over a period of years than any other oat disease. It appears as small, dusty orange-yellow pustules (blister-like lesions) mainly on the leaves and leaf sheaths (Fig. 14). Stem rust produces reddish-brown, ragged looking, elongated pustules on most any part of the plant above the ground.

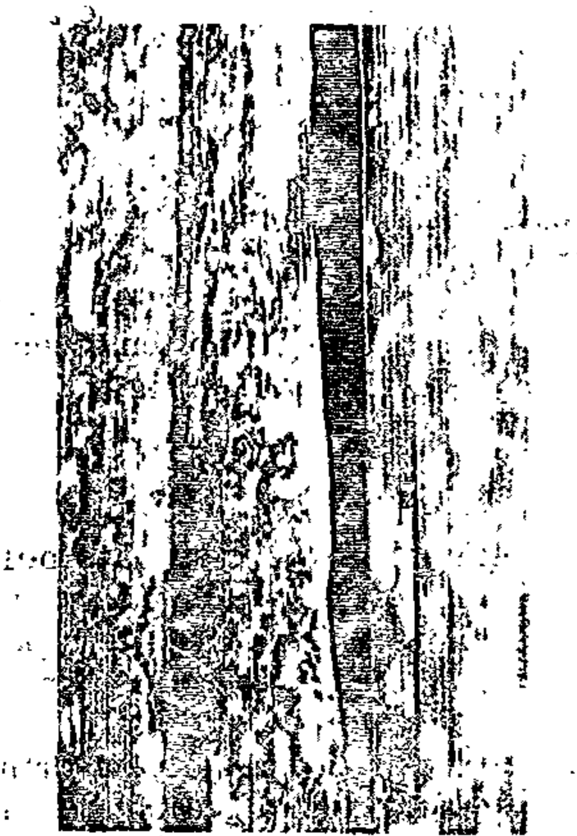

Fig. 14. Crown rust on oats; winter spore stage, left; summer spore stage, right (courtesy Illinois Experiment Station).

The number and size of the pustules vary greatly, depending on the susceptibility of the oat variety and the severity of infection. If weather is favorable for infection (high humidity, fogs, frequent heavy dews or light rains, and a temperature of about 70° F. or above), the pustules become numerous and may grow together as the season progresses. Rust may appear on oats in southern Illinois as early as late April. A new generation of summer spores may be produced every seven to fourteen days. These spores in turn are blown about by air currents to spread the disease from plant to plant and from field to field during the remainder of the growing period.

The rust diseases produce a rust colored, dusty material which may be seen on the plant. This "dust" rubs off onto your clothes as you walk through an infested field.

When attacks are severe, rust causes premature ripening, lowering of test weight, and lodging. In years of heavy attacks, 90 to 100 percent of all oat plants growing in the state become diseased, and the food-manufacturing ability of the leaves reduced up to 30 percent. In years unfavorable to rust infection, less than 5 percent of the oat plants develop any rust at all.

As oats mature, black overwintering spores (teliospores) are formed. These spores also may form during periods of adverse weather, such as extreme drought, excessive moisture, or excessively high temperatures.

The black, overwintering spores cannot infect oats the following year, so all infection must come from outside sources. One such source is spores from the common barberry plant that has been infected by the overwintering spores and the other from summer spores blown in from southern states.

Most prevention and control measures must be the eradication of any common barberry plants or buckthorn shrubs in the community and the development of resistant oat varieties. The latter is a continuing process, because the different races of rust cross with each other giving them hybrid vigor. Then oats varieties that have been resistant to rust may not be very resistant to some of the crosses.

Other management practices may also help prevent infection or reduce losses from infection. One is plant oats as early in the spring as practical. This helps the crop to escape much of the rust damage. Also, if the disease is present and building up rapidly — especially in late-maturing varieties— you may wish to harvest the crop for silage. Cutting in the soft dough stage usually makes the best quality silage.

Septoria disease

Septoria disease is a fungus disease of oats that attacks the leaves, stem, or head of a plant. For our discussion here, we will divide it into three phases, namely the leaf-blotch phase, the black-stem phase, and the kernel-blight phase.

The leaf-blotch phase appears in the early spring as small yellowish to light brown or chocolate-brown spots on the leaves (Fig. 15). As the spots enlarge, the infected leaf tissue dies. In severe cases the spots may fuse and cause the entire leaf to die prematurely. Infection usually starts on the leaves and then spreads upward on the plant.

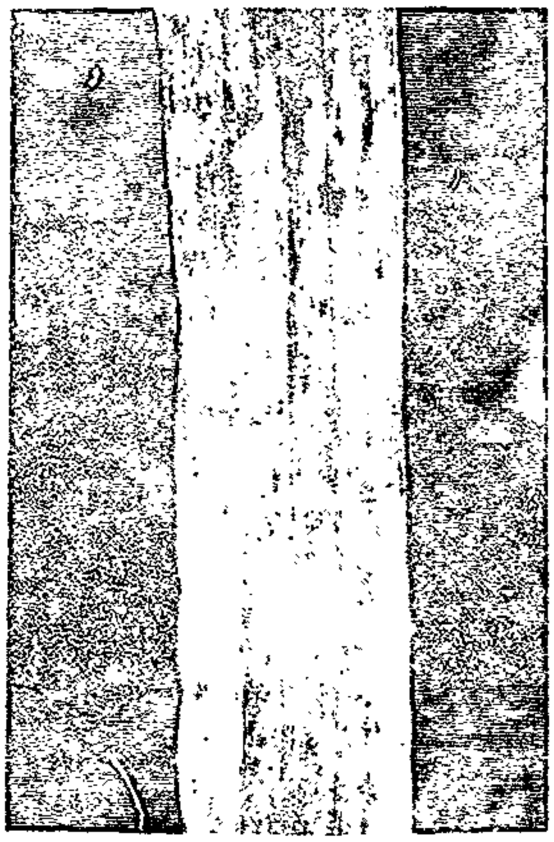

Fig. 15. Leaf phase of Septoria disease. In early spring the disease appears as small yellowish to light brown or chocolate-brown spots on the leaves (courtesy Illinois Experiment Station).

The black-stem phase of the disease is the most destructive (Fig. 16). Some time after the plant heads out, the symptoms begin to appear, usually first on the leaf sheath around the point where the leaf is attached to the sheath. From here it spreads to the stem of the plant where it forms grayish-brown to shiny black lesions, mostly above the upper two joints. Plants of varieties susceptible to this disease will lodge considerably at the points where the lesions occur.

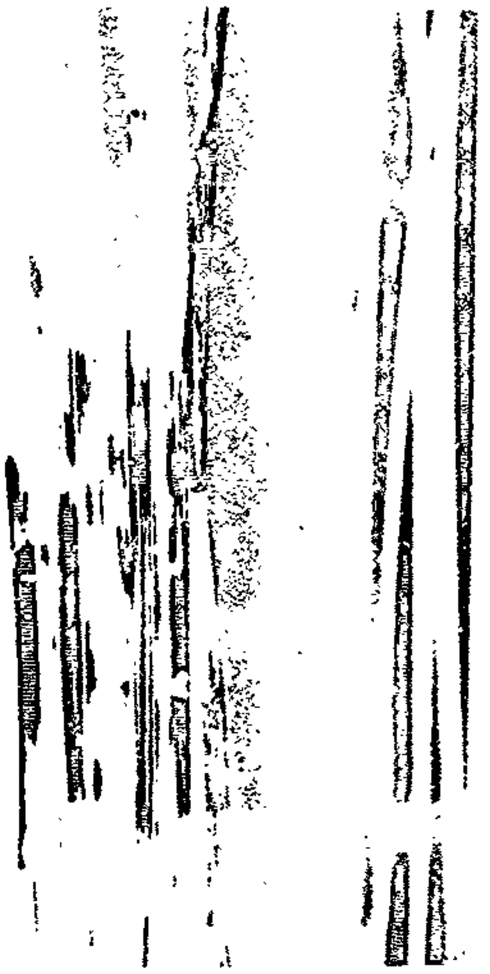

Fig. 16. Black stem phase of Septoria disease with leaf sheaths removed (courtesy Illinois Experiment Station).

The kernel-blight phase of the disease occurs in prolonged cool, wet weather (Fig. 17). Irregular yellow to brown blotches occur on the outer glumes. Black or dark brown lesions may later extend to the lemma and palea and even to the oat kernel. The disease is ordinarily not transmitted by infected seed.

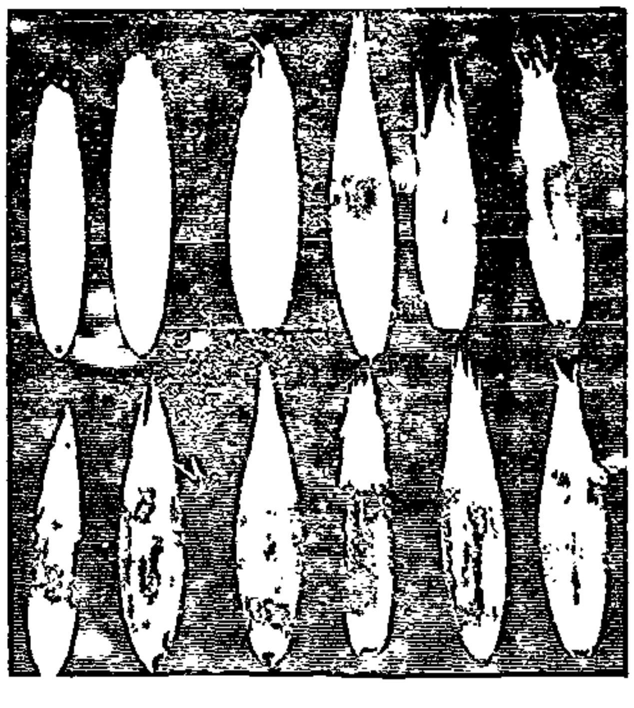

Fig. 17. Kernel phase of the Septoria disease, showing various degrees of infection. Healthy kernels at upper left (courtesy Illinois Experiment Station).

Control

Where feasible, plant tolerant or resistant oat varieties. Unfortunately, resistance of most varieties is low at present. Early varieties tend to be more susceptible. Tall, late varieties are generally more resistant or escape infection. More resistant oat varieties should be available in the future but the plant breeding program in this area is very difficult.

If possible, plant certified seed that has been thoroughly cleaned and treated with a recommended mercury-containing fungicide. Where practical, rotate crops for three or four years between oat crops. Do not apply manure containing known Septoria-infected straw on fields to be planted to oats within the next year or two.

Yellow dwarf

Yellow dwarf (also called red leaf) is recognized by the reddening, bronzing, and yellowing of the leaves. The color may vary from a yellow-red to a red to a reddish-brown, depending somewhat on the variety infected and the time of infection.

At the present the disease is known to be transmitted by more than ten different species of aphids that commonly infest small grains and grasses. In many instances, however, the aphids leave before the symptoms appear. Plants infected early in the seedling stage become stunted and in extreme cases die or fail to head. Severe blasting of the floral parts (seed fail to form) is associated with the infection. This blasting may involve a few florets or the entire head. The basal florets are usually the most severely affected. The intensity of the symptoms is directly correlated with the age of the plant at the time of infection.

The world oat collection of 5,000 different varieties of oats has been tested at the Illinois Station in a search for resistance to this disease. Brave, Newton, and Putnam 61 were found to have tolerance. At present early planting and high soil fertility also appear to aid in controlling it. This is because vigorously growing plants are able to tolerate the disease better than smaller ones, and large populations of aphids usually do not appear in Illinois oat fields until sometime in May. Applying contact insecticides in localized areas to control yellow dwarf does not appear to be effective. Continued research is needed before a more complete control can be recommended.

This unit was prepared in cooperation with the Agronomy and Plant Pathology Departments.

*TEXTBOOKS, REFERENCE BOOKS, *VOCATIONAL AGRICULTURE, *ENGINES, *REPAIR,

This document provides textual and reference material on small engine repair for high school vocational agriculture and adult farmer students. It was developed by a techer educator in consultation with subject matter specialists, teacher educators, supervisors, and teachers. Sections are (1) tools and equipment needed, (2) engine disassembly, (3) cylinder, piston, and ring wear measurement, (4) crankpin and bearing checking, (5) piston replacement, (6) valve servicing, (7) engine head replacement, (8) carburetor and fuel system repair, (9) ignition system servicing, and (10) engine operation and checking. The document is illustrated with photographs and drawings designed to emphasize key procedures. Students with average ability and interest would use the material for 2 to 6 hours. This document is available for 25 cents from Vocational Agriculture Service, 434 Mumford Hall, University of Illinois, Urbana, Illinois 61801. (JM)

SMALL ENGINES - REPAIR AND OVERHAUL

1. Special Tools and Equipment Needed for Small Engine Repair
2. Disassembling the Engine
3. Measuring Cylinder, Piston, and Ring Wear
4. Checking Crankpin and Bearing
5. Replacing the Piston
6. Servicing the Valves
7. Replacing the Engine Head
8. Repairing the Carburetor and Fuel System
9. Servicing the Ignition System
10. Operating and Checking the Engine

Small internal combustion engines are mass produced at low cost. It is often more economical to purchase a new engine than to pay for an extensive overhaul. However, if the owner has access to the proper tools and knows how to use them properly, he can often purchase needed parts and recondition an engine with a reasonable cash outlay.

A thorough program of maintenance, following the recommendations in the operator's manual, will greatly prolong the useful life of an engine. Eventually, normal wear of internal moving parts will make overhaul or replacement necessary.

1. SPECIAL TOOLS AND EQUIPMENT NEEDED FOR SMALL ENGINE REPAIR

The special tools and equipment listed and described here are in addition to standard mechanic's tools, such as socket wrenches, open-end wrenches, box-end wrenches, pliers, screwdrivers, hammers, and punches. It is assumed that these will be available in any good school or home shop.

Tools for disassembly and reassembly

Flywheel holder. Some device is necessary for holding the flywheel while the nut or recoil mechanism is unscrewed. Fig. 1 shows a shop-made tool for this purpose. Fig. 2 shows a special flywheel wrench which can be purchased from an engine manufacturer but this wrench is designed to fit one make of engine only.

Recoil mechanism wrench. Fig. 3 shows two shop-made wrenches with notches cut to fit the projections on one type of recoil mechanism. They can also be purchased from the engine manufacturer.

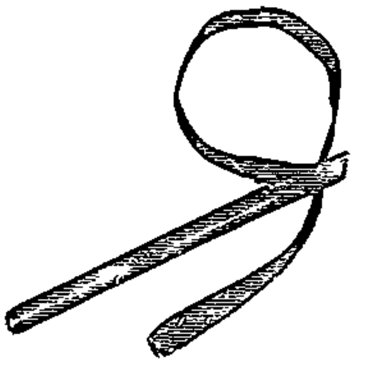

Fig. 1. This shop-made flywheel holder fits a variety of engines.

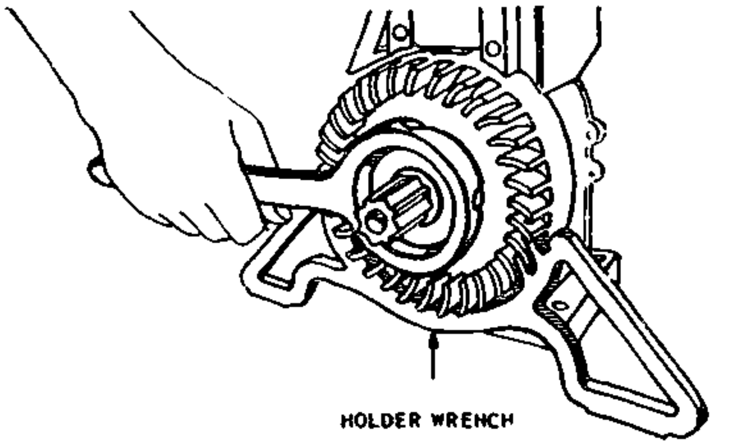

Fig. 2. This special flywheel holder wrench fits between the flywheel fins.

Fig. 3. These wrenches were made to remove the recoil mechanism.

Flywheel puller. Fig. 4 shows a special flywheel puller that is available from one engine manufacturer. This tool is not absolutely necessary as the flywheel can be removed with ordinary tools as explained later.

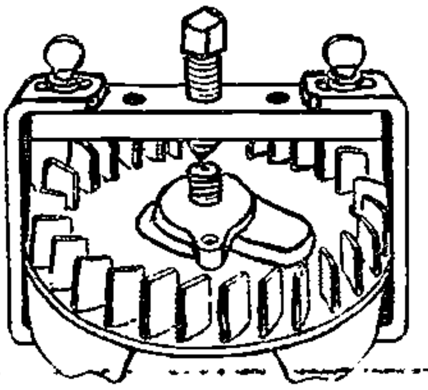

Fig. 4. A special puller may be used to remove a flywheel.

Valve spring compressor. Fig. 5 shows a special valve spring compressor for small engines. This tool is useful in controlling valve springs when removing and replacing valves.

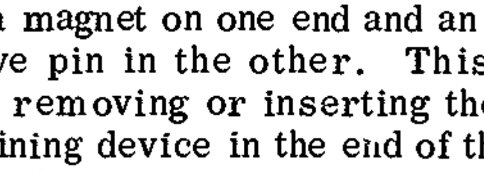

Fig. 5. Valve spring compressor.

Valve key inserter. Fig. 6 shows a device with a magnet on one end and an opening for a valve pin in the other. This tool is useful for removing or inserting the pin or other retaining device in the end of the valve stem while the spring is compressed.

Piston ring expander. This device (Fig. 7) is made both for removing and replacing piston rings. Using this tool properly will avoid breaking rings.

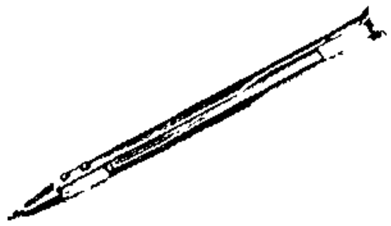

Fig. 6. Valve key inserter.

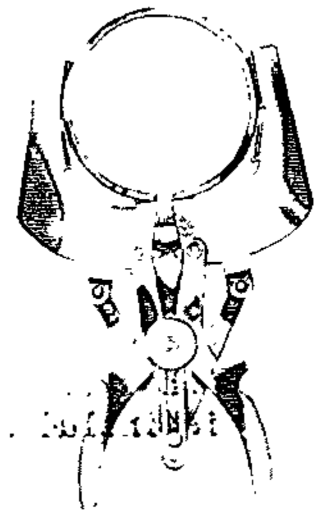

Fig. 7. Piston ring expander.

Piston ring compressor. Fig. 8 shows a piston ring compressor that is special for the small size piston found in a small engine. It is used for replacing the piston in the cylinder of a 4-cycle engine.

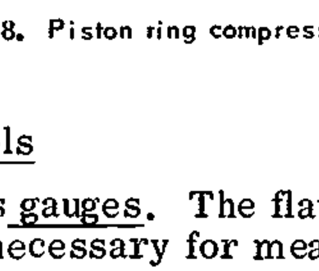

Fig. 8. Piston ring compressor.

Measuring tools

Thickness gauges. The flat feeler gauge (Fig. 9A) is necessary for measuring clearance between the piston and cylinder wall, piston ring gap, breaker point clearance,

Describe

Source (agency)
(address)

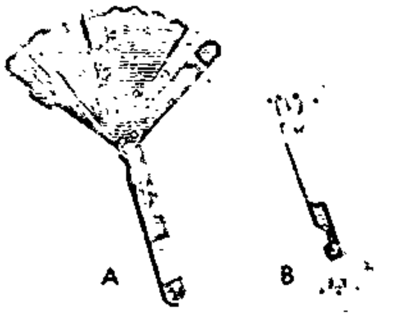

Fig. 9. Thickness gauges may be (A) flat-type for general use or (B) wire-type for measuring spark plug gap.

etc. The wire-type gauge (Fig. 9B) is preferred for measuring spark plug gap. It also has a notched lever for bending the flat terminal in setting spark plug gap.

Micrometers. Fig. 10 shows a set of three outside micrometers that are needed for measuring pistons, crankpin bearings, and other external diameters. One micrometer measures from 0 to 1 inch, one from 1 to 2 inches, and the third from 2 to 3 inches, all in thousandths of an inch.

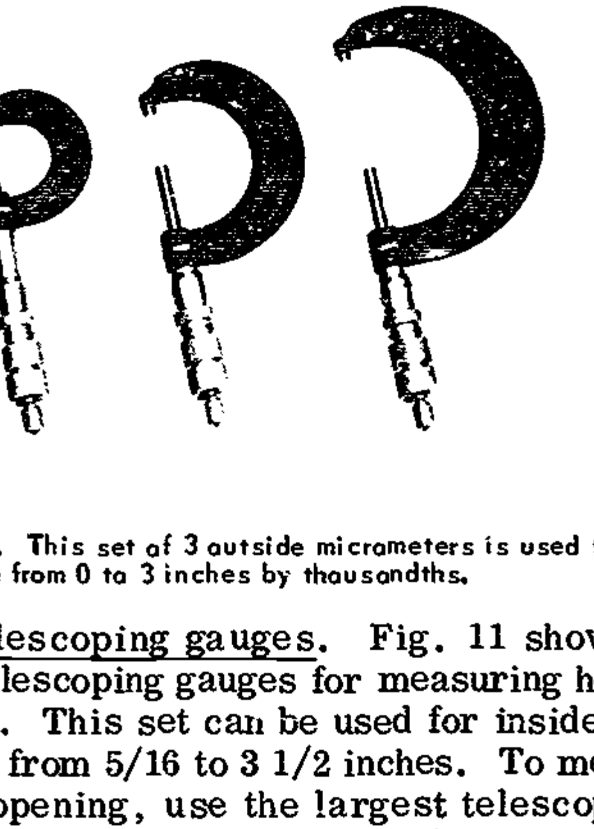

Fig. 10. This set of 3 outside micrometers is used to measure from 0 to 3 inches by thousandths.

Telescoping gauges. Fig. 11 shows a set of telescoping gauges for measuring holes or slots. This set can be used for inside diameters from 5/16 to 3 1/2 inches. To measure an opening, use the largest telescoping gauge that will go in when the plunger is depressed and locked. The plunger is spring-loaded so it expands against the sides of the opening when unlocked. Lock it in this position. Then remove the gauge and measure it with an outside micrometer to determine the exact diameter of the opening. When used this way, the telescoping gauge substitutes for an inside micrometer.

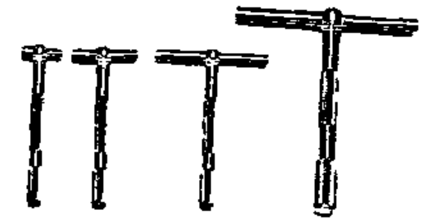

Fig. 11. This set of telescoping gauges is used to measure inside diameters from 5/16" to 3 1/2".

Miscellaneous tools

Torque wrench. The torque wrench, shown in Fig. 12, measures the torque applied in tightening a stud or nut. Its range is from 0 to 600 inch-pounds. It has a 3/8-inch square drive and is used with a standard set of sockets for tightening head bolts, bearing cap studs, spark plugs, etc. Most large torque wrenches read in foot-pounds and are not suitable for small engine work.

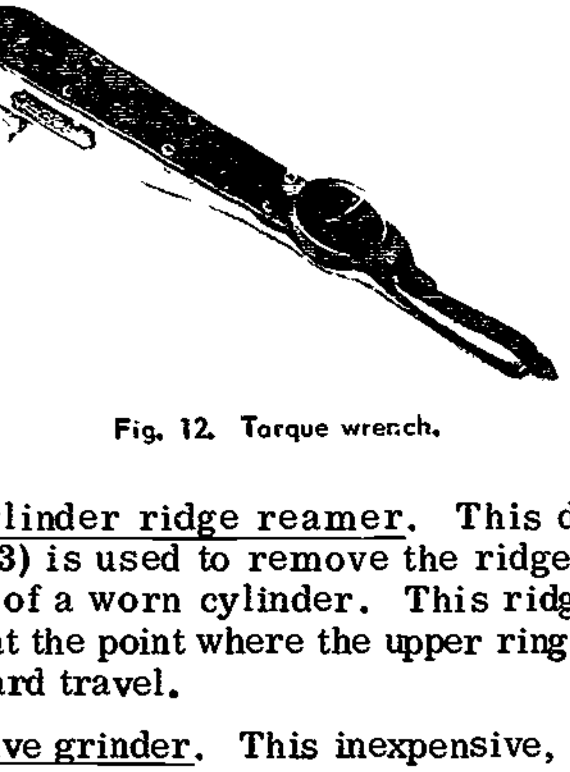

Fig. 12. Torque wrench.

Cylinder ridge reamer. This device (Fig. 13) is used to remove the ridge from the top of a worn cylinder. This ridge develops at the point where the upper ring stops its upward travel.

Valve grinder. This inexpensive, hand-

Fig. 13. Cylinder ridge reamer.

operated device (Fig. 14) may be used for light grinding of valve seats. It is of doubtful value if valves are in need of reconditioning.

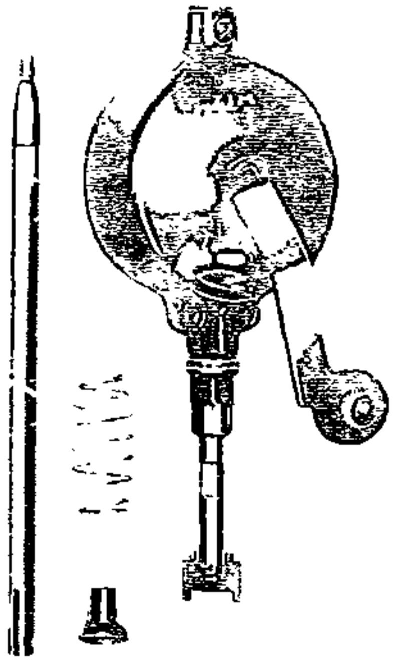

Fig. 14. Hand valve grinder.

Valve facing machine. This is an item of precision equipment (Fig. 15) that is not often available in a school or home shop. Unless a considerable amount of valve work is done, it may be more economical to have valves refaced at an implement dealer's shop or a commercial garage.

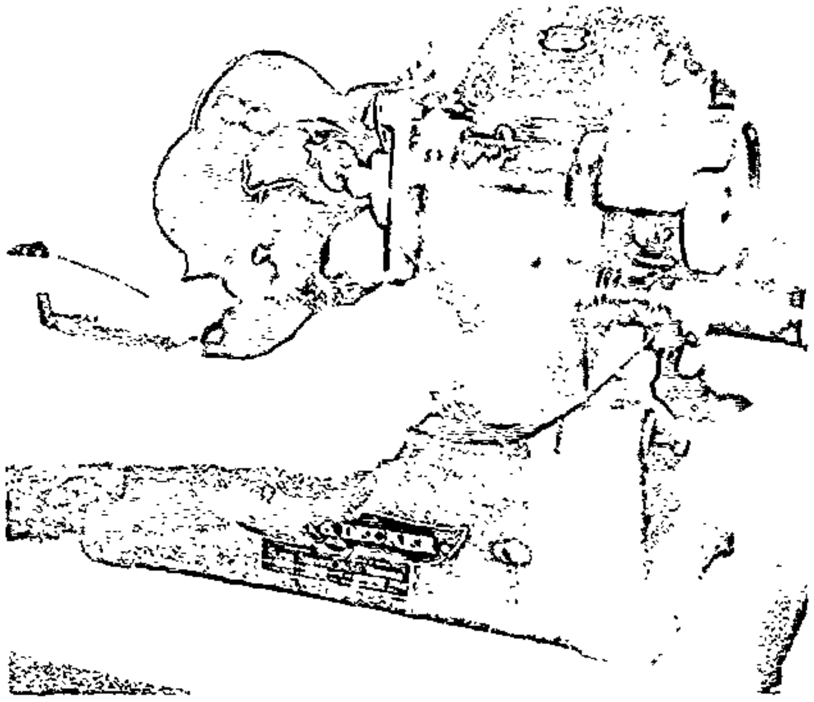

Fig. 15. Valve facing machine.

Valve seat grinder. This tool (Fig. 16) is the counterpart to the valve facing machine. It is advisable to have the valve seats reground when the valves are refaced in order to obtain a precise fit.

Fig. 16. Valve seat grinder.

2. DISASSEMBLING THE ENGINE

Preparing for disassembly

Before taking the engine apart, clean it thoroughly to avoid getting dirt into the internal parts. Loosen dry dirt with a putty knife and a stiff brush. Then blow it off with an air hose.

Clean off oil and grease with a safe solvent (not gasoline) and wipe parts dry with rags. It is generally necessary to remove the flywheel shield and other sheet metal parts to complete the cleaning.

Drain the fuel from the tank and the oil from the crankcase (4-cycle engine).

Remove air cleaner, carburetor, and fuel tank

Remove the air cleaner assembly. If it is an oil-bath type, drain and discard the old oil.

Unless you have a manual that shows a detailed picture of throttle linkage, attachment of springs, etc., draw a sketch of these parts before you disconnect them from the carburetor. It is difficult to get them hooked up again properly without a drawing or picture.

If the engine has a gravity fuel system, remove the fuel tank, disconnect the fuel lines, and remove the carburetor. If the engine has a suction system, remove the carburetor and fuel tank together. Place these parts in a box or other container and set it aside.

Remove the flywheel

Examine the threaded end of the flywheel shaft carefully to determine whether it has a right-hand or left-hand thread. You may also find this information in the manual.

Hold the flywheel with the shop-made tool shown in Fig. 1 or with a special wrench. Do not attempt to hold it with a screwdriver or a pry bar wedged between the flywheel fins. These fins break off easily and this throws the flywheel out of balance. On some rope-start engines, you can use a socket wrench to remove the flywheel nut, but if it has a recoil mechanism, a special wrench may be required as described previously. Use a sharp blow on the wrench with your hand to loosen the nut.

The flywheel is usually keyed on to a tapered shaft. To remove the flywheel, have a helper hold the engine up by the flywheel an inch or two above the bench. Hit the end of the shaft a sharp blow with a lead hammer or protect the threads with a hardwood block and strike the block with a hammer. The weight of the engine together witn the impact of the hammer will loosen the flywheel (Fig. 17).

Remove the engine head (4-cycle engine)

Remove the spark plug from the head first. Use a spark plug wrench that fits to avoid damage to the porcelain of the plug.

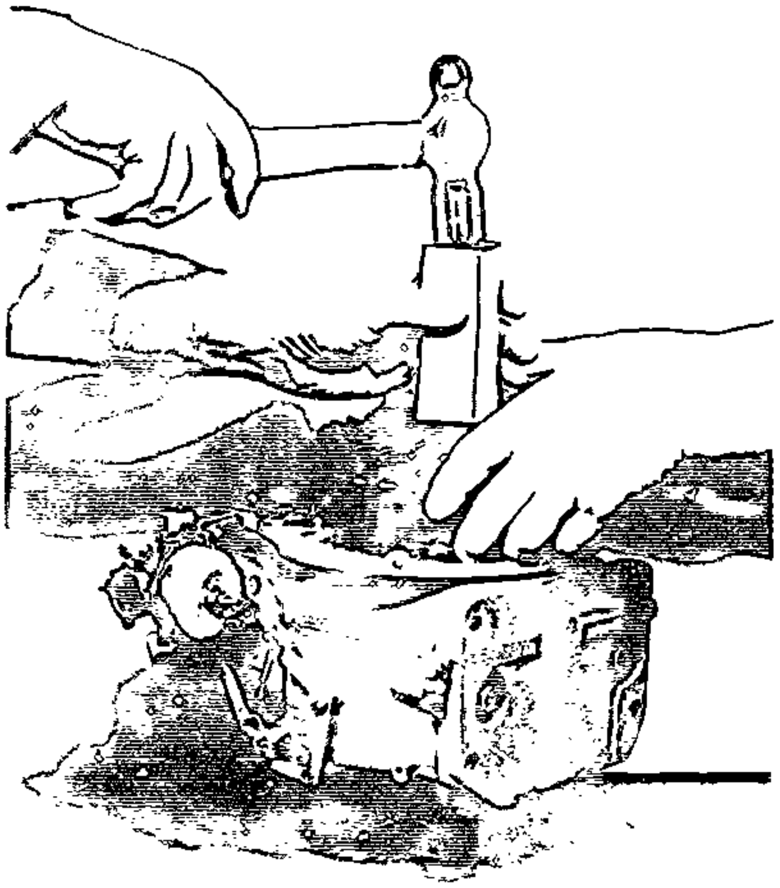

Fig. 17. Hold the engine by the flywheel and strike the end of the shaft a sharp blow, using a wood block to protect the threads.

Loosen and remove the head bolts. Note any difference in length of these bolts so you can properly reassemble the head later. Also note if a brace support or a spark plug shorting device is held in place by any of the head bolts.

Clean the carbon off the head, the top of the piston, and around the valves. If any of these parts are made of soft metal, be careful to avoid scratching them. Place the spark plug, engine head, and head bolts in a container so they will not be misplaced.

Open the crankcase

Note carefully how the engine is put together. To open the crankcase on some engines, you must remove the entire engine base. On others, one side of the engine comes off. If the engine is of the latter type, determine whether its main bearings are ball bearing or sleeve bearing type. You may find this in the manual. Type of bearings is often coded in the engine model number.

If the engine has ball bearings, it is usually necessary to remove the grease seal and a bearing locking ring before the side can be taken off. You have to destroy this seal to remove it. Drive a scratch awl or other sharp tool into the seal and pry it out (Fig. 18). Then remove the bearing locking ring (Fig. 19).

Before you remove the side of the crankcase, check for burrs or roughness on the exposed end of the crankshaft. If necessary use a fine file or emery cloth to smooth the shaft. Remove the bolts and slide off the side of the engine, exposing the crankcase.

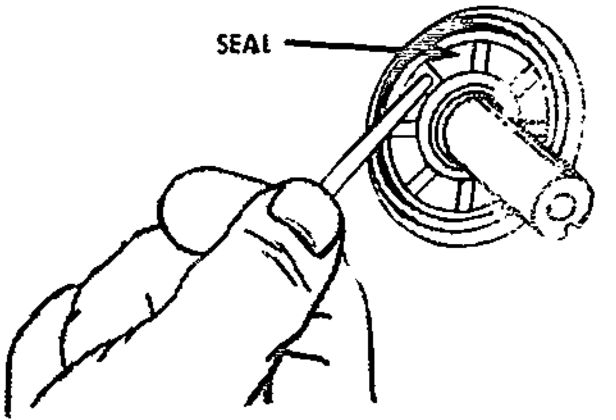

Fig. 18. Drive a sharp tool into the seal and pry it out.

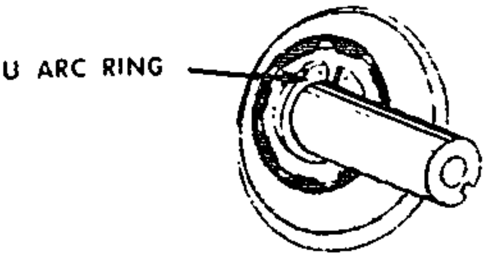

Fig. 19. The bearing is held on the shaft by a locking ring.

Be careful at this point not to let the timing gear fall out. It may be removed after you have noted the timing marks (Fig. 20). If you cannot find these marks, make them yourself with a sharp center punch before the gears are unmeshed.

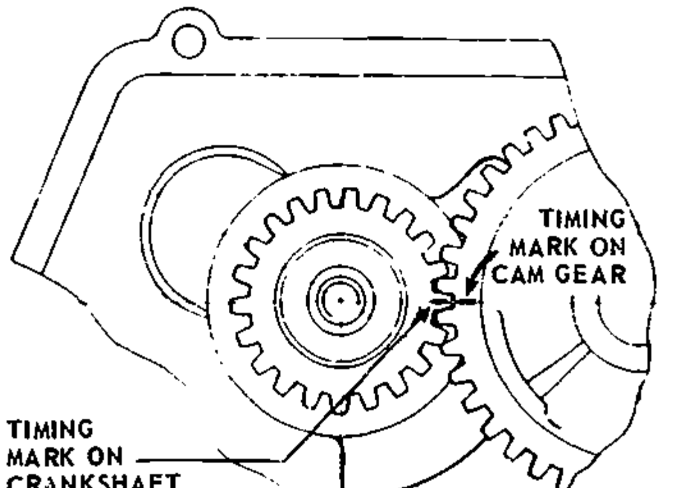

Fig. 20. Note timing marks on crankshaft and cam gears before unmeshing them.

VAS 3019

Remove the piston

Examine the upper end of the cylinder. If a noticeable sharp ridge is present, turn the engine so the piston is down out of the way. Remove the ridge with the ridge reamer. Unless you remove this ridge, the top ring may catch on the ridge and damage the piston when you force it out of the cylinder.

Before removing the crankpin bearing cap, note any marks on the cap and the connecting rod. It helps to write these things down. If no marks can be identified, mark these parts with a center punch so you can be ure to get them back in their original position.

Unscrew the studs holding the bearing cap and remove the piston from the cylinder. With a 4-cycle engine, push the piston out the top. Most 2-cycle engines do not have a removable head so the piston must be pulled out the bottom. Replace the bearing cap and keep all parts together.

Remove the piston rings

Use the piston ring expander to remove the rings from the piston (Fig. 21). Do not expand them more than necessary to free them from the grooves and slip them off the piston. Note any differences between the rings so they can be put back in the proper grooves and right side up.

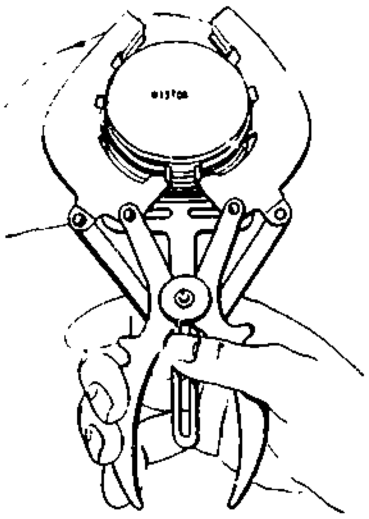

Fig. 21. Remove piston rings carefully to avoid breaking them.

Remove the valves

Four-cycle engine. Remove the valve cover, being careful to avoid injuring the gasket if possible. Adjust the jaws of the valve spring compressor so they are the right distance apart to engage the full length of the valve spring. Force the jaws onto the spring and tighten the compressor until the spring is fully compressed. This should free the pin or other retainer so it can be removed. Remove the valve, noting whether it is intake or exhaust. The valves may be marked or you can tell by their position relative to the intake and exhaust manifolds. The exhaust valve generally shows the effect of greater heat.

The valve springs may be removed or they may be left in place by releasing the valve spring compressor. If you remove the springs, tag them so they can be replaced in the proper position.

Two-cycle engine. Most two-cycle engines have a reed-type intake valve. Remove this and examine it carefully (Fig. 22). The reed is made of spring steel. It opens by suction and is supposed to spring shut to prevent loss of pressure back through the intake port. Hold the reed valve up to the light. If it is not light tight, it should be replaced before the engine is reassembled.

Remove the muffler and exhaust manifold. Clean the carbon out of the exhaust port with a hardwood scraper.

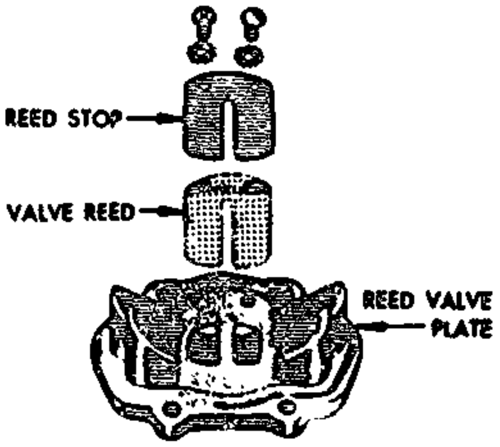

Fig. 22. The intake system on a two-cycle engine usually has a reed-type valve.

3. MEASURING CYLINDER, PISTON, AND RING WEAR

This is an important step in small engine repair. Unless you determine accurately the condition of these parts, you cannot be sure what should be done to restore the engine to good operating condition. Make all measurements carefully and check them with the manufacturer's standard for minimum, maximum, and reject dimensions. The figures quoted in this publication are for one model engine only and are given as examples. Consult repair manuals and other references to find corresponding figures for your engine.

Determining condition of cylinder

It is important first to determine the type and amount of wear that has taken place in the cylinder. If this is beyond acceptable limits, your choice is between having the cylinder rebored and fitted with an oversize piston and rings, or replacing the engine.

Cylinders may wear in three ways and usually in all three ways at once. They are (1) oversize in diameter; (2) out-of-round; and (3) taper. Following are the limits for our example engine:

	Minimum	Maximum	Reject
Cylinder diameter	2.3115	2.3125	2.3145
Out-of-round			
Cast iron			.0015
Lightweight			.0025
Taper			.006

Measuring diameter. Select the largest telescoping gauge that will fit inside the cylinder. Place it crossways in the center of the cylinder down about an inch from the top. Release the lock and let it expand against the cylinder walls. Be sure the plunger and stationary leg are held exactly perpendicular to the cylinder wall. Lock the gauge, remove it carefully, and measure with the micrometer. If your reading is between the maximum and minimum, wear in cylinder diameter has not been excessive. If it exceeds the reject dimension, you should conclude that the engine cannot be put in good working condition without being rebored. Repeat your measurement several times to be sure you are right.

Measuring for out-of-round. Repeat the diameter measurement first with the telescoping gauge held parallel to the crankshaft and then at a right angle to it. Compare these measurements. If they differ by more than the allowable amount, reject the engine as being worn too much out-of-round. The measurement taken at a right angle to the crankshaft is usually the larger one as the cylinder tends to wear more in the path of crank travel.

Measuring for taper. Take measurements near the top and bottom of the cylinder with the telescoping gauge held at a right angle with the crankshaft. If these measurements differ by more than the allowable amount, reject the engine on the basis of too much taper. Cylinders normally wear faster near the top than near the bottom because of greater heat and consequent poorer lubrication.

Taper can be measured in another way with no special equipment except a piston ring and a feeler gauge. Place a piston ring in the cylinder near the top. Use the piston upside down to position the ring exactly straight in the cylinder. Measure the ring gap with a feeler gauge (Fig. 23).

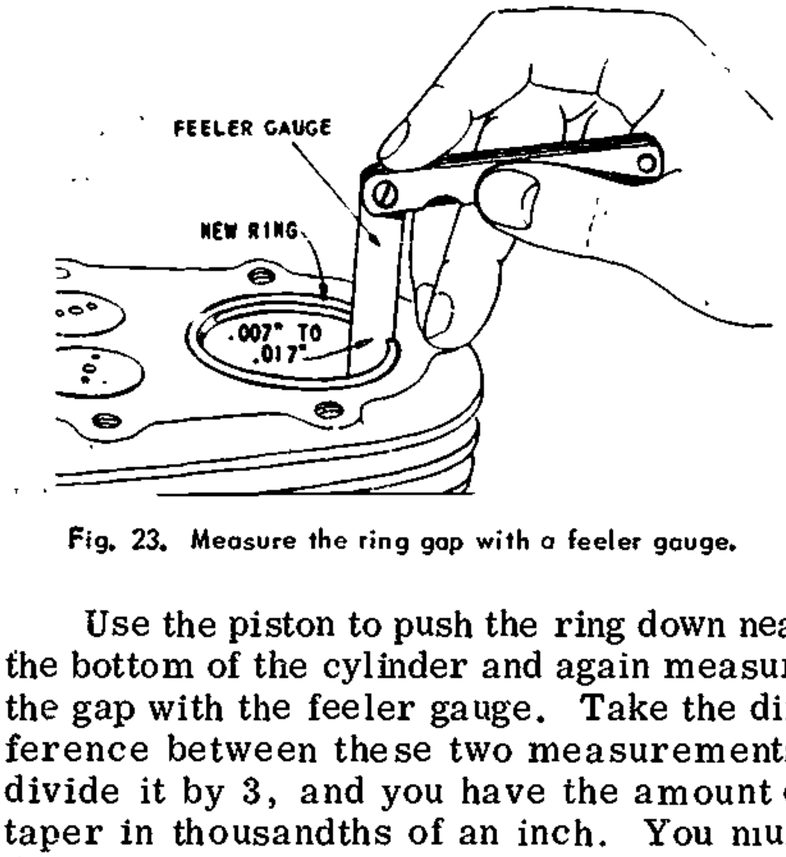

Fig. 23. Measure the ring gap with a feeler gauge.

Use the piston to push the ring down near the bottom of the cylinder and again measure the gap with the feeler gauge. Take the difference between these two measurements, divide it by 3, and you have the amount of taper in thousandths of an inch. You must divide by 3 (actually by pi or 3.1416) because taper is expressed in diameter and you were measuring difference in circumference. Circumference is pi X diameter, or diameter is circumference ÷ pi.

This simple test for taper is often enough to help you make a fairly good estimate of cylinder condition. If it causes you to reject the cylinder on the basis of taper, the other measurements are not necessary. If no serious taper is found, it is reasonable to assume that the cylinder is not badly worn in diameter or out-of-round.

Determining condition of the piston

If none of the cylinder measurements indicate rejection, the next step is to determine if the piston is suitable for reuse. First clean the carbon out of the ring grooves. A good tool for this purpose may be made by grinding a sharp edge on a broken piston ring (Fig. 24). Avoid cutting any metal out of the groove, particularly if the piston is made of lightweight, soft metal.

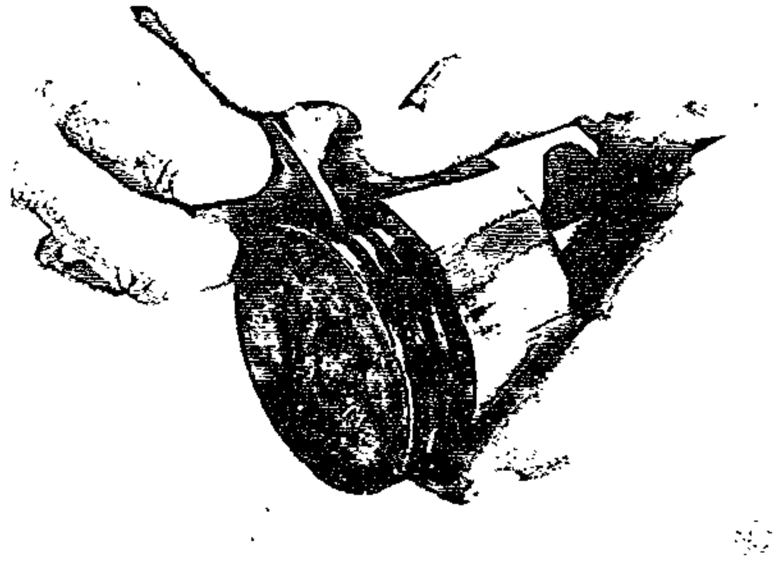

Fig. 24. Clean the carbon out of the piston ring grooves with a broken ring, ground to a sharp edge.

Two common reasons for rejecting a piston are (1) excessive wear in the upper ring groove; and (2) excessive piston skirt clearance. Manufacturer's recommendations for our example engine are:

	Minimum	Maximum	Reject
Ring groove side clearance			.007
Piston skirt clearance	.005	.007	.008

To determine wear in the upper ring groove, place a new ring on the piston and measure the clearance between the side of the ring and the groove with a flat feeler gauge (Fig. 25). Replace the piston if it exceeds the reject figure.

To measure piston skirt clearance, remove the ring and place the piston in the cylinder upside down and measure the clearance

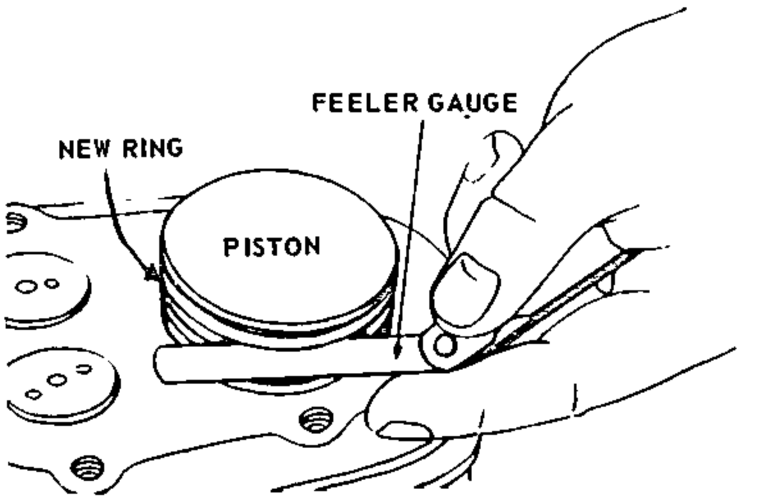

Fig. 25. Measure clearance between a new ring and the upper piston ring groove.

between the piston skirt and the cylinder wall (Fig. 26). Make this measurement at a right angle to the piston pin. You may find it easier to push the piston and a leaf of the feeler gauge down into the cylinder together. You have the right thickness leaf when it requires about a 5 pound pull to remove the feeler gauge.

Determining condition of piston rings

Piston ring end gap should be measured for each compression ring and the oil ring. To measure the end gap, place the ring inside the cylinder near the top of its working range and use the piston to true it up. Determine the amount of gap between the ends of the ring with a flat feeler gauge.

Manufacturer's recommendations for the example engine are:

	Minimum	Maximum	Reject
Compression ring	.007	.017	.035
Oil ring	.007	.017	.045

If your measurement of ring end gap exceeds the allowable amount, the rings should be rejected. Bear in mind, however, that it is not worthwhile to install new rings in an engine if either the piston or cylinder is beyond the reject point in wear.

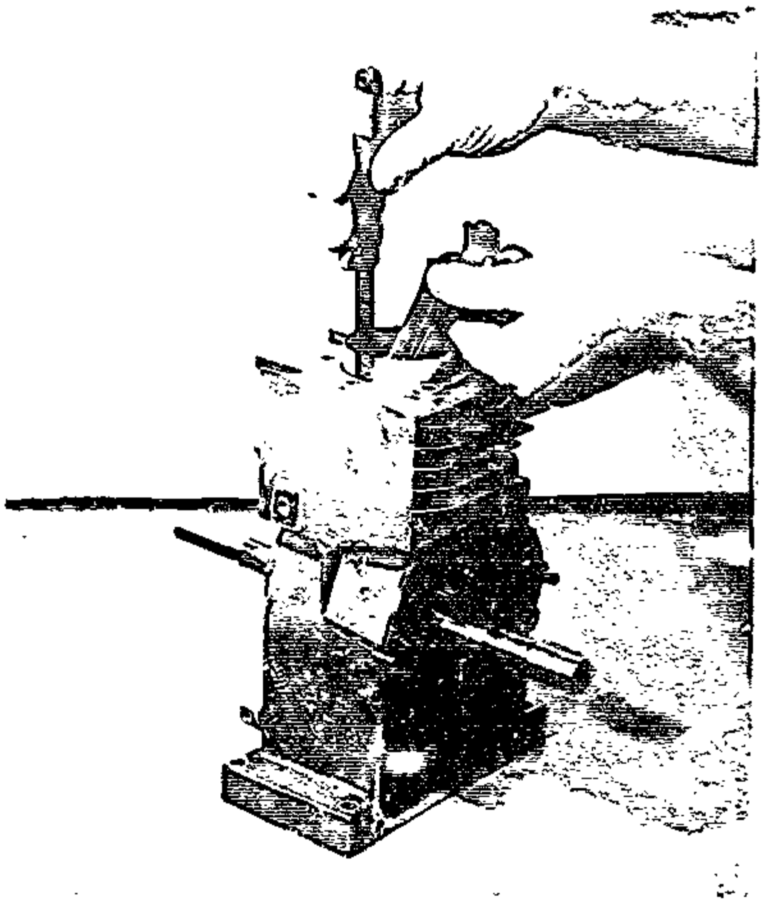

Fig. 26. Measure piston skirt clearance with a flat feeler gauge.

4. CHECKING CRANKPIN AND BEARING

Crankpin

The crankpin, or part on the crankshaft to which the connecting rod bearing is attached, should be checked for three things -- (1) scoring; (2) diameter wear; and (3) out-of-round. If the crankpin is badly scored due to poor lubrication or bearing disintegration, the crankshaft should be rejected.

Consult manufacturer's recommendations for minimum diameter and maximum out-of-round. For our example engine they are:

	Reject
Crankpin diameter	.867 or less
Out-of-round	.0007 or more

Measure the diameter of the crankpin with a small micrometer. Measure it several times in several places to determine actual diameter and differences in diameter or out-of-round. If either of these measurements indicate rejection, it will be impossible to fit the connecting rod bearing properly. Crankpins can be built up and reground or the crankshaft can be replaced, but either of these alternative may be so expensive you will decide to replace the engine.

Crankpin bearing

Again the manufacturer specifies a minimum, maximum, and reject bearing clearance. For our example engine, they are:

	Minimum	Maximum	Reject
Crankpin bearing clearance	.0015	.0045	.0095

A convenient way to measure bearing clearance is to use a plastic thread (Plastigage) made by a leading manufacturer of automotive and engine parts. Place a piece of the plastic thread about as long as the width of the bearing on the crankpin and tighten the bearing cap over it. Use the torque wrench and tighten the studs to the recommended torque. For our example engine this is 70 to 80 inch-pounds. Without turning the engine, remove the bearing cap carefully and measure the width of the flattened plastic with the paper gauge furnished with the material (Fig. 27). You read this gauge directly in thousandths of an inch of bearing clearance.

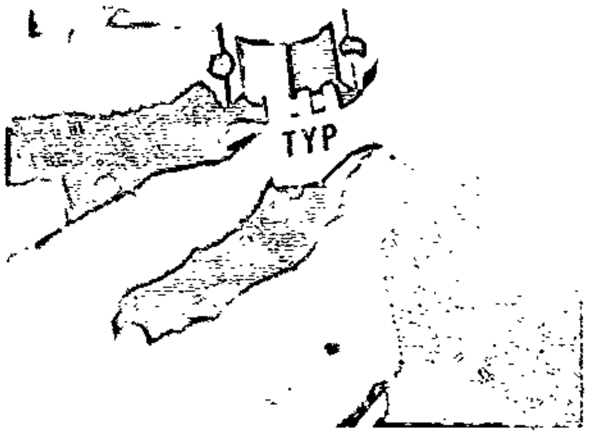

Fig. 27. Measure bearing clearance with Plastigage.

The plastic thread comes in different sizes. For small engine work, two sizes are generally sufficient -- .001 to .003, and .002 to .006. If you place the piece of plastic parallel to the crankshaft, your measurement will indicate bearing clearance. If you place it at a right angle to the crankshaft and use a piece long enough to extend about half way around the bearing, your measurement will give some indication of out-of-round.

If the crankpin is not too badly worn but bearing clearance is beyond the rejection point, you may correct the problem by replacing the connecting rod.

5. REPLACING THE PISTON

Having made the measurements on the cylinder, piston, rings, and crankpin bearing and having determined what parts should be replaced, you are ready to install these parts. Let us assume that the only parts you found necessary to replace were the piston rings.

Clean the cylinder wall thoroughly, first with an oil-soaked rag and then with a clean white rag. Continue until the clean rag shows no dirt. Do not use solvent as this would remove the protective oil film that has penetrated into the pores of the cylinder-wall surface.

Checking new rings

Place each new ring in the cylinder, true it up with the piston and check the ring end gap. If your cylinder measurements have been accurate, ring gap will probably be satisfactory. If the gap is found to be too small, file off the end of the ring carefully, holding it in a vise.

Installing new rings on the piston

Use the piston ring expander to install the rings on the piston. The oil ring is usually put on first and it can be either side up. The compression rings may be different. The center compression ring may have a slight recess on one outside edge, called a scraper groove. This scraper groove goes down. The upper compression ring may have a recess on one inside edge. This recess goes up. Fig. 28 shows the various rings and the proper position of each.

The piston of a 2-cycle engine may have a small pin or knob in each ring groove to keep the ring from turning (Fig. 29). The ring must be installed so this pin comes in the ring gap. These knobs are to prevent the ends of the rings from catching in the cylinder ports. If you install these rings improperly, they are likely to be broken when you force the piston into the cylinder.

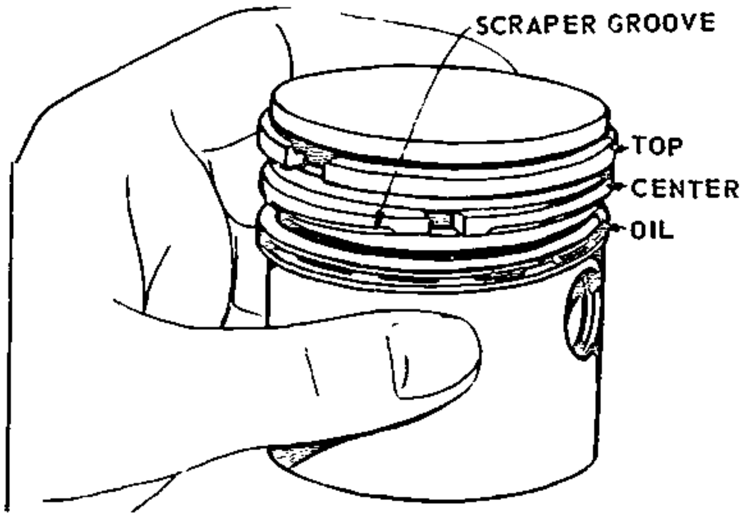

Fig. 28. Rings should be installed in correct position on the piston.

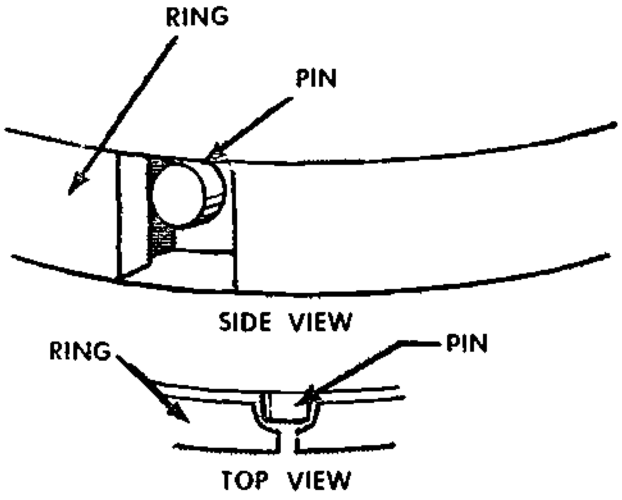

Fig. 29. Some pistons have a pin in each ring groove that fits in the ring gap.

Installing the piston in the cylinder

Squirt some oil on the piston and around the rings. Then lower the piston into the cylinder with the connecting rod bearing turned the right way until the projecting oil ring is in contact with the engine block. Place the ring compressor over the piston and tighten it to squeeze the rings into their grooves. Then push the piston down until all rings are inside the cylinder.

Oil the crankpin bearing surface, put on the bearing cap, and tighten the studs to specified tension with a torque wrench (70-80 inch-pounds). Turn the engine over to be sure it moves freely. If not, you may have the piston in backwards as some engines have a slightly offset connecting rod which binds if it is not installed in correct position. If the engine turns freely, lock the studs, and close up the crankcase.

In a 2-cycle engine, the piston is usually put in from the bottom. Be sure you have it turned correctly (Fig. 30). It is not necessary to use a ring compressor since the bottom of the cylinder has a chamfer which compresses each ring into its groove as the piston is pushed up.

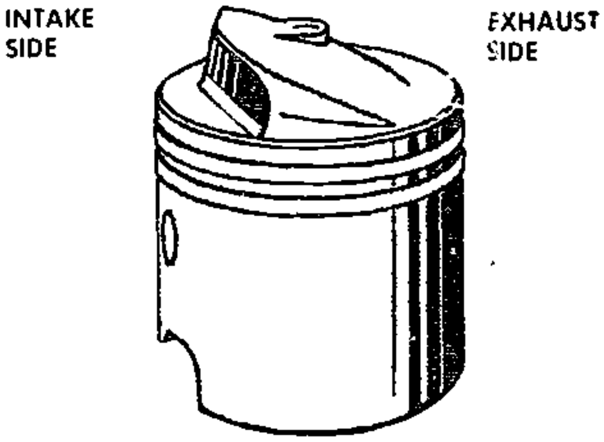

Fig. 30. Note the correct position of the piston in a 2-cycle engine.

6. SERVICING THE VALVES

Inspect the valves and valve seats carefully for evidence of improper contact and leakage. The mark of contact on both the valve and its seat should be clean and continuous. Since valve condition is so important in maintaining good compression, it is usually advisable to reface the valves when overhauling an engine.

Refacing valves

As mentioned previously, this is done on a special valve facing machine. The following suggestions are made in case you have access to a facing machine. Otherwise the valves can be taken to a repair shop for this work.

Dress the wheel lightly with the special diamond dressing tool before you use it to be sure the wheel is clean and true. Check the angle setting of the machine to be sure it is the same as your valves. For most small engines this angle is 45° but you should verify this from your manual.

Place the valve stem in the chuck and tighten securely. Start the machine and slowly move the valve up to the face of the wheel, moving it across the wheel steadily when it begins to cut. Take light cuts and continue only until the cutting is continuous around the entire valve face. You can tell this by the sound.

It is not until facing has been completed that you can tell for sure if the valve can be reused. The width of the valve margin on a new valve is usually about 1/32 inch (Fig. 31). If this margin is less than 1/64 inch wide after refacing, the valve should be rejected. Without this minimum width, the valve will overheat and warp or burn.

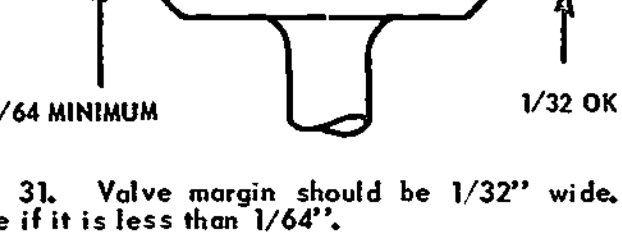

Fig. 31. Valve margin should be 1/32" wide. Reject valve if it is less than 1/64".

Servicing valve seats

If the valve seat is in bad condition, it may be reseated with the special reseating tool. Select the right size pilot to fit tightly in the valve guide and use a stone of proper diameter and angle. Dress the stone each time before using it. Grind the seat lightly until a clean, continuous line is formed.

Some engines have valve seat inserts made of hard alloy steel. These can be replaced but a special tool is required for removing the old seat (Fig. 32). Prepare the new insert by placing it in a freezer for several hours to shrink it so you can press it into the recess in the engine block. Then you peen the area around it with a ball peen hammer to hold it in place. A new insert should be lightly ground with the reseating tool to true it up.

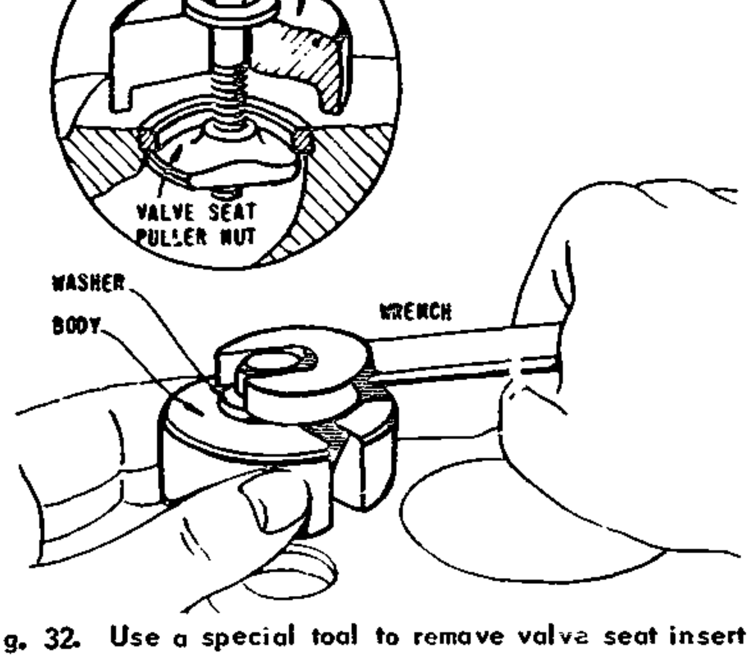

Fig. 32. Use a special tool to remave valve seat inserts.

Replacing the valves

After the valves have been refaced or replaced, they may be ground lightly with the hand grinding tool. Use fine valve grinding compound and grind only until a continuous mark shows around the valve face and seat. Too much hand grinding will destroy the effect of refacing because the valve may not seat where you ground it when the engine gets hot.

Wipe all traces of valve grinding compound off the valve faces, stems, valve seats, and guides. This material is very abrasive and will cause rapid wear if left on any moving parts.

Replace the valve springs and keepers, using the valve spring compressor and the pin inserter. Turn the engine over to be sure the valves are opening and closing properly.

Checking and adjusting tappet clearance

Be sure the valves are in fully closed position when you measure tappet clearance. Turn the engine over until the intake valve starts to open. The piston should be going down on the intake stroke at this time. Keep turning until the piston reaches the top again. This is the end of the compression stroke and both valves should be fully closed.

Measure the gap between the end of the valve stem and the tappet with a flat feeler gauge. This gap should be between the minimum and maximum prescribed by the manufacturer. For our example engine, these figures are:

	Minimum	Maximum
Intake valve	.005	.007
Exhaust valve	.009	.011

Too little clearance is very serious as it will not allow the valve to close fully when the stem has expanded with the heat. If a valve does not close and seat properly, it overheats and burns rapidly. Too much clearance makes a valve open a little too late. It also opens less than the full amount. Both of these things cause some loss of power.

Refacing and reseating causes the valves to seat deeper so tappet clearance is generally reduced. The only way to restore proper clearance on most small engines is to grind off the end of the valve stems. The valves must be removed from the engine for this operation.

If valve stems are ground off by trial and error, it is usually necessary to put them in and take them out of the engine several times in order to get the clearance just right. The valve springs must be secured to the valve each time before an accurate measurement can be taken. To avoid this repetition, note the first time how many thousandths of an inch must be removed from each valve stem. Take the valves out and measure the length of each with the large micrometer before you start grinding off the stems (Fig. 33). By alternate grinding and measuring, you can take off the desired amount.

Replace the valves, make a final check of tappet clearance and replace the valve cover.

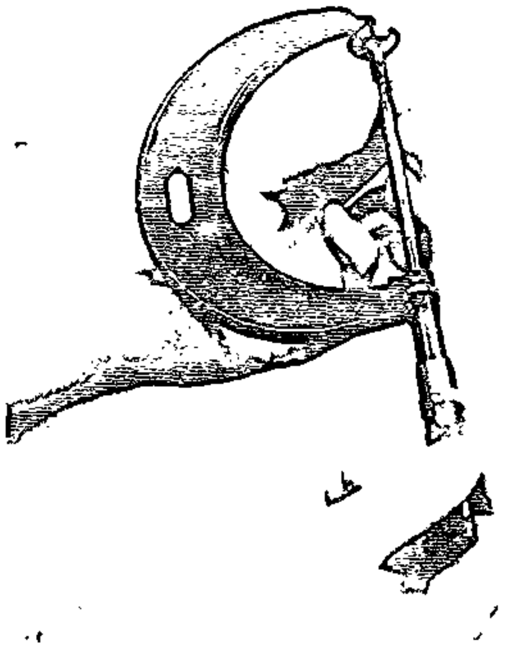

Fig. 33. Measure the length of the valve with a micrometer.

7. REPLACING THE ENGINE HEAD

After the valves have been serviced, you are ready to replace the engine head. It is advisable to obtain and use a new head gasket. Place the head in position and insert the head bolts. Draw them up evenly until they are snug.

Use the torque wrench to finish tightening the head bolts after determining the proper torque from the manual. For our example engine it is 125 to 150 inch-pounds. Alternately tighten bolts on one side and the other so that the head is drawn down evenly.

Do not replace the spark plug at this time. It will be easier to turn the engine over while servicing the ignition system if you do not have to work against compression.

8. REPAIRING THE CARBURETOR AND FUEL SYSTEM

Two types of fuel systems are common on small engines. They are the gravity system in which the tank is elevated above the carburetor and the suction system in which the tank is below the carburetor. With either type, clean out the tank thoroughly and rinse it with gasoline. Blow fuel lines clear with compressed air.

Servicing the float-type carburetor

The gravity system has a float-type carburetor which is quite similar to that of a large engine. It should be disassembled for checking, cleaning, and replacement of parts.

If the main fuel jet adjustment is on the side of the carburetor as in Fig. 34, remove the

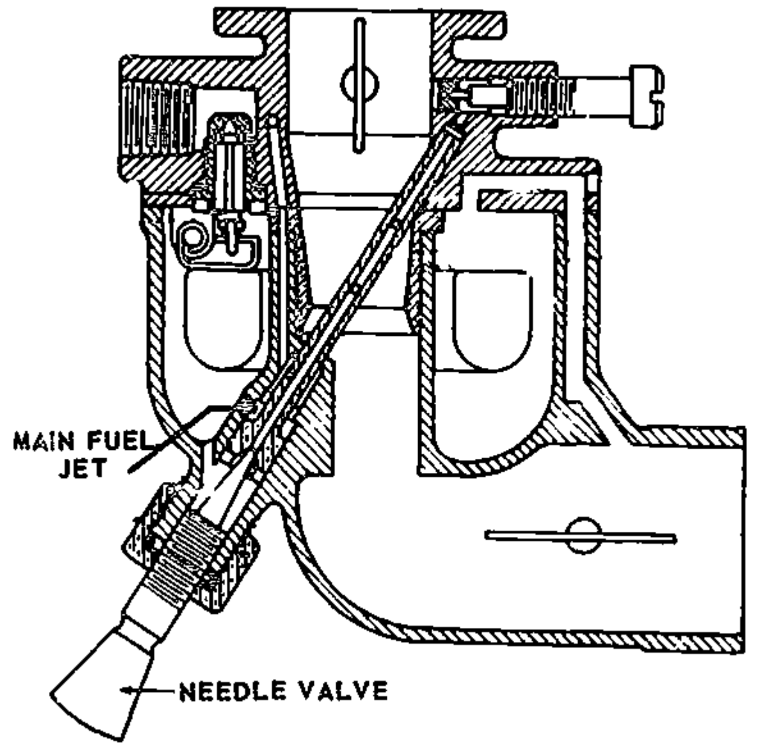

Fig. 34. Remove the main fuel adjusting needle valve and jet before disassembling the carburetor.

main fuel jet before taking the carburetor apart. This jet extends up through both halves of the carburetor and may be damaged if it is not removed first. Loosen the needle valve packing nut and remove the needle valve and nut together. Unscrew and remove the main fuel jet using a screwdriver that has been ground to the proper width and thickness to fit the slot in the jet. You can see this slot if you look inside the opening from which the needle valve has been removed.

Remove the screws and open up the carburetor, noting how all parts fit together. Remove the float and float valve. Remove the idle jet needle valve.

Clean the carburetor bowl and all parts with special gum solvent or lacquer thinner. Wipe parts dry and lay them out so you can examine them.

If the float valve has a groove around it that you can feel with your finger nail, replace it and its seat. Do the same with the two needle valves. Shake the float to see if there is any fuel inside it. If so, this indicates that the float has a hole in it and should be replaced.

Reassemble the float valve seat, float valve, and float. Check the float position when the valve is fully closed. In most cases the float should be at right angles to the carburetor body when the valve is closed (Fig. 35).

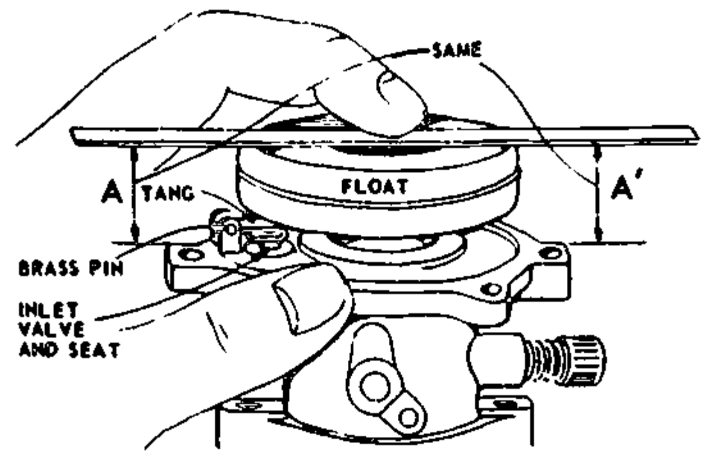

Fig. 35. Float position is correct when A and A' are the same.

If necessary, adjust by bending the projection that presses against the float valve.

Check the throttle shaft for wear and replace if there is noticeable looseness between the shaft and bearings. If the bearings are not replaceable, the entire carburetor should be replaced.

Reassemble the carburetor using new gaskets. Reconnect the fuel line and the linkage between the throttle, governor, and manual controls.

Servicing the suction-type carburetor

Remove the fuel tank from the carburetor, being careful not to damage the fuel tube. In the suction system the fuel tank corresponds to the carburetor bowl. The tank is generally made broad and shallow so that the variation in height of fuel level between a full and empty tank is held to a minimum.

Remove the fuel tube from the carburetor. This is generally a press fit and the tube may be held in a vise for removal as shown in Fig. 36. Test the ball check in the bottom of the fuel tube by blowing through it both ways. It should be air tight when blown from the

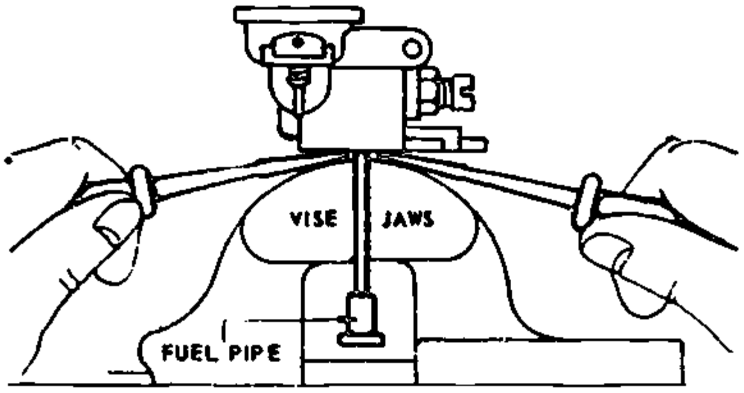

Fig. 36. Hold fuel pipe in a vise and pry it out of carburetor body with two screwdrivers.

top but the ball should open when you blow through the screen end.

If the ball is stuck or grimy, soak it in gum solvent or lacquer thinner until it is clean and free. Clean the screen also and replace the entire fuel tube assembly if it cannot be put in good condition by cleaning.

This type carburetor usually has only a main fuel jet. Remove the needle valve so you can check it and its seat for wear. Replace these parts if they show wear as described previously. Open up the carburetor, clean, and inspect all parts before reassembling. Press the fuel tube into the bottom of the carburetor, using a bench vise as shown in Fig. 37. Reconnect the fuel tank.

Mount the carburetor on the engine, using a new manifold gasket, and reconnect the throttle linkage. Service the air cleaner according to manufacturer's recommendations and mount it in place.

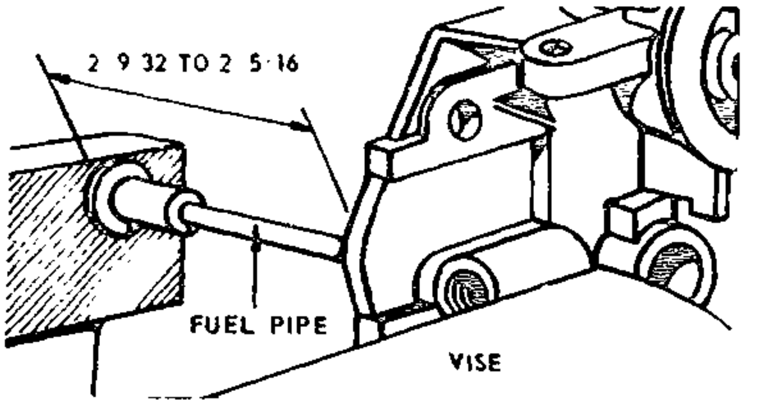

Fig. 37. Press new fuel pipe into carburetor body with a vise.

9. SERVICING THE IGNITION SYSTEM

Breaker points

Remove the breaker point cover and examine the condition of the points. If they are burned or pitted, they should be replaced. If you replace the points, have the condenser tested or replace it too.

Adjust the clearance between the breaker points when fully open to that recommended. For our example engine this clearance is .020. Wipe the blade of your feeler gauge clean of oil or grease before you use it to check point setting.

Spark plug

Inspect the spark plug for fouling, wide gap, or burned condition. Cleaning a dirty plug is a questionable practice. If in doubt, it is best to replace it with a new plug of the proper number as specified by the engine manufacturer.

Adjust the plug gap to the recommended clearance. For the example engine this is .025.

Coil and ignition wiring

The coil and ignition circuit can be tested with a 6-volt lantern battery as shown in Fig. 38. It is convenient to have a clip on the end of one battery wire and a test prod on the end of the other.

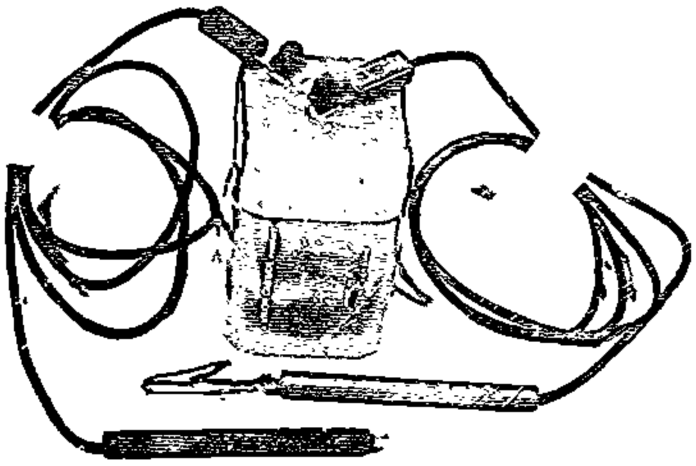

Fig. 38. A coil and ignition circuit tester.

Connect the spark plug wire to the plug and lay the base of the plug in contact with the engine head. Clip one battery wire to the engine frame. Turn the engine until the points are fully open and scratch the insulated part of the breaker point assembly with the test prod (Fig. 39). A spark should jump the gap at the plug. The spark is most intense when you touch the prod to the insulated point for a moment and then break contact quickly. This simulates the action of the breaker points when the engine is running.

If you get no spark at the plug, do not conclude immediately that the coil is defective. The trouble may be in the points, in the

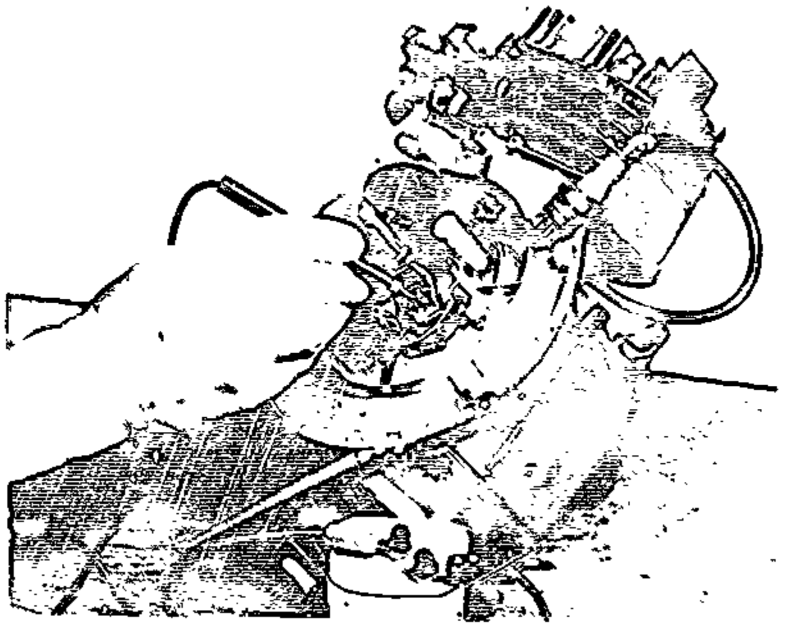

Fig. 39. Clip one battery wire to the engine frame. Scratch the insulated breaker point with the prod and a spark should jump the plug gap.

primary wire leading from the points to the coil, in the coil grounding wire, or in the secondary wire leading from the coil to the plug.

Note what kind of a spark, if any, occurs when you scratch the insulated point with the battery prod.

No spark. This means that the current is not going through the primary ignition circuit. Look for a poor connection or a break in the wire leading from the point assembly to the coil. A loose connection at the point where the coil winding is grounded will also cause this fault (Fig. 40).

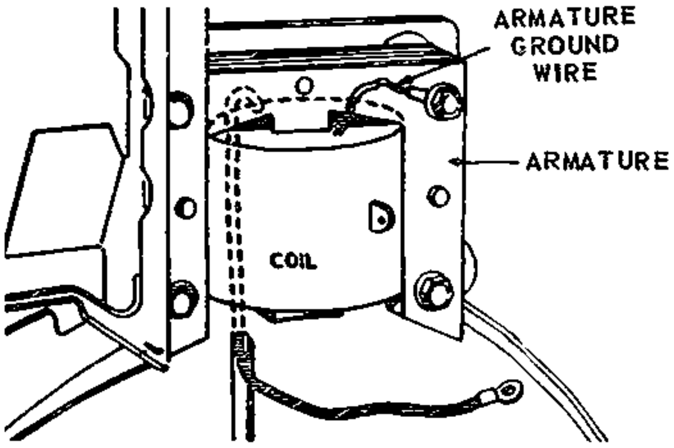

Fig. 40. The armature ground wire must be tight.

Small spark. A small spark of the same intensity that you get when you scratch the prod on the engine frame indicates that the insulated breaker point assembly is grounded somewhere. This may be due to the lug on the wire attached to the insulated point touching the frame, or to a break in the insulation on the wire leading from the point to the coil. Do not overlook the shorting mechanism that may be used to stop the engine. If your engine has a switch to turn it off, or if you close the throttle to stop it, this mechanism may be shorting out the points continuously.

Bright spark. This indicates that the primary circuit of the coil is probably all right. When you energize the primary circuit, a magnetic field builds up in the coil. When you break this circuit, the primary field collapses, giving a momentary surge of fairly high voltage back through the primary circuit. This causes a bright blue spark at your prod.

If you still get no spark at the plug and you are sure the plug base is making good contact with the engine head, look for trouble in the secondary circuit. Check the connection of the spark plug wire to the coil. It should be pinched tight as shown in Fig. 41 but not soldered.

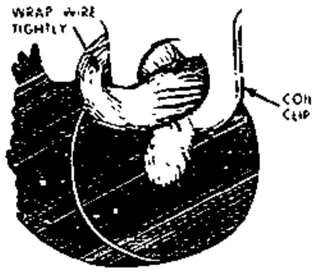

Fig. 41. The spark plug wire should be pinched tight but not soldered.

Look next for worn insulation on the spark plug wire, particularly where it passes through openings in the frame or under metal clips. High-voltage current may be shorting to the frame at these points. There may also be a break in the wire somewhere between the coil and the plug. To check these possibilities, disconnect the spark plug wire from the coil and connect a new piece of wire directly to the coil and plug.

If the plug still fails to fire, you may conclude that the coil is defective and should replace it with a new one.

Check magneto air gap

Magneto air gap is the distance between the rotating magnets in the flywheel and the stationary laminations of the coil. The closer these two come together without rubbing, the stronger the current produced by the magneto will be. Manufacturer's recommendations for magneto air gap for our example engine are:

	Minimum	Maximum
Magneto air gap		
Zinc flywheel	.008	.011
Aluminum flywheel	.018	.022

Coil and armature outside flywheel. If the coil and armature are outside the flywheel, checking and adjusting the magneto air gap is a simple procedure. Replace the flywheel. If the flywheel key is worn or partly sheared, use a new one. This is a special soft key supplied by the manufacturer which is meant to shear in case the engine jams or locks to avoid damage to the internal parts. Do not use a hardened steel key.

Check magneto air gap with a flat feeler gauge as shown in Fig. 42. If this gap is less than the minimum, or greater than the maximum, loosen the armature mounting screws. Adjust the armature to the proper gap and retighten the screws.

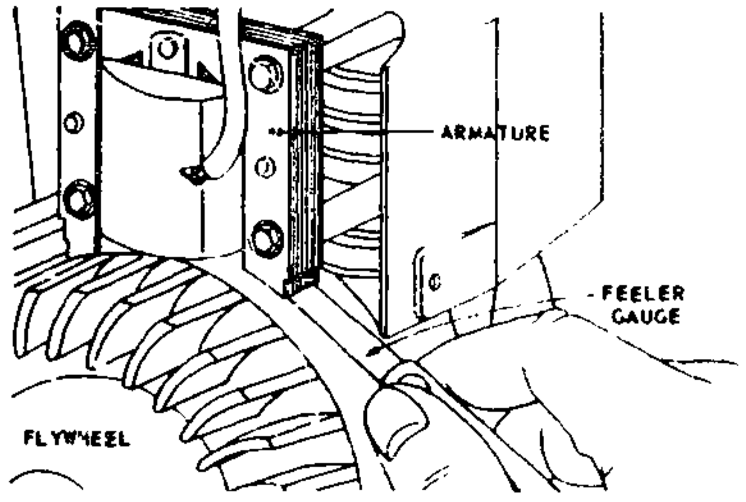

Fig. 42. Check magneto air gap with a flat feeler gauge.

An alternate method of setting magneto air gap if the coil and armature are outside the flywheel is to use special tag or a government postal card as shown in Fig. 43. A postal card is about .010 inches in thickness. Rotate the flywheel until the magnet pole pieces are opposite the stationary laminations of the coil. Place the card in the gap, loosen the screws holding the laminations, and allow the magnetic pull to draw the laminations down against the card. Tighten the screws and withdraw the card, leaving the proper air gap. Use two thicknesses of card for an aluminum flywheel.

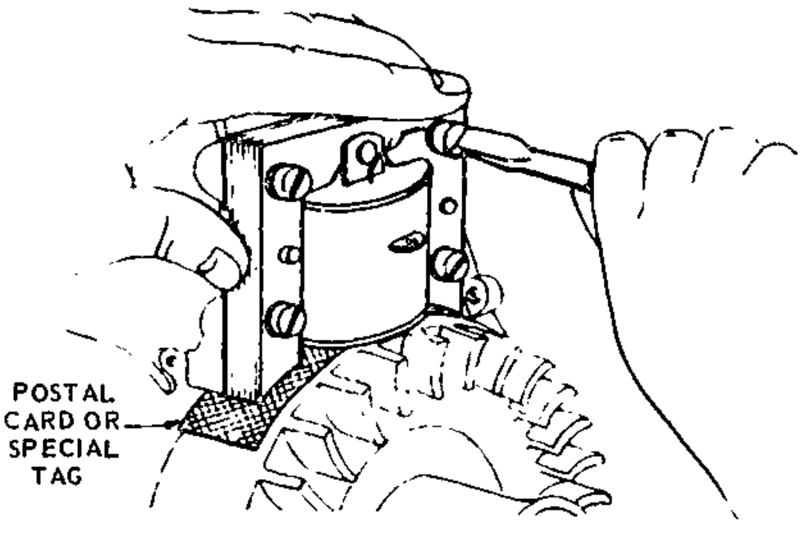

Fig. 43. Set magneto air gap with a postal card or special tag as the thickness gauge.

Coil and armature inside flywheel. If the coil and armature are inside the flywheel on your engine, it is somewhat more difficult to measure magneto air gap. One method is to wrap one thickness of electrician's plastic tape over the armature laminations as shown in Fig. 44. Replace the flywheel and tighten down the nut that holds it. Turn the engine over about twice and remove the flywheel, turning the magnets away from the armature before you disturb the wheel.

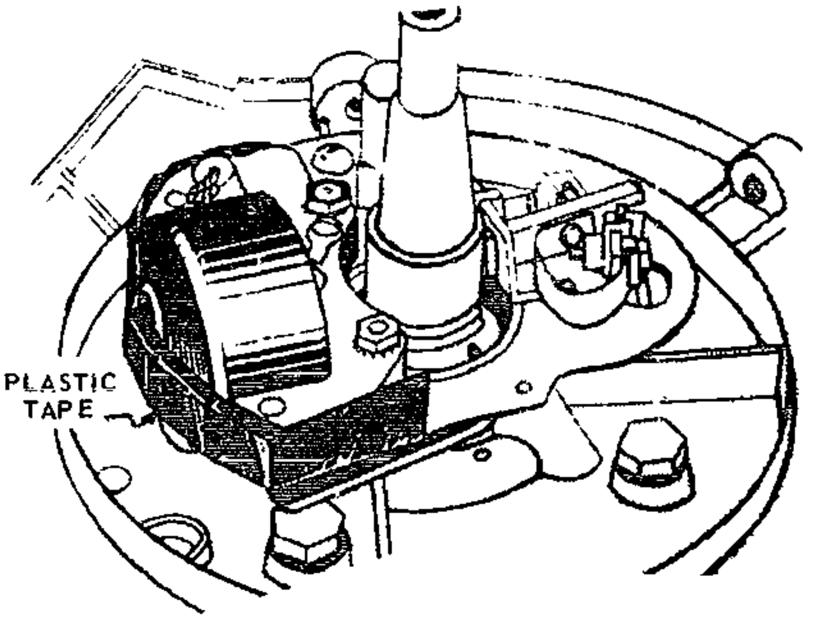

Fig. 44. If the coil and armature are inside the flywheel, use plastic tape to measure magneto air gap.

If the tape has been scuffed, it indicates the clearance is probably too small as the thickness of one layer of plastic tape is about .008. If the tape is not scuffed, apply a second layer, put the flywheel back on, tighten it, and again turn the engine two turns. If the tape is not scuffed this time, you have too much magneto air gap.

To adjust the air gap loosen the armature mounting screws and move the armature slightly. If there is no play in the holes, you can redrill them slightly oversize. After adjusting the armature, you should repeat the checks with tape as before.

Final check of ignition system

An ignition system in proper working order will produce a spark sufficient to jump a gap much larger than a normal spark plug setting. Specified magneto output should jump a gap of .166 for our example engine.

To check magneto output, open the point setting on a spark plug to .166. Connect it to the spark plug wire and lay it with its base in contact with the engine head. Crank the engine in the regular way as though you were trying to start it. At this speed a strong spark should jump this wide gap at regular intervals.

10. OPERATING AND CHECKING THE ENGINE

Put on the flywheel shield and any other remaining parts. Replace the spark plug, tightening it with the torque wrench to a torque of 250 to 275 inch pounds. Attach the spark plug wire.

Refill the crankcase (4-cycle engine) with new oil of proper type and viscosity. Fill the fuel tank with clean gasoline or with the proper mixture of gasoline and oil (2-cycle engine). If your engine has an oil-bath air cleaner, fill it with clean oil to the proper level.

Open the main fuel jet needle valve on the carburetor 1 to 1 1/2 turns from closed position. Open the idle jet needle valve a like amount if your engine has an idle jet. Close the choke and start the engine.

With the throttle in about half open position, adjust the main fuel jet to the position where the engine runs fastest and smoothest. Then hold the throttle shut and adjust the idle screw until the engine runs fastest and smoothest. Set the idle speed adjusting screw so that the engine idles at recommended speed.

Allow the engine to warm up and then readjust both carburetor jets until the engine accelerates smoothly and runs properly at all speeds.

The reconditioned engine is now ready to be put back into service. After 8 or 10 hours of use, retighten the head bolts with the torque wrench and check it over once more for any parts that have not been tightened properly.

Radio and Television Servicing, A Course of Study Designed for Cooperative Part-Time Students Employed in Radio and Television Servicing.

Campbell, B.H. * Oxley, Vincent
Missouri Univ., Columbia. Dept. of Industrial Education
Missouri State Dep of Educ, Jefferson City. Ind Educ Sect

Pub Date - Jun67
MF AVAILABLE IN VT-ERIC SET 206p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *TELEVISION REPAIRMEN, *RADIO, TELEVISION, HIGH SCHOOLS, POST SECONDARY EDUCATION, *COOPERATIVE EDUCATION, OCCUPATIONAL CLUSTERS,

This study guide is for student use in the related instruction phase of high school or post-secondary cooperative or preparatory trade and industrial education programs with a job cluster focus in radio and television servicing. It was developed by a statewide committee of subject matter specialists and teacher educators and has been periodically revised during several years of field use. The content objective is to provide a guide for the study of the technical and related occupational information basic to an intelligent understanding to the trade. The 216 job skills and procedures and technical and related information topics are correlated in parallel columns with 37 assignment sheets which provide the student with the assignment, reference, and a series of true-false, completion, multiple choice, and listing or problem-type questions. The material is to be used by individual students under teacher direction for 180 hours. The teacher should be a qualified coordinator or trade instructor, and the students must be juniors in high school with a basic course in electricity and electronics. Supplementary materials include a list of references keyed to the assignment sheets and a training plan and progress record. An answer key for the instructor is available as VT 003 387. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

RADIO AND TELEVISION SERVICING

A Course of Study

Designed for
Cooperative Part-time Students
Employed In Radio and Television Servicing

Issued by

Department of Industrial Education
College of Education
University of Missouri
Columbia, Missouri

MEMORANDUM

TO: The ERIC Clearinghouse on Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio 43212

FROM: (Person) James B. Karnes (Agency) University of Missouri at Columbia.

(Address) 103 Industrial Education Bldg., Columbia, Missouri

DATE: August 5, 1967

RE: (Author, Title, Publisher, Date) Industrial Education Dept., Univ. of Mo. at Columbia.
RADIO & TV SERVICING, cooperatively with Indus. Educ. Dept.,
(U. of Mo. at Columbia) and Missouri State Dept. of Education (1967)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Industrial Education Dept., Univ. of Missouri at Columbia
Address 103 Industrial Education Bldg.
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's key $ .50

(2) Means Used to Develop Material:
Development Group subject matter specialists; teacher educators, developmental committee
Level of Group State
Method of Design, Testing, and Trial Subject matter specialists; teacher educators; periodic revisions over several years of use in field.

(3) Utilization of Material:
Appropriate School Setting High school and Post-secondary
Type of Program cooperative or preparatory trade & industrial
Occupational Focus job cluster
Geographic Adaptability United States
Uses of Material study guide for related instruction
Users of Material students

(4) Requirements for Using Material:
Teacher Competency Qualified coordinator or qualified trade instructor
Student Selection Criteria Junior in high school with basic course in electricity and electronica.
Time Allotment 180 hours related instruction only.

FOREWORD

This course of study, consisting of an analysis of the work of the radio and television serviceman, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching radio and television servicing on an individual basis in a part-time cooperative occupational education program.

The original course of study for radio servicing was prepared by Mr. Charles See, B.S. in Electrical Engineering, University of Missouri, and formerly a student in the Diversified Occupations class at Hannibal High School, Hannibal, Missouri. The 1955 and the 1961 revisions of this course of study were prepared by Dr. Thomas R. Gaines and Dr. B. Wesley Brown, respectively, both former research assistants at the University of Missouri. The present revision was prepared by Mr. B. H. Campbell and Mr. Vincent Oxley, research assistants in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

Commissioner of Education

TABLE OF CONTENTS

Assignment Sheets:

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.

2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.

3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units," the job skills and procedures, has been arranged in the analysis under the heading of "Job Training." The second group of "learning units," the technical and related information, has been arranged under the heading of "Related Information." And the third group, the personal-social traits, has been listed in the introductory section addressed to the student-worker.

In a cooperative educational program it is necessary for both cooperating agencies, the school and the employer, to understand clearly just what each is to be responsible for in the training of the student worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student workers. This division of responsibility has been made in the arrangement of this course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes, and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the <u>specific job</u> of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, this series of assignment sheets has been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities, and a series of new-type questions designed to check his attainment.

It is usually desirable to teach the related information in school at the time it will be used most advantageously on the job. However, in the case of radio and television servicing the theory related to this subject is best learned in a certain order, each assignment being a building block upon which to add later assignments. Therefore, there will be occasions when the related classwork for this course will need to be presented in a logical, progressive order and may not coincide exactly with the job training.

In selecting instructional materials for this course, an effort has been made to restrict the number to those including information considered to be most important for the radio-television servicemen to know, and to those of recent publication. It is recommended that copies of these materials be secured and kept in the coordinator's classroom for ready use by the student.

In several of the assignments, "closed book exercises" have been suggested. These usually consist of drawing schematic circuit diagrams. They may either be used as examinations or the student may be given the assignment in advance so that he can practice drawing the prescribed circuit diagram. The important point is that if he fails to draw the diagram properly, he should not be allowed to go on to the next assignment until he has demonstrated that he can make the drawing without reference to any books or notes.

The key sheets, available in a separate pamphlet, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

The day of the "screwdriver radio mechanic" is past. To be successful today a radio or television serviceman must not only be familiar with the techniques of servicing but also must have a thorough understanding of the fundamentals and theory behind the work.

Radio and television servicing offers many things besides an occupation. It is an open door to many fields involving electricity, electronics, communications, and picture production. Further training may also lead to openings in physics, atomic research, or industrial electronic controls. Broadcast and telecast station technicians and operators often start as radio or television servicemen. Amateur radio operation, set-building, and radio and television experimenting offer possibilities for interesting hobbies.

The expansion of home television and radio, both AM and FM and the introduction of color television, closed circuit television, stereophonic radio, and miniature transistorized circuitry with its many uses have opened up many new possibilities in the field. According to the U.S. Department of Labor, Occupational Outlook Handbook, 1966-67, in 1964, more than nine out of ten households had one or more television receivers and those having two or more are expected to increase rapidly over the next decade. Much of the increase will be in the form of color and portable receivers. There will be a substantial increase in the use of stereophonic radios and phonographs, AM-FM radios, portable transistor radios, home tape recorders for home use and closed circuit television, two-way radios and many other electronic devices in business, industry, and the professions.

According to the Statistical Abstract of the U. S. 1966, which is published by the U.S. Department of Commerce, Bureau of the Census, of the households in the United States in 1965, 73 per cent had one television receiver, 20 per cent had two or more sets, and 7 per cent had no sets. Also, there are more radios of all types in the United States than there are people. In 1963, there were over 43,000 television and radio repair shops in our nation with an annual payroll of $8,700,000. This clearly indicates the unusual opportunities for those planning to enter the field of television and radio repair.

One of the most important phases of your training in this course should be that relating to the reading and drawing of circuit diagrams, especially schematic circuit diagrams. Throughout the course you will be asked to draw these diagrams, because the ability to draw a schematic diagram of a typical receiver shows a great deal of understanding of radio and television principles. You are urged, therefore, to practice drawing the schematic diagrams without referring to books or notes.

There are some personal traits which are necessary for success in most occupations, such as good health, cooperation with fellow employees and with customers, honesty, and a willingness to assume responsibility and to work hard.

Honesty probably deserves special consideration. In a technical occupation, when dealing with the public, it is very easy to develop dishonest practices with the mistaken idea that the people whom you are serving will not know the difference. Some people will soon suspect thay are being overcharged. After a time these dissatisfied customers will add up to a considerable number. You will then find that you have very few customers, or if you are working for someone else, your employer will become suspicious and will discharge you. It cannot be over-emphasized that honesty is of great importance in any undertaking.

Good health and personal appearance are also very important in any occupation in which the worker deals with the public. You should always present a neat and clean appearance, and your shop should be kept in the same manner. Although good health is important, it should be stressed that greater than average physical strength is seldom required, and average vision and hearing are sufficient.

Personal interests are of importance for the prospective radio and television serviceman. This occupation seldom involves vigorous exercise, it is generally indoor work with a small amount of outdoor activity. The hours are usually regular and the working day is the same as in other occupations of this nature; ordinarily this is eight hours per day. Any student who is interested in scientific and theoretical subjects which must be analyzed to be understood, should find radio and television servicing an interesting vocation. This interest should be deep enough to enable him to study radio and television theory and new developments without any feeling of boredom, because this knowledge is necessary for success.

ANALYSIS FOR RADIO AND TELEVISION SERVICING

JOB TRAINING: What the Worker Should be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Fundamental Radio and Electrical Theory		
	1	1. The nature of radio waves
	1	2. The electron theory
3. Read resistor color codes	2	3. Direct current circuits; batteries voltage, current, power, and resistance
4. Calculate resistance voltage, and current	2	4. The use of Ohm's Law
	2	5. Series and parallel circuits and their solution
	2	6. Magnetism in radio
	2	7. Elementary alternating current theory
	2	8. Explanation of phase and power factor
9. Calculate impedances	2	9. Ohm's Law in AC circuits
10. Read modern receiver schematic diagrams	2	10. Factors in reading circuit schematic diagrams
	3	11. Induced voltages in generators
	3	12. Theory and construction of transformers
13. Read capacitor color codes	3	13. Coils, reactance, and impedance in radio circuits
	4	14. The construction of capacitors
	4	15. The use of capacitors for radio and television circuits
	5	16. Theory of tuned circuits

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	6	17. How coupled circuits are used to transfer energy from one resonant circuit to another
	6	18. How filters are used to separate currents of different frequencies
19. Recognize and correct troubles in the filter	6	19. Power supply filter construction
	7	20. General characteristics of radio waves as they relate to generation, transmission and reception
21. Design and replace parts in the voltage divider	7	21. Construction and design of the voltage divider

Theory and Design of Radio and Television Components

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	8	22. The use of resistors in radio and television circuits
	8	23. The use of inductors in radio and television circuits
	8	24. The use of reproducers in radio and television circuits
	8	25. The use of switches in radio and television circuits
	8	26. How loop antennas function
	9	27. Advantages of the tetrode tube
	9	28. Superiority of the pentode tube
	9	29. Advantages of the beam power tube
	9	30. Uses of multi-unit tubes

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
31. Ascertain tube characteristics from tube manual	9	31. The meanings of tube characteristics
32. Check tubes	9	32. How tube checkers operate
	9	33. Tube numbering system and ratings
	9	34. Transistor theory and construction

Theory and Servicing of Amplifiers

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
35. Install universal output transformer	10	35. How impedance matching is accomplished
	10	36. Typical circuits for first audio stages
37. Determine if first audio stage is normal	10	37. Normal voltage and resistance readings in first audio stages
38. Read and interpret RC amplifier design tables	10	38. Typical RC amplifier circuit design
	10	39. Classification of amplifiers
	10	40. R.F. power amplifier design
	10	41. Characteristics of video-frequency amplifiers
42. Correct troubles in push-pull stages	11	42. Troubles typical of push-pull stages
43. Correct common troubles in the first audio stage	11	43. Typical troubles of the first audio stage
	11	44. Typical I.F. stage circuits
45. Determine if I.F. stage operation is normal	11	45. Normal voltage and resistance readings for IF stages
46. Shoot trouble in the I.F. stage	11	46. Typical troubles in I.F. stages

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	11	47. Function and typical circuits of R.F. stages
48. Determine if the R.F. stage is normal	11	48. Normal voltage and resistance readings for the R.F. stages
49. Shoot trouble in R.F. stages	11	49. Typical troubles in R.F. stages
	The Superheterodyne Circuit	
	12	50. Theory of the superheterodyne circuit
	12	51. Mixer circuits in superheterodynes
	12	52. AC-DC superheterodyne circuits
	12	53. Theory involved in alignment of superheterodyne receiver
54. Align a modern superheterodyne receiver	12	54. Alignment procedures for superheterodynes
55. Repair defective volume controls	12	55. Volume controls commonly used in superheterodynes
	Power Supplies	
56. Replace batteries in portable and farm receivers	13	56. How A, B, and C batteries are used in battery-powered receivers
	13	57. How an AC power supply operates
	13	58. The function of the rectifier tube
59. Replace a faulty power transformer	13	59. Power transformer construction and connection
	13	60. Purpose of the low-voltage power supply

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
61. Diagnose and remedy trouble in low-voltage power supplies	13	61. Types of low-voltage power supplies
	13	62. Combined low-high-voltage power supply
63. Diagnose and remedy trouble in high-voltage power supplies	13	63. Flyback high-voltage power supply
	13	64. Voltage doubling in flyback power supplies
	13	65. Direct drive flyback power supply system
	13	66. R-f high voltage power supply system
67. Diagnose and remedy trouble in AC-DC hi-low voltage power supplies	13	67. AC-DC hi-low voltage power supply systems
68. Remedy hum in an AC receiver	14	68. Causes of hum in an AC receiver
69. Correct troubles peculiar to AC-DC power supplies	14	69. Peculiarities of the AC-DC power supply circuit
70. Correct hum in AC-DC receivers	14	70. Causes of hum in AC-DC receivers

Test Equipment for Radio and Television Servicing

71. Read DC voltage and current	15	71. Direct current meter theory and construction
72. Read AC voltage and current	15	72. AC meter theory and construction
	15	73. Theory of the signal generator
	15	74. Uses of the signal generator

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	15	75. Construction of a typical signal generator
76. Measure AC and DC voltages, resistances, and direct current in milliamperes	15	76. Theory of the volt-ohm-milliameter multimeter
77. Measure AC and DC voltages, resistances, and alternating current in milliamperes	15	77. Theory of the vacuum-tube voltmeter
	15	78. Theory of the television alignment generator
	15	79. Uses of separate sweep and marker generators
	15	80. Uses of the cross batch generator
	15	81. Principles and uses of the CRT oscilloscope
	15	82. Use of the field strength meter

General Service Techniques

83. Lay out the radio service bench	16	83. Tools and equipment needed for the workbench
	16	84. Outline of the servicing procedure
85. Service a dead receiver	16	85. An outline for service procedure for a dead receiver
86. Correct noisy reception	16	86. Service technique for noisy reception
87. Correct distortion	16	87. Service technique for distortion
88. Correct oscillation and "motorboating"	16	88. Service technique for oscillation and "motorboating"

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
89. Correct weak reception	16	89. Service technique for weak reception
90. Remedy hum	16	90. Service technique for hum
91. Make the converter stage track	17	91. Need for proper alignment of the converter
92. Service the push-button tuner	17	92. Push-button tuner construction and alignment
93. Service permeability tuners	17	93. Permeability tuner construction
	18	94. Techniques involved in repair and replacement of inductors
	18	95. Techniques involved in repair and replacement of transformers

Characteristics and Uses of Electron Tubes

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	19	96. How the vacuum tube acts as a rectifier
	20	97. How the electron tube acts as a detector
	20	98. The regenerative triode detector circuit
	20	99. Theory of radio wave propogation
	20	100. Transmitting antenna theory
	20	101. Vacuum tube characteristic definitions
102. Read and interpret tube characteristic curves	20	102. Construction and use of characteristic curves and data
	21	103. The electrode tube as an audio frequency amplifier

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	21	104. The triode tube as a radio frequency amplifier
	21	105. Power audio stage circuits
106. Determine quickly if the power audio stage is active	21	106. Quick check for the power stage
107. Localize power stage trouble	21	107. Functions of typical components in power stages
108. Determine if power stage voltage and resistance readings are normal	21	108. Typical voltage and resistance readings in the power stage
109. Correct common power stage troubles	21	109. Commonly encountered power audio stage troubles
	22	110. Typical oscillator circuits
	22	111. Typical mixer-converter circuits
112. Determine if converter stage operation is normal	22	112. Normal voltage and resistance readings in the converter stage
113. Shoot trouble in the converter stage	22	113. Typical troubles in the converter stage
	22	114. Modern variations of mixer converter circuits
	22	115. How the electron tube acts as an oscillator
	Control Circuits	
	23	116. Commonly used noise-suppression circuits
117. Correct troubles on the AVC circuit	23	117. How automatic volume control works
118. Recognize and correct troubles in tone control circuits	23	118. Commonly used tone control circuits
	23	119. How automatic frequency control circuits operate

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	23	120. Operation of tuning indicators
	23	121. Typical second detector AVC stage circuits
122. Recognize and correct troubles in the second detector-AVC stage	23	122. Typical troubles of the second detector-AVC stage
	23	123. Types and comparison of r-f tunes
	Antennas	
	24	124. Theory of antenna design
125. Recognize antenna troubles	24	125. Troubles in the antenna system
126. Install an outdoor antenna properly	24	126. Proper antenna installation
127. Install and repair F.M. antennas	24	127. Common antenna troubles
	24	128. Theory of the dipole and folded dipole antennas
129. Select the best antenna for the requirements of the area	24	129. Theory of stacked and arrayed antennas
	24	130. Types of indoor and built-in antennas
	24	131. Types of transmission lines
	24	132. Tools and equipment necessary for receiver and antenna installation
133. Install television antennas and receivers	24	133. Methods and techniques of antenna and receiver installation
	24	134. Antenna orientation

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION; What the Worker Should Know
Theory and Servicing of Frequency-Modulation Receiver		
	25	135. Comparison of amplitude frequency and phase modulation
	25	136. Fundamentals of frequency modulation
137. Analyze F.M. receivers, using methods similar to A.M.	25	137. Comparison of A.M. and F.M. receivers
	25	138. Fundamental F.M. receiver circuits
	25	139. Various types of F.M. detectors compared
140. Install F.M. tuners	25	140. F. M. tuner circuits
141. Apply certain A.M. receiver servicing techniques to F.M. receiver servicing	25	141. Comparison of F.M. and A.M. receiver servicing
	26	142. Comparative advantages of the meter method and the visual method of alignment
143. Align a discriminator and a limiter	26	143. F.M. receiver alignment procedure
144. Align the R.F. and oscillator stages		
145. Align the I.F. stages		
146. Align receivers using the ratio detector		
147. Align receivers using the oscillator detector		
148. Locate troubles in F.M. receivers	26	148. Troubles peculiar to F.M. receivers

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Loudspeakers		
	27	149. Principles of the headphone
	27	150. Magnetic speaker operation
	27	151. Theory of the dynamic speaker
152. Recognize a faulty output transformer	27	152. Function of the output transformer
153. Correct field coil troubles	27	153. The field coil as a filter choke
154. Recognize and repair common speaker troubles	27	154. Troubles often found in the speaker
Cathode-Ray Tubes		
	28	155. Theory of the cathode-ray tube
	28	156. Use of cathode ray tube in oscillograph to show pictures of current
157. Replace CRT	28	157. Types of cathode ray tubes
158. Adjust ion trap magnet	28	158. Function of ion trap
159. Adjust focus for CRT	28	159. Focusing devices for CRT
	29	160. How television picture tubes operate
	29	161. Typical picture tube troubles
Theory and Servicing of Television Receivers		
	30	162. Theory and design of the tuner

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
163. Correct troubles in the tuning indicator	30	163. Tuning indicator circuits
	30	164. Types of tuners
	30	165. Typical tuner troubles

Assignment
Sheet No. 1

Covering
Units 1-2

ELECTRICAL THEORY

In this first assignment you will learn the fundamental facts which experience has proved are necessary for later understanding of more advanced radio and television principles.

Future progress will be determined largely by your mastery and understanding of basic concepts as outlined in this unit and expanded upon in the study assignments.

If you enjoy working with abstract ideas, electrical theory is a rewarding and fascinating study.

Assignment:

1. Read the reference listed below.
2. Work several of the exercises on your own.
3. Answer the following questions and turn in this assignment by ______________________________.

Reference:

A. Marcus Radio Servicing, pp. 1-9.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The electric charges of the electron and proton are equal.

T F 2. The nucleus of an atom is always electrically negative.

T F 3. An atom of uranium contains ninety-two planetary electrons.

T F 4. Concentric circles are circles which have a common center.

T F 5. According to Marcus, a piece of glass has very few free electrons, while aluminum has a great many free electrons.

T F 6. Even though molecules in a gas collide with each other, since the molecules are very light, the collisions do not amount to anything.

T F 7. The prefix meg or mega means that the unit of measurement involves thousandths.

T F 8. Adding an electron to a neutral atom gives it a negative charge.

T F 9. In an electrical formula such as E = I x R, the I stands for voltage.

T F 10. Different substances offer different amounts of resistance to the flow or pressure of electricity.

T F 11. All substances, being matter, offer the same amount of resistance to the flow of electricity.

T F 12. In an electrical formula such as E = I x R, the E stands for voltage.

T F 13. When electrons are moved from the negative to the positive end of a conductor, work is done.

T F 14. Temperature of a substance will not be a factor to consider in determining resistance.

T F 15. The cross-sectional area and length of a wire are both important factors to be considered in determining resistance.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Certain substances such as ______________, ______________, and ______________, when exposed to light, will give off or "emit" electrons.

2. The prefix ______________ means "a thousand".

3. Metals generally offer higher resistance at ______________ temperatures.

4. The unit of resistance is the ______________.

5. The unit of conductance is the ______________.

6. The mathematical shorthand 10^6 is the same as ______________.

7. The unit of electrical power is the ______________.

8. Energy is the capacity for doing ______________.

9. The ______________ is an instrument used for measuring emf.

10. The electrical symbol for resistance is ______________.

11. If an electron is removed from a neutral atom, this atom becomes ______________ charged.

12. Electrical energy travels at 186,000 mps (miles per second) which is the same rate of speed as ____________________.

13. The rate at which electrons flow past a given point is called ________________. In your house, the measuring point in your electrical circuit is called the ____________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. An ion is a particle that is (A) always electrically positive; (B) always electrically negative; (C) always electrically neutral; (D) always charged.

_____ 2. Free electrons in motion are present in (A) most substances; (B) all non-metallic substances; (C) all conductors; (D) all resistors.

_____ 3. If a substance is heated the movement of free electrons is (A) increased; (B) not affected; (C) decreased; (D) impossible to predict

_____ 4. The prefix <u>milli</u> means (A) 1,000,000; (B) 1,000; (C) 1/1,000; (D) 1/100,000

_____ 5. The prefix <u>micro</u> means (A) 1,000,000; (B) 1,000; (C) 1/1,000; (D) 1/1,000,000.

_____ 6. When dealing with extremely small units of electrical charge (the electron) the unit of measurement is the (A) volt; (B) watt; (C) erg; (D) coulomb.

_____ 7. When dealing with units of electrical energy, the unit of measurement is the (A) volt; (B) amp; (C) erg; (D) resistance.

_____ 8. An ammeter is an electrical device to measure (A) amperage; (B) voltage; (C) resistance; (D) capacitance.

_____ 9. In an electrical formula the R stands for (A) voltage; (B) amperage; (C) conductance; (D) resistance.

_____ 10. The unit of measurement of EMF is called the (A) volt; (B) amp; (C) capacitance; (D) coulomb.

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Natural gas, such as is used daily in the home and industry, is made up of molecules and atoms, which in turn are made up of electrical charges. In a short paragraph, explain why there is not a flow of electricity in an ordinary gas pipe.

2. In a short paragraph, describe the basic principle upon which most of our radio tubes operate.

3. How much work is done if an appliance which is rated at 15.5 amps operates one hour on a voltage of 120.5?

Assignment
Sheet No. 2

Covering
Units 3-10

ELECTRICAL CIRCUITS

In the preceding unit you have learned much of the language and terminology of radio and television repairmen.

In this assignment you will put your new knowledge to work. You will add new phrases and concepts to your radio and TV vocabulary, especially as they apply to electrical theory and circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________________.

Reference:

A. Marcus, Radio Servicing, pp. 9-33.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Because of the peculiar characteristics of electrons, the electrons in a conductor flow from a point of low potential to a point of high potential.

T F 2. One of the difficulties in tracing the flow of electricity in a circuit is a result of electrons moving in unpredictable paths.

T F 3. In a series circuit, the electrons can follow only one path from the high potential to the low potential.

T F 4. In a series circuit, the current is the same in all parts of the circuit.

T F 5. In a series circuit, the total resistance is equal to the sum of the separate resistances.

T F 6. Electrons will flow more readily through a high resistance than through a low resistance.

T F 7. In a parallel circuit, electrons can follow only one path from the high potential to the low potential.

T F 8. The permeability of all substances is calculated as unity or one

T F 9. Before a current carrying wire can become a magnet, the wire must be coiled.

T F 10. The number of cycles per second is commonly called frequency.

T F 11. Phase refers to the physical nearness of two or more conductors.

T F 12. It is not possible for two emf's to be phase-related.

T F 13. Rules and formulas which apply to DC circuits need not be changed when working with AC circuits.

T F 14. A conductor (wire) moves through a magnetic field of a permanent magnet and induces electricity. Since the magnetism continues indefinitely, we refute the law of physics which says you cannot get something for nothing.

T F 15. A wire that has an electrical current sent through it also has a magnetic field about it.

T F 16. Magnetism, being a separate physical science, has no discernable effect on electrons.

T F 17. Magnetic lines of force are thought to extend out from a permanent magnet at all times.

T F 18. Magnetic lines of force are thought to exist around a magnet at all times; therefore by placing a permanent magnet <u>beside</u> a copper wire, electricity will be induced in the wire <u>continuously</u>.

T F 19. Current that flows from a chemical cell is called AC or alternating current.

T F 20. It is impossible to have "mixed" AC and DC on one line at the same time.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Electric power is the product of ________________ and ______________.

2. The magnetic field around a conductor extends outward at _________ from the conductor.

3. Iron and steel have a permeability of about _________ to more than ________________.

4. The source of emf is the _____________________.

5. Current that flows from a dry cell is called ______________ or ____________________.

6. The amplitude of a 120 volt AC line is ________ volts.

7. Phase angle actually indicates a ___________ interval between two or more quantities.

8. The total opposition to the flow of alternating current in a circuit is called _______________.

9. When the voltage and current are out of phase, the impedance is always greater than the _________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The voltage drop across each of three resistors (R_1 = 15 ohms, R_2 = 30 ohms, R_3 = 45 ohms) in a parallel circuit is (A) the same; (B) R_1 lower voltage drop; (C) R_2 lower voltage drop; (D) R_3 lower voltage drop.

_____ 2. In drawing and reading circuit diagrams, it is well to remember that two wires which cross each other and have no electrical connection are shown with (A) a dot; (B) an "X"; (C) a loop; (D) a broken line.

_____ 3. Electrical power is usually expressed in (A) voltage; (B) watts; (C) amperage; (D) resistance.

_____ 4. An electromagnet always has at least (A) 1; (B) 2; (C) 3; (D) 4 poles

_____ 5. The unit of magnetic flux is called the (A) ohm; (B) gauss; (C) maxwell; (D) einstein.

_____ 6. The unit of magnetomotive force is called the (A) gauss; (B) einstein; (C) maxwell; (D) gilbert.

_____ 7. When discussing magnetism, reluctance has a similar meaning to what term in electricity: (A) voltage; (B) resistance; (C) amperage; (D) wattage.

_____ 8. A wire is passed through a strong magnetic field, thereby inducing a current. This wire, as it is being passed through the magnetic field, now (A) has a separate magnetic field of its own; (B) has no magnetic field of its own; (C) has a magnetic field equal in strength to the original strong field; (D) has split-phased magnetism.

_____ 9. A complete circle has (A) 180°; (B) 90°; (C) 360°; (D) 270°.

102

_____ 10. Alternating current supplied to dwelling houses generally has a frequency of (A) 60 CPS; (B) 90 CPS; (C) 120 CPS; (D) 180 CPS.

_____ 11. The DC formula for Ohm's Law may be used with AC circuits only when (A) the circuit is out of phase; (B) the circuit is in phase; (C) the circuit is dual-phased; (D) the Z factor is used.

_____ 12. The term "cycle" means nearly the same as (A) sickle; (B) circle; (C) snorkle; (D) snaffle.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three pieces of electrical equipment which use the heating effect of electricity to good advantage are:

(A) ______________________ (C) ______________________

(B) ______________________

2. Five different ways in which electricity may by generated are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

3. The strength of the magnetic field around a coil depends upon the:

(A) ______________________ (B) ______________________

4. The basic parts of an electric motor are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

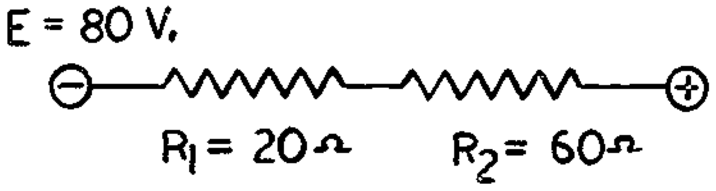
5. The basic parts of an electromagnet are:

(A) ______________________ (B) ______________________

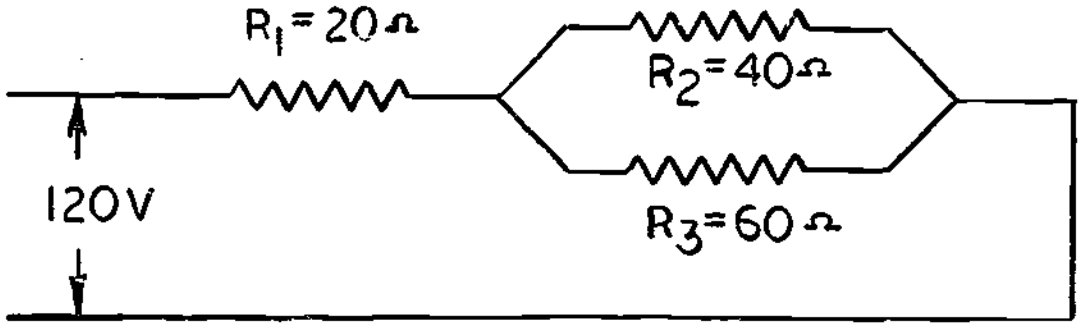
Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. What is the voltage drop across R_2?



2.



_____ A. What type circuit is this: (A) series; (B) parallel; (C) series-parallel; (D) shunt.

B. What is the combined resistance of the circuit?

C. According to Ohm's Law, how much current is passing through R_1? ______________

3. What is the essential difference between a primary cell and a "B" Battery?

4. Draw the symbol for:

a. resistor

b. cell

c. battery

5. What determines the charge or emf of a dry cell?

6. How is it possible to measure the electrical charge of a secondary cell with a hydrometer?

7. State the "law" of magnetism.

8. How is it possible to determine the polarity of an electromagnet by "hand"?

9. Basically, what is a generator?

10. Why is "peak value" of voltage not the same as effective value?

11. What conditions must exist, for an emf and current to be in phase?

Assignment
Sheet No. 3

Covering
Units 11-13

INDUCTANCE

Making further use of the materials we have studied thus far, we now approach the study of a highly important electrical characteristic called inductance.

As you progress still further in the radio-TV field, this term will occur with ever increasing frequency.

In this assignment you will learn the place of inductance as it applies to circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________________.

Reference:

A. Marcus, Radio Servicing, pp. 34-44.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The ability of a circuit to set up a current which reinforces the applied emf is called inductance.

T F 2. The unit of measure of inductance is the gilbert.

T F 3. Counter emf is voltage generated by one of a series of devices such as the geiger counter.

T F 4. The symbol for inductance is "L".

T F 5. The inductance of a straight wire is, except in unusual cases, rather low.

T F 6. Inductors, because of their extremely high potential, are never hooked up in series, parallel or series-parallel.

T F 7. The impedance of an AC circuit is considered only as that resistance to current offered by components such as resistors and capacitors.

T F 8. It is possible to connect inductors so as to complement or to oppose each other's magnetic field.

T F 9. The greatest transfer of power takes place when the impedance of the load is equal to that of the source.

T F 10. Eddy current and hysteresis loss are one and the same.

T F 11. In operating a step-up transformer, the voltage is stepped up and the amperage is stepped down.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When considering inductance, we uaually think of ________________ lagging behind the voltage.
2. The symbol for impedance is __________.
3. The symbol for reactance is __________.
4. It is theoretically possible to have a circuit with ___________ resistance.
5. The _______________ is the unit of measure of mutual induction.
6. A transformer always has at least ________________ windings or coils.
7. Energy loss in a transformer due to the changing of polarity as a result of AC frequency is called ________________ ___________.
8. The inductive reactance depends upon the ________________ of the induced voltage.
9. When an induced voltage in one circuit is the result of current changes in another circuit, the term _________ _______________ is used to describe the relationship.
10. When two coils are wound on the ____________ iron core, the coupling approaches __________ per cent.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Mutual inductance is one of those factors in radio and TV which is generally (A) undesirable; (B) screened out; (C) desirable; (D) screened in.

_____ 2. The core of a transformer is uaually a (A) closed square or ring; (B) hexagon; (C) triangle; (D) none of these.

_____ 3. Eddy current losses are reduced by using (A) solid construction; (B) plastic insulators; (C) lead insulators; (D) laminated construction.

_____ 4. The transfer of energy from the primary to the secondary winding of the transformer depends mainly upon (A) a wire connecting the two; (B) magnetic lines of force of the primary winding cutting across the secondary winding; (C) an extremely high voltage; (D) a direct current.

_____ 5. A transformer which has achieved its maximum magnetic capacity is said to have reached the point of (A) impedance; (B) reluctance; (C) saturation; (D) no return.

_____ 6. An inductor is usually constructed in the form of a (A) capacitor; (B) resistor; (C) coil; (D) filament.

_____ 7. Inductance is a property of a circuit which (A) reinforces an applied emf; (B) opposes an applied emf; (C) transforms an applied emf; (D) rectifies an applied emf.

_____ 8. The symbol for inductive reactance is (A) X_L; (B) X; (C) Z; (D) Z_L.

_____ 9. The unit for measuring inductive reactance is (A) henry; (B) gilbert; (C) einstein; (D) ohm.

_____ 10. The current lag in a circuit is caused by (A) reactance; (B) inductance; (C) impedance; (D) resonance.

Discussion

Directions: Answer each of the following questions with a brief, clearly worded paragraph.

1. When is it possible for the impedance of a circuit to be greater than the resistance of that circuit?

2. How is it possible to transfer energy from one circuit to another without running a wire between them?

3. Describe reflected impedance.

4. Describe a step-up transformer.

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. A transformer has a primary winding with 500 turns. With 110 volts AC across the primary, how many turns on the secondary will we need to have 11 AC volts output? (Assume a perfect transformer with unity coupling.)

2. Three inductors of 3,4, and 6 henries are connected in series. What is the total inductance if their magnetic fields do not interact?

3. What is the total inductance of two inductors of 5 and 2 henries connected in parallel, if their fields do not interact?

Assignment
Sheet No. 4

Covering
Units 14-15

CAPACITANCE

Capacitors play an increasingly important role in radio and television circuitry.

In this assignment, you will learn how capacitors are constructed, used, and specified for radio and television circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Marcus, Radio Servicing, pp. 44-49.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. One device used to store electrical energy is the capacitor.

T F 2. The amount of electrical energy which can be stored between the two ends of a wire alone is very large.

T F 3. Electrical energy may be stored in a capacitor for short periods of time only.

T F 4. The dielectric constant (K) of air is 10.

T F 5. Generally speaking, metallic dielectrics have a higher K than non-metallic.

T F 6. The unit of capacitance is the ohm.

T F 7. All capacitors are harmless when charged and make amusing party tricks possible.

T F 8. Generally speaking, the smaller (actual physical size) the capacitor, the smaller the capacitance.

T F 9. The farad is an extremely small unit of capacitance.

T F 10. Ideal capacitors (one with no power consumption), much like our present atomic "breeder" reactors, are now available.

T F 11. The microfarad is a smaller unit than the farad.

T F 12. The symbol for micromicrofarad is mf.

T F 13. Capacitance, since it "stores" electrical energy, decreases the impedance of an AC circuit.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ______________ the area of the dielectric, the greater the capacitance.

2. The _______ the dielectric, the greater the capacitance.

3. In circuits with very high frequencies, ______________ or ______________ capacitance must be taken into account.

4. The amount of capacitive reactance depends on the value of ______________ and the ______________ of the current.

5. When calculating capacitive reactance, the ______________ the frequency, the ______________ the Xc.

6. The symbol for capacitance is __________.

7. The _____________ the phase difference, the closer the capacitor approaches the ideal.

8. The ________________ the frequency, the smaller the capacitive reactance.

9. In a purely capacitive circuit, the ____________ would be equal to the capacitive reactance.

10. In an AC circuit, when capacitance and resistance are in series, the impedance is equal to the ______________ effect of the resistance and the capacitive reactance (Xc).

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In early literature, the following term was used to describe what we know as a capacitor today (A) resistor; (B) rheostat; (C) condenser; (D) cathode.

_____ 2. The dielectric constant of mica is (A) 1; (B) 3; (C) 5; (D) 7.

______ 3. The unit of capacitance is the (A) ohm; (B) farad; (C) amp; (D) volt.

______ 4. When K is being discussed, unity is the same as (A) copper; (B) mica; (C) titanium dioxide; (D) air.

______ 5. When a resistor is placed across a circuit that has a charged capacitor, we (A) discharge the capacitor; (B) burn up the capacitor; (C) burn up the resistor; (D) receive an electric shock.

______ 6. The excellence of a capacitor is expressed as a (A) power factor; (B) analysis factor; (C) farad factor; (D) phase factor.

______ 7. Current in a capacitive circuit may lead the voltage by (A) 360°; (B) 270°; (C) 180°; (D) 90°.

Listing

Directions: List the items called for in each of the following; Select your answers carefully.

1. Five substances from which most dielectrics are manufactured are:

(A) ______ (D) ______

(B) ______ (E) ______

(C) ______

2. The capacitance of a given capacitor is determined by what characteristics?

(A) ______ (C) ______

(B) ______

3. The plates of a capacitor are commonly made of:

(A) ______ (B) ______ (C) ______

4. Three factors which prevent a capacitor from being "ideal" are:

(A) ______

(B) ______

(C) ______

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Two capacitors of 5 and 2 microfarads are connected in parallel. What is their total capacitance?

2. What is the capacitance of the above two capacitors connected in series?

Assignment
Sheet No. 5

Covering
Unit 16

RESONANCE

Selectivity, one of the ever-present problems which confront the electrical design engineer, the manufacturer of electrical components and the radio-television repairman, is one of the most interesting phases of electrical theory. In resonant circuits we take the inherent characteristics, both good and bad, of certain electrical parts and put them to work for us.

In this assignment you will learn how resonance is a very essential part of the "internal" controls for radio and television circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. Marcus, Radio Servicing, pp. 49-54.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. At resonance, the inductive and capacitive reactances are both equal to zero (series circuit).

T F 2. When resonance is under consideration, "Q" is the same as the quantity of electrical charge.

T F 3. Generally speaking, we desire a circuit to have a high "Q".

T F 4. A signal which is caused to pass through a number of successive circuits, all tuned to the same resonant frequency, becomes progressively less selective.

T F 5. It is possible, under certain conditions, for voltage drops at resonance to be greater than the applied voltage of the generator (series circuit).

T F 6. If the frequency in a resonant circuit is reduced below resonance, the capacitive reactance becomes larger than the inductive reactance (series circuit).

T F 7. A parallel-resonant circuit has perfect or infinite capacitance.

T F 8. In a series-resonant circuit, the resistance affects the amplitude and the sharpness of the plotted curve.

T F 9. In a parallel-resonant circuit, the resistance affects the amplitude and the sharpness of the plotted curve.

T F 10. Amplification of resonant circuits causes distortion of the signal and is seldom, if ever, used.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The resonant frequency of a circuit depends upon the values of ___ ________________ and ________________________.

2. The inductive and capacitive reactances cancel each other out at resonance, leaving only __________________ to oppose the flow of current.

3. In a resonant circuit, where resistance alone opposes the flow of current, the flow of current may be very _________________.

4. We use the opposition to current flow by the inductive reactance and the opposition to current flow by the capacitive reactance to ______________ an _______________ ____________________.

5. The greater the ___________________, the lower the resonant peak and the flatter the curve.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The ability of a resonant circuit to discriminate against currents of non-resonant frequency is called (A) adaptability; (B) regeneration; (C) selectivity; (D) oscillation.

_____ 2. Essentially, the tuning of an antenna circuit is accomplished by (A) accepting one frequency and rejecting all others; (B) rejecting one frequency and accepting all others; (C) accepting the number of frequencies desired and rejecting all others; (D) rejecting the number of frequencies desired and accepting all others.

______ 3. In a working antenna system, the generator of our laboratory experiments is replaced by (A) a capacitor hooked up in a series with a resistor; (B) an emf induced in the antenna circuit as radio waves cut across the antenna; (C) a capacitor hooked up to the tank circuit by a coupling device; (D) an emf produced by a wet-cell.

______ 4. In a parallel-resonant circuit, the greater current will flow through path of (A) negative impedance; (B) positive impedance; (C) higher impedance; (D) lower impedance.

______ 5. In a parallel-resonant circuit, once oscillation has started, it is theoretically possible for it to continue indefinitely. The reason it does not is due to (A) wattage; (B) amperage; (C) resistance; (D) voltage.

COUPLED AND FILTERED CIRCUITS

The process of transferring energy from one resonant circuit to another is a good example of how we put theory to work for us. Without the theoretical base of induction, coupled circuits could not be.

In this assignment you will learn how various electrical components and parts are hooked "together" and made to work as a unit rather than working separately.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by
   ________________________.

Reference:

A. Marcus, Radio Servicing, pp. 49-54.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In the direct-coupled method of coupling, a component common to both circuits is inserted between the two resonant circuits.

T F 2. The capacitive-coupling method is essentially a parallel rather than series hook-up.

T F 3. A transformer is a good example of inductive-coupling.

T F 4. Reflected resistance tends to cause a voltage drop at the original resonant frequency.

T F 5. Coupling between inductors can be varied by placing the windings closer or further apart.

T F 6. In inductive coupling, the step-up and step-down effects rising out of turn ratios are still usable.

T F 7. At resonance, the inductive reactance cancels out the capacitive reactance.

T F 8. Filters are used to separate AC from DC.

T F 9. The higher the frequency, the less the impedance in an Xc circuit.

T F 10. A resistor in series will filter only high frequency currents.

T F 11. Fluctuating or pulsating direct current is a theoretical assumption and never really takes place.

T F 12. A band-pass filter is used to pass only current of a single frequency (or a narrow band of frequencies.)

T F 13. In some cases, a resonant circuit acts as a filter.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When considering inductive-coupling at resonant frequency the reflected resistance from each circuit reduces the ___________ of the other.
2. Generally speaking, when the energy transfer is low, the output voltage is _______________.
3. The point of maximum energy transfer is called _________________ coupling.
4. As the coupling is increased, the reflected impedance becomes ____________________.
5. An example of a band-stop filter is the _____________ ____________.
6. The series-resonant circuit offers relatively high ________________ to currents of other than resonant frequencies.
7. Sometimes it is possible to use a __________________ instead of the choke coil in a filter circuit.
8. The capacitor-resistor type of filter is used only where the current requirements of the power supply are ______________.
9. In a capacitive coupled circuit, the inductors are placed so there is no _______________ coupling between them.
10. An inductive-coupled transformer is usually a __________________ frequency transformer.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In the direct coupled method, current flows in the secondary circuit because of a (A) voltage increase across the common component; (B) voltage drop across the common component; (C) voltage which remains constant across the common component; (D) voltage which drops to zero across the common component.

_____ 2. The flow of current in the secondary circuit depends on the output voltage and on the (A) type of the load; (B) location of the load; (C) resistance of the load; (D) Q of the load.

_____ 3. If we assume DC = 0 frequency, the most logical component for complete filtering of DC is the (A) capacitor; (B) resistor; (C) inductor; (D) rheostat.

_____ 4. If we wish to filter a high frequency current, we should use a/an (A) capacitor; (B) resistor; (C) inductor; (D) rheostat.

_____ 5. If we wish to filter a low frequency current, we should use a/an (A) capacitor across the load; (B) resistor across the load; (C) inductor across the load; (D) rheostat across the load.

_____ 6. A high pass filter passes high frequencies on to the (A) transformer; (B) load; (C) inductor; (D) capacitor.

_____ 7. An example of a band-stop filter is a (A) sine wave; (B) wave trap; (C) sinusoidal wave; (D) wave form.

TIME CONSTANTS, VOLTAGE DIVIDERS AND RADIO WAVES

The precise definition of just what a radio wave consists of is perhaps not nearly so important as what a radio wave can do.

In this assignment you will study certain general characteristics of radio waves, especially as they relate to generation, transmission and reception.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. Marcus, Radio Servicing, pp. 63-69.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Theoretically, a capacitor never succeeds in becoming fully charged.

T F 2. The time constant of a circuit is equal to 100 per cent of the time for full-charge value of the capacitor.

T F 3. When alternating current flows through a conductor of any size, radio waves are sent out.

T F 4. Electric waves travel at the speed of sound.

T F 5. Radio waves travel at the speed of light.

T F 6. A meter is approximately equal to one foot.

T F 7. The frequency-modulation band lies between 88 and 108 megacycles.

T F 8. Radio waves bounced back to earth by the Kennelly-Heaviside layer are usually distorted beyond use.

T F 9. The Kennelly-Heaviside layer is usually called the ionosphere.

T F 10. Transmission of low frequency radio waves must always be by line of sight.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Frequencies of ________________ cycles per second are usually considered as the minimum of the high range.

2. The wave form of a radio wave resembles that of the ________________ ________________ producing it.

3. A radio wave with a uniform amplitude and constant frequency is called a ________________ ________________.

4. A given wave length may be calculated by dividing the speed of travel of the radio wave by the ________________ of the radio wave.

5. The standard broadcast band lies between ___________ and ___________ kilocycles per second.

6. A transmitter's antenna usually radiates ___________ types of radio waves.

7. One type radio wave radiated by a transmitter's antenna is the ground wave; another is called the ___________ wave.

8. Ground waves which are expected to travel any appreciable distance must be radio waves of ______________ frequency.

9. The ________________________ often reflects some radio waves back to earth.

10. The ionosphere often varies in height from _____________ to __________ miles above the earth.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When a capacitor is fully charged the back emf will equal the (A) resistance; (B) wattage; (C) emf; (D) amperage.

_____ 2. Voltage dividers are often used to (A) obtain various voltages; (B) route electricity; (C) separate electrons from protons; (D) separate AC from DC.

_____ 3. A radio wave of a constant frequency and variable amplitude is said to be a/an (A) carrier wave; (B) amplitude-modulated wave; (C) frequency-modulated wave; (D) saw-tooth wave.

_____ 4. A radio wave of constant amplitude and variable frequency is called a/an (A) carrier wave; (B) amplitude-modulated wave; (C) frequency-modulated wave; (D) saw-tooth wave.

_____ 5. The wave length is best described as the distance (A) between the transmitter and receiver; (B) between the top and bottom of the antenna; (C) between the amplifier and the voltage divider; (D) between two adjacent peaks of a radio wave.

_____ 6. A meter is approximately equal to one (A) inch; (B) foot; (C) yard; (D) rod.

_____ 7. Cycles per second (CPS) of some radio waves may go as high as (A) billions of cps; (B) millions of cps; (C) thousands of cps; (D) hundreds of cps.

_____ 8. Common house current usually is (A) 50 cps; (B) 60 cps; (C) 70 cps; (D) 80 cps.

_____ 9. The minimum CPS of radio waves which can be sent out readily are (A) 10,000; (B) 15,000; (C) 20,000; (D) 25,000.

_____ 10. At very high frequencies there are (A) no ground waves; (B) many ground waves; (C) absorbed ground waves; (D) reflected ground waves.

COMPONENTS

It is quite obvious that the proper functioning of a radio or television set must depend upon the proper application of scientific principles (theory), acting upon and through (circuits) many dependent and related parts (components).

In this unit you will become more familiar with many radio and television parts, their use and design.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Marcus, Radio Servicing, pp. 71-112.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Capacitors should be placed near heat-producing components in order to get maximum performance.

T F 2. The working voltage of a capacitor is also the maximum voltage.

T F 3. In capacitors peak voltages may exceed working voltages without damaging the capacitor.

T F 4. Wax-impregnated capacitors may be used in circuits where the DC working voltages do not exceed about 600 volts.

T F 5. Generally speaking, capacitors with a small physical bulk (size) can be expected to have a small capacitance.

T F 6. Oil-impregnated capacitors stand up better under higher operating temperatures than do wax-impregnated capacitors.

T F 7. An electrolytic capacitor cannot be used across an AC source.

T F 8. A lower than normal capacitive leaking indicates a partially opened circuit.

T F 9. The dielectric for a variable capacitor is usually made of aluminum.

T F 10. A variable capacitor is at maximum capacitance when the plates are open as far as possible.

T F 11. It is usually good practice to connect the rotor plates of a variable condenser to ground.

T F 12. A trimmer capacitor is simply a small semi-variable capacitor used for fine adjustment.

T F 13. Resistance is seldom, if ever, desirable in radio-television circuitry.

T F 14. The wattage of a tapped resistor is based upon that part of the resistor being used.

T F 15. A rheostat is a variable resistor.

T F 16. A potentiometer is a variable resistor.

T F 17. The essential difference between a rheostat and a potentiometer is in the number of leads present.

T F 18. Inductors are usually classified into two general categories, depending upon the frequencies at which they operate.

T F 19. Filter choke coils are used in power supplies to smooth out the ripples of rectified AC and to convert it into steady DC.

T F 20. Filter choke coils usually have heavy cores to prevent saturation.

T F 21. The current flowing through the primary windings of an inter-stage transformer is usually quite large.

T F 22. A loop antenna such as found on the portable receivers is actually one form of inductor.

T F 23. FM receivers use transformers which are usually tuned to 3 megacycles and higher.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In the audio-frequency section of a receiver, currents whose frequencies lie between __________ cycles and ____________ kilocycles are encountered.

2. In the filter circuit of the power supply, frequencies of __________ and ____________ cycles are common.

3. The ________ of a capacitor is sometimes used to express its merit.

4. Variable capacitors are used where changes in capacitance are needed to vary ______________ circuits.

5. When a capacitor is heated, its capacitance is generally __________________.

6. The dielectric for a variable capacitor is usually made of ____________________.

7. It is usually a good idea to allow a safety factor of__________ per cent when specifying watts for resistors.

8. Resistors used in ordinary recievers range from ________ to _______ watts.

9. Wire-wound resistors above __________ watts are generally not color-coded.

10. Inductors which operate at frequencies below 15,000 cps are called __________________________ inductors.

11. When discussing inductors, direct current may be considered as alternating current at _______________ frequency.

12. A step-up transformer is called a ______________ transformer.

13. A step-down transformer is called a ________________ transformer.

14. Generally, receivers employ a rectifier tube that requires ________ volts at __________ or _________ amps.

15. The dynamic loudspeaker operates on the principle of ____________ magnetic fields.

16. The field excitation for the electrodynamic loudspeaker usually comes from the ____________ ______________ of the ___________.

17. Toggle switches are rated by their ______ ___________ carrying capacity and _________________ that can be safely applied.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Inductors which operate at frequencies above 15,000 cps are called (A) audio frequency inductors; (B) fixed inductors; (C) radio-frequency inductors; (D) variable inductor.

_____ 2. The dynamic loudspeaker operates on the principle of (A) opposing magnetic fields; (B) a single magnetic field; (C) equal but opposite magnetic fields; (D) interacting magnetic fields.

_____ 3. A higher than normal capacitive leaking indicates (A) a partially opened circuit; (B) a defective dielectric; (C) too much voltage; (D) the electrolyte is drying out.

_____ 4. Trimmers and padders are semivariable because (A) they can rotate a full 360^{o}; (B) they are both auxiliary; (C) the distance between plates can be changed; (D) the distance between gangs can be changed.

_____ 5. Resistors are usually made of (A) brass; (B) aluminum; (C) iron; (D) carbon.

_____ 6. The potentiometer is usually used as a (A) volume control; (B) capacitor; (C) transformer; (D) fixed resistor.

_____ 7. Single-coil inductors are usually called (A) potentiometers; (B) transformers; (C) choke coils; (D) fixed capacitors.

_____ 8. Multi-coil inductors are usually called (A) potentiometers; (B) transformers; (C) choke coils; (D) fixed capacitors.

Listing

Directions: List tht items called for in each of the following. Select your answers carefully.

1. Two places where currents applied to capacitors require high frequency are:

(A) ______________________________

(B) ______________________________

2. The voltage at which a capacitor's dielectric will break down depends upon the:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. Fixed capacitors are used in the following circuits:

(A) __________ (B) __________ (C) __________

4. There are two general types of dynamic loudspeakers (according to the method used to obtain the field. They are:

(A) ______________ (B) ______________

5. Two switches which are in general use today:

(A) ______________ (B) ______________

6. Rotary switches may be either of the:

(A) ______________________________

(B) ______________________________

THE ELECTRON TUBE AND TRANSISTOR

High on the list of memorable inventions in the history of mankind must be placed the invention and development of the vacuum tube.

The vacuum tube, long the workhorse of the radio and television industry, now has a smaller helpmate, the transistor. The transistor has had wide application in military and civilian components, especially where size, weight and low power drain are critical design factors.

In this unit you will study the vacuum tube and transistor so as to gain a fuller understanding and appreciation of their role in the electronics industry.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________.
3. Draw the symbols and label the various electrodes for the following:

    A. Tetrode
    B. Pentode
    C. Power beam tube

References:

A. Marcus, Radio Servicing, pp. 114-167.
B. Radio Corporation of America, RCA Receiving Tube Manual, pp. 3-12.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. It is possible to heat the cathode by one of three different methods.

T F 2. The voltage at which the filament or heater operates does not determine the character or nature of the tube.

T F 3. The simplest electron tube is called the diode.

T F 4. The basic principle of all electron tubes is that a cathode emits a stream of electrons which are attracted to a positively charged plate.

T F 5. The space charge repels electrons which are emitted by the cathode and limits the space current.

T F 6. In a gas-filled tube, such as a tungar rectifier, current flow in the tube will be greatest when the larger electrode is positive.

T F 7. A certain amount of ionization is always present in any gas.

T F 8. It is impossible for the triode tube to function as a rectifier.

T F 9. The currents which flow in the plate circuit have both direct and alternating components.

T F 10. In the grid circuit, only DC is present.

T F 11. Characteristic curves of radio-television tubes are of little value to radio-television repairmen.

T F 12. It is impractical to use a triode as a power tube.

T F 13. The suppressor grid in a pentode prevents secondary emission.

T F 14. A pentode is a five-element tube.

T F 15. The third portion of a tube designation number consists of a single number which may be from 1 to 8.

T F 16. Crystal diodes are studied today only for historical background.

T F 17. An N-P transistor may either aid or impede the flow of electrons, depending upon the battery connections.

T F 18. Defects in electron tubes are usually checked by one or both of two general methods.

T F 19. Loose connections furnish a major source of noise in a radio receiver.

T F 20. A tube that tests <u>above</u> normal is quite satisfactory for continued use.

T F 21. In view of recent developments, namely the development of the transistor, the future of the electron tube is one of limited use.

T F 22. The space charge in a tube tends to retard the movement of other electrons.

T F 23. When a triode is used as an amplifier, a negative DC voltage is usually applied to the grid.

T F 24. An electron gun is a device which works on the principle of radar and which has an effective killing range of 1,000 yards.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The evaporation of electrons, called ______________ ______________ is the starting point of the action of nearly all our electron tubes.

2. The most commonly used emitter in the tubes of radio receivers is made of ________________, coated with oxides of _______________ and ___________________.

3. The external circuit from plate to cathode is called the ___________ ________________.

4. The internal flow of electrons from the cathode to the plate is called the __________________ current.

5. The battery that maintains the plate positive is called the ______________ battery or _____________ battery.

6. The battery that heats the cathode is called the __________________ battery or _______________ battery.

7. In a tungar rectifier tube, the envelope is evacuated, and a small amount of ________________ gas in inserted.

8. In a triode, if the grid is negative with respect to the cathode, the grid tends to ________________ the emitted electrons.

9. In a triode, a _________________ variation of the input voltage produces a _________________ variation in the output voltage.

10. A tetrode is a ___________-element tube.

11. In a tetrode, the screen grid by capacitive action will pass _________ voltage but will hold back the __________ voltage.

12. Tubes that have more than five electrodes are called _______________ tubes.

13. Tube envelopes are usually made of ________________ or _____________.

14. In a tube-numbering system, the first number or set of numbers indicates the approximate ______________ ________________ used.

15. The crystal triode is commonly called a __ __________________.

16. A negative type crystal triode is produced by adding a small impurity of ___________________ to the germanium.

17. A positive-type crystal diode is produced by adding a small amount of _________________ to the germanium.

18. Electron tubes are the most ____________________ parts of a reciever.

19. Failure of a tube to light up indicates an open__________________ or ______________________ circuit.

20. Short circuits in a tube which "come and go" with expansion and contraction are known as ____________________ short circuits and are usually difficult to isolate.

21. The importance of the electron tube lies in its ability to ___________________ almost __________________ the flight of millions of electrons supplied by the cathode.

22. The grid, plate, and cathode of a triode tube usually form what is essentially a ________________ between them.

23. Focusing of the electron beam in a television picture tube is accomplished _________________________ or _________________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The symbol for an instantaneous value of voltage is (A) E; (B) e; (C) I; (D) i.

_____ 2. Referring to the graph on page 129 of Reference A and assuming a plate voltage of 210 volts, what is the plate current when the grid voltage is -8? (A) .04 milliamperes; (B) .4 milliamperes; (C) 4. milliamperes; (D) 40. milliamperes.

_____ 3. The amplification factor of a 24-A tetrode compared with that of a 6J5 triode is (A) the same; (B) much lower; (C) much higher; (D) slightly less.

_____ 4. When the letters U, V, W, X, Y, and Z appear as the second portion of a tube-identification code, the tube is a/an (A) rectifier; (B) amplifier; (C) vibrator; (D) glass-envelope type.

_____ 5. The third portion of the tube designation indicates the (A) number of amps between anode and cathode; (B) number of volts between anode and cathode; (C) number of useful elements to terminals; (D) number of screen mesh of the grid.

_____ 6. That portion of the tube which furnishes escaping electrons is the (A) base; (B) anode; (C) grid; (D) cathode.

_____ 7. The anode or plate of the ordinary receiver-type tube is usually made of (A) aluminum; (B) strontium; (C) uranium; (D) nickel or iron.

_____ 8. If a negative voltage is placed on the plate, emitted electrons are (A) repelled, no plate current flows; (B) repelled, increasing plate current; (C) attracted, no plate current flows; (D) attracted, increasing plate current.

_____ 9. One of the chief functions of the diode in a radio receiver is that of (A) modulation; (B) rectification; (C) amplification; (D) oscillation.

_____ 10. Mercury vapor in a diode tends to (A) decrease electron flow; (B) increase electron flow; (C) decrease operating temperature; (D) increase operating temperature.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two advantages of enclosing the cathode in a vacuum are:

(A) ____________________ (B) ____________________

2. The four characteristics of an electron tube which distinguish one tube from another are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

3. The three essential (electrical) parts of a triode tube are:

(A) ____________________ (C) ____________________

(B) ____________________

4. Triode circuits are of three general types. They are:

(A) ____________________ (C) ____________________

(B) ____________________

5. In the triode, three factors control the flow of electrons from the cathode to the plate. They are:

(A) ____________________ (C) ____________________

(B) ____________________

6. The dynamic characteristics of the triode, known as the tube parameters, are:

(A) ____________________ (C) ____________________

(B) ____________________

7. Tube bases are usually made in three different types. They are:

(A) ________ ________________ (C) ____________________________

(B) ____________________________

8. Tube manufacturers usually include "ratings" of their products. These tube ratings may include:

(A) ____________________________

(B) ____________________________

(C) ____________________________

(D) ____________________________

(E) ____________________________

9. With the advent of the transistor, it was demonstrated that a crystal could function not just one, but in three ways: They are:

(A) ____________________________ (C) ____________________________

(B) ____________________________

AMPLIFIERS

The process of changing weak signals to audible or usable signals is known as amplification. In your previous readings you have noted that in some rare instances, amplification is not needed. For many purposes, however, a high-quality amplifier is a must.

In this lesson you will have the opportunity to learn about the characteristics of the various kinds of amplifiers.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ____________________.

3. Check with your coordinator relative to closed book exercise 1. He will give you an assignment from the coordinator's "Key to Radio and Television Servicing" which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

References:

A. Marcus, Radio Servicing, pp. 238-277.
B. Radio Corporation of America, RCA Receiving Tube Manual, pp. 25-27.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. A given amplifier will be one of several classes, depending upon the fraction of input cycle during which plate current is expected to flow under rated full-load conditions.

T F 2. All tubes contain a minute amount of residual gas which may lead to the ultimate destruction of the tube.

T F 3. One classification of amplifiers is based upon the frequencies at which they operate.

T F 4. In the radio receiver, amplifiers, both audio and radio-frequency types, generally are used in single stages.

T F 5. The impedance-coupled amplifier is frequently used in radio receivers.

T F 6. Modern receivers do not generally use transformer-coupled amplifiers because of the weight and cost factor.

T F 7. The impedance of the average voice coil is 2 to 30 ohms.

T F 8. Oneof the criteria for a push-pull amplifier is evenly matched tubes.

T F 9. One advantage of a push-pull amplifier is that the separate DC components are not cancelled out.

T F 10. In an ordinary amplifier where the grid is always negative, very few electrons coming from the cathode reach the grid.

T F 11. The signal currents flowing in a Class A amplifier are heavier than those in a Class B push-pull amplifier.

T F 12. One method of equalizing signal voltages in a push-pull amplifier is by resistance coupling.

T F 13. It is possible to obtain "two" tubes in one envelope, such as the 6V8.

T F 14. The r-f amplifier differs from the a-f amplifier in that the former is required to amplify only a single frequency, and the latter is required to amplify the entire audio band.

T F 15. Resistance coupling is generally used for r-f amplification.

T F 16. Radio-frequency transformers generally are of the air-core type.

T F 17. One advantage of powdered iron-core r-f transformers is the increased inductance without excessive eddy-current losses.

T F 18. Essentially, the i-f lies between the frequency of the carrier and the frequency of the signal used to modulate that carrier.

T F 19. The v-f (video-frequency) signal range is about 30 to 4,000,000 cycles per second.

T F 20. Generally speaking, DC amplifiers are in wide use in receivers today.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The suffix ________ may be added to the letter(s) of the class identification to denote that grid current does not flow during any part of the input cycle.

2. A remote cut off amplifier tube is a modified construction of a _______________ or a ________________ type designed to reduce modulation-distortion and cross-modulation in r-f stages.

3. A __________ ___________ is inserted to provide a path whereby trapped electrons may be drained off slowly.

4. Coupling capacitors generally run from ______________ to _________ microfarad.

5. ___________________ are generally used in resistance-coupled amplifiers.

6. A sharp rise in signal strength takes place at about _____________ cycles in a transformer-coupled amplifier.

7. In the push-pull circuit, the primary winding of the output transformer must match the _______________-_________-_____________ resistance of the two tubes.

8. In a DC amplifier, the plate current is measured by a _____________.

9. The direct-coupled amplifier may be used to amplify signals containing very ________________ ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A Class A amplifier is one with (A) multiple channels; (B) two 6L6 tubes in push-pull at all times; (C) the grid bias and alternating grid-voltages so designed that the plate current in a specific tube flows at all times; (D) the grid bias greater than the cut-off value, so that the plate current is zero.

_____ 2. The suffix 2, such as A_2 denotes an amplifier where (A) the grid current flows during some part of the cycle; (B) the grid bias is greater than the cut-off value; (C) the grid current is completely cut off; (D) the plate current is zero.

_____ 3. In a resistance-coupled amplifier, the component used to prevent a large positive voltage from appearing upon the grid of the second tube is a/an (A) resistor; (B) capacitor; (C) inductor; (D) transformer.

_____ 4. A grid leak is a (A) resistor; (B) capacitor; (C) inductor; (D) transformer.

_____ 5. In a push-pull circuit, the signal voltages must be 180 degrees out of phase with each other. This is accomplished by (A) using a converter tube; (B) using a ± 1% resistor and ± 1% capacitor in parallel; (C) using the center-tapped-secondary-winding input transformer; (D) using matched resistors only.

______ 6. The device most commonly used to couple stages of r-f amplification is the (A) tuned r-f transformer; (B) resistance coupling; (C) iron-core transformers; (D) mica capacitor.

______ 7. One use of the DC amplifier is in the (A) receivers general; (B) VTVM; (C) T-V; (D) transistor receiver.

______ 8. The frequency of a DC amplifier is (A) 0; (B) 10; (C) 100; (D) 1000.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The four classes of amplifiers are:

(A) ______ (B) ______ (C) ______ (D) ______

2. The input impedance of an electron tube consists of:

(A) ______

______

(B) ______

______

(C) ______

______

3. The system of amplifier classification which is based upon the frequency at which the amplifier will operate also has four classes. They are:

(A) ______ (C) ______

(B) ______ (D) ______

4. The speed with which electrons trapped on the grid will leak off will depend on the values of the:

(A) ______ (B) ______

5. In the ordinary receiver, the r-f amplifier serves a double purpose of:

(A) ______ (B) ______

6. Three cures for "feedback" are:

(A) ______

(B) ______

(C) ______

7. Radio frequency amplifiers have a number of advantages over a-f amplifiers:

(A) ______________________________

____

(B) ______________________________

____

(C) ______________________________

____

Diagrams

Directions: In the space provided, draw the following diagrams:

1. Two-stage resistance-coupled audio frequency amplifier employing pentodes.

2. A typical R. F. stage schematic diagram employing a pentode.

Assignment
Sheet No. 11

Covering
Units 42-49

SERVICING AMPLIFIERS AND RECEIVERS

As the previous unit made clear, the amplifier is often the "heart" of many electronics devices. Knowing how to repair an amplifier that is not functioning properly is an essential part of the radio-TV repairman's skills and knowledge.

In this unit you will have the opportunity to learn servicing techniques to go with your previously learned information about amplifiers.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ________________________.
3. Draw the circuit of a single tube used as an audio-frequency amplifier and phase inverter and explain its operation.

References:

A. Marcus, Radio Servicing, pp. 283-291.

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In general, most of the defects that cause trouble in the detector stage will do the same for the amplifier stage.

T F 2. If the receiver operates from the power main, the power transformer should be tested for short and open circuits.

T F 3. Short-circuited by-pass capacitors in the plate and screen circuits may cause an inoperative receiver.

T F 4. Reversed "B" or "C" battery should cause no operating difficulties in an amplifier.

T F 5. It is possible for a short-circuited grid leak to short-circuit the signal.

T F 6. The chief cause of distortion in an amplifier is overloading of the tubes.

T F 7. Grid and plate leads, if too close together, can cause distortion.

T F 8. In an inverse-feedback arrangement, too little feedback will cause distortion.

T F 9. Weak signal strength may cause feedback.

T F 10. One of the chief causes of oscillation howls, clicks, and whistles is unwanted feedback.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. If the amplifier produces no output, the first check should be for ______________ or ________________ power.

2. When trying to determine the cause of weak output from the amplifier stage, the grid circuit should be checked for any __________-________________ contacts which may have developed.

3. A major sourse of weak output in r-f and i-f amplifiers is __________________ of ____________________ ____________________.

4. In the push-pull a-f amplifier, any ______________________ may produce distortion.

5. Hum in an amplifier is usually caused by stray ____________________ or ___________________ pickup from the AC power lines or failure of the ________________ circuits designed to keep it out.

6. The r-f amplifier ____________ ____________ amplify 60 cycle hum.

7. The ____________ ____________ is a major source of hum in a receiver.

8. It is sometimes possible to eliminate hum by ______________________ either the primary or the secondary winding of the a-f transformers.

9. Twisting the leads carrying AC to the filaments or heaters of the tubes will _____________________ unwanted magnetic fields.

10. A _________________ _________________ between the heater and the cathode of a tube may cause hum.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When the amplifier produces no output, one should check the voltages at the plates and screen of the tube. Generally, the plates should operate at (A) 50 volts; (B) 100 volts; (C) 200 volts; (D) 250 volts.

_____ 2. The chief sources of weak output are (A) tubes; (B) resistors; (C) capacitors; (D) transformers.

_____ 3. In a-f amplifiers using inverse feedback, too much feedback will cause a (A) dead receiver; (B) weak output; (C) burned-out r-f transformer; (D) tube failure

_____ 4. Defective shielding of plate and grid leads may produce (A) a dead receiver; (B) neutralization; (C) feedback; (D) regeneration.

_____ 5. Audio howling is a special type of oscillation caused by some component (A) vibrating; (B) degenerating; (C) regenerating; (D) chopping.

_____ 6. Hum current is usually of the following frequency: (A) 30 cps; (B) 60 cps; (C) 90 cps; (D) 120 cps.

_____ 7. Audio-frequency transformers are a source of hum, largely due to (A) oscillation(internal); (B) magnetic field; (C) capacitance; (D) reactance.

_____ 8. All AC leads should be (A) as short as possible; (B) placed near plate or grid leads; (C) shielded; (D) grounded.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Defects which usually occur in the amplifier stage are:

(A) _______________ (C) _______________

(B) _______________ (D) _______________

2. When checking for weak output, the power supply should be tested to see that it is delivering the correct voltage to the:

(A) _______________ (C) _______________

(B) _______________

3. Intermittent output from an amplifier stage is usually caused by:

(A) _______________ (C) _______________

(B) _______________

4. Marcus lists four steps that should be taken before starting a service procedure. These are:

(A) _______________

(B) _______________

(C) _______________

(D) _______________

5. If a receiver is "dead", but the tubes light up, the sources of trouble could be:

(A) ____________________

(B) ____________________

(C) ____________________

6. There are two checks to make if a receiver is "dead", but the tubes light up. These are:

(A) ____________________

____

(B) ____________________

____

7. Some common causes of hum in a receiver are:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

8. Common causes of noise within a superheterodyne are:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

9. The grid bias voltage on the r-f, mixer, or i-f amplifier tubes of an AM receiver is composed of two components. These are:

(A) ____________________

(B) ____________________

10. Intermittent operation of a receiver may be caused by such troubles as:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

Assignment
Sheet No. 12

Covering
Units 50-55

THE SUPERHETERODYNE CIRCUIT

One of the most common circuits around which receivers are designed and built is the superheterodyne circuit. In such a receiver, the incoming modulated radio-frequency (RF) signal is amplified a small amount in the pre-selector section and then fed into the frequency converter section, where the RF signal is converted into a fixed and usually lower frequency called the intermediate frequency (IF) of the receiver. In the IF stage, the modulated IF signals are highly amplified and then fed into the second detector for demodulation. The resultant (relatively weak) audio signals are then amplified in the conventional manner by the audio amplifier, then reproduced as sound by the loudspeaker.

In this unit you will study the principles of the superheterodyne receiver in detail, inasmuch as modern radio and television receivers still rely heavily on these principles.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________________.
3. Draw the block diagram for a five-tube AC-DC superheterodyne receiver using miniature-type tubes.

References:

A. Marcus, Radio Servicing, pp. 419-432.
B. Radio Corporation of America, RCA Receiving Tube Manual, pp. 75-77.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The carrier current is generated at a constant radio frequency.

T F 2. Radio vacuum tubes, having no moving parts, are "electronically noiseless".

T F 3. Most home receivers have three stages of RF amplification.

T F 4. A rough estimate of the selectivity of a receiver may be obtained from the number of tuned circuits appearing before the detector--the greater the number, the more selective the receiver.

T F 5. A preselector is a device for always tuning in a given station at peak efficiency.

T F 6. The tuned RF receiver generally has replaced the superheterodyne receiver today.

T F 7. One of the distinct disadvantages of the tuned RF receivers is its lack of selectivity.

T F 8. Modulation is a changing or varying of the frequency, amplitude, or phase of a signal and passing on the "change" to the new signal.

T F 9. The local oscillator is important in that we can have, at all times, a constant IF regardless of the incoming signal.

T F 10. In this country, the frequency separation between adjacent stations generally is about ten kilocycles.

T F 11. Image frequency of a superheterodyne circuit refers only to the sound components of television receivers.

T F 12. Preselectors are absolutely necessary as a functioning part of the IF stage.

T F 13. A local oscillator is, in reality, a transmitter.

T F 14. A capacitor called a padder is a fixed capacitor.

T F 15. Most present-day superheterodyne receivers employ three or more stages of IF amplification.

T F 16. Misalignment of tuned circuits may be due to normal aging.

T F 17. A good indicating instrument for realignment is the VTVM equipped with a high-frequency probe.

T F 18. Manufacturers' service data should be disregarded since the principles of radio and television apply to all makes, not just a particular brand.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Frequency conversion is used in superheterodyne receivers to change the frequency of the rf signal to an ____________________ ____________________.

2. Because of the great sensitivity of the superheterodyne receiver a(n) ________________ antenna is not required.

3. The standard IF for AM broadcast and short-wave receivers is ________ kc.

4. When a pentagrid mixer tube is used for frequency conversion, variations in plate current are due to the combination of the ______________ and ______________ frequencies.

5. In the superheterodyne receiver, one of the mixing voltages is produced by the ________________ signal.

6. The lower the IF, the greater the percentage of ________________ ______________ between adjacent stations.

7. A large number of ___________-_____________ receivers do not use a preselector.

8. IF transformers operate at ______________ frequencies.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The frequency of the incoming signal is determined by the (A) IF transformer; (B) broadcasting station; (C) dummy antenna; (D) local oscillator.

_____ 2. In superheterodyne receivers for use in the broadcast band, it is usual to employ oscillators that are tuned (A) higher than the signal frequency; (B) lower than the signal frequency; (C) the same as the signal frequency; (D) none of the above.

_____ 3. The chief function of a preselector is to (A) reduce tube noise; (B) change stations automatically; (C) eliminate antenna systems; (D) eliminate signals from unwanted stations before they reach the converter stage.

_____ 4. The small capacitor usually connected in parallel with the main tuning capacitor and used mainly to obtain proper tracking, especially at the high-frequency end of the band is called a (A) trimmer; (B) tracker; (C) triad; (D) tetrode.

_____ 5. Most superheterodyne receivers employ a (A) triode type of second detector; (B) hexode type of second detector; (C) diode type of second detector; (D) pentode type of second detector.

______ 6. To minimize the undesirable effects caused by interaction between the oscillator and signal sections of the tube as the frequency increases, several pentagrid-converter tubes are designed so that (A) only one of the electrodes function alone as the oscillator anode; (B) two of the electrodes function alone as the oscillator anode; (C) three of the electrodes function alone as the oscillator anode; (D) none of the electrodes function alone as the oscillator anode.

______ 7. An example of a tube as discussed in the previous question is a (A) 12AT5; (B) 6BE6; (C) 6V3A (D) 6SH7.

______ 8. Virtually all receivers having automatic volume control (avc) are (A) t-r-f; (B) superheterodyne; (C) Williamson; (D) Miller.

______ 9. In realignment, the signal generator should be set at which of the following for best results? (A) weakest signal possible; (B) moderate signal; (C) strongest signal possible; (D) none of these.

______ 10. In servicing superheterodyne receivers, it is well to remember that (A) the chassis may be connected to both power leads; (B) the chassis may be connected to the antenna; (C) the chassis may be connected to the speaker, (D) the chassis may be connected to one lead of the power source.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three important advantages gained in a receiver by the conversion of signal frequency to a fixed intermediate frequency are:

(A) ______________________ (C) ______________________

(B) ______________________

2. The action of a mixer hexode in converting a R-F signal to an IF depends on:

(A) ____

(B) ____

(C) ____

____

3. In the superheterodyne receiver, one finds voltages and currents of four different frequencies. They are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

4. Small semivariable trimmers, used for tuning I-F transformers, generally have dielectrics made of:

(A) ________________ (C) ________________

(B) ________________

5. Three disadvantages of the tuned R-F receiver are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

6. Several advantages of the superheterodyne receiver over the tuned R-F receiver are:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

Units 56-67

POWER SUPPLIES

All the various components and stages of radio and television receivers depend upon the power supply for energy. As you will find in your study, receivers cannot use AC or DC as it is produced, except in certain instances. The power supply furnishes the type energy needed.

In this unit you will have the opportunity to learn the characteristics and design features of power supplies.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________________.
3. Check with your coordinator relative to a closed-book exercise. He will give you an assignment which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

Reference:

A. Marcus, Radio Servicing, pp. 372-407.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Pilot lamps will operate on AC or DC current.

T F 2. The electrodynamic speaker requires AC for best operation.

T F 3. An AC power transformer usually is a combination of step-up and step-down transformers.

T F 4. It is not necessary to filter the output of the rectifier.

T F 5. The filter choke coil may be placed in either the positive or negative leg of the power supply.

T F 6. Most home receivers employ a resistor-capacitor filter.

T F 7. Half-wave rectifiers are generally used because it is easier to filter their output.

T F 8. A choke-input filter will produce better regulation than a capacitor-input type.

T F 9. A voltage divider is used to obtain lower voltages which may be required.

T F 10. Most receivers employ an electromagnetic-dynamic speaker.

T F 11. In most receivers operating from house current or storage batteries, the cathode-resistor method for obtaining grid bias is used.

T F 12. The voltage output of the ordinary power supply is quite constant.

T F 13. Most AC-DC receivers employ a series of tubes, the sum of whose heater voltages add up to the line voltage, and, therefore, do not need a voltage regulator.

T F 14. Most receivers use miniature (pilot) lamps rated at 6 to 8 volts and operated at about 4.25 volts to prolong life.

T F 15. The greater the potential difference between the cathode and the heater of a tube, the greater is the possibility for hum.

T F 16. Tubes employed in portable receivers are of the filament type and require AC.

T F 17. The tuning capacitor in the secondary circuit is called a buffer capacitor.

T F 18. One of the chief difficulties encountered in the vibrator power supply is that of eliminating R-F interference (hash) from the receiver.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Most portable receivers use small ________________ volt batteries for ____________________ and screen supply.

2. Alternating current receivers usually employ a __________-__________ transformer to obtain the low potential needed for the tube filaments and heaters and a ___________-________ transformer for the high plate and screen potentials.

3. Current for the filament of the rectifier tube is provided by a third ____________________ __________________ of the ___________ ______________________.

4. High-frequency disturbances, usually originating in sparks in other appliances on the line, may be minimized by inserting _____________________ in the _______________ circuit of the power transformer.

5. Most filter capacitors have values of __________ to _________ mfds and working voltages of about ____________ to __________ volts.

6. Filter choke coils used in most AC receivers have inductances ranging from about _________ to ___________ henries.

7. The operation of the voltage-multiplier circuit depends upon alternating charging two or more capacitors to a value close to the peak ____________ _______________ and then permitting them to discharge in _________________.

8. Glow tubes, operating in voltage regulating circuits, have limited use because they can operate only on a fixed ________________ and a limited ________________.

9. A higher output can be obtained when the AC-DC power supply is used on _______________.

Multiple Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Plate and screen voltages must be (A) AC; (B) DC; (C) AC or DC; (D) mixed AC,DC.

_____ 2. Grid-bias voltage must be (A) AC; (B) DC; (C) AC or DC; (D) mixed AC, DC.

_____ 3. Most portable receivers do not use <u>one</u> of the following battery voltages for heating the filaments: (A) 1½; (B) 3; (C) 7½; (D) 9.

_____ 4. Power transformers used in present-day AC receivers have a secondary winding which supplies the heaters with (A) 1.5 V.; (B) 3.1 V.; (C) 6.3 V.; (D) 12.6 V.

_____ 5. The rectifier-filament winding of modern AC power transformers is usually designed to furnish (A) 5 volts at 2 to 3 amps; (B) 5 volts at 4 to 6 amps; (C) 10 volts at 2 to 3 amps; (D) 10 volts at 4 to 6 amps.

_____ 6. Power transformers are usually enclosed in shields of (A) aluminum; (B) copper; (C) alnico; (D) iron.

_____ 7. Capacitors used in power-supply filter circuits are called (A) brute-strength capacitors; (B) variable capacitors; (C) filter capacitors; (D) choking capacitors.

_____ 8. The inductors used in power-supply filter circuits are called (A) transformers; (B) artichokes; (C) filter choke coils; (D) inducers.

_____ 9. The AC-DC power supply is quite common because it eliminates the need for a (A) rectifier tube; (B) paired capacitors; (C) power transformer; (D) matched resistors.

_____ 10. A spark plate is a (A) capacitor; (B) resistor; (C) transformer; (D) tube.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The power supply must furnish energy for the following purposes:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

2. The electric energy for the power supply originally comes from one or more of the following three sources:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. The power-supply filter called the resistor-capacitor is not used in high-powered sets for the following reasons:

(A) ______________________________

(B) ______________________________

(C) ______________________________

4. Four advantages of the p-m dynamic speaker over the electromagnetic type are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

5. Often it is desirable to operate a radio receiver from storage batteries whose voltages may be:

(A) __________ (B) __________ (C) __________ (D) __________

6. Higher voltages than those listed in the previous question are often needed to activate plates and screens. This higher potential is obtained from:

   (A) ______________________ (C) ______________________

   (B) ______________________

7. Some advantages of the dynamotor power supply over the vibrator power supply are:

   (A) ______________________ (C) ______________________

   (B) ______________________ (D) ______________________

Problems

Directions: Solve the problems below using the information given.

1. Assume the following tube lineup in an AC-DC receiver: 6SA7, 6SK7, 6SQ7, 25L6, 25Z6. The line voltage is 117 volts. Find:
   a. the value of the filament-dropping resistor.
   b. the power dissipated in this resistor

2. Assume the following tube line-up in an AC-DC receiver: 6SA7, 63Q7, 6SK7, 25Z5, 35L6.
    a. Which tubes should have their heaters shunted?
    b. What value of shunting resistance is required?

Units 68-70

SERVICING POWER SUPPLIES

As is true for all other portions of the receiver, faults in the power supply may be due to open circuits, short circuits, accidental grounding, and the like.

The alert technician will be alert for these defects, as well as many others when the trouble is known to be in the power supply.

In this unit you will have the opportunity to learn servicing techniques for defective power supplies.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________________.

References:

A. Marcus, Radio Servicing, pp. 407-418.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. A faulty power supply may result in a dead or weak receiver.

T F 2. Run-down batteries tend to produce a noisy output.

T F 3. Electrolytic capacitors are quite critical as to their working voltages and polarity.

T F 4. Semiconductor rectifiers must be replaced quite frequently.

T F 5. The first a-f stage of the receiver is particularly sensitive to strong magnetic influences.

T F 6. The filter-choke coil is another major source of trouble.

T F 7. It is good practice to place all the power supply components as far as possible from the receiver proper.

T F 8. If an electrodynamic speaker is receiving excitation, a screw driver blade will be attracted to its center pole piece, whether the set is on or off.

T F 9. Generally speaking, AC-DC receivers run hotter than power-transformer receivers.

T F 10. Rectifier tube failure is greater in AC-DC receivers.

T F 11. Reversing the live plug with an AC-DC receiver operating on AC seldom, if ever, results in better reception.

T F 12. It is not generally advisable to try to repair a defective vibrator.

T F 13. If a receiver is dead and the tubes do not light, the first thing to check is the voltages at the plate and screen grid.

T F 14. A voltage-doubler system will operate on DC power source.

T F 15. The "dry" type of filter capacitor is commonly used in power supplies.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The chief source of trouble in a power supply operated from AC are the ________________ ______________________.

2. A ruined rectifier tube is generally associated with a short-circuited __________________ ________________.

3. In an AC-DC receiver an (a) ________________________ circuit in the heater circuit will extinguish all the tubes.

4. Electrolytic capacitors tend to ________________________ when not in use.

5. A ruined rectifier tube is often associated with a short-circuited ____________________ __________________.

6. The most common sources of trouble in a power supply are the ________________ _________________.

7. If the bypass capacitor across the grid bias resistor is short-circuited, ______________________ will set in and the volume of the receiver will decrease.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In a battery-operated power supply, if the B battery is connected in reverse, the set (A) remains operative, same strength; (B) remains operative, weaker; (C) gradually becomes inoperative: (D) immediately goes dead.

_____ 2. If the A battery in a battery-operated power supply is connected in reverse, the set (A) remains operative, same strength; (B) may become weaker or inoperative; (C) gradually becomes inoperative; (D) immediately goes dead.

_____ 3. Next to filter capacitors, most of the trouble in power supplies arise in the (A) transformer; (B) resistors; (C) rectifier; (D) choke coil.

_____ 4. If the shield around the power transformer is poorly grounded, the following will result: (A) intermittent howl; (B) short circuit; (C) hum; (D) sparking.

_____ 5. If the laminations of the power transformer are not tightly clamped, the following will result; (A) a tunable hum; (B) a sparking; (C) mechanical hum; (D) intermittent howl.

_____ 6. An automobile radio may draw (A) 2 amps; (B) 3 or more amps; (C) 4 amps; (D) 5 or more amps.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. A transformer that has burned out has the following characteristics:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Seven factors which can cause no B+ output from the power supply in an AC power supply are:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

3. Six factors which may cause the B+ from the power supply to be too low are:

(A) ______

(B) ______

______

(C) ______

(D) ______

(E) ______

______

(F) ______

______

4. Five causes of a B+ output from the power supply that is too high are:

(A) ______

(B) ______

______

(C) ______

(D) ______

______

(E) ______

SERVICE INSTRUMENTS

The increasing complexity of home receivers has taken the repair of such out of the hands of the "handyman" and placed it squarely in the hands of the fully qualified technician.

The fully qualified technician understands and uses the best test equipment available to diagnose, and therefore repair a defective receiver.

In this section you will have an opportunity to learn about the basic kinds of test equipment and their uses.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ______________________________.

Reference:

A. Marcus, Radio Servicing, pp. 487-547.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The most commonly used servicing instrument is the meter.

T F 2. The most common type of meter movement is the d'Arsonval or moving-coil type.

T F 3. The moving-vane type meter movement is as sensitive as the d'Arsonval type.

T F 4. The d'Arsonval movement-type meter can be used to measure AC.

T F 5. The range of some meters is increased by placing a shunt in series with the moving coil.

T F 6. The minus terminal of the voltmeter should be connected to the positive side of the circuit.

T F 7. The multimeter will measure DC voltage only.

T F 8. The AC - VTVM is essentially a device for rectifying the alternating voltage and increasing the resulting DC pulses.

T F 9. The ohmmeter cannot be used to test for open and short circuits.

T F 10. The scale of the VTVM may be calibrated to read resistance.

T F 11. A certain amount of leakage is normal in all electrolytic capacitors.

T F 12. Signal generators are used to reproduce signals normally encountered in the equipment under test.

T F 13. The desired wave form of the output of the signal generator used for ordinary servicing work is the sine curve.

T F 14. Transconductance tube checkers closely simulate actual operating conditions of tubes in the receiver.

T F 15. Fluctuations in line voltage are not considered serious enough to warrant attention when operating the tube checker.

T F 16. Short circuits existing within a tube may cause damage to the tube checker when the tube is placed under test.

T F 17. The neon-lamp test will show up leakage that may exist between the various electrodes.

T F 18. In reality the oscilloscope is a kind of voltmeter.

T F 19. Generally, the horizontal deflecting plates are reserved for the output of the sweep oscillator.

T F 20. Most amplifiers used in oscilloscopes consist of a single stage.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The divisions of a meter scale may be ____________________ or ____________________.

2. A meter used to measure the current flowing in a circuit is called an ____________________.

3. A voltmeter must be connected ____________________ or ____________________ with the circuit being tested.

4. When testing a circuit whose current or voltage is unknown, start with the ____________________ range and work ____________________ to the proper one.

5. In a DC VTVM, ____________________ tends to protect the meter from burn-out resulting from overload.

6. Most AC VTVM are of the ____________ type, with their scales usually calibrated in ____________ values.

7. Where direct voltages are to be measured across a high impedance circuit, it is customary to build into the probe a ____________ ____________ isolating resistor.

8. The measurement of resistance is based upon ____________ flowing through the resistor under test and the ____________ ____________ across the resistor produced by that current.

9. One of the most accurate devices for measuring ____________ is the Wheatstone ____________.

10. A multimeter is several meters combined in one using a common ____________ ____________ ____________ as an ____________ device.

11. The ____________ test is used to check diodes and rectifier tubes.

12. Heater-to-cathode electrode leakage is a major source of ____________ in a receiver.

13. To test for gas in a vacuum tube, place a resistor between the ____________ ____________ and cathode. The ____________ ____________ should be observed while the ____________ is shorted.

14. In the cathode-ray tube, a stream of electrons is emitted by a ____________ ____________.

15. If an alternating voltage is applied to the plates of an oscilloscope, the electron beam will form a ____________ ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. If a current is sent through a d'Arsonval meter, in the opposite direction, the pointer will (A) do nothing; (B) indicate a normal reading; (C) burn up; (D) move backward.

_____ 2. The electrodynamometer-type indicating meter will measure (A) AC only; (B) DC only; (C) AC-DC; (D) none of the above.

_____ 3. A meter with hot-wire movement is frequently used to measure (A) r-f output of radio transmitters; (B) AC only; (C) DC only; (D) none of the above.

_____ 4. An ammeter must be connected in (A) series; (B) parallel; (C) series-parallel; (D) none of the above.

_____ 5. The meter used to measure the difference of potential between two points is called a (A) voltmeter; (B) ammeter; (C) ohmmeter; (D) wattmeter.

_____ 6. A multiplier is a (A) voltage doubler; (B) power transformer; (C) large resistor; (D) large capacitor.

_____ 7. Output meters are used to measure (A) antenna currents; (B) power supply output; (C) loudspeaker-power output; (D) power-transformer output.

_____ 8. A phrase that means the same as frequency deviations is (A) sweeps per second; (B) heat frequency; (C) zero frequency; (D) metered frequency.

_____ 9. With no voltage applied to any of the plates of an oscilloscope, the electron beam produces a (A) sine wave; (B) spot of light in the exact center of the screen; (C) saw tooth; (D) vertical line.

_____ 10. If direct voltage is applied to the top vertical deflecting plate which is positive of an oscilloscope, the electron beam will move (A) up; (B) down; (C) right; (D) left.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The indicating meter may be calibrated to indicate:

(A) ______________ (B) ______________ (C) ______________

2. Generally, a meter consists of a:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. Meters may indicate from one of three directions. They are:

(A) ______________ (B) ______________ (C) ______________

4. The VTVM has several advantages over other voltmeters. They are:

(A) ____

____

(B) ____

(C) ____

(D) ____

(E) ____

5. A signal generator must be able to reproduce the following signals:

(A) ______________________________

(B) ______________________________

(C) ______________________________

6. Commercial tube checkers are of two types. They are:

(A) ______________ (. ______________

7. Damaged tube electrodes, leads, or supports may cause the following:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

8. The two parts of a cathode-ray oscilloscope power supply are:

(A) ______________________________

(B) ______________________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Diagram: Make a clear, accurate schematic diagram of a Wheatstone Bridge. Label all the parts.

2. Make a clear, accurate schematic diagram of an R-F oscillator and output circuit. Label all the parts.

Assignment
Sheet No. 16

Covering
Units 83-90

GENERAL SERVICING PROCEDURES

The chief purpose of radio servicing is to locate and remedy defects in a faulty receiver.

As in all fields of endeavor, a book cannot be a substitute for experience. Although there are many servicing techniques in use today, the basic principles which underlie all these techniques are the same.

In this unit you will have the opportunity to learn these basic techniques. As your experience becomes broader, several short cuts will present themselves.

Assignment:

1. Read the references listed below.
2. Answer the questions listed and turn in your work by ________________________.
3. Check with your coordinator relative to a closed-book exercise. He will give you an assignment which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

References:

A. Marcus, Radio Servicing, pp. 548-601.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Successful servicing must be conducted in accordance with a systematic plan.

T F 2. One of the first steps in servicing a receiver is to clean it of dust, dirt, drops of solder, etc.

T F 3. During the preliminary examination, nuts and screws that control trimmers and padders should be tightened.

T F 4. Static servicing procedure assumes that defects in radio receivers are cause, or are accompanied by, a change in the operating voltages on the various tube elements or in the resistances of the various components and circuits.

T F 5. The best way to measure tube-pin voltage is to remove the tube and insert it in a tube checker.

T F 6. Once the danger of a short circuit has been eliminated and the power of a receiver is turned on, the line voltage or battery voltage should be checked.

T F 7. A capacitor to be checked must be removed from the receiver.

T F 8. In signal injection you should use as low an output from the signal generator as will give positive results.

T F 9. If the receiver is defective, some component must be defective.

T F 10. Voltage of the AVC circuit must be measured with a VTVM.

T F 11. The voltage at the control grid is always positive.

T F 12. Realignment should be a last resort when it has been proved there are no other defects.

T F 13. If a receiver fails to operate, the tubes should be tested.

T F 14. In a superheterodyne receiver, a non-operating oscillator will stop the receiver from functioning.

T F 15. A major source of trouble is the misalignment of tuned circuits.

T F 16. Noises heard in the loudspeaker always originate within the receiver.

T F 17. Hum heard in the speaker is usually due to poor ground connections.

T F 18. The chief cause of distortion is a defect that prevents an amplifier tube from operating on the linear portion of its characteristic curve

T F 19. The transistor must be removed when making resistance measurements in the transistor receiver.

T F 20. Stray capacitance which may be negligible at AM frequencies may become quite large at FM frequencies.

Completion

<u>Directions:</u> Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. While cleaning the receiver, it should be examined for ______________ ____________________

2. The chief weakness of the static-servicing procedure is that many defects are possible in a radio receiver which will not show up on a ____________ or __________________ test.

3. Tube-pin voltage tests are usually made with the __________________ control of the __________________ turned to maximum and the ________________ controls of the receiver so adjusted that no signal is tuned in.

4. Dynamic testing consists of two general categories: signal ____________________ and signal _________________.

5. Low B+ voltages may be due to a weak __________________-____________ or semiconductor _________________ which should be replaced.

6. In its simplest form, the output indicator (for dynamic testing) may be the ______________________ of the receiver.

7. For the signal injection procedure, the "cold" lead of the signal generator is connected to the _________________ of the receiver.

8. If the tubes and the power supply of a superheterodyne receiver have been cleared of any defects and no note is heard when the signal is injected, a defect in the _____________ _________________ or _____________________ is indicated.

9. The signal-tracing procedure is similar to the signal-injection method, except that it is __________________.

10. A major cause of weak signals is ________________________ of the __________________ ____________________.

11. Distrubances in the loudspeaker may enter the receiver through the ______________ or through the _____________________ _________________ ______________.

12. The chief cause of oscillations is ________________________ produced by feedback from the ________________ to the _____________ circuits of a single stage or from stage to stage.

13. The heart of a "high-fidelity" system is the __________ ______________.

14. The voltage measured across a short-circuited plate bypass capacitor would be _____________ volts.

15. The voltmeter most often used in service work is a vacuum-tube voltmeter or a _____________________________ voltmeter.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. After all visible defects of a receiver have been repaired, the next step is to (A) return the set to the owner; (B) test the tubes; (C) test power supply; (D) test amplifier.

_____ 2. Tube-pin voltages may normally vary from chart values (A) ± 10%; (B) ± 20%; (C) ± 30%; (D) ± 40%.

_____ 3. In most receivers, the resistors have a tolerance of (A) ± 10%; (B) ± 20%; (C) ± 30%; (D) ± 40%.

_____ 4. With the power on an AC receiver, should the power-output tube be removed and a "click" heard, this would indicate that all except one of the following are operating: (A) audio-output stage; (B) antenna system; (C) power supply; (D) loudspeaker.

_____ 5. The converter tube of the three-way portable receiver is best checked by (A) feeling it for warmth; (B) a tube checker; (C) visual inspection to see if its filament lights; (D) substitution.

_____ 6. The chief cause of weak output in transistor receivers is (A) a weak battery; (B) the i-f section; (C) the r-f section; (D) in the audio section.

_____ 7. The i-f frequency of FM receivers is (A) 1.7 megacycles; (B) 7.1 megacycles; (C) 10.7 megacycles; (D) 17.5 megacycles.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Systematic servicing procedure may be divided into two general classifications. They are:

(A) ______________________ (B) ______________________

2. Defects which will not show up on a voltage or resistance test are:

(A) ______________________ (B) ______________________

3. A defective receiver presents one of two symptoms; these are:

(A) ____

(B) ____

4. If the output of a receiver is defective, it may exhibit a number of symptoms, which fall into the following general categories:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

5. When using an ohmmeter there are certain precautions to be observed. These are:

(A) ____

(B) ____

(C) ____

____

(D) ____

6. Most multimeters have the following ranges:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. Common sources of defects in transistor radios are:

(A) ____

(B) ____

(C) ____

8. Three main pieces of test equipment which may be used in alignment procedures are:

(A) ____________________ (C) ____________________

(B) ____________________

Problems

Directions: Read the following problem carefully. Do the specific operations which the question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Diagram a typical AVC circuit showing points to check for voltage readings. Label all parts.

Assignment

Units 91-93

REPLACEMENT, REPAIR, AND READJUSTMENT OF COMPONENTS

Once the defect of a receiver has been isolated, it must be repaired, replaced, and possibly readjusted.

The skills involved in this phase of radio and TV repair are as important as any learned up to this time.

In this unit you will have the opportunity to learn the skills and techniques necessary for this phase of radio and TV repair.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ______________________________.
3. Using a signal generator and the speaker of the set, describe how you would align the i-f section of an AM AC-DC receiver.

Reference:

A. Marcus, Radio Servicing, pp. 602-619.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The ability to solder properly is a prerequisite to successful servicing.

T F 2. As the material to be soldered is heated, it tends to form a coat of oxide, which makes soldering difficult.

T F 3. A mica capacitor can be replaced with an electrolytic capacitor of the same ratings.

T F 4. Receivers that employ only one i-f stage generally use high-gain input and output transformers.

T F 5. Any change in the position of wiring may result in misalignment.

T F 6. Realignment should be carried out on a metal-topped table.

T F 7. All shields normally found in a receiver should be in place before realignment takes place.

T F 8. Realignment tools should be made of high-carbon steel.

T F 9. Alignment consists of making adjustments in each tuned circuit to compensate for the various small discrepancies that exist between them.

T F 10. It is not necessary to allow a receiver to be aligned time to warm up.

T F 11. In most multiband receivers, one set of transformers, trimmers, and padders serves all bands.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A soldered joint must be strong ____________________ and should make perfect ________________ contact.

2. The tip of the soldering iron should be kept clean and free from ____________________.

3. A replacement resistor should have the same ____________________ and also be able to carry the same ________________ as the original.

4. When replacing fixed capacitors, the new should have both the same ____________________ and the same or higher __________ ____________ ________________ as the old.

5. When replacing potentiometers, one of the same ____________________ and ______________ of ______________ should be used.

6. As a preliminary to realignment procedures, the dial should be checked to see that it is synchronized with the ________________ ________________. When these capacitors are fully meshed, the pointer should be on the ________________ frequency marking of the dial.

7. The ____________________ - ____________________ section should be aligned first, since the proper operation of the other sections depends upon that stage for proper functioning.

8. In some modern receivers ________________ ____________ ____________ may be employed for tuning the i-f transformers instead of trimmers.

9. If signals from a powerful station blanket out all other signals, a __________ ________________ may be installed in the antenna circuit to cut out or reduce the interfering signal.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A soldering iron suitable for most repair work would have a wattage of about (A) 50; (B) 100; (C) 150; (D) 200.

_____ 2. The purpose of a flux is to (A) hold the wires together; (B) conduct heat; (C) prevent oxidation; (D) none of the above.

_____ 3. When replacing a field coil loudspeaker, the ohmic resistance should be the same and also the (A) physical size; (B) power-handling ability; (C) frequency response; (D) none of these.

_____ 4. After the i-f section has been aligned, the next adjustment should be on the (A) antenna system; (B) heater-cathode string; (C) speaker system; (D) oscillator and r-f sections.

_____ 5. At the high-frequency end of the band, the oscillator-tuning capacitor is (A) completely meshed; (B) meshed to the first segment; (C) open half way; (D) completely unmeshed.

_____ 6. In most FM receivers, the tuned circuits are required to pass a band of frequencies that is about (A) 50 KC; (B) 100 KC; (C) 150 KC; (D) 200 KC.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. In order to do a good job of soldering, the following three rules must be observed:

(A) ______________________________

(B) ______________________________

(C) ______________________________

____

2. Faults which may be symptoms of misalignment are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

103

3. We may align FM receivers by either of two methods with what devices?

(A) ____

(B) ____

Assignment

Covering
Units 94-95

RADIO FREQUENCY AND INTERMEDIATE FREQUENCY INDUCTORS AND TRANSFORMERS

Tuning coils and power transformers each fulfill extremely important functions in the proper functioning of the television receiver.

One inductor may aid in the control of energy in one circuit, while another may furnish the low or high power needed for effective component operation.

In this unit you will have the opportunity to learn the techniques involved in repair and replacement of inductors and transformers.

Assignment:

1. Read the referenceslisted below.
2. Answer the questions listed below. Turn in your work by ________________________.

References:

A. Marcus, Radio Servicing, pp. 40-44. 99-104, 318-320.
C. Marcus & Levy, Elements of Radio Servicing, pp. 152-167, 187-200, 365.
D. Mandl, Mandl's Television Servicing, p. 325.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. It is permissible to remove one turn of wire to effect a repair of a defective interstage r-f transformer.

T F 2. The placement of leads is not critical when replacing an r-f transformer.

T F 3. The probable cause of a faulty oscillator coil is an open winding.

T F 4. It is always necessary to obtain an exact replacement when installing a new oscillator coil.

T F 5. The single, most important specification to be met in replacing an i-f transformer is the proper intermediate frequency to which the transformer windings must resonate.

T F 6. Interstage transformers couple successive i-f amplifier stages together.

T F 7. I-f transformers for FM receivers differ from the AM type in that the FM has a large number of turns.

T F 8. Color coding of i-f output transformer leads have not yet been standardized.

T F 9. Color coding of input i-f transformer leads have been standardized.

T F 10. Laminated cores are frequently used in the construction of r-f inductors.

T F 11. Inductances of a-f inductors are greater than inductances of r-f inductors.

T F 12. Windings of r-f inductors are sometimes arranged in sections called "pies" to reduce distributed capacitance.

T F 13. Radio frequency coils are always shielded.

T F 14. A loop antenna is an a-f inductor.

T F 15. Permeability tuning is used in some recievers.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. High gain r-f transformers have ____________ turns on the primary winding and ____________ impedance.
2. The inductance of r-f choke coils usually is from ____________ to ____________ millihenrys.
3. The frequency band of i-f transformers may be ______________, ______________ or _______________________.
4. Frequency modulation receivers use transformers tuned to _________________ megacycles.
5. The symbol for an air-core inductor is _______________________.
6. The movable-iron slug symbol is _________________________.
7. A two-stage i-f stage may use a _______________ gain transformer.
8. The oscillator output voltage should be relatively free from ___________________ frequencies.
9. Fundamental and harmonic oscillations beat together to produce __________________ frequencies.

10. Incorrect operating potentials in an oscillator may cause ________________ oscillations.

11. Blocking is a tendency for an oscillator to operate ____________.

12. The output voltage of an oscillator should display a good ________________ curve on an oscilloscope.

13. At frequencies above 15 K cycles ____________________ or ______________________ transformers are used.

14. The condition of maximum magnetization of a transformer coil is called ____________________.

15. The impedance of a primary winding should be equal to the impedance of the ________________.

16. The impedance of the secondary winding should be equal to the impedance of the ______________.

17. Oscillator transformers used in superheterodyne receivers may be tuned by ______________ ____________ ________________ or ________________ ____________________.

18. Improper placement of r-f transformer leads may cause ____________________________ .

19. If an r-f transformer is replaced in a receiver circuit, the receiver should be ______________________.

20. Coupling between the primary and secondary coils of an i-f transformer may be increased by the addition of a ________________ coil.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Radio receivers use inductors which are constructed of (A) one coil; (B) two or more coils independent of each other; (C) two or more coils inductively coupled to each other; (D) A or B; (E) A or C.

_____ 2. The intermediate-frequency transformer is so named because it is used with currents whose frequencies lie between those frequencies handled by the a-f inductor and the r-f inductor. This implies that (A) the intermediate frequencies are low; (B) the intermediate frequencies are lower than the audio-frequencies; (C) the intermediate frequencies are lower than the signal frequency; (D) the intermediate frequencies are lower than the a-f and the r-f frequencies; (E) the intermediate frequencies are really a-f and r-f frequencies mixed.

_____ 3. Audio-frequency inductors generally have (A) relatively low inductance compared to those of radio frequency; (B) relatively high inductance compared to those of radio frequency; (C) fluctuations of inductance which is sometimes higher and sometimes lower than those of radio-frequency; (D) same inductance as those of radio-frequency; (E) no relation to those of radio frequency.

_____ 4. Inductance is measured in (A) henrys; (B) millihenrys; (C) microhenrys; (D) all of these; (E) none of these.

_____ 5. The output of the final a-f amplifier must be coupled to the (A) 50L6 tube; (B) one of the 6K6-GT tubes; (C) the 6K6-GT tubes in parallel; (D) the voice coil of the loud speaker; (E) audio-frequency transformer.

_____ 6. Radio-frequency inductors are usually constructed so as to have a core of (A) air; (B) laminated iron; (C) powdered iron; (D) wood; (E) ceramic.

_____ 7. Transformer designs have been limited to (A) 2 to 4 styles; (B) 10 to 12 styles; (C) 14 to 16 styles; (D) 18 to 20 styles.

_____ 8. An AC receiver has a heater winding with 2.4 amps flowing. The defective power transformer should be replaced with a minimum (A) 1 amp transformer; (B) 2 amp transformer; (C) 3 amp transformer; (D) 4 amp transformer.

_____ 9. Current rating of the plate secondary winding of a power transformer is ordinarily given in terms of the current (A) from the output circuit of the filter; (B) drain of the primary winding; (C) of the line; (D) consumed in the a-f section.

_____ 10. In a typical 300-v power supply the peak voltage between high voltage secondary and leads is about (A) 100-300 v; (B) 500-600 v; (C) 800-900 v; (D) 1000-1100 v.

_____ 11. When the leads of a transformer must pass through a hole in the chassis, it is good policy to protect them by (A) replacing with heavier gauge wire; (B) replacing with heavier insulated wire; (C) replacing with stranded wire; (D) using a grommet in the hole.

_____ 12. Filament-heater windings can usually be distinguished from primary or high voltage secondary windings in that filament-heater windings are usually (A) lighter; (B) heavier; (C) stronger; (D) weaker.

_____ 13. The maximum temperature rise allowed for a transformer is (A) 42° F.; (B) 52° F.; (C) 62° F.; (D) 72° F.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four important factors to be observed when replacing a coil in a television-frequency circuit are:

   a ____________________

   b ____________________

   c ____________________

   d ____________________

2. The three windings in an intermediate frequency transformer are named:

   a __________ c __________

   b __________

3. Troubles often encountered in the pentagrid converter tube are:

   a ____________________

   b ____________________

   c ____________________

   ____

4. If an oscillator is not functioning, the fault may be in one of its component parts. These parts are:

   a ____________________

   b ____________________

   c ____________________

   d ____________________

   e ____________________

5. The two types of built-in antennas are the:

   a ____________________

   b ____________________

6. Some common mechanical faults which occur in built-in antennas are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

7. The three types of r-f coupling units are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

8. Miniature types of tubes are employed in television receivers because they have:

____

Assignment
Sheet No. 19

Covering
Unit 96

THE VACUUM TUBE AS A RECTIFIER

The diode is generally used as a rectifier to change AC to DC which the plates of the rest of the tubes need.

In this unit you will have the opportunity to learn the operating characterisitics of a diode vacuum tube functioning as a rectifier.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________________.

References:

A. Marcus, Radio Servicing, pp. 168-182.
B. Radio Corporation of America, RCA Receiving Tube Manual, pp. 17-18.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Most radio receivers require a plate supply of about 300 volts and up to approximately 100 milliamperes of current.

T F 2. The maximum peak plate current is the maximum instantaneous current that can safely flow through the tube.

T F 3. The voltage drop of a mercury-vapor rectifier tube will never exceed the ionization potential of the mercury vapor which is about 15 volts.

T F 4. The mercury-vapor type, as well as the vacuum type, has a "built-in" degree of overload protection.

T F 5. The characteristic curves of the high-vacuum rectifier tube (type 83) and its mercury-vapor counterpart are essentially the same.

T F 6. The half-wave rectifier is generally used for low-current circuits.

T F 7. One advantage of the full-wave rectifier over the half-wave is lack of core saturation of the transformer.

T F 8. The bridge rectifier delivers about twice the voltage of a center-tapped full-wave rectifier.

T F 9. Bridge-type rectifiers are frequently used in radio receivers.

T F 10. Loose connections within the tube can be detected by fluctuations of the meter of the tube checker.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Most public address systems (and receivers with a large power output) require voltages of about ____________ volts and currents up to ______________ milliamperes.

2. Rectifier tubes should be operated so that the ____________________ voltage and peak ______________ current are not exceeded.

3. The peak value of sine wave AC is equal to _____________ times the rms value.

4. In a half-wave rectifier tube, the ________________ is _____________ with respect to the cathode during one-half of the AC cycle; during the next half of the AC cycle, the ______________ is positive with respect to the cathode.

5. If the input voltage has a frequency of 60 cycles per second, the frequency of the pulses of direct output voltage will be ________ pulses per second.

6. To obtain output voltages that are larger than the 117 volts of the AC supply, a step-up transformer is used ____________ the rectifier tube.

7. When two diodes are used for full-wave rectification, their ____________________ are hooked together and go to the _____________ side of the load resistor.

8. If the input voltage of a full-wave rectifier has a frequency of 60 cycles per second, the ripple frequency of the output voltage would be ___________ pulses per second.

9. One advantage of the full-wave rectifier over the half-wave rectifier is that the full-wave carries __________ the load ____________, whereas the half-wave carries ___________ the load.

10. If the safe peak inverse voltage of the rectifier tube is exceeded, the current may arc over from the ________________ to the ______________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When a rectifier tube plate is negative with respect to the cathode, it is (A) conducting; (B) not conducting; (C) overloaded; (D) probably arcing over.

_____ 2. The voltage drop of a rectifier tube is the (A) actual line voltage less line resistance; (B) difference between line and plate voltage; (C) difference between line and cathode voltage; (D) difference in potential between the plate and cathode as the tube is conducting.

_____ 3. In the vacuum-type rectifier, an increase in plate current causes a corresponding increase in (A) plate voltage; (B) maximum instantaneous current; (C) voltage drop; (D) minimum instantaneous current.

_____ 4. The output of a half-wave rectifier is called (A) pulsating direct voltage; (B) ripple-free direct voltage; (C) pure direct voltage; (D) AC.

_____ 5. The output of a full-wave rectifier is called (A) pulsating direct voltage; (B) ripple-free direct voltage; (C) pure direct voltage; (D) AC.

_____ 6. To obtain the same output that the half-wave transformer produces, the full-wave transformer must supply (A) twice the voltage that the half-wave produces; (B) three times the voltage that the half-wave produces; (C) four times the voltage that the half-wave produces; (D) five times the voltage that the half-wave produces.

_____ 7. A typical arrangement for converting AC to DC includes all but one of the following: (A) a rectifier tube; (B) a filter; (C) a capacitor in series with the load; (D) a voltage divider.

_____ 8. The function of a filter is to (A) smooth out the ripple or the tube output; (B) convert DC to AC; (C) act as a voltage divider; (D) replace resistors needed in the r-f stage.

_____ 9. When mercury-vapor rectifier tubes are connected in parallel in order to be sure that each tube will carry an equal share of the load, stabilizing resistors of the following size should be connected to each plate lead: (A) 50-100 ohms; (B) 500-1000 ohms; (C) 2000-4000 ohms; (D) 5000-6000 ohms.

_____ 10. When vacuum-type tubes are connected in parallel, stabilizing resistors (A) must be used; (B) must not be used; (C) may or may not be used; (D) none of the above.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The full-wave rectifier is often used in receivers and small public-address systems because:

(A) ____________________ (C) ____________________

(B) ____________________

2. Defects in the rectifier tube may be spotted by:

(A) ____________________ (C) ____________________

(B) ____________________

3. Defects in rectifier tubes may show up in the receiver in the following ways:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

4. If the output is distorted, the following tube defects are likely:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

5. If the output is noisy, the following tube defects are likely:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which the question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a schematic diagram of a rectifier circuit using two diodes. Indicate the direction of electron flow during one-half a cycle by arrows. Label all the parts.

Assignment
Sheet No. 20

Covering
Units 91-102

THE ELECTRON TUBE AS A DETECTOR

The carrier component of the alternating current flowing in the receiver must be separated from the sound component. Since only the sound component is wanted, it must be carried through to the reproducer, and the carrier component must be blocked and dissipated. This process is called demodulation or detection.

In this unit you will have the opportunity to learn the operating characteristics of various methods of detection.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ______________________.
3. Check with your coordinator relative to a closed book exercise. He will give you an assignment which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

References:

A. Marcus, Radio Servicing, pp. 183-210.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. A radio wave takes the wave form and frequency of the AC producing it.

T F 2. Rectification is the first step in detection.

T F 3. There is an increasing tendency to use the crystal diode as a detector in AM, FM, and TV receivers.

T F 4. The capacitor in parallel with the load resistor in a diode detector circuit must be large enough to by-pass the r-f component, but not large enough to allow the a-f component to flow through it.

F T 5. The diode detector is seldom used today.

T F 6. In the triode we have a sensitive detector capable of operating on weak signals.

T F 7. Detection may take place in the grid circuit of a triode.

T F 8. The major problem of a regenerative detector is to control regeneration, that is, to bring the detector up to, but not beyond oscillation.

T F 9. It is not possible to use a pentode as a detector.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Carrier currents in the ordinary broadcast band have frequencies of ____________ KC to _______________ KC.

2. The r-f carrier current and the _______________ - __________________ sound current are mixed to produce the r-f ________________________ carrier current.

3. In most commercial receivers, the _________________-_________________ method for obtaining grid bias is used.

4. The diode detector requires only __________________ power.

5. The grid-circuit detector tends to ________________ all signals except _______________ ones.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. As the radio wave strikes the antenna of the receiver, the following type current is set up in the antenna: (A) AC; (B) DC; (C) pulsating DC; (D) FM DC.

_____ 2. The fixed-negative voltage on the grid of a triode is called (A) grid negative; (B) grid bias; (C) grid screen; (D) grid damping.

_____ 3. The diode detector (A) amplifies the signals; (B) does not amplify the signal; (C) modulates the signal; (D) none of these.

_____ 4. Plate voltages in the detector stage should be about (A) 25 volts; (B) 50 volts; (C) 75 volts; (D) 100 volts.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The crystal detector has several advantages over other detectors. They are:

(A) ______________________________ (C) ______________________________

(B) ______________________________

2. Two types of plate-circuit detectors are the:

(A) ______________________________ (B) ______________________________

3. Most of the defects encountered in the detector circuits fall into three categories:

(A) ______________________________ (C) ______________________________

(B) ______________________________

4. Current leak between two points which are otherwise insulated can be caused by:

(A) ________________ (B) ________________ (C) ________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a schematic diagram of a circuit of the diode-detector. Label all the parts.

2. Make a schematic diagram of a circuit of a triode-detector. Label all the parts.

Assignment
Sheet No. 21

Covering
Units 118-119

THE ELECTRON TUBE AS AN AMPLIFIER

Mere amplification of a received signal is not the sole purpose of an amplifier. The sound must be reproduced as closely as possible in all ways.

In this unit you will have the opportunity to study the electron tube as it functions as an amplifier in various circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ____________________.
3. Draw a graph showing the fundamental, second harmonic, and third harmonic of a sine curve.

Reference:

A. Marcus, Radio Servicing, pp. 211-237.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. It is possible for a detector stage to drive a pair of headphones or a loudspeaker, making the rest of a receiver unnecessary.

T F 2. The current flowing in the plate circuit is pure DC, having no AC component present.

T F 3. The grid and plate are precisely in phase.

T F 4. The grid and the cathode are in phase.

T F 5. The signal input and output voltages are out of phase.

T F 6. Frequency distortion results when the amplifier does not amplify currents of different frequencies to the same degree.

T F 7. Frequency distortion may be corrected by tone control.

T F 8. In the voltage amplifier, as we increase the load resistance we decrease the amplification of the stage.

T F 9. The power output from an electrical device is greatest when the resistance of the load is equal to that of the device.

Completion

Directions: Fill in the blank s in each statement with the word s required to complete the sentence correctly.

1. The function of an amplifier is to ____________ the signal either before it reaches the ____________ or after it passes through it, or both.

2. The radio-wave coming across the ____________ causes ____________ ____________ of very low power to flow through the antenna ____________ system.

3. The intensity of the plate current will depend upon the ____________ on the ____________.

4. Generally, we seek to amplify the signal with as little ____________ as possible.

5. When screen-grid tubes are used, the current flowing through the cathode resistor is not only the ____________ ____________, but also the ____________ ____________.

6. Frequency distortion originates chiefly in the components of the amplifier stage, such as ____________ and ____________ rather than in the tube.

7. The chief type of distortion in an amplifier is ____________ distortion.

8. A ____________ of either side of the output curve results in the production of harmonics.

9. Distortion of the wave form of the output of the amplifier may produce ____________ harmonics.

10. ____________ generally suffer from second-harmonic distortion; ____________ usually have third harmonics.

11. In the radio receiver, all amplifiers except the last or power amplifiers generally are ____________ amplifiers.

12. In the pentode, the plate current is dependent chiefly on the ____________ rather than on the ____________ voltage.

13. Tubes used as voltage amplifiers usually have ____________ amplification and ____________ transconductances.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Generally, amplifier tubes in radio receivers operate with a plate voltage of (A) 100; (B) 150; (C) 200; (D) 250.

_____ 2. To prevent degeneration and subsequent loss of amplification, the cathode-resistor is generally by-passed by a (A) capacitor; (B) resistor; (C) potentiometer; (D) variable capacitor.

_____ 3. The phase difference between the signal input and output voltages is with a resistive load (A) 90 degrees; (B) 180 degrees; (C) 270 degrees; (D) 360 degrees.

_____ 4. Radio-frequency amplifiers in radio receivers are almost always of the following type: (A) A; (B) A_1; (C) A_2; (D) AB.

_____ 5. We have maximum power output when the plate resistance is (A) matched; (B) zero; (C) equal to load resistance; (D) made up of one per cent components.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The grid bias of an amplifier tube may be obtained by:

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. Three general types of distortion found in amplifiers are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. Amplifiers, according to function, are of two types. They are:

(A) _______________ (B) _______________

Assignment

Covering
Units 110-115

THE ELECTRON TUBE AS AN OSCILLATOR

The production of very high-frequency currents by mechanical devices is next to impossible. These very high frequencies can be produced, with help from certain other devices, with electron tubes.

In this unit you will have the opportunity to learn how the vacuum tube serves this function.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ________________________.

Reference:

A. Marcus, Radio Servicing, pp. 292-321.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In a simple L-C (L = coil; C = capacitor) oscillating circuit, the resistance in the circuit would soon stop the oscillations.

T F 2. In an oscillating circuit, the feedback of energy must take place during the entire cycle.

T F 3. Oscillators are generally operated as Class B or C amplifiers.

T F 4. A Hartley oscillator used two inductively coupled coils.

T F 5. Crystal oscillators are now considered obsolete and seldom, if ever, used.

T F 6. L-C oscillators are equally effective as r-f and a-f oscillators.

T F 7. The R-C oscillator works on exactly the same principle as that of the L-C oscillator.

T F 8. Unwanted frequencies in the output of the oscillator are produced by harmonics.

T F 9. In general, harmonic output is reduced by operating the oscillator with the least feedback which will maintain oscillations.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. If an L-C oscillatory (tank) circuit were connected to the input of an electron tube, the amplified energy would appear in the ______________ ______________ ____.

2. Increasing the grid voltage beyond the saturation point will produce little, if any, increase in ______________ ______________.

3. In a tank circuit, B battery in series-feed a ______________ must be connected ______________ the battery so that the ______________ components of the plate current may pass around and not through the battery.

4. In a shunt (parallel-feed) circuit, the ________ ______________ is connected in parallel with the remainder of the plate circuit.

5. A regenerative oscillator is also called a ____________ - __________ oscillator.

6. In the Colpitts oscillator, instead of using a tapped tank coil, the ______________ ______________ is tapped.

7. The beat-frequency oscillator consists of ____________ r-f oscillators whose outputs are ___________ to produce beat-frequency currents.

8. The ______________-______________ oscillator is designed to reduce the generation of harmonics.

9. The sweep-circuit oscillator is sometimes called a ______________-______________ oscillator.

10. Any relaxation oscillator is one in which the frequency is controlled by the charge or discharge of an ______________ or ______________ through a ______________.

11. Instantaneous changes in frequency of an oscillator are known as ______________ ______________.

12. Sometimes a tube that will work satisfactorily as an ______________ will fail as an ______________.

13. ______________ oscillators produce outputs of exceptionally high stability.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The input voltage of a Class C amplifier tube, which is applied to the grid of the tube, is developed by the (A) plate to cathode; (B) L-C tank; (C) grid bias; (D) grid capacitor.

_____ 2. Oscillations in a tank circuit are prevented from "building up" by (A) the characteristic curve of the tube; (B) grid capacitor; (C) grid resistor; (D) plate-to-cathode short.

_____ 3. In a shunt (parallel-feed) tank circuit, the AC is kept out of the B battery by a (A) capacitor; (B) resistor; (C) RFC; (D) diode.

_____ 4. In a Meissner oscillator, the tank circuit is (A) in the grid circuit; (B) in the plate circuit; (C) done away with; (D) a separate circuit inductively coupled to the grid and plate circuits.

_____ 5. The main advantage an R-C oscillator enjoys over an L-C oscillator is that it (A) is cheaper; (B) is lighter; (C) has wider frequency range; (D) has fewer components.

_____ 6. The most serious defect of a multivibrator oscillator is that it has an output which (A) is rich in harmonics; (B) has a narrow-frequency range; (C) has a low amplification factor; (D) is degenerative.

_____ 7. In the L-C oscillator, the Q of the tank circuit must be (A) high; (B) low; (C) non-existent; (D) none of these.

_____ 8. If good frequency stability is desired, the oscillator should be called on to furnish (A) a large output; (B) very little output; (C) no output; (D) maximum output.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Oscillators may be classified according to the type of oscillating circuit they employ. These are:

(A) ______________ __________ (B) ______________________

2. In an L-C oscillator, the B battery can be connected two ways. They are:

(A) ______________________ (B) ______________________

3. R-C oscillators are usually used in:

(A) ______________________ (C) ______________________

(B) ______________________

4. Two methods for coupling the load to an L-C oscillator are:

(A) ______________________________ (B) ______________________________

5. Drift (gradual change of frequency of an oscillator) is generally caused by:

(A) ______________________________

(B) ______________________________

6. Oscillator defects generally fall into one of the following groups:

(A) ______________________________

(B) ______________________________

(C) ______________________________

7. Unstable output of an oscillator may be caused by:

(A) ______________________________

(B) ______________________________

(C) ______________________________

8. The frequency of an oscillator may vary three ways. They are:

(A) ______________________________ (C) ______________________________

(B) ______________________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a schematic diagram of an L-C oscillator circuit showing the B battery in series-feed. Label all the parts.

2. Make a schematic diagram of an L-C oscillator circuit showing the B battery connected by the shunt of parallel-feed method. Label all the parts.

CONTROL CIRCUITS

The station received, volume of signal, and quality of tone may suit the owner of one receiver, while the same results would never be acceptable to the owner of another receiver. Most modern receivers, therefore, come equipped with several control circuits to allow for the wishes of the individuals who may purchase the sets and then who later become your customers as these same sets need repair.

In this unit you will have the opportunity to learn about the basic control circuits, how they are "hooked-up" with the other circuits, and about the things that can go wrong with them.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ______________________.
3. Check with your coordinator relative to a closed book exercise. He will give you an assignment which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

Reference:

A. Marcus, Radio Servicing, pp. 336-371.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. One condition required for AVC is that the original signal must be amplified until it is large enough to produce several volts of rectified voltage.

T F 2. One condition required for AVC is that the grid-biasing voltage must be steady and reflect the strength of the incoming signal.

T F 3. The AVC voltage is AC.

T F 4. Under certain conditions, it is desirable to apply different AVC voltages to different stages of the receiver.

T F 5. The AVC system tends to level off the output from the detector stage.

T F 6. Delayed AVC pulls very weak stations in.

T F 7. Generally, when there is no incoming signal, the receiver with AVC is at maximum sensitivity.

T F 8. One of the simplest tuning indicators is a milliammeter connected in series with the plate circuits of the tubes controlled by the AVC circuit.

T F 9. The indicator discussed in the previous question (No. 8) should show maximum deflection for perfect tuning.

T F 10. We can vary the tone of a receiver by dissipating some of the high-frequency audio currents.

T F 11. All tone control must be accomplished by attenuation and not by amplification of the high or low-frequency audio currents.

T F 12. The superheterodyne receiver may be too selective with a resultant loss of a-f currents.

T F 13. Some receivers are designed to operate on five or more bands.

T F 14. Generally, provision is made to silence a push-button receiver while the buttons are pushed.

T F 15. The chief cause of too much AVC is a defective AVC tube.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ________________ control must not permit the tubes to become overloaded by strong signals.

2. The simplest type volume control is a manually operated ______________ ________________ inserted in the circuit to vary the gain of one or more stages of the receiver.

3. The controlled tubes in AVC are generally of the ________________ (________________ - ______________, ______________________-______________) type.

4. At low-signal levels the ratio between noise and signal may be quite ______________, and, therefore, reception may be noisy.

5. To obtain quiet reception, the AVC voltage can be used to block the action of the last _________-_________________ tube.

6. Circuits that control the tone will generally be found in the _____________ __________________ of the receiver.

7. We may attenuate the low-frequency audio currents by reducing the value of the _________-_____________ by-pass capacitor.

8. The selectivity of a receiver enables it to tune in the desired station and ______________ all others.

9. Selectivity-control circuits are used so that selectivity can be increased when ___________________ from adjacent stations becomes too great, and the selectivity decreased when the _____________-___________ tones are desired.

10. The process of changing the receiver operation from one band to another is called _____________________________.

11. Band spread is a process whereby the band is spread out so that each division of the dial covers a _______________ frequency range.

12. Compared with incoming signals impluse noise is of extremely short duration and extremely ___________ amplitudes.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In filtering out the a-f component in a diode detector with an R_1 of 2 megohms and a C_3 of 0.05 microfarad, the time constant of this filter circuit would be (A) 1.0 second; (B) 0.5 second; (C) 0.3 second; (D) 0.1 second.

_____ 2. In order to apply different AVC voltages to different stages of the reciever, we use (A) a tapped load resistor; (B) two manual volume controls; (C) two resistors in series; (D) two capacitors in parallel.

_____ 3. Tuning indicators are used to give a visual signal when (A) the grid-bias drops to zero; (B) the Q tube is driven to cutoff; (C) the set is tuned accurately to the incoming signal; (D) the signal-to-noise ratio is greatest.

_____ 4. Bandswitching is usually accomplished by (A) cutting out one tuned circuit (by means of a switch)and substituting another with a different L-C constant; (B) dropping resistors; (C) matching capacitors (fixed); (D) two antenna systems.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. A potentiometer can act as a volume control in any one of the following ways:

(A) ______

(B) ______

(C) ______

2. In the modern receivers which use a 6SQ7 in AVC, what function does each of the three "tubes" actually serve?

(A) Diode: ______

(B) Diode: ______

(C) Triode: ______

3. When the signal becomes strong enough in a "quiet-reception" AVC, so that the AVC voltage exceeds the predetermined squelch level, the blocking action is removed, allowing the receiver to operate normally. Circuits of this type are known as:

(A) ______ (C) ______

(B) ______ (D) ______

4. Control of selectivity is generally accomplished by one of the following two methods:

(A) ______

(B) ______

5. Push-button tuning may operate on one of two general principles. They are:

(A) ______

(B) ______

6. Defects in AVC may be placed in four categories:

   (A) ____________________ (C) ____________________

   (B) ____________________ (D) ____________________

7. Defects in band-switching circuits manifest themselves by:

   (A) ____

   (B) ____

   (C) ____

8. Failure of the noise-suppression circuit may produce:

   (A) ____________________ (C) ____________________

   (B) ____________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a schematic diagram of an AVC circuit showing how low and high AVC voltages are obtained. Label all parts.

7. Make a schematic diagram of an AVC circuit showing the first and second i-f tubes and a milliammeter connected as a tuning indicator. Label all parts.

Assignment
Sheet No. 24

Covering
Units 124-134

ANTENNAS

The present developmental stage of radio and television engineering and design make some kind of antenna system mandatory for most receivers.

As distance and certain obstructions become factors in reception, a well-designed and maintained antenna system becomes extremely important for good results.

In this unit you will have the opportunity to learn some of the theory and service techniques which apply to receiver antenna systems.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ________________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 284-303.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Antenna troubles are immediately recognizable as such because the signal received is unlike that recieved when other components are faulty.

T F 2. Disconnecting one side of the antenna causes immediate loss of sound and picture.

T F 3. An increase in antenna height or the erection of a stacked array will invariably increase the signal-to-noise ratio.

T F 4. Wavelength of antennas are always expressed in terms of the physical length of the antenna.

T F 5. Even though an antenna may be cut for a specific frequency, it may reasonably be expected to give adequate reception for all channels, a range of 162 megacycles.

T F 6. The folded dipole, biconical, and fanned types of antennas have more desirable pickup patterns than the simple dipole.

T F 7. Antennas become better performers as wide-band types if they are deliberately mismatched to the transnission line.

T F 8. Antennas should be placed to favor the weakest stations.

T F 9. Tilting antenna elements slightly forward increases the gain for the higher channels in the direction of the tilt.

T F 10. Directors are four per cent shorter than the antenna element.

T F 11. Two reflectors are more efficient than one.

T F 12. Ghost images are a result of a reflected signal arriving at a slightly later time than the main signal.

T F 13. Not all common antennas lend themselves to stacking.

T F 14. A mismatch between the transmission line and the receiver, as was the case between the transmission line and the antenna, is not too important and may, in fact, be beneficial.

T F 15. Unused energy reflected back up the line combined with signals traveling down the line is called standing waves.

T F 16. Impulse noise caused by such devices as automobile ignition and other electrical devices can be reduced by giving the twin lead type of transmission line a twist every foot or so from the antenna to the receiver.

T F 17. Any increase in singal-to-noise ratio by putting up a higher antenna, a stacked array, or a Yagi will materially aid in diminishing all types of interference.

T F 18. Stubs function more effectively with ends shorted together.

T F 19. Standoff insulators are used to keep the line away from metal objects.

T F 20. A good lightning arrestor installation is to a water-pipe.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The field strength meter gives an indication of signal strength received at the end of the transmission line in ________________.

2. With an imporperly tracked tuner the low signal output would cause the a-g-c to decrease ____________ and thus increase ________ beyond where it should be for a normal signal.

3. Readings of ______________ microvolts or more are usually indications of a good signal strength in a locality.

4. In the absence of a field-strength meter, an _______________ _____________ may be used for test purposes.

5. Most single antennas such as the dipole or folded dipole have been cut to a ______________ wavelength of a certain frequency.

6. A reflector will _______________ signals from the rear and _______________ pickup from the front.

7. Reflectors are ______ per cent longer than the antenna elements and if spaced 0.15 wavelength from the antenna, they will result in more ____________, but with a decided loss in antenna _______________

8. Overall dimensions of an antenna for Channel 13 should include a length of _______ inches, a reflector length of _________ inches and a director length of ____________ inches.

9. In areas where there are considerable reflection problems, excellent results can be obtained by using an ________________ ________________.

10. When one or more directors are used in combination with a reflector, the antenna system is called a __________________.

11. Spacings for all folded dipoles between their elements may be anywhere from __________ to ____________ of a wavelength.

12. When antennas are stacked and properly hooked up to the transmission line, an increase in ____________ results.

13. In television reception, the antenna acts as a ___________________.

14. Twin-lead cable has a rating of __________ ohms, while coaxial cable has a rating of __________ ohms.

15. If the picture quality increases when the hand grips the lead-in, this indicates ___________________ ________________ reduced by __________________ change.

16. A stub consists of about 30 inches of ______________ _______________ transmission _________________.

17. It is possible that a director for channel two can act as a __________________ for channel three.

18. A convenient and practical way to adjust loose antenna guy wires is to use a _____________________ in each guy wire section.

19. A common trouble is the breaking off of the _____________ ____________ at the point on the antenna where the line is attached.

20. A twin lead should never be installed by __________________ it to the antenna mast.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The chief value of the field strength meter lies in (A) the technician having an instrument to keep the customer in the dark on true service charges; (B) determining whether the tuner is functioning properly; (C) determining whether the oscillator is functioning properly; (D) determining whether a weak signal or a defective receiver is present.

_____ 2. When an indoor antenna is used for test purposes, the built-in antenna of the receiver should be (A) disconnected completely; (B) left connected; (C) connected with one lead only; (D) connected for maximum capacitive coupling.

_____ 3. The physical dimensions of an antenna are always (A) the same as the electrical dimensions; (B) smaller than the electrical dimensions; (C) larger than the electrical dimensions; (D) unimportant for considering electrical dimensions.

_____ 4. A space loop is (A) a portable antenna; (B) an antenna suspended in space; (C) an antenna within an antenna; (D) an area with higher than usual signal strength.

_____ 5. Reflectors and directors are referred to as (A) extenders; (B) dividers; (C) band spreaders; (D) parasitics.

_____ 6. Standard twin-lead impedance is a minimum of (A) 100 ohms; (B) 200 ohms; (C) 300 ohms; (D) 400 ohms.

_____ 7. Ghost images usually appear in relation to the main image (A) to the left; (B) to the right; (C) up; (D) down.

_____ 8. Spacings between stacked antennas usually run (A) 1/4 wavelength; (B) 1/2 wavelength; (C) 3/4 wavelength; (D) 1 wavelength.

_____ 9. Stubs can be used to trap out (A) spark-generated disturbances; (B) extra-high and prolonged voltages; (C) ghost images; (D) unwanted frequencies.

_____ 10. Additional lightning protection is obtained by grounding the antenna mast with size (A) 14 wire; (B) 10 wire; (C) 8 wire; (D) 6 wire.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The appearance of retrace lines could easily be due to:

(A) ______________________ (C) ______________________

(B) ______________________

2. Symptoms which indicate that the gain of the antenna system is insufficient are:

(A) ______________________ (C) ______________________

(B) ______________________

3. If an antenna cannot be moved in order to obtain an improved signal, the technician can:

(A) ______________________ (B) ______________________

4. Ghost reception can be decreased by:

(A) ____

(B) ____

(C) ____

5. The two most widely used types of lead in lines for television reception are:

(A) ______________________ (B) ______________________

6. A theoretical antenna system would have mounting hardware consisting entirely of:

(A) ________________ (B) ________________ (C) ________________

Assignment

THE FREQUENCY-MODULATION RECEIVER

At the present time there is a widespread interest in the "hi-fi" record field. Music is recorded with as little background and component noise as the electrical engineers can devise. FM radio is to the radio listener as hi-fi is to the record listener.

The present method of FM transmission limits the listening range to about 75 to 80 miles from the transmitter. Even at this range, other stations "creep" in and reception is usually poor.

The technician will be called upon to service some FM receivers. More likely, he will have a combination AM-FM set to repair.

In this unit you will have the opportunity to learn about FM receivers, AM-FM combinations, and how to repair them.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ______________________.

Reference:

A. Marcus, Radio Servicing, pp. 452-480.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The greater the intensity of the sound, the greater the amplitude of the sound current.

T F 2. The radio wave is actually produced by the modulated carrier current.

T F 3. The intensity of the sound will vary the amplitude of the envelope of the modulated carrier current, and the pitch of the sound determines the number of such variations per second.

T F 4. The function of the oscillator in producing r-f carrier currents varies with AM and FM.

T F 5. When the sound current of an FM receiver is impressed on the carrier current, the intensity of the sound varies the amplitude of the carrier current.

T F 6. The standard broadcast band is often used for FM purposes.

T F 7. Tuned circuits in an FM set are usually made to pass bands of 100 KC or less.

T F 8. One disadvantage of the ratio detector is that it requires at least one limiter stage.

T F 9. One advantage of the FM system is that an efficient antenna system can be used.

T F 10. A radio receiver which is designed to pick up FM stations only is called an FM tuner.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The average human ear can hear sounds that range in frequency from about __________ to ______________ vibrations per second.

2. The tonal quality of sound is a function of its frequency and is determined by the intensity of the ______________-______________ and ______________-___________________ vibrations present in a given sound.

3. When sound strikes a microphone and related components, it is converted into an electric current having a ____________________-wave form.

4. At the receiver, the carrier current is separated from the sound current at the _________________ stage.

5. In FM, the intensity of the sound determines the amount of ________________-_____________________ of the carrier current from its normal value and the _______________ determines the number of same.

6. The demodulator of an FM set differs from the detector of an AM set in that the detector is sensitive to changes in the ___________________ of the signal, and the demodulator is sensitive to changes in the ____________________ of the signal.

7. Because of the high frequencies involved, _________________ of an FM receiver is of prime importance.

8. Noise and static are essentially ______________ phenomena.

9. Although FM has a limited range, greater __________________ may be used without fear of interference.

10. An FM antenna is called a ___________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The range of frequencies which the human ear can hear is called the (A) sonic range; (B) audio range; (C) visual-acuity range; (D) tonal-quality range.

_____ 2. The frequency (cps) of a sound current is determined by the (A) tonal quality of the sound; (B) intensity of the sound; (C) overtones of the sound; (D) pitch of the sound.

_____ 3. Present regulations state that sounds of maximum intensity will cause the frequency of the carrier current to vary above and below the central carrier frequency by (A) 25 KC; (B) 50 KC; (C) 75 KC; (D) 100 KC.

_____ 4. FM stations are usually separated by (A) 100 KC; (B) 200 KC; (C) 300 KC; (D) 400 KC.

_____ 5. The i-f stages of an FM set usually operate at (A) 10.7 mc; (B) 12.7 mc; (C) 14.7 mc; (D) 16.7 mc.

_____ 6. Amplitude variations present in an FM signal are eliminated by the (A) discriminator; (B) limiter stage; (C) central-carrier frequency; (D) 6AC7 in the r-f stage.

_____ 7. A ratio detector is one form of (A) FM demodulator; (B) amplifier; (C) AFC; (D) oscillator.

_____ 8. More "noise" is present when the carrier wave is modulated by a-f signals lying between (A) 5-15 KC; (B) 15-20 KC; (C) 15-30 KC; (D) 20-30 KC.

_____ 9. An FM antenna consists of a metal rod whose actual physical length is equal to approximately (A) 1/4 the wave length of the desired signal; (B) 1/2 the wave length of the desired signal; (C) 3/4 the wave length of the desired signal; (D) the full wave length of the desired signal.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Sound has two main characteristics. They are:

(A) ______________________ (B) ______________________

Assignment
Sheet No. 26

REALIGNING FM RECEIVERS

Realignment of radio or television receivers actually may involve knowing how and why to adjust components, rather than actual repair or replacement of defective parts. Realignment of a receiver may well follow the repair and replacement of parts which through age, heating, and other reasons have become defective.

In this unit you will have the opportunity to learn realignment procedures, especially as they apply to FM receivers.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by __________________________.

Reference:

C. Marcus and Levy, Elements of Radio Servicing, pp. 161; 355-403.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Most manufacturers' service notes confine visual-alignment procedures to the oscillator and r-f stages.

T F 2. The name f-m signal generator is often used for the sweep frequency signal generator.

T F 3. The superheterodyne principle is used in the f-m receiver circuit.

T F 4. The basic difference between f-m and a-m carriers is the strength of the signal.

T F 5. The servicing of a combined a-m and f-m receiver is more complicated than for a simple f-m receiver.

T F 6. The intermediate frequency for all f-m receivers is 10.7 mc.

T F 7. The function of the f-m ratio detector is the same as that of the discriminator.

T F 8. The outdoor dipole antenna is used most often for f-m receivers.

T F 9. Voltage checking in a defective stage is a poor means of locating defective components.

T F 10. "Hum" defects in an f-m receiver are resolved in the same manner as for a-m receivers.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two basic alignment techniques for the f-m section of an a-m/f-m receiver are the ____________________ and ____________________.

2. When aligning an f-m receiver, connect the set to the power source through an ____________ transformer.

3. When using a 20,000-ohms-per-volt meter as an output indicator, connect a resistor of approximately ______________ ohms resistance in series with the hot lead.

4. The r-f carrier frequency for f-m broadcasting is __________ megacycles.

5. The intensity control on an oscilloscope makes the image ______________ or ______________.

6. The warm-up time for a receiver under test should be about ______ minutes.

7. Capacitors used in f-m receivers often have additional specification such as ______________ ________________.

8. The f-m limiter is simply the last _______ stage of the receiver.

9. The signal-to noise ratio for monaural reception is ________ than that for stereo reception.

10. Misalignment in an f-m demodulator causes poor ________ quality and a __________ signal.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

____ 1. The i-f frequency for f-m receivers is: (A) 455 KC; (B) 10.7 KC; (C) 108 MC; (D) 10.7 MC.

____ 2. The i-f frequency for a-m receivers is (A) 455 KC; (B) 10.7 KC; (C) 108 MC; (D) 10.7 MC.

______ 3. Zero voltage for any plate or screen when all other tubes have the correct voltages indicates: (A) a short circuit in the plate circuit of that tube; (B) the meter is not recording properly; (C) that the resistance in that tube's screen circuit is too high; (D) there is an open in the screen or plate supply of that tube.

______ 4. If the signal in the receiver under test was found to drift, the trouble may be caused by: (A) open or short circuited components in the afc line; (B) faulty oscillator circuit; (C) defective afc circuit; (D) all of these.

______ 5. To match most f-m receivers, the impedance of the antenna system (dipole) should be: (A) 3000 ohms; (B) 300 ohms; (C) 10.7 ohms; (D) 455 ohms.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Circuits to be checked in an f-m receiver are:

   (A) ______________________________

   (B) ______________________________

   (C) ______________________________

2. If an f-m receiver is found to be "dead" the trouble may be due to:

   (A) ______________________________

   (B) ______________________________

   (C) ______________________________

3. Troubles in the r-f stage of an a-m f-m receiver are often caused by:

   (A) ______________________________

   (B) ______________________________

4. Two advantages of an f-m receiver over an a-m receiver are:

   (A) ______________________________

   (B) ______________________________

5. The main types of f-m demodulators are:

   (A) ______________________________

   (B) ______________________________

8. Better quality AM-FM receivers separate some of the AM and FM stages. These stages are:

   1 ______________________________ 2 ______________________________

   3 ______________________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a drawing of a ratio-detector circuit showing how and where the VTVM is connected to indicate the condition of alignment of the transformer secondary winding.

Units 149-154

REPRODUCERS

With the expansion of interest in high fidelity reproduction of music on various kinds of sound equipment, much has been done in the field of loudspeaker design and construction.

In many instances a defective "speaker" may simply be discarded, while in many other cases the investment of the individual customer in a truly fine speaker, involving many dollars, may dictate repair if possible.

In this unit you will have the opportunity to learn how to test, replace, and repair defective speakers.

Assignment:

1. Read the references listed below.
2. Answer the questions listed below and turn in your work by ____________________.

References:

A. Marcus, Radio Servicing, pp. 104-109.
C. Marcus and Levy, Elements of Radio Servicing, pp. 93-103.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Loose or cracked parts on a receiver cabinet may cause interference in the function of the radio speaker.

T F 2. The most frequent speaker defect is an open i-f coil.

T F 3. A shorted field coil may be the cause of a faulty P-M dynamic speaker.

T F 4. It is possible to vary the volume of auxiliary speakers and the receiver speaker by means of the volume control on the receiver.

T F 5. All spiders are cemented into place in the speaker assembly.

T F 6. It is never economically sound to replace a damaged voice coil in a speaker.

T F 7. Generally the modern tendency is toward the use of P-M dynamic speakers.

T F 8. It is often better to replace a damaged inexpensive speaker than try to repair it.

T F 9. An auxiliary speaker should never be wired in parallel with the receiver's speaker.

T F 10. The voice coil is fixed rigidly to the metal frame of the speaker.

T F 11. The paper cone causes the air at its surface to vibrate, thus producing audible sound.

T F 12. The function of the reproducer is to change radio-frequency sound into audio-frequency sound.

T F 13. There is an EIA color code for transformer windings.

T F 14. The diaphragm in a headphone serves the same function as the paper cone in a loudspeaker.

T F 15. The headphones have a fairly low impedance.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The headphones are usually connected into the ________________ circuit of an audio-frequency amplifier.

2. The impedance of a voice coil usually is between ___________ and _______________ ohms.

3. The receiver's power supply provides the current for the field excitation of the _____________________ loudspeaker.

4. To reduce hum some loudspeakers have _________________ coils.

5. The symbol for a pair of headphones is ______________________.

6. The common symbol for a permanent-magnet dynamic type loudspeaker is ___________________.

7. The colors for the winding leads on the voice coil are ___________ and ______________.

8. Loudspeaker leads are frequently ________________________ coded.

9. A common solvent for the cement used on the cone assembly is __________________________.

10. The varying magnetic field surrounding the voice coil is caused by _________________ frequency current.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The best way to test for a defective speaker is to (A) take it apart to determine the precise trouble; (B) turn the volume control to a low signal in order to reduce the defect; (C) replace the electromagnet with a PM known to be good; (D) replace the suspected speaker with one known to be good.

_____ 2. Power ratings in ordinary home-receiver loudspeakers generally run from (A) 1 to 10 watts; (B) 1 to 20 watts; (C) 3 to 10 watts; (D) 5 to 20 watts.

_____ 3. Since the input impedance of a voice coil is low, an output transformer is required to match it with the (A) input impedance of the receiver; (B) output of the i-f stage; (C) plate circuit of the power output stage; (D) grid circuit of the power output stage.

_____ 4. Practically all permanent magnets in PM speakers are of a special alloy called (A) Alnico V; (B) aluminum; (C) manganese; (D) manganese-dioxide.

_____ 5. The voice coil consists of (A) a great many turns of wire; (B) a few turns of wire around the voice coil form; (C) the entire speaker assembly; (D) the inductor only.

_____ 6. In applying the quick check for loudspeaker operation, one first (A) disconnects the AC from receiver output transformer; (B) disconnects field coil from DC; (C) grounds voice coil; (D) unseats a-f tube.

_____ 7. The quick check tells us(A) how well the speaker is functioning; (B) whether the voice coil is open or short circuited; (C) whether the field coil is faulty or good; (D) whether the cone is functioning or not.

_____ 8. The terminal wires of a loudspeaker voice coil may be identified by the colors: (A) finish-green and start-black; (B) finish-black and start-green; (C) finish-yellow and red and start-black and red; (D) finish-black and red and start-yellow and red.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. A visual and manual test of a loudspeaker will reveal defects such as the following:

(A) ______ (D) ______

(B) ______ (E) ______

(C) ______ ______

2. When replacement speakers are being purchased, the factors to be considered are:

(A) ______

(B) ______

(C) ______

(D) ______

3. If a speaker indicates no reception and there is no B+ voltage or click on the quick check test, the faults to look for are:

(A) ______

(B) ______

(C) ______

4. If strange rattles are observed, some of the faults to look for in the speaker are:

(A) ______

(B) ______

(C) ______

(D) ______

(E) ______

5. There are two common methods of securing the spider to the voice-coil form and the pot. These are:

(A) ______ (B) ______

Assignment

Units 155-159

THE CATHODE-RAY TUBE

Special tubes have been developed to serve a particular function. Once the basic principles of such devices as electron tubes were made known to men of vision and perception, the applications and uses of the tubes increased many times, especially so as modifications of earlier inventions evolved. One such of these modifications is the C-R tube.

In this unit you will have the opportunity to learn about the C-R tube as it operates in modern oscilloscopes and television receivers.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ____________________.

Reference:

A. Marcus, Radio Servicing, pp. 328-332.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In the electron gun, the heater heats the cathode, causing it to emit electrons.

T F 2. The control grid of an electron gun is negative with respect to the cathode and thus tends to repel the electrons that are emitted by the cathode.

T F 3. The effect of the control grid of an electron gun is to control the amount of emission from the cathode and to concentrate these electrons into a beam.

T F 4. The second anode of an electron gun has a high negative voltage.

T F 5. Phosphorescence and fluorescence are two words which mean the same.

T F 6. The electron beam is extremely light and may be moved with great rapidity without running into problems of inertia.

T F 7. The aquadag coating carries a negative voltage.

T F 8. If the aquadag coating were omitted, interference could result.

T F 9. Magnetic deflection is used in some TV receivers.

T F 10. Some C-R tubes use both electrostatic and magnetic deflection.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The operation of an electron-ray tube depends upon the fact that if a phosphor is struck by an electron beam, the phosphor will ______________ or ______________.

2. In the C-R tube, the electron beam is produced by an ______________ ______________.

3. The control grid of an electron gun is a metal tube having a small ______________ in one end and enclosing the ______________.

4. The purpose of the first anode of an electron gun is to reduce the spreading effect of the ______________ and to ______________ them to a certain degree.

5. Before the beam of electrons reaches the screen, it must pass between two sets of ______________ ______________.

6. Since the electrons of the beam carry a negative charge, they will be attracted to a ______________ charged plate, and repelled by a ______________ charged plate.

7. The aquadag coating is a deposit of ______________ on the inside of the C-R tube.

8. The electrostatic-deflection type is so-called because of ______________ ______________ on the deflection plates.

9. In the magnetic-deflection type, deflection of the electron beam is accomplished by means of ______________ ______________.

10. Since the electron beam constitutes a flow of current, it is surrounded by a ______________ ______________.

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each question requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a clear line diagram of an electron gun. Show the path of the beam. Label all the parts.

2. Make a clear line diagram of a cathode-ray tube. Show the path of the beam. Label all the parts.

Assignment
Sheet No. 29

Covering
Units 160-161

THE PICTURE TUBE

The picture tube is one of many cathode-ray tubes. Design engineers are constantly experimenting with and finding new uses for special types of cathode-ray tubes.

In this unit you will have the opportunity to learn the operating theory and service techniques that apply to television picture tubes.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ____________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 55-79.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The modern television picture tube has an indirectly heated cathode.

T F 2. The control grid of a television tube functions in precisely the same way that a conventional tube works; it acts as a valve.

T F 3. Magnetic deflection is accomplished by a single coil.

T F 4. When picture-signal amplitude is low, a high current will flow and a bright spot or section will appear on the screen.

T F 5. In order to give the electron stream sufficient velocity to reach the screen material with proper force to cause it to fluoresce, a second anode is included within the tube upon which a very high voltage is impressed.

T F 6. Beam velocity within the picture tube depends directly on the amount of high voltage applied to the second anode.

T F 7. In a given magnetic field a high-velocity beam is influenced to a greater extent than a low-velocity beam.

T F 8. All picture-tubes have the same deflection angles.

T F 9. When the cathode of the picture tube is heated suffiecintly to permit electron flow, ions are released; these ions will damage the screen area if permitted to reach the phosphor coating of the tube.

T F 10. An ion has a greater mass than an electron.

T F 11. If the picture tube is defective and the scanning beam is not perfectly round but has an oval shape, good focusing will be impossible to achieve without picture-tube replacement.

T F 12. Practically all modern picture tubes have the built-in ability to give a sharp focus unless they have been damaged by improper ion-trap setting.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The grid structure of a television picture tube is unlike that of a conventional tube in that instead of a wire mesh it consists of a ______________ with a small ______________ ______________ to keep the electron stream down to a small size.

2. An ______________ grid follows the control grid and a voltage of approximatley ______________ volts is applied to it.

3. The first-lens system reduces the stream of electrons into a tiny spot called the ______________.

4. The second-lens system consists of the ______________ ______________.

5. The phosphorescent characteristic of the chemically treated glass front of the tube has an afterglow called ______________.

6. The influence on the beam by the magnetic fields of both focus coil and deflection coils is at ______________ ______________.

7. When negative-signal amplitude to the grid increases, the beam current ______________ and a ______________ section will appear on the screen.

8. The operating bias for the picture tube is set by adjusting a ______________ which controls the amount of screen illumination desired by the viewer.

9. Magnetically deflected picture tubes are coated on the inside with ______________ ______________.

10. Beam velocity depends directly on the amount of high voltage applied to the second ______________, and such voltage may vary from ______________ volts for small tube sizes to well over ______________ volts for the larger sizes.

11. A decline in either high voltage or beam velocity will lower ________________ to a subnormal level.

12. Adjustments on the yoke are primarily for correcting ___________.

13. Beam-bending coils are sometimes referred to as ______________ ________________.

14. One method of preventing ion damage to the screen is to ______________ the phosphor screen material.

15. A voltmeter placed across the grid and cathode of the picture tube should always indicate a __________________ voltage.

16. The yoke should be as close to the tube __________________ as possible for maximum efficiency.

17. If a receiver is in need of alignment or if the video amplifier does not pass frequencies up to 4 megacycles, the _______________ wedge in a test pattern will not be clearly defined.

18. Most later types of television receivers use _____________________ ________________ for both focusing and picture positioning.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The cathode of a picture tube has for an emitting element (A) uranium; (B) phosphorus; (C) barium; (D) radium.

_____ 2. The accelerating grid, together with the cathode and control grid, forms an initial focusing of the beam referred to as a (A) first-lens system; (B) second-lens system; (C) third-lens system; (D) fourth-lens system.

_____ 3. The most widely used type of deflection in modern receivers is the (A) swinging; (B) electrostatic; (C) mechanical; (D) magnetic.

_____ 4. Some glass-walled picture tubes have an inside and outside coating of aquadag which acts as a (A) resistor; (B) variable resistor; (C) capacitor; (D) variable capacitor.

_____ 5. A tube with a deflection angle of 60 degrees has a maximum swing on either side of center of (A) 30°; (B) sine 30°; (C) 60°; (D) sine 60°.

_____ 6. Tubes having a larger deflection angle require a somewhat (A) stronger deflection field; (B) weaker deflection field; (C) wider deflection field; (D) more narrow deflection field.

_____ 7. Combined vertical and horizontal deflection coil sections are referred to as the (A) ion trap; (B) focus coil; (C) beam bender; (D) yoke.

_____ 8. The most probable defect in a television set that suddenly develops poor focus is (A) poor alignment; (B) poor tracking; (C) aging components; (D) defective component in the focus circuit.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The raster is formed by the combination of the:

(A) ____________________

(B) ____________________

2. Aquadag has the dual purpose of:

(A) ____________________

(B) ____________________

____

3. A clear picture in a television receiver depends on any one or more of the following factors:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

____

4. If the horizontal wedges of a test pattern cannot be clearly defined, the trouble will be found in one or more of the following:

a ______________________________

b ______________________________

c ______________________________

d ______________________________

____

5. If the focus unit is not in the proper place along the neck of the picture tube, the result will likely be:

a ______________________________

b ______________________________

Assignment
Sheet No. 30

Units 162-165

RF MIXER-OSCILLATOR STAGES

When television repair technicians refer to the "front end" of a receiver, they are usually referring to the tuner. The tuner is composed of several main stages, each having a particular function to fulfill.

Tuners may vary in mechanical appearance and construction, but electronically they all meet the same requirements.

In this assignment you will have the opportunity to learn the operating theory of the tuner with special consideration for its repair and service.

Assignment:

1. Read the reference listed below.
2. Answer the questions and problems listed below. Turn in your work by ______________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 85-107.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The tuner works at much higher frequencies than the rest of the receiver.

T F 2. The purpose of the tuner is to select the desired station; amplification and signal mixing are functions of other components.

T F 3. The two types of tuners are the turret type and the drum type.

T F 4. Oscillator coils for VHF tuners are usually wound with a few turns of wire for the lower channels, and progressively less turns for the higher channels.

T F 5. The fewer grids in a tube, the less will be the objectionable noise.

T F 6. Because of che load placed on pentodes with wide-band television usage, their final gain is approximatley equal to that of a triode.

T F 7. The tube capacity of a triode is large, making it easy for interfering signals to pass through it.

T F 8. Cascade tuners have the disadvantage of using tubes with strong tendencies to grid absorption of cathode coatings.

T F 9. Some tubes in use today contain neither mica nor glass and utilize ceramic materials.

T F 10. Even though an open circuit develops in the tuner, the raster will appear on the picture-tube screen.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A relatively new type of r-f amplifier being used is the neutrode which has been made possible by newer design in ________________.

2. A tuner which is used by many manufacturers of television receivers carries the manufacturer's name of ____.

3. A tuner should not be operated with the shields ________________.

4. Defective sockets of miniature size found in tuners usually must be ____________________ when found to be defective.

5. An open circuit in the tuner will have ____________________ effect on the power supplies.

6. Microphonics are usually caused by loose ________________ elements.

7. If the oscillator is functioning, the rectification of the feedback will produce a ___________ ____________ across the grid leak.

8. When any capacitor in the local oscillator circuit is replaced, care must be exercised that a __________________ __________________ type is not replaced with an ordinary one designed for general replacement in other circuits.

9. The initial warmup period of the receiver will cause the _______________ to drift lower in frequency because of expanding coils and other parts.

10. A common trouble of many tuners is failure of the __________________ associated with the selector shaft.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. If the converter in a VHF-UHF set has its own power supply, any troubles which occur in the unit will usually manifest themselves by (A) loss of both UHF reception and VHF reception in the receiver; (B) loss of VHF reception in the receiver without loss of UHF reception; (C) loss of UHF reception without any influence on the VHF reception of the receiver; (D) loss of UHF reception and poor reception from VHF receiver.

_____ 2. Some UHF strips in tuners incorporate a minimum of parts and these tuners will require (A) no servicing since the complete strip must be replaced when it malfunctions; (B) little servicing other than initial peak-tuning adjustments; (C) frequent servicing to insure peak performance; (D) little servicing but required servicing must be performed by one specializing in UHF tuners.

_____ 3. The cleaning agent to use when switching contacts are to be cleaned is (A) a mild salt solution; (B) kerosene; (C) H_2SO_4; (D) carbon tetrachloride.

_____ 4. If the sound or picture is missing from only one or two channels, this indicates (A) improper tracking; (B) an open circuit in the tuner; (C) a defective capacitor; (D) a defective resistor.

_____ 5. Many receivers use negative-coefficient-type capacitors to minimize (A) oscillator drift; (B) harmonies; (C) reflected images; (D) interference.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The purpose of the r-f mixer and oscillator stages is to:

(A) ____

(B) ____

(C) ____

____

2. Two design requirements for tuners are:

(A) ______________________________

____

(B) ______________________________

____

3. Two basic categories of tuners are:

(A) ______________ (B) ______________

4. Common troubles of television tuners include:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________ (F) ______________

5. Oscillator drift may be caused by a:

(A) ______________ (B) ______________

6. Defective tubes can:

(A) ______________________________

(B) ______________________________

(C) ______________________________

7. Noisy contacts can originate in the following places:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

8. Poor gain may be due to:

(A) ______________________________

(B) ______________________________

(C) ______________________________

9. Loss of picture and sound may result from open circuits in:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

Assignment
Sheet No. 31

Units 166-171

VIDEO INTERMEDIATE-FREQUENCIES, VIDEO AMPLIFIERS, VIDEO DETECTORS AND DC RESTORERS

The signal as it passes or is impelled through the various stages and sections of the television receiver must be within certain tolerances of strength and frequency.

In this assignment you will have the opportunity to trace the video signal to the cathode or grid of the picture tube, to determine how defects in video i-f, video amplifiers, the video detector, and the DC restorer will affect reception, and what the technician can do to remedy poor reception.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ______________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 134-178.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. It is well for the technician to remember that as the i-f signals are passed through i-f stages for gain, both the audio and video signals are impressed upon a single detector and demodulated.

T F 2. If a receiver is to be used in an area when adjacent channels cannot be received, sound traps need not be adjusted.

T F 3. For those receivers which have a more narrow bandpass than the standard 4 megacycles, adjacent channel traps are often omitted.

T F 4. If symptoms seem to indicate trouble in the i-f stages, tubes should be checked first.

T F 5. A fast and effective way of servicing a defective coupling capacitor is to simply bridge the old one with a new one.

T F 6. A burned-out decoupling resistor should not be replaced without first determining the cause for the burnout.

T F 7. If the sound is functioning, the tuner and the first video i-f stage must be functioning.

T F 8. The capacitor in a diode tube detector should always be large enough to pass voltage changes below 4 megacycles.

T F 9. Except for tube failure, little trouble is experienced with the video detector stage of a television receiver.

T F 10. If capacitors are used across cathode resistors, they are made large enough in value to prevent degeneration of low frequencies.

T F 11. Failure of either or both video amplifier stages will result in no picture.

T F 12. The leads of a new peaking coil should be cut as short as possible.

T F 13. Signal-tracing procedures can be used to locate a dead or defective stage.

T F 14. Some modern television receivers no longer have DC restorers.

T F 15. In a three-gun color television receiver, three separate video amplifiers are used.

T F 16. The a-g-c tube functions at all times in order to properly control the video signal.

T F 17. A lack of bias applied to the r-f/i-f stages is a positive indication of a-g-c circuit failure.

T F 18. Filter capacitors are a common source of trouble in an a-g-c circuit because of the low-to-high pulses in DC voltage they must handle.

T F 19. Receivers with an adjustable control for proper setting of the a-g-c bias level should have the control set for a stable picture on the weakest station in the area.

T F 20. Intercarrier buzz may result from improper i-f alignment.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The video and sound i-f signals derived from the tuner are passed through i-f amplifier stages for further ______________ and in order to secure the required _________________ characteristics.

2. The interference from maladjusted traps takes the form of _________________ lines if the spill-over is from a channel _________ in frequency than the one being received.

3. If the receiver's own sound i-f traps are not properly adjusted, the sound bars will vary in ________________ and _________________ as the sound frequencies from the station being received change.

4. If spill-over occurs due to interference from an upper adjacent channel, _________________ will be visible on the screen.

5. Misalignment of the intercarrier type of i-f stages will result in excessive __________________ ______________ which must be corrected by proper alignment of the common _____________ and _____________ i-f stages so that the sound i-f signal is set below the response curve at the proper level.

6. A bias check with a VTVM between grid and cathode should indicate a _____________ potential on the grid.

7. The video detector of a television receiver has the same general function as the _______________ _______________ in the AM superheterodyne radio.

8. The signal must be _____ __________-going at the picture-tube grid.

9. If shunt peaking coils open, it would mean loss of ____ ___ power with a resultant loss of ___________________.

10. Direct-current restoration is the process where the DC level of the signal is restored after it has been upset by ________________-_______________ between video amplifier stages.

11. The bias-clamp tube should be checked in a tube-tester which is capable of testing the _____________ as well as the triode section.

12. Rapid and repeated blanking of the horizontal trace which occurs at a fixed rate will give the appearance of _______________ bars.

13. Correct adjustment of the fine-tuning control, the a-g-c system, and ________________ ___________________ are all effective in reducing intercarrier buzz.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The intensity of spill-over interference will vary as the (A) volume is adjusted; (B) fine tuning is adjusted; (C) vertical-hold is adjusted; (D) lower adjacent channel sound trap is adjusted.

_____ 2. If the receiver's own sound i-f traps are not properly adjusted, sound bars will appear as (A) evenly spaced horizontal bars; (B) unevenly spaced horizontal bars; (C) evenly spaced vertical bars; (D) unevenly spaced vertical bars.

_____ 3. Poor and distorted amplification as a result of defective components which permit the minus bias on the grids of the amplifier tubes to be overcome can be caused by a (A) leaky coupling capacitor; (B) defective bleeder resistor; (C) poor antenna system; (D) defective variable capacitor.

_____ 4. In the intercarrier type of receiver, failure of any of the i-f stages following the tuner would result in (A) loss of sound; (B) loss of picture; (C) loss of sound and picture; (D) picture tube burn-out.

_____ 5. If a germanium crystal diode is defective, the picture will (A) not be present; (B) have a washed-out appearance; (C) have diagonal bars; (D) have a herringbone effect.

_____ 6. The distortion of a leaky coupling capacitor will show up as (A) a washed-out picture; (B) no picture; (C) no sound; (D) a dark picture.

_____ 7. Vertical sync pulses occur at (A) 30-cycle intervals; (B) 60-cycle intervals; (C) 90-cycle intervals; (D) 120-cycle intervals.

_____ 8. Hum introduced by a 60-cycle power supply will produce (A) one dark hum bar; (B) 20 dark hum bars; (C) 40 dark hum bars; (D) 60 dark hum bars.

_____ 9. The reduction of impulse noise and diathermy interference at the receiver can always be obtained by (A) increasing the signal-to-noise ratio; (B) decreasing the signal-to-noise ratio; (C) increasing the line voltage; (D) decreasing the line voltage.

_____ 10. Impulse noises may be effectively reduced with a (A) 0.02 capacitor; (B) 0.06 capacitor; (C) 0.08 capacitor; (D) 0.10 capacitor.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. In review, the technician should recall that the i-f stages he may have to work with may be one of two types:

   (A) ____________________ (B) ____________________

2. The video detector of a television receiver usually is a diode-type detector and can be either of two types:

   (A) ____________________ (B) ____________________

3. In order that the a-g-c tube will function properly, the following two conditions must exist:

   (A) ____

   (B) ____

4. When direct coupling is used, two requirements are:

   (A) ____

   (B) ____

   ____

5. Pulse-type interference in the video-stage may be caused by:

   (A) ____

   (B) ____

   (C) ____

   (D) ____

   (E) ____

Assignment

Units 172-175

VERTICAL AND HORIZONTAL SWEEP SYSTEMS

Many of the circuits which are used in television receivers have similar circuits in radio receivers. Vertical and horizontal sweep circuits are circuits found in television and cathode-ray tubes only.

In this unit you will have the opportunity to learn about sweep systems, especially as the received picture is affected. with proper steps for the technician to take to correct defects.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ______________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 193-259.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Six equalizing pulses are transmitted in order to keep the horizontal oscillator in sync during the initial vertical blanking.

T F 2. After the initial six equalizing pulses the vertical pulse is transmitted.

T F 3. Failure in one sweep system never influences the other sweep system.

T F 4. A noise pulse of sufficient amplitude which arrives at the sweep oscillator just prior to the time when tube conduction takes place could also trigger the vertical sweep oscillator, causing loss of vertical synchronization.

T F 5. A separate tube is usually used for sawtooth formation.

T F 6. A decrease in the vertical output tube emission or a decrease in plate voltage will result in a reduction of picture height.

T F 7. On rare occasions, television transmitting stations may lose interlace.

T F 8. The horizontal hold control normally has sufficient range so the viewer can compensate for ordinary line voltage variations.

T F 9. When the synchroguide system is operating normally, it should be impossible to turn the horizontal hold control fully counterclockwise without losing horizontal synchronization.

T F 10. Fold-over can be caused by defective tubes or bad parts in any of the sweep circuits from the sync locking stages to the damping circuits.

Completion

Directions: Fill in the blank(s) in each statement with the word s required to complete the sentence correctly.

1. After sync pulses have been removed from the composite video signal by the sync separator circuits previously discussed, they are used to __________ in the vertical and horizontal sweep oscillator.

2. Each sweep oscillator must be continuously kept locked in by the sync pulses; for if they are removed for only a fraction of a second, the __________ will __________ off frequency and thereby shift the picture information.

3. The effect of equalizing pulses on the vertical system can be minimized by a __________ __________ having a long time-constant.

4. The keystone effect will result when one-half of the __________ __________ coils has a short out, or has a short across it because of a defective resistor.

5. Most of the linearity controls and other controls which the viewer does not normally adjust are called __________ controls.

6. Poor linearity which cannot be corrected by adjustment of the vertical controls is usually the result of discharge circuit of the __________ __________ system.

7. Loss of __________ __________ causes the picture to roll vertically.

8. Poor interlace is usually caused by a defect in the __________ circuit.

9. Fold-over indicates improper __________ __________ __________.

10. Newer versions of the synchroguide system are superior to the older types because the new circuits include a stabilizing __________ __________ capacitor.

Multiple-Choice

Directions: In the space to the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The horizontal oscillator sweep causes the picture-tube beam to trace across the tube for A. [illegible] lines; B. [illegible] lines; C. [illegible] lines; D. [illegible] lines.

_____ 2. Equalizing pulses occur at a rate of A. [illegible] pulses per second; B. [illegible] pulses per second; C. 31,500 pulses per second; D. [illegible] pulses per second.

_____ 3. The hold control component of a vertical or horizontal hold is a A. variable resistor; B. variable capacitor; C. choke coil; D. fixed capacitor.

_____ 4. The blocking oscillator is one type of A. free-running oscillator; B. multivibrator; C. signal generator; D. sweep frequency generator.

_____ 5. A decrease in height indicates trouble in the A. resistive network in the B+ part of the power supply as applied to the plate; B. picture tube; C. antenna network; D. deflection yoke.

_____ 6. If vertical sweep is lost entirely, the result will be a bright A. vertical line; B. horizontal line; C. herringbone pattern; D. diagonal line.

_____ 7. The multivibrator is a two-tube type oscillator which A. vibrates mechanically in a sustained and free-running manner; B. vibrates electronically in a sustained and free-running manner; C. vibrates mechanically to supply power to the sweep circuitry; D. vibrates electronically to supply power to the sweep circuitry.

_____ 8. Barkhausen oscillations are visible on the screen as A. one or more black vertical lines near the center of the screen; B. one or more white vertical lines near the center of the screen; C. one or more black horizontal lines near the top of the screen; D. one or more white horizontal lines near the top of the screen.

_____ 9. A [illegible] horizontal output stage which is operating at [illegible] the tube will show A. horizontal sync instability at the top of the picture; B. horizontal sync instability at the bottom of the picture; C. horizontal sync stability but poor detail; D. horizontal sync stability but poor contrast.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. A well-formed sawtooth is a result of:

(A) ____________________ (C) ____________________

(B) ____________________

2. The combined functioning of the vertical and horizontal sweep systems will determine:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. Lack of vertical sweep is due to complete failure of either the:

(A) ____________________ (B) ____________________

4. If the vertical hold control is totally ineffective in stopping picture roll, it would indicate:

(A) ______________________________

(B) ______________________________

(C) ______________________________

5. The three signal waveforms involved in the synchroguide circuit are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

6. Troubles which are common in the horizontal sweep system of television receivers are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

7. When horizontal sweep is lost entirely, localization becomes difficult, as the trouble may lie in the:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

8. Symptoms of horizontal sweep failure are:

(A) ____

(B) ____

9. Fold-over can be caused by defective components in any of the following circuits:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

10. Horizontal lock circuits can be checked with the:

(A) ____________ (B) ______________ (C) ________________

TROUBLESHOOTING TELEVISION RECEIVERS

Troubleshooting television receivers must follow a sequence, just as a sequence for troubleshooting radio receivers has been established. The procedures follow certain fundamentals, sometimes complicated by the additional components which form a part of video portion of the television receiver.

In this unit you will have the opportunity to learn some trouble-shooting techniques which will apply to basic television circuits.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ____________________.
3. Check with your coordinator relative to a closed book exercise. He will give you an "assignment" which you should be able to complete without referring to any books or notes. If you fail the first time, study the appropriate chapter of the text and ask your coordinator to let you try again.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 2-26, 53-83, 109, 139-175, 188, 271, 337, 429.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The electron stream produced by the picture tube produces a bright white glow upon reaching the phosphorus coating inside the picture tube only if the negative potential is high.

T F 2. Side bands are produced by distortion of the pure sine-wave formation of the carrier waves by frequency-modulation and amplitude modulation.

T F 3. Video and sound arrive in the receiver on the same carrier to provide "interlocking synchronization."

T F 4. In order to obtain sharp, clear pictures, the video carrier is frequency-modulated.

T F 5. Shorted plate coils are a common source of trouble in the video I-F stages.

T F 6. In a TV receiver, high degrees of modulation correspond to the blackest parts of the picture.

T F 7. Blanking pulses, which cause the screen to darken 15,750 times per second, are really a series of sudden lowering of carrier amplitude.

T F 8. Horizontal retrace takes place 60 times per second.

T F 9. The first vertical sweep motion fills only the odd lines of the total picture.

T F 10. Since the i-f of the sound and video carriers are 4.5 mc apart, they can be made to heterodyne and produce a beat signal of 4.5-mc frequency.

T F 11. Echoes or overshoots may result from improper alignment of the video i-f where the high frequency end of the bandpass rises above normal.

T F 12. By far the biggest factor in video amplifier failure is tube and components failure.

T F 13. The video amplifier stages of all television receivers are designed to include D-C restoration.

T F 14. Picture brilliancy may be affected by a leaking coupling capacitor between the video amplifier and the picture tube grid.

T F 15. Transistor video i-f and video amplifier stages perform the same functions as their vacuum tubes counterparts but present different trouble symptoms than do the vacuum-tube components when affected by similar failures.

T F 16. All FM stations utilize 25 KC for their carrier swing and the other 175 KC is to prevent side b and interaction between adjacent stations.

T F 17. Interfering sine wave signals and square wave signals cause identical types of picture interference as long as the interfering signals are 60 cps.

T F 18. Oscilloscopes utilize the electrostatic type of sweep.

T F 19. If a filament cathode short occurs in the video amplifier (or the DC restorer), no voltage will be impressed across the picture-tube input.

T F 20. Light on the screen is produced by the flow of current in the electron beam causing fluorescing of chemical coating.

T F 21. One of the first things to do is adjust the ion-trap magnet on the neck of the picture tube.

T F 22. The purpose for A.G.C. systems in television receivers is to maintain a constant audio level.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The 12 standard VHF channels represent spectrum assignments from ________ to __________ mc called the "low band", and ___________ to ________ mc called the "high band".

2. The video carrier is transmitted on a frequency of __________ mc inside the low-frequency edge of the channel.

3. The sound carrier in a standard TV signal is _____________-_________________ with a deviation of ± ____________KC.

4. The video signal contains frequency components from about ________ cps to ___________ mc.

5. The picture-tube beam at the receiver sweeps across the picture ____________ times for each complete picture scan.

6. The downward motion of the horizontal trace and retrace is called _____________ _________________.

7. For one vertical sweep motion, the picture is divided into ________ lines.

8. The sound signals in a TV receiver pass through an i-f amplifier, limiter, detector, and a-f amplifier sections which are almost the same as those in standard ____________ broadcast receivers.

9. The video i-f signals pass through the video i-f amplifier, are demodulated in the video detector and amplified in the video amplifier to actuate the ____________ of the cathode-ray picture tube and produce the picture.

10. The sound and video carriers are transmitted on frequencies exactly ________ mc apart.

11. Because simple synchronizing systems are subject to interference from ignition and other noises, ________________ ________________ __________________ is now always used for the horizontal-deflection system.

12. The horizontal deflection coil which sweeps the ______________ across the face of the tube from ______________ to _______________ is split into two sections.

13. The signal information from the last video amplifier is applied to the __________________ __________________ of the picture tube.

14. Vertical and horizontal wedges of a test pattern are used to adjust the ____________________.

15. The shaded circles in the center of a test pattern are used for adjusting the ____________________ control.

16. The manner in which the circuit is wired depends on the type of ________________ used between the last video amplifier stage and the picture tube grid, as well as the ________________ of the signal.

17. In areas where signal strength is exceptionally strong a ____________________ picture may result.

18. If a negative picture is always present for each station in the area, and if A.G.C. circuits are functioning properly, the ________________ ________________ will have to be replaced.

19. When a defective picture tube cannot be replaced by an identical one, ____________________ _ __________________ available from the manufacturer should be consulted.

20. Manufacturers recommend the use of ________________________ ____________________ and ____________________ whenever picture tubes are handled.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The complete width of a single v-h-f channel is (A) 3 mc; (B) 6 mc; (C) 9 mc; (D) 12 mc.

_____ 2. TV receivers are properly tuned when the response to the picture carrier is (A) 25% of maximum response; (B) 50% of maximum response; (C) 75% of maximum response; (D) 100% of maximum response.

_____ 3. In an a-m signal which is modulated 100% the sidebands each have an intensity equal to what per cent of the carrier? (A) 25%; (B) 50%; (C) 75%; (D) 100%.

_____ 4. Complete picture scans (frames) recur (A) 20 times per second; (B) 30 times per second; (C) 40 times per second; (D) 50 times per second.

_____ 5. The process of returning the beam from the bottom to the top of the picture is known as (A) vertical retrace; (B) horizontal trace; (C) horizontal retrace; (D) vertical trace.

_____ 6. The system of fitting together two alternate sets of lines is known as (A) synchronization; (B) traversing; (C) panning; (D) interlaced scanning.

_____ 7. Poor high frequency responses due to open peaking coils or improperly alinged i-f system will (A) obscure the horizontal wedge and decrease its contrast with respect to the vertical; (B) obscure the horizontal wedge but increase its contrast with respect to the vertical; (C) obscure the vertical wedge and decrease its contrast with respect to the horizontal; (D) obscure both the vertical and horizontal wedges.

_____ 8. In signal tracing of video i-f stages, if the signal generator can be internally modulated by a 400-cycle note, (A) the VTVM can be used and sound bars noted on the screen; (B) the VTVM can be dispensed with and a raster noted on the screen; (C) the VTVM can be dispensed with and sound bars noted on the screen; (D) the VTVM can be used to detect the sound bars.

_____ 9. With direct coupling, or when a DC restorer is used with capacity coupling, the background illumination of the picture tube will be (A) in proportion to the signal strength of the station; (B) in proportion to the intensity picked up by the camera at the television studio; (C) dependent on the setting of the "contrast" control knob; (D) dependent on the quality of the antenna.

_____ 10. In the high-voltage supply, the voltage may reach (A) 5,000 volts; (B) 10,000 volts; (C) 15,000 volts; (D) 30,000 volts.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Television broadcasting requires two carriers. They are:

(A) ______________________________

(B) ______________________________

2. Two types of modulation are used in television receivers. They are:

(A) ______________________________

(B) ______________________________

3. A 100 mc FM carrier modulated by a 400-cycle per second tone would have twelve significant side bands (6 lower and 6 upper). They are:

(A) ________________

(B) ________________

(C) ________________

(D) ________________

(E) ________________

(F) ________________

(G) ________________

(H) ________________

(I) ________________

(J) ________________

(K) ________________

(L) ________________

4. Some of the advantages of FM over AM might be summarized as follows:

(A) ________________________________

(B) ________________________________

(C) ________________________________

(D) ________________________________

(E) ________________________________

5. Three advantages of transistors over vacuum tubes are:

(A) ________________________________

(B) ________________________________

(C) ________________________________

6. The triode type transistor has one lead known as the emitter, one known as the base, and one known as the collector which compare to the following parts of a vacuum tube of the same function respectively:

(A) ________________

(B) ________________

(C) ________________

7. Three basic circuits, irrespective of transistor types are:

(A) ________________________________

(B) ________________________________

(C) ________________________________

8. A number of troubles of an elementary nature common to both television and radio receivers are:

(A) ______________________________________

(B) ______________________________________

(C) ______________________________________

(D) ______________________________________

9. Most noise suppression circuits consist of a diode, a triode, or a transistor, and may be referred to as:

(A) ______________________________________

(B) ______________________________________

(C) ______________________________________

(D) ______________________________________

10. When repairing a completely dead receiver, the technician should look in one of the following two sections:

(A) ______________________________________

____

(B) ______________________________________

11. Virtually all receivers have a separately shielded high-voltage compartment which houses the:

(A) ______________________________________

(B) ______________________________________

(C) ______________________________________

(D) ______________________________________

12. Distortions of received picture may be divided into the following three classes:

(A) ____________________ (C) ____________________

(B) ____________________

13. The types of picture interference are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

14. If the picture is present with no sound, possible defects or trouble may be in the:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

15. The oscilloscope is a useful and informative instrument for:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

Problems

Directions: Read each of the following problems carefully. Do the specific operations which each questions requires for proper solution. You may wish to refer to the reading assignment before proceeding with the problems.

1. Make a block diagram of a conventional TV receiver. Label all the parts.

2. Make a block diagram of the various controls of a TV receiver, showing the section to which each is most closely related. Label all the parts.

Assignment

Covering
Units 188-203

TELEVISION REALIGNMENT

In order that the various sections of the television receiver function according to specifications, realignment of one or all of various stages may be necessary.

In this unit you will have the opportunity to learn about the various techniques and procedures of television realignment.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by ____________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 363-378.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Front ends of television sets differ to a considerable extent and no two receivers are aligned in exactly the same sequence or procedure.

T F 2. The general rule to follow is: If in doubt, realign.

T F 3. The experienced technician has little difficulty in determining whether a receiver needs realignment procedures instead of other troubleshooting techniques.

T F 4. Many times technicians fail to achieve desired results in aligning even though they follow the manufacturer's service notes in detail.

T F 5. Servicemen should remember that needed alignment is always obvious and that other circuit defects cannot cause symptoms of misalignment.

T F 6. Tracking of television receiver front ends can be done successfully with the average television repair equipment.

T F 7. The marker generator is really a single signal generator.

T F 8. Sweep generators may overload circuits being tested but markers have a built-in overload protector circuit.

T F 9. Improper setting of traps may result in trapping out frequencies which are part of the desired response curve.

T F 10. The Simpson VOM has DC and AC ranges from 5000 volts to 30,000 volts to take care of the high voltage circuits.

T F 11. To check the frequency of the marker generator for accuracy, one must have it tested by the Bureau of Standards.

T F 12. The alignment procedures for various sets differ, but certain precautions apply to any alignment or tracking procedures involving sweep and marker generators.

T F 13. The National Bureau of Standards operates a radio station.

T F 14. A television serviceman cannot procure an actual visual indication of amplifier response.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The sweep generator alone is ____________ ____________ ____________ the strict frequency requirements encountered in television and FM work.

2. The marker generator is really a ____________ ____________ ____________.

3. To prevent interaction between the marker generator and the sweep generator it is better to inject the marker signal--preferably a ____________ ____________ of the sweep generator.

4. Marker generators have ____________ adjustments by which the frequency indicated on the dial can be accurately adjusted and calibrated.

5. The process of calibration of a marker generator is to ____________ the marker signal generator with another generator of known accuracy.

6. The marker generator can also be calibrated against the transmission sent out by station ____________ or any ____________ ____________ ____________ of known frequency.

7. The grounding of all test equipment is a necessity for good results but precautions must be observed with respect to ____________ chassis.

8. Make sure test equipment has been turned on from ____________ to ____________ minutes before being put to actual use.

9. Commercial linearity adjustment generators use two oscillators, one below the ______________ sweep to produce a series of ______________ bars and one above ________________ to produce the ________________ bars.

10. ________________ effect and ________________ effect are defects caused by shorted turns in the yoke or by an improperly designed or matched yoke.

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The essential differences between the marker generator and the single signal generator are: (A) the single signal generator has a lower frequency and thereby, accuracy of a higher order than does the marker generator; (B) the marker generator has a much higher frequency range and accuracy of a higher order than does the single signal generator; (C) the single signal generator has a much higher frequency range and accuracy of a higher order than does the marker generator; (D) the marker generator has a much higher frequency range than the single signal generator but the accuracy of both are of equally high order.

_____ 2. At those places where the trap circuits of the receiver are giving spots of decreased gain, the marker indication will be (A) much larger in amplitude than on the normal portion of the response curve; (B) missing from the normal portion of the response curve; (C) visible intermittently on either end of the response curve; (D) much smaller in amplitude than on the normal portion of the response curve.

_____ 3. Excessive marker signal amplitude will (A) give a sharp response curve and very accurate band-pass indications; (B) give a ghost response curve and incorrect band-pass indications; (C) break up the response curve and give incorrect band-pass indications; (D) break up the response curve but will not affect the accuracy of the band-pass indications.

_____ 4. When using the "sweep sync" output of the sweep generator to sweep the horizontal trace of the oscilloscope, be sure to (A) shut off the internal sweep of the scope but not the horizontal sweep amplifier; (B) shut off both the internal sweep of the scope and the horizontal sweep amplifier; (C) shut off the horizontal sweep amplifier but not the internal sweep of the scope; (D) shut off the internal sweep of the scope for 3 minutes then turn on again.

_____ 5. For television servicing it is desirable to use meters which have (A) high input impedance to load circuits under test to prevent blooming; (B) low input impedance to avoid loading down the circuits under test; (C) high output impedance to avoid loading down the circuits under test; (D) high input impedance to avoid loading down the circuits under test.

_____ 6. The pincushioning effect can be produced when the corrector magnets (A) are out of adjustment on those sets which use them; (B) are properly adjusted on those sets which use them; (C) are grounded to the yoke housing; (D) are in phase with the raster.

_____ 7. To adjust the pincushion magnets (A) reduce the raster size and adjust to obtain pincushioning; (B) reduce the raster size until all 4 sides are visible then adjust for slight barrel effect; (C) reduce the raster size until all 4 sides are visible then adjust to straighten the raster sides and eliminate pincushioning; (D) increase raster size until barrel effect is obtained then adjust to straighten the raster and eliminate the barrel effect.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three resonant circuits which can be used to give marker indications on the response curves traced on the oscilloscope screen are:

(A) ____________________ (C) ____________________

(B) ____________________

2. The types of markers which are incorporated within sweep generators may be:

(A) ____

(B) ____

3. Some important factors often overlooked when aligning i-f stages and which because of this, cause much difficulty are:

(A) ____

(B) ____

____

(C) ____

(D) ____

____

4. When aligning video on FM i-f stages, two precautions should be observed:

(A) ____

____

(B) ____

____

5. A general rule to follow is to use the sweep generator, marker, and scope in the following sequence for tracking and alignment procedures:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

____

Assignment
Sheet No. 35

Units 204-207

COLOR TELEVISION

After much experimentation a system of color television transmission and reception has been designed which the FCC has approved. One of the main problems involved was designing a system which would permit the reception of black and white transmissions when color transmissions were not scheduled.

As manufacturing processes and methods bring color television sets within the present market of black and white receivers, more and more of the technician's work will involve the service and repair of color television receivers.

In this unit you will have the opportunity to learn the theory of the present system of color transmission and reception as the theory applies to service techniques and knowledge.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ____________________.

Reference:

D. Mandl, Mandl's Television Servicing, pp. 380-415.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. Color transmissions, in respect to bandwidth, separation between video and sound carriers, and the scanning process, are quite different from those used in black and white sets.

T F 2. The color subcarrier is modulated by the color components to form the sidebands, but the carrier itself is not transmitted.

T F 3. The Q signal is transmitted as a double-sideband signal, each sideband 500 kilocycles distant from suppressed subcarrier frequency.

T F 4. On a monochrome reciever, the color signal becomes the conventional black-and-white picture.

T F 5. Color television receivers use a separate detector to take the sound off prior to the video detector.

T F 6. The color receiver uses the conventional sync-separator and syn-amplifier stages as black-and-white receivers.

T F 7. In color television receivers it is necessary to take the 3.58-mc burst frequency which occurs during the back porch of a horizontal blanking and apply this to the proper a-f-c circuit.

T F 8. Resistors used at the grid of the demodulators minimize parasitic oscillations.

T F 9. The color and black and white receivers have the same type and number of circuits.

T F 10. A subcarrier used in color sets is an odd multiple of one half the horizontal sweep frequencies.

T F 11. Tolerances for resistors in the matrix circuits should be five per cent or less.

T F 12. To reduce the number of color signals necessary for modulating the carrier, the individual color singals are then changed to I and Q signals with definite phase relationships relating to color hues.

T F 13. The bandpass amplifier is employed between the audio amplifier section of a color TV receiver and the demodulators.

T F 14. A sweep generator with a flat output and an accurate marker generator are essential for color television servicing.

T F 15. The absence of raster but presence of sound indicates lack of high voltage.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Color transmission uses ______________________ for the horizontal scan frequency.

2. The color television camera at the transmitting station uses an optical system which filters from a televised scene the three primary colors of _____________, ______________, and _______________.

3. The color receiver must have an adequate bandpass to accomodate the flat portion of the signals which extend to _________megacycles.

4. Following the video detector, a __________-band ___________ amplifier is used.

5. The matrix circuits are composed of ____________________ which mix each of the color signal components in proper proportions with the luminance signals in order to derive the individual red, blue, and green signals.

6. A gating circuit tube acts as a gate for permitting the ____________ ________________ to be transferred across the tube and also ________________ the burst signal.

7. The 3.58-mc oscillator of a color television receiver may be checked by means of the bias which exists between _____________ and ___________________.

8. Inability of the reactance tube to hold the 3.58-mc oscillator may be caused by insufficient _____________ ___________________ from the video amplifier.

9. The demodulators must mix the chrominance signals with the generated _____________________, and for this reason it is essential that their conversion gain be at a _____________level.

10. The green color is restored by mixing the Q and I signals with the Y signals in a resistive network called a ________________.

11. The phosphor on the inside of a 3-gun color tube is made up of a _____________ pattern.

12. A phase detector, or ________________________ compares the phase of the __________________ burst frequency with that from the 3.58-mc oscillator.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Color information is added to the regular carrier as a subcarrier with a frequency of (A) 1.58 mc; (B) 2.58 mc; (C) 3.58 mc; (D) 4.58 mc.

_____ 2. The color receiver has an oscillator which generates a precise frequency in synchronization with the sub-carrier generators at the transmitter. This precise frequency is (A) 1.58 mc; (B) 2.58 mc; (C) 3.58 mc; (D) 4.58 mc.

_____ 3. The most common trouble which will be experienced in both the burst amplifier and the band pass amplifier are (A) losing sync; (B) losing alignment: (C) tube failures; (D) capacitor failures.

_____ 4. Low emission from the Q demodulator affects the rendition of (A) red; (B) blue; (C) green (D) all of the above.

_____ 5. The instrument to use in checking relative polarities of signals at each individual matrix circuit is the (A) VTVM; (B) ohmmeter; (C) signal generator; (D) oscilloscope.

_____ 6. If the beam from one color gun is permitted to strike a phosphor dot of a different color, (A) the signal voltage will drop; (B) polarity will change; (C) parasitic oscillations will increase; (D) incorrect color rendition will result.

_____ 7. Because both the burst amplifier and the bandpass amplifier have applied to them gating pulses for periodic tube cutoff, failure of the keying or blanking pulses will cause the circuit to (A) overheat; (B) remain in oscillation; (C) oscillate intermittently; (D) be inoperative.

_____ 8. A VTVM used in color television servicing must be capable of measuring a potential of (A) 0-5,000 volts; (B) 5,000-10,000 volts; (C) 20,000-30,000 volts; (D) 40,000-50,000 volts.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The wide-band video amplifier installed after the video detector has two primary functions. They are to handle the:

(A) ______________________________ (B) ______________________________

2. There are two basic commercial color demodulator systems in general usage. They are:

(A) ____

(B) ____

3. Use of a cathode resistor in the color demodulator without an accompanying bypass capacitor results in:

(A) ______________________________ (B) ______________________________

4. The outputs of the demodulators provide signals which indicate:

(A) ____

(B) ____

Assignment
Sheet No. 36

RECORD CHANGERS

The recent upswing in popular interest for high fidelity reproduction has centered manufacturers' attention on the production of many types and styles of record changers. If the technician is to keep on top of his job, he must be aware of these manufactured changes almost as they occur.

In this unit you will have the opportunity to learn some of the basic servicing techniques that apply to record changers.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below and turn in your work by _________________.
3. Prepare a record changer troubleshooting chart in which you list the trouble, possible causes of the trouble, and remedies.

Reference:

C. Marcus and Levy, Elements of Radio Servicing, pp. 248-279.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. High fidelity reproduction of music has led to a refinement of standard radio receivers.

T F 2. Record changer motors are so designed that they must be operated only on the voltage indicated on the service plate.

T F 3. The cutting stylus used in cutting records is forced, by electric currents that pass through an a-f amplifier, to vibrate vertically at the varying audio frequencies as it cuts the record.

T F 4. Magnetic pickups exert a very light pressure on records.

T F 5. A stroboscope disc is used for determining whether a record changer is level.

T F 6. Changer base plates and pickup arms must be insulated from common negative to avoid shock hazard.

T F 7. Only the more expensive phonographs are equipped with tone controls.

T F 8. The servicing of phonograph motors and record changers is a field in itself.

T F 9. When replacing shielded cable, be sure to solder the shielding in the middle of the lead to the chassis.

T F 10. When it becomes necessary to flip the radio-phonograph switch two or three times before positive contact takes place, a worn out switch is indicated.

T F 11. A characteristic of the push-pull stage is that it may increase even-harmonic distortion if it is not damped.

T F 12. An open output-transformer primary is a common trouble of the push-pull amplifier.

T F 13. An ordinary phonograph may be converted to high-fidelity by adding one or more speakers of the type found in the set.

T F 14. It is much easier to determine the faulty channel on a stereo amplifier with a center speaker than on one with a central speaker.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In phonograph playback, the vibrating needle acts on a ________________, ________________, or ________________ cartridge.

2. The crystal and the ceramic pickup cartridges of the phonograph produce an average audio signal output of about ________ volt(s).

3. Needle scratch is in the __________ audio-frequencies; therefore, in one-stage phonographs, turning the control knob toward __________ reduces scratch noise.

4. The light source to be used in conjunction with the stroboscope disc can be either the ________________ or ____________ types.

5. When using the stroboscopic disk, if the proper circle of dots remains stationary for the most part but shows a periodic jump for some of the dots, erratic action of the _____________ or ________________ ________________ is indicated.

6. Rumble may be caused by inadequate ________________ or ____________ ________________.

7. The last audio or power stage in high-fidelity home audio systems is generally a ________________ ________________.

8. The push-pull stage amplifies at ______________ frequencies with a ______________ power output and with little ______________________ and __________________.

9. Because ____________________________ distortion is reduced or eliminated in a push-pull stage, the tubes may be overloaded somewhat without ________________________.

10. Transformer-coupled push-pull amplifiers are very common in ______________ receivers and are still used in _____________________ receivers.

11. In order to get the 180-degree phase difference of signal voltage fed to the push-pull grids, in sets where resistance-capacitance couplings are used in place of transformers, a tube known as the _____________________________ is used.

12. For a defective output transformer, an exact replacement is recommended but when such a replacement is not possible, a ___________________ ___________________ output transformer may be used.

13. The only cause for trouble in the inverter is a _______________ __________ __________________ ___________________.

14. In replacing a speaker in a single speaker set, the polarity of the speaker is ______________________.

15. Connecting a multispeaker system correctly is known as _____________.

16. Tone controls are generally placed between a ___________ of ______________ in the amplifier.

17. When the balance control must be reset for every position of the loudness control on stereo systems, the problem almost always is due to ________________ _______________ in the loudness control.

18. The best position for a listener when listening to stereo-phonic recordings is between the ____________________ _________________ and ____________ the ________________ from them.

19. Low-frequency sounds are not ____________________ and do not require ______________________ to obtain the stereophonic effect.

20. Large AM/FM radio-stereo-phono combinations are generally built up of several individual chassis interconnected by ________________ __________________ and __________________ ________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The turn table in most common use in inexpensive players is the (A) manual; (B) semi-automatic; (C) fully automatic; (D) combination.

_____ 2. There are special high-output crystal cartridges which produce up to (A) 3 volts of audio output; (B) 6 volts of audio output; (C) 110 volts of audio output; (D) 220 volts of audio output.

_____ 3. For better hum elimination, practically all phonographs use at least a (A) one-section filter; (B) two-section filter; (C) three-section filter; (D) four-section filter.

_____ 4. When a phonograph motor fails to operate, the serviceman should check the (A) line switch and wiring; (B) field and armature windings; (C) brushes; (D) motor for dust and dirt.

_____ 5. With a push-pull amplifier, a simple method of obtaining the 180 degree phase difference for the two grids, as well as equal voltage, is by means of a(n) (A) i-f stage; (B) phase inverter; (C) phase detector; (D) center-tapped transformer.

_____ 6. If the output of the record changer seems very low or there is no output at all, the (A) motor should be checked; (B) line-cord should be checked; (C) drive mechanism should be checked; (D) pickup operation should be checked.

_____ 7. Four-unit speaker systems generally consist of (A) two "woofers" and two "tweeters"; (B) one "woofer", one "tweeter", and two mid-range speakers; (C) two "woofers", one "tweeter", and one mid-range speaker; (D) one "woofer", one mid-range speaker, and two "tweeters".

_____ 8. If a stereo set is dead, the trouble is almost sure to be in (A) the common power supply; (B) the switch; (C) the speakers; (D) one of the tubes.

_____ 9. When servicing an AM/FM stereo phonograph combination, which is dead on all functions, one should first (A) check pickup and input circuit; (B) check power supply; (C) check tuner; (D) check amplifier and speaker.

_____ 10. When servicing an AM/FM monaural combination which is exhibiting distortion on all functions, one should first (A) check power supply, amplifier, and patch cords for open; (B) check pickup and input circuit; (C) check tuner; (D) check amplifier and speaker.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two classifications of phongraph players and home audio systems according to types of records are:

(A) ______________________ (B) ______________________

2. A monaural phonograph consists basically of:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

3. Most record changers operate at speeds of:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. Common troubles to be considered when servicing phonographs and radio-phonograph combinations are troubles with the:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. When flexible shielded cable is found to be defective, it is best to replace the cable by making up a new cable in the following manner:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

____

____

(E) ______________________________

____

(F) ______________________________

(G) ______________________________

(H) ______________________________

6. When a radio phonograph switch needs cleaning, one may do so effectively by:

(A) ______________________________

(B) ______________________________

7. The push-pull amplifier generally performs the following functions:

(A) ____

____

(B) ____

(C) ____

Assignment

Covering
Units 213-218

AUTOMOBILE RECEIVERS

With many new model cars being manufactured with radios as standard equipment, plus the many older model cars which have had radios installed sometime in the past, a large proportion of the automobiles today now are equipped with radios.

The technician will do well to know the various service techniques and skills which apply specifically to automobile receivers.

Assignment:

1. Read the reference listed below.
2. Answer the questions listed below. Turn in your work by ________________________.

Reference:

C. Marcus and Levy, Elements of Radio Servicing, pp. 319-350.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In all cars the negative terminal of the storage battery is grounded.

T F 2. If a fuse which has been replaced also burns out, this indicates a fuse of a higher amperage should be used.

T F 3. The all-transistor auto radio is a superheterodyne circuit.

T F 4. Since auto radios operate on battery power and these batteries are of either 6 volts or 12 volts, there is no need for a fuse between the battery-plus lead and the battery.

T F 5. The spark plate is a choke that serves to filter out ignition noise.

T F 6. To compensate for different antenna installations with different antenna capacitances, there is an adjustment in the radio cabinet.

T F 7. Resistors which are added to the vibrator circuit to prevent voltage peaks in the primary are, as a result of the sudden changes of current in the inductance, subject to frequent replacement.

T F 8. The case of the transistor of the r-f amplifier stage is grounded in transistorized auto radios.

T F 9. A frequent service problem is the replacement of the buffer capacitor.

T F 10. Vibrators are seldom a source of trouble in car receivers.

T F 11. Generally speaking, resistances are larger and capacitances are smaller in transistor circuits than in tube circuits.

T F 12. Because of the expense involved, it is almost always better to repair a vibrator rather than replace it.

T F 13. A good vibrator will start only at the voltage specified, never lower.

T F 14. Push-button tuning systems employ a tuning stage with a special capacitor and tube or transistor for immediate selection of a desired station.

T F 15. The general procedure in alignment of auto radios is to begin with the i-f circuit and work back to the antenna.

T F 16. In checking to see if the vibrator power supply is working normally, if we have all tubes lit, a B+ voltage of 150 to 250 and no vibrator buzz, we may logically suspect the hash-suppression circuits.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In addition to the newer 12-volt systems presently used in new cars, many older model cars will have receivers with a low voltage of ___________ volts.

2. The first possibility of trouble in an antenna input circuit is that the antenna becomes grounded to the ___________ ___________ through its ____________________.

3. Because of the relatively low out-put impedance of the transistors, there is no out-put ________________________.

4. If it should become necessary to replace the speaker on a transistor auto radio, it is important to use a similar one for proper ________________ ________________ and ________________ operation.

5. The vibrator of a car radio acts as a _____________.

6. Most vibrators are designed so that the vibration takes place at about _____________cps.

7. When a receiver is dead and the trouble is traced to the output stage, a likely cause is a(n) ____________________ __________ ______ ____________________________.

8. Two devices for noise pick-up reduction which may be employed by service men, other than those devices incorporated in the receiver, are _______________ _______________ _____________ and ____ ____.

9. Cars that use alternators, instead of generators, do not require a __________________ across the alternator.

10. When trouble shooting the vibrator in older-style sets, the rectifier tube may exhibit the usual malfunctions of _________________ ___ _________________________________and/or ______________________ leakage.

11. Leakage of the cathode-heater is definitely indicated when there is no _____________________, the _________________ is working, there is a heavy _________________current drain, but there is some ______ voltage at the ___________________ plates.

12. If the search tuner searches but fails to bring in any station, yet the receiver works manually, the trouble probably is in the _____________________ ____________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The device which is first used to filter out generator interference is a (A) spark-plate capacitor; (B) paper-type capacitor; (C) dry-plate rectifier; (D) variable capacitor.

_____ 2. The primary purpose of the vibrator is to (A) convert AC to DC; (B) convert DC to AC; (C) provide a sound check for the technician to determine if voltage is present; (D) act as a filter choke.

_____ 3. Buffer capacitors, because of their use, may be replaced by (A) components of a higher value; (B) components of a lower value; (C) components of the same value; (D) a spark-plate capacitor.

_____ 4. Most intermittent conditions in car receivers arise from (A) a weak battery; (B) loose wires; (C) defective capacitors or resistors; (D) poor starting of the vibrator.

_____ 5. If a normal amount of hash and no signals are heard from the speaker and random noise is present, the trouble is likely to be in the (A) vibrator; (B) speaker; (C) a-f circuit; (D) antenna.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The design of parts for auto and home radios which are the same are:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________ (F) ________________

2. List 4 problems encountered when considering the design of the antenna input circuit to a car radio.

(A) ________________________________

(B) ________________________________

____

(C) ________________________________

(D) ________________________________

____

3. Distortion may occur in the receiver from the driver stage as a result of:

(A) ________________________________

(B) ________________________________

(C) ________________________________

4. When all voltages are low or at zero, the hot battery line is open or has developed a resistance. The service man should check for:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________

5. The purpose of the buffer capacitor is to:

(A) ________________________________

(B) ________________________________

____

6. The best points for bonding ground straps to insure good electrical bonding are from the:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

____

7. Vibrators may usually fail for either of two reasons:

(A) ______________________________

(B) ______________________________

Information
Sheet No. 1

THE RADIO-TELEVISION TECHNICIAN AND HIS JOB

One of the most important factors which will contribute to your success or failure as a beginning radio-television technician will be your ability to locate a defect in the quickest possible time. The actual time you spend in repairing or replacing the defect will often be much shorter than the time spent in finding it.

Once a receiver has been repaired or put back in top-notch condition, a fair and just customer-cost will have to be calculated, keeping in mind wages, shop overhead, wear on equipment, etc. Customers will soon know that your charges are fair or unfair, and your business will prosper accordingly. The radio-television technician must also, in addition to being a serviceman, be a businessman.

Generally speaking, the technician may work an eight-hour day in the shop or on "house calls". It may well be, however, that night service calls will have to be made when the occasion arises.

The financial return which a radio-television technician may expect will vary greatly with locality and type of employment. You may be starting work in a one-man shop where your salary is all that is left after rent, materials, supplies, insurance, new test equipment, advertising, and the like are paid for; or, you may begin work in a large repair house where your work hours and salary are fairly stable.

The working conditions which the radio-television technician has are generally good. Since there is a danger of high and low voltage shock, the experienced technician should not become too complacent about working with such voltages. Generally, heating and lighting are adequate.

Good health and personal appearance are also very important in any occupation in which the worker deals with the public. You should always present a neat and clean appearance, and your shop should be kept in the same manner. Although good health is important, it should be stressed that greater than average physical strength is seldom required, and average vision and hearing are sufficient.

Personal interests are of importance for the prospective radio and television serviceman. This occupation seldom involves vigorous exercise; it is generally indoor work with a small amount of outdoor activity. The hours are usually regular and the working day is the same as in other occupations of this nature; ordinarily, this is eight hours per day. Any student who is interested in scientific and theoretical subjects which must be analyzed to be understood should find radio and television servicing an interesting vocation. This interest should be deep enough to enable him to study radio and television theory and new developments without any feeling of boredom, because this knowledge is necessary for success.

A Guide for Use in Developing Training Programs in Vocational Welding (Combination).

Mississippi State Univ., State College. Curriculum Lab.
Mississippi State Dept. of Vocat. Educ., State College
Pub Date - Feb67
MF AVAILABLE IN VT-ERIC SET 72p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *WELDERS, *WELDING, HIGH SCHOOLS, POST SECONDARY EDUCATION, EQUIPMENT,

This curriculum guide was prepared to assist the trade instructor in planning and developing a welding course to prepare high school vocational students for entry-level occupation as a combination welder. The material was developed by a curriculum committee from a trade analysis involving welded joints, welding positions, and types of metals to be joined. Instructional blocks are (1) Layout, (2) Oxyacetylene, (3) Burning (Oxyacetylene Cutting), (4) Brazing and Soldering, (5) Manual Metal Arc, (6) Heliarc (Tig), (7) Manual Inert Gas, and (8) Short Arc. Job sheets within each block include (1) a job assignment, (2) references, (3) trade principles, (4) equipment, (5) tools and supplies, (6) safety, and (7) trade practices. Related instruction outlines cover (1) Introduction to Welding, (2) Oxyacetylene Welding, (3) Basic Metallurgy, (4) Welds, Joints, and Positions, and (5) Blueprint Reading. The course is designed as a 2-year program with 1,080 hours of training to be taught by a teacher with at least 2 years of work experience beyond the learner's level. The program is for students who want, need, and are able to profit from instruction and who have made a definite vocational choice. Equipment and consumable supplies are listed, and a bibliography contains instructor's references, recommended textbooks, and reference books. This document is available for $2.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

FOREWORD

Training for a trade has come to be a practice in which a qualified instructor (1) presents to the trainee special information (related instruction) and (2) directs the trainee in applying the information (skill building) to jobs performed in a shop. The development of skills is given the major emphasis as reflected by the large percentage of total training time devoted to shop work. During this time, every effort is made to provide trainees with assignments identical with on-the-job responsibilities in the trade or resembling those of actual employment as closely as possible. Since the combination welder is a very highly skilled tradesman, skill building is doubly important. Many hours must be invested in repetitive practice to develop satisfactory technique. The correct balance between these two types of instruction is important. Authorities in the field recommend that about one hour in five be devoted to related instruction. This 20 percent figure means that a little over 200 clock hours of total training time is considered adequate.

The decision as to exactly when to make the presentation of related instruction is another problem. Ideally, related information should be given at that point where it is of greatest benefit. Generally, this is immediately prior to application. However, much of the related instruction is not immediately applicable, but is of a broad nature and designed to give the trainee a strong foundation. Care should be taken to avoid lengthy lecture sessions when presenting this type of information. Experience has shown that trade trainees neither respond to nor profit from lengthy lectures nor to information far removed from its application. Some of the related information can be given in an orientation period, prior to any skill development. Other parts can then be intermittently dispersed as shop work progresses.

To encourage and support an organized instructional program, the staff of the Laboratory has invested considerable time in locating and indexing sources of information and technical data. These sources may be used by the trade instructor to supplement his daily instruction. In the left-hand column under the heading REFERENCES, fourteen sources have been indexed and keyed to be easily located by the instructor. Some of these sources will contain a type of information which the instructor will want to use in his related instruction. Other sources are developed around a job-sheet format. The instructor may want to use these as a guide in making up his own job sheets.

Summarizing, trade training for the welder requires extensive periods of repetitive practice in developing technique. Related instruction, while of equal value, requires fewer clock hours but greater effort by the instructor to effectively work it in. Related instruction is generally given immediately prior to application. When this practice is inadvisable or impractical, related instruction should be broken into teachable units and given by the instructor as his judgment dictates.

ACKNOWLEDGMENTS

The Curriculum Committee for welding met at the Holiday Inn, Starkville, Mississippi, on November 3, 4, and 5. The work of the committee included an analysis involving welded joints, welding positions, and types of metals to be joined. From the analysis, basic instructional units were developed which included steps of procedure in welding; knowledges required for intelligent job performance; equipment, tools, and supplies necessary for training; references or sources of trade information; and an estimate of training time. Members of the committee are to be commended for their effort in the initial development of instructional materials. Special thanks is to be given to the industry and the institutions which made these people available. The members of the committee and their organizations are as follows:

Jack Burt	Copiah-Lincoln Junior College
Donald M. Dexter	Hinds Junior College
B. B. Jones	Amory High School
Howard Little	Ross Collins Vocational School
Kenneth E. Matheiu	Northeast Mississippi Junior College
H. A. Murray	Ingalls Shipbuilding Corporation
Walter H. Moak	Southwest Mississippi Junior College
G. A. Parnell	Gulf Coast Junior College District
Reggie Roy Polk	Columbia Training School
D. J. Sims	Parchman Vocational School

Also in attendance, and making a significant contribution, was Mr. Charles W. Roye, Itinerant Teacher Trainer, State Department of Vocational and Technical Education, Trade and Technical Section.

Following the meeting, the staff of the Curriculum Materials Laboratory compiled the work of the committee for editing, extending, and duplicating. Additions to the material included all introductory material preceding the course content; a bibliography, a progress chart, and an equipment list.

Special recognition is given to Mr. Roy Morton, National Cylinder Gas, who was largely responsible for the original preparation of the equipment list as contained in the Appendix, and for checking the accuracy of the draft from which this copy was made.

TABLE OF CONTENTS

* Omitted: to be completed at a later date.

TO THE INSTRUCTOR

Introduction

The purpose of trade training is to prepare persons for entry into a specific trade. To accomplish this, the instructor guides each trainee in the development of knowledges and skills of his trade. The instructor uses teaching methods and instructional materials as tools, much as he uses the tools of his trade to perform specific tasks. His skill as a teacher and as a tradesman depends upon his ability to use these tools.

A full treatment of the role of the Curriculum Materials Laboratory in implementing the foregoing process is contained in the Operational Plan. Simply stated, the Laboratory provides technical assistance to state and local educators in improving instruction through the development of instructional materials, and communicates with industry about training being offered.

The first step

Since the accepted practice in trade training is the identification of the knowledges and the skills of the trade, the Laboratory asked Mississippi trade instructors to supply information. The process described in the FOREWORD was used in arranging the information in a teachable form. It is an instructional base and is usually referred to as a course outline or guide. Its proper use requires skillful applications of teaching methods as tools in presenting the content of the outline. The end result is a trainee who is skilled and knowledgable.

Since this publication is the instructional base for the teaching of a specific trade, all future work will be planned around this base. Workshops will be held to develop supplementary instructional materials for use by the trade instructor in enriching his program.

Characteristics of this publication

First, its scope, in terms of content, is broad and applicable in all parts of the state. The instructor, who directs his class in becoming proficient with each of these knowledges and skills, assists each student in meeting beginning employment standards. The student is prepared to take advantage of opportunities for gainful employment in any part of the state.

Second, while the scope of the program is broad and there is depth, an effort was made to confine the content of the outline to those knowledges and skills essential to occupational entry. This policy allows the local instructor to supplement his program with additional experiences. Although identifying only essentials, this publication encourages local insitiutions to seek and to offer the special instruction which will meet regional industrial needs.

Third, a serious effort has been made to arrange the content in a usable form. The elementary knowledges and easiest tasks precede more difficult ones. Assignments are written in a step-by-step fashion. All content has been carefully sequenced. Time for instruction in class and in shop is listed in approximate terms.

Fourth, as indicated by certain items in the format, this publication is designed for the Type B Shop found in Mississippi secondary schools. However, it should not be inferred that this is its only valid use. The content and sequence are equally applicable to trade training in junior colleges and in MDTA programs or in any preparatory program.

The impact of this publication

What then should be the impact of this publication on the local program? Since the purpose is to encourage a planned, orderly, more efficient instructional program, it must be used and evaluated by the instructor. He should give this publication his best efforts in light of the principles and practices of trade training. Examination, evaluation, and recommendation during preparation of instructional materials and while teaching from them will assist in continued program development. Using this publication as a guide, the instructor should make lesson plans for lectures and demonstrations and should prepare shop activities. In some instances, the instructor will likely find more information and in greater detail than he is presently using. There may be more than one job assignment. In other instances, the development of an idea may appear to shallow or a job may be absent. It is at this time that the instructor can be most helpful in the following ways: (1) by suggesting which areas can be effectively covered in a shorter time, (2) by identifying areas requiring greater emphasis, which would involve additional detail and an extended time allocation, (3) by extending the instructional content to reinforce or clarify ideas, (4) by preparing additional or alternate jobs, (5) by listing references, texts, and instructional aids at appropriate places, and (6) by suggesting additions and deletions.

Some of the suggestions listed above may require only marginal notes; others may call for development of completely new and more comprehensive materials. The result will be realistic evaluation of content, organization, and time allotment for each unit.

Purposes and characteristics not inferred

As previously stated, this publication is intended to assist in improving instruction. It is planned, items are sequenced, and time limits are set because these characteristics are the heart of a strong instructional program, and for no other purpose. Consequently, it should not be inferred that this publication is an exact image of any given program. As noted earlier, local institutions go well beyond these minimum requirements to enrich their programs.

Also, it is not expected that every institution's program be exactly like every other program, that hour allotments be rigidly adhered to, or that students be rotated on a clockwork or calendar basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods in certain areas. These students may gain only the minimum proficiencies, while more able students will progress rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and allotting are not designed to standardize programs, but to assist local teachers in planning more carefully and conducting their instruction more effectively.

Evaluation

Finally recent vocational-technical legislation contains provision for follow-up and program evaluation. The day is coming when vocational-technical education will be held accountable for its actions in training youth and adults and for the millions of dollars it has spent. The Curriculum Materials Laboratory will, no doubt, be involved in developing suitable instruments and evaluative criteria at that time. This publication, representing the combined efforts of Mississippi education and industry and containing the material these groups consider appropriate, may well serve as one basis for making such a study.

VOCATIONAL WELDER (COMBINATION)

The vocational welder fuses metal parts according to layouts, blueprints, and work orders. He may use a variety of welding processes that include manual metal arc welding, inert gas welding, oxyacetylene welding, and any other of a number of special processes.

The welder must set up and adjust equipment, estimate and order supplies, and often plan his work. He may find his work previously positioned, or be required to clamp together components himself. In smaller plants and companies he will be required to perform layout, fitting, and aligning with various degrees of difficulty. He repairs broken or cracked parts, fills holes, fills up worn parts. For these tasks, he must be familiar with fabricated, cast, and forged parts in structural forms which make up frames, tanks, pressure vessels, and shelves. Proper layout, fitting and alignment require a knowledge of geometry, the special properties of metals, effects of temperature variations, and standard fabrication techniques.

A more detailed job description of each specialty area may be found in the Dictionary of Occupational Titles, third edition. See WELDER, COMBINATION, 812.884; WELDER, ARC, 180.884; WELDER, GAS, 811.884; and WELDER-FITTER, 819.381.

CHARACTERISTICS OF TRADE TRAINING

Introduction

Training for various trades without on-the-job experience can be and is being given effectively by simulating, in locales other than industrial plants, an on-the-job environment. The industrial environment is achieved in an educational institution by performing jobs of fabrication and service using industrial techniques and industrial-type equipment and facilities. The additional requirements placed upon the training as a result of its operating within an institution have been successfully met. It has proved advantageous to all concerned to provide preparatory training for qualified students and extension training for employed tradesmen. Characteristics of institutional training are briefly described in the following paragraphs.

Physical Facilities, Equipment, and Supplies

As previously stated, trade-training facilities must be designed and constructed so that they lend themselves to fabrication and service operations found in industry. Built-ins are provided with adequate floor space, lighting, climate control, power sources, entrances, equipment, storage for supplies, finished-product handling, waste-disposal systems, etc. --each of which is duty-rated to serve its purpose in an industrial manner. That costs and floor-space requirements per pupil are higher than those for general education are facts that must be recognized because they are intrinsic in the nature of the training and cannot be side-stepped. Equipment and supplies must meet the standards of quality and variety used in industry, and they must be maintained and replenished.

Instructor Qualifications

Of equal importance is the caliber of the instructor. Past experience has assisted in establishing the requirement of at least two years of work experience beyond the learner's level, in the specific training being given, and of broad experience in the major areas of the industrial occupation. The instructor must be adept in selecting, organizing, and presenting trade information and skills--a fuller treatment of which may be found in later paragraphs. The trade teacher must also keep himself occupationally up to date through study and association with industrial activities.

Student Screening and Selection

The State Plan states that any student who wants, needs, and is able to profit by instruction is eligible for enrollment in vocational training. His ability to profit by the instruction depends, in large measure, on his making a definite vocational choice, his desire to gain the knowledges and skills of the trade, and his educational background. These qualifications are evaluated, insofar as is possible, by a vocational-guidance process which includes an examination of the applicant's school record, a personal interview, a check of references, and tests for interests, motivations, and learning rates; and, in the absence of adequate guidance facilities and a screening process, it is reasonable to expect that a considerable number of those accepted for training will need remedial instruction in science, mathematics, and communication skills.

In Mississippi, preparatory training is offered in the Type B Shop located in the comprehensive high school. Trade training is carried on 180 days per year. Normally, the course is elected for both the junior and the senior years. In two years a student receives 1080 hours of instruction. However, some students enroll for the senior year only. Although these students receive no more than minimal experiences, instruction on a planned rotational basis will provide them with knowledges and skills in the basic blocks of the trade and will render them employable.

Teaching Techniques

Trade training uses most, if not all, of the conventional teaching techniques and adapts them to the information to be presented. The "tell-show-do-check" method has been found highly effective and is the one most commonly used. The instructor "tells" by informally lecturing on a given topic. Open periods of discussion allow the student to clarify points not initially grasped. The instructor may choose to stimulate thought or to spot-check comprehension by questioning. The "show" method is employed when a demonstration can more vividly present a principle or the steps of trade procedure. Specially prepared audio-visual aids may be involved to "show". The major investment of time is on the "do", where the student is engaged in useful and productive work in typical trade jobs. He uses tools, equipment, and materials common to the trade. Thus he learns by doing. At predetermined intervals, a "check" of the student's progress serves to evaluate command of knowledge and skill learned to date. Deficiencies identified are retaught through additional, individual instruction, through reading, shop practice, etc., until an acceptable level of learning and performance is reached.

Related Instruction

The value of scientific principles and mathematical applications for the tradesman is unquestioned. Indeed the caliber of his work in these areas is determined by the quality of his foundation in these principles and his ability to apply and adapt them. However, trade trainees, characteristically, react to mathematics and science with disinterest when these subjects are presented on the academic level with the usual academic approach. But these subject areas become much more acceptable when they are applied to the job in which the trainee expects to develop skill and earn a living.

In the Type B Shop, no outside instruction related to the trade is given.

The shop teacher is expected to meet the need. Upon him rests the responsibility of supplying any and all necessary teaching of trade mathematics, trade science, trade drafting, etc. This information is also correlated with trade practice and given as needed by the student.

Group instruction and group shop activity are encouraged when space and equipment are available, for it is generally conceded that instruction of the typical class as a group is an advantage for the progress of the class. Extensive preparation prior to group instruction and keen observation of individual behavior are necessary to meet the variety of need and speeds in a heterogeneous class. The volume of trade tools, equipment, and materials, as well as adequate space and shop facilities required for the instruction of large groups, makes the costs prohibitive in many instances; and a scheduled rotational process must be employed. A suggested plan is found in the Appendix.

Instructional Content

The source of the instructional content of a given trade program can come only from the trade itself; that is, from the knowledges and the skills of the master. Usually a trade analysis is used to identify this content. Following the analysis, there is much need for proper organization and preparation prior to presentation of the material. An extension of this characteristic of the program is the establishment and maintenance of an up-to-date reference library in the classroom-shop. Materials housed here are found in many forms, such as textbooks, technical manuals, trade periodicals, manufacturers' catalogs, safety bulletins, etc. All of them should be shelved in a systematic arrangement with a careful record kept for ready reference.

Safety Instruction

The place and value of safety instruction cannot be overemphasized. The instructor is morally and legally responsible for introducing safety instruction prior to performance, for using safe techniques in demonstrations, and for tactfully, but firmly, pointing out each violation.

Summary

In summary, trade training can be characterized as instruction in trade practices given by an occupationally competent teacher. Related information is carefully correlated with shop activities and is given by the trade teacher as it is needed by the trainee. Students who have made a vocational commitment, and who are able to profit by the instruction are engaged in productive learning experiences. Successful completion of such a program prepares a student for employment at an advanced-learner level.

COURSE OF STUDY

COURSE OBJECTIVES

PURPOSE OF THE TRAINING

To develop entry-level knowledges and skills as a combination welder.

CONTENT OF THE COURSE

Systematic and purposeful presentation of the following information:

1. Detailed and thorough coverage of the following welding processes: manual metal arc, oxyacetylene manual inert gas, tungsten inert gas, and short arc or microwire
2. Broad coverage of brazing, soldering, cast iron welding and brazing, and burning
3. An introduction to these additional welding processes: atomic hydrogen, explosive, friction, laser, plasma, resistance, stud, thermit, ultrasonic, and underwater; and to natural gas burning
4. A strong emphasis on safety practices, processes, and work hazards
5. An explanation of joint design and preparation
6. An examination of filler rods, their uses, and their AWS numbers
7. The reading of blueprints for the metal trades with emphasis on welding symbols and structural shapes
8. The fundamentals of measurement and layout of plate and pipe
9. The use, adjustment, and care of the equipment, tools, and supplies for the welding processes contained in a. and b. above
10. An explanation of basic metallurgy
11. The definitions and spellings of trade terms
12. A description of the weldability of metals
13. The purpose and use of soldering, welding, and brazing fluxes
14. A discussion of shielding gases
15. An examination of destructive and nondestructive testing methods

SKILLS TO BE DEVELOPED

1. Immediately marketable skills in the welding of both plate and pipe with the manual metal arc and the oxyacetylene processes
2. Basic manipulative skills in brazing, burning, layout, manual inert gas, short arc or microwire, tungsten inert gas, and soldering

NATURE OF THE TRAINING:

1. Duration is three hours per day, five days per week, thirty-six weeks per year for two years; or, six hours per day, five days per week, thirty-six weeks per year for one year -- total of 1080 clock hours of training.
2. Related instruction by lecture, demonstration, use of audio-visuals, etc. immediately precedes application by the trainee (a high degree of correlation between presentation and application) with the major emphasis in time on development of manipulative skills.
3. No instruction directly related to the trade is offered outside the shop.

ASSUMPTIONS:

That those enrolling in training have had no previous training in welding principles or practices; that they have a general science background of a non-technical nature; and that they are in need of additional instruction in the fundamentals of arithmetic.

COURSE DESCRIPTION

Vocational Welding (Combination) is designed to develop marketable skills in the learner in the oxyacetylene and the manual metal arc methods of welding. In addition, basic manipulative skills are developed in brazing, burning, layout, manual inert gas, short arc or microwire, tungsten inert gas, and soldering. The information related to the intelligent application of these processes is presented by the trade instructor on a one-to-five ratio with skill-building job assignments. Major topics covered are basic metallurgy, the weldability of various metals, shielding coatings and gases, filler rods, safe working practices, blueprint reading, layout techniques, and the use of brazing fluxes.

INSTRUCTIONAL BLOCKS

		Contact Hours
I.	Layout	20
II.	Oxyacetylene	180
III.	Burning (oxyacetylene Cutting)	45
IV.	Brazing and Soldering	90
V.	Manual Metal Arc	500
VI.	Heliarc (Tig)	120
VII.	Manual Inert Gas	30
VIII.	Short Arc	70
	Total Contact Hours	1080

I. LAYOUT

A. Lay out straight lines

Job

Lay out a straight line which is parallel to a straight edge of a piece of metal

References

Trade Principles

1. Basic layout tools and their uses
   a. Straight edge
   b. Steel rule
   c. Scratch awl
   d. Scriber
   e. Soapstone
   f. Prick punch
   g. Center punch
   h. Hammer
2. Degree of accuracy required for welding layouts
3. Measuring with a rule
4. Measuring distance on a perpendicular line

Equipment, Tools, Supplies

1 Straight edge
1 Prick punch
1 Scratch awl
1 Hammer, ball peen; #1
1 Piece of soapstone
1 Steel rule
1 Piece of 1/4" mild steel plate large enough for a simple layout
1 Wire brush

Safety

Keep sharp points on the scratch awl and the prick punch; sharp tools are safe tools!

Trade Practices

1. Clean surface to be laid out, using a wire brush and/or the oxyacetylene welding torch
2. Examine the shape to be laid out and the stock with which you are working; determine the best layout position to make best use of the material
3. Select one edge as the starting point
4. Use a ruler to measure several points which are equal in distance from the edge
5. Use a prick punch and hammer, or soapstone to mark the points laid out
6. Lay a straight edge along these points and mark with a scratch awl or soapstone

B. Lay out angles

Job

Lay out several acute, obtuse, and right angles using both a plain protractor and the protractor head of a combination set

References

Trade Principles

1. Parts of an angle
    - a. Initial sides
    - b. Origin
    - c. Terminal side
    - d. Vertex
2. Types of angles
    - a. Acute
    - b. Right
    - c. Obtuse
    - d. Straight
3. Angular measure
    - a. Degrees
    - b. Minutes
    - c. Seconds
4. Measuring tool: the protractor
5. Tools for layout of angles
    - a. Protractor
    - b. Trammel points and bar
    - c. Compass

Equipment, Tools, Supplies

1	Straight edge
1	Prick punch
1	Scratch awl
1	Hammer, ball peen; #1
1	Piece of soapstone
1	Protractor, plain
1	Combination set with protractor head and a blade
1	Wire brush
1	Piece of unlined paper, $8\frac{1}{2}$ X 11"

Safety

Avoid "horseplay" with all tools, particularly with sharp ones such as scratch awls, dividers, and the like

Trade Procedure

(Layout with a plain protractor)

1. Use a piece of unlined paper
2. Determine which position makes for the best layout
3. Use a straight edge and a pencil to draw a base line
4. Select a point on this line as the origin and mark it
5. Properly position a protractor on the line and at the origin, use a pencil to mark a 30° angle
6. Place the straight edge along the two marks; draw a line which is the terminal side
7. Repeat the above for angles of 90°, 135°, and 200°

(Layout with a combination set)

8. Select a piece of 1/4" stock which must have one straight edge; this edge will act as the base line

d. Combination set with a dividing head

9. Clean the surface to be laid out
10. Mount the blade in the protractor head of a combination set and adjust it for an angle of 45°
11. Position the protractor head on the edge of the stock with the blade passing through a point chosen as the origin; use a scratch awl or soapstone to mark the terminal side
12. Repeat the above for angles of 60°, 90°, 120°, and 165°

C. Lay out circles and arcs

Job

Lay out circles and arcs using both dividers and trammel points

References

Equipment, Tools, and Supplies

1 Pair of dividers
1 Compass
1 Scratch awl
1 Straight edge
1 Hammer, ball peen; #1
1 Pair of trammel points and a bar
1 Piece of soapstone
1 Piece of 1/2" mild steel plate

Safety

Trade Principles

1. Circle: a curved line having all points of equal distance from the center

Trade Procedure

1. Select a piece of stock
2. Clean it with a wire brush and an oxyacetylene welder's torch if necessary
3. Lay out hole a given distance from the edge of the piece of stock
4. Use a center punch and a hammer to center-punch the location
5. Use dividers or trammel points and bar to scribe an arc or circle
6. Use a prick punch to clearly identify the circumference; mark every two inches

D. Basic Exercises

Job

Transfer angles from one layout to another

References

Trade Principles

Equipment, Tools, Supplies

Safety

Trade Procedure

1. Select a second piece of stock which has one straight edge
2. Clean by brushing and burning if necessary
3. Prepare to transfer the 45° angle from the previous layout; mark a point on the edge of the clean stock, using a scratch awl; remember to plan the spacing since several angles will be laid out along this edge
4. Use dividers or trammel points: place one point on the origin of the previously laid out 45° angle and scribe an arc along the base line at about 4-6" distance
5. Repeat this same procedure on the new piece of stock which has only the origin marked
6. Use the dividers or trammel points: place one point on the origin of the previously laid out 45° angle and scribe an arc along the terminal side at a convenient distance
7. Repeat this same procedure on the new piece of stock; be careful not to change the setting on the dividers while doing this
8. Use the dividers to measure by setting one point on the places where the arcs cross the base line and the terminal side on the 45° angle
9. Without changing the setting, transfer this measurement to the new workpiece by placing one point on the intersection of the previously made arc, and the making of a scratch with the other point on the arc above the base line
10. Use a straight edge to draw a line from the origin to the intersection of these arcs

II. OXYACETYLENE WELDING

A. Equipment setup

Job

Set up acetylene welding equipment and check for leaks

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit (see Page 43)
1 Set of oxyacetylene welder's tools (see Page 43)
1 Welding torch

References

(1) Chapter 2
(2) pp 212-215
(4) Unit 8, p 23
(7) pp 17-22
(9) pp 1-8
(10) pp 75-83
(11) pp 497-498
(12) Unit I, Job 1

Safety

1. Secure bottles in an upright position
2. Do not use lubricants on the connections of the bottle, gage or line

Trade Principles

1. A brief history of oxyacetylene welding
2. Basic equipment
    - a. Gas supply: oxygen and acetylene
    - b. Gas regulators
    - c. Hose
    - d. Torch
3. Typical gas supplies
    - a. Acetylene
        - (1) Generator
        - (2) Cylinder
    - b. Oxygen: cylinder
        - (1) Pressurized gas
        - (2) Pressurized liquid
4. Regulators: purpose and construction
    - a. Single-stage
    - b. Two-stage
5. Hose
    - a. Types of connections
    - b. Types of hose

Trade Procedure

1. "Crack" the cylinder valves slightly to remove foreign matter; close valves
2. Attach regulators to bottles, using the proper wrench
3. Attach hose to regulators
4. Back off regulator-adjusting screws
5. Turn regulator-adjusting valve
6. Select the proper tip for the job and attach it to the torch; tighten with proper wrench
7. Insert oxygen hose on torch tip or head to clear torch; close oxygen
8. Attach hose to torch, using the proper wrench
9. Adjust the acetylene pressure to 5 psi; adjust the oxygen pressure to 10 psi
10. Check for leaks, using soapsuds

6. Gas manifolds
    a. Purpose
    b. Typical arrangements
    c. Construction techniques
    d. Fire regulations
7. Torch and tip construction
8. Procedure for hooking up equipment

B. Lighting and adjusting the torch

Job

Light an oxyacetylene torch and adjust it through the carburizing, neutral, and oxidizing flame

Tools, Equipment, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal

References

(1) Chapter 1, pp 10-20.
(2) pp 215-220
(4) Unit 7, pp 20-22; Unit 8, pp 23-25
(7) pp 22-25
(9) pp 1-9
(10) pp 85, 86
(11) p 497

Safety

Do not use matches or open flame to ignite the acetylene; use a spark lighter only

Trade Principles

1. Oxyacetylene welding tools and clothes
    a. Cap
    b. Safety goggles (#5 lens)
    c. Leather gloves
    d. Spark lighter
    e. Shirt with long sleeves or welder's "leathers"
    f. Apron
    g. Heavy trousers with no cuffs
    h. High-top shoes (preferably with safety toes)
    i. Tip cleaners
    j. Cylinder or utility wrench
2. The oxyacetylene flame
    a. Parts
    b. Temperature
    c. Colors

Trade Procedure

1. Set up the oxyacetylene equipment
2. Attach a welding torch and tip
3. Make initial regulator settings for oxygen and acetylene
4. "Crack" oxygen valve and add as necessary
    a. For carburizing flame
    b. For neutral flame
    c. For oxidizing flame

   - d. Percentages of each gas used
   - e. Chemical composition

3. Uses of each flame
   - a. Carburizing
   - b. Neutral
   - c. Oxidizing

C. Fusion Bead

Job

Run a fusion bead on a piece of 16-gage sheet

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Piece of mild steel sheet, 16-gage x 4" x 6"

References

(1) Chapter 1, pp 21-23
(2) pp 221-222
(4) pp 24-28
(7) pp 26-29
(9) pp 15-18
(10) pp 170-172
(11) p 310
(12) Unit II, Job 1

Safety

Do not use acetylene at pressures 15 psi

Trade Principles

1. Method of selecting tip to match the job
2. Swirling technique of moving torch
3. Shape and size of the fusion puddle
4. Rate of travel
5. Characteristics of a good fusion weld
   - a. Fusion
   - b. Penetration
   - c. Bead size

Trade Procedure

1. Set up equipment
2. Set acetylene at 5 psi and oxygen at 10 psi
3. Use a #4 tip on the torch
4. Hold the torch in the right hand like a pencil if sitting down, or like a fishing pole if standing up; practice shifting the torch until the balance point is found
5. Hold the torch at an angle of about 45° off vertical and with the cone about 1/8" away from the metal
6. When a puddle forms, move the torch slightly in the direction it is pointed; continue until the workpiece has been crossed
7. Examine the weld

D. Flange weld

Job

Make a fusion weld on a flange joint

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
1 Pair tongs
2 Pieces of mild steel sheet, 16-gage x 4" x 6"

References

(1) Chapter 1, p 22
(2) p 227
(9) pp 19-22
(11) p 300

Safety

Trade Principles

1. Purpose: to develop puddling technique without using filler rod

Trade Procedure

1. Take two pieces of sheet and bend a 1/8" flange along the long side of each
2. Set up and adjust the welding equipment
3. Place the two pieces on the worktable with the flanges aligned
4. Tack at each end and at $1^1/2$" intervals in between
5. Start the puddle at the right end and weld out to the left
6. Make a visual examination and a bend test on the completed weld
7. Determine reasons for weld failures and method of improving technique
8. Repeat the exercise until good penetration and good bead are made

E. Bead with a filler rod

Job

Run a bead with a 1/16" filler rod on 16-gage mild steel

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
1 Piece of mild steel, 16-gage x 4 x 6
1 Filler rod, 1/16" AWS GB 45

References

(1) Chapter 1, pp 23-25
(2) pp 222-224
(4) pp 39-41
(7) pp 31-36
(9) pp 27-29
(10) pp 172-275
(12) Unit II, Job 2

Safety

Wear goggles and other safety clothing and equipment

Trade Principles

1. Method of selecting size and type of filler rod
2. Use of the AWS comparison chart for iron and steel gas welding rod
3. Technique of adding filler rod
    a. Dipping motion
    b. Keeping in flame at all times
4. Weld preparation
    a. Cleaning
    b. Spacing
    c. Beveling

Trade Procedures

1. Set up the equipment
2. Adjust acetylene to 5 psi; oxygen to 10 psi
3. Place the workpiece on the table
4. Attach an oxweld 29 (or equivalent) tip to the torch
5. Light the torch and adjust to a neutral flame
6. Start the puddle at the right edge
7. As the puddle forms, add filler rod
8. Maintain a rate of travel which gives good penetration and evenly spaced ripples
9. Examine the finished bead

F. Tack weld

Job

Tack-weld two pieces of 16-gage mild steel having a 1/16" gap

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip; NCG #63 or equal
2 Pieces of mild steel, 4" x 6" x 16-gage
Filler rods, 1/16 AWS GB 45

References

(1) Chapter 1, p 26
(2) p 225
(4) pp 42-44

Safety

Remove all combustible materials from the welding area

Trade Principles

1. Reason for tacking plates together
2. Reason for leaving 1/16" gap between plates

Trade Procedures

1. Set up equipment including tanks, lines, torch
2. Select two pieces of 16-gage, 4" x 6", and clean the edges to be tacked

a. Permits penetration
b. Allows for expansion

3. Procedure for cleaning areas to be welded

3. Place two pieces side by side; the long sides should have a 1/16" gap between them
4. Make 1/4" tack welds at each end, then at $1\frac{1}{2}$" intervals in between

G. Butt weld

Job

Butt-weld two pieces of 16-gage mild steel

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
2 Pieces of mild steel; 4" x 6" x 16-gage
Filler rods, 1/16 AWS GB 45

References

(1) Chapter [illegible], pp 26-27
(2) pp 226-[illegible]
(4) pp 42-44
(7) pp 49-50
(9) pp 29-34
(10) pp 175-179
(11) p 135, 382
(12) Unit II, Job 4

Safety

Trade Principles

1. Appearance of a good weld
   a. Beads even in width
   b. Fine, regularly spaced ripples
   c. Slight convex above joint
   d. Good penetration
2. Reasons for poor weld
   a. Puddle varied in size
   b. Irregular speed along joint
   c. Not enough filler rod added
   d. Torch improperly adjusted
   e. Torch improperly held

Trade Procedures

1. Set up and adjust equipment
2. Clean pieces to be welded back 1/2" from the edge
3. Clamp one piece of 16-gage, 4" x 6" mild steel sheet in place; position second sheet with long side at a distance of 1/16"
4. Light torch and adjust it to a neutral flame
5. Make 1/4" tack welds at either end and at $1\frac{1}{2}$" intervals in between
6. Begin weld at right end of joint; carefully observe puddle, add filler as necessary, and move at best speed
7. When weld is complete, pick up joined sheets with tongs and cool by immersing in water
8. Make a visual examination of the weld
9. Test quality of weld by bending

H. Outside corner

Job

Make an outside corner weld

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
2 Pieces of mild steel sheet, 16-gage x 4" x 6"

References

(1) Chapter 1, p 29
(2) pp 227-228
(4) pp 45-48
(9) pp 23-26
(10) pp 181-182
(11) p 193
(12) Unit II, Job 3

Safety

Trade Principles

Trade Procedure

1. Set up and adjust the equipment
2. Select sheet stock and clean the edges to be welded
3. Place the sheet stock over a firebrick and in an inverted V position
4. Select the proper gas welding rod
5. Light the torch and adjust it to a neutral flame
6. Tack the pieces together
7. Begin at the right and weld to the left; maintain a good puddle and add rod as necessary
8. Test the completed weld by flattening the pieces
9. Visually examine the quality of the weld

I. Lap weld

Job

Make a lap weld

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
2 Pieces of mild steel sheet, 16-gage x 4" x 6"
[illegible] Filler rods [illegible] 1/16" AWS [illegible]

References

(1) Chapter 1, pp 27-28
(2) p 228
(4) p 49-52
(7) pp 41-44
(10) pp 182-183

Safety

Trade Principles

1. Compare the relative strength of various joints
2. Describe the grain structure and stress lines in a lap joint
3. Explain the technique of making a fillet weld for a lap joint
4. Show the method of making a destructive test for a lap weld
5. Review the reasons for weld failure and the technique of correcting welder's errors

Trade Procedure

1. Set up and adjust equipment
2. Select stock, clean edges, and lap one piece 2" over the other
3. Select a welding rod
4. Light and adjust the torch
5. Tack the plates at the outside edge on both ends
6. Begin the weld at the right end and travel to the left
7. Concentrate the heat on the lower plate
8. Add filler rod at the top of the puddle; add enough filler rod to make the bead a little thicker than the top plate
9. Make a visual examination of the weld
10. Make a destructive test of the joint

J. Tee joint

Job

Make a tee joint

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
2 Pieces of mild steel sheet, 16-gage x 4" x 6"
Filler rod, 1/16 AWS GB 45

References

(1) Chapter 1, pp 29-30
(2) pp 228-229
(4) pp 53-57
(7) pp 45-48
(9) pp 35-38
(11) p 728

Safety

Trade Principles

Technique of making a tee weld

1. Concentrate over half the heat on the base
2. Preheat base plate to white-hot state
3. Undercutting of upright piece indicates too much heat
4. Add filler rod at the top of the puddle
5. Use crisscross motion of torch rather than circular
6. Hold tip at about 45° to the base and upright
7. Point tip about 30° off vertical from the base
8. Base piece should not rest on metal table top

Trade Procedure

1. Set up and adjust the equipment
2. Select the stock, welding tip, and rod
3. Position the two pieces to form a tee; use firebrick to support the pieces and to form a trough
4. Light the torch and adjust a neutral flame; then add a little extra oxygen
5. Tack the pieces at either end
6. Begin welding at right end and weld out to the left
7. Cool the finished weld and make a visual examination (naturally and artificially)
8. Make a bend test

K. Tack and weld plate

Job

Tack and weld a closed, square butt joint

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #54 or equal
2 Pieces of mild steel plate, 3/16" x 4" x 6"
1 Filler rod, 3/32 AWS GB 45

References

(4) pp 62-64
(9) pp 29-34

Safety

Trade Principles

A good job of tacking avoids much warping

Trade Procedure

1\. Set up and adjust the equipment
2\. Select two pieces of mild steel and prepare one long side on each piece
3\. Place the pieces with the prepared edges in contact over the entire length
4\. Select a gas welding rod
4\. Select a welding tip and attach it to the torch
6\. Light the torch and adjust it to a neutral flame

7. Make deep, strong tack welds 1/4" long at each end and at 1$\frac{1}{2}$" intervals along the joint
8. Start the weld at the right and weld out to the left; give special attention to forming a good puddle to get penetration
9. Cool the completed joint
10. Make a visual examination; give special attention to penetration
11. Make a guided bend test

L. Single-bevel butt joint

Job

Make a single-bevel butt joint on mild steel plate

Equipment, Tools, Supplies

1	Complete oxyacetylene welding outfit
1	Set of oxyacetylene welder's tools
1	Welding tip, NCG #48 or equal
3	Filler rods, 1/8 AWS GB 45
2	Pieces of mild steel plate, 3/8" x 4" x 6"

References

(4) pp. 58-61
(10) pp 515-516

Safety

Trade Principles

1. Types of bevels and vees
    a. Square-nose
    b. Feather-edge
2. Common angles for bevels and vees
    a. 45°
    b. 37°
    c. 30°
3. Method of selecting the proper tip and gas pressure for a given weld
4. Use of "Equivalent" chart in selecting tips of equal capacity

Trade Procedure

1. Select two pieces of mild steel plate, one of which has been beveled; or, bevel one piece at 45° along the long edge
2. Place the plates on a firebrick table top with the beveled edge forming one half the joint; there should be a gap of 1/8" between the two pieces
3. Set up and adjust the oxyacetylene welding equipment
4. Select a #2 welding tip and attach it to the torch
5. Light the torch and adjust a neutral flame
6. Make a 1/4" tack weld at either end and at 1$\frac{1}{2}$" intervals
7. Hold the torch with the tip more nearly horizontal to get more preheating

105

8. Begin the weld at the right end by forming a puddle in the tack; add rod until the bevel is filled and has a slight convex shape
9. Move the puddle to the tack in the bevel; repeat the above process of adding rod while maintaining a puddle
10. When the puddle is again built to a convex shape above the joint, move the puddle back to the tack in the root
11. Continue this technique until the entire joint has been made with a good quality weld

M. Single-vee butt joint

Job

Make a single-vee butt joint on mild steel plate

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #48 or equal
3 Filler rods, 1/8 AWS GB 45
2 Pieces of mild steel plate, 1/4" x 4" x 6"

References

(2) pp 234-236
(7) pp 71-73
(10) pp 188-195
(12) Unit II, Job 9

Safety

Trade Principles

Trade Procedure

1. Select two pieces of stock each of which has a 30° bevel on one long edge, or cut a bevel if this has not been done
2. Place these pieces with the beveled edges facing each other at about 1/16-inch distance
3. Set up and adjust the oxyacetylene welding equipment
4. Select a welding tip and attach it to the torch
5. Light the torch and adjust it to a neutral flame
6. Tack-weld the plates together
7. Preheat the right end of the joint until it is almost dull red

8. While forming a puddle at the right end, preheat the rod in the edge of the flame
9. Add rod and increase the size of the puddle
10. When the puddle has filled the vee, move the flame to the left and into the vee
11. Begin another puddle and repeat the above steps

N. Strapped, vee-butt joint

Job

Make a strapped, vee-butt joint on a mild steel plate

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #48 or equal
2 Pieces of mild steel plate, 1/4" x 4" x 6"
1 Piece of mild steel plate, 1/8" x 2" x 6"
1 Pound of filler rod, 1/8 AWS GB 45

References

(11) p 696

Safety

Trade Principles

1. Method of determining the proper root gap
2. Technique of getting penetration and fusion with backing strap

Trade Procedure

1. Select stock with bevel, or make a square-nose bevel along one long side of the two pieces of plate
2. Position beveled edges 1/8" apart, centered over the backing strap
3. Set up and adjust the oxyacetylene welding equipment
4. Attach a #5 Airco tip to the torch
5. Light the torch and adjust a neutral flame
6. Tack the ends of the plates and at 1½" intervals along the joint; use a high torch angle to get penetration and a full puddle to join both beveled edges
7. Begin the weld at the right end by building a puddle in the root and adding rod as necessary; continue to build the puddle until a convex bead is above the joint

8. Move the puddle to the root and begin to build it again
9. Repeat this technique until the entire length is welded
10. Cool the weld and inspect it

O. Butt joint in the horizontal position

Job	Equipment, Tools, Supplies
Make a single-bevel butt joint in the horizontal position	1 Complete oxyacetylene welding outfit 1 Set of oxyacetylene welder's tools 1 Welding tip, NCG #63 or equal 1 Pair of tongs 2 Pieces of mild steel sheet, 16-gage x 4" x 6" 2 Filler rods, 1/16" AWS GB 45

References	Safety
(1) Chapter 1, p 32 (2) p 232 (7) pp 39-41 (10) pp 208-209 (11) p 353	Position the work at about eye level; do not get any part of the body or equipment directly under the weld

Trade Principles

1. Definition and description of a horizontal weld
2. Technique of mounting work
   a. Clamp
   b. Tack weld
3. Technique of horizontal welding
   a. Point torch slightly upward; heat entire puddle
   b. Avoid overheating upper piece
   c. Add rod at top of puddle

Trade Procedure

1. Select workpieces and prepare edges to be welded
2. Set up and adjust equipment
3. Place the workpieces in a flat position, 1/16" gap, and tack them together
4. Mount the workpieces at about eye level; either joint should be in a horizontal position by clamping or tacking
5. Begin weld at right end and weld out to the left
6. Remove the piece and cool it
7. Make a visual examination and a test bend on the complete weld
8. Repeat the job until good penetration and a good bead are made

P. Lap joint in the horizontal position

Job	Equipment, Tools, Supplies
Make a lap joint in the horizontal position	1 Complete oxyacetylene welding outfit

1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
1 Pair tongs
2 Pieces of mild steel sheet, 16-gage x 4" x 6"
2 Filler rods, 1/16" AWS GB 45

References

Safety

Trade Principles

Trade Procedure

1. Select two pieces of mild steel sheet
2. Set up and adjust equipment
3. Clamp pieces at about eye level height with the joint in a horizontal position; lap one piece over the other about 1"
4. Light and adjust the torch; tack the joint at the ends and the middle
5. Begin the weld at the right end and weld out to the left
6. Remove the joint and cool it
7. Make a visual examination and a bend test

Q. Inside corner weld in the vertical position

Job

Make an inside corner weld on two pieces of 16-gage mild steel

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #63 or equal
2 Pieces of mild steel, 16-gage x 4" x 6"
2 Filler rods, 1/16 AWS GB 45

References

(1) Chapter 1, p 29-31

Safety

Trade Principles

1. Additional oxygen necessary to replace natural oxygen which is excluded
2. Filler rod added to top of puddle

Trade Procedures

1. Set up equipment and make necessary adjustments
2. Select two pieces of mild steel, 1/16 x 4" x 6" and clean for welding

3. Position pieces in an L-shape over a fire brick
4. Light the torch and adjust to a neutral flame
5. Tack weld ends
6. Reposition pieces for making an inside corner weld in a vertical direction
7. Add a little extra oxygen to the flame
8. Tack weld inside at 1½" intervals
9. Make inside fillet weld beginning at the bottom and moving to the top
10. Add filler rod to the <u>top</u> of the puddle
11. Cool the newly formed joint; inspect visually and by bending

R. Square butt joint in the vertical position

<u>Job</u>

Make a square butt joint in the vertical position

<u>Equipment, Tools, Supplies</u>

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #58 or equal
2 Pieces of mild steel, 1/8" x 4" x 6"
4 Filler rods, 3/32 AWS GB 45

<u>References</u>

(9) Part 2, Unit 14

<u>Safety</u>

Check goggle lens for proper shade

<u>Trade Principles</u>

1. Angles of intersection for the torch and the filler rod
2. Size of puddle for vertical welding

<u>Trade Procedure</u>

1. Set up the equipment
2. Select stock
3. Tack pieces with a 1/16" gap between two long edges
4. Clamp or tack in vertical position
5. Begin weld at bottom and build the weld toward the top
6. Use the torch and the rod to move the puddle to get proper penetration or to avoid blow-through and sags
7. Cut off the equipment and cool the joint
8. Examine the weld and make a bend test

S. Single-vee butt weld in the vertical position

Job

Make a single-vee butt weld in the vertical position

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
1 Welding tip, NCG #48 or equal
1 Piece of mild steel stock, 1/4" x 4" x 6"
1 Lb. of filler rod, 1/8 AWS GB 45

References

Safety

Wear protective clothing such as a leather jacket or leather sleeves when making out-of-position welds

Trade Principles

Trade Procedure

1. Set up equipment
2. Select two pieces of stock and bevel the edge at a 45° angle
3. Light the torch and adjust a neutral flame
4. Tack the two pieces together with a 1/16" gap
5. Clamp in a vertical position
6. Begin welding at the bottom by starting a small puddle; hold the torch at a 5° - 30° angle and move the tip in a tight circle
7. Move the puddle into the bottom of the vee to get penetration
8. Move the puddle back onto the old weld to chill it and to avoid a blowthrough
9. Use the force of the flame and the tip of the filler rod to control the position and the shape of the puddle
10. Complete the weld by moving from the bottom to the top
11. Shut off the equipment and cool the workpiece
12. Make a visual examination and a bend test
13. Repeat the job until a satisfactory weld has been made

T. Fillet, lap, and butt welds in the overhead position

Job

Make three acceptable joints of each of the following types of welds in the overhead position; fillet, lap, square butt

Equipment, Tools, Supplies

1	Complete oxyacetylene welding outfit
1	Set of oxyacetylene welder's tools
1	Welding tip, NCG #55 or equal
2	Pieces of mild steel plate 3/16" x 4" x 6" (for each joint)
1	Lb. of filler rod, 1/8 AWS GB 45

(10) p 204
(11) p 487
(12) Unit II; Job 10, Job 11

Safety

1. Wear leather sleeves or a leather jacket and a cap when welding overhead
2. Keep cuffs and collars buttoned

Trade Principles

1. Keeping puddle small and avoiding drops
2. Maintaining a high torch angle; 60° plus
3. Directing flame at the intersection of the two pieces
4. Using extra care in developing a puddle <u>before</u> adding filler

Trade Procedure

1. Set up the equipment
2. Select workpieces and make the setup
3. Light the torch and adjust a neutral flame
4. Tack-weld in the downhand position with a 1/16" gap
5. Clamp or tack-weld the pieces in overhead position
6. Begin the weld at the right by building a small puddle
7. Concentrate the flame and building the puddle at the intersection of the pieces
8. Weld out to the left
9. Cut off the torch and cool the weld
10. Make a visual examination and a bend test

U. Pipe welding in the vertical position

Job

Butt-weld short sections of pipe of 1" diameter in the vertical position

Equipment, Tools, Supplies

1	Complete oxyacetylene welding outfit
1	Set of oxyacetylene welder's tools
1	Welding tip, NCG #55 or equal
2	Pieces of pipe, 1" dia. x 6" long
2	Pieces of pipe, 2" dia. x 6" long
3	Filler rods, 3/32 AWS GB 45

References

(1) Chapter 1, p 33

(10) p 204
(11) p 487
(12) Unit II; Job 10, Job 11

Safety

Trade Principles

Trade Practice

1. Set up the equipment
2. Select two pieces of 1" diameter pipe; align on a jig in vertical position; leave a 1/32" gap
3. Light the torch and adjust a carburizing flame
4. Tack-weld at four evenly spaced places; remove the jig
5. Use the same welding technique as applied to horizontal welding of plate
6. Cut off the torch and cool the weld
7. Make visual examination and a destructive test
8. Repeat, using 2" pipe

V. Pipe welding in the horizontal position

Job

Butt-weld short sections of pipe of 1" diameter; repeat, using 2"-diameter pipe

Equipment, Tools, Supplies

1 Complete oxyacetylene welding outfit
1 Set of oxyacetylene welder's tools
2 Pieces of pipe, 1" dia. x 6" long
2 Pieces of pipe, 2" dia. x 6" long
3 Filler rods 3/32 AWS GB 45

References

(11) pp 511-539
(12) Unit 2, Job 17, 18, 19

Safety

Trade Principles

1. Clocked positions as they refer to the points on a circle
2. Rules governing the spacing of pipe joints

Trade Procedure

1. Set up equipment
2. Select two pieces of 1" dia. pipe, align on a jig, leave about 1/32" gap

3. Rules governing the angle of bevel on pipe joints
4. Reason for using carburizing flame in welding pipe
5. Proper torch angle and use of filler rod

3. Light the torch and adjust a carburizing flame
4. Tack-weld at four evenly spaced places
5. Begin the weld at the 2 o'clock position and weld up to 12 o'clock position; use a high torch angle and observe closely for good penetration
6. Rotate the pipe so that the weld end is moved from 12 o'clock to 2 o'clock. Resume welding and continue to the 12 o'clock position
7. Rotate the pipe again and continue this procedure until the weld is complete
8. Cut off the torch and cool the joint
9. Make a visual examination and a destructive test of the joint

A WORD OF EXPLANATION

One of the major purposes of this publication is the identification of the content of the trade. To this end, an analysis is contained in the appendix which lists the welds and joints to be made. The greater portion of this publication is a detailed treatment of the principles and practices of the welding trade. An examination will reveal that the treatment of these principles and practices, called a course outline, carefully parallels the analysis.

Due to time limitations, the course outline is only partially complete. The instructor is encouraged to carefully examine the completed portion and to develop his own course of study, using the analysis as a guide.

At a later date, the Laboratory will schedule workshops and lend technical assistance to instructors in developing additional instructional materials. All materials developed in the future will use this publication as a starting point.

RELATED INSTRUCTION

RELATED INSTRUCTION

I. INTRODUCTION TO WELDING

A. A brief description of the most widely used processes

1. Oxyacetylene welding
2. Oxyacetylene burning
3. Soldering and brazing
4. Manual metal arc welding
5. Tungsten inert gas welding
6. Manual inert gas welding
7. Micro-wire welding

B. A brief description of other processes and special techniques

1. Atomic hydrogen welding
2. Carbon arc welding
3. Cast iron welding
4. Explosive welding
5. Friction welding
6. Laser welding
7. Natural gas burning
8. Plasma welding
9. Resistance welding
10. Stud welding
11. Thermit welding
12. Ultrasonic welding
13. Underwater burning and welding

C. Major classes of welding processes

1. Arc welding
2. Brazing
3. Flow welding
4. Forge welding
5. Gas welding
6. Induction welding
7. Resistance welding
8. Thermit welding

II. OXYACETYLENE WELDING

A. The process

1. Definition: The heating of metals to be joined to their melting point; thus, a fusion process
2. History

   a. Development of process for making acetylene cheaply -- 1895
   b. Development of oxyacetylene torch -- 1900
   c. Introduction of the torch to the United States -- 1906

3. Combustion gases, their temperatures, and their products

   a. Gases for combustion

      (1) Acetylene: C_2H_2
      (2) Oxygen: O_2

b. Temperatures

(1) Luminous cone: 5800° - 6300°F.
(2) Envelope or outer cone: approximately 3800°F.
(3) Outer tip of the flame: approximately 2300°F.

c. Products

(1) First reaction: carbon monoxide plus hydrogen plus heat
(2) Second reaction: carbon dioxide and water vapor

4. The types of flames

a. Carburizing

(1) Ratio: 0.8 parts oxygen to 1.0 parts acetylene
(2) Temperature: 5550° - 5700°F.+
(3) Use: case harden

b. Neutral

(1) Ratio: 1.0 part oxygen to 1.0 part acetylene
(2) Temperature: 5850°F. approximately
(3) Use: welding

c. Oxidizing

(1) Ratio: 1.5 oxygen or more to 1.0 part acetylene
(2) Temperature: 6000° - 6300°F.
(3) Use: weld in an oxygen-starved atmosphere

B. Equipment

1. Combustion gases: the oxygen supply

a. Production

(1) By liquidation and distillation
(2) By electrolysis

b. Cylinders of compressed oxygen

(1) Construction

(a) Wall material: high carbon steel
(b) Wall thickness: 3/8"
(c) Neck ring
(d) Open center: no filler present

(2) Content

(a) Pressure: psig
(b) Volume: cu. ft.
(c) Calculation: Boyle's law

(3) Sizes

(a) Typical: 110, 220
(b) Other: 55, 80, 125, 250, 300

(4) Cylinder valves

(a) Back-seating seal
(b) Safety disc

    - (5) Safety cap
    - (6) Demurrage charge
  - c. Low-pressure, liquid oxygen cylinders
    - (1) Construction
      - (a) Double wall
      - (b) Filler and bleed lines
    - (2) Content and sizes
  - d. Oxygen manifold system
    - (1) Arrangement or construction
    - (2) Lines
    - (3) Regulator(s)
- 2. Combustion gases: the acetylene supply
  - a. Chemical composition: C_2H_2
  - b. Sources
    - (1) Generation by combining calcium carbide and water
    - (2) Purchase in storage cylinders
  - c. Acetylene cylinders: construction and content
    - (1) Wall: composition and thickness
    - (2) Cylinder valve
    - (3) Fuse plug
    - (4) Filler: pith and acetone
  - d. Cylinder discharge rates
  - e. Calculation of content: subtraction of tare weight from filled weight
  - f. Sizes from suppliers
    - (1) Typical: 130, 290, 300
    - (2) Other: 75, 190, 360
  - g. Acetylene generators
    - (1) Types
      - (a) Low-pressure
      - (b) Medium-pressure
    - (2) Adjustments and regulation
    - (3) Maintenance
    - (4) Safety precautions
  - h. Acetylene manifold systems
    - (1) Lines
      - (a) Size
      - (b) Metal composition
    - (2) Regulators
    - (3) Flash arrestor

3. Pressure regulators
    a. Purposes
        (1) To reduce storage pressure to a working level
        (2) To maintain a constant working pressure
    b. Types by valving
        (1) Nozzle-type
        (2) Stem-type
    c. Types by the number of stages
        (1) Single-stage
        (2) Two-stage
    d. Types used in manifold systems
        (1) Master service
        (2) Line station
    e. Safety precautions
4. Pressure gages
    a. Operation
        (1) Bourdon tube
        (2) Linkage
        (3) Pointer and dial
    b. Scales
        (1) For oxygen
        (2) For acetylene
        (3) Other: Nitrogen, Argon, CO_2, Hydrogen
    c. Types
        (1) High-pressure
        (2) Low-pressure
5. Hose: lines, connections, clamps
    a. Line diameters: 3/16", 1/4", 3.8", 1/2"
    b. Line composition: fabric and rubber
    c. Line connections: all female
        (1) Oxygen: right-hand thread
        (2) Acetylene: left-hand thread
    d. Line care and cleaning
        (1) Attaching connections
        (2) Work precautions
            (a) Avoid grease, acid, flame
            (b) Avoid abrasion, kinks, etc.
            (c) Check for leaks
6. Welding torches (blow pipes)
    a. Types

- (1) Injector type: use low pressure acetylene
- (2) Medium-pressure type

b. Acetylene sources used

- (1) Injector type
  - (a) Low-pressure generators
  - (b) Medium-pressure generators
  - (c) Cylinders
- (2) Medium-pressure type
  - (a) Medium-pressure generators
  - (b) Cylinders

c. Construction and operation

- (1) Injector type
  - (a) Body and handle with valves
  - (b) Welding head with injector
  - (c) Tip with removable or integral nozzle
- (2) Medium-pressure type
  - (a) Body and handle with valves
  - (b) Head with mixing chamber
  - (c) Tip with removable or integral nozzle

d. Care and cleaning

- (1) Tip and/or nozzle replacement
- (2) Tip and/or nozzle cleaning: selection and use of tip drills

III. BASIC METALLURGY

A. Basic definitions and explanations

1. Metallurgy
   - a. Extractive
   - b. Physical
2. Ore
3. Element
4. Metal
   - a. Properties, structure, characteristics
   - b. Base or parent
   - c. Filler
5. Alloys
   - a. Composition
   - b. Types

B. Properties of metals

1. Chemical
2. Electrical

- a. Conductors
  - (1) Good
  - (2) Poor
- b. Nonconductors

3. Thermal

4. Mechanical
   - a. Stress and strain
   - b. Tensile strength
     - (1) Yield point
     - (2) Yield strength
     - (3) Elastic limit
   - c. Elasticity
   - d. Ductility
   - e. Brittleness
   - f. Toughness
   - g. Hardness
     - (1) Brinell
     - (2) Rockwell
   - h. Corrosion resistance

C. Basic physics

1. The structure of matter
   - a. Compounds
   - b. Elements
   - c. Atoms
     - (1) Neutrons
     - (2) Protons
     - (3) Electrons
2. The table of the elements
   - a. Inert gases
   - b. Metals
   - c. Nonmetals
3. The states of matter
   - a. Gas
   - b. Liquid
   - c. Solid

D. Structure of metals

1. Grains: space-lattice type
   - a. Body-centered cubic

    - b. Hexagonal close-packed
    - c. Face-centered cubic
  - 2. Allotropic change
  - 3. Temperature range
    - a. Upper critical temperature
    - b. Transformation temperature
    - c. Lower critical temperature
  - 4. Iron-carbon structure
    - a. Pearlite
    - b. Austenite
    - c. Cemetite
    - d. Ferrite
    - e. Eutectoid mixture

- E. Extracting and forming metals
  - 1. Mining
  - 2. Smelting
    - a. Blast furnace
    - b. Bessemer process
    - c. Open hearth
    - d. Electric furnace
    - e. Other
  - 3. Casting
    - a. Pure iron
    - b. Iron-carbon and steel
    - c. Nonferrous
  - 4. Other metal forming
    - a. Cold rolling
    - b. Extruding
    - c. Hot rolling
    - d. Forging
  - 5. Heat treating
    - a. Annealing
    - b. Quenching
    - c. Carburizing
    - d. Spheroidizing
    - e. Hardening
    - f. Tempering
    - g. Flame hardening
    - h. Other

- F. Weldability
  - 1. Definitions and explanations of types
    - a. Practical weldability
    - b. Metallurgical weldability
    - c. Technical weldability

2. Factors to be considered in determining weldability
    a. Type of parent metal: its content
    b. Type of filler metal
    c. Influence of atmospheric gases
    d. Influence of shielding material
    e. Speed of weld
    f. Physical size of the object
    g. Need for pre- or post-processing: heat treat, anneal, preheat etc.

G. Types of metals and their weldability
  1. General
      a. Ferrous: iron is the main ingredient
      b. Nonferrous: nonmagnetic
  2. Ferrous
      a. Steel with carbon
          (1) Low-carbon: .05 -.30% carbon
          (2) Medium-carbon: .30 -.35% carbon
          (3) High-carbon: .45 - .75% carbon
          (4) Very high-carbon: .75 - 1.5% carbon
      b. Other alloying metals with steel
          (1) Nickel
          (2) Chromium
          (3) Molybdenum
          (4) Tungsten
          (5) Silicon
          (6) Manganese
          (7) Other: aluminum, copper
      c. Cast iron
          (1) Gray cast iron
          (2) Alloy cast iron
          (3) White cast iron
          (4) Malleable cast iron
          (5) Nodular
      d. Wrought iron
      e. Cast steel
      f. Stainless steel
          (1) Chromium-nickel: Group I
          (2) Hardenable chromium: Group II
          (3) Nonhardenable
  3. Nonferrous metals
      a. Copper and its alloys
          (1) Copper
          (2) Brass
          (3) Bronze

- b. Aluminum and its alloys
    - (1) Aluminum
    - (2) Wrought aluminum alloy
    - (3) Cast aluminum alloys
- c. Magnesium and its alloy
    - (1) Magnesium
    - (2) Alloying metals: aluminum, manganese, zinc
- d. Zinc and its alloys
    - (1) Zinc
    - (2) Alloying metals: copper, tin
- e. Nickel and its alloys
    - (1) Nickel
    - (2) Nonel: K, H, S, R, N
    - (3) Inconel
- f. Lead: grades
    - (1) Antimonial
    - (2) Corroding
    - (3) Common
    - (4) Chemical

H. Metal identification

1. Visual and manual examination of color, texture, and weight (an estimate)
2. Spark test
3. Chip test
4. Magnetic test
5. Hardness test

IV. WELDS, JOINTS, AND POSITIONS

A. Types of welds

1. Butt
2. Fillet

B. Fundamental types of joints and their variations

1. Butt (either open or closed)
    - a. Square butt
    - b. Bevel: single, double
    - c. Vee: single, double
    - d. J: single, double
    - e. U: single, double
2. Tee (either open or closed)
    - a. Plain
    - b. Vee: single, double
    - c. J: single, double
    - d. U: single, double

3. Lap
    a. Single-bead
    b. Double-bead
4. Corner
    a. Flush
    b. Half-open
    c. Full-open
5. Edge
6. Other
    a. Plug
    b. Slot

C. Positions for welding
1. Downhand
2. Horizontal
3. Vertical
4. Overhead

V. BLUEPRINT READING

A. Fundamentals
1. Basic lines
    a. Object line
    b. Hidden line
    c. Center line
    d. Dimension
    e. Extension
    f. Leaders
    g. Cutting plane
    h. Section
    i. Irregular break
        (1) Long
        (2) Short
2. Principal views (orthographic projection)
    a. Front
    b. Top
    c. Side, right
    d. Side, left
    e. Bottom
    f. Rear
3. Other representations
    a. Oblique
    b. Isometric
    c. Perspective

4. Dimensions
    a. Purpose
    b. Types
        (1) Location
        (2) Size
    c. Systems
        (1) Aligned
        (2) Unidirectional
    d. Methods
        (1) Fractions, decimals, and degrees
        (2) Chamfers and bevels
        (3) Radius, arc, and curves
        (4) Drilled holes
        (5) Other holes
        (6) Tolerances
        (7) Scale
        (8) Threads

7. Structural shapes and conventional representation
    a. Geometric solids
        (1) Square
        (2) Rectangular
        (3) Round
        (4) Hexagonal and octagonal
    b. Beams
        (1) Angles: equal and unequal, L-shape
        (2) Tees
        (3) Channels
        (4) I's
        (5) Irregular
    c. Cylinders
        (1) Thin-wall
        (2) Standard
        (3) Heavy
        (4) Extra-heavy

8. Auxiliary views
    a. Primaries
    b. Secondaries

9. Abbreviations and symbols
    a. Abbreviations
        (1) Standards
            (a) ASA - American Standards Association
            (b) AWS - American Welding Society
            (c) BWG - Birmingham Wire Gage

        - (d) SAE - Society of Automotive Engineers
        - (e) Others
    - (2) Metals
        - (a) br - brass
        - (b) bro - bronze
        - (c) CI - Cast Iron
        - (d) CRS - Cold Rolled Steel
        - (e) Others
    - (3) Geometry
        - (a) D - diameter
        - (b) R - radius
        - (c) Hex - hexagonal
        - (d) P - pitch
        - (e) Other
    - (4) Measurement
        - (a) ft. or ' - foot, feet
        - (b) in. or " - inch(es)
        - (c) deg. or ° - degrees
        - (d) lb. or # - pound(s)
        - (e) Other
    - (5) Process
        - (a) D - drill
        - (b) chfr - chamfer
        - (c) c'bore - counterbore
        - (d) ox - oxidize
        - (e) Other
- b. Symbols
    - (1) Reference line
    - (2) Arrowhead
    - (3) Element(s)
        - (a) Finish symbol
        - (b) Contour symbol
        - (c) Root opening: depth for plug and slot
        - (d) Size or strength for resistance welds
        - (e) Groove angle
        - (f) Length of weld
        - (g) Pitch
        - (h) Field weld symbol
        - (i) Weld all-around symbol
        - (j) Number of spot or projection weld
        - (k) Specification, process, or other
        - (l) Tail (when specification used)
        - (m) Basic weld symbol
            - (aa) Square
            - (bb) V
            - (cc) Bevel
            - (dd) U
            - (ee) J
            - (ff) Other

APPENDIX

OXYACETYLENE WELDING OUTFIT

Each work station for oxyacetylene welding shall be designed to perform all jobs identified in the course outline. The following pieces of equipment are recommended; any items substituted must have the same capabilities.

1	Cylinder of acetylene
1	Cylinder of oxygen
1	Oxygen cylinder valve
1	Acetylene cylinder valve
1	Single-stage oxygen regulator with gages
1	Single-stage acetylene regulator, with gages
10 ft.	Oxygen-acetylene hose, two-color, dual-type hose with female fittings attached
1	Welding torch, combination-type with gas nozzle and gooseneck

OXYACETYLENE WELDER'S TOOLS

Each trainee shall wear clothing appropriate to the welder's trade, such as heavy duck trousers, a long-sleeve shirt, high-top shoes, and a cap. In addition, each trainee shall have the following items:

1	Cylinder wrench
1 pr.	Welding goggles, #5 shade lens
1	Spark lighter
1	Wire brush
1 set	Tip cleaners
1 pr.	Welder's gloves

INSTRUCTOR'S REFERENCES

The following books have been chosen as being especially valuable to the instructor. It is recommended that he establish a reference library and draw heavily on these sources as he prepares for each day's teaching. To assist the instructor, considerable time has been invested in keying the instructional units in this guide to the particular book and page number.

TRAINING ANALYSIS

for the

COMBINATION WELDER

I. LAYOUT

- A. Fundamental operations
    1. Lay out straight lines
    2. Lay out angles
    3. Lay out circles and arcs
- B. Basic exercises

II. OXYACETYLENE WELDING

- A. Downhand position
    1. Fundamental operations
        - a. Set up the equipment
        - b. Light the torch and adjust it for a carburizing, a neutral, and an oxidizing flame
        - c. Run a fusion bead
        - d. Run a bead with a filler rod
    2. Light sheet (under 1/8")
        - a. Make a tack weld
        - b. Make a butt weld
        - c. Make an outside corner weld
        - d. Make lap welds
        - e. Make tee welds
        - f. Make flange welds with and without filler rods
    3. Heavy stock
        - a. Tack a square-butt weld
        - b. Make a square-butt weld
        - c. Make a single-bevel-butt weld

    - d. Make a single vee-butt weld
    - e. Make a strapped square butt weld

- B. Horizontal position

    - a. Make a single-bevel butt weld
    - b. Make a lap weld

- C. Vertical position

    - a. Run a filler bead in an inside corner
    - b. Make a square butt weld
    - c. Make a single-vee butt weld

- D. Overhead position

    - a. Make a fillet weld
    - b. Make a lap weld
    - c. Make a square butt weld

- E. Pipe welds (up to 2" diameter)

    - a. Make a butt weld in the vertical position
    - b. Make a butt weld in the horizontal position

III. SOLDERING

- a. Properly clean ferrous and nonferrous materials
- b. Make a lap joint on flat stock
- c. Make a strapped butt joint
- d. Make a sweated pipe joint

IV. BRAZING

- a. Braze a lap joint on sheet steel
- b. Join dissimilar metals by brazing
- c. Build up cast iron by brazing
- d. Braze a single-vee butt joint (heavy plate)
- e. Braze a tee joint

V. OXYACETYLENE CUTTING

- a. Make straight line cuts
- b. Cut arcs and circles

        - c. Pierce heavy stock
        - d. Bevel plate and pipe
        - e. "Wash" a weld
        - f. Set up and operate an automatic cutting machine

VI. MANUAL METAL ARC

A. Flat position

1. Use 6010 or 6011 electrode

    - a. Set up and adjust MMA equipment
    - b. Strike and maintain an arc
    - c. Run a stringer bead
    - d. Make a single-pass fillet joint
    - e. Make a multiple-pass fillet joint
    - f. Make a multiple-pass tee joint

2. Use a 7016 or 7018 electrode

    - a. Set up and adjust MMA equipment
    - b. Strike and maintain an arc
    - c. Run a stringer bead
    - d. Make a single-pass fillet joint
    - e. Make a multiple-pass fillet joint
    - f. Make a multiple-pass tee joint

3. Use a Jet 6024 electrode

    - a. Make a fillet joint

B. Vertical position

    - a. Make a single-pass tee joint
    - b. Make a multiple-pass tee joint
    - c. Make a strapped vee-butt joint
    - d. Make an open vee-butt joint
    - e. Make a vertical-down, single-pass fillet joint

C. Overhead position

1. Use 6010 or 6011 electrode

    - a. Run stringer beads

        - b. Run weave beads
        - c. Make an open vee-butt joint
    - 2. Use 7016 or 7018 electrode
        - a. Run stringer beads
        - b. Run weave beads
        - c. Make an open vee-butt joint
- D. Pipe welding
    - 1. Horizontal position (6010 electrode)
        - a. Make an open vee-butt weld (with a chill ring)
        - b. Make an open vee-butt weld (without a chill ring)
    - 2. Vertical position
        - a. Make an open vee-butt weld (with a chill ring)
        - b. Make an open vee-butt weld (without a chill ring)
        - c. Join standard pipe to a 90° elbow (a socket weld)

VII. TUNGSTEN INERT-GAS WELDING

- A. Fundamentals
    - 1. Downhand position
        - a. Run a fusion bead
        - b. Make a fillet weld on a tee joint
        - c. Make a square-butt joint
        - d. Make a single vee-butt joint
        - e. Make a lap weld
        - f. Make a corner weld

VIII. METAL INERT-GAS WELDING

- a. Set up the equipment
- b. Run a stringer bead
- c. Make a square-butt joint
- d. Make a corner weld
- e. Make a tee joint
- f. Make a lap joint
- g. Make a single vee-butt weld

EQUIPMENT LIST

for

VOCATIONAL WELDING (COMBINATION)

Oxyacetylene welding and cutting equipment

Quantity	Item
7	Combination outfit for welding, cutting, brazing, heating, and soldering
	Or, the contents may be purchased separately to include:
7	Welding torches
7	Gooseneck extensions:
21	Welding tips: 7 each of sizes 62, 55, 42
7	Gas mixers
7	Cutting attachments, with 90° head
7	Cutting tips: Size 53,
7	Acetylene regulators, two-gage type
7	Oxygen regulators, two-gage type
175 ft.	Welding and cutting hose, dual-type with two hoses permanently bonded together, 1/4" diameter, with appropriate female connections on all ends
7 pairs	Welding goggles with #5 lens
7	Spark lighters, with round file lighter
7	Torch wrenches:
15	Manuals, welding and cutting (optional item)
	Additional pieces not in the outfit:
7	Welding tips, tip size 50 27 or equal
7	Welding tips: Series 170, tip size 58
1	Cutting outfit, hand operated, heavy-duty, for cutting only
	Or, the contents may be purchased separately to include:
1	Cutting torch; brass head set at 90°:
3	Cutting tips, acetylene, Sizes 62, 53, and 46:

Quantity	Item
1	Regulator, acetylene, two-gage type with gages
1	Regulator, oxygen, two-gage type with gages
25 ft.	Cutting hose; dual-type with two hoses permanently bonded together; 1/4" diameter with appropriate female connections on all ends
	Additional pieces not in the outfit:
2	Cutting tips for rivets; size 53
2	Gouging tips, with tip orifice 1/8"
1 pair	Goggles, welding; with #5 lens
1	Spark lighter with round file lighter
1	Wrench, torch
1	Portable flame-cutting machine, with torch, torch-holder, cutting tip for acetylene, torch wrench, machine-to-torch hose assembly (with connections and hose connection block having double action cutoff), machine track, 115-volt motor with three-wire cord

<u>Gas manifold system to include the following:</u>

Quantity	Item
1	Manifold for oxygen, 4-on/4-off type with nonautomatic (manual) control having two gages; master shut-off valve for each bank (2); 8 header fittings; 8 pigtails
1	Line delivery system for oxygen to include the following:
	Oxygen station valves with check valves with chain and dust cap
8	Oxygen line regulators with chain and dust cap:
1	Manifold for acetylene, 4-on/4-off type with single regulator having two gages, nonautomatic (manual) control; flash arrestor; master shut-off valve for each bank (2); 8 header fittings; 8 pigtails, each with flash arrestors

Quantity	Item
1	Line delivery system for acetylene to include the following:
8	Acetylene station valves with check valves, with chain and dust cap
8	Acetylene line regulator, with chain and dust cap:

NOTE: Most local building regulations require installation of manifold and distribution systems by a licensed plumber; manufacturers and distributors are restricted to a consulting role only.

Manual metal arc welding equipment

Quantity	Item
3	Welding machines, arc (manual metal); a-c transformer type, 250-amp output, 230-volt, 60-cycle input, with pigtail and 2 cable plugs:
	Accessories for the above welder:
75 ft.	Cable; 12 1/2 ft. lead, 12 1/2 ft. ground for each machine, #2/0 gage:
3	Electrode holders, with replaceable tip insulators
3	Ground clamps
6	Welding machines, arc (manual metal), 250-amp, a-c/d-c transformer-rectifier-type, with reverse polarity switch and a-c or d-c selector; current selector; current valve control, with pigtail
150 ft.	Cable; 12 1/2 ft. lead, 12 1/2 ft. ground for each machine; #2/0 gage:
6	Electrode holders, with replaceable tip insulators
6	Ground clamps
1	Welding machine, arc (manual metal); 300-amp, motor-generator type d-c; current valve control; pigtail
25 ft.	Cable; 12 1/2 ft. lead, 12 1/2 ft. ground for each machine; #2/0 gage:
1	Electrode holder, with replaceable tip insulators
1	Ground clamp

Manual inert gas welding

Quantity	Item
1	Welder (manual inert gas) d-c: constant-potential type; 300-amp rating at 100% duty factor; 220-volt, 60-cycle, 3-phase input
1	Wire drive and dispenser, for 1/16" wire; 115-volt a-c, 60-cycle, 1/6-hp, high torque drive motor, with empty reel
1 set	Drive rolls for 1/16" wire (spare), for wire drive
1	Welding gun, arc (manual metal); air-cooled, adjustable handle or grip, min. 300-amp rating
1	Ground clamp
1	Regulator, argon
1	Flowmeter, for argon

Tungsten inert gas welding

Quantity	Item
1	Welding machine, arc (manual metal); a-c/d-c transformer-type with rectifier for straight and reverse polarity equal
1	Torch, TIG; water-cooled, 350-amp capacity with short and long back cap
12 1/2 ft.	Torch lead (connecting cable)
10 ft. (Per machine)	Ground cable; #1 gage
1	Ground clamp
1	Water coolant system, 10 gallon capacity, with 115-volt, 60-cycle pump motor
25 ft.	Coolant hose
1	Argon regulator
1	Argon flowmeter
12 ft.	Connecting hose, single; for Argon

Diptransfer equipment

Quantity	Item
1	Welding machine, constant-potential type, for mild steel only. 250-amp, 100% duty cycle, 220/440, 3-phase
	Accessory pieces required:
1	Wire drive, with burn-back control, 115-volt, a-c, 60-cycle, 1/10-hp motor
1	Gun, with stop-start trigger in the handle; 360° swivel gooseneck with 60°-angle offset; 100% duty cycle, 200-amp to accommodate .025 - .045 diameter wire
4	Nozzles
4	Contact tips
1	Regulator, argon, and flowmeter
10 ft.	Hose, single
10 ft.	Cable, ground, #1 gage
1	Clamp, ground.

Equipment and tools for the shop and for trainee protection

Quantity	Item
2	Grinders, heavy-duty, on pedestal; push-button switch; sealed ball-bearings; enclosed, adjustable wheel guards; adjustable safety-shields; tool tray and lift-out water pot, mounted on base; 200-volt, three-phase motor, fully enclosed, 1-hp, 1800 r.p.m., with two grinding wheels, 6" in diameter
2	Grinders, portable, with 36" flexible shaft and 1/4" chuck
1	Cylinder truck, with tool box and 10" rubber wheels (min)
10	Welding helmets, vulcanized fiber construction with fixed glass holder, complete with ratchet adjustment headband, cover lens, and #10 welding lens
4	Hand shields, vulcanized fiber construction with aluminum handle and fixed glass holder cover lens, and #10 welding lens

Quantity	Item
4 pairs	Welding goggles (for persons wearing prescription glasses), with #54 clear cover lens, and #74, shade 5 welding lens
15 pairs	Safety glasses, with folding temples and hardened lens of medium shade
15 pairs	Goggles, chipping and grinding goggles, with insulated ball chain bridge
4	Faceshield visors, with light green tint, .040 thick visor
10 pairs	Welding gloves, regular
4 pairs	Welding gloves, inert arc
15	Welder's coats, leather, with collar, snap fasteners down front and on sleeves, sized to fit student
10 sets	Tip cleaners in a case, standard range of drill size, 51-74
1 dozen	Chipping hammers, combination cone and chisel point

<u>Consumable supplies</u>

Quantity	Item
4	Brazing flux, 1-lb cans
4	Brazing flux, 1-lb. cans
4	Aluminum welding flux, 1-lb. jars
4	Cast iron welding flux, 1-lb. cans
2 dozen	Soldering paste, 2-oz. cans
2 dozen	Bars of solder, 1-lb., 40/60
50 pounds	Brazing rod, 1/8" - 36": AWS A5.7T, Class RCuZn-B
25 pounds	Aluminum rod, 3/32-36"

Quantity	Item
pounds	Welding rod, oxyacetylene, mild steel, copper coated, 1/16-36": AWS-ASTM A251-46T, Grade GA-50
pounds	Welding rod, oxyacetylene, mild steel, copper coated, 3/32-36": AWS-ASTM A251-46T, Grade GA-50
pounds	Welding rod, oxyacetylene, mild steel, copper coated, 1/8-36": AWS-ASTM A251-46T, Grade GA-50
pounds	Welding rod, oxyacetylene, medium carbon, high strength, 3/32-36": AWS-ASTM A251-46T, Grade GA-60, GB-60
	Electrode, tungsten, 2% thorium 3/32-6":
	Electrode, tungsten, 2% thorium; 1/16-6"
spools	Welding wire, diptransfer-type, .035 diameter, 25-pound spool: AWS GB 45
spools	Welding wire, metal-inert-gas-type, 1/16" diameter
pounds	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS-E6010 or 6011
pounds	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS-E7016 or 7018
pounds	Welding electrodes, arc (manual metal); mild steel, coated: 5/32-AWS-E7016 or 7018
pounds	Welding electrodes, arc (manual metal; mild steel, coated: 1/8-AWS-E6013
pounds	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS met 6024
2 dozen	Flints, renewal
1 dozen boxes	Headbands for welding goggle replacement, 4 per box
4 dozen	Cover lens, replacement
2 dozen	Welding lens, replacement, shade 5
	Cylinder(s) of acetylene, 30/mo. x 18 mo.

Quantity	Item
	Cylinder(s) of argon, 5 per mo. x 18 mo.
	Cylinder(s) of carbon dioxide; argon 75-57 premix, 12 per mo.
	Cylinder(s) of oxygen, 65/mo. x 18 mo.
500	Cover plates for welding helmet, clear glass 2 x 4 1/2"
2 dozen	Filter plates, for welding helmet, 2 x 4 1/2", shade 10
3 each	Filter plates, for welding helmet, 2 x 4 1/2", shade 8 and shade 12

NOTE: Schools using electric power from REA sources should specify equipment with power factor correction, and should contact their local power company about installation.

Pub Date - Apr67
MF AVAILABLE IN VT-ERIC SET 71p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *METAL MACHINING OCCUPATIONS, SHEET METAL WORKERS, WELDERS, OCCUPATIONAL CLUSTERS, HIGH SCHOOLS, POST SECONDARY EDUCATION, EQUIPMENT,

This curriculum guide was prepared to assist the trade instructor in planning and developing instructional materials for a high school metal trades course organized on the occupational cluster concept and encompassing the basic knowledge and skills of the metal machining, sheet metal, and welding trades. A curriculum committee developed the material by identifying operations and informational topics within each field. The objectives of the course are to develop entry-level knowledge and skills in one of the specific occupations or to develop knowledge and skills basic to the metal trades occupational cluster. Job procedures for the instructional blocks of sheet metal, welding, and machine shop, and related instruction for applied mathematics, applied physical science, basic metallurgy, and blueprint reading are outlined. This course is designed for a 2-year program with 1,080 hours of training. Instructional procedures are recommended for the trade competent teacher. Students should have a definite vocational committment to one of the specific trades or to the metal trades occupational cluster. Necessary equipment and consumable supplies are listed, and a bibliography contains recommended textbooks and reference books for each field. This document is available for $1.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

ACKNOWLEDGMENTS

The Curriculum Committee for the Metal Trades met on the campus of Mississippi State University on March 10 and 11. After a brief orientation, the members agreed upon the trades contained in the cluster, as well as the opportunities for employment. Using the traditional approach, skills and knowledges were then identified as operations and informational topics essential to successful entry into and progress within each trade. Following this, jobs were listed as suggested teaching vehicle. Finally, an equipment list was reviewed and modified which would adequately support the training activities.

Following the work of the Committee, the staff of the Curriculum Laboratory compiled, edited, duplicated, and distributed the material. This publication, which is the first step, will be the base for further development. A definite part of the developmental process is an evaluation and authentication by a representative industrial committee.

The members of the committee are commended for their efforts and their cooperative spirit in developing this material. The staff of the Curriculum Laboratory also wishes to acknowledge the continued support of Mississippi schools and their administrators who make their staff available. The members of the committee and their schools are:

James W. Bishop	Forest High School
George L. Curtin	Northeast Mississippi Junior College
Reo J. Grover	St. Martin High School
Glenn D. Millis	R. H. Watkins High School
Neil E. Wrenn	East Tallahatchie High School

FOREWORD

The Basic Plan for the Organization and Management of Instruction for Vocational Metal Trades is a departure from traditional trade training. Rather than confining itself to a single trade, the plan follows the "cluster" concept and encompasses the basic knowledges and skills of three trades: machinist, sheet-metal worker, and combination welder.

Trainees in a cluster program gain insight into a broader range of occupational requirements, than they could acquire in training for a single trade. Consequently, they enjoy a wider choice upon entry into the world of work. They have also the advantage of greater mobility as a tradesman, geographically as well as occupationally.

Institutions offering training in a cluster program must recognize and point out to trainees that this greater scope of occupational training can be gained only by limiting in-depth experiences. Administrators of these institutions must maintain communication with industry to insure that employment opportunity is available for the cluster graduate.

Only a carefully planned and executed series of activities can produce an orderly, well-balanced program of instruction. The following procedure is recommended to the instructor in a cluster program.

Group I. Trainees who have a definite vocational commitment to one specific trade within the cluster should be allowed to work in jobs of this trade for the full training time.

Group II. Trainees who are not committed to a specific trade at the time of entry should be systematically involved in basic knowledges and skills of all three trades during the first half of their training time

Group IIa. At the end of the first half of their training time, those trainees who have developed a definite trade objective should be allowed to invest the remainder of their training time in the knowledges and skills of that chosen trade

Group IIb. Trainees who have still not developed a definite trade objective should be systematically involved in activities designed to give the knowledges and skills of greater depth in *each* of the three trades of the cluster

As previously stated, the above program will require a high level of planning by the instructor. The use of job sheets and progress charts is strongly recommended as a time-proven method. Furthermore, it is recommended that the instructor make all decisions as to the activities of the trainee. Finally, the instructor should immediately modify the training plan of any trainee in accord with an identifiable vocational interest.

HOW TO USE THIS PUBLICATION

As a tool for teaching, this publication is primarily designed for use in planning, preparing, presenting, and evaluating instruction. As a tool, it lists operations, jobs, and informational topics--with the job as the focal point. Each job should be assigned to students, either as a group, a subgroup, or individually. The following procedure is recommended as an effective teaching sequence.

Step I. -- Tell how the job is done.
Give a full explanation of the steps necessary to perform the job. Emphasize the proper sequence; stress techniques requiring special care; point out the hazards to persons and the equipment.

Step II. -- Show how the job is done.
Demonstrate the proper procedure for performing the job. Re-emphasize the sequence, techniques, and hazards. Make sure each student can see what is being done and understands the steps.

Step III. -- Have the student do the job.
Assign each student the task of applying what he has just learned. Supervise his work; correct any variation from proper procedure or any hazardous techniques. Re-explain when necessary.

Step IV. -- Check the student for proficiency.
Assign a similar job to the student to be performed independently. Observe his work and examine the completed product or service. He is proficient when he can perform the job without supervision in a prescribed length of time.

Students who have demonstrated proficiency in one job move to the next job. The teaching steps *tell, show, do, check* are used again. Students who are not proficient perform additional jobs of a similar nature and are retaught in weak areas.

Additionally, this publication can be used (1) by the director and the instructor in a local program in communicating with their craft committee, (2) by the local director in supervising instruction and program operation, and (3) by the state supervisory staff in communicating with local school administrators and in supervising the operation of local programs.

TABLE OF CONTENTS

Page

JOB DESCRIPTION

It is neither possible nor desirable to identify a single trade as the employment goal of all trainees enrolled in a cluster program. Conversely, several employment opportunities exist, and four of these are briefly described below. Each of these descriptions is given a fuller treatment in the Dictionary of Occupational Titles, third edition.

MACHINIST. 600.280. Machinist, all-around; machinist, first class; machinist, general; machinist, journeyman; machinist, precision.

The machinist works from blueprints, sketches, and descriptions of parts or assemblies to be made. He plans the sequence of operations and sets up and operates machine tools such as engine lathes, shapers, milling machines, drill presses, and grinders. He may fit and assemble parts, mechanisms, tools, or machines. He may also use a broad range of precision measuring and gaging instruments as an inspector.

SHEET-METAL WORKER (any ind.) 804.281. Sheet-metal journeyman; sheet-metal man; sheet-metal mechanic.

The sheet-metal man works from a job order or blueprint and selects metal according to the product being fabricated. He lays out a pattern or works directly on metal by locating and marking dimensions and reference lines while using such tools as rules, calipers, scribes, squares, and punches. He sets up and operates cutting, folding, and fastening machines to shear, brake, roll, and punch metal to specified shape. Additionally, he uses hand tools such as hammers, snips, and clamps. He joins parts, using rivets and screws as well as soldering and welding equipment. He inspects assemblies and installations for conformance to specifications.

WELDER, COMBINATION (Welding) 812.884.

The combination welder joins parts together, using gas welding (WELDER, GAS) or brazing (BRAZER-ASSEMBLER) and any combination of welding processes, such as manual metal arc, tungsten inert gas, carbon arc, and others. He works from layouts, blueprints, and work orders, and uses a variety of clamping and holding devices as well as the welding equipment unique to the process being employed at the time. Extensive involvement in fit-up of parts, or inspection of final welds depends upon advancement in the trade.

MAINTENANCE MECHANIC (any ind.) II. 638.281. Fixer; machine adjuster; machine-maintenance man; machine overhauler; machine repairman; mechanical handyman; repair mechanic; tool-and-machine maintenance man.

The maintenance mechanic repairs and maintains equipment in accordance with diagrams, sketches, operation manuals, and manufacturers' specifications. The range of machinery and mechanical equipment, such as cranes, pumps, engines, motors, pneumatic tools, conveyor systems, production machines, and automotive and construction equipment. The mechanic uses hand tools and power tools, such as wrenches, hammers, and drills, as well as precision and nonprecision measuring instruments. He troubleshoots malfunctions by listening, observing, inspecting, and testing, and disassembling. He repairs and replaces defective parts, as well as lubricates and cleans. He may set up and operate lathes, drill presses, grinders, and other metal-working tools.

A person desiring or accepting employment as a maintenance mechanic must recognize gaps in his preparation in the areas of power mechanics and basic electricity. Such gaps must be filled after employment by trade extension training.

COURSE DESCRIPTION

ALTERNATIVE OBJECTIVES

Either

1. To develop entry-level knowledges and skills in those trainees having an identifiable occupational goal in machine shop, or sheet metal, or combination welder

Or

2. To develop knowledges and skills which are basic to the metal trades occupational cluster, namely machinist, sheetmetal worker, and combination welder

ASSUMPTIONS

1. That trainees have had no previous experience in metalworking
2. That trainees have a nontechnical background in general science
3. That trainees need additional instruction in the fundamentals of mathematics

DESIRABLE PREREQUISITES

1. That trainees have a vocational commitment to one of the three trades (preferable)
2. That trainees have a vocational interest in the metal trades area
3. That trainees have a mechanical aptitude
4. That they have had or are currently taking a course in applied mathematics including arithmetic, simple algebra, plane geometry, and elementary trigonometry
5. That they have had or currently are taking a course in mechanical drawing
6. That they will have a course in applied physical science before completion of their training

NATURE OF THE TRAINING

1. The duration of the training is normally three hours per day, five days per week, thirty-six weeks per year for two years; or, six hours per day,

five days per week, thirty-six weeks per year for one year -- a total of 1080 clock hours of training

2. Related instruction by lecture, demonstration, the use of audiovisuals, and others immediately precedes application by the trainee in shop practice; instruction and its application are correlated as closely as possible at all times; and the major allotment of time is given to the development of manipulative skills.

3. No instruction directly related to the trade is offered outside the shop

CONTENT OF RELATED INSTRUCTION

Systematic and purposeful presentation of topics of related instruction to all trainees is strongly recommended. The instructor in Metal Trades is faced with a diversity of needs on the part of the trainees. The following is a suggested procedure:

1. Trainees with identifiable vocational goals in either sheet metal, machine shop, or combination welding are to receive related instruction appropriate to that trade. The content is identified in detail in the Curriculum Laboratory publications, Vocational Sheet Metal, Vocational Machine Shop, and Vocational Welding.

2. Trainee with a general vocational interest in the metal trades are to be given a broader background in the composition, processing, and fabrication of metals. A detailed identification of this content is contained elsewhere in this publication and is titled "Related Instruction Topics".

TYPES AND LEVELS OF SKILLS TO BE DEVELOPED

1. Immediately marketable skills for those trainees electing to train in a specific trade

2. Basic manipulative skills of the metal trades cluster for those trainees electing broader training

INSTRUCTIONAL BLOCKS

The following blocks are the major areas of instruction. Each has been assigned a number of hours for the purpose of indicating the relative amount of emphasis it is to receive in the total training period. Instructors are urged to plan training carefully, to select, sequence, and assign learning experience, thus making maximum use of available time. It should not be inferred that hour allotments be rigidly adhered to or that students be rotated on a clockwork or calendar basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods in certain areas. These students may gain only the minimum proficiencies while more able students will progress more rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and allotting are not designed to standardize programs, but to assist local teachers in planning more carefully and in conducting their instruction more carefully.

I. SHEET METAL

Scale and precision measurement	15	
Geometric construction and layout	150	
Bench work: mark out, cut out, form, fasten	90	
Form with sheet metal equipment	105	
Subtotal		360

II. WELDING

Oxyacetylene welding, cutting, brazing	90	
Manual metal arc	150	
Tungsten inert gas	120	
Subtotal		360

III. MACHINE SHOP

Engine lathe	150	
Drill press	15	
Shaper	45	
Mill	90	
Surface grinder	45	
Power saws	15	
Subtotal		360
TOTAL TRAINING TIME		1080

ANALYSIS OF OPERATIONS

I. MEASUREMENT

A. Scale Measurement

1. Measure with a steel tape or rule
2. Measure with a steel square
3. Measure diameter and circumference with a circumference rule
4. Measure angles with a semicircular protractor
5. Measure angles with a swing-blade protractor
6. Measure angles with the protractor head and the blade of a combination set
7. Measure ferrous metal with a sheet metal gage
8. Measure nonferrous metal with a sheet metal gage
9. Transfer measurements with dividers or calipers
10. Measure threads with a screw pitch gage
11. Check twist-drill points with drill-point gage
12. Measure holes and recesses with a (scaler) depth gage
13. Measure with a hook rule

B. Precision Measurement

1. Measure with an outside micrometer
2. Measure with an inside micrometer
3. Measure with a vernier caliper
4. Measure with a dial indicator
5. Measure angles with a vernier bevel protractor
6. Measure with a sine bar
7. Measure with a micrometer depth gage
8. Transfer measurements with a telescoping gage
9. Measure with a vernier depth gage
10. Measure with a vernier height gage
11. Measure gaps with a feeler gage
12. Measure with gage blocks

II. LAYOUT

A. Sheet Metal: operations performed with a compass, dividers, rule, straight edge, and pencil or scribe

1. Bisect a line
2. Erect a perpendicular from a point on a line
3. Erect a perpendicular from a point off a line
4. Bisect an arc
5. Bisect an angle
6. Transfer an angle
7. Construct a line parallel to a given line, passing through a given point
8. Construct a line parallel to a given line, at a given distance
9. Divide a line into a given number of equal parts
10. Divide a line into proportional parts
11. Divide a surface into any given number of equal parts
12. Construct a triangle with all sides given
13. Construct a triangle with the hypotenuse and one side given
14. Construct an equilateral triangle
15. Construct a square
16. Construct a regular pentagon
17. Construct a regular hexagon
18. Construct a regular octagon
19. Find the center of a circle with a right triangle
20. Construct a circle tangent to a line at a given point
21. Construct a tangent to a circle through a point on the circle
22. Construct a tangent to a circle through a point off the circle
23. Construct a line tangent to two circles
24. Construct a circle through three points
25. Divide a circle into any number of equal parts
26. Construct an arc tangent to two intersecting lines
27. Construct an arc tangent to both an arc and a straight line
28. Construct an ogee curve

B. Precision: with a surface plate and precision measuring tools; repeat the above operations

III. MARKOUT

A. Scribe a line with a scratch awl or scribe and a straight edge
B. Mark a location with a prick punch and a hammer
C. Mark centers with a center punch and a hammer
D. Mark centers with an automatic center punch
E. Scribe arcs and circles on flat or sheet stock with dividers
F. Scribe arcs with trammel points and bar
G. Scribe parallel lines with a tinner's file
H. Scribe parallel lines with a marking gage or a scratch gage
I. Scribe parallel lines with a scratch awl or scribe and the square head and the blade of a combination set
J. Scribe irregular arcs with a french curve and a scribe or a scratch awl
K. Sharpen a scratch awl, center punch, prick punch, or scribe
L. Scribe arcs and circles with a hermaphrodite caliper
M. Scribe lines with a surface gage mounted on a surface plate
N. Locate centers with a scribe and the center head and blade of a combination set
O. Mark centers with a bell punch
P. Locate the center of round stock with dividers
Q. Locate the center of round stock with a hermaphrodite caliper

IV. CUTOUT

A. Sheetmetal

1. Cut along a straight line with straight-pattern snips
2. Cut along a straight line with combination-pattern snips
3. Cut heavy sheet with combination-lever snips
4. Cut along a curved line with aviation snips
5. Cut pieces which are held in a vise, with a flat chisel
6. Cut a starting slit with a flat chisel
7. Cut pieces lying flat, with a chisel
8. Cut along layout lines, with an electric nibbler
9. Punch holes with a solid punch and a hammer
10. Punch holes with a hollow punch and a hammer
11. Punch holes along an edge, with a hand punch
12. Cut rivets with a chisel

B. Heavy Stock

1. Cut flat and round stock with a chisel
2. Cut flat and round stock with a hand hacksaw
3. Cut angle iron with a hacksaw
4. Cross-file for rapid stock removal, with a mill bastard file

C. Other

1. Drill holes with a hand drill and a twist drill
2. Countersink holes with a hand drill and a countersink bit
3. Ream holes with a hand reamer
4. Cut internal threads in a drilled hole, with a tap and T handle
5. Cut external threads on round stock with a die and diestock
6. Cut a groove with a cape chisel or diamond-point chisel
7. Move a drilled hole which is improperly started with a diamond-point chisel

V. FORM WITH HAND TOOLS

A. Sheetmetal

1. Set down an edge or flatten seams with a tinner's hammer
2. Form sheet metal with a wood, rubber composition, or rawhide mallet
3. Form a square piece on the breakdown or needlecase stake with a mallet
4. Form a round piece on the conductor stake with a mallet
5. Form a round piece on the needlecase stake with a mallet
6. Form a conical piece on the blowhorn stake with a mallet
7. Form a conical piece on the candlemold stake with a mallet
8. Brake a piece of sheet metal at 90° angle, with a piece of angle iron, C clamp, and mallet
9. Brake pieces to form boxes with hand tongs or handy seamer
10. Form a radius in a piece held over a pipe with a clamp, using a mallet
11. Form a single hem with hand tongs or handy seamer
12. Form a double hem with hand tongs or handy seamer
13. Prepare an edge for grooved seams with hand tongs or handy seamer
14. Form a radius bend with a conductor stake
15. Finish an outside grooved seam, using a hollow or solid mandrel stake
16. Form a plain dovetailed seam, using straight-cutting aviation snips

17. Flange an edge on a stake with a tinner's hammer
18. Shrink an edge on a stake with a tinner's hammer
19. Flange an edge with a hand dolly and a tinner's hammer
20. Fit a tee, using hand snips
21. Wire straight edges before a piece is formed
22. Wire an inside or outside radius on a flat piece
23. Wire a square or rectangular piece after it is formed
24. Wire a tapered piece after it is formed
25. Double-seam corners on a square or rectangular piece with handy seamer and stakes

B. Heavy sheet and bar stock

1. Make angular bends in a piece held in a vise by striking with a hammer
2. Form a curve in a piece, with an anvil and a hammer
3. Twist a piece held in a vise, with a monkey wrench
4. Form an eye in a piece of flat stock over a short pipe held in a vise
5. Form irregular curves, with a wooden jig
6. Heat a piece for forming, with an oxyacetylene torch

VI. FORM WITH SHOP EQUIPMENT

A. Bar folders

1. Fold a single hem
2. Fold a double hem
3. Form the folds for a grooved seam
4. Form the fold for an edge to be wired
5. Form a 45°, 90°, or a special angle
6. Form a double right-angle brake

B. Box and pan brake

1. Sharp brake thin sheet metal
2. Form a mold
3. Form the pocket for a Pittsburgh lock
4. Form a lock seam

C. Slip rolls

1. Roll cylindrical shapes

2. Remove buckles (brake tin)
3. Roll tapered shapes
4. Roll a cylindrical piece with wired edges

D. Squaring shears

1. Cut marked sheet metal
2. Cut a sheet against the front gage
3. Cut a sheet against the back gage
4. Cut a sheet at an angle

E. Combination rotary machine for turning, burring, wiring, elbow edging, flanging, and flattening operations

1. Beading
    a. Form a single bead
    b. Form an ogee bead
    c. Form a triple bead
2. Crimping
    a. Crimp round pipe
    b. Crimp and bead cylindrical-shaped objects
3. Turning
    a. Form an edge for wiring
    b. Score or crease an edge, using a gage
    c. Turn edges for elbows
4. Burring
    a. Burr a disc
    b. Burr an edge on a cylinder
5. Elbow: form an elbow

F. Ring and circle shears

1. Cut a circle
2. Cut a ring
3. Cut a sheet of metal

G. Setting down machine: set down flanges and seams

H. Spot welder

   1. Spotweld ferrous sheet (3/16" thick capacity)
   2. Spot weld nonferrous sheet

I. Notcher: Notch the edge of sheet metal (up to 16 gage)

J. Throatless shear

   1. Make straight cuts along marked lines
   2. Make curved cuts along contours

VII. FASTEN WITH HAND TOOLS

A. Tighten or loosen screws with a flat-blade screw driver
B. Tighten or loosen screws with a Phillips screwdriver
C. Tighten or loosen nuts and bolts with hand wrenches
D. Drive, set, and flange rivets with a riveting hammer and a rivet set
E. Hold a piece in place by applying a C clamp
F. Hold a pattern in place by applying parallel clamps
G. Forge a soldering copper
H. File a soldering copper
I. Tin a soldering copper
J. Apply soft solder with a soldering copper
K. Apply soft solder with a propane torch
L. Apply soft solder with an oxyacetylene torch
M. Rivet with pop rivets

VIII. WELDING

A. Oxyacetylene welding

   1. Install a cylinder valve and a regulator on a cylinder
   2. Assemble a welding torch
   3. Assemble a cutting torch
   4. Attach a welding torch or a cutting torch to a regulator, using dual-type hose
   5. Light a welding torch and adjust it for a carburizing, a neutral, and an oxidizing flame

6. Light and adjust a cutting torch
7. Form a puddle, using an acetylene torch
8. Add filler rod to a puddle
9. Change the tip on a welding or a cutting torch
10. Change the lens in welding goggles

B. Manual metal arc

1. Plug the pigtail into an outlet (CAUTION!)
2. Attach a lug, ground clamp, or electrode holder to a lead cable
3. Attach the welding lead and the ground lead to the welding machine
4. Attach the ground lead to the work or to the worktable
5. Put an electrode in the holder
6. Put on and adjust a welding helmet
7. Change a cover plate and/or lens in a helmet
8. Strike an arc and hold it
9. Adjust the current controls

C. Tungsten inert gas

1. Install a cylinder valve and argon regulator-flowmeter on a cylinder
2. Assemble a TIG torch
3. Attach a TIG torch to a power supply, water supply, and gas supply
4. Insert a tungsten electrode and adjust the collet cap assembly
5. Turn on and adjust the cooling water supply
6. Select the type of current and the polarity; set the current flow
7. Turn on and adjust the flow of argon
8. Strike an arc and hold it
9. Add filler rod
10. Change nozzles on the torch

IX. ENGINE LATHE

A. Setup

1. Set the speed on a belt-drive lathe
2. Set the speed on a gear-drive lathe
3. Set the feed on a quick change
4. Mount a faceplate or chuck on a threaded spindle nose

5. Mount a taper shank tool or workpiece in a collet
6. Mount a taper shank tool in a standard-taper headstock
7. Remove a taper shank tool from a standard-taper headstock
8. Mount a taper shank tool in a tailstock
9. Remove a taper shank tool from a tailstock
10. Mount work in a universal chuck
11. Mount work in an independent chuck
12. Mount work in a headstock
13. Mount work in a taper-shank drill chuck
14. Mount work in a faceplate by bolting, etc.
15. Mount work in a faceplate for turning between centers with a lathe dog
16. Mount work on a mandrel
17. Sharpen tool bits on a bench or pedestal grinder
18. Mount a tool bit and holder in the tool-post holder
19. Set a tool bit for cutting to the left
20. Set a tool bit for cutting to the right
21. Set a tool bit for thread cutting
22. Mount a taper attachment on the carriage and bed
23. Offset the tailstock for taper turning
24. Set the compound feed for taper turning
25. Support work with a steady rest
26. Support work with a follower rest
27. Mount a tool-post grinder

B. Operation

1. Turn on the lathe
2. Engage or disengage the back gear
3. Engage the power cross feed
4. Manually cross-feed
5. Manually feed the compound
6. Engage the longitudinal feed (power); reverse the feed
7. Engage the half nut on the lead screw
8. Feed manually (longitudinally); reverse the feed
9. Feed a tool held in the tailstock
10. File on a lathe
11. Polish with emery cloth

X. HOLDING WORK

- A. Vises
  - 1. Hold work in a vise
  - 2. Hold work in a vise, using a wedge
  - 3. Hold work in a vise, supporting with parallels or rest blocks
- B. Clamps and others
  - 1. Clamp work to a table with a C clamp
  - 2. Clamp work to a table with hold-down clamps, T bolts, and step plates
  - 3. Support work with jack screws
  - 4. Position work with angle plates and C clamps
  - 5. Hold round stock in V blocks

XI. DRILL PRESS

- A. Sharpen a twist drill
- B. Mount a taper shank tool or toolholder in the spindle
- C. Remove a taper shank tool or toolholder from the spindle
- D. Mount a tool or workpiece in a drill chuck
- E. Set the speed on a drill press
- F. Feed the tool manually
- G. Adjust the feed stop
- H. Adjust the table height
- I. Center work, using a wiggler

XII. SHAPER

- A. Set up
  - 1. Adjust the travel of the ram
  - 2. Adjust the position of the ram
  - 3. Adjust the speed of the ram
  - 4. Sharpen a tool bit
  - 5. Mount the tool bit in a toolholder
  - 6. Mount a toolholder in the tool post
  - 7. Mount a tool bit for a horizontal cut

8. Mount a tool bit for a vertical cut
9. Mount a tool bit for a regular angular cut
10. Mount a tool bit for an inside angular cut
11. Secure or loosen the clapper
12. Set the toolhead at an angle
13. Adjust the height of the table and set the slide

B. Operation

1. Power-feed the toolhead vertically
2. Manually feed the toolhead down
3. Power-feed the table horizontally
4. Manually feed the table horizontally
5. Power-feed the table
6. Manually feed the table in a vertical direction

XIII. MILL

A. Table

1. Set the height of the table
2. Manually, feed the table vertically
3. Power-feed the table vertically
4. Set the horizontal position of the table
5. Manually feed the table horizontally (laterally)
6. Power-feed the table horizontally
7. Manually cross-feed the table
8. Power cross-feed the table
9. Set the table-feed rate when using power

B. Spindle

1. Set the spindle speed
2. Mount a taper shank tool or an adapter in a spindle, using a draw bar
3. Mount a taper shank tool or an adapter in a spindle having a drive-fit-type taper
4. Mount a straight shank tool in a drill chuck
5. Bolt a cutting tool to the spindle or to an adaptor (eg. shell-type mills)
6. Mount a cutter on an arbor (horizontal mill only)

7. Mount an arbor in the spindle, support it with the overarm and adjust the brass collet (horizontal mill only)

C. Indexing

1. Mount an indexing head having a live center and a dead center on the table
2. Set the index wheel and the work piece for straight cuts
3. Attach and engage the index-drive gears for power feed from the table
4. Set the table at an angle cut

D. Coolant

1. Check the composition of the cutting fluid
2. Set the coolant flow rate

XIV. SURFACE GRINDER (VERTICAL SPINDLE)

A. Setup

1. Mount a grinding wheel in the spindle
2. Set the wheel speed
3. Set the coolant-flow rate

B. Operation

1. Face a grinding wheel
2. Form-shape a grinding wheel
3. Manually feed the table down
4. Manually cross-feed the table
5. Power cross-feed the table
6. Manually traverse-feed the table
7. Power traverse-feed the table

XV. BENCH GRINDER

A. Mount a grinding wheel
B. Face a grinding wheel
C. Form-shape a grinding wheel
D. Adjust the guard and the tool rest
E. Set the coolant-flow rate

XVI. POWER SAWS

A. Reciprocating hacksaw
   1. Clamp stock for a straight cut
   2. Clamp stock for an angular cut
   3. Adjust and/or change a blade
   4. Change cutting speed
   5. Adjust cutting pressure

B. Band saw
   1. Cut, weld, and anneal a blade
   2. Cut along straight lines with the table in the horizontal position
   3. Cut along curved lines with the table in the horizontal position
   4. Cut along straight lines with the table in an inclined position
   5. Cut along curved lines with the table in an inclined position

XVII. HEAT TREATING

A. Anneal a nonferrous metal by heating, then cooling rapidly
B. Anneal a ferrous metal by heating, then cooling slowly
C. Harden a nonferrous metal by heating, then cooling slowly
D. Harden a ferrous metal by heating and tempering
E. Surface-harden a ferrous metal by heating in the presence of a carbon compound

XVIII. FINISH

A. Draw-file a piece of flat or round stock
B. Finish-file edges and corners
C. Wire brush a surface
D. Clean a surface with steel wool or abrasive cloth
E. Degrease a surface with a solvent
F. Etch a surface with an acid
G. Blue a finished piece
H. Apply enamel to a finished piece
I. Apply lacquer to a finished piece
J. Hand-buff a finished surface, using polish or wax

SUGGESTED JOBS IN THE METAL TRADES

I. SHEETMETAL: LAYOUT AND FABRICATION

A. Elementary layout

1. Lay out patterns and construct simple rectangular boxes and pans
2. Lay out patterns and construct rectangular flaring pans
3. Lay out patterns and construct multipiece boxes and pans
4. Lay out patterns and construct circular pipe
5. Lay out patterns and construct circular pans and pails
6. Lay out patterns and construct rectangular duct cleats and seams
7. Lay out patterns and construct rectangular duct ells and angles with square throat and heel
8. Lay out patterns and construct 90° Y and branch in a rectangular duct
9. Lay out patterns for rectangular duct-change elbows
10. Lay out patterns for rectangular duct-change angles

B. Parallel-line layout

1. Lay out stretchout patterns and construct parallel line profiles
2. Lay out patterns and construct two-piece 90° elbows and angles of round pipe
3. Lay out patterns and construct two-piece elbows of any profile
4. Lay out patterns and construct 90° T's of equal-diameter round pipe
5. Lay out patterns for angle T's of unequal diameter pipe
6. Lay out patterns and construct multipiece elbows
7. Lay out patterns and construct round pipe offsets
8. Lay out patterns, using 90° round elbow patterns for elbows with angles of less than 90°.
9. Lay out patterns, using multipiece elbows to construct round-pipe offsets
10. Lay out patterns and construct an oblong 90° angle
11. Lay out patterns and construct square-face miters
12. Lay out patterns and construct ogee return miters
13. Lay out patterns and construct butt miters
14. Lay out patterns and construct return miters other than right angles
15. Lay out patterns and construct butt miters against oblique surfaces in the plan
16. Lay out patterns and construct eaves-trough miters

17. Lay out patterns and construct oblique-face miters
18. Lay out patterns and construct a range hood
19. Lay out patterns, using the three-point method; 90° transition elbows
20. Lay out patterns of 90° transition elbows, using three-line method
21. Lay out patterns and construct 90° transition elbows with vanes
22. Lay out patterns and construct molded conductor heads
23. Lay out patterns and construct octagonal roof finals

C. Radial line development

1. Lay out patterns and construct cones and frustums
2. Lay out patterns and construct funnels
3. Lay out patterns and construct round ventilator heads
4. Lay out patterns and construct square pyramids
5. Lay out patterns and construct irregular frustums
6. Lay out patterns and construct irregular frustums of hexagonal pyramids
7. Lay out patterns and construct conical outlet for 1/2-round gutter
8. Lay out patterns and construct collars on double-pitched roofs
9. Lay out patterns and construct rectangular pyramids
10. Lay out patterns and construct oblong raised covers
11. Lay out patterns and construct frustum of cone intersected by cylinder obliquely
12. Lay out patterns and construct a cone intersecting a cone obliquely

D. Triangulation

1. Develop patterns and construct a square-to-square transition piece
2. Develop patterns and construct a square-to-round
3. Develop patterns and construct a round reducer
4. Lay out patterns and construct round-to-oblong transitions
5. Lay out patterns and construct drop-cheek elbows
6. Lay out patterns and construct twisted rectangular pipes
7. Lay out patterns and construct rectangular-to-round fittings, vertical on two sides
8. Lay out patterns and construct irregular oblong-to-round fittings
9. Lay out patterns and construct irregular T joints
10. Lay out patterns and construct square-to-round roof collars for pitched roofs

11. Lay out patterns and construct a round-to-rectangular, 90° furnace boot
12. Lay out patterns and construct scalene cones
13. Lay out patterns and construct a three-piece, square-to-round elbow
14. Lay out patterns and construct a three-piece, round reducing elbow
15. Lay out patterns and construct a tapering Y branch
16. Lay out patterns and construct three-branch fittings
17. Lay out patterns and construct a two-way elbow intersection
18. Lay out patterns and construct ship ventilator with a round base and mouth

II. MACHINE SHOP

A. Engine Lathe

1. Plain turn (rough, finish, polish)
    a. Between centers
    b. With chuck
2. Bore
    a. Straight holes
    b. Angular holes
    c. Taper holes
    d. Multi-diameter (concentric) holes
    e. Bore and face blind holes
    f. Recess and groove inside diameters
3. Face
    a. In a chuck
    b. Between centers
    c. To radii and fillets
4. Drill
    a. Straight drill
    b. Ream
    c. Countersink
    d. Drill and countersink
    e. Counterbore

5. Thread
    a. Chase external threads
    b. Chase internal threads
    c. Chase taper threads
6. Taper turn
    a. Using compound rest
    b. Using taper attachment
    c. Using offset tail stock
7. Grind, using tool post grinder
    a. External grinding
    b. Internal grinding
8. Use accessories
    a. Faceplate turning
    b. Use of steady rest

B. Drill press

1. Straight-drill flat stock
2. Straight-drill round stock
3. Countersink
4. Counterbore
5. Ream
6. Tap
7. Spot-face

C. Shaper

1. Shape horizontal surfaces
2. Shape angular surfaces
3. Shape vertical surfaces
4. Shape grooves and external keyways
5. Shape internal keyways
6. Serrate

D. Mill

1. Horizontal
   - a. Plain-mill a horizontal surface
   - b. Plain-mill a vertical surface
   - c. Cut a slot
   - d. Cut a keyseat
   - e. Make an angular cut
   - f. Drill and ream holes
   - g. Enlarge holes by boring and counterboring
   - h. Cut spur gears
   - i. Cut helical gears
2. Vertical
   - a. Plain-mill a surface with an end mill
   - b. Drill and ream holes
   - c. Enlarge holes by boring and counterboring
   - d. Cut a slot; cut a T slot
   - e. Set up and cut flues and splines

E. Bench grinder

1. Sharpen hand tools
2. Form grind

F. Surface grinder (vertical spindle)

1. Grind a plain surface
2. Grind an edge or end
3. Step-grind an edge, end, or face
4. Form-grind an edge or end

G. Power saws

1. Reciprocal hacksaw: cut off ferrous and nonferrous metals
2. Band saw
   - a. Straight-cut single pieces of stock
   - b. Contour-cut single pieces of stock
   - c. Cut internal contours of single pieces
   - d. Make straight and contour cuts of stacked, multiple pieces

III. WELDING

- A. Oxyacetylene welding
  - 1. Downhand position
    - a. Fundamental operations
      - (1) Run a fusion bead
      - (2) Run a bead with a filler rod
    - b. Light sheet (under 1/8")
      - (1) Make a tack weld
      - (2) Make a butt weld
      - (3) Make an outside corner weld
      - (4) Make lap welds
      - (5) Make tee welds
      - (6) Make flange welds with and without filler rods
    - c. Heavy stock
      - (1) Tack a square-butt weld
      - (2) Make a square-butt weld
      - (3) Make a single-bevel butt weld
      - (4) Make a single-vee butt weld
      - (5) Make a strapped square-butt weld
  - 2. Horizontal position
    - a. Make a single-bevel butt weld
    - b. Make a lap weld
  - 3. Vertical position
    - a. Run a filler bead in an inside corner
    - b. Make a square butt weld
    - c. Make a single-vee butt weld
  - 4. Overhead position
    - a. Make a fillet weld
    - b. Make a lap weld
    - c. Make a square butt weld

5. Pipe welds (up to 2" diameter)
    a. Make a butt weld in the vertical position
    b. Make a butt weld in the horizontal position

B. Brazing
  1. Braze a lap joint on sheet steel
  2. Join dissimilar metals by brazing
  3. Build up cast iron by brazing
  4. Braze a single-vee butt joint (heavy plate)
  5. Braze a tee joint

C. Cast iron
  1. Weld cast iron with oxyacetylene

D. Oxyacetylene cutting
  1. Make straight line cuts
  2. Cut arcs and circles
  3. Pierce heavy stock
  4. Bevel plate and pipe
  5. "Wash" a weld
  6. Set up and operate an automatic cutting machine

E. Manual metal arc
  1. Flat position
    a. Use 6010 or 6011 electrode
      (1) Set up and adjust MMA equipment
      (2) Strike and maintain an arc
      (3) Run a stringer bead
      (4) Make a single-pass fillet joint
      (5) Make a multiple-pass fillet joint
      (6) Make a multiple-pass tee joint
    b. Use a 7016 or 7018 electrode
      (1) Set up and adjust MMA equipment
      (2) Strike and maintain an arc
      (3) Run a stringer bead
      (4) Make a single-pass fillet joint

        - (5) Make a multiple-pass fillet joint
        - (6) Make a multiple-pass tee joint

2. Vertical position: 6010 or 6011

    a. Make a single-pass tee joint
    b. Make a multiple-pass tee joint
    c. Make a strapped vee-butt joint
    d. Make an open vee-butt joint
    e. Make a vertical-down, single-pass fillet joint

3. Horizontal (6010 electrode)

    a. Make a single pass tee joint
    b. Make a multiple pass butt joint

4. Overhead position

    a. Use 6010 or 6011 electrode

        - (1) Run stringer beads
        - (2) Run weave beads
        - (3) Make an open vee-butt joint

    b. Use 7016 or 7018 electrode

        - (1) Run stringer beads
        - (2) Run weave beads
        - (3) Make an open vee-butt joint

5. Pipe welding

    a. Horizontal position (6010 electrode): Make an open vee-butt weld (without a chill ring)

    b. Vertical position

        - (1) Make an open vee-butt weld (without a chill ring)
        - (2) Join standard pipe to a 90° elbow (a socket weld)

F. Tungsten inert-gas welding on ferrous stainless, and nonferrous aluminum

1. Downhand position

    a. Run a fusion bead
    b. Make a fillet weld on a tee joint

c. Make a square-butt joint

d. Make a single vee-butt joint

e. Make a lap weld

f. Make a corner weld

2. Horizontal position

    a. Make a single-pass tee joint
    b. Make a multiple-pass butt joint

3. Vertical position

    a. Make a single-pass tee joint
    b. Make a multiple-pass butt joint

4. Overhead position:

    a. Make a multiple-pass butt joint

    - 3. Temperature range
        - a. Upper critical temperature
        - b. Transformation temperature
        - c. Lower critical temperature
    - 4. Iron-carbon structure
        - a. Pearlite
        - b. Austenite
        - c. Cemetite

    - d. Ferrite
    - e. Eutectoid mixture

- E. Extracting and forming metals
  - 1. Mining
  - 2. Smelting
    - a. Blast furnace
    - b. Bessemer process
    - c. Open hearth
    - d. Electric furnace
    - e. Other
  - 3. Casting
    - a. Pure iron
    - b. Iron-carbon and steel
    - c. Nonferrous
  - 4. Other metal forming
    - a. Cold rolling
    - b. Extruding
    - c. Hot rolling
    - d. Forging
  - 5. Heat treating
    - a. Annealing
    - b. Quenching
    - c. Carburizing
    - d. Spheroidizing
    - e. Hardening
    - f. Tempering
    - g. Flame hardening
    - h. Other
- F. Weldability
  - 1. Definitions and explanations of types
    - a. Practical weldability
    - b. Metallurgical weldability
    - c. Technical weldability

2. Factors to be considered in determining weldability

a. Type of parent metal: its content
b. Type of filler metal
c. Influence of atmospheric gases
d. Influence of shielding material
e. Speed of weld
f. Physical size of the object
g. Need for pre- or post-processing: heat treat, anneal, preheat,etc.

G. Types of metals and their weldability

1. General

a. Ferrous: iron is the main ingredient
b. Nonferrous: nonmagnetic

2. Ferrous

a. Steel with carbon

(1) Low-carbon: .05 - .30% carbon
(2) Medium-carbon: .30 - .35% carbon
(3) High-carbon: .45 - .75% carbon
(4) Very high-carbon: .75 - 1.5% carbon

b. Other alloying metals with steel

(1) Nickel
(2) Chromium
(3) Molybdenum
(4) Tungsten
(5) Silicon
(6) Manganese
(7) Other: aluminum, pper

c. Cast iron

(1) Gray cast iron
(2) Alloy cast iron
(3) White cast iron
(4) Malleable cast iron
(5) Nodular

- d. Wrought iron
- e. Cast steel
- f. Stainless steel
    - (1) Chromium-nickel: Group I
    - (2) Hardenable chromium: Group II
    - (3) Nonhardenable

3. Nonferrous metals
    - a. Copper and its alloys
        - (1) Copper
        - (2) Brass
        - (3) Bronze
    - b. Aluminum and its alloys
        - (1) Aluminum
        - (2) Wrought aluminum alloy
        - (3) Cast aluminum alloys
    - c. Magnesium and its alloy
        - (1) Magnesium
        - (2) Alloying metals: aluminum, manganese, zinc
    - d. Zinc and its alloys
        - (1) Zinc
        - (2) Alloying metals: copper, tin
    - e. Nickel and its alloys
        - (1) Nickel
        - (2) Monel: K, H, S, R, N
        - (3) Inconel
    - f. Lead: grades
        - (1) Antimonial
        - (2) Corroding
        - (3) Common
        - (4) Chemical

H. Machinability

1. Definition
2. Factors influencing machinability
    a. Hardness
    b. Alloys
    c. Processing and heat treatment
3. Relation between cast-iron hardness and machinability
4. Relation between tensile strength and hardness

I. Machinability of metals

1. Classes: ferrous, nonferrous
2. Cast-iron
    a. Gray
    b. White
    c. Malleable
3. Wrought iron
4. Steel
    a. Carbon: low, medium, high
    b. High speed
    c. Tool
    d. Alloys: nickel, manganese, chromium, molybdenum, tungsten, vinadium sillite, tungsten carbide
5. Base metals: lead, copper, zinc, tin, nickel, aluminum
6. Alloys: Bar-alloy, pewter, brass, bronze, nickel silver
7. Precious metals: sterling silver, gold, platinum

J. Metal identification

1. Visual and manual examination: color, texture, weight
2. Spark test
3. Chip test
4. Magnetic test
5. Hardness test

IV. BLUEPRINT READING

- A. Fundamentals
  - 1. Basic lines
    - a. Object line
    - b. Hidden line
    - c. Center line
    - d. Dimension
    - e. Extension
    - f. Leaders
    - g. Cutting plane
    - h. Section
    - i. Irregular break
      - (1) Long
      - (2) Short
  - 2. Principal views (orthographic projection)
    - a. Front
    - b. Top
    - c. Side, right
    - d. Side, left
    - e. Bottom
    - f. Rear
  - 3. Other representations
    - a. Oblique
    - b. Isometric
    - c. Perspective
  - 4. Dimensions
    - a. Purpose
    - b. Types
      - (1) Location
      - (2) Size
    - c. Systems

        - (1) Aligned
        - (2) Undirectional
    - d. Methods
        - (1) Fractions, decimals, and degrees
        - (2) Chamfers and bevels
        - (3) Radius, arc, and curves
        - (4) Drilled holes
        - (5) Other holes
        - (6) Tolerances
        - (7) Scale
        - (8) Threads
- 7. Structural shapes and conventional representation
    - a. Geometric solids
        - (1) Square
        - (2) Rectangular
        - (3) Round
        - (4) Hexagonal and octagonal
    - b. Beams
        - (1) Angles: equal and unequal, L-shape
        - (2) Tees
        - (3) Channels
        - (4) I's
        - (5) Irregular
    - c. Cylinders
        - (1) Thin-wall
        - (2) Standard
        - (3) Heavy
        - (4) Extra-heavy
- 8. Auxiliary views
    - a. Primaries
    - b. Secondaries

9. Abbreviations and symbols

a. Abbreviations

(1) Standards

(a) ASA - American Standards Association
(b) AWS - American Welding Society
(c) BWG - Birmingham Wire Gage
(d) SAE - Society of Automotive Engineers
(e) Others

(2) Metals

(a) br - brass
(b) bro - bronze
(c) CI - Cast Iron
(d) CRS - Cold Rolled Steel
(e) Others

(3) Geometry

(a) D - diameter
(b) R - radius
(c) Hex - hexagonal
(d) P - pitch
(e) Other

(4) Measurement

(a) ft. or ' - foot, feet
(b) in. or " - inch(es)
(c) deg. or ° - degrees
(d) lb. or # - pound(s)
(e) Other

(5) Process

(a) D - drill
(b) chfr - chamfer
(c) c'bore - counterbore
(d) ox - oxidize
(e) Other

b. Symbols

- (1) Reference line
- (2) Arrowhead
- (3) Element(s)
  - (a) Finish symbol
  - (b) Contour symbol
  - (c) Root opening: depth for plug and slot
  - (d) Size or strength for resistance welds
  - (e) Groove angle
  - (f) Length of weld
  - (g) Pitch
  - (h) Field weld symbol
  - (i) Weld all-around symbol
  - (j) Number of spot or projection weld
  - (k) Specification, process, or other
  - (l) Tail (when specification used)
  - (m) Basic weld symbol
    - (aa) Square
    - (bb) V
    - (cc) Bevel
    - (dd) U
    - (ee) J
    - (ff) Other

EQUIPMENT LIST
for the
METAL TRADES

<u>Sheet metal equipment</u>

Quantity	Description
2 sets	Stakes: one set for bench plate mounting; one set with revolving stand Candlemold Beakhorn Blowhorn Needlecase Creasing Hollow Mandrel Solid mandrel Bottom Double seaming Conductor Bevel edge Common square Teakettle Hatchet Coppersmith Double seaming with four heads
1	Bar folder; including stand; 36"
1	Rotary machine, combination; A, B, C, D rolls; 22-gage capacity; including standard
1	Rotary machine, combination; 7" throat; with rolls A, B, C, D, E, F; 3/4" ogee rolls; elbow edging rolls; including stand; 24-gage capacity
1	Setting down machine; with standard; 1/2" seam, 18-gage capacity
1	Slip roll; 16-gage capacity 3" roll diameter; including stand; 42" length
1	Shears, squaring: foot-operated; 48" capacity
1	Bench brake, universal box and pan; 36-1/4" bench model; 22-gage capacity
1	Cornice brake; 16-gage capacity; 5' length
2	Gas bench furnaces; double burner
1	Bevel shear
1	Unishear: 16-gage capacity

Machine shop equipment

Quantity	Description
1	Lathe, engine; 16" swing, 48" between centers; gear-drive head; quick-change gear box; long-nose, taper spindle; 2-speed, reversing-type motor; coolant pump
	ACCESSORIES, to fit the above lathe
1	Collet attachment; with collets range 1/16 - 1", by 1/16" increments; with collet rack
1	Chuck, 3-jaw universal; 10" diameter
1	Drill chuck; 1/4" - 3/4" capacity
2	Chucks, 4-jaw independent; 10" diameter (1); 14" diameter (1)
2	Face plates; 1 large, 1 small
1	Taper attachment, telescoping
1	Steady rest
1	Follower rest
1 set (3)	Tool holders; left, right, straight
1	Boring bar set
1	Thread dial
1	Micrometer stop
1 set (3)	Parting tools;left, right, straight
1 set	Knurling tools
1	Live center; heavy-duty
1 set (3)	Tool holders, carbide; left, right, straight
1 set	Adaptor sleeve; for headstock
1 set	Lathe dogs; safety-type
1	Taper arbor; for tailstock
1 set	Pipe centers
1 set	Hollow centers
6	Combination center drill and countersink
2	Lathes, engine; 13" swing, 42" between center; gear head, quick-change gear box; long-nose taper spindle; 2-speed, reversing-type motor; coolant pump

Machine shop equipment

Quantity	Description
	ACCESSORIES, to fit the above lathe
1	Collet attachment; with collets range 1/16 - 1", by 1/16" increments; with collet rack
1	Chuck, 3-jaw universal; 10" diameter
1	Drill chuck; 1/4" - 3/4" capacity
2	Chucks, 4-jaw independent; 10" diameter (1); 14" diameter (1)
2	Face plates; 1 large, 1 small
1	Taper attachment, telescoping
1	Steady rest
1	Follower rest
1 set (3)	Tool holders; left, right, straight
1	Boring bar set
1	Thread dial
1	Micrometer stop
1 set (3)	Parting tools; left, right, straight
1 set	Knurling tools
1	Live center; heavy-duty
1 set (3)	Tool holders, carbide; left, right, straight
1 set	Adaptor sleeve; for headstock
1 set	Lathe dogs; safety-type
1	Taper arbor; for tailstock
1 set	Pipe centers
1 set	Hollow centers
6	Combination center drill and countersink
2	Milling machines, vertical; table size minimum 9" x 46" longitudinal travel minimum 32". Machine to have power feed to table (longitudinal only); head to rotate 360° on ram, turret to rotate 360° on column, head to tilt 45° backward on ram; power-feed head with independent motor drive.
	ACCESSORIES, to fit the above mill
1 set	Parallels
1	Vise, swivel base
1	Dividing head and accessories

Machine shop equipment

Quantity	Description
1	Rotary table
8	Cutters, woodruff key seat; high speed steel; two each of the following: 3/8 x 1/8, 5/8 x 3/16, 3/4 x 1/4, 1 x 3/8
6	Cutters, plain milling; high-speed steel; one each of the following sizes: 2-1/2 x 1/4 x 1, 2-1/2 x 3/8 x 1, 2-1/2 x 1/2 x 1; 2-1/2 x 5/8 x 1-1/4, 3 x 3/4 x 1-1/4, 3 x 1 x 1-1/4
4	Cutters, slitters (saws); hollow-ground, high-speed steel; two each of the following sizes: 1-1/4 x 1/16 x 1/2; 3-1/2 x 1/8 x 1/2
1 set (8)	Cutters, involute spur gear; high-speed steel; for 14-1/2° pressure angle; numbers 1 through 8 for a 16 diametral pitch, 2-1/8 diameter, 7/8" arbor
6	Cutters, side milling; high-speed steel; one each of the following sizes: 3 x 1/4 x 1, 3 x 3/8 x 1, 3 x 1/2 x 1, 5 x 5/8 x 1, 4 x 3/4 x 1, 4 x 7/8 x 1
8	End mills, 2-flute, single end; high-speed steel; hollow-ground, fast spiral flutes; right-hand spiral, right-hand cut, two each of the following sizes: 1/4 x 3/8, 3/8 x 3/8, 1/2 x 3/8, 5/8 x 3/8
12	End mills, 4-flute, single end; high-speed steel; hollow-ground, fast spiral flutes; right-hand spiral, right-hand cut, three each of the following sizes: 1/4 x 3/8, 3/8 x 3/8, 1/2 x 3/8, 5/8 x 3/8
4	End mills, 2-flute double end; high-speed steel; hollow-ground, fast spiral flutes; right-hand spiral; right-hand cut; standard length; one each of the following: 1/2 x 1/2, 5/8 x 5/8, 3/4 x 3/4, 1 x 1
6	End mills, 2-flute single end; high-speed steel; hollow-ground; right-hand spiral; right-hand cut; two each of the following: 1/4 x 3/8, 3/8 x 3/8, 1/2 x 1/2
2	End mills, shell; high-speed steel with mandrell; 3/4 - 1-1/2 by 1/8" increments
1	Shaper, horizontal 16" hydraulic, universal table, with swivel vise, with standard tool holders; one set hold-downs, 220 volt, 3-phase motor with magnetic switches. Power feeds, 360° head swivel accessories to include centers, rotary lathe, automatic oiler; extended tool holder; angle plate and all necessary wrenches, keys, bolts, and nuts

Machine shop equipment

Quantity	Description
2	Surface grinders, hydraulic, 8" x 24" minimum work capacity, 220 volt, 3-phase motor with automatic lubrication system. Hardened longitudinal ways, dust collector, permanent magnet chuck, wet-grind attachment with pulp and splash guards, hydraulic crossfeed, mounted diamond wheel dresser and all necessary wrenches, keys, and bolts
1	Reciprocating power saw; 6-3/4" x 6-3/4" with automatic lift, 1/2 hp motor, 115 volt, 60 cycle; with wetcutting attachment
1	Cut-off band saw
1	Tool grinder; 17" between tail stocks; 3-5/8 x 22-1/2 table working surface; 4-3/4" crossfeed; 10" table travel; with all attachments for cutter grinding; 1 hp, 220 volt, 3-phase motor
1	Drill press, floor model: 20"; min. 4" dia. colum; tapping attachment; with reducing sleeves for spindle; 3-phase preferred, single-phase acceptable; 1 hp motor, step pulley
1	Press, hydraulic, arbor; heavy-duty, structural steel frame, 50-ton capacity; hand operated; handwheel and screw for quick adjustment; automatic ram return; adjustable table
1	Power saw 20", 220 volt, 3-phase motor; with table tilt, welder, grinder, variable speed drive, and blade shear, disc cutting attachment, etching pencil, work light, illuminated magnetic attachment, mist coolant, band polishing attachment, long file, guide mitering attachment assembly, power feed, metal supply cabinet, kip fence; angle guide blocks

Oxyacetylene welding and cutting equipment

Quantity	Description
2	Combination outfits for welding, cutting, brazing, heating, and soldering
	Or, the contents may be purchased separately to include:
2	Welding torches
2	Gooseneck extensions
6	Welding tips: 2 each of sizes 62, 55, 42
2	Gas mixers
2	Cutting attachments, with 90° head
2	Cutting tips: Size 53
2	Acetylene regulators, two-gage type

Oxyacetylene welding and cutting equipment

Quantity	Description
2	Oxygen regulators, two-gage type
50 ft	Welding and cutting hose, dual-type with two hoses permanently bonded together, 1/4" diameter, with appropriate female connections on all ends
2 pairs	Welding goggles; with #5 lens, monogoggle-type
2	Spark lighters, with round file lighter
2	Torch wrenches
	Additional pieces not in the outfit:
2	Welding tips, tip size 50
2	Welding tips: size 58
1	Cutting outfit, hand operated, heavy-duty, for cutting only
	Or, the contents may be purchased separately to include:
1	Cutting torch; brass head set at 90°
3	Cutting tips, acetylene, sizes 62, 53, and 46
1	Regulator, acetylene, two-gage type with gages
1	Regulator, oxygen, two-gage type with gages
25 ft	Cutting hose; dual-type with two hoses permanently bonded together; 1/4" diameter with appropriate female connections on all ends
	Additional pieces not in the outfit:
2	Cutting tips for rivets; size 53
2	Gouging tips, with tip orifice 1/8"
1 pair	Goggles, welding; with #5 lens
1	Spark lighter with round file lighter
1	Wrench, torch
1	Circle cutting attachment
1	Portable flame-cutting machine, with torch, torch-holder, cutting tip for acetylene, torch wrench, machine-to-torch hose assembly (with connections and hose connection block having double action cutoff), machine track, 115-volt motor with three-wire cord

Manual metal arc welding equipment

1	Welding machine, arc (manual metal); a-c transformer type, 250-amp output, 230-volt, 60-cycle input, with pigtail and 2 cable lugs
	Accessories for the above welder:
25 ft	Cable; 12-1/2 ft. lead, 12-1/2 ft. ground for each machine, #2/0 gage
1	Electrode holder, with replaceable tip insulators
1	Ground clamp
1	Welding machine, arc (manual metal); a-c transformer type; 300-amp output; 230-volt, 60-cycle input; with pigtail and 2 cable lugs
	Accessories for the above welder:
25 ft	Cable; 12-1/2 ft. lead, 12-1/2 ft. ground for each machine #2/0 gage
1	Electrode holder, with replaceable tip insulators
1	Ground clamp
1	Welding machine, motor-generator type; 300-amp output, 230-volt, 60-cycle input; with pigtail and 2 cable lugs
	Accessories for the above welder:
25 ft	Cable; 12-1/2 ft. lead, 12-1/2 ft. ground for each machine, #2/0 gage
1	Electrode holder, with replaceable tip insulators
1	Ground clamp

Tungsten inert gas welding equipment

1	Welding machine, arc (manual metal); a-c/d-c transformer-type with rectifier for straight and reverse polarity
1	Torch, TIG; water-cooled, 350-amp capacity; with short and long back cap, end with ceramic tip
2	12-1/2 ft. Torch lead (connecting cable)
2	10 ft. Ground cable; #1 gage
1	Remote control switch, either hand or foot operated
1	Ground clamp
1	Water coolant system, 10-gallon capacity, with 115-volt, [illegible] 60-cycle pump motor
25 ft	Coolant hose
1	Argon regulator

Tungsten inert gas welding equipment

1	Argon flowmeter
12 ft	Connecting hose, single; for Argon; work-rated capacity and necessary fittings

Drafting equipment

5*	Drawing tables; 23" x 31" top
5*	Stools; 24" high
1	Chalkboard, green; reversible board on stand; 4' x 6'
1	Compass, chalkboard; 16"
1	Protractor, chalkboard; 15-1/2"
1	T-square, chalkboard; 6' long
5*	Scales, architect's (Plastic); 12"
5*	Triangles, 30°, 60°; 10"
5*	Triangles, 45°, 45°; 10"
5*	Irregular curves; 10"
1	Draftsman pencil sharpener
5*	T squares, wood or metal or plastic

* This quantity is dependent on the number of beginning students in the class.

Equipment and tools for the shop and for trainee protection

1	Grinder, heavy-duty, on pedestal; push-button switch; sealed ball-bearings; enclosed, adjustable wheel guards; adjustable safety-shields; tool tray and lift-out water pot, mounted on base; 220 volt, three-phase motor, fully enclosed, 1-hp, 1800 rpm, with two grinding wheels, 6" in diameter
1	Grinder, heavy-duty, bench mounted; push-button switch; sealed ball-bearings; enclosed, adjustable wheel guards; adjustable safety shields; lift-out water pot; 220 volt, three-phase motor, fully enclosed; 3/4 hp, 1800 rpm, with two grinding wheels, 6" in diameter
1	Hand grinder, for 4" grinding wheel
1	Disc sander
1	Air compressor, horizontal; 2-stage, 10 hp, 220 volt, 60 cycle, 3-phase motor, delivery 42 cu. ft. per minute, horizontal tank, 4 cylinder 120 gallon capacity, with enclosed belt guard
1	Furnace, for reprocessing aluminum

Quantity	Description
2	Grinders, portable, with 36" flexible shaft and 1/4" chuck
2	Cylinder trucks, with tool box and 10" rubber wheels (min) (purchase only if manifold system is not used)
10	Welding benches; 5 for oxyacetylene which must have firebrick top; 5 for electric welding, firebrick top optional; 24" x 24" top
5	Welding booths; for electric welding; with overhead clamp in each
1	Welding booth; for electric welding under handicap
1	Drying box for welding rod
5	Welding helmets, vulcanized fiber construction with fixed glass holder, complete with ratchet adjustment headband, cover lens, and #10 welding lens
4	Hand shields, vulcanized fiber construction with aluminum handle and fixed glass holder cover lens, and #10 welding lens
4 prs.	Welding goggles, nonogoggle-type, with #54 clear cover lens, and #74 shade 5 welding lens
4 prs.	Safety glasses, with folding temples and hardened lens of medium shade
2	Faceshield visors, with light green tint, .040 thick visor
4 prs.	Welding gloves, regular
2 prs.	Welding gloves, inert arc
4	Welder's coats, leather, with collar, snap fasteners down front and on sleeves, sized to fit student
3 sets	Tip cleaners in a case, standard range of drill size, 51-74
1 set	Tip drills
6 doz.	Chipping hammers, combination cone and chisel point

Hand Tools

15	Awls, scratch 6-1/2" long
8	Dividers, wing 8"
6	Dividers, wing 10"
6	Dividers, wing 12"
4	Square, steel framing: body 24" x 2", tongue 16" x 1-1/2"; 1/16" graduations
6	Squares, steel, with numbers on throat, 1/16" graduations 12"
6	Squares, combination 12"
4	Squares, combination 6"
1	Rule, zigzag, wood 6'

Quantity	Description
1	Rule, zigzag, metal 6'
6	Rules, circumference 36"
2 sets	Trammel points; 1 point adjustable in each set; 1 bar per set
6	Punches, center, hex 6"
6	Punches, automatic 4"
12	Punches, prick 6"
2 sets	Drive pin punches, 4" long, 1/16", 3/32", 1/8", 5/32", 3/16", 7/32". 1/4", 5/16", to include box
2 each	Cold chisels, cutting edge 1/4", 3/8", 1/2", 5/8", 3/4"; hex body
2 each	Chisels, round-nose, 1/4", and 1/2" cutting edge
2 each	Chisels, cape 1/4", 1/2", 3/8" cutting edge
1	Chisel, diamond point, 1/2" cutting edge
2 sets	Hand groovers 00, 0, 1, 2, 3, 4, 5, 6, 7, 8
6	Hammers, tinners riveting 12 oz.
4	Hammers, tinners riveting 8 oz.
1	Hammer, machinist's ball peen 8 oz.
1	Hammer, machinist's ball peen 12 oz.
1	Hammer, machinist's ball peen 16 oz.
1	Hammer, machinist's ball peen 24 oz.
3	Hammers, machinist's riveting 12 oz.
2	Hammers, brass faces or solid brass head, 16 oz.
2	Hammers, raising 16 oz.
4	Mallets, rubber 16 oz.
4	Mallets, wooden tinner's 3" x 6"
4	Mallets, rawhide 2" x 3-1/2"
4	Mallets, plastic 8 oz.
4	Snips, aviation left-cut
4	Snips, aviation right-cut
4	Snips, aviation straight-cut
1	Snip, aviation double-cut
6	Snips, straight 6-1/2"
6	Pliers, combination 8"
6	Pliers, straight-nose
4	Pliers, side cutting 7"
2	Pliers, needlenose; medium length nose 6"

Quantity	Description
6	Pliers, vise grip 10"
2	Coppers, soldering 1 lb.
2	Coppers, soldering 2 lbs.
2	Coppers, soldering 3 lbs.
1	Torch kit, propane, B-tank with hose and hand torch
6	Hacksaw frames, pistol grip handle, 10" - 12" adjustable
1 kit	Hole saws, 7/8", 1-1/8", 1-1/2", 1-3/4", 2", 2-1/2"
4	Files, mill, bastard 10"
4	Files, mill, smooth 10"
4	Files, flat, bastard 10"
4	Files, hand, smooth 10"
4	Files, square, bastard 8"
4	Files, three-corner, bastard 8"
4	Files, half-round, bastard 10"
4	Files, half-round, smooth 10"
4	Files, round, bastard 10"
4	Files, round, smooth 10"
6	File card and brush 1-1/2" x 5" x 9-1/2"
4	Files, knife, smooth 10"
4	Files, square, bastard 10"
36	File handles
1	Gage, size from 0 to 36 US Standard
1	Wire gage, 0 to 36 American Standard
1	Thickness gage, .002 to .025, 22 leaves
1	Rule, hook; 6"
1	Rule, hook; 12"
1	Rule, flexible steel 8'
4	Calipers,outside 8"
4	Calipers, inside 8"
2	Calipers, hermaphrodite, 6"
1	Grinding wheel dressers, spur type
2	Oil stones 6" x 2" x 1"
2	Oil cans, pump type, 1/2 capacity
1	Grease gun, lever type
2	Screw pitch gages, (1) ACME; (1) square

Quantity	Description
12	C clamps 2" opening
12	C clamps 6" opening
12	C clamps 8" opening
12	Bench clamps (spring-loaded type for sheet metal work)
4	Screwdrivers, flat blade 4" shank
4	Screwdrivers, flat blade 6" shank
2	Screwdrivers, flat blade 8" shank
1	Screwdriver, flat blade 12" shank
2	Screwdrivers, Phillips head #1 6-3/4"
2	Screwdrivers, Phillips head #2 6-3/4"
1	Screwdriver, Phillips head #3 8"
1	Screwdriver, Phillips head #4 9"
2	Screwdrivers, offset, 1/4" stock 4"
2	Screwdrivers, offset, 5/16" stock 5"
2 each	Wrenches, pipe, straight 8", 12", 18"
1	Wrench, pipe, stillson 12"
1	Wrench, adjustable 6"
1	Wrench, adjustable 8"
1	Wrench, adjustable 10"
1	Wrench, adjustable 12"
2 sets	Wrenches, Allen: #4 to 1/2" inclusive in pouch

Precision measuring tools

4	Micrometers, outside: 0-1" range
2	Micrometers, outside: 1-2" range
1	Micrometer, outside: 2-3" range
1	Micrometer, outside; 3-4" range
1	Micrometer, outside: 4-5" range
1	Micrometer, outside: 5-6" range
1 set	Inside micrometers: 2-8" range
1 set	Telescoping gages: six piece; with 5/16"-6" range
1	Micrometer depth gage: 0-3" range
1 set	Clamps, toolmakers: parallel, 3/4- 3-1/2" range

Quantity	Description
1 set	V blocks (2) and clamp (1); case hardened steel; 1-1/4" max. stock diameter; for general use
1 set	V blocks (2) and clamp (1): hardened and ground; 1" max. stock diameter; for precision layout and machining
1	Vernier caliper; 12", decimal
1	Height gage, vernier; 24", decimal
1 set	Gage blocks; grade B; 81 pieces
1 set	Dial indicator; .001-.125 range; continuous dial type with a wobbler, jeweled bearings; with magnetic base, post, sleeve, and indicator attachment; in a box
3	Dial indicators, 1" travel
1	Dial indicator, .030" travel
1	Surface plate; 18" x 24"; class B; for checking tools
1	Surface plate; 36" x 48"; class B; for layout
1	Universal surface gage with base hardened; ground and polished; 9" x 12" spindles
1	Surface gage, 12" and 18" spindles
1 set	Small-hole gages
1	Level, machinists precision; 15" overall length; 0.0005" or 10-second graduations
1	Square, steel; precision, certified; 8"

Consumable supplies

2	Brazing flux, 1-lb. cans for copper, brass, and bronze
2	Brazing flux, 1-lb. cans for cast iron
2	Stainless steel welding flux, 1-lb jars
2	Aluminum welding flux, 1-lb. jars
	Muratic acid, industrial grade
	Acid swab
1 doz.	Soldering paste, 2-oz cans
1 doz.	Bars of solder, 1-lb., 50/50
50 lbs.	Brazing rod, 1/8" - 36": AWS A5.7T, Class RCuZn-B
25 lbs.	Aluminum rod, 3/32-36"
	Welding rod, oxyacetylene, mild steel, copper coated, 1/16-36": AWS-ASTM A251-46T, Grade GA-50
	Welding rod, oxyacetylene, mild steel, copper coated, 3/32-36": AWS-ASTM A251-46T, Grade GA-50

Quantity	Description
	Welding rod, oxyacetylene, mild steel, copper coated, 1/8-36" AWS-ASTM A251-46T, Grade GA-50
	Welding rod, oxyacetylene, medium carbon, high strength, 3/32-36": AWS-ASTM A251-46T, Grade GA-60
	Electrode, tungsten, 2% thorium 3/32-6"
	Electrode, tungsten, 2% thorium: 1/16-6"
	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS-E6010 or 6011
	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS-E7016 or 7018
	Welding electrodes, arc (manual metal); mild steel, coated: 5/32-AWS-E7016 or 7018
	Welding electrodes, arc (manual metal) mild steel, coated: 1/8-AWS-E6013
	Welding electrodes, arc (manual metal); mild steel, coated: 1/8-AWS met 6024
2 doz.	Flints, renewal
2 bxs.	Headbands for welding goggle replacement, 4 per box
2 doz.	Cover lens, replacement; for oxyacetylene-type goggles
1 doz.	Welding lens, replacement, shade 5
	Cylinder (s) of acetylene
	Cylinder (s) of argon
	Cylinder (s) of carbon dioxide; argon 75-57 premix
	Cylinder (s) of oxygen
100	Cover plates for welding helmet, clear glass 2 x 4-1/2"
1 doz.	Filter plates, for welding helmet, 2 x 4-1/2", shade 10
3 ea.	Filter plates, for welding helmet, 2 x 4-1/2", shade 8 and shade 12
	30 gage, galvanized, 3 x 8 sheets
	26 gage, galvanized, 3 x 8 sheets
	22 gage, galvanized, 3 x 8 sheets
	18 gage, galvanized, 3 x 8 sheets
	16 gage, sheets of black iron, 3 x 8 sheets
	16 oz. copper sheets
	26 gage, stainless, type 304, #4 finish, 3 x 8 sheets

Quantity	Description
	20 gage, aluminum #.032, half hard, 3 x 8 sheets
	Bar stock: cold rolled, drawn steel; aluminum; brass
	Flats: 1/2 x 2"
	Square: 1" x 1"
	2" x 2"
	3" x 3"
	4" x 4"
	Rounds: 1/4"; 1/2"; 3/4"; 1"; 2"; 3"; 4"; 5"
	Steel plate: 1/4"; 1/2"; 3/4"
	Rivets, 1-5 lbs., galvanized
	Rivets, 1-5 lbs., copper
	Rivets, 1-5 lbs., aluminum
	Rivets, pop
	Screws, #4 x 1/2"
	Screws, #6 x 1/2"
	Screws, #8 x 1/2"
	Screws, #10 x 3/4"
	Screws, #12 x 3/4"
	Screws, #14 x 3/4"
	Bolts, 3/16" x 1/2"
	Bolts, 1/4" x 1/2"
	Bolts, 3/16" x 1/2"
	Bolts, 1/4" x 3/4"
	Angle iron, 1" x 1" x 1/8" x 20-ft. lengths
	Angle iron, 1-1/2" x 1-1/2" x 1/8", 20-ft. lengths
	Band iron, 1/8" x 1", 20-ft. lengths
	Band iron, 3/16" x 1"
	Band iron, 1/4" x 2"
	Sanding disc, 80 grit, 7" diameter
	Drawing paper: 11 x 17"
	Drawing pencils: F, 2H, 4H
	Stainless steel flux
	Cover plates for welding shields

VT003 493

VT 003 493
A Basic Plan for the Organization and Management of Instruction in Vocational Sheet Metal.

Mississippi State Univ., State College. Curriculum Lab.
Mississippi State Dept. of Vocat. Educ., State College
Pub Date - Mar67
MF AVAILABLE IN VT-ERIC SET 36p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *SHEET METAL WORKERS, *SHEET METAL WORK, HIGH SCHOOLS, POST SECONDARY EDUCATION, EQUIPMENT,

This curriculum guide was prepared to assist the trade instructor in planning and developing instructional materials for a sheet metal course for training high school students for employment at a beginner's level. The material was developed by a group of instructors and tradesmen by systematically grouping the major segments of a trade analysis into instructional blocks and then into basic manipulative tasks and informational topics. The instructional blocks are (1) Measurement, (2) Layout, (3) Hand Processes, (4) Machine Processes, and (5) Welding. Each block contains an outline of operations and jobs for group, subgroup, or individual performance. Related instruction outlines are presented. The course is designed for a 2-year program with 1,080 hours of training. Instructional procedures are recommended for the trade competent teacher. Students should have a vocational committment to the sheet metal trade, a general mechanical aptitude, a course in general mathematics, and a course in mechanical drawing. Necessary equipment is listed and a bibliography contains recommended texts and suggested references. This document is available for $1.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

MEMORANDUM

TO: The ERIC Clearinghouse on Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio 43212

FROM: (Person) Robert D. Sartin (Agency) Curriculum Laboratory

(Address) P. O. Drawer NU, State College, Mississippi 39762

DATE: September 11, 1967

RE: (Author, Title, Publisher, Date) Mississippi Curriculum Laboratory

A BASIC PLAN IN VOCATIONAL SHEET METAL
State College, Miss: Curriculum Laboratory of the State Department of
Vocational and Techical Education, Mississippi State University, March, 1967

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency P
Address P
*Limitation on Available Copies N/A Price/Unit $1.00
(quantity prices) N/A
*10 copies or less available immediately; large order printed by special request

(2) Means Used to Develop Material:
Development Group P
Level of Group P
Method of Design, Testing, and Trial - this is a preliminary draft which has been distributed to sheet metal instructors; at a later date it will be evaluated by an industrial committee; the published form will contain the revisions recommended by these two groups

(3) Utilization of Material:
Appropriate School Setting Vocational (trade) training
Type of Program Preparatory
Occupational Focus P
Geographic Adaptability - Normally found in the secondary schools but believed to
Uses of Material be applicable at the post-secondary level; for use by
Users of Material instructors in planning daily teaching activities

(4) Requirements for Using Material:
Teacher Competency - trade competent, with teaching skills
Student Selection Criteria - those who want, need, and are able to profit from the training; recommend screening by testing, by examination of school records, and by personal interview
Time Allotment P

ACKNOWLEDGMENTS

This publication was developed by a group of instructors and tradesmen attending a workshop held on the campus of Mississippi State University on March 3 and 4, 1967. The group, called a Curriculum Committee, took the traditional approach and developed an analysis for the trade. The trade was systematically broken into its major segments, called blocks, and then into the basic manipulative tasks, called operations. Next, typical on-the-job activities, which contained the operations, were listed to involve the trainee in useful and productive work. Also, the committee identified those informational topics which, when understood by the tradesman, would contribute to the intelligent use of his skills. Finally, the equipment, tools, and supplies necessary for training were listed.

The members of the Curriculum Committee are to be commended for their efforts and their cooperative attitude in the development of this basic plan. The Committee was composed of:

J. L. Brown, Owner, Brown's Sheet metal Works, Greenville
Donald Carter, Instructor, Sheet Metal, Pascagoula High School, Pascagoula
Carl Hedglin, Owner, Carl's Sheet Metal Shop, Jackson
W. J. Stuart, Instructor, Sheet Metal, Parchman Vocational School, Parchman

This publication will serve as the starting point for the development of instructional materials to be used by the trade instructor.

HOW TO USE THIS PUBLICATION

As a tool for teaching, this publication is primarily designed for use in planning, preparing, presenting, and evaluating instruction. As a tool, it lists operations, jobs, and informational topics—with the job as the focal point. Each job should be assigned to students, either as a group, a subgroup, or individually. The following procedure is recommended as an effective teaching sequence.

Step I. -- Tell how the job is done.
Give a full explanation of the steps necessary to perform the job. Emphasize the proper sequence; stress techniques requiring special care; point out the hazards to persons and the equipment.

Step II. -- Show how the job is done.
Demonstrate the proper procedure for performing the job. Re-emphasize the sequence, techniques, and hazards. Make sure each student can see what is being done and understands the steps.

Step III. -- Have the student do the job.
Assign each student the task of applying what he has just learned. Supervise his work; correct any variation from proper procedure or any hazardous techniques. Re-explain when necessary.

Step IV. -- Check the student for proficiency.
Assign a similar job to the student to be performed independently. Observe his work and examine the completed product or service. He is proficient when he can perform the job without supervision in a prescribed length of time.

Students who have demonstrated proficiency in one job move to the next job. The teaching steps *tell, show, do, check* are used again. Students who are not proficient perform additional jobs of a similar nature and are retaught in weak areas.

Additionally, this publication can be used (1) by the director and the instructor in a local program in communicating with their craft committee, (2) by the local director in supervising instruction and program operation, and (3) by the state supervisory staff in communicating with local school administrators and in supervising the operation of local programs.

TABLE OF CONTENTS

SHEET METAL WORKER

A sheet metal worker lays out, fabricates, assembles, and repairs sheet metal products and equipment, such as control boxes, drain pipes, ventilators, and ducts.

Working from a job order or blueprint, the sheet metal worker selects sheet metal of the proper gage and type according to the product being fabricated. He lays out a pattern or works directly on the metal by locating and marking dimension and reference lines. He uses measuring instruments, such as rules, scales, calipers, and micrometers. He sets up and operates fabricating machines, such as shears, brakes, bending rolls, punch presses, and drill presses to cut, bend, and straighten to specified shapes. The worker also uses hand tools such as hammers, snips, and clamps to shape metal over anvils, blocks, and forms. He sets up and operates soldering and welding equipment to join sheet metal parts. Upon completion, he inspects assemblies and installations for conformance to specifications.

Sheet metal workers are employed by plants fabricating and installing heating, air-conditioning and refrigeration equipment, and by contractors engaged in residential, industrial, and commercial work. Others may be self-employed, and their work consists mainly of repair work or smaller types of installations. Some craftsmen are employed in small shops manufacturing specialty products, and others in plants, such as aircraft and shipbuilding companies.

A further description can be found in the <u>Dictionary of Occupational Titles</u>, third edition, under SHEET METAL WORKER (any ind.) 804,281.

COURSE DESCRIPTION

GENERAL OBJECTIVES

To develop knowledges and skills that make the trainee a sheet metal worker employable on a beginner's level.

ASSUMPTIONS

1. That those enrolling in training have had no previous experience in sheet metal work.
2. That trainees have a nontechnical background in general science.
3. That they need additional instruction in the fundamentals of mathematics.

DESIRABLE PREREQUISITES

1. That trainees have a vocational committment to the sheet metal trade.
2. That trainees have a general mechanical aptitude.
3. That they have had a course in general mathematics or shop mathematics but need additional instruction in arithmetic, simple algebra, and plane geometry.
4. That they have had or are presently taking mechanical drawing.

NATURE OF TRAINING

1. The duration of training is normally three hours per day, five days per week, thirty-six weeks per year for two years; or, six hours per day, five days per week, thirty-six weeks per year for one year -- a total of 1080 clock hours of training.
2. Related instruction by lecture, demonstration, the use of audiovisuals, etc. immediately precedes application by the trainee in shop practice; instruction and its application are correlated as closely as possible at all times; and the major allotment of time is given to the development of manipulative skills.
3. No instruction directly related to the trade is offered outside the shop.

CONTENT OF THE RELATED INSTRUCTION

Systematic and purposeful presentation of the following:

1. Detailed coverage of the following sheet metal processes: measurement, layout, hand processes, and machine processes.
2. Broad coverage of soldering, riveting, welding, brazing, bending, and forming of sheet metal.
3. A strong emphasis on safety practices and processes, and on work hazards.
4. An explanation of fundamental information about metals, such as gages, types of metals, basic use of each metal in the sheet metal trade, oxidation of metals, and protective coatings.
5. The reading of blueprints for the metal trades with emphasis on the use of blueprints, elevation views, scales and dimensions, structural details, shop drawings, blueprint specifications, symbols for the sheet metal trade and for electricians, plumbers, etc.
6. Information in drawing, such as care and use of drawing equipment, geometric construction, orthographic projection, parallel and radial line development, triangulation, and layout procedures.
7. The use, adjustment, and care of the equipment, tools, and supplies for sheet metal trade.
8. The definitions and spellings of trade terms.
9. The purpose and use of soldering, welding, and brazing fluxes as they pertain to the metals used in the sheet metal trade.
10. Instruction in mathematics, such as arithmetic, simple algebra, and plane geometry as they are applicable to the sheet metal trade.

TYPES AND LEVELS OF SKILLS TO BE DEVELOPED

1. Immediately marketable skills in the layout and fabrication of sheet metal.
2. Basic manipulative skills in brazing, welding, cutting with torch, and working with heavier metals.

INSTRUCTIONAL BLOCKS

		Contact Hours
I.	Measurement	30
II.	Layout	525
III.	Hand Processes	280
IV.	Machine Processes	170
V.	Welding	75
	Total Hours	1080

ANALYSIS OF OPERATIONS

I. MEASUREMENT

- A. Measure with a steel rule
- B. Measure with a steel square
- C. Measure with a circumference rule
- D. Measure with semicircular protractors
- E. Measure with a swing-blade protractor
- F. Measure angles with the protractor head and the blade of combination set
- G. Measure with a micrometer caliper
- H. Measure ferrous metal with sheet metal gages
- I. Measure nonferrous metals with sheet metal gages
- J. Transfer measurements with dividers

II. LAYOUT

- A. Layout operations performed with a compass, dividers, rule, straight edge, and pencil or scribe
    1. Bisect a line
    2. Erect a perpendicular from a point on a line
    3. Erect a perpendicular from a point off a line
    4. Bisect an arc
    5. Bisect an angle
    6. Transfer an angle
    7. Construct a line parallel to a given line and passing through a given point
    8. Construct a line parallel to a given line and at a given distance
    9. Divide a line into a given number of equal parts
    10. Divide a line into proportional parts
    11. Divide a surface into any number of equal parts
    12. Construct a triangle with all sides given
    13. Construct a triangle with the hypotenuse and one side given
    14. Construct an equilateral triangle
    15. Construct a square
    16. Construct a regular pentagon
    17. Construct a regular hexagon
    18. Construct an octagon
    19. Find the center of a circle with a right triangle
    20. Construct a circle tangent to a line at a given point

21. Construct a tangent to a circle through a point on the circle
22. Construct a tangent to a circle through a point off the circle
23. Construct a line tangent to two circles
24. Construct a circle through three points
25. Divide a circle into any number of equal parts
26. Construct an arc tangent to two intersecting lines
27. Construct an arc tangent to both an arc and a straight line
28. Construct an ogee curve

III. HAND PROCESSES

A. Operations using markout tools

1. Scribe a line with a scratch awl and a straight edge
2. Mark a location with a prick punch and a tinner's hammer
3. Mark centers with a center punch and a tinner's hammer
4. Mark centers with an automatic center punch
5. Scribe arcs with dividers
6. Scribe arcs with trammel points
7. Scribe parallel lines with a tinner's file
8. Scribe parallel lines with a marking gage
9. Scribe parallel lines with a combination square
10. Scribe irregular arcs with french curves
11. Sharpen a scratch awl, center punch, or prick punch

B. Cutout

1. Cut wire with pliers or side cutters
2. Cut along a straight line on sheet metal with straight snips
3. Cut along a straight line with combination snips

. Cut along a straight line with compound-lever shears

5. Cut an outside curve with aviation snips
6. Cut light sheet metal in a vise with flat chisel
7. Cut a starting slit with a chisel
8. Cut flat stock with a chisel
9. Cut sheet metal with an electric nibbler
10. Punch holes with a solid punch and a hammer
11. Punch holes with a hollow punch and a hammer
12. Punch holes with a hand punch

13. Drill holes in flat stock with a hand drill
14. Cut flat stock with a hacksaw
15. Cut round stock with a hacksaw
16. Cut angle iron with a hacksaw
17. Cut rivets with a chisel
18. Drive out rivets with a punch

C. Forming

1. Set down an edge or flatten seams with a tinner's hammer
2. Form material with a wood, rubber composition, or rawhide mallet
3. Form a square piece on the breakdown or needlecase stake with a mallet
4. Form a round piece on the conductor stake with a mallet
5. Form a round piece on the needlecase stake with a mallet
6. Form a conical piece on the blowhorn with a mallet
7. Form a conical piece on the candlemold stake with a mallet
8. Brake a piece of sheet metal at 90° angle, with a piece of angle iron, C clamp and mallet
9. Brake pieces to form boxes with hand tongs or handy seamer
10. Brake heavy metals in a vise with ball peen hammer
11. Form a single hem with hand tongs or handy seamer
12. Form a double hem with hand tongs or handy seamer
13. Prepare an edge for grooved seams with hand tongs or handy seamer
14. Form a radius bend with a stake
15. Finish an outside grooved seam, using a hollow or solid mandrel stake
16. Form a plain dovetailed seam, using straight-cutting aviation snips
17. Flange an edge on a stake with a tinner's hammer
18. Shrink an edge on a stake with a tinner's hammer
19. Flange an edge with a hand dolly and a tinner's hammer
20. Fit a tee, using hand snips
21. Wire straight edges before a piece is formed
22. Wire an inside or outside radius on a flat piece
23. Wire a square or rectangular piece after it is formed
24. Wire a tapered piece after it is formed
25. Double seam corners on a square or rectangular piece with handy seamer and stakes

D. Fastening

1. Assemble or disassemble with a flat-blade screwdriver
2. Assemble or disassemble with a flat-blade Phillips screwdriver
3. Use a Phillips screwdriver
4. Drive, set, and flange rivets with a riveting hammer and a rivet set
5. Rivet a seam, using rivet set and riveting hammer
6. Hold a pattern in place by applying C clamps
7. Hold a pattern in place by applying parallel clamps
8. Solder a lap seam with soldering copper
9. Forge a soldering copper
10. Solder a groove seam with a soldering copper
11. Solder a seam with soft solder and an oxyacetylene torch
12. Solder a seam with soft solder and a propane torch

E. Finishing

1. Finish file a rough edge
2. Finish an inside grooved seam
3. Finish corners and edges with a file

IV. MACHINE PROCESSES

A. Bar Folders

1. Fold a single hem
2. Fold a double hem
3. Form the folds for a grooved seam
4. Form the fold for an edge to be wired
5. Form a 45°, 90°, or a special angle
6. Form a double right angle brake

B. Hand brake

1. Sharp brake thin sheet metal
2. Form a mold
3. Form the pocket for a Pittsburgh lock
4. Form a lock seam

C. Slip rolls

1. Roll cylindrical shapes

2. Form tin plates
3. Roll tapered shapes
4. Roll a cylindrical piece with wired edges

D. Squaring shears

1. Cut marked sheet metal
2. Cut a sheet against the front gage
3. Cut a sheet against the back gag

E. Combination rotary machine for turning, burring, wiring, elbow edging, flanging, and flattening operations

1. Beading

a. Form a single bead
b. Form an ogee bead
c. Form a triple bead

2. Crimping

a. Crimp round pipe
b. Crimp and bead cylindrical-shaped objects

3. Turning

a. Form an edge for wiring
b. Score or crease an edge, using a gage
c. Turn edges for elbows

4. Burring

a. Burr a disc
b. Burr an edge on a cylinder

5. Elbow: form an elbow

F. Ring and circle shears

1. Cut a circle
2. Cut a ring
3. Cut a sheet of metal

G. Drill press

1. Drill flat plates
2. Drill round stock

H. Bench or floor grinders

1. Grind flat stock
2. Grind round stock
3. Grind points and edges on tools

I. Disc sanders and buffers

1. Grind welds
2. Buff aluminum
3. Buff stainless steel

J. Box and pan brake

1. Form rectangular pans
2. Form a radius bend

K. Pittsburgh machine

1. Form a Pittsburgh lock
2. Form an Acme lock

L. Spot welder

1. Spot-weld galvanized iron
2. Spot-weld black iron
3. Spot-weld aluminum

M. Unishears

1. Cut along a straight line on metal
2. Cut inside and outside curves

N. Band saw

1. Cut straight lines in flat sheet metal
2. Cut arcs and circles in flat sheet metal
3. Cut angle iron

O. Throatless shears

1. Cut along a straight line
2. Cut along an arc
3. Cut along a zigzag line

P. Setting down machine: set down flanged and burred seams

V. WELDING, CUTTING, AND BRAZING

A. Manual metal arc: 14- and 16-gage material

1. Set up and adjust manual metal-arc equipment
2. Strike and maintain an arc
3. Run a stringer bead
4. Weld a single-pass fillet joint
5. Weld a single-pass butt join with a 1/16" gap

B. Oxyacetylene welding: 14- and 16-gage metal (black iron)

1. Set up oxyacetylene welding equipment
2. Light the torch and adjust it for a carburizing, a neutral, and an oxidizing flame
3. Run a fusion bead
4. Tack-weld two pieces of plate
5. Weld a butt joint with a 1/16" gap
6. Weld in outside corner joint
7. Weld a lap joint
8. Weld a tee joint
9. Weld flange joints with a filler rod
10. Weld flange joints without a filler rod

C. Brazing

1. Braze a lap joint on sheet steel
2. Braze a tee joint

D. Oxyacetylene cutting: light and heavy metals

1. Attach a cutting torch; light and adjust a cutting flame
2. Cut along straight lines
3. Cut arcs and circles

SUGGESTED JOBS IN LAYOUT AND FABRICATION

A. Elementary layout

1. Lay out patterns and construct simple rectangular boxes and pans
2. Lay out patterns and construct rectangular flaring pans
3. Lay out patterns and construct multipiece boxes and pans
4. Lay out patterns and construct circular pipe
5. Lay out patterns and construct circular pans and pails
6. Lay out patterns and construct rectangular duct cleats and seams
7. Lay out patterns and construct rectangular duct ells and angles with square throat and heel
8. Lay out patterns and construct 90° Y and branch in rectangular duct
9. Lay out patterns for rectangular duct change elbows
10. Lay out patterns for rectangular duct change angles

B. Parallel line layout

1. Lay out stretchout patterns and construct parallel line profiles
2. Lay out patterns and construct two-piece 90° elbows and angles of round pipe
3. Lay out patterns and construct two-piece elbows of any profile
4. Lay out patterns and construct 90° T's of equal-diameter round pipe
5. Lay out patterns for angle T's of unequal diameter pipe
6. Lay out patterns and construct multipiece elbows
7. Lay out patterns and construct round pipe offsets
8. Lay out patterns, using 90° round elbow patterns for elbows with angles of less than ninety degrees
9. Lay out patterns, using multipiece elbows to construct round pipe offsets
10. Lay out patterns and construct an oblong 90° angle
11. Lay out patterns and construct square face miters
12. Lay out patterns and construct ogee return miters
13. Lay out patterns and construct butt miters
14. Lay out patterns and construct return miters other than right angles
15. Lay out patterns and construct butt miters against oblique surfaces in the plan
16. Lay out patterns and construct eaves-trough miters
17. Lay out patterns and construct oblique face miters
18. Lay out patterns and construct range hood
19. Lay out patterns, using the three-point methods, 90° transition elbows

20. Lay out patterns, using three-line method, of 90° transition elbows
21. Lay out patterns and construct 90° transition elbows with vanes
22. Lay out patterns and construct molded conductor heads
23. Lay out patterns and construct octagonal roof finals

C. Radial line development

1. Lay out patterns and construct cones and frustrums
2. Lay out patterns and construct funnels
3. Lay out patterns and construct round ventilator heads
4. Lay out patterns and construct square pyramids
5. Lay out patterns and construct irregular frustrums
6. Lay out patterns and construct irregular frustrums of hexagonal pyramids
7. Lay out patterns and construct conical outlet for 1/2 round gutter
8. Lay out patterns and construct collars on double pitched roofs
9. Lay out patterns and construct rectangular pyramids
10. Lay out patterns and construct oblong raised covers
11. Lay out patterns and construct frustrum of cone intersected by cylinder obliquely
12. Lay out patterns and construct a cone intersecting a cone obliquely

D. Triangulation

1. Develop patterns and construct a square-to-square transition piece
2. Develop patterns and construct a square-to-round
3. Develop patterns and construct a round reducer
4. Lay out patterns and construct round-to-oblong transitions
5. Lay out patterns and construct drop cheek elbows
6. Lay out patterns and construct twisted rectangular pipes
7. Lay out patterns and construct rectangular-to-round fittings, vertical on two sides
8. Lay out patterns and construct irregular oblong-to-round fittings
9. Lay out patterns and construct irregular T joints
10. Lay out patterns and construct square-to-round roof collars for pitched roofs
11. Lay out patterns and construct a round-to-rectangular 90° furnace boot
12. Lay out patterns and construct scalene cones

13. Lay out patterns and construct a three-piece, square-to-round elbow

14. Lay out patterns and construct a three-piece, round reducing elbow

15. Lay out patterns and construct a tapering Y branch

16. Lay out patterns and construct three-branch fittings

17. Lay out patterns and construct a two-way elbow intersection

18. Lay out patterns and construct ship ventilator with a round base and mouth

EQUIPMENT LIST FOR SHEET METAL

Designed for a group of 15 students

Item No.	Quantity	Description	Capacity or Size
1.	15	Awls, scratch	6-1/2" long
2.	8	Dividers, wing	8"
3.	6	Dividers, wing	10"
4.	6	Dividers, wing	12"
5.	4	Square, steel framing: body 24" x 2", tongue 16" x 1-1/2"; 1/16" graduations	
6.	6	Squares, steel, with numbers on throat, 1/16" graduations	12"
7.	6	Squares, combination	12"
8.	4	Squares, combination	6"
9.	1	Rule, zigzag, wood	6'
10.	1	Rule, zigzag, metal	6'
11.	6	Rules, circumference	36"
12.	2 sets	Trammel points; 1 point adjustable in each set; 1 bar per set	
13.	6	Punches, center, hex	6"
14.	6	Punches, automatic	4"
15.	12	Punches, prick	6"
16.	2 sets	Drive pin punches, 4" long, 1/16", 3/32", 1/8", 5/32", 3/16", 7/32", 1/4", 5/16", to include box	
17.	2 each	Cold chisels, cutting edge 1/4", 3/8", 1/2", 5/8", 3/4"; hex body	
18.	2 each	Chisels, round-nose, 1/4", and 1/2" cutting edge	
19.	2 each	Chisels, cape 1/4", 1/2", 3/8" cutting edge	

Item No.	Quantity	Description	Capacity or Size
20.	1	Chisel, diamond point, 1/2" cutting edge	
21.	2 sets	Hand groovers 00, 0, 1, 2, 3, 4, 5, 6, 7, 8.	
22.	6	Hammers, tinners riveting	12 oz.
23.	4	Hammers, tinners riveting	8 oz.
24.	1	Hammer, machinist's ball peen	8 oz.
25.	1	Hammer, machinist's ball peen	12 oz.
26.	1	Hammer, machinist's ball peen	16 oz.
27.	1	Hammer, machinist's ball peen	24 oz.
28.	3	Hammers, machinists' riveting	12 oz.
29.	2	Hammers, raising	16 oz.
30.	4	Mallets, rubber	16 oz.
31.	4	Mallets, wooden tinner's	3" x 6"
32.	4	Mallets, rawhide	2" x 3-1/2"
33.	4	Mallets, plastic	8 oz.
34.	4	Snips, aviation left-cut	
35.	4	Snips, aviation right-cut	
36.	4	Snips, aviation straight-cut	
37.	1	Snips, aviation double-cut	
38.	6	Snips, straight	6-1/2"
39.	6	Pliers, combination	8"
40.	6	Pliers, straight-nose	
41.	4	Pliers, side cutting	7"
42.	2	Pliers, needlenose medium length nose	6"
43.	6	Pliers, vise grip	10"
44.	4	Coppers, soldering	1 lb.

Item No.	Quantity	Description	Capacity or Size
45.	4	Coppers, soldering	2 lbs.
46.	4	Coppers, soldering	3 lbs.
47.	1	Torch kit, propane, B-tank with hose and hand torch	
48.	6	Hacksaw frames, pistol grip handle, adjustable	10" - 12"
49.	1 kit	Hole saws, 7/8", 1-1/8", 1-1/2", 1-3/4", 2", 2-1/2"	
50.	4	Files, mill, bastard	10"
51.	4	Files, mill, smooth	10"
52.	4	Files, flat, bastard	10"
53.	4	Files, hand, smooth	10"
54.	4	Files, square, bastard	8"
55.	4	Files, three-corner, bastard	8"
56.	4	Files, half-round, bastard	10"
57.	4	Files, half-round, smooth	10"
58.	4	Files, round, bastard	10"
59.	4	Files, round, smooth	10"
60.	6	File card and brush 1-1/2" x 5" x 9-1/2"	
61.	4	Files, knife, smooth	10"
62.	4	Files, square, bastard	10"
63.	36	File handles	
64.	1	Gage, size from 0 to 36 US Standard	
65.	1	Wire gage, 0 to 36 American Standard	
66.	1	Thickness gage, .002 to .025, 22 leaves	
67.	1	Micrometer, outside	0-1"
68.	1	Rule, flexible steel	8'
69.	1	Caliper, outside	6"

Item No.	Quantity	Description	Capacity or Size
70.	2	Calipers, inside	6"
71.	1	Grinding wheel dressers, spur type	
72.	2	Oil stones	6" x 2" x 1"
73.	1	Bench oiler	3" spout
74.	1	Grease gun, lever type	
75.	12	C clamps	6" opening
76.	12	C clamps	2" opening
77.	12	C clamps	8" opening
78.	12	Bench clamps (spring-loaded type for sheet metal work)	
79.	4	Screwdrivers, flat blade	4" shank
80.	4	Screwdrivers, flat blade	6" shank
81.	2	Screwdrivers, flat blade	8" shank
82.	1	Screwdriver, flat blade	12" shank
83.	2	Screwdrivers, Phillips head #1	6-3/4"
84.	2	Screwdrivers, Phillips head #2	6-3/4"
85.	1	Screwdriver, Phillips head #3	8"
86.	1	Screwdriver, Phillips head #4	9"
87.	2	Screwdrivers, offset, 1/4" stock	4"
88.	2	Screwdrivers, offset, 5/16" stock	5"
89.	2 each	Wrenches, pipe, straight	8", 12", 18"
90.	1	Wrench, pipe, stillson	12"
91.	1	Wrench, adjustable 6"	6"
92.	1	Wrench, adjustable	8"
93.	1	Wrench, adjustable	10"
94.	1	Wrench, adjustable	12"
95.	2 sets	Wrenches, Allen: #4 to 1/2" inclusive in pouch	

Item No.	Quantity	Description	Capacity or Size
96.	1	Level, aluminum frame	24" long
97.	1	Gage, drill point	
98.	1 set (6)	Bits, countersink, high-speed steel	
99.	1 set	Drills, twist, high-speed steel; straight shank, fractional sizing 1/32" - 15/64" graduated in 64ths with drill index	
100.	12 each	Drills, twist, high-speed steel: straight shank, fractional sizing 1/8", 5/32", 3/16", 1/4"	
101.	2	Drills, twist, high-speed steel; straight shank, fractional sizing 1/16" - 1/2" with drill index	
102.	1 set	Hollow punches, 1/4", 3/8", 1/2", 5/8", 3/4", 7/8", 1", 1-1/4", 1-1/2", 1-3/4", 2".	
103.	1	Metal punch, 3/32", 1/8", 5/32", 3/16", 7/32", 1/4", 9/32", including metal box and bench mounting base	
104.	1	Hand punch, capacity, 9/32" hole through 23" length	
105.	1 set	Steel figures and letters 3/16" size	
106.	2 sets	Handy seamers, 3-1/2" blade, range 1/4" to 1"	8" overall
107.	2	Handy seamers, 6-7/8" blade, range 1/4" to 1"	10-1/4" overall
108.	2 sets	Bench stakes: Candlemold Beakhorn Blowhorn Needlecase Creasing Hollow mandrel Solid mandrel Double seaming with four heads Double seaming Conductor Bevel edge Common square Teakettle	

Item No.	Quantity	Description	Capacity or Size
		Hatchet	
		Bottom	
		Coppersmith	
109.	1 set	Cast stakes	
110.	1	Bench plate including stand	37-1/2" x 8"
111.	1	Bench plate including stand	30" x 8"
112.	1	Bar folder, including stand	36"
113.	2	Rotary machines, combination A, B, C, D rolls 22-gage capacity, including standard	
114.	2	Rotary machines, combination 7" throat, with rolls A, B, C, D, E, F, 3/4" ogee rolls, elbow edging rolls, including stand	24-g. capacity
115.	1	Setting down machine with standard	1/2" seam, 18-g. capacity
116.	1	Slip roll, 22-gage capacity, 2" roll including stand	36" length
117.	1	Slip roll, 16-gage capacity 3" roll including stand	42" length
118.	1	Shears, squaring: foot-operated	36"
119.	1	Bench brake, universal box and pan, 36-1/4" bench model, 22-gage capacity	
120.	1	Cornice brake, 16-gage capacity	5' length
121.	3	Gas bench furnaces, double burner	
122.	1	Bevel shear	
123.	1	Unishear, 16-gage capacity	
124.	3	Electric hand drills, heavy duty	1/4"
125.	1	Table, octagon 56" diameter, 32" high	
126.	6	Work benches, laminated maple top, including stake plate	120" x 40"
127.	8-15*	Drawing tables	23" x 31" top

* This quantity is dependent on the number of beginning students in the class.

Item No.	Quantity	Description	Capacity or Size
128.	8-15*	Stools	24" high
129.	1	Chalkboard, green; reversible board on stand	4' x 6'
130.	1	Compass, chalkboard	16"
131.	1	Protractor, chalkboard	15-1/2"
132.	1	T-square, chalkboard	6' long
133.	8-15*	Scales, architect's (Plastic)	12"
134.	8-15*	Triangles, 30°, 60°	10" base
135.	8-15*	Triangles, 45°, 45°	10" base
136.	8-15*	Irregular curves	10"
137.	1	Draftsman pencil sharpener	
138.	8-15*	T squares, wood or metal or plastic	
139.	2	Protector shields	2-6"
140.	6	Monogoggles, for grinding and buffing	
141.	1	Welding machine, arc (manual metal); a-c transformer type, 250-amp output, 230-volt, 60-cycle input, with pigtail and two cable plugs	
		Accessories for the above welder:	
	75 ft.	Cable; 12-1/2 ft. lead, 12-1/2 ft. ground for each machine, #2/0-gage	
	3	Electrode holders, with replaceable tip insulators	
	3	Ground clamps	
142.	4	Welding helmets, vulcanized fiber construction with fixed glass holder, complete with ratchet adjustment headband, cover lens, and #10 welding lens	
143.	2	Hand shields, vulcanized fiber construction with aluminum handle and fixed glass holder, cover lens and #10 lens	
144.	1	Welding screen, collapsible and portable 6' x 6' book size 3' wing size	

* This quantity is dependent on the number of beginning students in the class.

Item No.	Quantity	Description	Capacity or Size
145.	2 pr.	Welder's gloves, leather	
146.	2	Aprons and sleeves, leather	
147.	1	Complete oxyacetylene outfit, combination torch, dolly	
148.	1	Spot welder 230-volt, 30-amp, water-cooled	
149.	1	Drill press, 15" utility model, floor model 1/2" key chuck, 5-speed, pushbutton switch, 1/2" hp, 1725 rpm	
150.	24 (2 boxes)	Tips, spot welder; replacement: 3/4" bottom, straight; 30° angle tip	
151.	2	Machinist's vise, swivel base, 4-1/2" jaw width, 7" jaw opening, 4-1/8" throat depth	
152.	1	Bench drill vise, 2-3/8" jaw width, 2-5/8" jaw opening	
153.	1	Railroad iron	6'
154.	1	Square stock, 2 x 2	6'
155.	1	Pedestal grinder, with rough and fine grinding wheels	
156.	1	Pittsburgh lock machine, with Acme locks, 24-gage capacity	
157.	1	Band saw, 14" throat	
158.	1	Ring and circle shears, rotary-type: 42" throat	
159.	1	Easy edge, hand model	

SUPPLIES

Sheet Metal

26 gage	Galvanized	3 x 8 sheets
24 gage	Galvanized	3 x 8 sheets

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO BODY REPAIRMEN, *MOTOR VEHICLES, HIGH SCHOOLS, POST SECONDARY EDUCATION, EQUIPMENT,

This curriculum guide was prepared to assist the trade instructor in planning and developing instructional materials for an automobile body repair course to train high school students for employment at the advanced beginner's level. The material was developed by trade instructors by systematically grouping the major segments of a trade analysis into instructional blocks and then into basic manipulative tasks. A committee identified related informational topics. Instructional blocks include (1) Welding, (2) Body Alignment and Repair, (3) Special Body Jobs, (4) Frames, and (5) Painting. Each block contains an outline of operations and jobs for group, subgroup, or individual performance. Related instruction outline topics are included for each instructional block and for applied science and mathematics. The course is designed for a 2-year program with 1,080 hours of training. Instructional procedures are recommended for the trade competent teacher. Students should have a vocational commitment to the trade and general mechanical aptitudes. Equipment and consumable supplies are listed, and a bibliography contains recommended textbooks and suggested references. This document is available for $1.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

ACKNOWLEDGMENTS

This publication was developed by instructors attending a workshop held on the campus of Mississippi State University on July 10 and 11, 1967. Mr. Herbert Burk of Itawamba Junior College and Mr. Grover Shoemaker of East Central Junior College, working with Laboratory personnel, took the traditional approach and developed an analysis for the trade. The trade was systematically broken into its major segments, called blocks, and then into the basic manipulative tasks, called operations. Next, typical on-the-job activities, which contained the operations, were listed to involve the trainee in useful and productive work. Also, the committee identified those informational topics which, when understood by the tradesman, would contribute to the intelligent use of his skills. Finally, the equipment, tools, and supplies necessary for training were listed. Mr. Burk and Mr. Shoemaker are to be commended for their efforts and contributions.

Following the work of the committee, the staff of the Curriculum Laboratory compiled, edited, duplicated, and distributed the material. This publication, which is the first step, will be the base for further development. A definite part of the developmental process is an evaluation and authentication by a representative industrial committee.

HOW TO USE THIS PUBLICATION

As a tool for teaching, this publication is primarily designed for use in planning, preparing, presenting, and evaluating instruction. As a tool, it lists operations, jobs, and informational topics--with the job as the focal point. Each job should be assigned to students, either as a group, a subgroup, or individually. The following procedure is recommended as an effective teaching sequence.

Step I. -- Tell how the job is done.
Give a full explanation of the steps necessary to perform the job. Emphasize the proper sequence; stress techniques requiring special care; point out the hazards to persons and the equipment

Step II. -- Show how the job is done.
Demonstrate the proper procedure for performing the job. Re-emphasize the sequence, techniques, and hazards. Make sure each student can see what is being done and understands the steps.

Step III. -- Have the student do the job.
Assign each student the task of applying what he has just learned. Supervise his work; correct any variation from proper procedure or any hazardous techniques. Re-explain when necessary.

Step IV. -- Check the student for proficiency.
Assign a similar job to the student to be performed independently. Observe his work and examine the completed product or service. He is proficient when he can perform the job without supervision in a prescribed length of time.

Students who have demonstrated proficiency in one job move to the next job. The teaching steps *tell, show, do, check* are used again. Students who are not proficient perform additional jobs of a similar nature and are retaught in weak areas.

Additionally, this publication can be used (1) by the director and the instructor in a local program in communicating with their craft committee, (2) by the local director in supervising instruction and program operation, and (3) by the state supervisory staff in communicating with local school administrators and in supervising the operation of local programs.

TABLE OF CONTENTS

AUTOMOBILE BODY REPAIRMAN

The automobile body repairman repairs or replaces damaged automobile body parts. He hammers out or fills in dents and welds broken surfaces. He removes old paint from the vehicle, or from damaged and repaired parts of the vehicle, using abrasives (he may use liquid paint remover). He primes and paints the vehicle.

He may remove upholstery, accessories and trim in preparation for actual repair. Major damage is roughed out with hydraulic jacks and other equipment. Dents are removed by placing a dolly block on one side and tapping with a hammer on the other. Dents may be filled with solder or other plastic material. The repairman smoothes repaired surfaces by using grinders, files, and sandpaper.

Frames may be straightened with hydraulic jacks and pulling devices.

He must cover bumpers, windows, and trim with paper and masking tape to protect them during painting. The repairman mixes paints to obtain the desired results and spray-paints the automobile or repaired portions.

A detailed description of this occupation may be found in the Dictionary of Occupational Titles, third edition, under AUTOMOBILE-BODY REPAIRMAN (auto. ser.) 807.381, and PAINTER, AUTOMOBILE (auto. ser.) 845.781.

COURSE DESCRIPTION

GENERAL OBJECTIVE

To help the trainee develop knowledges and skills which prepare him to enter the automobile repair trade on the advanced learner's level

ASSUMPTIONS

1. That those enrolling in training have had no previous experience in automobile body repair
2. That trainees have a background in basic mathematics and general science

DESIRABLE PREREQUISITES

1. That trainees have a vocational commitment to the automobile body repair trade
2. That trainees have general mechanical aptitudes

NATURE OF TRAINING

1. The duration of training is normally three hours per day, five days per week, thirty-six weeks per year for two years; or six hours per day, five days per week, thirty-six weeks per year for one year--a total of 1080 clock hours of training.
2. Related instruction by lecture, demonstration, the use of audiovisuals, etc. immediately precedes application by the trainee in shop practice; instruction and its application are correlated as closely as possible at all times; and the major allotment of time is given to the development of manipulative skills.
3. No instruction directly related to the trade is offered outside the shop.

CONTENT OF RELATED INSTRUCTION

Systematic and purposeful presentation of the following:

1. A detailed explanation of fundamental information about metals, such as grain structure, corrosion resistance, weldability, effects of stresses, etc.
2. Instruction in types of abrasives, their construction, and characteristics
3. An explanation of the types of fasteners used in auto bodies
4. A discussion of fiber glass bodies, their qualities and construction
5. Instruction in inspection and planning of repair procedures
6. Information on the types of electrical controls and switches
7. Broad coverage of upholstery materials, cleaners, and stains
8. Detailed information on primers, sealers, color coats and their properties and uses

9. Information on methods of checking frame alignment
10. Broad coverage of welding processes and techniques
11. Instruction in mathematics, such as arithmetic and percentages
12. Instruction in general science as it relates to the body repair trade

TYPES AND LEVELS OF SKILLS TO BE DEVELOPED

1. Immediately marketable skills enabling the trainee to handle extensive body repairs under minimum supervision

2. Immediately marketable skills in minor frame-straightening under minimum supervision

3. Basic skills in masking, priming, and painting; additional training after employment would be necessary to develop a production painter

4. Basic skills in oxyacetylene welding, brazing, and cutting, as well as manual metal arc welding

INSTRUCTIONAL BLOCKS

The following blocks are the major areas of instruction. Each has been assigned a number of hours for the purpose of indicating the relative amount of emphasis it is to receive in the total training period. Instructors are urged to plan training carefully, to select, sequence, and assign learning experience, thus making maximum use of available time. It should not be inferred that hour allotments be rigidly adhered to or that students be rotated on a clockwork or calendar basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods in certain areas. These students may gain only the minimum proficiencies while more able students will progress more rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and alloting are not designed to standardize programs, but to assist local teachers in planning more carefully and in conducting their instruction more carefully.

INSTRUCTIONAL BLOCKS		Contact Hours
I.	Welding	150
II.	Body alignment and repair	480
III.	Special body jobs	180
IV.	Frames	90
V.	Painting	180
	Total Hours	1080

ANALYSIS OF OPERATIONS

I. WELDING AND CUTTING EQUIPMENT

A. Oxyacetylene welding

1. Install a cylinder valve and regulator on a cylinder
2. Assemble a welding torch
3. Assemble a cutting torch
4. Attach a welding torch or a cutting torch to a regulator, using dual-type hose
5. Light a welding torch and adjust it for a carburizing, a neutral, and an oxidizing flame
6. Light and adjust a cutting torch
7. Form a puddle, using an acetylene torch
8. Add filler rod to a puddle
9. Change the tip on a welding or a cutting torch
10. Change the lens in welding goggles

B. Manual metal arc

1. Plug the pigtail into an outlet (CAUTION!)
2. Attach a lug, ground clamp, or electrode holder to a lead cable
3. Attach the welding lead and the ground lead to the welding machine
4. Attach the ground lead to the work or to the worktable
5. Put an electrode in the holder
6. Put on and adjust a welding helmet
7. Change a cover plate and/or lens in a helmet
8. Strike an arc and hold it
9. Adjust the current controls
10. Spotweld with an arc-spot welding gun

II. HAND TOOLS

A. Hammering

1. Repair damage with a rawhide or rubber mallet
2. Raise low spots with a pick hammer
3. Raise low spots with a pick tool
4. Repair dents by direct hammering
5. Repair dents by indirect hammering
6. Repair dents by spring hammering
7. Repair dents with a roughing dolly

8. Repair dents with a low-crown spoon and a hammer
9. Repair dents with a high-crown spoon and a hammer
10. Repair dents with a dinging hammer
11. Cold-shrink with a dolly and hammer
12. Hot-shrink with a dolly, a hammer and an acetylene torch
13. Sink a weld with a dolly and a hammer

B. Surface finishing

1. Smooth a surface with a body file
2. Smooth a surface with sandpaper
3. Featheredge a section of paint with water-proof paper
4. Tin a surface with an acetylene torch and solder
5. Work solder with heat and a solder paddle
6. Apply plastic body filler to a surface
7. Establish a contour by filing and sanding
8. Remove dust and lint from body with a tack rag

C. Fastening

1. Loosen and tighten nuts with open-end and box-end wrenches
2. Loosen and tighten nuts with sockets and attachments
3. Loosen and tighten screws with a standard blade screwdriver
4. Loosen and tighten screws with a Phillip's screwdriver
5. Loosen and tighten screws with a clutch-head screwdriver
6. Loosen and tighten nuts with an allen wrench

D. Miscellaneous

1. Hold materials with vise-grip pliers
2. Cut metal with a cold chisel
3. Mark a surface with a scratch awl
4. Measure with a steel tape
5. Remove a door handle with a special tool
6. Thread a drilled hole with a tap
7. Thread a rod with a die

III. POWER TOOLS AND EQUIPMENT

A. Remove material with a disk-type portable sander
B. Remove material with a portable belt sander
C. Remove material with an air orbital sander
D. Polish a surface with a portable polisher

E. Remove paint with a sandblaster

F. Set up a jack with the various attachments

G. Straighten members with a remote-controlled jack

H. Straighten material in an arbor press

I. Mount a door in a holding unit

J. Mount a hood in a holding unit

K. Mount a deck lid in a holding unit

L. Lift an automobile with a floor jack

M. Lift an automobile with a twin-saddle hydraulic jack

N. Support an automobile with jack stands

O. Drill a hole with an electric drill

P. Remove a nut with an air-drive wrench

Q. Sharpen a chisel on a bench grinder

R. Sharpen a drill bit on a bench grinder

S. Hold materials with a vise

T. Clean a dusty surface with an air dusting gun

U. Dry a surface with an infrared light panel

V. Clean a surface with a steam cleaner

IV. REFINISHING EQUIPMENT

A. Assemble and fill a spray gun

B. Adjust an air transformer to the proper pressure

C. Spray paint with a spray gun

SUGGESTED JOBS IN AUTOMOBILE BODY REPAIR

The following is a list of the different types of jobs the automobile body repairman will be required to complete. On inspection it will be found that the term "repair or replace" has been used often. The two words signify two separate and distinct jobs. They were used together here to avoid repetition.

I. BODY ALIGNMENT AND REPAIRS

A. Repair or replace a quarter panel
B. Repair a front fender
C. Repair a rear fender (truck)
D. Repair a hood
E. Replace a hood hinge and spring
F. Replace and align a hood
G. Repair a deck lid
H. Replace a deck-lid hinge and spring
I. Replace and align a deck lid
J. Replace or repair a top panel
K. Repair or replace a cowl
L. Repair or replace a floor panel
M. Repair or replace a rocker panel
N. Repair or replace a lower deck-lid panel
O. Repair or replace a center pillow
P. Replace a door panel
Q. Repair or replace a door
R. Repair or replace a dash
S. Repair or replace front inner panel
T. Repair a fiber glass panel
U. Adjust convertible-top mechanism
V. Repair top rails on a convertible

II. SPECIAL BODY JOBS

A. Replace a door latch, key cylinder, and/or striker plate
B. Replace a door glass and a manual glass regulator
C. Replace electric glass-regulating mechanism, motor, and switch
D. Replace quarter glass and/or glass regulator
E. Replace vent glass and/or vent glass mechanism

F. Replace a windshield
G. Replace a rear glass
H. Replace windshield and rear glass rubber
I. Replace a headliner
J. Replace a windlace
K. Replace door trim pads
L. Replace garnish molds
M. Replace weather stripping
N. Replace a sun visor
O. Replace a rear-view mirror
P. Replace carpets
Q. Replace seats
R. Replace a power-seat motor
S. Replace a power-seat switch
T. Repair bumpers and bumper arms
U. Replace chrome trim and clips
V. Replace a grill assembly
W. Replace manual and power radio antennae
X. Replace a headlamp and headlamp assembly
Y. Repair or replace a gravel deflector

III. PAINTING

A. Prepare a bare ferrous metal surface for painting
B. Prepare an aluminum surface for painting
C. Prepare an old surface for painting
D. Mask glasses and trim
E. Apply lacquer by spraying
F. Apply enamel by spraying
G. Buff out and wax lacquer

IV. FRAME

A. Replace body-to-frame grommets, pads, shims, etc.
B. Check a frame for alignment with tape, trammels, and gages
C. Align frame extensions
D. Repair or replace front and rear frame extensions
E. Replace damaged front-suspension components and rough-set caster, camber, and toe-in

V. WELDING

A. Join two pieces of sheet metal by oxyacetylene welding

B. Joint two pieces of sheet metal by brazing

C. Cut sheet metal with an oxyacetylene cutting torch

D. Cut frame material with an oxyacetylene cutting torch

E. Cut rivets and bolts with an oxyacetylene cutting torch

F. Heat metal to a desired temperature with an oxyacetylene torch

G. Join two pieces of frame material by manual metal arc welding

H. Join two pieces of sheet metal with an arc-spot welder

RELATED INSTRUCTION TOPICS

I. BODY ALIGNMENT AND REPAIR

A. Methods of removing body deadener

1. Using putty knife
2. Using wire brush
3. Using solvents
4. Using heat

B. Characteristics of metal

1. Elastic ability
2. Grain structure
3. Resistance to corrosion
4. Weldability
5. Plasticity

C. Factors affecting metal structure

1. Stress

    - e. Sketches

2. Variable factors in collision

    - a. Impact angle
    - b. Relative speed of impact object
    - c. Size, rigidity, and weight of object
    - d. Construction of impact area

II. SPECIAL JOBS

A. Adhesives

1. Types
2. Bonding characteristics
3. Advantages and disadvantages of each type

B. Electrical controls

1. Types of manual switches

    - a. Headlight
    - b. Dimmer
    - c. Directional signal
    - d. Backup light
    - e. Windshield wiper

2. Reading specifications
3. Reading schematics

C. Cleaning upholstery

1. Types of upholstery materials

      - a. Fabrics
      - b. Genuine leather
      - c. Coated fabrics (vinyl or nylon)
      - d. Polyurethane foam
    - 2. Types of cleaners
      - a. Volatile cleaners
      - b. Synthetic detergents
      - c. Neutral soaps
      - d. Ammonia
    - 3. Specific stains
      - a. Battery acids
      - b. Blood
      - c. Candy
      - d. Chewing gum
      - e. Fruit, liquor, wine
      - f. Grease and oil
      - g. Ice cream
      - h. Nausea
      - i. Shoe polish and dressings
      - j. Tar
      - k. Urine
      - l. Lipstick

III. PAINTING

  - A. Base coats (bare metal to finish coats)
    - 1. Sealers
      - a. Enamel finish
      - b. Lacquer finish
      - c. Universal
      - d. Bleeder sealers
    - 2. Primers
      - a. Lacquer
      - b. Enamel
      - c. Universal

        3. Primer-surfacers, a base for
            a. Lacquer
            b. Synthetic finishes
    B. Color coats
        1. Synthetic enamel
        2. Acrylic enamel
        3. Nitrocellulose lacquer
        4. Acrylic lacquer
    C. Color-coat conditioners
        1. Thinner and reducers
            a. Use of thinner designed for specific color coat
            b. Correct amounts of thinners to use
            c. Thinners for use at extreme temperatures
        2. Retarders
    D. Surface cleaning and conditioning materials
        1. Wax, polish, and grease solvents
        2. Metal conditioners
        3. Etches
        4. Rust inhibitors
    E. Air-pressure requirements of painting
        1. For guns, approximately 9 cfm
        2. For synthetic enamels, 60 psi at the transformer
        3. For lacquers, 50 psi at the transformer
        4. For all applications, constant pressure

IV. FRAME ALIGNMENT

- A. Measuring diagonals (X checking)
    - 1. Making direct measurements
    - 2. Transfering measurements to the floor with plumb bob
- B. Using tram gages
- C. Using self-centering gages
- D. Using frame-checking and correcting machine

V. WELDING PROCESSES AND TECHNIQUES

- A. Fusion
  - 1. Oxyacetylene
    - a. Equipment
    - b. Types of joints
    - c. Procedure
    - d. Hazards
  - 2. Manual metal arc
    - a. Equipment
    - b. Types of joints
    - c. Procedure
    - d. Hazards
  - 3. Arc-spot
    - a. Equipment
    - b. Procedure
    - c. Hazards
- B. Bonding
  - 1. Brazing
    - a. Equipment
    - b. Brazing alloys
    - c. Fluxes
    - d. Procedure
    - e. Hazards
  - 2. Soldering
    - a. Equipment
    - b. Solders
    - c. Fluxes
    - d. Procedures
    - e. Hazards
- C. Cutting
  - 1. Equipment
  - 2. Procedure

        3. Hazards

VI. MATHEMATICS

- A. Whole numbers
    1. Addition
    2. Subtraction
    3. Multiplication
    4. Division
    5. Trade applications
- B. Fractions
    1. Addition
    2. Subtraction
    3. Multiplication
    4. Division
    5. Conversion to fractions
    6. Trade applications
- C. Decimals
    1. Addition
    2. Subtraction
    3. Multiplications
    4. Division
    5. Conversions to fractions
    6. Trade applications
- D. Measurements
    1. Linear
    2. Angular
    3. Surface
    4. Volume
    5. Temperature
    6. Weight
- E. Percentage
    1. Changing a percent to a decimal
    2. Changing a decimal to a percent
    3. Changing a fraction to a percent

- 4. Computing percentages
- 5. Applying principles of percentage to the trade

VII. APPLIED SCIENCE

- A. Center of gravity
- B. Forces
    - 1. Angular
    - 2. Parallel
- C. Motion
- D. Friction
- E. Simple machines
    - 1. Lever
    - 2. Pulley
    - 3. Wheel axle
    - 4. Inclined plane
    - 5. Wedge
    - 6. Screw
- F. Power
    - 1. Source
    - 2. Transmission
- G. Specific gravity
- H. Hydraulic principles
- I. Heat
    - 1. Sources
    - 2. Measurement
    - 3. Transmission
    - 4. Effects

EQUIPMENT LIST

for the

VOCATIONAL AUTOMOBILE-BODY REPAIR

Quantity	Item
1	Air compressor; horizontal tank; two cylinder; 7-1/2 hp; 3-phase, 220-volt
2	Oil and water extractors, with regulators (one for open shop, one for paint room); 75 cfm capacity; two main line pressure outlets; two regulated pressure outlets
4	Air hose, 50 ft. lengths; 5/16" diameter; furnished with 1/4" St.P connections
1	Spray gun, with qt cup; 1/4" St.P fluid hose connection; lacquer nozzle set-up
1	Spray gun, with qt. cup; 1/4" St.P fluid hose connection; enamel nozzle
1	Spray gun, with qt cup; 1/4" St.P fluid hose connection; lacquer nozzle set-up (for primer)
1	Wrench, air drive; hex sockets 1/2", 9/16", 5/8", 11/16", 3/4",13/16"
1	Metal-working tool kit, air driven; air slugger, cutter, chisel, rivet buster, extension chisel, scraper, punch, panel crimper
1	Orbital sander, air file; with built-in air regulator; fingertip air control
3	Orbital sander, air driven; heavy-duty; 3-2/3"x 9" pad
2	Automotive disc sanders; heavy-duty; 7" and 9" pads; 4250 rpm; 115V
4	Backup pad assembly, for body grinder; 5/8" arbor; 7" diameter
4	Backup pad assembly, for body grinder; 5/8" arbor; 9" diameter
1	Electric drill; 1/4"; 115V
1	Electric drill; 3/8"; 115V; with reversible drive
1	Portable polisher; heavy-duty; 7" pad, 5/8" spindle
1	Apron taping machine; 15" capacity
1	Grinder, bench; 7" wheels, 36 and 60 grit stones; with light, shields, pot, and stand
1	Grinder, bench; 7" wheels, wire brush and grindstone; with light, shields, pot, and stand
1	Gun, air dusting; 1/4" NPT (F)
1	Air chuck: for air tires
1	Spot welding gun; 110V, 30 amp; 8 ft heavy-duty power cord, with 3-prong polarizing plug; 15 ft work lead with Quick-tite clamp
1	Welder, a-c transformer type; 180 amp output; 230 volt, 60-cycle input; with pigtail and accessories

4	Helmets, welders flip-front; rachet headgear; #1 shade
4	Safety goggles, plastic 1-piece
4	Combination outfits for oxyacetylene welding, cutting, brazing, heating, and soldering; with dolly
2	Jacks, floor roller; minimum 2-ton capacity
1	Jack, twin saddle; hydraulic; 1-1/2-ton capacity
8	Stands, adjustable; 5-ton capacity; adjust 15" to 25"
1	Body-and-fender jack; push-and-pull action; 4-ton capacity; with stand and accessories
1	Body-and-fender jack; push action only; 4-ton capacity; with stand and accessories
1	Body-and-fender jack; push action only; 10-ton capacity; with stand and accessories
1	Jack, portable frame; 20,000 lbs capacity; with hydraulic unit and accessories
1	Panel puller, slide-hammer type; with attachments
4	Work benches; metal top; 28-1/2 x 60" x 34"
2	Vises, machinist; 5" jaw width, maximum opening 8"; with swivel base
4	Creepers, hardwood; 18" x 36", with adjustable headrest
2	Holding units, for removable panels; jacking platform; 52" door bar, bar bolt assemblies; pull bar 90"; clamps with adapters; holding stands
1	Door bar unit, single; 52" door bar; center support; adjustable clamps, with adapters
1	Steam cleaner, portable oil fired; 100 gal per hour capacity; electric starter, 115V
1	Arbor press; 5-ton capacity; with stand and adjustable handle
1	Sandblast gun, portable; handles grit sizes 16 to 1000; air pressure 60-150 psi; with abrasive container, abrasive hose, and face mask
1	Pop-rivet tool, general-purpose; for up to 1/8" diameter steel rivets; with starting assortment of rivets
10	Dollies, heel
10	Dollies, general-purpose
2	Dollies, low-crown general-purpose bumping
2	Dollies, high-crown
2	Dollies, roughing; heavy-duty
2	Dollies, general-purpose rail type

1	Spoon, double-end lower back panel and quarter panel
1	Spoon, double-end door and side apron
1	Spoon, double-end heavy-duty driving
1	Tool, double-end heavy-duty driving and fender beading
1	Ezy-edger
1	Spoon, surfacing
1	Spoon, low-crown surfacing
1	Hammer, round head and extra long pick
1	Hammer, roughing, heavy-duty with all-purpose dolly
1	Hammer, bullet-type, short pick
4	Hammers,bumping; 4" overall
1	Hammer, square-face taper-shank and molding
4	Hammers, bumping; 6" overall
1	Hammer, offset square face and cross-peen
1	Hammer, serrated face
1	Hammer, short bullet-type fender
1	Hammer, trim; magnetic
1	Mallet, bumping and shrinking
1	Pick, short curved
1	Pick,deep-throat straight
1	Pick, long curved
1	Pick, long tee handle chisel bit
1	Punch, curved finishing
1	Punch, hooked finishing
1	Punch, piercing
6	Solder paddles, curved face
6	Solder paddles, flat face
1	Cutter, sheet metal
1	Angle cutter, handklip
1	Pliers, drip molding
3	Pliers, vise-grip; 10 inch; with wire cutter and easy release
4	Pliers, slip-joint; 6-1/2"
1	Pliers, side cutting; 7"
1	Pliers, long chain nose; 6-3/4"

4	File holders, flexible adjustable
12	Files, flat; 8 teeth per inch
12	Files, half-round, 8 teeth per inch
2	Tools, door handle pin removing
2	Tools, door handle clip removing

Screwdrivers, square shank, standard tip

	Blade length	Tip width
1	2-1/2"	1/8"
1	1-1/2"	1/4"
1	4"	1/4"
2	7-1/2"	1/4"
1	3"	1/4"
1	4"	5/16"
1	9"	2/16"
1	5"	3/8"
1	6"	3/8"

Screwdrivers, Phillips, plastic handle

	Tip No.	Blade length
1	0	2-1/2"
1	1	3"
4	2	4-1/4"
1	3	6"
1	4	8"
1	2	9/16"

Screwdrivers, clutch head

	Tip size	Blade length
1	5/32"	4"
1	3/16"	4"
1	1/4"	5"
1	5/16"	5"

2 sets	Combined 1/4" and 3/8" drive sockets; 1/4" drive: 3/16", 7/32", 1/4", 9/32", 5/16", 11/32", 3/8", 7/16", 1/2", and spinner handle; 3/8" drive: 9/16", 5/8", 11/16", 3/4", 13/16", 7/8", 15/16", 1"; reversible ratchet, 3" and 6" extensions, 3/8" to 1/4" adapter, and 13/16" spark plug socket
2 sets	1/2" drive sockets; 7/16", 1/2", 9/16", 5/8", 11/16", 3/4", 13/16", 7/8", 15/16", 1", 1-1/4"; ratchet; 5-1/2" and 11" extensions; 16" flex handle and 18" speeder
1 set	Allen wrenches 5/64" - 1/4"
2 sets	Wrenches, open-end; 11 pieces, 1/4" - 1" by 16ths
2 sets	Wrenches, box; 6 pieces, 3/8" - 1"
1 set	Wrenches, combination; box-end and open-end; 14 pieces 3/8" - 1-1/4"

3	Scratch awl, heavy-duty; 3-1/2
1	Putty knife; wood handle; 2-1/8" blade
1	Putty Knife; wood handle; 4" blade
1	Putty knife; wood handle; 1-1/2" blade
1	Putty knife; wood handle; 3-1/2" blade
6 each	Drill bits; high-speed steel, 1/4" shank 1/16", 1/8", 3/16", 1/4"
6 each	Drill bits; high-speed steel, 3/8" shank 5/16", 3/8", 7/16", 1/2"
1	Tap and die set; one each of the following NF plug tap and NF die: 1/4-20, 5/16-18, 3/8-16, 7/16-14, 1/2-13, 9/16-12, 5/8-11, 3/4-10; one each of the following NC plug tap and die: 1/4 x 28, 5/16 x 24, 3/8-24, 7/16-20, 1/2-20, 9/16-18, 5/8-18, 3/4-16; one each 1/8" and 1/4" pipe tap and die; all dies 1-1/2" OD; with appropriate die stock and tap reamer wrench

SUPPLIES

Quantity	Item
12 sleeves	Silicon carbide paper; waterproof; 3-2/3 x 9"; 40 grit; 100 per sleeve
12 sleeves	Silicon carbide paper; waterproof; 3-2/3 x 9"; 80 grit; 100 per sleeve
6 sleeves	Silicon carbide paper; 2-3/4" x 17-1/2"; 40 grit; 100 per sleeve
6 sleeves	Silicon carbide paper; 2-3/4" x 17-1/2"; 80 grit; 100 per sleeve
12 sleeves	Silicon carbide paper; 9" x 11"; 500 grit; 100 per sleeve
12 sleeves	Silicon carbide paper; 9" x 11"; 400 grit; 100 per sleeve
2 sleeves	Silicon carbide paper; 4-1/2" x 11"; 400 grit; 100 per sleeve
6 sleeves	Silicon carbide paper; 9" x 11"; 320 grit; 100 per sleeve
12 sleeves	Silicon carbide paper; 9" x 11"; 240 grit; 100 per sleeve
6 boxes	Body sanding discs; 5/8" center hole, 9" OD; 16 grit; 50 per box
6 boxes	Body sanding discs; 5/8" center hole, 9" OD; 24 grit; 50 per box
3 boxes	Body sanding discs; 5/8" center hole, 9" OD; 36 grit; 50 per box
100 lbs	Body solder; 20/80/; 1/2 lb bars
8 qts	Soldering flux (Rubyfluid); in 1 qt containers
2 doz	Acid swabs; stiff bristle; with tin handle
10-25 gals	Plastic filler; for repairing holes, dents, etc.
4 pkgs	Plastic body filler spreader; 12 per package
5 gals	Body deadener-undercoating; 1 gal cans
3 tubes	Super-weatherstrip adhesive (yellow); 5 oz. tubes
3 tubes	Weatherstrip adhesive (black); 5 oz tubes
6 tubes	Trim adhesive; 5 oz tubes
12 tubes	Feathering disc adhesive; 5 oz tubes
5 cans	Windshield sealer; 1 pt cans with dispenser
4 tubes	Drip-check sealer; for drip molding; 5 oz tubes
6 tubes	Body calk; with gun
3 boxes	Strip calk; 60 one-foot lengths per box
2 cases	Masking tape; 3/4" width; 48 rolls per case, 100 ft per roll
3 rolls	Masking paper; 12" width, 100 ft per roll
1 drum	Acrylic lacquer thinner; low grade for gun cleaning and priming (55 gals)

1 drum	Acrylic lacquer thinner; high grade for color coat (55 gals)
1 gal	Retarder, for acrylic lacquer
6 bottles	Fish eye; 2 oz bottles
20 gals	Enamel reducer, variable temperature
3 containers	Tack rags, 6 per container
10 doz	Masks, filter face
100 lbs	Steam cleaner compound
2 drums	Kerosene; for steam cleaner (55 gals each)

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *DIESEL MECHANICS, *DIESEL ENGINES, HIGH SCHOOLS, POST SECONDARY EDUCATION, EQUIPMENT,

This curriculum guide was prepared to assist the trade instructor in planning and developing instructional materials for a course in diesel mechanics for training high school students for employment at advanced learner's level. The material was developed by trade instructors by a systematic analysis of the operations of the trade The major instructional areas are organized in blocks of operations and informational topics related to specific jobs to be performed by groups, subgroups, or individuals. The instructional blocks are (1) Block Assembly, (2) Head Assembly, (3) Electrical System, (4) Fuel System, (5) Cooling System, (6) Intake-Exhaust-Blower System, and (7) Miscellaneous. The course is designed for a 2-year program with 1,080 hours of training. Instructional procedures are recommended for the trade competent teacher. Students should have a background in mathematics and general science. Equipment and consumable supplies are listed, and a bibliography contains recommended textbooks and suggested references. The document is available for $1.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

State College, Miss: Curriculum Laboratory of the State Department of Vocational and Technical Education, Mississippi State University, 1967

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency P
Address P
*Limitation on Available Copies N/A Price/Unit 1.00
(quantity prices) N/A
*10 copies or less available immediately; larger orders printed by special request

(2) Means Used to Develop Material:
Development Group P
Level of Group P
Method of Design, Testing, and Trial This is a preliminary draft which is being reviewed by diesel-engine mechanics instructors; at a later date it will be evaluated by an industrial committee; the published form will contain the revisions recommended by these two groups

(3) Utilization of Material:
Appropriate School Setting Vocational (trade) training
Type of Program Preparatory
Occupational Focus P
Geographic Adaptability Normally found in the secondary schools, but believed to be
Uses of Material applicable at post secondary level; for use by instructor in
Users of Material planning daily teaching activities

(4) Requirements for Using Material:
Teacher Competency Trade competent, with teaching skills
Student Selection Criteria Those who want, need, and are able to profit from the training; recommend screening by testing, by examination of school records, and by
Time Allotment P personal interview

Source (agency)
(address)

Instructions

The form on the reverse side is for the purpose of providing information on curriculum material submitted to the ERIC Clearinghouse on Vocational and Technical Education. The form, as submitted, will appear on microfiche with the publication and the ERIC Resume; thus, typing is necessary. Instructions for providing information on the form are explained below. Please provide as much information as possible.

The person, agency and address should be provided in the memorandum heading. A bibliographic citation for the material being submitted should also be given.

(1) The name and address of the source where materials may be ordered should be included, regardless of authorship of the material. Limitations on the availability of copies should be listed, as well as the price per unit and quantity prices. If source does not wish to service orders for this material, please mark ERIC Only in the space designated for Agency.

(2) Means used to develop material should include:

Development Group -- the individual or group principally responsible for the material's development. (e.g., individual authorship; development committee of teachers, supervisors, teacher educators; R & D project)
Level of Group -- level of the group which developed the material. (e.g., local, state, regional, national) In the case of individuals, list their titles.
Method of Design, Testing, and Trial -- methods used in designing, testing, and trying the material prior to its final publication. (e.g., designed by subject matter specialists and teacher educators from the results of industry survey, tested on a small group, refined, and pilot tested in ten schools)

(3) Utilization information should include:

Appropriate School Setting -- the type of school for which the material was designed. (e.g., community college, technical institute, area vocational high school)
Type of Program -- the nature of the educational program for which the material was designed. (e.g., high school class, rehabilitation, retraining)
Occupational Focus -- the occupational focus to which the material is directed, whether a specific job or an occupational cluster.
Geographic Adaptability -- the limitations of the material related to geographical regions. (e.g., Southeastern United States, Western United States, Minnesota, etc.)
Uses of Material -- the specific uses for which the material was designed. (e.g., course planning, lesson planning, student reading)
Users of Material -- the person for whom the material was designed. (e.g., teacher, student)

(4) Requirement information should include:

Teacher Competency -- the subject matter specialization, level of training and experience required of the teacher in order to use the material.
Student Selection Criteria -- the age, sex, grade level, aptitude, prerequisite training, and employment goals of the students.
Time Allotment -- the amount of time required for use of the material in total clock hours.
Supplemental Media -- the media, either necessary or desirable, which is available for use with the material. Please list the source, including name and address, where the material may be obtained.

(5) Please list other information on a separate sheet. This might include unique aspects of the material not provided for in other categories on the form.

Inquiries should be directed to:

CURRICULUM LABORATORY
DEPARTMENT OF INDUSTRIAL EDUCATION
MISSISSIPPI STATE UNIVERSITY
State College, Mississippi

ACKNOWLEDGMENTS

Initial development of instructional materials for diesel-engine mechanics began on the campus of Mississippi State University on May 11 and 12, 1967. Mr. Eldon Davis of Hinds County Junior College and Mr. William Russell of Parchman Vocational School worked with Laboratory personnel in preparing the contents of this publication beginning with an analysis of operations and carrying through to a listing of equipment, tools, and supplies. Mr. Davis and Mr. Russell are to be commended for their efforts and contributions.

Following the work of the Committee, the staff of the Laboratory compiled, edited, duplicated, and distributed the material. This publication, which is the first step, will be the base for further development. A definite part of the developmental process is an evaluation and authentication by a representative industrial committee.

The staff of the Curriculum Laboratory also wishes to acknowledge the continued support of Mississippi schools and their administrators who make their personnel available.

HOW TO USE THIS PUBLICATION

As a tool for teaching, this publication is primarily designed for use in planning, preparing, presenting, and evaluating instruction. As a tool, it lists operations, jobs, and informational topics--with the job as the focal point. Each job should be assigned to students, either as a group, a subgroup, or individually. The following procedure is recommended as an effective teaching sequence.

Step I. -- Tell how the job is done.
Give a full explanation of the steps necessary to perform the job. Emphasize the proper sequence; stress techniques requiring special care; point out the hazards to persons and the equipment.

Step II. -- Show how the job is done.
Demonstrate the proper procedure for performing the job. Re-emphasize the sequence, techniques, and hazards. Make sure each student can see what is being done and understands the steps.

Step III. -- Have the student do the job.
Assign each student the task of applying what he has just learned. Supervise his work; correct any variation from proper procedure or any hazardous techniques. Re-explain when necessary.

Step IV. -- Check the student for proficiency.
Assign a similar job to the student to be performed independently. Observe his work and examine the completed product or service. He is proficient when he can perform the job without supervision in a prescribed length of time.

Students who have demonstrated proficiency in one job move to the next job. The teaching steps *tell, show, do, check* are used again. Students who are not proficient perform additional jobs of a similar nature and are retaught in weak areas.

Additionally, this publication can be used (1) by the director and the instructor in a local program in communicating with their craft committee, (2) by the local director in supervising instruction and program operation, and (3) by the state supervisory staff in communicating with local school administrators and in supervising the operation of local programs.

TABLE OF CONTENTS

DESCRIPTION OF DIESEL-ENGINE MECHANIC

The diesel engine mechanic repairs and maintains diesel engines used to power machines such as buses, ships, trucks, trains, electric generators, and construction machinery. The mechanic diagnoses trouble, disassembles engines, examines the parts for defects and excessive wear, reconditions or replaces parts, and reassembles engines.

He removes engines from their mountings and rebuilds individual components, such as the head assembly and the block assembly, and certain accessories, such as the starter, generator, and rootes-type superchargers, but not the exhaust-driven supercharger or the fuel pump.

He uses diagnostic equipment for the fuel system and the electrical system; he reconditions pistons, rods, cylinders, and valves, using shop equipment, such as the engine lathe, boring bar, drill press, and electric hand drill, as well as metalworking hand tools, such as taps, dies, reamers, and files; he makes precision measurements, using micrometers and dial indicators.

The mechanic reassembles engines and installs them in their mounting. He starts them and adjusts their controls for proper operation.

The experienced mechanic may diagnose and/or start dead or malfunctioning equipment in the field; or with additional training he may specialize in fuel-system rebuilding and work in a "clean" room.

Another definition of the diesel engine mechanic may be found in *The Dictionary of Occupational Titles*, under the title DIESEL MECHANIC (any ind.) 625.281.

COURSE DESCRIPTION

GENERAL OBJECTIVE

To assist the trainee in developing knowledges and skills which prepare him to enter the diesel-engine repair trade on the advanced learner's level.

ASSUMPTIONS

1. That those enrolling in training have had no previous experience in diesel-engine repair
2. That trainees have a vocational commitment to the diesel-engine repair trade
3. That trainees have a general mechanical aptitude

DESIRABLE PREREQUISITES

That trainees have a background in elementary mathematics and in general science

NOTE: Those desiring to enroll who lack the above prerequisites should be counseled concerning their deficiencies and then assigned to remedial courses when these are available. It is not recommended that a person lacking the above prerequisites be denied training.

NATURE OF THE TRAINING

1. The duration of the training is normally three hours per day, five days per week, thirty-six weeks per year for two years; or, six hours per day, five days per week, thirty-six weeks per year for one year--a total of 1080 clock hours of training.

2. Related instruction by lecture, demonstration, the use of audio-visuals, and others immediately precedes application by the trainee in shop practice; instruction and its application are correlated as closely as possible at all times; and the major allotment of time is given to the development of manipulative skills.

3. No instruction directly related to the trade is offered outside the shop.

CONTENT OF RELATED INSTRUCTION

Systematic and purposeful presentation of the following:

1. A thorough coverage of the components of the engine, head, and all engine systems, which includes nomenclature, function, and typical service required
2. A nontechnical presentation of fundamental electrical data, of characteristics of fuels and lubricants, and of principles of air and fluid flow
3. Broad coverage of fundamentals of internal combustion engines, the two-stroke cycle, the four-stroke cycle, as well as the timing and synchronization of all engine components
4. An introduction to the testing of fuel pumps and fuel nozzles, and the use of a dynomometer in testing or calibrating engines
5. General coverage of diagnostic and troubleshooting of the engine and its systems

LEVELS OF SKILL

1. Full use of all hand tools and small equipment
2. General use of electrical and fuel test equipment
3. Marketable skill in disassembly and cleanup of engines and system components
4. Marketable skill in service of certain engine components, such as grinding valves and seats, turning starter and generator commutators, as well as replacing brushes, and installing piston rings and rod bearings

INSTRUCTIONAL BLOCKS

The following blocks are the major areas of instruction. Each block has been assigned a number of hours for the purpose of indicating the relative amount of emphasis it is to receive in the total training period. Instructors are urged to plan training carefully, to select, sequence, and assign learning experience, thus making maximum use of available time. It should not be inferred that hour allotments be rigidly adhered to or that students be rotated on a clockwork or calendar basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods in certain areas. These students may gain only the minimum proficiencies while more able students will progress more rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and allotting are not designed to standardize programs, but to assist local teachers in planning more carefully and in conducting their instruction more carefully.

INSTRUCTIONAL BLOCKS

I.	Block Assembly	270
II.	Head Assembly	135
III.	Electrical System	150
IV.	Fuel System	270
V.	Cooling System	105
VI.	Intake-Exhaust-Blower System	105
VII.	Miscellaneous	45
	TOTAL	1080

OPERATIONS

I. MEASURE

A. With scale-type tools

1. Measure with a steel rule or tape
2. Measure angles with a semicircular protractor
3. Transfer measurements with dividers or calipers
4. Measure threads with a screw-pitch gage
5. Check twist-drill points with a drill-point gage
6. Measure holes and recesses with a (scaler) depth gage

B. With precision instruments

1. Measure with an outside micrometer
2. Measure with an inside micrometer
3. Measure with a dial indicator
4. Measure with a micrometer depth gage
5. Transfer measurements with telescoping gages
6. Measure with a feeler gage
7. Check clearances with plastigage

II. MARK OUT

1. Scribe a line with a scratch awl or scribe, and a straight edge
2. Mark a location with a prick punch and a hammer
3. Mark a center with a center punch and a hammer
4. Mark a center with an automatic center punch
5. Scribe arcs and circles with dividers or a hermaphrodite caliper
6. Scribe a parallel line with a steel square and a scratch awl or scribe
7. Sharpen a scratch awl, center punch, or prick punch
8. Mark with letter and number stamps

III. CUT OUT

A. Sheet metal

1. Cut along a straight line with straight-pattern snips or combination snips
2. Cut along a curved line with aviation snips
3. Cut pieces held in a vise, with a flat chisel
4. Cut pieces lying flat, with a chisel

    5. Punch holes with a solid punch or a hollow punch and a hammer
    6. Cut rivets with a chisel
    7. Cut circles with a hole cutter held in a hand drill
    8. Cut a square hole with a hole cutter

  B. Heavy stock

    1. Cut flat and round stock with a chisel
    2. Cut flat, round, and angular stock with a hacksaw
    3. Cross-file for rapid stock removal with a mill bastard file

  C. Other

    1. Drill holes with a hand drill and a twist drill
    2. Countersink holes with a hand drill and a countersink bit
    3. Ream holes with a hand reamer
    4. Cut internal threads in a drilled hole, with a tap and a T handle
    5. Cut external threads with a die and a diestock
    6. Cut a groove with a cape chisel or a diamond-point chisel
    7. Move a hole which is improperly started, with a diamond-point chisel

IV. FORM WITH HAND TOOLS

  A. Sheet metal

    1. Form sheet metal with a wood, rubber, composition, or rawhide mallet
    2. Brake a piece of sheet metal at 90°, using a piece of angle iron, C clamp, and mallet
    3. Form a radius in a piece held over a pipe with a clamp, using a mallet
    4. Form a 90° angular bend, using angle iron and a hydraulic press

  B. Heavy stock

    1. Make angular bends in a piece held in a vise, by striking with a hammer
    2. Make angular bends in a piece held over an anvil, by striking with a hammer
    3. Twist a piece held in a vise, using a monkey wrench
    4. Form an eye in a piece of flat stock over a short pipe held in a vise
    5. Form irregular curves, using a wooden jig
    6. Heat a piece for forming, using an acetylene torch

V. FASTEN WITH HAND TOOLS

A. Removable

1. Tighten or loosen screws with standard-tip screwdriver
2. Tighten or loosen screws with a Phillips screwdriver
3. Tighten or loosen screws with clutch-head screwdriver
4. Tighten or loosen nuts and bolts with open- and box-end wrenches
5. Tighten and loosen nuts and bolts with a socket set, Allen wrench, etc.
6. Tighten nuts and bolts with a torque wrench
7. Tighten and loosen nuts and bolts with an adjustable wrench (crescent), a pipe wrench, and plier (vise-grip) wrench
8. Tighten or loosen nuts and bolts with striker wrenches and a hammer
9. Hold a piece in place by applying a C clamp
10. Remove and install snap rings with snap-ring pliers
11. Remove and install springs with brake-spring pliers

B. Permanent

1. Drive, set, and flange rivets with a riveting hammer and a rivet set
2. Rivet with pop rivets
3. Solder terminals and electrical connections with a soldering gun
4. Apply soft solder with a propane torch
5. Apply soft solder with an oxyacetylene torch

VI. WELD

A. With oxyacetylene equipment

1. Install a cylinder valve and a regulator on a cylinder
2. Assemble a welding torch
3. Assemble a cutting torch
4. Attach a welding torch or a cutting torch to a regulator, using dual-type hose, and adjust the regulator
5. Light a welding torch and adjust it for a carburizing, a neutral, and an oxidizing flame
6. Light and adjust a cutting torch
7. Form a puddle, using an acetylene torch
8. Add filler rod to a puddle
9. Change the tip on a welding or a cutting torch
10. Change the lens in welding goggles
11. Shut off the tank, close the regulator, and bleed the line

B. With manual metal arc equipment

1. Plug the pigtail into an outlet (CAUTION!)
2. Attach a lug and a ground clamp or an electrode holder to a lead cable
3. Attach the welding lead and the ground lead to the welding machine
4. Attach the ground lead to the work or to the worktable
5. Put an electrode in the holder
6. Put on and adjust a welding helmet
7. Change a cover plate and/or lens in a helmet
8. Strike an arc and hold it
9. Adjust the current controls

VII. FINISH

1. Finish-file edges and corners
2. Draw-file a piece of flat or round stock
3. Wire-brush a surface
4. Clean and/or polish a surface with steel wool or abrasive cloth
5. Degrease a surface with a solvent
6. Apply enamel to a finished piece
7. Apply lacquer to a finished piece
8. Hand-buff a finished surface

VIII. PERFORM MISCELLANEOUS OPERATIONS

1. Bend tubing with a tubing bender
2. Flare tubing with a flaring tool kit
3. Remove studs with a stud puller
4. Extract broken screws, bolts, studs, etc., with a screw extractor
5. Scrape with a putty knife
6. Hone cylinders with a cylinder hone and an electric drill
7. Compress valve springs with a valve-lifter tool
8. Pull gears or wheels with a gear or wheel puller

SUGGESTED JOBS FOR DIESEL-ENGINE MECHANICS

I. BLOCK ASSEMBLY

A. Visually inspect the block assembly

B. Disassemble and clean the block assembly for a visual inspection

C. Check the pistons, cylinder sleeves, crankshaft, and camshaft for wear

D. Check the piston and pins, valve lifter push rods, cam gear, and crank gear by visual inspection and fee

E. Replace the wrist pin and/or rod bushing and hone to fit

F. Check the connecting rod for alignment

G. Check the piston and rod assembly for alignment

H. Remove and replace cylinder sleeves

I. Install the crankshaft and torque to specifications

J. Install the piston and rod assembly

K. Install the cam assembly: bushings, cam, gear

L. Inspect the oil pump for clearances and wear; install it in the block

M. Install the oil pan and gaskets

N. Diagnose block assembly malfunctions: worn or stuck rings and pistons, bearing failure, etc.

II. HEAD ASSEMBLY

A. Replace rocker-arm cover gaskets

B. Remove the head and clean it for inspection and repair

C. Remove carbon from the combustion chamber

D. Inspect a head to determine if it requires resurfacing

E. Grind the valve face and the valve stem and reface the rocker arm

F. Replace and/or grind the valve seat

G. Replace the valve guides

H. Install the rocker-arm assembly

I Clean and adjust the injectors

J. Install the head and torque the head bolts

K. Adjust the valves on an operating engine

L. Replace a head gasket

M. Diagnose head-assembly malfunctions: blown gasket, fouled injector, burned valve, improper adjustments, etc.

III. FUEL

1. Visually inspect tanks and lines for corrosion and leaks
2. Steam-clean and rinse tanks and lines; flush with diesel fuel
3. Replace fuel lines (tank to pump)
4. Service the fuel filters: clean and flush the permanent type; replace the element in the throw-away type

*5. Replace jerk-type pump

*6. Rebuild pump for common-rail system

7. Replace/service high-pressure fuel lines
8. Test injectors; rebuild when necessary
9. Check the fuel flow on each type of pump
10. Adjust the governor
11. Diagnose problems in a fuel system with a jerk-type pump
12. Diagnose problems in a common-rail fuel system

* Requires a clean room: When time and facility are available, rebuild jerk-type pump

IV. INTAKE-EXHAUST-BLOWER

1. Service an oil-bath air cleaner
2. Replace a throwaway-type element in the air cleaner
3. Install or replace intake pipes and manifold
4. Rebuild/replace a rootes-type blower
5. Replace an exhaust-driven turbocharger
6. Run/replace the external oil line to the turbocharger
7. Visually inspect and service the exhaust lines to the turbocharger; the lines from the turbocharger to the intake manifold
8. Inspect the exhaust manifold and pipe for leaks
9. Replace the gaskets, pipes, and mufflers
10. Diagnose intake-system malfunctions (normally aspirated)
11. Diagnose problems in the intake system (rootes-type blower)
12. Diagnose problems in the intake system (turbocharger)

V. COOLING SYSTEM

1. Inspect and test the radiator cap
2. Remove the radiator for major repairs; re-install it
3. Check the radiator for leaks: visual, pressure
4. Solder minor leaks in the radiator
5. Check and/or replace the coolant hoses

6. Check and/or replace the thermostat
7. Replace the inner seal in the water pump
8. Replace the water pump
9. Flush and fill the cooling system; put in a corrosion inhibitor
10. Check the drive belts for condition and tension
11. Inspect the pulleys for alignment, warp, etc.
12. Diagnose problems in the cooling system

VI. ELECTRICAL SYSTEM

1. Visually inspect the starter, generator (or alternator), battery, regulator, and wiring
2. Replace brushes on starters and generators; turn the commutator on a lathe
3. Replace bushings and/or bearings on starters and generators
4. Check the armature for shorts or opens
5. Check the field for opens and ground
6. Rebuild or replace the starter solenoid
7. Check and/or replace starter drive (bendix)
8. Make an electrical bench test (dynamically) of the generator or alternator
9. Check and/or replace generator-drive belt
10. Inspect and/or replace the points in the voltage regulator
11. Check the regulator setting and operation
12. Replace the wiring harness
13. Clean battery terminals and posts
14. Load-test the battery
15. Check the electrolyte in a battery
16. Diagnose problems in the electrical system

VII. MISCELLANEOUS

1. Steam-clean engines and parts
2. Clean parts with Oakite in a cleaning tank
3. Make minor repairs by welding with an oxyacetylene torch
4. Cut with an oxyacetylene torch
5. Make minor repairs by welding with a manual metal arc torch

RELATED INSTRUCTION

I. INTRODUCTION TO THE DIESEL ENGINE

A. General description of the engine

   1. Block assembly
   2. Head assembly
   3. Electrical system
   4. Fuel system
   5. Cooling system
   6. Intake-exhaust system

B. The four-stroke cycle

   1. Intake stroke
   2. Compression stroke
   3. Power stroke
   4. Exhaust stroke

C. Two-stroke cycle

   1. Compression stroke
   2. Power stroke
   3. Exhaust-intake action

    - d. Brushes
    - e. Drive mechanism
7. Operating principle
8. Typical internal arrangements
    - a. Four-pole, two-field
    - b. Four-pole, four-field
    - c. Six-pole, six-field

9. Starter-motor service
    - a. Disassembling and cleaning
    - b. Replacing brushes
    - c. Checking armature with growler
    - d. Turning commutator
    - e. Making continuity check of field coils

10. Starter-motor switches
    - a. Manual-operated
    - b. Vacuum-operated
    - c. Solenoid-operated
    - d. Solenoid-and-relay-operated

11. Solenoid test techniques

12. Solenoid repair methods

13. Control switches and circuit
    - a. Ignition switch
    - b. Starter button
    - c. Wiring in circuit

14. Battery-solenoid-starter circuit analysis
    - a. Ignition switch
    - b. Starter button
    - c. Wiring in circuit

C. The charging system

1. Introduction
    - a. Description: a mechanically driven electromagnetic device used to generate electricity
    - b. Principles
        - (1) Generation of a magnetic field
        - (2) Cutting of lines of force by conductors

2. D-C generators
    - a. Principles of operation
        - (1) Rotating conductors
        - (2) Fixed magnetic field

b. Construction features

  - (1) Housing
  - (2) Field coil
  - (3) Pole shoes
  - (4) Armature
  - (5) End plates
  - (6) Brushes
  - (7) Pulley
  - (8) Fan

c. Circuits

  - (1) Externally grounded
  - (2) Internally grounded

d. Service techniques

  - (1) Replacing bearings and brushes
  - (2) Testing and/or replacing the armature
  - (3) Turning the commutator
  - (4) Replacing field coils
  - (5) Checking external wires and connections
  - (6) Adjusting the belt

3. D-C regulators

a. Principle: varying resistance in the field circuit

b. Methods

  - (1) Externally grounded field
  - (2) Internally grounded field
  - (3) Cutout relay

c. Circuits

  - (1) Cutout relay
  - (2) Current regulation
  - (3) Voltage regulation

d. Temperature compensation

e. D-C regulator checks

  - (1) Cutout relay
  - (2) D-C regulator

- (3) Current-and-voltage regulator
  - (a) Autolite
  - (b) Delco-Remy
  - (c) Ford

4. A-C generator: alternator
   - a. Principles of operation
     - (1) Rotating magnetic field
     - (2) Fixed conductors
   - b. Construction features
     - (1) Rotor
       - (a) Field winding
       - (b) Pole pieces
       - (c) Slip rings and brushes
       - (d) Shaft
     - (2) Stator
       - (a) Winding
       - (b) Laminations
     - (3) Housing
       - (a) Mounting lugs
       - (b) Heat sink
       - (c) Diodes
       - (d) Capacitor
       - (e) Through Bolts
   - c. Circuit within alternator
     - (1) Within rotor
     - (2) Within stator
       - (a) Delta-connected
       - (b) Wye-connected
   - d. Service techniques
     - (1) External checks
       - (a) Adjusting drive belt

- (b) Checking output
- (2) Internal check
  - (a) Turning slip rings and replacing brushes
  - (b) Checking the field rotor
  - (c) Checking the stator
  - (d) Checking diodes
  - (e) Checking bearings

5. A-C regulators
   - a. Principle: varying resistance in field circuit
   - b. Types
     - (1) Conventional
       - (a) Single-unit
       - (b) Two-unit
       - (c) Three-unit
     - (2) Transistorized
       - (a) Partially
       - (b) Fully

6. Testing techniques for the charging circuit
   - a. Polarity check
     - (1) Positive-ground systems
     - (2) Negative-ground systems
   - b. Mechanical contact check of terminals and connections
   - c. Electrical checks of the charging circuit, using meters
     - (1) Excessive resistance
     - (2) Grounds
     - (3) Open Circuit

V. THE FUEL SYSTEM

A. System requirements

1. A measured quantity
2. The proper time
3. The proper rate
4. Proper distribution

B. System components

  1. Tank
  2. Lines
  3. Filter(s)
  4. Pumps
  5. Injectors
  6. Fuel

C. The fuel tank and its features

  1. Location and mounting
  2. Drain, filler, outlet
  3. Baffles
  4. Sending unit
  5 Coating

D. The fuel lines

  1. Low pressure
  2. High pressure: pump to injector

E. Fuel filters: types

  1. Porous bronze
  2 Metal disc
  3. Ceramic
  4. Other

F. Air injection

  1. Operational principles
  2. Uses: limited

G. Common-rail system with cam-operated spray valve (injector)

  1. High-pressure pump
  2. Relief valve
  3. Header or common rail
  4. Individual, high-pressure lines
  5. Cam assembly: cam, pushrods, control wedge, rocker arm
  6. Cam-operated spray valve

H Common-rail system with self-actuated spray valve (injector)

  1. Controlled-pressure pump
  2. Accumulator or common rail
  3 Fuel lines
  4 Cam assembly: governor-operated eccentric, control lever, cam
  5 Fuel injector
  6, Spring loaded or pressure differential valve (injector)

I. Pump-injection systems (jerk-pumps)

  1. Port-controlled pumps
  2. Valve-controlled pumps
  3. Variable-stroke pumps

J. Distributor system: Combination pump and distributor

K. Unit injectors (single unit)

  1. Cam action on plunger
  2. Gear action on plunger
  3 Helical edges on plunger
  4. Pressure differential nozzle

L. Unit-injectors (pressure-time principle)

  1. Governor and bypass valve action
  2 Cam-operated nozzel action

M. Content of crude oil

  1. Hydrocarbons: asphaltum, paraffin
    a. Hydrogen
    b. Carbon
    c. Others
  2 Impurities
    a Sulfur
    b. Oxygen
    c Nitrogen
    d. Other

N Types of crude oil

  1 Eastern or Pennsylvania

  2. Mid-Continent
  3. Western or California

O. Refining process

  1. Distillation
  2. Conversion

P. Properties of diesel fuel

  1. Ignition quality and octane number
  2. Volatility
  3. Viscosity
  4. Flash point
  5. Pour point
  6. Specific gravity
  7. Heating value
  8. Impurities content

Q. Other fuels

  1. Natural gas
  2. Manufactured gas
  3. By-product gas

EQUIPMENT LIST
for
DIESEL-ENGINE MECHANICS

Quantity	Item
1	Air compressor: horizontal tank; two-cylinder, single-stage; 5 hp, 220-volt, 60-cycle, 3-phase electric motor; to deliver a minimum of 10 cfm air at 100 psi; with automatic start-up and shut-off, and beltguard
100 ft (min.)	Galvanized pipe; air delivery line for shop; 3/8" i.d.; with necessary ells, nipples, and swages
2	Oil and water extractors, with air regulators; 3/8" St.P. inlet, 1/4" St.P. outlets; 2 main line press outlets, 2 regulated pressure outlets; with inlet pressure gage and regulated pressure gage
4	Air hose: 50 foot lengths; two (2) quality cotton braids, neopreme over and tube of 1/4" i.d., 5/8" o.d., and 1/4" NPT (F) on each end
6	Quick detachable connections: 1/4" NPT (F)
2	Air chucks: 3.3 cfm @ 80 psi; 1/4" NPT (F)
1	Paint gun, spray; general purpose to spray equipment enamel; enamel nozzel; 1/4 St.P. (F) air inlet; with quart cup, aluminum
1	Arbor press, hydraulic: heavy-duty; structural steel frame; 50 ton capacity; hand operated, hand wheel and screw for quick adjustment; automatic ram return, adjustable table
1	Grinder; heavy-duty; push buttom switch; sealed ball bearings; tool tray with two (2) lift-out water pots mounted on base; adjustable safety shields; 1 hp, 1800 rpm, 220-volt, 60-cycle, 3-phase electric motor; with two (2) six-inch grinding wheels, one (1) course, one (1) medium, enclosed in adjustable wheel guards
2	Chain hoists, differential; one of two (2) ton capacity with nine (9) foot lift, and one of three (3) ton capacity with a ten (10) foot lift; pre-lubricate, ball bearings at each rotating point; gears sealed in lubricant; welded link steel chain; with upper and lower forged steel hooks

1	Drill press, sensitive; 15"; column diameter min. 4"; floor mounted; 1 hp, 220-volt, 60-cycle, 3-phase electric motor; with reducing sleeve for spindle
1	Drill press chuck, universal; 1/4"-3/4" capacity
2	V block sets, for general use; case-hardened steel; 1-1/4" max. stock diameter; each set consists of two (2) V blocks and two (2) clamps
2	Engine stands; for diesel engines, complete with adapters for selected engines; on heavy-duty, ball bearing, rubber-wheeled casters or rubber tires
3	Vise, machinists; swivel base; 4" jaw width, 6" jaw opening, 3-5/8" throat depth, all minimum
1 set	Pipe jaws for the above vises
1 set	Soft metal jaws for the above vises
1	Steam cleaner; automatic mixing of steam, cleaning compound, and water in proper proportions; adjustable mixing valve; 35 gallon per hour capacity at 55 psi; complete with pressure gages for steam and fuel, relief valves
1	Qyacetylene welding rig; combination-type for welding, cutting, brazing, heating, and soldering; complete rig includes the following items:
1	Welding torch
1	Gooseneck extension
3	Welding tips: one each of sizes 62, 55, 42
1	Gas mixer
1	Cutting attachment, with 90° heat
1	Cutting tip, size 53
1	Acetylene regulator: two-gage-type with gages
1	Oxygen regulator: two-gage-type with gages
25 ft	Welding and cutting hose: dual-type with two hoses permanently bonded together,1/4" i.d., with appropriate female connections on both ends
1 pair	Welding goggles: #5 lens; monogoggle-type
1	Spark lighter, with replaceable elements
1	Torch wrench

1	Cylinder truck; on 10" rubber tires; with tool box
1	Welding machine, (manual metal) arc; a-c transformer type, 300 amp output; 230-volt, 60-cycle, 3-phase input; with pigtail and 2 cable lugs
50	Cable: 25 ft. lead, 25 ft. ground; #2/0 gage cable
1	Electrode holder, with replaceable tip insulators
1	Ground clamp
1	Injector test stand
	either
1	Engine lathe: 13" swing, 42" between centers; geared-head, quick-change gear box; long-nose taper spindle; 2-speed, reversing-type, 220-volt, 60-cycle, 3-phase electric motor; coolant pump included
	or
1	Armature lathe and undercutter; 7" swing, 12" between chucks, minimum size; hollow head and tail stock
1	Hot tank: for cleaning blocks, heads, etc; minimum size: 4' x 4', x 2' deep; including natural gas heating unit
1	Honing machine
8	Adjustable stands: 5-ton capacity; min. height 15", max. height 25"
4	Creepers, universal: hardwood frame with vinal covered head rest; all-metal, offset casters with ball bearing pivots, 18" x 36"
1	Drill motor, electric: industrial rating, heavy-duty; 1/4" chuck; double gear train; 2000 rpm, 115-volt, 60-cycle, single phase
1	Drill motor, electric: industrial rating, heavy-duty; 3/8" chuck; double gear train; 1000 rpm, 115-volt, 60-cycle, single phase
1	Drill motor, electric: industrial rating, heavy-duty; 1/2" chuck; double gear train; 450 rpm no load speed, 115-volt, 60-cycle, single phase
1	Portable grinder: industrial rating, heavy-duty; sealed ball bearings on output shaft; 115-volt, 60-cycle, single phase motor; with 4" medium grit stone on 5/8" arbor
1	Portable sander: industrial rating, heavy-duty; sealed ball bearings on output shaft; 115-volt, 60-cycle, single phase motor; with 7" back-up pad on 5/8" arbor

	either
1	Impact wrench, air-driven: 5/8" drive, reversible; 1/4 NPT (F) air inlet; 400 ft-lb torque, 1800 impacts per minute; 1300 rpm free speed @ 90 psi
	or
	Impact wrench, electric: 5/8" drive, reversible; 175 ft-lb torque in 10 seconds; free speed 2000 rpm; 115-volt, 25-60 cycle, 4.5 amp, single phase motor
	for either of the above wrenches
1 set (17 pieces)	Impact wrench sockets; 5/8" drive, 6-point, alloy steel, heat treated; one each from 1/2" to 1-1/2" by 1/16 increments, plus 19/32"
1	Transmission jack: hydraulic; floor-type, on all metal casters; cradle height at low position 6-1/2:, at high position 29"; transmission saddle to tilt backwards and forwards through an angle of 70° or more; 1000 lb. capacity
2	Service jacks: hydraulic; handle moves through an angle of 90°, locks in three positions, minimum lift of 19"; one jack of 4 ton capacity, one jack of 2 ton capacity
1	Jack; all-purpose or truck-type; with 4" screw extension; 3 ton capacity; with handle
1	Gear puller set; internal and external jaws; interchangeable 2-jaw yoke and 3-jaw yoke; both slide-hammer action and pressure screw action; for small, medium, and large jobs of 1-1/4" to 12" diameter and up to 9" reach
1	Lubricating gun; high pressure, air operated; 50 lb capacity with min. of 36 oz. per minute output; 6 ft. hose with swivel and gun; on a base with caster
1	Gear lubricant dispenser; manually-operated pump; 50 lb capacity, with meter graduated in pints; 5 ft. hose with handle and nozzel; on a base with swivel casters
1	Lubricating gun; hand-operated, lever action, with two nozzels

NOTE: All electrical test equipment should be suitable for working on 6, 12, and 24 volt systems, and should be of burnout proof construction when possible. It is acceptable to combine one or more pieces of electrical test equipment into master panels; it may be necessary to duplicate certain items.

Quantity	Item
1	Diode tester; for alternator and regulator diodes, including zener-types; minimum of two scales reading 0-100 ohms, and 0-100,000 ohms
1	Generator and regulator tester; combination voltmeter (0-30 volt range) and ammeter (0-60 amp range)
1	Alternator and regulator tester; combination voltmeter (0-30 volt range) and ammeter (0-60 amp range)
1	Armature growler; for locating opens, shorts, grounds, and high-resistance connections; heavy-duty, suitable for high-output generators; with test probes, meter, and light
1	Dwell meter; for 4, 6, 8, and 12 cylinder engines
1	Tachometer, electric; minimum of two scales: 0-1000, 0-5000
1	Combustion analyzer; to include tail pipe connection and electrical lead(s) to analyzer
1	Compression gage; 0-300 range; either screw-in or press-in type
1	Coil tester
1	Capacitor checker
1	Spark plug tester; 0-30 range
1	Vacuum and pressure gage, combination; 0-7 lbs pressure, 0-30 inch vacuum
1	Valve lifter (valve spring compressor); C clamp type; for 7/8" - 2-1/2" diameter springs
1	Valve adjusting tool; for 1/2 square drive socket
1	Valve seat grinder set; heavy-duty, 115-volt, 5 amp, 60-cycle motor with 12,000 rpm free speed, and 55° offset head; to include valve guide pilot, ball bearing wheel carriers, and an assortment of rough and fine grinding wheels, which must be of both 30° and 45° angles in 1-1/2 - 2-1/2" diameters

1	Valve refacing machine; hand adjustable collet for holding valves, which rotates from 0-90^{o}; 80 grit stone; coolant pump; butt grinder; diamond wheel dresser; to include rocker arm grinding attachment, collets for 9/32-9/16" and 1/2'-11/16", 80 grit wheel for stellite tipped valves, and work light
1	Valve lapping tool
1	Valve spring tester, torque-wrench type
1	Valve guide puller
1 set	Valve adjusting wrenches; thin construction, open-end, 3/8-3/4 range
1	Battery charger; for 6, 12, and 24 volt systems
1	Pressure tester for radiator and radiator cap
1	Radiator-leak test tank
1	Radiator hydrometer; glass barrel, rubber bulb and tip, for testing antifreeze
1	Radiator can; heavy-duty, galvanized; 3 gallon capacity
1	Battery hydrometer; glass barrel, rubber bulb and tip, for testing electrolite specific gravity
2 sets	Twist drills; high-speed steel; fractional sizing, 29 drills, from 1/16 to 1/2 by 1/64 increments, in metal index
1 set	Twist drills; high speed steel; letter sizing; 26 drills, from A-2, in metal index
1 set	Reamers, adjustable; eleven reamers in sizes A through K, to hanlde jobs 15/32 - 1-1/2, plus L (1-1/2 - 1-13/16), M (1-13/16 - 2-7/32), and N (2-7/32 - 3-3/4)
1 set	Bushing drivers; complete set including screw shaft (1/2 - 20 threads),washers (1/2 - 20 threads), nuts (1/2 - 20 threads), and bushing drivers 1/2 - 1-3/4 by 1/64 increments
1	Torque wrench; dial-type with "click" indicator; 1/2" square drive; 0-300 lbs
2 each	Piston ring compressors; 2-1/2" to 5", 3-1/2" to 7"
1	Double flaring tool kit; to include tubing cutter, yoke, bar, and 6 adapters, 3/16, 1/4, 5/16, 3/8, 7/16, 5/8
4	Extension lights; 25 ft of 16 gage wire, neoprene covered; swing-open guard; heavy-duty male plug

4	Extension cords; 25 ft of 14 gage wire; 3-wire; with heavy-duty, rubber male and female ends
1 pr	Battery jumper cables; 12 ft of #4 ga. copper wire, neoprene covered, with 4 heavy-duty, spring action ends
6	Work benches; all steel construction: 12 gage, one piece top, metal shelf at moderate height, metal legs, all riveted and welded; 72" long by 30" high
1	Grinding wheel dresser; diamond-tipped
1	Grinding wheel dresser; star-wheel type
1	Oil-can cutter spout
1	Carrying strap for battery
2	Flashlights, 2 dry cell
100 ft	Water hose; 5/8", heavy-duty with solid brass ends
1 set	Bolt extractors; multi-spline type; 1/4" hex head; one each of the following: 1/8, 5/32, 3/16, 7/32, 1/4, 9/32, 5/16, 11/32, 3/8, 13/32
1 each	Stud puller; 1/4 - 1/2 capacity; 1/2 - 3/4 capacity
4	Micrometers, outside: 0-1" range
2	Micrometers, outside: 1-2" range
1	Micrometer, outside: 2-3" range
1	Micrometer, outside: 3-4" range
1	Micrometer, outside: 4-5" range
1	Micrometer, outside: 5-6" range
1 set	Inside Micrometers: 2-8" range
1	Tap and die set; one each of the following NF plug tap and NF die: 1/4-20, 5/16-18, 3/8-16, 7/16-14, 1/2-13, 9/16-12, 5/8-11, 3/4-10; one each of the following NC plug tap and die: 1/4 x 28, 5/16 x 24, 3/8-24, 7/16-20, 1/2-20, 9/16-18, 5/8-18, 3/4-16; one each 1/8" and 1/4" pipe tap and die; all dies 1-1/2" OD; with appropriate die stock and tap reamer wrench

HAND TOOLS

Quantity	Item
3	Awls, scratch
2	Brushes, bristle; for parts washing
6	Brushes, wire
3	Calipers, inside, 8"
3	Calipers, outside, 8"
2	Calipers, hermaphrodite, 6"
1 set	Drifts, brass; 1/2" d. x 7", 3/4 x 7", 7/8 x 8, 1 x 8"
1 set	Starting or driving punches; 5/16 square x 3/32 point x 5-1/4" long; 3/8 x 1/8 x 5-3/4; 3/8 x 5/32 x 6; 7/16" x 3/16" x 6-1/4; 1/2 x 1/4 x 6-3/4; 9/16 x 5/16 x 7-1/4
2 sets	Center punches; 1/8 point x 5"; 3/16 x 6"
1 set	Chisels; square body: 3/8"; 7/16"; 1/2"; 5/8"; 11/16"
2 sets	Cape chisels; square body; 5/16 sq. x 1/4 edge x 5-5/8 length; 3/8 x 5/16" x 6
2	Compass, pencil
1 set	Diesel injection service tools
1	Dividers, wing; 2 each: 8", 10", 12"
1	Electric soldering iron; 115 v
2	Feeler gages; general use; 3-3/8 blade length in .001 increments, range .002 to .025, plus .0015
2	Feeler gages; wire type: .010, .012, .015, .018, .020, .022,.024, .025, .030
4	File clearer
4	Files, mill; bastard, 10"
4	Files, mill; smooth, 10"
4	Files, flat; double cut, bastard, 10"
4	Files, flat; double cut, smooth 10"

4	Files, hand; double cut, bastard, 8"
4	Files, hand; double,cut, smooth, 8"
4	Files, square; bastard, 10"
4	Files, square; smooth, 10"
4	Files, round; bastard, 10"
4	Files, round; smooth, 10:
4	Files, half round; bastard, 10"
4	Files, half round; smooth, 10"
4	Files, three corner; bastard, 10"
4	Files, three corner; smooth, 8"
6 doz	File handles; No. 2
6 doz	File handles; No. 3
1 set	Grease fitting tools
4	Hack saw frames; pistol grip 8", 10", 12" adjustments; square shank blade holder
2	Hammers, machinist's ball peen; 8 oz
2	Hammers, machinist's ball peen; 12 oz
2	Hammers, machinist's ball peen; 16 oz
2	Hammers, machinist's ball peen; 24 oz
2	Hammers, brass faces or solid brass head; 16 oz
1	Hammer, sledge; 12 lb
1	Mallet, rawhide; 2" d. x 3-1/2" l. head
6	Knives, putty; 1-1/2" wide blade
3	Oil cans; 1 pt capacity; lever action
2	Pliers, snap-ring; 5/16" tip x 8-7/8 long
1	Pliers, snap-ring; 5/16" tip x 14" long
2	Pliers, hose clamp; 8"
1	Pliers, brake spring; 13-1/4" long

2	Pliers, battery clamp; 7-3/4"
6	Pliers, combination, 8"
6	Pliers, straight nose
4	Pliers, side cutting, 7"
4	Pliers, needle nose of medium length, 6"
6	Pliers, locking jaw, 10"
1	Torch kit, LPG
2	Rule, pocket; flexible steel, black figures on white background; 6"
1	Steel tape; black figures on white background; 50"
6	Rules, steel
4	Screwdrivers; regular tip, square shank, stubby; 7/32" wide x 1" long blade, plastic handle
4	Screwdrivers; regular tip, square shank, 5/16" wide x 6" long blade, plastic handle
4	Screwdrivers; regular tip, square shank, 1/2" wide x 10" long blade, plastic handle
2	Screwdrivers, Phillips; #1 tip, 1-7/16" blade, stubby, plastic handle
2	Screwdrivers, Phillips; #2 tip, 1-5/16" blade, stubby, plastic handle
2	Screwdrivers, Phillips; #2 tip, 4" blade, plastic handle
2	Screwdrivers, Phillips; #3 tip, 6" blade, plastic handle
2	Screwdrivers, Phillips; #4 tip, 8" blade, plastic handle
2	Screwdrivers, offset; 1/4" tip, 4-5/8 length
2	Screwdrivers, offset; 3/8" tip, 6-1/8 length
2	Screwdrivers, clutch head; 1/8" tip x 3/16 dia. x 3" blade
2	Screwdrivers, clutch head; 1/4" tip x 9/32 dia. x 6" blade
1 set (16)	Sockets; 1/2" square drive, 6 point or single hex; one each, 3/8 - 1-5/16 range by 1/16" increments
1 set (19)	Sockets; 1/2" square drive, 12 point or double hex; one each, 3/8 - 1-1/2" range by 1/16" increments

1 set (11)	Sockets; 1/2" square drive, 12 point or double hex, long reach or deep; one each, 1/2 - 1-1/8 range by 1/16" increments
1 set (10)	Sockets; 1/2" drive; 2 square or 8 point; one each: 3/8, 7/16, 1/2, 9/16, 5/8, 11/16, 3/4, 13/16, 7/8, 1
3	Universal joints; 1/2" drive
3	Rachets; 1/2" drive, standard length
2	Speed handles; 1/2" drive, with rotating handle
2	Extension bars; 1/2" drive, 3" long
2	Extension bars; 1/2" drive, 6" long
2	Extension handles; 1/2" drive, 12" long
2	Flex handles; 1/2" drive, 16" long
2	Sliding T handles; 1/2" drive
2 set (12 pieces each)	Sockets; 3/8" square drive, 12 point or double hex; two each, 1/4" - 7/8" range by 1/16" increments
1 set	Sockets; 3/8" square drive, 12 point or double hex, long reach or deep; one each, 1/4" - 7/8" range by 1/16" increments
1 set	Sockets; 3/8 square drive; double square or 8 point; one each: 1/4, 5/16, 3/8, 7/16, 1/2, 9/16, 5/8
3	Universal joints, 3/8" drive
3	Rachets; 3/8" drive, standard length
3	Speed handles; 3/8" drive, with rotating handle
2	Extension bars; 3/8" drive, 3" long
2	Extension bars; 3/8" drive, 6" long
2	Extension bars; 3/8" drive, 12" long
2	Flex handles; 3/8" drive, 10-3/8" long
2	Sliding T handles; 3/8" drive
2 sets (21 pieces each)	Sockets, 1/4" drive; single hex or 6 point sockets: 3/16, 7/32, 1/4, 9/32, 5/16, 11/32, 3/8, 7/16, 1/2, 9/16; 3 square or 12 point sockets: 1/4, 5/16, 3/8; plastic grip handle on 1/4" drive shaft; 1/4" rachet; 1/4" universal joint; 1/4" drive x 2" extension bar; 1/4" drive x 6" extension bar; sliding T handle; flex handle, 6"; in a metal box

3 each	Wrenches, adjustable; locking jaw; 7" length, 10" length
3 each	Wrenches, adjustable; 6", 8", 10"
2 sets	Wrenches, box-end; double hex or 12 point, long handle; one each per set: 3/8 x 7/16, 1/2 x 9/16, 5/8 x 3/4, 11/16 x 13/16, 7/8 x 1, 15/16 x 1-1/16, 1-1/8 x 1-1/4, 1-3/16 x 1-5/16, 1-3/8 x 1-1/2, 1-7/16 x 1-5/8
2 sets	Wrenches, open-end; 15° angle offset; one each per set: 1/4 x 5/16, 3/8 x 7/16, 1/2 x 9/16, 5/8 x 3/4, 11/16 x 13/16, 7/8 x 1, 15/16 x 1-1/16, 1-1/8 x 1-1/4, 1-3/16 x 1-5/16, 1-3/8 x 1-1/2, 1-7/16 x 1-5/8
2 sets	Wrenches, combination open and box end; long handle; one each per set: 3/8, 7/16, 1/2, 9/16, 5/8, 11/16, 3/4, 13/16, 7/8, 15/16, 1, 1-1/16, 1-1/8, 1-3/16, 1/4, 1-5/16, 1-3/8, 1-7/16, 1-1/2, 1-5/8
2 sets	Wrenches, hex head; standard length, 90° angle on one end; one each per set: .028, .035, 3/64, 1/16, 5/64, 3/32, 7/64, 5/32, 3/16, 7/32, 1/4, 5/16, 3/8, 7/16, 1/2, 9/16, 5/8, 3/4
1 each	Wrenches, pipe; forged steel; 8", 12", 18", 24"
1	Soldering gun; 115-v, 60 cycle, 275 watt; pistol grip; to include two extra tips
2	Pry bars; forged alloy steel; rolling head, 7/16 dia. shaft, 12" long
2	Pinch bars; forged alloy steel; 1/2" sq. shaft, 5/8" edge, 16" long
1	Spring-tension gage; 0-24 oz; for generator brushes
1	Magnetic pickup tool
3	Carbon brushes, 1/4" stem, 1-5/8 dia.
1 set	Figure and letter stamps; steel, Gothic 1/4" high; 0-9 figures A-Z letters; packed in wood box; for marking metal
2	Snips, metal; combination pattern; inlaid cutting edge; 12-1/2 overall length
1 pr	Pliers, electrical; for stripping wire and crimping solderless terminals
1	Screw pitch gage; 24 pitches: 4, 4-1/2, 5, 5-1/2, 6, 7, 8, 9, 10, 11, 11-1/2, 12, 13, 14, 15, 16, 18, 20, 22, 24, 26, 27, 28, 30

SUPPLIES LIST

The following list indicates the types of supply items necessary for the operation of a program in diesel-engine mechanics. It is not an exhaustive list. Quantities and prices are not given since many factors have great influence, such as the number of trainees in the class, the content of the instruction, and local supply channels.

It is customary to replenish supplies on a yearly basis. Additionally, the instructor should keep a running inventory and submit purchase requests on small quantities needed during the school year early enough in advance to assure delivery before present supplies are exhausted. Also, many items listed as equipment and tools must be periodically replaced by the local school, such as hammer handles, hacksaw blades, twist drills, and extension cords.

Abrasive materials
- Commutator paper
- Crocus cloth
- Emery cloth
- Sanding discs: 7", open and closed coat
- Sandpaper (aluminum oxide: 400, 240, 100 grit)

Batteries
- Flashlight
- Truck: 6-v, 12-v, 24-v

Brazing and welding supplies
- Acetylene, in cylinders
- Brazing flux
- Brazing rod: 1/8, 3/16
- Oxygen, in cylinders
- Salammoniac
- Soapstone
- Soft solder: bar, wire
- Welding electrode: 5/32-AWS-E6010 or 6011
- Welding rod: mild steel, copper coated, 1/16, 3/32, 1/8

Brooms
- Shop
- Household

Brushes, paint: assorted, 3/4" - 3" width; 1 dozen

Cement
    Gasket: hard-dry, soft-dry
    Plastic
    Rubber
    Upholstery
    Weatherstrip

Chalk: white; colored

Cleaning materials
    Alcohol
    Baking soda
    Chamois
    Cleaning cloths (shop rags)
    Oil solvent compound
    Soaps: car wash, hand, steam cleaner, abrasive scouring powder
    Solvents, cleaning: engine, carburetor, odd parts (all should be nonflammable whenever possible)
    Sweeping compound

Covers: fender, seat

Electrical materials
    Bulbs: 6-v, 12-v, 24-v; various candlepower
    Fuses
    Tape: plastic; friction
    Terminals: assortment for the below listed wire sizes, both solder and solderless types; battery-type, lead coated
    Wire: 8, 10, 12, 14, 16, 18, 20, 20 gages, in solid colors and braids

Fastener assortment
    Bolts and nuts: NF, NC; steel, brass
    Cotter keys
    Screws, machine: round and flat heads
    Washers: flat, lock, star

Fire extenguishers
    For gasoline and oil fires
    For electrical fires

Gage stock: sheet brass in varying thicknesses

Gaskets
    Asbestos: sheet stock 1/16" thick
    Assorted items: head, pan, water pump, manifold, etc.
    Rebuild packs for engines: three packs per engine
    Sheet stock: tan fiber, 1/32" thick

Hacksaw blades: 18, 24, 32 teeth per inch

Hose
    Windshield wiper
    Vacuum
    Engine coolant

Iron wire, light gage

Light bulbs, shop: incandescent and/or flourescent

Lubricant
- Chassis grease
- Differential grease
- Door striker plate
- Heat-control valve
- Hypoid gear
- Lithium grease
- Lubriplate
- Oil: 10, 20, 30 weight; detergent and nondetergent
- Penetrating or rust-solvent oil
- Powered graphite, in a dispenser
- Power steering, automatic transmission oil
- Rubber lubricant
- Silicon, aerosol spray
- Transmission (standard) grease
- Upper cylinder lubricant
- Wheel bearing grease

Manuals, shop: minimum of one per engine used in training; must be current

Masking tape

Paint, engine: heat resistant; in the following colors: red, yellow, green, gray, blue, black; with thinner

Plastigage

Prussian blue

Tubing: copper; steel; 3/16", 1/4", 3/8", 1/2", 5/8"

Tubing fittings: steel, brass; such as:
- Ts
- Ls
- Unions
- Ferrules

Valve grind and lapping compound; fine, course

*RESOURCE MATERIALS, *TRADE AND INDUSTRIAL EDUCATION, *RADIATION, *RADIOGRAPHERS, TECHNICAL EDUCATION,

Information relative to the lesson plans in "Industrial Radiography Course, Instructor's Guide, Volume I" (VT 003 565) is presented on 52 information sheets including the subjects Shielding Equations and Logarithms, Metal Properties, Field Trip Instructions for Students, Welding Symbols and Sizes, Sample Report Forms, and Typical Shipping Container. The sheets were prepared by the Engineering Extension Service, Texas Agricultural and Mechanical University, College Station, Texas. They are for instructor use at the post-secondary level with students having courses in mathematics, chemistry, and physics or formal training as industrial or medical X-ray technicians. The sheets can be duplicated for class distribution, or they can be projected. They are illustrated with photographs, line drawings, and tables. A bibliography of books and films, and a glossary are included. (EM)

TABLE OF CONTENTS -- Volume 2

INFORMATION SHEETS

NOTE

The material contained in this volume consists of informational matter calculated to aid the instructor in his presentations.

In some instances, the instructor will find it advisable to duplicate some of the information sheets and use them as hand out material. In other situations it may be more advantageous to project the image on a screen using an overhead projector for this purpose.

Other applications may include the need for the disassembly of the text and its subsequent reassembly, all of which suggested the desireability of binding this material separately from the lesson plans and introductory statements.

RADIOGRAPHER

Information
Sheet # 1

JOB DEFINITION

Controls radiography equipment to take radiographs of metal castings, weldments, metal samples pipes, machinery, and structural members to detect flaws, cracks, porosity, and presence of foreign objects. Aligns object on stand between source of x-rays and film or plate; or aligns source of gamma rays, such as cobalt or iridium isotope and film or plate on opposite sides of object, manually or using hand or electric truck, chain hoist, or crane. Masks peripheral areas with lead shields. Selects type of radiation source and type of film, and applies standard mathematical formulas to determine exposure distance and time, considering size, mobility, and strength of radiation sources in relation to density and mobility of object. Verifies radiation intensities, using radiation meters. Takes radiograph by adjusting controls of x-ray machine or by exposing source of radioactivity. Removes and develops film or plate. Monitors working area, using survey meters, to protect personnel area. May replace radioactive isotope source in containers by manipulating tongs from behind protective lead shield Marks defects appearing on film and assists in analyzing findings May specialize in x-ray work and be designated as X-RAY TECHNICIAN.

EDUCATION, TRAINING, AND EXPERIENCE

High school graduation, including courses in mathematics, chemistry, and physics, is considered sufficient to qualify for on-the-job training. Formal training as an industrial or medical x-ray technician constitutes qualifying experience. Training or experience in welding, metallurgy or photography is considered helpful.

SPECIAL CHARACTERISTICS

Aptitudes

Verbal ability to understand and discuss technical material related to construction, operation and application of equipment

Numerical ability to apply standard formulas when computing exposure time and distances to set up equipment

Spatial ability to determine optimum placement of objects and shielding preparatory to taking radiograph

Form perception to perceive pertinent details in exposed film

Temperaments:
Worker determines angle and distance of equipment to object and time and intensity of exposure on basis of verifiable criteria such as strength of radiation source and density of object. The attainment of precise standards of accuracy is involved.

Physical Demands and Working Conditions:
Work requires occasional lifting of materials weighing up to 20 pounds. In some establishments, worker occasionally may lift radiation containers weighing up to 75 pounds. Individual walks or stands most of the time

Climbing ladders sometimes is required to rig equipment or when photographing large objects such as aircraft

Stooping and crouching when working on materials at or below floor level

Reaching, handling and fingering required to work in a darkroom, set up equipment and adjust controls

The hazard of exposure to radiation is present although reduced by the presence of warning and safety devices. In some plants, may be exposed to noise levels of 80-90 decibels from welding machines and high frequency equipment

Work is performed indoors and outdoors.

* Job description from "Selected Occupations Concerned with Atomic Energy," June, 1961; BES No. E-197; Bureau of Employment Security, U.S. Dept. of Labor, Washington, D.C.

ATOMIC ENERGY COMMISSION
REGULATIONS

UNITED STATES ATOMIC ENERGY COMMISSION

RULES and REGULATIONS ○ TITLE 10 - ATOMIC ENERGY

PART 20

STANDARDS FOR PROTECTION AGAINST RADIATION

GENERAL PROVISIONS

§ 20.1 Purpose.

(a) The regulations in this part establish standards for protection against radiation hazards arising out of activities under licenses issued by the Atomic Energy Commission and are issued pursuant to the Atomic Energy Act of 1954 (68 Stat. 919).

(b) The use of radioactive material or other sources of radiation not licensed by the Commission is not subject to the regulations in this part. However, it is the purpose of the regulations in this part to control the possession, use, and transfer of licensed material by any licensee in such a manner that exposure to such material and to radiation from such material, when added to exposures to unlicensed radioactive material and to other unlicensed sources of radiation in the possession of the licensee, and to radiation therefrom, does not exceed the standards of radiation protection prescribed in the regulations in this part.

25 FR 10914

§ 20.2 Scope.

The regulations in this part apply to all persons who receive, possess, use or transfer byproduct material, source material, or special nuclear material under a general or specific license issued by the Commission pursuant to the regulations in Part 30, 40, or 70 of this chapter.

§ 20.3 Definitions.

(a) As used in this part:

(1) "Act" means the Atomic Energy Act of 1954 (68 Stat. 919) including any amendments thereto;

(2) "Airborne radioactive material" means any radioactive material dispersed in the air in the form of dusts, fumes, mists, vapors, or gases;

(3) "Byproduct material" means any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear material;

(4) "Calendar quarter" means any period determined according to either of the following subdivisions:

25 FR 13952

(i) The first period of any year may begin on any date in January; provided that the second, third and fourth periods accordingly begin on the same date in April, July, and October, respectively, and that the fourth period extend into January of the succeeding year, if necessary to complete a three-month quarter. During the first year of use of this method of determination by a licensee, the first period for that year shall also include any additional days in January preceding the starting date for the first period.

25 FR 10914

(ii) The first period in a calendar year of 13 complete, consecutive calendar weeks; the second period in a calendar year of 13 complete, consecutive calendar weeks; the third period in a calendar year of 13 complete, consecutive calendar weeks; the fourth period in a calendar year of 13 complete, consecutive calendar weeks.

*Alternatively, the four periods may consist of the first 14 complete, consecutive calendar weeks; the next 12 complete, consecutive calendar weeks; the next 14 complete, consecutive calendar weeks; and the last 12 complete, consecutive calendar weeks. If at the end of a calendar year there are any days not falling within a complete calendar week of that year, such days shall be included for purposes of this part) within the last complete calendar week of that year. If at the beginning of any calendar year there are days not falling within a complete calendar week of that year, such days shall be included (for purposes of this part) within the last complete calendar week of the previous year.

No licensee shall change the method observed by him of determining calendar quarters for purposes of this part except at the beginning of a calendar year.

(5) "Commission" means the Atomic Energy Commission or its duly authorized representatives;

(6) "Government agency" means any executive department, commission, independent establishment, corporation, wholly or partly owned by the United States of America which is an instrumentality of the United States, or any board, bureau, division, service, office, officer, authority, administration, or other establishment in the executive branch of the Government;

---

*Added 25 FR 13952

25 FR 10914

(7) "Individual" means any human being;

(8) "Licensed material" means source material, special nuclear material, or byproduct material received, possessed, used, or transferred under a general or specific license issued by the Commission pursuant to the regulations in this chapter:

(9) "License" means a license issued under the regulations in Part 30, 40, or 70 of this chapter. "Licensee" means the holder of such license;

(10) "Occupational dose" includes exposure of an individual to radiation (i) in a restricted area; or (ii) in the course of employment in which the individual's duties involve exposure to radiation; provided, that "occupational dose" shall not be deemed to include any exposure of an individual to radiation for the purpose of medical diagnosis or medical therapy of such individual.

(11) "Person" means (i) any individual, corporation, partnership, firm, association, trust, estate, public or private institution, group, Government agency other than the Commission, any State, any foreign government or nation or any political subdivision of any such government or nations, or other entity; and (ii) any legal successor, representative, agent, or agency of the foregoing;

(12) "Radiation" means any or all of the following: alpha rays, beta rays, gamma rays, X-rays, neutrons, high-speed electrons, high-speed protons, and other atomic particles; but not sound or radio waves, or visible, infrared, or ultraviolet light;

(13) "Radioactive material" includes any such material whether or not subject to licensing control by the Commission;

25 FR 13952

(14) "Restricted area" means any area access to which is controlled by the licensee for purposes of protection of individuals from exposure to radiation and radioactive materials. "Restricted area" shall not include any areas used as residential quarters, although a separate room or rooms in a residential building may be set apart as a restricted area;

27 FR 5905

(15) "Source material" means (i) uranium or thorium, or any combination thereof, in any physical or chemical form; or (ii) ores which contain by weight one-twentieth of one percent (0.05%) or more of *a* uranium, *b* thorium or c. any combination thereof. Source material does not include special nuclear material

25 FR 10914

(16) "Special nuclear material" means (i) plutonium, uranium 233, uranium enriched in the isotope 233 or in the isotope 235, and any other material which the Commission, pursuant to the provisions of section 51 of the act, determines to be special nuclear material, but does not include source material; or (ii) any material artificially enriched by any of the foregoing but does not include source material;

25 FR 13952

(17) "Unrestricted area" means any area access to which is not controlled by the licensee for purposes of protection of individuals from exposure to radiation and radioactive materials, and any area used for residential quarters.

25 FR 10914

(b) Definitions of certain other words and phrases as used in this part are set forth in other sections, including:

(1) "Airborne radioactivity area" defined in § 20.203;

(2) "Radiation area" and "high radiation area" defined in § 20.202;

(3) "Personnel monitoring equipment" defined in § 20.202;

(4) "Survey" defined in § 20.201;

(5) Units of measurement of dose (rad, rem) defined in § 20.4;

(6) Units of measurement of radioactivity defined in § 20.5.

§ 20.4 Units of radiation dose.

(a) "Dose," as used in this part, is the quantity of radiation absorbed, per unit of mass, by the body or by any portion of the body. When the regulations in this part specify a dose during a period of time, the dose means the total quantity of radiation absorbed, per unit of mass, by the body or by any portion of the body during such period of time. Several different units of dose are in current use. Definitions of units as used in this part are set forth in paragraphs (b) and (c) of this section.

(b) The rad, as used in this part, is a measure of the dose of any ionizing radiation to body tissues in terms of the energy absorbed per unit mass of the tissue. One rad is the dose corresponding to the absorption of 100 ergs per gram of tissue. (One millirad (mrad) = 0.001 rad.)

(c) The rem, as used in this part, is a measure of the dose of any ionizing radiation to body tissue in terms of its estimated biological effect relative to a dose of one roentgen (r) of X-rays. (One millirem (mrem) = 0.001 rem.) The relation of the rem to other dose units depends upon the biological effect under consideration and upon the conditions of irradiation. For the purpose of the regulations in this part, any of the following is considered to be equivalent to a dose of one rem:

(1) A dose of 1 r due to X— or gamma radiation;

(2) A dose of 1 rad due to X—, gamma, or beta radiation;

(3) A dose of 0.1 rad due to neutrons or high energy protons;

(4) A dose of 0.05 rad due to particles heavier than protons and with sufficient energy to reach the lens of the eye;

If it is more convenient to measure the neutron flux, or equivalent, than to determine the neutron dose in rads, as provided in subparagraph (3) of this paragraph, one rem of neutron radiation may, for purposes of the regulations in this part, be assumed to be equivalent to 14 million neutrons per square centimeter incident upon the body; or, if there exists sufficient information to estimate with reasonable accuracy the approximate distribution in energy of the neutrons, the incident number of neutrons per square centimeter equivalent to one rem may be estimated from the following table:

NEUTRON FLUX DOSE EQUIVALENTS

Neutron energy (Mev)	Number of neutrons per square centimeter equivalent to a dose of 1 rem (neutrons/cm²)	Average flux to deliver 100 millirem in 40 hours (neutrons/cm² per sec)
Thermal	970×10^6	670
0.0001	720×10^6	500
0.005	820×10^6	570
0.02	400×10^6	280
0.1	120×10^6	80
0.5	43×10^6	30
1.0	26×10^6	18
2.5	29×10^6	20
5.0	26×10^6	18
7.5	24×10^6	17
10	24×10^6	17
10 to 30	14×10^6	10

(d) For determining exposures to X or gamma rays up to 3 Mev, the dose limits specified in §§ 20.101 to 20.104, inclusive, may be assumed to be equivalent to the "air dose". For the purpose of this part "air dose" means that the dose is measured by a properly calibrated appropriate instrument in air at or near the body surface in the region of highest dosage rate.

§ 20.5 Units of radioactivity.

(a) Radioactivity is commonly, and for purposes of the regulations in this part shall be, measured in terms of disintegrations per unit time or in curies. One curie (c) $=3.7\times10^{10}$ disintegrations per second (dps) $=2.2\times10^{12}$ disintegrations per minute (dpm). A commonly used submultiple of the curie is the microcurie (μc). One $\mu c=0.000001\ c=3.7\times10^4$ dps $=2.2\times10^6$ dpm.

(b) For purposes of the regulations in this part, it may be assumed that the daughter activity concentrations in the following table are equivalent to an air concentration of 10^{-7} microcuries of Radon 222 per milliliter of air in equilibrium with the daughters RaA, RaB, RaC, and RaC':

Maximum time between collection and measurement (hours)[1]	Alpha-emitting daughter activity collected per milliliter of air	
	Microcuries/cc	Total alpha disintegrations per minute per cc
0.5	7.2×10^{-8}	0.16
1	4.7×10^{-8}	0.10
2	1.3×10^{-8}	0.028
3	0.3×10^{-8}	0.0072

---

[1] The duration of sample collection and the duration of measurement should be sufficiently short compared to the time between collection and measurement, as not to have a statistically significant effect upon the results

(c) *Natural uranium and natural thorium.* (1) For purposes of the regulations in this part, one curie of natural uranium (U-natural in Appendix B or C) means the sum of 3.7×10^{10} disintegrations per second from U-238 plus 3.7×10^{10} dis/sec from U-234 plus 9×10^{8} dis/sec from U-235. Also, a curie of natural thorium (thorium-natural in Appendix B or C) means the sum of 3.7×10^{10} dis/sec from Th^{232} plus 3.7×10^{10} dis/sec from Th^{228}.

(2) For the purpose of the regulations in this part, one curie of natural uranium (U-natural in Appendix B or C) is equivalent to 3,000 kilograms, or 6,615 pounds of natural uranium; and one curie of natural thorium (thorium-natural in Appendix B or C) is equivalent to 9,000 kilograms or 19,850 pounds of natural thorium.

25 FR 10914

§ 20.6 Interpretations.

Except as specifically authorized by the Commission in writing, no interpretation of the meaning of the regulations in this part by any officer or employee of the Commission other than a written interpretation by the General Counsel will be recognized to be binding upon the Commission.

§ 20.7 Communications.

Except where otherwise specified in this part, all communications and reports concerning the regulations in this part, and applications filed under them, should be addressed to the Director of Regulation, U.S Atomic Energy Commission, Washington, D.C., 20545. Communications, reports and applications may be delivered in person at the Commission's offices at 1717 H Street NW., Washington, D.C.; at 4915 St. Elmo Avenue, Bethesda, Md.; or at Germantown, Md.;

31 FR 4668

§ 20.101 Exposure of individuals to radiation in restricted areas.

(a) Except as provided in paragraph (b) of this section, no licensee shall possess, use, or transfer licensed material in such a manner as to cause any individual in a restricted area to receive in any period of one calendar quarter from radioactive material and other sources of radiation in the licensee's possession a dose in excess of the limits specified in the following table:

		Rems per calendar quarter
1	Whole body; head and trunk; active blood-forming organs; lens of eyes; or gonads	1¼
2	Hands and forearms; feet and ankles	18¾
3	Skin of whole body	7½

25 FR 10914

(b) A licensee may permit an individual in a restricted area to receive a dose to the whole body greater than that permitted under paragraph (a) of this section, provided:

(1) During any calendar quarter the dose to the whole body from radioactive material and other sources of radiation in the licensee's possession shall not exceed 3 rems; and

(2) The dose to the whole body, when added to the accumulated occupational dose to the whole body, shall not exceed 5 (N-18) rems where "N" equals the individual's age in years at his last birthday: and

(3) The licensee has determined the individual's accumulated occupational dose to the whole body on Form AEC-4, or on a clear and legible record containing all the information required in that form; and has otherwise complied with the requirements of § 20.102. As used in paragraph (b), "Dose to the whole body" shall be deemed to include any dose to the whole body, gonads, active blood-forming organs, head and trunk, or lens of eye.

§ 20.102 Determination of accumulated dose.

(a) This section contains requirements which must be satisfied by licensees who propose, pursuant to paragraph (b) of § 20.101, to permit individuals in a restricted area to receive exposure to radiation in excess of the limits specified in paragraph (a) of § 20.101.

(b) Before permitting any individual in a restricted area to receive exposure to radiation in excess of the limits specified in paragraph (a) of § 20.101, each licensee shall:

(1) Obtain a certificate on Form AEC-4, or on a clear and legible record containing all the information required in that form, signed by the individual showing each period of time after the individual attained the age of 18 in which the individual received an occupational dose of radiation; and

(2) Calculate on Form AEC-4 in accordance with the instructions appearing therein, or on a clear and legible record containing all the information required in that form, the previously accumulated occupational dose received by the individual and the additional dose allowed for that individual under § 20.101(b).

(c)(1) In the preparation of Form AEC-4, or a clear and legible record containing all the information required in that form, the licensee shall make a reasonable effort to obtain reports of the individual's previously accumulated occupational dose. For each period for which the licensee obtains such reports, the licensee shall use the dose shown in the report in preparing the form. In any case where a licensee is unable to obtain reports of the individual's occupational dose for a previous complete calendar quarter, it shall be assumed that the individual has received the occupational dose specified in whichever of the following columns apply:

Part of body	Column 1 Assumed exposure in rems for calendar quarters prior to Jan 1, 1961	Column 2 Assumed exposure in rems for calendar quarters beginning on or after Jan. 1, 1961
Whole body, gonads, active blood-forming organs, head and trunk, lens of eye	3¾	1¼

(2) The licensee shall retain and preserve records used in preparing Form AEC-4.

If calculation of the individual's accumulated occupational dose for all periods prior to January 1, 1961 yields a result higher than the applicable accumulated dose value for the individual as of that date, as specified in paragraph (b) of § 20.101, the excess may be disregarded.

§ 20.103 Exposure of individuals to concentrations of radioactive material in restricted areas.

(a) No licensee shall possess, use or transfer licensed material in such a manner as to cause any individual in a restricted area to be exposed to airborne radioactive material possessed by the licensee in an average concentration in excess of the limits specified in Appendix B, Table I, of this part. "Expose" as used in this section means that the individual is present in an airborne concentration. No allowance shall be made for the use of protective clothing or equipment, or particle size, except as authorized by the Commission pursuant to paragraph (c) of this section.

(b) The limits given in Appendix B, Table I, of this part are based upon exposure to the concentrations specified for forty hours in any period of seven consecutive days. In any such period where the number of hours of exposure is less than forty, the limits specified in the table may be increased proportionately. In any such period where the number of hours of exposure is greater than forty, the limits specified in the table shall be decreased proportionately.

(c)(1) Except as authorized by the Commission pursuant to this paragraph, no allowance shall be made for particle size or the use of protective clothing or equipment in determining whether an individual is exposed to an airborne concentration in excess of the limits specified in Appendix B, Table I.

(2) The Commission may authorize a licensee to expose an individual in a restricted area to airborne concentrations in excess of the limits specified in Appendix B, Table I, upon receipt of an application demonstrating that the concentration is composed in whole or in part of particles of such size that such particles are not respirable; and that the individual will not inhale the concentrations in excess of the limits established in Appendix B, Table I. Each application under this subparagraph shall include an analysis of particle sizes in the concentrations; and a description of the methods used in determining the particle sizes.

(3) The Commission may authorize a licensee to expose an individual in a restricted area to airborne concentrations in excess of the limits specified in Appendix B, Table I, upon receipt of an application demonstrating that the individual will wear appropriate protective equipment and that the individual will not inhale, ingest or absorb quanti-

ties of radioactive material in excess of those which might otherwise be permitted under this part for employees in restricted areas during a 40-hour week Each application under this subparagraph shall contain the following information;

(i) A description of the protective equipment to be employed, including the efficiency of the equipment for the material involved;

(ii) Procedures for the fitting, maintenance and cleaning of the protective equipment; and

(iii) Procedures governing the use of the protective equipment, including supervisory procedures and length of time the equipment will be used by the individuals in each work week. The proposed periods for use of the equipment by any individual should not be of such duration as would discourage observance by the individual of the proposed procedures; and

(iv) The average concentrations present in the areas occupied by employees.

§ 20.101 Exposure of minors.

(a) No licensee shall possess, use or transfer licensed material in such a manner as to cause any individual within a restricted area who is under 18 years of age, to receive in any period of one calendar quarter from radioactive material and other sources of radiation in the licensee's possession a dose in excess of 10 percent of the limits specified in the table in paragraph (a) of § 20 101.

25 FR 10914

(b) No licensee shall possess, use or transfer licensed material in such a manner as to cause any individual within a restricted area, who is under 18 years of age to be exposed to airborne radioactive material possessed by the licensee in an average concentration in excess of the limits specified in Appendix B, Table II of this part For purposes of this paragraph, concentrations may be averaged over periods not greater than a week.

(c) The provisions of paragraph (c) of § 20.103, shall apply to exposures subject to paragraph (b) of this section.

§ 20.105 Permissible levels of radiation in unrestricted areas.

(a) There may be included in any application for a license or for amendment of a license proposed limits upon levels of radiation in unrestricted areas resulting from the applicant's possession or use of radioactive material and other sources of radiation. Such applications should include information as to anticipated average radiation levels and anticipated occupancy times for each unrestricted area involved. The Commission will approve the proposed limits if the applicant demonstrates that the proposed limits are not likely to cause any individual to receive a dose to the whole body in any period of one calendar year in excess of 0 5 rem

(b) Except as authorized by the Commission pursuant to paragraph (a) of this section, no licensee shall possess, use or transfer licensed material in such a manner as to create in any unrestricted area from radioactive material and other sources of radiation in his possession:

(1) Radiation levels which, if an individual were continuously present in the area, could result in his receiving a dose in excess of two millirems in any one hour, or

(2) Radiation levels which, if an individual were continuously present in the area, could result in his receiving a dose in excess of 100 millirems in any seven consecutive days.

§ 20.106 Concentrations in effluents to unrestricted areas.

(a) A licensee shall not possess, use, or transfer licensed material so as to release to an unrestricted area radioactive material in concentrations which exceed the limits specified in Appendix "B", Table II of this part, except as authorized pursuant to § 20.302 or paragraph (b) of this section. For purposes of this section concentrations may be averaged over a period not greater than one year.

(b) An application for a license or amendment may include proposed limits higher than those specified in paragraph (a) of this section. The Commission will approve the proposed limits if the applicant demonstrates:

(1) That the applicant has made a reasonable effort to minimize the radioactivity contained in effluents to unrestricted areas; and

(2) That it is not likely that radioactive material discharged in the effluent would result in the exposure of an individual to concentrations of radioactive material in air or water exceeding the limits specified in Appendix "B", Table II of this part.

29 FR 14434

(c) An application for higher limits pursuant to paragraph (b) of this section shall include information demonstrating that the applicant has made a reasonable effort to minimize the radioactivity discharged in effluents to unrestricted areas, and shall include, as pertinent:

(1) Information as to flow rates, total volume of effluent, peak concentration of each radionuclide in the effluent, and concentration of each radionuclide in the effluent averaged over a period of one year at the point where the effluent leaves a stack, tube, pipe, or similar conduit.

(2) A description of the properties of the effluents, including:

(i) chemical composition;

(ii) physical characteristics, including suspended solids content in liquid effluents, and nature of gas or aerosol for air effluents;

(iii) the hydrogen ion concentrations (p^H) of liquid effluents; and

(iv) the size range of particulates in effluents released into air.

(3) A description of the anticipated human occupancy in the unrestricted area where the highest concentration of radioactive material from the effluent is expected, and, in the case of a river or stream, a description of water uses downstream from the point of release of the effluent.

(4) Information as to the highest concentration of each radionuclide in an unrestricted area, including anticipated concentrations averaged over a period of one year:

(i) In air at any point of human occupancy; or

(ii) In water at points of use downstream from the point of release of the effluent.

(5) The background concentration of radionuclides in the receiving river or stream prior to the release of liquid effluent.

(6) A description of the environmental monitoring equipment, including sensitivity of the system, and procedures and calculations to determine concentrations of radionuclides in the unrestricted area and possible reconcentrations of radionuclides.

(7) A description of the waste treatment facilities and procedures used to reduce the concentration of radionuclides in effluents prior to their release.

(d) For the purposes of this section the concentration limits in Appendix "B", Table II of this part shall apply at the boundary of the restricted area. The concentration of radioactive material discharged through a stack, pipe or similar conduit may be determined with respect to the point where the material leaves the conduit. If the conduit discharges within the restricted area, the concentration at the boundary may be determined by applying appropriate factors for dilution, dispersion, or decay between the point of discharge and the boundary.

(e) In addition to limiting concentrations in effluent streams, the Commission may limit quantities of radioactive materials released in air or water during a specified period of time if it appears that the daily intake of radioactive material from air, water, or food by a suitable sample of an exposed population group, averaged over a period not exceeding one year, would otherwise exceed the daily intake resulting from continuous exposure to air or water containing one-third the concentration of radioactive materials specified in Appendix "B", Table II of this part.

(f) The provisions of this section do not apply to disposal of radioactive material into sanitary sewerage systems, which is governed by § 20.303

25 FR 10914

§ 20.107 Medical diagnosis and therapy.

Nothing in the regulations in this part shall be interpreted as limiting the intentional exposure of patients to radiation for the purpose of medical diagnosis or medical therapy.

§ 20.108 Orders requiring furnishing of bio-assay services.

Where necessary or desirable in order to aid in determining the extent of an individual's exposure to concentrations of radioactive material, the Commission may incorporate appropriate provisions in any license, directing the licensee to make available to the individual appropriate bio-assay services and to furnish a copy of the reports of such services to the Commission.

Precautionary Procedures

§ 20.201 Surveys.

(a) As used in the regulations in this part, "survey" means an evaluation of the radiation hazards incident to the production, use, release, disposal, or presence of radioactive materials or other sources of radiation under a specific set of conditions. When appropriate, such evaluation includes a physical survey of the location of materials and equipment, and measurements of levels of radiation or concentrations of radioactive material present.

(b) Each licensee shall make or cause to be made such surveys as may be necessary for him to comply with the regulations in this part.

§ 20.202 Personnel monitoring.

(a) Each licensee shall supply appropriate personnel monitoring equipment to, and shall require the use of such equipment by:

25 FR 10914

(1) Each individual who enters a restricted area under such circumstances that he receives, or is likely to receive, a dose in any calendar quarter in excess of 25 percent of the applicable value specified in paragraph (a) of § 20.101.

(2) Each individual under 18 years of age who enters a restricted area under such circumstances that he receives, or is likely to receive, a dose in any calendar quarter in excess of 5 percent of the applicable value specified in paragraph (a) of § 20.101.

(3) Each individual who enters a high radiation area.

(b) As used in this part,

(1) "Personnel monitoring equipment" means devices designed to be worn or carried by an individual for the purpose of measuring the dose received (e. g., film badges, pocket chambers, pocket dosimeters, film rings, etc.);

(2) "Radiation area" means any area, accessible to personnel, in which there exists radiation, originating in whole or in part within licensed material, at such levels that a major portion of the body could receive in any one hour a dose in excess of 5 millirem, or in any 5 consecutive days a dose in excess of 100 millirems;

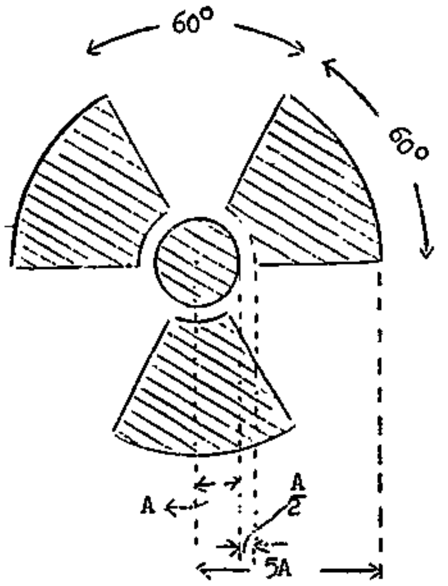
(3) "High radiation area" means any area, accessible to personnel, in which there exists radiation originating in whole or in part within licensed material at such levels that a major portion of the body could receive in any one hour a dose in excess of 100 millirem.

§ 20.203 Caution signs, labels, and signals.

(a) *General.* (1) Except as otherwise authorized by the Commission, symbols prescribed by this section shall use the conventional radiation caution colors (magenta or purple on yellow background). The symbol prescribed by this section is the conventional three-bladed design:

Radiation Symbol

1. Cross-hatched area is to be magenta or purple.
2. Background is to be yellow.



(2) In addition to the contents of signs and labels prescribed in this section, licensees may provide on or near such signs and labels any additional information which may be appropriate in aiding individuals to minimize exposure to radiation or to radioactive material.

(b) *Radiation areas.* Each radiation area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION[1]
RADIATION AREA

(c) *High radiation areas.* (1) Each high radiation area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION[1]
HIGH RADIATION AREA

(2) Each high radiation area shall be equipped with a control device which shall either cause the level of radiation to be reduced below that at which an individual might receive a dose of 100 millirem in one hour upon entry into the area or shall energize a conspicuous visible or audible alarm signal in such a manner that the individual entering and the licensee or a supervisor of the activity are made aware of the entry. In the case of a high radiation area established for a period of 30 days or less, such control device is not required.

(d) *Airborne radioactivity areas.* (1) As used in the regulations in this part, "airborne radioactivity area" means (i) any room, enclosure, or operating area in which airborne radioactive materials, composed wholly or partly of licensed material, exist in concentrations in excess of the amounts specified in Appendix B, Table I, Column 1 of this part; or (ii) any room, enclosure, or operating area in which airborne radioactive material composed wholly or partly of licensed material exists in concentrations which, averaged over the number of hours in any week during which individuals are in the area, exceed 25 percent of the amounts specified in Appendix B, Table I, Column 1 of this part.

(2) Each airborne radioactivity area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION[1]
AIRBORNE RADIOACTIVITY AREA

(e) *Additional requirements.* (1) Each area or room in which licensed material is used or stored and which contains any radioactive material (other than natural uranium or thorium) in an amount exceeding 10 times the quantity of such material specified in Appendix C of this part shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION[1]
RADIOACTIVE MATERIAL(S)

(2) Each area or room in which natural uranium or thorium is used or stored in an amount exceeding one-hundred times the quantity specified in Appendix C of this part shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION
RADIOACTIVE MATERIAL(S)

(f) *Containers.* (1) Except as provided in subparagraph (3) of this paragraph, each container of licensed material shall bear a durable, clearly visible label identifying the radioactive contents.

(2) A label required pursuant to subparagraph (1) of this paragraph shall bear the radiation caution symbol and the words "CAUTION, RADIOACTIVE MATERIAL" or "DANGER, RADIOACTIVE MATERIAL". It shall also provide sufficient information[1] to permit individuals handling or using the containers, or working in the vicinity thereof, to take precautions to avoid or minimize exposures.

31 FR 10514

(3) Notwithstanding the provisions of subparagraph (1) of this paragraph, labeling is not required:

(i) For containers that do not contain licensed materials in quantities greater than the applicable quantities listed in Appendix C of this part.

(ii) For containers containing only natural uranium or thorium in quantities no greater than 10 times the applicable quantities listed in Appendix C of this part.

(iii) For containers that do not contain licensed materials in concentrations

---

[1] Or "Danger"

[1] As appropriate, the information will include radiation levels, kinds of material, estimate of activity, date for which activity is estimated, mass enrichment, etc.

greater than the applicable concentrations listed in Column 2, Table I, Appendix B of this part.

(iv) For containers when they are attended by an individual who takes the precautions necessary to prevent the exposure of any individual to radiation or radioactive materials in excess of the limits established by the regulations in this part.

(v) For containers when they are in transport and packaged and labeled in accordance with regulations of the Interstate Commerce Commission, Federal Aviation Agency, or Coast Guard.

(vi) For containers which are accessible[2] only to individuals authorized to handle or use them, or to work in the vicinity thereof, provided that the contents are identified to such individuals by a readily available written record.

(vii) For manufacturing or process equipment, such as nuclear reactors, reactor components, piping, and tanks

§ 20.204 Exceptions from posting requirements.

Notwithstanding the provisions of § 20.203.

(a) A room or area is not required to be posted with a caution sign because of the presence of a sealed source provided the radiation level twelve inches from the surface of the source container or housing does not exceed five millirem per hour

(b) Rooms or other areas in hospitals are not required to be posted with caution signs because of the presence of patients containing byproduct material provided that there are personnel in attendance who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive material in excess of the limits established in the regulations in this part.

(c) Caution signs are not required to be posted at areas or rooms containing radioactive materials for periods of less than eight hours provided that (1) the materials are constantly attended during such periods by an individual who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive materials in excess of the limits established in the regulations in this part and: (2) such area or room is subject to the licensee's control.

(d) A room or other area is not required to be posted with a caution sign because of the presence of radioactive materials packaged and labeled in accordance with regulations of the Interstate Commerce Commission, Federal Aviation Agency, or Coast Guard.

§ 20.206 Instruction of personnel: posting of notices to employees.

(a) All individuals working in or frequenting any portion of a restricted area shall be informed of the occurrence of radioactive materials or of radiation in such portions of the restricted area; shall be instructed in the safety problems associated with exposure to such materials or radiation and in precautions or procedures to minimize exposure, shall be instructed in the applicable provisions of Commission regulations and licenses for the protection of personnel from exposures to radiation or radioactive materials, and shall be advised of reports of radiation exposure which employees may request pursuant to these regulations.

(b) Each licensee shall post a current copy of the regulations in this part, a copy of the license and a copy of operating procedures applicable to work under the license conspicuously in a sufficient number of places in every establishment where employees are employed in activities licensed by the Commission to permit them to observe such documents on the way to or from their place of employment or shall keep such documents available for employees' examination upon request

(c) Form AEC-3, "Notice to Employees", shall be conspicuously posted in a sufficient number of places in every establishment where employees are employed in activities licensed by the Commission to permit employees working in or frequenting any portion of a restricted area to observe a copy on the way to or from their place of employment.

NOTE Copies of Form AEC-3, "Notice to Employees," may be obtained by writing to the Director of the appropriate U S Atomic Energy Commission Regional Compliance Office listed in Appendix "D" or the Director, Division of Materials Licensing, U S Atomic Energy Commission, Washington, D C, 20545.

§ 20.207 Storage of licensed materials.

Licensed materials stored in an unrestricted area shall be secured against unauthorized removal from the place of storage.

WASTE DISPOSAL

§ 20.301 General requirement.

No licensee shall dispose of licensed material except

(a) By transfer to an authorized recipient as provided in the regulations in Part 30, 40, or 70 of this chapter, whichever may be applicable; or

(b) As authorized pursuant to § 20 302; or

(c) As provided in § 20 303 or § 20 304, applicable respectively to the disposal of licensed material by release into sanitary sewerage systems or burial in soil, or in § 20 106 (Concentrations in Effluents to Unrestricted Areas).

§ 20.302 Method for obtaining approval of proposed disposal procedures.

Any licensee or applicant for a license may apply to the Commission for approval of proposed procedures to dispose of licensed material in a manner not otherwise authorized in the regulations in this chapter. Each application should include a description of the licensed material and any other radioactive material involved, including the quantities and kinds of such material and the levels of radioactivity involved, and the proposed manner and conditions of disposal. The application should also include an analysis and evaluation of pertinent information as to the nature of the environment, including topographical, geological, meteorological, and hydrological characteristics, usage of ground and surface waters in the general area, the nature and location of other potentially affected facilities; and procedures to be observed to minimize the risk of unexpected or hazardous exposures

The Commission will not approve any application for a license to receive licensed material from other persons for disposal on land not owned by the Federal government or by a State government.

§ 20.303 Disposal by release into sanitary sewerage systems.

No licensee shall discharge licensed material into a sanitary sewerage system unless:

(a) It is readily soluble or dispersible in water; and

(b) The quantity of any licensed or other radioactive material released into the system by the licensee in any one day does not exceed the larger of subparagraphs (1) or (2) of this paragraph:

(1) The quantity which, if diluted by the average daily quantity of sewage released into the sewer by the licensee, will result in an average concentration equal to the limits specified in Appendix B, Table I, Column 2 of this part; or

(2) Ten times the quantity of such material specified in Appendix C of this part, and

(c) The quantity of any licensed or other radioactive material released in any one month, if diluted by the average monthly quantity of water released by the licensee, will not result in an average concentration exceeding the limits specified in Appendix B, Table I, Column 2 of this part; and

(d) The gross quantity of licensed and other radioactive material released into the sewerage system by the licensee does not exceed one curie per year

Excreta from individuals undergoing medical diagnosis or therapy with radioactive material shall be exempt from any limitations contained in this section.

§ 20.304 Disposal by burial in soil.

No licensee shall dispose of licensed material by burial in soil unless:

(a) The total quantity of licensed and other radioactive materials buried at any one location and time does not exceed, at the time of burial, 1,000 times the amount specified in Appendix C of this part; and

(b) Burial is at a minimum depth of four feet; and

(c) Successive burials are separated by distances of at least six feet and not more than 12 burials are made in any year

---

[2] For example, containers in locations such as water-filled canals, storage vaults, or hot cells.

§ 20.305 Treatment or disposal by incineration.

No licensee shall treat or dispose of licensed material by incineration except as specifically approved by the Commission pursuant to §§ 20.106(b) and 20.302.

RECORDS, REPORTS, AND NOTIFICATION

§ 20.401 Records of surveys, radiation monitoring, and disposal.

(a) Each licensee shall maintain records showing the radiation exposures of all individuals for whom personnel monitoring is required under § 20.202 of the regulations in this part. Such records shall be kept on Form AEC-5, in accordance with the instructions contained in that form or on clear and legible records containing all the information required by Form AEC-5. The doses entered on the forms or records shall be for periods of time not exceeding one calendar quarter.

(b) Each licensee shall maintain records in the same units used in the appendices to this part, showing the results of surveys required by § 20.201 (b), and disposals made under §§ 20.302, 20.303, and 20.304.

25 FR 10914

(c) Records of individual radiation exposure which must be maintained pursuant to the provisions of paragraph (a) of this section shall be preserved until December 31, 1970, or until a date 5 years after termination of the individual's employment, whichever is later. Records which must be maintained pursuant to this part may be maintained in the form of microfilms.

NOTE: Prior to December 31, 1970, the Commission may amend this paragraph to assure the further preservation of records which it determines should not be destroyed.

30 FR 14551

§ 20.402 Reports of theft or loss of licensed material.

Each licensee shall report by telephone and telegraph to the Director of the appropriate Atomic Energy Commission Regional Compliance Office listed in Appendix D, immediately after its occurrence becomes known to the licensee, any loss or theft of licensed material in such quantities and under such circumstances that it appears to the licensee that a substantial hazard may result to persons in unrestricted areas.

§ 20.403 Notifications of incidents.

(a) *Immediate notification.* Each licensee shall immediately notify the Director of the appropriate Atomic Energy Commission Regional Compliance Office shown in Appendix D by telephone and telegraph of any incident involving byproduct, source or special nuclear material possessed by him and which may have caused or threatens to cause:

(1) Exposure of the whole body of any individual to 25 rems or more of radiation; exposure of the skin of the whole body of any individual of 150 rems or more of radiation; or exposure of the feet, ankles, hands or forearms of any individual to 375 rems or more of radiation; or

(2) The release of radioactive material in concentrations which, if averaged over a period of 24 hours, would exceed 5,000 times the limits specified for such materials in Appendix B, Table II; or

(3) A loss of one working week or more of the operation of any facilities affected; or

(4) Damage to property in excess of $100,000.

(b) *Twenty-four hour notification.* Each licensee shall within 24 hours notify the Director of the appropriate Atomic Energy Commission Regional Compliance Office listed in Appendix D by telephone and telegraph of any incident involving licensed material possessed by him and which may have caused or threatens to cause:

(1) Exposure of the whole body of any individual to 5 rems or more of radiation; exposure of the skin of the whole body of any individual to 30 rems or more of radiation, or exposure of the feet, ankles, hands, or forearms to 75 rems or more of radiation; or

(2) The release of radioactive material in concentrations which, if averaged over a period of 24 hours, would exceed 500 times the limits specified for such materials in Appendix B, Table II, or

(3) A loss of one day or more of the operation of any facilities affected; or

(4) Damage to property in excess of $1,000.

27 FR 5905

(c) Any report filed with the Commission pursuant to this section shall be prepared so that names of individuals who have received exposure to radiation will be stated in a separate part of the report.

28 FR 6822

§ 20.404 Report to former employees of exposure to radiation.

At the request of a former employee each licensee shall furnish to the former employee a report of the former employee's exposure to radiation as shown in records maintained by the licensee pursuant to § 20.401(a). Such report shall be furnished within 30 days from the time the request is made; shall cover each calendar quarter of the individual's employment involving exposure to radiation, or such lesser period as may be requested by the employee. The report shall also include the results of any calculations and analyses of radioactive material deposited in the body of the employee and made pursuant to the provisions of § 20.108. The report shall be in writing and contain the following statement:

> This report is furnished to you under the provisions of the Atomic Energy Commission regulations entitled "Standards for Protection Against Radiation" (10 CFR Part 20). You should preserve this report for future reference.

(b) The former employee's request should include appropriate identifying data, such as social security number and dates and locations of employment.

25 FR 10914

§ 20.405 Reports of overexposures and excessive levels and concentrations.

(a) In addition to any notification required by § 20.403, each licensee shall make a report in writing within 30 days to the * Director, Division of State and Licensee Relations, U.S. Atomic Energy Commission, Washington, D.C., 20545 , with a copy to the Director of the appropriate Atomic Energy Commission Regional Compliance Office listed in Appendix D, of (1) each exposure of an individual to radiation or concentrations of radioactive material in excess of any applicable limit in this part or in the licensee's license; (2) any incident for which notification is required by § 20.403; and (3) levels of radiation or concentrations of radioactive material (not involving excessive exposure of any individual) in an unrestricted area in excess of ten times any applicable limit set forth in this part or in the licensee's license. Each report required under this paragraph shall describe the extent of exposure of persons to radiation or to radioactive material; levels of radiation and concentrations of radioactive material involved; the cause of the exposure, levels or concentrations; and corrective steps taken or planned to assure against a recurrence.

27 FR 5905

(b) In any case where a licensee is required pursuant to the provisions of this section to report to the Commission any exposure of an individual to radiation or to concentrations of radioactive material, the licensee shall also notify such individual of the nature and extent of exposure. Such notice shall be in writing and shall contain the following statement:

> This report is furnished to you under the provisions of the Atomic Energy Commission regulations entitled "Standards for Protection Against Radiation" (10 CFR Part 20). You should preserve this report for future reference.

25 FR 10914

(c) Any report filed with the Commission pursuant to this section shall be prepared so that names of individuals who have received exposure to radiation will be stated in a separate part of the report.

28 FR 6822

§ 20.406 Notice to employees of exposure to radiation.

At the request of any employee each licensee shall advise such employee annually of the employee's exposure to radiation as shown in records maintained by the licensee pursuant to § 20.401(a).

25 FR 10914

EXCEPTIONS AND ADDITIONAL REQUIREMENTS

§ 20.501 Applications for exemptions.

The Commission may, upon application by any licensee or upon its own initiative, grant such exemptions from the requirements of the regulations in this part as it determines are authorized by law and will not result in undue hazard to life or property.

§ 20.502 Additional requirements.

The Commission may, by rule, regulation, or order, impose upon any licensee such requirements, in addition to those

*Revised 31 FR 4668

established in the regulations in this part, as it deems appropriate or necessary to protect health or to minimize danger to life or property.

ENFORCEMENT

§ 20.601 Violations.

25 FR 10914

An injunction or other court order may be obtained prohibiting any violation of any provision of the act or any regulation or order issued thereunder. Any person who willfully violates any provision of the act or any regulation or order issued thereunder may be guilty of a crime, and upon conviction, may be punished by fine or imprisonment or both, as provided by law.

		I	3×10^{-8}	2×10^{-3}	1×10^{-9}	6×10^{-5}
	Zr 97	S	1×10^{-7}	5×10^{-4}	4×10^{-9}	2×10^{-5}
		I	9×10^{-8}	5×10^{-4}	3×10^{-9}	2×10^{-5}
* Any single radionuclide not listed above with decay mode other than alpha emission or spontaneous fission and with radioactive half-life less than 2 hours.		Sub	1×10^{-6}		3×10^{-8}	
* Any single radionuclide not listed above with decay mode other than alpha emission or spontaneous fission and with radioactive half-life greater than 2 hours.			3×10^{-9}	9×10^{-5}	1×10^{-10}	3×10^{-6}
* Any single radionuclide not listed above, which decays by alpha emission or spontaneous fission.			6×10^{-13}	4×10^{-7}	2×10^{-14}	3×10^{-8}

☆ [1] Soluble (S); Insoluble (I).

[2] "Sub" means that values given are for submersion in a semispherical infinite cloud of airborne material.

NOTE. In any case where there is a mixture in air or water of more than one radionuclide, the limiting values for purposes of this Appendix should be determined as follows:

1. If the identity and concentration of each radionuclide in the mixture are known, the limiting values should be derived as follows: Determine, for each radionuclide in the mixture, the ratio between the quantity present in the mixture and the limit otherwise established in Appendix B for the specific radionuclide when not in a mixture. The sum of such ratios for all the radionuclides in the mixture may not exceed "1" (i.e., "unity").

EXAMPLE: If radionuclides A, B, and C are present in concentrations C_A, C_B, and C_C, and if the applicable

MPC's, are MPC_A, and MPC_B, and MPC_C respectively, then the concentrations shall be limited so that the following relationship exists:

$$\frac{C_A}{MPC_A}+\frac{C_B}{MPC_B}+\frac{C_C}{MPC_C}\leq 1$$

☆ 2. If either the identity or the concentration of any radionuclide in the mixture is not known, the limiting values for purposes of Appendix B shall be:

a. For purposes of Table I, Col. 1—6×10^{-13}
b. For purposes of Table I, Col. 2—4×10^{-7}
c. For purposes of Table II, Col. 1—2×10^{-14}
d. For purposes of Table II, Col. 2—3×10^{-8}

26 FR 11046

3. If any of the conditions specified below are met, the corresponding values specified below may be used in lieu of those specified in paragraph 2 above.

a. If the identity of each radionuclide in the mixture is known but the concentration of one or more of the radionuclides in the mixture is not known, the concentration limit for the mixture is the limit specified in Appendix "B" for the radionuclide in the mixture having the lowest concentration limit; or

b. If the identity of each radionuclide in the mixture is not known, but it is known that certain radionuclides specified in Appendix "B" are not present in the mixture, the concentration limit for the mixture is the lowest concentration limit specified in Appendix "B" for any radionuclide which is not known to be absent from the mixture; or

30 FR 15801

c. Element (atomic number) and isotope	Table I		Table II	
	Column 1 Air (μc/ml)	Column 2 Water (μc/ml)	Column 1 Air (μc/ml)	Column 2 Water (μc/ml)
If it is known that Sr 90, I 125, I 126, I 129, I 131, (I 133, table II only), Pb 210, Po 210, At 211, Ra 223, Ra 224, Ra 226, Ac 227, Ra 228, Th 230, Pa 231, Th 232, Th-nat, Cm 248, Cf 254, and Fm 256 are not present	....	9×10^{-5}	....	3×10^{-6}
If it is known that Sr 90, I 125, I 126, I 129, (I 131, I 133, table II only), Pb 210, Po 210, Ra 223, Ra 226, Ra 228, Pa 231, Th-nat, Cm 248, Cf 254, and Fm 256 are not present	....	6×10^{-5}	....	2×10^{-6}
If it is known that Sr 90, I 129, (I 125, I 126, I 131, table II only), Pb 210, Ra 226, Ra 228, Cm 248, and Cf 254 are not present	....	2×10^{-4}	....	6×10^{-6}
If it is known that (I 129, table II only), Ra 226, and Ra 228 are not present	....	3×10^{-3}	....	1×10^{-4}
☆☆ If it is known that alpha-emitters and Sr 90, I 129, Pb 210, Ac 227, Ra 228, Pa 230, Pu 240, and Bk 240 are not present	3×10^{-9}	....	1×10^{-10}	....
If it is known that alpha-emitters and Pb 210, Ac 227, Ra 228, and Pu 241 are not present	3×10^{-10}	....	1×10^{-11}	....

25 FR 13952

4. If the mixture of radionuclides consists of uranium and its daughter products in ore dust prior to chemical processing of the uranium ore, the values specified below may be used in lieu of those determined in accordance with paragraph 1 above or those specified in paragraphs 2 and 3 above.

a. For purposes of Table I, Col. 1—1×10^{-10} μc/ml gross alpha activity; or 2.5×10^{-11} μc/ml natural uranium; or 75 micrograms per cubic meter of air natural uranium.

b. For purposes of Table II, Col. 1—3×10^{-12} μc/ml gross alpha activity; or 8×10^{-13} μc/ml natural uranium; or 3 micrograms per cubic meter of air natural uranium.

26 FR 11046

5. For purposes of this note, a radionuclide may be considered as not present in a mixture if (a) the ratio of the concentration of that radionuclide in the mixture (C_A) to the concentration limit for that radionuclide specified in Table II of Appendix "B" (MPC_A) does not exceed 1/10, (i.e. $\frac{C_A}{MPC_A}\leq\frac{1}{10}$) and (b) the sum of such ratios for all the radionuclides considered as not present in the mixture does not exceed ¼ i.e.

$$\frac{C_A}{MPC_A}+\frac{C_B}{MPC_B}+\ldots\ldots\leq\frac{1}{4}).$$

*Revised 30 FR 15801
**ERRATUM: This line should read:
"210, Ac 227, Ra 228, Pa 230, Pu 241, and Bk 249 are not"

NOTE: For purposes of §§ 20.203 and 20.304, where there is involved a combination of isotopes in known amounts the limit for the combination should be derived as follows: Determine, for each isotope in the combination, the ratio between the quantity present in the combination and the limit otherwise established for the specific isotope when not in combination. The sum of such ratios for all the isotopes in the combination may not exceed "1" (i.e., "unity").

EXAMPLE: For purposes of § 20.304, if a particular batch contains 2,000 μc of Au^{198} and 25,000 μc of C^{14}, it may also include not more than 3,000 μc of I^{131}. This limit was determined as follows:

$$\frac{2{,}000\ \mu c\ Au^{198}}{10{,}000\ \mu c}+\frac{25{,}000\ \mu c\ C^{14}}{50{,}000\ \mu c}+\frac{3{,}000\ \mu c\ I^{131}}{10{,}000\ \mu c}=1$$

The denominator in each of the above ratios was obtained by multiplying the figure in the table by 1,000 as provided in § 20.304.

UNITED STATES ATOMIC ENERGY COMMISSION

RULES and REGULATIONS ○ TITLE 10 - ATOMIC ENERGY

PART 34

LICENSES FOR RADIOGRAPHY AND RADIATION SAFETY REQUIREMENTS FOR RADIOGRAPHIC OPERATIONS

30 FR 8185

§ 34.1 Purpose and scope.

This part prescribes requirements for the issuance of licenses for the use of sealed sources containing byproduct material and radiation safety requirements for persons using such sealed sources in radiography. The provisions and requirements of this part are in addition to, and not in substitution for, other requirements of this chapter. In particular, the provisions of Part 30 of this chapter apply to applications and licenses subject to this part. Nothing in this part shall apply to uses of byproduct material for medical diagnosis or therapy.

§ 34.2 Definitions.

As used in this part:

(a) "Radiography" means the examination of the structure of materials by nondestructive methods, utilizing sealed sources of byproduct materials;

(b) "Radiographer" means any individual who performs or who, in attendance at the site where the sealed source or sources are being used, personally supervises radiographic operations and who is responsible to the licensee for assuring compliance with the requirements of the Commission's regulations and the conditions of the license;

(c) "Radiographer's assistant" means any individual who, under the personal supervision of a radiographer, uses radiographic exposure devices, sealed sources or related handling tools, or radiation survey instruments in radiography;

(d) "Radiographic exposure device" means any instrument containing a sealed source fastened or contained therein, in which the sealed source or shielding thereof may be moved, or otherwise changed, from a shielded to unshielded position for purposes of making a radiographic exposure;

(e) "Sealed source" means any byproduct material that is encased in a capsule designed to prevent leakage or escape of the byproduct material;

(f) "Storage container" means a device in which sealed sources are transported or stored.

§ 34.3 Applications for specific licenses.

Applications for specific licenses for use of sealed sources in radiography shall be filed on Form AEC 313R, "Application for Byproduct Material License—Use of Sealed Sources in Radiography."

Subpart A—Specific Licensing Requirements

§ 34.11 Issuance of specific licenses for use of sealed sources in radiography.

An application for a specific license for use of sealed sources in radiography will be approved if:

(a) The applicant satisfies the general requirements specified in § 30.33 of this chapter;

(b) The applicant will have an adequate program for training radiographers and radiographers' assistants and submits to the Commission a schedule or description of such program which specifies the:

(1) Initial training;

(2) Periodic training;

(3) On-the-job training;

(4) Means to be used by the licensee to determine the radiographer's knowledge and understanding of and ability to comply with Commission regulations and licensing requirements, and the operating and emergency procedures of the applicant; and

(5) Means to be used by the licensee to determine the radiographer's assistant's knowledge and understanding of and ability to comply with the operating and emergency procedures of the applicant;

(c) The applicant has established and submits to the Commission satisfactory written operating and emergency procedures as described in § 34.32;

(d) The applicant will have an adequate internal inspection system, or other management control, to assure that Commission license provisions, Commission regulations, and the applicant's operating and emergency procedures are followed by radiographers and radiographers' assistants;

(e) The applicant submits a description of its over-all organizational structure pertaining to the radiography program, including specified delegations of authority and responsibility for operation of the program; and

(f) The applicant who desires to conduct his own leak tests has established adequate procedures to be followed in leak testing sealed sources, for possible leakage and contamination and submits to the Commission a description of such procedures including:

(1) Instrumentation to be used,

(2) Method of performing test, e.g., points on equipment to be smeared and method of taking smear, and

(3) Pertinent experience of the person who will perform the test.

Subpart B—Radiation Safety Requirements

EQUIPMENT CONTROL

§ 34.21 Limits on levels of radiation for radiographic exposure devices and storage containers.

Radiographic exposure devices measuring less than four (4) inches from the sealed source storage position to any exterior surface of the device shall have no radiation level in excess of 50 milliroentgens per hour at six (6) inches from any exterior surface of the device. Radiographic exposure devices measuring a minimum of four (4) inches from the sealed source storage position to any exterior surface of the device, and all storage containers for sealed sources or for radiographic exposure devices, shall have no radiation level in excess of 200 milliroentgens per hour at any exterior surface, and ten (10) milliroentgens per hour at one meter from any exterior surface. The radiation levels specified are with the sealed source in the shielded (i.e., "off") position.

§ 34.22 Locking of radiographic exposure devices and storage containers.

30 FR 8185

Each radiographic exposure device shall be provided with a lock or outer locked container designed to prevent unauthorized or accidental removal or exposure of a sealed source and shall be kept locked at all times except when under the direct surveillance of a radiographer or radiographer's assistant, or as may be otherwise authorized pursuant to § 34.41. Each storage container likewise shall be provided with a lock and kept locked when containing sealed sources except when the container is under the direct surveillance of a radiographer or radiographer's assistant.

§ 34.23 Storage precautions.

Locked radiographic exposure devices and storage containers shall be physically secured to prevent tampering or removal by unauthorized personnel.

§ 34.24 Radiation survey instruments.

The licensee shall maintain sufficient calibrated and operable radiation survey instruments to make physical radiation surveys as required by this part and Part 20 of this chapter. Each radiation survey instrument shall be calibrated at intervals not to exceed three (3) months and after each instrument servicing and a record maintained of the latest date of calibration. Instrumentation required by this section shall have a range such that two milliroentgens per hour through one roentgen per hour can be measured.

§ 34.25 Leak testing, repair, tagging, opening, modification and replacement of sealed sources.

(a) The replacement of any sealed source fastened to or contained in a radiographic exposure device and leak testing, repair, tagging, opening or any other modification of any sealed source shall be performed only by persons specifically authorized by the Commission to do so.

(b) Each sealed source shall be tested for leakage at intervals not to exceed 6 months. In the absence of a certificate from a transferor that a test has been made within the 6 months prior to the transfer, the sealed source shall not be put into use until tested.

(c) The leak test shall be capable of detecting the presence of 0.005 microcurie of removable contamination on the sealed source. An acceptable leak test for sealed sources in the possession of a radiography licensee would be to test at the nearest accessible point to the sealed source storage position, or other appropriate measuring point, by a procedure to be approved pursuant to § 34.11 (f). Records of leak test results shall be kept in units of microcuries and maintained for inspection by the Commission.

(d) Any test conducted pursuant to paragraphs (b) and (c) of this section which reveals the presence of 0.005 microcurie or more of removable radioactive material shall be considered evidence that the sealed source is leaking. The licensee shall immediately withdraw the equipment involved from use and shall cause it to be decontaminated and repaired or to be disposed of, in accordance with Commission regulations. A report shall be filed, within 5 days of the test, with the Director, Division of Materials Licensing, U.S. Atomic Energy Commission, Washington, D.C., 20545, describing the equipment involved, the test results, and the corrective action taken. A copy of such report shall be sent to the Director of the appropriate Atomic Energy Commission Regional Compliance Office listed in Appendix D of Part 20 of this chapter "Standards for Protection Against Radiation."

(e) A sealed source which is not fastened to or contained in a radiographic exposure device shall have permanently attached to it a durable tag at least one (1) inch square bearing the prescribed radiation caution symbol in conventional colors, magenta or purple on a yellow background, and at least the instructions: "Danger—Radioactive Material—Do Not Handle—Notify Civil Authorities if Found."

§ 34.26 Quarterly inventory.

Each licensee shall conduct a quarterly physical inventory to account for all sealed sources received and possessed under his license. The records of the inventories shall be maintained for inspection by the Commission, and shall include the quantities and kinds of byproduct material, location of sealed sources, and the date of the inventory.

§ 34.27 Utilization logs.

Each licensee shall maintain current logs, which shall be kept available for inspection by the Commission at the address specified in the license, showing for each sealed source the following information:

(a) A description (or make and model number) of the radiographic exposure device or storage container in which the sealed source is located;

(b) The identity of the radiographer to whom assigned; and

(c) The plant or site where used and dates of use.

PERSONAL RADIATION SAFETY REQUIREMENTS FOR RADIOGRAPHERS AND RADIOGRAPHERS' ASSISTANTS

§ 34.31 Limitations.

(a) The licensee shall not permit any person to act as a radiographer until such person:

(1) Has been instructed in the subjects outlined in Appendix A of this part and shall have demonstrated understanding thereof;

(2) Has received copies of and instruction in the regulations contained in this part and the applicable sections of Part 20 of this chapter, AEC license(s), and the licensee's operating and emergency procedures, and shall have demonstrated understanding thereof; and

(3) Has demonstrated competence to use the radiographic exposure devices, sealed sources, related handling tools and survey instruments which will be employed in his assignment.

(b) The licensee shall not permit any person to act as a radiographer's assistant until such person:

(1) Has received copies of and instructions in the licensee's operating and emergency procedures, and shall have demonstrated understanding thereof; and

(2) Has demonstrated competence to use under the personal supervision of the radiographer the radiographic exposure devices, sealed sources, related handling tools and radiation survey instruments which will be employed in his assignment.

§ 34.32 Operating and emergency procedures.

The licensee's operating and emergency procedures shall include instructions in at least the following:

(a) The handling and use of licensed sealed sources and radiographic exposure devices to be employed such that no person is likely to be exposed to radiation doses in excess of the limits established in Part 20 of this chapter "Standards for Protection Against Radiation";

(b) Methods and occasions for conducting radiation surveys;

(c) Methods for controlling access to radiographic areas;

(d) Methods and occasions for locking and securing radiographic exposure devices, storage containers and sealed sources;

(e) Personnel monitoring and the use of personnel monitoring equipment;

(f) Transporting sealed sources to field locations, including packing of radiographic exposure devices and storage containers in the vehicles, posting of vehicles and control of the sealed sources during transportation;

(g) Minimizing exposure of persons in the event of an accident;

(h) The procedure for notifying proper persons in the event of an accident; and

(i) Maintenance of records.

§ 34.33 Personnel monitoring control.

(a) The licensee shall not permit any person to act as a radiographer or as a radiographer's assistant unless, at all times during radiographic operations, each such person shall wear a film badge and either a pocket dosimeter or pocket chamber. Pocket dosimeters and pocket chambers shall be capable of measuring doses from zero to at least 200 milliroentgens. A film badge shall be assigned to and worn by only one person.

(b) Pocket dosimeters and pocket chambers shall be read and doses recorded daily. A film badge shall be immediately processed if a pocket chamber or pocket dosimeter is discharged beyond its range. The film badge reports received from the film badge processor and records of pocket dosimeter and pocket chamber readings shall be maintained for inspection by the Commission.

30 FR 8185

PRECAUTIONARY PROCEDURES IN RADIOGRAPHIC OPERATIONS

§ 34.41 Security.

During each radiographic operation the radiographer or radiographer's assistant shall maintain a direct surveillance of the operation to protect against unauthorized entry into a high radiation area, as defined in Part 20 of this chapter, except (a) where the high radiation area is equipped with a control device or an alarm system as described in § 20.203(c)(2) of this chapter, or (b) where the high radiation area is locked to protect against unauthorized or accidental entry.

§ 34.42 Posting.

Notwithstanding any provisions in § 20.204(c) of this chapter, areas in which radiography is being performed shall be conspicuously posted as required by § 20.203 (b) and (c)(1) of this chapter.

§ 34.43 Radiation surveys and survey records.

(a) No radiographic operation shall be conducted unless calibrated and operable radiation survey instrumentation as described in § 34.24 is available and used at each site where radiographic exposures are made.

(b) A physical radiation survey shall be made after each radiographic exposure during a radiographic operation to determine that the sealed source has been returned to its shielded condition.

(c) A physical radiation survey shall be made to determine that each sealed source is in its shielded condition prior to securing the radiographic exposure device and storage container as specified in § 34.22.

(d) Records shall be kept of the surveys required by paragraph (c) of this section and maintained for inspection by the Commission.

EXEMPTIONS

§ 34.51 Applications for exemptions.

The Commission may, upon application by any licensee or upon its own initiative, grant such exemptions from the requirements of the regulations in this part as it determines are authorized by law and will not result in undue hazard to life or property.

APPENDIX A

I. Fundamentals of radiation safety.
A. Characteristics of gamma radiation.
B. Units of radiation dose (mrem) and quantity of radioactivity (curie).
C. Hazards of excessive exposure of radiation.
D. Levels of radiation from licensed material.
E. Methods of controlling radiation dose.
1. Working time.
2. Working distances.
3. Shielding.
II. Radiation detection instrumentation to be used.
A. Use of radiation survey instruments.
1. Operation.
2. Calibration.
3. Limitations.
B. Survey techniques.
C. Use of personnel monitoring equipment.
1. Film badges.
2. Pocket dosimeters.
3. Pocket chambers.
III. Radiographic equipment to be used.
A. Remote handling equipment.
B. Radiographic exposure devices.
C. Storage containers.
IV. The requirements of pertinent Federal Regulations.
V. The licensee's written operating and emergency procedures.

RADIOGRAPHY FORMULAS AND EQUATIONS

1. $EF \times D^2 = T$ (Exposure time)

2. $$\frac{T_1}{T_2} = \frac{D_1^2}{D_2^2}$$

3. $$\frac{MAS\ 1}{MAS\ 2} = \frac{D_1^2}{D_2^2}$$

4. $$\frac{I_1}{I_2} = \frac{D_2^2}{D_1^2}$$

5. $$\frac{TS}{D^2} = EF$$

Where:

FF or EF = Film factor or exposure factor
D = Distance (source to film)
I = Radiation intensity
T = Time (exposure time)
TS = Time x source strength

Some rules involving algebraic expressions:

Monomial - Algebraic expression with one term
Binomial - Algebraic expression with two terms
Polynomial - Algebraic expression with two or more terms
Algebraic expressions - Group of literal numbers and symbols that stand for a number
Term - Algebraic expression whose parts are not separated by plus or minus signs
Symbols - Plus, minus signs
Literal number - Letter that stands for a number
Absolute value of a signed number - The value of a signed number
Negative number - Shows minus sign before number
Signed number - Shows plus or minus before number

SHIELDING EQUATIONS AND LOGARITHMS

Information
Sheet # 8

Logarithmic method of determining half value and tenth value layers

$$N = \text{LOG} \frac{I_1}{I_2}$$

Where:
N= Number of TVL's
I_1 = Intensity of the incident radiation at a point
I_2 = Intensity of the emergent radiation at the same point

$$M = 3.3 \ \text{LOG} \frac{I_1}{I_2}$$

Where:
M= Number of half value layers

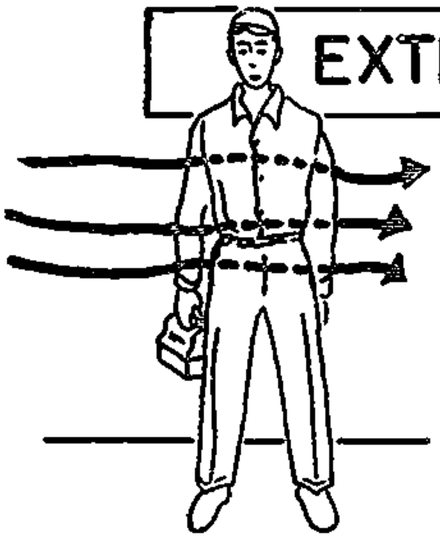
PAIR PRODUCTION

Information Sheet
on
PHYSICAL RADIATION EFFECTS

EXTERNAL RADIATION HAZARD



Some radiation goes through the body like X-rays, gamma rays and neutrons. (Beta particles to limited extent.)

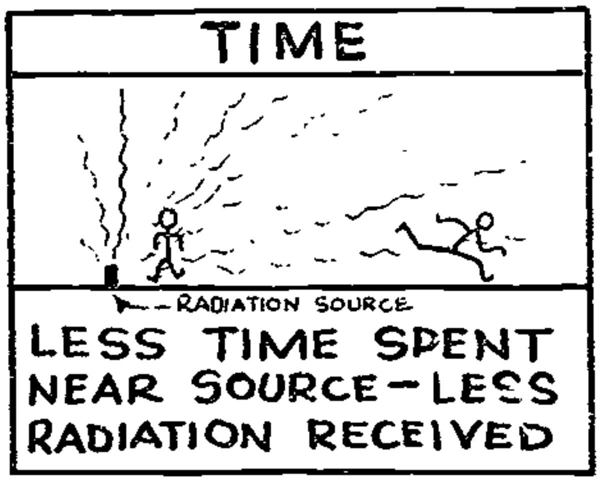
INTERNAL RADIATION HAZARD

We can receive radiation by swallowing or breathing radioactive materials. Includes alpha particles, beta particles and gamma ray emitter.

Information
Sheet # 11

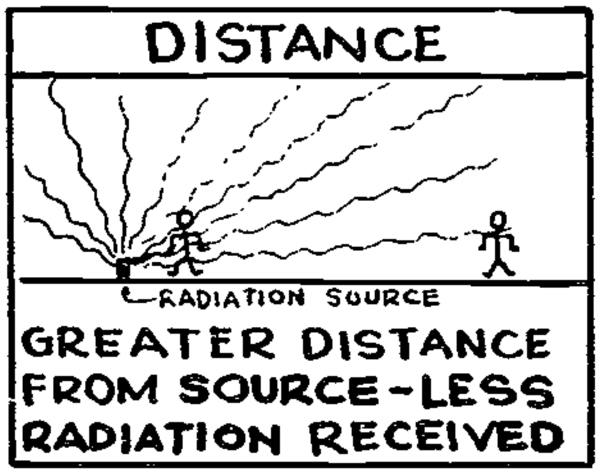
Information Sheet
on
RADIATION PROTECTION FACTORS

1.



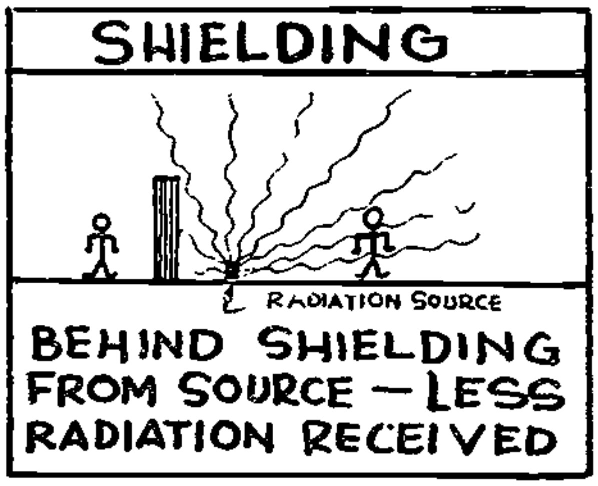
1. Radiation dose directly proportional to time

2.



2. Intensity of radiation is proportional to the inverse square law of the distance from the source

3.



3. Density and thickness of the shielding material and the intensity and energy of the source are factors in radiation exposure

140	21.6	21.3	21.1	20.9	20.6					

COBALT^{60} , HALF- LIFE 5. 27 YEARS

The exposure time is multiplied by a coefficient to compensate for the age of Cobalt^{60} dated from its removal from the reactor. Consider the date of the source and increase the time accordingly.

Age in Months	Coefficient	Age in Months	Coefficient
6	1.07	66	1.51
12	1.13	72	1.54
18	1.18	78	1.57
24	1.23	84	1.60
30	1.28	90	1.62
36	1.32	96	1.65
42	1.37	102	1.68
48	1.41	108	1.69
54	1.45	114	1.71
60	1.48	120	1.73

^{192}IRIDIUM , HALF-LIFE 74.27 DAYS

To find source strength at any number of months after known source strength at calibration multiply, by the above percentages. For example:
1. Given: 100,000 millicuries. Required: activity after 20 months. Solution. 100,000 millicuries is 100 curies. .32% is .0032. Whence 100 x .0032 equals .32 curies, .32 curies x 100 equals 320 millicuries.
2. Given: 100 curies. Required: source strength after 29 months. Read directly from table. Answer: .02 curies.

Months	Percent	Months	Percent	Months	Percent
0	100.0	10	5.9	20	.32
1	74.5	11	4.2	21	.23
2	59.4	12	3.2	22	.17
3	41.5	13	2.3	23	.13
4	31.5	14	1.7	24	.09
5	23.3	15	1.3	25	.07
6	16.5	16	.88	26	.06
7	13.2	17	.75	27	.04
8	8.8	18	.59	28	.03
9	7.5	19	.42	29	.02

COMPARISON OF RADIATION FIELDS

Radiation field of one curie at different distances in milliroentgens per hour.

Source	1 ft.	2 ft.	4 ft.	8 ft.	16 ft.	32 ft.

FIELD TRIP INSTRUCTION SHEET

Students will sign the register provided, take a pair of safety glasses (unless your own glasses have safety lens), be assigned to a company guide, follow the guide's instructions and the company rules throughout the tour.

Safety consideration such as the following should be remembered:

1. Do not pickup any metal chips; they may be hot.
2. Do not touch parts in process or just removed(they are hot).
3. Do not look at arc welding.
4. Follow close to the guide at all times and do not go off the tour path; some areas are dangerous.
5. Be aware of moving vehicles, overhead cranes, conveyors, and material handling equipment.
6. Do not talk to operators or distract them from their jobs.
7. Listen to what your guide has to say and if you see a process that you do not understand, ask questions and take notes.
8. Wear your safety glasses at all times while in the plant.
9. Take note book and pencil.
10. Do not talk while guide is talking to group.

Nondestructive Testing Symbols
MIL-STD-23A

1. This standard has been approved by the Departments of the Army, the Navy, and the Air Force, and establishes the symbols for use on drawings to specify nondestructive tests for determining the soundness of materials.

2. The Munitions Board Standards Agency on 25 August 1952 approved the revision of this standard for printing.

3. In accordance with established procedure the Munitions Board Standards Agency has designated the Ordnance Corps, Bureau of Ships, and the Department of the Air Force, respectively, as Army-Navy-Air Force custodians of this standard.

4. This revised standard is mandatory for use effective 25 August 1952. Where repeated deviation from the approved Military Standard is granted by a department, a report shall be made to the Munitions Board Standards Agency by that department with the reasons for deviation.

5. Recommended corrections, additions, or deletions should be addressed to the Director, Munitions Board Standards Agency, Washington 25, D. C.

TABLE

MIL-STD 23A
25 August 1952

SUPERSEDING
MIL-STD-23
27 November 1950

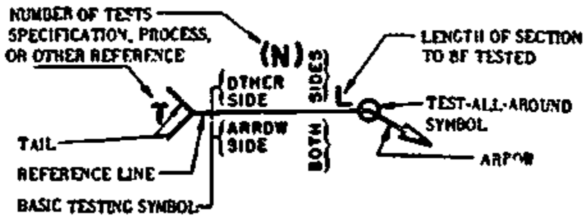
1. BASIC SYMBOLS

1.1 BASIC TESTING SYMBOLS. Basic Nondestructive Testing symbols shall be as shown in table I.

TYPE OF TEST	SYMBOL
RADIOGRAPHIC	RT
MAGNETIC-PARTICLE	MT
PENETRANTS	PT
ULTRASONIC	UT

1.2 ELEMENTS OF THE TESTING SYMBOL. The assembled testing symbol consists of the following elements. Such of these elements as are necessary shall be used and shall have standard locations with respect to each other as shown on figure 1.

- Reference Line
- Arrow
- Basic Testing symbol
- Test-all-around symbol
- (N) Number of Tests
- Tail
- Extent of test
- Specification, process, or other reference

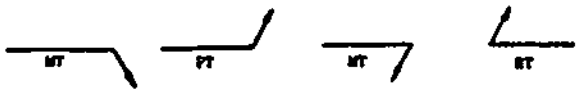


2. GENERAL PROVISIONS

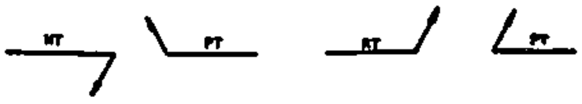
2.1 SIGNIFICANCE OF ARROW. The arrow shall connect the reference line to the part to be tested. The side of the part to be tested, to which the arrow points shall be considered the arrow side of the part. The side opposite the arrow side of the part shall be considered the other side.

2.2 LOCATION OF TESTING SYMBOL.

2.2.1 Tests to be made on the arrow side of the part shall be indicated by the test symbol on the side of the reference line toward the reader as follows:

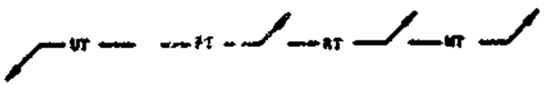


2.2.2 Tests to be made on the other side of the part shall be indicated by the test symbol on the side of the reference line away from the reader as follows:

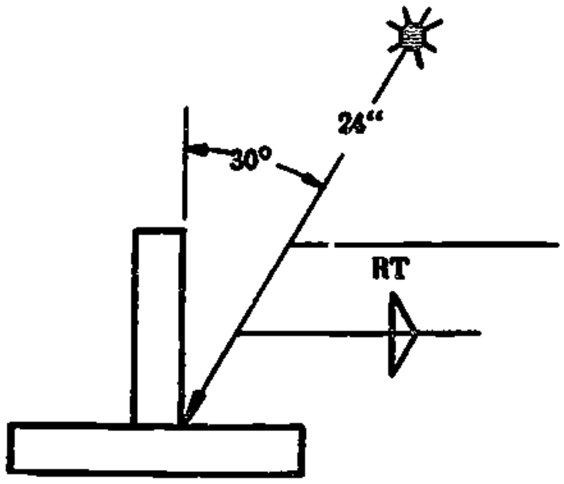


2.2.3 Tests to be made on both sides of the part shall be indicated by test symbols on both sides of the reference line, as follows:

2.2.4 When nondestructive testing symbols have no arrow or other-side significance, the testing symbols shall be centered on the reference line as follows:

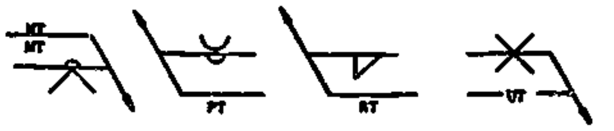


2.3 DIRECTION OF RADIATION. When specified, the location of the source of radiation and the direction of radiation shall be shown in conjunction with radiographic testing symbol. The location of the source of radiation shall be indicated by a symbol located on the drawing at the desired source of radiation, connected, and oriented as necessary by dimensions, as shown on figure 2.

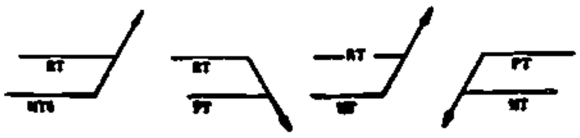


2.4 COMBINATION OF NONDESTRUCTIVE TESTING SYMBOLS AND WELDING SYMBOLS

2.4.1 Nondestructive testing symbols and welding symbols may be combined as follows:



2.4.2 Nondestructive testing symbols may be combined as follows:



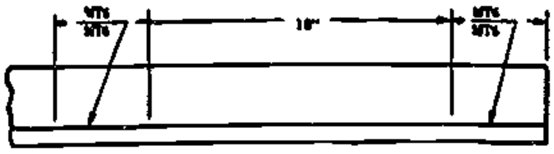
2.5 USE OF REFERENCES. Specifications, process, classification, or other references need not be used on testing symbols when the testing procedure is prescribed elsewhere. When a specification, process, classification, or other reference is used with a testing symbol, the reference shall be placed in the tail, as follows:

3. METHODS OF SPECIFYING EXTENT OF NONDESTRUCTIVE TESTS

3.1 SPECIFYING LENGTH OF SECTION TO BE TESTED

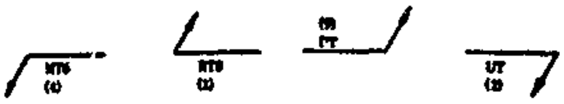
3.1.1 To specify tests of welds or parts where only length of section need be considered, the length in inches shall be shown to the right of the basic test symbol, as follows:

3.1.2 To show the exact location of a section to be tested as well as its length, dimension lines shall be used as follows:



3.1.3 When the full length of a part is to be tested, no length dimension need be shown on the testing symbol.

3.2 SPECIFYING NUMBER OF TESTS. To specify a number of tests to be taken at random, the number of desired tests shall be shown in parenthesis, as follows:



3.3 SPECIFYING TESTS MADE ALL AROUND A PART. To specify tests to be made all around a part, the test-all-around symbol shall be used, as follows:

3.4 SPECIFYING TESTS OF AREAS. When required, nondestructive tests of areas shall be indicated by one of the following methods:

3.4.1 For nondestructive testing of an area represented as a plane on the drawing, the area to be tested shall be enclosed by straight broken lines having a circle at each change of direction. The testing symbol specifying the kind of nondestructive test shall be used in connection with these lines, as shown below. When necessary, these inclosures shall be located by dimensions.

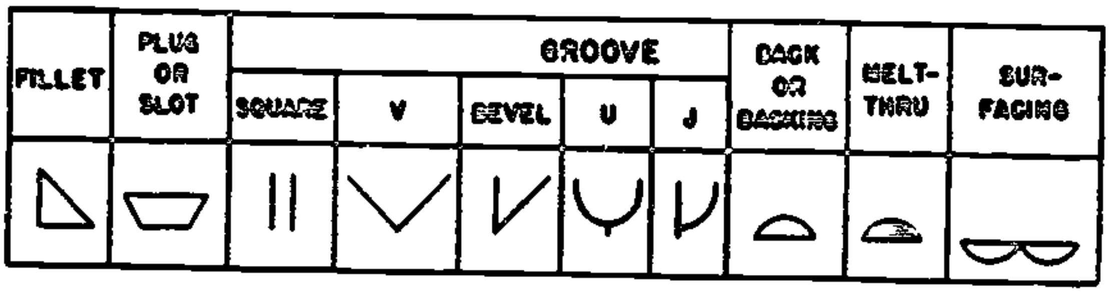
WELDING SYMBOLS AND SIZES

The first step in making a good weld is to know what the designer wants. The welding symbols used on prints are a simple, exact method of indicating welds and weld sizes, and you must be able to specify and read them correctly. Here is a brief summary of some of the more commonly used welding symbols:

Basic Arc and Gas Weld Symbols



Supplementary Symbols

WELD ALL AROUND	FIELD WELD	CONTOUR	
		FLUSH	CONVEX

TYPICAL EXPOSURE FACTOR FOR PIPE AND PLATE
(KODAK TYPE AA FILM)

Inches of Steel	Kodak "AA" Factor	Pipe Size	Pipe Square of Distance	Flat Plate
1/8	41	3"	11"	9"
1/4	48	4"	19"	16"
3/8	58	5"	30"	25"
1/2	70	6"	44"	36"
5/8	81	8"	75"	64"
3/4	97	10"	116"	100"
7/8	115	12"	163"	144"
1-	138	14"	196"	196"
1-1/8	160	16"	256"	256"
1-1/4	196	18"	324"	324"
1-3/8	230	20"	400"	400"
1-1/2	270	22"	484"	484"
1-5/8	320	24"	576"	576"
1-3/4	380	26"	676"	676"
1-7/8	450	28"	784"	784"
2-	530	30"	900"	900"
2-1/8	630	32"	1024"	1024"
2-1/4	740	34"	1156"	1156"
2-3/8	900	36"	1296"	1296"
2-1/2	1050			
2-5/8	1250			
2-3/4	1405			
2-7/8	1750			
3-	2050			

Note: These factors can be used under the following conditions:

(a) Developing time 5 minutes @ 68° F.
(b) H & D Density of base metal-1. 5
(c) Ir. 192 Gamma Radiation
(d) Radiation source must be within 1/2" of near pipe wall for exposure of far side of pipe wall.
(e) Always figure a total of 2 wall thicknesses for this type exposure because radiation is passing through both walls although exposure is made of one wall only. (This applies to pipe)
(f) Density may vary slightly depending on brand and condition of chemicals.

Note: Although nominal pipe diameter varies with the actual pipe size, this variation ceases with 14" pipe. Example: 10" pipe is actually 10. 75 inches in outside diameter; 14" pipe is 14 inches in outside diameter.

NOTICE TO EMPLOYEES SIGN

TRC Form 21-1
(3-63)

Texas State Department of Health
1100 West 49th Street
Austin 56, Texas

NOTICE TO EMPLOYEES

TEXAS REGULATIONS FOR CONTROL OF RADIATION

The Texas State Department of Health has established standards for your protection against radiation hazards, pursuant to the Texas Radiation Control Act, Art. 4590f, Revised Civil Statutes, State of Texas.

YOUR EMPLOYER'S RESPONSIBILITY

Your employer is required to--

1. Apply these regulations to work involving sources of radiation.
2. Post or otherwise make available to you a copy of the Texas State Department of Health regulations, licenses, and operating procedures which apply to work you are engaged in, and explain their provisions to you.

YOUR RESPONSIBILITY AS A WORKER

You should familiarize yourself with those provisions of the regulations and the operating procedures which apply to the work you are engaged in. You should observe their provisions for your own protection and protection of your co-workers.

WHAT IS COVERED BY THESE REGULATIONS

1. Limits on exposure to radiation and radioactive material in restricted and unrestricted areas;
2. Measures to be taken after accidental exposure;
3. Personnel monitoring, surveys and equipment;
4. Caution signs, labels, and safety interlock equipment;
5. Exposure records and reports; and
6. Related matters.

REPORTS ON YOUR RADIATION EXPOSURE HISTORY

1. The regulations require that your employer give you a written report if you receive an exposure in excess of any applicable limit as set forth in the regulations or in the license. The basic limits for exposure to employees are set forth in Section 21.101, 21.103, and 21.104 of the regulations. These sections specify limits on exposure to radiation and exposure to concentrations of radioactive material in air and water.
2. If you work where personnel monitoring is required,
   - (a) Your employer must give you a written report, upon termination of your employment, of your radiation exposures, and
   - (b) Your employer must advise you annually of your exposure to radiation.

INSPECTIONS

All licensed or registered activities are subject to inspection by representatives of the Texas State Department of Health.

INQUIRIES

Inquiries dealing with the matters outlined above can be sent to the Texas State Department of Health, Division of Occupational Health and Radiation Control, 1100 West 49th Street, Austin 56, Texas.

POSTING REQUIREMENT

Copies of this notice must be posted in a sufficient number of places in every establishment where employees are employed in activities licensed or registered pursuant to Part 41 of Texas Regulations for Control of Radiation, by the Texas State Department of Health, to permit employees working in or frequenting any portion of a restricted area to observe a copy on the way to or from their place of employment.

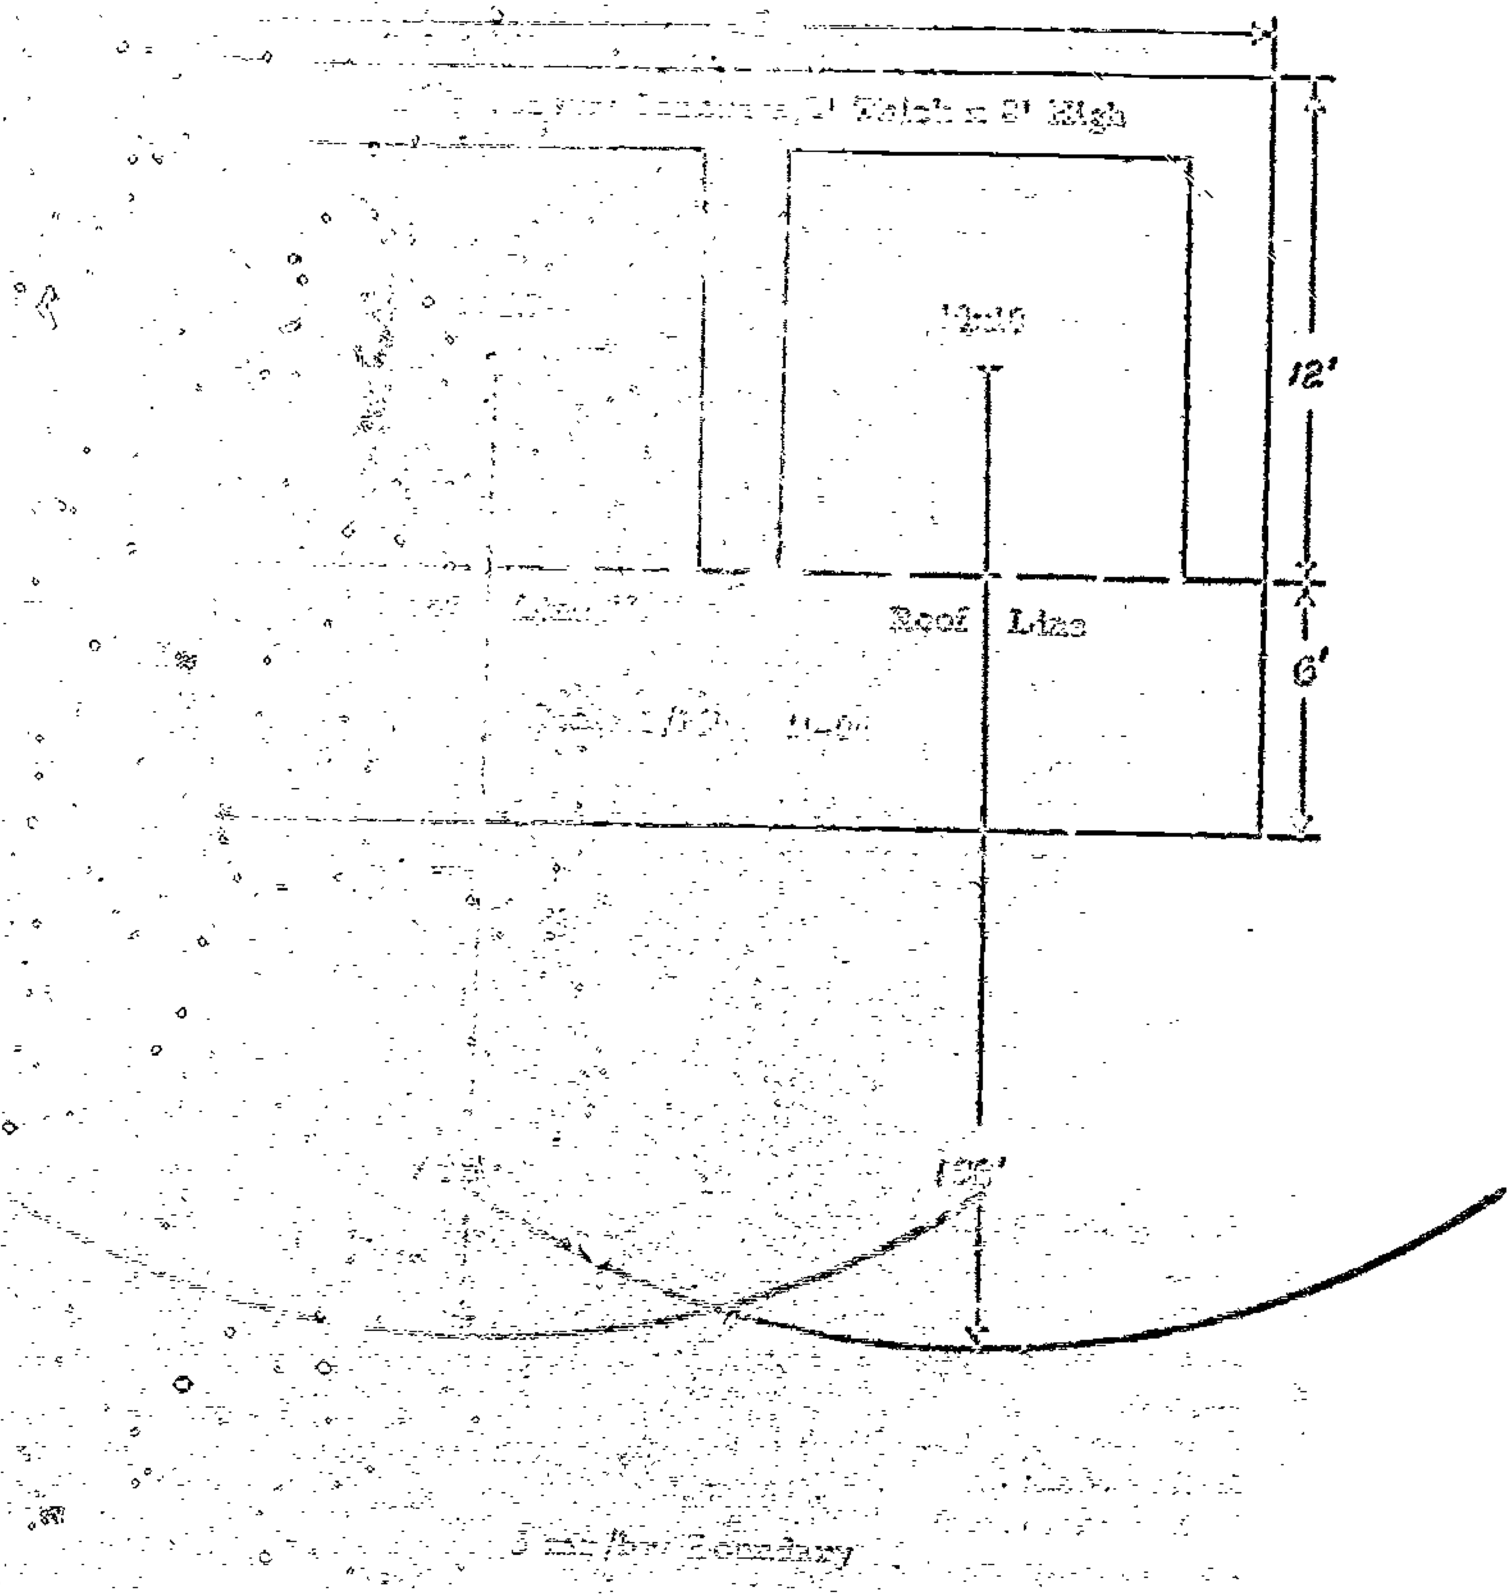
9. X-Ray generator.
10. Gamma Ray exposure device.
11. Cooling water taps for X-Ray head.

Note: Lead sheets on floor and walls are desirable, expecially in X-Ray exposure room, to reduce scatter. If this facility is built inside a building containing upper floors it may be necessary to provide a permanent roof to shield the floors above this facility. If built as a separate building, an attenuation survey should include the roof. Warning signs and a fence around the roof are desirable.

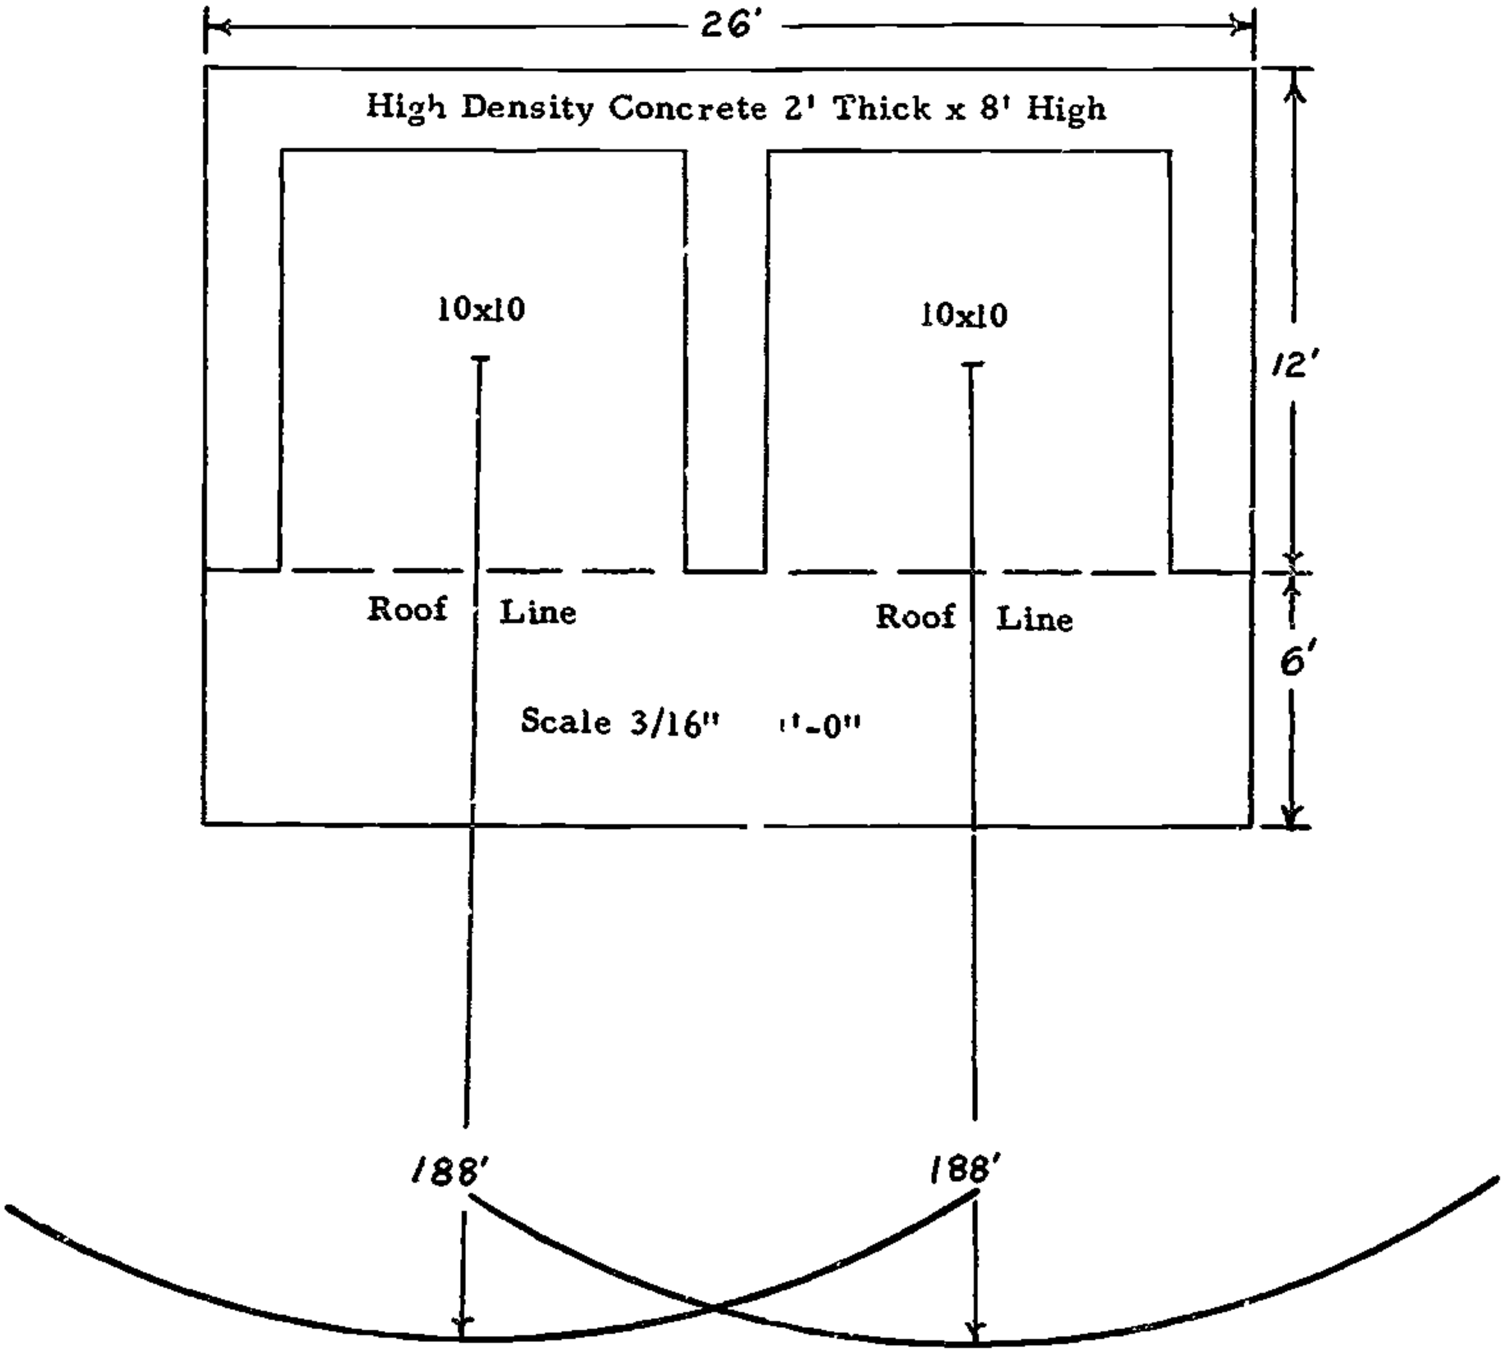
INDOOR FACILITIES



[illegible] equals 10,000 [illegible] in. 192.

[illegible] in center of cell, reading at outside surface of [illegible]

[illegible] FACILITIES



5 mr/hr Boundary

Attenuation factor for 24" concrete equals 10,000 for ir. 192.

With 30 curies ir. 192 positioned in center of cell, reading at outside surface of walls would be less than 1/2 mr/hr.

GLOSSARY

"A": Symbol for mass number, that is, the number of the protons in the nucleus; hence the number of positive charges on the nucleus. The mass number is approximately equal to the atomic weight. For example: "A" is 1 for hydrogen, 2 for deuterium and 235 for uranium.

ABSORPTION: Act or process of being absorbed - being taken in

ACTUATING: Putting into action

A. E. C.: U. S. Atomic Energy Commission

ALPHA RAY: Stream of fast-moving helium nuclei (alpha particles). A strongly ionizing and weakly penetrating radiation.

ANGSTROM UNIT: A minute unit of length equal to one ten-thousandth of a micron or one one-hundred millionth of a centimeter, used in expressing the length of light waves.

ANODE: Positive electrode; electrode to which negative ions are attracted

A. S. M. E.: American Society of Mechnical Engineers

A. S. T. M.: American Society for Testing Materials

ATOM: The basic building block of nature and the smallest particle that can enter into a chemical reaction. The atom can be subdivided and consists of an inner core or nucleus make up by neutrons and protons, surrounded by electrons which rotate around this nucleus like planets around the sun

ATOMIC NUMBER: The number of protons (positively charged particles) found in the nucleus of an atom. All elements have different atomic numbers. The atomic number of hydrogen is 1, that of oxygen 8, iron 26, lead 82, uranium 92. The atomic number is also called charge number and is usually denoted by Z.

ATOMIC WEIGHT: The atomic weight is approximately the sum of the number of protons and neutrons found in the nucleus of an atom. This sum is also called mass number. The atomic weight of oxygen, for example, is approximately 16, with most oxygen atoms containing 8 neutrons plus 8 protons. Aluminum is 27 - it contains 14 neutrons and 13 protons.

ATTENUATION: The process by which a beam of radiation is reduced in intensity when passing through some material.

AUTORADIOGRAPHY: Self-portraits of radioactive sources made by placing the radioactive material next to photographic film. The radiations fog the film leaving an image of the source. It was such self-portraits that led to the discovery of radioactivity.

AVERAGE LIFE: (MEAN LIFE): The average of the individual lives of all the atoms of a particular radioactive substance. It is 1.443 times the radioactive half-life.

A.W.S.: American Welding Society

BACKGROUND RADIATION: This is due to cosmic rays from outer space, small amounts of radioactive substances present in our bodies and in many of the materials surrounding us

BACKSCATTER The deflection of radiation by scattering processes through angles greater than 90 degrees with respect to the original direction of motion

BETA PARTICLE Charged particle emitted from the nucleus of an atom and having a mass and charge equal in magnitude to those of the electron.

BINDING ENERGY: The energy which holds the neutrons and protons of an atomic nucleus together.

BREMSSTRAHLUNG: Secondary photon radiation produced by deceleration of charged particles passing through matter

CALIBRATION: Determination of variation from standard, or accuracy of a measuring instrument to ascertain necessary factors

CASSETTE A holder for film

CATHODE: Negative electrode, electrode to which positive ions are attracted

CESIUM -137: An isotope of the element cesium having a mass number of 137. One of the important fission products and a constituent of fallout. It has a half-life of 33 years.

CHAMBER, IONIZATION: Ion chambers are filled with gas (often air) and are provided with two oppositely charged electrodes. They differ from Geiger counters in simply collecting the electric charge on the ions that radiation produces in the gas.
The collected ions produce a minute electrical current, which may be detected directly by a sensitive electrometer or may be amplified to give a meter reading. This current is a measure of the radiation.

COBALT - 60: A radioactive isotope of the element cobalt. Cobalt-60 is important as one of the least expensive sources of gamma radiation and is used widely in radiography.

COLLIMATOR: A device for confining the elements of a beam within an assigned solid angle (A device for directing the useful radiation into a more or less parallel beam.)

COMPATIBLE: Capable of coexisting in harmony

COMPTON EFFECT: The glancing collision of a gamma ray with an electron. The gamma ray gives up part of its energy to the electron. The name is taken from the discoverer, Dr. Arthur Compton .

CONTAMINATION: Disposition of radioactive material, generally in a finely divided or liquid form in any place where it is not desired and will produce a hazard to personnel.

CORPUSCULAR RADIATION: A general term given those types of radiation which consist of particles such as alpha and beta radiation.

COSMIC RADIATION: Extremely high energy radiation consisting of both particles and rays which originate out in space and constantly bombard the earth. Cosmic radiation has great penetrating ability in all materials.

COUNTER, PROPORTIONAL: Gas filled radiation detection tube in which the pulse produced is proportional to the number of ions formed in the gas by the primary ionizing particle.

CURIE That quantity of radioactive nuclide disintegrating at the rate of 37 billion atoms per second (abbreviated: c.)

DECAY CURVE: A curve showing the relative amount of radioactive substance remaining after any time interval.

DECAY, RADIOACTIVE. When a radioactive atom disintegrates it is said to decay. What remains is a different element. An atom of polonium decays to form lead, ejecting an alpha particle in the process.

DECONTAMINATION: The removal, by physical or chemical means, of unwanted radioactive material from a surface.

DENSITOMETER: Instrument utilizing a photocell to determine the degree of darkening of developed photographic film.

DENSITY (Photographic) Denotes the degree of darkening of photographic film. (Physics) Ratio of the mass of a homogeneous portion of matter to its volume.

DICHROIC: Having the property of presenting colors in two different directions, by transmitted light.

DISINTEGRATE: When a radioactive atom gives off its excess energy in the form of radiation it is said to disintegrate.

DOSE, PERMISSIBLE: The amount of radiation which may be received by an individual within a specified period with expectation of no significantly harmful result to himself.

DOSE RATE. The radiation dose delivered to the body in a certain period of time. Rate of any radiation energy absorption per gram of any material.

DOSE RATE METER Any instrument which measures radiation dose rate.

DOSIMETER: Instrument used to detect and measure an accumulated dosage of radiation. In common usage it is a pencil-sized ionization chamber with a built-in self-reading electrometer, used for personnel monitoring.

DROSS: The scum or waste matter from molten ore or metal.

ELECTROMETER: Electrostatic instrument for measuring change of electric potential of charged electrodes resulting from ionization produced by radiation.

ELECTRON: Negatively charged particle which is a constitutent of every neutral atom.

ELECTRON, SECONDARY: An electron ejected from an atom, molecule, or surface as a result of a collision with a charged particle or photon.

ELECTROSCOPE: Instrument for detecting the presence of electric charges by the deflection of charged bodies.

ELEMENT: A basic substance consisting of a "family" of naturally occuring isotopes. For example, hydrogen, lead and oxygen are elements. All atoms of an element contain a definite number of protons and thus have the same atomic number.

ENCAPSULATED: Enclosed in a capsule (a small container)

ENERGY: Capacity for doing work.

ENVIRONMENTAL: Related to the external conditions and influences affecting the life and development of an organism.

EROSION: The act of being eaten or worn away.

EXTERNAL RADIATION: Exposure to radiation from radioactive sources located outside of the body.

FILM BADGE: A pack of photographic film used for approximate measurement of radiation exposure for personnel monitoring purposes. The badge may contain a filter which shields part of the film from certain types of radiation.

FILM CONTRAST: The slope or steepness of the characteristic curve of the film. It depends upon the type film, the processing it receives, and the density.

FISSION, NUCLEAR: A nuclear transformation characterized by the splitting of a nucleus into at least two other nuclei and the release of a relatively large amount of energy. The division or splitting of an atomic nucleus releasing very great amounts of heat and radioactivity.

FLAW: A crack; a gap; a defect; a fault

FLUOROSCOPY: The process of examining an object by direct observation of the fluorescence of a screen caused by radiation transmitted through the object.

FOCAL SPOT (X-rays): The part of a target of the X-ray tube which is struck by the main electron stream.

GAMMA RADIATION: Short wavelength electromagnetic radiation of nuclear origin with a range of wavelengths from about 10-8 to 10-11 cm, emitted from the nucleus.

GEIGER COUNTER: Highly sensitive gas-filled radiation-measuring device which operates at voltages sufficiently high to produce avalanche ionization.

HALF-LIFE RADIOACTIVE: Time required for a radioactive substance to lose 50% of its activity by decay. Each radionuclide has a unique half-life.

HALF-THICKNESS (HALF VALUE LAYER): The thickness of any particular material necessary to reduce the intensity of an X-ray or gamma ray beam to one-half its original value.

HEALTH PHYSICS: A name given to that branch of radiation science concerned with the protection of personnel from radiation.

INCLUSIONS: Internal discontinuities commonly encountered in radiographic work such as trapped gas or blowholes and porosity; slag; or other foreign bodies.

INTENSITY: Rate of radiation energy passing through unit surface area.

ION: Atomic particle, atom, or chemical radical bearing an electrical charge, either negative or positive.

IONIZATION: The process or the result of any process by which a neutral atom or molecule acquires either a positive or a negative charge.

IONIZATION CHAMBER: A gas filled region in an electrical field between electrodes across which a potential difference is applied.

ISODOSE CHART: Chart showing the distribution of radiation in a medium by means of lines or surfaces drawn through points receiving equal doses.

ISOTOPE: One of several nuclides having the same number of protons in their nuclei, and hence having the same atomic number, but differing in the number of neutrons, and therefore in the mass number. Almost identical chemical properties exist between isotopes of a particular element.

MEV: A unit of nuclear energy equal to 1 million electron volts.

MICROCURIE: A measure of radioactive material. One-millionth of a curie.

MILLICURIE: A measure of radioactive material. One-thousandth of a curie.

MILLIROENTGEN: (mr) A submultiple of the roentgen equal to one one-thousandth (1/1,000) of a roentgen.

MODERATOR: Material used in a nuclear reactor to moderate (slow down) neutrons from the high energies at which they are released.

MONITOR: A radiation detector used to determine whether an area is safe for workers.

MONITORING: Periodic or continuous determination of the amount of ionizing radiation or radioactive contamination present in an occupied region as a safety measure for purposes of health protection.

NONDESTRUCTIVE TESTING: Includes all possible methods of detection or measurement of the properties or performance capabilities of materials, parts, assemblies, or structures, which do not impair their serviceability.

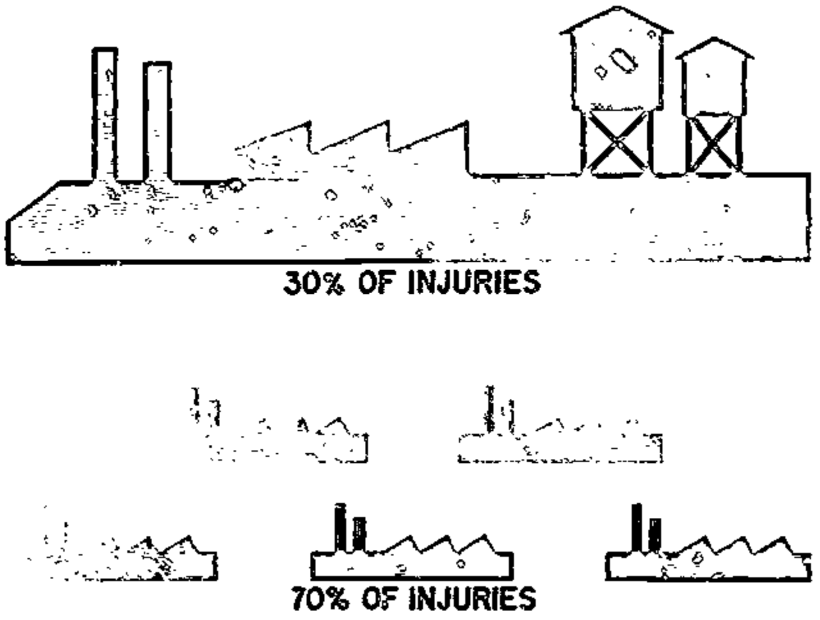
NEUTRON: Elementary nuclear particle with a mass approximately the same as that of a hydrogen atom and electrically neutral. Neutrons are divided into sub-classifications: thermal-.025 ev, epithermal-0.1 ev to 100 ev; slow-less than 100 ev; intermediate, 10^2 to 10^5 ev; fast, greater than .1 mev.

NUCLEUS: That part of an atom in which the total positive electric charge and most of the mass are concentrated.

PAIR PRODUCTION: An absorption process for X- and gamma radiation in which the incident photon is annihilated in the vicinity of the nucleus of the absorbing atom with subsequent production of an electron and positron pair.

PENETRAMETER: A standard test piece superimposed on the specimen to be radiographed to determine radiographic sensitivity by the visibility of the test piece on the finished radiograph.

NATIONAL PROBLEM



ENGINEERING
EDUCATION
ENFORCEMENT

CHART 6—SERIES A

SMALL PLANTS ARE A NATIONAL PROBLEM

Studies made over the years have established that out of 2 million disabling work injuries (per year), about 30 percent, or 600,000, were in plants which had organized safety programs; while 70 percent, or 1,400,000, occurred in plants which had no organized safety program.

It was found that these plants which had no organized safety programs were mainly small plants whose managements felt that they "could not afford" an accident-prevention program, or were "too small" for one.

THREE "E's"

In fact, no plant is "too small" for a safety program and every plant can "afford" such a program. The basic fundamentals of accident-prevention programs are the three "E's": Engineering, Education, and Enforcement.

ENGINEERING ENFORCEMENT

1. *Engineering* is to furnish information as to what is wrong and what should be done about it. (Technical know-how).
2. *Education* is the teaching of safety to all concerned. Convincing management, (a) to correct conditions found in the engi-

PHOTOELECTRIC EFFECT: Occurs when an electron is knocked out of an atom by a light ray or gamma ray. This effect is used in an "electric eye" Light falls on a sensitive surface, knocking out electrons which can then be detected.

PHOTON: A quantity of electromagnetic energy whose value in ergs is the product of its frequency in cycles per sec. and Planck's constant. (a natural constant of proportionality relating the frequency of a quantum of energy to the total energy of the quantum.)

PLATEAU: As applied to radiation detector chambers, the level portion of the counting rate-voltage curve where changes in operating voltage introduce minimum changes in the counting rate.

PLATEAU SLOPE; RELATIVE: The relative increase in the number of counts as a function of voltage expressed in percentage per 100 volts increase above the Geiger threshold

POSITRON: Particle equal in mass to the electron and having an equal but opposite charge.

PROTON: Elementary nuclear particle with a positive electric charge equal numerically to the charge of the electron and a mass of 1.007594 units.

QUANTUM THEORY: Concept that energy is radiated intermittently in units of definite magnitude called quanta, and absorbed in a like manner.

RAD: The unit of absorbed dose, which is 100 ergs/gram. The rad is a measure of the energy imparted to matter by ionizing radiation per unit mass of irradiated material at the place of interest.

RADIATION: The emission and propagation of energy through space or through a material medium in the form of waves.

RADIATION, BACKGROUND. Radiation arising from radioactive material other than the one directly under consideration. Background radiation due to cosmic rays and natural radiation is always present.

RADIOACTIVITY: Process whereby certain nuclides undergo spontaneous disintegration in which energy is liberated, generally resulting in the formation of new nuclides. The process is accompanied by the emission of one or more types of radiation, such as alpha particles, and gamma photons.

RADIOCHEMISTRY: That phase of chemistry concerned with the properties and behavior of radioactive materials.

RADIOGRAPHY: The making of radiographs or shadow images on photographic emulsion by the passage of X-rays or gamma rays through a specimen or object onto a film which, after development, provides a permanent visible record of the internal condition of the specimen or object. The shadow image is the result of the differential attenuation of the radiation in its passage through the object being radiographed.

RADIOISOTOPES: Another name for radioactive materials.

RADIUM: One of the earliest known naturally radioactive elements. It is far more radioactive than uranium and is found in the same ores.

RBE DOSE: Biological dose.

REACTOR: A nuclear reactor is an "atomic furnace". In a reactor, nuclei of the fuel are burned (i.e., undergo controlled fission) under the influence of neutrons, in a chain reaction. This energy is removed as heat which may be used to make steam for driving steam engines and to produce electricity. The moderator for the first reactor was piled-up blockes of graphite. Thus, a nuclear reactor was formerly referred to as a pile. Reactors are usually classified now as research, test, process heat and power, depending on their principal function. No workable design for a controlled fusion reactor has yet been devised.

REM: A measure of the dose to body tissue of any ionizing radiation in terms of its estimated biological effect relative to a dose of 1r. of X-rays.

RESOLVING TIME, COUNTER: The minimum time interval between two distinct events which will permit both to be counted. It may refer to an electronic circuit, to a mechanical indicating device, or to a counter tube.

ROENTGEN: The quantity of X or gamma radiation such that the associated corpuscular emission per .001293 grams of air produces, in air, ions carrying 1 electrostatic unit of quantity of electricity of either sign.

ROENTGEN EQUIVALENT MAN (REM): That quantity of any type ionizing radiation which when absorbed by man produces an effect equivalent to the absorbtion by man of one roentgen of X or gamma radiation (400 kv)

SCALER: An electronic device which registers current pulses received over a given time interval.

SHIELD: A body of material used to prevent or reduce the passage of particles of radiation.

SOURCE: Any substance which emits radiation. Usually refers to a piece of radioactive material conveniently packaged for scientific or industrial use.

URANIUM: The heaviest naturally occurring radioactive element, atomic number 92. Pure uranium is an alpha radiation emitter and an internal radiation hazard. Two of the radioisotopes of uranium are fissionable and can be used as fuel in reactors. Uranium-235 is the one most commonly used.

WELDMENT: A unit formed by welding together an assembly of pieces.

X-RAYS: Penetrating electromagnetic radiations having wavelengths shorter than those of visible light. They are usually produced by bombarding a metallic target with fast electrons in a high vacuum.

"Z": Symbol for atomic number. An element's atomic number is the same as the number of protons found in one of its nuclei. All isotopes of a given element have the same "Z" number. Z=92 for uranium isotopes.

Rigging Cargo Gear. (Safety in Industry, Mechanical and Physical Hazards Series).

Netterstrom, Ralph W.
Bureau of Labor Standards, Washington, D.C.
Pub Date - 66
DOCUMENT NOT AVAILABLE FROM EDRS   27p.

*SAFETY, *STEVEDORES, INDUSTRY, *RIGGING, *TEXTBOOKS, *INDUSTRIAL EDUCATION,

This bulletin is for use as an instructional handbook for stevedores in preventing ship's cargo gear failures and resulting personal injury and property damage. One of a series on safety in industry, it was prepared in the Maritime Branch. Safe practices in rigging and using cargo handling gear are suggested for the swinging boom, burtoned loads, stress on guys, jackknifing, and preventers. The document size is 6 by 9 inches. The document is available as GPO L16.3--240 for 15 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

CONTENTS

Safety in Industry

MECHANICAL AND PHYSICAL HAZARDS

RIGGING CARGO GEAR

THIS bulletin, "Rigging Cargo Gear," differs from others in the Safety in Industry series in that it is written for and about a specific industry—stevedoring. Since this is the case, the terminology of the industry, which may or may not be familiar to some of the people acquainted with other bulletins in the series, has been used. Also, a much more informal and personalized style of presentation has been adopted.

"Rigging Cargo Gear" was first published in mimeograph form in 1953. Over the years it has been revised and extended to reflect the Bureau of Labor Standards' efforts to prevent injuries in the use of ship's gear, first on a promotional and educational basis, and later under the administrative authority contained in Public Law 85–742 amending the Longshoremen's and Harbor Workers' Compensation Act. Although the bulletin is based on equipment peculiar to the maritime industry, it is believed that the suggestions offered can, in some cases, be applied to shore based hoisting apparatus as well.

★ ★ ★

Failure of conventional ship's cargo gear, while not common, occurs more frequently than necessary. Claims for gear replacement, cargo damage, loss of time and occasional injuries to personnel are the costs which the stevedore must often pay for the failure of gear which he does not own and over which he does not have complete control.

The fundamental cause of gear failure in burtoning cargo is the lack of safety devices to prevent overloading the gear and the lack of information available to the stevedore or the ship operator as to when gear is being overloaded.

Experienced seamen and stevedores know that if the falls are tightlined with little or no load on the hook, all but the weakest winches will part a guy or tear down a boom. They also know that if a load close to the alleged "5 ton SWL" of a set of gear is burtoned, the gear seems to be under excessive stress and may fail. The reason for these failures is seldom understood.

It is the purpose of this bulletin to give an understanding of the stresses to which the gear is subjected, to present a few simple rules for rigging the gear to keep these stresses at a minimum, and to point out in a general way the practices and conditions which are likely to result in failures. The illustrations used are based on the dimensions of a single specific set of gear. For other gear and other setups of the same gear, the stresses will differ from those indicated, but, except in very unusual cases, not to a significant degree. In any case the principles involved apply to all gear used for burtoning. If the stevedore combines this information with his own experienced judgment of the condition of the particular gear which he happens to be working, he can prevent many gear failures and so obtain a safer and more efficient operation.

The attempt has been made to present the explanatory material in as simple terms as possible, taking the development step by step. If a single model boom is erected, using approximately the proportions given in the examples, the statements regarding tension on lines can be demonstrated with a small spring scale and some fishline and sinkers.

The conclusions and practical applications of each step are summarized in the back of the bulletin.

THE SWINGING BOOM

Failures of swinging booms from overloading are rare because their safe working loads can be stated clearly and the safety factor is relatively high. The stresses on a swinging boom will be considered, however, because a knowledge of them will aid in understanding the additional stresses that are set up by burtoning cargo.

Figure 1A shows the compression on the boom and the tension on the topping lift produced by a 1-ton load hanging from the head of the boom. (The compression on the boom produced by the tension of the fall between the head block and the heel block has been disregarded. With a single part fall, it is equal to the weight of the load.) The boom is 55 feet long and is supported by a mast that is 43 feet between the heel of the boom and the topping lift block. The boom is shown in three different positions, from horizontal to about as high an angle as is likely to be worked. (See Plate 1.)

At 75° elevation of the boom, the tension on the topping lift is only 0.4 ton while, when the boom is horizontal, the tension on the topping lift is 1.6 tons. This increase is easy to understand if one realizes that, if the boom were standing upright, all the weight would be on the heel, and a man upon the mast could keep it from falling with his hand.

PLATE I.—Stresses on swinging boom at various boom angles.

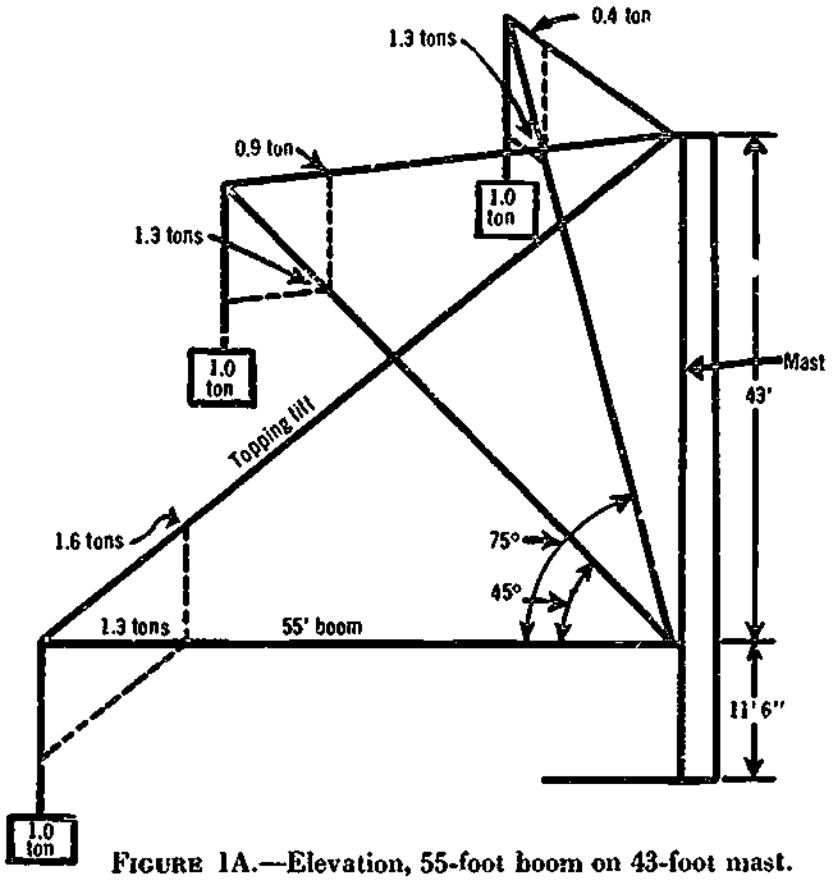

FIGURE 1A.—Elevation, 55-foot boom on 43-foot mast.

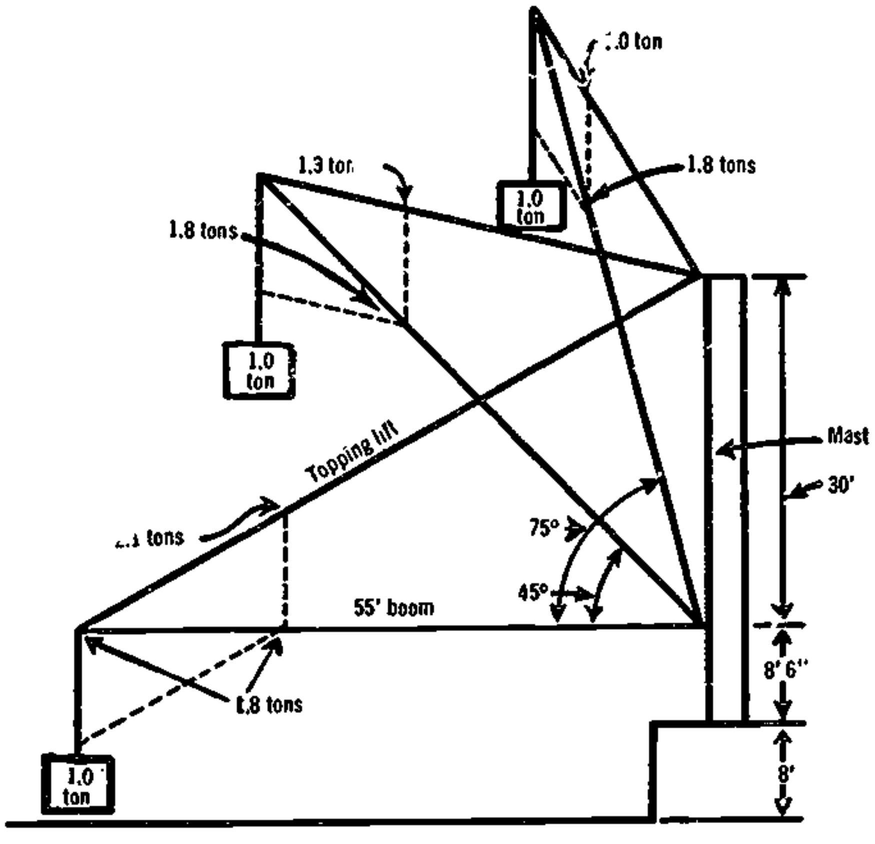

FIGURE 1B.—Elevation, 55-foot boom on 30-foot mast.

When the boom is horizontal, however, it is supporting none of the load, which is held entirely by the topping lift. The boom now serves only to force the load and the topping lift away from the mast.

The weight of the boom itself acts in a similar manner. In a vertical position this weight is all on the heel but when the boom is horizontal, half the weight is on the heel and the other half is supported by the topping lift.

Failure to realize that the tension on the topping lift increases as the boom is lowered has caused many booms to be dropped. The longshoreman takes enough turns on a cleat or gypsy to hold the boom when it is high, but when the tension gradually increases to the point at which he realizes that he needs another turn, he can't hold the line with one hand while he takes it. Then he must let go and the boom drops. On the other hand a boom is rarely dropped while raising it as the man must have sufficient turns to pick it up.

Figure 1B shows the stresses produced by a 1-ton load on the same length boom but on a shorter mast—30 feet from heel to topping lift block. The same three angles of the boom have been taken. At each angle the tension on the topping lift is greater than it was for the longer mast, going from 1 ton at 75° to 2.1 tons when the boom is horizontal.

This difference in tension on the topping lift for the two heights of mast is caused by the difference in the angle between the topping lift and the boom in the two cases. The smaller this angle, for the same angle of the boom, the greater the tension on the topping lift will have to be. (This can easily be demonstrated by raising the cover on a manhole. Your arm is the topping lift. If you pull always at right angles to the cover, it comes easily. But try raising it with your arm just a few inches above the hinge.) As might be expected, an increase in the tension on the topping lift produces an increase in the compression on the boom. In Figure 1A the compression is 1.3 tons, while in Figure 1B it has gone up to 1.8 tons.

This relationship between height of mast and length of boom is of no importance on a jumbo because it is taken into account in designing the gear. On light gear, however, it may be overlooked and the same strength, 55-foot boom, for example, may be used on a short mast as on a tall one. Since the difference in compression on the boom applies just as well to burtoning as it does to handling a load on a swinging boom, it is suggested that when he has a choice, the stevedore handle heavier loads, such as lift trucks, on the set of gear with the taller mast or king post.

Stress at High Angles

If the mast were the same height as the length of the boom, the tension on the topping lift would continue to decrease as the boom was topped higher than the 75° shown in the illustrations and would become zero when the boom was vertical.

Since in almost every set of gear the mast is shorter than the boom, a point is reached in topping the boom beyond which no further reduction in tension on the topping lift occurs. For example, with the proportions shown in Figure 1A, the tension on the topping lift will decrease to about one-quarter the weight of the load at more than 85° but with the proportions shown in Figure 1B the tension on the topping lift will remain approximately equal to the weight of the load at angles above 75° while the compression on the boom will increase slightly.

There is also a slight increase in topping lift tension and boom compression at high angles caused by the fact that these two lines do not meet the boom at a point, as shown in the drawings, but are offset from the axis of the boom by the head fittings. The result is the same as lengthening the boom. These increases are small and of no importance in practical operations.

Boom Failures

Since it is general knowledge that there is more danger of boom failure when the boom is low than when it is topped well up, the figures indicating that the compression on the boom remains the same at all angles may seem in error. The fact is that a boom fails, not through collapsing like an accordion but by bending like a soda straw. As long as the straw remains perfectly straight it can support a considerable weight, but once it starts to bend very little weight will cause it to fold up completely. What happens to the soda straw happens also to the boom.

When the boom is topped well up, its own weight is pretty much in line with its axis. Just as a man with his arms extended above his head can brace himself against the wall with his finger tips and keep his body straight, the boom easily remains straight. If, however, the average man tries to support himself with his toes on one chair and his extended arms reaching another, he will sag in the middle. The boom laid flat and supported by the gooseneck at one end and the topping lift at the other tends, like the man, to sag in the middle.

The boom has a greater tendency to fail at a low angle, not because there is greater compression on it but because it is less able to withstand the same compression when it is slightly bent by its own weight.

These principles apply equally well to both burtoning and to the use of the swinging boom. Three practical applications of the above facts can be made.

1. Particular care should be taken to avoid overloading or putting shock loads on the gear when the boom is at a low angle.

2. Care should be taken to avoid letting a loaded boom come up against a stay, shroud, or other fixed object, as the resultant bending may cause the boom to fail.

3. While it would be difficult, if not impossible, to judge from appearance just how much a boom was weakened by one or two inches of permament set, there is no doubt that its strength is reduced. It is suggested that the stevedore inspect all booms before starting work and report any bent booms to the mate.

Gooseneck Failures

Failures of the jumbo gear are usually confined to breaking the gooseneck or pacific iron. The most obvious cause is heaving on the guys with power when the gooseneck is frozen through lack of lubrication. It is suggested that stevedores try to have the ship's crew break out the jumbo and see that it is swinging freely before the longshoremen touch it. If the stevedore must break out the boom it should be lowered to an angle of about 45°, keeping the guy on the high side taut if there is a list on the vessel. Then have a few men swing on a guy to be sure that the gooseneck is free. If it will not turn by hand, additional effort should be made at the gooseneck rather than by heaving on the guy with winch power. Power applied to the end of a 50-foot wrench handle (the boom) is certainly going to move something but it may not break loose the rusted pin.

Another cause of bending or breaking the pacific iron is attempting to slew the boom with the guys when the boom is topped high. A moment's thought will show that if the boom is straight up and down, it must rotate to turn the gooseneck. Pulling on a guy would only bend the pacific iron—not rotate the boom. To be sure, neither the jumbo nor any other boom is worked in a vertical position, but at high angles the head of the boom goes through a very small arc as the gooseneck turns. In such a position more of the pull on the guy tends to bend the pacific iron than tends to turn the gooseneck.

For this reason it is suggested that the boom be topped no higher than necessary for the load to clear the deck before it is swung into its athwartships position. It can then be topped as high as necessary. In discharging cargo from the near end of the hatch, the boom should be lowered before it is swung.

Guy Failures

The guys on jumbo booms have carried away because the two drivers of the guy winches did not act together. One heaved while the other held or both heaved together. This can be avoided by being sure that both men can see the signalman. As a further precaution, winch drivers should be instructed to stop heaving and hold if at any time the stress on the guy appears to be excessive. It is difficult to imagine a situation in which to stop heaving would introduce a hazard. To stop in case of doubt might disclose a misunderstanding of signals in time to avoid carrying away a guy.

Auxiliary Stays

Some vessels, notably the Liberty ships, require setting up auxiliary stays on the mast when the jumbo is used. Failure to observe this precaution, which is clearly stated on the rigging plans, has resulted in carrying away some masts.

Conclusion

By observing the safe working loads for which the booms are rated and the precautions noted above, the possibility of failure of gear when using a swinging boom is very slight if proper inspection and maintenance schedules are followed.

BURTONED LOADS

The stresses on the gear when the boom is used swinging are relatively simple. Overstressing any part of the gear far beyond the designed limits can be avoided merely by keeping the loads within the rated capacity. In burtoning, however, no simple load limitation can be fixed. The stresses produced by a given weight of load vary widely with differences in the trimming of the booms, the position of the guys and the height to which the load is raised.

We shall start the discussion of these factors with the last point and consider the effect of the height of the load on the tension in the falls.

Tension on the Falls

The tension on the falls increases as the angle between them increases. Suppose we tie one end of a line to a pad eye on the bulkhead, hang a block with a 20-pound weight in the bight, attach the other end of the line to a scale, and then hold the scale. If we hold the scale close to the padeye, as in Figure 2A, it will read one-half the weight of the load, or 10 pounds. We support one-half the weight and the pad eye supports the other half. As we move back from the bulkhead, the reading on the scale will gradually increase. When the angle between the two parts of the line is 90° (Figure 2B), the scale will read 14 pounds. When the angle in the bight is 120°, the scale will read 20 pounds (Figure 2C), or the weight of the load. (See Plate II.)

From this point on a small change in the angle between the lines will produce an increasingly large change in the scale reading as shown in succeeding figures. At 140° (Figure 2D), the stress is

PLATE II.—Tension on the falls depends upon angle between the falls.

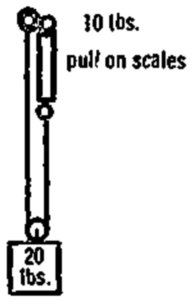

Figure 2A.—Fall angle 0°.

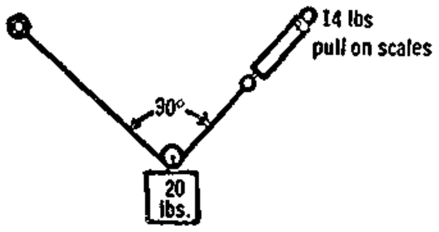

Figure 2B.—Fall angle 90°.

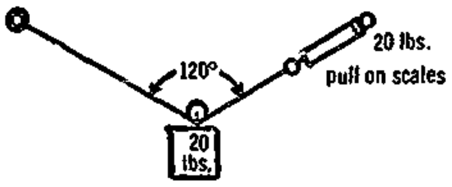

Figure 2C.—Fall angle 120°.

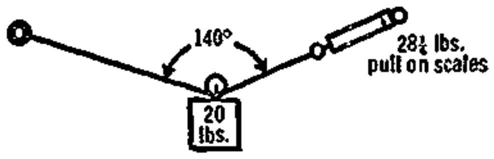

Figure 2D.—Fall angle 140°.

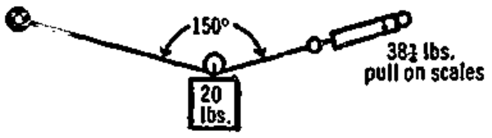

Figure 2E.—Fall angle 150°.

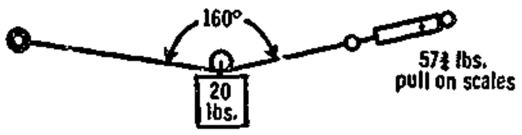

Figure 2F.—Fall angle 160°.

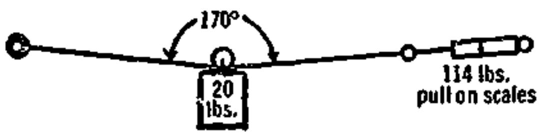

Figure 2G.—Fall angle 170°.

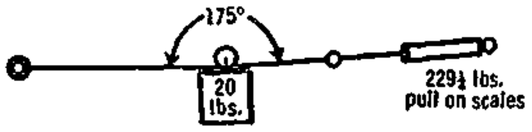

Figure 2H.—Fall angle 175°.

almost one and one-half times the weight of the load, and at 150° (Figure 2E) is almost double. At 160° (Figure 2F), the stress in the line is nearly 3 times the weight of the load, and to get the angle to 170° (Figure 2G) will require a pull of 5¾ times the weight of the load. If we wish to flatten the angle out to 175° (Figure 2H), we will have to pull 229¼ pounds or 11½ times the weight of the load to do so.

Keeping in mind that the actual downward pull of the load is only 10 pounds on each end of the line, what happens to all this extra pull? If you look closely at the figures you will see (and if you try the experiment you will feel) that it is largely a horizontal pull. Exactly the same thing takes place when a load is supported between the heads of the two booms. This horizontal pull tends to move the heads of the booms together. The outboard or working guys hold the booms against this pull.

Table I lists the tension on the fall and the horizontal pull tending to move the heads of the booms together for a load of a 2,000-pound ton at various angles between the falls. When loads are tightlined as high as the winch can lift them, the tension on the falls is limited only by the strength of one winch. With a heavy load the final fall angle will be small. With a light load it will be large. The interesting thing is that the light load at the large fall angle will produce a greater horizontal force than will the heavier load which stalls the winch at a smaller fall angle. It is this horizontal pull that the guys have to counteract.

TABLE I

Fall angle	Angle of each fall with horizon	Ratio of tension on fall to weight of load	Tension on each fall with load of 2,000 pounds	Horizontal pull tending to bring boom heads together
			(Pounds)	*(Pounds)*
0°	90°	.50	1,000	0
60°	60°	.57	1,155	577
90°	45°	.71	1,414	1,000
120°	30°	1.00	2,000	1,732
140°	20°	1.46	2,924	2,748
150°	15°	1.93	3,864	3,732
160°	10°	2.88	5,759	5,671
170°	5°	5.74	11,474	11.430
175°	2.5°	11.46	22,926	22,904

The above values for the tension on the fall are most frequently seen in tables and diagrams of sling angles. The only difference is that the sling angle diagram is upside down when applied to fall angles.

These facts have the following practical applications in burtoning:

1. Use slings which are no longer than necessary.
2. Keep the hook as close to the junction of the falls as possible.[1] If chain is used for additional weight, hang it in a bight beside the hook rather than between the hook and the junction of the falls.
3. Keep the loads as close to the rail as is practicable.
4. Severe tightlining of even very light loads is dangerous because a difference of only a foot or two in the height of the load may increase the stress tremendously.

STRESS ON GUYS

Experience shows that the burton (yard) gear very seldom presents any difficulty. When failures occur they are confined almost entirely to the up-and-down (midships) gear. For this reason the following discussion of stresses in relation to trimming the boom and guy refers exclusively to this side of the rig with only brief mention of the burton gear.

Figure 3A shows a plan view of a typical set of gear (No. 4 aft on a C–3) trimmed to work the near end of the hatch with the up-and-down boom in a fore and aft line through its heel and the guy in line with the fall. A number of elevation views are shown with calculations to indicate the tension on the guy produced by a one-ton load at several different fall angles. In these and the following illustrations the actual compression on the boom is not shown. Instead, the figure on the boom indicates the weight of load which, when lifted on a swinging boom, would produce approximately the same compression in the boom as is produced by the one-ton load in the situation shown. (The tension of the fall along the boom from head block to heel block has been disregarded. See Plate III.)

It will be noted (Figure 3B) that even with a fall angle of only 90°, where the junction of the falls is about 20 feet above the deck, the tension on the guy is 1.6 tons and the boom has to support the equivalent of 2.1 tons. The stresses go up (Figures 3C and 3D) as the one-ton load on the hook is raised until, (Figure 3E) the angle between the falls reaches 150°, when the tension on the guy is 6.2 tons and the equivalent load on the boom is 6.4 tons.

This explains why a boom which has been tested with a swinging load of 7 tons will sometimes fail under a load of only 3 or 4 tons which is being supported by 2 booms. Unless otherwise stated, "5 ton SWL" stenciled on the heel of a boom refers to a load on a swinging boom, not to a burtoned load.

---

[1] See. 1504.52(f) of the Safety and Health Regulations for Longshoring limits this distance to 2 feet.

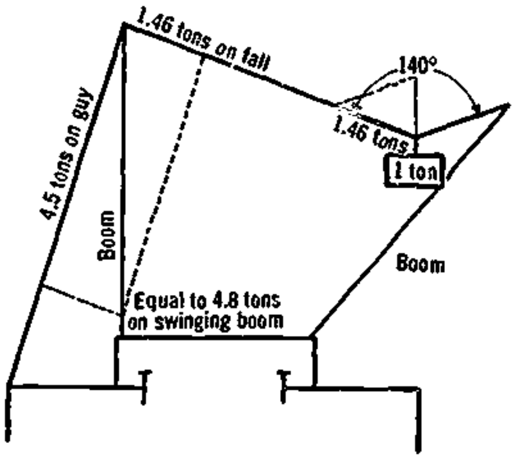

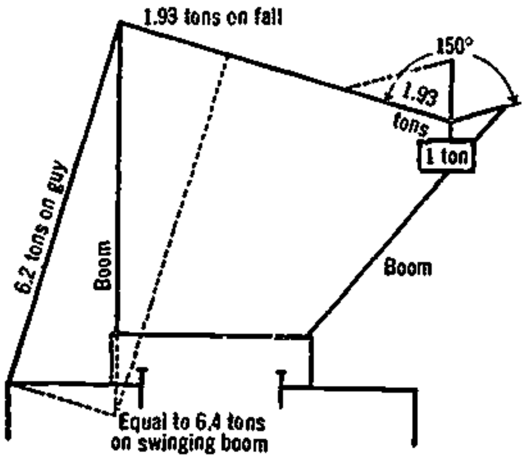

Figure 3D.—Stresses at fall angle of 140°. Figure 3E.—Stresses at fall angle of 150°

Boom Angled Inboard From Heel

Merely by swinging the boom inboard to the center line of the vessel (and slacking off on the topping lift so that the head of the boom is still the same distance from the end of the hatch, Figure 4A), we find that the stresses are considerably reduced. At a fall angle of 90° (Figure 4B), the tension on the guy has dropped from 1.6 tons to 1.0 ton and the equivalent load on the boom from 2.1 to 1.3 tons. At a fall angle of 120° (Figure 4C), the guy tension drops from 2.9 tons to 1.7 tons and the equivalent load on the boom from 3.2 to 1.9 tons. (Since the values for other fall angles are reduced in proportion, they are not shown. See Plate IV.)

Since the fall angles and therefore the horizontal pull are the same, one may wonder why the tension on the guy is lower in Figure 4C than in Figure 3C. A comparison of the two figures will show that the guy in Figure 3C is much more nearly vertical than it is in Figure 4C. Since the guy serves only to keep the head of the boom from moving horizontally, it could do this most easily if it too were horizontal. (You pull straight out on a door handle, not down toward the floor.) On the other hand, it should be clear that pulling straight down on the guy would do nothing to keep the boom head from swinging around. Therefore, the further the guy is from the vertical, the less tension on it, and the more nearly it approaches the vertical, the greater the tension on it.

One other benefit of swinging the boom inboard should be pointed out. In Figure 3B the fall angle of 90° was reached with the junction of the falls 20 feet above the deck, while in Figure 4B this angle was not reached until the junction of the falls was 26 feet above the deck. In other words if, with the setup shown in Figure 4B, we kept the load only 20 feet above the deck, we should have had a smaller fall angle and hence even less tension on the guy.

Now let us leave the boom where it is but move the guy around to see whether any further reduction in tension can be obtained. Looking at the plan shown in Figure 5B, we see that the head of the boom is not going to move directly athwartships in line with the fall but is going to swing in an arc around the mast or king post along the path of the curved arrow. The guy can most easily prevent this swing if it is at right angles to the boom. (Remember that you keep your arm at right angles to the door when opening a heavy one.) With the guy in line with the fall, Figure 5B, the horizontal pull acting on the guy must be the same as that produced by the fall. For a fall angle of 120°, this is equal to .86 times the weight of the load as shown in Figure 5A Using this value in Figure 5C, we find that the horizontal pull on the guy when it is at right angles to the boom has been reduced to .70 times the weight of the load. In Figures 5D and 5E are shown the guys in the two respective positions as they

PLATE IV.—Tension on guy and equivalent load on swinging boom at various fall angles. Boom over center line. Guy in line with fall.

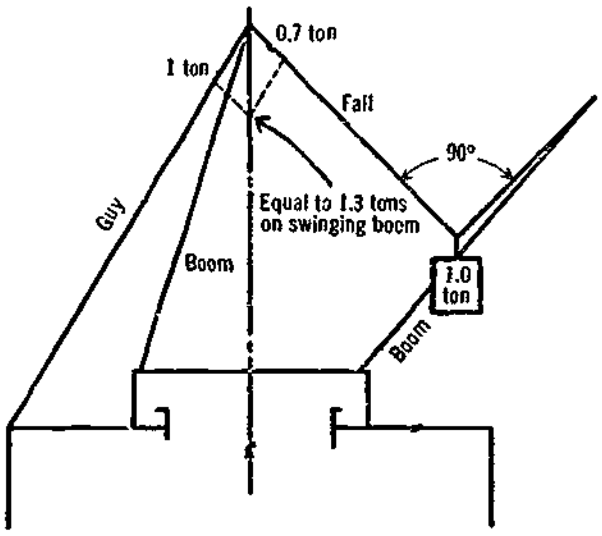

FIGURE 4B.—Elevation, stresses at fall angle of 90°

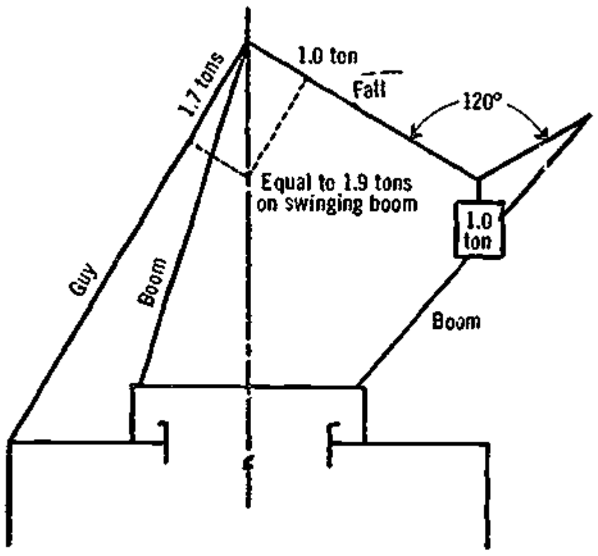

FIGURE 4C.—Elevation, stresses at fall angle of 120°.

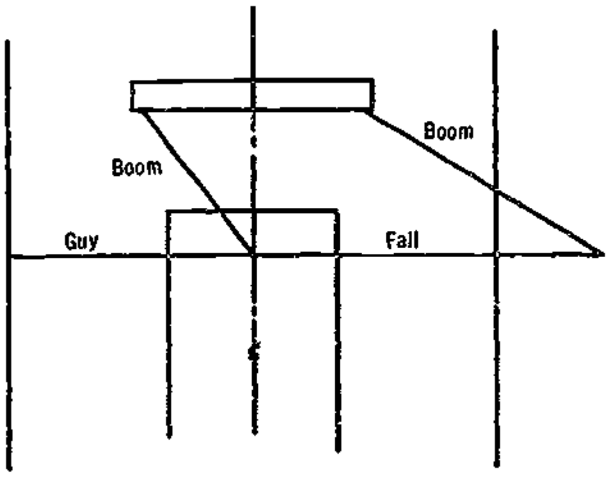

FIGURE 4A.—Plan, stresses on gear. 55-foot boom angled inboard from heel. Guy in line with fall.

would appear at their true length. The .86-ton horizontal pull produces an actual tension of 1.7 tons in the guy in line with the fall (the same value which was reached by a different method in Figure 4C) and the .70-ton horizontal pull produces an actual tension of only 1.1 tons on the guy at right angles. In the latter position, the tension on the guy is reduced not only by a decrease in the horizontal pull but also by the fact that the guy is flatter and hence can hold the boom more easily. The equivalent load on the boom is 1.5 tons as compared with 1.9 tons when the guy is in line with the fall. (See Plate V.)

Theoretically we could move the guy even beyond a right angle to the boom and have some further slight reduction because the guy would become still flatter. From a practical standpoint however, the movement of the guy in this direction is either limited by the shrouds at the next set of gear or, when the boom is not angled so far inboard, might be carried too far.

The practical application of these facts is as follows:

1. The closer the heads of the two booms are together, and the higher they are, the less will be the tension on the falls and therefore on the guys for any given height of the junction of the falls.

2. When the boom angles inboard from its heel, the tension on the guy will be least when the guy is approximately at right angles to the boom in plan view, or as seen when looking up from on deck.

Boom Fore and Aft From Heel

Referring back to Figure 3C, we saw that with the boom fore and aft, and the guy in line with the fall, a one-ton load at a fall angle of 120° produced a tension of 2.9 tons on the guy. If we move the guy back abreast the heel, as in Figure 6A, we will find (Figure 6B) that the tension on the guy has increased to 3.0 tons but the equivalent load on the boom has decreased from 3.2 tons to 2.9 tons. If, however, we lead the guy out ahead of the boom, as in Figure 6C, the same distance that it was behind the head in Figure 6A, the tension on the guy is not changed (Figure 6D). It remains at 3.0 tons but the equivalent load on the boom will increase from 2.9 tons to 3.6 tons. (See Plate VI.)

This increase in load on the boom when the guy is out ahead of the boom is caused by an increased tension on the topping lift, which went up from 0.5 to 2.8 tons. The guy pulls against the topping lift. When, however, the guy is abreast the heel, it pulls more nearly in the same direction as the topping lift and actually takes some of the load from it. (An extreme example of this occurs when the guy is so far behind the heel that it causes the boom to jackknife. There is then no load on the topping lift at all.)

The application of these facts is as follows:

With the boom fore and aft, the least compression will be placed on the boom if the guy is back near the heel. The least tension on the

PLATE V.—Showing change in tension on guy and equivalent load on swinging boom with change in position of guy. Boom over center line. Fall angle of 120°.

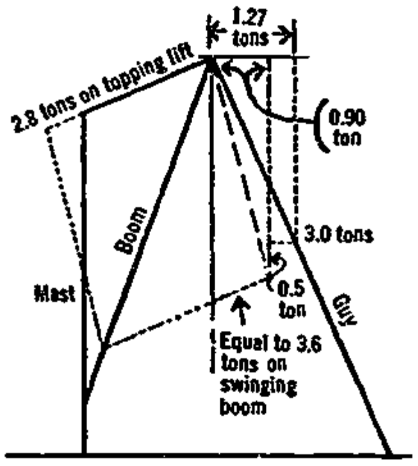

FIGURE 6D.—Guy and boom from 6C in true length showing tension on guy and topping lift and equivalent load on swinging boom.

guy will result if it is at right angles to the boom. With light booms on short masts, place the guy near the heel. With heavy booms and light guys, place the guy at right angles to the boom.

Boom Angled Outboard From Heel

In working an offshore deckload, or in spotting a boom over the offshore coaming, the boom on most gear will angle outboard. In such a case, it is very important that the guy be led back abreast the heel to avoid excessive stress. Figure 7 illustrates such a situation and shows three possible guy locations. At A, it is in line with the fall; at B, it is abreast the heel; and at C, it is about as far back of the heel as it can be placed without allowing the boom to jackknife. (See Plate VII.)

The corresponding stresses on the guy and the equivalent load on the boom are shown in Figures 7A, B, and C and are listed in the following table for a one-ton load at a fall angle of 120°.

Guy position	*Guy tension* (tons)	*Equivalent load on boom* (tons)
A	4.4	4.8
B	2.9	2.9
C	2.6	2.5

From the above it should be evident that when the boom angles outboard from its heel, the guy should be placed abreast the heel or as much farther back as it is possible to go without permitting the boom to jackknife.

Burton Boom

The infrequent failure of the burton gear can now easily be explained in the light of the previous discussion. The boom always angles outboard from its heel. In fact, it is often so far outboard that the angle between the fall and the boom in plan view is less than that between the boom and the guy, which is normally placed well behind the heel of the boom. Because the burton boom is usually lower than the up-and-down boom, the stress on the guy is further decreased by the fact that the guy of the burton boom is more nearly horizontal than is the offshore guy. Taken together these factors all combine to keep the stresses on the burton boom at a minimum.

JACKKNIFING

It was pointed out above that when the up-and-down boom angles outboard from its heel, the guy (and the preventer) will have the least tension on it when it is as far back of the heel as possible but not so far back as to allow the boom to jackknife. The question is, how far is "as possible"?

PLATE VII.—Showing changes in tension on guy and equivalent load on swinging boom with changes in position of guy. Boom angled outboard. Fall angle 120°.

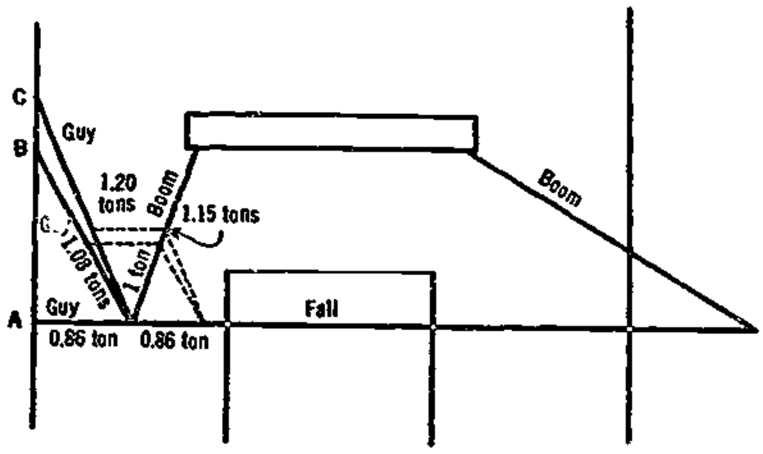

FIGURE 7.—Plan, three different positions of guy showing horizontal pull on guy and horizontal thrust on boom. Fall angle 120°.

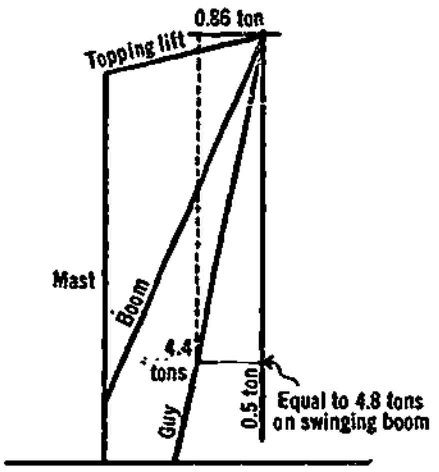

FIGURE 7A.—Tension on guy and equivalent load on swinging boom with guy at A in plan.

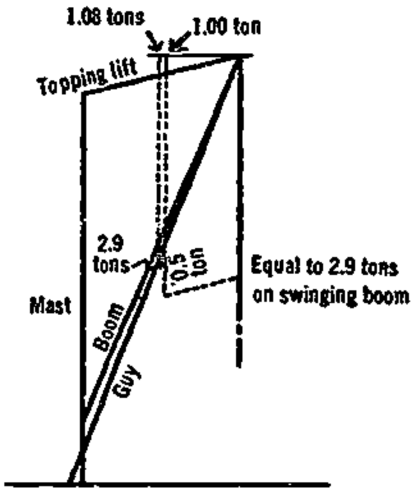

FIGURE 7B.—Tension on guy and equivalent load on swinging boom with guy at B in plan.

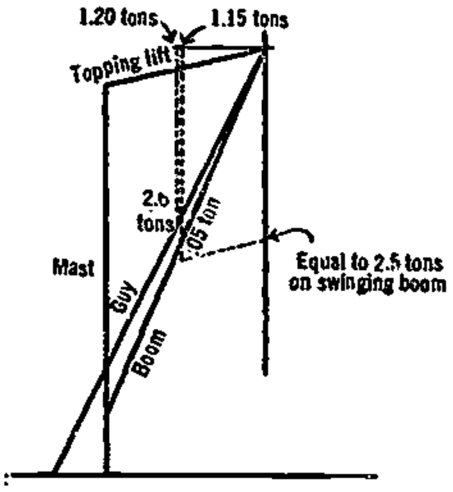

FIGURE 7C.—Tension on guy and equivalent load on swinging boom with guy at C in plan.

There is no way, other than calculation or experiment, to tell whether a particular setup will cause the boom to jackknife with a particular fall angle. For example, with the guy at C in Figure 7, a load at a fall angle of 120° is perfectly safe, but over 150° the boom would probably jackknife.

For safety, it is desirable to place the guy in a position which will hold the boom down, no matter how much it is tightlined, without securing it so far out toward the head of the boom as to place an unnecessarily high stress on the gear. This condition is met when either the guy or the preventer is secured to a pad eye located so that when one sights from the pad eye to the head of the burton boom the latter appears just beneath the up-and-down boom.

Again, using the examples in Figure 7, sighting from the pad eye on deck at C, the head of the burton boom would appear above the heel of the up-and-down boom, indicating that the latter can jackknife. On the other hand, sighting from the pad eye on deck at B, the head of the burton boom would appear a couple of feet below the up-and-down boom. Unless the burton boom itself jackknifed high enough to appear above the up-and-down boom, the latter could not jackknife even by tightlining the empty hook.

Jackknifing the Burton Boom

Once the up-and-down boom starts to jackknife, it is practically impossible to drop the load fast enough to stop it. Since the burton boom is the lower of the two, it does not act in the same manner but is raised by the fall. As soon as the winch driver stops heaving, the boom stops rising. For this reason, it is not so important that the burton boom be held down by the guy.

The same method of sighting is used for the burton boom as for the up-and-down boom. Sighting from the pad eye to which the outboard guy of the burton boom is secured, the head of the up-and-down boom will probably appear either above the burton boom or below it.

If the head of the up-and-down boom appears below the burton boom, the latter cannot rise at all.

If the head of the up-and-down boom appears above the burton boom, the latter can rise until it reaches the line of sight. It cannot be raised above this line even by tightlining an empty hook. This is the usual condition in actual practice. It causes no harm as long as the amount of rise is not enough to cause the up-and-down boom to jackknife.

If the head of the up-and-down boom should appear behind the king post which supports the burton boom, the latter can be raised all the way and will, by changing the line of sight, probably cause the up-and-down boom to jackknife also. This situation is often found at the

No. 4 forward gear on Victories and on any set of gear where the heels of the booms are close to the rail.

In such cases, particularly at No. 2 aft and No. 3 forward on many C-4's, it is suggested that the guy be left well back of the heel. To put the guy where it would prevent topping the boom, would mean that it would be so nearly parallel to the boom as to place it under terrific tension. Then to hold the boom down, place the preventer under the boom and leave it a foot or two slack.

This exception to the rule that preventers must be kept tight is to avoid the chance of the guy becoming slack (as in drying out after having been set up while wet) and throwing all the load on the preventer which, in this position, would probably carry away with a very light load.

Ebel Gear

On many new vessels there is an unusual rig known as the Ebel gear, in which each boom is supported by two topping lifts. The outboard topping lift reeves through a block and continues down to the deck to serve as a guy. The result of tightlining a load on this gear is to cause the burton boom, or in some cases the up-and-down boom, to top up. No danger is involved as the booms will not fly back. They will stop rising as soon as the winch driver stops heaving in.

With this gear, it is important that no attempt be made to hold the booms down with preventers, as to do so would subject the gear to excessive stress such as occurs when the usual type of gear is tightlined. As designed, the Ebel gear can burton the full 5 or 10 tons for which it is rated and, as long as the booms are free to top up, the gear will not be overloaded no matter how high the load is raised. This is the only burtoning gear of which we know that has this safety characteristic.

PREVENTERS

Preventers are poor substitutes for guys that are not strong enough. First, they cannot equally share the load with the guy. The preventer is usually a single heavy wire while the guy has a manila purchase. If the preventer and the guy have an equal tension under a light load, the guy stretches much more than the preventer under heavier loads so that the latter has to take most of the increase.

Second, rarely are fastenings available to secure the guy and the preventer close together on the deck or rail. We have seen that changing the position of the guy, changes the tension on it. If the guy is in one place and the preventer in another, the tension on the two will not be equal under all degrees of tension because the stress on one will increase more rapidly than on the other.

Third, the preventer is not usually included in the design and therefore gets little attention. Often it is a worn out fall, to start with, suitable provisions for properly securing it may be lacking, and it may be permitted to get in very poor shape.

While there have been few cases in which either the guy or preventer parted and the other held, it is undoubtedly true that the proper use of preventers has saved many a weak guy. It is therefore false economy for the stevedore to neglect to set them up properly. The following suggestions are offered:

1. Secure the preventer as close to the guy as available fastenings permit.
2. When the two cannot be nearly parallel, it is preferable that the guy be in the position of greater stress. That is, more nearly in line with the fall under most conditions.
3. Under light load (which is better produced by lifting a pontoon or beam on the hook than by hooking into a pad eye and using the winch power directly), the guy should be adjsuted until there is a little more tension on it than on the preventer. Under a heavy load the guy will stretch and let the preventer have its share.
4. Neither the preventer nor the guy should have real slack in it as it is almost a certainty that if one fails, the other will part when it fetches up with a jerk after the slack is taken out, and there will be two pieces of gear flying around instead of only one. The preventer is useful only in keeping the guy from parting, not in holding the boom after the guy parts. (A few vessels have heavy preventers which are intended to carry the guy load, and very light guys which are intended only for trimming the booms. So little additional strength is provided by these guys that they may better be left slack.)
5. Since the manila guy purchase shrinks when wet and stretches when dry, it must be checked from time to time during the job.

SUMMARY OF SUGGESTED SAFE PRACTICES IN RIGGING AND USING CARGO HANDLING GEAR

1. Since the load on a topping lift increases as a boom is lowered, longshoremen should be instructed to take sufficient turns while the boom is high to insure having control of it when it reaches a low position (p. 4).
2. Where there is a choice between a long and a short mast, with corresponding high and low topping lift blocks, in relation to the length of the boom, it will usually be safer to burton heavier loads, such as lift trucks, with the gear on the longer mast (p. 4).
3. Particular care should be taken to avoid overloading or putting shock loads on the gear when the boom is at a low angle (p. 5).

4. Care should be taken to avoid letting a loaded boom rest against a stay, shroud, or other fixed object as the resultant bending may cause the boom to fail (p. 6).

5. Booms should be inspected before starting work, and any that are visibly bent should be recognized as having been weakened (p. 5).

6. Before applying power to a guy, be sure that the gooseneck is free to turn by heaving on the guy by hand (p 6).

7. In using the jumbo, avoid slewing the boom at high angles by slewing the boom first and then topping to the desired position in loading and by lowering it before swinging in discharging (p. 6).

8. Guy winch drivers, or men handling the guys on a jumbo boom, should both have the signalman in clear sight at all times and should be instructed to stop heaving if at any time the stress on the hauling part appears to be excessive (p. 6).

9. A check should be made with the mate before making a heavy lift with the jumbo to find out whether auxiliary stays need to be set up (p. 7).

10. To keep tension on the falls as low as possible in burtoning and so avoid excessive tension in the guys, the following suggestions are offered (pp. 7, 10):

a. Use slings as short as practical.

b. Keep the hook as close to the junction of the falls as possible. Chain for additional weight should be hung in a bight beside the hook rather than used to connect the hook with the junction of the falls.

c. Keep the loads as close to the rail, deck, and coaming as possible.

d. Avoid severe tightlining of even very light loads as a difference of only a foot or two in the height of the load may increase the stress tremendously.

11. The closer the heads of the booms to each other and the higher they are, the less will be the tension on the fall and hence on the guys for a given height of the junction of the falls (p. 14).

12. Rules for placing guys for minimum stress:

a. When the up-and-down boom angles inboard from its heel, place the guy at right angles to the boom as seen when looking up from on deck (p. 14).

b. When the boom is fore and aft, the stress on the guy will be least when it is at right angles to the boom. With a spindly boom and a heavy guy, the guy should be abreast the heel of the boom. The tension on it will be increased slightly but the compression on the boom will be reduced (p. 17).

c. When the boom angles outboard from its heel, place the guy abreast the heel or as much behind it as possible without permitting the boom to jacknife (p. 17).

13. Jackknifing:

a. The up-and-down boom cannot jackknife if either the guy or the preventer is abreast the heel of the boom and no higher than the heel (p. 19).

b. The means of controlling jackknifing of the burton boom are explained on (p. 19).

14. Preventers should be secured as close to the guy as available pad eyes permit (p. 21).

15. Under light load, the guy should be adjusted so that it has a little more tension on it than does the preventer. It is safer to apply this load by lifting a weight than by shackling the fall to the deck and heaving with the winch (p. 21).

☆ ☆ ☆

Compliance with the suggestions contained in this bulletin should be helpful in preventing gear failures. Its use as an instructional handbook for stevedores is recommended as a means of preventing personal injury and property damage.

Introduction to Industrial Safety. (Safety in Industry, Instructor Outline).

Bureau of Labor Standards, Washington, D.C.
Bull-267
Pub Date - 65
DOCUMENT NOT AVAILABLE FROM EDRS 25p.

*CURRICULUM GUIDES, *SAFETY, *INJURIES, *INDUSTRY, *INDUSTRIAL EDUCATION,

The outline is for instructor use as a guide to standard presentation of safety instruction in industry. Additional information, materials, and illustrations should be included for a complete presentation. It was developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards, U.S. Department of Labor. Illustrations and basic content are included for (1) Early Injury Causes, (2) Unsafe Act--Unsafe Condition, (3) New Injury Sources, (4) Growth of Machine Age, (5) Industrial Injuries in the United States, (6) National Problem, (7) Functions of Federal and State Government, (8) The Inspector's Job, and (9) Consultative Approach. The document is available as GPO L16.3--267 for 20 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

SAFETY IN INDUSTRY
INSTRUCTOR OUTLINE

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.

2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.

3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.

4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.

2. Good ventilation, lighting, and sufficient room are important aspects to consider.

3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.

4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

   A. Some may be more mature.

   B. Some may have a knowledge of safety.

   C. Some may have actual experience to draw on in the discussion.

   D. Some may have a faster learning speed than others.

   - E. Some may be "stallers" who can slow down the discussion.
   - F. Others may be aggressive and want to monopolize the discussion.
   - G. There may be a "know-it-all" in the group who must be properly controlled.
   - H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:
   - A. Telling—this means giving background information to introduce a subject.
   - B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.
   - C. Illustrating—using charts, blackboard, slide. or films are very helpful to highlight specific points in the discussion.
   - D. Discussion conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.
   - E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.
   - F. Questions—during the session. the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

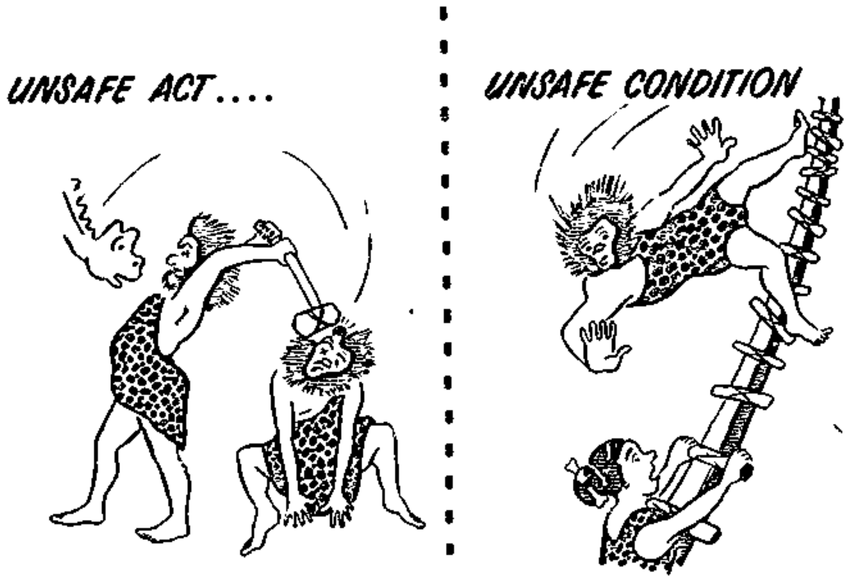
It is necessary that the instructor be granted full responsibility for conduct of the class: at times, however. he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course: he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined: he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course, a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training. and not to replace even part of this course which ould be taught by *one instructor*.

INTRODUCTION TO INDUSTRIAL SAFETY

EARLY INJURY CAUSES



ACCIDENTS ARE NOT NEW

CHART 1—SERIES A

ACCIDENTS NOT NEW	Accidents have always been with us and have been caused by unsafe conditions and unsafe acts.
PREHISTORIC	Primitive man moved to caves, formed clan or tribe organizations, made tools and weapons and learned the use of fire. These afforded him more protection but introduced new hazards.
NO STANDARDS	It would be difficult to judge him from this time distance, as there were no standards in his day to compare him, his facilities, his actions, his conditions, his customs, and his accomplishments. Risk-taking, unknown to us, to procure food and other necessities was part of his daily life.

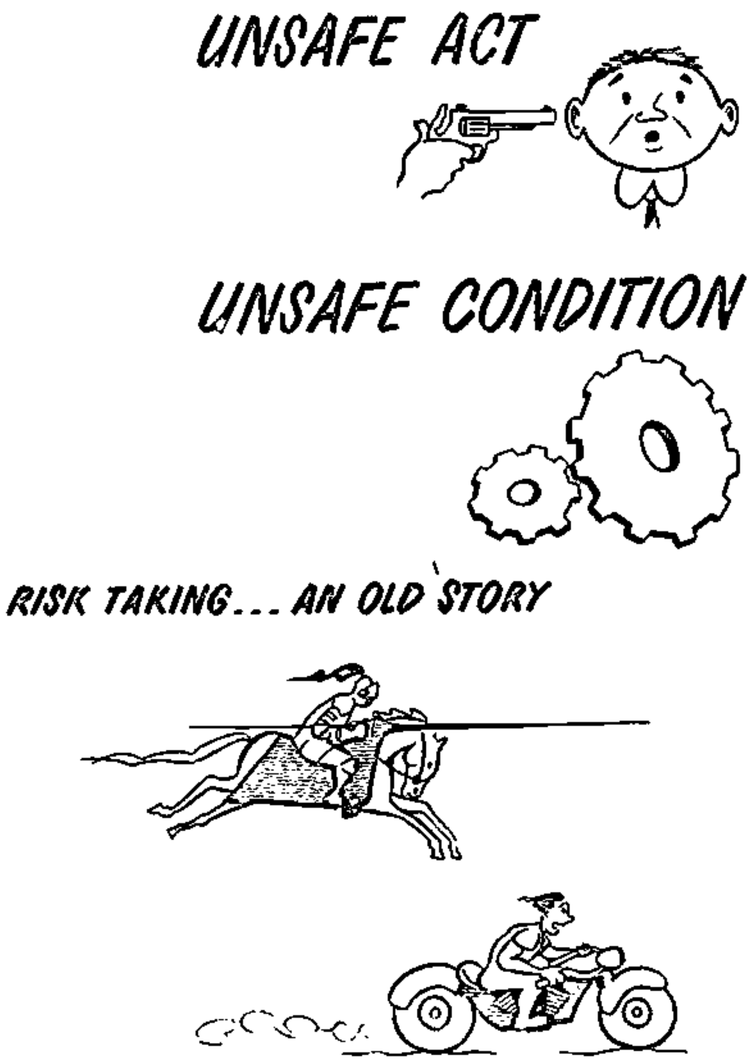


CHART 2—SERIES A

RISK-TAKING OLD STORY	With prehistoric and Stone Age man, risk-taking was usually "calculated risk for their personal and tribal welfare." In the Middle Ages, this had changed to risk-taking for thrills or glory, as the knight who took part in jousts or in tournaments for the personal satisfaction of winning, and for the excitement of action and danger involved. Today, we have the same motivation, in those who take part in racing of automobiles, motorcycles, and aircraft ("drag" races also). Boxing and wrestling are a part of this same urge.
RISKS AT WORK	Until recently and to some extent today, we find that there were workers who were proud of their ability to fell trees, ride logs, lift heavy objects, and to walk beams high in the air. They believed that safety was "sissy." By today's concept of safe performance, "risk-taking" at work is most unnecessary, but was characteristic of the daily lives of our forefathers in their work and in their recreation.

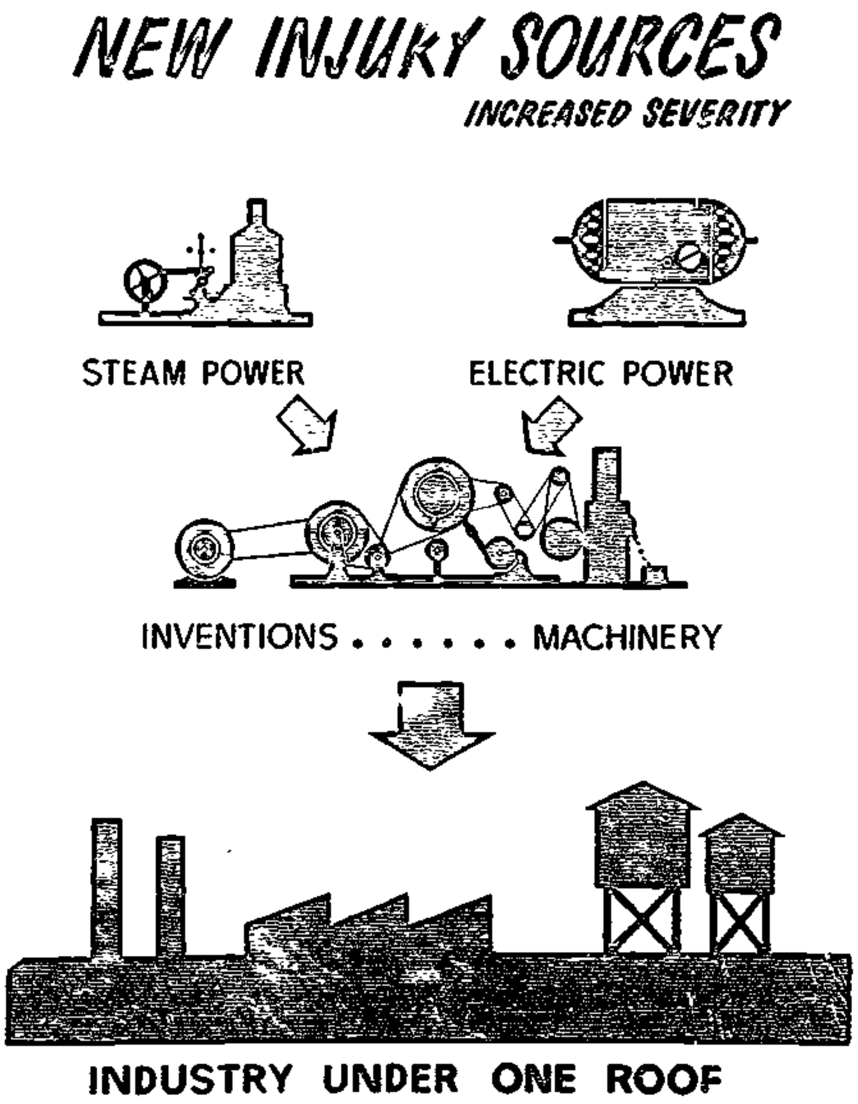

CHART 3—SERIES A

START OF INDUSTRY	
HOME WORKSHOPS AND CRAFTSMEN	The individual craftsman (shoemaker, hatter, blacksmith, carpenter, bricklayer, etc.) generally worked alone or with a helper or apprentice. If he was killed or severely disabled in a work accident, it would not attract much attention, as it would be an isolated incident and generally known only to his neighbors, customers, family, and immediate associates.
TYPES OF ACCIDENTS TO CRAFTSMEN	The power used was generally manpower or horsepower, except in gristmills (waterpower) and pumping (windpower). Serious accidents generally were caused by falls, falling objects, burns, drownings, and injuries inflicted by domestic animals.
EARLY INDUSTRIAL DISEASES	Certain industrial diseases were accepted as part of the job; for example, mercury poisoning of hatters, lead poisoning of painters, etc. Also silicosis in mining and in grinding operations.

NEW INJURY SOURCES	
STEAM AND ELECTRIC POWER	With the coming of the factory, waterpower was extended into manufacturing, closely followed by steam, and later, by electricity. Machinery was invented and improved to keep pace with expanding industrialization. This brought new hazards. The new machines were designed with no consideration for either the safety or the convenience of the operators. The workers were untrained and unskilled in the use of the new machines, and in the generation and use of the new power. Accidents multiplied and injuries became more severe as a result of these new and increased hazards.
INDUSTRY UNDER ONE ROOF	Due to the use of more efficient power and improved machinery, large factories came into existence when the new industries were placed under one roof. The resulting overcrowded conditions brought about an increase in the number of injuries which were thus sharply brought to the attention of the community.
INDUSTRIAL DEVELOPMENT 1837 TO PRESENT TIME	It may be considered that the first upward surge of industrialization started in the United States in 1837, and slowed up as a result of the Civil War (1861-1865). The next upsurge began about 1880 and continued until about 1890 when development became even more widespread.
STEEL INDUSTRY	To a great extent, this was due to the development of the steel industry. In 1886, the United States passed Great Britain in steel production, and has continued to lead the world in steel production since that year.
EFFECTS OF "PANICS" OR "DEPRESSIONS"	The increase in industrialization continued rapidly until the present time (halted or slowed only by "panics," "depressions," or "recessions," which have been followed by spurts of industrial activity and process improvements).

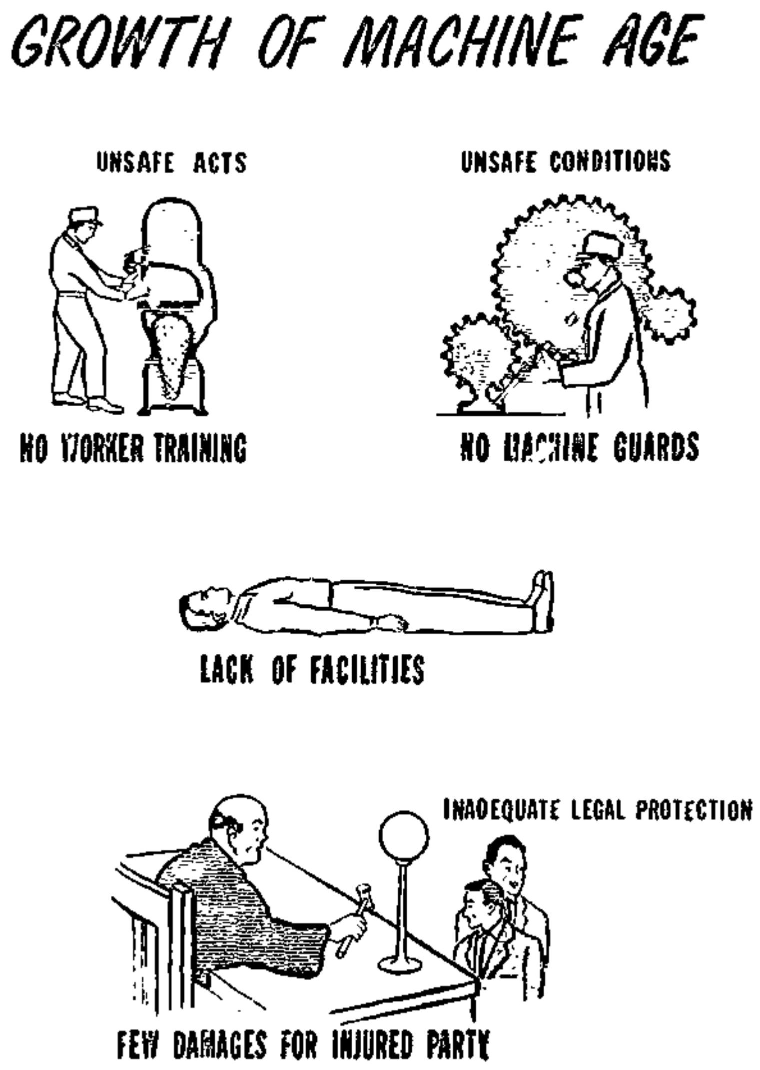

CHART 4—SERIES A

NO WORKER TRAINING NO MACHINE GUARDS	The growth of the machine age brought new sources of accidents. It also brought increasingly severe injuries. There were no machine and transmission guards. There was no worker training. The workday was very long and the worker was given only a short time to eat his lunch. In some continuous or shift operations, the work period was as long as 11 or 12 hours for the day shift, and 11 to 13 hours for the night shift, with lunch to be eaten on the job as the time and nature of the work permitted.
LACK OF FACILITIES	When workers were injured, there were no adequate facilities for emergency care and few, if any, persons on the premises were trained in first aid. In most cases, a medical doctor was not immediately available nor on call for their care. Most companies that had such facilities classed them as "welfare or charity activities."

PRIOR TO WORKMEN'S COMPENSATION

DISADVANTAGES TO EMPLOYER

COSTS OF DISASTERS

To management, disasters (such as those of Cherry, Ill.; Monongah, W. Va.; and "Darr," Jacob's Creek, Pa. where 858 men were killed, leaving about 2,000 dependents. Direct payments in addition to emergency relief amounted to more than $500,000), could result in ruin because of large judgments obtained against the companies. There was no definite basis for budget allowances to cover costs of accidents.

FEW DAMAGES FOR INJURED WORKER

Seldom did the injured worker get any compensation. During this period, *rights* of the injured worker were debated. He had to bear the burden of proof and then he could not collect if his employer could establish any of the following:

1. It was the fault of a fellow worker.
2. He had assumed the risks of his job.
3. It was his own fault.

Even when the injured worker won the verdict of the court, it was generally only after years of litigation with a large part of the money going to pay his attorney. Many times the worker was forced to seek other employment at once, at any wage, in order to support himself and his family. Almost invariably he did not sue.

STUDIES 1908–1910

In 1909, a study was made in Allegheny County, Pa. of the fatal industrial accidents (1-year = 526) in that county. "Over 50 percent of the widows and children were left by the employer to bear (alone) the entire income loss. It was calculated that 30 percent of those who did make settlements received more than $500.00." The same report states that there were 30,000 fatal industrial injuries in the United States the same year (1909).

In 1908, the Wisconsin Commission reported that there were 35,000 fatal injuries in industry in 1907.

In the same year, a study was made of all cases which were decided in the courts of New York. All of these involved widows and children (averaging 3 + children per family). The awards averaged $1,600 each; and of this amount, an average of $913 went to the lawyer.

PUBLIC REACTION TO SITUATION

Also, public sympathy in many sections was turning strongly in favor of the worker due to the publicity of disasters and publication of reports of investigative surveys.

In some cases, juries awarded large sums to injured workers or to their families.

An example of this is two almost identical cases in New York and in Kansas. In New York, the widow was denied compensation, while in Kansas, the widow was awarded a very substantial sum.

STRONGER EMPLOYER LIABILITY LAWS	Because of the pressure of public opinion, several States passed advanced "Liability Laws" which eliminated the defenses of "fellow servant," "strangers," "assumption of risk," and "own fault" (except deliberate actions). The burden of proof was transferred to the employer, and the employer was held accountable for the actions of foremen and supervisors. Example: Ohio—1910
FIRST LEGAL WORKMEN'S COMPENSATION LAW	The first workmen's compensation law in the United States was passed in 1908 and covered a small group of civilian, Federal workers. Several States passed workmen's compensation laws in 1911. The last of the States passed such a law in 1948. As the laws in each State are a matter for determination by that State, the laws vary among the individual States, although progress is being made to standardize the minimum benefits.
BENEFITS UNDER WORKMEN'S COMPENSATION TO MANAGEMENT	To management—the employer can calculate the costs of adequate insurance to protect his workers. The compensation law affords him relief from suits for damages for industrial injuries.
TO EMPLOYEE	To employee—He is assured of proper medical service, free from cost of law suits. Receives compensation as a matter of course. Receives immediate weekly payments—part of wages (tax free). Receives specified amounts for specific injuries (permanent-partial disabilities).
START OF ORGANIZED SAFETY MOVEMENT	Several large companies in the United States had "Safety" Departments as early as the 1890's. The first organized "Safety Congress" was held in Milwaukee, Wis., September 30 through October 5, 1912, under the auspices of the Association of Iron and Steel Engineers (Chairman was Lew Palmer, Jones and Laughlin Steel). It was voted to hold the next Safety Congress in September 1913, with Mr. Fred C. Schwedtman of the National Association of Manufacturers serving as Chairman. Wisconsin reported that it had 1 permanent and 2 traveling safety exhibits in use in Wisconsin.
FIRST ORGANIZED SAFETY CONGRESS	
"SAFETY MEN"	In April 1913, the National Association of Manufacturers reported that "276 member companies (of NAM) now have a special man in charge of Safety Shop Organization." They further reported that "three years ago the conclusion was reached that the time had

	passed when attention to these problems in the abstract was to any extent effective, and that results could be secured only by practical campaign methods . . . efforts of the Committee formed at that time (1909) and entrusted with this work, has carried on during these three years (1910–1912)." The National Association mailed out questionnaires to 20,000 U. S. manufacturers (in 1910) and "Ninety-nine per cent of the members answering expressed themselves emphatically in favor of an extended progressive campaign for accident prevention and compensation for injured workers." In 1913, NAM sent a special Accident-Prevention train to tour the United States, carrying exhibits, speakers, and moving pictures.
U. S. DEPARTMENT OF LABOR ESTABLISHED	The U. S. Department of Labor was created (in 1913) "to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions and to advance their opportunities for profitable employment."
NATIONAL SAFETY COUNCIL	The second "National Safety Congress" of the "National Council for Industrial Safety" was held in New York City, September 22 through 25, 1913. Mr. R. W. Campbell was elected President and Mr. William E. Cameron was elected Secretary, with offices in Chicago, Ill. The name was changed to National Safety Council in 1914.
UNITED STATES LAGGED BEHIND SOME EUROPEAN COUNTRIES IN SAFETY LEGISLATION	It is important to note at this point that the United States was several years behind some European countries (such as Germany) in passing legislation which required guarding of machinery, safety in mines, etc. In the United States, the enactment and enforcement of such laws were matters for the individual States with no overall *Federal* laws or regulations as in most other countries.
VOLUNTARY COOPERATIVE EFFORT	The result has been that safety started as separate efforts by individual companies and, to a great extent, reached its turning point in the formation of many voluntary programs and joint activities coincident with the founding of the National Council for Industrial Safety.
POSITIVE RESULTS PLUS STEADY IMPROVEMENT	Although late in starting, the United States has progressed rapidly in actual reduction in frequency and severity rates compared to those in most other countries. We have stressed individual cooperation of all interested persons in taking an active part in accident prevention, instead of only enforcing the law of guarding machines and neglecting the activities which we emphasized.

INDUSTRIAL INJURIES IN THE UNITED STATES

	1943	*1963*
Deaths	18,400	14,200
Permanent totals	1,700	1,400
Permanent partials	108,000	83,400
Temporary totals	2,285,000	1,921,000
Total	2,413,100	2,020,000

The average employment has increased 13,463,000 between 1943 and 1963.

Estimated annual losses from industrial injuries:

Wage loss to labor	$1,300,000,000
Total loss to management	3,700,000,000
Total	$5,000,000,000

CHART 5—SERIES A

COMPARISON INDUSTRIAL INJURIES, 1943-1963	Since World War II, industrial injuries in the United States have been decreasing both as to number and severity. Between 1943 and 1963 there was a reduction from 2,413,100 to 2,020,000 disabling injuries (a decrease of 390,000), while there was an increase of 13,463,000 workers in the same 20-year period. Thus, there was a decrease of 16 percent in the number of disabling injuries and an increase of 25+ percent in the average employment. This amounted to a net decrease of 33⅓ percent in the injury-frequency toll between 1943 and 1963.
ESTIMATED ANNUAL LOSSES	The estimated annual loss from industrial injuries in one year amounts to approximately $5 billion. Of this sum, about 30 percent represents loss by the workers and 70 percent, the costs to the companies.
FROM INDUSTRIAL INJURIES	Part of this overall loss is assumed by the State, since the disabled worker is a State problem. These include: A. Assistance to the family of the injured worker. B. Rehabilitation and second-injury fund, plus medical care beyond compensation. C. Costs of inspections, investigation, and hearings before the Compensation Board. D. Costs of regular accident-prevention service and inspection by the department of labor of the individual State. E. Taxes used to pay costs of public assistance, investigation, and control.

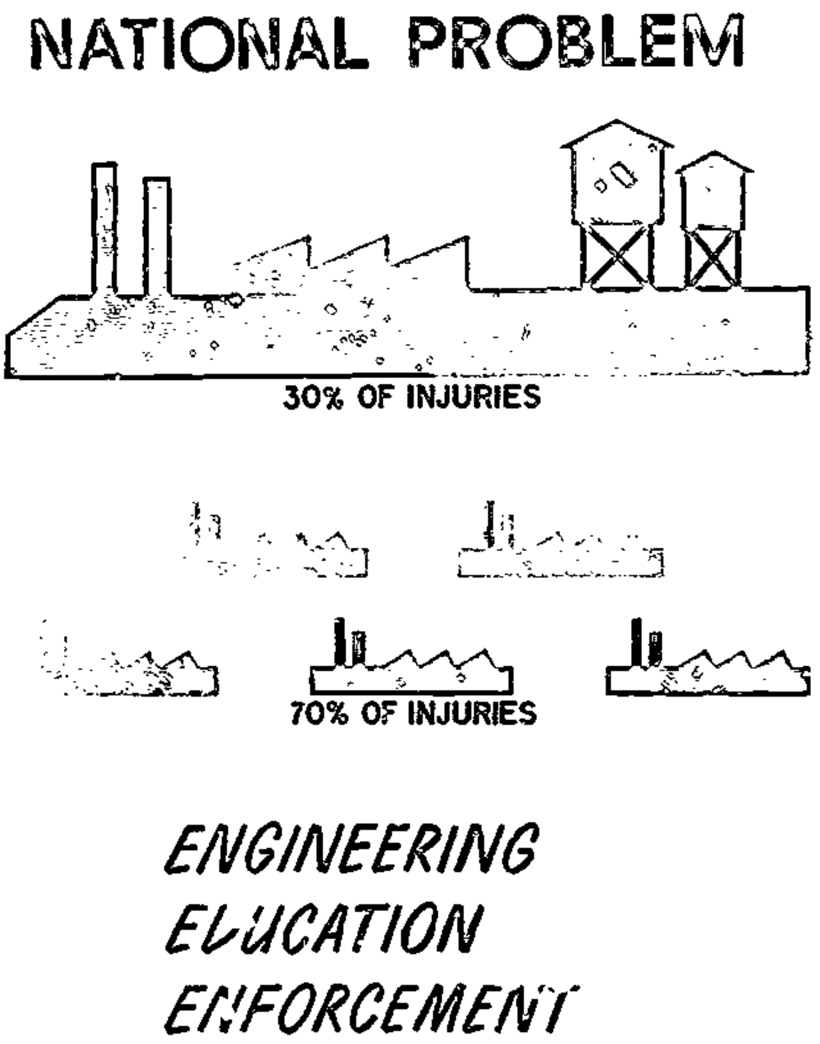

CHART 6—SERIES A

SMALL PLANTS ARE A NATIONAL PROBLEM

Studies made over the years have established that out of 2 million disabling work injuries (per year), about 30 percent, or 600,000, were in plants which had organized safety programs; while 70 percent, or 1,400,000, occurred in plants which had no organized safety program.

It was found that these plants which had no organized safety programs were mainly small plants whose managements felt that they "could not afford" an accident-prevention program, or were "too small" for one.

THREE "E's"

In fact, no plant is "too small" for a safety program and every plant can "afford" such a program. The basic fundamentals of accident-prevention programs are the three "E's": Engineering, Education, and Enforcement.

ENGINEERING
ENFORCEMENT

1. *Engineering* is to furnish information as to what is wrong and what should be done about it. (Technical know-how).
2. *Education* is the teaching of safety to all concerned. Convincing management, (a) to correct conditions found in the engi-

	neering survey; and (b) to inaugurate and support a safety program. Training workers and getting their support in the program. Selling foremen and technical people to give willing cooperation. 3. *Enforcement*—within the plant *enforcement* means to the worker the enforcement of rules of the company. Enforcement to the State means the inspection of the plant and the issuance of orders for the correction of violations of the law. This is the weakest of the three "E's." Several States, realizing this, have started the consultative approach which will be discussed later.
GOVERNMENTAL PARTICIPATION IN SAFETY	
GOVERNMENTAL	Broad in scope—dictionary states that "*governmental* refers to exercise of administrative powers; the mode or system of governing; the function; office, right or power of governing." Can, therefore, apply to Federal, State, municipal, county, or political subdivisions. For our purposes, we will discuss the Federal, State, and local government activities.
PARTICIPATION	To participate is "to have a share in common with others;" partaking; joint efforts; cooperation.
SAFETY	A keeping of oneself or others safe, from danger of accident or disease, or pertaining to the safeguarding of the public, or of a group of employees, or the like, from accident.
SUMMATION OF TITLE	Governmental agencies, through cooperative efforts with each other and with the public, play an important part in reducing accidents, injuries, and property damage.
SCOPE OF SUBJECT	Activities of government service-type safety functions devoted to safeguarding from injury the Nation's work force rather than to confining activities to their own personnel.

Explain that since governmental functions vary, there can be no standard pattern for each level, so we will deal with each one separately.

FUNCTION OF FEDERAL AND STATE GOVERNMENTS	To assist and advise the State and local governments.
FUNCTION OF THE FEDERAL GOVERNMENT	
SAFETY TECHNICIANS AND TECHNICAL ASSISTANCE	Provide competent safety technicians and technical assistance to the various State and local governments.
RESEARCH	Provide leadership in the field of research; collect and make available information on a national scale.
PRODUCTION AND WORKING CONDITIONS	Maintain agencies to assist and work with national organizations representing both management and labor to bring about improved production and working conditions.
STANDARDS	Provide trained personnel and facilities to develop the standards for safety and health of the Nation's work force, and assist the States to improve their safety administration.
EDUCATION SERVICES	Provide for safety and health education services which will be available to the various State agencies and to industry and labor.
ADVICE AND ASSISTANCE TO STATES	Assist and advise the States so that the experiences and methods developed by the various States are readily available to each other, to industry, to labor, and to the public.
PROMOTION	Provide leadership to promote the designing production of safer machines, equipment, and procedures. Cooperate with international safety and health organizations, and with all other agencies engaged in the promotion of accident prevention on a national, State, or local level.
LEGAL RESPONSIBILITIES	Carry out its legal responsibilities under the laws designating responsibility for safety in longshoring and ship repair and ship construction operations, coal mining, interstate commerce, and certain manufacturing under Federal contracts.
FUNCTION OF STATE GOVERNMENTS	Places of employment to be made safe and environments healthful to work in. To carry this out, agencies are set up with authority to develop standards and codes and to administer them.

SAFETY ACTIVITIES

State safety activities take many forms, and vary in type and effectiveness to a very great degree.

These safety activities relate to various areas of accident prevention for the public welfare—mining, highway safety, general occupational (industrial) safety, and safety for personnel employed by the State itself.

Many States have created safety advisory boards, or public safety commissions, State safety councils, Governor's safety committees, and similar bodies.

> We will concern ourselves primarily with *occupational* safety in this discussion.

ALL STATES HAVE ASSIGNED THIS RESPONSIBILITY IN SOME MANNER

Every State has created some department, bureau, or other subdivision, or has assigned to some such existing unit, the responsibility—in whole or in part—for the safety of that State's working force.

The responsibility—and all too often the authority which should accompany such responsibility—has been tragically weak in some cases.

Organization titles vary, but usually it is Department of Labor, Department of Labor and Industry, or Industrial Commission.

The first organization of this type was the Massachusetts Department of Factory Inspection created in 1867.

CONCEPTS ARE CHANGING

Originally, such agencies were set up only to enforce laws to correct hazards or abuses which could cause accidents.

Strong trend now is to temper enforcement—or replace it—with education: such as the "Consultative Approach" or (the "Sales Approach").

THE STATE INSPECTOR'S JOB

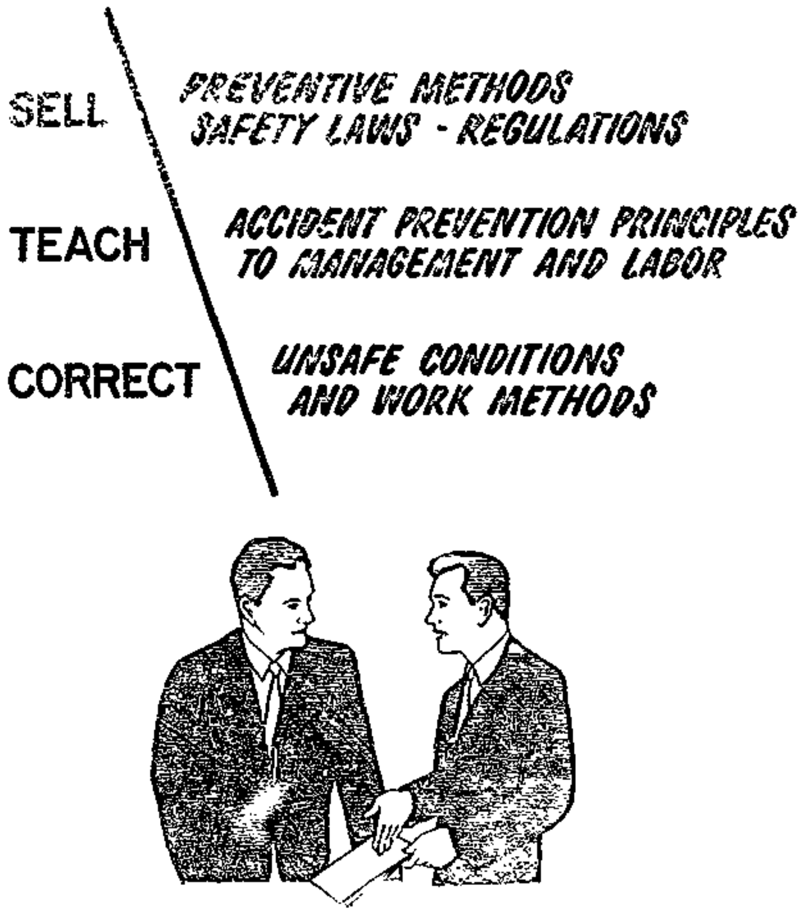

CHART 7—SERIES A

"CONSULTATIVE APPROACH"	A substantive theory is that even though the safety representative is backed by authority, if he knows his subject and can present it effectively, he will rarely have to use that authority. If management is "*sold*" on the idea that accidents are serious, preventable losses, it will "do something" to prevent them.
CONSULTATIVE ASSISTANCE	Particularly important to smaller firms. Requires a competent staff of safety technicians to provide services. Must include Industrial hygiene, fire prevention, and protection against disaster-producing hazards.
EDUCATION	Programs for safety and health, training for supervisors, members of safety committees, and employees of the industrial firms of the State.
TECHNICAL MATERIAL PRODUCTION	Such material would include posters, statistical information, technical bulletins. These are for use by safety committees, and for the development of regulations. They should not duplicate or supplant those being done by insurance companies, trade associations, or other groups.
LOCAL GOVERNMENTS	Safety programs are usually limited in scope. Should be confined to problems peculiar to city, town, or county, or to the problem

	created by congestion of population. Should relate to regulation of buildings, boilers, elevators, electrical installations, plumbing, and the like.
INTER-NATIONAL SAFETY ACTIVITIES	U. S. Federal Government agencies participate in the exchange of ideas in the field of occupational safety with developed and developing countries. This includes technical advice and assistance to developing countries under the foreign aid technical assistance program.
ILO	International Labor Office in Geneva, Switzerland, has an Industrial Safety Section. Has committee of 29 safety experts from 19 countries which assists by providing information. Has prepared international safety regulations for docks, construction operations, coal mines, and factories. Has prepared technical handbooks on hazardous operations and materials, such as power presses, acetylene, etc. Has also adopted numerous conventions and recommendations.

Distribute occupational safety aid—Development of the Safety Movement.

OCCUPATIONAL SAFETY AID

THE DEVELOPMENT OF THE SAFETY MOVEMENT

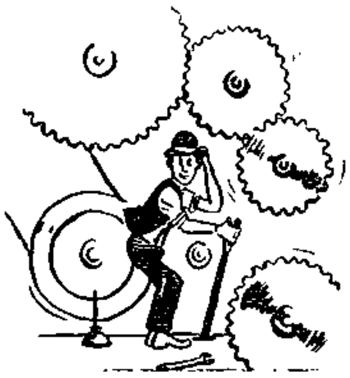
- The Industrial Revolution
- Early Legislation
- Safety Leadership

We hear the word "safety" so much nowadays that we may easily overlook its significance. Accidents are not new, but the organized safety movement *is* relatively new; and the achievements of that movement were hard won.

IN FACT, THE STORY OF "ORGANIZED SAFETY" IS ONE OF PAINSTAKING PROGRESS.

U.S. INDUSTRIAL EXPANSION UNDERSCORES A PROBLEM

The appalling number of workers killed or injured at their jobs began to dawn on the public conscience about the middle of the 19th century. Workers began to leave their small shops in ever increasing numbers to work in the larger plants. New machinery brought new hazards and new injuries. By 1867, legislation was enacted in Massachusetts to improve working conditions in the mills.



WHO IS RESPONSIBLE FOR SAFETY?

In spite of a growing concern for safety, there was a lack of unity among industry, labor, and the government. At first, employers assumed only a limited degree of liability for injuries; in defense against damage suits, they claimed negligence on the part of the worker or his fellow worker, or assumption of risk by the injured worker. But the rising tide of injuries led to stricter legislation to protect the worker, the now-familiar workmen's compensation laws.

U.S. DEPARTMENT OF LABOR
Bureau of Labor Standards

AMERICA TAKES ACTION

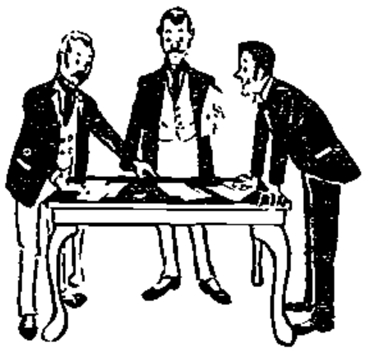
In 1867, Massachusetts passed a law providing for the services of factory inspectors; and 2 years later, it created the first bureau of labor statistics to study the accident problem. In 1877, the Massachusetts legislature voted to compel employers to safeguard hazardous machinery. This leadership in industrial safety was due to the humanitarian and social arguments voiced by the clergy and the press. In 1885, Alabama passed an Employer's Liability Law; and Massachusetts did likewise in 1887. Although these laws were a long step in advance, the financial burden on the employer was not sufficient to spur him to take steps to safeguard workers ftom injury.

WORKMEN'S COMPENSATION BECOMES UNIVERSAL

The oldest workmen's compensation system in the United States is the one that covers civil employees of the Federal Government. The Federal Employees' Compensation Act (FECA) is a plan for a single employer with over 2.5 million workers and operations as diversified as American business itself. It is financed by annual congressional appropriations.

The original limited act was passed in 1908 at the demand of President Theodore Roosevelt. It was replaced by the present basic law in 1916 (5. U.S.C. sec. 751 et seq.). In 1949, the act was amended to revise the entire benefit structure (P.L. 357, 81st Cong.). It is now considered "one of the most advanced workmen's compensation laws in the world."

Between 1911 and 1915, 30 States enacted compensation laws. By 1948, all States had workmen's compensation laws. One of the effects of such legislation was to impress on employers the high costs of accidents. Little by little, the economic protection afforded workers by such laws led to an enlightened interest in SAFETY on the part of the employers.



ACCIDENT-PREVENTION AS A POSITIVE GOAL

Laws had been put on the books to compel employers to practice certain safety measures. For example, at the turn of the century, guards were required on hazardous machinery in most European countries; and safety codes were set up for coal mining and steam-boiler operations. But now, with the economic pressure of workmen's compensation laws, employers set out on their own to promote safety.

Some firms were farsighted and realized that safety would pay its own way. In 1892, for example, a plant safety program was established by the Illinois Steel Company—the first of its kind. In 1912, a group of engineers representing insurance companies, industry, and government met in Milwaukee to exchange data on accident prevention. The organization formed at this meeting was to become the National Safety Council, which today carries on major safety campaigns for the general public as well as assisting in safety promotion for industry. The Council is supplemented by local safety councils, of which there are more than 500 throughout the country.

SAFETY IS A PART OF UNION BUSINESS

A safety conscious union has long been a most lethal weapon against worker injuries. Labor unions have campaigned vigorously for safe working conditions on the job. Local unions have established specialized safety education programs for their respective types of industry. Some unions have produced safety films, and others have drafted, with the cooperation of management, "Safety Regulations" under which proper observance is a condition of employment.

INDUSTRY PROVIDES SPECIALIZED PROGRAMS

The American Society of Safety Engineers

Incorporated in 1915, this group operated as a section of the National Safety Council from 1924 to 1947 when it withdrew to again become an independent organization. It is dedicated to accident-prevention techniques, and to the development of safety engineering as a profession.

Underwriters' Laboratories, Incorporated

A nonprofit organization which maintains facilities for the examination and testing of devices, systems, and materials to determine if they meet established standards of safety.

The American Standards Association

The ASA provides the machinery for voluntary establishment of recognized standards of safety engineering, frequently more rigorous than State safety codes in the same field.

The American Society of Mechanical Engineers

Since 1911, this organization has provided leadership in the development of safety codes including those for boilers and elevators.

American Mutual Insurance Alliance

A group of over 100 United States mutual fire and casualty companies whose accident-prevention activities are carried on through three independently operated affiliated associations:

- Federation of Mutual Fire Insurance Companies
- National Association of Automotive Mutual Insurance Companies
- National Association of Mutual Casualty Companies

The Association of Casualty and Surety Companies

In cooperation with the American Standards Association, this body provides technical books, pamphlets, and research services for the prevention of accidents in industry, schools, and in the home. New York University's Center for Safety Education is largely supported by annual grants from the Association.

HOW THE GOVERNMENT HELPS

State Government

Every State has created some department or bureau that is charged with at least partial responsibility for the safety of the wage earners employed in that State. The first organization of this type to be created was the Massachusetts Department of Factory Inspection in the year 1867.

Federal Government

Bureau of Mines, U. S. Department of the Interior, Washington, D. C., was organized in 1910. One of its major functions is to study the causes of accidents and ill health among miners, and to promote preventive measures against mine explosions.

Bureau of Labor Statistics, U. S. Department of Labor, Washington, D. C., organized in collects, tabulates, and disseminates statistical information about industrial accidents a health. It issues annual reports on industrial injuries, giving estimated national totals and breakdowns by industry.

National Bureau of Standards, U. S. Department of Commerce, Washington, D. C., was organized in 1910 to create safety standards for various materials and equipment, and to formulate testing methods for determining their safety.

Division of Safety in the U. S. Department of Labor's Bureau of Labor Standards, provides technical, educational, and promotional services to everyone concerned with industrial safety. The Division of Safety also administers the safety and health regulations that have been determined by the Secretary of Labor to be reasonably necessary to protect the life, health, and safety of employees engaged in longshoring, ship repairing, and related employments covered by section 41 of the Longshoremen's and Harbor Workers' Compensation Act.

Federal Safety Council was established in 1950 in the U. S. Department of Labor to serve in an advisory capacity to the Secretary of Labor in matters relating to the safety of Federal employees.

Other Organizations rendering safety services:

Literally hundreds of other organizations provide specialized safety services in more or less limited fields: The following are a few:

The National Bureau of Casualty Underwriters
The Industrial Hygiene Foundation of America
The National Council of Compensation Insurance
The American Industrial Hygiene Association
The National Society for the Prevention of Blindness
The Factory Insurance Association
The International Association of Industrial Accident Boards and Commissions
The National Fire Protection Association
The Associated General Contractors of America
The American Public Health Association

THE HISTORY OF ACCIDENT PREVENTION ACTIVITIES IS THAT OF COOPERATION BETWEEN GOVERNMENT, INDUSTRY, AND WORKERS.

Accident Cost Control. (Safety in Industry, Instructor Outline).

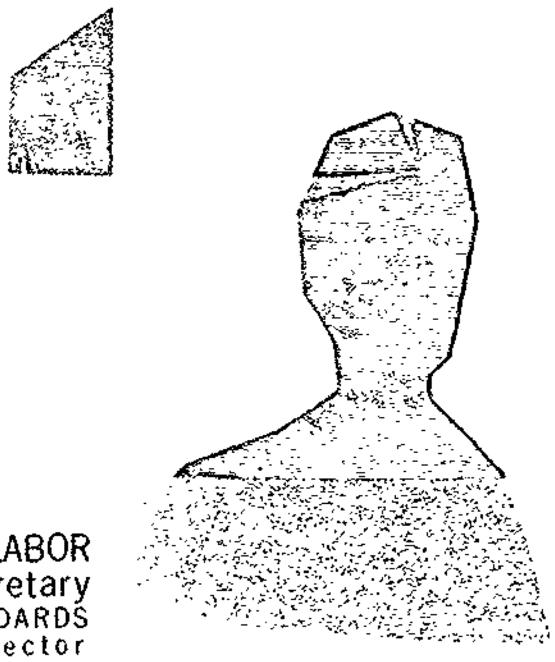
Bureau of Labor Standards, Washington, D.C.
Bull-268
Pub Date - 65
DOCUMENT NOT AVAILABLE FROM EDRS 20p.

*CURRICULUM GUIDES, *SAFETY, *INDUSTRY, *ACCIDENTS, *COSTS, INDUSTRIAL EDUCATION,

This outline is for instructor use as a guide to standard presentation of an accident cost control system which will show how much accidents cost and will therefore be an important factor in determining the safety program in a plant. Additional information, materials, and illustrations should be included for a complete presentation. It was developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards, U.S. Department of Labor. Illustrations and basic content are included for (1) Direct-Indirect Costs, (2) Insurance and Uninsured Costs, (3) Element of Production, Accident Cost Concept, (4) Medical and Compensation Costs, (5) Manpower Costs, (6) Machinery, Material, and Equipment Costs, (7) Total Costs of Accidents, (8) Elements of Production--Accident Cost Form, and (9) Workers Lose. This document is available as GPO L16.3--268 for 20 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

SAFETY IN INDUSTRY
INSTRUCTOR OUTLINE

accident cost control



U [illegible] DEPARTMENT OF LABOR
W[illegible]llard Wirtz, Secretary
B[illegible]U OF LABOR STANDARDS
Nelson M. Bortz, Director

Bulletin 268

This instructor outline is one of a series developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards, U.S. Department of Labor.

The outline is intended only as a guide to standard presentation of the subject in sequence and basic content. Additional information, material, and illustrations should be included for a complete presentation suitable to the conditions, locality, industry, or occupational group.

For sale by the Superintendent of Documents, U.S. Government Printing Office
Washington, D.C., 20402 - Price 20 cents

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.
2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.
3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.
4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.
2. Good ventilation, lighting, and sufficient room are important aspects to consider.
3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.
4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

   A. Some may be more mature.

   B. Some may have a knowledge of safety.

   C. Some may have actual experience to draw on in the discussion.

   D. Some may have a faster learning speed than others.

E. Some may be "stallers" who can slow down the discussion.

F. Others may be aggressive and want to monopolize the discussion.

G. There may be a "know-it-all" in the group who must be properly controlled.

H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:

A. Telling—this means giving background information to introduce a subject.

B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.

C. Illustrating—using charts, blackboard, slide, or films are very helpful to highlight specific points in the discussion.

D. Discussion conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.

E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.

F. Questions—during the session, the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

It is necessary that the instructor be granted full responsibility for conduct of the class; at times, however, he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course; he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined; he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course, a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training, and not to replace even part of this course which should be taught by *one instructor*.

ACCIDENT COST CONTROL

Accident Cost Control

Develop purpose with class; list items on the blackboard and discuss.

PURPOSE	
SHOWS NEED FOR PROGRAM	An accident cost control system will show how much accidents cost and will therefore be an important factor in determining the safety program in a plant.
ENLISTS SUPPORT OF MANAGEMENT	Management's interest in accident prevention should be stimulated by putting it on a profit-and-loss basis and integrating it with other production costs.
ENLISTS SUPPORT OF OTHERS	Supervision should take an interest in accident cost control, since it is an important factor in production costs. Workers and their organizations should be interested, since it affects their personal safety as well as their job security.
DETERMINING ACCIDENT COSTS	We know of three systems or concepts that are used for determining accident costs. The concept or system used will depend largely upon the degree of accuracy demanded, the scope of the program, and the availability of the data necessary to implement the system.
DIRECT-INDIRECT COSTS CONCEPT	This is the concept where the indirect costs (hidden or intangible costs) are in a ratio of 4:1 to direct costs (medical and compensation costs). Highly inaccurate and not generally acceptable to management. Management will accept the medical and compensation costs but will not in all instances accept the hidden or intangible costs.
INSURANCE AND UNINSURED COSTS CONCEPT	This is the concept where the insurance cost includes medical, compensation, and overhead insurance costs (insurance premium). The uninsured costs include A times number of lost-time cases + B times number of doctors' cases + C times number of first-aid cases + D times number of no-injury accidents (A, B, C, and D are estimated constants for the average cost of each category of cases, preferably based upon studies of a large number of such cases). This is a more complicated procedure than the direct-indirect 4:1 ratio cost method, but it is somewhat more accurate if the averages are based upon adequate studies.

ELEMENTS OF PRODUCTION, ACCIDENT COST CONCEPT

This concept is concerned with accident costs of injury to manpower, damage to machinery, equipment and material, as well as loss of production time.

This concept does *not* include such costs as: Cost of time lost by employees who stop work because of sympathy or curiosity and not because of injury, or cost of time that supervisors and company executives spend in assisting injured employee or investigating the accident, etc.

Only actual costs that are of sufficient importance, of easy recognition and accuracy to be acceptable to management are included. Averages, estimates, and ratios are excluded. This does not include all costs but is accurate and simple in what it does include and provides ready comparability of statistics.

Ask the class to participate with you in developing the elements of production concept; list on the board and discuss.

ELEMENTS OF PRODUCTION	
MANPOWER	Includes all employees from the worker to the engineer, as well as clerical and other salaried employees. Injuries to any of these people may result in medical and compensation costs and will result in lost production time.
MACHINERY AND TOOLS	Includes production machinery, machine tools, auxiliary machinery, as well as any other tools that are used in the plant. Accidents may result in damage of machinery and tools which will require repair or replacement as well as interference with production.
MATERIAL	Includes raw material, goods in process, and finished products. Accidents may result in damage to material requiring repair or replacement, as well as interference with production.
EQUIPMENT	Includes yards, buildings, electrical power, ventilation, lighting equipment, ladders, containers for material in process, tables and chair, and other physical equipment other than machinery and tools that are essential to plant operations. Damages from accidents result in increased costs as well as interference with production.

TIME	Includes production time loss resulting from damaged machinery and tools, material, equipment, as well as loss of production time by the injured employee.
ELEMENTS OF PRODUCTION, ACCIDENT COST CONCEPT	Every accident damages at least one or more of the elements of production. A decrease in the number of accidents should eventually affect the cost of production.

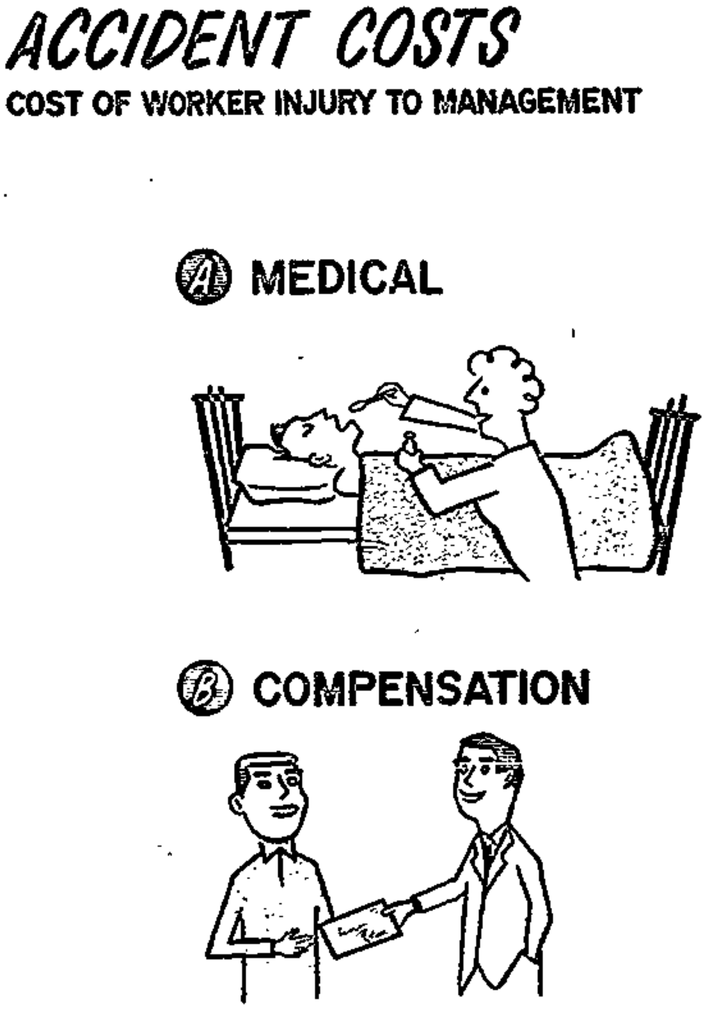


CHART 3—SERIES A

ACCIDENT COSTS	Extent of damage to machinery, material, and equipment determined by supervisor; cost of damage, lost production time, and manpower costs determined by accounting department.
MANUFACTURING BURDEN COST PER PRODUCTION UNIT	The accounting department computes the manufacturing burden cost per production unit which includes: supervisory costs, indirect labor costs, pensions and pension plans, insurance, taxes, social security, fuel, power, light, water, depreciation, research, etc.

	This cost is ordinarily added to the labor and material costs of each production unit to determine basic production costs per unit.
MANPOWER COSTS	Medical and compensation plus loss of production time by injured employee. Medical costs for the injured employee include all medical costs covered by compensation insurance, as well as those medical costs not covered. Compensation costs include workmen's compensation payments to the injured employee. Loss of production time costs of manpower includes the injured employee's salary that is paid for periods such as time lost on day of injury, time lost on subsequent days for medical treatment, or other reasons. It also includes the difference between workmen's compensation and the injured worker's regular salary if it is paid by the employer. It also includes the time the injured worker is on light work or reduced output.

ACCIDENT COSTS

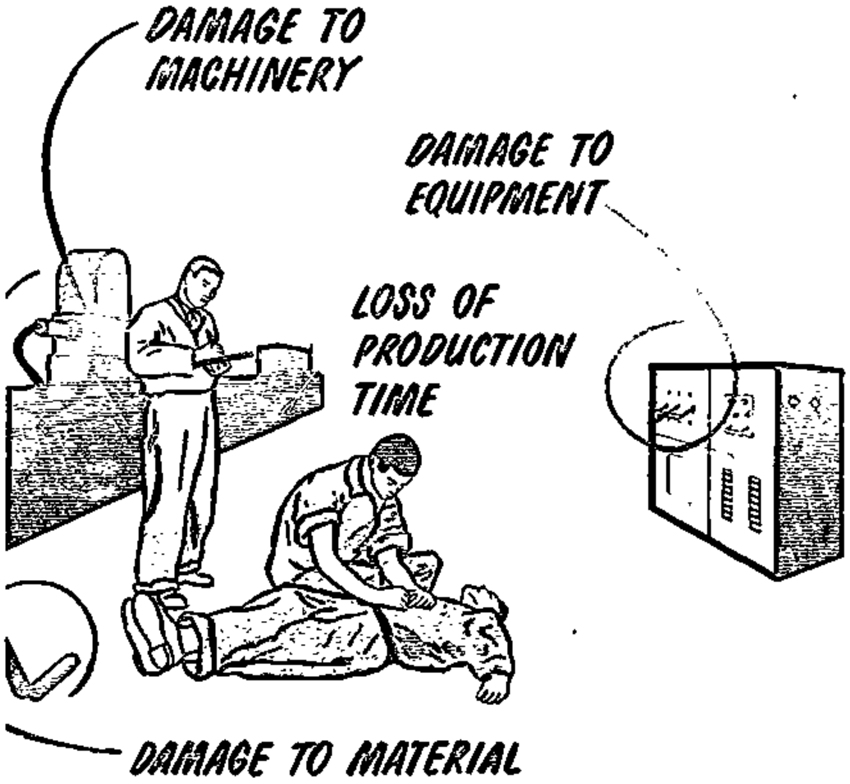

CHART 9—SERIES A

MACHINERY COSTS	Includes cost of repair to damaged machinery resulting from an accident, as well as loss or production time. This latter item is determined by establishing the amount of time that the machine was not in operation because of the accidental damage and the number of production units that would have been produced during this period of time. The number of production units are then multiplied by the manufacturing burden (overhead) costs per unit. (Determined by accounting department.) This will give you the loss of production time cost. Days machine is out of operation because of accident × production units per day × manufacturing burden cost per unit = Lost production time cost
EXAMPLE	Machine down 3 days × 80 units per day × manufacturing burden cost per unit .10 3 × 80 × .10 = $24 Cost of lost machine production.

	Repair of machine................$120 Cost of lost production........... 24 Total cost of damaged machine from accident................$144
MATERIAL COSTS	Includes cost of repair or replacement of material damaged by accident and loss of production time cost if the damaged material was the direct cause of such lost time. The cost of such time may be determined by establishing the days lost and the number of units produced per day by the operation involving this material and using the manufacturing burden unit cost. Days lost from damaged material × production units per day × manufacturing burden cost per unit = Lost production time cost from damaged material
EQUIPMENT COSTS	Includes the cost of repair of equipment that was damaged by an accident and loss of production time if the damaged equipment was the direct cause of such lost time. Days lost from damaged equipment × production units per day × manufacturing burden cost per unit = Lost production time cost from damaged equipment.
TOTAL COST OF ACCIDENTS	Manpower costs = Medical + compensation + lost production time + Machine and tool costs = Machine damage + lost production time + Material costs = Material damage + lost production time + Equipment costs = Equipment damage + lost production time Total cost of accidents Lost production time. Whenever more than one of the elements of production—machinery and tools, material, or equipment—are damaged because of the same accident and result in lost production time, then only one computation is used for lost production time: the one resulting in the greater loss. In other words, we use one lost production time figure for each accident.
HOW TO START	Use a form for investigating accidents and injuries that includes information for determining costs. This will be used first by the supervisor. It will therefore eliminate the need for any other supervisor's accident investigation form.

Distribute and discuss in detail the Elements of Production—Accident Cost Form.

TOTAL COST OF ACCIDENT ________

PROCEDURE	Two key groups that are closely concerned with this procedure are the supervisors and the accounting office. Their cooperation should be solicited through top management before this procedure is put into effect.
SUPERVISOR'S RESPONSIBILITY	The supervisor should be made responsible for determining the accident cause, the extent of damage to machinery and tools, material, and equipment, as well as the amount of time these elements of production are not normally producing because of damage resulting from an accident.
ACCOUNTING OFFICE RESPONSIBILITY	The accounting office should be made responsible for determining the cost of damage to one or more of the elements of production as well as the cost of production units lost because of such damage.
SAFETY DEPARTMENT RESPONSIBILITY	The safety department should be charged with the responsibility of making final cumulative tabulations of accident costs. These should be discussed with management and at central and departmental safety committee meetings.
CHARGE TO EACH DEPARTMENT	The accident costs should be added to the production costs in each department.
START WITH DISABLING INJURIES	To simplify the start of such a program, it may be advisable to begin with the investigation of accidents resulting in disabling injuries. Later, when the procedure is in operation and is working successfully, it can be expanded to include the investigation of minor-injury and no-injury accidents as well.
EFFECT OF PROGRAM	A good accident cost control program creates a stronger incentive for management and supervisors to actively participate in a safety program. It also helps to place accident prevention in the proper perspective as an integral part of production and plant administration.

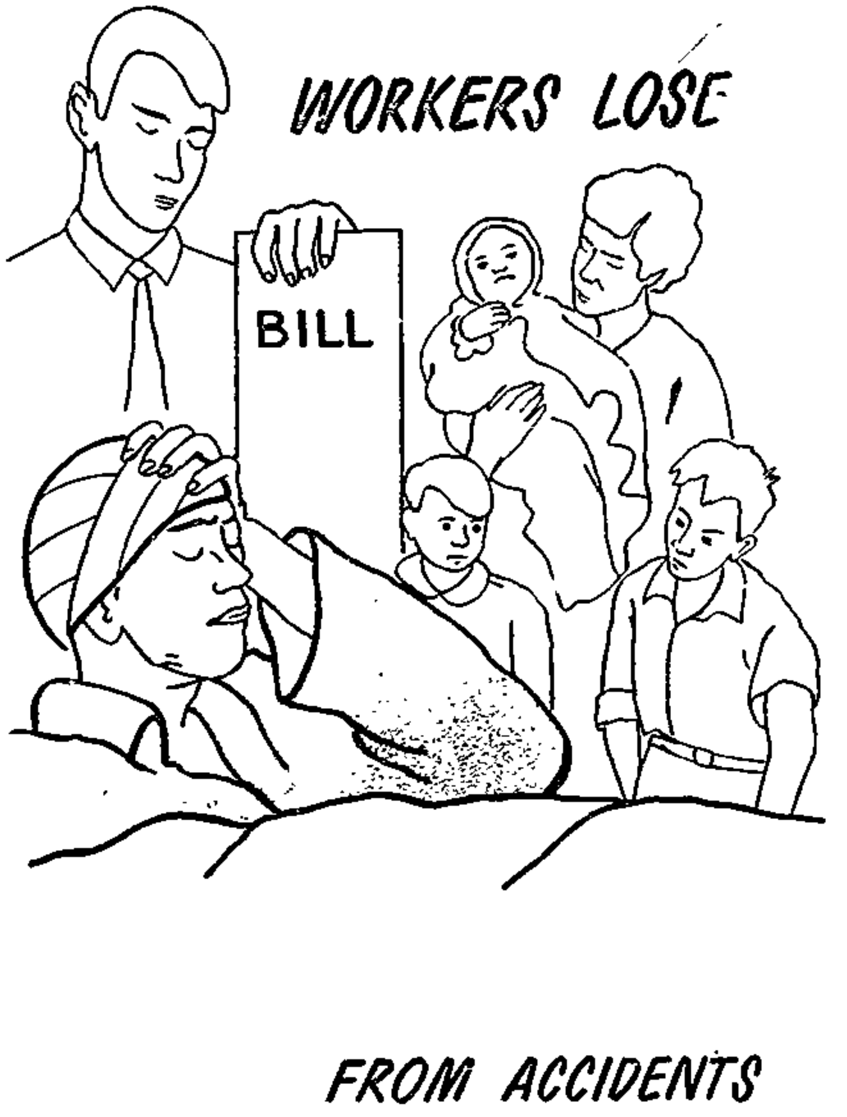

CHART 10—SERIES A

COST TO EMPLOYEE	This procedure for measuring accident costs is concerned mostly with management's costs. The employee, in addition to the physical suffering from the injuries, also loses money when accidents resulting in injuries occur. Employee's actual monetary losses are high in relation to the ability to afford the extra financial burden. Generally, an employee loses the difference between workmen's compensation payments and his regular salary. If his injury results in any permanent impairment, he may have a continuing wage -loss for the rest of his life. If the employee is injured off the job, he must pay his medical costs, and he will incur wage losses if he is unable to work because of the injury.
REDUCTION OF ALL ACCIDENT COSTS	The surest way to reduce all accident costs to employers and employees is to reduce accidents through an efficient accident control program.

Distribute paper "Accident
Cost Control."

Accident Cost Control

The need for an improvement of accident cost control systems has been recognized for many years in the United States. Many managements have a sincere humanitarian interest in their employees and their families. They, therefore, allocate some money toward the prevention of accidents without expecting a fair return for their investment. We might point out that "experience rating," which permits insurance companies to reduce workmen's compensation premiums for companies having safety programs and showing a reduction in the number of accidents, has been an important factor in the allocation of funds by industrial management for accident prevention programs. Despite this favorable position of the safety department, it cannot afford to neglect the effect of its activities on production and company profits. Competition has, in many cases, forced management to reduce overhead costs to a point where only such staff departments that show a profitable operation can be supported. It is, therefore, of primary importance that such management is aware of actual production cost reductions resulting from a safety program. In other words, a good safety program must prevent lost production and increased costs resulting from accidents.

Direct and Indirect Costs

In 1928, the American Engineering Council published a research report which resulted in the development of the direct and indirect cost concept. The compensation payments, plus the medical expense taken together, were referred to as direct costs. The indirect costs included:

1. Cost of lost time of injured employee.
2. Cost of time lost by other employees who stop work:
    a. Out of curiosity.
    b. Out of sympathy.
    c. To assist injured employee.
    d. For other reasons.
3. Cost of time lost by foremen, supervisors, or other executives as follows:
    a. Assisting injured employee.
    b. Investigating the cause of the accident.
    c. Arranging for the injured employee's production to be continued by some other employee.
    d. Selecting, training, or breaking in a new employee to replace the injured employee.
    e. Preparing State accident reports, or attending hearings before State officials.
4. Cost of time spent on the case by first-aid attendant and hospital department staff when not paid for by the insurance carrier.
5. Cost due to damage to the machine, tools, or other property or to the spoilage of material.
6. Incidental cost due to interference with production, failure to fill orders on time, loss of bonuses, payment of forfeits, and other similar causes.
7. Cost to employer under employee welfare benefit systems.

8. Cost to employer in continuing the wages of the injured employee in full after his return—even though the services of the employee (who is not yet fully recovered) may, for a time, be worth only about half of their normal value.

9. Cost due to the loss of profit on the injured employee's productivity, and on idle machines.

10. Cost that occurs in consequence of the excitement or weakened morale due to the accident.

11. Overhead cost per injured employee—the expense of light, heat, rent, and other such items, which continues while the injured employee is a nonproducer.

It was during this same period that the 4 to 1 ratio was developed. The ratio was an attempt to indicate that the indirect costs of an accident were at least 4 times as great as the direct cost of a disabling injury. The validity of this ratio has often been questioned. Subsequent studies have yielded ratios as low as 1 to 1 and as high as 20 to 1.

Recently, the terminology was changed from "direct cost and indirect cost" to "insured cost and uninsured cost," because it is felt that the latter is a more definite description of the costs and it also brings management to regard the uninsured costs with more interest. The change in terminology did not affect the content of what constituted "direct costs and indirect costs."

Generally, the feeling by industrial management has been to accept the "direct" or "insured" costs of accidents as the actual cost without regard for the "indirect" or "uninsured" costs. The reason for this reaction was due to the fact that "indirect" or "uninsured" costs were intangible in nature and could not be determined without an extensive amount of research detail. For example, it is difficult to determine the amount of time that supervisors and company executives spend in assisting an injured employee, investigating the accident, arranging for the employee's production to be continued by some other employee, selecting, training, or breaking in a new employee and preparing accident reports. These activities are conducted during the course of carrying out their job and are integrated to a degree where it is difficult to separate them. This is just one of many items that are included in the "indirect" or "uninsured" accident costs that fall into this category. It was with this problem in mind that a new, simple accident control concept was developed.

Elements of Production Concept

The concept described below has been under consideration in many countries including the United States of America and is being applied in some areas of the world. It is felt that this concept can be more successful when put into effect in plants that have an adequate safety and accounting department.

In this concept, we do not concern ourselves with such terminology as "direct costs," "indirect costs," "insured costs" or "uninsured costs," instead we use five basic factors of production which we call the elements of production. They include:

1. *Manpower*

By manpower, we mean the plant employees including workers, clerks, engineers, and other salaried employees. Injuries to these people result in lost production time and compensation and medical costs.

2. *Machinery*

This includes production machinery, machine tools, auxiliary machinery, and handtools. Accidents result in machine damage requiring repair or replacement which, in turn, results in interruptions to production. This means higher costs and lower quantity and quality production.

3. *Material*

This includes raw material, goods in process, and finished products. Accidents result in damage to material which then requires repair or replacement. This results in production interference and increased costs.

4. *Equipment*

This includes the buildings, yards, electrical power, ventilation and lighting equipment, ladders, containers for material in process, tables and chairs, and other physical equipment other than machinery that is essential to plant operations. Damages from accidents including fire and explosion result in increased costs and interference with production.

5. *Time*

Time includes production time lost because of injuries to employees, damaged machinery, equipment, and material.

Every accident damages at least one or more of the elements of production. A decrease in the number of accidents should eventually affect the unit cost of production.

When using the "Elements of Production" concept, we are concerned with accident costs as they affect production without any consideration of such terminology as "direct," "indirect," "hidden," "insured," or "uninsured." This concept has been found to be more acceptable to management. It should be recognized that this concept does not include all the items that were listed under "indirect" costs. It does, however, include such costs that are easily recognizable and more acceptable to management.

In order to derive the greatest benefit possible from a good accident cost control program, every accident, whether it results in an injury or not, should be investigated and reported. The determination as to the practicability of investigating all accidents should be made by management after a discussion of this procedure and its possible benefits.

The same form may be used for reporting all accident costs, costs of accidents resulting in disabling and minor injuries or costs of accidents resulting only in disabling injuries.

It might be desirable in some instances to start with the costs of accidents resulting in disabling injuries and as this system is used and greater experience is gained, it could be broadened to eventually include all accident costs.

Accident Cost Program Procedures

There are two key groups that can make this procedure successful or result in failure—they are the supervisor and the accounting office. It is, therefore, extremely important that top management impresses on them the importance of this procedure and its value to the plant.

The supervisor is in the best position to discover and make an immediate investigation of the accident, both for cause and for damage. He should also be instructed to notify the safety department as soon after the accident as possible about its extent and severity.

The accounting office will have to set up a separate record system for determining the cost of repairs and replacement of damaged machinery, material, and equipment and the cost of lost production time. This will enable them to complete the form that was originally started by the supervisor. The form should then be submitted to the safety department for final and cumulative tabulation. The safety department can compile the reports for scheduled periods and issue compiled copies to management and each departmental supervisor. Accident costs should be discussed as a regular agenda item during departmental safety committee and central safety committee meetings.

The cost of accidents should be charged back to each department and included as an item in the unit cost production within that department.

Such an accident cost control procedure will create a greater incentive for all levels of management and supervision to participate in an accident control program for direct benefits to management and labor. should assist in putting an accident prevention program in the proper perspective where the production and administration of a plant are concerned.

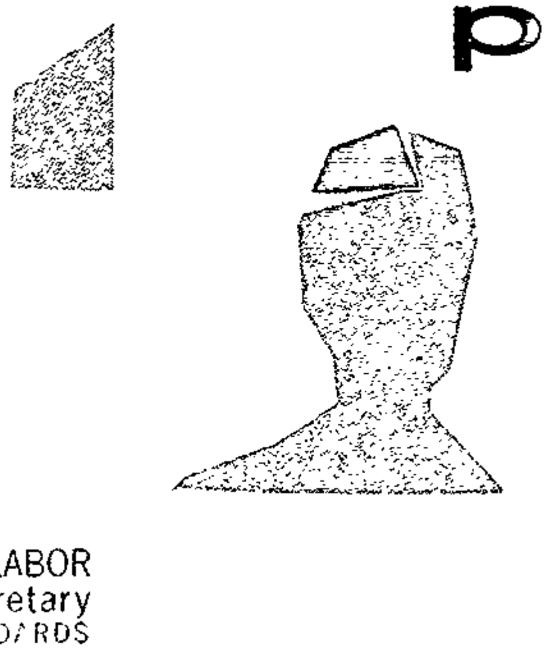
DOCUMENT NOT AVAILABLE FROM EDRS 20p.

*SAFETY, *INDUSTRY, *CURRICULUM GUIDES, *INDUSTRIAL EDUCATION, ACCIDENTS, INJURIES, *PROGRAM EVALUATION,

The course is concerned with appraising the effectiveness of the safety program and the quality of the safety performance in industry. This instructor outline is intended only as a guide to standard presentation of the subject in sequence and basic content. Additional information, material, and illustrations should be included. Content includes use of records, use of injury rates, frequency rate definition, frequency rate computation, severity rate definition, and use of time charges, severity rate computation, and other methods of appraisal. The outline was developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards, U.S. Department of Labor. This document is available as GPO L16.3--269 for 20 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

SAFETY IN INDUSTRY
INSTRUCTOR OUTLINE

appraising safety performance



. DEPARTMENT OF LABOR

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.
2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.
3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.
4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.
2. Good ventilation, lignting, and sufficient room are important aspects to consider.
3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.
4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

   A. Some may be more mature.

   B. Some may have a knowledge of safety.

   C. Some may have actual experience to draw on in the discussion.

   D. Some may have a faster learning speed than others.

E. Some may b scussion.

F. Others may e the discussion.

G. There may b must be properly contr

H. Some may be c ns about previous discus

4. The teaching proce

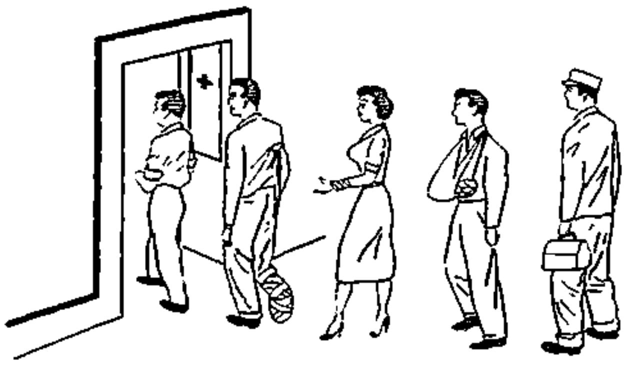
FREQUENCY RATE DEFINED

AS THE NUMBER OF DISABLING INJURIES PER MILLION EMPLOYEE-HOURS WORKED

FORMULA

$$F = \frac{\text{NUMBER OF DISABLING INJURIES} \times 1{,}000{,}000}{\text{NUMBER OF EMPLOYEE-HOURS WORKED}}$$



DISABLING INJURIES

CHART 12—SERIES A

FREQUENCY RATE	
USED TO DETERMINE:	1. Whether the comparative number of work injuries in an operating unit is fewer or greater than in other operating units in the same industry or in other operations having similar hazards. 2. Whether a given operating unit is having fewer or more injuries this year or this month than it had last year or last month. 3. Whether an industry has a better or worse accident experience than similar industries, or than the average for all similar industries.
FORMULA FOR COMPUTATION	Expressed as the number of disabling injuries multiplied by 1 million and divided by the total number of man-hours worked. This formula provides what is known as "the frequency rate of disabling injuries" or the number of disabling injuries per 1 million man-hours of exposure.

Use blackboard to develop this formula.

EXAMPLES:	FREQUENCY RATE = $\frac{\text{Number of disabling injuries} \times 1{,}000{,}000}{\text{Number of employee-hours worked}}$ Plant A had 10 injuries and worked 200,000 man-hours during 1 year. Using the above formula, we would have a frequency rate of 50 disabling injuries per million man-hours worked. FREQUENCY = $\frac{10 \times 1{,}000{,}000}{200{,}000} = 50.0$
DISABLING INJURY DEFINED	A disabling injury is one which results in death or permanent body impairment or which renders the injured person unable to perform a regularly established job that is open and available to him during the entire time interval corresponding to the hours of his regular shift on any one or more days subsequent to the day of the injury.

Make particular stress

EXPOSURE	Man-hours is the total hours worked by all employees—men and/or women.
THE FIGURE 1,000,000	The use of 1 million as a unit of exposure is for convenience and is accepted as standard. It is also a means of stability. Equals 500 persons working 1 year.
TIME ELEMENT	Definition of his next regular shift.

Distribute "Frequency Rate Work Sheet."
Discuss with class. Work out problems.

U. S. DEPARTMENT OF LABOR
Bureau of Labor Standards
Washington, D. C. 20210

FREQUENCY-RATE COMPUTATION

1. Plant "A" worked 103,000 man-hours during the month of January, 95,000 during February, and 131,000 during March. The number of disabling injuries totaled seven for January, four for February, and five for March. Using the standard formula, compute the cumulative frequency rate for the 3 months.

Answer____________________

2. Plant "B" had 500 employees during the month of July. They worked a total of 108,000 hours for the month. During this month, there were 15 first-aid cases and 5 disabling injuries. Using the standard formula, compute the frequency rate for the month of July.

Answer____________________

3. Plant "C" has 500 employees working an average of 8 hours per day. There are 20 working days in the month. (a) Find the estimated hours worked. If there were five disabling injuries during the month. (b) Compute the frequency rate.

Answer (a)--- ------------------- (b)----------------------

4. Plant "D" had 625 employees who worked 40 hours a week for 50 weeks during the year. They had 17 disabling injuries. Compute the man-hours and the frequency rate.

Man-hours---------------------- Frequency----------------------

5. Plant "E" had 500 employees throughout the year. The frequency rate for the first 6 months was 15.0 and for the last half of the year was 15.0. What was the frequency rate for the year?

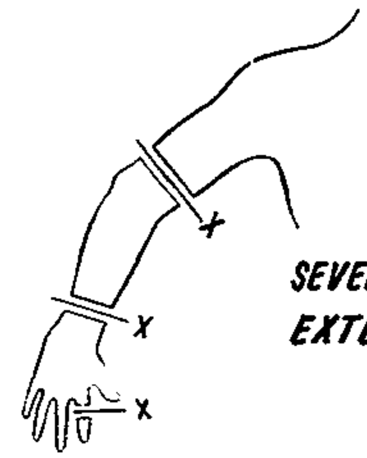
Answer--------------------

SEVERITY RATE DEFINED

AS THE ACTUAL TIME LOST (DAYS)
PER MILLION EMPLOYEE·HOURS WORKED

FORMULA

$$S = \frac{\text{TOTAL DAYS LOST} \times 1{,}000{,}000}{\text{NUMBER OF EMPLOYEE HOURS WORKED}}$$



SEVERITY RATE =
EXTENT OF INJURY

CHART 13—SERIES A

SEVERITY RATE	
USED TO DETERMINE	The severity rate should be used with discretion since only under certain conditions can it be used as a satisfactory gauge of the seriousness of injuries, provided the base is of a sufficient number, preferably 1,000 injuries or more. The smaller the exposure on which the rate is based, the greater the need for supplemental evidence obtained by analysis of the accident record, operating conditions, and the types of hazards involved.
DEFINITION	Number of days lost and/or charged per 1 million man-hours worked.

Place formula on board and work some problems; explain and clarify each step.

FORMULA	Severity Rate $= \frac{\text{Total days lost and/or charged} \times 1{,}000{,}000}{\text{Man-hours of exposure}}$
DAYS LOST	Sum of all days lost by disabling injuries except those in which there is some permanent disability.
DAYS CHARGED	Days charged for death, permanent total, or partial disability are taken from the "Table of Standard Time Charges." When there is any permanent disability, the actual days lost are not used.

WHEN TO USE TIME CHARGES

X *DEATH*

X *PERMANENT TOTAL DISABILITY*

X *PERMANENT PARTIAL DISABILITY*

TEMPORARY TOTAL DISABILITY

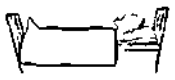


CHART 14—SERIES A

USE OF TIME CHARGES	
REASON	When there is a continuing disability such as a stiff leg, a lost finger, or a lost eye, the actual loss of time while the injury is healing is not an adequate measure of its seriousness. Therefore, an ASA standard schedule of time-loss charges has been agreed upon for all permanent injuries in the United States.
DEATH	Deaths resulting from work injuries shall be assigned a time charge of 6,000 days each.
PERMANENT-TOTAL DISABILITY	Permanent-total disability is assigned a time charge of 6,000 days because the insured's useful, industrial life is ended.
PERMANENT-PARTIAL DISABILITY	Functioning of some part of worker's body has been lost or impaired permanently.
TEMPORARY-TOTAL DISABILITY	Worker is totally disabled for work during a temporary period of time. Time charges are not used in this case; instead, the actual days lost are used.

Have class compute severity rates involving different combinations.

U. S. DEPARTMENT OF LABOR
Bureau of Labor Standards
Washington, D. C. 20210

STUDENT WORK SHEET

INJURY-SEVERITY RATE COMPUTATION

1. Plant "A" worked 108,000 man-hours. During this time, they had 11 disabling injuries, totaling 90 days' lost time. Compute the injury-severity rate.

   Answer______________ ______

2. The injury-severity rate for a plant having 10 injuries and causing 200 days lost in 200,000 hours worked would be—

   Answer______________________

3. A plant worked a total of 900,000 man-hours during a 6-month period. During this period, it had the following injuries:

   15 first-aid cases_____________________ __________no days lost
   3 permanent-partial cases_______________________3,150 days' time charged
   22 temporary-total disabilities____________________150 days lost

   Find the injury-severity rate for the 6-month period.

   Answer______________________

4. During 1 year, a plant operating 40 hours a week had 765 men. The plant had the following injuries:

   16 first-aid cases
   7 temporary totals__________64 days lost
   1 loss of thumb and two fingers, same hand
   1 loss of hearing, one ear__________lost 11 days
   1 loss of leg, below the knee.

   Compute the injury-severity rate.

   Answer______________________

OTHER METHODS OF APPRAISAL	
HOUSEKEEPING	Poor housekeeping is a major factor in accident causation: good housekeeping is a major factor in the efficient production of goods of high quality. The relationship is so close that it can safely be said that a management's standard of housekeeping is an excellent guage of its competency.
MACHINE GUARDING	The attention paid to the safeguarding of machinery furnishes a valuable clue to management's knowledge and backing of accident prevention.
MAINTENANCE	The condition of all equipment, safeguards, etc., which is essential to worker safety is a valuable guide to the probability of injury.
SAFETY EQUIPMENT	In every establishment or undertaking, there are activities or conditions for which specific equipment is essential to worker safety.
PROVISIONS FOR WORKER COMFORT	The provisions made for the comfort of the workers in a plant are strongly indicative of management's concern.
SAFETY TRAINING PROGRAM	Training in safe work practices is an essential to good safety performance.
SUMMARIZATION	"Frequency" means the number of disabling injuries. "Severity" means the seriousness of these injuries. There are other means of appraising a safety program in addition to frequency and severity.

Distribute occupational safety aid "How To Compute Injury Rates."

OCCUPATIONAL SAFETY AID

HOW TO COMPUTE INJURY RATES

(Frequency and Severity Rates)

Injury frequency and severity rates are important because they enable a company or operating unit to determine how effectively its employee injury problem is being met, and what progress is being made.

To accomplish this, a standard method of computing these rates is utilized, which adjusts for differences in size of operating units and other variables. This method is included in Standard Z16.1-1954 of the American Standards Association, entitled "American Standard Method of Recording and Measuring Work Injury Experience." It is widely accepted and used by industry.

Bulletins showing the monthly and annual frequency and severity rates of individual industries are issued periodically by the U.S. Department of Labor's Bureau of Labor Statistics.

INJURY-FREQUENCY RATES

INJURY-FREQUENCY RATES give a measure of how often a work-connected disabling injury happens. The ASA defines frequency rate as "The number of disabling injuries per million employee hours of exposure." The rates are used to determine:

(1) whether the number of work injuries in any particular operating unit is lesser or greater than in other operating units in the same industry;

(2) whether a given operating unit is having more or less injuries when compared to a previous period of time and similar operations;

(3) whether an industry has a better or worse injury experience than other industries, or than the average for all industries.

For example, let us assume an operating unit had an injury frequency rate of 9.8 disabling injuries per million man-hours worked, for this year. If the frequency was 10.5 last year, and 11.8 the year before, the 9.8 rate this year would indicate the injury experience is improving.

If the average frequency for this industry this year was 10.1, the injury experience of the unit with 9.8 frequency is slightly better than the average for other operating units having similar hazards. However, this industry frequency is an average made up of some units having frequencies much higher than 10.1, and of some other units having frequencies extending considerably below 10.1. In fact some industries have a number of plants which operate at or close to a zero frequency.

U.S. DEPARTMENT OF LABOR
Bureau of Labor Standards

This means that although the unit with the 9.8 frequency is slightly better than the average for the industry, there are still many other units in the industry having similar hazards, that have better frequency rates. Consequently, the injury experience is still not as good as it should be, and the use of better or additional safety measures for further reduction of accidental injury occurrence should be considered.

THE NUMBER OF DISABLING INJURIES and the MAN-HOURS OF EXPOSURE are needed for computing the injury frequency rate.

DEFINITIONS:

The DISABLING injury is a work injury that results in:

A. Death.
B. Permanent Total Disability.
C. Permanent Partial Disability.
D. Temporary Total Disability.

DEATH is any fatality resulting from a work injury, regardless of the time intervening between the injuty and death.

A PERMANENT TOTAL DISABILITY is any injuty, other than death, which permanently and totally incapacitates an employee from following any gainful occupation, or which results in the loss of, or the complete loss of the use of, any of the following in one accident:

A. Both eyes.
B. One eye and one hand, or arm, or leg, or foot.
C. Any two of the following: hand, arm, foot, or leg.

A PERMANENT PARTIAL DISABILITY is any injury other than death or permanent total disability which results in the complete loss of use of any member or part of a member of the body, or any permanent impairment of functions of the body or part thereof, regardless of any preexisting disability of the injured member or impaired body function.

A TEMPORARY TOTAL DISABILITY is any injury which does not result in death or permanent impairment, but which renders the injured person unable to perform a regularly established job which is open and available to him during the entire time interval corresponding to the hours of his regular shift on any one or more days (including Sundays, days off, or plant shutdowns) subsequent to the date of injury.

A MEDICAL TREATMENT (OR FIRST AID) injury is one which does not result in death, permanent impairment, or temporary total disability, but which requires medical treatment (including first aid).

MAN-HOURS OF EXPOSURE is the total number of employee-hours worked by all employees of the operation involved for the given period of time.

INJURY-FREQUENCY RATE COMPUTATION

First step: GATHER THE INFORMATION

1. Obtain the number of employee-hours of exposure.
2. Obtain the number of Disabling Injuries that occurred during the period of time covered by the employee hours.

It is important that both of these figures be taken from actual records of the plant or industry. Estimates of either can make the final rate only slightly better than a guess. Hours of exposure should be taken from payroll or time records. If an estimate of exposure MUST be made the best yearly estimate is obtained by multiplying the number of employees by 2,000 in the case of a 40-hour week. Suitable adjustment can be made for a shorter or longer workweek. Attempts to adjust for overtime or part-time employment should be avoided unless actual records are available. Absenteeism would likely balance these exposures.

The number of disabling injuries should be obtained from injury reports or similar records.

Second step: CALCULATE THE INJURY-FREQUENCY RATE

Use the above information and the following formula to calculate the injury-frequency rate:

$$\text{Injury-Frequency Rate} = \frac{\text{Number of Disabling Injuries} \times 1{,}000{,}000}{\text{Total Number of Man-Hours of Exposure}}$$

EXAMPLE: In one year there were 8 Disabling Injuries and 1,500,000 man-hours worked

$$\text{Injury-Frequency Rate} = \frac{8\ (\text{Disabling Injuries}) \times 1{,}000{,}000}{1{,}500{,}000\ (\text{Man-Hours of Exposure})}$$

$$\text{or: } \frac{8{,}000{,}000}{1{,}500{,}000} = 5.33$$

Injury-Frequency Rate is 5.33

INJURY-SEVERITY RATE COMPUTATION

The INJURY SEVERITY RATE is a measure of how serious the disabling injuries were. It is defined by ASA as "The average number of days per million hours of employee-exposure." In the case of death or permanent disablement the number of days should be taken from the standard scale of time charges and the actual absence should be disregarded.

First step: GATHER THE INFORMATION

1. Obtain the Man-Hours of Exposure by the same method used for computing Injury-Frequency Rates.

2. Obtain total days lost due to injuries, for the corresponding period of Man-Hours Exposure. This figure may be obtained from the employee injury record.

(Note that death and certain kinds of permanently disabling injuries are arbitrarily assigned a specific time charge in number of days regardless of the time the employee actually was absent from the job. See "Scale of Time Charges," (below) and American Standard Z16.1-1954.)

Second step: CALCULATE THE INJURY-SEVERITY RATE

The formula for computing Injury-Severity Rate is as follows:

$$\text{Injury-Severity Rate} = \frac{\text{Total Days Lost, plus time charges} \times 1{,}000{,}000}{\text{Total Number of Man-Hours of Exposure}}$$

Scale of Time Charges (in days)
(From ASA Standard Z16.1-1954)

Death	6,000
Permanent total disability	6,000

Amputation involving all or part of bone	Thumb	Fingers				Great toe	Each of other toes
		Index	Middle	Ring	Little		
Distal Phalange	300	100	75	60	50	150	35
Middle Phalange		200	150	120	100		75
Proximal Phalange	600	400	300	240	200	300	150
Metacarpal/Metatarsal	900	600	500	450	400	600	350

Hand at the wrist	3,000
Foot at the ankle	2,400
Any part of arm above elbow including shoulder joint	4,500
Any point above the wrist and at or below the elbow	3,600
Any point above the knee	4,500
Any point above the ankle and at or below the knee	3,000

-- **Impairment of function** --

One eye (loss of sight) regardless of sight in other eye	1,800
Both eyes (loss of sight) in one accident	6,000
One ear (complete industrial loss of hearing) irrespective of hearing in the other ear	600
Both ears (complete industrial loss of hearing) one accident	3,000
Unrepaired hernia	50

For complete details regarding loss of use without amputation see scheduled charges in A.S.A. report Z16.1-1954 available from the American Standards Association, Inc., 10 East 40th Street, New York 17, N. Y.

The outline is intended only as a guide to standard presentation of the subject in sequence and basic content. Additional information, material, and illustrations should be included for a complete presentation suitable to the conditions, locality, industry, or occupational group.

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.

2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.

3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.

4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.

2. Good ventilation, lighting, and sufficient room are important aspects to consider.

3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.

4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He should then introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experience to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor, therefore, strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

A. Some may be more mature.
B. Some may have a knowledge of safety.
C. Some may have actual experience to draw on in the discussion.
D. Some may have a faster learning speed than others.
E. Some may be "stallers" who can slow down the discussion.
F. Others may be aggressive and want to monopolize the discussion.
G. There may be a "know-it-all" in the group who must be properly controlled.
H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:
   - A. Telling—this means giving background information to introduce a subject.
   - B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.
   - C. Illustrating—using charts, blackboard, slides, or films is very helpful to highlight specific points in the discussion.
   - D. Discussion Conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.
   - E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.
   - F. Questions—during the session, the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

It is necessary that the instructor be granted full responsibility for conduct of the class; at times, however, he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course; he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined; he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course, a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training, and not to replace even part of this course which should be taught by *one instructor.*

BASIC PRINCIPLES OF MACHINERY SAFEGUARDING

Basic Principles of Machine Safeguarding

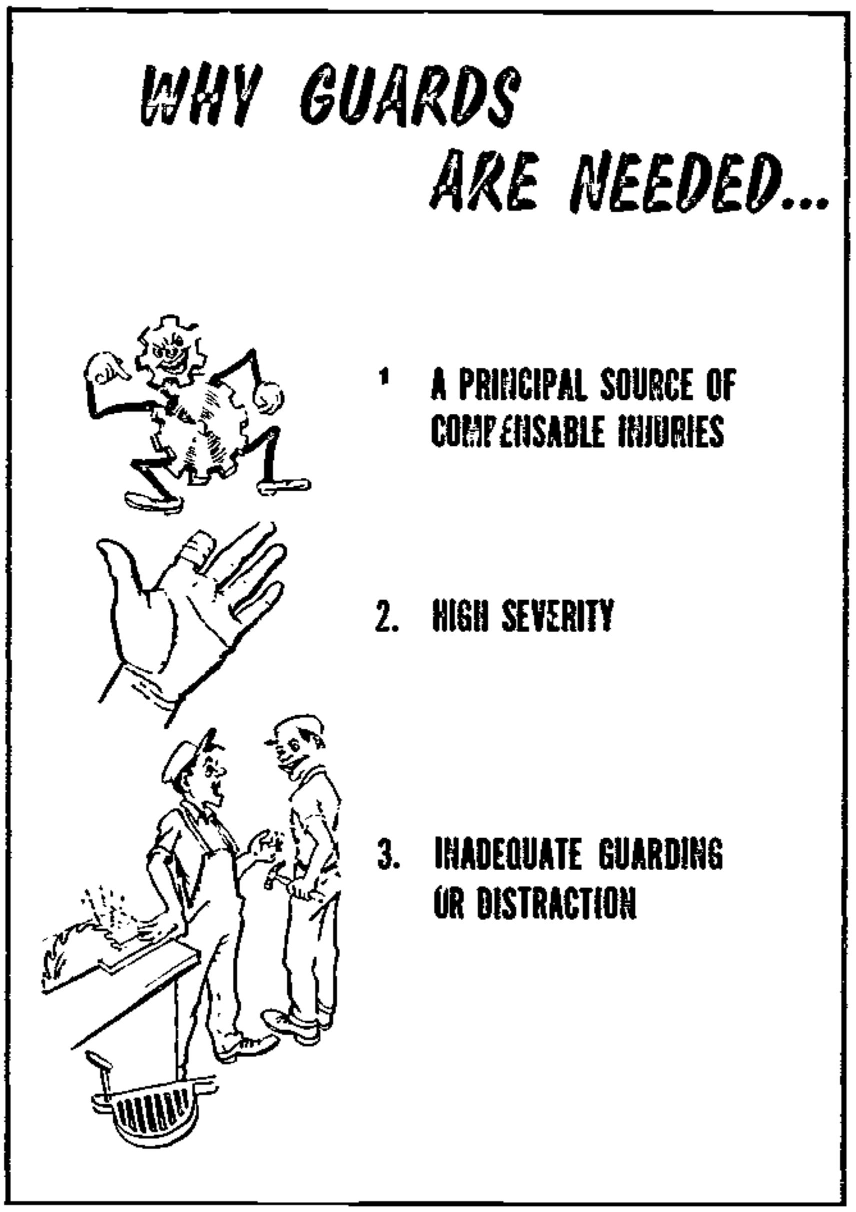

CHART 1—SERIES E

WHY GUARDS ARE NEEDED	
HIGH SOURCE OF INJURY	The National Safety Council estimates that 10 to 15 percent of all occupational injuries involve machinery and other power-operated equipment (excluding vehicles).
HIGH SEVERITY	The National Safety Council estimates that 19.2 percent of the compensable work injuries with permanent-partial disability involved machinery; 3.1 percent of the work-injury fatalities involved machinery.
INADEQUATE GUARDING OR DISTRACTION	It is management's responsibility to provide adequate machine safeguarding to protect the employee—even when he is distracted. Such safeguarding should also protect the machine from damage as well as prevent loss of production.

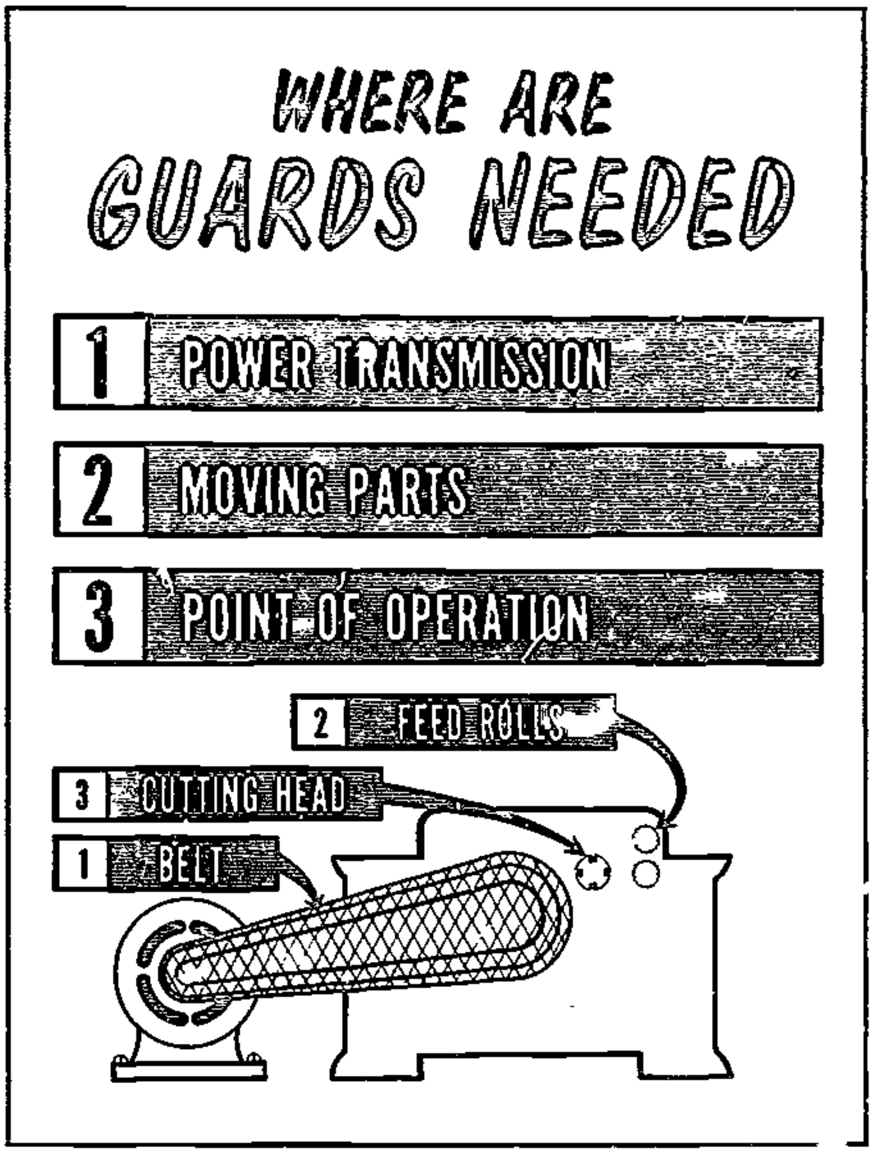

CHART 2—SERIES E

WHERE GUARDS ARE NEEDED	
POWER TRANSMISSION	This is the initial transfer of power from the motor to the machine. Mechanical power transmission apparatus includes shafting, flywheels, pulleys, belts, connecting rods, couplings, spindles, cranks, gears, etc.
MOVING PARTS	This constitutes the secondary transfer of power from the initial power transmission apparatus to the point of operation. Moving parts include reciprocating and rotating parts, cams, clutches, etc. They also include feed rolls and auxiliary parts that do not transfer power but are moving parts of the machine.
POINT OF OPERATION	This is that part of the machine where the material meets the machine. Here, the material is changed from one form to another; e.g., cutting, turning, shaping, stamping, etc.

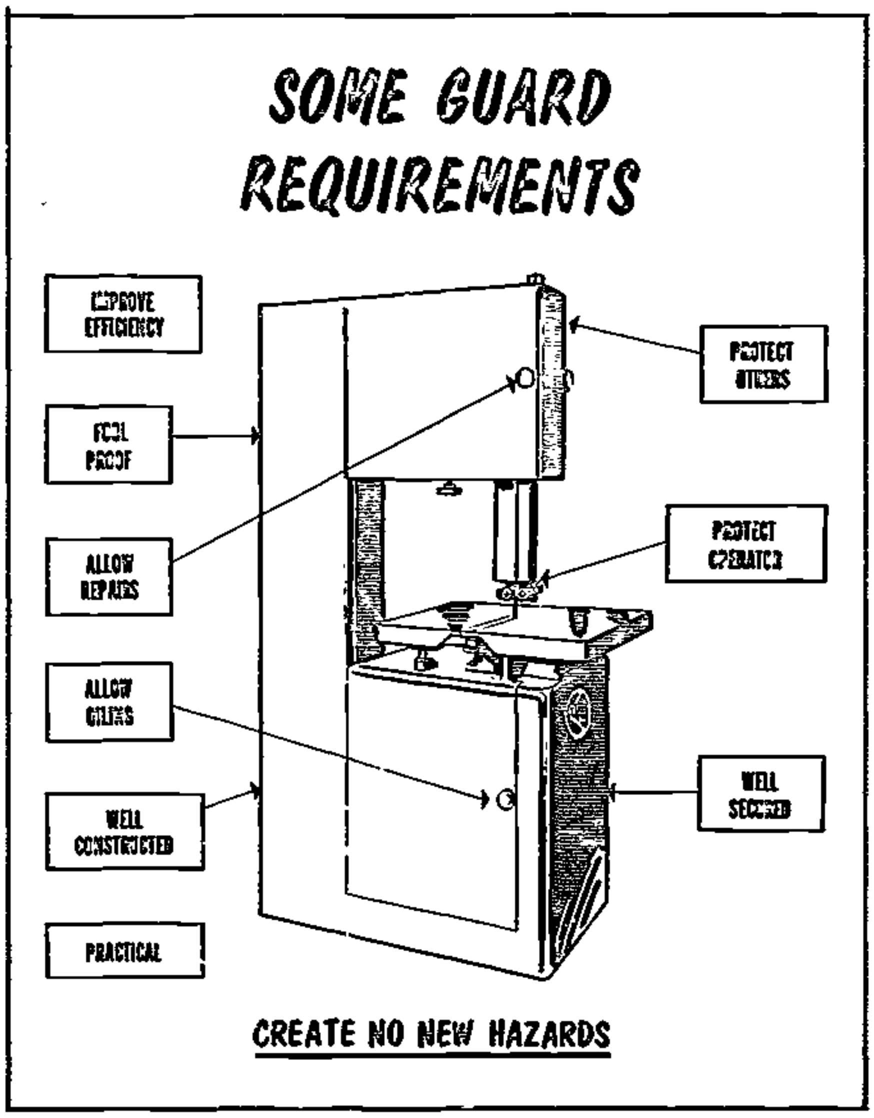

CHART 3—SERIES E

SOME GUARD REQUIREMENTS	Good engineering principles should be applied to the design and construction of each machine in order to eliminate hazards and to permit safe and efficient operation. When this is not possible or in cases where the machine is to be installed, then suitable safeguards should be provided.
PROTECT OPERATOR	The most important function of machine guarding is to protect the operator. This protection must be positive and as nearly as possible should control or eliminate the hazard.
PROTECT OTHERS	Personnel not working directly on a machine but working close to or passing by it should be protected against their coming in contact with machine hazards.
IMPROVE EFFICIENCY	Guards should be so designed and installed as not to interfere with production nor reduce or affect in any way the operator's efficiency. Good guarding gives the operator a sense of security from injury, enabling him to work with less tension and with greater ease of operation.
FOOLPROOF	Guards should be so constructed that their purpose and use are evident, even to the most uninformed worker, and their design and construction should be such that they resist tampering or easy removal.

ALLOW REPAIRS	Provision should be made for adjusting and making repairs on machine parts which are enclosed by guards without exposing personnel to the moving parts.
ALLOW OILING	Provision should be made for lubricating machines without removing the guards. Whenever possible, oil reservoirs should be located outside the guard, with the oil line leading to the point of lubrication.
PRACTICAL	All guards should have a practical application and should not interfere with the operation of the machine.
WELL CONSTRUCTED	Guards should be made of material substantial enough to withstand all conditions and made of quality at least equal to the materials in any other part of the machine.
WELL SECURED	Guards should be not only constructed but well secured so that any blow to, or vibration of, the machine will not cause the guards to work loose or break and fall into or off the area being guarded.
CREATE NO NEW HAZARDS	In the construction of guards, we must make sure that the guards themselves do not create a hazard. Shear points, sharp edges, exposed bolts, or jagged or unfinished surfaces can cause cuts and lacerations. All edges should be rolled and bolted in such a way as to reduce sharp edges and corners to a minimum.

REASONS FOR

MAKING GUARDS

FIT OLDER TYPE MACHINERY
FIT NON STANDARD MACHINES
USE OF OWN IDEAS

BUYING GUARDS

COMPLEX MACHINERY
INTERLOCKS
BETTER DESIGN
PART OF MACHINE

CHART 4—SERIES E

MAKING GUARDS	
TO FIT OLDER MACHINERY	Many industries, particularly smaller ones, may be using an older type machine which, though still serviceable, is not adequately guarded and for which guards cannot be purchased because of the machine's age. Oftentimes, they cannot be replaced by newer, modern type, guard-equipped machines, because the purchase of machinery generally is considered a capital expense which is closely budgeted. It then becomes necessary for guards to be designed and built locally.
TO FIT NON-STANDARD MACHINES	Machines in use by many industries are standard-type machines that have been converted or equipped to perform a special function. At time of purchase, the machine may or may not have been equipped with guards. However, its special use precludes the use of a standard type guard; therefore, guards must be designed and built locally to provide adequate protection for the operator.
USE OF OWN IDEAS	Foremen, maintenance personnel, and workers alike should be encouraged to use or submit their own ideas as to the design and construction of locally made guards. It should be pointed out, however, that these

designs and the construction should conform to the standards of the American Standards Association or to the State inspection department having jurisdiction.

BUYING GUARDS

COMPLEX MACHINERY

When machinery is purchased, guards should be included with the machine. It should be clearly specified in the purchase contract that the guards will meet the standards of the American Standards Association or the State or country inspection specifications.

INTERLOCKS

When guards are purchased with the machine from the manufacturer, interlocks are or can be designed and built into the machine to cover all hazardous parts. Thus, anytime the guard is open, removed, or malfunctions, the machine will stop automatically and cannot be restarted until the guard is returned to its proper position. An interlocking guard must satisfy three requirements:

1. It must guard the dangerous part before the machine can be operated.
2. It must stay closed until the dangerous part is at rest.
3. It must prevent operation of the machine if the interlocking device fails.

BETTER DESIGN

Guards for a particular machine, obtainable through the manufacturer, are the result of research and design by specialists. Therefore, it is almost impossible for the user to design a guard or possess a design that will meet specifications for a specific machine.

PART OF MACHINE

Guards designed and built by the manufacturer are generally designed and constructed so that they are not only an improvement on the appearance of the machine but are also functional. For example: sometimes the guards may be a part of the exhaust system, serve as a part of the oil or grease system, or provide hand or foot rests for the operator.

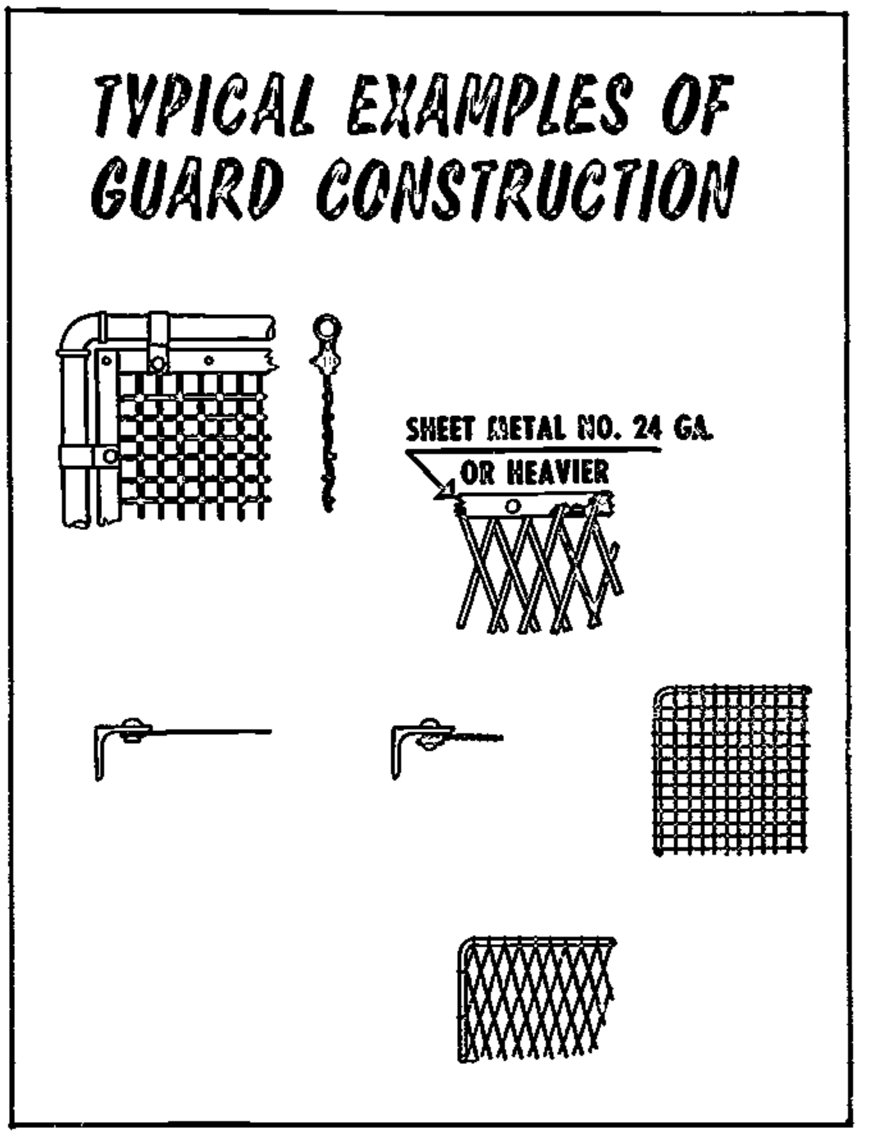

CHART 5—SERIES E

MATERIAL FOR GUARDS

Standard materials for construction of guards include expanded metal, perforated or solid sheet metal, or wire mesh on a frame of angle iron or iron pipe securely fastened to the floor or to the frame of the machine.

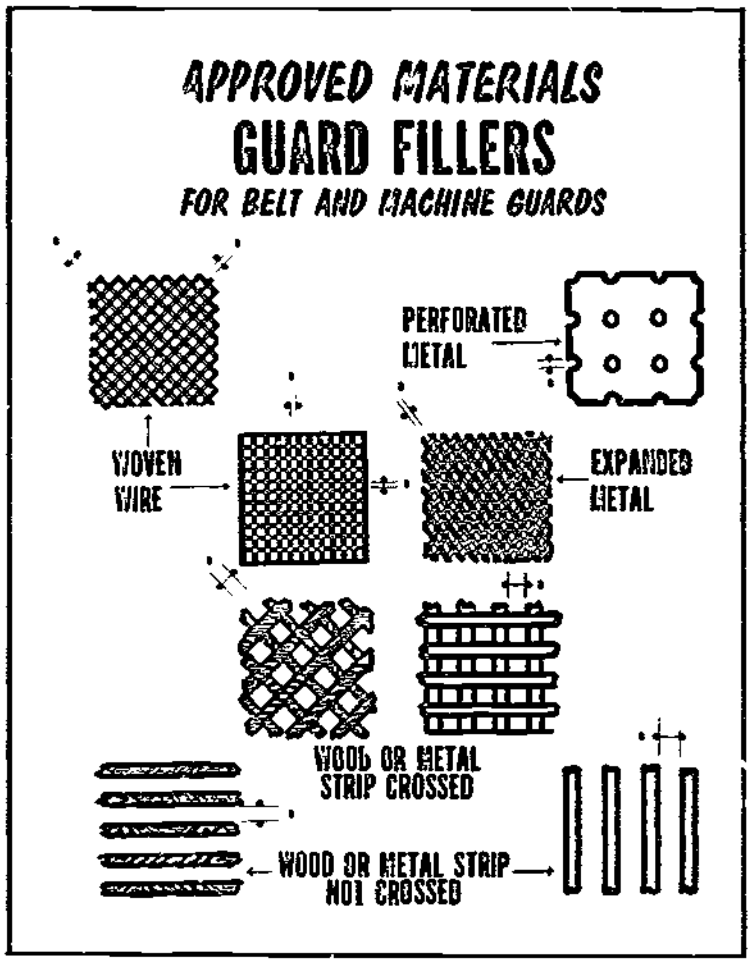

CHART 6—SERIES E

Table of Standard Materials and Dimensions

Material	Clearance from moving part at all points (in inches)	Largest mesh or opening allowable "B" (in inches)	Minimum gage (U.S. standard) or thickness	Minimum height of guard from floor or platform level (in feet)
Woven wire..........	Under 2 inches.....	⅜ inch	No. 16..........	7 feet
	2 inches–4 inches...	½ inch	No. 16..........	7 feet
	Under 4 inches.....	½ inch	No. 16..........	7 feet
	4 inches–15 inches..	2 inches.........	No. 12..........	7 feet
Expanded metal......	Under 4 inches....	½ inch	No. 18..........	7 feet
	4 inches–15 inches..	2 inches.........	No. 13..........	7 feet
Perforated metal......	Under 4 inches.....	½ inch	No. 20..........	7 feet
	4 inches–15 inches..	2 inches.........	No. 14..........	7 feet
Sheet metal..........	Under 4 inches.....	....	No. 22..........	7 feet
	4 inches–15 inches..	....	No. 22..........	7 feet
Wood or metal strip crossed.........	Under 4 inches.....	⅜ inch	Wood ¾ inch or Metal No. 16...	7 feet
	4 inches–15 inches..	2 inches.........		
Wood or metal strip not crossed..........	Under 4 inches.....	½ inch width		
	4 inches–15 inches..	1 inch width.....		
Standard rail.........	Minimum 15 inches. Maximum 20 inches	....	....	3 feet–6 inches

American Standard for Mechanical Power-Transmission Apparatus ASA B15.1—1953 Reaffirmed 1958.

DESIGN OF GUARDS	Where it is necessary to change belts, make adjustments, or apply oil or grease, guards should have hinged sections or should be removable. Guards should be designed so as not to interfere with the usual machine operations, but give maximum protection to the operator.

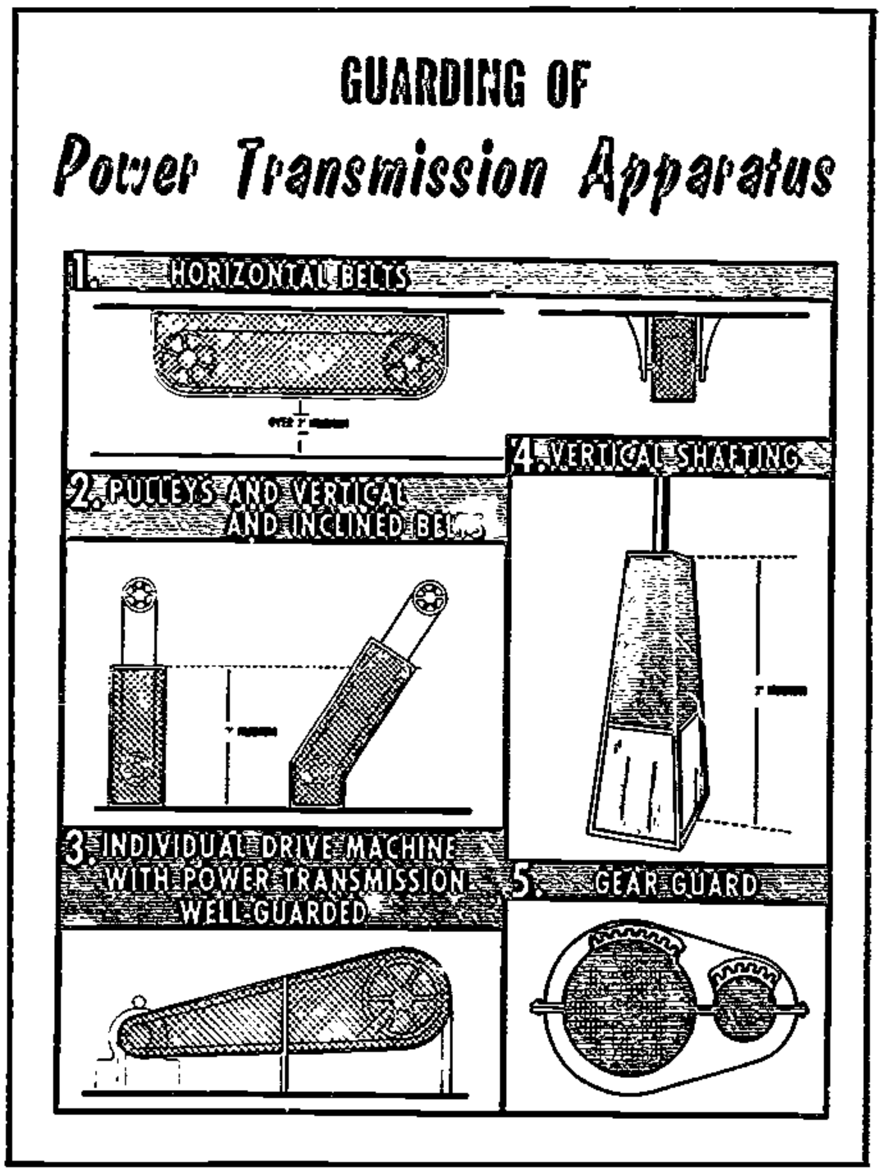

CHART 7—SERIES E

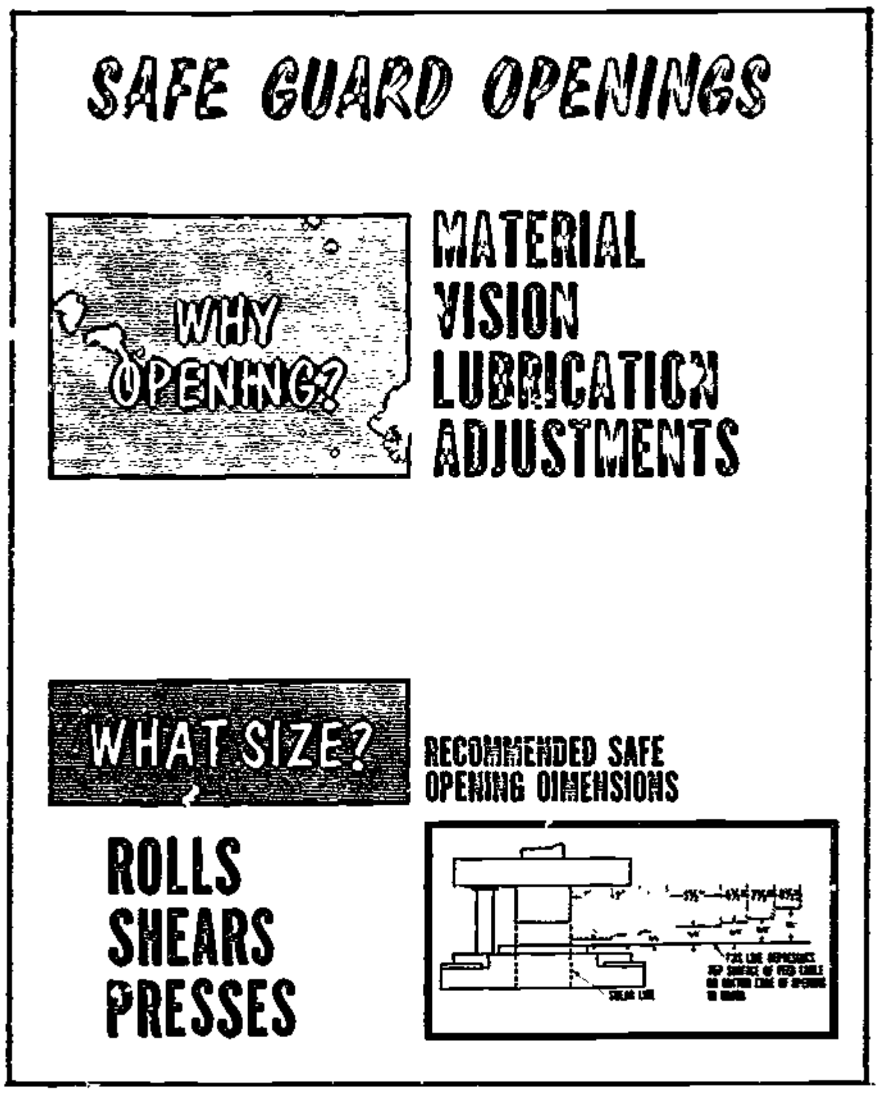
POWER TRANSMISSION INCLUDES	Prime movers including connecting rods, flywheels, as well as other moving parts of equipment used in the mechanical transmission of power, such as shafting, pulleys, belts, sprocket chains, clutches, and couplings.
FLYWHEEL GUARDS	When located so that any part is 7 feet or less above floor or platform shall be guarded.
COMPLETE ENCLOSURE	With sheet, perforated or expanded metal, or woven wire.
GUARDRAILS	Placed not less than 15 inches nor more than 20 inches from the rim. When flywheel extends into a pit or is within 12 inches from the floor, a standard toe board shall also be provided.
DISK GUARD	Flywheels with smooth rims 5 feet or less in diameter where the preceding methods cannot be applied, the following may be used: disk attached to flywheel to cover spokes on exposed side and to present a smooth surface and edge. To facilitate turning the wheel, a 4-inch wide space may be left between the outside edge of disk and rim.

GUARDS FOR CRANKS AND CONNECTING RODS	Full enclosure or guardrail.
HORIZONTAL SHAFTING	All exposed parts of horizontal shafting 7 feet or less from the floor or working platform except runways used exclusively for oiling or running adjustments shall be protected by a stationary casing which encloses shafting completely, or by a trough which encloses sides and top or sides and bottom of shafting, as location requires.
EXTENDING	Wherever shafting extends over a walkway or driveway, it should be protected as stated above unless it is located 15 feet or more above the walkway or driveway.
UNDER BENCH	Shafting under bench machines shall be enclosed by a stationary casing or by a trough at sides and top or sides and bottom, as location requires. The sides of the trough shall come within at least 6 inches of the underside of table, or if shafting is located near floor, within 6 inches of floor. In every case, the sides of trough shall extend at least 2 inches beyond the shafting or protuberance.
VERTICAL AND INCLINED SHAFTING	Vertical and inclined shafting 7 feet or less from floor of working platform, except maintenance runways, shall be enclosed with a stationary casing.
PROJECTING SHAFT ENDS	Projecting shaft ends shall present a smooth edge and end and shall not project more than one-half the diameter of the shaft unless guarded by nonrotating caps or safety sleeves. Unused keyways shall be filled up or covered.
PULLEY GUARDS	Any part of a pulley which is 7 feet or less from the floor or working platform shall be guarded in accordance with ASA standards. Pulleys serving as balance wheels (e.g., on punch presses) on which the point of contact between belt and pulley is more than 6 feet 6 inches from the floor or platform may be guarded with a disk covering the spokes.
PRECAUTIONS	1. Broken pulleys, pulleys with cracks, or pieces out of rim shall not be used. 2. Pulleys permanently out of service should not be allowed to remain on shafting which is in use. 3. Composition or laminated wood pulleys shall not be installed where they are subjected to influences detrimental to their structural composition. 4. Pulleys exposed to corrosive atmospheres should be made of corrosion-resistant material.

	5. Deep grooved sheaves should be used to quarter-turn drives for V-belts.
HORIZONTAL BELTS	Where both runs of horizontal belts are 7 feet or less from the floor level, the guard shall extend to at least 15 inches above the belt (see ASA standard), except that where both runs of a horizontal belt are 42 inches or less from the floor, the belt shall be fully enclosed.
OVERHEAD HORIZONTAL BELTS	Overhead horizontal belts with lower part 7 feet or less from the floor or platform shall be guarded on sides and bottom. Overhead horizontal belts more than 7 feet above floor or platform shall be guarded for their entire length under the following conditions: 1. If located over passageways or workplaces and traveling 1,800 feet or more per minute. 2. If center-to-center distance between pulleys is 10 feet or more. 3. If belt is 8 inches or more in width.
VERTICAL BELTS	Vertical belts running over a lower pulley more than 7 feet above floor or platform shall be guarded at the bottom in the same manner as horizontal overhead belts.
INCLINED BELTS	All guards for inclined belts shall be arranged in such manner that a minimum clearance of 7 feet is maintained between the belt and floor at any point outside the guard.
V-BELTS	Completely enclose all V-belts.
GEAR GUARDS	1. A complete enclosure. 2. A standard guard at least 7 feet high extending 6 inches above the mesh point of the gears. 3. A band guard covering the face of the gear and having flanges extended inward beyond the root of the teeth on the exposed side or sides. Where any portion of the train of gears guarded by a band guard is less than 6 feet from the floor, a disk guard or a complete enclosure to a height of 6 feet shall be required.
SPROCKETS AND CHAINS	All sprocket wheels and chains shall be enclosed unless more than 7 feet above the floor or platform. Where the drive extends over other machines or working areas, protection against falling shall be provided.



SAFE GUARD OPENINGS

WHY OPENING?

MATERIAL
VISION
LUBRICATION
ADJUSTMENTS

WHAT SIZE?

RECOMMENDED SAFE OPENING DIMENSIONS

ROLLS
SHEARS
PRESSES

CHART 8—SERIES E

WHY GUARD OPENINGS	For material: entrance, removal, scrap removal. For vision: cutting line, inspection, selection. For lubrication: greasing, oiling, cleaning. For adjustments: repairs, alterations, changes.
MAXIMUM SAFE OPENINGS	The average woman's fingers (glove size 6½) will go through ⅜-inch openings; therefore, for openings in any guard, use ¼-inch as the largest allowable opening within 1½ inch of the hazard.

TABLE OF DISTANCES

DISTANCE OF OPENING FROM SHEAR POINT (in inches)	MAXIMUM WIDTH OF OPENING (in inches)
0 to 1½	¼
1½ to 2½	⅜
2½ to 3½	½
3½ to 5½	⅝
5½ to 6½	¾
6½ to 7½	⅞
7½ to 8½	1¼

REASON FOR OPENINGS	The various openings are placed so they do not permit the operator's fingers to reach the shear point even though the guard contact is on the back of the fingers, hand, or forearm.
EXAMPLE	Suppose it is necessary to provide a ¾-inch opening between the bottom of the guard and the top of the feed table or between openings in a guard for the feeding of material. In this case, the diagram shows that a ¾-inch opening is permissible to within 5½ inches from the shear point.
CAUTION	When installing guards with openings over ¼ inch, tests should be carefully made by operators, particularly women, to make certain the guard is effective before the machine is operated. Test with hand flat on feed table; extend hand without support.

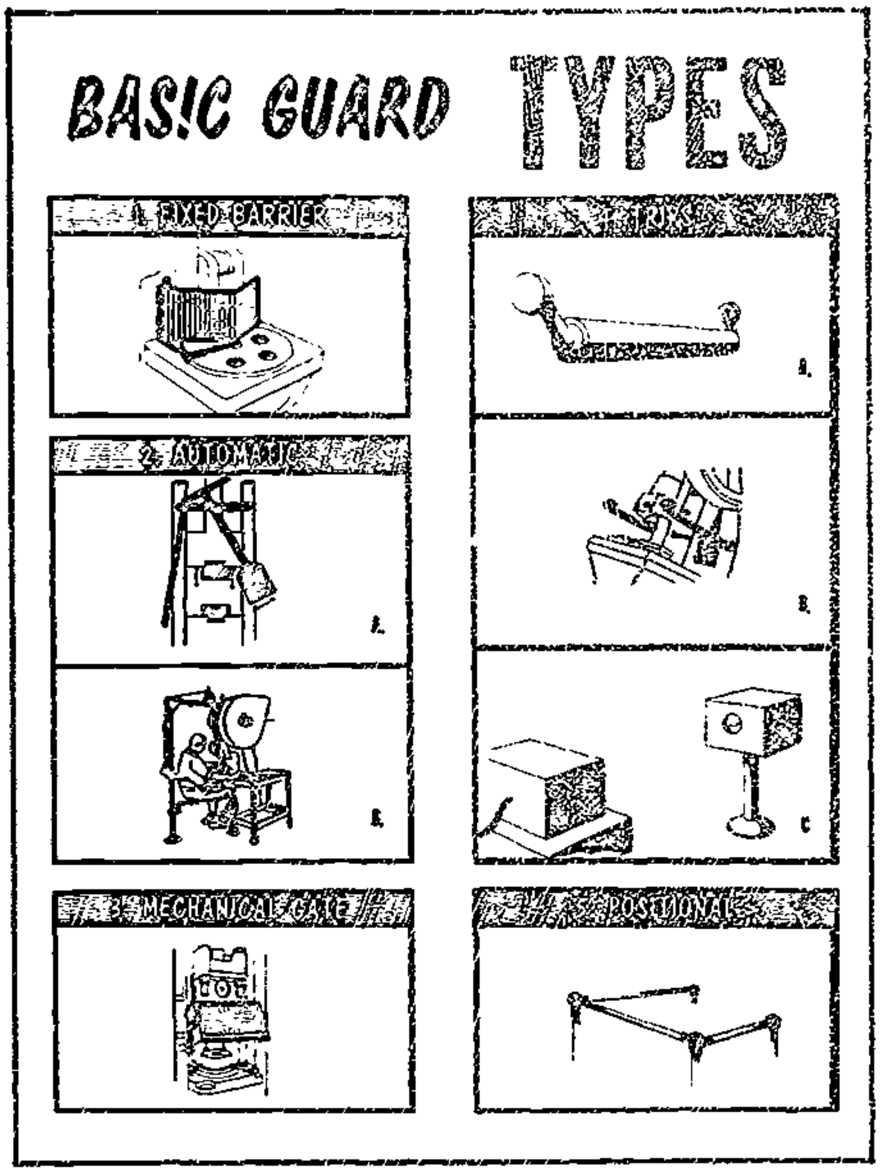


CHART 9—SERIES E

POINT OF OPERATION	
FIXED BARRIER GUARD	The fixed barrier guard may be best described as a stationary enclosure so arranged that it will protect the machine operator from accidental contact with the power transmission, moving parts, or point-of-operation hazard. It shall be secured to the machine by fasteners which cannot readily be removed by the operator. They are often used in connection with special feeding devices. Interlocking devices may be installed to control or prevent operation of the machine when a removable section is opened.
AUTOMATIC FEED	This is a feeding device which does not require the services of the operator except at intervals to restock the feeding device or magazine.
SEMIAUTOMATIC OR MECHANICAL FEED	An appliance, such as dial, slide, push, rotating, or other similar feed arrangement, actuated by or attached to the machine by which stock is fed under the slide, ram, or plunger without necessitating the operator's hands entering the danger zone.

RAM ACTUATED AUTOMATIC GUARDS	"Automatic guards" are generally two protective devices which remove the operator's hands, arms, or body from the danger zone as the slide or ram descends. These guards are operated by the machine itself by means of connections to the slide or ram. *"Sweep," "knock-away," or "push-away" device* is a moving barrier connected to the slide or ram of the machine. (It should be padded to avoid injury to the operator.) *"Pull-away" or "handcuff" device* is a "handcuff" arrangement connected to the hands or arms of the operator and to the slide or ram of the machine.
MECHANICAL GATE GUARD	In using this guard, the gate moves in front of the operation, and the press cannot be tripped until the guard is in position. This guard is not entirely reliable because it is actuated by the clutch, and the ram can repeat when the clutch is defective. The forward edge of the gate should be padded to avoid injury to the operator. This guard can also be converted to a fixed barrier guard.
TRIP GUARDS	a. *Trip guards for a calender roll* are horizontal trip rods located so that contact with the body or head of the operator will instantly actuate the stopping mechanism and quickly stop the roll within the travel limits set by the ASA. b. *Hand trips* are usually of a type requiring the application of pressure on two levers or buttons simultaneously. The two-hand trip can be rendered ineffective unless it is equipped with an equalizer or guarding arranged so that one lever cannot be tied down or blocked (which would permit one-hand operation). c. *Electric eye* type of guard is usually very expensive to install and to maintain. As part of this installation, a positive braking system is required which will effectively stop the machine, and will prevent it from being started if anything is in the danger zone protected by the beam of the electric eye.
POSITIONAL GUARD	A positional guard acts as a barrier or fence to prevent accidental contact of a person with moving machinery, chips, cuttings, etc. This is best illustrated by a standard guardrail.

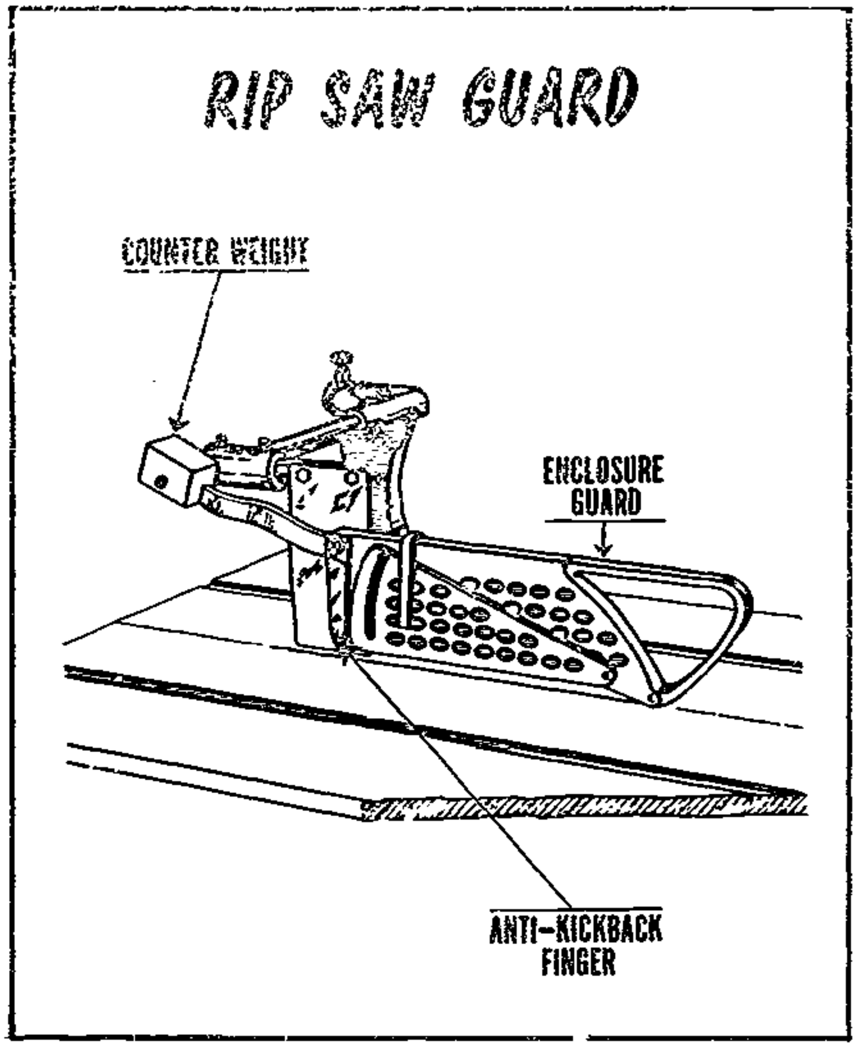

CHART 10—SERIES E

HAND-FED RIP SAWS	A basic type of power table saw which uses a circular blade, the teeth of which are usually larger, and is constructed to "rip" or cut along the grain of the wood.
MECHANICAL AND OPERATIONAL HAZARDS	General hazards are inherent in the following: power transmission, point of operation, kickbacks, or flying particles.
POWER TRANSMISSION	The saw may be driven by an individual motor or from a line shaft, comprising belts, gears, and pulleys.
POINT OF OPERATION	Accidental contact with the saw blade by the operator or others is possible.
KICKBACKS	Kickbacks or throwing material toward the operator through action of the blade can be caused by unsafe operating methods, improperly maintained equipment, or by lack of proper physical safeguards.
FLYING PARTICLES	Sawdust, splinters, and chips are thrown off as a result of the cutting action of the blade and can come in contact with the operator or others.

HAZARD CONTROL	
POINT-OF-OPERATION GUARD	Each circular, hand-fed ripsaw should be guarded by a device which would completely enclose the portion of the saw above the table, with the exception of an opening large enough to permit suitable visibility at the point of operation. This opening should not exceed one-half inch in width. The guard and mounting shall be so arranged that the guard will automatically adjust itself at all times to the thickness of, and remain in contact with, the material being cut. The guard should be of adequate strength to resist blows and strains incidental to normal operation, adjusting, and handling, and shall be so designed as to protect the operator from flying splinters and broken saw teeth. The guard should be mounted so as to insure that its operation will be positive, reliable, and in true alinement with the saw. The mounting shall be strong enough to resist any reasonable side thrust or other forces tending to throw it out of line.
SPREADER	Each hand-fed, circular ripsaw should be furnished with a spreader or splitter to prevent material from being thrown back. The spreader should be made of saw steel or tool steel which has been hardened, tempered, and ground to gage so that it is thinner than the saw kerf but thicker than the saw blade. The spreader should be of sufficient width —not less than 2 inches—to provide adequate stiffness or rigidity to resist a reasonable side thrust or blow tending to bend or throw it out of position. The spreader should be so attached as to remain in true alinement with the saw, even when either the saw or the table is tilted, and shall be placed so that no more than ½-inch space is between the spreader and the back of the saw when the largest saw is mounted in the machine.
ANTIKICKBACK ANTI-KICKBACK FINGERS	Each hand-fed, circular ripsaw should be provided with one or more antikickback fingers, or dogs of steel, or its equivalent in strength and so located as to oppose the thrust or tendency of the saw to pick up the material or to kick it back toward the operator. It should be designed to provide adequate holding power for all thicknesses of materials being cut.
EYE PROTECTION	Operators shall be provided with proper protective equipment, such as goggles and/or face shield, and it should be mandatory to use them each time the saw is operated.
POWER TRANSMISSION GUARDS	If saw parts are driven by belts that are exposed, belts and pulleys should be completely enclosed by sheet-metal or heavy mesh guards, even though the saw may be partially fenced off or partially removed from other machines.

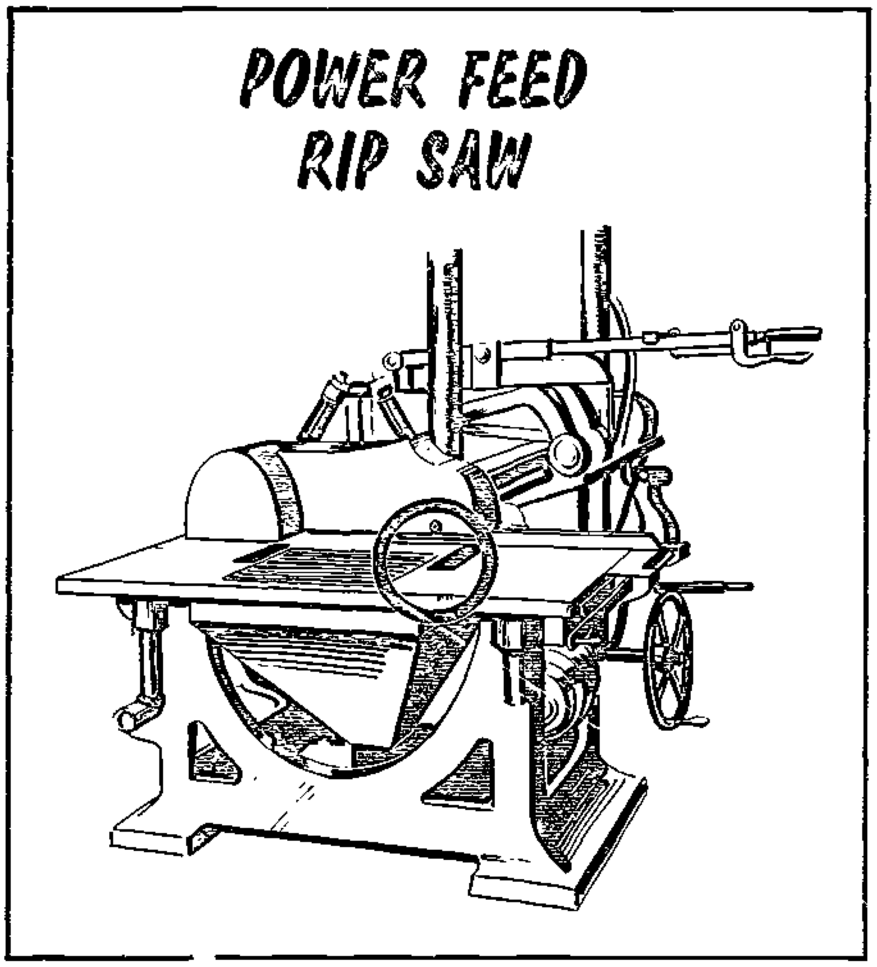

CHART 11—SERIES E

POWER FEED RIP SAW	This type of saw is used to "rip" or cut with the grain heavy, thick, long, lengths of lumber. This saw is equipped with rollers or a conveyor system that holds the lumber and force feeds it into the saw blade.
MECHANICAL AND OPERATIONAL HAZARDS	General hazards may be inherent in the following: power transmission, point of operation, kickbacks, and flying particles.
POWER TRANSMISSION	Saw may be driven by an individual motor or from a line shaft, comprising belts, gears, and pulleys.
POINT OF OPERATION	Accidental contact with the saw blade, or being pinched between the stock and the inrunning rolls by the operator or others, is possible.
KICKBACKS	Kickbacks or throwing material toward the operator through action of the blade can be caused by unsafe operating methods, by equipment being improperly maintained, or by lack of proper physical safeguards.
FLYING PARTICLES	Sawdust, splinters, and chips are thrown off as a result of the cutting action of the blade and can come in contact with the operator or others nearby.

CLEARANCES	Long stock is often ripped on power feed ripsaws, but it obstructs passageways and interferes with operation of other machines located too near.
HAZARD CONTROL	
POINT-OF-OPERATION GUARD	A power feed ripsaw should be guarded by a device which would completely enclose the top and sides of the saw and rolls. Such a guard shall be constructed so that the hands are prevented from coming in contact with the saw or from being pinched between the stock and in-running rolls, regardless of the thickness of the stock. At the front, the guard should extend to within ⅜ inch of the lowest part of the rolls. The guard should be so mounted as to insure that its operation will be positive, reliable, and in true alinement with the saw. The mounting shall be strong enough to resist any reasonable side thrust or other force tending to throw it out of line.
ANTI-KICKBACK FINGERS	Even though the feed rolls are automatic and help prevent kickbacks, kickbacks can still occur unless rolls are kept clean and corrugations, sharp. Each power-fed ripsaw shall be provided with one or more nonkickback fingers, or dogs of steel, or its equivalent in strength, and so located as to oppose the thrust or tendency of the saw to pick up the material or to kick it back toward the operator.
EYE PROTECTION	Proper protective equipment, such as goggles and/or face shield, shall be worn by the operator and helpers while the saw is being operated.
EMERGENCY STOPS	Emergency stop buttons should be provided, one each for the operator and the off-bearer.
CLEARANCE	A clearance at each working end of the saw table should exceed by at least 3 feet the length of the longest material handled.

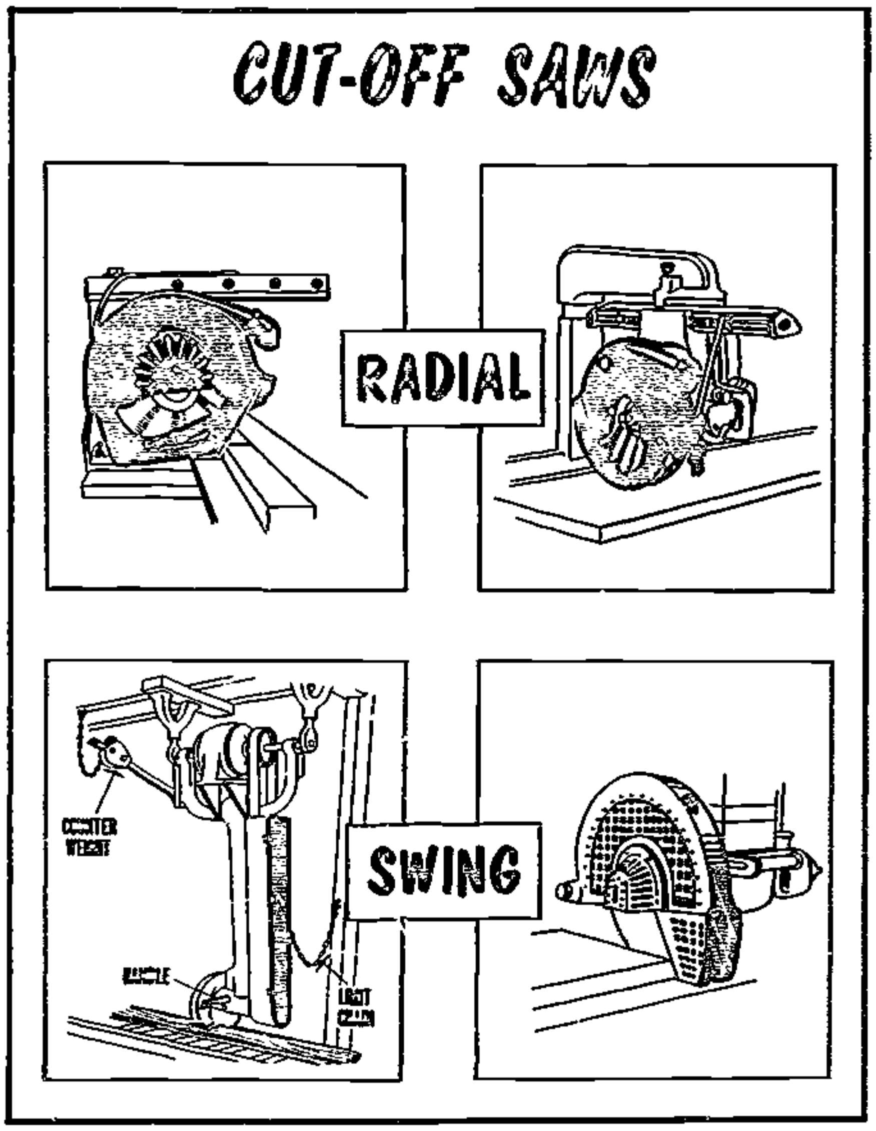

CHART 12—SERIES E

CUT-OFF SAWS	**Cut-off saws are used to cut across the grain of lumber. There are two types: radial, which is pulled forward horizontally along a fixed track toward the operator; swing, which is suspended from the roof or overhead and is pulled forward, like a pendulum, by the operator.**
MECHANICAL AND OPERATION HAZARDS	**Hazards in general may be inherent in power transmission and at point of operation.**
POWER TRANSMISSION	**This type of saw is driven generally by an individual motor with the saw attached directly to the motor shaft, or may be driven by an individual motor by belt and pulleys.**
POINT OF OPERATION	**Accidental contact with the saw blade by the operator while pulling saw forward; reaching for sawed stock before saw returns to normal "rest" position; or saw is not properly adjusted, permitting it to swing beyond saw table into body of operator.**

HAZARD CONTROL	
POINT-OF-OPERATION GUARD	Each swing or sliding cut-off saw should be provided with a hood that will completely enclose the upper half of the saw, the arbor end, and the point of operation at all positions of the saw. The hood should be constructed in such a manner and of such material that it will protect the operator from flying splinters and broken saw teeth and will afford him a clear view of the cutting edge of the saw at all times. The hood should be hinged at the back and provided with an extension at the front, so that when the saw is returned to the back of the table, the hood will rise on top of the fence. When the saw is moved forward, the hood shall drop on top of, and remain in contact with, the material being cut. At the end of the cut, the lip of the hood will be in contact with the table surface.
COUNTER-WEIGHT	Each swing cut-off saw should be provided with an effective device to return the saw automatically to the back of the table when it is released at any point of its travel. Such device should not depend upon any rope, cord, or spring for its proper functioning. If there is counter-weight, the bolts supporting the bar and counterweight should be prevented from dropping by either a bolt passing through both the bar and counterweight, or by a bolt being put through the extreme end of the bar, with a safety chain attached to it.
LIMIT CHAINS	Each swing cut-off saw should be provided with limit chains or some other equally effective device to prevent the saw from swinging beyond a front or back position where the gullets of the lowest tooth will rise above the table top.
LATCH	A latch should be provided to catch and retain the saw at the rear of table and to prevent it from rebounding.
SAW TABLE	Each swing and sliding cut-off saw table should be made wide enough at the point of operation to maintain table surface below the exposed edge of the saw blade to the full extent of the travel of the saw. It should be equipped with a backrail and dead rolls of sufficient length to provide support for the longest stock. Saw should not extend in front of back-rail when in released position.
SAFE OPERATION	While operating the saw, it is important that operator stand to the side of the saw on which the handle is located. Operator should used the hand nearest the handle. This keeps the operator's body out of line with saw and makes it unnecessary to expose the hands near the saw.
GOGGLES	Proper personal protective equipment, such as goggles or face shield, should be worn by the operator.

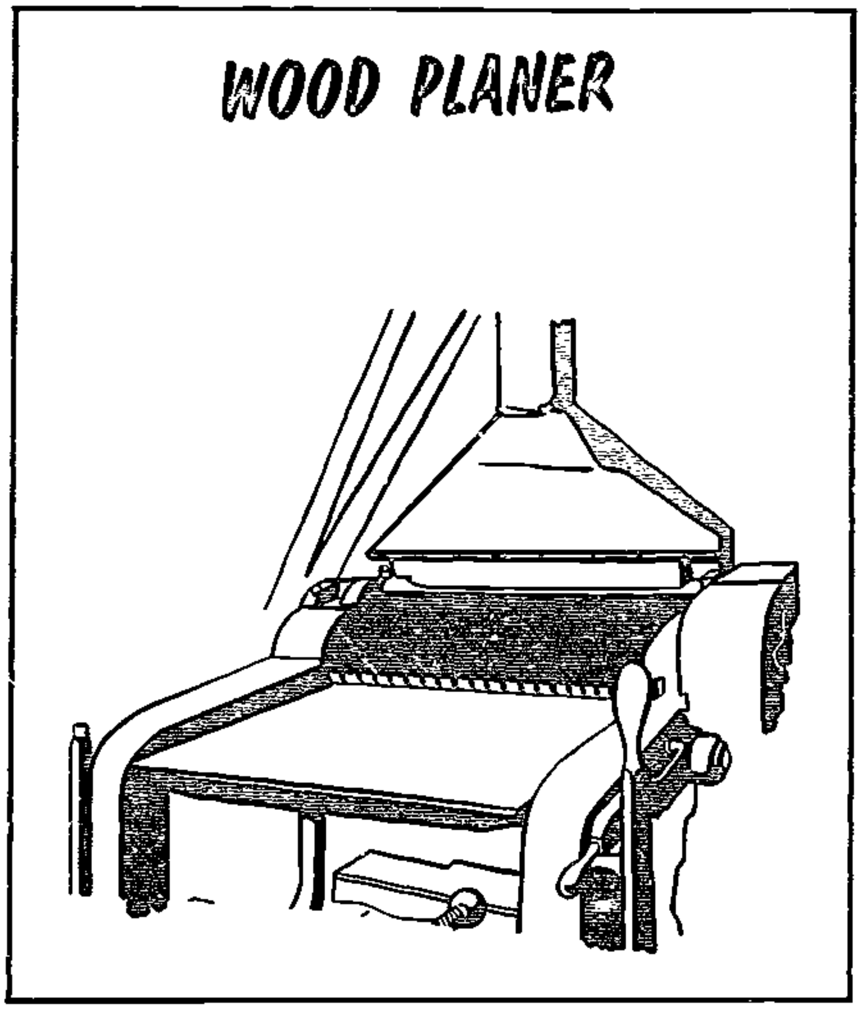

CHART 13—SERIES E

WOOD PLANER	Wood planers are production machines intended for volume work and designed to dress and size rough sawed lumber on one or more sides. These surfacing machines are less hazardous than jointers and shapers because they are power fed and the operator's hands need not come close to the cutting head.
MECHANICAL AND OPERATIONAL HAZARDS	Hazards in general may be inherent in power transmission, point of operation, kickbacks, flying particles, vibration, or clearances.
POWER TRANSMISSION	Often driven from line shaft, comprising belts, pulleys, and gears located on back side of planer.
POINT OF OPERATION	Accidental contact with blades while sharpening or adjusting. Pinching of fingers and hands between material and inrunning rolls by operator unless guarded adequately.
KICKBACKS	Kickbacks or throwing material toward the operator through action of the blade can be caused by unsafe operating methods, by equipment being improperly maintained or adjusted, or by lack of physical safeguards.

FLYING PARTICLES	Chips, splinters, etc., are thrown off as a result of the cutting action of the blade, since blade travels at high speed and can come in contact with operator or others nearby.
VIBRATION	A planer is powerful and fast running and tends to vibrate excessively. Vibration may also be caused by dull or improperly sharpened blades.
CLEARANCES	Since material passing through planer is generally long and moves fast, workers can be caught between stock emerging from the planer and stationary objects or structural members of the building.

HAZARD CONTROL

POWER TRANSMISSION GUARDS	Planer parts driven by belts and pulleys, even though they may be on the back side of the planer, should be completely enclosed by sheet metal or heavy mesh guards. Guards should always be used regardless of planer's location.
POINT-OF-OPERATION GUARDS	Cutter heads (blades) should be completely enclosed in solid metal guards which should be kept closed when planer is running. Where exhaust system is used, the guards should form part or all of the exhaust hood and should be constructed of sheet metal not less than 1/16 inch in thickness or cast iron not less than 3/16 inch in thickness. Sheet-metal guards should be reinforced with angle iron or other bracing to insure rigidity.
FEED ROLL GUARDS	Feed rolls should be guarded by a hood or a semicylindrical guard which will allow the material to pass but will prevent the hands of the operator from coming in contact with the inrunning rolls at any point. The guard should be fastened to the frame carrying the rolls so as to remain in adjustment for any thickness of stock.
ANTI-KICKBACK FINGERS	Kickbacks cannot be prevented entirely by mechanical means; therefore, operator should always stand out of line of board travel. Operators should never feed boards of different thicknesses at the same time because the thinner board will not be held by the feed rolls and can be kicked back from the cutter heads. Feed roll corrugations should be kept clean and free from dust, pitch, etc. They should be kept sharp by filing as needed so that they grip the material as tightly as possible. A row of antikickback dogs or fingers should be placed in front of the feed roll and should extend the width of the feed roll to give further protection.
EYE PROTECTION	The operator should wear a face shield or goggles as protection against slivers and chips thrown back by the cutter heads.

VIBRATION INSULATION	Vibration should be reduced by anchoring the planer on a solid foundation and, if necessary, by insulating it from the foundation with vibration-absorbing material.
LAYOUT	Planers should be located away from other machines to prevent workers from being caught between material emerging from the planer and stationary objects or structural members of the building. The space at the outrunning end should be fenced or marked off to keep workers out of the area where they might be struck by long, fast-moving boards. Insofar as possible, aisleways should be located where it will not be necessary for personnel to pass in front or rear of planer. Because planers create a great deal of noise, they should be isolated.

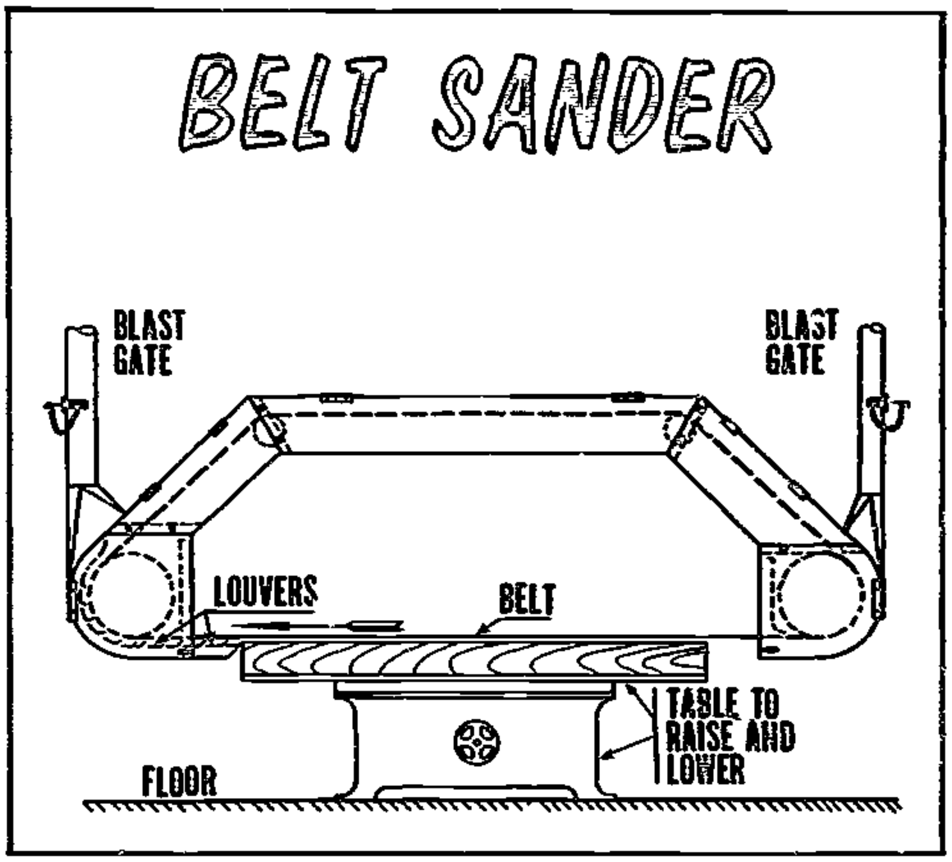

CHART 14—SERIES E

BELT SANDER	A belt sander is a type of sanding machine which uses a continuous strip of abrasive material and travels at moderate speed over two opposed power driven rollers. It is used to smooth large flat areas.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	A belt sander may be driven by an individual motor or from a line shaft, comprising belts and pulleys.
POINT OF OPERATION	Accidental contact by operator with moving abrasive belt. Operator's hands or fingers being caught between work rest and belt on manually fed machine, or between feed rolls and material on self-fed machine.
DUST AND FLYING PARTICLES	Considerable dust and bits of wood are thrown off in the sanding process.
LOOSE BELTS	Loose or improperly tensioned belts cause undue wear and fraying, and can tear or break, causing material on jam or belt to fly toward operator.

CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All power transmission parts of sanders driven by belts and pulleys even though they are on the back side of the machine should be completely enclosed by sheet metal or mesh guards.
WORK REST AND BELT GUARDS	All manually fed sanders should be equipped with a work rest and properly adjusted to provide minimum clearance between belt and rest and to secure support for the work being sanded. Pieces too small to allow the hands to be kept a safe distance from the work should be held in a jig or similar holding device. Feed rolls of self-fed machines should be protected with a guard to prevent the operator's hands from coming in contact with the inrunning rolls at any point. The guard shall be of substantial metal construction, firmly secured to the frame carrying the rolls so as to remain in adjustment for any thickness of material. The bottom of the guard should come down to within three-eighths inch of a plane formed by the bottom of the contact face of the feed roll where it touches the material. Each feed sanding machine should also have both pulleys or drums enclosed in such manner as to guard the points where the abrasive belt runs onto the pulley-drum. The unused run of the abrasive belt should be guarded where exposed to contact by the operator.
EXHAUST SYSTEMS	All belt sanders should be provided with an exhaust system. The exhaust hood should cover all the sanding surface except the operating area. Exhaust intakes should be designed and placed so that the natural throw of the abrasive belt is directly into the exhaust hood. Intakes should be placed as near as possible to the point of contact of the wood with the abrasive belt. Personnel operating sanders should wear goggles and dust-type respirators during sanding operations and while cleaning up afterwards.
BELT MAINTENANCE	Abrasive belts used on sanders should be the same width as the pulley-drum, and drums should be adjusted to keep the abrasive belt taut enough to turn at the same speed as the pulley-drum, yet not slip on the drum when material is brought into contact with the moving abrasive belt. Abrasive belts should be inspected before use, and those found to be cracked, frayed, or excessively worn in spots should be replaced, even though the remainder of the belt appears to be in good condition.

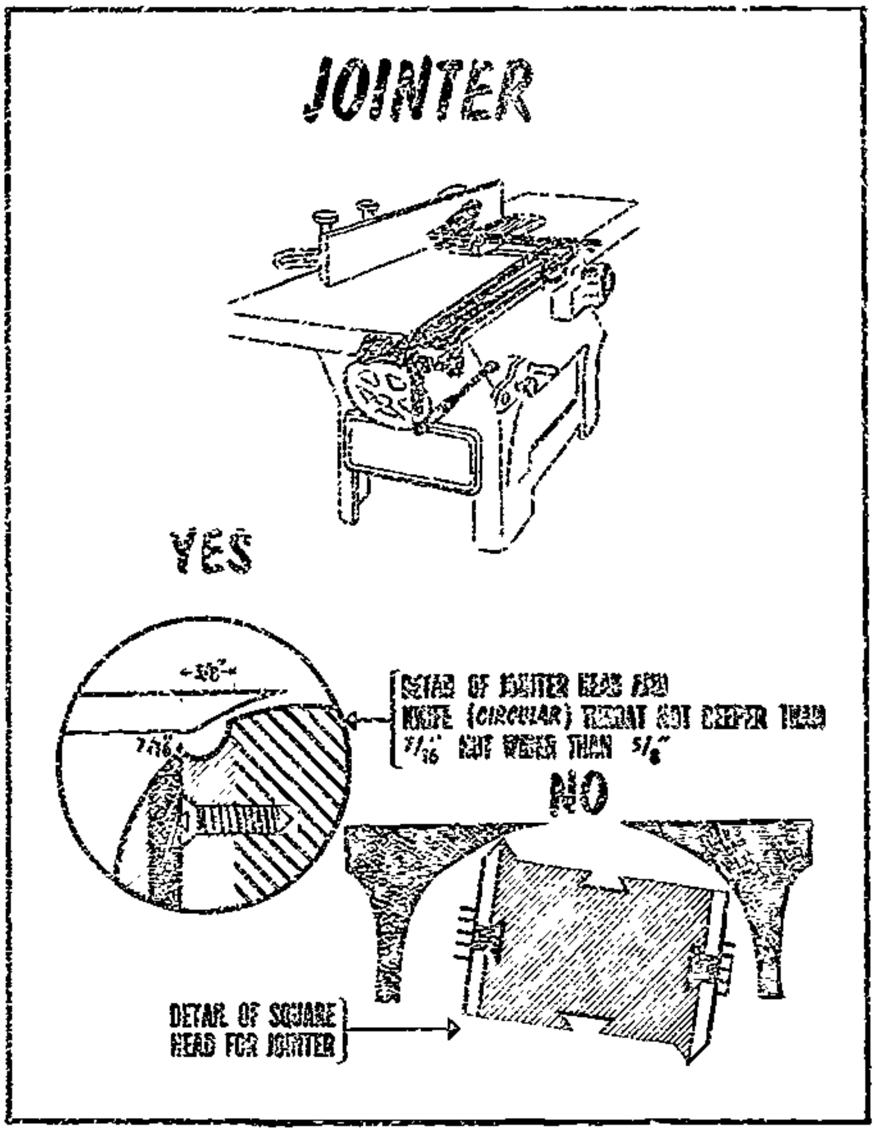

CHART 15—SERIES E

JOINTER	This is a type of wood surfacing machine considered to be second only to circular saws from the standpoint of danger among woodworking machines. Since jointers are used primarily in the jointing of small pieces of material, the many accident experiences are due chiefly to the prevalent practice of not using jigs or similar holding devices when working with small size material.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Power transmission.—Jointers may be driven by an individual motor or from a lineshaft, comprising belts and pulleys.
POINT OF OPERATION	Point of operation.—Accidental contact by the operator with blades while attempting to hold material with hands instead of holding device. Operator attempting to oil or adjust knives or guide while machine is operating. Using hands instead of brush to clean chips away from knives. Operator making automatic guard inoperative.

KICKBACKS	Kickbacks.—Kickbacks or throwing material toward operator through action of the blade can be caused by unsafe operating methods, by equipment being improperly maintained, or by improper adjusting of cutting head.
FLYING PARTICLES	Flying particles.—Chips, splinters, etc., are thrown off as a result of the high-speed cutting action of the blades. This creates a housekeeping problem as well as danger to the operator.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	Jointers driven by belts and pulleys: even though these belts and pulleys are at the rear of the machine, should be completely enclosed by sheet metal or mesh guards.
POINT-OF-OPERATION GUARDS	Each hand-fed jointer that has a horizontal head should be equipped with a cylindrical head, the throat of which should not exceed 7/16 inch in depth nor 5/8 inch in width. No cylinder should be used if the throat exceeds 3/8 inch in depth or 1/2 inch in width. Each hand-fed jointer that has a horizontal cutting head should be equipped with an automatic guard which will cover all of the head on the working side of the fence or gage. The guard should automatically adjust horizontally for edge jointing and vertically for surface work and should remain in contact with the material at all times. Each hand-fed jointer that has a horizontal cutting head should be equipped with a guard which will cover the section of the head back of the fence or gage. Each wood jointer that has a vertical head should be equipped with either an exhaust hood or a guard arranged so as to enclose completely the revolving head, except for a slot wide and convenient enough to insert the material to be jointed.
SAFE MAINTENANCE	At no time should adjustments to knives or fence-guide be attempted unless the machine has come to a complete stop and power has been turned off. Knives on jointers should be checked often to insure proper setting or adjustment. Knives should be kept sharp at all times. To insure efficient operation, the operator should make sure that no heavy cuts are taken. Floors and the area around jointers should be kept free of stumbling and slipping hazards. Since considerable dust and chips are formed during operation, operator should be provided with proper and adequate personal-protective equipment. Provision should be made for brushes, etc., to keep machine and surrounding floor area clean.

SAFE OPERATION

A push block should be used on short stock (generally any stock less than 18 inches in length) to prevent stock tipping and causing operator's fingers to come in contact with the knives.

Neither gloves nor loose or torn clothing should be worn by the operator or others working around jointers.

Always use a brush to remove chips and dust from around knives or cutting head area.

Guards should be inspected frequently, and operators should not make guard inoperative for any purpose.

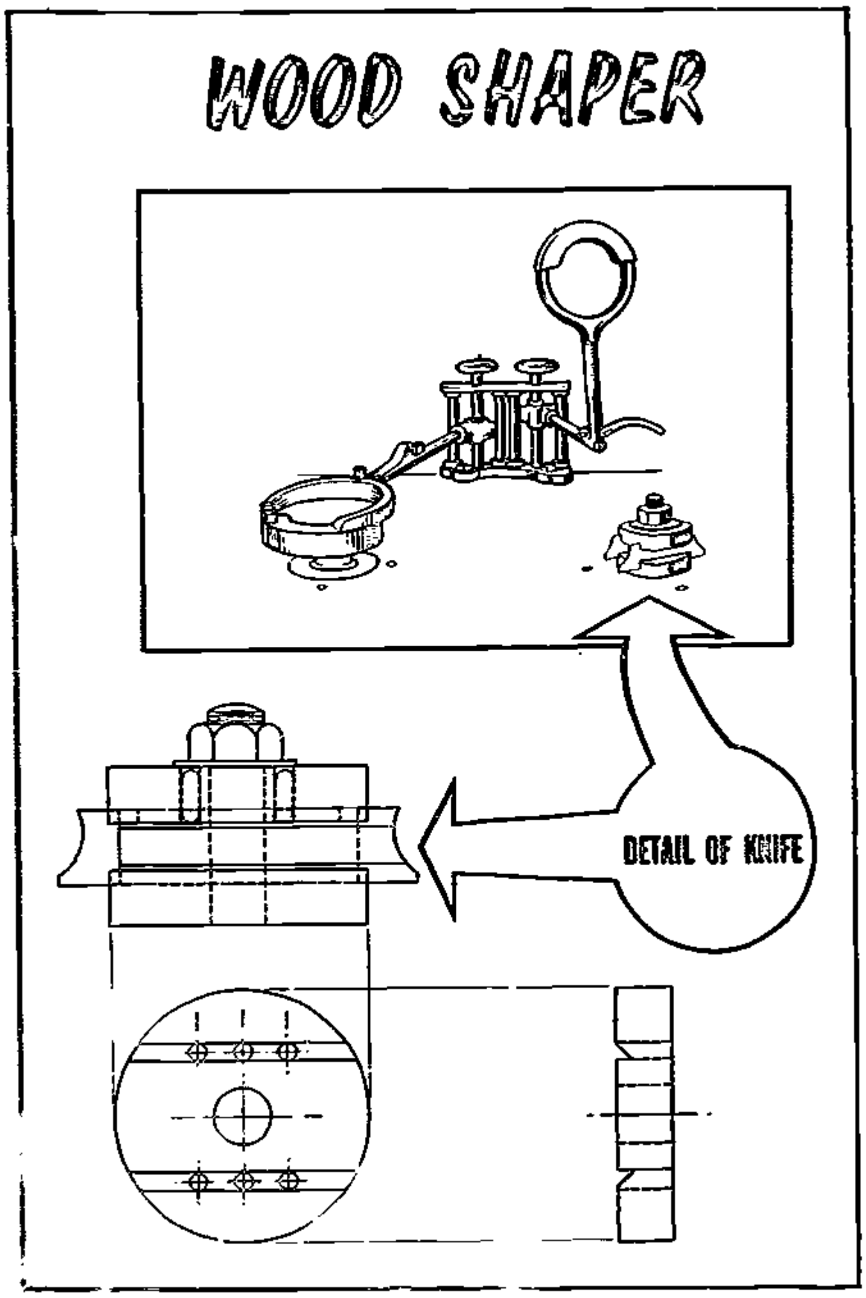

CHART 16—SERIES E

WOOD SHAPER	This type of woodworking machine has a variety of uses, but its best known or most common use is shaping the edges of material by placing the material in contact with knives rotating on one or more spindles at high speed. The shaper is one of the most difficult of all woodworking machines to guard effectively.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Power transmission.—Of necessity, shapers must turn at high speeds and while most are driven by individual motors, some are driven from lineshafts, comprising belts and pulleys.

POINT OF OPERATION	Point of operation.—Accidental contact by operator with blades while attempting to hold material with hands instead of with jigs or holding devices. Knives breaking or working loose and being hurled at the operator. Using hands instead of a brush to clean chips and dust from knives. Failure of operator to use guard, or the guard is inadequate or is improperly designed.
KICKBACKS	Kickbacks.—Kickbacks or throwing material toward the operator through action of the fast-turning blades can be caused by unsafe operating methods, by equipment being improperly maintained, or by improperly adjusted cutting head.
FLYING PARTICLES	Flying particles.—Chips, splinters, etc., are thrown off as a result of the high speed cutting action of the blades, constituting a housekeeping problem as well as danger to the operator.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, and drives should be completely enclosed by metal or mesh guards.
POINT-OF-OPERATION GUARDS	The cutting heads of each wood shaper which is not automatically fed should be enclosed with a cage or adjustable guard so designed as to keep operator's hands away from the cutting edge. The diameter of the circular shaper guards should be greater than the greatest diameter of the cutter. At no time should a warning device, made of leather or any other material, be attached to the spindle.
KNIFE CONSTRUCTION	Knives on shapers should be made from the best material available. Knives should be sharpened and kept in adjustment by qualified personnel. Knives should be balanced and should fit properly. Material should always be fed into knives gradually, and at no time should cuts be heavy.
EXHAUST SYSTEM	Exhausts with adjustable hoods are considered a necessity. They help keep chips and dust from accumulating near cutter heads, reducing the need for manual cleaning of heads and surrounding floor area. Operator should be provided with proper and adequate personal-protective equipment.
SAFE OPERATION	Cylindrical heads should be used wherever the nature of the work will permit. Templates, jigs, and fixtures which will remove the operator's hands from the point of operation should be used wherever possible. All double-spindle shapers should be provided with a starting and stopping device for each spindle. Solid cutters which fit over the spindle are preferred to knives which can be broken or thrown. Always use a brush instead of the hands to clean from around knives and cutting head areas.

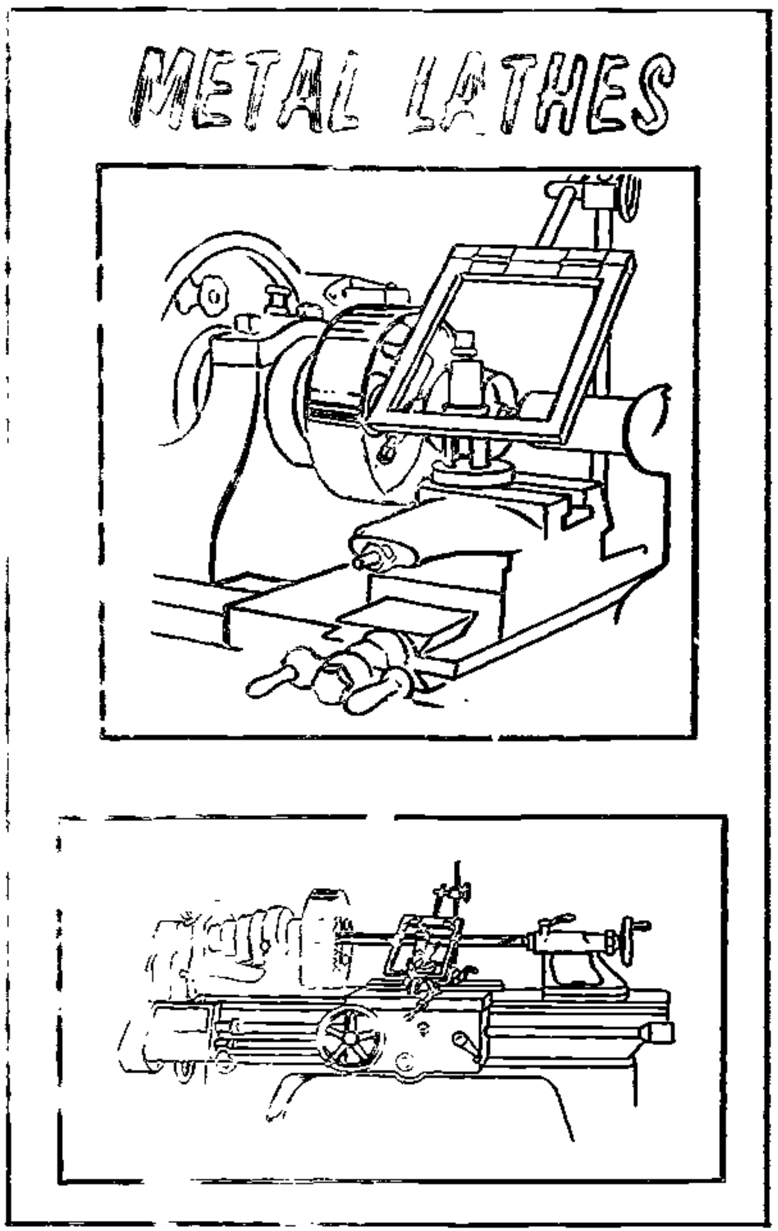

CHART 17—SERIES E

METAL LATHES	There are two main types of lathes: A. *The engine lathe* (includes the ordinary bench lathe). This is the regular revolving or turning lathe found in the majority of machine shops. B. *The turret lathe.* Here a number of tools are fixed in a monitor or turret, pivoted so as to revolve and present any of the various tools to the work. In many automatic lathes and screw-machines, the motions of the work and the turret are directed by a *cam wheel*, and the finished pieces of work are dropped out continuously at one end, while a bar from which the pieces are formed is fed at the other end.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Lathes may be driven by individual motors or from a line shaft, comprising belt and pulleys, also exposed gears in the headstock.

MOVING PARTS	1. Contact with projections on faceplates and chucks. 2. Contact with lathe dogs (especially projecting set screws). 3. Filing with the right hand, especially near dog or chuck, or using the hand instead of a stick to hold emery cloth against the work.
POINT OF OPERATION	4. Calipering or gaging the job while the machine is in operation. 5. Accidental contact with the tool. 6. Attempting to clean chips while machine is in operation. 7. Contacting projections on work or stock.
FLYING PARTICLES	On some types of metals, a continuous spiral is produced which frequently causes injuries to the hands, arms, or face; also, small particles are thrown off, creating a hazard to the eyes of operators and others.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, shafting, gears, etc., should be guarded in accordance with ASA standards.
MOVING PARTS GUARDS	A guard should be provided for the faceplate and chuck to protect the operator from accidental contact with them. If possible, faceplates and chucks should be without projections. Safety type lathe dogs should be substituted for ordinary ones. All filing should be done with the left hand, and the file should be kept away from the chuck and lathe dog.
POINT-OF-OPERATION GUARDS	A wire mesh or plastic guard should be provided which will protect the operator from accidental contact with the tool and from flying chips.
CONTROL OF OPERATIONAL HAZARDS	Care should be taken to remove chuck keys from the chuck sockets before the lathe is started. The floor and aisle area should be kept clear, and all tools, extra work, stock, etc., should be placed in a suitable rack. A lifting device should be provided for changing chucks, face plates, etc. Center holes of taper work should be clean and true, and lathe centers, true and sharp. The work should be well countersunk at the tailstock end to eliminate any danger or to keep work from being torn loose. Chips should be removed as follows: Continuous spiral chips should be removed with a hooked rod, never with the hand; small chips should be removed with a brush. Remove chips only after the lathe has completely stopped.
SAFE CLOTHING	Lathe operators should not wear gloves, neckties, loose clothing, long sleeves, nor wrist watches, chains, rings, etc., while operating the lathe. Gloves may be worn if there is a hazard from handling work with burrs

	or sharp edges, but should be taken off before starting the lathe. Always wear goggles or face shields for protection against flying chips and oil spatters. Operators should wash thoroughly and wear clothes free of oil. Operators should wear a hat or cap while working.

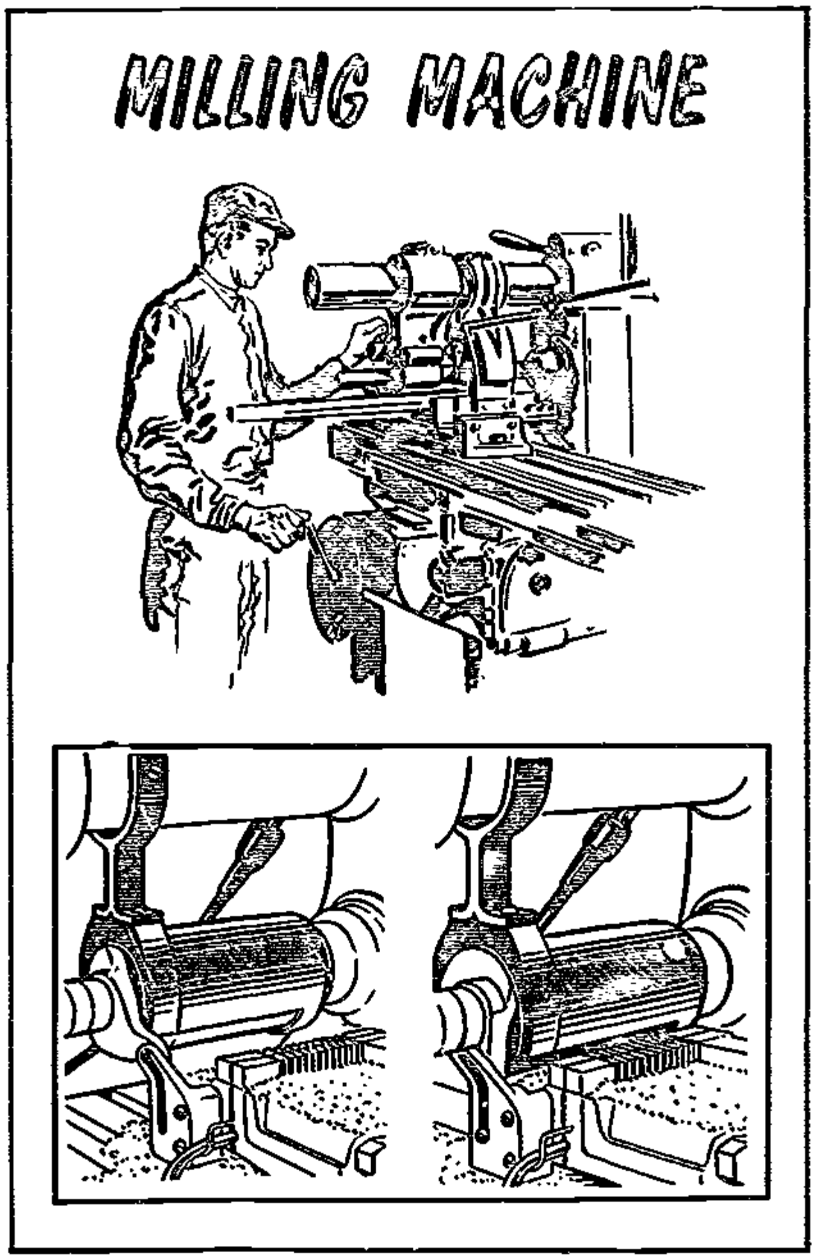

CHART 18—SERIES E

MILLING MACHINE	There are several types of milling machines. The following are the four most common ones: *Horizontal*—having the spindle horizontal to the table. *Vertical*—having the spindle vertical to the table. *Plain*—with tables that cannot swivel. *Universal*—with tables that can swivel up to 90 degrees of horizontal position.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Milling machines may be driven by individual motors or from a line-shaft, comprising belt and pulleys.

POINT OF OPERATION	Accidental contact with the cutter or cutters by the operator or others. There is danger of the cutters breaking under strain, and pieces may fly, creating a hazard to the operator and others.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, shafting, and gears should be guarded in accordance with the ASA standards.
POINT-OF-OPERATION GUARDS	There should be a fixed hood over the cutter or cutters clamped firmly to the overhead arm and adjustable to the work being done. This should effectively protect the operator against accidental contact with the cutters and against flying chips and fragments.
CONTROL OF OPERATIONAL HAZARDS	Coolant should be directed on that part of the tool which is turning away from the work. Work should always be clamped firmly to the table before the milling machine is started. Operators should remove chips with a brush at regular intervals while the milling machine is stopped. Snug clothing should be worn when operating milling machines. The wearing of loose clothing, neckties, long sleeves, wrist watches, rings, etc., should be prohibited. Milling machine operators should wash thoroughly to prevent danger of dermatitis and infections from lubricants. All guards should be in place while the machine is running. Operators should wear face shields or safety goggles to protect their eyes from chips and other objects, such as pieces of the cutter. The machine should be stopped before measuring the work.

PLANERS

(METAL)

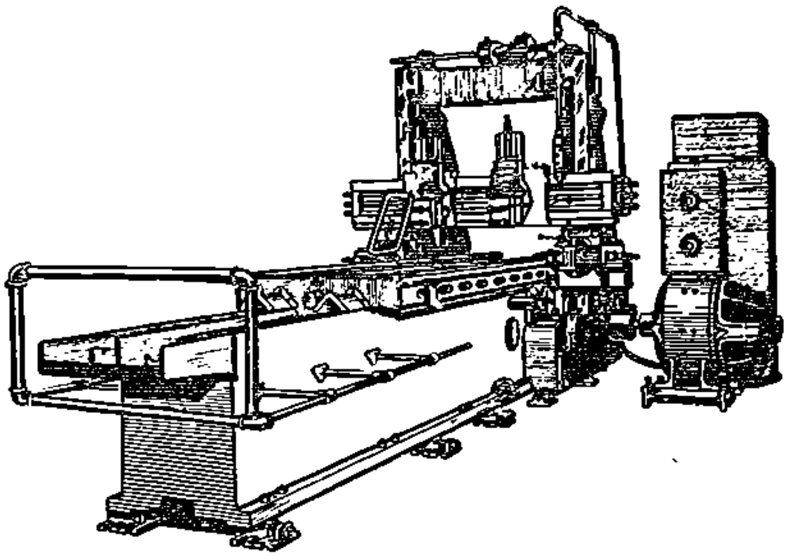

CHART 19—SERIES E

METAL PLANER AND SHAPER	The three types of metal working planers are: Single head. Double head. Open side. The metal planer, like many other machine shop power tools, is not dangerous to operate if certain safeguards are installed and if the operator is experienced and careful to closely follow safety rules and safe operating procedures.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Planers may be driven by individual motors or from a lineshaft, comprising belt and pulleys. Counterweight and exposed power gears. Contact with reversing dogs.
POINT OF OPERATION	Contact with the tool. Breaking of tool or gouging of work caused by cutting tools shifting and cutting into work.

OPERATIONAL HAZARDS	Work breaking loose because it was not wedged and clamped securely. Failing to turn on current when a magnetic chuck is used (before starting the planer). Cutting hands on sharp edges of work. Having insufficient clearance for the work. Flying chips or particles thrown off, creating a hazard to the eyes of the operator and others.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, shafting, gears, etc., should be guarded in accordance with ASA standards. Counterweights should be guarded from the floor, extending upward throughout the travel of the counterweight. The reversing dogs on planers (and shapers) should be covered.
POINT-OF-OPERATION GUARD	A hinged guard made of wire mesh or plastic should be provided which will protect the operator from accidental contact with the tool and from flying chips. The tool should be set so that if it shifts, it will raise away from the cut and will not dig into the work. All work should be clamped properly and securely before planer is started. When magnetic chucks are used, the work should be set in its proper position and the current turned on before the planer is started. A chip guard of heavy close-mesh wire screen or of heavy clear plastic material should be placed over the tool to prevent chips from flying and striking the operator or other workers.
MOVING PARTS GUARDS	All openings in the beds of planers should be covered with a permanent covering of solid heavy sheet metal to prevent a person from being caught between the bed and the planer table and to prevent the space from being used for the storage of tools and other articles. When the planer table is placed or materials thereon travel to within 18 inches of a post, wall, or other obstruction, the space between the end of the planer and such wall or object should be protected by a standard railing on each side of such space. Safety dogs should be placed at each end of the planer table to prevent it from running off the gear rack.
CONTROL OF OPERATIONAL HAZARDS	1. Before starting a planer or shaper, check the condition of the machine and its setup; be sure all guards are in place. 2. If any adjustments or repairs are necessary, stop the machine to make them. 3. Use a brush to remove chips.

	4. Keep floor area clear. 5. Do not leave tools under the "bed." 6. Wear goggles. 7. Wear snugly fitting clothes, short sleeves, and no necktie. 8. The planer should never be left running unattended.

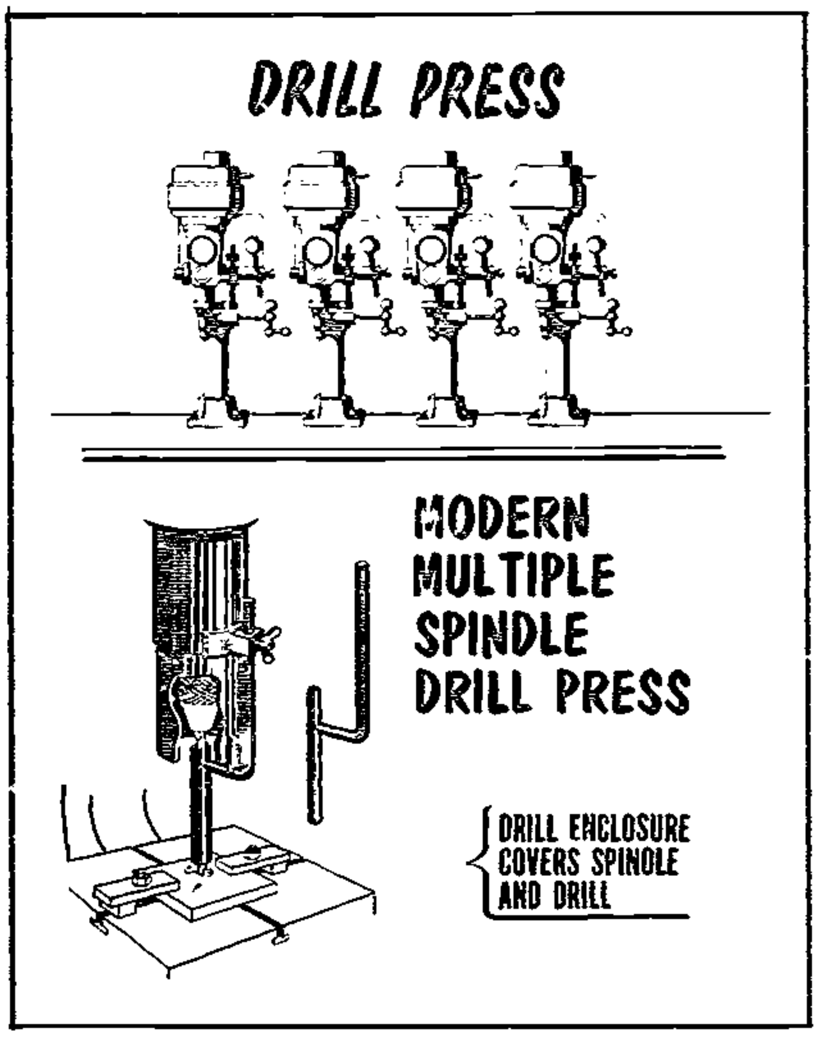

CHART 20—SERIES E

DRILL PRESSES	There are three main types of drill presses: Upright (vertical spindle). Multiple spindle. Radial.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Drill presses may be driven by individual motors or from a lineshaft, comprising belts and pulleys. There is also the hazard of gears, spindles, and counterweights.
POINT OF OPERATION	1. Contact with the drill. 2. Work slipping or turning because it was not properly clamped. 3. Catching clothes or hair in drill, chuck, or spindle. 4. Attempting to clean chips while drill is turning. 5. Breaking the drill (flying pieces).

CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, shafting, gears, etc., should be guarded in accordance with ASA standards.
COUNTER-WEIGHTS	Counterweights should be enclosed with guards, preferably iron pipe or sheet metal and angle iron, from the floor to the top of the weight when in extreme upward position.
EMERGENCY STOP	An emergency stopping device should be provided within easy reach of the operator. (If motor-driven, stop-and-start buttons are acceptable.)
POINT-OF-OPERATION GUARDS	Where practical, a telescope guard should be installed over the drill and spindle to protect against accidental contact. All work should be firmly and securely clamped to the table before starting the drill press.
CONTROL OF OPERATIONAL HAZARDS	Operators of the drill press should wear snugly fitted clothes, short sleeves, and no necktie. Hair should be confined in a proper hair net, snood, or cap (if a woman), or a cap (if a man). A brush or stick should be used to remove chips from a drill. File or scrape all burrs from drill hole. This should be done while drill is stopped. Do not operate the drill at excessive speed or feed; the drill may break or shatter. Chuck wrenches should not be left in chucks or on the table. All tools and loose material should be removed from the table before starting the machine. Operators should shut off power and be certain the machine has stopped before leaving. Goggles should be worn when operating drill presses.

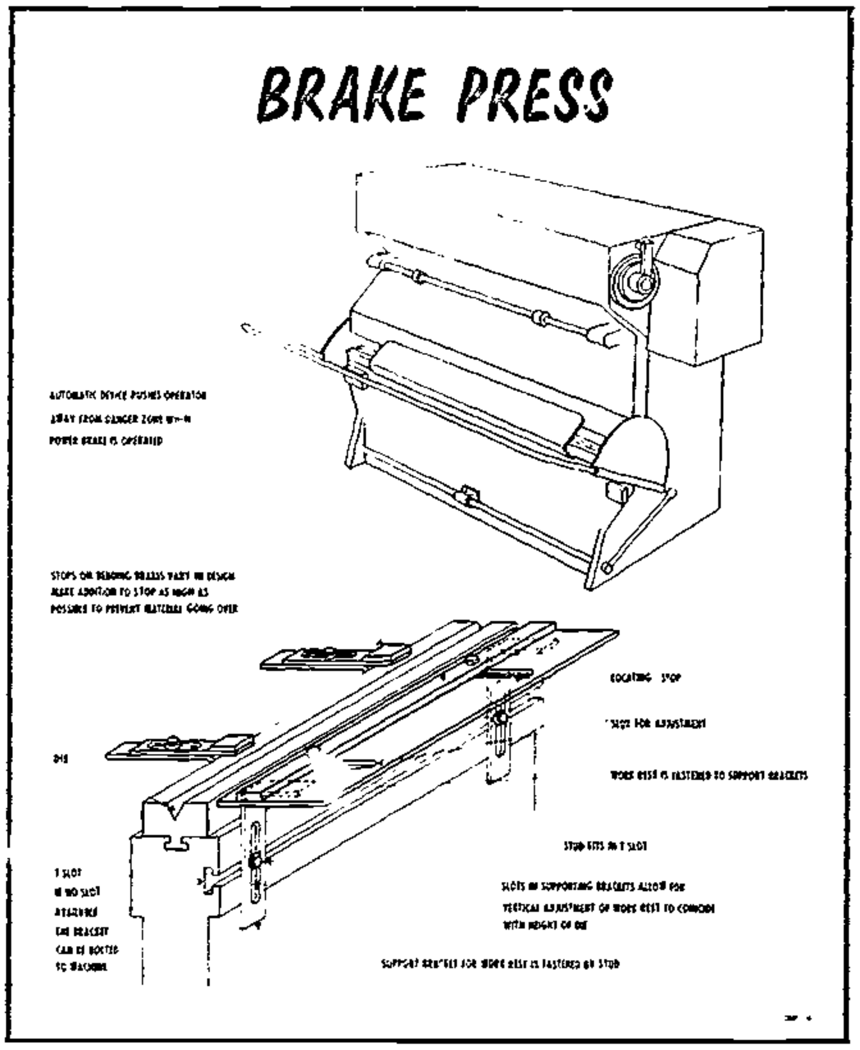

CHART 21 — SERIES E

BRAKE PRESS	The brake press is also called the "press brake," "bending brake," "power brake," "bending press," etc. This press is a development of the "hand brake" or "folder." Its primary function is forming (cold) channels, angles, etc., in metal plates, strips, and in sheet metal. It is used less frequently for punching, corrugating, notching, trimming, embossing, and for other operations usually performed on other types of presses.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Contact with power pulleys, gears, chains, cranks, couplings and other moving parts exposed to contact.
POINT OF OPERATION	Fingers or hands may be crushed between the punch and the die or between the work and the ram. Cuts from contact with work being processed.

CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, gears, chains, cranks, couplings and other moving parts should be guarded with complete enclosures of either sheet metal or standard guards to a height of at least 7 feet from the floor or working platform.
POINT-OF-OPERATION GUARDS	When narrow stock is being worked, the hands of the operator are very near the path followed by the ram. To reduce this hazard, equip the machine with mechanical safeguards and maintain them in good working order. The press should be provided with starting devices which will keep the hands of the operator out of the danger zone. These may include two-hand switches, or levers and treadle bars, foot pedals, and foot switches.
FOOT CONTROLS	Press brakes should be provided with foot controls for use on those jobs where the size of the stock being processed requires an operator to hold it in position. Before the ram is driven home, the two-hand buttons or levers are used to bring the die into position, allowing minimum clearance. The stock is then centered and formed by the further action of the ram which is actuated by the operator depressing the foot controls. Foot controls should be covered by stirrup guards. If a treadle bar is used, all portions of the bar should be covered except an area large enough for the operator's foot. These precautions are necessary to prevent accidental tripping.
CONTROL OF OPERATIONAL HAZARDS	Before the press action is started, it should be positively determined that there is adequate clearance for changing the shape of the stock being worked and that work stops or back gages are at the proper height. All parts of the control mechanism should be inspected at regular intervals, and the machine should be test-operated at the beginning of each shift; check especially the functioning of the disk-friction clutch. All replacement parts should be purchased from the manufacturer and his recommendations for the operation and maintenance of this machine should be followed. The operator should know the capacity of the machine and the three factors which determine the brake pressure required to form the material to be worked to a 90 degree bend (length of work, thickness of work, and the sharpness of the bend).

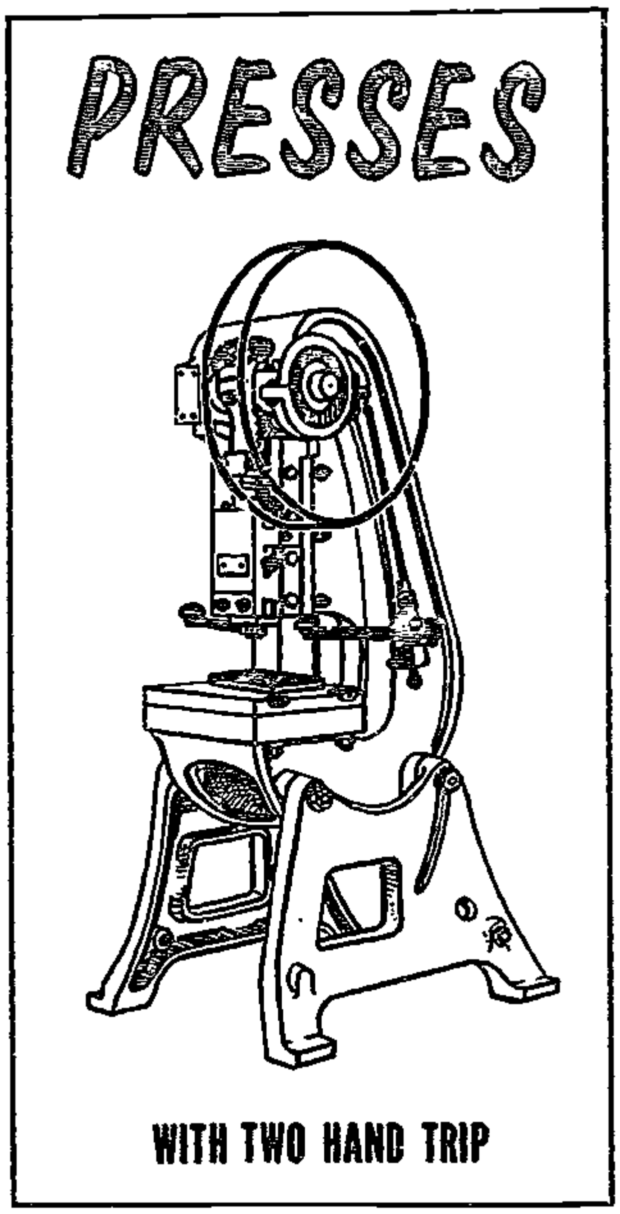

CHART 22—SERIES E

PRESSES	As a source of accidents, presses present possibly the most serious problem of any stationary machine in industry, particularly those accidents which result in permanent-partial injuries. The safeguarding of presses has been complicated by the wide variety of operations and operating conditions, owing to the variations in size, speed, and type of press; size, thickness, and kind of pieces to be worked; design and construction of dies; required accuracy of the finished work; skill of operators; and length of the run. (For more complete, specific information, please refer to ASA Standard Safety Code for Power Presses, B11.1—1960.) The most common types of presses are: Foot (kick or hand press). Power presses.

MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Power presses may be driven by individual motors or from a lineshaft, comprising belts and pulleys, clutch and brakes, counterweights and cables, flywheels, gears crankshaft and attachments, foot treadle, tripping mechanism.
POINT OF OPERATION	Dies and ram hazards. Reaching into danger zone for any purpose. Repeating of press.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, gears, flywheels, etc., should be guarded in accordance with ASA standards. Any counterweights and cables should be enclosed with a guard extending to at least 7 feet from the floor. The crankshaft and its attachments should be inspected at regular intervals; if exposed to contact, it should be guarded to a height of at least 7 feet from the floor.
POINT-OF-OPERATION GUARDS	A careful study should be made of the specific operating hazard on a particular job on a specific press. The safest guard should be installed to eliminate the hazard, and it should be maintained on a regular schedule. Guards should be so designed and constructed that they completely protect the operator at the point of operation.
CONTROL OF OPERATIONAL HAZARDS	Positive means should be taken to make sure the press does not repeat. Before starting work, operate the press without feeding it until you are completely satisfied as to its safe condition. Check all safety devices before starting work. There should be complete protection at the danger zone. Adequate lighting is very important to safety (ASA standards). All repairs and adjustments should be made by competent, authorized persons. Automatic feeding devices should be provided wherever possible.

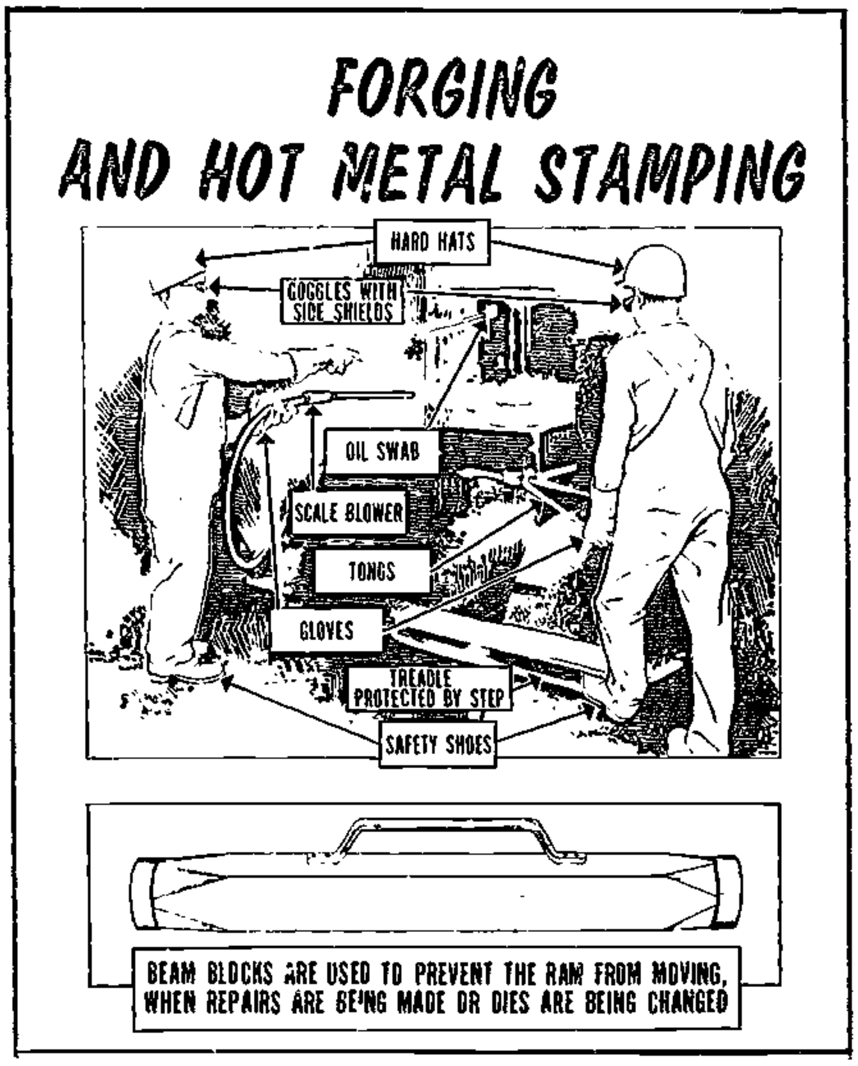

CHART 23—SERIES E

POWER HAMMERS	Power hammers may be classified in either of two different ways: Forging hammer or drop hammer. The classification is based upon the type of work that is to be done, and upon the manner in which the anvil is assembled in relation to the operating mechanism and machine supports; or they may be called steam hammers, pneumatic hammers, or mechanical hammers, the distinction being based upon the manner in which the ram is actuated.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Unguarded flywheels, belts, pulleys, rolls, ropes, drums, etc.
POINT OF OPERATION	Danger of flying drift key fragments and hot scale. Danger of head injuries from ram or falling objects. Danger of fingers or hands being crushed in tong reins. Danger of crushing fingers, hands, or arms between ram and die.

CONTROL OF HAZARDS

POWER TRANSMISSION

All belts, pulleys, shafting and gears should be guarded in accordance with ASA standards.

CONTROL OF OPERATIONAL HAZARDS

The hammer should not be operated while dies are cold. The dies should be closed temporarily on a bar of hot metal until they are heated.

Goggles or face shields should be worn around all hammer operations.

Scale should be removed with a scale blower which has a long handle.

Safety shoes should be worn.

A guard bar or guardrail should be installed over the treadle so it cannot be accidentally tripped.

Keep treadle clear of tools and scrap to avoid accidental tripping.

Hard hats or skull-guards should be worn by operators and helpers while working on these machines.

Tongs should be used and maintained in good condition.

Adequate hand protection should be worn while working on rough, sharp, or hot work.

Oil swabs and scale blowers should have adequate handles to avoid injury to the hands of operators.

Care must be taken that persons are in the clear when ram is raised. A ram beam block should be used to support ram if it must be left raised (unattended, repairs, etc.).

Care must be exercised in the use of tongs (kickbacks can be fatal).

Keep hands in the clear when using tongs.

Keep hands, arms, fingers, and head from under the ram.

Strength and Dimensions for Ram (Beam) Blocks

Size of timber[1] (in inches)	Square inches in cross section	Minimum allowable crushing strength parallel to grain. (p.s.i.[2])	Maximum static load within short column range[3]	Safety factor	Maximum recommended weight of forging hammer for timber used	Maximum allowable length of timber (in inches)
4 x 4........	16	5,000	80,000	10	8,000	44
6 x 6........	36	5,000	180,000	10	18,000	66
8 x 8........	64	5,000	320,000	10	32,000	88
10 x 10.......	100	5,000	500,000	10	50,000	100
12 x 12.......	144	5,000	720,000	10	72,000	132

[1] Actual dimension.

[2] Adapted from U.S. Department of Agriculture Technical Bulletin 479. Hardwoods recommended are those whose ultimate crushing strengths in compression parallel to grain are 5,000 p.s.i. or greater.

[3] Slenderness ratio formula for short columns is $\frac{L}{d} = 11$, where L = length of timber in inches, d = least dimension in inches; this ratio should not exceed 11.

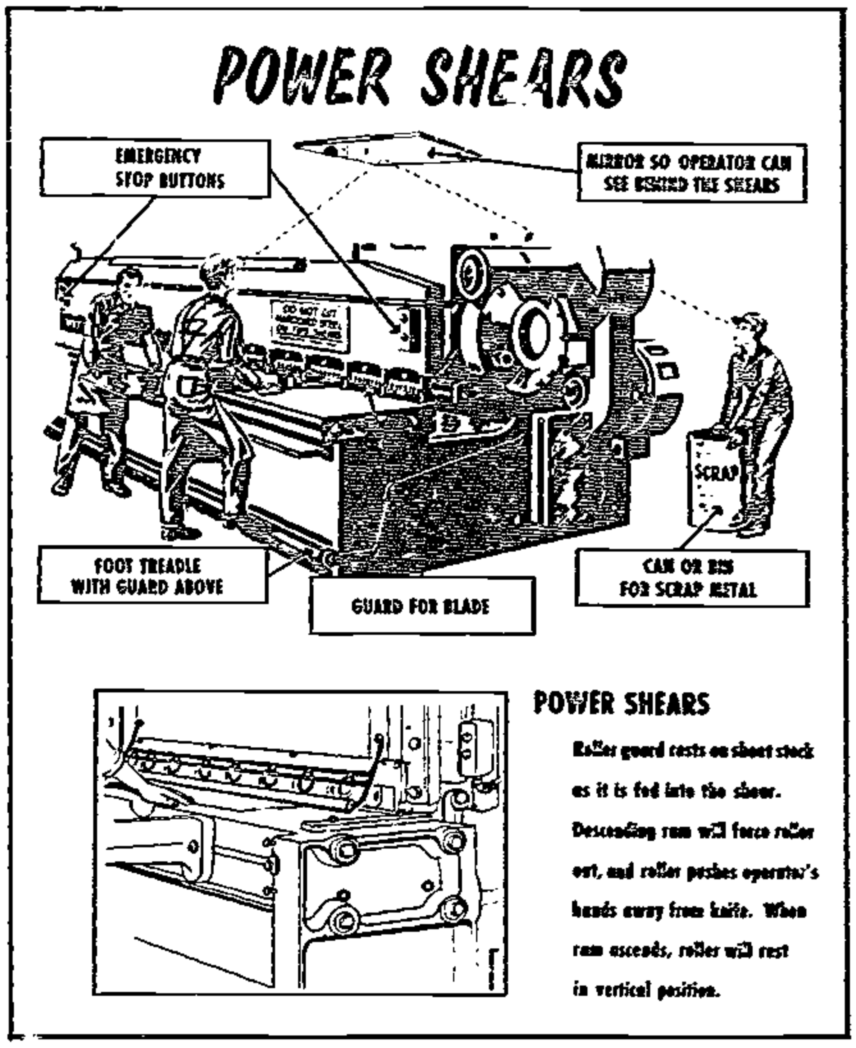

CHART 24—SERIES E

POWER SHEARS	Metal squaring shears are operated by any 1 of 3 means: hand, foot, or power. It should always be borne in mind that once the upper blade or knife has been set in motion, it cannot be stopped until the cutting stroke has been completed. Generally, a stock of material is placed on the cutting table and is fed into the shears by hand.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Power shears may be driven by individual motors or from a lineshaft, comprising belts and pulleys.
POINT-OF-OPERATION HAZARDS	The exposed blade or knife on the feed side and at the rear of the machine. Possible accidental tripping of power shear.

CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	All belts, pulleys, gears, and motor couplings should be enclosed in standard guards of angle iron with a filler of wire mesh, or expanded, perforated sheet metal (should conform to the requirements of ASA standards). Belt-driven shears should be equipped with positive acting and locking belt shifters. Start and stop buttons on motor-driven shears should be located within easy reach of the operator, preferably where they cannot be accidentally struck.
POINT-OF-OPERATION GUARDS	The movable knife on both foot- and power-operated shears should be protected by a fixed barrier guard the entire length of the table, extending downward to within three-eighths inch of the table, so as to admit the work but not the fingers. Any slots, perforations, or other openings in the guard should not exceed one-fourth inch between the knife or blade and the guard at all points. On foot- and power-operated shears, this guard should be located in front of the holddown, which can be guarded separately, or as a part of the knife guard. The back of the knife should be so guarded that a person cannot get his fingers under the knife. Before putting the shears in operation, the operator should always be sure that everyone is in the clear.
FOOT TREADLE GUARD	The foot treadle should be equipped with a guard, running the full length of the treadle, so arranged that the treadle cannot be accidentally tripped.
CONTROL OF OPERATIONAL HAZARDS	Boxes, bins, or other containers should be provided and used to keep scrap off the floor. Placed on every shear should be a warning sign reading, "Do not cut hardened steel," also a plate showing the cutting capacity. Only experienced operators should be allowed to operate shears. Operators should not wear torn or loose fitting clothes. They should wear safety shoes.

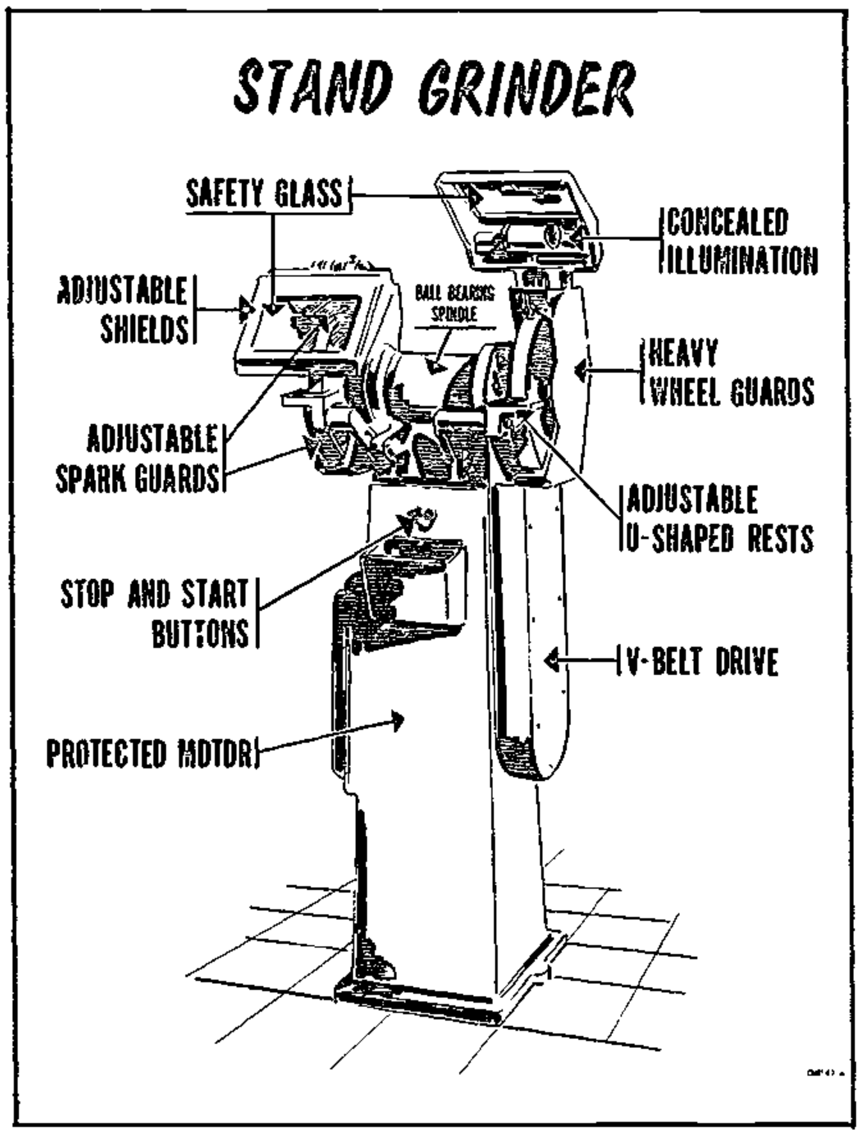

CHART 25—SERIES E

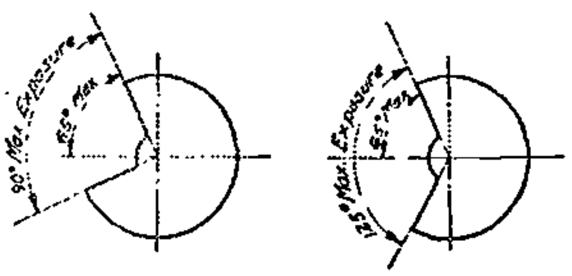
TYPES OF GRINDING MACHINES AND ABRASIVE WHEELS	For the purpose of this discussion, we will consider only the "stand grinder," although there are many types. These include bench, floor, swing frame, portable, precision, surface, cutoff grinder, etc. The types of wheels include plain (or straight) wheel, straight cup wheel, tapered wheel, cylindrical wheel, taper cup wheel, cutting-off wheel, dish wheel, etc.
MECHANICAL AND OPERATIONAL HAZARDS	
POWER TRANSMISSION	Stand grinders may be driven by individual motors or from a lineshaft, comprising belts and pulleys.
POINT OF OPERATION	Work getting caught between tool rest (or guard) and wheel. Hand coming into contact with the wheel. Clothing caught by wheel or by spindle ends. Tool rest (improper shape or size, wrong position, loose, worn).

WHEEL EXPLOSION	Flying fragments due to disintegration or "explosion" of abrasive wheel. This may result from: Improper mounting of the wheel. Cracks or flaws in the wheel. Incorrect wheel for the work. Wheel being run too fast. Flanges (lack of flanges, unequal size, etc.). Improper use of wheel (excessive shock, etc.). Vibration caused by the wheel's being out of balance, worn bearings, etc. Vibration caused by the use of abrasive wheel on buffing wheel stand, etc. Side pressure on wheels not designed for that work. Work being caught between tool rest or guard and the wheel.
FLYING PARTICLES	Particles from material being ground as well as wheel particles.
CONTROL OF HAZARDS	
POWER TRANSMISSION GUARDS	Power transmission hazards of shafting, belts, pulley, etc., should be guarded in accordance with ASA standards.
POINT-OF-OPERATION GUARDS	Abrasive wheels should be guarded in accordance with ASA standards; for example: The angular exposure of the grinding wheel periphery and sides for safety guards used on these machines should not exceed 90 degrees or one-fourth of the periphery. This exposure shall begin at a point not more than 65 degrees above the horizontal plane of the wheel spindle. Wherever the nature of the work requires contact with the wheel below the horizontal plane of the spindle, the exposure shall not exceed 125 degrees. Tool rests should be kept adjusted close to the wheel, and secured rigidly in place, so they do not move while in use. Flanges should be of equal size.

Draw these sketches on the board and explain



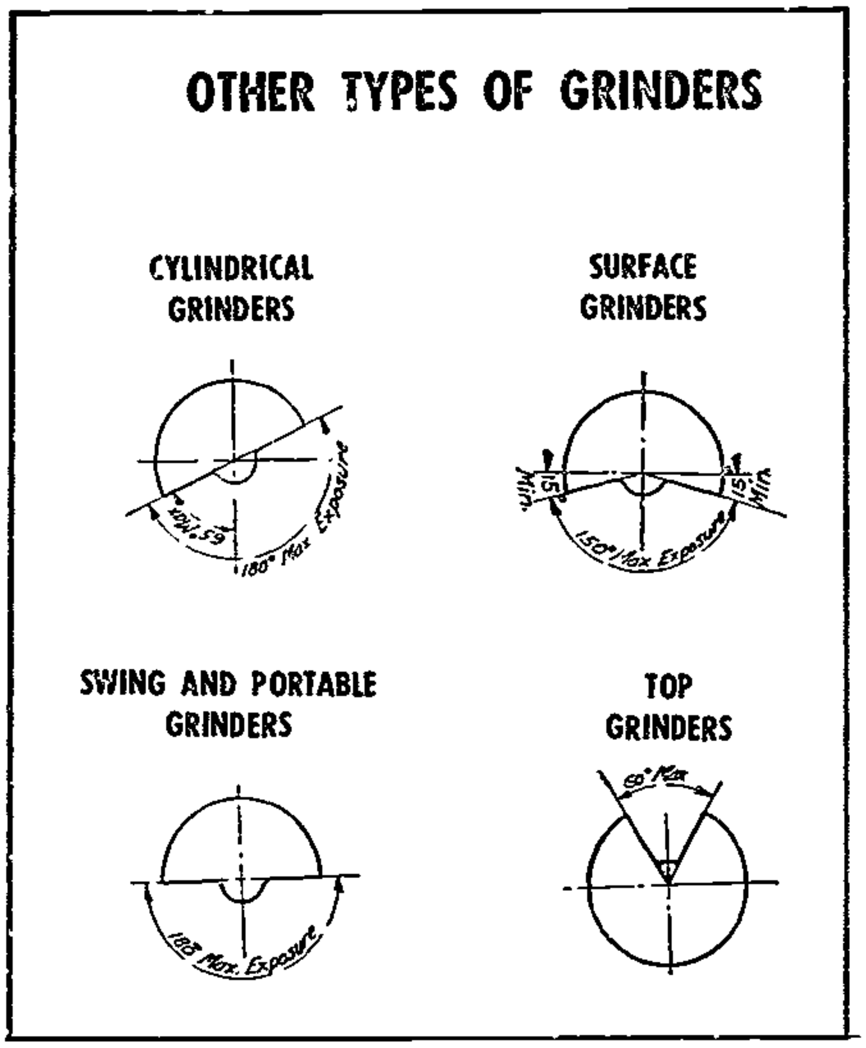


CHART 26—SERIES E

CYLINDRICAL GRINDERS	The maximum angular exposure of the grinding wheel periphery and sides for safety guards used on cylindrical grinding machines shall not exceed 180 degrees. The exposure shall begin at a point not more than 65 degrees above the horizontal plane of the wheel spindle.

Why do we insist on 65 degrees with horizontal even though allowing a wider opening for exceptional cases? (Sparks, metal in eyes, if higher.) This type of grinding requires even greater opening (180 degrees) but still has the angle start at 65 degrees with the horizontal.

SURFACE GRINDERS	The maximum angular exposure of the grinding wheel periphery and sides for safety guards used on cutting off machines and on surface grinding machines which employ the wheel periphery shall not exceed 150 degrees. This exposure shall begin at a point not less than 15 degrees below the horizontal plane of the wheel spindle.

SWING AND PORTABLE GRINDERS	The maximum angular exposure of the grinding wheel periphery and sides for safety guards used on these machines must be not more than 180 degrees. Exposed underside usually protected some by work it does (inside grinding).
TOP GRINDING	There are cases of grinding where only the top of the wheel is used. Where the work is applied to the wheel above the horizontal center line, the exposure of the grinding wheel periphery must be as small as possible, and shall not exceed 60 degrees.
STORAGE	Suitable racks, bins or drawers shall be provided to store the various types of wheels used. Stored wheels shall not be subject to extremes of temperature and humidity. Wheels can be damaged by high humidity and/or freezing temperatures.

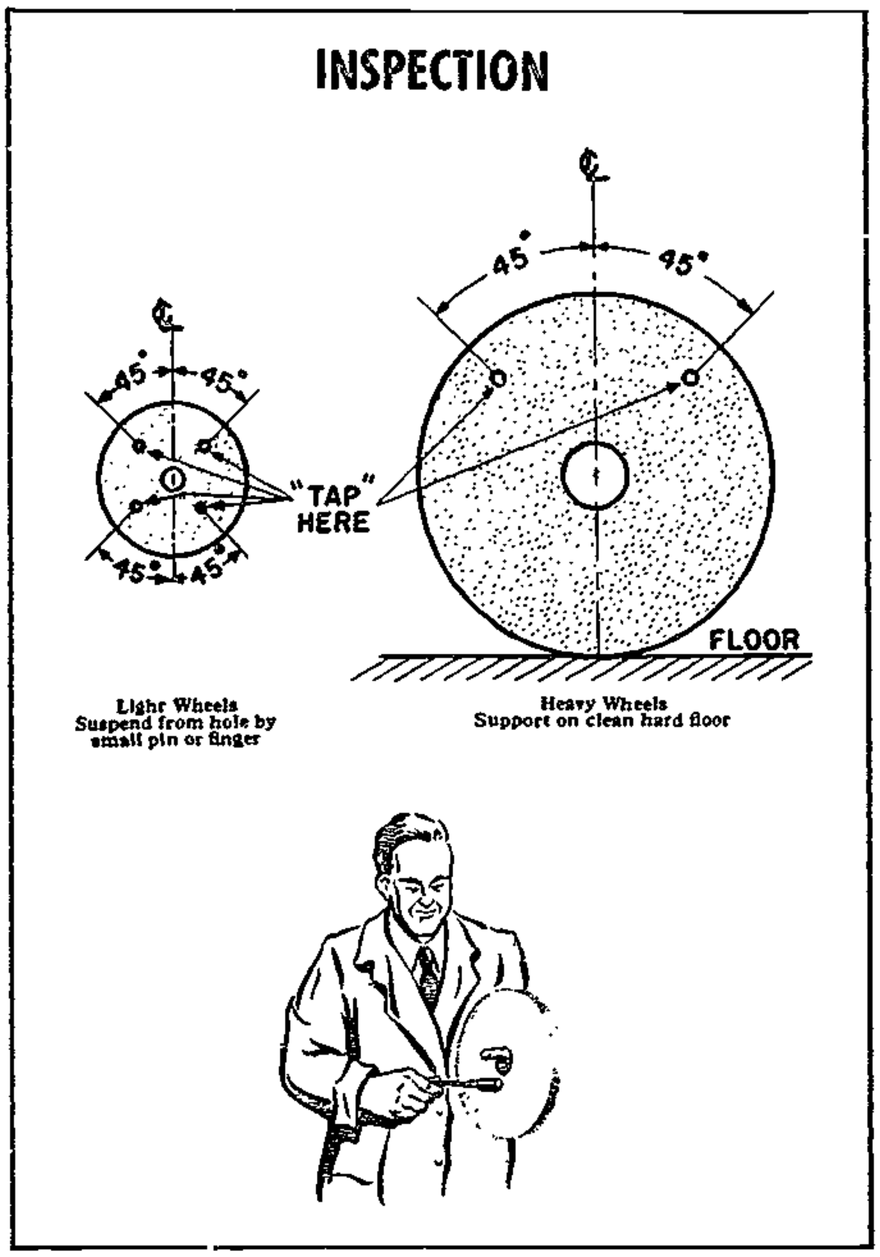

CHART 27—SERIES E

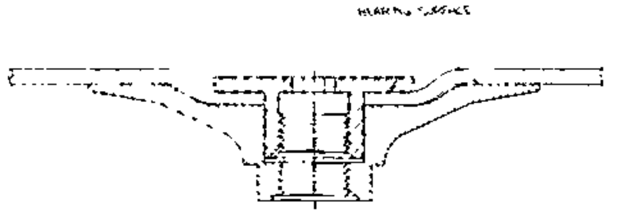
INSPECTION

Immediately after unpacking, all wheels should be carefully inspected to make sure that they have not been damaged by handling, shipping, or other causes. As an added precaution, wheels should be tapped gently with a light nonmetallic implement, such as the handle of a screwdriver for light wheels or a wooded mallet for heavier wheels. If they sound cracked (dead), they should not be used. Tap wheels about 45 degrees each side of the vertical center line and about 1 or 2 inches from the periphery, as indicated by the spots in chart 27. Then rotate the wheels 45 degrees and repeat the test. A sound and undamaged wheel will give a clear metallic tone. If cracked, there will be a "dead" sound and not a clear ring. This is known as the "ring" test. Wheels must be dry and free from sawdust when giving the ring test; otherwise, the sound will be deadened. It should also be noted that organic bonded wheels do not emit the same clear metallic ring as do vitrified and silicate wheels.

MAINTAINING EQUIPMENT	When operating grinding wheels on equipment specially designed for high speed, it shall be the responsibility of the user to maintain this equipment in safe operating condition at all times. Rules for the safe operation of this equipment submitted by the builder shall be observed.
ALTERED MACHINERY	If an existing machine is altered by the user to operate at special speeds, the user shall assume all of the responsibility of a machine builder.
INFORM ALL OPERATING PERSONNEL	The user shall fully inform all operating personnel that only wheels identified for operation at special speeds shall be used and that at no time shall the maximum speed marked on the wheel be exceeded. Protection to operating personnel, as well as adjacent areas, shall be maintained at all times.
POWER	Grinding machines should be supplied with sufficient power to maintain the rated spindle speed under all conditions of normal operation.
EXHAUST PROVISIONS	Stationary machines used for dry grinding should have provision made for connection to an exhaust system. For detailed recommendations, reference is made to American Standard for Ventilation Control of Grinding, Polishing, and Buffing Operations (Z43).
DIAMETER OF SPINDLE	Table 1 of ASA B7.1 shows the minimum diameters of spindles for wheels of various sizes. It applies to machines where wheels are not mounted between bearings. The use of heavier spindles than those listed in this table is often desirable.

GRINDING WHEEL MOUNTING



One type of adaptor for a Type 27 wheel.

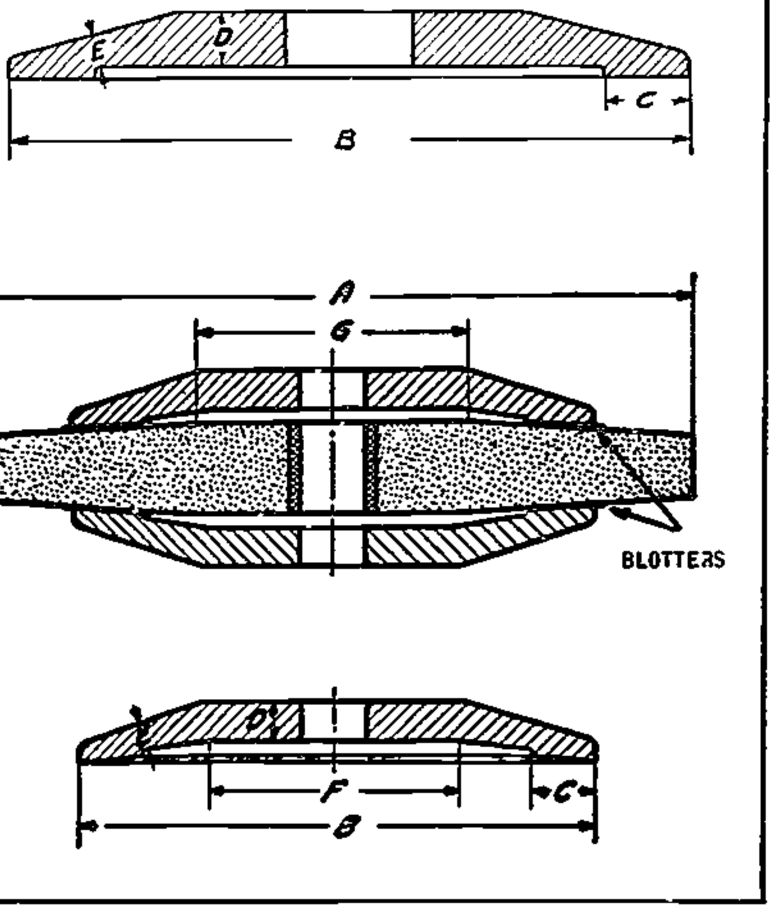


CHART 28—SERIES E

FLANGES

Grinding machines shall be equipped with flanges in accordance with the requirements shown below.

All abrasive wheels shall be mounted between flanges which should not be less than one-third the diameter of the wheel. Exceptions to this rule are listed below:

(1) Mounted wheels.

(2) Portable wheels with threaded inserts or projecting studs.

(3) Abrasive disks (inserted nuts, inserted washer, and stud type).

(4) Plate mounted wheels.

	(5) Cylinder, cup, or segmental wheels that are mounted in chucks. (6) Types 27 and 28 wheels which are mounted by means of a special adapter.

GRINDING WHEEL MOUNTING

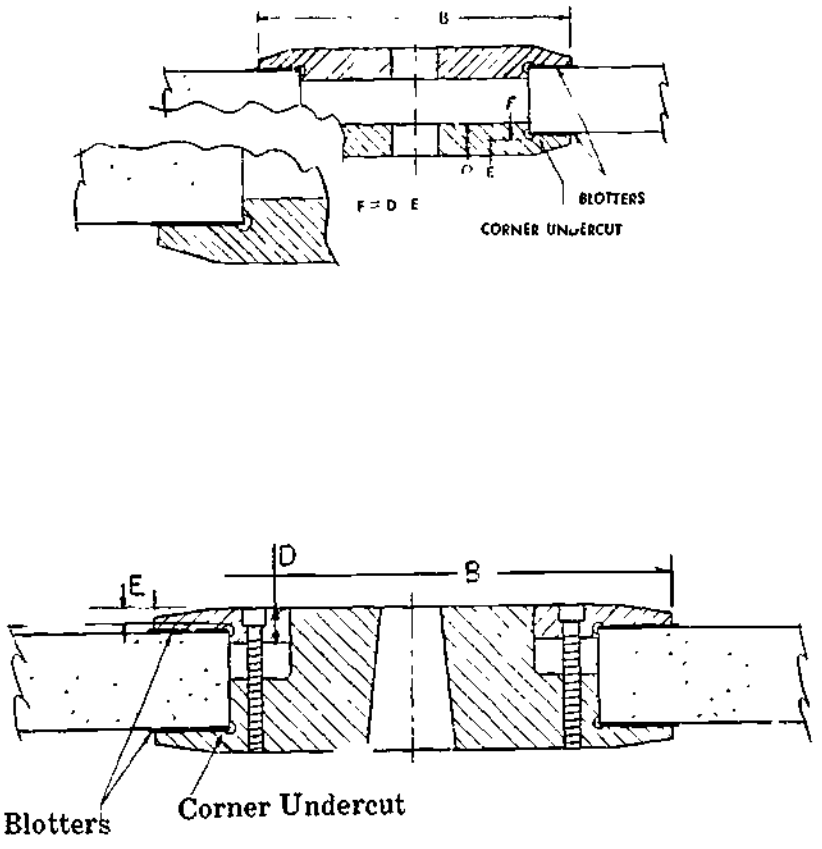

CHART 29—SERIES E

INSPECTION	There are four types of flanges: straight relieved flanges; straight unrelieved flanges; safety flanges and adapter flanges. Straight relieved flanges and tapered flanges shall be recessed at least 1/16 inch on the side next to the wheel for a distance as specified in the dimensions for these flanges. Straight flanges of the adapter or sleeve type should be undercut so that there will be no bearing on the sides of the wheel within ⅛ inch of the arbor hole.
WORK RESTS	On fixed base, offhand grinding machines, work rests shall be used to support the work. They shall be of rigid construction and designed to be adjustable to compensate for wheel wear.
LIMITING WHEEL DIAMETER	Grinding machines should be provided with a means of limiting the diameter of wheel which can be mounted. The safety guard is generally satisfactory for this purpose on single speed machines. On variable speed machines, the speed shifting device should be interlocked with an adjustable guard or other diameter limiting device to prevent the mounting of a wheel which might run at higher than the recommended surface speed.

WHEEL MANUFACTURER'S RESPONSIBILITY

It shall be the wheel manufacturer's responsibility to test wheels required for special speeds and so identify them.

MANUFACTURER'S TEST

It shall be the wheel manufacturer's responsibility to speed test wheels to determine their suitability for safe application.

Wheel Manufacturers Testing Speeds

Class of wheel	Operating speed (Surface feet per minute)	Minimum test factor[1]
Cutting-off wheels	All speeds	1.20
All bonds and wheel types (Except cutting-off wheels)	Up to 5,000	1.25
All bonds and wheel types (Except cutting-off wheels)	Faster than 5,000	1.50

[1] Actual operating speed shall be multiplied by this test factor to establish minimum speed at which wheels shall be tested by the wheel manufacturer.

IDENTIFICATION

It shall be the wheel manufacturer's responsibility to identify wheels which may be run at special speeds.

USER RESPONSIBILITY

The user shall be responsible for the proper handling, storage, and inspection of grinding wheels after receipt.

> The sections on Handling, Storage, and Inspection should be carefully reviewed by the class to assure a good understanding of all requirements.

HANDLING

All grinding wheels are breakable; therefore, care should be exercised in handling and storage to prevent damage. The following rules, which are based on experience, shall always be observed:

(1) Handle wheels carefully to prevent dropping or bumping.
(2) Do not roll wheels (hoop fashion).
(3) Use truck or suitable conveyors which will provide proper support for transportation of all wheels which cannot be carried by hand.

SPECIAL SPEEDS

The maximum safe operating speed marked on a wheel is not necessarily the most efficient grinding speed. Better results may be obtained at lower speeds.

Material used in construction of guard		Maximum thickness of grinding wheel	Grinding Wheel Diameters													
			3 to 5 inches		7 to 12 inches		13 to 16 inches		17 to 20 inches		21 to 24 inches		25 to 30 inches		31 to 48 inches	
			A	B	A	B	A	B	A	B	A	B	A	B	A	B
		(Inches)	(Inches)		(Inches)		(Inches)		(Inches)		(Inches)		(Inches)		(Inches)	
Materials satisfactory for speeds up to 7,000 feet per minute	Cast iron	2	1/4	1/4	3/8	5/16	1/2	3/8	5/8	1/2	7/8	5/8	1	3/4	1 1/4	1
		4	5/16	5/16	3/8	5/16	1/2	3/8	3/4	5/8	1	5/8	1 1/8	3/4	1 3/8	1

	Malleable iron	2	1/4	1/4	3/8	5/16	1/2	3/8	5/8	1/2	3/4	5/8	7/8	3/4	1	7/8
		4	5/16	5/16	3/8	5/16	1/2	3/8	5/8	1/2	3/4	5/8	7/8	3/4	1 1/8	7/8
		6	3/8	5/16	3/8	5/16	5/8	1/2	3/4	5/8	7/8	5/8	1	3/4	1 1/4	7/8
Materials satisfactory for speeds up to 10,000 feet per minute[1]	Steel castings	2	1/4	1/4	1/4	1/4	3/8	3/8	1/2	7/16	5/8	1/2	3/4	5/8	7/8	3/4
		4	1/4	1/4	1/4	1/4	3/8	3/8	1/2	7/16	5/8	1/2	3/4	5/8	1	3/4
		6	3/8	1/4	3/8	1/4	1/2	3/8	5/8	1/2	3/4	5/8	7/8	3/4	1 1/8	3/4
	Structural steel	2	1/8	1/16	3/16	1/8	3/16	3/16	1/4	1/4	5/16	1/4	3/8	5/16	1/2	3/8
		4	1/8	1/16	3/16	1/8	3/16	3/16	1/4	1/4	5/16	1/4	3/8	5/16	1/2	3/8
		6	3/16	1/16	1/4	1/8	1/4	3/16	3/8	1/4	3/8	1/4	7/16	5/16	5/8	3/8

[1] Includes cutting-off wheels, 16 inches in diameter and smaller, at speeds not exceeding 16,000 SFPM.

REQUIREMENTS FOR SPECIAL SPEEDS	Wheels used on special applications at higher speeds shall be subject to the following four conditions: (A), (B), (C), and (D).
CONDITION (A)	The machine builder shall make certain at time of manufacture that the machine is of suitable design and adequately guarded for the operation in question. The machine user shall maintain the machine in satisfactory condition.
CONDITION (B)	The wheel manufacturer shall make certain that the wheels are of adequate strength, have been tested at suitable overspeed, and bear the wheel manufacturer's approval of the higher speed.

In those cases where the shape, size, construction, or use conditions of the wheel make a speed test impractical or unnecessary, the wheel manufacturer should establish the maximum operating speed by other equally effective tests or past experience. Examples of wheels which need not be speed tested are: Wheels less than 6 inches in diameter; diamond wheels; metal and organic bonds; ball grinding wheels; segment, and segment disks; regulating wheels (for centerless type grinders); mounted wheels.

CONDITION (C)	The machine user shall make certain that the machine is used with an approved safety guard.
CONDITION (D)	It shall be the machine builder's responsibility to consult with a wheel manufacturer to determine that a wheel for the special speed application can be manufactured and tested in accordance with the requirements established in the table on page 59.
MACHINE BUILDER'S RESPONSIBILITY	It shall be the responsibility of the machine builder to approve machines manufactured by him for operation at higher speeds. The following areas are of importance in this regard.
GENERAL MACHINE CONDITIONS	If an existing machine is to be adapted for use at a special speed, the general machine conditions shall be observed and all component parts of the grinding machine shall be checked and, if necessary, modified or adjusted prior to operating at the special speed.

Specific requirements are detailed as follows so that each requirement will be discussed and understood by the class.

MACHINE DESIGN	It shall be the machine manufacturer's responsibility to design, and the user's responsibility to maintain, his machines for safe operating condition.

Distribute occupational safety aid "Safeguarding Machinery" to the class.

OCCUPATIONAL SAFETY AID

SAFEGUARDING MACHINERY

AREAS REQUIRING MACHINE GUARDING

Machine guarding is divided into three logical classifications:

1. Power transmission

The moving parts (shafting; pulleys; belt, rope, and chain drives; gears, sprockets; friction drives; keys, set screws, and other projections; collars and couplings) that transmit power from the source to the working parts of the machine.

2. Moving parts

The accessories to transmission (control or feeding devices; prime movers, cranks, connecting rods, tailrods, governors; moving heads or tables) other than direct power transmission or point of operation.

3. Point of operation

That part of the machine which does the work on the material or object being processed.

REASONS FOR MACHINE GUARDING

1. There is no way to keep an operator's mind on his work all the time.
2. A dangerous mechanical condition will eventually catch this person off guard during one of these moments.
3. The more effectively you control the hazard, the less the chance of injury.
4. There is no place in proximity to machinery in motion to which men do not go at some time.
5. Reasonably safe machinery is a <u>must</u> to any successful plant safety program.

U. S. DEPARTMENT OF LABOR
Bureau of Labor Standards

IMPORTANCE OF GUARDING

The statement that men not machinery cause most accidents and injuries is highly misleading if not false.

The importance of machinery as a source of injuries is shown by getting the facts. The facts show machinery to be a major source of injuries in manufacturing industries.

1. In practically every case of injury both mechanical hazard and faulty behavior are present.
2. The large number of injuries and the high proportion of deaths and permanent disabilities arising from mechanical equipment is adequate evidence of the importance of machinery safeguarding.
3. Human practices and habits are difficult to control; mechanical safeguards are permanent.

FUNCTIONS OF THE IDEAL GUARD

A mechanical safeguard should meet all these requirements:

1. Full protection to the operator or passer-by.
2. Maximum protection for the repairman and oiler.
3. Be interlocked where possible so that the machine is inoperable unless the guard is in place.
4. Provide for safe oiling, repair, and adjustments.
5. Be strong and secure enough to resist wear and tear.
6. Be secure enough to retain broken machine parts in case of failure.
7. Must not introduce any hazards of its own.
8. Must not interfere with efficient production.

Properly designed guards give steadier, more reliable production and usually bring higher production as well.

CONSTRUCTION DETAILS:

Fundamentals to keep in mind when designing a mechanical safeguard:

1. Size of opening in a guard must be limited in accordance with the distance of guard from hazard point inside.
2. While specific size of opening in guards should be obtained from the standards table, the following "rule of thumb" may be used:
   - (a) Where a finger may reach through a guard to a moving part, openings must be limited to 3/8".
   - (b) Where moving parts are beyond the reach of fingers, care must be taken to keep hands out, limiting openings to 2".
3. Guards about points of operation should have satisfactory visibility of the point of operation so the operator will use them.
4. Openings left for oiling, repairing, or adjusting should have hinged gates or covers to prevent their being laid aside or left off. These gates should, where practical, be constructed to interlock the machine so machine will not operate with gate open.

ADVANTAGES OF HOMEMADE GUARDS

1. Often only practicable course with old, obsolete machinery.
2. Satisfactory and cheapest for transmission machinery if plant has own machine shop.
3. Are sometimes cheaper also for point of operation if the plant has the machinery and skill to make them.
4. Can be designed to fit a nonstandard situation.
5. Can be installed on individual dies and feeding mechanisms.
6. Safeguarding work by plant personnel can help to promote safety mindedness.

DISADVANTAGES OF HOMEMADE GUARDS

1. Can't be fitted into the design of the machine.
2. Often weak and not durable; not properly constructed.
3. Made by inexperienced personnel; value dependent on designer.
4. Difficult to make so as to interlock with controls.

ADVANTAGES OF MANUFACTURED GUARDS

1. Usually less expensive than homemade guards of similar effectiveness.
2. Guard is designed for standard machine models.
3. No danger of weakening the machine structure.
4. Strong, durable, and less likely to be removed.
5. Can often be made to interlock with controlling mechanism.

OTHER OPERATING HAZARDS

Important as machine guarding is, there are still numerous other elements to be considered in connection with machine operation. Among these are:

1. Unsafe arrangement of work area.
2. Faulty illumination.
3. Faulty ventilation.
4. Excessive heat or temperature change.
5. Monotony, noise and vibration.
6. Unsafe work clothing.

Demolition. Safety in Industry, Instructor Outline, Construction Safety Series.

Otto, Francis L.
Bureau of Labor Standards, Washington, D.C.

Bull-277
Pub Date - 66
DOCUMENT NOT AVAILABLE FROM EDRS 74p.

*SAFETY, *INDUSTRY, *DEMOLITION, CURRICULUM GUIDES, *TEACHING GUIDES, *INDUSTRIAL EDUCATION,

The sequence and basic content of a course on safety techniques in demolition are given in this instructor's outline. Additional information, materials, and illustrations should be included for a complete presentation suitable to the conditions, locality, industry, or occupational group. Black and white picture charts illustrate 47 safe and unsafe demolition practices. Each is discussed briefly. Some chart titles are (1) Unsafe Wrecking Methods, (2) Brick Cleaning, (3) Window Removal, (4) Warning Signs, (5) Flagman, (6) No Sidewalk Protection, (7) Unsafe Ladder Use, (8) Long Chute, (9) Standing Wall Section, (10) Demolition by Clamshell, (11) Steel Framing, (12) Burning Operation, and (13) Safe Working Methods. The outline was developed in the Office of Occupational Safety. This document is available as GPO L16.3--277 for 45 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

N[illegible]n M. Bortz, Director

Bulletin 277

The outline is intended only as a guide to standard presentation of the subject in sequence and basic content. Additional information, material, and illustrations should be included for a complete presentation suitable to the conditions, locality, industry, or occupational group.

This instructor outline was developed in the Office of Occupational Safety by Francis L. Otto.

For sale by the Superintendent of Documents, U.S. Government Printing Office
Washington, D.C., 20402 - Price 45 cents

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.

2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.

3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.

4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.

2. Good ventilation, lighting, and sufficient room are important aspects to consider.

3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.

4. The room should be equipped with a good blackboard, sufficient chalk, and clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

A. Some may be more mature.
B. Some may have a knowledge of safety.
C. Some may have actual experience to draw on in the discussion.
D. Some may have a faster learning speed than others.
E. Some may be "stallers' who can slow down the discussion.
F. Others may be aggressive and want to monopolize the discussion.
G. There may be a "know-it-all" in the group who must be properly controlled.

   H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:
   - A. Telling—this means giving background information to introduce a subject.
   - B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.
   - C. Illustrating—using charts, blackboard, slide, or films are very helpful to highlight specific points in the discussion.
   - D. Discussion conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.
   - E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.
   - F. Questions—during the session, the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

It is necessary that the instructor be granted full responsibility for conduct of the class; at times, however, he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course; he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined; he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course, a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training, and not to replace even part of this course which should be taught by *one instructor*.

DEMOLITION

DEMOLITION—Continued

Instructor Outline

DEMOLITION

INTRODUCTION	Fifty years ago, buildings were razed by salvage and scrap dealers to build up their stocks of used building materials. It was a high injury-rate occupation. Today, it is a highly specialized and competitive field, and a large and active industry in its own right. In spite of the changes in methods and equipment, and the advances which have been made, demolition still continues to be a high accident-and-injury producing industry.
INJURY RATES	Injury rates for demolition and operations continue to be unduly high, both per se and by comparison with other types of work. INSTRUCTOR NOTE: Fill in current figures in the following paragraph. Also explain what injury rates are. The most recent statistics show demolition to have a frequency rate of ——, which is the highest of the "special trades," and a severity rate of ——.
Reasons for High Injury Rates	Some contractors that do this work are not fully qualified. Each individual job is unusual in some ways. Demolition is a highly specialized field. Detailed planning and care are necessary, but are not always provided.

CONTRACT ASPECTS	The demolition contractor should establish, by legal agreement with the property owner and any others involved, what care, obligations, responsibilities, and other requirements he is to be liable for. A reasonable completion date should be included, since time-pressure often motivates chance-taking to meet deadlines. When a reasonable completion date cannot be specifically set for any reason (due to property acquisition problems, etc.), a fixed period after the START of demolition should be agreed upon.
ADVANCED JOB ANALYSIS AND PLANNING	Advanced job analysis and planning are necessary because unsafe acts and methods and other conditions resulting from the lack of advanced planning greatly increase the probability of accidents. Thoroughly planning the job, including safety, is a regular procedure of the leading organizations in this industry. INSTRUCTOR NOTE: Principles expressed in the instructor's outline on "Planning for Safety on the Jobsite" can be applied here. These principles should be explained to the degree that appears desirable for each group instructed.
SAFETY STANDARDS	On the one hand, not all jobs can be performed in the same way and standard methods which apply to all situations have not been developed. It is true that different jobs sometimes require different practices, which in turn produce varying rates of progress and types of hazards and problems. However, standards which can be APPLIED to all jobs and which will produce greater efficiency and a safer operation have been developed. INSTRUCTOR NOTE: As of 1966, ASA demolition standards are "in preparation." Recommend their use when published.

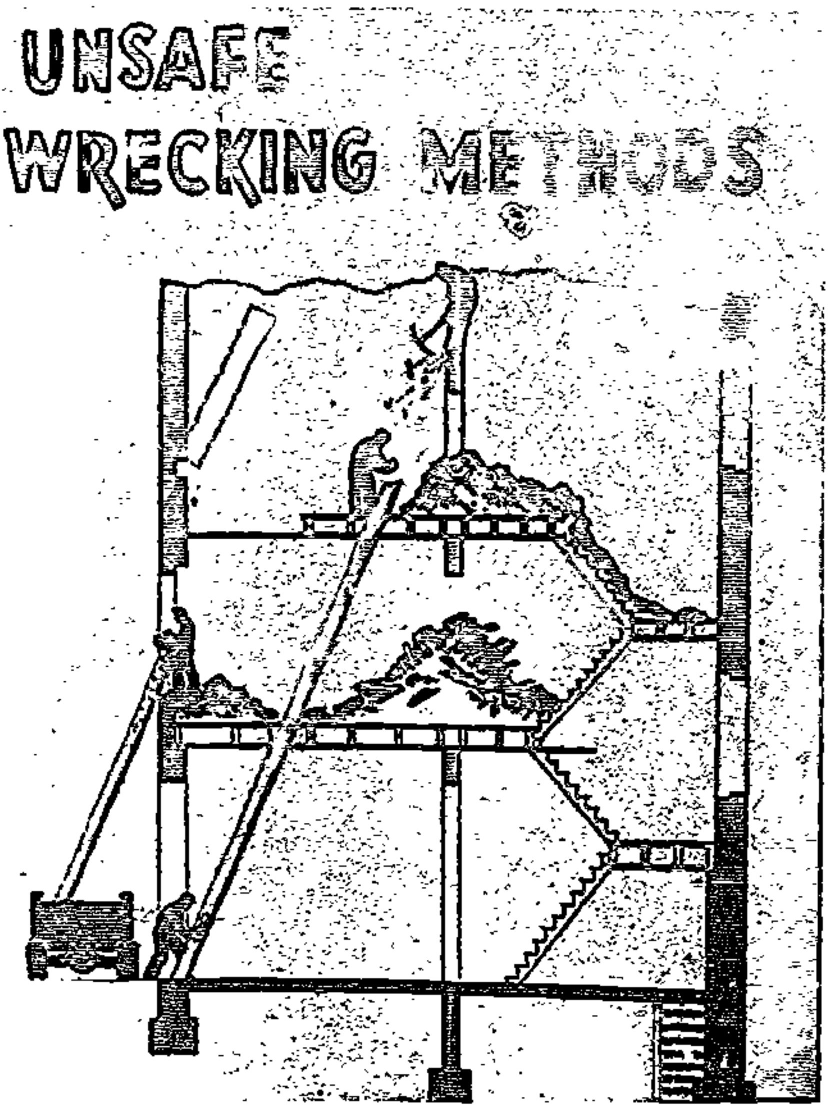

Chart 1. Unsafe Wrecking Methods.

Chart Discussion: UNSAFE WRECKING METHODS. At this point, comment briefly on the major areas which your subject will cover, as depicted by the slide: wall removal, floor holes, chutes, catch platforms, and other aspects of razing a structure.

SALVAGE AS AN EXAMPLE	Salvage can either increase or decrease hazards: decrease them due to the extra care used (the housekeeping necessary, for instance), and increase them due to the extra operations necessary (brick cleaning is an example).

Chart 2. Brick cleaning.

Chart Discussion: BRICK CLEANING. Point out the cost, the hazards, the supervision, and other problems represented by the operation depicted in this chart. Of course, the "other side" of the story can also be discussed as · ..

ELIMINATING OPERATIONS	Possible salvage profits must be compared with those of savings in time, efficiency, money, and reduced hazards which can be gained by eliminating some salvage operations, and making decisions as to the best course to follow.
WORK TIMING IS IMPORTANT	When demolition is to provide a location for a new structure, order of operations, orderliness on the site, and timing are very important. It is necessary to avoid delays to gain cost sav ., and to prevent an abnormal time-span between completion of the razing and the start of the next operation on the site.

CODES, RULES, ORDINANCES, AND OTHER REGULATIONS	**Applicability of Federal, State, or local codes, ordinances, or other regulations must be determined in advance, and plans made for compliance.**
ANTICIPATE COLLAPSE POSSIBILITIES	**An advance survey of the building should be made to determine the type and condition of the framing and walls (and other factors) to anticipate the possibility of collapse of any portion of the structure, or of adjacent structures.** **Any necessary shoring, bracing, underpinning, or other protection should be planned in advance.**

Chart 3. Bracing an adjacent building.

Chart Discussion: BRACING AN ADJACENT BUILDING. This chart shows bracing which was NOT erected in advance. This building started to settle into the excavation, causing it to crack and shift. Result was complete evacuation, condemnation, and its occupancy and use prohibited —a huge financial loss for the party responsible. Considerable loss of life could have resulted had the building COLLAPSED before the occupants were removed.

FLOOR LOAD PROBLEMS

When any unusual loads are to be imposed upon the floors of the structure to be demolished (storage, mobile equipment, etc.), steps should be taken to insure against, or compensate for, these overloads.

SPECIAL KNOWLEDGE NECESSARY	Although construction experience and knowledge are important in performing demolition, these operations also require a special know-how that many construction contractors do not possess.
REMEMBER THE OBJECTIVE	The site must be cleared as quickly as possible—at the least cost—but COMMENSURATE WITH the safety of the workers and the public.
PLAN FOR THE NEED	Operations, therefore, should always be preceded by thorough analysis of the job to plan the best applicable methods for accomplishing the work safely and quickly.
PREPARATORY OPERATIONS	Advanced planning and appraisal should bring out what these methods should be in each individual case.
APPRAISE ANY PRIOR DAMAGE	If the building has been damaged by fire, flood, explosion, or other cause, shoring or bracing should be installed, wherever necessary.
REMOVE HEALTH HAZARDS	If the building was used previously for storage or operations involving hazardous chemicals, explosives, certain flammable materials, or other dangerous substances, or if such items were used in any tanks, pipes, or other equipment on the property, all necessary steps should be taken to remove any remaining hazards. If the removal is not possible, or if the effect of attempted removal is questionable, personal protective measures should be applied.
REMOVE GLASS	Windows, glazed doors, and other glass and shatterable articles should be removed before actual demolition begins.

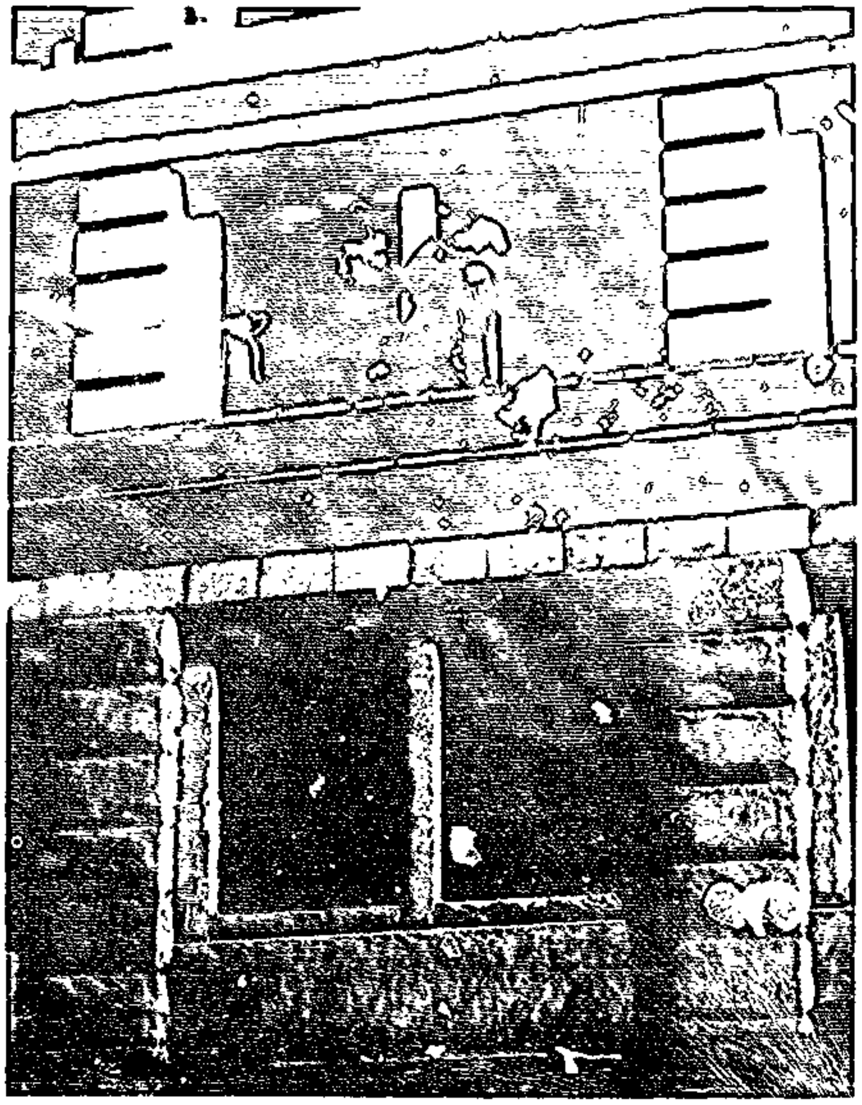

Chart 4. Window removal.

Chart Discussion: WINDOW REMOVAL. The point here is very simple: the windows were removed before regular razing began. A point to be made here, however, is in pointing out that the sidewalk shed should have been constructed before any other exterior work. (Also comment on incompleteness of shed.)

CLOSE UNNEEDED OPENINGS	Floor openings, shafts, or other apertures which are not to be used by workers or for the movement of materials should be covered, barricaded, or otherwise guarded. Exterior wall openings on all floors except grade should be protected by barricades at least 44 inches high or they should be closed off completely.

UTILITIES	Utilities, such as gas, water, steam, and similar service lines, should be cut off and capped outside the building line. Electric power should be disconnected outside the building line. Approval and cooperation of the utility company involved are usually needed, and sometimes its services. Sewer openings should be plugged to prevent storm water, debris, or other materials from entering the collection system. If any power, water, or other utilities are to be needed during demolition, these lines should be properly located and protected according to the recommendations of the utility company, and in compliance with any applicable codes.
CHECK STRUCTURAL MEMBER STRENGTH	All floor members should be checked to determine whether they are safe before workmen are sent in. Inspections should be continued during operations to detect weaknesses which may develop as a result of the work. Shoring or bracing should be installed as needed.
STARTING THE WORK	Except for cutting holes in the floor for chutes or material drops, for the preparation of storage space, or similar necessary preparatory work, the demolition of floors and exterior walls should begin at the top of the structure and proceed downward. Each story should be wrecked and removed before work is started on the story below. Suspended ceilings, floors, and similar structural segments should be removed from their supporting slabs before basic demolition operations begin.
PUBLIC AND GROUND-LEVEL PROTECTION	Protection of the public and that of his employees is probably more complex for the demolition contractor than for construction industry operators.
PROHIBITIVE LOSSES ARE POSSIBLE	Public liability, unlike worker-injury compensation which is limited, can result in awards which could be of near-disaster proportions for the contractor. It therefore behooves the demolition contractor to be very wary regarding the public's safety.
TRESPASSING AND VANDALISM	Trespassing and vandalism present definite public hazard problems. Work should start as promptly as possible after the demolition contractor assumes responsibility because— Vacant buildings present a legal liability for protecting the public, including trespassers and vandals. Catastrophe liability could also arise, as in the event of fire or explosion.

	If a building must be left vacant, it should be boarded up, barricaded, or otherwise protected to prevent entry by, or harm to, the public. This may even be required by ordinance or other code.
PUBLIC THOROUGHFARES	Arrangments should be made, if possible, to close off streets, sidewalks, or other public use facilities which may expose the public to a hazard. This is desirable to the contractor for the added protection it gives him. In some cases, street surfaces and sidewalks should be removed, altered, or relocated. In any event, any appreciable use of such facilities usually presents a need for corrective action before demolition begins, during the work, and sometimes after it is completed.

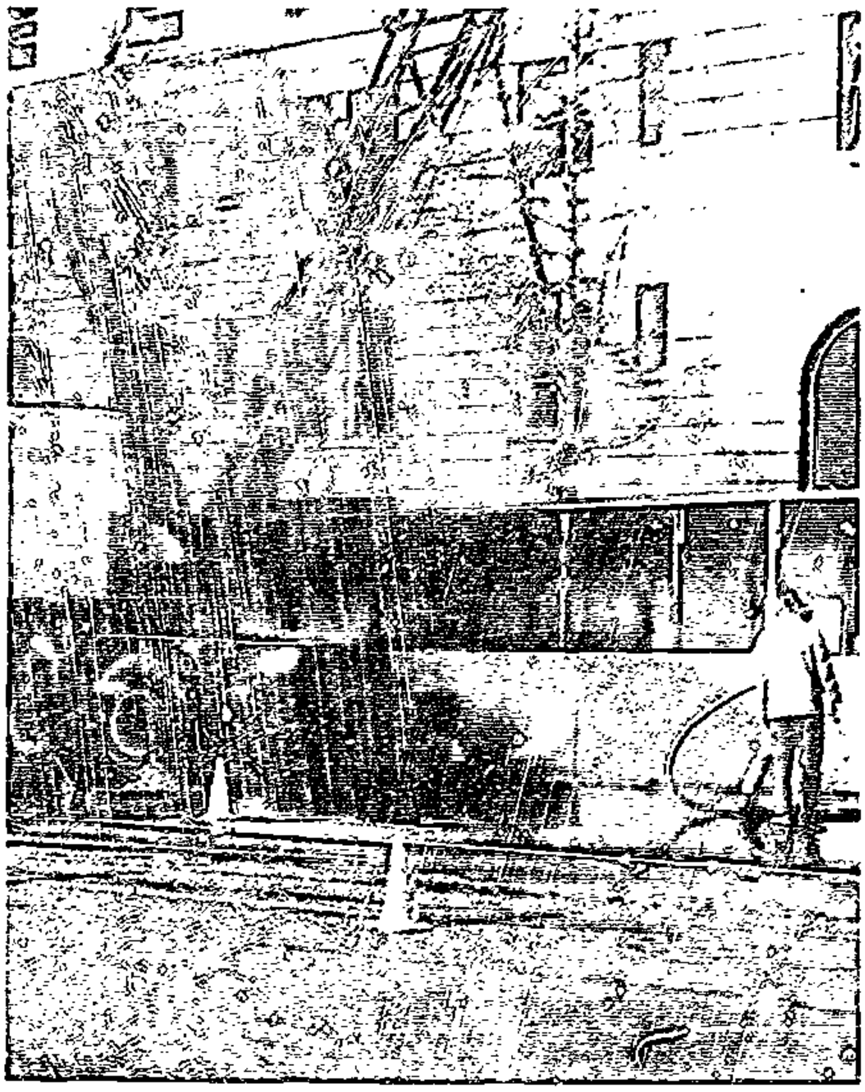

Chart 5. Street washing.

Chart Discussion: STREET WASHING. This illustrates washing down a street outside a job. Note flagman and markers for auto traffic.

MAINTAIN GOOD HOUSEKEEPING	**All public-use facilities should be kept clean, clear, unobstructed, and amply lighted at all times.**

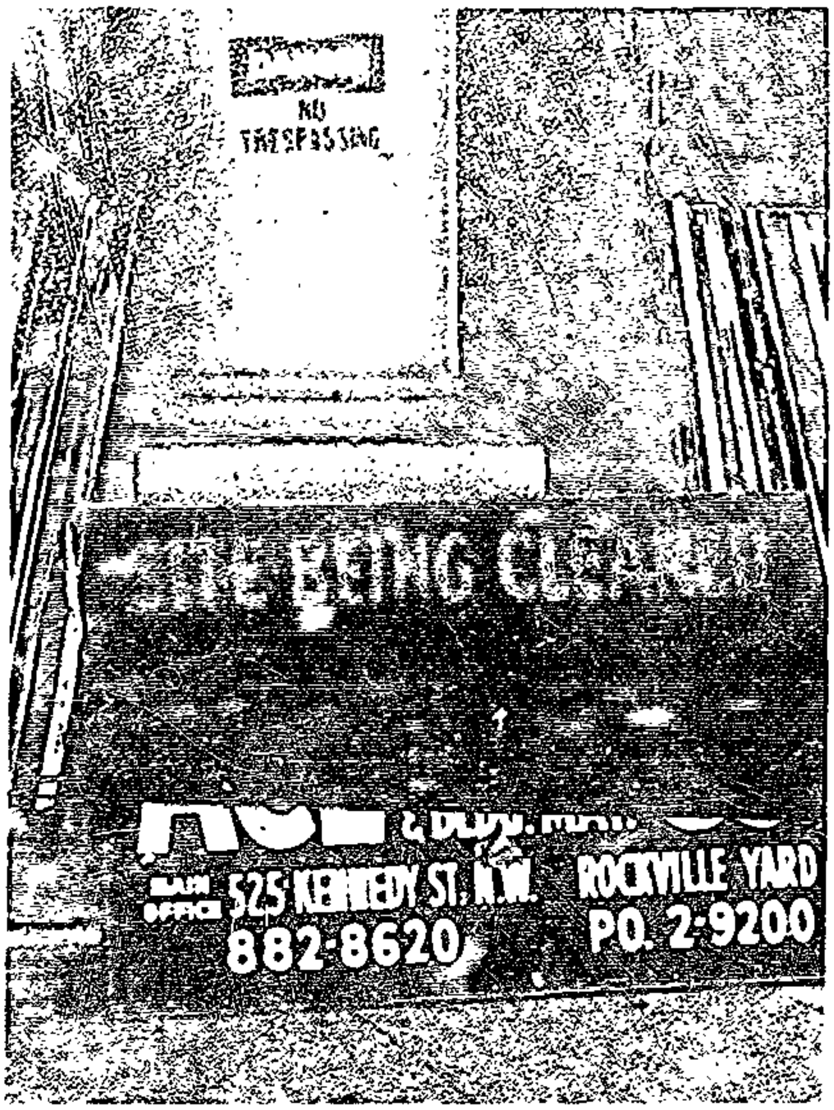

Chart 6. Warning signs.

Chart Discussion: WARNING SIGNS. These are not "shining examples" of the best warning signs, but they do depict the idea. It should also be stressed that the function of such signs is usually to supplement, not to substitute for, other protective devices.

WARNING DEVICES ARE NEEDED

Clear, understandable, durable, and easily seen "Danger" signs, designed effectively of ample size and when necessary properly illuminated, should be conspicuously located all around the area affected.

Dependable, bright red lights or flares should be strategically located and secured on all barricades, and elsewhere as needed, during the hours of darkness.

Lamps, torches, and similar flame-type lights should be located with care and secured firmly to prevent their becoming a fire or public hazard.

Chart 7. Debris on sidewalk and in street.

Chart Discussion: DEBRIS ON SIDEWALK AND IN STREET. Here is an example of flagrant disregard of public-protection principles. The sidewalk is completely covered, and the debris is well out into the streets. The old piece of two-by-four running out to the old nightstand is the only evidence of any protection for the public here.

CLOSE INGRESS POINTS	All outside openings of the structure and the surrounding work area should be effectively closed or barricaded, except when in actual use by personnel or by equipment. Doors or gates on such openings should not be permitted to open out into the line of travel of either pedestrians or vehicles.

PROVIDE GUARD	In many cases, a watchman should be provided when work is not in progress to maintain protective devices and to protect the public. The location of the job, or the extent or type of work, etc., may make it advisable to have a watchman on duty at all times.
TRAFFIC HAZARDS	Arrangements should be made for movement of vehicles and the security of the loads as protection of both the public and the workers involved. All truckloads, whether of dirt, debris, or other material, should be "trimmed" before leaving the jobsite. Any material which falls from a truck should be cleaned up immediately. A flagman should be provided to stop traffic and to direct vehicles in and out of the jobsite. When cranes or other equipment are in the street or jut out into it, a flagman, barricades, or other protective measures should be provided.

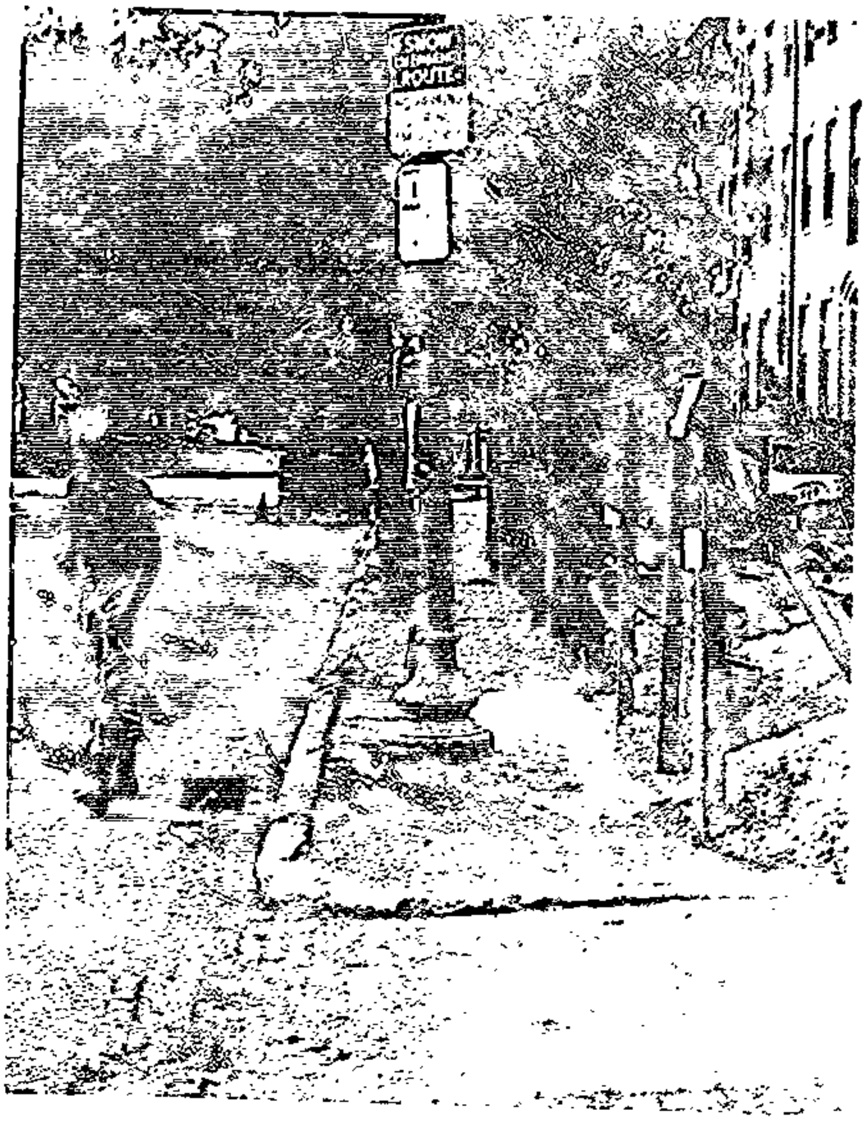

Chart 8. Cleaning up.

Chart Discussion: CLEANING UP. Any dirt, debris, or material which falls from a truck onto a public-use thoroughfare should be cleaned up immediately, as illustrated in this chart.

Chart 9. Flagman.

Chart Discussion: FLAGMAN. Depicted here is a flagman stopping traffic and directing the safe entry into the street of a truck coming out of the jobsite.

TRUCKS ENTERING OR LEAVING THE JOBSITE	Entry and exit of trucks and equipment from the worksite should be in such a manner as to guarantee the safety of passing pedestrians and vehicles.

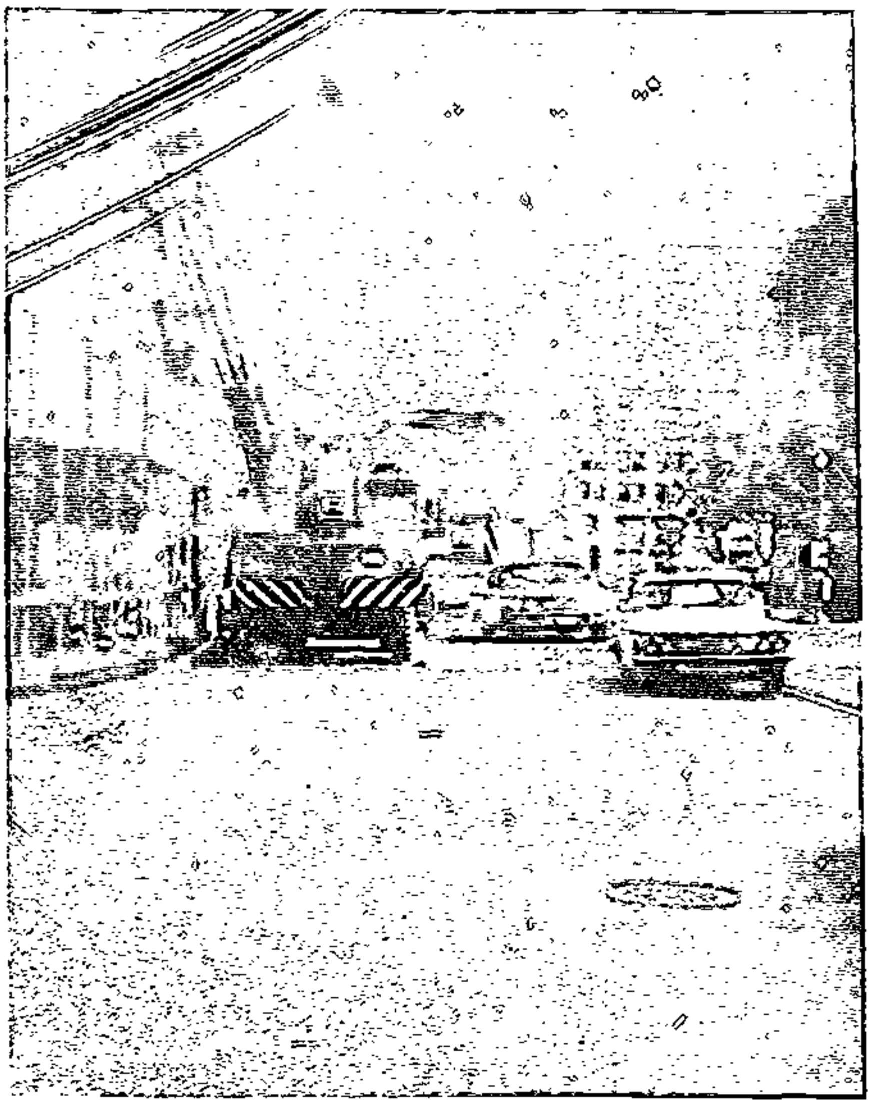

Chart 10. No street protection.

Chart Discussion: NO STREET PROTECTION. Graphically shown in this chart and the next one are the do's and don'ts of street protection. The "NO" picture shows a crane swinging out into the line of moving auto traffic; it has to swing out around its extended bed. There is no barricade, no flagman, no protection whatsoever.

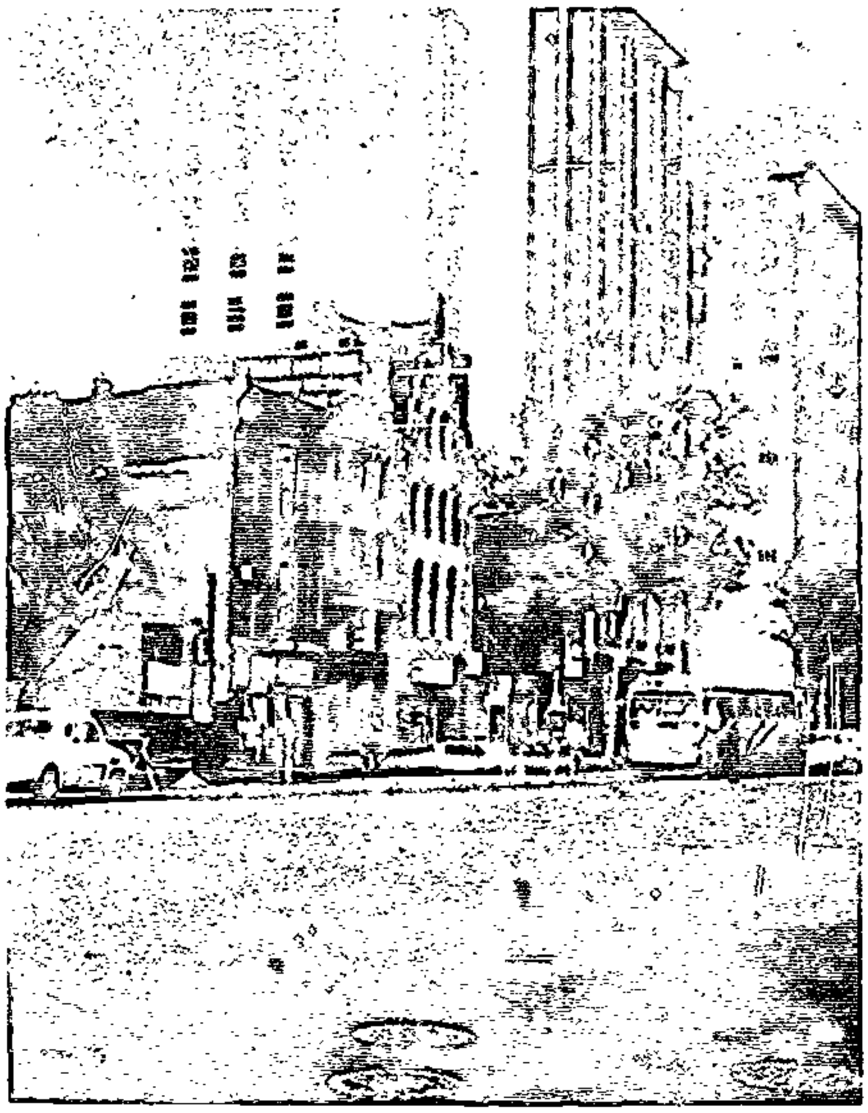

Chart 11. Good street protection.

Chart Discussion: GOOD STREET PROTECTION. In the "GOOD" picture, arrangements have been made not only for a flagman, but for a police officer as well. Note the officer just to the right of the front of the bus, where he has stopped it and the traffic behind it.

EQUIPMENT OUTSIDE THE JOBSITE

When cranes, compressors, or other equipment must be located EVEN "TEMPORARILY" on a street or walkway adjacent to the jobsite, barricades, flagmen, warning signs, or some other protection should be provided.

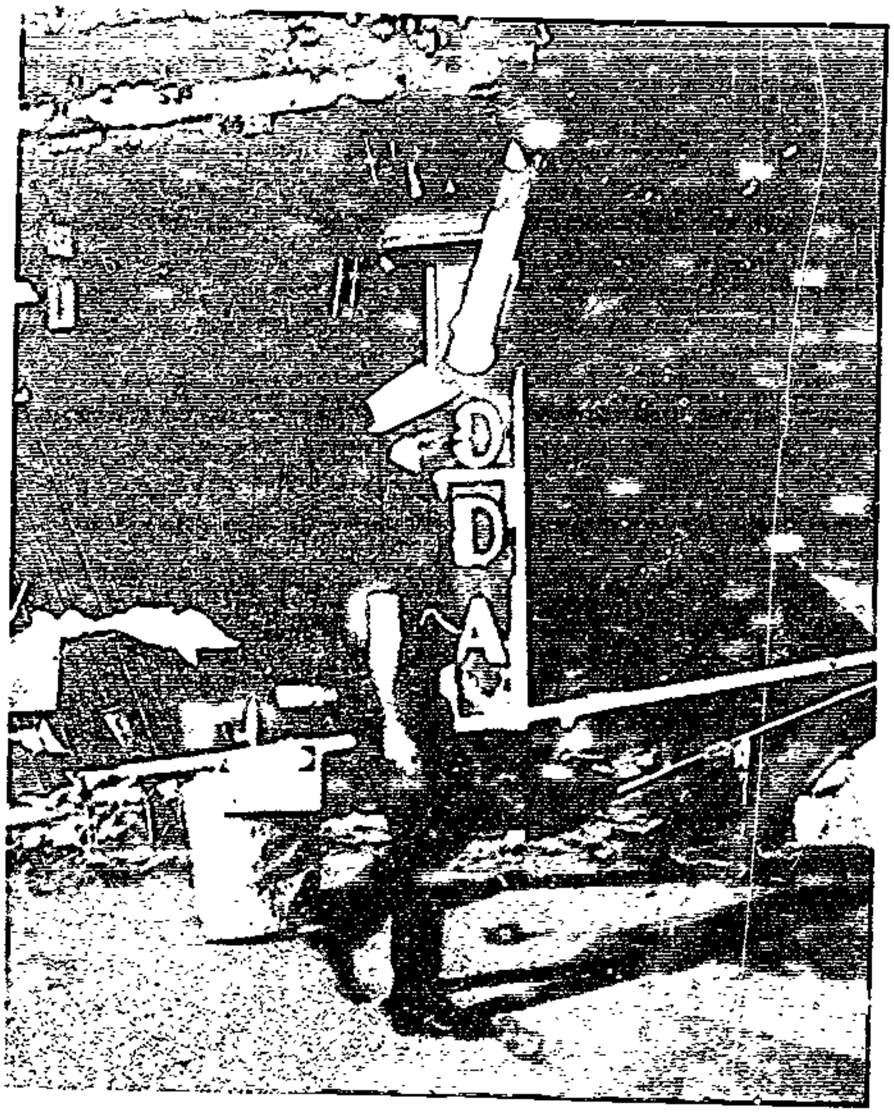

Chart 12. No sidewalk protection.

Chart Discussion: NO SIDEWALK PROTECTION. In the "No Sidewalk Protection" chart, we see well-advanced demolition work on a corner in a large city; no real protection has been provided for pedestrians.

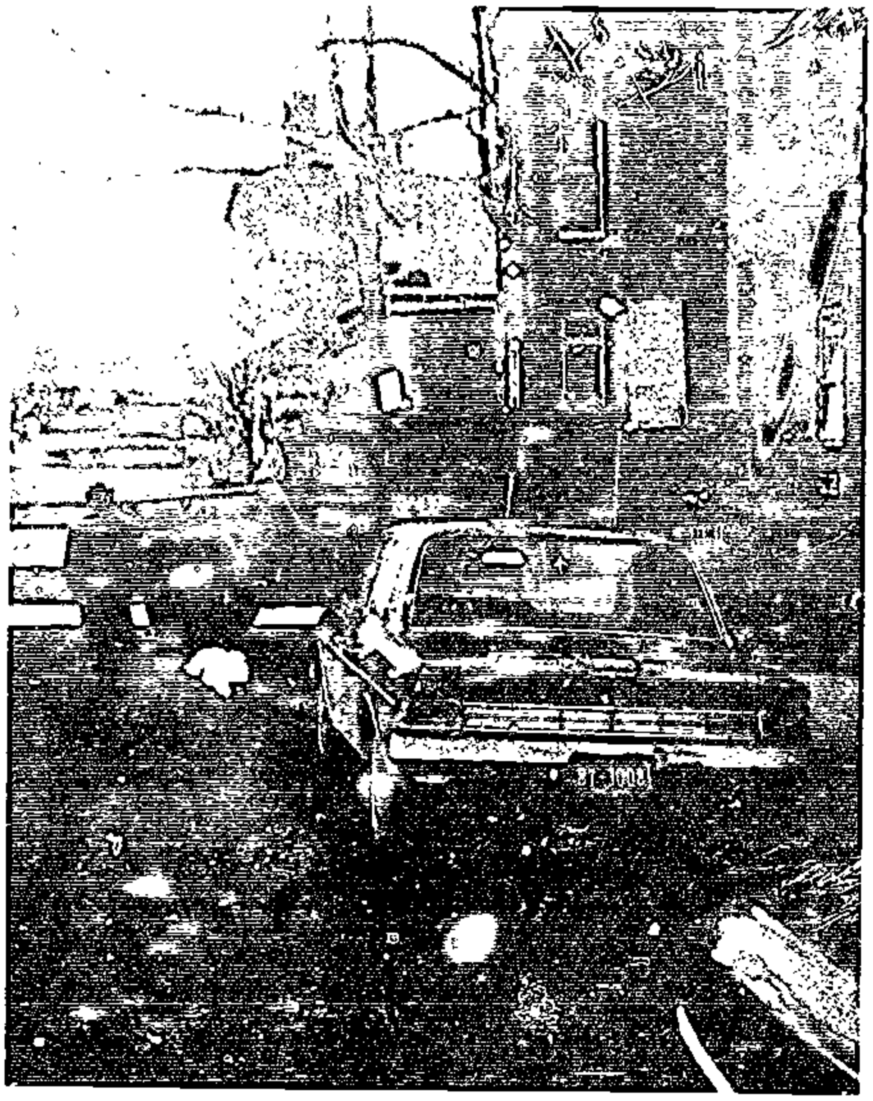

Chart 13. Sidewalk completely blocked.

Chart Discussion: SIDEWALK COMPLETELY BLOCKED. In the "Sidewalk Blocked" chart, a truck, backed up and parked for loading, is shown completely blocking the sidewalk, forcing pedestrians to walk out into the street. The truck-block may be unavoidable, but a flagman or some other protection should be provided, especially if the truck juts out into the *second* traffic lane.

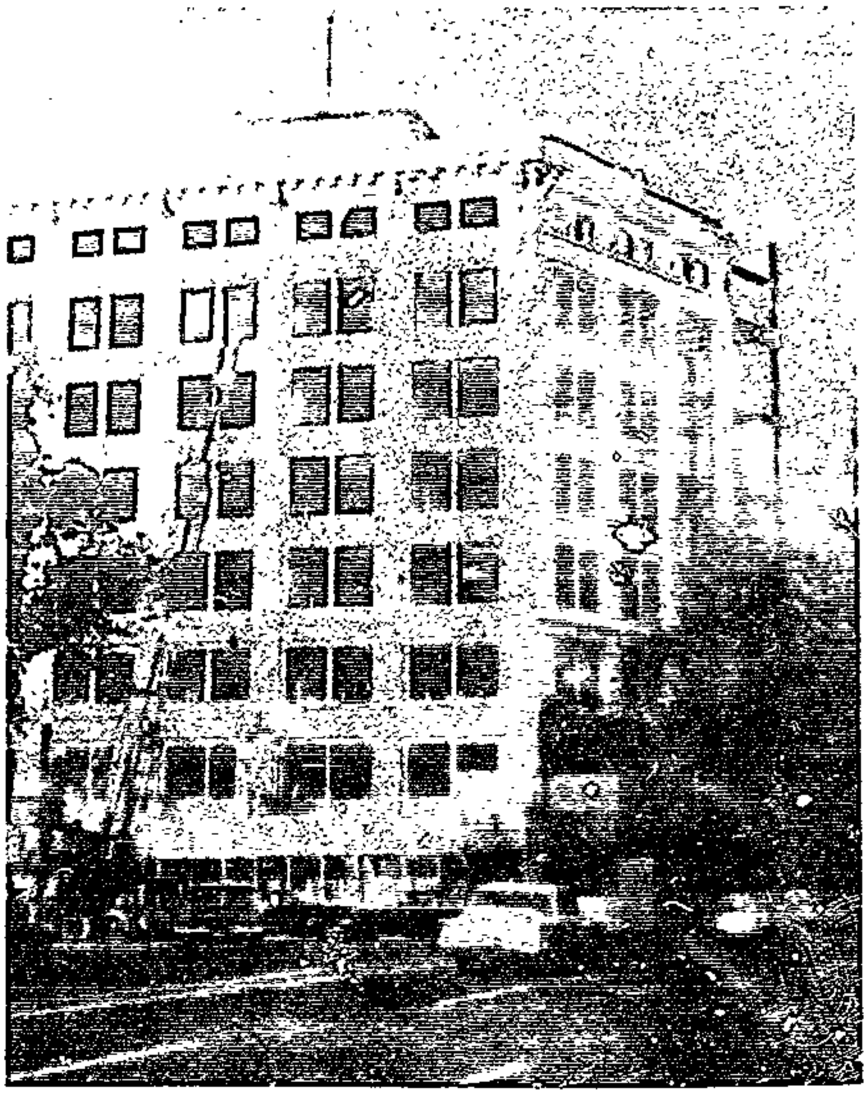

Chart 14. Sidewalk shed.

Chart Discussion: SIDEWALK SHED. Illustrated here is a good sidewalk shed, but it still does not embody all the features which should be included, as will be brought out in our discussion.

SIDEWALK SHEDS	When a sidewalk cannot be closed or relocated, a sidewalk shed should be erected if the structure to be razed is more than two stories or 25 feet high, and the horizontal distance from the inside edge of the sidewalk is 15 feet or less from the building.
Shed Strength and Length	A sidewalk shed should be substantial and conform structurally to the standards applicable for such sheds, and it should also cover the entire length of the sidewalk or other similar public-use pedestrian thoroughfare.
Shed Width	The sidewalk shed should be wide enough to permit reasonably normal pedestrian use without causing congestion.

Shed Lights	Provision should be made for ample illumination by either natural or artificial means, or both.
Shed Roofs	Shed roofs should be capable of sustaining a load of 150 pounds per square foot. If they are to be used for storage of materials, the load capability should be 300 pounds per square foot. Roofs should be a minimum of 8 feet from the ground. Shed roofs should be constructed of sound planking and a minimum of 2 inches thick, laid closely and evenly, and should be made watertight if the need is indicated.
Roof Extensions	Extensions should be attached to the outside edge and both ends of the roof. These extensions should project 42 inches from the roof edge and ends. The extensions may be vertical, but, preferably, they should be inclined outward to an angle no greater than 45°. They should be constructed of substantial boards which abut each other and are secured to braced supports. Alternate construction may be toe boards and galvanized wire netting of 1½-inch steel, wire mesh of not less than #16 U. S. gauge.
Openings	Any openings through a sidewalk shed should be used for work purposes only. These openings should be kept closed with strong, solid gates when not in use.
Supports	All supporting members for a sidewalk shed should be connected and braced to prevent their displacement.
Inside Shed Fence	A solid fence should be erected on the inside face of a sidewalk shed, except when the shed abuts the structure being demolished. If openings are necessary, they should be equipped with solid gates and kept closed when not in use.

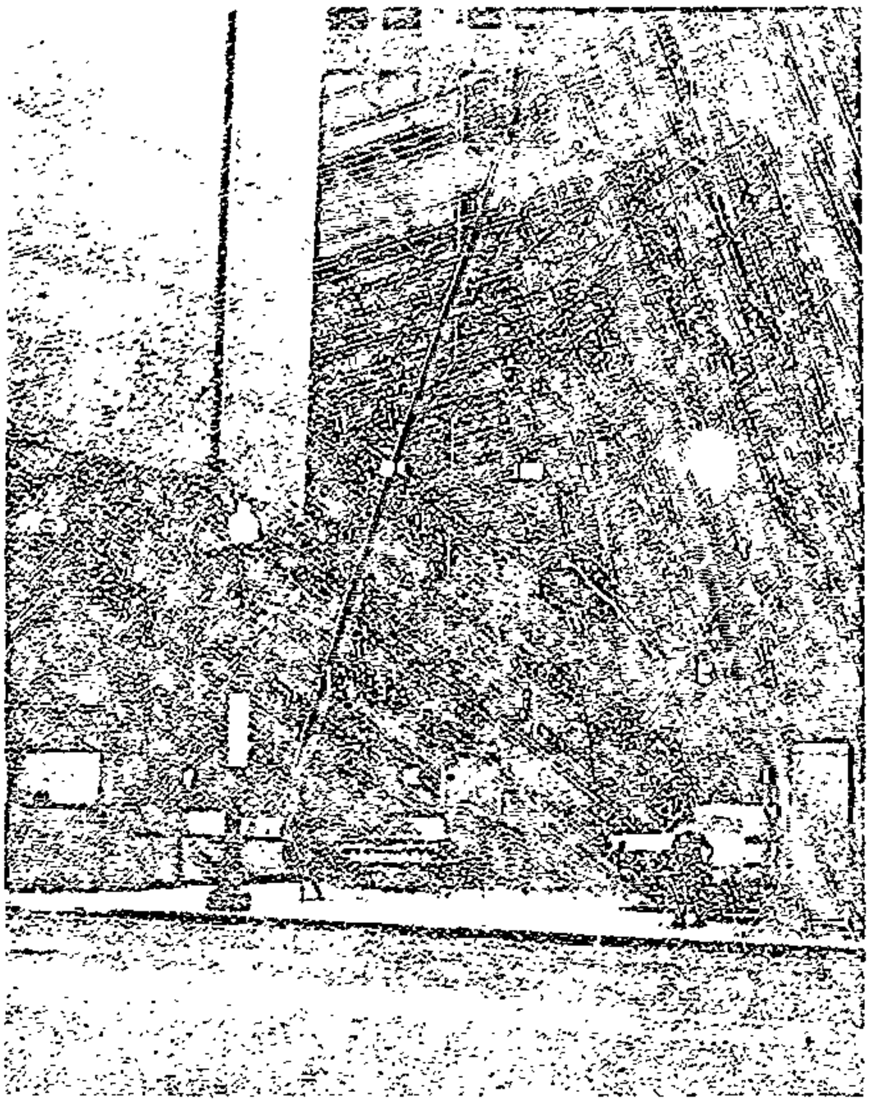

Chart 15. Sidewalk shed openings.

Chart Discussion: SIDEWALK SHED OPENINGS. Here is a glaring example of what we call an "exaggerated opening." On this job, an opening, for discussion purposes, is actually a length of sidewalk at the end of the job area where the contractor just didn't bother to erect a sidewalk shed. He left the entire stretch open and put a barricade at the end. At the time of the picture, the building had been completely razed and was being used for parking. This, of course, does not alter the fact that a shed *should have been* erected there.

FENCES AND RAILS

When the structure is more than 15 feet, but less than 25 feet, from the sidewalk, a fence may be erected along the inside edge of the sidewalk in lieu of a sidewalk shed.

	In those cases where closing the sidewalk has been permitted, the fence can be erected along the curb or the inside edge of the roadway if it is not to be used by pedestrians. This type of fence should be at least 6 feet high, be solidly constructed of sound wood or equally stable material for the entire length. All necessary openings should be equipped with solid gates, which are kept closed when not in use. If the traffic lane adjacent to a closed sidewalk is to be used by pedestrians, a sidewalk shed should be erected over the traffic lane.
Railings	When the structure to be demolished is more than 25 feet from the inside sidewalk line, a railing may be erected along the inside sidewalk line in lieu of either a shed or solid fence. The railing should run for the entire length of the site, and may be equipped with movable sections for work performance needs.
WORKERS' ENTRANCE PROTECTION	When the workers' means of access to the structure are not fully protected by a sidewalk shed, the entrances should be protected by a canopy extending at least 8 feet from the face of the building. Each side of the canopy should extend 1 foot beyond the side of the entrance for a total minimum of 2 feet wider than the total entrance width. Canopies should meet the same structural requirements that apply to a sidewalk shed roof.
ADJACENT STRUCTURE PROTECTION	When an adjacent structure is lower than the one to be demolished, its roof should be amply protected by the erection of debris catchers, barriers, or other effective covering. Structural support of adjoining buildings may also be necessary, through the use of shoring, underpinning panels, bracing, or other means.
CATCH PLATFORMS	The exterior walls of a structure 70 feet or higher should be equipped with catch platforms whenever the workers or the public are exposed to possible injury.
Exception	Outside scaffolding erected from the ground level upward may, if properly planked, serve in lieu of a catch platform.
Location	Catch platforms should be positioned not more than three stories below the level of the exterior walls being wrecked.
Not Necessary in Some Cases	Catch platforms are not necessary when the demolition has progressed to within three stories above grade, except in circumstances where good safety practice indicates otherwise.

Size and Material	Catch platform should extend at least 5 feet from the building, and they should be made of sound planks securely attached onto outriggers. The inner edge of the platform should touch the building wall. Its component planks should abut each other.
Load	The platform should be able to withstand a live load of not less than 125 pounds per square foot.
Incline	The platform should be inclined upward from the building so the outer edge is no less than 6 inches higher than the inner edge.
Supports	The outriggers should be at least 2- by 10-inch planks, not more than 10 feet apart, set on edge, and secured to prevent displacement. Outriggers should be securely supported where they meet the building wall and should be securely attached to the building.
Platform	The catch platform surface should be made of 2-inch planks. The planks should overlap each other over the outrigger supports and should be secured.
Outer Edge Enclosures	A strong enclosure should be mounted on the outer edge of a catch platform at approximately 45° with the horizontal. Outer edge enclosures should be at least 4 feet wide. Outer edge enclosures should be made of substantial boards, sheet iron, or galvanized ½-inch wire mesh of not less than #18 U.S. gauge. These enclosures should be mounted on at least 2- by 6-inch supports or equal which are securely attached and are not more than 10 feet apart. The supports should be mounted with the greater dimension at right angles to the enclosure. The joint between the catch platform and its outer edge enclosure should be tight.
Platform Use	Catch platforms are intended as a protective facility. Materials should not be stored or dumped on them. They should be cleaned daily—more often if necessary.
STAIRS, PASSAGEWAYS, AND LADDERS	The very nature of demolition operations requires that stairs, passageways, and ladders receive more than ordinary attention and care.

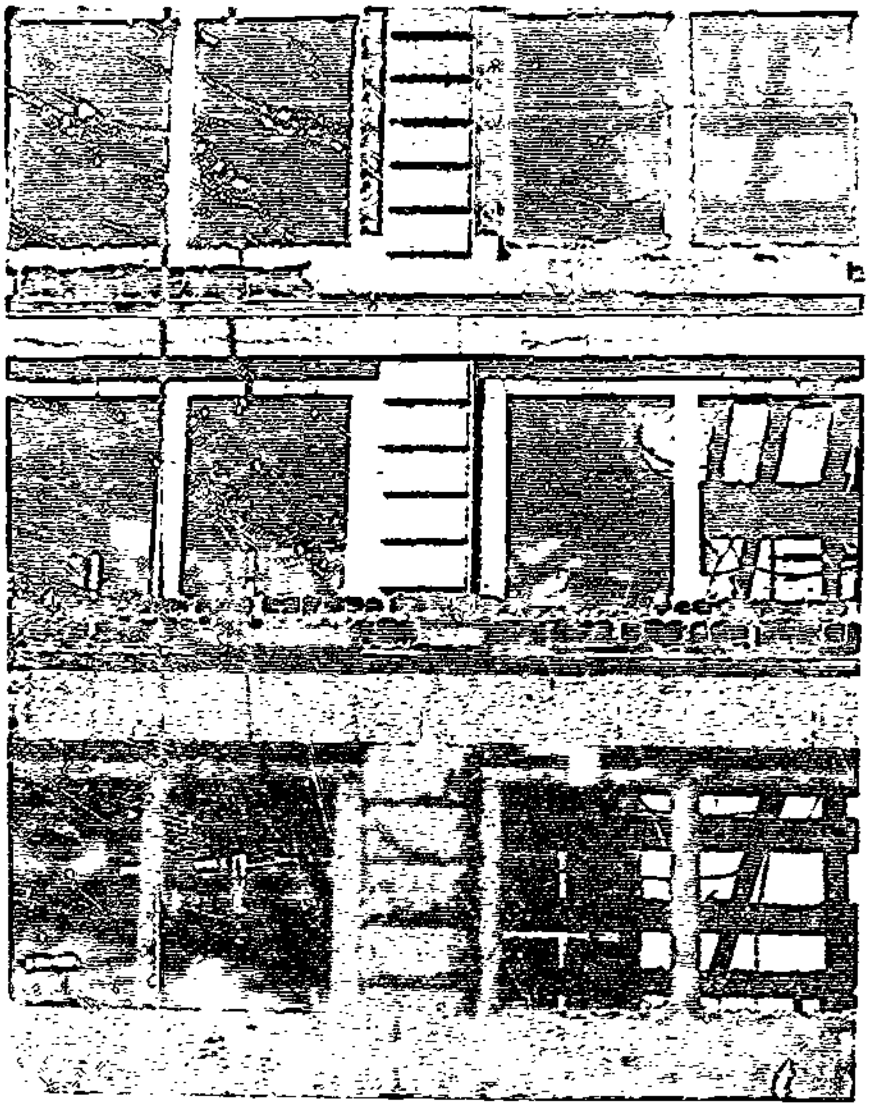

Chart 16. Interior ladder.

Chart Discussion: INTERIOR LADDER. By looking closely at the interior of the building in the center of the picture, you can see a specially installed ladder of the type often used during multistory demolition. This replaces the stairs which, by this time, have been removed.

STANDARDS

There are several applicable standards which should be followed when using stairs, passageways, ladders, and similar equipment during demolition operations.

INSTRUCTOR NOTE: Recommend the acquisition and use of ASA standards.

INGRESS AND EGRESS	Only those passageways and other such facilities which are *intended* for the workers should be used for this purpose. Other means of ingress and egress to the building should be closed off.
LADDER SIDE RAILS	Ladder side rails should extend at least 3 feet above the floor, platform, or other level to which they provide access.

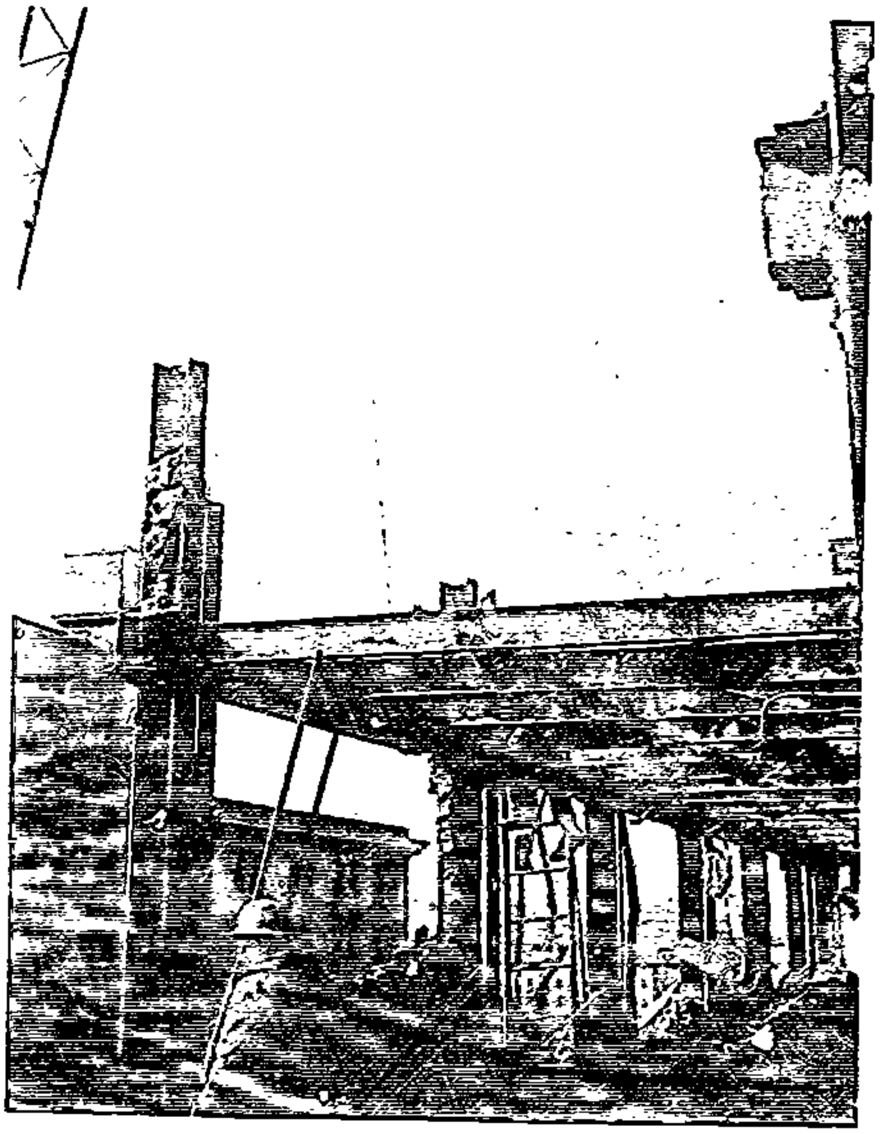

Chart 17. Unsafe ladder use.

Chart Discussion: UNSAFE LADDER USE. Here, a ladder is being used as an unsafe and inefficient substitute for a more proper means, such as a portable platform, to reach and cut beams, which are being removed.

SECURE THE LADDER	**When the use of a ladder is necessary, it should be secured to prevent slipping at the bottom and from moving at the top.**
SET OUT BOTTOM	**The bottom of the ladder should be set out one-fourth the length from the bottom to the point of contact.**
STAIRS	**On multistory structures, a stairwell which is being used should be effectively covered not less than two stories below the floor where work is in progress. Access to a work floor should be provided via a separate passageway.**

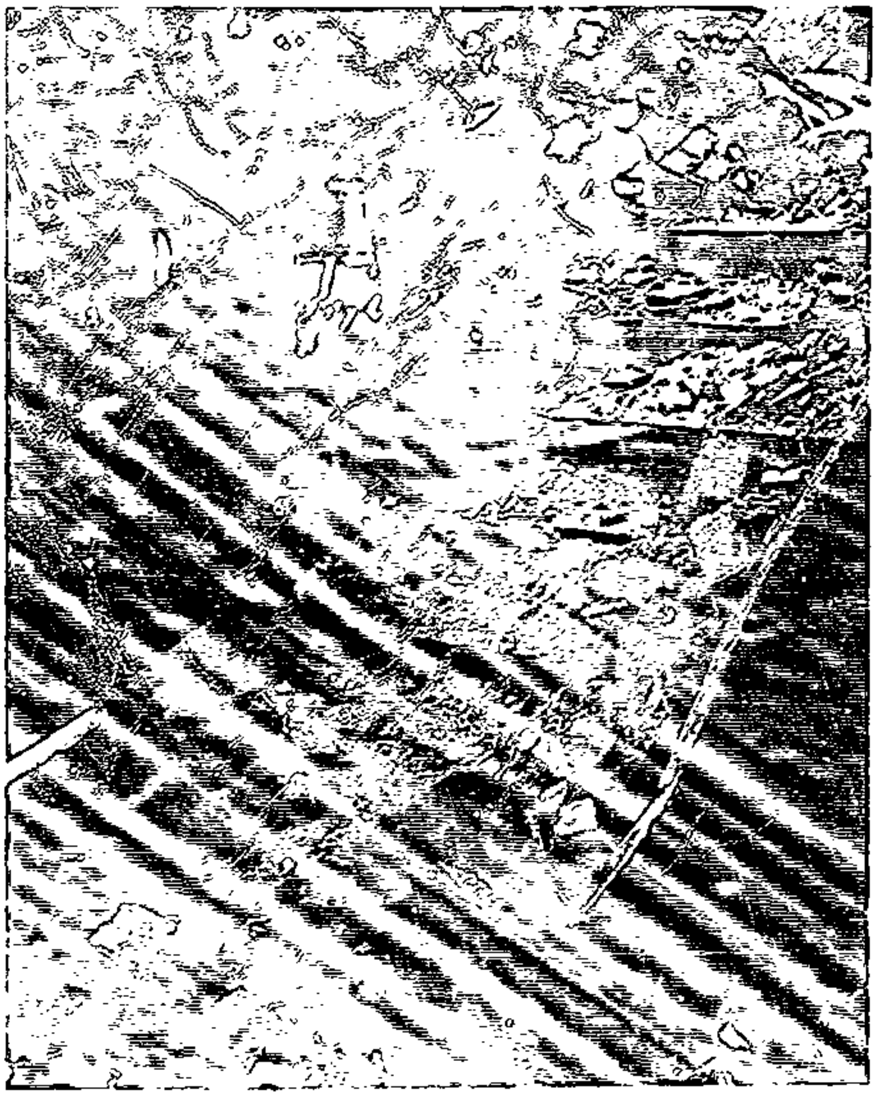

Chart [illegible] **Unsafe stairs**

Chart Discussion. UNSAFE STAIRS. The stairwell shown in this chart was being used regularly by the workers on this project. Note not only the unsafe clutter on the steps and landing levels, but also the lack of handrails.

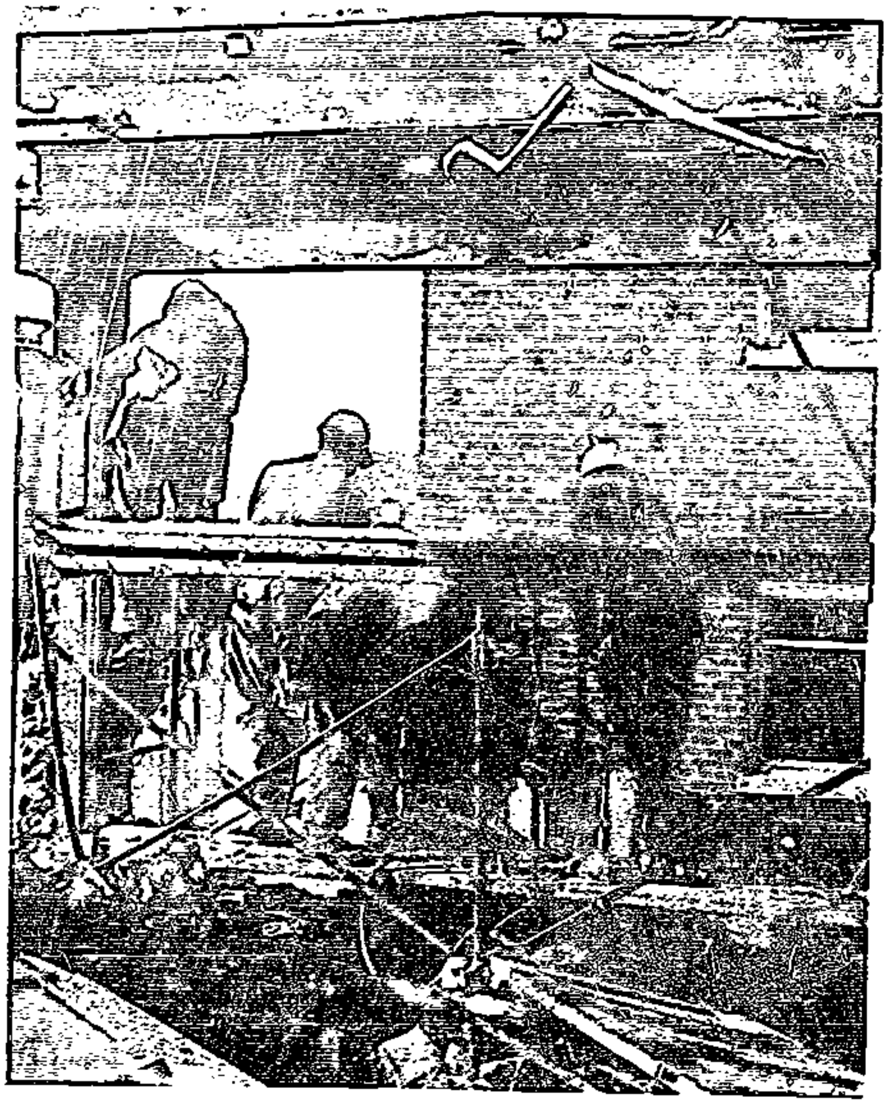

Chart 19. Scaffold

Chart Discussion: SCAFFOLD. Here is an example of a good type interior scaffold. Although it provides a good working level and has a railing on the INSIDE, unfortunately, there is no railing on the OUTSIDE where the men are moving the wall, and where a railing is considerably more important.

SCAFFOLDS	When work cannot be done safely from the ground or from solid construction, safe and substantial scaffolding should be provided, except for necessary ladder work.
Plan	Scaffolds should be planned and built to sustain any overload to which they might be subjected, e.g., materials falling on them. The requirements of ASA Standard A10.8 should be applied where applicable to demolition scaffolding.

Care	Due to the rough treatment scaffolds may get from falling materials, etc. in wrecking work, they should receive special care and maintenance.
Tie Lines	In demolition work, special care must be taken in tieing off scaffold lines. Where steel beams are involved, the saw-tooth edges sometimes found on old steel can damage lines. The lines should be protected from the sharp edges by wooden pads of at least 2-inch lumber. Also, before tieing off a line to a steel beam, make sure that that beam is not going to be removed.
MATERIAL CHUTES	Under most circumstances, dropping material by chute is the safe way. In some situations though, when job safety conditions warrant, material may be simply "gravity dropped." In this situation, however, the area to be used to receive the materials should be effectively barricaded, and all persons completely excluded from it.
Closed Chute	A chute should be closed on all four sides when it is at an angle of 45° or more from horizontal, except for floor-level closure-equipped openings for deposit of materials.
Openings in Chute	Openings should be not more than 4 feet long and, except on the top floor, should be kept closed when not being used for material deposit.
Open Top	When a chute has an angle of less than 45°, the upper side may be left open. However, when such a chute discharges into another chute which has an angle of more than 45°, the steeper chute should be completely enclosed.
Gates	The discharge end of a chute should be equipped with a strong gate. A dependable employee should be assigned to control the operation of the gate, as well as the movement of trucks being loaded and the protection of persons who may be in the area.
Openings Around Chute	The area around the discharge end of the chute should be so protected that when the chute is not being used, the area would not be accessible. Any wall openings where workers dump materials into a chute, or any opening on either side of the chute, should be guarded by a sturdy rail at least 44-inches high. The space between a chute and the edges of any floor openings through which it passes should also be protected, by being planked over.
Wheelbarrows	When dumping from a wheelbarrow, a bumper block at least 2 by 6 inches should be used.

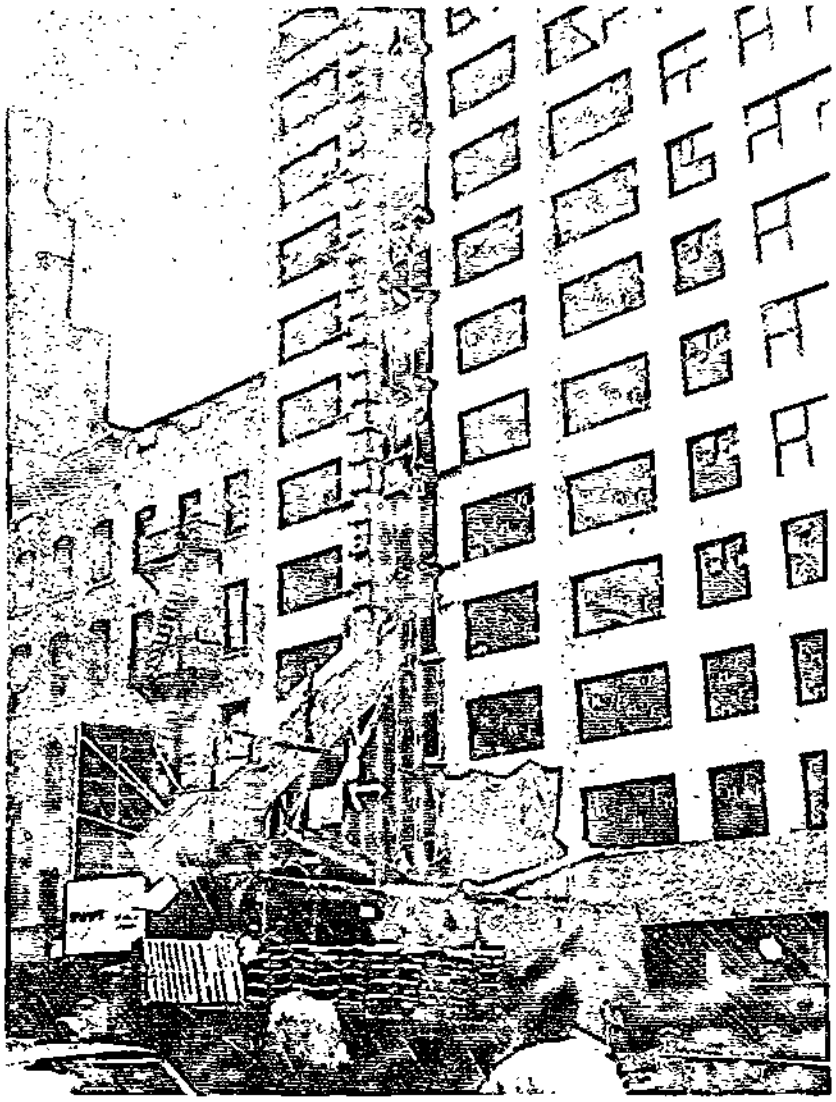

Chart 20. Long chute.

Chart Discussion: LONG CHUTE. Here is a good chute. However, we show it to point out that, for demolition purposes, it would present a hazard were an unduly heavy object inserted into such a long, drop chute. A heavy object would probably go right through the bottom of the drop, rather than out the discharge angle. As previously discussed, a manually controlled discharge gate is also a safety necessity on chutes.

Chute Length	Long chutes should be avoided, but when they are necessary, their direction should be changed at least every two floors. At direction-change points, sharp turns may require installation of a "baffle" or corner angle to prevent clogging the chute at that point.
Debris, Type and Size	Materials which might clog a chute should not be inserted into it. Also, objects weighing approximately 50 pounds or more should not be chuted; lowering is safer.

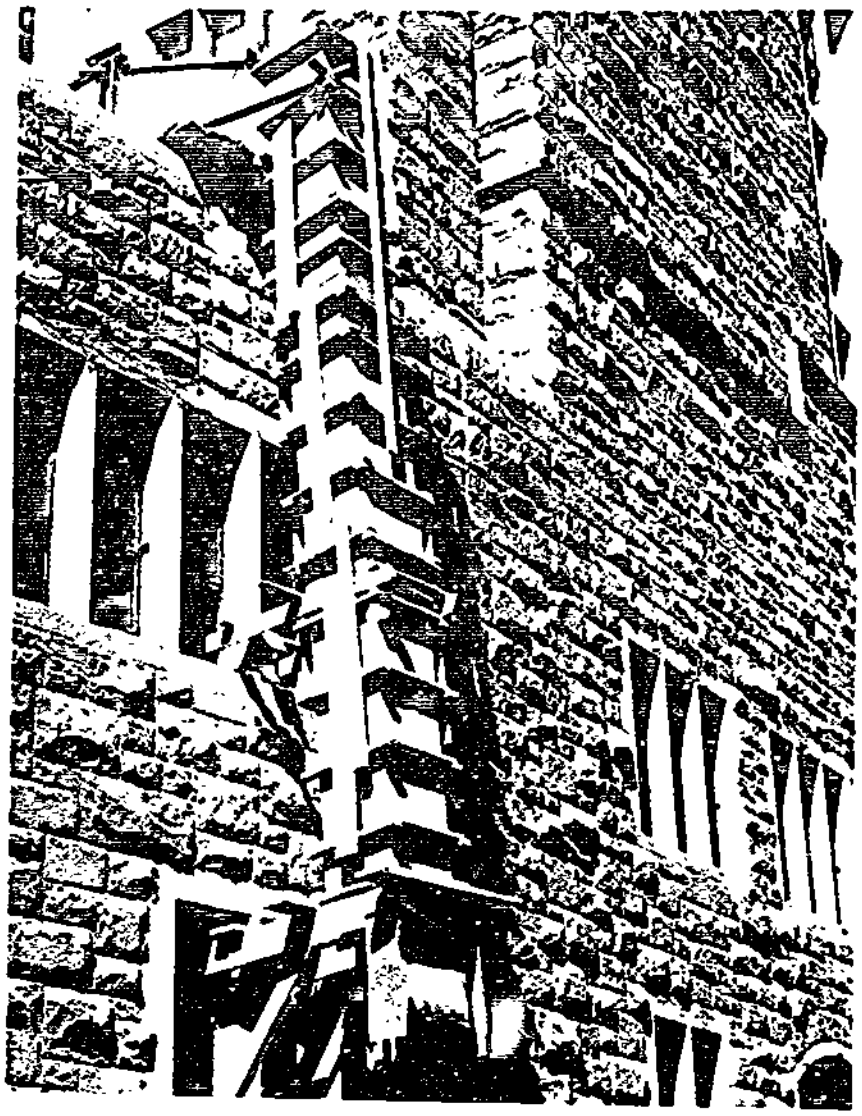

Chart 21. Wood chute.

Chart Discussion: WOOD CHUTE. This wood chute shows good construction, but there is a complete lack of protection at the discharge end.

Chart 22. Oil drum chute.

Chart Discussion: OIL DRUM CHUTE. The oil drum chute has no gate.

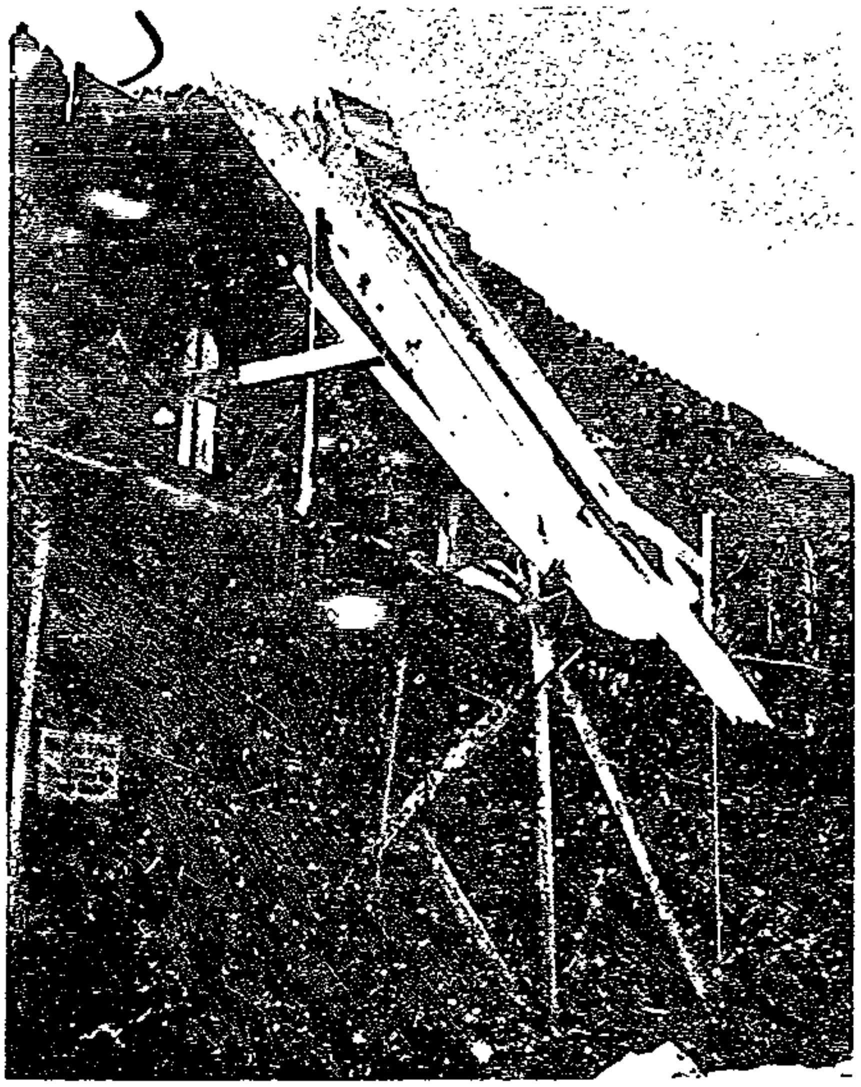

Chart 23. A sad chute.

Chart Discussion: A SAD CHUTE. Shown is an all-inclusive horrible example of just about everything a chute should NOT be.

WALLS, MASONRY SECTIONS, AND CHIMNEYS	Advance planning is usually important in wall removal. Which wall to remove first should be determined and then the sequence of removing the others.

Chart 24. Corner block removal No. 1.

Chart Discussion: CORNER BLOCK REMOVAL. The purpose for showing this chart and the following one is to illustrate unsafe practices in manual wall removal. In No. 1, the men are barring down corner blocks, causing them to work precariously and without benefit of lifeline protection. Note the special catch-shed built in front of the adjacent building.

Chart 25. Corner block removal No. 2.

Chart Discussion: CORNER BLOCK REMOVAL. Here, we see an almost unbelievable example of foolhardiness. The man shown is jackhammering the corner blocks away from the steel framing WITH ONE HAND, while holding on with the other. In doing so, he is hanging out over the corner of the building WITHOUT a lifeline, or any protection whatever. At the 8-story height from which he was working, only the fingers of one hand were keeping him from sure death.

DON'T OVERLOAD FLOORS	Walls or other masonry sections should never be dropped on a floor in a mass large or heavy enough to exceed the load capacity of the floor.

STANDING WALL SECTIONS	If the height of a wall section is 22 times greater than its thickness, it should not be permitted to stand alone unless it is braced laterally. An exception would be that the wall was originally designed and constructed to stand to a greater height alone and that it is still capable of doing so. At the close of any work period, *no* wall should be left in an unstable condition.
WEATHER HAZARDS	When ice, snow, wind, etc., present a hazard, workmen should not be permitted to do wall-top work.

Chart 26. Standing wall section.

Chart Discussion: STANDING WALL SECTION. Here, we see a section of wall left standing after work has stopped in the afternoon. The picture was taken from a frequently used sidewalk—even in the evening—in a large city. Note that there is no protection between it and the sidewalk, which is not more than 25 or 30 feet away. Fortunately, the wall did not fall. BUT IT MIGHT HAVE. MANY DO. THAT'S THE POINT.

Chart 27. Removing floor arches.

Chart Discussion: REMOVING FLOOR ARCHES. The purpose of this chart is to illustrate the balling method of floor removal. The crane, from the position shown, has balled out the wall sections and is in the process of dropping the ball on the floor arches, which will expose the steel framing for its removal.

REMOVAL OF STRUCTURAL MEMBERS

Structural or other members which support a floor should not be removed or cut until the stories above have been removed.

This would not preclude the cutting of floor beams for the purpose of creating floor holes for the disposal of material.

Nor would this preclude cutting for the purpose of installing equipment, or for storage purposes.

Any exceptions should, of course, give due consideration to maintaining the necessary structural safety of the building.

OPENINGS NEARBY	When a wall is being wrecked, any floor opening within 10 feet of the wall should be covered over, or effective measures should be taken to prevent personnel from entering the area immediately below the opening.
STEEL FRAMING	The steel framing of a structure may be left in place during the removal of the masonry. However, when the steel framing is left in place, all loose material should be removed from the beams, girders, etc., as the demolition progresses.

Chart 28. Steel framing.

Chart Discussion: STEEL FRAMING. Here, we see the steel framework which remains after the walls, floors, etc., have been removed, and while the steel removal is taking place. Note the men working the beams without any protection against falling.

WALKWAYS	Walkways at least 30 inches wide should be provided so that the workmen may safely reach or leave a wall or scaffold.
FOUNDATION WALLS	Those walls which function to retain or support earth or adjoining buildings should not be removed until the earth has been removed or supported, or until any adjoining structures affected have been braced or underpinned. When a foundation wall is a "party" wall, or will be used to retain debris, it should first be checked to determine that it has ample structural strength.

Chart 29. Wall demolition by balling.

Chart Discussion: WALL DEMOLITION BY BALLING. This chart shows the operation of knocking walls out with a demolition ball. Note that this building has steel framing. Note also the signalman.

Chart 30. Demolition by clamshell.

Chart Discussion: DEMOLITION BY CLAMSHELL. Note that the height, location, and type of framing of this building lends itself to the use of clamshells.

SPRAYING	When demolition balls or clamshells are used for demolition, the debris should be thoroughly wetted down by spraying with a hose to keep dust and dirt in the air to a minimum.

Chart 31. Watering down debris.

Chart Discussion: WATERING DOWN DEBRIS. Unless the operation shown here is performed, the air becomes heavily contaminated with dust and dirt, creating problems affecting efficiency, personnel, and public-relations.

CHIMNEYS AND STACKS	Toppling chimneys is very often a specialty-type operation, particularly if the stack is constructed of metal sections or is of a specialized construction or design.
Drop Inside	When chimneys or stacks of masonry construction cannot be toppled or dropped, debris should be dropped on the inside, unless job safety conditions are such that it is feasible to drop material on the outside.
Scaffolds	For chimney work, standard scaffolds should be provided when possible (see section on "Scaffolds"). When unusual job conditions require a specially designed and constructed scaffold, one should be erected which meets accepted safety standards.

Belts	Safety belts and lifelines or safety nets should be required.
Access	Safe access to the top should be provided for the workmen when a chimney is to be demolished manually.
Chutes	When a chute is used on chimney demolition, the discharge end should have an overhead canopy of closely and evenly laid planking at least 2 inches thick.
STEEL DEMOLITION	During the removal of steel framing, the stability of the remaining steel must be maintained.
Workers Should Be Briefed	Workers should be briefed on the planned sequence and procedure, with particular emphasis being placed on bracing and struts.
Coordinate	Coordination of the various phases of steel demolition is important so that no phase creates a hazard for any other.
Lower Steel	Steel should always be lowered, rather than dropped, unless a safely barricaded or otherwise protected receiving area is provided.
Planking Over	When a crane or derrick is not to be used for wrecking steel, the full tier of beams not more than two stories below the work point should be planked over. This would not apply to floors which still have their arches, or to openings in floors used for materials or equipment.
Sectioning	The removal of steel framing should be column length by column length, and tier by tier. To dismantle columns in two-story lengths is considered safe.
No Stress	No external stress should be permitted to affect a structural steel member which is to be cut off or dismembered.

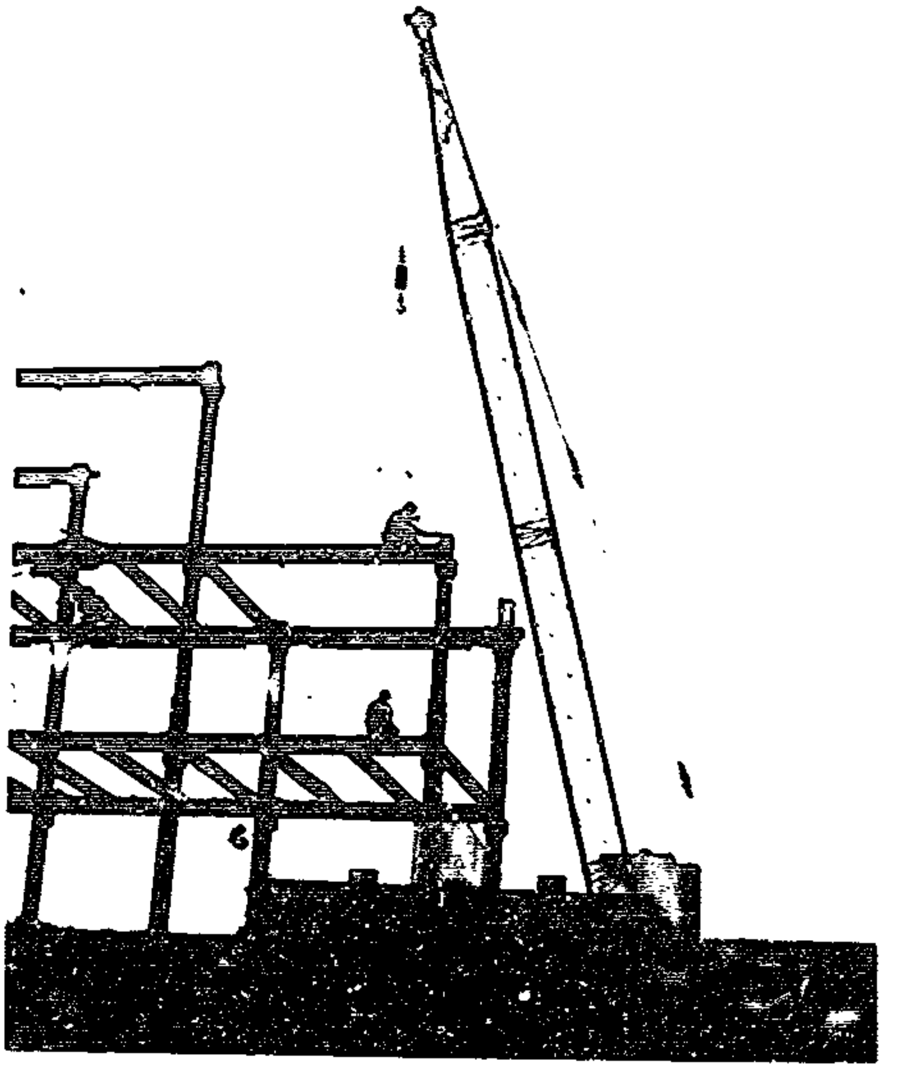

Chart 32. Steel framing removal.

Chart Discussion: STEEL FRAMING REMOVAL. Depicted here is the process of taking down the steel structure in sections, with the use of a crane. The walls, floors, etc., are gone, and columns are being removed. Note the men working the beams with no protection against falling.

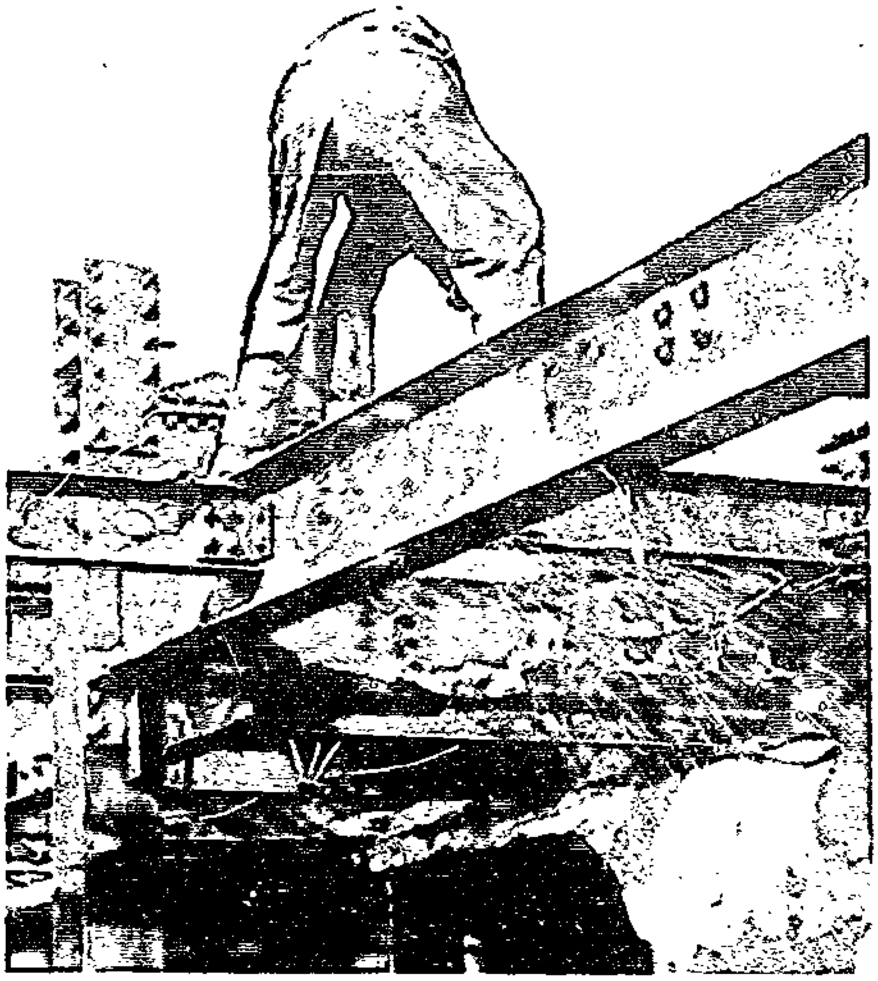

Chart 33. Sectioning.

Chart Discussion: SECTIONING. Here is a close-up of a man burning sections of steel framing for removal. Note the precarious working position. In this case, the floor arch below was still in place, so a platform or at least a ladder could have been used.

DERRICK ERECTION	Before the erection of a derrick, tower, crane, or other hoisting device on any floor support, it should be determined if any shoring is necessary. Necessary shoring should be designed and built to comply with accepted engineering standards, with a minimum safety factor of 4. If the floor arches have been removed at the point where a derrick or similar hoisting device is to be used, the entire tier of beams upon which the derrick is erected should be substantially planked over. Openings required in this planking for materials and equipment are acceptable.

CRANE SIGNALS	A standard signal system should be used in crane, hoist, derrick, and similar operations. Signal requirements of American Standard Code B30.2 are recommended for this purpose. All workers affected should be trained and required to use these signals, and to observe them.

Chart 34. Signaling.

Chart Discussion: SIGNALING. Although this is a balling operation, it illustrates the need for proper signaling. In this case, note the dangerous location of the signalman. He has no protection against falling should he slip or be struck.

HOOKING	The weight of a beam should be known before hooking up, and it should also be ascertained that the equipment to be used has sufficient capacity to handle the beam safely. Before hooking on, any loose material which is on the beam should be removed. In any case, hooking on should not be done until the workers have received authority to do so from the foreman in charge. At least a two leg sling should be used for hooking on.
TAG LINES	When lowering or hoisting a load, tag lines or guide ropes should be used. When dismantling steel sections, a tag line should be secured to each end of the member to prevent it from swinging. This is particularly important if the hooking on is by one line to the center of the beam, which could result in the attachment not being made at the center of gravity of the member. As previously discussed, hooking on should be made by two lines, one to either end of the beam. If only one line is used, certainly every effort must be made to attach at the exact center. The proper attachment of tag lines at each end of a member should not encourage dependence upon them as a substitute for proper hooking on.
TRANSPORTING CYLINDERS	When using cranes or similar hoisting devices for transporting cylinders, a cradle, boat, or suitable protected platform should be used. Protective caps should be in place. Cylinders should never be hoisted by hooking to regulators, torches, or other utilization equipment, nor by connecting slings directly to the cylinders.
DEMOLITION BALLS AND CLAMSHELL BUCKETS	Streets, walkways, or any other public-use thoroughfares which are adjacent or near enough to this work to present hazards should be closed, relocated, or the hazard otherwise resolved.
Protective Steps	The entire zone of operation for this work should be barricaded to protect both the workers and the public.
Prohibited Areas	Workers should not be allowed in any building area which can be adversely affected by these operations, nor should they be permitted in the barricaded area when balling is in progress. The number of workers in these areas should be limited to those necessary for the balling operations. A safety zone arc of 25 feet out from the line of bucket travel should be maintained for clamshell bucket work.

Posting	Appropriately worded, easily seen, well maintained warning signs should be located at all means of entry to any area where balling operations are being performed.
Ball Weights and Lines	The weight of a demolition ball should not be greater than 50 percent of the safe capacity of the crane at the maximum radius at which the ball will be used. The weight of a demolition ball should not be greater than 25 percent of the breaking strength of the line which holds it.
Ball Connection	Attachment of the ball to the load line should be by swivel-type connection to eliminate twisting of the load line. The ball should also be attached so securely that the weight cannot become disconnected by load line slack or other cause. The weight connection and the load line should be checked regularly, preferably twice daily.
Have Short Line	The load line and the crane boom on which it is hung should be as short as practicable.
CRANE WORK	Cranes used in this work should be equipped with boom stops.
Vibration Tests	Vibration or seismic tests should be made when there is any evidence of the need to do so to establish safe limits for the weight of the ball or the length of its drop, in order to prevent damage to nearby structures or utilities.
Cab Windows	For balling and clam operations, crane cab windows should be equipped with heavy-gauge metal screening.
Outriggers	Properly leveled outriggers should be used on truck-mounted cranes when the length of the boom or line or the weight of the ball or other factors relative to the size and weight of the crane require it.
Swing Limit	The boom of the crane should swing no more than 30°.
Checking Boom Swing	The crane operator should not check the ball's pendulum swing, or add impetus to the swing, by reversing the travel of the boom before the weight is at the peak of its arc.

Cut the Steel	When pulling over walls with a clamshell, a demolition ball, or a cable, any structural steel which might be affected should first be cut free.
Cornices	The roof, cornices, and similar ornamental parts of a structure should be removed before any wall pulling is done by clams or bails.
Riding the Ball	Riding the ball is a very dangerous practice, and should be prohibited.

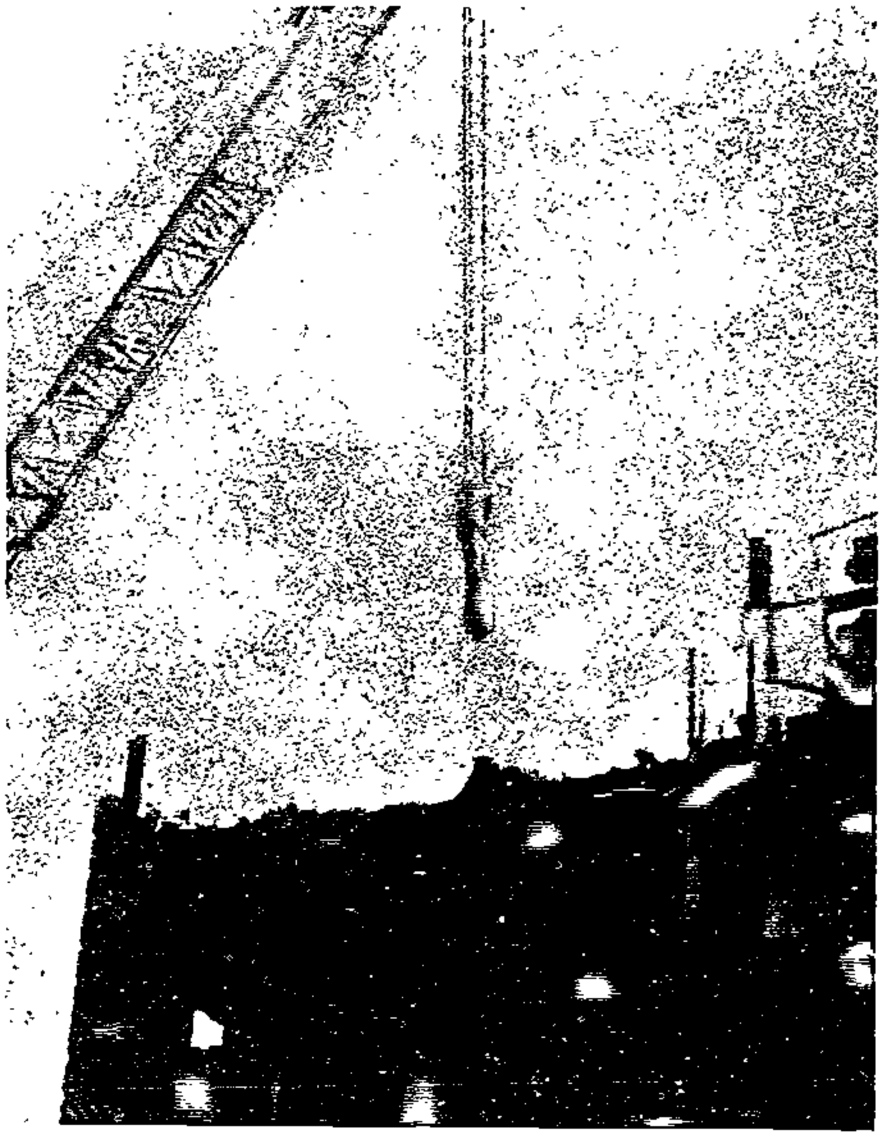

Chart 35. Riding the ball.

Chart Discussion: RIDING THE BALL. This picture is truly worth a thousand words. If this fellow, shown riding to the top of the building, wants to be killed, he's headed in the right direction. Fortunately, he made it to the top of the building this time.

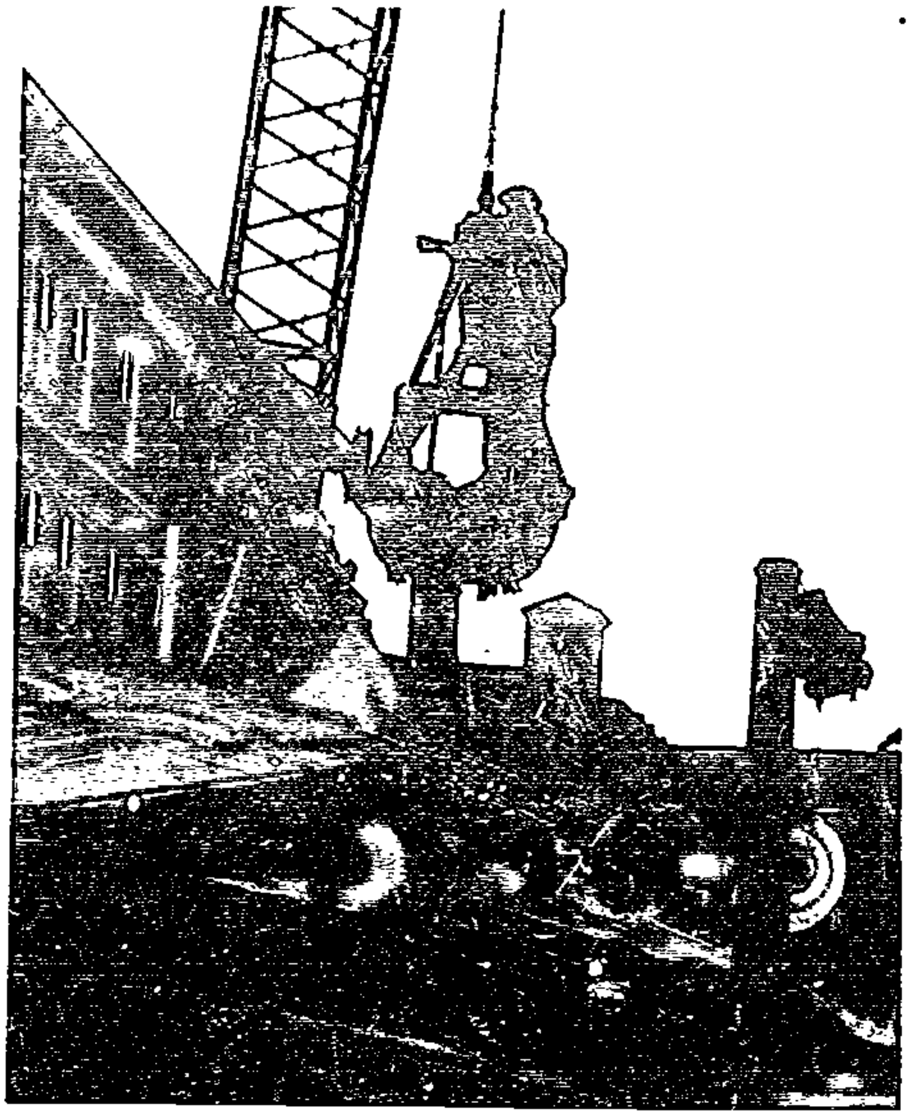

Chart 36. Riding the bucket.

Chart Discussion: RIDING THE BUCKET. This man must be a buddy to the fellow in the last slide. If he slips, at least he has a little better chance to survive, but not much.

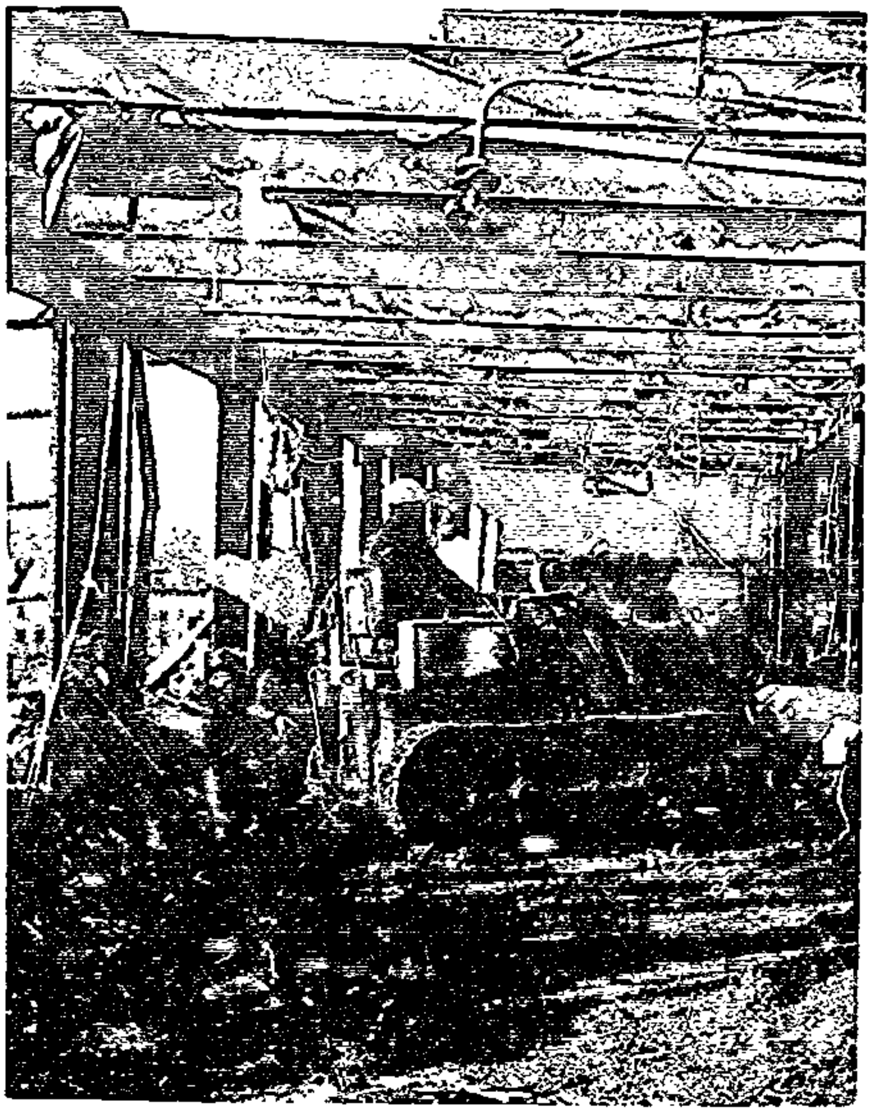

Chart 37. Removing floor debris with mechanical equipment.

Chart Discussion: REMOVING FLOOR DEBRIS WITH MECHANICAL EQUIPMENT. An illustration of debris being removed from the floor arch above with mechanical equipment. Note sparks from the burner's torch.

Chart 38. Dumping floor debris through wall hole.

Chart Discussion: DUMPING FLOOR DEBRIS THROUGH WALL HOLE. Size of hole eliminates need for bump block; operation OK as shown.

FLOOR REMOVAL	Debris and material storage should not exceed established floor loads.
Wood Beam Construction	When a structure has wooden floors, it is an accepted practice to remove the flooring boards from no more than one floor above grade level for the purpose of providing storage space, provided that dropping material therein does not affect the structure's stability. When free-standing exterior walls or interior walls are braced by wooden floor beams, the floor beams should not be removed until equal support is provided in their place.

Fire-Resistant Construction	In buildings of this construction, floor arches no higher than 25 feet above grade level may be removed, providing that removal does not adversely affect the structure's stability. Any intermediate steel floor beams that do not provide structural stability may also be removed. When, for storage purposes, floor arches are removed from more than one level, the removal should start at the highest floor and proceed downward, and should always be done according to the recommendations applying to the removal of floor arches. Also acceptable is an alternate method to remove floor arches for storage by starting at the lowest level and proceeding upward if the top surface of the debris stored is no more than one story below an arch which is to be removed.
STORAGE	
Workers Below	Material should not be dumped into a storage area while men are removing floor arches or beams, or performing any other work in the storage space.
Barricade	Storage areas should be blocked off, except for necessary openings for the removal of materials. Any necessary openings should be secured whenever materials are not actually being removed.
No Lateral Pressure	The storing of debris or material should not subject any wall to lateral pressure or lateral impact from falling material.
Fire Problem	The ever-present hazard of fire on a demolition job is particularly acute in storage areas. Appropriate precautionary measures should be taken.

Chart 39. Dumping into storage.

Chart Discussion: DUMPING INTO STORAGE. Here, debris is being dumped by a front-end loader through a wall opening. The principles we have discussed on this subject are being observed here. The area being used for the dumping is clear of men, safely isolated and barricaded, and is being wet down. All's clear.

WELDING AND RELATED OPERATIONS	**Torches, valves, regulators, blow pipes, and all other related equipment should be of the proper type.**
Secure Cylinders	**Cylinders should be kept in an upright position and lashed together when in use.**

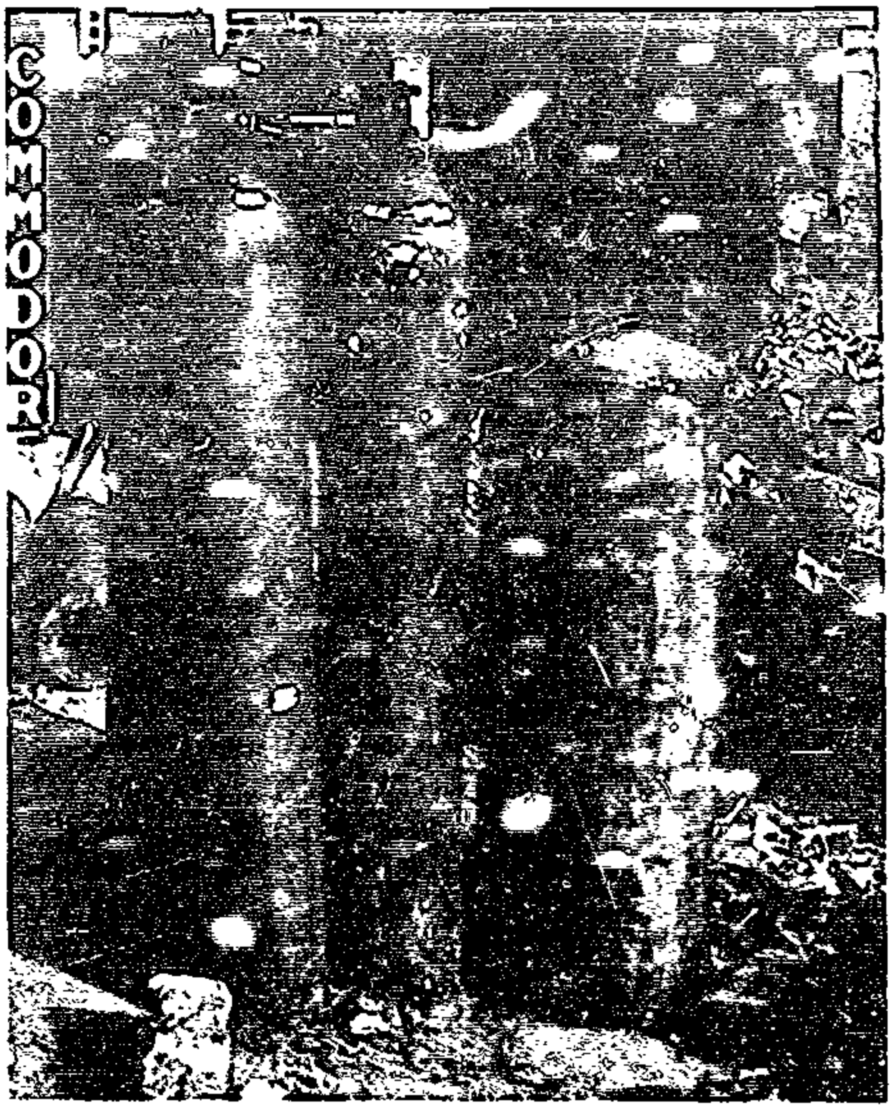

Chart 40. Cylinders.

Chart Discussion: CLYINDERS. Here's an attempt at safe practices: the cylinders are wired together, even though very close to the edge on a high building. The hose presents a tripping hazard. A better location and the use of a cylinder buggy would be more efficient and safer. Cylinders should *always* be fastened to something to keep them upright.

Moving Cylinders	Transportation of cylinders was outlined in the discussion under Steel Demolition (see p. 48).
Personal Protective Equipment	Welders and burners and other employees working in the area should be provided with necessary protective equipment, and be required to use it. See Personal Protective Equipment, p. 59.

Chart 41. Burning operation.

Chart Discussion: BURNING OPERATION. Reasonably well equipped, this burner has goggles, hard hat, and gauntlet gloves. We also hope he is wearing safety shoes in case that beam section he is burning swivels around on him when he cuts it loose. Neither his jacket nor his pants look to be fire resistant.

FIRE PROBLEMS	Fire extinguishing equipment should be located at or near any welding or oxygen cutting operations on a demolition job. (See section on Fire Protection.)
Purging	Tanks, gas lines, or other objects or containers which have contained flammable liquid or gas should have no welding or cutting done on them until they have been freed of flammable residues. The purging should be checked and approved by the foreman in charge of the job.

	If any residue remains after a container has been purged, the container should be filled with water or an inert gas before any welding or cutting is attempted on it.
Ventilation	Ample ventilation should be provided when burning operations are being done in an enclosed area.
TOOL CARE AND USE	For the care and use of tools, a formal program works best. Set up a procedure for systematic inspection, maintenance, repair, and replacement, and for maintaining records.
Tripping and Damage	Keep tools stored when not in use. This will eliminate unnecessary tripping hazards as well as damage to the tools.
Electric Tools	Electric tools should be grounded in the approved manner, and their cords inspected regularly for breaks, kinks, abrasions, etc. Any damages or defects should be repaired promptly.
Pneumatic Tools	Pneumatic tools and their air hoses and lines should be examined regularly, and any defects discovered should be taken care of promptly. Before removing the hose from these tools, or making any adjustments to them, be sure the air pressure has been cut off.
BLASTING	Blasting should be done only by an experienced and competent person who has been assigned to this responsibility. (License is required in some jurisdictions.)
Warning	Ample warning (several minutes) should always be given with flag or similar device by an assigned competent employee stationed at every means of approach to the blast area and a safe distance from the blast location. Personnel should always be sent a safe distance from the blast location, and should not be permitted to return until advised to do so by the blaster or by an employee assigned to do so for him.
FIRE PROBLEMS	A qualified fire plan should be established before demolition begins. This plan should include fire protection and control, an evacuation plan, and duty assignments to key personnel.
Heating Devices	Salamanders and other heating devices should be placed on a base of earth, sand, metal plate, or similar nonflammable material. Effective venting to the outside, through safe means, should be provided.
Fire Extinguishers	Fire extinguishers should be provided in a sufficient quantity, of proper type, and well dispersed in locations throughout the job. Signs should be posted to show fire extinguisher locations.

Hydrants	Ready access to hydrants, standpipes, or similar facilities should be maintained, if available, by prohibiting storage of material within 5 feet of them.
PERSONAL PROTECTIVE EQUIPMENT	The many hazards prevalent in this type work require the use of a fairly wide variety of safety clothing and equipment.
Safety Belts and Life Nets	Much of wall work in demolition operations necessitates using safety belts or life nets. These are especially important when working on chimneys.
Respiratory Protection	Because many phases of demolition work are particularly dusty, respiratory protection should be provided. When cutting or welding is done on steel covered with leadbase or other paints, platings, or coatings, the operators and other workers within 15 feet should be provided with appropriate respiratory equipment. (See ASA Codes Z49.1 and Z2.1 for details.)
Hands	Gloves and hand leathers should be provided to employees required to handle sharp or very rough materials.
Feet	The use of foot protection—safety shoes, instep protectors, etc.—should be required.
Body	Ragged, torn, loose, and otherwise hazardous clothing should not be permitted.

INSTRUCTOR NOTE: Refer to ASA L18 series for more information on protective clothing.

GENERAL SAFETY TIPS	Several other categories, while not requiring separate coverage, are important and worthy of attention.
Glass	Don't leave broken glass around the operation.
Stairs	Keep selected stairs and rails in place as long as possible.
Loads	Don't overload hoists or other mechanical equipment.
Flying Objects	Place screens where necessary to protect workers from flying objects.
Spray	Water should be sprayed to control dusts when tearing down plaster and other interior materials, and as needed.

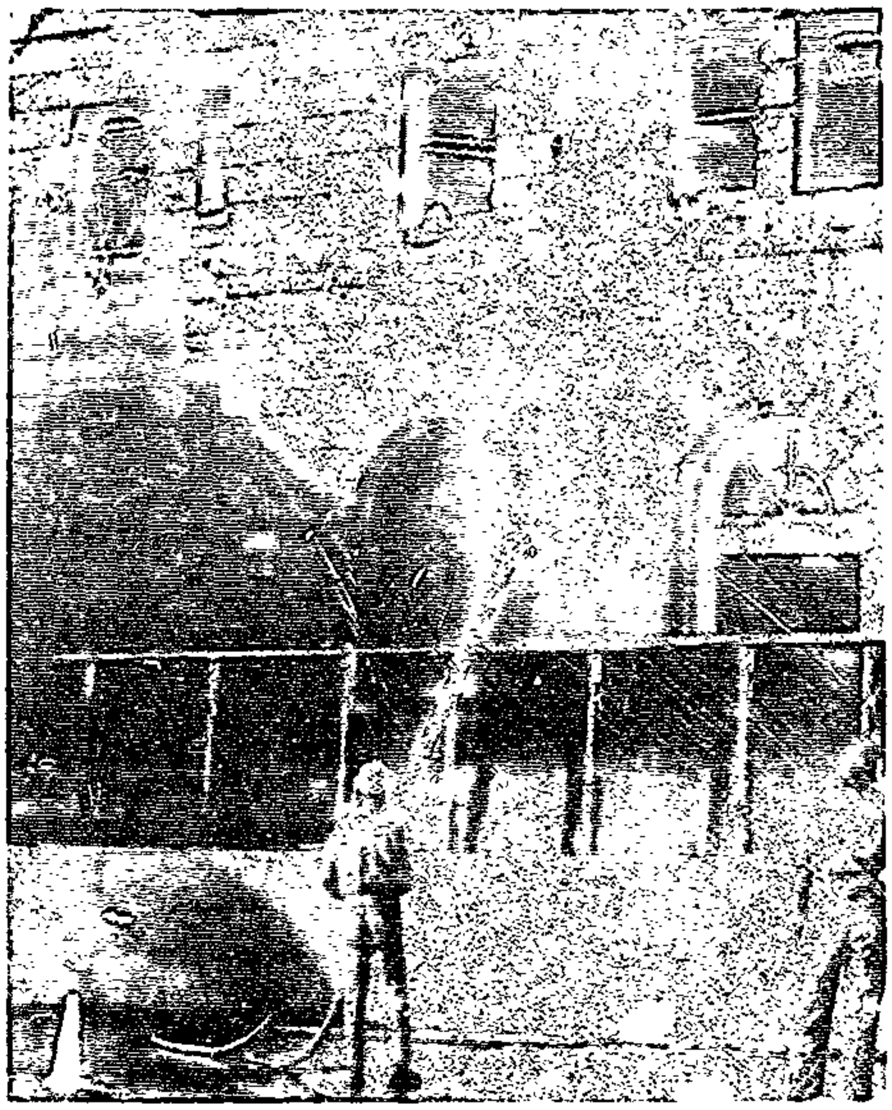

Chart 42. Spraying inside building.

Chart Discussion: SPRAYING INSIDE BUILDING. Here, they are hosing water through a window to spray down inside the building, to accomplish the result just discussed.

Nails	**Remove nails from lumber, bend them over, or drive them in.**
Piling	**Store materials in a safe way and in a safe place. Pile and stack safely.**
Hooks	**Don't use open hooks on cranes and hoists. Use a shackle or safety hook.**
Sheds	**Construction sheds, toolboxes, and similar supplemental structures should be placed well away from the danger of falling walls or other hazards.**
Occupancy	**In some cases, but not often, part of a structure or area being wrecked may be occupied. Special precautions must be taken in such situations.**

Lighting	Ample illumination should be provided for nightwork, or as required. (Reference: ASA A11.1.)
Slippery Conditions	All sidewalks, roadways, and other surfaces used by the public and workers should be kept clear of snow, ice, grease, mud, and other material or condition which would make it slippery.
Supervision	When there is more than one foreman on a demolition job, one should be designated as senior foreman in overall charge of the operations.

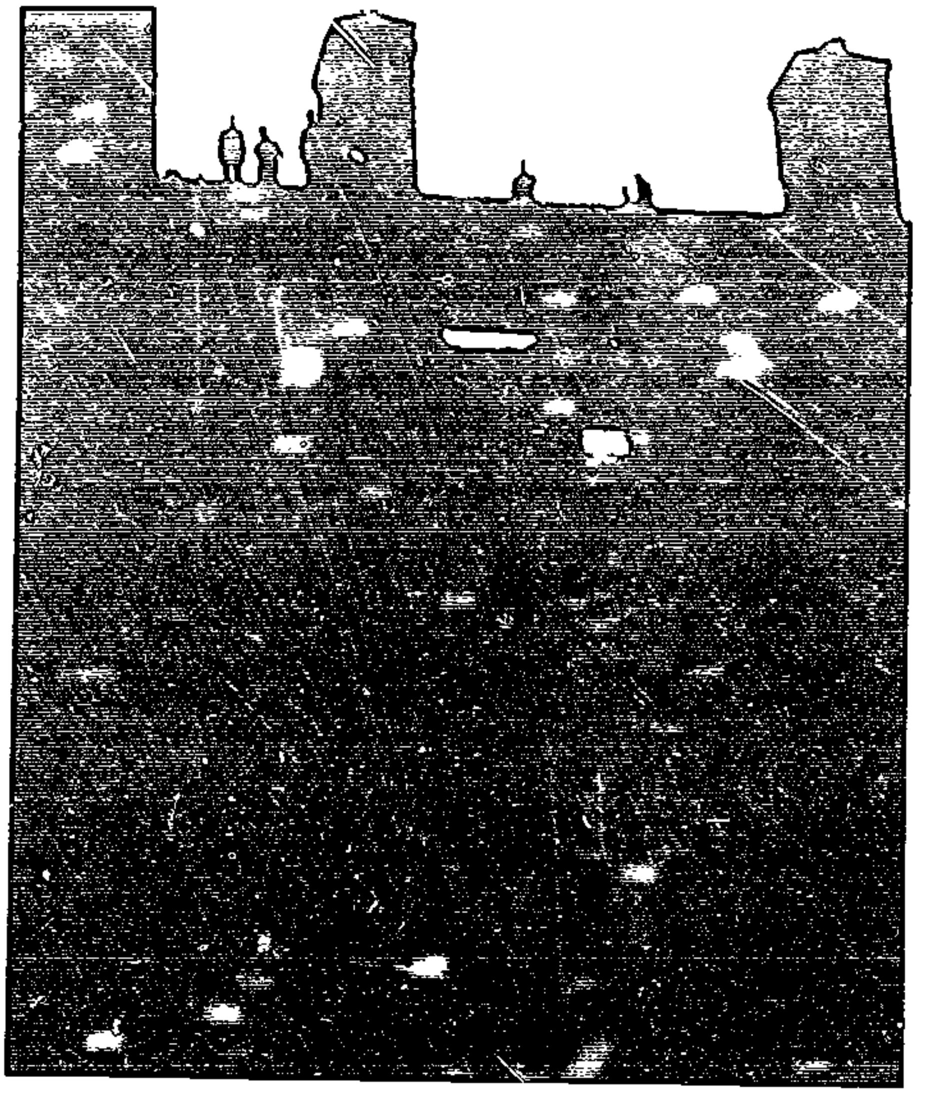

Chart 43. "Too many cooks?"

Chart Discussion: TOO MANY COOKS? This picture was taken as preparations were being made to pull down a stack near these men. Observe how each man is trying to say how it should be done. This can often cause confusion, and, in turn, often cause an accident. The point is: One man should be in charge; he should make the decisions, and only his directions should be followed. Other workers should be required to stay out of the area.

HOUSEKEEPING	Safety is efficiency. The neater the piling and the cleaner the operation, the faster and more efficiently the work progresses.

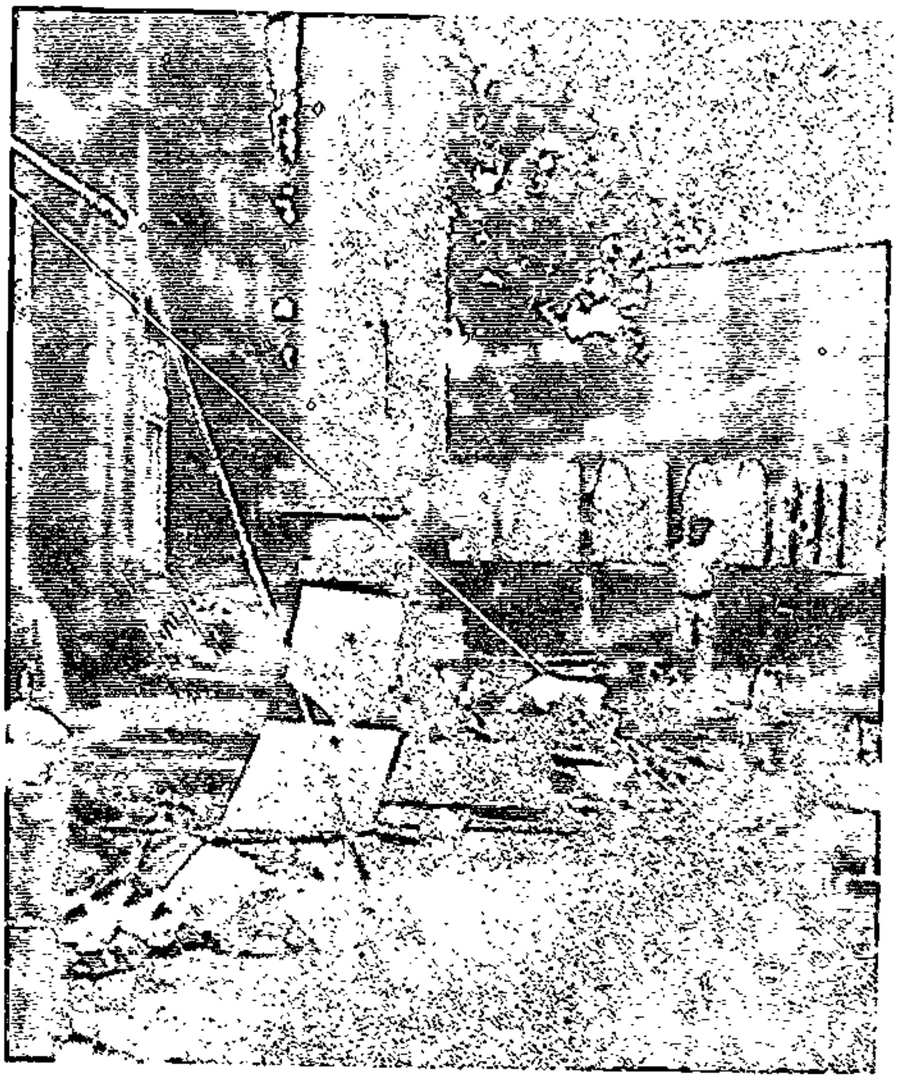

Chart 44. Housekeeping.

Chart Discussion: **HOUSEKEEPING.** Here is an example of poor housekeeping which sets up an obstacle course for the performance of the work, also conditions which could produce accidents.

Chart 45. Water and lunch facilities.

Chart Discussion: WATER AND LUNCH FACILITIES. This is hardly an example of how to promote worker morale. Such a drinking water facility can only give the impression of having been grudgingly provided. The lack of a better place has caused one worker to place his lunch on top of the water can. We wonder where the other fellows put their lunches.

PERSONAL FACILITIES	**Workers should be provided with good drinking and washing facilities, as well as toilet and other necessary personal facilities.**

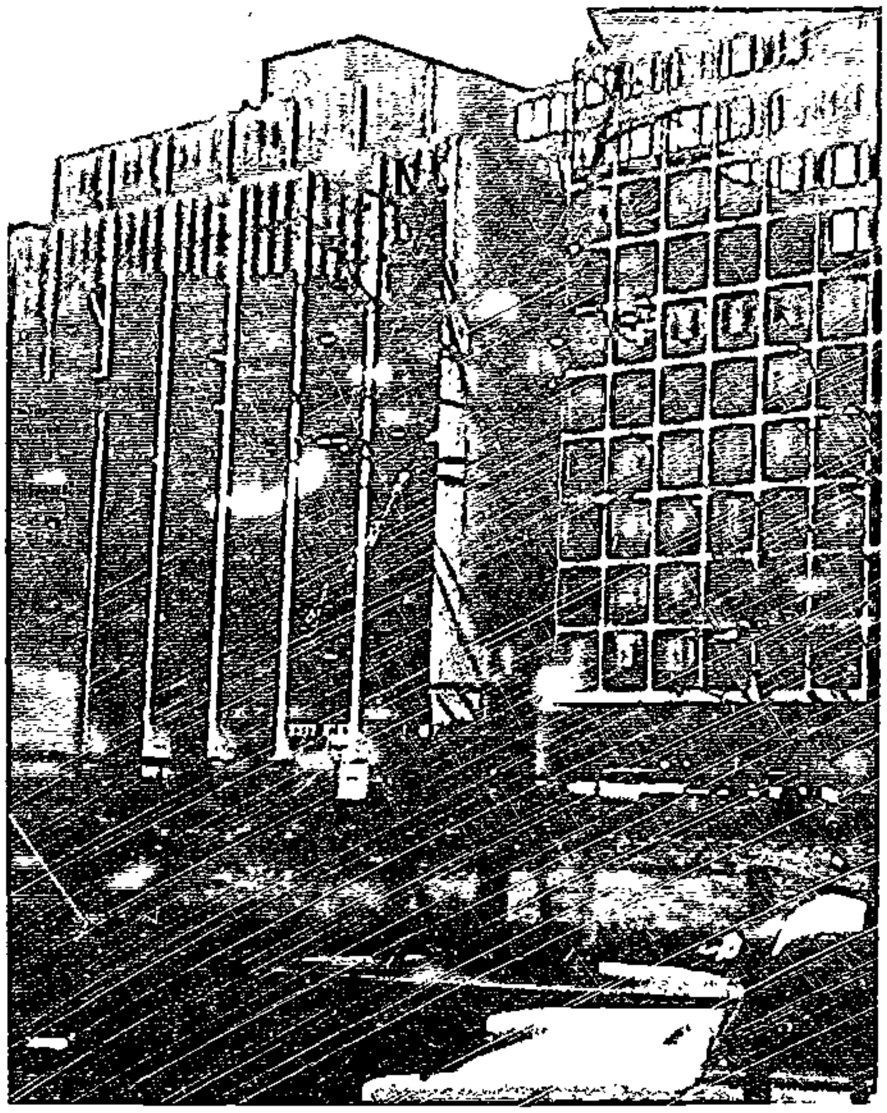

Chart 46. The final result.

Chart Discussion: THE FINAL RESULT. Here, we see a tract from which the building has been razed. The land is level, clear, free of holes, dry, clean, fenced, and posted. This situation and condition will not present any undue hazards to the public, which might produce a liability claim.

THE FINAL RESULT	When the job has been completed, the land should be clear, clean, dry, level (usually), fenced (when necessary) and left in a completely safe condition.
SUMMARY	At this point, we will make a comparison between the working conditions and practices which were highlighted from a negative standpoint at the beginning of this discussion and these conditions and practices from an affirmative standpoint as they were brought out during the discussion.

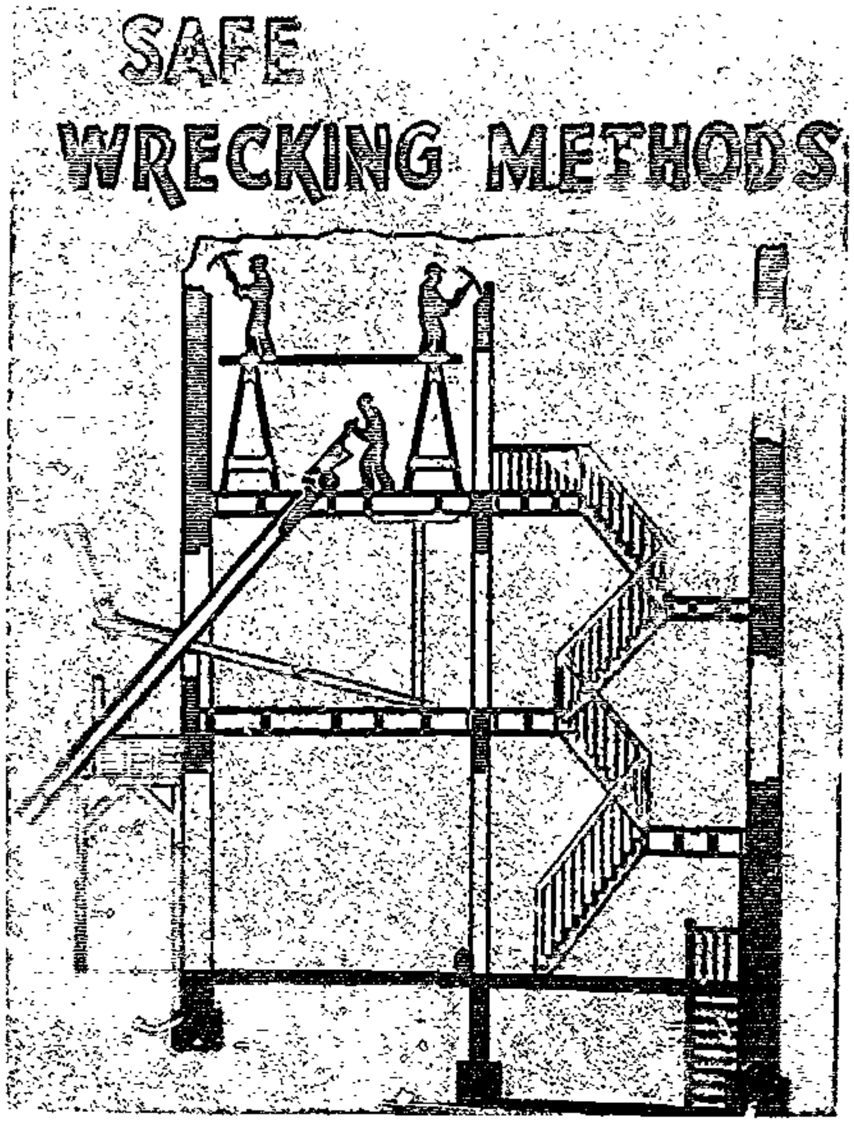

Chart 47. Safe working methods.

Chart Discussion: SAFE WORKING METHODS. INSTRUCTOR: At this time, make the comparison with the unsafe work methods as illustrated by the chart of that title. Show and discuss, in summary, how it "should be done"—the wall removal, scaffolding, chute, sidewalk shed, stairs, and all other points illustrated.

Safety Inspection Procedures. (Safety in Industry, Instructor Outline).

Otto, Francis L.
Bureau of Labor Standards, Washington, D.C.
Bull-286
Pub Date - 67
DOCUMENT NOT AVAILABLE FROM EDRS 49p.

*SAFETY INSPECTION, *SAFETY, *INDUSTRY, *CURRCULUM GUIDES, *INDUSTRIAL EDUCATION,

The basic purposes of safety inspection are to detect potential accident causes so that they may be corrected and to prevent an accident from occurring. Safety inspection procedures are illustrated by charts in this instructor's outline which provides a guide to standard presentation of the course in sequence and basic content. Additional information, materials, and illustrations should be included. Content includes (1) purpose of inspection, (2) inspection methods, (3) who inspects, (4) what guides, charts, and other aids the inspector should have, (5) what the inspector should look for, (6) reporting and recording procedures, (7) examples of what to check in a safety inspection, and (8) a plant inspection check sheet. The outline was developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards. This document is available as GPO L16.3--286 for 35 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

safety inspection procedures

U EPARTMENT OF LABOR
W lard Wirtz, Secretary
B OF LABOR STANDARDS
N n M. Bertz, Director

This instructor outline is one of a series developed by staff of the Office of Occupational Safety and the International Division, Bureau of Labor Standards.

The outline is intended only as a guide to standard presentation of the subject in sequence and basic content. Additional information, material, and illustrations should be included for a complete presentation suitable to the conditions, locality, industry, or occupational group.

This outline was revised in the Office of Occupational Safety by Francis L. Otto.

NOTE: American Standards Association name was changed to United States of America Standards Institute (USASI) August 1966. All American Standards now known as USA Standards (USAS).

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.
2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.
3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.
4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.
2. Good ventilation, lighting, and sufficient room are important aspects to consider.
3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.
4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating, and having students demonstrate under the supervision of the instructor. Students acquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

   A. Some may be more mature.

   B. Some may have a knowledge of safety.

   C. Some may have actual experience to draw on in the discussion.

   D. Some may have a faster learning speed than others.

E. Some may be "stallers" who can slow down the discussion.
F. Others may be aggressive and want to monopolize the discussion.
G. There may be a "know-it-all" in the group who must be properly controlled.
H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:
   A. Telling—this means giving background information to introduce a subject.
   B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.
   C. Illustrating—using charts, blackboard, slide, or films are very helpful to highlight specific points in the discussion.
   D. Discussion conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.
   E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.
   F. Questions—during the session, the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

It is necessary that the instructor be granted full responsibility for conduct of the class; at times, however, he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course; he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined; he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training, and not to replace even part of this course which should be taught by *one instructor*.

SAFETY INSPECTION PROCEDURES

Safety Inspection Procedures

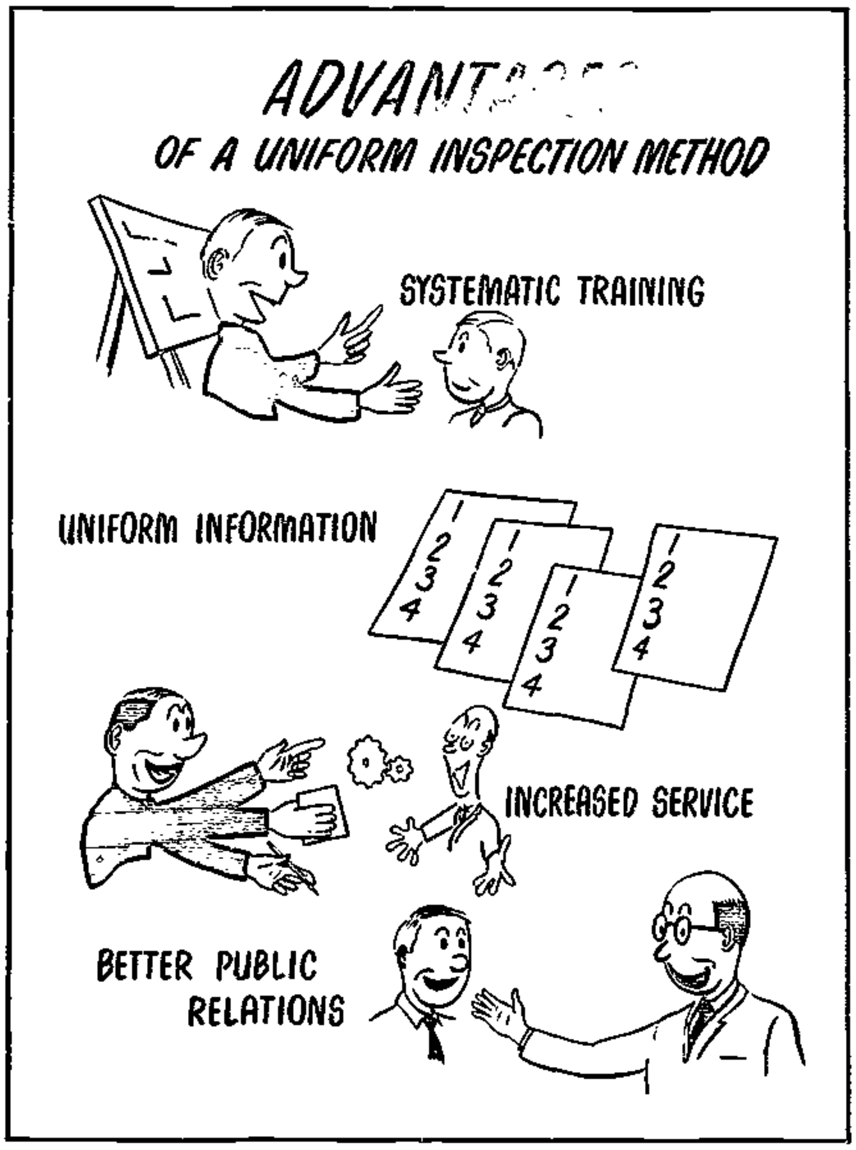

CHART 11—SERIES B

SAFETY INSPECTIONS

INSPECTIONS ARE A NECESSARY ACTIVITY IN A SAFETY PROGRAM

Every industrial plant and each occupational function or operation harbors some existing or potential hazards which arise through normal working or production procedures and through changes due to deletion or introduction of machines, materials, processes or methods, or structural changes due to construction. This points up the need for an effective method of hazard appraisal through inspections.

PURPOSE OF INSPECTION	
TO DETECT ACCIDENT CAUSES	The basic purpose of inspection is to *detect* potential accident causes so they may be corrected and to *prevent* an accident from occurring. Through inspection it is possible to determine those deficiencies which need to be corrected or improved to bring the plant or operation up to at least minimum accepted standards both from a safety and operational standpoint.
SYSTEMATIC PROTECTION	Methodical and well-performed safety inspections, done periodically, are an unequalled medium for determining accident-prevention needs. A definite, planned system is as necessary for safety inspection as for any other procedure.
UNIFORM INFORMATION	The use of standard or specially developed forms and procedures results in uniform information for use in checking against previous inspections or inspections of other area plants, jobs, or companies. With uniform information, repeatedly finding the same unsafe condition will be recognized and further necessary action can be taken.
CORRECTIVE ACTION	The practical value of inspection comes through corrective action being accomplished as soon as possible. The extent of hazard indicated for each item reported must be weighed to determine if immediate action is required or if some delay is necessary to obtain materials, etc. It is possible that temporary corrective action may be substituted until final action can be taken.
INCREASED EFFICIENCY	Good safety inspections often produce safer as well as more efficient methods. Methodically, uniformly planned and conducted safety inspections may be examples of efficient operations.
INSPECTIONS EXPRESS A TRUE INTEREST IN SAFETY	Coupled with effective action as a result of recommendations, safety inspection is one of the best methods by which management can demonstrate its sincerity regarding accident prevention.
OTHER SPECIFIC RESULTS ARE ACHIEVABLE	Other benefits which are shared by both management and the workers as a result of safety inspections include increased efficiency and better public and employee relations.

BETTER PUBLIC AND EMPLOYEE RELATIONS	Safety and efficiency always bring their own reward in better personnel and public relations. Employees usually prefer working in a safe plant, and the reputation of a company is usually judged by reports of accidents and injuries. Astute management which encourages or requires safety inspections realizes that good will and morale values can be obtained in no other way.
SAFETY TRAINING FOR EMPLOYEES	Safety inspections can be valuable in pointing out areas, operations, or methods which require emphasis in supervisor or employee training.

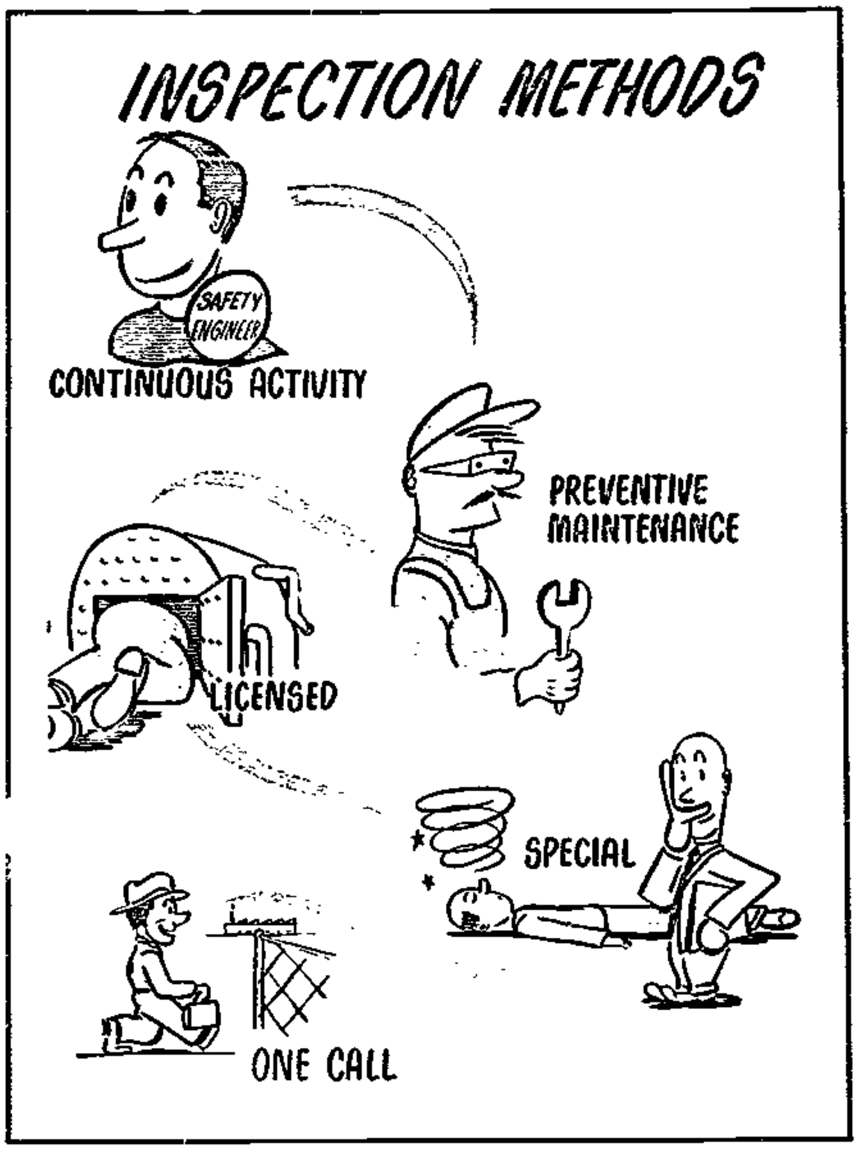

CHART 12—SERIES B

INSPECTION METHODS	
CLASSES OF SURVEYS	There are two fundamental classes of surveys: (1) those made or requested by the organization surveyed or some segment thereof as a function of an internal safety effort; and (2) those made by an "outside" agency or organization. These two classes are composed of five basic types. They are as follows:
CONTINUOUS ACTIVITY SURVEYS	These are regular periodic surveys made by safety engineers, safety directors, or their staffs. It includes safety committee surveys also, when such committees include weekly or monthly inspections in their activities. The advantages of this method include: a regular, planned program of inspection designed to cover all areas and subjects; familiarity by the staff and safety committee inspectors with the operations and procedures; early detection of changes in operations or equipment; followup of recommendations.

PREVENTIVE MAINTENANCE SURVEYS	These cover scheduled or continuing surveys by designated plant personnel, such as electricians, mechanics, and maintenance men. They include both safety surveys and those performed for mechanical functioning, lubrications, etc. Progressive plants schedule surveys at regular intervals, keyed to maintenance records of machinery and other equipment. Thus, potential machine, power, or other failures are sought out before they happen, thereby preventing damage, breakdowns, and injury-producing accidents.
LICENSED SURVEYS	These represent surveys made by specially trained certified or licensed inspectors, usually not part of the organization being inspected. Boiler, elevator, and electrical surveys are illustrations of this type. These surveys, and the tests which are usually a part of them, are very exacting and are made at specified times and intervals.
SPECIAL SURVEYS	These surveys are made for special purposes, usually at the request of management, employee groups, or unions. In some cases, they are made by a political subdivision, such as a State or municipality, and are sometimes required by law. Such surveys may be made to investigate a serious fire, explosion, or a serious accident. Many lost-time accidents (in some States, any accident involving machinery or any type permanent disability) and all deaths by accident may be subject to a special survey.
ONE-CALL SURVEYS	These surveys are made according to a predetermined schedule by "outside" inspectors; for example, State agency surveys. This type is generally performed on an annual or semiannual basis, since the usually small safety staffs and large coverage make it impossible for State, insurance, and similar engineers to do so more often. This method is termed "one-call" because there is seldom a personal followup on recommendations or orders issued, this being done by mail, if at all.

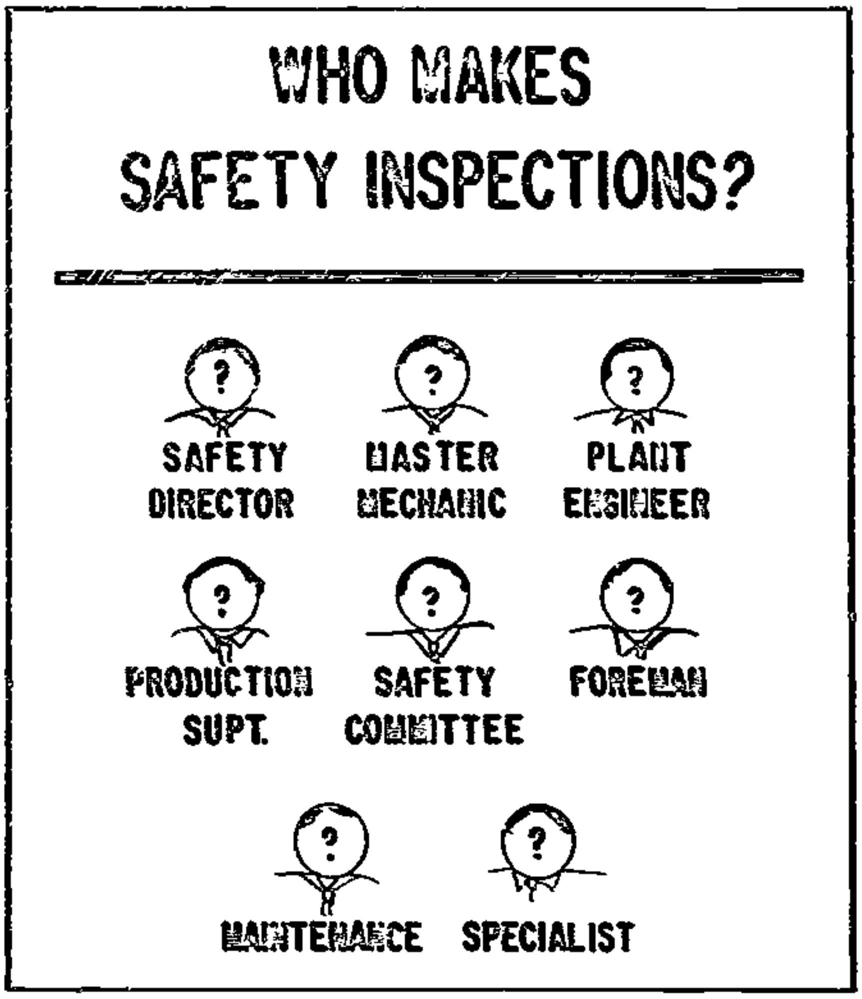

CHART 13—SERIES B

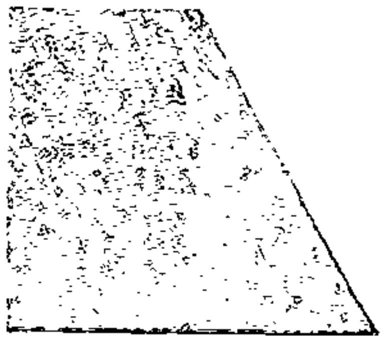
INTERNAL PLANT INSPECTIONS	
WHO SHOULD MAKE SAFETY INSPECTIONS?	**There are several possibilities: the safety engineer, the supervisor, the safety committee, a specialist in the operation affected, or somone from the boss' office.**

WHO INSPECTS

SUPERVISOR



Constantly **Daily**

Hourly

CHART 14—SERIES B

WHO INSPECTS—SUPERVISOR

Part of the answer to "Who inspects?" is based upon the fact that, in most cases, there should be more than one type of safety inspection.

Depending upon the size of plant, type, or circumstances involved in each case, safety inspections by several persons might be necessary.

The supervisor should be making a constant safety inspection as he makes his rounds—always alert to changing conditions or work methods. In some types of work (especially special or unusual work for his men), he may need to make *hourly* checks and inspections to be certain that all safety precautions are being taken. In some cases, the supervisor is instructed to make a *daily* inspection at the beginning of the shift to be sure there are no existing unsafe condtiions.

WHO INSPECTS

SAFETY COMMITTEE

Monthly Bi-monthly

CHART 15—SERIES B

WHO INSPECTS—SAFETY COMMITTEE	Inspections by the members of a safety committee may reveal hazards which might be overlooked by persons less familiar with the work. Also, inspections serve as a training medium by providing an opportunity for thinking and concentratng on safety as a group. By actually seeing conditions and work methods, members of the committee can conduct more intelligent and knowledgeable discussions in their meetings. Depending upon the size and complications of the operation, installation, or plant, varying schedules may be established. Some committees make inspections each month; others inspect every other month, holding meetings only once a month.
MORE THAN ONE PERSON	In almost all cases (a very small plant might be an exception), more than one person should make the safety inspections. Although the safety director should have charge of regular, functional-type safety inspections, inspections may be done under the direction of either the master mechanic, plant engineer, production superintendent, or other similar functionary. The important point is that such inspections should be under the direction of a responsible executive who can and will give the supervision necessary to assure effectiveness to prevent these inspections from becoming meaningless, perfunctory, routine gestures and functions.

THEY ALL SHARE THE DUTY

As the needs of an organization dictate, circumstances, times, and situations may arise when the safety director or one of his staff should make safety inspections.

So, too, recurring occasions may arise when safety inspections should be made by other persons or groups: management representatives, supervisors, committees or their members, "specialists," or maintenance personnel.

This is not meant to favor one of these in lieu of any of the others. For example, the "safety man's" regular inspections could be supplemented by regular inspections of the safety committee.

No individual or group should have exclusive responsibility for safety inspections.

CAN THE "NEW BROOM SWEEP CLEANER"?

In some organizations, when inspections are made by the safety committee, which is composed of workers or supervisors, the individuals involved inspect each other's areas of operation.

It has been found that in many situations, the "stranger" notes unsafe conditions or acts which the persons familiar with the operation have been missing, and therefore are likely to miss again when inspecting for safety.

WHAT SHOULD THE "INSPECTOR" KNOW OR LEARN?

Whatever position the person making the safety inspection has — a worker, supervisor, insurance engineer, State inspector—he should possess a good working knowledge of the machines, processes, functions, needs, problems, etc., of the plant, area, or operation which he plans to inspect, as well as a sound knowledge of basic accident causes.

SOMETIMES, SPECIAL KNOWLEDGE IS REQUIRED

In some special circumstances, he should be an expert; for example, in a special industrial hygiene inspection and in comparable situations, a high degree of technical and specialized training, background, or ability is required. In *this* topic under discussion, however, we are not covering such situations.

HOW CAN THE "NON-PROFESSIONAL" PREPARE HIMSELF?

Where the need exists, before attempting a safety inspection, an individual should acquire and digest all pertinent information available on the type operations which he proposes to survey.

He should review and acquaint himself with the details of these functions, generally and specifically and in relation to each other.

Other supplementary information also is often applicable, depending on the circumstances, such as data on accidents which have occurred, review of previous safety inspection reports, specific regulations which may be required, and standards which may be applicable.

WHAT "MAKES" A SAFETY INSPECTOR?

1. Expertise?
2. Ability?
3. Experience?
4. Capacity for ideas?
5. Self-analysis?

CHART 16—SERIES B

WHAT KNOWLEDGE IS NECESSARY TO QUALIFY AS A "SAFETY INSPECTOR"?	"Knowledge" should encompass at least a reasonable acquaintanceship with the various aspects of the operations which an individual is to inspect and an understanding of the hazards or other problems affecting safety which they represent.
EXPERTISE	An old adage refers to "not seeing the forest for the trees." In some cases, this has been applied to safety inspection in the sense that sometimes being too completely familiar with an operation or area can cloud a person's ability to discern even obvious hazards.

	There are certain techniques in making a safety inspection which are learned by *doing*. The more times a person makes inspections, the more expert he becomes in concentrating on looking for and recognizing unsafe conditions. The more knowledge the inspector has of the specific types of hazards that may exist in the operation he is inspecting, the closer he comes to being an expert in this activity.
ABILITY	Some people have a greater ability to see, perceive, and recognize potential accident causes—because of their basic safety interest, perceptiveness, and curiosity. Such natural ability can be improved through experience.
EXPERIENCE	Some persons assigned the responsibility for making safety inspections have never done so before and therefore have no experience. Lack of experience may be somewhat compensated for by studying and learning the basic accident causes and by reviewing previous inspection reports. If committee members are rotated, it is important that their rotation be staggered so that some persons with experience are always retained.
CAPACITY FOR IDEAS	It has been said that "accident prevention is mostly common sense." The knowledge that the inspector should have—particularly the nonprofessional—would therefore not necessarily include the ability to *solve* accident prevention problems, especially from a technical standpoint, but it is very advantageous if he "gets ideas" easily. What he needs most of all is the ability to *recognize hazards* or conditions and acts which represent potential hazards.
SELF-ANALYSIS	Good intentions and a desire to help, even when combined with common sense referred to previously, are not usually enough to qualify a person to inspect for safety. Therefore, to be truly effective, the conscientious inspector should critically analyze his own qualifications to inspect for safety.

WHO INSPECTS

SAFETY ENGINEER

Daily Weekly
Monthly Special

CHART 17—SERIES B

WHO INSPECTS—SAFETY ENGINEER	Where an organization has a safety engineer, safety director, or whatever his title might be, part of his responsibility is conducting safety inspections. He determines the frequency of his inspections depending upon the other factors involved. If there are great variations in conditions, such as a construction project, he may devote a part of each day to safety inspection. Distance between jobs or plants or other considerations may require that his inspections be made weekly or monthly. New construction, installations, or changes in processes or materials being used may require that he make special, unscheduled inspections to make certain that safety requirements are met in making the changes and in preparation for putting the new equipment or process into operation.

WHO INSPECTS

STATE SAFETY
REPRESENTATIVE

Annually

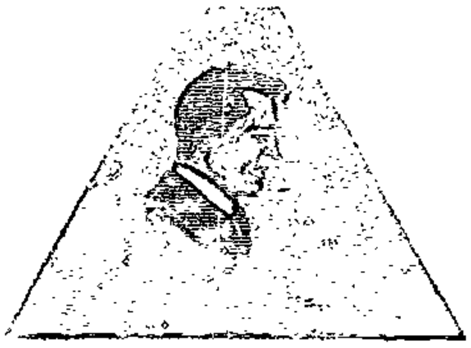
CHART 18—SERIES B

WHO INSPECTS—STATE SAFETY REPRESENTATIVE	Most States have a safety inspection staff in the Department of Labor, the Industrial Commission, or some other agency responsible for labor law administration. The extent of authority depends upon the specific State law and the type of promotion or enforcement prescribed. The small number of State safety representatives, compared with the number of establishments, generally allows only one inspection per year—often without any additional followup.

WHO INSPECTS

Federal Government

(WHPC – USDL)
(LSB– USDL)



By Contact

By Job

By Loadinq

CHART 19—SERIES B

WHO INSPECTS—FEDERAL GOVERNMENT

The Federal Government's responsibility for industrial safety inspections rests primarily on two Bureaus of the Department of Labor. The safety activity of the Wage and Hour and Public Contracts Divisions generally is confined to manufacturing firms with Government contracts of $10,000 and over. Safety standards established by WHPC are used as a basis for such inspections. In some States, these inspections are conducted by the State safety representatives.

The Longshoremen's and Harbor Workers' Compensation Act gives authority to the Bureau of Labor Standards to inspect longshoring, ship repairs, and shipbreaking activities.

WHO INSPECTS

INSURANCE COMPANY
SAFETY ENGINEER

According to Policy
Agreement

CHART 20—SERIES B

WHO INSPECTS— INSURANCE COMPANY SAFETY ENGINEER	**Workmen's compensation insurance companies often assign safety engineers to inspect the premises to detect unsafe conditions and submit recommendations. While there seems to be no standard, the amount of the premium usually is used to determine the extent of this service. Probably the greatest influence for making corrections is obtained by threatening to cancel the policy.**

WHAT AIDS ARE NEEDED?

1. Plans
2. Guides
3. Forms
4. Incidental Equipment
5. Technical Materials
6. Incentives

CHART 21—SERIES B

WHAT GUIDES, CHARTS, AND OTHER AIDS SHOULD INSPECTOR HAVE?	This is an important part of the preparation for a safety inspection. Good preparation is essential for good inspection.
LAYOUT AND MACHINERY	In many cases, a layout of the area to be inspected is helpful or even essential. A chart or listing of machinery, equipment, etc., helps considerably. All items in this general category should be considered or as the need may indicate.
FORMS	There are several types of forms available which can be applied to most safety inspections. A form adapted to meet local conditions and patterned to fit the particular aspects involved in the inspection to be made is even better.

	The form used may be filled out during inspection or completed afterwards from notes made. But, whatever the techniques, the use of forms is an integral part of good safety inspection. (Discussed later on.)
INSPECTION GUIDES	Such aids as checklists and similar inspection guides should be used to help guarantee a thorough inspection, thus minimizing the possibility of something being overlooked or forgotten.
INCIDENTAL EQUIPMENT	The inspector should take along incidental necessities, such as a hard hat, goggles, flashlight, tape measure, pencil, and any other basic accessories needed to make an efficient inspection.
ROUTING THE INSPECTION	Although there is no standard sequence for the most productive safety inspection, it is best to follow a process or operation from the beginning —*from* the raw material, step by step through to the finished product. This would be true in most production operations, chemical and manufacturing plants, etc. But in custom operations or in an area making a product by different methods, the layout may lend itself to unit-by-unit or a nonrouted method, rather than the step-by-step method of safety inspection. Usually, inspection in sequence is easier, saves time, and is more efficient; also, needs are recognized more readily. Then, too, there is less chance of missing something even though the safety inspector may feel that he is familiar with the operation.
SOME DO'S AND DONT'S	Make necessary notes, but don't be "obvious"; the fewer, the better. Avoid "showiness" in recording information. Don't disturb workers. As you make your inspection, do so without disrupting operations. Avoid conversation with workers, except with supervisor's approval. Do not "lecture"; do not argue. Inspect all areas. Check thoroughly, open doors, don't be "steered away" from any area whether isolated or not. (Exception: where security clearance is required but inspector has not been cleared.) Seek out the reasons why any adverse condition exists. Discuss the inspection with supervisors if they wish to, but don't get into an argument with them.

RECOMMENDATIONS

The safety inspector should organize his notes and decide upon necessary recommendations, listing each recommendation's definite location in the area inspected.

Recommendations should have a good basis in logic, be well worded, and take into account as much as possible the viewpoints of the people they affect.

He should be prepared to substantiate his opinions with standards, codes, or accepted practice and should not "load" the recommendation list with any of questionable importance.

WHAT SHOULD YOU LOOK FOR?

1. General Conditions
2. Specific Hazards
3. Work Practices

CHART 22—SERIES B

WHAT SHOULD THE SAFETY INSPECTOR LOOK FOR?	There are three basic categories in a safety inspection: general conditions, specific operations, and work practices.
GENERAL CONDITIONS	General conditions would include lighting, housekeeping, ventilation, and similar matters.
SPECIFIC HAZARDS	Specific hazards category would include tools, machines, equipment, materials, etc.
WORK PRACTICES	The work practices category is an appraisal of methods and the manner in which methods are implemented.

Pass out "Student Work Sheet," entitled "Thirty-five Items To Consider for a Safety Inspection," then discuss each of the items, pointing out that the list is illustrative and intended as a guide. Encourage class discussion.

HOW TO GET RESULTS

1. Reporting
2. Recording
3. Application

CHART 23—SERIES B

WHAT REPORTING AND RECORDING PROCEDURES SHOULD BE USED?	Reports and records should be as simple as possible. Cumbersome elaboration of any good, basic system will not necessarily make it work better nor will it produce a more effective result.

FORMS

Forms are a valuable adjunct to safety inspection if they are comprehensive and well prepared. The checklist and similar type forms have a tendency, of course, to limit the breadth of the inspection. On the other hand, completely narrative-type reporting usually is verbose, cumbersome, incoherent, and difficult to understand.

Inspection and reporting forms are therefore usually more effective when they combine the better features of both the checklist and narrative type which produce a quick and easy method of reporting, but also allows narrative description when necessary.

RECORDING AND HANDLING PROCEDURES

Recording and the procedural aspects of safety inspections, the recommendations made as a consequence, and the further activity resulting also are areas where brevity and efficiency combined with proper and established procedures and thoroughness will produce meaningful results.

APPLYING THESE PRINCIPLES

In this discussion, the foregoing comments on reporting and procedures are, of necessity, quite general. No exact rules or ideas can apply in all instances.

The main point here is that in each case, based upon the circumstances involved, a standard procedure *should* be set up to cover the type of reporting to be used and the method by which recommendations will be handled, recorded, filed, classified, and followed up, and all other material and functional details which are produced by safety inspections.

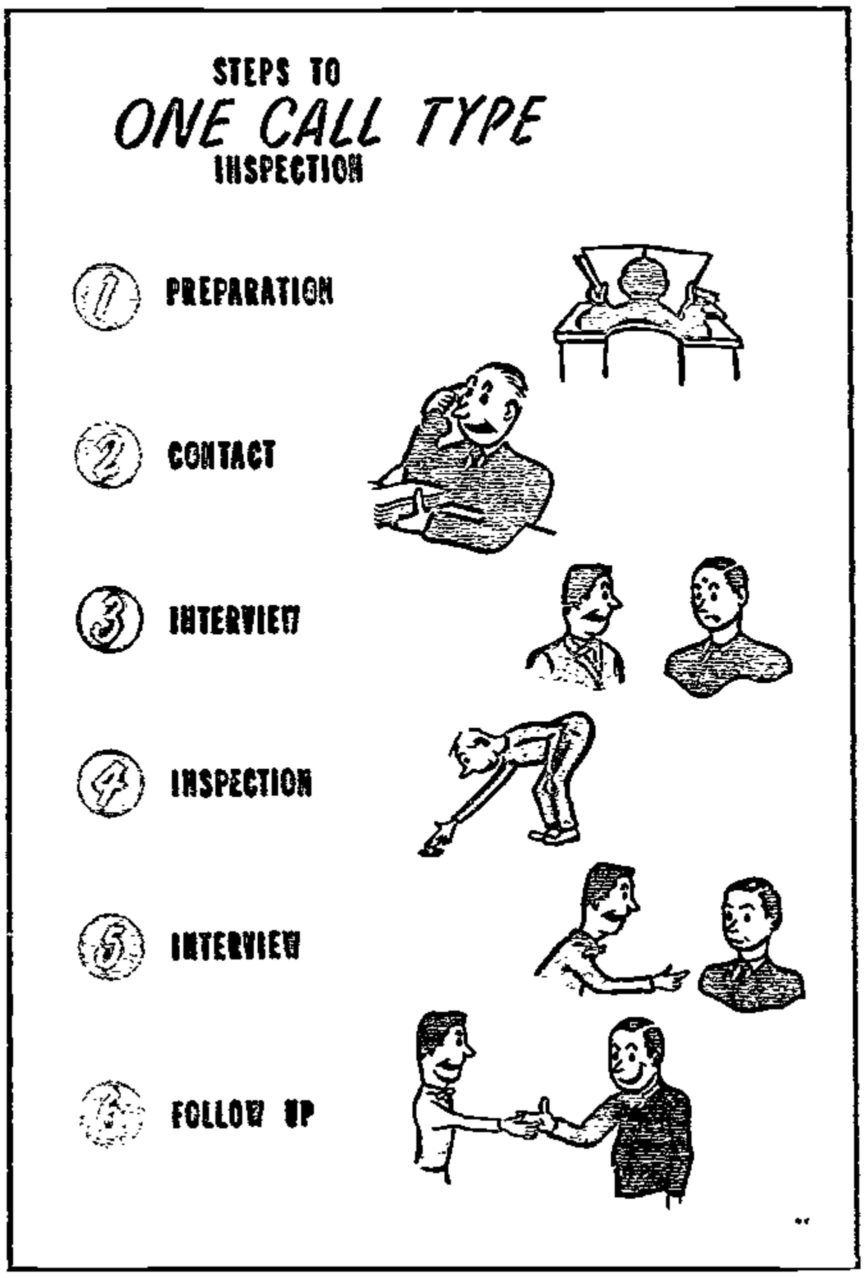


CHART 24—SERIES B

INSPECTION PROCEDURES	A worthwhile, productive, and valuable inspection must be a complete and well-planned operation. The following discussion on this subject relates primarily to the situation as it affects the representatve of a State agency, casualty company, etc., but much of the material, particularly that on the actual survey and the preparation for it, is important to the inplant survey operation as well.
PREPARATION HAS MANY SEGMENTS	Advance planning is an absolute essential for a worthwhile safety survey. The following steps must be given careful consideration and be thoroughly planned, when applicable:
REVIEW THE CIRCUMSTANCES IN GENERAL	Digest all pertinent information available on the industry and the type of operations involved, both generally and specifically, and in relation to each other. Acquire, develop, and study injury-frequency and severity rates and information on past accidents for both the industry concerned and the plant to be surveyed.

ANALYZE THE HAZARDS	Study published material on typical hazards of the industry and the plant or operation to be surveyed. If available, procure and study other surveys previously made by insurance, State, consultative, or other agencies or individuals.
APPRAISE YOURSELF	Is this an unusual situation, so far as your capabilities and experience is concerned? Are you fully qualified to handle this matter alone or should you arrange for assistance or collaboration?
DELIBERATE UPON LEGAL ASPECTS	Give consideration to what laws, codes, regulations, standards, and other required or established data may be applied. National, State, or local laws or codes and standards, such as ASA, NFPA, etc., may have appreciable bearing upon the decisions you will have to make in your survey.
THE TIMING ELEMENT	For obvious reasons, surveys should not be attempted when a plant is not operating in reasonably normal fashion, such as during slack operation, changeovers, or when, for any reason, a distorted or misleading picture might result. Exceptions to this would be a need for a survey under unusual circumstances. In some cases, planning the time of the survey would include consideration of personal expediency for either the person making the survey or for those in the plant. But, if a "surprise" type of survey is in order, the best time should be determined in advance. Under some conditions, timing can be important, and in all cases, it should be given due thought.
PERSONAL INFORMATION	Some personal information about persons with whom one must deal is helpful, particularly if some "selling" of safety becomes necessary. In any case, pertinent information on backgrounds, attitudes, and past actions and responses in such circumstances will be helpful.
INCIDENTAL PROCEDURES	Should a letter be directed to the plant, asking for an appointment, or should a notice of intent to survey be sent? Who will the surveyor contact in the organization or plant to be surveyed? Is coordination with any other persons or circumstances necessary? Are there any other special or unusual aspects which should be planned for in advance?
DEVELOP A PLAN	To the extent possible and based upon one's information of the plant, a plan or route for the survey should be developed, having definite objectives; a determination should be made of the areas, buildings, and operations which are to be covered and the order in which they should be studied. This would also apply to the order in which particular functions, such as repair, housekeeping, or maintenance will be surveyed, or whether they will be considered as parts of the operations they affect. Also to be decided are sequences of given operations.

	The objective of advance planning is usually a logical step-by-step sequence from the first step to the last, whether it is an entire plant or one particular operation to be surveyed. Advanced consideration should be given to special machinery, functions, or other aspects included. In general, the scope and specifics of the survey should be defined in advance as much as possible.
"SALES" IDEAS AND MATERIALS ARE NEEDED	Whether or not any safety improvements will actually be made on the basis of the inspection depends on how well the inspector is able to sell his ideas. He should therefore assemble materials that will support his recommendations.
TECHNICAL OR OTHER SAFETY MATERIALS	Inspectors should acquire booklets, posters, drawings, and plans of the areas, and other materials to present to plant or operations management for either use or distribution, or to use to complete explanation of recommendations.
FORMS ARE USUALLY NEEDED	There are several types of forms which might be used in an inspection or as a result of it—those for compiling data or for reporting purposes; usually State, insurance, and other similar groups have these. When such forms are not available, the surveyor should anticipate his needs and procure them in advance.
CONTACT	The State inspector's first contact may be preceded by a letter or notice. In any event, he should see top management first, present identification, clarify visit's purpose, maintain proper decorum, and make his original contact only with "the boss"—president, manager, etc.—but not with the line supervisor or staff.
PREINSPECTION INTERVIEW	The purpose of the preinspection interview is to provide an opportunity for the State, Government, or insurance inspector to discuss with top management the objectives and procedures for the inspection and to make arrangements for persons to accompany the inspector, etc. This is an excellent opportunity to establish good relationships, promote a safety program, and to reach a mutual understanding of purposes, procedures, and expected results. It is important that the interview be with the top official of the plant or installation.
THE INSPECTION "ROUTE" OR ORDER OF INSPECTION	It is not possible to outline any order of survey steps which will fit all situations. Whether the safety program records, when applicable (and a study of these as well as the plant can be very important), or the operations themselves should be surveyed first depends upon a number of factors. If the person making the inspection is not familiar with the departments and processes in a given plant, or if he wishes to determine plant safety needs before inspecting records, it may be more expedient to survey the operations first. If he is sufficiently familiar with the

	establishment and its procedures to be certain that the records are authentic, he can take this into consideration in making this conclusion. However, if there is a possibility that evidence of violations, needs, or other pertinent information might be concealed, it might be better to review the records first. Some agencies require their men to vary inspection procedures so that management will not know what the procedure will be.
WHAT TO LOOK FOR	To accomplish the objectives of checking general conditions, specific hazards, and work practices, the scope of your inspection would include:
RECEIVING, SHIPPING, STORAGE	Equipment, job planning, layout, methods. Piling and stacking—safe heights, floor loads, projecting materials, methods.
MATERIALS HANDLING	Inplant transportation—hand trucks, power trucks, push trucks, gantrys, overhead materials handling—monorails, hoists, bridge cranes.
BUILDING CONDITIONS, PLANT LAYOUT, HOUSEKEEPING	Floors, walls, exits, stairs, walkways, ramps, ceilings, building and operations locations, flow of materials equipment location aisles, special fixtures, storage. Waste disposal, tool cleanliness, leakage and spillage, general and immediate work areas, methods.
ELECTRICAL EQUIPMENT LIGHTING	Electrical—switches, breakers, fuses, junctions, motors, grounding, explosion-proof equipment. Lighting—modern, permanent, bright enough, well diffused, no glare, approved installation, independently controlled, not in the way, supplementary lighting.
VENTILATION	Temperature and ventilation—warm enough, cool enough, humidity, good artificial or natural ventilation. Dusts, fumes, gases—individual and general exhaust systems capacities, types, storage or disposition of contaminants.
COLOR CONDITIONING	Color—painted walls, floors, ceilings, machines, objects, equipment, piping, color coding.
MACHINERY	Point of operation, flywheels, gears, shafts, pulleys, keyways, belting, couplings, sprockets, chains, frame, methods of attachment, general condition, operating controls, electrical grounding, lighting, incidental tools and equipment, brakes, exhausting, oiling and adjusting, speeds, operating authority.
EMPLOYEES	Experienced; trained; clean, oil and adjust machinery safely; wear safe clothes and shoes; use protective equipment; use guards; use feeding devices; check machine before starting; store tools and equipment safely; lift safety. Check age, class, type, sex of employees.

MOTION AND FATIGUE	Repetitive motion and fatigue—muscular strain, pads and cushions, chairs and stools.
MANUAL LIFTING	Proper grip, safe footing, back straight, knees bent, gets help, carries slowly, steady motion. Objects not too heavy, slippery, poorly shaped, bulky.
PERSONAL EQUIPMENT	Protective clothing and equipment—shoes, gloves, eye protection, respirators, caps, coats, spats, aprons. Close fit or easy-to-remove clothes, maintenance. Psychological aspects.
FALLS—CAUSES	Floors, steps, ramps, slopes, platforms, different levels.
FLYING OBJECTS	Consider size and range from dust to kickbacks. Materials, flying machine parts, wheels, etc.
MAINTENANCE	Regular, effective, trained and specialized personnel, good materials and parts, safe methods.
FIRE PREVENTION	Fire prevention and control—extinguishers, exits, assigned personnel, safe conditions, proper storage, dangerous operations separated, fire doors and walls, flammable materials, explosion-proof fixtures.
WELDING	Cylinders, hoses, valves, torches, regulators, isolation, protection, actinic rays.
TOOLS	Handtools and power tools—purchase, inspection, storage, repair, maintenance, transport, safe use, proper type, proper size, special tools, grounding.
PRESURE VESSELS	Experienced operators, regular inspection, maintenance and repair, safety device equipped, safely located or protected.
FACILITIES	Employee facilities—roomy, clean, well lighted, screened, ventilated, painted.
LIFTING DEVICES	Conveyors, elevators, and other lifting devices—enclosed shafts, machinery protected, no unauthorized use, regular inspection, good maintenance.
DANGEROUS SUBSTANCES	Chemicals, explosives, and other dangerous substances—storage, handling, transportation, protective clothing and equipment, supervision, training, amounts, warning signs.
NOISE	Isolation, ear protection, baffles.
SAFETY PROGRAM	Present safety activities—safety engineer, safety committees, meetings, training, accident reporting, investigations, accident records, job safety analyses, cost charging system, responsibilities, job hazard analyses.

SUMMARY

The foregoing list is not a complete one; it is intended only as a guide to which the student will add as circumstances dictate to make up a thorough survey.

PERSONAL CONDUCT

The inspector's conduct should be exemplary at all times, particularly if he has legal authority. He should never assume that management is unwilling to obey the law or is indifferent to the safety of its employees. Employers are rarely consciously inhuman. The overwhelming majority of accidents are due to the lack of safety-mindedness either of management or workers and in no way justifies an attitude of condemnation on the part of the inspector. He is there to determine conditions and secure improvement where it is needed; it is his job to arouse management's interest in safety. He is there as a service to the workers, the employer, and the public.

Only if an employer consistently refuses to cooperate should force be used; however, a competent and experienced inspector rarely needs to use force.

POST-SURVEY INTERVIEW

This, too, is an important part of the work. Agreement must be reached on the results of, and the needs for, action disclosed by the inspection.

PREPARATION FOR THE INTERVIEW

Organize notes and decide upon necessary orders or recommendations, giving each of them a definite location in the plant for easy reference. Work the presentation carefully, taking into account the viewpoints of management and labor, the justification for any higher-than-normal expenditures, and sales points which may be used. Orders and recommendations should be written in order of importance, and the inspector should be prepared to substantiate all recommendations or orders.

SOME HINTS TO CONVINCE

This is the point at which the ability to give clear, concise, and reasonable explanations and descriptions—and to convince (sell) management of the importance and necessity for making the corrections or additions—will determine to an appreciable degree just how much good will come of this effort. A few rules of good salesmanship apply here: (1) be neat in dress and appearance; (2) have ability to sell one's self—have winning personality; (3) observe good human relations practices; (4) know your product; (5) observe the principles of the agency or organization you may represent; and (6) generate acceptance and enthusiasm.

THE ACTUAL DISCUSSION

Open with a compliment; think of something appropriate that you can remark upon. Tailor your recommendations to fit the particular needs of this plant or installation to the greatest degree possible, making sure you present them in a reasonable and well-organized fashion. Try to "tie in" any recommendations, orders, or plans you suggest with any safety activities presently existing in the plant. Be constructive, remembering that your approach should be clear, certain, and definite. Don't over-elaborate—be as brief as is commensurate with comprehensive coverage of your subject. Press for definite conclusions and get agreement. Arrange schedule for any revisit or other followup.

ISSUANCE OF ORDERS

Since the issuance of orders, as in the case of State agency inspectors, often presents a different situation than what occurs as a result of a normal "survey," particularly a voluntary one, a few words on this category are in order. The procedure for giving safety orders to the employer for compliance with the law will vary with the policy of each individual State labor department. Some departments require that all such orders be given by the head of the department by letter, based on information provided by the written report of the inspector. In this case, the inspector usually explains the regulations to the employer, pointing out any variance between the practice in the plant and the requirements of the law and writes and returns to his superior officer a complete and accurate report of his findings.

ORDERS BY INSPECTOR TO EMPLOYER

Where the policy of the department permits the inspector to give the orders to an employer, it is generally agreed that they should be given in writing to the plant executive, after verbal discussion and explanation. Securing the employer's signature is required by some States on the theory that the department thereby establishes a record of the fact that the conditions cited were known to the employer on a specific date and that he understood that he was responsible for making certain changes to comply with the law. Written orders should be at least in duplicate—a copy for the employer, one for the department, and perhaps a third copy for the inspector.

INSPECTOR TO DISCUSS ORDERS WITH EMPLOYER

In either of the foregoing cases, the inspector should discuss with the employer practical means of making the changes legally required, since the ultimate value of the inspector's work lies in the extent to which he is able to promote the employer's desire and interest to comply with the orders.

FOLLOWUP

Rarely does a safety inspection produce a complete result in and of itself; more often, it establishes what should be done. In most cases, therefore, further action, assistance, subsequent surveys, rechecking, or attention of some sort is necessary.

Followup is most practical on internal inspections where the persons making the original inspection are readily available to see if corrections have been made or if the changes or additions are satisfactory. This is a most important part of the inspection procedure which, in many cases, is not practical or possible where State, insurance company, or other inspection staffs are overworked or have too few inspectors.

While followup may be made by telephone or letter, the most productive and satisfactory method is the personal visit, at which time the inspector may give his approval and have the opportunity for further discussion and safety promotion.

SAFETY INSPECTION IN A NUTSHELL

1. What is to be inspected?
2. How often?
3. Who will inspect?
4. Who will supervise?
5. Reports and records?
6. Corrective action?

CHART 25—SERIES B

SUMMARY	Many details are involved in a good safety inspection procedure, but the points requiring full consideration and development in an effective system which will produce meaningful results are quite simple; namely— What is to be inspected? How often is each thing, process, or area to be inspected? Who is to do the inspecting, and what procedures are to be used? Who will supervise inspection activities and how? What reports and records will be needed, and how will they be handled? What provisions must be made for taking corrective action? Sincere and diligent safety inspection efforts made as a result and part of a good inspection system and which are based upon the foregoing principles can only produce a valuable and fulfilling result.

Hand out occupational safety aids, "Inspecting for Safety," "Plant Inspection Check Sheet," and "A Ladder and Stairway Inspection Sheet."

OCCUPATIONAL SAFETY AID

INSPECTING FOR SAFETY

Safety inspections are a necessary segment of a complete safety program. They are essential to maintaining acceptable standards of safety for physical facilities and working practices. Conditions are constantly changing. Materials are moved, stockpiles are depleted, waste materials accumulate, and many other changes occur daily or even by the hour. If machinery is involved, changes occur as a result of use, wear, or abuse. In offices and similar places of employment, there are changes in layout, additions of equipment, and wear and tear of such items as floors, rugs, and equipment.

Safety inspections are a means of surveying and appraising the problems of unsafe conditions and work practices which result from these changes. Safety inspections provide for:

DETECTION

--seeking out the unsafe work methods and conditions.

ANALYSIS

--determining why the unsafe methods or conditions exist.

CORRECTION

--elimination of the unsafe methods or conditions.

UNITED STATES DEPARTMENT OF LABOR
BUREAU OF LABOR STANDARDS
Washington, D. C. 20210

TYPES OF INSPECTIONS

CONTINUOUS ACTIVITY - These are the "day-to-day" inspections made by safety directors, safety engineers, or their staffs. Inspection activities of safety committees are included.

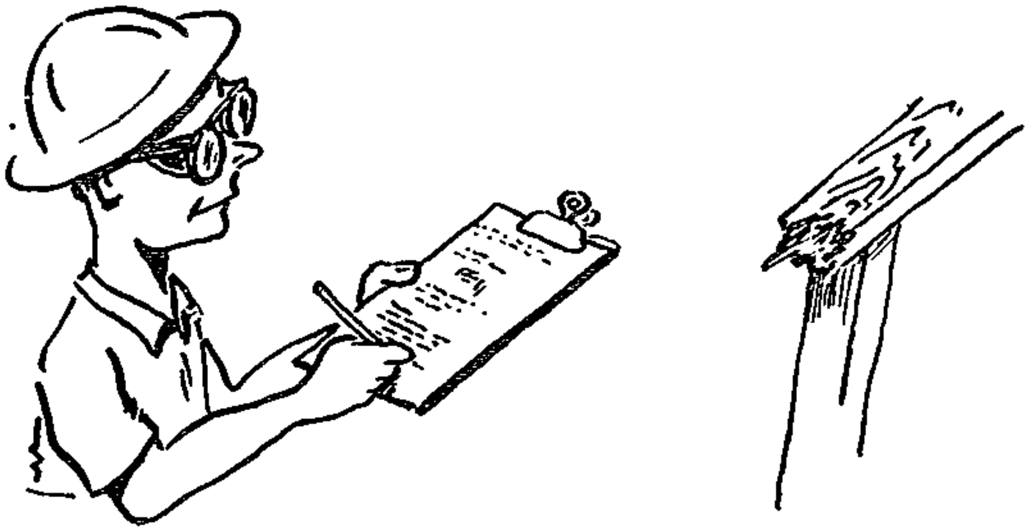
PREVENTIVE MAINTENANCE - Scheduled or continuing inspections by designated plant personnel such as electricians, mechanics, maintenance men and similar personnel. This includes inspections for safety as well as for mechanical functioning, damage, lubrication, and wear and tear.

LICENSED - Inspections made by certified and/or licensed inspectors, usually not employees of the organization being inspected. Boiler, elevator, and electrical inspectors conduct this type of inspection.

SPECIAL INSPECTIONS - Inspections made for special purposes; usually upon request of management, governmental officials, employee groups, or unions.

ONE-CALL - These are inspections made according to a predetermined schedule by "outside" inspectors, usually annually or semi-annually. An example would be State agency inspections.

STEPS IN A SAFETY INSPECTION



PREPARATION - **PLAN** - Prepare for your inspection beforehand by planning the procedures to be followed.
REVIEW - Check available records on past history of area to be inspected.
STUDY - Obtain and review information on hazards of operations to be inspected.
OUTLINE - Prepare list of specific items to check.
PROCURE - Acquire booklets, posters, or other materials to be distributed.

EQUIPMENT - **NOTEBOOK**, pencil, hard hat, flashlight, goggles, tape measure.

PLAN ROUTE - **HAVE DEFINITE OBJECTIVE** - Determine areas, buildings, operations, or other objectives such as housekeeping, machine guarding.
FOLLOW SEQUENCE - Observe operations by starting from first process, and following through in sequence.

INSPECTION PATTERN - **GENERAL CONDITIONS** - Lighting, work areas, buildings, chemicals, and materials.
SPECIFIC HAZARDS - Tools, machines, equipment.
WORK PRACTICES - The human element; how work is done.

SOME INSPECTION TIPS

MAKE NOTES But don't be obvious. Avoid "showiness" in recording information.

DON'T DISTURB As you make your tour, do so without disrupting operations.

AVOID CONVERSATION Don't stop and speak to the workers, except with the supervisor's permission.

INSPECT ALL AREAS Don't miss anything; even those areas "where no one ever goes." Don't be steered away from anything.

BE CONSTRUCTIVE Your approach should be clear and certain. Remember, you are performing an affirmative function.

SEEK REASONS Look for "why" adverse conditions exist; but think in terms of corrective action only.

ADVISE SUPERVISORS Give the benefit of your thinking to the supervisors you contact. Answer their questions, discuss items with them if they wish. (But, don't get into arguments, or time-consuming and disrupting discussion—a good inspector doesn't get involved in arguments.)

PREPARE RECOMMENDATIONS Be prepared to discuss recommendations with supervisor and top management. Have good reference notes. Make sure your ideas are reasonable and well organized. Use "selling" approach to convince of the needs you have observed.

EXAMPLES OF WHAT TO CHECK IN A SAFETY INSPECTION - This list does not cover *all* conditions. It is intended as a guide.

RECEIVING, SHIPPING, STORAGE - Equipment, job planning, layout, heights, floor loads, projection of materials, material-handling methods

BUILDING CONDITIONS - Floors, walls, ceilings, exits, stairs, walkways, ramps, platforms, driveways, aisles

HOUSEKEEPING - Waste disposal, tools, objects, materials, leakage and spillage, methods, schedules, work areas, remote areas, windows, ledges

ELECTRICITY - Equipment, switches, breakers, fuses, switchboards, junctions, special fixtures, circuits, insulation, extensions, tools, motors, grounding, code compliance

LIGHTING - Type, intensity, controls, condition, diffusion, location, glare and shadow control, standards applied

HEATING AND VENTILATION - Type, effectiveness, temperature, humidity, controls, natural and artificial ventilation and exhausting

MACHINES - Points of operation, flywheels, gears, shafts, pulleys, key ways, belts, couplings, sprockets, chains, frames, controls, lighting, tools and equipment, brakes, exhausting, feeding, oiling, adjusting, maintenance, grounding, how attached, work space, location

PERSONNEL - Training, experience, methods of checking machines before use, methods of cleaning, oiling, or adjusting machinery, type clothing, personal protective equipment, use of guards, tool storage, work practices

HAND AND POWER TOOLS - Purchasing standards, inspection, storage, repair, types, maintenance, grounding, use and handling

CHEMICALS - Storage, handling, transportation, amounts used, warning signs, supervision, training, protective clothing and equipment

FIRE PREVENTION - Extinguishers, alarms, sprinklers, smoking rules, exits, personnel assigned, separation of flammable materials and dangerous operations, explosion-proof fixtures, waste disposal

MAINTENANCE - Regularity, effectiveness, training of personnel, materials and equipment used, method of locking out machinery, general methods

PERSONAL PROTECTION - Type, size, maintenance, repair, storage, assignment of responsibility, purchasing methods, standards observed, rules of use, method of assignment

BUREAU OF LABOR STANDARDS

STUDENT WORK SHEET

U.S. DEPARTMENT OF LABOR SAFETY TRAINING PROGRAMS

SWS LS-128 OOS 11.64

PLANT INSPECTION CHECK SHEET

Metal Working Machines	Woodworking Machines
1. Engine and turret lathes	1. Swing cut-off saws
2. Milling machines	2. Table saws
3. Planers	3. Planers
4. Drill presses	4. Jointers
5. Grinding wheels	5. Band saws

I. Items of inspection to check on each machine:

		YES	NO
Point of Operation	a. Is there a point-of-operation guard provided for this machine?		
	b. Does it keep operator's fingers and hands out of the hazard zone?		
	c. Is there any evidence to show that protective devices are being removed?		
	d. Could you design or suggest a more practical, workable guard?		
	e. Could changes be made on the machine which would remove the point-of-operation hazard and increase the work efficiency?		
Power Transmission	f. Are there any exposed gears, sprockets, pulleys, or flywheels?		
	g. Are there any belt or chain drives exposed?		
	h. Are the starting and stopping devices within easy reach?		
	i. If there is more than one operator, are separate controls provided?		
	j. Are there any exposed set screws, key ways, collars, etc.?		

2. Other specific conditions relating to machines

		YES	NO
Guards	a. Do the guards provided meet the minimum State or ASA standards?		
	b. Would you suggest a change in the existing guard structure?		
	c. Can oiling be done without removing the guards?		
	d. Is there a system for shutting down machinery when guards are removed?		
General	e. Is there a chip hopper or exhaust system to take up scrap?		
	f. Is the flooring about the machine clear, free of holes, dry, etc.?		
	g. Is space provided for new or completed work?		

NOTES

3. Items to check in connection with machine operations

		YES	NO
Personal Hazards	a. Is there a possible strain due to faulty "handling" operations?		
	b. Does the operator have to reach over, through, or under dangerous equipment or objects?		
	c. Is there any danger of the operator starting the machine by accidentally pushing, pulling, dropping materials, or stepping on the operating mechanism?		
	d. Does the work of this machine endanger the operator on front, back, or at either side of this area?		
	e. Is seat provided for operator and does it have proper adjustment?		
	f. Where audible signals are used, can they be heard at this machine?		
	g. Is there any danger of this operator being pushed, shoved, or struck by passing trucks, material, or workers?		
Protective Equipment	h. Is this operator dressed for the job, i.e., short sleeves, tight clothing, absence of ties or finger rings, etc.?		
	i. Is this operator provided with protective clothing where needed, i.e., goggles, gloves, safety shoes, etc.?		

NOTE: From the answers, formulate, in narrative style, your recommendations (continue notes on page 4).

NOTES

STUDENT WORK SHEET

U. S. DEPARTMENT OF LABOR SAFETY TRAINING PROGRAMS

SWS LS-113 OOS 11.64

A LADDER AND STAIRWAY INSPECTION SHEET

Work sheet is to assist in locating and analyzing specific defects and condition of ladders, stairways and scaffolds. Also serves as an aid in making specific recommendations.

Plant:	Department:		
COLUMNS ARE LISTED FOR BRIEF NOTES ON CONDITIONS FOUND DURING INSPECTION			
I. TYPES OF LADDERS BEING USED:	YES	NO	REMARKS What they are used for
Fixed			
Portable Straight			
Extension			
Sectional			
Trestle or "A" Frame			
Step			
Trolley			
Slide-rolling			
Other			

2. DEFECTS IN LADDER	Type Ladder	Location or ladder number	REMARKS condition and recommendation
a. Non-uniform rung spaces?			
b. Too wide or too narrow?			
c. Inadequate clearances?			
d. Handholds lacking?			
e. Cages needed?			
f. Defective condition noted?			
g. Inadequate locking devices?			
h. Safety feet not used?			

3. MAINTENANCE	YES	NO	REMARKS condition and recommendation
a. Are ladders painted?			
b. Inspected regularly?			
c. Marked for identification?			
d. Stored properly?			

NOTES:

4. DEFECTS IN STAIRWAYS to and from area being inspected	YES	NO	REMARKS condition and recommendation
a. Non-uniform riser heights?			
b. Non-uniform tread widths?			
c. Worn or slippery steps?			
d. Nosing missing?			
e. Treads too narrow?			
f. Risers too high?			
g. Stairway too steep?			
h. Insufficient railing?			
i. Railing design correct?			
j. Stairway too long?			
k. Stairway too narrow?			
l. Other			

Note: Stairway lighting is treated later under the subject "Illumination."

Summarize your notes above for each subject or condition noted and write the recommendation in the space provided below as you would present it to management.

1. LADDER DEFECTS NOTED:

2. MAINTENANCE SUGGESTIONS:

3. RECOMMENDATIONS FOR STAIRWAY:

SAFETY TRAINING TECHNIQUES

It is of utmost importance that the instructor become acquainted with some of the basic training techniques in order to better prepare himself to conduct the course successfully.

Planning

1. The instructor should have such visual aids as are pertinent to the subject matter of the course. These should be set up in proper sequence. An indication or note on the instructor's outline could be very helpful as a guide that a particular visual aid should be used.

2. The course outline as well as the handout material and the visual aids should be checked at regular intervals. This should be done by the instructor in order to revise, improve, and modernize the course presentation. The material should also be checked to make sure that it conforms with policies of labor and management in the country where it will be presented.

3. The instructor's outline should be adapted by him to his particular method of presentation, keeping in mind that this is a discussion conference type of session.

4. The instructor would do well to get an advance list of the students that will participate and their positions and backgrounds. A study of such information could be very helpful to the instructor when he faces his class.

Preparation of Classroom

Many conferences and courses have failed simply because no preparation was made for the classroom facilities.

1. The classroom should be located in an area where there is the least amount of noise or distraction.

2. Good ventilation, lighting, and sufficient room are important aspects to consider.

3. The seating arrangement and seats should be comfortable as well as informal. A round-table seating arrangement is the most effective for discussion-conference sessions.

4. The room should be equipped with a good blackboard, sufficient chalk, and a clean eraser. A stand should be available for mounting the charts and visual aids to be used during the conference. A 35-mm. slide projector should be available.

Teaching

1. An official of the organization should open the first session with a statement regarding the general objectives of the course. He then should introduce the instructor to give him the proper posture in relation to the group he will teach.

2. At the first session, the instructor should open with an explanation of the course objectives and its method of presentation. At this time, he should draw upon his experiences to relate an illustrative incident that will bring him in closer relationship with the group and, at the same time, enable him to introduce the theme of the first session.

3. The course should be presented by employing the discussion-conference method.

4. The instructor should have the class follow a predetermined schedule and maintain order at all times. Only one participant should be permitted to give his viewpoint at a time. The instructor should keep the class discussion within the subject matter as contained in the instructor's outline.

5. If possible, an official should be asked to speak at the termination of the course.

Tips for Instructors

Learning is actually the acquisition of new ideas, abilities, and skills acquired through the senses of hearing, seeing, and feeling by touch.

1. New ideas are conveyed through the presentation of knowledge, and thought is stimulated through the student's sense of hearing.

Abilities and skills are presented through the media of telling, demonstrating and having students demonstrate under the supervision of the instructor. Students aquire abilities and skills via the senses of hearing, seeing, and feeling by touch.

2. An important aspect of teaching is to remember that the student absorbs more when he participates in a discussion. The instructor therefore strives to get 100-percent class participation.

3. The instructor should become aware of outstanding characteristics of his students. This could be very helpful when leading discussions. For example:

A. Some may be more mature.
B. Some may have a knowledge of safety.
C. Some may have actual experience to draw on in the discussion.
D. Some may have a faster learning speed than others.

- E. Some may be "stallers" who can slow down the discussion.
- F. Others may be aggressive and want to monopolize the discussion.
- G. There may be a "know-it-all" in the group who must be properly controlled.
- H. Some may be constant latecomers who ask questions about previous discussions and delay the class.

4. The teaching process consists of:
   - A. Telling—this means giving background information to introduce a subject.
   - B. Showing—a demonstration of some equipment pertaining to the subject to be discussed is very impressive.
   - C. Illustrating—using charts, blackboard, slide, or films are very helfpul to highlight specific points in the discussion.
   - D. Discussion conference—the participation of the students in formulating their thinking about the subject under discussion is fundamental to getting the most out of the session.
   - E. Conclusions—the instructor's summation of the session should knit together the points discussed during the session, and should include other important details that may have been overlooked by the group.
   - F. Questions—during the session, the instructor should use questions to stimulate discussion, and also to help bring the discussion back to the subject matter if it has strayed.

Guest Instructors

It is necessary that the instructor be granted full responsibility for conduct of the class; at times, however, he may wish to call in an expert in a particular field as a guest instructor (or lecturer). In such event, it is essential that the instructor maintain control of the course.

The instructor must tie in the work of the guest instructor with the balance of the course; he must outline the phase of the subject to be covered by the guest and satisfy himself that the guest limits himself to the field as outlined; he should summarize the guest's contribution, pointing out its relative importance in the field of accident prevention. While the use of a few guest instructors (properly utilized) can add to the effectiveness of the course, a series of "lecturers" whose topics are not correlated will inevitably result in confusion.

It is recommended that "guest experts" be used only for *supplementary* training, and not to replace even part of this course which should be taught by *one instructor.*

PERSONAL PROTECTIVE EQUIPMENT

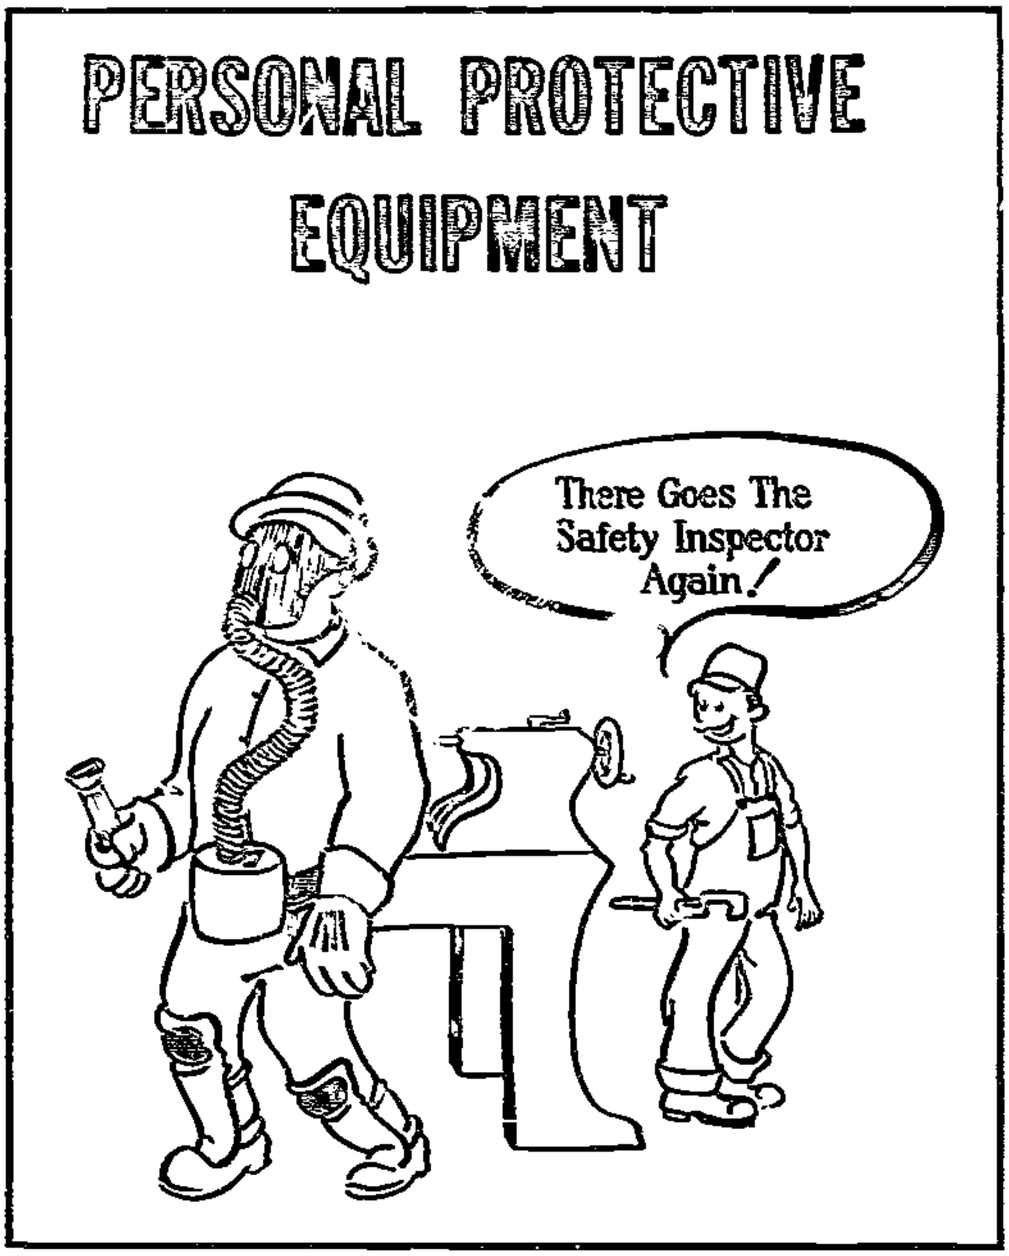

CHART 17—G

Check to see that visual aids and other course materials are in order and ready to use.

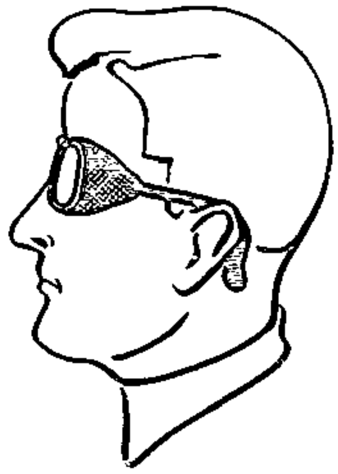
USE OF PERSONAL PROTECTIVE EQUIPMENT

Personal protective equipment should always be considered as the "last thin line of defense." Both the employer and the worker should realize that failure of the device or failure to use it exposes one immediately to the hazard in question.

FACTORS TO BE CONSIDERED	
NEED	There are three factors to be considered in regard to personal protective equipment. First, it is necessary to establish that a need exists.
SELECTION	Second is that of selection; to be considered is the degree of protection needed and provided and the facility of application. Will partial protection be sufficient, or is the exposure so extreme or long lasting as to require complete protection?
MAKE SURE WORKERS USE EQUIPMENT PROPERLY	Third is the problem of making sure that the workers wear personal protective equipment once it has been chosen. The following points should be considered as a means of solving this problem: 1. The extent to which the men who must wear the equipment understand its necessity. 2. The ease and comfort with which it can be worn and with minimum interference to normal work procedures. 3. The available economic, social, and disciplinary sanctions which can be used to influence the attitudes of the men.
AVAILABILITY	Much research, study, experimentation, and testing have been devoted to the development of effective personal protective equipment and devices. As a result, a great variety of excellent equipment to protect any part of the body is available commercially.

PERSONAL PROTECTIVE EQUIPMENT CLASSIFICATION	
FACE AND EYE PROTECTION	1. Spectacles and goggles. 2. Face shields. 3. Hoods. 4. Welding helmets.
HEAD PROTECTION	1. Protective hats. 2. Head protection. 3. Ear protection.
HAND, FOOT, AND LEG PROTECTION	1. Gloves and hand leathers. 2. Safety shoes. 3. Foot guards.

EYE PROTECTION



U.S.A. STATISTICS

1.	AVERAGE ANNUAL NUMBER OF EYE INJURIES	75,000
2.	PERSONS LOSING ONE OR BOTH EYES AT WORK	5,000
3.	AVERAGE ANNUAL COST OF EYE INJURIES	$80,000,000

CHART 18—G

EYE PROTECTION	The protection of eyes from damage or destruction by physical or chemical agents or by radiation has long been an important part of industrial accident prevention. Many thousands of disabling eye injuries occur annually, which indicate that eye protection is not used widely enough. The importance of protecting the eyes against flying objects resulted in the development of a method of hardening and mounting glass lenses which gives them substantial resistance to blows.
GOGGLE IMPACT TESTING	The severity of the specified test for these goggles is indicated by the fact that lenses for impact goggles in their mountings must withstand the blow from a steel ball seven-eighths of an inch in diameter dropped from a height of 50 inches. Protective goggles manufactured in accordance with currently accepted standards will protect the eye against a blow so severe that without goggles, the same blow would not only destroy the eye but would fracture the bone as well.

U.S.A. EYE INJURY STATISTICS	Every year about 5,000 persons lose one or both eyes in industrial accidents, and another 70,000 to 75,000 lose time from work because of injuries to their eyes while at work.
MONETARY LOSSES	The amount of money spent to acquire and fit eye protective devices is small when measured against the savings afforded by the protection given. For example, the purchase and fitting of a pair of impact resistant spectacles would cost from $2 to $10. Compensation costs for a lost eye may range from $1,600 to $10,000. While it is difficult to obtain reliable information concerning the actual cost due to industrial injuries to the eyes, it is safe to estimate it at a minimum of $80 million annually in the United States.
NO RECOGNIZED APPROVAL SERVICE	No nationally recognized testing or approval service, such as rendered by the Bureau of Mines for respiratory protective equipment, is available for eye and face protective equipment. Some, but not all, States require approval of such equipment through a State approval agency. The purchaser of equipment should, in all cases, be sure that the eye protectors meet the requirements of the American Standards Association Code.
AMERICAN STANDARD SAFETY CODE Z2.1–1959	The code classifies occupational eye hazards into eight categories and establishes minimum performance standards for the devices needed to protect against the hazards in each category.

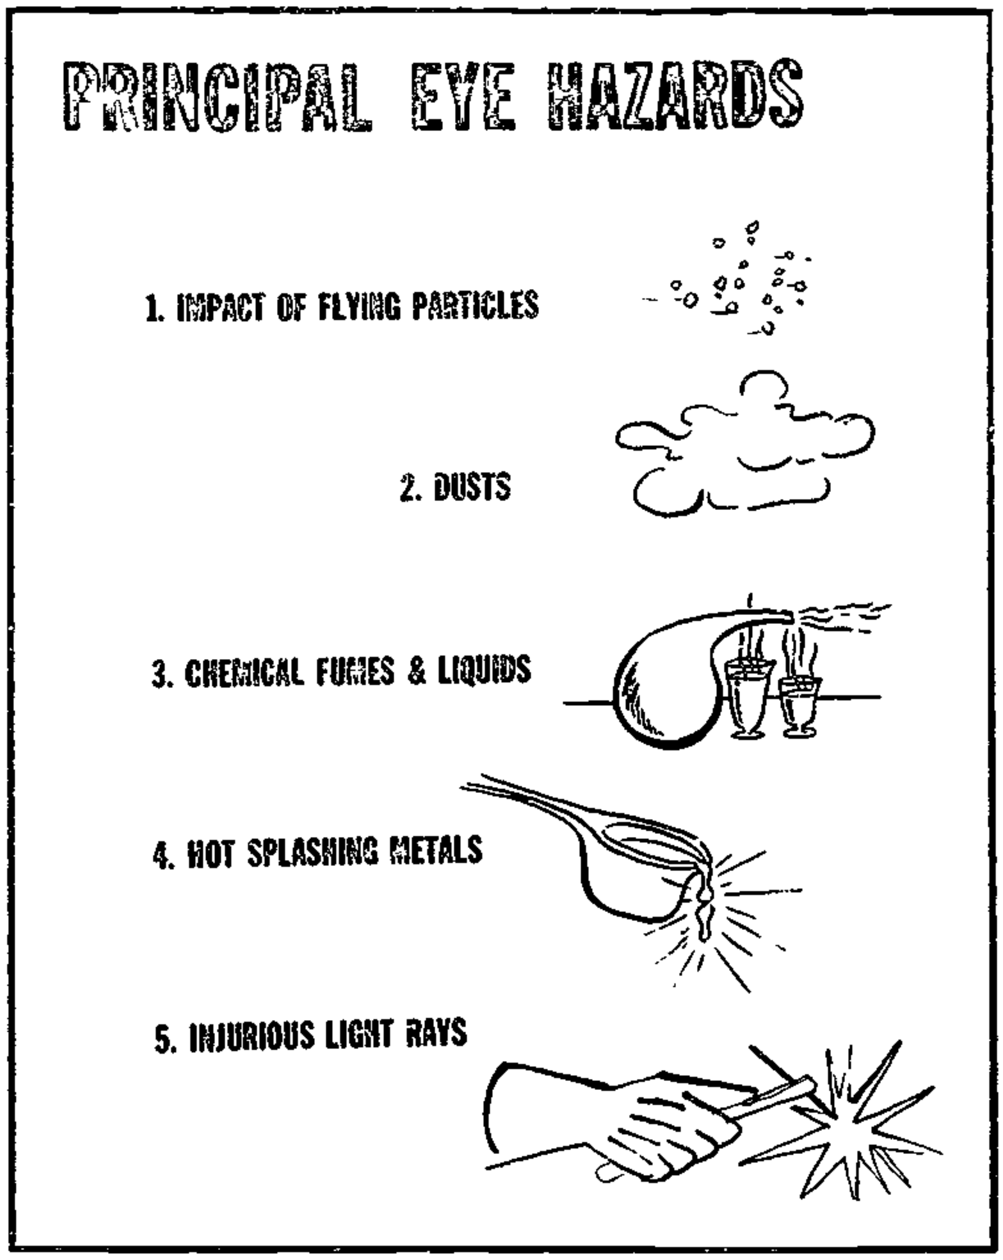


CHART 19—G

PRINCIPAL EYE HAZARDS	
FACTORS TO CONSIDER	The protection of eyes from damage or destruction by physical or chemical agents or by radiant energies should be an integral part of an industrial safety program. Eye protective devices must be considered as optical instruments; therefore, they should be carefully selected, fitted, and used. The devices should be selected for maximum effectiveness against the particular hazards anticipated.
IMPACT OF FLYING PARTICLES	Flying particles become a hazard on such jobs as chipping or finishing of iron and steel forgings and on jobs requiring the use of such tools as chisels, jackhammers, rock drills, sledges, hammers, and other impact tools, or on handling materials which may fly, as in cutting steel strapping.
PROTECTION NEEDED	Eye protection for this type of hazard should have impact-resistant lenses and side shields—lenses, lens containers, frames, and side shields should

	be of maximum comfort to the wearer. The frames should be light weight and not subject to rust or corrosion under sterilization. On those jobs where the particles may be fairly large, heavy-duty cup goggles with impact resistant lenses should be used.
DUSTS, WIND, AND METAL SPARKS	Dusts, wind, and metal sparks are hazards on such jobs as operating road building equipment, construction work, operating tractors and power shovels, electric spot and butt welding where there is no exposure to ultraviolet rays, scaling and grinding of metals, stone dressing, wood working, etc.
PROTECTION NEEDED	Eye protection for this type of hazard may be cover-all goggles of moderate strength that enclose the eye completely and have indirect port ventilation, face shields, or safety spectacles with impact-resistant lenses with or without side shields. Plastic lens eye protectors are particularly appropriate for butt and spot welding because of their resistance to damage by sparks.
CHEMICAL FUMES AND LIQUIDS	Chemical fumes and liquids are hazards on such jobs as handling volatile and corrosive chemicals, dipping in plating and pickling tanks, etc.
PROTECTION NEEDED	Eye protection for this type of hazard should be gasproof goggles with impact resistant lenses or rubber mask goggles with indirect, screened ventilation ports and wide vision impact resistant lenses. In severe conditions where chemicals are concentrated or where splash hazards are continuous, the goggles should be worn under face shields or acid hoods for greater protection.
HOT SPLASHING METALS	Hot splashing metals are a hazard on such jobs as casting, tinning, babbitting, pouring of lead joints, galvanizing, etc.
PROTECTION NEEDED	Eye protection for this type of hazard should be cup goggles with impact-resistant lenses capable of withstanding moderate blows, and with lens containers made to hold cracked lens in position (all materials should be nonflammable); metal screen face shields, or heavy plastic face shields with impact-resistant spectacles beneath.
INJURIOUS LIGHT RAYS	Light rays can be injurious on such jobs as torch brazing, welding, and cutting; irradiation with actinic rays; arc welding; hydrogen welding; lamp testing (exposure to excessive brightness); tending an electric Bessemer and other types of furnaces; crucible steel-making, etc.
PROTECTION NEEDED	Eye protection for this type of hazard should be carefully chosen to cope with the particular hazard or combination of hazards. For flame welding, brazing, or cutting, cup goggles with impact-resistant filter lenses and clear cover glass to save the welding lenses from pitting (with indirect screened ventilating ports to prevent fogging of lenses)

and to exclude injurious flashes, hot metal, and sparks are appropriate. For electric arc welding and other jobs (e.g., arc furnaces) involving heavy exposure to ultraviolet rays, it is important that the filter lenses protect from ultraviolet rays, as well as glare. Wearing an appropriate face shield over these goggles will protect the face as well as the eyes.

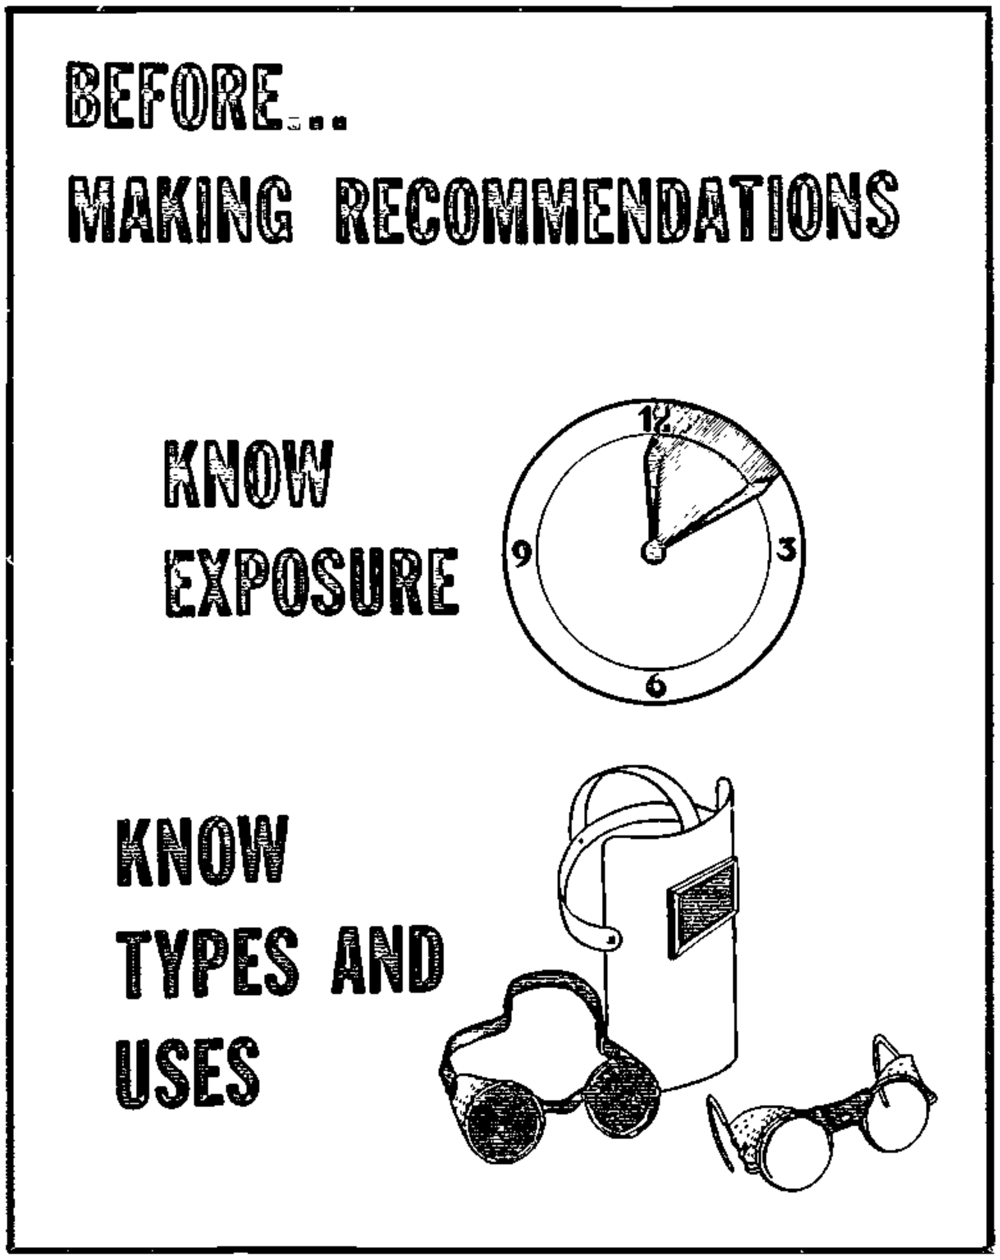

CHART 20—G

KNOW EXPOSURE	Before an inspector or safety director recommends an eye protection program, he should make a detailed study of the exposures to conditions hazardous to the eyes. He should list the eye protection requirements for each job.
KNOW TYPES AND USES	The inspector should know the various types of protective equipment and their proper uses and limitations and should know how to obtain maximum protection and comfort through the use of each for the exact purpose intended.
SPECIAL TESTS	All eye protectors should pass all American Standards Association standard test requirements.

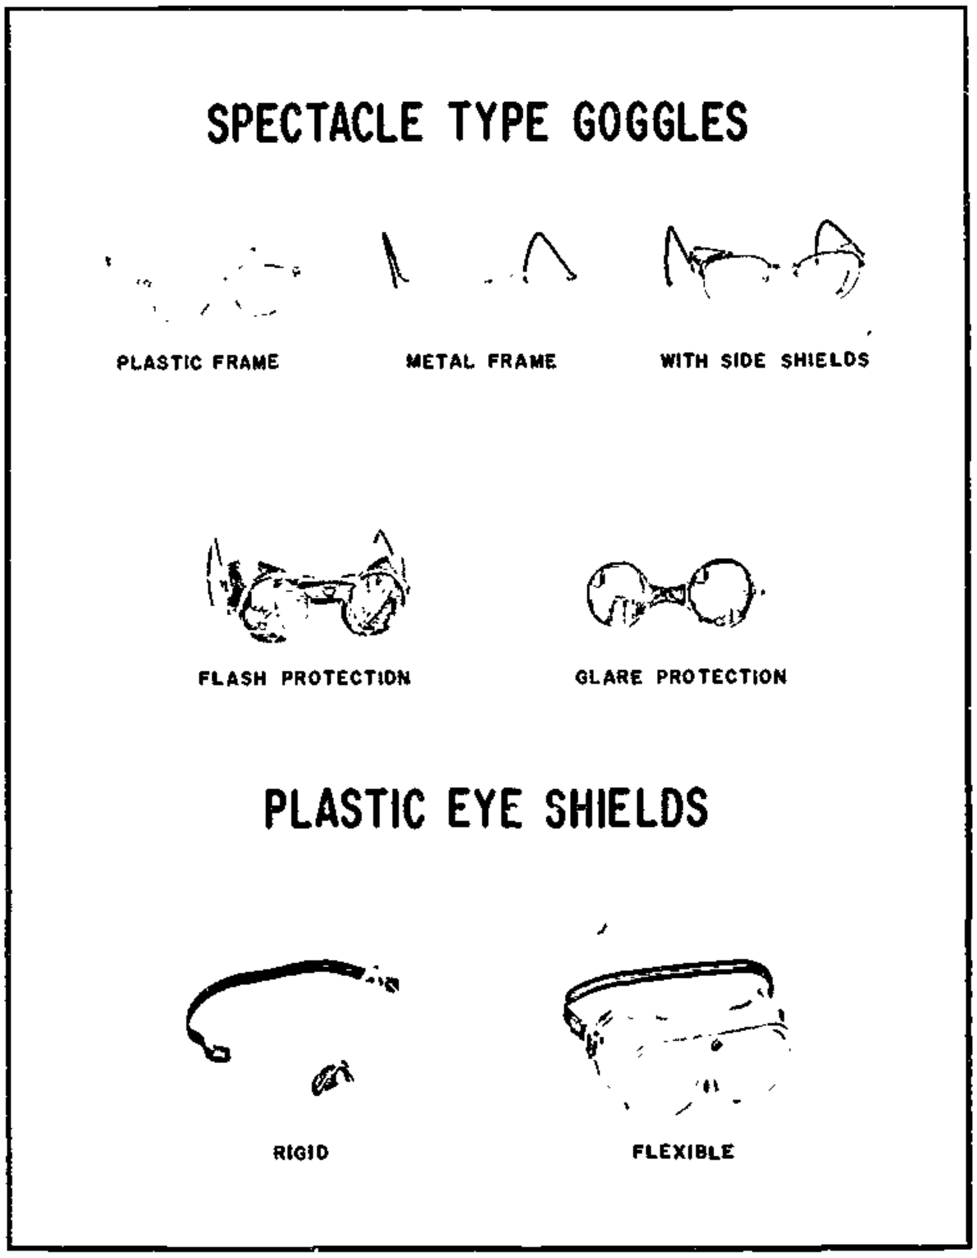

CHART 21—G

SPECTACLES	Safety spectacles are patterned after conventional-type spectacles but are of a more substantial construction.
SPECTACLES—METAL OR PLASTIC FRAMES	Spectacles consist of two lenses and two lens frames (of suitable size and shape for the purpose intended), connected by a nose bridge and supported on the face by temples or other suitable means. The lenses may be either glass or plastic and the bridge may be rigid with nose pads or flexible. They are provided with or without side shields, depending upon their intended use. The side shields (when provided) and the frames should be made of metal or of slow burning plastic material. In addition to these specific requirements, the materials used should be capable of withstanding tests for disinfection, corrosion resistance, water absorption, lens container construction, and flammability, as well as other tests required by the American Standards Association standards.
PROTECTION	Spectacles should provide protection to the eye from flying objects and, where required, from glare and injurious radiation. Spectacles without

	side shields provide frontal protection only. Where side as well as frontal eye protection is required, the spectacles should be provided with side shields.
CONSTRUCTION	Plastic lenses used in plastic eyeshields should be not less than 0.050 inch in thickness. Materials used should be capable of meeting the applicable requirements and withstanding the test as outlined in the standard.
PLASTIC EYESHIELD	Plastic eyeshield should consist of a frame of metal, fiber, or plastic material, plastic lens or lenses, and temples or other suitable means of support to retain the frame before the eyes. The lens or lenses need not be an integral part of the frame. The eyeshields should have side shields, if required for their intended use.
FLEXIBLE FITTING	Flexible fitting eyeshields consist of a frame (composed of a flexible, chemical resistant, nontoxic, nonirritating, and slow-burning material, forming a lens holder), lenses, and a positive means of support on the face, such as an adjustable headband of suitable material to hold the frame comfortably and snugly in place in front of the eyes. The lens or lenses should be held firmly and tightly in place in the lens holder.
CONSTRUCTION	The American Standards Association Z2 standard provides that plastic lenses used in flexible fitting goggles should be not less than 0.05 inch (1.25 mm.) in thickness. Materials used must be capable of withstanding the disinfection, corrosion resistance, water absorption, and flammability tests required by this standard.
FLASH GOGGLES	Flash goggles are spectacle-type goggles with leather side shields. The bridge is covered with leather for protection against radiant heat and flying hot particles. The lenses are impact resistant and are available in clear, medium, dark, and extra dark shades for protection against exposure to ultraviolet and infrared rays and glare. They are suggested for wear under welding helmets and for furnace work, brazing, babbitting, and other work involving heat and glare.
SMELTER'S GOGGLES	These are spectacle-type goggles with cobalt blue lenses for use by steel smelters and others whose work requires periodic inspection of metal heats. These goggles protect against glare and frontal impact from sparks and fine scale. The cobalt glass reduces the sodium yellow glare from fluxes and transmits red well, making temperature estimates from melt color relatively easy.

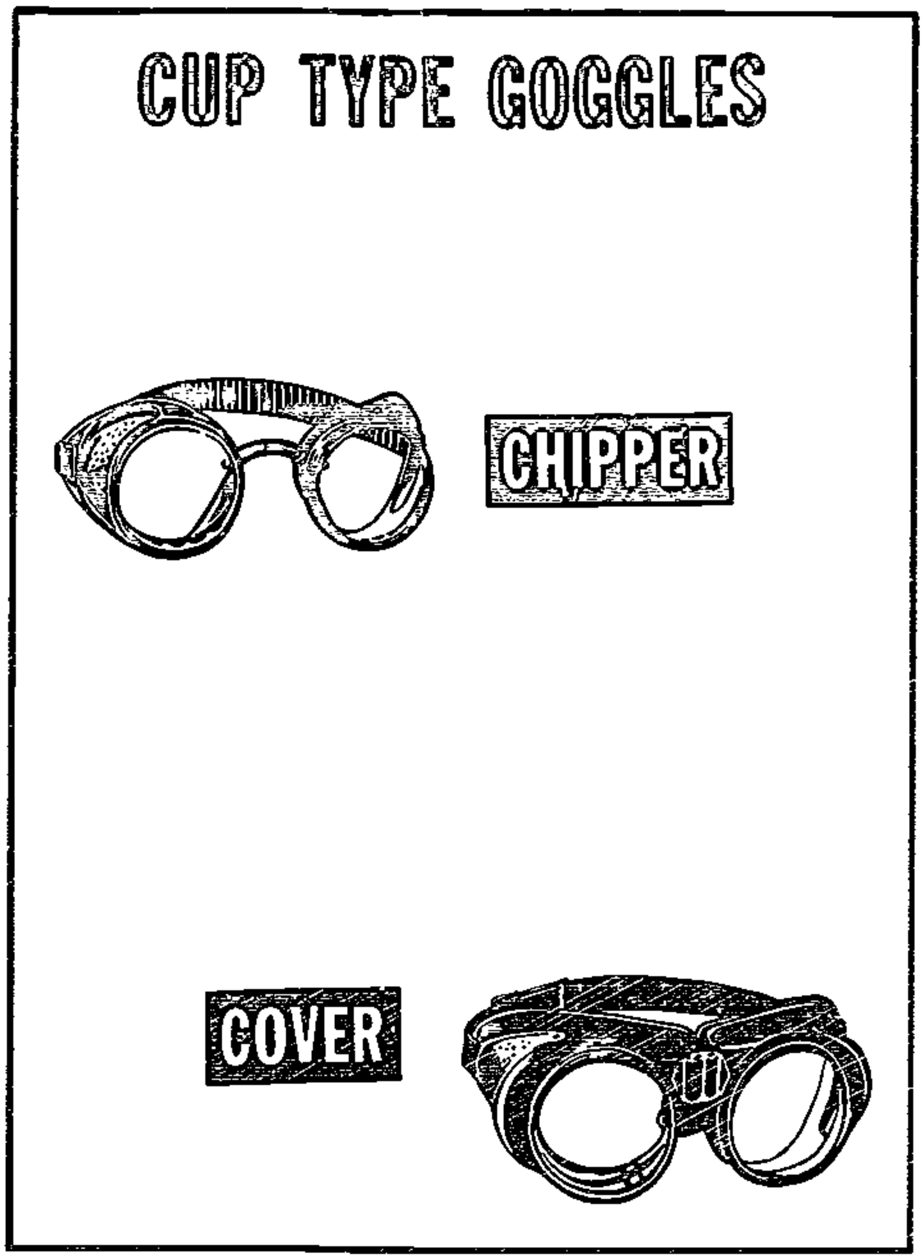

CHART 22—G

CUP-TYPE GOGGLES	Cup-type goggles should be used when greater protection is required than can be provided by spectacles with side shields. Each eyecup is provided with a lens retainer bearing evenly on the lens with sufficient pressure to retain fragments in the event of breakage. They are designed to permit ready removal or replacement of lenses. Lens retainers for welder's and cutter's models are made to accommodate a filter lens, fiber gasket, and cover lens. Eyecups are made from plastic or other composition that can withstand the heat deformation test and the disinfection, water absorption, and flammability tests of the American Standards Association. Eyecups should be right and left in pairs and should permit an effective angle of vision of not less than 105 degrees. They should fit closely and comfortably to the face and cover the entire eye socket. All models should be vented to permit air circulation. Eyecups are supported before the eyes by an elastic headband or by a headgear.

STANDARD CUP-TYPE GOGGLES	Standard cup-type goggles are designed to be worn by individuals who do not wear corrective spectacles.
COVER CUP-TYPE GOGGLES	Cover cup-type goggles are designed to fit over corrective spectacles.
CHIPPER'S MODELS	Chipper's goggles provide protection from front or sides against flying objects. Ventilation is provided through perforations in the cups which are shielded against strong light.
DUST AND SPLASH MODELS	Dust and splash goggles provide protection against flying objects from the front or sides. Ventilation openings are baffled to protect against the entry of liquid splashes or fine dusts.
WELDER'S AND CUTTER'S MODELS	Welder's and cutter's goggles provide protection against glare and injurious radiation. The basic design may be modified to provide more protection against special hazards, but the modified equipment should meet the same requirements as the basic design.

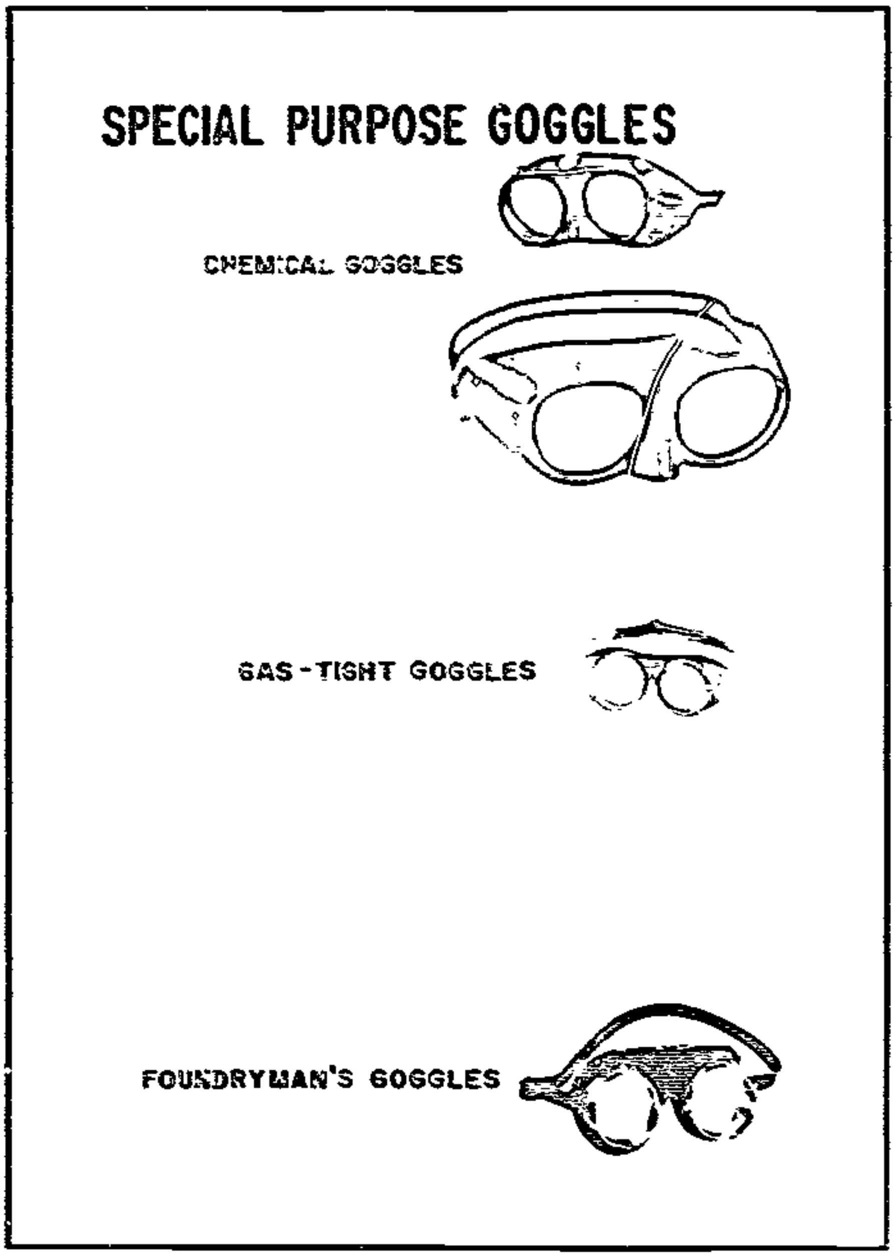

CHART 23—G

CHEMICAL GOGGLES	Chemical goggles form a tight seal against the face and prevent the entry of liquid splashes and dusts. They are ventilated with baffles to be splash-proof. They are ordinarily furnished with impact resistant lenses which may be clear, or in various shades if there is also exposure to glare, ultraviolet and infrared radiation.
VENTILATION	Where chemical goggles are ventilated, openings should be small enough to minimize the possibility of entry of dust or mists. If the goggles are intended to be used in connection with the handling of liquids, the ventilation openings should be splash-proof.
GAS-TIGHT GOGGLES	Gas-tight goggles have rubber frames with lens retaining cups so constructed that a small quantity of water may be placed inside each cup and, by bending (nodding) and gently shaking the head, the water will be thrown across the lens surface, thus eliminating any fog. They are available in the same type lenses as are all the others.

FOUNDRYMAN'S GOGGLES	Foundryman's goggles are masks of soft plastic with snug fitting edges bound in corduroy and soft sponge rubber. The ventilation openings of the eyecups are covered with fine, wire screen to prevent entry of dust and molten metal splashes. These goggles are used for protection against impact hazards normally encountered in foundries. They can be obtained in clear or in several shades of tinted, impact resistant lenses.

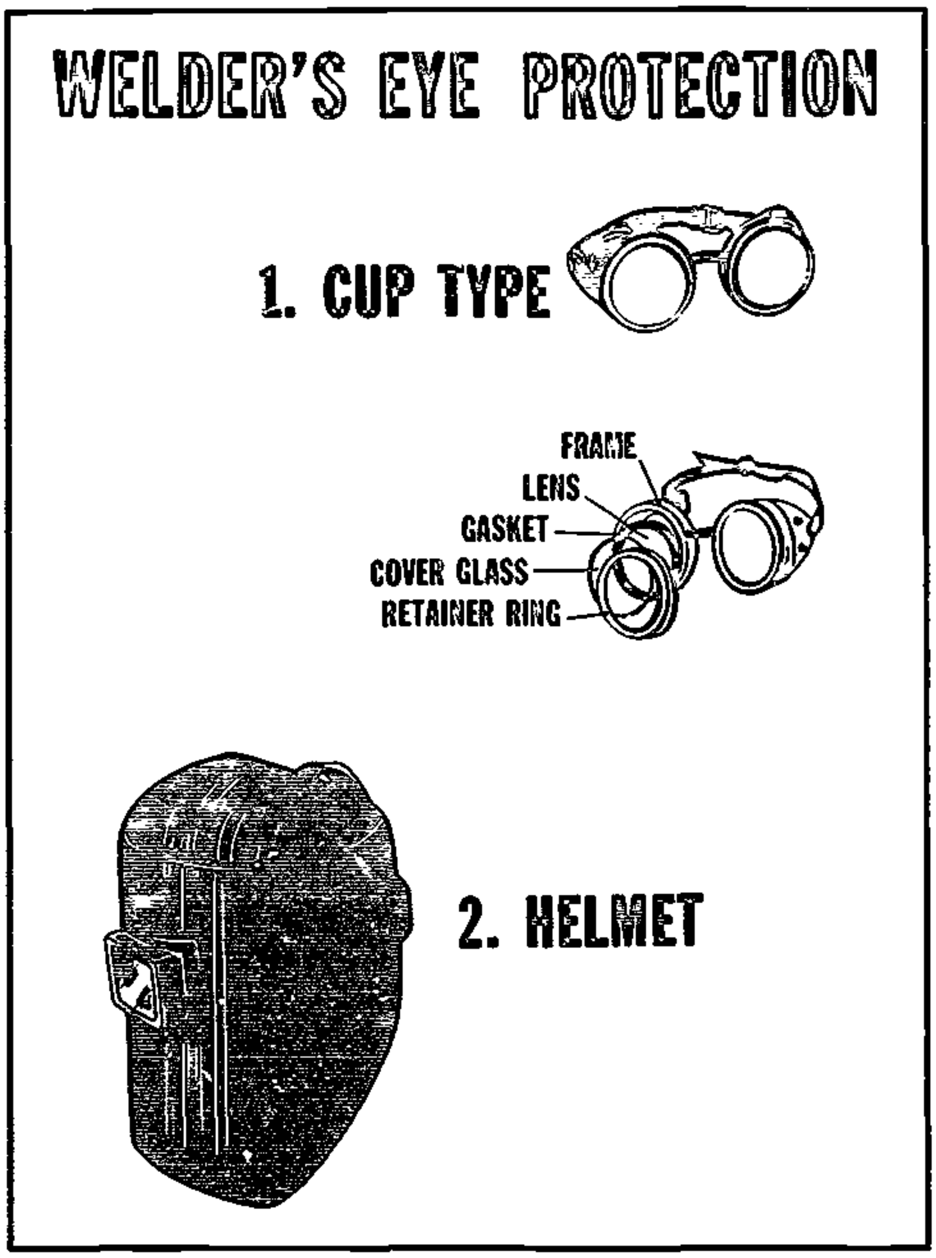

CHART 24—G

WELDER'S GOGGLES	Welder's and cutter's goggles should not only protect against flying sparks and scale, but should also reduce transmitted light to a safe level; they should also absorb dangerous ultraviolet and infrared rays. Welder's goggles are cup type with side shields; they are properly ventilated to reduce fogging and are designed to keep out stray light rays, sparks, and metal splashes. They are supported by an elastic headband or by a headgear for ease in flipping them up when the flame is not being used. They are usually supplied with welding lenses Nos. 4, 5, or 6. They also have clear cover lenses to protect the colored welding lenses from pitting by sparks. Cup goggles should be used for welding which involves only moderate exposure to radiant energy, such as in ordinary gas cutting or welding. Welding helmets should be worn for heavy gas cutting or arc welding.
WELDER'S HELMETS	A welder's helmet is constructed in size and shape to protect the face, top of the head, and the neck to a vertical line back of the ears. This design

	provides protection for the eyes, face, ears, and neck against intense radiant energy.
CONSTRUCTION	The helmet body has an opening or openings in the front for a filter plate and a cover plate. It is supported by a headgear to prevent contact with any part of the head. The welder is able to lift up the front to examine a weld. The body of the helmet should be made from vulcanized fiber, reinforced plastic, or other suitable material which is heat and flame resistant, opaque to visible, ultraviolet and infrared radiations, and should be capable of withstanding disinfection. All metal parts should be suitably insulated on the inside surface. The weight of the helmet, exclusive of the filter and cover glasses, should be no more than 24 ounces (680) grams.
VIEWING WINDOW OR OPENING	The window through which the welding or cutting operation is observed by the wearer should be at least 3⅞ inches wide and 1⅝ inches high. The lens frame must permit the removal and replacement of filter lens and cover plate without the use of tools or without damage to the plates or frame. The mounting should be so designed that the filter plate will be at least 2 inches (50.8 mm.) from the eyes of the wearer.
FILTER PLATES	Filter plates should be no less than 0.08 inch (2 mm.) and no more than 0.15 inch (3.8 mm.) thick. They should be free of striae, waves, or other defects which would impair their optical quality. Filter plates should conform with the radiant-energy transmission requirements of the American Standards Association Z2. The surfaces should be flat and substantially parallel.
COVER PLATES	Cover plates made of plain glass, glass coated on one or on both sides with plastic, or of a slow burning, solid plastic sheet should be used to protect the filter plates from damage. They should be the same size and shape as the filter plates, and should transmit not less than 75 percent of the incident luminous radiation; they should be substantially free from optical imperfections.
CHIPPING SLAG	If it is necessary to chip slag, a "standby" pair of goggles should be worn under the helmet.
HAND SHIELDS	Hand shields are used in some welding operations or for observing the welding process. The handle, used instead of a headgear, is made of material which is a nonconductor of electricity and is noncombustible or slow burning. Hand shields are constructed of materials similar to the ones used for helmets, also the lens mounting arrangements and filter and cover plates.

NONRIGID HELMETS	Helmets to be used in confined spaces may be made of nonrigid materials or they may be collapsible for convenience in carrying. The shape of a nonrigid helmet may be the same as the rigid helmet, except that a more complete covering of the top of the head is necessary to maintain the face, side, and windows in proper position.
FACE SHIELDS	Face shields provide protection to the face (i.e., the front part of the head, including forehead, eyes, cheeks, nose, mouth, and chin) from flying particles and sprays of hazardous liquids; they also provide antiglare protection.
CONSTRUCTION	Plastics used in the manufacture of face shields should combine mechanical strength and lightness of weight to a high degree, should be nonirritating to the skin, as well as capable of withstanding frequent disinfection. The materials used should be slow burning. Clear or colored plastic materials used should be of an optical grade to provide performance equivalent to the optical, physical, and radiant energy requirements specified for other eye protectors. When face shields are to be used in atmospheres or working areas that require special conditions of nonconductivity or nonsparking, then all materials used should meet these requirements. The face shields should be permanently and plainly labeled, either as nonconductive face shield or nonsparking face shield.

SOME GOGGLE COMPLAINTS

GOGGLES:

1. **ARE TOO TIGHT**
2. **IRRITATE SKIN**
3. **CAUSE HEADACHES**
4. **CAUSE EYES TO HURT**
5. **ARE TOO DIRTY AND PITTED**
6. **FOG UP**
7. **CAUSE SWEAT WHICH BOTHERS WORKER**
8. **LOOK STRANGE**

CHART 25—G

MOST FREQUENT COMPLAINTS	
GOGGLES DON'T FIT CORRECTLY	1. A properly trained person who has the responsibility for fitting goggles to the wearer should be stationed at the point of goggle distribution. 2. Each foreman should understand how to fit goggles and check on (and assist) all workmen in the proper fit and use of them.
GOGGLES IRRITATE THE SKIN	1. Goggles may not be suitable for the work being done. 2. Check on the cleaning schedule and sterilizing materials.
GOGGLES CAUSE HEADACHES	1. Goggles may be improperly fitted. 2. The worker may need corrective lenses.
EYES HURT AFTER WEARING GOGGLES	1. The worker may need corrective lenses. 2. Worker may need goggles with correct filter lenses (if used near actinic rays).

GOGGLES ARE TOO DIRTY TO WEAR AND ARE PITTED	1. Worker may be wearing his goggles hanging around his neck where they collect dirt and dust. 2. The worker may be handling goggles with dirty hands and does not understand the need for clean goggles. 3. The worker may be doing very dirty work. (Cleaning stations should be available for occasional cleaning of goggles and for replacement of pitted or scratched lenses.)
GOGGLES FOG UP	1. Worker may be able to use goggles with better ventilation. 2. Goggles should be inspected for possible change in design. 3. If fogging cannot be corrected, antifog compounds should be used inside lenses.
SWEAT BOTHERS THE WORKER	1. Goggles should be cleaned and dried frequently to avoid accumulation of moisture. 2. Use sweatband (absorbent) on forehead.
GOGGLES LOOK STRANGE	1. Be sure goggles are the required type. 2. Rules should be enforced regardless of complaints that goggles look strange. They could save your eyes.

EYE PROTECTION PLAN

A. MAKE A SURVEY

1. RECORDS

B. SET UP A PLAN

1. VISION ETC.
2. DISTRIBUTION ETC.
3. EXHIBITS

C. SELL THE PLAN

D. ENFORCEMENT

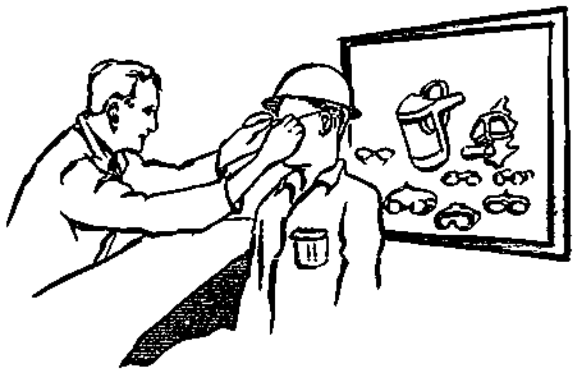

CHART 26—G

MAKE A SURVEY	Check records of past eye injuries and prepare a system for checking the results of a new program as it develops.
CHECK STATISTICS	Check over statistics and locate hazard spots as shown by experience.
STUDY ALL JOBS	Study all jobs for kind of eye protection needed—flying objects, particles of dusts, fumes, splashing chemicals or molten metals, intense heat and light.
STUDY DEMANDS ON EYESIGHT OF WORKERS	1. Distance from eyes of worker to point of operation. 2. Size of central working area. Depth perception factor. 3. Type of visual attention required—fixed or changing, casual or concentrated, detailed or gross. 4. Motion of work—slow or rapid, rotating, vertical, horizontal or reciprocating, fixed or intermittent.

	5. Foot candles of illumination at work point, foot candles of illumination surrounding areas, and direction of light reflected or direct glare. 6. Types of working surfaces—glossy or nonglossy, smooth or slightly or grossly uneven. Angle of working surface. Position of work in relation to normal level of eyes (if worker must look upward, down, or ahead). 7. Colors to be perceived and discriminated.
SET UP A PLAN	1. Make tentative recommendations on the types of eye protection needed. 2. Vision testing is a necessary part of the program. (Prescription ground lenses where needed.) 3. Plan a central distribution system with a designated person in charge of goggle distribution, fitting, repair, sterilization, and maintenance. 4. Set up necessary rules which can be enforced.
SELL THE PLAN	First, sell yourself, be sure of your facts and be sincere. Next, sell management. 1. Use economic gains as a selling point (saving one eye will pay for the entire program). 2. Convince supervisors—get their cooperation—have them help in the survey of their own departments—have them approve all rules—get them to wear goggles themselves and get others to wear goggles where needed.
SELL THE WORKER	
GET COOPERATION	Get cooperation of workers (use safety committee, if possible) and enlighten them on the need for and purpose of the plan.
STATISTICS	Prepare plant statistics and distribute to the workers.
WORKERS' APPROVAL	Have workers approve eye protection rules.
PUBLICIZE	Use bulletin boards, plant publications, and films on eye safety for promoting the program to all workers.
EXPLAIN WHY PROTECTION IS NEEDED	Be sure everyone understands why the eye safety program is needed.
NEAR INJURIES	Use bulletin boards to dramatize "near injuries" in which eye protection prevented personal injuries to workers; exhibit broken goggles, metal-splashed face shields, and other examples of no-injury accidents in which personal protective equipment shielded the worker's vision.

ENFORCEMENT	
APPROVAL OF RULES	Rules should be developed and approved by a safety committee composed of workers and management.
GOOD RULES	No rule should be approved as mandatory unless it can be enforced with the penalty provided. If a rule cannot be enforced, it should be canceled.
MANAGEMENT APPROVAL	The rules, as approved by the committee, should be sent to management for tentative approval.
POST RULES	After management approval, the rules should be posted on the bulletin boards and copies sent to all committee members. A notice signed by top management should be posted at the same time, approving the rules tentatively.
HOLD MEETING ON RULES	About 30 days after posting the rules, the safety rules committee should meet to discuss all objections and suggestions. When agreement is reached as to what the rules should be, copies of the new rules should be sent to all foremen. The committee should then meet with the foremen to obtain their suggestions; then the rules are ready for final approval by the safety rules committee.
FINAL APPROVAL	The rules should be sent to management for final approval. After approval, the rules should be printed with a foreword signed by top management.
DISTRIBUTE RULE BOOKS	The printed rules should be given to each foreman and each worker. Each person receiving a rule book should sign a dated receipt for it.
ENFORCE RULES	The foreman should enforce the rules. If a rule cannot be enforced as written, it should be modified or repealed. Final rules should be rigidly enforced.

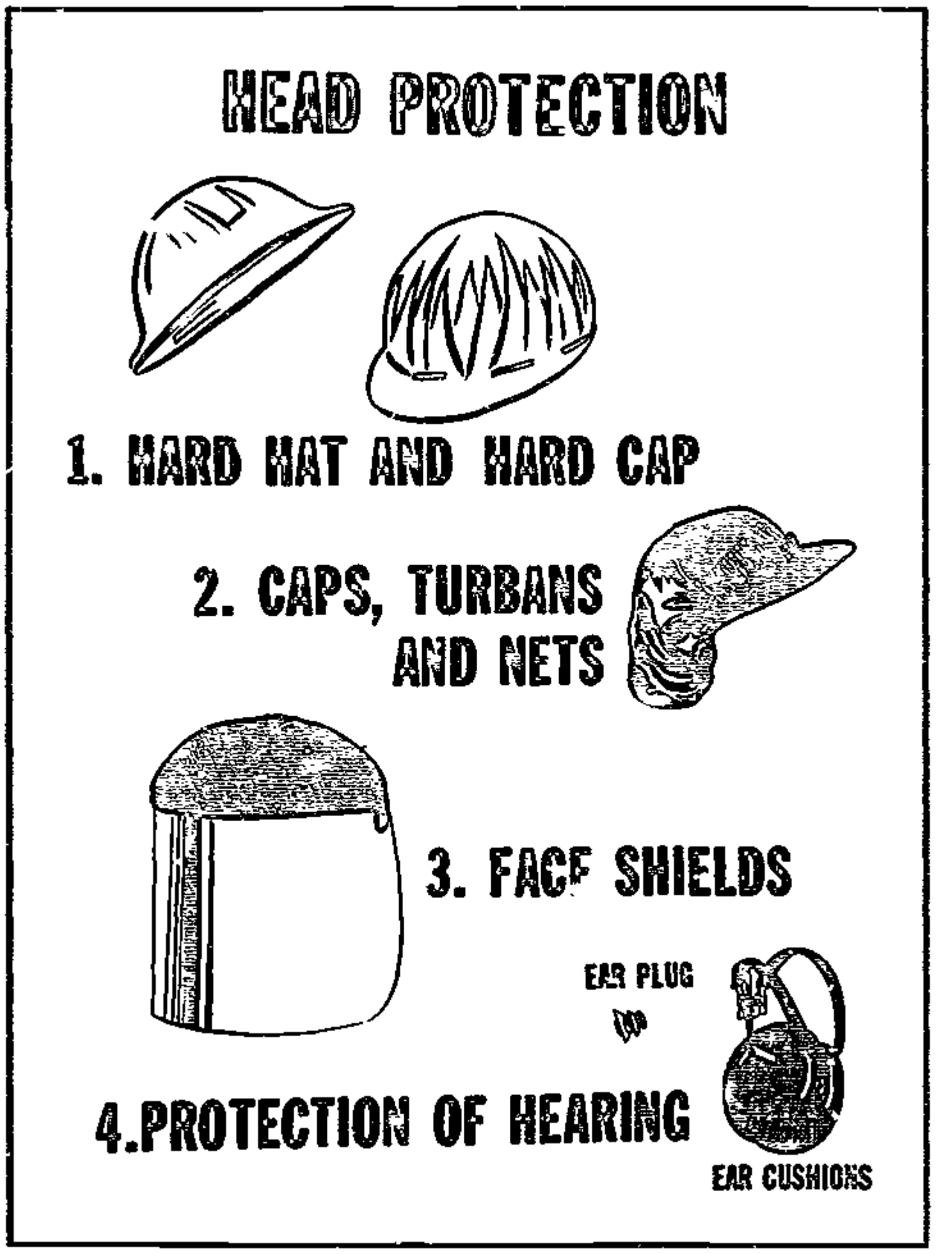

CHART 27—G

PROTECTIVE HATS	
TYPES AND CLASSES	Protective hats are classified into two types and four classes: Type No. 1 . . . . .Hat, full brim Type No. 2 . . . . .Cap, brimless, with peak
CLASS A	General service: protection against impact and flying particles; limited dielectric strength (not exceeding 600 volts).
CLASS B	Utility service: protection against impact and flying particles; high dielectric strength.
CLASS C	Special service: limited protection against impact; no dielectric strength (particular reference is made to metallic protective hats and caps).
CLASS D	Fireman service: protection against impact; limited dielectric strength (not exceeding 600 volts)—Type No. 1 only.

CONSTRUCTION REQUIREMENTS	
SHELL	The shell should be of one piece, seamless construction and designed to resist impact from falling materials.
SWEATBAND AND CROWN STRAPS	The shell is supported away from the head by a cradle formed by the sweatband and crown straps. The crown straps help absorb the force of impact. They are designed to maintain a clearance of not less than 1¼ inches between the shell and the skull of the wearer. Crown strap assemblies for use in Class B protectors contain no electrical conducting material.
INSULATION RESISTANCE	Although designed to protect against voltages of not over 600, Class A protectors are required to withstand 2,200 volts of alternating current for 1 minute with leakage current not in excess of 3 milliamperes. Class B protectors are required to withstand 15,000 volts of alternating current for 1 minute, with leakage current not in excess of 8 milliamperes. Class B protectors when tested to breakdown must withstand up to 20,000 volts.
IMPACT RESISTANCE	All three classes are tested by dropping an 8-pound steel ball on the crown from a height of 5 feet. Mounted on a standard head form, the protector must not transmit an average force of more than 850 pounds. The crown clearance for this test is 1½ inches for Classes A, B, and C.
PENETRATION RESISTANCE	Protectors shall be neither dented nor pierced for more than ⅜ inch when a 1-pound hardened steel plumb bob is dropped squarely onto the center of the crown from a height of 10 feet.
CAPS, TURBANS, AND NETS	Protecting the hair against scalping accidents could be classified as head protection. Women working around machinery always pose a problem because their hair may come in contact with moving shafts, belts, pulleys, drills, inrunning gears, etc. The problem of static electricity which may lift unconfined hair into the danger zone may also be present.
NO ACCEPTED STANDARDS	No standards have been accepted for women's caps, but the caps should be made of a durable fabric to withstand regular laundering and disinfecting. They should be of simple design for easy pressing or ironing by machine, and they should be available in various head sizes or be adjustable to fit all wearers.
SOME SPECIFICATIONS	The visor on a woman's cap should be long and rigid enough to provide warning before the head itself comes into contact with a moving object. The cap should be cool and lightweight. If dust protection is not required, the cap should be made of open weave material for better ventilation.
EAR PROTECTION	The problem of excessive noise in industry is receiving increased attention. When noise cannot be reduced to an acceptable value, ear protectors should be worn.

TWO TYPES OF EAR PROTECTORS	Ear protectors in general use fall into two groups: the plug or insert type and the cup or muff type.
PLUG OR INSERT TYPE	The plug type is inserted into the ear canal and varies considerably both in design and material. Materials used are rubber, soft or hard plastic, wax, and cotton. Rubber and plastic types are popular because they are easy to keep clean, inexpensive, and give good performance. It is important that earplugs contain no parts which could be driven into the ear canal by a blow to the side of the head, causing damage to the drum or middle ear.
SIZES	Since ear canals vary in size, these inserts come in several sizes. Some individuals might even require a different size for each ear. It is important that the ear plugs fit properly and remain correctly seated.
MATERIALS	
HARD	Inserts made of hard materials must be custom molded to the shape of the ear canal so they will fit precisely. They must have a substantial flange to fix the depth to which they can be inserted.
SOFT PLASTIC	Soft plastic plugs give more comfort than do hard types. To be effective, all earplugs must be pressed into the ear canal hard enough to form an airtight seal, which means that they are bound to produce some sensation of pressure in the ear.
WAX	Wax protectors vary in form from plugs of pure wax to impregnated cotton paper. If carefully molded to the ear canal, they can provide good protection.
COTTON	Dry cotton inserted in the ear is a poor choice as a noise suppressor.
MUFF TYPE	Cup or muff type protectors cover the external ear to provide an acoustic barrier.
AMOUNT OF PROTECTION	Commercially available earplugs, if properly fitted and used, will generally reduce noise reaching the ear by 20 to 35 decibels in the important sound frequencies. Muffs worn over earplugs give additional protection.

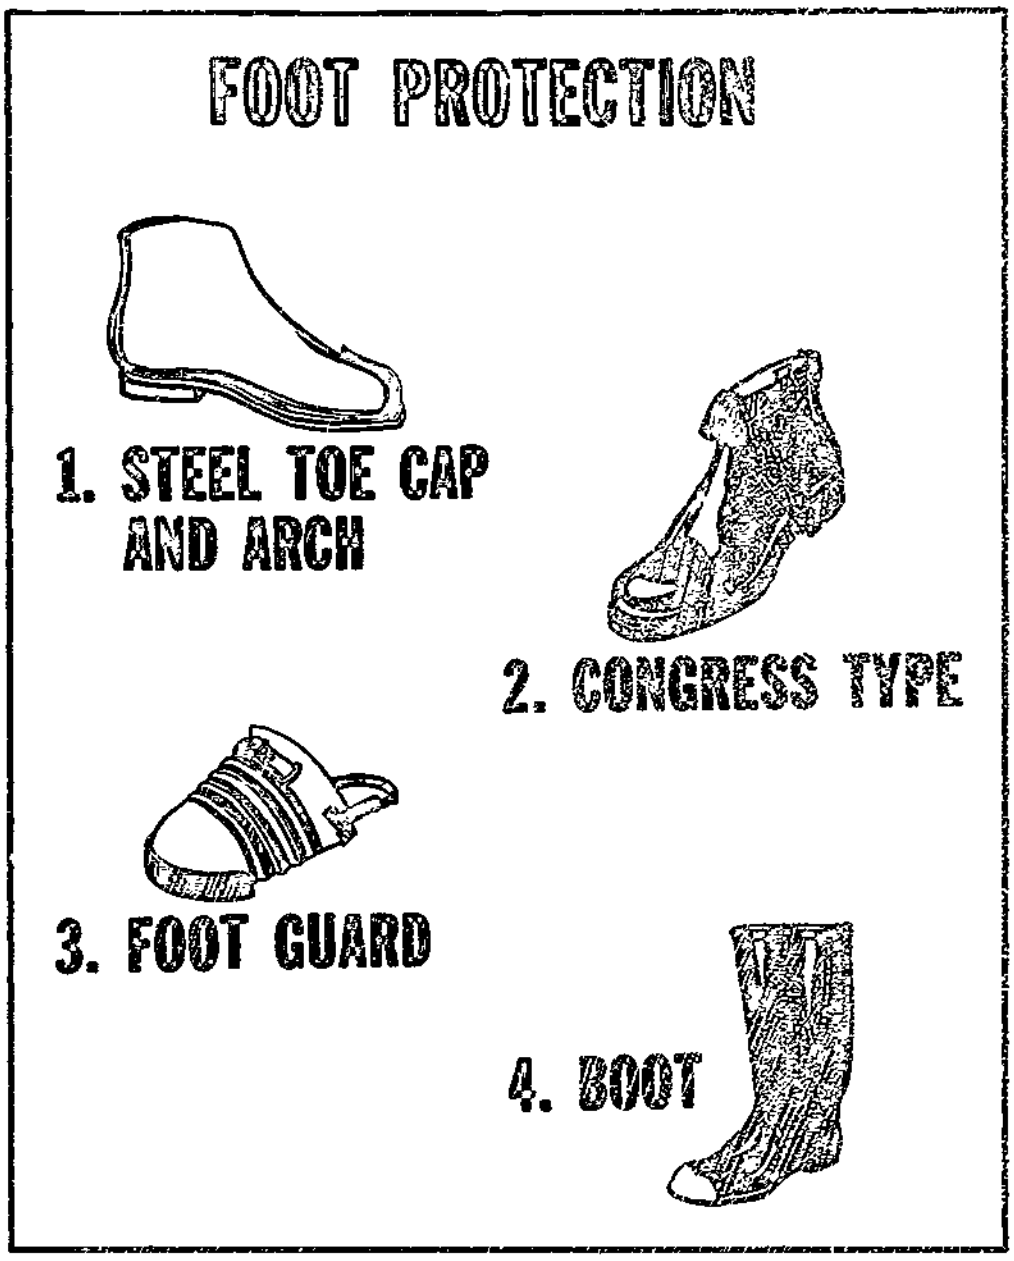

CHART 28—G

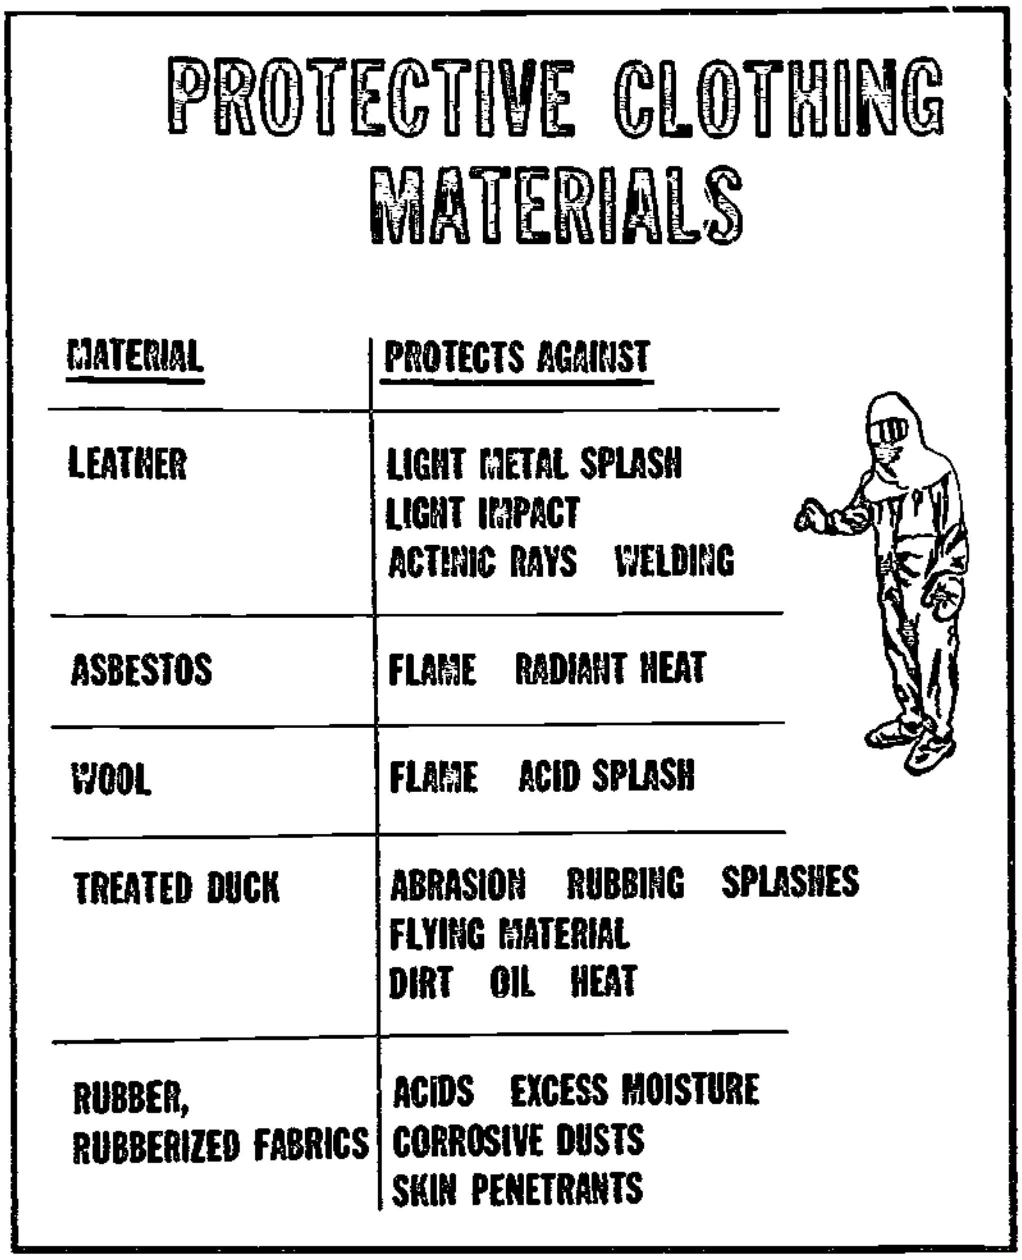
FOOT PROTECTION	Personal protective footwear is the accepted method of protection against injuries from heavy falling objects, against crushing from rolling objects, or against lacerations from edged tools. Protective footwear is also used against the hazards of molten metal and electricity.
SAFETY SHOES	For general wear, safety shoes should be well constructed with an impact-resisting metal toecap. These shoes must be comfortable, well fitted, and no heavier than regular style shoes. The protective toecap should support a static load of 2,500 pounds or 50 pounds dropped 18 inches.
STYLES AND MATERIALS FOR SAFETY-TOE SHOES	Safety-toe shoes are made in a large variety of styles and materials. Safety toes are incorporated into leather boots, rubber boots, oxfords, and many other types. Soles may be of leather, rubber, cord, or wood to protect against slipperiness, oil, heat, or other physical hazards. Safety-toe shoes are also made with insulation against heat or cold or with special features to protect against specific hazards, such as metal insoles to protect against puncture wounds. Plastic instep guards may be incorporated into safety-toe shoes where protection to the instep is desirable.

CONGRESS-TYPE SHOES	Congress-type safety shoes are usually required for places where molten metal may get into shoes. Laced shoes could be dangerous, so the congress type is recommended, because they can be removed quickly. These shoes generally have wooden soles or are attached to wooden soled sandals.
FOOT GUARDS	In addition to the basic type of safety shoes, a number of other types of foot guards are used. These foot guards should be capable of withstanding up to 200 pounds dropped 1 foot.
METAL FOOT GUARDS	Metal foot guards are coverings of aluminum alloy or galvanized steel which are temporarily attached to the shoes. They protect not only the toes but also the instep.
FOOT AND SHIN GUARDS	Where there is also a hazard to the shin, a combination foot and shin guard is available. The shin guard, made of the same material as the foot guard, is hinged to it and held in place by straps around the leg.
WOODEN SOLED SANDALS	Strap on sandals, consisting of wooden soles and held in place by straps over the shoes, are used as protection against hot walking surfaces, as in paving with hot asphalt.
BOOTS	Boots are generally made of rubber with safety toecaps. They are also available in neoprene, plastic, and leather. Wooden soles are available as well as nonslipping styles. The protective toecap should support a static load of 2,500 pounds or 50 pounds dropped 18 inches. Overshoes and pacs are also available for special requirements.

CHART 29—G

BODY AND LEG PROTECTION	Body and leg protective devices are used for a variety of purposes; however, in wearing these protective devices, care should be taken that these protective devices themselves do not create additional hazards.
APRONS	Aprons may be of either the bib type, covering the chest, waist, and knees or ankles, or of the waist type which lacks the chest covering bib. Aprons are available to protect against heat, hot metal splashes, impact and cut hazards, splashing liquids, or radiation hazards.
CAPE SLEEVES	Cape sleeves cover back, shoulders, and arms, and extend over the upper chest; they may have a detachable bib to protect the lower chest.
JACKETS	Jackets are used to protect the upper part of the body. They cover the shoulders and extend to the hips. Jackets made for flame and heat hazards are suitable for welding, particularly overhead welding, and for furnace or firefighting work. Other jackets intended for general laboratory or industrial use offer protection against chemical splashes, solvents, acids, alkalis, oils, and greases.

COATS	Coats and jackets are of similar material, coats being knee or ankle length which give leg as well as body protection.
COVERALLS AND OVERALLS	Coveralls and overalls cover the body, except head, hands, and feet. They also are made of materials designed to protect against heat and flame, or chemical burns.
NIGHT HAZARD CLOTHING	Luminescent clothing is designed to reflect light and is used by nighttime workers where there is a hazard from moving vehicles.
FIREFIGHTING SUITS	Flame resistant suits are designed to completely protect firemen while extinguishing fires and during rescue work around fires.
RADIATION EXPOSURE SUITS	Coverall suits, made of plastic or paper, protect clothing against contamination from particulate matter.
LIQUID HAZARD SUITS	Suits, consisting of lightweight jacket, overall pants, and hood, are used by maintenance men and repairmen when they are working around hazardous liquids.
OTHER PROTECTORS	Other personal protective devices (leggings, shinguards, kneeguards, pants, waders, or spats) are available for use against specific hazards.
ARM AND HAND PROTECTION	There are a large number of hand and arm protective devices, many of them designed for specific purposes.
GLOVES AND MITTENS	Gloves and mittens are intended to provide protection to the fingers, hands, and sometimes to the wrists and forearms. They should not be worn where there is the hazard of being caught in moving machinery. Materials available are leather, cloth, rubber, plastics, impregnated cloth, asbestos cloth, and metal mesh.
HAND PADS	Hand pads are used to protect the palm of the hand against cuts and abrasions or against burns caused by direct contact with hot objects or against sparks, flame, or heat. Generally, hand pads are heavier and less flexible than gloves or mittens and are used for heavy duty protection against direct contact.
FINGER COTS	Finger cots provide protection to finger tips only. They are designed to protect against moisture, acids, alkalis, oil, grease, and solvents, or against cuts. Cots are also used when only the fingers come in contact with hot materials.
SLEEVES	Where protection to the arms are necessary, sleeves are worn in conjunction with gloves. They are made in three lengths: cuff length for wrist and forearm, elbow length, and shoulder length. Rubber sleeves are worn by electricians and linemen for protection against live conductors.



PROTECTIVE CLOTHING MATERIALS

MATERIAL	PROTECTS AGAINST
LEATHER	LIGHT METAL SPLASH LIGHT IMPACT ACTINIC RAYS WELDING
ASBESTOS	FLAME RADIANT HEAT
WOOL	FLAME ACID SPLASH
TREATED DUCK	ABRASION RUBBING SPLASHES FLYING MATERIAL DIRT OIL HEAT
RUBBER, RUBBERIZED FABRICS	ACIDS EXCESS MOISTURE CORROSIVE DUSTS SKIN PENETRANTS

CHART 30—G

LEATHER MATERIALS	
PROTECTION	Good quality leather protective clothing will provide adequate protection against light metal splashes, light impacts, and harmful actinic rays.
CLOTHING	Leather is usually used to make coats, overalls, sleeves, aprons, leggings, capes, gloves, and hand leathers.
SPECIFICATIONS	Clothing should be made of a good quality leather and so fastened as to avoid any exposures during body movements. Clothing should cover completely, yet be designed for instant removal when necessary. All stitching should be protected from sparks and hot metal splashes.
ASBESTOS MATERIALS	
PROTECTION	Asbestos clothing should protect against excess dry heat and flame.

CLOTHING	Asbestos is usually used to make coats, overalls, sleeves, aprons, leggings, capes, gloves, and hand pads.
SPECIFICATIONS	All fastenings should be covered with flaps. When clothing is subjected to continual use, a leather backing is recommended for reinforcement.
DUCK MATERIALS	
PROTECTION	Duck material makes good light-duty protective clothing against small cuts and bruises on jobs where heavy, sharp, or rough materials must be handled.
CLOTHING	Duck is used primarily for gloves, aprons, and light clothing. In recent years, aluminized duck has been developed for protection against work exposure to radiant heat.
WOOLEN MATERIALS	
HEAT AND FLAME RESISTANT	Generally, woolen clothing is suitable for work in cold areas, around furnaces, and some chemical plants (especially acids).
RUBBER AND RUBBERIZED FABRICS (ALSO NEOPRENE AND PLASTIC)	Hats, hoods, gloves, coveralls, coats, pants, jackets, and aprons are available for use as protection in chemical plants and wherever there is exposure to acids. Clothing made of neoprene or plastics should be used for protection against solvents.

Distribute occupational safety aids "Face and Eye Protection," "A Plant Checksheet for Face, Head and Eye Protection," "Safe Practices—Gas Welding and Cutting Equipment," "Safe Practices—Arc Welding."

OCCUPATIONAL SAFETY AID

FACE AND EYE PROTECTION

More than 100,000 disabling eye injuries are reported each year. This high annual toll can be minimized and severity reduced by the use of proper engineering revision or point of operation guarding.

Even though most of the injuries are preventable by the above procedures, the severity of most of them could have been controlled by the use of personal protective equipment.

When a hazardous situation exists, examine the process of manufacture or the handling method to determine what changes could be made to eliminate the hazard. Sometimes, a simple design change on a machine will eliminate a cause of accidents by controlling the hazard at the source.

It is only after these measures have been considered and found to be impractical that the use of personal protective equipment should be considered.

There are definite limitations in the use of every piece of protective equipment. Detailed studies should be made before making recommendations. These studies should include:

KEEP RECORDS of injuries to the face or eyes to determine where and how such injuries are occurring.

MAKE A SURVEY of the establishment to determine the types and locations of eye hazards.

EDUCATE SUPERVISORS - Supervisors should be advised of the sources of eye injuries and the protective measures necessary.

EDUCATE THE WORKERS - Show them the need for eye protection. Work up statistics and distribute them. Answer workers' questions. Get a film on eye safety and show it to all workers. Post bulletins on eye protection and get the Safety Committee to work actively on the promotion set up.

VISION TESTING - This is a vital part of all eye protection programs. All employees who are to wear goggles should be tested to determine the need for corrective lenses. Eye tests on substantial groups indicate that 15 to 20 percent of adults should wear corrective lenses.

U. S. DEPARTMENT OF LABOR
Bureau of Labor Standards

FITTING - DISTRIBUTION - It is good practice to arrange with the oculist who does the eye testing to fit the goggles. Workers will not have full confidence if fitted by a stockroom attendant or foreman. Goggles that are confortable to wear and do not interfere with eye comfort or vision will be worn IF the wearer knows the hazards.

It is essential to provide for control and distribution to insure careful and thorough maintenance of all eye protection. This can be arranged by the examining oculist who will be able to give proper instructions to the persons selected to handle this work.

REPAIR OR REPLACEMENT - Protective eyewear should be handled through a central storeroom, to insure that it is checked for bent frames, worn temple coverings, or missing parts. Also, eyewear should be cleaned and sterilized regularly.

EXHIBITS - Many plants maintain a location where protective equipment, that has prevented injury, is displayed. This is a good practice as it helps in selling the program.

DISCIPLINE - Rules should be written out so there can be no misunderstanding. Have rule book signed. To back the rules, require rigid enforcement.

A program can be successful when properly administered according to the following recommendations:

1. MAKE ONE PERSON RESPONSIBLE FOR THE EYE PROTECTION PROGRAM.
2. PURCHASE PROPER TYPE OF EQUIPMENT.
3. PROVIDE ADEQUATE FITTING, AND VISION TESTING.
4. INSURE THAT GOGGLES ARE PROPERLY CARED FOR AND REPAIRED.
5. SELL THE PROGRAM THROUGH EXHIBITS AND BULLETIN BOARDS.
6. ENFORCE RULES BY RIGID DISCIPLINE.

The following chart is designed to assist in determining the type of equipment according to work being done, and is adapted from ASA Standard Z2.1-1959 "Head, Eye, and Respiratory Protection."

Face and Eye Protection*

FOR PROTECTION FROM-	In jobs such as-	Select this face or eye protection
Large flying objects rivets, nails, metal or rockchips, fragments from mushroomed tools.	Chipping, finishing of iron and steel castings, and forgings, lathe work.	Safety spectacles with impact resistant lenses, lens containers, frames, and side shields of maximum strength and comfort for wearer. Frames that are light in weight, and not subject to corrosion under sterilization. Heavy duty cup goggles with impact resistant lenses.
Dust and small flying particles.	Scaling and grinding of metals stone dressing, woodwork, etc.	Composition cup coverall goggles of moderate strength, that enclose eye completely and have indirect port ventilation. Cover type of plastic one piece lens; safety spectacles with impact resistant lenses, and side shields.
Dust, wind and metal sparks.	Operating road building equipment, construction work; operating tractors and power shovels; electric spot and butt welding, where there is no exposure to radiant energy.	Safety spectacles with impact resistant lenses. Full face plastic shield of moderate strength cover type of plastic one piece lens.
Splashing metal.	Casting, tinning, babbitting pouring lead joints. These operations are serious industrial eye hazards.	Cup goggles with impact resistant lenses capable of withstanding moderate blow of molten metal and with lens containers made to hold cracked lens in position--all materials nonflammable. Cover type of plastic one piece lens wire screen face shield with wide flare safety spectacles with side shields and impact resistant lenses.

* Adapted from ASA Standard Z2.1-1959.

Face and Eye Protection*--Continued

For protection from-	In jobs such as-	Select this face or eye protection
Gases, vapor and liquids entering the eyes.	Handling of volatile and corrosive chemicals, dipping in galvanizing and pickling tanks, etc.	Tight gas-proof goggles with impact resistant lenses. Wide flare plastic face shield. Cup goggles with impact resistant lenses. Rubber mask goggles with indirect screened ventilation ports, and wide-vision impact resistant lenses.
Reflected light and glare welding flash.	Working near or adjacent to furnaces, welding operations, etc.	Safety spectacles with filter shade lenses with or without side shields (with side shields and with use of helmet in gas shielded arc welding). Cup goggles with filter lenses, retaining and opaque side shields.
Injurious radiant energy when a moderate reduction of intensity of the visible radiant energy is desired.	Oxyacetylene, oxyhydrogen, or resistance welding and cutting, testing of lamps involving exposure to excessive brightness, tending electric, Bessemer and other types of furnaces, crucible steelmaking.	Cup goggles with impact resistant filter lenses and clear cover glass to save the welding lenses from pitting--with indirect, screened, ventilating ports to prevent fogging of lenses and to exclude injurious flashes, hot metal and sparks.
Injurious radiant energy when a large reduction of the visible radiant energy is desired.	Electric arc welding and cutting, irradiation with ultraviolet light, hydrogen welding.	Scarfing shield with impact resistant filter lenses and clear cover glass. One piece shell welding helmet with flip front. Welding section that can be raised for quick inspection of weld, and with a stationary section fitted with clear impact resistant glass for observation of weld. Fabricated shell welding helmet with stationary filter glass section.

* Adapted from ASA Standard Z2.1-1959.

Bureau of Labor Standards

A PLANT CHECKSHEET FOR FACE, HEAD, AND EYE PROTECTION

1. Are goggles, helmets, and face shields available for each employee exposed to the danger of:
   - (a) Splashing of molten metal or injurious chemicals? .... ________
   - (b) Flying dust or particles of emery, metal, rock wool or other hard substances? .... ________
   - (c) Falling or thrown tools or other large objects? .... ________
2. Are goggles fitted to the individual workman? .... ________
3. Are emery wheels equipped with glass shields, metal hoods, or other adequate protection? .. ________
4. Is some one person charged with responsibility for cleaning and replacing pitted or broken emery wheel shields? .... ________
5. (a) Is each worker needing a head [illegible], helmet, or goggles provided with such for his exclusive use? (The use of the same goggles by more than one person involves the danger of communication of disease.) .... ________
   - (b) Is there provision for approved sterilization of eye protection devices turned in by one employee before they are issued to another? .... ________
6. Is there adequate provision of proper goggles, masks, and helmets to protect workers from injurious heat and light rays in occupations involving:
   - (a) Acetylene welding? .... ________
   - (b) Electric welding? .... ________
   - (c) Irradiation by ultraviolet light? .... ________

PROTECTION AGAINST THE HAZARDS OF UNDUE EYE FATIGUE

7. Are prescription lenses provided for all employees with defective vision? (Yes or No) .... ________

ASSIGNMENT OF WORK

8. Is the vision of each employee taken into account in an assignment of work? .... ________
   - (a) Is it done through job analysis and test of vision? .... ________
   - (b) Is it left to the judgment of personnel manager, foremen, or other supervisors? .... ________
9. Is there a periodic check of the relation of worker's vision to the character and quality of his job which will lead to the recommendation of change to a less hazardous occupation if necessary? (If so, state how often) .... ________

SAFETY RULES

10. Is there a mandatory rule concerning the wearing of face shields, head protection, and goggles in prescribed occupations and is this rule enforced? .... ________

RECORDS

11. Are accurate records kept of:
    - (a) Number, nature, and cause of eye injuries? .... ________
    - (b) Frequency and severity rate of such injuries? .... ________
    - (c) Compensation and other costs due to such injuries? .... ________

OCCUPATIONAL SAFETY CHART No. 4

SAFE PRACTICES — ARC WELDING

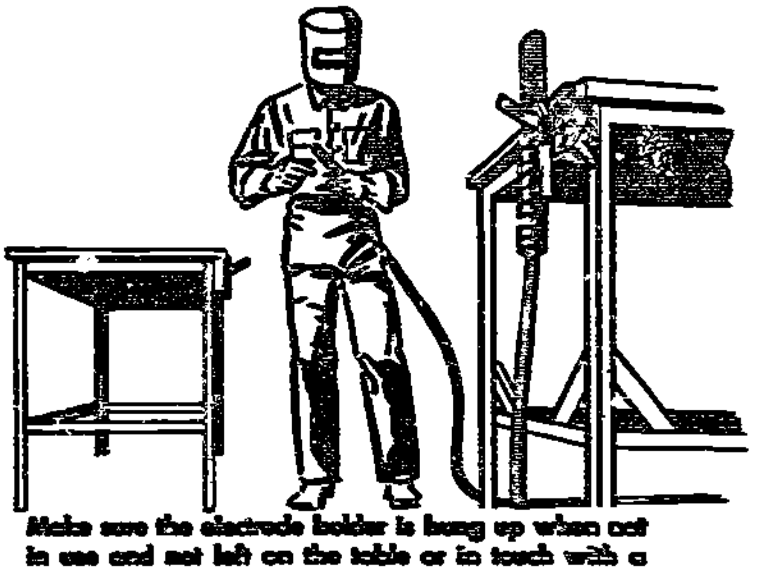
Wear Protective Clothes and Helmet — avoid injury

Wear protective equipment, such as leather sleeves, jacket, apron and welder's leather gloves to protect the skin from intense heat and sparks. Protect the eyes and face by means of a suitable helmet or shield equipped with a filter glass plate. Wear safety shoes, tightly laced.

See That All Connections Are Tight — avoid injury

See that cable connections to electrode holder and ground are tight and insulated. Make sure electrode holder is in good condition and grips electrode firmly. Always use well insulated holders.

Hang Up Electrode Holders Not In Use — avoid injury

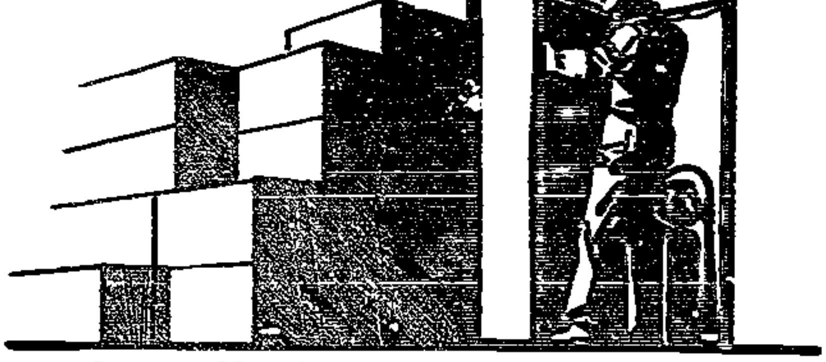


Make sure the electrode holder is hung up when not in use and not left on the table or in touch with a grounded object.

Wear Goggles When Chipping Weld — avoid injury

Always wear safety goggles under helmet for protection when chipping or grinding a weld. Clear or light tinted goggles will also help to prevent eye flashes when other welders are working nearby.

Don't Weld Near Combustible Materials — avoid injury



Erect suitable safeguards around any flammable materials near work and keep a fire extinguisher handy. Where sparks may come through floor or partition, have helper or fire watcher stationed where he can control the situation.

Protect Nearby Employes From Arc — avoid injury

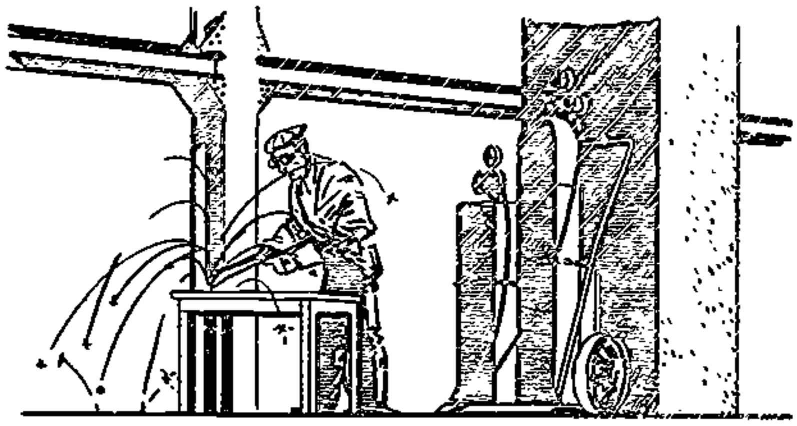
Erect large screen around welding work to protect nearby employes from arc rays. If unable to shield the arc completely, warn every one nearby not to look at the arc. Wherever possible, stand so you are between the arc and other workmen.

U. S. DEPARTMENT OF LABOR
BUREAU OF LABOR STANDARDS
Washington, D.C. 20210

OCCUPATIONAL SAFETY CHART No. 5

SAFE PRACTICES — GAS WELDING & CUTTING EQUIPMENT

Handle Gas Cylinders Safely—Avoid Injury

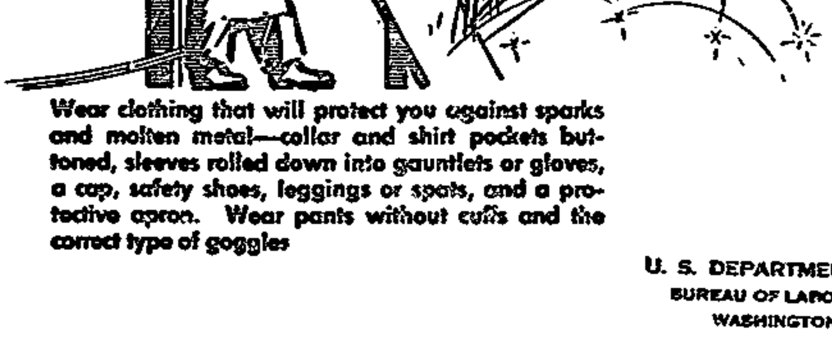


See that gas cylinders are firmly fastened and out of the way of shop trucks and other hazards. Keep cylinders away from electrical equipment and hot locations, including the direct rays of the sun. Close cylinder valves when stopping work for 15 minutes or longer. Disconnect torch and place in tool box.

Take Proper Precautions Against Fire—Avoid Injury

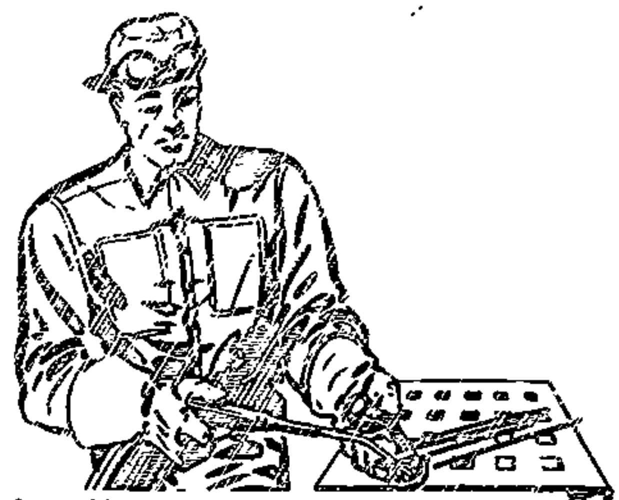
See that all combustible materials are well out of the way, or protected from sparks. If necessary use a spark shield. Keep a fire extinguisher handy.

Wear Proper Protective Clothing—Avoid Injury



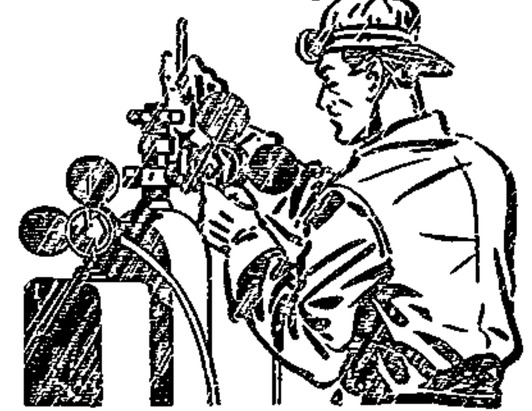
Wear clothing that will protect you against sparks and molten metal—collar and shirt pockets buttoned, sleeves rolled down into gauntlets or gloves, a cap, safety shoes, leggings or spats, and a protective apron. Wear pants without cuffs and the correct type of goggles

Use Torches Properly—Avoid Injury



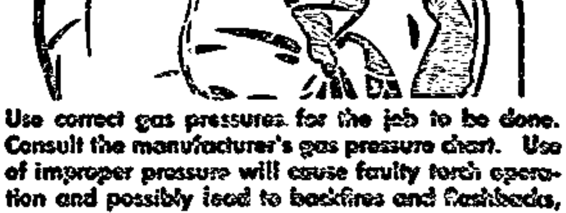
See that welding or cutting torches are in good condition. Light torch according to the manufacturer's instructions. Use friction lighter, not matches, so as to avoid hand burns.

Make Sure Connections Are Tight—Avoid Injury



Before using gas welding or cutting equipment, make sure that all cylinder, regulator and hose connections are tight. Tighten connections with wrench before gas pressure is applied and stand to one side of regulator before opening cylinder valves. Check hose and connections periodically for leaks by using soapy water.

Use Correct Gas Pressure—Avoid Injury



Use correct gas pressures for the job to be done. Consult the manufacturer's gas pressure chart. Use of improper pressure will cause faulty torch operation and possibly lead to backfires and flashbacks, which may damage inside of hose.

*PROGRAM PLANNING, *GUIDELINES, *HOME ECONOMICS EDUCATION, HOME VISITS, *HOME PROGRAMS, *STUDENT EXPERIENCE, HIGH SCHOOLS,

This guide is for teacher use in planning a home experience program for high school students. It was developed by the state home economics supervisor and a professor of home economics from teacher reports and materials from other states. Home experiences are usually of three types--individual, family, or community. Well directed home experiences offer opportunities for developing greater pupil responsibility, self-confidence, skill, and initiative. Content covers meaning and purpose of the home experience program, introducing the program, home visits, student conferences, ideas for home experiences, evaluation, checklist for rating a program, and references. Forms of letters to be sent to parents and students, evaluations, plans, records, and reports are included. (FP)

FOREWORD

Every individual has a place of abode which is home to him. Regardless of the size or type of home, there are certain competencies which enable the individual to make family living in that home satisfying for himself and for others. Home economics education aims to provide the kind of learning situations which will develop within the student skills and relationships competencies basic to successful family life. The home experience aspect of vocational home economics education is an integral part of that program.

Home experiences are learning experiences related to home and family problems which are planned and carried out in the home of the student under supervision of the teacher with the cooperation of the family. These learning experiences have definite goals for personal development of the student and for contributing some phase of family living.

A need for home experiences as a part of the home economics program is evident since it makes relating classroom learning to home situations more effective. Directed home experiences aid in keeping home economics education practical and usable. Through close contact with homes and families, the teacher can gain the insight and understanding necessary for planning and carrying out worthwhile learning activities with students. Well-directed home experiences offer opportunities for developing greater pupil responsibility, self-confidence, skill, and initiative. Therefore, the home experience program makes a unique contribution to the present family life situation of the student and paves the way for assuming home responsibilities in the future.

Dr. [illegible] E. Hartman
Acting Commissioner
Department of Education

INTRODUCTION

The home experience program is a vital part of vocational home economics. Those who teach home economics are aware of the value of this teaching technique and have expressed a desire for information that would aid them in using this education device more effectively.

At the 1966 Curriculum Development Summer Workshop, it was concluded that a home experience guide was a necessary supplement for Guidelines to Home Economics. It was felt that such a manual should be developed immediately, and many suggestions were given. Those suggestions plus many others gleaned from annual reports submitted by the teachers of home economics in the state of Alaska have been incorporated in this bulletin. Additional ideas were gathered from materials received from other states and modified to make them applicable to the home economics program in Alaska.

It is intended that this manual be a sharing of ideas. Therefore, the user is welcome to reproduce any portion giving credit to the source.

College, Alaska 99735

TABLE OF CONTENTS

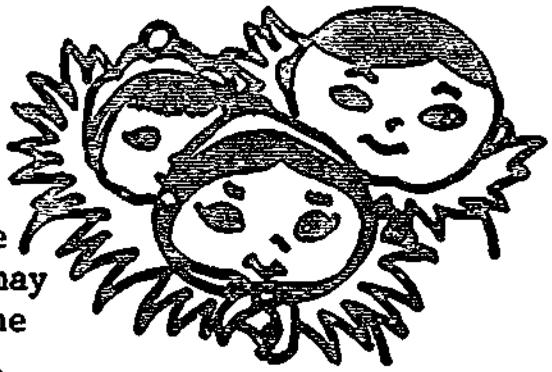
Foreword

Introduction

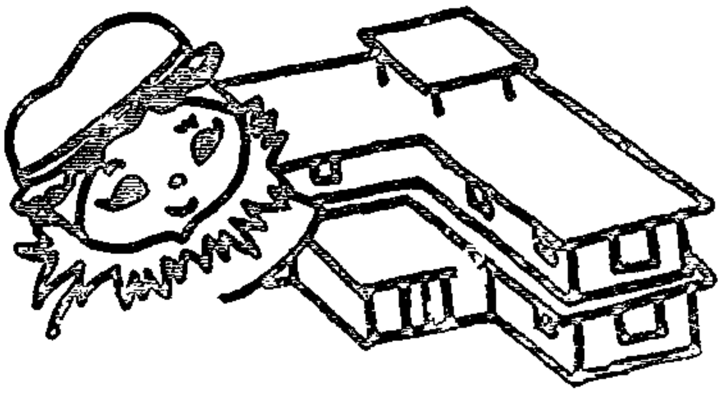
THE MEANING OF HOME EXPERIENCES

Home experiences usually are of three types: the individual home experience, the family home experience, and the community home experience.

The individual home experience emphasizes improvement of the student and may not greatly affect other family members. Such activities might develop from problems of personality development, personal grooming, improving eating habits, money management, career planning.

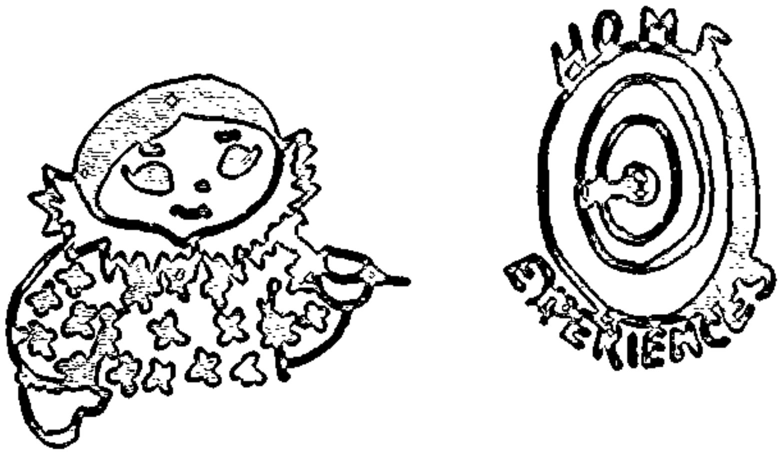


A family home experience directly affects the family of the student. These afford opportunities to attempt to solve home problems through cooperative effort of the whole family. The student takes the initiative and assumes the major responsibility. Projects of this nature may revolve around problems involving considering the desires and rights of others, caring for others, common goals of the family. Activity examples are marketing for the family, cooperating to preserve food for the family, redecorating the kitchen, planning a family celebration, caring for small siblings.



Community home experiences directly affect the welfare of the family and extends beyond the home. This type of experience may be a joint activity of several students. Some examples of community projects are assisting with a summer play group of small children, cooperating in a local safety program, exploring employment opportunities for women in the community. An experience of this type may serve to make students conscious of local concerns and aware that the home can contribute to the solution of community problems.

It would be ideal for pupils to experience all three types of home experiences during their enrollment in home economics courses. Opportunities for desirable experiences may be planned as (1) part of the overall home economics program, (2) parallel with the unit being studied, (3) to be carried out when practical or convenient regardless of the unit being studied at the time, or (4) a part of the FHA program.



THE PURPOSES OF HOME EXPERIENCES

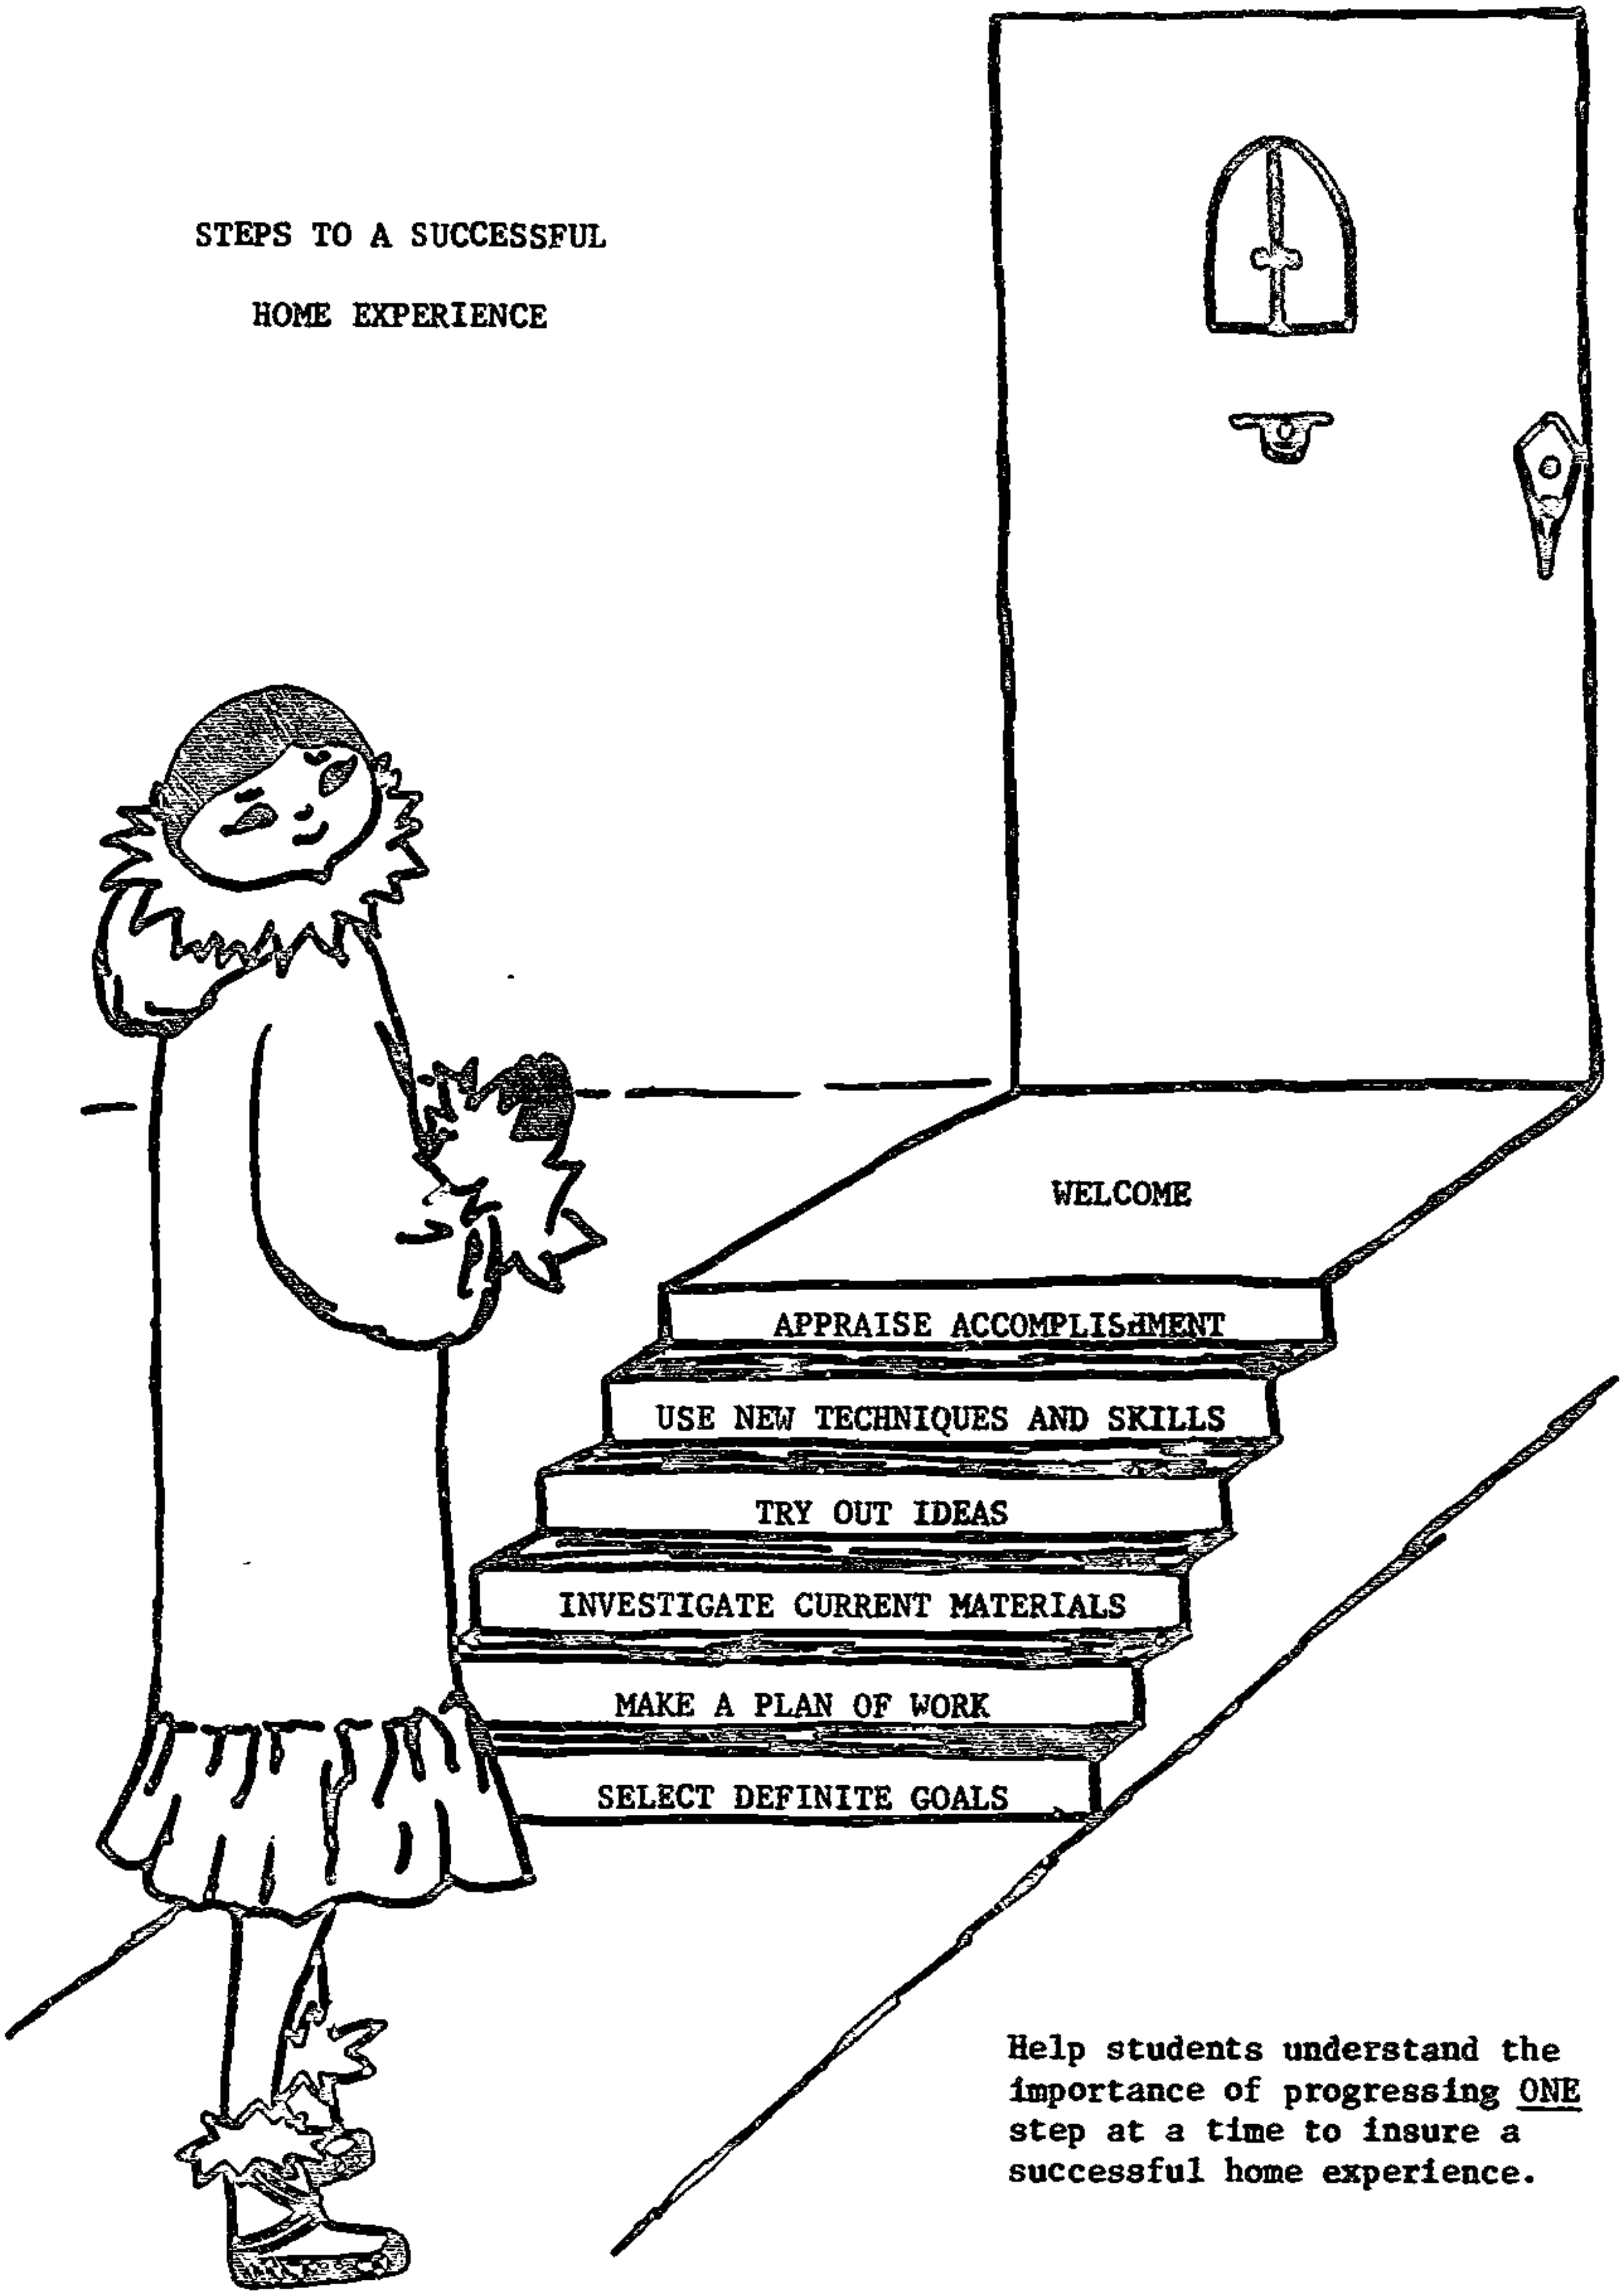
Home experiences are considered to be an integral part of a good home experience program. As such, the role they play is many-fold. Home experiences serve to:

* Relate classroom learnings to the everyday life of the student.
* Extend the scope of class work by encouraging activities that relate to concepts developed through in-class experiences.
* Provide for individual differences--differences in level of achievements, differences in rate of learning, differences in capacity for learning, differences in goals.
* Offer an opportunity for self-expression.
* Promote mutual understanding, interest, and cooperation among students, parents, and the school and thereby increase communication.
* Interpret home economics and the careers that may result from utilization of its knowledge and skills.
* Promote good public relations.

Home experiences offer students who are enrolled in home economics classes opportunities to:

* Develop problem-solving skills
* Work on projects which have definite meaning for the individual.
* Progress according to individual speed and ability.
* Become more aware of personal strengths and weaknesses.
* Practice self-evaluation.

STEPS TO A SUCCESSFUL HOME EXPERIENCE



Help students understand the importance of progressing ONE step at a time to insure a successful home experience.

INTRODUCING THE HOME EXPERIENCE PROGRAM

The teacher meets the same problems in making the home experience program effective that are encountered in making class instruction effective. She must stimulate and maintain keen, active pupil interest and guide the selection, organization, completion, and evaluation of the results. Recognition of these problems by the teacher and successful solution of them is essential.

The most successful methods of introducing the home experience program are those which permit interaction between students and teacher. They also provide a specific framework to guide the student by giving her activity suggestions and defining time limits.

Some methods which have proven effective tools for introducing the home experience program are:

* Write letters to the parents explaining the home experience program.

* Introduce the program through home visits.

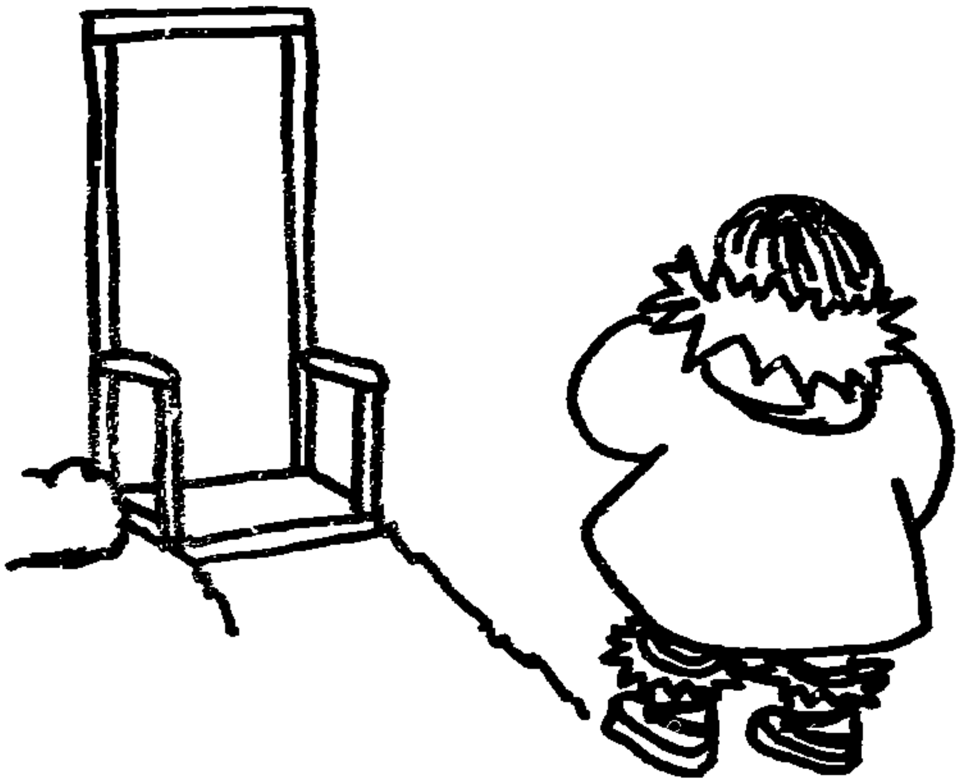
* Conduct a "Parent Night" to explain the home experience program.

- Have students from other classes discuss various types of projects.
- Conduct a class tour to see some completed experiences.
- Arrange an exhibit of the reports and the products of completed experiences.
- Give students a teacher-prepared list of experiences from which to choose.
- Display pictures of completed projects.
- Maintain a display of experiences in the school exhibit case.
- Have students present skits of home projects.
- Read outstanding projects from the previous year.
- Keep a department scrapbook or reference file of outstanding experiences to which students can refer.
- Divide a class into groups to prepare lists of home experience suggestions.
- Instruct students that they must do so many experience activities within a given period of time.
- Instruct students that they must do so many experience activities within a given time and within a given subject area.
- Assign an activity for each class member to carry out at home.
- Cooperatively plan home experiences in class.
- Have conferences with individual students.
- Present the home experience program through Future Homemakers of America as part of the chapter program of work.
- Incorporate the home experience program in the FHA degree program.

Careful planning is an absolute essential. No method of presentation will be successful if the teacher does not organize her part of the program first. The value of a home experience activity depends not only upon the opportunity for experience and practice, but also upon the guidance given the student in order that the practice is made meaningful.

Another absolute essential is a positive attitude by the teacher. A negative, unsympathetic attitude on the part of the teacher will doom the effectiveness of the program regardless of how complete the planning. There needs to be evidence of sincere interest in the joys, sorrows, and difficulties of the families of the students. Every individual is entitled to just treatment with justice based on understanding. Enthusiasm is infectious. So is imagination and creativity.

HOME VISITS



One of the most effective ways the home economics teacher may gain a real understanding of the students, the families, the homes, and the community is through the home visit. It provides the basic understandings she needs to plan and carry out an effective home experience program.

Preliminary planning of home visits is important and will help the teacher to receive invitations to students' homes. Several different approaches may be used, such as:

1. A letter to parents to explain the home economics program, including mention of home experiences and home visiting.
2. An invitation to parents to visit the home economics department during National Education Week.
3. A schedule of times the teacher has available for visiting may be posted on the bulletin board and students may "sign up" for a time best for them.
4. FHA offers excellent opportunities. If some students invite a committee to come to their homes, this provides a natural way to make a home visit that may provide valuable background as you work with the student on home experiences.
5. Taking a student home provides a natural situation to invite the teacher to come in and meet the family.
6. Teacher participation in community activities afford an opportunity to meet families of some students and may result in an invitation from the parents to visit the home.
7. An invitation to mothers to "coffee" in the teacher's home often results in a return invitation to visit the home.

In some communities, the home economics teacher is employed beyond the regular school year. This may mean she is employed two weeks before school begins in the fall and/or two weeks after school closes in the spring.

Extended employment affords an excellent opportunity for the home economics teacher to make home visits that may have been impractical or impossible during the school term. It also provides opportunity to plan and direct home experiences that extend into the summer.

Some Keys to Successful Home Visits*

1. Be friendly, natural, at ease, and express a sincere interest in the student.

2. Do not stay too long, especially on the first visit.

3. Explain the home economics program and tell how home experiences are included.

4. Give parents an opportunity to ask questions.

5. Enlist parents' assistance in providing real experiences for students in a home setting.

6. Show an interest in hobbies of family members.

7. If you are ill-at-ease, remember the family may be too. Try to put them at ease with your manner.

8. Remember, when you do home visits, you are an ambassador of the school; as such, you have a real opportunity to strengthen good relationships between the school and the home.

9. Be careful in keeping a confidential, professional attitude toward what you may learn on home visits.

STUDENT CONFERENCES

Conferences with students, individually and/or collectively, are a "must" for a strong home experience program.

Vocational home economics programs have a conference time set aside for working specifically with students. This time may not always be satisfactory, but the teacher with foresight will arrange a schedule with her students which will be of advantage to both herself and them.

The conference period is important. It will give the teacher an opportunity to discuss with the student home experiences she may be interested in and will help her make a choice. Following the first conference, the student should have several ideas about experiences she is interested in. She should then discuss the possibilities with her mother and together they should make a choice.

When a second conference is held, the student should present a plan for the home experience selected. The teacher should take this opportunity to discuss the plans pointing out possible problems, suggesting sources of help, a time plan, and type of record(s) to keep.

The number of conferences held with an individual will vary according to need.

Group conferences may be held, and students may report on progress and success of their experiences. The teacher should note progress and schedule further individual conferences if a need arises.

It is helpful to keep a record of conferences held and home visits made. The following record form is suggested:

RECORD OF CONFERENCES AND HOME VISITS
(use 4 x 6 file cards)

Name

Address

Phone

Conferences	Home Visits

CUMULATIVE RECORD OF HOME EXPERIENCES
(use 4 x 6 file cards)

Year	Home Experience	Evaluation
Freshman		
Sophomore

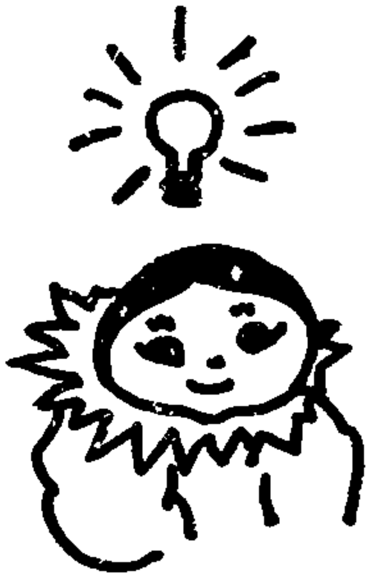
Senior		

IDEAS FOR HOME EXPERIENCES

Care and Guidance of Children



1. Learn to bathe, dress, and change a baby.
2. Take complete care of an infant's clothing, blankets, and equipment.
3. Learn to sterilize the baby's feeding bottles and to prepare formula.
4. Plan a story hour for a younger brother or sister or a neighbor's child.
5. Take care of a young child over a period of time; plan different types of entertainment and study development.
6. Serve as a "baby-sitter" for a period of time with a definite plan for the child's best care.
7. Supervise a small child's meals for two weeks helping him develop his eating habits.
8. Teach your three-year-old brother or sister to dress himself.
9. Prepare a baby-sitter's packet of "tricks" which will be helpful when you baby sit.
10. Prepare a variety of toys, books, games, and creative materials suitable for children three and four years old.
11. Observe children you know at different developmental levels for such things as bathing, feeding, dressing, and caring for themselves.
12. Make some inexpensive toys suitable and safe for children.
13. Investigate household objects which are safe and with which young children enjoy playing.
14. Plan and give a children's party for three to five year olds. Include appropriate records, toys, stories, books, and food.
15. Review current magazine articles which deal with habit formation of young children.

16. Make a chart using pictures to illustrate the steps in the physical development of a child during the first eighteen months of life.

17. Take complete care of a younger brother, sister, or relative for several days or a weekend.

18. Over a period of time, observe children in groups for various behavior patterns. Evaluate observations.

19. Practice reading or telling stories, singing songs, directing games for children. Evaluate results.

20. Compile a suitable list of games, records, stories for young children.

21. Make a check sheet, "What the Baby-Sitter Should Know."

22. Observe the parallel play of several children; note the frequency and form that social interaction takes.

23. Plan completely and carry out a party for a young chil· and his guests.

24. Make an observation over a period of time of a young baby. Record observations of such things as sleep, clothing, habits, mental and physical development, emotional responses, family adjustment to the new baby.

Consumer Buying

1. Visit a local grocery store over a period of several weeks. Observe arrangement of store, frequency of sales, prices of some standard items in comparison to other stores, services offered, peak hours of business, types of customers frequenting store. Analyze observations.

2. Do some comparative shopping for a small appliance, such as a toaster, hair dryer, hand mixer. Evaluate results and determine which model you would purchase.

3. Visit the baby department in a local store or consult a mail-order catalog and compile a list of clothing and equipment recommended for a new baby. Figure the cost.

4. Investigate several models of sewing machines reading available literature on each; then decide which you would purchase. Validate your reasons for selection.

5. Do a comparative study of a ready-made garment that is similar to a garment you have made. Record findings.

6. Select an item; study newspapers, magazines, and mail-order catalogs to see how much information is given about it. Record results.

7. Make a comparative study of several foods--raw, frozen, pre-cooked, and ready prepared. Record findings.

8. Work out a buying plan for clothing, including articles to buy; order of buying--what to buy first; time of buying--season, sale; qualities you expect in article; amount of money available; types of things you want to buy; what you have that can be used; make-over jobs that can be done; ready-made garments to be purchased; material to be purchased to make garments; how additions will fit into present wardrobe--color, style.

9. Investigate sources of ready-made garments--mail-order, department stores, specialty shops, custom made. Compare findings.

10. Visit local grocery stores and observe the variety of foods available and their relative costs.

11. Evaluate sales policies of various markets and decide on the economies of "sale buying."

12. Investigate various types of household equipment as to cost, availability, ease of care, efficiency, performance, etc.

13. Conduct a research project to determine meaning of different Seals of Approval, Brands, Trade Marks, Labels.

14. Study various consumer buying guides and evaluate information.

15. Do a comparative study on one of the following and decide which model you would purchase. Validate reasons and indicate from what source you would purchase. (Use a minimum of three sources in comparison.)

    Snow traveler
    Boat
    Outboard motor
    Camping trailer
    Airplane

Money Management

1. Make a plan for spending the money you earn.

2. Make a record of a week's personal spending; study and analyze good and poor management.

3. Keep an account of money earned during the summer. Make a plan for buying school clothes for the year.

4. Plan how to use summer earnings to best advantage. Prepare a plan indicating short- and long-term goals.

5. Discuss with your parents the financial planning for a college education or training for the career of your choice. Make plans for attaining this goal.

6. Keep a record of the money you spend for one month. Analyze the expenditures and use the information to plan a personal budget.

7. Keep a daily account of all the money spent by the family for one week; then discuss with the family how part of it may have been spent, saved, or used more wisely.

8. Make a budget plan which will help you to save money for college.

9. Plan on an allotted budget the whole family's "Easter outfit" and assist the members in their purchases.

10. Determine the family clothing budget for the year; then plan how each family member may purchase one new outfit.

11. Study a variety of methods of saving, such as government bonds, savings accounts, etc. Select one for personal use and work out a plan to add money to account at regular intervals. Report progress.

12. Develop a check list for good money management. Rate yourself and plan how to improve your habits.

13. Investigate the cost of one year at the college of your choice. Set up a budget for yourself based on findings.

14. Study ways of buying (cash, credit, revolving plan, etc.) and relate to overall cost of a specific item.

15. Keep track of family food purchases for one month. Analyze and plan how to cut down expenditures. Repeat, using new plan.

16. Set up a budget for your family based on actual income. Include items such as food, clothing, rent, utilities, recreation, education, insurance, savings, etc.

17. Work out a "Christmas Club Plan" for yourself. Test over a period of time and report results.

18. Investigate the various types of money-lending agencies and compare their interest rates.

19. Work out problems such as buying a TV, car, radio, etc., and figure cost of credit, amount of down payment, monthly payment, total finance charges, amount you will be paying and compare difference with cash value.

20. Investigate the kinds of insurances available and select the type of coverage needed by your family and the cost of same. Determine how your family will pay for this.

21. Select items of food, clothing, and household and make a study of sale prices versus regular prices. Use mail-order catalogs, local stores, and discount houses and determine savings, if any.

Grooming and Personal Development

1. Develop a list of needed improvements in individual appearance. Check on progress.

2. Keep a record of time required for grooming. Evaluate record and determine improvements to be made.

3. Determine your own figure type, designs, texture, and color best suited to self.

4. Make an inventory of and evaluate the accessories you have on hand. List those needed and plan how they may be obtained.

5. Evaluate personal wardrobe and wardrobes of family members in order to determine personal and family clothing needs.

6. Make plans for a self-improvement project; carry out project making periodic progress reports.

7. List problems of hands, nails, face, and feet and devise a plan for correcting. Report progress.

8. Decide which qualities you need to work on to be better accepted socially. Plan and carry out project recording results.

9. Keep a time and activity schedule for several days. Analyze and make changes as needed.

10. List personality traits you would like to acquire and develop a plan for improvement.

11. [illegible] a personal dating code. Try out and evaluate.

12. Keep a [illegible]ly schedule for a week and plan for better use of leisure time.

13. Devise a plan for forming a good habit to substitute for a [illegible] one. Carry out plan over a definite period of time and evaluate [illegible]sults.

14. Make a good grooming chart. Choose one item which has to do with good health habits and plan how you can improve this habit.

15. Plan and execute a project for improving personal appearance, such as taking care of hair and skin, learning to stop biting nails, or improving posture by exercise and diet.

16. Keep a daily record of time for one week. Study record and develop a plan for the following week. Evaluate the two weeks and develop schedules for another week on the basis of evaluation.

17. Devise a score sheet to evaluate your eating and health habits. Analyze results and plan for improvement.

18. Select a career in which you are interested. Study all available materials concerning the career and the necessary attributes for success in this career. Determine which attributes you now lack and plan how to develop them.

19. Interview several employers and determine their opinions of the importance of grooming and personality in employees. Summarize opinions.

20. If you are shy and ill-at-ease, make a determined effort to overcome this by attending a variety of social events. Report progress.

21. Make a schedule to take care of the clothes you will wear for the next week. See that clothes are ready and in good repair. At end of week summarize results. Repeat for another week improving on first week's schedule.

22. Make a grooming schedule for one week. At end of week analyze results. Repeat for another week making some necessary changes and evaluate progress.

23. Interview several women in various walks of life and determine their opinions of the kind and importance of grooming and personality development in relation to their station in life. Tabulate results.

24. Develop a self-rating chart to use in making a vocational choice.

Family and Social Relations

1. Plan the food and fun for some family occasions. Record results.

2. Make a work sheet for the family, including jobs for the small child. Study results and make necessary changes to improve efficiency.

3. Plan and carry out a project for improving table manners and/or table service. Report on results.

4. Plan with the family ways that each member may share responsibility for care of the home.

5. Discuss with your family their special hobbies and interests and plan how your home can better provide for these interests.

6. Work out a plan for improving and strengthening relationships with one or more members of the family; then carry out plan and report progress.

7. Devise means of improving relationships between self and family. Plan and carry out an evening of fun for family and friends.

8. Make a work plan to help improve cooperative attitude toward those with whom one shares responsibility for a room.

9. Make a scrapbook collection of games, stunts, and puzzles that might be used for entertainment of family members or friends.

10. Determine some of your family's special traditions. Discuss these traditions with family members to determine their origin, how they contribute to the family unit, and the value of continuing these ·ditions.

11. Devise a score sheet to evaluate your eating and health habits.

12. Help guide younger members of the family in learning courtesy and consideration for others.

13. Devise a fair way of sharing family possessions with other family members.

14. Reserve some time each week for family work and recreation. Plan and carry out independently certain home responsibilities.

15. Assist in planning special family activities for holidays, anniversaries, and birthdays.

16. Relieve your mother of household chores so that she will have some leisure time.

17. Investigate community activities in which family may participate; then devise plan for family participation.

18. Enlist the help of older family members in learning such skills as needlework, carpentry, wood carving, gardening, photography.

19. Evaluate the family's use of leisure time. Set up a plan for making the best use of the time in order to include a variety of activities.

20. Plan an outing for the family, such as a camping, hunting, or fishing trip. Make all arrangements for transportation, food, and equipment. Figure cost and evaluate results.

Family Health and Safety

1. Plan, equip, and label items for a medicine chest at home.

2. Make a survey of your home for possible safety hazards and plan how they might be corrected.

3. Find out what immunizations each member of the family has and check with the local health service or the family physician to see whether each one is protected against disease-carrying bacteria by the proper immunization. If not, make arrangements to have it done.

4. Prepare a chart of first-aid rules for common emergencies and post in a convenient location in your home.

5. Study the problem of waste disposal in your home and provide for its sanitary handling; waste food, waste tin and glass, waste paper, waste water.

6. Care for some member of the family who is ill, including good nursing care.

7. Make some improvised equipment and use in the care of an ill family member.

8. Take a first-aid course and make a simple first-aid kit for your family.

9. Plan ways of entertaining the sick child, adult, or aged.

10. Investigate the types of fever thermometers used in the home. Learn how and when to take temperatures, cleanse and store thermometers, and to record temperatures.

11. Prepare attractive food for a sick person in the home. Record results.

12. Get acquainted with the various types of medical care available in the community.

13. Study city health rules regarding garbage disposal.

14. Devise a chart for mother's care after the birth of a baby.

15. Check for danger spots in the homes of children with whom you sit. Suggest ways to correct or eliminate them.

16. Take an inventory of and appraise the medicine cabinet at home and make necessary changes.

17. Make a plan for your family in case of national or local emergency.

18. Help develop a good health habit chart for younger members of your family to keep. Check results at periodic intervals.

19. Assume responsibility for caring for family members who become ill. Prepare attractive trays to tempt their appetites; plan such surprises as flowers, cards, books.

20. Check your home and neighborhood to see if health and safety standards are satisfactory.

21. Prepare and use a check list on home safety. Check your home.

22. Teach younger brothers and sisters good health habits. Report progress.

Housing and Home Improvement

1. Work out a schedule for daily, weekly, monthly, and seasonal care of your home.
2. Study the storage facilities in your home and make plans to improve.
3. Make some improvised storage containers for specific use in your home.
4. Study traffic patterns in your home and experiment with ways to improve the flow of traffic.
5. Refinish a piece of furniture.
6. Upholster a piece of furniture.
7. Make some improvised furniture with boxes and/or barrels.
8. Take the responsibility of cleaning your home for two weeks. Make a schedule for daily and weekly care.
9. Take complete care of your room.
10. Plan kitchen storage. Plan specific places for all utensils.
11. Assume responsibility in your home by sharing in making beds, dusting, and cleaning.
12. Make simple, attractive accessories for your room, such as a waste basket, pin-up board, or a clothes hamper.
13. Arrange belongings conveniently and attractively, such as drawers, furniture, desk, closet, top of dresser.
14. Create a study center in your home.
15. Use and arrange flowers and materials of beauty in the home.
16. Decorate your home for Christmas or another special occasion.
17. Study the proper kind of pressing equipment and make some needed improvements to provide efficiency and safety.
18. Plan and make efficient arrangement of equipment in one or more work areas at home. Evaluate results.
19. Develop a score card for use in evaluating performance of duties in home care.

20. Make a cleaning kit for home use equipping it with all the necessary items.

21. Plan and improve the closet arrangement and storage for a room. Improvise a closet for a bedroom.

22. Plan a storage space for toys and books for a young child. Teach him to put his toys away.

23. Plan a window treatment for a room; select and make the articles.

24. With your family, plan the general outside repairs needed to improve the appearance of home and yard. Take responsibility for some repairs and evaluate results.

Laundering

1. Do the family wash for a period of time. Compare time spent and methods used.

2. Be responsible for the family wash; try different detergents and compare results.

3. Prepare a stain-removal chart and hang in a convenient place in the laundry area.

4. Assemble a stain-removal kit and place in a convenient place in the laundry area.

5. Assume responsibility for laundering your clothes for a period of time. Keep a record of time spent and methods used.

6. Make a comparative study of two or more laundry products.

7. Plan with mother to do family washing for the week. Check over laundry supplies and equipment and make improvements for mother's convenience and use.

8. Draw a plan of the laundry area at home and make suggestions as to how it could be arranged to save time and energy. Talk this over with the family and plan any changes which would seem desirable.

9. Do the family wash for one week. Check through clothes to find stains and remove according to directions. Do any necessary mending.

10. Do the family ironing. Practice ironing men's shirts according to the new time-saving method until proficient. Record progress.

11. Using a coin-operated dry cleaning machine, do the family dry cleaning; follow directions for use of machine and care for clothes when cleaned. Record results. Repeat several times to improve efficiency. Determine amount saved by doing dry cleaning in this manner as compared to sending to professional cleaners.

12. Collect all hang tags with laundering instructions from ready-made garments family has. Identify each and file in convenient place in laundry area for ready reference.

13. Set up a time and motion study in doing personal laundry. Evaluate.

14. Do a comparative study of washing some articles by hand and/or machine.

15. Set up a schedule for doing the family laundry. Test schedule and make necessary changes.

16. Compare results of doing family wash with cold water and cold-water detergent versus hot water and detergent.

17. Make a study of the laundry and spot-removal products on the market and available in your locality.

Family Foods and Nutrition

1. Plan the family's breakfast for one week seeing that each member has a balanced meal.

2. Plan and prepare the family's Sunday dinner for a given period of time.

3. Care for and plan for the use of all leftovers from meals for one week.

4. Plan menus for your family for one week.

5. Plan and prepare three meals a day for your family on some weekend.

6. Plan, prepare, and pack lunches for one week for yourself and other family members.

7. Take the responsibility for a luncheon for your mother's club entertainment.

8. Supervise the family meals for one week to see that every member has his quota of milk.

9. Plan and prepare a meal for a special occasion, birthday, holiday.

10. Prepare some special dishes to supplement mother's cooking, such as salad, dessert, vegetable, meat.

11. Keep a record of foods eaten for several days and summarize in terms of basic food groups. If improvement is needed, make a plan for it.

12. Check the nutritive value of all foods served at home for a given period of time. Analyze results.

13. Help your mother prepare the weekly grocery list, shopping, and assisting in storing purchases made.

14. Using a special diet problem, plan several days' menus for the family in such a way that the special diet can be provided without much trouble.

15. Become familiar with newer foods by using current magazines, newspapers, television, radio, etc., and compile the information.

16. Plan for a new meat, vegetable, and fruit to be included in the family's meals. Prepare and evaluate results.

17. Plan meals for one week and buy groceries based on the family food budget.

18. Collect recipes and ideas for creative means of preparing and serving foods for special occasions. Try some and record results.

19. Plan ways to make regular meals "special occasions" for the family.

20. Make a plan for improving dietary habits of self and/or a family member. Test and evaluate results.

21. Purchase family meat for at least one week. Take full responsibility for cooking the meat for the main meal each day.

22. Plan, prepare, and serve family meals with home preserved foods.

23. Assist mother in preserving foods at home. Compare cost of these foods preserved at home with foods commercially preserved.

24. Compare home canned and commercially canned food from a nutritional standpoint. Compare the Vitamin C content in foods canned by open-kettle and hot-water bath methods.

25. Plan and prepare desserts for family dinners for two weeks.

26. Make a scrapbook of ideas for special occasion dinners—menus, decorations, recipes, etc.

27. Plan, prepare, and serve a dinner for a special occasion.

28. Plan family menus for two weeks, including one menu for a special occasion.

29. Plan a foreign meal for the family and evaluate results.

30. Plan nutritious after-school snacks for younger members of your family.

31. Investigate the local foods available for preservation and preserve some using different methods of preservation. Compare results.

32. Plan and prepare several dinners using native products available locally for main dishes. Calculate nutritive value.

33. Gather wild berries and preserve by several different methods.

34. Prepare several main dishes that will freeze and store for later use.

35. Plan and prepare several main dishes using wild game, such as moose, reindeer, caribou, mountain goat.

36. If fish is plentiful in your area, experiment with it preparing it in several different ways. Record results.

37. Try a variety of yeast breads. Determine types family prefers and freeze some for later use.

38. Preserve wild game and fish by canning and/or freezing.

Community Experiences

1. Assist with a community drive to collect items of clothing and household articles to be used for families whose homes have been destroyed.
2. Volunteer your services to a charitable organization for a period of time. Report activities.
3. Assist with community playground activities.
4. Visit patients in your local hospital, especially the older people.
5. Volunteer your time to baby sit while mothers go to vote.
6. At Christmas or Thanksgiving, help collect food, clothing, toys and make them usable for some family.
7. Assist in a Sunday School, Church, or PTA nursery.
8. Volunteer to assist at a community health clinic for children.
9. Make a survey of local organizations which deal with children and identify the purpose they serve.
10. Volunteer to help serve at some large public banquets.
11. Assist in entertaining at special occasions, such as church socials, FHA, banquets, etc.
12. Assume responsibility for a Civil Defense job in the community.
13. Volunteer to work as a nursing aid or for other jobs at a hospital or health center.
14. Set up a gift-wrapping service or a messenger service during the holiday season.
15. Organize a recreation hour for children in your neighborhood.
16. Select a child who is a "shut in" and visit him at regular intervals.
17. Visit elderly people in your community offering to do little favors for them.
18. Increase your knowledge about health service agencies within the community.
19. Conduct a survey of your community to determine the job opportunities available to students not entering college. Prepare a report for the school newspaper.

20. Assist with community drives, such as Red Cross, Heart, March of Dimes, United Good Neighbor.

21. Cooperate with community organizations in preserving historical buildings and landmarks as part of our American heritage.

22. Work with community leaders to carry out a "Keep Our City Clean, Safe, and Beautiful" campaign.

23. Organize a neighborhood children's group to help children develop hobbies.

24. If a Head Start program is operating in your community, volunteer to assist. Report experiences.

25. Help organize a community information center to assist visitors in your community during the tourist season.

26. Volunteer to be a tourist guide during tourist season. Record experiences.

27. Study community traditions and help preserve those unique to community.

Clothing Care, Repair, Renovation, and Construction

1. Sort all clothes in your closet; repair those needing it and discard those beyond repair.
2. Press, clean, spot, and repair clothing at regular intervals.
3. Make a garment for a younger brother or sister.
4. Take care of the clothing of a younger brother or sister (launder, iron, repair).
5. Do all the family mending for a period of time.
6. Make a formal dress for yourself or your sister for some special occasion. Compare cost with ready-made garment.
7. Clean and store your summer or winter clothes.
8. Make a parka for yourself or a member of your family.
9. Make a pair of mukluks for yourself or a member of your family.
10. Learn the techniques of skin sewing by making a pair of mittens.
11. Alter a garment for yourself.
12. Make a small sewing kit and equip with the necessary items for making general repairs on clothing.
13. Arrange a sewing center in your home organizing equipment and storage in the most convenient way possible.
14. Remodel several garments for self or family members.
15. Store out-of-season clothing for the family.
16. Plan how to keep clothes in good condition and check on their care and storage. Report progress.
17. Repair clothes you no longer wear and give them to a community agency for distribution.
18. Study the advantages and disadvantages of buying fabric from fabric clubs, mail-order houses, out-of-town department stores.
19. Investigate the price charged by a store, tailor, dressmaker, dry cleaners, and/or laundry for alterations on ready-to-wear garments.

20. Study new man-made fabrics on the market; learn how to care for these fabrics. Select one fabric and make a garment following carefully manufacturer's instructions for fabric. Report results.

21. Study and practice the care of woolen garments, such as sweaters, skirts, coats.

22. Plan your clothing wardrobe for one year considering additions, discards, renovations.

23. Plan and construct a summer wardrobe for yourself.

24. Plan the clothes you will wear to school for a week and see that all garments are clean, pressed, mended, and ready to wear.

25. Study present wardrobe and decide what accessories you could make which will enhance wardrobe.

EVALUATION OF HOME EXPERIENCES

Evaluation of home experiences may be accomplished in a variety of ways, such as rating scales and score cards which have been developed by the students themselves.

Other methods might include written evaluations by parents and students, diary records, anecdotal records, and oral and written reports.

The devices used in the evaluation of home experiences should be developed in terms of the extent to which they furnish real evidence of growth. In some instances, this may mean that it is desirable to use several devices for evaluating each project. For example, soon after the project is under way one method of evaluation may be used. As the project progresses toward completion, another device is used. The final evaluation may be a device developed by the teacher, the pupil, and the parent. In this way, all concerned can see the growth of the pupil over a period of time.

The following are some suggested criteria for evaluating the home experience program:

1. The home experience should be evaluated in terms of pupil growth as it is related to the goals set up in the original plan for the home experience.

2. The teacher, pupil, and parents should all be involved in evaluating the home experience.

3. Techniques used in evaluation may vary with the individual and with the home experience being evaluated.

4. In record keeping, the evaluation is best recorded in the form of comments rather than grades.

5. Evaluation is not the final objective, but rather it should lead to new experiences.

Regardless of the method of evaluation selected, to be effective it must take into consideration the four parts of the home experience: the selection of the experience; the plan; the execution of the plan; and the student's judgment of the results.

CHECK LIST FOR THE HOME EXPERIENCE PROGRAM

Now that we've discussed what a good home experience program is like, let's take a look at the home experience program you have right now. Rate it on the following check list.

	Yes	No
1. Students and their families are aware of the purpose of home experience program.		
2. Home visits are conducted to enable the teacher to better understand the student, the home, and the community.		
3. Home visits are utilized to help interpret the home experience program to parents.		
4. The values of home experiences are emphasized to the students and their parents.		
5. Needs and interest, rather than grades, are used to motivate home experience selection.		
6. Results of outstanding home experiences are displayed.		
7. Home experiences are used as a means of helping students broaden interests and develop skills.		
8. Parents are helped to feel their responsibility in the home experience program.		
9. School and home experiences are used to supplement each other and build toward the goals of the total homemaking program.		
10. Home experiences are planned cooperatively by the student, teacher, and parent.		
11. Each home experience is planned to fill a need in the family, the school, or the community.		
12. Students are guided to select tasks done at home as a basis for selecting home experiences.		
13. Each home experience is adapted to the needs, abilities, and interests of the student.		
14. Students are helped to identify specific goals toward which to work.		
15. Students are guided to plan specific activities for attaining their goals.		

	Yes	No
16. Conferences are scheduled regularly with students.		
17. Specific topics of discussion for conferences are identified to the student in advance.		
18. Students gain satisfactions through accomplishment of goals.		
19. Accomplishments are evaluated in terms of student goals.		
20. Evaluation is continuous throughout the experience.		
21. Experiences are evaluated in terms of student growth.		
22. Evaluation of home experiences is done cooperatively with the student, the family, and the teacher participating.		
23. Each home experience provides the teacher with more insight and understanding about the student and his family.		

If your present home experience program rates a "yes" for 20 or more items, you have a well-planned and well-presented program that is producing the desired results. Give yourself an E for Excellent. If you score "yes" to 16-19 items, give yourself a G. The program is Good but can be improved. A "yes" score of 12-15 gives you an F for Fair. You have been overlooking a step or two that would make home experiences more valuable to your students. If you can answer "yes" to 11 items or less, record an O for Ouch! Your home experience program is getting less-than-desirable results. Some changes are in order.

SUPPLEMENT

The following pages contain samples of devices used in the home experience program. All devices not otherwise identified are developed from those used by home economics teachers in Alaska.

LETTERS TO BE SENT TO PARENTS

Dear _______________:

Your daughter (son) is enrolled in the Home Economics _____ class this year. The class meets for a single period daily so that she (he) may include more elective subjects in her (his) (sophomore, junior, senior) school year.

The goal of the home economics program is to help students become the kind of home members who can successfully assume the complex responsibilities of homemakers. Our program is no longer merely cooking and sewing. The student is offered a much broader view of homemaking. In addition to Foods and Clothing, we include activities in Child Care, Money Management, Home Nursing, House Planning and Decoration, Clothing Selection and Care, and Home Management.

We feel that close relations with the home of the students is necessary if good homemaking is to be taught in our school. We also feel that the activities introduced in school will have greater meaning if they are put into practice by the girl in her own home.

Therefore, your daughter (son) will be asked to select some activity to be carried on at home which will be related to the particular unit being studied in her (his) homemaking class. We will help her (him) select and plan something in which she (he) is interested and for which she (he) recognizes a need.

We hope that you will go over these plans with her (him) and give her (him) your suggestions. At the completion of this activity, we will appreciate your comments.

I would like very much to be able to call on you sometime or have you call on me in my home or visit school so that I may further explain the program as well as enlist your aid in carrying out these home experiences.

Your help in really "putting the home into homemaking" will be of great value to us. We thank you for your cooperation with the home economics department.

Sincerely,

Home Economics Teacher

Dear ______________:

As part of our home economics program, we include assignments known as home experiences.

A home experience is a task undertaken by home economics students at home which gives them an opportunity to learn something that will be important to them as a family member now and as a homemaker in the future. These projects are not "busy work" and are not simply for the purpose of acquiring skills. They serve a three-fold purpose.

1. They help the student learn to recognize and attempt to solve their individual problems.
2. They provide a means of putting our home economics program to work for the student.
3. They enrich our home economics program by helping us to become aware of the student's needs.

It is important that you and your daughter (son) agree on what experience is needed and together work out the means of accomplishing it effectivly. You are in a position to contribute considerably to the choice and accomplishment of those experiences that will some day help her (him) to be the kind of homemaker we both want her (him) to be.

Your cooperation and overseeing of home experiences is important if this purpose is to be attained. Your written approval is needed with the initial choice of the home experience. Your thoughtful appraisal and comment at its completion is also important if we are both to assess what your daughter (son) learned from her (his) undertaking.

I am looking forward to meeting you at our "Open House."

Very truly yours,

Home Economics Teacher

Adapted from "Home Experiences in Homemaking Education in New Jersey," Department of Education, Vocational Division, Trenton, New Jersey, 1962.

LETTER TO BE SENT TO SUPERINTENDENTS, PRINCIPALS, AND FACULTY

Dear _______________:

The goal of the homemaking program in the school is to help pupils develop into the kind of home members who will be able to assume successfully the complex responsibilities of homemakers.

For many years, homemaking or home economics was thought of as a program of cooking and sewing. With our changing world, this can no longer be so. Homemaking has become a career in itself; and the homemaker must be a well-informed buyer, nurse, manager, child care expert, home decorator, and counselor. We are trying to prepare the students, as best we can, to meet these tasks. In addition to instruction in Foods and Clothing, we are able to offer to the student instruction in Child Care, Health and Home Nursing, House Planning and Decoration, Home Management, and Family Relationships.

In connection with our program at school, it is recommended that each student participate in home experiences. These experiences are carried on by the student at home and require planning and supervision. Sometime during the year I hope to visit with each mother to explain the program and enlist her aid in carrying out these home experiences.

With the cooperation of school officials, faculty, and parents, it is felt that the homemaking department can help develop a more worthy citizen for the school, community, and home.

Sincerely yours,

Home Economics Teacher

Adapted from "Homemaking Education Progress Report, Curriculum Study Program - Vermont," State Board for Vocational Education.

PARENTS' CHECK LIST ON NEEDED HOME EXPERIENCES

My daughter needs experience in the following activities:

___ Preparing breakfast

___ Preparing other meals

___ Setting the table properly

___ Cleaning up after meals

___ Preparing school lunches

___ Preparing family meals

___ Preparing dishes from leftovers

___ Making breads

___ Baking cakes and pies

___ Canning

___ Freezing

___ Planning menus

___ Buying groceries

___ Arranging cupboards and drawers

___ Cleaning or caring for her own room

___ Cleaning other rooms

___ Painting or rearranging room

___ Doing family ironing

___ Doing family washing

___ Mending, repairing, darning

___ Personal grooming

___ Caring for her clothing

___ Sewing for herself

___ Sewing for family

___ Making over clothes

___ Correcting posture

___ Developing good manners

___ Sharing family responsibilities

___ Caring for younger children

___ Cooperation with other family members

___ Choosing and buying general merchandise

___ Budgeting spending money

___ Choosing and buying own things

___ Refinishing furniture

___ Reupholstering furniture

___ Cleaning upholstered furniture

___ Develop hobbies for spare time

Add additional suggestions:

Taken from Vocational Homemaking News Bulletin, Vol. IV, No. 2, April '56, Helena, Montana.

CHECK LIST FOR STUDENTS	Things I Do At Home	Things I Would Like To Do	Things I Would Like To Be Able To Do
1. To care for my clothes.			
2. To get in the habit of caring for my room before school in the morning.			
3. To get up when I am called.			
4. To get in the habit of doing the dishes as soon as the meal is over.			
5. To prepare breakfast for my family.			
6. To prepare the evening meal.			
7. To prepare desserts.			
8. To help with cleaning the house on Saturday.			
9. To do sewing for myself at home.			
10. To get along better with other members of the family.			
11. To serve and wait on the table.			
12. To plan my wardrobe.			
13. To redecorate my room.			
14. To refinish some furniture.			
15. To keep my closet and dresser drawers neat.			
16. To care for my shoes.			
17. To care for little children.			
18. To budget my money.			

Taken from "Home Experiences in Homemaking Education in New Jersey," Department of Education, Vocational Division, Trenton, New Jersey, 1962.

HOME EXPERIENCE PLAN FORM

Name of student ______________________________ Date ____________

Project ____

Date on which project was begun ______________________

Date on which project was completed ____________________

Mother's consent on subject of project ___________________

Before starting the project:

Consider several possibilities. Think each one over and see if it meets the following requirements of a good project.

1. It is an out growth of my school work or related to it.
2. It gives me a chance to use at home something I have learned or started to learn at school.
3. I have a definite goal which I am trying to accomplish.
4. I really want to do it.
5. It is difficult enough so that I will have to work to accomplish it.
6. It will require planning and management.
7. It will have the cooperation and interest of my family.
8. It needs to be done.

My reasons for choosing this project are:

My purposes and aims for this project:

My plans for doing this project are:

What I need to know and where I can find it are:

If it involves buying something, how will I finance it?

Who will help you?

Where might you get additional information.

Do you intend to refer to any books, magazines, etc.?

Report of my project:

Record (step by step):

Results:

The most successful part of my home project was:

My difficulties in accomplishing my goals were:

The changes I made in my project and the changes I would make if I were doing it again are:

The ways in which I gained ability by doing this project:

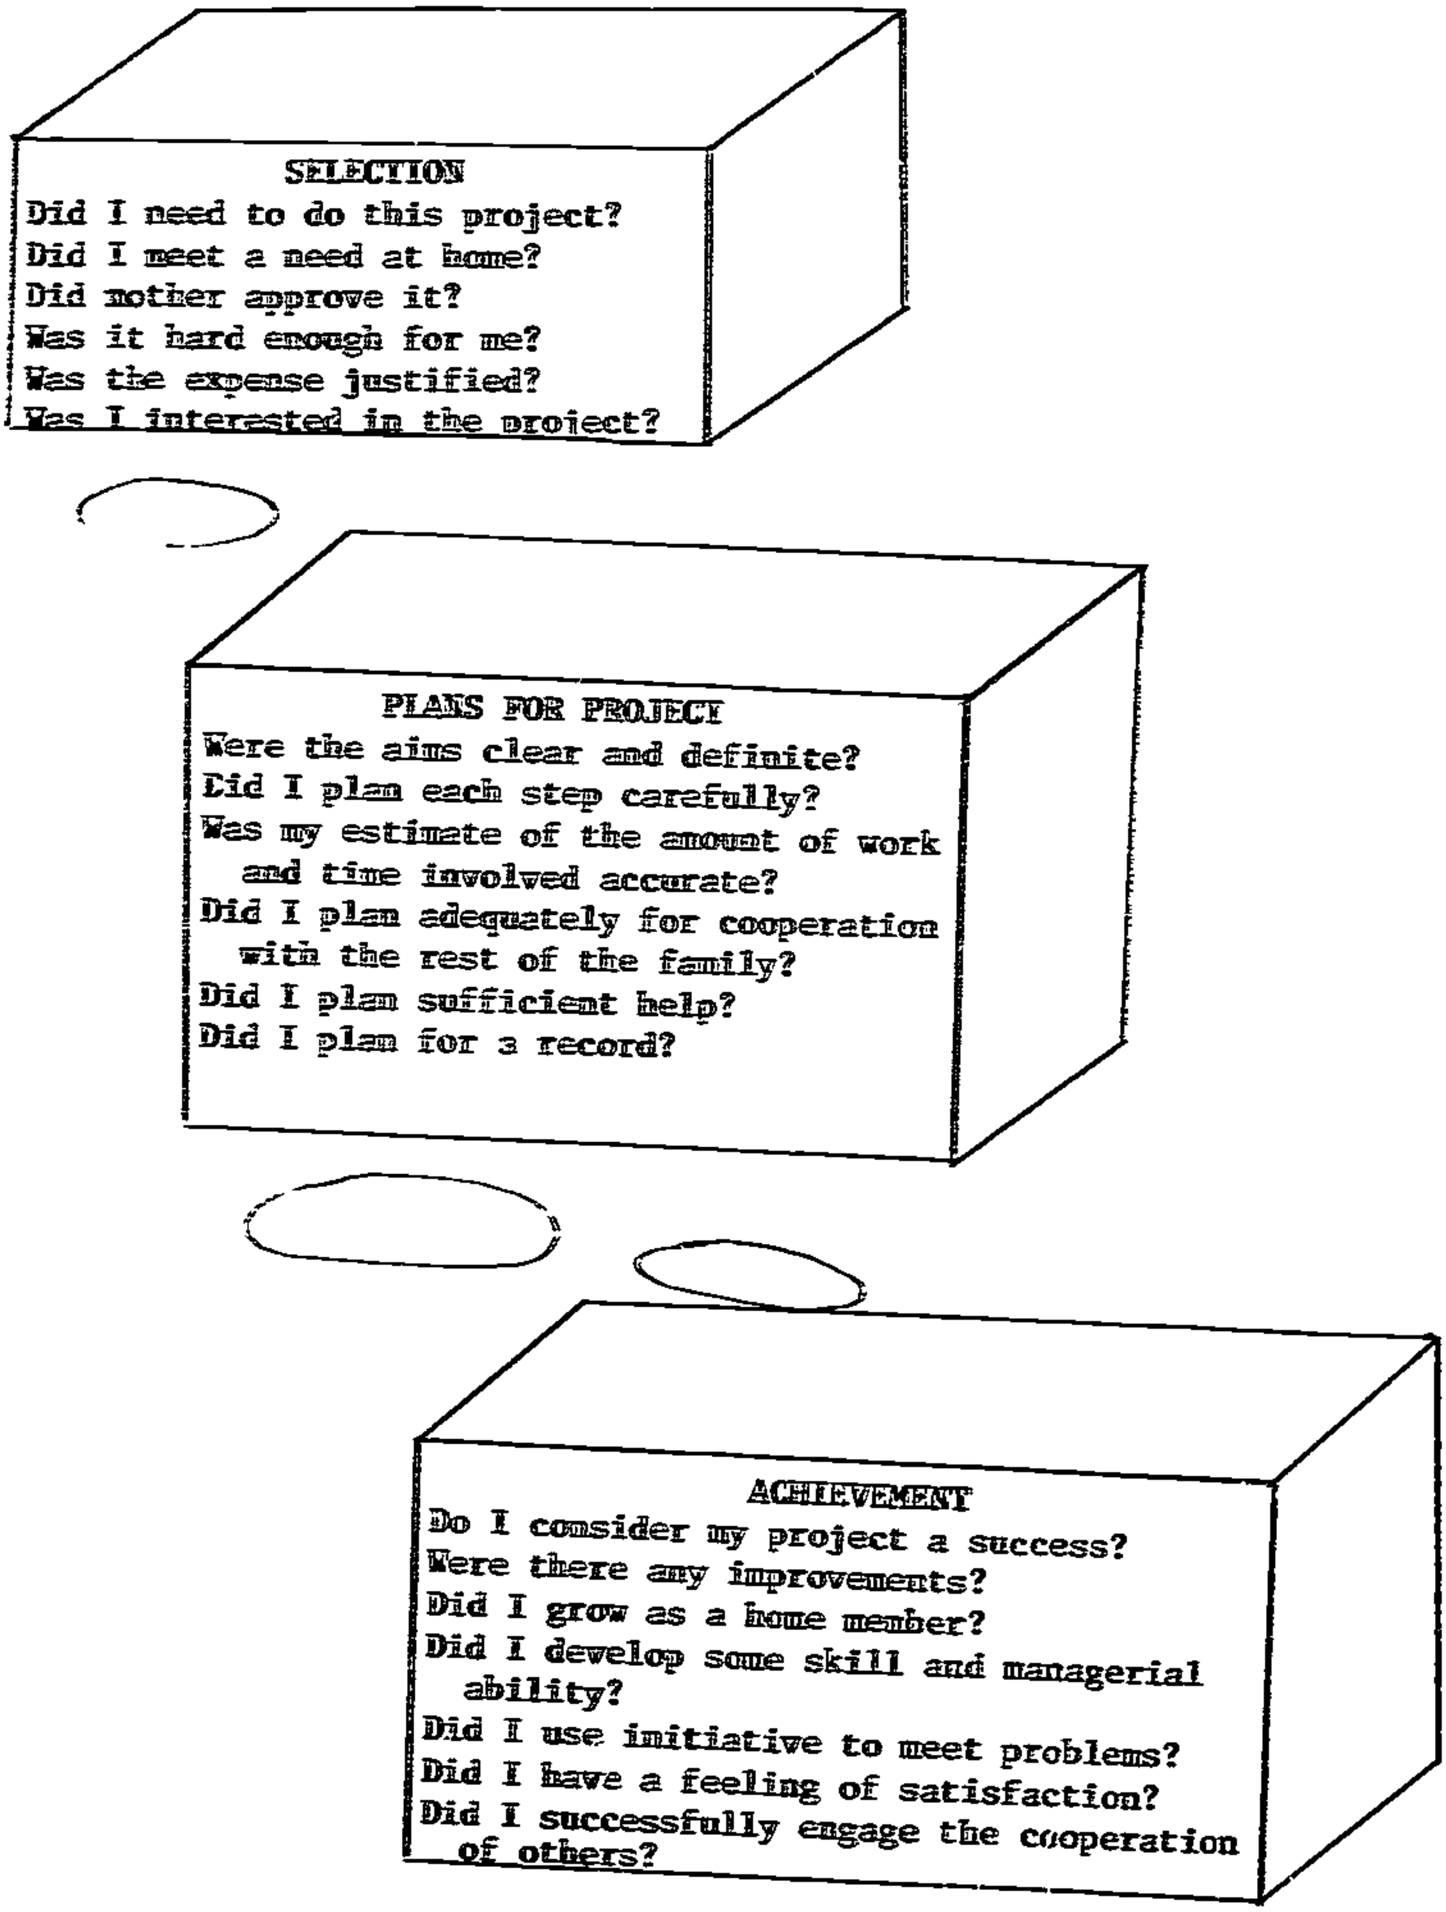
Where did I get the idea for my project:

Does my family feel the project is worthwhile:

What additional information is there about your project that might be of interest:

Comments and signature of my parents or person with whom I worked:

STUMBLING BLOCKS OR STEPPING STONES OF MY PROJECT



SELECTION

Did I need to do this project?
Did I meet a need at home?
Did mother approve it?
Was it hard enough for me?
Was the expense justified?
Was I interested in the project?

PLANS FOR PROJECT

Were the aims clear and definite?
Did I plan each step carefully?
Was my estimate of the amount of work and time involved accurate?
Did I plan adequately for cooperation with the rest of the family?
Did I plan sufficient help?
Did I plan for a record?

ACHIEVEMENT

Do I consider my project a success?
Were there any improvements?
Did I grow as a home member?
Did I develop some skill and managerial ability?
Did I use initiative to meet problems?
Did I have a feeling of satisfaction?
Did I successfully engage the cooperation of others?

A PARENT HAS THE LAST WORD

Name____________________________

	Much	Some	Little
1. Was she interested in the project? Comments:			
2. Did she use her time well? Comments:			
3. Was she able to follow her plans? Comments:			
4. Was she able to meet difficulties? Comments:			
5. Did she obtain good results? Comments:			
6. Did she benefit from the project? Comments:			
7. Did the family benefit from the project? Comments:			

In what ways did YOU think the project was worthwhile?

HOME EXPERIENCES

What are They?

Home experiences are designed to give you an opportunity to do things on your own in order to help you grow and develop and acquire skills which will aid you as an individual person, as a family member, or as a member of your school and community. Your projects are to be carried on outside of school but with the aid of your teacher, parents or some other family member, or friend if necessary.

Your home experience should help you reach some goal which you have set for yourself. Two projects are required each year, and at least one of the projects should be for someone in the family other than yourself. Use the following pages as a guide. When you have completed your project, you may bring it to school for checking, take pictures of your project as you work along on it, or you may ask your teacher to visit your home to see it.

The Important Thing is to Follow the Four Main Steps:

1. Decide upon a goal which has meaning for you and your family. (Mom and Dad may be a real help here.)
2. Set your goal and plan for reaching it.
3. Follow your plan recording your successes and failures.
4. Evaluate or judge the success of your project.

How are They Graded?

Each home project requires a minimum of twenty hours of work. Record the hours immediately after you work on your project so you will not forget how many hours you put in and what you did. (See page c.)

1. A good job which is well reported rates a ____ grade and will ______ your ________ grade.
2. An average or "so-so" kind of report and project gets a ____ and ____________ your ________ grade.
3. A poor sloppy project showing lack of interest and effort will receive a ____ grade and will _______ your ________ grade.
4. Failure to do a home project means _______ for the _________.

PLANNING YOUR PROJECT

MY GOALS:	**MY REASON FOR CHOOSING EACH GOAL:**

MY PLAN FOR WORKING TOWARD GOALS

WHAT I NEED TO LEARN:	**HOW I WILL LEARN:**

HOW I WILL REPORT PROGRESS TOWARD GOALS

(b)

Checking Your Plan

Keep a careful record here of your progress toward your goals or goal. Be sure to record date and time each time you work on the project:

Goal: ____

Date	Time	What I Did

Give yourself credit for your success. Think how you may be able to improve upon the things that did not turn out so well.

What I Learned	Ways I Was Successful	Need To Improve

Summary of information gained from my references:

Parents' Evaluation

We would like to get your parents' honest opinion on this project. Did they think it was of benefit to you and your family or was it just a waste of time?

VT 003 565 ED 015 271
Industrial Radiography Course, Instructor's Guide, Volume I.

Texas Agricultural and Mechanical Univ, College Station
Pub Date - 67
EDRS PRICE MF-$1.50 HC-$16.16 402p.

*CURRICULUM GUIDES, *TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *RADIOGRAPHERS, *RADIATION, TECHNICAL EDUCATION,

The purpose of the guide is to give maximum assistance to instructors in planning the training of licensed industrial radiographers. It was developed by the Engineering Extension Service, Texas Agricultural and Mechanical University, College Station, Texas. The 21 units include (1) industrial applications, (2) nondestructive testing methods, (3) professional ethics, (4) radiation detection instruments, (5) related mathematics, (6) effects of radiation, (7) iron and steel, (8) applications of welding, (9) contamination tests, (10) film exposure factors, (11) standards and licenses, (12) required records and reports, (13) equipment, (14) film, (15) measurement of radiographic sensitivity, and (16) transportation of radioactive materials. The 114 lesson plans each give subject, purpose, teaching aids, references, preparation of the learner, instructional topics, application, test, and summary. Students should be 18 years old and high school graduates who, whenever possible, possess proficiency in mathematics, physics, and chemistry. They must not be accident prone, emotionally unstable, or have a tendency to panic. Total lesson time required is 242 hours. A companion volume (VT 003 503) contains 52 information sheets related to the lesson plans, a glossary, and a bibliography of books and films. (EM)

INTRODUCTION

Anyone planning to teach the course outlined in this guide should briefly review his objectives recognizing the fact that the field of radiography has not been reduced to an exact science capable of providing repeatable, predictable and non-variable responses to tests and scientific exploration.

He must recognize as well the greater importance of interpreting the findings of a test as compared to the more accurate pictorial representation of the conditions being examined.

The basic objectives of the course previously referred to are simply these:

To train adept individuals in the appropriate techniques of inspecting parts, materials and processes using for this purpose radioactive material or radiation producing equipment including all technical and practical applications related thereto, that is, film exposure, film processing, interpretation and evaluation.

To develop individual competency in the art or science of radiography to a degree that the individual can meet all of the requirements for a license that may be issued by an appropriate state licensing authority or the U. S. Atomic Energy Commission.

In order to give maximum assistance to the instructor in meeting the objectives of the course and in the accomplishment of his teaching assignment this instructors guide outlines in detail all information, helps, guides and suggestions that he may need in acquitting his responsibility.

The lesson plans contained herein provide the instructor with essential information relating to each topic together with other helpful aids and ready references for his use.

These lessons are not intended as inflexible guides or stereotyped formats but should be used as suggested and when coupled with the skilled techniques and professional ability of the teacher can be most helpful in allowing for each individuals own personal treatment of the subject matter being careful, however, that a thorough course coverage is effected.

Topic arrangement has been planned and should be adhered to whenever possible providing for the orderly development of procedural knowledge and technical aptitude.

The instructor must take sufficient time to review each lesson plan prior to its use giving himself the opportunity of procuring the suggested teaching aids, films or whatever else is suggested therein.

Several films are listed as essential conveyors of information, however, the instructor should be aware of the need for scheduling these well in advance of the anticipated date of showing to insure adequate time for delivery.

It might be stated merely as a refresher note that good instructors have no difficulty in placing the proper emphasis on the use of films, visual aids and other teaching devices, never using them in place of sound teaching techniques but rather to emphasize and stress various elements of the program or as a device for effective summarization of course material.

In addition to the aforementioned related technical information lesson plans, manipulative lesson plans, and experiment exercises are also included in this guide. These are used in conjunction with laboratory exercises and planned practice sessions. Their use and application is quite similar to those previously discussed and will be found to be quite helpful in the operation of the training program.

Appropriate tests and examinations are also included for the instructor's use and should be applied in their respective sequences or at such times when it is a reasonable certainty that all subject matter covered by the test has been adequately presented.

The appendix of this instructors guide also contains a glossary of terms, bibliography, film list, selected reference material, specifications, drawings and suggested instructional aids.

ENROLLEE QUALIFICATIONS

The basic or fundamental qualifications of a radiographic trainee are a minimum age of 18 with a capability of rendering mature and sound judgements, making intelligent decisions and correct interpretations. The individual must also possess good health and be physically able to perform routine manually dextross operations.

The prospective student should have a high school education or its equivalent. Whenever possible it is desirable that the trainee possess or develop proficiency in algebra, trigonometry, mechanical drawing, elementary physics and chemistry.

The individual should possess a reasonably neat appearance, have normally good or properly corrected vision making him capable of detecting minute structural plans in poorly lighted areas.

There must be no record of accident proneness, emotional instability or tendency to panic.

He must be ready adaptable to any work situation, be reasonably facile, completely honest and dependable.

TABLE OF CONTENTS -- Volume I

Unit 6

Lesson 1	Ionizing Radiation
Lesson 2	Isotopes -- Excursions in Science
Lesson 3	Atomic Structure of Matter
Lesson 4	Nuclear Radioactivity
Lesson 5	X-Radiation
Lesson 6	The Effects of Radiation of Physical Matter
Lesson 7	Biological Effects of Nuclear Radiation
Lesson 8	Methods of Reducing Radiation Dosage
Lesson 9	The Calculation of Shielding Thickness
Lesson 10	Elements of Electrical Circuits

Unit 7

Lesson 1	Gamma Ray Apparatus
Lesson 2	X-ray Apparatus
Lesson 3	Decay of Radioactive Materials
Lesson 4	Construct an Isotope Decay Chart

Unit 8

Lesson 1	Chemistry of Iron and Steel
Lesson 2	Semi-finished Steel
Lesson 3	Rolling of Sheet and Plate Steel
Lesson 4	The Structure of Metals
Lesson 5	The Phase Diagram (Metallurgy)
Lesson 6	The Manufacture of Castings
Lesson 7	The Heat Treatment of Steel
Lesson 8	Visit of a Foundry

Unit 9

Lesson 1	The Metallurgy of Welding
Lesson 2	The Welding and Joining Processes
Lesson 3	The Weld Profile
Lesson 4	Weld Defects
Lesson 5	Welding Procedures and Operations
Lesson 6	Multiple Exposure Pipe Radiography
Lesson 7	The Effect of Focal Distance
Lesson 8	Double Wall Pipe Radiography
Lesson 9	Panoramic Pipe Radiography
Lesson 10	Radiography Film Interpretation (Welds)
Lesson 11	Radiography Film Interpretation (Castings)

Unit 10

Lesson 1	How to Interpret Lines on Drawing or Blue Prints
Lesson 2	Shop Drawings and Blueprints
Lesson 3	Graphic Inspection Symbols
Lesson 4	Graphic Welding Symbols

Unit 11

Lesson 1	Tests for Contamination
Lesson 2	Make a Wipe Test

Unit 12

Lesson 1	Factors Governing Exposure
Lesson 2	Calculations of a Gamma Exposure
Lesson 3	Conversion Formulas and Graphs used in X-ray Exposure Calculations
Lesson 4	How to Use X-ray Exposure Charts
Lesson 5	X-ray Exposure Charts
Lesson 6	Scattered Radiation
Lesson 7	The Control of Scattered Radiation
Lesson 8	Exposure Changes for Changing Density
Lesson 9	Changing Focal Distance

Unit 13

Lesson 1	Standards for Protection Against Radiation
Lesson 2	Licensing of By-Product Materials
Lesson 3	Licenses for Radiography
Lesson 4	Emergency Procedures for Radiographic Operations

Unit 14

Lesson 1	Record Keeping for Radiographic Operations

Unit 15

Lesson 1	Permanent Exposure Facilities

Unit 16

Lesson 1	X-ray Tubes
Lesson 2	X-ray Generator
Lesson 3	Set-up, Connecting, and Preheating of X-ray Generator Tubes

Lesson 4	Auxiliary Equipment for Handling X-ray Generators
Lesson 5	The X-ray Generator
Lesson 6	Measuring X-ray Tube Heel Effect
Lesson 7	Design Characteristics of Gamma Camera
Lesson 8	Gamma Ray Exposure Devices
Lesson 9	Preparation of a Remote Controlled Gamma Ray Camera for an Exposure
Lesson 10	Radiography with Unattached Gamma Ray Sources
Lesson 11	Changing Sources
Lesson 12	Focal Spot Size
Lesson 13	Visit to a Pipeline or Process Construction Job

Unit 17

Lesson 1	Film Manufacturing Process
Lesson 2	Characteristics of Radiographic Film
Lesson 3	Radiographic Film
Lesson 4	Loading of Film Cassettes
Lesson 5	The Photographic Process
Lesson 6	Film Artifacts
Lesson 7	Care and Handling of Radiographic Film
Lesson 8	Multiple Film Exposure

Unit 18

Lesson 1	Darkrooms
Lesson 2	Darkroom Housekeeping
Lesson 3	Insertion of Film on Processing Hangers
Lesson 4	Use of Film Processing Reels
Lesson 5	Film Processing Chemicals
Lesson 6	Darkroom Film Processing
Lesson 7	Control of Chemical Processing
Lesson 8	Preparing for Film Radiography

Unit 19

Lesson 1	Photographic Density
Lesson 2	Calibration of a Transmission Densitometer

Unit 20

Lesson 1	Measuring Radiographic Sensitivity
Lesson 2	Radiographic Subject Contrast
Lesson 3	Radiographic Film Contrast

Lesson 4 The Effects of Geometric Factors on Definition
Lesson 5 The Effects of Graininess Factors on Definition
Lesson 6 Depth Localization of Defects
Lesson 7 Depth Localization of Defects
Lesson 8 Procedure Qualification

Unit 21

Lesson 1 Operation of Portable Power Plants

Unit 22

Lesson 1 Shipping Radioactive Materials

TABLE OF CONTENTS -- Volume 2

INFORMATION SHEETS

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 1
Lesson 1
Time 2 hours

SUBJECT: Radiography as an Industrial Tool

AIM (or purpose): To develop a familiarization with the various uses of penetrating radiation as it may be used by industry

TEACHING AIDS: Radiography facilities
Radiographic film of defects in welds and castings
Film of corrosion damage in piping
Sample defective parts

REFERENCES: Nondestructive Testing Handbook, Volume I, 1963, Society of Nondestructive Testing, Evanston, Ill.
Information Sheet #1 (Included in Appendix of this manual)

I. PREPARATION (of the learner)

A. As an introduction, explain the purpose of this course and briefly describe the procedures and activities in which the class will be involved during the course
Define radiography (write it on chalkboard)
State briefly the function of a radiographer
Make comparison of medical and industrial radiography
Indicate some uses of radiography besides defect detection
Point out that some defects are not detectable by radiography

B. Introduce the aim or purpose of this lesson.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Radiography for flaw detection	1. Explain and discuss preventive maintenance programs to detect fatigue cracks, corrosion, and other service defects. 2. Explain & discuss the code requirements for inspection of new fabrication. 3. Explain the use of radiography for inspection of high performance equipment such as aircraft, where failure cannot be tolerated. 4. Explain & discuss flaw detection for the improvement of manufacturing processes. 5. Questions
B. Radiography as a gauging device	1. List the automated devices used by steel mills to control the thickness of sheet steel. Processes whereby sheet steel is gauged through detecting variation in radiation intensity as it passes through the sheet while it moves past the radiation beam. 2. Explain the control of cigarette density by radiation gauging. 3. Explain & discuss the measurement of corrosion damage employing the use of radiographs and instrumented radiation gauges. 4. Sketch a typical fluid level gauging application using a "Penetron" type device. 5. Questions
C. Other uses of radiography	1. Describe the: a. Identification of false art works b. Location of hidden objects c. Inspection of components for proper placement in electronic manufacturing 2. Questions

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Take students on a guided tour of the school facilities and point out the various pieces of equipment used in industrial radiography.

B. Show sample of radiographs, defective welds, castings and corrosive metal loss in steel pipe.

C. Promote discussions during tour regarding the use of penetrating radiation.

IV. TEST (final check on students' comprehension of material presented)

NOTE TO INSTRUCTOR: The following essay type test questions will be given for most of the lesson plans in this course. It is suggested that the instructor use the essay questions as a guide for designing objective type test items (true-false, multiple choice, completion, matching, etc.) to be used as a printed "Pass-out" test. The testing method should be varied to maintain a high interest level.

Conduct a question and answer period on the uses of penetrating radiation for industrial purposes.

A. How can penetrating radiation measure thickness of materials?

B. How can penetrating radiation measure the relative density of a material?

C. How can penetrating radiation be used as a remote liquid level indicator and/or level controller?

D. How can penetrating radiation be used to detect the presence of internal erosion or corrosion in a pipe or vessel?

E. How can penetrating radiation detect internal flaws in opaque objects?

V. SUMMARY

A. Radiograph is a shadow image of an opaque object.

B. Radiographs cannot detect all hidden discontinuities in an opaque object.

C. Penetrating radiation has many other industrial uses.

The Next Lesson is: Industrial Applications of Radioisotopes

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 1
Lesson 2
Time 2 hours

SUBJECT: Industrial Applications of Radioisotopes

AIM (or purpose): To develop an understanding of the many industrial uses of radioisotopes

TEACHING AIDS: Film: Industrial Applications of Radioisotopes, (1960), 57 mins., 16 mm, sound, U.S. Atomic Energy Commission

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

Introduce the film - name, length, color, etc. stress lesson aim,

A. The following points should be observed by the student when viewing the film:
   1. The three fundamental divisions of industrial usage
   2. The various types of gauging devices and how they differ; i.e., the through - transmission, the backscatter, the beta and the gamma ray gauges
   3. Methods of flow measurement using radioisotopes
   4. Uses of flow gauges and fluid level indicators
   5. The various types of radiographic exposure devices shown in the film

B. The above points will give a better understanding of the many applications of industrial radioisotopes.

C. After the film is shown a test will be given regarding the previously discussed items.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Industrial Applications of Radioisotopes"	Show the film

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Discuss the film - with the students and emphasize the following points:

A. The three fundamental classifications of industrial radioisotope applications:

   1. Gauging
   2. Radiography
   3. Tracing

   As each of these areas of work are discussed the subject should be amplified and elaborated upon.

B. The principles and applications of:

   1. Back scatter gauges
   2. Beta gauges
   3. Gamma gauges
   4. Through-transmission gauges
   5. Fluid densitometers
   6. Fluid level gauges

C. The different types of gamma exposure devices seen in the film and the various applications of each.

D. Tracer applications

E. If certain points need additional clarification reshow the film or portions of it.

IV. TEST (final check on students' comprehension of material presented)

Note: Oral Quiz

A. What are the three basic categories or classifications of industrial isotope applications?

B. Explain the difference between a back scatter and a through transmission thickness gauge.

C. What is the field of application of a beta gauge? Of a gamma gauge?

D. Why is it necessary to have different types of gamma ray exposure devices in radiographic applications? Why are different isotopes used?

E. How can a volume of fluid flow be measured using radioisotopes?

V. SUMMARY

A. Industrial applications of radioisotopes are being applied by manufacturers of rubber, steel, plastics, paper, nylon, foods, cement, ships, oil and automobiles.

B. Tracer materials must be handled carefully and controlled because they are not usually recovered.

C. Beta emitters are used for penetrating thin materials having a low relative density.

D. Gamma emitters are used in radiography and in measuring thick, high density materials.

The Next Lesson is: Ultrasonic Nondestructive Testing

\\\\8

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 2
Lesson 1
Time 1 hour

SUBJECT: Untrasonic Nondestructive Testing

AIM (or purpose): To develop understanding of nondestructive testing methods outside the field of industrial radiography

TEACHING AIDS:
- Ultrasonic test equipment
- Ultrasonic test blocks
- Sample defective parts
- Transducers

REFERENCES: Nondestructive Testing Handbook, Volume II, 1963, Society for Nondestructive Testing, Evanston, Ill.

I. PREPARATION (of the learner)

Explain how this method of testing can be useful to the radiographer:

A. As a supplement to radiography

B. Where radiography can not be effected

C. When a less expensive method of testing is needed

D. As a thickness test where only one side of the material is exposed

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Pulse echo testing 1. Transmission 2. Reception 3. Reflection	1. Draw a chalkboard sketch to illustrate the introduction of sound into a material, its reflection, and reception by the instrument. 2. Explain the pulsing of the sound to allow time for receiving the reflected signal. 3. Questions
B. Ultrasonic transducers	1. Explain the piezoelectric phenomenon. Term means "Pressure Electric" Pressure applied to Quartz crystal causes a potential difference between its opposite sides; ultrasonic transducer contains such a crystal. 2. Describe the construction of transducers including the wear-plate, dampening materials, and electrical connections. 3. Display typical transducers. 4. Questions
C. Wave propagation 1. Longitudinal 2. Shear 3. Surface 4. Lamb	1. Illustrate and define on chalkboard the various wave forms. 2. Illustrate applications for each mode or wave form. 3. Questions
D. Acoustic impedance	1. Explain sonic reflections in terms of accoustical mismatch. 2. Explain why some materials reflect part and transmit part of the incident beam. 3. Explain the decay of the sound intensity as the beam travels farther away from the transmitter. 4. Questions

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
E. Applications for sonic testing 1. Flaw detections 2. Thickness measurement	1. Illustrate flaw detection on chalkboard. 2. Illustrate on chalkboard the measurement of pipe wall thickness. 3. Questions
F. Limitations of ultrasonics 1. Favorably oriented defects 2. Surface condition	1. Compare favorable flaw orientation to radiography. 2. Define the minimum preparation required of parts to be tested. Weld spatter on surface should be removed to ensure proper contact with probe. Small balloon filled with water can be placed between probe and specimen surface to ensure proper contact over irregular surfaces. Oil or grease sometimes used to improve probe-specimen contact. 3. Questions

III. APPLICATION (drill, illustrations, analogies, oral questions or assignment)

Have students illustrate or explain the following:

A. The three methods of pulse echo testing.

B. The detection of a defect by chalkboard sketches using the longitudinal wave, the shear wave, and surface wave techniques.

C. The piezoelectric effect.

D. How discontinuities in a casting can be located by the acoustic impedance method.

E. The sonic method of flow detection; thickness measurement.

F. Advantages and disadvantages of the ultrasonic method of testing.

NOTE: A field trip to a commercial testing lab should be undertaken later to give the students a better understanding of ultrasonic non-destructive testing techniques.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Define the piezoelectric effect.
B. Draw a sketch of longitudinal wave, shear wave and surface wave propagation modes.
C. What is meant by pulse echo testing?
D. What is acoustical impedance?
E. What are the two major uses of ultrasonic testing?

Check papers and discuss

V. SUMMARY

A. Ultrasonic testing advantage over radiography is that operator can work from only one side of specimen being examined.
B. Disadvantage is intimate contact with specimen requires smooth working surfaces or angle inspections.
C. Area covered in a given time is usually greater than that covered by radiographic methods.
D. Lack of a permanent record, as in radiography, is a disadvantage
E. Wave propagation method of testing is a visual method of inspection employing the use of an oscilloscope.
F. Acoustic impedance method of testing employs the use of sound waves.

The Next Lesson is: Magnetic Particle Testing

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 2
Lesson 2
Time 2 hours

SUBJECT: Magnetic Particle Testing

AIM (or purpose): To develop an understanding of a testing technique other than radiography

TEACHING AIDS: Chalkboard, chalk, and eraser
Horseshoe magnet and cracked specimen

MATERIALS: Oil for wet powder method
Magnetic powders

REFERENCES: Information Sheet #2
Nondestructive Testing Handbook, Volume II, Society for Nondestructive Testing, 1963, Evanston, Illinois
Nondestructive Testing-Magnetic Particle Testing PI-4-3, 1964, General Dynamics-Convair, San Diego, California

---

I. PREPARATION (of the learner)
   A. Explain the advantages of the magnetic particle method
      1. Very sensitive to surface defects
      2. Useful for detection of fine fatigue cracks
      3. Requires very little training for most tasks

   B. Show how the method can be used to aid the radiographer
      1. Help to identify film defect indications
      2. Can be used where radiography may not be effective
      3. May be less expensive test for the same quality of inspection

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Magnetic fields 1. Longitudinal fields 2. Circular fields 3. Induced fields	1. Pass out sheet #2, (PP. 7-8 Inst. Guide). 2. Draw chalkboard sketch of the various type fields and how they are produced. 3. Explain how the direction of the energizing current determines the type of magnetic field. 4. Explain how the anticipated defect orientation determine the type of field to be used. 5. The type of current determines the depth of the defect which can be detected. 6. Question the group to emphasize the major points on this topic.
B. Flux leakage 1. At a discontinuity 2. Related to field direction 3. From subsurface defects 4. Methods of detecting	1. Explain the polarity of the flux leakage at a discontinuity. 2. Illustrate why the defect must be of proper shape and orientation to cause leakage. 3. Illustrate by sketching, on chalkboard, the broadening of the flux leakage from subsurface defects. 4. Explain the attraction of magnetic powder to a flux leakage field: a. Particle polarity b. Magnetic attraction 5. Briefly review key points.
C. Magnetic particles 1. Color contrast dry powder 2. Color contrast wet powder 3. Fluorescent wet powders	1. Explain the difference between the three primary types of powders, and the advantages of each type: a. Dry powder has more mobility b. Dry best for subsurface defects c. Wet powders best for fine defects d. Fluorescent powders easier to see when used with ultraviolet light e. Color contrast powders require less expensive equipment

Instructional Topics	Things to Remember to Do or Say
	2. Ask questions
D. Magnetic particle method	1. Demonstrate the magnetic particle method. 2. Select a piece of ferrous material known to contain a discontinuity. 3. Place specimen on table and sprinkle iron powder on surface known to contain discontinuity. 4. Straddle discontinuity with open end of horseshoe magnet 5. Have students observe how iron powder particles rearrange themselves to the shape of the discontinuity.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Draw typical part shapes on chalkboard or have students to make the drawing on the chalkboard showing typical defects and ask the following questions:
   1. What type of magnetizing field is used to magnetize the part for each type defect?
   2. What type defects cannot be detected by this method?
   3. What type magnetic particle would be best for each defect?

B. Have students sketch the magnetizing of parts to produce:
   1. A longitudinal field
   2. A circular field
   3. An induced field

C. Let students make some applications of magnetic particle flaw detection and observe the pattern of rearrangement of the iron powder particles.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is a magnetic particle?

B. What causes flux leakage?

C. Why does the direction of the field influence the test results?

D. Draw a sketch of a longitudinal field, a circular field and an induced field indicating the method used to achieve each field.

With the class participating check and discuss the test.

V. SUMMARY

A. Magnetic particle method is a relatively simple, easy to learn, operation.

B. This method locates small cracks that cannot be picked up by radiography.

C. Specimen must be capable of being magnetized.

D. Magnetic particle inspection confined to surface or near-surface discontinuties.

E. This is a relatively inexpensive method of inspection.

The Next Lesson is: Liquid Penetrant Testing

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 2
Lesson 3
Time 1 hour

SUBJECT: Liquid Penetrant Testing

AIM (or purpose): To acquaint the student with testing methods other than radiography

TEACHING AIDS: Chalkboard, chalk, and eraser
Sample defective parts and test blocks

MATERIALS: Liquid penetrant spray can kit

REFERENCES: Information Sheet #2
Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Nondestructive Testing - Liquid Penetrant Inspection - PI-4-2, 1964, General Dynamics-Convair, San Diego, California

---

I. PREPARATION (of the learner)

Write aim of lesson on chalkboard

A. Explain the advantages of the liquid penetrant method briefly:
   1. Describe liquid penetrant
   2. For inspection of nonmagnetic materials
   3. Detection of surface defects
   4. Relatively inexpensive equipment and materials create economic advantage

B. Tell how the method can be used to aid the radiographer:
   1. Helps to identify film defect indications
   2. Can be used where radiography may not be effective
   3. May be a less expensive test for the same quality of inspection

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Types of penetrants 1. Oil phase 2. Water soluble 3. Color contrast 4. Fluorescent	1. For each type of penetrant describe and explain why used: a. Removal control b. Number of operations involved c. Equipment required d. Ease of viewing 2. Questions
B. Preparation of the part 1. Remove paint, dirt, etc. 2. Degrease	1. Explain and give reasons why: a. Penetrant cannot enter defects b. Penetrant will not displace oil 2. Improper cleaning can cause erroneous answers -- give reasons. 3. Questions
C. Application of penetrant 1. Brushing, spraying, and dipping 2. Time of soak	1. Explain the various methods and application: a. Drag off b. Field inspection vs. laboratory c. Production line testing 2. Manufacturers recommendations should be followed on time of soak since soak time determines entrapment of penetrant. 3. Questions
D. Removal of penetrant 1. Plain water wash 2. Emulsified water wash 3. Solvent removal	1. Water wash for soluble types. 2. Oil phase penetrants require emulsification prior to wash -- explain. 3. Small volume of parts may be solvent cleaned --explain why. 4. Over washing should be avoided. 5. Questions
E. Development 1. Wet developers 2. Dry developers	1. Wet developers best for water phase penetrants on production line testing. 2. Wet developers best suited to use with oil phase penetrants

3. Parts must be dry to use dry developers.
4. Good ventilation required for dry developers.
5. Explain use of developers for withdrawing entrapped penetrant.
6. Questions

F. Inspection
   1. Inspection area
   2. Lighting

1. Refer to information sheet #2 -- explaining why.
2. Inspection should be performed immediately after development.
3. Well lighted area is needed for color contrast penetrant inspections.
4. A darkened area is needed for fluorescent penetrant inspections.
5. Ultra-violet light is needed for viewing fluorescent penetrants.
6. Questions

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Promote the discussion of the limitations of the penetrant method:
   1. Will the method detect subsurface defects?
   2. What effect does oil have on the entrapment of a penetrant?
   3. Would the technique be useful for detecting leaks in vessels, etc?

B. Request a listing of the steps of the process in their proper order.

C. Discuss the advantages of the fluorescent method over the color contrast method.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. List the steps of the penetrant process in the proper order.

B. List three examples of poor practice which will cause false results.

C. Why do the listed practices cause false results?

D. Why is the penetrant method more effective on shallow surface defects than radiography?

Check papers and discuss.

V. SUMMARY

A. Liquid penetrants can be used to inspect non-magnetic materials.

B. Specimen must first be thoroughly cleaned and de-greased.

C. Liquid penetrant method is limited to detecting surface defects.

The Next Lesson is: Inspection of a Defective Part using the Liquid Penetrant Method

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit	2
Lesson	4
Time	2 hours

JOB (or operation): Inspect a defective part using the liquid penetrant method

AIM (or purpose): To develop skill in the technique of liquid penetrant inspection

MATERIALS: Paper Towels
Liquid Penetrant Kit

TEACHING AIDS: Chalkboard, chalk and eraser
Sample defective parts and test blocks
Manufacturers instruction sheets

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Nondestructive Testing - Liquid Penetrant Inspection PI-4-2, 1964, General Dynamics-Convair, San Diego, California

---

I. PREPARATION (of the learner)
   A. Write AIM of lesson on chalkboard.

   B. Explain the importance of being able to perform a liquid penetrant inspection:
      1. A good technician has a basic knowledge of testing methods
      2. The test can be useful in the interpretation of radiographs
      3. The method may be more useful than radiography for certain applications

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
	Proceed slowly & carefully explaining each step -- questioning as demonstration develops Give reasons whenever necessary.
A. Demonstrate	
1. Preparation of part	1. Remove all paint, dirt, etc, by brushing, chemicals or other suitable methods. 2. Degrease part with spray can cleaner.
2. Place part on inspection table	1. Turn area to be inspected upward 2. Place on paper or cloth to protect table.
3. Apply penetrant	1. Direct spray nozzle toward inspection area. 2. Hold about 12" from part to get best coverage. 3 Press valve to release penetrant 4. Spray to cover entire inspection area. 5. Do not waste penetrant by spraying until dripping 6 Allow to soak for time recommended by supplier.
4. Remove penetrant	1. Wipe off surface penetrant with cloth. 2. Wet cloth or towel with cleaner/remover from spray can. 3. Wipe off remaining excess penetrant with dampened cloth. 4. Continue to clean until only a trace of penetrant is visible. 5. Caution: overcleaning by direct spraying may remove all penetrant from very shallow or wide defects
5. Apply developer	1. Direct developer nozzle toward the inspection area.

	2. Hold nozzle 12" to 18" from the part to achieve best action of developer. 3. Spray lightly by pressing spray can valve. 4. Inspection area should just be damp while applying developer. 5. Caution: over wetting of the inspection surface will cause running of the indications and hinder interpretation of results.
6. Inspection	1 Allow adequate time for developer to stand. Check for recommended time. 2. Observe any indication of stains which indicate a defect. NOTE: BEFORE GOING FURTHER MAKE SURE OF UNDERSTANDING BY ASKING QUESTIONS

III. APPLICATION (practice by learner under close supervision)

A. Supervise groups of students in the performance of a liquid penetrant inspection.

B. Discuss the factors which can cause poor results after student has made liquid penetrant inspection.

C. Instruct students to tell what they did and why.

IV. TEST (performance of skill to acceptable standards)

A. Assign students to perform a complete penetrant inspection. Give each student close supervision during test.

B. Discuss and comment on results observed.

V. SUMMARY

A. Preparation of test specimen must be thorough to insure best results.
B. Use of the penetrant materials in the proper sequence is mandatory.
C. Each step must be timed according to manufacturers instructions.

The Next Lesson is: Visiting a Commercial Nondestructive Testing Laboratory.

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

NOTE TO INSTRUCTOR: All field trips must be carefully planned well in advance to make sure students will be able to observe the items given in Step I of this lesson.

Unit 2
Lesson 5
Time 6 hours
(includes travel)

JOB (or operation): Visiting Commercial Nondestructive Testing Laboratory

AIM (or purpose): Develop a better understanding of the various inspection techniques employed by industry for control of material quality

MATERIALS: Film badges
Dosimeters
Safety glasses
Hard hats

TEACHING AIDS: Chalkboard
Chalk
Eraser

I. PREPARATION (of the learner)
   A. Write aim on chalkboard.

   B. Ask students to observe the following:
      1. The different types of inspection equipment and processes
      2. The internal quality control measures to insure reliable inspection results
      3. The methods used to identify the customers materials
      4. Preparation of materials prior to inspection
      5. Preparation of technique cards and work logs
      6. Marking of parts for disposition
      7. Preparation of reports and certifications
      8. Radiation safety devices
      9. A test will be given to check the results of this field trip

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Stress safety procedures which are to be followed in the laboratory	1. Select a commercial nondestructive testing laboratory which offers a a complete complement of testing processes.
B. Issue equipment, goggles, hard hats, etc., before entering laboratory or as instructed by company officials	2 Cover all aspects of safety. 3. Point out the need for gentlemanly behaviour and the fact that we are visitors.

III. APPLICATION (practice by learner under close supervision)

A. After returning from the trip, ask the students to discuss and explain:

1. The different processes and techniques observed in use by the laboratory
2. Established internal controls to insure a quality inspection
3. Methods of maintaining records of techniques employed in various tests
4. Safety devices used in maintaining radiation survelliance

B. Discuss any unusual situations observed during the tour of the laboratory.

IV. TEST (performance of skill to acceptable standards)

NOTE: WRITTEN TEST

A. Name the different types of nondestructive testing methods you observed in this laboratory.

B. Describe their safety equipment and procedures.

C. Describe some of the records that must be kept and also furnished the client.

D. What is meant by "Internal Controls" to insure a quality inspection?

Discuss results of test

V. SUMMARY

A. Safety precautions.

B. Various types of tests and inspections.

C. Need for records.

D. Conduct on tours and plant visitations.

The Next Lesson is: Professional Ethics for the Industrial Radiographer

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 3
Lesson 1
Time 2 hours

SUBJECT: Professional Ethics for the Industrial Radiographer

AIM (or purpose): To develop an appreciation of the responsibilities of a Radiographer and situations which may arise in the span of his career

NOTE TO TEACHER:
Secure sufficient number of copies of AEC or State regulations in advance of this class to hand out at this time

TEACHING AIDS: Chalkboard, chalk, and eraser
Copy of AEC or State regulations

REFERENCES: Welding Inspection Manual D-1, D-46, Page 42, FOREWORD "Description of an Inspector" American Welding Society 33 WEST 39th St., New York, N. Y.

AEC or State regulations (Information Sheet #3)

I. PREPARATION (of the learner)

A. Write aim of lesson on chalkboard.

B. Ask the following questions:
   1. How can a radiographer augment his salary?
   2. What are the normal results of unethical business practices and conduct?
   3. Express how you feel about such practices

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The inspector	1. Explain that the radiographer may not always be the inspector. 2. Explain also that the inspector is generally not the evaluator. 3. Define the job of the inspector as: The interpretation of the results of an inspection of parts or an assembly and the report of this inspection to the controlling authority. 4. Questions
B. The responsibility of the inspector-radiographer	1. Explain to the prospective inspector-radiographer his role in: a. Ensuring product reliability b. Prevention of accidents and loss of life c. Securing a profit for the employer d. Maintenance of radiographer equipment e. Reporting deficiencies in equipment and personnel under his supervision 2. Questions
C. Short cuts which lead to professional degradation	1. Point to the tendency to produce inferior quality as the working conditions worsen. 2. Explain the hazard and consequences of the following unethical practices: a. Incorrect penetrameters b. Wrong placement of penetrameters c. Incorrect film types d. Incorrect film-focal distance e. Substitution of satisfactory film for film from areas of inferior quality 3. Explain the moral and legal problems caused by irradiation of persons not under a health control program.

  - a. You and your company could be sued
  - b. Your AEC License could be revoked
  - c. Criminal charges could be filed against you and your company
  - d. You have a moral responsibility to protect those who are in your work area
- 4. Questions

D. The industrial spy

1. Point out the tendency of some companies to employ means of gaining information from competitors.
2. Illustrate a number of job assignments where a radiographer has access to confidential information:
   - a. Defense plant work
   - b. Research work on space programs
   - c. Work on parts for which a patent has been applied
3. Warn the student of the hazard if discussing his work with people outside of his job responsibilities.
4. Questions

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask the students for an opinion of their responsibilities to an employer observing unusual attitudes as this will indicate individuals who may need closer supervision and guidance.

B. Invite students to explain or discuss the legal consequences for accepting gratuities for the falsification of test records.

C. Suggest students explain and discuss the role of the inspector in:
   - a. Making a profit for the company
   - b. Maintenance of equipment
   - c. Ensuring safety of company and customer personnel

D. Assign students to discuss the job of an inspector.

IV. TEST (final check on students' comprehension of material presented)

NOTE: WRITTEN TEST

A. What are the possible consequences of accepting favors or money for falsifying records?

B. What is the job of the inspector?

C. Name three hazards of using unethical radiographic short cuts.

D. What possible monetary loss or consequence could arise from the unnecessary exposure of others to radiation?

E. What is the best way to avoid revealing industrial secrets?

Check and discuss

V. SUMMARY

A. Unethical reporting methods and practice can destroy the value of product inspections.

B. Improper inspection practice can create and propogate hazardous working conditions.

C. Poor inspection practices can be considered a form of sabotage.

D. How federal laws control the possession, use and handling of radioisotopes in industry.

The Next Lesson is: Radiation detection instruments

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 4
Lesson 1
Time 2 hours

SUBJECT: Radiation Detection Instruments

AIM (or purpose): To develop an understanding of the use of instruments for detection and measuring ionizing radiation

TEACHING AIDS: Film strip: Civil Defense Radiological Instruments, 35 mm Office of Civil Defense, Department of Defense, (Complete with lecture narrative from Radiological monitoring for Instructors course; RMI, or Exhibit-A of Appendix)
35mm film slide projector and screen
Dosimeters, dosimeter charge, and survey meters

REFERENCES: Maintenance manuals for instruments
Radiation Safety in Industrial Radiography with Radioisotopes, P.M. Frazier, C.R. Buchanan, B.W. Morgan, Bulletin AECU 2967, U.S. Atomic Energy Commission, Washington, D.C.

I. PREPARATION (of the learner)

A. State the subject of this lesson and briefly explain why radiographers must be familiar with radiation detection instruments.

B. Introduce the film and explain briefly the important items it covers including the following:

1. Different types of instruments for detecting ionizing radiation
2. Purpose of each type of detecting instrument
3. Similarities in the ability of each to detect ionizing radiation
4. The limitations of each type of detecting instrument
5. The basic difference between a dosimeter and a survey meter
6. The comparison of total dose vs dose rate
7. The definitions of the following: Roentgen, rad, and rem and how they apply to radiation safety
8. Abbreviations of certain often used terms

C. Advise group a test will be given.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Show the film strip in three parts	NOTE: Present the narrative in three (3) parts as furnished with the film strip. NOTE: Ask for questions or ask questions during the showing of each of the three parts.
Part I:	Part I: Dosimeters and dosimeter charges
Part II:	Part II: Geiger Muller-type survey meters
Part III:	Part III: Ionization chamber-type survey meters

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Review the following points of information presented in the film:
   1. Similarity of the various types of radiation detection instruments
   2. Difference between a geiger counter and an ionization chamber
   3. Meaning of dose rate
   4. Meaning of roentgen, rad, and rem
   5. Desirable characteristics of detection instruments
   6. Undesirable characteristics of different types of detecting instruments
   7. Care and maintenance of detecting instruments

B. Call on individuals in the class to give the abbrevations for roentgens, roentgens per hour, milliroentgens per hour.

C. Point out the basic difference between a dosimeter and a survey meter as was illustrated in the film strip.

IV. TEST (final check on students' comprehension of material presented)

A. Give a written test -- (The following questions are suggested)
  1. List four desirable characteristics of survey meters.
  2. What is the phenomenon on which the detection of radiation is based in the construction of gamma ray detection and measuring instruments ?
  3. What are the two most popular types of enclosed gas volume rate-measuring instruments ?
  4. Define dose and dose rate.
  5. Explain the operation of an ionization chamber. Use a sketch if necessary.
  6. Draw a sketch of the ionization chamber and electrometer suspension of the pocket dosimeter. Label the parts.

B. After the class has completed the test, state the correct answers to each question with the students assisting.

The Next Lesson is: The Film Badge

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit	4
Lesson	2
Time	1 hour

SUBJECT: The Film Badge

AIM (or purpose): To thoroughly acquaint the student with the function and construction of an industrial film badge

TEACHING AIDS: Film badge holder and film badge
Cut-away of film badge and holder

I. PREPARATION (of the learner)

A. Write aim on chalkboard.

B. Explain the importance of the film badge.
  1. Give an account of an actual incident such as the following: A filme badge processing service company wired a customer that one of its film badges indicated an exposure to 5,000 millirem of gamma ro x radiation. An investigation revealed the employee had lost his film badge temporarily while making radiographic exposures and the film badge was later found a few inches from the exposure device. This indicated the film badge, but not the wearer, was exposed to 5,000 m/rem.
  2. Indicate that it used to control the radiographers radiation exposure and will determine if the radiographer has exceeded his safe operating dosage.
  3. Point out that control and monitoring of dosage is essential to the continued health and safety of the radiographer.

II, PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Purpose of film badge	1. Display cut away badge and film envelopes so that all may see construction. 2. Explain how the badge is used to measure accumulative dosage.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
	3. Point out reason why film badge is used in addition to the dosimeter. 4. Indicate that the badges are for permanent record.
B. Types of radiation detected	1. List the two basic types of radiation detected: beta and gamma. 2. Explain how these are recorded on one film by use of filters, filter density and thickness filters out beta particles.
C. Construction of film badges and film badge holders	1. Sketch the construction of the badge and holder, and display actual items. 2. Stress that the purpose of the cadmium and copper strips in the holder-filters out beta particles in filtered area leaving only an indication of gamma radiation. 3. Define the function of the film badge holder case; In addition to filtering it provents damage to films, also provides convenient carrying case.
D. Wearing of film badges	1. Give reasons why badges should be worn: a. Badges should be worn on the body b. Badges should be worn at all times while performing radiographic operations c. By only one person
E. Care of film badges	1. Point out why: a. Badges must not be placed near heat. b. Film badges must be stored away from radiation.

c. Badges must be in holder when worn.
d. Badges must be kept dry.

F. Control badge

1. Explain purpose of control badge:
   a. During shipment to and from customer and while radiographer is not using badge, all badges are stored with control badge.
   b. If control badge indicates 50 m/rem when checked, subtract same amount from individual users dose.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have all students sketch a cross section of the typical film badge holder with filters.

B. Ask students to explain the purpose of the filters.

C. Ask students to list three actions which could damage the film badge.

D. Have students explain all the rules for wearing film badges.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What are three mandatory rules regarding the wearing of film badges?

B. Why does a film badge holder have metal strips attached inside?

C. Why is the film badge worn in addition to the dosimeter?

D. What are the three types of radiation recorded by the film badge?

E. Does the film badge record total dose or dose rate? Explain in detail?

Check and discuss when all tests are completed.

V. SUMMARY

A. Film badges advantage is that a permanent record of total accumulated exposure is obtained.

B. Badge can indirectly differentiate between beta and gamma radiation.

C. Film badge and dosimeter readings compliment each other.

The Next Lesson is: Use of Pocket Dosimeters

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 4
Lesson 3
Time 2 hours

JOB (or operation): Use of Pocket Dosimeters

AIM (or purpose): To develop skill in the use, and maintenance of pocket dosimeters and chargers

TEACHING AIDS: Pocket dosimeters
Dosimeter charger
Small source of ionizing gamma radiation such as 5 mc Co60 sources used in civil defense classes

REFERENCES: Manufacturers operation and maintenance manuals for dosimeter and charger

I. PREPARATION (of the learner)

A. Show the class a pocket dosimeter and explain its importance to a radiographer.

B. Point out advantages of the dosimeter over the film badge.

C. Emphasize the importance of proper maintenance of pocket dosimeter and charger.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Reading the dosimeter	Position students so they can see and hear. 1. (DEMONSTRATE) and point out the various parts of a dosimeter and charger. 2. Point out that the eyepiece should be held about 1/2" from the eye.

	3. Call attention to the strong light or use light on charger.
	4. <u>CAUTION</u> not to press the dosimeter to charger position when using charger as this would cause the reading to be altered.
	5. Emphasize that the zero mark should be to the left of the field of vision.
	6. Note that the dosimeter need not be set to exactly zero at the beginning of the exposure period.
	7. Explain that the dosage is determined by subtracting the first reading from the last reading in the exposure period.
B. Charging of dosimeters	Demonstrate and explain each step
1. Place charger on table	1. Place at convenient height for ease of reading of dosimeter. Remove dust cover from charging receptacle.
2. Connect dosimeter to charger	2. Remove dust cover from dosimeter. Insert contact into charging receptacle.
3. Adjust the dosimeter	3. Place eye about 1/2" from the eyepiece of the dosimeter.
	4. Depress the dosimeter to the bottom of the receptacle.
	5. Rotate the adjust knob on the charger until the dosimeter reads near zero.
	6. Release pressure on dosimeter until charger disengages.
	7. Read dosimeter using internal light to ascertain if charging is correct.
	8. Emphasize importance of reading scale in horizontal positions.

II. PRESENTATION (continued)

Operations or Steps	Key Points (things to remember to do or say)
C. Dosimeter charger adjustments	Demonstrate and explain. 1. If dosimeter will not zero: a. Replace battery in charger b. Polish battery contacts with crocus cloth 2. If replacement battery is not available, try removing the light bulb inside charger. 3. Explain why 4. If bulb is burned out, replace with the spare bulb located inside the case.

III. APPLICATION (practice by learner under close supervision)

A. Have students demonstrate ability to read and charge dosimeter.

B. Let students reset dosimeters to read exactly 100 mr. Ask students to turn dosimeter 180 degrees so that the reticle or scale is up-side-down, and have them read dosimeter in the inverted position.

Repeat readings obtained at 90 degrees and at 180 degrees from horizontal. Compare readings with horizontal reading.

IV. TEST (performance of skill to acceptable standards)

A. Ask one or more students to charge dosimeters to near zero and let other class members check for correct procedure.

B. Have students place their dosimeters on the rim of a 2 foot radius circle. Place a 5 MC cobalt 60 source in the exact center of the circle and let each student calculate the period of time to produce a dosage of from 100 to 150 mr. at the circle. Remove all dosimeters at the same time.

C. Have students read, record, and recharge his dosimeter.

D. Compare and discuss the results of each students efforts.

The Next Lesson is: How to Use a Survey

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 4
Lesson 4
Time 2 hours

JOB (or operation): How to use a Survey Meter

AIM (or purpose): To develop adeptness in the operation of beta-gamma survey meters

TOOLS AND EQUIPMENT: Several beta-gamma survey meters
Radioactive gamma source

REFERENCES: Manufacturers operation and maintenance manuals

I. PREPARATION (of the learner)

A. Explain the importance of the proper use of survey meters. Pointing out that it is the most valuable piece of safety equipment in the radiographers possession. It indicates the presence of a radiation field and immediately indicates its intensity.

B. Indicate that in almost every case radiographic accidents could have been avoided if the survey meters had been used properly.

C. Relate story or personal experience along this line such as: A radiographer was making several exposures using a gamma exposure device as illustrated on the chalkboard. This device enabled the radiographer to crank the source capsule into a flexible tube. At the end of each exposure he was supposed to crank the capsule back into the device and then check the surface of the device with his survey meter to make certain the capsule was safely back in the storage device.

After making several routine exposures he stopped checking the device with his survey meter after each exposure.

At the completion of his assignment he noticed that the survey meter indicated the source was not in the storage device. A quick check with his survey meter located the capsule at the far end of the flexible source tube.

For quite some time he had been cranking the source out when he should have been cranking it in. As a result he had been exposing himself to a large amount of ionizing radiation and was not making any radiographs. A quick check with the survey meter before and after each exposure would have prevented this accident.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
NOTE: Encourage students to ask questions during Demonstration. Position students so they can see and hear.	
A. Pick up survey meter	1. Grasp meter by handle. 2. Point chamber end away from body, explaining why.
B. Turn instrument switch to on position	1. Turn selector switch to zero position. 2. Allow the instrument to warm up at least two minutes, pointing out why.
C. Zero calibrate	1. Turn zero knob until needle reads zero on meter. 2. Observe needle for drift or erratic action. 3. Repeat zero step after waiting a short period if needle tends to drift.
D. Range selection	1. Check the zero reading on each scale as the switch is moved to each position. <u>NOTE:</u> The zero should not shift when the meter is not in a radiation field. 2. Turn selector switch to the position for the required measurement of radiation.
E. AEC range requirements	Explain that meter must be capable of indicating ionizing radiation intensity from 2 mr/hr to 1 r/hr.

III. APPLICATION (practice by learner under close supervision)

A. Request that each student perform the normal operation of zeroing and checkout of the survey meter.

B. Draw meter readings and range switch position on chalkboard and have students state dose rates indicated.

C. Question group in the areas of what, how and why.

IV. TEST (performance of skill to acceptable standards)

NOTE: Written Test

A. What is the purpose of the adjustable rheostat knob?

B. The survey meter ____________ and measures ______ ________.

C. A survey does not measure ___________ dose.

D. Survey meter ranges can be ________ to indicate __________ per hour as well as ____________ per hour.

E. An AEC approved survey meter for use in radiography must have a range of __________ mr/hr or lower to __________ r/hr or higher.

V. SUMMARY

A. Survey meters or rate meters give a quick indication of the presence of a radiation field.

B. Rate meters also indicate the dose rate of a radiation field.

C. Rate meters cannot indicate the total accumulated dose unless the radiation field is constant.

The Next Lesson is: Practical Procedures for Measurement

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 4
Lesson 5
Time 2 hours

SUBJECT: "Practical Procedures for Measurement"

AIM (or purpose): To develop an understanding of the supporting theory of radiation detection instruments used in industrial radiography

TEACHING AIDS: Film: PRACTICAL PROCEDURES FOR MEASUREMENT, 48 mins., 16 mm, sound, U.S. Atomic Energy Commission

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

A. In order to achieve the maximum benefit from radiation detecting and measuring devices a radiographer must be familiar with the operating characteristics of the equipment. A thorough knowledge of the equipment in which the radiographer has entrusted his life can only be termed as good common sense.

B. LOOK FOR THE FOLLOWING POINTS IN THE FILM:
The avalanche effect in a geiger tube.
Fluorescent effect in a scintillator.
Steady flow of current generated in an ionization chamber.
The operating ranges of the three types of instruments and their individual characteristics.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. "Practical Procedures for Measurement." First part, Principles of Radiation Detection	1. Show film, rerun if necessary stopping film to clarify points as needed.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Request students to show by chalkboard sketches or with pencil and paper the range of voltage operation of each of the three type detectors.

B. Have them review and discuss the characteristics of the three types of detectors.

C. Discuss the formation of secondary ion pairs and the phenomenon called an "ion avalanche".

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. List in increasing order of operating voltage the three types of detection instruments shown in the film.

B. Outline the operating characteristics of each type instrument.

C. What happens in a detection chamber when a gamma ray passes through?

D. What are secondary ions?

E. What is an ion avalanche?

Check papers and discuss

V. SUMMARY

A. The need for radiation detection and measurements, the principles and the use of various types of instrumentation.

B. Emphasis on the Geiger-Muller tube

C. Absolute and comparative activity measurements.

The Next Lesson is: Radiation

V. SUMMARY

A. Safety Precautions

B. Various types of tests and inspections

C. Need for records

D. Conduct on tours and plant visitations

The Next Lesson is: Professional Ethics for the Industrial Radiographer

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 4
Lesson 6
Time 1 hour

SUBJECT: Radiation

AIM (or purpose): To develop familiarization with the methods of monitoring and the control of penetrating radiation

TEACHING AIDS: Film: Living with Radiation, 28 mins., 16mm, sound, U.S. Atomic Energy Commission

EQUIPMENT: Film, projector and screen

I. PREPARATION (of the learner)

- A. Introduce subject and aim of lesson - write it on chalkboard.
- B. Look for the following points while viewing the film:
  1. Continuous employment of survey meters by the atomic workers while conducting work with radioactive materials.
  2. Types of monitoring devices used at the facility in addition to survey meters.
  3. Methods used in disposal of unwanted radioactive materials.
  4. Heavy shielded chambers used to make precision measurements of weak source strengths.
- C. The points given above will assist the learner to better understand the various methods of monitoring and controlling penetrating radiation.
- D. Advise group a test will be given.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Living with Radiation"	Show film, rerun if necessary stopping film to clarify situations as necessary.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments) Discuss the film - Emphasizing these points:

A. Use of safety devices and monitoring equipment used by the atomic workers.

B. Monitoring devices used by atomic workers but seldom employed in industrial radiography.

C. The safety record of the facility shown in the film relating this to the safety devices used by the facility.

D. Waste disposal procedures shown for the disposal of radiographic sources.

E. The purpose of the heavy shielding used in the construction of the counting devices. Relate this to instruments used in wipe testing.

F. Rerun film again if necessary for understanding of certain situations or of certain items that still may not be clear.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. Name at least four different detection devices used by the atomic workers in the film.

B. Why is it necessary to have controlled disposal methods for radioactive materials?

C. What is the purpose of the heavy shielding used with the counters shown in the film?

D. Why do the atomic workers always use the survey meter when working with radioactive materials?

V. SUMMARY

A. Separation-distance factor

B. Storage and/or disposal of radioactive wastes

C. Protection of populations, water, crops, and livestock by air and enviromental monitoring.

D. Protection of workers through use of film badges, radiation counters, shielding, remove-control devices, decontamination procedures and biochemical studies.

E. The various types of detection instruments

The Next Lesson is: Algebriac Expressions

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 5
Lesson 1
Time 1.5 hours

SUBJECT: Algebraic Expressions

AIM (or purpose): To develop skill in the use of algebraic equations

REFERENCES: Brief College Algebra, W.L. Hart, 1947, D.C. Heath and Co., Boston, Mass.
Industrial X-ray Handbook, Allan Lytel, 1962, H.W. Sams, Indianapolis, Ind.
Information Sheet #4

I. PREPARATION (of the learner)

A. Using chalkboard list the subject of lesson explaining why it is essential to have a working knowledge of algebraic expressions.

B. List several algebraic formulas on the board gauging their complexity to the contemplated proficiency level of the group in attendance.

C. Upon determining the lowest level of understanding present, proceed with the presentation, keeping before the group good and sufficient reason for wanting to know.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The fundamental operations a. Addition b. Subtraction c. Multiplication d. Division	Define and illustrate on the chalkboard: 1. Addition: Combining two or more numbers so as to obtain a number called a sum. 2. Subtraction: The act of taking one number or quantity from another. 3. Multiplication: The process of adding a given number or quantity a certain number of times by a briefer computation.

	4. Division: The process of determining how many multiples of one number are contained in another.
B. Numbers a. Explicit b. Literal	Define the explicit and literal numbers: 1. Explicit number-absolute value of a signed number. 2. Literal number-letter that stands for a number.
C. Law of	List the rules on the chalkboard and explain: 1. When multiplying or dividing, the answer will have a plus sign if both numbers have the same sign and a negative sign if the operators are of opposite sign. 2. When adding like signs, the sum has the sign of the operators. When adding unlike signs, the sum has the sign of the operator with the greatest absolute value. 3. To subtract, change the sign of the operator and add.
D. Principles of fractions	State and illustrate on the chalkboard: 1. The value of the fraction is not changed if both the numerator and denominator are multiplied or divided by the same number, not zero 2. The product of two fractions is the product of the numerators divided by the same number, not zero. 3. To divide a fraction by another invert the divisor and multiply. 4. To multiply a fraction by a number, multiply the numerator by the number.

5. To divide a fraction by a number, multiply the denominator by the number.

E. The equation

1. List the following definitions:
   a. An equation is a statement that two members of an expression are equal.
   b. A solution is a set of values that satisfy the equation. Illustrate.
2. Illustrate the rules of equivalent equations:
   a. Add and subtract the same value from both sides.
   b. Multiply both sides by the same value.
   c. Cancel equal terms on both sides.
   d. Transpose terms from one side to the other by changing signs.

F. Equations

$$\frac{EP \times D^2}{S} = T$$

Explain step by step use of equation using the following information work problem: Explain each step what is being done and why:

1. A client requests a gamma radiograph be made of a steel casting 4"x6"x 1/2" thick. Relative film density should be 1.5, film should be Kodak type AA, film-focal distance should be 12" and an Iridium 192 gamma source should be used. You have a 10 curie (10,000 millicurie) source. What should your exposure time be?
   Ans: Exposure factor - 70 (from chart) film-focal distance squared = 12x12=144" Gamma source strength= 10,000MC (10 curies) = $\frac{70 \times 144}{10,000}$ = 1.08 minutes exposure time.

Instructor using a chalkboard, should have students tell what to do, how to do it, and why it is being done in solving the following problems (2) and (3):

2. Solve for exposure time if EF = 100 D = 10" and S = 5 curies.

$$\frac{EF x D^2}{5} = T$$

3. Work step by step on chalkboard. If radiation intensity at one foot is 500 MR/HR:; what is the intensity at five feet?

$$\frac{I_1}{I_2} = \frac{D_2^2}{D_1^2}$$

$$\frac{500}{X} = \frac{25}{I}$$

$$\frac{500}{25} = \frac{X}{I}$$

$$\underline{X = 20}$$

Ans: 20 mr/hr at 5 feet

G. Work step by step on chalkboard: If it took 100 milliamp seconds (MAS) to produce an x-ray radiograph @ 1 foot film-focal distance how many film-focal distance MAS would be required if the film-focal distance was lengthened to 2 feet?

$$\frac{MAS\ 1}{MAS\ 2} = \frac{D_1^2}{D_2^2}$$

$$\frac{100}{X} = \frac{1}{4}$$

$$\frac{100}{x} = \frac{X}{4}$$

$$X = 400$$

Ans: 400 MAS @ 2 feet

H. Work step by step on chalkboard: What is the exposure factor if a radiograpn was made in 10 minutes with 5,000 millicuries of Iridium 192 at a focal distance of 8 feet?

$$\frac{TS}{D^2} = EF$$

$$\frac{10 \times 5000}{64} = \frac{50,000}{64} = 781$$

Ans: EF = 781

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Require students to solve for a given value in terms of all others using the equations for: The Time-Distance rule, the Ma-Time rule, the Ma-Distance rules, and the inverse square law. Supervise very closely until all students have mastered the technique of handling algebraic expressions.

B. Have them list the laws governing signs in the operations of addition, subtraction, multiplication, and division.

C. Ask for a listing of the rules governing operations to produce equivalent equations.

D. Have class solve the following problems and explain.

1. Intensity at 2 feet is 600 mr/hr. What is it @ six feet? @ 1.5 ft?
2. T = 2 minutes, S = 500 mc, D = 4 feet, what is EF?
3. T_1 = 2 minutes, D_1 = 4 minutes, D_2 = 1 foot what will T_2 be?
4. EF = 100, D = 2 feet S = 2000 mc. What is T in minutes?

Work all problems on the chalkboard allowing class to discover and correct any errors as they may develop.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Olve for D^2: $\frac{I}{I_o} = \frac{D^2}{D^2}$

B. Solve for Ma_1: $\frac{D_2^2}{D_1^2} = \frac{Ma_1 \; S_1}{Ma_2 \; S_2}$

C. If Ma_1 = 5 ma
S_1 = 60 sec.
Ma_2 = 10 ma
What is the time of S_2 if $Ma_1 \; S_1 = Ma_2 \; S_2$

D. Solve for the new time if:
T_1 = 10 sec.
D_1 = 24 inches
D_2 = 48 inches

and

$$\frac{T_2}{T_1} = \frac{D_2^2}{D_1^2}$$

Check and discuss

V. SUMMARY

A. An understanding of the use of algebraic expressions, formulas, and equations is essential in radiography.

B. Mathematical law of signs must be understood.

C. Formulas and equations tend to speed up and simplify most radiographic mathematical problems.

The Next Lesson is: The Inverse Square Law

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 5
Lesson 2
Time 1.5 hours

SUBJECT: The Inverse Square Law

AIM (or purpose): To develop an understanding of the meaning, manipulation, and use of the mathematical relationship as used in radiography calculations

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N.Y.
Nondestructive Testing Handbook, Society for Nondestructive Testing, 1963, Evanston, Illinois
Information Sheet #4 (see appendix)

I. PREPARATION (of the learner)

A. Find out by oral questions what knowledge the class has about the inverse square law.

B. Point out that all exposure calculations in radiography are based on the inverse square law and that the radiographer will never fully understand his trade until he has mastered its use in making necessary calculations.

C. Indicate that the inverse square law is used to calculate the distance required to be safe from harmful radiation.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The inverse square law-define and explain	1. The inverse square law is: a. The basic mathematicsl relationship between intensity and distance b. The most frequently used relationship in industrial radiography

	c. The basis of all exposure calculations
B. The mathematical formula	1. Write the inverse square law in mathematical terms on the chalkboard. 2. Explain the symbols in the inverse square law equation. 3. Transpose the equation to all forms-distance, time, intensity.
C. Visual schematic illustration	Draw on chalkboard a geometric sketch of the inverse square law relationship and discuss with the class.
D. Application of inverse square law	Work the following problems on chalkboard step by step. Explain each step encouraging students to ask questions: a. Exposure time is 3 minutes at 1 foot. What is exposure time at 3 feet? b. Intensity at 1 foot is 500 mr/hr. What is intensity at 2 feet? c. Intensity at 5 feet is 200 mr/hr. At what distance is intensity 2 mr/hr?

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask the students to recite a word statement of the inverse square law.

B. Ask the students to define the inverse square law by an example.

C. Place the inverse square law on the chalkboard in one form and ask the students to transpose to all the other possible forms.

D. Give the students a set of conditions for each of the following cases: Calculate from the given data:
   1. A value of I_o
   2. A value of D_o
   3. A value of D
   4. A value of I

IV. TEST (final check on students' comprehension of material presented)

A. Write the inverse square law in any form.
B. Transpose to all other forms. Show each step.
C. Give three examples for use of the inverse square law.
D. Given the following information, solve each problem:
Cobalt 60 yields 14,500 mr/hr/curie at 1 foot
Iridium 192 yields 5,900 mr/hr/curie at 1 foot

1. What is the distance where the intensity of radiation from 5 curies of Cobalt 60 is 20 mr/hr?
2. At 20 feet from a source of Iridium 192 the radiation intensity is 250 mr/hr. How many curies of Iridium is present?

Check the answers with the class and discuss -- correcting all errors.

The Next Lesson is: The Square Root

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 5
Lesson 3
Time 2 hours

SUBJECT: The Square Root

AIM (or purpose): To develop skill and understanding in solving problems involving square root as applied to radiography work

REFERENCES: Information Sheet #5

I. PREPARATION (of the learner)

A. Explain briefly why it is important for a radiographer to be able to figure square root.

B. Give practical situations where this type calculation is needed. For example: To solve problems involving safe working distances and distance shielding problems.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The square root	Using simple examples explain the meaning of square root.
B. The long division-estimate method of determination	1. Illustrate on the chalkboard the calculation of the square root of the number 2 using the following procedure: a. Write the number as a non-terminating decimal; i.e., 2.000000. b. Group the digits to the right and left of the decimal point in pairs; i.e., 02. 00 00 00. c. Construct the square root sign over the number and place the decimal point just above the decimal point in the number.

d. Estimate the square of the first pair of numbers. Use the whole number which is nearest but just less than the first pair.
e. Write this number above the first pair and the square of the number below the pair.
f. Subtract the squared number from the first pair and draw down the next pair as in long division; i. e., 1+00 = 100.
g. Double the value of the number above the first pair (1) and add a zero to the value; i. e., 2 (1) - 2, 2+0 = 20.
h. Divide this number (20) into the number obtained in step "f". Add the quotient to the number in step "g" and multiply by the quotient. If the product is greater than the value of step "f" reduce the quotient number by one and repeat until the product is just less than step "f"; (20+4) times 4=96.
i. Write this number above the second pair.
j. Double the value of the number above the radical sign and add a zero 2(14) = 28+0 = 280. Repeat steps "h" and "i".
k. Continue the process to obtain the accuracy desired. Ask questions, and have students solve problems.

2. Work several problems on the chalkboard with the class assisting.

C. The estimate- average technique

Illustrate on the chalkboard the calculation of the square root of the number 10.
a. Estimate the value of the root of 10. (Use the figure 3).
b. Divide 10 by 3 for an approximate answer of 3. 3.

c. Add 3 and 3.3; divide the result by 2.
d. Divide 10 by 3.15 from step "c". Ans. 3.17.
e. Add 3.15 and 3.17; divide the result by 2.
f. Continue the process as above until the desired accuracy is obtained.

Have students solve problems using this technique.

D. Use of square root tables

Hand out and explain the use of tables.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have students solve the following problems using the <u>long division estimate method</u> first, then solve the same problems using the <u>estimate average technique.</u>

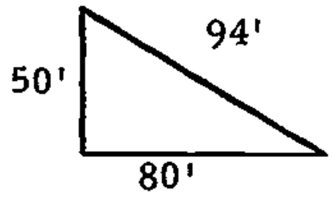
A. Assume you were making a radiograph in a pipe yard and you needed to know what distance from the exposure device your radiation intensity would be 5 mr/hr so that you could place your warning signs at that distance. Your gamma source emits 5,900 mr/hr per curie @ 1 foot. You have a 10 curie source.

B. A 30 curie source of Ir. 192 was being used at ground level. A water tank located 80 feet from the source was being painted. The painters were working on the near side of the tank (80') at a height of 50'. What was their exposure dose rate assuming they remained at the near side of the tank?

Calculations and answers: (for instructors' use)

1. $D = \sqrt{80^2 + 50^2} = 94'$ (Distance to 50' level to tank)
2. $I_1 = 5.9 \times 30 = 177,000$ Mr/hr @ 1

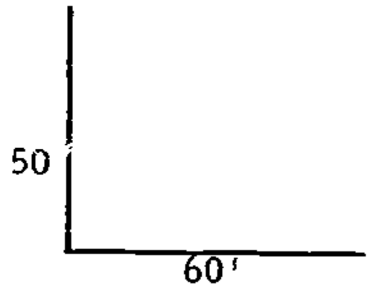
$$I_2 - \frac{177000}{94^2} = \frac{177000}{8836} = 20 \text{ mr/hr}$$



IV. TEST (final check on students' comprehension of material presented)

A. Give a brief written test to determine if all class members understand procedure of square root calculations.

1. A cobalt 60 source produces a radiation intensity of 217, 500 mr/hr @ 1 foot. At what distance would the intensity be 1 mr/hr?
2. At a distance 1 the survey meter reads 215 r/hr. At what distance does the meter read 5 r/hr?
3. Meter reads 450 mr/hr @ point 1. A worker on a scaffold 60 feet from point 1 and 50 feet high is exposed to how much radiation intensity.



B. Check answers to the test with the assistance of the class and review problems solving procedures as needed is indicated.

The Next Lesson is: Geometric Principles of Exposure

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 5
Lesson 4
Time 1.5 hours

SUBJECT: Geometric Principles of Exposure

AIM (or purpose): To teach the fundamentals of exposure as related to the geometric arrangement of the exposure setup and develop a thorough knowledge of the subject.

TEACHING AIDS: Spot film viewer
A round cardboard disc taped to the end of a stick or pointer

REFERENCES: Information Sheets No. 6 and No. 7
Nondestructive Testing Handbook, Volume I, 1963, Society for Nondestructive Testing, Evanston, Illinois

I. PREPARATION (of the learner)

Explain briefly that certain very simple and basic laws govern the art of making good radiographs.

X-rays and gamma rays obey the same physical laws as light and formation of shadows or radiation may be better understood by knowledge of these laws. The relationships of source, object and film will have a considerable bearing on the definition in the reproduced image. The skill displayed by the radiographer in image reproduction will depend a great deal on his knowledge of geometric principles and how these factors govern exposure patterns.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Geometric enlargement	1. Explain by chalkboard sketch the enlargement of the image when the film is moved away from the object.

Instructional Topics	Things to Remember to Do or Say
	2. Illustrate the geometric principle by using the spot viewer and the cardboard disc. 3. Use the method of similar triangles to show how the magnification can be predetermined.
B. Distortion	1. Use the spot viewer and cardboard disc to illustrate distortion caused by inclination of the object to the film. 2. Explain the difficulties caused by distorted images: a. A blurred image is hard to identify. b. It is difficult to estimate the actual size of a distorted image.
C. Geometrical unsharpness	1. Show by a chalkboard sketch the formation of penumbra. 2. Use the spot viewer to illustrate penumbra 3. Using the chalkboard sketch, define geometrical unsharpenss. 4. On chalkboard using the method of similar triangles, derive the formula for geometrical unsharpness; i. e., $U_g = \frac{Ft}{d}$ 5. Handout Information Sheet No. 7 (Contains explanation of formula) 6. Display and explain the use of a nomogram for determining geometrical unsharpness. (Nomogram on information sheet #7)

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have individual students:

A. Draw a sketch of the situation which causes penumbra explaining why and using the spot viewer and disc to illustrate.

B. Explain enlargement of the image in radiography. Use the viewer and disc to illustrate. Show calculation to predetermine the magnification.

C. Outline the consequences of image distortion.

D. Define geometrical unsharpness. Derive the formula and illustrate the use of a nomogram.

Solve the Following Practice Problems:

E. An exposure device's focal spot is positioned 36" from the specimen to be radiographed. The specimen is 12" x 12" x 1" thick. The x-ray film is positioned 12" beyond the specimen, what would be the projection of the image?

F. A flat plate 12" x 12" x 2" thick is radiographed at a film-focal distance of 15". What is the width of the penumbra shadow?

G. Use nomogram to determine the geometric unsharpness in millimeters of a radiograph of a flat plate that is 12" x 12" x 2" thick if the radiograph was made with a Cobalt 60 source 5 millimeters in diameter and a film-focal distance of 20".

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. If the object is placed at 24 inches from the source and the film at 36 inches, what would be the magnification of the image?

B. If a flat plate 1" thick is radiographed using a 20" film-focal distance and a 3 mm diameter source, what is the size of the penumbra?

C. What would be the focal distance to produce a radiograph with no more than 0.2 geometrical unsharpness, if the source is 5 mm diameter and the object is four inches thick?

Check and discuss.

V. SUMMARY

A. Certain geometric principles are applied in radiography.

B. Image distortion is generally caused by improper geometric considerations.

C. Image unsharpness is a major problem when making radiographs.

The Next Lesson is: Logarithms

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 5
Lesson 5
Time 2 hours

SUBJECT: Logarithms

AIM (or purpose): To outline the advantages of the use of logarithms as applied to radiography and to develop ability in their use

REFERENCES: Brief College Algebra, W.L. Hart, 1947, D.C. Heath and Co., Boston, Mass.
Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N.Y. (Page 39)
Information Sheet #8. Logarithm tables. Shielding equations

I. PREPARATION (of the learner)

A. Through adroit questioning determine the level of understanding of logarithms by various members of the class.

B. Explain the importance of using logarithms in radiography pointing out that:
   1. Logarithms are used to determine exposure times required to produce satisfactory radiographs.
   2. Exposure time varies with film speed. There are many different types of industrial radiography film, each having a different speed.
   3. Decay of radioactive materials are logarithmic function which every radiographer should be able to calculate.
   4. Shielding or attenuation properties of the elements are determined by the use of logarithms.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The logarithm	1. Define a logarithm of a number "N" to the base "a" as the exponent of the power to which "a" must be raised to obtain "N". 2. Place the mathematical form on the chalkboard.

	3. Define a natural and common logarithm
B. Properties of logarithms: a. Multiplication b. Division c. Powers	State the rules and illustrate each type of computation on chalkboard.
C. The characteristic and mantissa	Illustrate on chalkboard the integer and decimal parts of a logarithmic expression.
D. Properties of the characteristic and mantissa	List the following theorems--illustrate on chalkboard: 1. The characteristic depends only on the number of digits to the left of the decimal point in the number. 2. When the number is greater than one, the characteristic is an integer which is one less than the digits in the number left of the decimal place. 3. When the number is less than one, the characteristic is negative and equal to the number of spaces left of the decimal to the first significant figure. 4. Explain each of the above by chalkboard example. 5. Show the students a log table Information sheet #8 for determination of the mantissa.
E. Computation with logarithms	Show on the chalkboard simple computations to determine a product, quotient, extraction of roots and determination of a power.
F. The antilogarithm	Define the antilogarithm and illustrate the determination from table and computation. The number corresponding to a given logarithm is called the antilogarithm.
G. Slide rule	Display slide rule and refer students to illustration of scale for determining mantissa logarithms - Page 39 in the Eastman Kodak Textbook.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. List a group of numbers on the chalkboard and ask the students for the characteristic and mantissa of each number. Show each on the chalkboard after students have given the answers.

B. Ask individual students to explain the rules for multiplication, division,. and computation of powers by logarithms.

C. State simple problems on chalkboard for student exercise. Solve problems on chalkboard after students have completed calculations. (Furnish mantissa values from log tables).

D. Using equations on information sheet #8, work the following problem: Radiation intensity is 500 mr/hr. How many half-value layers are required to reduce the intensity to 100 mr/hr?

E. How many tenth value layers are required to reduce radiation intensity from 500 mr/hr to 2 mr/hr?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the characteristic and mantissa of the following logarithmic expressions?
   a. 1.4271
   b. 3.9721
   c. 8.4731-10
   d. 17.6541-20

B. What is the logarithm of the product of the logarithms: 3.5001 and 5.4379?

C. What is the logarithm of log 5.4970 divided by the log 4.3660

D. What is the logarithm of $(27.315)^4$ if the mantissa of 273 is .4362.

E. What is the value of 27.315^4 if the antilogarithm of the mantissa .7448 is 5556?

Check and Discuss

V. SUMMARY

A. The whole number of a logarithm is called the characteristic.

B. The fraction of the number is called the mantissa.

C. The characteristic number contains one less digit than the number it represents in log form.

D. The mantissa of a logarithm can be obtained from a log table such as the one used in this lesson.

E. The mantissa can also be found by using a slide rule.

F. Problems of shielding can be solved quickly and accurately by the use of logarithms.

G. Exposure time charts and the characteristic curve of x-ray film are drawn on semi-log paper forms.

The Next Lesson is: Ionizing Radiation

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 1
Time 1.5 hours

SUBJECT: Ionizing Radiation

AIM (or purpose): To familiarize the student with the basic concepts of radiation physics

TEACHING AIDS: Film: Invisible Bullets, Challenge Series, 45 mins., 16 mm., sound, U. S. Atomic Energy Commission

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

A. Caution group to look for the following points while viewing the film and advise that a test will be given regarding some of these situations later in the session.
   1. Ionization traces in the cloud chamber
   2. The relative energy of the different types of radiation
   3. The type of shielding necessary to stop different types of radiation
   4. The explanation of various terms used in evaluation of biological effects of radiation
   5. The effects of overdosage on the human body
   6. The geiger counter and the different windows used to detect different types of radiation

B. Explain and stress the importance of these situations to the radiographer.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Invisible Bullets"	Introduce Film
	1. Title
	2. Length

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments,

Discuss the film. Emphasize strong points in the discussion. Use questions listed below to spark discussion.

A. The spark chamber and the cloud chamber.
   1. Methods of visually observing ionization from radiation
   2. The ionization path of the different forms of radiation
   3. The effect of radiation on the conductivity of gases

B. The geiger counter and the different window materials needed for the different forms of radiation.

C. The relative penetrating power of different types of radiation.
   1. Lead shielding for gamma
   2. Glass for beta
   3. Paper for alpha

D. The units of measurement for biological radiation effects.
   1. The RAD
   2. The RBE

E. The effects of overdosage on the human body.
   1. Blood damage
   2. Bone marrow damage
   3. Nausea
   4. Lethal dose

F. Why are alpha and beta particles not usually considered hazardous in radiography?

G. When could they create a hazard?

H. Explain whether or not the human body can repair radiation damage.

I. Name three considerations in determining a lethal dose of ionizing radiation to a human being.

J. In what manner may the blood be damaged by ionizing radiation?

K. What is meant by the relative biological effect?

L. How does a geiger counter measure radiation dose rate?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the effect of radiation on an air path through which it passes?

B. Explain how this can be seen.

C. Which of the three types of radiation (alpha, beta, and gamma) has the greatest penetrating power? The least?

D. Which of these could be shielded by a piece of paper?

E. What is the rad and the rbe? What are they used to measure?

F. Do all forms of radiation have the same biological effects?

G. What is the dosage level considered lethal?

Check and discuss

V. SUMMARY

A. The meaning of radiation, its natural source, the various forms it takes, and how it is used.

B. The difference between alpha and beta particles and between gamma rays and x-rays.

C. The extent of damage to living tissue by ionizing radiation depends on: type and intensity of the radiation; amount and parts of body exposed; duration of exposure.

D. Ionizing radiation can be observed in a cloud chamber instrument.

E. Time, distance, and shielding can reduce the hazards of ionizing radiation.

The Next Lesson is: Isotopes - Excursions in Science

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 2
Time 1 hour

SUBJECT: Isotopes - Excursions in Science

AIM (or purpose): To acquaint class members with the basic concepts of the nuclear sciences

TEACHING AIDS: Film: Isotopes - Excursions in Science, 20 mins., 16mm, sound, U.S. Atomic Energy Commission

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

A. Introduce the film by title giving a brief rundown on content pointing out that in order to be able to employ and use radioisotopes in industry one must satisfy the Atomic Energy Commission and/or the State that one fully understands the basic concepts of nuclear science.

B. Suggest that group watch for the following items when viewing the film:

1. The three rays (or particles) ejected by radioactive decay.
2. The definition of half-life.
3. The methods used to create artificial isotopes.
4. The safety precautions used by companies and individuals working with radioactive materials.
5. The encapsulation of radioactive materials.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Isotopes - Excursions in Science"	Show the film

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Discuss the film, emphasizing these points in the discussion and questioning as needed:

A. The rays and particles produced by radioactive decay
   1. Alpha
   2. Beta
   3. Gamma

B. Re-define and discuss decay half-life.

C. Production of artificial isotopes used for industrial radiography.

D. Safety equipment used by the workers in the film.

E. Encapsulation, particularly where related to radiography.

F. What is meant when one states that half-life is exponential?

G. Give an example: (If a radioactive isotope is said to have passed through three half-lives what percentage of its original activity remains?

H. Explain why all isotopes of elements are not radioactive.

I. Which of the three emitters has the greatest penetrating power, Alpha, Beta, or Gamma?

J. Which emitter is most suitable for radiography?

K. Why?

L. What are the three basic methods of shielding against nuclear radiation?

M. Why is an isotope that is used in radiography encapsulated?

N. How is the isotope encapsulated?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. What are the three types of particles or rays emitted by radioactive decay?

B. Define a half-life of a radioisotope.

C. How are radioisotopes produced?

D. Why are isotopes used in radiography encapsulated?

V. SUMMARY

A. The three types of radiation produced by radioactive decay.

B. Encapsulation usually eliminates alpha and beta radiation.

C. Half-life of a particular isotope of an element determines its useful life in an industrial application.

D. Safe handling procedures and rules must be understood and observed in order to use and handle radioactive materials.

The Next Lesson is: Atomic Structure of Matter

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 3
Time 2 hours

SUBJECT: Atomic Structure of Matter

AIM (or purpose): To outline the basic nuclear science concepts and assist the student in developing a proper vocabulary regarding the subject

REFERENCES: Radiological Monitoring for Instructors, Instructor's Guide, Lesson 2, Department of Defense, Office of Civil Defense, Training Division, Battle Creek, Mich.
Information Sheet #41

I. PREPARATION (of the learner)

A. Introduce topic developing interest by asking a few simple questions regarding the structure of matter, supplying quick and informative explanations.

B. Stress the fact that the atomic theory as related to radiography is not difficult to understand if you develop the theory a step at a time. Explain that the purpose of this lesson is to help to visualize the atomic structure of matter and how it can be altered to make gamma radiography possible.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Matter	1. Anything which occupies space and has mass or weight. 2. That which can be classified according to physical and chemical properties. 3. Many different kinds of matter exist. 4. Classification of matter is an important part of nuclear science.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
B. Classification of Matter 1. Mixture	1. Physical combination of two or more substances characterized by no definite ratio. Each substance maintaining its individual identity: Example: Cup of coffee.
2. Compound	2. Chemical combination of two or more substances characterized by definite ratio of the combining substances. Water contains two parts hydrogen to one part oxygen no matter where it is found.
3. Element	3. Substance which cannot be separated into substances different from itself by ordinary chemical means. Gold is one of the over 100 different substances which contain <u>only</u> atoms of the same chemical property. Silver is another.
4. Molecule	4. Smallest part of a compound that can exist and still retain the chemical properties of the compound. A molecule contains two or more atoms.
5. Atom	5. Smallest conceivable part of an element. Smallest portion of an element that can enter into chemical combination.
C. Concept of the atom	Information Sheet #41 1. The term "atom" means undividable. It is from the Greek letter "a" meaning "not" and the word "tomos" meaning "cut". 2. The Greek concept proved to be erroneous, and it has been demonstrated, that an atom is dividable. 3. In about 1900 scientists discovered the atom was not a uniform sphere. 4. It was also determined that it contained a strong positive charge in its center with a negative charge about it.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
	5. The center dimension is small compared to the atom as a whole, about 1 to 10,000 ratio and the negative charges orbit around a nucleus. 6. If the nucleus of an atom was the size of a marble the entire atom would weight about 36 million tons and the closest negative charge would orbit about 200 feet away.
D. Atomic structure	1. An atom consists of protons, electrons, and neutrons. 2. Proton: is a subatomic particle found in the nucleus of an atom. It is positively charged. 3. Electron: a very light particle, negatively charged. Orbits the nucleus. A proton is 1840 times heaver than an electron. 4. Neutron: carries no electrical charge. Weighs the same as a proton and is found in the nucleus. 5. Properties of each element are the period functions of the number of protons in its nucleus.
E. Isotopes of elements	1. Different forms of the same element. 2. Like brothers, they have the same last name but different first names. 3. Each element is assigned an atomic number which is equal to the number of protons in the nucleus of its atom (Sometimes called "Z" number). 4. Each different form, or isotope, of an element has a mass number (The "A" number) The "A" number equals the total number of neutrons and protons in the nucleus of its atoms. 5. Write on the chalkboard the correct symbols for describing cobalt 60.

6. Draw the structure of an atom other than the one shown on information sheet and explain each step. Ask for student participation.
7. Some isotopes are not radioactive. (Stable)
8. Only unstable isotopes can be used in radiography. Explain.

F. Ioniziation

1. A process which results in the formation of electrically charged particles (ions) from neutral atoms or molecules.
2. Ionization is the process and positive and negative ions are products of the process.
3. All three types of radiation, alpha, beta, and gamma. Cause ionization as they interact with various matter.
4. On the chalkboard, demonstrate how radiation strikes orbital electrons and moves them out of orbit.
5. They actually disturb the organized balance of the atomic structure disrupting the normal electrical balance of the atom.
6. Ionization is also the process by which nuclear radiation loses its energy.
7. Ionization permits detection of nuclear radiation, produces the biological effects from nuclear radiation and provides a means of shielding against nuclear radiation.

III. APPLICATION (drill, illustrations, analogies, oral question or assignments)

A. Suggest that students draw an atomic structure without refering to information sheet.

B. Have them state the number of positive and neutral charges in the structure.

C. Ask them to define the "z" number, "a" number.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. Describe a compound, give an example.

B. A mixture, give an example

C. An isotope, give an example

D. Describe the structure of an atom, illustrate on chalkboard.

E. Define ionization.

F. Describe its (ionizations) safety value in radiography.

V. SUMMARY

A. An atom is the smallest part of the elements hydrogen and oxygen. If two atoms of hydrogen and atom of oxygen combine chemically they form one molecule of the compound water.

B. Concepts of the atom

C. Atomic structure

D. Isotopes

E. Ionization

The Next Lesson is: Nuclear Radioactivity

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 4
Time 2 hours

SUBJECT: Nuclear Radioactivity

AIM (or purpose): To assist the student in developing a basic understanding of the source of the energy emitted from radioactive materials

REFERENCES: Information Sheet #41
Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois

---

I. PREPARATION (of the learner)

Explain the importance of understanding the radioactive decay process because:

A. The information will aid the radiographer in selection of the proper isotope material for each radiographic assignment.

B. The information is useful in the design of effective shielding.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The structure of an atom	Draw chalkboard sketch of a typical atomic structure. Also use information sheet #41 for this discussion.
B. The atomic nucleus 1. The proton 2. The neutron 3. Atomic number 4. Atomic weight	1. Define: a. Proton - positive parts of atom b. Neutron - neutral parts c. Atomic weight - mass or weight of atom, total number of protons and neutrons in an atom d. Atomic number - total number of protons in an atom 2. Show by sketches why the isotope has the same atomic number but a different atomic weight.

C. Radiation emitters 1. Natural emitters 2. Neutron activated emitters	1. List on chalkboard some natural emitters such as radium - uranium 2. Explain energy equilibrium and radioactive decay. Stable isotopes are in equilibrium - not radioactive. 3. Explain how elements can become radioactive by neutron bombardment - Unstable isotopes are not in equilibrium and decay back to stability. Neutrons upset stability by changing the atomic weight. 4. Illustrate the reaction of a neutron with the element Cobalt 59 to illustrate the formation of Cobalt 60.
D. Products of nuclear radiation 1. Alpha particles 2. Beta particles 3. Gamma rays	1. Define the alpha particle - lightly penetrating highly ionizing stream of fast-moving helium nuclei 2. Explain why the alpha particle is stopped by a small amount of light shielding material. 3. Define a beta particle. 4. List the properties of beta particles - negative charged particle emitted from nucleus of atom. Mass and charge equal to electron. Low penetrating power. 5. Explain the origin of the gamma ray. Short wave length; electromagnetic radiation of nuclear origin, emitted from the nucleus, pure energy. 6. List the properties of gamma rays: a. Electromagnetic energy b. Discrete energy levels c. Penetrating power relatively high 7. Discuss and contrast the electronic and magnetic properties of the three types of radiation.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students sketch a model of a typical atomic structure and label each component.

B. Ask students in turn to indicate and define the following:
   1. The proton
   2. The neutron
   3. The Electron
   4. Atomic weight
   5. Atomic number

C. Questions why an element becomes radioactive if an extra neutron is injected into the nucleus.

D. Ask the students what materials are necessary to shield:
   1. Alpha particles
   2. Beta particles
   3. Gamma rays
   4. X-rays

IV. TEST (final check on students' comprehension of material presented)

A. Give brief test:
   1. List the three nuclear disintegration products.
   2. Indicate their penetrating power in increasing order.
   3. Explain the physical difference in the three types of radiation.
   4. Why are alpha and beta particles deflected by a magnetic field when gamma rays are not.
   5. What is the difference between the gamma rays emitted from different radioactive sources?

B. Check answers and discuss with the class.

V. SUMMARY

A. Gamma rays emitted from radioisotopes of elements have discrete energy levels, therefore, the isotope and the element can be identified.

B. Gamma energy is non-magnetic.

C. Beta particles can be deflected in a magnetic field.

D. Gamma rays are pure energy therefore they have no mass.

E. Beta particles have mass or weight.

F. Alpha particles are the least penetrating but are highly ionizing.

The Next Lesson is: X-radiation

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 5
Time 2 hours

SUBJECT: X-radiation

AIM (or purpose): To explain the theory of x-ray generation and to develop a thorough understanding of the subject

TEACHING AIDS: Chart of the Electromagnetic Spectrum - Page 3- Radiography in Modern Industry

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois

---

I. PREPARATION (of the learner)

Explain briefly why an industrial radiographer must have an understanding of the principles of x-ray generation. Point out that a knowledge of these principles is necessary to understand the calculations of exposure.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The nature of radiation 1. Rays and/or particles 2. Energy	1. Define electromagnetic wave energy. 2. Explain gamma and x-radiation in terms of rays of energy. 3. Display and explain chart of the electromagnetic spectrum.
B. X-ray generation 1. Decelleration of charged particles 2. Source of particles 3. Target materials 4. Voltage potential 5. Radiation from point of impact	1. Sketch on chalkboard an atomic structure model and a point representing a source of charged particles. 2. Explain: a. The source of charged particles b. Function of the target c. Reason for the high voltage

6. Energy converted to heat	3. Illustrate on the sketch the reaction at the point of impact, showing electron being displaced from orbit. 4. Indicate the efficiency of this system.
C. The continuous spectrum 1. Short wave length limit 2. Effect of kilovoltage	1. Sketch a typical intensity vs. wave length graph on the chalkboard. 2. Define and point out the short wave length limit. 3. Define and explain the effect of decelleration alone on the wave length of radiation. 4. Sketch in additional curves to show the effect of changing kilovoltage.
D. The characteristic spectrum 1. Critical voltage 2. Definite wave lengths	1. Add a characteristic line to the chalkboard sketch. 2. Explain the origin of this line. 3. Use chalkboard to define the critical voltage. 4. Explain the relation between the characteristic wave length and the orbits of the atomic structure.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Using a sketch of an atomic structure on the chalkboard or on a passout sheet have students identify the parts of the structure and indicate the source of charged particles.

B. Have students indicate the following:
1. The reaction which produces the continuous spectrum.
2. The reaction which produces the characteristic spectrum.
3. The effect of increasing the kilovoltage by drawing a graph of intensity vs. wave length.

IV. TEST (final check on students' comprehension of material presented)

A. Suggested questions for written test:
1. Explain radiation in terms of rays of energy.
2. What is the function of the target?
3. What is produced at the target besides radiation?
4. Why does decelleration produce white radiation?
5. What is the effect of kilovoltage on the short wave length limit?

B. Review answers with the class allowing brief time for students to make needed corrections.

The Next Lesson is: The Effects of Radiation on Physical Matter

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 6
Time 2 hours

SUBJECT: The Effects of Radiation on Physical Matter

AIM (or purpose): To outline and thoroughly explain the reactions which occur within a material when it is subjected to radiation

REFERENCES: Nondestructive Testing Handbook, Volume 1, Society for Nondestructive Testing, 1963, Evanston, Illinois
Information Sheet #9, Scattering Effect

I. PREPARATION (of the learner)

A. Impress upon the students the need for developing a thorough understanding of the subject and how this knowledge can affect the personal safety of the individual.

B. Help him to understand the damage that could be done to his body.

C. Attempt to develop a sense of responsibility in each student that untoward actions on his part may affect not only his but the safety of others as well.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Scattering	Pass out Information Sheet #9
1. Coherent energy scattering	1. Draw sketch of typical atomic structure on chalkboard.
2. The Compton effect	2. Explain on the sketch:
3. Pair production	a. The reaction in coherent scattering
4. Photoelectric effect	b. The dual Compton reaction
	c. The formation of the particles in pair production
	d. The formation of the particle in the photoelectric effect
	e. The fluorescence of certain materials

	3. Compare and contrast the four common types of scattering.
B. Ionization 1. Photon 2. Electron	1. Draw sketch on chalkboard of atomic structure as an ion. 2. Define an ion. 3. Explain how an ion can be created by a photon of energy 4. Indicate how the ejected electron can create other ions. 5. Point out useful utilization of the ionizing effect. a. Sterilization of food b. Radiation detection instruments 6. Explain metallic bonding and show why metals are not permanently affected by irradiation.
C. Permanent effects	Point out that: 1. Irradiation does not leave the material in a state of radioactivity. 2. Most ionization is permanent.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Give individual students one of the following problems to be illustrated on chalkboard:

1. Coherent energy scattering
2. The compton effect
3. Pair production
4. Photoelectric effect
5. Creation of an ion by a photon of energy
6. Creation of an ion pair by a photon and the ejected electron

B. Have each student explain his subject to the rest of the class asking the group to offer comments or questions as the subject is developed.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Why does radiation cause ionization?

B. What is the difference between coherent and incoherent (Compton) scattering?

C. Does irradiation leave any residual radioactivity? (Explain)

D. Describe a use of ionizing radiation.

E. Contrast pair production with the Compton effect.

Check papers and discuss.

V. SUMMARY

A. Radioisotopes normally used in industrial radiography do not affect the materials being radiographed.

B. Radioisotopes normally affect only living matter.

C. Ionization can damage or destroy living tissue.

D. Ionizing radiation can be created in several ways.

The Next Lesson is: Biological Effects of Nuclear Radiation

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 7
Time 1.5 hours

SUBJECT: Biological Effects of Nuclear Radiation

AIM (or purpose): To develop an awareness of the effects of nuclear radiation on the radiographers' personal health

REFERENCES: Title 10, Federal Register, Part 20, U.S. Atomic Energy Commission, Washington, D.C. Radiological Health Handbook - U.S. Dept. of Health, Education and Welfare - Public Health Service, Washington, D.C. Distributed by U.S. Dept. of Commerce - Office of Technical Services.
Information Sheet #10

I. PREPARATION (of the learner)

A. Point out that this lesson will help to insure the future health of the radiographer.

B. That it can also help to prevent serious injury to the radiographer.

C. Stress that it will help the radiographer to understand why his employer has certain safety rules which the radiographer must observe if he is to keep his job.

D. Explain that it will provide a thorough understanding of the biological effects of ionizing radiation and precautionary measures that must be taken, if a person is to be licensed to use, possess, and handle radioactive materials.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Types of exposure	Pass out Information Sheet #10
1. External radiation	1. Explain the difference between: a. External exposure
2. Inhalation and ingestion	b. Inhalation and ingestion
3. Energy level of radiation	2. Emphasize the increased hazard of inhalation particularly of blood soluble elements.

II. PRESENTATION (continued)

Instructional Topics	Things To Remember to Do or Say
	3. Explain the effect of exposure from increasingly higher energy radiation.
B. Immediate effects 1. Radiosensitivity 2. Erythema 3. Blood blisters 4. Drying of mucous	1. Explain the immediate effects of the ionization of sensitive tissue. 2. Point out the immediate skin disorders which indicate over-exposure. 3. Explain other side effects such as: nausea, lifeless feeling, and general ill feeling.
C. Delayed effects 1. Genetic effects 2. Scar tissue 3. Cancer	1. Explain the function of chromosomes. 2. List some changes in offspring caused by alteration of chromosomes a. Possible deformation b. Features unlike either parent 3. List the effects on cancer formation: a. Heavy over-exposure could cause cancer. b. Exposure can cause accerlerated growth of existing cancer. c. Radiation can sometimes destroy cancer. 4. Tissue which has been damaged remains as scar tissue without useful function.
D. Permissible dosages 1. Roentgen 2. Rem 3. Biological limitations 4. Legal limitations a. whole body b. partial exposure	1. Define a roentgen and a rem on chalk-board 2. Explain the relation of a roentgen to the rem. 3. Outline the following biological effects: a. 50 to 100 rem—temporary blood changes b. 100 rem and greater - erythema, blood blisters, inflamation of mucous membranes, possible fatality c. 450 rem and greater - 50% chance of survival, loss of hair, changes in nails 4. Indicate the whole body dosage allowed by law, a. 1250 millirem every 13 weeks b. 5 rem per year c. Life time dosage determined by the formula 5 (N-18) Explain fully

5. Outline the partial exposure allowed by law for persons in restricted areas:
    a. Hands and forearms, feet and ankles - 18 3/4 rems every 13 weeks
    b. Skin of whole body - 7 1/2 rems in 13 weeks
6. Outline the whole body dosage allowed by law for person outside restricted areas:
    a. Maximum of 1/2 rem in one year
    b. No more than 100 millirem in seven days

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Invite the students to discuss and list the biological effects of exposure to ionizing radiation.

B. Discuss the effects listed.

C. Have members of the class give the legal permissible dosages for whole body exposure in restricted and unrestricted areas.

D. Ask for exact definitions of a roentgen and a rem.

E. Discuss the limits and effects of massive doses of radiation—chances of survival and visible effects.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. List the permissible legal dosages for whole body exposure.

B. If a group of adults was exposed to a short term, whole body dose of 450 rems of radiation what percentage would probably survive?

C. List five effects of excessive exposure of the human body to nuclear radiation.

... Why does the higher energy radiation have a greater biological effect?

E. From what dosage level of exposure would the average person completely recover from all ill effects?

Check papers and discuss

V. SUMMARY

A. The total permissible accumulated radiation dose is determined by a formula: 5 (N-18).

B. The permissible dose varies with individual parts of the body.

C. Detailed, current dose records of personal radiation exposure must be kept.

D. Ionizing radiation can destroy cancer cells but can also cause growth of existing cancer cells.

E. Internal radiation exposure to alpha, beta, or gamma radiation can be caused by inhalation or ingestion of contaminated air, food, or water.

The Next Lesson is: Methods of Reducing Radiation Dosage

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 8
Time 2 hours

SUBJECT: Methods of Reducing Radiation Dosage

AIM (or purpose): To develop a working knowledge of the methods used to reduce unwanted radiation intensities

TEACHING AIDS: Small source of radioactivity
Samples of shielding materials
Dosimeters

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Information Sheet #11

I. PREPARATION (of the learner)

A. Review the important points on effects of radiation convered in the two previous lessons.

B. Introduce the three essential ways of reducing or controlling radiation dosage when working with radioactive materials.

C. Explain why it is essential for a radiographer to understand methods of reducing radiation dosage.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Time of exposure	Pass out Information Sheet #11 1. Explain the concept of dose rate and total dosage. 2. Demonstrate: a. Place two dosimeters at a fixed distance from a source of radiation. b. Remove one dosimeter after a short period.

c. Remove the second after twice the time of the first.
d. Have students read and report the results of both dosimeters.
e. Discuss the results & why.

B. Distance from Source

1. Review the inverse square law.
2. Demonstrate:
   a. Place one dosimeter a fixed distance from the source and a second at twice the distance.
   b. Expose both for the same period of time.
   c. Have students read and report the results of both dosimeters.
   d. Discuss the results & why.

C. Shielding of Source

1. Explain absorption and attenuation of radiation by shielding.
2. Demonstrate:
   a. Place two dosimeters at a fixed distance from a source of radiation.
   b. Place shielding material between source and one dosimeter.
   c. Remove both dosimeters at the same time.
   d. Have students read and report the results of both dosimeters.
   e. Discuss the results & why.
   f. Explain the "Half-Value and Tenth-Value Layers"
      1. Amount of <u>any</u> shielding materials required to reduce radiation intensity to one-half.
      2. Amount required to reduce to one-tenth.

III. APPLICATION (drill, illstrations, analogies, oral questions or assignments)

A. Repeat the three preceding demonstrations.

B. For the "Time of Exposure" demonstration have students estimate the dosage of the second dosimeter before reading.

C. For the "Distance from Exposure" demonstration have students calculate the dosage on the second dosimeter before reading.

D. For the "Shielding of Source" demonstration use several dosimeters and layers of shielding material to obtain data for the plotting of a curve of dosage vs. thickness.
Ask the students to estimate the thickness of the material to reduce the dosage to half of that without shielding.

IV. TEST (final check on students' comprehension of material presented)

A. Ask class to write answers to the following questions:
   1. Name the three factors in the control of dosage.
   2. If a radiographer receives a dose of 7 mr/hr from a source by standing 100 feet away for 5 minutes, how much will he receive in 12 minutes?
   3. If a radiographer receives a dose of 7 mr/hr from a source by standing 100 feet away for 5 minutes, how much would he receive in 5 minutes at 75 feet away?
   4. How thick is a Half-Value Layer? A tenth-value layer?

B. Check and discuss answers given. Make sure all class members understand correct answers.

V. SUMMARY

Emphasize the following major points:

A. Time, distance and shielding are the three most important radiation protection factors.

B. Radiation intensity is inversely proportional to the square of the distance of source of radiation.

C. All materials having density and mass have some radiation shielding value.

D. Time spent in radiation field is proportional to the total exposure dose.

The Next Lesson is: The Calculation of Shielding Thickness

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 9
Time 2 hours

SUBJECT: The Calculation of Shielding Thickness

AIM (or purpose): To develop understanding and ability in making calculations required for determining the thickness of radiation shielding

REFERENCES: Radiation Safety in Industrial Radiography with Radioisotopes, P.M. Frazier, C.R. Buchanan, and G.W. Morgan, 1954, U.S. Dept of Commerce, Washington, D.C.
Information Sheets #8, #9, #12

I. PREPARATION (of the learner)

A. Introduce the topic and briefly review the need for shielding radioactive sources and radiographers from ionizing radiation.

B. Outline some of the subjects to be studied explaining why it is important to know the thickness of a half or tenth value layer, the location of shielding material, its properties and amounts needed for varying source intensities.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Absorption of gamma radiation 1. Compton effect 2. Photoelectric effect 3. Pair production	Refer to information sheet #9 and review mechanisms of attenuation of a photon beam as it passes through a material.
B. Geometry of Absorption 1. Narrow beam 2. Broad beam	1. Define the two terminoligies and contrast their meanings: a. Broad beam shielding includes the effects of scattered radiation resulting from deflection of the primary radiation as well as absorption of the primary radiation.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
	b. Narrow beam shielding does not include the effects of scatter from the shield. 2. Explain the importance of determining the method of calculation. 3. Questions
C. Calculations of narrow beam shielding $I = I_0e - ut$	1. Define the terms of the equations on the chalkboard: Reduction factor = eut e = 2.718 (A constant) u = the linear absorption coefficient t = thickness of shield (in centimeters) $I = I_0e - ut$ I_0 = the original radiation exposure rate I = the attenuated radiation exposure rate e = 2.178 (a constant) u = the linear absorption coefficient t = the thickness of shield in centimeters 2. Show calculations of a typical problem in shielding. 3. Questions
D. Emperical data for broad beam absorption	1. Define: a. Reduction factor - $\frac{\text{Dose rate without shield}}{\text{Dose rate with shield}}$ b. Half-value and tenth-value layer - amount of shielding material required to reduce radiation intensity to one half its original value Tenth value layer - amount of shield material required to reduce radiation intensity to one-tenth its original value 2. Explain the origin of the NBS curves for broad beam absorption. 3. Demonstrate the determination of shielding thickness by use of half-value layers. Explain and discuss

	4. Tabulate on the chalkboard the values of half value and tenth value layer of iron, lead, and concrete for Cobalt, Iridium, and Cesium radiation. 5. Distribute copies of the NBS reduction factor curves for broad beam shielding and information sheets 12A, 12 B, 12C. 6. Explain and discuss.
E. Relative efficiency of shielding materials	Hand out information sheet #13 - Explain and discuss
F. Equation for determining the number of half-value layers required to reduce primary radiation to an acceptable level and equation for tenth-value layers (Logarithmic method)	Refer to Information Sheet #8: 1. Write both equations on chalkboard. 2. Have students copy them. 3. Work two problems on chalkboard using each equation. 4. Prove validity of answers.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask students to define broad and narrow beam absorption and to explain the limitations of the calculations from narrow beam absorption.

B. Request others to define the Compton effect, photoelectric effect, and pair production.

C. Have another define the reduction factor, half-value layer, and tenth-value layer.

D. Suggest members of the group use or explain the NBS curves for broad beam absorption.

E. Have each individual determine the number of half-value layers to reduce an Iridium 192 radiation intensity of 1000 mr/hr to 10 mr/hr. Ask for verbal replies and demonstrate the solution.

F. Ask the students to determine the thickness of lead, iron, and concrete which corresponds to the half-value layers in the above problem.

G. Invite all class members to work two shielding problems requiring the use of the logarithmic method for solving the problems as explained in step II. Discuss answers. Review the equations if necessary.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Define:
   1. Half-value layer
   2. Tenth-value layer
   3. Reduction factor

B. How many half-value layers are needed to reduce a radiation intensity of 250 mr/hr to 2 mr/hr?

C. How much lead shielding is required to reduce the level of Cobalt 60 from 250 to 2 mr/hr?

D. What thickness of lead is required if the information is taken from the NBS absorption curves?

E. What is the difference between narrow beam and broad beam absorption?

Check and discuss.

V. SUMMARY

A. Shielding can be achieved with any relatively non-porous material or anything that has mass or weight.

B. The required amount of shielding can be calculated by several methods.

C. Shielding from contamination is not as simple as shielding from a point source of radiation.

D. A mixture of several different types of material is sometimes used as shielding; i.e., concrete, steel, sand, water, wood, etc.

The Next Lesson is: Elements of Electrical Circuits

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 6
Lesson 10
Time 1.5 hours

SUBJECT: Elements of Electrical Circuits

AIM (or purpose): To outline and acquaint the student with the fundamentals of electronic circuitry

TEACHING AIDS: Film: Elements of Electrical Circuits, 11 mins., 16 mm, sound, Pennsylvania State University, University Park, Pa.

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

A. Point out that an understanding of the fundamentals of electronic circuitry is necessary if the student is going to use and maintain x-ray generating, portable power generating, and nuclear radiation detecting equipment properly and in a non-hazardous manner.

B. Invite special attention to the definitions of the following terms by the student:

1. Conductivity
2. The amp
3. The volt
4. Resistance and the ohm
5. Ohm's Law

C. Caution the group that a test will be given at the conclusion of the film showing.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Elements of Electrical Circuits"	Review film before showing to students. Make notes of key points and inform students of these key points before showing them the film.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
	Have film and projector set up before students arrive.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Discuss the film, emphasizing these points in the discussion.

A. The definition of the terms:
   1. Conductivity
   2. Insulators and conductors
   3. The volt, amp, and ohm

B. Ohm's Law and its application

C. The effects of heat on resistance

D. The effects of size and length of the conductor on resistance

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. If a six volt battery was connected across a 3 ohm resistor, how many amps would flow?

B. Define:
   1. Resistance
   2. Amperage
   3. Voltage

C. What happens to the electrons in a conductor when a voltage is applied? How is this related to the atomic bonding in metals?

V. SUMMARY

A. In order to understand the behavior of electric power one must first learn to understand the basic laws pertaining to this subject.

B. The terms used in applying these laws must be interpreted properly.

C. Students must learn to use these circuits in a non-hazardous manner.

The Next Lesson is: Gamma Ray Apparatus

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 7
Lesson 1
Time 1.5 hours

SUBJECT: Gamma Ray Apparatus

AIM (or purpose): To provide knowledge and understanding of the characteristics of gamma ray exposure apparatus

TEACHING AIDS: Sample radiographs
Film viewer

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Radiography in Modern Industry, Eastman Kodak Company, 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

A. Introduce subject and explain the usefulness of the information to be given in this lesson; point out that it will aid the radiographer in obtaining better radiographs making his job easier and safer.

B. Stress the fact that a thorough understanding of the equipment and its capabilities will result in improved techniques and economic advantages.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Penetrating power of gamma rays	1. List on the chalkboard and explain, the useful range of penetration for Cobalt, Iridium, Cesium and Radium. 2. Explain the term KEV and MEV. 3. List the KEV range or MEV range of the three synthetic isotopes - cobalt, iridium, and cesium. 4. Explain main energy spectrum of CO 60, i.e., 1.1 MEV and 1.3 MEV.

B. Quality of Radiation	1. Define radiation quality. 2. Explain: a. Why the radiation quality of gamma radiation is fixed b. The effect of the fixed radiation quality on the latitude of thickness c. The difficulties of sensitivity control with isotope radiation 3. Show sample radiographes 4. Questions
C. Safety	1. Point out the hazards of the continuously active source: a. Cannot be turned off while being transported b. During periods of storage c. Between exposures d. In the event of capsule rupture 2. Explain the problems of shielding: a. Other workers b. Confined areas c. Scaffolds d. Congested areas e. Uncontrolled areas 3. Questions
D. Disadvantages of gamma radiation	Discuss: 1. The cost of source replacement 2. The expense of safety programs 3. The limitations for inspection of thin or light materials 4. Questions
E. Advantages peculiar to gamma radiation	Explain: 1. Equipment mobility 2. Self containment 3. Unrestricted beam geometry 4. Questions

---

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Discuss the following questions:

A. What is the useful thickness range (in steel) of radiation from Iridium 192 ? Cobalt 60 ? Cesium 137 ?

B. What is the KEV range of Iridium 192? Cesium 137?

C. What is the MEV of the two Cobalt 60 gammas?

D. What is the duty cycle of isotope radiation?

E. What is the greatest operational disadvantage of isotope radiation?

F. Why are the shielding requirements greater for Cobalt than Cesium?

G. Why is gamma radiation ineffective for inspection of light materials such as aluminum and magnesium?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Define KEV and MEV.

B. List the useful range of thickness for radiography with:
1. Cobalt 60
2. Iridium 192
3. Cesium 137

C. What effect on contrast would result from changing the radiographic technique of a 1/4" steel plate from the use of Iridium to Cobalt?

D. What is the greatest advantage of gamma radiation for radiographic use?

Check and discuss

V. SUMMARY

A. Gamma rays have relatively more penetrating power than portable x-ray generators.

B. Gamma radiation cannot be shut off.

C. Gamma ray uses are more flexible than those of x-ray generators.

D. Gamma rays are unsuitable for radiographing thin, light metals and plastics.

E. Gamma ray intensity decays with time.

The Next Lesson is: X-ray Apparatus

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 7
Lesson 2
Time 1.5 hours

SUBJECT: X-ray Appartus

AIM (or purpose): To familiarize the student with the characteristics of x-ray generators and x-ray apparatus

TEACHING AIDS: Sample radiographs
Film viewer
X-ray generator and apparatus

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N.Y.
Information Sheet #14

I. PREPARATION (of the learner)

A. Arrange the class in good viewing position around the x-ray apparatus and point out the essential parts and characteristics of the equipment.

B. Give a brief review of the capabilities and uses of x-ray with special emphasis on industrial application.

C. Point out that each student will be given individual instruction on how to use x-ray apparatus.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Penetrating power of x-ray apparatus	1. List on the chalkboard the range of penetrating power for portable generators, fixed generators, and accelerations. Portable x-ray generators range: about 1/8" to 1 1/2" steel equivalent. Fixed type:

1/4" to 2 1/2"; accellerators up to 12" or more.

2. Explain how penetration power can be varied by changing kilovoltage.
3. Point out that as x-ray wave length decreases, the penetrating power increases.

B. Quality of radiation

1. Define radiation quality. X-ray quality can be compared to the KV or wave length of the x-rays being generated.
2. Explain:
   a. How radiation quality can be varied on an x-ray generator by changing KV setting
   b. The effect of radiation quality on thickness latitude
   c. The ability to adjust sensitivity by changing the radiation quality
3. Show sample radiographs of the above.
4. Hand out Information Sheet No. 14.

C. Safety

1. Point out the advantages of electrically generated radiation from a safety standpoint. Radiation can be turned off when not in use.
2. Explain why x-rays are easier to shield than higher energy gamma radiation. The higher the energy the more shielding necessary.

D. Disadvantages of x-ray apparatus

1. Define duty cycle and constant potential. Explain the length of time than an x-ray generator can be operated without overheating tube is called duty cycle.
2. Explain why cooling is required in the operation of x-ray generators. Cooling required to protect target and tube.
3. Point out the disadvantages of:
   a. Large size of x-ray tube heads
   b. Electrical power requirements
   c. Restricted beam geometry of tank units
   d. Restircted duty cycle because of

excessive heat generated by electrons striking target in x-ray tube.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Ask the class to assist in answering the following questions:

A. What is the thickness range in steel of x-rays from a 200 KVP x-ray generator?

B. How can penetrating power be adjusted on x-ray generators?

C. What effect does radiation quality have on the latitude of thickness which can be covered by a single exposure?

D. How does radiation quality effect sensitivity?

E. Why are x-rays from portable generators easier to shield than gamma rays?

F. What is meant by an x-ray generators duty cycle?

G. How can the duty cycle be increased?

H. List four disadvantages of x-ray generators?

IV. TEST (final check on students' comprehension of material presented)

A. Suggested questions for oral or written test:
   1. Define radiation quality.
   2. What happens to the wave length of the radiation when the KV is increased?
   3. Define thickness latitude capability.
   4. List three safety features of x-ray generators.
   5. What is meant by a constant potential x-ray generator?

B. Discuss correct answer for each question included in the test and clarify any additional questions class members may have about x-ray apparatus.

The Next Lesson is: Decay of Radioactive Materials

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 7
Lesson 3
Time 1.5 hours

SUBJECT: Decay of Radioactive Materials

AIM (or purpose): To develop an understanding of radioactive decay mechanisms

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois
Information Sheets #15, and #16

I. PREPARATION (of the learner)

A. Write aim of lesson on chalkboard explaining that the lesson is calculated to help the radiographer in selecting the proper source of radiation for a particular assignment and should help him understand the safety requirements for each type of source.

B. Briefly review previously discussed material by holding a short discussion, on alpha and beta particles, gamma photons and where these energy forms originate.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Disintegration mechanisms	1. List the four modes of disintegration alpha particle emission, beta and positron particle emission and "K" capture. 2. Define electron or "K" capture, i.e., electron capture from the "K" shell by the nucleus of the atom. 3. Define: a. Alpha particle - stream of fast moving helium nuclei, highly ionizing, weakly penetrating

   b. Beta particle - negatively charged particle emitted from nucleus.
   c. Gamma photon - short wave length, electromagnetic radiation of nuclear origin
4. Questions

B. Disentegration scheme

1. Draw chalkboard sketch of Cobalt 60 decay scheme explaining:
   a. The intermediate gamma emission
   b. The two beta disintegrations
   c. The final two gamma emissions
   d. The formation of stable Nickel 60
2. Questions

C. Decay half- life

Refer to information sheets #15 and 16

1. Define half-life and decay rates on chalkboard.
2. List the half-life values for:
   a. Cobalt 60 = 5.3 years
   b. Iridium 192 = 75 days
   c. Cesium 137 = 27 years
3. Sketch a half-life decay curve on the chalkboard, explaining its use.
4. Questions

D. Decay tables

1. Explain the advantages of decay tables:
   a. Helps in figuring exposure time accurately and quickly
   b. Reduces calculation errors
   c. Helps to project future needs of replacement source capsules
2. Work sample problems using decay tables.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have the group list the four modes of disintegration.

B. Ask students to define each mode and discuss.

C. Request students draw the Cobalt 60 decay scheme and explain.

D. Ask the following questions and discuss each:
   1. What is meant by half-life?
   2. What is the half-life of Iridium 192? Cobalt 60?
   3. What is the value of the decay chart?

E. Have students work the following problem using a Cesium decay chart:
   1. 5 Curie Cesium 137 source was purchased in 1959. When will its remaining activity be 30% of its original activity? What is its activity now?
   2. Using Cobalt tables (Information Sheet #15) what is the remaining activity of a 2 curie Cobalt 60 source that was encapsulated in September 1960?

IV. TEST (final check on students' comprehension of material presented)
NOTE: Written Test

A. Why are the two beta disintegrations of Cobalt 60 not used in industrial radiography?

B. Does nuclear disintegration always produce a stable element- Explain.

C. How long is a half-life?

D. What is the half-life of Cobalt 60? Iridium 192?

E. Define K capture?

F. What is the result of K capture?

G. How many half-lives has a cobalt 60 source had if it is 21.2 years old?

H. What percentage of its original activity does it still retain?

Check and discuss.

V. SUMMARY

A. Time required for a radioactive isotope of an element to lose one-half of its original energy or intensity is called half-life.

B. Long half-life is desirable in selecting a radioactive isotope for use in radiography.

C. Only a few radioisotopes are economically useful in industrial radiography.

D. Most radioactive isotopes are either too weak having a long wave length or have an undesirable half-life, or a combination of both.

The Next Lesson is: Construct an Isotope Decay Chart

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit	7
Lesson	4
Time	2 hours

JOB (or operation): Construct an isotope decay chart

AIM (or purpose): To develop skill in the preparation of decay charts and to develop an awareness of the importance of decay charts

MATERIALS: Pencils, straightedge, and eraser
Cartesian coordinate paper
Semi-log paper, 2 cycle, 70 divisions

REFERENCES: Information Sheet #17

I. PREPARATION (of the learner)

Introduce the subject and stress that this lesson is recommended to enable one to find the source strength of a capsule so that accurate exposure time can be calculated. It should also help to project the basis for source capsule replacement.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Place semi-log paper on table	1. Pass out information sheet # 17. 2. Place log scale vertically facing upward.
B. Title the paper	Write the following in the upper right hand corner: 1. The source model and serial number 2. The type of radioactive material 3. The date of chart preparation
C. Label coordinates on paper	1. Label the log scale as "Activity in Curies". 2. Label the arithmetic scale in months or years according to type of source.

	3. Start with the month or year the isotope was measured. 4. Use abbreviations to avoid cluttering paper. 5. The scale across the bottom should cover the period of usefulness of the source.
D. Mark the present activity	1. Determine source activity from manufacturers data or measurements previously made on the source. 2. Place mark on the chart for this activity. 3. Mark is placed at point representing the date of measurement.
E. Mark the activity at one-half the life-decay period from the present	1. The source activity will be one half the present value in one half-life period. 2. Mark the time on the scale across the bottom of the paper. 3. Mark the source activity for that date.
F. Draw the decay curves	1. Connect the lines between the present and the first half-life activities. 2. Extend the curve for the entire period of the graph.
G. Semi-log paper	1. Give advantages of using semi-log paper for this chart. 2. Compare a chart made on semi-log paper to a chart made on cartesian coordinate paper. 3. Questions

DEMONSTRATE AGAIN BUT HAVE THE STUDENTS INDICATE THE PROPER SEQUENCE AND PROCEDURE.

III. APPLICATION (practice by learner under close supervision)

A. Supervise the students in the preparation of a decay chart for 75 curies of Iridium 192 using the steps outlined in Step II.

B. Have group prepare a chart for twenty years decay of 30 curies of Cobalt 60.

C. Suggest students prepare Iridium 192 decay chart substituting cartesian coordinate graph paper for semi-log graph paper.

D. Compare the two charts and invite students to explain the advantages of using semi-log graph paper.

IV. TEST (performance of skill to acceptable standards)

NOTE: Written Test

A. Prepare a decay chart on 50 curies of Iridium 192.

B. Develop a decay chart on 20 curies of Cobalt 60.

C. Determine the strength of the Iridium source 60 days from now. 6 months later.

D. Show the Cobalt source will have one-fourth the activity of the present time.

E. What is meant by a half-life of decay? Check and discuss.

V. SUMMARY

A. Decay charts save time when making calculations for radiographic exposures.

B. Semi-log paper condenses the size of charts necessary to plot decay and straighten the curve.

C. Separate decay charts are necessary for each type of radioisotope because of differences in decay rates.

D. Decay charts are not used in x-ray exposure calculations.

The Next Lesson is. Chemistry of Iron and Steel

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 1
Time 1 hour

SUBJECT: Chemistry of Iron and Steel

AIM (or purpose): To acquaint the class members with the basic metallurgical processes in iron and steel refining

TEACHING AIDS: Film: Chemistry of Iron and Steel, 14 mins., 16 mm, sound, U.S. Steel Corperation
16 mm projector
Pieces of metal with defects

REFERENCES: Metals Handbook, 1948 Edition, American Society for Metals, Cleveland, Ohio

---

I. PREPARATION (of the learner)

This film will illustrate how certain types of defects originate in steel plate, forgings and castings. The radiographer's job will include locating and identifying these defects. Gas bubbles as well as solid materials trapped in the solidified metal are considered defects.

Point out the following to be noted during the showing of the film:

A. The product of the blast furnace is iron.

B. The product of the open hearth and electric furnaces is steel.

C. Iron must be separated from other elements before it is of commercial value.

D. Very high temperatures must be used to accomplish separation of iron from other chemicals.

E. Other chemicals are added to the iron and steel to cause reactions that produce slag and gases.

F. Notice the melting temperature of iron as given in the film.

G. Announce to the class that an oral test will be given after the film is viewed.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. "The Chemistry of Iron and Steel"	Show the film NOTE: The film should be viewed by the instructor in advance to showing it to the class. Detailed notes should be made by the instructor on important information presented by the film for use in class discussion after the film showing.
B. Causes of defects in metals	Review the basic causes of defects in metals and relate to the information presented in the film. Explain how these defects makes radiography necessary.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Discuss the film. Note the following points and invite comments from the students:

1. The purpose of the blast furnace
2. The purpose of the open hearth and electric furnaces.
3. The materials which are charged to each type furnace.
4. The temperatures required for the making of iron and steel.

B. Show class examples of metal with defects and discuss what caused the defects.

IV. TEST (final check on students' comprehension of material presented)

Give verbal quiz. The following questions are suggested:

A. What is the product of the blast furnace?

B. What is the product of the open hearth furnace?

C. What is the material charged to the blast furnace?

D. What is the temperature of the iron in the bottom of the blast furnace?

E. What are the bubbles that rise to the top of the metal in the open hearth furnace?

F. What are some typical defects in metal and what are their causes?

The Next Lesson is: Semi-finished Steel

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 2
Time 1 hour

SUBJECT: Semi-finished Steel

AIM (or purpose): To teach the basic metallurgical practices employed in steel making

TEACHING AIDS: Film: Semi-Finished Steel, 8 mins., 16 mm, sound, United States Steel Corporation

EQUIPMENT: Film projector and screen

REFERENCES: Metals Handbook, 1948 Edition, American Society for Metals, Cleveland, Ohio
Nondestructive Testing-Introduction PI-4-1, 1964, General Dynamics-Convair, San Diego, California

I. PREPARATION (of the learner)

A. Introduce the film, pointing out some of the features to watch for:
   1. The castings of the ingot
   2. Various types of ingot molds
   3. Addition of aluminum during pouring
   4. The squeezing of the metal as it passes through the rolling mill

B. Stress that this information will help the radiographer to better understand how some defects are removed while some remain in the ingots.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Semi-finished Steel"	Show the Film

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students discuss the practice of pouring the ingot:
   1. The use of the various types of ingot molds
   2. Hot topping molds
   3. Cropping of molds after solidification
   4. The source of future defects from improper cropping

B. Discuss the practice of deoxidation in the mold:
   1. The addition of aluminum and/or silicon to control gases in the steel
   2. The source of future defects from improper deoxidation

C. Discuss the reason for reducing the steel in several passes instead of one and the problem of internal rupture from excessive single pass reduction.

D. Discuss the problem of laminations and the effect of gas bubbles which do not weld during rolling.

E. Invite questions from students for further discussion.

F. Reshow film if all points or questions have not been cleared up.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the purpose of the hot top on an ingot mold?

B. Give reasons for the addition of aluminum during pouring.

C. What happens to the gas bubbles in the ingot when it passes through the rolling mill?

D. Why is the top of an ingot mold cut off and discarded?

E. What type of defect can be caused by poor stirring of the materials added for deoxidation, i.e., aluminum and silicon?

Discuss test results - give help where needed

V. SUMMARY

A. Casting of semi-finished steel requires many methods of removing undesirable components and discontinuities from the ingot.

B. It is important that the correct amounts of each material be added to the steel before the ingot is poured so that the ingot will meet required specifications.

The Next Lesson is: Rolling of Sheet and Plate Steel

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit	8
Lesson	3
Time	1 hour

SUBJECT: Rolling of Sheet and Plate Steel

AIM (or purpose): To develop an understanding of the basic metallurgical practices in the making and finishing of steel

TEACHING AIDS: Film: Hot Rolling Steel Sheets, 8 mins., 16 mm, sound, U.S. Steel Corporation

EQUIPMENT: Film projector and screen

REFERENCES: Metals Handbook, 1948 Edition, American Society for Metals, Cleveland, Ohio
Nondestructive Testing-Introduction - PI-4-1, 1964, General Dynamics-Convair, San Diego, California
Information Sheet #18

I. PREPARATION (of the learner)

A. Introduce film and point out the following highlights to be noted during the viewing of the film:
   1. The ragged ends of the plates and sheets as they are being rolled
   2. The removal of defects in the slab before final rolling
   3. The use of x-ray radiation to control the thickness of the sheet
   4. The control of the final temperature at the end of the rolling
   5. How some defects are removed at the mill and how some cannot be removed because their presence and location is not known
   6. The importance of temperature control if proper strength, welding and impact properties are to be obtained from the finished product

B. Stress the importance of acquiring this related information and how it will benefit the student in the pursuit of knowledge in the field of radiography.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Hot rolling steel sheets"	Show the Film

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students discuss the control of end and edge defects:
   1. The cropping of the skelp to eliminate edge laminations
   2. The shearing of sheet strip before coiling

B. Discuss the removal of defects before final rolling.
   1. Defects may not be removed on thicker materials
   2. Areas of removal are leveled by subsequent rolling in thin sheet
   3. All defects may not be detected by the mill

C. Discuss the techniques of gauging thickness by radiation

D. Discuss the effect of poor finishing temperature on the steel:
   1. Wrong strength properties
   2. Poor welding properties
   3. Poor impact properties

E. Invite questions throughout discussion and reshow all or parts of film if necessary.

F. Pass out information sheet # 18 and discuss.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. Why is it necessary to crop the edges and ends of rolled sheet and plate?

B. What is the result of improper control of the final rolling temperature?

C. Are all plates and sheets rolled from materials from which the defects have been removed?

D. Can improper final rolling temperature cause defects to occur in later fabrication?

Upon completion of test, discuss answers given, give help where needed

V. SUMMARY

A. Sheet and plate steel ends are cropped to remove laminations.

B. Grinders remove surface defects before final rolling.

C. Radiation emitting gauges are used to control the desired plate thickness as plate is being rolled.

D. Steel must be soaked before rolling to insure uniform temperature throughout the plate before rolling.

E. Temperature control during rolling insures proper strength, welding and impact properties

The Next Lesson is: The Structure of Metals

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 4
Time 1.5 hours

SUBJECT: The Structure of Metals

AIM (or purpose): To outline the basic structure of metals and develop a thorough understanding of the subject

TEACHING AIDS: Prepared sketches on passout sheets showing the three basic metallic structures

REFERENCES: Elements of Material Science, L. H. Van Vlack, 1961, Addison-Wesley Publishing Company, Reading, Mass.
Physical Metallurgy for Engineers, D. S. Clark, and W.R. Varney, 1962, D. Van Nostrand Company, Princeton, N. J.

I. PREPARATION (of the learner)

Explain why the knowledge of basic structure of metals is necessary information for the radiographer.

Point out that this information will be most helpful in interpreting x-ray films and in giving explanation of defects shown in the film.

Review again some of the defects of metals that are evidenced by x-ray film.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The metallic bond	1. Sketch a single plane view of a metallic structure. 2. Explain: a. The loosely held orbital electrons b. The electron cloud c. The forces holding the structure together 3. Relate the loosely held electron forces to the high electrical and thermal conductivity of metals.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
B. The crystalline structure or space lattice	1. Sketch the three basic metallic structures on the chalkboard. 2. Draw sketches and show the major slip planes in each structure. 3. Define yield point and ultimate strength in terms of bonding energies.
C. The metallic phases	1. Define the phase as a physically homogenous and distinct portion of a material system. 2. List some possible types of phases in metals such as: pure component, intermetallic compounds, solid solutions, etc. 3. Define the intermetallic compound and solid solution on chalkboard. 4. Use the example of ice tea and sugar to illustrate possible phases; liquid, solid (ice) and steam vapor. 5. Define and contrast the substitutional and interstitial solid solutions. Explain that substitutional solid solutions have limited effects on strengthening of metals. Point out that substitutional alloying is generally used to improve properties other than strength; such as corrosion resistance, better impact properties, ductility. Interstitial alloying is generally employed to increase tensile and yield strength. 6. Use the example of carbon in iron and copper in nickel to illustrate the two types of solid solutions. 7. Ask questions for understanding.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students explain the ice tea and sugar system in terms of the type of solution and the phases present from frozen to boiling.

B. Have students sketch the three basic metallic crystalline structures.

C. Ask the students to define an intermetallic compound, a substitutional solid solution, and an interstitial solid solution. Have the students draw sketches to illustrate the structures of each of the above phases.

D. Ask students to define "steel".

E. Review with the class the reason for the high electrical and thermal conductivity of metals.

F. Discuss with the class the yield point and untimate strength of a metal in terms of atom movements in the structure.

IV. TEST (final check on students' comprehension of material presented)

A. Suggested questions for a brief written test:
  1. List and sketch the three basic metal lattice structures.
  2. Define a phase.
  3. What are three types of phases found in metallic structures?
  4. What happens to the atomic structure when a piece of metal is yielded? Pulled into two pieces?
  5. What is steel?

B. Discuss correct answers with the class.

V. SUMMARY

Before advancing to the next lesson review the following points of this lesson.

A. The bonding between atoms determines the properties of the materials.

B. The properties of metals are determined by their crystalline structure. All metals have one of three basic types of crystalline structure: body centered lattice, face centered cubic, and hexagonal close pack.

C. The properties of a specific alloy system can be altered by suitable changes in the phases present in the system. These changes are generally accompanied by heat treatment.

The Next Lesson is: The Phase Diagram (Metallurgy)

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 5
Time 2 hours

SUBJECT: The Phase Diagram (Metallurgy)

AIM(or purpose): To acquaint the student with the basic metallurgical principles

TEACHING AIDS: Copies of Iron-Carbon Diagram

REFERENCES: Elements of Material Science, L. H. Van Vlack, 1961, Addison-Wesley Publishing Company, Reading, Mass.
Physical Metallurgy for Engineers, D. S. Clark and W. R. Varney, 1962, D. Van Nostrand Co., Princeton, N. J.

I. PREPARATION (of the learner)

A. Introduce topic giving a thorough explanation of why this subject is important to the development of a radiographer.

B. Also show how this lesson will help one to understand the properties of metals and how they can be altered or tailored to fit a particular need.

C. Create discussion by explaining what properties are desirable in an automobile spring, a cutting tool, a pocket knife, coil spring, and baling wire.

D. Point out the difference between cast iron and steel and how raw material is altered to make cast iron or steel.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The phase diagram	1. Define the phase diagram as a graphical representation of temperature and composition of phases. Draw a typical diagram on the chalkboard.
	2. Explain the equilibrium conditions under which the diagram is constructed. a. All diagrams based on very slow temperature changes b. Diagrams reveal phases present at a given temperature c. They serve as reference to possible phases present in an alloy system.
	3. Draw a phase diagram of copper-nickel.
	4. Label and define coordinates.
	5. Define terminal phases as the pure component or liquid solubility phase.
	6. Define liquid phase as molten metal.
	7. Define the liquid plus solid phase field as the phase where solid metal floats in liquid.
	8. Define solid phase field as the phase below the melting point of all alloys.
	9. Draw phase diagrams of the Ag-Cu system.
	10. Define Eutectic as the reaction of a liquid that forms two or more different solid phases during cooling.
	11. Ask questions
B. The Iron-Carbon diagram	1. Sketch the iron-carbon diagram on chalkboard.
	2. Define Ferrite as iron with a maximum of 0.07% carbon content.
	3. Define Austenite as a body centered cubic lattice structure in iron at temperatures above 1,333 Deg. F. or at room temperature in steel achieved by alloying with suitable elements. More ductile than alpha ferretic steel.
	4. Define the Eutectoid reaction as the reaction of a solid that forms two or more new solid phases during cooling.

As with Eutectic, the word Eutectoid can also refer to an alloy composition or structure associated with the reaction.

5. Carbide or Cementite is also called iron carbide; a normal constituent of annealed steels and cast iron. Strengthens steel but decreases ductility.
6. Explain the upper and lower critical temperatures between ferrite and austenite fields.
7. Define limits of steel as between 0.07% and 1.7% carbon content.
8. Define limits of cast iron as between 1.7% and 6.6% carbon content.
9. Explain the lower melting point of the Eutectic composition and explain its importance in casting practice. The eutectic temperature can be achieved with less expensive equipment because of the lower temperatures required. Eutectic composition contains 4.3% carbon.
10. Indicate the temperature ranges of melting for cast steel. (about 2,800 Degrees F.)
11. Ask questions

C. The phase transformation

1. Explain the transformation from one phase to another on heating or cooling through the transformation temperature:
   a. As temperature changes metal may go through a change because the structure at that temperature may be unstable.
   b. This phenomenon used to advantage to change properties of an alloy system.
   c. Example: Steel heated to transform structure to austenite; if quenched in oil the phase produced results in much higher strength.
   d. Alpha iron: The form of iron that is stable below 1,670 Deg. F., the temperature at which a change in phase occurs.

   - e. Gamma iron: The form of iron that is stable between 1, 670 Deg. F. and 2, 550 Deg. F.
2. Indicate the crystalline structure change in the transformation of austenite to ferrite by explaining that austenite is the high temperature body cubic centered structure (sketch) and ferrite is the FCC structure (draw sketch).
3. Elaborate on the temperature range of transformation of steel compositions above and below as well as the eutectoid composition.
   - a. Full transformation to austenite below eutectoid composition accomplished at 1, 650 Deg. F.
   - b. Above the eutectoid temperature the maximum required is 2, 065 Deg. F. at a carbon content of 1. 7%.
   - c. To achieve full hardness from heat treatment the temperature must produce a full austenitic structure.
4. Explain the martensite reaction on the chalkboard as the change from the austenitic structure (face centered cubic) at elevated temperature to the ferrite structure (body centered cubic) at low temperatures.
5. Define the properties of martensite:
   - a. strong
   - b. hard
   - c. tough

   Ask and invite questions

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have a student sketch a simple phase diagram of a system of components which are completely soluble in one another,

B. Ask group to explain various parts of the diagram.

C. Have another student sketch the iron-carbon diagram.

D. Request group members to label each phase field by its metallurgical name.

E. Have a discussion on the limits of the steel and iron ranges of composition.

F. Ask for comments on the difference in melting points of steel and cast iron.

G. Have each member explain the advantages and methods of using the diagram.

H. Ask and invite questions throughout the drill.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Describe the composition of the following:
   1. Ferrite or alpha iron
   2. Austenite or gamma iron
   3. Cementite or carbide

B. Outline the composition limits of irons and steel.

C. Define a terminal phase.

D. What does the upper and lower critical temperature represent on the phase diagram?

E. What is a eutectic composition?

F. Sketch the iron-carbon diagram.

Check and discuss.

V. SUMMARY

A. The phase diagram is useful for determining changes in structure when the temperature or composition of the alloy is altered.

B. The iron-carbon system is the most important engineering alloy system.

C. The alteration of composition and temperature can produce a multitude of desirable properties.

D. The phase transformation is a result of changing the temperature of the system. The martensite transformation is the most widely used and most economical strengthening material used in engineering alloys.

The Next Lesson is: The Manufacture of Castings

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 6
Time 2 hours

SUBJECT: The Manufacture of Castings

AIM (or purpose): To familiarize the student with the methods used to produce castings and the defects which can result from improper casting procedures

TEACHING AIDS: Sample castings with and without defects
Small casting with riser, runner, and sprue attached

REFERENCES: Cast Metals Handbook, American Foundrymen's Society, 1944, Chicago, Illinois
Physical Metallurgy for Engineers, D. S. Clark and W. R. Varney, 1962, D. Van Nostrand Co., Princeton, N. J.

I. PREPARATION (of the learner)

A. Introduce the subject and explain the importance of the information contained in this lesson pointing out that a knowledge of the origin of casting defects aids in their interpretation as they may be shown on radiographs.

B. Explain further that a good inspector should be able to discuss the nature of a casting defect and the alleged origin of it in the language of the foundryman.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The mold	1. Sketch a typical foundry mold and label the drag, the cope, cores, risers, and downsprue. 2. Define the function of the various parts of the mold. 3. Show the casting with all gates and risers still in place.

	4. Ask pertinent questions and invite discussion.
B. The pattern	1. Explain the function of the pattern and how it creates the shape of the casting in the mold. 2. Explain why the pattern is always larger than the final part: a. To allow for thermal expansion b. Allowing for surface defect removal without altering size of casting. c. Ask questions
C. The molding materials	1. Define the composition of the sand used for molding. 2. Explain the difference between a green and dry sand mold pointing out that green sand used wet is more economical than dry sand. Steam generated from wet sand causes little trouble on large castings. Scabs may be formed but can be avoided by skin-drying mold with gas flame. 3. Describe the process of ramming as the packing of sand around the pattern in making a sand mold. It is necessary to overcome the formation of voids, however, care must be exercised in the process to prevent the shifting of the pattern in the mold. 4. Ask questions
D. Pouring of the hot metal	1. Define metal fluidity explaining that it pertains to molten metal and its ability to flow as into a mold. 2. Explain why metals are poured 200 to 700 degrees above their melting temperatures: a. To prevent cold laps b. To allow thicker section of casting to form properly before metal solidification 3. Ask questions.

E. Solidification	1. Explain the solidification in thin and thick sections of a mold stressing that metal must flow from thin to thick section of mold or vice versa and must not solidify prematurely. 2. Define "hot spots". 3. Ask questions
F. Casting defects	1. Define and illustrate the origin of: a. Porosity b. Dross c. Shrinkage cavity d. Misruns e. Cold shuts f. Cracks 2. Show the sample castings and defects discussing and explaining as each is shown.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have a member of the group draw a cross section of a casting mold on the chalkboard.

B. Have another student draw in a simple pattern with all necessary openings.

C. Have still another label all the parts of the mold.

D. Ask participants to explain why the pattern cavity is larger than the final part.

E. Ask each individual student to explain the origin of the following defects: (Using a sketch for clarity if necessary)
   1. Porosity
   2. Dross
   3. Shrinkage cavity
   4. Misruns
   5. Cold shuts
   6. Cracks

IV. TEST (final check on students' comprehension of material presented)
NOTE: Written Test

A. Why is the pattern always larger than the final part ?

B. Do larger castings require higher pouring temperatures? Why?

C. What type of defect could occur if the pouring temperature was not high enough?

D. What type of defects can develop from the contraction or shrinkage of the metal on cooling?

E. What is meant by ramming a mold?

F. What type defect would occur from improper ramming?

Check and Discuss

V. SUMMARY

A. Proper design of mold can eliminate the formation of casting defects.

B. Pattern size allows for shrinkage that occurs when casting cools and solidifies.

C. Some molding materials are porous to allow escape of hot vapors and gases through the walls of the mold.

D. Castings with a wide thickness latitude can contain shrinkage cracks due to uneven cooling.

E. There are several types of casting defects, the more numerous being porosity and shrinkage.

The Next Lesson is: The Heat Treatment of Steel

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 8
Lesson 7
Time 2 hours

SUBJECT: The Heat Treatment of Steel

AIM (or purpose): To outline the operations which are employed in strengthening of steel

TEACHING AIDS: Sketch of iron-carbon diagram on pass out sheet (one for each class member)
Sample of normal, quenched and tempered steel strips
Samples of heat treat cracks in metal

REFERENCES: Elements of Material Science, L. H. Van Vlack, 1961, Addison-Wesley Publishing Company, Reading, Mass.
Physical Metallurgy for Engineers, D. S. Clark and W. R. Varney, 1962, D. Van Nostrand Company, Princeton, N. J.

I. PREPARATION (of the learner)

Use the following questions with explanation to introduce this lesson:

A. What happens when a piece of metal is heated to red hot and immersed in water?

B. What process has been used on your pocket knife blade to give it proper temper?

C. Why is this process sometimes used on welds?

D. Why do some metals crack when subjected to this type treatment?

E. After heating and cooling, what would happen if the piece was reheated to a lower temperature?

F. Explain that this information will assist the radiographer in understanding the cause of equipment failure due to a lack of heat treatment or because of improper heat treatment.

II. PRESENTATION (of [illegible] information)

Instructional Topics	Things to Remember to Do or Say
A. The iron-carbon diagram	1. Sketch the iron-carbon diagram on the chalkboard. 2. Call to the students attention that this is an equilibrium diagram. 3. Review the phase change of cooling from the austenite phase to the ferrite region. 4. Explain the formation of pearlite in slow cooling when cooled slowly from critical temperature, it is a direct transformation product from Austenite. Pearlite is the eutectoid of iron and iron carbide and it resembles mother-of-pearl when viewed under a microscope. It consists of alternate layers of lamellae of iron and cementite and contains 0.33% carbon. 5. Explain the expansion of steel in the transformation change due to the difference in volume of the two phases.
B. The martensite reaction	1. Define the martensitic structure as a body centered tetragonal. Martensite is the hardest of the transformation products of austenite. When carbon content exceeds 0.5% tetragonality of the crystal structure is observed. Martensite is not an equilibrium phase. 2. Explain the distortion of the ferritic structure by the wedging action of the supersaturated carbon. 3. Describe how martensite is formed by rapid cooling to prevent the transformation to pearlite. Martensite in quenched steel has needle-like patterns. This structure in steel is obtained by direct transformation from austenite, by rapid cooling to prevent upper transformation products.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The iron-carbon diagram	1. Sketch the iron-carbon diagram on the chalkboard. 2. Call to the students attention that this is an equilibrium diagram. 3. Review the phase change of cooling from the austenite phase to the ferrite region. 4. Explain the formation of pearlite in slow cooling. When cooled slowly from critical temperature it is a direct transformation produce from AUSTENITE. Pearlite is the eutectoid of iron and iron carbide and it resembles mother-of-pearl when viewed under a microscope. It consists of alternate layers of lamellae of iron and cementite and contains 0.33% carbon. 5. Explain the expansion of steel in the transformation change due to the difference in volume of the two phases.
B. The martensite reaction	1. Define the martensitic structure as a body centered tetragonal. Martensite is the hardest of the transformation products of austenite. When carbon content exceeds 0.5% tetragonality of the crystal structure is observed. Martensite is not an equilibrium phase. 2. Explain the distortion of the ferritic structure by the wedging action of the supersaturated carbon. 3. Describe how martensite is formed by rapid cooling to prevent the transformation to pearlite. Martensite in quenched steel has needle-like patterns. This structure in steel is obtained by direct transformation from austenite, by rapid cooling to prevent upper transformation products.

4. Define the martensite start and finish temperatures.
5. Describe the properties of martensite before tempering. It has the maximum hardness and strength of any decomposition product from austenite in steels.

C. The tempering process

1. Define the term "tempering" (sometimes called "drawing") as a treatment below the lower critical temperature below the lower critical temperature followed by any desired rate of cooling. Example: One percent carbon steel after quenching in water from 1, 450 degrees F. is extremely hard and brittle. Tempering at between 200 and 400 degrees F. results in slight loss of hardness and a great increase in toughness.
2. Explain the effect of tempering on the structure of martensite, pointing out that quench cracking may be prevented and the steel is less susceptible to distortion.
3. List some desirable properties of tempered martensite.

D. Cracking caused by heat treatment

Show samples containing heat treating cracks.

1. Discuss the stresses caused by the martensite reaction.
2. Explain the quench crack and its formation -- show sample.
3. Draw a chalkboard sketch of the stress that develops in the transformation to martensite.

Demonstrate·

1. Display three strips of steel about 1/4" x 1/4" x 12" long. One should be heated and quenched, one tempered and one without heat treatment.
2. Explain the properties of each steel strip and how they differ.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students explain by a chalkboard sketch the formation of pearlite by the slow cooling of steel from the austenite to the ferrite region.

B. Have students explain by a chalkboard sketch the formation of martensite by rapid cooling from the austenite region.

C. Ask students to elaborate on the transformation of martensite in terms of the volume change and stresses created. Have them contrast the martensite and pearlite transformation.

D. Ask the students to list the desirable properties of tempered martensite.

IV. TEST (final check on students' comprehension of material presented)

A. Explain the martensite reaction using a sketch of the iron-carbon diagram.

B. What is the purpose of tempering the martensitic structure?

C. Explain how stresses are created by the martensitic reaction. Account for the stresses from both transformation and cooling.

D. Sketch the crystalline structure of steel in the austenite range and after transformation to martensite.

E. List three desirable properties of tempered martensite.

Discussion of questions by the group after the test

V. SUMMARY

A. Heat treatment of steel can both prevent and cause equipment failure.

B. Heat treatment can remove stresses that were formed in a weldment during the welding process.

C. Metal properties can be changed to fit their applications by heat treatment.

D. Some of these properties are: ductility, elasticity, malleability, toughness, and brittleness.

The Next Lesson is: Visit to a Foundry

INSTRUCTOR'S LESSON PLAN
Field Trip

Unit 8
Lesson 8
Time 6 hours

SUBJECT: Visit to a Foundry

PURPOSE: To permit the students to observe the pouring, control and inspection of cast metals

MATERIALS: Film badges, dosimeters, safety hats, and safety glasses

---

I. PREPARATION (of the learner)

A. Outline purpose of visit and stress need to observe all safety precautions.

B. The students should also be coached to carefully observe and make notes of the following:

1. Preparation of the sand for molds
2. Preparation of the molds (ramming)
3. Placement of the chaplets and chills
4. The flow paths of the molten metal
5. Pouring of the molten metal
6. The removal of the casting from the sand (shakeout)
7. Inspection of the finished casting

II. PRESENTATION (of the information)

A. Issue safety instructions to be followed while in the plant stressing the need for gentlemanly behaviour.

B. Make the tour only under the guidance of a designated foundry employee and the instructor.

III. APPLICATION

A. After completing the trip, ask the students to discuss:

1. Why the sand is given so much care and testing.
2. Why the molds are larger than the final part.
3. The purpose of chaplets and chills in mold preparation.
4. Why the metal is allowed to flow back to the surface of the mold during pouring.
5. How defects can result from removing the casting from the sand while the metal is still red hot.

6. The inspection techniques used by the foundry.

B. Invite questions and discuss unusual procedures noted.

IV. TEST

NOTE: Written Test

Write a brief report on the observations made during the field trip covering all aspects of foundry operation from preparation of molding materials to the inspection of the finished product.

V. SUMMARY

A. A casting is the result of many closely controlled processes and steps.

B. Misalignment of molds can cause casting defects.

C. Extra metal is necessary when pouring a mold to allow for shrinkage during the cooling process.

D. Final inspection of castings may include hardness tests and a variety of other types of nondestructive explorations.

E. A ladle analysis is generally made before castings are poured.

The Next Lesson is. The Metallurgy of Welding

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 1
Time 2 hours

SUBJECT: The Metallurgy of Welding

AIM (or purpose): To provide information and develop an understanding of the reactions which occur during the welding process and their effect on the weld structure

TEACHING AIDS: Iron carbon diagram chart (pass out sheet for each class member)
Sample electrodes with coatings
Sectioned and etched welds

REFERENCES: Welding Metallurgy, G.H. Linnert, 1965, American Welding Society, New York, N.Y.
Physical Metallurgy for Engineers, D. S. Clark and W.R. Varney, 1962, D. Van Nostrand, Princeton, N.J.

I. PREPARATION (of the learner)

A. Introduce the lesson subject by asking selected basic questions to start short discussions. The following questions should be used to help lead the class into a discussion of the lesson:
   1. Have any of you ever done any welding?
   2. What is welding?
   3. How many different types of welding processes do you know of?

B. Point out that a general knowledge of welding processes is necessary to understand the cause of welding defects and a radiographer must have this understanding in order to intelligently perform his work.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The structure of the weld 1. The weld deposit 2. The fusion zone 3. The heat affected zone 4. The parent metal	1. Review the metallurgy of cast steel. 2. Draw a sketch of a typical weld and label the different zones. 3. Show samples of actual welds and explain pertinent features.

B. The molten metal shield 1. Inert gases 2. Electrode coatings a. Slagging coatings b. Volatile coatings 3. Suberged arc flux	1. Show sample electrodes and discuss: a. The degasification of the molted metal b. Protection of the molten metal from the atmosphere c. Reduction of impurities in the weld puddle d. Addition of alloys to the weld from slags and flux
C. Cooling of the weld puddle (solidification)	1. Draw a sketch of a typical weld and an iron-carbon diagram on the chalkboard. 2. Associate the structure of the weld with phases of the iron-carbon diagram. 3. Describe the effects of cooling on warpage and residual stresses in welds of steel.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask students to sketch a typical weld profile on the chalkboard and label each metallurgical zone.

B. Have students plot the changes in volume and explain the stresses developed in the solidification and cooling of welds.

C. Discuss with student participation the control of the final structure of welds in steel by proper heat control, i.e., preheat, postheat and interpass temperature.

D. Have the students explain the purpose of electrode coatings, gas shielding and fluxes.

IV. TEST (final check on students' comprehension of material presented)

A. Suggested questions for written test:

1. Outline the purpose of the coating on welding electrodes.
2. Describe the source and action of the stresses developed in the cooling of the weld deposit in a weld of carbon steel.
3. Sketch a typical weld and label each distinct metallurgical zone.
4. What is the purpose of preheat and postheat in the welding process?
5. How do the slag and flux shields differ from that produced by gases?
6. What are the advantages of the slagging shields?

B. Check the test with the class, making sure each person has the correct answers.

V. SUMMARY

The structual soundness of a weldment depends upon: proper selection of weld electrode, controlled metal temperature, proper joint preparation, removal of foreign materials from weld, prevention of oxidation of the weld, and joint, control of effects of expansion, contraction and warpage and environmental factors.

The Next Lesson is: The Welding and Joining Processes

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 2
Time 2 hours

SUBJECT: The Welding and Joining Processes

AIM (or purpose): To develop an acquaintance with the various approved methods and processes of joining metals

TEACHING AIDS: Posters and charts
Samples of various types of welds
Samples of soldering

REFERENCES: Welding Metallurgy, G. H. Linnert, 1965, American Welding Society, New York, N. Y.

I. PREPARATION (of the learner)

A. Introduce the topic and briefly describe the radiographer's interest in the proposed subject.

B. To arouse attention and create interest discuss and outline the difference between welding and soldering, also point out the advantages of welding a structure instead of bolting it together, and whether the welding assembly is considered as sound structurally as one that has been made by the forging process.

C. In addition, explain that the lesson should help the radiographer in the interpretation of radiographs. Radiographic interpretation of weldments depends to a significant degree upon the radiographers understanding of the welding or joining process. For this reason, the radiographer should be able to assure the welder that he (the radiographer) knows enough about the welding process to be able to render sound judgements.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Fusion welding 1. Shielded metal arc (coated electrode) 2. Inert gas metal arc 3. Submerged arc 4. Tungsten inert gas arc 5. Gas welding 6. Thermit welding	1. Explain and illustrate the process of fusion and how it is employed to join metals. 2. Give a brief description of each of the various fusion processes: a. Coating on the electrode protects weld puddle from oxidation . b. Inert gas, usually argon, displaces air around weld puddle. c. Air is submerged beneath granular coating for protection from air. d. Tungsten inert gas arc - heat generated by arcing between it and the material being welded. Tungsten does not melt during process. e. Acetylene and Oxygen furnish heat in gas welding. f. In Thermit welding aluminum and iron powder are mixed and burned to give off heat up to 5,000° F. for welding. 3. Discuss the method of heat generation for each method. 4. Outline the purpose of shielding the molten weld metal from air contact thereby preventing oxidation. 5. Show sample welds of each method. 6. Explain the advantages and disadvantages of each method.
B. Electric resistance welding: 1. Spot and seam welding 2. Flash welding 3. Induction welding	1. Explain and discuss the method of heat generation in electrical resistance welding. 2. Explain the contact of mating parts during and after the heating cycles. 3. Explain the advantages and disadvantages of the processes: a. High initial cost of equipment is a disadvantage. b. Results easily reproduced an advantage.

   c. Speed of production also is an advantage.

C. Solid phase welding
   1. Ultrasonic welding
   2. Diffusion bonding
   3. Forge welding
   4. Pressure welding

1. Explain the process of diffusion, i. e., the movement of atoms across weld interface.
2. Describe the methods of creating a diffusion bond.
3. Explain the advantages and disadvantages of the listed group of welding processes:
   a. Limited to thin materials
   b. Very accurate control needed for good welds
   c. Entrapped oxides remain in weld
   d. No filler metal needed
   e. No heat needed for ultrasonic method
   f. Heavy forge equipment unnecessary for ultrasonic diffusion, and pressure welds

D. Liquid to solid joining or soldering

1. Explain and illustrate the wetting of a solid metal with a molten metal:
   a. This process is sometimes called "tinning". Specimens to be joined are first dipped in or coated with molten solder.
   b. Soldering is widely used in developing electrical circuitry.
   c Galvanized materials such as root gutters are also joined by soldering.
   d Household appliances usually have some soldered joints.
2. Give some additional examples where soldering is applicable.
3. Explain the advantages and disadvantages of the method
4. Show samples of soldering and explain.

III. APPLICATION (drill, illustrations, analogies. oral questions or assignments)

   A. Suggest that students describe the fusion joining process.

118

B. Have group explain the origin of the heat in the various arc welding processes.

C. Request a thorough discussion and explanation of heat generation in the electrical resistance welding methods.

D. Ask class for examples of applications using the various methods discussed. Have members justify their choice.

E. Have class identify the type of welding used to join each of the samples exhibited in the classroom.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What are the four major classifications of metal joining techniques?

B. What is the purpose of the gas or slag shield of the molten weld puddle?

C. What is the nature of the bond between the parent metal and solder in the solder-type joint?

D. Compare the advantages and disadvantages of:
   a. The shielded metal arc weld
   b. The inert gas metal arc weld

E. Why are the electrical resistance methods used primarily for production line work? Check and discuss.

V. SUMMARY

A. Fusion methods of welding are the types that account for a major part of industrial radiography work. They include shielded metal arc, inert gas metal arc, submerged arc, tungsten inert gas arc, acetyline gas, and Thermit welding processes.

B. Another widely used method is the electric resistance welding method which includes spot and seam welding, flash welding and induction welding.

C. Solid phase welding usually precludes the use of bonding metal and includes ultrasonic welding, diffusion bonding, forge welding, and pressure welding.

D. Liquid to solid joining is more commonly called soldering.

The Next Lesson is: The Weld Profile

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 3
Time 1 hour

SUBJECT: The Weld Profile

AIM (or purpose): To develop knowledge and understanding of the component parts of a weld and welding terminology in general

TEACHING AIDS: Sample weld sections
Sample steel plates prepared for welding

REFERENCES: Welding Metallurgy. G. H. Linnert, 1965, American Welding Society, New York, N. Y.
Information Sheet #19
Test

I. PREPARATION (of the learner)

A. Explain the importance of the lesson and how it will help the radiographer to properly interpret radiographs of weldments, the radiographer must know the structure of a weld, its components and correct welding terminology if he is to have the confidence of his associates.

B. The welder will naturally have greater respect for the radiographer when discussing detected weld defects if the radiographer can converse in the language of the welder and make a professional diagnosis of the defects.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The fillet weld	Use an overhead projector if transparencies have been prepared. If not, make chalkboard sketch as follows:
1. Width	
2. Throat	
3. Toe	
4. Root	1. Draw a sketch of a typical fillet weld on the chalkboard.
5. Face	

	2. Label parts. 3. Explain the method of measuring the various dimensions. 4. Draw sketches of dimensionally correct and incorrect fillet welds. 5. Ask questions.
B. The butt weld 1. Groove 2. Groove angle 3. Root 4. Face 5. Root face 6. Root opening 7. Backing strips	1. Draw a sketch of a typical butt weld. 2. Describe and sketch the single and double groove butt welds 3. Label the parts of the welds. 4. Explain the methods of determining the various dimensions of butt welds. 5. Explain the purpose of the groove angle, the root opening, and the root face. 6. Sketch a backing strip in place on a single groove butt weld. 7. Explain the purpose of the backing strip. 8. Review welds and terminology throughout the discussion. 9 Ask questions.
C. Weld passes or layers 1. Stringer or root	Refer to information sheet # 19 and to the first illustration on the chalkboard The root pass is probably the most important and most troublesome pass. 1. Complete penetration of this pass is necessary. 2. A root pass can contain: incomplete penetration, burn through, icicles, incomplete fusion, slag and cracks. Illustrate these on chalkboard during discussion.
2. Hot pass	A hot pass follows the root pass. 1. Some defects found in the root pass can be eliminated with a hot pass. 2. Lack of fusion, slag and cracks are sometimes found in a hot pass.

3. Filler passes	Filler passes follow the hot pass.
4. Crown or reinforcement pass	The crown is the top or final pass and some crown defects include, undercut, and lack of form in that some are concave or convex.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Pass the sample plates and welds among the students for examination.

B. Ask a student to:
   1. Sketch a fillet weld on the chalkboard
   2. Label the various parts of the fillet weld
   3. Sketch a single groove butt weld on the chalkboard
   4. Label the parts of the butt weld

C. Ask for the definition and purpose of the following parts of the but weld:
   1. The groove opening
   2. The root face
   3. The backing strip
   4. The root opening

D. Request discussion and definition of root, hot fillet, and crown passes or layers.

E. Discuss possible flaws sometimes found in these passes and invite questions.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Sketch a fillet weld and name the parts.

B. Sketch a single groove buttweld and name the parts.

C. Explain the purpose of:
   1. The root opening
   2. The root face
   3. Backing strips

D. Give test on Information Sheet #20

Check and discuss

V. SUMMARY

A. An understanding of the weld profile is essential when radiographs of weldments are being interpreted and discussed.

B. Fillet weldment description includes: toe, root, face, throat and width.

C. Butt weldments are described by: root, root opening, face, face opening, groove, groove angle, backing strips.

D. Weld passes include: root, hot pass, filler passes and crown.

The Next Lesson is: Weld Defects

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 4
Time 2 hours

SUBJECT: Weld Defects

AIM (or purpose): To assist the student in acquiring the ability to recognize the defects found in weldments and to be aware of the capabilities of radiography to detect these defects

TEACHING AIDS: Samples of defective welds
Film of defective welds
High intensity film viewer

REFERENCES: Nondestructive Testing Handbook, 1963, Society for Nondestructive Testing, Evanston, Illinois
Information Sheet #19

I. PREPARATION (of the learner)

A. Introduce this lesson by discussing the following questions giving the correct answers.
  1. Can radiographic techniques be used to find all defects in welds? Why?
  2. What type of defects can be detected?
  3. Why is it important for the radiographer to know the limitations of the technique?

B. Explain that the information presented in this lesson will help to interpret radiographs correctly. Point out that the interpretation should indicate the type of defect shown in the radiograph as some defects are more serious than others. For example, a crack in a weld would be more important than a gas bubble.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Profile defects	1 Use overhead projector or draw a chalkboard sketch of fillet and

1. Undercutting 2. Excessive reinforcement 3. Lack of penetration 4. Concavity	butt welds showing each type of defect. 2. Refer to information sheet #19. 3. Illustrate the origin of each type defect. 4. Compare the severity of each defect. 5. Illustrate the appearance of the defect image on radiographic film. 6. Show sample film.
B. Structural defects 1. Porosity 2. Slag inclusions 3. Incomplete fusion 4. Cold lapping 5. Cracking a. Longitudinal b. Transverse c. Crater d. Underbead	1. Draw a chalkboard sketch of each type defect. 2. Illustrate the origin of each type defect. 3. Compare the severity of the defects. 4. Illustrate the appearance of the defect indication on radiographic film. 5. Show sample film-explain and discuss. 6. Explain the limitation of radiography in detecting certain types of defects.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have students sketch welds with the four types of cracks found in welds.

B. Ask students to explain the origin of the cracks.

C. Ask the students to define the limits of radiography for detection of weld defects.

D. Have the students identify defects on the sample film.

E. List the following defects in terms of their severity:
   1. Slag inclusions
   2. Porosity
   3. Concavity
   4. Cracking

IV. TEST (final check on students' comprehension of material presented)

A. List three types of profile defects.

B. List three types of structural defects.

C. What is the cause of slag inclusions in a weld?

D. Show the four types of cracks found in welds by sketches.

E. State what conditions must exist for a weld defect to be found by radiography.

Check and discuss

V. SUMMARY

A. Welding defects can be either structural or profile defects.

B. Profile defects are usually visible except if they are inside a small diameter pipe.

C. Structural defects can be either visible or invisible, such as cracks in the weld or the base metal or extending into both.

The Next Lesson is: Field Trip to Observe Welding Procedures and Operations

INSTRUCTOR'S LESSON PLAN
Related Technical Information
Field Trip

Unit	9
Lesson	5
Time	6 hours

SUBJECT: Welding Procedures and Operations

AIM (or purpose): To observe joint preparation, welding, and inspection of welded assemblies

MATERIALS: Film badges, dosimeters, safety glasses, hard hats

REFERENCES: Information Sheet #21

I. PREPARATION (of the learner)

A. Introduce subject of trip and its purpose requesting students to carefully observe the following procedures:
   1. Inspection of materials prior to fabrication
   2. The techniques of joint preparation
   3. The various types of welding processes
   4. Methods of marking for inspection identification
   5. Documentation of inspection and quality control

B. Read instructions to be followed while on field trip from Information Sheet #21, and invite any questions regarding the subject trip.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Tour a fabrication shop which maintains its own inspection department.	Stress the need for gentlemanly behaviour.
B. Students are to make notes as necessary.	

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. After returning from the trip, ask the students to describe:
  1. Methods employed to inspect materials before beginning fabrication
  2. The various types of welding joints used by the fabricator
  3. All welding techniques and equipment employed by the manufacturer
  4. The observation of weldments at the final inspections
  5. The preparation of documents relative fabrication and inspection

B. Discuss any unusual observations made while touring the shop and invite questions.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Name and briefly describe the various welding processes you observed on the field trip.

B. How does the inspector know which welder or welders worked on a particular weldment?

C. Why do two or more welders work simultaneously on the first pass of a thick walled, large diameter pipe joint?

D. Describe briefly the joint preparation of a weldment.

E. Name some methods of quality control observed on this field trip.

Check and discuss

V. SUMMARY

A. Joint preparation

B. Types of passes

C. Inspection procedures and aids

D. Documentation and quality control

The Next Lesson is: Multiple Exposure Pipe Radiography

EXPERIMENT SHEET
Multiple Exposure Pipe Radiography

Unit 9
Lesson 6
Time 4 hours

SUBJECT:

Inspection of a circumferential pipe weld using the multiple exposure technique

NOTE: Instructor performs all operations

INTRODUCTORY INFORMATION:

Inspection of circumferential pipe welds may be accomplished using several techniques of exposure. The double wall multiple exposure technique is used when access is not available to the inside surface, or the diameter to thickness ratio is too small to achieve satisfactory sensitivity. The length of weld which can be inspected on each exposure is limited by the change in metal thickness and change in film-focal distance around the pipe. With proper procedures, satisfactory radiographs can be obtained from one side.

MATERIALS AND EQUIPMENT:

Gamma ray source and exposure facilities
Film cassettes and film
Gamma ray survey meter
Pipe samples
Penetrameters, lead numbers, and shims
Chart of diagnostic film lengths
Dark room facilities

PROCEDURE:

A. Single load film cassettes with selected film and lead screens.

B. Transport film, gamma ray exposure device, and accessories to exposure site.

C. Determine the diagnostic length of each exposure.

D. Divide the pipe circumference into segments equal to the diagnostic length.

E. Attach the exposure tube to the pipe opposite to the first segment to be exposed.

F. Position the tube to the edge of the weld and directly opposite to the center of the segment to be exposed.

G. Determine the extent of the weld reinforcement and select shims of this added thickness.

H. Select a penetrameter which will indicate 2-2T sensitivity on the pipe wall if its equivalent 2T penetrameter could be placed on the inside.

I. Attach penetrameters on shims to the pipe at the center and the extreme end of the segment selected for exposure.

J. Attach lead numbers to the pipe segment to identify the exposure and to facilitate location of defects.

K. Mark the location of the lead numbers on the surface of the pipe.

L. Attach the film cassette to the outside of the pipe.

M. Position the film neatly over the segment to be inspected.

N. Secure the film tightly to the pipe with tape or elastic bands to insure intimate contact of film and screens.

O. Attach a large letter "B" to the back side of the film cassettes where it will not interfere with the image of the weld line.

P. Calculate the exposure time required to produce a density not less than 1.5 on the greatest thickness or more than 3.3 on the least thickness.

Q. Attach the source tube to the camera and extend the control cables to a convenient location for operation.

R. Energize the survey meter, wait for warm up, and zero meter.

S. Extend source and expose for the required time.

T. Retract source into camera and survey camera to insure the safe return of the source. Lock source in camera.

U. Remove film, move source tube to next segment of the pipe, and repeat steps F through T until all segments have been exposed.

V. Develop all film for 5 minutes at 68°F. fix, wash, and dry.

W. View film for defects; prepare report of exposure and weld quality.

CONCLUSIONS:

A. Penetrameters are required at two locations on the pipe because the ____________ path is not of the same thickness and the __________ distance is different at these two locations.

B. The image of the letter "B" may appear on the radiograph due to ___________. This can be eliminated by ____________.

C. The sensitivity at the edge of the film is ________________ than the center of the film due to the effect of ______________________ radiation.

D. The density of the film at the edge of the film is ______________ than in the center because of the difference in ___________ _________________ distance.

The Next Lesson is: The Effect of Focal Distance

EXPERIMENT SHEET
The Effect of Focal Distance

Unit 9
Lesson 7
Time 4 hours

SUBJECT:

The effect of changing the film-focal distance on the distortion of the image and the sensitivity of the film

NOTE: Instructor performs all operations

INTRODUCTORY INFORMATION:

The degree of sharpness of an image depends on the size of the source and the distance between the source and the film. When the source is not a point, the case in all radiographic equipment, the image is distorted because each point in the source forms its own image. The overlapping of these images form a halo around the central image which is called penumbra. The penumbra distorts defects and the small holes of the penetrameter resulting in loss of definition. These effects can be reduced by increasing the film-focal distance and making use of the basic laws of mathematics.

MATERIALS AND EQUIPMENT:

Gamma ray (or x-ray) source and exposure facilities
8" x 10" film cassettes and film
Gamma ray survey meter
6" x 8" steel plate, 1/2" to 3/4" thick
Penetrameters and lead numbers
Dark room facilities

REFERENCES:

formation Sheet #7 Nomogram of Geometrical Unsharpness

PROCEDURE:

A. Single load film cassettes with selected film and lead screens.

B. Select penetrameters for 1/4" to 1 1/4" thickness in 1/8" steps.

C. Place the film on a lead sheet or exposure table.

D. Place the steel plate on the film and position in the center of the film.

E. Position the penetrameters on the plate in two neat rows in the center of the plate. Separate slightly and arrange in sequential order.

F. Attach lead number for identification. Avoid placing identification where it will obstruct the image of the penetrameters or plate edge.

G. Align source tube end directly over the center of the plate at a film - focal distance 5 times the thickness of the plate.

H. Calculate the exposure time required to produce a density of 1.8 to 2.2.

I. Attach the source tube to the camera and extend the control cables.

J. Energize the survey meter, wait for warmup, and zero meter.

K. Extend source and expose as required.

L. Retract source, survey, and lock source in camera.

M. Repeat steps C through L using 7, 10, 15 and 20 times the thickness of the plate for a film — focal distance.

N. Develop all film for 5 minutes at 68 F. Fix, wash and dry.

O. Examine film on viewer.

P. Record the minimum penetrameter sensitivity for each focal distance.

Q. Measure the geometric unsharpness of the plate dimensions and record for each focal distance.

R. Determine the expected geometrical unsharpness from the nomograms.

CONCLUSION:

A. The minimum sensitivity attained at a D/T of 7 is ______________.

B. A 2-2T sensitivity was observed at a D/T of __________ and above.

C. List the values obtained for geometrical unsharpness:

D/T	Actual Measurement	From Nomogram
5	____________________	________________
7	____________________	________________
10	____________________	________________
15	____________________	________________
20	____________________	________________

D. The measured value of geometrical unsharpness ________________ with that taken from the nomogram.

E. To improve radiographic sensitivity the film – focal distance is ____________________.

The Next Lesson is: Double Pipe Radiography.

EXPERIMENT SHEET
Double Wall Pipe Radiography

Unit 9
Lesson 8
Time 3 hours

SUBJECT:

Inspection of welds in small diameter pipe using the double wall method of exposure to produce an image of both walls.

NOTE: Instructor perform all operations.

INTRODUCTORY INFORMATION:

When the outside diameter of a pipe is less than about four inches, inspection of welds can be accomplished by exposing both walls of the pipe to produce an elliptical image of the weld. Two exposures are required to achieve 100% coverage using this technique.

MATERIALS AND EQUIPMENT:

Gamma ray source and exposure facilities
Film cassettes and film
Gamma ray survey meters
Penetrameters, lead numbers, and shims
Welded pipe samples 4" or less
Dark room facilities

REFERENCES:

<u>Information Sheet #22</u>

PROCEDURE:

A. Single load film cassettes with selected film and lead screens

B. Transport equipment to exposure site.

C. Determine the outside diameter of the pipe.

D. Position source tube to expose the weld.

E. Locate source tube to the side of the weld about 30 degrees from the centerline of the weld.

F. The film to focal distance should be at least seven times the outside diameter of the pipe.

G. Determine the extent of weld reinforcement and select a shim of this added thickness.

H. Select a penetrameter which will indicate 2-2T sensitivity on the total thickness of both walls.

I. Attach the penetrameter, on a shim, to the pipe on the source side.

J. Place penetrameter directly in line with the source tube end on the opposite side of the weld from the 30 degree offset with the long axis parallel to the pipe.

K. Attach a film cassette to the pipe.

L. Attach the film to the pipe opposite to the source tube. The film should not be wrapped to the pipe but should remain flat and tangent to the pipe, perpendicular to the centerline of the exposure.

M. Position film allowing for the throw of the shadow of the weld. About two inches overlap of the weld on the source offset side is sufficient.

N. Attach lead numbers to the film for identification of the exposure.

O. Mark the point of tangency of the film to facilitate location of defects.

P. Calculate the exposure time required to produce a density not less than 1.5 nor more than 3.3.

Q. Attach the source tube to the camera and extend control cables.

R. Energize the survey meter, wait for warmup, and zero meter.

S. Extend source and expose the required time.

T. Retract the source into the camera, survey, and lock camera.

U. Repeat the entire operation to achieve a second exposure at 90 degrees to the first exposure.

V. Develop film for 5 minutes at 68 F. Fix, wash and dry.

W. View film for defects, prepare reports.

CONCLUSIONS:

A. The equivalent single wall penetrameter sensitivity of this radiographic tehcnique is ______________.

B. Two exposures are required for 100% coverage because ______ ____.

C. The source is offset from the weld to prevent the image of the top _________________ from obscuring the image of the bottom ________________.

D. The pipe diameter is used as a basis for determining the _________ __________ distance in order to obtain a ________ image.

The Next Lesson is: Panoramic Pipe Radiography

EXPERIMENT SHEET
Panoramic Pipe Radiography

Unit 9
Lesson 9
Time 4 hours

SUBJECT:

Inspection of a circumferential pipe weld using the panoramic exposure technique

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

Inspection of circumferential pipe welds may be performed using several techniques of exposure. The panoramic technique produces rapid reliable results when access is available to the internal surface of the pipe and the diameter to thickness ratio is sufficient to permit the necessary film — focal distance. The advantages of the panoramic technique are, exposure through a single wall, uniform film-focal distance, and one exposure for an entire weld circumference.

MATERIALS AND EQUIPMENT:

Gamma ray source and exposure facilities
Film cassettes and film
Gamma ray survey meter
Penetrameters, lead numbers, and shims
Pipe samples
Dark room facilities

PROCEDURE:

A. Single load film cassettes with selected film and lead screens .

B. Transport film, gamma ray exposure device, and accessories to exposure site.

C. Position exposure tube end at the exact inside center of the pipe in line with the weld.

D. Select a penetrameter which will indicate 2-2T sensitivity on the pipe wall if its equivalent 2T penetrameter were placed on the outside.

E. Determine the extent of the weld reinforcement buildup.

F. Select a shim equivalent to the amount of weld reinforcement.

G. Place a penetrameter, on a shim, on the outside surface of the pipe adjacent to the weld with the long axis parallel to the pipe axis.

H. Attach lead numbers to the outside circumference of the pipe on the opposite side of the weld from the penetrameter.

I. Place numbers in increasing sequential order every six inches of circumference of the pipe.

J. Mark the location of the numbers in crayon on the exterior of the pipe.

K. Prepare and attach an identification code made from lead numbers and letters.

L. Attach the film cassettes to the exterior of the pipe.

M. Position the film neatly over the weld with approximately 1 1/2" overlap of film.

N. Secure film tightly to the pipe to insure intimate contact of film and screen and a minimum distance between the pipe and cassette.

O. Calculate the exposure time required to produce a density not less than 1.5 on the greatest thickness and no more than 3.3 on the least thickness.

P. Connect exposure tube to the gamma ray camera.

Q. Extend control cables of gamma camera to a convenient location for operation.

R. Energize the survey meter, wait for warm up, and zero meter.

S. Unlock the gamma camera and extend source to exposure position. Expose film for the required time.

T. Return source to camera, survey to insure safe return, and lock source in camera.

U. Remove film from pipe, develop for 5 minutes at 68 F. fix, wash, and dry.

V. View film for defects. Prepare report of exposure and weld quality.

CONCLUSIONS:

A. Only one penetrameter is required to insure sensitivity because the ______________ is the same for all film.

B. The penetrameter will indicate 2% sensitivity of the __________ thickness through a total metal path equal to the _____________ thickness.

C. The penetrameter size used for this exposure did not correspond to the measured plate thickness because the penetrameter was placed on a shim equal in thickness to the weld ____________.

D. Sequential numbering of the pipe surface is performed to enable the inspector to determine the exact ___________ of defects.

The Next Lesson is: Radiography Film Interpretation (Welds)

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 10
Time 2 hours

Note to Instructor: This is a practice lesson and time should be provided each week for practice on this material

SUBJECT: Radiography Film Interpretation (Welds)

AIM (or purpose): To acquaint the student with the fundamentals of weld film interpretation

TEACHING AIDS: Film viewer
Reference Radiographs of Steel Welds, ASTM E-99, American Society for Testing and Materials, Philadelphia, Pa.

MATERIALS: Sample welds
Sample film

REFERENCES: Nondestructive Testing Handbook, Volume I, Society for Nondestructive Testing, 1963, Evanston, Illinois

I. PREPARATION (of the learner)

Explain that knowledge of the theory of image formation cannot be substituted for experience in welding control. The radiographer must be able to explain each indication found on the film, and be able to differentiate the nonrelevant indications from those of consequence. This lesson is calculated to help the student to more fully understand the theoretical explanation of various defects and to assist him in gaining valuable experience in film interpretation.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Weld defects 1. Slag inclusions	1. Sketch a cross section of a butt weld containing slag inclusions.
2. Lack of penetration	2. Sketch a density profile corresponding

3. Porosity 4. Cracks 5. Lack of fusion 6. Surface discontinuities a. Root and crown concavity b. Excess penetration c. Excessive and irregular crown d. Misalignment (hi-lo) e. Undercut f. Backing rings	to the weld cross sections. 3. Explain the source of the density variations. 4. Display sample weld sections. 5. Show the sample film and explain. 6. Repeat the procedure for each of the other defects.
B. Viewing Screens	1. A high intensity film viewing screen is desirable for film interpretation. 2. A rheostat-type light intensifier is also a desirable feature. 3. Viewing screen should be free of artifacts. 4. Varying light intensity is an aid in studying shapes of defects.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask the group to sketch each of the weld defects discussed in the presentation and show the density profile for each type of defect. Allow one or more students to present each type.

B. Display the sample film on a viewer one at a time to the group. Have individual students identify each defect and its origin. Repeat until each student can identify every defect.

C. Display the film one at a time to the class for identification. Ask the group to identify each film on a sheet of paper to be handed to the instructor. Examine the papers. Review the cause of the defect, the density profile, and the film of each defect which the student fails to identify.

IV. TEST (final check on students' comprehension of material presented)

Test the group on weld defect interpretation by displaying sample films to the group. Ask the students to identify each of the defects by placing their answers on a piece of paper to be turned in for scoring.

V. SUMMARY

A. To become skillful in weld defect interpretation the student should be able to identify weld defects by name.

B. The location of a defect in the weld is often a clue to its identification.

C. Weld defects are also called discontinuities.

D. Some defects are more serious than others so they should be correctly identified by their proper name.

The Next Lesson is: Radiograph Film Interpretation (Castings)

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 9
Lesson 11
Time 2 hours

Note to the Instructor: This is a practice lesson, time should be provided each week for practice on this material.

SUBJECT: Radiography Film Interpretation (Castings)

AIM (or purpose): To teach the student the fundamentals of casting inspection, the appearance of casting defects on film, and the interpretation of serviceability of castings

TEACHING AIDS: Film viewer
Industrial Radiographic Standards for Steel Castings, ASTM E-71, American Society for Testing Materials, Philadelphia, Pa.

MATERIALS: Sample castings
Sample film

REFERENCES: Defects and Failures in Pressure Vessels and Piping, Helmut Thielsch, 1965, Reihold Publishing Corp, New York, N. Y.

I. PREPARATION (of the learner)

Stress that this lesson should help an individual to recognize casting defects as the images appear on an x-ray film and should help the student to distinguish one type of defect from another. It should also develop an understanding of the cause of many casting defects recognizing that castings often exhibit certain defects which are peculiar to the process. Film interpretation of castings can be explained theoretically; however, there is no substitute for practical experience. In this effort the student will have an opportunity to constantly compare the film and theory in practice interpretations.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Casting defects 1. Gas and blow holes 2. Sand spots 3. Inclusions 4. Internal shrinkage 5. Hot tears and cracking 6. Unfused chaplets 7. Internal chills	1. Make a chalkboard sketch of a casting containing gas pockets. 2. Sketch the density profile corresponding to the casting. 3. Explain and discuss the source of the density variations. 4. Display film showing the defect. 5. Display sample casting with the defect. 6. Repeat the procedure for each of the other type defects.
B. Viewing Screens	1. A high intensity film viewing screen is desirable for film interpretation. 2. A rheostat-type light intensifier is also a desirable feature. 3. Viewing screen should be free of artifacts. 4. Varying lights intensity is an aid in studying shapes of defects.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask individuals from the group to explain the origin of each of the casting defects, sketch a cross section showing the defect, and sketch a density profile for the defective casting.

B. Display the sample film to the group one at a time on a film viewer. Have individual students identify each defect and outline its cause. Repeat until the students can identify each type of defect.

C. Show the film again one at a time on a film viewer. Ask the students to identify and record the type of defect on a piece of paper to be turned in. Review the papers. Analyze the cause, the density profile, and discuss the film of each defect type the students fail to identify properly.

IV. TEST (final check on students' comprehension of material presented)

Test the group on casting defect interpretation by displaying sample radiographs on a viewer. Ask the students to identify each defect by placing their answers on a piece of paper. Have students exchange test papers. Review each radiograph on the screen and interpret. Check results.

V. SUMMARY

A. Casting defect interpretation requires practice.

B. Sample reference radiographs are used for practice.

C. Variable light intensity viewing screens are also a valuable training aid.

The Next Lesson is: How to Interpret Lines on Drawings or Blue Prints.

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 10
Lesson 1
Time 1.5 hours

SUBJECT: How to Interpret Lines on Drawing or Blue Prints

AIM (or purpose): To outline and explain the basic lines in drawings or blueprints

TEACHING AID: Chart showing lines with brief explanation identifying each type of line; chart with drawings fully dimensioned. Drawings or blueprints as used in radiography

MATERIALS: 8 1/2" x 11" paper, pencils, and straightedge

I. PREPARATION (of the learner)

Point out that to do an effective job of reading one must be able to interpret type, symbols, lines and the like, even in the simple task of reading a road map. We interpret symbols, lines and a variety of characters.

In drawing and blueprint reading, it is also necessary to recognize and understand the various lines used to construct, measure, and show the design of a machine part or structure. This interpretation of lines and figures is known as blueprint reading and if the task is to be handled effectively, considerable emphasis should be placed on the accuracy of the operations.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Object line	Pass out sample blueprints or drawings as used in radiographic work. Illustrate on chalkboard and point out on actual blueprints or drawings and explain. 1. Is a heavy solid line 2. Represents the real object on a drawing or blueprint

	3. May be shown from several views or angles 4. Ask questions
B. Extension line	1. Is a light solid line 2. Extends from object to indicate points of measurement 3. Seldom touches object (1/16" from object point of measure) 4. Ask questions
C. Dimension line	1. Is a light broken line 2. Is broken for indicated dimensions between points of measurement 3. Has arrow on either end 4. Arrows touch extension lines, usually 1/4" distance from end away from object 5. Ask questions
D. Hidden line	1. Is a heavy dashed line 2. Represents hidden shapes of the object that are obstructed by the exposed view 3. Ask questions

---

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have students do the following on chalkboard or paper. Give close supervision:

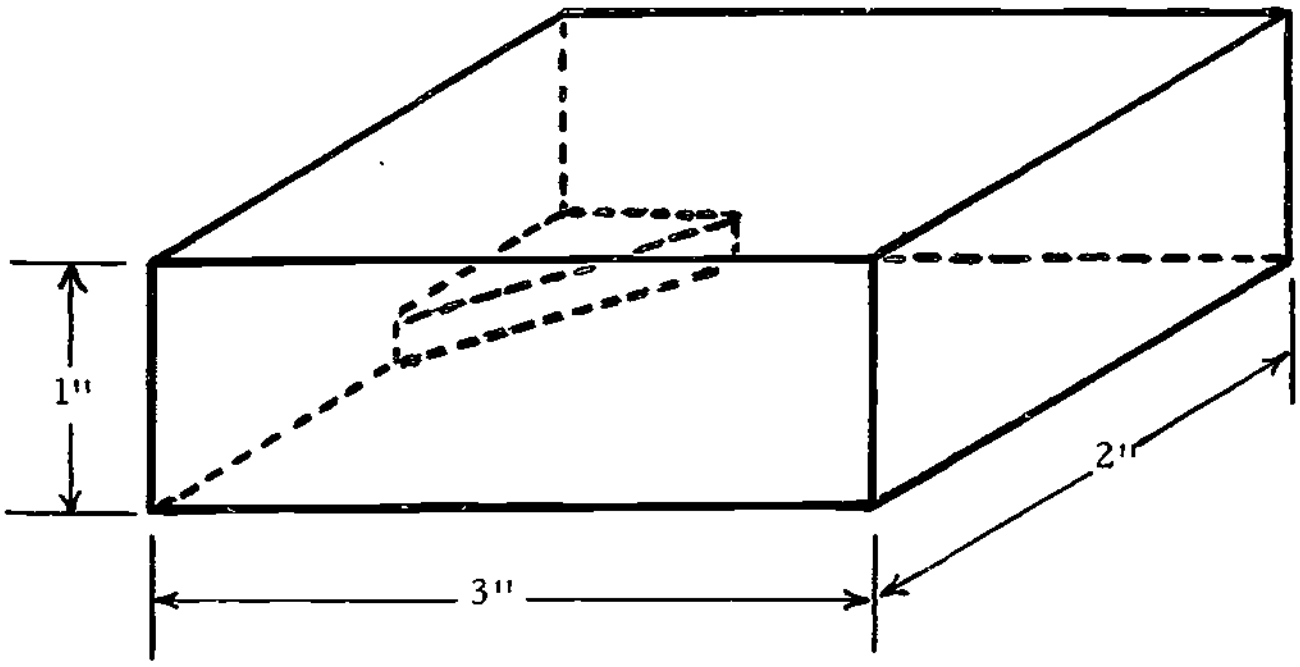
A. Draw or sketch an object 3" long, 2" wide, and 1" thick

B. Add extension lines

C. Install dimension lines, showing dimensions

D. Show a step cut across the back corner of the object, using a hidden line

E. Ask students to locate on drawings or bleuprints the following lines:
   1. Object lines
   2. Extension lines
   3. Dimension lines
   4. Hidden lines



IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the line that represents the real object on the drawing?

B. What is a hidden line? Why is it used?

C. What is the difference between a dimension line and an extension line?

Check and discuss.

V. SUMMARY

A. Object line - heavy solid line. Represents the real object on a drawing.

B. Extension line - thin, broken line with dimensions indicated in break. Indicates points of measurements.

D. Hidden line - heavy dash line. Indicates hidden shapes.

The Next Lesson is: Shop Drawings and Blueprints

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 10
Lesson 2
Time 2 hours

SUBJECT: Shop Drawings and Blueprints

AIM (or purpose): To develop an understanding of the process of blue print production and to assist the student in the interpretation of blue prints

TEACHING AIDS: Film: Shop Drawings, 22 mins., 16 mm, sound, Pennsylvania State University, University Park, Pa.

EQUIPMENT: Film projector and screen

I. PREPARATION (of the learner)

A. Introduce film, giving title and pointing out the following points should be observed or noted while viewing the film:

1. The types of lines used to denote various parts and areas of the image.
2. The number and placement of views necessary to clearly define the part.
3. Methods used to reduce the size of the drawing and the placement of dimensions.
4. The methods of indicating internal sections.

B. Stress that this lesson should help the individual to locate component parts on a drawing that are to be radiographed and should help the radiographer to make sketches indicating where radiographs are to be made or were made on a piece of equipment such as a refinery pressure vessel.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
"Shop Drawings"	Show the film

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Discuss the film, emphasizing the following points in the discussion:
   1. Types of lines used in drawings and what they denote.
      a. Solid lines
      b. Dashed lines
      c. Center lines for axis of rotation
      d. Diagonal lines indicating sectioning
   2. The number of views necessary to define a part.
      a. The plain view
      b. The side view
      c. The front view
      d. Internal details
   3. Methods of scaling
      a. Shortening of uniform sections
      b. Section rotations

B. Have members of the group prepare sketches on chalkboard or paper using the various lines, views and details shown in the film.

C. Reshow the film in the event that any lack of understanding develops.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What type of lines are used for:
   1. Outlining the part?
   2. To show a center of rotation?
   3. To indicate a section?

B. How many views should be shown of a part?

C. Should all details be shown in every view? Why?

D. What is meant by scale?

V. SUMMARY

A. Radiographer sometimes works from a shop drawing.

B. It is important that you be able to identify the location of radiographed parts from a drawing.

C. Sketches sometimes contain several different views of an object.

D. Sketches are not always drawn to scale.

E. Sketches and symbols should indicate what part of weld is to be radiographed.

The Next Lesson is: Graphic Inspection Symbols

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 10
Lesson 3
Time 2 hours

SUBJECT: Graphic Inspection Symbols

AIM (or purpose): To teach the student the standard symbols used on drawings to indicate the place and type of inspection to be employed

TEACHING AIDS: Information Sheet #24 (test)

REFERENCES: Information Sheet #23
Nondestructive Testing Symbols, Military Standard 23A, August 1952, U. S. Department of Defense, Washington, D. C.

I. PREPARATION (of the learner)

This lesson is a continuation of the language of drawing symbols. The symbols discussed in this lesson are particularly useful to the inspectors. With a satisfactory blueprint or shop print the inspector can use these symbols to outline his inspection task without the necessity of further instructions.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The basic symbols	Pass out Information Sheet #23 1. List the basic methods and their symbols on the chalkboard; i.e., RT, MT, PT, and UT. 2. Explain the meaning of the symbols and answer questions.
B. Elements of the testing symbol: 1. Reference line and arrow	1. Draw the reference line on the chalkboard and add the arrow. 2. Explain the purpose of the arrow and the meaning of arrow and opposite side.

	3. Point out that the arrow can point in any direction from either end of the reference line. 4. Invite questions.
2. Test-all-around symbols	1. Add the symbol to the sketch. 2. Explain its meaning.
3. Extent of test	1. Sketch arrow to indicate a test from both sides - Explain. 2. Add information to sketch to indicate the length of the part to be inspected. 3. Add information to show the number to tests required for random testing.
4. Direction of radiation	1. Sketch a symbol indicating the location and distance of the radiation source from the area to be tested. 2. Explain, and discuss.
5. Combination of symbols	1. Sketch a combination welding and testing symbol. 2. Illustrate and explain the method of combining test symbols.
6. Specification	1. Add the tail to the reference line - Explain. 2. Show placement of specification information in the tail of the arrow. Explain and discuss. Invite questions.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask several members of the class to draw on the chalkboard symbols to indicate types of tests indicated below:
   1. The symbol for a magnetic particle test of a pipe weld in accordance with ASTM specifications.
   2. A symbol for radiographic inspection of a weld on a plate. The film-focal distance should be indicated at 24" at an inclination of 15 degrees from the perpendicular.
   3. A symbol for a combination ultrasonic test of a plate from the top side and a magnetic particle test from the back side.
   4. A symbol combining the welding of a fillet weld in the field with a magnetic particle inspection in accordance with ASTM specifications.

5. A symbol for the panoramic X-ray of a large diameter pipe weld in accordance with Mil-Std-271.

B. Solicit the assistance of the entire class in checking the symbols drawn for accuracy and defining the meaning of each.

IV. TEST (final check on students' comprehension of material presented)

A. Ask the group to draw the following symbols on a paper to be turned in for checking:

1. A symbol for radiographic inspection of a butt weld with a film-focal distance of 12" and an inclination of the source from the perpendicular of 30 degrees.
2. A symbol for a radiographic inspection of a pipe weld in accordance with ASME specifications.
3. A symbol for magnetic particle and ultrasonic inspection of a weld.
4. A symbol for magnetic particle inspection of 20" of a power shaft which is six feet long.

B. Pass out the symbol test sheet #24 and ask the group to answer the following questions, to be turned in for checking:

1. How many different types of tests are indicated on the test sheet?
2. How many tests are required on the inside of the pipe?
3. What type of tests are made on the inside of the pipe?
4. How many welds are to be radiographed in whole or part.
5. What is the extent of testing required on the welds of this assembly?
6. Where in the system are the welds located that require two types of tests?

The Next Lesson is: Graphic Welding Symbols

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 10
Lesson 4
Time 2 hours

SUBJECT: Graphic Welding Symbols

AIM (or purpose): To acquaint the student with an accurate and quick method of determining the welding procedures used in fabrication and to improve an individual's ability to read blueprints

TEACHING AIDS: Information Sheet #26 (test)

REFERENCES: Standard Welding Symbols, AWS 2.0, American Welding Society, New York, N. Y.
Information Sheet #25

I. PREPARATION (of the learner)

Explain that a detailed drawing of each weld in an assembly might be pleasing to the eye; however, few draftsmen can achieve the artistic detail of a professional artist. To convey the necessary information to the craftsmen who must perform the work, engineers and draftsmen have created a language of symbols which adequately tell the workman what is to be done. A knowledge of the welding symbols will aid the radiographer in establishing proper work procedures and help a great deal in the interpretation of processed radiographic film.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Welding symbols	1. Distribute information sheet #25 depicting standard arc welding symbols.
	2. Explain the need for symbols as follows: a. Language understood by all b. Easy to learn and draw c. A lot of information in a small space
	3. Invite discussion

	4. Explain the use of these symbols in blueprint preparation.
B. The elements of the welding symbol	
1. The reference line and arrow	1. Draw a reference line on the chalkboard and add an arrow. 2. Explain the purpose of the arrow and the meaning of arrow side and opposite side; indicates the side to weld. 3. The arrow can point in any direction from either end of the line. 4. Ask questions.
2. Field weld and weld-around symbol	1. Add the field weld symbol to the sketch. 2. Add the weld-all-around symbol. 3. Explain their meaning. 4. Point out the meaning of the symbol without these elements.
3. Basic weld symbol	1. Add a basic weld or groove symbol to the chalkboard sketch. 2. Explain the meaning of the symbol placement. 3. Show alternate placements.
4. Contour symbols	1. Add symbol to chalkboard sketch. 2. Explain the symbols meaning. 3. Show placement and meaning.
C. Supplementary information	1. Using the information sheet #25 show the various other symbols for the finish, length of weld, groove angle, specification compliance, and root opening. 2. Give other illustrations on chalkboard as needed. 3. Illustrate the placement of information to indicate the length and size of welds. 4. Ask and invite questions.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Suggest one or more students portray on the chalkboard symbols to indicate the following types of welds and accessory information. Have group discuss each:

A. An intermittent chain fillet weld to be completed in the field with a pitch of 5 inches on 2 inch increments.

B. A double "V" groove field weld on a large pressure vessel shell.

C. An example of a shop weld on flat plate with a "U" groove which requires a single pass back weld.

D. The pressure containing field type weld used on piping with a single "V" groove.

E. A field fillet weld of a large slip-on flange welded inside and out. (Provide a sketch or a print of the slip-on flange)

IV. TEST (final check on students' comprehension of material presented)

Pass out test sheet #26 showing different types of welds. Ask the students to:

A. Identify each type of weld profile shown on the drawing.

B. Indicate the number of shop welds and the number of field welds.

C. Enumerate the number of fillet welds.

D. Indicate the number of groove welds.

E. On a separate sheet of paper, have the students draw the symbol for
  1. A "V" groove field weld for pressure piping.
  2. The field fillet weld on a "T" joint with a fillet leg length of 1/2".

V. SUMMARY

A. Welding symbols condense welding information.

B. Shop welds can be identified and separated from field welds.

C. Knowledge of welding symbols is helpful in writing inspection specifications.

D. Knowledge of welding symbols is helpful in cost estimating of radiographic inspection services.

E. Welding symbols include identification of types of joint preparations required, as well as the length, type and contour of weld.

The Next Lesson is: Testing for Contamination

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 11
Lesson 1
Time 2 hours

SUBJECT: Testing for Contamination

AIM (or purpose): To outline the correct methods and procedures used to test for leakage of radioactive source capsules.

TEACHING AIDS: Empty source capsules
Dummy wipe test kits

REFERENCES: Information Sheet #27

I. PREPARATION (of the learner)

A. Explain to students that early methods of encapsulation proved inadequate and as a result many contamination incidents occurred.

B. Point out the possible hazards of handling source equipment that is leaking and explain why this is vital information for the radiographer.

C. Discuss the need for frequent leak testing of sources and generally indicate the grave hazards that develop if careless or contemptuous attitudes are formed regarding contamination.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The wipe test	1. Explain the purpose of the wipe test and why it is so called. 2. Point out that it is to detect and measure radiation contamination. 3. Show the students typical wipe test kit and explain the services available to the radiographer. Showing how an area being checked is wiped with a damp swab or towel.

4. Outline the requirements for authorization to perform wipe tests and the equipment necessary to achieve successful testing.
5. Explain the methods employed to wipe remote controlled equipment and hand cameras.
6. Define the Curie, explaining that it emits 37 billion disintegrations or counts per second.
7. Illustrate on the chalkboard the conversion of counts per second (disintergrations/sec) to curies.
8. Pass out Information Sheet #27.

B. Counting instruments

State the legal capabilities required of the instruments used for counting-ability to measure 0.005 microcuries of ionizing radiation.

C. Leaking sources and contamination

1. Outline the procedures for disposing of leaking sources and explain that a leaking source should be reported immediately by wire or telephone.
2. State the requirements for reporting a leaking source to the regulatory agencies.
   a. Place source and container in plastic bag to prevent spread of contamination.
   b. Place bag in locked permanent storage room.
   c. Notify AEC or State authorities.
   d. Monitor area for possible contamination.
   e. Check self with monitoring device and remove contamination as quickly as possible by using shower.

NOTE: PLUG SHOWER DRAIN AND HAVE WATER CHECKED FOR CONTAMINATION.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask students to explain the purpose of the wipe test and the procedure for obtaining the sample.

B. Have the students calculate the leakage in curies of material from a given number of counts on a counting instrument.

C. Ask students to define the legal requirements for testing and handling of sources which show leakage.

D. Show the students samples of capsules used in industrial radiography and ask for discussion on how leakage occurs.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the maximum limit of contamination allowed on a wipe test of a radiographic source?

B. How often are wipe tests required by regulations?

C. What is the procedure when a source is found to be leaking?

D. How many microcuries of leakage has been detected by a wipe test if the counter indicates 50 disintegrations/sec?

E. Where is the wipe made on the testing of remote controlled equipment? On testing hand cameras? On testing loose capsules?

V. SUMMARY

A. Inadequate methods of encapsulation led to wipe testing regulations.

B. Improved techniques still inadequate in the event of an accident while transporting radioactive materials.

C. A.E.C. or State regulatory body arranges for disposal of contaminated materials.

The Next Lesson is: Make a Wipe Test

	3. Swab the port with a circular motion in order to cover the inside surface for a distance of about one-half inch. 4. Return the swab to the vial and replace the lid tightly. 5. Return the plug to the extension tube port and lock the source in place. 6. Tape the lid on the vial to prevent accidental opening. Vial made of plastic. 7. Check the vial with a survey meter to detect possible gross leakage. 8. <u>Caution:</u> Use a separate wipe test kit for each source or surface to be tested.
3. Preparation of tag for mailing, or shipping	1. Write the date, source number, source type and capsule model number on the tag. 2. Tape the tag or label to the vial. 3. Package the vial for shipment using sufficient insulation to prevent breakage.

III. APPLICATION (practice by learner under close supervision)

A. Divide the students into pairs and have each pair perform the entire wipe test, using all precautionary measures and plan demonstration so that it can be carried out according to regulations. Give close supervision.

B. After each individual team completes wipe test have other students offer constructive criticism.

C. If a Geiger counter is available have students test vial containing swab with this instrument after first having checked the background count in the room.

D. Arrange to hide a beta calibrating source under a paper towel near the vial containing the wipe test swab. Have student check the swab with Geiger counter and observe his reactions when counter picks up a reading from the hidden beta button. Be sure tube window is open to allow beta radiation to be detected.

E. If an Ion chamber is the only type of detection instrument available have one member of a team change the zero setting on instrument with the rheostat adjusting knob. This will give a false indication on the rate meter. Ask the other member of the team what he proposes to do since there is an apparent indication of contamination above the allowable level.

F. If training-type gamma sources are available (such as the cobalt 60, five millicurie sources used in Civil Defense classes) the instructor can bring one source into the work area, unobserved by the team performing the wipe test. This will give a high background count and will simulate a contamination problem.

Note: Use all available precautionary measures and plan student demonstration so that it can be carried out according to regulations. Give close supervision.

IV. TEST (performance of skill to acceptable standards)

A. Have each individual student perform a wipe test using the Gamma exposure device and wipe test kits.

B. Have each individual student fill out labels as required.

C. Give students simulated test results and have them record on proper report form.

D. Discuss results.

V. SUMMARY

A. AEC regulations require that wipe tests be performed every six months, or whenever contamination problem is suspected.

B. Contamination cannot be detected without the use of detection instruments.

C. Survey meters cannot be used to determine if contamination is being held at a permissable level. Low level counting instruments must be used.

D. AEC regulations outline reporting and emergency procedures in event contamination is found.

The Next Lesson is: Factors Governing Exposure

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 12
Lesson 1
Time 1.5 hours

SUBJECT: Factors Governing Exposure

AIM (or purpose): To teach the essential factors which govern the time calculation

TEACHING AIDS: Equivalence Factors P. 18 Eastman Kodak Textbook (table)

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y.

I. PREPARATION (of the learner)

Explain the importance of this lesson by discussing and emphasizing the following points:

A. The calculation of exposure is the task in which the radiographer has the most difficulty. Explain why.

B. A basic understanding of the methods of exposure calculation is necessary for the student to become a successful radiographer. Give reasons why this is true.

Note to Instructor: This lesson is an overview of all the factors governing exposure. Individual factors will be covered by other lesson plans. The student should not be expected to retain all the information presented at this time.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Factors governing exposure	1. Explain the effect of each factor which alters the exposure setup:
1. Radiation source and strength	a. Source penetrating ability determines its density and thickness applications.
2. Film type	
3. Source to film distance	

4. Type of material being inspected 5. Intensification screens 6. Desired film density 7. Darkroom processing	Source strength is an exposure time factor. b. Film type is an exposure time factor. c. Source to film distance affects image sharpness and is an exposure time factor. d. Type of material being inspected governs type of source used for exposure or KV setting on x-ray exposure. e. Lead intensification screens affect exposure time. f. Radiographic quality. g. Desired film density is governed by adjusting exposure time. h. Darkroom processing time can adjust for improper exposure time.
B. The exposure factor, a proportionality constant	1. Express the relationship between the exposure factor and other parameters of the gamma exposure; i. e. $T=\frac{EFxD^2}{S}$ EF represents film speed, specimen density and thickness and wave length of radiation source being used. D represents source to film distance squared. S represents source strength in millicuries. T represents exposure time in minutes. 2. Explain how the equation can be used to determine the time of an exposure.
C. Exposure charts	1. Explain the origin of exposure factor charts. 2. Outline the methods used for preparation of exposure charts for x-ray generators. 3. Explain why an exposure factor is not a constant for x-ray exposure because KV can be adjusted.

D. Exposure factor corrections	1. Explain the radiographic equivalence factor. Refer to P. 18 Eastman Textbook. Specimen relative densities must be considered when using exposure factor charts. Equivalence factor tables uses aluminum as reference up to 100 KV and steel from 150 KV up. 2. Explain the film factors.
E. Conversion factors for exposure. a. Time-distance corrections b. Time-density corrections c. MaS-distance corrections	1. State the relationship between time and distance; i. e., $\frac{T_1}{T_2} = \frac{D_1^2}{D_2^2}$ 2. Show sample calculations of the above formula. 3. Display the characteristic curve and explain what is shown by the curve. 4. State the relationship between MaS and distance; i. e., $\frac{MaS_1}{MaS_2} = \frac{D_1^2}{D_2^2}$ 5. Show sample calculations of the above formula.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Use the following for discussion:

A. As the students name them list on the chalkboard the factors which govern the radiographic exposure.

B. Have students define the gamma ray exposure factor.

C. Ask students to explain the exposure chart for gamma ray exposure factors and x-ray exposure.

D. Review with the class participating in the discussion the use of correction factors of radiographic equivalence and film factors.

E. Ask students to state the purpose of a characteristic curve.

F. Using a gamma exposure factor chart, have students calculate the time for a typical radiographic exposure.

IV. TEST (final check on students' comprehension of material presented)

A. Suggested questions for a short written test:

1. List five factors which will alter the radiographic exposure.
2. What is a gamma exposure factor?
3. What is meant by radiographic equivalence?
4. What is the purpose of the characteristic curve?
5. What is meant by film factors?

B. With the class assisting check the answers to the test making sure that all answers are corrected.

V. SUMMARY

A. Many factors govern the selection of proper exposure time. (Check off list in A of Step II)

B. Exposure factor is a proportionality constant and differs with each type film and gamma source.

C. Exposure charts simplify exposure computations.

D. Exposure factors are a combination of film speed, KV or MEV rating of radioactive source, and specimen density and thickness.

E. Conversion factors are for time-distance, time-density, and MaS-distance adjustments.

The Next Lesson is: Calculation of a Gamma Exposure

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 12
Lesson 2
Time 2 hours

SUBJECT: Calculations of a Gamma Exposure

AIM (or purpose): To adequately outline the use of mathematical expressions used for exposure calculations

MATERIALS: Film suppliers exposure factor charts for each student, Ansco C70d-31 Table of material or radiographic equivalence factors

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y.
Information Sheets #28, #29, and #30

I. PREPARATION (of the learner)

A. It should be pointed out to the student body that radiography is not an exact science, therefore, it will always be important to make use of all information that will help to improve the final product, the radiographer, and hold the element of variability to a minimum. This lesson is calculated to assist the radiographer in correctly calculating the time it will take to make a radiographic exposure of the desired relative density. Inability to calculate exposure time correctly may require that the specimen be re-radiographed one or more times.

B. An explanation should also be given regarding the methods of determining the exposure necessary to produce an acceptable radiograph and how these methods can be applied to various situations.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The exposure factor	1. Define on the chalkboard the exposure factor as a proportionality factor between thickness and time

for a set of standard exposure conditions.

$$EF = \frac{TS}{D^2}$$

where: T=time
S= ource strength
D= ource to film istance

2. Distribute copies of suppliers exposure charts to the students, information sheets #28 and 29.
3. Explain the methods used for constructing an exposure factor chart.
4. Outline the restrictions on an exposure factor chart:
   a. For a single type of film
   b. For definite source type and size
   c. For one type of material
   d. For one set of darkroom conditions

B. Calculation of exposure from exposure factor charts

1. Establish a set of conditions for an exposure. List these conditions on the chalkboard: 1/2" steel plate, 12" focal distance 1.5 relative film density, Ansco "A" film, 5 curies Iridium 192.
2. Show the students how to read the chart to obtain the value of the exposure factor.
3. Show typical calculations to obtain the time of exposure using the exposure factor from the chart.
4. Show how to figure the exposure time. The unit cancellation method should be used to avoid the use of the wrong units of measure.

C. Radiographic equivalence factors

1. Issue information sheet #30 and define the radiographic equivalence factor.

2. Show the procedure for obtaining the equivalent thickness of steel from the thickness of another material.
3. Explain and illustrate by working problem on chalkboard using information listed on exposure chart.

D. Problems

1. Example problems
2. Work problems
3. Ask questions
4. Determine that there is full understanding.

E. Exposure factor tables

1. Tables for frequently used pipe and plate sizes are time savers.
2. A separate exposure factor column is necessary for each type film.
3. Outside pipe diameters do not vary with pipe wall thickness.
4. Use of tables cut down figuring time.
5. Work sample problems on chalkboard using information sheet.
6. Ask questions.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Request students to illustrate to the class on the chalkboard, the calculation of exposure time using a different set of conditions for each student.

B. Have various individuals determine the time for an exposure using a set of conditions listed on the chalkboard. Student should restate these conditions on their individual papers.

C. Suggest that students calculate exposure times for the following problems using an exposure table:
a. 1" steel plate 12" in diameter. Use 5 curies, Iridium 192
b. 8" pipe, 3/8" wall thickness. Use 5c. IR. 192

D. Have group calculate exposure time for the following problems using an Ansco exposure chart:

a. 1" steel, focal distance 10", relative density 2.0, using Ansco "A" film and a 1 curie source of Iridium 192.
b. 2" steel, focal distance 14" relative density 1.5 using Ansco "C" film and 10 curies of Iridium 192.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the time for exposure of a 1" thick steel plate at a film-focal distance of 24" for a density of 2.0 using Ansco A film and a 20 curie source of Iridium 192?

B. What is the time for exposure of a 4" thick aluminum plate at a film-focal distance of 36" for a density of 2.0 using Ansco B film and a 15 curie source of Iridium 192?

C. If a piece of Ansco A film was exposed through 1" of steel for 2 minutes from a distance of 24" to produce a density of 2.0, what is the strength of the Iridium 192 source needed to make the exposure?

Check and discuss.

V. SUMMARY

A. Exposure factor represents the kind of gamma material and type of film being used.

B. Charts and tables enable you to figure exposure times quickly and accurately.

C. Exposure time considerations include:
   1. Specimen material
   2. Film-focal distance
   3. Relative density of film
   4. Film type
   5. Type of gamma source
   6. Source strength

The Next Lesson is: Conversion Formulas and Graphs used in X-ray Exposure Calculations

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 12
Lesson 3
Time 2 hours

SUBJECT: Conversion Formulas and Graphs used in X-ray Exposure Calculations

AIM (or purpose): To clarify and provide practice in the use of the mathematical expressions employed in exposure calculations

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y., Pages 42 and 43.

I. PREPARATION (of the learner)

A. Outline the topic and explain the purpose of this lesson. Pointing out that although it is possible to make radiographs without making use of the characteristic curves for each type film, an understanding of the curves will eliminate a lot of guesswork in selecting the most appropriate film for a given assignment. These curves are especially helpful in selecting the right film when radiographing castings having a wide latitude of thickness. Operators who guess at the proper type of film to use are sometimes referred to as "picture takers" implying that their capabilities are limited to opening and closing a shutter. Therefore, take advantage of these characteristic curves and eliminate the possibility of being so categorized.

B. Stress the fact that a student must know the correct method of determining the x-ray exposure times necessary to produce satisfactory or acceptable results if he is to succeed as a radiographer.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Conversion formulas	1. Explain that a conversion formula is used to adjust exposure time for focal-film distance, film speed, and Ma settings.

2. Stress the need for conversion formulas when using X-ray exposure charts.
3. Outline the necessity for having an accurate exposure chart before application of the formulas pointing out that if the exposure chart is inaccurate, results after applying conversion formulas will also be inaccurate.

B. Time-distance relation

$$\frac{T_1}{T_2} = \frac{D_1^2}{D_2^2}$$

1. Show the relationship between the inverse square law and this relationship. The exposure time (T) required for a given exposure is directly proportional to the square of the focal-film distance (D).

$$\frac{I_1}{I_2} = \frac{D_2^2}{D_1^2}$$

2. Demonstrate on the chalkboard by showing a sample calculation for a change in the focal distance.

C. The Ma - time relation

1. Define the reciprocity law MT=C (Constant) showing that an increase in ma results in a proportinate decrease in exposure time.
2. Outline the limitations of the law. Refer to Table V page 38 of the Eastman Textbook.
3. Show sample chalkboard calculation for a change in the time of exposure and the change in milliamperage required.

D. The density- time relation

1. Have students turn to page 43 of the Eastman Textbook.
2. Review the information presented by the curves.
3. Review the definition of logarithms and antilogarithms.

4. Explain the determination of exposure increase required to double the density of Type AA film if the original density is 1.5.
5. Show sample calculations to alter the density from any value to another.

E. Problems

1. If a satisfactory radiographic exposure was made in 4 minutes at 1 foot what would be the exposure time at 9 inches (.75).
2. An exposure made in 5 minutes at 4 ma would take how long to make at 6 ma?
3. A 1.5 Density was obtained in 2 minutes with Kodak AA Film. What would be the time for a 2.0 density.
4. Solve problems with students participating.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask for an explanation of the purpose of the time-distance relationship, and solve a sample problem on the chalkboard.

B. Request that someone define the reciprocity law, explain the limits of accuracy, and solve a sample problem on the chalkboard.

C. Have another member of the group explain to the class the method of determining the exposure change from one density value to another using the same exposure working the problem on the chalkboard as it develops.

D. Suggest that all participants work a sample problem using:
   1. The time-distance relationship
   2. The reciprocity law
   3. A characteristic curve to calculate a change in exposure time.

E. Additional problems to be used for drill.

1. If a radiograph was made in 4 minutes @ a 3 foot focal distance, how long would it take to make the same radiograph @ 2 feet?

2. If an X-ray picture was made in 2 minutes with 150 kv and 4 ma how long would it take to make same exposure @ 1.5 ma?

3. A radiograph was made with AA film, 1.5 density, in 2 minutes, how long would it take to make same radiograph if 2.5 density was required?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. If satisfactory exposure is obtained in 2 minutes at a distance of 24", what is the time required at 36"?

B. If an acceptable exposure is obtained in 3 minutes at 5 ma, how long will the exposure be if the current is raised to 15 ma?

C. If a radiograph was made from an exposure chart to obtain a density of 1.0 using Kodak AA film, how much should the exposure time be increased to obtain a density of 2.5?

Check and discuss

V. SUMMARY

A. Conversion formulas and graphs help to make calculations of variations in film-focal distance, film density, ma settings and film speed.

B. Time and distance variations require use of the inverse square law.

C. Law of reciprocity is used in adjusting for ma settings.

D. Film density changes are calculated by a logarithmic method.

E. Practice problems are considered helpful in reviewing these calculations.

The Next Lesson is: How to Use X-ray Exposure Charts

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 12
Lesson 4
Time 2 hours

SUBJECT: How to Use X-ray Exposure Charts

AIM (or purpose): To promote the use of x-ray exposure charts

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y. (Charts on pgs. 40 through 46)

I. PREPARATION (of the learner)

A. Develop interest by pointing out that x-rays and gamma rays are sometimes considered alike in every aspect except that their origins differ. Discuss the possibility that exposure time can be figured by one common method for x-rays and gamma rays explaining to the class what the basic difference is, and its effect on time calculations.

B. Point out that this lesson will explain the various methods that can be used to figure x-ray exposure times. X-ray quality can be altered by adjusting a knob on the x-ray console controlling the kv (kilovoltage). This means that with the x-rays you can select the radiation quality that should give the best results for a particular application. This also means that exposure time will differ with each setting. An x-ray exposure chart is a graph showing the relation between material thickness, kilovoltage, and exposure. Although exposure charts are available from manufacturers of x-ray equipment, corrections must be made for different brand generators. It is, therefore, considered desirable to prepare an exposure chart for ones own x-ray generator.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The x-ray exposure chart	1. Refer students to pages 40 to 46, in the reference textbook explaining the purpose of the exposure chart.

	a. Exposure chart usually offers a choice of about four KV selections. b. Exposure time is usually shown in milliampere seconds. c. One or two film-focal distances are usually listed. d. One relative film density is used. e. Conversion factors are available for changes in speed and film density.
B. Figuring exposure from the x-ray exposure chart	1. Establish a set of conditions for an exposure listing these conditions on the chalkboard. 2. Determine the kilovoltage for the exposure from the graphs of recommended voltage. 3. Illustrate the selection of the correct exposure from the chart. 4. If the exposure is given in milli-ampminutes, show how to obtain the time in minutes. If one ma is being used, read time directly; if two ma are used divide by 2, etc.
C. Film factors for change of film types	1. Define film speed and film factor. Film speed is relative; coarse grain film is faster than fine grain film. If one film has a relative speed of 1 and another film has a relative speed of 2, then the exposure factor for film with relative speed of 2 is twice as long as that for film with a relative speed of 1. NOTE: An industrial x-ray film is seldom described as being coarse grained, it is usually described "less fine", "very fast". 2. Explain how this factor can be used to obtain an equivalent exposure with a different type of film. Use film speed comparison between the two type films and increase or decrease time accordingly.

D. Film speed tables	1. Turn to page 55 of Eastman Textbook. Refer to the column on relative speed. Discuss differencies in film speed between Kodak AA and Kodak M film. (Ratio is 30:200 at 200 KV). Discuss how ratio changes with KV change.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Suggest that students calculate the exposure for several sets of conditions. Ask the students to explain their method of figuring to the other students.

B. Have others in the group establish the time for exposure using a set of conditions listed on the chalkboard. Students should also list these conditions as a part of the solution to the problem.

C. Invite participating members to determine the new exposure time caused by changing the film from that specified on the exposure chart to another type.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. In radiographing a part made of 3/4" thick steel, what is the exposure time to obtain a radiograph of 1.5 density on Kodak AA film using a film-focal distance of 40" using 200 kv and 2 ma?

B. What is the exposure time of the same set up if the film is Kodak M?

C. If the part is steel 1 1/4" thick, what is the exposure time to obtain a radiograph of 1.5 density on Kodak M film using a film-focal distance of 40" and 3 ma?

V. SUMMARY

A. X-ray exposure charts are used to figure x-ray exposure times.

B. Resultant time can be given in milliampere minutes, or milliampere seconds.

C. Each line on the chart represents a different kilovoltage setting.

D. Times are shown for a 1 milliamperage setting. Settings higher than 1 will reduce exposure time proportionally.

The Next Lesson is: X-ray Exposure Charts

EXPERIMENT SHEET
X-ray Exposure Charts

Unit 12
Lesson 5
Time 4 hours

SUBJECT:
Construction of an exposure chart for an industrial x-ray generator

NOTE:
Instructor performs all operations

INTRODUCTORY INFORMATION:
Problems of exposure calculation have been presented in the class room using an x-ray exposure chart. These charts are published and are generally furnished by the manufacturer; however, it is generally considered good practice to prepare a chart on each generator because of their variations in output. It is the purpose of this experiment to develop an x-ray exposure chart for a particular generator.

MATERIALS AND EQUIPMENT:
X-ray generator and exposure facilities
Film cassettes loaded with Kodak AA film and .005" lead screens front and back
Steel step wedges, 1/4" to 1 1/2" in 1/4" steps
Densitometer
Lead sheet for masking wedges
Darkroom facilities
Semi-log graph paper, two cycle, 70 divisions
Clean rags

REFERENCES:
Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y., page 40

PROCEDURES:

A. Clean and examine cassettes before loading film. Use lead screens which have no visible defects.

B. Single load eight cassettes with Kodak AA film.

C. Set up x-ray machine for an exposure using a 36" film-focal distance and maximum milliamperage.

D. Place a film directly under the focal spot of the machine at 36" distance. Center the step wedge directly under the focal spot and mask all sides with lead sheeting. Mark the film for identification.

E. Make an exposure at 140 KV for 1 minute.

F. Repeat steps D and E using 160, 180 and 200 KV.

G. Repeat the procedure of D, E, and F using KV settings of 140, 160, 180, and 200 and a six minute exposure time.

H. Develop all eight film simultaneously at 68°F. for 5 minutes. Fix and dry.

I. Prepare a chart of KV settings versus thickness for a density of 1.5.

J. Using a transmission densitometer, determine the thickness which produces a density of 1.5 for the film 1 through 4.

K. The exact thickness will have to be determined by interpolation between the two steps where the density is 1.5.

L. Record the thickness opposite the KV on the prepared chart.

M. Note the ma-min for this set of values; for example, 5 ma for 1 minute equals 5 ma-min.

N. Repeat the procedure for the film set 5 through 8.

O. Record the thickness versus the KV which produced a density of 1.5.

P. Note the ma-time for this set of values; i.e., 5 ma for 6 minutes = 30 ma-min.

Q. Prepare a sheet of log paper by marking the thickness across the bottom and the ma-min along the side. The first cycle of the log paper will cover 1 ma-min to 10 ma-min.

R. Plot the points for thickness at a line representing the lower ma-min setting of exposures 1 through 4.

S. Plot the points for the ma-min setting for exposures 5 through 8.

T. Connect the point for each KV setting by straight lines. Extend these lines to the edge of the graph.

U. Label each KV line with the appropriate value.

CAUTION: Make sure only one thickness lead screens are used for this experiment.

CONCLUSIONS:

A. The prepared chart is valid for a density of ____________.

B. Type ___________ must be used when using this chart.

C. If an exposure was made of a 3/4" thick piece of steel using a 36" film-focal distance, 5 ma, and 160 KV, the time of exposure would be __________.

D. The purpose of the lead sheet masks is _________________.

The Next Lesson is: Scattered Radiation

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 12
Lesson 6
Time 2 hours

SUBJECT: Scattered Radiation

AIM (or purpose): To describe and develop proven methods and techniques of reducing scattered radiation thereby improving radiographic quality

TEACHING AIDS: Film samples, sample masks, film cassettes, screens and gamma ray collimators

REFERENCES: Nondestructive Testing Handbook, Volume I, 1963, Society for Nondestructive Testing, Evanston, Illinois
Information Sheet #31

I. PREPARATION (of the learner)

A. Introduce the subject explaining that this lesson will deal with minimizing the adverse effects of scattered radiation through the use of scatter controls.

B. Explain that when performing gamma radiography of welds, castings, and parts, the irradiated area and the hazard to personnel in the area can be materially reduced by using simple scatter control devices.

C. Stress the need for acquiring this knowledge and how important it is in protecting the life of the radiographer.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The effects of scattered radiation on radiographic quality	1. Explain the role of scattered radiation in: a. Reducing contrast b. Increasing film fog c. Reducing sensitivity d. Producing undercut 2. Show film samples

II. PRESENTATION (of the information -- continued)

Instructional Topics	Things to Remember to Do or Say
B. Sources of scattered radiation 1. The specimen 2. Cassettes 3. The floor or exposure surface 4. Filters	Illustrate by chalkboard sketches the creation of scattered radiation from each of the sources listed.
C. Methods of scatter control 1. Masks 2. Filters 3. Diaphragms 4. Collimators 5. Intensification screens	1. Describe the function of the mask and display several examples: Masks are usually thin lead sheets placed around the outside edges of a specimen to absorb scatter. 2. Define masking methods using clays, shot, and liquid lead solutions. 3. Explain the functions of the filter in radiography and how it reduces scatter filtering out soft, scatter producing rays before they reach the specimen and film. 4. Display typical diaphragms and collimators used to contain beam spread. 5. Illustrate by chalkboard sketches the function of each of these scatter control devices.
D. Exposure variations from the use of scatter control devices	1. Explain why the use of masks, filters, and collimators can result in increased exposure time. Show how the total relative film density is the product of primary radiation and scatter. 2. Emphasize the reduction in personnel hazard gained from the use of these devices, and how scatter control devices reduce these hazards by reducing environmental scatter. 3. Pass out information sheet #31 showing examples of exposure time with collimation variations.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Invite students to describe to the class the origin of scattered radiation and its effect on the quality of the radiograph.

B. Ask members of the group to outline several sources of scattered radiation and the methods of controlling the scatter.

C. Suggest that students draw a chalkboard sketch of a radiographic setup using good scatter control techniques on a part of complicated shape.

D. Have the group define the increased safety derived from the use of scatter control devices.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What are the advantages that ensue from the reduction of scattered radiation?

B. Why does the reduction in scatter generally result in increased exposure time?

C. List three scatter control devices and tell how they reduce scatter.

D. Describe at least three methods of masking to reduce scatter.

E. What function does the collimator serve besides the reduction of scatter?

Check and discuss.

V. SUMMARY

A. Radiation scatter has a very detrimental effect on image quality.

B. Many factors contribute to creation of this adverse effect.

C. Several methods are used to minimize this adverse effect.

D. Elimination of scatter effect increases exposure time but also increases image quality.

E. Personnel safety is increased by controlling environmental scatter.

The Next Lesson is: The Control of Scattered Radiation

EXPERIMENT SHEET
The Control of Scattered Radiation

Unit 12
Lesson 7
Time 3 hours

SUBJECT:

Methods of reducing scattered radiation and improving radiographic quality

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

Production of high quality radiographs requires the use of many techniques. The use of good exposure techniques, proper selection of film, and good dark room procedures will not always guarantee a satisfactory radiograph. Reduction of scattered radiation is also an essential necessity for the detection of very fine defects. This experiment will show the difference in quality obtained from good scatter control techniques.

MATERIALS AND EQUIPMENT:

X-ray generator and exposure facilities
Film cassettes, 0.005 and 0.010 lead screens, and film
2" thick aluminum casting
Lead sheet, barium clay, and lead acetate solutions
Penetrameters
Film viewer
Lead numbers
Dark room facilities with equipment, timer, materials, etc.

PROCEDURE:

A. Single load a film cassette with film and remove the intensifying screens.

B. Set up the x-ray generator for an exposure of the aluminum casting using 160 KV and the exposure chart constructed in a previous experiment. Use radiographic equivalence factors to determine the thickness of steel to be used in the exposure determination.

C. Place a 1" thick piece of wood on a steel plate and position the film on the wood block directly under the focal spot of the x-ray generator. Center the casting on the film. Mark the film for identification. Place a 2-2T penetrameter on the casting in the area of interest.

D. Expose the film to obtain a density of 2.0 in the area of interest.

E. Single load another cassette with the same film using a .005 front and a 0.010 back screen.

F. Place the film on a thick sheet of lead under the focal spot of the generator.

G. Position the part on the film using a good masking technique. A water tight aluminum pan is required if liquid masking is used. CAUTION: Liquid lead solutions are poisonous and must be handled with care.

H. Mark the film for identification and place a 2-2T penetrameter on the casting.

I. Place a diaphragm on the tube port of the x-ray generator.

J. Expose the film using the same exposure as in the first film.

K. Develop both films simultaneously at 68°F. for 5 minutes. Fix and dry.

L. Place film on a viewer and compare the results.

CONCLUSIONS:

A. The increased sensitivity of film number two is due to ____________.

B. The effect of the screens in the cassettes is to ____________________.

C. The two film ____________ or ___________ of the same density in the area of interest.

D. The purpose of the lead back up sheet in exposure number two was to ______________________.

The Next Lesson is: Exposure Changes for Changing Densities

EXPERIMENT SHEET
Exposure Changes for Changing Density

Unit 12
Lesson 8
Time 3 hours

SUBJECT:

Changing the density of radiographs from one value to a second desired value

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

The exposure charts for x-ray radiography are constructed for a fixed density. It is often necessary to change the density of a radiograph to comply with specifications, increase contrast, or to improve the readability of the film. The radiographer should be able to adjust the density of the film by adjustment of the exposure time given by the exposure chart.

MATERIALS AND EQUIPMENT:

X-ray generator and exposure facilities
Film cassettes and Kodak AA film
Sample part for inspection
Densitometer
Characteristic curves for type AA film
Darkroom facilities including equipment, materials, lead numbers, etc.
Logarithm tables

PROCEDURE:

A. Single load film cassettes with type AA film.

B. Set up the x-ray generator for an exposure of the sample part using the exposure chart constructed in a previous experiment.

C. Place a film directly under the focal spot of the machine and center the sample part on the film. Mark the film for identification.

D Make an exposure in accordance with the exposure chart.

119

E. Using the characteristic curve calculate the increase in exposure time necessary to increase the density of the film to 2.5 in the area of interest.

F. Change the time setting on the x-ray machine.

G. Place a second film under the machine and center the part on the film exactly as in the first exposure. Mark the film for identification.

H. Expose the second film in accordance with the new time setting.

I. Develop both films simultaneously at 68°F. for five minutes. Fix and dry.

J. Using the densitometer determine the density of each film at the point of interest on the image.

K. Measure the density at the lowest and highest densities on each film .

L. Record the values on the lab work sheet.

CONCLUSIONS:

A. The effect on contrast from the increase in density is ___________.

B. The density _____________ increase the same for all thicknesses of the part.

C. The increase in time necessary to achieve a density of 3.5 in the area of interest is _______________.

D. The same amount of time ______________ or __________ ___________ be required to raise the density at the lowest density spot to 3.5 as was required for the original area of interest because _________________.

The Next Lesson is: Changing Focal Distance

EXPERIMENT SHEET
Changing Focal Distance

Unit 12
Lesson 9
Time 3 hours

SUBJECT:

Obtaining equivalent exposures when changing the focal distance

NOTE: Instructor performs all operations

INTRODUCTORY INFORMATION.

The exposure charts for x-ray radiography are constructed using a fixed film-focal distance. It is often necessary to alter this distance because of the geometry of the part, obstructions in the radiation beam path, or a desire to increase sensitivity and resolution. The radiographer should be able to make the simple calculations required to achieve an exposure equivalent to that obtained at the standard focal distance.

MATERIALS AND EQUIPMENT:

X-ray generator and exposure facilities
Film cassettes and film
Sample part for inspection
Densitometer
Dark room facilities, supplies and materials
Lead numbers
Six foot tape

PROCEDURE:

A. Single load film cassettes with film selected for the experiment.

B. Setup x-ray generator for an exposure of the part selected using the exposure chart constructed in a previous experiment.

C. Place the film directly under the focal spot of the machine and center the sample part on the film. Mark the film for identification.

D. Make the exposure in accordance with the exposure chart.

E. Move the tube head of the machine from 36" to 24" focal distance.

F. Place a second film under the machine and center the part on the film exactly as on the first exposure. Mark the film for identification.

G. Calculate the change in time required by moving the tube head to the new position.

H. Expose the new set up in accordance with the calculated time.

I. Develop both film simultaneously at 68°F. for 5 minutes. Fix and dry.

J. Using the densitometer, determine the density of each film at the same point on the image of the part.

K. Record the values on the lab work sheet.

CONCLUSIONS:

A. If the procedures are correctly followed, the density of the film will be ____________________.

B. When the film-focal distance is shortened, the intensity of the radiation beam is ____________________.

C. When film-focal distance is shortened, the sharpness of the film is ____________________.

D. If the procedure did not produce the desired results, the difficulty could be caused by incorrectly ______________ the distance or an error in _________________.

The Next Lesson Is: Standards for Protection Against Radiation

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 13
Lesson 1
Time 2 hours

SUBJECT: Standards for Protection Against Radiation

AIM (or purpose): To outline the regulations imposed by the controlling agencies who issue licenses for use and possession of radiation producing devices

REFERENCES: Information Sheet #3, #32, #33 and #34
Copy of Title 10, Federal Register, Part 20, "Standards for Protection Against Radiation"

I. PREPARATION (of the learner)

A. Introduce the topic and develop student interest by touching briefly on the radiation banking concept and the minimum age of a radiographer. Explain what the maximum accumulated dosage is that a person may receive before he can no longer work as a radiographer, and how long a radiographer must be idle from work before he may return to his duties after receiving the maximum allowable dosage.

B. Point out how this lesson will help the individual to better understand the safety rules and regulations that govern the handling, use, transfer, disposal, and possession of radioactive materials.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Definitions under Part 20	1. Refer to Information Sheet #3 and read the pertinent part of each definition to the class.
1. 20.3-Byproduct material Calendar quarter Licensed material Occupational dose Radiation Radioactive material Restricted area Unrestricted area	2. After reading each definition translate the legal terminology into terms readily understood by the students.

II. PRESENTATION (continued)

Instructional Topics	Things to Remember to Do or Say
20.202 - Personnel monitoring equipment Radiation area High radiation area	
B. Permissible dose and radiation levels 1. 20.101 - Exposure of individuals	1. Read and explain all pertinent regulations to the students. 2. Explain the exceptions to the general rule. 3. Perform sample chalkboard calculations to determine maximum dosages for individuals.
2. 20.102 - Determination of accumulated dose	1. Read the regulations pertaining to records and calculation of dosages. 2. Display Form AEC-4 to the students. 3. Explain the preparation of the form
3. 20.104 - Exposure of minors	Read and explain the regulation to the students.
4. 20.105 - Permissible levels of radiation in unrestricted areas	Read and explain all pertinent matters to the students.
C. Precautionery procedures 1. 20.201 - Surveys 20.202 - Personnel monitoring	1. Refer to Information Sheets # 32 and 33 2. Read and explain the regulations to the students.
2. 20.203 - Caution signs and labels	1. Refer to Information Sheet #34. 2. Display the sample signs and explain where each is required by regulations
3. 20.206 - Posting of notices	Display AEC-3 forms and explain the requirements for posting them.
D. Waste disposal 1. 20.301 - General requirements	1. Read the section pertaining thereto and explain to the students. 2. Explain why the exceptions are not generally applicable to radiographic sources.

E. Notifications
   1. 20.403 - Incidents
   2. 20.404 - Former employees
   3. 20.405 - Report of over-exposure

Read each section and explain to the students.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have individual students explain to the class the regulations for:

A. Rules for exposure of individuals
B. Determination of accumulated dosage
C. Exposure of minors
D. Permissible levels of radiations in unrestricted areas
E. Requirements for use of monitoring devices, signs, and notices.
F. Disposing of radioactive materials
G Notifying the control agency of incidents and accidents

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the normal whole body dosage allowed per calender quarter for individuals working in a restricted area?

B. If a radiographer were 25 years old, what would be the maximum accumulated dose he could have from occupational exposure?

C. What are the limits of radiation intensity marked by the "Radiation Area" and the "High Radiation Area"?

D. When are surveys required by regulations?

E. How are unwanted radiographic sources usually disposed of?

F. Where is the "Notice to Employees" sign required to be posted?

G. What are the exposure levels which require immediate and 24 hour notification that an accident has occurred?

H. What is the basis of the requirements for reporting over-exposure which do not exceed the levels specified for incidents or accidents?

I Who is responsible for furnishing information on an employee's previous exposure history? How is this information obtained? Who requests the information?

Check and discuss

V. SUMMARY

A. A thorough understanding of the AEC standards for protection from radiation are necessary in order to qualify for an AEC Radiography License.

B. Permissible dose and radiation levels must be observed and current records of dose levels must be maintained.

C. All precautionary procedures must be enforced.

D. Waste disposal procedures seldom apply to radiography licensees.

E. Notification time limits and procedures must be understood and maintained.

The Next Lesson is: Licensing of Byproduct Materials

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 13
Lesson 2
Time 1.5 hours

SUBJECT: Licensing of Byproduct Materials

AIM (or purpose): To develop an appreciation and understanding of the requirements and provisions for obtaining a license to use byproduct materials

REFERENCES: Information Sheet #3

I. PREPARATION (of the learner)

A. Develop an interest in the subject by discussing the purpose of the license.

B. Explain that federal laws control the possession, handling and use of synthetic radioactive materials and that the U. S. Atomic Energy Commission regulates the possession, use and handling of these materials. So-called "Agreement States" control these operations in their respective areas and some of these have reciprocal agreements among themselves. In the spring of 1966 there were about twelve agreement states in the United States.

C. Discuss the fact that while some radioactive materials can be obtained in very small amounts, usually ten microcuries or less, without a license, this small amount would have little or no value in radiography.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Definition in Part 30 1. Agreement states 2. Byproduct materials 3. Radiographer 4 Radiographers assistant 5. Sealed sources	1. Refer to Information Sheet #3 and read the definition of each term from the regulations. 2. Define each term in language understandable to the student. 3. Ask for questions and discuss all aspects 4. Give examples

B. Exemptions 1. AEC contracts 2 Carriers 3. Weak concentrations 4. Luminous dials	1. Read the pertinent part of each applicable section and explain to the students. 2. Ask for questions and discuss 3. Give examples
C. Licenses 1. Types - General and Specific 2. Applications 3. Requirements for issuance 4. Terms: a. Transferral b. Limits of use c. Implied and written 5. Expiration, termination and renewal	1. Read the applicable sections on each of the listed topics. 2. Explain the regulations to the students. 3. Ask for questions 4. Give examples
D. Enforcement 1. Modification and revocation 2. Recall 3. Violations	1. Read the pertinent part of each section and explain all subject matter to the student. 2. Ask questions 3. Cite practical examples

---

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have individual students explain to the class the regulations for:

A. Persons who are exempt from licensing for use and handling of radioactive materials.

B. The types of licenses available and to whom they apply.

C. The terms of issuance, usage, and the transferral of licenses.

D. The legal measures available to the government for enforcement of the provision of a license.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What are the two types of licenses issued for use of byproduct materials? What is the difference?

B. Who is exempt from license requirements?

C. What is the difference between a radiographer and a radiographer's assistant as defined by the regulations?

D. What is an agreement state? What authority does an agreement state have over licensing?

E. What type of penalities can be imposed on persons who violate the terms of a license?

Check results and discuss.

V. SUMMARY

A. The Atomic Energy Commission regulates the safe handling, use and possession of synthetic radioactive isotopes.

B. The licensee must have a thorough understanding of these regulations.

C. These regulations include use, handling and possession of gamma sources used in radiography.

D. Regulations also cover: enforcement of rules, types of licenses, requirements for issuance of licenses, definitions, agreement states and exemptions.

The Next Lesson is: Licenses for Radiography

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 13
Lesson 3
Time 2 hours

NOTE TO INSTRUCTOR: Repetition or application of this lesson should be given as often as possible

SUBJECT: Licenses for Radiography

AIM (or purpose): To explain and clarify the governmental requirements for licensed radiographic operations

REFERENCES: Information Sheet #3

I. PREPARATION (of the learner)

A. Point out that this lesson will help the individual to know the licensing requirements for possession, use, and the handling of radioactive materials. The AEC must control the use of this material in order to protect the operator and the public from the hazards of radiation. The lesson includes definitions, licensing requirements for radiographers, safety requirements and precautionary procedures.

B. Stress the importance of acquiring the information contained in this lesson because:
   1. The regulations contain the minimum training requirements for an individual acting as a radiographer in a licensed operation.
   2. The regulations contain the minimum safety program required by a licensee for the protection of his employees.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Definitions under Part 34 1. Radiography 2. Radiographic exposure device 3. Storage container	Read the definitions to the student and explain them having a short discussion as to the how, why, when, where and what.

B. Licensing requirements for radiography 1. Training program 2. Written procedure manual 3. Internal inspection program 4. Organizational structure for operational control	1. Read the entire section on requirements and explain and discuss. 2. Display an operational procedure manual. 3. Read Appendix A outlining the minimum training program.
C. Safety requirements 1. Radiation levels from exposure devices 2. Locks on exposure devices. 3. Storage areas 4. Survey meters 5. Wipe testing 6. Inventories 7. Emergency procedures 8. Personnel monitoring devices	1. Read and explain the applicable sections of the regulations and discuss them. 2. Read the applicable sections of the procedure manual dealing with these topics and discuss them thoroughly. 3. Explain the purpose of the procedure manual, explaining all aspects of the manual.
D. Precautionary procedures 1. Survellience of radiation areas 2. Posting of signs 3. Survey of radiation areas	Read, explain and discuss the applicable sections of the regulations, inviting all questions as they develop.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have various students explain:

A. The minimum requirements necessary to obtain a license for radiographic operations

B. The maximum radiation intensity allowed to be emitted by a locked exposure device.

C. Requirements for locking of storage and exposure devices

D. The basic requirements for survey meters

E. The need for wipe testing

F. The necessity of logging of source usage

G. The procedure for conducting inventories

H. The number and type of personnel monitoring devices required by law

I. The requirements for posting of notices

J. The essential need for conducting radiation intensity surveys during radiographic operations

---

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. How often must survey meters be calibrated?

B. How frequently should wipe tests be performed?

C. When must an inventory be made of exposure devices and sources?

D. What are the requirements for tagging of sources and marking of storage areas?

E. When are exposure devices allowed to be unlocked?

F. What personnel monitoring devices must be worn by all radiographers?

G. What is the purpose of the operating procedure manual?

H. When must physical radiation surveys be performed?

I. What is the operating range of a survey meter which conforms to governmental regulations?

Check and discuss.

V. SUMMARY

A. Certain definitions must be studied and remembered if regulations are to be understood.

B. Licensing requirements include formal training, written procedures for company operation, and organizational control structures.

C. Many specific safety regulations must be observed.

D. Precautionary procedures must be spelled out.

The Next Lesson is: Emergency Procedures for Radiographic Operations

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 13
Lesson 4
Time 2 hours

SUBJECT: Emergency Procedures for Radiographic Operations

AIM (or purpose): To stress the need for adhering to safe practices when emergencies occur in radiographic operations

REFERENCES: Copy of typical operating and administrative procedures

I. PREPARATION (of the learner)

A. Introduce the subject and develop interest by pointing out that a radiographer must be capable of coping with emergencies which may arise while operating or transporting exposure devices. He may also be required to handle other emergencies caused by fires in the area where the exposure device is stored, or is being used, and in cases of suspected theft of radioactive materials.

B. The lesson will cover a variety of subjects and will help the individual to understand the importance of a licensee's emergency and operating procedures. Point out that these written procedures must be approved by the AEC.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Accidents involving radioactive exposure devices	1. Explain that accidents can occur regardless of the amount of care exercised. 2. Cite examples of accidents: i.e., fire in the exposure area, objects falling on the equipment, and auto accidents while transporting materials
B. Problems involving malfunction or breakage of exposure devices	1. Outline the procedures for posting signs, barricading, and alerting proper officials. 2. Warn against attempts to repair

	or recover devices when the radiographer is without experience in these functional areas. 3 Inform the students of agencies and individuals who should be contacted for assistance. 4. Caution against leaving the area unattended.
C. Problems involving stolen equipment	Instruct the students in the correct procedures for notifying the local regulatory officials of the theft.
D. Problems involving fire	1. Explain the importance of returning the source to the locked position in case of fire or a fire alarm. 2. Instruct in the removal of equipment from the hazard area. 3. Explain the notification procedures necessary if sources are exposed in the fire area. 4. Outline the assistance which must be rendered to fire fighters when sources are in the fire area.
E. Problems involving vehicle accidents	1. Instruct the student in the importance of removing injured personnel as a first action. 2. Explain why the area should be immediately surveyed and made secure. 3. Explain the importance of informing law enforcement officers of any hazards. 4. Impress on the student the necessity of keeping curiousity seekers from the area and notifying the proper officials of the accident.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Ask the students to explain:

A. The procedures to follow in case of a malfunction or damage to an exposure device.

B. The proper action to take when equipment is stolen, explaining why.

C. What to do in case of fire and the reasons for the action.

D. How to handle a vehicle accident in which radioactive materials are involved.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What persons and officials are to be notified if equipment is stolen?

B If a fire breaks out in the area in which a radiographer is working, what is the first action to be taken?

C. What is the first concern of a radiographer involved in a vehicle accident where people are injured and equipment is damaged?

D. Who can a radiographer always turn to for assistance if he cannot contact his designated safety officer?

E. Under the circumstances should a radiographer leave a source which has been damaged?

Check and discuss.

V. SUMMARY

A. Accidents involving radioactive materials continue to happen despite the strict exacting regulations that cover it uses and handling.

B. Many accidents occur because of negligence, apathy and contempt on the part of the user of radioactive materials.

C. Stolen equipment must be reported to the AEC or the State immediately so that the danger created by the incident can be minimized by warning the public of the potential hazard that exists.

D. Emergency operating procedures must cover the measures to be taken in case of fire involving radioactive materials.

E. Emergencies involving transportation of radioactive materials must also be covered in the Emergency Operating Procedures.

The Next Lesson is: Record Keeping for Radiographic Operations

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 14
Lesson 1
Time 2 hours

SUBJECT: Record Keeping for Radiographic Operations

AIM (or purpose): To outline the type records and reports required for radiographic operations

REFERENCES: Information Sheets #3, #35, #36, #37, #38, and #39

I. PREPARATION (of the learner)

A. Center a short discussion around record keeping that students know, i.e., (income tax, bank book, employment, etc.) stressing the need for record keeping.

B. Point out that failure to keep adequate records is a legal violation of the license to possess radioactive materials and that failure to maintain record files can result in a citation for non-compliance with the regulations and result in possible revocation of a license.

C. Explain the importance of this lesson and stress that it will help the individual to set up and keep current the records that are required of the licensee and that the AEC requires that certain records pertaining to radiation safety be kept

---

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Why records are maintained	1. Explain the legal requirements for record keeping in that a federal law requires it and that AEC inspectors check these records for discrepencies. 2. Explain the advantages of adequate records to counteract and discourage employees claims of malpractice. 3. Impress on the student that the prime objective of record keeping is to insure his own safety.

B. Daily record requirements 1. Daily dosimeter records 2. Utilization logs 3. Job survey records 4. Set-up sketches	1. Distribute sample report forms. 2. Explain the proper methods for completing each form. 3. Explain why each is required and the extent of detail required. 4. Fill out each sample form while discussing procedures. 5. Invite questions.
C. Periodic records 1. Film badge summary and records 2. Dosimeter summary 3. Quarterly inventory 4. Wipe/leak tests 5. Survey meter calibration 6. Unscheduled surveys 7. Container and exposure device surveys	1. Distribute sample report forms. 2. Explain the source of information and the proper methods of completing the forms. 3. Illustrate techniques for summation of exposure records. 4. Explain the nature and purpose of an unscheduled survey.
D. Historical records 1. AEC-4 2. AEC-5 3. Transfer and disposal records	1. Distribute sample forms. 2. Show chalkboard calculations to determine allowable dosage. 3. Explain the need for maintaining transfer and disposal records; AEC keeps a careful awareness of each and every source of nuclear radiation under their control.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have individual students explain:
   1. The daily records required.
   2. The records required on a periodic basis and the time interval of each.
   3. The historical records of employees and equipment.

B. Invite students to fill in practice forms supplying all necessary information.

C. Create a variety of pseudo situations to fully cover the lesson in all its aspects, giving each student the opportunity for practice and questions.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What records require preparation on a daily basis?

B. What is the time interval for survey meter calibration? Wipe Test? Source inventory?

C. What record is necessary before a prospective radiographer may work for a new employer?

D. How often are dosimeter readings entered in the records?

E. What is the value of the sketch prepared of the exposure area?

Check and discuss.

V. SUMMARY

A. A well kept, current set of records is necessary if you are to keep your AEC radiography license.

B. Some records require daily entrys.

C. Proper entry on each form is essential.

D. Records are inspected periodically by AEC representatives.

E. Legitimate records are most helpful in planning safety improvements.

The Next Lesson is: Permanent Exposure Facilities

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 15
Lesson 1
Time 3 hours

SUBJECT: Permanent Exposure Facilities

AIM (or purpose): To cover in detail the features and construction characteristics of radiation exposure facilities

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y.
Radiation Safety in Industrial Radiography with Radioisotopes, AECU 2967, 1954, U. S. Atomic Energy Commission
Information Sheet #40

I. PREPARATION (of the learner)

Explain that the construction of exposure rooms is a very expensive endeavor and that many rooms have been constructed which later proved inadequate or inconvenient because of poor planning. A familiarization with desirable features is mandatory if mistakes are to be avoided. Emphasize that every radiographer should be able to make some constructive contribution to the design of a facility for exposure.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Construction materials	1 Outline the use of lead and concrete for x-ray and gamma ray radiation shielding. Wide lead sheet for floor cover and wall cover is desirable but quite fragile and expensive. 2. State the maximum energy levels for practical use of each type shielding. 3. Compare construction costs for the various types of construction. 4. Draw chalkboard sketches of methods of lead construction

	such as lapping and nail head covering. Refer to page 114 of the Eastman textbook.
B. Construction features	1. Draw a chalkboard sketch of a typical exposure room layout or refer to Information Sheet #40. 2. Explain the desirability of keeping metallic members of construction to a minimum thereby minimizing scatter. 3. Describe how vacant areas or idle work space can be used for shielding; Employing the distance factor. 4. Define the limits of allowable intensity at the outside boundary of the exposure room 2mr/hr. 5. Describe the construction of pits and vaults for the storage of isotopes. 6. Describe the use of circuit breakers and entry way interlocks; Line voltage to X-ray tube should be interrupted when the door is opened while the unit is in operation.
C. Openings	1. List the requirements for openings in the exposure room walls or floors: i.e., control cables, piping, ventilation, access doors, etc; Should be angled. Refer to page 114, of the Eastman textbook. 2. Describe the construction methods of shielding around openings. See Information Sheet #40. 3. Draw a chalkboard sketch of a shielding maze at a major entry way. (Labyrinth)
D. Monitoring devices	1. Describe the console type instruments for continuous radiation monitoring. Automatic monitor alarms are activated when 2 mr/hr

is exceeded.

2. Explain why the survey meter must be used in addition to the automatic devices. Survey meters are portable and do not rely on line voltage for power. A survey meter is carried into the exposure room.
3. Describe warning light systems. Red light when radiation field exists. Green light when radiation field does not exist.

E. Auxiliary equipment

1. Explain the need for utilities, water lights, power, and air conditioning.
2. Explain the need for hoists, cranes, and exposure tables. To speed up production less lifting and positioning of specimen and equipment.
3. Explain the desirability of keeping metallic materials out of the exposure room to eliminate scatter.
4. Elaborate on the use of collimators for gamma radiography to reduce scatter.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have several students draw a sketch of an exposure room for use with 20 curies of Cobalt 60 and 50 curies of Iridium 192. Show calculations for determining the thickness of the walls. Justify the use of construction materials.

B. Have other students;
   1. Add safety devices to the design.
   2. Describe auxiliary equipment needed,
   3. Indicate control devices needed for the design.

C. Invite questions and promote discussion.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What type of material would be most economical for exposure room construction if a 300 KV X-ray generator were the only source of radiation? If Cobalt 60 is to be employed?

B. What techniques are used to shield openings in exposure room walls?

C. What type of safety devices are employed in construction of exposure facilities to insure against accidental entry?

D. Why is metal construction material (other than lead) undesirable in the exposure room?
Check and discuss.

V. SUMMARY

A. Permanent exposure facilities are very desirable in radiographic operations.

B. Selection of proper materials for exposure room will improve the quality of radiographs by minimizing the effects of scatter radiation.

C. Automatic interlock systems on all entrances to exposure room are very desirable.

D. Radiation monitoring devices are necessary for this type of installation.

The Next Lesson is: X-ray Tubes

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 1
Time 2 hours

SUBJECT: X-ray Tubes

AIM (or purpose): To illustrate and describe the characteristics of commercial x-ray tubes

TEACHING AIDS: Defective x-ray tube to be used for demonstration

REFERENCES: Nondestructive Testing Handbook, Volume I, Section 14, 1963, Society for Nondestructive Testing, Evanston, Illinois

---

I. PREPARATION (of the learner)

A. Write aim of lesson on the chalkboard and point out that this lesson explains the characteristics of various types of x-ray tubes and the uses of each type. Although some radiographers may not have an opportunity to advise on new equipment purchases, they will find this information useful for a variety of other purposes.

B. Identify the many different types of commercial x-ray generations and describe their individual identifying features. Use this opportunity to develop interest by relating some of the advantages and disadvantages of each type.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Tube components 1. The anode 2. The cathode	1. Draw a chalkboard sketch of a typical hot cathode vacuum x-ray tube.
3. The target 4. The envelope 5. The filament	2. Explain the function and construction of each component, describing the materials used.
6. The window	3. Label the parts of the tube as previously listed in tube component.
	4. Display sample tube.

B. X-ray tube targets 1. Target materials 2. Inclined targets 3. 360 degree emission 4. Rotating anodes 5. Reduced focal spot tubes	1. Define the optimum characteristics of target materials: a. High melting point b. High atomic number c. High termal conductivity d. Low vapor pressure 2. Draw chalkboard sketches of the various geometric shapes of targets. 3 Explain the advantages of each type of target design: a. 360° emission target for circumferential shots. b. Rotating target for longer target life 4 Explain the advantages of the smaller focal spot in that it reduces geometric unsharpness 5 Define and explain "heel effect".
C. Efficienty and heat dissipation	1 Define the efficiency of the x-ray tube for low and medium voltages explaining that as the voltage is lowered the penetrating ability of the x-ray is also lowered. 2. Explain the reason for the lack of efficiency (x-rays result in less than 1% of energy created in tube) 3. Explain techniques for dissipation of heat from the anode: a Tungsten target surrounded by copper heat dissipator b. Oil and water circulated around the anode c Metal heat dissipating fins 4. Define the duty cycle outlining the percentage of the total working day that an x-ray generator can be operated without overheating.
D. Special construction features 1. Focusing cuts 2. Hooded anodes	1. Draw chalkboard sketches of each of the special features. 2. Explain the advantages of each feature: a Focusing cups collimate the high speed electrons toward tungsten

	target b. Hooded anode improves geometry of the electrodes
E. Beryllium windows	Discuss the advantage of a beryllium window in an x-ray tube, explaining that it provides maximum radiographic contrast for thin or low density materials.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have each student sketch on paper a typical inclined target hot cathode vacuum x-ray tube.

B. Ask individual students to:
1. Sketch the x-ray tube on the chalkboard
2. Explain the function of each part
3. Discuss the target in detail and sketch other target designs
4. Sketch and explain the purpose of special features which are used to increase the performance of the tube
5. Approximate the efficiency of x-ray tubes and tell how heat is dissipated from the anode.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Draw a sketch of a hot filament, inclined target, high vacuum x-ray tube.

B. Label all of the parts of the tube.

C. Define the function of the filament, the anode, the target, and the envelope.

D. Why is the efficiency of x-ray tubes very low?

E. Outline the advantage of a small focal spot size.

F. What is the purpose of an anode hood and the beryllium window?

Check and discuss.

V. SUMMARY

A. X-ray generators consist of two main components, the control console and the tube head.

B. The tube head contains the x-ray generating tube.

C. X-ray tube focal spot size is important. It should be as small as possible.

D. The duty cycle of the tube is very important and depends upon the tube's ability to dissipate excessive heat generated while in use.

The Next Lesson is: X-ray Generator

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 2
Time 2 hours

SUBJECT: X-ray Generator

AIM (or purpose): To develop an understanding of the basic circuitry of industrial x-ray generators

TEACHING AIDS: An x-ray generator with top of control panel removed to expose the internal wiring

MATERIALS: Colored pencils

REFERENCES: Nondestructive Testing Handbook, Volume I, Section 14, 1963, Society for Nondestructive Testing, Evanston, Illinois

I. PREPARATION (of the learner)

Introduce the subject and tell the group that the basic circuitry of x-ray generators will be discussed in detail. Although generators vary slightly in design and placement of meters, fuses, and circuit breakers, all generators are basically the same. As shown in schematic drawings, all circuitry also seems to be of the same general nature. It should be pointed out that knowledge of the basic circuitry is most useful when the radiographer by necessity must repair his own equipment.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The basic circuit 1. Fuses 2. Switch 3. Line voltage compensator 4. Voltmeter 5. Timer 6. Milliammeter	1. Pass out Information Sheet #14. Sketch a typical self-rectified x-ray generator circuit on the chalkboard.

7. Filament transformer 8. X-ray tube	2. Explain the function of each of the components as previously listed under A, the basic circuit. 3. Trace the current flow as it passes through the circuit.
B. Current characteristics 1. Self-rectifying 2. Valve tube half wave rectification 3. Full wave valve rectification	1. Draw chalkboard sketches of the voltage wave form applied to the tube of a self-rectifying tube. 2. Show the effect of self-rectification. 3. Draw a simple bridge circuit and explain how valve rectification is achieved. 4. With chalkboard illustration explain the advantages of the full wave valve rectification.
C. Tank unit designs 1. Grounded cathodes 2. Grounded anodes 3. Center ground systems	1. Define a tank unit and explain how it differs from externally fed high-voltage units. 2. Draw sketches of each of the various tank-type circuits. 3. Explain the advantage of each on the chalkboard.
D. Separated unit machines	1. Sketch the layout of this type machine by block diagrams. 2. Explain the use of rod anodes by illustrating their ability to make exposures in areas too small for conventional equipment. 3. Explain why these units are generally limited to fixed installations (360° radiation pattern creates a hazardous condition outside of the exposure room). 4. Explain the unlimited duty cycle and the ability to use the x-ray generator continuously without the danger of overheating the tube.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have several students make a chalkboard sketch of a self-rectified x-ray generator.

B. Suggest that others:
   1. Label all components
   2. Explain the function of each component
   3. Draw a sketch of the applied and the rectified wave form of this generator
   4. Explain the advantage of full wave rectification

C. Ask other students to describe the various tank unit circuitry designs and explain their advantages to the group.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Draw a sketch of a self-rectifying x-ray generator circuit.

B. Label all essential parts.

C. Draw arrows to indicate current flow in the circuit.

D. Explain the advantages of the grounded anode and the grounded cathode tank units.

E. What are the advantages of separated unit construction? What are the disadvantages?

V. SUMMARY

A. Self-rectified x-ray circuit is usually employed in a tank-type, or self-contained, portable x-ray unit.

B. Self-rectified x-ray circuits have a relatively low milliamperage output.

C. Rod-anode type units are used where access to exposure area must be made through a relatively small opening.

D. Rod-anode units are capable of making a circumferential exposure.

E. Constant potential circuits are used to increase penetration, reduce exposure time, and produce longer tube life. These units are almost always stationary or fixed.

F. Rectified high-voltage circuits allow a more compact design plus higher tube output.

The Next Lesson is: Set-up, Connecting, Preheating of X-ray Generator and Tube

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 16
Lesson 3
Time 1 hour

JOB (or operation): Set-up, Connecting, and Preheating of X-ray Generator and Tube

AIM (or purpose): To develop skill in conditioning x-ray tubes before applying high voltages

TOOLS AND EQUIPMENT:
- X-ray exposure facilities
- X-ray generator
- X-ray tubes - (new and used)

REFERENCES: Equipment manufacturers instruction manual
Nondestructive Testing Handbook, Volume I, 1963, Society for Nondestructive Testing, Evanston, Illinois

I. PREPARATION (of the learner)

Point out that this lesson will provide instruction in the correct procedure for operating the x-ray generator, stressing that improper procedures could result in damage to the x-ray tube, which is relatively expensive and not an easy item to install.

Explain that the tube must be warmed up slowly at the beginning of the working day otherwise the radiation output will fluctuate and life of the tube may be materially shortened.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Setup x-ray generator	Place generator as if to make exposure. 1. Rotate kv and ma controls to the minimum settings (Manufacturers recommendations).

B. Preset controls	2. Set line voltage control to the proper value 220v or 110 v.
C. Connect cables	1. Connect tube head to control panel. 2. Connect to power line. 3. <u>Caution:</u> Always connect ground lead to proper ground.
D. Turn on power switch	1. Check indicator lights to insure that generator is energized (Lights should be on).
E. Set timer	2. Check kv and ma readings for minimum values (Check manufacturers machine rating) Place timer on maximum value (Check range of generator)
F. Turn on high voltage	1. Press the kv button to energize the high voltage. 2. <u>Caution:</u> Generator is now producing dangerous radiation. Do not stand or walk in front of tube head. Increase kv slowly to one-half of the maximum rated value. Increase ma to one-half the rated maximum value.
G. Increase kilovoltage	1. To warmup generator wait one minute after making initial adjustment. 2. Increase voltage 10 kv every minute until maximum value is obtained. 3. <u>Caution</u>: X-ray generators which have been stored for long periods of time should be "<u>seasoned</u>" according to manufacturers recommendations. To season, warm up slower and longer.
H. Increase milliamperage	
I. Increase kv by steps	4. The warmup is performed slowly to prevent tube damage and to give constant radiation output rather than a fluctuating output. 5. Examine sample tubes and explain and discuss parts that are easily damaged.

III. APPLICATION (practice by learner under close supervision)

A. Supervise the students in performing the demonstrated x-ray tube set up and preheat procedure.

B. Have all students discuss and explain why the warmup procedure is essential.

C. Suggest that points of caution be repeated by all to impress the seriousness of the subject.

IV. TEST (performance of skill to acceptable standards)

NOTE: Demonstration

A. Have each student set up the x-ray generator from the beginning. Test for use of proper safety precautions and proper sequence of operations.

B. Rotate the assignment of warming up the x-ray generator each day.

C. Post the warmup sequence on the lid of the x-ray control console.

V SUMMARY

A. The x-ray tube is the most expensive and one of the most fragile parts of an x-ray generator.

B. Tubes cannot be replaced quickly and efficiently in the field.

C. An x-ray generator's behavior can vary between individual tubes.

D. A properly timed warmup period is essential.

E. Heat dissipation from x-ray tubes is a major problem on field units.

The Next Lesson is: Auxiliary Equipment for Handling X-ray Generators

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 4
Time 1 hour

SUBJECT: Auxiliary Equipment for Handling X-ray Generators

AIM (or purpose): To acquaint students with the various devices employed to position and transport x-ray equipment

TEACHING AIDS: Photos of x-ray equipment and auxiliary handling equipment

REFERENCES: Manufacturers literature
Industrial X-ray Handbook, Allan Lytel, 1962, Howard W. Sams Co. Inc., Indianapolis, Indiana

---

I. PREPARATION (of the learner)

Develop student interest by relating the fact that when a commercial photographer shoots certain pictures he is required to use necessary or auxiliary equipment to make an effective shot.

The job of a radiographer would be most difficult, in fact, almost impossible, if he were required to use an x-ray generator without the benefit of supporting equipment. Various types of handling devices have been devised to lighten the physical labor of radiography and to increase the production rate of routine jobs. Several of the more common devices will be discussed in this lesson. For example, the matter of moving an x-ray generator through a long section of welded pipe or the positioning of an x-ray tube for overhead exposures.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Tube stands for portable tank units	1. Display photographs of the several types of tube stands or display the actual equipment. 2. Explain and discuss the limits and uses of tube stands.

	3. Display photos of portable cranes and mechanical positioners used with tube-tank units. Discuss importance of these aids and give examples.
B. Positioners for fixed installations	1. Display photos of overhead rails and boom cranes used to position x-ray equipment. Explain their use, giving examples. 2. Show a photo of a production exposure box explaining its importance and purpose. 3. Discuss photos of precision positioning devices used to control beam orientation outlining their use and the assistance they render. 4. Show photos of semi-fixed fork lift and motorized equipment, explaining their advantages.
C. Special purpose devices 1. Pipe line crawlers 2. Vertical tank wall crawlers 3. Pipe girth weld positioners	1. Display photos of these special devices. 2. Explain the operation of these devices. 3. Discuss how the devices are used to speed production or to accomplish difficult jobs.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have all students outline the procedures for:

A. Positioning a portable x-ray machine to make a radiograph of a 6" pipe 10 feet from the ground in a refinery.

B. Setting up the equipment to make a radiograph of a 36" pipe line girth seam using both internal and external techniques.

C. Making an exposure of a section of a large oil storage tank if the weld is vertical and 15 feet from the ground.

D. Radiographing a rudder tab in place on the airplane.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Oral Quiz

A. How can the expense of fabricating auxiliary equipment be justified?

B. If the radiographer were given a long production run of small parts to be inspected, what type of set up would probably be most economical?

C. What is the advantage of a pipeline crawler over external exposure devices?

V. SUMMARY

A. Tube stands and jigs are available from x-ray equipment manufacturers.

B. Special types of auxiliary equipment such as "crawlers" have been patented and are used extensively in pipeline construction.

C. Vertical wall crawlers and centering devices are used on tanks and pressure vessels.

The Next Lesson is: The X-ray Generator

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 5
Time 2 hours

SUBJECT: The X-ray Generator

AIM (or purpose): To emphasize the need for exercising the proper care in the use and handling of x-ray generators

TEACHING AIDS: A defective or damaged x-ray tube

REFERENCES: Nondestructive Testing Handbook, Volume I, Section 14, 1963, Society for Nondestructive Testing, Evanston, Illinois

I. PREPARATION (of the learner)

A. Introduce the subject and invite consideration of the matters to be discussed on the basis that the information is both essential and quite interesting.

B. To insure satisfactory performance of x-ray generators, it is necessary to have knowledge of the many factors which can cause a malfunction. Following certain basic and accepted procedures in the care and maintenance of the equipment will insure the radiographer that the x-ray will perform satisfactorily. X-ray generators that remain in a fixed position or location usually require less care and maintenance than the portable field units and frequently have a longer duty cycle in warmer climates because the units can be kept cool by controlling tube head temperature with circulating air, oil or water and by controlling exposure room temperature.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. X-ray tube ratings	1. Explain the meaning of kvp, ma, kvp-ma product, and duty cycle ratings.

  a. Kvp refers to kilovolt potential of an x-ray generator
  b. Ma refers to its milliamperage range
  c. X-ray exposure time is the product of kvp and ma
  d. Duty cycle ratings refer to length of time an x-ray generator can be used without overheating and the length of time it must remain off before being used again. This, of course, varies with the heat-dissipating features of the generator.
2. Explain the function of the thermal cut-off switch and how the thermal cut-off temperature effects the duty cycle.
  a. The thermal cut-off switch shuts off power to the tube head when the temperature in the head reaches a predetermined limit.
  b. Power remains off until tube head temperature returns to normal, but will not automatically turn itself on as this could create a safety hazard.
3. Explain the relation of the thermal control parameters to tube life and how overheating the tube head can shorten tube life.

B. Expected tube life
  1. Design life
  2. Guaranteed life

1. Inform the students that x-ray tubes are expected to produce several thousand hours of satisfactory service if properly handled.
2. Explain the inability of the suppliers to determine abuse and how this determines the guaranteed life.

C. Causes of failure

Explain, discuss and illustrate as necessary.

1. Mechanical failures caused by mechanical shock.
2. Ring fracture of glass caused by

	internal stress due to poor annealing of glass.
	3. Puncturing of glass caused by faulty mounting and/or bubbles in glass.
	4. Filament burn-out due to excessive heating in which case filament evaporates and burns out. Excessive filament voltage can be caused by defective connections.
	5. Inverse filament burn out caused by backfiring in tubes fed with alternating current because of over-loaded focal spot.
	6. Melted focal spot caused by load, exceeding instantaneous ratings, the effect of poor control being exercised by the user. It can also be caused by timer failure in the ma circuit.
	7. Melted anode caused by exceeding heat-storage capacity.
	8. Gassy tube, the result of tube over-load or a poorly gassed tube.
D. Aids to longer tube life 1. Preheating 2. Careful handling	1. Explain why x-ray tubes should be preheated before applying high voltage. 2. Outline the procedure for storage, transportation, and handling of x-ray tubes to minimize shock.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have individual students define:
  1. KVP
  2. KVP - MA product
  3. Duty cycle
  4. Thermal cut-off temperature

B. Suggest that students outline the various reasons for x-ray failures.

C. Have other students explain to the class the methods normally used to avoid or delay tube failure.

D. Invite all students to discuss the procedures for preheating an x-ray tube before using it for an exposure, being sure to always give the reasons why.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What are three possible consequences of thermal overloading of an x-ray tube?

B. How do x-ray tubes become gassy in service?

C. Why should an x-ray tube be preheated before applying high kv?

D. What is the proper method of preheating an x-ray tube?

E. What is meant by a thermal cutoff temperature?

F. What are the consequences of adjusting the cutoff temperature to gain a higher duty cycle than designed?

G. Approximately how long should a well-cared-for x-ray tube perform satisfactorily?

V. SUMMARY

A. X-ray tube ratings include maximum milliamperage and kilovoltage settings that may be controlled by automatic overload switches.

B. Thermal overload diaphragms and switches are also used.

C. Tube life usually depends upon the manner in which it was used and not upon the total time of use.

D. Careful preheating of the x-ray tube, observance of the suggested duty cycle and careful handling of the unit to prevent shock will prolong the life of the tube and other parts of the equipment.

The Next Lesson is: Measuring X-ray Tube Heel Effects

EXPERIMENT SHEET
Measuring X-ray Tube Heel Effect

Unit	16
Lesson	6
Time	3 hours

SUBJECT:

Measuring the variation in x-ray tube intensity due to the Heel Effect

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

The beam characteristics of x-ray tubes depend partially upon the angle of inclination of the target with respect to the axis of the cathode. The beam intensity diminishes toward the anode side of the tube and increases toward the cathode side. Knowledge of the characteristics of the machine can be used to advantage as well as prevent the production of inadequate film information.

MATERIALS AND EQUIPMENT:

X-ray generator and exposure facilities
Film cassettes and film
Densitometer
Characteristic curves of the film
Dark room facilities including all materials, lead numbers, etc.

PROCEDURE:

A. Single load two 14" x 17" film cassettes with film which displays a near linear response to exposure from a density of 1.0 to 3.5. (Kodak M or Ansco B)

B. Setup x-ray machine for an exposure.

C. Place the two film cassettes tightly end to end to form a plane 14" x 34".

D. Position the tube head over the film with the focal point exactly 26 3/4" from the film.

E. Using a tube port pointer, align the focal spot directly over the abutting edges of the two film at the center of their 14" edges.

F. Mark the film with suitable identification in order to be able to identify film position with the respective ends of the tube head.

G. Using approximately 150 kv, expose the film for a density of 3.0 (If exposure factors are not known, make several trial exposures on small pieces of film in 5 x 7 cassettes before performing steps 3 through 6).

H. Develop both film simultaneously at 68°F for 5 minutes. Fix and dry.

I. With a crayon or pencil, draw a line 1/4" offset from the center line of the film. Draw the line the full length of the 17" dimension.

J. Commencing at the edge which was directly under the tube port, determine the density every 1/2" until the opposite side has been reached.

K. Prepare a table of distance in degrees for recording the density values.

L. Label the center as "zero" degrees with negative distance toward the anode side and positive distance toward the cathode. (Each 1/2" equal one degree).

M. Opposite the distance on the chart, place the value determined by densitometry.

N. Using the characteristic curves, determine the log of relative exposure for each value of density.

O. Using the log of relative exposure of the center point, divide each of the other values by this value and express as a percentage.

P. Enter this percentage value on the chart opposite the proper distance.

Q. Prepare a plot of emission angle vs. intensity using percentage values from the chart. (See Nondestructive Testing Handbook, pgs. 14/30.) Enter a value for every four degrees.

CONCLUSIONS:

A. For near uniform exposure results, the object should not be more than ____________ inches in diameter if this film-focal distance is employed.

B. For near uniform exposure, the ratio of diameter to focal distance should be ___________ for this machine.

C. The heel effect be used to advantage when __________ __________ distance must be kept to a minimum.

D. If density readings are made across the film plane, changes in density are also noted. The source of this difference is _________________.

E. The density decreases for all angles above the center line of the focal spots is explained by the _________ __________ law.

F. The ____________ electrode of the tube is nearest to the electrical connection.

The Next Lesson is: Design Characteristics of Gamma Cameras.

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 7
Time 1.5 hours

SUBJECT: Design Characteristics of Gamma Cameras

AIM (or purpose): To illustrate and stress the various design features of gamma ray exposure devices

TEACHING AIDS: All available gamma camera equipment
Dummy source pigtail

REFERENCES: Nondestructive Testing Handbook, Volume I, Section 26, 1963, Society for Nondestructive Testing, Evanston, Illinois
Title 10, Federal Register, Part 34, Licenses for Radiography and Radiation Safety Requirements for Radiographic Operations
Information Sheets #42 and #43

I. PREPARATION (of the learner)

Write aim of lesson on chalkboard, introducing the topic and explaining that all gamma ray exposure devices are essentially of the same basic design; however, each manufacturer has incorporated individual features which differentiate his equipment from that of his competitors. The individual features of the different cameras may result in increased safety, reduced weight, or ease of operations; or they may act to produce the opposite results and for this reason the radiographer should be familiar with the essential design features of available gamma exposure equipment.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Shielding materials	1. Define shielding equivalent.
1. Lead	2. Draw a chalkboard sketch of density vs. HVL (Half value layers) and indicate points for the various shielding materials.
2. Tungsten	
3. Depleted uranium	3. Distribute information sheets #42, and #43.

	4. Illustrate by chalkboard sketch of a camera cross section showing the use of various construction materials.
B. Locking devices 1. Separate containers 2. Locking plugs 3. Pinned shutters 4. Pigtail locks	1. Display available equipment with different locking devices. 2. List and explain other types of locks by use of chalkboard sketches. 3. Display source pigtail and explain how locking mechanisms are designed to prevent removal during cable disconnects.
C. Radiation leakage 1. At camera surface 2. At surface of an outer container	1. Read the applicable section of AEC Title 10, Part 34 concerning limits of radiation levels for exposure defices. 2. Explain the technique used by manufacturers of enclosing the shield in a larger container to meet the requirements of the regulations.
D. Extension and control cables	1. Display webbed metal and plastic source extension tubes. 2. Illustrate by demonstration the ease of damage to some types of tubes. 3. List and explain the intended purpose of odometers and safety lights: a. Safety lights, red and green, indicate whether source is outside or inside the body of the exposure device. b. Odometers indicate distance source capsule has moved away from the stored position inside the body of the exposure device. 4. Explain the dangers of complete reliance on these safety devices. 5. Outline the maintenance procedures for cranks and cables.

	a. Prevent kinking of cables and housing b. Periodically check cable odometer zero setting c. Remove cable from housing and clean both d. Try to prevent stepping on cable housing.
E. Safety procedures	Remind students that the AEC requires the use of an operating survey meter to determine position or location of source capsule. There are no alternatives to this requirement.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Use the following procedures to create discussion of the topic:

A. Have each student detail and construct a chalkboard sketch of the type of materials he would use and the safety features he would employ in the construction of an "ideal" camera. Have students justify each item as it is developed.

B. Invite other students to constructively criticize the construction designs and demonstrate how they would improve them.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. List the common shielding materials in the increasing order of their shielding ability per unit mass.

B. What is the prime disadvantage of reliance on devices which are designed to indicate the location of the source in remote handling equipment?

C. What is the best device for determining if the source is extended or shielded?

D. Describe the procedure for maintaining remote controlled devices. What is the most important item to consider in the inspection?

E. What are the possible consequences of worn locking devices on detachable control cable exposure units?

Check and discuss

V. SUMMARY

A. Exposure device shielding materials are usually lead, tungsten, or depleted uranium. Depleted uranium is the most efficient but is expensive.

B. All exposure devices have locking mechanisms. This is an AEC requirement.

C. All exposure device designs must be approved by the AEC. This is to assure that devices do not create a radiation hazard.

D. Webbed metal flexible tubes, plastic hoses and aluminum tubes are used to contain the drive cable and source capsule while exposures are being made. These can all be damaged easily thus creating a radiation hazard.

E. Safety lights, flags, arrows, and odometers are helpful safety tools but are not foolproof. A properly operating survey meter must be used whenever the source is moved from its locked storage position.

The Next Lesson is: Gamma Ray Exposure Devices

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 8
Time 2 hours

SUBJECT: Gamma Ray Exposure Devices

AIM (or purpose): To further the understanding of the various types of gamma ray exposure devices available to the radiographer

TEACHING AIDS: Photographs of various devices
All available gamma ray exposure equipment

REFERENCES: Manufacturers literature
Industrial X-ray Handbook, Allan Lytel, 1962, Howard W. Sams Co. Inc., Indianapolis, Indiana
Information Sheets #42 and #43

I. PREPARATION (of the learner)

Write aim of lesson on chalkboard and develop student interest by pointing out that certain design features have been adopted to better suit the gamma ray exposure device to a specific job. A particular type of device may be many times more efficient in the performance of a unique or specific task. The radiographer should be aware of the advantages and disadvantages, the limitations and attributes of each type of device. There is no universally best type exposure device. Knowledge of the types that are available can be a valuable asset to the radiographer when selecting a particular type equipment for a specific type of job.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Remote controlled portable units 1. Crank extension 2. Crank shutter 3. Pneumatic 4. Snorkels	1. Issue information sheets #42, and #43 and display available types of gamma ray equipment. 2. Demonstrate the operation of the equipment.

	3. Explain the principles of operations and construction using the chalkboard: a. A source capsule attached to a cable and cranked in and out of the storage capsule b. A shutter that is remotely opened and shut in a crank shutter-type of device c. A source capsule that is moved through a flexible tube pneumatically d. A source that is raised and lowered inside an aluminum tube with a nylon string is the snorkel type 4. Display photos of other types of devices. 5. Outline the scope of operations performed with these devices on chalkboard. 6. Indicate the maximum activity of the materials which are generally loaded into these devices i.e., 30 to 100 curies of iridium 192.
B. Fixed and semi-portable units 1. Lab units 2. Wheeled mountings	1. Display photos of large fixed installations and semi-portable wheel mounted units. 2. Explain the method of manipulating the source and the safety devices of large fixed exposure devices. 3. Outline the scope of operations performed with these devices and how they are used for radiographing thick, dense materials, usually with cobalt 60 which requires heavier shielding than iridium 192.
C. Hand cameras 1. Hinged shutter 2. Rotating shutter	1. Display available hand cameras. 2. Show photos of other hand camera units. 3. Outline the scope of operations with these devices and how they

are used mostly for panoramic shots and pipeline radiography.

4. Indicate the activity of the materials generally loaded into these devices i.e., about 30 curies of iridium 192.

D. Personnel exposure from portable exposure devices

1. Describe the radiation conditions which exist when a source is extended from a remote control camera pointing out that there is little or no shielding surrounding the capsule while exposure is being made.
2. Describe the radiation conditions that exist while using a hand camera and that a large percentage of the source capsule is shielded while the exposure is being made.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Display available devices and illustration of devices and invite students to ask questions.

B. Ask for descriptions of the various types of portable remote control equipment that is available.

C. Suggest that students outline the scope of work performed with these devices.

D. Have them describe the construction and uses for various hand cameras.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the probable maximum amount of cobalt 60 which can be safely loaded and handled in remote controlled portable exposure devices?

B. What is the maximum amount of iridium 192 generally supplied in remote controlled portable devices?

C. Describe an exposure condition where a hand camera would be of more value than a portable remote extension unit.

D. Why is a portable remote extension unit best suited for work on construction sites?

E. Compare the radiation hazards of hand cameras and remote controlled extension units if both contained the same source.

V. SUMMARY

A. Remote controlled portable exposure devices can increase production because the relatively heavy body of the exposure device does not have to be repositioned with each exposure.

B. Remote controlled devices usually require more surveillance during exposures because of the large radiation field they create.

C. Fixed and semi-portable units usually use cobalt 60 as the source of radiation. Cobalt 60 requires much more shielding than does iridium 192.

D. Hand exposure devices are popular in shop work where space is at a premium and where workers are operating in the area will not be endangered. Hand exposure devices are also used extensively in pipeline construction due to their portability.

The Next Lesson is: Preparation of a Remote Controlled Gamma Ray Camera for an Exposure

INSTRUCTOR S LESSON PLAN
Manipulative Skills

Unit 16
Lesson 9
Time 4 hours

JOB (or operation): Preparation of a Remote Controlled Gamma Ray Camera for an Exposure

AIM (or purpose): To develop skill in the setup and assembly of the components of a gamma ray exposure device

TOOLS AND EQUIPMENT: Remote controlled gamma ray exposure device
Gamma radiation survey meter

TEACHING AID Exposure facility or restricted area

REFERENCES: Manufacturers instruction manuals

I. PREPARATION (of the learner)

A. Write aim of lesson on chalkboard - explain the importance of developing skill in the set up and assembly of the components of a gamma ray exposure device.

B. Explain that the proper procedures and safety precautions are essential in the assembly of an exposure device when preparing for radiographic operations. Improper procedures may result in the detachment of the source from the cable and cause serious exposure to the radiographer. Care must also be exercised to avoid damage to cables and extension tubes which can result in the improper lodging of the source in the extended position.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Demonstrate 1. Placement of camera	1. Select an area free from obstructions and entanglements for the placement of the camera. 2. Place camera on a solid level surface.
2. Extend control cables	1. Extend cables with the crank away from the anticipated area of exposure. 2. Extend cables without kinks or loops
3. Energize survey meter	1. Turn on survey meter, wait for warm-up and zero meter. 2. Keep survey meter in clear view throughout the remainder of the operations.
4. Connect control cables to camera (Some cameras may have permanently attached cables)	1. Extend extension cable from sheath approximately six inches. 2. Caution: Do not drop or lay extended cable in the dirt. 3. Remove cover from source pig-tail port. 4. Connect cable to pig-tail. 5. Caution: Check to insure that the connection is properly made and free acting. 6. Bring cable sheath forward by cranking extension handle. 7. Connect sheath to camera.
5. Connect extension tube to camera	1. Select only the amount of tube length required to perform the job. 2. Firmly attach tube to camera (Tubes may have snap, quick twist, or screw-type connectors). 3. Attach end cap, source switch, or collimator to free end of tube.

	4. Extend tube to object to be radiographed. 5. Remove all kinds and loops from the tube using tape to support it if necessary.
6. Unlock the camera	1. Retract the source as far as possible by reverse cranking on the handle. 2. <u>Caution:</u> Do not force crank. Use only enough pressure to insure source is in the fully retracted position. 3. Place key in lock and unlock the source.
7. Extension and retraction of the source	1. Turn crank to extend until source is firmly against the end of the tube. 2. Make desired exposure. 3. Turn crank to retract source until source is firmly against stop in the camera. 4. Observe the survey meter to insure source is in the safe position. Approach camera with caution using survey meter to insure source in actually in the safe position.

III. APPLICATION (practice by learner under close supervision)

A. Divide the class into two groups and have one group instruct the other in the proper techniques while the second group performs the instructed operations.

B. Reverse the groups and repeat.

C. Supervise the students very closely to insure development of sound practices and safety procedures.

D. Stress very strongly the proper and constant use of the survey meter.

E. Invite questions and promote sound discussion whenever possible.

IV. TEST (performance of skill to acceptable standards)

Test each student determining that he can perform the proper technique of camera setup for gamma radiography. Have him state his intended actions before performing the next step. The student should explain the reasons for each of his actions as he progresses.

V. SUMMARY

A. No exposure is to be made without having a properly operating survey meter at the job site.

B. Survey meter must always be used for each individual exposure to make certain that the radioactive source is in a safe or controlled position.

C. Planning each exposure set-up beforehand will save a lot of steps and a lot of unnecessary lifting.

D. Personnel monitoring equipment and radiation warning signs must be used at all times while making exposures or handling radioactive materials and equipment.

The Next Lesson is: Radiography with Unattached Gamma Ray Sources

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 10
Time 1.5 hours

SUBJECT: Radiography with Unattached Gamma Ray Sources

AIM (or purpose): To develop a working knowledge of the techniques for handling gamma source capsules

TEACHING AIDS: Magnetic source handlers, radioactive capsule and shield

MATERIALS: Paper cups
Tape

REFERENCES: Information Sheet #44

I. PREPARATION (of the learner)

A. Develop student interest by discussing the fact that the Atomic Energy Commission allows the use of a maximum of 1 curie of cobalt 60 and 3 curies of iridium 192 without an exposure device providing that a 1" x 1" metal tag is permanently attached to the capsule with stainless steel wire. The tag is colored magenta and yellow, has the standard radiation warning sign on one side and contains the following notice on the opposite side: "Warning - radioactive material - do not handle - if found notify civil authorities".

B. The use of these sources is becoming obsolete in radiography particularily with the advent of the crankout type exposure devices. Many incidents have occurred in the past when these type of sources were left unattended in shop and field operations. A well trained radiographer should be familiar with all types of operations involving radioactive material and especially the safety precautions related thereto.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The unattached gamma ray source	1. Briefly outline this practice referring to Information Sheet #44: a. A paper cup is taped to an object and the specimen to be radiographed is placed a pre-determined distance from cup. b. Source storage shield is unlocked and capsule is removed and placed in paper cup with a magnetic source-handling rod about eight feet long. c. Source is replaced in storage shield and shield locked after exposure has been made. 2. Tag attached by a length of wire to the capsule is usually kept hanging outside the storage shield to facilitate handling of capsule with magnetic handler. If necessary, a nylon cord attached to the tag can be attached to a pole to remove the capsule.
B. Handling precautions	1. Exposure to radiation by the radiographer can be calculated before the actual exposure is made. 2. Care must be taken to prevent damage to the source capsule as this could create a serious contamination problem. Explain at length. 3. Source storage shield cavity and plug have offsets in their diameters to prevent radiation from passing between cavity and plug. (Illustrate this on chalkboard) 4. A bright colored tag attached to capsule is an aid in locating a lost capsule.

5. Remember, if you can read the printing on the tag then you are probably too close to the capsule.

C. Advantages and disadvantages

1. An unattached source can be used to advantage when working in a relatively inaccessible area such as between two rows of boiler tubes.
2. This type source creates a hazard if dropped from a structure or into a stream where it would be difficult to retrieve.
3. Source of this type also creates an environmental hazard in the possibility of overexposure.
4. These sources usually represent a considerable saving in that costly exposure devices are not required and the storage shields used with unattached sources are relatively inexpensive.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Ask students to cite situations where free sources could be used to advantage giving a full and thorough explanation of each condition.

B. Have students explain the approved methods for handling free sources.

C. Suggest that students:
   1. Outline the safety hazards associated with handling free sources.
   2. State the advantage of using free sources.
   3. Discuss the disadvantages of using free sources.

D. Simulate using a free source and have each student perform the operation. Discuss their techniques and make corrections if necessary inviting all questions as they arise.

IV. TEST (final check on students' comprehension of material presented)
NOTE: Written Test

A. List three advantages of radiography with free sources.

B. Give three disadvantages.

C. What is the chief cause of the decline in the use of free sources?

Check and discuss.

V. SUMMARY

A. Gamma ray sources used without an exposure device have had a long history of incidents involving overexposures to radiographers and workers near the area of operations.

B. This practice originally started with the use of radium as an industrial inspection tool. Regulations were non-existant during that time.

C. All safety precautions must be rigidly adhered to for this type of operation as well as for the more conventional methods.

D. With the advent of crankout and pneumatic type exposure devices, there is little justification for the use of the subject method.

The Next Lesson is: Changing Sources

INSTRUCTOR S LESSON PLAN
Manipulative Skills

Unit 16
Lesson II
Time 2 hours

JOB(or operation): Changing Sources

AIM (or purpose): To develop skill in the exchange of a depleted source with a new high activity unit

TOOLS AND EQUIPMENT: Remote control gamma ray exposure device
Source changer for the exposure device
Gamma radiation survey meter

TEACHING AIDS Exposure facility or restricted area

REFERENCES: Manufacturers instruction manuals
Information Sheet #45

I. PREPARATION (of the learner)

When a source's activity has decayed to an unsatisfactory level, it is replaced in the camera by a more active source. This is done by returning the equipment to the supplier or by its exchange as performed by the radiographer New sources are shipped in containers called source changers Changing of sources is a simple operation if properly performed; however, a series of accidents have resulted from inexperience or negligence in source changing. The radiographer must master the techniques to avoid these accidents and this lesson is calculated to help the individual to attain this desired skill.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Placement of camera and source changer	1. Demonstrate by selecting an area free from obstructions and entanglements for placement of equipment.

	2. Place camera and source changer on a firm level surface.
B. Energize survey meter	1. Turn on survey meter, wait for warm-up, and zero meter. 2. Note: The changing of sources is best accomplished by two people and the use of two meters is recommended. 3. Each man should keep a meter in clear view throughout the operation.
C. Set up camera	1. Follow standard procedures for connecting the cables. 2. Use one length of tube (Special tubes may be supplied with the changer) to connect camera to source changer. 3. Connect tube to empty cell of changer. 4. Check cables and tubes for freedom from kinks, loops, or tension.
D. Disconnect old source	1. Issue Information Sheet #45 and extend old source into empty cell of changer. 2. Place survey meter in view throughout the disconnect operation. 3. Disconnect source from cable very carefully. 4. Danger: Source changers generally do not have locking devices to hold the source while disconnecting. Exercise extreme care not to pull source from the shielded position while making connections. 5. Remove the extension tube and lock old source in place.
E. Connect new source	1. Connect the tube to the cell containing the new source. 2. Place survey meter in view throughout the connect operation.

3. Using the same caution as before, connect the new source to the cable.
4. Retract the source into the camera.
5. Lock the camera.
6 Survey the camera to insure the source is in the safe position.
7. Disassemble the camera and return it to storage.
8. Prepare source changer for storage or shipment.

III. APPLICATION (practice by learner under close supervision)

A. Have each student perform the instructed operations under the close supervision of the instructor

B. Offer corrective suggestions, invite questions and repeat until all have performed the operation satisfactorily.

IV. TEST (performance of skill to acceptable standards)

A. Divide the students into groups of two. Each group must display the proper technique of camera setup, positioning of the source changer, and use of safety procedures while performing a change of sources. Have the students state their intended actions before performing the next step of their operations. Have students explain the reasons for their action.

B. Discuss and evaluate performance as tests progress.

V. SUMMARY

A. Same safety precautions necessary for source changing as when making an exposure.

B. Operation should not be performed by only one person as a second person is necessary to act as a monitor.

C. Source changers generally are not a safety locking device that can be used while sources are being exchanged.

D. Source changing operation should always be performed by using a written step procedure for each operation so that the proper sequence will be maintained.

The Next Lesson is: Focal Spot Size

EXPERIMENT SHEET
Focal Spot Size

Unit 16
Lesson 12
Time 4 hours

SUBJECT: Determining the Focal Spot Size of an X-ray Generator

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

The size of the focal spot of an x-ray generator or the size of an isotope source has a great influence on the quality of the radiographs produced by the equipment. Occasionally the internal components of a tube will shift or become damaged altering the focal size and resulting in poor radiographic quality. Isotope sources are occasionally shipped in the wrong size for the job or specification intended The radiographer should be able to determine when any of these unusual conditions exist.

MATERIALS AND EQUIPMENT:

X-ray generator or gamma source and exposure facilities
Film cassettes and film
Sheet of lead, 8" x 10" by .005" thick
Sheet of plywood 8" x 10" with 1" diam. hold in center
Dark room facilities
Hand drill and 1/64" drill bit
1-6 ft. measuring tape with 1/32" graduations
1-rule with millimeter scale

PROCEDURE.

A. Single load 5" x 7" film cassette with selected film and lead screens.

B. Set up x-ray generator or gamma source for exposure.

C. Set the film-focal distance at 24".

D. Drill a 1/64" hole through the lead sheet at exactly the center.

E. Place the lead sheet on a sheet of plywood or similiar materials in which a hole about an inch in diameter has been cut Position the pin hole in the lead sheet in the center of the large hole.

F. Position the board and lead sheet directly under the source of radiation exactly half way between the film and the source. (approximately 12" distance from source)

G. Expose the film to a density between 1 and 1.5.

H. Develop the film at 68°F for 5 minutes. Fix and dry

I. Measure the image of the focal spot which appears on the developed film

J. Add 1/32" to the dimensions obtained by measurement.

CONCLUSIONS:

A. The focal spot size of this machine is ________________.

B. The value of twice the pin hole size is added to the dimensions of the focal spot because of the __________ ____________ distance.

C. The value obtained from measurement ____________ (does/does not) compare favorably with the manufacturers data.

NOTE TO INSTRUCTOR

If this experiment is performed with gamma rays, have one student process the radiographic film and continue with the same experiment using an x-ray generator

The Next Lesson: Visit to a Pipeline or Process Construction Job

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 16
Lesson 13
Time 6 hours
(1 day)

SUBJECT: Visit to a Pipeline or Process Construction Job

AIM (or purpose): To permit the student to observe the construction and inspection of pipe, and to experience the hazards and rigors of pipe construction

MATERIALS: Film badges
Dosimeters
Safety glasses
Hard hats

I. PREPARATION (of the learner)

A. Before leaving for the field trip,the student should be instructed as to the reasons for the trip, its objectives, and the need for carefully observing the following operations:

1. The hazards of the construction, particularly the overhead handling of pipe, overhead welding, movement of heavy equipment, and the work at elevated positions
2. The welding of pipe in all positions.
3. The care (or mishandling) of welding electrodes
4. The types of welding equipment employed
5. Methods of pipe alignment
6. Preheating and stress relieving practices
7. Weld bead preparation and cleaning practices
8. The types of inspections employed after completion of welding

B. Issue safety instructions to be followed while at the job site, particularly caution against watching the welders at work. Issue safety glasses, hard hats, and any other items that will be needed. Remind all students to behave as guests of the company and remain in the group under the guidance of the supervisor.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
Observations in the visited facility	Be sure that students are made aware that a test will be given on what was observed.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

After returning from the trip, ask the students to discuss:

A. Their opinion of pipe construction work

B. The possible source of defects in welded pipe

C. The method of handling welding electrodes and how this can affect the weld quality

D. How the pipe ends were aligned and how this could affect the x-ray film image

E. How the weld cleaning practices affect quality and possible improved methods of weld cleaning

F. The methods used for inspection

G. The special handling tools used by the inspectors

IV. TEST (final check on students' comprehension of material presented)

A. Instruct each student to prepare a detailed written report on the observations made during the plant tour. Suggest that he cover in detail all observations that will in any way affect the radiographers function either in the field of manufacture, fabrication, inspection, handling or testing.

B. Have them list any suggestions they may have for future field trips and how these trips may be made more fruitful or benificial to them.

C. Check each report and discuss the results with the group.

The Next Lesson is: Film Manufacturing Process

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 1
Time 1 hour

SUBJECT: Film Manufacturing Process

AIM (or purpose): To emphasize the methods and controls used in the making of radiographic film

TEACHING AIDS: Film: The Inside Story, 32 mins., 16 mm, sound,
Eastman Kodak Company, Rochester, N.Y.
Film projector and screen

I. PREPARATION (of the learner)

A. Introduce the film giving its name, length and type. Ask the students to carefully observe the following:
   1. The layers of different materials which comprise the structure of radiographic film
   2. The functions of each layer of the radiographic film
   3. The chemicals used to produce a sensitized emulsion
   4. The care used to insure uniformity of the finished product
   5. The care used in handling of radiographic film.
   6. The fact that most x-ray film consists of seven layers of materials

B. Advise the students that a test will be given after the film is shown and suggest that it be closely observed with this in mind.

II. PRESENTATION (of the learner)

Instructional Topics	Things to Remember to Do or Say
A. The Inside Story	Show the film.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Review the film emphasizing these points in the discussion:
   1. The structural make up of radiographic film
      a. The film base
      b. The emulsion
      c. The surface gelation layer

EXPERIMENT SHEET
Exposure Changes for Changing Density

Unit 12
Lesson 8
Time 3 hours

SUBJECT:

Changing the density of radiographs from one value to a second desired value

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

The exposure charts for x-ray radiography are constructed for a fixed density. It is often necessary to change the density of a radiograph to comply with specifications, increase contrast, or to improve the readability of the film. The radiographer should be able to adjust the density of the film by adjustment of the exposure time given by the exposure chart.

MATERIALS AND EQUIPMENT:

X-ray generator and exposure facilities
Film cassettes and Kodak AA film
Sample part for inspection
Densitometer
Characteristic curves for type AA film
Darkroom facilities including equipment, materials, lead numbers, etc.
Logarithm tables

PROCEDURE:

A. Single load film cassettes with type AA film.

B. Set up the x-ray generator for an exposure of the sample part using the exposure chart constructed in a previous experiment.

C. Place a film directly under the focal spot of the machine and center the sample part on the film. Mark the film for identification.

D Make an exposure in accordance with the exposure chart.

119

2. The treatment of silver nitrate and potassium bromide to produce the sensitive silver bromide crystals
3. The extreme care exercised in making of film to insure freedom from defects in the finished product
4. The quality control checks used to insure uniformity of the finished product

B. In addition to reviewing the actual film content, some reference can be made regarding the need for continued careful handling of the product after it is received for use by the radiographer and the need for his being aware of expiration dates and film storage conditions.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the purpose of the plastic layer between the two emulsion layers of radiographic film?

B. What is the composition of the gelation layer in radiographic film?

C. What part does the emulsion perform in the exposure of a radiographic film?

D. Why is the radiographic film subjected to the various inspection by the manufacturer during the manufacture of the film?

E. What would be the consequences to the radiographic operator if the film did not react uniformly on exposure?

V. SUMMARY

A. Parts of this instructional movie were made under simulated conditions because the film cannot be exposed to white light.

B. It is possible for the resultant film speed to vary slightly from one batch of raw material used in the manufacture of the film to another.

C. When opening a new box of film, cut off a strip of the top or bottom sheet, or both, and develop without exposing it to check for film fog.

D. Always observe the manufacturing date on the box before accepting film.

The Next Lesson is: Characteristics of Radiographic Film

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 2
Time 2 hours

SUBJECT: Characteristics of Radiographic Film

AIM (or purpose): To develop background information regarding the properties of industrial film and how these properties affect radiographic quality

TEACHING AIDS: Samples of coarse and fine grain film
Identical radiographs using different films

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N.Y.
Kodak Photographic Films and Plates for Scientific and Technical Use, Publication P-9, Eastman Kodak Co., Rochester, N.Y. (1960)
Characteristic curves of various films - Eastman Kodak Co

I. PREPARATION (of the learner)

A. State the subject and relate its aim or purpose outlining briefly why film characteristics are so vitally important to the radiographer.

B. Explain that the lesson will prove to be an interesting and informative one, imparting some fundamental and basic information that will be of considerable help to all.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The characteristic curve	1. Refer to curves shown in text. 2. Explain by chalkboard sketches: a. The method of constructing a characteristic curve b. The coordinates of the curve c. The relationship between density and exposure

	3. Outline the differences in characteristic curves of different film, i.e., the differences in chemistry and processing. 4. Display typical characteristic curves.
B. Granularity	1. Define granularity on chalkboard as minute silver particles having a tendency to group together in relatively large masses. This is referred to as clumping. Coarse grain film exhibit this graininess more than fine grain film. The x-ray image is composed of countless minute silver grains. 2. Explain: a. The relationship of granularity to film speed b. The effect of increased radiation energy on graininess c. The granularity from fluorescent screens d. The relationship of development time to graininess 3. Compare a fine grain film with a coarse grain film on chalkboard.
C. Resolving power	1. Define and explain resolving power. 2. Explain the dependence of resolving power on the character of the emulsion.
D. Turbidity	1. Explain film turbidity and its relation to exposure. 2. Define as muddled or stirred up.
E. Inherent film contrast	1. Differentiate between inherent film contrast and subject contrast. 2. Film contrast is: a. The range of inherent grain sizes b. Its relation to density 3. Subject contrast is the ratio of radiation intensities passing through two selected portions of a specimen.

	4. Show the method of determining the contrast exaggeration from the slope of the characteristic curve.
F. Sharpness (Acutance)	1. Define film sharpness as detail of image not blurred. Refer to Figure 20, Page 27 Eastman Textbook. 2. Explain: a. The dependence of sharpness on the emulsion b. Why weak developer reduces sharpness 3. Explain why sharpness is more important than resolving power in radiography. 4. Sharpness also depends upon intimate film and screen contact.
G. Factors affecting sensitivity	Have students turn to Page 48, Eastman Textbook and explain the factors listed in Table VI.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have all students:

A. Explain the construction of a characteristic curve,

B. Point out the information which can be derived from the curve. Have the student concentrate on speed and density gradient.

C. Explain film contrast and how to determine the density range which produces the maximum contrast.

D. Define granularity and how it is produced. Explain the techniques for minimizing "graininess".

E. Give a definition of sharpness.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. From the characteristic curves which have been discussed, determine the film with the maximum speed. (Curves are in textbook)

B. Above what approximate value of density will contrast exaggeration occur in Kodak AA film?

C. What range of density will give the best contrast using Kodak M film with lead screens?

D. What is graininess? What factors can be controlled to minimize graininess?

E. Define image sharpness. How does the character of the emulsion effect sharpness?

F. Have students work a problem involving the use of logarithm tables in figuring a change in film exposure time for a particular film by increasing the required relative density from 1.5 to 2.0.

Check and discuss.

V. SUMMARY

A. The characteristic curve is most important in selecting film to be used for any particular assignment.

B. Film grain size increases with film speed. Relatively small grain size is desirable.

C. Film resolving power depends upon the character of the film emulsion.

D. Film contrast is inherent. Subject contrast depends upon the shape or thickness variation of the specimen and on its density variation.

E. Spent developer causes a reduction in image sharpness.

F. When using intensifying screens, good contact with film is necessary for maximum sharpness.

The Next Lesson is: Radiographic Screens

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 3
Time 2 hours

SUBJECT: Radiographic Screens

AIM (or purpose): To define the purpose, and mechanisms of intensification and the advantages and disadvantages of radiographic intensification screens

TEACHING AIDS: Lead and fluorescent screens

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y.
Information Sheet #46

I. PREPARATION (of the learner)

A. After introducing the subject, make the following statement to create interest and discussion: The use of lead screens with radiographic film will decrease the required exposure time and reduce the adverse effects of scattered radiation on the film and lead screens can also improve image quality. Calcium tungstate screens reduce exposure time and the amount of the x-ray radiation beam absorbed by the film is less than 1% of the total. This means that more than 99% of the available energy is performing no useful purpose. Therefore, any means of increasing the amount of energy utilized for creating the image will increase the efficiency of the operation. Radiographic screens are used for this purpose.

B. Explain that it is not expected that these statements will either be understood or accepted as such but are being made to demonstrate the depth and scope of this particular lesson and what exactly is being proposed for coverage.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The purpose of screens 1. Intensification 2. Reduction of scattering 3. Preferential intensification	1. Outline on the chalkboard the possible reductions in exposure time which result from the use of lead or fluorescent screens. 2. Explain the reduction in scattering when lead screens are employed and the problems of scattering when fluorescent screens are used. Lead screens filter out or absorb soft primary radiation and secondary scattered radiation while fluorescent screens cause film blurring and fogging, particularily if intimate contact is not made and maintained with the film. 3. Define on chalkboard the conditions which may result in longer exposure times when lead screens are used. 4. Explain the preferential intensification of lead to the primary beam and filtering of scattered radiation.
B. Mechanisms of intensification	1. Issue Information Sheet #46 and explain the action of lead screens in producing electron emission and secondary radiation pointing out that a lead screens' reaction to radiation is in the form of electron emission while secondary radiation is absorbed by the lead. 2. Explain the light emission of fluorescent screens in that certain chemicals fluoresse and as they absorb x-rays or gamma rays they immediately emit light. The light intensity depending upon radiation intensity.
C. Disadvantages of screens 1. Film contact 2. False indications	1. Explain the effects of non-uniform contact between film and screens resulting in blurring and fogging.

3. Static electricity marks
4. Afterglow
5. Graininess
6. Cleanliness requirements

2. Show how to determine if screens contact is uniform. Tape cassette tightly but do not damage film.
3. Explain how false indications are generated by scratches on the screens. See illustration page 24, figure 19, Eastman Textbook.
4. Discuss the generation of static electricity and the marks it produces. Static marks are star shaped and usually occur in dry climates when cassette is thrown on work bench and if operator is wearing rubber soled shoes.
5. Outline the effect of afterglow from fluorescent screens. Afterglow in fluorescent screens blurs film.
6. Explain why fluorescent screens cause graininess and why graininess from fluorescent screens is independent of film grain size.
7. Demonstrate the necessity of keeping screens free from dirt, lint, and trash. (images of dirt will appear on radiograph and will tend to scratch the film. It will also contaminate developing chemicals.)

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have students:

A. Explain the effects of using lead screens on the speed of exposure when employing 160 kv or more.

B. Explain the effects of lead screens on the definition of the radiograph.

C. List and explain the undesirable effects of intensifying screen usage.

D. Explain the phenomenon which results in intensification when using lead screens.

E. Explain why lead screens are not used at lower kv settings.

F. Explain why calcium tungstate screens are not used with gamma rays.

G. Place a calcium tungstate screen near a source of gamma radiation and have students observe the greenish glow emitted by the screen. Darken the room before exposing the screen. Observe all required safety precautions when conducting this demonstration. Ask students to explain the demonstration.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What happens when radiation passes through a thin sheet of lead placed in contact with a film in its exposure holder?

B. What is the most objectionable characteristic of fluorescent screen intensification?

C. What is afterglow and why is it objectionable?

D. Scratches, dirt, and lint between the film and the screen cause undesirable effects. Elaborate.

E. What is the effect of poor film to screen contact? How can the degree of contact be determined?

Check and discuss.

V. SUMMARY

A. Lead intensifying screens are usually used at radiation intensities above 125 kv.

B. Calcium tungstate screens are for x-ray use only.

C. Lead screens speed exposure time by electron emission.

The Next Lesson is: Loading of Film Cassettes

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 17
Lesson 4
Time 1 hour

JOB (or operation): Loading of Film Cassettes

AIM (or purpose): To assist the student in the development of skills and the proper techniques of handling film, screens and cassettes

MATERIALS: Film
Trichloroethylene
Cheese cloth
Very fine steel wool

TEACHING AIDS: Film cassettes
Intensifying screens

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N. Y.

I. PREPARATION (of the learner)

Write aim of lesson on chalkboard and stress the need for this effort in that proper handling, loading, and care of film cassettes and screens is essential to production of high quality radiographic film. Use of proper handling procedures and high quality work are characteristics of competent radiographers and an individual will prosper and succeed in direct proportion to how well he can perform the total task. Making a first class exposure is not enough if the film is damaged or destroyed through improper handling.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Demonstrate in lighted room preparation of loading area	1. Clean work bench space of all objects in the area particularily where film is to be loaded

	2. Wipe top of work bench with damp cloth to remove all dirt and lint.
	3. Dry bench top with dry cloth
	4. Rub top of bench with palm of hand to insure freedom from grit and dirt.
B. Collect materials	1. Select cassettes, screens, and film to be used in loading.
	2. Place each component in convenient position for assembly.
	3. Stand film box upright against backboard behind work area.
C. Examine cassettes and screens	1. Open cassettes and inspect for lint or dirt. If necessary clean them with a damp cloth and dry thoroughly.
	2. Examine screens for lint, dirt, excessive oxidation, scratches, or creases.
	3. If necessary clean oxide from lead screens with cloth wetted in trichloroethylene. Dry thoroughly. Heavy concentrations of dirt and oxidation may be removed by light rubbing with very fine steel wool.
	4. Caution: Use only recommended solvents and never use an abrasive on fluorescent screens.
	5. Discard screens with creases.
	6. Examine screens to insure that intimate contact can be made over the full surface.
D. Assemble components	1. Place screens in cassettes with cassettes flat and open on the bench.
	2. If a thicker screen is to be used on one side, be sure that the screen is on the back side of the cassettes.

E. Load film

1. Remove film from the box one at a time.
2. Remove interleave from film.
3. Hold film by the edge and lay on screen opposite the flap of the cassettes.
4. Caution: Avoid crimping, sliding, fingerprinting or scratching the film.
5. Lay other screen on film without sliding.
6. Close cover, tape or lock.

III. APPLICATION (practice by learner under close supervision)

A. Have all students practice film loading while room is lighted, using old developed film.

B. Have all students practice film loading in dark room with only safe light illumination still using old developed film.

C. Give close supervision throughout, inviting all questions and repeating any procedure that is the least doubtful.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

A. Collect cassettes, screens and undeveloped film on the work bench. Have each student load one cassette in total darkness from the disassembled layout.

B. Check results and discuss repeating operation where unsatisfactory results were obtained.

V. SUMMARY

A. Good Housekeeping in film loading room is absolutely necessary to prevent film artifacts.

B. Preliminary steps can be taken before white lights are extinguished.

C. Cassettes should be marked top and bottom so that proper thickness screen is on the proper side.

D. Screens are sometimes used on one side only.

The Next Lesson is: The Photographic Process

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 5
Time 1.5 hours

SUBJECT: The Photographic Process

AIM (or purpose): To acquaint the students with the chemical reactions which occur in the process of producing a radiograph

REFERENCES: College Chemistry, Sinko and Plain, 1966, McGraw-Hill Book Co., New York, N. Y.
Negative Making - with Kodak, Blank and White Sheet Films, Kodak Publication No. F-5-1962, Eastman Kodak Co., Rochester, N. Y.

I. PREPARATION (of the learner)

A. Develop student interest in the proposed subject by pointing out that the sole purpose of the lesson is to assist the radiographer in doing quality work.

B. While a knowledge of the chemical processes of film exposure and development is not absolutely essential to the production of darkened film, this knowledge is essential if the radiographer desires to maintain the highest possible level of quality workmanship.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. The emulsion 1. Gelatin 2. Chemical composition 3. Sensitive collodial suspension 4. Grain size	1. Explain the purpose of the gelatin: a. Acts as a vehicle which silver bromide crystals are distributed b. Crystal distribution must be uniform for dependable radiographs c. It has properties which increase silver bromide ($AgBr$) sensitivity to radiant energy

2. Outline on the chalkboard the process of mixing chemicals to form the sensitive collodial suspension:
   a. Start with a flexible cellulose derivitive base coated with an adhesive sub-coat which binds emulsion firmly to base
   b. Film coated on both sides to increase speed
   c. Film consists of seven layers; cellulose base, adhesive on both sides, emulsion on both sides, protective coating on both sides
3. Write the chemical equation for the reaction on the chalkboard, i.e.,
   $AgNo_3 + KBr = AgBr + KNO_3$
4. Explain the light-sensitive characteristics of silver bromide.
5. Explain the relationship between grain size and holding time of the suspension.

B. Exposure and the latent image

1. Explain the tendency of AgBr to decompose to free metallic silver when exposed to radiation.
2. Relate the amount of decomposition to the amount of exposure.
3. Ask questions.

C. Developing

1. Explain the reduction of AgBr by the developer to form black metallic silver.
2. Relate the film density to the extent of decomposition on exposure and the amount of AgBr converted on developing.
3. Define the time dependence of the developing process.

	4. Caution against over development and the reduction of all silver to the metallic form.
D. Fixing	1. Explain the presence of unaffected AgBr left in the film after developing and its sensitivity to radiation and light. 2. Outline the reaction between the fixer (sodium thiosulfate) and the unexposed AgBr to form water soluble silver thiosulfate ions. 3. Explain and discuss the time dependence of the fixing reaction. 4. Define the action of hardeners.
E. Washing and drying	1. Explain the necessity of washing to remove the soluble silver ions from the film. 2. Stipulate the time and temperature requirements of washing for adequate removal of the silver ions. 3. Explain and discuss the drying process necessary to put the film in condition for handling and storage: a. Remove excess moisture from film b. Vent drying cabinet c. Do not overheat film d. Clean, warm, dry air necessary

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have individual students explain and illustrate when possible:
   1. The composition of the emulsion
   2. The exposure process and the chemical reactions that occur
   3. The chemical process of development
   4. The chemical process of fixation

B. Question to promote discussion:
   1. What is the result of prolonged over-development?
   2. What happens to the unaffected silver bromide crystals if film is exposed to light before fixation?
   3. How are solvable ions removed from film? Why?
   4. Why is film washed before drying?
   5. What effect does humidity have on film drying? How can it be reduced?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Define the sensitive chemical compound in film emulsions.
B. What occurs when radiation strikes the emulsion?
C. Describe what takes place in the developing of film.
D. What happens to the film if it is left in the developer for an amount of time longer than necessary to develop the latent image?
E. Define the element that forms the black image on the film?
F. What occurs when the film is fixed?
G. Why is it necessary to wash the film after fixing?
   Check and discuss.

V. SUMMARY

A. Radiographic film normally consists of seven layers of materials; three layers on each side of the base material.

B. Silver bromide crystals are light sensitive and are sensitive to radiation.

C. The latent image of a specimen is formed by the decomposition of silver bromide to free metallic silver.

D. Fixation and hardening are necessary for the removal of undeveloped silver salts and the hardening of the gelatin so it will withstand drying with warm air.

E. Washing diffuses and washes off the fixer.

The Next Lesson is: Film Artifacts

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 6
Time 2 hours

SUBJECT: Film Artifacts

AIM (or purpose): To develop an understanding of the various unsatisfactory conditions which occur in radiography, the causes of these conditions, and how they are eliminated

TEACHING AIDS: An assortment of damaged film

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Company, Rochester, N. Y

I. PREPARATION (of the learner)

A. After introducing the subject of the lesson, point out that nothing reflects more on the abilities of a radiographer than the production of poor quality film, even though the poor quality may be the result of a variety of causes and many circumstances other than poor workmanship. Conditions quite often arise which change the quality level of the film and the radiographer must learn to recognize these conditions in order to be able to correct the cause and bring the level of quality back to normal.

B. This lesson will deal with the abnormal qualities that can affect the quality of film adversely and its importance is relatively self evident.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Incorrect density 1. Over or under-exposure 2. Over or under-development 3. Depleted developer	1. Explain the conditions which can result from incorrect exposure. 2. Describe the latitude in density which can result from developing procedures. Explain how changes

	in development can be beneficial as well as harmful. 3. Display sample film.
B. Incorrect contrast 1. Radiation quality 2. Over or under-development	1. Outline the effects of improper penetration characteristics on film contrast. 2. Describe the effects of development procedures on contrast. 3. Display sample film.
C. Poor sensitivity 1. Geometric factors 2. Film factors	1. Outline the methods of adjusting exposure dimensions to improve definition. 2. Review the effects of a large focal spot on film sensitivity. 3. Review the problems in the use of radiographic screens 4. Examine the choice of film for the job being performed. 5. Display sample film.
D. Fog 1. Light leaks 2. Radiation leaks 3. Improper safe lights 4. Heat, humidity, and vapors 5. Improper darkroom procedures	1. Describe the effect on film when exposed to light or radiation leaks. 2. State the desired characteristics of a safe light and detail the consequences of improper handling of film under safe light condition. 3. Explain the effects of atmospheric conditions on film fogging. 4. Describe the dark room procedures which result in fogging. 5. Display sample film.
E. Streaks and stains 1. Film hangers 2. Poor chemical agitation 3. Elimination of stop bath 4. Elimination of wetting agents 5. Spent chemicals	1. Explain why dirty film hangers cause streaks. 2. Describe the effects of improper agitation of developer, stop bath, and fixer on stains and streaking. 3. Explain why the elimination of stop bath and wetting agents cause streaking. 4. Describe the staining of film from the use of depleted chemicals.

	5. Display sample film.
F. Mechanical film defects 1. Damage to emulsion a. Loosening b. Scratching 2. Crimp marks 3. Static marks 4. Air bells 5. Dirt in cassettes	1. Describe the conditions which cause each of the listed defects. 2. Explain how these conditions are eliminated. 3. Display sample film.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Have all students separate the sample film into groups representing:
   1. Improper techniques
   2. Improper darkroom practices
   3. Mechanical handling defects

B. Suggest that they identify the source of the defects in each category.

C. Have them explain how each defect can be eliminated.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the cause of light and dark streaks on film which has been developed using hangers?

B. What causes streaks at the top corners of film which has been processed while suspended on film hangers?

C. How can a radiographer determine if a crimp mark was made before or after exposure?

D. How is a static mark identified? Eliminated?

E. What happens to film that is washed for prolonged periods in warm water? Why?

F. Describe the effect of fogging on sensitivity? Why?

G. How can a radiographer determine when the darkroom chemicals need replenishing or replacing?

H. What causes air bells? How can they be eliminated?

Check and discuss.

V. SUMMARY

A. Correct optimum film density is seldom achieved.

B. Film contrast can be improved with correct developing procedures.

C. Good film sensitivity depends upon proper geometry of exposure set-up, proper film screens and the proper film.

D. Film fog is caused by age of film, heat, light leak, over-developing, improper safe lights, humidity, vapors, etc.

E. Other film or artifacts are streaks, stains.

F. Mechanical defects include damaged emulsion, static marks, dirt in cassettes, etc.

The Next Lesson is: Care and Handling of Radiographic Film

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 17
Lesson 7
Time 1.5 hours

SUBJECT: Care and Handling of Radiographic Film

AIM (or purpose): To teach the correct techniques for care and handling of radiographic film

TEACHING AIDS: Film boxes
Film with interleaves
Film storage envelope

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Co., Rochester, N.Y.

I. PREPARATION (of the learner)

Since radiographic film is highly sensitive and easily damaged. It is necessary to consider the subject of care and handling film. Radiographic film is sensitive to light, heat, moisture, some gases, radiation and physical strain. The best radiographic techniques can be rendered worthless if the film is damaged before, during, or after processing. To avoid this waste in time, energy, and money, a knowledge of film handling practices is most essential and in some instances mandatory.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Opening of film boxes	1. Demonstrate the operation. 2. Explain the function of the inner pack or seal (keeps out moisture) 3. Caution against rapid withdrawal of film from the box and explain static marks. 4. Recommend removal of the film in the interleave to avoid scratching.
B. Loading and handling cassettes	1. Recommend the loading of film in the interleave when screens are not employed.

2. Explain why the film cannot be loaded in the interleave when using screens; Interleaf image appears on radiograph.
3. Caution against abrasion of film in loading
4. Describe the strain damage to film caused by excessive bending or pressure on the cassette or exposure holder.

C. Storage of film

1. Explain the ideal storage facility, such as the film storage cabinet in the darkroom.
2. Explain the desire for:
   a. Controlled temperature and humidity
   b. Controlled environment
   c. Light tightness
   d. Radiation shielding to prevent fogging
3. Recommend a film supply equal only to requirements.
4. Explain the desirability of maintaining a stock rotation plan.

D. Dark room handling

1. Use oldest film first.
2. Explain and display film damage from:
   a. Improper attachment of film to hangers
   b. Overloading tanks
3. Explain why the temperature of the drying process must be controlled.
4. Excessive humidity and heat affects film quality and film drying time.
5. Explain the necessity of corner removal on processed film, because it removes corner clip holes and sharp edges that scratch other film.
6. Recommend the utilization of interleaving for storage of processed film as it prevents film abrasion.
7. Display the recommended edge seal envelope for processed film storage.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have all students:

A. Explain the procedures, precautions and whys for opening and handling of boxed film.

B. Outline the techniques for loading film cassettes, employing paper interleaving, and the avoidance of strain damage.

C. Describe the ideal film storage area and explain the reasoning behind the design.

D. List three operations in the darkroom where film may be damaged.

E. Describe the procedure for the storage of exposed film.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the purpose of the paper interleave found in new film packages? How can it be used to advantage after the box is opened for use?

B. What type of film defect can result from very rapid withdrawal of film from the package?

C. List four operations of film handling where emulsion strain is likely to occur.

D. Why is it best to keep only a limited amount of film in storage?

E. What is the purpose of corner cutting after the drying of film?

Check and discuss.

V. SUMMARY

A. Care must be taken when removing unexposed film from container to prevent static marks on film and to keep sharp corners of film from damaging other film.

B. Interleaving paper prevents abrasion and can be left on film if screens are not being used in cassettes.

C. Film storage includes proper inventory to prevent ageing of film; protection from x-ray and gamma radiation and protection from excessive heat.

D. Interleaves should be used in storing processed film.

The Next Lesson is: Multiple Film Exposure

EXPERIMENT SHEET
Multiple Film Exposure

Unit 17
Lesson 8
Time 4 hours

SUBJECT:

The radiographic inspection of parts or materials with high subject contrast due to shape of the part

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

When a part must be inspected which has two or more areas of varying thickness, selection of the proper film involves a critical analysis to determine the density at the thickest and thinnest areas of the part. If the density of the film in these areas cannot be maintained within the limits desired for a single film, multiple exposures are required to achieve the desired results. To avoid the time consumption of multiple exposure, techniques may be used to achieve the desired results in a single exposure. Developing skill in the use of these techniques is the purpose of this experiment.

MATERIALS AND EQUIPMENT:

Gamma ray or x-ray source and exposure facilities
Film cassettes and film
Survey meter
Densitometer
Penetrameters, lead numbers, and shims
Characteristic curves of film
Sample parts
Darkroom facilities

PROCEDURE:

A. Measure the thickness of the part at the maximum and minimum areas. Determine the ratio of the thicknesses.

B. Examine film types to determine if a suitable film is available for a single film inspection.

C. Use characteristic curves to determine the difference in the relative exposure to maintain the density limits between 1.5 and 3.0.

D. If a single sheet film cannot be used, select a slow speed film for the thin section of the part. The film should be selected to be given an exposure for a density of 2.0.

E. Examine the characteristics of other film to determine which possesses a speed, at a density of 2.0, relative to the first equivalent to the ratio of the thicknesses from the maximum and minimum areas.

F. Load suitable film cassettes with one film of each type and appropriate screens. Use only two screens placing one screen on each side of the film sandwich.

G. Transport the equipment to the exposure site.

H. Select desired exposure conditions and erect equipment.

I. Setup film for exposure using 2-2T penetrameters for each thickness to be examined. Place penetrameters on shims of equal thickness if placement cannot be made directly on the part.

J. Mark the film with appropriate numbers for identification.

K. Calculate the exposure time to produce a density of 2.0 on the slower film and the thinnest section. Check the density which will result from exposure of the faster film in the thicker section. The density should be between 1 5 and 3.3.

L. Energize the survey meter, wait for warmup, and zero meter.

M. Perform exposure, survey equipment, and secure in safety condition.

N. Develop film for 5 minutes at 68°F., fix, wash and dry.

O. View each film individually in the areas of the part where the density and sensitivity meet the required limits.

P. Measure the density of each film in the areas of interest.

CONCLUSIONS:

A. The maximum thickness ratio which could be tolerated under these limitations if Kodak AA and M film were used is __________.

B. This technique _________, ___________, or ___________. be used with only one type film even though the density could not be maintained within limits on a single sheet of film. Explain.

C. The density of each film_________ or ______the value expected from the exposure calculations.

The Next Lesson is: Darkrooms

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 18
Lesson 1
Time 2 hours

SUBJECT: Darkrooms

AIM (or purpose): To acquaint the student with construction features of portable and stationary darkrooms

REFERENCES: Nondestructive Testing Handbook, Volume I, 1963, Society for Nondestructive Testing, Evanston, Illinois
Information Sheet #47 and #48

I. PREPARATION (of the learner)

A. Explain that it is sometimes necessary to improvise a temporary field darkroom, and a knowledge of the basic requirement of such a facility would be most helpful. It would be beneficial to know what problems occur when operating from portable darkrooms that generally do not occur in stationary facilities.

B. This lesson will also provide a thorough study and consideration of all construction features whether they are used in portable or fixed installations.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Stationary darkrooms 1. Layout	1. Issue information sheets #47 and 48. 2. Describe the area requirements by the planned volume of work to be performed. 3. Explain the desirability of separate loading and processing rooms for large work loads. 4. Discuss and explain the necessity for keeping the wet functions separate from the dry as it prevents damaging of the film.

2. Construction	1. Explain the desirability of using chemical resistant paints on smooth finished walls since photographic chemicals attack ordinary house paint. 2. Elaborate on the necessity for tile, stainless steel or plastic coverings around the processing tank area -- to combat corrosive chemicals. 3. Describe suitable floor coverings again stressing chemical resistant materials. 4. Draw chalkboard sketches of maze type entrance and light lock. 5. Explain the necessity for stainless steel or plastic plumbing-to combat corrosive effect caused by chemicals. Give examples. 6. Explain the function of water line check valves which are installed in automatic cooling lines preventing reverse flow contamination.
3. Processing tanks	1. List the desirable tank construction materials--some types of stainless steel, plastics, hard rubber or fiberglass. 2. Define the ideal water temperature control system. Controls at 68° - 72°. 3. Outline the desirable capacity ratio for developer, stop bath, fixer, and wash tanks. No less than 5 gallons each and 10 gallon for wash.
4. Dryers	1. Explain the necessity for adequate capacity so film won't touch and stick. 2. Describe the desirable features; i.e., timer, heat and fan controls, drip pans, etc.

5. Illumination

1. Outline the requirements for illumination.
2. List the restrictions on brightness:
   a. Filtered light fixtures positioned so film will be handled at least 4' away
   b. 15 watt bulbs and Wratten filters except for extremely light sensitive film use 7 1/2 watts
3. Describe the method of checking to determine if the room is over-illuminated:
   a. Cut piece of film in two
   b. Develop one piece
   c. Check density
   d. Place other piece on table top for an hour
   e. Develop second film
   f. Check density
   g. Compare the two films

B. Portable Darkrooms

1. Describe a typical portable darkroom in terms of size and method of construction, see information sheet #46 (both sides).
2. Explain the necessity for additional care when working in the restricted space of a portable darkroom:
   a. Danger of damaging developed, unexposed film
   b. Film must be protected if gamma exposure device is stored in darkroom
3. Discuss and explain the problems of entrances, cleanliness, sealing of tanks, maintenance of chemical temperature, drying of film, tank capacity, environmental temperature control, water supply, power supply, etc.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Have students:

A. Describe the layout and facilities for the processing of several hundred hangers of film per day.

B. Outline the requirements and restrictions of darkroom illumination.

C. Discuss the available construction materials for processing tanks.

D. Describe the materials for protection of floors and walls of darkrooms.

E. Compare portable field darkrooms with stationary installations and discuss the additional problems of working from portable darkrooms.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Draw sketches of two types of entrance ways for stationary darkrooms.

B. Why are processing tanks usually made from stainless steel?

C. Why are check valves on processing tanks and water lines desirable and required by many city regulations?

D. List three problems of field darkroom construction which are not found in stationary facilities. Explain how these are overcome in field installations.

E. What is the safe distance from exposed film for a 15 watt bulb when used in an acceptable safelight holder with a filter?

Check and discuss.

V. SUMMARY

A. Portable field darkrooms are usually not as desirable as fixed installation. This is due mainly to an inadequate wash water supply and the problem of maintaining temperature control of the chemicals.

B. Darkrooms should be planned to provide a "dry" side for film loading and unloading and a "wet" side for film processing.

C. Film processing chemicals are corrosive and precautions must be taken to counteract this problem when designing darkroom facilities.

D. Portable facilities have much greater inherent problems in combating the effects of corrosion by film-developing chemicals.

The Next Lesson is: Darkroom Housekeeping

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 18
Lesson 2
Time 1.5 hours

SUBJECT: Darkroom Housekeeping

AIM (or purpose): To develop an appreciation for maintaining clean safe facilities and the care of clothing and skin

TEACHING AIDS: Plastic gloves and apron
Film hangers which have been cleaned and some which require cleaning

MATERIALS: Commercial process tank cleaners

REFERENCES: Radiography in Modern Industy, 1958, Eastman Kodak Company, Rochester, N. Y.

I. PREPARATION (of the learner)

A. Explain that most radiographer beginners subject their work uniforms to chemical stains unknowingly because their vision is obscured while processing films in the darkroom.

B. Outline further that it is possible to remove chemical stains from clothing and that this will be covered in the lesson, as well as the removal of chemical stains from the hands.

C. Stress the need for maintaining clean and safe facilities in which to work as these are the marks of true professionalism.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Processing tanks	1. List the sources of contamination: a. Chemical stain and gelatin b. Fungus and algae c. Precipitation from chemicals 2. Explain the necessity for cleanliness and sterility because of fungus growth

that can occur in chemical tanks.

3. Describe and display commercial cleaners for the removal of contamination.
4. List the chemical formulas on the chalkboard for use in removal of various contaminating agents.
5. Outline precautions to be employed in handling chemicals:
   a. Do not let chemicals remain in contact with the skin.
   b Avoid splashing liquid or chemicals in the eyes.

B. Processing hangers

1. Describe and explain the similarity of hanger contamination to tank contamination since hangers come in contact with tank walls and with chemicals in the tanks.
2. List chemical formulas of solutions for removal of contamination on the chalkboard.
3. Detail the use of nitric acid solutions for very difficult clip stains explaining the process of soaking hanger clips in nitric acid water solution a few minutes. Then rinse with tap water. NOTE: Always add acid to water (water in the tank first)
4. Display dirty and properly cleaned hangers.

C. Stains on clothing

1. Explain that the best method of control of clothing stains is the careful handling of materials to avoid spillage.
2. Display rubber or plastic apron used to keep chemicals from clothing. Demonstrate use.
3. Describe the chemicals and methods used to remove stains from clothing. Moisten with spot remover and rinse with water. Chemical spot and stain removers all supplied by film manufacturers.
4. List the chemical formulas for stain removers on the chalkboard.
5. Caution against the use of solutions on colored fabrics and synthetic fibers since some spot removers will bleach

out color of garment.

D. Care of hands

1. Caution against over exposure of hands to processing chemicals because they can cause skin discoloration and rash.
2. Recommend the use of gloves and disposable towels.
3. List on the chalkboard the formula for potassium permanganate solutions used to remove skin stains.
4. Describe the method of skin stain removal.
5. Demonstrate the preferred method.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Explain the necessity for periodic cleaning of processing tanks and promote discussion.

B. Explain the consequences of dirty hanger clips and how to remove contamination asking questions as explanation progresses.

C. Describe the method of removing stains from hands and clothing demonstrate and have students participate in the examples used.

IV. TEST (final check on students' comprehension of materials presented)

NOTE: Written Test

A. What is the source of contamination found in chemical processing tanks?

B. What effect does contamination have on film processing quality? Describe.

C. How can stains be removed from clothing? Give examples.

D. What measures can be employed to prevent skin irritation from chemicals?

Check and discuss.

V. SUMMARY

A. Dirty film hangers are a major cause of film artifacts.

B. Quality work cannot be maintained without a constant program of darkroom housekeeping.

C. Fresh chemicals offer no advantage if chemical tanks are not kept clean.

D. Stains on worker's hands and clothing reflect poorly on the ability of the worker.

The Next Lesson is: Insertion of Film on Processing Hangers

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 18
Lesson 3
Time 1.5 hours

JOB (or operation): Insertion of Film on Processing Hangers

AIM (or purpose): To develop skill in the insertion of film into processing hangers

TOOLS AND EQUIPMENT: Darkroom facilities

MATERIALS: Clean rags

TEACHING AIDS: Sheets of 14" x 17" film (defective or outdated)
14" x 17" processing hangers
14" x 17" film cassettes or exposure holders
Brush

I. PREPARATION (of the learner)

A. Introduce the subject and elaborate on how the best radiograph can be damaged by improper insertion into processing hangers. Explain that faulty insertion can result in film becoming detached in the chemicals or dryer with subsequent damage to one or more of the other film.

B. Outline that processing camera cut film sheets is very similar to processing x-ray film and if anyone has such experience it will stand him in good stead when studying the material about to be presented.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Assemble equipment	1. Gather hangers to be loaded. 2. Collect exposure holders or cassettes containing exposed film. (Use outdated or damaged film.)

B. Inspect hangers	1. Examine hangers for contamination. 2. Inspect clips for bits of film left from previous processing. 3. Clean hangers if necessary before proceeding using brushes, solvents and rags.
C. Position equipment	1. Turn hangers upside down and lean them against back board of work bench. 2. Clear area to stack hangers after loading them (hang from hanger storage racks if convenient). 3. Stack cassettes near the hangers allowing room for opening and stacking of unloaded cassettes.
D. Remove film from cassette (Simulate darkroom procedure while demonstrating in white light)	1. Unlatch exposure holder. 2. Remove film from holder by grasping the upper left hand corner of the 17" length between the thumb and forefinger of the left hand.
E. Pick up processing hanger (hangers are stacked upside down. Directions apply to handling in the position in which they are stacked)	1. Pick up the hanger with the right hand. 2. Grasp the clip in the upper left corner between the thumb and forefinger. 3. Steady the hanger with the other three fingers of the right hand,
F. Clip film to hanger	1. Open clip in the right hand by squeezing. 2. Insert the corner of the film held in the left hand into the clip. 3. <u>Caution</u>: Do not pin it too close to the edge or force it too deeply into clip. The pin should pierce the film about 3/8" from each edge of the film. 4. Reverse hands and pin the other top corner. 5. <u>Caution</u>: Pin both top corners in such manner that the film hangs straight in the hanger. 6. Holding the hanger upside down in the right hand, grasp the bottom left edge of the film by the thumb and forefinger

	of the left hand with the bar of the hanger in the web of the thumb and the back of the hand toward the body.
	7. Turn the hanger over.
	8. Clip the corner held in the left hand.
	9. Grasp the upper right corner with the thumb and forefinger of the right hand.
	10. Clip the corner with the left hand.
	11. Stack or hang the loaded hangers to avoid damage until film is loaded into processing tanks.
G. Repeat steps D, E, and F with white lights extinguished and after adjusting to darkened room	Repeat the procedure outlined above.

III. APPLICATION (practice by learner under close supervision)

A. Have each student simultaneously perform the task of inserting a film into a processing hanger several times under supervision of the teacher. Do this in a lighted room.

B. Inspect work and discuss.

C. Repeat process several times in darkened room under closest possible supervision.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

Have each student insert a film in a hanger in total darkness. Repeat until all students can load film without damage and without the aid of safe lights.

Check and discuss.

V. SUMMARY

A. All preliminary steps must be planned in advance so that student will be oriented as to equipment and material location before room is darkened.

B. Hands must be washed and dried before handling film to prevent artifacts.

C. Hangers must be inspected for cleanliness before lights are extinguished.

D. Film must hang squarely in hanger to prevent bulging and subsequently touching adjoining film while in the chemical processing tanks.

The Next Lesson is: Use of Film Processing Reels

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 18
Lesson 4
Time 1.5 hours

JOB (or operation): Use of Film Processing Reels

AIM (or purpose): To familiarize the student with the correct use of film processing reels

TOOLS AND EQUIPMENT: Dark room facilities
Film cassettes
Reels
Plastic or stainless steel "tee" sticks

MATERIALS: Clean rags
Scrub brush

TEACHING AIDS: 70 mm film (used or outdated)

I. PREPARATION (of the learner)

A. Outline that many radiographic applications require the use of film over 17" long requiring for its processing a different type of film handler. A reel is usually substituted for the hanger in situations of this sort. Show students typical reels. There are several types on the market. Also show the students the "Tee" shaped stainless steel wire through which reels are threaded prior to immersion into chemicals.

B. Explain that the process is quite similar to that used in processing regular 35 mm film and if any of those present have experience in the processing of this size film,this exposure will be most helpful in acquiring the new skills.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Preparation of 70 mm film	Illustrate and explain on the chalkboard that one end of the film should be trimmed with a paper cutter or scissors removing corners. This will facilitate starting the film into the grooved guides of the reels.
B. Inserting film in reel	1. The film is wound into the grooves in the reel or in the space between the wire that the reel is made of. (Show both types) The grooves act as spacers that allow the chemical solution to contact the film between each circumferential warp of the film. 2. Grooves are spaced so that properly inserted film surfaces will not come in contact with each other.
C. Demonstrate using previously developed film, in light	1. Hold the reel in one hand. 2. Place the end of the film in the clip located on the axle of the reel. Some reels have a sharp end of a nail that is forced through the end of the film. 3. Holding the side edges of the film with the other hand, between the thumb and index finger, apply slight, but steady pressure to the film to reduce its width until it is equal to the width between the reel grooves. 4. While maintaining this slight pressure on the film, start rotating the reel with the other hand,thereby feeding the film into the reel grooves. 5. After the film has been placed on the reel check to see if any film surfaces are touching. If they are, unwind the film to the point of film contact and rewind.
D. Placing reels in chemicals	1. String each completed reel of film on a "Tee" stick by threading the stick through the hollow axle of the reel.

	2. To develop film immerse the reels and stick in the chemicals. 3. Remove the film from the reels by grasping the very edge of the film with one hand and reel with the other hand and unwind it.
E. Removing developed film from reel	1. Developed film can be dried by hanging the film on an improvised clothes line made of nylon string and using plastic clothes pins. 2. If the film is dried outdoors avoid strong sunlight and dusty areas. 3. A large percentage of field radiographs are dried in this manner especially on pipeline construction jobs.
F. Reel housekeeping	Reels must be scrubbed the same as film hangers to remove contaminants

---

III. APPLICATION (practice by learner under close supervision)

A. Pass out reels to each student

B. Review film inserting sequence and technique by threading an 18" x 70 mm film on reel.

C. Pass out strips of film to each student.

D Ask them to prepare film for threading as demonstrated in Step II.

E. Have each student thread film on reel.

F. Time this operation.

G. Examine each threaded reel for kinked film and for film surface contact.

H. Practice as many times as necessary.

I. Repeat E above, using exposed, undeveloped film with white lights out in dark room.

J. Process films.

K. Examine and discuss results.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

A. Have students place films in film cassettes in dark room with white lights out.

B. Have students remove films from cassettes and thread film on reels.

C. Turn on lights, examine and discuss results.

D. Turn out white lights and distribute some previously exposed film that has not been developed. (Film should be in cassettes).

E. Have students remove film from cassettes, place on reels and develop.

After film have been processed, inspect each person's film on viewing screen and point out results of improper reel techniques. (Kinks, finger prints, etc.)

Remind students that film artifacts can sometimes be mistaken for specimen defects.

V. SUMMARY

A. Film preparation for aid in inserting film in reel groove.

B. Grooves separate layers of film.

C. Creases and kinks in film will cause film surface contact during processing and show up as artifacts on finished radiograph.

D. Film reels must be kept clean, especially groove surfaces.

The Next Lesson is: Film Processing Chemicals

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 18
Lesson 5
Time 2 hours

SUBJECT: Film Processing Chemicals

AIM (or purpose): To provide knowledge and information regarding the use of various chemicals in the processing of industrial radiographic film

MATERIALS: Bottles and packages of processing chemicals

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Company, Rochester, N. Y.

I. PREPARATION (of the learner)

Much of the students time to date has been devoted to developing a clear understanding of the principles of exposure or the taking of a good radiograph. The care exercised in the exposure must be followed by painstaking perfection in the darkroom if the fundamentals learned to date are to be fully utilized. Everyone produces better work when he understands the reasons for his actions. The principles of chemical processing will be reviewed and expanded in this lesson to help improve the procedures and processes employed in the darkroom.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Developer	1. This subject was discussed previously in the lesson plan entitled "The Photographic Process" and therefore it should be reviewed briefly. 2. Show the types of prepared chemicals available for radiographic use. 3. Explain the mixing of chemicals, especially the precautions that should be taken in mixing dry chemicals. 4 Describe the ideal storage environment for radiographic chemicals:

	a. Dry, cool room. b Chemicals must not be exposed to bright sunshine.
B. Stop bath	1. Define the purpose of the stop bath and explain that it stops the alkaline developing process with an acid neutralizer. 2. Relate the acidity of the stop bath to the alkalinity of the developer. 3. Describe commercial stop baths and the use of acetic acid 4. Caution: Use care in mixing strong acids demonstrating the proper method.
C. Fixer	1. Review the purpose of the fixer outlining that it removes all the undeveloped silver. 2 Explain the use of ammonium or sodium thiosulfate for fixing. 3. Describe the added benefits from use of commercially prepared chemicals containing agents to control the rate of reaction. 4. Outline the purpose of the hardener explaining that it conditions the gelatin so film can withstand drying with warm air.
D. Wetting agents	1. Describe the purpose of wetting agents: a. Wetting agents remove film water marks. b. Accelerates drying time. 2. Explain that household liquid detergents are sometimes used for this purpose.
E. Replenishers	1. Define the purpose of replenishing. 2. Tabulate the results in increased chemical usage from replenishing. 3. Explain the effect of replenishment on fixing and how it reduces fixing time. See Table XIII, P. 75, Eastman Textbook.

F. Supplemental

1. Describe the process of film intensification:
   a. Under developed film can be darkened by immersing it in hardener solution for 5 minutes.
   b Film can be washed for 5 minutes then immersed in an intensifier solution for up to 10 minutes.
2. Caution students on the safe handling of strong chemicals used in these processes.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Suggest that students describe the entire and complete chemical processing of film.

B. Have individual students describe and elaborate on each step in the process.

C. Have students describe the controls employed for the reaction.

D. Ask for a description of the use of chemicals other than prepackaged that can be used in the processing of film.

E. Have one student develop a small radiograph in a set of chemicals previously prepared in jars. Reverse the sequence of the developer and the fixer, inviting a prediction of the results (Film will be clear).

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is the purpose of the stop bath?

B. What type of film artifacts result from elimination of the stop bath or from continued use of weak baths?

C. What happens to the fixer if the stop bath is depleted or is too weak to perform its intended task?

D. What is the purpose of replenishing?

E. What is the purpose of the post-wash wetting agents?

Check and discuss.

V. SUMMARY

A. Developer should be mixed thoroughly, kept in a temperature controlled environment and not exposed to sunlight.

B. The stop bath neutralizes the alkaline action of the developer.

C. The fixer removes all undeveloped silver. Also hardens or conditions gelatin for drying in warm air.

D. Wetting agents remove water marks and accelerate drying time.

The Next Lesson is: Darkroom Film Processing

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 18
Lesson 6
Time 2 hours

JOB (or operation): Darkroom Film Processing

AIM (or purpose): To assist students in acquiring the necessary skill and the proper techniques in darkroom procedure and the chemical processing of film

TOOLS AND EQUIPMENT:
- Film hangers
- Processing tanks
- Development time indicator chart
- Darkroom facility
- Timer
- Thermometer

MATERIALS: Processing chemicals

TEACHING AIDS: Exposed or outdated film

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Company, Rochester, N. Y.
Nondestructive Testing Handbook, Volume I, 1963, Society for Nondestructive Testing, Evanston, Illinois

---

I. PREPARATION (of the learner)

Explain that the exposure of a film is only one part of the process of producing a radiograph. The proper chemical processing of the film is equally as important as the exposure. Processing techniques do not change appreciably once the fundamentals have been mastered and repetition and practice does the rest, until ultimately the procedures become automatic reactions. It is therefore easy to see the importance of establishing good work habits from the beginning.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Prepare processing tanks	1. Have all chemicals and materials ready to use in dark room. Establish proper temperature and prepare to demonstrate. 2. Remove lids from the tanks and store out of way. 3. Energize temperature control device. 4. Use plastic or rubber paddles to stir chemicals. 5. Replenish chemical to proper height in tanks.
B. Load hangers	Since hanger loading is covered by another lesson, review briefly.
C. Set timer	1. Check the temperature of the chemicals. 2. Use a process time indicator or chart to determine the optimum process time. 3. Set timer for the indicated time.
D. Developing	1. Pick up hangers containing film by the cross bar. 2. Caution: If more than one film is handled at a time, separate hangers with fingers. Do not attempt to handle more than three hangers at a time. 3 Lower film into tank slowly, keeping hangers vertical and separated. 4. Energize timer. 5. Agitate each film to remove air bubbles from the surface by raising hanger about 1/2" and tapping sharply on the top of the tank. 6. Agitate each film every 30 seconds by moving from side to side and up and down in tank. Better results can be obtained by lifting film clear of tank and draining from the corner. 7. Remove film from the tank and place in clear water when proper time has been reached.

	8. Accomplish Step 7 quickly as developing reaction is continuing.
E. Stopping development	Immerse film in stop bath for 30 to 60 seconds maintaining good agitation.
F. Fixation	1. Immerse film in fixing solution. 2. Agitate frequently using the same procedure as for development. 3. Allow the film to remain in the solution for twice the length of time required to clear for a pre-established time interval.
G. Washing	1. Remove the film from the fixer solution and place in the wash tank. 2. Preferably place it in the end of the tank nearest the drain. 3. Caution: Entire hanger must be immersed to remove all chemicals from the hanger as well. 4. Continue moving the film toward inlet side as more film is added to the wash tank. 5. Leave the film in the tank the length of time necessary to remove all of the fixer solution.
H. Removing water marks	1. Remove the film from the wash water and immerse it in a wetting agent. 2. Drain all excess water from the film and tap the hanger lightly on the tank to loosen all water under the clips.
I. Drying	1. Energize the film dryer. 2. Place the film in the dryer and allow it to remain until the film is thoroughly dry.

III. APPLICATION (practice by learner under close supervision)

A. Divide the students into groups of two. Have each pair run through the entire procedure using dry tanks (no chemicals).

B. Observe each group and make notations and corrections.

C. Discuss observations, give help as needed.

D. Continue practice. This time follow the same procedure but actually process undeveloped film Give close supervision.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

A. Have each student develop an exposed film under safelight conditions using the procedures outlined in the lesson.

B. Continue testing until all students have developed acceptable film and have demonstrated proper darkroom procedures.

V. SUMMARY

A. Correct film processing technique is as important as correct exposure techniques in obtaining quality radiographs.

B. Shortening of recommended processing times can only result in a reduction of quality in the radiograph.

C. Every film processing step is important if optimum results are to be obtained.

The Next Lesson is: Control of Chemical Processing

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 18
Lesson 7
Time 2 hours

SUBJECT: Control of Chemical Processing

AIM (or purpose): To furnish the student with information on methods of testing and controlling dark room chemical processing

REFERENCES: Radiography in Modern Industry, 1958, Eastman Kodak Company, Rochester, N. Y.

I. PREPARATION (of the learner)

Write aim of lesson on chalkboard and point out that many laboratories employ a system of chemical replacement on a time or film-processed basis regardless of the activity of the chemicals. Other laboratories use chemicals until the quality of the processed film is noticeably affected. Competent radiographers use more economical and scientific approaches to the replacement of chemicals and this lesson will provide the information on how this important procedure is accomplished.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Developer control	1. Explain the desirability of controlling the chemical activity of the developer. 2. Describe the procedure and list the steps on the chalkboard for developer control: a. Exposure of test film b. Preparation of test strip c. Storage of test film d Development of test strip e. Determination of density f. Adjustment of procedure g. Preservation of standard strip

B. Stop bath control	1. Explain the method of control based on the area of film processed, noting that stop bath changes color as it weakens. 2. List on the chalkboard the area of the various types of film which can be processed with one gallon of stop bath.
C. Fixer control	1. Explain the use of emulsion clearing time to control baths which are not replenished explaining that total fixing time should be twice the clearing time. 2. Describe the limitation on replenishment cycles for discarding a fixer bath (Refer to Table XIII,P. 75, Eastman Textbook) 3. List on the chalkboard the areas of various films which can be processed with one gallon of fixer bath. See Table XIII,P. 18,Eastman Textbook.
D. Adequacy of washing	1. Describe commercial hypo test solutions for determining the amount of fixer remaining in the film emulsion after washing. 2. Inform the student of the existence of the American Standard ASA PH4.8 for precision determination of fixer remaining in the emulsion.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Start discussion and have students explain the method of developer control.

B. Have them compare the amount of film processed to useful life of a stop bath.

C. Ask students to describe the methods for determining exhaustion of fixer solutions.

D. Have the group tell why all fixer should be removed from film and how to determine the adequacy of the wash cycle.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. Why is a check system desirable for control of chemical solution activity in film processing?

B. What method is used to correct the activity of a developer if the film test strip has too high a density?

C. What is the common practice used to control fixer activity?

D. What undesirable effects restrict the repeated replenishment of fixer solutions?

Check and discuss.

V. SUMMARY

A. While recommended developing and fixing times vary, they are all based on fresh, full strength chemicals used at or near 68° F.

B. Some developer stop baths indicate a need for replacement by a change in color.

C. Developer is seldom contaminated because it is used first but liquid level must be maintained in addition to replacing spent developer with a replenishing agent.

D. Adequate cycle with a constant replacement of wash water is very desirable.

The Next Lesson is: Preparing for Field Radiography

INSTRUCTOR'S LESSON PLAN

Manipulative Skills

Unit 18
Lesson 8
Time 6 hours

JOB (or operation): Preparing for Field Radiography

AIM (or purpose): To develop skill in the procedures and precautions required to move radiographic equipment and portable darkrooms to a field location

TOOLS AND EQUIPMENT: Portable darkroom
Motor vehicle
Gamma ray camera and controls
Survey meter. Dosimeter charger,
Film badges

MATERIALS: All film and accessories necessary to perform the radiographic functions

REFERENCES: Title 10, Federal Register, Parts 20 and 34, Rules and Regulations, U. S. Atomic Energy Commission, Washington, D. C.
Information Sheet #3

I. PREPARATION (of the learner)

Much of the success achieved in any field operation depends in large measure on careful planning before leaving for the jobsite. A professional radiographer should form the habit of checking all equipment before leaving and be able to select the darkroom location which is most convenient to the work on the site. With practice and study these good work habits can be acquired and retained. Write aim on chalkboard.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Prepare vehicle for travel	1. Place "Caution Radioactive Materials" signs on vehicle carrying the gamma source. 2. Stow all loose materials in the darkroom in the proper bins. 3. Fill water containers with fresh water. 4. Replenish process chemicals as needed. 5. Check expendable supplies and replenish where necessary. 6. Check accessory equipment: a. Film holders b. Lead numbers c. Film hangers d. Tape e. Measuring rules f. Survey meters g. Spare chemicals 7 Fasten all covers and doors securely. 8. Load gamma source and secure in place. 9. Load film. <u>Caution:</u> Store film at greatest distance possible from source.
B. Travel to location	1. Select route with smoothest road surface. 2. Avoid quick stops or weaving in and out of traffic. 3. Do not leave vehicle unlocked if unattended.
C. Place vehicle on location	1. Select a level location for spotting of the portable darkroom. <u>Caution:</u> Do not obstruct normal traffic. 2. Place jacks under vehicle for stability if jacks are available.

D. Preparation of job site	1. Examine the work area for presence of other workmen or for instruments which might be damaged by radiation. For example: Many processing plants use control instruments that respond to a fixed amount of radiation. If another radiation field is created near this instrument, it will start to give false signals that can upset the operation of the processing unit. 2. Erect rope barricades and radiation signs. Note: Do not obstruct normal operations with barricades unless a radiation hazard does actually exist. Do not omit the barricades from areas where radiation hazards exist just because it may hinder other operations. 3. Examine area again for presence of workmen. 4. Unload the equipment to be used.

III. APPLICATION (practice by learner under close supervision)

A. Divide the class into small groups. Have each group prepare the vehicle for movement, move to a job site, and setup for performance. Have the group return the vehicle to the laboratory and place the equipment in its original condition. Supervise the preparation and movements.

B. Repeat the operations having the students tell what they are doing and why they are doing it; correct any faulty concepts or operations.

IV. TEST (performance of skill to acceptable standards

NOTE: Performance Test

A. Grade each student on the preparation of equipment and vehicle, conduct of driving, and selection of location on each trip made with the portable darkroom.

B. After each trip, discuss the conduct of the trip with the students. Indicate areas of needed improvement.

V. SUMMARY

A. It is important to use a check list when preparing for a field assignment.

B. Gamma exposure devices must be locked at all times when not in use and especially when being transported to and from field assignments.

C. Vehicle transporting gamma exposure device must have radiation warning signs prominently displayed.

D. It is desirable to pick the smoothest route to and from field location because:
   - a. Chemicals can spill out of tank
   - b. Survey meters can be damaged
   - c. Exposure device can be damaged

E. Constant surveillance is necessary when using gamma and x-ray equipment outside a controlled area.

The Next Lesson is: Photographic Density

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 19
Lesson 1
Time 2 hours

SUBJECT: Photographic Density

AIM (or purpose): To develop an understanding of the meaning and the mathematical concepts of photographic density

TEACHING AIDS:
Light source (spot film viewer)
Film densitometer
Film density strips
Logarithm tables

REFERENCES: Radiography in Modern Industry, Eastman Kodak Company, 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

The variation in film densities caused by differences in radiation intensity cause a contrast which outlines the image of the part and any possible defects. Film density is a logarithmic function which relates to the radiation absorption characteristics of the specimen. To better understand the character of the defect which alters the radiation intensity and the resultant film image, it is necessary to understand the nature of density variations. This lesson will help one gain a better understanding of these principles.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Photographic density	Write the definition on the chalkboard: "Density is the logarithm of a ratio of the amount of light striking a film compared to the amount which passes through to the other side".
B. The mathematical expression $D = \log \frac{I_o}{I_t}$	1. Write the expression on the chalkboard.

2. Also write the definition of each member of the expression on the chalkboard showing that density equals the log of light incident on the film divided by light intensity transmitted through the film.
3. Use an example to explain the use of the equation.
4. Display film strips to show differences in density. Do this with the use of a spot viewer.

C. Measuring density

1. Display the film densitometer.
2. Outline its function explaining that it measures relative film density.
3. Explain briefly the principle of the instruments operation:
   a. Measures the ratio between the amount of light reaching front side of film compared to amount of light emerging at the back side of film.
   b. That a photo cell is the basis of this method of measurement.
4. Show the instrument in operation using a film strip.
5. Demonstrate how to use the film strip to estimate the density without the necessity of performing an actual measurement:
   a. Hold film strip next to radiograph.
   b. Try to match up radiograph's density with a particular step of the calibrated film strip.
   c. Check results and discuss.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

To promote discussion and provide the basis for questioning, ask the group to answer the following statements giving one or more students an opportunity to handle each topic.

A. Define film density. Explain your definition.

B. How is density measured? How do densitometers measure density?

C. What is the mathematical equation of density?

Suggest that students solve the following problems on the chalkboard:

A. If the light entering a film has an intensity of 100 and the light coming through to the opposite side has an intensity of 10, what is the film density?

B. If the light passing through a film is reduced by a factor of 4, what is the film density?

C. If the percentage of light passing through a film is only 5% of that entering the film, what is the density?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Indicate the correct answer.

A. Film density is the logarithm of the reduction factor of the ____________ passing through the film.
   1. Radiation strength
   2. Radiation intensity
   3. Light emission
   4. Light intensity

B. Density is measured by determining the logarithm of the ___________.
   1. Ratio of the light entering to light leaving
   2. Ratio of the light leaving to the light entering
   3. Light intensity of the light leaving the film
   4. Intensity of the light entering the film

C. Density can be approximated by _______________.
   1. Measuring the thickness of the part being inspected
   2. Measuring the intensity of the light leaving the film
   3. Comparing the film with a density strip
   4. Approximating the intensity of the radiation reaching the film

Work the following problems:

D. The light entering a film has an intensity of 500 and the light coming through to the other side has an intensity of 50. What is the film density?

E. If the light passing through a film is reduced by a factor of 25, what is the film density?

F. If the density of a film is 2.0 and a light enters the film with an intensity of 100, what is the intensity of the light at the exit side?

V. SUMMARY

A. Radiographic relative film density is the log of the ratio of light incident on a film compared to the light emerging through the film.

B. Film densities cannot be estimated accurately on a visual basis, therefore, a densitometer should be used.

C. The radiographic film density range is important for quality work.

The Next Lesson is: Calibration of a Transmission Densitometer

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 19
Lesson 2
Time 2hours

JOB (or operation): Calibration of a Transmission Densitometer

AIM (or purpose): To develop skill in calibrating and using a film densitometer

TOOLS AND EQUIPMENT: Photovolt transmission densitometer
Various types of measuring meters

TEACHING AIDS: Film density strips
Sample radiographs
Various types of measuring meters

REFERENCES: Manufacturers operating instruction manual

I. PREPARATION (of the learner)

Introduce this lesson by having students visually estimate three different relative densities on a radiograph of a steel step wedge. Record individual estimates on the chalkboard and follow up by checking the relative densities on the photovolt type densitometer. The results should be something less than accurate and this will demonstrate the importance of using a densitometer in measuring relative film density. Compare a densitometer to other type meters students should be familiar with. A densitometer is an instrument for measuring relative film density. Densitometers are of two types, visual and photoelectric. Great accuracy is generally not required in film density measurements, however, some specifications require a definite range of density for all film delivered to specification. It is necessary for the radiographer to know how to obtain the density of a film if the work is performed according to these specifications.

II. PRESENTATION (of the skills)

II. PRESENTATION (continued)

Operations or Steps	Key Points (things to remember to do or say)
A. Set up	1. Place densitometer on a table of convenient height. 2 Turn off main switch and power switch on the density unit. 3. Connect control panel to density unit. 4. Connect instrument to proper power source.
B. Zero and warmup	1. Check mechanical zero on indicating meter. Adjust if necessary. 2. Turn range switch to the lowest sensitivity setting. 3. Turn selector switch to warmup position. 4. Turn lamp control knobs on density unit full counter clockwise and energize power switch on the density unit. 5. Allow ten minutes for warmup.
C. Calibrate photometer	1. Set the pointer to the index on the high density side of the meter by electrical zero control adjustment. 2. Turn sensitivity switch to maximum and check above operation. Readjust if necessary. 3. Return sensitivity to minimum position. 4. Depress arm of density unit firmly to the aperture without a negative in position. 5. Open shutter by depressing plunger on end of arm. 6. Turn fine lamp control to midway position. 7. Make an approximate meter zero with the coarse lamp control. 8. Make final zero adjustment with fine control. 9. Release shutter and check index on high end of scale. Recalibrate if necessary

D. Measuring density

1. Place negative on density unit table with the area to be measured over the aperture.
2. Depress the arm and open the shutter.
3. Read the density direct from the meter.
4. For density above 1.3 move sensitivity switch to proper position and add a density value equal to the number on the selector switch opposite the index mark.

III. APPLICATION (practice by learner under close supervision)

Divide the students into small groups. Under close supervision have each student in each group repeat the following demonstration:

A. Set up.

B. Zero and warm up.

C. Calibrate photometer.

D. Measure density of film.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

A. Request that each student calibrate the instrument.

B. Have them read and record the density of each increment of a test strip made of a step wedge.

E. Compare their results with yours.

Check and discuss.

V. SUMMARY

A. A densitometer is a valuable aid in improving the quality of radiographs.

B. The densitometer eliminates guesswork when checking results of exposure time calculations.

C. A densitometer is often used to estimate percentage of metal loss occurring in piping subject to corrosive attack.

The Next Lesson is: Measuring Radiographic Sensitivity

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 1
Time 2 hours

SUBJECT: Measuring Radiographic Sensitivity

AIM (or purpose): To outline the purpose and methods of using image quality indicators

TEACHING AIDS: Assorted penetrameters
Film viewer
Sample film showing penetrameters

REFERENCES: Standard for Welding of Reactor Coolant and Associated Systems and Components for Nuclear Power Plants, Nav-Ships, 250-1500-1, Nov. 1960, U.S. Navy Bureau of Ships
Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester. N. Y.
Information Sheets #49 and #50

I. PREPARATION (of the learner)

Write aim on chalkboard explaining that much of the success of the radiographic operation depends on the ability of the radiographer to achieve the required sensitivity in his work. To insure that he has met the desired requirements, the radiographer must have some type of image quality indicator. The purpose of this lesson is to develop a better understanding of the various types of indicators, describe their use, and impart a thorough knowledge of the limitations of their use.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Penetrameter sensitivity	1. Write the following definition on the chalkboard: "An indication of the ability of the radiographic procedure is to indicate a certain difference in specimen thickness."

	2. Elaborate on the above definition: a. Penetrameter sensitivity does not guarantee the ability to detect a defect. b. The sharp edges of a penetrameter are more easily seen than natural defects. c. Only indicates ability to detect a thickness change, 3. Describe the generally accepted sensitivity levels of American specification (2% of the specimen thickness)
B. Penetrameter construction	1. Draw a chalkboard sketch of the various types of penetrameters including the European types. 2. Distribute a specification sheet on a typical American penetrameter. Information sheets #49 and #50 3. Explain the function of the holes and slots outlining that hole diameters are usually one, two and four times the penetrameter thickness. One or more holes should be perceptible in the radiographic image. 4. Display all available penetrameter types for student examination. 5. Explain why penetrameters should be made of similar material to that being inspected as they usually represent a 2% increase in subject thickness on the radiograph.
C. Radiographic quality level	1. Explain radiographic quality level in terms of shim thickness and hole size. 2. Standard quality level is generally designated as 2-2T. 3. To indicate 2-2T quality the 2T hole is a 2% shim must be clearly visible.

D. Placement of penetrameters	1. Explain that penetrameters are placed on the source side of the specimen because image quality indication should represent the farthest specimen-film distance. 2. Explain that shim blocks are required to achieve proper thickness since shim blocks make up difference in weld thickness and plate thickness. (Penetrameter is placed on the plate.) 3. Describe and illustrate with a chalkboard sketch the technique for determining the proper penetrameter when the penetrameter can not be placed on the source side.
E. Film quality	1. Caution students against acceptance of film quality on penetrameter image alone. 2. Outline other means of determining film quality such as: a. Freedom from light leaks b. Elimination of processing defects such as streaks, air bells, and water marks c. Cleanliness of film and freedom from dirt and scratches d. Absence of pressure marks and crimps e. Indication of poor screen contact

---

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Refer to specification sheet for construction of penetrameters and ask individual students to explain the various dimensions and how they are obtained.

B. To stimulate discussion ask the group the following questions, give one or more students an opportunity to answer. In the event that no answer or an incorrect one is offered, hasten to supply the correct information and give all supporting data freely. Be careful not to request answers on subject not fully covered in previous presentations:

1. What is meant by penetrameter sensitivity?
2. What is the generally accepted penetrameter sensitivity?
3. What is meant by radiographic quality level?
4. What is the generally accepted value of radiographic quality level?
5. Why is the penetrameter placed on the source side of the specimen?
6. What does a penetrameter measure?
7. What are other factors which indicate film quality?

C. Have the students view the sample film and identify the penetrameter sensivity and the radiographic quality level of each film.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Each statement below contains a missing word or words, therefore, the missing information should be supplied.

A. Penetrameter sensitivity is an indication of the ability of a radiographic procedure to indicate a difference in specimen ____________.

B. The generally accepted radiographic quality level is ________, which means the procedure has the ability to resolve a _________ hole in a ___________ thick shim.

C. Shim blocks are used under penetrameter in weld inspection to increase the _________ of the metal to the same as the weld reinforcement.

D. Penetrameters are placed on the source side of the specimen because their image is ______________ greatest by this placement.

E. Penetrameters should be constructed of materials having similar radiation ___________ properties as the specimen to be inspected.

V. SUMMARY

A. A penetrameter is an image quality indicator.

B. An image quality indicator is used to detect a thickness change.

C. There are several shapes and sizes of penetrameters.

D. Penetrameters are placed between the source of penetrating radiation and the specimen being radiographed when feasible.

E. There are other means of determining film quality besides the penetrameter image.

The Next Lesson is: Radiographic Subject Contrast

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 2
Time 2 hours

SUBJECT: Radiographic Subject Contrast

AIM (or purpose): To furnish the student with a basic understanding of the factors controlling radiographic sensitivity

TEACHING AIDS: Film viewer
X-ray exposure charts
Sample radiographic film

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

Since the primary purpose of most radiographic inspections is to detect defects and discontinuities in materials, a knowledge of the factors affecting the sensitivity of the procedure is quite important. The thickness of the various portions of the specimen influences the radiation reaching the film, therefore, the ratio of the intensities from different thicknesses is called the subject contrast. To study the effect of subject contrast on film sensitivity is the purpose of this lesson and its relative importance is self evident.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Subject contrast	1. Write the definition of subject contrast on the chalkboard: "The ratio of radiation intensities transmitted by different portions of the specimen." 2. Explain the definition and illustrate with a chalkboard sketch such as Fig. 10 in Radiography in Modern Industry.

	3. Explain the independence of subject contrast from time, milliamperage, distance, and film type, pointing out that subject contrast depends basically upon specimen thickness and density variations.
B. Factors affecting subject contrast 1. Thickness difference in specimen	1. Using an exposure chart, illustrate by a chalkboard sketch the range of intensities which can be produced from a specimen with a thickness difference of 2 to 1. See page 49 of Radiography in Modern Industry. 2. Display sample film showing the subject contrast obtainable from different thicknesses.
2. Radiographic quality	1. Define radiographic quality and write on the chalkboard: "The relationship between the specimen geometry and the penetrating qualities of the radiation." 2. Using an exposure chart, illustrate on the chalkboard the ratio of intensities from a specimen with a 2 to 1 thickness ratio when different kv's are used. 3. Display film showing the change in subject contrast from several different kv's.
3. Radiation scattering	1. Review the effects of scattered radiation on the overall density of the film. 2. Explain why scattering reduces contrast. 3. Explain the benefits from the use of masks and diaphragms: a. Scatter fogs film, undercuts thin parts of specimen, reduces overall contrast. b. Tends to cause a fog or haze over image. c. Masks and diaphragms absorb scatter. d. Filters absorb soft radiation that causes scatter.

4. Describe the action of filters in the radiation beam.
5. Review the actions of intensifying screens:
   a. Reduce exposure time at high kvp.
   b. Improve radiographic quality at low kv.
   c. Reduce scatter in both cases.
6. Display sample radiographs which show proper and improper control of scattered radiation.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

To promote discussion, invite the group to consider various questions. Give one or more individuals opportunity to answer, however, in the event an improper or incorrect answer is given the instructor must hasten to correct the matter and avoid such questions as reflects unexplored subject matter.

A. What are the factors which affect subject contrast?

B. What is subject contrast?

C. What is radiation quality?

D. How does scattered radiation affect subject contrast?

E. What effect does a difference in section thickness within a specimen have on subject contrast?

F. What are some of the methods of reducing radiation scattering?

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Indicate the correct answer by writing in one of the four suggested answers.

A. Subject contrast is the ratio of the ______________ transmitted by different portions of the specimen.
   1. Gamma rays
   2. X-rays
   3. Radiation intensities
   4. Density levels

B. When the subject contrast increases, the film will respond by __________.

1. Fogging
2. Increasing contrast
3. Decreasing contrast
4. Decreasing exposure time

C. If two radiographs are made of the same test piece using different kilovoltages, the radiation intensity ratio from area of different thicknesses will be ____________ for the higher kilovoltage.

1. Higher
2. The same
3. Lower

D. Radiographic quality is the relationship between the specimen geometry and _____________.

1. The gamma ray source strength
2. The intensity of the radiation
3. The exposure factor
4. The penetrating qualities of the radiation

E. Scattered radiation reduces subject contrast by __________.

1. Reducing exposure time
2. Producing a coherent uniform radiation
3. Intensification of the primary radiation
4. Creating a haze or fog over the image

V. SUMMARY

A. Subject contrast is the ratio of radiation intensities transmitted by different portions of the specimen.

B. The factors affecting subject contrast are: Thickness variation in specimen, radiation quality, and radiation scattering.

C. Radiation scattering effects can be reduced with filters, diaphragms and masks.

The Next Lesson is: Radiographic Film Contrast

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 3
Time 2 hours

SUBJECT: Radiographic Film Contrast

AIM (or purpose): To develop a basic understanding of the factors controlling radiographic sensitivity

TEACHING AIDS: Film viewer
Characteristic curves of various film
Sample radiographs

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

The purpose of the radiographic inspection is generally speaking the detection of small discontinuities in a material. The radiographer is hired to perform the necessary functions to detect these small irregularities and this lesson is to help him understand the factors which affect the sensitivity of the procedure, and his ability to achieve the desired results.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Film contrast	1. Write the definition of film contrast on the chalkboard: "The slope of the characteristic curve; i. e., the ratio of density to the relative exposure of the film." 2. Explain the definition and illustrate with a chalkboard sketch of the curve. 3. Outline the independence of film contrast from the quality of the radiation. Film contrast is an inherent part of each type film

B. Factors affecting film contrast
   1. Exposure time
   2. Temperature
   3. Agitation
   4. Developer activity

1. Explain the necessity of controlling the development time to achieve full development.
2. Display films developed at various times at the same temperatures. Discuss the differences.
3. Caution against over development to achieve greater speed. Overdevelopment causes fog.
4. Remind the student of the relationship between time and temperature in developing. As developer temperature rises, development time decreases.
5. Recommend the control of temperature or adjustment of time to achieve uniform results, by controlling darkroom temperature or developer chemical temperature.
6. Display sample film developed at the same time but at various temperatures. Discuss.
7. Explain the need for maintaining fresh chemicals and compare the effects of depleted chemicals to insufficient developing time. Fresh chemicals increase production and quality.
8. Invite questions.

C. Density

1. Review the relationship between the slope of the characteristic curve and the difference in film density for various exposures. A linear relationship exists only between the heel and the toe of the characteristic curve.
2. Show by a chalkboard sketch, the method of calculating a density gradient.
3. Explain by use of the chalkboard the difference in densities obtained for an equivalent exposure of a part in an area of the curve with a low and a high density gradient. (See Fig. 75 of Radiography in Modern Industry) Heel and toe areas of a characteristic curve offer wider density ranges.

4. Discuss the slope of the curve and density of film contrast.
   a. Compare and discuss slopes of three or four different types of film
   b. Measure the range of linear relationship for each type

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

Oral questions following the same procedures as outline in Step III of the preceeding two lesson plans.

A. What is meant by film contrast?
   Ans. The slope of the characteristic curve

B. What are the factors affecting film contrast?
   Ans. Processing practices and density

C. List the processing practices which affect film contrast
   Ans. Time, temperature, agitation, and developer activity

D. Why should the developing time be controlled?
   Ans. Full development produces maximum film contrast, while over development reduces contrast and promotes fogging

E. Why is agitation important to control of film contrast?
   Ans. Improper agitation retards development and produces streaks which obsecure the true image contrast

F. What is meant by a density gradient?
   Ans. Density gradient is the instantaneous slope of a point on the characteristic curve

G. What value is a knowledge of the density gradient?
   Ans. Density gradient is useful in determining the film density and contrast produced by different radiation intensities.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Each statement below contains a missing word or words. Supply the missing information.

A. Film contrast is the ratio of the ____________________ to the relative exposure of the film

B. Film contrast is independent of ______________.

C. Over development of film can result in reduction of density and the production of an overall ______________________.

D. Time of development is directly related to the ______________ of development.

E. Lack of agitation reduces film contrast by reducing chemical activity at the surface of the film and by producing ______________ on the film.

F. The density gradient is the ________________ of the curve at a particular point on the characteristic curve.

G. Image contrast between two portions of a specimen is increased when the exposure is made in a region of the curve with a high ________________.

V. SUMMARY

A. Film contrast is defined as the slope of the characteristic curve or the ratio of the density to the relative exposure of the film.

B. Radiographic contrast is the product of subject contrast and film contrast.

C. Processing factors affect radiographic contrast.

D. Film contrast varies with each type of film.

The Next Lesson is: The Effects of Geometric Factors on Definition

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 4
Time 2 hours

SUBJECT: The Effects of Geometric Factors on Definition

AIM (or purpose): To outline the factors controlling radiographic sensitivity

TEACHING AIDS: Film viewer
Samples of radiographic film

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

The sensitivity of a film is a function of radiographic contrast and image definition. Radiographic contrast has been treated with discussions on subject and film contrast. However, image definition is a function of geometric and graininess factors. This lesson will deal with the first of these, the geometric factors and demonstrate how they can be controlled to improve the overall film sensitivity.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Geometric factor	Define the geometric factor affecting definition as any factor which possesses dimensional measurements.
B. Geometric factors affecting sensitivity	
1. Focal spot size	Illustrate and explain the effects of changing the focal spot size on sensitivity by using a chalkboard illustration and a light source with a diaphragm closure. (See Fig. 10 of Radiography in Modern Industry)

2. Film-focal distance	1. Illustrate and explain the effects of film-focal distance by chalkboard sketch and light source. 2. Display sample film for student examination. 3. Invite questions.
3. Specimen-film distance	1. Illustrate and explain by chalkboard sketch and light source demonstration. 2. Display sample film for student examination. 3. Discuss results of film examination.
4. Abruptness of thickness change	1. Display sample radiographs with "defects" having rounded and sharp edges. 2. Explain why sharp edges are easier to detect than rounded edges. Use the density gradient for explanation.
5. Screen to film contact	1. Display sample film made with good and poor screen contact. 2. Explain the image distortion caused by poor screen contact. Use chalkboard sketch. 3. Invite questions.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Promote discussion and questions by asking the group to describe the following geometric factors and explain how they affect sensitivity. Allow one or more students to treat each factor being ready to correct any misconceptions and incorrect responses. Be careful not to request information on subject matter not covered in previous work:

1. The focal spot or gamma source size
2. The film to focal spot distance
3. The film to specimen distance
4. Abruptness of thickness change
5. Intensifying screen to film contact

B. Ask individual students to demonstrate the first three factors using a visible light source.

C. Using the sample film, ask the students to elaborate on the possible causes of poor sensitivity on each film.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Each statement below contains a missing word or words. Supply the missing information.

A. The specimen image will have greater ______________ as the focal spot size is decreased.

B. The specimen image is _____________ in size as the specimen to film distance is increased.

C. The image will also have poorer _____________ as the specimen to film distance is increased.

D. As the change in section thickness becomes more abrupt, the specimen image will become _______________.

E. When the screen fails to make good contact with the film, the image is blurred because the emanation ____________ from the point where it was generated.

V. SUMMARY

A. Any factor which has dimensional measurements is called a geometric factor.

B. Focal-film distance is the distance between the source of penetrating radiation and the film that is to be exposed.

C. Distance between the near side of the specimen being radiographed and the film is called the specimen-film distance.

D. Use of density gradient explains why sharp edged defects are easier to detect than rounded defects.

E. Screen must be in intimate contact with film for optimum results.

The Next Lesson is: The Effect of Graininess Factors on Definitions

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 5
Time 2 hours

SUBJECT: The Effect of Graininess Factors on Definition

AIM (or purpose): To develop a basic understanding of the factors that control radiographic sensitivity

TEACHING AIDS: Film viewer
Sample radiographic film

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N. Y.

I. PREPARATION (of the learner)

Throughout the career of a radiographer, he is confronted with one major problem. He must show the part to be inspected in sufficient detail to permit evaluation of its serviceability. This lesson and the preceeding three lessons cover the major factors that control sensitivity and are a complete outline of the problem. An understanding of each factor and its relationship to the others will help to eliminate many of the problems of maintaining a satisfactory sensitivity level in the finished product.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Graininess factors	1. Define a graininess factor as any influence which tends to produce a "graininess" in the image of the specimen. 2. Define graininess as the clumping of silver grains in the film to produce a visually discernable particle in the emulsion. 3. Draw a chalkboard sketch to illustrate graininess and show how it reduces film sensitivity.

B. Graininess factors affecting definition 1. Type of film	1. Explain the presence of grains in all film, all x-ray film is grainy and the faster the film the grainer. 2. Relate the speed of a film to its graininess, explaining that film speed increases with grain size. 3. Explain the desirability of using fine grain film for detecting small defects. Fine grain gives better image detail so is better for detecting small defects. 4. Display sample film. Allow students to compare grain size of various films. 5. Ask questions.
2. Types of intensifying screens	1. Describe the construction of fluorescent screens and explain how the grains in the screens cause graininess in the film image. Calcium tungstate and barium lead sulfate finely powered and mixed with a binder and coated as a thin layer on a cardboard support. 2. Compare lead and fluorescent screens and their effect on graininess. Lead screens cause no graininess when intimate contact is made with film. Calcium tungstate screens are not used with gamma rays because they cause graininess. 3. Explain the relationship between the strength of the radiation and graininess when fluorescent screens are employed. As radiation penetration increases, graininess increases when using calcium tungstate screens. 4. Display sample film for student examination to illustrate the effects of different types of screens. 5. Ask questions.

3. Radiation quality	1. Explain the effect of radiation strength in producing graininess. As penetration of radiation increases, graininess also increases. 2. Explain the rate of reaction of different types of film to high strength radiation. Graininess is increased when development time is lengthened to increase film speed. 3. Describe the use of inherent fine grain film for high energy radiation pointing out why.
4. Development	1. Explain the relation between developing time and the growth of "Clumps". A developing speed which gives a decrease in graininess will also give an appreciable loss in film speed. 2. Describe the adverse effects which accompany the practice of increasing developing time to gain film speed. Overdevelopment can cause fog and decrease contrast.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

To promote discussion invite the group to answer the following questions, giving one or more students an opportunity to answer each question. The instructor should be careful to quickly supply the correct answer in the event of misunderstanding or lack of knowledge. No questions should be asked if there is doubt that the subject was adequately covered or if the information is new or beyond the knowledge of the student:

A. Define the graininess factor and its effect on sensitivity.

B. What is graininess?

C. Explain why some films have more graininess than others.

D. Explain why fluorescent screens cause graininess.

E. Define radiation quality.

F. How does radiation quality affect graininess ?

G. How do film developing practices affect graininess ?

H. Select a film to be used in detecting fine casting cracks and explain why you picked that particular film.

I. Explain why you would not use a fluorescent screen with gamma rays.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

Indicate the correct word or words to complete the following statements.

A. The speed and graininess of the film are increased by _____ ____.
  1. Increasing the time of development
  2. Decreasing the time of development
  3. Using a lower kilovoltage
  4. Increasing the ma and decreasing the time

B. Graininess decreases the sensitivity of a film by __________.
  1. Creating a fog on the film
  2. Decreasing the film contrast
  3. Accentuating large defects
  4. Obscuring small defects

C. Graininess is increased by ___________.
  1. Lower energy radiation
  2. Using lead intensifying screens
  3. Shorter developing times
  4. Using higher energy radiation

D. Inherent graininess is a characteristic of _______________.
  1. Fast speed film
  2. Slow speed film
  3. High contrast film
  4. Low contrast film

E. The _______________ intensifying screen has little effect on graininess.
  1. Calcuim tungstate
  2. Bariun lead sulphate
  3. Zinc sulfide
  4. Lead

V. SUMMARY

A. Any factor which tends to produce graininess in the specimen image is referred to as a graininess factor.

B. Graininess is the combining of individual silver grains in the film to produce a visible particle in the film emulsion.

C. Graininess varies with:
   1. Type of film
   2. Type of screens
   3. Radiation quality
   4. Film development techniques

The Next Lesson is: Depth Localization of Defects

INSTRUCTOR'S LESSON PLAN
Related Technical Information

Unit 20
Lesson 6
Time 2 hours

SUBJECT: Depth Localization of Defects

AIM (or purpose): To develop ability to locate flaws detected through the inspection of materials

TEACHING AIDS: Film viewer
Sample film

REFERENCES: Radiography in Modern Industry, Eastman Kodak Co., 1958, Rochester, N.Y.
Information Sheet #51

I. PREPARATION (of the learner)

Often a defective part will be found which can be salvaged in the machining process if the defect is in an area where metal is to be or can be removed. The machinist will want assurance that the defect can or will be removed before commencing operations. This lesson will cover a method of determining where a defect is located.

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
A. Parallax	1. Place the definition of the chalkboard: "The apparent displacement of an object as seen from two different points." 2. Explain the definition. 3. Issue information sheet #51. 4. Invite questions.
B. The parallax method	1. Draw a chalkboard sketch of the set-up as shown on the information sheet, for making a flaw depth determination. Indicate on the sketch:

    a. The position of the markers
    b. The position of the source
    c. The important distances
    d. The position of the film
2. Indicate on the chalkboard what happens to the flaw image when the two exposures are made.
3. Display for student examination a sample film from a depth determination. Explain all aspects.

C. Depth calculations

1. Illustrate and explain the method of distance measurement on the chalkboard and with the sample film.
2. Discuss the mathematical calculations on the information sheet.
3. Explain the method of determining the approximate location of the defect without making calculations.

III. APPLICATION (drill, illustrations, analogies, oral questions or assignments)

A. Promote discussion with the use of the following oral questions, being careful to observe the admonitions outlined in previous lesson plans.

1. What is the purpose of the markers on the test piece?
   Ans. A reference point for measurement of parallax.
2. What is parallax?
   Ans. The apparent displacement of an object as seen from two different points.
3. Why is the source shifted for the second exposure?
   Ans. To furnish a second point from which to observe the defect.

B. Give finite dimensions to the shift in image, the film-focal distance, and the focal spot shift on a chalkboard sketch. Ask each student to calculate the location of the defect.

IV. TEST (final check on students' comprehension of material presented)

NOTE: Written Test

A. What is parallax?

B. What dimensions must be known to be able to calculate a flaw depth by the parallax method?

C. If the shift in flaw location was less than one half of the top marker shift, where is the flaw located?

D. If the film-focal distance of a parallax exposure was 36" and the flaw moved 1/2" when the focal spot was moved 5 1/2", what is the distance from the bottom surface of the flaw to the bottom surface of the specimen?

V. SUMMARY

A. Initially a radiograph does not necessarily indicate the depth of a flaw or discontinuity.

B. Parallax is the apparent displacement of an object (flaw) as seen from two different points.

C. Depth of a flaw can be determined by the parallax method.

D. Approximate depth of a flaw can be determined without making calculations.

The Next Lesson is: Depth Localization of Defects

EXPERIMENT SHEET
Depth Localization of Defects

Unit 20
Lesson 7
Time 4 hours

SUBJECT:
Determination of the location of an internal defect in a metal part

NOTE:
Instructor performs all operations

INTRODUCTORY INFORMATION:
It is often desirable to know how far below the surface a defect in a part is located. The defect may be of little significance if located in an area of low stress or it may be desirable to remove or repair the defective area. The parallax method is a useful technique for localization of the defect position.

MATERIALS AND EQUIPMENT:
Gamma or x-ray source and exposure facilities
Film cassettes and film
Gamma ray survey meter
Sample part with known defect. (A casting about three inches thick with the defect near the center is preferable)
Lead numbers
Darkroom facilities

PROCEDURE:

A. Single load a film cassette with the selected film and screens.

B. Place lead numbers on the back of the part to be inspected near the outer edges and in a straight line which includes the defect.

C. Place a lead number on the top of the part about half the distance from the defect and the more distant edge in line with the numbers on the bottom.

D. Place the part on the film and position the source of radiation at a film-focal distance of 24 inches. Center the source over the part at a point which is displaced from the center line of the defect by two to four inches. Note: The distance the source is offset from the defect is not important and the amount is generally dictated by the size of the part; however, once the distance is established it must be measured with the best possible accuracy and recorded.

E. Energize the survey meter, wait for warmup, and zero the meter.

F. Determine the exposure time required to produce a density of approximately 1. 5.

G. Expose the film for the indicated length of time.

H. Return the equipment to the safe position.

I. Move the source of radiation two to four inches on the oppsite side of the defect maintaining the alignment with the lead markers.

J. Expose for the additional time to achieve the total density of 2. 5.

K. Return the equipment to the safe position.

L. Develop the film for 5 minutes at 68°F. fix, wash, and dry.

M. Examine the film on a film viewer. Note: If the image is not satisfactory for measurement of the defect position shift with the single exposure, the procedure must be repeated using two film; i. e., one for each exposure. The films then can be superimposed for viewing.

N. Record the amount of image shift in the defect image and record the results as dimension "b".

O. Record the image shift on the top marker and record and dimension "m".

P. Add the exact amount of the source shift from the center of the defect for each exposure and record as dimension "a".

Q. The film-focal distance should be recorded as dimension "t".

R. Calculate the distance "d" of the defect from the bottom surface of the part.

S. Determine if the image shift is more or less than one half of the top marker shift.

CONCLUSIONS:

A. The defect is closer to the ____________________ surface of the part because the defect shift is ____________ than half the marker shift.

B. The depth of the defect from the top surface of the part is ____________.

C. A film-focal distance of 48" would be ____________________ for this technique if the specimen is only 1/2" thick because of the __________ ____________ shift in the position of the defect on the radiograph.

The Next Lesson is: Procedure Qualification

EXPERIMENT SHEET
Procedure Qualification

Unit 20
Lesson 8
Time 3 hours

SUBJECT:

Qualification of the techniques for double wall pipe exposure with subsequent single wall viewing.

NOTE:

Instructor performs all operations

INTRODUCTORY INFORMATION:

Most specifications for radiography require the penetrameter to be placed on the source side of the part. This procedure may not by possible when making a double wall multiple exposure of pipe to be viewed as single wall or under other circumstances which preclude placing the penetrameter on the source side. To qualify a procedure with penetrameters on the film side, a test exposure is generally required on a sample of equal thickness. This exposure is to demonstrate the capability of achieving the desired sensitivity and to establish the equivalent penetrameter to be used to indicate the desired sensitivity.

MATERIALS AND EQUIPMENT:

Gamma ray (or x-ray) source and exposure facilities
Film cassettes and film
Gamma ray survey meter
Sample pipe
Penetrameters and lead numbers
Dark room facilities

PROCEDURE:

A. Single load film cassettes with selected film and lead screens.

B. Determine the pipe wall thickness.

C. Select a penetrameter for 2-2T sensitivity on the full wall thickness and a series of penetrameters ranging in thickness down to one fourth the wall thickness.

D. Place the film on a lead sheet or exposure table and tape all the penetrameters except the 2-2T to the film in a straight line near the center of the film. Align the penetrameters end to end in sequential order of thickness.

E. Align the pipe sample over the penetrameters. The penetrameters should be in line at the point of tangency of the pipe.

F. Place the full wall 2-2T penetrameter inside the pipe with the long axis parallel to the pipe. Position in order not to interfere with the image of the other penetrameters.

G. Attach lead numbers and letters to the film for the purpose of identifying the exposure.

H. Align the source tube directly over the pipe at a film-focal distance not less than seven times the pipe wall thickness.

I. Calculate the exposure time required to produce a density not less than 1. 5 nor more than 3. 3.

J. Attach the source tube to the camera and extend the control cables.

K. Energize the survey meter, wait for warmup, and zero meter.

L. Extend source and expose for required time.

M. Retract source, survey, and lock source in camera.

N. Remove and develop film for 5 minutes at 68°F. fix, wash, and dry.

O. Examine film on viewer.

P. If the penetrameter on the source side indicates proper sensitivity, determine the thinnest penetrameter on the film side which has a 2T hole clearly visible.

CONCLUSIONS:

A. For this exposure the ____________ penetrameter will indicate a 2-2T sensitivity when used on the film side.

B. The exposure calculation was made using a thickness of __________ to produce a film which is viewed as a thickness of ___________.

C. The sensitivity of this film will indicate 2-2T sensitivity on a thickness of ________________.

D. This qualification procedure is necessary because it is sometimes impossible to place the ____________ on the ____________ side.

The Next Lesson is: Operation of Portable Power Plants

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 21
Lesson 1
Time 2 hours

JOB (or operation): Operation of Portable Power Plants

AIM (or purpose): To assist students in acquiring skill in the care, maintenance, and operation of powerplants used in field radiographic operations

TOOLS AND EQUIPMENT: Portable powerplant

MATERIALS: Fuel
Oil
Lubricants

REFERENCES: Manufacturers operating manual

I. PREPARATION (of the learner)

Many field radiographic operations rely on portable power plants to furnish power for x-ray generators and the operation of the darkroom. The success of the entire operation is dependent on the proper functioning of the power plant, therefore, the radiographer must know how to care for and operate these portable power plants to best advantage. This lesson will help to provide some basic and fundamental facts, however, it is recommended that a thorough study be made of the manufacturer's operating manual and its procedures be followed as closely as possible.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Preparation	Place students in proper position to see and hear. 1. Check and fill crankcase with proper or recommended motor oil. 2. Check and fill oil bath air cleaner if so equipped.

3. Fill fuel tank with the correct grade of fuel.
4. Lubricate bearings which require periodic service.
5. Remove all covers from intakes and exhausts.
6. Disconnect all electrical loads from power plant.

B. Starting

1. Open fuel tank valve.
2. Close choke lever. (Some units may have automatic chokes)
3. Wind starter rope around pulley (Some units may have electrical starters and do not require hand cranking)
4. Remove ground or energize starting switch.
5. Pull starter rope with steady even motion. Repeat if engine does not start.
6. When engine starts, return choke to open position.
7. If engine is electrically cranked, return starting switch to "Run" position after engine starts.

C. Apply load

1. Turn off switches on all apparatus to be connected to power plant.
2. Engage power lines to power plant after engine has been warmed.
3. Pickup load on each apparatus as needed.
4. <u>Caution:</u> Do not apply load greater than the capacity of the power plant.

D. Stopping

1. Remove load from power plant.
2. Connect ground or push stop button to short circuit ignition of engine.
3. Turn off fuel line valve.
4. Allow engine to cool then replace covers on intake and exhaust.

E. Precautions

1. Never fuel engine while running.
2. Keep guards on flywheels and moving parts.
3. Do not restrict passage of cooling air to engine.
4. Do not overload power plant.
5. Have spare spark plugs available.
6. Caution: An x-ray generator cannot function properly with a fluctuating power supply.

III. APPLICATION (practice by learner under close supervision)

A. Have one student instruct another in the proper starting procedure under close supervision of teacher.

B. Alternate student and learner positions until all students have performed the operations.

C. Have each student tell what he is going to do, how he will do it and why he is doing it.

IV. TEST (performance of skill to acceptable standards)

NOTE: Written and performance test

A. Have each student outline in written form the procedure for starting a portable power plant.

B. Have each student start the engine, apply a load, stop and prepare engine for shut down.

V. SUMMARY

A. Power plants perform two separate functions in that they furnish power for the x-ray generator and for the portable darkroom.

B. Fluctuation of power to the x-ray generator will reduce quality of the resultant radiograph.

C. Maintaining a power plant in accordance with the manufacturer's recommendations should be adequate for outdoor operations.

The Next Lesson is: Shipping Radioactive Materials

INSTRUCTOR'S LESSON PLAN
Manipulative Skills

Unit 22
Lesson 1
Time 2 hours

JOB (or operation): Shipping Radioactive Materials

AIM (or purpose): To develop skill in the preparation of radioactive materials for shipment

TOOLS AND EQUIPMENT: Gamma ray source (simulate)
Screw driver, pliers, adjustable wrench
Shipping containers

MATERIALS: Labels (poison)
Straps, nails, tape, screws, etc.

REFERENCES: Transportation of Radioactive Materials, 1965, U.S. Atomic Energy Commission, Washington, D.C.
Information Sheet #52

I. PREPARATION (of the learner)

The shipment of radioactive materials is controlled by strict legal procedures for the purpose of avoiding injury and damage to other people. These procedures are very simple requiring only an adequate exposure to the fundamental requirements to learn them. The purpose of this lesson is to assist the individual in the development of skill in handling radioactive materials in accordance with prescribed regulations.

II. PRESENTATION (of the skills)

Operations or Steps	Key Points (things to remember to do or say)
A. Preparation of records and shipping documents	. Pass out information sheet #52 and place students so all can see and hear. 1. Enter date of shipment in source location and source inventory records.

	2. Prepare packing slip indication: a. Source type b. Source serial number c. Strength of source on shipment date 3. Enclose copy of decay chart if source is not being shipped for disposal. 4. Prepare class D label (poison)
B. Prepare gamma source	1. Transfer to shipping container 2. Secure and survey container 3. Crate or package in shipping container 4. Survey the surface of shipping container with gamma survey meter. 5. Secure all closures on shipping container
C. Label shipping container	1. Place radiation signs on outside of container 2. Fill in the surface radiation level block of the class D label (poison) 3. Attach the label to the container 4. Attach the packing slip to the container
D. Notify recipient	1. Telephone, wire, or send letter to addressee informing of the shipment indicating carrier and exact route if available. 2. Notify the transportation company to pick up container.
E. Receipt of sources	1. Reverse the procedure of survey, removal from container, and entry into records. 2. Notify the shipper of receipt. 3. Store source in approved vault.

III. APPLICATION (practice by learner under close supervision)

A. Separate the students into small groups. Have each group prepare a simulated shipping container for shipment. The group should show the necessary record entries and prepare all documents. Supervise the activity very closely.

B. Have the groups exchange containers. Ask the students to now take the necessary receiving actions. Observe all procedures for exact conformity to regulations, invite questions and supervise closely.

IV. TEST (performance of skill to acceptable standards)

NOTE: Performance Test

Have the students prepare an actual source for shipment, make entry in the record book, attach all labels, and prepare notifications. If conditions permit, have students actually ship container.

V. SUMMARY

A. Federal laws govern the transport of radioactive materials.

B. Shipping containers must be properly labeled and addressed.

C. All containers must be monitored for excessive leakage of radiation.

D. Containers must be made of an acceptable material.

E. Shipping containers must be locked.

F. Incoming shipments must be checked for leakage, quantity of material and for contamination.

Basic Electricity Series, No. A (First Year), Related Training for Electrical Apprentices, Instructor's Manual.

Hedinger, Howard E.
North Carolina State Board of Education, Raleigh.
Pub Date - Jul64
MF AVAILABLE IN VT-ERIC SET 58p.

*TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, *APPRENTICESHIPS,

This teaching guide is the first of a four-unit series to help the instructor plan and present course materials to electricians in the first year of the related technical phase of post-secondary apprenticeship training. It was developed by a curriculum committee of subject matter specialists and the educational committee of the National Electrical Contractors of North Carolina, tested on a small group, and used in apprenticeship programs. The 28 lesson plans in this guide cover Basic Mathematics and Orientation, Fundamentals of Electricity, and National Electrical Codes. Each lesson plan is outlined into a four-step method of instruction--introducing the lesson, presentiation, application, and checking and followup. The teacher of the 144-hour course should be a journeyman tradesman, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include lists of textbooks, library reference books, industrial bulletins, recommended films, and required tools. Correlated student assignments and information sheets, unit tests, and a final examination are given in VT 003 625. Documents of the series are listed as VT 003 624 through VT 003 631. (HC)

ACKNOWLEDGMENTS

The Instructor's Manual and Assignment Sheets for the Electrical Apprentice Training Program have resulted from a need recognized by representatives of Trade and Technical Education and the Apprentice Council of the Department of Labor of North Carolina. They believe that an apprentice, in order to become a skilled craftsman in our times, needs not only to work hard on the job but also to study the related technical materials of his trade in an organized manner.

The Curriculum Laboratory of the Department of Community Colleges, was given the assignment of preparing materials that could be used by the instructors as a guide. The material contained in the lesson outlines is designed to help the instructor plan the lessons and to lead his classes gradually into the more complex studies of electricity.

Representatives of the Curriculum Laboratory have worked in close cooperation with a statewide Education Committee of the North Carolina Association of Electrical Contractors. Among these men are contractors, engineers, and journeymen who have not only worked as electricians but also are serving as instructors for apprentice classes.

Thanks are extended to Mr. D. J. Colter, Chairman of the Apprentice Training and Manpower Development Committee for the Electrical Contractors Association, Mr. C. L. Beddingfield, State Director of Apprenticeship and Training, and Mr. W. F. Humbert, III, Instructor of Winston-Salem who prepared the study guide questions for each lesson.

In addition, appreciation is expressed to all those instructors and apprenticeship committee members who have made themselves available for consultation regarding this course.

A. J. Bevacqua, Coordinator
Curriculum Laboratory
N. C. Department of Community Colleges

H. E. Hedinger
Curriculum Specialist

BASIC ELECTRICITY

TO THE INSTRUCTOR

The following Instructor's Manual for Basic Electricity, Series A, is the first of four units that will be developed for electrical apprentices. The lesson outlines will act as a guide for presenting materials and aids that will comprise the core for the proper related training of electricians. This manual is designed to aid both the instructor and learner in the presentation and mastery of related technical information.

The lessons are designed to give the beginner a good start in his related training. The general outline includes the following subjects: Orientation, Blueprint Reading, National Electric Code, Basic Mathematics, Job Information and Basic Electricity. The beginning lessons are basic but will be expanded in future assignments with additional technical information. For example, the first lesson on Ohm's Law will cover the very elementary facts about it, but there will be more advanced study on this subject in future assignments.

The lessons do not have a time limit attached to each class session. Some lessons that review basic mathematics may be completed in 30 minutes while other lessons may require several periods for a good understanding. In the event a lesson is completed in less time than the assigned period, start on the next assignment. Under most any method of class operation all the outlined lessons can be completed in a minimum of 144 hours each year.

The instructor should take time to become thoroughly familiar with the outlines for this course. He should follow the system of operation and also, explain it to the class. It is most important that all apprentices fully understand how to use the material and the step by step operation of the class. Use the orientation sheet with the first lesson to help you explain the material and its use.

Each lesson plan is outlined into the "four step" method of instruction and should assist you in presenting the lessons. In group instruction, it is recommended that the class period include the following:

Step I - INTRODUCING THE LESSON:
Call attention to interesting facts concerning the subject.

Step II - PRESENTING THE LESSON:
Demonstrate the use of necessary tools, materials, problems, and experiments. NOTE: When adequate equipment is provided, each student can perform the experiments individually.

Step III - APPLICATION:
Make use of the assignment sheets which correlate with each lesson. The assignments serve not only as a valuable aid to the learner, but also indicate to the instructor how well the lesson was taught. A well presented lesson will require the student to do a minimum of reading in the assigned texts.

TO THE INSTRUCTOR (Continued)

Step IV - CHECKING AND FOLLOW-UP:
Check the assignments with aid of answer sheets. This can be done quickly by the instructor or by exchange of papers in class. Return the papers to the students and give individual help to those that need it.

TESTING PROCEDURES:

1. Short tests can be given each week on the lesson or the previous assignment.

2. A thorough test should be given shortly after completing a unit or group of lessons. This test should cover six weeks work or less.

3. A good comprehensive test administered at the end of the course will act as a gage of progress for the year. Some questions using charts, tables, and National Electrical Code can be of the "open book" type.

4. All tests should be checked in detail, reviewed in class and returned to you. Tests should be retained by you and the committee as a part of the student's record. Also, you can use the test again next year.

HINTS ON CLASS OPERATION:

1. Each student should have a large three-ring notebook to keep assignment sheets, information sheets, and notes.

2. Hand out the assignment sheets at the beginning of the term. Make assignments for next week during the last session of the present week.

3. Require each student to study the assigned lessons at home, answer the questions and work problems.

4. Use the class time to present the lesson in the "four step" method.
   a. Give information on the lesson, either before or after the student studies it, or both.
   b. Discuss the lesson, ask and answer questions.
   c. In the third step, "APPLICATION", have the students study, answer questions, work problems, and perform experiments. The instructor should give individual assistance during this part of the period.

5. The completed assignment sheets should be turned in to the instructor when the class meets for the lesson. A small part of the session can be used to complete assignments when needed.

6. All required assignments should be checked, indicate the correct and incorrect answers. Do not write the correct answers on the papers. The learner should find the correct answers and write them on his paper for future reference.

7. Review parts of a lesson where several fail to have the correct answer.

8. The instructor should give individual assistance when the student needs help in finding the correct answers.

9. The completed lessons are put in the student's notebook for future reference.

10. The instructor should have a roll and record book to keep accurate attendance and grades for the related work of each apprentice.

NOTE: The responsibility of any instructor is not an easy one but it is hoped that this manual will make the results of your instruction both easier and more fruitful.

TEXTBOOKS:

It is very important that each student have his own textbooks. Other reference books should be furnished by the Local Committee or Institution and kept in a classroom or school library for use by the apprentices.

Textbooks for Instructors and Students to be used 4 years:
Order from the publisher.

			Approximate List Price
1.	Basic Electricity, by Van Valkenburgh & all (Five volumes bound in single text) John F. Rider, Inc., A Division of Hayden Publishing Company 850 Third Avenue New York 22, N. Y.		$12.75
2.	Basic Mathematics, by Singer McGraw-Hill Book Company, Inc. 330 West 42nd Street New York, N. Y. 10036		$ 5.75
3.	American Electricians' Handbook, 8th edition by Croft McGraw-Hill Book Co., Inc		$14.75
4.	National Electrical Code National Fire Protection Association 60 Batterymarch Street Boston 10, Mass.	(6-24 copies)	.95 ea.

LESSON NO. BASIC MATHEMATICS AND ORIENTATION

FUNDAMENTALS OF ELECTRICITY

NATIONAL ELECTRICAL CODE

INSTRUCTIONAL MATERIALS

WHOLE NUMBERS

DESIRED RESULTS:

1. To review and apply the fundamental operations using whole numbers involving basic problems in electricity.
2. To stress neat work and identified answers on all mathematics assignments.

MATERIALS & REFERENCES:

1. Assignment Sheet
2. NO TEXT--Any student who has trouble with this lesson should be assigned additional problems to work from the text.
3. Chalkboard

PRESENTING THE LESSON:

Review the fundamental operations using whole numbers to represent electrical parts or money transactions. This lesson is designed to let you know how well your students can handle the simple operations involved. Stress neat work and identified answers on all mathematics assignments. Mathematics is used as a tool in the study of electrical science. If the student has the habit of doing accurate and neat work in mathematics, he will generally do the same kind of work on the job.

APPLICATION:

Using the assignment sheet, the students will work the problems listed.

CHECKING & FOLLOW-UP:

Check the problems for correct answers and neatness. Mistakes should be corrected.

COMMON FRACTIONS

DESIRED RESULTS:

1. To review the fundamental operations of mathematics using fractions.
2. To show that fractions are vital to the electrical trade in every day work.

MATERIALS & REFERENCES:

1. Basic Mathematics, by Singer, pages 13-20 Job 2-1 & 2-2
2. Assignment Sheet - Math 2
3. *Practical Mathematics, by Palmer & Bibb, pages 20-24, sec. 10-19
4. *Basic Mathematics for Electronics, by Cooke, pages 25-28, sec. 4-1 thru 4-5

INTRODUCTION:

DEFINITION: A common fraction is one or more of the equal parts into which a unit or group of units may be divided.

Illustrate how the use of fractions is important when we figure dimensions from blueprints or locating outlets, depth of boxes, etc.

PRESENTING THE LESSON:

Review the addition, subtraction, multiplication and division of fractions. Since most people have trouble handling fractions, it is essential that the student master their use. They are used in calculating speed changes, transformer ratios, parallel circuits and many more everyday problems.

APPLICATION:

Using the assignment sheet, complete the operations of fractions listed.

CHECKING & FOLLOW-UP:

Check the answers on the students' assignment sheets and have them correct the mistakes. Any student who does not do well on this lesson should be given additional work from problems in the text.

TOOLS

DESIRED RESULTS:

1. To learn the names, uses and care of the basic tools used on the job.

2. To stimulate the students' interest in the use of catalogs to learn the names of tools.

MATERIALS & REFERENCES:

1. Tool Kit of hand tools used in the trade.

2. Electrical Catalogs from local supply houses.

3. Chalkboard.

INTRODUCTION:

The lesson materials are used primarily to introduce the basic tools of the trade for discussion.

PRESENTING THE LESSON:

The value of this lesson lies in the discussion of tools in class. Be sure to allow time to discuss the proper use and care of tools. Warn the apprentice to learn the respect for the tools of others.

APPLICATION:

Using the assignment sheets, the students will fill in the common names of tools used in the area.

CHECKING & FOLLOW-UP:

Check the assignment sheets and return to learner for placing in his workbook for future reference.

ANSWER SHEET:

The names applied to tools vary with use in different areas, therefore, the answers are left for you to fill in the common name used in your area.

DECIMAL FRACTIONS

DESIRED RESULTS:

1. To review decimal fractions as another check-up and practice lesson in mathematics.

2. To show the importance of handling problems involving decimal fractions in the electrical field.

MATERIALS & REFERENCES:

1. Basic Mathematics, by Singer, pages 37-49, Job 2-8
2. Assignment Sheet
3. *Practical Mathematics, by Palmer & Bibb, pages 57-60
4. *Basic Mathematics for Electronics, by Cooke, pages 35-42

PRESENTING THE LESSON:

Review the changing of fractions to decimals and decimals to fractions. If we have a dime, we do not write the fraction 1/10 of a dollar, but .10 which is a decimal fraction. In stating the diameter of a #10 type RH wire, we write .242", not 242/1000. We must be sure that we know how to handle problems involving decimal fractions.

This is another check-up and practice lesson in basic mathematics. Use it to review the fundamental operations in the use of decimals. Train the students to do accurate and neat work in solving problems involving decimal fractions.

APPLICATION:

Use the assignment sheet MATH - 3 for check-up and practice of fundamental operations involving decimals.

CHECKING & FOLLOW-UP:

Correct the problems and note the mistakes made by the students.

MATERIALS

(Conduit and Cable Fittings)

DESIRED RESULTS:

1. To help the beginner to learn the names and uses of the more basic materials of the trade.
2. Learn to use the electrical catalogs for specifications of materials and how to order them.

MATERIALS & REFERENCES:

1. Samples of various materials; switches, boxes, connectors, clamps, conduit, etc.
2. Catalogs from various supply houses.
3. Electrical Conduit & Cable Fittings, Thomas & Betts

INTRODUCTION:

The samples of various materials and the use of catalogs will introduce a general discussion of materials as used in your area. The bulletin, Electrical Conduit & Cable Fittings, will show the picture and use of fittings for raceways and cable.

PRESENTING THE LESSON:

Best results will be achieved by introducing a general discussion of materials as used in your area. The common trade name for much of this material will vary from place to place so be sure to supply the class with the common usage name for your area. Make use of the electrical catalogs.

APPLICATION:

Using the assignment sheets, have the students list the names in the blanks of conduit and cable fittings used in a typical dwelling installation.

CHECKING AND FOLLOW-UP:

Check the assignment sheets and return to learner for placing in his workbook for future reference.

ANSWER SHEET:

The answers to these questions will vary with the catalogue used and the area of the country, therefore, no specific answers are given.

FORMULAS AND EQUATIONS

DESIRED RESULTS:

1. To determine the ability of the students to handle simple formulas and equations.

2. To determine if the students need further training in mathematics before continuing with equations.

MATERIALS & REFERENCES:

1. Chalkboard
2. Basic Mathematics, pages 24-36
3. *Practical Mathematics, by Palmer & Bibb, pages 368-382
4. *Basic Mathematics for Electronics, by Cooke, pages 122-134

INTRODUCTION:

This is probably the most important mathematics assignment in the first year lessons. Any student who cannot handle this material with reasonable ease will have trouble with most of the electrical theory lessons in the course. The students that do have trouble should be urged or required to take an outside course in elementary algebra. Present simple equations involving the Ohm's Law formula. Review positive and negative numbers and transferring of terms.

PRESENTING THE LESSON:

Demonstrate on the chalkboard several simple formulas including problems involving Ohm's Law. Assist the students with practice problems found in the text.

APPLICATION:

Distribute the assignment sheets and allow time for the students to try all the problems. Make note of the students having trouble and the problems they could not solve.

CHECKING & FOLLOW-UP:

Correct the papers and help the students that had problems incorrect. Make additional assignments of problems from the text for those that need more practice.

FRACTIONS AND DENOMINATORS

DESIRED RESULTS:

1. To have a good understanding of the rules involving the solution to fractional problems.

2. To review reciprocal numbers and least common demoniator in order to solve parallel resistance problems.

MATERIALS AND REFERENCES:

1. Chalkboard
2. Basic Mathematics, pages 104-111
3. Assignment Sheet

INTRODUCTION:

It is essential that the electrical apprentice have a good understanding of the solution to fractional problems. To find the total resistance or capacitance for parallel and series circuits we find the sum of the reciprocals of the individual resistors or capacitors.

If the students have a good understanding of the rules involving fractions, they will have very little trouble calculating electrical problems in future work.

PRESENTING THE LESSON:

Define and give examples of the term reciprocal. Example, if two resistors of 10 and 20 ohms were connected in parallel, the reciprocals are added 1/10 + 1/20. The total resistance equals the sum of the reciprocals. It is necessary to obtain the least common denominator (L.C.D.) before the reciprocals can be added.

Spend enough time on this lesson to review fractions and establish a method of setting up equations from known facts to find an unknown quantity.

Give examples on the chalkboard and have the students practice problems. Those students who have trouble with this lesson should be required to do extra work.

APPLICATION:

Using the assignment sheet for this lesson, the students should work the problems listed. Give assistance to those that need it.

CHECKING & FOLLOW-UP:

Correct the papers and assist those that had difficulty and assign extra work to them.

PERCENTAGE

DESIRED RESULTS:

1. To review percentage problems as they are applied to a great number of electrical calculations.
2. To review decimal fractions and the changing of decimals and fractions to per cents.

MATERIALS AND REFERENCES:

1. Chalkboard
2. Basic Mathematics, pages 218-226

INTRODUCTION:

In our study of electrical mathematics we find "percentage" is used in the following calculation: 1. Efficiency of an electrical device; 2. Proper fusing of motors; 3. Code requirements as to amount of wire (in area) allowed in conduit, tubing and gutters; 4. Wire sizes based on room temperature; 5. Voltage drop in electrical circuits.

PRESENTING THE LESSON:

As stated in the introduction, percentage is used to solve a great number of electrical problems. It is important that the students put forth extra effort to master this subject as applied to electrical problems. The lessons in electricity to follow will require a good knowledge of percentage. Drill in the conversion of common fractions to decimals and percentage, and vice versa. Stress the importance of solving written problems in connection with electrical work.

APPLICATION:

Have the students give answers and work out problems on the assignment sheet.

CHECKING & FOLLOW-UP:

Check the answers to questions on the assignment sheet. Discuss any questions or problems that were found incorrect and should be explained.

SQUARE ROOT

DESIRED RESULTS:

1. To review square root from "perfect squares" through large or small whole numbers or decimals.
2. To study the method of marking off the numbers into groups and finding the square root.

EQUIPMENT AND REFERENCES:

1. Chalkboard
2. Basic Mathematics, pages 163-173

INTRODUCTION:

The ability to extract "square root" is necessary in the calculations of many electrical formula that will be needed throughout this course. Square root problems are used frequently in A. C. Circuits and problems in electronics.

PRESENTING THE LESSON:

Finding the "square" of a number, we simply multiply that number by itself. For example, 10 squared, written $10^2 = 10 \times 10$ or 100. The "square root" of a number is that number which must be multiplied by itself in order to obtain the original number. The symbol for the square root is the radical sign. When a number appears under this symbol, it means that we are to find a number which can be multiplied by itself to give the number under the square root symbol.

The square root of 144 equals 12 because 12 x 12 equals 144. Such numbers under the square root radical are called "perfect squares" because the square-root is a whole number.

As the numbers get beyond the range of the ordinary multiplication table, we need a system that will help us to find the square root of any number--large or small, whole number or decimal. In the following system, it will help if we mark off the numbers into groups of two digits to a group. We start marking off the groups at the decimal point. If there is no decimal point indicated, start at the end of the number. See examples in text, p. 164 ff. Work several problems on the chalkboard and show how to check them.

APPLICATION:

Have the students work the problems on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers to the problems. Call attention to errors and have the students correct them.

RATIO AND PROPORTION

DESIRED RESULTS:

1. To show that the mathematical concepts of ratio and proportion enable us to compare voltage, currents, etc, and to show how they depend on each other.
2. To review the rules of ratio and proportion and apply them to electrical problems.

MATERIALS AND REFERENCES:

1. Chalkboard
2. Basic Mathematics, pages 246-258

INTRODUCTION:

To understand and solve problems dealing with transformers, gears, pulleys and even current capacity of wire, we must study ratio and proportion.

A ratio is a statement of the relationship of one value on quantity to another, they must be measured in the same units of measurement. Also, the quantities themselves must be of the same kind, like two resistors, two amperes, two volts but not amperes and volts. When two quantities depend on each other, the relationship between them may be stated as a proportion. Proportion is a comparison or equality of two ratios, these two ratios may be of different substances like amperes and volts.

PRESENTING THE LESSON:

1. DIRECT PROPORTION

When two ratios in a transformer are compared in the same order so that the items in the first situation (T_1 turns of wire and V_1 voltage) are in the numerator and the items of the second situation (T_2 and V_2) are in the denominator. The proportion is stated:

$$\frac{T_1}{T_2} = \frac{V_1}{V_2}$$

This direct proportion deals with two different items, turns of wire and voltage, but each ratio contains like items. Now, we can say that the voltage in two windings of a transformer are in direct proportion to the turns of wire in the windings. See Rule for Direct Proportion in text, page 252.

2. INVERSE PROPORTION:

This is another statement of proportion we must understand. The transformer is a good example of this statement. The voltage is in direct proportion to the ratio of turns of wire in the windings, but the current is in inverse proportion to the voltage. Sample problem: A transformer delivering 100 volt-amperes. If the primary has 100 volts, with 1 ampere flow, and the secondary has 10 volts with 10 amperes flowing. To set up the inverse proportion, we have $\frac{100V}{10V} = \frac{10A}{1\ A}$.

The same is true in figuring gears and pulleys, the diameters of the pulleys set up an inverse proportion to the speed. Examples: A 2" dia. pulley running at 1750 r.p.m. would travel the same distance as a 4" dia. pulley at 875 r.p.m. The inverse proportion would be: $\frac{2''}{4''} = \frac{875}{1750}$ See rule for inverse proportion, page 255 of text.

Be sure to drill on the fundamental ideas of ratio, direct and inverse proportion during this assignment. Use the text for examples.

APPLICATION:

Have the students to work the problems on the assignment sheet. Give assistance when needed.

CHECKING AND FOLLOW-UP:

Check the answers to questions on assignment sheet. Call attention to errors.

Lesson A-9

INTRODUCTION TO ELECTRICITY

DESIRED RESULTS:

1. To introduce basic electricity by explaining the behavior of electrons.

2. To show supplementary evidence of the electron theory by use of a film.

MATERIALS & REFERENCES:

1. American Electricians' Handbook, pages 1-20 & 21, Sec. 25-29
2. Basic Electricity, Vol. 1, pages 1-20
3. Basic Mathematics, pages 1-3
4. Film--"Basic Electrical Theory" - Local Film Library, U. S. Air Force or Modern Films, Inc.
5. Film--"What is Electricity?" - Encyclopoedia Britannica Films, Inc.
6. *Swoope's Lessons in Practical Electricity, pages 1-14

INTRODUCTION:

Some of the mystery which has veiled the subject of electricity in the past has been removed. For many years, the natural laws and observed behavior of electricity were the only available sources of information for a study of this subject. The electron theory of matter, which has been certified by these natural laws, has led to a better understanding of the nature of electricity. The knowledge gained from this lesson will be the foundation upon which many later lessons will be developed.

PRESENTING THE LESSON:

It should be stressed that no one has ever seen an atom or an electron. There has been a large amount of research time devoted to the subject, and most of the evidence accumulated from this research supports the electron theory. The behavior of electrons and most atoms generally follows a definite pattern. For this reason, it is possible to predict mathematically the results of many experiments before they are performed. These predictable results have been sufficiently stable to make it feasible to label the study of electrons a science.

There are still many unpredictable results of experiments and research problems. After the discovery of the electron in 1897, scientists finally became convinced that all matter was composed of a positive mass having a definite number of electrons in orbit around this mass. The number of electrons determined the type of matter. This idea provided a very neat package. There was only one thing wrong with the theory - it was not exactly true.

There is now supporting evidence to indicate that some atomic structures are composed of more than twenty components in addition to the originally known parts. Scientists believe there are still others not yet discovered.

Some restraint should be used in defining the electron and electricity. It appears that there is a close association between these two factors, but keep in mind that there still is not an accepted definition for electricity.

In using the sun and the orbiting planets as an analogy for the description of an atom, be very careful not to leave any erroneous impression. The planets orbit about the sun very nearly in the same place. The electrons may or may not follow this pattern. Some electrons are transients. Even though it may be possible, so far as we know there is no transient planet in our solar system.

It is suggested that the local film library be contacted for suitable film to supplement this lesson. If a film is available, it should be reviewed carefully before showing. Unless it closely parallels the lesson, it could cause some confusion rather than supplementing the lesson.

APPLICATION:

DISTRIBUTE the assignment sheets for this lesson and allow time for the students to answer the questions.

CHECKING AND FOLLOW-UP:

Correct the answers to questions and return to the students. They should find the correct answers to questions that were incorrect.

Lesson A-10

CURRENT

DESIRED RESULTS:

To inform the student of the nature of OHM'S Law, and to show how this formula is used to determine the current of a circuit. To understand that when electrons are put into motion, we have current flow.

MATERIALS, EQUIPMENT AND REFERENCES:

1. American Electricians' Handbook, pages 1-21, Sec. 31 and 37
2. Basic Electricity, Vol. 1, pages 40-50
3. Basic Mathematics, pages 4-7
4. Chalkboard
5. Film--"Current Flow, What It Is"; from United World Films, Inc.

INTRODUCTION:

The next three lessons will involve the three components of a circuit that make up Ohm's Law, namely, current, voltage and resistance. Each component is studied individually and each lesson will point out the main points for the apprentice to learn and understand.

PRESENTING THE LESSON:

We have learned that all matter is composed of various particles, one of which is an electron. Now in this lesson when we put electrons in motion there is current flow.

The main point of this lesson is to understand that current flow is the movement of electrons along the conductor. Current flow in a circuit changes as a result of resistance and voltage changes. The length, cross section, and different materials of a conductor will cause the current in a circuit to vary. Experiments show that when the voltage is decreased, the current flow is increased. The unit of measurement, symbol, and nomenclature used in conjunction with current are also pointed out.
GIVE AN EXPLANATION AND SHOW THE FILM, IF AVAILABLE.

APPLICATION:

Have the students answer the questions on the assignment sheet. Give assistance where needed.

CHECKING AND FOLLOW-UP:

Check the papers and have the students correct the errors before placing them in the notebooks.

Lesson A-11

RESISTANCE

DESIRED RESULTS:

1. To understand that RESISTANCE is an apposition offered to the flow of current in an electrical circuit.

2. To learn the unit of measurement, symbol, and names used in conjunction with the term RESISTANCE.

MATERIALS, EQUIPMENT & REFERENCES:

1. <u>American Electricians' Handbook</u>, by Croft, pages 1-22
2. <u>Basic Electricity</u>, Vol. 1, pages 98-122
3. <u>Basic Mathematics</u>, by Singer, pages 6 & 8
4. Chalkboard
5. Film--"What Controls Current Flow - Resistance" United World Films, Inc.
6. *<u>Swoope's Lessons in Practical Electricity</u>, pages 104-106; 125-126

INTRODUCTION:

Review the main points discussed about current and voltage. This lesson has one main point - resistance in an opposition offered to the flow of current in an electrical circuit.

PRESENTING THE LESSON:

Show by the use of Ohm's Law Formula the relationship of RESISTANCE to current and voltage. The unit of measurement for resistance is the OHM, and the symbol for resistance is R. Adapting the formula ($I=\frac{E}{R}$) to find resistance. EXPLAIN how to change the formula to have $R = \frac{E}{I}$. Use this formula to find the resistance in an electric circuit by substituting known values. Remember--to find the resistance in OHMS, one divides the E.M.F. in volts by the current in amperes.

Give an explanation and show the film, if available.

APPLICATION:

1. Answer questions concerning the film.
2. Have the students complete the problems on the assignment sheet.

CHECKING & FOLLOW-UP:

Check the assignment sheets and allow time for the class to correct them. Discuss the questions found to be incorrect.

Lesson A-12

ELECTROMOTIVE FORCE

(VOLTAGE)

DESIRED RESULTS:

1. To understand that voltage is the force or pressure that causes the electron to move.

2. To learn the unit of measurement, symbol, and names used in conjunction with voltage.

MATERIALS, EQUIPMENT AND REFERENCES:

1. American Electricians' Handbook, by Croft, pages 1-21
2. Basic Electricity, Vol. 1, pages 83-97
3. Basic Mathematics, pages 3 and 7
4. Chalkboard
5. Film--"What Causes Current Flow--E.M.F." United World Films, Inc.
6. *Swoope's Lessons in Practical Electricity, pages 125-126 and page 105

INTRODUCTION:

Review the difference between current and voltage and show their very close relation. Voltage is the second of the three important terms associated with Ohm's Law.

PRESENTING THE LESSON:

Voltage or electromotive force of an electric circuit is the pressure which causes the current to flow. It is measured in volts and represented in the formula by the letter "E". Show from the references the individuality of the voltage but at the same time its close relationship with the current.

The class should use time for additional study in the reference material. GIVE EXPLANATION AND SHOW THE FILM IF AVAILABLE.

APPLICATION:

Have the students to answer the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the papers and have the students correct any incorrect answers. Discuss the questions that need explanation.

YOUR EMPLOYER

DESIRED RESULTS:

1. To aid the apprentice in becoming a better employee.
2. To give the apprentice an insight into the general organization, plan and function of an average contracting firm.
3. To show the importance of the Local apprentice agreement.

MATERIALS AND REFERENCES:

1. Information Sheets
2. The Local Contract (Agreement)

INTRODUCTION:

Many employees have no knowledge of the problems which must be solved by employers. In many cases, misunderstandings will be prevented and better employer-employee relations will result when an employee understands some of the problems. Where action of an employee can assist the contractor in operating his business profitably, it enables the contractor to make money and be able to stay in business and provide work for his employees.

PRESENTING THE LESSON:

The following suggestions can be incorporated into the sections under which they are listed:

Tools and Transportation: The journeyman should use the tools and transportation equipment carefully and efficiently to avoid damages and delays on the job.

Organization: The number of people in these departments will depend upon the amount of business being done by the contractor. The smaller contractor may have one person besides himself to do the work, while the larger contractor may employ one or more persons in each department.

Estimating: The major unknown factor in any estimate is labor productivity. The journeyman must work as efficiently as possible so that the labor costs remain within the estimate.

Accounting: To keep his business functioning, it is necessary for the contractor to know the costs of his operations. The journeyman can be of assistance in this respect by turning in accurate time sheets and material lists. Then the contractor will know the actual cost of the job, and in the future he will be better able to compete on similar jobs.

APPLICATION:

The class should study the information sheet entitled "Your Employer". Using the assignment sheet, the students will answer the questions.

Lesson A-13

OHM'S LAW

(Simple Circuits)

DESIRED RESULTS:

1. To understand the relationships of voltage, current, and resistance in an electric circuit.
2. To show how the formula may be used to determine the voltage, current, and the resistance of a circuit.

MATERIALS AND REFERENCES:

1. <u>American Electricians' Handbook</u>, by Croft, Div. 1-37 and 1-39
2. <u>Basic Electricity</u>, Vol. 1, page 123; Vol. 2, pages 24-41
3. <u>Basic Mathematics</u>, by Singer, pages 20-24

INTRODUCTION:

George S. Ohm, a German Physicist, discovered that the amount of current that passes through a conductor depends upon the amount of pressure (voltage) and the resistance (Ohms). Ohm's Law is expressed by the three forms of equations:

$$E = 1 \times R \qquad 1 = \frac{E}{R} \qquad R = \frac{E}{1}$$

Emphasize the fact that students who have trouble studying electrical subjects have failed to learn and apply Ohm's Law.

PRESENTING THE LESSON:

The relationship of Amperes, Ohms and Volts can be expressed by the formula $1 = \frac{E}{R}$

(1) "1" stands for the Intensity of the current flow in Amperes.
(2) "E" stands for the Electromotive Force in Volts.
(3) "R" stands for the Resistance in Ohms.

Show how Ohm's Law is so helpful in using what one learns about electricity, that the student should know how to use the formula in all its forms.

Adapt the formula to practical problems involving a house wiring circuit.

APPLICATION:

Have the students complete the assignment sheet.

CHECKING AND FOLLOW-UP:

Check assignment sheets and return to learner for correction and placing in workbook. Assign more practice problems from text.

Lesson A-14

SERIES CIRCUITS

DESIRED RESULTS:

To teach the student the relationship of voltage, current and resistance in a series circuit.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Dry cells (1.5 volts), "B" Batteries, Auto Storage Battery
3. Voltmeter, Ammeter, Ohmmeter
4. Wire for connections

REFERENCES:

1. American Electricians Handbook, Div. 3, pages 277ff.
2. Basic Electricity, Vol. 2, pages 7-23
3. Basic Mathematics, pages 67-82 and 88-93
4. Film--"Series Circuits"--Color, No. 48506, Encyclopedia Britannica
5. *Swoope's Lessons in Practical Electricity, pages 145-148

INTRODUCTION:

Be sure that the students understand that:

1. The current is the same in any part of the circuit.
2. The total resistance is the sum of resistances in the various parts.
3. The total circuit voltage is the sum of the voltages in the various parts.

PRESENTING THE LESSON:

1. Show how cells may be connecte[illegible] , provide a high Voltage than is produced by one cell.
    - a. Dry cells supply current at a pressure of 1.5 volts. No matter what their size or shape. A single dry cell is therefore unsuitable when voltages greater than 1.5 volts are needed.
    - b. Certain devices require higher voltages for their operation and will work at its maximum when operated at its rated voltage.
    - c. Connect the cells in series.
        - (1) The voltage resulting will be the sum of the voltage of individual cells.
            - (a) Water pumps connected in series are like cells connected the same way. Each cell gives the current a "kick" and thus increases the flow of current in the circuit (Rate of Flow).

(b) Flashlights, "B" Batteries, auto storage battery are examples of series connections.

2. The Current in a series circuit is the same in all parts of the circuit.

   a. Show this by using the Ohm's Law Formula $I = \frac{E}{R}$

   b. Draw a series circuit to show a resistance of 10 Ohms, a 6 volt battery and an ammeter. Formula: $I = \frac{6}{10}$ or .6 ampere.

   c. If the ammeter is placed at any point in the circuit, it will read the same.

3. The total Resistance of a series circuit is equal to the sum of the various resistances in the circuit. Expressed as R (totals) = $R_1 + R_2 + R_3$ etc.

   a. Point out that adding resistance to a series circuit reduces the current flow.
   b. That the current flow would read the same on an ammeter placed at any point in the series circuit.
   c. To find the current flow in a series circuit, it is necessary to know two things:
      (1) The circuit Voltage
      (2) The total circuit Resistance

4. Summary of the Rules: See items 1, 2, and 3.

5. Show Film--"Series Circuits"

APPLICATION:

Have the students work and hand in the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against answer sheets and return to learner for placing in workbook. Where needed assign additional problems from <u>Basic Mathematics</u> by Singer, Chap. IV.

Lesson A-15

PARALLEL CIRCUITS

DESIRED RESULTS:

1. To acquaint the student with the relationship of current, voltage and resistance in a Parallel circuit.
2. To understand that the total resistance of a parallel circuit is less than the smallest resistor.

REFERENCES:

1. American Electricians' Handbook, pages 3-2 thru 3-4
2. Basic Electricity, Vol. 2, pages 55ff.
3. Basic Mathematics, pages 111-125
4. *Swoope's Lessons in Practical Electricity, pages 148-157

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Dry cells (1.5 volts) wire, resistors and lamp banks
3. Film--"Parallel Circuits" Modern Films, Charlotte, N. C.

INTRODUCTION:

The parallel circuit is another method of connecting electrical devices in a circuit. There are several ways of calculating the total resistance of a parallel circuit. To help the students to visualize the problems, it is well to require them to draw a circuit diagram for each problem. Many problems in this assignment are not long or complicated but will give the student good practice in OHM'S law calculations. Present examples of these problems on the chalkboard, and give demonstrations using various resistors or lamp banks for loads. Measure the voltage and currents at various locations throughout the circuits.

PRESENTING THE LESSON:

Show several ways of calculating the total resistance of a parallel circuit with examples on the chalkboard. Explain that the understanding of more than one method of solving the problems will help them later with control and electronic work.

Show that two or more resistors of the same size or various sizes may be connected in parallel, the total resistance of a parallel circuit is ALWAYS less than the value of the smallest resistor.

Explain that in studying the theory of electricity, we often use a resistor in the circuit to represent the load. It is easier to draw the symbol for a resistor than a picture of an appliance.

Many demonstrations may be presented in conjunction with this lesson by using resistors of different values connected in various ways. In each circuit measure the total resistance with an OHMMETER and also calculate the resistance using the formula. Show the film, "Parallel Circuits", which is a good teaching aid. It will show animated current flow in PARALLEL circuits.

SUMMARY OF RULES FOR PARALLEL CIRCUITS:

1. The total current is the sum of the currents in various parts.
2. The voltage of a parallel circuit is the same in any part of the circuit.
3. The resistance is the reciprocal of the sum of the reciprocals of the various parts.

APPLICATION:

1. Discuss questions and applications presented by the films.
2. Have the students work the problems on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against answer sheets and return to learner for placing in workbook. Assign extra problems from Singer's Basic Mathematics to those that need the extra practice. Pages 98, 101, 118, 122 and 125.

Lesson A-16

COMBINATION CIRCUITS

(SERIES AND PARALLEL CIRCUIT CONNECTIONS)

DESIRED RESULTS:

1. To acquaint the learner with the elementary problems of series and parallel circuits.
2. That the student learn to think in terms of, and visualize the combination of series and parallel hook-ups.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Supplies for demonstrations
3. Large wiring charts, mock-ups and models

REFERENCES:

1. American Electricians' Handbook, page 3-3ff.
2. Basic Electricity, Vol. 2, pages 90-103
3. Basic Mathematics, pages 127-137
4. Film--"Series and Parallel Circuits" United World Film, Inc.
5. *Swoope's Lessons in Practical Electricity, page 151, sec. 83; page 158, sec. 85 and 86.

INTRODUCTION:

Stress the understanding of the relationship of resistance, voltage and current as in other OHM'S Law lessons.

The student should be well acquainted with the various methods of interconnecting circuits when greater amounts of voltage and current are needed. Most workmen deal with circuits in terms of parallel connections and become confused when they get into a combination of series and parallel hook-ups. Electrical energy, if wrongfully directed in a circuit, will oppose the direction of the desired current flow with harmful results.

PRESENTING THE LESSON:

The use of demonstrations, models, mock-ups, and large wiring charts will help greatly in presenting this lesson.

You may draw similar circuits on the chalkboard and ask the class to tell how the current and voltage would be distributed. It is recommended that some demonstrations be used with this lesson, if possible. The demonstrations can be applied to the material at hand by setting up a SERIES - PARALLEL CIRCUIT and making various readings throughout the circuit. Then calculate the voltage, current or resistance of the circuit. This type of illustration will make a lasting impression on the student.

Remember to always work the SERIES and PARALLEL groups separately within the combined circuit and then solve for the whole combination.

Note: If you wish to use more practice problems for SERIES-PARALLEL combination, see Basic Mathematics by Singer, pages 136-138.
Show film--"Series and Parallel Circuits"

APPLICATION:

Have the students to answer questions and work the problems on the assignment sheet. Give individual suggestions where needed, but do not answer the question for the student.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against the answer sheets and return to the students. Assign extra problems if required.

Lesson A-17

POWER AND WORK

DESIRED RESULTS:

1. To acquaint the student with some of the terms of electrical energy that apply to work and power.
2. To inform the learner that work is done when force accomplishes something (weight x distance). Power is the work done times the speed of doing it.
3. To solve problems involving the power formula.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Lampbank and meters

REFERENCES:

1. American Electricians' Handbook, Div. 1, page 25 sec. 56-64; p. 40, sec. 110-111
2. Basic Electricity, Vol. 2, pages 42-54
3. Basic Mathematics, pages 148-155
4. *Swoope's Lessons in Practical Electricity, pages 168-177, 180-183

INTRODUCTION:

This lesson will introduce the students to the use of terms such as, horsepower, watts, etc. Ask the students to check the labels on electrical equipment they see on the job for horsepower, watts, KW, voltage and current rating. An electrician may be called upon to install a unit of equipment rated in horsepower, or watts or voltage only. The electrician must decide how much current the piece of equipment will demand. Knowing the current needed, he must install the proper size wire and protect the circuit and equipment with the proper fuse. The power equations studied in this lesson will be used many times to find information not given on the name plate of a piece of electrical equipment.

PRESENTING THE LESSON:

For a practical demonstration of this lesson, use a lampbank with lamps of various sizes. The ammeter and voltmeter will show a good relationship between the wattage of rating of the lamps, the applied voltage, and the current drawn by the circuit.

A thorough understanding and the ability to use the power equations should be stressed. Point out to the students the close relationship between the following Power Equation and the Ohm's Law equation.

$$P = IE \qquad E = \frac{P}{I} \qquad I = \frac{P}{E}$$

If more practice problems are necessary than given on the assignment sheet, see Basic Mathematics, by Singer, pages 150-152.

APPLICATION:

Have the students answer the questions and work the problems on the assignment sheet. Give assistance if needed, but do not give them the answer.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against the answer sheet and return to the students for correction and filing in their notebooks.

Lesson A-18

WIRE CONSTRUCTION

(PATHS FOR THE ELECTRIC CURRENT)

DESIRED RESULTS:

1. To acquaint the learner with the fact that all electrical devices receive their energy from a source by means of metallic conductors.

2. These conductors are separated or supported by non-metallic materials called insulators.

MATERIALS, EQUIPMENT, AND SUPPLIES:

1. Chalkboard and chalk
2. Samples of wire and insulators to be studied
3. Experimental materials to demonstrate "Conductors and Insulation"

REFERENCES:

1. American Electricians' Handbook, pages 2-2 thru 2-13, 2-36 thru 2-38
2. Information Sheet--"Wire and Materials"
3. National Electric Code--Article 310
4. Text: *Swoope's Lessons in Practical Electricity

INTRODUCING THE LESSON:

Call attention to the fact that wires are very much like pipes in that they permit the flow of electricity, but whereas pipes are hollow, wires are a solid. It is important to know the characteristics of these "electrical pipes", called conductors, and how they are made safe within the home and in appliances.

PRESENTING THE LESSON:

A. Electrical devices are connected to a source by wires to provide a path for the electric circuit.

   1. Make a sketch:

      a. Two wires are needed to complete a circuit.

      b. Electric current must flow from the source to the device and return to the source.

B. Electrical devices are made of different materials.

   1. Show:

      a. Difference of materials in an insulated wire.

      b. Different materials in a plug.

      c. Define materials such as metallic and non-metallic.

C. Demonstrate: "Conductors and Insulation"

1. Samples of wire and insulating materials are studied.
2. Experiment showing materials that conduct current and insulate current.

APPLICATION:

Have learner work and hand in assignment sheet #A-18. Give individual help where needed.

CHECKING AND FOLLOW-UP:

Check assignment sheets against answer sheet and return to learner for placing in workbook.

Lesson A-19

WIRE SIZES

DESIRED RESULTS:

1. To acquaint the student with a number of different types of wire, according to the insulation.

2. To teach the student to identify types of wire and sizes in general use on the job.

MATERIALS, EQUIPMENT & SUPPLIES:

1. Chalkboard & Chalk

2. Sample wire up to No. 4

3. Wire Gages & a Micrometer

REFERENCES:

1. National Electrical Code, Article 310, Chapter 9

2. American Electricians' Handbook, pages 1-33, Sec. 92-94, Div. 2-4 & 2-5, 2-40 thru 2-45

INTRODUCTION:

1. The lesson should acquaint the student with the fact that there are different types of wire classed according to the insulation.

2. Call attention to the fact that the size of wire is usually expressed according to some wire gage. However, it has become standard practice in the United States to employ the American Wire Gage, also known as the Brown & Sharpe for designating copper and aluminum wire and cable used in the electrical industry.

PRESENTING THE LESSON:

1. Show the class samples of as many types of wire according to the insulation as possible. Have each student examine the types of wire so he can classify wire according to insulation. Discuss the different types of insulation with the class.

2. Demonstrate to the class how to use the gage in measuring the size of wires. Wire gages are used for the measurement of diameters of wire and thicknesses of sheet metal. Wire sizes are referred to by gage numbers, the smaller the number the larger the wire. Micrometers are gages for that purpose. Where micrometers are used, the wire diameters are expressed in thousandths of an inch.

3. The students should use the gages and micrometers to help identify wire sizes. They are expected to know sizes up to No. 4 on the job.

   Note: A circular, mil (C.M.) is the area of a circle 1/1000 in. in diameter and is the unit for all wire measurement.

APPLICATION:

Have the students complete the answers to questions on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against answer sheet and return to students for discussion and placing in notebooks.

Lesson A-20

VOLTAGE DROP

DESIRED RESULTS:

1. To understand what is meant by Voltage Drop.
2. To be able to use the formula to determine excessive voltage drops.

MATERIALS AND EQUIPMENT:

1. Chalkboard
2. Voltmeter, Lamp Bank

REFERENCES:

1. American Electricians' Handbook, pages 300-328
2. Basic Electricity, Vol. 1, pages 90-97
3. Basic Mathematics, pages 280-284
4. National Electrical Code, page 43, section 215-3
5. *Swoope's Lessons in Practical Electricity, pages 134-339

INTRODUCTION:

The two factors that must be considered in determining the size of wire to be used in an electrical circuit are the current-carrying capacity of the wire and the permissible voltage drop.

The electrician always determines current-carrying capacity by consulting tables in the various electrical codes. On the other hand, voltage drop is nearly always calculated by the electrician himself. The National Electrical Code recommends that voltage drop from service head to distribution center be not more than 1 per cent for lighting and 3 per cent for power loads. These voltage drops should be limited to 2 per cent. Voltage drop must be allowed when circuits are installed on commercial and industrial buildings, but is seldom considered for circuits on residential buildings.

PRESENTING THE LESSON:

In this lesson, the student will not learn all there is to be known about voltage drop. Teach them some of the basic facts so they can learn to figure Voltage Drop. Also, how voltage drop is used in calculating the sizes of wires required for certain circuits. Spend enough time on this lesson to be sure that the students understand how to use the formula for finding Voltage Drop.

Introduce the following formula by writing it on the chalkboard and explaining its use.

$$VD = \frac{K \times I \times 2L}{CM}$$

VD = Voltage Drop
K = Resistance (1 mil foot of wire)
I = Amperes
L = Distance of wire one way
CM = Circular mils

Work several problems illustrating how to solve for various unknowns.
NOTE 1: If the students have trouble rearranging the formula. It is much easier for some to substitute in the original form and solve for the unknown.

NOTE 2: By use of the formula, we find Voltage Drop, but the National Code recommendations give <u>PERCENTAGE</u> voltage drop.

APPLICATION:

The students will answer questions and work problems on Assignment Sheet A-20.

CHECKING AND FOLLOW-UP:

Correct the assignment sheet. Be sure to give assistance to those that had trouble.

INTRODUCTION TO NATIONAL ELECTRIC CODE

DESIRED RESULTS:

1. To acquaint the apprentice with the purpose and scope of the CODE.
2. To introduce the apprentice to the definitions and fundamental rules covered by the CODE.

REFERENCES:

1. National Electrical Code, Articles 90, 100, 110
2. American Electricians' Handbook, General Interior Wiring, p. 1208

INTRODUCTION:

This is the apprentice's first contact with the NATIONAL ELECTRIC CODE. He will be working by these rules for his entire life in the electrical industry. The importance of learning the purposes and organization of the CODE cannot be over emphasized.

This lesson should give the student a clear picture of how the CODE is organized so that the apprentice may find information more easily in later assignments and on the job. The CODE is not a set of laws; it is a set of rules. It is intended for use by governmental bodies exercising legal jurisdiction over electrical installations and for use by Insurance Inspectors.

Article 100 - Contains definitions of Electrical Terms.

PRESENTING THE LESSON:

In the National Electrical Code Book - Article 90, which is the Introduction, outlines the purpose and explains the scope of the CODE.

The best results will be obtained from all CODE lessons if they are used as study guides for the student. The instructor should lead a class discussion of the material contained in each section of the CODE used in the assignment.

After discussing the sections and giving illustrations from your experience, then the assignment sheet with specific questions can be distributed.

Remind the students that the Chief Electrical Inspectors usually exercise legal jurisdiction over electrical installations through city ordinances or laws based on National Electrical Code. Some communities use the CODE as it is for their local Electrical Ordinance. Most citizens realize that the CODE is only the minimum standard so they improve on certain portions for their use. If the electrician knows the National Electrical Code, he may be able to work in any locality, but he should become familiar with local ordinances.

APPLICATION:

Hand out the assignment sheets and have the students answer the specific questions using the CODE book.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in the workbook.

GENERAL REQUIREMENTS FOR WIRING INSTALLATIONS

DESIRED RESULTS:

To acquaint the apprentice with the general requirements for wiring methods and installations.

REFERENCES:

1. American Electricians' Handbook, Div. 9-140 thru 171
2. National Electrical Code, Article 300, 310

NOTE: This assignment may take two lesson periods to complete.

INTRODUCTION:

In the U.S.A., cable wiring is probably the most recognized wiring method, especially for residential type construction. Local ordinances in some cities may limit the extent of its use, but cable wiring in some form is recognized in almost every place where electrical power is available. The General Requirements for wiring methods are listed in the National Electrical Code, Article 30.

This assignment contains information about over-current protective devices and fuses, sizes of conductors, types of conduit, installing boxes, grounds and grounding, and various raceways. This information will be very useful to the apprentice in his daily work on the job.

The student may not realize the fact but it requires a skilled craftsman to make a concealed electrical installation in an old building. It is essential that he leave the building in good repair when he is finished.

PRESENTING THE LESSON:

The instructor should lead a class discussion of the material found in the assignment. The students should have read the assignment and have questions for discussion ready to present.

Use American Electricians' Handbook, Division 9 and National Electrical Code, Article 300 and 310 as study guides for this assignment.

There are 22 types of wiring for general use for power and light systems.

1. Call attention to the method of determining the minimum and maximum size of conduit for interior installations. The current capacity of a conductor is limited by the temperature its insulation will withstand.

2. The National Electrical Code requires that fuses or circuit breakers be provided for all ungrounded conductors to open the circuit when the current is abnormally high.

3. Conduit systems contain both junction and outlet boxes. A junction box is placed where several conduit runs intersect. It provides means for pulling in the wire and serves as an inclosure for the connections that must be made. It is possible to ground the entire system with one ground connection. Outlet boxes may be used to inclose a switch which controls the current in a circuit or fitted with outlets and special cover through which light and power loads can be connected.

4. Grounding is executed by connecting one wire from a wiring system or the metallic covering of electrical devices to a steel beam of a building, to a ground strap fastened to a water pipe or a pipe driven in the ground. Grounding is necessary to protect life and property.

APPLICATION:

Have the students find the answers to the questions on the assignment sheets. This may take two meetings.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their workbooks.

RIGID METAL CONDUIT

DESIRED RESULTS:

To acquaint the apprentice with some of the techniques connected with conduit installations that must be learned through experience.

REFERENCES:

1. American Electricians' Handbook, Div. 9, par. 57 ff.
2. Local Electrical Codes and Ordinances
3. National Electrical Code, Article 346

INTRODUCTION:

Single family dwellings are seldom wired completely with rigid metal conduit because of the high cost of such an installation. However, it is widely used in industrial plants. Electrical metallic tubing is sometimes employed because the cost of labor for installation is much less than for rigid conduit. The cost is still somewhat higher than that for a knob-and-tube or a cable-type installation.

It is common practice to install a rigid-conduit or an electrical-metallic-tubing service raceway even though the bulk of the installation is carried out by some other method of wiring.

HYDRAULIC CONDUIT BENDERS

Industrial installations of Rigid Metal Conduit have routinely presented electricians with jobs of great proportions; however, with the hydraulic equipment in use today, this work is easily accomplished. Various attributes of fluid or hydraulic power equipment recommend it to the electrical industry. Hydraulic tools readily increase 100 pounds of applied effort to 200,000 pounds of output. The tools are versatile, light in weight, compact in size and completely mobile, so that one man can carry a hydraulic set capable of moving 50 tons.

In recent years, electrical installations have become larger and more complicated with the result that the electrician is called on to make many large bends in conduit. Hydraulic equipment is used to bend conduit having a diameter larger than 1". Conduit of smaller dimensions is usually bent by a hand bender. The two principal types of benders for large conduit are: 1. A "One-shot" bender which makes a full 90° bend with a single stroke and setting; and 2. A segment bender, which requires several smaller, single-stroke stages to complete a 90° bend.

PRESENTING THE LESSON:

Try to have a small Hydraulic Conduit Bender to demonstrate to the class. The student should know how the machine operates as well as its use.

Using the Information Sheet on Rigid Metal Conduit Bending as a guide, the following topics should be discussed:

1. Radius of Bend
2. Principles of Precision Bending
3. Concentric Bending
4. General Purpose Bending
5. Bending the Angle

Review important topics on Rigid Metal Conduit Wiring referred to in American Electricians' Handbook.

APPLICATION:

Have the students complete the answers to the questions on the assignment sheets.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their workbooks.

ELECTRICAL METALLIC TUBING

DESIRED RESULTS:

To acquaint the apprentice with the construction and restrictions in the uses of electrical metallic tubing.

REFERENCES:

1. American Electricians' Handbook, Div. 9, 68-70
2. National Electrical Code, Article 348

INTRODUCTION:

Electrical metallic tubing (EMT) sometimes called "thin-wall conduit" has a wall thickness less than that of rigid conduit, and it bends more easily. It is connected with compression or indentation type fittings, since it is too thin to thread. A special tool is used to install indentation fittings.

PRESENTING THE LESSON:

Electrical metallic tubing is installed and has the same use for both exposed and concealed work as rigid conduit except it cannot be used where subject to sever physical damage. When used in wet locations or poured over in concrete, fittings of the type to prevent water entering the conduit shall be used.

Tubing and fittings may be obtained, made of an alloy having corrosion-resisting characteristics. This makes them especially suitable for use in many locations where there are corrosive fumes, or excessive moisture.

No tubing shall be used smaller than $\frac{1}{2}$ inch in diameter, electrical trade size, except for under plaster extensions. The maximum size tubing shall be the 2-inch electrical trade size.

Bends in the tubing shall be made that the tubing will not be injured and that the internal diameter of the tubing will not be effectively reduced. One run of conduit should preferably include not more than three "quarter" bends.

APPLICATION:

Have the students complete the answers to the questions on the assignment sheets for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their workbooks.

FLEXIBLE METAL CONDUIT

DESIRED RESULTS:

To acquaint the apprentice with the construction and restrictions in the uses of flexible metal conduit.

REFERENCES:

1. American Electricians' Handbook, Div. 9, 50-55
2. National Electrical Code, Articles 350 and 351

INTRODUCTION:

Flexible metal conduit is used in difficult places requiring a number of irregular bends or where flexibility is required. Such as connecting a motor to rigid conduit, not exceeding 24 inches in length.

Flexible metal conduit is used and installed according to the rules and practices for installation and use of armored cable. It is installed and conductors are pulled into it in the same way conductors are installed in rigid conduit. The size of flexible conduit is determined by the inside diameter.

PRESENTING THE LESSON:

Installations of flexible metal conduit shall comply with the provisions of the code listed in prargraph 3501 of the code.

Flexible metal conduit shall not be used in:

1. wet locations, unless lead-covered type
2. hoistways, except as provided in section 62-6
3. storage-battery rooms
4. any hazardous location except permitted in Sections 5054 and 5073
5. where rubber-covered conductors are exposed to oil, gasoline, etc.

MINIMUM SIZE - No flexible metal conduit less than one-half inch electrical trade size shall be used except as permitted in section 3503.

Straps or other means of securing the conduit in place should be spaced much closer together for flexible conduit than is necessary for rigid conduit. Every bend should rigidly secured so that it will not be deformed when the wires are being pulled in, thus causing the wires to bind.

LIQUID-TIGHT FLEXIBLE METAL CONDUIT

This conduit is similar in construction to the flexible metal conduit but is covered with an outer sheath of material to make a liquid tight jacket.

Connectors and grounding bushings are available for terminating the conduit and providing effective grounding connections. It is used in the wiring of machine tools, motors or portable equipment where flexibility of connection is required.

In paragraph 3512-b lists the conditions under which Liquid-Tight Flexible Metal conduit shall not be used.

1. Where it is subject to mechanical injury
2. Where it is in contact with rapidly moving parts
3. Where the temperature is above (60°C) or 140°F
4. In any hazardous location.

The maximum sizes of the conduit and conductors to be installed are listed in article 351, paragraphs 3514 and 3515.

APPLICATION:

Have the students complete the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers to the questions and return the sheets to the students for correction and placing in their workbooks.

Lesson A-26

STORAGE BATTERIES

DESIRED RESULTS:

1. To acquaint the student with the construction and operation of storage cells.
2. To acquaint the student with the chemical properties of different types of cells.
3. To teach the student to understand electrolysis, and other instances of electrochemical action.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Supplies to make a storage cell

REFERENCES:

1. American Electricians' Handbook, Div. 4, Sections 130-178
2. Basic Electricity, Vol. 1, pages 23-29
3. National Electrical Code, Article 480
4. *Swoope's Lessons in Practical Electricity, pages 67-102

INTRODUCING THE LESSON:

The study of batteries could be a course in itself but in this lesson the student should become acquainted with the chemical properties of several types of cells. One of the major problems involved in electrical systems, depending on storage cells for part-time operation, is the proper battery care and maintenance. The facts explained in this lesson should be thoroughly understood by people who maintain this type of equipment.

PRESENTING THE LESSON:

Point out:

a. That cells, such as dry cells, that cannot be charged, are called "primary cells" to distinguish them from those that can be recharged, known as "secondary cells" or the storage battery.

b. A storage cell does not store electrical energy; it stores chemical energy and then changes the chemical energy into electrical energy as needed.

c. When the chemical energy has all been changed to electrical energy, it can be restored only by sending a current through the cell.

d. There are two main types of storage cells in use. The "lead acid" used on all motor-driven vehicles and the "Edison Cell" which is extremely rugged but has low cell voltage. The Edison Cells are not as efficient as "lead acid" cells, as they return only 60 to 65 per cent of the charging energy.

APPLICATION:

Have the students work and hand in ASSIGNMENT SHEET. Give individual help where needed.

CHECKING AND FOLLOW-UP:

Check assignment sheets against answer sheets and return to the students for correction and placing in workbook.

FUSES

DESIRED RESULTS:

1. To learn that in electrical work every circuit must be provided with over-current protection.

2. To understand the National Electrical Code standard fuse ratings and the sizes required for protection of certain devices.

MATERIALS AND EQUIPMENT:

1. Sample fuses of different types: plug, cartridge, knife-blade contact renewable fuse, etc.

2. Edison type fuse; time-lag fuse (if available).

REFERENCES:

1. Basic Electricity, Vol. II, Pages 47-48.

2. National Electrical Code, Article 240.

3. American Electricians' Handbook, Div. 4, Sec. 28-62.

4. Fuseology - Bussman Manuf. Co.

INTRODUCTION:

In electrical work every circuit must be provided with over-current protection. It may be a 132,000 volt transmission line carrying 200 amperes or it may be 110 volt lighting circuit with a load of 10 amperes. Each must have some form of protective device for the possible overload of current for the protection of both circuits and apparatus.

In this lesson we are primarily concerned with the simpler circuits requiring the common types of over-current protective devices, such as, the plug fuses and the cartridge fuses. As we advance in out study, the more complicated protective devices will be investigated.

PRESENTING THE LESSON:

The need for the use of protective devices as fuses has been discussed. You have learned that excessive current may seriously damage electrical equipment - motors, instruments, radio receivers, etc. Fuses are cheap, other equipment much more expensive. When the fuse which is connected in series with the equipment is blown, the circuit will open before the excessive current does damage to the equipment.

Demonstrate sample fuses to the class: glass cartridge fuses, solid cartridge fuses and screw-plug fuses.

It is important that you always use fuses with the proper current rating. The rating should be slightly higher than the greatest current you expect in the circuit. Example: Since the range of a ammeter is 0 to 1 ampere, a 1.5 amp fuse should be used to protect the equipment. In protecting equipment to use fuses with too low current rating will result in unnecessary blow-outs, while one with too high current rating may allow dangerously high currents to pass.

(Precautions): Fuses are used for protection. Do not jumper out a fuse. Do not increase the size of a fuse unless and until you are sure it is the right thing to do.

NOTE: The Bussman Fuse Company will be glad to put on a demonstration for this lesson. Contact their representative and arrange for him to be present. In the event that a representative of the above company is not available, try to contact a representative of another company or a specialist in this field.

APPLICATION:

Give the class time to answer the questions concerning "overcurrent protection" on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Correct the assignment sheets, discuss the results and have the student place them in their workbooks.

Lesson A-28

SAFETY AND FIRST-AID

DESIRED RESULTS:

1. To impress on the apprentice the need for him to practice SAFETY.
2. To keep the apprentice aware of the hazards of his job and to do all we can to improve SAFETY in the electrical construction work.
3. To present a film on FIRST-AID or have a specialist in FIRST-AID make a presentation with demonstrations.

MATERIALS & EQUIPMENT:

1. Safety posters and Slogans
2. 16 mm Film Projector
3. Safety and First-Aid Films

REFERENCES:

1. Information Sheet
2. Safety Manuals
3. First-Aid Manuals

INTRODUCTION:

Emphasize to the students that two of the major hazards of a construction job are falling objects and falls of workmen. The practice of good housekeeping will help to eliminate many hazards that result in accidents.

There seems to be a tendency to skip Safety as a subject that is not very important. However, if you can prevent a broken bone for yourself or a fellow workman through good housekeeping practices, it would be a very important accomplishment.

Great strides have been made in Safety and Safety Education in the construction field in recent years. There is still a great deal of room for improvement. In the Electrical Construction work, we must constantly keep ourselves aware of the hazards of our job. Each worker must continue to improve Safety in his job daily. First of all for his own benefit, as well as for the sake of his family, his fellow workmen, and his employer.

In this course, it has been left to the instructor to find out and inform the apprentice as to the particular areas of the Workman's Compensation Laws: 1. In relation to his being hurt on the job and suffering lost time injury. 2. How much money can be collected per week. 3. When the payments start and for how long? It will be necessary for the apprentice to have this information to answer some of the questions on the assignment sheet for this lesson.

Point out that many construction electricians have not only been crippled but also have died because of unsafe practices on ladders. Point out any local accidents caused by unsafe use of ladders. Experience has proven that the most effective way to reduce accidents is to concentrate on one phase of the accident problem at a time.

If there are specific Safety regulations in the local apprentice agreement, now is the time to discuss them in conjunction with this lesson.

PRESENTING THE LESSON:

The instructor should give illustrations to encourage the apprentice to develop clean personal and Safety habits. To instill in him a sense of responsibility and good will for his employer and all concerned will prove of great value.

In this and future lessons, Safe practices will be discussed on many topics such as: ladders, tools, scaffolds, protection of the eyes, and others. Careful consideration and study of such items may eliminate an accident to you or a fellow workman.

A few suggested things to do to make this lesson more effective:

1. Make it a general discussion of SAFETY.
2. Have a good many SAFETY posters available to illustrate a particular point.
3. Have men suggest SAFETY slogans - record and discuss some.
4. Have men discuss SAFETY practices they have observed on the job.
5. Have men discuss unsafe conditions they have observed on the job.
6. Have the class discuss accidents or near accidents that they have witnessed where ladders were involved. Using the ladders for demonstrations--
   a. Point out "unsafe conditions" in using ladders.
   b. Point out "unsafe acts" while using a ladder.

NOTE: 1. Show a safety film which will apply or have a specialist in first-aid make demonstrations.
2. Suggested maximum time to spend on this lesson--one hour.

APPLICATION:

Have the students answer the questions on the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers to the questions and return to the student for correction and placing in workbook.

Tools Required

The following minimum tool lists were submitted by the Carolinas Chapter, National Electrical Contractors Association:

A. Apprentices should own the following tools:

1. Pocket knife (Electrician's)
2. Screwdrivers
   a. Large
   b. Small
3. 6 ft. rule
4. 2 pairs Channel Locking Pliers
5. Side Cutting Pliers

B. Journeymen should add the following tools:

1. Pipe Wrenches
   a. 10"
   b. 14"
2. Cold Chisels
3. Center Punch
4. Screw Driver Set 3" to 6"
5. Claw Hammer
6. 10" - Crescent Wrench
7. Tri-Square
8. Plumb Bob
9. 12" - Hack Saw Frame
10. Level
11. Brace & Extension Bit
12. Voltage Tester - "Square-D" or equal

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, TESTS, *APPRENTICESHIPS,

This study guide, the first of a four-unit series, is for individual student use in studying technical information in the first year of the related technical phase of post-secondary electrician apprenticeship training. It was developed by a curriculum committee and the educational committee of the National Electrical Contractors of North Carolina. The material was designed by subject matter specialists, tested on a small group, and used in apprenticeship programs. Assignment and information sheets are included for 28 lessons in the areas of basic mathematics and orientation, fundamentals of electricity, and National Electrical Code. They contain textbook references, introduction and directions, and problems. The minimum class time is 144 hours per year. The teacher should be a journeyman tradesman, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include unit tests to be given approximately every six weeks and a final examination. Correlated lesson plans for the instructor are given in VT 003 624. Documents of the four-unit series are listed as VT DD3 624 through VT 003 631. (HC)

PREFACE

The materials in this publication have been prepared to provide specific assignments for studying related topics necessary in the training of electrical apprentices. An effort was made to develop the schedule for the instructors to follow as the apprentice progresses with his training. It will also enable the apprentice to know what skills and knowledges will be required of him. One objective of this program is to aid the instructor and employer in providing experiences necessary to develop a competent worker in the electrical field.

This workbook includes assignment sheets and information sheets for the electrical apprentice to use in searching out related information. They contain textbook references, problems to solve and key sentences to complete, diagrams to draw, and blueprints to consult. The apprentice should study the assigned references before he attempts to answer the questions or solve the problems.

In actual use of these lessons, instructors should feel free to modify their application of the material to conform with local needs, For example, there may be certain sections of the Code to teach because the apprentices are working with special installations. Thus, the instructor will prepare additional materials to use with the course. In other classes, the instructor may need to spend more time on topics dealing with mathematics than with blueprint reading. In any event, the minimum class time for related material is 144 hours per year. It is sincerely hoped that the assignment sheets are used correctly, so that apprentices can gain maximum benefits from their related studies.

ORIENTATION

Lesson A-1

YOUR RELATED INSTRUCTION

INTRODUCTION

The lessons prepared for the electrical apprentice have been divided into four one-year courses of approximately 144 hours each. Each lesson is designed to give you fundamental related information that will help you progress in your work. Basic electrical theory, mathematics, job information, National Electric Code and blueprint reading will comprise the subjects to be studied during the four years. It will be impossible for you to learn all you need to know in class, but these courses should give you a good basic foundation.

If you are to make proper progress in the electrical wiring trade, it is necessary to understand how this related instruction is organized. Also, how to get the most out of your work on each assignment. The following information explains how to make the most efficient use of this course.

WHY YOU ARE TAKING THIS COURSE

Apprentice training is an educational program in which the apprentice learns a skilled trade through a combination of work experiences on the job and related technical instruction in class. On the job, the apprentice learns how to do many of the skilled operations of the craft while working with experienced journeymen.

In the electrical wiring trade, the beginner must learn the related information as well as the job operations. This technical knowledge is easier to learn in an organized class than on the job. The related information is available only in books, manuals, and films that can best be used in schools, with the aid of a teacher. The mechanic who knows the technical phase of his craft is better prepared to plan work, understand the plans of others, and "trouble-shoot" or solve problems. A mechanic can sometimes "get by" with a small amount of technical information, but rarely does such a man become a successful foreman, supervisor, or electrical contractor. The related information you can learn through regular school attendance and careful study of the assignments in this course will prepare you for advancement in your trade.

THE COURSE AND HOW TO USE IT

The Assignment Sheets provided for each lesson are study guides to use in searching out related information. They contain textbook references, problems to solve and key sentences to complete, diagrams to draw and blueprints to consult. Be sure that you study the assigned references before attempting to answer the problems or fill in the blanks.

It will be necessary to study the assignments outside of class, so be sure you understand what is required. Each lesson will have a number, as A-4, which is Mathematics - Formulas and Equations. References will be found in Basic Mathematics by Singer, pages 24-36. Some references that are marked with the asterisk (*) are substitute texts or references you may use if available in the library.

The instructor will assign the information sheets and the lesson sheets to study the week before the class meets. Be sure to read the related information carefully before completing the problems in the space provided. The lesson sheets will be checked in class and returned to you. Correct the mistakes and place the sheets in your notebook for future reference.

TESTING AND EVALUATION

Special problems and tests will be worked out during class periods. There are short tests to be given weekly, and unit tests to be given approximately every six weeks. A final examination will be given at the end of each year. Many of these questions will be of the "open book" variety in order to use formulas, tables and the National Electrical Code. These tests will be given to see how well you are learning the related information. Also, they will determine to a large extent your grade in the course.

TIPS ON HOW TO STUDY

In order to make the information you study of any value, it is necessary to prepare your lessons in a way that you will remember them. This requires concentration and real effort rather than just "reading," but it pays off in the long run. Many apprentices object to being required to learn by reading, as they sometimes find it difficult to get the meaning from the printed word. The ability to read accurately and rapidly is an important advantage if you want to progress in the electrical business. The electrician who wants to get ahead or even keep up with his craft must be able to get the latest technical information by reading. Most slow readers are not aware of the handicap under which they are working. Many adults are enrolling in Reading Courses to improve their accuracy and speed. It would be wise for you to visit your local school for a reading "check-up."

The following method studying technical information has proved an excellent one:

1. Survey the entire assignment, by "skim" reading paragraph headings and key sentences. This will give you the over-all picture of the lesson.
2. Go back to the beginning of the assignment and read the first paragraph. Now, look up from your book and try to repeat to yourself, in your own words, the meaning of the paragraph. If you cannot do this, the information did not become "fixed," and you will have to go over it again until it does.
3. Repeat the above process with each paragraph in the assignment. As you study, try to apply the information to a practical job situation.
4. Then, you are ready to complete the problems on the Assignment Sheet for the lesson. You will quickly recognize the material and be able to find the answers in less time.

NOTE: For additional help on how to read and study profitably, find the following booklets in the library or write to the publisher for a copy.

1. How to Study, American Technical Society, Drexel at 58th St., Chicago 37, Ill.
2. Tips on How to Study, Delmar Publishers, Inc., Albany, New York
3. How to Study, Morgan & Deese, McGraw-Hill Book Co., New York, N.Y., 1957.

REFERENCE: ELECTRICAL CATALOGS

GENERAL INFORMATION:

One of the first duties of an apprentice is to learn the tools used on the job. He should not only know their names but also the proper use and care for them. In this assignment we will consider only a few of the basic tools. When you see a new tool, ask what it is called and its proper use.

ASSIGNMENT DIRECTIONS:

In the space provided, place the names for hand tools used by the electrician. As you learn about new tools, add their names to the list. Later you will learn the names of power tools and their uses.

MATERIALS

(Conduit and Cable Fittings)

REFERENCE:

1. Electrical catalogs
2. Electrical Conduit and Cable Fittings, The Thomas & Betts Co.

INTRODUCTION & DIRECTIONS:

The beginning apprentice must become familiar with the materials used to install an electrical system. The sooner he acquires this knowledge the more valuable he becomes to the industry. If you are truly interested in your work, you will learn all the different materials used in the trade as soon as possible.

Look through the catalog and find the common fittings shown on the pictured sheet (Electrical Conduit and Cable Fittings). Study other materials as you look for the specified ones. You cannot learn all of them at once, but try to become acquainted with specifications and how to order the materials.

Place the proper name in the blank of common fittings and other materials needed in a small dwelling.

ORIENTATION

Lesson 4

BASIC ELECTRICITY

Topic: Your Apprenticeship

REFERENCES:
1. Apprenticeship Agreement
2. Local Apprenticeship Standards
3. Local Agreement (Contract)

GENERAL INFORMATION:

When you discussed your apprenticeship with the Local Joint Committee, they gave you important information. You remember some of it; some has slipped your mind. Now is a good time for refreshing your mind, discussing more of the details in class so you may get a better understanding as this affects your life-time work.

QUESTIONS:

1. How many years will you be an apprentice?

2. How many hours will you attend apprentice classes each year of apprenticeship?

3. What wages will you make during apprenticeship?

4. How long is your probationary period?

5. What is the purpose of the probationary period?

NAME ______________________ Lesson 4

Your Apprenticeship Page 2

6. How many "work hours" in your term of apprenticeship?

7. Is your "apprenticeship agreement" with an employer or with the Joint Apprenticeship Committee?

Why?

8. Are the Apprenticeship Standards important to you? Why or why not?

9. What is the authority for the Joint Apprenticeship Committee's Actions?

10. How many members are on the Joint Apprenticeship Committee? How are they selected? Be specific.

PROBLEMS

1. Addition of Fractions:

(a) 1/16 + 1/32 + 5/64 = ____________________

(b) 5/6 + 1/9 + 3/4 = ____________________

(c) 1/2 + 4/7 + 3/4 = ____________________

(d) 7/8 + 1/4 + 3/16 = ____________________

(e) 1/100 + 8/25 + 7/10 = ____________________

2. Find Least Common Denominator:

(a) 5/6 + 1/9 + 2/3 = ____________________

(b) 1/4 + 1/12 + 1/15 = ____________________

(c) 1/50 + 1/100 = ____________________

(d) 1/5 + 1/7 + 1/9 = ____________________

(e) 1/3 + 1/6 + 1/9 = ____________________

3. Find value of unknown letter:

(a) $\frac{R}{6} = \frac{2}{12}$

(b) $\frac{E}{5} = \frac{2}{3}$

(c) $\frac{2E}{5} = \frac{3}{5}$

(d) $\frac{11}{22} = \frac{R}{7}$

(e) $\frac{1}{C} = \frac{15}{20}$

MEN OF ELECTRICAL HISTORY

To appreciate the history of the Electrical Industry, we must investigate the work of great scientists in this field. The first discovery of static electricity was made in 600 B.C., when a piece of amber rubbed with a cloth attracted small bits of paper, straw, etc. Approximately 2000 years later, Dr. Gilbert discovered that other materials such as glass, sealing wax, rock crystal, and sapphire would attract light materials the same as amber. The Greek work for amber is "electrum", and our modern word "electricity" is derived from it. The word "electricity" was first used by Dr. Gilbert in 1600.

There are many other men that have contributed to the discoveries concerning electricity, although we know very little about this great form of energy. It is suggested that you visit the library or use a good encyclopedia and write out the main contributions to the electrical field by the following men. You could write a longer theme about the discoveries of one particular man.

1. Stephen Gray
2. Luigi Galvani
3. Samuel F. Morse
4. Michael Faraday
5. Z. T. Gramme
6. Alexander Graham Bell
7. M. G. Marconi
8. Thomas Alva Edison
9. Charles P. Steinmetz
10. George Westinghouse

5. The flow of an ________________ current is ____________ at regular intervals.

6. List three classifications of direct currents:

   (a) ______________ (b) ______________ (c) ______________.

7. An ________________ is the rate of flow of electricity.

8. The speed of electric current is approximately ____________ miles per second.

9. An ______________ measures current in units of amperes and is connected in ________________ in the circuit.

10. The principal effects of current are ______________, ______________, and ______________.

11. One ampere is equal to a flow of ______________ electrons per second.

INFORMATION SHEET

Lesson A-10

YOUR FUTURE IN THE ELECTRICAL INDUSTRY

When you decided to sign an agreement to become an electrical apprentice, it was an important decision in your life. It was a good choice if you like the work. To be successful you must strive to be above average in your work and devote many hours to the study of technical information.

You have expressed a desire to learn this trade by signing the apprentice agreement to work for moderate wages and attend classes for at least 144 hours per year for four years. You realize that in this time you cannot learn all the "hows" and "whys" of your job. The basic technical information and the on-the-job experience will help you become a better craftsman.

The future depends entirely upon you. There are many and varied opportunities in the electrical industry for you. The wages of journeyman in the electrical trades are as good or better than those employed in other trades. A majority of the electrical contractors who operate their own businesses once worked as tradesmen. There are many jobs in maintenance and repairing of electrical equipment in industrial plants, public buildings, schools, power and light companies, and other utilities. There are many opportunities in the field of radio and television for those who know the "how" and "why" of electronics.

The electrical industry is less than one hundred years old and is expanding by leaps and bounds. The United States produces and uses about one-half of the world's supply of electricity and has only seven per cent of the population. Perhaps you can see today the many opportunities that await you tomorrow.

What are you going to do? You have the opportunity by attending the apprentice classes maintained to help you to prepare for a better life. It is the sincere hope of the committee and the school that you cooperate by working at the height of your ability.

REFERENCE

1. American Electricians' Handbook, Page 3-3 ff.
2. Basic Mathematics, Page 127 - 137.
3. Basic Electricity, Pages 2-90 thru 2-103.

PROBLEMS

1. Series circuits provide a means for ______________ and ________________ the current by connecting _________________ in series.

2. Series circuits are used where ____________ ______________ ______________ and _______________ _________________ are needed.

3. List two disadvantages of series circuits:

   (a) ___________________________________

   (b) ___________________________________

4. Parallel circuits are used where ______________ ______________ and ___________ ______________ of ________________ are required.

5. List two advantages of parallel circuits:

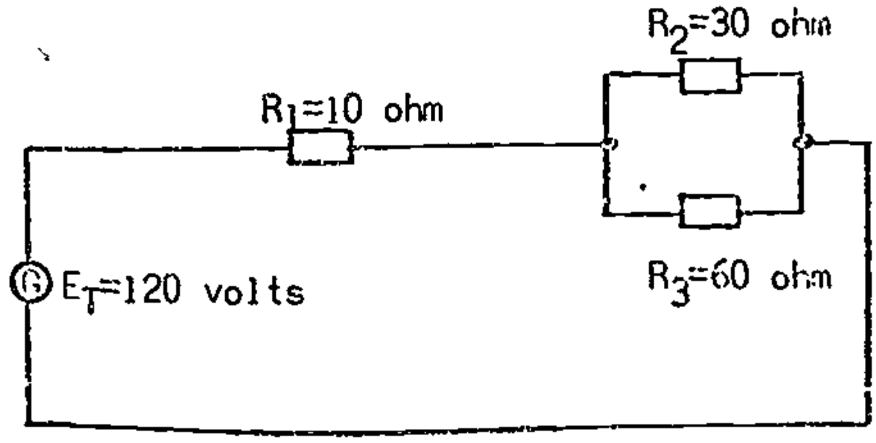
   (a) __________________________________

   (b) __________________________________

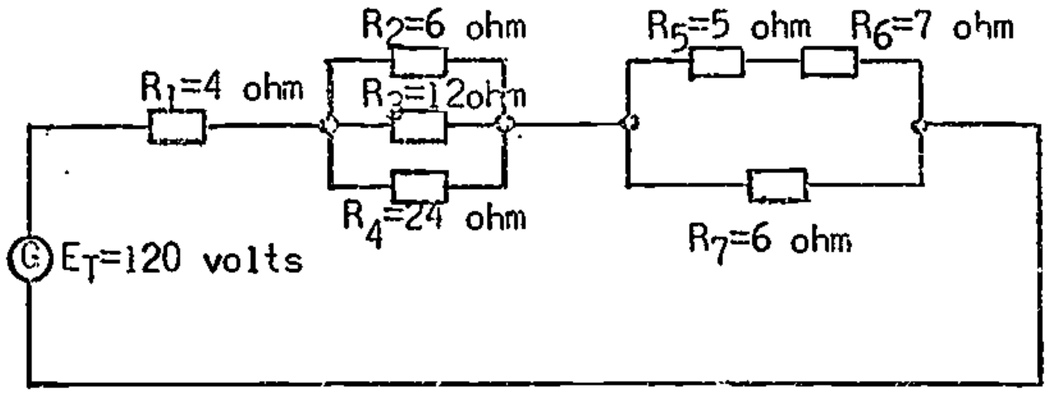
6. A ________________ - _________________ circuit is a circuit in which one or more ______________ of resistances in ______________ are connected in series.

7. A _________________ - _________________ circuit is a circuit in which one or more ________________ of resistances in series are connected in _____________ are connected in parallel.

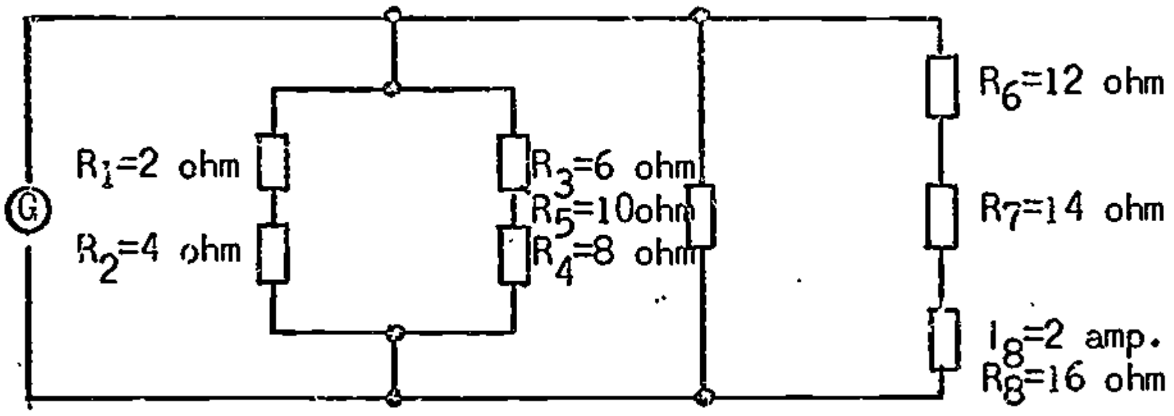
8. Solve the following circuit for all values of current, resistance and voltage.



9. Solve the following circuit for all values of current, resistance and voltage.



10. Solve the following circuit for all values of current, resistance and voltage.



11. Solve the following circuit for all values of current, resistance and voltage.

DATE________________________________ Power and Work

REFERENCE

1. American Electricians' Handbook, Pages 1-24 - 1-27, 1-40.
2. Basic Mathematics, Pages 148 - 156.
3. Basic Electricity, Vol. 2, Pages 42 - 54.

PROBLEMS

1. Mechanical power depends upon ________________ and ________________.

2. Electrical power is the product of ________________ and ________________.

3. ________________ is the unit of power.

4. State the number of watts per horsepower.

5. ________________ is the capacity to do work.

6. ________________ is the ______________ rate of doing work.

7. ________________ watts equals one kilowatt.

8. ________________ is the electrical work done in one hour.

9. ________________ is the effect of rotation.

10. Express the three relationships between power, voltage and current in D. C. circuits.

    (a) ________________ (b) ________________ (c) ________________

11. ________________ is the unit of work.

12. A lamp draws 9 amperes at 110 volts. How much power is consumed?

13. An electric water cooler is rated 700 watts at 110 volts. How many amperes does it pull? What is the horsepower rating of the compressor motor?

14. A ________________ of electrical power is the power used when one volt causes one ampere of current to flow in a circuit.

15. ________________ is the ratio of output to input.

NAME ______________________________ Lesson A-17

Power and Work Page 2

16. A toaster rated 1350 watts draws 12 amperes. Find the correct voltage.

17. A motor draws 1600 amperes at 120 volts. How much power is consumed?

18. A resistor carries 2 amperes at 120 volts. What is the rating in watts?

19. How much power is drawn by a 3/4-Horsepower motor drawing 7.59 amperes from a 208-volt line?

20. Six 200-watt lamps are connected in parallel on a 120-volt line. Find the total power used and total current.

21. How many kilowatts are developed by a 22,000 Horsepower generator?

22. Find the power used by a 40-ohm resistor drawing 5 ampe

23. Find the power used by a 40-ohm resistor on a 120-volt line.

24. A floodlight is rated 1500 watts on a 115 volt line. Find the amperes used.

25. A 300- and a 150-watt lamp are connected in parallel across 115 volts. Find the total resistance of the lamps.

26. What is the maximum current carrying capacity of a toaster marked 1350-watts and 20-ohms?

REFERENCE

1. American Electricians' Handbook, Pages 2-2 - 2-13, 2-36 - 2-38.

2. National Electrical Code, Article 310.

PROBLEMS

1. A wire is a __________ ______________ or ____________ of __________ metal.

2. A ____________ is a wire or combination of wires, not insulated from each other, suitable for carrying a single electric current.

3. ____________ ______________ is a group of twisted wires to form a conductor.

4. A cable may be a single ____________ or ____________ - ______________.

5. ______________ is one wire in a stranded conductor.

6. What is a stranded wire?

7. What is a cord?

8. _____________ cable is composed of two insulated single-conductor cables twisted together.

9. _____________ cable is composed of three insulated single-conductors, twisted together.

10. Sizes of wires in this country are expressed in ______________ ______________ ______________.

11. A ______________ may be used to determine the size of a wire or cable.

12. List six classifications of wires or cables.

(a) ______________________________
(b) ______________________________
(c) ______________________________
(d) ______________________________
(e) ______________________________
(f) ______________________________

13. ______________ conductors are protected against mechanical injury only.

NAME ______________________________ Lesson A-18

Wire Construction Page 2

14. ________________ cables are covered with electrical insulation and an outer protective covering over the insulation.

15. Types "_______" and "_______" are examples of covered cables.

16. _________________ conductors are more flexible than a solid conductor.

17. List six materials used in construction of cables:

(a) ______________________________ (d) ______________________________
(b) ______________________________ (e) ______________________________
(c) ______________________________ (f) ______________________________

18. _______________ is the most commonly used material for wires and cables due to its _____________ _____________.

19. List three grades of copper wires:

(a) ________________________
(b) ________________________
(c) ________________________

20. ______________ - ______________ wire is used for long-span transmission lines.

21. ______________ - ______________ wire is used for most insulated conductors.

22. List three advantages of multiple-conductor cable:

(a) ____________________________
(b) ____________________________
(c) ____________________________

23. List three advantages of a single-conductor cable:

(a) ____________________________
(b) ____________________________
(c) ____________________________

24. List seven characteristics for an ideal insulating material:

(a) ____
(b) ____
(c) ____
(d) ____
(e) ____
(f) ____
(g) ____

25. ________________ compounds are used more often for insulation of electrical conductors.

NAME______________________________ Lesson A-18

Wire Construction Page 3

26. All wires shall be marked indicating __________ ___________ ___________ designation.

27. Type "______" cable is insulated with mineral insulation.

28. All conductors shall be _______________ unless permitted otherwise by the code.

29. All conductors shall be rated for ___________ volts unless permitted otherwise by the Code.

30. Give the Code designation for the following types of insulation:

    (a) Moisture-Resistant Thermoplastic ______________________
    (b) Moisture and Heat-Resistant Thermoplastic ___________________
    (c) Moisture and Heat-Resistant Rubber ______________ ______________
    (d) Heat-Resistant Rubber __________ _______ ___________
    (e) Mineral Insulation __________________

31. Maximum operating temperature for Type "RHW" insulation is ____________ F.

32. Maximum operating temperature for Type "RHH" insulation is ____________ F.

33. Maximum operating temperature for Type "THW" insulation is ____________ F.

34. Maximum operating temperature for Type "TW" insulation is ____________ F.

35. Type "RHH" insulation is restricted to use in ___________ locations.

36. Type "RHW" insulation may be used in __________ and __________ locations.

37. Type "THW" insulation may be used in __________ and __________ locations.

38. Code rubber insulation is Type ______________.

39. List eight types of insulating materials:

    (a) ____________________________ (e) ____________________________
    (b) ____________________________ (f) ____________________________
    (c) ____________________________ (g) ____________________________
    (d) ____________________________ (h) ____________________________

WIRE AND MATERIALS

INTRODUCTION:

According to the electron theory, electricity has been called the movement of free electrons through a material. Thus, we can assume that unless a material contains free electrons, it will not conduct electricity.

In this lesson, we will consider the number of free electrons contained in materials associated with the use of electricity. To identify these materials, they are divided into two classes called conductors and insulators. A conductor is a material that will allow current to flow through it. An insulator is a material that will not allow current to flow through it.

CONDUCTORS OF ELECTRICITY:

Copper is used as the most common conductor of electricity. From the figures below you can see that it contains nearly as many free electrons per square inch as silver and is less expensive.

Copper contains about 1,600,000 billion billion free electrons per square inch. (In electrical mathematics, this number is written 16×10^{23} and means 1,600,000,000,000,000,000,000,000) The following list of common conductors show that as the number of free electrons decreases, the ability to conduct electricity decreases. It is a fact that when equal voltage is applied, the better materials will conduct more electricity.

Material	Free Electrons Per Cubic Inch	Material	Free Electrons Per Cubic Inch
Silver	16.4×10^{23}	Nickel	3.5×10^{23}
Copper	16×10^{23}	German Silver	3.3×10^{23}
Aluminum	9×10^{23}	Nichrome	2.5×10^{23}
		Iron	2.2×10^{23}

INSULATORS OF ELECTRICITY:

The materials considered to be the best insulators contain very few free electrons compared with metal conductors. It should be remembered that there is no material known as a perfect electrical insulator. It is evident that some electrons will flow when the material is subjected to voltage. Thus, when only a few electrons will flow, the material can be considered to be a good insulator. The following is a list of insulating materials and the amount of free electrons they contain per cubic inch:

Hard rubber	3	Waxed Mahogany	670,000
Paraffin	270	Plate Glass	1,380,000
Clear Mica	14

2. Basic Mathematics, Pages 258 - 284.
3. National Electrical Code, Article 310, Tables 8 and 9.

NOTE: Use Copper Conductors for Calculation of all Problems.

PROBLEMS

1. A good conductor has a high ____________________.
2. Insulators have a low ____________________.
3. List four factors affecting resistance:

   (a) ____________________ (c) ____________________
   (b) ____________________ (d) ____________________

4. The longer a conductor, the ______________ the resistance.
5. Increase in the diameter of a conductor ________________ the resistance.
6. Materials of ______________ resistance are used for conductors.
7. An increase in temperature will ________________ the resistance of a conductor.
8. Cross sectional area of a conductor is expressed in ____________ ____________.
9. A copper conductor 500 feet long has a resistance of 6 ohms. What is the resistance of 800 feet of this conductor?

10. A copper conductor 0.05 inches in diameter has a 6-ohms resistance. If the diameter is increased to 0.07 inch, what is the resistance of the conductor?

11. Find the resistance of a copper conductor at 110° F. if the resistance at 72° F. is 6-ohms.

12. One mil equals __________________inches.
13. ____________ is the abbreviation for circular mil.

NAME______________________ Lesson A-19

Wire Sizes Page 2

14. A wire having a diameter of 5 mils has a sectional area of ____________ circular mils.

15. A wire having a diameter of 0.007 inch has a sectional area of ____________ circular mils.

16. A wire having a sectional area of 12,450 circular mils has a diameter of ____________ mils or ____________ inch.

17. Normally diameters of wires are expressed in ____________.

18. Sizes of wires are given in ____________ ____________ ____________ (____________).

19. Find the diameter in mils and AWG number of a conductor having a diameter of 0.1285 inch.

20. Find the diameter in inches and AWG number of a conductor having a sectional area of 66,360 circular mils.

21. ____________ ____________ is the ability of a specific material to resist the flow of current.

22. The specific resistance of copper is ____________; aluminum, ____________; silver, ____________; nickel, ____________.

23. Find the resistance of 700 feet of copper wire having a cross-sectional area of 12,000 CM.

24. Find the length of aluminum wire on a distribution system having a resistance of 3-ohms and a diameter 0.80 inch.

25. Temperature coefficient of resistance for aluminum wire is ____________ per Fahrenheit degree.

26. Temperature coefficient of resistance for copper wire is ____________ per Fahrenheit degree.

27. Find the resistance of a copper wire at 170° F. if the wire has a 40-ohms resistance at 62° F.

NAME ________________________________ Lesson A -19

Wire Sizes Page 3

28. Firm, tight joint connections have a ________________ resistance.

29. The area of wire in circular mils is equal to the ________________ of the diameter in ________________.

30. Find the resistance of a Tungsten wire to replace a copper wire having a resistance of 8-ohms.

31. Find the length of nickel cable, 0.005 inch in diameter, required to make a resistor of 1000-ohms.

32. Heat is produced in a wire whenever a ________________ flows.

33. Increasing the wire size ________________ the resistance.

34. Find the maximum allowable current-carrying capacity of a No. 2/0 Type "THW" insulated conductor in conduit.

35. Find the minimum Type "THW" insulated conductor to carry a load of 77 amperes.

36. List three criteria for selecting a conductor size:

(a) ________________________________

(b) ________________________________

(c) ________________________________

37. Find the minimum size Type "THW" insulated conductor to supply a 12 kw load rated 230 volts, single phase.

38. Find the minimum size Type "THW" insulated copper conductor to supply a 50 kw lighting load from a 230 volt single phase source 425 feet away.

39. The current issue of National Electrical Code permits a ________ per cent drop in feeders for lighting loads and __________ per cent drop in feeders for power loads.

40. A well pump rated 10 HP, 220V., single phase, is connected to the panelboard by a No. 6 Type "THW" insulated feeder. What is the maximum distance the pump may be located from the panelboard? (Note: Refer to National Electrical Code, Table 430-148).

41. Six No. 10 Type "THW" conductors are installed in a 1-inch conduit. What is the maximum current-carrying capacity of the conductors?

42. A No. 4/0 Type "RH-RW" feeder is installed in a furniture factory. What is the maximum current-carrying capacity?

43. In a textile plant a dryer is installed requiring 700 amperes. What is the minimum size of Type "RHW" conductors necessary for two parallel runs to serve this load?

44. With the same load of Problem 43, what size of Type "V" conductors for two parallel runs?

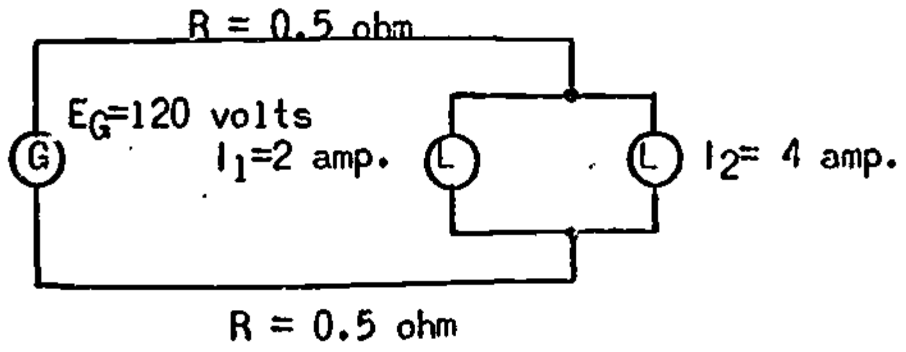
PROBLEMS

1. ____________ ____________ is the total voltage supplied to the circuit from the source of voltage.
2. ____________ ____________ is the voltage available to operate the devices or loads.
3. ____________ ____________ is the voltage lost by the flow of current through the line wires.
4. ____________ ____________ is the sum of ____________ ____________ and load voltage.
5. ____________ is the symbol for line voltage.
6. ____________ is the symbol for line resistance.
7. ____________ is the symbol for line current.
8. ____________ is the symbol for load voltage.
9. ____________ is the symbol for generator, source, or supply voltage.

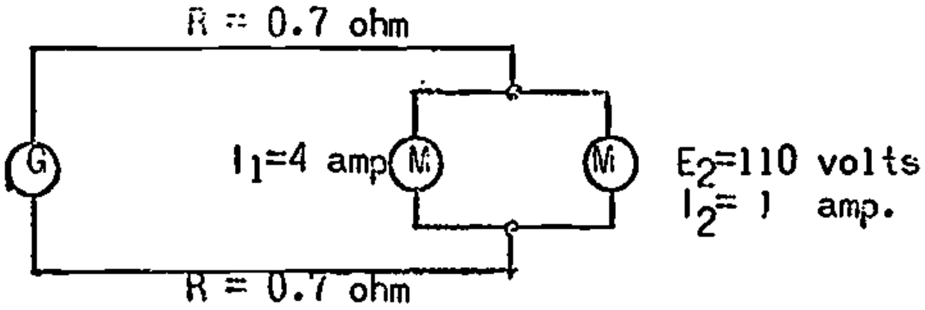
10. Find the line drop and load voltage of the following circuit.



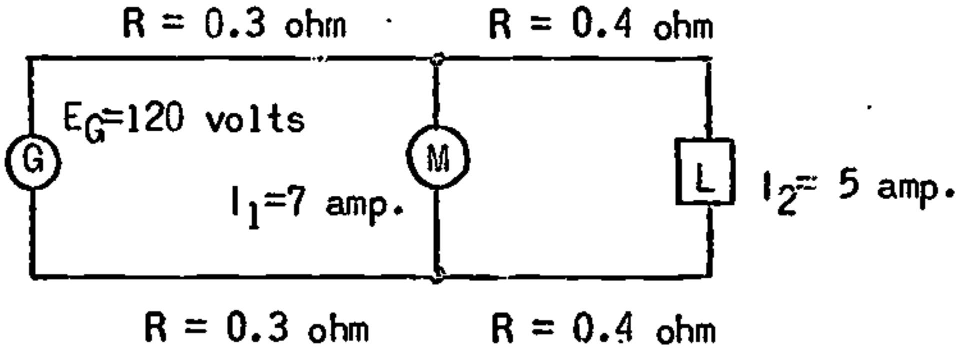
NAME ______________________ Lesson A-20

Voltage Drop Page 2

11. Find the line drop and generator voltage of the following circuit.



12. Find load voltages of the following circuit.



13. A lighting panelboard draws 60 amperes from a 220 volt source 200 feet away. Find the minimum gauge of Type "THW" permitted by the National Electrical Code.

14. A 25-Horsepower motor is operated from a 460-volt source 150 feet away. Find the minimum gauge of Type "THW" permitted by the National Electrical Code if the motor has an efficiency of 85 per cent.

15. A load 400 feet from the source requires 100 amperes. The generator voltage is 220 volts and the required load voltage is 208 volts. Find the minimum size of Type "THW" cable permitted.

16. List three unsatisfactory operating conditions which may be caused by excessive voltage drop:

PROBLEMS

1. Minimum size conductor for interior wiring work shall be ______________ AWG.

2. List two advantages of No. 12 AWG conductor over minimum size conductor:

   (a) ____

   (b) ____

3. Maximum size for solid conductors is ________________ AWG.

4. ________________ conductors are used for ease in handling.

5. All ____________ conductors shall be protected by __________ or __________ ________________.

6. The branch circuit over-current protective device may be located at the load-end of the conductor provided (1) ______________________________

   (2) ______________________________

   (3) ______________________________

7. ________________ ________________ circuit breakers shall be set at not more than __________ per cent of the allowable current-carrying capacity of the conductor.

8. ______________ conductors must not be fused.

9. Enclosures for overcurrent devices shall be mounted in a ________________ position.

10. Fuses shall not be mounted in ______________.

11. Fuses and circuit breakers shall be ____________ or ____________ to prevent ____________ or ____________ by their operation to persons.

12. Minimum size flexible cord shall be ______________ AWG.

13. Conductors shall not be ____________ or ____________ within the raceway or conduit.

14. Minimum size conductor permitted to be connected in parallel is __________ AWG.

15. In parallel conductors run in separate conduits, one wire of ______________ ______________ shall be installed in each conduit.

NAME ______________________________ Lesson A-22
General Requirements
For Wiring Installations Page 2

16. Grouping of conductors by phases in parallel runs in separate conduits will cause _______________ _______________ to _______________ of the metal by _______________.

17. Each outlet shall have at least ____________-inches of free conductor.

18. Ungrounded conductors, No. 4 AWG or larger, entering a cabinet shall be protected by a ___________ ____________ _________.

19. Conductors of light and power systems of 600 volts or less may occupy the same enclosure provided the _______________ are _______________ for the _______________ _______________ of any conductor within the enclosure.

20. Minimum insulation resistance for No. 14 or No. 12 AWG circuits shall be _______________ ohms.

21. The test for the insulation resistance is made with a _______________.

22. In general, all interior wiring systems shall have a ______________________ conductor.

23. The __________________ conductor must be continuously identified throughout the system.

24. In a screw shell device, the _______________ _______________ conductor shall be connected to the screw shell.

25. Equipment located __________ feet above accessible working area provides suitable protection.

26. All conduits must be __________________ from outlet to outlet.

27. All boxes shall be _______________ _______________ in place.

28. For exposed conduit, wiring conduit boxes less than ______________ cubic inches in size may not be separately fastened if the conduit is secured in threaded hubs on the box.

29. A fixture weighing more than _______________ lbs. or exceeding _______________ inches in any dimension must not be supported by the screw shell of the lamp holder.

30. A fixture weighting more than __________ lbs. must be supported independently of the outlet box.

31. The maximum No. 12 AWG conductors permitted in an outlet box, 2 1/8 x 4 11/16 square, shall be _____________.

32. All junction boxes shall be installed with the wiring _______________.

NAME ______________________________ Lesson A-22
General Requirements
For Wiring Installations Page 3

33. Boxes installed in tiled or plastered walls or ceilings shall have the front edge of the box set back flush maximum of __________ inches from the finished surface.

34. Boxes installed in wood walls shall be set ________ with finished surface.

35. The minimum size in length for straight pull junction boxes shall be ______ times the trade diameter of the largest raceway.

36. Unused openings in cabinets shall be ___________.

37. Gutters shall be supported at intervals not exceeding _________ feet.

38. List two types of grounds: (a) ______________________________
(b) ______________________________

39. Define a system ground:

40. Define an equipment ground:

41. In general, all exposed non-current-carrying metal parts of fixed equipment shall be ____________.

42. ____________ ____________ circuits are not required to be grounded.

43. ____________ ________ ____ operating over combustible fibers in Class III hazardous location shall not be grounded.

44. The __________ conductor is commonly known as "the white wire" or "____________".

45. There shall be a ground at each building service on the _________ side of the ___________ _________.

46. The minimum size service grounding conductor shall be ___________AWG.

47. The minimum size grounding conductor for a 500 mcm service conductor shall be ___________AWG. (man made electrode)

48. The grounding conductor shall not be ____________ or ____________ throughout its length.

49. Bare grounding conductors smaller than ________AWG shall be in conduit or EMT.

50. The best grounding electrode is an __________ __________ __________ system.

NAME ______________________________

51. The maximum resistance to ground shall not exceed ______________ ohms.

52. Grounding conductors shall be attached to a water piping system on the ____________ ________ __________ of the water meter.

53. Grounding connections shall not be made with ________________.

54. Grounding connections shall be made by an approved ____________________ ____________________.

55. Only ______________ grounding conductor shall be connected to the grounding electrode by a single fitting.

56. All ungrounded conductors must be finished in ______________, ____________, ______________ or any color contrasting to _________________.

57. No _______________ shall be used in a grounded conductor.

58. What are service-drop conductors?

59. What are service-entrance conductors?

60. The service equipment shall consist of ______________ __________________ ______________ ________________ and __________ ____________ ____________

61. ____________ ______________ is a service which supplies more than one building under single management.

62. ______________ service shall supply one building from another unless under the same management.

63. ______________ _______________ may require a separate service.

64. Minimum size service conductor shall be ____________ AWG.

65. List three types of insulation for overhead service drops:

(a) _________________________________
(b) _________________________________
(c) _________________________________

66. ___________________ loops shall be formed on overhead individual service conductors.

67. Where underground service raceways enter the building the ends within the building shall be _______________ to prevent the entrance of __________ or ______________.

68. Service conductors shall not be ______________.

69. Type "AA" insulated wire is limited to ____________ volts.

70. Switches rated __________ amperes at __________ volts or less cannot be used to open under load.

71. ________________ device shall be installed in raceways for refrigeration room to prevent circulation of air from warmer to cooler area.

72. Splices and taps may be made in auxiliary gutters and wireways provided cross-sectional area of the splices and taps does not exceed ____________ per cent of the cross-sectional area of the gutter or wireway.

73. Underfloor raceway shall have a maximum conductor fill of ____________ per cent of the total cross-sectional area of the raceway.

74. __________________ shall not be installed until the interior of the building has been physically protected from the ________________.

75. _______________ and ________________ may be used to lubricate conductors to be pulled through raceway system.

76. Vertical support of 250 MCM copper cable shall not exceed ______________ feet.

Lesson A-23

RIGID METAL CONDUIT BENDING

The art of conduit bending with hydraulic equipment, although still dependent upon the skills of the individual, has been simplified by workable formulas that are easily learned and applied. The principle upon which these formulas are based is safety. The NEC states that bends must be so made that the conduit is not injured and its internal diameter is not effectively reduced. It further states in a table the minimum inside radius of conduit bends.

RADIUS OF BEND

Various factors influence, and in some circumstances determine, the radius of a bend. Generally, it should be the longest radius possible. Although, the inside radius of a field bend is specified in the National Electrical Code in terms of minimum radius, the specification is intended to insure an undamaged elbow and safe passage for cable. When it comes to actually installing cable in conduit, the relative ease or difficulty of the pull becomes very important to the electrician. Experience quickly teaches you that it is easier to pull cable through a long sweeping elbow than it is through a short, more tightly bent one. Of course, the radius of the bend is the determinant here, for as the radius length increases, the sweep or arc of the bend increases.

From the experience of many electricians, the "rule of thumb" has evolved that a satisfactory elbow can be made in conduit. (1) For LEAD SHEATHED CONDUCTORS by using a radius that is 10 to 12 times the internal diameter of the conduit. (2) Elbows that do not have lead sheaths require a radius equal to 8 to 10 times the conduit's internal diameter.

PRINCIPLES OF PRECISION BENDING

In "one-shot" or "segment bending" of conduit, you must be familiar with the hydraulic benders and how they operate.

Before you can made a precision bend in conduit, you must:

1. Determine the size of conduit to be bent.
2. Determine the radius of the bend.
3. Determine total degrees in the bend.
4. Calculate the developed length.
5. Calculate the gain.
6. Locate the center of bend.
7. Determine the number of bends required.
8. Calculate and mark spacing for bends on the conduit.

All formulas and factor tables are based on measurements to the centerline of conduit.

CONCENTRIC BEND.

Concentric bends are calculated by the same formulas and made by the same processes as those used for 90° bends. Radii and segment bending spaces will differ as each bend recurs in the next-lying run of conduit.

NOTE: Students should observe concentric bending of exposed conduit in several industrial installations.

Whether these bends are to be made in the same or varying sizes of conduit, the radius of the second of two successive concentric bends is equal to the radius of the first plus one-half the sum of their outside diameters plus the width of the spacing between them. Since concentric bends have not only a common center, but also equal separation, sufficient space must be provided between all concentric bends. This will accommodate couplings and straps sized for the largest conduit in the run regardless of their diameters.

GENERAL PURPOSE BENDING

In actual practice, the electrician finds that all hydraulic bending operations do not require an equal degree of precision. While the same mathematical principles are involved, generally, on some jobs it may not be necessary to work with centerline measurements, or to consider the gain or center location of a proposed bend.

However, minimum radius length, which in effect constitutes a safety factor in any conduit installation, and the determination of a bend's developed length cannot be overlooked.

Preliminary Calculations. The electrician's rule, states that ten times the diameter of the conduit as a satisfactory bending radius for the average bending job. The next consideration is to find out the point on the conduit the bend should start. To do this, measure the required rise from the bottom of the conduit, and, from this measurement, deduct the length of the radius. The distance remaining is the starting point of the bend, measured from the end of the conduit. Now, with chalk, mark this remaining distance on the conduit as the starting point for the bend.
(Illustrate on chalkboard using a 30" radius and 50" rise.)

Now, to calculate the developed length of the bend as before, multiply the radius (30") of the bend by 1.57. Mark this distance on the conduit, measuring from the start of the elbow. Bending gain is calculated by the formula--radius of bend multiplied by gain factor (from table). The overall length equals the leg length plus the developed bend length plus the riser. It is important to find the center of bend and mark it on the conduit for reference.

BENDING THE ANGLE

Experience becomes the best teacher regardless of the procedure used for bending conduit. Although, the conduit may be divided into two-inch segments and operating instructions are provided for the hydraulic equipment, the special bending accessories may differ from bender to bender. Experience has shown that it is advantageous to reserve two bending spaces, the first and the last, until the other segments are completed and the bend has been checked in place.

It should be noted that to confine the intended bending effect within a given segment, the center of the ram and shoe of the bender should be in line with the center of each bending space (segment). This will provide better overall control and accuracy.

DATE ______________________________ Rigid Metal Conduit

REFERENCE

1. American Electricians' Handbook, Pages 9-27 - 9 -55.
2. National Electrical Code, Article 346.

PROBLEMS

1. ____________ ____________ conduit may be used under all atmospheric conditions and all occupancies except in ____________ ____________ areas and where ____________ conduit is installed.

2. ____________ conduit may be used indoors only and areas not subject to ____________ ____________ conditions.

3. The use of ____________ metals in contact in a rigid raceway system shall be avoided to eliminate the possibility of ____________ action.

4. Standard conduit shall be installed at least ____________ inches below cinder fill unless installed in a ____________ inch minimum concrete envelope.

5. In wet locations, entire conduit system shall be installed to prevent ____________ from entering conduit.

6. In wet locations, ____________-inch air space shall be maintained between conduit and ____________ ____________.

7. In general, the minimum size of conduit shall be ____________-inch.

8. List two conditions which are exceptions to the minimum size conduit:

   (a) ____

   (b) ____

9. The maximum fill-area permitted by the current issue of National Electrical Code in existing raceways for non-lead covered conductors (3 or more) is ____________ per cent.

10. Conduit ends shall be ____________ to remove rough edges.

11. In a junction box or fitting, ____________ shall be installed on conduit to protect conductors from abrasion.

12. ____________ thread shall not be used to facilitate installation of coupling.

13. Minimum radius of bend for a 1-inch conduit is ____________ inches.

NAME ____________________ __________ Lesson A-23

Rigid Metal Conduit Page 2

14. The maximum number of bends permitted in one conduit run is ____________ quarter-bends or total ____________ degrees.

15. Standard length of rigid conduit shall be ____________ feet.

16. List four advantages of rigid-metal conduit:

(a) ____
(b) ____
(c) ____
(d) ____

17. List two types of rigid-steel conduit:

(a) ____
(b) ____

18. Each conduit run shall terminate in an ____________ outlet box.

19. All boxes shall be installed where the outer edge box will be ____________ with the plaster surface.

20. Top of a junction box shall never be ____________.

21. Conduit must be fastened securely to the box using a ____________-____________ on the outside and a ____________ on the inside of the box.

22. The use of elbows, bends and conduit crossings can be eliminated by installing ____________ ____________.

23. Conduit shall run as ____________ and ____________ as possible with a maximum of ____________ right-angle bends between ____________.

24. A vertical run of 500 MCM conductors shall be supported on a maximum of ____________ foot centers. (copper) Use current code.

25. ____________ are popular field benders.

26. ____________ ____________ is the best tool for cutting conduit.

27. ____________ ____________ is tempered rectangular steel wire.

28. Care must be taken in feeding conductors in conduit to prevent ____________ or ____________.

15. Type "S" fuses are the _______________-_______________ type.

16. The maximum rating of a plug fuse is __________________ amperes.

17. Plug fuse will open a circuit in ____________ seconds at 200 per cent load.

18. _______________ ______________ ____________ ______ fuse has a maximum rating of 60 amperes.

19. ______________ ______________ __________________ fuse has ratings from 70 through 600 amperes.

20. _____________ _______________ fuses are designed for readily replacement of the fuse element.

21. Dual element cartridge fuses contain a ________________ ______________ and ___________________ ___________________.

22. List two general types of silver-sand fuses:

(a)_________________________ (b)_____________________________

23. The interrupting capacity of a silver-sand fuse is ____________ amperes.

24. The maximum rating of silver-sand fuses is ______________ amperes.

25. Plug fuses shall not be rated over ______________ volts.

26. ___________-_____________ type plug fuses are permitted only as replacement in an existing installation.

27. In new construction all plug fuses shall be ______________ _____________.

28. Maximum rating of cartridge at 250 volts is ________________ amperes.

29. ______________ _____________ fuse holders shall not permit the insertion of fuses which are not ________________ ______________.

30. The ______________ volt cartridge fuse is permitted on lower voltages.

31. _______________ fuses shall be used only by special permission.

SAFETY PRECAUTIONS

It is an accepted fact that electricity, if not handled properly, is extremely hazardous. This fact has attributed greatly to the progress that has been made in its control. Through cooperation of manufacturers of electric equipment, governmental bodies, insurance companies and others, the National Electrical Safety Code has been developed. This Code has played an important part in accident-prevention work.

Frequently, construction electricians working with the comparatively low voltage used in house wiring do not have the same respect for it as they do for the high voltage used in delivering current to transformers. They fail to realize that the relationship between the voltage and the resistance of the material serving as ground is the determining factor and therefore danger is not determined solely by the voltage. It should be thoroughly understood that the 110-volt current used in lighting circuits is sufficient to kill under many ordinary situations in which the electricians will be working. If the material to which the worker is grounded has low resistance to the flow of electricity, the amperage will be high, resulting in severe electric shock. Electric shock ranges from mild discomfort to actual stoppage of heart beat and breathing. Serious burns may also result.

The extent of the injury received from electric shock is controlled mainly by the amount of current, the path of the current through the body, and the duration of the shock. The physical condition of the victim may also have a bearing. This fact should never be interpreted to mean that a strong individual should take chances with electricity.

The frequency of the current and the type of current, direct or alternating, are also factors affecting the nature of shock. High frequency current tends to produce heat instead of shock. This is also the case with direct current. Shock hazards are less, but more severe burns can be expected from direct current accidents. Accident reports indicate minor electric shock has caused serious accidents. In these cases, involuntary contraction of the muscles has caused workmen to fall from ladders and scaffolds.

While accidents with electricity are frequently serious, there are fewer safety precautions to be considered than in many other industries. The following rules should be carefully observed by all workmen employed as construction electricians.

1. Assume a circuit is alive until tested and proved dead.
2. Test circuits with proper testing equipment. (110-volt test lamp placed across a 440-volt line will blow up)
3. Use safety equipment, such as insulated tools, rubber mats and rubber gloves.

4. Main switches should be locked open and a tag indicating workmen are working on some part of the circuit before work is started.

5. Before closing a circuit, check carefully to see that workmen are clear of the circuit.

6. Observe the rules of the National Electrical Safety Code.

7. If minor repair of a live circuit cannot be avoided, arrange to have a qualified helper present.

8. Make all parts of a job safe even though they are temporary.

Aside from the hazards of electric shock, the construction electrician is subject to accidents similar to those encountered by other workmen in the building trades, such as, falling from ladders and scaffolds, accidents in manipulation of tools, etc.

Falling is a major cause of industrial accidents. Workmen should avoid improvised steps and ladders. Dependable ladder and scaffolding equipment is available and should be used. Ladders should be inspected frequently to see that rungs or steps are not overly worn, loose, broken, or missing. Rails that are badly split should be discarded. Antislip feet are desirable for both step and straight ladders. They should be of a type designed for the particular purpose. The design of step ladders is an important factor in stability. Frequently, improper placing of ladders results in their slipping, or the workman trying to reach too far and becoming overbalanced.

QUESTIONS

1. List some ways that Safety habits are responsible for cash savings.
   a. To your company as the employer.

   b. To you as the employee.

2. List several pieces of wearing apparel classed as Safety Equipment generally furnished by the company.

   a.__________________________ b.______________________ c.____________________

3. In the event you are disabled, how much would you collect per week from Workmen's Compensation? $______________

4. Recall an accident that happened to you in the home or on the job. What Safety rule was broken?

5. Give five Safety habits an electrician should practice?
   a. d.
   b. e.
   c.

6. Write your favorite Safety slogan.

7. Name five hazards on any construction job.
   a. d.
   b. e.
   c.

8. List five "unsafe conditions" that may show up in the normal use of a ladder by an electrician.
   a. d.
   b. e.
   c.

9. List five "unsafe acts" that may happen on ladders.
   a. d.
   b. e.
   c.

10. Show how good housekeeping is very much a part of your job. How is good housekeeping a good indication of a safe worker?

21. Efficiency is the ratio of __________ to ________________.

22. _________-____________ copper is used for all covered or insulated copper conductors.

23. Express the diameter in inches of a 105,500 cir mil cable.

24. The NEC permits a maximum of three per cent voltage drop in _____________ feeders.

25. Find the power consumed by a 208 volt motor drawing 10 amperes.

26. ________-__________ copper is used for transmission lines.

27. Find the resistance of 2500 feet of No. 6 AWG copper wire if the resistance is 0.4 ohms per 1000 feet.

28. Find the minimum size Type "TW" conductor to supply a load of 100 lamps each drawing 2.5 amperes.

NAME ______________________

29. Calculate the amperes drawn by a 1/4 Horsepower fan at 120 volts. How many watts are consumed?

30. Conductors sized No. ______AWG and larger installed in conduit shall be stranded.

31. Find the CM area of a cable having a 5/8-inch diameter.

32. The NEC permits a maximum of one per cent voltage drop in ______________ feeders.

33. Find the power used with eight lamps connected in series if each lamp is rated 15 volts and draws 0.2 amperes.

34. The minimum size conductor permitted for multiple runs is No. ______AWG.

35. Express the diameter of a No. 2 AWG conductor in inches.

36. CM is the abbreviation for ____________ __________________.

37. Find the operating voltage of a motor using 880 watts and drawing 4 amperes.

38. Provide the required information for the following cable insulations:

TRADE NAME	CODE TYPE	MAXIMUM OPERATING TEMPERATURE
Asbestos-covered, heat resistant, Fixture Wire		
Heat-resistant rubber		
Moisture-resistant thermoplastic		
Moisture and heat resistance Thermoplastic		

NAME ______________________________

ELECTRICAL APPRENTICESHIP

SERIES "A", TEST NO. 4

39. A wire has 50-ohm resistance and 200 cir mil area. Find the resistance of the same length of wire having 600 cir mil area.

40. Find the power used from a 12-volt battery by a parallel circuit of two headlamps (6 amps. each) and four taillights (1.0 amperes each).

41. Type _____ is the code designation for code rubber insulation.

42. Find the diameter and gage number of a copper heating element 240 feet long if the resistance is 40 ohms.

43. Find the current drawn by twenty 100-watt lamps, parallel connected, from a 120-volt source.

44. The maximum current carrying capacity of No. ____ AWG copper conductor in conduit with Type "THW" insulation is 200 amperes.

45. If more than ____ conductors are installed in a raceway, the current carrying capacity of the conductors shall be reduced.

46. Find the minimum size Type "RHW" conductor to supply a 75 kw load at 480 volts.

47. Type (RHH" cable is limited to use in _____ locations.

48. Find the current drawn by a 5000-watt dryer from a 220-volt source.

NAME ______________________________ ELECTRICAL APPRENTICESHIP

49. The current carrying capacity of nine No. 12 AWG Type "THW" conductors installed in the same raceway is ____________ amperes.

50. The minimum size Type "V" cable, in conduit, required for a 295 ampere circuit load is No. ____________AWG.

NAME _____________ __________

MATERIAL COVERED - LESSONS A-21 thru A-22.

1. The NEC contains ____________ provisions considered necessary for safety.
2. A general purpose branch circuit supplies outlets for ____________ and ________________.
3. In general, _______________ conductors are used to conduct current.
4. The minimum size conductor permitted for general interior wiring shall be No. _____AWG.
5. A maximum of ______fusible switches or circuit breakers may be used as service equipment.
6. A motor circuit switch is _________ rated and capable of _____________ under load.
7. The ___________conductor is intentionally grounded.
8. _______ ___________ are not approved for securing equipment to masonry walls.
9. __________ conductors, No. 8 AWG and smaller, may be installed in a conduit.
10. Only Type ________ cable shall be installed for underground service entrance conductors.
11. A safety switch is an example of a ___________ means.
12. Field applied insulation over the conductor splices shall be _______________ in value to the conductor insulation.
13. All ___________conductors shall be protected by an overcurrent device.
14. All holes in outlet boxes shall be _______________.
15. The NEC is not intended as a ______________specification.
16. A _____________ is a circuit conductor between the switchboard and the branch circuit protective device.
17. The insulation resistance of No. ____AWG conductor shall be 1,000,000 ohms.
18. A minimum of ______inches of free conductor shall be provided at each outlet or switch.
19. The minimum mounting height of an overhead service drop is _________feet above grade.

NAME ____________________

20. A ________-__________ ____________ __________ consists of two or more ungrounded conductors having a potential difference between them and an identified grounded conductor having an equal potential difference between it and each of the ungrounded conductors.

21. The NEC mandatory rules are characterized by the word ____________.

22. Electrical equipment mounted a minimum of ____feet above the floor is a substitute for the required floor mounted horizontal clearances.

23. Equipment grounding conductors shall not be ____________.

24. Lath shall not be used to support ___________boxes.

25. The minimum size service entrance conductor is No.____AWG.

26. ___________switches have no interrupting rating and shall be operated only after the circuit is dead.

27. ___________-____________ conductors are located between the service drop and service equipment.

28. The minimum insulation resistance for a 500 MCM Type "THW" conductor shall be ___________ohms.

29. All conduits shall be __________from outlet to outlet.

30. The maximum number of No. 10 AWG conductors permitted in a 1½-inch x 4-inch square outlet box shall be _________.

31. The minimum size grounding conductor for three parallel 300 MCM service conductors shall be No. ____AWG.

32. Neutral conductors shall not be ___________.

33. Outlet boxes in wood walls shall be set _______with finished surface.

34. Conductor ________or___________shall not be made within raceway.

35. A general purpose switch is rated in __________and capable of __________ at its rated current and voltage.

36. __________locations are not normally subject to dampness or wetness.

37. The NEC advisory rules are characterized by the word ___________.

38. The minimum size conductor permitted for multiple or parallel runs shall be No. ____AWG.

NAME ____________________

39. A vertical run of 350 MCM copper feeder shall be supported on a maximum _____-foot centers.

40. ___________ outlet boxes shall not be installed on a conduit system requiring locknuts and bushings.

41. A right angle pull junction box with entering and exiting conduits sized: 3-inch, 3-inch and 4-inch; shall be a minimum of _____x_______ inches.

42. A ____________ ______________ ______________ piping system is the best grounding electrode.

43. Overhead service conductors shall form a ________ _________ at the servicehead.

44. Metal ___________ shall not be used to make grounding connection to water system.

45. Insulated bushings shall be installed on raceways for No. ____ AWG and larger conductors.

46. Conductors of different system may be installed in the same conduit provided all conductors are ___________ for the ___________ ___________ on any of the conductors.

47. A lighting fixture exceeding _______ pounds shall not be supported from the lampholder screw-shell.

48. A straight pull junction box with a 3-inch conduit entering and exiting shall have a minimum length of ______-inches.

49. The minimum size grounding conductor for service conductors shall be No. _____ AWG.

50. A lighting fixture exceeding _______ pounds shall be supported from the building structural members.

DATE ____________________ SERIES "A", TEST NO. 6
Page 1

MATERIAL COVERED - LESSONS A-23 thru A-28.

1. Rigid metal conduit shall be installed a minimum of __________ feet below cinder fill.

2. E.M.T. shall not be installed on systems exceeding ________ volts.

3. Flexible metal conduit is _______ and __________ to install than rigid conduit.

4. Lead-acid type batteries are rated _____ volts per cell.

5. Fuses are rated in _______ and _________, and have a ________ resistance.

6. The ________ and ________ of ________ and the __________ of ____________ determine the extent of injury due to electrical shock.

7. Threaded __________-__________ couplings may be used to connect two sections of conduit.

8. E.M.T. may be installed _________ or ____________.

9. Flexible metal conduit shall not be installed in _________ locations.

10. Storage battery room shall be ______________.

11. A _________-_________ fuse will carry approximately twice its rated current for 20 to 30 seconds.

12. ___________ current causes more severe burns.

13. The standard length of rigid metal conduit is ________ feet.

14. On exposed E.M.T. installations in wet locations, __________-___________ threadless couplings and connectors shall be used.

15. ___________ ____________ should be used to cut flexible metal conduit.

16. Type ___ conductors shall not be used in storage battery rooms.

17. Fuses are used for __________ protection of a circuit.

18. Always assume a circuit to be ________ until tested and proven dead.

19. The number of bends and offsets in one run of conduit shall not exceed __________ degrees.

20. E.M.T. shall not be installed in a ___________ fill.

NAME ______________________

21. Flexible metal conduit shall be supported on maximum __________ foot centers.

22. Alkali-type batteries are rated _________ volts per cell.

23. Plug fuses have a maximum rating of ___________ amperes.

24. The minimum size conduit permitted is _________-inch.

25. The standard length of E.M.T. is ____________ feet.

26. The maximum size of liquid-tight flexible metal conduit is __________-inches.

27. A dry cell battery is an example of a _______________ cell.

28. Type "S" plug fuses shall not be ___________ with plug fuses of different ampere classifications.

29. _______________ cells cannot be recharged.

30. _______________-_______________ flexible metal conduit is not a general purpose raceway material.

31. E.M.T. installed in concrete shall be provided with _________-_____________ threadless couplings and connectors.

32. The minimum radius of bend for a 4-inch rigid conduit for Type "THW" conductors shall be ______ inches.

33. ______________ is a major cause of industrial accidents.

34. A __________ volt cartridge fuse is permitted on a lower voltage.

35. A 12-volt lead-acid storage battery consists of _________ cells.

36. The maximum size conductor permitted in a 2-inch liquid-tight flexible conduit shall be No. ____ AWG.

37. The maximum size of E.M.T. is _____-inches.

38. The supports for a horizontal run of 3/4-inch conduit should be on maximum _____-foot centers.

39. The maximum ampere rating of fuses rated 250 volts shall be ______ amperes.

40. Only __________ water should be added to storage batteries.

41. Liquid-tight flexible conduit is permitted for use in connecting __________.

42. All outlet boxes and fittings for E.M.T. shall be the __________ type.

43. The maximum fill permitted in rigid conduit on new work for Type "V" conductors is _________ per cent.

NAME ______________________

44. Alkali-type battery is an example of a __________ cell.

45. Plug fuses may be installed on circuits not exceeding _________ volts.

46. A storage battery is charged with ____________ _____________.

47. E.M.T. shall be installed a minimum of ______-inches below cinder fill.

48. A storage battery rated 6.000 amp. hours will produce 100 amperes for _________ minutes.

49. Current limiting fuses shall not be ___________ with standard fuses.

50. The cell temperature of a lead-acid battery should not exceed ___________ F.

NAME ______________________________

ELECTRICAL APPRENTICESHIP
FIRST YEAR CLASS - 'SERIES A"
FINAL EXAM

1. Change the following fractions to decimals:

(a) 144/1000	(b) 7/10
(c) 6/100	(d) 15/60

2. Change the following mixed numbers to decimals:

(a) 7-35/100	(b) 3-3/10
(c) 3-4/5	(d) 15-49/100

3. What value of current flows through a line supplying 1800 watts to a load of 20 ohms resistance?

4. How many minutes can a 600 amp. hour battery supply 25 amps.?

5. Find the square roots of the following: (carry out to two decimal places)

   (a) 3,481

   (b) 267

   (c) 17.64

   (d) 18,769

6. A 125 KVA transformer will stand a 25% overload. What KVA load will the transformer handle?

7. What current flows through the heater of a radio tube having a resistance of 85 ohms and uses 3.4 watts?

NAME______________________________

8. A wire is 3/16 inches in diameter. What is the diameter in mils? Approximate AWG size?

9. What is the resistance of a line 1 mile long if No. 8 AWG copper wire is used? What is voltage drop across this line if the current is 0.05 amps.?

10. A 40-ohm heater draws 6 amps. What is the voltage drop across the heater?

11. Find the value of the unknown letter in the following:

(a) $\frac{8}{3} = \frac{R}{6}$

(b) $\frac{E}{18} = \frac{3}{2}$

(c) $\frac{3.6}{5} = \frac{I}{2}$

(d) $\frac{16}{P} = \frac{2}{6}$

12. Find the current drawn by a 40-ohm toaster from a 120-volt line.

13. How much power is consumed by a 50-ohm electric lamp which draws 2 amps.?

NAME______________________________

14. A load 400 feet from the generator requires 160 amps. The generator voltage is 115.6 volts. The load requires 110 volts. What is the voltage drop and the minimum size Type "THW" cable that may be installed?

15. What is the diameter in inches of a cable having a cross-sectional area of 83,690 circular mils?

16. A 50 kw load is installed 100 feet from the generator rated 240 volts. What is the minimum size Type "THW" cable that will be permitted by the NEC?

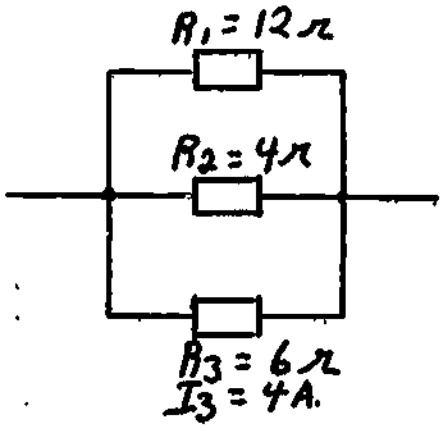
17. What is the resistance of 900 feet of No. 8 AWG copper wire?

18. A generator supplies 5.5 kw at 125 volts to a motor 500 feet away. The motor delivers 6.3 HP at an efficiency of 90%. Find (a) watts input to the motor, (b) watts loss in line, (c) current in the line, (d) voltage drop in the line, and (e) smallest size Type "THW" cable that may be used.

19. What is the resistance of a copper conductor at 200° F. if the resistance is 50 ohms at 70° F.?

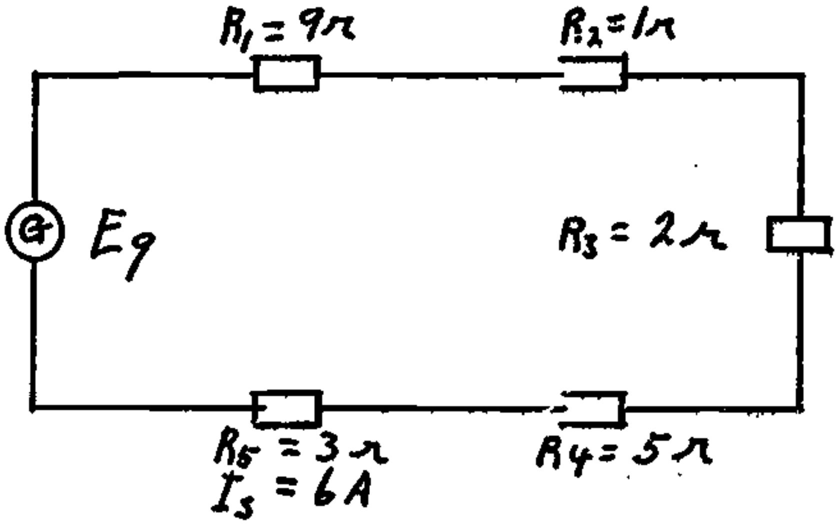
20. How many bells rated 2.5 amps., at 6-volts, can be connected in series on a 120-volt circuit?

21.



Find I_1, I_2, I_T, & V_T.

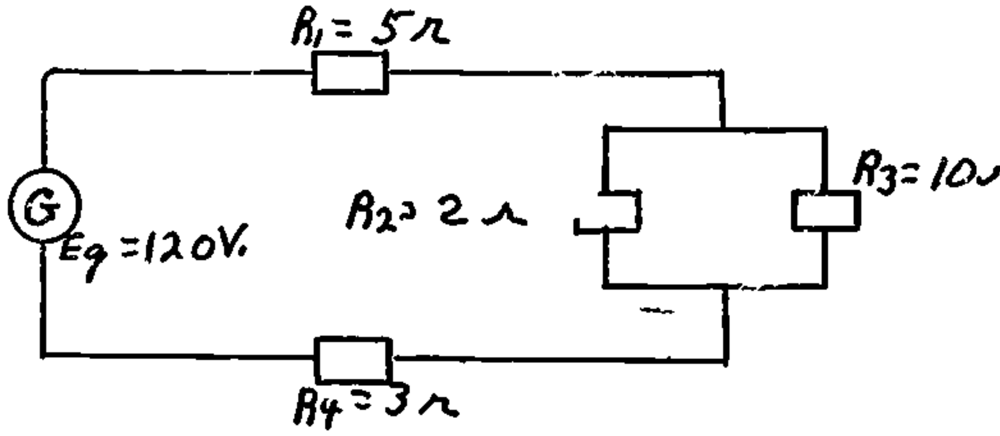
22.



Find V_1, V_2, V_3, V_4, V_T, R_T, & I_T.

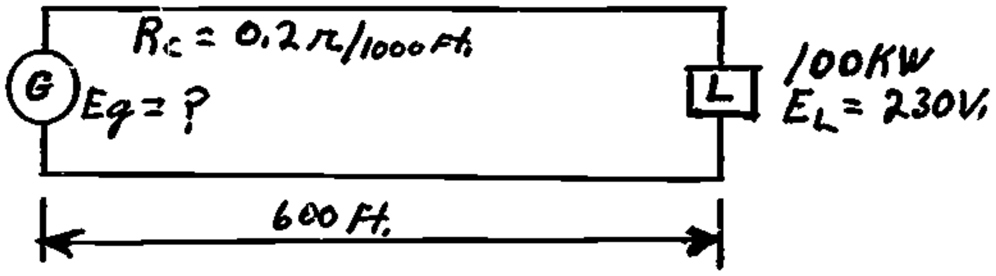
NAME ______________________

23.

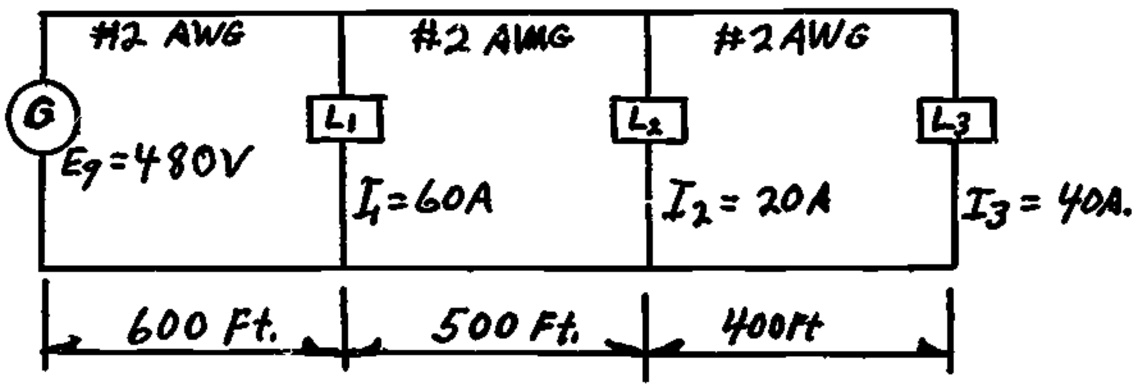


Find V_1, V_2, V_4, I_1, I_2, I_3, & R_T.

24. Find voltage at generator:



25. Find voltage across each load. Is the voltage drop between generator and L_3 within Code limitations?



26. Most building wire is insulated for __________ volts.

27. One inch equals __________ mils.

28. The ______________ part of the atom has a negative charge.

29. NEC sets up _____________ standards for electrical installations.

30. ______________ drawn copper wire is used mostly in insulated wires.

31. The word "______________" in NEC means this requirement is mandatory.

32. Copper wire is made in three grades of hardness known as _______________, _______________ and _______________.

33. Cable smaller than No. _______ AWC shall not be used on interior wiring.

34. In a series circuit, the ________________ is constant, total _____________ is equal to the sum of the ________________ _______________ across each resistor, and the total ______________ is equal to the ________________ of each resistor.

35. ________________ means 1000 watts.

36. A ________________ cell can be re-charged.

37. The resistance of a wire ________________ as the length increases.

38. The maximum voltage drop permitted by NEC for combined lighting and power loads is _______________ and ________________ for power loads.

39. In a parallel circuit, the ____________ is constant, total _______________ is the sum of the ______________ in each resistor.

40. _____________ is a better material for electrical conductor than copper.

41. Plug fuses have a maximum rating of __________ amps.

42. The resistance of a wire _________ as the area increases.

43. The cross-sectional area of a conductor is equal to the ________________ of the diameter in _____________.

44. The flow of current is limited by the _______________ with a constant voltage.

45. As a wire gets hotter the _______________ increases.

46. A 2-inch conduit shall not have less than a ________________ radius bend.

47. Voltage of several dry cells connected in ________________ is the same as the voltage of any one dry cell.

48. Conductors No. _____ AWG and larger installed in raceways shall be stranded.

49. Any number having a whole number as its square is a _______ _________.

50. The largest size of EMT is _______.

51. __________ prevent shortcircuit currents from burning up electrical equipment.

52. Torque is the effect of __________.

53. _______ watts equals one horsepower.

54. There are __________, __________ and __________ types of fuses.

55. Stranded conductors are more __________ than solid conductors.

56. Storage batteries may be __________ and __________.

57. A __________ has a high conductivity.

58. Maximum size liquid-tight flexible conduit shall be ________ inches.

59. Specific resistance is the ability of a _______ ________ to resist the __________ of __________.

60. The maximum size of EMT is _______ inches.

61. __________ and __________ joint connections have a low resistance.

62. Bushings are installed on conduits in a junction box to protect the __________ from __________.

63. A grounded conductor is _________ __________ to the earth and is also called "__________" or "__________ __________."

64. __________ is the minimum size raceway permitted by the NEC.

65. __________ quarter-bends are the maximum permitted in one conduit run.

66. A general-use switch is rated in __________ and is capable of _______ its __________ __________ at its __________ __________.

67. Vertical support of #4/0 conductor shall not exceed _______ feet.

68. A mortar-circuit switch is __________ rated.

69. Lubricants for conductors being pulled through a raceway system may be __________ or __________.

NAME______________________________

70. The insulation resistance for a No. 8 AWG conductor shall be __________ ohms.

71. ______________ ________________ are also secondary batteries.

72. _____________ sizes are given in AWG.

73. ______________ or _______________ of conductors is not permitted within a raceway.

74. ______________ can neither be created nor destroyed.

75. ______________ is used to measure current.

76. ______________ is used to measure voltage.

77. ______________ is used to measure resistance.

78. ______________ is used to test the insulation resistance of conductors.

79. Efficiency is the ratio of ______________ to _______________.

Basic Electricity Series, No. B (Second Year), Related Training for Electrical Apprentices, Instructor's Manual.

Hedinger, Howard E.
North Carolina State Board of Education, Raleigh.
Pub Date - Jun64
MF AVAILABLE IN VT-ERIC SET 51p.

*TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, *APPRENTICESHIPS,

This teaching guide, the second of a four-unit series, is to help the instructor plan and present course material to electricians in the second year of the related technical phase of post-secondary apprenticeship training. It was developed by a curriculum committee of subject matter specialists and the educational committee of the National Electrical Contractors of North Carolina, tested on a small group, and used in apprenticeship programs. The 30 lesson plans in this guide cover Lighting and Lamps, Transformers, A.C. Motors, and National Electrical Code related to wiring installation. Each lesson plan is outlined in desired results, materials, references, introduction, presentation, application, and checking and followup. The teacher of this 144-hour course should be a journeyman tradesman, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include lists of textbooks and recommended films. Correlated student assignment and information sheets, unit tests, and a final examination are given in VT 003 627. Documents of the series are listed as VT 003 624 through VT 003 631. (HC)

ACKNOWLEDGMENTS

The Instructor's Manual and Assignment Sheets for the Electrical Apprentice Training Program have resulted from a need recognized by representatives of Trade and Technical Education and the Apprentice Council of the Department of Labor of North Carolina. They believe that an apprentice, in order to become a skilled craftsman in our times, needs not only to work hard on the job but also to study the related technical materials of his trade in an organized manner.

The Curriculum Laboratory of the Department of Community Colleges, was given the assignment of preparing materials that could be used by the instructors as a guide. The material contained in the lesson outlines is designed to help the instructor plan the lessons and to lead his classes gradually into the more complex studies of electricity.

Representatives of the Curriculum Laboratory have worked in close cooperation with a statewide Education Committee of the North Carolina Association of Electrical Contractors. Among these men are contractors, engineers, and journeymen who have not only worked as electricians but also are serving as instructors for apprentice classes.

Thanks are extended to Mr. D. J. Colter, Chairman of the Apprentice Training and Manpower Development Committee for the Electrical Contractors Association, Mr. C. L. Beddingfield, State Director of Apprenticeship and Training, and Mr. W. F. Humbert, III, Instructor of Winston-Salem who prepared the study guide questions for each lesson.

In addition, appreciation is expressed to all those instructors and apprenticeship committee members who have made themselves available for consultation regarding this course.

A. J. Bevacqua, Coordinator
Curriculum Laboratory
N. C. Department of Community Colleges

H. E. Hedinger
Curriculum Specialist

BASIC ELECTRICITY

TO THE INSTRUCTOR

The second year (Series B) of the course in Basic Electricity for apprentices is designed, as was the first, to make it easier for the instructor. The lesson outlines should help him lead his classes gradually into the more complex phases of the study of electricity.

It should be noted by the instructor that:

1. Topics on basic mathematical principles were reviewed and other applied topics were introduced during the first year (Series A). The second year (Series B) contains no topics specifically on mathematical subjects. Yet the instructor will realize that additional practice in handling equations will be necessary for most apprentices by the time they begin to study alternating current. Also, he will be aware that simple trigonometry and vector diagrams must be introduced along with A.C. theory. References on these subjects have been assigned in the appropriate topics so that the apprentice will be ready for the mathematics used in A.C. theory. It will be essential for the instructor to pay special and separate attention to these mathematical tools in order to be sure that the electrical theory will be completely understandable to the apprentices. In the event that some of the apprentices are weak in mathematics, the instructor should make additional assignments and give special individual help.

2. In this course, the topics on the National Electrical Code will be studied in terms of wiring methods. Most of these topics are presented at the end of each year's work. It is hoped that by studying the Code along with other subjects each year will help create interest and will be better applied to job situations.

3. There is a suggested list of audio-visual aids; however, the instructor should use any other aids available, but be sure to order them in ample time. It is hoped that the instructors will not have too much difficulty obtaining particular aids at the time they need them.

LESSON NO. LIGHTING AND LAMPS

TRANSFORMERS

A. C. MOTORS

NATIONAL ELECTRICAL CODE

INSTRUCTIONAL MATERIALS

GENERAL LIGHTING

DESIRED RESULTS:

1. To help the student understand what light is and how it is produced.
2. To help prepare the student to utilize the experience he receives on the job in relation to lighting.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Samples of lamps
2. Light meter
3. Designs of lighting installations

REFERENCES:

1. * Swoope's Lessons in Practical Electricity, Pages 548-549; 558-575.
2. American Electricians' Handbook, Div. 10, page 2-20.
3. National Electrical Code, Article 410.
4. Films: (a) How Man Made Day - 16 mm sound film - Coronet Films.
   (b) Light is What You Make It - 16 mm sound film - National Better Light and Sight Bureau.

INTRODUCTION:

The electrician should have a basic understanding of the nature and character of light. You may not be asked to design a large lighting system but you will spend much of your working time installing equipment. It will help you to know the basic things about light--what light is and how it is produced. Intensive study of applied light and its influence upon man has developed only recently. We have witnessed the development of several new light sources and the demand for safe equipment and higher illumination levels for industrial and commercial buildings.

There are four separate divisions in the development of a lighting system that must be considered.

1. Design of the lighting equipment.
2. Manufacture of the lighting fixture.
3. Design of the lighting layout and system.
4. Actual installation of the equipment.

PRESENTING THE LESSON:

A. 1. Discuss and define the following terms:

(a) light
(b) Foot-candle
(c) watt
(d) lumen
(e) reflected light
(f) refraction

2. List the three primary colors.

3. Discuss three different classes of glare.

4. Explain incandescent lamps, arc lamps and gaseous lamps.

5. Explain how lamp efficiency is found.

6. List four general classes of illumination.

B. Demonstrate the light meter by showing how the light reading varies in different parts of the room.

APPLICATION:

Have the students answer the questions on assignment sheet B-1.

CHECKING AND FOLLOW-UP:

Correct the answers and discuss any questions that the students may ask concerning the lesson.

FLUORESCENT LAMPS

DESIRED RESULTS:

1. To acquaint the student with some of the properties and characteristics of the various types and sizes of fluorescent lamps.
2. To learn the importance of using correct equipment for replacement.

MATERIALS AND EQUIPMENT:

1. A display of different lamps, fixtures and ballasts.
2. 16 mm Film Projector.

3. * Industrial Electricity (Nadon and Gelmine), Pages 666-683.
4. Film - The Magic of Fluorescence, General Electric Co.

INTRODUCTION:

This lesson is concerned with the lamp only, later lessons will deal with the ballast and starters. There are several different types of lamps, therefore, the apprentice should know which type he is working with and how it operates. Thus, he should become acquainted with some of the properties and characteristics of the various types of fluorescent lamps.

PRESENTING THE LESSON:

1. Show the film and discuss any questions that may rise.
2. Let the students examine the various samples of lamps.
3. Discussion questions.
   - (a) Why are fluorescent fixtures gaining in popularity over incandescent fixtures?
   - (b) For what types of installation would you recommend the use of fluorescent fixtures?
   - (c) In your opinion, which is the better type of lighting, fluorescent or incandescent?

FLUORESCENT LAMPS

DESIRED RESULTS:

1. To acquaint the student with some of the properties and characteristics of the various types and sizes of fluorescent lamps.
2. To learn the importance of using correct equipment for replacement.

MATERIALS AND EQUIPMENT:

1. A display of different lamps, fixtures and ballasts.
2. 16 mm Film Projector.

REFERENCES:

1. American Electricians' Handbook, Pages 10, 45-72, Sec. 103-138.
2. * Swoope's Lessons in Practical Electricity, Pages 556-558.
3. * Industrial Electricity (Nadon and Gelmine), Pages 666-683.
4. Film - The Magic of Fluorescence, General Electric Co.

INTRODUCTION:

This lesson is concerned with the lamp only, later lessons will deal with the ballast and starters. There are several different types of lamps, therefore, the apprentice should know which type he is working with and how it operates. Thus, he should become acquainted with some of the properties and characteristics of the various types of fluorescent lamps.

PRESENTING THE LESSON:

1. Show the film and discuss any questions that may rise.
2. Let the students examine the various samples of lamps.
3. Discussion questions.
   - (a) Why are fluorescent fixtures gaining in popularity over incandescent fixtures?
   - (b) For what types of installation would you recommend the use of fluorescent fixtures?
   - (c) In your opinion, which is the better type of lighting, fluorescent or incandescent?

APPLICATION:

Have the students answer the questions on Assignment Sheet B-3.

CHECKING AND FOLLOW-UP:

Check the answers on the assignment sheets against the answer sheets. Return to learner for placing in workbook.

FLUORESCENT BALLASTS

DESIRED RESULTS:

1. To study the equipment which is used to make fluorescent lamps burn.
2. To discuss the function of the ballast used on fluorescent fixtures.

MATERIALS AND EQUIPMENT:

1. Samples of ballast equipment, capacitors, and lamp fixtures.

REFERENCES:

1. American Electricians' Handbook, Pages 10-57 thru 67, Sec. 123-130.

INTRODUCTION:

In the previous lesson, we studied the fluorescent lamp and how it operates. In this lesson we will study the equipment which is used to make the fluorescent lamp burn and give off the type of light needed to illuminate a particular area. This equipment has many variations and must be correct for the type of lamp used.

PRESENTING THE LESSON:

When a decision to use fluorescent lighting has been made you should ask the following question. What kind and color of light do you want? The answer will determine the type fluorescent lamp to be used. The type lamp determines the other equipment to be used in the fixture.

Discuss the purposes of the ballast. List the functions and types of starting switches. Discuss the action of the common types of starting switches. What is a "no-blink" starter? Give its advantages. Does the surrounding air temperature effect the output of a fluorescent lamp? What difference does it make in the ballast for a fluorescent fixture when it is operated on high frequency current?

APPLICATION:

Have the students answer the questions on the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Correct the answers and discuss any questions that the students failed to understand.

LIGHTING INSTALLATION

DESIRED RESULTS:

To learn that the proper installation of a lighting system must be correct in order to be effective.

MATERIALS AND REFERENCES:

1. National Electric Code, Article 410.
2. American Electricians' Handbook, Pages 1572 - 1622.
3. *Industrial Electricity, by Nadon & Gelmine, pp. 676 - 683.

INTRODUCTION:

The technical details of the design of a lighting system are only a partial solution of the problems of satisfactory lighting operation. If a lighting system is to be effective, the installation must be correct in every respect. However, unless it is properly maintained, a system that is adequate at the time of installation will depreciate rapidly. This is equally true for natural and artificial lighting. Maintenance should not be entrusted to the average caretaker unless he is properly supervised. It should be based upon a regular, systematic schedule and include a system of reports and checks.

PRESENTING THE LESSON:

1. Call attention to the main items of installation included in Article 410 of the National Electrical Code.
2. Explain how the lighting unit for general illumination should be located symmetrically throughout the area to be illuminated.
3. Is complete uniformity of illumination desirable in all installations? Why?
4. What is the most common method of illumination and what is the reason for its popularity?
5. How much illumination (foot candles) is needed for the following: (See tables in Handbook)

   (a) Bakery
   (b) Cannery
   (c) Linotype room (printing)
   (d) Office (close work)
   (e) Textile (cotton spinnin

APPLICATION:

Have the students complete the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers and discuss the common errors with the class.

ELECTRICAL TESTING

DESIRED RESULTS:

1. To determine whether or not circuits are shorted or open.
2. To become familiar with some of the many types of testing instruments and their uses.

INSTRUMENTS AND MATERIALS:

1. Volt and Ohm-meter
2. Voltage tester D.C. or A.C.
3. Test lamp outfit and others if available
4. Wire connections

REFERENCES:

1. American Electricians' Handbook, Pages 56-93.
2. * Swoope's Lessons in Practical Electricity, Pages 272-278.
3. * Industrial Electricity, Nadon & Gelmine, Pages 100-103; Pages 483-508.

INTRODUCTION:

The testing of circuits is a common practice in the industry. Volts, amperes, ohms, watts, cannot be seen, however, they can be measured by the use of proper instruments. The wireman often finds it necessary to measure the amount of electricity that is being used or the number of volts and amperes in the circuit or to determine the resistance of the circuit. The reference material in this lesson is very general and you should learn much more about this subject. As you work on the job give attention to the testing and metering equipment.

An electrical meter should be handled as carefully as a fine watch; it should not be dropped or jarred. It is important that the instrument be connected properly. When connecting meters that are furnished with switchboards, the electrician should never cut the leads sent with the meters even though they are too long. These leads are sometimes calibrated with the meter, and shortening them may cause the meter to give inaccurate readings.

PRESENTING THE LESSON:

Demonstrate how to use the Ohm and Volt meters and any other measuring instruments on hand. Review and define terms associated with this lesson such as: volts, amperes, ohms, resistance, watts, megger, etc.

Discussion Questions:

1. How would you tell A.C. from D.C. when using a voltage tester?

2. How would you tell A.C. from D.C. when using a neon-glow lamp tester?

3. Describe the following test sets:

   (a) Telephone receiver

   (b) Lamp set

   (c) Magneto set

   (d) Electric-bell

4. What testing device is best suited to locating a neutral on a 3 wire circuit?

APPLICATION:

The students will be given time to fill out the answers on the assignment sheet B-6.

CHECKING AND FOLLOW-UP:

Check the answers and return to students to find the correct answers where review is needed.

INDUCTANCE

DESIRED RESULTS:

To inform the learner how magnetism may be used to produce an electric current flow as the result of the electromotive force (E.M.F.) of induction.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Supplies for demonstration:
   (a) Wire for coils, core material (iron and copper rods), meters
   (b) Permanent magnet and electromagnet
3. Inductance--16 mm sound film United World Films

REFERENCES:

1. American Electricians' Handbook, Pages 1-23 to 1-44.
2. Basic Electricity, Vol. 3, Pages 3-43 to 3-53.
3. *Industrial Electricity, by Nadon & Gelmine.

INTRODUCTION:

It has been learned how an electric current can produce magnetism. We can now study how it is possible to create a flow of electricity in a conductor by the use of magnetism. The extent of the inductive effect depends upon the physical nature of the circuit, the amount by which the current changes in a particular length of time, and the length of this period. Inductance opposes flow of current through a circuit by imposing a counter-voltage much like the counter-electromotive force of the D.C. motor. The value of this opposition is stated in terms of equivalent ohms and is called the inductive reactance of the circuit.

PRESENTING THE LESSON:

A. The principles studied in this assignment are the foundation upon which most of our present day electrical industry is built. Examples: motors and transformers. The student should master the formulas dealing with induced voltage and with inductive reactance. He should remember that the inductance of a coil is dependent upon the square of the number of turns of wire in that coil.

Advanced study of inductance will be presented later in the course. The student must have an insight into induction in order to understand the fundamentals of the transformer and motors, which will follow.

B. Show 16 mm Film - "Inductance" at this time.

PRINCIPLES OF TRANSFORMERS

DESIRED RESULTS:

To acquaint the student with ways that the voltage of a source of supply (primary) can be used to induce a current in another coil (secondary). This is accomplished by means of mechanical movement through the electromagnetic field or by using alternating current.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Supplies for experiments
   (a) Induction coil
   (b) Transformers (50 and 100 turn coils)
   (c) Bar magnet

REFERENCES:

1. American Electricians' Handbook, Div. 5, Sec. 1-4.
2. Basic Electricity, Vol. 3, Pages 54-57.
3. Basic Mathematics, Pages 351-359.
4. *Swoope's Lessons in Practical Electricity, Pages 526-533.

INTRODUCTION:

The electrical principles set forth in this lesson apply specifically to transformers and indirectly to motors and electronic circuits. The transformer is an inductive device used in alternating current distribution, to change the voltage to higher or lower amounts where needed. It is quite doubtful that there would be an electrical industry if the transformer principle had not been discovered and developed. Discussion of the operating principles and simple demonstrations of the transformer action are necessary if a thorough understanding of this important device is to be acquired.

PRESENTING THE LESSON:

A. When A.C. flows through a coil, E.M.F. is induced in the coil or an alternating magnetic field is generated around the coil.

   1. E.M.F. is induced in a coil and is called self induction when:

      (a) The coil is moved through a magnetic field.
      (b) When the field is moved through the coil.
      (c) By opening and closing the circuit of the electromagnet supplying the magnetic field.

2. Another way is to vary the magnetic flux of the core in a coil.

3. Use a bar magnet to vary induced flux.

4. Explain other uses of induction coils - as telephone circuits, "neon" signs, step-up voltage supply.

B. Mutual Induction

The E.M.F. generated in the second coil is called the "E.M.F of Mutual Induction" or known as transformer action. Both induction coils and transformers operate by the principle of mutual induction.

1. Point out that:

   (a) The "induction" coil is really a kind of transformer or voltage changer.
   (b) A transformer has a primary and a secondary wound on a core of magnetic material.
   (c) The secondary of an induction coil always has more turns than the primary.
   (d) A transformer secondary may have more or fewer turns than the primary, depending on whether the voltage is to be increased o. decreased.
   (e) An induction coil has an open core. (The core ends do not form a complete magnetic path.)
   (f) A transformer has a closed core. (The core forms a complete magnetic path.)
   (g) Transformers may be used to decrease as well as increase voltage by the mutual induction of their windings.

C. Two kinds of transformers are the <u>step-up</u> and the <u>step-down</u>.

1. Point out that:

   (a) Both have a primary and a secondary winding.
   (b) The step-up transformer has more turns of wire in its secondary than in its primary winding, thus, a higher voltage is produced in the secondary.
   (c) A <u>step-down</u> transformer has fewer turns in the secondary than the primary. Thus, a lower voltage is produced in the secondary. Examples, a pole transformer, a bell transformer, or a toy transformer.

D. The voltage output of a transformer depends on ratio of primary to secondary coil turns.

1. Point out that:

   (a) The voltage of the secondary of a transformer has the same ratio to the primary voltage as the number of secondary turns has to the number of primary turns.

(a) Continued.
Stated as an equation:

$$\frac{\text{Secondary voltage}}{\text{Primary voltage}} = \frac{\text{Secondary turns}}{\text{Primary turns}}$$

(b) Demonstrate this equation in proportion by working several problems on the chalkboard.

E. A current that flows in one direction and then in another is called an alternating current.

1. A transformer ordinarily has an alternating current flow through its primary and always has an alternating current induced in its secondary.

F. Demonstrate the following experiments:

1. Induction coil
2. Bar magnet to vary induced flux
3. Make an experimental transformer or use demonstration model or mock-up.
4. Exchanging coils affects secondary voltage.

APPLICATION:

Have the students work and hand in assignment sheet. Give individual help where needed.

CHECKING AND FOLLOW-UP:

Check assignment sheets against the answer sheets and return to learner for placing in workbook.

(a) Continued.
Stated as an equation:

$$\frac{\text{Secondary voltage}}{\text{Primary voltage}} = \frac{\text{Secondary turns}}{\text{Primary turns}}$$

(b) Demonstrate this equation in proportion by working several problems on the chalkboard.

E. A current that flows in one direction and then in another is called an alternating current.

1. A transformer ordinarily has an alternating current flow through its primary and always has an alternating current induced in its secondary.

F. Demonstrate the following experiments:

1. Induction coil
2. Bar magnet to vary induced flux
3. Make an experimental transformer or use demonstration model or mock-up.
4. Exchanging coils affects secondary voltage.

APPLICATION:

Have the students work and hand in assignment sheet. Give individual help where needed.

CHECKING AND FOLLOW-UP:

Check assignment sheets against the answer sheets and return to learner for placing in workbook.

APPLICATION:

Have the students answer the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for placing in their workbook.

APPLICATION:

Have the students answer the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for placing in their workbook.

SINGLE PHASE TRANSFORMERS

DESIRED RESULTS:

To learn the basic facts needed to hook-up a single phase transformer.

MATERIALS AND EQUIPMENT:

1. Open type transformer
2. Chalkboard

REFERENCES:

1. American Electricians' Handbook, Div. 5, Sec. 16-18, Sec. 31, Sec. 46-50, Sec. 67-69, Sec. 73-79, Sec. 115-121.
2. Basic Electricity, Vol. 4, Pages 77-89.

INTRODUCTION:

Transformer connections seem to be a complicated subject to many electricians. The student must learn the basic facts of the simple single-phase connections if he expects to understand the three-phase connections later.

PRESENTING THE LESSON:

The electrician will not hook up a transformer every day and he should not ask someone else to show him how to do the work.

Demonstrate on the chalkboard and on the model transformer how to make the connections. Have the students draw transformer connections on the board and on the notebook paper without help of the book.

APPLICATION:

Have the students answer the questions on the assignment sheet. Give individual help where needed.

CHECKING AND FOLLOW-UP:

Check the assignment sheets against the answer sheet and return to the students for placing in their notebooks.

THREE-PHASE TRANSFORMER

DESIRED RESULTS:

To acquaint the student with the technical or the theory and practice of three-phase transformer connections.

MATERIALS AND REFERENCES:

1. Chalkboard
2. American Electricians' Handbook, Div. 5, Sec. 50-57, 80-90.

INTRODUCTION:

This lesson concerns itself with the technical information about transformer connections. The next lesson will deal with the actual drawing of the connections. The student will need to know the facts learned in this lesson in order to complete the lesson by drawing actual connections. Have the students pay particular attention to the voltage and current relationships in wye and delta connections. These relationships apply to other devices such as generator and motor coils.

Three-phase transformer connections have become so varied and complicated that it is impossible for a student electrician to become completely familiar with the subject or to analyze without diagrams many of the problems that arise. However, a basic knowledge and understanding of simple transformer connections is not only essential to the apprentice from a standpoint of know-how but also is necessary for personal safety when he is connecting transformers.

PRESENTING THE LESSON:

There are severa basic transformer connections that the apprentice must memorize and be able to recognize at first glance in an actual transformer set-up and in wiring diagrams. These basic connections for three-phase work are delta and wye (Y) for three and four wire systems.

Present the advantages and disadvantages of a three-phase transformer. Discuss the voltage and current on the windings of a delta-delta connected transformer. Discuss the voltage and current on the windings of a wye-wye connected transformer.

In connecting large transformers in parallel, they will operate satisfactory with their low and high-tension windings connected to the same circuits provided they have (1) the same ratio of transformation (2) the same voltage rating and (3) approximately the same regulation.

Discuss the advantages of the wye connected primary. Discuss the disadvantages of the open delta transformer connection. Discuss the relative cost of transformer connections.

APPLICATIONS:

Have the students complete the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Correct the answers on the assignment sheet and return to the students. Discuss any questions that need to be clarified.

THREE-PHASE TRANSFORMER CONNECTIONS

DESIRED RESULTS:

To become acquainted with the basic type connections for the three-phase transformers. To be able to draw diagrams for these connections.

REFERENCE:

1. American Electricians' Handbook, Div. 5, Sec. 50-57, 80-90.

MATERIALS AND SUPPLIES:

1. Chalkboard
2. Paper to draw transformer connections

INTRODUCTION:

The instructor should establish a uniform method of drawing transformers prior to making this assignment. This procedure, if followed will make the job much easier and more effective. Have the students make practice drawings of the basic connections. It is more important for them to know why than how in the connections of transformers.

PRESENTING THE LESSON:

Review several of the basic circuits using diagrams on the chalkboard. Have several of the students draw the diagrams on the chalkboard. Should the students have trouble with these particular drawings you should refer them to their references for further reading.

APPLICATION:

The students should complete the assignment sheets and make the drawing connections required.

CHECKING AND FOLLOW-UP:

Check the drawings and return them for correction and filing in the workbook. Assign extra drawings to those that need further study.

THREE-PHASE TRANSFORMER CONNECTIONS

DESIRED RESULTS:

To become acquainted with the basic type connections for the three-phase transformers. To be able to draw diagrams for these connections.

PRINCIPLES OF A.C. MOTORS

DESIRED RESULTS:

1. To acquaint the learner with the "Basic Principles" of A.C. Motors in order to have a good understanding of the operation of the various types of motors to be studied later.
2. To review the action of a current carrying conductor in a magnetic field.

EQUIPMENT:

1. Film - "Rotating Magnetic Fields" and 16 mm projector
2. Electric Motors and Controllers by Crow (Demonstration Equipment)

REFERENCES:

1. Basic Electricity, Vol. 5, Pages 97-112.
2. American Electricians' Handbook, Div. 7, Sec. 54-65, 118-131.
3. Basics of Fractional Horsepower Motor and Repair, Pages 1-12.
4. *Swoope's Lessons in Practical Electricity, Pages 5-6, 509-511.

INTRODUCTION:

The use of electrical energy would be very limited if means for producing rotary motion had not been discovered. The electrical device which makes this possible is the electric motor. This lesson concerns itself with only the basic principles or concepts upon which all A.C. motors operate. Future lessons on motors will require more understanding of Induction and Capacitance. Some students may wish to go deeper into these subjects, if so, discourage this at this time. They will have plenty of time to study A.C. Theory at a later date.

There are several terms used in this lesson, such as, "Phase angle" and "Induction" which may need more explanation. These terms will be studied later as individual subjects.

PRESENTING THE LESSON:

A. Show and discuss the film.

B. Any demonstration equipment which may be available such as the Crow Equipment should be used to illustrate the principles involved in this lesson. The illustrations in Basics of Fractional Horsepower Motors and Repair by Schweitzer will show some demonstrations with minimum equipment.

C. Class discussion on the Basic Principles of A.C. Motors is very important in order to determine the degree of understanding of the learners.

DISCUSSION QUESTIONS

1. What two factors determine the strength of an electromagnet?
2. How can the polarity of an electromagnet be reversed?
3. What happens when a conductor formed into a closed circuit is moved through a magnetic field?
4. What do we call the difference in the sychronous speed and the actual speed of an induction motor?
5. What is the proper term used to indicate a twisting or turning force? (Additional questions should be used.)

APPLICATION:

Fill in the answers to assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for discussion and placing in the workbooks.

SINGLE-PHASE MOTORS

DESIRED RESULTS:

To acquaint the students with the single-phase motor, how and why it operates, and its proper use on the job.

MATERIALS:

1. Sample motors
2. Film - Motor Principles. United World Films or General Electric Co., Schenectady 5, N. Y.

REFERENCES:

1. Basic Electricity, Vol. 5, Pages 97-112.
2. Basic of Fractional Horsepower Motors and Repair, Pages 13-73.
3. *Swoope's Lessons in Practical Electricity, Page 515.
4. American Electricians' Handbook, Div. 7, Sec. 99-106.

INTRODUCTION:

When it was discovered that a coil of wire induces magnetic polarity in a soft-iron core, studies were made to find out that the poles were induced into the rotor. It was discovered that two sets of poles are so induced, one by transformer action, and one by the generating action of cutting lines of force. The poles induced by transformer action were found to be the most essential to successful operation of the motor. A pole induced in the rotor through transformer action becomes active only after it has rotated far enough to be attracted toward the next stator pole ahead. This delayed action was found to be caused by the fact that induced voltages lag inducing fluxes by 90 degrees, and that current flow in a highly inductive circuit, as exists in the rotor, lags the voltage by 90 degrees.

The capacitor motor plays such an important part in the work of an electrician today that it cannot be slighted. You will be working with this motor almost daily as an electrician, so be sure to know how and why it runs. It is easy to get confused because of the different classes of capacitor motors. Learn to recognize the several classes of capacitor-start split-phase induction motors.

The repulsion motor is not nearly as popular as it was before the introduction of capacitor-start motor. Although they are being replaced in many installations today, there are a great number still in service on air compressors and other heavy starting load applications. The electrician should be familiar with this motor and its characteristics.

This lesson begins a series of study of fractional horsepower motors. These motors are named from their differences in methods of starting. One type of induction motor which incorporates a starting device is called a "split-phase" induction motor. This motor uses combinations of inductance, capacitance and resistance to develop a rotating field. Split-phase motors come only in small sizes since the special starting windings are very light, thus, the motor does not develop enough torque to start heavy loads. Remember that this type of motor is very common and you will contact it most frequently in your work.

PRESENTING THE LESSON:

1. The first type of split-phase induction motor that we will study is the capacitor-start model. Refer to the simplified schematic diagrams in your texts for a typical capacitor-start motor. There are two windings, the main winding and a starting winding which is connected in parallel with the main winding and spaced at right angles to it. The 90 degree electrical phase difference between the two windings is obtained by connecting the auxiliary winding in series with a capacitor and the starting switch. Upon starting, the switch is closed, placing the capacitor in series with the auxiliary winding. The capacitor is of such a value that the auxiliary winding is effectively a resistive-capacitive circuit in which the current leads the live voltage by approximately 45 degrees. The main winding has enough resistance to cause the current to lag the line voltage by approximately 45 degrees. The two currents are therefore 90 degrees out of phase and so are the magnetic fields which they generate. The effect is that the two windings act like a two-phase stator and produce the revolving field required to start the motor.

2. Demonstrate the sample motors to the class and be sure that the students understand how they run. The student should be able to determine whether or not a motor should be sent to a shop, be replaced, or repair it on the job.

3. The student should obtain a clear picture of the rotating magnetic field. He should be familiar with the relationships between voltage, and torque, and starting, running, and breakdown torques in the induction motor.

4. Show the film - Motor Principles.

5. Discuss items brought out by the film or any questions that arise from the students.

APPLICATION:

The students will complete the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and discuss any questions the students will ask concerning split-phase motors.

7. Show how a three-phase motor can be reversed.
8. What is the starting torque of a pure synchronous motor?
9. How do you control the speed of a wound-rotor motor?
10. The formula for finding the per cent of slip of an induction motor:

$$\text{Per cent of slip} = \frac{\text{Synchronous speed} - \text{operating speed} \times 100}{\text{Synchronous Speed}}$$

APPLICATION:

Have the students answer the questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and discuss any noticeable mistakes made by the students.

7. Show how a three-phase motor can be reversed.
8. What is the starting torque of a pure synchronous motor?
9. How do you control the speed of a wound-rotor motor?
10. The formula for finding the per cent of slip of an induction motor:

$$\text{Per cent of slip} = \frac{\text{Synchronous speed} - \text{operating speed} \times 100}{\text{Synchronous Speed}}$$

APPLICATION:

Have the students answer the questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and discuss any noticeable mistakes made by the students.

MOTOR CIRCUITS

DESIRED RESULTS:

To acquaint the student with the requirements in regard to motors and their installation.

MATERIALS, EQUIPMENT AND SUPPLIES:

1. Chalkboard
2. Assignment Sheets

REFERENCES:

1. American Electricians' Handbook, Div. 7, Sec. 245-260
2. National Electrical Code, Article 430

INTRODUCTION:

The Code places great importance upon the proper installation of this equipment even to the point of devoting a lengthy section to motors. Be sure that the student understands the requirements of Article 430 and how they apply on the job.

PRESENTING THE LESSON:

The students should read the reference article and class discussion should cover those sections of Article 430 not specifically touched upon by the questions on the Assignment Sheet. The student can usually answer some of the questions from general knowledge or guessing. However, if he is required to list the section number after his answer, he will read and learn more Code in studying the lesson.

APPLICATION:

Have the students look up the answers to the questions and list the section number after each.

CHECKING AND FOLLOW-UP:

Check the answers with the students and return the papers for placing in the notebooks.

GENERAL INSTALLATION PROVISIONS

DESIRED RESULTS:

To acquaint the apprentice with the general installation provisions required or permitted by the "Code" for electric wiring and equipment.

REFERENCES:

1. National Electrical Code, Article 110
2. State and Local Electrical Codes & Ordinances

INTRODUCTION:

The requirements set forth in this section of the Code are general in nature and must be considered whenever an electrical installation is made. These provisions apply to all wiring and equipment installations unless specifically exempted by other sections of the Code. Therefore, the students should learn them well. Be sure that they study the entire article and not just find the answers to the questions.

It should be clearly understood that the apprentice wireman is not expected to memorize the contents of either the National Electrical Code, State and Local Safety Orders or Ordinances.

PRESENTING THE LESSON:

A. Studying the article, 110.

1. Study the definitions of the following terms, which are listed in Article 100 of the NEC: accessible, approved, concealed, device and enclosed.
2. Study the Mandatory and Advisory Rules and the use of the words "shall" and "should".
3. Give attention to Sections concerning conductors, equipment, and connections to terminals 110-6 thru 110-15.

B. Questions for discussion.

1. Are electrical fire hazards the same in small communities as in large cities?
2. Do you think there should be a single universal electrical code? Why?
3. Would it be wise to leave the matter of electrical requirements solely to the electrical wireman? To the electrical contractor?
4. Suppose you own a large building without electrical wiring. There are no electrical laws in the state or community. Ten electrical contractors wish to bid on the job of wiring the building. (a) What problems would you face in trying to decide who should get the work?

(b) Suppose, in this case, there was a national ordinance. Would decision be made easier? (c) Suppose, again, that there are state and local ordinances covering electrical installations. How would this fact help you in making the decision?

APPLICATION:

Have the class answer the questions on the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their workbooks.

GROUNDED CONDUCTORS

DESIRED RESULTS:

To acquaint the apprentice with the code concerning Grounded Conductors.

REFERENCES:

1. American Electricians' Handbook, Div. 9, Sec. 246-259
2. Design Manual on Steel Electrical Raceways, Pages 29-36
3. National Electrical Code, Articles 200 and 250

INTRODUCTION AND PRESENTATION:

The subject of "grounding" is very important in our work as electricians. Proper grounding insures safety for life and property. There are two general headings or types of grounding; namely, equipment and system grounding. This assignment will introduce you to the many rules and requirements for this subject. This section of the Code should be studied very carefully. A "system ground" is a connection to ground from one of the current carrying conductors of a distribution system or of an interior wiring system. An "equipment ground" is a connection to ground from one or more of the non-current carrying metal parts of the wiring system. The term equipment used here includes all such metal parts as metal conduit and raceways, metal armor of cables, outlet boxes, switch boxes, and metal motor frames. The grounding conductor may be attached to the nearest cold water pipe.

All interior wiring systems, except as provided in sections of the code, shall have a grounded conductor. This conductor shall be identified throughout the system except as explained in the section of Code called "Unidentified Circuits". In some hazardous locations, such as hospital operating rooms, it may be desirable to install ungrounded circuits. Such ungrounded circuits must be connected to a system which is provided with a contact indicating a device that will warn the occupants of a faulty ground.

1. Study the definitions for the following terms which are listed in Article 100 of NEC: Ground, Grounded, Grounded Conductor, Grounding Conductor, Equipment.
2. Study the assigned sections of the Code very carefully.
3. Stress any particular applications noted in sections of this article which are vital in your area.

APPLICATION:

Have the students find the answers to the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students.

BRANCH CIRCUITS

DESIRED RESULTS:

To acquaint the apprentice with the requirements of the Code concerning branch circuits.

REFERENCES:

1. American Electricians' Handbook, Div. 9, Sec. 375 ff.
2. Design Manual On Steel Electrical Raceways, Pages 37-41 - 100-109
3. National Electrical Code, Article 210

INTRODUCTION:

Most of the electrical work to be done on any job will be concerned with Branch Circuits. The apprentice should become familiar with the requirements of the Code concerning these circuits. To know these requirements and carry them out on the job will become the electrician's "bread and butter". The apprentice should study this section carefully before attempting to answer the questions on the assignment sheet.

PRESENTING THE LESSON:

1. Study the definitions for the following terms listed in Article 100 of the NEC: Branch Circuit, Branch Circuit (Appliance), Branch Circuit (General Purpose), Branch Circuit (Individual).

2. Discuss:
   (a) The scope of branch circuits.
   (b) Exceptions to the provisions in Article 210.
   (c) Classification of branch circuits.
   (d) What is a Multi-Wire Branch Circuit?
   (e) What "Color Code" is required for a fire-wire branch circuit?
   (f) What is a Heavy-Duty lampholder?

3. What is meant by "Adequate Wiring"?
   (a) Discuss the minimums required by the Code.
   (b) Name the two handbooks that contain data on the design of adequate wiring.

4. Review the Calculation of Load.
   (a) For General Lighting.
   (b) Other outlets supplying specific appliances and heavy-duty lampholders.
   (c) Additions to existing installations.

5. Discuss specific requirements for:
   (a) Conductors
   (b) Overcurrent Protection
   (c) Outlets Required
   (d) Maximum Load
   (e) Permissible Loads

APPLICATION:

After studying and reviewing the Code requirements, have the students complete the questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the class for correction and placing in their workbooks.

FEEDERS

DESIRED RESULTS:

To acquaint the apprentice with the determination of the minimum sizes of feeder conductors necessary for safety.

REFERENCES:

1. American Electricians' Handbook, Pages 3-18 to 3-54
2. National Electrical Code, Articles 215 and 220; Table 29 of Chapter 10

INTRODUCTION:

This topic is concerned largely with feeder requirements for apartment houses and for stores. Although the basic rules are the same as for the single dwelling, the additional rules are more complex. For example, it is often the job of the electrician to install the single-phase three-wire service entrance for an apartment building. He has the problem of determining the size of the conductors and conduit for the service entrance. It is also necessary to determine the size of the subfeeders for each apartment. Of particular interest in this assignment is the method for determining demand load for groups of electric ranges in an apartment house. It is not necessary to memorize the requirements listed for groups of ranges or other fixed appliances. It is wise to spend enough time studying the notes appended to the table to make certain that methods for determining service and feeder demand factors are thoroughly understood.

PRESENTING THE LESSON:

Study the following sections: Feeder size; Normal voltage and Voltage drop; Calculation of Load; Computation of Feeder Sizes and Common Neutral Feeder.

After the students have studied the above sections, the instructor should go through each topic with them and point out the important items.

DEMONSTRATIONS: Computation of Feeder Sizes--Examples.

I. Maximum Demands for Range Loads
 (Use examples in code book)
II. Single-family dwelling
 (Use examples in code book)
III. Multi-family dwellings (apartment building)
 (Use examples in code book)

APPLICATION:

Have the students fill in the answers to questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

After checking the answers, have the students correct the errors and place the sheets in their workbooks.

SERVICES

DESIRED RESULTS:

1. To understand the connections of standard single-phase, three-wire service entrances.
2. To understand the requirements of the National Electrical Code and power utility companies for a typical single family dwelling.

REFERENCES:

1. American Electricians' Handbook, Pages 9-159 thru 171; 9-177 thru 180
2. National Electrical Code, Article 230

INTRODUCTION:

In general, a building shall be supplied through only one set of service conductors. A building may be supplied by two or more service drops when there is good reason for this arrangement. (See Sections 230-2)

The service entrance for most present day lighting installations is a single-phase, three-wire service. The middle wire is called the neutral wire and is grounded; it is identified by the white insulation. The two outside wires are known as the hot wires. The voltage between the neutral wire and either of the hot wires is 115 volts and the voltage between the two hot wires is 230 volts.

In these modern times with the many electrical appliances, it is a definite advantage to have both 115 and 230 volts available. Many types of loads such as electric water heaters, electric ranges, and fractional horsepower motors operate on 230 volts. The higher voltage is preferable because heating appliances and motors will take less current. This permits the use of smaller wires, results in less voltage drop and less wasted power.

PRESENTING THE LESSON:

After the students have read Article 230, the instructor should point out the fundamental rules of the National Electrical Code. The rules concern the calculations affecting the service entrance switch, service entrance conductors, and grounding should be called to their attention.

Using the information sheets provided the students, review how to determine the number of circuits, the rating in volts and amperes, and the wire sizes for a typical, single family dwelling. This dwelling will have three bedrooms with a living area of 1500 square feet. The modern appliances scheduled for this home are listed including six space heating units. Determine the size panel to be installed to accommodate these circuits.

APPLICATION AND CHECKING AND FOLLOW-UP:

The students will complete the answers on the assignment sheets for this lesson. Then, check the answers and return to students for correction and filing in their workbooks.

GROUNDING

DESIRED RESULTS:

1. To acquaint the apprentice with the Code regulations for the protection of electric installations by grounding.
2. To understand the difference between "system grounds" and "equipment grounds", and how to ground them.
3. To study the methods of grounding and the sizes of conductors used.

REFERENCES:

1. American Electricians' Handbook, Pages 8-94 to 8-100; 9-144 & 9-151 to 159
2. National Electrical Code, Article 250

INTRODUCTION:

Protection of electric installations by grounding is very important work for the electrician. Insulation, isolation, and guarding are suitable alternatives under certain conditions. A good example of the need in some installations for isolated or insulated ungrounded circuits is covered in the Code section for hospital operating rooms.

A "system ground" is a connection to ground from one of the current-carrying conductors of a distribution system or of an interior wiring system. An "equipment ground" is a connection to ground from one or more of the non-current-carrying metal parts of the wiring system or of apparatus connected to the system. The term "equipment" includes all the materials with metal parts used in the installation, such as: metal conduit, raceways, outlet boxes, cabinets, switch boxes, motor frames, and metal enclosures for motor controllers.

PRESENTING THE LESSON:

Circuits are grounded for the purpose of limiting the voltage upon the circuit which might otherwise occur through exposure to lightning or other voltages higher than that for which the circuit is designed; or to limit the maximum potential to ground due to normal voltage.

Give examples of grounding systems encountered:

a. Transformer grounding.

b. An interior wiring system grounded at the service entrance.

c. System with neutral ungrounded, with voltages to ground with an accidental ground on one conductor.

d. Instrument transformers, relays, and switchboards.

GROUNDING

DESIRED RESULTS:

1. To acquaint the apprentice with the Code regulations for the protection of electric installations by grounding.
2. To understand the difference between "system grounds" and "equipment grounds", and how to ground them.
3. To study the methods of grounding and the sizes of conductors used.

REFERENCES:

1. American Electricians' Handbook, Pages 8-94 to 8-100; 9-144 & 9-151 to 159
2. National Electrical Code, Article 250

INTRODUCTION:

Protection of electric installations by grounding is very important work for the electrician. Insulation, isolation, and guarding are suitable alternatives under certain conditions. d. Instrument transformers, relays, and switchboards.

Lesson B-25

ALTERNATING CURRENT INSTRUMENTS

DESIRED RESULTS:

1. To review what the apprentice has found out about how current, voltage and resistance can be measured.
2. To become more familiar with the types of alternating current instruments.

REFERENCES:

1. American Electricians' Handbook, Pages 1-60 thru 69
2. Basic Electricity, Pages 1-62 thru 82; 1-88 thru 97; 1-108, 1-118 & 119

EQUIPMENT:

1. Available measuring instruments of all types
2. Materials for demonstration "hook-ups".

INTRODUCTION:

You know that an electric current is the movement of "free electrons" in a conductor. We have learned that an electric current does not begin to flow all by itself; there must be a source of electrical force to move the "free electrons" through the material. We must use instruments to measure the current, voltage and resistance. Now let us look again at what you have studied and observed concerning the units of measurement and the correct use of the instruments.

PRESENTING THE LESSON:

1. Demonstrate how a lamp current is measured with an ammeter connected in series. How small currents are measured in milliamperes and microamperes. How these units of current are changed to amperes.

2. Demonstrate meters for measuring voltage that have ranges in microvolts, millivolts, volts and kilovolts. Review of voltage units and the changing of voltage units.

3. Demonstrate the ohmmeter and how it measures resistance. Review the various units of resistance. Review the various units of resistance and their relation to the basic unit--ohm.

APPLICATION:

Have the students complete the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers on the Assignment Sheet and return to the student for correction.

Lesson B-26

ELECTRICAL SYSTEMS

DESIRED RESULTS:

1. To review reasons for providing separate circuits for lamps and motors.
2. To be able to sketch various three-wire Delta and four-wire Wye systems.

REFERENCES:

1. American Electricians' Handbook, Pages 3-8 thru 18

INTRODUCTION:

There are several systems that may be used for distributing electrical energy over the various arrangement of circuits. It is generally not good practice to supply lamps and motors from the same circuit unless the motors are small, fractional horsepower sizes. Most power utility companies require a three-phase service installation when the connected motor load is in excess of 5 horsepower. Most three-phase motors of one horsepower or larger are cheaper than single-phase motors of equal rating. Furthermore, the three-phase motor is easier to maintain than a single-phase motor. The three-phase motor does not have a centrifugal switch or a commutator that require a great deal of maintenance.

PRESENTING THE LESSON:

Demonstrate:

1. A Wye connection on the chalkboard.
2. A Delta system on the chalkboard.
3. Discuss line and phase voltages and current relationships of each system.
4. Give applications of Wye and Delta connections
   a. Generators, motors, and transformers.
   b. The three and four wire transmission lines.

APPLICATION:

Have the students complete the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for correction.

ELEVATORS

DESIRED RESULTS:

1. To study the Code requirements for electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, and moving walks.

REFERENCES:

1. National Electrical Code, Article 620

INTRODUCTION:

The provisions of this article apply to electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, etc. They will also apply to console lifts, equipment for raising and lowering or rotating portions of theater stages and all similar equipment.

All wiring in the raceways and in or on the cars of elevators, etc. shall be flame-retardant and moisture-resistant insulation. The thickness of the insulation of all wiring shall be suitable for the voltage to which the wiring is subjected.

NOTE: A distinction is made here between the heavy connections carrying the power current and the smaller wires of operating circuits, such as wire connected to the magnet coils of contactors. The operating current passing through the magnet coils may be quite small and a small current leaking through damp slow-burning insulation where two insulated wires are in contact might be sufficient to operate a contactor.

PRESENTING THE LESSON:

Have the students review the Article 620 and then study it in detail. They should note the minimum size of conductors and the installation of them. The different systems in one raceway or cable and the requirements for this installation. The requirements for motor circuit conductors should be discussed.

There should be disconnecting means, overcurrent protection, grounding and overspeed control provided.

A machine room shall be provided to secure all moving motor generator sets, driving machines, controllers and auxiliary control equipment.

APPLICATION:

Have the students complete the questions on the Assignment Sheet using the Code book.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for correction and placing in their notebooks.

ELEVATORS

DESIRED RESULTS:

1. To study the Code requirements for electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, and moving walks.

CHECKING AND FOLLOW-UP:

Check the answers and return to the students for correction and placing in their notebooks.

SWIMMING POOLS

DESIRED RESULTS:

To study the Code requirements for installing electric wiring for equipment and lighting at swimming pools.

REFERENCES:

1. National Electrical Code, Article 680

INTRODUCTION:

The provisions of this Article apply to the construction and installation of electric wiring for equipment in or adjacent to swimming pools, and to the auxiliary equipment such as pumps, filters, and similar equipment. No electric wiring or apparatus shall be installed in the water or enclosed walls of a swimming pool, except as provided for in this article.

PRESENTING THE LESSON:

Have the students study this short Article and look up any references. Discuss any questions that may arise.

APPLICATION:

Have the students complete the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers to the questions and return the sheets to the students for correction.

Lesson B-29

EMERGENCY SYSTEMS

DESIRED RESULTS:

1. To study the reasons for providing separate power and light emergency systems in places of assembly.
2. To acquaint the student with the requirements of the National Electrical Code that apply to emergency systems.

REFERENCES:

1. National Electrical Code, Article 700

INTRODUCTION AND PRESENTATION:

Emergency systems are generally installed in places of assembly where artificial illumination is required, such as buildings subject to occupancy by large numbers of persons, hotels, theaters, sports arenas, hospitals, and similar institutions. Storage batteries have been used for emergency power for short periods of time. Diesel powered generator sets are generally installed for use when the normal service fails.

Emergency systems may provide power for such functions as: 1. Essential refrigeration; 2. Ventilation when essential to maintain life; 3. Operation of mechanical breathing apparatus; 4. Illumination and power for hospital operating rooms; 5. Fire pumps; 6. Industrial processes where current interruption would produce serious hazards; 7. Public address systems and similar functions.

DISCUSSION OF THE LESSON:

1. Discuss the emergency system needed for a hospital. How is the system approved for use? Who makes periodical tests and maintenance checks to insure proper operating conditions?

2. What current supply systems are available for installation where emergency lighting and power may be needed?

3. List some of the requirements for emergency circuits for lighting and power. Will independent wiring be required?

4. Discuss some of the controls for emergency lighting circuits. Who is responsible for overcurrent devices?

5. Explain what is meant by individual unit equipment.

APPLICATION:

Have the students complete the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return to the class for correction and discussion.

Basic Electricity Series, No. B (Second Year), for Apprentices Employed in Electrical Work, Assignment Sheets and Information Sheets.

Wedinger, Howard E.
North Carolina State Board of Education, Raleigh.
Pub Date - Jun67
MF AVAILABLE IN VT-ERIC SET 107p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, TESTS, *APPRENTICESHIPS,

This study guide, the second of a four-unit series, is for individual student use in acquiring technical information in the second year of the related technical phases of post-secondary electrician apprenticeship training. It was developed by a curriculum committee of subject matter specialists and the educational committee of the National Electrical Contractors of North Carolina, tested on a small group, and used in apprenticeship programs. Assignment and information sheets for 30 lessons cover lighting and lamps, transformers, A.C. motors, and the National Electrical Code in terms of wiring methods. They contain textbook references and problem exercises. The teacher of this 144-hour course should be a journeyman of the trade, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include unit tests to be for approximately every 6 weeks and a final examination. Correlated lesson plans for the instructor are given in VT 003 626. Documents of the series are listed as VT 003 624 through VT 003 631. (HC)

Instructor for Electrical Apprentices
Winston-Salem-Forsyth County
Technical Institute

The Instructor's Manual, Information and Orientation Sheets keyed to the Assignment Sheets were developed by:

Howard E. Hedinger
Vocational-Technical Division

PREFACE

The materials in this publication have been prepared to provide specific assignments for studying related topics necessary in the training of electrical apprentices. An effort was made to develop the schedule for the instructors to follow as the apprentice progresses with his training. It will also enable the apprentice to know what skills and knowledges will be required of him. One objective of this program is to aid the instructor and employer in providing experiences necessary to develop a competent worker in the electrical field.

This workbook includes assignment sheets and information sheets for the electrical apprentice to use in searching out related information. They contain textbook references, problems to solve and key sentences to complete, diagrams to draw, and blueprints to consult. The apprentice should study the assigned references before he attempts to answer the questions or solve the problems.

In actual use of these lessons, instructors should feel free to modify their application of the material to conform with local needs. For example, there may be certain sections of the Code to teach because the apprentices are working with special installations. Thus, the instructor will prepare additional materials to use with the course. In other classes, the instructor may need to spend more time on topics dealing with mathematics than with blueprint reading. In any event, the minimum class time for related material is 144 hours per year. It is sincerely hoped that the assignment sheets are used correctly, so that apprentices can gain maximum benefits from their related studies.

NAME ______________________________ Lesson B-1

General Lighting Page 2

14. Any brightness within the field of vision which causes discomfort, annoyance, interference with vision or eye fatigue is called ______________________.

15. List three different classes of glare: (a) ____________________, (b) ____________________, (c) ____________________.

16. Incandescent lamps are rated by input ____________________.

17. The output of incandescent lamp ____________________ as the applied voltage decreases.

18. Lamp efficiency is the ratio of the ______________ ______________ to ______________ ______________.

19. What is the lamp efficiency of a 200-watt lamp with 3700 lumens?

20. List four general classes of illumination: (a) ________________, (b) ________________ (c) ________________, (d) ________________.

NAME ______________________________ Lesson B-2

DATE ______________________________ Incandescent Lamps

REFERENCE

1. Croft's American Electricians' Handbook, Pages 10-21 - 10-44, Sec. 48-102.
2. National Electrical Code, Article 410.

PROBLEMS

1. List four essential parts of an incandescent lamp: (a) ____________________,

   (b) ______________________________, (c) ______________________________,

   (d) ______________________________.

2. List six ways incandescent lamps are classified: (a) ____________________,

   (b) __________________, (c) ____________________, (d) __________________,

   (e) __________________, (f) ____________________.

3. In a Type "B" lamp, the filament operates in a ____________________________.

4. Type "C" lamps are __________________________________.

5. What are the common uses for the following bulbs?

   (a) Inside Frosted __________________________

   (b) Clear ________________ ________________

   (c) Silvered ________________________________

   (d) Daylight ________________________________

6. List three types of filaments: (a) ____________________________________,

   (b) ______________________________, (c) ______________________________.

7. List four ordinary uses of general lighting service lamps: (a) ____________,

   (b) ______________, (c) ____________________, (d) ____________________.

NAME ______________________________ Lesson B-2

Incandescent Lamps Page 2

8. List four uses of special lighting service lamps: (a) ________________,
(b) ________________, (c) ________________,
(d) ________________.

9. List five types of miscellaneous lighting service lamps: (a) ________________,
(b) ________________, (c) ________________, (d) ________________,
(e) ________________.

10. In general, general service lamps may be burned in ____________ position.

11. Rough-service lamps sacrifice ____________ for strength.

12. The life of an incandescent lamp is the number of burning hours before the ________________ drops to ____________ per cent of the initial.

13. Lamps operated at less than rated voltage will have ____________ life.

14. Lamps operated at above rated voltage will have ____________ life.

15. ____________ voltage on a lamp decreases the ____________ output.

16. A lamp rated at 95 per cent of rated voltage will emit ________________ per cent of rated lumens.

NAME ______________________________ Lesson B-3

Flourescent Lamps Page 2

14. Cold Cathode starting is called ______________ __________ ____________.

15. Instant-start lamps are constructed with ____________ _______________

or __________________ ___ - ___________ bases.

16. Instart Start lamps are ___ __________-____________________ when starting.

17. List five methods of operating fluorescent lamps:

(a) ____________________________________

(b) ____________________________________

(c) ____________________________________

(d) _________________ ____________ _____

(e) ____________________________________

18. Give types of lamp bases for following operating methods:

(a) Pre-heat start ______________________________

(b) Rapid start ________________________________

(c) High-output rapid start _______________________

(d) Powergroove ________________________________

19. Cool white lamps have _________________ efficiency, good _____________,

_____________________ and blends with ____________________________.

NAME ______________________________ Lesson B-3

Fluorescent Lamps Page 3

20. Warm white lamps have the ____________ efficiency.

21. Deluxe cool lamps simulate the appearance and color properties of ____________ ________ __________.

22. List the approximate life and initial lumens of the following lamps:

Lamp	Life, Hrs.	Initial Lumen
(a) T-5- Cool White - 13 watts		
(b) T-8- Daylight- 30 watt		
(c) T-12- Cool white - 20 watt		
(d) T-12- Cool white-rapid start-40w		
(e) T-12- Warm white-rapid start- 40 watts		
(f) T-12- Cool white-HO - 105 watts		
(g) PG-17- Cool white- PG- 200 watts		

23. Rated average life of a fluorescent lamp is ____________ based on ____________ burning hours per start.

24. Life of fluorescent lamp is affected by:

(a) ____________________________

(b) ____________________ ________

(c) ____________________________

25. Efficiency of a fluorescent lamp is highest at ________ to ________°.

26. Efficiency of fluorescent lamp ___________ ___________ as temperature increases and ___________ ___________ as temperature decreases below normal.

27. Line voltage in ____________ of 125 volts ___________ the ballast.

28. List three means a fluorescent lamp may interfer with a radio:

(a) ____________________________
(b) ____________________________
(c) ____________________________

29. List four reasons for inferior operation of fluorescent lamps on D.C. circuits:

(a) ____
(b) ____
(c) ____
(d) ____

30. (Cont.)

(c) ______________________________________
(d) ______________________________________

31. List five advantages for high-frequency operation of fluorescent lamps:

(a) ______________________________________
(b) ______________________________________
(c) ______________________________________
(d) ______________________________________
(e) ______________________________________

32. What is the cause of swirling and spiraling in a fluorescent lamp?

33. ____________________ ____________________ lamps have cathodes designed for high-voltage starting.

NAME ______________________________ Lesson B-4

DATE ______________________________ Fluorescent Ballasts

REFERENCE

1. American Electricians' Handbook, Pages 10-57 - 10-67, Sec. 123-130.

PROBLEMS

1. Operation of fluorescent lamps requires a ________________________.

2. List two purposes of a ballast:

   (a) ________________________________

   (b) ________________________________

3. The power-factor of a ballast is __________________.

4. __________________ are added in the ballast circuit to raise the power-factor.

5. In the preheat-start method, a ________________ ________________ is required.

6. ________________ must be properly designed for starting method.

7. List two functions of the starting switches for the pre-heat method:

   (a) ________________________________

   (b) ________________________________

8. List four types of starting switches:

   (a) ________________________________

   (b) ________________________________

   (c) ________________________________

   (d) ________________________________

9. Describe the advantage of a "No-Blink" or "Watch-Dog" starter.

10. Describe the action of the thermal-switch starter.

NAME ______________________ Lesson B-4

Fluorescent Ballasts Page 2

11. Describe the action of the manual starting switch.

12. Thermal-switch starters give the ______________ __________________.

13. Excessive temperatures in a ballast causes the ____________ to fail.

14. The maximum safe operating temperature of a capacitor ballast is __________.

15. Noise rating of ballasts are indicated by letters; ____________ for the quietest; ____________________ for noisiest.

16. A ballast with an ________________ rating is suitable for residential use.

17. Study the fluorescent lamp circuit with a No-Blink starter. Discuss in class

18. Study the fluorescent lamp circuit with a thermal-switch starter.

19. Study wiring diagram for two 40-watt lamps with medium bipin bases and circuits using starters, 118V., "A" sound rating. (Indicate Diagram No. also.)

11. Describe the action of the manual starting switch.

12. Thermal-switch starters give the ______________ ______________.

13. Excessive temperatures in a ballast causes the ______________ to fail.

14. The maximum safe operating temperature of a capacitor ballast is ______________.

15. Noise rating of ballasts are indicated by letters; ______________ for the quietest, ______________ for noisiest.

16. A ballast with an ______________ rating is suitable for residential use.

17. Study the fluorescent lamp circuit with a No-Blink starter. Discuss in class

18. Study the fluorescent lamp circuit with a thermal-switch starter.

19. Study wiring diagram for two 40-watt lamps with medium bipin bases and circuits using starters, 118V., "A" sound rating. (Indicate Diagram No. also.)

DATE ______________________________ Lighting Installation

REFERENCE

1. National Electrical Code, Article 410.

PROBLEMS

1. Lamp-holders, receptacles and switches which have exposed accessible terminals shall not be installed in ______________ ______________ canopies or in open bases of portable table or floor lamps.

2. Fixtures installed in ____________________ or ______________ ____________ shall be approved for such locations.

3. Fixtures shall be equipped with shades or guards so that combustible material will not be subject to ____________________ in excess of ______________°C.

4. Fixtures in clothes closets shall be installed on the __________________ or on the ______________________ above the ____________________.

5. Each outlet box shall be provided with a ______________________.

6. Fixtures weighing in excess of ______________________ shall not be supported screw shell of a lampholder.

7. Fixtures weighing in excess of ___________________ shall be supported independently of ________________________ ______________________.

8. Fixture conductors shall be No. 18 AW or ______________________.

9. Branch circuit conductors within 3-inches of a fluorescent ballast shall be ________________ ________________ or other types of conductors recognized for use at temperatures not lower than ____________________.

10. Fixtures without an approved raceway may be used as a raceway for a ___________ ______________ or ______________ single branch circuit.

11. The ______________________ conductor shall be connected to the lampholder screw shell.

12. Pull type canopy switches shall be mounted within _________________ of the center of canopy.

13. All wiring shall be free from ___________ ___________ and _____________ and shall be ________________ for these defects prior to being connected to ____________________.

NAME ______________________________ Lesson B-5

Lighting Installation Page 2

14. Weatherproof lampholders shall be installed in ______________ or ______________ locations.

15. Lamps shall be equipped with a __ ________ ____________ when rated 300 watts or less.

16. Mogul bases shall be on lamps rated above ____________ watts but not larger than ________________ watts.

17. Receptacles located in floors shall be ________________ in ____________ ______________ ________________.

18. Weatherproof recaptacles shall be installed in __________ or __________ locations.

19. The terminal for connection to grounding conductor shall be designated by ________________-colored finish.

20. Grounding type receptacles shall be rated __________ amperes at a potential between ______ and ________ volts, or ____________ or ____________ amperes at a potential not over ______________ volts.

21. Grounding type attachment plug shall have one separate fixed grounding member designated by a green colored finish and so designed to prevent it from being capable of touching any __________________-____________ ____________________________________ of the receptacle.

22. At lease __________ ________________ of flexible metal raceway shall be installed between outlet box and recessed fixture.

23. Fixture shall be marked indicating ______________________ lamp wattage.

24. Fluorescent fixture is an example of an ______________-______________ lighting equipment.

25. Electric-discharge lighting equipment having an open circuit voltage of more than ____________________ volts shall not be installed in a dwelling.

26. Exposed ballasts shall not be in contact with ______________________ ____________________.

NAME ______________________________ Lesson B-5

Lighting Installation Page 3

27. A fluorescent fixture shall be mounted __________ inches from surface of fibreboard unless ________________ for installation directly on fibreboard.

28. Snap switches for controlling florescent equipment shall be approved for ________________ ____________.

29. Mercury vapor lamps are an example of an ______________ ____________ lighting system of more than 1,000 volts.

30. On equipment of more than 150 volts to ground, all metal fixtures, parts, etc., shall be ____________________.

31. All metal electrical equipment near plumbing fixtures unless grounded shall maintain clearances ________________ feet horizontally and ____________ feet vertically.

4. Swoope's Lessons in Practical Electricity, Pages 526 - 533.

PROBLEMS

1. A ____________ ____ is a device for changing ______________ energy from one potential to another.
2. The ____________ windings of a transformer are ______________ and secondary.
3. Secondary windings are connected to the ______________ side.
4. The line side is connected to the ____________ windings.
5. A ____________________________ transformer delivers energy at a higher potential than it receives.
6. List three types of losses in a transformer:
   (a) ______________________________
   (b) ______________________________
   (c) ______________________________
7. A transformer which delivers energy at a lower potential than it receives is called a ______________________________.
8. Find the secondary voltage of a transformer having 2400 volt primary, 250 secondary turns and 25 primary turns.
9. Find the primary turns of a transformer having 120 volt on primary, 24 secondary voltage and 100 secondary turns.
10. Basic construction of a transformer consists of the following:
    (a) ______________________________
    (b) ______________________________
    (c) ______________________________

NAME ______________________________ Lesson B-8

Principles of Transformers Page 2

11. Transformers are rated in ________________.

12. Primary currents flow ________________ to secondary currents because of ________________ of ________________ ________________.

13. Find the secondary current in a transformer having 2400 volt primary, 240 volt secondary, and 5 amperes in primary.

14. Find the primary voltage of a transformer having 40 amperes in secondary, 5 amperes in primary and 550 volt secondary.

15. Describe the principle operation of a transformer.

16. A bell transformer draws 40 watts from a line. Find the secondary current if the secondary voltage is 20 volts.

17. Find the secondary current of a transformer that draws 180 watts from the line operating at 95% efficiency and delivers 80 volts from the secondary.

18. Find the efficiency of a transformer drawing 180 watts from 120 volt primary and delivers 24 volts at 5 amps.

19. The ________________ is the magnetic circuit upon which the windings are wound.

20. Define regulation of a transformer.

21. Find the regulation of a transformer having a rise of potential difference at the secondary terminals from 550 to 575 volts when the rated load is removed.

22. List two advantages of Spirakore core construction:

(a) ______________________

(b) ______________________

23. In general, the ____________ input of a transformer is __________ to the power output.

(a) ______ ______ ____________

(b) ____________ ____________

(c) ____________ ____________

25. Bearings for motors are __________ or ______ ________ types.

26. Describe an open motor.

27. Describe a dripproof motor.

28. Describe a splashproof motor.

29. Describe a totally enclosed motor.

30. Describe a totally enclosed fan-cooled motor.

31. Describe an explosionproof motor.

32. The starting torque or ________ ________ ________ is the turning effort in starting a motor or load from rest.

33. ____________ current is the first inrush current that occurs as a motor starts.

34. ____________ is the term used to describe turning or twisting force.

PROBLEMS

1. ____________ ____________ has a ____________ resistance than the running winding of a split-phase motor and provides a ____________ ____________ for the motor.

2. The purpose of the ____________ ____________ is to get a ____________ ____________ between the windings.

3. The angular phase displacement in a split-phase motor is approximately ________ to 30 degrees in time.

4. The ____________ ____________ opens the circuit to the starting winding as the rotor speed reaches approximately ____________ per cent of the synchronous speed.

5. Overheating of the winding insulation may be caused by ____________ ____________, ____________ ____________ and ____________ ____________ currents.

6. Describe the action of the kilixon type split-phase motor protector.

7. Draw a schematic diagram of split-phase motor and label each major part.

8. NEMA has adopted a system for marking the terminals of a split-phase motor; running windings, ________ and ________; starting winding, ______ and ______.

9. The standard direction of rotation is ____________ as viewed from the ____________ ____________.

10. Two-speed split-phase motors have __________sets of windings, ____________for each speed.

NAME________________________________ Lesson B-15

Single Phase Motors Page 2

11. List five reasons a split-phase motor may fail to start:

(a) ________________________________
(b) ________________________________
(c) ________________________________
(d) ________________________________
(e) ________________________________

12. The starting winding of a split-phase motor is wound with ____________ ____________ and ____________ ____________ than the running.

13. List five classifications of the capacitor motor:

(a) ________________________________
(b) ________________________________
(c) ________________________________
(d) ________________________________
(e) ____________ ____________________

14. The capacitor motor is ____________ ________________ than the split-phase motor.

15. ____________ ________________ have a higher torque than ________-________ ____________.

16. Capacitor-start motor rated ________ HP and larger are generally the ____________-________________ type.

17. List the two types of capacitors used in a single-voltage capacitor-start motor:

(a) ____________________
(b) ____________________

18. ________________ capacitor has a capacitance of ____________ to ____________ microfarads and a maximum voltage of ____________ volts.

19. ____________ capacitor has a capacitance in excess of ________________. microfarads.

20. Draw schematic diagram of Reversible Capacitor-Start Motor and label each major part.

NAME______________________________ Lesson B-15

Single Phase Motors Page 3

21. Draw the schematic diagram for a two-capacitor type capacitor motor and label major parts.

22. What is the difference between the two-value capacitor motor and capacitor-start motor?

23. Draw schematic diagram for a permanent-split capacitor motor and label major parts.

24. The permanent-split capacitor motor has a ____________ __________ torque.

25. There is no _______ _____ ____ _________ in the permanent-split capacitor motor.

26. __________-________________ _____________ motors are used for fans and blowers.

27. Draw schematic diagram for two-speed capacitor motor and label major parts.

NAME ______________________________ Lesson B-15

Single Phase Motors Page 4

28. Why are electrolytic capacitors used almost exclusively in capacitor-start motors?

29. List six causes of a rotor or starter to burn out in a capacitor-start motor:

(a) ______________________________
(b) ______________________________
(c) ______________________________
(d) ______________________________
(e) ______________________________
(f) ______________________________

30. List four types of repulsion motors:

(a) ______________________
(b) ______________________
(c) ______________________
(d) ______________________

31. Repulsion motors have a __________ __________ torque.

32. As the load increases in the repulsion motor, the __________ decreases.

33. Repulsion motors may be reversed by ____________ ______________ to the ______________ side of neutral.

34. In a repulsion motor, the ___________ poles are repelled by the _______ poles causing the _____________ to rotate.

35. In a repulsion motor, the __________ windings are _________ __________ to the line input.

36. Draw schematic diagram of a straight repulsion motor and label major parts.

37. The difference between straight repulsion motor and compensated repulsion motor are __________ _____________ and _________ ____________ ____________.

38. In compensated repulsion motor, ________ ________ are wound on the starter.

39. In compensated repulsion motor, ________ ________ and ________ ________ ________ are maintained.

40. In repulsion motor. lap windings require a ________ for each ________ ________.

41. Field windings in a repulsion motor may be ________ or ________ wound.

42. List two major types of repulsion-start induction motors:

(a) ________________
(b) ________________

43. The purpose of the ________-________ in the repulsion-start motor is to cut off all ________ flow through the ________ and is actuated at approximately ________ per cent of synchronous speed.

44. The ________-________ is not in the repulsion-induction motor.

45. ________-________ motors have a very low starting torque and high slip.

46. Each pole in a shaped-pole motor is ________________.

47. List two methods of reversing a shaded-pole motor:

(a) ________________________________
(b) ________________________________

48. List three methods used for making a varying-speed shaded-pole motor:

(a) ________________________________
(b) ________________________________
(c) ________________________________

49. Describe the construction of a "consequential-pole" shaded-pole motor.

50. The ________ motor operates on A.C. or D.C. circuits.

51. The ________ is connected in series with the ________ in a universal motor.

52. In a universal motor operating on an A.C. source, the ________ windings are arranged so the ________ of the magnetic poles changes causing the ________ to turn.

APPLICATIONS:

Have the students complete the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Correct the answers on the assignment sheet and return to the students. Discuss any questions that need to be clarified.

NAME______________________________ Lesson B-15

Single Phase Motors Page 6

53. What is the purpose of a commutator on the universal motor?

54. The no-load speed of universal motors is ________________.

55. A ______________ ________________ may be used to vary the speed of the universal motor.

56. List two types of universal motors:

(a) ____
(b) ____

57. The __________________ universal motor has an extra winding embedded in the poles of the starter.

58. The __________________ in the universal motor maintains a more constant speed.

59. The starter is made up of laminated pieces in the ____________-______________ universal motor.

60. The ____________-______________ universal motor is a low-horsepower motor operating at ________________ speeds.

61. A _______________ must be installed in series with one of the power lines to the concentrated-pole universal motor at speeds less than ____________RPM.

62. List three methods used to control the no-load speeds of the universal motor:

(a) ____
(b) ____
(c) ____

8. The __________-__________ motor operates on the induction principle.

9. The squirrel-cage motor never reaches __________ speed.

10. List the four conditions which regulate the speed of a squirrel-cage motor:

(a) ______________________________

(b) ______________________________

(c) ______________________________

(d) ______________________________

11. __________ is the difference between the speed of the rotating field and the __________.

12. The squirrel-cage motor is considered to be a __________-__________ type.

13. The squirrel-cage rotor has __________ or __________ bars the entire length which is permanently __________-__________.

14. If the synchronous speed of a squirrel-cage motor is 4500 RPM and the operating speed is 3750 RPM, what is the percentage of slip?

15. The currents produced in the rotor are fed to __________ __________ of a wound-rotor motor.

16. In a wound-rotor motor, the starting __________ and __________, __________ __________ and __________ of the motor can be controlled.

17. In a wound-rotor motor, loss of speed results in a __________ of __________.

18. The wound-rotor motor is used for equipment having __________ __________ __________ and __________ __________ up to full-rated load.

19. The rotation of a three-phase motor may be reversed by __________ and __________ __________ to the motor.

20. The two windings of three-phase induction motors are located in the __________ and __________.

21. The __________ windings are embedded in slots.

22. The rotor windings may be of the __________-__________ or __________-__________ type.

23. Find the synchronous speed of a 6-pole motor at 60 cycles.

DATE ____________________________________ Branch Circuits

REFERENCE

1. National Electrical Code, Article 210.

PROBLEMS

1. This article applies to branch circuits supplying ______________ or ___________ loads or __________________ of such loads.

2. In a circuit containing lighting and motors, Article __________ shall also apply.

3. Rating of branch circuit shall be based on maximum permitted rating or setting of ___________________ ____________________.

4. Minimum size conductor for a ____________________-ampere branch-circuit classification shall be No. 14 AWG.

5. Minimum size conductor for a ____________________-ampere branch circuit classification shall be No. 12 AWG.

6. Minimum size conductor for a ____________________-ampere branch-circuit classification shall be No. 10 AWG.

7. Minimum size conductor for a ____________________-ampere branch-circuit classification shall be No. 6 AWG.

8. A multi-wire branch circuit on a 120/208 volt, three phase, four wire system contains ____________________ phase wires and _________________ neutral wire.

9. When more than three current carrying conductors are installed in a raceway, the _________ _____________ of _____________ shall be derated.

10. Internal wiring of equipment may utilize conductors having a green covering for other than ______________ _________________.

11. All two-wire branch circuits from _____-phase main feeders shall be ___________-_______________.

12. In general, voltage to ground for a 15-ampere receptacle shall not exceed _____________ volts.

13. Fixtures above 250 volts to ground shall be mounted a minimum of ________ feet above the floor.

14. Lighting fixtures rated 300 watts or less shall be equipped with ____________ base.

15. Grounding type receptacles shall be installed in ____________ ____________ of a dwelling.

16. Lighting fixture in a swimming pool shall be connected to a ____________ conductor.

17. ____________ or ____________ are not acceptable as a grounding conductor in swimming pool installations.

18. Heavy duty lampholder shall have a minimum rating of ____________ watts except ____________ lampholder rated ____________ watts is acceptable.

19. Branch-circuit conductors shall not have a current carrying capacity less than:

(1) ____

(2) ____

20. In general, minimum size conductor for range rated 8-3/4 kw. or larger shall be No. ____________ AWG.

21. Minimum tap on a 50-ampere branch-circuit conductor shall be No. ____________ AWG.

22. Branch-circuit protection for an appliance rated 12 amperes shall not exceed ____________ per cent of appliance rating.

23. The lampholder on a 30-ampere branch circuit shall be of the ____________-____________ type.

24. Receptacles on 15- or 20-ampere branch circuits shall be the ____________ type.

25. The maximum load for portable appliances on a 20-ampere branch circuit served by receptacles shall be ____________ amperes.

26. In dwellings, maximum distance between receptacles on walls shall not exceed ____________ feet.

27. Floor outlets in center of area ____________ ____________ count for a required wall receptacle.

28. Receptables required in a dwelling shall include wall space occupied by ____________ ____________ in exterior walls.

29. Maximum load on branch circuits shall not exceed ____________ per cent of branch-circuit rating.

30. Maximum fixed appliance rating shall not exceed ____________ per cent of the branch-circuit when lighting units are also supplied.

NAME ______________________________ Lesson B-21

DATE ______________________________ Feeders

REFERENCE

1. American Electricians' Handbook, Pages 3-18 - 3-54.
2. National Electrical Code, Articles 215 and 220.

PROBLEMS

1. This Article deals with the ______________ of the conductors needed to supply power to the loads.
2. Minimum size feeder for two-wire feeder for two or more 2-wire branch circuits shall be No. _________ AWG.
3. Voltage drop for power feeders should not exceed ________ per cent.
4. Voltage drop for lighting feeders should not exceed ______ per cent.
5. List five basic items that should be included in a feeder diagram:

   (a) ____
   (b) ____
   (c) ____
   (d) ____
   (e) ____

6. Unit loads for lighting circuits operating for long periods shall be increased __________ per cent.
7. The floor area for a building shall be computed from the _____________ dimensions.
8. In general, each residential receptacle outlet shall be rated ______ amperes.
9. Show window lighting is not considered a part of the ______ _______ lighting.
10. Show window lighting shall be based on ______ watts per linear feet.
11. Each __________ foot length of fixed multi-outlet assemblies with receptacles on 1-foot centers shall be rated ________ amperes.
12. A minimum of ________ appliance branch circuits shall be installed in kitchens.
13. Small appliance circuits shall be rated __________ amperes.
14. Find the minimum Type "THW" lighting feeder size permitted by the Code to serve six floors of an office building, 75 feet by 125 feet floor area. The service is 4-wire, 3-phase, 208 volts.

15. Find the minimum Type "THW" lighting feeder size permitted by the Code to serve a fifteen story hospital, 125 feet by 175 feet floor area. The service is 4-wire, 3-phase, 277 volts.

16. Lighting sub-feeders to ballrooms shall have ________ per cent capacity of branch circuit claculations.

17. On a 120-volt, two-wire branch circuit, the neutral carries the ________ current as the "hot" wire.

18. On a 120/208 volt, three phase, four wire system with a balanced load, the neutral current will be equal to ______________.

19. One branch circuit per _______ square feet should be the minimum for general illumination in a dwelling.

20. On a three phase, four wire, A. C. system, the neutral-feeder conductor may be reduced for loads above _______ amperes; the capacity being equal to _______ amperes plus ________ per cent of excess above _______ amperes.

21. Capacity of Neutral shall not be reduced on that portion of load consisting of _________ fixtures.

22. In general, the feeder capacity for fixed electrical space heating shall be __________ per cent of total connected load.

23. Small appliance outlets in dwellings shall be rated __________ watts.

24. The feeder kw. load for twelve ranges rated 11 kw. is _____________ kw.

25. The feeder capacity for four or more appliances in a dwelling is ________ per cent of the load.

26. Calculate the minimum service required for a dwelling of 1800 square feet having one 12-kw. range, 5-kw. water heater, 1.5-kw. dishwasher, 5-kw. dryer, two 1.5-kw. bathroom space heaters, and 3 Horsepower air conditioning unit using standard method and optional method of calculations. Voltage to be 120-230.

INFORMATION SHEET BASIC ELECTRICITY

NEC Lesson B-22

SERVICES FOR A TYPICAL DWELLING

A typical application for a 115/230 volt, single-phase, three wire service installation in a single family dwelling will be considered. It is the intent to give the apprentice the fundamental rules of the National Electrical Code insofar as they concern the calculations that affect the service entrance switch, service entrance conductors, and grounding. The branch circuits supplying the various items of electrical equipment will be discussed briefly. Since the metering of the electrical space heating equipment as well as electric water heaters varies with different power companies, the apprentice should check the requirements in the area.

The building under consideration will be a three-bearoom residence with an area of 1500 square feet.

A. THE FOLLOWING APPLIANCES ARE SCHEDULED FOR THIS HOME:

1. 3-kw water heater
2. 4.7-kw clothes dryer
3. 8 ampere-230-volt air conditioner
4. 11.1 ampere-115-volt dishwasher
5. 4-kw wall-mounted oven
6. 6-kw counter-mounted cooking unit
7. 7.5 ampere-115-volt garbage disposal
8. 12-kw space heating unit in each of 6 rooms

B. CALCULATIONS:

1. Determine The Number of Lighting Circuits

Calculate the load based on the "watts per square foot" method. 1500 sq. ft. x 3 watts per sq. ft. = 4500 watts

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{4500}{115} = 39.1 \text{ or } 40 \text{ amperes.}$$

Generally, 15-ampere lighting circuits are installed in residential buildings using No. 14 AWG conductors. Some electrical specifications require No. 12 AWG conductors as a minimum on all circuits. Then $\frac{40}{15} = 2$ plus or 3

Note: In a residence of this type, there may be as many as 60 outlets. Most electricians prefer to limit the number of outlets per circuit to 8 or 10, thus there would be 6 circuits installed.

2. Small Appliance

Most electricians prefer to run three 20 ampere circuits for small appliances to be used in the kitchen, laundry, pantry, dining room, and breakfast room areas. It is a code requirement to install a spearate 20 ampere circuit for the laundry outlet and divide the outlets in the kitchen and dining room area.

between two other 20 ampere circuits. The use of No. 12 wire instead of No. 14 wire to minimize the voltage drop, improves the performance of the appliances and lessens the danger of overload.

3. Clothes Dryer

The electric clothes dryer is rated 4.7 kw at 230 volts. The load value in watts is 4700.

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{4700}{230} = 20.4 \text{ amperes}$$

The circuit to the dryer will be a 30 ampere 115/230 volt, 3 wire circuit of two No. 10 AWG conductors and one No. 12 AWG for the neutral conductor. The neutral may be smaller than the phase wires because it carries only the current of the motor and the light.

4. Air Conditioning

The load is 8 amperes x 230 volts - 1840 watts. It will be connected to a 15 ampere, 230 volt circuit with No. 14 AWG conductors. Circuits for air conditioners must conform to the provisions of the Code.

5. Dishwater

The load is 11.1 amperes x 115 volts = 1276 watts. This unit will be supplied by a separate 15-ampere circuit using No, 14 AWG wire.

Note: It is possible to supply the garbage disposal unit and the dishwater with one 115/230 volt, 3 wire circuit.

6. Garbage Disposal

The load is 7.5 amperes x 115 volts = 852 watts. This circuit will be supplied by a separate 15-ampere circuit which requires No. 14 AWG wire.

7. Wall-Mounted Oven

The oven is rated 4-kw at 115/230 volts and will be connected to a separate circuit. The load value in watts is 4000.

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{4000}{230} = 17.4 \text{ amperes}$$

According to the table No. 12 AWG conductor may be used for this circuit.
NEC - 250-260, Ground with No. 10.

8. Counter-Mounted Cooking Unit

The surface cooking unit is rated 6 kw at 115/230 volts and will be connected to a separate circuit consisting of three No. 10 AWG conductors supplied by a 30-ampere, 2 pole overcurrent device.

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{6000}{230} = 26 \text{ (approx.) amperes}$$

Note: The Code permits the use of one 50-ampere circuity to supply these two units, provided the individual taps to the 50-ampere circuit are not longer than necessary for servicing.

9. Electric Space Heating

Six 2 kw. electric space heating units will be installed with a thermostate which provides individual room control for heating purposes. Also, it is necessary that there be four or more individually controlled electric space heating units in order to apply certain demand factors permitted by the Code used in calculating service-entrance capacity. Each of these units is rated at 2 kw and 230 volt circuit.

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{2000}{230} = 8.7 \text{ amperes}$$

Each separate unit will be connected to a separate 15-ampere, 230 volt circuit using No. 14 AWG wire.

10. Water Heater

The water heater in this residence is rated at 3-kw.

$$\text{Amperes} = \frac{\text{watts}}{\text{volts}} = \frac{3000}{230} = 13 \text{ amperes}$$

Connected for unlimited demand, the maximum current would be 13 amperes and No. AWG could be used. However, for a load that so closely approaches the maximum current-carrying capacity of No. 14 AWG, most electricians would install No. 12 AWG (20 ampere) and connect it to a 15-ampere, 230 circuit.

Note: Consult local utility for proper connections of water heaters because some require a special "off-peak" meter and others use special methods to cover the power consumption.

SUMMARY OF SERVICES FOR 1500 SQ. FT. DWELLING

Use of Circuits	No. of Circuits	Rating		Wire Size
		Volts	Amperes	AWG
General Lighting	6	115	15	14
Small Appliances	3	115	20	12
Garbage Disposal	1	115	15	14
Dishwasher	1	115	15	14
Dryer	1	115/230	30	10
Oven	1	115/230	20	12
Counter Cook Top	1	115/230	30	10
Air Conditioner	1	230	15	14
Water Heater	1	230	15	12
Space Heat	6	230	15	14

Service Entrance Switch

To accommodate the number of circuits listed in the summary, a 200-ampere panel will be installed. This panel will contain all of the required branch circuits plus a 200-ampere main pullout in one enclosure. This type of enclosure is approved by Underwriters' Laboratories, Inc. and should meet the Code requirements in most localities.

Ground Connection

The Code requires interior-alternating-current systems to be grounded. This is done by running a wire from the neutral connection in the main service switch or meter to a water pipe. Exceptions to the rule are specified in the Code.

PROBLEMS

1. Service entrance for the electrical system of a building may be by __________ or __________ service conductors.

2. A service includes the service, entrance and __________, __________.

3. Service conductors are the conductors which supply electrical energy to a building from the utility power system outside the building and consist of that portion of the supply conductors which extend from the street distribution __________ or distribution __________ to the __________ __________ of the building.

4. Service-drop conductors are the __________ conductors from the last utility pole to the _____ _____ of attachment to a building.

5. Service-entrance conductors of an overhead service are the service conductors between the point of attachment to the building and the _____ _____.

6. Disconnect means shall consist of an __________ operated disconnecting device and __________ protective device.

7. A service switch shall be assessible and shall disconnect all the service conductors from the __________ __________.

8. Service equipment may consist of __________ or a maximum of __________ manually operated circuit breakers or switches.

9. A service switch shall be located as close as possible to the point of entrance of _____ _____ to the building.

10. Means shall be provided at the service entrance for disconnecting the __________ conductor of the supply from the interior wiring.

11. Each occupant in a multiple-occupancy building shall have __________ to his __________ means.

12. Each __________ service conductor shall be provided with __________ protection.

13. A __________ service is a service supplying more than one building under single management.

14. Fire pumps require a ________ service.

15. In general, the minimum size service drop conductor is No. ________ AWG.

16. The minimum size service conductor recommended for residence is ________ amperes, three-wire.

17. Service drops shall be a minimum of _______ above a roof.

18. Service drops shall maintain a minimum clearance of _______ feet from windows, doors, etc.

19. The point of attachment to a building for a service drop shall be a minimum of ________ feet above grade.

20. The minimum clearance for service entrance conductors shall be ________ feet above grade.

21. Service raceways shall be equipped with _________ service head.

22. Drop loops shall be formed on _________ _________ conductors.

23. Service conductors shall not be ____________.

24. Underground service raceways shall be ________ where terminated in the building to prevent entrance of _______ of __________.

25. Exit lights and fire alarm systems may be connected to the ______________ side of the service equipment.

26. Grounded service conductors may be ________ provided the nominal voltage to ground does not exceed ___________ volts.

27. List six conditions which permit more than one service drop to a building:

(a) ____

(b) ____

(c) ____

(d) ____

(e) ____

(f) ____

28. Underground service conductors shall be rubber, cambridge, _____________ or _______________ insulated.

29. Underground spare service raceways shall be _____________ in the building at the termination point.

30. Service entrance conductor shall tap service drop at a point _____________ service head.

31. Metallic raceways exposed to the weather shall be ____________ and shall ____________ to the service head.

32. Service equipment enclosures shall be ______________.

33. Service raceway shall be _____________.

34. The disconnecting means may be __________ or __________ the building wall.

35. The minimum rating for service equipment shall be _______ amperes for circuit breaker and ___________ amperes for switch.

36. Pressure connectors shall be used for terminating __________ conductors in disconnect means.

37. In general, overcurrent protective device shall not be installed in _______________ conductor.

38. Service entrance conductors of more than 600 volts shall be installed in _____________ _______________.

39. Minimum size service entrance conductors of more than 600 volts shall be No. _______________ AWG.

40. Service conductors of more than 600 volts enclosed in a minimum ________ - inch thick concrete or brick envelope shall be considered outside of the building.

2. National Electrical Code, Article 240.
3. Basic Electricity, Pages 2-47 and 48.

PROBLEMS

1. The purpose of the overcurrent protection device is to _______ circuit if current value causes excessive or dangerous temperatures in the _________ or ____________ insulation.
2. All equipment shall be protected against _____________.
3. In residential occupancies, all overcurrent protective devices with maximum rating of 20 amperes shall be the ______________ ____________ type.
4. Conductors shall be projected to prevent currents above _________ per cent of allowable current carrying capacity of the conductor.
5. Where adjustable-trip circuit-breakers are used as overcurrent protection, the maximum setting shall be ___________ per cent of allowable current carrying capacity of the conductor.
6. Temperature will affect the operation of ________ ____________ circuit breakers and must be considered in the application and sizing.
7. Motor circuit overcurrent protective devices may be rated from _____________ per cent to _________ per cent of motor full-load current.
8. Plug fuses and fuse holders shall be used on circuits rated _______________ volts or less.
9. Plug-fuseholders screw shall be connected to _________ side of circuit.
10. Overcurrent device shall be installed in each _____________ conductor.
11. In general, overcurrent device shall not be installed in _____________ conductor.
12. Fuses may be installed in ___________ where capacity of conductors exceeds rating of largest approved cartridge-type fuse.
13. Overcurrent devices shall be located where conductors receive ___________.
14. Overcurrent device is not required on a feeder tap to a panelboard located within _____________ feet of feeder.
15. Overcurrent device is not required on a feeder tap to a panelboard located within ___________ feet of feeder provided the current carrying capacity of tap conductors is equal to _________ of feeder current carrying capacity.

16. Overcurrent devices shall be in __________ __________ locations.

17. Service overcurrent devices locked or sealed are not __________ __________.

18. Overcurrent devices shall not be __________ to physical damage.

19. Overcurrnet devices shall not be located in the vicinity of easily __________ materials.

20. Overcurrent devices shall be installed in __________-__________ __________ or __________.

21. Overcurrent devices located in damp or wet locations shall be mounted a minimum of __________-inch off wall.

22. Fuses shall be located on the __________ side of disconnect switch.

23. Edison-Base plug fuses are recognized in the Code only as __________ items in __________ installations.

24. There are __________ classifications of Type "S" plug fuses.

25. Fuses shall be usable only in __________ of same classification.

26. The standard cartridge fuse has a maximum rating of __________ amperes.

27. There are __________ classifications of the high capacity cartridge fuse.

28. The 600-volt fuse may be installed for __________ voltages.

29. Minimum rating of link fuse shall be __________ amperes.

30. Link fuse rating shall be __________ per cent of maximum current carrying capacity of fuse.

31. Circuit breaker shall be capable of being __________ opened or closed.

32. Circuit breaders with a maximum rating of 30-amperes shall be of the __________-__________ type.

33. Ampere rating shall be visible after __________ of breaker.

34. A circuit breaker in excess of __________ amperes shall be indicated on the breaker.

2. National Electrical Code, Article 250.

PROBLEMS

1. All ______________ ______________ systems shall have a grounded conductor which must be continuously ____________ throughout the system.
2. List two types of grounds in an interior wiring system:

   (a) ____________________________

   (b) ____________________________
3. An ______________ ground connects the non-current-carrying metal parts of the wiring system or equipment to __________ which keeps the metal parts exposed to contact by people at or near ____________ ______________.
4. In general, all metallic conduits and enclosures shall be ________________.
5. Study five types of wiring systems requiring a system ground.
6. Electric crane circuits over combustible fibers in Class III hazardous location shall not be ____________________.
7. On A. C. systems, the system ground shall be located at the ______________ ______________ supply the system and on the line side of the ______________ ________________ at each building service.
8. In A. C. interior wiring systems, the ________ conductor shall be grounded.
9. Study six methods of grounding non-current-carrying parts of fixed equipment.
10. Study three methods of grounding non-current-carrying parts of portable equipment.

NAME ______________________________ Lesson B-24

Grounding Page 2

11. Study six methods of assuring the continuity of the ground of metal enclosures for conductors.

12. The equipment ground should be located as close as practicable to the
______________ __________ or __________ ______________.

13. Bonding jumpers shall be used to connect isolated equipment to ____________ equipment.

14. The minimum copper grounding conductor for an A.C. system shall be No. ____AWG.

15. The maximum copper grounding conductor required for an A.C. system is No. ____AWG.

16. The minimum copper grounding conductor for an A.C. system with 250 MCM service entrance conductors shall be No. ____AWG.

17. The minimum copper equipment ground conductor for a 60-ampere circuit shall be No. ____AWG.

18. The grounding conductor of a wiring system shall be of ______ material (in general) and may be ________ or __________, __________ or
__________, without__________ or __________ throughout its length.

19. Study five types of grounding electrodes.

20. The best grounding electrode is an ____________ ____________ ____________ system.

21. The resistance of made electrodes shall not exceed _______ ohms.

22. The minimum length of buried metallic water piping system permitted as a grounding electrode shall be __________ feet.

23. In general, underground water pipes have a resistance to ground of less than
____________ ohms.

24. Splice connections on the ____________ conductor is not permitted.

25. The equipment ground conductor shall be __________ color or __________.

26. Sheet-metal straps shall not be used for connecting ______________
______________ to water pipe or made electrodes.

27. Grounding helps to prevent __________ to people and _________ by fire to property.

28. The purpose of grounding conductor is to provide a ________ ____________ electrical path to ground.

NAME ______________________________ Lesson B-24

Grounding Page 3

29. Study four methods of reducing ground resistance.

30. Grounding limits circuit __________ upon accidental contact of primary and secondary distribution lines or breakdown in transformers.

31. The ______________ conductor shall be run to each individual service where the secondary system may be grounded at any point.

32. In general metal enclosures for conductors shall be located a minimum of ___________ feet from lighting rod grounding conductors.

33. Switchboard frames shall be __________ regardless of ______________.

34. All portable tools shall be ______________.

35. Service entrance conduit shall be ________________.

36. A grounding conductor in cord shall be provided for cord-connected __________________ equipment.

37. Metal frame constructed building shall be ________________.

38. Frames of electric ranges and clothes dryer shall be ________________.

39. Aluminum grounding conductors shall not be installed in direct contact with ___________ or ______________ or subject to ___________ conditions or with ______________ inches of the ______________ on the exterior of a building.

40. The minimum size copper grounding conductor for a parallel No. 4/0 copper service entrance shall be No. ____________ AWG.

41. The maximum size copper ground conductor connected to a "made electrode" for a No. 4/0 service is No. ______________ AWG.

42. All service equipment shall be __________ to grounding conductor using minimum size conductor for service entrance conductor.

1. Emergency systems are generally installed in places of assembly such as ___________ ___________ and ___________.

2. Emergency systems may provide power for ___________, ___________, ___________ pumps and ___________ rooms.

3. All equipment shall be approved for use on ___________ systems.

4. Emergency systems shall be ___________ periodically.

5. A ___________ ___________ shall be kept of tests and maintenance of emergency systems.

6. List three means of providing emergency power:

(a) ___________________________ (c) ___________________________

(b) ___________________________

7. Storage batteries shall maintain voltage to a minimum of _______ per cent system voltage and supply power to all emergency circuits for a minimum period of ___________ minutes.

8. In a hospital, the transition time from power failure on normal source to emergency generator shall not exceed ________ seconds.

9. Two separate services shall be widely separated electrically and physically to minimize the possibility of ___________ ___________ of supply.

10. A connection ahead of service disconnecting means is permitted to prevent ___________ ___________ of supply through an ___________ within the building.

11. Audible and visual signals shall be provided to give warnings of functioning of ___________ ___________ ___________.

12. In general, ___________ and ___________, not specifically required for emergency use, shall not be supplied by emergency lighting circuits.

13. Emergency illumination shall include all ___________ ___________ and other ___________ required to provide sufficient illumination.

14. Emergency lighting system should be designed and installed to prevent any ___________ being in total ___________.

NAME ______________________________ Lesson B-29

Emergency Systems Page 2

15. Emergency circuit wiring shall be kept ________ of all other wiring.

16. Three and four-way switches ________ ________ be used on emergency lighting circuits.

17. The control switch for emergency lighting in a theater shall be located in the lobby or in a ___________ ______________ _______________.

18. Emergency lighting circuits shall be installed to provide service _____________ upon interruption of normal supply.

19. Exterior lights may be controlled by a ____________ ____________.

20. Branch-circuit overcurrent devices shall be accessible to _________ _________________ only.

21. Storage batteries shall maintain total lamp load at a minimum of _________ per cent of rated lamp voltage and for a minimum period of ___________ minutes.

22. Emergency battery lights shall be installed __________ in place.

1. Find the average foot-candle illumination in an office having 235 sq. ft. area and 35,000 lumens of light flux.

2. What is the speed of light?

3. An increase in voltage ______________ the output of an incandescent lamp.

4. There are ______________ and ____________ cathodes used in fluorescent lamps.

5. Flurescent fixtures shall not be mounted less than ________ feet above the floor on a 277 volt system.

6. Incandescent lamps rated over ___________ watts have a mogul base.

7. The "T-" rating of a lamp refers to the diameter in __________ inches.

8. Ballast temperatures should not exceed _________°F.

9. _______________ _______________ is provided by fluorescent ballast for starting lamp.

10. __________________ determines the color of fluorescent lamps.

11. Draw circuit connections for an instant start lamp.

12. What is the total flux of a light source having 750 mean spherical candlepower?

13. What are the three primary colors of light?

14. ___________________ of light is the redirecting of light rays by a reflecting surface.

NAME ____________________

15. Draw wiring diagram for a two lamp, 8-foot, high output rated fluorescent ballast.

16. The efficiency of a fluorescent lamp ______________ as the temperature decreases below normal.

17. Define the term "foot-candle".

18. ________________ rating is the best ballast noise rating.

19. ________________ of a light source is stated in lumens per watt.

20. _______-________ __________-__________ lamps have recessed double-contact-type bases.

21. ___________ ___________ ___________ fluorescent lamp most closely stimulates natural daylight.

22. An instrument for measuring illumination in foot-candles is __________-

____________ ____________.

23. At temperatures _______° to _______°, the efficiency of a fluorescent lamp is highest.

24. _____________ _____________ fluorescent lamps have the highest efficiency.

25. ______________ lamps are classified as Type "B" or Type "C".

26. The fluorescent lamp is an ________________ device.

27. Type "___" incandescent lamps are gas-filled.

28. Match the following incandescent bulb classifications:

(a) PAR _____	(1) Reflector
(b) T _____	(2) Standard Line
(c) PS _____	(3) Parabolic
(d) R _____	(4) Pear Shaped
(e) A _____	(5) Tubular

15. Draw a bank of three transformers with wye-delta connections.

16. A ________-__________ transformer delivers energy at a lower voltage than it receives.

17. Find the number of primary turns in a transformer having E=240 volts, I_p = 10 amps., N_S = 1600 turns, I_S = 40 amps.

18. L is the letter symbol for ____________.

19. A ___________current flow produces a small magnetic field.

20. _________________are used for boosting the voltage a small amount.

21. The word "transformer" in the NEC may mean a __________transformer or a bank of _________or__________transformers.

22. Ammeters with a __________ ____________for protection, are connected in _____________in a circuit.

23. Draw connections for a distribution transformer having a single primary winding and dual secondary windings for 4800 volt primary and 120/240 volt secondary.

NAME ______________________________

24. Draw and label the materials needed to make an electric-bell testing outfit.

25. Voltmeters are connected in ______________ in a circuit.

26. A low resistance reading on a conductor indicates a ______________.

27. Overcurrent protection for a transformer shall not exceed ______________ of the primary current.

28. The __________ is the magnetic circuit on which the windings are wound.

29. Find the primary voltage of a transformer having $E_s = 240$ volts, $N_s = 50$ turns and $N_p = 500$ turns.

30. Find the maximum primary and secondary overcurrent protection for a transformer rated 250 KVA, 240/120 volts, single phase.

31. _______________ shall be installed in vaults having oil transformers rated above 100 KVA.

32. Dry type transformer enclosures shall be ____________ and _________ ____________.

33. Pole mounted distribution transformers shall be mounted a minimum of _______ feet above grade.

34. Minimum clearance of combustible materials around a transformer rated 100 KVA shall be ________ inches.

NAME ____________________

35. Draw a bank of three transformers with delta-delta connections.

36. The __________ on the windings of a wye-wye connected transformer is 0.58 times the ____________ ______________.

37. A bank of three transformers is connected delta-delta to supply a load of 800 KVA. What is the minimum size of each transformer?

38. The ____________ in the windings of a wye-wye connected transformer is the same as the ___________ ____________.

39. ____________ or ______________ ____________ may be used as over-current protective devices for transformers.

40. The transformer efficiency is the ratio of the ____________ to the ____________ plus ____________ and _______ ______ losses.

MATERIAL COVERED - LESSONS B-14 thru B-17

1. The control circuit conductors of a motor circuit may be protected by the branch-circuit protective device provided the device rating does not exceed ________ per cent of the current capacity of the ________________ ________________ conductors.

2. Like poles ____________ and unlike poles ________________.

3. Use a ____________ to measure the resistance of motor windings.

4. Motor branch-circuit protection devices may be ____________ or ____________ ________________.

5. The speed of a constant speed induction motor is determined by the __________ and ____________ of ________________.

6. The ______________ motor is series-wound.

7. Electrolytic capacitors, in capacitor-start motors, have a higher ____________ rating and ____________ ____________ of ____________ rating.

8. Motor circuit conductors shall be a minimum of ______ per cent of the ______________ full-load current rating.

9. The ____________ ____________ in a split-phase motor provides the starting torque.

10. The __________ motor cannot start by itself.

11. Manually started portable motors rated 1 HP. and less do not require __________.

12. An induction motor consists of a ____________ and a ____________.

13. Torque is the term used to describe the motor _________ or ___________ force.

14. In general the running protection of the motor shall not exceed ________ per cent of the ____________ full-load current rating.

15. Find the synchronous speed of an induction motor having 12 poles on a frequency of 60 cycles.

NAME ______________________

16. The heaters in the controller provide __________protection for the motor.

17. Maximum ratings of overcurrent devices for motors with high starting currents shall not exceed _____per cent of the motor full-load current rating.

18. The speed of a constant speed squirrel-cage motor is determined by the _______, __________of ____________and ____________of ____________.

19. The speed of a squirrel-cage motor depends upon the ________ _____, applied ___________, _____________and ___________of____________.

20. The earth is a ____________magnet.

21. Current carrying capacity of motor circuit conductors supplying three motors shall be a minimum of _________per cent of the full-load current rating of the __________motor plus the ___ ________of the full-load current ____________of the remaining motors.

22. Bearings for motors may be the __________ or ________-____________ type.

23. In a three-phase motor, the windings are __________electrical degrees apart.

24. Motor circuit switches shall disconnect all _____________conductors to the motor.

25. Split-phase motors are _____________for use on 115-volt or 230-volt power source.

26. All motor terminals shall be _________-_____________or____________.

27. __________type motor protector is a snap-acting, bimetallic disc.

28. A motor located ______feet from the controller is considered out of sight.

29. Motor-circuit switch shall be _________rated.

30. The most widely used types of single phase motors are __________-___________ motors.

31. The power factor of a repulsion motor increases with the ____________.

32. Overheating of winding insulation may be caused by lack of ____________, ___________ ____________or ___________ ______________currents.

NAME ____________________________

33. List the three major types of three-phase motors:

(a) ______________________________
(b) ______________________________
(c) ______________________________

34. Squirrel-cage motors do not have a ______________ ______________torque.

35. A split-phase motor consists of a __________ ______________, __________-__________ ________, ____________ ______________, ______________ ______________switch and an ______________protector.

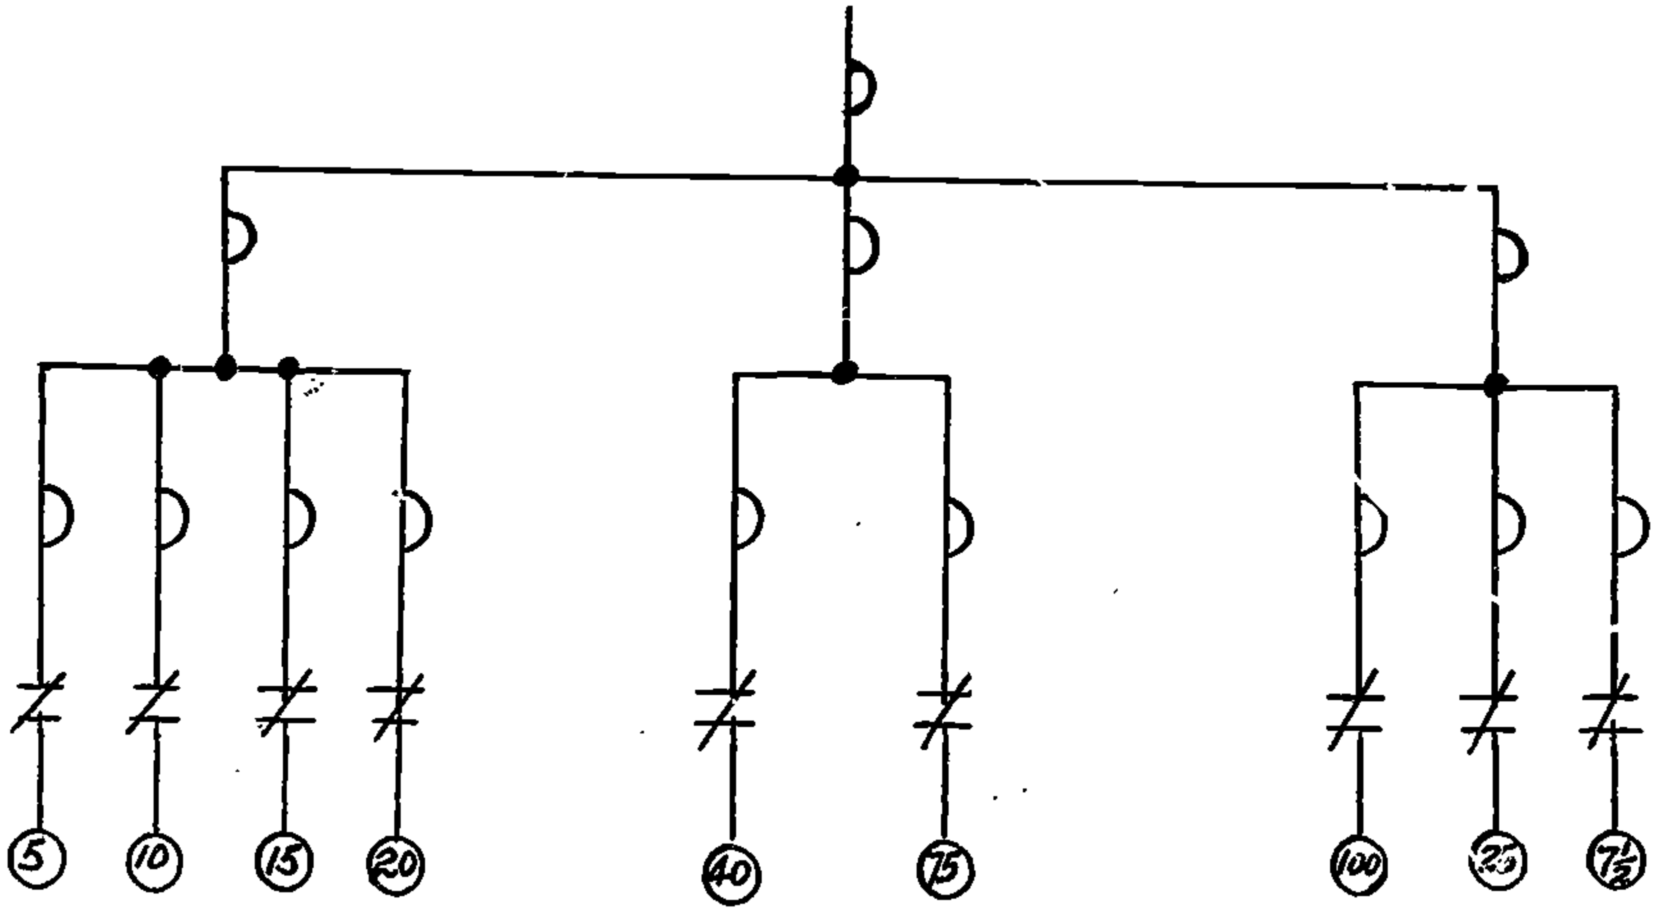
36. ____________-____________ torque is the starting torque of a motor.

37. A capacitor-type motor is more ____ __________than a split phase motor.

38. Induction motors are known as ______________speed motors.

39. ____________ is used in a universal motor to keep the armature turning.

40. Give proper sizes for running protection, conductor sizes, branch circuit overcurrent protection, feeder overcurrent protection and feeder sizes. Voltage is 220V, 3 phase. Use Type "THW" conductors.



NAME ______________________

ELECTRICAL APPRENTICESHIP

SERIES "B", TEST NO. 4
Page 1

MATERIAL COVERED - LESSONS B-18 thru B-23

1. Article __________ covers provisions applicable generally in installation of electrical wiring and equipment.

2. The general lighting load for a school is ______ watts per square foot.

3. A feeder tap having _______ the current carrying capacity of the feeder and terminating in a fusible switch within _____ feet of the feeder does not require ________ protection.

4. Terminals on __________ __________ or __________ __________ do not require identification.

5. No. ________ AWG conductors shall be installed on a 15-ampere branch circuit.

6. Service drops shall be a minimum of ________ above roads.

7. Each ungrounded conductor shall have __________ protection.

8. The identified grounded conductor shall be color-coded ______________.

9. In general, a grounded conductor shall be installed on all ____________ wiring systems.

10. The maximum distance between receptacles in a dwelling shall be _____ feet.

11. All 15-ampere receptacles in a dwelling shall be the __________ type.

12. Overcurrent protection shall be provided for each _____________ service conductors.

13. The voltage at which the circuit operates is the __________ __________.

14. The _________ conductor shall be connected to the screw-shell terminal.

15. Four-wire branch circuits shall be color-coded __________, red, __________, and _____________.

16. The maximum voltage drop permitted on a 480 volt system for power feeders is __________ volts.

17. Never install the __________ conductor and ____________ conductors of a circuit in separate conduits.

18. The point of service drop attachment on a building shall be a minimum of _________ above finish grade.

19. __________ space adjacent to electrical equipment shall not be used for storage.

20. Multi-pole switching devices shall __________ operate on each __________ conductor.

21. The grounding conductor shall be color-coded ______________.

22. The minimum size feeder shall be No. ______ AWG.

23. A maximum of ________ manually operated overcurrent devices shall be provided as service equipment.

24. _________ __________ should not be used for securing electrical equipment on masonry block walls.

25. A white colored terminal is for the ___________ (identified) circuit conductor.

26. The overcurrent device rating determines the __________ ______________ rating.

27. Office lighting branch circuit load shall be increased ______ per cent.

28. A 2000-square foot dwelling shall have a minimum of __________ lighting branch circuits.

29. _________ ___________ are the power supply conductors between the utilities transformer and the Owner's service equipment.

30. A feeder tap terminating in a circuit breaker within ______ feet of the feeder does not require _______ protection.

31. An enclosed switchboard rated 550 volts requires a minimum of ________ feet for working space provided there is no live or grounded parts on the other side of the working space.

32. The insulation for the identified conductors of No. _____ AWG or smaller shall be color-coded ____________.

33. The maximum load on a portable appliance branch circuit shall not exceed _______ per cent of the branch circuit rating.

34. The maximum voltage drop permitted on a 120/208 volt system for lighting and heating loads is ________ volts.

35. A separate ________ drop shall be provided for a fire pump.

36. Small appliance outlets for a dwelling shall be installed in the __________, ___________, ___________, _______________ and _______________.

NAME ______________________________

37. "__________" indicates a mandatory rule in the NEC.

38. A green colored terminal is for the ______________ ______________ conductor.

39. The maximum load on a 15-ampere receptacle shall not exceed ______________ amperes.

40. The _______________ dimensions shall be used for computing the building area.

41. Underground service raceways shall be ____________ at the termination point in the building.

42. Miscellaneous receptacle outlets shall be computed at __________ amperes.

43. Service _____________ and service ______________ shall be grounded to a cold water line.

44. Store-window loads shall be computed at __________watts per linear foot.

45. A _____________-______________ shall be provided at the service-head.

46. Circuits of 350 MCM Type "THW" conductors shall have an insulation resistance of ___________ ohms.

47. Throughout a system, the _______________ conductor shall be identified.

48. If four or more conductors are installed in a raceway, the conductor _____________-_________________ capacity shall be derated.

49. In a system with a balanced load, ___________ current will flow in the neutral conductor.

50. The maximum voltage drop permitted on a 550 volt system for power and heating loads shall be _______ volts.

51. _____________ small appliance outlets shall be installed in a kitchen and shall be rated ___________watts each.

NAME ______________________

52. Determine the minimum Type "THW" service conductors and size of service equipment for a 2300 square-foot residence with 115/230 volt, single phase, 3-wire service, having the following appliances:

(a) 5.0 kw Electric Water Heater (230v)
(b) 5.0 kw Dryer (230v)
(c) 5.1 kw Cooking Unit (230v)
(d) 4.0 kw Oven (230v)
(e) 1.2 kw Dishwasher (115v)
(f) 5 Horsepower Air Conditioner (230v)
(g) 12 - 2.0 kw Space Heaters (230v)
(h) 1/4-Horsepower Washer (115v)
(i) 1/3-Horsepower Disposal (115v)

Page 1

MATERIAL COVERED - LESSONS B-24 thru B-30

1. Grounding helps to prevent ________________ to persons and _____________ to property.

2. Draw a diagram for a 120/240 volt, single phase, three-wire system.

3. Frames of elevators shall be ______________.

4. Emergency __________ includes exit lights.

5. Lamps for outdoor lighting shall be located below all __________ conductors.

6. Frames of electric clothes dryers and ranges shall be ______________.

7. Receptacles shall not be installed within ______ feet of the interior swimming pool walls.

8. The maximum control voltage for an elevator shall not exceed ________ volts.

9. The secondaries of transformers shall be ____________.

10. The standard frequency for this country is _________cycles.

11. The grounding conductor shall be color-coded _____________.

12. The minimum size copper service ground conductor shall be No. ________AWG.

13. The deflection reading of an ohmmeter ____________ the value of the resistance.

14. Indicate opposite each of the distribution systems below the area or areas in which it may be used (residential, commercial, school, industrial).

    (a) 120/240 volts, single phase, three wire ________________________

    (b) 120/208 volts, three phase, four wire ________________________

    (c) 480 volts, three phase, three wire ________________________

    (d) 1277/408 volts, three phase, four wire ________________________

15. Emergency wiring shall be ____________ of other wiring.

NAME ____________________________ ELECTRICAL APPRENTICESHIP

16. Outdoor lighting lampholders shall be of molded ____________________.

17. Switchboard frames shall be ____________________.

18. ____________________ is used to test the cable insulation.

19. Draw a diagram for a 220 volt, three phase, three wire, Delta system.

20. A sheet-metal-strap type clamp is not approved as a _______________ clamp.

21. _____________ lights in an auditorium shall not be controlled from the stage.

22. The minimum size copper grounding conductor for a parallel 500 MCM copper service entrance shall be No. _________ AWG.

23. An ____________ ground connects the non-current carrying metal parts of a wiring system to ground.

24. _____________ lights and specified _____________ lights shall be included in the emergency system.

25. Installing multiple driven ground rods is effective in _____________ ground resistance.

26. ____________________ conductors shall not be installed in a pool area.

27. The minimum size conductor for lighting on an elevator shall be No. _______ AWG.

28. The ground resistance shall not exceed __________ ohms for a water-pipe ground and _________ ohms for a driven ground.

29. ____________ measures electrical power.

30. Increasing the system voltage ____________ the cable size for a determined load.

31. Disconnect means required for an elevator are (a) _____________ supply and (b) ________________ circuit.

32. All circuits to underwater fixtures shall be ________________.

NAME ______________________________

ELECTRICAL APPRENTICESHIP

SERIES "D", TEST NO. 5

33. _______________ systems may be connected ahead of the main service disconnect switch.

34. Type "THW" conductors may be used for outdoor _______________ lighting.

35. The metallic underground water piping used as a grounding electrode shall have a minimum buried length of ________ feet.

36. The maximum operating voltage for a lighting fixture at a swimming pool shall be ________ volts.

37. Draw a diagram for a 277/480 volt, three phase, four wire, Wye system.

38. The main feeders supplying power to elevators shall not be installed in the ____________________.

39. All metal parts of a swimming pool shall be __________________.

40. Open conductors over automobile parking lots shall be a minimum of ____________ feet above grade.

41. The minimum size grounding conductor for a 400 ampere service using Type "THW" conductors shall be No. _________ AWG.

42. ________________ measures circuit voltage.

43. _______________ __________________ shall be installed from each deck distribution box in a swimming pool to the common ground panel.

44. ___________ and _______________ ____________________ switches shall not be installed on emergency lighting circuits.

45. The deflection reading of an ammeter ___________ the value of current.

46. The minimum size equipment grounding conductor for a 200 ampere branch circuit shall be No. _________ AWG.

47. An ohmmeter is used on a ___________ circuit.

48. Grounding conductors shall be connected to the __________________ ________________ of the water meter.

49. Ammeters are ________________ connected in a circuit.

NAME ____________________

50. Service entrance conduit shall be ______________.

51. ____________ measure circuit current.

52. All portable tools shall be ________________.

53. Voltmeter is ____________ connected in a circuit.

54. Generally, all metallic __________ and ___________ shall be grounded.

55. All service equipment shall be __________________.

56. It is more ____________ to operate lighting fixtures and motors on ______________ circuits.

57. Elevator raceways shall terminate a minimum of _____ inches above the floor.

58. _____________ ____________ in a swimming pool shall not be depended upon as a ground.

59. All emergency systems shall be _____________ periodically.

60. Article _________ does not apply to the exterior electrical installation of a power company.

ELECTRICAL APPRENTICESHIP
SECOND YEAR CLASS - "SERIES B"
FINAL EXAM

1. How many recessed troffers (No. 31) having four rapid start lamps rated 3100 lumens are required to produce 175 footcandles in an office area 85 ft. x 150 ft., 8'-6" ceiling, reflective values 80% ceiling, 10% floor, 50% walls, 75% maintenance factor?

2. Find the winding current in a delta connected single phase transformer rated 150 KVA, 240 volts.

3. Draw ballast wiring diagram for two 40-watt rapid start lamps and label each component.

4. Draw a diagram indicating two 3-way and three 4-way switches for controlling three light outlets and identify each part. All lamps turn on and off together.

NAME ____________________________

ELECTRICAL APPRENTICESHIP
SECOND YEAR CLASS - "SERIES B"
FINAL EXAM

5. Draw a diagram indicating the connections two single phase transformers rated 4160 - 120/240 volts, to supply a 120/240 volt load and identify each component.

6. Find the total flux of a light source having 750 mean spherical candlepower.

7. Find (a) secondary current, (b) secondary voltage, and (c) power output of a 5:1 transformer drawing 0.5 amps, from a 120 volt line.

8. Draw 3-phase transformer connections for primary delta, lower voltage; secondary wye, higher voltage. Transformer has dual windings in both primary and secondary sides.

9. What is the per cent slip of a 4 pole, 60 cycle motor operating at 1710 RPM?

NAME ______________________

10. An office building requires an incoming service of 785 amps. on a 120/208 volt, 3-phase, 4-wire system. What is the minimum size of each transformer if a bank of three is installed?

11. Find the luminous intensity of a light source producing 15,000 lumens.

12. A substation transformer reduces the voltage from 175 KV to 4400 volts. Find the secondary current if the primary current is 30 amps.

13. Twelve poles are installed in a parking area to provide 5 foot-candles of illumination. Each pole is equipped with four 40,500 lumen lamps. How large is the parking area in square feet?

14. How many poles are required for a motor to operate at 7200 RPM on 120 cycles?

NAME ______________________________

15. Draw 3-phase transformer connections for primary wye, higher voltage; secondary delta, lower voltage and identify each connection. Transformer has dual windings in both primary and secondary sides.

16. Draw and properly identify the leads of a single phase transformer for additive polarity.

17. Draw a circuit diagram for 460/265 volt, 3-phase, 4-wire, lighting and power system indicating voltages, light and single and three phase power connections and ground where required. Identify each major part or connection.

18. Find the winding current of a delta connected transformer having 25 amps. line current.

19. A transformer has 7200 volt primary, 460 volt secondary, 1000 primary turns, 10 amps. secondary current. Find primary amps. and secondary turns.

NAME ______________________________

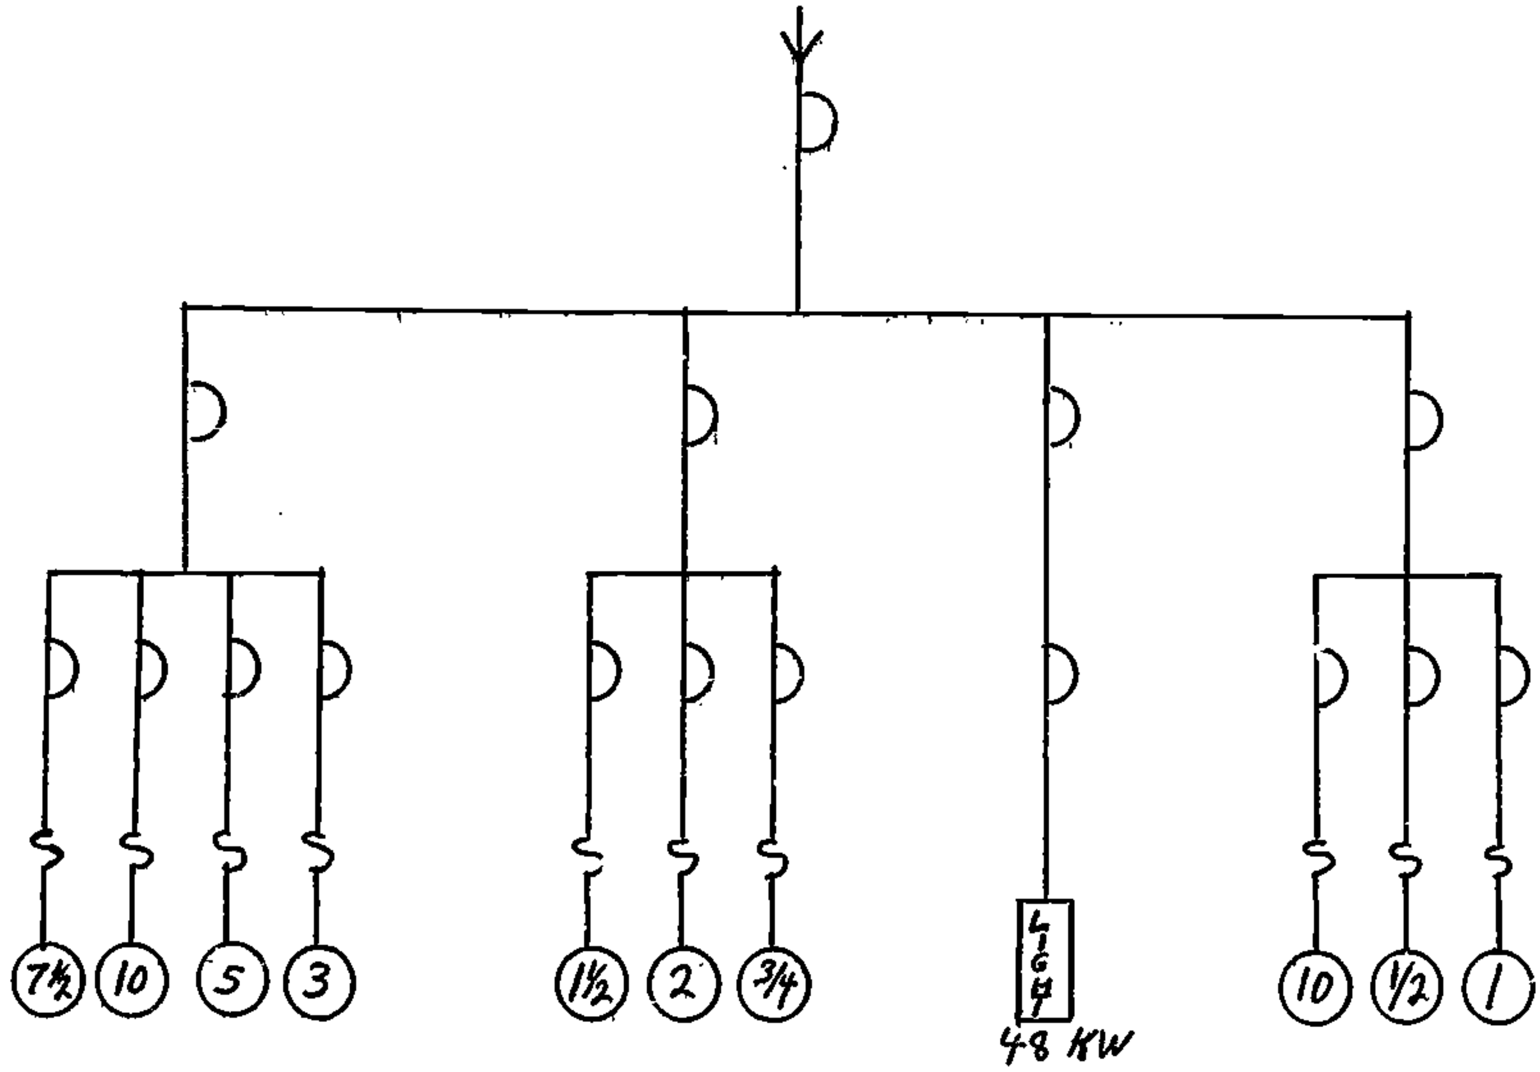
20. What size transformers are required for a 3 transformer wye-wye connected bank for 1250 KVA load?

21. Find the primary winding voltage of a wye-wye connected transformer having 440 volt line.

NAME ______________________

22. Using the National Electrical Code as reference, find the following for the electrical system below rated 240 volts, single phase, three wire, using Type "THW" conductors:

(a) Maximum motor-running overcurrent protection.
(b) Minimum feeder size.
(c) Maximum branch circuit overcurrent protection.
(d) Minimum branch circuit conductors.
(e) Maximum feeder overcurrent protection.



NAME ______________________________

23. Find the minimum Type "THW" lighting feeder permitted by the Code to serve ten floors of a store having 125 ft. x 200 ft. floor area.

24. Find the minimum Type "THW" lighting feeder permitted by the Code to serve a hospital having three floors of office area and eight floors for hospital, 150 ft. x 175 ft. floor area.

25. Calculate the minimum service required for a residence of 2400 sq. ft. having one 12-kw range, one 5-kw water heater, 1.5 kw dishwater, 5 kw dryer, 7½ HP air conditioning unit, 15 kw space heating, 1½ HP water pump, 1/3 HP disposal three 1/6 HP exhaust fans and 4.5 kw shop equipment.

13. "Tong Test" ____________ is a convenient instrument for measuring current without breaking the circuit.

14. Install ammeters in ____________ and voltmeters in ____________ in measuring currents and voltages.

15. For protection of an ammeter a ________ ____________ shall be installed.

16. A ____________ ____________ lamp tester is a convenient

and compact device for determining ________ ________, ________

of ______ ______ and ____________ or ____________ circuits.

17. Study the magneto test set and method of use.

18. List three advantages of the telephone receiver test set over the magneto tester.

(a) ____________________

(b) ____________________

(c) ____________________

19. Study the telephone receiver test set and method of use.

20. What is one advantage of the telegraph sounder?

21. Describe an electric-bell testing outfit and method of use.

22. Describe a test lamp set.

23. What are two items to be considered in construction of a test lamp set?

(a) ____________________

(b) ____________________

PROBLEMS

1. A ______________ is a device for changing ______________ energy from one potential to another.

2. The ____________ windings of a transformer are ______________ and secondary.

3. Secondary windings are connected to the ______________ side.

4. The line side is connected to the ____________ windings.

5. A ______________________ transformer delivers energy at a higher potential than it receives.

6. List three types of losses in a transformer:

   (a) ______________________________

   (b) ______________________________

   (c) ______________________________

7. A transformer which delivers energy at a lower potential than it receives is called a ______________________________.

8. Find the secondary voltage of a transformer having 2400 volt primary, 250 secondary turns and 25 primary turns.

9. Find the primary turns of a transformer having 120 volt on primary, 24 secondary voltage and 100 secondary turns

10. Basic construction of a transformer consists of the following:

    (a) ______________________________
    (b) ______________________________
    (c) ______________________________

NAME ______________________________

26. The universal motor has the armature winding and field winding connected in ________________.

27. Three-phase delta system over 300 volts are not required to be ____________ except when feeding ______________ _______________ at over 300 volts.

28. A motor located __________ feet from the starter is within sight if there are no ________________ between the motor and starter.

29. A three-phase motor may be reversed by ______________ any ________________ _______________ leads to motor.

30. The "T-"rating of a lamp refers to the ________________ in _________ inches.

31. There are ______________ and ________________ cathodes used in fluorescent lamps.

32. On 277 volt systems, lighting fixtures shall not be mounted less than ______ feet above the floor.

33. Running protection for a motor having less than 40° C. temperature rise shall not exceed _____________ per cent of the full load current.

34. A 460-265 volt system requires approximately __________per cent less copper as a 120/208 v. system with the same load.

35. ______________ _______________ type starting is for instant-start lamps.

36. Indoor dry type transformers shall be mounted not less than __________ inches from combustible material.

37. ________________ determines the color of fluorescent lamps.

38. Line current is ________________ to winding current in wye connected transformers.

39. Windings on three-phase motors are spaced ________________ electrical degrees apart.

40. The _______________ winding of a transformer is connected to the load.

41. Distance between receptacles in a dwelling shall not exceed __________ feet of wall space.

42. _______________ type outlets shall be installed in the kitchen.

43. Transformers are rated in _______________.

44. Branch circuits are classified as _____, _____, _____, and _____ amps.

NAME ______________________________

45. Efficiency of a transformer is the ratio of the __________ to __________.

46. Slip is the difference between __________ speed and __________ speed.

47. Primary protection of a transformer shall not exceed __________ per cent of its rated current.

48. The capacitor motor provides a __________ torque.

49. ______________, ______________ and ______________ types of open conductors are permitted to be installed within ten feet of a building.

50. Circuit ______________ ______________ must open each ungrounded conductor.

51. ______________ systems shall be tested periodically.

52. ______________ ______________ conductors shall have an insulation resistance of 25,000 ohms.

53. ______________ ______________, ______________ and ____________ ____________ are suitable means of providing emergency power.

54. The identified conductor shall be connected to the ____________-____________ terminal.

55. ____________ ____________ and other ____________ required to provide ____________ ____________ shall be provided for emergency illumination.

56. A multi-wire branch circuit on a 120/240 volt, single phase, three wire system contains __________ __________ wires and __________ __________ wire.

57. All swimming pool ______________ shall be grounded to a ______________ pool ______________.

58. Minimum size conductors for a 20-amp. branch circuit shall be No. _____ AWG.

59. __________ __________ or __________ shall not be installed in an elevator shaft.

60. ___________ ___________ in the center of a dwelling area floor does not count as a required wall outlet.

61. In a swimming pool, a grounded conductor shall be installed from ____________ box to ______________ ______________ ground.

62. ____________ ____________ lighting shall be based on 200 watts per ____________ ____________.

63. Separate circuits are provided for lights and motors because ____________ and ____________ - ____________ are more common as ________________ ________________.

NAME ______________________________

64. Two ______________ ______________ ______________ shall be provided in kitchens.

65. Megger measures the ______________ ______________ of a ______________.

66. The minimum size copper grounding conductor for a parallel 500 MCM copper service entrance shall be No. ______ AWG.

67. The minimum size copper grounding conductor for a service entrance shall be No. ______ AWG.

68. Service equipment shall consist of a maximum of ______ manually operated ______________ ______________ or ______________ ______________.

69. The ______________ of ______________-______________ electrodes shall not exceed __________ ohms and __________ ohms for underground ______________ ______________.

70. Service conductors shall not be ______________.

71. Overhead service crop shall be attached a minimum of __________ feet above grade.

72. Maximum rating of motor circuit overcurrent protective devices shall be _____ percent of motor full-load current.

73. In transformer vaults, the floor shall be __________ inches thick and door sills shall be __________ inches high.

74. ______________ is the rotating part of an induction motor.

75. All ______________ tools shall be grounded.

Basic Electricity Series, No. C (Third Year), Related Training for Electrical Apprentices, Instructor's Manual.

Hedinger, Howard E.
North Carolina State Board of Education, Raleigh
Pub Date - Jul64
MF AVAILABLE IN VT-ERIC SET 56p.

*TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, *APPRENTICESHIPS,

This teaching guide, the third of a four-unit series, is to help the instructor plan and present course materials to electricians in the third year of the related technical phase of post-secondary apprenticeship training. It was developed by a curriculum committee of subject matter specialists and the educational committee of the National Electrical Contractors of North Carolina, tested on a small group, and used in apprenticeship programs. The 28 lesson plans in this guide cover Fundamentals of A.C. Electricity, National Electrical Code, related to installation in hazardous areas, and Motor Controls. Each lesson plan is outlined in desired results, equipment and materials, references, introduction, presentation, application, and checking and followup. The teacher of the 144-hour course should be a journeyman tradesman, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include lists of textbooks and recommended films. Correlated student assignment and information sheets, unit tests, and a final examination are given in VT 003 627. Documents of the series are listed as VT 003 624 through VT 003 631. (HC)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency ERIC Only, except North Carolina Institutions.
Address
Limitation on Available Copies Price/Unit
(quantity prices)

(2) Means Used to Develop Material:
Development Group Curriculum committee/ National Electrical Contractors for Carolinas - Educational committee
Level of Group State and Dept. supervisor
Method of Design, Testing, and Trial Designed by subject matter specialists and tested on a small group; has been used with 1,200 apprentices per year for 3 years.

(3) Utilization of Material:
Appropriate School Setting Vocational (Apprentice Training)
Type of Program Post-high; Apprenticeship
Occupational Focus A specific job (electrical construction)
Geographic Adaptability N/A
Uses of Material Course and lesson planning and student study guides.
Users of Material Instructor and student

(4) Requirements for Using Material:
Teacher Competency Journeyman instructor
Student Selection Criteria 18 year old, male (mostly), post-secondary educ. to become a journeyman electrician
Time Allotment 144 hours per year (minimum)

ACKNOWLEDGMENTS

The Instructor's Manual and Assignment Sheets for the Electrical Apprentice Training Program have resulted from a need recognized by representatives of Trade and Technical Education and the Apprentice Council of the Department of Labor of North Carolina. They believe that an apprentice, in order to become a skilled craftsman in our times, needs not only to work hard on the job but also to study the related technical materials of his trade in an organized manner.

The Curriculum Laboratory of the Department of Community Colleges, was given the assignment of preparing materials that could be used by the instructors as a guide. The material contained in the lesson outlines is designed to help the instructor plan the lessons and to lead his classes gradually into the more complex studies of electricity.

Representatives of the Curriculum Laboratory have worked in close cooperation with a statewide Education Committee of the North Carolina Association of Electrical Contractors. Among these men are contractors, engineers, and journeymen who have not only worked as electricians but also are serving as instructors for apprentice classes.

Thanks are extended to Mr. D. J. Colter, Chairman of the Apprentice Training and Manpower Development Committee for the Electrical Contractors Association, Mr. C. L. Beddingfield, State Director of Apprenticeship and Training, and Mr. W. F. Humbert, III, Instructor of Winston-Salem who prepared the study guide questions for each lesson.

In addition, appreciation is expressed to all those instructors and apprenticeship committee members who have made themselves available for consultation regarding this course.

BASIC ELECTRICITY

TO THE INSTRUCTOR

The third year (Series C) of the course in Basic Electricity for apprentices is designed to make it easier for the instructor to present the work in a systematic manner. The lesson outlines continue the study of alternating current and circuits.

It should be noted by the instructor that advanced mathematical principles are stressed in order to understand alternating current and the application of vectors. In this course, there is a continued study of the National Electrical Code in terms of wiring methods in hazardous locations. References are made to the National Electrical Code and Blueprint Reading to help clarify the Code in making installations in hazardous areas. Also, presented in this course is the technical subject of motor controls and their applications. These topics are given in language as non-technical as possible and will continue in the fourth year (Series D).

It has been found from experience that many instructors have had difficulty obtaining particular visual aids at the time they need them. It is suggested that each instructor find his own sources of appropriate aids. The brief list included in this manual will act as a guide until a more comprehensive list of audio-visual and other aids can be prepared.

NATIONAL ELECTRICAL CODE

MOTOR CONTROLS

INSTRUCTIONAL MATERIALS

Lesson C-1

ALTERNATING CURRENT

DESIRED RESULTS:

1. To acquaint the apprentice with the importance of alternating current.
2. To know the basic fundamentals of alternating current.
3. To know the terminology used in working with alternating current circuits.

EQUIPMENT AND MATERIALS:

1. Oscilloscope
2. Lamps
3. Motor
4. Relay
5. Transformer (Bell)
6. Capacitor

REFERENCES:

1. American Electricians' Handbook, p. 1-40 to 1-45; Sec. 112-129 & 134
2. Basic Electricity, Vol. 3, pages 1-21, 31-34; 43-57 and 77-92
3. Basic Mathematics, Singer, pages 294-310; 319-335
4. Film--"Alternating Currents"--35 MM slide film - Jam Handy
5. *Swoope's Lessons in Practical Electricity, pages 340-360

INTRODUCTION:

Alternating currents have been refe-red to briefly in other lessons. As you know, most all of the electric power generated and transmitted in the United States is alternating current.

Five reasons are listed for using electrical energy as alternating current rather than direct current:

1. The A.C. Generators have no commutators. Therefore, units having larger power ratings and resultant heavier current ratings can be used without the problem of brush arcing and heating.

2. Because alternators or A. C. generators have no commutators, they can generate at comparatively high voltages such as 11,000 to 13,000 volts.

3. Because alternating current can be transmitted economically over great distances. It is possible to generate electrical energy in large quantities in a single station and distribute it over a comparatively large territory.

4. By the use of the transformer, alternating current can be increased or decreased easily without much power loss.

5. For constant speed work, the A. C. squirrel-cage induction motor is less expensive than the direct current motor, both in cost and in maintenance.

PRESENTING THE LESSON:

I. The Cycle:
Since we know that alternating current flows back and forth in a conductor at regular intervals, going first in one direction and then the other.

- A. Develop the concept of the cycle using the four positions of a loop in an elementary generator.

- B. Define cycle--Draw a waveform or sine wave and mark the points of maximum, average and effective values. Have the students give definitions of Cycle.

II. Discuss and define Mechanical and Electrical Degrees

- A. Compare two and four pole A. C. generators
  - 1. Calculate the mechanical and electrical degrees in each generator per turn of rotor coil.

- B. Arrive at the definitions

III. Frequency

- A. Compare the number of cycles generated per turn of rotor in two and four pole A. C. generators.
  - 1. Calculate the number of cycles generated per second in each generator at a given speed.

- B. Arrive at a definition of frequency

IV. Phase

- A. Definition of Single-phase
- B. In-phase
  - 1. Give definition
  - 2. Illustrate VOLTAGE and CURRENT relationship using SINE WAVES
    - a. Draw Waveform or SINE WAVE
    - b. Illustrate with OSCILLOGRAPH
- C. OUT OF PHASE - LAG
  - 1. Definition
  - 2. Illustration of sine waves showing the current lagging the voltage.
- D. OUT OF PHASE - LEAD
  - 1. Definition
  - 2. Illustration of SINE WAVES showing current leading the voltage.

V. Demonstrations with Cathode Ray Oscillograph

- A. Cycle of line voltage sine waves
- B. Waves of at least two different frequencies
- C. Current and Voltage
  - 1. Connect a lamp to the line
- D. Current lagging voltage
  - 1. Connect a relay, a transformer, or a motor to the line
- E. Current leading the voltage
  - 1. Connect a capacitor to the line

VI. Visual Aids

Show "Alternating Currents"
35 MM Slide Film
Jam Handy Organization

APPLICATION:

The students should complete the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for placing in notebooks.

Lesson C-2

RESISTANCE IN A.C. CIRCUITS

DESIRED RESULTS:

1. To acquaint the student with the affect of resistance only in A. C. Circuits.

2. To understand the meaning of the term "power factor".

EQUIPMENT AND MATERIALS:

1. Oscilloscipe
2. Lamp bank
3. Switches
4. Meters
5. A. C. Generators
6. Capacitor

REFERENCES:

1. American Electricians' Handbook, pages 1-43, Sec. 122

2. Basic Electricity, pages 3-31 to 35

INTRODUCTION:

The effect of resistance in alternating current circuits which contains resistance only is the same as its effect in direct-current circuits. It causes a loss or drop in voltage, with a specified voltage, the greater the resistance the smaller the current and vice-versa. Remember that some materials have much less resistance than others. Pure resistance circuits are made up of electrical devices such as resistors, lamps and heating elements which have negligible inductance or capacitance. When only such devices are used in an A. C. circuit, Ohm's Law, and the circuit rules for voltage, current and power can be used as in D. C. Circuits.

Power in the A. C. circuit is determined in a similar manner as in a D. C. circuit by multiplying volts and amperes. When the power factor is other than unity, all A. C. voltage and current are given in effective valves. Effective valves are determined by considering the angle of lag or lead between voltage and current.

The power represented by the product of volts, amperes, and cosine is registered on a wattmeter or a watt-hour meter. It represents the power you pay for when furnished by the electric company.

PRESENTING THE LESSON:

1. Review the fundamental concepts of power.
    a. A. C. resistance circuits
    b. Draw voltage and current wave
        (1) Sine waves of voltage and currents are "in phase" whenever they are the same frequency and pass through zero simultaneously, both going in the same direction.
        (2) Demonstrate on the oscilloscope
        (3) Set up a circuit of incandescent lamps to A. C. Power supply. Measure the volts, amps, and watts. Show that volts x amps equals watts.
2. Determination of Power
    a. Circuit having resistance only - measure the volt-amps and power supplied to:
        (1) A reactor of negligible resistance
        (2) A capacitor
    b. Circuit having inductive or capacitive reactance
        (1) Measure the power supplied to a single-phase induction motor.
    c. Present the General Formula for Single phase or A. C. Power factor.

APPLICATION:

Have the students answer all questions; show all formulas used on the assignment sheet.

CHECKING AND FOLLOW-UP:

After checking the papers, return the sheets to the students for correction and placing in their notebooks.

Lesson C-3

INDUCTANCE IN A.C. CIRCUITS

DESIRED RESULTS:

To acquaint the apprentice with the effects of inductance in an alternating current circuit.

EQUIPMENT AND SUPPLIES:

1. Resistors, coils, capacitors, lamps
2. Oscilloscope
3. Connecting wire
4. 16 MM Projector and film

REFERENCES:

1. American Electricians' Handbook, Div. 1- p. 23, Sec. 45; p. 44, Sec. 125 & 126
2. Basic Electricity, Vol. 3, pages 49-52
3. Basic Mathematics, pages 336-351
4. Electric Circuits & Machines, Lister, pages 63-71 and pages 152-154

INTRODUCTION:

INDUCTANCE, which is treated in this assignment, is the electrical property that in an A. C. circuit imposes a counter or back voltage. When the current increases, inductance tries to hold it down and when the current decreases, inductance tries to hold it up. While you cannot see inductance, it is present in every electrical circuit and has the above effects on the circuit whenever the circuit current changes.

Inductance of a circuit is measured in a unit called "henrys." It is expressed by the symbol L. A circuit has an inductance of 1 henry when, if the current is changed at the rate of 1 ampere per second, 1 volt is induced into the circuit. You must understand inductance and inductive reactance in order to learn the basics of alternating current.

PRESENTING THE LESSON:

Remember that an alternating current is continuously changing so that the circuit inductance affects A. C. current flow at all times. Because a coil of wire has more inductance than a straight length of the same wire, the coil is called an "inductor."

Resistors, coils, and capacitors may be connected in series in several combinations. A circuit which contains a resistor connected in series with a coil will be considered.

Resistors and coils offer opposition to alternating current. The voltage and current relationship in a resistor will be in phase while in a coil; the current lags the voltage drop across the coil by 90 degrees. The combined opposition is called <u>impedance</u> and is measured in ohms.

DEMONSTRATIONS:

1. Analysis of a series circuit containing two resistors, or lamps.
2. Analysis of series circuit containing a resistor in series with a coil.
3. Set up a series circuit consisting of a resistor and a coil, each having corresponding resistance and reactance of about the same value.
4. Show the actual relationship of voltage and current in each part of the circuit by using an oscilloscope.
5. Show film--"Inductance in A. C. Circuits"

APPLICATION:

A. Check-up on Basic Mathematics:

   1. Work problems No. 2, 3, and 5, page 340.
   2. Work problems No. 1, 6, and 12, pages 342-343.

B. Answer questions on the Assignment Sheet

CHECKING AND FOLLOW-UP:

Check the answers to questions and return to the students for correction and filing in notebooks.

Lesson C-4

INDUCTIVE REACTANCE

DESIRED RESULTS:

To acquaint the apprentice with the effects of Inductive Reactance in an alternating current circuit.

EQUIPMENT AND SUPPLIES:

1. Oscilloscope
2. Resistors
3. Core Materials
4. Bell Transformer
5. Light Bulbs, for batteries & 60-watt, 110 V (white & red)
6. Coils
7. Wire connectors
8. Meters

REFERENCES:

1. <u>American Electricians' Handbook</u>, Div. 1, page 23, Sec. 46
   Div. 1, page 44, Sec. 126 & 127
2. <u>Basic Electricity</u>, Vol. 3, pages 61-64
3. <u>Basic Mathematics</u>, pages 340-366
4. *<u>Swoope's Laws in Practical Electricity</u>, pages 365-366

INTRODUCTION:

Inductive reactance is the opposition to current flow offered by the inductance of a current. As you know, inductance only affects current flow while the current is changing, since the current change generates an induced EMF Reactance is expressed in Ohms as in resistance. In the formula inductive reactance is represented by the letters X_L.

Because an understanding of inductance and inductive reactance is fundamental to an understanding of alternating current, be sure that the students master this material including the use of formulas.

PRESENTING THE LESSON:

I. Show the following waveforms on the chalkboard:
   1. A. C. Voltage and current waveforms in an inductive circuit
   2. How frequency affects current
   3. Voltage and currents are in phase in a circuit of pure resistance.
   4. Voltage and currents are 90° out of phase in a circuit of pure inductance.

II. Demonstrations:
1. How inductance varies with core material.
2. Determining the starting voltage of a neon lamp.
3. Observing A. C. and D. C. cirrent flow in a resistive circuit.
4. How inductive reactance affects the total circuit current.

APPLICATION:

Have the students answer the questions and work the problems on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers and help any of the students that had trouble with the problems.

Lesson C-5

CAPACITANCE IN A.C. CIRCUITS

DESIRED RESULTS:

- To help clarify the concept of capacitance by showing that when the voltage across an electric circuit changes, the circuit opposes this change.

EQUIPMENT AND SUPPLIES:

1. Two-plate capacitor
2. Knife switch
3. Dry cell
4. Ammeter
5. Various types of capacitors
6. Wire connections
7. 16 MM projector
8. 16 MM Film--"Capacitance in A. C. Circuits"

REFERENCES:

1. American Electricians' Handbook, Div. 1, p. 23, Sec. 47; p. 44, Sec. 128
2. Basic Electricity, Vol. 3, pages 77-92
3. Basic Mathematics, pages 366-376 and 383
4. *Swoope's Laws in Practical Electricity, pages 331-336

INTRODUCTION:

Capacitance exists in an electric circuit because certain parts of the circuit are able to store electric charges. Capacitance is dependent on the area of the metal plates, the characteristics of the dielectric, and the distance between the plates. The effectiveness of a dielectric for use in a capacitor is described by a number called the "dielectric" constant. The number is based on the assumption that air has a dielectric of 1. Bakelite varies from 4.0 to 10.0, rubber compounds from 3.0 to 7.0 and paper from 2.0 to 2.6.

PRESENTING THE LESSON:

A. What factors determine the reactance?

1. The size of the capacitor is one factor. The larger the capacitor, the greater the number of electrons that may be accumulated on its plates.
2. Increasing the distance between the plates decreases capacitance.
3. Changing the Dielectric material changes the capacitance. Example, using Mica as a dielectric increases the capacitance.

B. What is working voltage?

The working voltage is the largest voltage that may be placed across a capacitor before it breaks down. The working voltage in a parallel circuit is the working voltage of the weakest capacitor. The working voltage in series circuit is the sum of the working voltages of the series capacitor. See formulas--Basic Mathematics, pages 377 and 394.

DEMONSTRATIONS: (See Basic Electricity)

1. Charging a plate NEGATIVELY AND POSITIVELY.
2. D. C. current flow stops when the capacitor becomes charged. Switch closed--capacitor charges Switch open-capacitor remains charged. Switch reversed--capacitor discharges and then charges with reversed polarity.
3. A. C. current in a capacitive circuit--charge and discharge currents cause a deflection on the A. C. ammeter.
4. To prove that capacitors appear to block D. C. but permit A. C. to pass.

C. Show the film--"Capacitance in A. C. Circuits"

REVIEW of Capacitance in A. C. Circuits by having the students explain the terms and items brought out in the film:

1. Capacitance
2. Capacitor
3. Capacitor charge
4. Capacitor discharge
5. Farad
6. Microfarad
7. Micromicrofarad
8. Dielectric

APPLICATION:

Have the students answer the questions on the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

After checking the papers, return them to the students for correction and placing in their notebooks,

Lesson C-6

CAPACITANCE REACTANCE

DESIRED RESULTS:

To acquaint the apprentice with the effects of Capacitive Reactance in an alternating current circuit.

EQUIPMENT AND SUPPLIES:

1. Lamps
2. Resistors
3. Capacitors
4. Voltmeter
5. Batteries
6. Power supply or Transformer

REFERENCES:

1. American Electricians' Handbook, Di. 1 - page 24, sec. 49
   page 44, sec. 129
2. Basic Electricity, Vol. 3, pages 107-111
3. Basic Mathematics, pages 376-381
4. *Swoope's Laws in Practical Electricity, pages 368-371

INTRODUCTION:

Capacitive Reactance is the opposition to current flow offered by the capacitance of a circuit. It is measured in ohms, the same as resistance and inductive reactance. Capacitive Reactance is designated by the symbol X_C Alternating Current continuously varies in value and polarity, therefore the capacitor is continuously charging and discharging, resulting in a continuous circuit current flow and a finite value of capacitive reactance.

Inductive reactance and capacitive reactance have exactly opposite effects in a circuit. Inductive reactance opposes change of current in a circuit; capacitive reactance opposes change in voltage. In a series circuit the inductive reactance tends to neutralize the capacitive reactance.

PRESENTING THE LESSON:

A. Show by drawing on the chalkboard and in the text Basic Electricity:
   1. Charging and discharging currents of a capacitor.
   2. How frequency affects the flow of A.C. current through a capacitor.
   3. How capacitance values affect capacitive resistance.
   4. In a pure capacitive circuit, the current leads the voltage.
   5. Show the Power Wave of a circuit containing only capacitance.

B. Demonstrate (See Basic Electricity, Vol. 3, pages 113-118)
   1. A voltmemter connected across a capacitor acts as a RESISTOR
   2. A neon lamp is an open circuit until its starting voltage is reached.
   3. Observe the time delay of an R. C. time constant.
   4. Show that a change in resistance changes the R. C. time constant.
   5. Show that a change in capacitance changes the R. C. time constant.
   6. Observe the charging current of a capacitor.
   7. Observe the capacitance reactance as the capacitance changes.

APPLICATION:

Answer questions and solve problems on the assignment sheet for this lesson. See Basic Mathematics for formulas to use with problems.

CHECKING AND FOLLOW-UP:

After checking the assignment sheets, return them to the students for correction and placing in the notebooks.

Lesson C-7

TRIGONOMETRY FOR A.C. ELECTRICITY

DESIRED RESULTS:

1. To study the relationships that exist among the sides and angles of a right triangle.
2. To know that these relationships form a basic mathematical tool used in the solution of A. C. electrical problems.

EQUIPMENT AND MATERIALS:

1. Chalkboard
2. Chalkboard Tools

REFERENCES:

1. Basic Mathematics, pages 294-307

INTRODUCTION:

Trigonometry is the study of the relationships that exist among the sides and angles of a triangle. It is one of the most useful forms of mathematics, which treats of the measurement of triangles. A study of trigonometry and its methods is important to students of technical subjects. The students will find its use necessary in the solution of many problems in alternating-current circuits, mechanics, surveying, etc.

In solving alternating current problems, it is necessary that the student know the functions of the SINE, COSINE, and TANGENT of an angle and how to use them.

PRESENTING THE LESSON:

1. Review ANGLES--NAMING ANGLES, MEASURING OF ANGLES and KINDS OF ANGLES.

2. TRIANGLES--a closed plan figure of three sides.
   a. A Right Triangle
   b. Naming the sides of a Right Triangle

3. The Trigonometric Formulas
   a. Sine of an angle
   b. Cosine of an angle
   c. Tangent of an angle

4. Using the Table of Trigonometric Functions
   a. How to find the decimal values of the functions of angles from the table of natural functions.
   b. How to find the angles corresponding to the decimal values of the functions.

5. Demonstrate
   a. Finding the Acute Angles of a Right Triangle.
   b. Finding the sides of a Right Triangle.
   c. How to use the Right Triangle to solve alternating current problems by substituting electrical values.

APPLICATION:

The students will answer the questions and work the problems on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their notebooks.

Lesson C-8

VECTORS

DESIRED RESULTS:

1. To study the term VECTOR as it represents a straight line having a definite LENGTH & DIRECTION.
2. To learn that VECTORS are commonly used to show the amount and direction of a quantitiey like 100-lb. force which acts straight up.
3. Vectors are used to show the amount and time at which a voltage or current is acting.

EQUIPMENT & MATERIALS:

1. Chalkboard
2. Chalkboard Tools

REFERENCE:

1. Basic Mathematics, pages 399-404

INTRODUCTION:

In a circuit containing only resistance, we have seen that the voltage and current occur at the same time or are in phase. To indicate this condition by means of vectors, draw the vectors for the voltage and the current in the same direction. Vectors which are drawn in different directions will indicate that the voltage and current are happening at different times.

PRESENTING THE LESSON:

1. Draw a line representing vectors for the voltage and the current acting in the same direction. The angle between the vectors is 0° and is called the phase angle; it is demoted by the Greek letter, theta ~~(θ)~~. (See figure 17-2, p. 399 of Basic Mathematics). Work the examples on the chalkboard.
2. Draw a vector Diagram showing the voltage Vector "leading" the current vector by 90° in a purely inductive circuit. (See fig. 17-4, page 401 of Basic Mathematics). We must show which vector is the "leading" vector and which is the "lagging" vector. To show these quantities, we must use the numbers on a clock. Let us use the hour hand of a clock as a vector. A vector pointing to 3 o'clock occurs after a vector pointing to 12 o'clock, and are 90° apart. Similarly, a vector pointing to 3 o'clock occurs before a vector pointing to 6 o'clock.

3. The amount of current that will flow in a "pure" inductive circuit is found by Ohm's Law. (See p. 401, Basic Mathematics) Demonstrate with several problems.

APPLICATION:

The students will answer the questions and work the problems on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their notebooks.

Lesson C-9

SERIES A.C. CIRCUITS

DESIRED RESULTS:

1. To show the effects of a combination of resistance, inductance, and capacitance connected in series.

2. To show the relationship of voltage and current in a series circuit containing R, L, and C.

3. To acquaint the apprentice with the problem of resonance in an alternating current series circuit.

EQUIPMENT AND SUPPLIES:

1. A. C. Power Supply or Transformer
2. Knife-edge switches
3. Resistors (1500-OHM)
4. A. C. Voltmemter (0-250 volt)
5. Filter Choke (5-Henry)
6. Capacitors (1-mfd & .25-mfd)
7. 16 MM Projector - A. C. Series Circuits

REFERENCES:

1. <u>Basic Electricity</u>, pages 4-26 thru 4-42
2. <u>Basic Mathematics</u>, pages 408-432
3. *<u>Swoope's Lessons in Practical Electricity</u>, pages 391-394

INTRODUCTION:

An electrical AC circuit may be completely inductive or capacitive. It may also include resistance, inductance and capacitance in series. When the inductive reactance equals the capacitive reactance, a condition called <u>resonance</u> exists.

Since the capacitive reactance opposes inductive reactance, they will cancel each other and the resistance of the circuit will be the only remaining opposition. Illustration--AC Series Circuit Current Flow, pages 4-26, <u>Basic Electricity</u>.

PRESENTING THE LESSON:

I. Characteristics of the Series Circuit having R, L, and C.
   A. Circuit having X_L greater than X_c
   B. Circuit having X_c greater than X_L
   C. Resonant circuit, X_L equal to X_c
   D. Summarize the characteristics with respect to impedance, total voltage, and phase relation to the total voltage and current.

II. Demonstrations
   A. Set up a R and L series circuit voltage as shown on pages 4-37, Basic Electricity.
   B. Set up a R & C series circuit voltage; see pages 4-38.
   C. Set up the L & C series circuit voltages; see pages 4-39
   D. Series resonance
      1. Set up and observe the voltages and current flow in an R, L, and C series circuit. See pages 4-40
      2. Observe the circuit voltages and current change as the capacitance value is changed.

III. Visual Aid
Use a cathode ray oscilloscope to show the phase relationship of current and voltage across each part of each circuit used in the demonstration.

APPLICATION:

Using the Assignment Sheets for this lesson, the students should answer the questions and solve the problems.

Note: This is a lengthy assignment and it may require more than one meeting to complete.

CHECKING AND FOLLOW-UP:

Correct the questions and problems, and return the sheets to the students for correction and filing in their notebooks.

Lesson C-10

PARALLEL AC CIRCUITS

DESIRED RESULTS:

1. To determine the current and voltage relations in an alternating current circuit containing resistance and capacitance in parallel.
2. To determine the current and voltage relations in an alternating current circuit containing resistance, inductance, and capacitance in parallel.
3. To find the inductance or capacitance needed to produce resonance in an AC parallel circuit.

EQUIPMENT AND SUPPLIES:

1. AC Power Supply or Transformer
2. Knife edge switches
3. AC milliammeter (0-50 MA)
4. Voltmeter (0-250 volt)
5. Resistors (24 MA)
6. Capacitors (32 MA & 1-Mfd)
7. Filter Choke (5-Henry)
8. Wire connections

REFERENCES:

1. <u>Basic Electricity</u>, pages 4-41 thru 4-62
2. <u>Basic Mathematics</u>, pages 433-467

INTRODUCTION:

The majority of industrial power distribution lines have currents lagging the voltage. Power companies have found it advantageous to offset this condition by connecting banks of capacitors in parallel with the load. In this assignment the study is first limited to a circuit containing a resistor connected in parallel with a capacitor.

The second consideration is given to the parallel circuit containing three branches; resistance, inductance, and capacitance. When the reactor current is equal to the capacitor current, a parallel resonance or anti-resonance exists. This condition has a very practical application in the industrial electrical field.

PRESENTING THE LESSON:

I. Parallel Circuit with Capacitor and Resistance
    A. Current and voltage relations in resistance branch
    B. Current and voltage relations in capacitor branch
    C. Resultant current taken by the combining of these two branches into a parallel circuit
    D. Line voltage and current relations

II. Parallel Circuit Containing Resistance, Inductive Reactance, and Capacitive Reactance in Parallel
    A. Current and voltage relationship in each branch
    B. Obtaining the line current using vectors
        1. Current in capacitive reactance branch 180 degrees out of phase with current in inductive reactance

    2. Reactor current greater than capacitor current
    3. Capacitor current greater than reactor current

III. Resonance in a Parallel Circuit
  A. Review of resonance in a series circuit
  B. Effect of line current
    1. Current is equal in inductive reactance branch and in capacitive reactive branch
    2. Line current is equal to current taken by resistance branch
    3. Line current is equal to minimum value

IV. Demonstrations
Wire up a parallel circuit consisting of three branches, R, L, and C.
  1. Observe the total current of an R and L parallel circuit.
    a. Measure the branch currents of R and L
  2. Observe the total current of an R and C parallel circuit
    a. Measure the branch currents of R and C
  3. Observe the total current of a C and L parallel circuit
    a. Measure the branch currents of C and L
  4. Find the total current of the R_1 and L and C parallel circuit
    a. Measure the branch currents I_r, I_c, and I_L
  5. Show the current flow in a parallel resonant circuit
    a. Varying values of capacitance through resonance varies the currents I_c and I_L
    b. Check the value of circulating current in a parallel resonant circuit.

APPLICATION:

Complete the Assignment Sheets containing questions and problems. Lend assistance with the problems where needed.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for corrections and filing in their workbooks.

POWER IN AC CIRCUITS

DESIRED RESULTS:

1. To understand the meaning of the term "Power Factor".
2. To show the apprentice how power in an AC circuit is determined.

EQUIPMENT AND MATERIALS:

1. Voltmeter
2. Ammeter
3. Wattmeter
4. AC Power Supply
5. Motor or Industrial Power Load
6. Lamp banks
7. Capacitors
8. Resistors

REFERENCES:

1. American Electricians' Handbook, pages 1-45 & 48; 3-38
2. Basic Electricity, pages 3-33 thru 35; 3-72 thru 76 & 3-112
3. Basic Mathematics, pages 402, 405, 468-490
4. *Swoope's Lessons in Practical Electricity, page 398

INTRODUCTION:

The power in a DC circuit is the product of volts and amperes. In an AC circuit, the voltage and current are seldom in phase. Incandescent lighting and heating are the exceptions. The apparent power or product of volts and amperes must be multiplied by a "power factor" to determine the true or real power.

See AC Power Waveform, pages 3-33, Basic Electricity.

For "in phase" voltage and current waves, all of the instantaneous powers are above the zero axis and the entire curve is above the zero axis. This is determined when two positive values are multiplied together, the result is positive, and whenever two negative values are multiplied together, the result is also positive.

PRESENTING THE LESSON:

I. Fundamental Concepts of Power
   - A. AC Resistance Circuits
   - B. AC Inductive Circuits
   - C. AC Capacitive Circuits

II. Determination of Power
  A. Circuit having resistance only
  B. Circuit having inductive reactance or capacitive reactance
  C. Circuit having a reactive load (capacitive or inductive)
  D. General Formula for "single phase" or AC Power
  E. Measurement of AC Power

III. Power Factor
  A. Concept, definition and determination of power factor

IV. Demonstrations
  A. Set up circuits of incandescent lamps connected to an AC supply. Measure the volts, amperes, and watts. Show that volts x amperes equals watts.
  B. Measure the volt-ampere and power supplied to:
    1. A reactor of small resistance
    2. A capacitor
  C. Measure the volts, amperes, watts or the power supplied to a single-phase induction motor.

APPLICATION:

The students will answer the questions and solve the problems on the Assignment Sheet. Give assistance with the problems where needed.

CHECKING AND FOLLOW-UP:

After checking the answers return the sheets to the students for corrections and placing in their workbooks.

Lesson C-12

POWER FACTOR CORRECTION

DESIRED RESULTS:

To acquaint the student with the method and importance of power factor correction.

EQUIPMENT AND MATERIALS:

1. Chalkboard
2. A capacitor (large kva) for demonstration

REFERENCES:

1. American Electricians' handbook
2. Basic Mathematics, pages 490-500
3. Library

INTRODUCTION:

Power is the rate of doing work. A watt is the unit of power or equal to the work done by the current of one ampere under the pressure of one volt. A wattmeter is not constructed with the basic meter movement. It uses field coils with no permanent magnet to furnish the magnetic field. Since wattmeters work differently than other meters and are easily damaged if connected incorrectly, they must be operated properly.

Measurement of Power Factor can be done by using a power factor meter. The exterior of the single-phase power factor meter is identical to the wattmeter. While a source may produce volts and amperes, the power in watts may be small or zero. The ratio between the power in watts of a circuit and the volt-amperes of a circuit is called "power factor". In a pure resistive circuit the "power factor" is equal to power in watts divided by volt-amperes which equals one (1).

PRESENTING THE LESSON:

The ideal power transmission occurs when the current is in phase with the voltage or when the "power factor" is one (1). This can be accomplished by connecting a capacitor or a bank of capacitors across the line or in parallel with the inductive equipment. Show the students a capacitor.

The size of the capacitor is determined from tables showing the relationship between "power-factor", load Kva and Kva capacitors needed for any desired new power-factor. The size of capacitor necessary to raise the power factor of a given load to a higher value can be found as follows:

Assume a 500 kva load at 60 per cent power factor; 500 kva x 0.60 = 300 kw. It is desired to raise the power factor to 90 per cent. The capacitor kva necessary is found by multiplying 300 kw by the factor taken from the power factor correction table, which is 0.85. The capacitor needed would be 255 kva.

The power-factor correction theory is not in the realm of apprentice work or the electrical maintenance department. It is an engineering problem and engineers should calculate the problems with the actual correction being made with capacitors or synchronous motors. The maintenance electrician should be familiar with the dangers in working with capacitors. A capacitor can maintain a charge sufficient to produce a fatal shock for a long time after it is disconnected from a charged line. A capacitor should be fully discharged before any maintenance work is done to it or around it.

APPLICATION:

The students will complete the questions and solve the problems on the assignment sheet.

CHECKING AND FOLLOW-UP:

The answers should be checked and the papers returned to the students for correction and filing in their workbooks.

CAPACITORS

DESIRED RESULTS:

To acquaint the apprentice with construction, installation, use, markings, and protection of capacitors needed for industrial use.

MATERIALS:

1. A C Supply, meters and oscilloscope
2. 100 W. lamp, 10 and 5 mfd capacitors, switches
3. a. 16 mm. sound film - Capacitance - U. S. Navy - Castle No. 15402
   b. 35 mm. - Filmstrip - Capacitive Reactance - U. S. Navy, Castle No. SN648
4. Samples: Industrial Capacitor & Motor Capacitor

REFERENCES:

1. <u>American Electricians' Handbook</u>, pages 4-126 thru 130
2. <u>Basic Electricity</u>, pages 3-93 thru 105
3. <u>National Electrical Code</u>, Article 460

INTRODUCTION:

Practically all electrical apparatus is composed of a combination of resistors or coils. Some industrial equipment such as capacitor motors, capacitor banks, and automatic switchgear use capacitors. Many kinds of capacitors are used in electricity and electronics. In order to choose the best type for a particular job, you should know how they are made and operate. You should be familiar with the symbols used to indicate certain special types of capacitors. Capacitors consist of two plates of electricalconducting material such as aluminum or tin, separated by an insulating material called the "dielectric", such as air, waxed paper, mica, glass, etc.

PRESENTING THE LESSON:

I. The meaning of capacitance

  A. Physical construction of a capacitor

    1. Two conductors with insulation between them

  B. Characteristics of a capacitor

    1. Will not pass current

    2. Will hold a current

  C. Demonstration of the action of a capacitor

  (show diagram) and set up circuit

Test 1 - Close the switch and note the ammeter reading. Instantaneous current indication is followed by zero reading.

Test 2 - Open the switch and connect a suitable scale voltmeter to the terminals of the capacitor about one minute after the switch is opened. The voltmeter will read instantaneously and fall to zero as the charge is absorbed by the meter.

II. Measurement of Capacitive Reactance Effect

A. Demonstrate the effects of capacitive reactance in a lighting current.

Test 1 - Insert a capacitor of about 10 mfd capacity in the circuit. Note the brilliancy of the lamp.

Test 2 - Replace the 10 mfd capacitor with 5 mfd capacity. Note the brilliancy of the lamp. Current decreases with a decrease of capacity. Reactance effect increases with decrease of capacity.

B. Review the characteristics of capacitive reactance .

1. Review the formula for capacitive reactance.
2. Calculate the reactance of each capacitor used in the demonstration.
3. Calculate the current for each demonstration.

III. Effect of the Capacitor on Voltage - Current Relationship

A. Connect a cathode ray oscilloscope in the circuit of a capacitor which is across an AC line.

IV. Visual Aids

A. Show samples of models of an industrial capacitor and a motor capacitor.

B. Show the films. Discussion of the films.

APPLICATION:

Have the students complete the assignment questions based on the NEC, Article 460.

CHECKING AND FOLLOW-UP:

After checking the answers, return the papers to the students for corrections and filing in their notebooks.

HAZARDOUS LOCATIONS

DESIRED RESULTS:

1. To acquaint the student with the three classes of hazardous locations and the general type of wiring permitted in each place.

2. To be able to recognize a hazard and develop the ability to classify the hazard involved.

REFERENCES:

1. American Electricians' Handbook, pages 9-180 & 181
2. Local Electrical Codes and Ordinances
3. National Electrical Code, Articles 500 and 510
4. National Electrical Code & Blueprint Reading, Graham, Unit 5, p. 121 ff

INTRODUCTION:

The assigned material for the next lessons deals with wiring in areas where there is danger of explosion or fire, resulting from operation of the electrical installation. The CODE breaks down the various types of hazardous locations into three classes. Each of these three main divisions is subdivided into two smaller divisions. Various types of wiring and equipment have been specified for the different kinds of hazards. Class I deals with activities in which fire or explosion may result from gases or vapors. Class II deals with dusts and Class III is reserved for combustible fibers. There are two small divisions under each class. In the first section, the particular danger is imminent at any or all times during the normal course of operation. In the second section, the danger is not believed present under ideal conditions. It is likely to arise from a reasonably foreseeable accident.

PRESENTING THE LESSON:

First, the students should review the particular kinds of hazards covered by the three main divisions and the general type of wiring permitted in each location.

Second, the detailed requirements for each sub-class should be carefully read.

The main benefits to be derived from this study are the ability to recognize a hazard and the ability to decide upon a rough classification of the hazard involved. After the wireman has accomplished this much, he should then study the more detailed rules concerning installation.

DISCUSSION ITEMS:

1. What is the principle of operation of a dielectric point spray unit? What precautions would you suggest for preventing spark-over?

2. In a booth where lacquers are sprayed on small machine parts, which is the greater hazard, explosion or fire?

3. A motor is installed in the basement of a three-story garage building. This motor drives a blower which draws gasoline fumes out of the garage through a sheet-metal duct system to the outside of the building.

    a. What type of induction motor is required for the operation?

    b. Suppose the blower were installed on the roof instead of in the basement. Would this change in location after you reply?

4. Gasoline in closed containers is stored in a large room. Through the upper part of the room, a 2-inch pipe carries high-test gasoline from a pump located outside the room to a tank located on the other side of the room.

    a. What type of hazard exists in the room?

5. A certain industrial building has quantities of dry dust suspended in the air.

    a. What class of hazard does this constitute?

    b. Can you suggest a simple expedient for reducing the hazard inside the building?

VISUAL AIDS:

Show 16 mm Film--"Preventing Fires through Electrical Safety" Employers Mutual Liability Insurance Co. of Wisconsin, Wausan, Wis.

APPLICATION:

Have the students answer questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheet to the student to be placed in their workbooks.

CLASS I INSTALLATIONS

(HAZARDOUS LOCATIONS)

DESIRED RESULTS:

To acquaint the apprentice with the safety devices used in hazardous locations called Class I.

REFERENCES:

1. National Electrical Code, Article 501
2. National Electrical Code and Blueprint Reading, Graham, Unit 5, page 121 ff; b/p page 123

INTRODUCTION:

The next three lessons are concerned with locations that, because of their nature, call for higher standards with respect to materials or for methods of installation, than are thought necessary in the general run of electrical wiring.

Class I deals with activities in which fire or explosion may result from gases or vapor.

METHODS OF REDUCING HAZARDS:

1. Placing seals between safe areas and perilous ones. Seal fittings are inserted in conduits to arrest sparks, using a suitable compound to accomplish the purpose. In some areas, where non-conductive dusts are present, a length of conduit may serve in place of the fitting.

2. Sparking devices are sealed off from runs of conduit which enter them. In some cases, the safety rule is met by placing sparking contacts in an oil bath or a hermetically sealed chamber.

3. Rigid conduit or mineral-insulated cable are prescribed as the only acceptable wiring methods in the majority of hazardous locations. Continued grounding must be assured by means of bonding and not by locknuts and bushings. Fittings must be explosion proof, dust-ignition proof, depending upon the nature of the particular hazard.

4. Motors within the scope of Class I, Division I, must be explosion proof. Under Class I, Division 2, standard motors can be used if they have no sliding contacts. Motors within Class II and III must be totally enclosed or pipe-ventilated.

   Extension cords are prohibited in certain occupancies, and allowed in others only if approved for the particular service.

ESPECIALLY LISTED OCCUPANCIES:

1. In <u>Commercial Garages</u>, the NEC requires that plug receptacles within 18 inches of the floor be treated as subject to Class I, Division 2 requirements.

2. Unventilated Garage Pits, Aircraft Hangars, Gasoline Dispensing Island are devoted as Class I, Division 1, to a height of 4 feet above grade.

3. Finishing Processes, where paints, lacquers, or other flammable coatings are applied by spraying, dipping, brushing, or similar means, must be carried out under prescribed safeguards for electrical wiring and equipment. Of particular interest here, are electrostatic units which incorporate high-voltage transformers.

4. Anesthetizing Locations of Hospitals are deemed to be Class I, Division 1 to a height of 5 feet above the floor. Gas Storage Rooms are in the same designation.

   Special Rules apply to lighting and surgical equipment within the operating room.

5. Theatres and Motion Picture Studios are given adequate consideration in the NEC.

   Fires may occur suddenly from temporary wiring in connection with stage scenery, projection room equipment, arc lamps, and other portable devices.

6. Radio or Television Studios and Receiving Stations must be guarded from danger offered by high-voltage electronic wiring systems or equipment.

VISUAL AIDS:

Appropriate Films or Models

APPLICATION:

The students answer the questions on the assignment sheet.

CHECKING AND FOLLOW-UP:

Check the answers on the sheets and return to the students for correction and placing in workbooks.

CLASS II INSTALLATIONS

(HAZARDOUS LOCATIONS)

DESIRED RESULTS:

To acquaint the apprentice with the safety devices used in hazardous locations, called Class II.

REFERENCES:

1. National Electrical Code, Article 502
2. National Electrical Code and Blueprint Reading, Graham, Unit 5, See p. 125 b/p

INTRODUCTION:

If approved electrical devices of high quality are used, but installed in a haphazard fashion and with no regard to the relation of one device to the other, the total load, or the hazardous operating conditions, the complete installation may be dangerous. It is necessary that standardized methods be set up which have been found in practice to be safe.

These standardized methods that experiment and experience have shown to be correct are set down in a form which has come to be known as the National Electrical Code. "NEC"

Class II is concerned with the possibility of fire or explosion from dusts.

THE PURPOSES OF THE CODE:

It is well to review the purposes of the CODE as outlined in the following quotation from the INTRODUCTION of the Code.

a. The purpose of this Code is the practical safeguarding of persons and of buildings and their contents from hazards arising from the use of electricity for light, heat, power, radio, signaling, and for other purposes.

b. This Code contains basic minimum provisions considered necessary for safety. Compliance therewith and proper maintenance will result in an installation, essentially free from hazard, but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical uses.

c. The Code is not intended as a design specification or an instruction manual for untrained persons.

The Code is revised from time to time but not necessarily at regular intervals. Usually the Code is reissued every two or three years. Each new Code carries changes in the rules as compared with the previous issue. New Sections or even New Articles are added from time to time.

Give examples of installations that must be made in Dust areas. Show how the fittings must be explosion-proof, dust-ignition proof, or dust tight, depending upon the nature of the hazard.

APPLICATION:

The students will answer the questions on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets to the students for correction and placing in their workbooks.

CLASS III INSTALLATIONS

(HAZARDOUS LOCATIONS)

DESIRED RESULTS:

To acquaint the apprentice with the safety devices used in hazardous locations, called Class III.

REFERENCES:

1. National Electrical Code, Article 503
2. National Electrical Code & Blueprint Reading, Graham, b/p, page 126

INTRODUCTION:

Class III deals with activities in which fire or explosion may result from combustible fibers.

Electricity is a powerful force. Under control, it safely performs an endless variety of work for us; uncontrolled, it can lead to harm and damage. It is under control when the right kinds of materials are installed in the right way. It becomes uncontrolled when the wrong kinds of materials are used or when the right kinds of materials are wrongly installed.

Uncontrolled electric power can cause fires that can kill people and lead to a multitude of costly results. When these things happen, individuals and companies are the greatest sufferers. Insurance companies also suffer losses, which can result only in higher rates which individuals are called upon to pay. Insurance companies have led the way in setting up of minimum standards of quality in electrical materials as well as uniform methods of installation.

PRESENTING THE LESSON:

In the state of North Carolina, there are many examples of mills that store, process, and weave cloth that have hazardous locations that may cause fibers to burn. Locations in which ignitable fibers are merely stored or handled, other than in the actual process of manufacture are assessed to Class III, Division 2. This classification applies mostly to warehouses in which manufactured goods, materials in bales, are held for shipment to consumers.

Study the Article 503 of the NEC for this assignment. Help the students to interpret the rules set up for wiring methods in the areas where combustible fibers are stored or processed.

APPLICATION:

Have the students to answer questions on the assignment sheet for this lesson.

CHECKING AND FOLLOW-UP:

The answers will be checked and the sheets will be returned to the students for placing in the workbooks.

COMMERCIAL GARAGES, REPAIR AND STORAGE

RESIDENTIAL STORAGE GARAGES
(Special Occupancies)

DESIRED RESULTS:

To become acquainted with the National Fire Protection Association Standards in certain hazardous locations:

a. Used for service and repair operations in connection with self-propelled vehicles (automobiles, busses, trucks, tractors, etc.) in which volatile flammable liquids or gases are used for fuel or power.

b. Used for a residential storage garage of not more than three vehicles.

REFERENCES:

1. National Electrical Code, Articles 511 & 512
2. National Electrical Code & Blueprint Reading, Graham, B/p, page 127

INTRODUCTION & PRESENTATION:

The provisions of this article shall apply to occupancies which may be hazardous because of atmospheric concentrations of explosive gases or vapors, or deposits of materials which may be readily ignitable.

The general rules of this Code shall apply to the installation of electrical wiring and equipment in occupancies within the scope of this article except as such rules are modified. Where unusual conditions exist, the Code enforcing authority shall judge with respect to the application of specific rules. The Code enforcing authority shall be familiar with National Fire Protection Association standards applying to occupancies included within the scope of this article.

a. Commercial Garages, Repair and Storage. This classification shall include locations used for service and repair operations in connection with self-propelled vehicles in which volalite flammable liquids or gases are used for fuel or power. In these locations there are or may be more than three such vehicles stored at one time.

b. Residential Storage Garages. This classifies a residential storage garage as a building or room in which not more than three vehicles of the types described may be stored. The building will not normally be used for other than minor repairs or service operations on such stored vehicles.

Have the students study the articles assigned and give individual help where needed.

APPLICATION:

Have the students complete the answers to the questions on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers to the questions and return them to the students for correction and placing in their workbooks.

AIRCRAFT HANGARS

(Special Occupancies)

DESIRED RESULTS:

To acquaint the student with the classification that includes locations used for storage and servicing of aircraft.

REFERENCES:

1. National Electrical Code, Article 513, Section 5115
2. National Electrical Code & Bluepring Reading, Graham, B/p, page 127

INTRODUCTION:

Aircraft hangars are assigned similar regulations as commercial garages, but stricter protection. This classification shall include locations used for storage and servicing of aircraft in which gasoline, jet fuels, or other volatile flammable liquids are used.

PRESENTING THE LESSON:

Call attention to the following areas and have the students read each subject in the Code reference.

a. Hazardous Areas
b. Wiring and Equipment within Hazardous Areas
c. Wiring not within Hazardous Areas
d. Equipment not within Hazardous Areas
e. Stanchions, Rostrums, and Docks
f. Approved Seals
g. Aircraft Electrical Systems
    (1) De-energizers
    (2) Energizers
h. Aircraft Battery
    (1) Charging and control Equipment
i. Mobile Servicing Equipment
j. Grounding

APPLICATION:

The students will answer the questions on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the answers to the questions, return the sheets to the students for corrections and placing in their workbooks.

GASOLINE DISPENSING AND SERVICE STATIONS

(Special Occupancies)

DESIRED RESULTS:

To acquaint the apprentice with the classification that includes locations used for Gasoline Dispensing and Service Station work.

REFERENCES:

1. National Electrical Code, Article 514, Section 5120
2. National Electrical Code & Blueprint Reading, Graham, page 128

INTRODUCTION AND PRESENTATION:

Space in the immediate vicinity of a gasoline dispensing island is denoted as Class I, Division 1, to a height of 4 feet above grade. Bulk storage plants for gasoline are subject to comparable restrictions.

This classification shall include locations where gasoline or other volatile flammable liquids are transferred to the fuel tanks of self-propelled vehicles. Dispensing islands are areas extending 18 inches in all directions from the base of the pump. Where an individual pump or dispensing device is not mounted on an elevated island, an area extending 18 inches in all directions from the base of the pump shall be considered to be in dispensing island.

Call attention to the following areas and have the students read the restriction for each subject in the code reference.

a. Hazardous Areas
b. Wiring and Equipment within and not within Hazardous Areas
c. Circuits Disconnects
d. Sealing
e. Grounding

APPLICATION:

Have the students answer the questions provided on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

After checking the answers, return the sheets to the students for corrections and placing in their workbooks.

BULK STORAGE PLANTS
(Special Occupancies)

DESIRED RESULTS:

To acquaint the apprentice with the classification that includes locations where gasoline or other volatile flammable liquids are stored in tanks of one carload or more.

REFERENCES:

1. National Electrical Code, Article 514, Section 5125
2. National Electrical Code & Blueprint Reading, Graham, page 128

INTRODUCTION AND PRESENTATION:

Bulk storage plants for gasoline are subject to comparable restricitions as Aircraft Hangars. The products stored in these large tanks are usually distributed by tank truck.

Call attention to the following areas and have the students read the rules for each subject in the Code reference.

a. Hazardous Areas
b. Wiring and Equipment within and above Hazardous Areas
c. Underground Wiring
d. Sealing
e. Gasoline Dispensing
f. Grounding

APPLICATION:

Have the students answer the questions provided on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

After checking the answers, return the sheets to the students for correction and placing in their workbooks.

FLAMMABLE ANESTHETICS

(Special Occupancies)

DESIRED RESULTS:

To acquaint the apprentice with the classification that includes locations where combustible anesthetics are or may be administered to patients in hospitals.

REFERENCE:

1. National Electrical Code, Article 514, Section 5135

INTRODUCTION AND PRESENTATION:

Combustible anesthetics are gases or vapors which may form flammable or explosive mixtures with air, oxygen or nitrous oxide.

Anesthetizing locations are areas in hospitals in which combustible anesthetics are or may be administered to patients. Such locations will include any area that may be used for the above purpose as operating rooms, delivery rooms, anesthesia rooms, any corridors or utility rooms. Recovery rooms are not classed as anesthetizing locations unless used for the purpose.

Call attention to the following areas and have the students read the Code references for each subject:

a. Hazardous Areas

Anesthetizing locations of hospitals are deemed to be Class I, Division 1 to a height of 5 feet above floor level.

b. Wiring and Equipment With Hazardous Areas

In hazardous areas, all fixed wiring and equipment including lamps and appliances shall conform to the requirements. All such equipment shall be specifically approved for the hazardous atmospheres involved.

c. Wiring and Equipment Above Hazardous Areas

Wiring above hazardous areas shall be installed in metal raceways or Type MI cable. Equipment which may produce sparks such as lamps, switches, generators, motors, etc. should be totally enclosed type or provided with suitable guards.

d. Sealing

Approved seals shall be provided in conformance with the Code.

e. Circuits in Anesthetizing Locations

Each circuit shall be controlled by a switch having a disconnecting pole in each circuit conductor supplied from an ungrounded distribution system. This circuit shall be isolated from any distribution system supplying areas other than anesthetizing locations by special transformers.

f. Low Voltage Equipment and Instruments

Electrical apparatus and equipment used within hazardous area, and which has current-carrying elements or which is frequently in contact with the bodies of persons, shall be designed to operate at 8 volts or less unless it is entirely surrounded by a metallic casing.

g. Other Equipment

Suction, pressure, or other equipment located or used within hazardous area shall be approved for Class I locations. X-ray equipment operated in these areas shall be provided with approved means for preventing accumulation of electrostatic charges.

h. Grounding

In any hazardous area, all metallic raceways, and all non-current carrying metallic portions of fixed or portable equipment (except the 8 volts) should be grounded.

APPLICATION:

The students will answer the questions on the Assignment Sheet for this lesson.

CHECKING AND FOLLOW-UP:

After checking the answers, return the sheets to the students for corrections and placing in their workbooks.

FUNDAMENTALS OF MOTOR CONTROL

DESIRED RESULTS:

To study the meaning of motor control and the basic differences in manual, semiautomatic, and automatic controls.

REFERENCES:

1. American Electricians' Handbook, pages 7-124 to 7-128
2. A-C Motor-Control Fundamentals, pages 1-9

INTRODUCTION:

Much of the inside wireman's work is concerned with motors and controllers. It is essential that he acquire a general knowledge of motor types, controls, and other characteristics.

With the advent of mass production, down came the line shaft and the electric motors were installed on individual machines. This change allowed more frequent and more rapid starts, stops, and reversals of the machine. Once the drive motor was put on the machine, with the sole function of operating one piece of equipment, it was possible to introduce some automatic operations.

Now, in our industrial plants, the operator sets up the original process and the operations are carried out automatically. These automatic operations are dependent upon motor and machine control. Thus, the modern machine consists of three divisions: 1. The machine, 2. The motor, and 3. The controls.

PRESENTING THE LESSON:

A. Discussion:
   1. What is the meaning of motor control?
   2. What is an electric controller?
   3. Discuss the basic differences in manual, semiautomatic, and automatic controls.

B. Demonstration:
   1. Show the construction and demonstrate how several controllers operate.
   2. Visit the machine shop and observe the work of motor controls on several machines.

APPLICATION:

Have the student complete the assignment sheets for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the papers for correction and placing in their notebook.

CONTROL OF MOTOR STARTING

DESIRED RESULTS:

To acquaint the student with the basic principles and general types of automatic motor controls in a simplified manner.

REFERENCE:

1. A-C Motor-Control Fundamentals, pages 11-32

INTRODUCTION:

The subject of motor controllers is of great importance to the industrial electrician. He is often called upon to connect, disconnect or troubleshoot them. It is necessary that he have a sound knowledge of the principles upon which they operate.

The most common of the controllers is the magnetic switch or across-the-line starter. This starter, combined with pilot devices, can give full protection to the motor and be fully automatic in operation. The student should make sure he understands the purpose of each component. Circuits containing plugging relays should be analyzed and the essential ones memorized. It is not advisable to try memorizing the complicated circuits of reversing or multi-speed motors. However, the material relating to these components should be read carefully.

PRESENTING THE LESSON:

A. Discuss the following types of motor starting with the use of diagrams:
   1. Full-voltage starting
   2. Reduced-voltage starting
   3. Starting Squirrel-cage motors
   4. Starting Wound-rotor motors
   5. Starting Synchronous motors

B. Discuss the selection of starting controllers:
   1. Name the two types of starting control.
   2. How many types of protection are there for motors?
   3. Do the running conditions of the motor affect the type of control to be used on a motor?
   4. What is the difference between an automatic and a semiautomatic controller?
   5. Summarize the factors needed to be considered when selecting starting controllers.

C. Problem for illustration:
   It is desired that four motors start in the sequence 1, 2, 3, and 4, the start button being depressed only once to establish the sequence of operations. A second requirement is that if one motor stops because of operation of its overload device, or for other reasons, the others will continue to operate. Standard magnetic switches are to be used. Draw the diagram of the circuit on the chalkboard.

APPLICATION:

The students will complete the assignment sheets for this lesson.

CHECKING AND FOLLOW-UP:

Check the answers and return the sheets for correction and placing in notebooks.

CONTROL COMPONENTS

DESIRED RESULTS:

To give the student an insight into the many variations in devices used to control the functions of motors.

REFERENCES:

1. A-C Motor-Control Fundamentals, pages 33-70
2. Catalogs on Control Components

INTRODUCTION:

The selection of control components is carefully made after it has been decided what functions of control are needed for a machine. It should be remembered that a motor can perform only as well as the components in its control circuit. The fact that a certain component is a high quality product does not necessarily mean that it will perform well in a particular circuit. The component must be selected to fit the motor to be controlled and the function to be performed.

PRESENTING THE LESSON:

Discussion Questions:

1. What functions of control are intended to be performed by switches and breakers?
2. Compare a contactor and an across-the-line motor starter.
3. What is meant by a relay? What is required to operate a voltage relay?
4. What is meant by the terms pull-in current, drop-out current, and differential used in connection with current relays.
5. Name two uses for a frequency relay. What are the two basic methods of delaying the closing or opening of the time-delay relays.
6. What is the chief advantage to using an automatic motor starter instead of a manual motor starter? What is meant by clapper-type and solenoid type contact arrangements?
7. Name the three basic magnetic shapes used on modern motor starters.
8. What is the basic difference between a motor starter and a motor controller?
9. What is the common name for a manual reduced-voltage starter? Name three basic methods of obtaining reduced-voltage starting.
10. What is meant by the following:
    a. Definite time control
    b. Current-limit control
    c. Sequence speed control
    d. Selective speed control
    e. Automatic speed control
    f. Reversing starter

APPLICATION:

The students should complete the assignment sheets.

CHECKING AND FOLLOW-UP:

Check the answers with the Instructor's Answers. Help those that have trouble finding the correct answers.

PILOT DEVICES

DESIRED RESULTS:

1. To acquaint the student with the basic types of control components.
2. The student should be able to look at a strange control device and analyze its function both mechanically and electrically.

REFERENCE:

1. A-C Motor Control Fundamentals, pages 71-87

INTRODUCTION:

All components used in motor-control circuits are classed as either primary control devices or pilot control devices. A primary control device connects the load to the power line, such as a motor starter or controller; they may be manual or automatic. Pilot control devices are those which control or regulate the primary control devices. Pilot devices are such components as push buttons, float switches, pressure switches, limit switches, and thermostats. We will cover the most common and frequently used types in this lesson.

PRESENTING THE LESSON:

1. Describe various pilot devices and their uses. The requirements of pilot devices vary greatly with their function and their proposed use.
2. Demonstrate samples of pilot devices available. Show how they are installed and ways to "trouble-shoot" when the unit will not function.
3. Invite a specialist that deals with motor controls and pilot devices to give a demonstration to the class.
4. Use Review Questions, pages 86-87 of A-C Motor-Control Fundamentals for discussion.

APPLICATION:

Have the students complete the questions on the Assignment Sheets.

CHECKING AND FOLLOW-UP:

Check the answers on the Assignment Sheets and return to the students for correction.

CONTROL-CIRCUIT DIAGRAMS

DESIRED RESULTS:

To learn the basic symbols that are used on prints to express the meaning and purpose of the circuit.

REFERENCE:

1. A-C Motor-Control Fundamentals, pages 89-105.

INTRODUCTION:

Until the electrician masters the control diagrams, he will be dependent upon someone else for most of his information. This lesson deals with the written language of control and control circuits. It will be necessary for the apprentice to learn the basic symbols in order to understand the details of the schematic control diagrams. When we learned to read English, we first learned the 26 letters of the alphabet that are used to form all the words and sentences. The same thing is true in learning a graphical language. There are only a few basic symbols that are used to express the meaning and purpose of the control circuit.

PRESENTING THE LESSON:

1. Use Fig. 5-1, page 91 for a drill on recognizing the basic symbols.
2. The control diagram is the written language of control circuits and it takes several different forms to fit the needs. Study the three general types of control diagrams used in the text.
3. Show how a schematic diagram is developed from a wiring diagram. Wiring diagram from the schematic.
4. If possible, have available control-circuit diagrams used in the local area for review by the class.
5. Discuss the adding of circuit elements, such as a limit switch, float switch, or push button to an existing circuit.
6. Summarize the use of schematic and wiring diagrams as presented in this lesson.

APPLICATION:

Have the students complete the questions on the Assignment Sheets.

CHECKING AND FOLLOW-UP:

Check the sheets and return to the students for correction and filing.

DEVELOPMENT OF CONTROL CIRCUITS

DESIRED RESULTS:

1. To acquaint the student with the principles involved in the development of control circuits.
2. To have the student practice the development of a circuit adding one function at a time.

REFERENCE:

1. A-C Motor Control Fundamentals, pages 107-131

INTRODUCTION:

In the development of control circuits, they are seldom drawn or designed as a complete unit. They are developed one step at a time, adding only the components necessary to perform that function. The designer of a circuit should have all of the control functions in mind when he starts. He should analyze the circuit after each addition to check that it does not interfere with previous operations and that it will perform the function intended. The greatest danger in developing control circuits is to attempt to draw a complete circuit at one time. Therefore, it cannot be overstressed that the step-by-step method of developing control circuits will lead to very few errors. It will save many hours of "trouble-shooting" trying to find out why a circuit did not function after it was wired.

PRESENTING THE LESSON:

1. Discuss the basic two-wire and three-wire circuits in the development of control circuits.
2. Using a schematic diagram, show the simplest method for the development of a control circuit by starting with the coil and the overloads.
3. Review with the students the development of illustrated circuits No. 1-8 given in the text.
4. Using the review questions, assign the problems for the students to develop. One problem for each student or one problem for two students to work together.

APPLICATION:

Have the students complete the problems on the Assignment Sheet.

CHECKING AND FOLLOW-UP:

Check the assignment sheets and return to the student for correction and placing in their workbooks.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *ELECTRICITY, POST SECONDARY EDUCATION, TESTS, *APPRENTICESHIPS,

This study guide, the third of a four-unit series, is for individual student use in acquiring technical information in the third year of the related technical phase of post-secondary electrician apprenticeship training. It was developed by a curriculum committee of subject matter specialists and the educational committee of the National Electrical Contractors of North Carolina, tested on a small group, and used in apprenticeship programs. Assignment and information sheets for 28 lessons cover fundamentals of A.C. electricity, the National Electrical Code, in terms of installation in hazardous areas, and motor controls. They contain textbook references and problem exercises. The teacher of the 144-hour course should be a journeyman tradesman, and the students should be 18 years old and employed as apprentices in an electrical construction trade. Supplementary materials include unit tests for approximately every six weeks and a final examination. Correlated lesson plans for the instructor are given in VT 003 626. Documents of the series are listed as VT 003 624 through VT 003 631. (HC)

ACKNOWLEDGMENTS

Questions and problems for the Lesson Topics in this workbook were prepared and authorized for use by:

W. F. Humbert, III
Instructor for Electrical Apprentices
Winston-Salem-Forsyth County
Technical Institute

The Instructor's Manual, Information and Orientation Sheets keyed to the Assignment Sheets were developed by:

Howard E. Hedinger
Curriculum Laboratory

PREFACE

The materials in this publication have been prepared to provide specific assignments for studying related topics necessary in the training of electrical apprentices. An effort was made to develop the schedule for the instructors to follow as the apprentice progresses with his training. It will also enable the apprentice to know what skills and knowledges will be required of him. One objective of this program is to aid the instructor and employer in providing experiences necessary to develop a competent worker in the electrical field.

This workbook includes assignment sheets and information sheets for the electrical apprentice to use in searching out related information. They contain textbook references, problems to solve and key sentences to complete, diagrams to draw, and blueprints to consult. The apprentice should study the assigned references before he attempts to answer the questions or solve the problems.

In actual use of these lessons, instructors should feel free to modify their application of the material to conform with local needs. For example, there may be certain sections of the Code to teach because the apprentices are working with special installations. Thus, the instructor will prepare additional materials to use with the course. In other classes, the instructor may need to spend more time on topics dealing with mathematics than with blueprint reading. In any event, the minimum class time for related material is 144 hours per year. It is sincerely hoped that the assignment sheets are used correctly, so that apprentices can gain maximum benefits from their related studies.

Lesson C-1

Alternating Current

REFERENCE

1. Croft's American Electrician's Handbook, Pages 1-40 - 1-44, Sec. 112-129, 1-45, Sec. 134.
2. Basic Electricity, Pages 3-1 - 3-21, 3-31 - 3-34, 3-43 - 3-57, and 3-77 - 3-92.

PROBLEMS

1. An alternating current or voltage is one which is ____________ at ____________ intervals.
2. Alternating voltages and currents follow a curve known as the ____________ law (curve).
3. A ____________ is a complete set of values through which an ____________ current passes.
4. Frequency of an alternating current is the ____________ of cycles completed in ____________ second.
5. One cycle is equal to ____________ electrical degrees.
6. Phase is a term used to express ____________.
7. Two phase current is two different ____________ ____________ 90 degrees out of phase.
8. Three-phase current is ____________ different alternating currents ____________ degrees out of phase.
9. The maximum value of alternating current or voltage is ____________ ____________ ____________ ____________.
10. The average value of alternating current or voltage is ____________ ____________ ____________ ____________ and ____________ times ____________ ____________.
11. The ____________ value of alternating current or voltage is ____________ times ____________ ____________.

NAME ______________________________ Lesson C-1

Alternating Current Page 2

12. Resistance ______________ and ________________ may affect the current in an a-c circuit.

13. List two factors which affect the resistance in an a-c circuit:

(a) ____________________ (b) _________________________

14. Ohms Law applies to a-c circuits containing ________________ only.

15. Voltage and _________________ are in phase in resistive circuits.

16. Average power is equal to product of ______________________________ and ______________________________.

17. Inductance produces _______________ to flow of current and makes the current _____________ the ______________.

18. Pure inductive circuit causes the _____________ to _____________ the _________________ by __________________ degrees.

19. Inductance exists because electric current produces a ____________ field.

20. Unit of inductance is ____________________.

21. Unit of inductive reactance is ____________________.

22. Inductive _______________ is the opposition to alternating current produced by inductance.

23. Magnetic field expanding and contracting with a __________ __________ produces inductance.

24. Capacitance produces _____________ to flow of current and makes the current _________________ the _________________.

25. Pure capacitive circuit causes the ______________ to ______________ the _______________ by ______________ degrees.

26. Unit of capacitance is ______________________.

NAME ______________________________ Lesson C-1

Alternating Current Page 3

27. Unit of capacitive reactance is ________________________.

28. Symbol for inductance is ____________________________.

29. Symbol for capacitance is ____________________________.

30. Symbol for inductive reactance is _______________________.

31. Symbol for capacitive reactance is ______________________.

32. Iron ____ increases inductance.

33. Copper ______________________________________ decreases inductance.

34. List eight items that affect inductance:

(a) ______________________________

(b) ______________________________

(c) ______________________________

(d) ______________________________

(e) ______________________________

(f) ______________________________

(g) ______________________________

(h) ______________________________

35. When are DC circuits affected by capacitance?

36. Capacitors and ____________________________________ are electrical devices which are used to add capacitance to a circuit.

37. Capacitance exists because certain parts of the circuit are able to _________________________ electric charges.

38. What is a capacitor charge?

39. What is a capacitor discharge?

40. What is the frequency of a generator having 12 poles and revolving at 720 RPM?

NAME ______________________________ Lesson C-2

Resistance in A-C Circuits Page 2

13. Resistance is expressed in terms of _________________________.

14. Power factor is expressed in ______________ or _________________.

15. Power factor in a resistive circuit has a value of _________________.

16. Power factor is the ratios of ______________________ of the circuit and ______ of the circuit.

17. Find the power and the power factor of a resistive circuit with impressed voltage of 220-volts and current of 10 amperes.

18. A water heater rated 5000 watts is connected on a 220-volt system. Find the current in the A-C circuit.

NAME ________________________ Lesson C-2

Resistance in A-C Circuits Page 2

13. Resistance is expressed in terms of ____________________.

14. Power factor is expressed in ____________ or ________________.

15. Power factor in a resistive circuit has a value of ______________.

16. Power factor is the ratios of ____________ ____________ of the circuit and ______ of the circuit.

17. Find the power and the power factor of a resistive circuit with impressed voltage of 220-volts and current of 10 amperes.

18. A water heater rated 5000 watts is connected on a 220-volt system. Find the current in the A-C circuit.

1. Define the three classes of hazardous locations:

(a) ______________________________

(b) ______________________________

(c) ______________________________

2. List the group classification for the following areas:

(a) Ethylene ____________
(b) Starch ____________
(c) Gasoline ____________
(d) Acetylene ____________
(e) Benzol ____________
(f) Hydrogen ____________
(g) Coal ____________
(h) Aluminum Dust ____________
(i) Lacquer Solvent Vapors ____________
(j) Flour ____________

3. Where may hazardous materials be found in a Division 1 area?

4. Where may hazardous materials be found in a Division 2 area?

5. What type hazardous location requires the installation of wiring in threaded rigid metal conduit with explosion-proof fitting or Type "MI" cable?

6. What type wiring installation is required in a Class III, Division I location?

7. What type wiring installation is required in a Class II, Division I location?

8. Electrical metallic tubing may be used in Class ________, Division ________ location.

9. What type wiring installation is required in a Class I, Division 2 location?

NAME ______________________________ Lesson C-14

DATE ______________________________ Hazardous Locations

REFERENCE

1. American Electricians' Handbook, Pages 9-180 - 9-181.
2. National Electrical Code, Article 500.

PROBLEMS

1. Define the three classes of hazardous locations:

(a) ____
____

(b) ____
____

(c) ____
____

2. List the group classification for the following areas:

(a) Ethylene ____________________
(b) Starch ____________________
(c) Gasoline ____________________
(d) Acetylene ____________________
(e) Benzol ____________________
(f) Hydrogen ____________________
(g) Coal ____________________
(h) Aluminum Dust ____________________
(i) Lacquer Solvent Vapors ____________________
(j) Flour ____________________

3. Where may hazardous materials be found in a Division I area?

4. Where may hazardous materials be found in a Division 2 area?

5. What type hazardous location requires the installation of wiring in threaded rigid metal conduit with explosion-proof fitting or Type "MI" cable?

6. What type wiring installation is required in a Class III, Division I location?

7. What type wiring installation is required in a Class II, Division I location?

8. Electrical metallic tubing may be used in Class ________, Division ____________ location.

9. What type wiring installation is required in a Class I, Division 2 location?

NAME ______________________________ Lesson C-14

Hazardous Locations Page 2

10. Where it is impractical to make a threaded joint tight, ____________________

____________________ should be utilized.

11. What is the intent of Article 500 through 503?

12. Define "Explosion-Proof Apparatus".

13. What type of electrical equipment shall be used in Class I, Divisions I and 2 locations?

14. What type of electrical equipment shall be used in Class II, Divisions I and 2 locations?

NAME ____________________________________

Class I Installations

13. Explosion-____________________ flexible motor fittings shall be used in Class I, Division I locations.

14. The thickness of compound in seal fittings shall not be less than ________ inch.

15. Splices and __________ shall not be made in sealing fittings.

16. In Class I, Division 2 locations, a disconnecting switch may be of the ____________________ type.

17. List the four conditions under which a panelboard with a general purpose enclosure may be installed in a Class I, Division 2 area.

(a) ________________________________
(b) ________________________________
(c) ________________________________
(d) ________________________________

18. Flexible cord with a ground conductor may be used in Class I, Division ________ wiring.

19. Motors shall be _________ _________ or __________ __________-Type for Class I, Division I locations.

20. Lighting fixtures in Class I, Division I locations shall be approved as a ____________________.

21. Stems for pendant fixtures in Class I, Division I and 2 locations shall not exceed ______________ inches without permanent bracing.

22. List two required methods of protecting lighting fixtures in Class I, Division I areas:

(a) ____
(b) ____

23. Flexible cords may be used for connection to portable ________ in Class I, Divisions I and 2 locations.

24. List two requirements for using receptacles in Class I, Divisions I and 2 locations

(a) __________________________ (b) ________________________________

25. In Class I, Divisions I and 2 locations, conductor insulation shall be ________ of ____________ where condensed vapors or liquids may collect on conductors.

26. All exposed non-current-carrying metal parts of electrical equipment shall be ______________ in Class I, Divisions I and 2 locations.

27. In Class I, Divisions I and 2, there shall be ____________ live parts.

NAME ______________________________ Lesson C-15

Class I Installations Page 2

13. Explosion-_________________ flexible motor fittings shall be used in Class I, Division I locations.

14. The thickness of compound in seal fittings shall not be less than ______ inch.

15. Splices and _________ shall not be made in sealing fittings.

16. In Class I, Division 2 locations, a disconnecting switch may be of the _______ ___________ type.

17. List the four conditions under which a panelboard with a general purpose enclosure may be installed in a Class I, Division 2 area.

(a) ____________________________
(b) ____________________________
(c) ____________________________
(d) ____________________________

18. Flexible cord with a ground conductor may be used in Class I, Division _______ wiring.

19. Motors shall be _______ _______ or _________ _________-Type for Class I, Division I locations.

20. Lighting fixtures in Class I, Division I locations shall be approved as a _______ ____________.

21. Stems for pendant fixtures in Class I, Division I and 2 locations shall not exceed ____________ inches without permanent bracing.

22. List two required methods of protecting lighting fixtures in Class I, Division I areas:

(a) ____
(b) ____

23. Flexible cords may be used for connection to portable _______ in Class I, Divisions I and 2 locations.

24. List two requirements for using receptacles in Class I, Divisions I and 2 locations

(a) _______________________ (b)___________________________

25. In Class I, Divisions I and 2 locations, conductor insulation shall be _______ of __________ where condensed vapors or liquids may collect on conductors.

26. All exposed non-current-carrying metal parts of electrical equipment shall be ___________ in Class I, Divisions I and 2 locations.

27. In Class I, Divisions I and 2, there shall be __________ live parts.

PROBLEMS

1. Class III locations are hazardous due to the presence of ______ ______.

2. Rigid ______________ or Type ______ cable shall be installed in Class III, Division 1 areas.

3. Flexible connections shall be made with ______-______ connectors in Class III, Division ______ areas.

4. Open ____________ may be installed in Class III, Division 2 locations.

5. Partially enclosed type or ____________ ____________ motors shall not be installed in Class III locations.

6. Maximum pendant length on a lighting fixture is ______ inches in a Class III location.

7. Electric-____________ lighting fixtures with guard may be installed in Class III locations.

8. In Class III locations, the power supply for cranes shall be ______ from all other systems and ____________.

9. Recording ______ ______ shall be installed on crane systems in Class III locations.

10. Storage battery charging equipment shall be installed in ______ ______ in Class III locations.

11. In Class III installations, all exposed non-current-carrying metal parts shall be ____________.

12. There shall be no exposed live parts in Class III areas except for ______-______ installations.

13. List two conditions for receptacles and plugs for Class III areas:

(a) ______________________ (b) ______________________

14. In general, ______ ______ motors shall be installed in all Class III areas.

15. List two requirements for construction of lighting fixtures in Class III areas:

(a) ______________________________________

(b) ______________________________________

DATE ______________________________ Flammable Anesthetics

REFERENCE

1. National Electrical Code, Article 517

PROBLEMS

1. What are flammable anesthetics?

2. List five gases or vapors which are flammable anesthetics:

   (a) ________________________
   (b) ________________________
   (c) ________________________
   (d) ________________________
   (e) ________________________

3. List five areas in a hospital where anesthetics may be administered:

   (a) ________________________
   (b) ________________________
   (c) ________________________
   (d) ________________________
   (e) ________________________

4. What hazardous classification is given to areas used for storing flammable anesthetics or volatile flammable disinfecting agents?

5. The entire anesthetics area up to _______ feet above the floor is classified as Class _______, Division _______ location.

6. Raceways in masonry walls are considered to be in ____________ area.

7. Conduits in block walls in an anesthetics area are in a ___________ area.

8. Boxes in a masonry wall in an anesthetics area are in a ___________ area.

9. MI cables may be installed in ____________________ areas.

10. List three types of wiring permitted in a hazardous area.

   (a) ________________________
   (b) ________________________
   (c) ________________________

11. Seals shall be installed in _________________ passing from anesthetics area.

12. In anesthetics area, each circuit shall have a switch to disconnect each ________ conductor.

NAME ______________________________ Lesson C-22

Flammable Anesthetics Page 2

13. Each circuit shall be supplied from an __________ distribution system.

14. List three methods used for circuit isolation:

(a) ____________________________
(b) ____________________________
(c) ____________________________

15. Secondary voltage of an isolation transformer shall not exceed ______ volts.

16. Primary voltage to isolation transformer shall not exceed __________ volts.

17. Overcurrent ___________ shall be installed in secondary neutral of isolation transformer.

18. Isolation transformer shall be mounted in __________ area.

19. Ground __________ shall be installed on each ungrounded system.

20. Current through the ground indicator shall not exceed ________ __________-amperes.

21. Grounded branch circuits and ungrounded branch circuits shall be installed in

____________ raceways in anesthetics area.

22. Fixed lighting fixtures in anesthetic area shall be mounted at least _____ feet above floor.

23. Switches for grounded circuits shall be located _________ of anesthetics area.

24. Electrical apparatus used in the hazardous area shall operate at a maximum of

___________ volts.

25. Low-voltage supply from a common source for electrical apparatus in hazardous

area shall be located in ______________ location.

26. Motors used in hazardous area shall be approved for Class ____ locations.

27. Overcurrent devices for low voltage equipment shall be installed in __________ area.

NAME ______________________________ Lesson C-23

Fundamentals of Motor Control Page 2

15. Automatic motor control of equipment provides more ____________________.

16. Automatic operation of a machine is dependent upon the ____________ and ____________ ________________.

17. List the three divisions of a machine:

(a) __________________________
(b) __________________________
(c) __________________________

18. The operating requirements of the motor and machine dictates the _________-_______________ design.

19. Motor ___________ means the governing or regulating the functions of a motor or machine.

20. A __________ _____________ is equipment used to govern or regulate the function of a machine.

21. The most popular manual controller is the ___________ __________-__________ motor starter.

22. The manual starter does not provide __________-__________ protection.

23. The __________ is a manual reduced-voltage starter and provides ____________ protection, __________-__________ protection and ________ ____________ release.

24. The __________ is used on large horsepower motors.

25. With the addition of a __________ _____________ with the compensator, speed and flexibility are provided for a wound-rotor motor.

26. Semi-automatic control is provided by a magnetic starter and remote ___________ operated devices.

27. Automatic control is provided by a magnetic starter and __________ or ______________ and ___________ operated devices.

28. Semi-automatic controls provide flexibility in _________ of manual controls.

29. Automatic controls eliminate the necessity of manual control.

NAME ______________________________ Lesson C-24

DATE ______________________________ Control of Motor Start

REFERENCE

1. A-C Motor-Control Fundamentals, Pages 11 -32.

PROBLEMS

1. Synchronous motors are sometimes stopped by the use of ________ braking.

2. An ____________ load is the term used when the load has a tendency to turn the motor.

3. Plugging is the term used when the motor is momentarily __________ to abruptly stop the motor.

4. Motors may be stopped either _______________ or ________________.

5. Thermal relay is connected across the line during ______________ of a reduced-voltage starter to prevent damaging the motor windings or auto transformer.

6. Phase-failure protection is provided by using ___________ ___________ relay units.

7. Squirrel-cage motors can be damaged by excessive currents at ____________ per cent of load without affecting the second overload relay unit.

8. Single ____________ occurs when a three-phase motor has current interrupted on one phase.

9. Under voltage protection requires the motor to be started ________________.

10. Under voltage _____________ permits starting the motor automatically provided the power is restored to its proper value.

11. Momentary-_______________ pilot devices provide under-voltage protection.

12. Maintained-_______________ pilot devices provide under-voltage release.

13. List four general types of speed control:

    (a) ________________________________

    (b) ________________________________

    (c) ________________________________

    (d) ________________________________

14. The most versatile a-c motor with speed control is the ___________-____________ motor (_______________-_______________ motor).

T F 23. A faceplate is used to hold straight-shank twist drills to the spindle of the drill press.

T F 24. To hold round work, V-blocks are used during the drilling operation.

T F 25. Where several pieces of work have to be drilled alike, a device called a jackscrew is used so that all holes will be drilled at the same location on each piece of work.

T F 26. Drill press operators should wear goggles.

T F 27. The drill press operator should wear protective gloves.

T F 28. Chips should be removed from the drill press table by use of a brush.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The machinist should learn to tell whether or not a drill or other cutting tool is working properly, by the ______________, by the ____________________, and by the ____________________.

2. The standard drill press has a separate motor which drives the drill spindle and chuck by means of a ________________.

3. For most quantity production work, the work is held in a ________________.

4. In production work where two or more different sizes of holes are to be drilled, it is customary to use a ____________________ drill.

5. The process of laying out work for drilling consists of indicating by means of ________________ ______________, the positions of centers of the holes to be drilled.

6. If the surface on which the layout is to be made has been machined, a coating of ________________ ________________ solution or ________________ ________________ solution may be used before scribing or marking.

7. The reversing mechanism on a back-geared drill press enables the operator to do ________________.

8. Small diameter, straight-shank twist drills are held in a ________________ to do drilling.

9. Taper-shank drills are removed from the taper hole by means of a ______________________.

10. If the taper hole in the spindle is too large for the taper shank of the drill or chuck, the taper-shank tool is held in a ________ ________.

11. Vises, V-blocks, angle plates, and other holding devices are fastened to the drill press table by means of ________.

12. To protect the eyes from chips and other flying particles, the drill press operator should always wear ________.

List

Directions: List the items called for in each of the following. Select your answers carefully.

1. Types of clamps used for holding work to be drilled:

(A) ________

(B) ________

(C) ________

(D) ________

(E) ________

(F) ________

2. The principal parts of the bench-type sensitive drill press are:

(A) ________

(B) ________

(C) ________

(D) ________

(E) ________

(F) ________

(G) ________

(H) ________

(I) ________

3. Some of the work-holding devices used for mounting and supporting the workpiece in the drill press are:

(A) ________

(B) ________

(C) ________

(D) ________

(E) ________

(F) ________

(G) ________

(H) ________

(I) ________

T F 6. Drill chucks are made in various sizes, and a series of three or four are needed to hold drills from the smallest size up to one inch in diameter.

T F 7. The drills most commonly used in the machine shop are flat fluted drills.

T F 8. The twist drill is probably the least used and the least efficient cutting tool in the shop.

T F 9. If small drills are not marked, the size is found by the use of a drill gage.

T F 10. In shops where considerable amounts of drilling are done, it is economical to sharpen drills by hand.

T F 11. When sharpening carbon-steel drills, dip them in water frequently to prevent overheating and loss of temper.

T F 12. The clearance on a drill at the cutting edge should be 25 degrees.

T F 13. The edges of a drill should be ground at an angle of 59 degrees with the axis to obtain the best results in most metals.

T F 14. For drilling brass, bronze, or other soft metals, a drill with rake is considered best.

T F 15. To strengthen a drill, the web is made thicker toward the shank.

T F 16. When sharpening or selecting a drill, there is a tendency for the beginner to give insufficient lip clearance toward the center of the drill.

T F 17. When a drill squeaks, it is usually an indication of a crooked hole or dullness.

T F 18. Cutting oils tend to dull the cutting edge of the drill.

T F 19. Lard oil is the original cutting oil and is still highly recommended.

T F 20. Sulphur added to lard oil is recommended for drilling hard or tough metals.

T F 21. Since a drill will follow a hole already made, many times it is a good plan to drill a small hole about one-fourth inch deep to keep the larger drill from running.

T F 22. If a power feed is used when drilling steel, it should be thrown in after the feed has been started by hand.

T F 23. A lead hole, when used, should be as large as possible to prevent undue strain on the machine.

T F 6. Drill chucks are made in various sizes, and a series of three or four are needed to hold drills from the smallest size up to one inch in diameter.

T F 7. The drills most commonly used in the machine shop are flat fluted drills.

T F 8. The twist drill is probably the least used and the least efficient cutting tool in the shop.

T F 9. If small drills are not marked, the size is found by the use of a drill gage.

T F 10. In shops where considerable amounts of drilling are done, it is economical to sharpen drills by hand.

T F 11. When sharpening carbon-steel drills, dip them in water frequently to prevent overheating and loss of temper.

T F 12. The clearance on a drill at the cutting edge should be 25 degrees.

T F 13. The edges of a drill should be ground at an angle of 59 degrees with the axis to obtain the best results in most metals.

T F 14. For drilling brass, bronze, or other soft metals, a drill with rake is considered best.

T F 15. To strengthen a drill, the web is made thicker toward the shank.

T F 16. When sharpening or selecting a drill, there is a tendency for the beginner to give insufficient lip clearance toward the center of the drill.

T F 17. When a drill squeaks, it is usually an indication of a crooked hole or dullness.

T F 18. Cutting oils tend to dull the cutting edge of the drill.

T F 19. Lard oil is the original cutting oil and is still highly recommended.

T F 20. Sulphur added to lard oil is recommended for drilling hard or tough metals.

T F 21. Since a drill will follow a hole already made, many times it is a good plan to drill a small hole about one-fourth inch deep to keep the larger drill from running.

T F 22. If a power feed is used when drilling steel, it should be thrown in after the feed has been started by hand.

T F 23. A lead hole, when used, should be as large as possible to prevent undue strain on the machine.

T F 24. It is the usual practice to follow the drill with the reamer under the same conditions that the drilling was done.

T F 25. On reamers larger than one-half inch in diameter, the recommended amount of stock to leave for ferrous metals is 1/32 of an inch.

T F 26. The taper reamer should always be turned by machine.

T F 27. In production work, it is usually not economical to use high-speed reamers.

T F 28. Oil is used as a cutting lubricant when reaming cast iron.

T F 29. At no time, nor under any circumstances, should a reamer be turned backward.

T F 30. The larger size counterbores are usually made with removable cutters.

T F 31. Countersinking and counterboring are two words used for the same operation.

T F 32. To avoid chattering, countersinks are run at slow speeds.

T F 33. Fractional drills over one-half inch in diameter are made with a straight shank only.

T F 34. To drill tool steel with a one inch high speed drill, the cutting speed should be fron 50 to 60 surface feet per minute.

T F 35. Alloys and hard steels can usually be drilled with a heavier feed than can cast iron, brass, or aluminum.

T F 36. Kerosene or lard oil are recommended cutting fluids for drilling aluminum.

T F 37. Adjustable reamers are designed so that the blades may be expanded or contracted by means of an adjusting nut.

T F 38. Before drilling is done, a center punch is used to make an indentation at the center to help start the drill.

T F 39. The reamer should revolve at approximately twice the speed of the drill press.

T F 40. The drill press cannot be used for buffing and grinding.

2. The parts of a drill as given in Reference A are:

(A) ____________________ (F) ____________________

(B) ____________________ (G) ____________________

(C) ____________________ (H) ____________________

(D) ____________________ (I) ____________________

(E) ____________________

3. Types of drills are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

4. Points to consider in grinding a drill properly are:

(A) ____

(B) ____

(C) ____

5. Six types of reamers are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________
