Size and Square Boards with Hand Tools		PWH pp 173-179, 24	

1. In sizing and squaring boards, what selection should the carpenter make before he begins the sizing?

2. What is meant by the "working face" and the "working edge"?

3. Why should boards not be clamped tightly in the vise while being sized?

4. In planing boards with the hand plane, what observation should be made of the grain in the board? Why?

5. Explain how the edge and the side of the board can be tested for squareness.

6. Why should boards not be cut to the exact length or the finish length before the sizing is done?

7. Explain how to gauge the width of a board with the marking gauge. See Fig. 23,p 24, PWH.

8. What should be used to gauge a wide board? Give two methods. See Fig. 24, p 24, PWH.

9. Fill in the blank spaces in the following sentences with the correct word.
   (a) To size the edge of a long board I would use a ________ plane.
   (b) To size the side or surface I would use a ____________ plane.
   (c) To square the end I would use a ____________ plane.

10. How can splitting be prevented when planing across the end of a board?

Make a Plain Pad Seat		PWH pp 417-419	

1. What is a pad seat (Fig. 16)?

2. (a) If a pad is to cover the entire board except for a 1 inch margin along the edge, how is work laid out?
   (b) What is the next step?
   (c) How is the stuffing held in place?
   (d) What is done with the second half of the stuffing?

3. (a) What goes over the stuffing and how is it fastened?
   (b) How is the tacking done?

4. (a) What goes between the muslin and the covering?
   (b) What procedure is used in tacking the covering?

5. (a) What finishing touch is now given the seat?
   (b) How far apart are tacks spaced?

6. How is gimp mitered in the corners?

7. What is gimp?

Lay Out the Miter Between a Straight and a Curved Molding		Inf. Sheet # 119A Draw. Prob. 8	

In building mantels for a twelve apartment building the specification called for a straight mold along the underside of the shelf and the innerside of the pilasters, meeting at the corner with a quarter circle of mold of the same cross section, the molding fitting flat against the ground. Radius of the inside curve of the corner molding is 6".

1. Could the straight molding be cut at a 45° angle and the curved molding fitted to this angle? If not, why not?
2. (a) Can a curved miter be easily determined for joining a curved molding to a straight molding as called for on this job? (Draw. Prob. 8 and Inf. Sheet # 119A.)
   (b) What materials will the workman need in laying out the miter on a drawing, such as Fig. 8 of the information sheet?
3. How can a short piece of molding be used to determine the several points of the profile as they occur respectively in the straight and the curved moldings?
4. In this case, where would the steel point of the compass be placed in drawing the profile lines of the curved molding? Why?
5. When profile lines of both moldings are drawn so that they intersect, how does this help to determine the miter angle?
6. How can the miter angle be transferred from the drawing to the molding?
7. Will it be necessary to lay off an additional miter line for the other end of the circular molding? Why?

Lay Out the Miter Between a Straight and a Curved Molding

Information Sheet No. 119A

When straight molding is intersected with a curved molding of the same size and contour, the miter is not a straight line. The miter line is found by projecting lines from the several points of both the straight and curved moldings so that the respective lines intersect, as shown in Draw. Prob. 8. In order to find the miter between the two moldings, draw a line through the points of intersection of the straight and curved lines, as Xby in Draw. Prob. 8. (ab and bc represent the projected line from the center of the straight and curved moldings.) A template of the curved miter Xby can be made of heavy paper or metal for marking the miter on the straight back of the actual molding.

Job 120

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Lay Out Decorations on a Panel		PWH p 21 Inf. Sheet #120A Draw. Prob. 9, 10, 11	

1. The shopman wanted to put a cherry molding around a panel. He had one piece of cherry lumber 2-5/8 inches wide from which to cut the four pieces of molding. Show by a drawing how he used a rule to divide 2-5/8 inches into four equal parts.

2. The panel was further decorated with an octagon 5 inches in diameter in its center and a 2 inch hexagon near each corner. draw a pattern for the octagon.

3. Draw a pattern for the hexagon.

4. The panel was further decorated with a plywood ring 1-1/2 inches wide fitted around the octagon with its inner edge 1 inch minimum away from the octagon.
   (a) What is the diameter of the hole in the ring?
   (b) What is the outside diameter of the ring?

5. What is the outside circumference of the ring?

6. Find the area of the ring.

7. The ring is cut from a 10 inch square of plywood. What is the area of the waste on the square corners?

8. The octagon can be cut from a 5 inch disk. The shopman cuts the 5 inch disk from the 7 inch disk cut from the ring. How much waste is there in this operation?

9. If 40.3096 square inches of the 10 inch square plywood is waste, what is the percentage of waste? (To one decimal place.)

Lay Out Decorations on a Panel Information Sheet #120A

Drawing Problem #9 - shows a way to divide a distance into a given number of parts. The ruler is simply skewed across the width until the number of equal divisions coincides with the width to be marked.

Drawing Problem #10 - shows the method for constructing a polygon on a given line. This polygon of six sides is called a hexagon, but this method can be used to lay out polygons of more sides or of less number of sides. Draw the line EF equal to the length of one side of the polygon to be constructed, and with EF as a radius and F as center draw a quadrant (one fourth of a circle). Divide the quadrant into six equal parts and draw from E through 2. From the midpoint of EF draw a perpendicular, and where this line, G2, intersects E2 will be the center of a circle containing the hexagon. (On other polygons the perpendicular will not cut E2 at the point 2.) Draw the circle and step off with dividers around the circle the length EF and join these points with straight lines.

Drawing Problem #11 - shows how to draw a hexagon in a circle. Draw the circle with diameter AB, and divide the diameter into six equal parts. With A and B as centers and AB as Radius, draw arcs which intersect at C. From C draw a line through point 2 meeting the circle at D. Draw line AD which is the length of one side of the hexagon. With dividers step off the length of AD around the circle and join these points.

This method can be used to draw a polygon of fewer sides or of more sides than a hexagon.

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Lay Out Miter Angles		Draw. Prob. 1, 2, 6, 7 Inf. Sheet 121A	

11. Use 12" and 1-19/32" on a square to obtain miter cut for a figure of 20 sides. What is the miter cut in degrees?

12. What tool is especially useful in transferring angles from the layout onto the work?

Lay Out Miter Angles Information Sheet No. 121A

A circle is a curved line, every part of which is equidistant from a point called the center. Around this point is an angle of 360°. Lines drawn from the center to the circle are radii and equal, and the opening between the lines at the center of the circle is the angle. A line drawn connecting the ends of the radii at the circumference of the circle forms a triangle with the radii. The sum of the three angles of a triangle is 180°. Therefore, if the angle at the center is known, the other angles may be found by subtracting the central angle from 180° and dividing the remainder by two. Thus, if the central angle is 65°, 180°- 65° = 115° sum of two angles. 115° ÷ 2 = 57-1/2° each angle.

An angle may be bisected (Draw. Prob. 1 and 2) with any convenient radius. Set one leg of the dividers at O and strike arcs at A and B on the lines OX and OY. With A and B as centers, draw arcs cutting at P. Draw PO, the bisector of the angle XOY.

A right angle may be trisected to obtain 30° angles as shown in Draw. Prob. 3. Angle XOZ is a right angle. With O as a center, draw a quadrant cutting at A and B. With A as center and AO as radius, draw the arc cutting at D. With B as center, and the same radius, draw an arc cutting at C. AOC, COD, and DOB are 30° angles.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO MECHANICS (OCCUPATION), AUTO MECHANICS, *MOTOR VEHICLES, ADULT VOCATIONAL EDUCATION, *APPRENTICESHIPS,

The technical information in this study guide is for use in related technical classroom instruction in the auto mechanics apprentice training program. The material was planned under the direction of the State Educational Advisory Committee for the Automotive Trades and written by trade instructors. The units are (1) Fuel Systems, (2) Carburetion, (3) Crankcase Vents and Manifolds, (4) Basic Electricity, (5) Batteries, (6) Automotive Lighting Systems, (7) Ignition Systems, (8) Starters and Starting Motors, (9) Generators, (10) Generator Controls, (11) Automotive Accessories, and (12) Engine Tune-Up. Units are divided into study topics, each of which contains an assignment from reference material, an introduction, a section of related information, and check-up questions for student self evaluation. Photographic and line-drawing illustrations are included in the related information. Space for checking completed topics is provided in the study guide index. The study of this 144-hour course by indentured apprentices on a group or individual basis is to be directed by a qualified journeyman of the trade. Recommended supplementary instructional materials for the apprentice are listed. Testbooks and final examinations are available to the instructor. Auto Mechanics, Part I, (VT 002 761) is also available. This document is available for $2.10 from Bureau of Industrial Education, California State Department of Education, 721 Capitol Mall, Sacramento, California 95814. (HC)

WORKBOOK

Related Training Record

A column labeled "Assignment Date" has been provided at the right-hand side of each page in the Contents. Whenever your instructor assigns a topic, he should write this date in the appropriate blank. When you have completed the topic satisfactorily, your instructor should place his initials next to the assignment date. If this procedure has been followed, and you should transfer from one school to another, you will have an accurate record of the work you have completed. It should never be necessary for you to duplicate work on topics already studied or to skip topics not previously assigned.

In order to provide other school records needed, be sure to fill in below your name, home address, and telephone number. Then ask your instructor to fill in the official date of your enrollment in his class and to sign his name.

Foreword

The apprenticeship programs offered in California are important phases of the total educational program for which the state is so well known. They are also unique phases of the total program, for they offer each participant opportunity to profit from paralleled and closely related learning experiences. One of these is to learn by actually working at one's chosen vocation under the direction and supervision of men who are both trained and experienced in the vocation. The other is to learn by attending classes in which all instruction is directed toward helping one to acquire the information and understanding he needs to perform on the job intelligently and with increasing proficiency and success.

The California State Department of Education has the responsibility for developing and making available the instructional materials that are used in the related training classes. It meets this responsibility primarily through the Bureau of Industrial Education.

Every effort is being made to produce instructional materials that are appropriate and adequate. These materials should be helpful to instructors in conducting their classes and to students in doing the required learning.

Max Rafferty

Superintendent of Public Instruction

Preface

The Bureau of Industrial Education has responsibility for making available the related instructional materials required for use in the training programs offered by the various trade groups in the state. The Bureau meets this responsibility by working cooperatively with employer-employee groups representing each of these trades in determining what materials are needed and in developing these materials.

This edition of Auto Mechanics, Part 4, was planned under the direction of the State Educational Advisory Committee for the Automotive Trades. The membership of this committee included the following representatives of employers and employees:

Representing the Employers	Representing the Employees
Amos Crowl, San Francisco	L. J. Costa, San Mateo
Roy J. Harper, Los Angeles	Mack O. Keister, Fresno
Paul Stockburger, Fresno	R. N. Fleming, San Diego

Educational Consultant: Lee D. Bodkin, Bureau of Industrial Education

Joseph W. Menconi, Auto Mechanics Instructor, John A. O'Connell Vocational High School and Technical Institute, San Francisco, wrote the material for this edition. Wallace Theilmann, Supervisor of Instructional Materials, Bureau of Industrial Education, California State Department of Education, coordinated the project activities. Thanks and appreciation are extended to Toshiro Sugimoto, Instructor, Los Angeles City Schools, for his able assistance as a consultant on this revision.

Instructions for Checkup Questions

Checkup questions will be found at the end of each topic in the workbook. Answer the questions for each topic as soon as you have finished studying the assignment. Remember that although you are not graded on the checkup questions, your ability to answer them shows how well you understand the information and the assignments in the topic preceding them.

The checkup questions in this book are completion items. These are sentences in which certain key words are omitted. A numbered blank will be found in the right-hand margin corresponding to each of the missing words. Write the required word in the blank with the correct number.

Other types of questions may be found throughout the book. When this is the case, directions will be given for their use.

unit A | FUEL SYSTEMS

TOPIC 1—AUTOMOTIVE ENGINE FUELS

Assignment *

1. Automotive Encyclopedia, pp. 20-1 to 20-7.
2. Crouse, Automotive Mechanics, pp. 165-71.

Introduction

The improvements made in internal combustion engines during the last decade have to a great extent been made possible by the improvement of fuels. These improvements have permitted the use of increased compression ratios, which raises the developed horsepower per cubic inch of piston displacement.

A good knowledge of the various types of automotive fuels and the behavior of each under operating conditions is essential to the understanding of internal combustion engines.

Checkup

Automotive fuels are ___1___ compounds.

1. ____________

The combustion of gasoline is the rapid ___2___ of the ___3___ and ___4___ constituting the fuel.

2. ____________
3. ____________
4. ____________

One of the most important qualities of modern fuel is its ability to burn without causing ___5___, or ___6___.

5. ____________
6. ____________

Vapor lock is caused by gasoline ___7___ in the fuel ___8___, fuel ___9___, or ___10___.

7. ____________
8. ____________
9. ____________
10. ____________

Liquid petroleum gas, as a dry gas, creates less ___11___ than other fuels and does not cause ___12___ of engine oil.

11. ____________
12. ____________

Fuels with a high cetane rating have a slightly lower ___13___ ___14___ than the same quantity of a low-grade fuel.

13. ____________
14. ____________

Increasing sulfur content from 0.25 to 1.25 percent increases ___15___ and ___16___ 135 percent.

15. ____________
16. ____________

---

* For publication information, see the list of instructional materials in the back of this book.

Water in gasoline will ___17___ zinc die castings of which ___18___ ___19___ and ___20___ are made.

17. __________
18. __________
19. __________
20. __________

For economy or maximum miles per gallon, fuel must have a high ___21___ ___22___.

21. __________
22. __________

The speed of flame travel is called the "___23___ of flame ___24___."

23. __________
24. __________

The temperature rise of air or of a gas due to compression is called "___25___ of compression."

25. __________

Preignition is referred to as ___26___ knocking, since it can occur almost any time after the ___27___-___28___ charge is admitted.

26. __________
27. __________
28. __________

Amounts of harmful chemicals and ___29___-forming substances in gasoline must be held to the minimum.

29. __________

The combustion of one lb. of octane yields 1.42 lb. of ___30___.

30. __________

TOPIC 2—FUEL TANKS

Introduction

The servicing of fuel tanks consists principally of draining them and repairing leaks. Even though tanks require only a minimum of attention, the mechanic must still have knowledge of their construction, and it is extremely important that he be aware of the precautions that must be taken while servicing them.

Related Information

Construction of fuel tanks. Automobile fuel tanks are made of terneplate, which ranges in thickness from approximately 0.015 to 0.050 inch, and which is joined by welded seams. Fittings, such as the drain valve, filler neck and fuel-line connections, are soldered to the tank. The tank contains a number of baffles, or metal plates, which are attached to the inner surface of the tank and are parallel to the ends. These baffles have openings through which the gasoline can pass, and their main purpose is to prevent a sudden surging of the gasoline from one end of the tank to the other when the car rounds a corner.

The tank is usually secured to the car by means of two metal bands that are lined with padding material to prevent them from wearing into the tank. The tank end of the fuel line is usually located about 1/4 inch from the bottom of the tank. This clearance is designed to prevent water and dirt from entering the line. There is often a small sump in the bottom of the tank in which water and dirt can collect. When the fuel line is attached near the top of the tank, another piece of steel tubing is run from the inside of the fuel-line fitting to the bottom of the tank. If this tubing develops an air leak below the point where it is attached at the upper end, the fuel pump will draw air after the fuel level in the tank drops below the level of the leak. This trouble does not occur very often, but if this possibility is not taken into consideration, the leak may be difficult to locate.

The filler neck on some passenger cars is not long enough to reach to the outside of the car, and it is welded or otherwise securely attached to the inside of the car body. The tank is usually attached to the filler neck by means of a neoprene sleeve, so that the tank may be removed and replaced easily.

In order for gasoline to be drawn from the fuel tank, the tank must be vented in some way so that normal atmospheric pressure is maintained at all times on the surface of the fuel. This is necessary because the fuel pump works on the differential of pressure principle. An air vent is sometimes soldered into the top of the tank, but frequently the tank is vented through the filler cap. Should a vent become clogged, a vacuum can be created in the tank which will prevent fuel from being drawn into the fuel pump line. Since a clogged vent can affect engine performance much the same as when the car is running out of gas, the fuel pump is often suspected of failure.

Cleaning, testing, and repairing. Dirt, pieces of rubber hose, leaves, or other foreign matter sometimes get into the tank. The most practical way of cleaning the tank is to remove it and turn it upside down. However, water and small particles of dirt may be drained out through the drain opening in the bottom of the tank, if any, and tanks should therefore be drained at least once a year as a matter of good preventive maintenance. A fuel-tank filler cap lock offers excellent protection for the fuel system, for such a cap will prevent anyone from putting rocks, dirt, or other foreign matter into the filler neck.

Leaks may occur in the seam welds or soldered joints because of vibration, strain, or faulty construction. Occasionally, leaks in the tank may be caused by sharp objects that are kicked up on the road by the wheels of the vehicle and thrown against the tank.

Since a fuel tank always offers a chance of explosion, it should be cleaned thoroughly before any attempt is made to make any repairs. The usual procedure, after first removing the float mechanism, is to fill the tank with a solution containing an alkaline cleaner and then flush it out with steam. This procedure is absolutely necessary as a safety precaution to prevent possible explosion of gasoline fumes that may otherwise remain in the tank. While the tank is being flushed, all the fittings should be kept open to drain the sediment and prevent the building up of steam pressure high enough to weaken or damage the tank.

Fuel tanks are tested for leaks by either the wet method or the air-pressure method. The following steps are followed in the wet method:

1. Plug all openings tightly except the filler neck.
2. Dry the entire outer surface thoroughly with compressed air or a clean rag.
3. Place the tank on a bench on top of blocks so that the underside can be easily seen with the aid of an electric light.
4. Fill the tank with water.
5. Insert the end of an air hose into the filler neck and cover the rest of the opening with the palm of the hand.
6. Apply air pressure against the water in the tank by opening the air valve for a short time.
7. Examine the entire tank for moist spots, which will occur if water is forced through at any point. Draw a ring around each spot.

The following steps are followed in the air-pressure method:

1. Plug all openings except the fuel outlet connection.
2. Attach the loose end of the air-supply hose to the fuel outlet connection by a short threaded tube.
3. Submerge the fuel tank in a tank of clean water, or cover the tank with soapy water.
4. Turn on the air pressure (not more than four pounds per square inch).
5. Draw a ring around each spot on the fuel tank where bubbles appear, indicating leaks.

It is extremely important for the mechanic to remember that a torch should never be used to solder a gasoline tank. A soldering iron, preferably electric, is considered the most satisfactory means of repairing a leak in a fuel tank.

No matter how thoroughly drained a tank is thought to be or how long it has been since last used, enough fuel may still remain in the tank to produce a combustible mixture. Therefore, whenever a fuel tank is being soldered, extreme care must be taken to prevent any open flame from coming into contact with the tank or with the fumes that might still be present in the tank.

Checkup

The fuel tank contains baffles to prevent __1__.

1. ________

To avoid picking up __2__ and __3__, the tank end of the fuel line is located __4__ from the bottom of the tank.

2. ________
3. ________
4. ________

The fuel tank is vented in order to maintain __5__ __6__ upon the fuel.

5. ________
6. ________

A clogged tank vent will produce the same effect as a(n) __7__ tank or a faulty __8__ __9__.

7. ________
8. ________
9. ________

If an air leak is developed in the "pickup" tube, the fuel pump will draw __10__, instead of __11__, as the fuel level in the tank __12__.

10. ________
11. ________
12. ________

For easy tank removal, some tank filler necks are attached with __13__ sleeves.

13. ________

To prevent explosion, a fuel tank must be thoroughly __14__ and flushed out with __15__.

14. ________
15. ________

When a tank is tested with air pressure, the pressure should not exceed __16__.

16. ________

TOPIC 3—MECHANICAL FUEL PUMPS

Assignment

1. Automotive Encyclopedia, pp. 26-1 to 26-4.
2. Crouse, Automotive Mechanics, pp. 130-31.

Introduction

Early-model cars were provided with various types of fuel feed systems, making use of such devices as mechanically-driven pumps, or tanks that supplied fuel by means of gravity or a vacuum system. Many of the advantages of each of these early types of gasoline feed systems are combined in the mechanically-operated diaphragm pump, which has the added advantage of providing fuel at the pressure required to keep the carburetor properly supplied under all conditions of engine load and speed.

Most modern automobiles are equipped with mechanically operated diaphragm fuel pumps, a few with combination mechanical and vacuum fuel pumps. The repair of these pumps is not difficult; however, it is seldom done because it is generally cheaper to replace than to repair a pump. However, to determine when a pump is in need of replacement or repair, how to diagnose problems of low volume, high or low pressure, and the like, a mechanic must understand the principles of pump operation.

Checkup

The mechanically operated pump provides ___1___ under constant ___2___.

1. __________
2. __________

The vacuum pump operates the windshield wipers when engine vacuum is ___3___.

3. __________

The function of the air dome on the outlet side of the pump casting is to ___4___ ___5___.

4. __________
5. __________

A fuel pump is tested for ___6___, ___7___, and ___8___.

6. __________
7. __________
8. __________

A fuel pump should not be replaced before proper __9__ are made. 9. __________

Excessive pressures can be caused by __10__ diaphragm flexing. 10. __________

Fuel pump pressure is determined by the diaphragm __11__ __12__. 11. __________
12. __________

A ruptured vacuum diaphragm can cause excessive __13__ consumption. 13. __________

The fuel pump delivers fuel to the carburetor when the pump __14__ moves the diaphragm. 14. __________

TOPIC 4—ELECTRIC FUEL PUMPS

Assignment	1. Automotive Encyclopedia, pp. 26-4 to 26-6. 2. Crouse, Automotive Mechanics, pp. 131-32.

Introduction

The electric pump has one definite advantage over the mechanical pump in that, unlike the mechanical pump, it may be mounted at any convenient location on the vehicle. All the pump requires for its operation is an electric current; it needs no mechanical link to the engine. When it is mounted in a cool place away from the heat of the engine, the possibility of vapor lock is greatly reduced. Although electric fuel pumps are not standard equipment on passenger cars at present, many of these pumps are sold as replacements for mechanical pumps. Electric fuel pumps are standard equipment on many trucks.

Reference books provide very little information concerning electric fuel pumps, but specifications and service instructions may be obtained from the manufacturers. Since electric pumps require occasional maintenance, every mechanic should understand the principles upon which these pumps operate and have some knowledge of the service procedures involved in cleaning and adjusting them.

Related Information

Operation. The electric fuel pump operates independently of any mechanical linkage with the engine. Its principle of operation is similar to that of the diaphragm-type mechanical pump, except that some electric fuel pumps use a bellows instead of a diaphragm, and the motive power which produces the vacuum is an electromagnet (or an electric motor) rather than the engine. The return or pressure stroke is produced by spring action. Back pressure in the carburetor builds up pressure in the bellows (or diaphragm) and prevents further pumping by holding the electrical circuit open.

Construction. Figure 1 shows a cross section of a typical electric fuel pump. The binding post is connected to the ignition switch. When the switch is turned on, current passes through the binding post to contact the arm through the coil, and it completes the circuit by passing through the contact points to

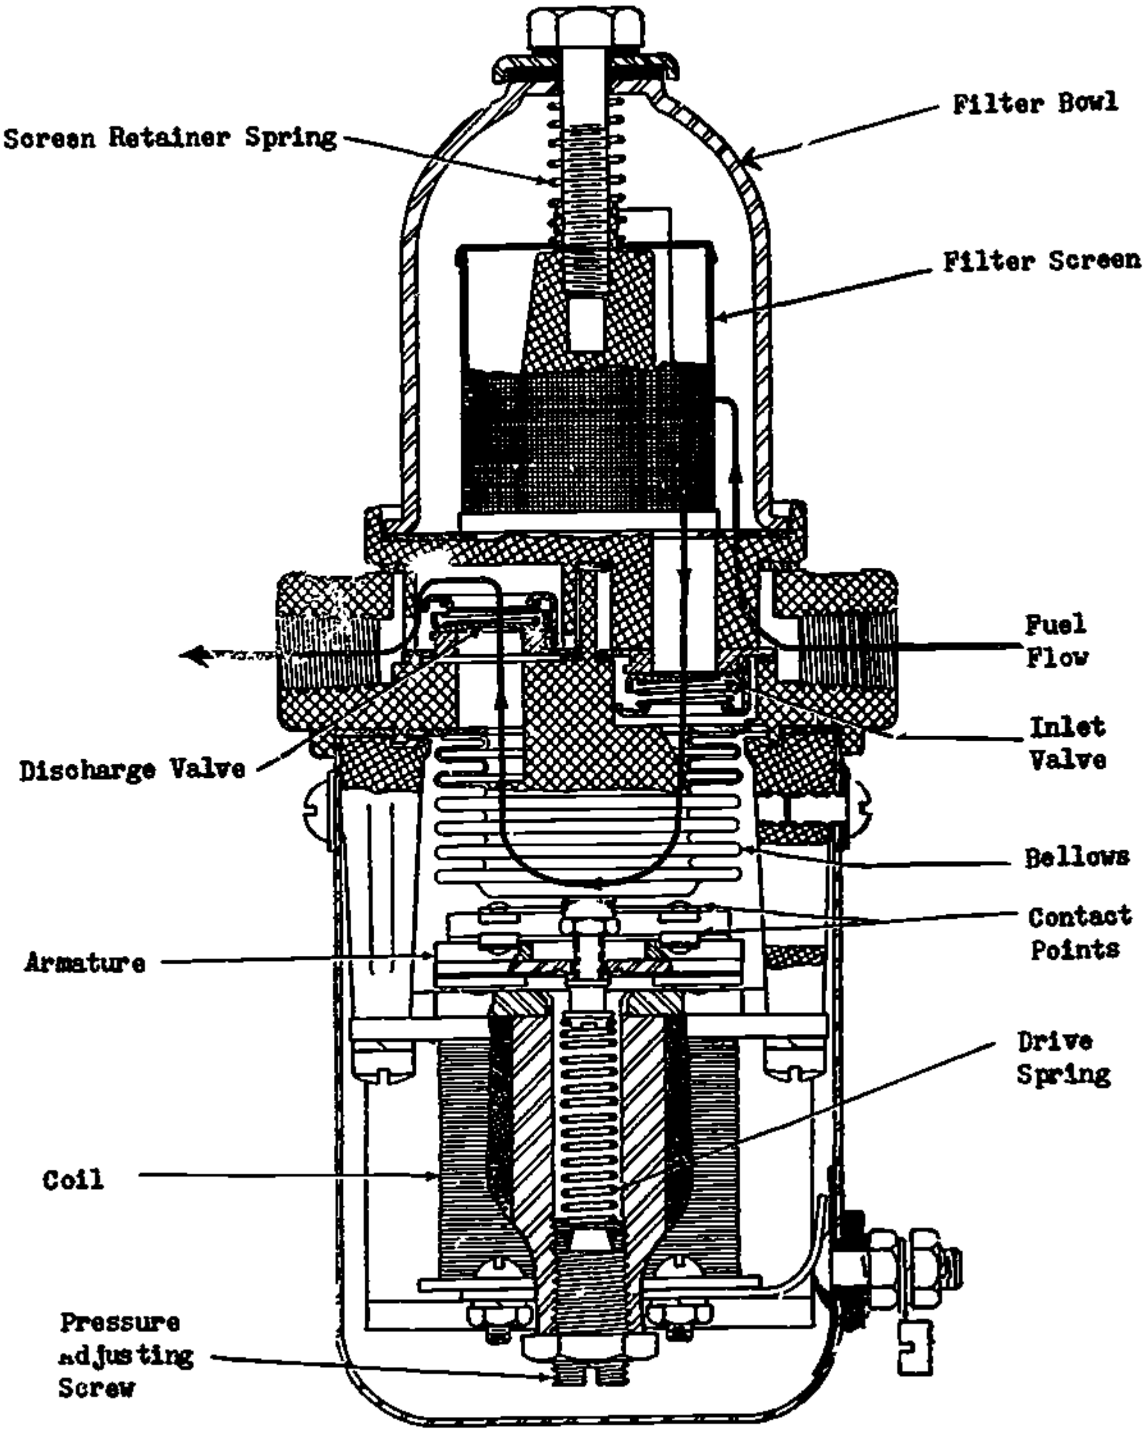

Fig. 1. Cross section of a typical electric fuel pump

ground. As the coil is energized, electromagnetism pulls the armature down, which expands the bellows and opens the points. As the bellows are pulled down, a partial vacuum is created above the bellows that causes fuel to be drawn from the supply tank, through the inlet valve, and into the chamber above the bellows. When the points are pulled apart, the current stops flowing, and the magnetic pull on the armature is broken. The drive spring then pushes the bellows up, creating a pressure on the fuel, which causes the inlet valve to close and forces the fuel through the outlet valve to the carburetor. When the spring returns the bellows, the contact points are again closed, and the cycle is started all over again. When the carburetor is not in need of additional fuel from the pump, a pressure is built up above the bellows, which holds the contact points open and stops the operation of the pump. The bellows type fuel pump develops a pressure of between 2 and 5 pounds per square inch.

Maintenance. Electric fuel pumps give very little trouble, although they need periodic cleaning and adjusting. Dirt and water coming from the fuel supply tank are filtered out by the bowl screen. To clean this screen, the fuel bowl retainer screw must first be removed, then the bowl, the spring, and the screen. A new gasket should be installed to guard against any air leaks around the lip of the bowl. When the pump pressure is to be adjusted, the cover should be removed and a battery connected to the contact arm. The locknut is loosened, and if a higher pressure is desired, the adjustment screw is turned clockwise. If the pressure is too high, the adjustment screw is turned counterclockwise.

Parts replacement. Practically all the parts in these pumps are replaceable. Factory specifications relative to clearances and adjustments should be followed closely when any major work is done on the pump.

Checkup

The electric fuel pump is usually supplied with current through the ___1___ ___2___.
1. __________
2. __________

The flexible part of the pump, which develops the suction, is called the ___3___ or ___4___.
3. __________
4. __________

The pump coil is energized when the contact points are ___5___.
5. __________

When the contact points are closed, the bellows begin to move ___6___.
6. __________

When the bellows are moved down, the ___7___ valve is open.
7. __________

The valves are returned to their seats by ___8___.
8. __________

The bellows are moved down until the contact points ___9___.
9. __________

The bellows are moved upward by a(n) ___10___.
10. __________

As it enters the pump, the fuel is filtered through a(n) ___11___.
11. __________

The bellows are drawn downward by the force of ___12___.
12. __________

When the bowl is cleaned, a new ___13___ should be installed.
13. __________

The screen of the Autopulse pump is held in place by a(n) 14 . 14. __________

Pressure is increased in the Autopulse pump by turning the adjustment screw 15 . 15. __________

The adjustment screw is held in place by a(n) 16 . 16. __________

When the carburetor is not in need of fuel, the bellows and the contact points are held 17 . 17. __________

The pusher type pump has an advantage since it has no 18 . 18. __________

Electric fuel pumps are less subject to 18 19 than mechanical types. 19. __________

TOPIC 5—FUEL FILTERS

Assignment : Automotive Encyclopedia, pp. 26-10 to 26-11.

Introduction

Every automobile is equipped with some kind of fuel filter, either as part of the fuel pump or carburetor, or installed as a separate unit in the fuel line. Many designs of fuel filters have been developed during the past several years, but all of them perform the same function--to remove impurities from the gasoline before it is delivered into the carburetor jets. Much carburetor repair is necessary simply because a filter has not done its job, which can be avoided if filters are kept operating efficiently.

Related Information

Types of Filters

Ceramic filter. The ceramic-type of filter, shown in Fig. 2, is one of the filters in wide use. The fuel is strained through a ceramic filter element (a porous clay product) that filters out microscopic particles of dirt. The ceramic element is held in position by a coil spring. For cleaning, the ceramic element is washed in acetone or a good carburetor cleaning solvent and blown out with air.

Under normal fuel pump pressure, the filter will permit a flow of approximately 50 gallons of gasoline an hour, much more than the 10 gallons or less most automobiles consume even at excessively high speeds.

Fiberite filter. Another filtering element is made of a series of fiber discs. This type of filter, shown in Fig. 3, strains out lint, dust, dirt, and water. The discs are not affected by water or acids found in the fuel, or by any of the various types of blended alcohol and aromatic fuels. The manufacturers recommend that this filter element be replaced periodically rather than cleaned.

Disc-type fuel filter. The disc-type fuel filter was popular several years ago. It consists of a series of laminated metal discs and spacers with openings

Fig. 2. Typical ceramic fuel filter

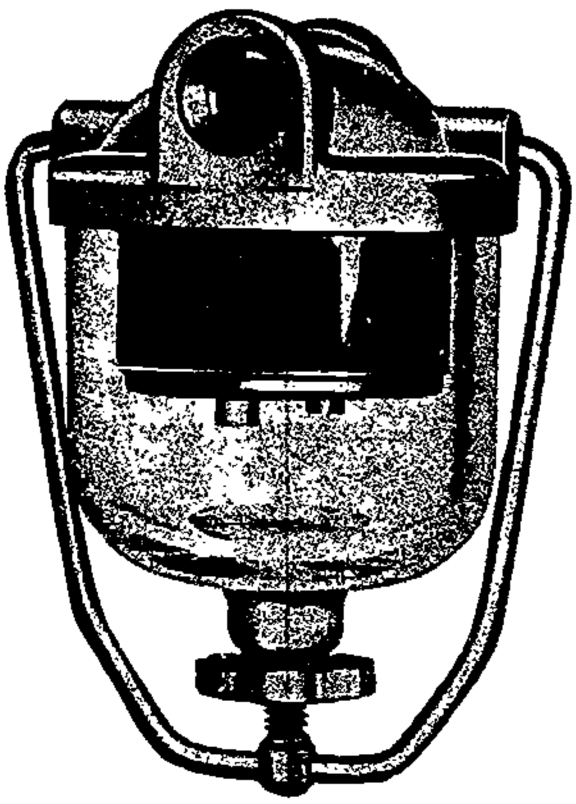

Fig. 3. Fiberite filter

Fig. 4. Replaceable filter element

approximately .002 inch in width, which is several times finer than openings in 120-mesh wire screen. This filter strains out all foreign matter such as water and dirt. The fuel is forced into the glass bowl and between the laminations to the inside of the filtering unit. In the process of cleaning this unit, the bowl is removed and the stack of discs is unscrewed. As these discs are unscrewed, they separate somewhat to permit cleaning. The filter should be swished back and forth in clean solvent and then allowed to dry. The bowl gasket should be replaced to prevent leakage. The disc-type filter is no longer manufactured. A composition element is supplied to replace the laminated discs when they become worn.

Screen filter. The average mechanic is familiar with the screen-type filter that has been in use for many years. Such filters are sometimes inefficient because the screen does not always seat correctly. A filter of this type may have a very fine mesh screen, but if the dirt is allowed to pass between the screen and the seat, the filtering action is poor. Screen filters are often used on the intake side of the fuel pump. Whenever the bowl is removed for cleaning, the bowl gasket must be replaced, because if a leak were present, even though the fuel would not leak out, air would be taken in, reducing the fuel capacity of the pump.

Other Filters

Other locations of filters. Filter units that are not a part of the fuel pump or carburetor are usually installed next to the carburetor so that the fuel is filtered just before entering, thereby assuring the passage of clean fuel to the carburetor. Many makes of cars are equipped with line filters. These filters are inserted in the line between the pump and carburetor. They are capable of very fine particle filtration. These filters are not serviced, but replaced according to the recommendations of the manufacturers.

Air domes. The mechanic will find that many types of filters do not become completely filled with gasoline. Fuel filters are often designed to accommodate an air pocket that acts as a cushion to damp fuel pulsations caused by the fuel pump. These pockets are called "air domes."

Checkup

Ceramic fuel filters use a(n) __1__ clay element through which the fuel is strained. 1. ________

About __2__ of fuel an hour can pass through the ceramic filter. 2. ________

The filter element in the ceramic filter is held in position by a(n) __3__ __4__.
3. ________
4. ________

When a Fiberite filter element becomes dirty, it should be __5__. 5. ________

The discs of a disc filter are spaced about __6__ apart. 6. ________

The fuel is filtered through most elements from the __7__ to the __8__.
7. ________
8. ________

Disc, screen, and ceramic-type filters should be washed in __9__ or other good carburetor cleaning __10__.
9. ________
10. ________

Whenever a bowl-type filter is cleaned, the bowl __11__ should be replaced. 11. ________

If the filter bowl on the suction side of a fuel pump leaks, the pump's __12__ __13__ is reduced.
12. ________
13. ________

TOPIC 1—BASIC PRINCIPLES OF CARBURETION

Assignment

1. Automotive Encyclopedia, pp. 21-1 and 21-3.
2. Crouse, Automotive Mechanics, pp. 132-36.

Introduction

It is necessary to gain a thorough understanding of the basic principles of operation that apply to all carburetors before attempting to understand the construction, operation, and characteristics of any particular brand or type. Although one carburetor may look considerably different than another, the fact is that all carburetors work on the same fundamental principles, regardless of variations in design.

Checkup

The purpose of the carburetor is to supply the engine with a(n) ____ 1 ____ - ____ 2 ____ mixture in the ____ 3 ____ proportions.

Fuel is atomized for quicker ____ 4 ____ .

The air-fuel ratio best for full power is ____ 5 ____ to ____ 6 ____ .

The purpose of the venturi is to create ____ 7 ____ by increasing air ____ 8 ____ .

Gasoline is pushed out the nozzle by ____ 9 ____ pressure.

Carburetors operate on the ____ 10 ____ of air ____ 11 ____ principle.

High temperatures will cause rapid ____ 12 ____ .

Final evaporation takes place in the ____ 13 ____ .

Fuel is sprayed into the venturi from the end of the fuel ____ 14 ____ .

14. ____________

The various fractions contained in commercial gasoline vaporize at temperatures of ____15____ to ____16____.

15. __________
16. __________

Evaporation of a liquid is increased by ____17____ ____18____ pressure above the liquid.

17. __________
18. __________

Air flow through the air horn is controlled by a(n) ____19____ valve.

19. __________

To increase the amount of fuel surface exposed to evaporation, the fuel is ____20____.

20. __________

TOPIC 2—BASIC CARBURETOR CIRCUITS

Assignment

1. Automotive Encyclopedia, pp. 21-2 to 21-11.
2. Crouse, Automotive Mechanics, pp. 136-44.

Introduction

A carburetor controls the flow of air and gasoline into the combustion chamber of an automobile engine by means of three distinct processes:

1. Measuring--The carburetor is a measuring device designed to deliver the correct amount of gasoline and air mixture to the engine. This amount varies with speed, altitude, temperature, kinds of fuel, acceleration, and the type of manifold used on the engine. The parts that perform this function are the throttle valve, jets, metering rods, air valves, and metering valves.

2. Atomizing--The carburetor acts as an "atomizer" to break up the gasoline into extremely fine particles so that combustion will be as complete as possible. The venturis are mainly responsible for this. Carburetors may have from one to four venturis for each throat.

3. Blending--The carburetor correctly blends and mixes air and fuel for burning in the cylinders. The most important part of this function is the maintenance of a proper ratio of air to fuel under all circumstances and conditions. The parts of the carburetor that do the blending are the low-speed jet, intermediate jet, power jet, accelerator pump, air bleeds, air horn, venturi, float bowl vents, and manifolds.

Checkup

The accelerating pump supplies fuel to eliminate the "__1__ __2__" when the throttle is suddenly opened.

1. __________
2. __________

A high float level will cause too much fuel to flow from the main __3__.

3. __________

The six basic carburetor circuits are the ___4___, ___5___ ___6___ or ___7___ - ___8___, ___9___ or ___10___ - ___11___, ___12___, and ___13___ or ___14___ system.

4. ________

14. ________

The pump circuit employs a(n) ___15___ and ___16___ valve.

15. ________
16. ________

The idle system takes gasoline from the ___17___ jet through the ___18___ jet and discharges it ___19___ the throttle valve.

17. ________
18. ________
19. ________

The high speed circuit takes in fuel through the ___20___ jet and discharges it from the main ___21___ with the throttle ___22___ to ___23___ opened.

20. ________
21. ________
22. ________
23. ________

When the choke valve is closed, only a small amount of ___24___ can get past it, developing a high ___25___ in the air horn. This causes a heavy discharge from the ___26___ nozzle.

24. ________
25. ________
26. ________

Metering rods or power jets can be ___27___ or ___28___ operated.

27. ________
28. ________

TOPIC 3–CARBURETOR CONSTRUCTION AND DESIGN

Introduction

Carburetor design keeps changing as time goes by, but the most recent changes have been primarily in appearance, rather than in function--the interior function of the modern carburetor is much the same as it has been for several years. The six circuits are there (refined in some instances, relocated in others), but the basic function remains the same. Carburetors vary by make and model, but the mechanic has only to understand the basic carburetor components, their design, and the reason for each to be able to troubleshoot and repair this part of the automobile fuel system.

Related Information

Construction

Carburetors are usually made up of three main parts: the air horn, main body, and throttle body.

The air horn. The air horn is usually made of die-cast pot metal or aluminum. Some earlier models were made of cast iron, but these are no longer used for passenger cars.

The air horn is also the cover for the main body. Some air horns are quite simple, containing a choke valve and necessary mountings for manual or automatic choke operation; others are more complicated. They may contain the choke and its controls, the floats, needle and seat assemblies, power or metering rod assemblies, accelerating pump and linkage, bowl vents, and antipercolators. One early model had the secondary venturi located in the air horn. All air horns do not contain all of the components listed. No set rule exists for what should go into the makeup of the air horn--one popular single-barrel carburetor, for example, has the idle crossover, main nozzle, and secondary venturi in the air horn.

Main body. Some large commercial vehicle and boat engines have carburetors with cast iron main bodies, but most modern passenger car carburetors are of die-cast pot metal or aluminum.

Die-casting is a process wherein two dies of the required shape or form are used. One part of the die has the outer shape, and the other die controls the inner shape. Molten metal is forced between the dies. As soon as the metal is cool enough to set, the dies are opened and the part extracted. The dies can be used over and over again to turn out parts that are exactly alike. Die-casting practically eliminates most machining processes. The necessary passages are drilled. Any holes drilled from the outside in are plugged with metal plugs.

The main body can contain any number of the following items: the main (or primary) venturi, needle and seat assemblies, the float assembly, carburetor bowl and main jets, main nozzle and air bleeds, and idle jet and passages. Vacuum passages to operate power valves, metering rods, and chokes are drilled into the main body. Some automatic choke assemblies, mounted onto the main body, operate the choke valve through linkage. Economizers or power jets, located in the bottom of the float bowl chamber, often are operated by a piston and spring assembly mounted in the cover or air horn.

Fig. 5. Zenith downdraft carburetor

The primary venturi is usually cast as part of the main body; while other venturis are separate pieces connected to the cover or suspended into the main body. The purpose of the venturi is to increase air velocity. Several venturis used together can improve the "spray" or break-up of fuel. However, the maximum number of venturis that can be used to advantage is four. Most carburetors have two venturis, but many others use three. Four venturis are used mostly on updraft carburetors.

Throttle body. Throttle bodies, which are of either aluminum or cast iron, often have grooves cut on the lower side. Some grooves are made small to equalize vacuum for choke and power valve control. The larger grooves are designed to pass exhaust gases from the heat riser crossover to heat the carburetor base. (However, excessive heat on the carburetor must be avoided to prevent vapor lock.) Sometimes fiber blocks are used under the carburetors as heat insulators. Throttle bodies for two- and four-barrel carburetors are usually cast separately, although on some four-barrel carburetors in use today, the main body and the throttle body are cast together.

The throttle body contains the throttle valves and their operating shafts and levers. Idle passages are extended through the throttle body to the idle discharge ports on either side of the closed throttle valves. The idle mixture screws are located in the throttle body. The fast idle, lockout, and unloader are located on the throttle shaft. In cars with a throttle-controlled starting switch, the switch is mounted on the throttle body. (This type of starting device has an advantage over other types of starters. When the driver engages the starter, he must depress the accelerator pedal sufficiently to allow the automatic choke to close and to open the throttle. With the throttle open, the engine is assured of getting a mixture rich enough for easier starting.)

An automatic throttle opener consisting of a spring-loaded vacuum diaphragm is used on some models. When the engine is not running, the spring pushes a plunger which opens the throttle a specific amount. When the engine is running, the engine vacuum returns the plunger to an "off" position.

On engines that drive automatic transmissions, dashpots are used to prevent the throttle from closing too quickly and the engine from stalling. These are referred to as slow-closing throttles.

Float Systems

Bowls. The float bowl contains a small amount of gasoline which flows into the engine because of the pressure differential between the surface of the gasoline and the nozzle tip. The gasoline must be maintained at a specific level at all times. For best results, the level should be 1/64 to 1/32 inch below the tip, and this level is controlled by a float which opens and closes a needle valve. At driving speeds the float keeps the needle off its seat just enough to keep a steady stream of fuel running into the bowl.

Proper fuel level is set at the factory by the use of sight gauges or by drilling holes in the sides of the bowl. These holes are closed with plugs which can be removed to check fuel level while the engine is running. Some floats can be adjusted while the engine is running; others can be adjusted only by removing the cover and float assembly.

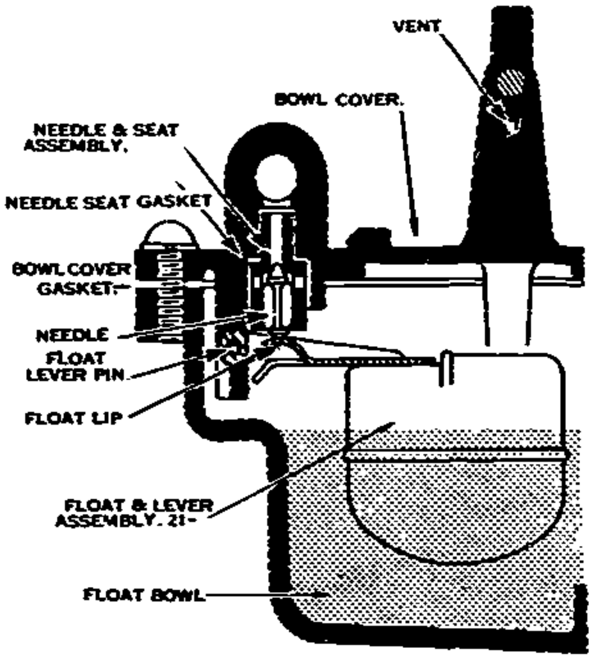

Fig. 6. A float circuit system

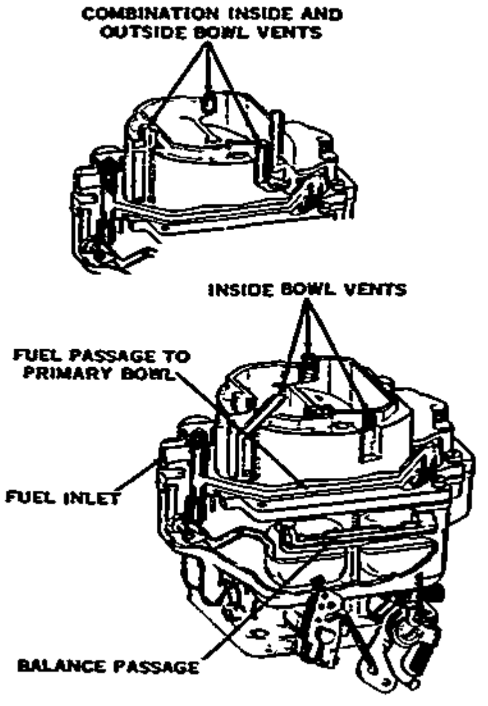

Fig. 7. An example of a two-float system

Early floats were made of cork, the pores of which were sealed with shellac to prevent the cork from becoming fuel-logged. It is quite obvious that if the float changes weight, the fuel level will change. Modern floats are hollow "cans" formed to fit the shape of the bowl. The floats are made of very thin brass and must be handled carefully to avoid punctures. When a float springs a leak, the air is replaced by fuel, which results in carburetor flooding. No amount of adjusting will correct the conditions caused by a punctured float. The bowl also contains the main metering jet, the idle and power jets, and the accelerating pump well.

Bowl location. The location of the bowl in relation to the nozzle affects both the performance and economy of an engine. When the bowl is set to one side of the barrel (eccentric), certain effects are noticed. On many carburetors the bowl is on the front, or radiator, side of the barrel. When the car is traveling on a level surface, the fuel level remains constant; but when the car climbs an incline, the liquid level in the bowl changes--the front of the level drops, and the rear level rises. This causes fuel to spill out of the nozzle, creating an extra rich condition. When a car is climbing, additional gasoline is necessary to run the engine and a certain balance is achieved by the additional fuel. When the car is going downhill, the opposite effect is obtained--the front level rises and the main nozzle is starved. Since the car is going downhill, less power is needed, and a leaner mixture is satisfactory.

This phenomenon was more noticeable in early aircraft carburetors. An aircraft not only climbs but also banks sharply to the right and the left. This led to the development of the "aerotype" carburetor which has a float bowl surrounding the barrel (concentric). The reason for this design can be demonstrated if a glass, partially filled with water, is tilted to one side. If tilted far enough, the water will spill out over the lower edge of the glass. No matter how it is tilted, however, the depth of the liquid at the center remains practically the same. Today we have single-, double-, and four-barrel carburetors employing this "concentric" principle. One model has the bowl in the center and the "throat" on the outside.

Needles and seats. Most needle valve seats are made of brass with calibrated holes to match fuel pump pressure and engine needs. The materials from which needles are constructed vary. Early needles were made of nonmagnetic steel alloys. A needle that accidentally becomes magnetized will hold any iron particles present in the fuel between it and the seat, and may cause flooding. A nonmagnetic needle therefore has certain advantages in this respect. During World War II, when metal was scarce, many carburetors were equipped with plastic needles. However, plastic needles proved to be inferior to metal types, so they are no longer used. These plastic needles are not to be confused with the metal needles that have a plastic tip. These needles are said to have the advantage of being soft enough to "surround" small particles, so they seat properly. In most cases a needle needs weight to be pulled from its seat. Sometimes float lips are clipped onto the needle to open it; other needles are spring-loaded for smoother operation.

Needle and seat assemblies come in matched sets and should never be interchanged. The sharper the needle angle and the narrower the seat, the better the seal; but this also results in a wedging action which can cause the needle to stick closed, thereby starving the engine. The flatter the needle angle and the broader the seat, the poorer the seal, but also the less reason for the needle to stick. Valve assemblies are therefore generally bevelled somewhere between these two extremes, for both sticking and leaking must be avoided.

Bowl vents. The bowl vent has the job of maintaining the required pressure on the fuel in the bowl. Unless a pressure differential is maintained between different parts of the carburetor, the fuel will not flow. A simple experiment will prove this: fill a glass about three-fourths full of water. Place a straw in the glass. Now as you draw on the straw, you create low pressure in the straw, and water is pushed up the straw by atmospheric pressure exerted on the surface of the water. Next, leave the straw in the water and pour some heated paraffin over the water and wait for the wax to cool. The atmospheric pressure will then be sealed off the surface of the water. Then when you draw on the straw, you will observe that no water is forced into the straw. This is because there is no atmospheric pressure on the surface of the water.

Some carburetors have bowl vents extending into the air horn; others, bowl atmospheric vents which upset the balance of pressure, for the advantages are always lost when there is an opening in the bowl to atmospheric pressure. Some models use metal washers on the metering rods to seal out the air; others use metal covers with gaskets over metering rods and accelerating pump assemblies.

To service a carburetor, it is necessary to know which type of venting system is employed and to understand the functioning of the system.

- The atmospheric vent. An atmospheric vent consists of a hole drilled in the bowl cover which allows air to enter the chamber. A certain amount of dust and dirt can also enter through this vent. The main disadvantage of this type of vent, however, is demonstrated when the air cleaner is plugged or restricted. The pressure in the carburetor throat then decreases below normal, but the pressure in the fuel bowl remains the same. This condition forces an excessive amount of fuel from the main nozzle, causing gas mileage to drop rapidly. Also at high altitudes, where the air is less dense, the atmospheric vent causes an unbalanced effect, resulting in a richer mixture.

- The balanced vent. The balanced vent opens into the carburetor throat, usually above the choke valve. This compensates for any air cleaner clogging. When the air cleaner of an externally vented carburetor becomes restricted (usually due to dirt), it acts like a partially closed choke. With the balanced vent, the air pressure is decreased on the fuel in the bowl as the air pressure is decreased in the carburetor throat. This tends to maintain a balance between bowl pressure and manifold pressure. This balance is also maintained at high altitudes--as the air becomes less dense and the pressure drops, the fuel-air ratio remains fairly constant. Carburetors with balanced vents are often operable at altitudes up to 10,000 or 15,000 feet with little change in fuel-air ratio.

Idle Systems

The idle system usually consists of two passages (one feeding and the other discharging), a metered jet, air bleeds, and two discharge ports (one above and one below the closed throttle). On the one below the closed throttle, a needle valve and screw control the amount of mixture for idling. On one model, an idle air control screw is used for idle speed control. The throttle valves are completely closed, and air for idle speed is introduced below the throttle valves through a separate passage controlled by a large screw.

In many cases the idle jet is screwed into a passage fed by the main jet. The main nozzle is not working while the idle system is working, and the idle system stops working when the main metering starts working, so they do not interfere with each other. In some cases the air bleeds of the idle system become part of the main metering system.

The air-fuel mixture at idle is controlled, in most cases, by the size of the jet and its air bleeds. The idle screw allows more mixture, but it does not make the mixture leaner or richer. The only way to change the air-fuel ratio is by changing the jet size. For example, suppose a car is running poorly and the engine seems to "hunt" (speed up and slow down) at 25 mph. This indicates that the idle, or low-speed, system is dropping out before the main metering system takes over. The idle screw can be turned out, but this may not help. The next step is to increase the idle jet size by about 0.002 inch. This will supply the additional fuel needed for a smooth transfer. Other factors, such as low float level, pump pressure, or vent problems can give the same symptoms, but these should have been checked out and corrected, or eliminated as a source of trouble.

Two types of carburetors have a different type of idle system. In these, the fuel is taken from one side of the throat over a "bridge" to the other side, and then down. The main nozzle is located in the center of the bridge. The theory behind this system is that there will be a continuous flow of fuel across the bridge, thereby minimizing or eliminating a "flat spot" when changing from low-speed system to main metering system at 25 to 28 mph.

Single-barrel carburetors have one idle system, dual-barrel carburetors and four-barrel or multiple carburetors have two idle systems. An idle compensator is used on cars equipped with air conditioning. This compensates by admitting more air when the engine compartment heats the air and causes it to become less dense.

Antipercolators

When an engine is running, fuel is constantly flowing through the carburetor and is therefore relatively cool. When the engine is stopped, the heat from the engine (or the sun) causes the fuel in the bowl to boil. Depending on carburetor design, a "percolating" action then develops as gasoline is forced up the nozzle and into the manifold, causing hard starting when the engine is hot.

Several different methods are used to offset this: one of the simplest and least noticeable is the one in which the main air bleed is used as an antipercolator. The main discharge tube is designed so that if any vapor bubbles are formed in the hot gasoline, the vapors pass around the outside of the tube, instead of passing through the center of the tube. These bubbles collect and condense in the dome-shaped high-speed bleed, thereby eliminating percolation troubles.

In another method, valves open to vent the bowl or main discharge nozzle when the throttle is closed. When an antipercolator vents the main nozzle, care must be taken that the valve is closed during throttle operation. Air entering through the antipercolator will cause lean mixtures, resulting in loss of power and economy. The antipercolator valves can be open only when the throttle is closed.

Bowl vent valves are used on some models as antipercolators. The carburetors with this system are usually of the balanced-vent type and the bowl vent valve is similar in operation to the nozzle type of antipercolator. The only difference is that instead of making the mixture leaner, this system can make the mixture richer. The balanced vent cannot work when the bowl is vented directly to the atmosphere by the open antipercolator valve.

Main Metering Systems

The main metering system consists principally of a nozzle, a main jet, and air bleeds. It is closely related to the power system, which is a means of enriching the mixture for power and acceleration.

Main jet. The main jet is located in the bottom of the bowl. A passage supplying the main nozzle usually supplies the low-speed jet also. When the main nozzle is in operation, the idle jet air bleeds become part of the main metering

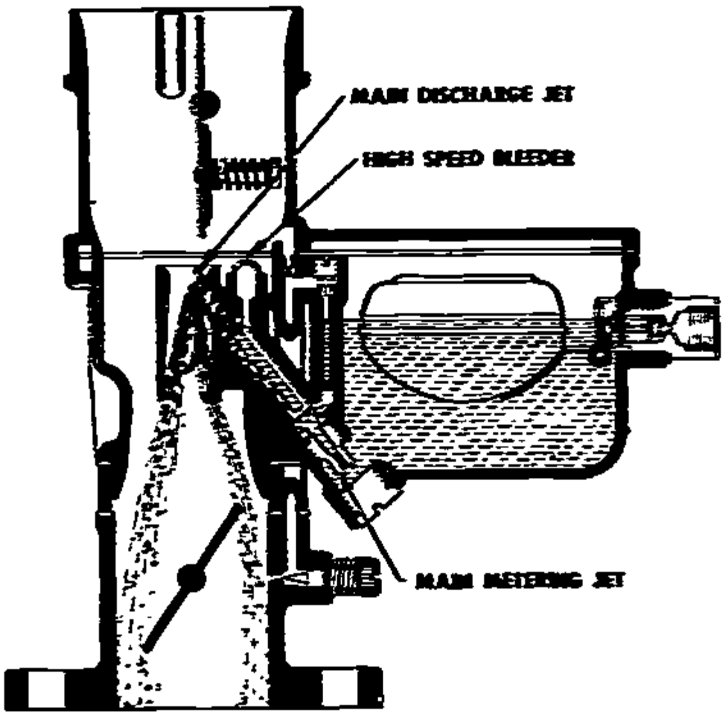

Fig. 8. A main metering system

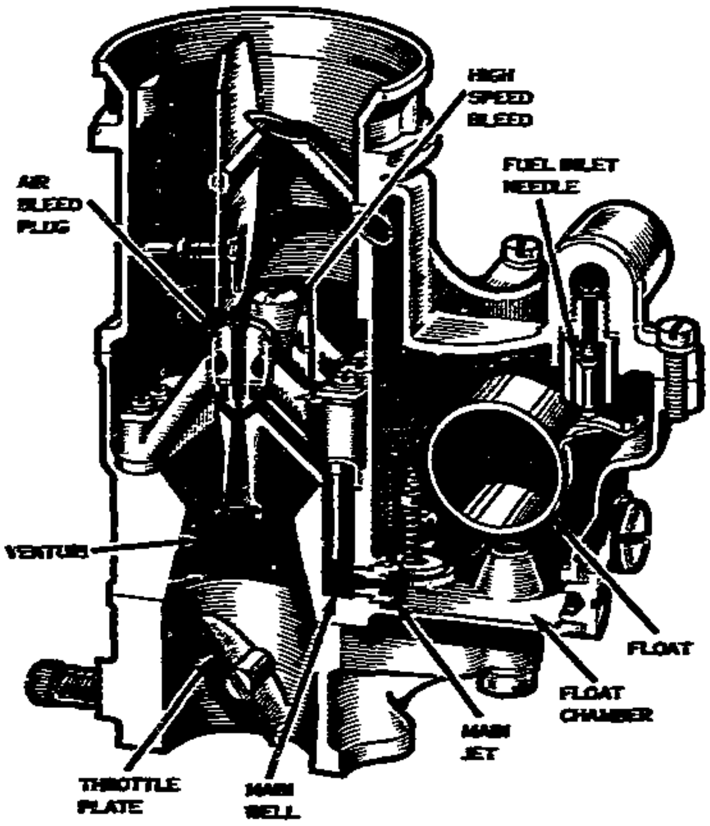

Fig. 9. A cutaway of a main metering system

system. Main jets are stamped with numbers indicating their sizes. For example, a jet marked 0.059 is fifty-nine thousandths of an inch in diameter. Jets in two or three sizes are available for most carburetors.

Main nozzles. Most main nozzles angle up from the bottom of the bowl and extend into the carburetor throat. These nozzles are surrounded by the secondary (smallest) venturi. In another type a passage or well connects to a "bridge" or crossover called a nozzle bar. The nozzle bar, also containing the idle passage, discharges fuel at the center directly into the air stream. The nozzle bar contains the necessary air bleeds. Theoretically, this provides for a smoother transition from low-speed metering to main metering. Gasoline flows through the bar at all engine speeds.

Another design of this type has a nozzle which extends up and over to the center of the carburetor throat, but does not extend to the other side. A "cluster," containing a secondary venturi, nozzles, idle jets, air bleeds, and pump discharge passages and jets, is formed.

Still another version, the concentric-bowl type, employs an inverted U passage, discharging fuel below the bowl. The bowl is in the center of the air stream or "throat."

Power System

The power system is part of, and works with, the main metering system. The main objective of the power system is to enrich the mixture for acceleration and maximum power. A common method of doing this is by a spring-loaded valve operated by a vacuum through a diaphragm or a piston and spring.

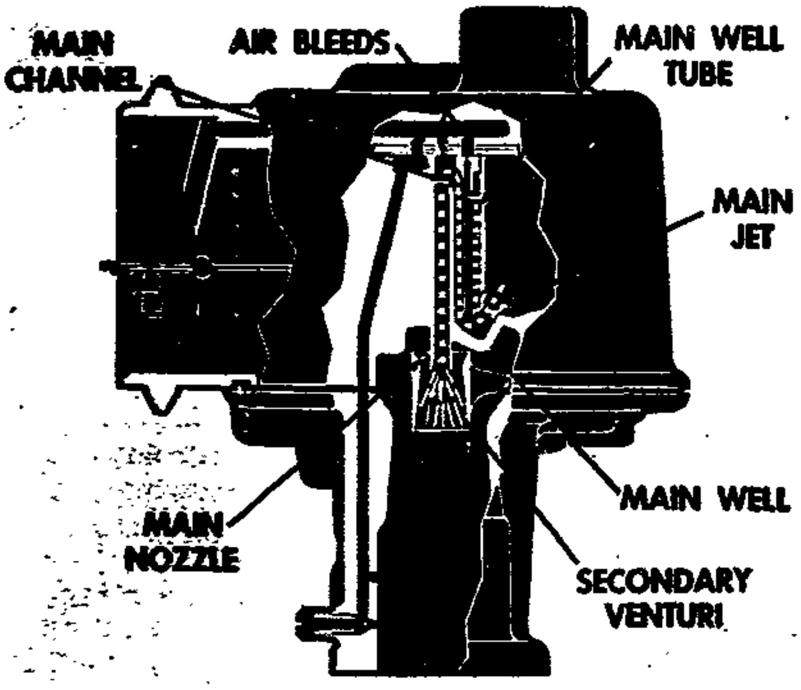

Fig. 10. A main metering system

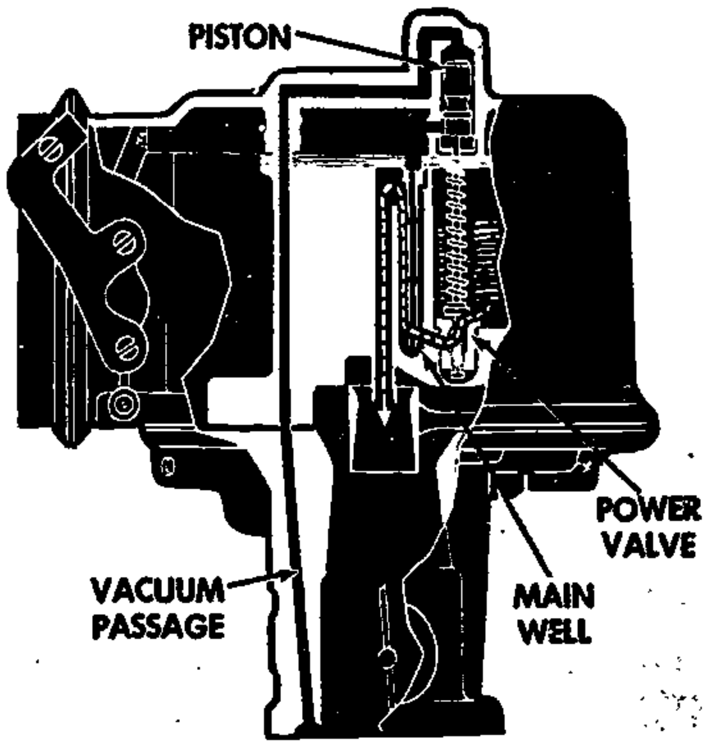

Fig. 11. A power system

In one early version of a power system, the pump discharge check valve was used as an "economizer"--actually a power valve. When the plunger reached the end of its stroke, the discharge valve was held open and additional fuel was discharged into the main stream through the pump discharge nozzle.

In most of the power systems used today, a passage to the main well bypasses the main jet and supplies additional fuel to the main nozzle.

Metering rods. The metering rod works in the main jet, changing the hole size to meet different engine demands. The metering rod is tapered, and as the size of the taper in the hole is changed, the main jet supplies the required amount of fuel.

Main metering rods are operated either mechanically or in combination with engine vacuum. During part-throttle operation, the metering rod is controlled by engine vacuum. When the throttle is opened suddenly for acceleration and at high speeds, the vacuum drops. This causes the metering rod to rise and, in effect, to increase the metering jet hole size. On some models, in addition to the vacuum control, a mechanical means of operating the metering rod is provided. The vacuum control is provided by a piston and a spring. The spring is calibrated to operate with the vacuum piston to give the proper fuel-air ratio for part-throttle operation.

Adjustment of metering rods on earlier models was rather complicated. Almost every model had a different setting. The adjustments were quite similar mechanically, but different gauges were used for different models. This made servicing difficult unless the mechanic had the proper metering rod gauges.

On most carburetors in use today, the metering rod adjustment is done without gauges. In most cases, the rods are pushed down as far as the vacuum power piston or diaphragm allows, and the lip of the mechanical lever is set so it just touches the operating bar. Other adjustments may be necessary first, like throttle opening, but these are usually explained in detail in most manuals.

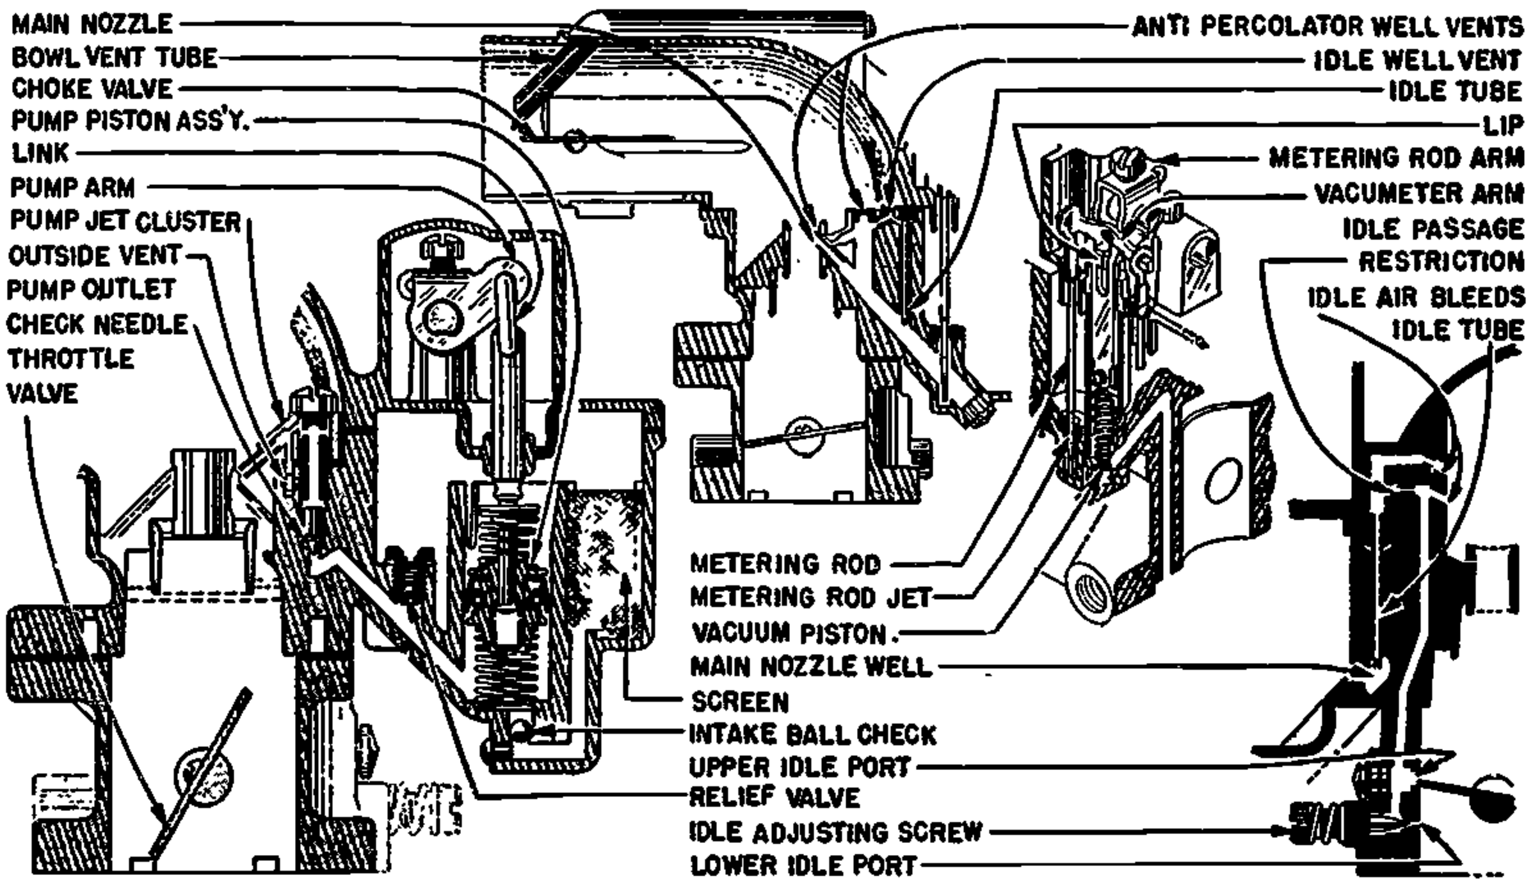

Fig. 12. A dual-type carburetor

Other power systems. Most other power systems are operated by vacuum only in conjunction with a piston and spring, or a diaphragm and spring. These work independently of the main jet. Under power conditions, the vacuum drops and the spring pushes a rod that opens a valve. The valve allows additional fuel to bypass the main jet and flow through the main nozzle.

The piston (or diaphragm) and spring can be located either in the cover or main body. One model uses an "economizer" valve located below the bowl between the throttle body and the main body. Regardless of type or location, their function is the same.

Vacuum operated power or economizer valves cannot be adjusted. The piston or diaphragm size is matched with the spring at the factory. The piston must work freely, and the spring should be replaced if it is worn or has lost tension.

Pump or Accelerating Systems

The accelerating pump can be of the piston or diaphragm type. Both types employ an intake and a discharge check valve. Since a liquid is not compressible, a means of maintaining throttle flexibility must be provided. If the throttle linkage were connected solidly to the pump, the throttle could not be opened quickly. The speed would be controlled by how quickly the fuel could flow through the discharge jet restriction. Some means must therefore be used to allow the throttle to move freely and independently of the pump.

One method is to use an inverted cup on the plunger or piston. Air is trapped in the cup, and when the throttle is opened, the air is suddenly compressed. The compressed air then pushes the fuel out of the discharge nozzle in a steady stream. The disadvantage of this system is that when the air in the cup is lost through leakage, the throttle becomes stiff because the pump now acts as a dashpot.

The most common method used is to spring-load the plunger. When the throttle is opened suddenly, the spring is compressed and operates the pump. This method is used with the diaphragm type of pump also. Another spring is used to return the plunger or diaphragm.

Some pump plungers are equipped with relief ball checks to prevent high pressure from developing in the pump circuit when the engine is not running. This prevents gasoline from being forced into the manifold and causing hard

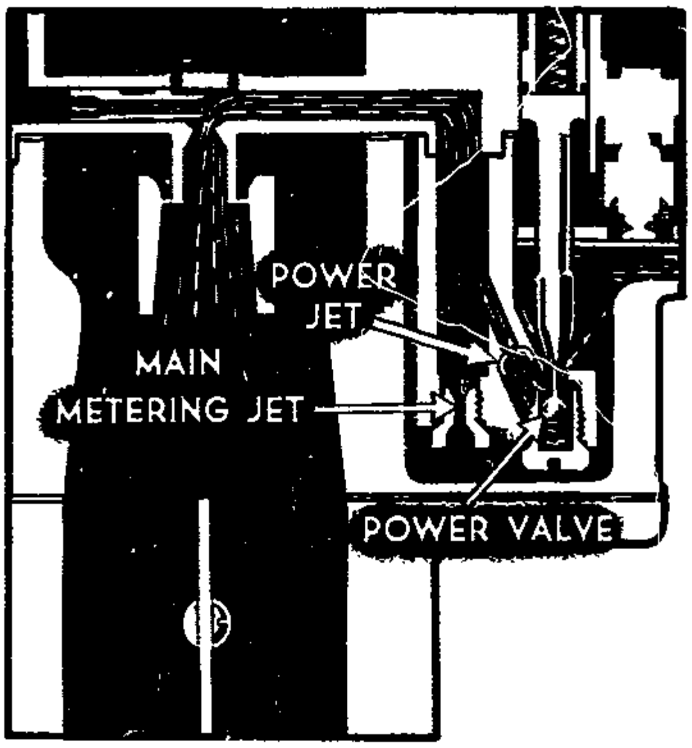

Fig. 13. A power system

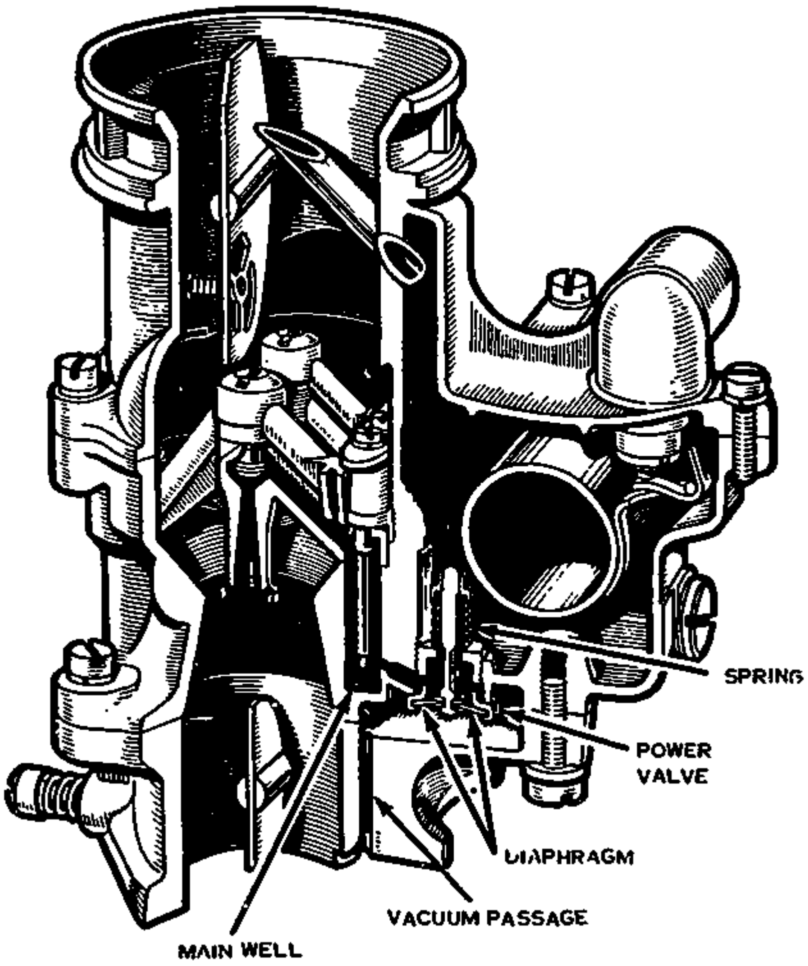

Fig. 14. A power enrichment system

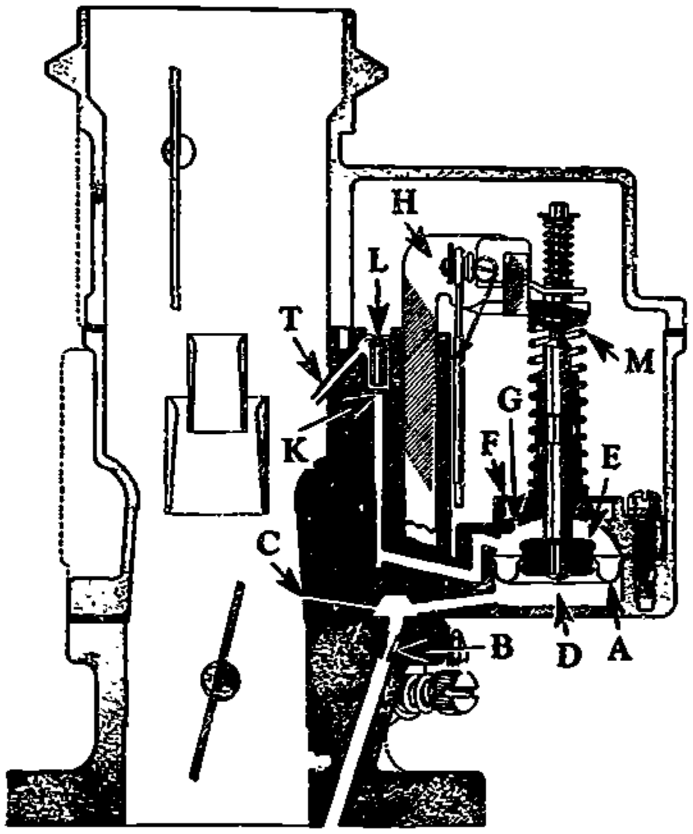
starting when the engine is hot. In other words, the ball check acts as an antipercolator for the pump system and the pump intake valve.

The piston of most pump plungers has a leather cup, but some have a synthetic rubber cup. Leather has been used for many years and has given little trouble. As long as the leather is not allowed to dry out and harden, it will have a long, useful life.

Diaphragm-type pumps have a synthetic rubber diaphragm with a piece of metal on each side of the rubber. The diaphragm assembly is riveted together in the center. One side forms the seat for the return spring and the other side the seat for the operating lever.

Some pumps have two intake check valves; others have one. All have a discharge check valve. Most intake valves are of the ball type, and discharge valves are of the needle or spring-loaded ball type. Some disc-type valves were used on earlier models. In some pumps, the plunger is used as an intake valve. The fuel level is higher than the top of the plunger at all times. When the plunger is on the return stroke, vacuum created below the plunger allows fuel to pass by the cup and fill the space below. Ball discharge valves are kept closed by a spring, and needle types are kept closed by their weight, or by a vent in the cross passage. This is necessary to prevent fuel from flowing because of the differential of pressure between the pump well and the discharge nozzle.



Fuel enters pump circuit through restricted opening in diaphragm housing (G) and is discharged through a pump jet in the carburetor wall (T) on the side of the secondary venturi.

Fig. 15. A pump circuit

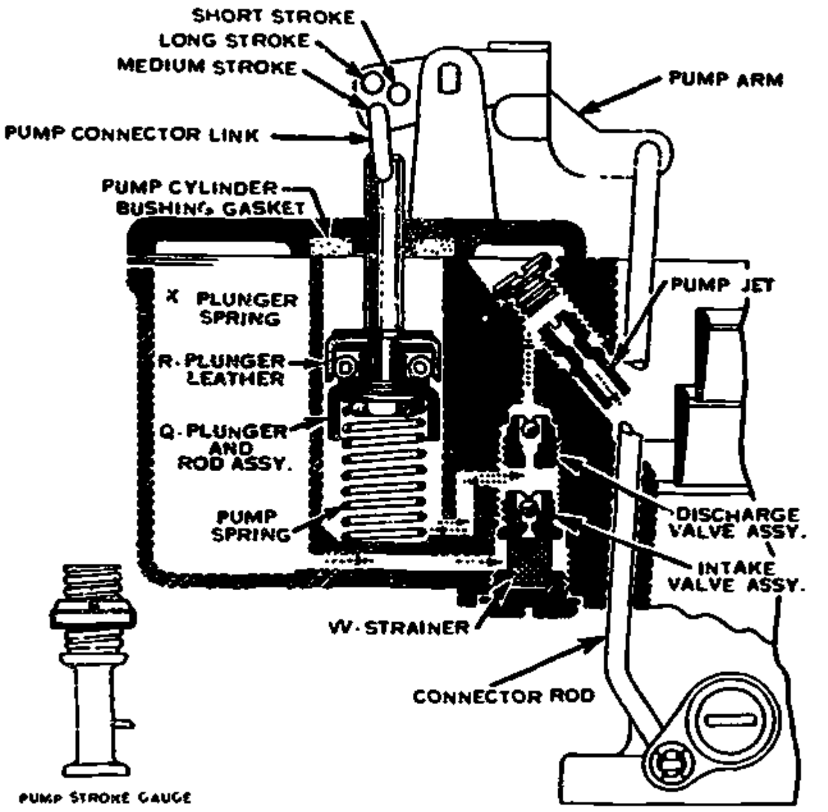


Fig. 16. A pump circuit

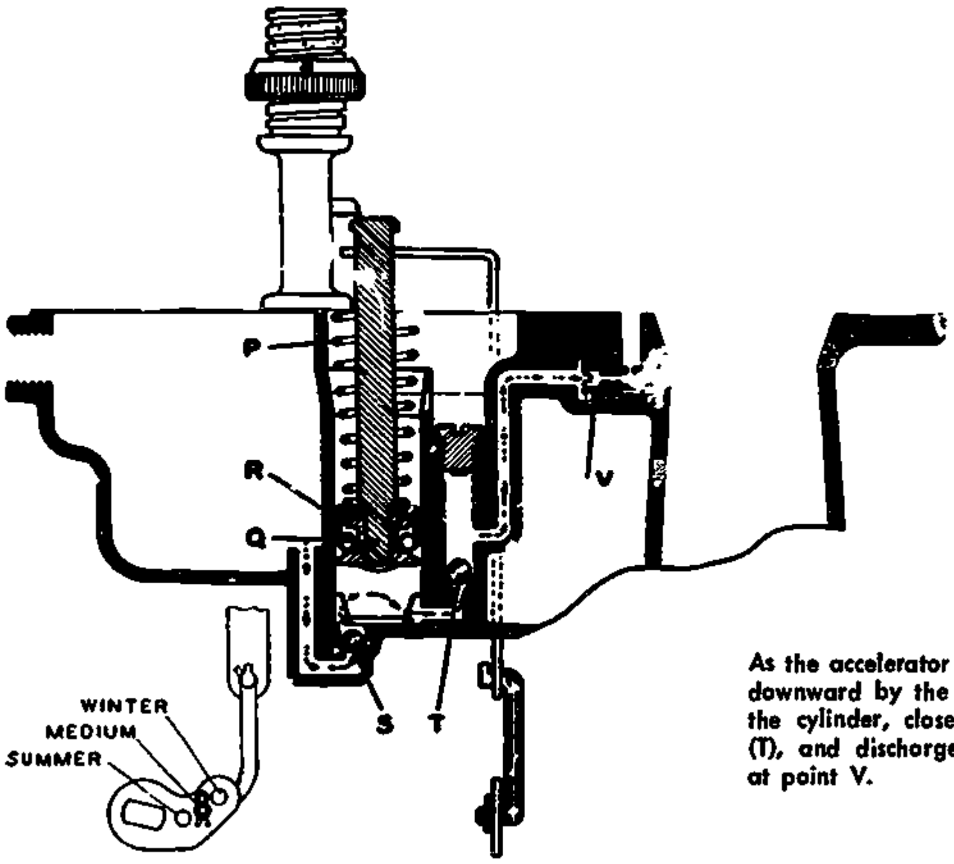

As the accelerator pedal is depressed, the pump piston is forced downward by the pump spring. This forces the gasoline out of the cylinder, closes the inlet valve (S), opens the outlet valve (T), and discharges gasoline into the throat of the carburetor at point V.

Fig. 17. An acceleration circuit

The discharge nozzle discharges into the barrel just above the main venturi. Most discharge nozzles are removable for service. Two- and four-barrel carburetors have one pump and two discharge nozzles. The pump and discharge nozzles are located only in the primary side of four-barrel carburetors. The only adjustment is the stroke adjustment. Some carburetors have two or three holes on the throttle lever to connect to the plunger by a link. Since each hole gives a different length pump stroke, the stroke for most economical operation can be selected. Other carburetors are provided with connecting link adjustment. The pump stroke is adjusted to specifications by bending the connecting link. The length of the pump stroke has a definite effect on gas mileage. An overlong pump stroke can decrease mileage considerably. The accelerating pump is responsible in large part for the difference between city and highway driving mileage. The pump is at the end of its stroke when the throttle is opened for a speed of approximately 55 mph.

Checkup

Most carburetor changes in recent years have been in __1__ rather than in design. 1. ________

When gasoline is forced up the nozzle and into the manifold because of heat when the engine is not running, the action is called __2__. 2. ________

Four-barrel and multiple carburetors use ___3___ idle systems.
3. ________

Float lips are often clipped onto the needle in a float system in order that the needle will ___4___ properly.
4. ________

On some carburetor models, the pump stroke is adjusted by ___5___ the ___6___ ___7___.
5. ________
6. ________
7. ________

The location of the bowl in relation to the ___8___ has a decided effect on engine performance and ___9___.
8. ________
9. ________

In all carburetors, some means must be used to allow the ___10___ to move independently of the pump.
10. ________

In some pumps the plunger is used as a(n) ___11___ valve.
11. ________

For best results, fuel level must be maintained 1/64" to 1/32" ___12___ the ___13___ tip.
12. ________
13. ________

Antipercolator valves are ___14___ when the throttle is closed and ___15___ when the throttle is open.
14. ________
15. ________

Needle and seat assemblies are supplied in ___16___ sets and should not be ___17___.
16. ________
17. ________

Two types of bowl vents are designed, called ___18___ and ___19___.
18. ________
19. ________

Most power systems work by ___20___.
20. ________

The level of gasoline in the center of a(n) ___21___ bowl remains constant regardless of carburetor angle.
21. ________

The metering rod in a carburetor is ___22___ and the amount of fuel delivered by the main jet is determined by the ___23___ of the rod.
22. ________
23. ________

Most main nozzles extend into the carburetor ___24___ or are surrounded by the ___25___ venturi.
24. ________
25. ________

The advantages of a(n) ___26___ vent are lost when an opening is available to the atmosphere.
26. ________

Idle mixture is controlled in most cases by the size of the ___27___ and its ___28___ ___29___.
27. ________
28. ________
29. ________

The primary venturi is usually cast as part of the ___30___ body.
30. ________

When fiber blocks are installed under carburetors, they act as __31__ against __32__.

31. __________
32. __________

The balanced vent compensates to some degree for __33__ __34__ restriction.

TOPIC 4—CHOKE SYSTEMS

Assignment

1. Automotive Encyclopedia, pp. 22-1 to 22-5.
2. Crouse, Automotive Mechanics, pp. 145-49.

Introduction

A combustible fuel-air mixture richer than that needed for normal operation is essential in starting a cold engine. Nearly all carburetors are equipped with chokes to reduce the air supply and thus permit the mixture to become enriched. The chokes on some carburetors are operated manually, those on others by automatic control. The automatic chokes must be kept in good working condition and proper adjustment to secure proper mixture for starting and running.

One European make of carburetor has no choke, but is equipped with a special jet that feeds extra gasoline into the mixture to secure enrichment. This jet, called the "starter jet," is sometimes equipped to be controlled manually, and sometimes to be controlled automatically.

Related Information

Automatic control of chokes is accomplished by employing a mechanism that is controlled by temperature. When the engine is cold, the choke is closed to enrich the fuel-air mixture; as the engine warms up, the choke opens. The conventional thermostatic spring and vacuum piston type of automatic choke is slowly being replaced by a system utilizing only the thermostatic spring, which both opens and closes the choke valve. Since no pistons are used in this new system, one of the major problems encountered in servicing the conventional type of automatic choke is thus eliminated.

Fast idle. The fast idle has a function much more important than just keeping a cold engine from stalling. This function is to provide the lubrication needed to secure efficient engine operation--minimum wear and maximum performance. When an engine is left idle for any period of time the oil drains off the cylinder walls and piston rings. If the engine is started and idled slowly, the amount of oil thrown off the crankshaft and connecting rods will not be sufficient to oil the cylinder walls adequately to prevent excessive piston ring wear and ring blowby. The idle speed should therefore be sufficiently great for sufficient oil to be thrown onto the cylinder walls to provide the required lubrication and ring sealing. The fast idle speed required for this purpose is approximately that of the engine when the car is traveling 25 mph.

Many drivers pump the accelerator pedal several times before they attempt to start the motor. In doing so they cause additional fuel to be thrown into the carburetor by the accelerator pump. This fuel is not needed if the engine is equipped with an automatic control that is working properly. But if the control is not working properly they may get satisfactory starting and then be unable to understand why the motor stalls frequently until it is warmed up. When a customer reports that the engine in his car starts well, but then stalls and must be restarted several times, a mechanic should inquire whether the customer pumps the gas pedal before he starts the motor. If this is the case, the mechanic then has reason to believe that the automatic choke needs to be serviced.

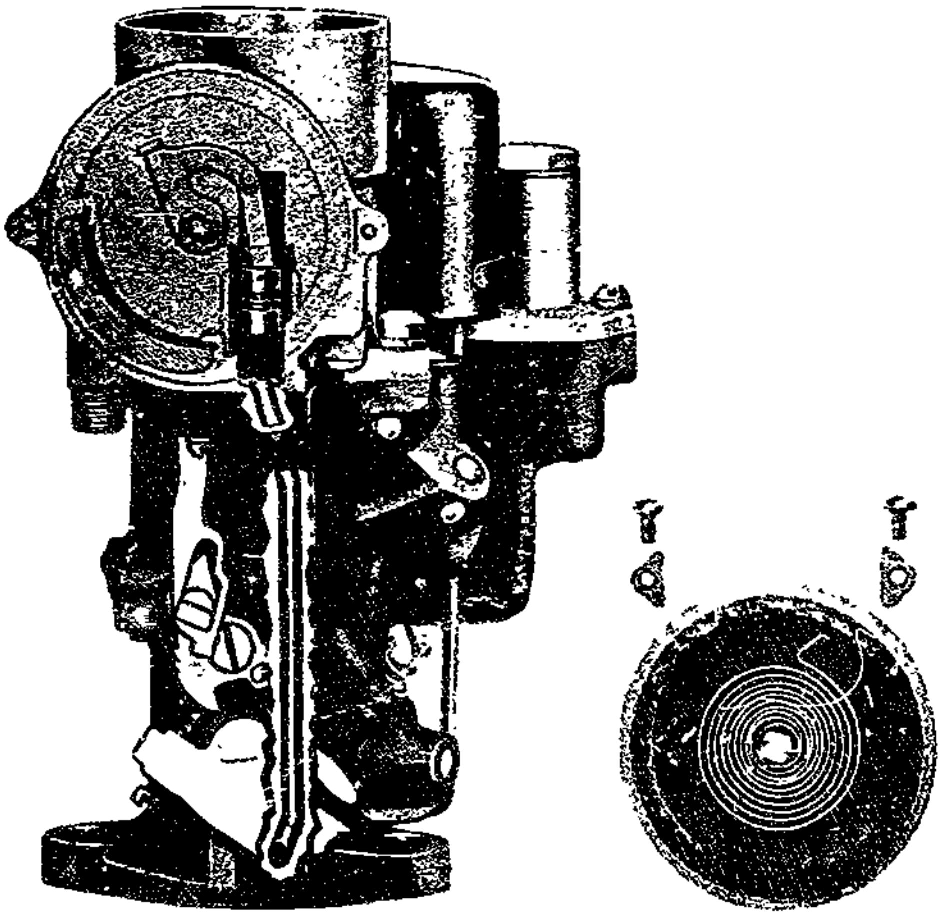

Fig. 18. A climate control circuit

Checkup

Choking devices are used to provide a(n) __1__ mixture for starting and a somewhat __2__ mixture for __3__.

Chokes are either __4__ or __5__ in operation.

1. ________
2. ________
3. ________
4. ________
5. ________

The thermostatic spring depends on engine ___6___ for expansion.

6. ___________

On the Carter climate control, the spring ___7___ the choke and the ___8___ piston ___9___ the choke.

7. ___________
8. ___________
9. ___________

Heat is obtained from the exhaust ___10___ to operate ___11___ springs.

10. ___________
11. ___________

The Sisson choke employs a(n) ___12___ to close the choke and a(n) ___13___ ___14___ to open it.

12. ___________
13. ___________
14. ___________

Some choke valves are set off-___15___ to allow air velocity to open the choke ___16___.

15. ___________
16. ___________

The fast idle is to keep the engine from ___17___ and to lubricate the ___18___ ___19___.

17. ___________
18. ___________
19. ___________

The thermostatic spring is made up of two metals with different ___20___ rates.

20. ___________

The same result as choking can be achieved by adding more ___21___ instead of restricting the ___22___.

21. ___________

TOPIC 5—AIR FILTERS AND CLEANERS

Assignment

1. Automotive Encyclopedia, pp. 24-1 to 24-3.
2. Crouse, Automotive Mechanics, pp. 132, 334-35.

Introduction

The proper functioning of a carburetor requires that the air cleaner must be clean, so that the air intake of the carburetor is sufficient to permit the proper fuel mixture. Therefore, when a carburetor is serviced, the air filter or cleaner should always be examined and cleaned or replaced, depending upon its type and its condition.

The air cleaner on a carburetor acts as the "nostrils" of the gasoline engine. It filters every bit of air that enters the carburetor, keeping out dust, lint, soot, and other foreign particles. A dirty filter element restricts the flow of air to the carburetor and this in turn causes the engine to run poorly. Furthermore, restricted air flow into an externally vented carburetor causes the air-fuel mixture to be even richer, which reduces the engine's efficiency. However, a clean air filter will not reduce engine efficiency because the carburetor has been calibrated with the cleaner installed. On all factory-equipped air cleaner installations, the added restriction of the air cleaner is compensated for in the carburetor jets so that the maximum performance is maintained.

Because the air cleaner works during every mile that a car, truck, or tractor is driven, an accumulation of some dirt is expected in normal use and is compensated for in its design and that of the carburetor.

Related Information

Fuel economy. Air cleaners are designed with a minimum of air resistance, and they can safely be used on any car for which they are recommended by the manufacturer without risk of impairing gasoline economy or engine performance. It is true that removing a restricted cleaner or a portion of it will increase the mileage, but this increase in mileage is obtained only at a sacrifice of other performance characteristics, such as acceleration and power, and carries with it the danger of increased engine wear. Increasing very low gasoline mileage by removing a part (or all) of the air cleaner is a dangerous practice, since it can damage an engine. The same increase in mileage could probably be obtained with the air cleaner installed correctly if the carburetor and engine were in good condition and properly adjusted. The gasoline mileage will be correct for a particular car when the air cleaner specified for that carburetor and engine is used.

If still greater fuel economy is desired, the solution is not to be found in the removal of engine safety devices, such as air cleaners. The correct approach is to make the necessary adjustment in air-fuel ratio and reduction in the size of carburetor jets. This will improve gasoline economy without endangering performance of the engine.

Oil-bath air cleaners. Some impairment of the function of an oil-bath type air cleaner can be caused by a too-high oil level. A high oil level in an oil-bath air cleaner may be due to servicing with too much oil or to the presence of water that could enter when the car is washed. Too high an oil level may cause either pull-over or splash-over. Of these two conditions, pull-over is probably the most dangerous, since it can result in gumming of the carburetor and also pulling of road dirt, mixed with the oil, into the carburetor. Danger of pull-over in warm climates can be minimized by the use of SAE 50 oil in the oil reservoir. Splash-over results in decreased cleaner efficiency due to loss of reservoir oil.

Air restriction can be caused by an overfilled oil reservoir in oil-bath types of cleaners; by a dirty or inadequately cleaned mesh element; by a jarred part in the cleaner; or by a dent in the original shape which restricts the passage of air. Any air restriction lowers gasoline mileage.

Oil-wetted air cleaners. The filter unit in an oil-wetted type air cleaner that is not serviced regularly may dry out. This drying can result in a loosening of the accumulated dirt that was originally trapped in the element, which can be sucked into the carburetor and engine.

Air leakage. Any air cleaner that stays unusually clean between servicing times should be examined thoroughly for air leakage. Air leakage might occur at the air cleaner neck or at the cleaner cover, as a result of a bent or warped condition, or possibly a broken or dried-up cover gasket.

Crankcase ventilation air cleaners. The inlet to the crankcase is protected by a somewhat smaller, but equally important, air cleaner. Its purpose is to remove dirt particles from air entering the crankcase. Crankcase ventilation air cleaners are supplied in two general types--oil-wetted mesh and oil bath.

The location of crankcase ventilation air cleaners varies on different makes of vehicles: some are placed on the oil filler tube; some on the tappet cover plate; and others on the overhead valve cover plate.

Service of crankcase breather air cleaners is performed in the same manner as service of carburetor air cleaners. The filter mesh (the more common

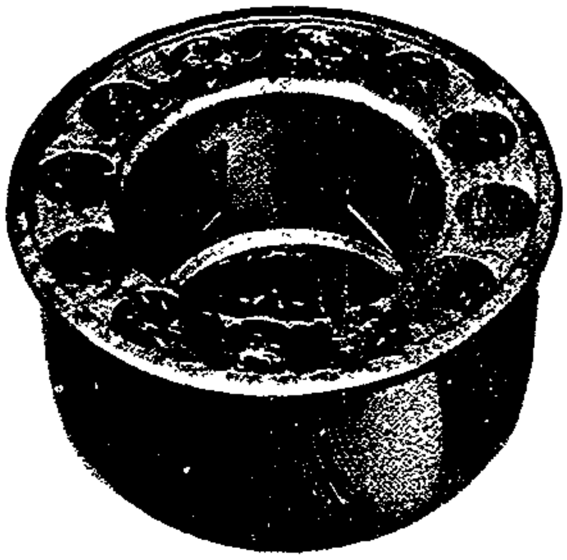

Fig. 19. Crankcase breather type filter

type) must be washed out in cleaning fluid, dried, and reoiled. In oil-bath types, the oil must be renewed and the mesh element washed out.

Checkup

The purpose of the air cleaner is to reduce the amount of __1__ and __2__.

1. ________
2. ________

The air cleaner also acts as a(n) __3__ arrestor.

3. ________

On the oil-bath type, the dirt is trapped in the oil because of the __4__ of the __5__ flow.

4. ________
5. ________

A highly efficient air cleaner is the __6__ element type.

6. ________

One of the least efficient types of air cleaner is the __7__ __8__ type.

7. ________
8. ________

The oil-bath type cleaner normally uses a(n) SAE __9__ oil, but a warm climate calls for SAE __10__ oil.

9. ________
10. ________

Small air cleaners are used on __11__ ventilation systems.

11. ________

As much as __12__ of air passes through an air cleaner every thousand miles.

12. ________

TOPIC 6—SUPERCHARGERS

Assignment : Automotive Encyclopedia, pp. 9-4 and 26-6 to 26-9.

Introduction

Superchargers are not used to any great extent on American passenger cars. There are several reasons for this, mainly the high initial purchase cost and the inefficiency with which they operate at low speeds. They are, however, used on some cars, and this makes it necessary for a mechanic to understand how superchargers function and to learn how to service them.

Checkup

Superchargers increase overall __ 1 __.
1. ________

Rootes-type blowers run at __ 2 __ to __ 3 __ times engine speed.
2. ________
3. ________

On a diesel engine only __ 4 __ is blown into the cylinders.
4. ________

The increase in horsepower of a supercharged engine is not proportional to the __ 5 __ consumed.
5. ________

The turbo-charger has the advantage of using __ 6 __ __ 7 __ for its source of power.
6. ________
7. ________

The supercharger is needed for __ 8 __ speed driving but not for __ 9 __ speed driving.
8. ________
9. ________

Superchargers are used extensively on __ 10 __ cars, and to a limited extent on __ 11 __ cars and trucks.
10. ________
11. ________

There are two general types of superchargers: the __ 12 __ type and the __ 13 __ type.
12. ________
13. ________

A centrifugal type supercharger can easily attain a speed of _14_.

Superchargers can be installed either between the _15_ and the _16_ or at the _17_ _18_ of the carburetor.

14. ________
15. ________
16. ________
17. ________
18. ________

unit C | CRANKCASE VENTS AND MANIFOLDS

TOPIC 1—CRANKCASE SMOG DEVICES

Assignment

1. Crouse, Automotive Mechanics, pp. 185-86.
2. Handbook for Installation and Inspection Stations: Motor Vehicle Pollution Control (Crankcase Devices), California Highway Patrol, pp. 1-36.

Introduction

Crankcase smog devices have been used on commercial and military vehicles for 25 years or more. Also, enclosed engines, such as those used for bus air conditioning as early as 1940, are installed in baggage compartments; and the crankcases of these engines are ventilated through crankcase smog control devices to prevent objectional odors from seeping into the passenger compartments and to remove water vapors from cold-running engines.

All new cars sold in California must be equipped with crankcase smog control devices. In addition, California law makes it mandatory that such devices be installed on other American-made cars manufactured since 1955 and which are registered in areas organized as pollution control districts. This extended use of crankcase smog control devices has presented many new problems and it is increasingly important for every mechanic to know how these devices function, how to install and service them, and how they relate to other engine units.

Related Information

Crankcase smog control systems are actually closed crankcase ventilation systems. In these systems the road draft tube on the crankcase is sealed shut or eliminated, and a tube is installed through which the gas vapors are drawn from the crankcase into the intake manifold, either directly or indirectly through the carburetor or air cleaner. From the intake manifold, the vapors go into the cylinders, where they are burned and many of the objectionable hydrocarbons thus eliminated. These closed crankcase systems are called "smog control devices," for their function is to reduce smog-producing elements.

Types of devices. The type of device connected below the carburetor has a spring-loaded valve with a metered hole that controls the air flow. When the vacuum is high (idling), the valve is seated, allowing air to enter through the metered hole only; but as engine speed increases, the valve is lifted off its seat and air passes around the valve as well as through the metered hole.

Another type is connected to both the intake manifold and the air cleaner through a diaphragm valve. At idle and low engine speed, the air passes through the valve body by means of a small tube connected below the carburetor. At speeds above idle, the valve is opened, and air flows through to the air cleaner.

The simplest type of all consists of a hose leading from the crankcase to the clean air side of the air cleaner, thus avoiding clogging the air cleaner. This is quite similar to devices sold to take care of excessive blowby of fumes caused by worn or stuck rings. Neither of these devices operates through a valve.

Deposits. All these smog control devices have one fault in common, though each may have different effects on engine operation: crankcase vapors contain fumes that leave deposits along paths they travel and therefore carbon accumulation occurs inside the hoses, valves, connections, and tubes. As this accumulation builds, the efficiency is reduced, and since the devices are calibrated to work with the carburetor, the function of the carburetor is disturbed to a point where rough engine idling, misfiring, loss of power at all speeds, or blowing of oil from the breather cap and seals results.

If the devices are connected through the air filter, the vapor from the crankcase will soon clog the carburetor air cleaner filter element. If the devices are connected to the carburetor below the air cleaner, the vapor will be pulled directly through the carburetor throat. Clogging of the air filter is thus avoided, but "dirty" air is drawn through the air bleeds and clogs them. Detergents and other cleaning agents in most modern gasolines keep fuel passages relatively clean, but there is no means of preventing buildup in the air bleeds, which can have a detrimental effect on gasoline economy. For example, in a 0.010-inch air bleed hole with a 0.002-inch deposit, the air flow will be reduced to less than half. The carburetor must be cleaned frequently to keep the air bleeds open.

Failure of a smog control device to function has the same effect as a plugged road draft tube--excessive crankcase pressures are built up and oil is thrown out the breather cap, past the rear main seal, and through any other openings. Care must therefore be taken to make sure that smog control devices are examined at regular intervals and given the service required. Factory recommendations should be followed in servicing those on new engines; those on older engines--especially those with excessive blowby--should be serviced at relatively short intervals. Cars used for slow or intermittent driving tend to accumulate more engine carbon than those driven at high speed for prolonged periods. The smog control devices on cars that are used for slow or intermittent driving will therefore plug up faster than those on cars driven fast for prolonged periods and must therefore be serviced at shorter intervals. The intervals may vary from 6,000 to 12,000 miles, with servicing of the devices ranging from cleaning to complete replacement.

Checkup

Crankcase ventilating systems are designed to remove 1 and 2 vapors.

1. ________
2. ________

Positive crankcase ventilation has been in use for more than 3 .

3. ________

The worst problem of smog control devices is 4 accumulation and 5 .

4. ________
5. ________

Crankcase vapors can be drawn into the engine 6 or 7 the carburetor or 8 ways.

6. ________
7. ________
8. ________

Stopped-up smog control devices can cause 9 to be thrown out of the 10 cap because of excessive crankcase 11 .

9. ________
10. ________
11. ________

In one type of valve, air goes through the center of the valve at 12 speeds and around and through the valve at 13 speeds.

12. ________
13. ________

An air bleed can be restricted more than 14 by 15 deposits.

14. ________
15. ________

Engine damage can result from a(n) 16 or inoperative crankcase ventilation system.

16. ________

A license to operate an official smog control device installation and inspection station will be issued only to stations meeting 17 18 .

17. ________
18. ________

Many crankcase devices designed to control blowby gases have been certified by the Motor Vehicle 19 20 21 .

19. ________
20. ________
21. ________

One of the basic characteristics of the tube-to-air cleaner type device is that it tends to 22 the air-fuel mixture.

22. ________

Combination systems that use a fixed orifice to control the flow to the intake manifold can provide 23 emission control under 24 engine speeds.

23. ________
24. ________

In order for the road draft tube to work effectively, the vehicle must be traveling at a speed of 25 or better.

25. ________

Any indication of a faulty engine, or an engine that tends to run rough, should be called to the attention of the car owner 26 a smog control device is installed.

26. ________

TOPIC 2—ENGINE MANIFOLDS

Assignment

1. Automotive Encyclopedia, pp. 23-1 to 23-6.
2. Crouse, Automotive Mechanics, pp. 90, 149-52.

Introduction

The intake manifold conducts the air-fuel mixture from the carburetor to the cylinders, and the exhaust manifold, usually made of a gray cast iron alloy, conducts the burned gases from the cylinders to the exhaust pipe. The exhaust manifold is internally streamlined to prevent the build-up of back pressure, for such pressure impairs cylinder scavenging. The exhaust manifold must be large enough to permit rapid expansion of the gases discharged into it from the cylinder and to permit rapid discharge of the gases into the exhaust pipe before excessive heat or pressure can build. This is also one of the provisions made to secure quiet motor operation.

The manifolds seldom cause trouble, but the mechanic should know why they are designed as they are and be prepared to identify and correct any conditions that may cause them to function improperly.

Checkup

Because of ___1___ temperatures and ___2___ from the exhaust, the manifold heat valve shaft is mounted on ___3___ steel bushings.

1. ________
2. ________
3. ________

Intake manifolds serving dual carburetors are designed so a(n) ___4___ number of cylinders is supplied by each carburetor ___5___, as required by the firing order.

4. ________
5. ________

It is important that a minimum of heat reaches the carburetor to avoid ___6___ ___7___ and ___8___.

6. ________
7. ________
8. ________

A groove is cut in the ___9___ of the carburetor where it is ___10___ to the manifold to equalize ___11___ in sections of the ___12___ manifold.

9. ________
10. ________
11. ________
12. ________

The usual arrangement of manifold parts is to "_13_" as many as possible.

13. ________

One of the important factors affecting distribution is that the heavy particles of the _14_ _15_ have greater _16_ than the lighter particles.

14. ________
15. ________
16. ________

The difficulty in designing intake manifolds is to provide each cylinder with the same _17_ and _18_ of fuel.

17. ________
18. ________

unit D | BASIC ELECTRICITY

TOPIC 1—NATURE OF ELECTRICITY

Assignment

1. Automotive Encyclopedia, pp. 30-1 to 30-5.
2. Fundamentals of Electricity and Magnetism (Section A, Delco-Remy Training Chart Manual), pp. 1-5 and 22-23.

Introduction

The basic principles of magnetism, electricity, and electronics must be understood before anyone can understand the functioning of automotive electrical equipment and systems. The increased use of a-c generators (alternators) and various transistorized units in the d-c systems--with every promise of many further developments along the same lines--makes it apparent that a mechanic must not only know electrical circuits, but that he must be continually studying to learn about the new improvements introduced and how they are serviced.

The molecular structure of matter, the makeup of atoms, the phenomena of magnetism, and the movement of electrons through solids are all subjects directly related to the study of harnessing electricity for useful work. In this study, the electron theory is of prime importance. The movement of electrons makes current flow possible, and current flow is electricity in motion--electricity at work. Electron flow is from negative to positive, which is directly opposite to an idea arbitrarily adopted over a century ago, called the current theory, which held that current flow was from positive to negative. Electric current is electron flow, free electrons moving along a given path, always from a negative source to a positive terminal.

Checkup

The accepted theory is that electricity is a flow of __1__.

Electric current is caused by the __2__ of electrons from one __3__ to __4__.

1. __________
2. __________
3. __________
4. __________

Similarly electrified bodies __5__ each other, while oppositely electrified bodies __6__ each other.

5. ________
6. ________

Ohms law is expressed by the formula __7__ over __8__.

7. ________
8. ________

One ohm is the amount of __9__ needed to limit the current rate to one __10__ when a pressure of one __11__ is applied.

9. ________
10. ________
11. ________

Two basic circuits are the __12__ and the __13__.

12. ________
13. ________

For electricity to flow, a circuit must be __14__.

14. ________

A good conductor is a material containing a substantial number of __15__ electrons.

15. ________

To create a flow of electrons through a circuit, it is necessary to have an electrical __16__.

16. ________

The unit used to measure electrical power is the __17__.

17. ________

In a series circuit the total resistance is the __18__ of the __19__ resistances.

18. ________
19. ________

The decrease in voltage as current passes through a resistor is known as the __20__ __21__.

20. ________
21. ________

Visualizing the existence of open spaces in all materials helps in understanding __22__ flow in seemingly __23__ material.

22. ________
23. ________

The electrical unit for measuring work is called the __24__.

24. ________

TOPIC 2—MAGNETS AND MAGNETISM

Assignment

1. Automotive Encyclopedia, pp. 30-5 to 30-10.
2. Fundamentals of Electricity and Magnetism, (Section A Delco-Remy Training Chart Manual), pp. 6-21.

Introduction

Magnetism is used to operate many electrical units of an automobile. Charging circuits, ignition components, and starting motors all work on magnetic principles. The mechanic who understands these principles and knows how to employ them has little trouble in locating improper functioning in any of these units or in servicing them.

When studying this subject it will be found that reference is made to both the right and left hand rule of determining the direction of current flow. To avoid confusion between these two rules, it should be kept in mind that the right hand rule is based on the current theory; that is, that current travels from positive to negative. The left hand rule is based on the electron theory; that is, electrons travel from negative to positive (see Topic D-1). Both rules will provide the same answer if properly applied. Some authors use the word current to mean electron flow; however, whenever the word current is used, it is usually referring to the current theory. Electron flow is usually described as such.

Checkup

Like poles ___1___ and unlike poles ___2___ each other.

Soft iron loses nearly all of its ___3___ ___4___ when it is removed from the magnetic ___5___.

There is always a magnetic ;field around a conductor carrying an electric ___6___.

The right hand rule is used with the ___7___ theory, and the left hand rule is used with the ___8___ theory.

1. __________
2. __________
3. __________
4. __________
5. __________
6. __________
7. __________
8. __________

The right hand rule is used to determine the ___9___ of coils.

9. __________

A solenoid is an ___10___ core magnet.

10. __________

The strength of a magnetic field surrounding a wire is in direct ___11___ to the number of ___12___ and the strength of the ___13___.

11. __________
12. __________
13. __________

The strength of a magnet is often discussed in terms of ___14___ turns.

14. __________

The kind of iron used in the core of electromagnets and the ___15___ of lines of force created have a pronounced effect on the total ___16___ ___17___ obtained.

15. __________
16. __________
17. __________

When the only function of a solenoid is the closing of switch controls, it is called a(n) ___18___ switch.

18. __________

The force of attraction of a magnet is inversely proportional to the ___19___ of the ___20___ fromthe magnet.

19. __________
20. __________

TOPIC 3—CIRCUITS, SYMBOLS, AND CONDUCTORS

Assignment

1. Automotive Encyclopedia, pp. 36-4 to 36-10 and 36-25.
2. Fundamentals of Electricity and Magnetism (Section A, Delco-Remy Training Chart Manual), p. 22.

Introduction

The mechanic must be qualified to replace original wiring or to install new wiring for added accessories. In many instances to do the work he must read the manufacturer's drawing or blueprint, a skill that requires interpretation of the symbols used and knowledge of electrical circuits and conductors.

Checkup

A circuit is a(n) __1__ path for the __2__ of electricity.

1. __________
2. __________

If the wire is too small in diameter, the resistance will be too __3__ for proper operation of the particular electrical unit.

3. __________

Circuit __4__ and fuses protect the circuit from __5__ in cases of __6__ and __7__.

4. __________
5. __________
6. __________
7. __________

High tension cable should be designed to withstand the effects of __8__, __9__, __10__, __11__, __12__, and __13__.

8. __________
9. __________
10. __________
11. __________
12. __________
13. __________

A circuit which offers only one path for electricity to follow is called a(n) __14__ __15__.

14. __________
15. __________

A circuit which offers more than one path for electricity to follow is considered a(n) __16__ __17__.

16. __________
17. __________

A circuit that comprises both single and multiple paths for current flow is called a __18__ - __19__ __20__.

18. __________
19. __________
20. __________

Resistor ignition cable is made up of __21__ and __22__ thread, treated with __23__.

21. __________
22. __________
23. __________

When a five-foot piece of 14-gauge wire, carrying a 75 cp lamp load, is lengthened to 15 feet, the circular mil area of the new conductor needs to be more than __24__ the original.

24. __________

unit E | BATTERIES

TOPIC 1—BATTERY CONSTRUCTION

Assignment

1. Automotive Encyclopedia, pp. 36-13 to 36-16.
2. Crouse, Automotive Mechanics, pp. 200-04.
3. Storage Batteries (Section B, Delco-Remy Training Chart Manual), pp. 1-7.

Introduction

One main function of the battery is to supply current for the operation of the starter and the ignition system to get the engine running. The resulting loss of charge is compensated for by the generator, which recharges the battery during engine operation. Another function of the battery is to supply current to the other electrical circuits during the periods when the generator is not charging. To understand why the battery functions as it does, the mechanic must be familiar with its construction.

Checkup

Wooden sheets, ___1___ ___2___ matted into sheets, and porous ___3___ sheets are used as separator material in batteries.

1. ____________
2. ____________
3. ____________

Negative plate groups normally contain ___4___ more ___5___ than the corresponding ___6___ groups.

4. ____________
5. ____________
6. ____________

Charged negative plates contain ___7___ lead which is ___8___ in color.

7. ____________
8. ____________

Charged positive plates contain ___9___ ___10___, which has a ___11___ color.

9. ____________
10. ____________
11. ____________

The electrolyte for lead acid batteries is made up of ___12___ and ___13___ ___14___.

12. ____________
13. ____________
14. ____________

Cells are connected in __15__ to obtain the battery __16__ desired.

15. ________
16. ________

The basic reason for adopting 12-volt electrical systems for passenger cars was to improve __17__ performance and provide greater __18__ __19__ on high-compression eight-cylinder engines.

17. ________
18. ________
19. ________

The lead acid storage battery is a(n) __20__ device for converting __21__ energy to __22__ energy.

20. ________
21. ________
22. ________

Battery cases are usually made of hard __23__ or __24__ composition.

23. ________
24. ________

The greater the number of plates, or plate __25__, the greater the __26__ of the cell.

25. ________
26. ________

TOPIC 2—PRINCIPLES OF BATTERY OPERATION

Assignment

1. Automotive Encyclopedia, pp. 36-16 to 36-19.
2. Crouse, Automotive Mechanics, p. 204.
3. Storage Batteries (Section B, Delco-Remy Training Chart Manual), pp. 8-13.

Introduction

Once the apprentice mechanic has studied the various components of a battery, he should learn the function of each component and how it contributes to the function of the battery as a whole.

Checkup

Cell voltage depends primarily upon the ___1___ between plate ___2___.

1. ___________
2. ___________

While a battery is discharging, the ___3___ acid is used up and replaced by ___4___.

3. ___________
4. ___________

The sulfate radical ___5___ with the lead at both ___6___ to form lead ___7___.

5. ___________
6. ___________
7. ___________

Water in the battery is used up when ___8___ occurs.

8. ___________

A fully charged battery is not likely to freeze because the amount of ___9___ in the electrolyte is at a minimum.

9. ___________

Charging drives the ___10___ out of the ___11___.

10. ___________
11. ___________

After the battery is quick-charged, the ___12___ ___13___ reading may be erroneously low because of the ___14___ in the electrolyte.

12. ___________
13. ___________
14. ___________

The percent of sulfuric acid remaining in the ___15___ determines approximately how much ___16___ is available.

15. ___________
16. ___________

76

To compensate for the effect of temperature on a specific gravity reading, 17 gravity points must be 18 to the gravity reading for every 19 of electrolyte temperature above 20 F.

17. ________
18. ________
19. ________
20. ________

Separators are damaged by 21 .

21. ________

Any 22 in the water detrimentally affect the life and performance of a battery.

22. ________

TOPIC 3—BATTERY SERVICE

Assignment

1. Automotive Encyclopedia, pp. 36-19 to 36-26.
2. Crouse, Automotive Mechanics, pp. 356-62.
3. Storage Batteries (Section B, Delco-Remy Training Chart Manual), pp. 14-20.

Introduction

After the mechanic learns how a battery is made and how it functions, his next step is to learn how to determine its condition, and service it when required. The exterior condition of a battery can be checked by visual inspection, but the interior condition can be checked only by the use of proper testing equipment.

Checkup

The usual methods used in converting alternating to direct current are ___1___ - ___2___, ___3___ ___4___ rectifiers, and ___5___ - ___6___ rectifiers.

1. ________
2. ________
3. ________
4. ________
5. ________
6. ________

High charging rates can be used, providing the temperature of the electrolyte does not exceed ___7___ F and charging does not cause excessive ___8___ and loss of electrolyte.

7. ________
8. ________

Behavior during charge can indicate many important ___9___ of a storage battery.

9. ________

Batteries are tested to determine the ___10___ condition of the electrolyte and the ___11___, or ability to deliver ___12___.

10. ________
11. ________
12. ________

The light load test, claimed to be simpler and more conclusive than the hydrometer test, is accomplished with a(n) ___13___.

13. ________

When water is added, the battery should be operated for
a sufficient time to thoroughly __14__ the water with the 14. ________
electrolyte __15__ a sample is taken with a hydrometer. 15. ________

The voltage regulator protects the battery from serious
overcharging and __16__. 16. ________

Any condition in a battery which affects its voltage will
cause a serious deviation from normal __17__ 17. ________
characteristics.

Some batteries used in hot climates have a specific
gravity of __18__ when fully charged. 18. ________

It is always advisable to use __19__ or other water that is 19. ________
relatively free from __20__ when filling a battery. 20. ________

Battery __21__ and terminals should be tested for 21. ________
voltage __22__. 22. ________

The gases that form in the battery during charging
are very __23__. 23. ________

With a high rate charger, batteries can be charged
in approximately __24__. 24. ________

The electrical potential of a battery while idle is
commonly called the __25__ __26__ voltage. 25. ________
26. ________

A battery subjected to severe __27__ will soon be ruined. 27. ________

Visual inspection of the battery will disclose __28__ 28. ________
damage to the case or cell covers.

Sulfuric acid is very __29__ and will destroy most things 29. ________
with which it comes in contact.

The basic instruments required for battery testing are 30. ________
the __30__, __31__, and __32__. 31. ________
32. ________

Specific gravity readings should be used cautiously
unless the __33__ fully-charged specific gravity of the 33. ________
battery is known.

During battery quick-charging the __34__ of the electrolyte 34. ________
should be checked and the charging stopped if the
electrolyte becomes __35__. 35. ________

Acid must always be poured __36__ into the battery water. 36. ________

Insufficient watering can cause permanent changes in
battery __37__. 37. ________

When more complete battery testing is contemplated, the 38 rate 39 tester may be added.

38. ______
39. ______

Continued operation in either hot or cold climates usually requires a tailored adjustment of the 40 .

40. ______

unit F | AUTOMOTIVE LIGHTING SYSTEMS

TOPIC 1—LIGHTING SYSTEM DEVELOPMENT

Assignment ⁞ Optics and Wheels, General Motors, pp. 3-31.

Introduction

The science of optics, which deals with the nature and properties of light, has made a great contribution to the continuous development of the automobile, making it not only more dependable,but safer. A study of the developments in optics and light will show how this knowledge has been applied to the night-driving problem. The modern headlight system was developed cooperatively by the automotive industry, lamp manufacturers, safety groups, and state motor vehicle agencies.

Checkup

Until recent times the source of all light, other than that from the sun, was ___1___. 1. __________

Since 1929 all bulbs have been made so accurately that the ___2___ is at the focus when the bulb is put into the socket. 2. __________

The intensity of light varies ___3___ with the ___4___ of the distance.
3. __________
4. __________

A triangular-shaped wedge of glass is called a(n) ___5___. 5. __________

Flutes and prisms are used to ___6___ the light beam. 6. __________

Only a portion of the night-lighting problem can be solved by ___7___ on the car. 7. __________

Tail lights have a section that will ___8___ the light from the ___9___ of an overtaking car.
8. __________
9. __________

The sealed reflector maintains lighting ____10____ as the car grows older.

10. ____________

The first horseless carriage either had no lights at all or adapted ____11____ ____12____ from horse-drawn carriages.

11. ____________
12. ____________

The standard of measurement for light is the ____13____.

13. ____________

Fog droplets act as many-sided ____14____ which reflect the light back in ____15____ direction.

14. ____________
15. ____________

The first filaments used in electric lights were ____16____ and easily broken, making them ____17____ for automotive use.

16. ____________
17. ____________

Acetylene was easily ____18____ for vehicle ____19____.

18. ____________
19. ____________

One of the first laws of light is that it travels in a(n) ____20____ ____21____.

20. ____________
21. ____________

Reflectors can increase the light from a low candlepower filament by as much as ____22____ times.

22. ____________

The starter requires a battery and generator, thus making the ____23____ ____24____ system possible.

23. ____________
24. ____________

TOPIC 2—ALIGNMENT AND TROUBLESHOOTING

Assignment ⋮ Automotive Encyclopedia. pp. 36-1 to 36-6.

Introduction

No matter how well the mechanic has mastered the theory of automotive lighting and individual lighting systems, the real test of his knowledge will be in his ability to locate and correct any electrical difficulties that he encounters in those lighting systems.

Checkup

A circuit breaker is designed to ____1____ and ____2____ a circuit when a short circuit occurs.

1. __________
2. __________

Light ____3____ are used to reduce voltage loss.

3. __________

The "second wire" is the ____4____ of the car body and ____5____.

4. __________
5. __________

Sealed beam head lamps do not need to be ____6____.

6. __________

A voltage drop test made between the ____7____ and each individual lamp will pinpoint excessive ____8____.

7. __________
8. __________

Short life or frequent burning out of headlamps results from excessive ____9____.

9. __________

Voltage loss (or drop) can be minimized by using a wire of sufficient ____10____ to carry the current ____11____.

10. __________
11. __________

The wiring in lighting circuits should be inspected periodically for ____12____ and ____13____ connections, and ____14____ insulation.

12. __________
13. __________
14. __________

Dim lights in older cars are often traced to poor connections to the __15__ or __16__.

15. __________
16. __________

Draw a simple automobile wiring system, naming various lights and switches.

TOPIC 3—LEGAL REQUIREMENTS FOR LIGHTING

Assignment : Vehicle Code, State of California, 1965, pp. 294-318.

Introduction

The mechanic must be prepared to maintain and repair original lighting equipment and to install new lighting equipment on vehicles if necessary. He also must know the legal requirements pertaining to lighting for motor vehicles. These requirements are not the same for every state, but at present an electrical lighting code for motor-driven vehicles that operate on the highways is being developed that will be recommended for adoption as a nationwide code.

Checkup

Headlights are required to be on when there is not sufficient light to render clearly discernible any person or vehicle at a distance of ___1___.

1. __________

No spotlight shall be equipped with any lamp source exceeding ___2___ watts.

2. __________

Fog lamps should be mounted at a height of not less than ___3___ nor more than ___4___ from the road.

3. __________
4. __________

Every vehicle shall be equipped with ___5___ or more tail lamps capable of exhibiting ___6___ light plainly visible at a distance of ___7___ to the rear.

5. __________
6. __________
7. __________

During darkness, every motor vehicle other than a(n) ___8___ shall be equipped with at least ___9___ lighted headlamps with at least one on each side of the ___10___ of the vehicle.

8. __________
9. __________
10. __________

The stop lamp on every new vehicle must be visible from a distance of ___11___ to the rear both during normal ___12___ and at night.

11. __________
12. __________

Flashing lights are permitted on vehicles for indicating a left or right ____13____, as warning lights on certain disabled or parked vehicles, and for use on authorized ____14____ vehicles.

13. ____________
14. ____________

No vehicle shall be equipped with any lights not ____15____ or ____16____ by the code.

15. ____________
16. ____________

Whenever any motor vehicle is parked or standing upon a highway, any headlamp that is lighted shall be ____17____ or on the lower ____18____.

17. ____________
18. ____________

unit G | IGNITION SYSTEM

TOPIC 1—CONSTRUCTION AND OPERATION

Assignment

1. Automotive Encyclopedia, pp. 35-1 to 35-9.
2. Better Ignition, Delco-Remy Service Manual, pp. 1-10.
3. Crouse, Automotive Mechanics, pp. 233-36 and 239-44.
4. The Ignition Circuit (Section D, Delco-Remy Training Chart Manual), pp. 1-7 and 10-16.

Introduction

The ignition system is the most vital of the automotive electrical systems. It is the only system that operates continuously while the engine is running and is mechanically controlled. This system must be capable of a high degree of proficiency in spark quality and synchronization.

Checkup

The ignition circuit has the job of producing and delivering 1 2 3 to each spark plug in turn at correctly 4 intervals.

1. ________
2. ________
3. ________
4. ________

The current of the vibrating coil flowing through the 5 winding creates a magnetic field, which attracts the 6 carrying one of the sets of contact 7 .

5. ________
6. ________
7. ________

Full vacuum control is possible because the speed of the 8 through the carburetor air horn is directly related to engine 9 .

8. ________
9. ________

The condenser is made up of two thin 10 plates separated by a(n) 11 .

10. ________
11. ________

Coil characteristics must be balanced with 12 - 13 of time, so that at top engine speed the ignition coil will still build up sufficiently for good 14 .

12. ________
13. ________
14. ________

A coil is supplied with 6 or 12 volts and produces a voltage 15 to 16 times greater.

15. ______
16. ______

"Build-up" on positive points happens when the 17 builds up too fast in the 18 coil due to coil design or circuit 19 .

17. ______
18. ______
19. ______

The highest voltage requirements exist at 20 engine speed with very 21 acceleration.

20. ______
21. ______

The condenser is connected directly across the distributor 22 23 .

22. ______
23. ______

The ignition coil has 24 circuits in it.

24. ______

One of the distributor functions is to 25 and 26 the circuit between the 27 and the ignition 28 .

25. ______
26. ______
27. ______
28. ______

Negative voltage at the center electrode results in 29 and more consistent sparking voltage than is obtained when the center electrode is 30 .

29. ______
30. ______

Engine speed, compression, carburetor mixture ratios, spark plug temperature, and width and shape of plug gap all affect the 31 required to produce the spark.

31. ______

Resistors are bypassed while the engine is being cranked to compensate for 32 33 .

32. ______
33. ______

Resistors are built into rotors to suppress high frequency 34 in the 35 circuit.

34. ______
35. ______

The purpose of the ignition condenser is to reduce 36 at the 37 38 .

36. ______
37. ______
38. ______

The difference in voltage on the two sides of the condenser dielectric creates the 39 action which brings the voltage and current to a(n) 40 stop.

39. ______
40. ______

With special cam and breaker lever combinations, it is possible to obtain 41 to 42 usable cam angle on an 8-cylinder distributor.

41. ______
42. ______

Too close a contact point opening results in a slow rate of 43 .

43. ______

In an 8-cylinder engine, 12,000 sparks are produced every mile traveled; at 90 mph, the ignition is delivering these surges at the rate of 44 per second.

44. ______

The voltage usually needed to establish spark across the spark plug gap is from ___45___ to ___46___.

45. __________
46. __________

Spark is advanced to allow for the ___47___ time of the fuel mixture.

47. __________

The vacuum advance supplies the additional spark advance needed to compensate for slower-burning ___48___ mixtures at part-throttle operation.

48. __________

The quick collapse of the magnetic field induces as much as ___49___ in the primary coil and ___50___ in the secondary coil.

49. __________
50. __________

TOPIC 2—TRANSISTORIZED SYSTEM

Assignment

1. Crouse, Automotive Mechanics, pp. 234-37.
2. Introduction to Transistor Operation and Applications (Section W, Delco-Remy Training Chart Manual), Charts 1-6.

Introduction

Transistorized ignition systems are arousing considerable interest, and they are being used more widely as time goes by. A number of manufacturers have developed a variety of complete systems and conversion kits. Some of the major car manufacturers are offering transistorized ignition systems as extra cost options. As the cost of these systems is brought down and the components are improved, transistorized systems will probably become standard equipment on most passenger cars.

Related Information

Conventional ignition systems require frequent adjustment and repair, particularly at the weakest link--the contact points. High-compression engines require a high ignition output, hence the change from the 6-volt to the 12-volt system. One reason this change in voltage was necessary was that the current-carrying capacity of ignition points is limited to approximately 3 to 5 amperes. Since the current could not be increased, it was necessary to increase the voltage.

The industry as a whole was rather reluctant to change. The main advantage of a 12-volt system is in ignition and engine starting, but the disadvantages are many: shorter lamp bulb life, higher rate of battery self-discharge, insulation problems due to higher voltages, and the like. If transistorized systems had been introduced earlier, probably the 6-volt system would not have been abandoned, because the transistorized system is designed primarily to increase the life of contact points or eliminate them entirely.

Conversion kit systems. The change to a transistorized system is made in several ways. The simplest and least costly way is to use conversion kits now on the market. The ignition points are retained, but the condenser is removed. The contact points are used as a trigger to open and close the transistor primary circuit, which operates the secondary circuit. Some coils operate with currents as high as 15 amperes.

In transistorized systems, the points carry approximately 1/10 of the 3- or 4-ampere current of a conventional system. This reduction in amperage gives the points greater life and reliability.

An additional advantage of this type of transistorized system is that voltage output is not greatly affected by dwell time. However, this does not eliminate point problems due to fiber block wear and cam lobe wear, which can change overall timing and vary cylinder-to-cylinder firing.

Magnetic control systems. A second type of transistorized system is magnetically controlled. One method uses a distributor much like the standard distributor except that the points are replaced by a magnetic pulse generator. The pulse generator is similar to a low-voltage magneto, the pulses being used to trigger the transistor primary circuit with the help of an amplifier unit.

One manufacturer supplies a magnetic pulse generator mounted on an adapter plate to replace the points and condenser. A pulse amplifier transistor and other electronic components are mounted on a printed circuit and sealed.

Capacitor discharge systems. A third type of transistorized system, the capacitor discharge system, has conventional breaker points which are used to trigger the transistors. A means is provided to charge the capacitor, and the capacitor can be discharged either directly to the spark plugs or to the primary circuit of the coil. This system is a bit more complicated and more costly than the other transistorized systems, and at the present time is used primarily for experimentation.

Detailed information on each type of system is available from the manufacturers. Service data manuals carry service information on the units in most common use.

Checkup

The primary purpose of transistorized systems is to improve point __1__ or __2__ points entirely.

1. __________
2. __________

Contact point current-carrying ability is limited to __3__ to __4__ amperes.

3. __________
4. __________

Transistorized systems using contact points are still subject to problems due to fiber block and cam lobe __5__.

5. __________

Transistors are __6__ devices which act as electrical __7__.

6. __________
7. __________

The small current in the emitter-__8__ circuit controls a much larger current in the emitter-__9__ circuit.

8. __________
9. __________

The emitter- 10 circuit is used in place of a set of 11 12 .

10. ________
11. ________
12. ________

The emitter- 13 circuit can be controlled by 14 or 15 means.

13. ________
14. ________
15. ________

Resistors are placed on the 16 of ignition units so that heat can be 17 more readily.

16. ________
17. ________

The transistor is turned 18 with the ignition switch and 19 by the voltage generated by the magnetic pulse.

18. ________
19. ________

Since the transistor is capable of carrying more current than the contact points, more 20 voltage is available at 21 engine speeds.

20. ________
21. ________

With a transistor ignition system, the points carry 22 of the current of those in a conventional ignition system.

22. ________

TOPIC 3—MAINTENANCE AND TESTING

Assignment

1. Automotive Encyclopedia, pp. 35-31 to 35-32.
2. Better Ignition, Delco-Remy Service Manual, pp. 10-16.
3. Crouse, Automotive Mechanics, pp. 384-89.
4. The Ignition System (Section D, Delco-Remy Training Chart Manual), pp. 8, 9, and 20-23.
5. Introduction to Transistor Operation and Application (Section W, Delco-Remy Training Chart Manual), Charts 7-10.

Introduction

The ignition system must be tested regularly because of its intricate mechanical operation. Regular, methodical inspections by the mechanic will ensure better, more reliable performance of the vehicle and, in the end, will save the car owner time and money.

Checkup

All the wiring switches and connections should be ___ 1 ___ inspected and checked for ___ 2 ___ or ___ 3 ___ connections.

1. ________
2. ________
3. ________

A low-capacity condenser can cause ___ 4 ___ starting.

4. ________

Clogged engine breather pipes and piston blowby create crankcase ___ 5 ___ which may force ___ 6 ___ up into the distributor.

5. ________
6. ________

Misfiring will occur when the voltage required to fire a plug ___ 7 ___ the voltage available from the ___ 8 ___ ___ 9 ___.

7. ________
8. ________
9. ________

As high as a ___ 10 ___ leakage can occur outside a spark plug under adverse conditions if the plug is left ___ 11 ___.

10. ________
11. ________

Contact point work is simplified by a one-piece __12__ of the circuit breaker level and __13__ support.

12. ________
13. ________

Emery cloth must __14__ be used to clean __15__ points.

14. ________
15. ________

A good condenser tester should be able to test the condenser for __16__ or __17__ and to measure the __18__ and __19__ of the insulation.

16. ________
17. ________
18. ________
19. ________

Contact points which have been used often will make contact over an even __20__ area than can be expected with new points.

20. ________

If points need cleaning or replacement, the distributor should be __21__.

21. ________

Ignition coil primary windings can be checked by connecting a(n) __22__ across the two ignition coil __23__ terminals.

22. ________
23. ________

Used points are best checked with a dial indicator or __24__ meter.

24. ________

A cam lubricator impregnated with a(n) __25__ __26__ lengthens the life of cams and rubbing blocks.

25. ________
26. ________

If worn, distributor housing bushings will allow excessive side __27__ and __28__.

27. ________
28. ________

Low point pressure will cause the contact points to __29__ and __30__.

29. ________
30. ________

Increasing the cam angle decreases the __31__ __32__ opening.

31. ________
32. ________

The operation of the centrifugal advance mechanism can be checked through the full distributor speed range on a(n) __33__.

33. ________

It must be remembered that loose or corroded connections cause __34__, which will impair ignition performance.

34. ________

TOPIC 4—SPARK PLUGS

Assignment : Automotive Encyclopedia, pp. 17-2 and 35-18 to 35-22.

Introduction

Efficient ignition of an engine depends upon proper performance of the spark plugs. Spark plugs may look alike, but their performance characteristics vary. Considering the fact that ignition systems are designed to be used with certain types of spark plugs, the best performance can be obtained only by using those plugs engineered to meet specific engine and driving conditions.

Checkup

For tightening a spark plug, a(n) ____1____ wrench should be used.

1. __________

If the engine is operated for long periods of low speed at part-throttle opening, ____2____ plugs will tend to foul.

2. __________

The spark plug gap size is dependent upon the ____3____ ratio, characteristics of the ____4____ chamber, and the characteristics of the ____5____ system.

3. __________
4. __________
5. __________

An advantage of the wider spark plug gap is that it can hold more fuel ____6____ than a narrow gap, and consequently there is better opportunity to ____7____ it.

6. __________
7. __________

Spark plug life can be materially extended by frequent ____8____ and ____9____.

8. __________
9. __________

Systems with high capacity are subject to more rapid ____10____ wear than systems with low capacity.

10. __________

The center wire temperature ranges from a low of ____11____ at 10 mph to a high of ____12____ at 80 mph.

11. __________
12. __________

The material from which the insulator is made and its shape will affect spark plug __13__. 13. ____________

Engine designers select spark plugs which will give good performance for __14__ driving conditions. 14. ____________

Before installing a spark plug, it is important to make certain that the __15__, __16__, and insulator are clean. 15. ____________
16. ____________

Partly fouled plugs do not allow __17__ to build up enough to jump the gap. 17. ____________

A plug with a heat range too high for operating conditions will cause __18__. 18. ____________

unit H

STARTERS AND STARTING MOTORS

TOPIC 1—CONSTRUCTION AND OPERATION

Assignment

1. Automotive Encyclopedia, pp. 33-24 to 34-4.
2. Cranking Motors and Series-Parallel Switches (Section C, Delco-Remy Training Chart Manual), pp. 2-7.
3. Crouse, Automotive Mechanics, pp. 205-14.

Introduction

Many types of internal combustion engines--and all those used on modern automobiles--are equipped with electric starters, sometimes referred to as cranking motors. The dependability and efficiency of the present-day "self starter" has progressed to the point where there is no other way to start the car. The old-time crank is no more, and the advent of the automatic transmission has made it virtually impossible to start a car unless the starter is functioning properly. It has become imperative, therefore, that this unit work properly every time it is needed.

Checkup

A starting motor operates on the principle that a current-carrying conductor tends to move from a(n) __1__ magnetic field to a(n) __2__ magnetic field.

1. __________
2. __________

A shunt-connected coil is used for the purpose of __3__ the top __4__ speed of a starting motor.

3. __________
4. __________

The natural magnetic strength of the magnetic poles is aided by the __5__ winding.

5. __________

An assist spring pushes the commutator end of the armature against a(n) __6__ washer, which acts as a(n) __7__ to slow down the __8__ speed of the armature when the clutch is disengaged.

6. __________
7. __________
8. __________

Two field windings are connected in ___ 9 ___ to each other and in ___ 10 ___ with the armature to produce a high cranking torque.

9. __________
10. __________

When the armature loops rotate and reverse the ___ 11 ___, flow is reversed by the ___ 12 ___.

11. __________
12. __________

Motor brushes are usually located back of the static neutral point to prevent excessive ___ 13 ___ and to obtain more ___ 14 ___ operation.

13. __________
14. __________

With no load, the speed of a series-wound motor will continue to ___ 15 ___ to such an extent that ___ 16 ___ force will destroy the ___ 17 ___.

15. __________
16. __________
17. __________

In all starting motors, the adjacent pole shoes must be of ___ 18 ___ polarity.

18. __________

Wave-wound armatures have only ___ 19 ___ paths for current flow; lap-wound armatures have as many paths as there are ___ 20 ___.

19. __________
20. __________

TOPIC 2—STARTER DRIVES AND CONTROLS

Assignment

1. Automotive Encyclopedia, pp. 34-8 to 34-15.
2. Cranking Motors and Series-Parallel Switches, (Section C, Delco-Remy Training Chart Manual), pp. 8-14, 16, and 20-22.
3. Crouse, Automotive Mechanics, pp. 211-14.

Introduction

Several different methods are used to engage and disengage the starting motor pinion and the engine starting gear. Generally, sufficient torque cannot be developed by a starting motor without some means of gear reduction. Gear reduction mechanisms are of several different designs, but the purpose is always the same--to couple the starting motor to the engine in such a way that the engine will turn over with sufficient speed to start. Once the engine has started, the coupling must automatically remove itself from the engine and this, too, is a vitally important function of the starter unit.

Checkup

The Bendix drive depends on ___1___ to provide meshing of the ___2___ ___3___ with the engine flywheel ring gear.

1. __________
2. __________
3. __________

The Dyer drive is designed to make it impossible to start another cranking cycle without completely ___4___ the shift lever.

4. __________

For heavy duty cranking, a ___5___ clutch type Bendix drive is used.

5. __________

The series-parallel system provides ___6___ voltage for cranking and ___7___ voltage afterwards.

6. __________
7. __________

The armature is protected from excessive speed by the overrunning ___8___ when the pinion remains enmeshed and the engine ___9___.

8. __________
9. __________

Magnetic ___10___ are used with some Bendix-drive starting motors to ___11___ the motor switch.

10. ____________
11. ____________

During the cranking interval, lights and other accessories are supplied by ___12___ batteries in the series-parallel system.

12. ____________

Series-paralled circuits can be of the ___13___ or the ___14___ type.

13. ____________
14. ____________

The solenoid switch on a starting motor ___15___ the pinion in mesh with the flywheel before the motor is supplied with ___16___.

15. ____________
16. ____________

TOPIC 3—TROUBLESHOOTING STARTERS

Assignment

1. Automotive Encyclopedia, pp. 34-4 to 34-8.
2. Cranking Motors and Series-Parallel Switches (Section C, Delco-Remy Training Chart Manual), pp. 15, 17, 18-19 and 23-24.
3. Crouse, Automotive Mechanics, pp. 363-70.

Introduction

Any mechanic must have a thorough understanding of troubleshooting, a vital factor in the servicing of starting motors. Many mechanics are inclined to be parts changers rather than good repairmen, because they lack a sound knowledge of automotive theory and the ability to read and understand manufacturers' charts.

Checkup

Because of the high current draw of starting motors under load, ___ 1 ___ must be of adequate size and connections clean and ___ 2 ___ to prevent excessive voltage drop.

1. __________
2. __________

To determine how fast a starting motor will run and the current draw at a given voltage, the ___ 3 ___ - ___ 4 ___ test is used.

3. __________
4. __________

If the commutator is out of round, worn, or has high ___ 5 ___, it should be turned in a lathe.

5. __________

A quick check for starter trouble can be made by turning on the ___ 6 ___ and ___ 7 ___ the starting motor.

6. __________
7. __________

The overrunning clutch type drive should not be cleaned by any high ___ 8 ___ or grease- ___ 9 ___ methods.

8. __________
9. __________

If the starting motor fails to operate and draws no ___ 10 ___, this is an indication of a(n) ___ 11 ___ circuit.

10. __________
11. __________

Stall torque is the torque developed with the ____12____ stalled, or not rotating.

12. __________

Burned commutator bars usually indicate a(n) ____13____ -circuited armature.

13. __________

Grounded fields can be tested either with a test lamp or a(n) ____14____.

14. __________

The brush spring tension should never be ____15____ specified limits.

15. __________

Voltage drop is checked with a(n) ____16____.

16. __________

Voltage drop across the battery terminal of the starter relay and the other lead to the battery is limited to ____17____ for a 6-volt system and ____18____ for a 12-volt system.

17. __________

18. __________

unit I | GENERATORS

TOPIC 1—A-C GENERATORS

Assignment

1. A.C. Charging Circuits (Section H, Delco-Remy Training Chart Manual), pp. 2-9.
2. Automotive Encyclopedia, pp. 31-1 to 31-4.
3. Crouse, Automotive Mechanics, pp. 217-20.
4. "Delcotron" Generator and the Charging Circuit (Section M, Delco-Remy Training Chart Manual), Charts 1-17.

Introduction

Both alternating and direct current generators operate on the same principle. The direct current generator changes alternating current to direct current by means of a rotating switch. Alternating current can also be changed to direct current by electronic means.

Alternators have been used for many years on vehicles that have high current requirements. Since the necessary rectifiers were both bulky and expensive, alternators were not used on passenger cars until recently. The heavy current demands of most modern passenger cars and the development of solid state diodes have made the use of alternators on such vehicles both practical and possible at reasonable cost.

Checkup

In an alternator, the magnetic field is __1__, and the voltage is generated in the __2__ coils.
1. __________
2. __________

Magnesium-copper sulfide rectifier plates are limited to a maximum voltage of __3__.
3. __________

Direct current is supplied to the rotor coils through brushes and __4__ __5__.
4. __________
5. __________

The voltage or electrical pressure at a particular point with respect to another point is called __6__ __7__.
6. __________
7. __________

Diodes with a negative case have __8__ polarity leads, 8. ________
while positive case diodes have __9__ polarity leads. 9. ________

To provide voltage control at high speed, many
alternators have a __10__ field winding. 10. ________

A generator constructed with three separate windings
in the stator is referred to as "three __11__." 11. ________

As alternating current cannot be used to charge a battery,
it is necessary to change the __12__ current to __13__ 12. ________
current by means of a __14__. 13. ________
14. ________

The field windings on the rotor are energized by current 15. ________
from the __15__ by __16__ and __17__ __18__. 16. ________
17. ________
18. ________

The number of cycles per second in alternating current
is called the __19__. 19. ________

The composition of a diode is such that it will allow
current to travel through itself in __20__ direction(s). 20. ________

TOPIC 2—D-C GENERATORS

Assignment

1. Automotive Encyclopedia, pp. 31-10 to 31-21.
2. Crouse, Automotive Mechanics, pp. 215-17.
3. Generators (Section E, Delco-Remy Training Chart Manual), pp. 1-10, 15-18, and 21-23.

Introduction

The rising popularity of the alternator would seem to indicate that the automotive direct current generator is becoming obsolete. However, millions of d-c generators are in service today, and these will need service for the next five or ten years. In addition, the low cost of the d-c generator will tend to keep it popular on lower priced vehicles and on vehicles that have low current requirements.

Checkup

How much may the drive ratio of an automotive generator vary? 1. ________

What are the two types of shunt generator circuits? 2. ________
____

Name four other types of generator circuits. 3. ________
4. ________
5. ________
6. ________

The generator field frame forms the return ___ 7 ___ circuit for the lines of ___ 8 ___ from the south or the north pole.
7. ________
8. ________

An "interpole" is used to ___ 9 ___ commutator ___ 10 ___ .
9. ________
10. ________

Bucking field coils are used to obtain ___ 11 ___ generator output at ___ 12 ___ speeds.
11. ________
12. ________

Polarity is the ___ 13 ___ of current flow from the ___ 14 ___ to the external circuits.
13. ________
14. ________

Cleanliness and proper 14 are vital to the life of any generator.

14. ______

If current is allowed to flow through the field coil of a generator in the wrong direction, the generator will become 15 16 .

15. ______
16. ______

Generator circuits should be tested for 17 , 18 , 19 , and 20 .

17. ______
18. ______
19. ______
20. ______

Short circuits in the armature may be detected on a 21 .

21. ______

Lack of understanding of generator polarity and its relationship to the vehicle battery has been responsible for many unnecessary electrical failures in the 22 - 23 24 , 25 , and 26 .

22. ______
23. ______
24. ______
25. ______
26. ______

To conduct a generator output test, some means must be provided for 27 the generator.

27. ______

An open-circuited armature is easily identified by visual inspection of the 28 29 .

28. ______
29. ______

Generator output test voltage should be in excess of 30 on a 6-volt system and 31 on a 12-volt system.

30. ______
31. ______

Rectifiers used on an alternator can be tested by means of a 12-volt battery and a(n) 32 lamp.

32. ______

Generators should be tested at the specified rotation speed to produce the required 33 and 34 .

33. ______
34. ______

A short-circuited field coil has 35 effect on generator 36 .

35. ______
36. ______

Brushes worn to 37 - 38 their original length should be replaced.

37. ______
38. ______

Where brush adjustment is provided, it is necessary to first locate the mechanical 39 40 .

39. ______
40. ______

Wrong spring tension results in 41 and short 42 life.

41. ______
42. ______

Heel or toe seating of a brush changes the 43 position and will result in excessive 44 .

43. ______
44. ______

Each generator operating condition requires a brush with a different 45 .

45. ______

Generator operation is based on the principle of ___15___ ___16___.

15. ____________
16. ____________

The commutator changes ___17___ current to ___18___ current.

17. ____________
18. ____________

Voltage will be at maximum when the armature coil passes through a magnetic field of ___19___ density.

19. ____________

The strength of the voltage induced in a rotating coil is proportional to the strength of the ___20___ ___21___, the speed of ___22___ movement through the magnetic field, and the number of ___23___ ___24___.

20. ____________
21. ____________
22. ____________
23. ____________
24. ____________

Residual magnetism in the pole shoes is used to induce the initial ___25___ in the ___26___.

25. ____________
26. ____________

Iron loss is reduced by using ___27___ armature cores.

27. ____________

The effect of the magnetic field created by the armature upon the magnetic field created by the field coils is known as ___28___ ___29___.

28. ____________
29. ____________

With varying speeds and loads, the ideal commutating point is constantly ___30___.

30. ____________

The residual magnetic field of the pole is ___31___ by current flowing through the field coils.

31. ____________

The physical strength of a generator must be great enough to withstand the electrical ___32___ it is designed to produce.

32. ____________

Generators with more than two field poles have one ___33___ point for each ___34___.

33. ____________
34. ____________

A generator is capable of supplying current in either direction, depending on the ___35___ of the ___36___.

35. ____________
36. ____________

TOPIC 3—GENERATOR TESTING

Assignment

1. Automotive Encyclopedia, pp. 32-1 to 32-9 and 31-6 to 31-8.
2. Crouse, Automotive Mechanics, pp. 371-79.
3. "Delcotron" Generator and the Charging Circuit (Section M), Charts 30-32.
4. Generators (Section E, Delco-Remy Training Chart Manual), pp. 24-36.

Introduction

Generators usually give trouble-free service for many thousands of miles. Even when troubles do develop, they are generally minor in nature caused by dirty connections, worn or sticking brushes, and the like. The mechanic should make the proper tests to determine the cause of such troubles. Repairs will vary from changing a faulty part to changing the whole unit.

Checkup

A short circuit is any ___1___ connection that permits the current to ___2___ part of the electrical unit.

1. __________
2. __________

The test procedure to be used is determined by the ___3___ of generator being checked.

3. __________

It is important to avoid grounding the alternator field circuit to prevent damage to the ___4___ ___5___.

4. __________
5. __________

An armature with a grounded circuit can be checked with a(n) ___6___ ___7___.

6. __________
7. __________

Mica insulators higher than the commutator bars will cause rapid ___8___ wear, ___9___ brushes, and ___10___.

8. __________
9. __________
10. __________

Stator windings should be tested for ___11___, ___12___, and ___13___.

11. __________
12. __________
13. __________

When replacing worn brushes, the brush holder rails must be polished to allow __46__ movement of the brush. 46. ________

unit J | GENERATOR CONTROLS

TOPIC 1—CONSTRUCTION AND OPERATION

Assignment

1. Automotive Encyclopedia, pp. 33-1 to 33-4, 33-7, 33-8 to 33-9, 33-13, 33-14, and 33-15.
2. Crouse, Automotive Mechanics, pp. 221, 224-26.
3. Generators (Section E, Delco-Remy Training Chart Manual), pp. 10-14 and 18-20.
4. Standard Duty Generator Regulator (Section F, Delco-Remy Training Chart Manual), pp. 1-13.

Introduction

The voltage regulator is often regarded as a "mystery box," but actually the box contains only simple relays and resistors. A mechanic must understand how and why each part works. When the function of each part is thoroughly understood, it can be seen that the operation of a voltage regulator is quite simple.

Checkup

Third-brush generators used on some farm tractors are provided with only a __1__ __2__.

1. __________
2. __________

In Auto-Lite regulators, the effect of heat on the resistance and operating characteristics of regulator windings is compensated for on some units by a nickel-__3__ __4__ __5__.

3. __________
4. __________
5. __________

The purpose of the cutout relay is to prevent the battery from __6__ through the __7__ when the engine is __8__ or turning at slow speed.

6. __________
7. __________
8. __________

The regulator controls the voltage and the current by automatically cutting additional __9__ in or out of the __10__ circuit.

9. __________
10. __________

The vibrating contact __11__ used in generator regulation have a very definite __12__.

11. __________
12. __________

"A" circuit generators have the field coils connected between the 13 14 .

13. ________
14. ________

The regulator points are part of the 15 circuit.

15. ________

The current regulator has a(n) 16 winding of 17 wire, as it carries the entire 18 of the generator.

16. ________
17. ________
18. ________

Either the 19 regulator or the 20 regulator operates at any one time; they never operate simultaneously.

19. ________
20. ________

The necessary temperature correction is provided by means of a(n) 21 hinge on the 22 of the relay or regulator of some models.

21. ________
22. ________

Surges of induced field voltage due to changes in field strength are partially dissipated by the two 23 which reduce 24 at the contact points.

23. ________
24. ________

Some regulators are designed for use with systems having the negative terminal of the 25 grounded, while others are designed for use with 26 grounded systems.

25. ________
26. ________

The voltage regulator has a(n) 27 shunt winding of many turns of 28 wire.

27. ________
28. ________

The cutout relay has 29 windings which are assembled on a(n) 30 core.

29. ________
30. ________

TOPIC 2—TRANSISTORS AND REGULATORS

Assignment

1. A.C. Charging Circuits (Section H, Delco-Remy Training Chart Manual), pp. 10-28.
2. Introduction to Transistor Operation and Applications (Section W, Delco-Remy Training Chart Manual), Charts 11 and 12.

Introduction

With the development of diodes and transistors, it is now possible to eliminate some moving parts from the automotive electrical system, thereby producing a more reliable and trouble-free operation. Of course, voltage and current control by vacuum tubes has been used for many years in other than automotive applications, but the ability of transistors to withstand the vibration and road shocks of automotive applications now makes possible an all-electronic automotive generator output control. Understanding how transistors work and their function in a circuit is essential to proper service.

Checkup

The emitter-collector current to the fields is stopped by making the voltage potential at the __1__ more positive than the voltage potential of the __2__.

1. ________
2. ________

A material is considered a conductor when the __3__ have freedom of __4__.

3. ________
4. ________

Transistorized regulators contain a(n) __5__ transistor working with a(n) __6__ voltage regulator unit.

5. ________
6. ________

Because transistors generate a considerable amount of heat during operation, it is necessary to provide some means of __7__.

7. ________

If the voltage contacts opened without a diode in the circuit, the sudden interruption of field 8 would cause a high voltage to be induced in the 9 10 , causing a failure of the 11 .

8. __________
9. __________
10. __________
11. __________

The transistor regulator contains no moving parts; it limits the generator 12 through the 13 of two transistors working together.

12. __________
13. __________

The transistor regulator performs one function only--to 14 the generator 15 current.

14. __________
15. __________

The generator field windings are connected to the 16 through the field relay by the 17 switch.

16. __________
17. __________

The transistorized regulator with its 18 contact point current and 19 generator field current, reduces 20 at the contacts and gives better generator performance.

18. __________
19. __________
20. __________

The resistor connected across the emitter and base of the transistor acts to 21 emitter-to-collector current 22 when the voltage regulator contacts are 23 .

21. __________
22. __________
23. __________

The element antimony has 24 electrons in its outer ring.

24. __________

The combination of 25 and 26 is known as "P" type or positive material.

25. __________
26. __________

The unusual operating characteristics of the transistor results from the physical arrangement of the 27 , 28 , and 29 .

27. __________
28. __________
29. __________

A circuit arrangement with the negative post of the battery connected to the "N" material and the positive post of the battery connected to the "P" material is known as a(n) 30 - 31 connection.

30. __________
31. __________

The addition of a(n) 32 section of "P" type material to a(n) 33 forms a complete transistor.

32. __________
33. __________

When a number of germanium atoms are combined together in 34 form, the result is called " 35 36 ".

34. __________
35. __________
36. __________

TOPIC 3—TESTING PROCEDURES

Assignment

1. Automotive Encyclopedia, pp. 31-8 to 31-10, 33-3 to 33-5, 33-6 to 33-7 and 33-9 to 33-22.
2. Crouse, Automotive Mechanics, pp. 371-79.
3. Introduction to Transistor Operation and Application (Section W, Delco-Remy Training Chart Manual), Charts 13-16.
4. Standard Duty Generator Regulator (Section F, Delco-Remy Training Chart Manual), pp. 15-29.

Introduction

Many regulators which need only a few minor adjustments to keep them in operation are discarded and replaced with new ones. The chief reason for this is the mechanic's lack of knowledge pertaining to the proper adjustment of regulators; hence, the customer is forced to buy a new piece of equipment instead of paying only for the adjustment that was needed. Usually only a few minutes of testing a regulator can pinpoint the cause of trouble, and a few more minutes of work will correct it.

Checkup

The fixed 1/4 ohm resistance method and the variable resistance method are used to set ___1___.

1. __________

The regulator cover should be ___2___ and the generator should be ___3___ when adjustments are checked.

2. __________
3. __________

The mechanic should never attempt to use a regulator of the wrong ___4___.

4. __________

Most Auto-Lite two-charge regulators have a fuse mounted on the base and connected in the generator ___5___ circuit; this provides protection against excessive ___6___ ___7___.

5. __________
6. __________
7. __________

The regulator must be at ___8___ temperature when checks are conducted and adjustments made.
8. ________

The air gap is the space between the regulator ___9___ and the winding ___10___.
9. ________
10. ________

A wide air gap will ___11___ the difference between operating levels under high and low ambient temperatures.
11. ________

Cutout points are soft and should not be cleaned with a(n) ___12___ ___13___.
12. ________
13. ________

The cutout relay requires three checks and adjustments: ___14___ gap, point ___15___, and ___16___ required to close the contact.
14. ________
15. ________
16. ________

Transistors and diodes may be checked with a(n) ___17___.
17. ________

To check the voltage setting of the transistor regulator, the ammeter is inserted ___18___ the battery terminal and battery wire. The voltmeter is connected from the regulator ___19___ terminal to ___20___.
18. ________
19. ________
20. ________

To check the current regulator setting, the ___21___ ___22___ must be prevented from operating.
21. ________
22. ________

Excessive resistance in the charging system between the regulator and the battery causes the ___23___ ___24___ to operate and reduce the ___25___ output.
23. ________
24. ________
25. ________

When high operating temperatures are normal, as in tropical climates, the voltage regulator must be ___26___ to ___27___ for the effect of heat on the ___28___.
26. ________
27. ________
28. ________

The upper and lower contacts of both voltage and current regulators are made of ___29___ metals.
29. ________

The opening amperage of the cutout relay is the amount of ___30___ current discharged from the battery to the generator that is required to open the points.
30. ________

unit K | AUTOMOTIVE ACCESSORIES

TOPIC 1—HORNS AND WARNING DEVICES

Assignment

1. Automotive Encyclopedia, pp. 36-10 to 36-12.
2. State of California Vehicle Code, Horns and Warning Devices, pp. 334-35.

Introduction

Although an automobile horn seldom gives trouble, the mechanic should understand its construction and operation so that when trouble does arise, he can determine whether repair is feasible and, if so, make the necessary repairs or adjustments. It must be remembered that although the automobile horn is used for other purposes, it is essentially a safety device and should always be operative.

Checkup

All mounting ____1____ and electrical ____2____ for a horn should be tight.
1. ____________
2. ____________

To test whether a horn is inoperative, connect a(n) ____3____ wire from the ____4____ to the horn.
3. ____________
4. ____________

Most modern horns consist of a diaphragm which is vibrated by means of a(n) ____5____.
5. ____________

The horn must be capable of emitting a sound audible under normal conditions from a distance of not less than ____6____.
6. ____________

A relay is used to eliminate ____7____ ____8____ in the circuit from the horn to the battery.
7. ____________
8. ____________

Because of the relatively heavy current required to operate a horn, the wire used for horn circuits should be ____9____ or larger.
9. ____________

No vehicle shall be equipped nor should any person use upon a vehicle any __10__ except as authorized by the Department of Motor Vehicles. 10. ________

The adjustment of the armature gap is critical and must be done in accordance with the __11__ for that particular make and model of horn. 11. ________

Some types of horns have a resistance connected in __12__ with the magnetic winding, or a condenser across the contact points to reduce __13__.

12. ________
13. ________

There are only three checks and adjustments necessary to repairing a horn relay: the __14__ gap, the __15__ __16__ opening, and the __17__ __18__.

14. ________
15. ________
16. ________
17. ________
18. ________

The approximate range of armature gap on an electric horn is __19__ to __20__.

19. ________
20. ________

TOPIC 2—INSTRUMENTS AND GAUGES

Assignment

1. Automotive Encyclopedia, pp. 26-9 to 26-10 and 36-27 to 36-31.
2. Crouse, Automotive Mechanics, pp. 128-29, 183-85, 196-97, and 245-47.

Introduction

The mechanic usually does not have to service automotive instruments and gauges beyond the point of checking their working order and making whatever minor corrections are necessary. An automobile instrument seldom needs repair, but the mechanic should know how each one works before making tests to locate possible troubles.

The current tendency of manufacturers to use "idiot lights" rather than gauges will probably continue, but mostly on economy models. The fuel gauges and speedometers now in use will probably remain unchanged for many years.

Gauges are often replaced unnecessarily by mechanics who fail to realize that a gauge may only show the effect of an automotive trouble, not always the cause of it. The mechanic should always look for the cause of the effect he sees before replacing any gauge. Since dashboards are generally difficult to work behind, much discomfort can be avoided and time saved by a mechanic who can rely on his knowledge instead of guesswork.

Checkup

Electric fuel, oil, and temperature indicating devices are of two types: __1__ and __2__.
1. __________
2. __________

Two types of fuel gauges now being used are the __3__ coil and __4__.
3. __________
4. __________

The speed-indicating portion of the speedometer operates on the __5__ principle.
5. __________

When both speed and mileage readings are too high or too low, 6 size and transmission speedometer 7 should be checked for correct size.

6. ________
7. ________

The tank unit of the balancing coil type fuel gauge contains a(n) 8 contact that slides back and forth on a(n) 9 as the float moves up and down in the fuel tank.

8. ________
9. ________

The thermostatic gauge has a pair of 10 blades, each with a(n) 11 coil.

10. ________
11. ________

More or less bending is imposed upon the tank thermostatic blade by a(n) 12 .

12. ________

While speedometers of different manufacturers differ in detail, they are all designed to register the same 13 at a given number of 14 .

13. ________
14. ________

Speedometer cables should be lubricated every 15 .

15. ________

The pressure-expansion indicator uses a hollow 16 tube that is 17 on one end and 18 on the other.

16. ________
17. ________
18. ________

The temperature indicator bulb, usually placed in the 19 20 of the engine, is filled with a(n) 21 that 22 at a fairly low temperature.

19. ________
20. ________
21. ________
22. ________

The ammeter is connected between the 23 and the 24 .

23. ________
24. ________

unit L | ENGINE TUNE-UP

TOPIC 1—TUNE-UP PROCEDURES

Assignment

1. Automotive Encyclopedia, pp. 18-1 to 18-4. Review pp. 32-3 and 32-4, 35-31 and 35-32, 34-6 to 34-8, and 36-19 to 36-21.
2. Crouse, Automotive Mechanics, pp. 248-57. Review pp. 356-58, 363-65, 371-78, and 384-87.

Introduction

In the early 1930s, the owner of a car was not very particular about performance, provided his motor would start and keep running. The mechanic had few factory specifications to guide him. Spark plugs were set with a thin dime, distributor points with a calling card, and valves more or less at the mechanic's option.

As time passed, the car buyer demanded more speed, faster acceleration, a quiet-running engine, smooth idle, quiet valves, and with all this, better gas mileage.

In response to this demand, automotive engineering has produced remarkable economy and performance in modern motor cars. After exhaustive tests, the best settings for valves, plugs, and spark gap were established by the car manufacturers. Compression was increased, coils and condensers were carefully chosen and balanced, and great improvements were made in carburetion and in ignition timing.

To restore all of these things to their original factory condition is the only way original factory performance and economy can be attained for the customer. To do this, the mechanic should have complete factory specifications, so that he knows what equipment to use for testing and what adjustments to make.

The auto mechanic must know how to use test equipment and to interpret the results. The test equipment illustrated in the instructional material is representative, since all makes are basically the same. Most manufacturers furnish an instruction manual with their tune-up equipment, so it is a simple matter for the mechanic to apply his general knowledge of testing and repair procedures.

Related Information

The following is a typical example of recommended procedures in the use of test equipment for trouble diagnosis:

The combustion tester. The engine exhaust is composed of several gases--carbon dioxide (CO_2), carbon monoxide (CO), oxygen (O_2), hydrogen (H_2), and nitrogen (N_2). The proportion of these gases in the exhaust varies, depending upon the fuel-air ratio of the fuel mixture supplied to the combustion chambers by the carburetor.

This relationship is definite; consequently, an instrument which will respond to changes in the proportion of certain of the gases can be used to indicate the fuel-air ratio of the fuel mixture. A rich mixture--one containing more fuel and less air than normal--results in an increase in hydrogen and a decrease in carbon dioxide. A lean mixture is the reverse of this proportion.

Hydrogen has a thermal conductivity about six times greater than that of air, while carbon dioxide has approximately one-half that of air. It is upon this difference in thermal conductivity of the two gases and their varying proportions in the exhaust that the operation of this testing instrument is based.

A greater proportion of the volume of hydrogen gas readily carries the heat away from the cells or resistors of the testing instrument. This cools, and therefore lessens, the resistance of the resistor and causes the needle to indicate a rich mixture. The movement of the needle is in direct proportion to the increase of hydrogen gas. A greater proportion of carbon dioxide gas and a decrease of hydrogen gas around the cells or resistors will carry off heat less readily, and the instrument will indicate a leaner mixture.

There is one exception: If the mixture is leaned to a point where detonation occurs, high proportions of hydrogen are liberated, causing the needle to swing to the rich side or reverse itself. This condition, however, is usually encountered only under laboratory conditions.

Checkup

A test report lists, step by step, the ___1___ to follow and the ___2___ to be made.

1. ________
2. ________

The purpose of cylinder compression and leakage testers is to determine whether or not the cylinder can hold ___3___ or whether there is excessive leakage past the ___4___, ___5___, or ___6___ ___7___.

3. ________
4. ________
5. ________
6. ________
7. ________

The last step in an engine tune-up is usually the final adjustment of the ___8___.

8. ________

The fuel pump test measures ___9___ developed, the ___10___ of fuel delivered in a given time, and the amount of ___11___ developed.

9. ________
10. ________
11. ________

A device that enables the user to look around corners when making engine checks is called a(n) __12__.

12. ________

A balance test is made by running an engine on only __13__ __14__ at a time.

Maize Dwarf Mosaic of Corn.

Illinois Univ., Urbana. Vocational Agriculture Service
VAS-4049
Pub Date - Dec65
MF AVAILABLE IN VT-ERIC SET 7p.

*TEXTBOOKS, *REFERENCE BOOKS, *VOCATIONAL AGRICULTURE, *PLANT PATHOLOGY, *CORN (FIELD CROP),

The purpose of this document is to provide textual and reference material for high school vocational agriculture and adult farmer students on maize dwarf mosaic of corn, a new disease which is potentially very serious in the Corn Belt. The material was developed by a teacher educator after being designed by subject matter specialists, teacher-educators, supervisors, and teachers. The sections of the document answer the questions--(1) How Much Damage Does the Disease Cause, (2) Where Does the Disease Occur, (3) What Are the Symptoms, (4) How Does it Spread, and (5) How Can I Control It. It is appropriate for use by teachers with competence in general agriculture with students of average ability with interest and an occupational objective in production agriculture. Time required is 1 to 2 hours. This document is available for 10 cents from Vocational Agriculture Service, 434 Mumford Hall, University of Illinois, Urbana, Illinois 61801. (JM)

MAIZE DWARF MOSAIC OF CORN.

1. How Much Damage Does the Disease Cause?
2. Where Does the Disease Occur?
3. What Are the Symptoms?
4. How Does It Spread?
5. How Can I Control It?

Maize dwarf mosaic is a new virus disease of corn, first reported in southern Ohio and Arkansas in 1962. It is closely related to corn stunt, another virus disease of corn found in the Southern states.

Dwarf mosaic and corn stunt both attack corn of all ages from the very young to matured plants. Disease symptoms may show up as early as seven days after the plant is infected with dwarf mosaic. Corn stunt symptoms, however, may not show up for six weeks after the disease hits.

The ranges of these two diseases are believed to overlap. It is possible for both to be found in the same field, or even on the same plant.

This corn virus complex is potentially the most serious disease or diseases ever to invade the Corn Belt. Already, corn growers in some areas have had to give up growing corn until corn varieties with good disease resistance are developed.

Fig. 1. A matured corn plant showing symptoms of maize dwarf mosaic.

1. HOW MUCH DAMAGE DOES THE DISEASE CAUSE?

Losses due to maize dwarf mosaic are staggering. In Ohio, the loss from the disease in 1964 was estimated at 5 million bushels. Yields in hard-hit fields fell from 100-150 bushels per acre to 5 bushels or less. An overall loss of 10 percent was reported for more than 15,000 acres in the Scioto, Ohio, Muskegon, and Miami River valleys. The loss in Scioto County was 20 to 30 percent of the total corn crop.

Other states that reported major losses included Tennessee, Kentucky, Arkansas, and Missouri. A number of fields in each of these states have been abandoned as far as corn production is concerned.

In Missouri, losses of 90 to 95 percent were reported in 1964 in severely affected fields in several counties--especially Jefferson, where an estimated 40 to 85 percent of all corn plants in the county were infected. In Arkansas, corn yielded 3 to 30 bushels per acre where maize dwarf mosaic was severe. In Tennessee, 500 to 700 acres near Memphis suffered a 50 percent loss. In the south-central counties, the loss was estimated at 40 percent, with losses of 100 percent in certain fields. The overall loss in Tennessee, involving some 10,000 acres, was 20 percent or roughly 100,000 bushels.

Several states have found greater losses on the late-planted corn than on the early. In Missouri, many late-planted fields were a complete loss, while in Tennessee a 30 percent loss and 50 to 70 percent infection were reported.

In extreme southern Illinois about 400 acres of corn was affected and reduced in yield by 70 percent or more in 1964. Another 400 acres had losses between 5 and 50 percent. Very light or trace infections were found on another 1,200 acres. In one late-planted field grown for silage, the yield was reduced from an expected normal 8 tons to about 2 tons.

2. WHERE DOES THE DISEASE OCCUR?

In 1964, maize dwarf mosaic was reported in California, Iowa, Illinois, Missouri, Arkansas, Tennessee, Kentucky, Indiana, Ohio, West Virginia, Virginia, North and South Carolina, and possibly Kansas and Nebraska (Fig. 2). Corn stunt was reported in Florida, Georgia, Alabama, Arkansas, Mississippi, and Louisiana. The two were believed to be "mixed together" in the latter southern states as well as in southern Missouri, Arkansas, and possibly Tennessee and South Carolina. Other states may well have had one or both diseases in 1964, but they were not adequately surveyed.

In many of the states, maize dwarf mosaic has been found only in bottomland soils close to major rivers and other bodies of water. In Ohio, Tennessee, Kentucky, Indiana, Iowa, Arkansas, Missouri, and North Carolina, however, the disease was also found in upland soils many miles from a major river--particularly late in the season.

Fig. 2. This map shows the known locations of the corn virus disease complex in 1965. Additional areas may be discovered and present locations may change.

3. WHAT ARE THE SYMPTOMS?

The first symptoms of maize dwarf mosaic are indistinct light and dark green mottlings between the veins or as elongate, pale green blotches (flecks) and interrupted stripes on the younger leaves. The blotches and stripes often merge and turn yellow, giving affected plants a pronounced yellowish cast (Fig. 3).

Diseased plants are often stunted or dwarfed from a bunching of the upper internodes. The degree of stunting and the development of later symptoms apparently depend on a number of factors, such as the age and maturity of the plant when first infected, the corn hybrid or inbred, strain of virus involved, temperature, and soil fertility.

In the field, the dark green mottling or blotches frequently disappear, especially during hot weather. Diseased plants remain dwarfed or stunted with yellowish tops. On some hybrids, brilliant reddish-purple streaks and blotches begin to develop in the leaves, particularly the upper ones, about tasseling time (Fig. 4). Certain leaves appear to be largely reddish purple. In some fields, especially in cooler areas, mosaic, yellowing, and purple-reddening of the leaves all appear

Describe

Source (agency)
(address)

Fig. 3. University of Illinois extension plant pathologist, M. C. Shurtleff, examines ears of corn infected by maize dwarf mosaic. M.D.M. last summer reduced the yield 70 percent or more in the field near McClure in Alexander County.

at the same time--even on the same plant.

Excessive tillering and development of multiple ear shoots are other common symptoms. Early-affected plants produce only nubbin ears that are often partly or totally barren. Many of these plants die prematurely (Fig. 5).

Fig. 5. Early-infested corn plants produce nubbins with scattered kernels.

It is suspected that corn plants infected after tasseling, produce a normal yield and are normal in height. The appearance of large, reddish-purple streaks and blotches on the upper leaves is the only indication of disease.

Fig. 4. Diseased plants may develop streaks or color changes in the upper leaves about tasseling time.

Positive identification of the disease cannot be made by field symptoms alone. Symptoms closely resembling these may be caused by other viruses, herbicides in the soil, mechanical or insect damage to roots or stalks, lack of one or more essential nutrients (e.g., zinc, magnesium, potassium), drought combined with hot, dry winds, and possibly other factors.

Because similar symptoms may be produced by a variety of causes, it is necessary, for positive identification, to transmit the virus by sap transfer from infected plants to other corn, sorghum, or Johnsongrass plants to show infectivity. Other laboratory techniques, such as electron microscope and serology (the science dealing with the reactions, preparation, use, etc., of serums), are also used to identify the virus. When seen under an electron microscope at 5,000 to 20,000 magnification, maize dwarf mosaic appears as flexuous virus-like rods (Fig. 6).

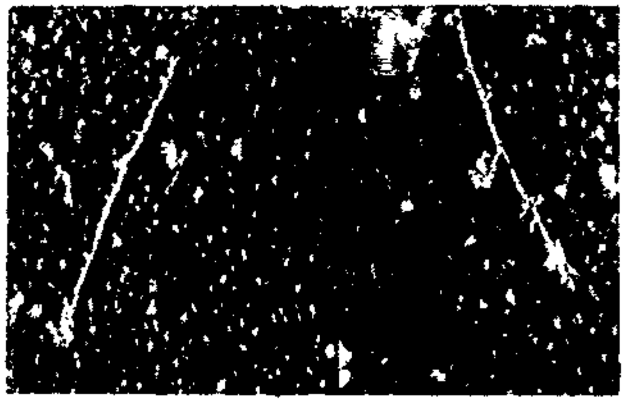

Fig. 6. With the electron microscope, flexuous, virus-like rods could be seen in some of the mounts prepared from experimentally infected plants.

The findings reported from these tests provide the first positive experimental proof that the new corn disease in southern Illinois is infectious. They also indicate without any doubt that a flexuous elongate virus is associated with the disease.

It has not been proved, however, that this virus is the sole cause of the disease in the field. To finally determine the primary cause, or causes, of the field disease, the typical disease must be experimentally induced with known cultures or samples of the causal agent(s), and then the agent(s) must be isolated from the experimentally diseased plant and identified. Figure 7 shows the areas where maize dwarf mosaic virus has been diagnosed by tests in 1965.

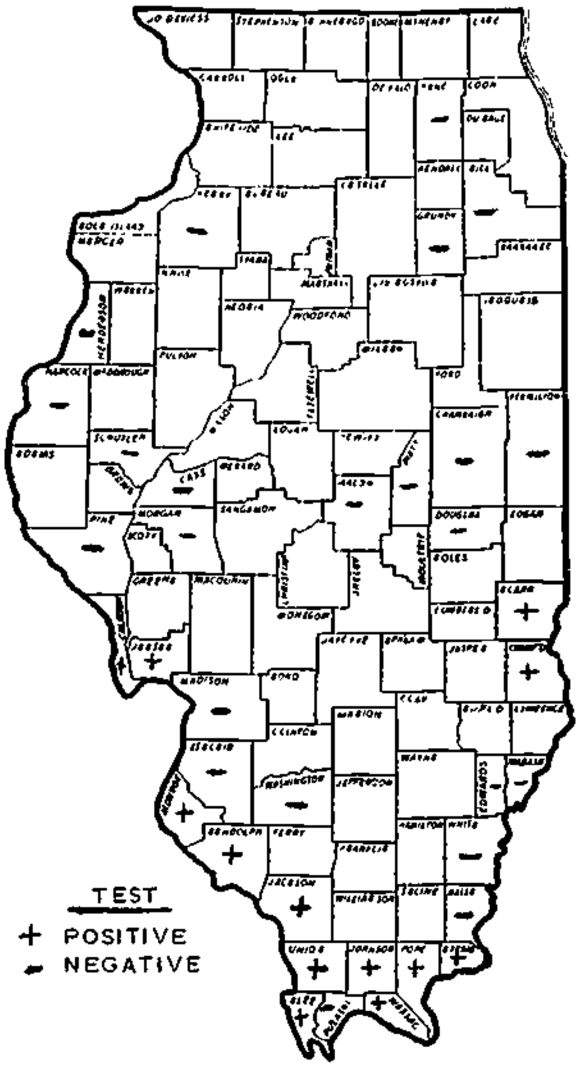

Fig. 7. Map showing the areas of maize dwarf mosaic virus in Illinois in 1965 as diagnosed by tests.

4. HOW DOES IT SPREAD?

Since maize dwarf mosaic is so near like corn stunt, it was believed that the two were transmitted alike. It was known that the corn stunt virus was transmitted by specific leafhoppers, so researchers worked along this line. They soon found, however, that the dwarf mosaic virus could be easily transmitted mechanically from one plant to another by using sap from infected plants (Figs. 8 and 9). Aphids were then found to be carriers of the virus from infected corn plants to healthy corn, sorghum, Johnsongrass, and other grass hosts. It has been found that aphids may acquire the virus while feeding for as short a period as 20 seconds.

Fig. 8. H. H. Thornberry, U. of Ill. plant pathologist, demonstrates laboratory technique for transferring M.D.M. virus from infected plants, in the foreground, to healthy corn.

Fig. 9. Carborundum, in the shaker in Fig. 8 when applied to the corn leaves insures inoculation.

The most efficient aphid carriers, for transmitting the virus in the Corn Belt are probably those that migrate considerable distances and move restlessly about from plant to plant within a field (e.g., green-peach aphid). They may not necessarily be those that find corn or sorghum a suitable host on which to feed and multiply regularly (e.g., corn leaf aphid).

Johnsongrass, a prevalent weed along river valleys where dwarf mosaic is most serious, is probably the most important overwintering host of the virus. Several aphids also feed on Johnsongrass in the spring and summer.

To date the virus has been transmitted to all types of corn (field or dent, sweet, and popcorn), teosinte, sorghum, Sudangrass, sorghum x Sudangrass hybrids, sugarcane, large crabgrass, barnyardgrass, downy brome or cheat, Japanese chess, bristlegrass, foxtails, and cubgrass. At present, transmission to goosegrass, foxtail millet, lovegrass, and certain millets is questionable.

None of the small grains (wheat, oats, barley, and rye), or such common grasses as Kentucky and other bluegrasses, smooth bromegrass, orchardgrass, fescues, wild rye, ryegrasses, quackgrass, bullgrass, and reed canarygrass are known to become infected. To date the maize dwarf mosaic virus seems to be restricted to members of the grass family.

The host range of the virus differs somewhat among investigators, possibly because of the strain of the virus or technique that is used, age of the grass plant, temperature, and presently unknown factors.

5. HOW CAN I CONTROL IT?

At present the development of resistant corn hybrids and varieties appears to offer the best and most lasting method of control. No corn breeder can say with certainty, however, how long it will be before commercially acceptable, highly resistant single- and double-cross hybrids will be available to farmers. It is not known yet how many virus strains are involved and whether a hybrid that is highly resistant in Ohio or Kentucky will also be highly resistant in Iowa, Illinois, or Missouri. Some corn lines that are rated "resistant" in field plots may actually have been missed by migrating aphids.

Environmental factors affect aphid population and movement. Present sprays have not been very effective. If you grow corn where the virus has cut yields severely, continue planting hybrids that seem to do best for you or possibly change your rotation or grow another crop.

Corn breeders are optimistic, however, that suitable replacements for the more susceptible commercial lines will be developed. Resistance to the virus(es) now appears dominant to susceptibility, and inheritance studies so far have shown that relatively few genes are involved. On the basis of extensive 1964 field tests in Ohio, Indiana, Kentucky, Tennessee, Mississippi, and Louisiana, the possibility of having commercial corn hybrids and varieties with good resistance seems bright now compared with just a year ago. A considerable number of inbreds and crosses in common use by commercial, experiment station, and USDA sources have shown a high degree of field resistance to the maize dwarf mosaic virus. Many exotic strains of corn developed in Mexico and other Central American countries have also shown excellent field resistance.

Extensive field plantings, using all available corn germ plasm (standard lines, hybrids, synthetics, and interspecifics) that appear promising, are planned in practically all states where the new disease has appeared. A "spectrum test" of 20 selected corn inbreds and other strains susceptible and resistant to both maize dwarf mosaic and stunt are being made in at least 13 breeding nurseries and field plantings in 1965. Plants will also be experimentally inoculated in infested fields and in greenhouses under controlled conditions.

Until resistant corn varieties become available, the most immediately effective control measure is a vigorous Johnsongrass eradication program. Other perennial and winter annual grasses known to harbor the virus should also be controlled in the vicinity of corn, sorghum, Sudangrass, and sorghum x Sudangrass hybrids.

Controlling Johnsongrass. Johnsongrass first appears as a few scattered clumps along roadsides, railroads, or fences, on waste land, or in fields. If not controlled, a clump may become a solid stand in a few years. The easiest way to keep Johnsongrass from spreading is to eliminate clumps or small patches promptly. Two materials are recommended for this purpose:

Use Atlacide at the rate of one cupful per clump or 6 pounds per square rod in patches. Be sure to treat far enough from the plants for the chemical to kill the rhizomes under the soil surface. Atlacide may be used in dry form or mixed with water and used as a spray.

Use dalapon at the rate of 1 pound in 5 gallons of water. Treat when the grass is between 1 and 2 feet high. Apply a second treatment about three weeks later to kill any new growth. Dalapon acts through the leaves, so wet the foliage thoroughly with the spray. A knapsack or small compression-type sprayer is satisfactory for treating small patches.

In solid stands in pastures, fencerows, levees, railroad right-of-ways, and other non-crop lands, mow 2 or 3 times during the summer, then spray with dalapon when the grass is growing actively. Use 8 pounds of dalapon in 30 to 40 gallons of water per acre. If the area cannot be mowed, apply dalapon when the grass is 2 to 3 feet tall, using the amounts as mentioned above. A second and third application may be necessary to kill all of the roots and rhizomes.

*TEXTBOOKS, *REFERENCE BOOKS, *VOCATIONAL AGRICULTURE, *COMMUNISM, GOVERNMENTAL STRUCTURE, *CAPITALISM,

The purpose of this document is to provide high school vocational agriculture and adult farmer students with textual or reference material on forms of economic and governmental systems. Development by a teacher-educator included consultation with subject matter specialists, teacher educators, supervisors, and teachers. Sections are (1) Communism is Socialism, (2) How Do Industrialized Economies Operate, (3) What is Capitalism, (4) Can Personal Freedoms Be Maintained Under Socialism or Communism, and (5) Comparison of Capitalism and Socialism-Communism. Vocational agriculture teachers may use the material with students of average ability with interest and occupational goals in agriculture. Time required is 1 to 3 hours. This document is available for 15 cents from Vocational Agriculture Service, 434 Mumford Hall, University of Illinois, Urbana, Illinois 61801. (JM)

CAPITALISM, SOCIALISM, AND COMMUNISM

1. Communism Is Socialism.
2. How Do Industrialized Economies Operate?
3. What Is Capitalism?
4. Can Personal Freedoms Be Maintained Under Socialism or Communism?
5. Comparison of Capitalism and Socialism-Communism

The terms capitalism, socialism, and communism have varying meanings. In this unit we will use them to designate different types of economic organization of a society or a nation. A comparison is made at the end of this unit of such items as ownership, profits, freedom of enterprise, and economic incentives under these different systems.

In our time the communistic form of economic organization is often closely associated with dictatorial governments and with atheistic philosophical views. However, neither communism nor any other form of economic organization is necessarily tied to any particular religious belief or to any certain form of government.

Forms of government

Essentially there are two basic types of government in the world today: (1) popular governments and (2) dictatorial governments.

Popular government is one that is responsive to popular opinion, where the people have easy access to essential information, and where they are free to express in public their support for or opposition to the government. The United States, England, France, West Germany, Canada, and Japan are examples of such governments. We say that these countries have "democratic" (spelled with a small "d") governments, but some dictatorial governments also use the word democratic to describe their governments. Thus the official name of the dictatorial government that rules the eastern (communist) part of Germany is the "German Democratic Republic."

There is one unfailing test to show whether a government is dictatorial or popular. This test is the nature and extent of the opposition to the ruling group or individual. In any country where the people are really free, there is always open, organized, aggressive opposition to the group or party in power. Such opposition is always absent under dictatorial governments.

The evidences of open, organized, aggressive opposition to the group in power are opposition newspapers and other publications and one or more opposition organizations with well-known leaders who wish and work to take over power from those in control.

Religion and economic systems

Our generation has come to associate communism with atheism, probably because the Russian communistic leaders have opposed religious organizations. Communism, however, is not always antireligious. In fact, many communistic communities have been organized and operated on religious bases. One of the best known of these societies was that founded by Robert Owen at New Harmony, Indiana, in 1825. Others were those at West Roxbury, Massachusetts, at Bishop Hill in northern Illinois, and the Amana Society at Amana, Iowa. The Amana Society continued its communistic form until about 1932.

Describe ____

Source (agency) ____
(address) ____

1. COMMUNISM IS SOCIALISM

Many Americans seem to believe that there are important differences between socialism and communism. Communism and socialism, however, are primarily two different names for the same thing. This fact is made clear by a study of reliable dictionaries and encyclopedias and of statements by the leaders of the socialist-communist movement.

Most dictionaries give essentially the same definition for socialism as for communism. Each is defined as a social or economic system in which the government owns and runs most of the "means of production." It owns the land, mines, factories, stores, transportation, newspapers, radio, television, hospitals, service agencies, and apartment houses. There is only one major employer and one landlord--the government. Families and individuals may be allowed to own a few personal things such as clothes, books, bicycles, and perhaps some furniture.

Karl Marx (1818-1883) was the founder of modern socialism-communism. He was a German writer on economic subjects. He used the words socialism and communism interchangeably. The Encyclopedia Britannica describes Marx as a "socialist and philosopher." The Encyclopedia of the Social Sciences describes him as a "social philosopher, revolutionary leader, and founder of the chief current in modern socialism." Other major reference works use similar descriptions.

Communistic parties in all modern countries base their programs on the writings of Karl Marx (and his fellow worker, Friedrich Engels), especially the Communist Manifesto, published in 1848. The Manifesto advocated the following measures:

1. Abolition of all private property in land.
2. A progressive income tax.
3. Abolition of all rights of inheritance.
4. Government ownership of all banks and credit agencies.
5. Government ownership of all transportation and communication.
6. Operation of all productive enterprises by the government.
7. Compulsory labor, with the establishment of armies of laborers for industry and especially for agriculture.
8. The combining of agriculture with industry to eliminate differences between town and country.
9. Free education and abolition of child labor in factories.

These recommendations provide important questions for discussion. For example, to what extent have these measures been adopted in the United States? What are some good and bad results? What advantages and disadvantages would arise from the adoption of others?

Marx claimed that the productive wealth of nations had become concentrated in fewer and fewer hands, leaving a growing class of people, the proletariat, with nothing to sell but their labor. He believed that the workers would and should organize, seize all productive property, and use it for the common good.

The doctrines of Marx and Engels are being followed in Russia, China, Cuba and, to varying degrees in the United States and many other countries.

Khrushchev himself has made some statements about the relationship between socialism and communism. According to the Russian leader, the present system in Russia is socialist, but the eventual goal is communism. It is significant to note that the name of "Russia" today is the Union of Soviet Socialistic Republics, while the name of the organized group in control is the Russian Communist party.

2. HOW DO INDUSTRIALIZED ECONOMIES OPERATE?

The creation and operation of a modern industrialized economy requires three distinct, though closely related, processes:

1. The creation of capital.
2. The management of the productive processes.
3. The allocation of the products of the economy among the people.

We shall see how these processes are carried out in the socialistic-communistic system and in what we call the capitalistic system.

The creation of capital

By the creation of capital we mean the production of products or goods that are used in the production of other goods and services. These products include simple tools like hammers and knives and highly complex tools like tractors, ships, airplanes, machine tools, steel mills, electric power plants, irrigation systems, automated factories, business buildings, and electronic computers.

In every form of economic organization all capital goods must be the result of production in excess of consumption. In our capitalistic system the formation of capital (the accumulation of goods for further production) is largely the result of individual enterprise. The motivating force is the hope for profit.

In order that capital may be accumulated, the workers must produce more than they receive for consumption. This means that in primitive economies the laborers must work for low wages. They must work for low wages regardless of whether the society is capitalistic or socialistic-communistic. This is because the productivity of primitive economies is low, and the people can not consume more than their economy produces. Further, if they wish to accumulate machinery and equipment (capital) they must consume less than they produce, or they must borrow from more highly developed nations. Our people did both in the early years. Now we help others by lending our capital.

In the socialistic-communistic system the government, called the state in most discussions, decides what capital goods are to be produced and forces the people to produce them. Force can be exerted by withholding food and other necessities of life and by inflicting physical punishment upon the worker or members of his family.

In our capitalistic economy the people, through their spending patterns, largely determine what capital goods will be produced. By this spending they determine whether the nation's capital formation will be used for more drive-in theaters, more shopping centers, or more gasoline refineries.

Even in our economy the state decides upon the creation of certain capital items. Such items generally include streets and highways, sanitary systems, many water and irrigation systems, some hospitals, some electric power-producing and distributing systems, public recreational facilities, and most schools and colleges. (Some of our best hospitals, schools, and colleges, however, are privately owned and operated.) The workers are forced to contribute to the production of these capital items through taxes, inflation, or charges for use of the facilities.

Capital formation requires two steps, (1) saving and (2) investment. In our capitalistic system different people often perform these two functions. Some people save--put some of their income into savings accounts, government bonds, and retirement funds. Other people borrow from the savings institutions to invest--build factories, motels, bowling alleys, restaurants, and apartment houses, open mines, or drill oil wells.

The management of productive processes

In our capitalistic system the management for our industries is selected on a competitive basis. Each firm competes with others to get the best management for top and subordinate positions. The poor managers are weeded out when their divisions or their companies fall behind or fail.

A big chain-store company keeps careful records on the performance of each department manager and each store manager. The top producers get the promotions; the nonproducers get the axe.

When a whole company has poor management, the stockholders throw out the chief executives or take a big loss when the company fails. For example, of more than 70 automobile companies in the United States in 1924, less than half a dozen are still operating today.

In the socialistic-communistic system, management is selected largely on the basis of politics. This system is much like that we use in selecting persons for postmasters and many other federal and state jobs. It gets some good managers, but it is not very effective in eliminating poor management.

In our capitalistic system the management of industry is guided by the continuous voting of the people. They vote with their money. They vote every time they spend a dime for a coke, a dollar for a lunch, ten dollars for a motel room, a hundred dollars for a suit, a thousand dollars for a boat, ten thousand for a new barn, 100 thousand for an apartment house, or a million for an airplane.

In the socialist-communist system the management receives much less guidance from the people and much more from the central government. In many cases the people cannot vote for what they want because none of it is available in the markets.

Allocation of the products among the people

In our capitalistic system the allocation, or division, of products and services among the people is determined by (1) the amount of buying power that they can command and (2) their personal preferences for the unlimited variety of goods and services that are available to them.

The amount of buying power available to each person is determined in part by competitive conditions and in part by law and contractual arrangements. The incomes of individual farmers and independent business and professional men are determined in highly competitive situations where individuals or small groups of individuals are the competitive units. The incomes of large union labor groups are also determined largely by competitive conditions, but the competitive unit is a larger group, such as the employees of a specific factory or the workers in a trade.

Here we should note that union contracts in effect tell an employer how much he must pay and the worker how little he must take. Unions do not guarantee any worker a job, although contracts with employers usually indicate some order of seniority for workers. This order establishes a system of rationing jobs when employment opportunities are fewer than the number of qualified workers who would like to work at the established wage rates.

This may be said about the level of wages: They can never be more than the productivity of the economy. Thus increased productivity is always essential to higher real wages. By real wages we mean purchasing power.

In addition to wages, we use two other devices to allocate products of the economy among the people. These devices are (1) rationing and (2) taxes and public aid.

Rationing is always necessary whenever the price of any commodity is kept below its balance point, or market value. If the government does not ration the item, then the producer or distributor must do it. Rationing may be on a simple first-come, first-served basis, or on some basis of need, merit or influence.

During World War II shoes, gasoline, tires, and many foods were rationed. Most raw materials were rationed to manufacturers in accord with the importance of their product to our military effort. A few items are still rationed today; for example, natural gas for heating homes is rationed in some areas. The privilege of attending college may be rationed on the basis of merit--scholarship. Students with low grades are not admitted.

In socialist-communist countries prices of some things are often kept below market value. For this reason it is necessary to ration many items, including housing. Usually a long wait is necessary before housing can be secured. The privilege of attending high school and college is more carefully rationed in socialist-communist countries than in the United States. Good scholars can attend college with little or no expense. In the United States the size of father's checking account, rather than the student's scholarship, sometimes is the factor that determines whether or not the good student goes to college. Some families do not value education highly. Some farm families, for example, may prefer to spend their money for a new automobile, tractor, or furniture, or more land than for education. The proportion of farm boys and girls attending college in our country is well below the average for the nation.

Public aid is used extensively in the United States and other capitalistic countries to allocate food and other essentials to individuals and families that cannot take care of themselves. Unfortunately public aid is also given to many who could provide for themselves if they wished to do so, or were forced to do so. We do not have much information about public aid in communistic systems.

3. WHAT IS CAPITALISM?

The word capitalism has many connotations, some of them unfavorable. According to a huge dictionary published 50 years ago, capitalism is "a system which favors the concentration of wealth in the hands of a few." This definition or description was devised and publicized by Marx. Most of us in America could not support that kind of capitalism.

An equally heavy, but newer, dictionary defines capitalism as "an economic system in which...the ownership of land and natural wealth, the production, distribution and exchange of goods, the employment and reward for labor,... are entrusted to and (carried on) by private enterprise and control under competitive conditions." According to this definition, the two key characteristics of our form of economic organization are (1) private ownership and (2) competitive conditions. This definition is much more appropriate for us in America than the one given by Marx a century ago. Incidentally, this same dictionary says that "usually socialism denotes the doctrines developed by...Karl Marx...." This supports our earlier observation that socialism is identical with communism.

Curiously enough, the New International Encyclopedia, published in 1917, does not have an article on capitalism, although it has long discussions of both socialism and communism. Among other things it says that "communism, in its broadest sense, is the economic basis of socialism."

The concept of capitalism is much newer than the idea of socialism-communism. Karl Marx is given credit for "discovering capitalism." His most famous book is called "Das Kapital." Most of the other economists of his time did not even mention capitalism. They accepted it, but did not have a name for it.

The famous German economist, Werner Sombart, who lived until 1941, was the first to recognize capitalism as fundamental to the modern system of economic thought. His chief work, Der Moderne Kapitalismus, was first published in 1902.

We may note some of the essential characteristics of modern capitalism:

1. The capitalistic process is evolutionary; it is always changing; it can never remain static. It is the only known economic system that has led to the highest levels of living for the masses of people.

2. The capitalistic system inflicts at least temporary hardship on some people. They lose out in the competitive struggle and are forced to find other employment. Farmers, coal miners, and railroad workers are examples of entire groups who find that opportunities for employment are diminishing.

Many persons assert that there is little or no competition in our present business world. Most of them apparently have had little or no experience in the management or ownership of any business. We do have literally millions of persons who have worked in the business world of modern America and who can testify to the reality of competition there. Just talk to a few businessmen in your own home town--or someone who has a managerial position in a large corporation.

3. The capitalist society has a class structure (as do most known societies). Marx alleged that there were only two classes--the wealthy owners and the poor working people, the "haves" and the "have-nots," but we have many "classes." We have managers of businesses, farmers, skilled workers, common laborers, the clerical ("white collar") group, and the professional class. These are, of course, not distinct classes, but rather broad areas that have no distinct border lines. Supporters of capitalism ascribe individual success in this society to superior ability, strenuous effort, and strong moral standards. Opponents of capitalism assert that exceptional economic achievement under capitalism is the result of "luck" or the absence of moral standards, or both!

4. A fourth characteristic of the capitalistic system is that it runs by spurts--sometimes fast, sometimes slow. Thus we have alternating periods of boom and recession. The recession periods bring extensive unemployment and also political unrest. Recessions and depressions are fertile breeding grounds for political revolution. The depressions after World War I brought on the destruction of popular governments and the rise of dictators in Germany (Hitler), Italy (Mussolini), and several other countries. Even here in the United States we experienced a considerable revolution led by Franklin D. Roosevelt.

In our society the government owns considerable property and operates a number of major enterprises. Among these are roads and streets, parks, public lands in the Rocky Mountain states, dams, reservoirs, and much electric power generating and distribution equipment. Among the government operated enterprises are the postal system, the social security system, and most of our schools and colleges.

It is argued that since the government has managed these properties and enterprises efficiently and satisfactorily, it could own most of our other property and operate most of our other enterprises with equal success and satisfaction. There is one big fallacy, however, in this line of argument. It overlooks the fact that private enterprise provides essential competition for the government institutions. The government must meet the competition provided by the private sector of the economy. Thus, state universities must meet the competition provided by private schools, such as Harvard, Yale, Princeton, Northwestern, and the University of Chicago. The state schools must meet competition in paying staff members but, more important, they must meet competition in excellence of teaching.

Employment by a public agency is reasonably pleasant and remunerative under present conditions. Employment by the state, however, might be very unpleasant, or unobtainable, if there were no private employers.

We should say a word about laissez faire, a French expression meaning let it be, do not interfere. It is a policy supported by some economists in the past and also at the present time. Many people confuse laissez faire with competition. They argue that we do not have laissez faire in business; therefore, we should not expect to maintain competition in agriculture. The first part of this argument is right, but not in the sense that is commonly meant. Certainly we do not blindly follow the doctrine of laissez faire in our economy. We intervene especially to maintain or create competition. By contrast, laissez faire would permit big business to become highly monopolistic.

If there is any one characteristic that is special to our (the U.S.) form of capitalism, it is intense competition. We have extensive laws to promote and maintain competition. This fact is illustrated by the court trials and the conviction of the executives of some large corporations for conspiring to avoid competition.

To be sure, our competition is not perfect. We have some laws to promote and maintain monopolies. Outstanding among them are laws that exempt labor unions from antitrust laws. In this respect West Germany is ahead of the United States. We see the results in the fact that the U. S. dollar is weak while the mark is strong. The Germans have been gaining gold while we have been losing it.

4. CAN PERSONAL FREEDOMS BE MAINTAINED UNDER SOCIALISM OR COMMUNISM?

One important question for us to consider is whether a popular or free government can be maintained where that government owns most of the means of production and hires and fires most of the people. In the United States today many people prefer working for the government to working in private industry or going into business for themselves. Most employees of federal, state, and local governments enjoy reasonably good pay, often more than they could earn in private employment. Goldbrickers seldom get fired. Wage increases come almost automatically. Disability and retirement benefits are acceptable, and if any good worker becomes dissatisfied he can usually get acceptable employment in private business.

However, if the government controlled all jobs--was practically the only employer, the individual would have no choice of employer. The best jobs would go to political favorites and to those who would support the "party line." Persons who criticized the administration or its policies would be penalized by being denied promotions, by being demoted, or by being assigned to some American equivalent of Siberia.

There are some of these practices in our own country, and probably in every country that has popular government and private enterprise. For example, there are hundreds of jobs in the federal government that are filled to pay political debts and to build political organizations. Similar practices prevail in most state and city governments.

Another example is the collection of so-called voluntary contributions from city, state, and federal employees to build political campaign funds.

A third example is provided by many of our labor unions. They virtually control the employment opportunities of their members. Workers who oppose the union may find themselves subject to personal harassment and be denied employment.

Union members, like government workers, are often asked to make "voluntary" contributions to so-called educational programs which are in reality political campaigns. Failure to make such contributions results in social and economic pressures on the members who would be independent.

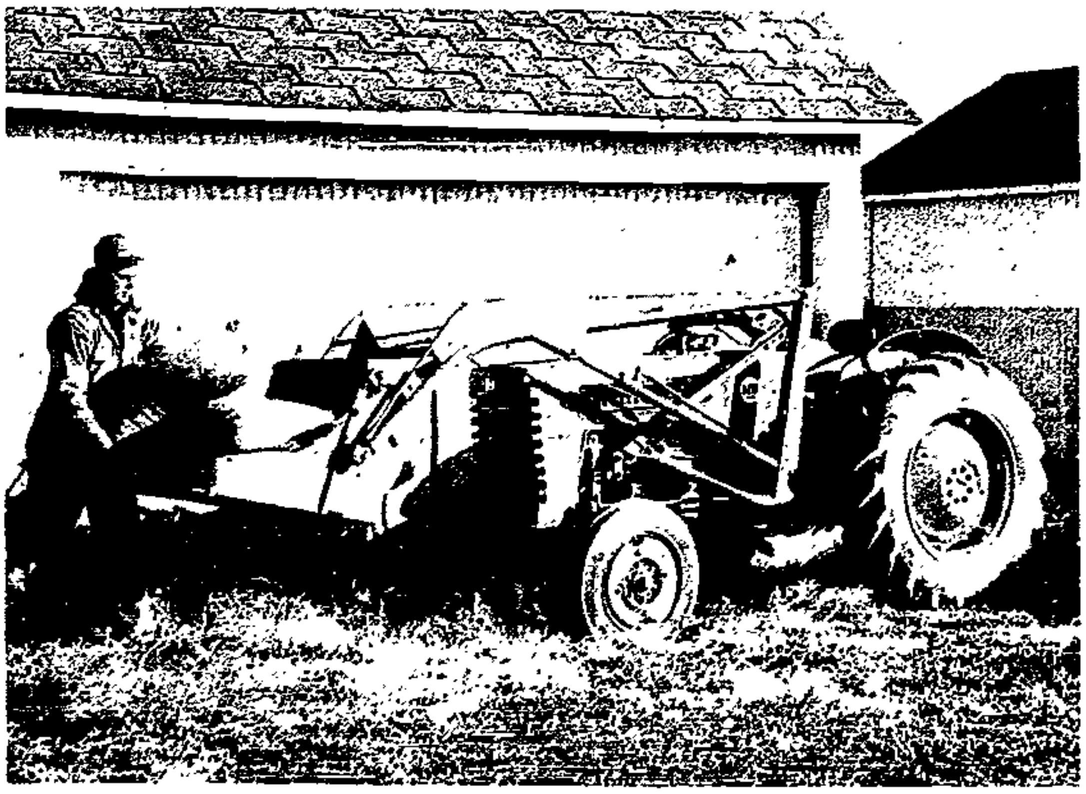

Fig. 3. American farmer at work on his farm.

In a private enterprise system, employment in government service is always protected by the existence of alternative employment in private industry. The alternative of private employment is the essential force that makes and keeps government employment bearable.

Recall the quotation, "Power corrupts. Absolute power corrupts absolutely."

While it is theoretically possible to have popular government that is also socialist-communist, no such government has ever existed for any substantial period of time. In the absence of specific examples to the contrary, and in view of the nature of people, it seems unlikely that we can expect to see personal freedoms maintained under any socialist-communist economic system.

5. COMPARISON OF CAPITALISM AND SOCIALISM-COMMUNISM

All known economic systems are mixtures of capitalism (private enterprise) and socialism-communism (public enterprise). There seem to be some important advantages from such a mixture. For example, a good system of public schools seem to be necessary for the achievement of a high standard of living for a nation. And no socialist-communist country has been able to operate without some private enterprise.

While a mixture of private and public enterprise seems to be desirable, the nature of the mixture is very important. Some essential services apparently can be provided advantageously by public agencies, but extensive government control of production and employment--especially schools, newspapers, radio, and television--leads to inefficient production and loss of personal freedom.

An economic system can be compared with the making of concrete. Strong and useful concrete can be made with the right mixture of high quality cement, sand, gravel, and water. But poor quality ingredients, or improper proportions of them produces only a worthless mess. The following paragraphs provide some comparisons between capitalism and socialism-communism.

Fig. 4. Russian women at work on a farm.

Ownership of property

Capitalism. Most property is owned by individuals or groups (corporations). The owners have great freedom in the use of their property. They can use it for personal enjoyment or for producing things for sale, so long as such use does not interfere materially with the rights of other people. Private property can be sold or given away. Owners usually must pay taxes based on the value of the property, for the maintenance of public services. Taxes also may be levied upon property when it is transferred from one party to another. Private property rights are granted by society as a whole and are limited by the whole society.

Socialism-Communism. Property generally belongs to the people collectively. The public owns the land, mines, factories, transportation, stores, hotels, restaurants, theaters, newspapers, radios, and television. The public also owns the houses, apartments, and automobiles. These properties are managed by government employees who are directed by a highly centralized authority. Individuals and families may be permitted to own personal items such as clothing, furniture, and bicycles.

Freedom of enterprise

Capitalism. Each person has the privilege of choosing his occupation or business. He can work for himself, or choose a private or public employer. It is believed that when each person is free to choose his occupation he is likely to make his best contribution to group welfare. Freedom of enterprise does not guarantee that each individual will be successful in his chosen vocation. Governmental units, representing the public, intervene to prohibit activities judged to be against the public interest.

Socialism-Communism. Practically all individuals must work for the government or a government agency. Each person is expected to work in a job provided by the government, though he may have some choice of jobs. While socialist-communist countries usually permit some small private enterprises, no one, except possibly a favored few political leaders, is permitted to earn substantial profits. Freedom of enterprise is often expressed in graft--or the sale of influence.

Economic incentives

Capitalism. Individuals base most of their activities on a desire from some kind of economic gain such as wages or profits. The desire for power and prestige, and the satisfaction from helping others, also serve to motivate individuals to produce useful goods and services. The desire for economic gain guides individuals into occupations and activities where they can make a large contribution to the satisfaction of the wants of many people.

Socialism-Communism. There is very little opportunity for personal profit, or to become the owner of such attractive things as automobiles, homes, and farms. According to traditional socialist-communist theory each individual would be paid largely according to his needs. Thus wages and salaries would be about the same for everyone. In practice, however, public officials and the managers of enterprises, (who usually double as political leaders) receive much higher incomes than do most of the people.

The price system

Capitalism. Most of the economic activity is guided by an impersonal price system. It directs the production and use of goods and services, except those provided by public agencies. Individuals consider prices when they decide what and how much to buy. They are guided in a large part by wages and salaries (the price of their labor) in the choice of their occupation and employer. Prices also guide the use of land and capital (buildings and equipment) into the most desired uses. Prices keep production and consumption in balance without need for rationing.

Socialism-Communism. Prices are relatively unimportant in guiding production and consumption. Major decisions are made by public officials, who usually are political leaders. The central governing group decides what and how much to produce. Prices provide some guide to consumers in their purchases, but most major items--such as housing --are allotted by government officials. Wage differentials (prices) apparently are essential to encourage leadership and the assumption of responsibility. The lack of a free pricing system prevents the development of efficient agricultural and industrial enterprises.

Competition

Capitalism. In the American form of capitalism competition works to reward the efficient and to penalize the inefficient. Competition among firms encourages the reduction of costs of production, the improvement of quality and the development of new products for consumers and industry. In most industries competitive conditions are maintained by government rules, and court action if necessary. Some monopolies are permitted and even encouraged, for example the supplying of water, electricity, gas, and telephone service. Charges by monopolies are controlled by the government, not to insure a profit to the owners, but to protect the public. Competition among individuals for the better jobs leads to constant improvement of individual performances.

Socialism-Communism. There is relatively little direct competition among farms, factories, and other economic units in the socialist-communist systems. Effective competition is impossible without free prices and free markets. There is little incentive to reduce costs, improve quality or to develop new products for consumers. Factories, railroads, etc., operate largely as monopolies. Prices and charges are regulated primarily for the benefit of the government. This benefit may be monetary or political. There is considerable competition among ambitious individuals. This competition begins in school. Students who show exceptional abilities are given advanced training. Later, those who exhibit technical ability and/or political leadership are given the better jobs. Those who incur the displeasure of the leaders are demoted or punished.

Political and economic freedom

Capitalism. Experience over many centuries has shown that a high degree of political and economic freedom can be achieved and maintained under our form of capitalism, which is characterized by the private ownership and competitive operation of land, factories, and other productive property. Each individual can go into a business for himself, or get a job with any one of many private businesses or public agencies. He can freely and publicly support or criticize his private employer or the public officials. He can participate in the selection of nominees for public office, and usually can choose between at least two contenders for any public office. He can himself become a candidate for public office without or with the support of the ruling group.

Socialism-Communism. Marx and other leaders long claimed that people were oppressed under capitalism and that they would gain freedom under socialism-communism. It hasn't worked out that way. Everywhere that the communists have taken over the people have lost, rather than gained freedom. They have lost the privileges of owning property, going into business for themselves, or working for an employer of their own choice. They have lost the freedom to criticize their employer and government officials. Most of the people have no voice in the selection of candidates for public offices. They can vote, but only for the man selected by the party leaders. The lack of freedom and opportunity is clearly shown by the stringent measures, including the building of the infamous wall in Berlin, taken to prevent the people from leaving the socialist-communist countries.

*TEXTBOOKS, REFERENCE BOOKS, *VOCATIONAL AGRICULTURE, *SAFETY,
*EQUIPMENT, *FARM SHOPS, AGRICULTURAL ENGINEERING,

The purpose of this document is to provide reference and textual materials for high school vocational agriculture and adult farmer students on the safe operation of shop equipment. Development by a teacher educator included consultation with subject matter specialists, teacher-educators, supervisors, and teachers. The document concerns general safety rules, and hand tool, electrical, tractor and machinery, and sheet metal safety. Safety instructions are included for portable electric circular saws, tilting arbor and radial arm saws, jig saws, band saws, jointers, electric sanders, routers, planers, drills, grinders, power hacksaws, arc welders, gas welders, inert gas welders, spot welders, and gas forges. The material is appropriate for use by vocational agriculture teachers with students of average ability with interest and occupational goals in agriculture. Time required is for 2 to 8 hours. This document is available for 30 cents from Vocational Agriculture Service, University of Illinois, 434 Mumford Hall, Urbana, Illinois 61801. (JM)

ED020442

SAFETY IN THE AGRICULTURAL MECHANICS SHOPS

1. What Are General Rules for Safety in the Agricultural Mechanics Shop?
2. What Are Safety Instructions for the Use of Hand Tools?
3. What Are Safety Regulations When Working with Electricity?
4. What Are Safety Instructions for Tractor and Machinery Repair?
5. What Are Safety Instructions for Soldering and Sheet Metal Work?

Safety Instructions for Operating

6. Portable Electric Circular Saws
7. Circular Saws (Tilting Arbor and Radial Arm)
8. Reciprocating and Portable Jig Saws
9. Band Saws
10. Jointers
11. Electric Sanders
12. Routers and Planers
13. Drill Press and Portable Electric Drills
14. Power Grinders
15. Power Hack Saws
16. Arc Welders
17. Oxy-Acetylene Welders
18. Inert Gas Shielded Welders
19. Spot Welders
20. Gas Forges

One of the most valuable habits you can acquire in your shop training is the formation of a positive safety attitude. A positive safety attitude means the habit of not only being safety conscious but also familiar with recommended safety procedures in using tools and operating equipment. It is not difficult to be constantly aware of the importance of safety when you know how vital it is to you to cultivate proper attitudes toward safe work habits.

VT003013

The danger of the absence of a positive attitude toward safety becomes immediately apparent when you consider the consequences of neglect in any one area. In the field of traffic safety, evidence shows that where traffic law enforcement decreases, accidents increase. In another case, a factory foreman became lax in enforcing the requirements for wearing safety goggles, and in one month's time, eye injuries increased five percent. No doubt each of you can easily recall recent accidents in your community that were due to carelessness, neglect, or an improper safety attitude. Industrial shops are not the only place where a positive safety attitude is important. It is important in agricultural mechanics shops. Therefore, the safety recommendations found here have been established for three very good reasons:

1. To protect you and your co-workers from bodily harm.
2. To minimize damages to the facilities, machinery, and tools.
3. To provide you with experience in safety concepts that apply to occupational fields.

77

1. WHAT ARE GENERAL RULES FOR SAFETY IN THE AGRICULTURAL MECHANICS SHOP?

Safety is of first importance in any shop. Safety involves many things. It means having tools and equipment in good operating condition with proper guards in place at all times. It means that students who use the shop must be properly trained in safe operating procedures. Most of all, it means the use of common sense and good judgment by students who are alert and who really believe in safety.

Statistics show that 85 percent of school and industrial plant accidents are due to human factors against which mechanical devices cannot guard. Thus, guards and other safety devices afford only about 15 percent protection against accidents. Most accidents result from someone's thoughtlessness, carelessness, or lack of consideration for others.

Safety depends upon YOU; YOU must believe in it; YOU must learn and practice safe rules of conduct in the shop; YOU must sell others on the idea of safe operation at all times.

Proper dress in the shop

Wear appropriate clothing in the shop. Avoid loose fitting or ragged clothing. When working with power equipment, remove your tie, roll your sleeves above the elbows, and tuck your shirt in your trousers.

For welding, clothing should be free from accumulated oil, dirt, and grease. Fire resistant gauntlet gloves are recommended for the hands and wrists. Woolen clothing is preferable to cotton because it is not as readily ignited. Keep sleeves and collars buttoned. Cuffs should be turned down and pockets should be eliminated. Low shoes with unprotected tops permit slag or sparks to lodge in them.

Keep hair cut to avoid hazards when working in the shop.

Wear safety goggles while working in the shop. Safety goggles protect the eyes from injuries caused by small particles, splashed acids, etc.

Proper work habits in the shop

Avoid HURRY. Plan your work so you will have plenty of time to finish before clean-up time. A hasty operator cannot be a careful operator.

Keep busy during the entire period in the shop. Plan your work so you are busy during the shop period. Do not bother other students or work on another student's project unless you have been so assigned by your instructor.

Refrain from loud talking or shouting. The shop is a teaching laboratory and unnecessary noise is distracting. Talk in a low tone and avoid shouting.

Do not leave the shop without the instructor's permission. The instructor is responsible for all members of the class during the time they are assigned to him. Do not leave the class without first checking with your instructor.

Do not talk to another student while he is operating power equipment. Operating a machine is a full time job. If necessary to talk, signal him and wait until he has turned off the machine.

Do not start or stop machines unless you are the operator. The operator of a machine must be in full control at all times. Some operations require a helper, but the helper should not start or stop the machine or control its operation in any way. All stationary power tools should have a working safety zone. It may have lines plainly marked encircling the power tool. During the operation of the power tool, only the operator or the operator and his assistant should be within the safety zone.

Do not engage in horseplay, scuffling, or pushing while in the shop. Any student who, by his actions in the shop, becomes a hazard to the safety of himself or his fellow students, should not be permitted to operate equipment. In extreme cases he may not be permitted to continue as a member of the class.

Clean the shop before leaving it. When the warning bell rings, all tools should be returned to their proper storage place and work areas cleaned up before the class is dismissed. Spilled oil or grease should be cleaned up promptly as it may cause others to slip and fall. Accumulations of dirt, sawdust, and trash create a fire hazard as well as an accident hazard.

Report all defective equipment to your instructor. Turn off any motor or appliance

that does not seem to be operating properly. Turn off the motor if it seems to be heating above normal operating temperature. Equipment must be kept in good condition to be safe. Cutting tools must be kept sharp, handles tight, and guards in place on grinders, saws, and other power tools. Equipment that is not in good operating condition should be labeled "OUT OF ORDER" and not used until it is repaired.

THINK. Most accidents are caused by thoughtlessness. When in doubt about the correct safety procedure, ask your instructor.

Proper fire protection in the shop.

Know the location of fire extinguishers. Learn the types of fire extinguishers that are available in the shop and the correct type to use on each class of fires.

Know the location of the fire blanket. The fire blanket should be available to the welding area for emergency use to extinguish clothing fire.

Always check the area for flammable material before lighting torches or turning on welders.

Store paint, lacquer, and other flammable material in metal cabinets.

Use only safe solvents for cleaning. Gasoline should never be used for cleaning purposes because of the danger of fire or explosion.

Proper first-aid in the shop

Report all injuries, including minor cuts, to your instructor. Infections can develop wherever the skin has been broken or cut. Use first-aid materials and if in any doubt, consult a doctor or nurse. No student who has had an accident which caused the flow of blood should leave the shop alone.

Know the location of the first-aid cabinet. The standard items of first-aid supplies should be kept in a first-aid cabinet in the shop.

Welding or cutting on containers

Never do any welding or cutting on containers that have held a flammable substance until they have been thoroughly cleaned and safe-guarded.* An empty gasoline container may be just as dangerous as a full one because gasoline vapor usually remains in the container after gasoline or other flammable material has been removed.

First wash the tank several times and flush it with live steam until all possibility of gasoline vapor has been removed. Washing with a strong solution of caustic soda or similar chemical will remove heavy oils.

Fill the tank with water or carbon dioxide before welding or cutting on it.

Water drives out any remaining vapor. However, before starting to weld, drain the water to a point just below the spot to be welded. Also be sure there is a vent or opening above the water to provide for the release of heated air from inside the container (Fig. 1).

Carbon dioxide may be forced into the container where it is not practical to fill it with water (Fig. 2). Periodic examination of the gas contents of the container should be made to make sure the concentration of carbon dioxide (80% of air space inside container) is great enough to prevent an explosive mixture.

Dry ice is sometimes used by placing a sufficient amount in the container to provide

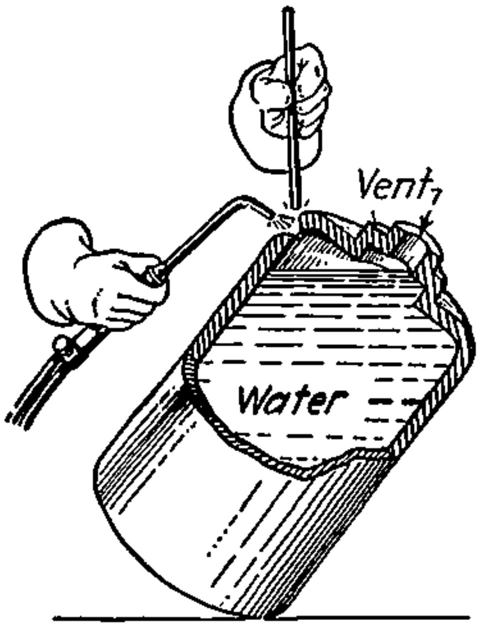

Fig. 1. Containers which have held flammable materials should be filled with water before welding or cutting. Make sure that the space above the water level is vented.

---

*Detailed procedures for safe-guarding containers for welding may be found in the booklet "Safe Practices for Welding and Cutting Containers That Have Held Combustibles." American Welding Society, 33 W. 39th St., N. Y.

protection. The dry ice produces carbon dioxide which occupies the air space in the container. In using dry ice, be sure to use enough dry ice to replace 80% or more of the air space with the carbon dioxide.

PRECAUTION! - The use of carbon tetrachloride in place of carbon dioxide is not recommended as carbon tetrachloride gives off a poisonous vapor when heated.

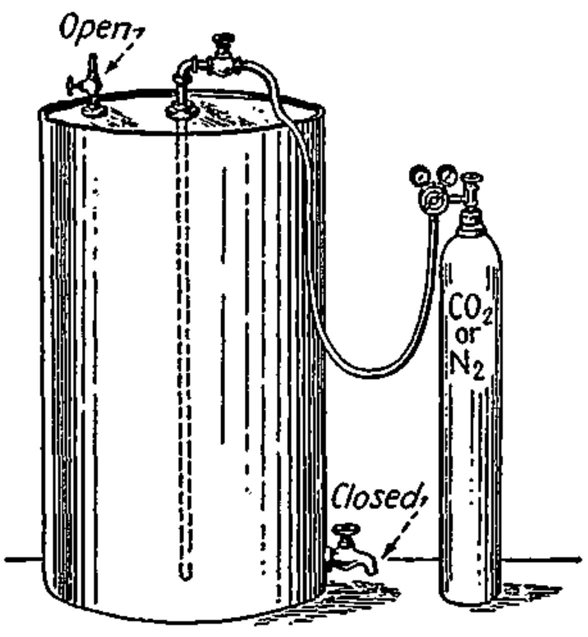

Fig. 2. Suitable concentrations of nitrogen or carbon dioxide may be used to supplement thorough cleaning to safeguard containers.

2. WHAT ARE SAFETY INSTRUCTIONS FOR THE USE OF HAND TOOLS?

Although most serious accidents involve power equipment, many minor accidents occur with common hand tools. Following are some suggested practices that will help to eliminate shop accidents with hand tools.

Proper use of hand tools

Keep all edge tools sharp. Dull tools are dangerous because excessive pressure is necessary to make them cut and this frequently causes tools to slip and injure the operator.

Avoid cutting toward yourself or others around you, when using an edge tool. There is always a possibility of the tool slipping and injuring you or others. It is necessary to pull a draw knife or a spokeshave toward you, but, since you use both hands with these tools, they are relatively safe.

Use wrenches of the proper kind and size for the job. Wrenches with worn or spread jaws are hazardous. Do not use a pipe to extend the handle of a wrench. Wrenches that fit improperly increase the chance of slipping and injuring your knuckles. Do not strike wrenches with hammers.

Do not handle tools carelessly. Avoid dropping tools or placing them where they can fall or be easily knocked over.

Provide handles for all files. This reduces the possibility of an injury from the sharp tang.

Use tools correctly. Do not use a tool for a purpose other than for which it was designed. Use the right tool for the job. The wrong tool may damage materials, injure workers, or both.

Do not use pliers in place of a wrench.

Do not use a wrench as a hammer. The wrench may break or chip.

Do not use a screwdriver as a chisel, punch, or pry bar. Hammering on a screwdriver may damage it.

Do not use a machinists or ball pein hammer for carpentry work.

Do not use carpenter's hammers to strike punches or cold chisels.

Do not use punches or chisels with mushroomed heads. Dress the heads of mushroomed cold chisels and punches on the grinder in order to prevent particles from breaking off and endangering the user or other persons.

Store tools properly so that sharp edges are guarded.

Keep handles secure and in good repair. Be sure all tool handles are securely attached before using them. Loose hammer heads or weak handles endanger other workers as well as yourself. Check for cracked or loose handles on all axes, hatchets, and hammers before using them.

Adjust the jaws of adjustable wrenches. Take time to properly adjust the jaws and keep the face of the wrench forward in the direction the handle is to turn. Adjustable wrenches often slip or break when used improperly.

Keep tool handles free from dirt, oil, and grease. Dirty, greasy tools are dangerous because it is impossible to grip them properly. Clean tools make a worker more efficient.

Drive nails correctly. Hold the nail between the thumb and forefinger. Keep the remaining fingers closed and away from the nail.

Do not carry edged or pointed tools in your pocket. Serious injuries can be caused by chisels, scribers, wing dividers, etc. in this way.

Hold work steadily. Be certain that work to be cut, sheared, chiseled, or filed is steady and secure to prevent tools from slipping.

Use screw drivers of the proper size. Don't use one with a blade too thick, too thin, too wide, or too narrow, as it may slip and cause injury. Keep the tip in good condition, not worn or rounded. Use screw drivers of proper design. Do not hold work in your hand when using a screwdriver. If possible, use both hands on a screwdriver and keep it pointed away from your body. Puncture injuries caused by screwdrivers are rather common and often quite serious.

Mount vises securely. A loose vise is dangerous. If a machinist's vise has a swivel base, be sure it is locked. Do not strike the vise handle with a hammer. Do not use a pipe as an extension of the handle. Normal leverage will hold the work securely in place. Do not hammer on the beam. It is not an anvil and is not intended for this use. Keep vise jaws clean at all times.

3. WHAT ARE SAFETY RECOMMENDATIONS WHILE WORKING WITH ELECTRICITY?

Students are surrounded in the agricultural mechanics shop by various types of electrical equipment, tools, and appliances. In order to work safely under these conditions, it is important to understand the possible dangers that may result from unsafe and improper operation of electrical equipment.

Recommendations for safety with electricity

Check all wiring, outlets, and service fixtures in the shop regularly for safety. This should include wire size, outlets, fuses, switch boxes, etc. All wiring should comply with the National Electrical Code.

Locate and check the master switch. Be sure you know where this switch is located and how to shut it off in an emergency.

Check all electrical tools for damaged cords, faulty plugs, or loose connections. All cords should contain a grounding conductor.

Check all extension cords for exposed wires, faulty plugs, poor insulation, and poor connections. Avoid overloading extension cords. Avoid handling electrical cords and switches with wet hands. Do not place extension cords in doorways or lay them on radiators or steam pipes. Wipe them to remove grease before putting them away. Do not disconnect power tools, appliances, or extension cords by pulling on the cord. This may cause loose connections or broken conductors.

Use grounding plugs on all power tools. Be sure that all receptacles in the shop are the grounding type and properly installed.

Use care in damp places. Do not operate electrical equipment adjacent to water or damp places unless special precautions have been taken. When working with electrical equipment in damp places, it is best to wear rubber-soled shoes.

Keep proper size fuses on hand. Do not use pennies or other objects as a substitute for fuses. This may result in overheated conductors and appliances or in a fire.

Unplug heating appliances. Never leave heating appliances connected when not in use. Overheating or fire may result.

Use proper cleaning solvents. Do not use gasoline or flammable solvents to clean electric motors or appliances.

Check motor temperature. Turn off motors and appliances that are smoking, have a peculiar smell, or are operating above normal temperature.

Check circuits carefully. Use an insulated circuit tester to check circuits. Do not use bare fingers to see if a circuit is energized.

Use a fuse puller to remove cartridge fuses.

Lock a control switch open if you are working on a circuit. If it is not locked open, someone may close the switch and energize the circuit.

Use proper extinguisher on electrical fires. Do not use water-type extinguishers as they can result in a fatal shock.

Observe the following precautions when completing electrical wiring, electric motors, and controls exercises.

a. First make a wiring diagram on paper and have it checked.
b. Solder wire splices and tape them unless insulated solderless connectors are used.
c. Properly connect and tighten screws on wires connected to electrical fixtures. Do not tighten screws so hard that fixtures are broken or threads are stripped.
d. Use correct wiring methods and procedures and follow the rules of the National Electrical Code.
e. Have instructor check the work before connecting up to current.
f. Have instructor check connections before turning on an electric motor.
g. Be sure the neutral conductors are not switched in controls exercises.

4. WHAT ARE SAFETY INSTRUCTIONS FOR TRACTOR AND MACHINERY REPAIR?

The repair of tractors and farm machinery in the farm mechanics shop demands serious consideration of safety. In working with present day complex farm machines, it is necessary that the student be alert and safety conscious in order that he avoid accidents.

Safety instructions for farm equipment

Use hoists and jacks correctly. Never allow any part of your body to be under a machine while it is suspended by hoists or resting on jacks. After raising the machine, make it safe and secure by use of solid supports placed under the machine.

Use proper sizes and types of wrenches. Wrenches which do not fit or are used improperly may slip and cause injury.

Use small parts containers. Provide containers for bolts, screws, and disassembled parts. Bolts and parts left scattered on the floor become lost or may cause others to trip over them.

Cover protruding parts. Exposed shafts, axles, and sheet metal may cause injury to others.

Provide ventilation. Make provisions for removing exhaust gases when engines are operated in the shop. Carbon monoxide from tractor exhaust fumes may be fatal if inhaled in sufficient quantities.

Avoid burns. Never remove the radiator cap while the engine is overheated. Steam pressures from the radiator may explode and cause burns on face, hands, and arms. Keep parts of body away from hot manifolds to prevent burns.

Clean up grease and oil from the floor promptly or cover it with an absorbent. Grease spilled on floors may cause falls.

Stop equipment before adjusting it. Do not adjust tractors or machines while they are running. This is important. Fingers, hands, arms, and legs may be injured or lost because of failure to observe this recommendation.

Do not use your mouth in siphoning gasoline. Gasoline contains many additives, some of which are harmful.

Prevent gasoline fires. Wipe up spilled

gasoline promptly. Sparks may ignite the gasoline causing serious fires and burns. Welding of farm machinery should never be done in the vicinity of fuel storage. Never add fuel to a tractor while it is running as sparks from the engine may ignite escaping gasoline fumes. Never use gasoline to wash parts. Various types of commercial solvents are now available which are less flammable and easier on the hands. Do not leave open pans of cleaning fluid in the shop. Never pour gasoline or dirty cleaning fluid down the drain.

Avoid lifting heavy machinery parts. Back injuries are often the result of improper lifting of heavy objects. Use an overhead hoist when available.

Warn others before you move any levers or trip any parts that might cause pinching or crushing.

Wear gloves when removing tight and rusted nuts to avoid injury to knuckles.

5. WHAT ARE SAFETY INSTRUCTIONS FOR SOLDERING AND SHEET METAL WORK?

By engaging in unsafe practices while soldering or working with sheet metal you risk injury to yourself and others. Safety instructions should be strictly followed while soldering and working with sheet metal.

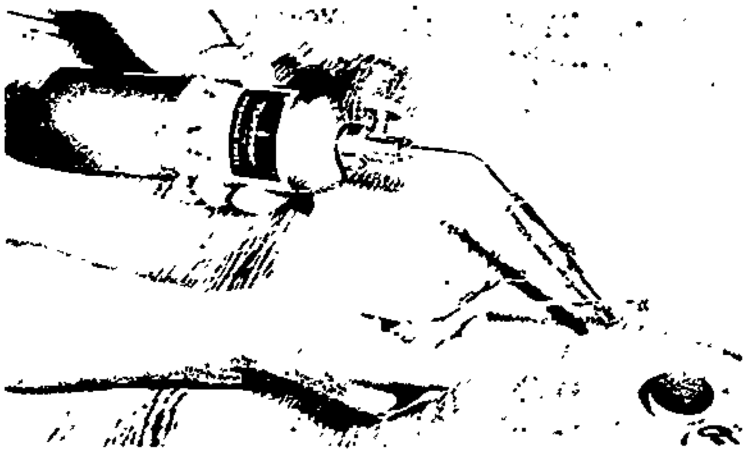
Safety instructions for soldering

Be careful with soldering acid. This acid will ruin your clothes, burn your skin or injure the eyes. If you get acid on your skin, wash it off as quickly as possible. In case of any burns, report at once to your instructor for first aid treatment.

Avoid breathing fumes. Fumes from soldering fluxes and from tinning a soldering iron are harmful when breathed in quantity and should be avoided.

Use care with molten solder. Avoid dropping molten solder on cold, damp surfaces. Molten solder spatters and the small droplets of metal may cause burns. Molten solder can cause steam pockets when it comes in contact with moisture. These pockets can explode and cause burns. Position yourself so molten solder will not fall on you. Be careful that the hot metal does not burn you. Burned fingers are almost the sure sign of a beginner at soldering. Just because the solder has cooled enough to solidify does not mean that the metal is cool enough to handle with the bare hands.

Be careful of fires and explosions from propane torches, blow torches, and gas firepots. Do not light a soldering torch near combustible materials. Stand to one side when lighting gas burners or torches. If gas does not light immediately, turn off valves before investigating the reason for the failure.



Never throw empty propane cylinders in an incinerator.

Handle electric soldering irons carefully. Inspect the plugs and cords regularly. When soldering with welding equipment, refer to safety regulations recommended for operating arc and oxy-acetylene welders. Never solder a container until it has been "safe-guarded". For methods of "safe-guarding" containers see footnote bottom of page 3.

Use shears carefully. Make sure metal squaring shears are equipped with guards. Never put the fingers under the blade and never reach behind the shear blade to hold small pieces. Do not permit sheet metal to slip through your hands. Cuts from metal are usually from a slicing motion. Snip off sharp points left from pattern cutting. Watch for slivers on edges of cut metal. When beginners cut sheet metal with snips they often leave sharp needlelike slivers on the edges.

Use correct procedures. When in doubt about the correct safety procedures ask your instructor.

6. SAFETY INSTRUCTIONS FOR OPERATING PORTABLE ELECTRIC CIRCULAR SAWS

In carpentry work, one of the most useful power tools is the portable saw. Most hand-cutting operations can now be performed with the portable electric saw. This tool becomes dangerous when improperly used. The operator should be properly trained in handling the saw and procedures in making the various cuts. Suggestions for safe use of the portable electric saw follow:

1. Keep a sharp blade on the saw at all times.

Dull blades may pinch in the work and cause a kick back. Do not use a blade after you sense it is dull, needs setting, or has come in contact with metal.

2. Check to see if safety devices are functioning properly before using the saw.

Safety guards are provided in front and over the bottom of the blade, and usually are constructed to return to position after sawing. Some saws have a kickproof clutch. This relieves motor strain and protects the operator from possible kickback of the saw.

3. Check regularly for cracked blades.

Considering the damage that might result from a cracked blade, it is best to replace it at once.

4. Before starting the cut, be sure the extension cord is away from the saw, and that it will allow freedom of movement throughout the length of the cut. The third wire in the extension cord is for grounding and should be connected.

5. Never use a portable saw unless you are well balanced and have good footing.

Keep from standing on scraps or rubbish and do not lean over or reach to extreme positions while sawing.

6. Be sure the blade is clear of the work before the saw is turned on or off.

7. Keep both hands on the saw unless a protractor or other aid to guide the saw is used.

Never hold a small piece with one hand and the saw with the other. Clamp small pieces to a saw horse or table; hold larger pieces down with your knee so that both hands may be used to control the saw. Never reach around to catch a board to prevent it from falling.

8. Hold the saw until it stops turning before you lay it down after a cut.

9. Disconnect the saw when making any adjustments that require your fingers to be near the blade.

Two adjustments are incorporated in the body of the saw. One lock knob provides for (1) depth of cut adjustment and (2) another lock knob allows for angular adjustment. A third adjustment is provided through use of a rip guard. This device must be installed when needed.

10. When starting a pocket or interior cut, the telescoping blade guard should be pushed up out of the way.

7. SAFETY INSTRUCTIONS FOR OPERATING CIRCULAR SAWS
(Tilting Arbor and Radial Arm)

One of the most common pieces of equipment in the agricultural mechanics shop is the table saw. There is no safety device in the shop that is disregarded more than the saw guard. Quite often serious accidents result from careless use of the circular saw. Listed below are some recommendations for proper operation of the circular saws:

1. Be sure that the saw is located in a position so that the electric power cord from the saw to the electric outlet will not be in the way while operating the saw. Encircle the saw with "safety zone" lines.

Painted lines enclosing an area around the saw should indicate a safety zone. Only the operator should be within the zone area when the saw is being operated except in cases where the instructor has assigned a student to assist the operator.

2. Check the power cord and plug for damage.

3. Check the saw table before using to see that it is clean.

A clean table permits holding the material to be cut in a solid flat position against the guide fence. Do not place tools, accessories, or attachments on the saw table as they can mar the surface.

4. Make sure the saw is grounded.

Use the grounding wire in the power cord for grounding the saw.

5. Do not use dull or damaged blades or cutters of any type on the saw.

A dull tool is a dangerous tool and when driven at high speed is even more dangerous.

6. Do not wear gloves, long loose sleeves, neckties, or rings. Keep shirts in trousers.

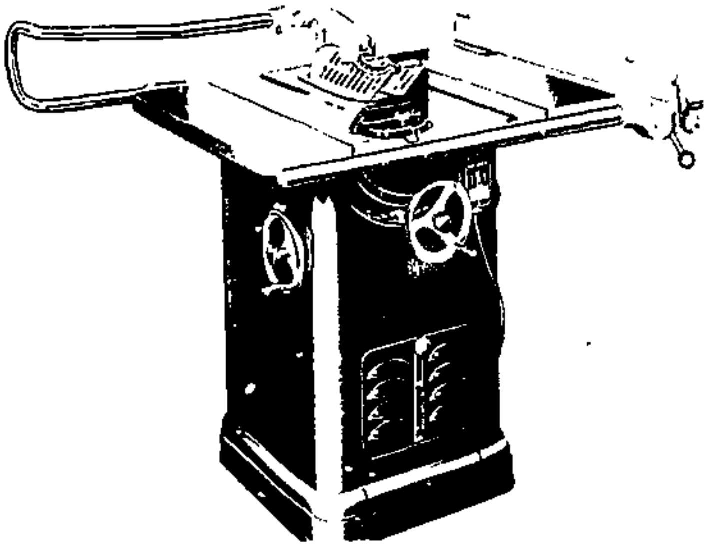
They may get caught in the moving parts of the machine and cause injury.

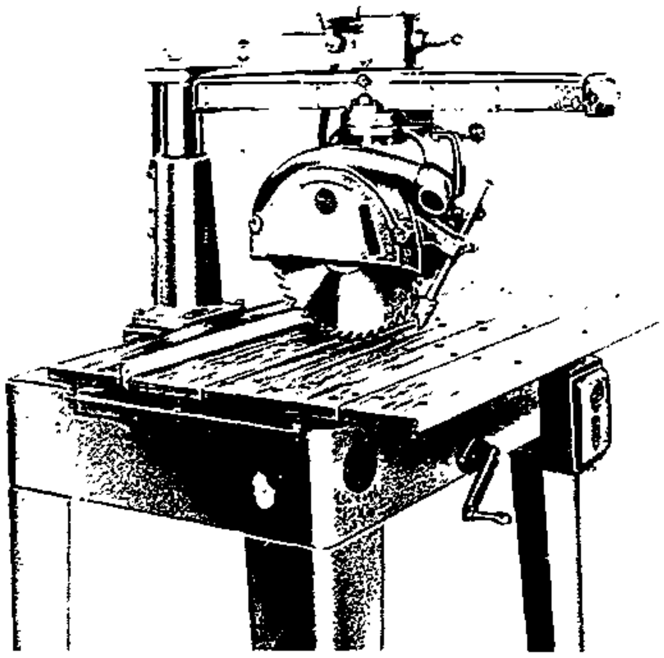
7. Keep the guard down over the saw blade for all normal sawing operations. Always use the guard when ripping or cross-cutting. It is usually necessary to remove the guard on a table saw when rabbetting, dadoing, or resawing. In these cases, compensate by being extra careful and replace the guard immediately when the operation has been completed.

8. Do not saw freehand or try to follow a line with a table saw.

Use the rip fence for ripping and the miter gauge for cross-cutting.

9. Adjust the blade height of the table saw so that it clears the work by no more than 1/4 inch.





This makes for smoother cuts as well as safer operation.

10. When ripping, use a push stick to push the end of the piece through the saw.

11. Never allow your fingers to go beyond a line even with the edge of the guard unless both hands are on the miter gauge, or unless a push stick is being used.

12. Do not use the fence as a stop to gauge the length of pieces being cross-cut.

A clearance block may be clamped to the fence near the edge of the table for gauging the length of pieces being cross-cut.

13. Never clear away scraps close to the blade with your fingers while the saw is running.

If necessary to remove scraps, use a stick at least 2 feet long.

14. When helping someone rip a long board, do not push or pull on the board being ripped.

Merely support the board and allow the operator to control the cut at all times.

15. Always stand with your face slightly to one side of the direct line of the saw blade.

16. Disconnect the power before working around the blade with your fingers.

17. Make no adjustments until the saw has come to a complete stop and never attempt to stop the blade from coasting with a piece of scrap lumber.

Additional recommendations for radial arm saw

18. Do not position yourself directly in front of the saw blade. Be sure the floor is clean of debris and that fellow workers are not within the safety zone area. Be sure all clamping and adjusting handles are tight before the power is turned on.

19. Get the feel of the saw before operating it.

To do this grasp the saw handle and pull the saw out to its full travel on the radial arm. Do this several times and find the most convenient foot position that will enable you to bend your arm naturally without strain on your body. This will help maintain your foot position on the floor and at the same time permit watching the operation of the saw.

20. Before ripping, adjust the front of the guard to not more than 1/8 inch above the work to be ripped.

21. Before ripping, adjust antikickback device so that the fingers are at about 60° angle when in contact with board to be ripped.

22. Before ripping, check the direction of rotation of the blade and push the board in from the proper side.

Remember, in ripsawing operations, the saw rotates up and toward the operator and the material to be cut is pushed into the saw.

23. In cross-cutting, pull the saw from the rear side of the table toward you and through the board.

In crosscutting operations, the saw blade should rotate down and away from the operator and the saw blade should be pulled slowly into the material or it will climb up on the material, stall the saw, or throw it out of adjustment.

24. Return the saw to the rear side of the table when you have finished cross-cutting.

8. SAFETY INSTRUCTIONS FOR OPERATING RECIPROCATING AND PORTABLE JIG SAWS

The sabre saw, sometimes called a bayonet saw, is essentially a portable electric jig saw. Reciprocating saws are more versatile than the sabre saw and the blade action is usually different. Both saws have a broad range of work capacity. Although they are not considered as dangerous tools, certain safety precautions should be observed in operating them.

1. Check electrically operated saws to see that they are adequately grounded and all electric connections are safe.

2. Do not use electric saws or any electric tools while standing on wet ground.

3. Make sure the electric cord cannot become fouled during operation of the tool.

4. Make sure the work to be cut is solidly supported.

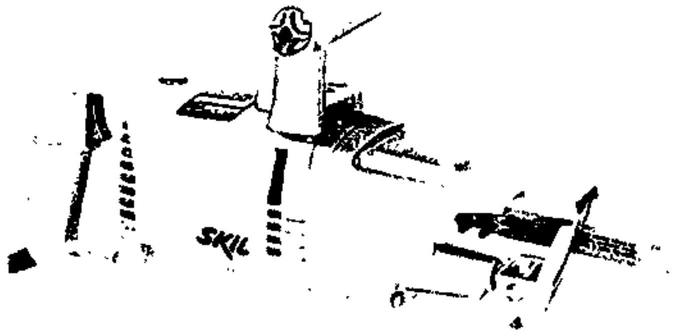
5. Select the proper blade for the type of work to be done.

Sabre blades are of three types: woodcutting, metal cutting, and knife blade. Reciprocating saw blades are made in a variety of sizes and shapes.

6. Make sure the blade is locked securely before starting to work.

In changing blades follow the instructions found in the Operator's Manual which usually comes with each electric saw.

7. Rest the shoe firmly against the work when operating the saw. Otherwise the blade



may catch and the saw will move instead of the blade.

8. Move the saw forward rapidly enough to keep the blade cutting.

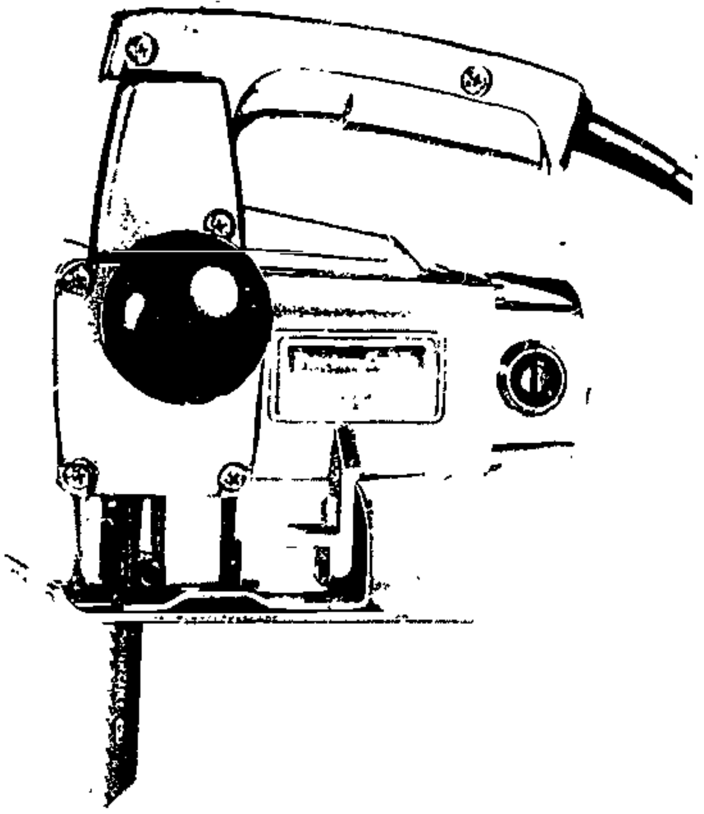
Do not force the saw. Use the hand knob for safer control of the saw. Follow the line of cut accurately.

9. Check the saw for loose parts and screws.

This will help to insure better work and safer operation.

10. Clean the saw periodically.

Air inlet and outlet passages should be kept clean to insure a cool running motor.



Accumulated dust should be blown out of the motor frame with an air jet.

11. Always disconnect the cord when repairing or adjusting the saw and when changing blades.

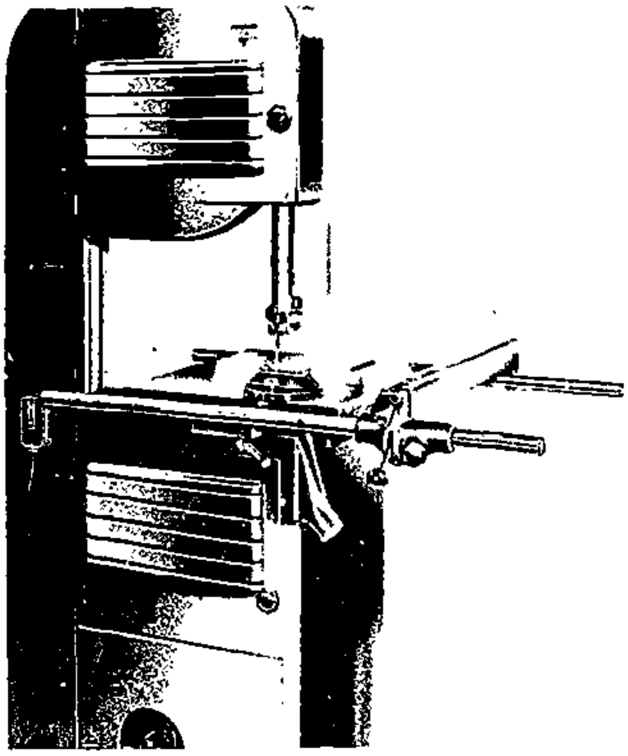
9. SAFETY INSTRUCTIONS FOR OPERATING BAND SAWS

Although the band saw is considered less dangerous than other types of power saws, certain precautions must be observed in its operation. No student should attempt to operate the band saw without permission from the instructor.

1. Before turning on the saw, check to see that no fellow workers are within the saw "safety zone" area.

Painted lines enclosing an area around the saw should indicate the safety zone area. When the saw is being operated, only the operator should be within the zone area, except in cases where the instructor has assigned a student to assist the operator.

2. Loose clothing, aprons, and ties are considered hazardous when operating the band saw.



VAS 3022

3. Check the saw for free movement and trueness of blade before turning on the power.

This may be done by turning the saw a few revolutions by hand to track or align the blade on the wheels. Realign and reset adjustments if necessary.

4. When operating the saw, be alert to possible dangers and loss of fingers.

Keep both hands on the same side of the saw blade while pushing work through the band saw. Do not allow fingers to come closer than two inches to the saw blade when cutting. Keep fingers away from a direct line with the blade. Use a push stick. Do not reach back of the blade to pull stock through.

5. Keep the saw blade clean, sharp, and properly set.

Running the saw with a dull blade may cause it to break. It also causes undue pressure on guide wheels. Operating the saw caked with dust and gums frequently causes breakage. Insufficient set causes the blade to burn the wood.

6. Keep the saw guide down within one-half inch of the stock being cut.

7. Keep the blade fully guarded at all times.

8. Avoid backing the saw blade out of a long curved cut.

If necessary to back saw blade out of a cut, turn off power and wait until machine stops before freeing the blade from the cut.

9. Be alert for such saw troubles as twisted, dirty or dull blades, or any other saw problems.

When saw trouble is apparent, quickly turn off the power and call the instructor.

10. Do not saw cylindrical stock on the band saw. Use the band saw for straight cuts only. Sawing cylindrical cuts tends to twist the blade and may cause it to fly off. Round stock tends to spin.

10. SAFETY INSTRUCTIONS FOR OPERATING JOINTERS

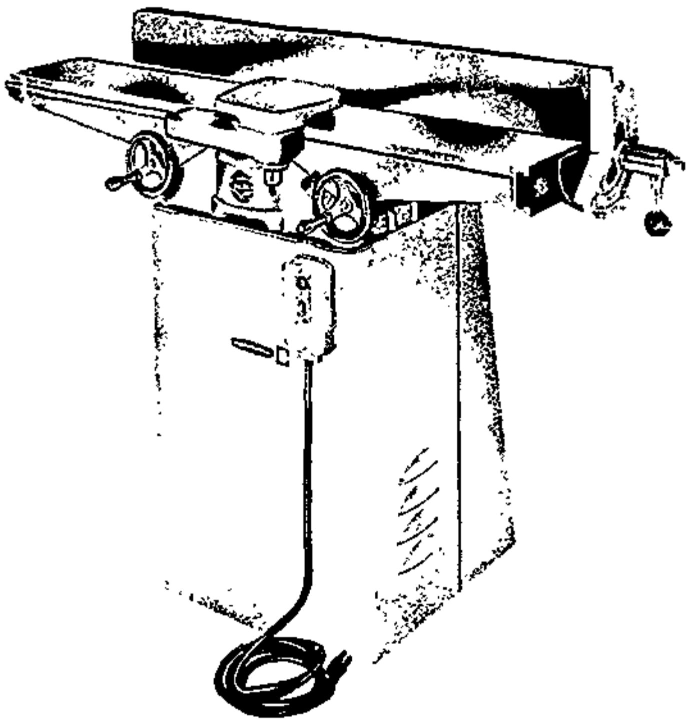
Jointers usually come equipped with guards that automatically cover the jointer head. Nevertheless, many accidents occur with this piece of equipment. The fact that the blades are usually covered may be the reason people become careless in its operation. Some recommendations for safe use of the jointer follow:

1. Keep the guard over the blades and in good working condition at all times. Adjust only when the machine is not in motion.

There are various styles of guards for jointers. Make sure you understand the correct position for the guard and how it works.

2. Keep the jointer blades sharp.

When the cutting blades become dull, both the efficiency and safety factors are lessened. The machine also becomes more difficult to operate. Always disconnect the power when checking or removing blades.



3. Check the blades for proper depth before operating the jointer.

Make sure the power is off before examining the blades. After setting or adjusting depth of blade, it is well to check the position of the rear table.

4. Make no cuts deeper than 1/16 inch without the instructor's permission.

Light cuts are safer than heavy cuts and are easier on the jointer.

5. Avoid jointing short pieces.

Due to the danger involved in handling small pieces, no attempt should be made to joint pieces less than 12 inches in length.

6. Use a hand plane on narrow pieces.

Secure the instructor's permission before jointing narrow pieces. A push stick should be used on any piece less than 2 inches wide.

7. Use an assistant when jointing the edge or face of long pieces.

Make sure only the operator and the assistant are in the safety zone area while operating the jointer.

8. Examine the stock carefully for knots, splits, paint, or nails before running it over the jointer. If any are found, do not run the stock through the jointer as they will damage the cutter.

9. Do not run the flat side of a piece of stock over the jointer without special permission from your instructor.

Remember, the jointer is designed for straightening and smoothing the EDGES of boards. It is not made for planing the flat sides or the ends of boards. Using it for these purposes is extremely dangerous and a frequent cause of jointer accidents.

10. Do not place your hands above the cutter. Feed the work through by using fingertips not the flat of the hand.

11. Do not run end grain over a jointer.

12. Be sure the fence is clamped in place.

13. The stock should be run through with the grain, not against it.

11. SAFETY INSTRUCTIONS FOR OPERATING ELECTRIC SANDERS

Although the sander is not found in many agricultural mechanics shops, some shops have access to their use. They are not considered a dangerous tool, however, there are certain recommendations and care which must be observed in their use in order to avoid accidents.

Disk sanders

1. Sand only on the downstroke side of the disk.

2. Do not hold small pieces in your hand.

Small pieces have a tendency to rotate and may pull your fingers against the revolving disk. Sand small pieces by hand or, if a large number are to be sanded, devise a jig to hold them securely.

3. Always stop the sander to clean, make adjustments, or repair it.

4. Never leave the sander after turning it off until it has come to a complete stop.

5. Never touch a moving sanding disk.

6. Wear a dust mask when sanding masonry.

To sand masonry, install a #24 or #36 grit carbide disk.

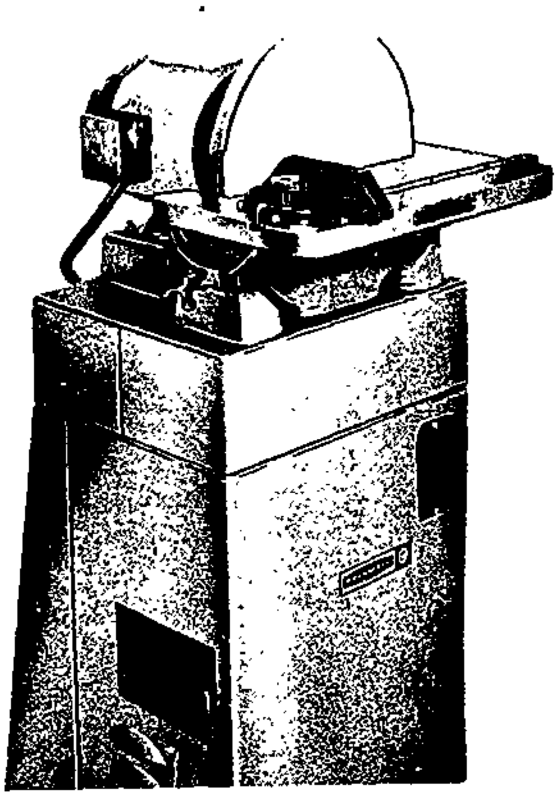
Belt sanders

1. Check sander belt before starting motor.

Make sure the cord is disconnected. If belt needs replacing, select proper abrasive and belt size. Follow replacement instructions.

2. Fasten the item to be sanded firmly.

The sander exerts tremendous pulling force. The material to be sanded should be fastened accordingly.



3. Make sure the belt is tracking.

To do this, start the motor before the sander is placed on the surface and observe the motion of the sander belt. Make adjustments if necessary.

4. Check the dust collector.

Make sure the opening to the bag is clean. In some types of sanding dust, there is danger of spontaneous combustion if dust is left in the dust collector.

5. Never stop or start a portable sander that is resting on the work.

6. To stop the portable sander, lift it from the work and turn off the switch. This results in less strain on the motor. Never lay the sander down until it has stopped running.

Finishing sanders

(Finishing sanders may be identified as either orbital or oscillating type)

1. Check the power cord for loose connections.

2. Check the sander for loose screws or parts.

3. Make sure the cord is long enough for the job.

In finishing walls, cabinets, etc., an extension cord is usually necessary to provide enough length to cover the area. The extension cord should be heavy enough to supply adequate current for the sander.

4. Hold the sander firmly while operating it.

5. Always disconnect the sander from the power before changing the abrasive sheets.

Select the proper size abrasive sheet for replacement. Check for proper operation of the machine after changing the abrasive sheet by allowing the sander to operate a short time before applying it to the work.

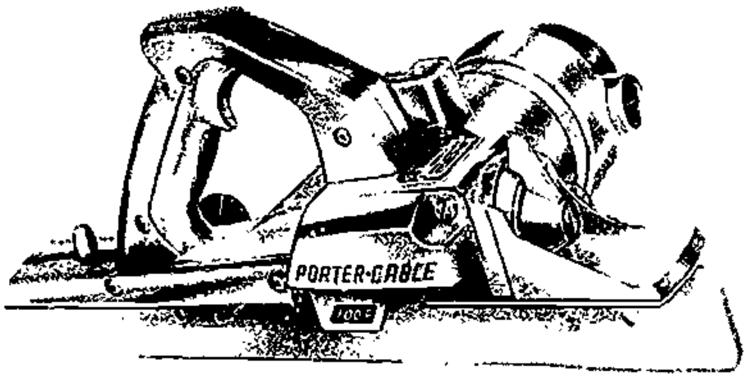
6. Always start the sander off the work and apply it evenly.

The normal weight of the machine is sufficient for proper sanding. Do not put additional pressure on the machine.

7. When sanding is completed, lift sander off the work before stopping the motor.

12. SAFETY INSTRUCTIONS FOR OPERATING ELECTRIC ROUTERS AND PLANERS

The router is one of the most versatile portable power tools to be found in woodworking shops. Neither the router or electric planer are commonly found in the agricultural mechanics shop. For students having access to these tools, the following regulations should be followed for safe use:



Electric router

1. Make sure you are familiar with the router and how it operates.

If you have not previously operated a router or planer, ask for a demonstration of its use and adjustments. Make sure you are familiar with all moving parts.

2. Carefully check the router before turning on the power.

Make sure you are using the proper bit and that it is properly fitted into the collet of the router and firmly tightened. Run the motor briefly before applying to the stock.

3. Examine the attachment cord.

Are all connections tight? Is the ground attached properly? Is the cord long enough to allow for work to be done?

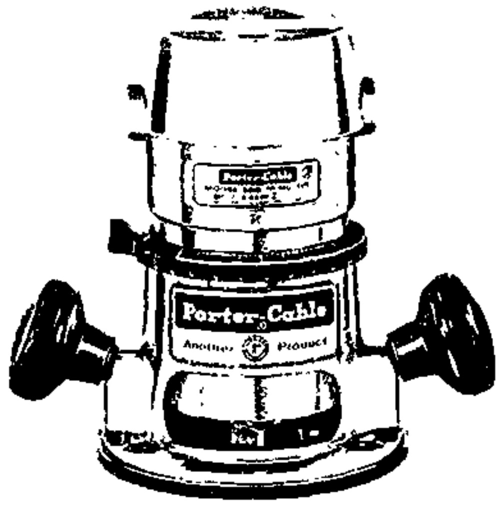
4. Adjust the router for depth.

For this adjustment follow instructions in the Operator's Manual which accompanies the tool. Make a sample cut on scrap lumber after each adjustment.

5. Always make sure the stock is securely fastened before starting work.

6. Keep a firm grip on the router while operating it.

Since the cutter rotates clockwise, more efficient cutting will be obtained if the router is moved from left to right as you stand facing the work.



7. Keep the router free from dirt, oil, and cuttings.

Always use a brush to clean away cuttings even though the power is turned off.

Additional safety instructions for electric planers

8. Make sure the electric cord cannot become fouled and is properly grounded.

Do not run the planer over the power cord.

9. Hold the plane correctly while operating it.

The four fingers of the left hand should be wrapped underneath the motor and against the vertical fence. Keep left thumb firmly on top of front shoe.

10. When a cut is finished, turn off power but do not lay the planer down until cutter stops rotating.

13. SAFETY INSTRUCTIONS FOR OPERATING DRILL PRESSES AND PORTABLE ELECTRIC DRILLS

The drill press ranks second only to the electric grinder in the number in agricultural mechanics shops. Although the drill press and portable electric drill are not considered particularly hazardous, there are many careless practices that need to be eliminated to avoid accidents when operating the drill press. Following are some precautions to be observed when operating these tools:

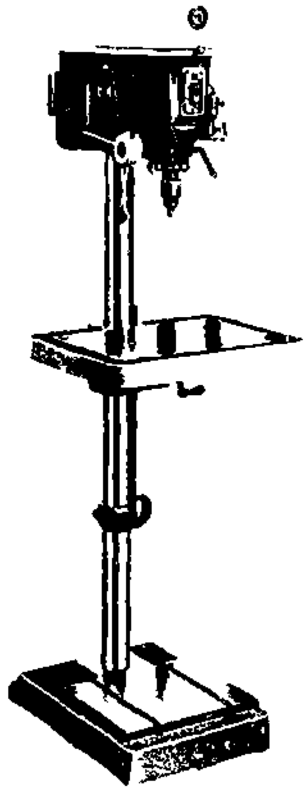
Drill presses

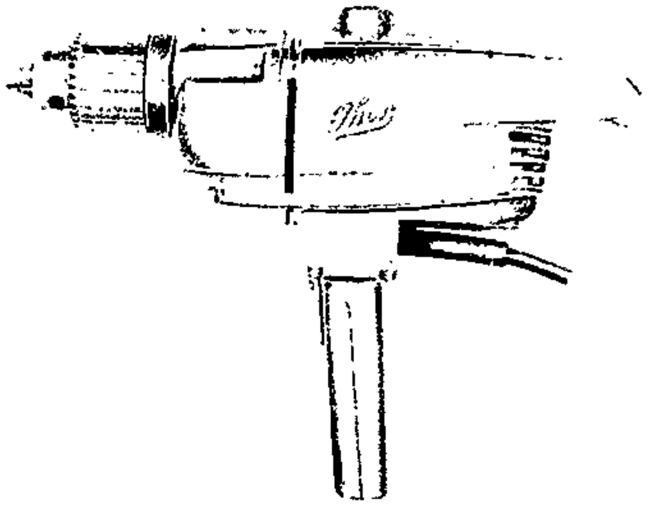
1. Use drills that are properly sharpened.

2. Check the drill to see that it is straight and has no nicks or burrs. A bent drill is difficult to control. To check for bent drills, start the drill motor and observe the drill point for trueness.

3. Never operate the drill with a loose chuck. Tighten the drill in the chuck firmly with a chuck wrench.

4. Avoid wearing loose clothing when operating the drill press.





5. Check to see that the chuck key is removed before starting the drill press.

6. Keep floor around the machine free from scrap material, oil, and grease.

A working zone with well marked lines should encircle the drill.

7. Select the drilling speed that is suitable for the work being done.

8. Wear goggles or other eye protection when drilling metal or wood.

9. Be sure the main power switch is "off" when setting up or making adjustments on the drill press.

10. Relieve the pressure on the drill just before it breaks through a piece of metal to prevent "seizing."

11. Do not hold small work by hand for drilling on the drill press.

Be sure you have at least 12 inches of leverage (distance from hole being drilled to your hand) before holding work to be drilled. Clamp smaller pieces to the table or use a drill press vise, wrench, or pliers to hold them securely while drilling.

12. Remove chips and shavings with a brush, not your hand.

Portable drills

13. Be sure that the portable electric drill is properly grounded through the third wire in the attachment cord.

14. Have a firm grip on a portable electric drill when drilling holes in metal.

Portable drills of 1/2 inch capacity and larger may throw the operator off balance and cause an accident if the bit catches while drilling.

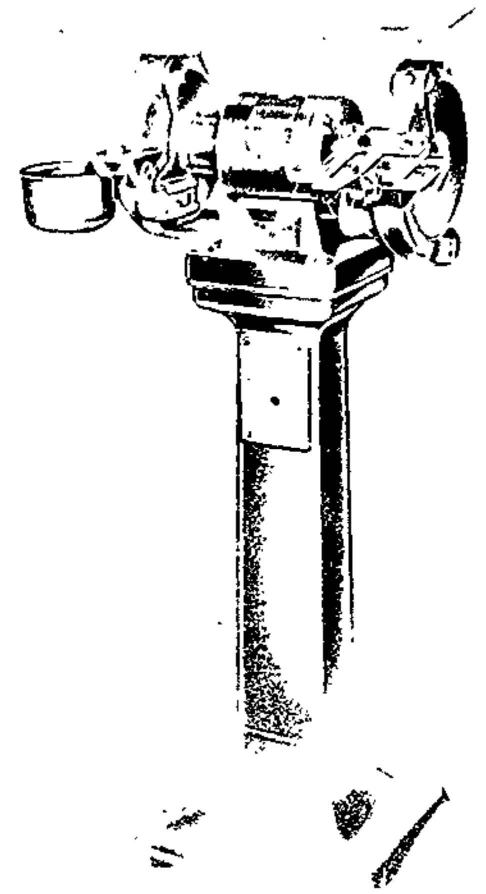
15. Keep the connecting cord for the portable drill clear of the bit or chuck to prevent wrapping when operating the portable drill.

16. Never lock the switch in "on" position when a portable drill is held in the hands.

The switch lock should be used only when the portable drill is fastened in a stand.

14. SAFETY INSTRUCTIONS FOR OPERATING POWER GRINDERS

Grinders are the most common pieces of power equipment in the agricultural mechanics shops. Despite the fact that the grinder is simple to operate and appears harmless to many people, accidents are relatively frequent in its use (or misuse). Following are some of the safe practices to be followed in grinder operation:



Stationary grinders

1. Wear a face shield or goggles for all grinding operations.

Goggles and shields should be shatterproof.

2. Check and if necessary adjust tool rests before starting grinder.

Tool rests should be rigid, slightly above the center of the grinding wheel, and not more than 1/8 inch away from the face of the wheel.

3. Check the wheel for flaws and cracks.

After a new grinding wheel has been installed, stand to one side and let grinder run for a full minute. Do this if you are unfamiliar with the grinder, or if a piece of metal has been jammed into it, even though the wheel is not new. A defective wheel will usually break and fly to pieces during the first minute.

4. Grind only on the face of the wheel. Side pressure may cause the wheel to break and will put strain on the wheel bearings.

5. Do not grind until the wheel has come up to full speed after the grinder is turned on, and stop grinding before the grinder is turned off.

6. Do not make adjustments of the rests or other grinder parts until the wheel has come to a full stop.

7. Keep fingers away from the wheel. Use pliers to hold small objects against the wheel.

8. Do not touch your face or eyes after grinding until your hands have been thoroughly cleaned to remove abrasive dust.

9. A dull wheel causes unnecessary heating. Keep grinding wheels dressed and trued. This requires a special tool. Do not use grinding wheels that are "out-of-round".

10. Do not apply pressure on the work great enough to slow the speed of the grinder.

11. Turn off machine and correct any vibration as soon as it is noticed.

Portable grinders

1. Before you start the portable grinder, see that other workers are out of range or are wearing suitable eye protection.

2. Do not lay the portable grinder down until it comes to a complete stop.

3. Use a portable grinder only when you are in a balanced, comfortable position and you have good footing.

4. Hold the portable grinder firmly with both hands at all times.

5. Be careful to avoid entanglement with the attachment cord.

6. Check the grinder regularly for damaged parts or cracked or glazed grinding wheel.

15. SAFETY INSTRUCTIONS FOR OPERATING POWER HACK SAWS

A power hack saw is a great time and labor saver in a shop where much metal work is done. It will cut faster and more accurately than can usually be done by hand. In operating a power hack saw, the following safety precautions should be observed.

1. Before using the saw, carefully read the operator's manual which comes with it. Run the saw at the speed recommended by the manufacturer.

2. Clamp the work securely in the saw vise. Clamp the work so that the blade will not have to cut straight across thin sections. Clamp angle iron with the corner up.

3. Use the right blade for the job.

4. Insert blade so that the teeth will point in the direction of cutting. Check with the blade manufacturer for the correct tension to put on a blade. Use a torque wrench to tighten the blade.

5. Use a file to start the blade on very sharp edges.

6. Be sure the blade is up and out of contact before starting the saw.

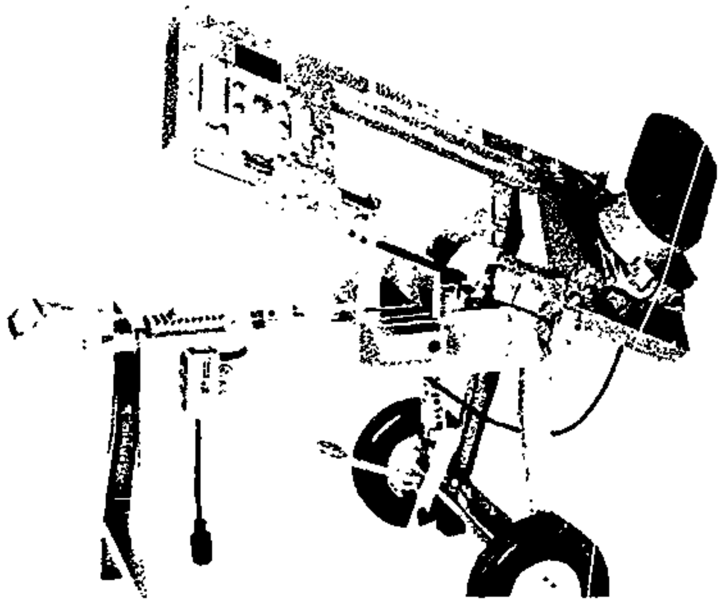
After the blade is in motion, let it down gently on the work, holding up on the handle slightly to reduce the pressure while the blade is starting its cut.

7. Do not push down on the saw to add pressure to the blade while cutting.

Use a suitable cutting pressure on the blade, just enough to keep it cutting. Reduce the pressure when cutting thin metal. Curly chips indicate correct pressure. Fine dust means the pressure is too light. Thick chips mean the pressure is too heavy.

8. Always stop the saw before adjusting it.

9. Wear safety glasses. Keep your hands away from your eyes after working around a power hack saw.



SPECIAL FOR THE BAND HACK SAW

1. Wear safety glasses and keep hands away from eyes.

Small pieces of metal rubbed into the eyes causes pain and serious injury to the eye.

2. If saw teeth wear off unusually fast, reduce speed.

3. Clean blade brushes frequently in kerosene.

4. Keep saw blade and moving parts properly lubricated.

5. Keep hands a reasonable distance from the blade when cutting.

6. Keep the adjustable blade guide as close as possible to the material.

7. Always keep the blade at proper tension when cutting.

8. Follow general safety rules applying to all power equipment.

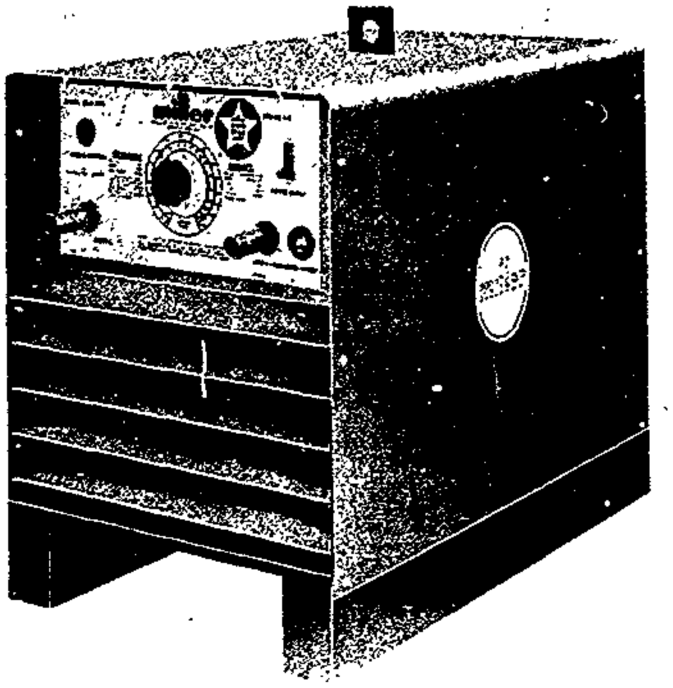
16. SAFETY INSTRUCTIONS FOR OPERATING ARC WELDERS

Hazards which most frequently affect the health of the welding operator are burns, injurious light rays, and injurious fumes. These can best be avoided by following these safety practices while welding.

1. Wear a welding helmet and leather gloves at all times when arc welding.

Protection from hot metal, hot electrodes, particles of spatter and slag, or the metal being welded is necessary at all times when welding.

2. Wear high top shoes to protect feet and ankles from burns caused by weld spatter. Avoid wearing clothing with turned up cuffs.



Keep your collar and pockets buttoned. Avoid wearing ragged clothing.

3. Inspect welding cables for broken insulation and frayed conductors. Check the electrode holder and ground clamps for good connections before beginning to weld.

Loose connections and grounds may prove dangerous. Provide a dry wooden platform to work on or wear rubber sole shoes where there are damp floors.

4. Clear all combustible materials away from the welding area before beginning to weld.

Flying sparks from the spatter will readily ignite combustible material.

5. Turn on exhaust fan before beginning to weld.

Welding fumes soon spread to all parts of the shop and may be injurious when inhaled. Always take special precaution from fumes when welding or cutting metals containing zinc.

6. Do not strike the arc before covering the face and eyes with the protective shield or helmet.

Rays given off by the "arc" are very intense, especially when one is close to the arc. Irritation and eye burn will result if eyes are not covered.

7. Do not endanger your fellow workers by welding without a welding screen enclosing your area. Warn persons standing nearby to cover their eyes when you are ready to strike an arc.

8. Do not weld barrels, tanks, or other containers which has held combustible material until they have been cleaned and "safe-guarded."

For methods of "safe-guarding" containers see footnote bottom of page 3.

9. Be alert for fires at all times.

10. Do not "chip" when your eyes or those of others near you are unprotected.

11. Do not leave hot metals where others may pick them up or step on them.

12. Guard against saturation of clothing by moisture or perspiration as this increases shock hazard.

13. Disconnect the welder when working on it.

14. Always unplug the welder and put equipment away when through welding.

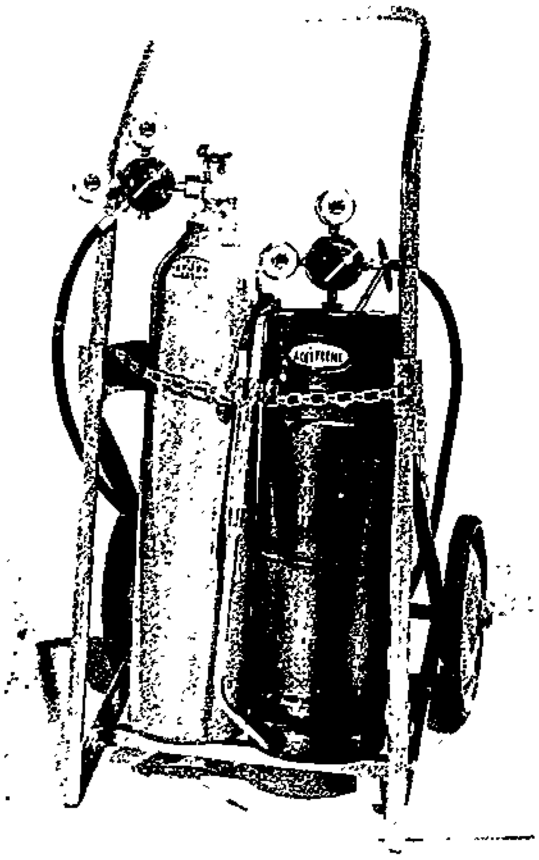
15. In case of eye or skin burns, secure first aid treatment. Report all burns to the instructor immediately.

17. SAFETY INSTRUCTIONS FOR OPERATING OXY-ACETYLENE WELDERS

Oxy-acetylene welding is not considered to be a hazardous operation. Most injuries and fires are caused by negligence. However, there are some hazards connected with welding which can affect the health of the operator if not properly guarded against.

1. Fasten oxygen and acetylene cylinders securely in an upright position.

Chain cylinders to a cart, bench, wall, or post to keep them from being accidentally tipped over.



2. Keep oil and grease away from oxygen cylinders and equipment.

Oil and grease may catch fire or explode spontaneously in the presence of oxygen.

3. Test equipment connections periodically with clean paint brush and soapy water to be sure there are no leaks of oxygen or acetylene. Test hoses by immersing them in a pail of water and watching for bubbles.

Test equipment immediately after making any new connections.

4. Check operating pressures carefully and follow recommendations.

5. Clear the area of all combustible materials before lighting the torch. This may avoid an explosion or serious fire.

6. Cover eyes with proper goggles or colored face shield and put on leather gauntlet gloves before lighting torch. Wear clothes suitable for work being done.

7. Do not stand too close to the regulator when opening the cylinder valve.

A defect in the cylinder valve may cause the gas to blow out, shattering the glass and blowing it into your face. Make it a practice to stand to one side of the regulator, never in front, when opening the cylinder valve. Open valve slowly. If the gas in the tank, which is under high pressure is permitted to come against the regulator suddenly, it is apt to cause damage to the equipment.

8. Do not open blowpipe valves more than one-half turn when lighting torch.

9. Never use a match to light a torch.

Using matches bring the fingers too close to the tip and the sudden ignition may cause burns. Always use a spark igniter.

10. When igniting a torch, keep the tip facing downward and away from you.

Lighting the torch while it is facing upward or outward may result in burning someone.

11. Make no attempt to relight a torch from the hot metal when welding in an enclosed box, tank, drum, or other small container.

There may be just enough unburned gas in the confined space to cause an explosion.

12. Be sure that your fellow workers are in the clear before relighting a torch.

13. Do not walk with a lighted torch or lay down a lighted torch.

Get in position before lighting and remove all obstacles between you and shut off controls.

14. If a flashback should occur, turn off torch immediately, close cylinder valves, and notify your instructor.

A flashback occurs when the flame disappears and burns back inside your equipment. There is a hissing, squealing sound, smoke may come out the torch tip, and the handle may get hot. If the torch is not turned off promptly, fire may get to the hoses or the cylinders. Do not relight after a flashback until the equipment has been inspected closely, and perhaps repaired.

15. Never open acetylene cylinder valve more than 1 to 1 1/2 turns and leave the T-

handle wrench in position at all times while welding.

In case of fire, you want to be able to turn off the acetylene cylinder promptly.

16. Never do any welding on containers that have held flammable substances until it has been "safe-guarded."

For methods of "safe-guarding" containers see footnote bottom of page 3.

17. When welding or cutting zinc or galvanized metals, make special effort to avoid breathing the fumes as they may be injurious. Zinc fumes cause an illness called zinc fume fever.

18. Be sure that cylinders are turned off and all valves closed before leaving the welder.

19. Never leave hot metal where others may be burned by it. Cool it in water or mark it "HOT" with chalk.

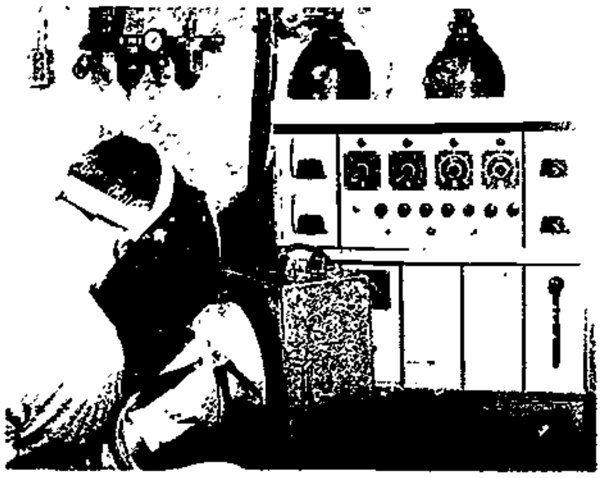
20. Be alert for fires at all times and use the proper fire extinguisher or a fire blanket if necessary.

18. SAFETY INSTRUCTIONS FOR OPERATING INERT GAS SHIELDED WELDERS

The safety practices for inert gas-shielded arc welding are specific for this type of welding. In general the same safe practices that apply to other arc welding would also apply to inert gas-shielded arc welding. You should review the potential shock, burn, and fire hazards that are included in the SAFETY INSTRUCTIONS FOR ARC WELDERS before using the shielded-arc welder. You should also read the manual provided with the welder to make sure you are familiar with the equipment.

1. Store argon cylinders in a cool dry storage area. Do not drop or abuse cylinders in any way. Argon is an inert gas so the cylinders are not potential fire hazards. However, they should be protected from arc burns, high temperatures, and mechanical damage. Do not move cylinders unless the valve protection cap, where provided is in place and tight. Never strike an arc on a cylinder of compressed gas. Be sure cylinders are securely fastened so they do not fall. Do not use a wrench or hammer to open cylinder valves. Notify the supplier of defective valves. Do not force connections that do not fit. Check all connections to regulators, adapters, and valves with soapy water to detect leaks.

Be sure argon cylinders are never grounded. Cylinders, fittings and supports should be insulated with wood or rubber from structures, fixtures or electrical conduit. Keep cylinders away from work tables and welding fixtures. Check to see how the work is grounded so ground connections do not touch the cylinder.



2. Hang the welding torch or electrode holder on a hook when it is not in use. Do not hang it on the flow meter, regulator, or cylinder valve. Do not lay the torch on the work or work table. Hang it in a safe place so the electrode is not touching metal which may be grounded.

3. Make sure all electrical connections are tight, clean, and dry. There is danger of water leaking from a water cooled unit. If the floor is damp, a wooden platform or rubber mat may be used to insulate the operator from the damp floor.

4. Be sure you are properly dressed for welding. Thin cotton clothing may be inadequate for protection from the ultraviolet rays. Protect your hands from the arc rays by wearing gloves. It may be necessary to remove the tips of the glove fingers to permit manipulation of the electrodes but the rest of the glove should be worn.

5. Protect your eyes and face. Never look directly at the arc without protection for the eyes. Use a welder's helmet with the proper shade of glass. Shades 10 and 12 are recommended for carbon arc and shielded-arc welding. Do not chip or grind without safety goggles.

6. Handle all hot metal with tongs or pliers. Aluminum does not change color when it gets hot and there is great danger of burning the hands on aluminum because it is such a good conductor of heat. Mark metals "Hot" that have been welded.

7. Start the exhaust fans before beginning to weld. Fumes given off from the welding process may not be injurious but certain metals do give off harmful fumes. It is best to weld galvanized metal out of doors. Inhalation of zinc oxide causes an illness called zinc fume fever. Drinking milk has been recommended to relieve the toxic effect.

8. Maintain good housekeeping within the welding area. Tools and scrap metal on the floor create a tripping hazard. Pick up tools and scrap metal. Grease on the floor makes a slipping hazard. Cover grease with sand to remove this hazard.

9. Clear the welding area of possible fire hazards before starting to weld. Remove straw, shavings, rags, paper and other combustible materials. At least one fire extinguisher and one fire blanket should be located near the welding area. In case of clothing fire, immediately strip off the burning article. If a blanket is available wrap yourself in it and lay on the floor. If no blanket is available, roll on the floor and fold your arms across your face.

10. In case of eye or skin burns, secure first aid treatment at once. Report burns to the instructor immediately. Do not wait until the next day as eye burn may cause serious trouble if not treated as soon as detected. A supply of tannic acid and burn ointment should always be available in the first aid kit.

11. Do not change a tungsten electrode before it has cooled or while the welder switch is in the "on" position.

12. Clean aluminum with alcohol or acetone prior to welding. Be sure the surfaces cleaned are thoroughly dry and the area properly ventilated before welding. Carbon tetrachloride, trichlorethylene, or other chlorinated hydrocarbons should not be used for cleaning aluminum prior to welding.

13. Do not weld on closed containers without first "safe-guarding" the container. (See p. 3.

14. Use the correct size welding cable. Continuous overloading of welding cables will deteriorate the insulation and damage the cable, creating both a shock and fire hazard.

15. Do not use defective welding cable. If any of the connections are hot, this usually indicates a poor electrical connection.

16. Protect the hose and welding cable from being run over. Avoid having them tangled or kinked. Keep them so they are not a tripping hazard. Protect them from flying sparks, hot metal or open flame. Protect them from oil and grease which will cause the rubber to deteriorate.

17. When welding is to be stopped for a period of time, release the pressure adjusting screws on the regulators.

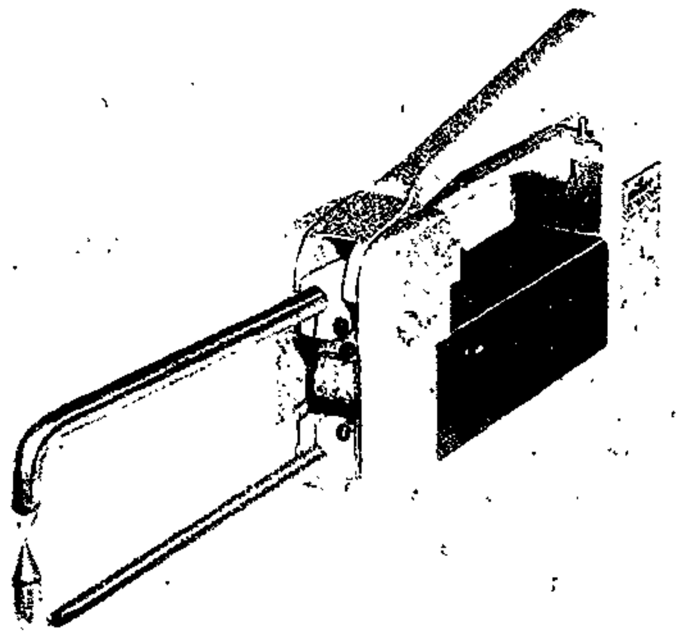
18. Use paints that are nonreflective in the welding area. A flat finish paint is suitable.

19. SAFETY INSTRUCTIONS FOR OPERATING SPOT WELDERS

Spot welding is a method of joining two pieces of metal together with electric heat and mechanical pressure.

The heat is developed by the resistance of the metal to high-amperage, low-voltage current which passes through a limited area. This is where a resistance weld is made. Some safety suggestions for operating the spot welder follow:

1. Before attempting to make power-line connections, change tips, or make repairs, be



sure the unit is completely disconnected from the power line.

2. Always avoid contact between any part of the human body and any current-carrying part of the spot welder.

3. Be sure the welder is connected to the proper voltage and securely grounded. A grounding wire is provided in the power cord for grounding the welder in case of internal insulation breakdown. Do not cut off the grounding terminal on the cord plug.

4. The spot welder should be operated from a separately fused circuit. The capacity of the welder is affected by the line voltage. If the circuit is overloaded, the performance will be reduced. Extension cords should not be used because of the voltage drop they are apt to cause.

5. Wear a face shield when operating a spot welding machine. This protects your eyes and face from hot molten particles.

6. Be sure the tongs are properly aligned and pressure correctly adjusted before turning on the welder. Check the alignment before the power is turned on. If the tips are misaligned, the work to be welded will move out of place. There is no advantage in having excessive tong pressure. The metal to be welded should be in close contact before applying pressure on the tongs.

7. Never apply current to the tong tips without having metal between them.

The points will burn together and the welder may be damaged.

8. Keep tong tips dressed.

As the welder is used, the diameter of the tong tips will increase in size. This increased diameter will require more current and a longer time setting.

For galvanized and stainless steels, the tips must be clean and properly dressed or the weld will cause excessive splatter.

9. Be sure there is water flowing through water cooled welders before using them.

If water is not flowing to cool the tips, they will be burned.

10. Start the exhaust fan before welding galvanized metal.

The fumes given off from welding zinc coated material may cause zinc fume fever.

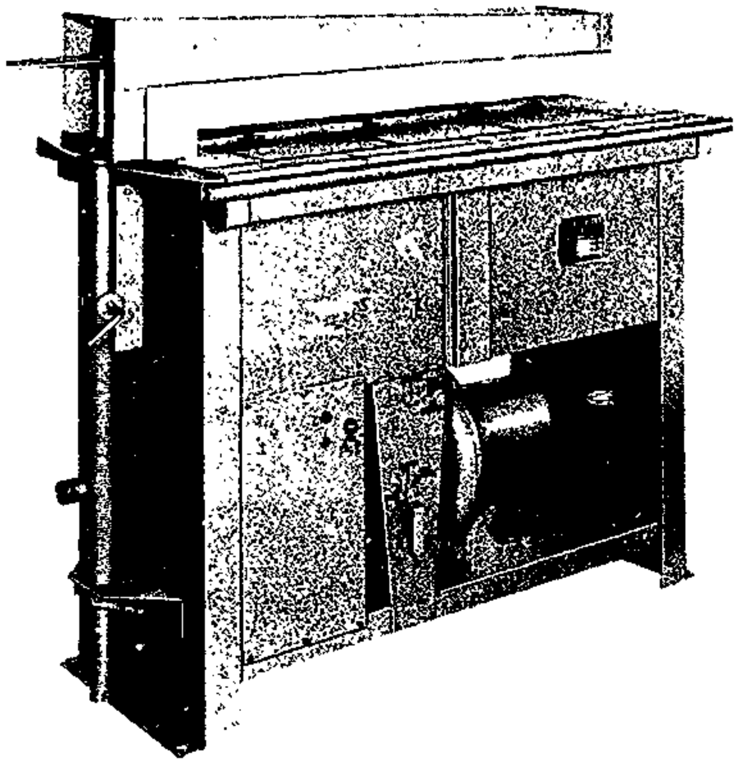
20. SAFETY INSTRUCTIONS FOR OPERATING GAS FORGES

Any piece of shop equipment that uses flame has potential fire and burn hazards. While there are a limited number of gas forges in agricultural mechanics shops, if you have one, it is important that care be used to prevent burns and fires.

1. Wear a safety face shield when working with a forge. A face shield provides more protection than goggles.

2. Be sure you have materials at hand before trying to light the forge. Crumple or twist paper, light it and insert it in the forge. Do not try to light the forge with a match.

3. Turn on the gas. The air supply should be regulated until the flame is blue. If the air and gas are turned on separately, turn on the gas first, then the air. Shut off the gas first, then the air. Do not rely on an electric valve to shut off the flow of gas completely. When the forge is not in use, use a gate valve ahead of the electric valve to shut off the gas securely.



4. Do not leave hot stock lying around the shop. Someone may step on or pick up a piece of metal that is still hot. Pieces should be marked "HOT."

5. Be sure the handles are securely fastened in all hammers used in forging.

6. Do not strike the face of the anvil with a hammer. When you do this, you are striking hardened steel against hardened steel and chips are liable to break off and fly.

7. Be sure you cut metal on the cutting block of the anvil. Be careful when cutting stock or rivets that no one else is in line with or close to the parts being cut off.

8. Keep forge tools well dressed, sharpened, and free of mushroomed heads.

9. Use tongs that fit the stock.

10. When using the forge to heat a lead or solder pot, be sure that no moisture is introduced into the molten metal. The water will turn to steam and explode the molten metal.

11. Wear gauntlet gloves to protect your hands from the heat of the forge.

*CURRICULUM GUIDES, *CURRICULUM, *VOCATIONAL AGRICULTURE, ANIMAL SCIENCE, PLANT SCIENCE, AGRICULTURAL ENGINEERING, HIGH SCHOOLS, FARM MANAGEMENT, SUPERVISED FARM PRACTICE, LEADERSHIP TRAINING, CURRICULUM DEVELOPMENT, GUIDELINES,

The purpose of this guide is to assist vocational agriculture teachers in developing an agricultural production curriculum. It was developed by a committee of supervisors, teacher educators, and teachers and tested in local schools. It provides guidelines for curriculum development as related to program areas, basic assumptions, subject matter selection, sequence, and vocational objectives. Procedures for recording data on the curriculum sheets are outlined. Major subject areas include plant science, animal science, agricultural mechanics, and farm business management. Each major area is divided into teaching units, and each unit includes time allotment, vocational objectives, major competencies to be attained, and a subject matter outline. Sections on supervised occupational experiences and leadership training are included. The guide is appropriate for high school programs with farming and farm-related occupational focus in the Midwestern United States. This document is available for $2.00 from Ohio Vocational Agriculture, Instructional Materials Service, The Ohio State University, 2120 Fyffe Road, Columbus, Ohio 43210. (JM)

FOREWORD

Today's teacher of vocational agriculture is faced with ever expanding problems of what to teach and whom he should serve. The American farm has expanded into a well-organized, highly efficient business. Agriculture production is based predominantly on sound scientific technology and operated on sound principles of business. The farmer of today is a well-educated individual who is constantly seeking information upon which to base the many decisions he is required to make in conducting this business.

The teacher of vocational agriculture has a responsibility for the agricultural education of those who are or will be engaged in production agriculture, for those who will be engaged in the agriculturally related businesses supporting production agriculture, and for those who plan to become professional agricultural workers. The agricultural education needs of these groups are varied and complex and pose a challenging problem to the teacher in planning a curriculum to meet the needs of agriculture in the local community.

It is the belief of the Supervisory Staff, Teacher Education Staff, and Advisory Committees of Teachers that each teacher of vocational agriculture in Ohio should have planned and written a complete curriculum for his program of vocational agriculture. This curriculum guide has been prepared to assist teachers in developing the curriculum for their departments of vocational agriculture.

James E. Dougan, Supervisor
Agricultural Education Service
Department of Education

Ralph E. Bender, Chairman
Department of Agricultural Education
The Ohio State University

ACKNOWLEDGMENTS

The curriculum guide has been developed through the efforts of many people over a long period of time. Some of the groups and individuals who have assisted are as follows:

A production agriculture committee composed of teachers of vocational agriculture and combined staff members worked in 1965 and 1966 in giving recommendations for curriculum development. The committee was comprised of the following individuals:

Teachers: D. C. Barrett, Homer Burt, Jack Devitt, Clarence Fridline, Henry Horstman, Horace Hummell, Roger Roediger, Odell Miller, Jack Nowels, and John Watkins.

Staff: John T. Starling, Harlan E. Ridenour, and Gilbert S. Guiler.

In addition to the above committee work, individual teachers have worked with the development of specific areas of the curriculum guide. They are as follows: Plant Science and Soils, Clarence Fridline; Animal Science, Henry Horstman; Agricultural Mechanics, Martin Rehmert; and Farm Business Management, Bennie White.

The combined Supervisory and Teacher Education Staff has given leadership to the development of this production agriculture curriculum guide. Specific staff members who have contributed to the writing and editing of the information in the guide are as follows: Dr. John T. Starling, Dr. R. J. Woodin, Dr. G. S. Guiler, and Dr. H. E. Ridenour, who coordinated the work and did final editing.

AGRICULTURAL PRODUCTION

CURRICULUM DEVELOPMENT

PROGRAM AREAS

Agriculture is comprised of the group of related courses or units of subject matter which are organized for carrying on learning experiences concerned with developing knowledge, understanding, appreciations, and skills involved in preparation for upgrading in occupations requiring knowledge and skills in agricultural subjects.

The program areas in agriculture are as follows:

01.00	Agricultural Production
02.00	Agricultural Supplies
03.00	Agricultural Mechanics
04.00	
05.00	Ornamental Horticulture
06.00	Agricultural Resources
07.00	Forestry

The functions for the above program areas and the services related thereto are emphasized in the instruction designed to promote opportunities for students to prepare for or improve their competencies in an agricultural occupation or cluster of related occupations. An agricultural occupation or cluster of occupations may include one or any combination of these functions.

Supervised occupational experience programs are an integral part of the teaching program in each of the program areas of vocational education in agriculture. Occupational experience provides an opportunity for the student to apply the knowledge, skills, and abilities gained in the classroom to real-life situations similar to those he will be experiencing in the world of work. The classroom teaching and occupational experience program should be coordinated to supplement each other. The student should be assisted in recognizing the competencies required for success in his chosen occupation, or cluster of related occupations, gain an understanding and appreciation of the fundamental principles, concepts, and laws related to his needed competencies, and be assisted in making practical applications of his knowledge.

The Future Farmers of America and related leadership training are highly significant integral activities which aid agricultural education in making contributions to the guidance and total general educational development of pupils. The Future Farmers of America and related leadership training permeates every aspect of the instructional program in agriculture.

CURRICULUM GUIDE SERIES

A series of curriculum guides has been prepared for each of the above program areas. These publications are intended to serve as guides in their respective program areas. They are for use by teachers of vocational agriculture in planning local programs of instruction, identifying curriculum materials needs, and identifying facilities and equipment requirements. School administrators, boards of education, and advisory committees may use the curriculum guides as a basis for decision-making in determining needs for program offerings and in evaluating existing programs.

Emphasis should be placed on the fact that this publication is only a guide. It is in no way intended to be "the" curriculum for vocational agriculture in Ohio. It should be used as a guide in planning local programs to meet local student and community needs. Time would not permit the inclusion of all the teaching units presented in this guide. Thus, the teacher has the responsibility of including in the local program those units or parts of units that best meet the needs of local conditions.

PLANNING THE CURRICULUM IN AGRICULTURAL PRODUCTION

In preparing a curriculum for agricultural production in the vocational agriculture program, certain assumptions are made as to the type of students enrolled, the type of school in which the program will be offered, and the opportunities for occupational experience. The curricula which follows has been designed with the following assumptions in mind:

1. The vocational agriculture program, comprising of several courses would ordinarily be a part of a comprehensive high school enrolling at least 30 students, and employing one or more teachers depending upon the total enrollment.

2. This curriculum is planned for a four-year period. The courses for the first two years basically consist of plant and animal science, with appropriate units in agricultural mechanics, while the third and fourth years are devoted to agricultural mechanics and farm management, respectively.

3. This curriculum is planned for a daily time schedule of seven to ten 45-minute periods per week.

4. It is assumed that most of the occupational experience of the students will be secured on their parents home farms or on neighboring farms.

5. It is assumed that a part of the teaching will include supervised instruction in relation to the student's occupational work experience program.

6. Most students are preparing for and will enter an agricultural occupation upon graduation. Some may be expected to continue this education through post-high school technical education, and some through a four-year college program.

7. The first two courses consisting of plant and animal science with appropriate units in agricultural mechanics will also provide a basis for those students whose agricultural occupational objective is other than farming who, in their third and fourth year, may be enrolled in one of the other agricultural programs.

8. This curriculum guide has been prepared for a broad application. It contains more material than could be covered in a four-year period. This requires making a selection of those areas of instruction and teaching units or parts thereof that best meet the agricultural education requirements of the students served.

DETERMINING WHAT TO TEACH IN AGRICULTURAL PRODUCTION

What we teach in vocational agriculture determines to a large extent the success of our total program. When we teach carefully selected, appropriate and useful information, our students are eager and receptive. When we make mistakes in what we select for teaching, our students become uninterested, unenthusiastic, and waste their own time as well as that of their teacher.

What we teach in vocational agriculture should depend upon the following seven points:

1. Our approach to learning helps determine what we teach.--In vocational education, we believe that people learn best by doing, and by doing as soon as possible in relation to the unit taught. We believe in the teaching of principles, but also in the opportunity for practice in using these principles as soon as possible.

2. The particular occupation or cluster of occupations for which training is provided determines what should be taught.--Job analysis is a process which helps to determine which learnings are important to perform a given job. In this process an analysis is made of the time which a person spends in various aspects of his

work and of the new learnings he must possess in order to succeed. Using this approach, we teach the vocational agriculture student those abilities he will need, leaving out much of the related information which might be only "nice to know."

3. Student situations provide an important clue as to what to teach.--In agriculture the previous experience of the student, his age level, his preparation in other courses, and his mental and emotional maturity all help us to decide what to teach. This means that what we teach in a particular first-year course may vary considerably from what we might teach in another course which includes a different group of students.

4. Teaching should recognize the organized knowledge of the discipline.--In the biological sciences there has been much scientific investigation and, therefore, we can teach more efficiently by moving from the simple to the more complex. This provides a basis for teaching the basic principles of cell growth, of genetics, of cell division, and similar understandings. It should be kept in mind, however, that this may not be the most interesting approach from the standpoint of the student so, therefore, the organized knowledge of the discipline must be related to the student's own frame of reference.

5. A teacher's objective determines what he selects for teaching.--Most vocational educators are committed to the approach of developing in the student those abilities, skills, attitudes, and ideals which they believe the student should possess to be successful in his first occupation. Decision-making becomes a key ability in this psychological approach; therefore, the students are taught to solve problems rather than to memorize facts.

6. The continuing educational effort which is expected of the student determines what is taught.--Teachers of vocational agriculture need to recognize the fact that some of their students will complete their education at the end of high school, that others will have an opportunity to participate in young and adult farmer programs or two-year technical programs, while still others may take baccalaureate degrees in agriculture at agricultural colleges.

7. Finally, teacher judgment is the major determinant of what is taught.--Teacher judgment becomes sharper with additional years of experience.

AGRICULTURAL PRODUCTION (Program Area)

Agricultural production includes subject matter and learning activities which are concerned with the principles, concepts, and processes involved in the planning related to and the economic use of facilities, land, machinery, chemicals, finance, and labor in the production of plant and animal products. In practice, activities include classroom instruction, laboratory experiences, and supervised occupational experiences in and out of school, including farms and other agriculturally related establishments.

AREAS OF INSTRUCTION

The program areas are divided into logical areas of instruction. Each area of instruction should prepare students for entry into and advancement in an occupation or cluster of related occupations.

The areas of instruction for agricultural production are as follows:

Animal Science	(The production of livestock products)
Plant Science	(The production of crop products)
Agricultural Mechanics	(The selection, operation, repair, adjustment, and the economic use of agriculture machinery. Farm Construction.)
Farm Business Management	(Farm record keeping, summary, and analysis. Allocation of resources to maximize farm profits.)

Other Production Agriculture

Related Instruction

- Occupational experience programs
  - Student occupational experience programs, record keeping, supervision.
- Leadership training
  - Conduct activities to develop leadership abilities. The FFA.

WHEN TO TEACH CERTAIN PRODUCTION AGRICULTURE UNITS

Timeliness of instruction has always been considered important in vocational agriculture. However, in providing for the teaching of related problems in single blocks of time, seasonal teaching becomes more difficult. These blocks of time or units of instruction should be scheduled as nearly as possible to coincide with the decisions being made and the operation being performed in the agriculture of the community.

Another consideration is the year during which certain subject matter should be taught. Certain units should logically appear early in the four-year program while others should be scheduled later in the program.

Some guiding principles for the teacher, concerning when certain units of production agriculture should be taught, are as follows:

First and Second Years

1. Provide for instruction of basic science of soils, plant and animal life as it relates to agriculture.
2. Provide educational experiences that assist students to make an intelligent assessment of career opportunities in agriculture.
3. Provide an opportunity for the students to solve individual problems encountered in farming and related agricultural occupations.
4. Provide for basic experience in record keeping, summarization, and analysis of business records.
5. Provide for some basic instruction in agricultural mechanics.

Third and Fourth Years

1. Provide for relating basic soil, plants, and animal science to the total farm business management situation.
2. Provide for training and experience in marketing food and fiber.
3. Provide training for the selection, operation, maintenance, and repair of agriculture and processing equipment used in the agricultural area. Make application of basic agricultural mechanics skills in constructing items required in the farm business.
4. Provide for understanding and ability to make sound farm management decisions through complete farm record keeping, summarization, analysis, and adjustments for balanced farming programs as opposed to individual enterprises.

All Four Years

1. Provide for proper learning experiences based on past achievements and present needs.

2. Provide an opportunity for the student to apply his knowledge, skills, and abilities to actual situations through an occupational experience program.

3. Provide students with available information relative to character of the opportunities in, and the qualifications necessary to become established in farming and related agricultural occupations.

4. Provide for study of certain phases of farm business management based on the immediate needs of student's home farm situation and community.

5. Provide opportunities to develop rural leadership through FFA and other community activities.

TEACHING UNITS

Each area of instruction is divided into teaching units. The teaching units are confined to one body of subject matter within a given area of instruction. This divides the areas of instruction into manageable units that facilitate teacher planning and student comprehension.

VOCATIONAL OBJECTIVES

Vocational education in agriculture has the responsibility of providing agricultural education for those persons requiring knowledge and skills in agriculture for entry into and advancement in farming or agriculturally related occupations.

The vocational educator should be assisting students in choosing their vocational objectives. His teaching should be based on the fact that students will be applying their knowledge of agriculture when they are conducting occupational experience programs and upon entry into their chosen occupations.

Each teaching unit lists the occupational objectives for its area of study. These objectives may be divided into primary and secondary areas of work. The agricultural production program prepares students for entry into production agriculture or for continuing education. Achievement of many of the secondary objectives requires additional vocational, technical, or collegiate education.

MAJOR COMPETENCIES

The program in agricultural production must equip the student with the competencies required for entry into and advancement in farming or other agriculturally related occupations. Each teaching unit lists the major competencies thought to be important for that unit of instruction.

PROCEDURE FOR RECORDING DATA ON THE CURRICULUM SHEETS

1. Carefully study and familiarize yourself with the total curriculum guide in production agriculture. Secure a copy of the blank curriculum sheet* and a sample "work sheet" before you start to develop a curriculum plan for your department of vocational agriculture.

2. Fill in the "date" column from top to bottom with the first week of school, list month and week date; for example, September 4-8, 11-15, 18-22, etc.

3. Obtain from the local school calendar the dates and events of each week during the coming school year along with all allowable vacation days, assemblies, and any other <u>irregularities</u> which may affect your teaching program. Fill out the first (left side) column on the curriculum sheet with these dates and events.

MAKE ALL ENTRIES ON CURRICULUM "WORK SHEETS" WITH PENCIL SO ADJUSTMENTS CAN BE MADE EASILY BEFORE COPYING ONTO THE FINAL CURRICULUM FORM

4. For the purpose of making better utilization of your agricultural mechanics shop facilities, it is suggested that you first list the <u>teaching units</u>, <u>skills</u>, and <u>practices</u> which you plan to teach in the area of agricultural mechanics under each column (course of study).

---

*"Curriculum Sheet" may be obtained free of charge from State Department of Education, Vocational Agriculture Service, State Office Building, G16, Columbus, Ohio 43215, or from the Department of Agricultural Education, Agricultural Administration Building, The Ohio State University, Columbus, Ohio 43210.

Be specific as space will permit. Do not list only farm power and machinery - specify - for example, Seeding Equipment, Troubles - Parts - Functions - Operation - Repair - Calibration - Storage - Evaluation - etc. List these in sequence of intended instruction during the period they are to be taught.**

Plan your agricultural mechanics instruction on a seasonal basis in order that such instruction can be coordinated with production agriculture subjects. For example, the study of Hay Balers and Forage Harvesters may well be at such time as you would be teaching better pastures, meadows, and hay making.

5. Under each column (course of study) list all livestock teaching units you expect to teach throughout the school year. Include those units which you think are essential according to the needs of the students and the teaching of the previous year. Include the individual and class work on occupational experience programs which apply to livestock such as agreements, budgets, summary, analysis, etc.

6. Under each column (course of study) list all crop teaching units that you expect to teach during the school year. Be certain to include all class or individual work on the crop phase of the occupational experience program under these columns.

7. Under each column (course of study) list those items that you expect to teach in Farm Business Management. List, for example, farm policy, taxes, insurance, family living, etc.

8. Under each column (course of study) list the FFA activities which will need class time.

9. Check each column (course of study) from top to bottom to make certain that all weeks are accounted for in each course.

10. Finally, check the completed curriculum sheet against the evaluation sheet in the back of this publication.

11. You may choose to color code your planned curriculum sheets according to Agdex colors. Some teachers believe that by color coding, it is easier to see the time being devoted to certain phases of the complete program. For example, orange for agricultural mechanics, red for animal science, green for crops, and yellow for farm business management.

12. Post the curriculum sheet on the bulletin board or similar place where it is convenient for you and school officials to check frequently and also where the students can readily see it. Do not stuff it away in the files!

**If for example, you plan to teach more than one unit or parts of several during the same week, you may indicate this by drawing diagonal lines between each specific unit or problem taught, as shown below:

Sept. 11-15 / seeding equipment / troubles / repair

Planning a Daily Teaching Schedule

1. To make the "curriculum" more meaningful, each teaching unit should be spelled out in detail on the daily teaching schedule (Agdex .30). The curriculum sheet is only an over-all guide by the week while more specific information is needed for the teaching days ahead.

2. Start with the first week and list the specific problem, topic or activity for each day on the daily teaching schedule (Agdex .30).

3. When the first six weeks have been specifically worked out in detail for Vocational Agriculture I, then start with Vocational Agriculture II, etc., until each week has been planned in detail for all courses.

4. From this "daily teaching schedule" you are now ready to make out your lesson plans and arrange for your major teaching materials. The daily teaching schedule should at all times be planned for six weeks in advance.

ADDITIONAL SUGGESTIONS TO MAKE THE TEACHING PROGRAM MORE EFFECTIVE

1. Before school starts, review with your school administrator your program of instruction for each class.

2. Soon after school starts, plan the year's work with the students in each class.

3. Record each week those changes made in courses taught. (These data will be necessary for planning the curriculum in succeeding years.)

4. Review your teaching schedule each month according to needed changes. Keep your program up-to-date.

SUPERVISED OCCUPATIONAL EXPERIENCE (A TEACHING OUTLINE)

I. Assisting students in establishing vocational objectives.

- A. What are the opportunities for starting farming?
  - 1. The home farm.
  - 2. The local community and county.
  - 3. Opportunities in the state.
- B. What income can the beginning farmer expect?
- C. What requirements must the beginning farmer meet?
  - 1. Capital.
  - 2. Livestock.
  - 3. Machinery.
- D. What arrangements are desirable for starting?
  - 1. Partnerships.
  - 2. Renting.
- E. How can a high school student acquire needed capital and experience?
- F. How have some local young farmers become established?
- G. Opportunities in non-farm agricultural businesses which require proficiency in certain agricultural production skills.

II. Why have an occupational experience program?

- A. Putting theory into practice.
  - 1. To gain practical experience in the production of agricultural products for market.
- B. To learn how to manage labor.
- C. To learn how to plan production sequences.
  - 1. Performing operations at the best time.
- D. To learn how to invest money in a production enterprise.
- E. To gain experience in marketing products.
- F. To gain experience in record keeping and in summarizing and analyzing records.
- G. To use previous experience in planning new production enterprises.

III. What is an occupational experience program?

- A. Students should plan long-time occupational experience programs which include:
  - 1. Production enterprises.
    - a) Field crop production.
    - b) Horticultural crop production.
    - c) Livestock production.
      - (1) Breeding herds or flocks.
      - (2) Feeder stock.
  - 2. Improvement projects.
  - 3. Supplementary farm practices.
  - 4. Agricultural mechanics projects.
  - 5. Farm placement--may be used when home farm is inadequate to provide experiences.

AGRICULTURAL PRODUCTION

SUPERVISED OCCUPATIONAL EXPERIENCE (A TEACHING UNIT)

Approximate Teaching Time

The supervised occupational experience unit should be started early in the first year of the agricultural production course. Various aspects of the record keeping, summary, and analysis of the programs will extend throughout the entire agricultural production course. (See Enterprise Accounting for Vocational Agriculture in Ohio.)

Approximately 45 classroom hours would be required for teaching the unit. Additional teaching time is required in developing a satisfactory program involving the student and his parents. About two hours per student would be required.

Vocational Objectives

Primary vocational objectives.

1. To help students to become satisfactorily established in farming and other production agriculture.

Secondary vocational objectives.

1. To prepare students for off-farm agricultural businesses requiring practical farm experience for proficiency.

Major Competencies

1. To select profitable farm enterprises.
2. To successfully conduct farm enterprises through a complete cycle of production.
3. To keep accurate records.
4. To summarize and analyze records.
5. To make decisions based on information provided by records.
6. To appraise opportunities for establishment in farming.

IV. Selecting individual occupational experience programs.

- A. Type of occupational experience program needed by the student.
    - 1. Experiences required for successful achievement of vocational objectives.
    - 2. Interests of the student.
    - 3. Experience and ability of the student.
- B. Home situation.
    - 1. Size of home farm and type of farming operation.
    - 2. Size of family, age of parents, and other family members.
    - 3. Financial situation and farm tenure.
        - a) Farm ownership.
        - b) Renting.
    - 4. Machinery and equipment available.
- C. Availability of production enterprises.
    - 1. On home farm.
        - a) Crops and livestock raised.
        - b) Production and management practices followed.
    - 2. In community.
        - a) Crops and livestock raised.
        - b) Production and management practices followed.
- D. Capital requirements.
    - 1. Amount of money required--livestock, feed, seed, fertilizer, labor, machinery, and other operating costs.
    - 2. Availability of capital. Savings on credit.
- E. Opportunity for successful completion.
    - 1. The market outlook.
- F. Labor requirements.
    - 1. Amount of student labor.
    - 2. Amount of other party labor.

V. What are the marks of a satisfactory occupational experience program?

- A. Farming program.
    - 1. Student ownership.
        - a) Full ownership.
        - b) Partnership with parents, other family members, or neighbors.
    - 2. Student management.
        - a) The student should have full or part responsibility for all management decisions.

3. Student labor.
    a) The student should perform all labor possible. Should gain experience in each part of the production cycle.
4. Size of enterprise.
    a) The enterprise should be large enough to challenge the student and provide meaningful experiences.
    b) The enterprises should grow in size as the student advances in school.
5. Provide opportunity for profit.
    a) Provide money for personal expenses.
    b) Provide money for expansion.
6. Quality of farming programs.
    a) The quality of the enterprises should meet market demands and insure pride of ownership.
7. Provide opportunity to expand into farming or finance further education.
8. Has student, parent, and teacher approval.

B. Farm placement.
1. Provide opportunity for student to gain wide range of experience in enterprises common in community.
2. Provide a plan of experiences to be made available to the student.
3. Provide for supervision and instruction by the employer.
4. Provide for fair wages to be paid the student by the employer.
5. Provide for a record of experiences gained and money received.
6. Provide for evaluation by the employer of quality of work performed by student.
7. Provide for supervision by the teacher.
8. Provide for agreement of the parents of the student.

VI. Record keeping in vocational agriculture.
Reference: Enterprise Accounting for Vocational Agriculture in Ohio.

A. The importance of keeping complete and accurate records.
B. Planning the budget for production projects.
C. Preparing project agreements for production projects.
D. Taking inventories in production projects.
E. Entering receipts and expenses in production projects.
F. Overhead and operating expenses for production projects.
G. Summarizing production enterprise.
H. Analyzing production enterprise.
I. Using project record information in decision-making.
J. Keeping improvement project records.
K. Preparing net worth statement.

AGRICULTURAL PRODUCTION

PLANT SCIENCE

Teaching Units in Plant Science Area of Instruction

Field Crop Growth, Development and Nutrition

Crop Seed Production and Selection

Preventing Common Crop Diseases

Prevention and Control of Crop Insects

Weed Control

Grain Marketing

FIELD CROP GROWTH, DEVELOPMENT, AND NUTRITION (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the field crop growth, development, and nutrition unit be taught as an entire unit during either the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 40 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately three hours per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Farm crop production. Producing farm crops for feed, seed, or sale.

Secondary vocational objectives.
The field crop growth, development, and nutrition unit will prepare students to enter certain occupations on a limited basis or to enter more advanced educational programs.

1. Agricultural business occupations concerned with the sale of fertilizer, lime, seed, chemicals, machinery,

and analyzing various crop production problems.
2. Vocational education programs at third and fourth year high school levels requiring a knowledge of plant science such as horticulture.
3. Technical schools.
4. College of Agriculture.

Major Competencies

1. Understand processes involved in plant growth, and factors affecting the growth processes.
2. Ability to apply knowledge of plant growth processes in crop production.
3. Understand nutrient needs of crops and the effect they have on plant growth.
4. Interpret soil and plant analysis tests.
5. Provide crop nutrient needs through application of lime, manure, and fertilizer.
6. Ability to select the correct kind and amount of commercial fertilizer and limes for a particular crop.

FIELD CROP GROWTH, DEVELOPMENT, AND NUTRITION (A TEACHING OUTLINE)

Managing the environmental factors of soil fertility, light moisture, temperature, and tillage methods to obtain maximum crop production.

I. Seeding the crop.

- A. The germination of seed in the soil.
  - 1. Requirements for seed to germinate.
    - a) Moisture.
      The osmosis process.
    - b) Temperature.
    - c) Air.
    - d) Light (required for some seeds).
  - 2. Seed structure characteristics.
    - a) Monocote - corn.
    - b) Dicote - soybeans.
    - c) Seed parts - what they do.
      Pericap.
      Endosperm.
      Embryo.
  - 3. Respiration.
  - 4. Cell growth and development of seedling.
    - a) Growing point.
    - b) Root development.

5. Providing soil conditions favorable for germination.
    a) Temperature of soil depending upon time of year.
        Moisture content of soil.
        Color of soil.
        Depth of planting.
        Contact of seed and soil. (Tillage method, soil structure.)
    b) Moisture.
        Time of planting in relation to rainfall.
        Water holding capacity of soil. (Soil type, tillage method.)
        Ground cover.
        Depth of planting.
        Contact of seed and soil. (Tillage method, soil structure.)
    c) Air.
        Density of soil. (Tillage method, soil structure and type.)
        Depth of planting.
        Moisture content of soil.

B. Effect of date of planting on later plant growth and development.
    1. Seasonal requirements - effect of temperature on plant growth.
    2. Use of available moisture by plants.
    3. Use of available rainfall during growing season.
    4. Best use by plants of available sunlight. Hours of sunlight during growing season.

II. Growing the crop from seedling stage to harvest. (Base teaching on crops important in community.)

A. Needs of the plant for growth and development.
    1. Air - CO_2.
    2. Water - H_2O.
    3. Sunlight - energy.

B. How plants grow. Use of air, water, and sunlight.
    1. Important parts of a plant and their function.
        a) Roots - take in water.
            store manufactured food.
            anchor plant in soil.
        b) Stem - transport water to leaves.
            transport manufactured food to roots.
            store some manufactured food.
        c) Flowers, fruit, and seed -
            reproduction.
            store manufactured food.
        d) Leaves - food manufacture.
            stomata - take in air - move out water.

2. Plant processes required for normal crop growth.
    - a) Photosynthesis process.
      Carbon + water + sunlight energy
      Dioxide in chlorophyll →

      Simple sugar + water + oxygen
      (First food)

      Glucose or simple sugar is the first food manufactured by the photosynthesis process.
    - b) Respiration process.
      Energy release.
      Chemical breakdown (digestion).

      Simple sugar + oxygen → Water + Energy

    - c) Transpiration process.
      Water loss through stomata.
      Water entry through plant roots.
      Effect of air temperature.
    - d) Assimilation process.
      Converting energy and food to cell parts.
    - e) Diffusion process.
      Movement of water and nutrients into the plant.

C. Plant population - row spacing of crops.
1. Space requirements for plants to grow. Compare species.
2. Effect of species and variety on plant population.
3. Effect of plant population on crop yields.
4. Choosing machinery system to seed, till, and harvest crops at different populations.

III. Planning the fertility program.

Plants use air and water through the process of photosynthesis to make simple sugar. Most mature plants are composed of about 90 per cent carbon, hydrogen, and oxygen. Why do plants need other nutrients?

A. Nutrient materials required for plant growth and development.
1. Major nutrients.
    - a) Element name.
    - b) Nutrient form.
    - c) Plant function.
2. Secondary nutrients.
    - a) Element name.
    - b) Nutrient form.
    - c) Plant function.
3. Micro nutrients.
    - a) Element name.
    - b) Nutrient form.
    - c) Plant function.

B. Determine nutrient requirements for maximum economic crop yields.
   1. Crop nutrient requirements.
      a) Corn.
      b) Soybeans.
      c) Small grains.
      d) Forage crops.
         (1) Grass.
         (2) Legumes - nitrogen fixing bacteria. Inoculation.
   2. Crop nutrient deficiency symptoms. Hunger signs for those crops on which nutrient shortages can be observed.
   3. Soil analysis.
      a) Sampling procedure.
      b) Testing procedures.
      c) Interpreting results.
         (1) pH
         (2) O.M.
         (3) K_2O
         (4) P_2O_5
   4. Plant analysis.
      a) Sampling procedure.
      b) Testing procedures.
      c) Interpreting reports.

C. Determine fertilizer recommendation for maximum economic crop yields.
   1. Determine crop yield goals.
   2. Determine crop needs.
      a) Major nutrients.
      b) Secondary nutrients.
      c) Micro nutrients.
   3. Determine availability of nutrients.
      a) Available from the soil. (Soil test.)
      b) Available from manure.
         (1) Handling and storage.
         (2) Time of application.
      c) Available in crop residue.
         (1) Legume sod.
         (2) Grass sod.
         (3) Corn stalks or small grain stubble.
   4. Determining fertilizer requirements for maximum economic crop yields.
      a) Determine difference between nutrients supplied and nutrients required to meet yield goals.
   5. Determine point of diminishing returns in the application of fertilizer.

D. Selection and application of commercial fertilizer.
   1. Application of fertilizer.
      a) Time of year.
      b) Method of application.
         (1) Broadcast.
         (2) At planting.
         (3) Row.
         (4) Pop up.
         (5) Side dress.

- c) Placement in relationship to seed (diffusion).
- d) Amount to apply.
  Build up fertilizer reserve in soil.
  Supply immediate need of current crop.
- e) Mix with herbicide or insecticide.

2. Form of fertilizer to apply.
   - a) Physical form.
     Liquid, dry, gas.
   - b) Chemical form.
     Availability, solubility, fixation in soil, soil type.
3. Cost per pound of available plant nutrient.

F. Application of lime for maximum economic crop production.
1. Crop needs.
2. Soil pH - cation exchange.
3. T.N.P. of liming materials.
4. Type of liming materials.
   - a) Magnesium needs (dolomite).
   - b) Calcium needs.
5. Fineness of liming materials.
6. Plowing depth in relation to amount of lime applied.

IV. Plant identification.
(May be taught on a separate unit.)
(Plant identification information may be used with each of the plant science units.)
(Suggest that study of plants be limited to those used in the agronomy contest.)

A. Dicot plant characteristics.
1. Leaf.
2. Stipule.
3. Stolons.
4. Pubescence.
5. Rhizomes.

B. Monocot plant characteristics.
1. Leaf.
   - a) Blade.
   - b) Sheath.
2. Stem.
3. Auricle.
4. Ligule.
5. Pubescence.
6. Inflorescence.
7. Rhizomes.

AGRICULTURAL PRODUCTION

PLANT SCIENCE

CROP SEED PRODUCTION AND SELECTION (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the crop seed production and selection unit be taught as an entire unit during either the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 25 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately one hour per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Crop farming for production of crops for sale and feed.
2. Certified seed production for sale of seed to farmers.

Secondary vocational objectives.
Most of the secondary vocational objectives would require additional vocational, technical, or college education for entry into the jobs.

1. Field inspection to inspect crops grown for certified seed.
2. Laboratory technician to inspect and test seeds.
3. The packaging, wholesaling, retailing, and advertising of seeds.
4. Scientists, who search for new use of seeds.
5. Professional persons such as teachers of vocational agriculture who counsel with farmers.
6. Those persons who plan to continue their education at the college level in agronomy.

Major Competencies

1. To recognize the economic value of using quality seed in the production of field crops.
2. To identify the job opportunities in the seed production industry.
3. To apply the knowledge of how plants reproduce seed to the production of quality seed.
4. To identify crop and weed seeds.

5. To describe a crop variety and how new varieties are produced.
6. To produce certified seed.
7. To select quality seed for commercial crop production.
8. To use federal and state laws for protection in buying seed.
9. To determine the most economical seed to purchase.

CROP SEED PRODUCTION AND SELECTION (A TEACHING OUTLINE)

I. Importance of farmer using quality seed.

- A. Effect of seed quality on crop production.
  - 1. Crop losses resulting from using poor quality seed.
    - a) Yield loss.
      - (1) Poor germination.
      - (2) Low test weight.
      - (3) Winter killing.
    - b) Seed quality lowered.
      - (1) Disease and insect damage.
      - (2) Mixed with other crop and weed seed.
      - (3) Not mature - low test weight.
  - 2. Determine probable costs and returns from using seeds of different quality.
    - a) Use common field crops as examples.

II. Production of quality seed.

- A. Crop varieties and how they are developed.
  - 1. Plant classifications - plant kingdom.
    - a) Seed producing plants.
      Gyminosperms (confiers).
      Avgiosperms (crop plants in their group).
    - b) Augiosperm division.
      Dicots - soybeans and other legume plants.
      Monocots - corn and small grains all other grass plants.
    - c) Further breakdown of classification (both dicots and monocots).
      - (1) Order.
      - (2) Family.
      - (3) Tribe.
      - (4) Genes.
      - (5) Specie.
    - d) Plant specie such as corn, wheat, etc. are broken down into varieties.
  - 2. What is a variety?
    - a) Rank within a specie.
    - b) Distinguished by capital name before the specie name (Fulton wheat).

c) Varieties are developed by man, other classifications are not.
d) Names often confused with variety names. (Type, strain, blend, brand, hybrid.)

3. How are varieties developed?
  a) Plant reproduction.
    (1) Asexual - negative propagation - grafting, budding, cuttings, new plant like parent plant.
    (2) Sexual -
  b) The plant flower.
    (1) Male and female reproductive parts and their function.
    (2) Other flower parts.
  c) The flowers of grass plants and how they are different.
    (1) Lack sepals and corolla.
    (2) Corn plant - male and female parts located on different section of plant.
  d) Plant pollination.
    (1) Self-pollination.
    (2) Cross-pollination.
  e) How plants acquire characteristics.
    (1) The plant cell.
      Cytoplasm.
      Nucleus.
      Chromosomes.
      Genes.
    (2) Transmitting of plant characteristics.
      Dominant genes.
      Recessive genes.
  f) Steps in variety development.
    (1) "Weed out" undesirable characteristic.
    (2) Build up desirable characteristic.
  g) Procedures used in plant breeding.
    (1) Cross-pollination.
    (2) Self-pollination.
    (3) Progeny testing.
    (4) Back crossing.
    (5) Hybridizing.
  h) Development of varieties of small grains and soybeans.
  i) Development of hybrid varieties of corn.
    (1) Inbreeding.
    (2) Crossing.
      Male sterility (cytoplasm as a heredity factor).
  j) Development of hybrid wheat.

III. Production of quality seed.

- A. Certified seed.
  - 1. Quality guarantee of certified seed.
  - 2. The Ohio Seed Improvement Association.
    - a) Non-profit organization.
    - b) Controls and regulates production and sale of certified seed.
    - c) Keeps pedigree records of crop varieties.
    - d) Supervised
      - (1) Field inspection,
      - (2) Harvesting and cleaning,
      - (3) Laboratory testing.
  - 3. Production of certified seed.
    - a) Who may produce.
    - b) Procedures required
      - (1) Field,
      - (2) Equipment,
      - (3) Laboratory.
    - c) Seed classes required
      - (1) Breeder,
      - (2) Foundation,
      - (3) Registered,
      - (4) Certified.
  - 4. Standards required for each seed class.
    - a) Weed seeds.
    - b) Other crop seeds.
    - c) Germination.
    - d) Inert matter.
- B. Protection offered seed buyers by state and federal seed laws.
  - 1. License requirements.
  - 2. Seed package label requirements.
    - a) Per cent germination, inert matter, other crops seeds, hard seeds.
    - b) Number of primary noxious and secondary noxious seed per grains of crop seed.
    - c) Date germination test made.
    - d) Name of crop and variety.
    - e) Certified seed and the "blue tag."
  - 3. Penalties for seed law violation.

IV. Purchasing quality seed.

- A. Which variety?
  - 1. Disease restraint.
  - 2. Adapted to growing conditions, maturity length.
  - 3. Growth characteristics.
    - a) Straw or stalk strength.
    - b) Amount of straw or stalk size.

B. Label information.
    1. Per cent germination.
    2. Per cent hard seeds.
    3. Cost of seed.

formula $\dfrac{\text{cost per bushel}}{\text{purity \% x germination \%}}$ = cost of pure line seed

V. Seed identification.
(May be taught during the seed production unit or as a separate unit.)
(Suggest limit study of seeds to those used in agronomy contest.)

A. Crop seeds.
    1. Dicots.
        a) Shape.
        b) Size.
        c) Color.
        d) Hilum.
        e) Seed cost characteristics.
    2. Monocots.
        a) Same as dicots except use rachis and awn characteristics.
B. Weed seeds - primary and secondary noxious; other weed seeds (division the same as crop seeds).

AGRICULTURAL PRODUCTION

PLANT SCIENCE

PREVENTING COMMON CROP DISEASES (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the preventing common crop diseases uni be taught as an entire unit either during the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately eight classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately one hour per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Providing competencies for preventing crop diseases in the crop production phase of farming.

Secondary vocational objectives.

1. Agricultural business sales and service dealing with crop disease preventing chemicals and seeds.
2. Custom application of crop disease preventing chemicals.
3. Entrance to technical schools for courses dealing with farm chemicals.
4. Entrance to college of agriculture for professional training in agronomy and plant pathology.

Major Competencies

1. Identify the common crop diseases that are present problems.
2. Understanding of how disease organisms cause damage to crops.
3. Ability to prevent crop disease losses.

PREVENTING COMMON CROP DISEASES (A TEACHING OUTLINE)

I. Crop losses that occur from disease infestations (include only those diseases that are present problems).

- A. Types of losses caused by diseases.
    - 1. Yield loss - (smut of small grain and corn).
    - 2. Seed quality - (scab of wheat).
    - 3. Plant quality - (alfalfa leaf spot).

II. What ways are diseases caused and can they be prevented?

- A. Infections or parasitic.
    - 1. Fungi.
        - a) Prevention.
        - b) How spread.
        - c) Common characteristics of fungi - leaf spots, molds, seed smuts.
    - 2. Bacteria.
        - a) Prevention - control.
        - b) How spread.
        - c) Common characteristics of bacteria.
    - 3. Virus.
        - a) Prevention - control.
        - b) How spread.
        - c) Common characteristics of nemotode.

III. Infectious diseases are often mistaken for other abnormal plant growth.

- A. Non-infectious diseases or physiological disorders.
    - 1. Mechanical injury.
    - 2. Herbicide injury.
    - 3. Unfavorable weather.
    - 4. Plant nutrient deficiency.

IV. How can the farmer identify the common crop diseases? (Part of the plant they affect.)

- A. Seed diseases.
    - 1. Crops affected.
    - 2. Description and cause.
      Example: Loose smut of wheat - entire seed head replaced by black smut - fungus.
- B. Leaf and stem diseases.
    - 1. Crops affected.
    - 2. Description and cause.

V. How can the farmer reduce losses by disease prevention methods?

- A. Use of fungicide on seeds or plants.
    - 1. Diseases prevented.
    - 2. Material used.
      Example: Stinking smut of wheat - Caoptan.
- B. Resistant varieties.
    - 1. Disease prevented.
    - 2. Variety namo.
      Example: Phytophtera root rot soybeans - Harosoy 63.

C. Cultural practice.
    1. Disease prevented.
    2. Practice used.
        Example: Scab of wheat - do not sow wheat in corn ground.

D. Intermediate plant host.
    Example:
    1. Johnson grass rhizoner - Maize Dwarf Mosaic.
    2. Common barberry - Black Stem Rust of Wheat.

AGRICULTURAL PRODUCTION

PLANT SCIENCE

PREVENTION AND CONTROL OF CROP INSECTS (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the prevention and control of crop insects unit be taught as an entire unit either during the first or second year of the agricultural production course. This would be determined by the needs and interests of students.

Approximately 10 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately one hour per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Providing competencies for preventing crop insect damage in the crop production phase of farming.

Secondary vocational objectives.

1. Agricultural business sales and service dealing with insect prevention and control chemicals.
2. Custom application of crop insect prevention and control chemicals.
3. Entrance to technical school for courses dealing with farm chemicals.
4. Entrance to college of agriculture for professional training in agronomy and entomology.

Major Competencies

1. Identify the common crop insects and type of damage done.
2. Understand how different insects damage crops.
3. Understand insect life cycles.
4. Ability to select and use prevention and control methods.

PREVENTION AND CONTROL OF CROP INSECTS (A TEACHING OUTLINE)

I. Crop losses that occur from insect damage. (Limit to common crops and insects that are present problems.)

- A. What insects cause damage to our crops?
  - 1. Corn - borer - ear worm - root worm - aphid.
  - 2. Wheat - Hessian fly - cereal leaf beetle.
  - 3. Alfalfa - weevil - leafhoppers.
- B. How much crop damage may these insects do?
  - 1. Alfalfa weevil.
  - 2. Corn root worm.
  - 3. Aphid.
  - 4. Leafhopper.

II.

- A. Life cycle of insects.
  - 1. Without metamorphosis (no common crop insects - chicken lice and hog lice are examples).
  - 2. Gradual metamorphosis. Leafhoppers an example.
  - 3. Incomplete metamorphosis - none in this group are important crop insects.
  - 4. Complete metamorphosis - most crop damaging insects in this group.
    - a) Egg.
    - b) Larvae.
    - c) Pupae.
    - d) Adult.
- B. Types of mouth parts.
  - 1. Chewing - eat leaves, stems, and roots of plants - alfalfa weevil, corn rootworm.
  - 2. Sucking - puncture and withdraw plant juice - leafhopper.
  - 3. Sponge - absorb soluble material (home fly).
  - 4. Tube - siphon like (butterfly and moths).

III. Identifying the insect and damage done to a crop or crops. Alfalfa, corn, and small grains.

- A. Part of plant damaged and description.
- B. Time of year damage is done.
- C. Stage of insect life cycle and description.

IV. What prevention and control practices can be used?

- A. Cultural practices.
  - 1. Crop rotations.
  - 2. Destroying crop residue.
  - 3. Resistant or tolerant varieties.
  - 4. Intermediate hosts.

B. Insecticides.
    1. Stomach poisons.
    2. Contact.
    3. Vapor action.
C. Insect parasites.
D. Mechanical action.
    1. Flaming.

AGRICULTURAL PRODUCTION

PLANT SCIENCE

WEED CONTROL (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the weed control unit be taught as an entire unit either during the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 15 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately one hour per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Providing competencies for the prevention and control of weeds in the crop production phase of farming.

Secondary vocational objectives.

1. Agricultural business sales and service dealing with herbicides and cultivating equipment.
2. Custom application of herbicides.
3. Entrance to technical schools for courses dealing with farm chemicals.
4. Entrance to college of agriculture for professional training in agronomy.

Major Competencies

1. Ability to identify weed and crop plants.
2. Determining crop losses caused by weeds.
3. Ability to understand growth characteristics of weed plants.
4. Ability to understand how herbicides kill weeds.
5. Ability to select the correct herbicides to control a weed plant.
6. Ability to prepare and apply herbicides to control weeds.

WEED CONTROL (A TEACHING OUTLINE)

I. How serious are crop losses from weed infestations?

- A. Seed losses (from seed production outline).
- B. Nutrient and water competition.
- C. Hay and pasture loss from poor quality forage.

II. Plant identification.
(See plant identification section.)

- A. Identification of problem weeds and their characteristics.

III. Why are some weeds more difficult to control?

- A. Perennials (live for several years).
    - 1. New plants come from roots and seeds.
    - 2. Have rhizomes.
- B. Biennials (live for 2 years).
    - 1. Produce flower and seed 2nd year.
- C. Annuals (new plant from seed each year).
    - 1. Winter annuals.
    - 2. Spring annuals.

IV. What types of herbicides are used to kill plants?

- A. Non-selective - kills all plant life.
    - 1. Contact.
    - 2. Soil sterilant.
    - 3. Systemic.
- B. Selective - kills certain plants and not others.
    - 1. Enzyme action.
    - 2. Degree of absorption.
    - 3. Systemic.
- C. Place of application.
    - 1. Foliar.
    - 2. Soil.
- D. Type of material.
    - 1. Wettable powder.
    - 2. Ester - emulsion.
    - 3. Granular.

V. What cultural practices are helpful in controlling weeds?

- A. Plowing time.
- B. Soil preparation (or lack of).
- C. Cultivation.
- D. Fallowing.
- E. Crop rotations.

VI. How to use herbicides to control specific weeds such as quack grass.

- A. Crop to be grown and the cropping sequence.
- B. Weeds to control.
- C. Herbicides to use.
- D. Time of application.
- E. Method of application.
    - 1. Amount of herbicide.
    - 2. Amount of water.

AGRICULTURAL PRODUCTION

PLANT SCIENCE

GRAIN MARKETING (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the grain marketing unit be taught during the first or second year of the agricultural production course. This is an elementary unit. A more complete unit on marketing is recommended during the fourth year farm business management area of instruction.

Approximately five classroom hours would be required.

Vocational Objectives

Primary vocational objectives.
1. Crop farming. Marketing of grain crops.

Secondary vocational objectives.
1. Agricultural business - grain buying or selling.

Major Competencies

1. To determine best time and method of marketing grain.

GRAIN MARKETING (A TEACHING OUTLINE)

I. Importance of efficient grain marketing.

  A. Income from grain crops sold from a farm, county, state, nation.

II. Market outlets for grain.

  A. Local markets available.
  B. Feed to livestock.

III. Grain prices.
  A. Seasonal fluctuations of prices.
    1. Determine best time to sell.

78

AGRICULTURAL PRODUCTION

ANIMAL SCIENCE

Teaching Units in Animal Science Area of Instruction

Livestock Feeding

Livestock Selection and Breeding

Livestock Marketing

Livestock Health

Quality Milk Production

LIVESTOCK FEEDING (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the livestock feeding unit be taught as an entire unit during either the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 30 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately two hours per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Livestock farming. To plan feeding programs and to feed livestock.
    a. Registered livestock breeders engaged in the development and sale of breeding stock.
    b. Commercial livestock farmers engaged in the production and sale of meat, milk, and wool.

Secondary vocational objectives. (Non-farm occupations related to livestock farming.)

The livestock feeding unit will prepare the student to enter certain occupations on a limited basis or to enter more advanced educational programs.

1. Agricultural business dealing with feed sales, feed additives, dealerships, veterinary supplies, feed manufacturing.
2. Technical school - feed laboratory technician.
3. College of agriculture - nutritionist, veterinarian, vo-ag teacher, county agent.

Major Competencies

1. To recognize the need for and uses of feed for efficient production.
2. To identify body processes and their relationship to nutrition of animals.
3. To identify food nutrients, sources, and their characteristics.
4. To identify the characteristics and functions of various foodstuffs.
5. To determine needs and requirements of animals at all stages of life for confinement and pasture.
6. To determine an economical balanced ration for a specific kind of livestock.
7. To select a method of preparing feed stuffs for livestock.
8. To select a feeding system and schedule for livestock.

LIVESTOCK FEEDING (A TEACHING OUTLINE)

I. The need for and uses of feed for efficient livestock production.

A. Need for feed.
   1. Growth.
   2. Maintenance.
   3. Reproduction.
   4. Production.
   5. Fattening.

B. Uses of feed stuffs - define each.
   1. Roughages - supplying bulk, energy, and nutrients.
      High carbohydrate.
      High protein.
   2. Concentrates.
      Carbohydrate concentrates - grains supplying energy.
      Protein concentrates - animal and plant by-products and synthetic sources - supplying body-building materials.
   3. Mineral and vitamin feed supplements and feed additives for body composition, regulation, and health.

- C. Efficient production from adequate feeding. (Use examples from beef, dairy, sheep, and swine enterprises.)
    - 1. Improved grains.
    - 2. Better and faster growth.
    - 3. Increased production of milk and wool.
    - 4. Improved quality of production.
    - 5. Improved efficiency of production.
    - 6. Improved health of animals.

II. Utilization of food nutrients by animals.

- A. Define digestion.
- B. Identify parts of the digestive system of simple stomach animals and fowl.
- C. Identify the digestive system of ruminants and related body processes.
- D. Explain how food is broken down and nutrients absorbed in the blood stream.
    - 1. Mouth.
    - 2. Stomach.
    - 3. Small intestine.

      (simple stomach animals and ruminants)

III. The food nutrients, sources, and characteristics.
Identify the function and make-up of each nutrient.
Identify major feed stuffs where nutrients may be found.

- A. Carbohydrates.
- B. Fats.
- C. Proteins.
- D. Minerals.
- E. Vitamins.
- F. Water.

IV. Common feeds for farm animals, their characteristics, and functions.

- A. Identify the following:
    - 1. Digestible protein.
    - 2. Nitrogen-free extract.
    - 3. Total digestible nutrients.
    - 4. Net energy.
- B. Identify common feeds.
    - 1. Roughages.
        - a) Hays.
        - b) Haylage.
        - c) Grass silage.
        - d) Green chop.
        - e) Pasture.
        - f) Corn silage.
    - 2. Grains.
        - a) Shelled corn.
        - b) High moisture corn.

        c) Ear corn.
        d) Small grains.
    3. Supplements.
        a) Protein - animal and plant by-products and synthetics.
        b) Mineral supplements.
        c) Vitamin supplements.
    4. Feed additives.
        a) Antibiotics.
        b) Hormones.
        c) Iodinated casein.
        d) Arsenical.
        e) Detergent.
        f) Tranquilizer.
        g) Rumen organism.

V. Animal needs and requirements.

Identify ration requirements as protein, total digestible nutrients, net energy, mineral, and vitamin requirements for different stages of growth, production, and methods of feeding - use of feeding standards.

A. Beef cattle.
    1. Calves and yearlings - stockers and feeders.
    2. Cows.
B. Dairy cattle.
    1. Veal.
    2. Calves.
    3. Heifers.
    4. Cows by breed and production.
C. Swine.
    1. Gilts and sows by ranges of weight.
    2. Market hogs.
D. Sheep.
    1. Breeding flock.
    2. Lambs.

VI. Balancing rations for different stages of production for each species. (Beef, dairy, sheep, swine.)
Breeding stock during different stages of reproduction cycle.

A. Young stock.
B. Meat production.
C. Milk production.
D. Identify feeds to use and composition of each.
    1. Grains.
    2. Roughages.
        a) Evaluate quality - (analysis of protein).
    3. Supplements - per cent protein.
        a) Commercials.
        b) Others.

E. Identify limitations of the amount of specific feeds in ration (as oats for fattening hogs).
F. Identify status of animals and requirements for same.
  1. Age, weight.
  2. Production - (lbs. and % B.F. of milk).
G. Define ration, balanced ration, protein, digestible protein, T.D.N., N.F.E., N.R., and N.E.
H. Identify characteristics of a good ration.
I. Use the trial and error method of balancing a ration and compare against requirements.
J. Use the Pearsons square method to balance a ration. (Balance a ration for beef, dairy, swine, sheep.)

VII. Preparation of feed stuffs for livestock.
(Beef, dairy, swine, sheep.)

A. Define mastication and rumination.
B. Value of feed vs. digestibility.
C. Preparation of feed - its effect on nutritive value.
  1. Grinding.
  2. Pelleting.
  3. Soaking.
  4. Cooking.
  5. Chopping.
  6. Crumping.
  7. Cracking.

VIII. Feeding systems and practices.
(Beef, dairy, swine, sheep.)

A. Daily intake of feed - its effect on animal performance.
  1. Condition of animal.
  2. Purpose for which feed is to be used.
B. Methods of feeding - advantages and disadvantages. (Beef, dairy, swine, sheep.)
  1. Self-feeding.
  2. Hand-feeding.
  3. Limited feeding.
  4. Crop feeding.
C. Schedule for hand feeding.
  1. Importance of regularity.
  2. Once, twice, or three times daily.

AGRICULTURAL PRODUCTION

ANIMAL SCIENCE

LIVESTOCK SELECTION AND BREEDING (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the livestock selection and breeding unit be taught as an entire unit during either the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 45 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately two hours per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Livestock farming - breeding and selection of livestock.
    a. Registered livestock breeders engaged in the development and sale of breeding stock.
    b. Commercial livestock farmers engaged in the production and sale of meat, milk, and wool.

Secondary vocational objectives. (Non-farm occupations related to livestock farming.)

Most of the agricultural occupations related to the livestock breeding and selection unit will require additional vocational, technical, or college training for entry into a job.

1. Agricultural businesses - sale of breeding supplies, breeding associations, artificial insemination.
2. Technical school - laboratory technician.
3. College of agriculture - animal science majors, agricultural education, veterinarian.

Major Competencies

1. To select a breed of livestock and evaluate breed characteristics in terms of their economic importance.
2. To select individual breeding stock for the herd and identify the traits that are important to the farmer and consumer.

3. To breed animals for efficient production of livestock products.
4. To manage the female breeding stock for the reproductive role.
5. To manage the male breeding stock for its role.
6. To identify causes of infertility.
7. To determine the breeding programs to use to improve livestock.

LIVESTOCK SELECTION AND BREEDING (A TEACHING OUTLINE)

The study may be centered around the species of livestock (beef, swine, dairy, sheep) that are important to the students in the class.

I. Selecting a breed of livestock.

- A. Define species, breed, grade, purebred, registered, crossbred, scrub.
- B. Characteristics of breeds.
  1. Appearance, physical traits.
  2. Breeding characteristics.
  3. Production characteristics - application to breeds of beef, swine, dairy, sheep common in Ohio.

II. Selecting individual breeding stock.

- A. Define livestock traits (type).
- B. Identify livestock traits that are important to the farmer and consumer.
  1. Identify the exterior parts of the animal.
  2. Identify the ideal type.
  3. Identify the wholesale and retail cuts of meat (beef, swine, sheep, veal).
  4. Identify quality of livestock products (milk and wool).
  5. Identify the quality and kind of meat products demanded by consumer.
     - a) Quality of meat.
     - b) Appearance of cuts.
     - c) Size of cuts.
     - d) Freedom from disease.
  6. Determine efficiency of feed conversion (beef, swine, dairy, sheep).
  7. Breeding ability.
  8. Health.
  9. Temperament.
  10. Ability to raise young.
  11. Amount of wool - (sheep).
  12. Ease of milking - (dairy).

      13. Milk producing ability.
      14. Type - size.
   - C. Selecting livestock for commercial feeding. (Beef, swine, sheep, veal.)
      1. Production testing.
      2. Feeder grades.

III. Breeding animals for efficient production of livestock products.

- A. Influence of heredity and environment on offspring.
- B. Degree of heritability traits chromosomes, genes (beef, swine, dairy, sheep).
- C. Improving livestock through selecting for desirable traits.
   1. Number of traits to select for at one time.
   2. Rate of change to expect.

IV. Selection and management of female breeding stock for most efficient reproduction of quality young.

- A. Reproductive organs and how they function.
   1. Identify organs and their functions.
   2. Formation of eggs.
      - a) Meiosis and mitosis (inheritance).
      - b) How female transmits traits.
      - c) Estrous.
      - d) Regulatory hormones and glands.
      - e) Number of eggs produced.
      - f) Number of young for species.
- B. Breeding ages and amount of service.
- C. Types of mating.
   1. Natural.
   2. Artificial.
- D. Traits carried by egg.
- E. Feeding and management of female livestock during breeding season (beef, swine, dairy, sheep).
   1. Condition of animal (flushing).
   2. Age to breed, symptoms of heat.
   3. Time of year.
- F. Feeding and management of female during gestation period.
   1. Normal development of fetus in uterus.
   2. Regulatory; hormones.
   3. Feeding and management recommendations for each species (beef, swine, dairy, sheep).
      - a) Length of gestation.
      - b) Normal rate of development of fetus.
      - c) Feeding and management recommendations.
      - d) Milk production and dry period (dairy).
      - e) Wool production and shearing (sheep).
- G. Care and management of female and young at birth.
   1. The birth process.
   2. Influence of regulatory hormones.

3. Normal position of fetus.
4. Predelivery symptoms (beef, swine, dairy, sheep).
5. The afterbirth and its disposal.
6. Assistance during delivery if required.
7. Attention to give newborn animals.
8. Feeding and management of female during and just after delivery.
   a) Return of reproduction organs to normal.
   b) Regulatory hormones.
   c) Rebreeding (beef, swine, dairy, sheep).

H. Care and management of young from birth to weaning (beef, dairy, swine, sheep).
1. Colstrum in milk of mother.
2. Special practices - ear marking, navel treatment, dehorning, castration, weaning, worming, etc.

V. Selection and management of male breeding stock for most efficient service.

A. Reproductive organs and how they function.
1. Identify organs and their function.
2. Puberty and the production of the sperm.
   a) How male transmits traits.
   b) Number of sperms produced.

B. Breeding age and amount of service.

C. Breeding by artificial insemination (dairy, beef).
1. Advantages and disadvantages.
2. Selection of a bull.
3. Detecting heat.
4. Notifying inseminator.

D. Feeding and management of male during breeding season.
1. Condition of animal.
2. Number of animals to breed.

VI. Problem of infertility.

A. Age and fertility.

B. Nourishment and care.
1. Effect of nutrition.
2. Effect of heat and environment.

C. Diseases of reproduction.

D. Physical defects.

E. Purposeful sterility - castration.

VII. Breeding programs to improve livestock.

A. Progress in selection.
1. Heritability traits (beef, swine, dairy, sheep).
2. Generation interval.
3. Selection differential.
4. Selection pressure.

B. Types of selection.
    1. Single (tandem).
    2. Culling levels.
    3. Merit scales.
C. Aids to selection.
    1. Pedigrees.
    2. Progeny records.
        a) Bull proofs.
        b) Certified offspring.
    3. Individual performance.
        a) D.H.A. records.
        b) Beef improvement.
        c) Sheep improvement records.
        d) Swine improvement records.
D. Systems of breeding.
    1. Inbreeding.
        a) Line breeding.
    2. Outbreeding.
        a) Cross breeding.

AGRICULTURAL PRODUCTION

ANIMAL SCIENCE

LIVESTOCK MARKETING (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the livestock marketing unit be taught during the first or second year of the agricultural production course. This is an elementary unit. A more complete unit on marketing is recommended during the fourth year farm business management area of instruction.

Approximately six classroom hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Livestock farming - marketing of livestock and livestock products.

Secondary vocational objectives. (Non-farm occupations related to livestock marketing.)

1. Agricultural businesses - livestock yards and markets, meat packers, wholesalers, and retailers.

Major Competencies

1. To recognize the need for efficient livestock marketing.
2. To select an efficient marketing system for livestock or livestock products.
3. To determine ways farmers can receive higher prices for their livestock and livestock products.

LIVESTOCK MARKETING (A TEACHING OUTLINE)

I. Importance of efficient livestock marketing.

   A. Income from livestock and livestock products sold from a farm, county, state, nation.
      1. Beef cows and steers.
      2. Dairy cows, veal, milk.

   3. Sows and pigs.
   4. Ewes and lambs.
   5. Poultry and eggs.

II. Marketing systems for livestock and livestock products.

- A. Market outlets.
  - 1. Auctions.
  - 2. Daily markets.
  - 3. Terminal markets.
  - 4. Direct "off market" channels.

III. Livestock prices.

- A. Seasonal price fluctuations.
  - 1. Determine when to buy or sell (beef, dairy, swine, sheep).

IV. Ways farmers can receive higher prices for their livestock and livestock products.

- A. Preventing livestock losses.
  - 1. Eliminate bruises.
    - a) Outlaw clubs and whips.
    - b) Eliminate protruding nails and broken boards.
    - c) Remove machinery from feedlots.
    - d) Remove horns.
    - e) Bed the truck properly.
    - f) Check the truck for danger points.
    - g) Load carefully.
    - h) Load wisely.
    - i) Protect from weather.
    - j) Drive carefully.
- B. Improve grades of livestock and livestock products.
  - 1. Improve grades of livestock.
    - a) Beef.
      - (1) Meat type.
      - (2) Production testing program.
      - (3) Feeder cattle grades.
      - (4) Market cattle grades.
      - (5) Carcass grades.
    - b) Swine.
      - (1) Meat type.
      - (2) Pork yield evaluation - carcass data.
      - (3) Pork Improvement Association.
      - (4) Market classes and grades of feeder pigs.
      - (5) Slaughter, barrow and gilt standards for grades.
      - (6) Market classes and grades of pork carcasses.
    - c) Sheep.
      - (1) Grades of sheep.
      - (2) Grades of slaughter lambs.
      - (3) Carcass grades.

- d) Dairy.
  - (1) Slaughter cattle grades (see beef).
  - (2) Milk.
    - (a) Grades of milk.
    - (b) Blend price.
    - (c) Federal milk marketing orders.

C. Keep livestock shrinkage at a minimum.
- 1. Identify shrinkage.
- 2. Causes of shrinkage.
- 3. Define pencil shrinkage.
- 4. Keep shrinkage at a minimum.
  - a) Condition cattle before shipping.
  - b) Plan shipping program.
  - c) Select best type of transportation.
  - d) Provide attendant for large shipment.
  - e) Sort different size animals.
  - f) Keep off feed and water up to 12 hours before shipping.
  - g) Provide protection from weather.
  - h) Take advantage of feed, water, and rest stops on long journeys.
  - i) Provide for fillback if in transit more than 12 hours.
  - j) Plan movements during desirable part of day.

D. Plan livestock marketings for seasonal peaks.
- 1. Identify seasonal price fluctuations.
- 2. Identify production cycles. (Beef, dairy, swine, sheep.)

E. Sell at proper market weights.

AGRICULTURAL PRODUCTION

ANIMAL SCIENCE

LIVESTOCK HEALTH (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the livestock health unit be taught as an entire unit during either the first or second year of the agricultural production course. This would be determined by the needs and interests of the students.

Approximately 24 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately one hour per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Livestock farming - to maintain livestock health for efficient production.
    a. Registered livestock breeders.
    b. Commercial livestock farmers.

Secondary vocational objectives.
The livestock health unit will prepare students to enter certain occupations on a limited basis or to enter more advanced educational programs.

1. Agricultural businesses - sale of veterinary supplies and feed additives, feed manufacturers, drugs.
2. Technical school - laboratory technician.
3. College of agriculture - animal science.
4. College of veterinary medicine.

Major Competencies

1. To recognize the need for prevention of losses due to livestock diseases and parasites.
2. To identify unhealthy animals.
3. To determine causes of infectious and non-infectious diseases.
4. To identify how animals are protected from disease.
5. To recognize how animal diseases are treated and when professional assistance is needed.

6. To recognize symptoms, causes, and prevention of common diseases of farm animals.
7. To determine how common parasites are controlled.
8. To identify common internal and external parasites of farm animals, method of infestation, injury, and control.

LIVESTOCK HEALTH (A TEACHING OUTLINE)

I. Losses from animal diseases and parasites.

- A. Animal losses.
  - 1. Cattle.
  - 2. Calves.
  - 3. Sheep.
  - 4. Swine.
- B. Income loss - annually.
  - 1. Bangs.
  - 2. Bovine Mastites.
  - 3. Vibrosis.
  - 4. Leptospirosis.
  - 5. Bloat.
    Annual cattle losses.
    Annual swine losses.
- C. Other losses.
  - 1. Poor gain.
  - 2. Increased labor.
  - 3. Increased feed costs.

II. Recognizing signs of good health vs. unhealthy conditions.

- A. Visual indications.
  - 1. Contentment.
  - 2. Alertness.
  - 3. Eating habits.
  - 4. Sleek coat and pliable, elastic skin.
  - 5. Bright eyes and pink eye membranes.
  - 6. Normal feces and urine.
- B. Other indications.
  - 1. Normal temperature.
  - 2. Pulse rate.
  - 3. Breathing rate.

III. Causes of diseases.

- A. Infectious.
  - 1. Bacteria.
  - 2. Virus.
  - 3. Fungi.

- B. Non-infectious.
  - 1. Metabolic.
  - 2. Faulty nutrition.
  - 3. Poison in feed.
  - 4. Heredity.
  - 5. Misc. - eating, hardware, mechanical, injury, etc.

IV. Protection from animal disease.

- A. Sanitation.
  - 1. Disinfectant.
  - 2. Manure removal.
  - 3. Removal of afterbirth.
- B. Immunization.
  - 1. Vaccination.
    - a) Vaccines.
    - b) Anti-serums.
    - c) Bacterins.
    - d) Toxoids.
- C. Isolation.
  - 1. Quarantine.
- D. Housing.
  - 1. Space requirements.
  - 2. Ventilation requirements.
- E. Immunity.
  (Identify sanitary practices for beef, dairy, swine, sheep)

V. Treating animal diseases (Layman - Veterinarian).

- A. Medical methods.
  - 1. Oral.
  - 2. Intramuscular.
  - 3. Introperitoneal.
  - 4. Subcutaneous.
  - 5. Intravenous.
  - 6. Rectal.
  - 7. Skin absorption.
- B. Physical aids.
  - 1. Tranquilizers.
  - 2. Trocar and cannular.
  - 3. Restrain.
  - 4. Throw.
  - 5. Balling gun.
  - 6. Intravenous set.
  - 7. Hypodermic.
  - 8. Leads.
  - 9. Holder-swine.
  - 10. Lancing.
- C. Professional services - veterinarian.
  - 1. The veterinarian's role.
  - 2. Identify diseases to be controlled by veterinarian.

VI. Symptoms, causes, prevention, and control of common diseases.

- A. Identify how diseases spread.
  - 1. Direct or immediate contact with a diseased individual.
  - 2. Contacts through inanimate objects.
  - 3. Contact with disease carriers.
  - 4. Infection from soil.
  - 5. Infection from food and water.
  - 6. Infection from blood sucking arthropods.
  - 7. Air-borne infections.
  - 8. Infection from organisms normally carried.
- B. Common diseases. (Beef, dairy, swine, sheep.)
  - 1. Shipping fever.
  - 2. Pinkeye.
  - 3. Foot-rot.
  - 4. Bloat.
  - 5. Mastitis.
  - 6. Brucellosis.
  - 7. Leptospirosis.
  - 8. Tuberculosis.
  - 9. Hog cholera.
  - 10. Swine influenza.
  - 11. Virus pneumonia.

VII. Controlling parasites of farm animals.

- A. Knowledge of life cycle of parasites.
- B. Direct control.
  - 1. Insecticide.
  - 2. Pesticide.
  - 3. Arsenical.
  - 4. Vermifuge.
  - 5. Systemic.
  - 6. Repellent.
  - 7. Residue.
  - 8. Spray.
  - 9. Dust.
  - 10. Dip.
- C. Indirect control.
  - 1. Disposal.
  - 2. Rotation.
  - 3. Sanitary.
  - 4. Carcass removal.
  - 5. Filth.
  - 6. Disinfection.
  - 7. Dilution.
  - 8. Regulatory.

VIII. Common internal and external parasites of farm animals, method of infestation, injury, and control.

- A. Identify how parasites spread.
    - 1. Travel - fly, on animals, conveyances.
    - 2. Host animals.
    - 3. Intermediate host.
    - 4. Natural enemies.
- B. Internal parasites.
    - 1. Roundworms.
    - 2. Trichina.
    - 3. Lungworms.
    - 4. Kidney worms.
    - 5. Tapeworms.
    - 6. Flukes. (Identify parasites and know life cycle.)
- C. External parasites. (Beef, dairy, swine, sheep.)
    - 1. Heelfly.
    - 2. Ticks.
    - 3. Mites.
    - 4. Flies.
    - 5. Lice.
    - 6. Fleas.

AGRICULTURAL PRODUCTION

ANIMAL SCIENCE

QUALITY MILK PRODUCTION (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the quality milk production unit be taught during either the first or second year of the agricultural production course. It would only be included in the local curriculum when students had a need and interest in this subject-matter area.

Approximately 15 classroom hours would be required for teaching the unit. Additional teaching time is devoted to individual instruction based on the student's occupational experience program. Approximately two hours per student would be required.

Vocational Objectives

Primary vocational objectives.

1. Dairy farming.

Secondary vocational objectives.

1. Agricultural business. Selling and servicing dairy supplies and equipment.
2. Advanced study at the college level in dairy science or dairy technology.

Major Competencies

1. To manage the milking herd to maintain udder health and insure production of a quality product.
2. To conduct the milking operation to maintain udder health and to produce a quality product.
3. To maintain and operate milking equipment and storage units to insure delivery of a quality product.

QUALITY MILK PRODUCTION (A TEACHING OUTLINE)

I. The importance of producing quality milk.
   1. Economic importance.
   2. Human health aspects.

II. The cow's udder and how it functions.
  1. The anatomy of the cow's udder.
  2. The vascular system.
  3. Sympathetic system.
  4. Hormonal control of udder development, milk secretion and "let down" (see Livestock Breeding unit).

III. Infections and udder health.
  1. Definition of mastitis.
  2. Classification of mastitis.
  3. Causes of mastitis.
  4. The development of mastitis within the udder.
  5. Diagnosis of mastitis.
  6. Prevention of mastitis.
  7. Treatment of mastitis.
  8. Public health aspects of mastitis.

IV. Maintaining efficient and healthy udders.
  1. Inheritance and udder function.
  2. Udder and teat conformation.
  3. Cow age.
  4. Leason.
  5. Level of production and udder health.
  6. State of lactation.
  7. Feed.
  8. Housing.
  9. Sanitation.
  10. Over and under milking.
  11. Drying up process.
  12. Records.

V. Proper machine function and providing a safe water supply.
  1. Importance of good machine function.
  2. Machine operation.
  3. Pipeline system.
  4. Milking system analysis.
  5. Milking equipment maintenance.
  6. Sources of water and possible contamination.

VI. Factors affecting the quality of milk.
  1. Definition of normal milk.
  2. Characteristics of abnormal milk.
  3. Milk flavors.
  4. Sources of bacteria in milk.
  5. Interpretation of tests run on milk.

AGRICULTURAL PRODUCTION

AGRICULTURAL MECHANICS

Teaching Units in Agricultural Mechanics Area of Instruction

Farm Power and Machinery

Farm Buildings and Conveniences

Soil and Water Management

Rural Electrification and Processing

Agricultural Construction and Maintenance

FARM POWER AND MACHINERY (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the major portions of the farm power and machinery unit be taught during the third and fourth year of the four-year program. The small gasoline engine unit may be taught during the second year.

Approximately 180 classroom and laboratory teaching hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Farming - custom operator.

Secondary vocational objectives.

1. Agricultural business occupations concerned with the sales and/or repair of agricultural equipment.
    a. Local machinery dealers.
    b. Private repair shops.
    c. State and regional distributorships.
2. Further training in a special program such as advanced technical school or college.

Major Competencies

1. To operate, adjust, service, and maintain farm tractors, including spark ignition and diesel types and small internal combustion engines.

2. To operate, adjust, and service field machines including lubrication, recognition of malfunction such as harvest loss; make the operating adjustments and properly hitch implements; calibrate planting, fertilizing, and spraying equipment.
3. To plan and execute a program of preventative maintenance including protection-shelter, rust prevention, periodic inspection and adjustment to compensate for wear, and repair in anticipation of breakage.
4. To adjust, adapt, and modify machinery to satisfy local conditions such as trash cover control, hillside operation, specialized crop use and multiple hitching.
5. To determine and use safe operating practices with special emphasis on speed, protection from moving parts, and stopping the machine to adjust and remove obstructions and for refueling.
6. To recognize and identify the fundamental principles involved in machines, the relationship of mechanisms and systems to processes and functions; and that the basic processes are unchanging but mechanisms vary with systems employed in machine design.
7. To select power units and machines with regard for adaptation of systems of machines to types of farming considering the compatability of individual machines with other components of the machinery system; size and number of power units, hours of utilization, annual cost, and availability of custom rental and dealer service.
8. To locate and remedy common operating troubles due to wear of parts, breakage, misalignment, and other improper functioning.
9. To make repairs and parts replacement.
10. To recognize the need for major repairs involving the use of specialized tools and equipment and determine appropriate methods of getting such work done.

FARM POWER AND MACHINERY (A TEACHING OUTLINE)

Competencies and Skills Desirable for the Vocational Agriculture Student in Farm Power and Machinery

A. One cylinder engines.
   1. To clean engine and prepare it for maintenance and adjustments.
   2. To identify parts and their functions.
   3. To check for compression.
   4. To clean and adjust the carburetor.
   5. To replace and adjust the points.
   6. To check and/or replace the condenser.
   7. To clean, adjust, and install the spark plug.

8. To test and/or replace the coil.
9. To install the head.
10. To determine the proper idling and running speed.
11. To prepare the engine for proper storage.
*12. To grind and reseat valves.
*13. To adjust valves.
*14. To check and install the crankshaft.
*15. To replace and torque the connecting rod.
*16. To check and replace the rings and piston.

*Optional - used primarily in joint vocational schools.

B. Tractors.
1. Economics of tractor ownership.
    a) Ownership vs. rented.
    b) Size suited to needs.
    c) Type of fuel.
    d) Type of tractor.
2. To clean a tractor and prepare it for maintenance and adjustment.
3. To use safe operating practices.
4. To identify the systems on a tractor and describe the function of each. To have a knowledge of the major parts within each system and their functions.
5. To identify the type of fuel storage to use.
6. To check, adjust, repair, and replace the component parts of each of the following systems:
    a) Cooling.
    b) Ignition.
    c) Fuel and air.
7. To select the proper lubricants for the tractor. To change oil in the crankcase, to lubricate gear boxes and other parts.
8. To analyze tractor engine troubles.
    a) When starting.
    b) When idling.
    c) When under load.
    d) Faulty operation.
       Low oil pressure, missing, sludge formation, lack of power, pinging.
9. To maintain pneumatic tires.
10. To perform a major overhaul of the tractor.
11. To torque the engine head.
12. To replace and adjust the clutch.
13. To bleed the hydraulic system.
14. To use a dynamometer.
15. To use a fuel flow meter.
16. To replace* and/or adjust brake bands.

*Optional - used primarily in joint vocational schools.

C. Combines.
  1. Economics of combine ownership.
    a) Ownership vs. custom or rental arrangement.
    b) Size of combine suited to needs.
    c) Machine operating efficiency.
  2. Value of doing a good job of combining.
    a) Field losses.
    b) Crop quality.
    c) Market value.
    d) Storage requirements.
  3. To identify the operations performed by the combine and the system within the combine performing the operation. To identify the major parts within each system and their functions.
    a) Cutting and feeding.
    b) Threshing.
    c) Separating.
    d) Cleaning.
  4. To practice safe operating procedures.
  5. To identify losses from each of the operating areas of the combine.
  6. To perform adjustments in correct sequence to reduce losses.
    a) Machine speed.
    b) Cylinder clearance, cylinder speed.
    c) Cutter bar heighth.
    d) Reel.
    e) Speed forward travel.
    f) Cleaning sieves and fan blast.
  7. To adjust belt tensions, chains, and slip clutches.
  8. To select and apply lubrication.
  9. To prepare for storage.
  *10. To replace defective parts on a combine when needed.

*Optional - used primarily in joint vocational schools.

D. Corn picker.
  1. Economics of corn picker ownership.
    a) Ownership vs. custom or rental arrangement.
    b) Alternate harvesting methods.
    c) Size of corn picker needed - row spacing.
    d) Machine operating efficiency.
  2. Value of doing a good job of picking.
    a) Field losses.
    b) Moisture level of corn.
    c) Storage requirements.
    d) Market value.
  3. To identify the functional areas of the corn picker and to identify their parts and their functions.

      a) Gathering.
      b) Elevating and snapping.
      c) Husking.
      d) Cleaning.
   4. To practice safe operating procedures.
   5. To measure losses and to identify their source.
   6. To determine mechanical condition of the picker and to correct deficiency.
      a) Check for worn snapping and husking rolls. Replace if required.
      b) Check for worn bearings and to replace if required (snapping rolls, etc.).
      c) Check condition of working parts, gears, chains, belts; repair or replace as required.
      d) Check linkage on levers making adjustments.
   7. To perform adjustments required to maintain minimum acceptable losses.
      a) P.T.O. speed.
      b) Snapping roll clearance and timing position in relation to ground surface.
      c) Gathering snouts.
      d) Gathering chains. Timing and position.
      e) Forward speed of travel (3 m.p.h.).
      f) To provide shielding to prevent loss of shelled corn.
      g) To adjust chains, belts, and slip clutches.
   8. To select and apply lubricants.
   9. To prepare for storage.
   *10. To replace defective parts on the picker when needed.

*Optional - used primarily in joint vocational schools.

E. Mowers.
   1. Economics of mower ownership.
      a) Size and type mower required.
      b) Machine efficiency.
   2. To identify the parts of the mower and describe their functions.
   3. To practice safe operating procedures.
   4. To repair the cutter bar unit.
   5. To adjust the cutter bar for lead.
   6. To adjust register of the knife.
   7. To repair and adjust the pitman.
   8. To repair and adjust drive gears.
   9. To adjust the tension of springs, V belts and chains.
   10. To determine correct ground speed.
   11. To properly lubricate the mower.
   12. To determine causes of poor cutting.
   13. To determine causes of knife breakage.

  14. To determine causes of bunching.
  15. To make proper adjustments in the field as needed.
  16. To select and apply lubricants.

F. Grain drills.
  1. Economics of grain drill ownership.
    a) Ownership vs. rental or custom work.
    b) Size of drill required for operation. Machine efficiency.
  2. To identify the parts of the grain drill and describe their functions. (Types of seeding mechanism.)
  3. To practice safe operating procedures.
  4. To calibrate the rate of seeding.
  5. To calibrate the rate of fertilizer applications.
  6. To adjust the disc scrapers.
  7. To adjust the pressure springs and furrow openers.
  8. To replace worn parts.
  9. To determine need of and to make adjustments in the field.
  10. To determine efficient ground operating speeds in the field.
  11. To prepare for proper storage.

G. Corn planter.
  1. Economics of corn planter ownership.
    a) Ownership vs. renting or custom work.
    b) Size of machine needed. (Machine efficiency.)
  2. To practice safe operating procedures.
  3. To identify the parts of the corn planter and describe their function.
  4. To determine when and how to replace shoes.
  5. To repair and adjust the clutch.
  6. To determine and adjust rates of planting.
  7. To determine and adjust rates of fertilizing.
  8. To determine proper planting speed.
  9. To determine cause of shoe plugging.
  10. To determine and correct cause of kernel cracking.
  11. To determine proper planting depth.
  12. To prepare for proper storage.

H. Balers.
  1. Economics of baler ownership.
    a) Ownership vs. custom or rental.
    b) Alternate harvesting methods.
    c) Size and type of machine.
  2. To identify the parts of the baler and describe their function.
  3. To practice safe operating procedures.
  4. To time the baler.
  5. To adjust baler and ground speed.
  6. To adjust twine and wire tensions.
  7. To adjust the parts of the tying mechanism.
  8. To sharpen and replace shearing knives.

   9. To determine and correct causes of improperly shaped bales.
   10. To determine and correct causes of failure to tie properly.
   11. To prepare for proper storage.
   12. To replace worn and broken parts.

I. Forage harvester.
   1. Economics of forage harvester ownership.
      a) Ownership vs. custom or rental.
      b) Alternate harvesting methods.
      c) Size and type of machine.
   2. To identify the parts of the forage harvester and describe their function.
   3. To practice safe operating procedures.
   4. To determine correct ground operating speed.
   5. To determine and adjust correct speeds of the various parts of the machine.
   6. To sharpen, balance, and replace knives.
   7. To adjust the length of cut.
   8. To adjust the feed roll tension.
   9. To determine and correct ground speed to prevent clogging of the machine.
   10. To determine and correct causes of excessive vibrations.
   11. To replace worn or broken parts.
   12. To prepare for proper storage.

J. Plows.
   1. Economics of plow ownership.
      a) Ownership vs. rental or custom work.
      b) Alternate tillage operations.
      c) Size of plow required for operation.
   2. To practice safe operating procedures.
   3. To recognize quality plowing.
      a) Furrow conformation and uniformity.
      b) Quality of tilled surface.
      c) Trash coverage.
   4. To determine the hitch attachment for drawn plows that will insure most efficient operation.
   5. To perform adjustments in correct sequence to insure most efficient operation.
      a) Depth.
      b) Pitch.
      c) Level.
      d) Width.
   6. To adjust coulters and jointers.
   7. To replace or adjust the clutch or hydraulic life devices.
   8. To check and replace sprung beams, frogs, and moldboards.
   9. To determine proper operating speed.

10. To determine proper weight shift on mounted plows.
11. To determine and reduce wheel slippage on drawn plows.
12. To prepare for proper storage.

K. Sprayers.
  1. Economics of sprayer ownership.
    a) Ownership vs. rental or custom work.
    b) Size and type of machine needed.
  2. To practice safe operating procedures.
  3. To select the correct nozzles for the job.
  4. To select and repair the pump.
  5. To calibrate the sprayer.
  6. To calibrate the nozzles.
  7. To determine and adjust pressure.
  8. To determine proper ground speed for the job.
  9. To prevent excessive drift.
  10. To determine and correct uneven applications.
  11. To properly clean sprayer between the use of different chemicals.
  12. To clean and prepare for proper storage.

AGRICULTURAL PRODUCTION

AGRICULTURAL MECHANICS

FARM BUILDINGS AND CONVENIENCES (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the farm buildings and conveniences unit be taught during the third year of the agricultural production course.

Approximately 38 classroom and laboratory teaching hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Farming - livestock and crop production.

Secondary vocational objectives.

1. Agricultural business occupations concerned with the sales and/or construction of farm buildings and conveniences.
    a) Carpenter - contractor - mason.
    b) Lumber yard - salesman.
    c) Draftsman.
2. Further training in a special trade such as apprenticeship, technical school, or college.

Major Competencies

1. To recognize good construction methods and work with standard building materials.
2. To recognize and be prepared to correct common occupational hazards to life and property; fire, accident, wind, lightning.
3. To lay out a farmstead and plan an integrated farm improvement program, evaluate existing buildings, analyze the needs for new or remodeled construction.
4. To plan buildings for utilities and production equipment systems to meet the operating needs of the farmer: elevators, conveyors, water distribution and disposal systems, light and power, feed handling, and processing devices.
5. To recognize and meet requirements for environmental and sanitation control: temperature, ventilation, light, and moisture.

6. To select suitable building materials for specific uses; durability, functional performance, strength, ease of application, availability, economy and appearance. Recognize standard commercial units, grade, estimate quantities and determine construction costs.

FARM BUILDINGS AND CONVENIENCES (A TEACHING OUTLINE)

Competencies and Skills Desirable for the Vocational Agriculture Student in Farm Buildings and Conveniences

A. Farm buildings.
   1. To identify the parts of a building.
   2. To lay out a farmstead (including feed lots).
   3. To evaluate existing buildings.
   4. To level and plumb a building site.
   5. To estimate construction cost.
   6. To identify and select building materials.
   7. To recognize good construction methods.
   8. To recognize grades and kinds of lumber.
   9. To identify and select types of fasteners.
   10. To lay out and cut rafters.
   11. To develop and carry out a building maintenance program.
   12. To identify and select insulation.
   13. To determine environmental requirements for livestock. Temperature, light, moisture, air, sanitation, water, feed, space.
   14. To determine requirements for materials handling and storage.

B. Fencing.
   1. To identify and select fence materials.
   2. To identify, select, and treat fence posts.
   3. To set post and stretch fence.
   4. To install electric fence.
   5. To construct a livestock guard.

C. Concrete.
   1. To accurately estimate quantities of materials needed.
   2. To accurately estimate the cost of materials needed for a job.
   3. To properly select materials.
   4. To determine and measure the proper proportions of materials.
   5. To prepare and construct farms.
   6. To properly mix concrete.
   7. To place and work concrete.
   8. To reinforce concrete.
   9. To finish concrete.
   10. To protect and properly cure concrete.
   11. To properly remove forms.
   12. To lay concrete blocks.

AGRICULTURAL PRODUCTION

AGRICULTURAL MECHANICS

SOIL AND WATER MANAGEMENT (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the soil and water management unit be taught during the third year of the agricultural production course.

Approximately 30 classroom and laboratory teaching hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Farming - livestock and crop production.

Secondary vocational objectives.

1. Agricultural business occupations concerned with sales and services related to soil and water management.
    a. Supply centers.
    b. Soil conservation service.
    c. Aide to a surveyor.
2. Further training in a special program at the technical level or college.

Major Competencies

1. To relate equipment and tillage practices to soil erosion control.
2. To plan and lay out typical irrigation systems considering the advantages and limitations of the various types of irrigation systems.
3. To maintain irrigation and drainage systems.
4. To make land surveys, read soil survey and aerial maps, run levels, and contours by using the farm level, locating and placing grade stakes, and making contour maps.
5. To plan terracing and simple farm drainage systems, estimate costs of construction, and maintenance.
6. To plan and lay out farm reservoirs.

SOIL AND WATER MANAGEMENT (A TEACHING OUTLINE)

Competencies and Skills Desirable for the Vocational Agriculture Student Studying Soil and Water Management

A. Surveying.
   1. To learn the nomenclature of equipment and its functions.
   2. To read a soil survey map.
   3. To learn proper procedures for recording data in a field book.
   4. To draw a contour map.
   5. To read an aerial map.
   6. To draw a tile drainage map.

B. Drainage.
   1. To dig a ditch to grade.
   2. To plan and install a tile drainage system.
      a) Selection of tile (quality, quantity, type, cost, number).
      b) To lay and cover tile.
   3. To construct a sod waterway.
   4. To construct a terrace.
   5. To construct a diversion ditch.
   6. To provide surface drainage.
   7. To calculate the expected flow into a pond from the watershed area.

AGRICULTURAL PRODUCTION

AGRICULTURAL MECHANICS

RURAL ELECTRIFICATION AND PROCESSING (A TEACHING UNIT)

Approximate Teaching Time

It is recommended that the wiring portion of this unit be taught during the second year. The electric motors and materials handling units might be taught during the third year.

Approximately 45 classroom and laboratory teaching hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Farming.

Secondary vocational objectives.

1. Agricultural business occupations concerned with the sales and service of electrical and processing equipment.
    a) Power company representative.
    b) Service center repairman.
    c) Service center salesman.
    d) Rural electrician.
2. Further training as a specialized technical program or college entry.

Major Competencies

1. To perform maintenance jobs and simple wiring installations.
2. To recognize difficulties which require the attention of trained personnel.
3. To select lighting equipment and locate it in the yards, lots, buildings, and work areas to provide adequate illumination.
4. To select electrical home appliances and farm equipment, including motors and controls. Consider safety, quality, energy consumption, life, and servicing.
5. To plan wiring systems and rewiring for adequacy, convenience, and safety, including determination of probable future electrical loads.

6. To adapt electricity to the farm enterprises, coordinating the equipment with the size and arrangement of the farm buildings.
7. To repair, service, and maintain electrical equipment. Locate and correct troubles and hazards in connection with: fuses, controls, switches, fixtures, cords and wiring, motors, heating appliances, and lamps.
8. To install electric equipment considering power transmission, equipment ventilation, servicing, safety, etc.

RURAL ELECTRIFICATION AND PROCESSING (A TEACHING OUTLINE)

Competencies and Skills Desirable for the Vocational Agriculture Student Studying Rural Electrification and Processing

A. Wiring.
   1. To define electrical terms.
   2. To determine present electrical loads.
   3. To plan for future electrical loads.
      a) Lighting.
      b) Electrical power.
      c) Electrical tools.
   4. To recognize and determine type and size of wire to use.
   5. To determine the size of service entrance required and to install a service entrance box.
   6. To perform simple wiring skills.
      a) Splicing, pigtail, western union, tap, and solderless connector.
      b) To install lighting fixtures and other electrical equipment.
   7. To install a simple electrical circuit.
      a) Determine number and kind of outlet.
      b) Polarize the circuit.
      c) Wire single pole, 3-way, and 4-way switches.
      d) To ground the circuit.
      e) To determine the proper type and size of protection device (fuse, circuit breaker, etc.) for the circuit.
   8. To install electrical equipment.
      a) Grounding.
      b) Protective devices.
   9. To read a meter and determine cost of electricity.
   10. To read and draw circuit diagrams.

B. Electric motors.
   1. To select motors and controls.
   2. To select drive devices for motors.

3. To clean, service, and lubricate motors.
4. To reverse the direction of rotation.
5. To change wiring for different voltages.
6. To adjust belt tension.
7. To determine motor maintenance programs.
8. To determine the cost of operation.
9. Determine the size of pulleys, sprockets, and gears to use.

C. Materials handling equipment.
    1. Economics of materials handling equipment.
        a) Cost of equipment.
        b) Cost of performing work by hand vs. using labor-saving equipment.
        c) Alternate methods of handling materials.
        d) Expanding volume of business through using materials handling equipment.
        e) Age and health of farm operator.
        f) Matching materials equipment to specific farm situations.
    2. To identify the various pieces of materials handling equipment and to describe their functions.
    3. To practice safe operating procedures for the various pieces of equipment.
    4. To determine use capabilities and select proper size of equipment for the job.
    5. To service and maintain various pieces of equipment.
    6. To repair or replace equipment.

AGRICULTURAL PRODUCTION

AGRICULTURAL MECHANICS

AGRICULTURAL CONSTRUCTION AND MAINTENANCE (A TEACHING UNIT)

Approximate Teaching Time

A major portion of the agricultural construction and maintenance unit would be taught during the first and second year of the agricultural production course.

Approximately 192 classroom and laboratory teaching hours would be required.

Vocational Objectives

Primary vocational objectives.

1. Farming.

Secondary vocational objectives.

1. Agricultural business occupations concerned with construction, repair, and/or sales of farm equipment and facilities.
2. Further training as an apprentice or entering a technical school.

Major Competencies

1. To promote the establishment of a home farm shop or farm service center.
2. To recognize dangers and hazards connected with the use of tools and equipment and guard against them.
3. To select hand and power tools and shop equipment for the home farm shop, including makes, models, sizes, quantities, and grades.
4. To sharpen, repair, maintain, and safely use the common shop tools and equipment.
5. To install, safely use, service, and maintain power tools found in the agricultural mechanics shop.
6. To do electric arc and oxyacetylene welding, including cutting bronze welding and hard surfacing.
7. To do hot metal work including bending, shaping, and heat treating.
8. To do cold metal work including cutting, drilling, filing, tapping, threading, riveting, and bending.
9. To do sheet metal work including cutting, bending, and fastening.

10. To do pipe and tubing work and make simple plumbing repairs.
11. To select lumber, hardware, and other building materials and calculate bills of material.
12. To supervise and assist with construction and maintenance of smaller farm buildings and equipment.
13. To do painting and glazing. Apply wood preservatives.

AGRICULTURAL CONSTRUCTION AND MAINTENANCE (A TEACHING OUTLINE)

Competencies and Skills Desirable for the Vocational Agriculture Student Studying Agricultural Construction and Maintenance

A. Woodworking.
  1. To read a plan, blueprint or ozalid.
  2. To make a sketch.
  3. To make an accurate bill of materials, including cost calculations.
  4. To recognize and select grades and kinds of lumber.
  5. To practice safe working procedures.
  6. To lay out stock.
  7. To identify, select, and use common hand and power tools.
  8. To learn and practice safety procedures in using hand and power tools.
  9. To identify and select fasteners.
  10. To select and use glue.
  11. To select and use coated abrasives.
  12. To construct woodworking projects.

B. Finishing.
  1. To select a paint by its type.
  2. To select paint for wood, metal, and concrete.
  3. To select wood preservatives.
  4. To calculate quantity of materials needed for a job.
  5. To identify paint problems.
  6. To prepare a surface for finishing.
  7. To identify, select, and use brushes.
  8. To operate a spray gun.
  9. To clean and store a spray gun.
  10. To clean and store brushes.

C. Tool fitting and care.
  1. To select oil stones and grinding wheels.
  2. To make a template to check for correct angle.
  3. To dress and true a grinding wheel.
  4. To sharpen single edged tools.
  5. To sharpen double edged tools.
  6. To sharpen auger bits and twist drills.
  7. To clean, joint, set and sharpen (hand, circular, chain) saws.
  8. To fit handle in tools.
  9. To prevent tools from rusting.

D. Soldering.
  1. To select and use an electric soldering iron.
  2. To operate a blow torch.
  3. To select and operate an electric soldering gun.
  4. To operate an L-P torch.
  5. To solder with a welder.
  6. To mend small holes.
  7. To make a lock seam joint.
  8. To make a riveted joint.
    a) Include pop-rivets.
  9. To sweat a patch.
  10. To solder a lap seam.
  11. To solder galvanized metal.
  12. To solder copper.
  13. To solder stainless steel.

E. Welding.
  1. Electric arc.
    a) To identify types of welders and describe their characteristics.
    b) To practice safe operating procedures.
    c) To identify and select electrodes.
    d) To identify metals (including spark test).
    e) To cut and pierce metal.
    f) To use the carbon arc torch.
    g) To identify correct heat control.
    h) To minimize metal distortion.
    i) To make lap, corner, fillet, edge, and butt welds.
    j) To weld horizontally.
    k) To weld vertically.
    l) To weld overhead.
    m) To weld cast iron.
    n) To weld steel castings.
    o) To weld round stock.
    p) To hard-surface.
    q) To braze (arc torch).
    r) To make a pad weld (build up worn arc).
  2. Oxy-acetylene welding.
    a) To identify the parts of the welder and their functions.
    b) To practice safe operating procedures.
    c) To assemble a welder and test for leaks.
    d) To select proper tips.
    e) To heat and cut metal.
    f) To make a flange weld.
    g) To braze mild steel.
    h) To braze cast iron.
    i) To bend, wrinkle, and weld pipe.
    j) To silver solder.
    k) To apply hardsurfacing.

F. Metal work.
  1. To practice safe working procedures.
  2. To identify, select, and use files, chisels, punches, drills, hacksaws, taps, dies, and tin snips.
  3. To operate a power grinder, power hacksaw, power drills, and lathes.
  4. To make out a bill of materials.
  5. To read plans and plan a procedure in doing the work.
  6. To read a caliper.
  7. To lay out metal with a scribe.
  8. To make an elongated slot.
  9. To cut threads.
  10. To operate a gas furnace.
  11. To anneal metal.
  12. To temper metal.
  13. To upset metal.
  14. To normalize metal.
  15. To draw metal.
  16. To cut hot metal.
  17. To remove broken studs.
  18. To use screw extractors.

G. Plumbing.
  1. To identify pipe fittings.
  2. To identify kinds and sizes of pipe and tubing.
  3. To measure and cut pipe to a given dimension.
  4. To ream and thread pipe.
  5. To determine correct size and type of pipe to use.
  6. To repair a faucet.
  7. To insulate a pipeline.
  8. To install plastic pipe.
  9. To install galvanized pipe.
  10. To cut, flare, and solder copper pipe.
  11. To use pipe thread compound.
  12. To install soil pipe.
  13. To determine type of pump to install.
  14. To determine and correct an air logged tank.
  15. To determine and correct a water logged tank.
  16. To determine reasons for and correct low pressure.

H. Glazing.
  1. To prepare sash for glass.
  2. To measure sash for glass.
  3. To cut glass.
  4. To fasten glass with glazier points.
  5. To use glazing compound.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

Teaching Units in Farm Business Management Area of Instruction

- Introduction to Farm Business Management
- Farm Business Goals
- Inventorying the Resources
- Soils as Related to Farm Business Management
- Farm Business Records
- Marketing in the Farm Business
- Summarizing Farm Business Records
- Analyzing the Farm Business
- Mechanization of a Farm Business
- Net Worth
- Financing the Credit Needs of a Farm Business
- Farm Business Planning
- Insurance
- Taxes
- Government Programs
- Selecting Farm Land Resources

Approximate Teaching Time

This course outline is designed to be used as the basis for teaching farm business management to junior or senior students in a comprehensive high school or as a course for senior students in a joint vocational school. This course is designed to make use of a "case" farm situation whereby students could make application of the principles taught to their home farm situations.

Approximately 284 classroom hours would be required for teaching the farm business management course. The student's occupational experience program would require about 240 hours. The on-the-farm instruction by the teacher would require three to five hours per student.

Vocational Objectives

Primary vocational objectives.

1. This course of instruction provides students with the competencies needed by the beginning manager of a farm business firm.

Secondary vocational objectives.

1. This course of instruction also provides students with many of the basic competencies which will better prepare them for advanced education in vocational or technical schools and the college of agriculture. Advanced education could prepare students for such positions as:
    a. Farm management analysis service personnel.
    b. Farm management service fieldmen.
    c. Farm management specialists in agricultural extension, area vocational schools, farm supply companies, and farm service companies.
    d. Teachers of vocational agriculture.
    e. County agricultural agents.
    f. Credit organization personnel.

Major Competencies

1. To identify the opportunities for using management skills on the farm and in related ag-businesses.
2. To develop and use a systematic accounting plan (case farm situation).
3. To evaluate the facts from a set of farm accounts and translate them into meaningful measures of performance.
4. To reorganize a farm business to increase the net profit.
5. To choose adequate and meaningful goals for a farm business.
6. To organize a financial plan for maximizing profits.
7. To solve related farm management problems in credit, marketing, insurance, taxes, and government programs.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

INTRODUCTION TO FARM BUSINESS MANAGEMENT (A TEACHING UNIT)

Approximate Classroom Teaching Time 7 Hours

Major Competencies

1. To describe what farm business planning as a total concept means.
2. To list related businesses in which farm management skills would be of value.
3. To describe employment opportunities for which farm management training would be basic.
4. To use the case farm information and situation as a tool for learning practical planning and management skills.

INTRODUCTION TO FARM BUSINESS MANAGEMENT (A TEACHING OUTLINE)

I. What is a farm business and how is it managed?

  A. List businesses in the community.
  B. Characteristics of any business.
  C. Compare a farm to other businesses.
  D. Steps in managing a business for highest profits.
    1. Analyze the present situation.
      a) Inventory resources.
      b) Keep business records.
      c) Summarize those records.
      d) Find strengths and weaknesses.
    2. Locate the problems.
    3. Identify business goals.
    4. Evaluate alternatives and their probable outcome.
    5. Decide the course of action.
    6. Put the plan into action.

II. What businesses other than farming might training in farm management be useful?

  A. List businesses.
  B. Identify how farm management skills would be helpful.
  C. Prepare specific job requirement reports.

III. Present the case farm situation and explain its implication in learning about farm management. How important are farm records in planning and operating a farm business?

A. Motivation - develop a realistic approach to problem solving.
B. Present an outline of the whole area of instruction showing how the case farm is to be followed.
C. Develop student understanding of the whole picture of planning and managing a farm business. (Possibly even use student suggestions for expanding the units.)

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

FARM BUSINESS GOALS (A TEACHING UNIT)

Approximate Classroom Teaching Time 7 Hours

Major Competencies

1. To identify the importance of setting realistic goals.
2. To identify the various types of goals in a farm business.
3. To develop adequate and meaningful goals for a farm firm.

FARM BUSINESS GOALS (A TEACHING OUTLINE)

I. Why set goals for a farm business?

- A. Define goals.
- B. Explain what goals do for a business manager.

II. What goals should a farm business have?

- A. Farm and family characteristics.
    1. Size of family.
    2. Age of operator.
    3. Size and type of farm business.
    4. Farming situation - manager, partnership, part-time, ownership.
    5. Family desires and values.
    6. Social values.
    7. Financial structure of the farm business.
- B. Sample goals - prepared list.
    1. Types of goals.
        - a) Immediate.
        - b) Intermediate.
        - c) Long-range.
    2. Identify by areas.
        - a) Economic goals.
        - b) Family living.
        - c) Citizenship.
        - d) Livestock and crops.
- C. Prepare a challenging set of goals for the case farm.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

INVENTORYING THE RESOURCES (A TEACHING UNIT)

Approximate Teaching Time 15 Hours

Major Competencies

1. Develop the ability to measure storage facilities on a farm.
2. Develop the ability to place reasonable values on livestock, buildings, and equipment.
3. Develop the ability to make a map of a farm showing field arrangement and the major soil types.
4. Develop the ability to calculate the capacity of storage facilities.

INVENTORYING THE RESOURCES (A TEACHING OUTLINE)

This unit would be taught almost entirely through the use of field trips to a "case" farm whereby the students would get actual practice in taking inventory.

I. What are the available resources on the "case" farm? This would be determined by student participation in the following activities:

   A. Measuring fields and making a map of the farm showing field arrangement.
   B. Taking soil samples to be used in determining the soil potential on this farm.
   C. Measuring buildings, bins, cribs, silos, mows, etc.
   D. Placing a value on all power and equipment items.
   E. Placing a value on all livestock.
   F. Calculating the amount of grain, hay, silage, etc., stored on the farm.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

SOILS AS RELATED TO FARM BUSINESS MANAGEMENT (A TEACHING UNIT)

Approximate Classroom Teaching Time 20 Hours

Major Competencies

1. Understanding of why soils differ.
2. Ability to identify different soil types.
3. Understanding of the numbering system given to Ohio soils.
4. Ability to read a soil map.
5. Ability to classify soils according to their capability.
6. Ability to recognize the potential of a certain soil.
7. Ability to plan a cropping system according to soil classification and potential.

SOILS AS RELATED TO FARM BUSINESS MANAGEMENT (A TEACHING OUTLINE)

I. What factors should be considered relative to soils, in determining the best cropping system on a farm?

- A. Topography - slope.
  - 1. Crops best adapted to sloping land.
  - 2. Crops best adapted to level land.
  - 3. Slope classifications.
- B. Erosion.
  - 1. Crops that cause erosion problems.
  - 2. Crops that prevent erosion.
  - 3. Erosion classifications.
- C. Texture.
  - 1. Kinds of texture and how determined.
    a) Sand, b) Silt, c) Clay.
  - 2. Different textures in relation to crop growing capacity.
    - a) Water retention, b) absorbtion, c) ease of tillage, d) plant nutrient availability.
- D. Soil depth.
  - 1. Crops requiring deep soils.
  - 2. Barriers to soil depth.
    - a) Distance to rock (parent material).
    - b) Distance to hard pan (impervious clay)

3. Crops that will grow on shallow soils.

E. Air and water movement in the soil.
   1. Drainage profiles.
      a) excessive, b) good, c) poor.
   2. Depth to mottling - description of mottling.
   3. Crops adapted to different drainage profiles.
      a) time of planting, b) water requirements.

II. How can the soil on a farm be classified as to the crop production potential?

A. Soil map information.
   1. Soil family and type numbering system.
      Catena numbers
      a) Origin - glacial - residual - laenstrine - parent material (underlying rock).
   2. Soil position.
      a) allevial, b) terraced, c) upland.
   3. Drainage profile numbering system.
   4. Texture numbering system.
   5. Slope lettering system used to indicate amount of slope.
   6. Erosion numbering system used to indicate degree of erosion.

B. Land classes for soils suitable for crop production.
   1. Roman numeral system.
   2. Color code.
   3. Possible cropping systems to be used for each land class.

C. Land classes for soils suitable for production of permanent vegetation such as permanent pasture, woodland, or recreation.
   1. Roman numeral system.
   2. Color code.
   3. Type of vegetation to use to apply for each class.
      a) woodland, b) permanent pasture.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

FARM BUSINESS RECORDS (A TEACHING UNIT)

Approximate Classroom Teaching Time 30 Hours

Major Competencies

1. To identify the need and uses of accurate records in a farm business.
2. To list the kinds of records for a farm business.
3. To select a workable accounting system for a farm firm.
4. To identify the importance and procedure for taking an inventory.
5. To record and complete a year of accounts for a farm business (inventory, cash receipts, expenses, production, enterprise, etc.).

FARM BUSINESS RECORDS (A TEACHING OUTLINE)

I. Why keep farm records?

A. Income tax reporting.
B. Basis for making decisions.
    1. Strengths and weaknesses.
    2. Planning.
C. Margin of farm profit is continually narrowing.
    1. Statistics - by years, size of farms, income, capital needs.
    2. Technical advances.
D. Factors that influence success of a business.
E. Show that records are necessary to get facts that apply to that business.

II. What records of a farm business should be kept?

A. Inventory.
    1. Feed and supplies.
    2. Raised livestock.
    3. Purchased livestock.
    4. Market livestock.
    5. Machinery.
    6. Buildings.
    7. Land.

B. Receipts and expenses.
C. Net worth.
D. Supplemental records.
  1. Crops - land use, map, yield, fertility, disposition.
  2. Livestock - feed, production, cost.
  3. Labor - by enterprise, months.
  4. Gas refunds, etc.

III. What should be considered when choosing an accounting system for a farm business?

A. Kinds of account books available.
  1. Bank.
  2. Machinery dealers.
  3. Ohio account book.
  4. Ohio commercial book.
  5. Others.
B. Advantages and disadvantages of each type of book.
C. Items to consider in selecting a complete accounting system.
  1. Complete enough to give important facts.
  2. Simple enough that the system will be used.
  3. Can be expanded to include more complete accounting.
  4. Acceptable source for tax information.
  5. Choosing cash method or accrual method of accounting (explain difference).

IV. Recording a year's account records for a farm business (case farm).

A. Use Ohio Commercial Account Book.
B. Inventory.
  1. Choose areas - livestock, machinery, etc.
  2. Establish values.
  3. Develop depreciation schedule.
C. Cash receipts.
  1. Operating receipts.
  2. Sale of capital gain items.
  3. Non-operating receipts (loans, etc.).
  4. Non-farm receipts.
D. Cash expenses.
  1. Operating expenses.
  2. Purchases eligible for capital gains.
  3. Personal expenses.
  4. Non-operating expenses (principle repayment).

E. Net worth.
   1. Beginning and closing inventories.
   2. Change in inventory (net worth).
   3. Combining personal and business net worth.
F. Supplemental records.
   1. Feed records.
   2. Cost records.
   3. Enterprise records.
   4. Production records.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

MARKETING IN THE FARM BUSINESS (A TEACHING UNIT)

Approximate Teaching Time 24 Hours

Major Competencies

1. To explain our agricultural marketing system.
2. To evaluate marketing services and choose the service giving the greatest net profit.
3. To explain the concept of price determination (supply, demand, and quality).
4. To use the marketing concepts in making marketing decisions for a farm business.
5. To evaluate market outlook information.
6. To recognize factors influencing the price of agricultural products.

MARKETING IN THE FARM BUSINESS (A TEACHING OUTLINE)

I. What markets are available in our area for selling agricultural products?

- A. Marketing agencies and how each operates.
    1. Local buyers.
    2. Cooperatives.
    3. Auctions.
    4. Central or terminal markets.
    5. Direct or contract.

II. What services do these marketing agencies provide for us?

- A. Livestock marketing (as an example).
    1. Market.
        - a) Transportation (farm to market).
        - b) Assembling.
        - c) Sorting (grading.
        - d) Weighing.
        - e) Selling.
        - f) Holding.
        - g) Risk bearing (financing).
    2. Packer.
        - a) Transportation (market to packer).
        - b) Slaughtering.

- c) Processing (cut, cure, wrap).
- d) Sorting (grading).
- e) Storing.
- f) Selling.
- g) Transportation (packer to retailer).
- h) Risk bearing (financing).

3. Retailer.
    - a) Processing.
    - b) Storing.
    - c) Displaying.
    - d) Selling.

III. What determines the price we receive for our agricultural products?

- A. Demand.
    1. Elastic and inelastic demand.
    2. Population trends.
    3. Consumer tastes.
    4. Religious beliefs.
    5. Consumer income.
    6. Availability of substitutes.
    7. Foreign trade.
- B. Supply.
    1. Elasticity of supply.
    2. Weather conditions.
    3. Insect and disease hazards.
    4. Government programs.
        - a) Acreage allotments on various crops.
    5. Production cycles.
        - a) Products usually affected by production cycles.
        - b) Why certain products are affected by cycles.
- C. Quality (use grain as an example).
    1. Moisture content.
    2. Test weight per bushel.
    3. Shrunken or broken kernels.
    4. Amount of foreign material.
    5. Disease or insect damage.

IV. What can we do to market products to receive the maximum net return?

- A. Quality control.
    1. Selection of breeds, types, and varieties.
    2. Breeding, feeding, cultural practices, harvesting, and storing.
- B. Study production and price cycles and adjust farming operations to take advantage of high price periods.
    1. Beef.
    2. Hogs.
    3. Sheep.

C. Evaluate market outlook information.
    1. Acreage to be planted.
    2. Sows to be farrowed.
    3. Cattle on feed.

D. Determine the best combination of enterprises, in relation to marketing, in order to realize the greatest net return. (Use case farm as an example.)
    1. Marketing grain through livestock vs. direct sale.
    2. Produce the maximum acreage of high value crops and the best combinations of crop enterprises.

E. Study the process of "hedging" as a means of protection against a drop in price.
    1. Grain.
    2. Feeder cattle.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

SUMMARIZING FARM BUSINESS RECORDS (A TEACHING UNIT)

Approximate Classroom Teaching Time 7 Hours

Major Competencies

1. To list the uses for a farm business summary.
2. To identify what should be included in a farm business summary.
3. To summarize the farm business accounts for manual or computer analysis.

SUMMARIZING FARM BUSINESS RECORDS (A TEACHING OUTLINE)

I. Why summarize farm business records?

- A. Income tax information.
- B. Provide information for making a check of strengths and weaknesses.

II. What should be included in a summary of the farm records?

- A. Special forms for recording summary information.
  - 1. Form 7363 - Farm Business Summary, extension service, OSU.
  - 2. Summary pages of the farm account book.
  - 3. Enterprise information sheets.
- B. Summary of income.
  - 1. Cash farm income.
    - a) Capital gains.
    - b) Operating income.
  - 2. Non-cash income.
- C. Summary of expenses.
  - 1. Operating expenses.
  - 2. Non-operating expenses.
    - a) Principle payments.
    - b) Capital purchases.
    - c) Personal expenditures from the firm.
- D. Inventory change - net worth evaluation.
- E. Enterprise evaluation.
  - 1. Size.
  - 2. Production
  - 3. Costs - money, labor, other resources.

III. How is a summary of a farm business made?

- A. Explanation of case farm summary.
- B. Use appropriate forms to record information for analysis.

IV. What items should be checked for accuracy of a summary of a farm business?

- A. Cash accounts reasonable.
- B. Inventories for reasonable weights and values.
- C. Crop and feed report for completeness.
- D. Check, if a tenant, for sharing expenses and returns.
- E. Clerical procedures.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

ANALYZING THE FARM BUSINESS (A TEACHING UNIT)

Approximate Classroom Teaching Time 14 Hours

Major Competencies

1. To list the uses of a farm business analysis.
2. To describe the up-to-date analysis services and aids available to the modern farm business man.
3. To describe a basic plan for computing efficiency factors for a farm business.
4. To compare levels of performance to an accepted standard.
5. To evaluate the strengths and weaknesses of a farm business.

ANALYZING THE FARM BUSINESS (A TEACHING OUTLINE)

I. Why analyze a farm business?

- A. Determine strengths and weaknesses.
- B. Facts for making decisions.
- C. Organize the business for maximum profit.
    1. Selecting enterprises based on facts.
    2. Determining the size of each enterprise.
    3. Insurance needs.
    4. Credit planning.
    5. Pay correct taxes.
    6. Evaluate kinds and amounts of resources.

II. What services are available to assist in analysis of a farm business?

- A. Vocational agriculture departments.
    1. Adult classes.
    2. Farm business analysis and planning classes.
- B. Area Extension service.
    1. County agricultural agent.
    2. University computer service.
    3. Area agricultural agent.

C. Commercial services.
  1. Buckeye Farm Records service.
  2. Farm management services - Doans, Opekasit, etc.
D. Individuals.

III. How are records analyzed?

A. Start with an accurate summary of parts of the business to be analyzed.
B. Techniques (procedures).
  1. Hand method - step-by-step procedure.
  2. Adapting to a computer.
  3. Combining the two.
C. Use case farm summary for complete analysis.

IV. How is a farm business measured? What does a complete business analysis show?

A. Importance of profit.
  1. Acceptable standard of living.
  2. Encouraging growth of the business.
  3. Records must be accurate to show true profit.
B. Kinds of profits.
  1. Cash farm profit.
  2. Net farm profit.
  3. Labor and management.
  4. Management profits.
  5. Profit to capital.
C. Size of the business.
  1. Crop acres.
  2. Capital invested.
  3. Gross income.
  4. Man hours (PMWU).
D. Relationship between investment and income.
  1. Rate of return to capital.
  2. Gross ratio - the per cent of gross income going to all expenses.
  3. Operating ratio - per cent of gross going to operating expenses.
  4. Overhead ratio - per cent going to fixed or overhead expenses.
E. Analysis of the cropping system.
  1. Crop yield.
  2. Crop yield index.
  3. Gross value of crop per acre.
  4. Special crop information.
F. Analysis of the livestock system.
  1. Over-all efficiency.
    a) Net livestock increase.
    b) Return per $ feed.

   2. Individual enterprises.
      a) Daily rate of gain.
      b) Feed per 100 lbs. gain.
      c) Returns over feed.
      d) Production per unit.

G. Analysis of labor and machinery.
   1. Crop acres per man.
   2. Gross income per man.
   3. PMWU per crop acre.
   4. Power and equipment costs per acre.
   5. Power and equipment investment per crop acre.
   6. Machinery cost per PMWU.
   7. Man-year equivalents.

H. Analysis of the net worth
   1. Inventory change.
   2. Depreciation.
   3. Total capital invested.
   4. Ratios of assets to liabilities -
      net capital, working, current.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

MECHANIZATION OF A FARM BUSINESS (A TEACHING UNIT)

Approximate Classroom Teaching Time 28 Hours

Major Competencies

1. To describe the concepts involved in selecting and maintaining machinery in a farm business.
2. To plan for changes in farmstead arrangement, building construction, and labor-saving equipment.

MECHANIZATION OF A FARM BUSINESS (A TEACHING OUTLINE)

I. What should be considered when organizing a machinery plan for the farm business?

- A. Selecting machinery.
  1. Inventory of machinery resources.
  2. Using a partial budget - making selection based on profitability.
  3. Buying, leasing, or custom hiring.
  4. Comparing similar equipment available.
- B. Developing a plan for having machinery operational when needed.
  1. Providing facilities for maintenance and repair.
  2. Using a check list for maintenance jobs.
  3. Organizing a record system for repairs and use.
  4. Analysis of equipment use and repair as a basis for planning mechanization.
- C. Shop work on at least one major machine.
  1. Showing importance of planned maintenance.
  2. Developing a maintenance plan.
  3. Using a maintenance plan.
  4. Developing student skills in shop work.

II. What should be considered when planning changes in the farmstead arrangement, construction of buildings, and labor-saving devices?

- A. Principles of arrangement and construction.
- B. Developing a plan.
- C. Student construction of one major structure or device.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

NET WORTH (A TEACHING UNIT)

Approximate Classroom Teaching Time 7 Hours

Major Competencies

1. To evaluate or compare various net worth statements.
2. To identify ways the net worth statement is used to improve the management of a farm business.
3. To make a complete net worth statement for a farm business.
4. To make a net worth statement for securing a loan and know why it might differ from the business statement.

NET WORTH (A TEACHING OUTLINE)

I. What is a net worth statement?

   A. Annual statement form - pg. 58 of Commercial Account Book.
   B. Comparison of net worth by years.
      1. Assets, pg. VV.
      2. Liabilities, pg. WW.
   C. Forms from lending institutions.

II. Uses of a net worth statement.

   A. Strengths and weaknesses of business.
   B. Show growth of the business.
   C. A basis for planning the use of borrowed credit.

III. How is the net worth used to determine a business' soundness? How can sudden demands for payment of debts be considered secure?

   A. Meaning of soundness, solvency of the farm business.
   B. Net capital ratio.
      1. Divide total assets by total liabilities.
      2. General rule - 2:1 ratio.

C. Working ratio.
    1. Divide current and working assets by deferred and current liabilities.
    2. General rule - 6:1 ratio.
D. Current ratio.
    1. Divide current assets by current liabilities.
    2. General rule - 8:1 ratio.

IV. Prepare a net worth statement for case farm business and for credit.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

FINANCING THE CREDIT NEEDS OF A FARM BUSINESS (A TEACHING UNIT)

Approximate Classroom Teaching Time 14 Hours

Major Competencies

1. To define capital and explain why a farm business may use capital from outside sources.
2. To identify various sources of credit and evaluate their effectiveness in maximizing farm profits.
3. To calculate the cost of credit based on the more common credit plans.
4. To use the time comparison principle to evaluate the total cost of a capital purchase over a period of time.
5. To evaluate a farm business and identify if optimum use of capital is being made.
6. To develop a financial plan for a farm business.

FINANCING THE CREDIT NEEDS OF A FARM BUSINESS (A TEACHING OUTLINE)

I. What is credit?

- A. Define capital.
- B. Kinds of capital.
  - 1. Money in bank or pocket (current).
  - 2. Livestock, machinery (working).
  - 3. Land, buildings (fixed).
  - 4. Crops, seed, feed market animals (current).
- C. Uses of credit.
- D. When to borrow.
  - 1. When capital is limited.
  - 2. When profit justifies risks.
  - 3. Ability to pay back and show profit.
- E. How to borrow - credit instruments.
  - 1. Check.
  - 2. Drafts.
  - 3. Mortgage.
  - 4. Warehouse receipts.
  - 5. Bill of lading.
  - 6. Sales contract.

II. How are credit costs computed?

- A. Explanation of interest as a cost to a business (time comparison principle).
- B. Interest calculation.
    1. Annual interest on the original amount.
    2. Interest paid in advance (discounted).
    3. Annual interest on the unpaid balance.
    4. Extra charges - carrying, insurance, office fees, etc.

III. Where can money be borrowed?

- A. Kinds of credit.
    1. Short-term.
    2. Intermediate.
    3. Long-term.
- B. Agencies lending money for farm businesses.
    1. Banks.
    2. PCA.
    3. Federal Land Banks.
    4. FHA.
    5. Insurance Co.
    6. Individuals.
    7. High risk - high interest rates.
- C. Characteristics of lending agencies.
    1. Dependability.
    2. Service designed to meet a farmer's needs.
    3. Lending policies.
    4. Cost of the service.
- D. Comparing all sources of credit.

IV. How is a total credit plan for a farm business made? (Case farm.)

- A. Determine the credit available - the amount that can be borrowed.
    1. Total net worth.
    2. The amount of net worth that can be used to borrow on.
    3. A cash flow chart showing when cash is available by months.
- B. Determine the needs for extra capital in the farm business.
    1. Where investment will give greatest return (opportunity cost principle).
    2. Applying analysis information to decision-making.
    3. Considering alternate opportunities (substitution principle).
        - a) Capital purchases.
        - b) Resource expansion (diminishing returns principle).
        - c) Repairs and maintenance.
    4. Cash flow chart showing when cash will be needed by months.

C. Choosing a total repayment plan.
   1. Cash flow chart showing the logical time of year to make payment.
   2. Consider family living and savings needs.
   3. Amount of annual profit needed for payment of principal.
   4. The length of time needed to repay.
   5. Maintaining a good credit rating.
      a) Keep all credit in one place.
      b) Use a complete plan for creditor.
      c) Plan ahead.
      d) Know consequences of failure to repay.
   6. Consider future capital purchases to be made.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

FARM BUSINESS PLANNING (A TEACHING UNIT)

Approximate Classroom Teaching Time 42 Hours

Major Competencies

1. To identify that a well-planned operation forms the foundation of a profitable business.
2. To list the characteristics of poorly organized and a well-organized farm business.
3. To identify the basic principles of farm business planning.
4. To evaluate analysis information for a farm and suggest alternative plans to improve total profits.
5. To identify profitability of choosing alternatives in a farm plan.
6. To choose a total farm plan that would give maximum returns to the resources of land, labor, capital, and management.

FARM BUSINESS PLANNING (A TEACHING OUTLINE)

I. What are the basic principles of planning a farm business?

A. Decision-making as a process.
   1. Facts (quality).
   2. Values.
   3. Problem-solving method.
B. Economic principle of decision-making (use instructional units on profit-maximizing principles).
   1. Pricing (supply and demand).
   2. Diminishing returns.
   3. Fixed-variable costs.
   4. Substitution.
   5. Opportunity costs (equa-marginal).
C. Concepts of farm business organization.
   1. Volume - efficiency.
   2. Combination of enterprises.
   3 Technology of production.
   4. Prices.

II. What are the production resources of a farm business? How are they evaluated?

A. Resources vary from farm to farm.
   1. Scarce resources command above-average returns.
   2. Plentiful resources command below-average returns.
   3. Adjusting plentiful resources to give maximum total returns from scarce resources.
B. Land.
   1. Fertility (yield potential).
   2. Topography.
   3. Improvements.
   4. Climate.
   5. Adaptation of crops.
C. Labor.
   1. Manager labor.
   2. Family or hired.
   3. Labor costs.
   4. Scheduling (demands).
   5. Quality (skill).
D. Capital.
   1. Liquid (cash flow chart).
   2. Production (inventory).
   3. Fixed (land and buildings).
   4. Buy enterprises or equipment.
   5. Credit rating.
E. Management.
   1. Ability to organize.
   2. Capacity to make a plan work.
      a) Make decisions.
      b) Follow up with action.
      c) Make adjustments easily.

III. What are the steps in reorganizing a farm business to give maximum returns?

A. Set personal and business goals.
B. Inventory production resources available.
   1. Use business accounting inventory.
   2. Present situation as it really exists.
   3. Identify all resources for substitution.
C. Budgeting of business by enterprises.
   1. Forecast future prices and yields.
   2. List all alternatives.
   3. Set up a unit budget for each alternative (enterprise) showing resources used.
   4. Estimate receipts of each enterprise.
      a) Limiting factors.
      b) Opportunity cost principle.
      c) Marketing of production.

5. Estimate costs of each enterprise.
    a) Cash expenses.
    b) Fixed costs (fixed variable cost principle).
6. Estimate income of each enterprise.
    a) Return per unit of labor.
    b) Return per unit of capital.
    c) Return per crop acre.
    d) All other important resources.
7. Combining alternatives into a final plan.
    a) Effect on income.
    b) Land utilization.
    c) Capital required.
    d) Labor demanded - total, seasonal, skill, length of time to make change, when to begin.
    e) Specific resources needed - buildings, machinery, government allotment.

D. Partial budgeting for minor changes in the total farm plan.
1. Uses for partial budgeting.
    a) For adding an enterprise.
    b) Changing an existing enterprise.
    c) Purchasing machinery.
2. Partial budget outline.
    a) Additional receipts plus reduced costs.
    b) Reduced receipts plus increased costs.
    c) Difference (whether to make the change).
3. Testing alternate choices by using partial budgeting.

E. Limitations of reorganizing a business.
1. Facts not available or accurate (records).
    a) Resources.
    b) Yields.
    c) Efficiency.
2. Uncertainty of future.
    a) Prices.
    b) Demand.
3. Time involved in making calculations limits the number of alternatives that can be considered.

IV. How can a computer be programmed to assist in reorganizing a farm plan? What is linear programming?

A. Applying arithmetic to regular budgeting process.
1. Linearity - straight line proportions.
2. Divisibility - units must be divisible.
3. Addibility - sum must add up to total.
4. Finitness - a limit on alternatives.

B. Establishing resource limitations.

C. Rate individuals according to management ability.

D. Prepare unit budgets for resource requirements.

   1. List all costs - fixed and variable.
   2. Get exact returns.
   3. Calculate returns per unit of resource.

E. Prepare a resource limitation table.
   1. Resources and amounts of each.
   2. Maximum amount of each enterprise possible.

F. Each enterprise is compared one against the other.

G. If all costs and returns are accurate, no other combination will give a higher return.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

INSURANCE (A TEACHING UNIT)

Approximate Classroom Teaching Time 14 Hours

Major Competencies

1. To identify risk as a cost to a farm business.
2. To choose all types of risks too great for a farm business to carry and list various ways they may be shared economically.
3. To outline a plan of total insurance protection for a farm business to maximize the net profits.

INSURANCE (A TEACHING OUTLINE)

I. Why does a farmer need insurance protection?

- A. Reasons for insurance.
  - 1. Protect against prohibitive losses.
  - 2. Savings - endowment.
- B. Kinds of losses that can occur.
  - 1. Fire and wind.
    - a) Buildings.
    - b) Livestock.
    - c) Machinery.
    - d) Crops.
  - 2. Liability claims (injuries).
    - a) Property owner.
    - b) Employer.
    - c) Workman's Compensation.
    - d) Auto operator.
  - 3. Auto collision, etc.
  - 4. Manager income.
    - a) Life.
    - b) Disability.
    - c) Mortgage (term life).
  - 5. Health expenses.
  - 6. Social security.
- C. Extent of various losses.
- D. Risk of loss as a cost to a farm business.
  - 1. Losses more economical to share.
  - 2. Losses the business can bear.

II. What should be considered when selecting a total insurance plan for a farm business?

- A. When to insure.
    - 1. Net worth.
    - 2. Savings.
    - 3. Age.
    - 4. Experience.
- B. What to insure.
    - 1. Fire.
    - 2. Liability.
    - 3. Life.
- C. Selecting a reliable insurance agency.
    - 1. Personal service.
    - 2. Size of company.
    - 3. Rates.
    - 4. Insuring policies.
    - 5. Variety of protections available.

III. Develop an insurance plan for the case farm.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

TAXES (A TEACHING UNIT)

Approximate Classroom Teaching Time [illegible] Hours

Major Concepts

1. To list all taxes which are important to a farm business.
2. To [illegible] a farm [illegible] of taxes in the farm business [illegible].
3. To identify the importance of good records in reporting tax information.
4. To [illegible] [illegible]

TAXES (A TEACHING UNIT)

I. What are taxes?

   A. Use of tax moneys.
   B. Kinds of taxes in farm business.
      1. [illegible]
      2. Personal property tax.
      3. Real estate tax.
      4. [illegible]
      5. [illegible]
   C. Taxes of the individual.
      1. Income tax.
      2. Sales tax.
      3. [illegible] tax.
      4. Inheritance tax.
      5. Social security (insurance).

II. What is the procedure for paying the taxes of the farm business? When? Where? How?

   A. Personal property tax.
   B. Real estate.
   C. [illegible]

III. How can the farm business [illegible] [illegible]?

c. Economic summary.
  1. Ability to reduce income fluctuation from year to year.
  2. Estimate income before end of year.
  3. Ways to reduce fluctuation.
    a Shifting sales of crops.
    b Increase deductions.
    c [illegible] [illegible] tips.

7. What is the procedure for paying income tax and social security?

a. When and where to pay.
b. Reporting taxable farm income.
  1. Schedule F (Form 1040) - farm income and expenses.
  2. Schedule D (Form 1040) - capital gains or losses.
  3. Schedule E (Form 1040) - retirement income.
  4. Form 3468 - investment credit.
c. Computing income tax for the individual.
  1. Social security.
    a Self-employed - Schedule SE (1040).
    b Employees.
  2. U.S. Individual income tax return (Form 1040).
  3. Estimated tax - [illegible] of 1040.

8. Prepare tax statements for the basic farm business and income tax forms for the farmer.

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

GOVERNMENT PROGRAMS (A TEACHING UNIT)

Approximate Classroom Teaching Time 14 Hours

Major Competencies

1. To explain the purpose of government programs.
2. To evaluate up-to-date government programs as they influence the profitability of a farm business.
3. To choose government programs that maximize farm profits.

GOVERNMENT PROGRAMS (A TEACHING OUTLINE)

I. What is the purpose of the U.S. Department of Agriculture?

- A. Activities of U.S.D.A.
  - 1. Education.
  - 2. Control production.
  - 3. Protect health.
    - a) Check livestock sold.
    - b) Slaughtered meat.
    - c) Grains.
    - d) Shipping.
- B. Agencies of U.S.D.A.
  - 1. Education Service, Washington, D.C.
    - a) Bulletins.
    - b) Statistics.
    - c) Reports.
  - 2. Agricultural Stabilization and Conservation (ASC).
    - a) Allotment.
    - b) Conservation payments (booklet available).
  - 3. Soil Conservation Service.
    - a) Technical assistance.
    - b) Farm planning.
  - 4. Credit and other agencies.
    - a) FHA.
    - b) Federal Land Bank.
    - c) Crop Insurance.
- C. National Agriculture policies.

II. Government programs other than at the federal level.

A. State colleges.
   1. Extension service.
   2. Vo-Ag departments.

III. How should government programs and assistance be used to maximize income of a business?

A. Inventory allotments.
B. Identify all services available.
C. Apply partial budgeting to each alternative (increased income plus reduced costs minus reduced income plus increased costs).

AGRICULTURAL PRODUCTION

FARM BUSINESS MANAGEMENT

SECURING FARM LAND RESOURCES (A TEACHING UNIT)

Approximate Classroom Teaching Time 7 Hours

Major Competencies

1. To describe the methods of securing farm land.
2. To select a farm for rent or purchase.

SECURING FARM LAND RESOURCES (A TEACHING OUTLINE)

I. How can farm land be secured for a farm business?

A. Purchasing land.
   1. Advantages of owning land.
   2. Terms (deed, administrator, beneficiary, bequeath, chattel, collateral, dower, easement, eminent domain, executor, fungible, grant, lease, tenant).
   3. Land contracts.
      a) Characteristics.
      b) When to use.
   4. Legal procedure of a purchase.

B. Renting or leasing.
   1. Types of leases.
      a) Cash.
      b) Crop share.
      c) Livestock share.
   2. Limitations of leasing.
   3. Advantages of leasing.
   4. Essentials of a good lease.

C. Inheritance.
   1. Transfer by descent.
   2. Transfer by will.
   3. Transfer by marriage.

D. Partnership or joint ownership.
   1. Tenancy in common.
   2. Joint tenancy.
   3. Tenancy by entirety.
   4. Advantages of joint ownership.
   5. Disadvantages of joint ownership.

II. What should be considered when choosing a farm for rent or purchase?

- A. Type of farming anticipated.
- B. How to locate possibilities.
  - 1. Contact established farmers.
  - 2. Credit agencies.
  - 3. Auctioneers.
  - 4. Ads.
  - 5. Farm managers.
  - 6. Vo-Ag or extension persons.
- C. Characteristics of a good renter.
- D. Appraisal of a farm.
  - 1. Land.
    - a) Soil type.
    - b) Slope and erosion.
    - c) Intensity of crops possible.
    - d) Acreage allotment.
  - 2. Buildings.
    - a) House, barns, etc.
    - b) Condition - value.
    - c) Capacity - storage.
    - d) Conveniences.
  - 3. Water available.
  - 4. Fences.
  - 5. Landscaping.
- E. Whether a particular farm unit would give the volume to use labor supply, capital, etc.
- F. What is the actual procedure for purchasing a farm?
  - 1. Legal assistance.
  - 2. Securing a clear title.
    - a) Legal description of a farm by determining land location.
  - 3. Recording in court house.
  - 4. Surveying when necessary.
  - 5. Down payment and contracts.
- G. What should a good farm lease contain?
  - 1. Legal assistance.
  - 2. Factors of a good lease.
  - 3. Sample lease contracts.
  - 4. Father and son agreements.
- H. Corporations.
  - 1. Real.
  - 2. Pseudo.
  - 3. Partnership.

AGRICULTURAL PRODUCTION

LEADERSHIP TRAINING (A TEACHING UNIT)

Approximate Teaching Time

Although much leadership development is accomplished beyond normal classroom hours, it is recommended that sufficient emphasis be given in the teaching process to develop this area adequately. It may be noted in the following curriculum guide that Leadership is a series of developmental activities that are normally taught as separate units rather than a complete "leadership" unit. In normal circumstances, it is expected that 25 hours should be allotted for the entire leadership unit. This time should be distributed throughout the entire four-year course of study.

Vocational Objectives

1. To develop the ability to get along with one's associates. Be adaptable.
2. To develop the ability to become a good listener.
3. To develop the ability to analyze a situation and come to a logical conclusion.
4. To develop an understanding of classmates or associates.
5. To be cooperative, rather than individualistic.

Major Competencies

1. To develop a feeling of confidence in the ability to achieve success in individual and group activities.
2. To work cooperatively with others in achieving common goals.
3. To be accepted by the group.
4. To assume initiative in group leadership when appropriate.
5. To develop the ability to serve as chairman of a meeting.
6. To express oneself effectively before groups. To speak with authority.
7. To participate in group meetings using accepted procedures.
8. To participate in committee activities.
9. To practice appropriate social graces, personal grooming, and other superior personal qualities.
10. To develop tact.
11. To develop poise.

LEADERSHIP TRAINING (A TEACHING OUTLINE)

I. Orientation to leadership training.

The purpose of this unit is to acquaint incoming students with organization within the school and specifically with the FFA.

A. Understanding why students should belong to selected school activities including the FFA.
  1. What is the purpose of the organization?
  2. What is the program of activities?
  3. What is the plan of operation?
  4. What are the membership requirements?
  5. What is the image created?
  6. What are the major activities?
  7. What is the value of the organization:
     a) To the school?
     b) To the individual?
  8. What is the desirability of membership in the FFA?
     a) Participate in social activities.
     b) Provides activities that encourage personal development.
     c) Provides an opportunity to work cooperatively with fellow students.
     d) Provides an opportunity to practice principles of democracy.
     e) Provides encouragement for those who need assistance.
     f) Provides recognition for those who achieve success.

B. Growing into active FFA membership.
  1. The need for followers and workers as well as leaders.
     a) Stressing the importance of each individual.
     b) New members helping with assigned duties.
     c) New members encouraged to accept responsibilities.
     d) Exhibiting the willingness to work for the benefit of the group as well as for personal gain or recognition.
  2. Committee membership.
     a) Gathering information.
     b) Organizing information.
     c) Reporting results of committee work.
  3. Committee chairman.
     a) Organizing the committee.
     b) Assignment and acceptance of responsibility.
     c) Presenting report to the organization.
  4. Participation in organization meetings.
     a) Become familiar with chapter procedure.
        (1) Presenting a motion.
        (2) Amending motions.
        (3) Tabling a motion.

(4) Removing from the table.
(5) Referring to a committee.
(6) Leaving the chairman's station.
(7) Making a point of order.
(8) Appeal the decision of the Chair.
(9) To reconsider a motion.
(10) Suspend the rules.
(11) Adjourning.
5. Chairing a small group practice meeting.
6. Expressing oneself before a group by means of presenting a speech.
a) Types of speeches.
(1) Informative.
(2) Persuasive.
(3) Humorous.
(4) Special.
b) Preparing and presenting the speech.
(1) Determining theme or topic.
(2) Preparing outline of introduction, body, summary.
(3) Developing content.
c) Preparing and presenting the speech, continued
(1) Making the presentation
(a) Interest techniques.
(b) Voice.
(c) Stage presence.

II. Becoming acquainted with the FFA.

A. Understanding the history of the FFA.
1. Background of vocational agriculture.
2. Development of the FFA organization.
a) National.
b) State.
c) Local.
B. Understanding the objectives of FFA.
1. Aim and purposes.
2. Creed.
3. Motto.
C. Understanding the organizational structure of FFA.
1. Levels of the organization.
a) National.
b) Local.
c) State.
2. Constitution and by-laws.
3. Relation to vocational agriculture.
4. Membership.
a) Active.
b) Associate.
c) Honorary.
d) Collegiate.

5. Degrees.
    a) Greenhand.
    b) Chapter Farmer.
    c) State Farmer.
    d) American Farmer.

D. Understanding program of activities and the incentives award program.
  1. National Activities and Awards.
  2. State Activities and Awards.
  3. Local Activities and Awards.

III. Developing the individual to work with others in organized groups.

The FFA organization is an excellent vehicle to use in developing those traits and abilities that are desirable in working with others. It is especially effective in developing and maintaining interest in the student so that he may be receptive to learning, in addition to providing situations for "Learning by Doing." This type of work must be performed outside the classroom in committee meetings and FFA meetings.

A. Participating in group discussions.
  1. Possible situations for adult group participation.
    a) Community meetings.
    b) Professional staff meetings.
    c) Committees.
    d) Programs.
  2. Types of group discussions.
    a) Panels.
    b) Symposiums.
    c) Forums.
    d) Dialogues.
    e) Roundtable.
  3. Possible roles group participants assume.
    a) Initiating an activity (suggesting new ideas, etc.).
    b) Seeking information (asking questions for information).
    c) Giving information (providing facts or other information).
    d) Giving opinion (expressing a belief).
    e) Summarizing (restating or concluding previous ideas).
    f) Testing (applying the situation to life conditions).
  4. Position roles which maintain and improve a meeting.
    a) Encouraging (permissive atmosphere, inviting discussion).
    b) Gatekeeping (giving all a chance to participate).
    c) Expressing group feelings (summarizing group feeling).

        - d) Compromising (cooperating so that objective may be reached).
        - e) Harmonizing (making the group feel congenial).
        - f) Concensus taking (testing group feeling).
        - g) Following (being interested in the presentation of others).
    5. Position roles which degrade a meeting.
        - a) Being aggressive (trying to degrade the status of others).
        - b) Blocking - opposing (unreasonably).
        - c) Recognition seeking (drawing attention to oneself).
        - d) Being a playboy (making a conscious display of non-involvement, as whispering, reading a paper, horseplay, etc.).
        - e) Dominating (asserting authority, giving directions, interrupting others).
        - f) Special-interest pleading (cloaking a personal prejudice by speaking for "the small farmer," "the housewife," etc.).

IV. Developing personal habits and traits.

Social graces, personal grooming, grammar usage, integrity, and other personal traits are highly important in the development of a desirable image. The FFA provides an ideal situation for the development of many of these qualities. It is recommended that the adviser and members give emphasis to personal development through example. These are not abilities that can be mastered within the classroom. Rather, the members must be able to practice desirable personal traits in connection with FFA activities.

A. Ways in which personal traits are revealed in adult life.
    1. Personal appearance.
    2. Personality exhibited.
    3. Manners used.
    4. Type and method of conversing.
    5. Willingness to participate and carry one's share of the load.

B. Some personal traits for development.
    1. Personal appearance.
        - a) Appropriate dress for the situation.
        - b) Clean, well-pressed clothes.
        - c) Correct posture.
    2. Grooming.
        - a) Personal cleanliness.
        - b) Hair neatly arranged.
        - c) Neat clothes, including shoes and accessories.
    3. Social graces.
        - a) Table manners.
        - b) Courtesies with ladies.
        - c) Attitudes.

4. Work habits.
    a) Punctuality.
    b) Initiative.
    c) Reliability.
5. Oral communication.
    a) Grammar.
    b) Ability to converse easily.
    c) Refraining from vulgarity, cursing, and "loud talk."
6. Personality.
    a) Friendliness, warmth.
    b) Sincerity.
    c) Helpfulness.
7. Integrity.
    a) Honesty.
    b) Reliability.
    c) Morality.

V. Committee work.

Due to the failure of many committees to function effectively and the desirability of a good committee work, this activity is presented separately from the area of "organized groups" which is outlined earlier in this unit. FFA Chapters make considerable use of committee work which is excellent preparation for effective committee participation in later life. This is not an item for classroom teaching. Rather, committee work procedures should be a part of the operational procedure of the organization. New members will become acquainted with the procedure as they work with committees.

A. How the FFA uses committees.
    1. Use of standing committees to provide leadership in major program areas.
    2. Use standing committees to provide leadership for major chapter activities.
    3. Use short-term committees to accomplish major or minor job assignments of a short duration.
B. Some principles to be followed in making committees function effectively:
    1. Select members wisely.
    2. Notify all members of their responsibility.
    3. Secure acceptance from all committee members.
    4. Define goals and specific responsibilities.
    5. Recognize individual effort.
    6. Encourage written reports.
    7. Have reports submitted to parent organization with appropriate action.
    8. Recognize the contribution of committees at meetings of the parent organization.
    9. Discharge committees upon completion of their work.

*CHILD DEVELOPMENT, *PRESCHOOL CHILDREN, *CHILD CARE, CHILD PSYCHOLOGY, *NURSERY SCHOOLS, *HOME ECONOMICS EDUCATION, HIGH SCHOOLS, PROGRAM DEVELOPMENT, EQUIPMENT, ACTIVITIES, OBSERVATION,

A detailed guide is presented for organizing, operating, and utilizing the play school as a tool for teaching child development to high school students. Such a program provides real experiences and takes advantage of adolescent interest in children to stimulate understanding of self and others. Objectives of the child care unit are to help students understand how growth and learning take place in young children, to provide a good environment for children in the play school, and to help students offer intelligent guidance by realizing why children behave as they do and learning to see things from a child's point of view. Generalizations to support each objective are included. Developmental characteristics of 3- to 5-year olds are discussed and specific guidelines for teaching young children are listed in two columns, "Do This" and "Not This." Equipment lists, activity schedules, observation techniques, and record forms suggest supplies and procedures. A reference section lists books, pamphlets, and tests for teacher and student use. This article is published in the "Illinois Teacher of Home Economics," volume [illegible], number [illegible], [illegible]. [illegible] copy #1

THE PLAY SCHOOL IN TEACHING CHILD DEVELOPMENT

Irene Liebig, Alton Senior High School
Marjorie Savage, Ed. D., University of Illinois

Miss X locks at her calendar and discovers that the unit in Child Care is scheduled to begin in three weeks. Her deep sigh reveals a lack of self-confidence with respect to the goals she can help pupils attain. Miss X feels that maybe she needs a vitamin pill to combat spring fever. She vaguely remembers a principle learned in one of her courses which had reference to the value of accepting a child's feelings and helping the child express these feelings constructively. At the present time, she realizes that her own feelings of insecurity are difficult to accept and express in desirable channels.

At a recent meeting, she heard some educators expound concerning the values derived from a play school. Miss X reviews her notes from this panel with a bit of skepticism. First of all, a play school entails responsibility for young children assumed by the high school students in her second and third year classes. Some of her students have been very irresponsible in past situations. Did she dare to assume that each girl could be responsible for her own job in the total program of play school activities? After all, the cakes which did not turn out well were still consumed by the amateur cooks. A good job of pressing corrected some of the sins in those skirts worn in the recent style show. But the reactions would be an entirely different matter if a child were hurt or received improper guidance in the play school.

Teen-agers seem to need so much supervision that Miss X wonders how they could guide anyone else. From all that has been said about the importance of generalizations, Miss X is puzzled as to how a teacher or her pupils would have time to think of any of these in a play school situation.

Will it be wise for Miss X to take some vitamins for spring fever and try her first play school or skip the idea altogether? To read subject matter out of a text with occasional case situations and movies would be *so* much easier!

Miss X decides to consider the possibility of a play school to provide interesting activities for her child care units. According to the bulletin by Mildred Weigley Wood, *Play School in the Homemaking Program*, "A play school is used as a teaching device; because, in this way, high school students learn faster about children, about personality development, and about getting along with others, than they do by the method of class discussion alone!"

EXCELLENT REASONS FOR HAVING A PLAY SCHOOL

In order to explain the needs involved in directing a play group, it is necessary to illustrate and thus define the purpose of play school. It is possible then to take one teacher, Miss X, and see how she copes with typical problems. Within her scope, must be understanding of the high school students who are learning the processes of good sound play along with their own emotional development. So rewarding are these real experiences to students that the play school, once tried, is accepted as a must, no matter how much additional work is involved.

Seeing Is Believing

What one sees and does impresses more than what one hears. When Billy overturns his juice that first morning at play school, the teacher shows that she is really able to practice what she tells students. Susan believes that seeing her high school teacher, Miss Smith, in action in the play school is adequate proof that she really accepts the feelings of children.

Susan has little difficulty responding to the problem which appears on the weekly evaluation sheet. In fact, she enjoys a test for a change. Billy, a three-year old, overturns his glass of fruit juice and the juice lands on the table at Jane's place next to him. Billy does manage to catch the cup before it reaches the floor. Select the statement or statements which you feel would be most suitable for the teacher to use.

____ a. Have Billy remain in his chair while you clean up the juice.
____ b. Tell Billy he should be more careful. Ignore the fact that he caught the cup.
____ c. Give him a towel to help clean the table as Jane is using his paper napkin to clean the spilled juice.
____ d. Tell him that nice children keep still while they are drinking juice.
____ e. Say to him, "You reached for the cup quickly. That's fine. Together we can wipe up the spilled juice in no time."

Even though Billy and Tommy each had separate accidents at juice time, Susan feelsshe understands certain principles which will transfer to future situations. Thus evaluation can be seen based upon real happenings. Real life situations which accompany reading and discussion can give new meaning to many generalizations. Without the experience with children, Susan feels she would have had some difficulty understanding certain principles.

Another example of the value of real experience occurred. The excitement over an earthworm which one child found at school could have resulted in a quarrel because several children who were near claimed the worm. Class discussion was directed toward ways in which this incident could have been handled.

One spring morning a group of five children who were digging become quite interested in the worms they are finding. At one place where they all appear to be digging, an unusually large worm comes to the surface. All the children are fascinated with the size of the worm. Each one wishes to take the worm home with him. Select the statement or statements which you feel would be most suitable for the teacher to use.

____ a. Explain to the children that around the stump is the worm's home where he lives. Therefore, it is best to let the worm stay there.
____ b. Scold the children for spending time digging in the dirt.
____ c. Use their interest in worms the next day at story time.
____ d. Destroy the worm in the presence of the children.
____ e. Provide opportunities for the children to discover and to observe insects of different kinds.
____ f. Require the children to transfer to another type of activity since they disagree about the ownership of the worm.

A teacher's action will establish within the child an evaluation of his own seeing and believing. If the teacher contends that the worm should be allowed to live, she will influence the children more positively than if she were to scold them.

Susan had read that the attention span of children is short. Opportunity is provided at play school for Susan to recognize that activities such as clay and marbled sand are well-liked and result in holding the attention of the children much longer than some other activities. One day Susan notices that the children are enjoying marbled sand for twenty minutes; another time, clay is enjoyed for twenty-five minutes.

The grocery store idea provides another activity which helps Susan understand how happy children can be in their shifting play groups for some time. She is surprised that empty cartons, boxes, and paper sacks from home can provide the materials for a grocery store.

Susan finds that she has fun and learns a great deal from observing the grocery store activity. As a result of her observations on three different days, she gives the grocery store a high rating on most of the items in the following check list:

The activity allows the children to have freedom of movement and expression and is not definitely restricted to one type of movement.
Excellent____ Average____ Needs Improvement____ Comments________

Activity provides opportunity for the child to broaden his environment with a variety of things about him.
Excellent____ Average____ Needs Improvement____ Comments________

The activity is one which bears repetition.
Excellent____ Average____ Needs Improvement____ Comments________

Opportunity is given to verbally express and convey his ideas and experiences to others.
Excellent____ Average____ Needs Improvement____ Comments________

Activity provides opportunity for the child to express needs and feelings.
Excellent____Average____Needs Improvement____Comments________

The activity provides for spontaneity on the part of the individuals in the group.
Excellent____Average____Needs Improvement____Comments________

The content of the activity is familiar in the everyday life of the pre-school child.
Excellent____Average____Needs Improvement____Comments________

Eye-opener for Parents

The entire homemaking program gains respect as a result of play school. One mother said she never realized that home economics was much more than cooking and sewing. Another parent, as a result of visiting the exhibit of toys at school, was stimulated to make some of the same equipment for her children at home. Some teachers have found time spent on informal publicity is a way of interpreting the breadth of the program to the community. Informal cues to interest adult classes can stem from parents' contacts in play school. Miss X found that a frequent remark from parents was that their children seemed to enjoy eating a hearty lunch after attending play school. From the group meeting and informal conversation over coffee, she recognized that the child's appetite at the age of three and three and one-half was a real problem to parents in the group. What an excellent opportunity to schedule the film which has been widely accepted by educators, "Food as Children See It," (General Mills Company). Miss X already has the interest and basis for discussion at an early meeting of her adult class in the fall.

Adolescent Interests

As homemaking teachers, we recognize that the child development unit will fall short of the needs it can meet if advantage is not taken of the adolescents' interest in children.

After an analysis of adolescent characteristics, the Nevada Course of Study concludes that a major objective for the young adolescent in junior high is increasing ability to undertake responsibility for baby sitting tasks. For the older adolescents, who feel that they are close to marriage and a home, a major objective to be emphasized is that of performing effectively with young children. In the process of play schools, both ages of adolescents inevitably learn to better understand themselves through their growth in understanding young children.

Adolescent Needs

Adolescents are groping to understand themselves, their own feelings and aspirations. The adolescent has certain needs which will be important for a teacher to recognize in every phase of her program. Much of the adolescent's striving occurs because she is interested in satisfying these needs. The environment of the school can provide for each of the following needs of the adolescent:

a. The need for security.
b. The need to love and be loved.
c. The need for companionship.
d. The need for ego satisfaction, that is, for a sense of worth through accomplishment and through the regard of others.
e. The need for variety.

Under adverse or insensitive conditions, an adolescent can be deterred because of lack of understanding.

Concerning the need for security, the environment of the school may be too difficult for the adolescent because scholastic requirements are beyond her ability, the teacher is sarcastic, and discipline is too strict and inconsistent. With respect to the need for love and companionship, the school environment may picture unfriendly teachers and very formal classroom situations. This type of environment in a play school situation would inhibit learning of young children as well as adolescents. The need for ego satisfaction could not be met in the school if the work is too difficult, leadership positions are given to only a few, and the grading system forbids success to some. As for the need for variety, a classroom environment in which we find unimaginative teaching and sedentary activities seem to discourage learning.

Spot Light on Young Children

Throwing the spot light on young children is one of the most practical, profitable and stimulating ways to help adolescents meet their need of understanding human relationships. Yet it is very important that an interesting and satisfactory experience be provided which is geared toward meeting the needs of young children.

Needs of Pre-school Child

This paper will not attempt to fully list all the possible needs of the pre-school child. The pertinent ones are listed. For a fuller reference, consult the small book *Understanding the Young Child* by James Hymes. (It should be in your library).

Some needs of the pre-school child which may be satisfied through a play school are as follows:

*To develop a feeling of belonging

*To develop habits of eating, resting, dressing, and toilet habits which represent a sound foundation for further growth

*To use his imagination and express his ideas, needs, and feelings through use of materials

*To begin to solve his own problems and to think independently

*To learn to share

*To learn to do what is important for group welfare

Values Derived From Play

Pupils must be helped to realize that play is the media through which the child achieves physical, mental, social and emotional development. Dr. Ernest Groves has stated that "children do not play because they are young; they are young, so they can play." Charlotte Garrison once said that the child begins his study and mastering of objects around him when very young. The value of these early childhood experiences depend largely upon the wisdom of adults in providing him with materials which stimulate desirable habits of thought, feeling and action.

Play is a time for experimenting, attempting to reproduce a world he can control and conquer. To the child, play is a serious business. The child gains much through play. Play provides:

*Development of muscular co-ordination

*Opportunity for self-expression

*Ability to solve problems

*Habits of caring for materials, for neatness and orderliness

*Habits for developing social adjustment, leadership, co-operation, self-control, consideration of others, self-reliance, resourcefulness and independence

*Opportunity for corredt concept of things.

Toys are the tools of play. Just as adults need the correct tools and materials, the child needs appropriate play materials for productive play.

BASES FOR SUCCESS

Before trying to sell a play school to others, some teachers learn the hard way that they must really believe in it themselves. This is a simple idea, but it is important before expecting others to identify with the project and to be enthusiastic! Most teachers enjoy the lift given to high school teaching when they include spring units in child care, centering around the play school. The teen-ager perks up, and there is no time for spring fever when true-to-life experiences with children give meaning to and reinforce what is presented through reading and discussion.

Personal Attitudes

A teacher's attitude toward children influences the success she can hope to achieve in the play school. The degree of success or satisfaction the teacher has derived from her own past experience with children will determine whether or not she has a genuine liking for them.

As young children are quite sensitive to the attitudes of people around them, it will not only be important that the teacher have a genuine liking for children, but that the students have wholesome attitudes also. At an early date, the teacher should determine how the high school students feel about young children. In order to obtain valuable information concerning the attitudes of students, the test, "Bringing Up Children: An Inventory of Attitudes," by Remmers and Stedman is quite pertinent.

Varieties in Past Experience

Although past experience in working with children will vary for individuals, some teachers are able to utilize knowledge derived from such experience in planning a play school. The high school teacher may have had pleasant experiences with children in college nursery schools, church nurseries and/or summer camps. Married teachers can profit from experiences they have with children in their own homes.

Information Concerning Students

Some information concerning a group of students enables the teachers to plan more intelligently the nursery school schedule and provides opportunity for the teenager to have some degree of success in working with small children. Furthermore, the teacher can feel more secure as she recognizes or takes into account the assets of her students. A number of items on a personal data sheet would be available as a result of the teacher's having worked with students in other aspects of homemaking. However, a summary and tabulation of information concerning the total group would help the teacher have an over-all picture of what the group is like.

The hypothetical Miss X decides to take a look at the past experience of her students with respect to pre-school children. Students will vary in terms of their past experience with young children. Different opportunities will have been available to individuals.

Personal Data Sheet

From examining a few personal data sheets, Miss X finds that being able to hold the attention of children with interesting stories and musical activities has been a part of the past experience of several of her students. Often students have regular jobs in community baby-sitting; these girls seem to have received a variety of experiences, while other students reveal that they have had only limited experience with young children for short periods of time.

An example of the personal data sheet she used with her students is as follows:

Personal Data Sheet

How many sisters?____ Their ages?__________________

How many brothers?___ Their ages?__________________

Are there additional young children living in your home?

What age children are they?

Are there young neighbor children?

Do you have nieces and nephews?

Do you earn any money by baby-sitting?

Have you taught a beginners' Sunday School class?

Have you cared for children while the parents were away?

Do you like to play with children?

Have you bathed and dressed children?

Have you directed play activity for children?

If so, what was the type of activity?

Did you ever teach finger plays to children?

Did you ever read a story to a pre-school child?

State the greatest problem you have had in dealing with children?

As a result of summarizing the information from the personal data sheets, the teacher finds particular assets revealed for different students. In cases where specific problems and limitations seem evident concerning other students, Miss X decides to utilize these results to advantage in early planning.

Unless some data sheet reveals a highly personal problem, a student committee can be given an assignment to summarize information from this sheet. Then, both teachers and students have common information with which to work.

Good Mental Health

According to Redl and Wattenberg, a person who has mental health is well-adjusted, mature, and normal. They further state that complete adjustment is very rare; perfect adjustment is unknown. Most people seem to fall in between the two extremes. Yet, it is wise for a teacher to be aware of the conditions which foster good mental health.

Miss X is interested in trying to meet both the needs of young children and adolescents in the play school experience. If she and the high school students have learned to achieve reasonably good mental health in their day-to-day relationships with others, they will have more likelihood of succeeding with the children. Then, Miss X and her students will be more able to give attention to the needs of the children rather than to concentrate upon their own unmet needs!

Recent Course Work

Miss X realizes that the recent summer workshop which she attended at one of the state universities gives her a basis for feeling secure. Knowledge derived from her undergraduate courses in Child Development, plus a workshop on the graduate level, better enables Miss X to understand and explain to her high school students ways of dealing with behavior situations.

Access to Available Materials

Resource materials can greatly enrich the thinking of a teacher who wants to succeed in the play school venture. In the following references, suggestions can be derived. Some of these recent materials which Miss X asks for her library before attempting to plan with her students are as follows:

Co-operative [illegible]

Plans must be completed to a point where the help of others has been worked out in detail. Co-operation from the following will be necessary in most situations:

Administrators
Students
Other teachers from whom help is requested
Janitors
Parents

Sometimes a form letter to other teachers and parents is the most effective and time-saving method for reaching these people.

Alton Senior High School
2200 College Avenue
Alton, Illinois

Dear Parents:

The first and seventh hour Family Living Classes are setting up a three week play school on Wednesdays and Thursdays, beginning Wednesday, May 1 and ending Thursday, May 16 as part of the Child Care unit.

We are inviting your pre-school child to participate in our Play School, which will meet in the Living Room of the Home Economics Department on the second floor of the Main Building.

In order that both first and seventh hour class members can participate we will conduct the Play School from 9:00 – 10:20 on Wednesdays and from 1:00 – 2:30 p.m. on Thursdays. We hope your child will be able to participate in both Wednesday and Thursday sessions for the three weeks.

Eighteen girls are enrolled in our class. At each Play School session half of the class members will observe and half will help with the Play School.

We are hoping to have an enrollment of 10 to 15 pre-school children. Since we have classes following and preceding the Play School period, we would like for you to bring and come after the children. There is no charge in connection with the Play School. If you have any questions regarding the Play School, you may contact our teacher, Miss Liebig, by calling her at the Main Building, [illegible], Extension 5.

We are hoping that you will find it convenient to participate and help us make our project a success.

Very truly yours,

[illegible], Class Secretary

Prevention Better Than Cure

Some points that have been suggested from experienced teachers have been enumerated. From people who have had successful experiences, one may secure the following pointers which help to avoid trouble:

*Provide a conveniently placed listing of names of the children with addresses and telephone numbers.

*Check constantly on mothers' whereabouts in case of an emergency. Try to encourage a mother to tell you if she expects to be away from home while the child is at schoo. Also secure information as to where the mother can be reached.

*Have an awareness of daily absenteeism.

*Encourage parents to telephone of the child's absence with reasons.

*Have suggestions for the children's needs at play school.

*Emphasize the value of treating in the strictest of confidence children's personal information at school or revealed in their behavior.

*Give parents some help with respect to marking and identification of children's clothing. In one play school, the shoes were so much alike in shape and color that one child wore another child's shoes home. Another incident was quite vivid when one little boy screamed all the way home because he lost his cap.

*Leave out of sight those play materials which will not be used until a later time. In one play school, the free play period almost became a free-for-all confusion because there was so much to do.

*Provide labeled temporary storage for each child's clothing.

*Emphasize to the parents that children must not come to play school with colds, fevers, or disease symptoms.

*Secure knowledge of school liability in case of accident or injury to a child.

*Plan to alternate play school sessions with class meetings so that adequate educational value is gained by students as well as the pleasure gained by the children.

Other problems will arise which will have to be cleared according to the individual situation. No one answer covers all questions. The individual problems must be met as they occur.

SUGGESTIONS FOR OPERATING A PLAY SCHOOL

Time Period

The time period usually lasts three to six weeks. Many teachers have more satisfactory results if children come two or three days a week. The remaining days, then, could be used to evaluate results, to analyze how generalizations were applied, and to plan the ongoing program.

Bases for Selection of Children

Ages three to five years—It is best not to have too wide an age range among the group of children. Some teachers find the problems connected with a play school too difficult in terms of supervision when children as young as two and one-half years are included in the group.

Number of children—Limiting the number of children to a group of not more than ten or twelve is recommended for the average-sized high school class. Most room arrangements and physical facilities in the high school laboratory will not accommodate a larger group. According to the purpose of a play school, the teacher is not only attempting to guide the small child but also to assist the adolescent who is assuming responsibility. It is, therefore, very necessary to limit the number of children.

Toilet habits established—A number of toilet accidents may occur in the early days of play school. The teacher, however, should find out for certain from parents that the child has established bladder control before she enrolls him as a member of the group.

Division between sexes—An approximately equal number of boys and girls is the goal of teachers setting up a play group. This division makes it possible to see whether or not play interests and abilities differ between children of the opposite sex.

Source of children—The plan for securing children will need to be carefully worked out with the administration and explained to students. Other arrangements may be quite simple and satisfactory. Each pupil could be responsible for securing one child of a given age.

Transportation of children—The administration may require the parents to transport their children to and from school. Whatever the policy recommended by the school, Miss X will need to have it defined and clearly understood. Serious consequences could result for a teacher if high school girls have this responsibility.

Physical Safety

Protection of the children is of utmost importance. It would be extremely helpful if a unit on first aid could precede the play school experience. This unit would probably be taught by the health or physical education teacher.

Some of the following suggestions are adapted from the bulletin Taking Care of a Pre-School Child published by the National Safety Council and are very important:

*Do not plan to take care of a child if you have a cold, or know that you have been exposed to a contagious disease. A teacher in charge of a play school should be responsible for the high school students and herself in the observance of the above rule.

*Discourage planning of field trips for children attending play school. There is usually enough of interest which can be provided within the bounds of school itself.

*Control danger spots in and around play school. The teacher and her students will need to determine the safe areas in which children may play.

*Be sure that refrigerators are within your sight when little children are present. Be definitely sure that the lock cannot be manipulated by children.

*Pay attention to the child when he is near a stove, hot water heater, electric cord, sewing machine, windows, or stairs.

*Avoid any use of balloons at play school. Children have been known to suck a balloon down their windpipe.

*Check sand in the sandbox and have it strained periodically for glass or other hazardous materials.

*See to it that horns, bubble blowers, etc., are strong enough to prevent the user's sucking parts of it into his throat.

*Check frequently to see that crayons and paint brushes are not being held in the mouth. In case of a fall, serious mouth or throat injuries could result, or part of the object might be swallowed.

*Be sure that blocks and toys are not within the passage areas of the room.

*Require the children to wear rubber-soled sneakers, if the floor covering of the room is such that wax is used or there is any danger of falling.

*Have available short blunt-edged scissors if the activity of cutting is to be provided.

*Have children help you pick up toys, such as blocks, after they have been used. When toys are left on stairs, floors, or sidewalk, it is possible for others to stumble over them.

*Be aware of the danger involved in a moving swing. The supervision of children in a swing plus those moving in the direction of a moving swing is a heavy responsibility requiring constant attention.

*Check outside play equipment, such as boxes on which children may be climbing. Play equipment should be dry because wet pieces are often slippery.

*Sterilize bubble pipes with proper disinfectant if they are to be used for blowing bubbles.

*Know what first aid supplies are available and where they are located.

*Have some knowledge as to how to treat a slight burn, scratch, or bump.

*Always remove pins, matches, medicines, and cleaning agents from the child's reach.

*Inspect grounds daily for bottles, nails, and other harmful rusty metals.

*Restrict pushing and rough-and-tumble play, which is unnecessary.

*Keep children away from strange dogs and cats. Do not allow children to play in areas where there are wild squirrels.

*Check all the locks on doors. Be sure that it is not possible for children to lock themselves in the bathroom or any of the rooms where play school is being held.

*Children who seem to be showing the first signs of a cold should not be left with the group.

The bulletin, You're In Charge, a part of the National Safety Council packet, asks the question, "What safety reminders are most frequently needed by children?" See this bulletin for the answers.

The Administrator and the Play School

Encourage the superintendent to participate in making suggestions regarding policies of conducting a play school. In addition to helping with a policy concerning physical safety, administrators in the local school need to understand the educational goals of a play school, budgetary needs, plans for space and equipment, method of selecting children, and the place of the play school in the total yearly program.

Prior to a play school venture, let your superintendent help evaluate the policy regarding safety and react to these suggestions:

a. Parents who wish to send their children should have their family physician sign a health record sheet prior to attendance at play school.

b. Parents should sign a slip saying they do not hold the school or teachers liable in case of an accident.

c. Services of the school nurse should be made available for the informal inspection of the children each day.

Discuss your plans for dealing with parents with your administrator. Follow his suggestions, because he is accepted by the community as the administrator. Moreover, once he has approved your plans, he is responsible for supporting these plans in every way possible.

Consider the suggestions of parents. Often a teacher finds visiting the home of each child extremely helpful. However, in other instances, the teacher may ask each parent to come for a conference before a child is accepted as a member of the group. At the time of the conference, a <u>personal</u> <u>information</u> <u>sheet</u> is filled out.

INTRODUCING THE UNIT

If the Family Living course includes a unit on Child Care, and if the Play School is a traditional part of the unit, the teachers needs to spend little time on an interest approach. The young teacher, or the teacher who is contemplating the play school as part of the Child Care unit for the first time, may be hesitant. However, if she recalls the fact she so well knows that "adolescents are groping to understand themselves, their own feeling and aspirations," the child development unit would fall short of the needs it can meet if advantage is not taken of the adolescents' interest in children by means of a play school.

Throwing the spot light on young children is one of the most practical, profitable and stimulating ways to help adolescents meet their need of understanding human relationships.

Preliminary Steps

"Bringing Up Children," form A, by Remmers and Stedman, is helpful to the teacher and interesting to the class members. After having completed the inventory, each pupil scores her own test and determines her own percentile. This score which tells how she compares with others of her own sex and age arouses interest and serves as an incentive for further study.

A bulletin board display of "Play-School Activities" is all that is needed to arouse interest in having a play school as part of the Child Care unit.

Understanding the adolescents' interest in children, we recognize why high school students are impatient to set up the play school. The teacher knows the type and amount of study, understanding, and pupil preparation that must precede the play school period. Therefore, before beginning a play school, the teacher must help students recognize the need of a basic understanding of child guidance principles so that a happy experience may be provided for the children and a worthwhile, educational experience for the class.

What Students Must Understand

A brief outline of the requisites in setting up the play school may be an aid in helping the class members understand the need for careful planning, the amount of work that is involved, and the need for an understanding of the child guidance principles, which means reading and study on their part.

As previously discussed, there are certain important matters to clear with the administration, such as:

1. Available space
2. Insurance in case of accident
3. Transportation of children
4. Securing certain basic equipment
5. In emergencies securing cooperation of other teachers if necessary to release students from another class
6. Securing permission for a student to be excused from assemblies during the play school time

Class members should realize the need for committee work as well as assignments. The class will undoubtedly have to be reminded that the first question they must answer when contacting the faculty and other students is "What are the objectives of a play school?"

This brings in the matter of available books and pamphlets for the unit. A suitable bibliography of books and pamphlets needs to be in readiness. The class needs to know where the material is, whether in the school library or the classroom.

Over-all Objectives

From class study and discussion, pupil interest, and unit goals, the following over-all objectives for the play school would evolve:

1. To better understand how growth and learning take place in young children.

To achieve this objective the class would realize that another objective would be:

2. To provide a good environment for children in the play school.

3. To help students realize why children behave as they do, to learn to see things from a child's point of view, and thereby guide children more intelligently.

To attain these objectives requires study on the part of both the teacher and her students. The point of view of the authors is that both the teacher and her students can work together to determine some of the principles of child guidance from films, filmstrips, and pamphlets.

COMMON DENOMINATORS

The material presented in this section deals with what is called a "norm" or average. Some understanding of the characteristic reaction of children who will attend play school should be helpful. What can we expect of children at certain ages?

What the Experts Say

According to Franks', How to Help Your Child in School, "growth charts are general guides only; they are statements about averages, not about individuals." The common denominators, if used wisely, can be of value to parents and teachers of a play school. It is helpful to know that certain behaviors are characteristic of a particular stage of growth. If we know what to expect, we may plan the environment or set the stage for children to exercise their growing powers, as well as guide undesirable behavior into constructive channels. At the same time, parents will become more willing to accept a certain range of behaviors on the part of the child.

Dr. James Hymes speaks of the sequence in the growth process in this way: "A child must be a complete and utter capitalist when he is first developing a sense of property--'Mine, mine, mine'--or there are no grounds to nourish sharing at a later stage. . ." "Messing and dirt and goo and goosh when you are small are the basis for accepting cleanliness later." Certain behaviors which are annoying are often necessary for him to really grow as he normally should.

Individual Differences

The fact that there are individual differences in the time at which each child arrives at a particular stage in the growth sequence is most important. Emphasis is being placed on the right which each child should have to live out a particular stage. Although every child will go through each of the stages, the time for arriving at a particular "turning point" will vary according to the rate and pattern of growth of individual children. Therefore, any anxiety on the part of parents may be due to their lack of knowledge concerning this range.

The importance of the "Common Denominator" needs to be recognized; however, there needs to be developed an understanding that each child is a unique individual whose own individual characteristics must be respected and aided toward optimum development.

A logical goal might be "to learn what can be expected of the 2-3 and four-year old child." Pupils can be guided to work out various procedures by which the age characteristics of the common denominator for each age level is ascertained.

After a discussion of films and filmstrips, and after studying books and pamphlets, individuals or committees should prepare written reports on the characteristics of each age level. These reports must be carefully read and analyzed by the teacher.

Use Filmstrips

An important generalization is that a mature behavior exists at any stage of development. In order to arrive at this generalization, an essential requirement on the part of the learner is some basic understanding of the maturity indicators. Through the use of a filmstrip available from McGraw-Hill text films, "Child Care and Guidance", which shows the growth process, the teacher enables students to get a clear view of the special learnings which are typical for a given age and the order in which they occur. After the filmstrip is shown, there is a review of the major principles of continuity of development and growth sequence. The filmstrip is shown again to the class and at definite intervals the teacher stops the filmstrip and gives opportunity for the class members to suggest problems which may normally arise from a particular stage of development.

At this time students begin to think in terms of how they believe certain problems should be solved on the basis of former situations. This discussion may lead to some difference of opinion among students. Near the end of the class period, the teacher lists problems on the board and suggests available resource materials as a means of guidance in the solution of these problems. She plans to use the problems for later lessons in development of the unit.

Later Use Films

The viewing of the films, "The Terrible Twos and the Trusting Threes," and "The Frustrating Fours and the Fascinating Fives," will also help in understanding what to expect from each age level.

Three-Year Old

Language--One of the child's achievements about this time is his ability to use language effectively and to be responsive to verbal guidance. Since maturity of the nerve centers which govern inhibition has taken place, the child does not get lost between opposite extremes as he formerly did and can make a choice. Certain words like surprise, guess who, etc., are attractive to him. Many children respond well to whispering when there is a group pressure situation. At this age, the child seems to be able to solve his problems more successfully than earlier.

Routines--Routines are enjoyed and fairly well accepted by most three-year-old children. It is interesting to see the child at this age do many things he does not particularly like to do if he is given a reason, along with the fun of participating in a game and some adult help. Patience is needed in helping the child develop independence as he participates in certain routines, such as dressing himself. Since the child has advanced so much in language development, he frequently has difficulty combining dressing and talking. Therefore, he may wish to pause and finish his story before he completes an activity.

In regard to toilet habits, the three-year-old seldom has daytime "accidents." Usually he makes known his desire to go to the bathroom by action or speech. The three-year-old can wash and dry his hands without help. In dressing himself, he can usually assume some responsibility.

Schedules--In adapting to the schedule at play school, the child seldom experiences difficulty in making transitions from one activity to another, provided the one guiding him does not pressure him and warn him of the need for changing activity. A schedule needs to be flexible for a child of this age.

Activities--The child at this age needs some time for "free" play when he can exercise some choice in terms of what he would like to do. In activities, such as drawing with crayon, building with blocks, dressing dolls, looking at pictures, and working a peg board, the child tends to keep himself occupied without too much supervision on the part of the adult. Of course, the stage must be set to stimulate the interest of children in these kinds of activities.

Children at this age like to take part in group activities, such as simple games and music. They like acting out or "let's pretend" activities.

Sociability--By this time, the child seems to be arriving at a friendly and sharing "we" stage.

Although sharing or taking turns may be difficult for some children, it is accepted by most children of this age when they have had adequate past experiences. At this age, one sees a glimpse of cooperative play. Yet many children engage in and enjoy parallel play, which is often quite helpful when tensions seem to be evident.

Three and One-Half--Growing Pains

The parent and teacher of play school begin to say goodbye to the delightful stage of equilibrium which was present at three years. The degree of dis-equilibrium manifested by individual children at this time will vary.

Language--Children may begin to stutter when no previous signs of stuttering have been evident.

Routines--If parents and teachers understand that insecurity and incoordination characterize the child at this period, they can understand the value of patience and can more wisely guide routines.

Schedule and Activity--The children at play school often respond better to a planned activity, such as soap bubbling or marbled sand, to start the early morning play time. Outside active motor play needs careful supervision as motor in-coordination may be evident. The child may show a tendency to stumble, fall, or fear heights.

Sociability--The child who may be uncertain and insecure during this period, may discriminate against other children and give annoying commands. Sometimes he resorts to hitting and pushing and displays extremes of behavior.

Four-Year Old

Language--At this time, the child becomes very curious about his environment and frequently asks "why" and "how". He responds well to verbal direction. Sometimes, as he boldly uses language, he may wish to exclude certain children from the group. Guidance is necessary for the talkative, lively four-year-old who may engage in tattling, disputes, and have difficulty distinguishing between fact and fancy.

Routines--The four-year-old engages in routines more smoothly than he did at the age of three. A certain out-of-bounds behavior may occur in connection with toileting. Therefore, adult guidance is needed in connection with this part of the routine. At this age there are few daytime "accidents". Most children are able to go to the bathroom alone and without help.

The child of four years has achieved more independence in dressing himself. In certain instances, he may need help with outdoor clothing, close-fitting clothes and shoe laces.

Schedule--The child needs more carefully planned activities. He shows improvement as he engages in group activity. The schedule should still provide for alternating periods of active and quiet play because he has a high motor drive now.

Activities—As the child at this age is imaginative and versatile, he likes to engage in dramatic play. Children often like to act out certain stories, such as "Little Red Hen" and "Billy Goat's Gruff".

He finds that at this age the child is usually able to draw with pencil and crayon a simple, but recognizable picture of a man, animal, etc., [illegible]

Sociability—The child is highly sociable. However, guidance is needed to curb his characteristic out-of-bounds behavior.

Four and One-Half—Pulling in From Out-of-Bounds

Language—They like to discuss various things in the environment as well as stories they hear. Their desire for realism is shown in their response to certain happenings and in their desire for detail and information.

Routines—There is less need for adult control. Children show a tendency to stay with a routine much better than at the age of four years.

Interests and activities—Again the tendency is seen to stay with activities, such as block building, and achieve a certain goal. Children at this period sometimes need more time to complete an activity in which they are interested. They are interested in making their drawings look more like the real thing. Increased motor control is seen in outdoor play as well as in drawing pictures.

Sociability—Since the child at this time seems to be pulling in from his out-of-bounds behavior which is characteristic of four, he seems to be a more sociable individual.

Sometimes it is wise for a nursery school teacher to [illegible] her four-year group [illegible] from five-year olds. This reduces her problem of guidance and permits opportunities for the children to experience play without being dominated by [illegible]

Five-Year Old—[illegible]

Language—The child has a good command of language and talks freely. He seems to enjoy talking and expressing his ideas.

Routines—Routines, such as washing, dressing, eating, and toileting himself are often seen as the [illegible] of individual abilities. Rarely, the child may need occasional help.

Activities—The child needs alternating periods of active and quiet play. Although the child is noisy and vigorous, he may become tired rather easily. In everything, he likes to know reasons concerning the here and now world.

Activities—His activity seems to have definite direction or be repetitive at this time. The child enjoys some group activity but he may become tired of the group. Although he may enjoy playing in a small group of five or six children, his interests are still self-centered. Dramatic play is enjoyed by the 4-year old child. Children need opportunity for plenty of activity.

Sociability—At this stage, there seems to be a good balance between self-sufficiency and sociability. He is interested in staying near the home base.

[illegible]

When a class decides to learn about young children, the goals of the class vary in accordance with changing aspects of interest in early and late adolescence. The objectives and desired outcomes for either age level might be to help the students get an understanding of how growth and learning take place in young children and provide a good environment for children in play school. Since the juniors and seniors are interested more in preparation for the care of their own children, the objectives and desired outcomes for this age level would be to help them realize why children behave as they do and how to guide children more intelligently.

Application of Principles

Whatever the age of the group, the primary purpose of the play school is to provide opportunities for observation of small children and to apply the principles of child guidance learned. The class members must be helped to realize that a basic understanding of the principles of child guidance is important in order that observation and guidance may be as meaningful as possible.

The material which is discussed at this point stimulates thinking in terms of the kind of [illegible] [illegible] which is suggested for children. It is, however, important that teachers and high school students have some understanding as to the use which can be made of this type of [illegible] by individual children.

Adjustment-Maladjustment Scale

Because of the nature of the background of each child, there may be either acceptance, rejection, or other frustration by individual children who are present in the play school situation where the following principles are applied. It is important for teachers to help students recognize that variety in types of background will color the individual child's reaction to the situation and produce different behaviors. In a home situation where the child has been unfamiliar with anyone saying "Let's" or "Shall we" do a certain thing, he may experience a great deal of anxiety in the absence of the commands of his parents or others. Some children may experience a certain amount of distress in a setting which has entirely different expectations from those of the home base. Other children may display a tendency to be negative in the new situation at play school. In other words, a child may [illegible] anywhere on the continuum of an adjustment-maladjustment scale.

Individual Differences

Informing students of the fact that children may not only be from different kinds of backgrounds, but also have arrived at different points in achieving various degrees of learning may enable them to work more intelligently with the children. One child, who comes from a democratic family, may feel very secure and have experienced the feeling of ownership. Therefore, when he comes to play school, this particular child may have little difficulty participating in the business of sharing, taking turns, or giving up to another child. Whereas, a child who has been reared in an atmosphere of complete freedom may not have any awareness of social values, such as sharing. Therefore, it is quite understandable that he behaves the way he does.

Emotional Climate

Finally, in absence of any scientific documentation, the principles below on How to Handle Youngsters are those which we have found worthwhile.

Do This	Not This
Plan for opportunities for children to feel that they belong to the group. Each should have a chance to be a leader in the band if he wishes.	Allow certain children to assume responsibility repeatedly.
Look at the child's life as a whole to find the reason for undesirable behavior and try to eliminate the causes.	Work on the symptoms and fail to find the root of the problem.
Help the child feel that he can do some things well.	Have him develop a negative picture of himself.
Let the child know that you like him, even though you dislike what he is doing.	Say "I don't like you if you bite other children."
Have more than one of the more popular and much used toys. Remember that duplicate toys simplify situations.	Demand concepts of sharing before children are mature.
Let children have a chance to experiment and enjoy the process as they engage in creative activity.	Furnish a model or standard for children to follow, e.g., teacher asks child, "What are you making?"
Permit the child some freedom of choice in joining a group activity as long as he does not disturb the larger group.	Pressure the child to participate in what most of the other children do.

Do This	Not This
Keep your hands off the children unless they initiate the contact. For example: steady the equipment instead of the child.	Immediately help the child or show a distrust in the child's ability to use the equipment.
Use positive clear statements when a request is necessary. For example: "It is clean-up time."	Ask him, "Would you like to clean up?" which may result in a "no."
Allow a choice if it is really possible for the child to exercise choice.	Insist upon certain action at precise time.
Appear as calm as possible. Show no outward irritation no matter how trying a child or group may be.	Become angry because the group displayed out-of-bounds behavior (Maybe there had been too much quiet activity and this was needed).
Manner and tone of voice can invite the co-operation of the child. For example: whispering is effective with three and four-year-olds.	Invite resentment by the quality of a dictatorial tone in giving a command.
Remember that words like "let's" and "shall we" help children want to carry out suggestions.	Give a forceful command which may invite negativism.
Remember that a few reasonable clearly defined limits help children feel secure.	Furnish complete freedom by absence of limits.
Form the habit of re-directing undesirable activity.	Say immediately, "Don't do that."
Use the positive approach, "puzzles are used at the table."	Say, "Don't use puzzles on the floor," and encourage negativism.
Enforce desired action by physical presence and direction, e.g., even though the teacher might say, we take it easy going down the steps, one at a time—her presence and the reminder may be needed.	Expect each child to remember correct performance in the excitement of leaving the building.
Forestall undesirable activity by making the desirable behavior attractive. The teacher says to the boys approaching and preparing to burst the cakes of sand, "Maybe you would like to be the guests and come to Janie's birthday party."	Give the child opportunity to get reward through being destructive.

Do This	Not This
Suggest to children desirable social techniques to use, e.g., The child seems to want to join the group but needs help in making a constructive approach.	Allow children to fail to be included and accepted by others.
Channel the child's energy and interest. "Here's something you might like to do."	Punish him for inability to wait his turn.
Differentiate between "indoor" and "outdoor" voices by setting an example.	Threaten the child by ridicule, sarcasm or shame.
Help children want to learn new things because the process of learning is fun and interesting. New textures in foods can be exciting, e.g., the finger foods at juice time are crisp and easy to handle.	Use rewards like stars to bribe them into better eating habits.
Let child approach a new activity through watching, feeling some security and wishing to participate before he tries it, e.g., children often like to observe the finger paint or clay being made before they have opportunity to use it. The first approach to paint at least for awhile may be with just a poke with one little finger.	Have child feel he must immediately participate.
Be willing to observe children and let them proceed in their own way as long as they are playing safely.	Hover over the children; interfere; try to do something when help is not really needed.
Try to see things from the child's point of view.	Expect children to act as miniature adults.
Treat the personality of little children with the same respect that would be given an adult.	Shame or ridicule a child into prescribed behavior.
Remember that a busy child tends to be a happy child.	Provide one activity at a time only.
Not only accept a child's feelings, but also help him express them so the desirable feelings can take the place of negative ones.	Fail to provide opportunity for him to express negative feelings in a constructive way.

Do This	Not This
Set the stage for constructive play, so that participation is possible and attractive for children.	Make it difficult for him to participate by having to use carelessly mixed easel and finger paints, inadequate materials.
Respect and appreciate differences in performance among individual children.	Encourage competition among the children or respect only those children who excel in certain ways.
Give child opportunity for responsibility.	Do all complicated jobs for the child.
Be willing to make adjustments in the schedule to meet immediate interests.	Have too definite a schedule.
Direct child toward another activity if he is upsetting the group.	Scold him for being uncooperative.
Enter situation where quarrel is brewing and help children to settle difficulties themselves.	Decide for the children what should be done.
Remember your promise that the child who needs a scarce item will have a turn, see to it that he does have a turn very soon.	Allow each child to look out for himself.
Attempt to show without punishing or scolding, that blocks, for example, are for building, not for throwing, except in special cases.	Threaten the children because they are incorrectly using the blocks.
Assist children in putting their things away, e.g., "We need to put our blocks away, because we will soon be going home!"	Command the children to take over the task.
Assure the child of acceptance and approval whether he is a success or failure.	Encourage an atmosphere of competition and being first among children.
Respect the personality of each child.	Form the habit of labelling behavior as good or bad and using these terms.
Carry out routines without evident fuss, commands, or tense preparation.	Use command and expect sudden adjustment to new activity.

Do This	Not This
Avoid using pressure in introducing children to new experiences. If one child does not want to join the group he may play quietly away from it.	Make an issue about the child who refuses to join the group.
Have patience; children make many mistakes when they are trying to learn.	Blame children for making mistakes.
Frequent punishment is unwise; use it cautiously.	Believe punishment can have the opposite effect of reward.
Remember that the experience play school gives can only be supplementary to life at home.	Try to place too much responsibility for a temporary experience.
Remember it is easier to prevent problems rather than try to cure those which have occurred.	Fail to set the stage for constructive activity (adequate space for block building, etc.)
Remember that the child learns through enjoyable activity.	Allow dissatisfaction to be the result of activity.
Give opportunity for children to express their feelings.	Have behavior problems as a result of bottled up feelings.
Offer a substitute when a squabble begins to brew over use of a toy. For example, "Can't we find a special toy for Janie?"	Expect disputes to be settled according to adult standards.
Set the stage and plan arrangements so that the child enjoys being with others.	Make sharing an issue in itself.
Realize that many difficulties children get into are a part of growing up.	Scold and be cross when certain difficulties arise.
Realize that children need positive help, such as genuine praise.	Be critical and set impossibly high standards.
Help children want to take responsibility by making certain kinds of activity fun. For example, make a game of helping them pick up blocks.	Challenge his ability.

Evolving Principles or Generalizations

Because of the enormous information which is available, generalizations must be evolved. No one individual can retain more than some selected generalizations that might be expected to apply to most situations. To test the validity of a generalization, it must meet specific criteria:

must be clearly stated
must be true
must be significant enough to influence behavior
must apply in most situations

The teacher is faced with the question of how to teach principles or generalizations. This can best be accomplished by means of the problem-solving method. Case situations from filmstrips, films, and books can be presented and pupils encouraged to discuss their ideas of desirable solutions to the problem. From these solutions, a general statement can usually be formulated. The test of whether it is a generalization is to try whether it applies to two or three other, but similar situations.

After student acceptance has been achieved, the teacher should arrange that periodically these generalizations can be applied in new situations. Only through the three steps of problem solving can principles or generalizations become working knowledge for each student.

Generalizations to Support Selected Objectives

The following material presents only some of the generalizations to develop the selected objectives.

Objective

1. To better understand how growth and learning take place in young children.

Generalizations

a. A relaxed atmosphere is conducive to learning in a play school.
b. Young children learn by example, imitation and experimentation.
c. The attention span of young children is short; however certain kinds of activity encourage a longer playtime.
d. Toys can be made to encourage learning if they have the following characteristics: safety, sturdiness, suitability for age, interests, and abilities; stimulating to active participation on the part of the child.
e. Each individual faces particular needs as he grows and matures.
f. Simple stories about familiar things help a young child to better understand his world and the people in it.
g. A child learns through having a variety of play materials: for large muscular development, for sensory, experience, for developing his imagination, for engaging in dramatic play, for stimulating interests.
h. Growth and development follow an orderly sequence.
i. Each child has his own individual rate of learning.

Objective

2. To provide a good environment for children in the play school.

Generalizations

- a. Children should not be interrupted in their play as long as they are achieving some degree of success and not interferring with others.
- b. Children like to engage in different types of play according to their particular stage of development.
- c. Young children frequently engage in parallel play.
- d. Shifting play groups are characteristic of the pre-school child.
- e. A good schedule provides for alternating periods of active and quiet play.
- f. Dramatic play will take place both inside and outdoors if appropriate materials and climate are provided.
- g. Dramatic play fosters good mental health by providing opportunity for a child to express his feelings, protest against certain conditions, and better understand adult roles.
- h. Acceptance of children by both teacher and students is the first requisite in setting the stage for constructive play.

Objective

3. To help students realize why children behave as they do, to learn to see things from a child's point of view, and thereby guide children more intelligently.

Generalizations

- a. There is always a reason why a child behaves as he does.
- b. The same behavior may result from causes which are entirely different.
- c. The same cause may produce behaviors which are entirely different.
- d. Most children are sensitive to the feelings of people in their environment.
- e. Children often appear stubborn and negative in an atmosphere of hurry and pressure.
- f. Bad feelings need to be expressed before a child can be expected to have good feelings.
- g. Children need to express their feelings but they also need guidance in directing their feelings into constructive channels.
- h. In order to help a child, it is most desirable to deal with causes rather than external symptoms.
- i. Each stage of growth has particular characteristics.

Case Situation

Objective: To better understand how growth and learning take place in young children.

Generalizations: Young children learn by example, imitation and experimentation. A child learns through having a variety of play materials: for large muscular development; for sensory experience; for developing his imagination; for engaging in dramatic play; for stimulating interests.

John is playing at the ladder bar, falls to the ground, and gets a slight scratch on his knee. It has taken John longer than the other children to feel at ease on the ladder bar. Select the procedure which you think it would be wise for the teacher to follow. Place an X to the left of the statement or statements which you choose.

__1. Smile and say, "That's right; up you come," as he examines the scratch and asks for a bandaid like his mother uses at home, say "That's right, we do need some merthiolate and a bandage!"
__2. Say, "Mean--bad ladder bar!" "We will play somewhere else."
__3. If he cries, tell him to stop crying. When he asks for a bandage, ignore his request and scold him for being careless.
__4. Show John how to hold on and swing his feet so that he will not be as likely to fall next time. With a little help, enable him to experience success.
__5. Be abrupt with John while placing the bandage. Also spend time talking about how terrible this accident might have been.

Objective: To help students realize why children behave as they do, to learn to see things from a child's point of view, and thereby guide children more intelligently.
Generalizations: Bad feelings need to be expressed before a child can be expected to have good feelings.
Children need to express their feelings but they also need guidance in directing their feelings into constructive channels.

A field trip to the neighboring farm had been planned for a week and the children came to school with the intention of going. Unforeseen circumstances over which the teacher had no control prevented the group from going to the farm. One child named Kenneth, who had many pressures at home, was much more disturbed than anyone else concerning the change plans. Following the news, he hit the teacher and started tormenting the children. Place an X in the column to the left of those sentences which you feel would be helpful to the teacher in handling this situation.

__1. The teacher, after taking Kenneth to her lap, said "It looks as though you are feeling mean. It's all right to feel mean. I know you are angry with me because I told you we couldn't go to the farm today. I know how you feel."
__2. The teacher said, "Let's play nicely today--you didn't really want to go to the farm."
__3. The teacher has the janitor go to the special storage room early in the morning and bring a surprise which is a group of car seats for bouncing which the children have not used for a long time.
__4. The teacher said to Kenneth, "You are a naughty boy because you hit the teacher and bothered a part of the group.
__5. The teacher constructed the play situation with blocks in order that Kenneth might play with two children with whom he liked and got along well.

EQUIPMENT FOR PLAY SCHOOL

If kindergarten tables and chairs are available from within the system or from a near-by church school, one big problem of equipment is taken care of. If such equipment is not available, the boxes, orange crates, benches made from boards or children's chairs brought by class members, may be the answer.

Booklets of play school equipment may be of help in getting assistance from the industrial department in making some simple equipment. After several years of conducting a play school, several suitable pieces might be collected.

From the compiled list of equipment the class must decide what is essential equipment and what are some of the articles and equipment that will make the play school more interesting and contribute to the greater development of the children:

Needed Equipment

Basic Furnishings:
- Toilets equipped with step arrangement for children.
- Two to six tables.
- Twelve chairs.
- Boxes for storage toys.
- Two wash basins or washing facilities in or near the room.
- Rag rugs for resting, or placing heads on table for resting.

Play materials:
- Easel painting paper, newsprint 18" x 24", wrapping paper, or back side rolls of old wall paper.
- Easel and paint--red, yellow, and blue.
- Shelf paper and finger paint.
- Aprons or smocks which girls can make out of daddy's old shirt or plastic.
- Paint brushes.
- Old pie tins, spoons, and sifters to be used in play with marbled sand and in dramatic play.
- Dress up clothes--hats, shoes, purses, etc.
- Books and scrapbooks.
- Blunt scissors.
- Colored chalk.
- Sand or salt.
- Clay.
- Three dolls.
- Colored construction paper.
- Paste.

For outside use:
- Wooden sawhorses and kegs.
- Boards and packing cases for playhouses, boats, and cars.
- Hollow blocks (5½" x 11" x 11") for furniture or seats on trains.
- Supplementary toys to enrich block play; cigar box trains.
- Old car steering wheel mounted on a wooden block.

Transportation toys--source, cheesebox
Wedgies and standpatters--source, clothespins on wooden bases
Airplanes--source, clothespins
Sandbox made from tractor tires, plenty of shovels, pie tins,
   large strainers and cans with edges smoothed
Provision for water play--large tub with floating toys
Bouncing apparatus such as old car seat

Be Resourceful

With such a variety of suggestions for equipment for the play school, the initiative and creative ability of every class member can be challenged. A class requirement might be that each member contribute either a piece of equipment or work in a committee to prepare and be in charge of some type of activity.

Securing Needed Equipment

Visit to the local junk yard

Tractor tires make excellent sand boxes and provide opportunity for parallel play. More than one tire can be used with a group of eight children. Two or three children can play in one tire.

Old inner tubes with a leak and pieces of old hose may be used for dramatic play. These materials when combined with an old pump provide excellent opportunity for children to assume various roles in dramatic play. Such activity can last for as long as twenty-five minutes with the same children participating. In fact, this activity is so popular that two sets of such material is recommended for eight or nine children.

Old car seats provide experience in active jumping and bouncing. The children will like to take turns bouncing and will enjoy playing "follow the leader."

A steering wheel or old car wheel can be mounted on a wooden block. The wheel will need a shaft 25 inches long. One-half inch water pipe can be welded on the wheel for the shaft. After the wheel and shaft are attached to a box, a crutch tip on the end of the shaft will guard against cuts from the end of the shaft. An old radiator cap on a round block of wood can be nailed to top of the box for realism. Hand tools are adequate for all the work needed to make this simple toy. An entire car without wheels can be made for $3.00.

Visit the local paint store

Broken lots of wallpaper can be used for easel painting and coloring with crayons. Many dealers are glad to give away broken lots which they do not plan to re-stock. Old wallpaper books furnish material for paper-cutting and pasting.

Visit the school cafeteria

Obtain large size cans (No. 10) which can be used for drums. Large glass containers may also be secured for storage of finger paints, easel paints, etc.

Band Instruments at Little Cost

Maracas can be made by persons saving old light bulbs and the cardboard rolls from inside toilet tissue. With these two items, plus a package of paper mache, eight or nine instruments can be made in a short time. The socket end of the light bulb is broken off and the roll from the toilet tissue inserted. The bulb and roll are entirely covered with paper mache. When the maracas is thoroughly dry, it is necessary to break up the light bulb section with a hammer. The glass then makes for an attractive sound. Girls will like to decorate each maracas with attractive paints, etc.

Rhythm-paddles can also be fun. Have your [illegible] make [illegible]. Another easy way is to buy enough [illegible] wood for each child to have his own paddle. Enough [illegible] for eight or nine children would cost about fifteen cents in some hardware stores. Dimensions of each paddle should be approximately 3" x 4" and can easily be cut out of scrap lumber by the Industrial Education Department. Girls would have fun painting the paddles, [illegible] for each paddle, and applying simple decorations.

Xylophones may be [illegible] and excellent opportunity provided to experiment with sound when glass milk bottles are filled with varying amounts of water and tapped with a spoon.

Drums may be made from old pieces of inner tube, [illegible] cans open at both ends, a large needle, and cord for lacing. Children may bring pieces of inner tube from home which is pulled tightly over each end of the cans. These sections of inner tube are then laced between the ends of the cans.

Tambourines can be made from paper plates, jingle bells, large needle and heavy cord. Two paper plates are placed so as to have their sides [illegible], joined together with [illegible] needle and jingle bells at both top and bottom of plates.

Toys Can Be Evaluated

Name ____________________

RATING SCALE

Score each toy for evaluating the suitability of toys for children: 1 is superior; 2 is adequate; and 3 is poor

1	2	3	Score
Safety Rough edges, sharp edges and corners, poisonous paints, small pieces that can be swallowed or put in ears and nose.		Smooth edges, blunt edges, rounded corners, non-poisonous paints, large pieces	______

Durability Easily broken, chipped or bent	Solid pieces, not easily chipped or bent.	____
Decoration Poor paint, material falls apart, fades in water	Easily washed, fast color	____
Attractiveness Dull, muddy color	Bright, clear colors; realistic (life like) in color and design	____
Suitability Mechanical toy does it only to be watched. Passive.	Leads to constructive play, stimulates child's interest, makes noise.	____
Size Too large and awkward to be handled by the child	Easily stored, small enough to be handled easily by a child but also large enough to be interesting to him.	____
Cost Too cheap, too expensive in relation to type of toy. Difficult to repair	Inexpensive in relation to value child may derive from it. Easily repaired.	____
Construction Flimsy, [illegible], corners likely to fall apart, loose screws	Sturdy, solidly built, nicely finished in corners, tight screws.	____

SCHEDULE OF ACTIVITIES

It is advisable to have a day, or better, two days, after the play school is equipped before the actual opening of the school. During the time when committees are at work, one committee works out a schedule for the play school period. In case there are two Family Living Classes, the morning sessions must be dovetailed with the foods or clothing laboratory sessions. An afternoon session of play school is not advisable as it will mean that children will miss afternoon naps. However, if the Family Living Class meets in the afternoon, that may be the only time a play school can be scheduled. In this case, each class works out its individual schedule.

Example of Schedule

	A.M.	P.M.
Opening time Nurse Inspection	8:40	1:40
Bathroom Drink	8:40-8:45	1:40-1:45
Free indoor play	8:45-9:10	1:45-2:10
Rest--ready for lunch	9:10-9:15	2:10-2:15
Lunch period	9:15-9:30	2:15-2:30
Story telling or Records or Music or Movie	9:30-9:45	2:30-2:45
Walk or outdoor play	9:45-10:10	2:45-3:10
Drink and bathroom	10:10-10:15	3:10-3:15
Ready to go home	10:15-10:20	3:15-3:20
Class members put room into order	10:20-10:30	3:20-3:30

Preparation of Room

The arrangement of the activity centers of the play school must be given some consideration before articles begin to arrive. A rough sketch on the chalk board or on a large sheet of paper may be helpful. If an adjoining foods or clothing laboratory is available, more activity centers may be provided.

If the regular Family Living room is to be transferred into a play school, consideration must be given to the clearing out of the regular class room furniture.

ASSUMING RESPONSIBILITIES

A very important experience for the class members is to work out a class schedule of student observation and participation. After experience with several sessions of play school, it has been discovered that the play school session is more enjoyable and more profitable to the student if she participates for fifty minutes as well as observes for the same period of time.

Participation-Observation Schedule

Class members are scheduled for participation and observation before the play school starts. If there are few absences or schedule changes, the class schedule should work out quite satisfactorily. All members must understand the work involved in each job as set up. Two girls work at all jobs so as to inter-change at the end of the fifty minute period or to replace the one who is absent. A summary of duties for each job is worked out and placed on the bulletin board, thus serving as reference:

Date	Register Toilet	Lunch	Play School Schedule Housekeeping Corner	Boys Corner Large Equipment	Paints Color Clay	Recreation Stories Records
Participate						
Observe						

Attendance

The registrar has an important job. She must take roll, have the sheet of names of enrollees, parents' names, and addresses and telephone numbers in a convenient place so anyone can procure the sheets in case of an emergency. She must at all times keep her eye on the school enrollment. Of course the teacher also does this, but the registrar must feel the responsibility of being able to account for each child in attendance. This last requisite means that all class members have been instructed how to call and inform parents in case of an emergency. The teacher does the calling in most cases, but students need to know what to do in case the situation arose.

Attendance Sheet

Parents' Names	Address	Phone	Age	Child's Name	Girl's Name

Role of Observers

In order that class members can derive the greatest benefit from their observation periods, they need guidance in how to observe and what to look for. The observer should be seated on a low chair so she is on a level with the children. The observer should not disturb the children's activity by her movements or conversation with other adults, either observers or participants.

Hints for Observers

The observer should remain in the background, at no time giving any indication of amusement or making comments or conversation with the children. If the child asks questions of the observer, he should be answered in a pleasant matter of fact manner.

Observations should be completed during the observation period. It might be wisest to have observation sheets turned in at the close of each observation period.

Students observing the same child might find it interesting and help to compare observations. Opportunity should be provided for the discussion of observations.

Observation Record Sheet

Since high school students need much help in interpreting their observations as well as in preparing for their participation duties, play school should meet every other day or only two days a week.

The teacher needs to be present at all times, first to be of assistance in problems pertaining to the children and secondly to observe and make recordings of student observation and participation.

Observation Record

General Instructions

The chief object of your observation is to give you a greater knowledge and better understanding of little children. You can best gain this by (1) remaining in the background, giving no indication of amusement, making no comment, and starting no conversation with the children or with others; (2) locating your chair so you are not in the way of the children, and not hiding any of the playthings; (3) not disturbing their activity by either your coming or going.

A. What does the child do?

1. How many different activities does he engage in during the period observed?
2. How long does he engage in each activity?
3. Does he play contentedly and satisfactorily with others?
4. Does he play contentedly by himself?
5. With whom does he play?
6. What toys does he use?
7. Does he imitate someone else, or do others imitate him?
8. Is he enthusiastic in his play?
9. When he changes from one play to another, what reason do you see for the change?
10. What appear to be his favorite activities?

B. To what extent can the child help himself?

1. What personal care is he able to give himself?
2. What personal care that he should give himself is done for him?
3. Does he get out his toys?
4. Does he put them away?
5. Does he often say, "Do this"?

C. How does he act toward other children? (Give specific example.)

1. Is he bossy?
2. Does he interfere with the play of other children?
3. Is he selfish?
4. Is he generous?
5. Does he show off?

6. Is he shy?
7. Is he irritable?
8. Is he quarrelsome?
9. Is he sympathetic?
10. Does he tease and annoy others?
11. Is he cooperative?

D. What guidance measures did the teacher or mother use?

1. Did she give verbal instruction?
2. Did she tell the child to stop doing something? or,
3. Did she suggest he do something else?
4. Was corporal punishment of any type used? What? Was it desirable? What other means of discipline might have been used?

What conclusions do you draw concerning the characteristics of the child observed?

PLAY SCHOOL ACTIVITIES

In this section, some activities are presented and discussed with respect to a few of their values, needed student responsibilities, and materials.

Easel Paints

Values: Provides opportunity for gradual development of skill
Provides opportunity for the release of feelings and emotions
Provides opportunity for manipulation and experimentation with colors
Provides opportunity for freedom of movement

Materials

Non-poisonous, washable paint
Newsprint, wallpaper, or other large unprinted paper
Long brushes (3/4" x 1") and long handles (8")
Easel with rack and proper height
Aprons and smocks

Student Responsibilities

Display paintings on wall with each child's name on his picture
Limit the number of children who easel paint--recommended number to paint at one time is two
Avoid asking what child is making
Provide full colors, large paper, brushes, containers for paint so that each child has his own equipment
Avoid hurrying children to finish

Finger Paints

Values: Opportunity for experimenting with color and messing
Opportunity for expression of feeling and release of tension
Opportunity for maximum freedom of movement
Opportunity to experience a feeling of rhythm and real satisfaction
Opportunity to directly handle material of different consistency

Student Responsibilities

Arrange adequate table space
Limit the number of children who finger paint at one time to three children
Provide proper materials: adequate supply of finger paint; paper with wax-like surface
Provide for auxiliary materials, such as mops, sponges, and water
Display painting on wall with each child's name on his own picture
Avoid hurrying children to finish
Cover some types of table surface with oilcloth
Immerse shelf paper in water or use spong to wet paper
Smooth paper before child begins
Provide place where children may wash
Never ask what they are making

Materials

Aprons and smocks for children and students participating
Paper with slick surface
Deep pan for wetting paper
Non-poisonous paint, clear in color
Sponge for additional wetting of paper

Recipe for finger paint:

1 Cup Linit Starch	5 Cups boiling water	1/2 Cup soap flakes

Mix the starch with enough cold water to make a smooth paste. Add the boiling water and cook mixture until it is glossy. Stir in the dry soap flakes while the mixture is warm. Cool. Add vegetable coloring or powder color. Put into jars. This mixture will keep a week or longer if covered with a tight lid.

Blocks

Values: Opportunity to develope balance and coordination
Opportunity to grow familiar with sizes, weights, and shapes
Opportunity to provide basic play material
Opportunity to have experience with a medium which may stimulate dramatic play

Student Responsibilities

- Enforce simple rules concerning safety in use of blocks
- Point out to the children that a few may be removed from the shelf and carried at a time as needed for building
- See that children respect other people's building
- Provide adequate space for building
- Provide for accessory toys

Materials

- Blocks and accessory toys
- Cabinets for storage of blocks

Housekeeping Corner

Values: Provides opportunity for children to engage in dramatic play and to act how they feel

Children have a chance to better understand what it is like to be big, feel closer to adults, and look forward to assuming adult roles at a later time. In one house corner, a little girl, who was pretending to be the "mother," told the child who was playing "daddy" that she didn't like pouting "daddies." The little boy from the point of view of the teacher seemed to be in a good mood. This was not true through the eyes of the child.

Student Responsibilities

- Sit near the doll house corner and be aware of what the children are doing.
- Make it possible for the child who wants to play with the group but is unable to do so alone to be accepted.
- Redirect a few children to some other activity in case the house corner becomes too crowded.
- Re-arrange the house corner at certain times.
- Provide special activities, such as washing doll clothes, washing dishes, or giving the doll a bath.
- Allow their placing blankets and doll clothes on the floor, to be picked up later
- Discourage children climbing on furniture in house corner.

Materials

- Old clothes, furniture made out of orange crates and boxes, dolls, tables and chairs.
- Accessory toys, such as telephones, dishes, cooking utensils

Clay

Values: Provides opportunity for release of tension through pounding, etc.
Provides experience with a solid medium and makes possible alteration of shape and size
Stimulates constructive parallel play
Provides opportunity for children to enjoy each other, and exchange ideas

Student Responsibilities

Set the stage in terms of adequate space and clay
Provide protection for clothing
Encourage children to use clay at table
Avoid furnishing a model for children to follow
Sit so you will be on child's level and try to enjoy the progress of manipulation

Materials

Adequate amount of clay for each child
Aprons

Recipe for cooked clay:

Mix 1 cup flour and ½ cup corn starch with 1 cup cold water in large bowl or pan.

Boil 4 cups water and 1 cup malt in large-based pan.

Pour boiling water slowly into bowl mixture. Return milky-looking fluid to the pan and stir on low heat until thickened (3-5 minutes). Cool and stir in 4 - 5 cups of flour. Color now if using powder paint. Separate into batches for different colors. If vegetable coloring is used, add color before flour is added. It takes a considerable amount for a good color. Knead in 4 - 5 cups of flour, until correct consistency, pliable and soft, but not sticky.

This play-dough is spongier and less drying to the hands than uncooked salt dough. It is more usable in that you can add flour to it if it draws moisture due to weather changes while stored. If it becomes too stiff with flour from use or drying, work more water into the dough. It keeps indefinitely in a covered crock, pottery jars, foil-lined tin or pliofilm bag.

Note: Takes more water for Faultless.
Dissolve Faultless in more cold water; 1½ cup

Stories

Suggestions: Stories may be offered informally if children ask for them
See that children do not bring playthings or other books to the story group
Children who do not wish to listen to the story can find something else to do in the form of some quiet activity which does not distract the story group
A check list can be a motivating device for story-telling.

Check list

"Responsibility for Storytime"

Goals for Storytime	Excellent	Average	Needs Improvement
Mechanics			
1. Opportunity was provided for each child to sit comfortably in the circle and get ready to listen.			
2. The student was able to hold the book so that it was within the range of each child in the story group.			
3. The student seemed to have the essential points of the story well in mind.			
4. The story seemed to be a part of the student as she was able to look away from the book and communicate with the children.			
Selection			
5. The content of the story was familiar in the every-day life of the pre-school child.			
6. The children were able to enjoy the story through repetition, familiar phrases or rhythmic effects.			
7. The pictures or other illustrative material contributed to the enjoyment of the story.			
8. The length of the story was within the attention span of the particular age group.			
9. The story was one which increased the child's ability to listen.			
Feelings			
10. The experience was one which seemed to be enjoyed by the student.			
11. Ideas expressed by the children at the completion of the story showed appreciation, understanding or intellectual curiosity.			

Goals for Storytime	Excellent	Average	Needs Improvement
12. The student was able to use a positive approach in the event there was likelihood of a behavior difficulty.			

Music

Suggestions: Music is offered informally in connection with other activities.
There may be a scheduled music period each day.
Children who do not wish to participate in the music can find some other quiet activity.
Children at the age of three and 3½ years enjoy playing instruments like those in a band. They also like to march to good rhythm records.
Games which provide activity related to the familiar in the environment are lots of fun when accompanied by simple piano music and singing.
Interesting records can be used when a piano is not available.

Listening to Records

The following records are suggested:

Sunday in the Park
Muffin in the City
Muffin in the Country
Little Fireman
Little Grey Ponies

Source: Creative Playthings, Inc., 5 University Place, New York 3, N. Y.

Singing and Dramatic Play

Book needed: Songs for the Nursery School, prepared by Laura MacCartney. In this book there are found many interesting activities for children connected with simple piano music. Willis Music Co., Cincinnati, Ohio, $2.50

The series of records entitled "Childhood Rhythms" is excellent for dramatic play. When familiar subjects in the child's environment are used in the musical experience, each is free to interpret the music or dramatize in his own way. Write: Ruth Evans, Box 132, P.O. Branch X, Springfield, Mass.

Again, a check list may be an incentive for evaluation and motivation of students.

"Having Fun With Rhythms"

Goals for Rhythmic Activities	Excellent	Average	Needs Improvement
Individual Difference			
1. To what extent did the activity allow for spontaneity on the part of children in the group?			
2. Did the standards set by the students allow for individual differences in children?			
3. Was there evidence of children becoming tired of the activity or going out-of-bounds?			
Reward			
4. Was there appreciation on the part of the student of the performance or contribution to the activity on the part of the individual children?			
5. Was there opportunity for children to assume any leadership or offer suggestions as to the activity?			
6. Did the time for rhythms give the children opportunity to express their feelings? (Release of tension)			
Preparation			
7. Did adequate plans seem to be made toward having arrangements in order for the activity?			
8. Did students who participated with the children appear to enjoy the activity?			
9. Did there appear to be enough variety in the rhythmic activity?			
Type of Learning			
10. Had the children learned to associate a particular rhythm with special music?			
11. Did the student appear to emphasize the experience of doing rather than perfect performance?			

As can be seen, this year's program has been an [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible], [illegible] [illegible] [illegible], suggestions for [illegible] a play school, [illegible] of the [illegible], [illegible] [illegible], [illegible] of [illegible] [illegible], [illegible] for play school, [illegible] [illegible], and play school [illegible].

It is hoped that these suggestions prove helpful in your programs.

Finger Plays

Beverly's class of four-year-olds [illegible] [illegible] finger plays [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]. [illegible] [illegible] [illegible] [illegible] [illegible] [illegible], [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] the [illegible] [illegible]. The children [illegible]. [illegible] [illegible] [illegible] [illegible], "[illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]?" the children [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]. [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] the children [illegible] [illegible] [illegible] [illegible] the [illegible] [illegible] [illegible]. [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]. [illegible], [illegible] [illegible] [illegible] [illegible] the finger play, the children all [illegible], "[illegible] [illegible] [illegible] [illegible]."

The children also wanted to [illegible] one of their favorite finger plays. [illegible] [illegible] [illegible] [illegible] [illegible] [illegible]. [illegible] [illegible] [illegible], [illegible] [illegible] [illegible] [illegible] [illegible] of the [illegible] finger plays already learned by the children. It was fun to repeat their favorites.

For a discussion of values derived from finger plays, see the following, Finger Plays and How to Use Them, by [illegible].

Examples of Finger Plays:

Five Little Baby Mice

Five little baby mice
Snuggled in their beds
With the warm cover tucked right over their heads
Then all at once—they crawled out of bed.
Let's go out and see the world, they said.

Little Turtle

There was a little turtle
He lived in a box
He swam in a puddle
He climbed on the rocks.

He snapped at a mosquito
He snapped at a flea
He snapped at a minnow
He snapped at me.

He caught the mosquito
He caught the flea
He caught the minnow
But he didn't catch me.

Bunny Song

Here is a bunny, with ears so funny
And here is his hole in the ground
When a noise he hears, he pricks up his ears
And then he jumps into the ground.

Singing Games

For these singing games, children join hands in a circle and walk around to the music of the chorus. After the chorus, children stop and pretend to do activities in verses. Children may suggest various activities which are acted out with appropriate gestures. No attempt is made to insist that each child do exactly the same thing in the same way.

Here We Go 'Round the Mulberry Bush

1. Here we go 'round the mulberry bush
   The mulberry bush, the mulberry bush,
   Here we go 'round the mulberry bush
   So early in the morning.

2. This is the way we wash our clothes, etc.
   So early Monday morning.

3. This is the way we iron our clothes, etc.
   So early Tuesday morning.

4. This is the way we scrub the floor, etc.
   So early Wednesday morning.

5. This is the way we mend our clothes, etc.
   So early Thursday morning.

6. This is the way we sweep the house, etc.
   So early Friday morning.

7. Thus we play when our work is done, etc.
   So early Saturday morning.

Looby Loo

Here we dance Looby Loo,
Here we dance Looby Light,
Here we dance Looby Loo,
All on a Saturday night.

1. I put my right hand 'way in,
   I put my right hand 'way out,
   I give my hand a shake, shake, shake,
   And turn myself about.

2. I put my left hand in, etc.
3. I put my right foot 'way in, etc.
4. I put my left foot in, etc.
5. I put my head 'way in, etc.
6. I put my whole self in, etc.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *MATHEMATICS, TESTS, INDIVIDUAL INSTRUCTION, *APPRENTICESHIPS,

The purpose of the course, designed for apprentice programs, is to provide the necessary training in the fundamentals of mathematics needed by the electrician. This book of assignment sheets was developed by a vocational coordinator, a vocational director, and members of an electricians' joint apprenticeship committee. The course was designed around the concept and philosophy of using individual assignment sheets to allow each student to progress at his own rate and to enable the teacher to devote most of his time to individual instruction. Each of the 14 assignment sheets provides the student with the references, assignment, and technical terms. Tests, to be used to identify the mathematical ability of the student, and answer sheets are included for each assignment. This book is for teacher use only. The students are to use the assignment, test, and answer sheets in loose, unbound form. When the student completes an assignment sheet, he returns it to the teacher and secures the test. After taking the test, the student is given the next assignment sheet. This document is available for $1.05 from Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. "Industrial Technical Mathematics II" (VT 003 188) is available. PREFACE

This course in Industrial Technical Mathematics I for Electricians is designed for the apprentice electrician. The basic purpose or objective is to provide the necessary training in the fundamentals of mathematics as needed by the electrician. Additional advanced courses in the program will follow this basic course.

This book of assignment sheets is designed for the instructors use. Students are to use the assignment sheets in loose, unbound form. The individual differences of the students may be taken care of if the assignment sheets are used as described in "Directions to Instructor".

Appreciation is made to Delmas Vaughn, vocational coordinator of Bloomington High School; Joe Stradling, vocational director of Bloomington High School and to Russel Noel, Henry Richards, Lester Noel and Russel Isom, all members of the Electricians Joint Apprenticeship Committee of Bloomington. The coordinated and cooperative efforts of all made the development of this course possible.

DIRECTIONS TO THE INSTRUCTOR

This course was developed around the concept and philosophy of using individual assignment sheets. If these sheets are used correctly, each student will be allowed to progress at his own rate. The abilities of all will be developed to their fullest extent.

The instructor only, should use this book. The loose individual assignment sheets are used by the students. The following method of operation has proven satisfactory:

Each student should have two folders in the file; one for the "completed" work, the other for the "incomplete" work. The assignment sheets should be filed in consecutive order in another drawer. The instructor should lay out the student folders before class time. This prevents congestion and a bottleneck around the file cabinet at the beginning and ending of class. When the student completes an assignment sheet, he turns this into the instructor, then secures the next sheet.

Tests are included periodically. These may be used to identify the mathematical ability of each student. This makes it possible to start the students at the proper level in the course. The tests may also be used in the traditional manner.

If the course is used as it should be, the instructor will be freed of many routine activities and will be able to devote his time almost entirely to individual instruction.

It must be kept in mind that the assignment sheets are only a teaching aid or device. Necessary instruction is still necessary.

An accurate record of each student's progress should be kept by the instructor.

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Test on Whole Numbers   Assignment M-I T-1

Remarks and Purpose ____

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. In wiring eight houses the electricians find that they must install 68, 58, 89, 84, 72, 59, 69 and 57 outlets respectively. How many outlets must be roughed-in all together?

2. In the course of 4 months an electrician used the following switch outlet boxes on different jobs: 56, 9, 86, 36, 93, 105, 42 and 56. What is the total number used?

3. From 2 barrels of dry cells 325 cells were placed in the stock room, 45 cells were placed on the shelf in the show room and 18, 25, 30, 24 and 6 dry cells were sold. What was the total number of cells packed?

4. An electrical supply house purchased in separate lots 35, 40, 125, 200, 75, 90, 20 and 30 lbs. of solder. What was the total number of pounds of solder purchased?

5. A school has twelve electrical circuits which have a capacity of 545, 650, 750, 1820, 2462, 2571, 1360, 1540, 793, 1225, 330 and 793 watts respectively. What is the total number of watts consumed when all these circuits are being used under their total loads?

6. BX cable in the following amounts was used on an apartment house job: 625 ft., 785 ft., 75 ft., 140 ft., 310 ft., 325 ft., and 120 ft. What was the total amount used on the job?

7. An electrician took out of stock 500 ft. of BX cable on Monday; on Tuesday 250 ft.; and on Wednesday 750 ft. On Friday 339 ft. of BX were returned. How many feet of BX were used?

8. An inventory sheet showed 565 outlet boxes on January 1. On January 10, 145 were taken out of stock. On January 14, 35 were returned to stock. How many outlet boxes were left?

9. A 1000 ft. reel of fairly large R.C. stranded cable weighed 1106 lbs. Of this 365 lbs. were used on a certain job from the switch to the first pull box and 422 lbs. from the first box to the last box. How many pounds of wire were left on the reel?

80

10. At inventory time 435 lbs. of magnet wire for winding motors were checked as being available. In ten successive days, the following number of pounds of wire was taken out of stock; 15, 6, 24, 12, 3, 8, 17, 32, 16 and 13. How many pounds were left?

11. A supply house has 804 solenoids for 5 hp. G.E. motor controls. The clerk must reorder this item when the supply reaches 60. On January 1, 14 were sold; on January 16, 75 were sold. How many more can be sold before reordering?

12. A buyer was told he could purchase 70 screw drivers. He needed ten 4" lengths, twelve 6" lengths, twenty 8" lengths, twenty 10" lengths. How many heavy 24" length screw drivers can he buy and remain within his quota?

13. If two of these forms were used and the wire was of such a size that only 42 layers and 98 turns per layer could be wound, how many turns would there be in both coils?

14. If we were using in a building, sixteen 50 watt, nine 15 watt, twelve 25 watt, six 75 watt and four 100 watt lamps, how many watts are consumed when all the lights in the building are burning?

15. In a 182 ft. run of BX wiring the staples are placed 4 ft. apart. How many staples were used? Add one to the number of spaces. What did they cost per staple if the total cost was \$1.88?

16. A total load of 25,620 watts was distributed equally over 15 branch circuits. What would be the load per circuit in watts?

17. How many 250 ft. rolls of BX wiring are required on a job requiring 5250 ft.?

18. Two electricians worked a total of 640 hours on a job. Each worked on an 8 hour, 5 day week schedule. How many weeks did each man work?

19. Twenty-five hundred feet of BX cable were ordered, to be shipped in 250 ft. coils. How many coils were received?

20. The cost of 3600 insulated staples was \$6.30. What was the cost per standard package of one hundred?

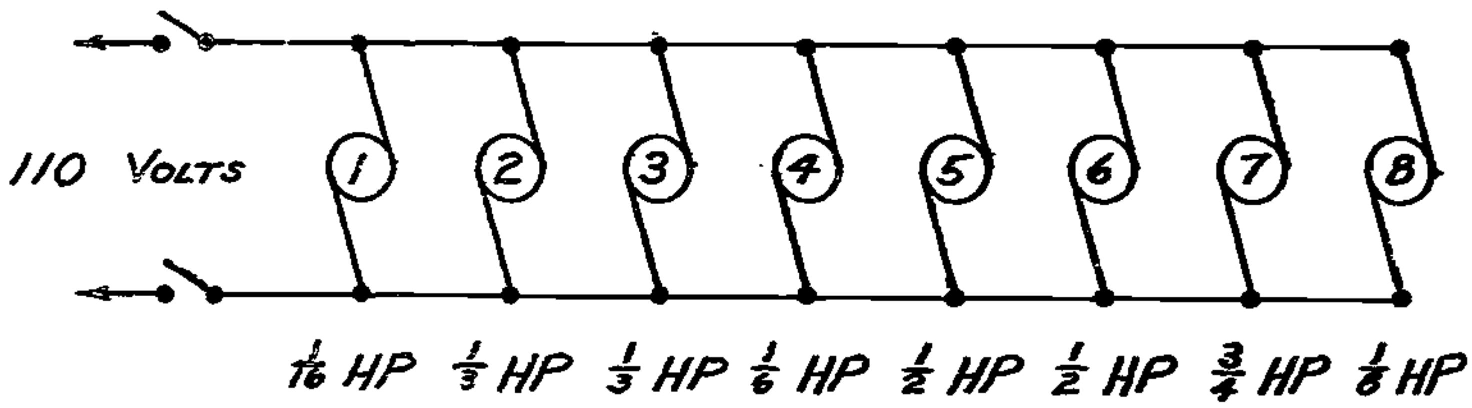
Assignment M-I T-2

Remarks and Purpose ______________________________

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

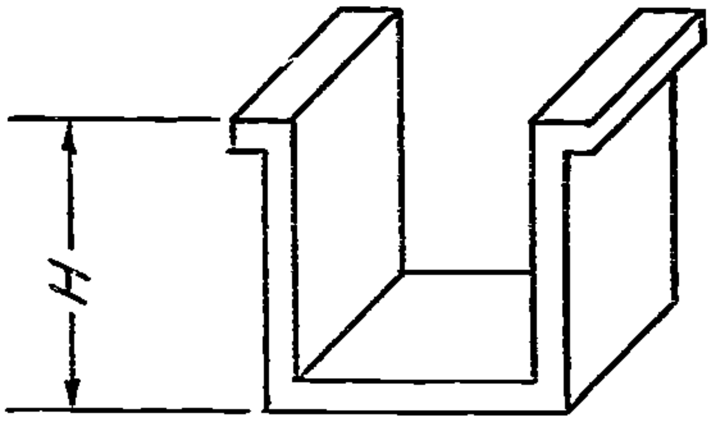
1. Eight motors, having rated horsepower as indicated on the diagram below, were connected in a circuit. What is the total horsepower of motors No. 1 to No. 4 inclusive?

2. What is the total horsepower of motors No. 5 to No. 8 inclusive, shown on diagram below?



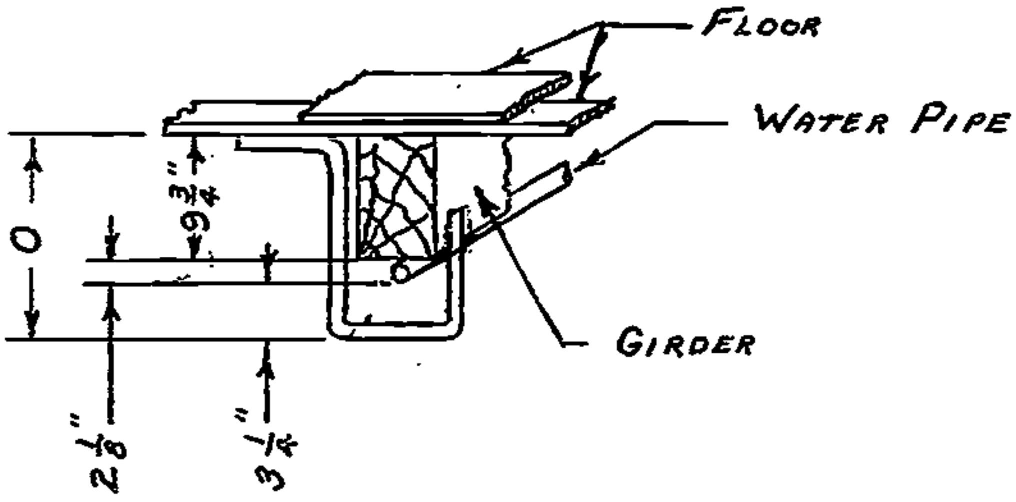
3. A piece of carbon 31/32" thick has a copper plating of 1/64" on each side. What is the total thickness?

4. On a theater repair job, it was found that a fixture had been hung from several pieces of wood spiked together. A bracket (see figure) was made to take the place of the wood. The wooden pieces were 7/8", 1 3/4", 2 3/4", 15/16" and 11/16" thick. What was the height, "H", of the bracket?



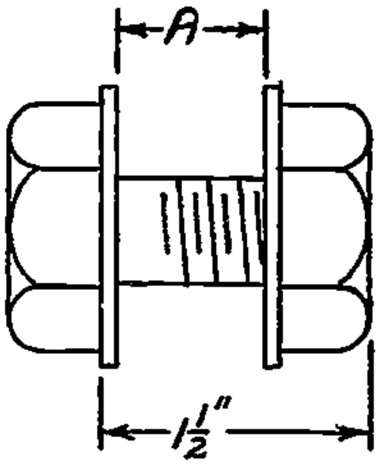
SUBJECT: Test on Fractions

5. Find distance O for bending electrical conduit in the figure.



6. What space on a bolt will six washers or spacers of the following thicknesses occupy: 1/16", 1/2", 1/8", 3/32", 3/64", 3/16"?

7. On a bolt 1 1/2" long under the head, were placed a 1/8" washer and a 3/32" washer. What distance (A in the figure) was left between the two washers after the 1/2" nut was screwed on to its full thickness?



8. If the same bolt (in the figure above) was inserted through a block 11/16" thick with the 1/8" washer, how much of the bolt would extend beyond the nut when drawn up tightly?

9. A slot in a piece of copper is too wide for a wire to be held in tightly. The slot is 5/32" in width and the wire 3/64". How much larger is the slot than the wire?

10. What is the lowest common denominator?
1/16, 3/4, 7/8, 31/32, 10/12

11. What is the lowest common denominator?
3/4, 8/12, 5/8, 5/9

12. If an electrician worked 4 3/4 hours a day on a certain job at $1.72 1/2 an hour, what was his pay for a 5 day work week?

13. A department in a factory had three 3/4 hp. (horsepower) motors, five 1/4 hp. motors, six 3 1/3 hp. motors and eight 7 1/2 hp. motors. What was the total connected motor load in horsepower rating?

14. A wiring job calls for thirty-two pieces of 1/2" conduit 7 1/2 ft. long, eight pieces 13 1/4" long, three pieces 7 3/4" long and six pieces 9 5/8" long. What is the total number of feet of 1/2" conduit required for the job?

15. An oblong coil has two sides 5 5/8" long and two sides 9 1/4" long with 1325 turns. What is the total length of the wire?

16. A coil of BX has 85 1/2 turns and an average diameter of 1 2/3 ft. Multiply the diameter by 3 1/7 to obtain the average length of each turn and then estimate the total length.

17. How many 7 3/8" pieces of conduit can be cut from a 10 ft. length?

18. A lot of bushings cost $3.69. If the price per bushing was 4 1/2¢, how many bushings were in the lot?

19. How many whole wedges 3 7/8" long can be made from 20 wedge strips, each 3 ft. long?

20. How many 16 3/8" lengths can be cut from a 10 ft. length of conduit?

21. If a spool of magnet wire was purchased for $7. 87, how many pounds did the spool contain if a pound cost 31 1/2¢?

22. A motor base must be blocked up 6 1/8". If two blocks are used one of which is 3 3/4", how thick is the other? (see figure)

Test

ELECTRICIANS VOCATIONAL SCHOOL

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Test on Decimals

Assignment M-I T-3

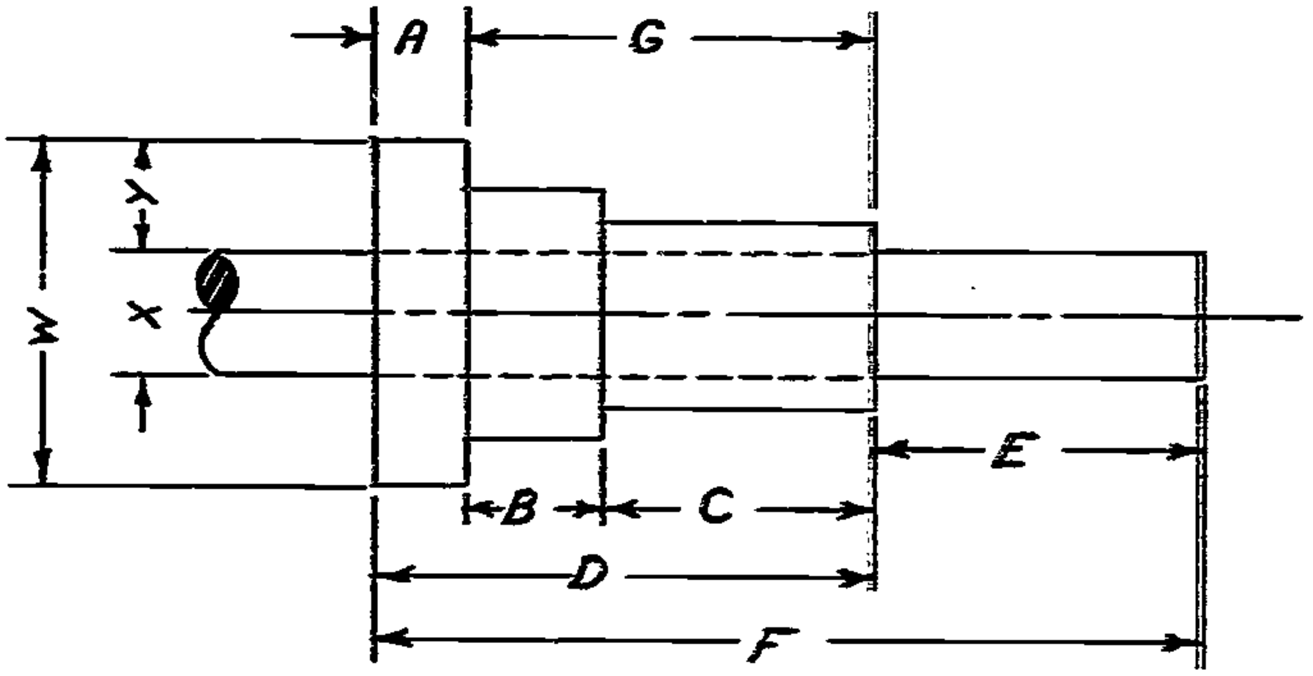
Remarks and Purpose ______________________________

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. What would be the cost of winding an automobile armature if it took 1 lb. of #16 E.S.C.C. (enamel single cotton covered) wire at $0.29; 1 pt. of insulating varnish at $.56; 2 oz. of Tufflex insulation at $0.20; top sticks; $0.08; 1/16" gray fibre, 2 oz., $0.20; 1/2 yd. varnished cambric $0.15; and labor for 2 hours $3.50?

2. A contractor required the following additional items for a certain job: BX cable $32.65; conduit pipe, $2.56; toggle switches, $24.45; loom boxes, $7.50. What was the total cost of these additional materials?

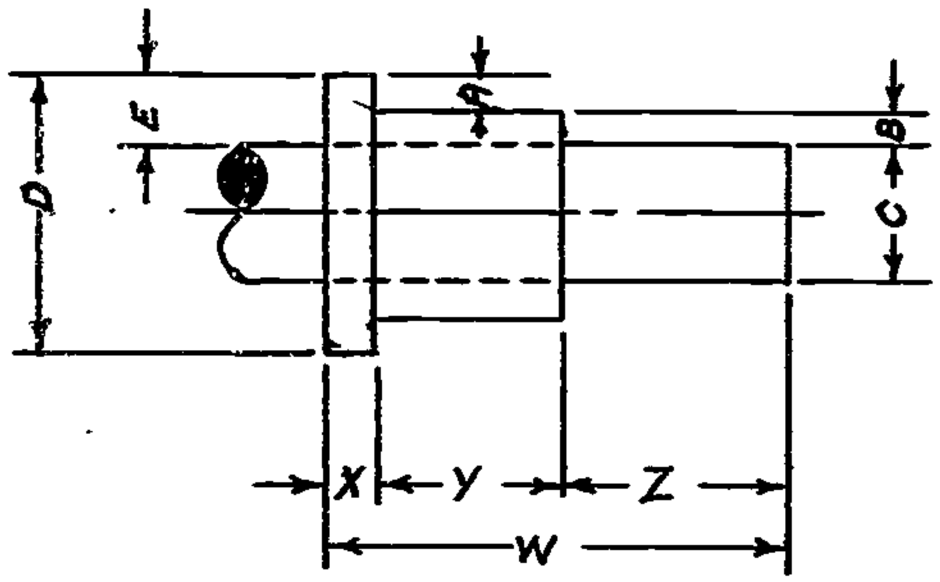
3. Refer to sketch. If A .375", B .875", C 1.0625", find D.



4. If X .9375" and Y .875", find W. (Refer to sketch)

5. A pin insulator measures 1.312" in diameter at the small end and 1.9375" at the other. What is the difference in diameter?

6. In the sketch below, if D=1.875" and C=1.250", find E.



7. In the same sketch, if X =.250", Y=2.0625" and W=3.375", find Z.

8. A wire is 72 thousandths of an inch in diameter. What number wire is it?

9. A motor shaft that was 1" in diameter has worn down to 996 1/2 thousandths. How much has the diameter been reduced by wear? Write your answer decimally and also in words.

10.. What would be the cost to operate this [illegible]

11. A commutator has a diameter of 2.375". What is the circumference of the commutator?

12. What would be the resistance of 2.5 mil ft. if the resistance of one mil ft. 10.4 ohms (unit of electrical resistance)?

13. What will 1750 ft. of BX cost at $.2475 per ft.?

14. If a dry cell delivers avout 1.375 volts, what voltage will 27 dry cells deliver, if connected in series? (In series connection the voltage is equal to the sum of the voltages of the cells).

15. If the power company charged a city $14.60 per street lamp per year, and 1125 street lamps were supplied with current, what would the city's power bill be, per month?

16. If it costs $938.50 for constructing 1/3 of a mile (5,280 ft. 1 mile) of an underground transmission system, what is the average cost of this job per foot?

17. If porcelain tubes cost $10.56 per M (thousand), what would be the loss to the school over a period of 27 school days if an average of 3 were broken per day?

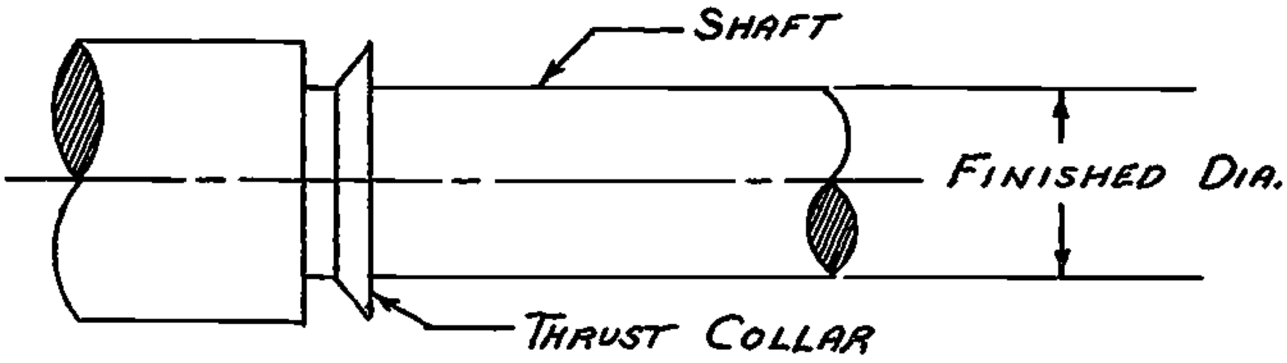
18. A panel board 28" in width is to have 7 holes spaced equally across it in a straight line. Each hole will be 1.25" in diameter, and the distance from the edge of the panel to the first and last hole will be equal to the distance between the edges of consecutive holes. What will be the spacing between holes?

19. A Christmas tree lighting set having 8 lamps in series will have about the same number of volts across each lamp. The number of volts across each lamp.will equal the voltage applied to the circuit (112.5 volts) divided by the number of lamps in the set. What is the voltage across each lamp?

20. Number four 0 (0000) cable (three conductor) weighs 3530 lbs. per M ft. What would be the weight (net) of a reel of this cable 475'-0" long?

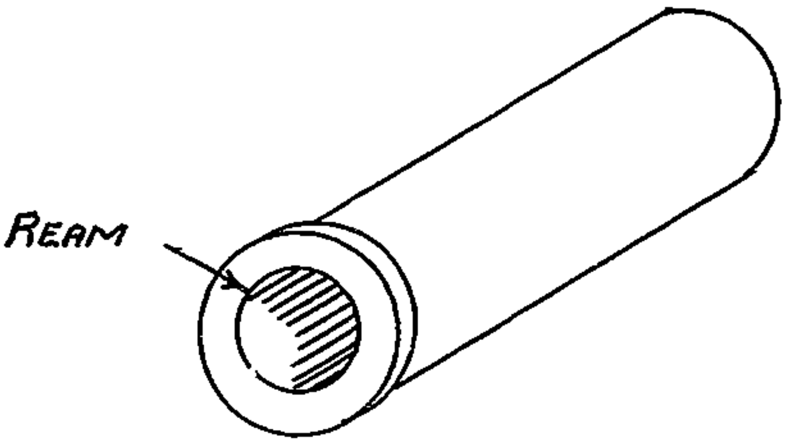
21. The weight of A. B. C. flexible #14-2 conductor cable is 145 lbs. per M ft. What would it cost to ship 600'-0" of this cable at 70¢ per hundred lbs.?

22. An armature shaft (see figure) originally 1 3/8" in diameter was turned 1/16" smaller in diameter due to the irregular surface caused by running in a dry bearing. What was the finished size of the shaft, expressed as a decimal?



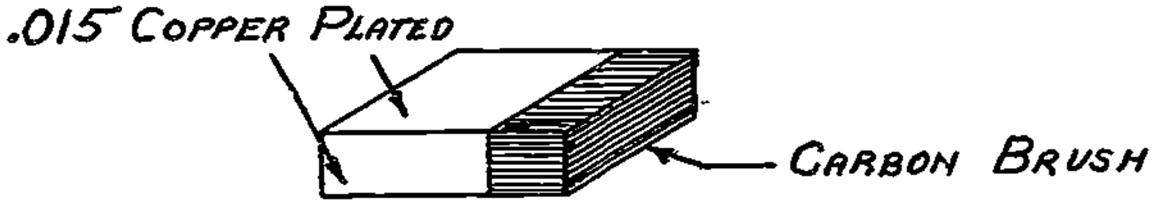
23. What size (expressed decimally) drill would you use to drill holes for bolting a meter to a switchboard, if the studs on the meter measured .4365"? The holes are to be 1/32" larger than the studs.

24. What fraction size reamer should be used to ream a hole in a motor bearing to fit a shaft that measures 1.625" in diameter? (See Figure)



25. A bearing with a diameter of 1 1/4" is found to be .008" oversize for the armature shaft. What should the bore (hole through center) of the bearing be, to fit the shaft? Allow .002" for lubrication.

26. A carbon brush (see figure) measuring 23/32" thick and 1 15/32" wide is to have a copper plating on the sides .015" thick. What are the finished dimensions?



27. A set of 2" wide x 5/8" thick carbon brushes fitted the brush holders too tightly. 5/1000" was taken off the width and .015" off the thickness by sanding. Give the dimensions of the width and thickness of the carbon brush after sanding.

ELECTRICIANS VOCATIONAL SCHOOL

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Test on Percentage and Discount — Assignment M-I T-4-5

Remarks and Purpose A knowledge of percentage is very useful and necessary in all walks of life. It is especially applicable to many phases of the electricians work. This is a check-up to see if you have mastered the fundamentals of percentage and discount.

Assignment: Work the following problems in the space provided on the answer sheet and place your answers in the space provided.

1. How much is 2 per cent of 25; 3 per cent of 15; $\frac{1}{2}$ per cent of 50?
2. What per cent of 80 is 8?
3. $2.00 is 5 per cent of how many dollars?
4. The input to an electric motor is 7 kw. If it delivers 7.1 hp., what per cent of the input is delivered?
5. A 15 amp fuse carried a 15 per cent overload for 3 seconds. What current flowed through the fuse during this time?
6. What is the efficiency of a transmission line if the power supplied is 4,500 watts and the power delivered is 4, 200 watts?
7. The National Electric Code specifies a maximum of 2 per cent voltage drop in a house line. What is the minimum voltage at a load if the supply voltage is 120 volts?
8. A solenoid exerts a pull of 0.9 lb. at its rated voltage. What pull is exerted at 85 per cent of its rated voltage?
9. The voltage lost in a line supplying a motor is 5 per cent of the generator voltage of 220 volts. Find (a) the voltage lost and (b) the voltage supplied to the motor.
10. The effective value of an a-c wave is 70.7 per cent of the peak value. What is the effective voltage of a wave which reaches a peak of 165 volts?
11. How many watts of power are lost in a transformer rated at 250 watts if 3 per cent of the energy is lost in heat?
12. If 100 ft. of a 250-ft. roll of wire has been used, what per cent has been used?

13. A motor has an output of 5 hp. This amount is 85 per cent of the power put into the motor. Calculate the power input.

14. The plate voltage on a radio tube may vary up to 10 per cent of its rated value and still be satisfactory. A tube rated at 200 volts has a plate voltage of 185 volts. Is this within the normal variation.

15. What per cent of the power taken by a transformer is delivered if it takes 200 watts and delivers 190 watts?

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. Raise the following expressions to the power indicated:

   a. 8^2
   b. 10^2
   c. 8^3

2. If the volts were 220 and the resistance 3.6 ohms, how many watts would be used?

3. Solve the following expressions and carry the results out to two places:

   a. $\sqrt{169}$
   b. $\sqrt{892}$
   c. $\sqrt{2000}$

4. Five hundred fifty ohms, hot resistance, and 22 watts have a current of how many amperes flowing?

$$\text{Amps.} = \sqrt{\frac{22}{550}}$$

5. What current would be required in a circuit of 25 watts and 64 ohms?

$$\text{Amps.} = \sqrt{\frac{25}{64}}$$

6. When the resistance is 73.3 (hot) and the wattage is 165, what current would be necessary?

$$\text{Amps.} = \sqrt{\frac{165}{73.3}}$$

7. If a 250,000 C.M. cable is composed of 37 strands, what is the approximate diameter of each strand?

8. A 750,000 circular mil cable is composed of 61 strands of copper wire of equal size. What is the approximate diameter of one of the strands?

INDUSTRIAL TECHNICAL MATHEMATICS-I

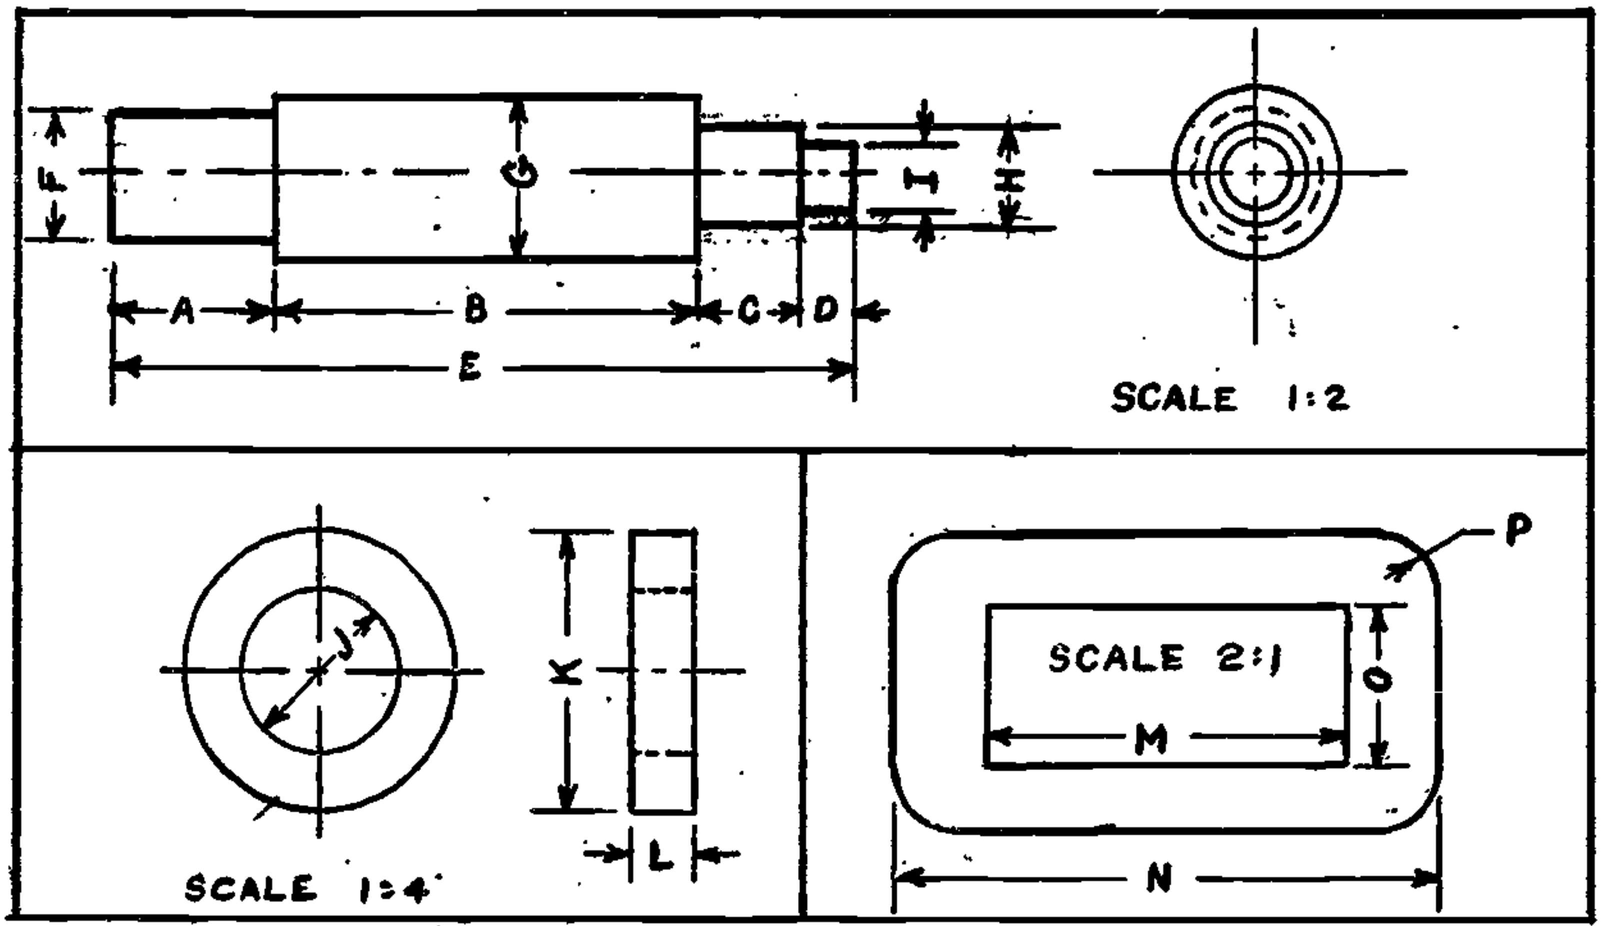
SUBJECT: Test on Ratio and Proportion

Assignment M-I T-8

Remarks and Purpose ______________________________

Assignment: Work the following Problems:

1. Measure the various lengths and diameters as shown on each drawing. Then, using the scale given for each drawing, compute the actual size.



2. What is the ratio of a pinion gear with 14 teeth to a driven gear with 72 teeth?

3. What is the inverse ratio of the r.p.m. of two motors if the first motor turns 1750 and the second turns 3500?

4. What is the ratio of two generators if the outputs are 3500 watts and 24500 watts respectively?

5. If an electrically driven sump pump discharges 125 gals. of water in 4.5 mins., in what time will it discharge 320 gals?

6. A wire 750 ft. long, has a resistance of 1.893 ohms. How long is a copper wire of the same area whose resistance is 3.156?

7. A wire 2725 ft. long, 85 mils in diameter, has a resistance of .372 ohms. Find the resistance of a wire of the same material 3600 ft. long.

8. Four men did a certain electrical job in 120 hours. How long would it take three men to do the same type of job?

9. One hundred twenty feet of conduit cost $7.89. What would 250 ft. cost at the same rate?

10. A pinion driver gear has 24 teeth; the driven gear, 84 teeth. What is the ratio of the driver gear to the driven gear?

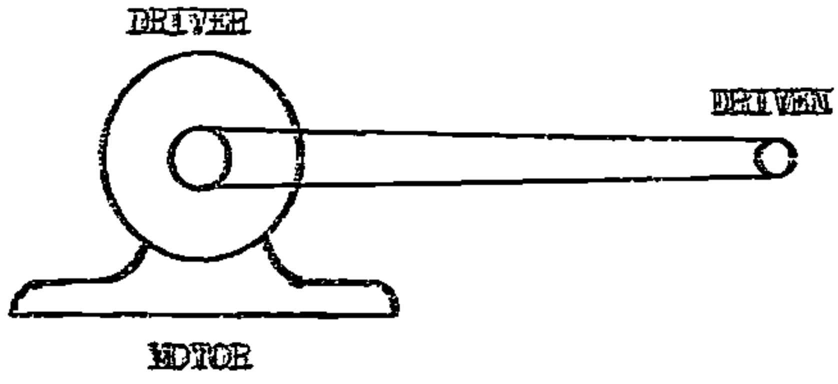
11. Give the ratio of a primary winding of 350 turns to a secondary winding of 17 1/2 turns.

12. Determine the ratio of the shaft diameter (D) to bearing length (L) in problems A through E.

	Shaft Diameter	Bearing Length
A	1.000"	2 1/2"
B	.750"	1.500"
C	1.250"	3.750"
D	.312"	1"
E	.625"	1 7/8"

13. A wire that is 925 feet long has a resistance of 2.92 ohms. Determine the length of copper wire of the same area that has a resistance of 4.24 ohms.

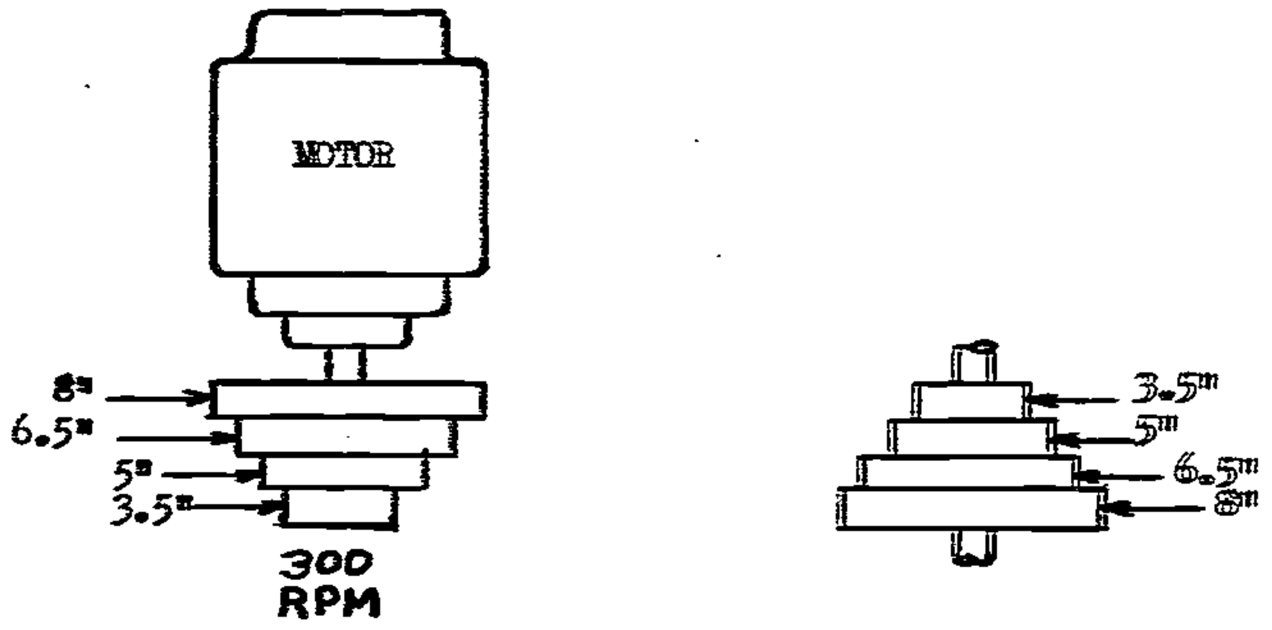
14. In the direct drive illustrated, the 4" drive pulley revolves at 1700 RPM. What size pulley is needed to increase the RPM of the driven pulley to 3200? Round off pulley diameter to nearest 1/2".



15. Compute the missing value for gears A through E.

	No. Teeth in Driver	No. Teeth in Driven	RPM of Driver	RPM of Driven
A	24		200	150
B	56	72		300
C	8	36	70	
D		144	50	32
E	72	96	60	

16. Determine the spindle speed for each step of the step cone pulley and drive illustrated.



17. A crew of 12 men assemble 45 units a day. If the production is to be increased to 80 units a day, how many additional men will be needed?

18. Determine the diameter of the smaller pulley.

ELECTRICIANS VOCATIONAL SCHOOL

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Test on Solution of Simple Formula   Assignment M-I T-9

Remarks and Purpose ______________________________

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. $R=\frac{KL}{d_2}$

When R = resistance
K = specific resistance of copper (10.8)
L = length in feet
d = diameter in mils

What is the resistance of 240 ft. of a 2-wire circuit using #10 S.B.W.P. wire with a cross-sectional area of 10,380 cir. mils?

2. $I=\frac{E}{R+r}$

When I = amperes
E = volts
r = internal resistance
R = resistance of external circuit

If a cell has an e.m.f. of 2.4 volts, an internal resistance of 0.03 ohms, and is connected to an electromagnet with a resistance of 1.5 ohms, what current will the magnet receive?

3. $I=\frac{E \times ns}{(r \times ns)+R}$

When E = volts of one cell
ns = number of cells in series
r = internal resistance of one cell
R = resistance of external circuit
I — amperes

If the internal resistance of five cells is 1.8 ohm each, and the cells are connected, as shown in the diagram, to a 2 ohm resistance, what current will flow through the circuit?

e.m.f. per cell 1.5 volts

4. R_3 is the unknown resistance of a wheatstone bridge arrangement. If R_1= 22 ohms, R =30 ohms, R_2=200 ohms, find the resistance of R_3 by substituting in the formula given below.

$$\frac{R}{R_2} = \frac{R_1}{R_3}$$

When R =) variable resistance
R_1 =) in arms of bridge
R_2 =)
R_3 = unknown resistance

5. $$HP = \frac{IE\ \%Eff.}{746}$$

When I = current in amperes
E = voltage in volts
%Eff. = %efficiency of motor
HP = horsepower

Find the current required by a motor when the horsepower, % efficiency of the motor and the voltage are known. Transpose the above equation to get the value of I.

6. What is the impedance of a coil with 3 ohms resistance and 12 ohms reactance?

$$Z = \sqrt{R^2\ X^2}$$

When Z = impedance
R = resistance
X = reactance

7. A 3-phase 3-wire circuit supplying power to several motors takes 275 amps. If the pressure is 220 volts and the power factor P.F. 80%, what is the kilowatt load?

$$KW. = \frac{I \times E \times 1.73 \times P.F.}{1000}$$

When KW = 3-phase power in kilowatts
I = current in amperes
E = pressure in volts
P.F. = % power factor

8. A 2-phase 4-wire circuit with an e.m.f. of 220 volts is connected to a group of motors that requires 85 amps. at 80% P.F. What will the load be in kw.?

$$KW. = \frac{I\ E \times 2\ P.F.}{1000}$$

When KW. = 2-phase power in kilowatts
I = amperes
E = volts
P.F. = % power factor

9. What would be the amps. in a 3-phase circuit when the load is 67.5 HP, 90% eff,, pressure 440 volts and 80% P.F.?

$$HP = \frac{I \times E \times 3 \times \%Eff. \times P.F.}{746}$$

10. What is the frequency (in cycles) of the current furnished by an alternator having 8 poles and running at a speed of 900?

$$f = P \times \frac{N}{60}$$

When f = frequency
P = number of pairs of poles
N = revolutions per minute

Test

ELECTRICIANS VOCATIONAL SCHOOL

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Test on Ohm's Law

Assignment M-I T-10

Remarks and Purpose ____________________

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. A neon electric sign draws $1\frac{1}{4}$ amps. If its resistance is 92 ohms, find the voltage needed.

2. What current is drawn by a 6,000 ohm electric clock when operated from a 110 volt line?

3. What is the resistance of a motor if it draws 5 amp from a 110 volt line?

4. A 110 volt line is protected with a 15 amp fuse. Will the fuse "carry" a 5.5 ohm load?

5. A voltage of 28.8 volts is required to send 7.2 amp of current through a wire 5 miles long. (a) What is the resistance of the wire? (b) What is the resistance per mile of a wire?

6. If a 0.6 ohm rail connector accidentally shorted the 12 volt system of a model railroad, what current would flow?

7. According to the National Electrical Code, No. 14 asbestos-covered type A wire should never carry more than 32 amp. Is this wire safe to use to carry power to a 10 ohm 230 volt motor?

8. A 600 watt soldering iron is used on a 120-volt line and has a resistance of 24 ohms. Find the current used.

9. What is the smallest number of insulators, each rated at 12,000 volts that should be used to safeguard a 220,000-volt transmission line?

10. Find the resistance of an electric furnace drawing 41 amp from a 230 volt line?

11. Find the resistance of an iron if it draws 3.8 amp from a 110-volt line?

12. The resistance of the field coils of a shunt motor is 60 ohms. What is the field current when the voltage across the coils is 220 volts?

Assignment M-I T-11

Remarks and Purpose ____________________

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. What would be the length of a copper wire 0.104" in diameter and having a resistance of 3.1 ohms?

2. What are the watts consumed in a circuit with an e.m.f. of 115 volts and a current of 7.5 amps. flowing?

$$W = E \times I$$

W = watts
E = volts (e.m.f.)
I = amps.

3. What pressure, in volts, is necessary for a circuit of 1625 watts and a current of 14.3 amps.?

$$E = \frac{W}{I}$$

4. What current will flow through a 550 watt electric iron when a pressure of 112 volts is maintained?

$$I = \frac{W}{E}$$

5. What is the current required in a circuit having a resistance of 26.5 ohms and 500 watts?

$$I = \sqrt{\frac{W}{R}}$$

6. What is the lost wattage in the armature of a generator having an internal resistance of 0.3 ohm and a pressure of 125 volts across its terminal?

NOTE: 6 volts lost in armature circuit.

$$W = \frac{E^2}{R}$$

7. What is the resistance of the coils of an electric bell if 0.25 amp. flows when a pressure of 2.8 volts is applied?

$$R = \frac{E}{I}$$

E = volts (pressure, e.m.f.)
R = resistance in ohms
I = current in amperes

8. What is the resistance of an electromagnet connected to a cell having an e.m.f. of 2.2 volts and a current of 0.3 amp. flowing through it?

9. Find the resistance of one conductor of an annunciator cable operating on a 12 volt circuit with a 1.2 volt drop and line current of 2 amps. The cable is 160 ft. long.

10. A 110 volt battery supplies current for signal lights and switch operation between 2 factory substations. The cable is composed of thirty #12 gage copper conductors. The length of the cable is 2200 ft. and the diameter of one conductor is 80.8 mils. Find the resistance of the circuit.

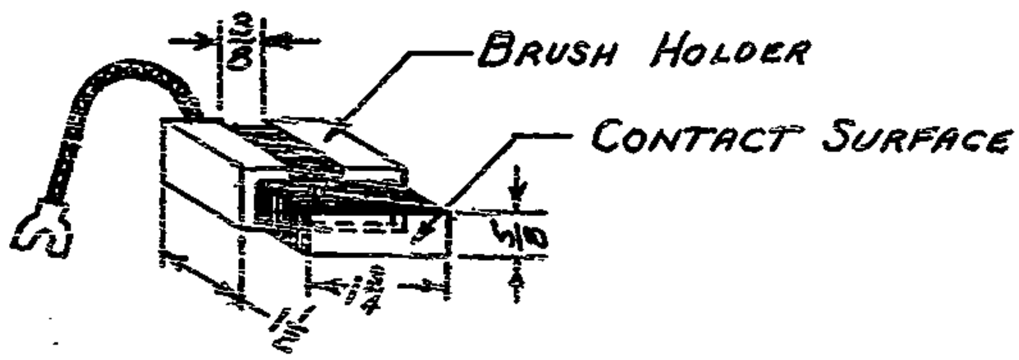
Assignment M-I T-12

Remarks and Purpose____

Assignment: Work the following problems in the space provided on the answer sheet and place your answers in the space provided.

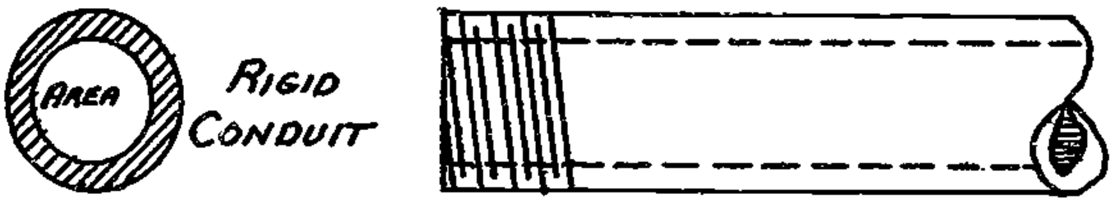
1. A piece of copper bus-bar, 5/8" x 1" in cross section, has an area of how many sq. mils?

2. Carbon brushes have a certain contact surface area. What would be the contact surface area of the brush shown below?



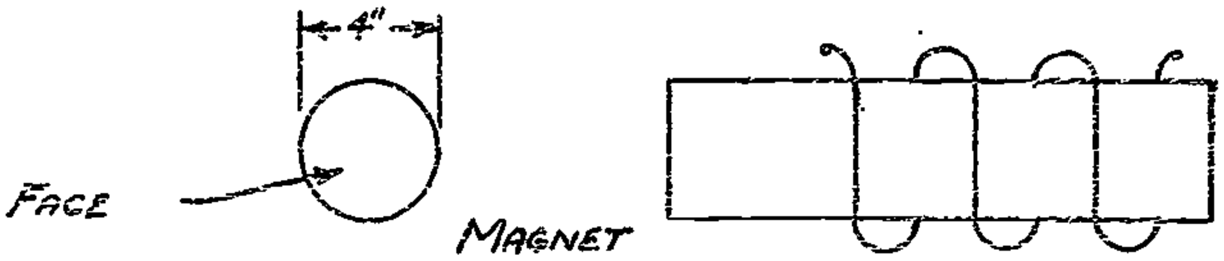
3. If the brush in the above sketch was 2" long and placed in a 4 sided brush holder with a depth of 1 1/2", what amount of surface would be making contact with the brush holder?

4. Give the inside areas of the following sizes of rigid steel conduit: 1/2" conduit, inside diameter .622; 3/4" conduit, inside diameter .824; 1" conduit, inside diameter 1.049. See Figure.



5. A lead covered 500,000 3/c (three conductor) cable has an approximate outside diameter of 2.44". What is the approximate cross-sectional area of this cable?

6. The tractive force of a magnet is proportional to the square of the density of the lines of force per square inch and is propörtional to the area of the surface contact. What is the area of the face of a magnet that has a 4" diameter? See figure.



7. What is the square mil area of the cross section of a #0, B and S gauge copper wire? Refer to wire tables.

8. What is the square mil area of a wire 1/4" in diameter?

9. What is the surface contact area of a magnetic pole that has an outside diameter of 5.563"?

10. An electromagnetic brake used a brake lining that is 1 3/4" wide and the outside diameter is 8". What is the area of braking surface if 4 brake linings are used per brake?

INDUSTRIAL TECHNICAL MATHEMATICS-I

SUBJECT: Right Triangles

Assignment M-I T-13

Remarks and Purpose ______________________________

Assignment: Work the following problems:

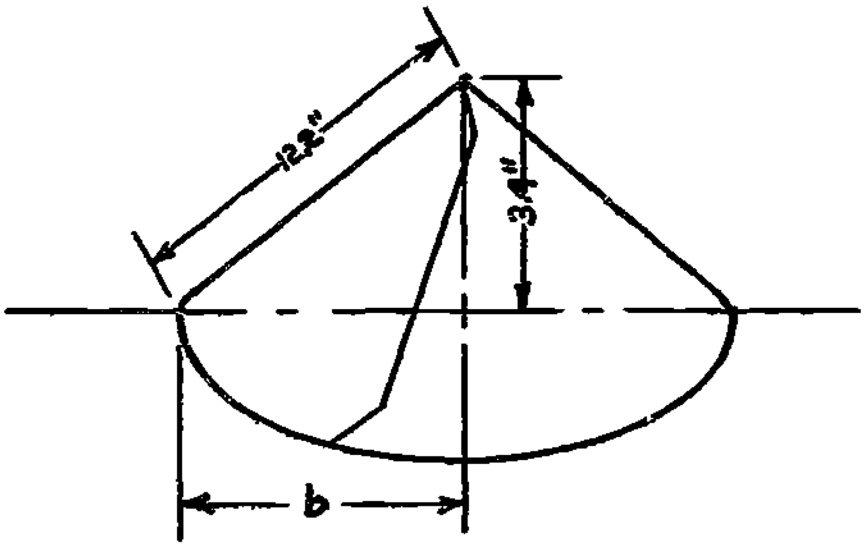
1. Determine the length of side (L) for triangles A through E. Substitute the values given in the table in the equation,

$$L = \sqrt{X^2 + Y^2}$$

	A	B	C	D	E
X	3"	6.6"	1'	10"	5.6"
Y	4"	8.8"	2'	16"	7.8"

2. Determine length (b) when

$$b = \sqrt{c^2 - a^2}$$

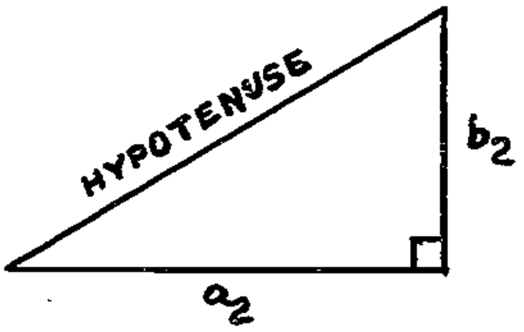


3. Compute dimension Z of the part illustrated, for each dimension given for X and Y, correct to three decimal places. Wherever practical, use the table of square root values.

	Given Values	
	X	Y
A	3	4
B	6	7
C	12.5	15
D	8.6	10.5

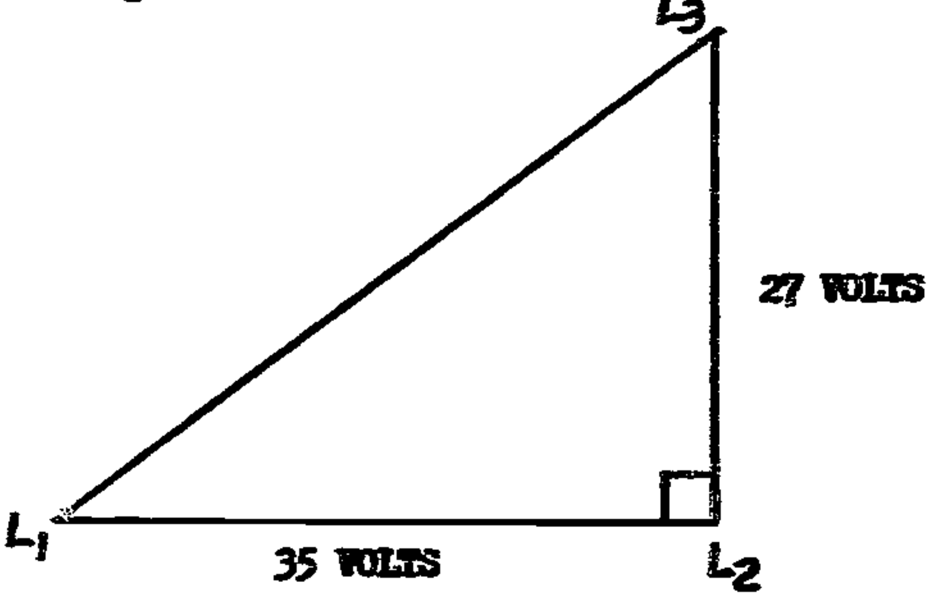
$$Z = \sqrt{X^2 + Y^2}$$

4. The largest side (hypotenuse) of a 90° triangle is $= \sqrt{a^2 + b^2}$
Find the hypotenuse for triangles A, B and C.

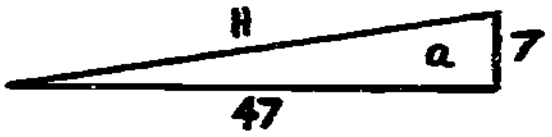


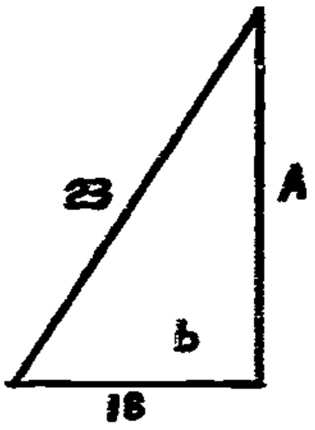
Triangle	A	B	C
Side a=	6 1/2"	7 1/2"	11.5"
Side b=	2"	3 1/2"	4.5"

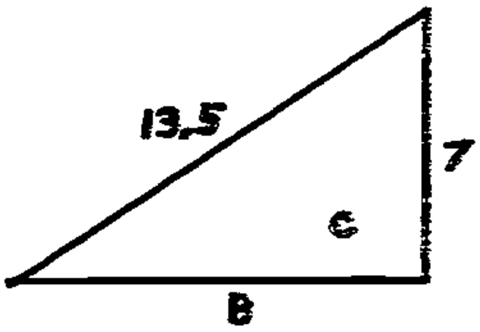
5. The vector diagram shows a voltage of 27 between L_3 and L_2 and 35 volts between L_1 and L_2. What is the voltage across L_1 and L_3? This voltage is equal to the square root of the sum of the squares of the other two sides of the triangle.



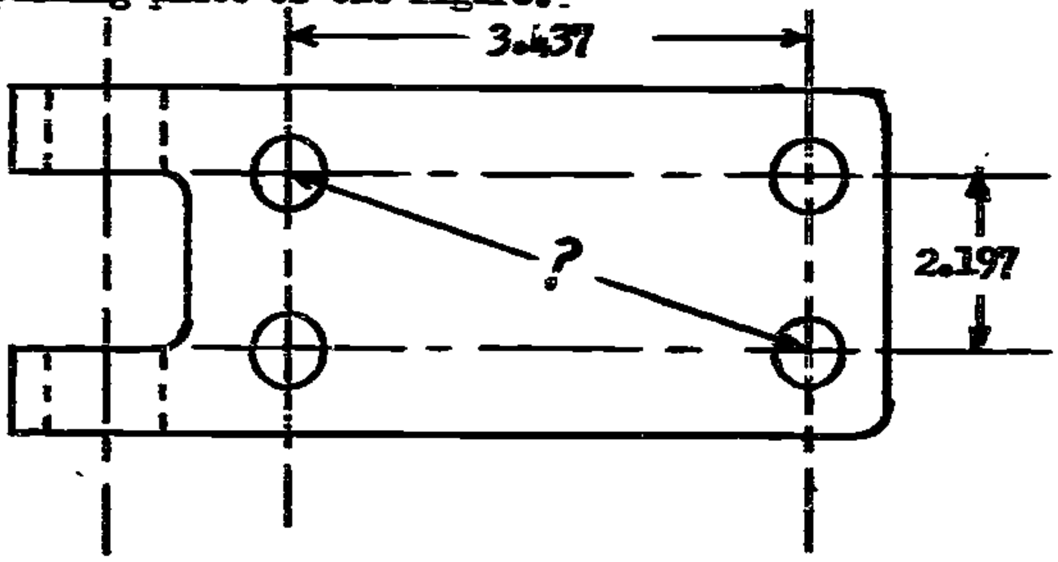
6. Find the length of the missing side in each of the following right triangles.







7. Find the diagonal distance between the two drill bushing holes shown in the bushing plate of the figure.



8. If an acre of land is laid out in the form of a rectangle and one side of the rectangle is 153 feet long, what is the length of the other side?

9. How long can a piece of sheet metal be which is 2 ft. wide and can be placed inside of a box 2 ft. wide X 3 ft. high X 4 ft. long? Disregard its thickness.

10. What length of wire will be required to wind around a bar 18 inches long, 1 15/16 inches in diameter, with a lead of 2 1/4 inches if the wire is 1/16 inch in diameter?

Assignment: Work the following problems in the space provided on the answer sheet, and place your answers in the space provided.

1. A circuit has an impedance of 45 ohms. The current flowing is 1.3 amp. What is the e.m.f. across the circuit?

2. Find the impedance of a coil which draws 4.6 amp. when connected across a 110-volt 25-cycle line.

3. A circuit has an impedance of 35.2 ohms. What is the effective voltage if the maximum value of the current is 11.4 amp.?

4. What is the impedance of a circuit which has a resistance of 48 ohms and a capactive reactance of 64 ohms?

5. The impedance of a certain appliance is 52 ohms at 60 cycles. If this device can take 10.6 amperes safely, at what 60-cycle a-c voltage can it be operated?

6. The 60-cycle impedance of a circuit is 37 ohms. When connected across a 60-cycle source of supply the current in the circuit is 1.06 amp. at the instant when 18° of the cycle have been completed. If a voltmeter is connected across this circuit, what should its reading be?

7. The instantaneous value of the current in a certain circuit is 15 amp. when 40° of its cycle have been completed. If the impedance of the circuit is 12 ohms, how many volts would be indicated by a voltmeter connected across the circuit?

8. A coil whose impedance is 15.8 ohms is connected across a line where the e.m.f. is 200 volts. Find the instantaneous value of current 29° after its zero value.

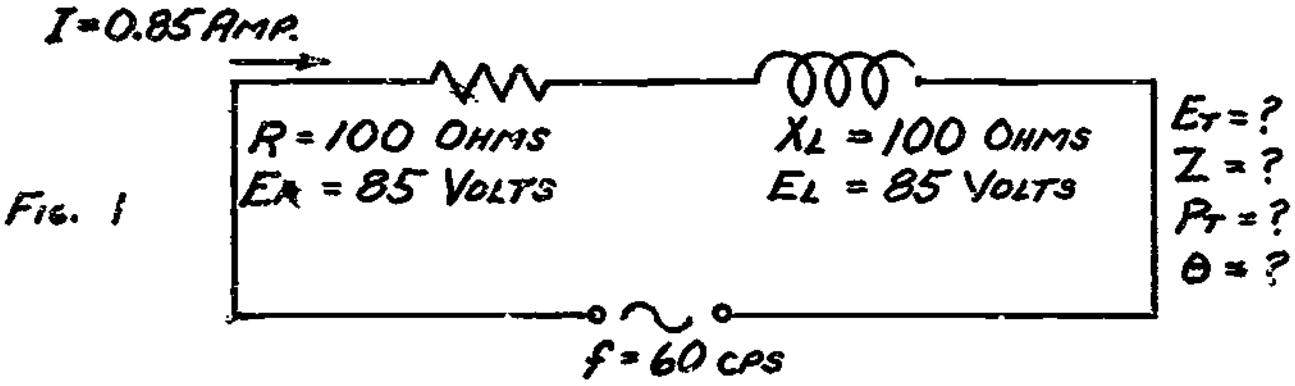
9. A circuit has an impedance of 37.8 ohms. What would a voltmeter read when connected across this circuit, if the instantaneous current is 4.9 amp. 75° after the 0° position?

10. What effective voltage is necessary to force 11.5 amp. through a circuit whose resistance is 9.1 ohms and whose reactance is 7.2 ohms?

11. The reactance of a circuit is equal to 1/3 of its impedance. If the resistance of the circuit is 24 ohms, calculate the impedance and reactance values.

12. In Fig. 1 find (a) the total voltage, (b) the impedance, (c) the phase angle, and (d) the power.

Fig. 1



13. An inductance of 0.17 henry and a resistance of 50 ohms are connected in series across a 110-volt 60-cycle line. Find (a) the inductive reactance, (b) the impedance, (c) the total current, (d) the voltage drop across the resistor and the coil, (e) the phase angle, and (f) the power used.

14. A resistance of 5 ohms is in series with a coil whose inductive reactance is 12 ohms. If the total voltage is 104 volts, find (a) the impedance, (b) the total current, (c) the voltage drop across each part, (d) the phase angle, and (e) the power.

15. Part of the oscillator circuit for a continuous-wave transmitter is shown in Fig. 2. Find the current from point A to point B if the voltage drop is 70 volts.

*CURRICULUM GUIDES, *TEACHING GUIDES, STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *CARPENTERS, *CARPENTRY, HIGH SCHOOLS,

This curriculum guide was designed to aid the instructor in orienting students to and preparing them for entrance into the carpentry trade through experiences in practical construction and study of technical related information. The material was developed by building trades teachers and journeymen carpenters in a workshop under the supervision of the Supervisor of Trade and Industry. The units are (1) Form Building, (2) Floor Framing, (3) Wall Framing, (4) Roof Framing and Sheathing, (5) Exterior Covering and Trim, (6) Insulation, (7) Interior Finish, (8) Stair Building, and (9) Scaffolding. Each unit has assignment sheets with objectives, textbook references, related technical information topics, on-the-job information and work topics, and a student study guide. Emphasis is on light or resident-type construction, and a building project is used as the vehicle for instruction. The course is designed for day school trade classes. The students enrolling in the course should be high school juniors at least 16 years of age who intend to complete 2 years of training and enter the trade. Basic references and supplementary materials are listed in the bibliography. A suggested list of hand tools and equipment and the by-laws and articles of incorporation for the Vocational Building Trades, Inc. are included. This document is available for $1.00 from Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. (HC)

PREFACE

This curriculum guide has been developed primarily for use by the instructors of the day trade classes. Emphasis has been placed on light or resident type of construction so as to meet the objectives of these day trade classes in the public schools.

Instructors in the apprenticeship program and journeymen also can use this guide to good advantage. The technical related portions can be used together with the regular question assignments for apprentices. Journeymen can use any parts or assignments for instructional purposes as needed to further their knowledge of or proficiency in the carpentry trade.

Additional units concerning industrial types of carpentry construction must be added to those in the guide in order to fulfill all the basic requirements necessary for a complete carpentry course of study for apprentices and journeymen upgrading program.

Carpentry utilizes the major portion of the time in the day trade classes; therefore, the set of units for this area has been developed first. Sets of units in the other trades, with which the classes are concerned, will be developed later.

The material for this volume was developed by teachers of building trades and journeymen carpenters of Indiana in summer workshops under the auspicies and guidance of the Supervisor of Trade and Industry of the State of Indiana.

Special acknowledgement is made to the State Board of Vocational Education of Illinois for permission to use material developed by the building trade teachers of that state.

Alfred Drew Teacher Trainer	Purdue		

OBJECTIVES

General:

To prepare the boy for advantageous entrance in the carpentry trades.

Specific:

1. To orient students in the carpentry trade.
2. To develop skills and knowledge through practical construction.
3. To develop appropriate and safe work habits.
4. To develop the ability to apply technical related information.
5. To develop a wholesome understanding of trade and social problems.
6. To develop desirable attitudes of initiative, responsibility,
7. To develop a pride in good workmanship.

Standards For Day Trade Programs:

1. Students shall be at least 16 years of age & have junior standing.
2. Students shall enroll with the intention of completing two years of building trades.
3. Students shall enroll with the intention of entering the trade.
4. It is recommended that all enrollees in the building trades have at least one year of previous industrial arts on an exploratory basis. Exceptions may be made where an enrollee enters from a school where industrial arts courses are not available.
5. A building project equivalent to a two bedroom residence shall be constructed as a vehicle for instruction. In cities and towns where outside projects cannot be built a project within the shop area may be built. The area available would determine the size of the house to be built.
6. With a one-half day program, it is better to spend two years on one project than to sacrifice on giving all the necessary technical related information.
7. Classes shall be limited to <u>16</u> students.

UNIT I. FORM BUILDING

ASSIGNMENT 1. TYPES OF SOILS IN FOUNDATION WORK.

REFERENCES

1. Concrete Form construction pp. 1-7
2. Lair, pp. 13-14
3.
4.
5.

The nature of the prevailing soil should be known, because soils are the determining factors for a permanent base for a foundation.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Bearing strength of sub-soils	Data of climate and area drainage	Tests: Open pit method. Auger Method.

STUDENT STUDY GUIDE

1. List three types of soil encountered in small building foundations?
2. What type of soil makes the best footing base?
3. Why is clay the most uncertain of soils for building foundations?
4. Name three types of soil that are less suitable as a foundation soil?
5. What is the common cause of foundation movement?
6. What is the depth of the frost line in your community?
7. What might happen if frost does get under the footings?
8. How can the footings be protected against frost?
9. How may water be drained from foundation soils?
10. How is soil tested by the "open pit" method?

CARPENTRY

UNIT I. FORM BUILDING

ASSIGNMENT 2. LAYOUT OF FOUNDATIONS

REFERENCES

1. Durbahn, Vol. II pp. 18-22, 456-467
2. Lair, pp. 7-13
3. Concrete Form Construction, pp. 8-13
4.
5.

The purpose of this unit is to describe in detail the methods of laying out foundations, setting batter boards, establishing building lines, and checking the layout by 6-8-10 method.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety Precautions. Study Local Building Codes. Read Plot Plans and Survey maps. Orientation in use of transit of dumpy level.	Safety Precautions. Apply Building Codes. How to square by 6-8-10 rule. How to check diagonals. How to make and set batter boards. Use of Plumb bob and line.	Locate Property Line. Establish Front Building Line. Locate other building lines. Set Batter Boards. Layout offsets. Locate Excavation Lines. Locate Footing Lines.

STUDENT STUDY GUIDE

1. Why is it important to check the plot plan or have a survey made?
2. Why are the restrictions of the local code?
3. Why is it important to follow all the provisions of the local code?
4. Why should all layout dimensions be checked?
5. Tell how to establish a base line from the surveyor's lines.
6. Describe the "6-8-10 method" of squaring corners and explain why these figures are used.
7. Explain how the "diagonal method" is used to square a building.
8. What is the purpose of batter boards?
9. Should batter boards be erected level? Why?
10. How are corners relocated after the excavation is made?
11. What factors determine the size of the excavation as compared to the size of the foundation?
12. How are excavation and footing lines located?
13. List the tools and equipment necessary for laying out building lines.

UNIT I. FORM BUILDING

ASSIGNMENT 3. BUILDING FOOTING & PIER FORMS

REFERENCES
1. Dalzell and Townsend, Vol. II pp. 8-14
2. Durbahn, Vol. II pp. 24-26
3. Concrete Form Construction, pp. 34-54
4. Local Code
5.

The purpose of this lesson is to teach the names, sizes and proper construction of each type of footing forms.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety Precautions.	Safety Precautions.	Locate footing lines.
Reasons For Footings.	Locate depth and level footing lines.	Establish corners to correct level.
Types and Sizes of Footing Forms.	Footing keyways.	Build, brace and level outside forms.
Methods of Leveling Forms	Locate steel in footings.	Build, brace and level inside forms
Estimating.	Size of piers.	Build special footings, piers, for chimneys and special appliances.
Math related to forms and materials.		Installation of steel.
Load weight for piers and spans.		

STUDENT STUDY GUIDE

1. How are footing lines determined?
2. What two items must be taken into consideration when determining the width of footings?
3. What rule of thumb is used to determine the width and depth of footings?
4. What can be done to strengthen a footing which passes over a filled area?
5. Describe method of leveling footing forms.
6. Why should outside footing forms be built first?
7. What provision should be made in the footing for bonding the wall?
8. Sketch two types of special footing forms used for piers.
9. How is the straight edge used in form building?
10. Write a brief step-by-step procedure of how to build a form for a tapered footing.

CARPENTRY

ASSIGNMENT 4. WALL FORMS

REFERENCES

1. Dalzell and Townsend, Vol. pp. 14-25
2. Durbahn, Vol. II pp. 26-44
3. Concrete form construction pp. 14-33, 53-72, Checking Your Knowledge.
4.
5.

The purpose of this lesson is to familiarize the student with the various types, methods of construction, erection, tying, and bracing of forms for concrete walls.

CLASSROOM

Related technical information

Safety Precautions.
Materials Used in Form Building.
Lubrication of Forms
Study spreaders, wholers, and ties.
Scaffolds pertaining to runways.
Math related to wall forms.
Anchors, tie rods, reinforcements and clamps.

ON THE JOB

Information to be given on the job

Re-check form lines.
How to make and set wall forms.
Bracing forms.
How to erect runways.
Opening sizes for windows, doors and other openings.

Work to be done on the job

Re-check building corners and lines.
Building, plumbing, bracing, and lubricating outside wall forms.
Building plumbing, bracing, inside wall forms.
Building runways
Establish concrete wall levels.
Setting window, door, and other opening frames.
Removal of forms.

STUDENT STUDY GUIDE

1. How is the building or wall line located on the footing?
2. How are the studs fastened at the footing?
3. Studs for forms should be located 12", 16", 24", 28" O.C.
4. Give the actual sizes of the following pieces used in form work--2 x 4; 2 x 6; 2 x 8; 2 x 10; 2 x 12.
5. How much lumber would one order to compensate for lack of actual width?
6. Describe procedure for making a form panel.
7. How does the length of the inside form differ from the outside form? Explain.
8. What is the difference in function between the wholer and the spreader?
9. Name and describe three types of tie rod fasteners.
10. Why should a ladder be used when entering or leaving basement after wall forms are in place?
11. Name the parts of a wall form that contribute to rigid bracing.
12. How are door and window openings, water pipes entrances, grider pockets, etc., formed in concrete walls.

CARPENTRY

UNIT I. FORM BUILDING

ASSIGNMENT 5. STAIR AND STEP FORMS

REFERENCES

1. Dalzell and Townsend, Vol. I, pp. 331-335
2. Durbahn, Vol. II, p. 40
3. Townsend, pp. 180-182
4. Concrete Form Construction, pp. 73-87
5.

The purpose of this assignment is to acquaint the student with the correct methods and procedures in the construction of forms for concrete stairs and steps.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety Precautions	Safety precautions.	Locate stairs.
Types of Concrete Steps & Advantages of Each.	How to make and use a pitch board.	Layout & locate stringers.
Estimating.	Why reinforcement steel is used.	Bracing & shoring.
Formulas: a. Height, Width of steps. b. Tread Pitch for drainage.	How to layout stringers. Determining sub-grades.	Placing Reinforcements.

STUDENT STUDY GUIDE

1. What two measurements must be determined before steps can be laid out?
2. The proper height of a concrete step is 6, $6\frac{1}{2}$, 7, $7\frac{1}{2}$, or 8 inches.
3. How are number of steps determined?
4. State a general rule indicating the relationship between the height of riser and the width of tread?
5. How is the relationship between riser and tread a safety factor?
6. How is a pitch board made and used?
7. In the open stair form, the joist (need, neednot) extend beyond the slab supporting sheathing. Explain.
8. What is the purpose of beveling the bottom of the riser board?
9. Why should the open stair horse have shoring wedges under the posts?
10. Why is it desirable to build step forms so that the risers and side forms can be easily removed?
11. How close to the top of the step slab should the reinforcing steel be placed:
12. Sketch an undercut and an ornamental riser.
13. What are the advantages of concrete steps over wooden steps?
14. Why is good workmanship so important in building forms for concrete steps?

CARPENTRY

ASSIGNMENT 6. BUILDING COLUMNS AND BEAM FORMS	1. Dalzell and Townsend, Vol. II, pp. 26-27 2. Durbahn, Vol. II, pp. 45-47 3. Giese, pp. 54-55 4. Concrete Form Construction, pp. 42-43 5.

The purpose of this lesson is to explain the types and methods of construction forms for concrete columns and beams, as well as setting, bracing and shoring in position.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Material used in construction. Methods of anchoring.	Safety Precautions. How to build forms for columns and beams. Bracing columns and beam forms.	Setting, spacing and shoring posts and other supports. Sheathing forms.

STUDENT STUDY GUIDE

1.(a). What is the purpose of a column?
  (b). What is the purpose of a beam?
2. Why are triangular strips placed in the corners of column and beam forms?
3. How long should the forms be left in place after pouring a load bearing column?
4. What is the function of a yoke?
5. Illustrate two types of yokes which can be made on the job?
6. Indicate the number and spacing of yokes on a column two feet square and ten feet high.
7. Explain how a beam form is held in position.
8. What advantages are there in making up panels for column and beam forms?
9. Why is it recommended to use tongue and grove sheathing in the construction of column forms?
10. What special consideration must be kept in mind when making forms of plywood for short columns or piers?
11. Explain the advantages of a tapered form for short piers or columns?

ASSIGNMENT 7. SIDEWALK & FLOOR FORMS

REFERENCES

1. Dalzell and Townsend, Vol. I pp. 313-319; 339-346
2. Giese, pp. 33-35
3. Concrete Form Construction, pp. 90-93

This lesson is to familiarize the student with the methods and materials used to construct forms for sidewalks, and to explain the laying out, setting and bracing of straight and curved forms for walks, drives and terraces.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety Precautions	Safety Precautions.	Locate & level walk.
Types & sizes of walks straight & curved.	Pitch or slope for sidewalks & driveways.	Excavate & level area to receive walk.
Soil Conditions & drainage.	Materials used in expansion joints.	Construct & set forms.
Use of expansion joints in slab concrete.	Setting & leveling screeds.	Brace & level forms.
Estimating.		Provide for expansion joint.
The Use of screeds.		Setting screeds.

STUDENT STUDY GUIDE

1. What type of lumber is usually used for sidewalk forms?
2. Why should the edge of forms be straight?
3. What pitch should be provided for the width of a sidewalk.
4. Explain how an expansion joint is provided for in sidewalk forming?
5. How are the edges of sidewalk forms aligned?
6. State two reasons for the use of spreaders in sidewalk forms?
7. Sketch a layout for building curved walk forms?
8. How thick should a sidewalk be constructed.

ASSIGNMENT 8. ARCH CENTER FORMS

REFERENCES

1. Architectural Graphic Standards, p. 23
2. Concrete Form Construction, pp. 94-105
3.
4.
5.

The purpose of this assignment is to familiarize the student with the types and sizes of arch centers, and the methods of laying out and constructing.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job.	Work to be done on the job
Safety Precautions. Study types and where used; functions.	How constructed. Use of tool for arches.	Use of framing square and trammel points in laying out arches.
Materials to be supported.	Safety practices.	Layout and construction.
Type of construction of forms for arched openings.		"Plumb and line" (Set) Brace in position.
Flat, jack, segmental, semi-circular, and semi-elliptical arches.		

STUDENT STUDY GUIDE

1. What is the function of arch centers?
2. Why is a slight crown built in a flat arch?
3. Explain the advantages of a segmental arch.
4. What is meant by lagging?
5. Sketch a method of setting forms for arch center installation.
6. Why do the side walls of a crowned arch opening need solid support?
7. How are segments laid out for the semi-circular arch?
8. Illustrate on a drawing the following: spring line, strut, tie and cleat.
9. What is the purpose of the spring line?
10. Sketch the following types of arches: Gothic Roman, Tudor, Elliptical and Jack.

UNIT I. FORM BUILDING

ASSIGNMENT 9. FORMS FOR CAPS, SILLS & LINTELS AREAWAYS.

REFERENCES

1. Dalzell and Townsend, Vol. II, pp. 99; 185-188; 190, 245, 273.
2.
3.
4.
5.

The purpose of this assignment is to familiarize the student with the various methods of building and anchoring forms for caps.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Build forms to size.
Bracing for precast forms.	How to hold form in place for casting in position.	Brace & tie properly for pre-cast form.
Types of forms for coping.		Layout & construct forms for casting in position.
Methods of Holding Forms in place for casting in position.	How to brace & tie for precast forms.	Set forms for areaways.
Types of forms for areaways.	How to drain the areaways.	

STUDENT STUDY

1. Why should precast concrete lintels be made at least three weeks before using?
2. How far from the bottom of a solid reinforced concrete lintel should the reinforcing bars be placed.
3. Make a sketch showing how a lintel can be made from 8" x 8" concrete blocks?
4. Under what conditions is it more desirable to cast caps in position?
5. What problems do you have when pouring a cap on an open masonary or block wall?
6. Sketch a plan for a chimney precast cap form to fit a two-flue chimney. Flue sizes $8\frac{1}{2}$" x $8\frac{1}{2}$". Chimney size 16" x 30". Show bracing.
7. What is the purpose of areaways?
8. How are areaways fastened to the main foundation when they are not poured as an integral unit?

1. Durbahn, Vol. II, pp. 54-57
2. Lair, pp. 28-33
3. Framing Sheathing and Insulation, pp. 14-23
4.
5.

The purpose of this construction unit is to familiarize the student with the name, size, and location of each member of the most common types of sill construction and to demonstrate the proper construction of each type of sill.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions	Selection of material and location of each member of sill.
Shrinkage	Tools used.	Placing of termite shield.
Comparative cost of different types of sills.	Various locations of sills.	Laying out and fitting mud sill.
Nominal & actual sizes of lumber.	Why mud sill is laid in fresh mortar or mastic.	Level and anchor mud sill in fresh grout or mastic.
Termite shielding.		

STUDENT STUDY GUIDE

1. Make a sketch of a box sill.
2. Name three other types of sill construction.
3. Which type of sill construction is affected least by shrinkage?
4. Name four species of lumber commonly used for sill construction. Which is to be preferred? Why?
5. Show on the sketch of box sill where termite shields are installed.
6. Why are termite shields necessary?
7. What are the advantages of back filling before beginning sill construction?
8. What are the disadvantages of back filling before beginning sill construction?
9. Figure the board feet of material necessary for the sill used in the project house?
10. How are sills anchored to foundations?
11. What standard lengths of 2" planks would be used for the mud sill of a house 24'-0" x 30'-0"? Show by sketch.
12. What safety measures are necessary while installing sills?

2. Lair, pp. 18-41
3. Framing, sheathing and insulation, pp. 36-48.
4.
5.

The purpose of this assignment is to familiarize the student with the various type of posts or columns used for carrying floor loads. They must be carefully selected, spaced and designed to stand up under the required load. It is important to make a careful study of ground conditions relative to the bearing load before footings are poured.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Selection, size, spacing.
Types, kinds & costs.	Determine length.	Construction or fabrication.
Comparative strengths.	Procedure of installation	Setting, fastening and anchoring.
Load calculations.		
Methods of anchoring.		

STUDENT STUDY GUIDE

1. Name three materials used for posts and columns.
2. How are the bottoms of wood posts protected from moisture and termites?
3. How is the wood post anchored at the bottom?
4. Why should posts or columns have a bearing plate at the top?
5. What is a good method to use to find the exact length of a post or column?
6. What is the relationship of the cross-section size of a wood timber to its load capacity?
7. From the chart on page 40, framing, sheathing and insulation, figure the difference in load capacity between a 6" x 6" wood post and an 8" x 8" wood post both seven feet long. Give answer in tons.
8. What is the minimum size (cross-section) recommended for a wooden post?
9. How do you usually determine the span between posts?
10. What safety measures should be observed while erecting posts or columns?

2. Lair, pp. 33-41
3. Framing, sheathing and insulating, pp. 24-25
4.
5.

The purpose of this assignment is to familiarize the student with the various types of girders or beams used to support floor loads. They should be carefully selected and constructed so that they will carry this load.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Types, kinds and cost.	Method of procedure.	Selection, size, spacing.
Load calculation.	Safety precautions.	Construction or fabrication.
Comparative strength.		
Bearing.		Placing.

STUDENT STUDY GUIDE

1. What types of materials are used for girders or beams? Which is best? Which is most expensive?
2. How much bearing should a beam have on an outside wall?
3. What factors determine the size of a girder or beam?
4. Which is stronger for any given cross-section size, the built-up or the solid beam?
5. When constructing a built-up beam or girder, what rule must be followed as to location of splices?
6. Why should air space be left around the end of a wooden girder resting on an outside wall?
7. What is the maximum span for a wooden girder 6" x 8" for a one story house?
8. Figure the number of board feet needed for the beam or girder used in the project house.
9. Sketch the end view of a steel girder showing girder supporting floor joist.
10. List the safety measures to be followed when installing beams or girders.

CARPENTRY

UNIT II. FLOOR FRAMING

ASSIGNMENT 4. FLOOR & CEILING JOISTS

REFERENCES

1. Durbahn, Vol. II, pp. 61-66; 97-100
2. Lair, pp. 41-48
3. Framing, sheathing and insulation, pp. 43-52
4.
5.

The purpose of this assignment is to familiarize the student with the horizontal framing members of a building which supports floors & ceilings & the selection of material, estimating loads, laying out, truing, leveling & fastening of these members.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Selection, size, location.
Function of joists.	Selection of crown edge.	
Grade, selection & cost.	Doubling joists for partition & added weight.	Cutting, fitting, nailing.
Estimating of floor & ceiling joists.		
Methods of framing joists.	Selecting nails.	

STUDENT STUDY GUIDE

1. What are the functions of floor and ceiling joists?
2. What are the standard spacings between joists?
3. What factors determine these standard?
4. The minimum span for 2" x 10" joists, 12" O. C. with 40 pounds live load plastered ceiling is ____________.
5. Make a sketch showing how the "bow" or "crown" of joists must be placed, give reason.
6. In fitting joists around steel beam, allowance should be made for ____________.
7. The __________metal support is recommended when framing joists against wood beams on girders.
8. How do you determine the O. C. spacing of the first and second joists installed?
9. How do you lay out joists locations along a box sill? What does the X indicate?
10. After setting and nailing all joists, the next procedure is to ____________ outside joists and brace them.
11. How is the center of the joists span spaced after installation? Why is it necessary to space them?
12. List three factors which determine the maximum joists span.
13. Where are joists doubled? Why? Sketch two ways this may be done.
14. Figure the cost of the joists for the project house.

CARPENTRY

UNIT II. FLOOR FRAMING

ASSIGNMENT 5. FRAMING OPENINGS

REFERENCES

1. Durbahn, Vol. II, p. 64
2. Lair, pp. 47-49
3. Framing, sheathing and insulation, pp. 53-59
4.
5.

The purpose of this assignment is to familiarize the student with the framing of floor and ceiling openings.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Purpose. Size. When framed. Joist hangers.	Safety precautions. Method of procedure. Kinds of openings. Names of members.	Location & method. Cutting, fitting and nailing.

STUDENT STUDY GUIDE

1. What are the purposes of "trimmers?"
2. What are the sizes of "trimmers?"
3. Give three examples illustrating when it is necessary to frame openings in floor joists?
4. State the purposes or uses of joists "headers?"
5. Why should iron stirrups be used with "headers?"
6. What determines the spacing of "headers" and "trimmers"?
7. Tail joists run from __________ to ______________.
8. When is it advantageous to use double headers?
9. What should be the dimensions of the rough opening for an 8" x 8" flue?
10. In framing around a chimney, how much space should be left between chimney and joists?
11. Sketch a typical opening labeling all parts.
12. How many feet of lumber will be needed for framing all the openings in the first floor of the project house?
13. A ____________ rail should be placed around the stairwell opening. Why?

CARPENTRY

UNIT II. FLOOR FRAMING

ASSIGNMENT 6. PLACING OF BRIDGING

REFERENCES

1. Durbahn, Vol. II, pp. 68-71; 101-103
2. Lair, pp. 53-54.
3. Framing, sheathing and insulation, pp. 50-52.
4.
5.

The purpose of this assignment is to familiarize the student with the methods of laying out, cutting and installing bridging. The purpose of building is to prevent warping and stiffen the joists.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Locating, measuring, cutting, & installing.
Sizes.		
Types of bridging.	Methods of laying out bridging.	
Reasons for using bridging.		
Kind, size & number of nails used.		
Bridging regulations.		

STUDENT STUDY GUIDE

1. Name three types of bridging.
2. In F.H.A. specifications, the maximum span allowed without bridging is ______.
3. The nails are generally started in the _________ of cross bridging before if is installed.
4. The most common time to install bridging ________________________________.
5. The final nailing of the bridging should be after ______ has been installed.
6. Give two methods of cutting bridging A. _____________ B. ____________.
7. What size material could be used for cross bridging?
   A.______X_______ B.__________X______ C.______X______ D.______X______.
8. If joists have a span of 20 feet, how many rows of bridging will be needed?
9. What is the advantage of using steel bridging?
10. Sketch the end view of two floor joists showing cross bridging.
11. How many linear feet of 1" x 3" bridging will be needed for the project house?

2. Lair, pp. 54-60
3. Framing, sheathing and insulation pp. 60-65
4.
5.

The purposes of this assignment is to familiarize the student with the different types and applications of sub-flooring. The sub-floor provides a working floor, strengthens the construction, provides a base for finish floors and adds deadening and insulating properties to the building.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Selection as to size and quality of material.
Kinds of quality of sub-flooring.	Methods of laying & nailing.	
Estimating material.	Expansion joints.	Cutting.
Advantages & disadvantages of different methods of floor laying.		Nailing.

STUDENT STUDY GUIDE

1. What are two methods of laying sub-floor?
2. Rough flooring is generally nailed with __________ penny nails.
3. Squeaky floors are sometimes caused because the sub-floor is not ____nailed.
4. What percentage of allowance for waste is necessary for 1" x 8" shiplap laid diagonally?
5. 1/2" to 3/4" space should be left between the flooring and the outside walls to allow for __________of the boards when they become wet.
6. When the sub-floor is laid ________the finish floor may be laid directly on the sub-floor in either direction.
7. What types of lumber are used for sub-flooring?
8. Give four reasons why sub-flooring is used.
9. Should two consecutive joints be made on the same joist?
10. Sketch the two methods of laying sub-floor.
11. Figure the number of square feet in the floor of the project house.
12. Figure the cost of 6" T&G needed for sub-floor of the project house if it is laid diagonally.
13. If plywood is used for the sub-floor, how many 4' x 8' sheets will be needed for the project house? What thickness is usually used?

The purpose of this assignment is to familiarize students with platform framing.

CLASSROOM	ON THE JOB	
related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Study local building codes. Study floor plans and wall selections. Study types of framing. Nails and nailing. Bracing corner posts.	Safety precautions. Tools used. Local building codes. How to space studs. How to plumb walls How to tie and brace walls.	Layout and cut sole plates. Cut studs. Construct corner posts and angles.

STUDENT STUDY GUIDE

1. State two methods of installing permanent corner bracing.
2. Figure number of studs needed on a problem furnished by your instructor
3. Sketch two methods of constructing corner posts.
4. Figure the lineal feet of sole and top plate needed as in problem #2.
5. Why are studs placed 16" apart on center?
6. What two methods may be used to straighten the walls and plate?
7. What size nails are ordinarily used in wall framing?
8. Show by diagram the wall construction in a platform structure.
9. Should stud spacing be for the inside or outside or both sides of the walls? Why?
10. How far apart should top plate joints be staggered?
11. When doubling the wall plate, what is the minimum distance for staggering joints?
12. Sketch the method of lapping corners on top plates

ASSIGNMENT 2. BALLOON FRAMING

REFERENCES

1. Durbahn, Vol. II, pp. 51-52
2. Lair, pp. 3-4; 67-68
3. Framing, sheathing and insulation, pp. 66-67
4.
5.

The purpose of this assignment is to familiarize students with the balloon type framing.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Study local building codes. Study floor plans & wall sections. Study types of framing. Nails & nailing.	Tools used. Local building codes. How to space studs. How to locate partitions. How to plumb walls. How to tie & brace walls. Safety precautions.	Layout and cut sole plates. Cut studs. Construct corner posts and angles.

STUDENT STUDY GUIDE

1. State two methods of wall bracing.
2. Figure the number of studs needed on a problem furnished by your instructor.
3. Sketch two methods of constructing corner posts.
4. Figure the lineal feet of top plate needed on the project house.
5. Why are the studs placed 16" O. C.?
6. What two methods may be used to straighten walls and plates?
7. List four advantages of balloon construction.
8. Where must fire stops be installed? Why?
9. Show by diagram on the back of your paper the wall construction in balloon structure.
10. Should stud spacing be for the inside or outside or both of the sides of the walls? Why?

ASSIGNMENT 3. DOOR FRAMING,
EXTERIOR,
INTERIOR

REFERENCES

1. Durbahn, Vol. II, pp. 75-76
2. Lair, pp. 62; 155.
3. Framing, sheathing and insulation, pp. 81-83
4.
5.

The purpose of this assignment is to familiarize the student with the best methods of framing outside and inside door openings.

CLASSROOM	ON THE JOB	
related technical information	information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Determine location and size of openings from floor plans.
Types and Kinds of doors.	How to determine length of cripples.	Construct headers.
How to determine allowance for all types of doors.	How to determine open allowances.	Install headers and cripples.
	How to construct and place headers.	Cut and place upper cripples.
	How to place trimmer for wood sills.	Layout, cut and place trimmers.
	How to place trimmers for concrete.	Layout and install a trussed opening.

STUDENT STUDY GUIDE

1. Which dimension is stated first on a door schedule?
2. How do you determine the size of the rough opening?
3. What size opening must be framed for a 3' -0" x 6'-8" exterior door.
4. How long are the cripples over a 6'-8" door using two 2" x 4" on edge as a header, on an 8'-1" ceiling?
5. What is the purpose of the story pole?
6. What is the difference between a header and trimmer?
7. Explain the difference between an outside and an inside door jamb.
8. How do you determine the size of the rough opening of an inside door?
9. Determine the size opening for a 2'-4" x 6'-8" inside door.
10. What length headers are necessary for a 2'-6" door?
11. How are the header heights determined?
12. Sketch two types of trusses that may be used over an inside door opening.
13. Name one other method that is used for support over large openings, besides the truss.
14. What is the cost of all the door jambs in the project house?

CARPENTRY

1. Durbahn, Vol. II, pp. 74-78; 117-119.
2. Lair, 65-68; 187-191
3. Framing sheathing and insulation pp. 78-87
4.
5.

The purpose of this assignment is to familiarize the student with the best methods of framing window openings.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Types and kinds of windows. When to use a trussed opening. How to determine size of members of a trussed opening. How to determine allowance for various types of sash balances.	How to determine opening allowances. How to determine lengths of cripples and trimmers. How to construct and place headers. How to place sills and trimmers. How to layout, cut and install members of a trussed opening.	Determine location and size of openings from floor plans. Construct headers and sills. Cut and place trimmers. Layout, cut and install members for a trussed opening.

STUDENT STUDY GUIDE

1. Which dimension is stated first on a window schedule?
2. Which part of a window does the dimension in a window schedule refer to?
3. What allowances are made in determining the size of a rough opening?
4. How are the lengths of cripples determined?
5. Explain the following abbreviations: 24" x 26", 2 lt. D. H.
6. How is window header height determined?
7. What is the distance from the corner of the building to the window opening in Figure 1?

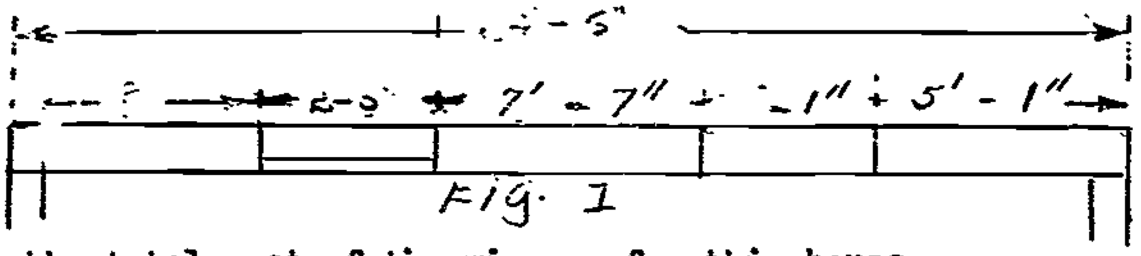

FIG. 1

8. Figure the total cost of the windows for this house.

ASSIGNMENT 5. PARTITION FRAMING

REFERENCES

1. Durbahn, Vol. II, pp. 72-74
2. Lair, pp. 67; 155
3. Framing, sheathing and insulation, pp. 67; 155.
4.
5.

The purpose of this unit is to describe the most common methods of framing partitions.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Tools used.	Layout and cut soles and plates.
Study local building codes.	Local building codes.	Locate and cut interior door openings.
Standard blue print dimensioning for partition location.	How to figure cutouts for door openings.	Sole plates.
Information about bearing and non-bearing partitions.	How to put up partitions in restricted spaces.	Cut studs.
Special partition framing for studs.	How to tie partitions to exterior walls.	Assemble, erect and straighten partitions.
Method of partition framing with roof trusses are used.		Tie partitions to exterior walls.
		Tie partitions to ceiling joists.

STUDENT STUDY GUIDE

1. What is the purpose of interior partitions?
2. How should the openings in bearing partitions be constructed in order to keep them from being weakened?
3. Figure the opening cut out for a 2-6 door; for a 2-8 door.
4. How much set over must you make from the blueprint dimensions to properly locate the partition?
5. Why are partition studs spaced 16" O.C.?
6. Sketch two ways of tying partitions to exterior walls.
7. Describe a simple way of tying partitions to ceiling joists which run parallel to partition walls.
8. How much allowance should be made for the head jamb and finish floor?
9. The load-bearing partitions support what part of the house frame?
10. What is the difference between a bearing and a non-bearing partition?
11. Can partitions be framed after the plastering is done?
12. Explain how a stud in a partition may be straightened.
13. Make a list of tools and equipment needed for framing partitions.

CARPENTRY

UNIT III. WALL FRAMING

ASSIGNMENT 6. FIREPLACE FRAMING

REFERENCES

1. Dalzell and Townsend, pp. 282-286
2. Book of successful fireplaces,
   Donley Bros. Co.
3. Manufactures' Literature
4.
5.

The purpose of this assignment is to describe the various types of framing necessary for different types of fireplaces.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Fire safety requirements. Local codes governing framing around flues. Types of flues & chimneys. Heat circulating liners for fire places.	Necessary allowances for masonry clearance. Trussing requirements. Proper blocking for later finish. Importance of allowing for shrinking of wood & settling of flue. Safety precautions.	Lay out & cut soles, plates & install same. Cut studs & install. Cut headers & install. Cut required trussing & install set in blocks for fastening mantels & trim.

STUDENT STUDY GUIDE

1. How far should the framing be kept from the brick work?
2. Sketch the layout of framing members around the fireplace opening:
   a. For a fireplace on an outside wall
   b. For a fireplace on an inside wall
3. If the partition in front of the fireplace were non-bearing, how much trussing would be required?
4. If the fireplace is on an exterior wall, how must the clearance requirements be modified to insure a tight wall?
5. What are some of the advantages of using a metal circulator in the fireplace?
6. What are the advantages of having a fireplace in a home? Are these advantages worth the extra cost? Give your reasons.

CARPENTRY

ASSIGNMENT 7. POCKET TYPE SLIDING DOOR FRAMING

REFERENCES

1. Manufactures Literature
2.
3.
4.
5.

The purpose of this assignment is to familiarize the student with the best method of framing for sliding doors.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Places where sliding doors are used. Different types of sliding door hardware on the market Advantages of sliding doors.	Figure needed space for door opening & pocket. Importance of adequate bracing to prevent sagging. How to install track.	Frame door space needed. Cut & nail in required headers. Install bracing needed at head & sides of framing. Notch last full stud to take plaster base. Nailing strips. Rip & install thin studs at opening of pocket. Nail on lath nailing strips. Install overhead track.

STUDENT STUDY GUIDE

1. Why are sliding doors sometimes substituted for swinging doors?
2. How much space must you allow in framing to use a 2-6 door?
3. Sketch the framing for a sliding door.
4. Sketch two forms of overhead bracing you could use for the framing for a sliding door.
5. What is the cost of sliding door hardware?
6. Estimate the cost of sliding doors over the conventional type of swinging doors.

CARPENTRY

UNIT III. WALL FRAMING

ASSIGNMENT 8. FURRING

REFERENCES
1. Durbahn, Vol. II, p. 306.
2. Framing, sheathing and insulation, pp. 205-211
3.
4.
5.

The purpose of this assignment is to give the student an **understanding** of the necessary furring for plumbing, electrical & heating fixtures, different types of dry wall construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions	Where are walls furred?	Furring walls.
Amount & placement of wall furring	When is floor furring necessary?	Cross-furring.
Purpose of floor furring?		Furring floors.
Types & sizes of furring.	Spacing of furring on ceilings.	Furring ceilings.
Purpose of ceiling furring.		

STUDENT STUDY GUIDE

1. What is the function of a furring strip?
2. What kind and size of stock is usually used for furring strips?
3. How many lineal feet of 2" x 2" furring is necessary for a bathroom wall 10' long and 8' - 1' high?
4. Why is it necessary to furr out around a chimney?
5. Why are furring strips sometimes used under a finished floors?
6. What is the proper spacing of furring strips under finished floors?
7. How can floor furring strips be held to a concrete floor?
8. How should furring strips be nailed?
9. Would you furr a poured concrete wall on which you placed a knotty pine covering? Why?
10. How much space should be left between the face of the masonry wall and the back of the wall covering?
11. Would a concrete wall, above grade, need to be furred before plaster or dry wall was applied? If the voids in the blocks were filled with insulation would the wall need to be furred?
12. How are furring strips used in connection with the installation of acoustical and dry wall?

CARPENTRY

UNIT III. WALL FRAMING

ASSIGNMENT 9. BACKING AND GROUNDS

1. Durbahn, Vol. II, pp. 84-87
2. Lair, pp. 144-145
3. Framing, sheathing and insulation, pp. 205-211

The purpose of this assignment is to give the student an understanding of the necessity for backing and grounds for interior trim and plaster.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Amount and placements of plaster grounds. Purpose of grounds. Size of grounds.	Where interior and fixture grounds are applied. Where lath and plaster backings are placed. Methods of installing grounds accurately. Safety precautions.	Installing plaster grounds, backing corners.

STUDENT STUDY GUIDE

1. What is the primary purpose of a plaster ground?
2. What determines the thickness of grounds?
3. What is the ordinary thickness of plaster grounds?
4. The sizes and methods of application of grounds vary. What are some of the causes of these variations?
5. Why is it necessary to exercise special care in placing grounds?
6. Why must backing be placed on a non-bearing partition?
7. Why is it necessary to back a corner or partition intersection?

CARPENTRY

ASSIGNMENT 10. FRAMING GABLE ENDS

REFERENCES

1. Durbahn, Vol. II, pp. 198-199
2. Lair, pp. 221-226
3. Framing, sheathing and insulation, pp. 126-127
4.
5.

The purpose of this lesson is to acquaint the student with the proper methods of cutting and installing gable end framing members.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety procedures.	Laying out studding.
Estimate materials.	How to make the top	Cutting studding.
Methods of Making top cuts.	How to prevent crowning of the end rafter.	Installing gable studs.
Methods of prevention of crowning of end rafter.	How to frame for louvers.	Framing for louvers.
Purpose of louvers.	How to frame for veneer walls.	Installing gable studs for veneer walls.
Kinds of louvers.		Set in end rafter for veneer walls.
Methods of installing studs for veneer walls.		
How to figure extra overhang for veneer walls.		
Estimating size of louvers.		

STUDENT STUDY GUIDE

1. From what points may the spacing of gable end studs be started?
2. What methods may be used to determine the length of gable studding?
3. Show by diagram two ways to make the top cut on gable end studding.
4. Briefly explain how gable end studs are erected.
5. What method is used in lining up gable end studs?
6. How long is the first short gable end stud on a 1/3 pitch roof if the studs are spaced two feet on centers?
7. How is the amount of material needed for gable ends estimated?
8. What two sizes of common nails are used for nailing the studs?
9. What is the purpose of louvers?
10. Are louvers usually made on the job or purchased ready made?
11. What should be the minimum louver opening per square foot of ceiling area in the attic?
12. How is ventilation provided for in a hip roof with box cornice?

1. Durbahn, Vol. II, pp. 78-84
2. Lair, pp. 70-76
3. raming, sheathing and insulation, pp. 96-99
4.
5.

The purpose of this assignment is to demonstrate the proper application of wall sheathing.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Relative strength of various types of sheathing materials. The additional wall needed to cover a given area when dressed or matched stock is used. Comparitive rigidity of diagonal & horizontal application of sheathing.	How to make horizontal applications of dressed or matched sheathing. How to make diagonal applications of sheathing. How to apply composition sheathing.	Determine length of sheathing. Align first course of sheathing. Nail sheathing in place. How to sheath around window & door openings.

STUDENT STUDY GUIDE

1. When is the sheathing put on the building?
2. For what purpose is sheathing applied?
3. In what sections of the country is diagonal sheathing most widely used?
4. Name three or four kinds of sheathing materials.
5. What are the advantages of diagonal applications of sheathing?
6. Why is the diagonal application of sheathing more expensive than horizontal applications?
7. Is composition board gaining favor as sheathing material with contractors and builders?
8. How is the amount of sheathing necessary for gable ends estimated?
9. Figure the cost of the side wall sheathing of the project house?
10. Figure the difference in cost of sheathing the house 8" shiplap and 4' x 8' composition board.
11. How many pounds of 8d common nails will be needed to apply 8' shiplap horizontal sheathing on the project house?
12. What safety factors must be considered while erecting and working on scaffolds?

UNIT IV. ROOF FRAMING AND SHEATHING

ASSIGNMENT 1. GENERAL INFORMATION

REFERENCES

1. Durbahn, Vol. II, pp. 133-144
2. Lair, pp. 83-103
3. Wilson and Werner, pp. 1-7
4. Framing, sheathing and Insulation pp. 115-127
5.

Previous to the framing of a roof, it is necessary that one become acquainted with local building regulations specified in the local building code and/or FHA specifications as it applies to the different kinds of roof design. The student should acquire: (1) Knowledge of different kinds of roofs. (2) How rafter lengths are determined. (3) How to interpret roof code regulations. (4) The procedure for selecting the roof framing material, e.g., kinds, quality & quantity of material. (5) Knowledge of applicable safety precautions.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Local building requirements. Different types of roofs. Safety precautions on roof construction.		

STUDENT STUDY GUIDE

1. What are the local building regulations regarding roofs?
2. What are the four types of roofs commonly used in house construction?
3. What is meant by the following terms: rafters: span: rise: run: pitch: rafter length: rafter thrust?
4. What are the two methods of laying out rafter lengths?
5. Give the rule for finding the rise when you know the span and pitch?
6. What is meant by rise per foot of run?
7. What is meant by the rafter length per foot of run?
8. Describe the following terms: topcut; seat cut; and tail cut.
9. Name four kinds of rafters.
10. Describe the methods of using the framing square in laying out the cuts of rafters.

CARPENTRY

UNIT IV. ROOF FRAMING
AND SHEATHING

ASSIGNMENT 2. FRAMING A
GABLE ROOF

REFERENCES

1. Durbahn, Vol. II, pp. 182-183; 150-156
2. Lair, pp. 83-103
3. Wilson and Werner, 9-20
4. Framing, Sheathing and Insulation, pp. 115-127

The purpose of this assignment is to demonstrate the methods of framing a gable roof.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Methods of determing span, rise, run, and pitch of roof. Relationship between unit and total measurement. Methods in rafter lay-out; step-off, unit length, and rafter tables. Kinds, size and grades of lumber. Use of square	Safety precautions Determine the pitch, span and rise. Size of material. Length of tail. Size of nails. Scaffold and/or holding devices. How to nail	Determine pitch, span, and length. Layout and cut common rafters. Spacing of rafters on the plate. Erect and nail. Bracing. Install Ridge.

STUDENT STUDY GUIDE

1. What is an equal pitch gable roof?
2. Define the rise, run and pitch of a common rafter.
3. What does the term "unit length" mean to you?
4. Describe the following methods of laying out rafters: step off; rafter table; unit length.
5. What is the length of a common rafter for a gable roof with a span of 27 feet and 1/3 pitch.
6. What is the unit of run for common rafters?
7. What is the unit of rise for a roof of $\frac{1}{2}$ pitch?
8. Is it advisable to have an overhang on a gable roof? Why?
9. What will be the length of the tail of a common rafter of 1/3 pitch if a 1" x 12" is used for the plancher?
10. What is the length of a common rafter per unit of run for 1/3 pitch; for $\frac{1}{2}$ pitch?

SHED ROOF

REFERENCES

1. Durbahn, Vol. II, pp. 184-185
2. Lair, pp. 95-99
3. Wilson and Werner, pp. 110-111

The purpose of this assignment is to demonstrate the way to lay out and cut common rafters of various pitches and spans.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Determine basic roof information.	Determine the length, pitch, and run.	Layout and cut rafters, common space and nail rafters.
How to lay out plate cut and overhang.	Sizes and kinds of material. Tools used.	
Use of framing square in laying out rafters.	Safety precautions.	Bridge on long runs.
Rafter tables.		
Common pitches.		
How to find pitch.		
Rafter cuts		
Estimating.		

STUDENT STUDY GUIDE

1. Where are shed type roofs used? What makes them of added importance at this time?
2. What type rafter is used in a shed type roof?
3. Compare the shed and gable roof.
4. What are the advantages and disadvantages of the shed roof?
5. Describe two methods of finding the length of a common rafter?
6. What is the length of the common rafter for a shed roof with a 17 foot span and 1/6 pitch?
7. What numbers on the square will give a plumb cut for 1/6 pitch?
8. What new materials and methods make this roof satisfactory for ranch type homes?
9. Figure the cost of the rafters for a shed roof the size of which will be given by your instructor.

CARPENTRY

UNIT IV. ROOF FRAMING
AND SHEATHING

ASSIGNMENT 4. FRAMING A
HIP ROOF

REFERENCES

1. Durbahn, Vol. II, pp. 135; 183-k84
2. Lair, pp. 83-98; 99-103
3. Wilson and Werner, pp. 21-49
4. Framing, sheathing and insulation, pp. 128, 137
5.

Another kind of roof framing is the hip roof. This type not only employs the common rafter but other kinds of rafters known as the hip, and jack. This roof is used for many designs of homes, and also in combination with the gable type roof. When considering construction and costs, the hip roof has some advantages and disadvantages.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Advantages and disadvantages in different methods. How to determine span, rise, run and pitch of roof. Relationship between unit length and total length. Estimating. Methods used in rafter layouts, step off, unit length and rafter tables. Safety precautions.	Tools used. Safety precautions. Ridge cut specifications. Specifications for sizes of material and spacing. Consider pitch and span, and determine rafter length, seat cut, overhang, tail cut, cheek cuts, and dropping or backing. Size of nails, location, and technique in nailing.	Layout and cut common rafter. Layout and cut hip rafter pattern. Layout and cut jack rafter. Space and locate, erect, and nail rafters. Consider pitch and span, and determine rafter length, seat cut, over hand, and check cut.

STUDENT STUDY GUIDE

1. What are the specifications for hip roof as set forth in the local code?
2. Describe the method of calculation of a common rafter.
3. Describe the method of calculating a hip rafter.
4. Describe the method of calculating and cutting a jack rafter.
5. What are the advantages of a hip roof?
6. What is the unit of run of a hip rafter? Why?
7. What is the length of a hip rafter for a roof of 29' span and 1/4" pitch?
8. Is the unit of rise for a hip rafter of 1/3 pitch the same as the unit of rise of a common rafter of 1/3 pitch?
9. What numbers on the square are used to get a plumb cut on a hip of 1/4 pitch?
10. What is meant by "dropping" and "backing"?
11. What numbers on the square are used to get the side cut on a hip rafter of 1/3 pitch?
12. What is the cost of the rafters for the project house?

3. Framing, sheathing and insulation, pp. 163-175

An equal pitch roof is one in which the main part has a different pitch from the projecting part. The width and height of an intersecting roof of a hip or gamble type is sometimes restricted, in this case, the rise per foot run of the main common rafter may be different from that of the gable common rafter.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Methods of determining span, rise, run, and pitch of roof. Methods of layout and cutting rafters. Method of erecting roof without rafter tails. Method of erecting roof with rafter tails.	Safety precautions. Determine the pitch, span, and rise. Size of materials. Size of nails.	Determine pitch, span, and length. Layout, roof plan. Layout common jack, and valley rafters for main and projecting roof. Erect and nail.

STUDENT STUDY GUIDE

1. List the three conditions by which two roofs will have unequal pitches?
2. Where is the measuring line for rafters in unequal pitch roofs if there is to to be no rafter tails?
3. By what means is the unit run of the valley rafter, of an unequal pitch roof determined?
4. The problems involved in framing the unequal pitch roof divide themselves into two parts? List each.
5. How is the length of common rafters determined on an unequal pitch roof?
6. Explain the layout process of the ridge cut of an unequal pitch valley rafter?
7. What new principal is involved in finding the angle of side cuts on a valley rafter? (unequal pitch roofs)

AND SHEATHING

ASSIGNMENT 8. FRAMING DORMERS

REFERENCES
1. Durbahn, Vol. II, pp. 169; 186-188
207-213
2. Lair, pp. 184-186
3. Wilson and Werner, pp. 106-109; 110
4. Framing, sheathing and insulation, pp. 150-156
5.

The purpose of this assignment is to provide a working knowledge of framing for any of the common types of dormers.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Types and purposes of dormers. How to determine the meeting point of two slopes. Finding top cut of dormer rafters. Finding common difference of stud lengths.	Safety precautions. How to layout opening. How to layout dormer studs and rafters. How to layout headers.	Layout and frame opening in main roof. Layout and cut dormer studs. Layout and cut dormer rafters. Layout and frame wall opening. Erect dormer frame work.

STUDENT STUDY GUIDE

1. Name three types of dormers?
2. How is the dormer opening determined?
3. Illustrate the framing of one type of dormer opening?
4. Describe the method used to determine the meeting points of two slopes?
5. Illustrate the layout of the rafter cuts.
6. Describe the laying out of the different stud lengths?
7. Why are dormers used?
8. Problem in estimating or figuring cost of material to be given by the instructor?

ASSIGNMENT 9. FRAMING FLAT DECKS

REFERENCES
1. Burbank, p. 41
2. Mix and Cirou, pp. 122
3. Townsend and Dalzell, pp. 211-213
4.
5.

A roof having a pitch of less than 1/8 is considered a deck roof. A deck roof may be a shed or a hip. In either case, the rafters are framed in the same manner as for other roofs having the same kind of rafter.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Purpose of the deck. Advantages. Disadvantages. Estimating.	Safety precautions. Determine lengths of material.	Layout, assemble and nail. Put in position if necessary and frame as needed.

STUDENT STUDY GUIDE

1. What are some uses for a deck roof?
2. Compare the cost of a deck roof with that of a gable roof.
3. What is the greatest slope ordinarily allowed for which a built-up covering is used.
4. Describe two methods of construction to obtain the desired slope.
5. How are the sizes of rafter-joist determined for a roof deck?
6. What type of sheathing is often used where the rafter is also used for the ceiling joist?
7. Where an overhang is involved on all sides of the house, describe or sketch the type of construction used.
8. What is the ratio between the distance from wall-line to double header and the overhang?
9. What is the purpose of sheet metal edging used on flat decks.

UNIT IV. ROOF FRAMING
AND SHEATHING

ASSIGNMENT 10. FRAMING TRUSS
ROOFS

REFERENCES
1. Small House Carpentry, pp. 71, 75-77
2. Small Homes Council, Circular Series
E2. 1, pp. 6-8
3. Small Homes Council "W" Truss Instruction
Sheet A, I, A, 19 B 3
4.
5.

Trusses as used in commercial and farm buildings are of long standing. Their use in small home construction is, however, relatively new. These trusses are similar to the conventional gable roof with the exception that the use of trusses permits spacing the entire width of a house without the need of interior partitions for ceiling or roof support. This measure is economical from the standpoint of both labor and materials.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Methods of determining span, rise, run, and pitch of roof. Relationship between unit and total measurement. Methods used in rafter layout. Step off, unit length, and rafter tables. Size, kinds, and grades of lumber. Truss fastenings.	Safety precautions. Pitch, span, and rise calculations. Size requirements for materials Calculations for length of tail. Truss fastenings. Kind and size of nail.	Determine pitch and span. Layout and cut common rafters. Arrange construction jig on sub-floor. Fabricate trusses. Raise trusses onto plates. Space, erect and nail brace.

STUDENT STUDY GUIDE

1. Sketch a 16 foot simple truss.

2. Sketch a jig for assembly of the above truss.

3. Compare member sizes with those used in conventional construction.

4. List advantages and disadvantages; also limitation of this type of construction.

5. Figure thrust, compression and shear at main points of truss.
(Problems to be given by instructor).

CARPENTRY

UNIT IV. ROOF FRAMING
AND SHEATHING

ASSIGNMENT 11. ROOF SHEATHING

REFERENCES
1. Duroahn, Vol. II, pp. 11 -122
2. Lair, pp. 76-79
3.
4.
5.

Sheathing is some form of rigid material used to support the weather repellant roof covering. The material used for the sheathing and the workmanship exhibited in laying of same. Greatly contributes to the value of the building and the durability of the roof covering. The carpenter should become well acquainted with the particulars contributing to a good sheathing job.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions Study types of sheathing from the standpoint of durability, cost & desirability. Estimating. Sheathing for different roofs. How to cut for hips & valleys.	Safety precautions. Nailing information. Staying of rafters. Breaking joints. Use of metal tie clips or plywood sheathing.	Layout. Cut and nail in place. Line and cut ends if necessary.

STUDENT STUDY GUIDE

1. List common materials used for sheathing.
2. What size nails should be used and how many in each shiplap?
3. What is the purpose of sheathing?
4. Describe the methods of applying solid roof sheathing.
5. Figure the cost of various kinds of roof sheathing for a problem given by the instructor.
6. Write a summary on the use of roof boards for wood shingles. Include size, spacing, nailing, etc.
7. What change in the roof framing is necessary for prefinished insulated plank roofing?

CARPENTRY

UNIT IV. ROOF FRAMING AND SHEATHING

ASSIGNMENT 12. COLLAR BEAMS

1. Durbahn, vol. II, pp. 197-198
2. Lair, pp. 102-103
3. Wilson and Werner, pp. 113-115

To strengthen roofs most rafters are tied together with collar beams. Your job is to be able to cut and place collar beams of the proper size in the proper location to insure good construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Saety precautions. Purpose of collar beams. Location of collar beams. Sizes of collar beams. Estimating. Spacing collar beams	Determine length of collar beams. Locate collar beams. Determine size of collar beams.	Layout pattern for collar beams. Cut out collar beams. Nail collar beams in place.

STUDENT STUDY GUIDE

1. Where are collar beams used?
2. What is the purpose of collar beams?
3. What size stock is used for collar beams?
4. What determines the length of a collar beam?
5. How is a collar beam laid out?
6. How often are these beams used in a roof?
7. When should they be nailed in place?
8. How is the distance between attic floor and the collar beam determined?
9. Give the formula for figuring the lengths of collar beams.
10. What is the length of a collar beam for a $\frac{1}{4}$ pitch roof when the beam is to be placed 2 feet from the ridge?

CARPENTRY

UNIT IV. ROOF FRAMING AND SHEATHING

ASSIGNMENT 13. FRAMING FOR ROOF OPENINGS

REFERENCES

1. Durbahn, Vol. II, pp. 191-194
2. Lair, p. 186
3. Framing, sheathing and Insulation, pp. 156-157; 162
4.
5.

Openings are needed in the roof for various reasons. It is far better that the carpenter cut and frame these openings, as the other mechanics consider this secondary to the performance of their specific job. This will insure a "completed-type job," that the carpenter considers necessary.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Fire regulations. Plumbing regulations. Line projection from one plane to another.	Safety precautions. Use of plumb line or spirit level to locate roof openings. Size of materials. Size of nails.	Methods of locating headers and trimmers for chimneys, sky lights, scuttles, louvers, etc. Methods of locating and drawing plans on attic floor. Methods of supporting and cutting roof members. Methods of nailing headers and trimmers in place.

STUDENT STUDY GUIDE

1. What are some common openings found in roof construction that require special framing?
2. How are roof openings located?
3. Why would a plan of an opening drawn full size on the attic floor help in locating the same opening in the roof?
4. Explain what is meant by a single header. A double header.
5. What are trimmers?
6. How is the cut on the end of a trimmer determined?
7. When trimmers are nailed in place, why should they be in line with the tops of the rafters?
8. Why is a strip nailed across the top of the rafters to be cut?
9. What is a chimney saddle?
10. What determines the span of the saddle?
11. Write a short summary of the steps necessary to frame a chimney opening in a roof.

CARPENTRY

UNIT IV. ROOF FRAMING AND SHEATHING

ASSIGNMENT 14. FRAMING A SNUB GABLE

REFERENCES

1. WILSON AND WERNER, pp. 97-102
2. Framing, sheathing and insulation, pp. 177-180
3.
4.
5.

One of the variations used by designers to deviate from the regular type of roof is known as the snub gable. The carpenter should have a knowledge of its layout and construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Use of steel square in determining lengths and cuts of rafters. Reasons for snub gable including type of architecture.	Safety precautions. How to determine miter cuts on shortened common rafters. How to determine length of gable plate. How to determine length of hip and jack rafters and make check and seat cuts.	Layout and cut shortened common rafters. Layout and cut gable plate. Layout and cut snub hip rafters and jack rafters and jack rafters. Nail gable plate and snub hip rafters in place. Space and nail jack rafters in place.

STUDENT STUDY GUIDE

1. What is a snub gable?
2. What determines the size of a snub gable?
3. What three spans are involved in a snub gable?
4. How is the height of the plate for the snub gable determined?
5. What are the names of the different rafters used in framing this roof?
6. How does the tail-cut of a hip rafter for a snub gable differ from an ordinary hip rafter?
7. Explain how a T-bevel may be used in framing a snub gable.
8. How is the length of the jack rafters found?
9. Draw a sketch of a snub gable roof.
10. Summarize the operations for framing a snub gable in their proper order.

CARPENTRY

UNIT IV. ROOF FRAMING AND SHEATHING

ASSIGNMENT 15. FRAMING A LEAN-TO ROOF

REFERENCES

1. Durbahn, Vol. II, pp. 188-189.
2.
3.
4.
5.

The layout for the lean-to roof rafter is similar to the layout for the shed-dormer rafter with the exception that the lean-to roof extends, in part, over the main roof. The rafter plates for the lean-to roof and the main roof are usually at different heights.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Determine Basic roof information.	Determine the length, pitch, and run.	Layout and cut rafters.
How to lay out plate cut and overhang.	Size and kinds of materials.	Space and nail rafters.
How to lay out cut at top end of rafter.	Safety precautions.	

STUDENT STUDY GUIDE

1. Draw a sketch showing a lean-to roof.
2. The layout for the lean-to roof rafter is similar to the layout for the ______________ rafter.
3. How is the top cut laid out for the lean-to roof rafter?
4. What shortening is necessary on a rafter for a lean-to roof?
5. Would a lean-to roof be used most often in new construction or in adding to an old building?
6. A practical problem should be given to the class requiring them to figure the lean-to roof after length.

CARPENTRY

UNIT IV. ROOF FRAMING
AND SHEATHING

ASSIGNMENT 16. FRAMING A CHIMNEY SADDLE

REFERENCES
1. Durbahn, Vol. II, pp. 191-194
2. Framing, sheathing and insulation, pp. 180-181
3.
4.
5.

Unless a chimney straddles the ridge, a small gable called a saddle is constructed at the rear of the chimney to keep snow and dirt from collecting. Chimney saddles are constructed and installed prior to covering the roof.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Methods of determining span and pitch of saddle. Method of layout and cutting of rafters, valley strip, and ridge boards	Safety precautions. Determine span, pitch, rise, and necessary shortening. Kinds and sizes of materials. Determine length and layout of ridge. Determine necessary shortening of common rafter.	To determine the width of chimney and unit rise of the main roof. To layout and cut various members of the saddle. To assemble and nail in position.

STUDENT STUDY GUIDE

1. What is the purpose of a chimney saddle?
2. What is the span for a chimney saddle and how is it determined?
3. How is the length of a valley strip determined?
4. What size stock is recommended for the valley strip?
5. Why is it necessary to shorten the common rafter of a chimney saddle?
6. Show by diagram a method of finding the required shortening for a common rafter run of a saddle?
7. Show by diagram the layout of the common rafter for the chimney saddle. Identify the ridge cut and the seat cut?
8. How is the ridge layout, that fits against the valley strip, determined?

4.
5.

The purpose of a cornice is to provide a definite and satisfactory finish in building construction at the points where the roof and side wall intersect. This usually includes the gutter as a part of its design. The size is largely determined by the type of architecture as well as the size and balance of the house. This unit has as its purpose the teaching of the most common types of cornices and their respective construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Kinds of cornices	Cutting, fitting and placing of frieze boards plancier boards, fascia boards, and barge boards.
Local adaptations.	Rafter tails

3. Interior and Exterior Trim, pp. 53-77
4. Manufacturer's Specifications
5.

The purpose of the window and door frame is to receive and protect the various types of windows and doors and to permit necessary operation. Details such as opening sizes and methods of setting are determined by frames and methods of setting are determined by tye type of manufactured doors and windows used. Hence a knowledge of the kinds and types of door and window frames and methods of assembly and setting are necessary.

The purpose of this assignment is to give this information.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Lumber & rot proofing. Kinds of paper and insulation. Primers and sealers. Nail sizes and types. Local building codes. Termite proofing. Caulking.	Name, size and location of each member of frame. Safety. Tools used. Kinds of frames and casting. Methods of layout and assembly. Methods of spacing. Methods of bracing. Methods of insulating. Methods of papering or caulking.	Construct and/or assemble. Locate, plumb, level, fasten and brace.

STUDENT STUDY GUIDE

1. Why are frames put in place before exterior wall finish is applied?
2. What is a window rod? How used?
3. List steps in setting window frames.
4. What wood is used for jambs and casing and sills?
5. What size nails? How spaced for both door and window frames?
6. What materials is used for flashing? How is it applied?
7. Do all metal sash require a frame?
8. Figure the differences in cost between wood and metal in windows for a specific house.

CARPENTRY

2. Lair, 125-135
3. Interior and Exterior Trim, pp. 80-95
4.
5.

It is necessary to finish the outside of all building construction with some type of covering. The purposes of wall coverings are to decorate and insulate these structures from the elements. Many kinds of materials can be used and a knowledge of the application of the most common kinds are necessary. A study of construction, durability and design forms one of the most interesting phases of building construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Name, size, type of materials for wall coverings.	Methods of application.
Materials and manufacturing methods.	Tool used.	Methods of finishing, corners.
Pre-construction finishes.	Cutting of different materials.	Methods of trimming intersections.
Expansion and sun action.	Nailing or application of materials.	
Tools and equipment used in wall covering application.	Insulating and caulking.	
	Fitting metal corners.	

STUDENT STUDY GUIDE

1. How are the courses of siding or covering spaced?
2. How do windows determine spacings?
3. Describe how courses are started for three different types of wall coverings.
4. How are courses finished at the corners for three materials?
5. How are courses finished at the cornice and rake for three materials?
6. How are courses kept horizontal? What tools or materials used?
7. How are courses nailed, nail sizes, setting and filling, if necessary, for three materials?
8. How are scaffolds maintained?

BUILDING TRADES CARPENTRY

UNIT # 6 INSULATION

ASSIGNMENT #1	GENERAL INFORMATION
ASSIGNMENT #2	LOOSE TYPE
ASSIGNMENT #3	BLANKETS AND BATTS
ASSIGNMENT #4	RIGID BOARD
ASSIGNMENT #5	REFLECTIVE TYPE

CARPENTRY

UNIT VI. INSULATION

ASSIGNMENT 1. GENERAL INFORMATION

REFERENCES

1. Durbahn, Vol. II, pp. 155-182
2. Lair, pp. 212-223
3. Framing, sheathing, & insulation, pp. 231-236
4.
5.

The primary purpose of insulation is to retard the passage of heat or to keep heat where it belongs. The purpose is the same whether insulation in the walls of your refrigerator, or in the walls of your range oven, around the pipes of your furnace, in the walls and ceilings of your home, or in the clothing you wear. The insulation you choose for your house should be selected for its insulating efficiency, its permanence, its resistance to fire and rodents, and the ease and speed with which it can be installed.

Where the attic is insulated, ventilation is necessary to prevent accumulation of excessive moisture and heat.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Study principles of thermal insulation. Study types of insulating materials and compartive values.	Safety precautions.	

STUDENT STUDY GUIDE

1. What is meant by the term "thermal building-installation?"
2. What is the purpose of a vapor barrier?
3. What type of vapor barriers are most effective?
4. How are building materials tested for heat conductivity?
5. What are the methods of preventing the infiltration of cold air?
6. What are the methods of preventing the transmission of heat?
7. Why is attic ventilation necessary with attic insulation?
8. How would you provide for this attic insulation?
9. Figure the cost of insulation of various problems given by your instructor.

CARPENTRY

UNIT VI. INSULATION

ASSIGNMENT 2. LOOSE TYPE

REFERENCES
1. Durbahn, Vol. II, pp. 159-160
2. Lair, pp. 212-216
3. Framing, sheathing, and insulation, pp. 231-236
4.
5.

The loose type of insulation is blown or poured into the space between studdings, joists, rafters, or inaccessible places after sheathing and other covering material are in place.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Materials used in manufacturing. Advantages & weakness of this type of insulation. Trade names. Estimations.	Show where this type is best suited. Method of installing. Safety precautions.	Installation on the job.

STUDENT STUDY GUIDE

1. What materials are used in making loose type insulation?
2. What are the advantages of loose type insulation?
3. How is it installed in old buildings?
4. What hazards are encountered in using this insulation both to the building and to the carpenter?
5. How is loose type insulation packaged and sold?
6. If one bag of ozite will cover 3 sq. yards, 1 inch thick, what will be the cost of insulating a ceiling 26' x 36' to a depth of 3 inches?
7. Give some trade names for loose type-insulation:
   a.
   b.
   c.
8. Give the advantages and disadvantages of insulating an old house.

UNIT VI. INSULATION

ASSIGNMENT 3. BLANKETS OR BATTS

REFERENCES

1. Durbahn, Vol. II, pp. 157-159; 162-164
2. Lair, pp. 216-217
3. Framing, sheathing and insulation, pp. 213-236
4.
5.

The purpose of this lesson is to give the student a knowledge of blanket & batt insulation so he will be able to choose and compare its use with other types.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Trade Names. Sizes Used. Spacing. Fastening methods. Insulating qualities of various makes of batts & blankets.	Safety precautions. Proper placement in regards to vapor barrier.	Installation.

STUDENT STUDY GUIDE

1. What are the trade names for some of the various brands of flexible insulation?
2. Explain how flexible insulation is used in masonry walls.
3. Make a sketch showing how blankets are placed between studding in relation to air space and fastening.
4. What are the standard widths of blankets and batts?
5. Explain how this type insulation is held between rafters.
6. Should the vap r barrier be to the inside or the outside in the wall?
7. Where should the greatest amount of insulation be placed?

CARPENTRY

UNIT VI. INSULATION

ASSIGNMENT 4. RIGID INSULATION BOARD

REFERENCES

1. Durbahn, Vol. I, pp. 164-171
2. Durbahn, Vol. II, pp. 78-83
3. Lair, pp. 214-215
4.
5.

A common type of insulation used in building is the rigid fiber type made of wood pulp, sugar cane, corn stalks & other vegetable matter. It is made in various sheet sizes & thickness & is water proofed. Rigid insulation boards being strong, are being used today for insulation & sheathing purposes in new house construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	APPLICATION
Advantages of rigid board.	Nails & nailing.	
Estimating.	Other fasteners.	
Raw materials used in manufacturing.		
Trade names.		
Sizes & colors.		
Film on insulation form celotex corp.		
Heat loss coefficient in relation to blanket or fill insulation.		

STUDENT STUDY GUIDE

1. How are rigid insulation boards applied to the studding?
2. What thickness of insulation boards should be used on the outside of a house for sheathing?
3. List five trade names for rigid insulation boards:
   A.
   B.
   C.
   D.
   E.
4. How many square feet of insulation board are needed to cover the outside of a house with a hip roof that is 30' wide, 34' long, and 9' high? (Do not allow for doors and windows)
5. What will the cost be for the material in Problem 4 @ $8.00 per square?
6. How does the insulating valve of a 25/32 rigid sheet compare with full thick batts?

CARPENTRY

UNIT VI. INSULATION

ASSIGNMENT 5. INSTALLATION OF REFLECTIVE TYPE

REFERENCES

1. Durbahn, Vol. I, pp. 171-173
2. Lair, pp. 216
3.
4.
5.

While reflective insulation was first patented in 1804, it has not been used in the building field until recently. New applications of this insulation are coming on the market constantly. Follow the manufacturer's directions in applying to gain maximum insulation.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Installation.
Study kinds of reflective insulating materials and comparative values.	Demonstration.	
Trade names.		
Cost estimating		
Heat loss coefficient in relation to blanket or fill insulation and rigid insulation.		

STUDENT STUDY GUIDE

1. By what principle does reflective insulation work?
2. What material is used most for reflective insulation?
3. How would you anchor foil surfaced plaster board?
4. How would you anchor foil reflective?
5. What would be the cost of material to insulate an area 28' x 32' at $7.50 per square?
6. When using reflective insulation in the walls where should it be fastened for maximum efficiency?

3. Lair, pp. 196-200
4. Interior and Exterior Trim, pp. 117-126
5. Manufacturers' Literature

The purpose of this unit is to familiarize the student with the various methods and procedures of hanging various types of window sashes. Consideration should be given to the proper workmanship since it is essential that the windows operate or function properly. There are a number of new types of sashes which have been introduced on the market. Manufacturers charts should be consulted for proper installation of these windows.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Methods of hanging. Standard sizes of sash.	Tools used. Check frame for plumbness. Safety precautions.	Trimming & fitting to site. Installing sash.

STUDENT STUDY GUIDE

1. Name four types of window sashes:
   A.　　　　C.
   B.　　　　D.
2. List three safety precautions for storing and installing windows on the job.
3. The members which separate the panes of lights of a divided window are called ______________.
4. The _________ sash of a double hung window is hung first.
5. Sash that are hinged at the verticle edge are called ____________.
6. ___________ are used in place of sash weights in double hung windows.
7. How are window sizes indicated?
8. List the steps in the procedure in fitting and hanging a double hung window.
9. Figure the cost of all the windows in the project house.

3. Interior and Exterior Trim, pp. 153-158
4.
5.

The purpose of this assignment is to familiarize the student with the selection and application of the casing, stools, aprons and stops. Due to the numerous types of casings, selecting the proper kind of wood depends upon the finish to be used. Great care must be taken to avoid hammer marks or any other blemishes on the finished trim members.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Types of casings, stools & aprons.	Tools used.	Layout. Cut & fit stool, apron, casing & stops.
Make a size of parts of trim.	Determining lengths of stools, apron, casings & stops.	
Selection & grade of material.	Sizes, numbers & spacing of nails.	
Mullions.	Methods for fitting to wall surface marking.	
Joints used in trim.		

STUDENT STUDY GUIDE

1. Name the four types of window casings and make a sketch illustrating each type.
2. The horizontal member just below the bottom cut of the side casings is called the _______________.
3. The member that is found directly below the stool of a window which covers the rough edge of plaster is called the __________.
4. The vertical trim member between multiple windows is called the ___________.
5. ______ ________ on castings are caused by the incorrect use of the hammer.
6. __________ d nails are used to fasten the outer face of the casing and __________d nails are used for the inner face.
7. The inside stops serve as a ____________ for the lower sash.
8. List the steps in the procedure of applying inside trim for a double hung window.
9. List 4 safety precautions for care of windows and trim in installation of window trim.
   a.
   b.
   c.
   d.

4.
5.

The purpose of this unit is to familiarize the student with the method and procedures of laying different types of flooring. A great deal of emphasis should be placed on the starting course of flooring in the relationship to the various rooms. Careful selection and matching of boards will tend to make a more desirable appearing finish floor.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Methods of laying. Types of materials for flooring. Grades of flooring Estimating flooring. (No. of ft.) Kinds and sizes of nails. Climatic conditions effecting floor laying.	Safety precautions. Tools used. Method of nailing. Location first course of flooring in relationship to various rooms. Starting course. Finish course.	Preparation for finish floors. A. over concrete 1. Emulsion furring 2. Blocks or strips. 3. Vapor barrier B. Frame structure 1. Applying paper on sub floor Selecting, cutting, fitting and nailing.

STUDENT STUDY GUIDE

1. The preparation of the sub-floor for laying the finish floor consists of:
   A. C.
   B. D.
2. The classifications of finish flooring with reference to the methods of sawing are __________ and __________.
3. __________ marks on the edge of the finish flooring are the result of striking the nail at an improper angle.
4. The recommended size nail for 13/16 finish floor is ________d.
5. The usual amount allowed for waste for 13/16 x 2¼" hardwood floor is _______ per cent.
6. __________ nailing is necessary and permissible when fastening the first and last course of hardwood flooring.
7. Correct __________ matching is as important as edge matching in laying hardwood floor.
8. What is the correct accepted position of the worker when laying flooring?
9. Write a brief summary of the procedure of drawing together and nailing the last few courses of hardwood flooring.
10. Figure the cost of the finish floor for the project house.
11. The standard sizes for flooring are: _______, _______, _______, _______, _______, _______.
12. Nails in hardwood flooring should not be placed more than _____ inches apart.
13. List procedure for flooring over concrete.
14. List several reasons why one should consider climatic conditions when laying finish floor.

3. Lair, pp. 56-59
4.
5.

The purpose of this assignment is to make the student familiar with these various materials and their application and comparitive cost.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Study of various types of materials. Special mastic. Estimating. Design & color scheme. Manufacture's catalogue. Note: many manufactures have excellent material for free distribution.	Safety precautions. Tools used. Care of material Demonstration.	Installation on over plywood. over old flooring. over any D.T.M. Prepare base. Locate starting point. Apply mastic. Lay tile.

STUDENT STUDY GUIDE

1. List several types of composition floor covering (tile).
2. What are the common sizes and thicknesses of composition tile?
3. How should the base be prepared for composition tile?
4. How are composition tile secured in place?
5. In laying a composition tile floor where is the best place to start?
6. Figure the cost of composition tile for the project house.
7. In what form does ceramic tile come to the worker?
8. To provide a base for ceramic tile, what type of floor and wall construction is necessary?
9. Figure the cost of ceramic wall and floor tile for the project house.
10. What type of underlayment is used for composition flooring on both new and old floors?
11. Name more than one type of fasteners used for underlayment.
12. What types of composition may be layed on concrete below grade.
13. What type of adhesive must be used for floors laid below grade.

3. Interior and Exterior Trim, pp. 142-143
4.
5.

The purpose of this assignment is to demonstrate the correct way to set and fasten door jambs.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Check opening for plumbness & size.
Protection of surfaces of jambs.	Tools needed.	Assemble frame.
Framing jambs to fit.	Sizes of doors.	Plumbing, blocking, squaring.
Specific doors.	Sizes, kind & location of nails.	Locating & fastening to rough opening.
Methods and information concerning plumbing, blocking, squaring and fastening.	Kinds of blocking.	
Estimating.	Type of fastening.	
When to install-wood-metal thickness to sizes.		

STUDENT STUDY GUIDE

1. Rough openings are usually made ______inches larger each way than the size of the door to be hung.
2. When setting the frame, the ________is used on the side jambs and the ________ is used on the head jamb.
3. Standard width of the door jambs for plasterd walls is ______inches.
4. Width of door jambs for bull nosed finish is ________ inches.
5. Inside door jambs are usually ________inches in thickness.
6. The __________joint is used in the construction of door jambs.
7. Summarize the steps in the procedure in setting and fastening an inside door frame.
8. How do wood and metal frames compare in price?
9. In labor costs are a factor to consider, which type frame is less expensive.

4.
5.

The purpose of this assignment is to familiarize the student with the selection of types, the cutting, locating, and fastening of door casings and stops. When selection is made, consideration should be given to the types of joinery used for best results. Emphasis should be placed on materials as to durability and beauty.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Methods of casing joists and door openings. Joinery of casings. Sizes, types, and materials for casings. Location and position of door stops.	Safety precautions. Location of casings on jambs. Sizes, kind, and spacing of nails.	Fit and nail casing and door stops to plaster and grounds. Fit and nail casing and stops to dry wall.

STUDENT STUDY GUIDE

1. What is the primary purpose of door casings?
2. Name three types of door casings and describe each?
3. In what order should the casing be fastened?
4. Why should the casing be of the same variety of wood as the jambs?
5. How far back on the jamb should the casing be set?
6. The approximate distance door stops are fastened on jambs from the side of which the door swings is determined by the ______________.
7. __________d nails are used to fasten the outer face of the casing and __________d nails for the inner face.
8. Summarize the steps in the procedure of installing door casing and stops.

ASSIGNMENT 7. FITTING AND HANGING A DOOR

REFERENCES

1. Durbahn, Vol. II, pp. 311-325
2. Lair, pp. 204-207
3. Townsend, pp. 423-428
4. Interior and Exterior Trim, pp. 267-263
5.

The purpose of this assignment is to familiarize the student with the operations of fitting and hanging a door. Consideration should be placed on clearance selection, appearance, design, and location of hardware. The gaining of jambs, the use of quickset for hardware should be demonstrated and practiced.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Trim and fit door to opening.
Types, sizes and material of doors.	Tools used.	Layout and install hardware.
Types of hardware.	Selection of door for appearance, and direction door opens.	Hang door.
Parts of a door.	Setting hinges and lock.	Install stop.
Note: Use films and manufacturers catalogues.		

STUDENT STUDY GUIDE

1. The usual amount of clearance on the bottom of an interior door is ________inches.
2. The edges of a door should be ________slightly outward so that there is a greater clearance of the sides striking the stops.
3. ________inches is the usual amount of clearance on the sides and top of the door.
4. The top hinge is usually set down ________inches and the bottom hinge is set up ________inches.
5. The location of the lock on the door is ________inches from the bottom.
6. __________hardware should be used on the interior sides of bathroom doors.
7. The vertical members of a door are called _______, and the horizontal members are called.
8. List and number the steps in order of the procedure of fitting and hanging a door.
9. Figure the cost of the doors in the project house.
10. If a carpenter can fit and hang four doors in an 8-hour working day, and if his wage scale is $4.00, what would be the cost of fitting and hanging all the doors in the project house.

ASSIGNMENT 5. HOW TO LAYOUT AND CUT STAIR HORSES

REFERENCES
1. Durbahn, Vol. II, pp. 337-339
2. Lair, pp. 177-181.
3. Simplified Stair Layout, pp. 33-40
4.
5.

Careful layout and cutting of a stair horse is of major importance in securing a satisfactory stair.

CLASSROOM

Related technical information

- Safety precautions.
- Proper use of square in layout.
- Scribing around the square.
- Built up stair horse.
- Precautions in sawing.

ON THE JOB

Information to be given on the job

- Safety precautions.
- Points in selecting stair horses material.
- Methods of anchoring stair horses.
- Cutting stair horses, with power equipment.

Work to be done on the job

- Select material for structural strengths.
- Layout the risers and treads with square.
- Layout seat cut at bottom.
- Mark off for drop.
- Mark for plumb cut at top.
- Cut along final layout lines.
- Nail stair horses in place.

STUDENT STUDY GUIDE

1. What lumber characteristics must be observed in selecting stair horse material?
2. What is a stair gauge and how is it used.
3. How are the rise and the run of a stair used on the carpenters square in the layout of a stair horse?
4. Why is it important to accurately scribe around the square?
5. What happens if you neglect to cut off for stair horse drop?
6. Make two simple sketches showing the difference between sawed-out and built-up stair horses.

ASSIGNMENT 6. HOW TO LAYOUT AND CUT STRINGERS

REFERENCES

1. Durbahn, Vol. II, pp. 334-335; 338-339.
2. Lair, pp. 177-181.
3. Interior and Exterior Trim, pp. 209-210; 213; 221.
4. Simplified Stair Layout, pp. 43-54.
5.

The purpose of this assignment is to teach the use and construction of stringer boards.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Select proper materials.
Layout a plain stringer.	Points in selecting material.	Plane edges of stock straight and square.
Intersection of stringer and base board.	Determine tread and rise.	Layout and scribe.
Mitered stringer.	Caution in scribing and sawing.	Sawing and fitting.
Housed stringer.		Fastening in place.
Wedges and Wedging.		

STUDENT STUDY GUIDE

1. From which of the two edges may a stair stringer be laid out?
2. From which edge is the layout work done for the risers and treads if the risers are to be mitered.
3. When the stringer is housed, why is the layout work for risers and treads done from the bottom edge?
4. When working from the top edge of the stringer, how is the steel square held for the layout?
5. How is the square to be held if the layout work is to be done from the lower edge?
6. How may a pitch board be used in stringer layout work?
7. Explain the use of a set of square gauges in the layout of a stringer?
8. What is the difference between the layout of the cut-out type of stair stringer and the housed stringer?
9. What is the purpose of the line drawn along the edge of the stringer?
10. What allowance should be made on the top and bottom cuts of the stringer?
11. What should be used in marking the stringer?
12. How is the open stringer laid out?

ASSIGNMENT 1. LOW SCAFFOLDING

REFERENCES

1. Durbahn, Vol. II, 122-126
2. Lair, pp. 235-248
3. -
4.
5.

It is difficult and unsafe for a carpenter to work on a building unless he can reach the work comfortably. The types and sizes of scaffolds will vary with the different types of work. Scaffolding materials should be structurally sound. Although they are only temporary structures, nevertheless, scaffolds must be designed and built to carry the required load safely, permitting the workman to reach and perform his work with ease and safety.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Selection of type and size.
Types of scaffolds.	Soils and footings.	Location and placing.
Strength of material.	Defects in materials.	Assembly and nailing.
Nailing.	Bracing.	Checking for safety.
Proper fastening to main structure.		

STUDENT STUDY GUIDE

1. What size material should be used for the ledger board on a low scaffold?
2. What precaution should be considered to keep the scaffold from sinking into soft dirt?
3. Make a sketch of a simple low scaffold.
4. Mention several defects found in lumber that make it unsatisfactory for scaffolding.
5. Estimate the materials needed to build a simple scaffold for the 36' side of a one-story house with a hip roof, to be used while building the cornice.

ASSIGNMENT 2. MEDIUM SCAFFOLDING 3 TO 10 FEET

REFERENCES

1. Durbahn, Vol. II, pp. 122-125
2. Lair, pp. 235-248
3. Framing, Sheating and Insulation, pp. 103-105
4.
5.

The purpose of the assignment is to familiarize the student with the proper methods of scaffold construction.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions.	Safety precautions.	Construct masons squares.
Study types of medium scaffolding.	Select the materials to be used.	Assemble horses.
Reasons for the different types.	Assembly and nailing.	Cutting and fitting.
Materials used.	Bracing of members.	Placing and spacing.
The assembly of each type show safety films.		Nailing assembly.
		Leveling.

STUDENT STUDY GUIDE

1. Name the conventional sizes of wood members in constructing medium scaffolding.
2. What kind and sizes of nails are commonly used in the construction and erection of scaffolding?
3. What is a rolling platform scaffold?
4. Where is a rolling platform used and what are its advantages?
5. How is bracing nailed for greatest strength and rigidity?
6. What are the advantages of two headed nails?
7. Write a brief on the care and use of tools on the scaffold.

1. Durbahn, Vol. II, pp. 122-126
2. Lair, pp. 235-248
3. Framing, Sheathing and Insulation, pp. 100-105
4.
5.

The purpose of this assignment is to familiarize the student with the construction, erection and dismantling of high scaffolding.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Types of scaffolds. Strength of materials. Principles of pulleys. Removal of wrecking. Estimating.	Safety precautions. Purpose of scaffold. Defects in material. Nail sizes. Methods of nailing. Proper dismantling.	Locate & prepare footing area. Selection of material for main scaffold, platform, and hand rail. Erection. Inspection.

STUDENT STUDY GUIDE

1. What standard size material should be used for the ledger board in a scaffold twenty feet high?
2. What standard size material should be used for the uprights in a scaffold twenty feet high?
3. What standard size material should be used for bracing a high scaffold?
4. What is the proper spacing of the uprights on a scaffold twenty feet high?
5. What are the dimensions of mason squares?
6. How high is it safe to scaffold with mason squares?
7. Which is the more rigid figure, a triangle or a rectangle?
8. List several good reasons for handrail.
9. What is the proper height for the handrail above the platform?
10. What is the proper manner in which workmen ascend to the working platform of the high scaffold?
11. List several safety rules which should be considered by the workmen in getting tools and materials onto the platform of a high scaffold

2. Durbahn, Vol. II, p. 129
3. Lair, pp. 251-252
4.
5.

The purpose of this assignment is to demonstrate safe ladder use.

CLASSROOM	ON THE JOB	
Related technical information	Information to be given on the job	Work to be done on the job
Safety precautions. Types of wood used in ladders. Metal ladders. Types & uses of ladders. Ladder jacks. Center of gravity theory.	Safe angles for ladders. Safe uses of ladder jacks. Bracing & fastening of ladders. Care of ladders.	Selecting & placing ladders. Use of brackets. Using ladders for scaffold planks. Selecting, placing & extending extension ladders. Selecting & placing of scaffold planking. Selecting & placing of roof ladders, hooks & brackets.

STUDENT STUDY GUIDE

1. Name the kinds of ladders.
2. List three rules for the safe setting of ladders.
3. Compare two kinds of ladder jacks.
4. List three causes for ladder accidents.
5. How are ladders fastened to roofs?
6. List several good practices for the care and use of ladders.
7. What woods make good ladders?
8. What is the maximum and minimum angle inclination of a ladder.

AGENDA A

BIBLIOGRAPHY

This list of reference materials is not to be considered a complete listing of all the available items, but it does offer a good cross section of what can be obtained in the area of carpentry. Nor, because any particular item has been included, is it to concluded that this is the best in the field covering any particular subject. Rather, these are the books, pamphlet etc. that are known to the committee to be adequate. It is suggested that others which are equally as good, and with which you are familiar should be included in your own reference list.

The items in part I are considered as basic reference. Reference to these has been made in the individual assignments. Part II contains supplemental materials which are to be used for specific areas in the trade.

AGENDA C

BY-LAWS

ARTICLE I.

Membership

Section 1 - Qualifications.

There shall be only one class of members, to be designated and known as "General Members."

Every person, firm, association or corporation who pays to the corporation such membership fee as the Board of Directors may, from time to time, establish, shall become a "General Member" and shall be issued a general membership certificate which shall remain in effect until the end of the corporation's then fiscal year, as established by the By-Laws. Such general membership shall not be assignable or transferrable.

Each General Member shall be entitled to one (1) vote at all meetings of the members, so long as the membership fee, as established by the Board of Directors, has been paid for that year.

Section 2 - Annual Meeting.

The annual meeting of the members of this corporation shall be held at the principal office of the company in the City of Elkhart, Indiana, on the second Tuesday of February of each year, or at such other time as the Board of Directors may, by resolution, determine, but in any event, not later than July 1st of each year, for the election of Directors and transaction of such other business as may lawfully come before the meeting. It shall be the duty of the Secretary to give ten (10) days notice of such meeting in person to each member or by mail to each member not personally notified, such notice to state that the meeting is the annual meeting, and the time and place thereof. This notice shall be addressed to each member at his address as the same appears upon the records of the company.

Section 3 - Special meetings.

Special meetings may be called by the majority of the Board of Directors or by the President or by members holding not less than twenty-five (25%) per cent of the membership certificates of the corporation at the time issued and outstanding, filling with the Secretary a written request for such meeting and stating the object thereof and the date and hour. Upon the filing of such request, the Secretary shall give immediate notice of such meeting by mailing written notices thereof to each member at his last address, as the same appears upon the record of the company, and shall state in said notice the time, place and purpose of holding such meeting. Such notices shall be mailed at least ten (10) days prior to the time fixed for such meeting. If all members attend in person, no notice shall be required and such attendance shall constitute a waiver of notice of such meeting.

Section 3 - Quorum.

The members holding a majority of the membership certificates issued by the corporation for the current year shall constitute a quorum at any meeting of such members, and be capable of transacting any business, except when otherwise especially provided by law or by the Articles of Incorporation. If, at any meeting of the members, there be less than a quorum present, a majority in interest of the members present may adjourn from time to time without notice other than by announcement at the meeting until the holders of the number of membership certificates requisite to constitute a quorum shall attend. At any such adjourned meeting at which a quorum shall be present any business may be transacted which might have been transacted at the meeting as originally called and notified.

Section 4 - Organization.

The President, and in his absence the Vice-President, and in their absence any member chosen by the members present, shall call meetings of the members to order and shall act as chairman of such meetings, and the Secretary of the Company shall act as Secretary of all meetings of the members. In the absence of the Secretary the presiding officer may appoint a member to act as Secretary of the meeting.

ARTICLE II.

DIRECTORS

Section 1 - Board of Directors.

The Board of Directors shall consist of five members, who shall be elected annually by a majority of the members at the annual meeting of the members. Such Directors shall hold office until the next annual meeting of the members and until their successors are elected and qualified. A majority of the Directors must be citizens of The United States.

Section 2 - Duties.

The corporate power of this corporation shall be vested in the Board of Directors, who shall have the management and control of the business of the corporation. They shall employ such agents and servants as they may deem advisable, and fix the rate of compensation of such agents and servants. In no event shall any member or members of the Board of Directors be entitled to receive any compensation from the corporation.

Section 3 - Qualifications of Directors.

At least one director shall be chosen from the personnel of each of the three Banks in the City of Elkhart, Indiana, represented on the membership of this corporation, one director shall be chosen from the School City of Elkhart, Indiana, and the one shall be chosen from the Building Trades Council of Elkhart, Indiana. PROVIDED, HOWEVER, that all Directors shall be members of this corporation.

Section 4 - Resignation and removal.

A Director may resign at any time by filing his written resignation with the Secretary. Any Director may be removed for cause at any time and at any regular meeting or of the special meeting of the members of the corporation called for such purpose, by the affirmative vote of the holders of a majority of the membership certificates outstanding for the current year.

Section 5 - Vacancies.

In case of any vacancy in the Board of Directors through death, resignation, removal or other cause, the remaining Directors by the affirmative vote of a majority thereof may elect a successor to fill such vacancy until the next annual meeting and until his successor is elected and qualified.

Section 6 - Annual and regular meetings.

The annual meeting of the Board of Directors shall be held immediately after the annual meeting of the members of the corporation as set by the Board of Directors. There shall be no regular meetings of the Board of Directors other than said annual meeting.

Section 7 - Special meetings.

Special meetings of the Board of Directors shall be held whenever called by the Secretary upon the direction of the President, or a majority of the Board of Directors. It shall be the duty of the Secretary to give notice by telephone, telegraph, letter or any other manner and for such period of time as will reasonably enable the Directors to be present at said meeting. Said meetings may be held at any time or place.

Section 8 - Quorum

A majority of the Directors shall constitute a quorum for the transaction of business; but if, at any meeting of the Board, there shall be less than a quorum present, a majority of those present may adjourn the meeting from time to time.

Section 9 - Organization.

The President and in his absence the Vice-President and in their absence any Director chosen by the Directors present, shall call meetings of the Board of Directors to order, and shall act as Chairman of such meetings. The secretary of the corporation shall act as Secretary of the Board of Directors, but in the absence of the Secretary the presiding officer may appoint any Directors to act as Secretary of the meeting.

Section 10 - Order of Business.

The order of business at all meetings of the Board of Directors shall be as follows:

(1) Roll call.
(2) Reading of the minutes of the preceding meeting and action thereon.
(3) Reports of Officers.
(4) Reports of Committees.
(5) Unfinished Business.
(6) Miscellaneous Business.
(7) New Business.

ARTICLE III.

GENERAL OFFICERS

Section 1 - Election.

The officers of this corporation shall be a President, Vice-President, Secretary and Treasurer, and such other officers as may be created by the By-Laws or by the Board of Directors. The office of Secretary and Treasurer may be combined. The Board of Directors shall annually, at the regular meeting of the Board held immediately following the annual meeting of the members, elect a President, Vice-President, Secretary and Treasurer, or Secretary-Treasurer and such other officers as the corporate articles and By-Laws require. Said officers shall hold office for a period of one (1) year and until their respective successors are elected and qualified. The President shall be elected from the Board of Directors.

Section 2 - Duties.

The principal duties of the several general officers respectively are as follows:

(1) The President shall preside at all meetings of the members and of the Board of Directors. He shall be the chief executive officer of the corporation, and shall have the general supervision, direction and active management of the property, affairs and business of the corporation, subject to the Board of Directors. He shall see that all orders and resolutions of the Board of Directors are carried into effect. He shall sign all certificates, stocks, bonds, deeds, leases, conveyances, commercial paper, contracts, and all other obligations and instruments in writing, unless otherwise ordered by the Board of Directors. He shall submit a complete and detailed report of the corporation for the fiscal year and of its financial condition to the Board of Directors at the annual meeting in each year, and to the shareholders at their annual meeting, and shall, from time to time, report to the Board of Directors all matters within his knowledge which the interest of the corporation may require to be brought to its notice. He shall preform such additional duties as may be prescribed from time to time by the Board of Directors or by the By-Laws.

Section 4 - Execution of documents.

All contracts, leases, notes, commercial paper and other instruments in writing, and legal documents, shall be signed by the President and countersigned by the Treasurer. All bonds, deed and mortgages shall be signed by the President and Treasurer and attested by the Secretary. All membership certificates shall be signed by the Secretary.

Section 5 - Vacancies.

Whenever any vacancies shall occur in any office of the company such vacancy shall be filled by the Directors by the election of a new officer, who shall hold his office until the next annual meeting and until his successor is duly elected and qualified.

ARTICLE IV.

Membership Certificates

Section 1 - Certificates.

The Secretary of the corporation shall issue to each member annually, upon the payment of the dues prescribed by the Board of Directors, a membership certificate indicating the membership of said member in this corporation.

ARTICLE V.

Miscellaneous

Section 1 - Fiscal year.

The fiscal year of this corporation shall begin on the 1st day of January and terminate on the 31st day of December of each year.

Section 2 - Waiver of notice.

Any member, director or officer may in writing waive the giving and the mailing of any notice required to be given or mailed, either by the Statutes of Indiana, the Articles of Incorporation, or by the By-Laws of this corporation, if the waiver sets forth in reasonable detail the purpose for which the meeting is called and the time and place thereof.

ARTICLE VI.

Amendments

Section 1 - Amendments

By-Laws may be adopted, amended or repealed at any meeting of the Board of Directors either regular or special, by the vote of a majority vote of said Directors.

(2) The Vice-President shall discharge the duties of the President in the event of his absence or disability for any cause whatever. He shall perform such additional duties as may be prescribed from time to time by the Board of Directors or as may be prescribed from time to time by the By-Laws.

(3) The Secretary shall sign all membership certificates and attest all bonds, deeds, leases or conveyances executed by the corporation, affix the corporate seal thereto and to all other papers requiring said seal, and shall keep a correct and complete record of all of the proceedings of said corporation, including such as relate to the election of its officers. He shall also keep a book containing the names of all members since its organization showing the place of residence and the status of membership, and shall safely and systematically keep all books, records and papers belonging to the corporation, or in anywise pertaining to the business thereof. He shall attend to the giving and serving of all notices of meetings of the Board of Directors and members. He shall in general perform all of the duties which are incident to the office of Secretary of a corporation, subject to the Board of Directors. He shall perform such additional duties as may be prescribed from time to time by the Board of Directors or as may be prescribed from time to time by the By-Laws.

(4) The Treasurer shall keep account of all moneys, credits and property of the corporation which shall come into his hands and keep an accurate account of all moneys received and disbursed. He shall have the custody of all of the funds and securities of the corporation. Whenever necessary he shall endorse on behalf of the corporation all checks, notes or other obligations and evidence of the payment of money payable to the corporation or coming into his possession, and shall deposit the funds arising therefrom, together with all other funds of depositories of the corporation or properly care for them in such other manner as the Board of Directors may direct. He shall sign all checks and other instruments drawn on or payable out of the funds of the corporation. Whenever required by the Board of Directors so to do, he shall exhibit a true and complete statement of his cash account and of the securities and otherfunds in his custody and control, and shall at all reasonable times within business hours, exhibit his books and accounts to any Director. He shall in general perform all of the duties which are incident to the office of Treasurer of the corporation, subject to the Board of Directors. If the Board of Directors shall so require, he shall give bond in such sum and with such surety as the Board of Directors may direct for the faithful performance of his duties and for the safe custody of the funds and property coming into his possession. He shall perform such additional duties as may be prescribed from time to time by the Board of Directors or by the By-Laws.

Section 3 - Delegation of duties.

In case of the absence or inability to act of any officer of the corporation, the Board of Directors may delegate for the time being the duties of such officer to any other officer or to any Director.

Secretary of State

ARTICLES OF INCORPORATION

of

VOCATIONAL BUILDING TRADES, INC.

The undersigned, being three or more natural persons of lawful age, at least a majority of whom are citizens of the United States, do hereby adopt the following Articles of Incorporation, representing beforehand to the Secretary of State of the State of Indiana and all persons whom it may concern, that a membership list of lists of the above named corporation for which certificate of incorporation is hereby applied for, having heretofore been opened in accordance with law and that at least three (3) persons have signed such membership list.

Be it further remembered that the following Articles of Incorporation and all matters heretofore done or hereafter to be done are in accordance with "An Act concerning domestic and foreign corporations not for profit, providing for fees, providing penalties for the violation thereof, and repealing certain laws", approved March 7, 1935, and all acts amendatory thereof and supplemental thereto.

1. The name of this corporation shall be Vocational Building Trades, Inc.

(Name must include the word "Corporation" or "Incorporated" or one of the abbreviations thereof)

2. The purpose or purposes for which it is formed are as follows: In furtherance and not in limitation of all the powers and rights conferred by law upon non-profit corporations:

a. The particular purpose of this corporation is to provide for the students of School City of Elkhart, Indiana, and students of any school corporation which may be consolidated with said School City, training in the building trades in both theory and practice and to that end to provide facilities to further such training.

b. To promote better means of instruction for said students in all phases of engineering, architecture, construction and other allied sciences.

c. To engage in any other activity for the betterment of said students and the furtherance of their education along said lines or any other phases of education undertaken from time to time.

d. Accept and receive from any branch of Government of whatever nature or kind of financial aid or other assistance provided by law.

e. To acquire, own, hold, use, sell, convey, mortgage, lease or pledge any property to secure payment thereof.

f. To loan or invest its own money upon such security or in such securities as may from time to time be determined by its directors.

g. To borrow money, issue, sell, transfer, assign or pledge its obligations, assets, evidences of indebtedness, enter into contracts; to mortgage or pledge its own property to secure payment thereof.

h. To expand the activities of the corporation to improve service or for community welfare whenever it appears advisable and to the best interest of the corporation.

i. To have and exercise all of the general powers and rights of non-profit corporations provided under the Laws of the State of Indiana as they now exist or all laws amendatory thereto.

3. The period during which it is to continue as a corporation is perpetual years.

4. The post office address of its principal office is 228 W. Franklin Street, Elkhart (City) Elkhart (County) Indiana (State)

5. The name of its resident agent is E. T. Organ

6. The post office address of its resident agent is 1043 E. Jackson Blvd. Street, Elkhart (City) Elkhart (County) Indiana (State)

7. If the memberships are to be divided into classes the designations of the different classes, and a statement as to the voting rights of any such class:

There shall be only one class of members, to be designated and known as "General Members".

Every person, firm association or corporation who pay to the corporation such membership fee, as the Board of Directors may from time to time establish, shall be issued a General Membership Certificate which shall remain in effect until the end of the corporation's then fiscal year as established by the By-Laws. Such General Membership shall not be assignable or transferable.

Each General Member shall be entitled to one vote at all meetings of the members, so long as the membership fee, as established by the Board of Directors, has been paid for that year.

8. The number of directors of this corporation shall be five
(This must be an exact number and cannot be stated in the alternative.)

9. The names and addresses of the first board of directors are as follows:

Name	Street	City	County	State
Charles Minser	916 Cleveland Avenue	Elkhart	Elkhart	Indiana
Chester Huffman	2825 S. Main Street	Elkhart	Elkhart	Indiana
Thomas W. Romberger	1525 Roys Avenue	Elkhart	Elkhart	Indiana
John D. Bentz	101 Highland Avenue	Elkhart	Elkhart	Indiana
C. Robert Bickel	502 Arcade Avenue	Elkhart	Elkhart	Indiana

10. The names and post office addresses of the incorporators are as follows:

Name	Street	City	County	State
Thomas W. Romberger	1525 Roys Avenue	Elkhart	Elkhart	Indiana
John D. Bentz	101 Highland Avenue	Elkhart	Elkhart	Indiana
C. Robert Bickel	592 Arcade Avenue	Elkhart	Elkhart	Indiana

11. A statement of the property and an estimate of the value thereof, to be taken over by this corporation at or upon its corporation:

NONE

12. Any other provisions, consistent with the laws of this state, for the regulation and conduct of the affairs of this corporation, and creating, defining, limiting or regulating the powers of this corporation, of the directors or of the members of any class or classes of members:

a. Meetings of the members of this corporation shall be held at the principal office of the corporation in the City of Elkhart, Indiana, or at such other place as the Board of Directors may from time to time decide.

b. This corporation reserves the right to alter, amend, change or repeal any provisions contained in these Articles of Incorporation in the manner now or hereafter prescribed by statute and all rights granted to or conferred upon the members of this corporation are granted, subject to their reservation.

c. This corporation reserves the right to take advantage of the provisions of any law under which it is organized or of any law applicable or relating to corporations formed under the law now in force or which may hereafter be enacted, and all rights conferred to or upon its members are granted and conferred, subject to this reservation.

Thomas W. Romberger

John D. Bentz

C. Robert Bickel

A minimum of three of the incorporators designated in Article 10 on page -c- should sign above.

STATE OF INDIANA)

Pub Date - 62
MF AVAILABLE IN VT-ERIC SET 81p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRONIC TECHNICIANS, *TRANSISTORS, *VACUUM TUBES, THEORIES, INDIVIDUAL INSTRUCTION,

The purpose of this course is to introduce the electronic technician student to the principles of operation of the vacuum tube and transistor. The guide was developed by a vocational coordinator and a committee from industry using notes from instructors who have taught the course. It was designed on the concept and philosophy of using individual assignment sheets to allow each student to progress at his own rate and to enable the teacher to devote most of his time to individual instruction. Assignment sheets for each of the 24 lessons provide the student with an introduction, textbook references, a materials list, a schematic drawing, job procedures, and study questions. The appendix contains charts and schematic drawings related to the lessons. This manual is for teacher use only. The students are to use the assignment sheets in loose unbound form, returning each completed sheet to the teacher and taking the next one. Students should be admitted to the course only upon satisfactory completion of a proficiency test on basic AC-DC electronic theory. This document is available for 90 cents from the Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. (HC)

ACKNOWLEDGEMENT

Appreciation and acknowledgement is made to Tom Reckerd, Vocational Coordinator of Bloomington High School, and to his committee consisting of Harold Fischel, Morris Robertson, and John Robinson. The committee, all members of industry, made it possible to relate these electronics courses directly to the needs and applications of industry.

The instructors who taught this course kept very complete notes and from these notes this revision was made.

PREFACE

BASIC VACUUM TUBE AND TRANSISTOR THEORY

Basic Vacuum Tube and Transistor Theory is designed to take the student who has a firm foundation in Basic AC-DC Electronic Theory and introduce him to the principles of operation of the vacuum tube and transistor. It is composed of three equally timed areas:

1. Electronics Mathematics IV
2. Electronics Theory II
3. Electronics Laboratory II

The established technician who needs only updating in the transistor field would be better satisfied to wait and take a specialized course in transistor theory only. The new student who wants to enter the training program at this level should be given a proficiency examination over AC-DC theory and should be admitted only upon satisfactory completion of said examination or course.

DIRECTIONS TO THE INSTRUCTOR

This course has been developed around the concept and philosophy of using individual assignment sheets. If these sheets are used correctly, each student will be allowed to progress at his own rate. The abilities of all will be developed to their fullest extent.

The instructor only, should use this book. The loose individual assignment sheets are used by the students. The following method of operation has proven satisfactory:

Each student should have two folders in the file; one for the "completed" work, the other for the "incomplete" work. The assignment sheets should be filed in consecutive order in another drawer. The instructor should lay out the student folders before class time. This prevents congestion and a bottleneck around the file cabinet at the beginning and ending of class. When a student completes and assignment sheet, he turns this into the instructor, then secures the next sheet.

Test are included periodically. These may be used to identify the mathematical ability of each student. This makes it possible to start the students at the proper level in the course. The tests may also be used in the traditional manner.

If the course is used as it should be, the instructor will be freed of many routine activities and will be able to devote his time almost entirely to individual instruction.

It must be kept in mind that the assignment sheets are only a teaching aid or device. Adequate instruction is still needed.

An accurate record of each student's progress should be kept by the instructor.

Basic Vacuum Tube and
Transistor Theory

Lesson 1
Diode Characteristics

Introduction:

We are now ready to enter another major field of electronics. The electron tube is both interesting and a necessary field for our study. About 90% of the maintenance problems will be concerned with the tube. We must be able to understand the construction and operation of the electron tube. Without this knowledge our understanding of the operation of the different stages of the radio would be incomplete. Our study will include interpretation of the data obtained when the tube is tested. In this particular lesson we will study the relationship between the plate voltage and plate current in a vacuum tube.

Materials:

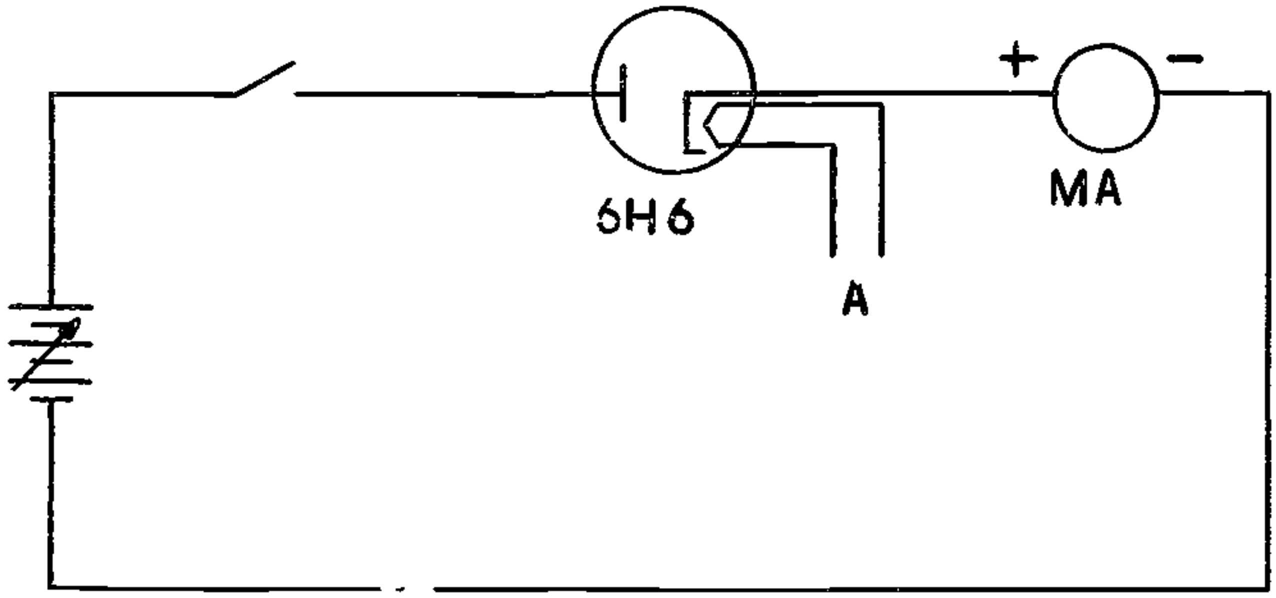
1. Variable "B" Supply
2. "A" Supply
3. VTVM -(Vacuum Tube Voltmeter)
4. VOM -(VoltOhmmeter)
5. Octal tube socker
6. 6H6

Schematic:

1. Included in lesson.

Procedure:

1. Wire the following circuit.



2. Wire "A" supply and see if tube lights.
3. Wire balance of circuit with switch open.
4. Turn "B" supply to zero.
5. Place ma meter on 10 ma scale.
6. Close switch
7. Increase plate voltage in 1 volt steps and record E_p and I_p.
8. Record and draw graph showing relationship.

9. Record and draw graph showing relationship.

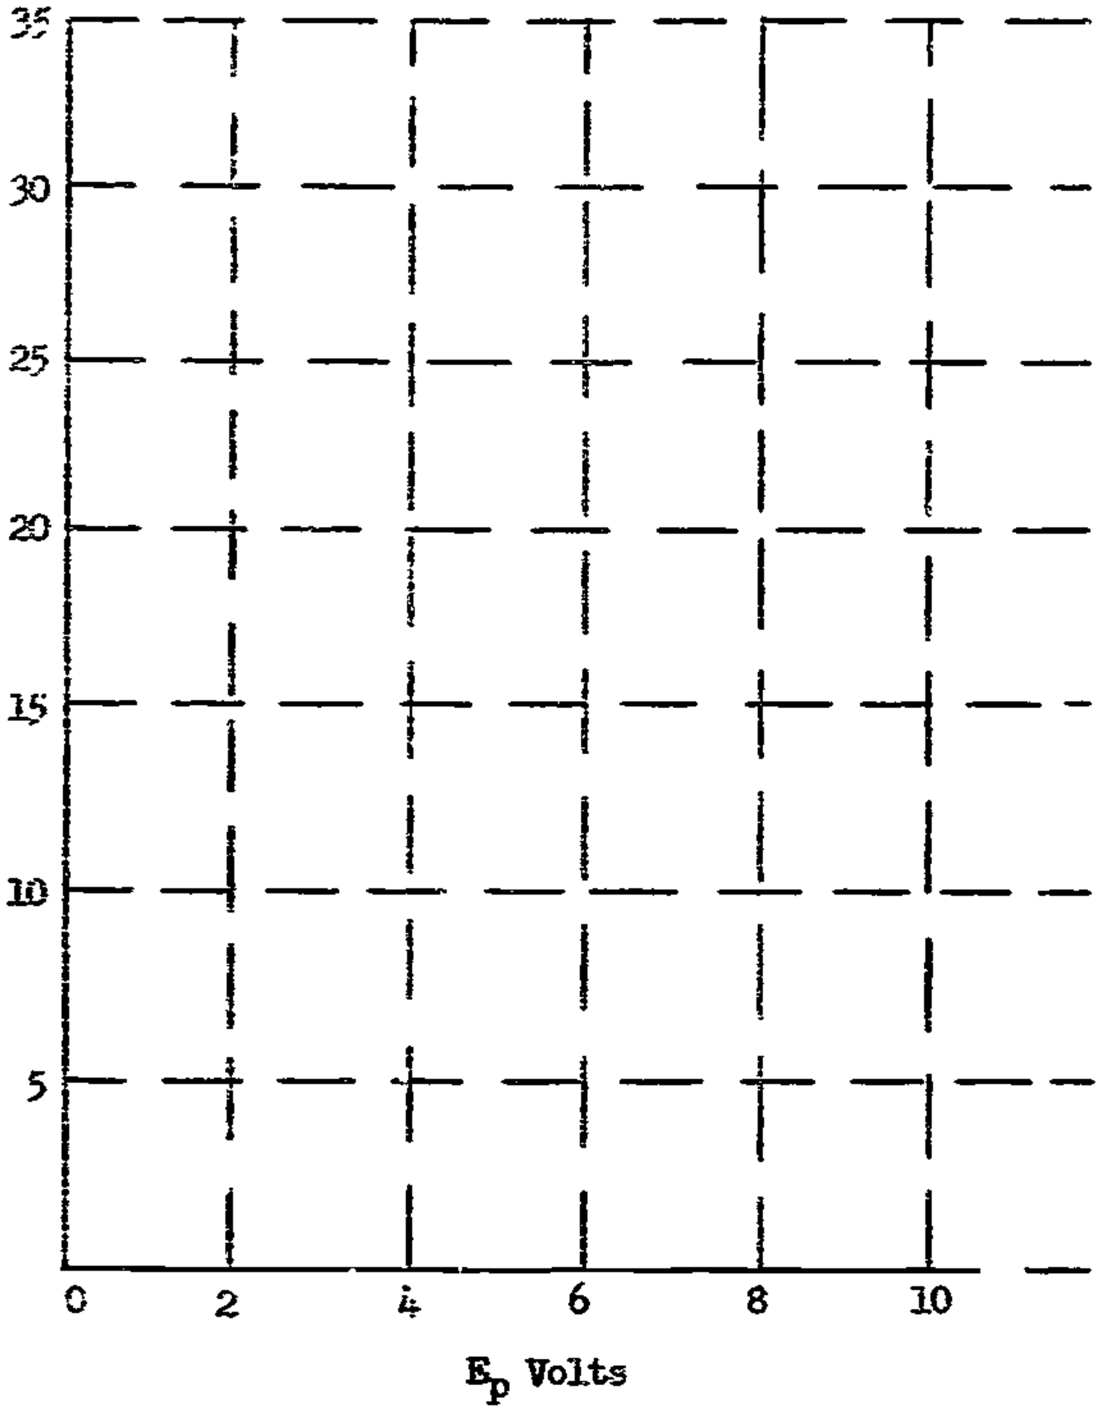
DIODE CHARACTERISTICS



Questions:

1. Will a diode ordinarily permit electrons to flow in two directions? Explain.
2. What happens when you parallel the diodes?
3. What portion of the graphs would be considered linear?
4. What are the filament voltage and current requirements of your tube?
5. In placing this tube in parallel with others in a radio what rating must we watch concerning the filament?

6. In placing this tube in series with others in a radio what rating must we watch concerning the filament?

7. Could this tube be used as a practical power supply rectifier? Explain.

Basic Vacuum Tube and
Transistor Theory

Lesson 2
PN Junction

Introduction:

The crystal diode has long been with us. We have often used them as rectifiers or valves ad we did the diode vacuum tube in lesson one. Today thorough understanding of their behavior can be had. Complete understanding of the diode in semi-conductors is necessary for transistor study.

References:

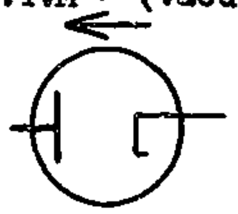
1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 1-10.

2. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 12-36.

Materials:

1. Crystal diode

2. VTVM - (Vacuum tube voltmeter)



1. ________

2. ________

3. ________

Schematic:

1. Use schematic #S-III-2 (appendix). See instructor.

Procedure:

1. Plug in VTVM and let it warm up. Adjust for zero center, using DC plus volts.

2. Using the smallest scale possible, the meter now reads:

Full scale right ____________

Full scale left ____________

3. Place the negative lead on the cathode of the crystal. Touch the positive lead to the anode. Do not touch probe with your hand. Explain what takes place.

4. Before a junction is formed what is the net charge of the P type material?

5. Before a junction is formed what is the net charge of the N type material?

6. Why is a slight potential shown when a junction of P and N type is formed?

7. Set VTVM on ohms and adjust.

8. Using a VOM determine the polarity of the VTVM leads when the meter is set on ohms.

AC/Ohms lead ____________

Ground lead____________

9. Place the negative lead on the cathode and the positive lead on the anode.

Record the resistance __________

10. Reverse the leads of the ohmmeter and again record the resistance ______.

11. Explain steps 9 and 10 in terms of forward and reverse bias.

12. Compare valve action of the vacuum tube with that of the crystal.

13. What is reverse current? Where does it exist?

14. Draw a graph illustrating forward and reverse current of the crystal diode. Use graph #G-III-2 (appendix). See instructor.

Questions:

Transistor Theory

Lesson 3
Diode At Work

Introduction:

In this lesson we will study the ability of the diode to rectify and to produce pulsating DC. There are some very high voltages in this lesson. A current as small as 50 ma can cause fatal defects.

References:

1. Keith Henney and Glen A. Richardson, Principles of Radio. Sixth Edition. John Wiley & Sons, Inc., New York, 1952. pp. 236-243.
2. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. p. 8.
3. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 9-14 and 15-39.
4. Paul Zbar and Sid Schildkraut, Basic Electronics, Laboratory Manual for Radio and Television Technicians. Second Edition. Electronics Industries Association. McGraw-Hill Book Co., Inc., New York, 1958. pp. 1-4.

Materials:

1. VTVM - (Vacuum tube voltmeter)
2. Scope
3. 121-1 Power supply

Schematic:

1. Use schematic #S-III-3 (appendix). See instructor.

Procedure:

1. Remove SS-1, C_1, and C_2.
2. Place SS-2 in the circuit.
3. Draw a schematic of the resulting circuit.

4. Using VTVM measure the following voltages (AC):
    a. Measure the voltage of the primary.
    b. Measure pin 4 to ground.
    c. Measure the total secondary of the high voltage winding.
    d. Measure pin 2 to 8 of the rectifier.
5. The transformer has a step up ratio of __________ to ___________ and a step down ratio of ___________ to _________.
6. Using VTVM measure the following DC voltages:
    a. Pin 8 to ground. Explain
7. Using the scope,
    a. Observe and sketch the primary waveform.
    b. Observe and sketch the secondary waveform of pin 4 to ground.
    c. Observe and sketch the secondary waveform of pin 8 to ground.
8. Turn the equipment off and have the instructor check your data.
9. Place SS-1 in the circuit.
10. Using the VTVM measure the following AC voltages:
    a. Voltage primary.
    b. Pin 4 to ground.
    c. Pin 6 to ground.
    d. Total high voltage secondary
11. Using VTVM measure the following DC voltages:
    a. Pin 8 to ground.
12. Using scope,
    a. Observe and sketch primary waveform.
    b. Pin 4 to ground
    c. Pin 6 to ground
    d. Pin 8 to ground

13. Turn gear off and have instructor check.
14. Replace all equipment in original condition.

Questions:

1. What is rectification?
2. Compare the input frequency to the ripple frequency in both the half-wave and full-wave.
3. Compare the DC magnitude of the output to the AC input in both half-wave and full-wave types.
4. Name an advantage of full wave.
5. What are the plate current ratings of the tube we used?
6. What effect does the resistance of the vacuum tube have on the voltage output?
7. What additional refinement must we do to make this a usable power supply?

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course III

Basic Vacuum Tube and
Transistor Theory

Lesson 4
Selenium Rectifier

Introduction:

In this lesson we will study a half wave semi-conductor power supply.

Reference:

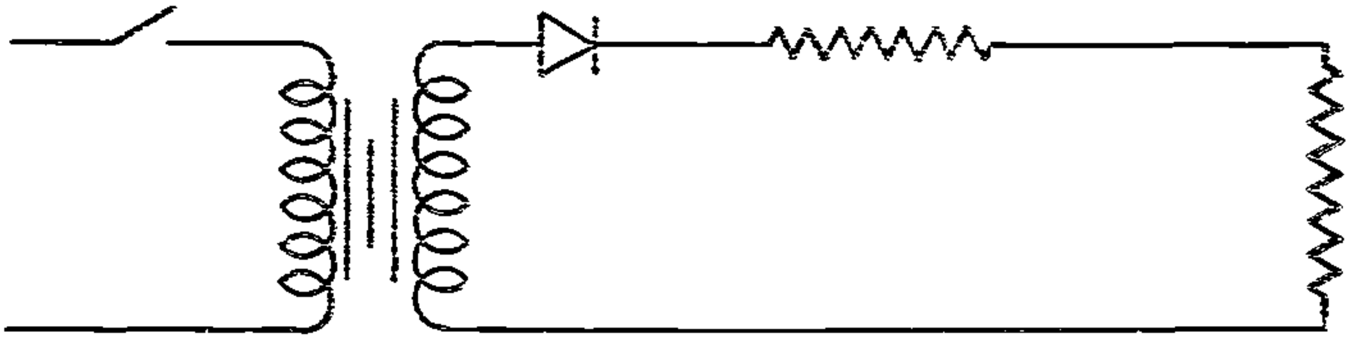
1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 28-29.

Materials:

1. RCA 121-67

2. VTVM -(Vacuum tube voltmeter)

3. Scope



Schematic:

1. See schematic above

Procedure:

1. Remove C_1, C_2 and C_3.

2. With VTVM make the following AC voltage measurements:

   a. Transformer primary

   b. Transformer secondary

3. With VTVM make the following DC voltage measurements:
    a. Negative to positive jack
    b. Ground to negative jack
    c. Ground to positive jack
4. Using 'scope, draw waveforms
    a. Primary
    b. Secondary
    c. Negative to positive jack

Questions:

1. Describe the transformer used here.
2. What type of rectification is this?
3. Why is there only one secondary winding?
4. What is the ripple frequency?
5. What is meant by reverse current? Do you see any?

Transistor Theory

Lesson 5
Triode Characteristics

Introduction:

The diode had one important drawback; it could not amplify. With the addition of a third element the tube can now amplify if placed in the proper conditions. This lesson is designed to give us some inside information of the behavior of the triode. A series of graphs will be constructed. It will be very important that one watch his meter very carefully. With so many variables it would be very easy to let one meter go beyond its range.

References:

1. Keith Henney and Glen A. Richardson, Principles of Radio. Sixth Edition. John Wiley & Sons, Inc., New York, 1952. pp. 244-253.
2. Abraham Marcus and William Marcus, Elements of Radio. Second Edition. Prentice-Hall Publishing Co., Englewood Cliffs, New Jersey, 1948. pp. 266-263.
3. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 40-85.
4. Paul Zbar and Sid Schildkraut, Basic Electronics, Laboratory Manual for Radio and Television Technicians. Second Edition. Electronics Industries Association. McGraw-Hill Book Co., Inc., New York, 1958. pp. 9-13.

Materials:

1. One triode vacuum tube, 6J5, 6SN7.
2. VTVM -(Vacuum tube voltmeter)
3. VOM -(VoltOhmmeter)
4. Adapter for 121-1 (121-1A)
5. 121-1 power supply
6. 121-67 bias supply

Schematics:

1. Included in this lesson.

Procedure:

1. Place the 121-1 in the left side of the rack. Make sure all switches are off.

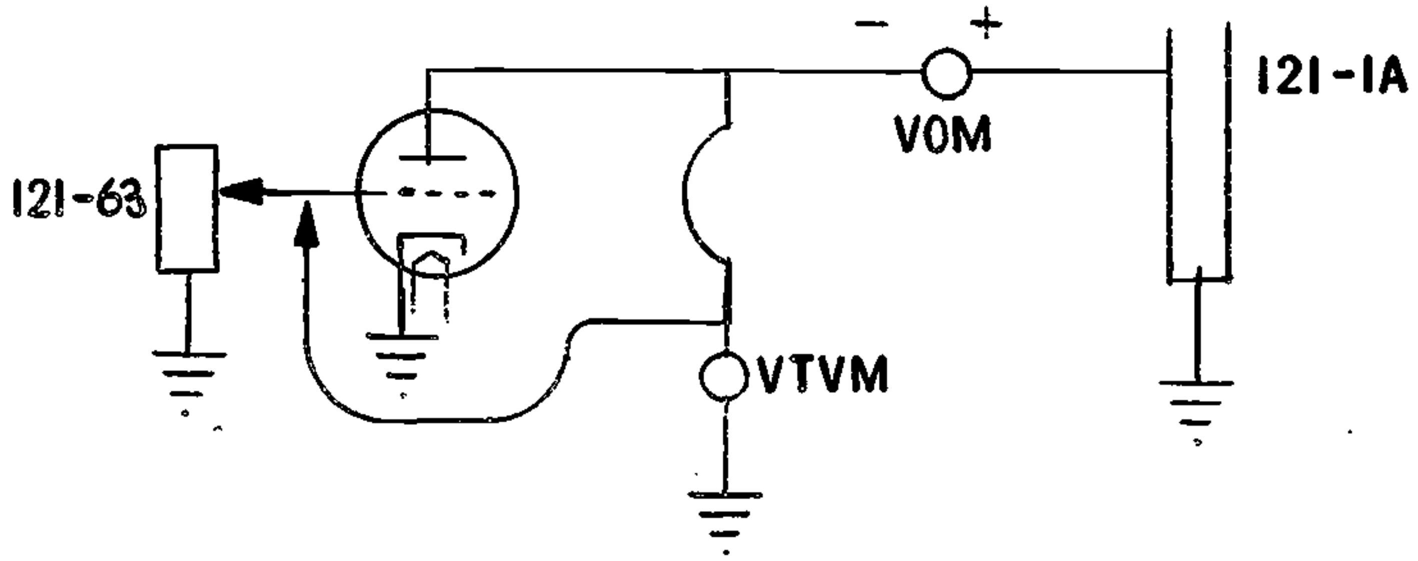
2. Place the 121-1A beside the 121-1, turn control maximum counter-clockwise.

3. Place 121-67 in right side of the rack, turn R_5 maximum clockwise.

4. Place the 6J5 and 6AQ5 in their respective sockets. Wire their filaments from the distribution box.

5. Wire the jumper from the B plus of the 121-1 to the top red jack on left side of variable "B" supply (adapter).

6. Complete wiring as shown in the following schematic:



7. Have the instructor check the circuit.

8. Turn the circuit on and take the following readings.

   a. Set the grid-bias to approximately 10 volts negative. R_5 on the 121-67.

   b. Set the plate voltage to approximately 50 volts positive. Control on 121-1A.

   c. If the tube is not cut-off advance the grid-bias until the tube ceases to conduct.

   d. Decrease the grid-bias one volt at a time until there is no bias on the tube. Record grid voltage and plate current for each step.

   e. Increase the grid-bias to approximately 20 volts negative. Increase the plate voltage to approximately 100 volts positive. Repeat steps c and d.

f. Change the plate voltage to 150 volts and the bias to 30 volts and repeat steps c and d.

g. Draw a set of E_g - I_p curves for the constant values of plate voltage used.

h. Turn plate voltage down to about 50 volts.

i. Set grid voltage to about a minus 4 volts. Increase E_g slowly until the tube starts to conduct. Pick the closest multiple of 25 volts and continue to increase in 25 volt steps recording I_p each time until you reach a plate voltage of approximatley 250 volts. Decrease E_p to see if the tube ceases to conduct at the same place it started to conduct.

j. Change E_g to a minus 6 volts and repeat step i.

k. change E_g to a minus 8 volts and repeat step i.

9. Have the instructor check your data before tearing down the equipment.

10. Draw a set of E_p - I_p curves holding E_g constant at the three test points.

Questions:

1. What is meant by the u (mu) of a triode?

2. Compute the u of the tube that you used by using both sets of curves.

3. What is meant by the dynamic plate resistance? Is this different than the static or DC plate resistance that we found in the diode? How?

4. Compute the R_p of the tube that you used.

5. Compute the r_p of the tube that you used.

6. What is transconductance?

7. Compute the gm of your tube.

8. Draw a graph of R_p vs E_g when E_p was 100 volts.

9. What is the relationship between gm, r_p, and u?

10. Can a triode be used as a variable resistor? Explain.

11. Summarize.

Basic Vacuum Tube and
Transistor Theory

Lesson 6
PNP Transistor

Introduction:

In lesson 2 we studied the properties of a PN junction. The next logical step is to experiment with a two junction device such as a PNP configuration. This lesson is designed to teach the characteristics of the PNP configuration which is rightly referred to as a PNP transistor. A basic understanding of the two terminal diode and three terminal (transistor) semi-conductor devices will prove to be a necessity for an understanding of the circuit position of these devices.

References:

1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 11-18.

2. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 36-38.

3. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., Inc., New York, 1961. pp. 522-538.

Materials:

1. Transistor lab kit

2. VTVM - Vacuum tube voltmeter

3. VOM - VoltOhmmeter

4. Template No. 2 (If using RCA equipment)

Schematic:

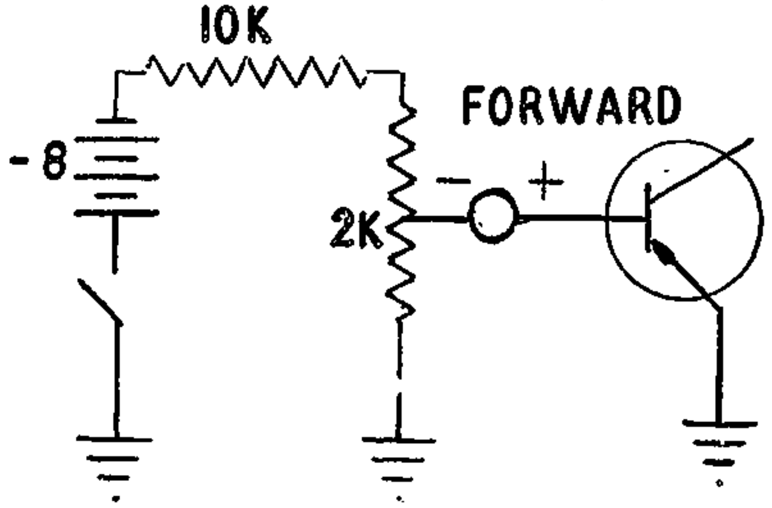
1. Use schematic #S-III-6 (appendix). See instructor.

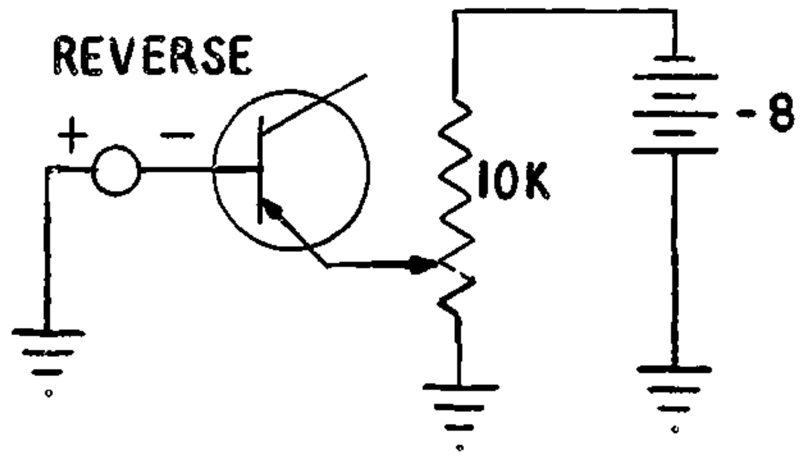
Procedure:

PART A

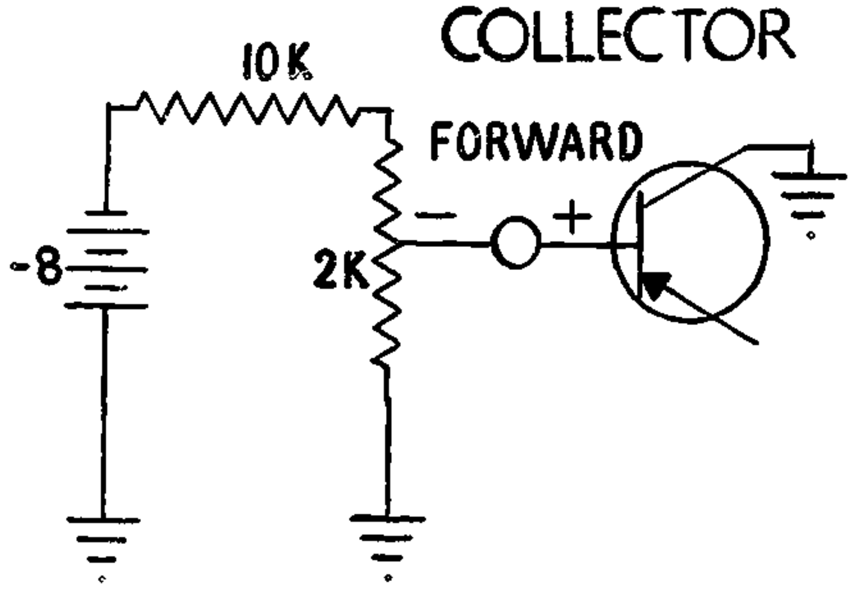
1. Wire the following circuits and record the forward and reverse currents of the individual junctions. Be sure you understand the bias. (Record voltages.

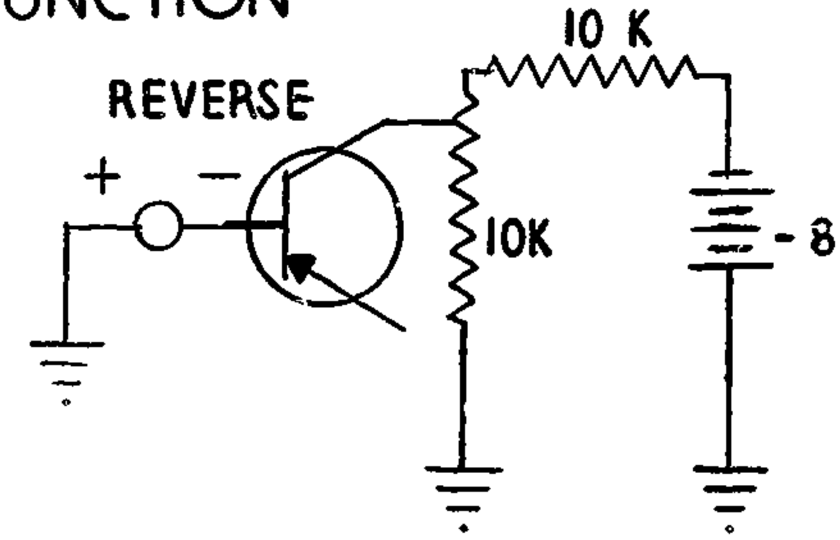
EMITTER JUNCTION





COLLECTOR JUNCTION

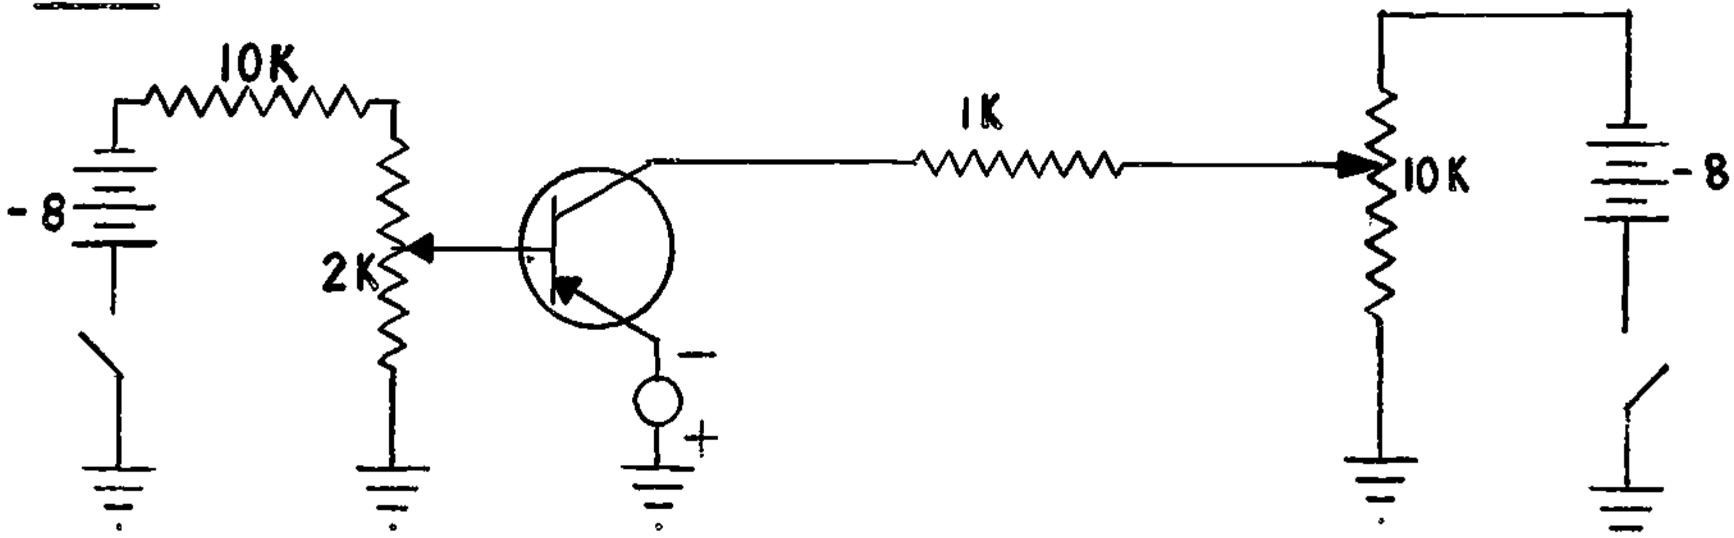




2. How do the two junctions compare?

3. Is this a growth or a fused transistor? Why?

PART B



1. Wire the circuit shown on the bottom of the previous page and adjust the forward bias between emitter and base so the I_e is about 1.2 ma.

2. Adjust the reverse bias on the collector to base to about - 6.0 volts.

3. Adjust the base to emitter to about .14 volts.

4. Readjust to arrive at a V_{be} of .14 and V_{cb} of 6 volts or as close as possible.

5. Record V_{be}, V_{cb}, and I_e.

6. Turn the circuit off and move ma from emitter circuit, replace it with a 27 ohm resistor. Place the ma meter in the collector circuit.

7. Energize the circuit and record V_{be}, V_{ce}, and I_c.

8. Turn equipment off. Remove the ma meter from the collector circuit and place it in the circuit so as to measure I_b.

9. Energize the circuit and record V_{be}, V_{ce}, and I_b.

10. Compute the following:

    a. Alpha or I_c/I_e

    b. Z_{cb} or V_c/I_c

    c. Power out or V_c x I_c

    d. Z_{eb} or V_e/I_e

    e. Power in or V_e x I_e

    f. Power gain

PART C (To study the effect of V_e and V_c on I_c)

1. Using the same circuit used in part B adjust V_c for maximum I_e. (emitter current) Set V_e at the following settings and record I_e.

V_e	I_e
.1	________
.12	________
.14	________
.15	________

Explain what takes place.

2. Remove the ma meter from the emitter circuit and place a 27 ohm resistor in its place.

3. Place the ma meter so as to measure I_c, watch polarity and have the instructor check it.

4. Set V_e equal to .1 volt and vary V_c in the following steps recording I_c.

V_c	I_c
6.0	
5.0	
4.0	
3.0	
2.0	
1.0	

5. Adjust V_c for maximum and vary V_e in the following steps, record I_c.

V_e	I_c
.1	
.12	
.13	
.14	
.15	
.16	

6. How does V_e compare with V_c or the effect on I_c?

Lesson 7
Triode DC Amplifier

NOTE: This is the first opportunity for students to use voltage regulator.

Introduction:

In lesson 5, we saw how a change in grid voltage was much more effective on plate current than a change in plate voltage. Our job now is to put a load in the plate circuit of the triode and see what effect a change in grid voltage will have on the voltage across the load.

3. Paul Zbar and Sid Schildkraut, Basic Electronics, Laboratory Manual for Radio and Television Technicians. Second Edition. Electronics Industries Association. McGraw-Hill Book Co., Inc., New York, 1958. pp. 14-16.

Materials:

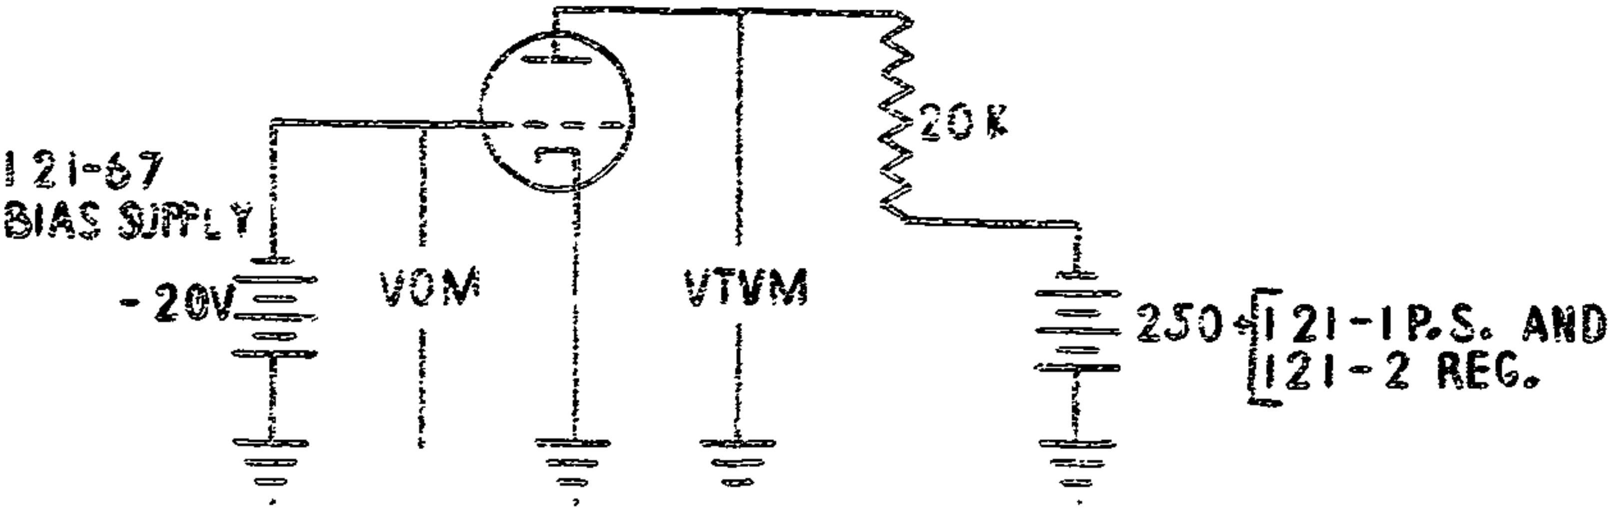
1. Triode vacuum tube
2. One VTVM -(Vacuum tube voltmeter)
3. One VOM -(VoltOhmmeter)
4. 20 K load resistor
5. Tube socket
6. Power supply 121-1
7. Regulator 121-2
8. Bias supply 121-67

Schematic:

1. Included in the lesson.

Procedure:

1. Connect the following circuit:



2. Place the tube in the circuit. Set E_g to a minus 20 volts.

3. Set B plus to 250 volts.

4. Record E_p.

5. Change E_g in one volt steps and record E_p each time. Decrease E_g until you reach zero.

6. Draw the graph of E_p verses E_g. Make E_p the vertical axis.

7. Locate and record on your graph the points which determine the linear portion of the curve. Locate the midpoint.

8. Compute the actual gain on the tube. Show complete work and formula used.

Questions:

1. Complete the plate current at all three points in step 7. Plate current will be equal to the supply voltage minus the plate voltage divided by the load resistor.

2. Explain the gain of a DC amplifier.

3. Compare the gain that you computed in step 8 with the rated mu of the tube.

Materials:

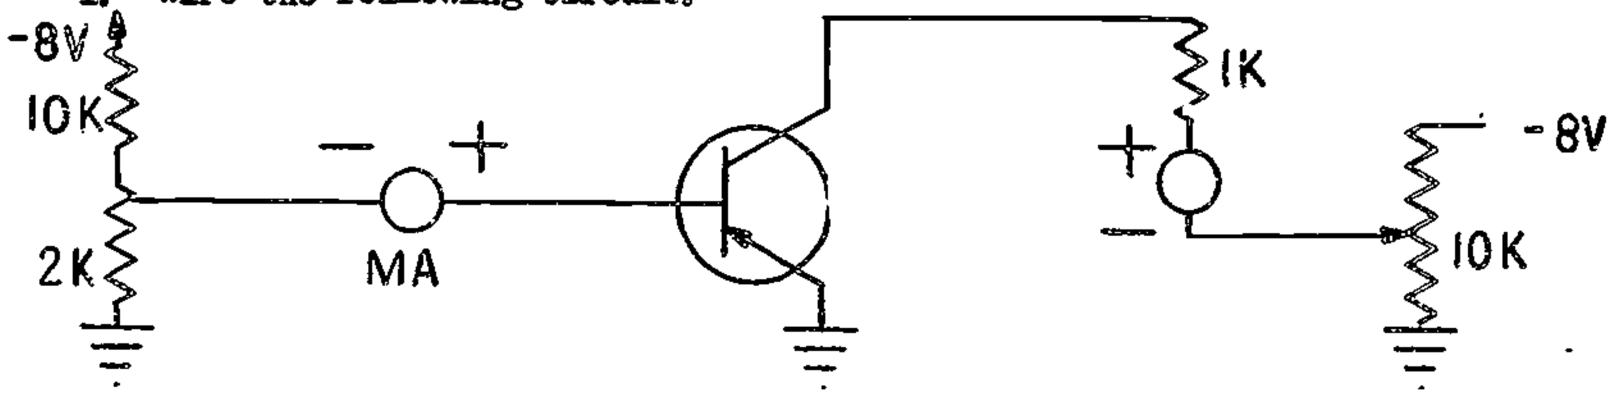
1. Transistor trainer
2. 2 VOM -(VoltOhmmeter)
3. 1 VTVM -(Vacuum tube voltmeter)
4. Template No. 2 (If using RCA equipment)

Schematic:

1. Included in the lesson.

Procedure:

1. Wire the following circuit.



2. Set base current on 15 ua.
3. Set V_c on maximum ua.
4. Maintain I_b at 15, reduce V_c in 1 volt steps recording I_c.
5. When you reach 1 V for V_c go in .5, .25, .1, steps if possible.
6. Repeat for base currents at 25, 40, 50, 70 ua.
7. Draw a set of V_c, I_c curves. Make at least two sets, one for the lesson write up, and one for you to keep. (See instructor for graph form)

Lesson 9
Triode AC Amplifier

Introduction:

This lesson is designed to show actual wave form so that we may actually see that the tube is amplifying.

Reference:

1. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 40-85.

Materials:

1. Triode vacuum tube
2. 0-30 DC voltmeter
3. One VTVM -(Vacuum tube voltmeter)
4. 20 K load resister
5. Small AC signal course

Schematic:

Procedure:

1. Connect the triode as we had it in lesson 7.
2. Adjust the grid-bias until the tube is operating at the center portion of the curve.
3. Break the grid circuit between the battery and the grid.
4. Insert in this spot an AC signal voltage. Consult the curve you made in lesson 7 so that you do not drive the tube into distortion.
5. Show the signal on the scope in both the grid and plate circuits.
6. Vary the signal so that the signal goes into distortion.
7. Vary the bias so that the signal goes into distortion.

Questions:

1. Where is the input signal in the triode?
2. Where is the voltage out?
3. Why must we have a load to have amplification?
4. How could we compute the actual amplification of the tube?
5. Would this differ from mu?
6. Why is the operating point of a triode so important?

Lesson 10
Transistor DC Amplifier Circuit

Introduction:

In circuit design and circuit analysis it becomes necessary to predict the behavior of the circuit components. By proper utilization of basic AC and DC principles we are able to determine, to a close tolerance, the behavior of linear passive components such as resistors and capacitors; however, the behavior of non-linear, active components, such as transistors and vacuum tubes, presents a different situation. This lesson is designed to teach the student a way to predict the behavior of a transistor when it is subjected to a small signal. The circuit configuration shall be limited to common emitter.

Materials:

1. VTVM -(Vacuum tube voltmeter)

2. VOM -(VoltOhmmeter)

3. Template No. 3 (If using RCA equipment)

4. Transistor Trainer

Schematic:

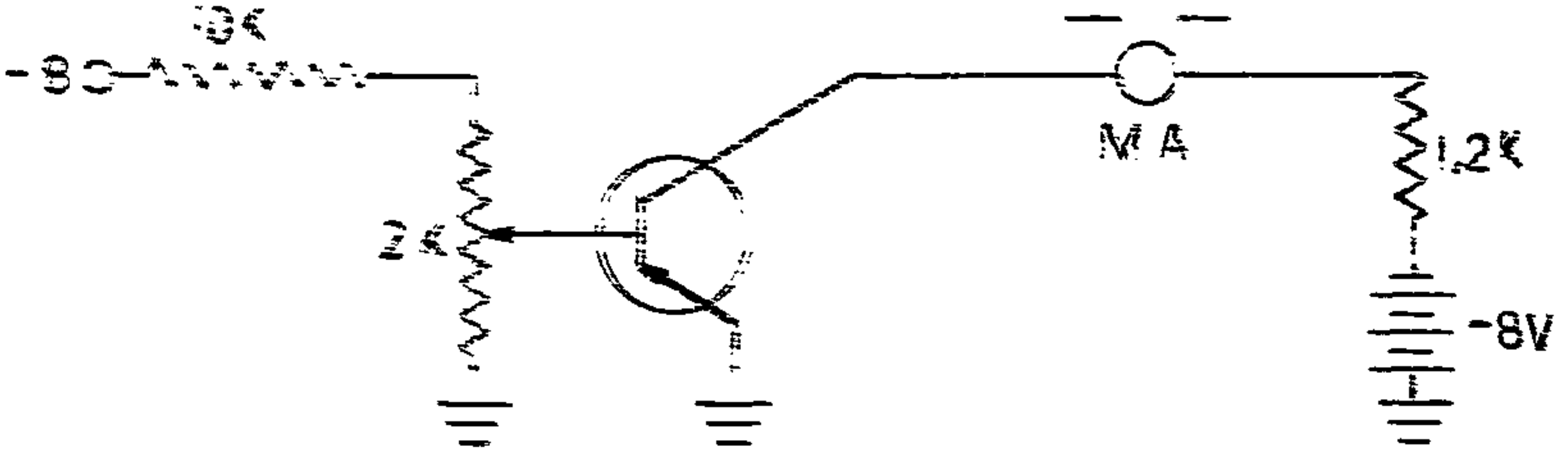
1. Included in the lesson.

Procedure:

1. Using the set of curves that you made in lesson 8, draw a load line for the 2.2K resistor used as load.

2. What current would flow in the collector with this load and collector voltage of -4. -2?

3. Wire the following circuit.



4. Adjust V_{BE} to -.1 volts. Read and record I_C.

5. Adjust V_{BE} to -.2 volts. Read I_C and record.

6. Compare measured values to values obtained from graph.

7. Choose operating point from load line and adjust circuit to meet these requirements.

8. Complete the following chart by varying forward bias around operating point to simulate signal change.

	- SIGNAL	OPERATING POINT	+ SIGNAL
VCE			
VBE			
IB			
IC			

COMPUTE

9. ΔV_{BE} = __________

10. ΔV_{CE} = __________

11. Voltage gain __________

12. ΔI_B = __________

13. ΔI_C = __________

14. Current gain __________

15. Power gain __________

Lesson 11
Single Stage Amplifier

Introduction:

In this lesson the student is to design and load out a single stage amplifier.

References:

1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 19-23 and 33-43.

2. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 69-81

Materials:

1. RCA 121-1
2. RCA 121-28
3. RCA 121-2
4. Audio signal generator
5. Vacuum tube voltmeter
6. Oscilloscope

Procedure:

1. Using the 6AB4, design a circuit with a gain of 40.

Questions:

1. Is the change in plate current or a change in grid voltage more or less when a load is used in the triode circuit? Why?

2. Explain how you go about drawing a load line for a given set of grid-family curves.

3. When can a quiescent value of plate current be obtained?

4. What problems would an inductance cause with a loadline?

Lesson 12
Transistor AC Amplifier

Introduction:

In lesson 10 the behavior of a transistor connected in a common emitter configuration was studied when a small DC signal was applied. We shall now apply a small AC signal to a similar circuit and observe the resulting voltage, current and power gains.

References:

1. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 102-111
2. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 33-43.

Materials:

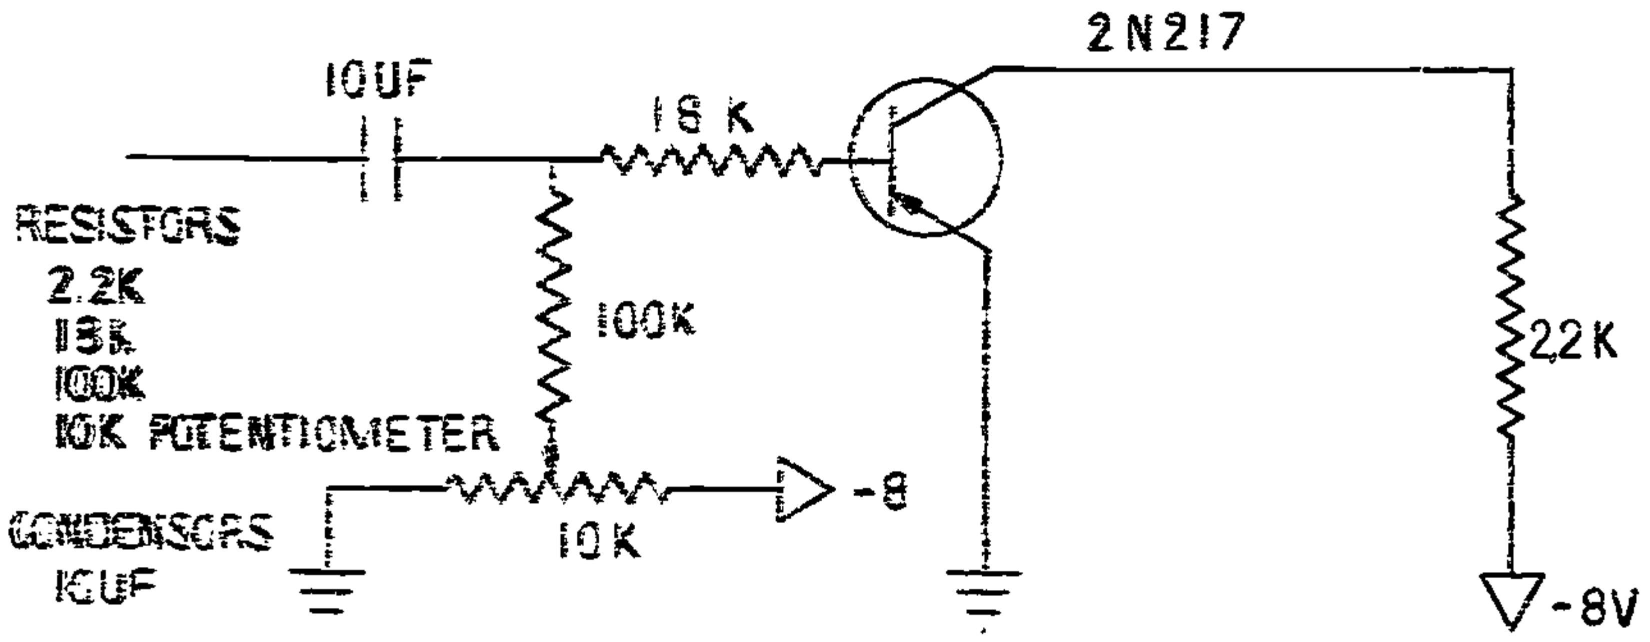
1. Transistor lab equipment
2. Template no. three
3. Scope
4. VTVM -(Vacuum tube voltmeter)
5. Audio generator

Schematic:

1. Included in the lesson.

Procedure:

1. Wire the following circuit.



2. Adjust the forward bias control until an operation point of about 4 volts is reached.

3. Feed a 1 KC signal into the input and adjust the amplitude of the generator until two volts p-p signal appears at the output.

4. Do the following measurements and calculations.

   a. Compute collector current. (2 V p-p/load resistance)

   b. Measure voltage on the base. (Signal voltage)

   c. Measure signal on the base.

   d. Compute the signal across the 18 K resistor.

   e. Compute the base current. (Signal)

   f. Compute current gain.

   g. Compute voltage gain for the system.

   h. Compute the transistor voltage.

   i. Compute input signal power.

   j. Compute output signal power.

   k. Compute power gain.

5. Replace the 2.2 K load resistor with a 33 K or the largest possible resistor under a 33 K that will allow the operating point to be reached.

   a. Adjust for operating point.

b. Apply a 1 KC signal to the base and adjust until the output voltage is approximately 2 V p-p.

c. Compute the collector signal current and record.

d. Measure base signal voltage.

e. Measure output of generator and record.

f. Compute the voltage drop across the 18 K resistor.

g. Compute base signal current.

h. Compute overall voltage gain.

i. Calculate current gain.

j. Calculate power gain.

k. Construct a chart to show the gains of the DC amplifier with the two loads of the AC amplifier.

6. Cut off frequency.

a. Using the 2.2. load adjust for the operating point.

b. Feed a 1 KC signal on the base and adjust the amplitude of the generator for the largest undistorted output. Record the value.

c. Increase the frequency of the generator until the output voltage is .7 of what it was. This is the half-power point.

7. Wire the circuit as shown in figure 5-5 of the transistor manual. (p. 42)

a. Show the direction of all electron flow by drawing the schematic and then placing arrows on it.

b. Adjust the base resistor until the operating point is reached.

c. Record base current.

d. What type of bias are we using?

e. How does this differ from previous methods of bias?

8. Be sure and include your conclusions in your write up.

Basic Vacuum Tube and
Transistor Theory

Lesson 13
Tetrode and Pentode

Introduction:

In our studies of the vacuum tube we have seen how the plate current is directly related to the plate voltage and how a small change in grid voltage has more effect on plate current than an equal change in plate voltage. The B supply is divided across the vacuum tube and the tube load. Because of the action of the control grid there is a charge that gathers around the cathode which has the name of space charge. This charge increases the resistance of the tube and therefore cuts down on the amplification of the stage. We have also encountered a great deal of feedback in the triode. To help eliminate these two unwanted characteristics of the vacuum tube a second grid was added. A four element tube called the tetrode.

2. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 81-94.

Materials:

No materials needed.

Schematic:

1. No schematic needed.

Procedure:

The teacher will set up and run as a class demonstration two plate characteristics for the tetrode. He will use a 6AC7 wired as a tetrode. Draw the curves and answer the following questions.

Questions:

1. How many elements does the tetrode have?

2. How does the u of the tetrode compare with the triode?

3. What is the dynamic plate resistance of the vacuum tube?

4. Compute the dynamic plate resistance of this tube from your curves.

5. What is meant by negative resistance?

Transistor Theory

Lesson 14
Pentode

Introduction:

In working with the tetrode it was noted that the tube was unstable until the plate voltage had reached a high value. This is believed to be because the electrons are striking the plate at such a high velocity that they dislodge many electrons which are accelerated to the screen grid because of its charge. At low plate voltages the plate may actually emit some interesting changes in the tubes operation.

3. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 86-110.

Materials:

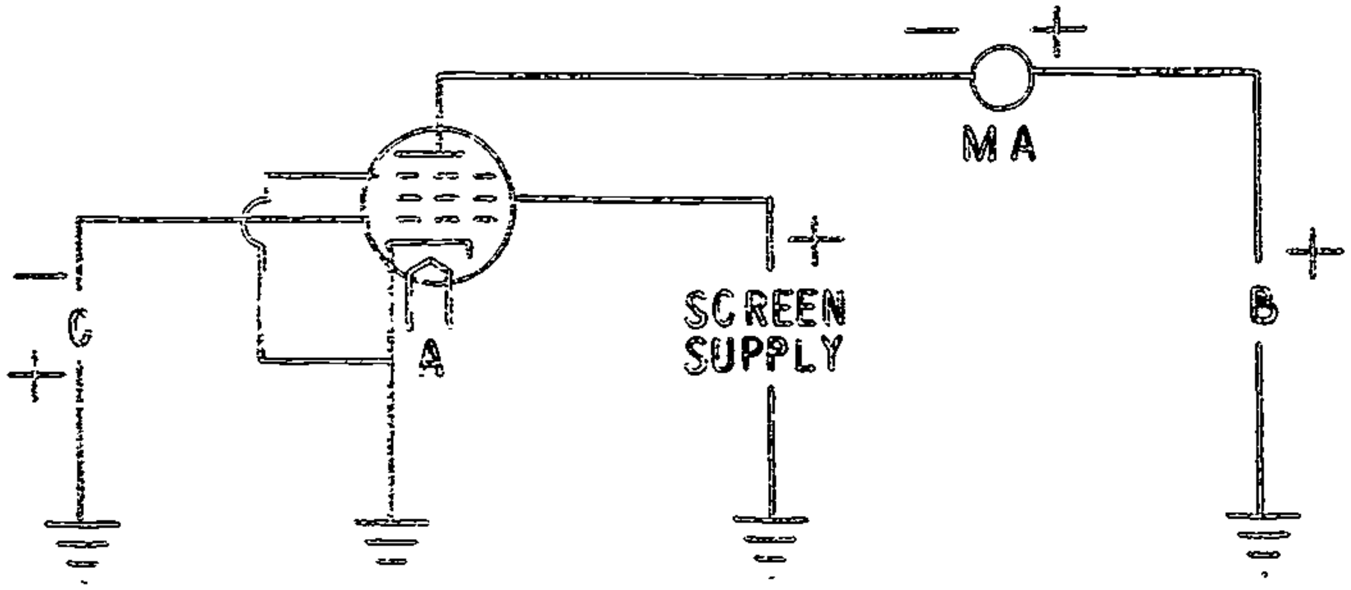
1. Sharp Cut-off pentode, 6AC7
2. VOM -(VoltOhmmeter)
3. VTVM -(Vacuum tube voltmeter)
4. "B" supply
5. Screen supply
6. Tube socket
7. 100 volts available for screen voltage from distribution panel.
8. "C" supply
9. "A" supply

Schematic:

1. Included in the lesson.

Procedure:

1. Wire the following circuit.



2. Wire "A" supply, see if tube gets warm.

3. Wire "C" supply, set at -10 volts.

4. Connect "C" supply and cathode to common ground.

5. Set screen supply at 150 volts. Connect from screen to ground. Leave in off position.

6. Connect "B" supply from plate to ground set at 0 volts.

7. Place a ma meter set on 10 ma to monitor plate current.

8. Wire suppressor grid to cathode.

9. Decrease grid bias to -3 volt.

10. Turn screen on.

11. Increase E_p in 25 volt steps and record E_p and I_p each time.

12. DO NOT pin meters

13. Repeat with E_c of -2, and the -1 volts.

Questions:

1. How many elements does the pentode have?

2. What advantage over the tetrode does the pentode have?
3. What is the grid-plate transconductance of a tube?
4. What is the constant feature of gm?
5. What is the gm of the tube you use? Support this with your data.

Transistor Theory

Lesson 15

Transistor Stability

Introduction:

It is characteristic of transistors to be sensitive to changes in ambient temperature as well as changes in frequency and voltage. This sensitivity to temperature change often produces a drift in the operation of the transistor. This may produce an undesirable distortion of the signal. As a result, the temperature sensitivity of a transistor is generally considered undesirable and compensation circuits have been designed to minimize the effects of temperature change on transistors. This lesson deals with circuits and attempts to explain their operation, function, and application.

References:

2. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey. Experiment No. 8 - page 59.

Materials:

1. Template No. six

2. VTVM -(Vacuum tube voltmeter)

3. VOM -(VoltOhmmeter)

4. Transistor Trainer

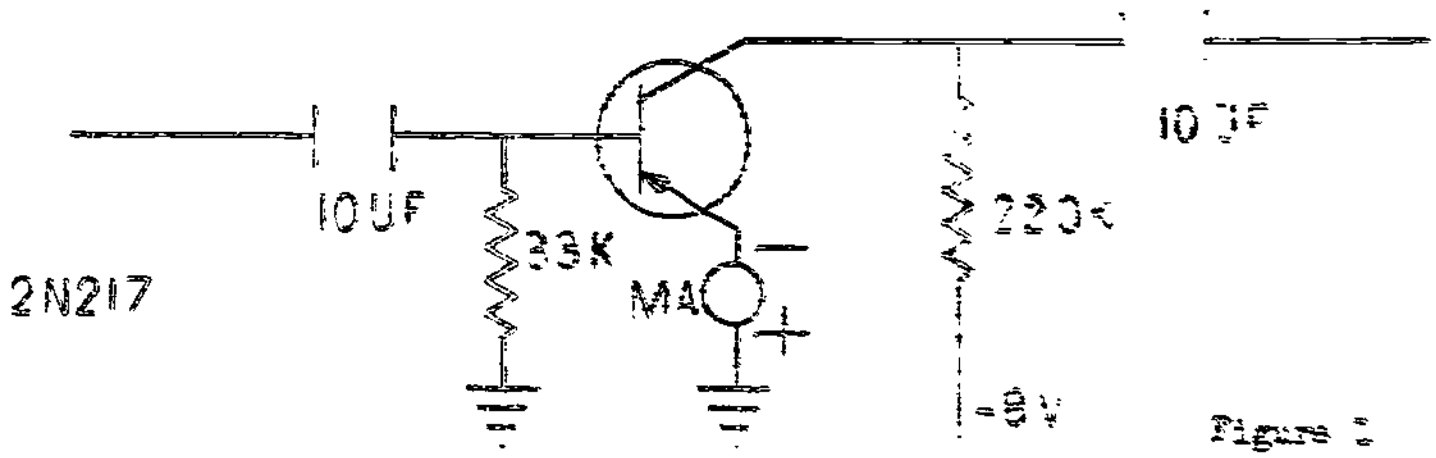

Figure 1

Schematic:

1. Included in the lesson.

Procedure:

1. Using the transistor trainer and template number 6, wire the circuit shown in figure 1.

2. Adjust the base resistor until the self bias results in an operation point with V_{ce} in the range of 3.5 to 4.5 volts.

3. Measure V_{ce} and record.

4. Record I_c.

5. Feed a 1 KC signal through the isolating 10 uf input condenser to the base and adjust the generator to result in an output voltage of 2 volts P-P. We want the largest output without distortion that we can get.

6. Place the VTVM on the base and monitor the voltage present.

7. Hold your hand on the transistor and record the effect on V_{ce} and I_c.

8. Note and record the effect upon waveform.

9. The instructor will discuss and you should read in your references about the increasing of the emitter resistance.

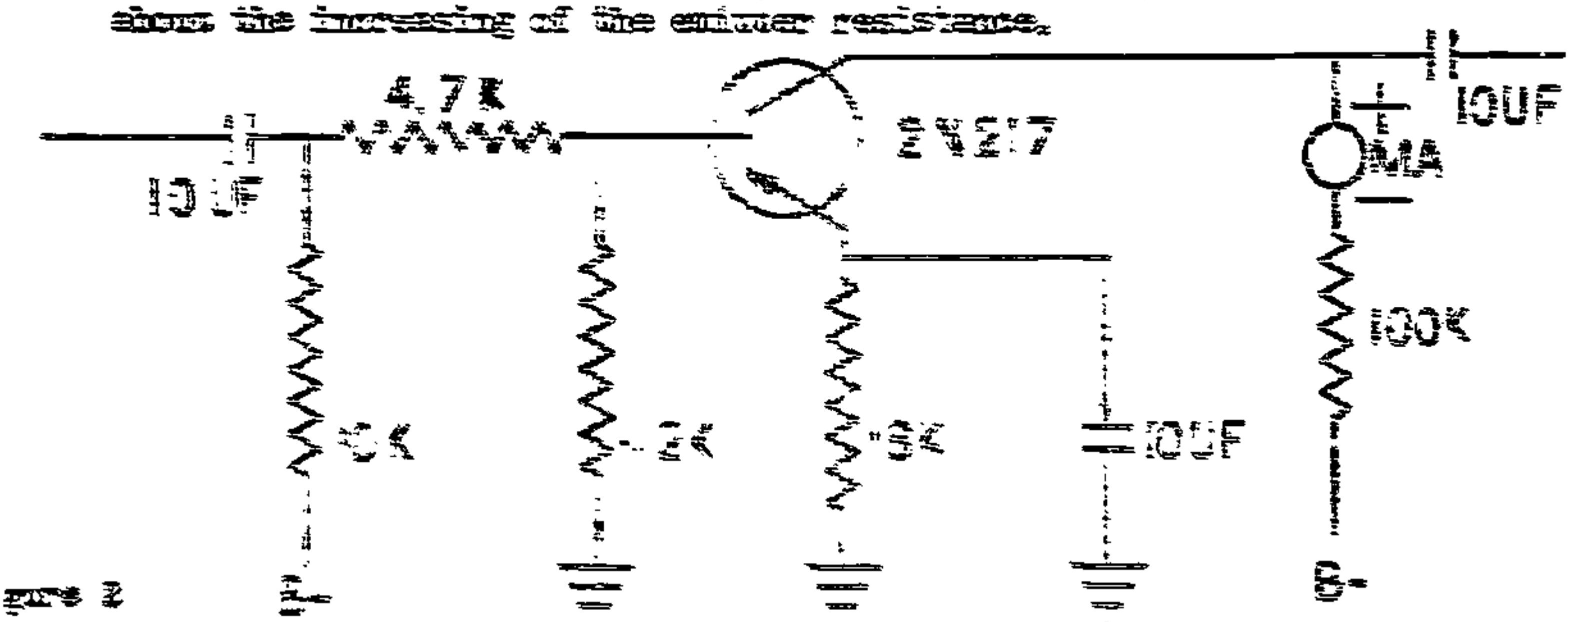

Figure 2

10. Wire the circuit shown in figure 2, reducing the base resistance.

11. Turn on and record the following:

I_e ______________ V_b ______________

I_c ______________ V_e ______________

12. Again apply a 1 KC signal and adjust generator for max undistorted output.

13. Again hold the transistor in your hand and record I_c and V_b.

14. Record the waveform.

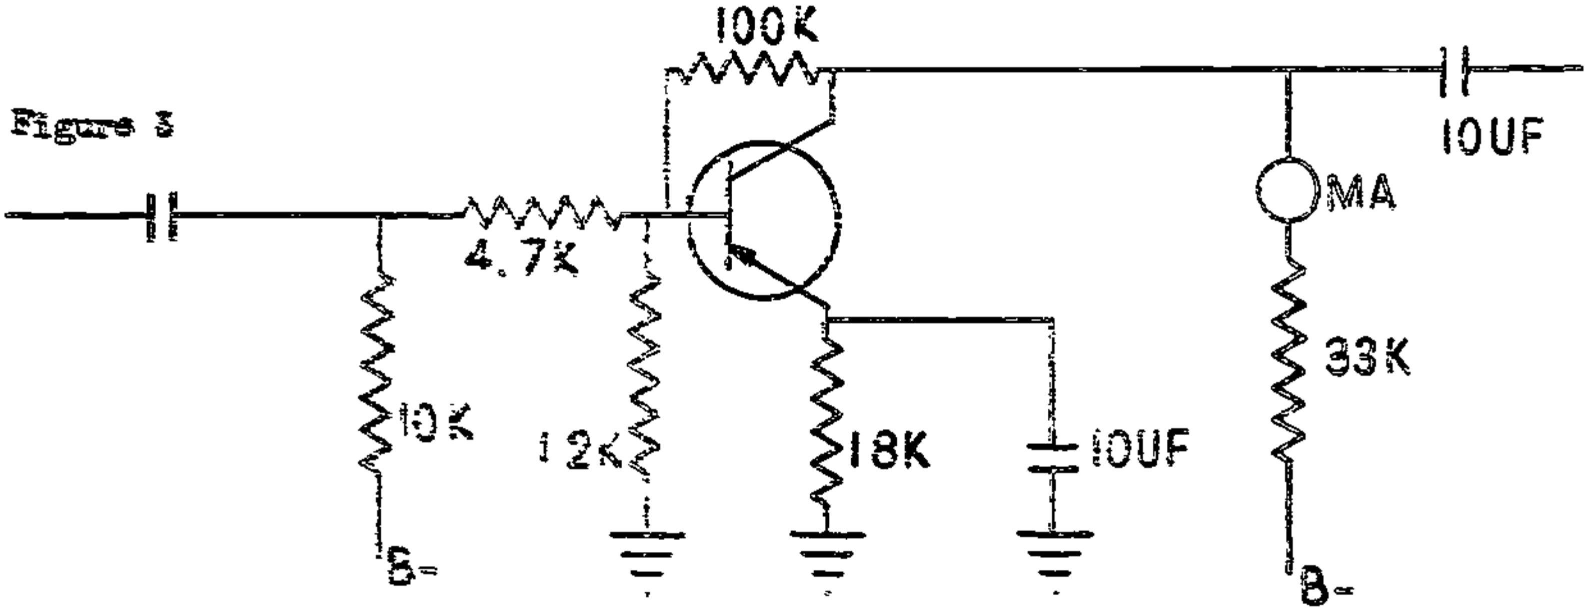

Figure 3

15. Wire the circuit shown in figure 3. Collector-base feedback to improve stabilization.

16. Repeat the same procedures outlined in steps 10-14.

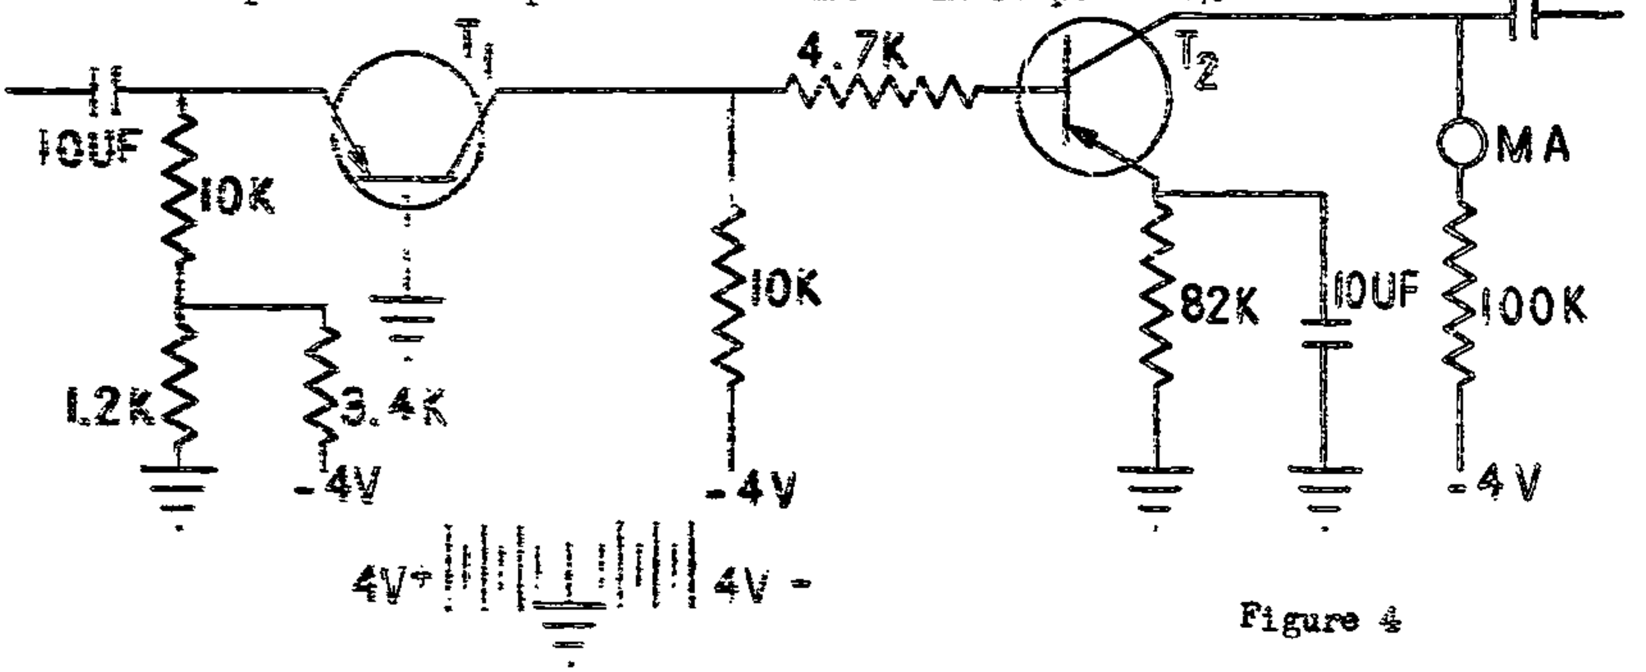

Figure 4

17. Wire the circuit shown in figure 4. Two transistor stabilization.

18. Measure the following and record.

T_1		T_2			
V_e	________	V_e	________	V_b	________
V_c	________	V_c	________	I_c	________

19. Apply heat and note change in T_2 of I_c and V_b.

Questions:

1. List the basic methods of transistor stabilization as outlined in this lesson.

2. Explain the basic theory behind the operation of a transistor.

Lesson 16
Power Supply

Introduction:

We have seen half and full-wave rectification using both vacuum tube diodes and semi-conductor. In this lesson we will attempt to convert the pulsating DC current to a steady DC current. We will also study the effect of various loads on output voltage and ripple.

References:

1. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 42-51 and 144-158 (section 1).

2. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 7-18.

Materials:

1. Chassis 121-1

2. VTVM -(Vacuum tube voltmeter)

3. Oscilloscope

Schematic:

1. Included in the lesson.

Procedure:

1. Obtain chassis 1 from storage rack and remove C_1, C_2, and SS_1.

2. Place SS_2 in position.

3. Turn the equipment on and measure DC voltage out and ripple voltage.

4. Obtain four or five various condensers up to a maximum size of the 8 uf furnished.

5. Starting with the smallest condenser place them in the C_1 position one at a time noting effect on ripple and DC voltage out.

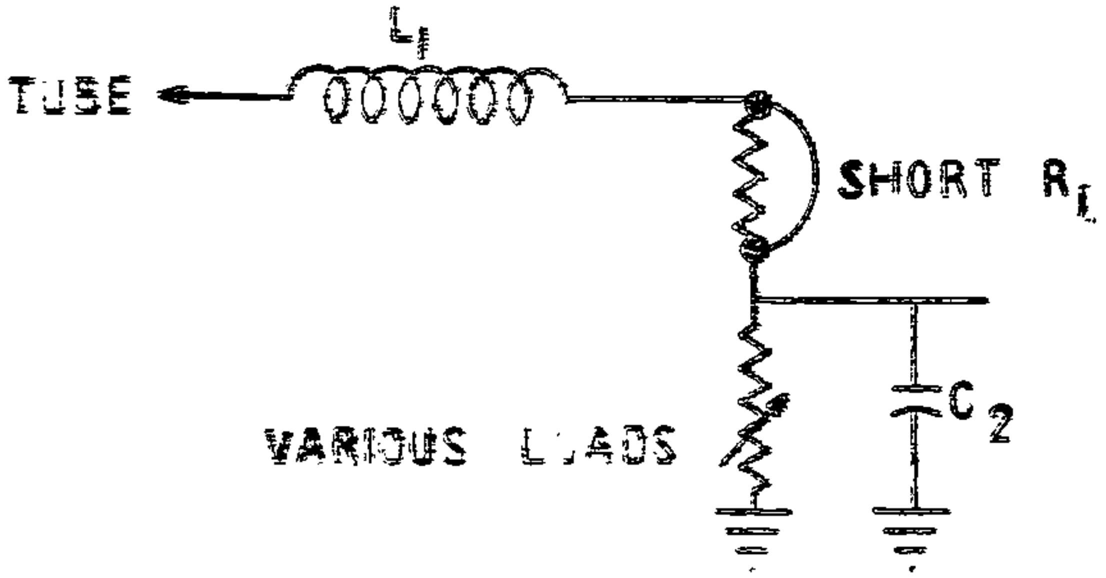
6. Prepare a graph showing these relationships in this simple condenser input filter.

7. Leaving the condenser in the circuit which did the best job, obtain four or five load resistors varying in size between 1.5K and 25K.

8. Change the load resistors one at a time from the largest to the smallest noting the effect on DC voltage and ripple.

9. Place SS_1 in the circuit and repeat step 8.

10. Wire the following circuit and repeat lab procedure as in step 8.



11. Place both C_1 and C_2 in the circuit. Replace R_1 with a shorting strip.

12. Measure DC voltage and ripple voltage across C_1 and C_2.

13. Again place various loads on the power supply and record DC voltage out and ripple at C_1 and C_2.

14. Prepare charts showing the various relationships between filter and voltage out, ripple voltage.

Questions:

1. What comparison is there between input frequency and ripple frequency in a half-wave rectifier, full-wave rectifier?

2. Describe the characteristics of a capacitor input filter.

3. Describe the characteristics of a choke input filter.

4. Why should the rectifier tube have a separate filament winding?

5. Complete the abnormal circuit chart. (If using RCA equipment)

Transistor Theory

Lesson 17
Bias Supply

Introduction:

In this lesson we will study a half-wave semi-conductor power supply. This one is designed as a bias supply, that is supply small negative voltages at small currents.

Reference:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 27-34.

Materials:

1. Chassis 121-1 and 121-67
2. VTVM -(Vacuum tube voltmeter)
3. Oscilloscope

Schematic:

1. Use schematic #S-III-4 from lesson 4 (appendix). See instructor.

Procedure:

1. Place the equipment in the rack.
2. Remove C_1, C_2, and C_3.
3. Place a 1500 ohm resistor in the C_1 position.
4. Observe the waveforms across the transformer secondary, the 150 resistor, and the rectifier. Explain.
5. Replace C_1, C_2, and C_3 and again observe the waveforms.
6. Turn R_4 and R_5 maximum clock-wise.
7. Measure the positive voltage present and the negative voltage present.

8. Measure the voltage from the negative to the positive jack. Compare with the sum of the voltages in step 7.

9. Turn the equipment off and measure both the forward and reverse resistors of diode.

Questions:

1. What would happen if the diode was replaced and wired in backwards?

2. Why is the positive side of C_3 grounded?

3. What would happen to the -1.5 volts if R_2 opened, R_3 opened?

4. Complete both the normal and abnormal charts. (If using RCA equipment)

2. Chassis No. 68
3. VTVM - (Vacuum tube voltmeter)
4. Oscilloscope

Schematic:

1. Use schematic #S-III-18 (appendix). See instructor.

Procedure:

1. Place the chassis No. 1 and 68 in the rack and turn on.
2. Measure the AC secondary voltage on the transformer.
3. Measure the DC voltages across C_1, C_2, C_3 and C_4.
4. Place a 25K-20 watt resistor across the output terminals and repeat the DC measurements.
5. Measure the AC ripple with and without load at the output jacks.

Questions:

1. Compare the various voltages across the condensers with the transformer secondary voltage.

2. Describe the regulation characteristics of this type power supply.

3. What would happen if C_1 is shorted?

4. What is the purpose of R_1?

5. Complete both the normal and abnormal circuit charts. (If using RCA equipment)

1. Chassis No. 1

2. Chassis No. 2

3. VTVM - Vacuum tube voltmeter

Schematic:

1. Use schematic #S-III-19 (appendix). See instructor.

Procedure:

1. Place chassis 2 in the rack beside chassis 1.

2. Place S_2 on chassis 1 in the off position.

3. Place a jumper wire from the B+ connection on chassis 1 to the left hand B+ connection on chassis 2.

4. Adjust R_6 to result in 250 volts at the B+ regulated jack.

5. Measure the following DC voltages:

    a. Regulated B+ output voltage.

b. Drop across $V_1 - V_2$ and R_5.

c. Sum of Reg B+ and $V_1 - V_2$ and R_5.

d. Unregulated B+ output voltage.

e. Bias for $V_1 - E_2$ voltage across R_4.

f. Bias for V_3 (V_4 to R_6).

6. Place two 25K-20 watt resistors in parallel on the output of the voltage resistor.

7. Measure the following DC voltages:

a. Regulated B+ output voltage

b. Drop across $V_1 - V_2$ and R_5.

c. Sum of regulated B+ and $V_1 - V_2$ and R_5.

d. Unregulated B+ output voltage.

e. Bias for $V_1 - V_2$ (voltage across R_4).

f. Bias for V_3 (V_4 to R_6).

8. Complete the normal and abnormal charts. (If using RCA equipment)

Questions:

1. Explain each of the loaded and unloaded relationships in steps 5 and 7.
2. Explain the operation of V_4 and R_1.
3. What two component parts have voltages that combine to form the grid-bias on V_3?
4. Explain the biasing on V_1 and V_2.

Lesson 20
Cathode Biased Amplifier

Introduction:

This is the first lesson that we will study which eliminates "c" supply. We will also study the characteristics of a typical vacuum tube audio amplifier.

References:

1. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 111-126.
2. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 44-50.

Materials:

1. 121-1 Power supply
2. 121-2 Regulator
3. 121-28 Audio amplifier
4. VTVM -(Vacuum tube voltmeter)
5. Audio generator
6. Oscilloscope
7. Various resistors as outlined by instructor.

Schematic:

1. Use schematic #S-III-20 (appendix). See instructor.

Procedure:

1. Place the equipment in the rack and adjust the regulator for a B+ of 250 volts.
2. Place the audio generator on the input of audio amplifier and ground. Adjust the output of the generator for 2 volts p-p (with R_1 maximum clock-wise.)

3. Measure output wave form and compute amplifier gain.

4. Place the resistors as plate loads one at a time. Measure plate voltage and compute gain for each one. (Resistors 10K, 33K, 47K, 100K, 220K, 330K)

5. Replace the load resistor with 220K.

6. Check the gain of the amplifier in several steps from a 100 to 15,000 cycles.

7. Repeat step six but remove the cathode by-pass condenser.

8. Prepare a graph showing the following:

    (a) Gain versus plate voltage.

    (b) Gain versus load resistors.

    (c) Gain versus frequency with cathode by-pass.

    (d) Gain versus frequency without cathode by-pass.

Questions:

1. How is gain affected by the load resistors?

2. How does the load resistors affect the plate load?

3. Why should the cathode resistor be by-passed?

4. What effects should we notice in frequency response versus gain when the by-pass condenser is removed?

5. What class of operation is this amplifier?

6. Complete the normal and abnormal charts. (If using RCA equipment)

Lesson 21
Transistor Two-Stage Amplifier

Introduction:

The use of transistors in amplifiers gave few absolutely new circuits to the field of electronics; however, transistors did permit the miniaturization of circuits so vital to the field where minimum space, weight and power loss was becoming a great problem. The guided missile and related industries make wide use of the transistor amplifier in their circuits. In recent years the application of transistor amplifiers have invaded almost every field of electronics from military to commercial and have succeeded in carving a niche in the electronic industry which once was monopolized by the famous vacuum tube. In this lesson we shall attempt to explain how transistors may be used in amplifier circuits.

Materials:

1. Transistor lab kit

2. VTVM -(Vacuum tube voltmeter)

3. VOM -(VoltOhmmeter)

4. Scope

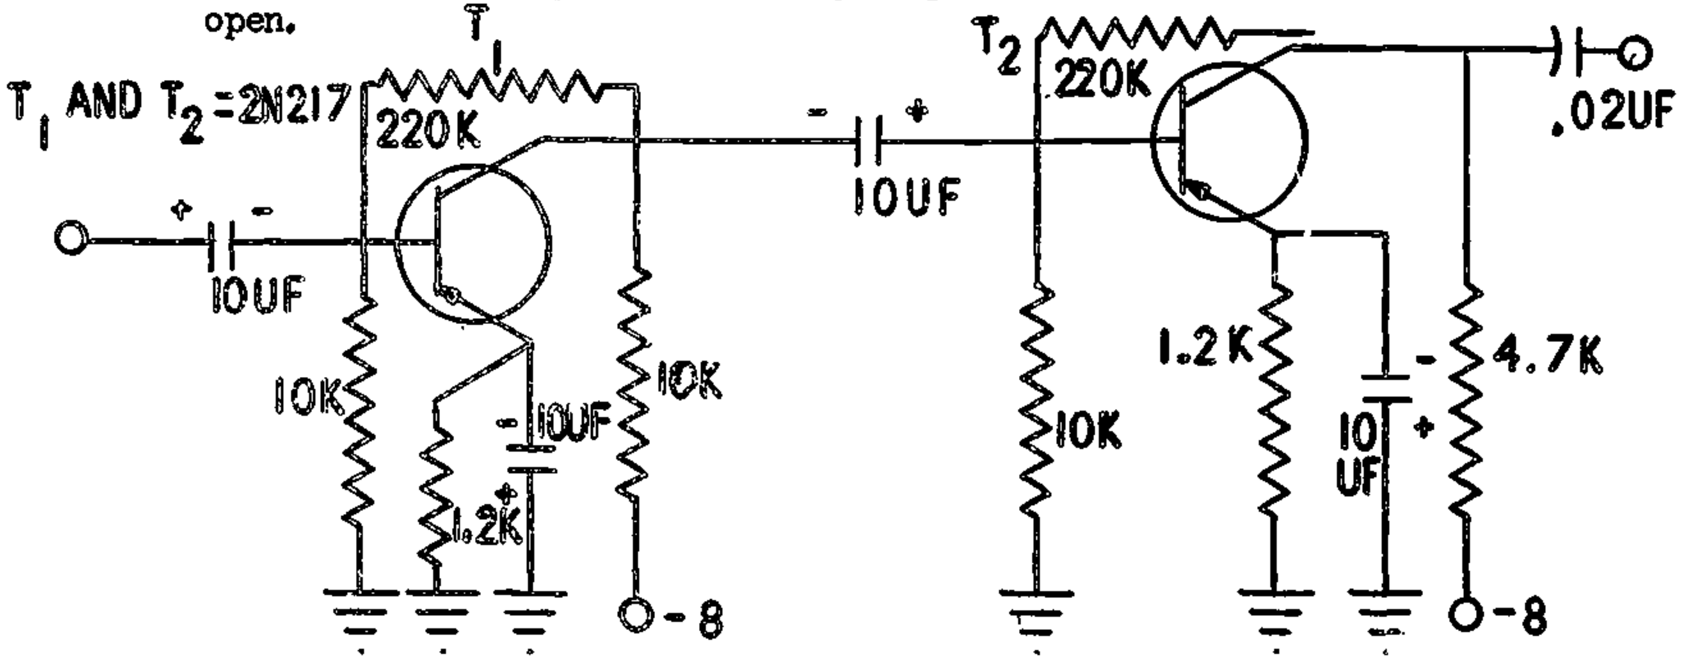
Schematic:

1. Included in the lesson.

Procedure:

DC MEASUREMENTS

1. Wire the following circuit using template number seven. Leave the switch open.



2. Turn circuit on and adjust transistor for approximately 4 volts from collector to emitter.

3. Take the following DC readings using your VTVM.

a. Battery voltage V_{bb} ____________

b. Collector-emitter voltage of transistor 1 V_{c1} ____________

c. Base-emitter voltage of transistor 1 V_{be1} ____________

d. Emitter voltage of transistor 1 V_{e1} ____________

e. Voltage across the load of transistor 1 V_{L1} ____________

f. Voltage collector-emitter of transistor 2 V_{ce2} ____________

g. Base-emitter voltage of transistor 2 V_{be2} ____________

h. Emitter voltage of transistor 2 V_{e2} ____________

i. Voltage across load of transistor 2 V_{L2} ____________

j. Collector to base voltage of transistor 1 V_{cb1} ____________

k. Collector to base voltage of transistor 2 V_{cb2} ________

4. Compute the following:

a. I_{e1} ________

b. I_{e2} ________

c. Battery I of transistor 1 E_{L1}/R_{L1} ________

d. Battery I of transistor 2 E_{L2}/R_{L2} ________

e. Power dissipated transistor 1 (Step C) V_b ________

f. Power dissipated transistor 2 (Step D) V_{bb} ________

g. Total power P_1 plus P_2 ________

h. Collector to base voltage of transistor 1 V_{ce1} minus V_{be1} ________

i. Collector to base voltage of transistor 2 V_{ce2} minus V_{be2} ________

AC MEASUREMENTS

1. Using a 1 KC audio signal at the input of T-1, adjust the generator so that the output of T-2 is the largest possible undistorted signal.

2. Measure E_{in} and E_{out} using the oscilloscope and compute overall voltage gain.

3. Measure the voltage out of transistor number one and compute its gain.

4. Measure the voltage in of transistor number two and compute its gain.

5. What relationship exists between the individual gains and total gain?

6. Advance the generator setting until the output of T-2 distorts. Measure and record waveshape of E_{in}, E_{out} of transistor 1, E_{in} of transistor 2, and E_{out} of system.

7. Return the generator to the largest signal possible producing undistorted output. Measuring the input voltage each time and keeping it constant compute total gain at the following frequencies.

30, 50, 100, 250, 1 KC, 5 KC, 10 KC, 20 KC, 30 KC

8. Draw a graph of the gains in step 7. (See figure 9-4, RCA Lab Manual) Draw a dotted line showing the half power point in relation to 1 KC.

9. If time permits the instructor will discuss with you the effect of changing parts on the operation of this amplifier.

10. Check your data and then return all equipment to its original condition and storage position.

Lesson 22
Phase Splitter

Introduction:

There are common types of phase splitters, the transformer and the vacuum tube. This experiment is about the vacuum tube. This amplifier gives us two outputs of equal amplitude and 180 degrees apart.

Reference:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 52-58.

Materials:

1. Chassis 121-1
2. Chassis 121-2
3. Chassis 121-29
4. VTVM -(Vacuum tube voltmeter)
5. Scope
6. Audio generator

Schematic:

1. Use schematic #S-III-22 (appendix). See instructor.

Procedure:

1. Place the equipment in the rack and adjust the power supply for 250 volts.
2. Set the generator on 1,000 cycles and place lead on input and ground of phase splitter.
3. Set generator on 2 volts P-P output.
4. Measure the AC output at both output jacks.
5. Ask the instructor to help you and determine the phase relationship of the output wave to the input wave.

6. Complete the normal and abnormal charts. (If using RCA equipment)

Questions:

1. If the amplifier had unequal outputs which parts would you suspect?
2. Would this amplifier have a higher heater to cathode voltage than normal?
3. Would an output voltage appear across R_4 with plate voltage missing?

Lesson 23
Transistor Audio Amplifier

Introduction:

The purpose of this lesson is to acquaint the student with amplifiers that fit in the general classification of audio amplifiers. Audio amplifiers are used extensively in radar, radio, television, public address systems, sound recorders and many other places. An audio amplifier is broadly defined as any amplifier which operates within the frequency range of approximately 20-20,000 cycles per second.

References:

1. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 127-143.

2. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 75-79.

3. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 571-592.

Materials:

1. Transistor trainer
2. Template number eight (If using RCA equipment)
3. Audio oscillator
4. Scope
5. VTVM -(Vacuum tube voltmeter)

Schematic:

1. Included in the lesson.

Procedure:

1. Wire the circuit as shown in figure 1. This circuit differs from the original one in the lab manual in the following respects:

   a. Volume control

   b. Tapping off volume control

   c. Biasing of power amplifier

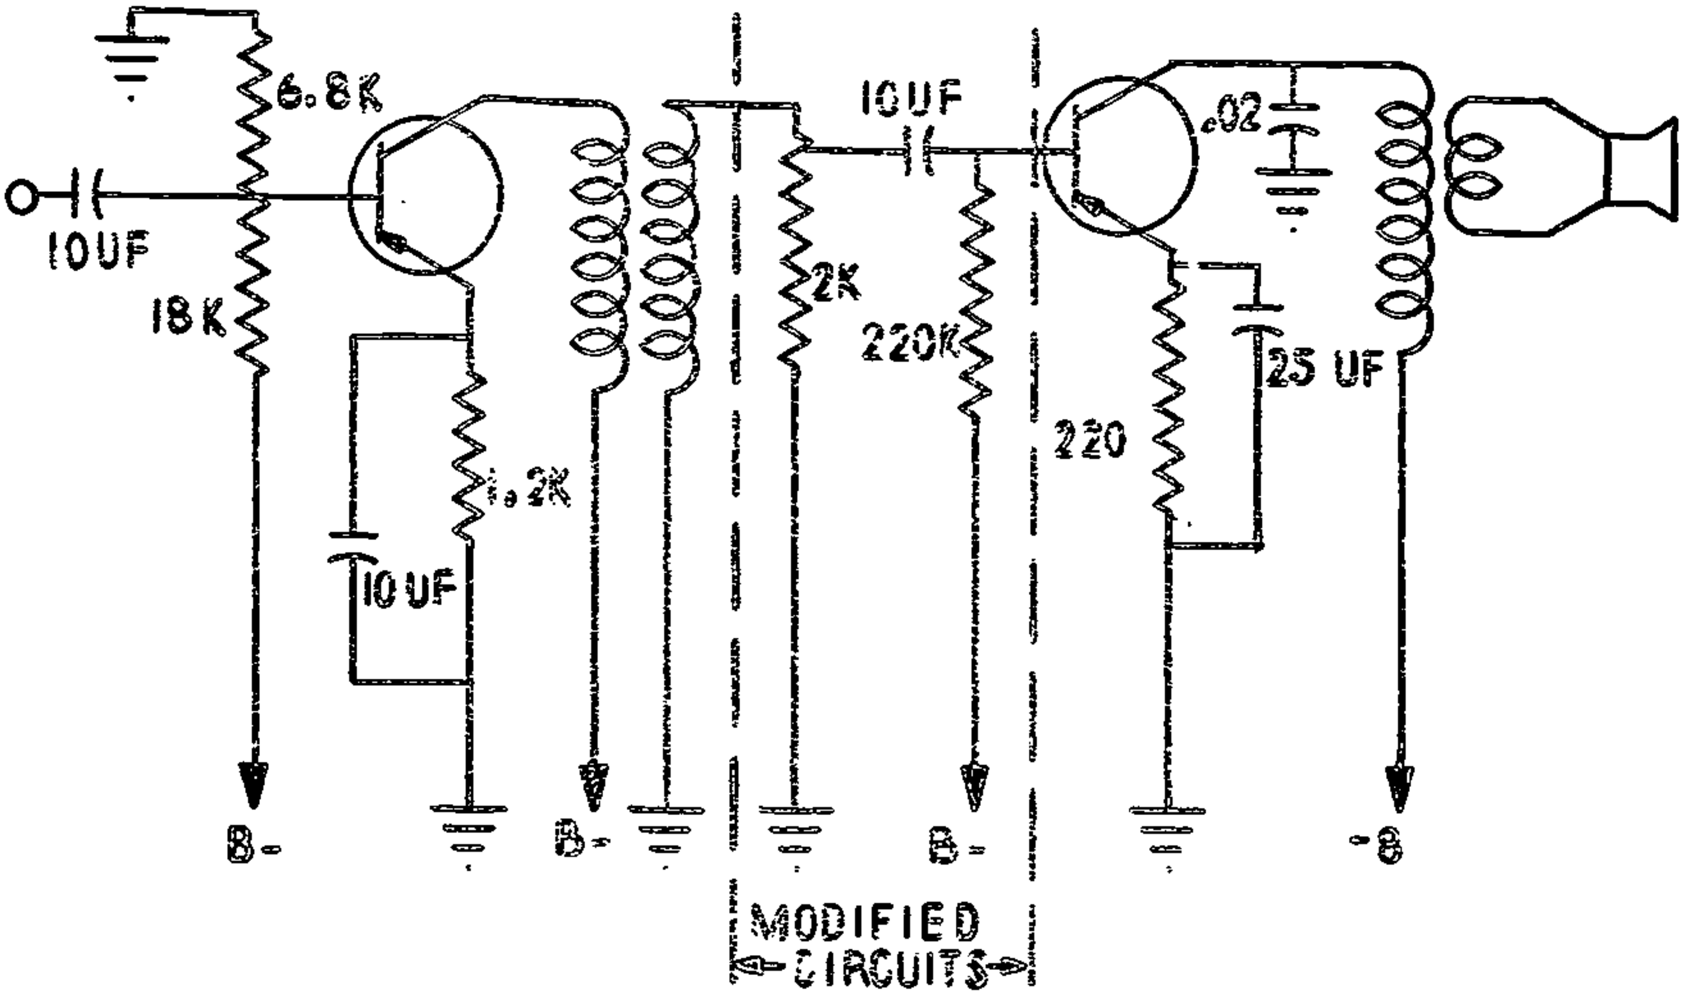
   d. Resistor five is changed to a 220 K ohm resistor.

   e. Volume control and coupling condenser will have to lay on top of template and jumper wires used.

2. Have the instructor check your circuit before applying power.

3. Apply a 1 KC signal at the input. Have the generator set on a low amplitude range.

4. Place the scope across the speaker leads and adjust the generator and volume control for the maximum signal with minimum distortion.



5. If you have trouble adjusting generator and volume control move scope and signal trace trouble step by step.

6. Vary generator amplitude setting and note effect on output.

7. Vary volume control setting and note effect on output.

8. Return the settings to give maximum undistorted output.

9. Place a 10 K potentiometer with jumpers across the generator input leads. Adjust the potentiometer used as a rheostat until the output signal is half what it was. (Do not change the generator setting)

10. Remove the potentiometer and measure its value. This is the approximate input impedance of the amplifier.

11. The output impedance is determined by the speaker and is approximately 12 ohm in this case.

12. Measure voltage in and compute power in.

13. Measure voltage out and compute power in.

14. Compute power gain of this amplifier.

15. Return set to maximum undistorted signal if any changes have occurred.

16. Set the scope to result in only a vertical line for voltage measurements.

17. Reduce the setting of the generator in 200 cps steps, recording voltage out for each step until the voltage out is .707 of maximum. Maintain the input voltage constant.

18. Increase the setting of the generator in 1 KC steps from 1,000 cycles and record the voltage out for each step until the voltage out is .707 of what it was for 1,000 cycles. Maintain the input voltage constant at all times.

19. Draw a graph of the voltage out at the different points.

20. If time permits, with the instructor's supervision, simulate shorts, opens, and the changing of sizes of the various parts noting effect on output.

Lesson 24
Vacuum Tube Power Amplifier

Introduction:

In order to drive a dynamic speaker, we must have more power. The power amplifier together with the matching transformer will give us the necessary power for the speaker.

References:

1. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. pp. 111-126.

2. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 59-67.

Materials:

1. 121-1 Power supply
2. 121-2 Regulator
3. 121-29 Phase splitter
4. 121-26 Audio power amplifier
5. Oscilloscope
6. VTVM -(Vacuum tube voltmeter)
7. Audio signal generator

Schematic:

1. Use schematic #S-III-24 (appendix). See instructor.

Procedure:

1. Plug in power supply and regulator and adjust for 250 volts B plus.

2. Skip a space or two and plug in the phase splitter and the power amplifier.

3. Check B plus for 250 volts.

4. Connect the signal generator to the input of the phase splitter and set on 1 kc.

5. Connect the 10 ohm resistor on the test stand across the speaker transformer.

6. Adjust the generator level to obtain 2 volts p-p across the speaker leads.

7. Adjust the load resistor to obtain the best match to the tube. Be careful not to plug in to the B plus line on the output plates.

8. Check the amplifier for proper balance at the correct test points.

9. Determine the phase relationships of the signal at all test points compared with the input at the phase splitter. Draw a block diagram indicating this.

10. Measure the voltage and determine its frequency across R_3. Explain.

11. Remove C_1 and again measure the voltage and determine its frequency across R_3. Explain.

12. Remove C_1 and V_1 in the power amplifier and again measure the voltage and determine its frequency across R_1.

13. Return C_1 and V_1, this places the power amplifier in its normal operating condition.

14. Temporary short a turn in the output transformer and note effect in output.

15. Complete normal and abnormal charts. (If using RCA equipment)

Questions:

1. What order harmonics are dropped in a push pull amplifier?

2. List the formula which relates turns ratio of a transformer to impedance.

3. Why is C_1 included in this amplifier?

4. Why does plate voltage on the output tubes approach B plus? The other amplifiers only had B plus when the tube was cut off.

Industrial Technical Mathematics II for Electricians.

Electricians Vocational School, Bloomington, Ind.
Indiana State Dept. of Public Instruction, Indianapolis.
Indiana State Univ., Terre Haute. Instr. Materials Lab.
Pub Date - 64
MF AVAILABLE IN VT-ERIC SET 45p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICIANS, *MATHEMATICS, INDIVIDUAL INSTRUCTION, *APPRENTICESHIPS,

The purpose of this course is to develop the fundamental skills of algebra as applied to the problems of the electrician's trade. This study guide was developed by a vocational coordinator, a vocational director, and members of an electricians' joint apprenticeship committee. It was designed on the concept and philosophy of using individual assignment sheets to allow each student to progress at his own rate and to enable the teacher to devote most of his time to individual instruction. Each of the 35 assignment sheets provides the student with the textbook references and assignments. An algebra textbook and an electrician's mathematics textbook are used as references. The assignment sheets are increasingly difficult so that the course may be used for both apprentice and journeyman electrician training programs. This book is designed for teacher use only. The student is to use the assignment sheets in loose unbound form. When he completes an assignment sheet, he returns it to the teacher and secures the next one. Tests are included periodically to identify the mathematical ability of the student. This document is available for 65 cents from the Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. "Industrial Technical Mathematics I" (VT 003 185) is available. (HC)

PREFACE

Industrial Technical Mathematics II for Electricians is designed to follow Industrial Technical Math I. In order for electricians to be competent in advanced mathematics, they must be proficient in the fundamental skills of algebra. These algebraic skills are useless unless they can be applied to the problems of the trade. This course was written with this basic principle in mind.

A new easy to understand algebra text was used as reference for the algebraic assignment sheets. A well-known reliable electrician's math text was used for the basic text for the assignment sheet to make application of the algebraic skills. The assignment sheets for each text are increasingly difficult. This will make it possible for this course to be used for both apprentice and journeyman electricians.

This book is designed for the instructors use only. Students are to use the assignment sheets in loose unbound form. The individual differences of students may be taken care of if the assignment sheets are used as described in "Directions to Instructor."

Appreciation and acknowledgement for a job well done is made to Delmas Vaughn, Vocational Coordinator of Bloomington High School: Joe Stradling, Vocational Director of Bloomington High School and to Russell Noel, Henry Richards, Lester Noel and Russell Isom, all members of the Electricians Joint Apprenticeship Committee of Bloomington. These people in cooperation with Lester Hale representing the Trade-Industrial-Technical Education Branch of the Division of Vocational Education of Indiana, have made the development of this course possible.

DIRECTIONS TO THE INSTRUCTOR

This course was developed around the concept and philosophy of using individual assignment sheets. If these sheets are used correctly, each student will be allowed to progress at his own rate. The abilities of all will be developed to their fullest extent.

The instructor only, should use this book. The loose individual assignment sheets are used by the students. The following method of operation has proven satisfactory:

Each student should have two folders in the file; one for the "completed" work, the other for the "incomplete" work. The assignment sheets should be filed in consecutive order in another drawer. The instructor should lay out the student folders before class time. This prevents congestion and a bottleneck around the file cabinet at the beginning and ending of class. When the student completes an assignment sheet, he turns this into the instructor, then secures the next sheet.

Tests are included periodically. These may be used to identify the mathematical ability of each student. This makes it possible to start the students at the proper level in the course. The tests may also be used in the traditional manner.

If the course is used as it should be, the instructor will be freed of many routine activities and will be able to devote his time almost entirely to individual instruction.

It must be kept in mind that the assignment sheets are only a teaching aid or device. Necessary instruction is still necessary.

An accurate record of each student's progress should be kept by the instructor.

TEACHING GUIDES, *CURRICULUM GUIDES, STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRONIC TECHNICIANS, *MATHEMATICS, *ELECTRONICS, HIGH SCHOOLS, TESTS, INDIVIDUAL INSTRUCTION,

This course for use in electronic technician programs was designed to develop skill and knowledge in the use of fundamental mathematical skills for the solving of basic electronic problems. This revised teaching guide was prepared by an individual author after teaching the course and using the material for 2 years. It was developed on the concept and philosophy of using individual assignment sheets to allow each student to progress at his own rate and to enable the teacher to devote most of his time to individual instruction. Each of the 36 2-hour lessons has a teaching outline and a student assignment sheet. The outlines provide the textbook reference, discussion topics, the current homework assignment, and the advanced assignment. The assignment sheets contain the textbook reference, an introduction, new terms, the assignment, and the advanced assignment. Sample assignment subjects are Simple Electrical Circuits-Working with Formulas, Electrical Measurement, Graphs-Simultaneous Linear Equation, and Electrical Power. This book is designed for teacher use only. The student is to use the assignment sheets in loose unbound form. After he completes an assignment sheet, he returns it to the teacher and secures the next sheet. Tests are included periodically to identify the mathematical ability of the student. This document is available for $1.50 from Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. (HC)

DIRECTIONS TO THE INSTRUCTOR

This course was developed around the concept and philosophy of using individual assignment sheets. If these sheets are used correctly, each student will be allowed to progress at his own rate. The abilities of all will be developed to their fullest extent.

The instructor only, should use this book. The loose individual assignment sheets are used by the students. The following method of operation has proven satisfactory:

Each student should have two folders in the file; one for the "completed" work, the other for the "incomplete" work. The assignment sheets should be filed in consecutive order in another drawer. The instructor should lay out the student folders before class time. This prevents congestion and a bottleneck around the file cabinet at the beginning and ending of class. When the student completes an assignment sheet, he turns this into the instructor, then secures the next sheet.

Tests are included periodically. These may be used to identify the mathematical ability of each student. This makes it possible to start the students at the proper level in the course. The tests may also be used in the traditional manner.

If the course is used as it should be, the instructor will be freed of many routine activities and will be able to devote his time almost entirely to individual instruction.

It must be kept in mind that the assignment sheets are only a teaching aid or device. Therefore, instruction is still necessary.

An accurate record of each student's progress should be kept by the instructor.

PREFACE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS   BASIC ELECTRONIC MATHEMATICS

Basic Electronic Mathematics is designed to develop skill and knowledge in the use of fundamental mathematical skills for the solving of basic electronic problems. The course is composed of 36 class meetings of two hours each. A great deal of time will be spent on practice ard drill. There will be such a large amount of electronic theory that the student must use in more advanced courses that the math skills must be his own by the time he reaches that level. Self-discipline will be the key to success in reaching the development of these necessary skills, thereby furthering the students' knowledge in the field of electronics.

ACKNOWLEDGEMENT

Appreciation and acknowledgement is made to Tom Reckerd, former Vocational Coordinator of Bloomington High School, and to his committee consisting of Harold Fischel, Morris Robertson and John Robinson. The committee and all members of industry made it possible to relate this electronics course directly to the needs and applications of industry.

The revision, made in the fall of 1961, is a result of the cooperative efforts of Tom Reckerd, the instructors of Basic Electronics Mathematics at Bloomington, Bedford and Logootee; and the staff of the Instructional Materials Laboratory of Indiana State College. The secretarial staff also worked very diligently in order to produce this revision.

The second revision was made in the summer of 1963 by Robert Porter, Foreman, Sarkes Tarzian Incorporated, Tuner Division. Mr. Robert Porter made this revision after teaching this course and using this material for two years.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 1
Introduction to Electronics

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. An element is the fundamental material whose properties are definable by chemistry and are not divisible by chemistry or ordinary methods.
Example: copper, lead, gold, etc.

B. The atom is the smallest portion of an element that still has all of the properties of the element.

1. All matter is electrical in nature.
2. The atom can be broken, but the pieces have none of the elemental properties.
3. Parts of the atom: protons, electrons, and neutrons

C. Structure of the atom

1. The nucleus contains the protons (+) and neutrons (neither charge).
2. The number of planetary electrons in the orbit is equal to the number of protons in the nucleus. Illustration H & He.

D. Free electrons

1. Electrons that are in the orbit farthest from the nucleus are loosely bound, and are called free electrons.
2. Demonstrate static electricity.

E. Electron flow

1. A flow of electrons occurs to do work. Use analogy of water and sand blast.

F. Voltage or pressure

1. Waterhead analogy: Water produced .431 lbs. of pressure per foot of head.
2. Electromotive potential of metals: carbon and zinc (1.5 volts); lead and sulphur (2.1 volts); nickel and iron (1.2 volts)

G. Coulomb, quantity of electricity 6.28×10^{18} electrons

H. Current

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson I (Con't.)
Introduction to Electronics

1. Useful work can be done with motion of electrons. The speed of flow is almost equal to the speed of light. (Motion of electrons by interchange of free electrons) (Use analogy of billard balls.)
2. Current flow as analogous to water flow
3. Current flow of one ampere as defined in coulombs

I. Resistance

1. Conductors and non conductors, the differences in mobility and quality of free electrons
2. Symbol for ohms, the origin of ohm, George Simon Ohm, 1787-1854
3. International Standard; a column of Hg of uniform cross section is 106.3 cm. long and 14.45 grams in weight.
4. When a voltage of 1 volt causes a current flow of 1 amp, the circuit contains 1 ohm of resistance.
5. The resistance of 1,000 ft. of no. 10 copper wire is 1 ohm.
6. Devices that make use of resistance

J. Measurements and circuits, demonstration and lecture

1. Equipment required: DC voltmeter (1 to 10 volts Weston 901 or equivalent) 6 volt 1 amp source (battery or equivalent); DC ammeter (1 to 3 amps); resistor (6 ohms, 10 watts)
2. Placing the ammeter in the circuit
3. Placing the voltmeter in the circuit; the source or the load point
4. Description of equipment: ohmmeter; electrical circuit; open circuit
5. Fuses
   a. Purpose of fuse and construction of fuse
   b. Short circuit conditions
   c. Delayed fuses for motor starting purposes
6. Symbols; bring to attention of pupils (page 10 of Singer)

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read chapter 1, pages 1-12 in reference 1.

IV. Advanced Assignment: Read pages 13-17 to Multiplication of Fractions. Work the problems on pages 13, 15 and 17 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 1
Introduction to Electronics

Reference:

1. Singer, Bertrand, B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

In this lesson we will introduce some basic electrical quantities. The purpose of introducing these new terms at this point is so that we may use electrical problems in the further study of mathematics.

New Terms:

1. Element
2. Atom
3. Electrons
4. Voltage
5. Current
6. Resistance
7. Series
8. Parallel

Assignment: Use reference listed above.

1. Write definitions in your own words for the above terms.

2. Read chapter 1, pages 1-12.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read chapter 2, pages 13-17 to Multiplication of Fractions.

2. Work the problems on pages 13, 15 and 17.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 2

Simple Electrical Circuits—Application of Fractions

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Parts of fractions

1. Numerator 6 ← vinculum
   Denominator 27

2. The fraction denotes division. The denominator denotes how many equal parts the whole has been divided into (or the denomination of the parts). The numerator denotes how many parts of the given denomination are being considered. This is the real meaning of the fraction.

B. Reducing fractions

1. Rule—Divide the numerator and denominator by the same number until division is no longer possible. A fraction is reducible as long as both numerator and denominator can each be divided by the same number with quotients resulting in integers.

C. Proper and improper fractions

1. A fraction is defined as improper when the numerator is larger than the denominator. A fraction is proper when the inverse is true.

D. Mixed number

1. A mixed number is a number composed of an integer and a proper fraction.

E. Changing mixed numbers to improper fractions

1. Rule and explanation of rule

F. Changing improper fractions to mixed numbers

1. Rule and explanation of rule

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read chapter 2, pages 13-17 to Multiplication of Fractions. Work the problems on pages 13, 15 and 17 in reference 1.

IV. Advanced Assignment: Read pages 17-20 to Ohm's Law. Work the problems on pages 17, 18 and 19 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS   BASIC ELECTRONIC MATHEMATICS

Lesson 2

Simple Electrical Circuits--Application of Fractions

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Lesson 2 is working with parts of numbers, fractions. The student should try to have a knowledge of relative size of two different fractions. Being able to change from a proper fraction to an improper fraction is a skill often found useful in electronics.

New Terms:

1. Fraction
2. Denominator
3. Numerator
4. Vinculum
5. Proper
6. Improper
7. Mixed number

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read chapter 2, pages 13-17 to Multiplication of Fractions.

3. Work the problems on pages 13, 15 and 17.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 17-20 to Ohm's Law.

2. Work the problems on pages 17, 18 and 19.

Lesson 3

Simple Electrical Circuits—Application of Fractions

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

2. Hart, Walter W., Workbook for First Course in Algebra, D. C. Heath and Company, Boston.

I. Discussion Topics:

A. Like denominator

1. Rule—When two fractions having a common denominator are to be added, add the numerator and affix the common denominator.

B. Unlike denominators

1. Rule—When two or more fractions having unlike denominators are to be added, change all of the fractions to fractions having a common denominator. Then, add the numerators and affix the common denominator.

C. The common denominator

1. Rule—The common denominator can be found by multiplying all of the denominators. This is seldom the least common denominator.

D. Changing the fractions to the least common denominator

1. Rule—Choose a value to be the least common denominator. Divide the denominator of the fraction to be changed, into this chosen denominator, then multiply the numerator of this fraction by the quotient just obtained. This is the numerator of the new fractions. Affix the chosen common denominator.

Example: $3/4 + 3/6 + 2/3$ Least common denominator is 12.

$(3)\ (3/4) = 9/12$

$(2)\ (3/6) = 6/12$

$(4)\ (2/3) = 8/12$

$9/12 + 6/12 + 8/12 = 23/12$ or $1\ \ 11/12$ or

$\frac{9 + 6 + 8}{12} = 23/12$ or $1\ \ 11/12$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 3 (Con't.)
Simple Electrical Circuits—Application of Fractions

E. Addition of mixed numbers

1. Rule—Change to improper fractions having a common denominator and proceed as in the addition of fractions.

F. Multiplication of fractions

1. Rule—Place the product of the numerators over the product of the denominators and reduce to the lowest terms.

2. Cancellation with the problem
Example: $\overset{2}{\cancel{8}}/2 \times 3/\underset{1}{\cancel{4}} = 6/2 = 3$
Cancellation is reduction to lowest terms before completion of the problem.

G. Division by a fraction

1. Rule—To divide a number or fraction by another fraction, invert the divisor and multiply.
Example:

$$1/2\overline{)5} = 5/1 \times 2/1 = 10$$

$$3/2 \div 3/8 = \overset{1}{\cancel{3}}/\underset{1}{\cancel{2}} \times \overset{4}{\cancel{8}}/\underset{1}{\cancel{3}} = 4$$

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 17-20 to Ohm's Law. Work the problems on pages 17, 18 and 19 in reference 1.

IV. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Test 3, test 6 and test 7 of workbook in reference 2.

V. Advanced Assignment: Read pages 24-27 to Changing Formulas into Rules. Work the problems on pages 24 and 27 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 3

Simple Electrical Circuits—Application of Fractions

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Lesson 3 is to develop skill in the combined operations with fractions. Special care should be taken with the addition of fractions as this is used in the study of parallel electrical circuits.

New Terms:

1. Common denominator
2. Lowest common denominator

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 17-20 to Ohm's Law.

3. Work the problems on pages 17, 18 and 19.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 24-27 to Changing Formulas into Rules.

2. Work the problems on pages 24 and 27.

Lesson 4

Simple Electrical Circuits--Working with Formulas

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

2. Hart, Walter W., Workbook for First Course in Algebra, D. C. Heath and Company, Boston.

I. Discussion Topics:

A. The general number

1. Definition--a general number is a letter or symbol substitute for a real number whose value is either known or unknown.

2. The use of the general number

a. Formulas - compact way of expression

b. Endless derivations possible by assignment of general numbers

B. Algebraic expressions

1. Definition--an expression that uses signs and/or symbols to express a mathematical relationship.

a. Numerical algebraic expression - signs and numbers only
Example: $8(6 + 2)$

b. Literal algebraic expression - signs and letters only
Example: $I(R + V)$

C. Factor definition

1. When two or more are multiplied together, any individual number, or the product of any combination of the number is a factor of the whole of the product.
Example: 2 ayz can be factored as: (a) (2yz), (2a) (yz), 2(ayz) etc.

D. Co-efficients

1. Any single factor of an expression is also the co-efficient as related to the rest of the parts; thus, in the above expression, 2 is the co-efficient of (ayz); a is the co-efficient of 2yz; etc.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS BASIC ELECTRONIC MATHEMATICS

Lesson 4 (Con't.)
Simple Electrical Circuits--Working with Formulas

2. One (1) is an understood co-efficient. This will later prove useful to know.

E. Sign of operation

1. +, -, ÷, and x still prevail.
2. Multiplication is indicated by (·) between symbols or by placing letters adjacent to each other.
3. Division is indicated by vinculum (–). $\frac{A}{Z}$

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 24-27 to Changing Formulas into Rules. Work the problems on pages 24 and 27 in reference 1.

Lesson 4

Simple Electrical Circuits—Working with Formulas

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

This is the first lesson where we are concerned with algebraic terms. This will be done using electrical formulas.

New Terms:

1. General numbers
2. Algebraic numbers
3. Arithmetic numbers
4. Term
5. Factor
6. Co-efficient
7. Sign of operation

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 24-27 to Changing Formulas into Rules.

3. Work the problems on pages 24 and 27.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 27-30 to Job 2.6.

2. Work the problems on page 30.

Lesson 5

Simple Electrical Circuits—Working with Formulas

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.
2. Hart, Walter W., Workbook for First Course in Algebra, D. C. Heath and Company, Boston.

I. Discussion Topics

A. Equations—definitions

1. General—An equation is a mathematical statement that one number or one quantity is equal to another number or another quantity.

B. An operation that is performed on one side of an equation must be performed on the other side or the equality will no longer exist.

C. A mathematical rule can be put into a formula, or vice-versa.

Example: Rule—The area of a rectangle is equal to its length times its width. Formula or equation $A = (L)(W)$ Show the converse, formula to rule.

D. Axioms

1. Addition: Equals added to equals are equal.

Example: $3 + 4 = 7$

$$(3 + 4) + 8 = 7 + 8$$
$$15 = 15$$

2. Subtraction: Equals subtracted from equals are equal.

Example: $83 - 2 = 81$

$$(83 - 2) - 8 = 81 - 8$$
$$73 = 73$$

3. Multiplication: Equals multiplied by equals are equal.

Example: $8 \times 4 = 32$

$$(8 \times 4) \times 10 = 32 \times 10$$
$$320 = 320$$

4. Division: Equals divided by equals are equal.

Example: $6 \div 2 = 3$

$$(6 \div 2) \div 3 = 3 \div 3$$
$$1 = 1$$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 5 (Con't.)

Simple Electrical Circuits—Working with Formulas

5. Other axioms will be studied later.

E. Solution of the unknown

General procedure. Example: $E = IR$ find R
R is desired not I, so apply an axiom that will remove I such as $6 \times 4 = x$ above.
Divide both sides by I. $\frac{E}{I} = \frac{\cancel{I}R}{\cancel{I}}$ or $R = \frac{E}{I}$

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 27-30 to Job 2.6. Work the problems on page 30 in reference 1.

IV. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Tests 22, 23, 24 and 25 on both sides. Practice workbook in reference 2.

V. Advanced Assignment: Read pages 20-24 and 30-37 to Job 2.8. Work the problems on pages 23, 24, 35, 36 and 37 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS   BASIC ELECTRONIC MATHEMATICS

Lesson 5
Simple Electrical Circuits—Working with Formulas

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Lesson 5 concerns the use of developing and solving equations. Many times during the study of electronics the student must develop and solve his own equation. Sometimes it is easier to use several small equations to solve a process and sometimes it is easier to use one large equation. Processes which occur over and over again can best be described by a general equation. Substitution of arithmetic numbers in an algebraic equation changes a general description to a specific case.

New Terms:

1. Axioms
2. General
3. Specific
4. Unknown
5. Given

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 27-30 to Job 2.6.

3. Work the problems on page 30.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 20-24 and 30-37 to Job 2.8.

2. Work the problems on pages 23, 24, 35, 36 and 37.

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 6
Simple Electrical Circuits—Ohms Law

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

2. Hart, Walter W., Workbook for First Course in Algebra. D. C. Heath and Company, Boston.

I. Discussion Topics:

A. Ohms Law as stated by George Simon Ohm. Voltage drop is directly proportional to the product of the current and resistance. $E = IR$

1. Draw a simple labeled sketch on blackboard. Stress E = potential analogous to waterhead, energy of suspended weight, etc. Stress I flow analogous to water flow, falling weight, etc. Stress R resistance analogous to friction of air, etc.

B. Resistance, in terms of voltage and current.

1. Develop formula $R = \frac{E}{I}$, from $E = IR$

   Allow students to do so at their desks. Stress the axiom applied.

2. Allow students to apply the converse, transforming $R = \frac{E}{I}$ to $E = IR$ stress axiom involved.

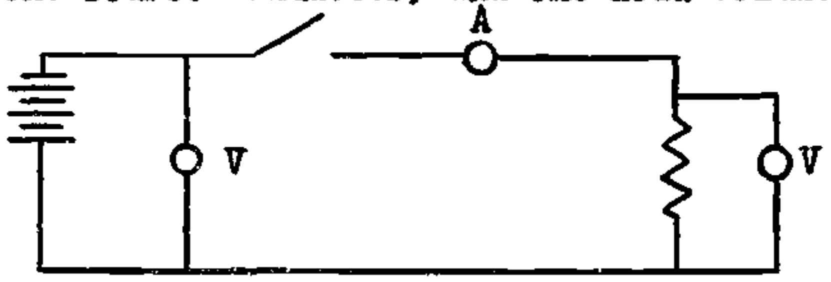
C. Current, in terms of voltage and current.

1. Develop formula $I = \frac{E}{R}$ from $E = IR$. Allow students to participate as in B 1 & 2.

2. Develop formula $I = \frac{E}{R}$ from $R = \frac{E}{I}$ (B • 2) Stress procedure and axioms.

3. Ask students what value of current results when $R = 0$.

D. Show 3 diagrams of simple series circuits; one resistor, one voltage source, one ammeter, one source voltmeter, and one load voltmeter.



TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

BASIC ELECTRONIC MATHEMATICS

Lesson 6 (Con't.)
Simple Electrical Circuits—Ohm's Law

First,
$R = 8$ ohms $I = 2$ amps
$E = ?$ (16 volts) $V_R = ?$ (16 volts)

Second,
$E = 12$ volts $R = 3$ ohms
$I = ?$ (4 amps) $V_R = ?$ (12 volts)

Third,
$E = 24$ volts $I = 8$ amps
$R = ?$ (3 ohms) $V_R = ?$ (24 volts)

1. Stress (without allusion to Kirchoff's Law) that the voltage <u>must</u> be "used up".

E. Demonstrate procedure of solution of problem by blackboard demonstration of the following steps:

1. Read carefully
2. Diagram, if possible
3. Insert knowns of diagram
4. Write formula
5. Substitute known and unknown in formula
6. Solve
7. Table answers by units

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 20-24 and 30-37 to Job 2.8. Work the problems on pages 23, 24, 35, 36 and 37 in reference 1.

IV. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Tests 24, 25, back of 25, 26 and 27 of workbook in reference 2.

V. Advanced Assignment: Read pages 37-45 to Multiplication of Decimals. Work the problems on pages 30, 39, 44 and 45 in reference 1.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 6
Simple Electrical Circuits--Ohm's Law

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Ohm's Law is an electrical equation describing the relationship between pressure, opposition, and electron flow. The student should learn this equation and how to adapt it to his particular situation.

New Terms:

1. Volts
2. Ohms
3. Amperes
4. Ohm's Law
5. Kirchoff's Law

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 20-24 and 30-37 to Job 2.8.

3. Work the problems on pages 23, 24, 35, 36 and 37.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 37-45 to Multiplication of Decimals.

2. Work the problems on pages 30, 39, 44 and 45.

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 7

Simple Electrical Circuits--Application of Decimals

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radi^ and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Decimal fraction definition.
A decimal fraction is a number to the right of the decimal point; the denominator not shown, but understood by the number of places to the right of the point.

1. Examples:
.2 = 2/10 = two tenths
.22 = 22/100 = twenty-two hundredths
.222 = 222/1000 = two hundred twenty-two thousandths

or .2 .20 .200 .2000 etc.

B. Changing a common fraction to a decimal fraction
Rule--Always divide the numerator by the denominator.

1. Example: 1/8 = 8/1.00

C. Division of one decimal by another.
1. The rule of the carrot
The divisor and the dividend are multiplied by 10 or multipliers of ten without disturbing the value of the quotient.

D. Multiplication of one decimal with another.
1. Rule--Complete the multiplication until the product is obtained. In the product point off from right to left the same number of decimal places as the combined number of places in the multiplicand and the multiplier.

Example: .483 x .106

```
  .483      3 places
  .106    + 3 places
  ----    ----------
  2898      6 places
 483
 -----
 51198
```

Add number of zeros necessary when no integer is present, thus,
(.483) (.106) = .051198

E. Addition. Rule--Keep the decimal point in line in both the summates and the sum.

Lesson 7 (Con't.)
Simple Electrical Circuits—Application of Decimals

F. Degree of accuracy

G. Subtraction. Rule--Keep the decimal point in the minuend, subtrahend, and difference in line.

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 37-45 to Multiplication of Decimals. Work the problems on pages 30, 39, 44 and 45 in reference 1.

IV. Advanced Assignment: Read pages 45-52. Work the problems on pages 46, 48, 49, 51 and 52 in reference 1.

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 7
Simple Electrical Circuits--Application of Decimals

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Many times in using numbers it is more convenient to use decimals instead of fractions. A fraction is an exact number where decimals usually describe a rounding off.

New Terms:

1. Decimal
2. Significant places
3. Three place accuracy
4. Rounding off

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 37-45 to Multiplication of Decimals.

3. Work the problems on pages 30, 39, 44 and 45.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 45-52.

2. Work the problems on pages 46, 48, 49, 51 and 52.

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 8

Simple Electrical Circuits—Further Study in Decimals

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

- A. Multiplication of decimals
  - 1. Demonstration and practice
    - a. Proper placement of decimal point
- B. Division of decimals
  - 1. Demonstration and practice
    - a. Dividing a whole number by a decimal or by a whole number (example 2-39)
    - b. Dividing a decimal by another decimal smaller than 1/10 (examples 2-40 and 2-41)
    - c. Dividing a very small decimal such as .00004 by another decimal (example 2-42)

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 45-52. Work the problems on pages 46, 48, 49, 51 and 52 in reference 1.

IV. Advanced Assignment: Read pages 308-310 to Graphs. Work the problems on pages 308 and 309 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS BASIC ELECTRONIC MATHEMATICS

Lesson 8

Simple Electrical Circuits--Further Study in Decimals

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Decimals are multiplied in exactly the same way that ordinary numbers are multiplied. However, in addition to the normal multiplication, the decimal point must be correctly set in the answer.

Assignment: Use reference listed above.

1. Read pages 45-52.

2. Work the problems on pages 46, 48, 49, 51 and 52.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 308-310 to Graphs.

2. Work the problems on pages 308 and 309.

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 9

Addition and Subtraction of Signed Numbers

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

2. Hart, Walter W., Workbook for First Course in Algebra. D. C. Heath and Company, Boston.

I. Addition

A. The negative number.

1. The negative number mathematically defined.

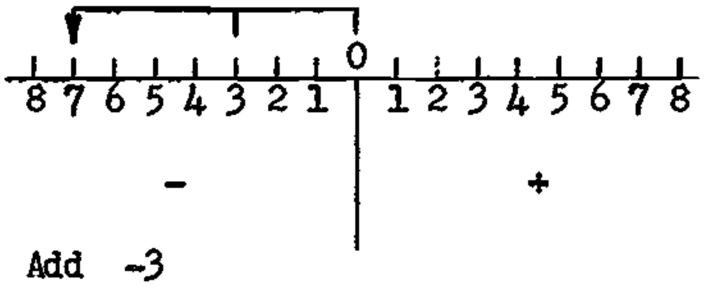
Subtraction $6 - 1 = 5$
$6 - 2 = 4$
$6 - 3 = 3$
$6 - 4 = 2$
$6 - 5 = 1$
$6 - 6 = 0$
$6 - 7 = -1$

2. The negative number as a reference point.

Example: 10.1.2.1. The auto ammeter
10.1.2.2. Temperature
10.1.2.3. Opposite directions from a given point

B. Graphical illustration of algebraic addition, three cases

1. Case 1. Two negative numbers



Add -3
$\underline{-4}$ Start from zero and go left for -3, add 4 more places for -4 and you come to -7.

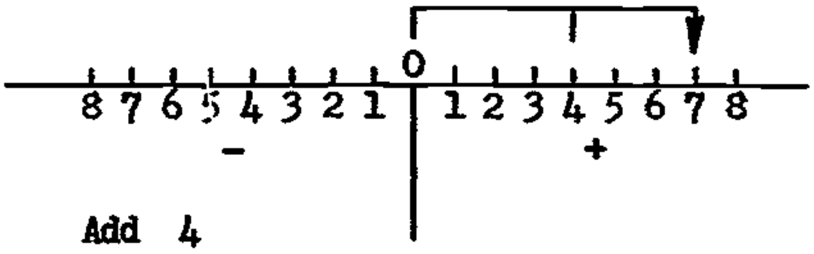
TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS | BASIC ELECTRONIC MATHEMATICS

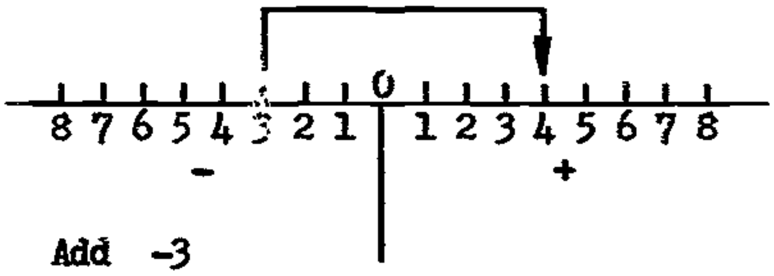
Lesson 9 (Con't.)
Addition and Subtraction of Signed Numbers

2. Case 2. Adding two positive numbers



Add 4
<u>3</u> Locate 4 on the right of zero. Proceed to mark off 3 more places to the right of this point. Answer is 7.

3. Case 3. Adding a positive number to a negative number



Add -3
<u>7</u> Locate -3 on graph. Proceed 7 steps to the right in direction going positive. Answer is 4.

C. Rule—Case 1 and 2, numbers having like signs. Find the arithmetical sum of the absolute number value and affix the common sign.
Example: $4 + 3 = 7$ and $-4 + -7 = -11$

D. Rule—Case 3, numbers having unlike signs. Find the numerical difference of the absolute number value and affix the sign of the greater number.
Example: $-4 + 8 = 4$ and $-18 + 7 = -11$

E. Addition of numbers having like terms

1. Rule—Add the numerical value algebraically and affix the common term.

   a. Example: \$5 + \$3 = \$8

   5 eggs + 8 eggs = 13 eggs (=baker's doz.)

   But, 5 apples + 2 pears = 5 apples + 2 pears
   unless the form is changed and a new name applied.

   Thus, $5a + 8a = 13a$ but, $4x + 2y = 4x + 2y$

F. Summarizing—Only like terms can be added by summing the numerical co-efficients.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS | BASIC ELECTRONIC MATHEMATICS

Lesson 9 (Con't.)
Addition and Subtraction of Signed Numbers

II. Subtraction

A. Stress the use of the graph method. The student is finding a difference.

Rule—Change the sign of the subtrahend and add algebraically.

B. Four general cases, work examples of each on the board.

1. Positive from a positive.

2. Negative from a positive

3. Negative from a negative

4. Positive from a negative

C. Have the students make up several problems and work as a group.

III. Homework (current) Assignment: Read pages 308-310. Work the problems on pages 309 and 310 by subtraction in reference 1.

IV. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Work the test on pages 31, 32, 33 and 34 on both sides in reference 2.

V. Advanced Assignment: Read pages 156-162 to Job 7.8. Work the problems on pages 158, 160, 161 and 162 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 9

Addition of Sign Numbers

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

In lesson 9 we concern ourselves not only with signs of operation, but with signs of the number. Understanding of graphical method is most important. If a student fully understands this method of solution, the solving of AC circuits will be much easier.

New Terms:

1. Zero
2. Postive number
3. Negative number

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 308-310 to Graphs.

3. Work the problems on pages 308, 309, & 310.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 308-310.

2. Work the problems on pages 309 & 310 by subtraction.

3. Read pages 156-162 to job 7.8.

4. Work the problems on pages 158, 160, 161, & 162.

Lesson 10
Sign Numbers—Multiplication and Division

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.
2. Hart, Walter W., Workbook for First Course in Algebra. D. C. Heath and Company, Boston.

I. Multiplication

A. Like signs. Rule—The product of two numbers having like signs is positive.

1. $(+2) \times (+3) = 6$ (plus sign understood)
2. $(+2) \times (+8) = 16$
3. $(-A) \times (-B) = AB$
4. $(-3A) \times (-4B) = 12\ AB$

B. Unlike signs. Rule—The product of two numbers having unlike signs is negative.

1. $(-2) \times (6) = -12$

   $(+2) \times (-6) = -12$

   $(-A) \times (B) = -AB$

   $(-3A) \times (+4AB) = -12A^2B$

C. Long problems with positive and negative numbers

1. Apply the above rules (A and B) successively.

D. Co-efficients and exponents, review.

1. Rule—Multiply first the co-efficient determining the sign as above, then the literal numbers, obeying the laws of the co-efficient.

   Example: $(-3A) \cdot (2A) \cdot (6B) \cdot (8B) \cdot (C) =$

   $(-3)\ (2)\ (6)\ (8)\ (A)\ (A)\ (B)\ (B)\ (C)$

   $(-288)\ (A^2)\ (B^2)\ (C) = -288\ A^2B^2C$

85

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 10 (Con't.)

Sign Numbers—Multiplication and Division

II. Division

A. The teacher should be sure that the student understands the development of the rules for sign numbers by graphical means.

B. Like signs. Rule—The quotient of two numbers having like signs is positive.

Example: $-8 \div -2 = 4$

$8 \div 2 = 4$

$-A \div -B = A/B$

C. Unlike signs. Rule—The quotient of two numbers having unlike signs is negative.

Example: $-8 \div 2 = -4$

$8 \div -2 = -4$

$6A \div -2B = \frac{-3A}{B}$

D. General procedure. Rule—Divide the numerical numbers first and affix the sign from the above rules (B and C). Then divide (or indicate) the literal numbers, obeying all the laws of exponents.

E. Indication of division

1. The fraction is an indicated division. Thus: $2/3$ means $2 \div 3$

$4/17$ means $4 \div 17$, etc.

Examples for D and E:

$$\frac{-6A^4}{2A^3} = \frac{-3A^4}{A^3} = -3A$$

$$\frac{-6A^3B^4C^8}{2A^3B^8C^8} = \frac{-3}{B^4} = -3B^{-4}$$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 10 (Con't.)
Sign Numbers—Multiplication and Division

F. The vinculum

1. The vinculum is a sign of grouping. An operation that is involved in a fraction is subject to the vinculum as a sign of grouping.

$$\frac{3A - 4B}{5A - 2B}$$

G. Other signs of grouping: ( ) parenthesis, [ ] brackets, { } brace

H. No sign of grouping can be removed if preceeded by a - (minus) sign without first changing the sign of the expression within.

Example: $43AB - (-42CB) = 43AB + 42CB$ This can be visualized by placing the subtrahend in this case beneath the minuend. Another example: $6A - (42 - AB) (23 - 2B) - (3C - 2A) = 6A - 42 + AB + 23 - 2B - 3C + 2A$

III. Discussion of Previous Assignment

IV. Homework (current) Assignment: Read pages 308-310. Use the problems on pages 309 and 310 for multiplication and division in reference 1.

V. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Work the test on pages 35, 36 and 42, also back of page 42 in reference 2.

VI. Advanced Assignment: Read pages 53-65. Work selected problems on pages 54, 57, 58, 64, 65 and 66 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS BASIC ELECTRONIC MATHEMATICS

Lesson 10
Sign Numbers--Multiplication and Division

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

In lesson 9 and 10 we became concerned with signs of the number as compared with signs of operation. In lesson 13 we will continue with the study of the sign of the number. Students in the past have had a great deal of trouble with multiplication and division of sign numbers. Perhaps at one time you memorized rules for these operations. If you have forgotten those rules, this should illustrate to you that a more thorough knowledge of the number system be used. In this lesson we invite you again to use your graphical method of solution. It will be slower at first, but once mastered you will have a firm foundation and never will be embarrassed by being caught without your rules.

Assignment: Use reference listed above.

1. Read pages 308-310.

2. Use the problems on pages 309 and 310 for multiplication and then division.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 308-310.

2. Use the problems on pages 309 and 310 for division.

3. Read pages 53-65.

4. Work selected problems on pages 54, 57, 58, 64, 65 and 66.

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 11

Electrical Power--Application of Exponents

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. The meaning of the exponent

1. Parts of the exponential number

3 exponent n exponent
2 base A base

2. The exponent. Definition. The exponent denotes the number of times the base is to be used as a factor, called the power.

a. Example $2^3 = 2 \times 2 \times 2 = 8$ $\qquad A^4 = A\cdot A\cdot A\cdot A$

B. Law of exponent in multiplication

1. To multiply two numbers having a common base but different exponents, add the exponents and affix the common base.

Proof: $A^3 = A^1\cdot A^1\cdot A^1 = A^{1+1+1} = A^3$

Thus $A^n \cdot A^m = A^{n+m}$ and $2\ A^3$ times $6\ A^4 = 12\ A^7$

C. Law of exponents in division

1. To divide two numbers having a common base but different exponents, subtract the exponent of the number in the divisor from the exponent of the number in the dividend and affix the common base.

Proof: $A^3\,\overline{)\,A^6} = \frac{A\ A\ A\ \cancel{A}\ \cancel{A}\ \cancel{A}}{\cancel{A}\ \cancel{A}\ \cancel{A}} = A^3$ or $\frac{A^6}{A^3} = A^{6-3} = A^3$

and $\frac{4A^6}{2A^2} = 2\ A^4$

D. The negative exponent

1. $\frac{A^4}{A^5} = \frac{A\cdot A\cdot A\cdot A}{A\cdot A\cdot A\cdot A\cdot A} = \frac{A^{-1}}{A}$ or $A^{4-5} = A^{-1}$ thus $A/A^2 = A^{-2}$ and $A/A^n = A^{-n}$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 11 (Con't.)
Electrical Power--Application of Exponents

E. The zero exponent

1. $\frac{A^3}{A^3} = \frac{\cancel{A}\cdot\cancel{A}\cdot\cancel{A}}{\cancel{A}\cdot\cancel{A}\cdot\cancel{A}} = \frac{1}{1} = 1$ or $A^{3-3} = A^0 = 1$

   Any number to the zero power, except 0 is equal to 1.

F. The fractional exponent

1. Development $A = A^1$ The exponent can be factored by the laws of multiplication of exponents.

   Thus: $A = A^1 = A^{\frac{1}{2}+\frac{1}{2}} = A^{\frac{1}{2}} \cdot A^{\frac{1}{2}}$

   and $A^1 = A^{\frac{1}{4}+\frac{1}{4}+\frac{1}{4}+\frac{1}{4}} = A^{\frac{1}{4}} \cdot A^{\frac{1}{4}} \cdot A^{\frac{1}{4}} \cdot A^{\frac{1}{4}}$

G. The power of a power

1. To raise an exponent to an "n" power, multiply the exponent by that number.

   $(A^3)^2 = A^3 \cdot A^3 = A^{3+3} = A^6$ or $(A^3)^2 = A^{3\times2} = A^6$

   $(A^m)^n = A^{mn}$

H. Powers of 10, special exponentials

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 156-162 to Job 7.8. Work the problems on pages 158, 160, 161 and 162 in reference 1.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 11
Electrical Power—Application of Exponents

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

When working with numbers, we will often use the same number as a factor many times. There is a short method of expressing this situation. This method uses the exponent. Multiplication and division using the exponent is tricky at first, but will save much time in the manipulation of numbers.

New Terms:

1. Exponent
2. Base

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 156-162 to Job 7.8.

3. Work the problems on pages 158, 160, 161 and 162.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 162-173.

2. Work selected problems from pages 162, 171, 172 and 173.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 12
Electrical Power—Further Study in Exponents

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. The radical defined

1. The radical is a different method of expressing a fractional exponent.

Example: $A^{\frac{1}{2}}$ $\sqrt[2]{A}$ The two is omitted ordinarily, and the index number is understood as 2 unless otherwise specified.

$$\underset{\text{index}}{n}\sqrt{\overline{A}}\;\text{—radical}\qquad \xleftarrow{\text{vinculum}}$$

index—$\sqrt[n]{A}$ —radical ← vinculum

2. In a fractional exponent having a numerator other than 1, the numerator is expressed as the power of the radicand while the denominator is expressed as the index number of the radical.

Example: $A^{3/7}$ $\sqrt[7]{A^3}$ $A^{m/n}$ $\sqrt[n]{A^m}$

B. Multiplication

1. Radicals having a common radicand but unlike indexes

Example: $\sqrt[9]{8}$ $\sqrt[8]{8}$

Consider as fractional exponents:

$\sqrt[9]{8}$ $\sqrt[8]{8}$ $8^1/9$ $8^1/8$ $8^8/7^2$ $8^9/7^2$ $8^{17}/7^2$ $\sqrt[7^2]{8^{17}}$

C. Arithmetical square root

1. Demonstration of problem and procedure $\sqrt{482.34}$ = 21.96 answer—21.96

$$\begin{array}{rr}
 & 21.96 \\
 & \sqrt{482.34} \\
 & \underline{4} \\
41 & 82 \\
 & \underline{41} \\
429 & 4134 \\
 & \underline{3861} \\
4386 & 27300 \\
 & \underline{26316}
\end{array}$$

Electrical Power—Further Study in Exponents

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

In lesson 11 we become familiar with the whole numbered exponents. In lesson 12 we will work with the fractional exponent. This is one method of illustrating root problems. Sometimes it is convenient to express roots using the radical while other times the exponent makes the problem seem easier. The easiest way is always the way the student understands at the moment the problem is to be solved. Once a problem has been solved, however, we should review our methods to see if we might not be able to improve our methods for next time. This often entails learning new skills and many hours of practice.

New Terms:

1. Radical
2. Root

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 162-173.

3. Work selected problems from pages 162, 171, 172 and 173.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 308-310.

2. Use the problems on pages 309 and 310 for multiplication.

Lesson 13
Electrical Measurement

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Discuss the kilowatt hour and compute the cost of operation of some home appliances.

B. Discuss meter scales. Obtain as many V. O. M. as possible and practice reading the scales. A variable power supply would be a great help.

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 53-65. Work the selected problems on pages 54, 57, 58, 64, 65 and 66 in reference 1.

IV. Advanced Assignment: Read pages 67-75. Work the problems on pages 71, 72 and 74 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 13
Electrical Measurement

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

A series circuit is a circuit such that the current has only one path to follow. It is not a circuit unless there is a source of E. M. F., a load, a set of conductors, and some means of controlling the current flow. Lesson 13 is concerned with measuring its units, E. M. F., current and load.

New Terms:

1. Kilowatt hour
2. Meter sensitivity
3. Full scale
4. Multi-range

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 53-65.

3. Work the selected problems on pages 54, 57, 58, 64, 65 and 66.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 67-75.

2. Work the problems on pages 71, 72 and 74.

BASIC ELECTRONIC MATHEMATICS

Lesson 14
Series Circuits

Reference:

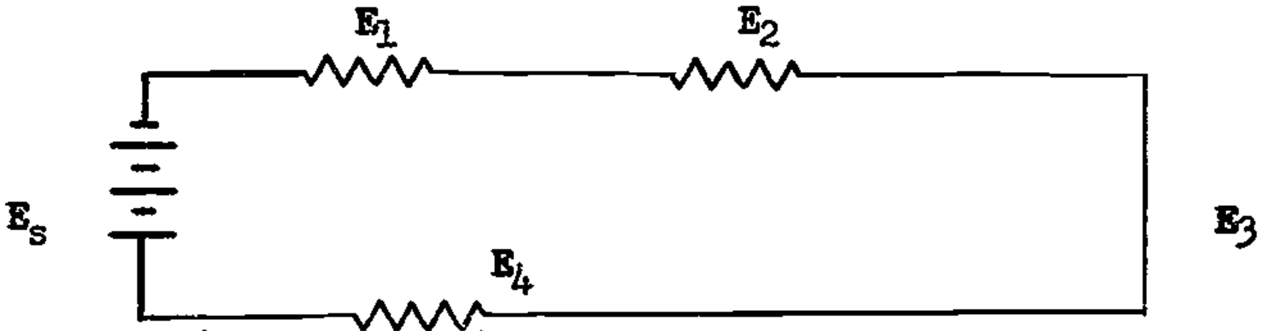
1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Law of current. The current in the series circuit is the same throughout any portion of the circuit.

1. This is logical as there is but one single path by definition of a series circuit. Draw illustration.

B. Law of voltage. The sum of the voltage drops throughout the parts of the series circuit is equal to the supply voltage. Or stated differently, the algebraic sum of all the voltage drops in a series circuit equals zero (Kirchoff's Law).



Starting from A (above circuit)

$$E_1 + E_2 + E_3 + E_4 - E_s = 0$$

E_s is minus because in our trace of the circuit it is opposite polarity to all of the other voltages.

C. Law of resistance in the series circuit

1. Resistance, total of the series circuit, has already been established as equal to total voltage over total current. Since the current is equal in all parts of the circuit then the following relationship (circuit of B) is noted:

$$\frac{E_s}{I_s} = \frac{E_1}{I_s} + \frac{E_2}{I_s} + \frac{E_3}{I_s} + \frac{E_4}{I_s}$$

Then by inspection it is obvious that $R_T = R_1 + R_2 + R_3 + R_4 + \ldots R_n$

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 14 (Con't.)
Series Circuits

D. Current control by adding resistance

1. When the voltage of the source and the resistance of the load is fixed, rated current of the load can be controlled by adding resistance.

A. Problem. A shunt wound motor field draws 2 amps with a 40 ohm resistor in series, the voltage of the source being 150 volts. To increase the speed by 20% the field current must be reduced to 1.5 amps. What change is necessary?

(1) Draw diagram first.
(2) Volts across R of 40 ohms by $E = IR$
$E = (40)\ (2) = 80$ volts
(3) Volts across field before change by Kirchoff's voltage law
150 volts = 80 volts + E_f
$E_f = 150 - 80 = 70$ volts
(4) $R_{field} = \frac{E \text{ source}}{I \text{ before change}} = \frac{70}{2} = 35$ ohm
(5) New current required 1.5 amps. New voltage across field = $(1.5)\ (35) = 52.5$ volts.
(6) New voltage across R (Kirchoff's Voltage Law)
150 volts = 52.5 volt + E_R
$E_R = 150$ volts $- 52.5$ volts $= 97.5$ volts
(7) New R_{field} for change of current $R_f = \frac{E}{I} = \frac{97.5}{1.5} = 65$ ohm
(8) Change required $65 - 40 = 25$ ohm

E. Voltage control by adding resistance

1. When the source voltage and allowed load voltage are fixed, the load voltage can be lowered by adding resistance.

A. Problem example: Source – 6 volts
Load – filaments 1.5 volts, 45 amp.
Resistance required?

Solution

TEACHERS OUTLINE

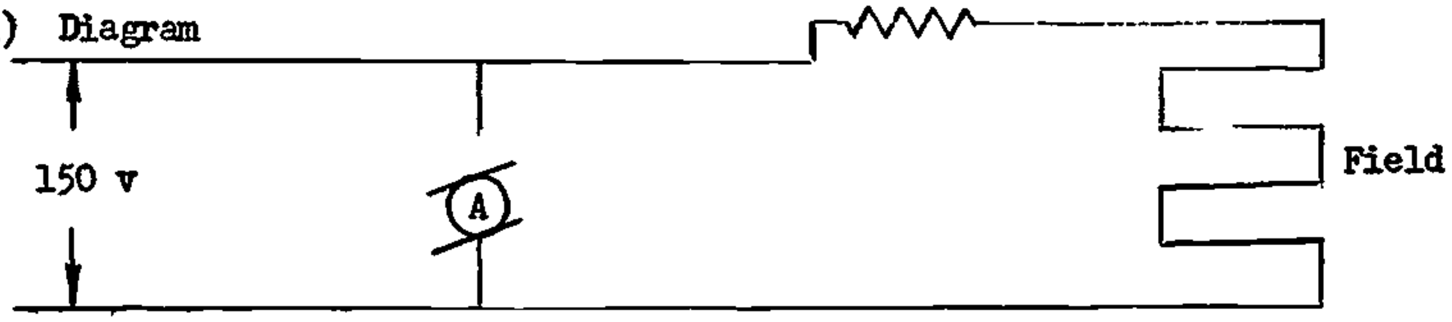
VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 14 (Con't.)
Series Circuits

(1) Diagram



(2) R must drop ? volts by Krichoff's Voltage Law. $6 = 1.5v + E_R$

$E_R = 6 - 1.5 = 4.5$ volts

(3) $R = E/I = 4.5v/.45a = 10$ ohm

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 67-75. Work the problems on pages 71, 72 and 74 in reference 1.

Lesson 18

Percentages

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Meaning of per cent

1. Definition—literally, the word per cent means by the hundred. Thus, the word means:
    a. Number of units considered out of one hundred such units.
    b. Number of equal parts considered out of one hundred such equal parts of the whole.

B. The whole number per cent designates how many 1/100 parts.

1. 6% means 6 equal parts out of one hundred equal parts: therefore, 6% = .06 or 6/100 of the whole.

C. Per cent to decimal and decimal to per cent

1. If 6% = .06 = 6/100, then to change a per cent to a decimal, divide the % by 100. (Move decimal two places to left)

2. To change a decimal to per cent, multiply by 100.

D. Expressions

1. What per cent is M of N? Solution: divide N by M.
Thus, what per cent is 14 of 28? Solution: 14/28 = .5 = 50%

2. Per cent change

a. A resistor, cold, measures 42 ohms. Because of its temperature coefficient it measures 48 ohms, when carrying rated load current.
What per cent change does this represent?

Solution:
1. Subtract 42 ohms from 48 ohms.
2. This gives actual change in ohms.
3. Compare the change of ohms to the original resistance.
Thus, 6 ohms (change) is what per cent of 42 ohms.
$42\overline{)\,6\quad} = .14$

If the resistor had been 100 ohms, the actual change of resistance would have been 14 ohms.

Lesson 18 (Con't.)

Percentages

3. Per cent of N

(a) To find the per cent of N, change the designated per cent to a decimal and multiply times N.

Example: What is 8% of $600.00.

8% = .08 (.08) ($600) = $48

II. Homework (current) Assignment: Read pages 218-226. Work the selected problems from pages 218-226 in reference 1.

III. Discussion Topic: Efficiency

Often one needs to know the output or the input of a certain device that operates at a certain efficiency. Lesson 18 will give us practice in computing these values.

IV. Homework (current) Assignment: Read pages 230-234. Work the problems on pages 232-234 in reference 1.

V. Advanced Assignment: Read pages 94-102. Work the problems on pages 98, 99, 101 and 102 in reference 1.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 20
Parallel Circuits

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

When resistances are connected in parallel, the total resistance is always less than the resistance of any branch. When resistances are added to a circuit in parallel, they merely provide extra paths for the current to flow. Each extra path will draw its own current from the voltage source, increasing the total current drawn. But resistance is that quality of a circuit which attempts to stop the flow of current. If the addition of a resistance increases the current, then this resistance must be reduced to total resistance.

New Terms:

1. Reciprocal
2. Assumed voltage

Assignment: Use reference listed above.

1. Write definitions for the above terms.
2. Read pages 111-117.
3. Work the problems on pages 115, 116 and 117.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. We have studied series circuits and parallel circuits individually. In practice we will more often find a combination of these circuits. A student here must apply all that he knows about both types of circuits. The instructor should review simple, series, and parallel circuits. Signal tracing is a must from this point on. Electron flow should be traced through each resistor in each problem.

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 127-138. Work the selected problems on pages 133, 134, 136, 137 and 138 in reference 1.

IV. Advanced Assignment: Read pages 148-157 and 170-173. Work the selected problems on pages 150, 151, 152, 153, 154, 155, 171, 172 and 173 in reference 1.

Lesson 24
Combination Circuits

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

We have studied both series and parallel circuits. These circuits are often found in simple electrical equipment in their original form. It is more common in electronic equipment to find combinations of these circuits.

New Terms:

1. Series - parallel
2. Parallel - series

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 127-138.

3. Work the selected problems on pages 133, 134, 136, 137 and 138.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 148-157 and 170-173.

2. Work the selected problems on pages 150-155 and 171-173.

BASIC ELECTRONIC MATHEMATICS

Lesson 25
Electrical Power

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Power. Definition—power is work times speed.

1. Horse power - The weight (33,000 lbs.) times distance (1 ft.) times time (1/1 min.)

$$1 \text{ Hp} = \frac{33{,}000 \text{ lb. ft.}}{1 \text{ min.}} = \frac{\text{work}}{\text{time}}$$

2. Electrical power, Basic Equation

Q x E is work done. E is force.
Q is charge going past a certain point.

a. The ampere is defined as 1 coulomb (Q) flow past a certain point in one second (Q/F).

b. $P \frac{(Q) \quad (E)}{F}$ and $Q/F = I \therefore P = IE$

Example: What is the power disipated through a resistor when the measured current is 4A and the voltage drop across the resistor is 8 volts?
$P = IE = 4A \times 8V = 32W$

3. From this defining equation, all other equations for power are developed.

B. Power from other circuit values

1. When resistance and current, only, are known. Basic Formula: $P = EI$

a. Suppose that resistor is one of many in the circuit. It is inconvenient to figure voltage.
b. Resistance is known.
c. Current is known.
d. E is unknown.
e. Substitute known values for E by Ohm's Law. $E = IR$
f. $P = (IR) \ (I) = I^2R$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Lesson 25 (Con't.)

Electrical Power

2. When voltage and resistance, only are known.

   In the same manner substitute in the basic formula ($P = EI$) for the unknown (I).

   By Ohm's Law $I = \frac{E}{R}$

   $$\text{Thus, } P = E(I) = E\left(\frac{E}{R}\right) = \frac{E^2}{R}$$

3. Select problems for demonstration of the above formulas.

C. Other parameters of the circuit can be calculated from the power formulas.

1. $P = EI$ $\qquad I = \frac{P}{E} \qquad E = \frac{P}{I}$
2. $P = I^2R$ Have students derive equations for R and I from this formula.
3. $P = \frac{E^2}{R}$ Have students derive equations for E and R from this formula.

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 148-157 and 170-173. Work the selected problems on pages 150, 151, 152, 153, 154, 155, 171, 172 and 173 in reference 1.

IV. Advanced Assignment: Read pages 174-191. Work the selected problems on pages 176, 177, 178, 179, 181, 182, 184, 185, 189 and 191 in reference 1.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 26

Application of Series and Parallel Circuits

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Units and powers of ten

1. Power of ten, definition by mathematics

   Example: $10^3 = 10 \cdot 10 \cdot 10 = 1000$

   $10^{-2} = 1/100 = .01$

2. Rule--To multiply by 10^n move the decimal point of the multiplicand n places to the right. To divide by 10^n move the decimal point of the dividend n places to the left.

B. Scientific notation

1. When large and cumbersome numbers are to be mathematically manipulated, it is often convenient to express them with scientific notation.

   Examples:
   - a. The government is \$2.5 x 10^{11} in debt.
   - b. There are about 1 x 10^{27} electrons in 1 gram of matter.
   - c. A millimicron is about 4 x 10^{-8} inches in length (about 1/25,000,000 inches)
   - d. The surge current in a pulse welder machine was limited by .8 ohms. What peak current resulted when the capacitors were charged to 4800 volts?
     Solution by scientific notation

     (1) .8 ohms = 8×10^{-1} ohms

     (2) 4800 volts = 4.8×10^4 volts

     $$I = \frac{E}{R} \quad \frac{4.8 \times 10^4}{8 \times 10^{-1}} = 0.6 \times 10^5 \text{ amp.} = 6. \times 10^4 \text{ amps} = 6000 \text{ amp.}$$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 26 (Con't.)

Application of Series and Parallel Circuits

2. Rules for changing to scientific notation

   a. To convert a number greater than 10 to scientific notation, move the decimal point to the left until the number is a whole unit between one and ten (this is the same as dividing by 10 to the plus whole n power), then affix a multiplier of 10 to the plus n whole number power.

   Thus, (1) $3.300 = \frac{3300}{10^3} \times 10^3 = 3.3 \times 10^3$

   (2) $46324 = \frac{46324}{10^4} \times 10^4 = 4.6324 \times 10^4$

   b. To convert a decimal to scientific notation, move the decimal point to the right until the number is a whole number between 1 and 10 (this is the same as multiplying by 10 to the plus whole number) then affix a multiplier of 10 to the minus whole number power.

   Example 1. $.0032 = .0032 \times 10^3 \times 10^{-3} = 3.2 \times 10^{-3}$

   Example 2. $.0000483 = .0000483 \times 10^5 \times 10^{-5} = 4.83 \times 10^{-5}$

C. Units, their prefixes

1. Units are altered in value by prefixes which have mathematical meaning. Students are urged to learn the basic prefix values, and never to resort to "conversation tables".

   a. Milli = 1/100 or 10^{-3}
   b. Deci = 1/10 or 10^{-1}
   c. Micro = 1/1,000,000 or 10^{-6}
   d. Millimicro = 1/1000 of micro of $\frac{1}{1,000,000,000} = 10^{-2}$
   e. Micro Micro = 10^{-12}
   f. Picro = Micro Micro = 10^{-12}

2. Have student practice in class. Stress the importance of constant practice and application.

II. Discussion of Previous Assignment

Lesson 27

Application of Series and Parallel Circuits--Ammeters

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Circuit application. The ammeter as a voltmeter.

1. The voltmeter is basically an ammeter with enough resistance added in series to cause the voltage required for full scale (or any point intermediate) deflection to increase.

2. To use an ammeter as a voltmeter adjust the series resistance to give the desired full scale voltage reading with full scale current.

a. Example: It is desired to make a 0 to 1 ma millimeter read 100 volts full scale. Its resistance is 25 ohms. What value of series multiplication is required?

Solution: Given $R_m = 25$ ohms

F_s ma $= 1$ ma

$F_s = 100$ volts

$$R_s = \frac{100 \text{ volts}}{.001} = 100{,}000 \text{ ohms}$$

The meter drop was so insignificant that it was ignored. (.025 volts)

B. Extending the voltmeter range

1. Voltmeter sensitivity. A voltmeter's sensitivity is a measure of the amount of loading the voltmeter imposes on the source. Sensitivity is expressed as ohms per volt. High sensitivity R/volt is desirable to prevent error in reading.

a. Example: What is the sensitivity of a meter which has a resistance of 5 megs. and a full scale reading of 100 volts?

$$\frac{R}{V} = \frac{R_t}{E_t} = \frac{5 \times 10^2}{1 \times 10^2} = \frac{5 \times 10^4}{V} = \frac{50{,}000 \text{ ohm}}{\text{volt}}$$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 27 (Con't.)
Application of Series and Parallel Circuits--Ammeters

2. Multipliers. A voltmeter multiplier is a resistor added to the resistance of the meter to increase the range of the meter.

   a. Let's suppose our meter which has a sensitivity of 1000 ohm/volt reads 300 volts full scale. What resistance must be added to give a full scale reading of 600 volts?
   Solution:
   (1) Meter resistance $R_m = \frac{300 \text{ volt}}{1} \times \frac{1000}{\text{volt}} = 30{,}000$ ohms

   (2) F_s ma (full scale current) $= \frac{300 \text{ volts}}{300000 \text{ ohm}} = .001$ amp or

   $F_s \text{ ma} = \frac{1 \text{ volt}}{1000 \text{ ohm}} = .001$ amp

   (3) Total resistance $R_t = \frac{600}{.001} = 600{,}000$

   (4) Resistance to add = 600,000 - 300,000 = 300,000 ohms

3. **Deviation of a formula for multipliers.** From the problem above, it can be seen that to read 5 times as much voltage we would have to add resistance until the total is 5 times greater (meter resistance + multiplier).

   R_s = (multiplier factor x R_m) - R_m
   R_s = resistance to add as multiplier
   R_m = resistance of meter or resistance usually there

   But since the factor (MF) is a number times the meter resistance already there, we can rewrite the formula.

   $$R_s = (MF - 1) \times R_m$$

   a. Give example pages 203 of reference 1.

4. True value. When an ammeter or voltmeter has been extended with a shunt or multiplier, the value apparent on the dial must be multiplied by a factor determined by the shunt or multiplier to determine the true value of current. The general practice in industry is to multiply by factors of 10 or powers of 10, or, when this is not possible—to change the dial face.

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 28

Application of Series Circuits and Parallel Circuits—Voltmeters

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Extending the range of an ammeter

1. Basic Ammeter. Description - An ammeter is essentially a delicately pivoted coil connected to a pointer (indicator). The coil causing movement of the meter by exerting its force against the fixed field of a stationary coil or the field of a permanent magnet. The amount of deflection is in proportion to the amount of current through the field.

2. Since the coil is delicate, its current must be limited. This makes necessary the use of shunts to multiply the current ability.

3. The meter multiplier
   a. F_s ma is the full scale current of the ammeter
   b. The diagram

4. The practical methods. The meter calibration department in a laboratory proceeds as follows:
   a. The current for full scale deflection is set to coincide with the indicated value F_s on the meter face.
   b. The voltage for F_s is read with a K_2 or K_3 voltage potentiometer.
   c. Since the ammeter and the shunt are in parallel, the voltage across the shunt and the meter are the same at F_s (call it E_m).
   d. A shunt resistance will have to be set to carry the shunt current (I_s) in excess of the meter current (I_m) at F_s.
   e. Shunt resistance will then be calculated as $R_s = \frac{E_m}{I_s}$

5. When the resistance and range of the meter is known, the shunt resistance can be calculated by the formula.

Where $I_m = F_s$ ma

R_m = meter R

$$R_s = \frac{I_m \quad R_m}{I - I_m}$$

I = Maximum range of current for meter and shunt

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 28 (Con't.)

Application of Series Circuits and Parallel Circuits—Voltmeters

6. From the above formula, another formula can be developed.

Old formula: $R_s = \dfrac{I_m \quad R_m}{I - I_m}$

$I_m = F_s$ ma
$R_m =$ meter R
$I =$ line current

Rewrite the formula: $R_s = (R_m) \quad \dfrac{(I_m)}{I - I_m}$ then invert $\dfrac{I_m}{I - I_m}$

But change the sign of operation to divide (-) to keep from disturbing the equality.

Thus, $R_s = R_m - \dfrac{I - I_m}{I_m}$ separate the term $\dfrac{I - I_m}{I_m}$ by expanding it to

$\dfrac{I}{I_m} - \dfrac{I_m}{I_m}$ then $R_s = \dfrac{I}{I_m} - 1$

If we now define $\dfrac{I}{I_m}$ as the ratio of the line current to the meter current, or thus the multiply factor N of the shunt to its meter then

$R_s = R_m$ where $R_s =$ shunt resistor
$R_m =$ meter resistance
$N = \dfrac{\text{Max. new range}}{\text{Max. old range}}$

II. Discussion of Previous Assignment

Lesson 29

Application of Series and Parallel Circuits—The Bleeder Resistor

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. The "bleeder" is a very important and useful application of power supply circuits serving two important functions.

  1. The bleeder current maintains a finite amount of current through the inductor of the circuit, thereby insuring better voltage regulation because inductance is a function of current.

  2. The bleeder allows various values of voltage to be tapped for different values of current.

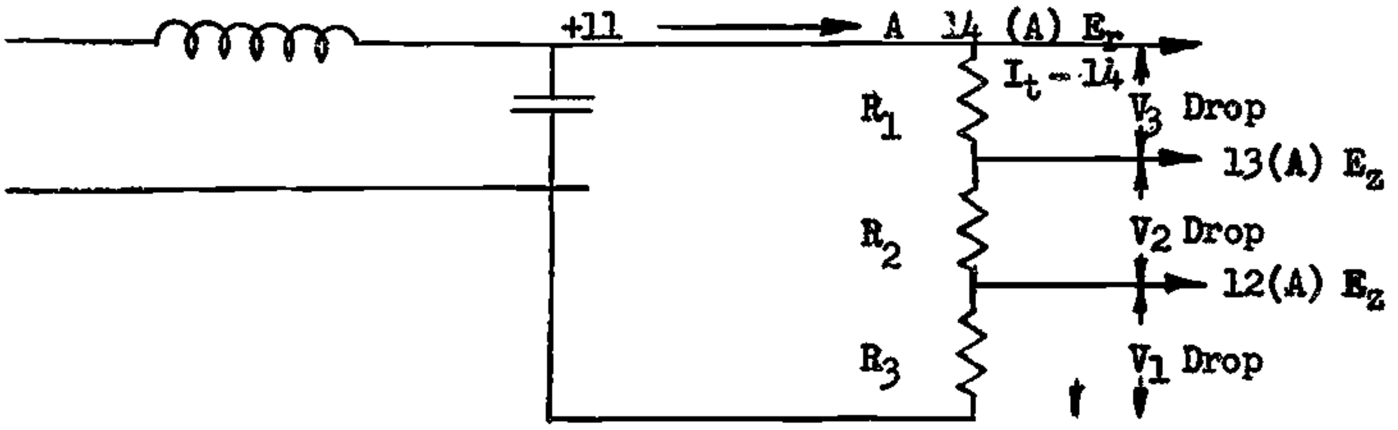
B. A simple procedure for determining exact bleeder values is needed because currents are not equal in all parts of the bleeder.

  1. Procedure:

    a. The bleeder current should be (90% of the p.t. current rating) - (the required current of all of the loads). This value must be established first.

    b. Assume conventional current flow from the top of the drawing (positive of the power supply).

    c. Make a drawing of the bleeder circuit and the functions.



TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 29 (Con't.)

Application of Series and Parallel Circuits--The Bleeder Resistor

d. It is total current entering function A. 14 leaves function A. Thus, the current left through R_1 section is $I_t - 14$. Then the resistance required will be the voltage that was dropped divided by the current or

$$\frac{E_t - E_3}{I_t - 14} = \frac{V_3 \text{ drop}}{I_t - 14} = R$$

e. The next section in the same manner will be

$$\frac{E_3 - E_z}{I_t - 14 - 13} = \frac{V_z \text{ drop}}{I_t - 14 - 13} = R$$

f. In the last section, we must drop what voltage is "left over". Thus,

$$R_3 = \frac{E_t - E_3 - E_z}{I_t - 14 - 13 - 12} = \frac{V_1 \text{ drop}}{I_t - 14 - 13 - 12}$$

BASIC ELECTRONIC MATHEMATICS

Lesson 30

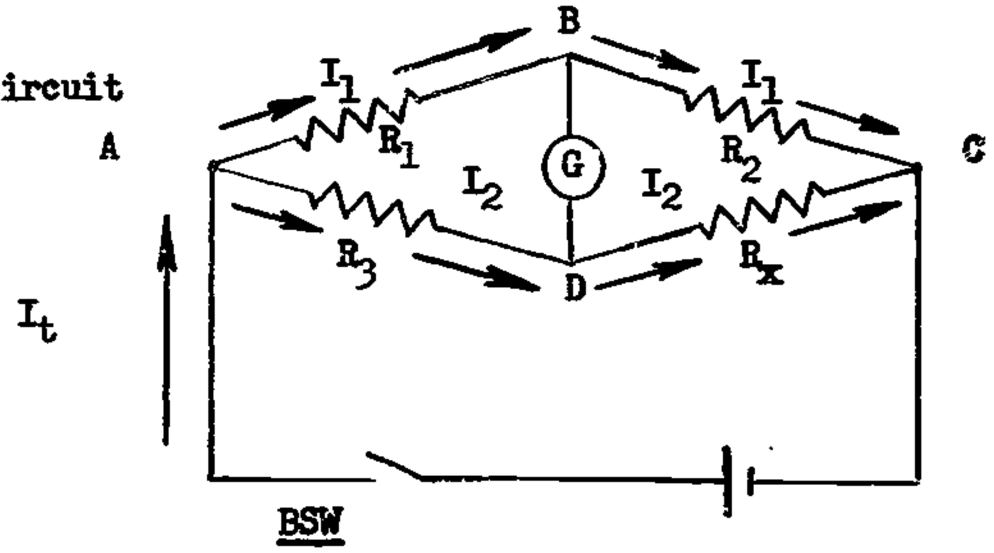
Application of Series and Parallel Circuits
The Wheatstone Bridge and Kirchoff Voltage Law Problems

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. The Wheatstone bridge circuit



1. R_3 is usually made adjustable.
2. The bridge is adjusted to balance by adjusting R_3 until no current flows in the galvanometer.
3. Then, the voltage from A to B = voltage from A to D or $I_1 \times R_1 - I_2 \times R_3$.
4. In the same manner, voltage of B to C = the voltage from D to C or $I_1 \times R_2 = I_2R_x$.
5. Then, dividing the one equation by the other will give the bridge quotient. Thus:

$$\frac{I_1 \times R_1 - I_2 \times R_3}{I_1 \times R_2 - I_2 \times R_x} \quad \text{or} \quad \frac{R_1 = R_3}{R_2 = R_x}$$

B. A Kirchoff Law problem

1. Review Kirchoff's Laws of current and voltage.

   a. Voltage The algebraic sum of all voltages within a loop is equal to zero.

   b. Current The algebraic sum of all of the currents at a junction is equal to zero.

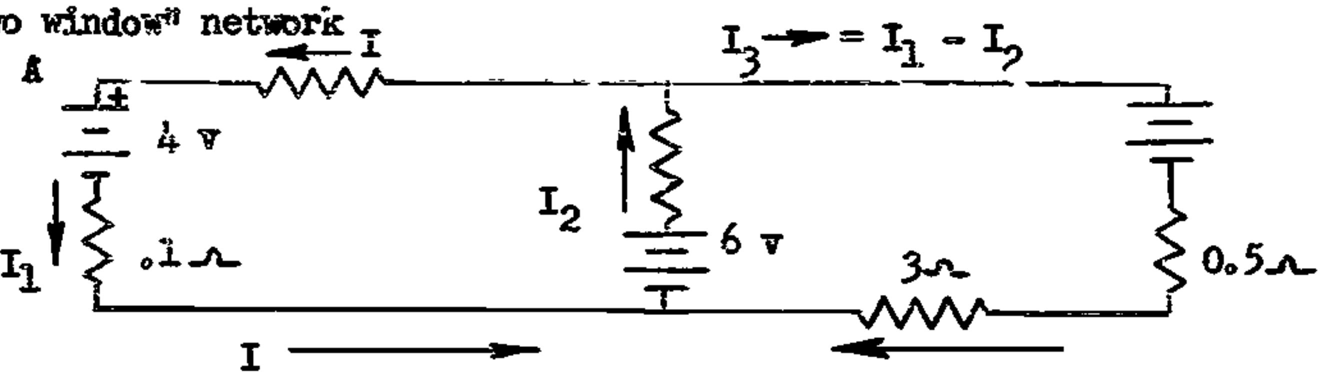
TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

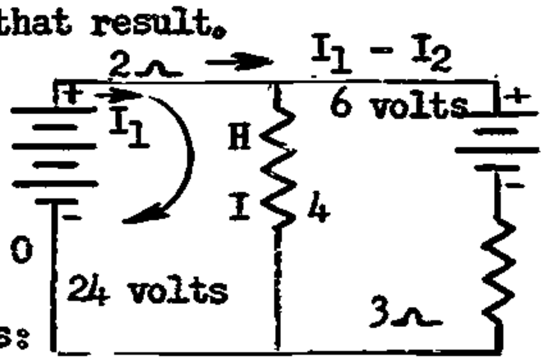
Lesson 30 (Con't.)
Application of Series and Parallel Circuits
The Wheatstone Bridge and Kirchoff Voltage Law Problems

2. A "two window" network



a. Outline for solution of network

(1) Draw and label a diagram being especially careful of polarities of sources.
(2) Assume a direction of current flow. Try to be logical, but remember that a negative answer will indicate when the assumption was incorrect. When possible, indicate one current in terms of others by Kirchoff's Law of currents.
(3) Trace a path throughout the circuit by Kirchoff's Law of voltages. Trace as many paths as there are unknowns; be sure to include a part of the circuit not previously included for each part traced.
(4) Solve simultaneously the known equations that result.



Example:

Equation 1: $2I_1 + 4I_2 - 24 = 0$

2: $2I_1 + 6 + 3(I_1 - I_2) - 24 = 0$

Solution by addition and subtraction gives:

$I_1 = 5.54$ amps

$I_2 = 3.23$ amps

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 212-217. Work the problems on pages 214, 215 and 216 in reference 1.

IV. Advanced Assignment: Read pages 235-245. Work the selected problems on pages 237-245 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 30

Application of Series and Parallel Circuits
The Wheatstone Bridge and Kirchoff Voltage Law Problems

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

Now for some fun. Here is a practical place for you to use your mathematics and electronics. Kirchoff's Laws can provide many hours with popcorn before the fire.

New Terms:

1. Kirchoff
2. Bridge
3. Galvanometer
4. Branch

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 212-217.

3. Work the problems on pages 214, 215 and 216.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 235-245.

2. Work the selected problems on pages 237-245.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 31
Electrical Energy

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. **Discussion Topics:**

A. Lesson 31 is more practice in computing the cost of operation of electrical devices. Some practical problems from home and industry would make this lesson much more interesting.

II. **Discussion of Previous Assignment**

III. Homework (current) Assignment: Read pages 235-245. Work the selected problems on pages 237, 238, 239, 240, 241 and 245 in reference 1.

IV. Advanced Assignment: Read pages 246-258 to Job 11-4. Work the selected problems on pages 246, 247, 250, 251, 254, 256, 257 and 258 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 31

Electrical Energy

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

The electronic technician will be called upon to convert from mechanical to electrical energy and power. He will also have to compose cost of operation, wire size, and fuse sizes for various electrical and mechanical devices.

New Terms:

1. Mechanical energy
2. Electrical energy

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 235-245.

3. Work the selected problems on pages 237, 238, 239, 241 and 245.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 246-258 to Job 11-4.

2. Work the selected problems on pages 246, 247, 250, 251, 254, 256, 257 and 258.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 32

Resistance of Wire—Ratio and Proportion

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

   A. Ratio

      1. Definition--the product or quotient comparison of one number to another.

         a. Examples:

            (1) The Jones' have 3 times as much as we do. (3:1) or 3/1
            (2) Pulley A is 9 inches in diameter. Pulley B is 2 inches in diameter. Therefore, pulley A is $4\frac{1}{2}$ times larger in diameter than pulley B.

      2. Comparisons can be made only when the terms are alike. The example below shows how to make a proper comparison.

         a. Example:

            (1) The ratio $\frac{\$2}{1\text{¢}} = z$ is incorrect, but if it is changed from $\frac{\$2}{1\text{¢}}$ to $\frac{200\text{¢}}{1\text{¢}}$ it is correct. It would be written $\frac{\$2}{1\text{¢}} = \frac{200\text{¢}}{1\text{¢}}$

   B. Proportion

      1. A proportion is the expression of equality of two or more ratios.

         a. Direct proportion. When two interdependent quantities have a relationship such that when the one increases or decreases so does the other respectively, then the two quantities are said to be in direct proportion to each other.

            (1) Examples:

               1. General $\frac{M_1}{M_2} = \frac{N_1}{N_2}$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 32 (Con't.)
Resistance of Wire—Ratio and Proportion

2. With a fixed resistor the current with 18 volts applied is 2 amps. What current will result with 54 volts applied? Let (x amps) be the unknown amperage.

$$\frac{18 \text{ volts}}{2 \text{ amps}} = \frac{54 \text{ volts}}{x \text{ amps}}$$

$$18x = 108$$
$$x = 6 \text{ amps}$$

b. Indirect proportion. When two interdependent quantities have a relationship such that the increase or decrease of one will cause a decrease or increase respectively, then the quantities are said to be in inverse proportion to each other.

(1) Examples:

1. General $\frac{M_1}{M_2} = \frac{N_2}{N_1}$

2. When voltage is constant, current flow is inversely proportioned to the resistance of the circuit.

$$I = \frac{E \text{ (constant)}}{R \text{ (variable)}}$$

$$IR = E \quad \text{or} \quad \frac{I_1}{I_2} = \frac{R_2}{R_1} \quad \text{or } I_2 R_2 \quad \text{or } I_1 R_1$$

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 246-258 to Job 11-4. Work the selected problems on pages 246, 247, 250, 251, 254, 256, 257 and 258 in reference 1.

IV. Advanced Assignment: Read pages 258-274. Work the selected problems on pages 263, 264, 266, 268, 270, 272, 273 and 274 in reference 1.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 33
Resistance of Wire and Size of Wire

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

Introduction:

The resistance and the current carrying capacity of wire depends upon the material it is made from, the diameter of the wire, the length of the wire, and even the insulation and physical placement of the wire in the equipment on the job.

New Terms:

1. Ratio
2. Proportion
3. Power factor
4. Inverse
5. Direct
6. N. E. C.
7. Line drop
8. Buss
9. Entrance

Assignment: Use reference listed above.

1. Write definitions for the above terms.

2. Read pages 258-293.

3. Work the selected problems on pages 263, 264, 266, 268, 270, 272, 273, 274, 277, 278, 279, 280, 290, 291, 292 and 293.

Advanced Assignment: Work as much of this assignment as you can before the next meeting.

1. Read pages 138-147.

2. Work the selected problems on pages 142, 145, 146 and 147.

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 34

Combination Circuits--Polynomials

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Adding and subtracting polynomials

1. The rules of addition and subtraction discussed previously still hold true. (Review rules with student participation.)

2. It is necessary to keep like terms under like terms. Remember literal terms are like dollar signs in money problems, like volts, ohms, and current in electronic problems. Thus, perform the numerical algebra according to the rules, then affix the common literal terms.

3. Examples: Addition— $(2x^2 - 3x + 4) + (x^2 + 2x - 5)$ write in this manner

$$\begin{array}{rr} & 2x^2 - 3x + 4 \\ + & -x^2 + 2x - 5 \\ \hline & x^2 - x - 1 \end{array}$$

Subtraction—

$$\begin{array}{rr} & 8R - 63 - 2T \\ \text{less} & 5R - 63 + 2T \\ \hline & 3R \qquad - 4T \end{array}$$

B. Multiplication

1. A polynomial (many-number) with a monomial (one number)

a. Doing it with numbers (48) (3) consider the same as (40+8) (3) thus,

$$\begin{array}{rl} 40+8 & \text{(polynomial)} \\ 3 & \text{(monomial)} \\ \hline 120+24 & \text{or } 144 \end{array}$$

b. With numerial and literal numbers

$(2x+5)$ $(-4x)$

$$\begin{array}{r} 2x + 5 \\ -4x \\ \hline -8x^2 - 20x \end{array}$$

Lesson 34

Combination Circuits—Polynomials

Reference:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

I. Discussion Topics:

A. Adding and subtracting polynomials

1. The rules of addition and subtraction discussed previously still hold true. (Review rules with student participation.)

2. It is necessary to keep like terms under like terms. Remember literal terms are like dollar signs in money problems, like volts, ohms, and current in electronic problems. Thus, perform the numerical algebra according to the rules, then affix the common literal terms.

3. Examples: Addition— $(2x^2 - 3x + 4) + (x^2 + 2x - 5)$ write in this manner

$$\begin{array}{rr} & 2x^2 - 3x + 4 \\ + & -x^2 + 2x - 5 \\ \hline & x^2 - x - 1 \end{array}$$

Subtraction—

$$\begin{array}{rr} & 8R - 63 - 2T \\ \text{less} & 5R - 63 + 2T \\ \hline & 3R \qquad - 4T \end{array}$$

B. Multiplication

1. A polynomial (many-number) with a monomial (one number)

a. Doing it with numbers $(48)\ (3)$ consider the same as $(40+8)\ (3)$ thus,

$$\begin{array}{rl} 40+8 & \text{(polynomial)} \\ 3 & \text{(monomial)} \\ \hline 120+24 & \text{or } 144 \end{array}$$

b. With numerial and literal numbers

$$(2x+5)\quad(-4x)\qquad \begin{array}{r} 2x+5 \\ -4x \\ \hline -8x^2 - 20x \end{array}$$

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS — BASIC ELECTRONIC MATHEMATICS

Lesson 34 (Con't.)
Combination Circuits--Polynomials

2. Multiplication of a polynomial with a polynomial

   a. Consider the product of 48 x 23. We could call it (40 + 8) (20 + 3) or (50 - 2) (18 + 5). Consider it the latter.

$$\begin{array}{r}
50 - 2 \\
\underline{18 + 5} \\
250 - 10 \\
\underline{900 - 36} \\
1150 - 46 = 1104
\end{array}$$

   Test it as 48 times 23.

3. From the above comes the rule--to multiply a polynomial by a polynomial take each term of the multiplier times each term of the multiplicand and combine all terms of the product by addition.

Example:

$$\begin{array}{rl}
 & x^2 - 2xy - y^2 \\
\text{times} & \underline{\quad x - y \quad} \\
 & x^3 - 2x^2y - xy^2 \\
 & \underline{\quad - x^2y - 2xy^2 - y^3} \\
 & x^3 - 3x^2y - 3xy^2 - y^3
\end{array}$$

Lesson 35
Graphs

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.

2. Hart, Walter W., Workbook for First Course in Algebra, D. C. Heath and Company, Boston.

I. Discussion Topics:

A. In the study of AC, vacuum tubes, and transistors, it is much easier to show relationships by graph rather than formulas. The student should be able to choose axis, make divisions and plot curved lines. The E_p I_p curves are a very good example of graphing in electronics. One can predict almost any operational condition of a tube from its set of curves.

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 310-319. Work the problems on pages 316-319 in reference 1.

IV. Advanced Assignment: Test on pages 57, 58 and 59 in reference 2.

Lesson 36

Graphs--Simultaneous Linear Equation

References:

1. Singer, Bertrand B., Basic Mathematics for Electricity, Radio and Television, McGraw-Hill Book Company.
2. Hart, Walter W., Workbook for First Course in Algebra, D. C. Heath and Company, Boston.

I. Discussion Topics:

A. Simultaneous equations: When a problem exists where there are two or more unknowns, a solution of the problem is not possible unless the same number of different but true equations are available. The simultaneous operation of these two equations will produce values of the unknowns that are satisfactory to all of the equations. This is then the proper solution of the equations.

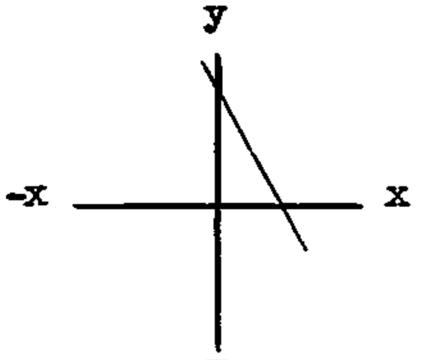
B. Graphical solution

1. The equation $8x + 2y$ equals 14 is a linear equation and its plot on a graph can be accomplished as follows:

a. Find values for y while varying x.

when x equals	then y equals
0	7
-2	15

b. Plot the points obtained.



c. All the points along this straight line are solutions of this equation.

C. Two linear equations will result in a plot with two straight lines. Plotting two straight lines on the same graph will result either in them intersecting in one place or them being parallel. If they intersect, their intersection is a common solution of the two equations.

INDIANA DEPARTMENT OF PUBLIC INSTRUCTION
VOCATIONAL EDUCATION DIVISION
TRADE AND INDUSTRIAL SERVICE

INSTRUCTIONAL MATERIALS LABORATORY
INDIANA STATE COLLEGE
TERRE HAUTE, INDIANA

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

FUNDAMENTALS OF ELECTRONICS

BASIC ELECTRONIC MATHEMATICS

Lesson 36 (Con't.)

Graphs--Simultaneous Linear Equation

1. The instructor should now issue graph paper and have the class plot the following examples:

a. $3x + 2y$ equals 5
   $2x + (-y)$ equals 8

b. $3x + 7y$ equals 8
   $x + y$ equals 0

D. Solution by addition and subtraction

Rules:

1. If necessary, multiply each equation by a number that will make the coefficients of one of the variables of equal absolute value.
2. If these coefficients of equal absolute value have like signs, subtract one equation from the other; if they have unlike signs, add the equations. In this manner you should have a new equation in only one unknown.
3. Solve the new equation in the usual manner.
4. Substitute the value solved for in one of the original equations and then solve for the other unknown.
5. Check these solutions in the remaining original equation. They should satisfy the equation.

a. The instructor should work a problem illustrating this method. Example:

$$\begin{array}{rl} 3x + 2y & \text{equals } 8 \\ -5x - y & \text{equals } 11 \end{array}$$

$$\begin{array}{rl} 3x + 2y & \text{equals } 8 \\ \underline{-10x - 2y} & \underline{\text{equals } -22} \\ -7x - 0y & \text{equals } -14 \end{array}$$

$$x \text{ equals } 2$$

$$\begin{array}{rl} 3(2) + 2y & \text{equals } 8 \\ 6 + 2y & \text{equals } 8 \\ 2y & \text{equals } 2 \\ y & \text{equals } 1 \end{array}$$

$$\begin{array}{rl} 5(2) + 1 & \text{equals } 11 \\ 10 + 1 & \text{equals } 11 \\ 11 & \text{equals } 11 \end{array}$$

II. Discussion of Previous Assignment

III. Homework (current) Assignment: Read pages 310-319. Work the problems on pages 316-319 in reference 1.

IV. Optional Assignment: This assignment should be given only if the student or students need additional practice.

Work tests 57 and 58 and both sides of tests 59 and 60 in reference 2.

Teaching outlines and assignment sheets are used in this revised teaching guide to direct the student in basic A-C D-C theory in a beginning course in electronic technician training. The course was developed by a vocational coordinator and an electronics instructor in cooperation with the staff of the Trade and Industrial Instructional Materials Laboratory. The electronic theory presented includes a study of simple circuits, series and parallel courses, vacuum tube voltmeters, milliammeters, signal generators, scopes, and other instruments. Reactance, capacitance, and other units are also included. Job experiments illustrating theory and use of these instruments are included. Mathematics is introduced at the time it is needed to understand the theory and work the lab experiments. The teacher's outlines include the lesson introduction and objectives, mathematics references, electronics references, and lab experiment titles. The student assignment sheets provide introduction and objectives, references, materials and equipment list, experiment procedures, and study questions. A bibliography of related textbooks is included. This document is available for $1.00 from Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. (HC)

ACKNOWLEDGEMENT

Appreciation and acknowledgement is made to Tom Reckerd, Vocational Coordinator of Bloomington High School and Don Dewar, instructor in the electronics program, who, in coordination with the staff of the Trade and Industrial Instructional Materials Laboratory, made possible the development and printing of this course.

PREFACE

This course in Basic A-C D-C is definitely one of the most important basic electronics courses. The person who intends to become an electronic technician will need to master this course before continuing his technician training. It is in the study of Basic A-C D-C that the fundamental electronic theory and mathematics is presented.

The electronic theory presented in this material includes a study of the following: simple circuits, series and parallel circuits, the use of vacuum tube voltmeters, milliammeters, signal generators, scopes and other instruments. Reactance, capacitance and other units are also included. The job experiments make it possible to study and help understand the theory and use of these instruments.

The mathematics presented covers the algebra, geometry and trigonometry necessary for the study and understanding of electronics.

This is set up in such a way that the mathematics, theory and experiments contribute to each other. The math is introduced at the time it is needed to understand the theory and work the lab experiments.

It is believed that this course will be very successful if the suggested teaching plan is followed. The course has been used, corrected, then revised before it was printed.

Explanation of lecture and lab set-up

MATHEMATICS TEST (1960-1961 Test)

Objective: The purpose of this test is to find out how much review of mathematics and algebra will be necessary for this group of students. After its evaluation, the review schedule will be set up to provide adequate review Forty minutes will be allowed for the test

MATHEMATICS

Objective: Lesson 1 will be the beginning review of algebra. In this lesson, we will review literal and signed numbers along with the addition and subtraction of signed numbers. There will be an assignment of material to be done by the student as homework. (Express the importance of homework in this type of study.)

1. Literal numbers
2. Signed numbers
3. Addition and subtraction of signed numbers

ELECTRONICS

Objective: Lesson 1 will introduce the student to the basic electron theory. Chapter 2 of Slurzberg will be covered. An assignment of reading material will be given at the end of the lesson.

1. Read Chapter 2 of Slurzberg's, Essentials of Electricity for Radio and Television, pages 45-56.
2. Hand out Lesson 1-A, "The Electron", and explain the purpose of the handout.
3. Hand out Lesson 1-B, "Units".

Lesson 1-A
The Electron

INTRODUCTION

Before starting our study of the electron and its behavior, there are a few basic terms with which we must become acquainted. Although some of you may think this is a boring discussion, you should make every attempt to get this information under your hat. It will be very difficult for you to visualize the electron, which has a mass of 0.0000000000000000000000000000911 grams or the proton which is 1845 times larger.

OBJECTIVE

The purpose of this handout is the same as that of the first hour of lecture on electron theory. Answer the questions on a separate sheet of paper and hand them in along with the handout sheet. If there are any questions about this or any handout, be sure to ask them to the instructor.

Sams, Howard W., Basic Electricity, Twelfth Edition, Job 1, Bobbs Merrill.

Slurzberg, Morris, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 45-61.

QUESTIONS

1. What are the two types of charges that a body may take?
2. What are the two types of electricity as defined in class?
3. What is a conductor?
4. What is an insulator?
5. How can an atom become charged?
6. What are the three forms of matter?
7. What is the difference between current and electromotive force?
8. What are the four ways of creating an electromotive force?
9. Explain in what direction electrons flow.
10. How do bodies with like charges behave?
11. How much does the proton weigh?

Lesson 1-B
Units

INTRODUCTION

Electronics, like other fields, has a language all of its own. Many of these terms have other meanings elsewhere.

OBJECTIVE

The purpose of this lesson handout is to acquaint you with some of the most common and basic electronic terms. Remember these terms; they will be used again and again.

REFERENCES

Henney, Keith, Principles of Radio, John Wiley and Sons, pp. 26-29.

Marcus, Elements of Radio, Prentice-Hall, Second Edition, pp. 321-327.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 67-74.

Note: The instructor will usually provide sufficient reading material, however, if he should fail to assign the material from Slurzberg that is specified in these handouts, you are expected to go ahead and read it. Remember, it is for your benefit.

QUESTIONS

1. What is electromotive force?
2. Why are we concerned with differences in pressure?
3. How many electrons make a coulomb of charge?
4. What is an ampere?
5. What is the unit of power for electrical work?
6. Define force.
7. Define energy.
8. R is the symbol for ______________.
9. E is the symbol for ______________.
10. I is the symbol for ______________.

Lesson 2
Algebra - Review and Application to Electronics

INTRODUCTION

This lesson will consist of three hours of lecture. Approximately two hours will be spent on the review of mathematics. The remaining hour will concern electron theory.

MATHEMATICS

Objective: In the review of mathematics we will concern ourselves mostly with the addition, subtraction and multiplication of signed numbers. The laws of exponents, multiplication of monomials, multiplication of polynomials, and the multiplication of polynomials by polynomials will take up most of the lecture period. This review may be somewhat slow or fast according to the ability of the students. STAY WITH YOUR STUDENTS as much as possible.

Explanation: Continued review of algebra. Cooke's Basic Mathematics for Electronics, Second Edition, pages 74-84, and Cooke's Mathematics for Electricians and Radiomen, First Edition, pages 25-36.

1. Multiplication of signed numbers
2. Laws of exponents
3. Multiplication of monomials
4. Multiplication of polynomials by monomials
5. Multiplication of polynomials by polynomials

Summarization: In this very rapid review of math and algebra fundamentals we have talked of addition, subtraction and multiplication of signed numbers. In your study of electronics, a basic knowledge of these things is an absolute necessity. Be sure that you understand them.

1. Assign problems as homework.

ELECTRONICS

Objective: The objective of this lecture period will be to give the student a clear understanding of potential, current flow, methods of producing an electric current and primarily, Ohm's Law.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 2 (Con't.)

Algebra - Review and Application to Electronics

Explanation: Review pages 45-57 in Slurzberg's, Essentials of Electricity for Radio and Television. Answer the students' questions.

1. Potential--Discuss potential and potential difference. Give other terms for potential.

2. Current flow--What it is and what it is affected by.

3. Discuss the methods of producing an electric current--chemical, thermal, magnetic and solar.

4. Ohm's Law--Use the hydraulic analogy of current flow.

   a. Rate of flow is equal to the pressure divided by the opposition.

   b. Rate of current flow is equal to the voltage (pressure) divided by the opposition (resistance).

   Therefore, $I = E/R$

5. Discuss Figure 2-18 on page 68 in Slurzberg's, Essentials of Electricity for Radio and Television.

6. Go through Slurzberg's, Essentials of Electricity for Radio and Television, page by page in the Symbols and Abbreviations.

Summarize:

Assign Ohm's Law problems for the students' homework. Select problems from Cooke's Mathematics for Electricians and Radiomen, Cooke's Basic Mathematics for Electronics, Second Edition, and Slurzberg's Essentials of Electricity for Radio and Television.

Hand out Lesson 2-A, "Simple Circuits".

TERRE HAUTE, INDIANA

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 2-A
Simple Circuits

INTRODUCTION

In order to read electrical diagrams and service electronic equipment, the complete understanding of electrical symbols and diagrams is a necessity.

OBJECTIVE

The purpose of this lesson is to introduce you to the basic electronic symbols and to the circuit diagram. You will complete this just as you did the first two handouts.

REFERENCES

Marcus, Elements of Radio, Prentice-Hall, Second Edition, pp. 332-336.

Radio Electronics and Television Laboratory Manual, Basic Electricity, Lesson 2, Electronic Industries Association, McGraw-Hill Book Company.

Sams, Howard W., Basic Electricity, Twelfth Edition, Job 2, Bobbs Merrill.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 129-149.

QUESTIONS

1. What four things must a practical electrical circuit have?
2. In what direction do electrons flow?
3. What do we mean by a series circuit?
4. What do we mean by a parallel circuit?
5. The instructor will place several circuits on the board for you to identify.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 3
Algebra - Review and Exponents

MATHEMATICS

Objective: In this hour of lecture, we will go into the division of signed numbers, the laws of exponents, zero and negative exponents, the division of monomials, and the division of polynomials by monomials. You will be assigned material for study in preparation for a short math quiz on the material covered to date. I will introduce you to the slide rule in the latter part of the hour.

1. Division of signed numbers
2. Law of exponents in division
3. Zero and negative exponents
4. Division of monomials
5. Division of polynomials by monomials

Assign problems 5-2, 5-3, and 5-4 on pages 37-4? in Cooke's, Mathematics for Electricians and Radiomen, and problems 9-5, 9-6, 9-7, and 9-8 on pages 85-91 in Cooke's, Basic Mathematics for Electronics, Second Edition. Work the even problems.

Read "Equations" next week.

Prepare for a math test next week on the material covered so far.

Be sure everyone has a slide rule.

ELECTRONICS

Objective: In this hour of lecture, we will discuss resistance, conductors, and insulators. I will also hand out your first laboratory experiment and explain it to you. You will have approximately one hour in the lab.

1. Resistance, conductors, and insulators
2. Resistors--Show examples of many types.
3. Hand out Lesson 3-A, "Ohm", and Lesson 3-B, "Ohm's Law". Explain 3-B in detail and prepare the class for lab.

Lesson 3-A
OHM

INTRODUCTION AND OBJECTIVE

This is the first real assignment where we begin to use some of the terms we have learned to date. This lesson concerns itself with the ohm. The ohm is the unit of resistance as the inch is the unit of length. The ohm is named for Dr. George Simon Ohm (1784-1854) who was a famous German physicist. Dr. Ohm did very much of the early work in electricity.

Sams, Howard W., Basic Electricity, Twelfth Edition. Lesson 4, Bobbs Merrill.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 66-82, 129-149.

QUESTIONS

1. Define the ohm as outlined by the Bureau of Standards.
2. Define the ampere as outlined by the Bureau of Standards.
3. Define the volt as outlined by the Bureau of Standards.
4. If the resistance remains constant, an increase in voltage will have what effect upon the circuit?
5. If the voltage remains constant, an increase in resistance will have what effect upon the circuit?
6. A table lamp has a resistance of 220 ohms. How much current does it draw when used on a circuit that has a voltage of 110 volts?
7. What is the symbol for the ohm?
8. Three resistors of 7.15, 4.22, and 9.63 ohms are connected in series across a 110 volt line. How much current will flow?
9. What is the voltage across each resistor above?
10. What is the power expended in each resistor above?

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 3-B
Ohm's Law

INTRODUCTION AND OBJECTIVE

This lesson is to prove or disprove Ohm's Law. Do not turn the circuit on until it has been checked by the instructor. Meters cost money. Ask the instructor for the form to be used on laboratory write-ups. The voltage source will be provided by the instructor.

REFERENCES

Radio Electronics and Television Laboratory Manual, Basic Electricity, Job 7, Electronic Industries Association, McGraw-Hill Book Company.

Sams, Howard W , Basic Electricity, Twelfth Edition, Lesson 4A; Lessons 1A-3A.

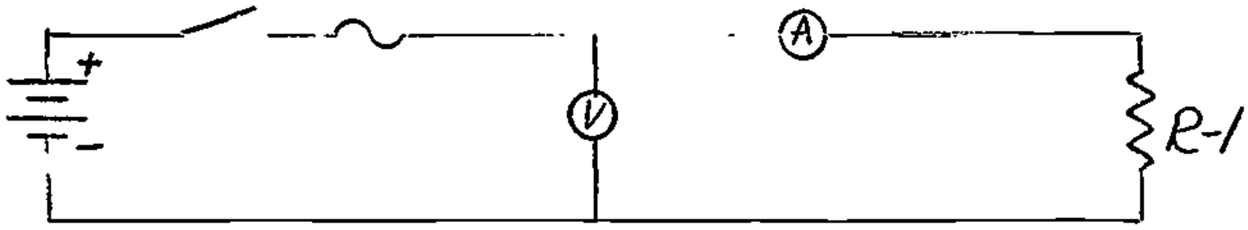
Slurzberg, Morris, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, Chapter 4.

MATERIAL AND EQUIPMENT REQUIRED

0-30 volt, DC voltmeter; 0-10 ma., DC ammeter; and the following resistors: 3300; 3600; 10000; 12000; and 22000 ohms

PROCEDURE

1. Construct the circuit shown here. Use one of the breadboards the instructor will provide. Insert the 22000 ohm resistor first.



2. Do not close the switch. Have the instructor check the circuit.
3. Make a table and record the following data:
   a. The applied voltage
   b. The current flowing through the circuit
4. Remove the 22000 ohm resistor and repeat step 3 with each of the other resistors. Use the larger values first.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 3-B (Con't.)

Ohm's Law

5. Compute the value of R in each case. The resistance in any circuit is equal to the voltage across the resistor divided by the current flowing through the resistor.

QUESTIONS

1. Explain the color code on the 10000 ohm resistor.
2. Explain any difference found between the rated and computed values of R.
3. With a fixed resistance, one that does not change, what is the effect of doubline E?
4. With a fixed voltage, what is the effect of doubling R?
5. What must one remember concerning the units when using Ohm's Law?
6. Did we prove or disprove Ohm's Law? Explain.
7. Summarize in a paragraph or two.

Lesson 4

Algebra - Review of Equations, Primes, and Subscripts

INTRODUCTION AND OBJECTIVE

In this lecture period we will continue our review of algebra by starting on equations, literal equations and primes and subscripts. There will be a short math test on the material you have covered to date. In the electronics portion of the lecture, I will answer any questions which arose in last lesson's introduction to the laboratory. We will work several Ohm's Law problems. I will also hand out Lesson 4-A. This will measure the resistance of the current meter. It may clear up some inaccuracies in the last experiment.

MATHEMATICS

1. Equations
2. Primes and subscripts
3. Math test--Allow 30 minutes.
4. Assign: 7-1 through 7-6, pp. 55-59, in Cooke's, Mathematics for Electricians and Radiomen; 10-1 through 10-6, pp. 92-97, in Cooke's, Basic Mathematics for Electronics, Second Edition, as reading and work material for next week.

ELECTRONICS

1. Review Ohm's Law and any questions on last week's handouts and laboratory.
2. Work problems assigned last week.
3. Hand out Lesson 4-A, "Meter Resistance Measurement" and explain.
4. Assign 12-16, page 84, in Slurzberg's, Essentials of Electricity for Radio and Television, to work by next week.
5. There will be a short quiz on Ohm's Law if time permits.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 4-A
Meter Resistance Measurement

INTRODUCTION AND OBJECTIVE

Some of the inaccuracy encountered in Lesson 3-B was due to the resistance of the milliammeter, which was actually in series with the resistor. Meter movement may be damaged if measured with an ohmmeter. In this short experiment, you will measure the resistance of the meter indirectly.

REFERENCE

Lesson 3-B

PROCEDURE

1. Construct the same circuit that you had in Lesson 3-B. Use the 3.3 k ohm resistor. Disconnect the voltmeter from the circuit and attach leads to its terminals.

2. Have the instructor check the circuit before you apply the voltage.

3. Measure the voltage across the milliammeter terminals and record it along with the current reading.

4. Compute the resistance of the milliammeter.

QUESTIONS

1. What was the computed resistance of your milliammeter?
2. How is it possible to damage a current meter with an ohmmeter?
3. Since the milliammeter was in series with the resistors being measured in Lesson 3-B, it was also limiting the current. Therefore, the resistance you computed in each case was the total resistance of the meter and the resistor.
4. Subtract the resistance of the meter from each computed resistance in Lesson 3-B. Compare the results with the rated value of each resistor.

Lesson 5

The Slide Rule - Powers of Ten

INTRODUCTION AND OBJECTIVE

In this lecture period we will review or critique the last period math test. There will be more preparation for the use of the slide rule. We will start our study of powers of ten. In the electronics portion of the lecture, you can be sure to ask any questions you have on the lab experiments. You will be introduced to the multimeter, a new piece of test equipment. There will be a short electronics quiz following this lesson.

MATHEMATICS

1. Review math test.

2. Preparation for the use of the slide rule
    a. Powers of ten
    b. Work chapter 7 over to and including problems 7-2 in Cooke's, Mathematics for Electricians and Radiomen, pp. 55-62. Work chapter 10 over to and including problems 10-8 in Cooke's, Basic Mathematics for Electronics, Second Edition, pp. 92-100.

3. Assign the rest of chapters 7 and 10 for next week.

ELECTRONICS

1. Review last week's lab.
2. Pass out and explain Lab Lesson 5-A, "Resistors in Series".
3. Explain and demonstrate the use of the ohmmeter portion of the multimeter.
4. Work some of the problems on pages 156-157 in Slurzberg's, Essentials of Electricity for Radio and Television.
5. Assign problems 6-13 on pages 156-157 in Slurzberg's, Essentials of Electricity for Radio and Television. Use the slide rule as much as possible.
6. There will be a short electronics quiz.

LAB

1. Lesson 5-A, if all other lab work is completed.

Lesson 5-A
Resistors in Series

INTRODUCTION AND OBJECTIVE

In this lesson we will see what occurs when we put more than one resistor in series on a single voltage source. You are to use a new instrument, the ohmmeter.

REFERENCES

Radio Electronics and Television Laboratory Manual, Basic Electricity, Job 8, McGraw-Hill Book Company, Electronic Industries Association.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 118-162.

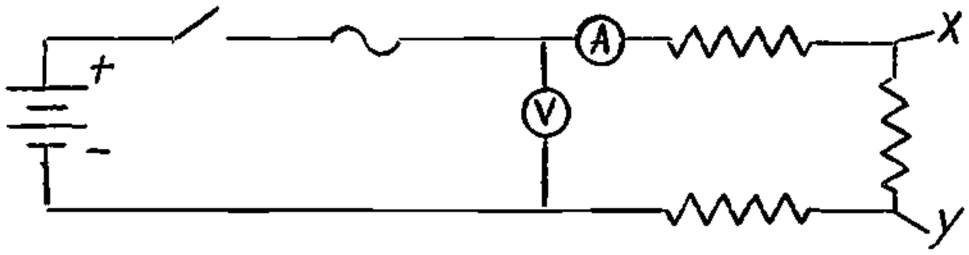
MATERIALS AND EQUIPMENT USED

0-30 volt, DC voltmeter; 0-10 ma, DC millimeter; multimeter; and the following resistors: R-1, 330; R-2, 510; R-3, 1000; R-4, 2200; R-5, 3900: and R-6, 4700 ohms.

PROCEDURE

1. Measure the following combinations with the ohmmeter. Record your readings.
    - Combination A--R-1, R-3 and R-5
    - Combination B--R-2, R-4 and R-6
    - Combination C--R-1, R-4 and R-2
    - Combination D--R-2, R-3 and R-5

2. Complete the following circuit. Have the instructor check it. Place combination A in the circuit first.



3. Record the following information for each combination. Do combination D last.
    - a. Total E
    - b. I measured
    - c. R computed (E divided by I)

ASSIGNMENT SHEET

Lesson 5-A (Con't.)
Resistors in Series

4. Using combination D, move the current meter so as to measure the current flowing through point X and then point Y.

5. Remove the voltmeter from its place and measure the voltage across each resistor. Watch the ammeter as you do this.

6. Ask the instructor for a vacuum-tube voltmeter and repeat Step 5 under his supervision.

QUESTIONS

1. How can we compute the total resistance of a series circuit prior to taking voltmeter, ammeter readings?
2. Explain any differences found between rated, measured and computed values of R.
3. What is the relationship between the current passing through each resistor in a series circuit?
4. Would changing positions of the resistors in a series circuit have any effect on the flow of electrons? Why?
5. What did you notice about the sum of the voltages in Step 5?
6. What did you notice about the sum of the voltages in Step 6?
7. What is the total power being expanded in combination D?
8. Summarize the experiment.

Lesson 6
The Use of the Slide Rule - Ohm's Law

INTRODUCTION AND OBJECTIVE

In this lecture period we will continue our study of the slide rule and work Ohm's Law problems. I will try to give you sufficient time to catch up on the lab work.

MATHEMATICS

1. Continue with powers of ten as far as power of a product.
2. Assign for next week, problems 7-3, pages 64 and 65, Cooke's, Mathematics for Electricians and Radiomen, First Edition and problems 10-3, pages 102 and 103, Cooke's, Basic Mathematics for Electronics, Second Edition.
3. Finish chapter 7, Cooke's First Edition and chapter 10, Cooke's Second Edition.

(Blackboard quiz)

1. Multiply: $(0.0036 \times 10^{-5} \times 450 \times 0.007 \times 10^{-5})$
2. Draw schematic on board.
    a. E is 1.73 volts, R is 600 ohms, find I.
    b. I is 3.25 ma, R is 2,500 ohms, find E.
    c. An electric lamp is designed to carry 0.75 amperes. Its resistance is 148 ohms. For what line voltage is it designed?

ELECTRONICS

1. Use and operation of the ohmmeter.
2. Work problems 7, page 156 in Slurzberg's, Essentials of Electricity for Radio and Television.
3. Study Ohm's Law, chapter 9, page 75, Cooke's First Edition and chapter 13, page 135, Cooke's Second Edition. Lecture on first three paragraphs and the first group of problems.
4. Assign problems 9-1, page 78, Cooke's First Edition and problems 13-1, page 139, Cooke's Second Edition.

Lesson 7

Electronic Circuits - Series and Parallel

INTRODUCTION AND OBJECTIVE

Math will continue in the use of the slide rule and math that will parallel the electronics theory. In electronics I will introduce you to the parallel circuit. We will study many formulas for computing total resistance.

MATHEMATICS

1. Work problems 7-3, page 64, in Cooke's, Mathematics for Electricians and Radiomen, First Edition and problems 10-3, page 102, in Cooke's, Basic Mathematics for Electronics, Second Edition.

2. Review the rest of the chapter on powers of ten.

3. Study chapter 9 in Cooke's First Edition, pp. 75-91. Work problems 9-1, page 78; 9-3, page 89 in Cooke's First Edition.

   Study chapter 13 in Cooke's Second Edition, pp. 135-158. Work problems 13-1, page 139, 13-2, page 145, 13-3, page 151 in Cooke's Second Edition.

4. Next week's assignment will include 7-3, 9-2 and 9-3 in Cooke's First Edition and 10-3, 13-2 and 13-3 in Cooke's Second Edition.

5. Assign problems 30, 31 and 32, page 85, in Slurzberg's, Essentials of Electricity for Radio and Television. Use the slide rule when solving these problems.

ELECTRONICS

1. Explain Lab 5-A on any points that are not clear to the students.

2. Ask for lab hand-in to be handed in as soon as they are ready.

3. Review the operation of the ohmmeter.

4. Work problems on page 78 of Cooke's First Edition and problems on page 139 in Cooke's Second Edition

5. Parallel circuits
   - a Current, voltage, resistance and power
   - b Characteristics, page 135 in Slurzberg's, Essentials of Electricity for Radio and Television

MATERIALS AND EQUIPMENT USED

0-10 DC milliammeter; 0-30DC voltmeter; multimeter; vacuum-tube voltmeter; and the following resistors: R-1, 1k; R-2, 3.3k; R-3, 4.7k; and R-4, 2.7k ohms.

PROCEDURE

1. Measure each resistor with the ohmmeter and record its value in a table opposite its rated value.

2. Form the following parallel combinations and measure the combinations with the ohmmeter. Record their value.
   a. Combination A--R-1, R-2 and R-3
   b. Combination B--R-2, R-3 and R-4
   c. Combination C--R-3, R-1 and R-4
   d. Combination D--R-1, R-2 and R-4

3. Connect the following circuit, using combination A first.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II | Basic A-C D-C

Lesson 7-A (Con't.)
Parallel Circuits

4. Record the value of the applied voltage and the current that is flowing. Compute the value of R_t by dividing E by I.

5. Repeat with combinations B, C and D. Leave C in the circuit for the next part of the experiment.

6. Place the VOM in the circuit as an ammeter and only the electrons through R-1. Let the instructor check the circuit before you turn the circuit on.

7. Repeat for the number of electrons in R-3 and R-4.

QUESTIONS

1. Compute the value of each of the combinations by the special formula that you will find in the reference material for parallel circuits.
2. Explain any differences found between the measured value of R (Step 2), computed R (Step 4 and 5), and the values found in question 1.
3. What relationship, if any, do we notice between the total current and the current in the individual branches?
4. What is true concerning the voltage across each resistor in a parallel circuit?
5. What is the total power consumed in combination C?
6. What effect does the milliammeter's resistance have on the circuit?
7. Summarize the experiment.

Lesson 8

Parallel Circuit Problems

INTRODUCTION AND OBJECTIVE

In this period of lecture and discussion we will continue using parallel circuits. In order to fully acquaint you with the characteristics of parallel circuitry, we will work several problems.

MATHEMATICS

1. Review of reciprocals
2. Power of a power
3. Work last week's assignment.
4. Work problems 9-3, page 89, in Cooke's, Mathematics for Electricians and Radiomen, First Edition and problems 13-3, page 151, in Cooke's, Basic Mathematics for Electronics, Second Edition.
5. Study Ohm's Law--Parallel circuits.
6. Work example, bottom of page 164 in Cooke's First Edition and example on page 235 in Cooke's Second Edition.
7. Assign for next week: Problems 14-1, page 165, in Cooke's First Edition and problems 18-1, page 235, in Cooke's Second Edition.

ELECTRONICS

1. Review parallel circuits.
2. Review the operation of the multimeter to date.
3. Explain Lab 7-A and ask for questions about it.
4. Read pages 133-137 in Slurzberg's, Essentials of Electricity for Radio and Television.
5. Assign for next week: 18, 19 and 20, page 157, in Slurzberg's, Essentials of Electricity for Radio and Television.

Lesson 9

Simple Series - Parallel Combination Circuits

INTRODUCTION AND OBJECTIVE

So far we have studied series circuits and parallel circuits separately. Seldom in electronics will you see these circuits in this simple form. Electronic circuits consist of a combination of series and parallel circuitry In this lecture period, you will be introduced to simple series-parallel circuits. The next lab experiment will be of this type.

MATHEMATICS

1. Work problem 16 in problems 9-2, page 84, Cooke's, Mathematics for Electricians and Radiomen, First Edition and problem 16, problems 13-2, page 146, Cooke's, Basic Mathematics for Electronics, Second Edition.

2. Work problems 9-3, page 89, Cooke's First Edition and problems 13-3, page 150, Cooke's Second Edition.

3. Review parallel circuits, page 162, Cooke's First Edition and parallel circuits, page 230, Cooke's Second Edition.

4. Study formulas -- examples on pages 163-164, Cooke's First Edition and examples on pages 233-235, Cooke's Second Edition.

5. Work problems 14-1, page 165 and 14-2, page 167, in Cooke's First Edition. Work problems 18-1, page 235, and 18-2, page 238, in Cooke's Second Edition.

6. Assign problems 14-1, 14-2 and 14-3, pages 165-173, in Cooke's First Edition and problems 18-1, 18-2 and 18-3, pages 235-243, in Cooke's Second Edition for next week.

7. Assign paragraph 14-3, page 168, to read in Cooke's First Edition and paragraph 18-3, page 238, to read in Cooke's Second Edition.

ELECTRONICS

1. Review parallel circuits.

2. Simple combination circuits.

3. Work example 4-9, page 138, in Slurzberg's, Essentials of Electricity for Radio and Television.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 9-A
Combined Series and Parallel Circuits

INTRODUCTION AND OBJECTIVE

We have studied the reaction of pure resistive load in simple series and parallel combinations. Now we are going to place them both in the same circuit at the same time.

REFERENCES

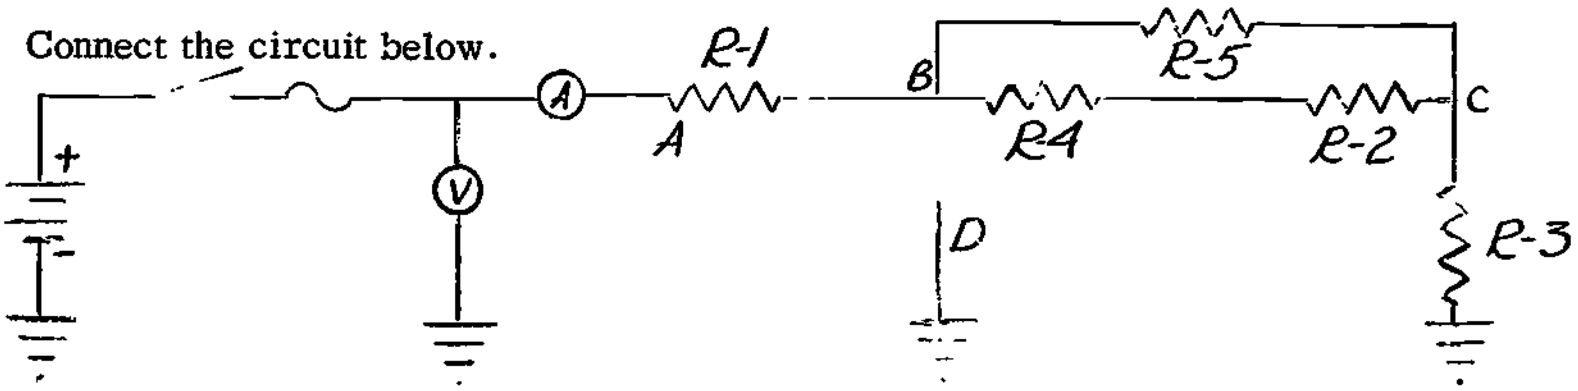
Lessons 1-8

MATERIAL AND EQUIPMENT USED

0-10 DC ma meter; 0-30 DC voltmeter, vacuum-tube voltmeter; multimeter; and the following resistors: R-1, 330; R-2, 470; R-3, 1000; R-4, 2200; R-5, 3900 ohms

PROCEDURE

1. Measure and record the resistance from point A to D.
2. Connect the circuit below.



3. Measure and record the resistance from point A to D.
4. Measure and record the resistance from point B to C.
5. Place the ammeter so as to measure total current. Be sure to place the switch so as to protect both meters.
6. Measure and record total voltage and the voltage across each resistor. Remember we have to use a VOM so as not to load the circuit.
7. Record the total current and the current through R-2 only.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 9-A (Con't.)
Combined Series and Parallel Circuits

8. Record the current through R-4 only.

9. Record the current through R-5 only.

10. Remove R-2 from the circuit. This is what would happen if that resistor burned out. What does the current read now?

QUESTIONS

1. Compute the resistance from point B to C by the formula for parallel resistors.

2. How can we compute the total resistance from A to D so that we might predict the current?

3. How does the voltage across R-5 compare with the sum of the voltages across R-4 and R-2?

4. Calculate the resistance of the parallel branch by using total current.

5. Calculate the total resistance by using the total current.

6. Calculate the current in each branch by using rated values for the resistors.

7. What is the power consumed in the circuit?

8. Summarize the experiment.

Lesson 10
Bridge Circuits

INTRODUCTION AND OBJECTIVE

This lecture is a continuation of complex resistive circuits. In the mathematics portion of the lecture, we will discuss a new circuit known as the bridge. If you find that the math discussion seems to be electronics and vice versa, keep in mind that the two are actually inseparable. You must understand them both to really understand either. In the electronics hour, you will meet the pesky voltage divider. You will also be assigned another lab handout.

MATHEMATICS

1. Compound circuits
2. Bridge circuits; The Wheatstone Bridge
3. Work example 1 on page 178 in Cooke's, Mathematics for Electricians and Radiomen, and example 6 on page 274 in Cooke's, Basic Mathematics for Electronics, Second Edition.
4. Work the problems in last week's assignment.
5. Assign problems 1 and 2 of 14-5 on pages 179-180 in Cooke's, Mathematics for Electricians and Radiomen, and problems 1 and 2 of 20-3 on page 275 in Cooke's, Basic Mathematics for Electronics, Second Edition.
6. Assign any problems we have covered that the students seem to need practice on.

ELECTRONICS

1. Parallel and combination circuits
2. Start in Slurzberg's, Essentials of Electricity for Radio and Television, on page 137.
3. Rheostats and potentiometers
4. Voltage dividers
5. Work problems 18-24 in Slurzberg's, Essentials of Electricity for Radio and Television, pages 154 and 155.
6. Critique Lab 9-A.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 10-A
The Voltage Divider

INTRODUCTION AND OBJECTIVE

We have to this time seen a need for many power supplies. A, B, C and filament supplies must all be obtained for the receiver. We have seen that each individual tube in a set may require different voltages for operation. To have a seperate supply for each need would make us utilize a moving van for the power supply only. In this lesson we will demonstrate how one supply may be utilized to supply the many different voltages needed in electronic circuitry.

MATERIAL AND EQUIPMENT USED

0-10 ma meter, volt-ohmmeter, four 1200 ohm resistors and the following load resistors: 1000, 3300, 2200, 3900, 4700, 5600, 6800, 8200 and 10000 ohms

PROCEDURE

1. Connect the following circuit.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 10-A (Con't.)
The Voltage Divider

2. Record the following with the switch open.
    a. Voltage A-F
    b. Voltage B-F
    c. Voltage D-F
    d. Voltage C-F
    e. Voltage E-F
    f. Current through load

3. Place the 10,000 ohm load in the circuit and take all the voltage and current readings again.

4. Using each of the other resistors, one at a time and repeat all voltage readings, record in chart form. (Use the larger value of resistance first.)

5. Place the VOM in the circuit as to measure current in the load. Have the instructor check.

6. Place the 10,000 ohm load in the circuit and record the divider and load current.

7. Repeat with each remaining load, recording both currents and record in chart form.

QUESTIONS

1. How does the load current vary with the load?
2. Graph the load current versus the divider current for this particular circuit.
3. What is the relationship between voltage E to F and C to F?
4. What relationship does voltage B to F have with A to F?
5. What two important items must we know about the load in order to design a voltage divider?
6. An amplifier requires the following voltages and currents:
    a. 250 volts at 40 mils
    b. 180 volts at 10 mils
    c. 90volts at 5 mils

    The bleeder current is 10 mils. Design a suitable divider.
7. Summarize the experiment.

Lesson 11

Review for Mid-Term Electronics Exam

INTRODUCTION AND OBJECTIVE

During this hour of lecture, which will be devoted to math, we will review the slide rule and bridge circuits. An examination will be given during the second hour on the electronics to date. Any time left will be spent in lab.

MATHEMATICS

1. Problems 14-3 on pages 171 and 172 in Cooke's, Mathematics for Electricians and Radiomen, and problems 18-3 on pages 241 and 242 in Cooke's, Basic Mathematics for Electronics, Second Edition.

2. Bridge circuits 14-5 on page 177 in Cooke's, Mathematics for Electricians and Radiomen, and bridge circuits 20-4 on page 272 in Cooke's, Basic Mathematics for Electronics, Second Edition.

3. Explain the Wheatstone Bridge.

Problems 14-5, 1 and 2 on pages 179-180 in Cooke's, Mathematics for Electricians and Radiomen, and problems 1 and 2 of 20-3 on page 275 in Cooke's, Basic Mathematics for Electronics, Second Edition.

5. Stress the slide rule and review problems on R_t of parallel circuits.

6. Page 170, example 4, in Cooke's, Mathematics for Electricians and Radiomen, and example 9 on page 240 in Cooke's, Basic Mathematics for Electronics.

ELECTRONICS

1 Assign material to work and study for next week.

2. Give mid-term electronics exam.

3. Any time left will be spent in lab.

Underline the correct answers and place the letter in the blank at the right.

1. A voltmeter is used to measure
   a. electron flow. c. electrical current.
   b. electrical power. d. electromotive force. ________

2. An instrument that will measure AC and DC voltages, resistance, and direct current is called
   a. an ammeter. c. a multimeter.
   b. a voltmeter. d. an ohmmeter. ________

3. A meter that will read current in thousandths of an ampere is called
   a. a rheostat.
   b. an indicator.
   c. a milliammeter. ________

4. Materials which do not permit electrons to flow through them are called insulators or
   a. resistance extensions. c. non-conductors.
   b. service wires. d. trimmers. ________

5. The amount of current flowing through a conductor that has a resistance of 10 ohms and a voltage of 130 volts impressed across it is
   a. 0.07 amperes. c. 1.07 amperes.
   b. 130 amperes. d. 13 amperes. ________

6. The unit of electrical power is the
   a. volt. c. watt.
   b. ohm. d. ampere. ________

7. An electric heater takes seven amperes when connected to a 120 volt circuit. Its resistance is
   a. 0.5 ohms. c. 840 ohms.
   b. 17.14 ohms. d. 0.58 ohms.
   e. 580 ohms. ________

8. If an electric iron has a resistance of 30 ohms and five amperes are required to keep it hot, the voltage necessary for the proper operation of the iron is
   a. 150 volts. c. 0.166 volts.
   b. 6 volts. d. 16.6 volts. ________

Lesson 12
Geometry - Angles

INTRODUCTION AND OBJECTIVE

In this lecture you will be introduced to the geometry necessary for the study of alternating current. We will study angles, their generation and how they are measured. The electronics portion of the lecture will continue with what was already started, the voltage divider.

MATHEMATICS

1. Work problems 26, 30, and 32 in Slurzberg's, Essentials of Electricity for Radio and Television, pages 158-159.

2. The study of angles: Chapter 22 in Cooke's, Mathematics for Electricians and Radiomen, First Edition, and chapter 26 in Cooke's, Basic Mathematics for Electronics, Second Edition.

3. Study 22-1 on pages 327 and 328 in Cooke's First Edition, and 26-1 on pages 385 and 386 in Cooke's Second Edition.

    a. Go through part of this material from the book.
    b. Give terms to understand.

4. Generation of angles: 22-2 on pages 328 and 329 in Cooke's First Edition, and 26-2 on pages 387 and 388 in Cooke's Second Edition.

5. The sexagesimal system: 22-3 on pages 329-331 in Cooke's First Edition, and 26-3 on pages 388 and 389 in Cooke's Second Edition.

6. Angles of any magnitude: 22-4 on pages 329-330 in Cooke's First Edition, and 26-4 on page 389 in Cooke's Second Edition.

7. Assign problems 22-1 on page 332 in Cooke's First Edition, and problems 26-1 on page 390 in Cooke's Second Edition.

8. Assign problems 3, 4, 6, 7, 8, 28, 36, and 38 on pages 154-155 in Slurzberg's, Essentials of Electricity for Radio and Television, as hand-in material.

ELECTRONICS

1. Review voltage dividers.

Lesson 13

Geometry - The Voltmeter Circuit

INTRODUCTION AND OBJECTIVE

You have used the voltmeter in several instruments--the multimeter, the vacuum tube voltmeter, and the small voltmeter on your breadboard. In this lecture we will see how a voltmeter works. You will have a lab experiment in which you will take a meter movement and design a voltmeter circuit. We will continue our study of angles during the math portion.

MATHEMATICS

1. Review these terms:

   a. angle
   b. vertex
   c. sides
   d. right angle
   e. acute angle
   f. obtuse angle
   g. complementary angle
   h. supplementary angles
   i. initial side
   j. terminal side
   k. standard position
   l. positive angle
   m. negative angle
   n. first quadrant
   o. degrees
   p. minutes
   q. seconds

2. Read 22-4, "Angles of Any Magnitude", in Cooke's, Mathematics for Electricians, First Edition, page 331, and 26-4, in Cooke's, Basic Mathematics for Electronics, Second Edition, page 389.

3. The circular or natural system of measurement:

   a. Explain radian and pi measurements.
   b. Convert radians to degrees.
   c. Convert degrees to radians

4. Work example 1 on page 334 in Cooke's First Edition and example 1 on page 392 in Cooke's Second Edition.

5. Work example 2 and problems 22-2 on page 334 in Cooke's First Edition and example 2 and problems 26-2 in Cooke's Second Edition, page 392.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Geometry - The Voltmeter Circuit

6. Read 22-6, "Similar Triangles", in Cooke's First Edition, page 335 and 26-6, page 392, in Cooke's Second Edition.

7. Explain the right triangle, hypotenuse, altitude and base.

8. Explain briefly the square and square root on the slide rule.

9. Assign problems 22-4, page 338, in Cooke's First Edition and problems 26-4, page 395, in Cooke's Second Edition.

10. Assign the first three problems of 22-2, page 334, in Cooke's First Edition and the first three problems of 26-2, page 392, in Cooke's Second Edition.

11. Assign as reading material: Pages 339-345 in Cooke's First Edition and pages 397-403 in Cooke's Second Edition.

ELECTRONICS

1. Review any questions on the voltage divider lab experiment.

2. Voltmeters: Explain and review the following:

   a. How to connect a voltmeter in a circuit
   b. Construction of a voltmeter
   c. Example 6-1, page 211, in Slurzberg's, Essentials of Electricity for Radio and Television
   d. How to obtain more ranges
   e. Example 6-2, page 212, in Slurzberg's, Essentials of Electricity for Radio and Television
   f. Sensitivity of voltmeters
   g. Ohms per volt rating
   h. Precautions to be observed when using a voltmeter

3. Read pages 210-215 in Slurzberg's, Essentials of Electricity for Radio and Television, by next week.

4. Assign problems 8 and 9, page 239, in Slurzberg's, Essentials of Electricity for Radio and Television.

Course II — Basic A-C D-C

Lesson 13-A
Voltmeter

INTRODUCTION AND OBJECTIVE

We have had several lessons using Ohm's Law and have been studying the behavior of different electronic circuits. In our studies we have used several different types of meters. In all the circuits we had electrons flowing. Some of our meters read current while others read volts or ohms. They all have one thing in common; they depend upon the flow of electrons for their operation. A voltmeter will develop into a simple series circuit.

REFERENCES

Marcus, Elements of Radio, Prentice-Hall, Second Edition, pp. 375-376.

Lesson 14

Basic Trigonometric Functions

INTRODUCTION AND OBJECTIVE

This lesson will cover more mathematics for a-c. You may think that we are never going to get into actual theory, however, if you understand the math we are covering, the a-c theory will come much easier for you. In this lecture, you will be introduced to the trigonometric terms for the first time. They are sine, cosine, tangent, and the solution of problems concerning right angles.

MATHEMATICS

1. Radians and degrees
2. Obtuse and acute triangles
3. Right triangles
4. Trigonometric functions
    a. Read the first paragraph in Cooke's, Mathematics for Electricians and Radiomen, First Edition, page 339, and the first paragraph in Cooke's, Basic Mathematics for Electronics, Second Edition, page 397.
    b. Draw 23-1 on page 339 in Cooke's First Edition and 27-1 on page 398 in Cooke's Second Edition on the board and explain fully.
    c. Sine, cosine, and tangent
    d. Cotangent, secant, and cosecant
5. Adjacent, opposite, and hypotenuse
6. Work the example on page 341 in Cooke's First Edition, and the example on page 399 in Cooke's Second Edition. Explain fully.
7. Reciprocal relations of the functions
8. Complementary angles: Explain 343 in Cooke's First Edition, using figure 23-4 as an example, and explain 401 in Cooke's Second Edition, using figure 27-4 as an example.
9. Assigned as reading material, pages 234-350 in Cooke's First Edition, and pages 401-408 in Cooke's Second Edition.

Lesson 15

Trigonometric Functions - Introduction to Magnetism

INTRODUCTION AND OBJECTIVE

Mathematics will concern the same topic as last period. We will continue to study the trigonometric functions. In the electronics portion of the class, you will be introduced to magnetism. In lab we will discover how to extend the range of the current meter.

MATHEMATICS

1. Review the basic trigonometric functions.

2. Work problems 23-1, pages 344-345, in Cooke's, Mathematics for Electricians, First Edition, and problems 27-1, pages 402-403, in Cooke's, Basic Mathematics for Electronics, Second Edition.

3. Read pages 345-347, in Cooke's First Edition and pages 403-405, in Cooke's Second Edition.

4. Study the signs of the functions, page 346, in Cooke's First Edition and pages 404-405, in Cooke's Second Edition.

5. Study 23-8, Functions of 45°, page 349; 23-9, Functions of 60° and 30°, page 349; and 23-10, Functions of 0°, page 350, in Cooke's First Edition.

   Study 27-8, Functions of 45°, pages 406 and 407; 27-9, Functions of 60° and 30°, pages 407 and 408; and 27-10, Functions of 0°, pages 408 and 409, in Cooke's Second Edition.

6. Study and review line representation of the functions.

7. Assign problems 23-3, page 355, in Cooke's First Edition and problems 27-3, page 412, in Cooke's Second Edition.

8. Assign as reading material pages 356-366, in Cooke's First Edition and pages 413-423, in Cooke's Second Edition.

ELECTRONICS

1. Review the lab assignment.

2. Introduction to magnetism, pages 162-177, in Slurzberg's, Essentials of Electricity for Radio and Television.

Lesson 15-A
Current Meters

INTRODUCTION AND OBJECTIVE

In the voltmeter lesson we learned that even the voltmeter depends upon the flow of electrons for its operation. In this lesson we will learn how we can take a basic meter-movement and make it read the current scale that we need. The ammeter is actually a simple parallel circuit.

REFERENCES

MATERIALS AND EQUIPMENT USED

0-1 ma meter and the vacuum-tube voltmeter

NEW TERMS

1. Shunt
2. Full-scale deflection

PROCEDURE

1. What is the full-scale deflection of your meter?
2. What is the resistance of your meter movement?
3. What is the voltage drop across your meter at full-scale?
4. Compute the value of shunt required to convert the basic movement to a 0-10 ma meter.
5. Design a circuit that will allow us to test your meter, but call the instructor before testing.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 15-A (Con't.)

Current Meters

QUESTIONS

1. Compare the voltage across the shunt with that across the meter movement.
2. Compare the resistance of the shunt with that of the meter movement.
3. Compare the current through the shunt with that of the meter movement.
4. Compare the value of shunt needed to convert your meter to a 0-100 ma meter.
5. Compute the value of shunt needed to convert your meter to a 0-1 ammeter.
6. What precautions must we observe when using a current meter?
7. What is the purpose of the shunt?
8. Will a good ammeter show a great amount or a small amount of resistance? Why?
9. Summarize the experiment.

Lesson 16

Review of Mathematics - Ohmmeter and Current Meter

INTRODUCTION AND OBJECTIVE

In this lesson there will be a review of all the math to date. In the electronics portion we will discuss the ohmmeter and the current meter. There will be a test to see what you have learned to the present in both math and electronics. No new material will be discussed as we will possibly have new people about the time we discuss the section in the book on alternating current.

MATHEMATICS

1. Review.

2. Work a few of the series and parallel problems on pages 156-161 in Slurzberg's, Essentials of Electricity for Radio and Television.

ELECTRONICS (New terms for discussion)

1. The ohmmeter

2. Multiplier

3. Limiter

4. Zero adjustment

5. Hand out lab Lesson 16-A, "The Ohmmeter", and explain fully.

6. Give tests.

MATH QUIZ

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

NAME ______________________________

1. Solve for x. $21 - 15x = -8x - 7$

2. Solve for R. $P = I^2R$

3. Express as numbers between 1 and 10 to a power of ten:

   a. 643,000,000

   b. 0.0000000000125

4. Solve:

   a. 13.5 kv equal ______________ volts.

   b. 0.350 amps equal ______________ milliamperes.

   c. 165,000 ohms equal ______________ megohm.

   d. 36.5 kw equal ________________ milliwatts.

5. The potential across a 600 ohm resistor is 1.73 volts. How much current is flowing in the circuit?

6. A voltmeter connected across a 1500 ohm resistor reads 3 volts:

   a. How much power is being expended in the resistor?

   b. How much current flows in the resistor?

7. Find the joint resistance of 10, 15 and 30 ohm resistors connected in parallel.

8. Find the joint resistance of 500 ohms and 250 ohms connected in parallel.

9. You have three 12 ohm resistors. Draw a schematic of how you would connect them to have a total resistance of 18 ohms.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 16-A
The Ohmmeter

INTRODUCTION AND OBJECTIVE

This lesson is designed so that we will be able to take our basic meter movement and construct a meter that will use Ohm's Law. A meter that will have the value of resistance calibrated on the dial. We know by now that all meters depend upon current flow for their operation.

REFERENCES

Henney, Keith, Principles of Radio, John Wiley and Sons, pp. 60-61.

Marcus, Elements of Radio, Prentice-Hall, Second Edition, pp. 378-379, 383.

Oldfield, Radio, Television and Basic Electricity, American Technical Society, pp. 103-104.

Sams, Howard W., Basic Electricity, First Edition, Lesson 14, Bobbs Merrill.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 222-225.

MATERIALS AND EQUIPMENT USED

0-1 or 0-10 ma meter, 500 ohm potentiometer, and assorted resistors

PROCEDURE

1. Connect the circuit below. R-1 must be computed much as the voltage multiplier in the voltmeter. Using the available voltage and meter-movement compute R-1 to give full scale deflection when the circuit is shorted. Choose R-1 to be a value of 250 ohms less than the computed value to allow for the potentiometer.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course III

Basic A-C D-C

Lesson II-A (Con't.)
The Ohmmeter

2. Short the test leads and adjust for full scale deflection. Draw a meter face on your paper and label full scale deflection as zero.

3. Open the test leads, the meter will now read no deflection. It is measuring infinity. Notice that the circuit is not drawing any current now. This type of an ohmmeter is a series ohmmeter, and the leads must be left open when not in use to prevent the batteries from running down.

4. Compute the value of resistance that you would have to measure in order to get one-quarter, one-half, and three-quarter scale deflection.

5. Get resistors close to these values and test your meter.

QUESTIONS

1. What is the center scale marking on a series ohmmeter using a 50 ma meter that has a resistance of 2,000 ohms? Use a battery of six volts.
2. Upon what does the center scale reading of a voltmeter depend? Explain.
3. What must we be sure to take into consideration when using an ohmmeter?
4. What must we take into consideration when measuring resistance in a radio circuit?
5. What is a shunt type ohmmeter?
6. Why must a shunt ohmmeter have a switch to turn it off and on?

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 17
Magnetism

INTRODUCTION AND OBJECTIVE

The study of magnetism is essential in order that you understand alternating current. This lecture will be almost entirely about magnetism. In the laboratory, you will be introduced to a new piece of equipment, the oscilloscope.

ELECTRONICS

1. Maxwell - one magnetic line
2. Magnetic flux - total magnetic lines leaving or entering a pole
3. Oersted - unit of field intensity
4. Flux density - B - number of magnetic lines per sq. cm. in a perpendicular field
5. Reluctance · opposition - not constant in magnetic fields
6. Gauss - unit of magnetic inductance
7. Reluctivity
8. Permeance - the reciprocal of reluctance
9. Retentivity - the ability of a material to hold its magnetism
10. Assign as reading material, pages 177-179 in Slurzberg's, Essentials of Electricity for Radio and Television.
11. The magnetic field surrounding a wire carrying a current
12. Demonstrate Fig. 5-29 on page 183 in Slurzberg, if possible.
13. Relation of magnetic field to electron flow
14. The magnetic field about a wire increases as the current decreases.
15. Left-hand rule
16. Coils
17. Assign related reading material in Slurzberg.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 17-A
Cells and Batteries

INTRODUCTION AND OBJECTIVE

We have to date used only DC electricity. That is electricity that flows in one direction only. We have obtained this power from cells and batteries. This lesson is designed to give you some background in the chemical action that takes place in a cell or battery.

REFERENCES

Henney, Keith, Principles of Radio, John Wiley and Sons, pp. 41-42.

Marcus, Elements of Radio, Prentice-Hall, Second Edition, pp. 336-344.

Sams, Howard W., Basic Electricity, Twelfth Edition.

Slurzberg, Essentials of Electricity for Radio and Television, McGraw-Hill Book Company, pp. 59, 87-115.

MATERIALS AND EQUIPMENT USED

Several cells or batteries, wires and the voltmeter

PROCEDURE

1. Connect at least three cells in series, read the total voltage.

2. Connect at least three cells in parallel and read the total voltage.

QUESTIONS

1. Explain the difference between a cell and a battery.
2. Upon what does the amount of voltage a cell develops depend?
3. What does the voltage developed by a battery depend?
4. What is the ampere hour rating?
5. Connecting batteries in series will change what rating of the battery?
6. Connecting batteries in parallel will change what rating?
7. What type of electricity does your car depend?
8. What keeps the battery in your car from becoming discharged?
9. Summarize.

Lesson 18
Theory of the Alternating Current

INTRODUCTION

This is the first lesson concerning the alternating current theory. Just as in the basic D-C theory, the first few lessons are the most important. It is essential that you understand its basis before taking on more complex ideas. The lecture in electronics will begin with magnetism. Math will consist of the trigonometric functions necessary for the study of A-C theory.

ELECTRONICS

Objective: The objective of this lecture period is to introduce the student to the basic theories of magnetism. There will be many new terms. These terms may occasionally have other meanings in every day usage. Don't confuse them.

REFERENCE

Slurzberg, Morris, and William Osterheld, Essentials of Electricity for Radio and Television, Second Edition, McGraw-Hill Book Company, Inc., New York, 1950, pages 169-186.

EXPLANATION

1. Terms
   - a. Magnetic field
   - b. Magnetic flux
   - c. Magnetic lines
   - d. Lines of force
   - e. Field intensity
   - f. Flux density
   - g. Magnetic induction

2. Magnetic properties
   - a. Reluctance
   - b. Permeance
   - c. Retentivity

3. Physical shapes of magnets
   - a. Horseshoe
   - b. Bar
   - c. Laminated

4. Magnetic field due to current flow
   - a. Field around a current carrying wire
   - b. Relationship of field and amount of current flow
   - c. Relationship of field and direction of current flow

5. Left hand rules

6. Field around a coil

TEACHERS OUTLINE

Lesson 18-A
Scope Controls

INTRODUCTION

The oscilloscope has come into use with television and radar. It can be very useful in all of our work and should be thought of as one of our fundamental instruments. This lesson will acquaint you with the many knobs on the scope.

MATERIALS

The scope and manufacturer's manual

PROCEDURE

1. Place the scope on a wooden bench or leave it on its stand if it is mobile.

2. Turn on and allow the unit to warm up.

3. Advance the intensity control unit until a spot is seen. You may have to rotate the positioning controls to locate the spot.

4. Turn the course frequency control to a mid-frequency.

5. Rotate the focus to get the sharpest line.

6. Set the intensity to the best setting.

7. Turn the vertical gain to maximum counter-clockwise.

8. Place your hand on the vertical input and rotate the vertical gain with the other.

9. Touch your other hand to the cabinet.

10. Connect a lead from the test jack on your scope to the vertical input.

11. Set the course and fine frequencies control until one or two complete cycles appear on the screen.

12. Change the horizontal gain through its position.

13. Set the sweep selector switch to the external position.

ASSIGNMENT SHEET

Course II — Basic A-C D-C

Lesson 18-A (Con't.)
Scope Controls

14. Place your finger on the horizontal input.

15. Place the sync selector to line.

16. Return the sweep selector to internal and adjust for one or two cycles.

17. Rotate the positioning controls and notice the effect.

QUESTIONS

1. What great advantage does the scope have over other instruments we have used?
2. What is the purpose of the cathode-ray tube?
3. What is the purpose of the heater, the cathode and the control grid in the cathode ray tube?
4. Which control on the scope varies the bias on the control grid?
5. What is the purpose of the first and second anodes?
6. Explain the deflection system of the scope.

Lesson 19

Magnetism and A-C Math - The Scope

INTRODUCTION

This lesson is a continuation of the study of magnetism and a-c mathematics. There is a lot of math and theory to be covered before the student is ready for a-c lab work. A short scope lab practice will help you to understand this valuable piece of test equipment and to appreciate its uses.

MATHEMATICS

Objective: In order to understand a-c theory, you must know how it is generated and its characteristics. We will resume where we left off in the last lesson.

Lesson 19-A
A-C Scope Calibration

OBJECTIVE

The object of this lesson is to prepare the student to calibrate the oscilloscope to be used as a measuring device for alternating current voltages.

MATERIAL USED

Oscilloscope, various a-c sources and a vacuum tube voltmeter

PROCEDURE

1. Calibrate the oscilloscope using the calibrating voltage on the scope. (Be sure to measure or determine the voltage with the VTVM to assure correct calibration.)

2. Measure the following a-c voltages:

   a. The voltage off the power transformer secondary of the RCA Trainer.

   b. The voltage off the secondary of T_1 in the voltage tripler chassis.

   c. The voltage off the filament transformer supplied to the tables.

3. Using the voltage from the box on the table, perform the following: (R_1 is 220 ohms, R_2 is 820 ohms, R_3 is 2700 ohms and R_4 is 10k ohms).

   a. Connect R_1 and R_2 across the transformer and measure the voltage across each one with the scope and VTVM.

   b. Repeat with the following groups of resistors: (1) R_2-R_3, (2) R_3-R_4, (3) R_2-R_4, (4) R_1-R_4.

QUESTIONS

1. Does Ohm's Law still apply to a-c circuits of this type?
2. Does Kirchoff's Law apply to a-c circuits in which resistors are used?
3. Which do you think has the greater accuracy, the oscilloscope or the vacuum tube voltmeter? Why?

Lesson 20
Trigonometry Applied to A-C Problems

INTRODUCTION

So far we have had a lot of discussion concerning angles and trig functions. We will soon be applying this to the solution of actual circuit problems This lesson will be a continuation of the last one.

MATHEMATICS

Objective: This lesson will attempt to teach the student the trig functions necessary for the solution of certain a-c problems and how to apply the functions to the actual problems.

REFERENCES

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 20-A
Scope Lab Practice

OBJECTIVE

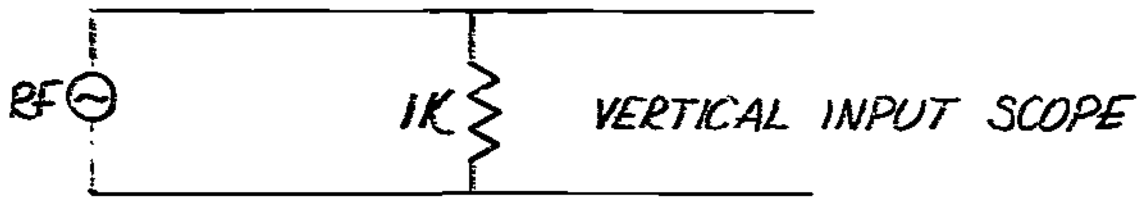
To calibrate the scope for reading a small AC signal. The signal used will be of the rf type in the 100 millivolt range.

MATERIAL USED

Scope, WR 49-B signal generator, used as a 100 kc source, 1000 ohm terminating resistor and a vacuum tube voltmeter.

PROCEDURE

1. Use the following set-up circuitry, steps 4-7.



2. Measure a-c calibrating voltage on the scope with the VTVM.

3. Calibrate the scope with this voltage.

4. Now using the voltage multiplier switch on the scope, set it to read the rf signal of 100 millivolts or 0.1 volts.

5. Verify your reading with the instructor.

6. Slowly change the frequency of the signal generator and watch the amplitude of the rf signal measured on the scope. This indicates that the amplitude of the signal will change with a change in frequency on this particular generator.

7. Set the sweep frequency switch on the scope so that it shows a single sine wave. Have the signal generator set at 100 kc at this time. Again slowly increase the frequency of the signal generator and the sweep frequency of the scope to keep the sine wave. Note the frequency on the signal generator when the scope will no longer follow.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 20-A (Con't.)
Scope Lab Practice

QUESTIONS

1. As the frequency is increased on the WR 49-B, what happens to the amplitude of the signal?

2. At what frequency are you no longer able to obtain a single sine wave on the scope?

Lesson 21

Trig Functions - Cycle and Frequency

INTRODUCTION

This lesson will be a continuation of the math and trig functions that we have been working with for the last few lessons. We will work some problems using these functions. In the electronics portion more a-c theory will be covered concerning cycle and frequency and we will have a discussion of instantaneous values.

MATHEMATICS

Objective: In the math portion we will continue to use the functions for the solution of angles and especially those of the most used angles. Trig is interesting if you apply yourself when studying the basics.

Lesson 21 (Con't.)

Trig Functions - Cycle and Frequency

ELECTRONICS

Objective: The purpose of this portion of lecture will be to explain additional characteristics of alternating current. We will use some of the trig functions previously discussed.

REFERENCE

Slurzberg, Morris, and William Osterheld, Essentials of Electricity for Radio and Television, Second Edition, McGraw-Hill Book Company, Inc., New York, 1950, pp. 241-249.

EXPLANATION

1. Define alternation, cycle and frequency.

2. Instantaneous values
   a. The sine wave
   b. Maximum value
   c. Average value
   d. Effective or RMS value

3. The a-c ampere

NEXT WEEK'S ASSIGNMENT

1. Read pages 241-249 in Slurzberg's, Essentials of Electricity for Radio and Television.

2. Work problems 12-15 on page 264 in Slurzberg's, Essentials of Electricity for Radio and Television.

3. Work problems 22-27 on page 265 in Slurzberg's, Essentials of Electricity for Radio and Television.

Lesson 22

Solution of Right Triangles - Inductive Reactance

INTRODUCTION

This lecture period will consist of a continuation of previous material. Quite a bit of theory and math must be covered before you are ready for the next lab exercise, which will be on inductive reactance. In the electronics lecture, you will be introduced to inductance and inductive reactance.

MATHEMATICS

Objective: To apply trig functions to the solution of right triangles.

REFERENCES

Cooke, Nelson M., Mathematics for Electricians and Radiomen, First Edition, McGraw-Hill Book Company, Inc., New York, 1942, Chapter 25, pp. 371-381.

Cooke, Nelson M., Basic Mathematics for Electronics, Second Edition, McGraw-Hill Book Company, Inc., New York, 1960, Chapter 29, pp. 428-439.

EXPLANATION

1. The solution of a problem concerning the right triangle.

2. Work as many examples and problems as time will permit.

ELECTRONICS

Objective: The opposition to direct current is called resistance. With alternating current, we have other opposition besides resistance. This is called reactance. In this lesson, we will discuss inductive reactance. This is one of two types of reactance. The other, capacitive reactance will be covered later.

REFERENCE

Slurzberg, Morris, and William Osterheld, Essentials of Electricity for Radio and Television, Second Edition, McGraw-Hill Book Company, Inc., New York, 1950, Chapter VIII, pp. 267-306.

EXPLANATION

1. Definition of inductance and inductive reactance

2. Factors affecting inductance

Lesson 22 (Con't.)
Solution of Right Triangles - Inductive Reactance

3. Time constant and angle of lag

4. Impedance

NEXT WEEK'S ASSIGNMENT

1. Read Slurzberg's, Essentials of Electricity for Radio and Television, on pages 267-280 and 284-287, and work the problems 18-24 on page 304.

Course II

Basic A-C D-C

Lesson 23

Right Triangles - Circuits Containing Inductance

INTRODUCTION

In this lesson period we will continue the study of a-c. The math will mainly on the solution of problems concerning right triangles. The electronics lecture will be on inductance and inductive reactance. We have a lab exercise called "Inductive Reactance". It will help you to understand the principle of inductance and to apply some of the math that you have learned.

MATHEMATICS

Objective: In this math portion we will study the solution of problems concerning the right triangle. This is an absolute necessity for the understanding of alternating current.

REFERENCES

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 23-A
Inductive Reactance

OBJECTIVE

In this lab lesson you will take an rf type choke of unknown value and find its value. You will use a known frequency a-c voltage and a resistance. You will also use the oscilloscope as a voltage measuring instrument.

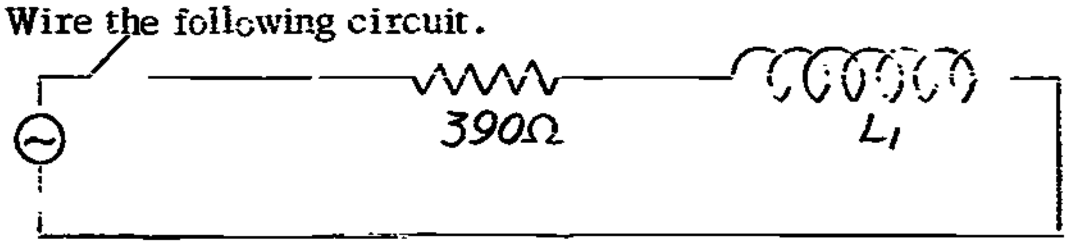
MATERIALS USED

RF generator to supply 100 millivolts at 100 kc., VTVM, oscilloscope, an unknown value rf choke, a 390 ohm resistor and a resistor equal to the dc resistance of the choke.

PROCEDURE

1. Measure the resistance of the choke with the ohmmeter. Measure the resistance of the resistors with the ohmmeter and record.

2. Wire the following circuit.



3. Complete the following table. (Be sure to show examples of your calculations used in conversion.)

	P-P	RMS
ET		
ER		
EL		

4. Replace the coil with the equal resistor and repeat the experiment if possible.

5. Have the instructor demonstrate how to measure the inductance of the choke on the Q meter (inductance bridge).

QUESTIONS

1. Compute I of step 3 and step 4. How do they compare?

2. Compute X_L of the choke.

Lesson 24

Inductance in Series or Parallel

INTRODUCTION

Math will be more practice concerning the solution of problems concerning triangles. Practice makes perfect is a good rule to follow, so we will work several examples. Just as certain rules apply for resistance in series and parallels, so do certain rules apply when we place inductance in series or parallel. In the electronics lecture we will discuss these rules.

MATHEMATICS

Objective: We intend to further your proficiency with trig functions in the solution of problems concerning right triangles. You have possibly reasoned that you must apply some of this math to the lab lesson on inductive reactance. Listen closely and be sure to ask any questions that you may have.

Lesson 25
Instantaneous Values in A-C

INTRODUCTION

Understanding what we mean by instantaneous values is essential in a-c study. We will work several problems of this type in the math period. In the electronics portion we will discuss several inductive terms and properties. You will be introduced again to a "must know" formula for computing inductive reactance.

MATHEMATICS

Objective: With this lesson you should be able to solve most of the fundamental problems concerning instantaneous values. We will work several problems. Be sure to work as many problems in your spare time as possible. Our time in class should be for the introduction of new material, so we can't spend too much time on practice.

REFERENCES

Lesson 25-A
Series Inductance

OBJECTIVE

To observe the effect upon voltage, current and impedance when inductances are connected in series.

MATERIALS USED

Scope, VTVM, 2 rf chokes, 330 ohm resistor and the RCA WR 49-B rf signal generator which will be used as a 125 kc signal source at a 100 millivolt level.

PROCEDURE

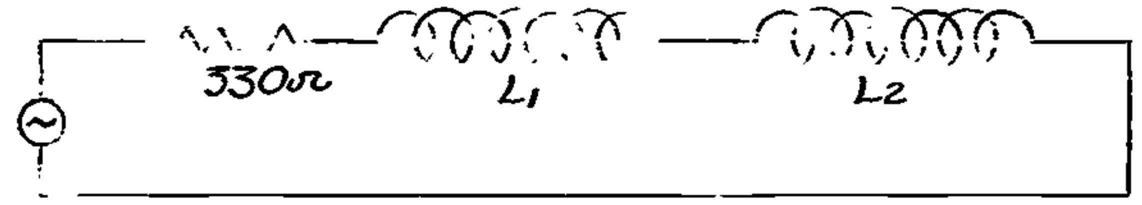
1. Measure the inductances on the Q meter and record. Let the larger inductor be L_1.

   L_1 ________________ L_2 ________________

2. Connect the two in series and measure on the Q meter.

   L_t ________________

3. Wire the following circuit.



4. Measure and record the following: E_t, E_{L_1}, E_{L_2}, E_r and E_{L_t}.
5. Compute E, I and total inductance using the experimental method explained for the last lesson.

QUESTIONS

1. Write a formula to describe inductances in series.
2. Write a formula describing total inductive reactance in series.
3. Compare the computed value in step 5 to the measured value in step 2 and the value obtained from the formula in question 1.
4. What would happen if the lines of force from one coil were to reach the other?
5. What is the phase relationship in L_1, L_2, and R?

Lesson 26
Series and Parallel Capacitive Reactance

INTRODUCTION

As stated before, inductive reactance was only one of two types of a-c opposition, the other being capacitive reactance. In this lesson, you will be introduced to capacity and to the opposition it produces, capacitive reactance. Note how capacity and inductance compare.

MATHEMATICS

Objective: In this math period, we will work problems which will help in the solution of capacitive circuits.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 27-A
Capacitive Reactance

OBJECTIVE

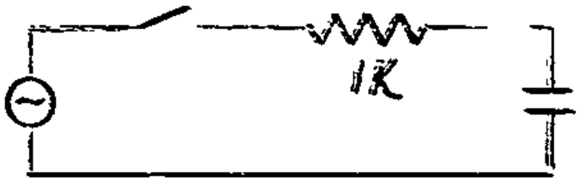
To observe and study the effect on voltage, current, and impedance, in a capacitive circuit.

MATERIALS USED

1. Four capacitors, 0.01 mfd, 0.022 mfd, 0.033 mfd and 0.047 mfd; scope; vacuum tube voltmeter; 1,000 ohm resistor and RCA WA-44C signal generator, used as a 5 kc, 2 volt peak to peak source

PROCEDURE

1. Measure and record each capacitor with the condenser checker. You will have to use all one checker, so while you are waiting, go ahead with the following.
2. Construct the following circuit. Use the 0.01 mfd capacitor first.



3. Record E_t, E_r, E_c. Compute I, X_c, and C.
4. Repeat steps 2 and 3 for the other three capacitors.
5. Compute Z for each capacitor-resistor combination.

QUESTIONS

1. How does F affect C?
2. What is the phase relationship in a capacitor?
3. How does the phase in a capacitor compare with an inductor?
4. Which capacitor has the largest reactance?
5. Summarize.

Notation and Conversion - RLC Series Circuits

INTRODUCTION

In this lesson we will study various forms of notation. We will study the conversion from one type of notation to another. In the math portion more a-c problems will be discussed.

MATHEMATICS

Objective. We will discuss RLC series circuits, then go into notation. This study is necessary, as these forms of notation are used in many textbooks and in technical articles and publications.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 28-A
Series Capacitance

OBJECTIVE

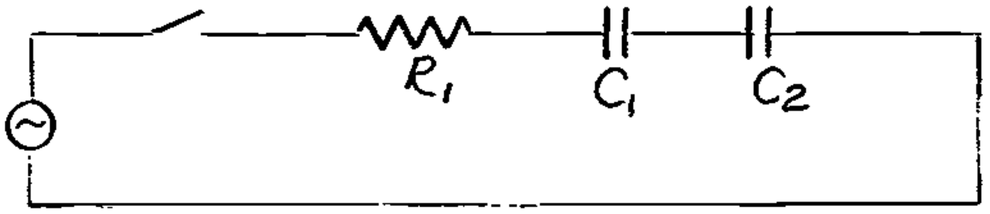
To study the effect of voltage and current in a series capacitive circuit and to study the effect on total capacity and total capacitive reactance when they are placed in series.

MATERIALS USED

RCA WA-44C audio generator, oscilloscope, the capacitor workboard and the following capacitors: C_1-0.01 mfd, C_2-0.022 mfd, C_3-0.033 mfd and C_4-0.047 mfd

PROCEDURE

1. Set up the following circuit using the 0.01 mfd and the 0.022 mfd capacitors.



2. Set the signal generator to 50kc, and the amplitude to 1 vrms.
3. Measure E_t, E_r, and E_{ct}.
4. Compute I, X_c and C_t.
5. Compute C_t using the rated values and formula for series capacitors.
6. Repeat steps 1-7 using the 0.022 and 0.033 capacitors.
7. Repeat steps 1-7 using the 0.01 and the 0.047 capacitors.

QUESTIONS

1. Write a formula for capacitors in series.
2. Compute C_t by the formula. How does it compare to step 4?
3. How does E_{ct} plus E_r compare to E_t?
4. What is the phase relationship in a capacitor?

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 28-A (Con't.)
Series Capacitance

5. Compute Z in each of the three combinations.

6. Draw a vector diagram. Show Z, X_C, R and the phase angle in each combination.

7. Summarize.

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 28-B
Parallel Capacitance

OBJECTIVE

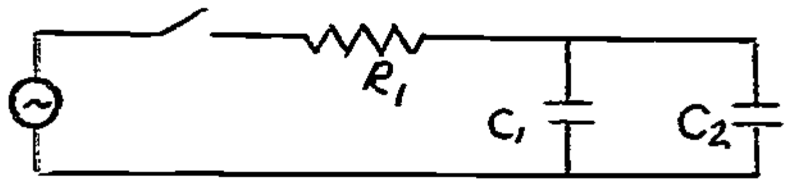
To study and observe voltage and current in a circuit where capacitors are in parallel and to study the effect on total capacity and capacitive reactance in a parallel circuit.

MATERIAL USED

WA-44C, RCA audio generator, scope and capacitor board

PROCEDURE

1. Connect the following circuit using the 0.022 mfd and the 0.033 mfd capacitors.



2. Set the signal generator to 5 kc at a 1 vrms level.

3. Compute I, X_C, and C_t using these measurements: E_t, E_r and E_{ct}.

4. Compute C_t using the formula for parallel capacitors.

5. Repeat steps 1-4 using the 0.01 and 0.033 capacitors.

6. Repeat steps 1-4 using the 0.022 and 0.047 capacitors.

7. Repeat steps 1-4 using the 0.01 and 0.022 capacitors.

QUESTIONS

1. Draw a vector diagram showing X_c, R, Z and the phase angle for each of the four combinations.

2. Write a formula for parallel capacitors.

3. Compute C_t by the above formula and compare it to the calculated C_t in the experiments.

4. How does increasing the frequency affect the I, the C_t and X_C? (Assuming the amplitude is kept the same.)

5. Summarize.

Lesson 29
Resonance in Series and Parallel

INTRODUCTION

We shall continue with a-c study. By now, you are acquainted with inductance and capacitance. Now we will study some new terms. Resonance, both series and parallel, will be discussed.

MATHEMATICS

Objective: The forms of notation are occasionally difficult to understand. But they are not solutions to the problems themselves. They are for simplification of description of a-c circuits.

REFERENCES

Cooke, Nelson M., Basic Mathematics for Electronics, Second Edition, McGraw-Hill Book Company, Inc., New York, 1960, Chapter 33, pages 482-518.

Cooke, Nelson M., Mathematics for Electricians and Radiomen, First Edition, McGraw-Hill Book Company, Inc., New York, 1942, Chapter 29, pages 422-457.

EXPLANATION

1. Review of rectangular and polar coordinates
2. Explain paragraph 14, the general series circuit.
3. Work the example on the series circuit.
4. Series resonance
5. Q
6. The resonant frequency formula

NEXT WEEK'S ASSIGNMENT

1. Work problems 29-5 on page 452 in Cooke's First Edition, or problems 33-5 on page 513 in Cooke's Second Edition.
2. Work problems 29-6 on page 455 in Cooke's First Edition, or problems 33-6 on page 516 in Cooke's Second Edition.

TEACHERS OUTLINE

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course II

Basic A-C D-C

Lesson 29 (Con't.)

Resonance in Series and Parallel

3. Read pages 457-461 in Cooke's First Edition or pages 518-523 in Cooke's Second Edition.

ELECTRONICS

Objective: We will discuss more about series RLC circuits, power, voltage, current, and impedance. At this time you will find it is very difficult to separate math and electronics.

REFERENCE

Lesson 30

Mathematics Applied to Resonant Circuits

INTRODUCTION

Inductance and capacitance are present to some extent in all circuits. Series parallel L and C circuits and the accompanying math will be covered in this lesson.

MATHEMATICS

Objective: To acquaint the student with the math involved in resonant circuits. We will study the "j" factor, inductance and capacitance in series, and assumed voltages.

REFERENCES

EXPLANATION

1. Work problems 29-5 on pages 452 and 453 in Cooke's First Edition, or problems 33-5 on pages 513 and 514 in Cooke's Second Edition.

2. Resonant frequency

3. Parallel circuits
   - a. "J" factor
   - b. Inductance and capacity in parallel
   - c. Vector addition of current
   - d. Assumed voltages

NEXT WEEK'S ASSIGNMENT

1. Work problems 4 and 5 on page 456 in Cooke's First Edition, or problems 4 and 5 on page 517 in Cooke's Second Edition.

2. Read pages 457-467 in Cooke's First Edition, or pages 518-529 in Cooke's Second Edition

ELECTRONICS

Objective: More about RC circuits, resonance and non-resonance circuits will be discussed.

Lesson 30-A

Series Resonance

OBJECTIVE

To study and observe voltage and current in a series resonant circuit.

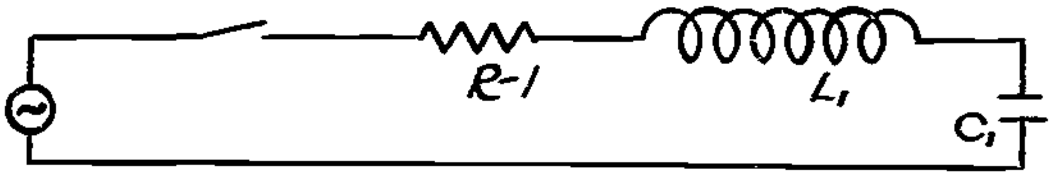
MATERIALS USED

Audio generator, scope, various coils and capacitors

PROCEDURE

A. Find the resonant frequency of the circuit.

1. Wire the following circuit.



2. Set the frequency range switch to X1000 and find the resonant frequency of L and C. Resonance is that frequency where E_c and E_L are equal since X_c and X_L are equal. To check, place the scope across L and C in series and observe a null on the voltage amplitude by slowly varying the frequency.

3. Check the capacity of C on the capacitor checker and assume this to be the correct capacity.

4. From this information compute the value of L.

B. Construction of a series circuit resonant at 30,000 cps.

1. Compute the C required to resonate with L (step 4) at a frequency of 30,000 cps.

2. Acquire this capacity by paralleling and checking with the capacitor checker.

3. Construct a series circuit to see if resonance is obtained.

QUESTIONS

1. How did the computed L compare with the rated or measured L?

Lesson 30-A (Con't.)

Series Resonance

2. How did you find the resonant frequency of the original circuit?

3. What capacity did you use in the 30, 000 resonant circuit?

4. At what resonance in a series circuit, is current maximum or minimum?

5. Compare X_L and X_c at resonance.

6. What is the phase angle at resonance?

7. In step A, what is the Z of the circuit at resonance?

8. Summarize.

Lesson 31

Solution of RLC Circuit Problems

INTRODUCTION

The solution of RLC circuit problems is quite complex at times. In this lesson we will go ahead with the discussion of RLC circuits. The lesson will be predominantly math as we have covered the theory fairly well.

MATHEMATICS

Objective: We will work several math examples to further your acquaintance with parallel RLC circuits.

REFERENCES

Cooke, Nelson M., Basic Mathematics for Electronics, Second Edition, McGraw-Hill Book Company, Inc., New York, 1960, Chapter 34, pages 518-546.

Cooke, Nelson M., Mathematics for Electricians and Radiomen, First Edition, McGraw-Hill Book Company, Inc., New York, 1942, Chapter 30, pages 457-483.

EXPLANATION

1. A-C parallel circuits
2. Assumed voltages
3. Resistance and inductance in parallel
4. Resistance and capacitance in parallel

NEXT WEEK'S ASSIGNMENT

1. Read section 30-6 on pages 463-464 in Cooke's First Edition, or 34-6 on pages 518-519 in Cooke's Second Edition.
2. Work problems 30-1 on page 466 in Cooke's First Edition, or 34-1 on page 529 in Cooke's Second Edition.

ELECTRONICS

Objective: A theory review should assist you in understanding what we've been talking about in the last few lessons. We intend to clarify any questions you may have on RLC circuits in this lecture period.

Lesson 31 (Con't.)
Solution of RLC Circuit Problems

REFERENCE

Slurzberg, Morris, and William Osterheld. Essentials of Electricity for Radio and Television, Second Edition. McGraw-Hill Book Company, Inc., New York, 1950. Chapter X, pages 357-392.

EXPLANATION

1. Series RLC circuits
   - a. L, C, and a-c source are in series.
   - b. X_L is equal to X_C.
   - c. At F_r, current is maximum.
   - d. At F_r, circuits act as a low resistance.
   - e. E_C and E_L are 180° out of phase.
   - f. I_C, I_L, and I_t are equal.
   - g. E_C or E_L may be larger than E_a.
   - h. Increasing R decreases I.
   - i. Increasing L or C lowers F_r.
   - j. Decreasing L or C lowers F_r.
2. Parallel RLC circuits
   - a. Discuss 10 steps on page 375.
   - b. Work example 10-4.

NEXT WEEK'S ASSIGNMENT

1. Read section 10-10 on page 378, parallel-series circuits, in Slurzberg.
2. Work example 10-15 on page 379 in Slurzberg.
3. Work problems 30-32 on page 389 in Slurzberg and HAND IN.

LAB

Continue series resonance. Explain some experiments the students may wish to perform. Changing L, C, or F are examples.

NEXT WEEK'S ASSIGNMENT

1. Work problems 35, 36, and 37 on page 390 in Slurzberg and hand in.

ASSIGNMENT FOR FINAL EXAM

1. Questions at the end of chapters 8, 9, and 10 in Slurzberg

LAB

1. Explain a parallel resonant circuit and have the students select their own components and equipment. Have them write up and explain.

2. All lab write-ups must be in by the next meeting.

Course II

Basic A-C D-C

Lesson 33
RLC Circuitry - Math

INTRODUCTION

This is more math concerning the RLC circuitry. This will be the final lesson on a-c math and theory as such. Many problems will be worked and theory will be discussed. In the next lesson we will review the a-c semester of the course, both math and theory. The final exam will be given the following meeting.

MATH AND ELECTRONICS

Objective: To help the student understand a-c math and theory more clearly.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRONIC TECHNICIANS, TRANSISTORS, VACUUM TUBES, *ELECTRONICS, HIGH SCHOOLS, EXPERIMENTS, ASSIGNMENTS, INDIVIDUAL INSTRUCTION,

The purpose of this course is to introduce the high school electronic technician student to the applications of vacuum tubes and transistors. This study guide was developed by a vocational coordinator and personnel of the electronic industry. The course was designed on the concept and philosophy of using individual assignment sheets to allow each student to progress at his own rate and to enable the teacher to devote most of his time to individual instruction. Emphasis is placed upon audio application and the study of RF, IF, and oscillator circuits. The lessons are experimental in nature. Assignment sheets for each of the 19 lessons provide a lesson introduction, textbook references, a materials list, a schematic drawing, and job procedures. Questions are given at the end of each job to test the student's comprehension of the completed work. Mathematics and theory are included and taught as needed. This book is designed for teacher use only. The student is to use the assignment sheets in loose unbound form. When he completes an assignment sheet, he returns it to the teacher and secures the next sheet. The student taking the course should have mastered the theory and basic understanding of the vacuum tube and transistor in previous courses. This document is available for 85 cents from the Division of Industrial Education, Indiana State University, Terre Haute, Indiana 47809. (HC)

ACKNOWLEDGEMENT

Appreciation and acknowledgement is made to Tom Beckerd, Vocational Coordinator and Supervisor of Bloomington High School and David Link of Sarkes-Tarzian Company, Bloomington, Indiana, who in cooperation with other members of the Bloomington electronic industries, made possible the development of this course.

PREFACE

This is the age of technological change and advancement. Electronics is a vital part of this technological upheaval. Every aspect of our lives - military, production, education, communications, entertainment, health - is being influenced by the impact of electronics.

In order for our technology to continue its swift advancement, electronic technicians must be available. These technicians must be trained on modern equipment and devices. They must be trained in both theory and application.

This course in Vacuum Tube and Transistor Application is designed for the technician who has mastered the theory and basic understandings of these two all-important electronic devices. Emphasis is placed upon audio application and the study of RF, IF, and oscillator circuits. The lessons are experimental in nature. By following a logical sequence of jobs in which he learns basic technical skills, the student is taught electronic, radio and television principles which contribute to his technician preparation. The required materials, references, schematics, and procedures are clearly set forth. At the end of each job, questions are posed to test the student's comprehension of the completed work. Mathematics and theory are included and taught as needed.

This course is another block in the foundation of electronic skills and understanding which all qualified technicians must have.

DIRECTIONS TO THE INSTRUCTOR

This course has been developed around the concept and philosophy of using individual assignment sheets. If these sheets are used correctly, each student will be allowed to progress at his own rate. The abilities of all will be developed to their fullest extent.

The instructor only, should use this book. The loose individual assignment sheets are used by the students. The following method of operation has proven satisfactory:

Each student should have two folders in the file; one for the "completed" work, the other for the "incomplete" work. The assignment sheets should be filed in consecutive order in another drawer. The instructor should lay out the student folders before class time. This prevents congestion and a bottleneck around the file cabinet at the beginning and ending of class. When a student completes and assignment sheet, he turns this into the instructor, then secures the next sheet.

Test are included periodically. These may be used to identify the mathematical ability of each student. This makes it possible to start the students at the proper level in the course. The tests may also be used in the traditional manner.

If the course is used as it should be, the instructor will be freed of many routine activities and will be able to devote his time almost entirely to individual instruction.

It must be kept in mind that the assignment sheets are only a teaching aid or device. Adequate instruction is still needed.

An accurate record of each student's progress should be kept by the instructor.

Course IV

Basic Vacuum Tube and
Transistor Application

Lesson 1
Audio Amplifier System Laboratory

Introduction:

This lesson is to acquaint the student with the electrical characteristic of a quality audio amplifier.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 301-310.

2. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1959. pp. 111-121.

Materials:

1. VTVM -(Vacuum tube voltmeter)
2. Scope
3. Chassis 121-26 Audio power amplifier
4. Chassis 121-29 Phase splitter
5. Chassis 121-28 Audio voltage amplifier
6. Chassis 121-1 Power supply
7. Chassis 121-2 Regulator
8. Audio generator

Schematics:

1. Use schematic #S-IV-1 (appendix). See instructor.

Procedure:

1. Assemble chassis 28, 29, and 26 to form a standard audio amplifier.
2. Turn volume control on chassis 28 maximum clockwise.
3. Using regulated power supply adjust E_B for 250 volts.

4. Use 10 ohm resistor load provided on stand.

5. Apply 1 KC signal at input and adjust matching transformer for maximum signal.

6. Adjust audio generator for maximum undistorted output from amplifier as viewed on oscilloscope.

7. Calibrate scope and record value of output.

8. Check the amplifier for balance at phase splitter, output grid, and output plate, record signal level.

9. Is the amplifier balanced?

10. Remove cathode bypass from power amplifier.

11. Measure AC voltage across cathode resistor.

12. What is the frequency of step 11? What causes it?

13. Remove one output to simulate unbalanced output.

14. Again measure AC signal across cathode resistor and determine frequency. Explain.

15. Replace both output tubes and check output signal (across load) for 60 cycle by placing scope sweep on line frequency.

16. Return equipment to original condition and set for maximum undistorted output at 1 KC.

17. Compute power out

$$P_o = \frac{(E_o)^2}{R_o} \qquad P_o = \frac{(E_o)^2}{10}$$

Compute power in

$$P_{in} = \frac{(E_{in})^2}{Z}$$

Z determined output of generator.

18. Compute power gain of amplifier.

19. Complete chart, figure 3, page 107 of Lab Manual.

20. Plot gain in DB in reference to 1 KC on chart like #G-IV-1 (appendix). See instructor.

21. Have the instructor simulate a typical trouble and you locate it by signal tracing.

Questions:

1. A push pull power amplifier provides less (odd, even) harmonic distortion than a single ended stage.

2. Convert the following power ratios to decibels.

   a. 100 to 1---------------db

   b. 1000 to 1--------------db

   c. 10000 to 1-------------db

3. A push pull power amplifier does not ______________ the output transformer core.

4. Gas in a tube generally causes a (larger, smaller) than normal plate current.

5. A (shorted, open) cathode bypass capacitor results in distortion because the operating point of the tube is shifted to a (linear, non-linear) part of the characteristic curve.

6. The output signals from chassis 29 are (equal, unequal) in amplitude but are (in phase, 180 degrees out of phase).

7. What components on chassis 29 must be matched?

8. What reference frequency is used in testing the power gain of audio amplifiers?

9. If a microphone is rated at -55 DBM what gain (in DB) would a pre-amplifier stage require to bring the level up to zero DBM?

10. If an amplifier capable of 10 watts output were to be used with the microphone of question 9, to realize full power at 1000 cycles, what overall gain in DB would the system require?

11. Zero DBM is decibels gain referred to one milliwatt in ______________ ohms at ______________ cycles.

12. A class B amplifier conducts plate current for:

    a. 360 degrees of the input cycle.

    b. 90 degrees of the input cycle.

    c. 180 degrees of the input cycle.

    d. More than 180 degrees but less than 360 degrees of the input cycle.

    e. Class B amplifiers never conduct plate current.

Basic Vacuum Tube and
Transistor Application

Lesson 2
Audio Amplifier System Laboratory

Introduction:

The purpose of this lesson is to acquaint the trainee with some of the fundamentals of an AM modulated wave, percentage modulation detector load, and RF filters are all a part of this lesson.

References:

1. Department of the Army Technical Manual TM11-662, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 148-154.
2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 68-79.
3. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. p. 115.

Materials:

1. Scope
2. RF signal generator
3. VOM - (VoltOhmmeter)
4. 100 K Resistor
5. 121-23 (IF amplifier)
6. 121-27 Diode detector
7. 121-1 Power supply
8. 121-2 Regulator

Schematic:

1. No schematic needed.

Procedure:

1. Place 121-1 and 2 in rack. Adjust for B+ of 250 volts.
2. Skip at least one space and then install IF amplifier and diode detector.
3. Place a 100 K resistor across the input connections of the IF amplifier.
4. Place a scope on output of IF amplifier.

5. With all gear on adjust frequency of generator for maximum unmodulated signal on scope. This tunes the frequency of generator to scope.

6. Remove scope leads.

7. Place ground lead of scope on ground.

8. Take following waveforms and explain.

    a. Pin 2 of 7AL5 to ground

    b. Across C_1

    c. Across C_2

    d. Output of detector to ground

9. Adjust modulation control to approximately 75% and complete waveforms a, b, c, and d.

10. Turn equipment off and remove C_1 and R_1. Place earphones in place of C_1. Draw equivalent circuit.

11. Remove IF amplifier and place standard broadcast tuned circuit in place of input of detector.

12. Set modulated generator at 1000 KC and lay cable close to antenna.

    Remarks:

13. Remove earphones and replace R_1 with shorting strip. Place scope on output. Apply 1000 KC signal again.

    Remarks:

14. Remove tube and replace with crystal in socket.

    Remarks:

15. Remove scope and plug in complete audio amplifier.

Remarks:

16. What would be undesirable in the design of a satisfactory communication receiver?

Remarks:

Lesson 3
RF Voltage Amplifier

Introduction:

The fundamental requirement that an RF signal must meet besides frequency is that it must be strong enough to operate the detector.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 75-83
2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 140-157.
3. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1952. p. 111.

Materials:

1. 121 test stand with
   a. 121-1 Power supply
   b. 121-2 Voltage regulator
   c. 121-67 Bias supply
   d. 121-21 RF amplifier
2. RF generator
3. Oscilloscope
4. VTVM-(Vacuum tube voltmeter)

Schematic:

1. Use schematic #S-IV-3 (appendix). See instructor.

Procedure:

1. Set the regulator so that it provides 250 volts.

2. Set the number one grid by using the bias supply connected to the AVC end or R_1 (see schematic) to -1 volt.

3. Place a 600 kc unmodulated signal on the 6BA6 RF amplifier in one of the methods described by your instructor.

4. Tune the RF amplifier tuned circuit for maximum signal at the output jack as viewed on the oscilloscope.

5. Check grid bias and set at minus one.

6. Compute stage gain.

7. Repeat for 800, and 1,000 kc.

8. How does this compare with the theoretical gain of a pentode?

9. Set the RF generator and amplifier to obtain 1,000 kc at output. Plot a curve showing upper and lower sidebands. Mark the 3 and 6 db points.

10. If time permits join this circuit with the detector lesson.

Questions:

1. Which end of the band is the trimmer adjusted? Why?

2. An RF amplifier mainly improves ________________?

3. Why is band width important?

4. Explain - carrier, audio, AM modulation.

Lesson 4
TRF Receiver

Introduction:

TRF receiver was one of the first attempts to make the radio receiver more sensitive. It adds more stage of RF amplifier in front of the detector.

Reference:

1. Morris Slurzberg and William Osterheld, Essentials of Radio Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 441-444.

Materials:

1. The RF voltage amplifier, chassis 21
2. Dio detector, chassis 27
3. Audio voltage amplifier, chassis 28
4. Phase splitter, chassis 29
5. Audio power amplifier, chassis 26

Schematic:

1. No schematic needed.

Procedure:

1. Set the detector audio power amplifier stage in the rack and test for operating condition.
2. Place the RF amplifier stage in front of the detector stage. The equipment is not made to operate in this manner, so check with the instructor for methods of coupling. RC coupling should be used first.
3. Tune in a radio station if possible.
4. Add the second RF stage in front of the first RF. Check with the instructor for methods of coupling.

5. Attempt to tune in a radio station.
6. Return the equipment to its original condition.

Questions:

1. What does TRF refer to, and why was it introduced?
2. Draw a block diagram of a TRF receiver.
3. Describe the purpose of the detector and TRF receiver.
4. Name two common methods of coupling RF amplifiers.
5. Name a disadvantage of a TRF receiver.
6. Would lead dress be a problem in a RF receiver?

Basic Vacuum Tube and
Transistor Application

Lesson 5
Hartley Oscillator

Introduction:

The various mechanical means of generating are not practical. Here we study the vacuum tube used as a generator or oscillator.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 67-75.
2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co.: New York, 1961. pp. 297-299, 596-599.
3. Department of the Army Technical Manual, TM11-662, Basic Theory and Application of Electron Tubes. U.S. Government Printing Office, Washington, D.C., 1959. pp. 165-177.
4. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 165-177.

Materials:

1. Scope
2. VTVM -(Vacuum tube voltmeter)
3. 121-41 RF oscillator
4. 121-1 Power supply
5. 121-2 Voltage regulator

Schematic:

1. Use schematic #S-IV-5 (appendix). See instructor.

Procedure:

1. Place the chassis 41 on table without power applied.

2. Then loosely wind 10 or 12 turns of wire around L_1 and connect the RF signal generator to the coil of wire.

3. Place the scope across the tuned circuit.

4. Close the tuning condenser and adjust the RF generator to get maximum indication on the scope.

5. Repeat with the tuning condenser half way and fully opened. Record all 3 values.

6. Remove the coil of wire from L_1 and place chassis 41 in the test stand.

7. Adjust B+ for 250 volts.

8. Place the scope on the output jack and ground.

9. Rotate the tuning condenser and note the effect on the waveform on the scope.

10. Measure and record all the potentials around the pins of the oscillator tube and explain each.

11. Remove the cathode resistor of the oscillator and explain what takes place.

12. Replace the cathode resistor with its original size. Place a 470,000 ohm resistor in place of the 33,000 ohm grid resistor. Explain what takes place.

Questions:

1. This oscillator generates a (1) sine, (2) square, (3) saw-tooth wave?

2. This is a (1) series, (2) shunt Hartley Oscillator?

3. Draw both a series and a shunt fed Hartley Oscillator.

4. If time permits complete the trouble shooting chart for this lesson.

Transistor Application

Lesson 6
IF Amplifier

Introduction:

One of the disadvantages of the TRF is that each stage must be variable tuned for each station to be received. This makes alignment difficult and lead capacitance critical. The IF amplifier is an example of an RF frequency amplifier which is factory aligned to one frequency or band of frequencies.

References:

1. Department of the Army Technical Manual TM11-662, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. p. 111.

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 605-611, 615-617.

3. Student Laboratory Manual, RCA Electronic Trainer, Model 121. Government Service Department. RCA Service Co., Camden, New Jersey pp. 109-122.

4. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. p. 81.

Materials:

1. 121-1 Power supply
2. 121-2 Voltage regulator
3. 121-23 IF amplifier
4. 121-27 Diode detector
5. Scope
6. VTVM - (Vacuum tube voltmeter)
7. RF generator

Schematic:

1. Use schematic #S-IV-6 (appendix). See instructor.

Procedure:

1. Set the equipment up using a plate supply of 250 volts.
2. Place the ground leads of the VTVM and scope on chassis ground.
3. Place RF generator on input of the IF and ground.
4. Place scope on output of detector.
5. Using 60% modulation tune generator until the output on scope is at a maximum.
6. Note and record output signal voltage.
7. Record AVC signal voltage with VTVM.
8. Remove generator (DO NOT CHANGE AMPLITUDE OR FREQUENCY SETTING)
9. Record voltage out and AVC voltage now present.
10. Replace generator and change frequency until 6 db points are reached on both sides of center frequency.
11. Draw a graph showing frequency response.
12. Fill out the normal circuit chart as shown in the RCA Lab Manual. Ask instructor for blank sheet.

Questions:

1. An IF amplifier improves selectivity of a radio receiver. True or false? Why?
2. What is the resonant frequency of the IF amplifier?
3. Why is the transformer called a double tuned circuit?

Lesson 7
Converter
Complete Radio

Introduction:

A special tube was designed to take the place of both the mixer and oscillator. This was the pentagrid converter.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 123-139 and 311-329.

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 446-459.

Materials:

Complete Radio:

1. Power supply 121-1
2. Regulator 121-2
3. Converter 121-22
4. IF 121-23
5. Detector 121-27
6. Audio voltage amplifier 121-28
7. Phase splitter 121-29
8. Power output 121-26
9. VTVM- (Vacuum tube voltmeter)
10. RF Generator
11. Scope
12. .01 uf Isolation condenser

Schematic:

1. Use schematic #S-IV-7 (appendix). See instructor.

Procedure:

1. Set equipment in correct order to now have a complete radio. Have instructor check before turning on.

2. Set B+ on 250 volts.

3. Place scope on speaker leads and place switch so that resistor is used in place of speaker.

4. Using audio output of RF generator signal trace audio section.

5. Place generator on 455 kc modulated about 60%.

6. Connect generator to ground and through isolation condenser. Connect hot side to grid one of IF amplifier.

7. Short oscillator section of converter to ground.

8. Adjust last IF for maximum deflection on scope.

9. Move hot lead to signal grid of converter and adjust first IF for maximum deflection.

10. Readjust both input and output IF CANS for maximum deflection on scope.

11. You have now aligned the IF to 455 kc.

12. The oscillator section must now be aligned. This one is more involved than most.

13. Remove the short that you previously placed on the oscillator.

14. Set the RF generator at 540 kc. Place hot lead on primary side of converter transformer and ground lead on ground.

15. Close tuning condenser for maximum capacitance.

16. Adjust C_4 for maximum signal. (This is not usually included in commercial radio).

17. Change generator to about 1600 kc and adjust $C3_A$ and C3 open.

18. Readjust C_4 and $C3_A$ for maximum output at scope.

19. Place set on outside antenna and obtain a weak station. Adjust $C1_A$ for maximum signal.

20. You have now completely aligned the radio. Signal tracing can be accomplished by one of these main methods or combinations thereof.

	General Position	Scope Position
A.	Start at last stage and work forward.	Speaker or detector load.
B.	At input	Start forward and work AFT.
C.	Input to any stage	Output of same stage.

21. Obtain a detector probe if possible and use B&C Method for signal tracing.

22. Complete both charts on converter stage. Page 129 and 130 RCA Lab Manual.

23. Have instructor place a trouble in radio for you to locate.

Questions:

1. Explain operation of each tube element in converter.

2. What three operations does converter do?

3. Why are two condensers ganged?

4. Describe a fast way to check to see if oscillator is working.

5. What is image?

6. What is a harmonic?

7. Where does the signal first audio?

8. How would you change bands on a broadcast Superhet radio?

Lesson 8
Radio Trouble-Shooting and Repair

Introduction:

The purpose of this lesson is to do actual repair of a commercial radio receiver.

References:

1. All previous lessons.
2. Schematic of receiver.

Materials:

1. Radio receiver
2. All test equipment as needed.

Schematic:

1. See reference 2.

Procedure:

1. Inspect the line cord, replace if dangerous.
2. Place the receiver on a bench with a wooden top.
3. See if the tubes are lit when the receiver is turned on.
4. If the tubes do not light, turn the unit off and test the tubes.

   Remove ONLY ONE tube at a time. Replace the tube which you have tested, before removing the second tube.
5. If the tubes light try to tune a station. If you are unable to receive a station, follow the steps in testing tubes as outlined in step four.
6. Check to see if the antenna is properly connected.
7. Remove the set from the cabinet.
8. Familiarize yourself with the individual stages of the receiver, by consulting schematic.

9. It is convenient to isolate the troubles to one of the three main sections of the receiver.

    a. Power supply

    b. Audio section

    c. RF and IF section

10. Check B plus. Usually around 100 volts.

11. Signal trace in regular manner.

12. Test oscillator grid for negative voltage, usually around 5.0 volts.

13. By this time you should have located the trouble to a specific area. Turn the receiver off and take some readings with the ohmmeter of the suspected area.

14. Locate the bad part and report to the instructor. He will tell you what to do next.

15. This is only one method for trouble-shooting a receiver. Other methods will be explained at a later time.

Questions:

ASSIGNMENT SHEET

VOCATIONAL ELECTRONIC TECHNICIAN TRAINING

Course IV

Basic Vacuum Tube and
Transistor Application

Lesson 9
Transistor Superhet

Introduction:

In this lesson we will study the characteristics of a complete transistor radio. It is very much like the vacuum tube radio. Some of the differences that should be noted by the students are as follows:

1. Coupling
2. Converter stage
3. Amounts of voltage

References:

1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 87-96.
2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 593-626.

Materials:

1. RCA trainer
2. VTVM - (Vacuum tube voltmeter)
3. Oscilloscope
4. Template No. 11 (If using RCA equipment)
5. .002 uf condenser

Schematic:

1. No schematic needed.

Procedure:

1. Place all the parts in the template as noted.
2. Place the oscilloscope on the speaker leads.

3. Signal trace audio section and compute voltage gain per stage. (Be sure and use isolation condenser in hot lead of generator and have amplitude as low as possible.)

4. Set RF generator on 455 kc.

5. Disable local oscillator.

6. Place hot lead of generator through isolation condenser on the base of Q_2.

7. Adjust output IF to maximum signal.

8. Place the hot lead of the generator on the base of Q_1 and adjust both transformers for maximum signal.

9. Place the local oscillator in operating condition.

10. Set the RF generator on 550 kc, adjust the tuning condenser until it is fully closed.

11. Loosely couple the RF generator to the transistor antenna and adjust the oscillator slug for maximum signal.

12. Open the tuning condenser and set the RF generator on about 1600 kc.

13. Adjust the oscillator trimmer for maximum signal.

14. Repeat steps 9-13.

15. Tune the radio into a weak station adjust the RF trimmer for maximum signal.

16. Contact the instructor. He will now place a trouble in the receiver for you to repair.

Questions:

1. What type of oscillator is used in a converter stage?

2. How is the oscillator coupled to the converter?

3. How does the RF section differ from the vacuum tube RF section?

4. How does the AGC voltage vary with signal strength?

Conclusions:

Transistor Application

Lesson 10
The Cathode Follower

Introduction:

This circuit is an excellent impedance matching device. It is found very useful in matching high impedance circuits to low impedance devices.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 228-236.

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 202-208.

Materials:

1. Chassis 121-77
2. Chassis 121-1
3. Scope
4. VTVM -(Vacuum tube voltmeter)
5. Audio generator
6. Chassis 121-24

Schematic:

1. Use schematic #S-IV-10 (appendix). See instructor.

Procedure:

1. Place chassis 1 and 77 in the rack and turn on.
2. Place the audio generator on the input of 77.
3. Adjust the input to 3 volts P-P 1,000 cps.
4. Measure the output signal voltage and compute stage gain.

5. Place S_1 on chassis 77 in the other position and again compute stage gain.

6. Determine the phase relationship between input and output signals.

7. Turn the equipment off and place chassis 28 so that it feeds into 77. (Place a jumper wire from the output of 28 to the input of 77.)

8. Place S, of chassis 77 in ground position.

9. Place the oscillator on the input of chassis 28 and using the oscillator adjust the generator level so that chassis 28 has the largest undistorted output.

10. Measure the output of the cathode follower. If it is distorted reduce the generator level to obtain the maximum undistorted signal.

11. Place S, in the nongrounded position and compare single handling capabilities with the grounded position.

12. Remove chassis 28 and with the signal set at 3 volts P-P connect to the input of the cathode follower.

13. Prepare a chart showing frequency response versus gain of the cathode follower.

14. Complete both the normal and abnormal charts. (If using RCA equipment)

Lesson 11
Common Collector Circuit

Introduction:

The common collector transistor configuration reminds us of the cathode follower vacuum tube stage.

References:

1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Service Department. RCA Service Co., Camden, New Jersey. pp. 53-58.

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 545-546.

3. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 108-111.

Materials:

1. Template No. 5 (If using RCA equipment)

2. VTVM -(Vacuum tube voltmeter)

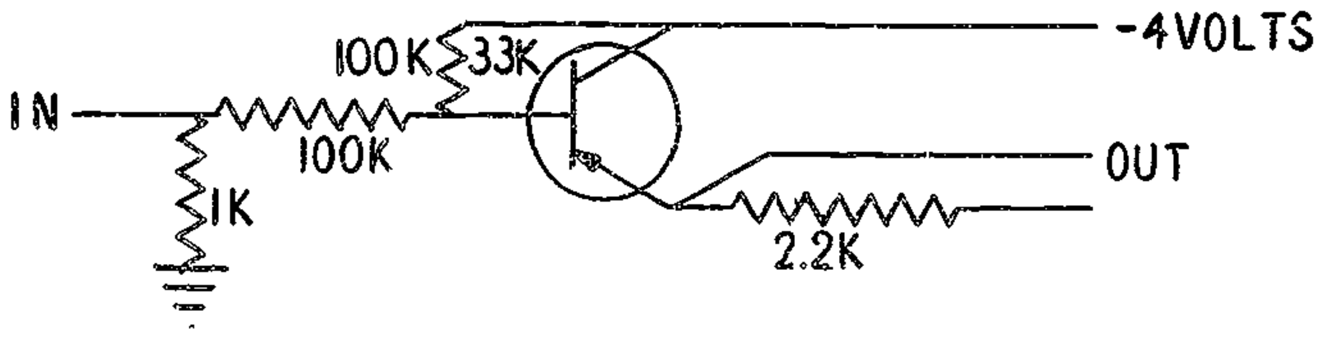
3. MA -(Milliammeter)

Schematic:

1. Use schematic below.

Procedure:

1. Wire the following circuit.



2. Plug in and record the following:

V_e = ____________ I_b = ____________

V_b = ____________ I_c = ____________

V_c = ____________ I_e = ____________

3. Apply a positive DC voltage in the range of 3-6 volts at the DC input.

   Record the readings as before.

4. Compute the change in V_e and V_b.

5. Compute the voltage gain of the stage. Be careful to divide input by output.

6. Compute the change in I_b and I_e.

7. Compute the current gain of the stage.

8. Compute power in power out and power gain.

9. Using a 1 kc test signal, setup and test the frequency response of the stage.

Questions:

1. How does the common collector compare with the common emitter?

2. How does the common collector compare with cathode follower?

3. Draw a graph showing the frequency response and mark the half power point.

4. Mark the 6 db point on the graph.

Transistor Application

Lesson 12
RC Oscillator

Introduction:

The RC oscillator is an example of one of the first oscillators we will study without an LC circuit. This oscillator is usually fixed frequency. Be sure and notice the phase shifting network.

Reference:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 132-138.

Materials:

1. 121-1 Power supply
2. 121-2 Voltage regulator
3. 121-52 Oscillator
4. Oscilloscope
5. Audio generator

Schematic:

1. Use schematic #S-IV-12 (appendix). See instructor.

Procedure:

1. Set up the power supply with the regulator and adjust for 250 volts B+.
2. Plug in the RC oscillator and using the output jack to an oscilloscope adjust R_3 and R_1 for a good clean output on the scope.
3. Place a set of leads on the horizontal input of scope to output of RC oscillator and adjust for inphase indications.
4. Read page 134 in the RCA Lab Manual and any oscilloscope manual on phase relationships.
5. Determine the phase shift between plate signal and the intersection on C_1R_1.

6. Determine the phase relationship between the plate and the intersection of C_2R_2.

7. Determine the phase relationship between the plate and the grid.

8. Remove the previous wiring and wire what ever necessary to determine the frequency of the oscillator by TWO different methods.

9. Change R_3 and determine its effect on frequency and amplitude. Explain.

10. Change R_4 and determine its effect on frequency and amplitude. Explain.

Questions:

1. How much phase shift must be accomplished between plate and grid?

2. Name the three main parts of an oscillator.

3. Complete the normal and abnormal charts. (If using RCA equipment)

Plate-Coupled Multivibrator

Introduction:

The multivibrator is a very common relaxation oscillator. This circuit is found in many different applications.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 151-158.

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., Inc., New York, 1961. p. 288.

3. Bureau of Naval Personnel, Basic Electronics, Navy Training Courses, NAVPERS 10087. U.S. Government Printing Office, Washington, D.C., 1955. pp. 324-335, 620-688.

Materials:

1. 121-57 Plate-coupled multivibrator
2. 121-1 Power supply
3. 121-2 Voltage regulator
4. Scope
5. VTVM -(Vacuum tube voltmeter)

Schematic:

1. Use schematic #S-IV-13 (appendix). See instructor.

Procedure:

1. Plug in the power supply, regulator, skip a couple of spaces and then the multivibrator.

2. Turn all equipment on and adjust the B plus to 250 volts.

3. Place the scope on the H jack and adjust R_3 for symmetrical operation.

4. Measure and record waveshape and size on each pin of the 6J6.

5. Determine the frequency of the multivibrator.

NOTE: During the next portion we will change sizes and notice effect on frequency. It is not necessary to determine the new frequency. Just notice the effect on it.

6. Change both plate loads to 15 K. Note frequency effect ____________.

7. Replace the original plate loads and change R_2 to 100 K, adjust R_3 to same value. Note effect ___________.

8. Change R_2 to 3.3 meg and adjust R_3 to same value. Note effect __________.

9. Replace original grid lead resistors and change the coupling condensers C_2 and C_3 to 100 mmf. Note change in frequency.

10. Change the coupling condensers to .01 mf and note change in frequency.

11. Write a summary noting effect of changing grid lead combination on frequency.

12. Complete the normal and abnormal charts. (If using RCA equipment)

Lesson 14
Transistor Multivibrator

Introduction:

In this lesson we will look at a free running transistor multivibrator. Understanding this type will make all the other multivibrators easier.

References:

1. Experiment Guide, RCA Transistor Trainer, Models 301-T and 601-T. Government Services, RCA Service Co., Camden, New Jersey, 1960. pp. 97-100.

2. Department of the Army Technical Manual, TM11-690, Basic Theory and Application of Transistors. U.S. Government Printing Office, Washington, D.C., 1959. pp. 181-183.

Materials:

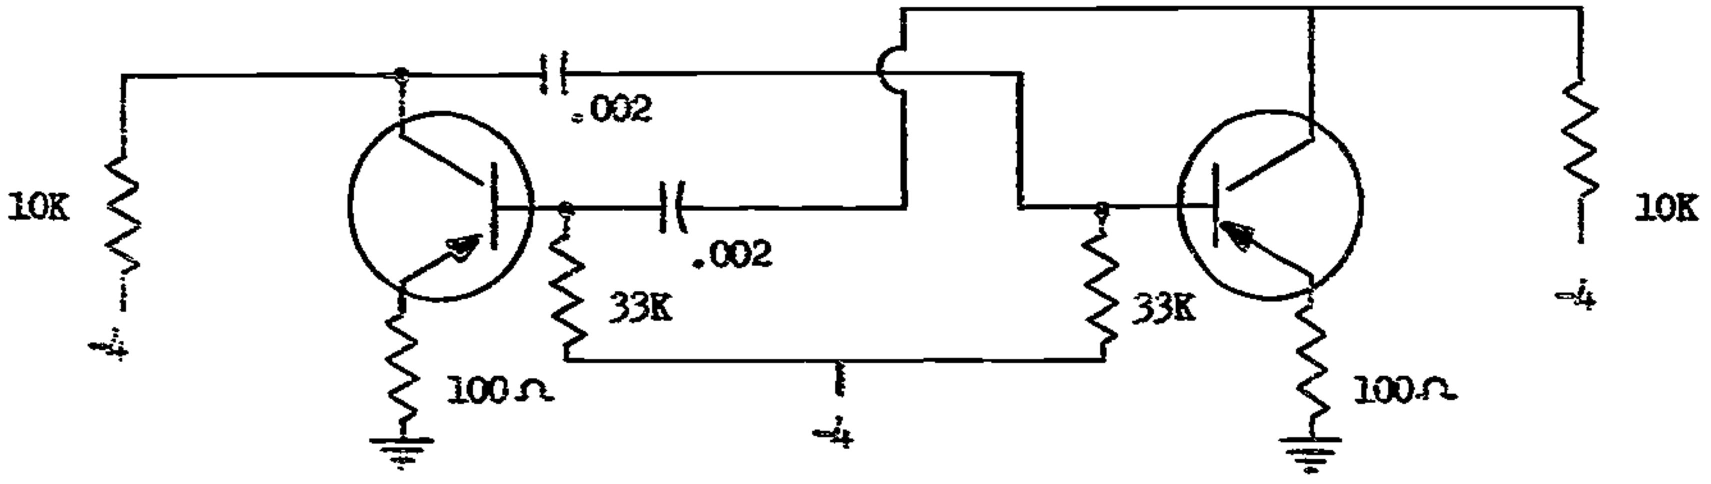
1. Template No. 12 (if using RCA equipment)
2. VTVM - (Vacuum tube voltmeter)
3. Scope
4. Square wave generator

Schematic:

1. Use schematic below.

Procedure:

1. Wire the following circuit.



2. Turn the circuit on and start it oscillating.

3. Take all waveforms and DC voltages.

4. Increase the size for first one and then the other coupling condenser noting effect on waveform.

Questions:

1. Explain the reaction when the coupling condensers are changed.

2. What would happen if one of the base resistors increased in size?

3. Explain the waveshape obtained.

Lesson 15
Vacuum Tube Sawtooth Generator

Introduction:

The vacuum tube sawtooth generator is not really a generator but a waveshaping device.

Reference:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 246-254.

Materials:

1. Chassis 65 Vacuum tube sawtooth generator
2. Chassis 57 Multivibrator
3. Chassis 2 Voltage regulator
4. Chassis 1 Power supply
5. VTVM (Vacuum tube voltmeter)
6. Scope

Schematic:

1. Use schematic #S-IV-15 (appendix). See instructor.

Procedure:

1. Plug in power supply and regulator, adjust B+ for 250 volts.
2. Skip a space and plug in chassis 57.
3. Skip another space and plug in chassis 65.
4. Using a 1.2 ohm resistor for isolation connect the upper jack of the multivibrator to the input of the sawtooth generator.
5. Set R_3 on both chassis to mid-range.
6. Turn all equipment on and observe waveshape into and out of the generator.

7. Measure all DC voltages around the generator.

8. Turn off the multivibrator and repeat all DC voltages around the generator.

9. Explain any change in the voltage readings.

10. Rotate R_3 on the sawtooth generator chassis noting effect on waveshape of output. Explain.

11. Decrease the size of C_1 on chassis 65 and note effect. Explain.

12. Return 65 to original condition and then vary R_3 on multivibrator chassis. Explain change to output signal.

Lesson 16
Thyratron Sawtooth Generator

Introduction:

The thyratron generator operates much as the neon bulb generator. The behavior of the grid is very interesting and important.

References:

2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 645-646.

Materials:

1. Chassis 66 Thyratron sawtooth generator
2. Chassis 1 Power supply
3. Chassis 67 Bias supply
4. Oscilloscope
5. VTVM (Vacuum tube voltmeter)

Schematic:

1. Use schematic #S-IV-16 (appendix). See instructor.

Procedure:

1. Plug in the power supply and the sawtooth generator. Skip several spaces between.
2. Turn both units on.
3. Measure the waveshape of the generator.
4. Vary R_1 and note the effect.
5. Turn the equipment off and place the bias supply next to the generator.

6. Run a lead from the negative jack of the bias supply to the bias jack on the generator.

7. Turn all equipment on.

8. Vary the bias supply and note effect on the output of generator.

Questions:

1. Explain the action of the grid in the gas tube.

2. Explain the charge and discharge cycle of C_1.

3. What mainly determines the firing point of the gas tube?

4. What determines the cut-off point of the gas tube?

Advance Work:

Determine the firing point and cut-off point of this gas tube for various settings of grid voltage.

Lesson 17
Single-Swing Blocking Oscillator

Introduction:

The blocking oscillator is a very common oscillator found in the modern television receiver. While there are many types their operation all depends upon the same principles as this one.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department, RCA Service Co., Camden, New Jersey. pp. 141-148.

Materials:

1. Chassis 53 Single swing blocking oscillator
2. Chassis 2 Voltage regulator
3. Chassis 1 Power supply
4. VTVM - (Vacuum tube voltmeter)
5. Scope

Schematic:

1. Use schematic #S-IV-17 (appendix). See instructor.

Procedure:

1. Plug in the regulator and power supply. Adjust the B+ for 250 volts.
2. Turn the power off and plug in the oscillator. Skip several spaces.
3. Place S_1 on the oscillator in the ground position.
4. Turn on all equipment.
5. Measure the waveform at the L and H jacks and the control grid of the oscillator.

6. Vary R_1 and note effect on waveforms.
7. Measure DC voltages around the oscillator.
8. Remove C_1 and measure voltages and waveforms. **Explain.**

Questions:

1. What is meant by single swing blocking?
2. Explain action of C_1.
3. Explain action of R_3.
4. What type waveshape is offered by this oscillator?

Lesson 18
One-Shot Multivibrator

Introduction:

This oscillator is an interesting application of the multivibrator. Its ability to switch or key makes it very useful.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 160-165.

Materials:

1. Chassis 76 One-shot multivibrator
2. Chassis 53 Single swing blocking oscillator
3. Chassis 2 Voltage regulator
4. Chassis 1 Power supply
5. VTVM -(Vacuum tube voltmeter)
6. Scope

Schematic:

1. Use schematic #S-IV-18 (appendix). See instructor.

Procedure:

1. Plug in power supply and regulator. Adjust B+ to 250 volts.
2. Turn the power supply off. Skip several spaces and install chassis 76.
3. Turn the equipment on and measure DC voltages around the multivibrator.
4. Measure waveforms around chassis 76.
5. Turn the power supply off and install the blocking oscillator to the left of chassis 76. Have S_1 in the grounded position.
6. Turn the power supply on and repeat the DC and waveforms around the chassis 76. Explain the behavior. (Run a wire from the L jack of the blocking oscillator to the input of the multivibrator.

7. Rotate R_4 on the multivibrator and note the effect on the output waveforms.

8. Change the frequency of the blocking oscillator and note effect on output of multivibrator.

Questions:

1. What part is left out of the multivibrator compared with the previous multivibrator?

2. Which tube is normally off?

3. If the cathode resistor would increase what effect would it have on the multivibrator?

4. Explain the relationship between the H and L signals.

Lesson 19
Cathode Ray Oscilloscope

Introduction:

Now is the time.

References:

1. Student Laboratory Manual, RCA Electronic Trainer, Model 121, Government Service Department. RCA Service Co., Camden, New Jersey. pp. 255-264.
2. Morris Slurzberg and William Osterheld, Essentials of Radio-Electronics. Second Edition. McGraw-Hill Book Co., New York, 1961. pp. 644-649.

Materials:

1. Chassis 69 CRT
2. Chassis 67 Bias supply
3. Chassis 68 Voltage tripler
4. Chassis 1 Power supply
5. Chassis 52 RC oscillator
6. Chassis 53 Blocking oscillator
7. Chassis 77 Cathode follower
8. Chassis 76 One-shot multivibrator
9. Chassis 65 One-shot multivibrator
10. VTVM - Vacuum tube voltmeter
11. Scope

Schematic:

1. Use schematic #S-IV-19 (appendix). See instructor.

Procedure:

1. Connect the power supply and voltage tripler in the rack.

2. Skip several spaces and place the CRT in the rack.

3. Turn the equipment on.

4. Adjust R_7 and R_8 so that the spot is centered. How is this accomplished?

5. Adjust R_1 and R_3 to give the smallest and brightest dot.

6. Adjust R_1 so that the spot will not burn the screen.

7. Measure all the voltages around the tube.

8. Turn the equipment off and place the bias supply next to the CRT.

9. Turn the equipment on and readjust if necessary.

10. Measure the diameter of the screen.

11. Connect a jumper from the positive jack to the H jack of the CRT.

12. Adjust the bias supply until the spot moves to the outer edge.

13. Measure the amount of voltage that caused the deflection and record the direction.

14. Now connect the jumper to the negative jack of the bias supply and repeat steps 12 and 13.

15. Find the horizontal deflection sensitivity in VDC/IN. from your data.

16. Repeat this procedure for the vertical plates and compute the vertical deflection sensitivity.

17. Turn the equipment off.

18. Remove the bias supply and return it to its storage place.

19. Connect two rolls on the rack together with the use of the cable for this purpose.

20. On the rack above the already installed chassis 1, 68, and 69 install from left to right the following:

Chassis 53	Single swing blocking
Chassis 77	Cathode follower
Chassis 76	One shot multivibrator
Chassis 65	Vacuum tube sawtooth generator

21. Connect the L jack on the 53 to the input of the follower, connect the output of the follower to the input of the multivibrator and L jack of the multivibrator to the input of the sawtooth generator.

22. Turn the equipment on and take waveshapes at test points along the last installed roll.

23. Connect the output of the sawtooth generator to the H input of the CRT.

24. Adjust and focus the trace on the CRT.

25. Turn the equipment off and install chassis 52 next to the CRT.

26. Connect a jumper from the output of 52 to the vertical input of the CRT.

27. Turn the equipment on. Center and focus the trace if necessary.

28. Connect a jumper from the H jack of the multivibrator to the Z input of the scope.

29. Explain what took place.

Questions:

1. Explain the uses of the parts on the CRT chassis.
2. Why is the Z axis provided?
3. What is blanking?
4. Obtain a schematic of a commercial oscilloscope and compare.
5. Why is the oscilloscope so important?
6. Why is the deflection sensitivity of a CRT important?
7. What design feature of a CRT would effect deflection sensitivity?

PART I

SKETCHING AND THE THEORY OF MECHANICAL DRAWING

BLUEPRINT READING

SKETCHING AND THE THEORY OF MECHANICAL DRAWING

1. What Blueprints Are:

A blueprint is a copy of a working drawing or mechanical drawing made by engineers and draftsmen in industry. A working drawing shows by means of lines, figures, notes, and dimensions, the information needed by the workman in order to build a certain structure. If the engineering department of an industry were to take the time to write a letter to a man in the field telling him to build a base for a pump at a certain location, giving him the exact location of the bolts, the height of base, the dimensions of the base, and all other information necessary to complete the job, the letter would be long and complicated. The workman would have to take the time to read the letter several times trying to understand what the engineer meant and trying to get a mental picture of the pump base before he could begin work. Then the workmen would probably make some error in locating the bolts or placing the base in the wrong direction, due to some little mistake in English, and this would cause delay and change in construction.

Blueprints are considered the language of industry. They are the engineer's means of explaining to the workmen what he wants done. The working drawings made by a German engineer could be understood and followed by an American workman, with the exception of a few German notes that would be made on the drawing. All the lines of the drawing would be the same no matter in what country or industry it was drawn even though the unit of measure be different. The workman who wants to advance with industry and be able to meet changes that take place should prepare himself by learning to read the language of industry, which is the blueprint made by the engineering department of the company for which he works.

The draftsman makes his working drawings on thin white tracing paper, or a high grade of cloth, which has been starched and treated so that it is transparent. The paper is used for jobs which are temporary or in cases where permanent records are not necessary. The cloth is much more expensive and is used where the working drawing must be kept for many years. These working drawings on either cloth or thin paper are used in making blueprints in the same way that the negative of a photograph is used to make a print. Blueprint paper is yellowish green on one side and white on the other side. A bright light will make it change color so it must be kept in a dark room. In making a blueprint the working drawing is placed over the blueprint paper and the sunlight or the light from an electric arc allowed to shine through the tracing paper. The lines, either ink or pencil, keep the sunlight from shining on the blueprint paper so that the color of the blueprint paper changes every place except where there are lines on the tracing paper. The blueprint paper is then taken out of the light and placed in water where the color change is completed. Every place where there were lines turns white, and the rest of the paper turns blue, and so we have a blueprint. The working drawing may be used to make as many copies or blueprints as are needed. After the blueprints have been made, the tracings or working drawings are stored in a dry place and kept as records. If the blueprint happens to be of a pump base and the engineering department decides to install a new pump or change the pump house in any way, the engineer can go to the filing room and get the original working drawing at any time and know exactly what is in the pump house and make changes whithout having to make a trip to the location.

2. Use of Blueprints in Industry:

The blueprint made from an accurate working drawing should have all the information needed for the workmen to do the job. Before the workman asks for more information he should first read every note and symbol on the blueprint. He should remember that the blueprint is an exact copy of the working drawing on file in the drafting room, and if he follows every detail and note on the blueprint, he will be protected in case of error. If he checks accurately with the blueprint, the blame will be placed squarely on the draftsmen in the office.

A working drawing shows an object from one or more sides with all lines and all angles drawn exactly as they are. All dimensions or measurements, the radius of any curve, the kind of material, the finish of the surface, and any other notes necessary to fully describe the object should be given on the working drawing. The working drawing usually shows three views of the object and there is usually a note to tell whether it is a front view, the top view, the plan, the end view, or whatever it may be. The workmen should remember that the blueprint was put in water in developing and a piece of paper that has been wet shrinks up so that measurements made with a rule on the blueprint are not accurate. The result is that the workman shall take all measurements as they are figured out and shown on the blueprints by dimension lines and only make measurements when the draftsman has failed to put on a dimension. An accurate blueprint will give all measurements and all information necessary to complete the object.

The engineering department spends considerable money in providing blueprints for the workman and the least that the workman should be expected to do is to take care of the blueprints. The blue color will fade if left exposed to the sunlight for any length of time, so the workman should take care that blueprints are not left exposed to the sunlight when not in use. The blueprints are usually 24 inches by 36 inches or

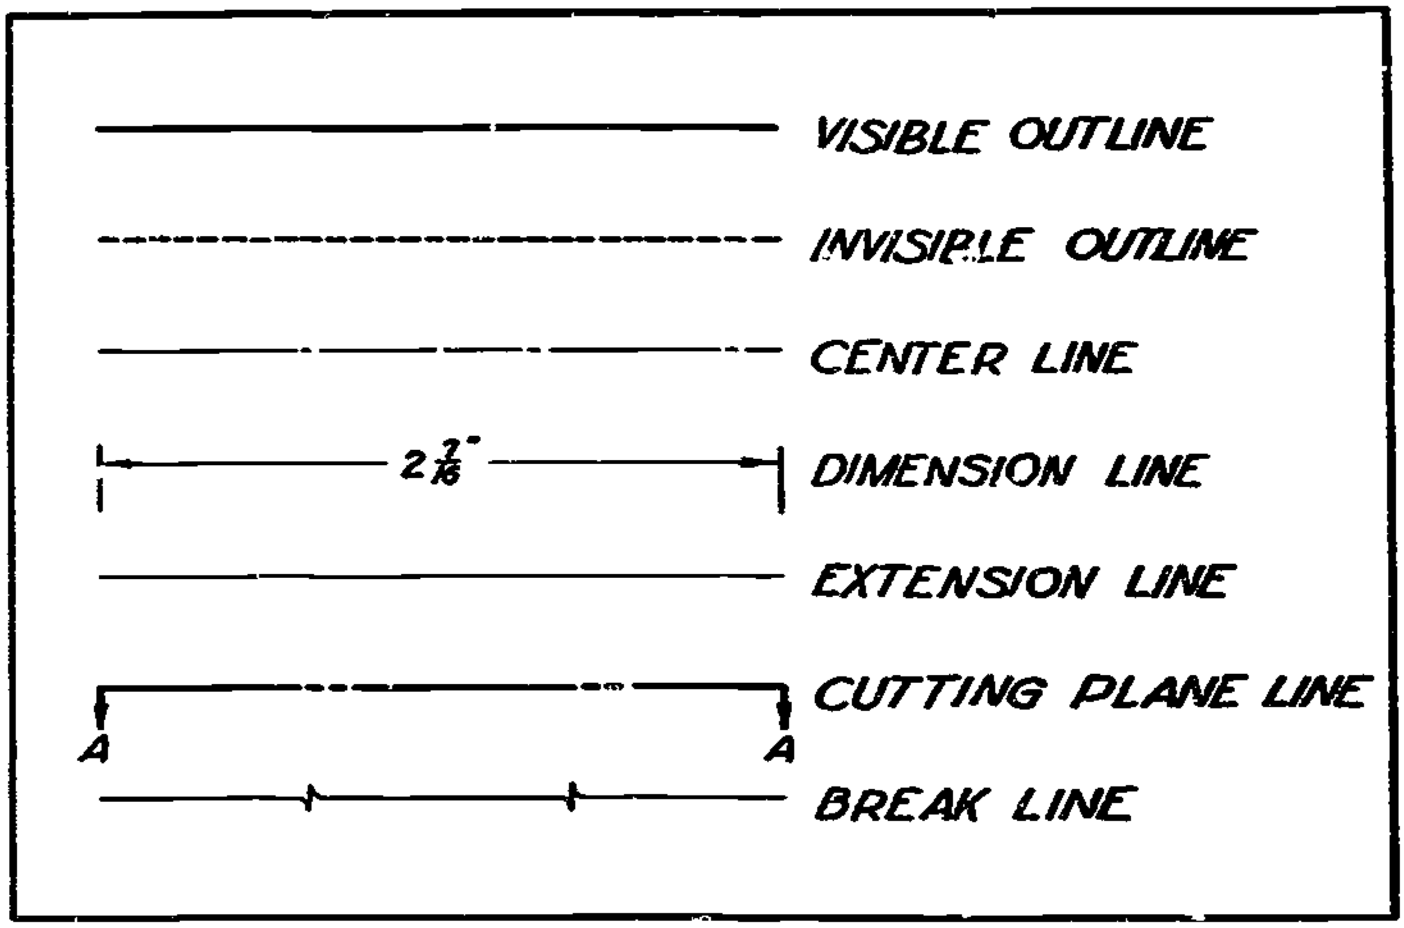

Fig.1

some other size which may be decided upon by the engineering department. It is necessary, therefore, to have some way of folding or rolling the blueprints, and the usual method is to roll them. The workman should take care to preserve the blueprint in whatever form he receives it, and never fold it if it was intended to be rolled.

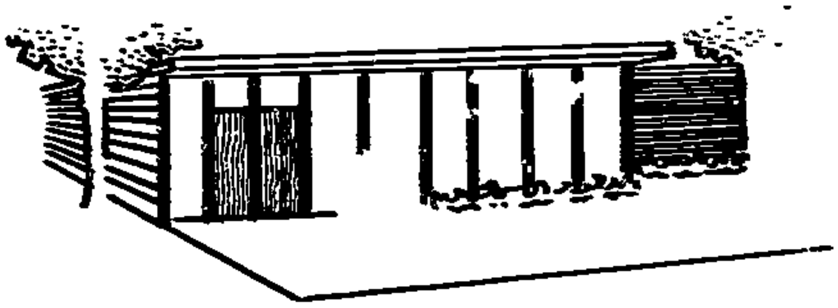

Fig. 2

In order to read blueprints the workman must know something of the principles of making working drawings. This is quite a bit like learning a new alphabet and to read a printed page. The workman should first understand that a blueprint is a record of instructions given to him to read. Secondly, he should realize that the language used by the draftsman is largely a language of lines and that unless he knows how to read the lines, the instructions recorded on the blueprint are almost in a foreign language.

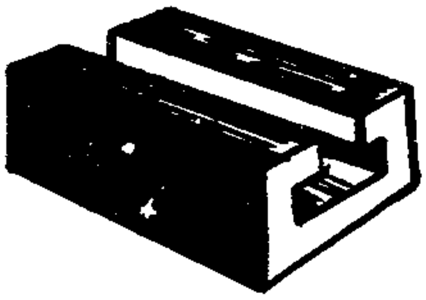

Fig.3

Blueprint Reading

Fig. 1 shows the more common lines which go to make up the language of industry. The visible outline is a heavy white line on the blueprint and is used to represent the lines of the object which can be seen from the side that is being drawn. The dotted line called the invisible outline is used to represent any line in the object which cannot be seen. The dimension line is a light white line on the blueprint which is used to indicate the distance between any two points. The extension line is also a light solid line which is used to extend to points outside the object so that the draftsman will have more space to place the dimension line. The heavy line with two dots and a long dash and the arrows pointing to each end is called the cutting plane line and is used to show where sections are taken. This is necessary in the case of complicated objects because the regular views do not clearly show the shape of parts inside the object. The break line is used to show that a part of the object has been left out because it was too large to be drawn on the paper.

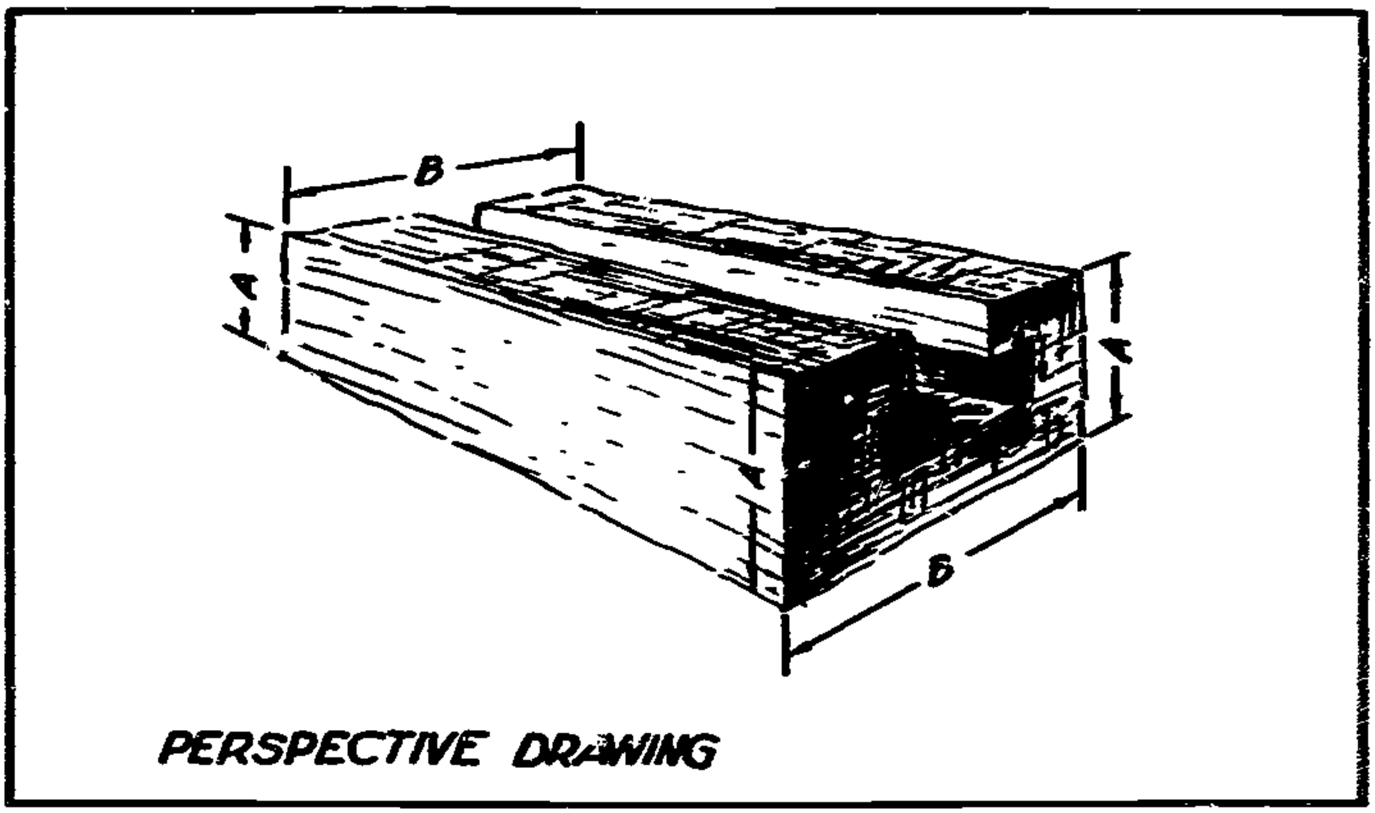

Fig 4

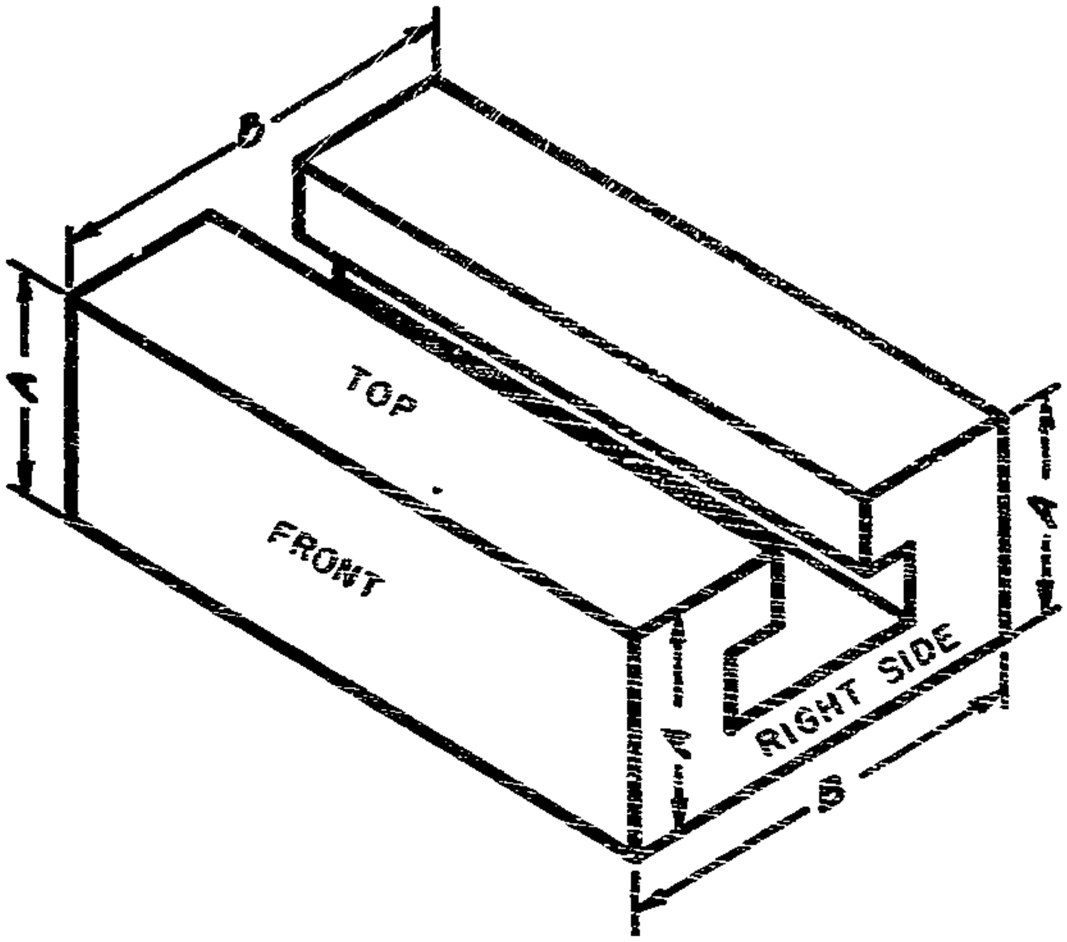
After the workman has become familiar with these lines he has completed his first lesson in learning the language of blueprints. In order to read a blueprint, the first thing to do is to study the different views until one has a mental picture of what he is to build. The drawings all are made on a flat sheet of paper and it is necessary to study these and use the imagination to make the lines and views stand up off the paper and obtain a mental picture. Next, all letters and notes should be read and considered. Carelessness in any one of these respects is not to be excused.

3. Freehand Isometric Sketching:

A pictorial drawing is any kind of drawing which resembles a picture. Fig. 2 shows an actual photograph of a building.



ISOMETRIC DRAWING

FIG.5

We know that the building is the same height in the rear as it is in the front and that the two dimensions marked "A" and "B" are the same, but it can be seen at a glance that they do not show up equal in the picture. The picture gives a very clear mental image of the building but it gives no information that will help the workman to construct the building. Therefore, it is plain that a photograph is of little value to the workman.

Fig. 3 is a photograph of a block. It shows very clearly the shape of the block and again the workmen get a very clear mental image, but it will be noticed that the information is not such that he could actually make the block.

Fig. 4 is a perspective drawing of the same block and it will be noticed that the three dimensions marked"A" should be equal but they are not, and likewise the two dimensions marked "B". This form of drawing is similar to an actual photograph inasmuch as it is possible to get a very good mental image but it, too, fails to give sufficient information to be of value to the man in industry.

Fig. 5 is known as an isometric drawing. It will be noticed that the dimensions marked "A" in this drawing are equal and also that the dimensions marked "B" are equal. Some measurements can be made on an isometric drawing and this gives it much more value than a perspective drawing. This form of drawing is becoming more important in the drafting room as it shows a little better picture than the three-view type drawing and the workman should acquaint himself with isometric drawing so that he can become able to make a simple freehand sketch of any part of his work, which will be a valuable aid to him in explaining to a foreman how he did a particular job. There are two other forms of pictorial drawing, the oblique drawing and the cabinet drawing, but as they are used very little in some industries, they will not be discussed at this time.

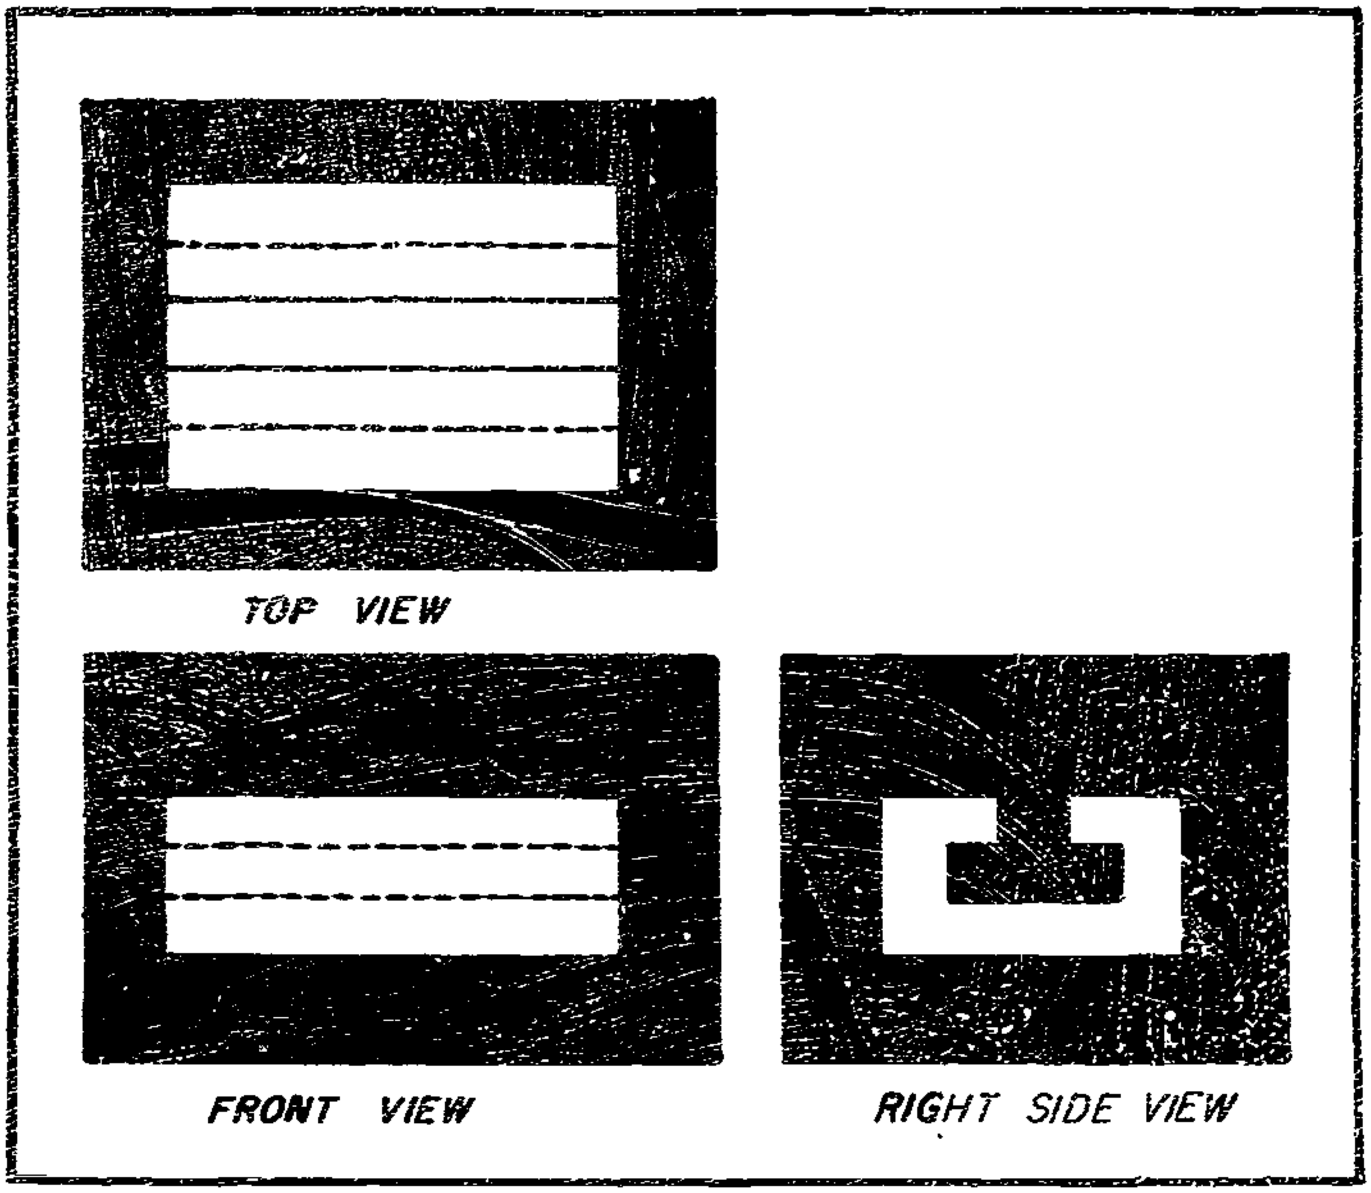
4. The Theory of Mechanical Drawing:

Three-view drawing is another name for working drawing. In most cases three views of an object are drawn. The three views commonly shown are front view, right side view, and top view. A view of an object, for instance, the front view, is almost what one would see if he were directly in front of the object, and, likewise, the top view of an object is what one would see if he were looking directly down on top of it, and in the same way, the right side view is what a person would see if he were looking at the object from a point directly out from the right side of the object.

Fig. 6 is an arrangement of three photographs of the block. In each case the camera was placed at a point directly out from the center of the front of the block. This operation was repeated using the right side view and the top view. These pictures have been arranged in the same order as the draftsman would arrange them in making a working drawing. The dotted lines have been added to the front and top views so as to give the same information as would be given on a working drawing.

These three views have a certain arrangement on the blueprint. The draftsman usually draws the front view first, and the top view is placed up above the front view, and the right side view is placed to the right of the front view, as is shown in Fig. 6, and, if a bottom view were drawn, it must be placed below the front view. The reason for placing these views in this arrangement is that this is a standard method of making a working drawing, and if all draftsmen are taught to make drawings in this way, and all workmen learn that working drawings are made in this way, then there will be no misunderstanding between the workman and the draftsman. If the draftsman takes a notion to change this arrangement and workman is not told about the change, it can very easily cause an error, so we learn this arrangement of the views and do not change them.

Fig. 7 shows a three-view drawing of the same simple block that was shown in the preceding figures. Fig. 3 is a photograph of the block. Fig. 4 is a perspective sketch of the block.



TOP VIEW

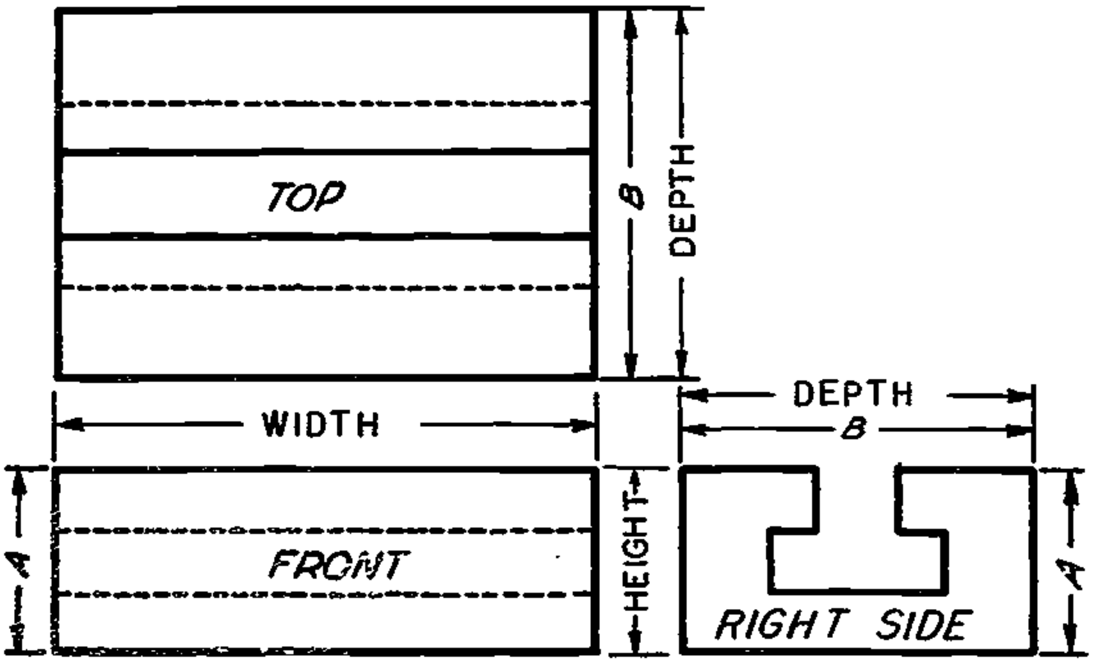
FRONT VIEW

RIGHT SIDE VIEW

FIG.6

Fig. 5 is an isometric drawing of the block. Fig. 6 is photographs of three actual views of the block, and Fig. 7 is a working drawing of the block. The student will get a better idea of three-view drawings by going over these figures again and comparing each one with the working drawing. This working drawing is the means industry uses to instruct the workman to do a job.

The shape of an object determines the number of views required to show it. The purpose of a working drawing is to instruct the workman on what is needed for the job and how to make it. In the case of a section of six-inch pipe four feet long, the right side view of the pipe would show the outside diameter of the pipe, the thickness of the pipe, and the inside diameter. The front view of the pipe would give the length and a top view would be exactly like the front view, so that the front and right side views are all that would be necessary. As the object becomes more complicated more views will be required. In the case of a complicated pipe hook-up, 3 or 4 views will be necessary to give the workman all of the required dimensions and, in some cases, the draftsman will furnish an isometric drawing to give the workman a little better picture of how all the parts will be arranged and assembled, so that the number of views required are the number of views that are necessary for the workman to get the job done.



THREE-VIEW DRAWING OR WORKING DRAWING

Fig 7

5. Kinds of Drawings:

Drawings are divided into two principal classes, pictorial drawings and three-view drawings, as has been mentioned. The pictorial drawings are divided into four types; perspective, isometric, oblique, and cabinet. The isometric drawing is the important one of these and its use is becoming more general. Working drawings or three-view drawings may be classified according to type of work, for instance, sheet metal drawings, piping drawings, architectural drawings, machine drawings, structural steel drawings, etc. In industry the worker must know a little about each of these types of working drawings because even though he may be employed in one branch of work, for instance, pipe work, occasionally he will have a job which deals with sheet metal work. The principles of working drawings are the same regardless of the kind of work, and a good draftsman is capable of making several types of drawings.

6. Making Isometric Sketches from Three-View Drawings

The ability to read a blueprint is to be able to study a blueprint and form a mental picture of the object represented by the working drawings. If the student can study a blueprint and make a mental picture, he should be able to make the picture on paper. The sheet of paper with the diagonal lines at the back of this book is known as isometric ruled paper. If a sheet of typewriting paper or other reasonably thin paper be placed over this isometric paper the isometric lines can be seen through the typewriting paper. If the student has studied the working drawing in Problem 1 and has formed a mental image of the object he should next place a sheet of typewriting paper over the isometric paper and draw the isometric drawing of the object, which is a simple block of wood. The heavy lines of the ruled paper are one inch apart and the lighter lines give half-inch spaces, so that by using this method of sketching it is not necessary to use a ruler for making measurements and a reasonably accurate drawing is obtained. All lines should be made freehand as ability to draw freehand is the result of practice.

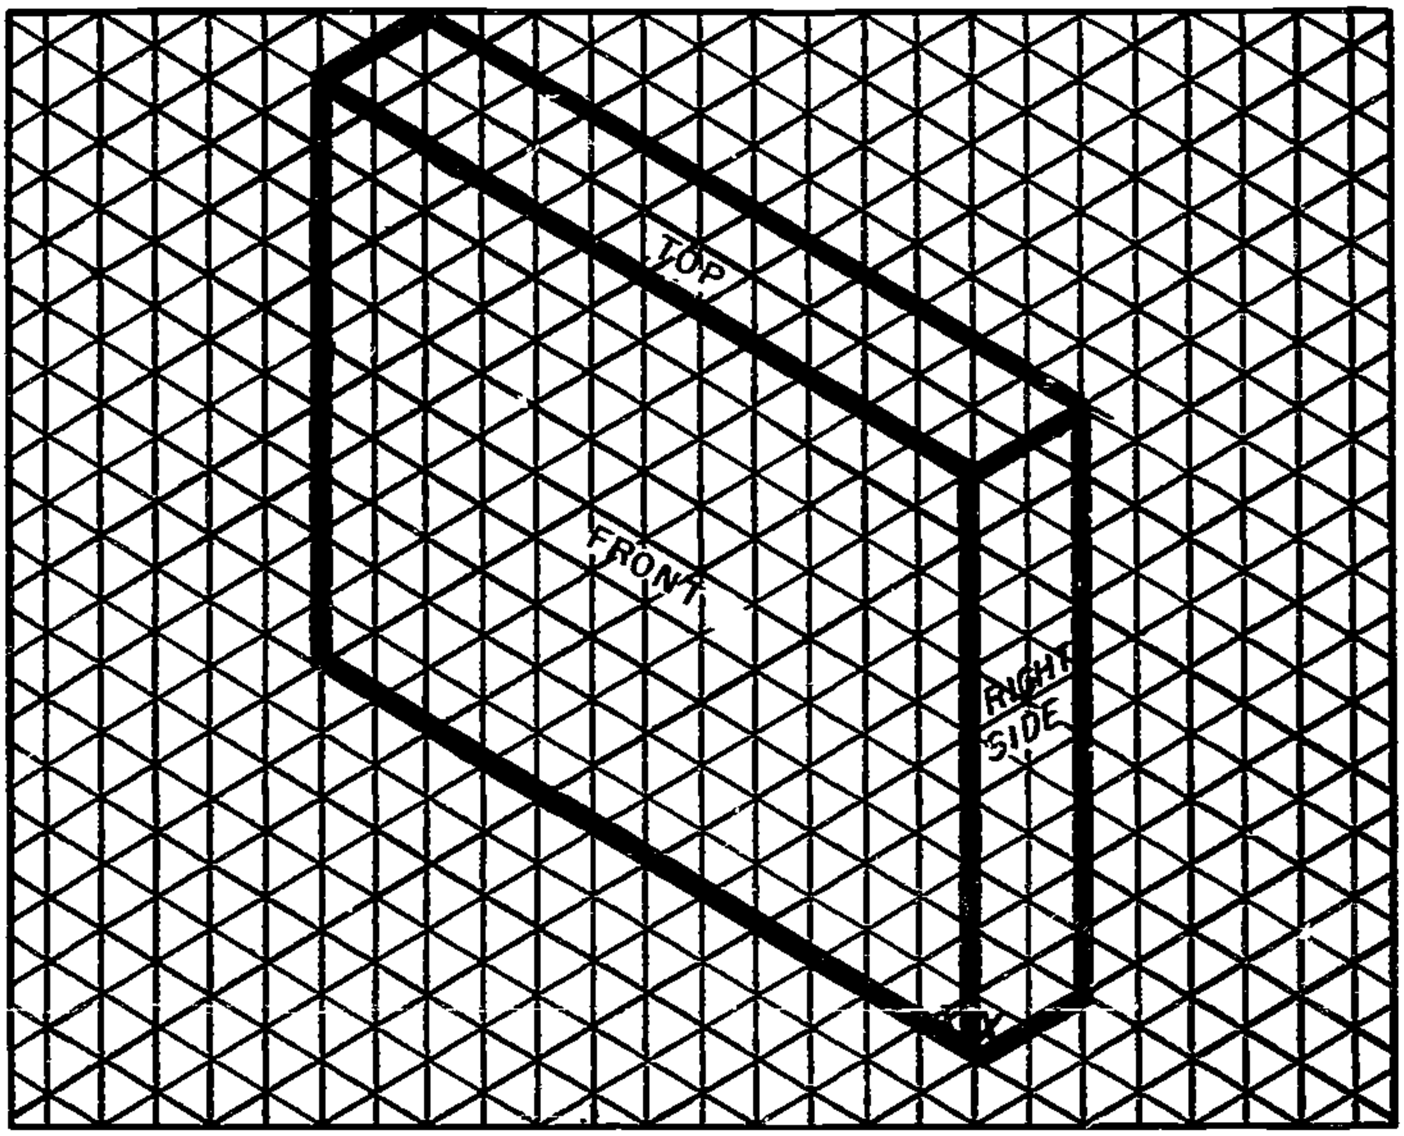


Fig 8

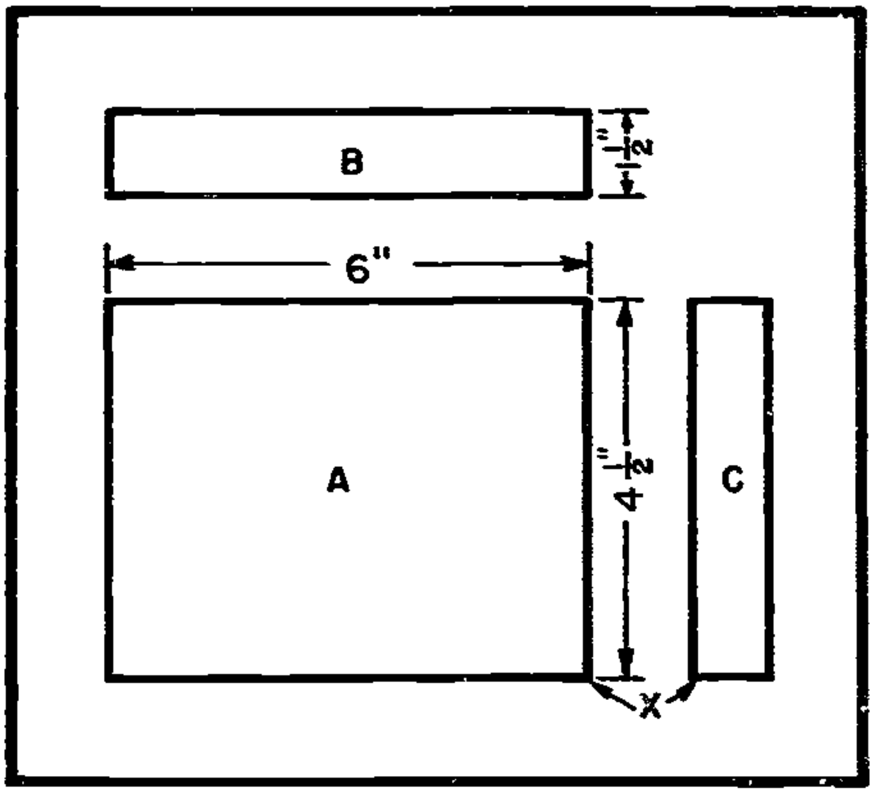
Fig. 8 will illustrate how the object should be drawn. The corner of the object should be drawn. The corner of the object marked "X" should be placed well towards the bottom of the sheet at the intersection of three heavy lines. These three heavy lines on which the drawing is started are called the isometric axes. The isometric axes always are located before the drawing is started. Complete the three views of the isometric drawing by taking the information necessary off the working drawing. After the student has finished the isometric drawing of Problem 1, he should answer the following questions about the working drawing. Although these problems look very simple, the student will find it well worth his time to make carefully a freehand sketch of each problem as directed and answer carefully each question asked about the problem.

Blueprint Reading

Problem No. 1

Make an isometric drawing of this block placing the corner marked "X" on the isometric axes. Do not dimension. Questions to be answered about the working drawing on this sheet:



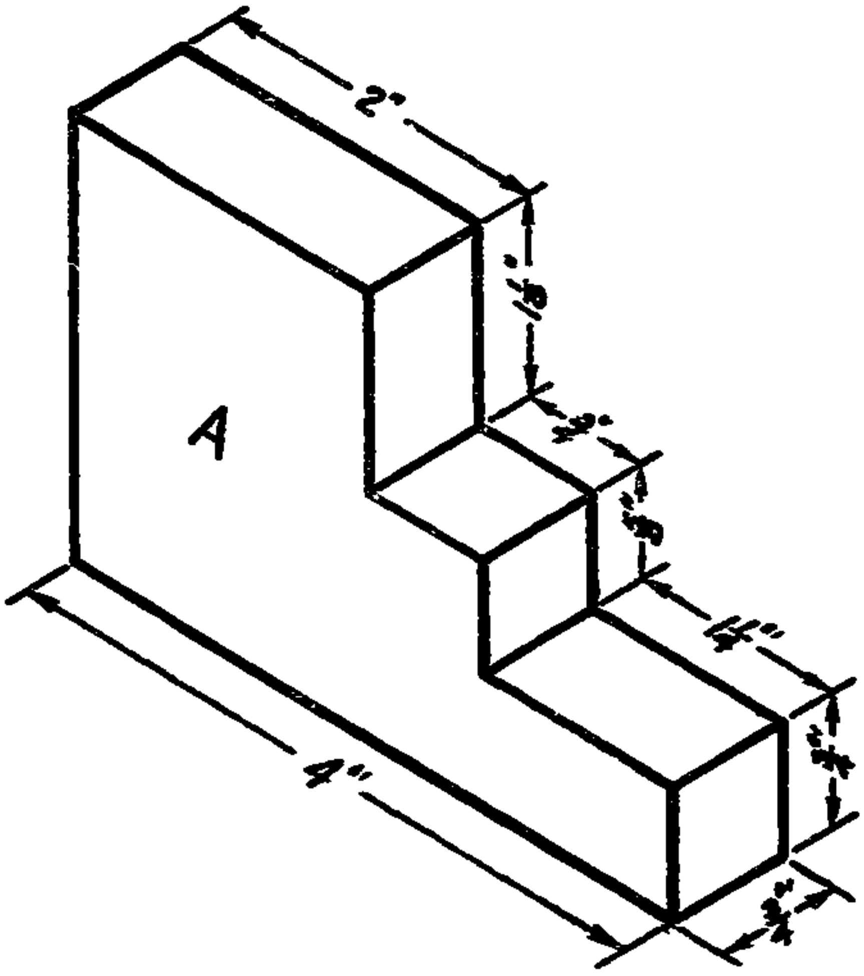
Problem 1

1. What view shown above is labeled "A"? ________
2. What view shown above is labeled "C"? ________
3. What view shown above is labeled "B"? ________
4. Is the front view longer horizontally or vertically? ________________
5. The depth of the block is shown in what views? ________________
6. The width of the block is how many inches? ______
7. The width of "A" is the same as the width of what view? ________________
8. Is "B" longer horizontally or vertically? ________
9. Is "C" longer horizontally or vertically? ________
10. The top view is always directly above the ________ view.
11. In a three-view drawing we see the ________ form.
12. The working drawing uses three views to show the block which the isometric drawing shows the block in but ______ view.
13. Each of the views drawn in the working drawing form a geometric figure called ____________.

Now in order to see if the student has learned what a working drawing is, Problem 2 will be just the opposite. An isometric drawing of a gauge block is given and the student is to make a three-view drawing. Rectangularly ruled paper will be found in the back of the book and if a sheet of typewriting paper be placed over it, the lines will show through and this will save the trouble of making measurements and also will be helpful in drawing straight lines freehand.

The views should be arranged in the proper manner and the dimensions given so that sufficient information is given to enable a workman to make the gauge block.

This kind of drawing is used by many men in the field and in many cases, blueprints are made by the engineering department from such sketches sent in by foremen and workmen.



Problem No. 2

Make a three-view drawing of this gauge block using side "A" as the front view.
Questions to be answered after the drawing has been completed:

1. Straight lines that never meet, no matter how far they are extended are called ______________ lines.
2. Any line drawn at 90° with a horizontal line is called a ______________________ line.
3. The longest dimension in the front view is ________ inches.

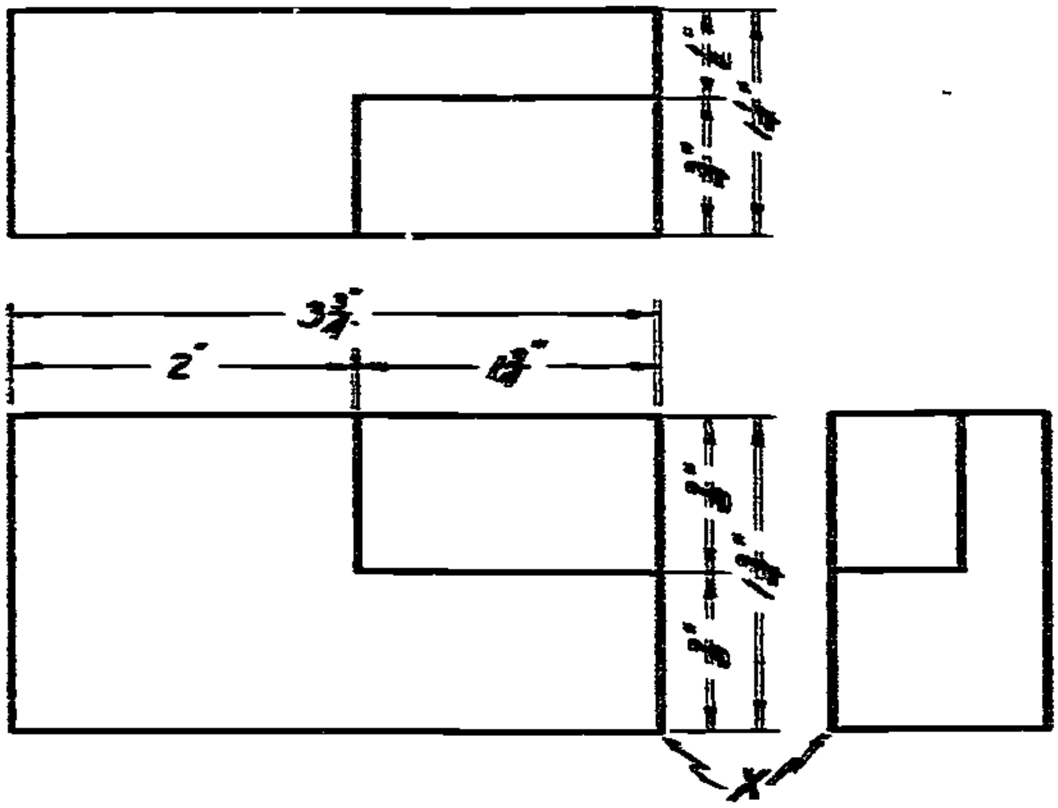
4. The right side view is placed to the right of the __________ view.

5. The block is made of material of what width? __________

6. The top and right side views form geometric figures called ____________________.

7. The shortest dimension on the block is how much? ________

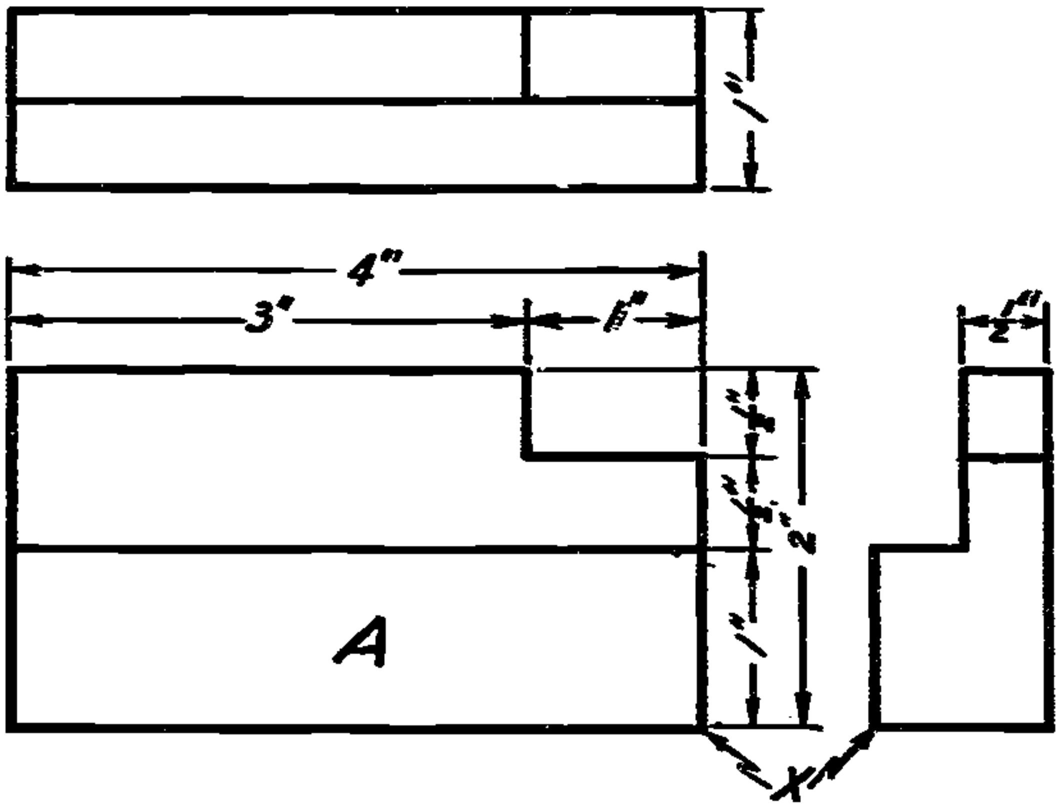
8. What size piece of boiler plate would be required to make this block? ____________________



Problem No. 3

Make an isometric drawing of this notched block placing the corner marked "X" on the isometric axes. Questions to be answered about the working drawing on this sheet:

1. The size of the piece taken out of this block is _____ x _____ x _____.
2. The intersection of two planes in the front part of an object is shown by a _____________ line.
3. The shortest dimension on the block is _____ inches.
4. The longest dimension on the block is _____ inches.
5. How many views are needed to show the shape of the notch? _____________
6. The width of the right side view can be obtained from what view? _____________
7. The length of the top view can be obtained from what view? _______________
8. Which two views show the depth of the block? ________ _______________
9. An angle of 90° is called a _______ angle.
10. How many right angles are there inside a rectangle? _________________



Problem No. 4

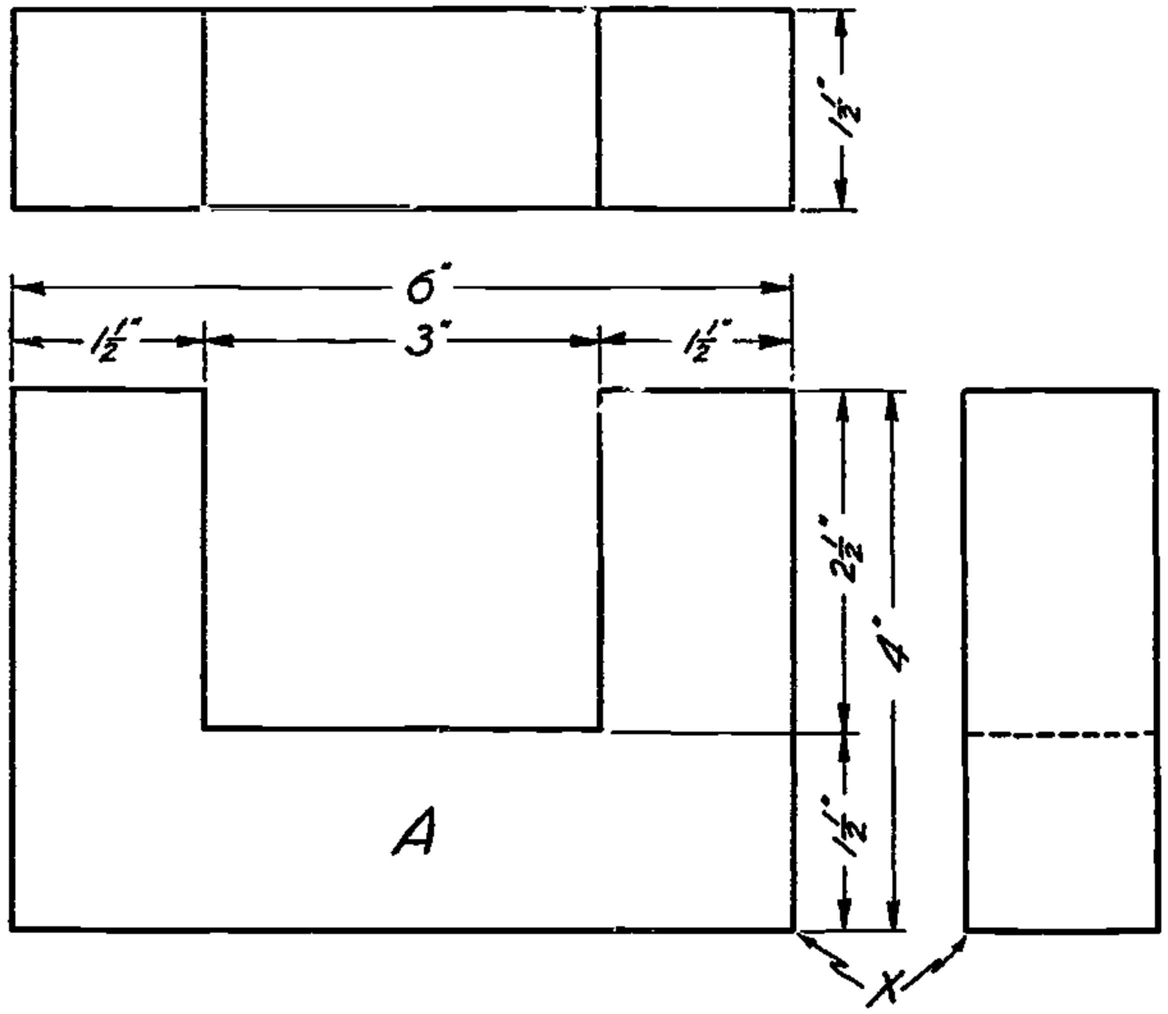
Make an isometric drawing of this block placing the corner marked "X" on the isometric axes. Questions to be answered about the working drawing on this sheet:

1. Isometric drawing is a form of _________ drawing.
2. The over-all length of the block is _______ inches.
3. The over-all width of the block is ________ inches.
4. Mark an "X" on the line in the right end view which represents surface "A".
5. The isometric axes are at an angle of how many degrees with each other? ______________________.
6. Measurements in making isometric drawings can be made only on the _____ axes or on lines __________ to it.
7. What must one do to the right side view to make it a complete rectangle? ____________________________________
8. Considering the two pieces are cut from the block, what are the dimensions of the largest piece removed? __________

Blueprint Reading

9. What size piece of material would be required to make this block? ________ x ________ x ____________.

10. Is the top view in this drawing necessary? ____________



Problem No. 5

Make an isometric drawing of this block, placing the corner marked "X" on the isometric axes. Questions to be answered about the working drawing on this sheet:

1. Why is the side "A" used as the front view?
2. Why doesn't all of the notch in the isometric drawing show? ____________________
3. If the shape of the notch was shown in the isometric drawing, it would have to be with a ________ line.
4. Which view of the working drawing most clearly shows that a notch has been cut out of the block? ____________
5. The depth of the notch is shown on the right side view by a ________ line.
6. An edge which is behind some other part of the object is shown by a ________ line.

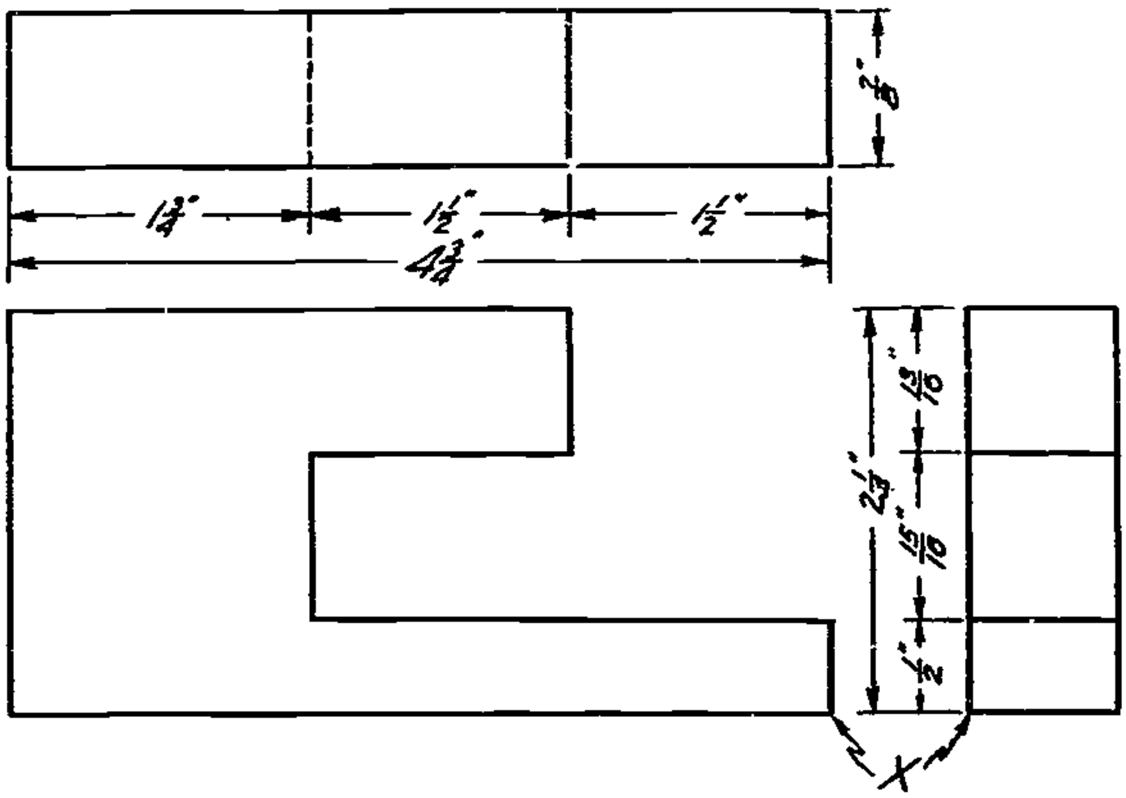
Blueprint Reading

7. In case an invisible line is directly behind a solid line it is ________ shown.

8. The size of the piece cut out of this block is ________ high, ________ wide, and ____________ deep.

9. There are no dotted lines in the top view because ________ ________________.

10. What size piece of stock is required to make this block? ______________________________



Problem No. 6

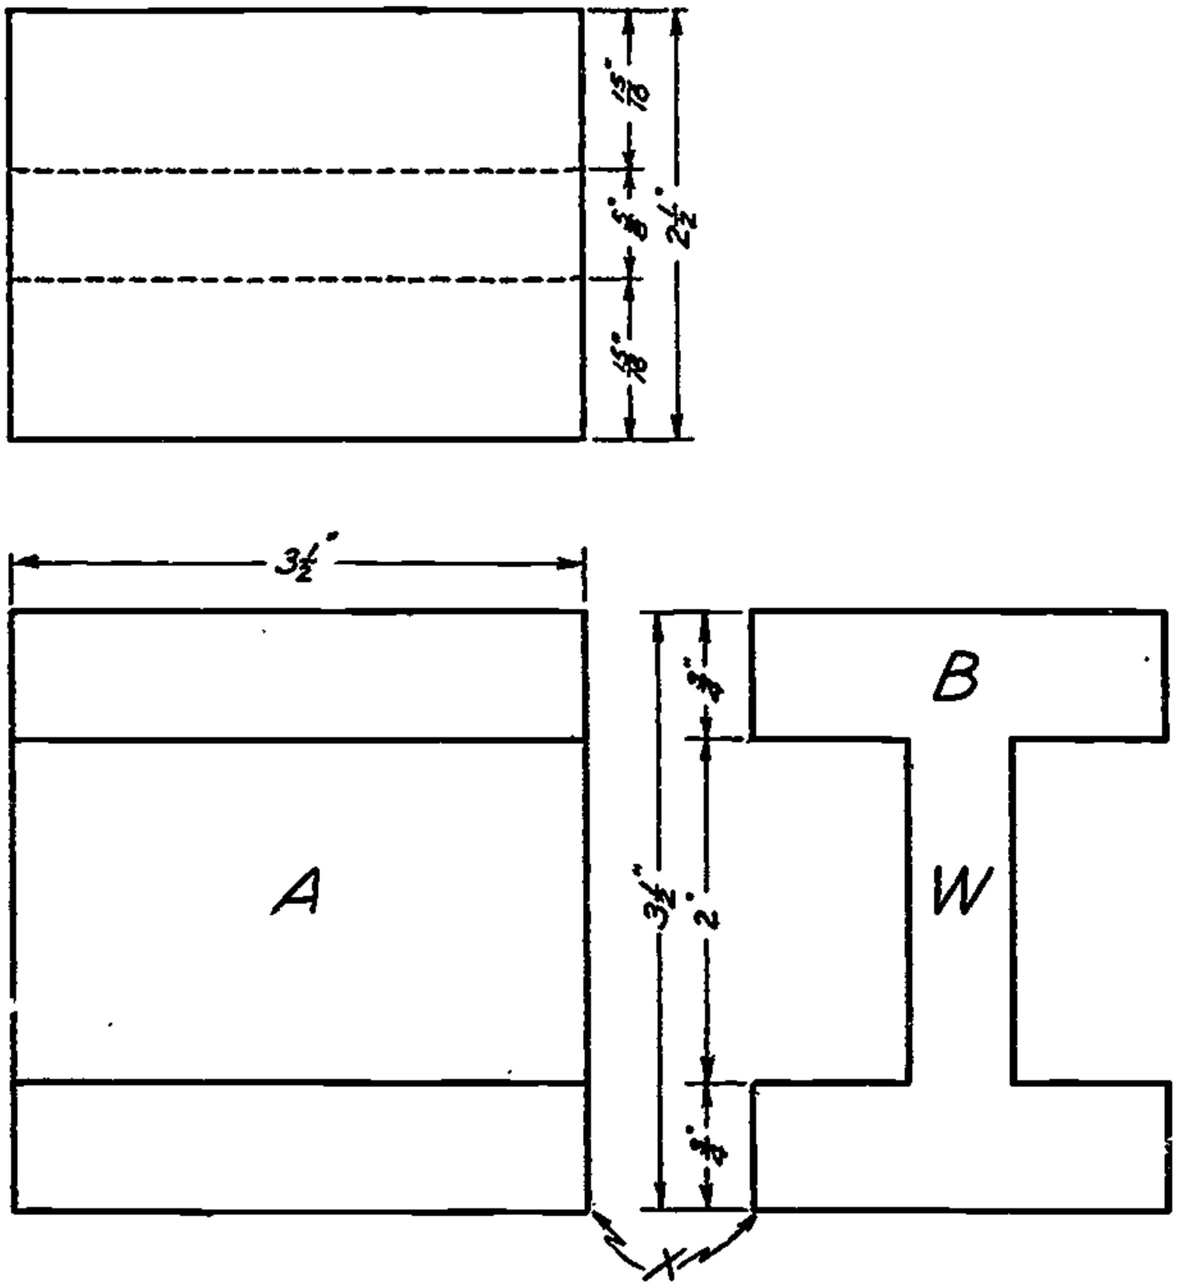
Make an isometric drawing of this block, placing the corner marked "X" on the isometric axes. Questions to be answered about the working drawing on this sheet:

1. The only invisible line in the working drawing is in the ____________ view.
2. What size piece of stock would be required to make this block? ________________
3. The right side view makes a geometrical figure known as a ________________
4. What are the over-all dimensions of the piece cut out of the block? ____________________
5. What kind of a line is used to show an invisible surface? __________________
6. Which line is drawn heavier, an invisible outline or a dimension line? ________________
7. Which view of the working drawing most clearly describes the shape of the block? __________________________
8. How long is the top of the block? _________________

Blueprint Reading

9. How wide is the bottom of the block? ________________

10. What is the shortest dimension in the working drawing?
____



Problem No. 7

Make an isometric drawing of this I-beam. Questions to be answered about the working drawing on this sheet:

1. How many invisible lines are there in the drawing?

   ____

2. These invisible lines represent the intersection of the "W" and the top piece marked ____________.

3. The web of the I-beam is ________ inch in thickness.

4. Why are there no invisible lines in the front view?

   ________________ ________________

5. Which view most clearly gives the shape of the object?

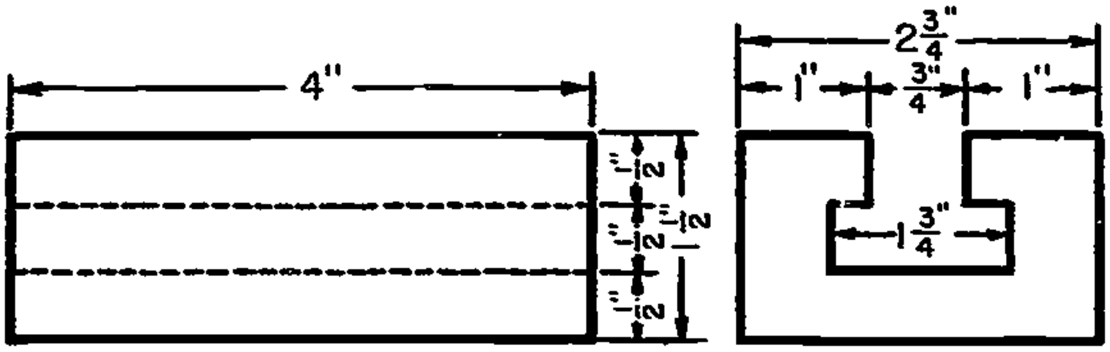
   ____

Blueprint Reading

6. How thick are the flanges of the I-beam?________________

7. What is the distance from the under side of the top flange to the bottom of the beam? ________________________

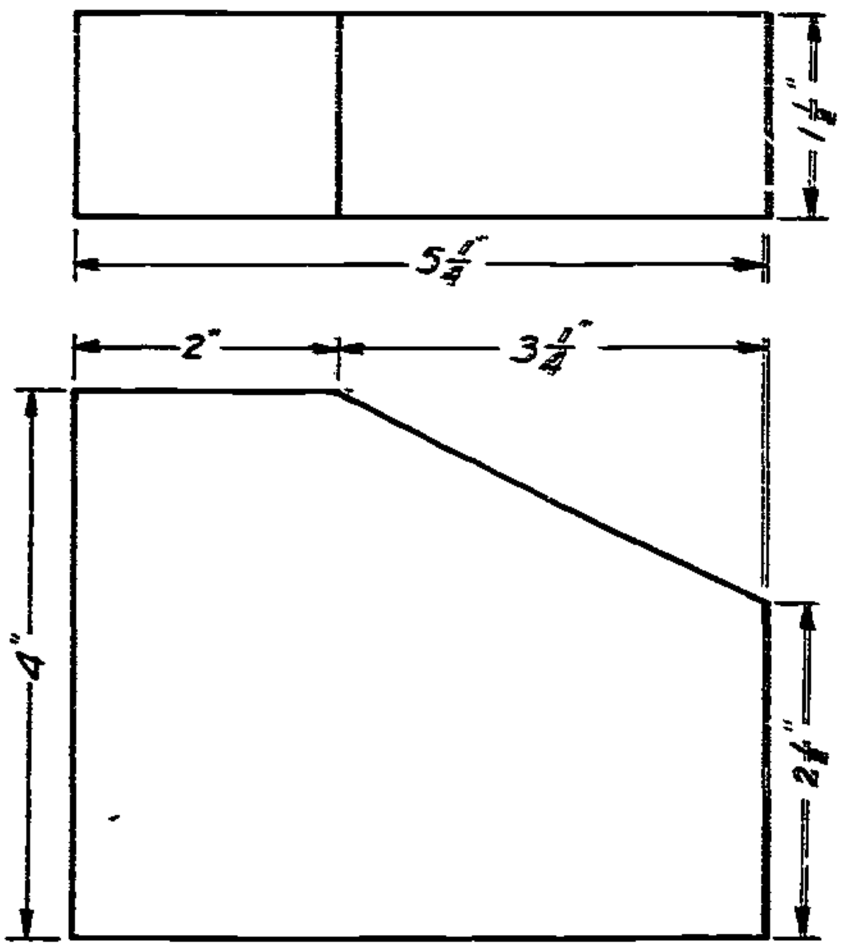
8. What are the two dimensions of surface "A"? ____________



Problem No. 8

Make an isometric drawing of this block. Questions to be answered about the working drawing on this sheet:

1. Would two views give the workman enough information to make the block? Why? ______________________
2. How many invisible lines are in the drawing? ________
3. The height of the "T" slot is shown on an invisible line in the ______ view.
4. What is the depth of the slot at the upper part of the block? ____________
5. What is the depth of the bottom part of the slot?______
6. What view best shows the shape of the slot? ________
7. In the alphabet of lines, invisible lines are made ______ than the outline lines.
8. What determines how many views a draftsman will make of an object? ______________________



Problem No. 9

Make an isometric drawing of this block. Questions to be answered about the working drawing on this sheet:

1. The true length of the sloping surface is shown in the ______________ view.

2. The best procedure in drawing a sloping line when the angle is not shown is to locate its ___________ points.

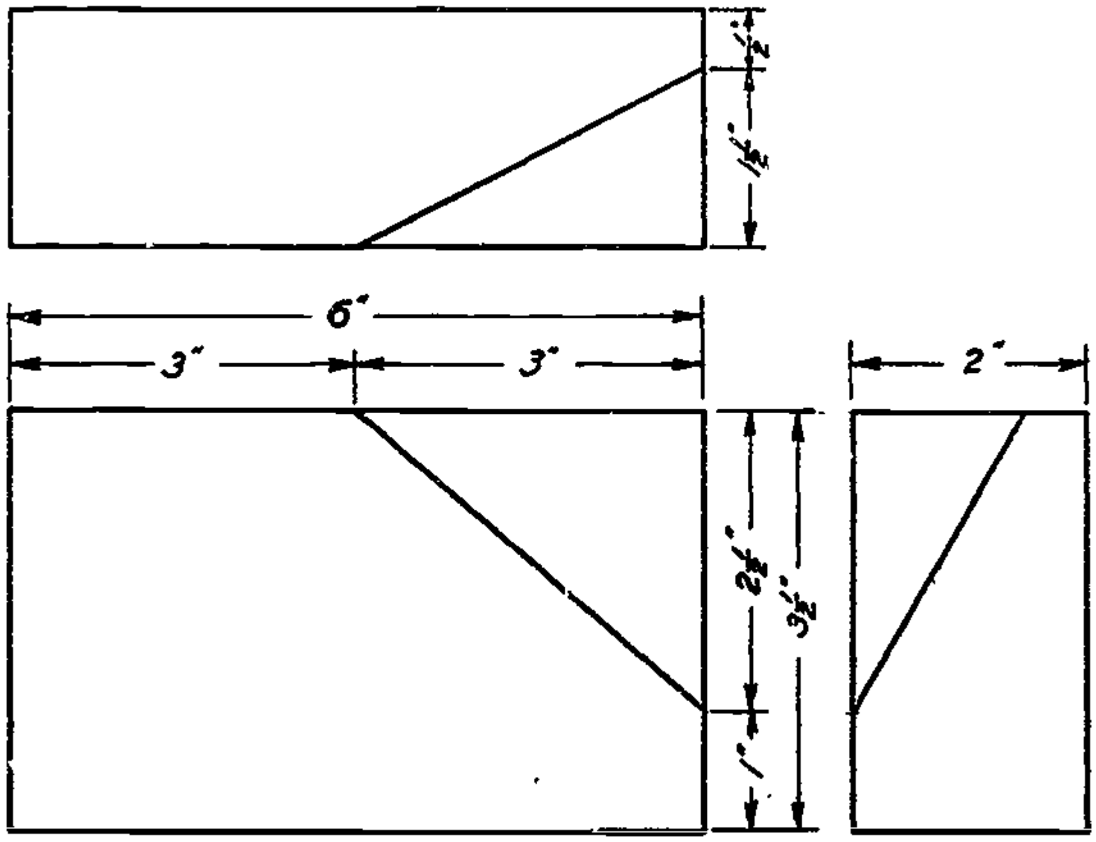
3. All measurements in isometric drawings must be made along the ______________________.

4. The front view contains three right angles and two other angles larger than the right angles which are called ___________________ angles.

Blueprint Reading

5. Do the two views of this object give the workman enough information to enable him to make the object?__________

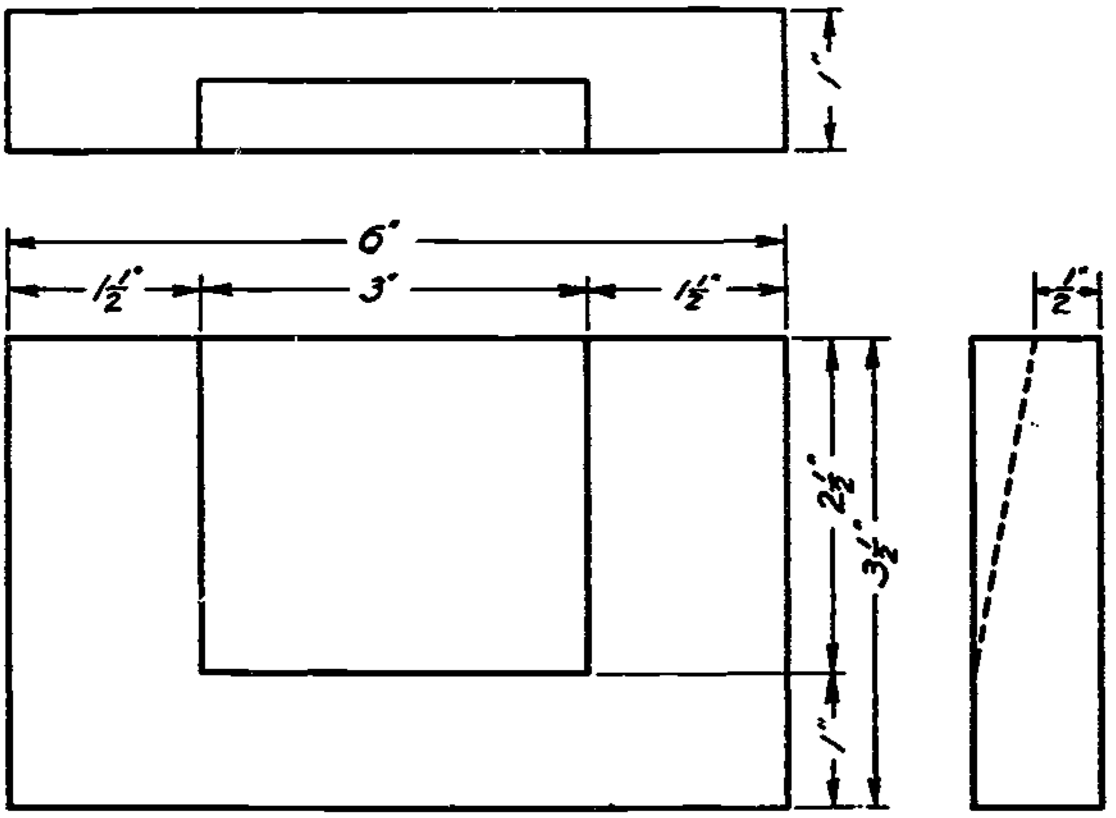
6. Is there a dimension in the working drawing which gives the true length of the sloping surface?________________



Problem No. 10

Make an isometric drawing of this block which has had a corner cut off it. Questions to be answered about the working drawing on this sheet

1. Does the slanting line in the right side view show in its true length? ____________
2. Does the slanting line in the top view show in its true length? ____________
3. In drawing slanting lines it is usually best to locate the ____________________ points.
4. The true shape of the sloping surface is shown in which of the three views? ____________________
5. Would less than three views enable the workman to make the object? ________________________



Problem No. 11

Make an isometric drawing of this block. Questions to be answered about the working drawing on this sheet:

1. Which view shows that the notch is slanting? __________

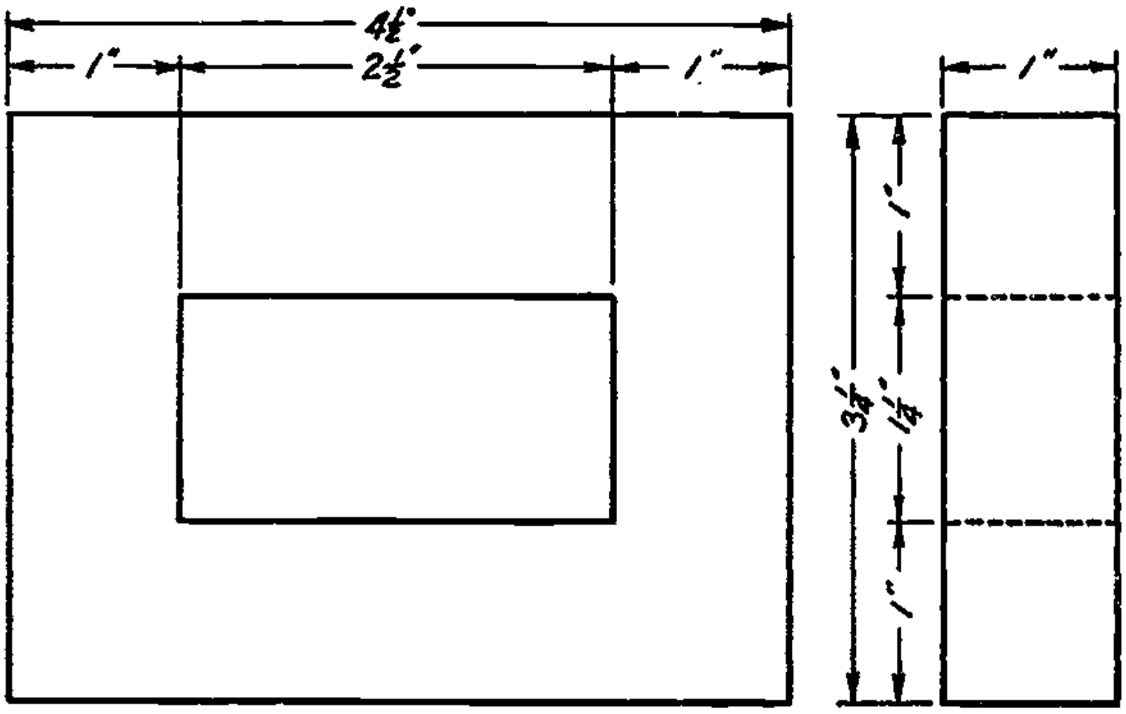
2. The lines on which the figures are placed are called ____________ lines.

3. The lines which extend out from the drawing in order to show exactly where the dimensions begin and end are called ______________ lines.

4. Arrow heads should always ______________ the extension lines.

5. The line between the enumerator and denominator of a fraction should be in line with the _____________ line.

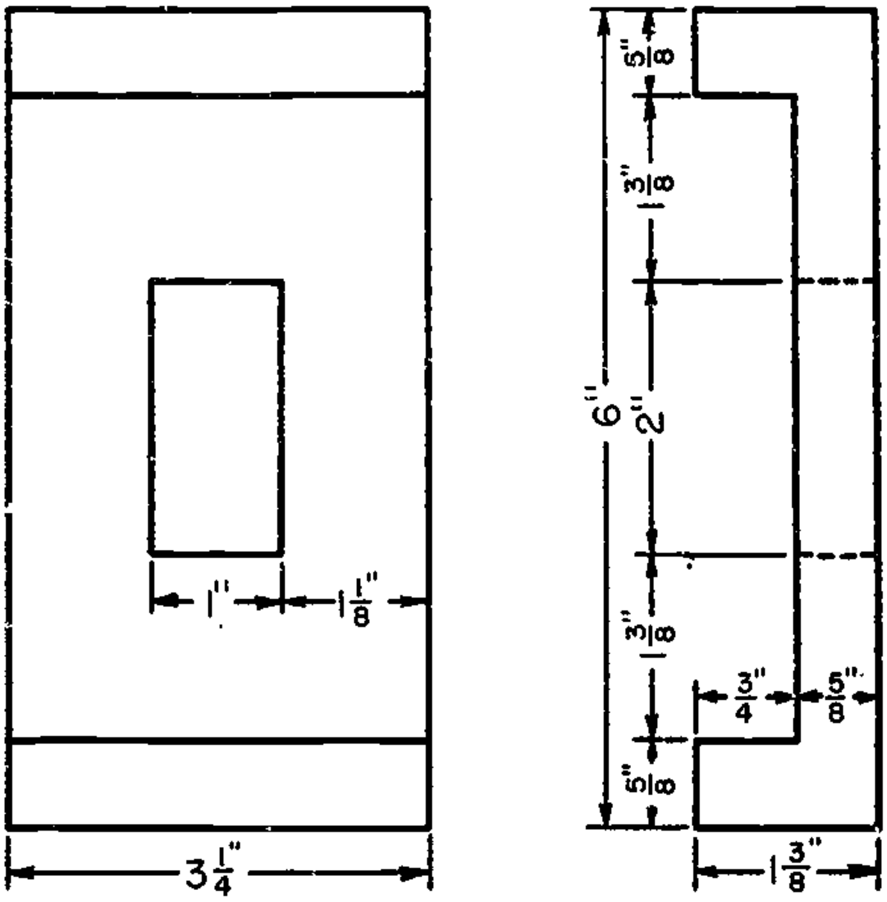
6. Would less than three views enable the workman to make this object? Why? ____________________________________



Problem No. 12

Make an isometric drawing of this block. Dimension the drawing. Questions to be answered about the working drawing on this sheet:

1. What are the dimensions of the piece cut out of this block?
   ____
2. Which view shows that the hole goes all of the way through?
   ____
3. What are the over-all dimensions of the block? ________ x ___________ x__________.
4. Which view shows the width of the block?
5. Do the two views give the workman enough information to make this block? ________________
6. Which view gives the better mental picture of the block?
   ____



Problem No. 13

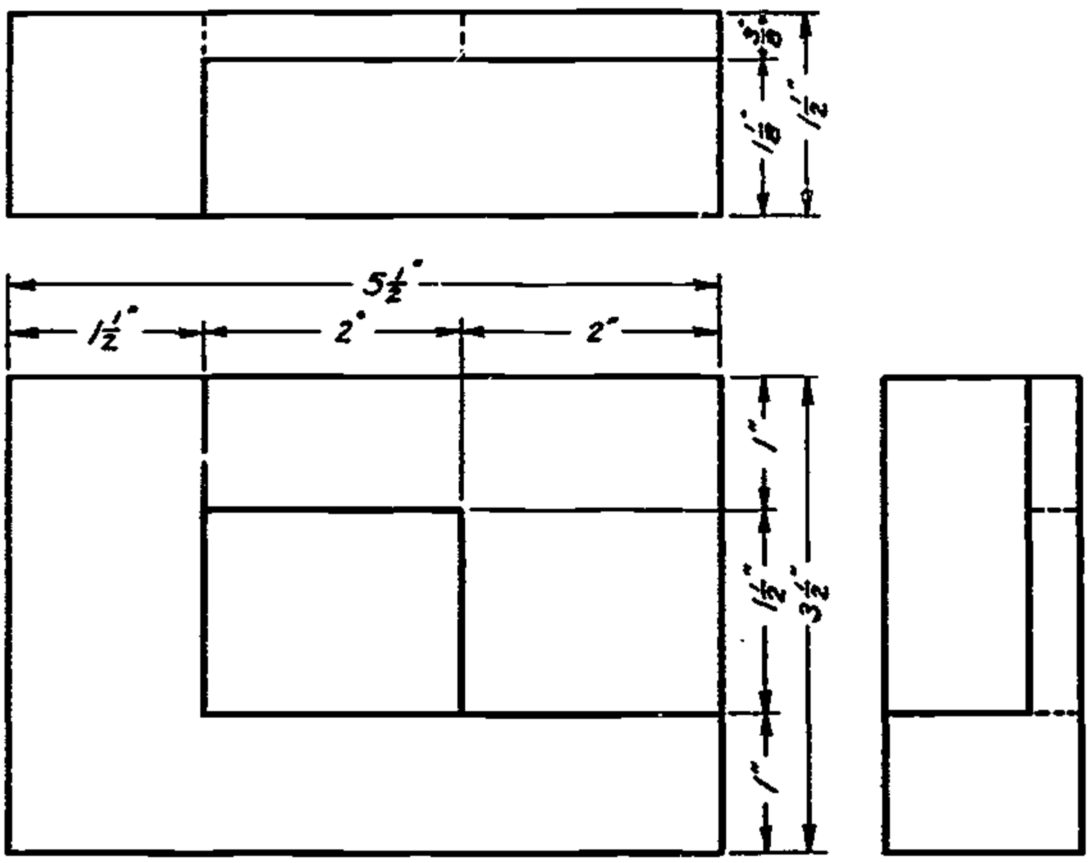
Make an isometric drawing of this section of channel iron. Dimension the drawing. Questions to be answered about the working drawing on this sheet:

1. How thick is the web of this channel iron? ____________
2. How thick are the flanges? ______________
3. What is the size of the hole cut in the web? __________
4. What is the distance from the bottom of the flange to the hole? ______________________
5. Which view shows that the hole goes all the way through the web? ______________________

Blueprint Reading

6. Which view shows better the shape of the object? ________

7. What information do engineers give to describe channel iron? ____________________



Problem No. 14

Make an isometric drawing of this block. Questions to be answered about the working drawing on this sheet:

1. What is the size of the material cut out of the small hole which goes entirely through the block? ____ x______ x____
2. Which two views show that the hole goes entirely through the block? ______________________
3. What are the over-all dimensions of the block?___________
4. What is the depth of the thinnest part of the block?
   ____
5. What is the distance from the bottom of the block up to the hole? ________________________
6. What is the size of the larger piece cut out of the block?
   ____

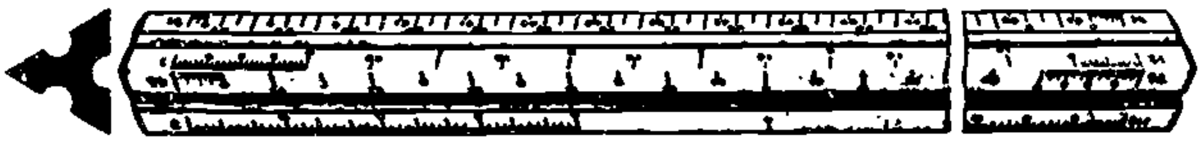
7. Measurements:

The draftsman makes measurements with a tool known as a scale. This resembles a rule with which the workman is familiar. The scale commonly used has three sides as is shown in Fig. 9. It will be noticed that the scale shown is known as an architect's scale divided into the following ratios: 3/32, 3/16, 1/8, 1/4, 3/8, 1/2, 3/4, 1, 1 1/2, and 3 inches to the foot. It also contains a full size scale of 12 inches and divided into sixteenths. This type scale is also available divided into tenths and is used in civil engineering work and is known as an engineer's scale.

Triangular Boxwood Scales

U. S. Standard. Made of Thoroughly Seasoned, Highest Quality Boxwood. Machine Divided.

WHITE CELLULOID FACED



Architect's Scale, 12-inch. Open divided: 3/32, 3/16, 1/8, 1/4, 3/8, 1/2, 3/4, 1, 1 1/2, 3 inches to the foot, 1/16-inch.

Engineer's Scale, 12-inch. Full divided: 10x20x30x40x50x60 parts to the inch.

Fig 9

A small object would always be drawn full size, that is, if the length of an object were four inches and the width two inches, the draftsman would make the drawing to the actual size. However, it is necessary generally to make the drawing smaller than the actual object. This is done for convenience and this reduction of an object so that it can be conveniently put on a certain size of paper is known as drawing an object to scale.

The foot usually is used as the basis in determining the scale to be used in laying out a drawing. If the scale is half size, it would be written 6" = 1' -0", or half-size; 1/4th size would be written 3" = 1' -0", etc. A scale of 3/4" = 1' -0" means that every three-quarters inch on the drawing represents one foot. A scale of 1/4" = 1' -0" means that every quarter-inch on the drawing equals one foot; a scale of 1/8" -1' -0" means that every eighth-inch on the drawing equals one foot. Nearly all architectural drawings are laid out on a scale of 1/4" = 1' -0". If the building is very large, this scale is 1/8" = 1' -0". Pump bases, engine houses, foundations, tank walks, and other objects will be drawn to scale, depending upon the size of the object and the size of the paper which the draftsman will have to use.

The student will find it worth his while to obtain a scale and examine it. On one side will be found a foot laid out in standard inches showing sixteenths. This, of course, is a full sized scale. It will be noticed that there are figures printed at the end of the scale. These will be found to be 3, 1 1/2, 1,. 3/4, 1/2, 3/8, 1/8, and 3/32. These figures mean that the scale so marked is divided into feet and that the unit marked on the end is taken as the foot. Take the end of the scale marked "3", and it can be seen that the unit is three inches, which is divided into twelve parts. Each one of these twelve parts is divided into eight parts. Thus, the smallest division on the scale 3" = 1'0" is 1/8th of an inch. If it is desired to measure off one foot on this scale, one would start at the zero mark and run to the point marked "1". Then if three inches were to be added to the foot, the three inches would be added out of the foot which is marked in feet and inches. Fig. 10, scale "A", will illustrate how this is done.

Scale "B" represents the scale, 1 1/2" = 1' -0". Here the measurement 2' -9 1/2" has been laid out. Here again the method of scaling was to start at the zero point and run to the 2' point and then returning to the zero point running 9 1/2" into the divided foot. It will be noted that on this scale 1" measures 1/8" on the full size scale. Many large details which the petroleum worker will read will be drawn to this scale and workman can easily scale these drawings by using an ordinary rule.

Scale "C" is scale 1" = 1'0", and the measurement 4' -4 3/4" has been set off. Scale "D" is the scale 3/4" = 1' -0", and here the measurement 6' -10" has been set off. It will be noticed that the 1" division on this scale is equal to the 1/16" on a full sized scale or the workman's rule. This scale is also used very often on details and such blueprints are easily scaled by using an ordinary rule.

Scale "E" is the scale 1/2" = 1' -0" and the measurement 9' -7 1/2" has been laid off. The next scale on Fig. 10 is the scale 1/4" = 1' -0", and it should be remembered that this is the one to which most architectural and mechanical blueprints are made. On this scale the measurements 20' -6" has been laid off. The last scale in Fig. 10, scale "G", is used for large buildings or any large object in order to use paper of standardized size. Scale "G" shows how 31' -8" would be laid off at the scale of 1/8" = 1' -0".

Each side of the scale is used for two different sized scales. It should be noted that one is just half the other in each case, and this should be remembered in using the scale in order to avoid errors.

In laying out work, the written dimension should be followed. For example, if you find that the length of a pump base details five feet and seven inches but has a written dimension of six feet and seven inches, make that pump base six feet and seven inches long. You will find the following sentence inserted after each set of specifications: "Where figures are given they are to be followed in preference to measurement by scale." Sometimes the scale is actually shown on the drawing. Where this is done the workman uses it exactly as you would a regular scale.

8. Taking Information off Blueprints:

Many symbols are used on drawings to indicate the kind of finish, kind of material, kind of thread, etc. The draftsman can write the symbol and give the needed information in a very small space where a large space and more time would be required if the information were written out. Fig. 11 gives a few of the common notes and symbols used by the draftsman. The symbol F.A.O. is used when the draftsman wishes to tell the machinist that the machine part being detailed is to be finished all over. Therefore, F.A.O. means finished all over. The student will find many of the symbols and notes shown in Fig. 11 on the problems and blueprints to be presented later in this study.

Problem No. 15

Problem 15 is a working drawing for a rectangular steel face plate. The working drawing shows a front and right side view. The front view shows that there are six 1" holes drilled in the plate; that these holes are centered 2" on either side of the horizontal center line; that two holes are drilled on the vertical center line and the other holes are centered four inches on either side of the vertical center line. The right side view shows that the plate is three-quarters inch thick, and the dotted lines in the right side view show that the holes go all the way through the plate.

The student should first study the drawing, read all notes, and form a mental picture of the object. If this is done he will then be able to proceed to answer the questions about the problem.

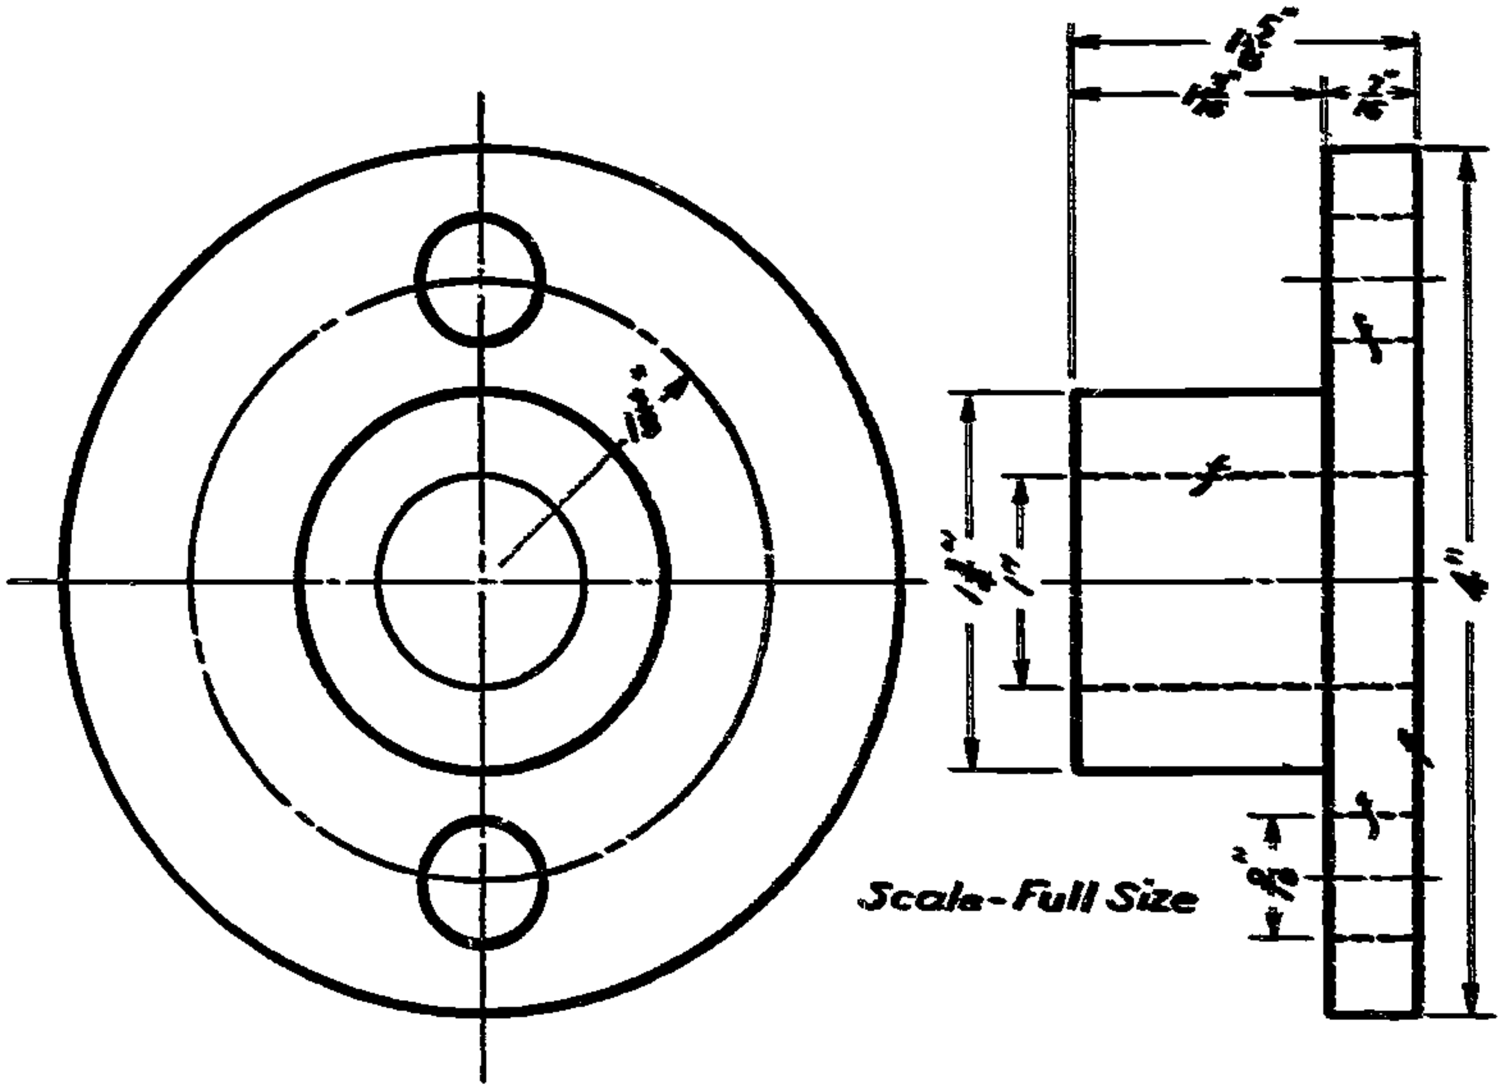
PROBLEM 15



PROBLEM 16

Questions to be answered about problem No. 15:

1. What is the size of the holes drilled in the plate?

    ____

2. Do these holes go all the way through the plate? _______
3. What is the height of the plate? _____________
4. What is the width of the plate? ______________
5. What is the depth of the plate? ____________
6. What is the vertical distance between the center lines of the holes?
7. What is the horizontal distance between the center of a center hole and the center of either outside hole?_______
8. What is the distance between the center of the holes and the edge of the plate? _________________
9. What parts of the plate are to be finished? ____________

Problem No. 16

Problem 16 is a working drawing for a packing gland. A pattern is to be made from which a casting is poured. The surfaces marked "f" must be machined reasonably accurately. The two small holes are to be drilled through the casting and the radius of the circle on which they are located is given.

Questions to be answered about Problem No. 16:

1. What is the size of the center hole? _______________
2. What is the length of the center hole? _____________
3. What is the size of the bolt holes? _______________
4. How far are the bolt hole centers from the center of the bore? ___________________
5. What is the largest over-all measurement of the gland base?

    ____

6. How deep is the base? ______________________
7. How many surfaces are to be finished? _____________
8. To what scale was this drawing made?

Problem No. 17

Problem 17 is a working drawing for a bearing. It also is made from a casting and certain parts of it are to be finished while others may be left as the casting comes from the mold. The center of the bearing must be located an exact distance above the bottom of the base. The bolt holes must be located accurately and also must be located by center lines as the outside edges of the casting aren't to be finished and won't be true.

Questions to be answered about Problem No. 17:

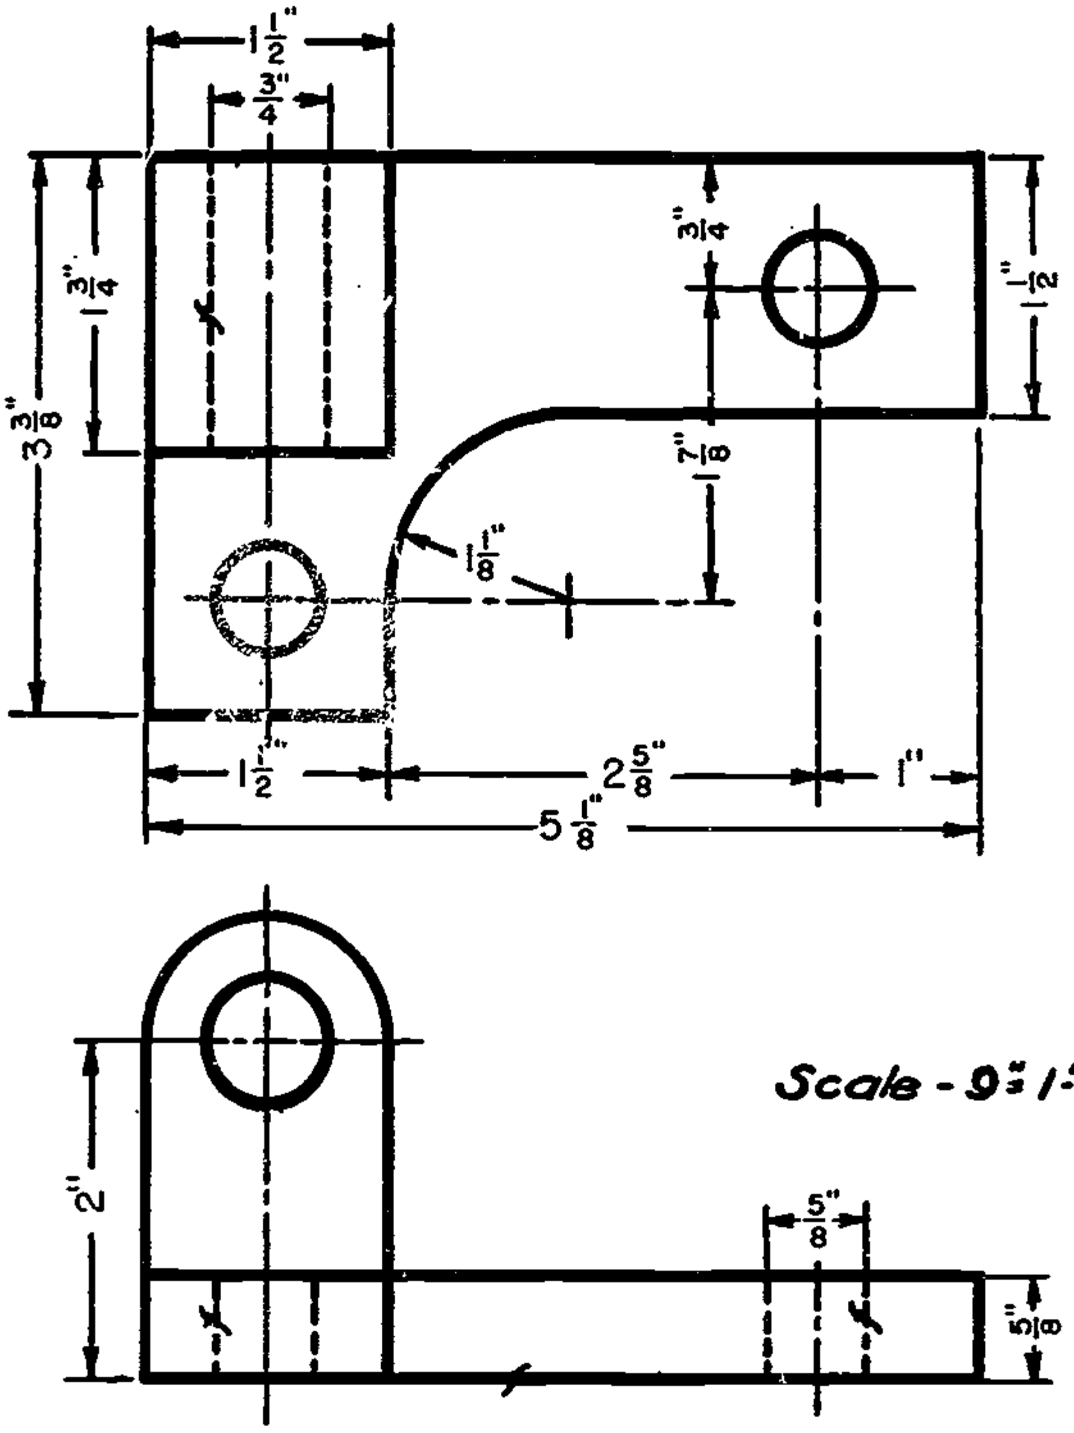
1. What are the over-all measurements of the bearing base? ____________________
2. How high is the bearing base? ____________________
3. The bearing is for what size shaft? ____________________
4. How long is the bearing? ____________________
5. How far is center of shaft above bottom of base? __________
6. How many bolt holes are there? ____________________
7. Bolt holes are what size? ____________________
8. How are the bolt holes located? ____________________
9. How many surfaces are to be finished? ____________________

Problem No. 18

Problem 18 is a working drawing for a round cover. It is also a casting and must be machined to fit the end of a pump cylinder. Other parts of the casting may remain as it comes from the mold.

Questions to be answered about problem No. 18:

1. What is the depth of the rim of the cover? __________
2. What is the depth of the cover over the ribs? __________
3. How wide are the ribs? ____________________
4. What is the diameter of the holes? ____________________
5. What is the angle between the holes? ____________________
6. How many holes are there? ____________________



Scale - 9" = 1'-0"

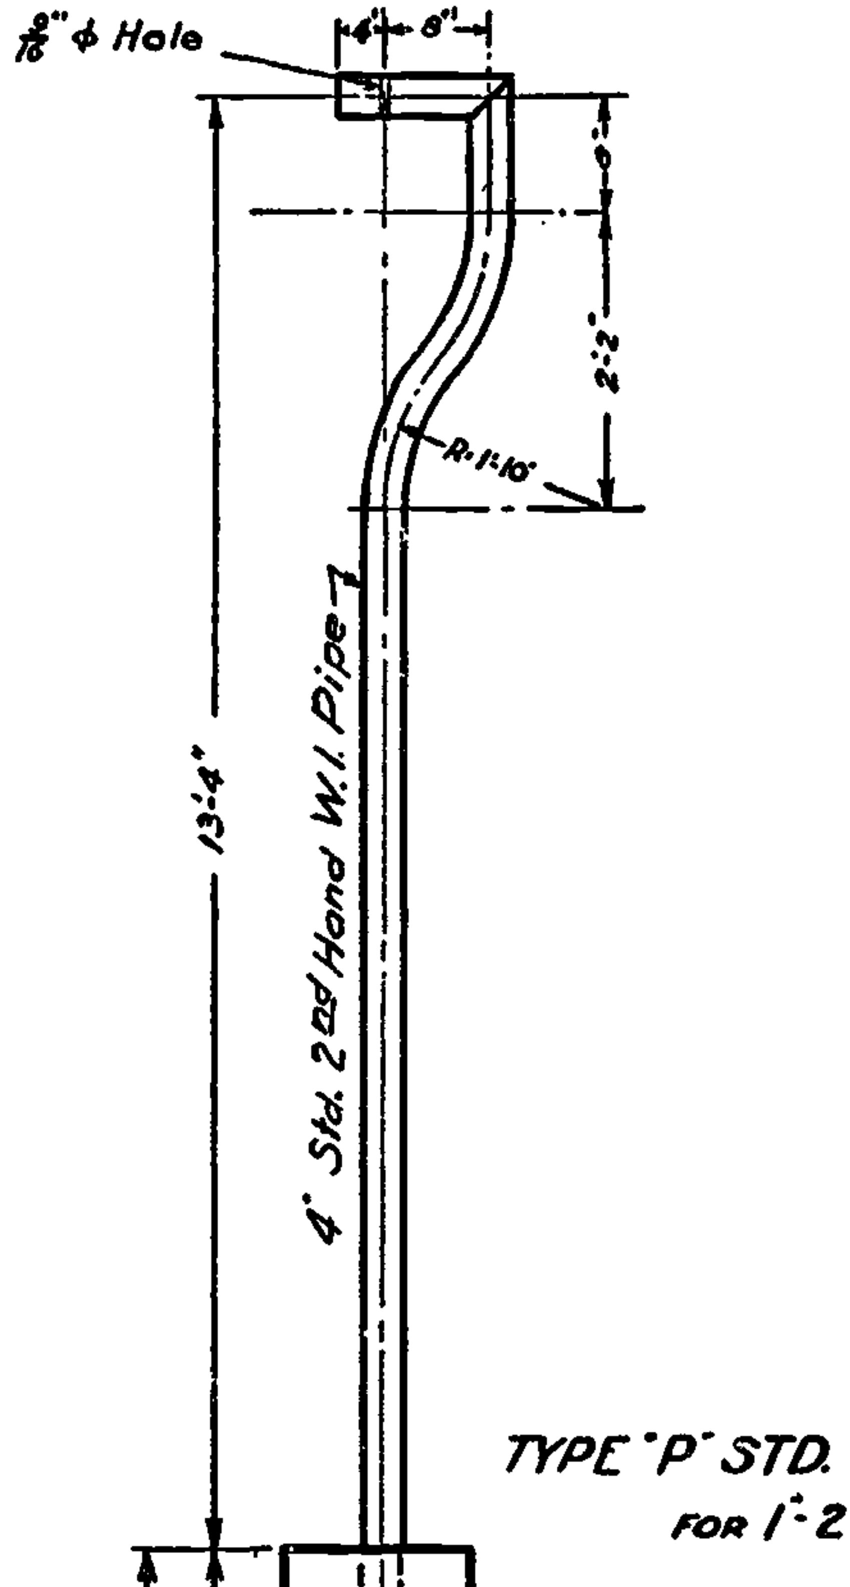
PROBLEM 18

Scale - Half Size



TYPE "P" STD. PIPE SUPPORT
FOR 1"-2" OR 3" LINE

PROBLEM 19

7. What is the size of the spotface? ____________________

8. What is the depth of the recess in the bottom of the cover? ____________________

9. What is the diameter of the recess? ____________________

10. What is diameter of the bolt circle? ____________________

11. What parts of the cover are to be finished? ____________________

12. Of what material is the cover made? ____________________

13. What is the outside diameter of the cover? ____________________

14. How thick is the cover inside the recess, not including the ribs? ____________________

Problem No. 19

Problem 19 is a working drawing of a standard pipe support. The height of the pipe support may be changed to meet the needs of a particular job, but all other dimensions are to remain the same. It will be noticed that this support is made to carry three sizes of pipe line. There are two symbols used on this drawing which should be noted. The hole drilled through the top end is noted with a symbol which means that it is to be a round hole and the note pointing to the bottom of the pipe uses the symbol for "plate," instead of spelling out the word.

Questions to be answered about Problem No. 19:

1. What is the height of concrete footing? ____________________

2. What is width and depth of concrete footing? ____________________

3. How far does pipe extend into concrete? ____________________

4. What mix is used for the footing? ____________________

5. What size plate is welded to bottom of pipe? ____________________

6. What size hole is drilled through top end of pipe? ____________________

7. How far is the center of the hole from the end of the pipe? ____________________

8. How much is pipe offset? ____________________

9. What is height of horizontal section of pipe above concrete footing? ____________________

10. What kind of pipe is to be used in making the pipe support? ____________________

11. What size lines will this support carry? __________

12. What is radius of curve in offset? __________

Problem No. 20

Problem 20 is a working drawing of a gear. The petroleum worker should be familiar with gears as they are used in practically every machine in any industry. Some of the terms used in gear design will be of very little value to the petroleum worker, but if he is not already familiar with the different gear parts it would be well to study Problem 20 for a short time. The diagram at the top of Problem 20 gives the names of the parts of the gear. The working drawing at the lower part of the sheet shows a front and side view of a gear. The gear is designed to fit a certain size shaft as given in the note and the accuracy required for the bore is noted immediately after the diameter of the bore. The machinist who makes this gear knows how much he is allowed to vary from the specified bore, or, in other words, he knows what tolerance is allowed. Such terms as addendum, dedendum and circular pitch are of interest to the experienced machinist and pattern maker.

Questions to be answered about Problem No. 20

1. What is the outside diameter of the gear? __________
2. What is the root diameter? __________
3. What is the diameter of the pitch circle? __________
4. What is the width of the face of the gear? __________
5. What is the size of the bore? __________
6. How much tolerance is allowed? __________
7. What size keyway is to be cut? __________
8. What is the diameter of the hub? __________

movement of the pipe due to contraction or expansion as the pipes become hot or are allowed to cool. The slotted holes in the bracket permit adjustment so that the bracket may be raised or lowered in order to straighten the pipe line.

Questions to be answered about Problem No. 21:

1. The bracket is designed to carry what size pipe? __________
2. Of what material is the bracket made? _______________
3. What is the width of the slotted holes? _______________
4. What is the length of slotted holes? _______________
5. What is the distance from the top of the bracket to the center of the top slotted hole? _______________
6. What is the distance from the top of the bracket to the center of the lower slotted hole?
7. What is the thickness of the material through which the upper slotted holes are cut? _______________
8. What is the thickness of the material through which the lower slotted hole is cut? _______________
9. What is the thickness of the top flange? _______________
10. What is the width of the top flange? _______________
11. How far does bracket extend out from wall? ____________
12. What is height of the bracket? _______________
13. What is thickness of web reinforcing? _______________
14. What is width of web reinforcing along bottom side of top flange? _______________
15. What is width of web reinforcing along back flange and diagonal flange? _______________
16. What is width of back flange at the top? _______________
17. What is width of lower part of back flange? ____________
18. What is width of middle part of back flange? ____________
19. How thick is back flange at the middle section? __________
20. How wide is the diagonal flange? _______________

Problem No. 22

Problem 22 is a working drawing for a pair of standard pipe line flanges. The drawing consists of a front view which will apply to either flanges and to sectional views of both flanges. These flanges are Standard Pipe Line and the measurements do not apply to American Hydraulic flanges. They are flanges for three-inch pipe. Note that the two flanges are made in pairs so as to fit together.

Questions to be answered about Problem No. 22:

1. What is the diameter of the bolt circle? ____________
2. What is the diameter of the bolt holes? ____________
3. The holes are spaced how many degrees apart? __________
4. How many bolts will be required per pair of flanges? _____
5. What is the outside diameter of the flanges? ___________
6. What is the thickness of the flanges at the points where the bolts go through? __________________
7. How deep is the recess on the face of the right-hand flange? _________________________
8. What is the diameter of the recess? _______________
9. How long is the extended part on the other flange which fits in the recess? ____________________
10. What is the outside diameter of the extended part? _____
11. When assembled, how much clearance will there be between the two flanges? __________________
12. When the two flanges are bolted together, how much space will there be between the two flanges where the bolts are? __________________

Problem No. 23

Problem 23 is a working drawing for a flanged shaft coupling. The two parts are made in pairs so as to fit together. The working drawing consists of a right side view and a front view which is in section. The flanges are keyed to the ends of the shafts and then bolted together.

Questions to be answered about Problem No. 23:

1. The coupling is for what size shaft? _______________
2. What size keyway is to be cut? _______________

3. What is diameter of bolt circle? ____________________

4. What size holes are to be drilled for the bolts? ________

5. What is depth of recess in each part of coupling? ________

6. What is diameter of this recess? ________________

7. What is diameter of hub? __________________

8. What is measurement over both flanges after they are assembled? ______________________

9. What is the width of flange of the right-hand piece of the coupling? __________________

10. What is the width of flange of the left-hand piece of the coupling? __________________

11. How thick is the flange at the outer edge? _____________

12. At what angle does inner side of flange taper back to web? _______________________

13. What is over-all length of the coupling? _______________

14. What is the difference in diameter of the hub at the outer edge and the diameter of the hub next to the web? _______ ___________________

15. What is the thickness of the web of each part of the coupling at the points where the bolts go through? _________________

16. How many surfaces are to be finished? _____________________

Problem No. 24

Problem 24 is a working drawing for an island to be built in a filling station driveway to receive gasoline pumps, and water and air connections. The great numbers of filling stations that have been built and that are being built have caused more or less standardization of filling station design and accessories. Each oil company decides on a standard design for its own filling stations. Problem 24 is a design for a ten-foot island. The symbol used in giving the sizes of the reinforcing bars should be noticed. This symbol, as has been pointed out before, stands for the word "round," thus, as it is used in this case it indicates that round reinforcing bars are used. If square bars had been used, the circular part of the symbol would have been replaced by a small square.

Questions to be answered about Problem No. 24:

1. What is the width of the island? ____________________

2. What is height of the top of the island above the driveway? ____________________

3. How thick is the concrete in the island? ________________

4. What concrete mix is to be used? ____________________

5. What kind of finish is to be put on the concrete? __________ ________________________

6. How far is the lower layer of reinforcing bars to be placed above the bottom of the foundation? ____________________

7. How far is the top layer of bars to be placed below the top of the concrete? ____

8. How many different lengths of bars are required? _________

9. Make a list of all reinforcing bars required. ___________
____
____

10. What are the sizes of the holes running through the concrete?
____

11. What is the measurement between these holes center to center?
____

12. Make a freehand three-view sketch of the island, giving all the information that one would need to actually lay out and build the island.

Problem No. 25

Problem 25 is a working drawing for the fabrication of a structural steel cross-member to be used in a Dubbs Still Cleaner. The crossmember is a I-beam and fastened in place by means of angle irons. The symbol for angle iron will be noticed as well as the symbol for round holes as has been pointed out previously. The small circles indicate rivets and the circles which have been filled in with ink represent open holes.

Questions to be answered about Problem No. 25:

1. What length I-beam is required? ____________________

2. What is the weight of the I-beam per foot? ______________

3. What is the size of all holes? ________________________

Blueprint Reading

4. What size rivets are used? ____________________

5. How many holes must be punched in the I-beam? ________

6. The I-beam is to be coped to fit what size I-beam? _____ ________________

7. How many different sizes of angle irons are required? ______________________

8. The wide flange of each of the larger angle irons is fastened to the web of the I-beam with how many rivets? _____ ________________

9. What is the distance center to center between the open holes of the small angle irons measured lengthwise with the beam? __________________________

10. What is the distance between the open holes of the small angle irons measured across the I-beam center to center? ____________________________

PART II

PIPE LAYOUT

DEFINITIONS

Fabrication--To build up from parts, to forge

Complicated--Difficult to understand; many parts closely combined

Well-Versed--Well-read; know the meaning of

Templet--Pattern of shape to be cut

Centerline--A line used in blueprints denoting the center of holes, parts, etc. It is a line made up of long and short dashes — – —

Angle--A measure of the amount of turning to get around a corner. An angle is given degrees.

Diameter--Longest possible distance from one side of a circle to the other.

Horizontal--Parallel to the horizon or on a level

Circumference--the distance around a circle

Segment--Part of a whole

Compass--Instrument used in drafting to draw a circle

Perpendicular--a line is said to be perpendicular when it intersects a second line at ninety degrees

Base line--bottom line of a drawing; line representing base plane

Intersects--crosses

Slant line--slope line

Points--places or locations

Intersections--Crossings

Originating--beginning or starting place

Parallel--Two lines are said to be parallel when they are side by side, and will never cross regardless of the distance they are extended

O.D.--Outside Diameter   I.D.--Inside Diameter

Technique--Way or method of performing an operation or job

Friction--The resistance to relative motion between two bodies in contact

Elevation--Height from some known point or the view of a blueprint showing the heights of the object.

Turbulence--a swirling, turning, moving mass of gas or liquid

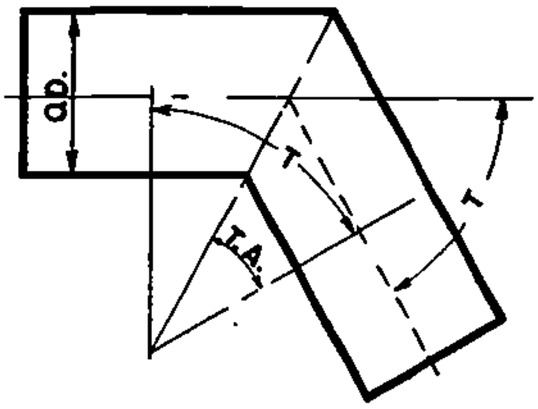
Job 1

Many fittings of varied shapes are needed in the fabrication of complicated piping systems. By the time the student has reached this point in the course, he has become familiar with most of the welding fittings available from the pipe supply houses.

There are often needs for the shop fabrication of connections between pipes and fitting for changing the size or direction of a run of pipe. The well-versed pipe man should know how to draw templets to be used in the shop as patterns for cutting pipe and and shaping it into the desired form.

This section of the text will be devoted to giving the student a sound understanding of how the various templets are developed.

The first problem which will be considered is the change of direction with a simple two-piece turn.



T - Total Turn Angle
TA - Templet Angle
OD - Outside Diameter

Figure 1

Everyone who has ever watched the work done by pipe welders has seen the flat patterns which the layout man wrapped around the pipe. The pattern end of the templet was outlined on the pipe with soapstone. This outline was used as the cutting line for the torch.

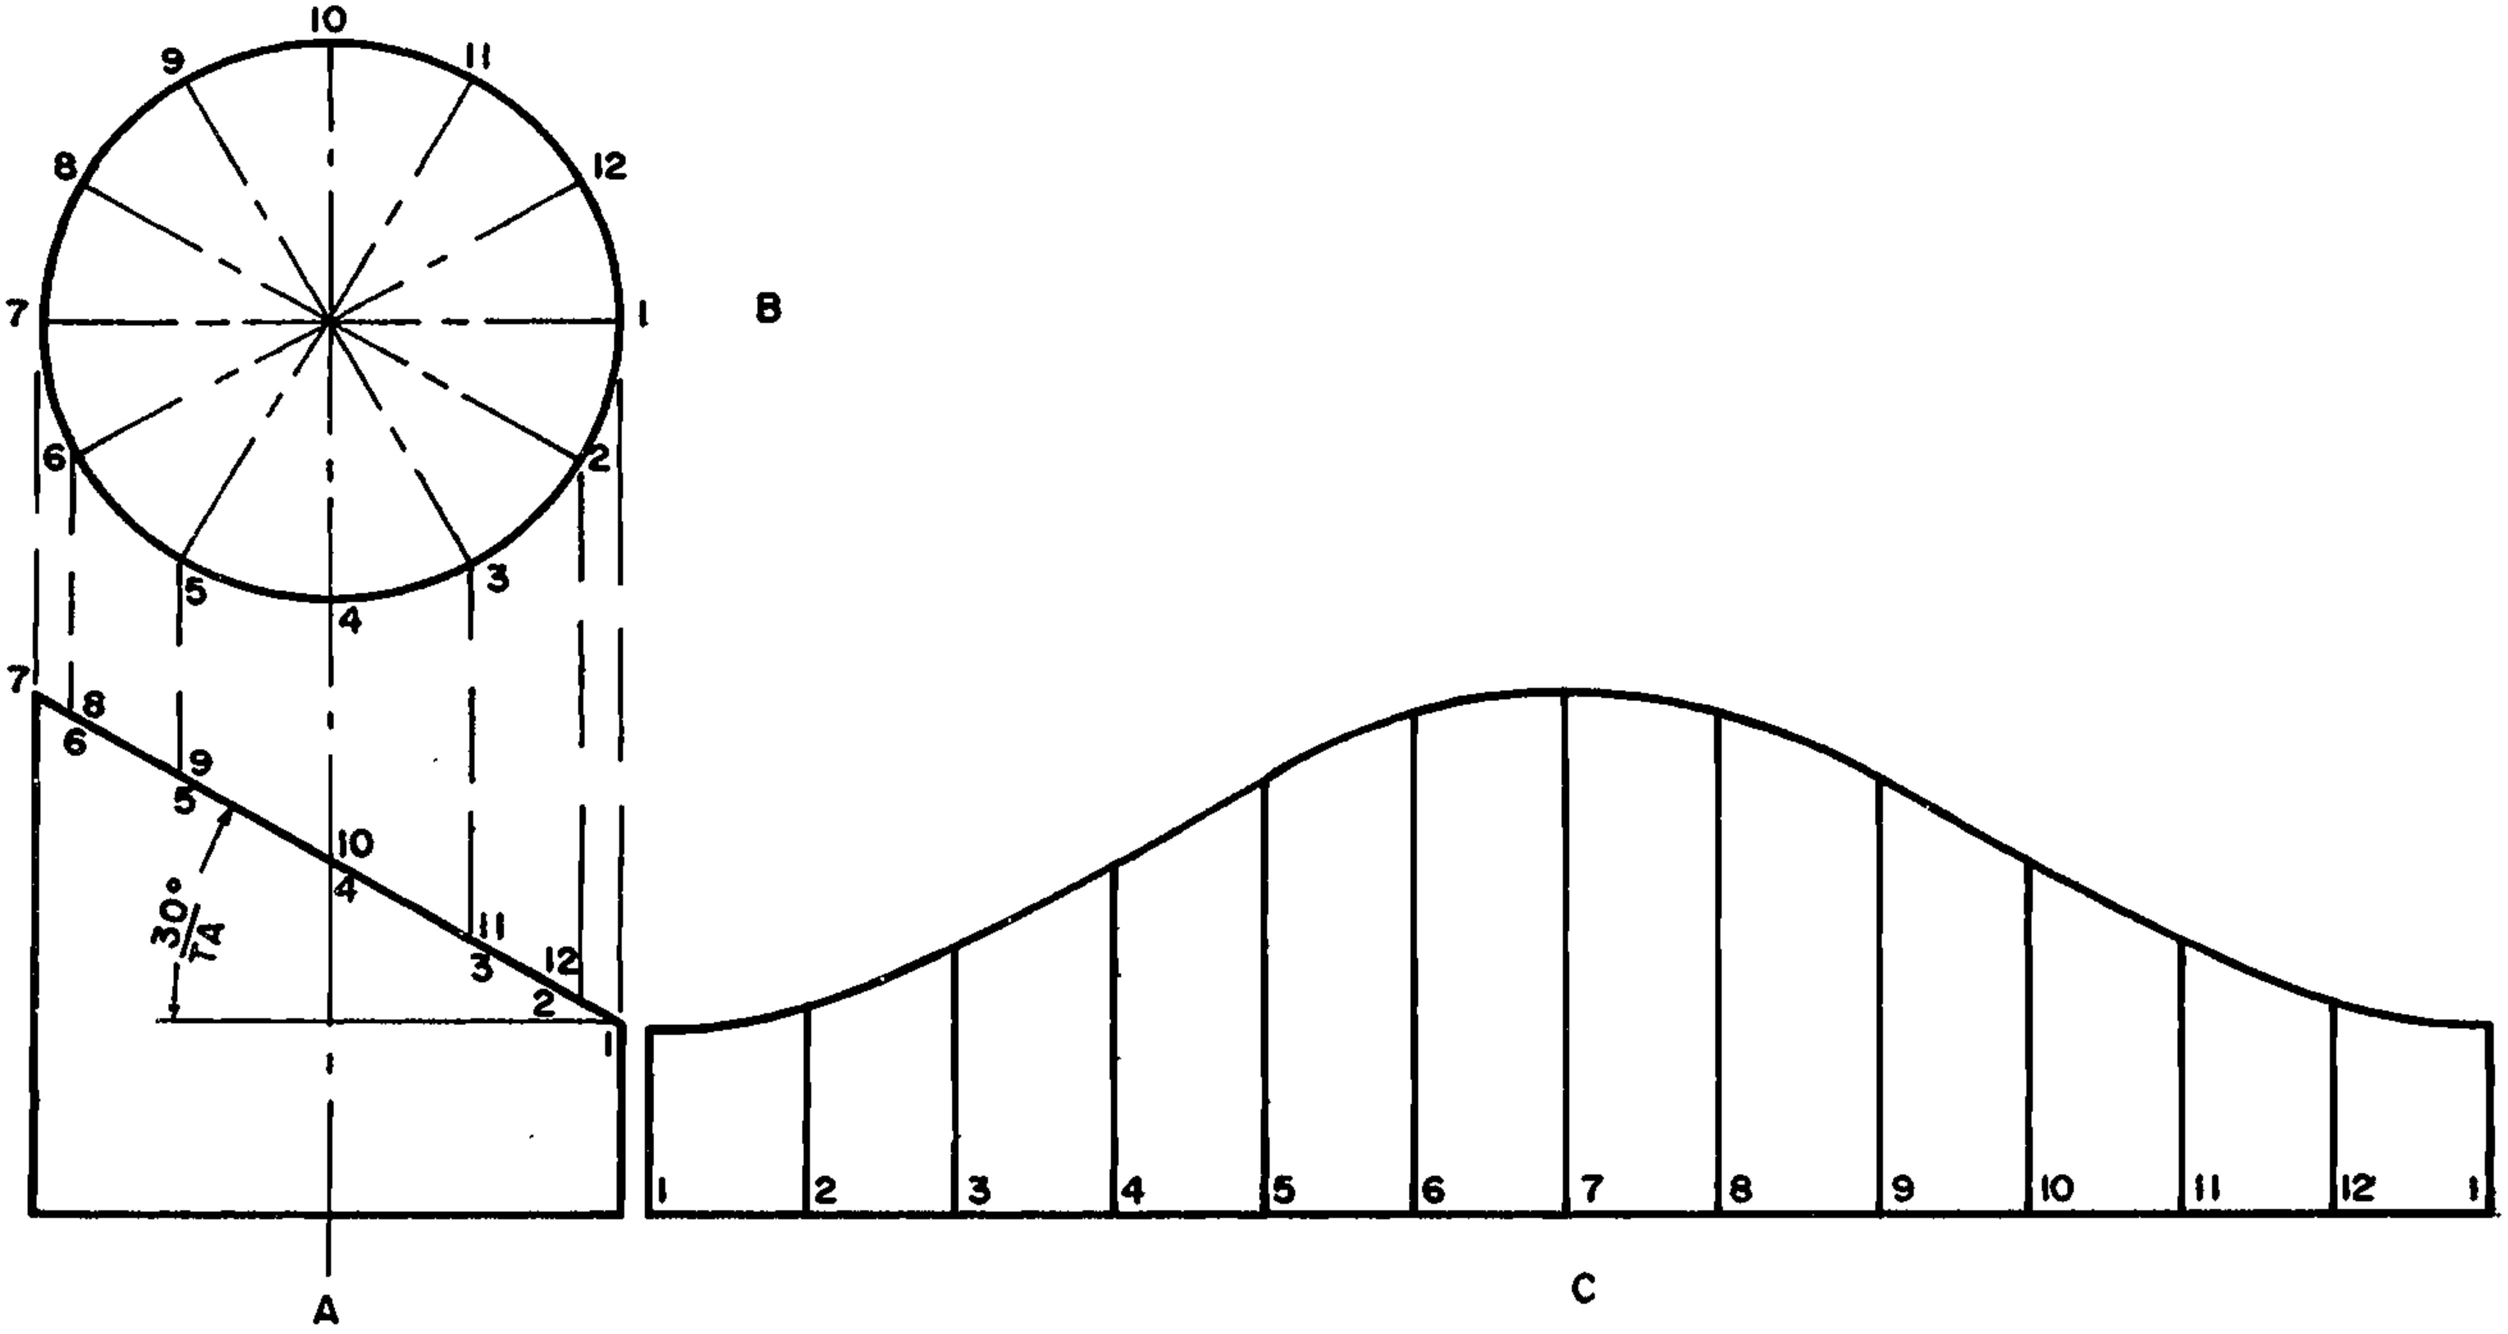
The angle of turn is the change of direction of the centerline of the pipe (see fig. 1.) To make a simple 2-piece turn, this angle of turn is divided by the number of pieces to be used in changing direction. The result of dividing the angle of turn by the number of pieces of pipe used is known as the templet angle.

Draw a side view of a piece of pipe showing the turn desired. Use the outside diameter of the pipe for the width of the view. Move up from the base line a distance great enough to give room for the hands in handling the templet angle above the horizontal as is shown in "A" of fig. 2.

Directly above "A", draw a circle with the outside diameter of the pipe used. Be sure that the center used for the circle is exactly above the center of the side view.

Divide the circumference of the circle into the desired number of equal parts. This may be done by stepping around the circle with the compass set at approximately 1/12th of the circumference. Each segment should be marked lightly. When 12 segments have been laid off, note how far short of or how far past the beginning point the last segment ends. Either lengthen or shorten the setting of the compass by 1/12th of the error, and step around the circle again. When the proper setting has been found, mark the circle into twelve segments and number as shown in "B."

Draw a line perpendicular to the base line of "A" which passes through each pt. on the circumference of the circle "B" and intersects the slant line of the side view. Number these pts. of intersection with the same numbers as their originating points in the circle "B."



TWO PIECE TURN OF
ANY ANGLE

FIG. 2

Extend the base line of "A" out to the right a little more than the circumference of the pipe. Move to the right a little distance and draw a perpendicular line through this point which is numbered "1." From this beginning, lay out toward the right 12 segments, each equal to 1/12th the circumference of the pipe with a perpendicular line drawn through each point and numbered up through 12, with the last line again given the number "1." Here we have effectively cut the side view along a vertical line at the right hand edge and unrolled it. Thus the templet begins and ends with lines marked 1.

Draw a line from pt. 1 in "A" parallel to the base line to intersect both vertical lines marked 1 in "C."

Draw a horizontal line from pt. 2 & 12 in "A" to intersect lines 2 and 12 in "C."

Draw a horizontal line from pt. 3 & 11 in "A" to intersect lines 3 and 11 in "C."

Draw a horizontal line from pt. 4 & 10 in "A" to intersect lines 4 and 10 in "C."

Draw a horizontal line from pt. 5 & 9 in "A" to intersect lines 5 and 9 in "C."

Draw a horizontal line from pt. 6 & 8 in "A" to intersect lines 6 and 8 in "C."

Draw a horizontal line from pt. 7 in "A" to intersect line 7 in "C."

Now all the intersection points in "C" should be connected in order by a smooth curved line. This completes the templet and it may now be cut from the material. (Leave a little material on each end as suggested by dashed line for lapping.)

The number of divisions in this example was 12. This was taken at random, but is a satisfactory number for smaller size pipes. As the O.D. of the pipe increases and as greater accuracy is desired, a greater number of segments should be used.

Assignment 1 of Job 1

Learning methods of laying out angles and the use of wrap around for pipe.

Reference: The Pipe Fitters and Pipe Welder's Handbook
By Thomas W. Frankland
Pages 31-34, 72-77

Job 2

In the previous assignment, the student learned how to develop the templet for any degree of turn, using two pieces of pipe and only one weld.

Make a templet using the technique in the last lesson for a 45 degree, two-piece turn. Keep in mind that although the total turn is 45 degrees, the slope on each piece used accounts for 22½ degrees which is of course, the templet angle.

Assignment 1 of Job 2

Find the angle of cut and lay out a two-piece 35° turn using the wrap around method; cut and weld.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Page 80

Job 3

A two piece 90 degree turn is often used in making an abrupt change of direction in a pipe line. This type of turn needs a templet of the same general construction as the templets for smaller angles.

Make a templet drawing for a two piece, 90 degree turn.

Assignment 1 of Job 3

Find the angle of cut and lay out a two piece 80° turn using the wrap around method.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Pages 78-79

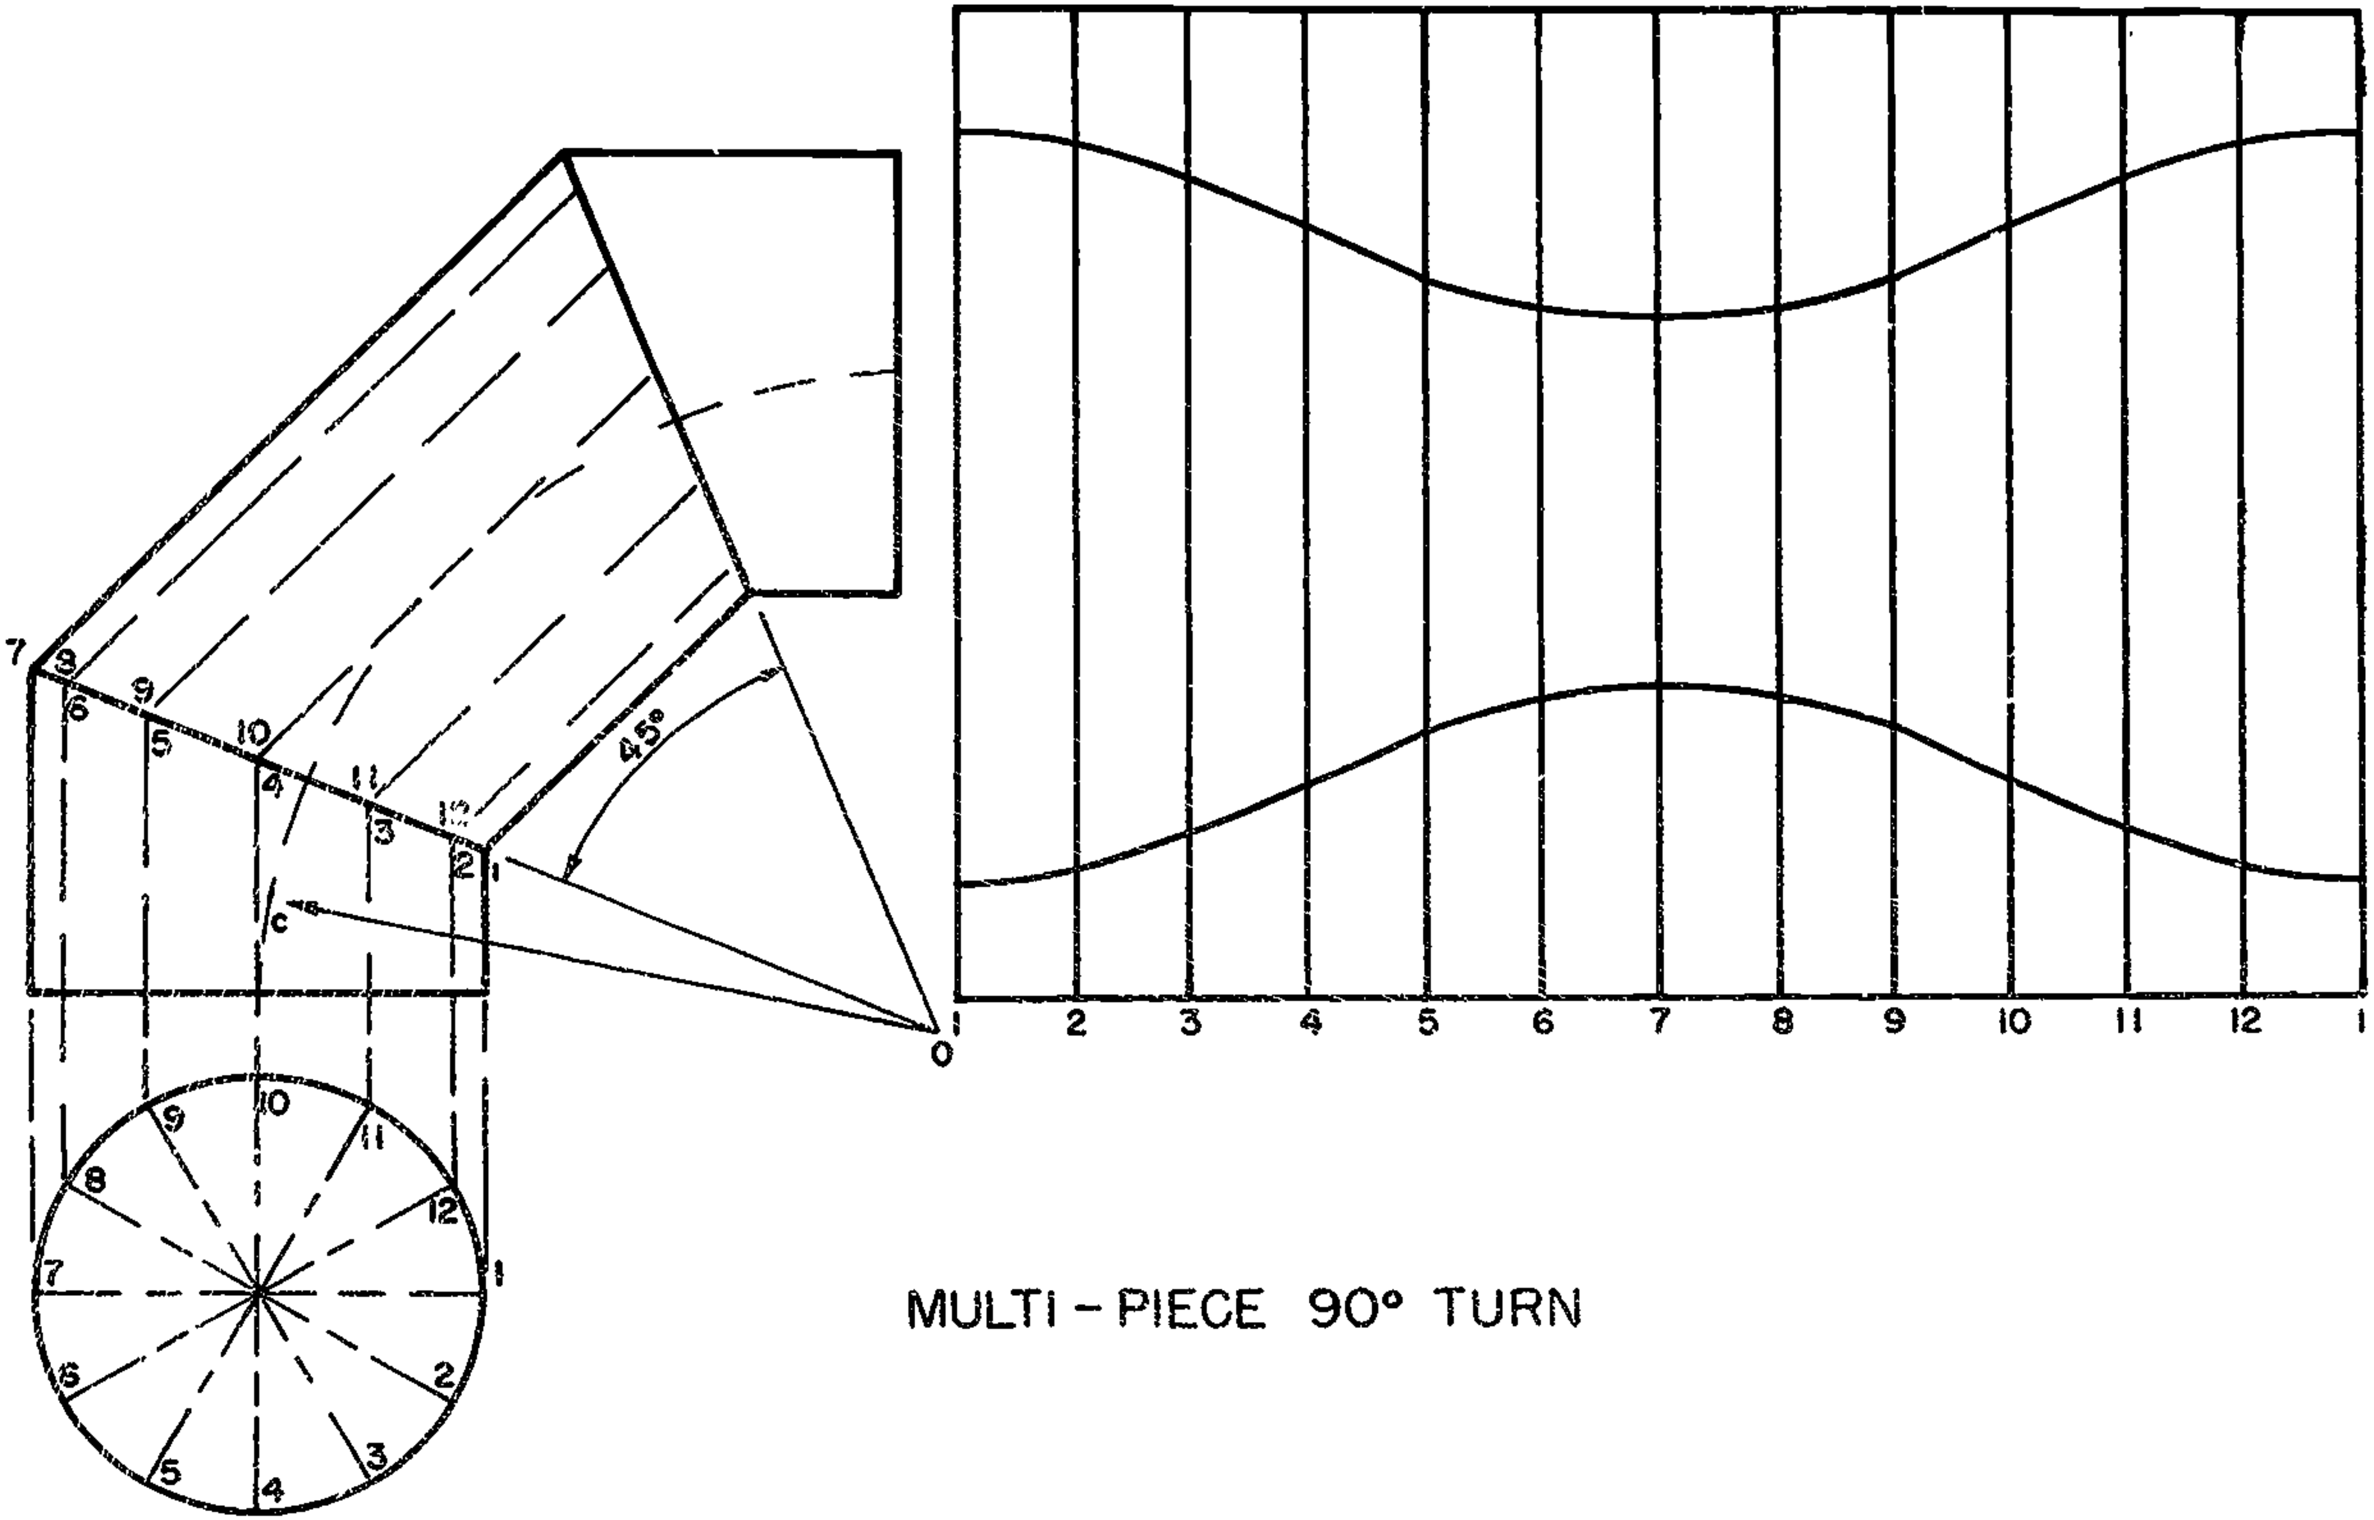
Job 4

A two piece 90 degree turn is so abrupt that the friction and turbulence losses are greater than desirable. The same change in direction may be secured by making two 45 degree turns in succession in the same direction turn. When this is done the resulting turn is known as a three piece 90 degree turn. Figure 3 in this section shows an elevation of such an item. The total turn angle is of course 90 degrees. This angle is made by breaking the turn into two 45 degree turns. Each 45 degree turn is divided into two 22½ degree templet angles, one on each piece of pipe that meet at the weld.

The distance on the drawing OC is known as the radius turn. This radius may be varied as much as is desirable to give a longer sweep to the turn. Since the radius of the turn does not change the total turn angle or the number of pieces in the turn, it is obvious that the templet angle will not change; therefore, the same templet may be used for any radius of turn as long as the same size pipe is used. The only thing that is changed as the radius of turn is increased is the length of the center section of the turn.

By the time the student has reached this point in the course, he should be developing a real understanding of how the pattern for a templet of turn is developed, and why the profile of the sloping cut on the pipe appears to be a straight line, while the templet has a smooth curve for marking the cut.

Make a templet drawing for a three piece 90 degree turn in a three-inch line.



MULTI - PIECE 90° TURN

FIG. 3

It should be explained at this time that, whereas it is common practice to call the entire pattern (including the hand hold and overlapping material) a templet, this is actually not true. If the student will draw a straight line from the beginning of the curve on the templets he has drawn to the end of the curve, he will find that the part above the line that shows the contour of the cut to be made on the pipe is actually the templet, while all the other material is left on the templet for convenience. Also, if the student will extend lines No. "1" upward a distance equal to the height of the first pattern at the center point and connect the ends of these two extensions with a straight line, he will find that actually he has drawn two templets any time the curve is established once. The lower templet begins and ends at the shortest point on the pipe, while the upper one begins and ends at the longest point.

Assignment 1 of Job 4

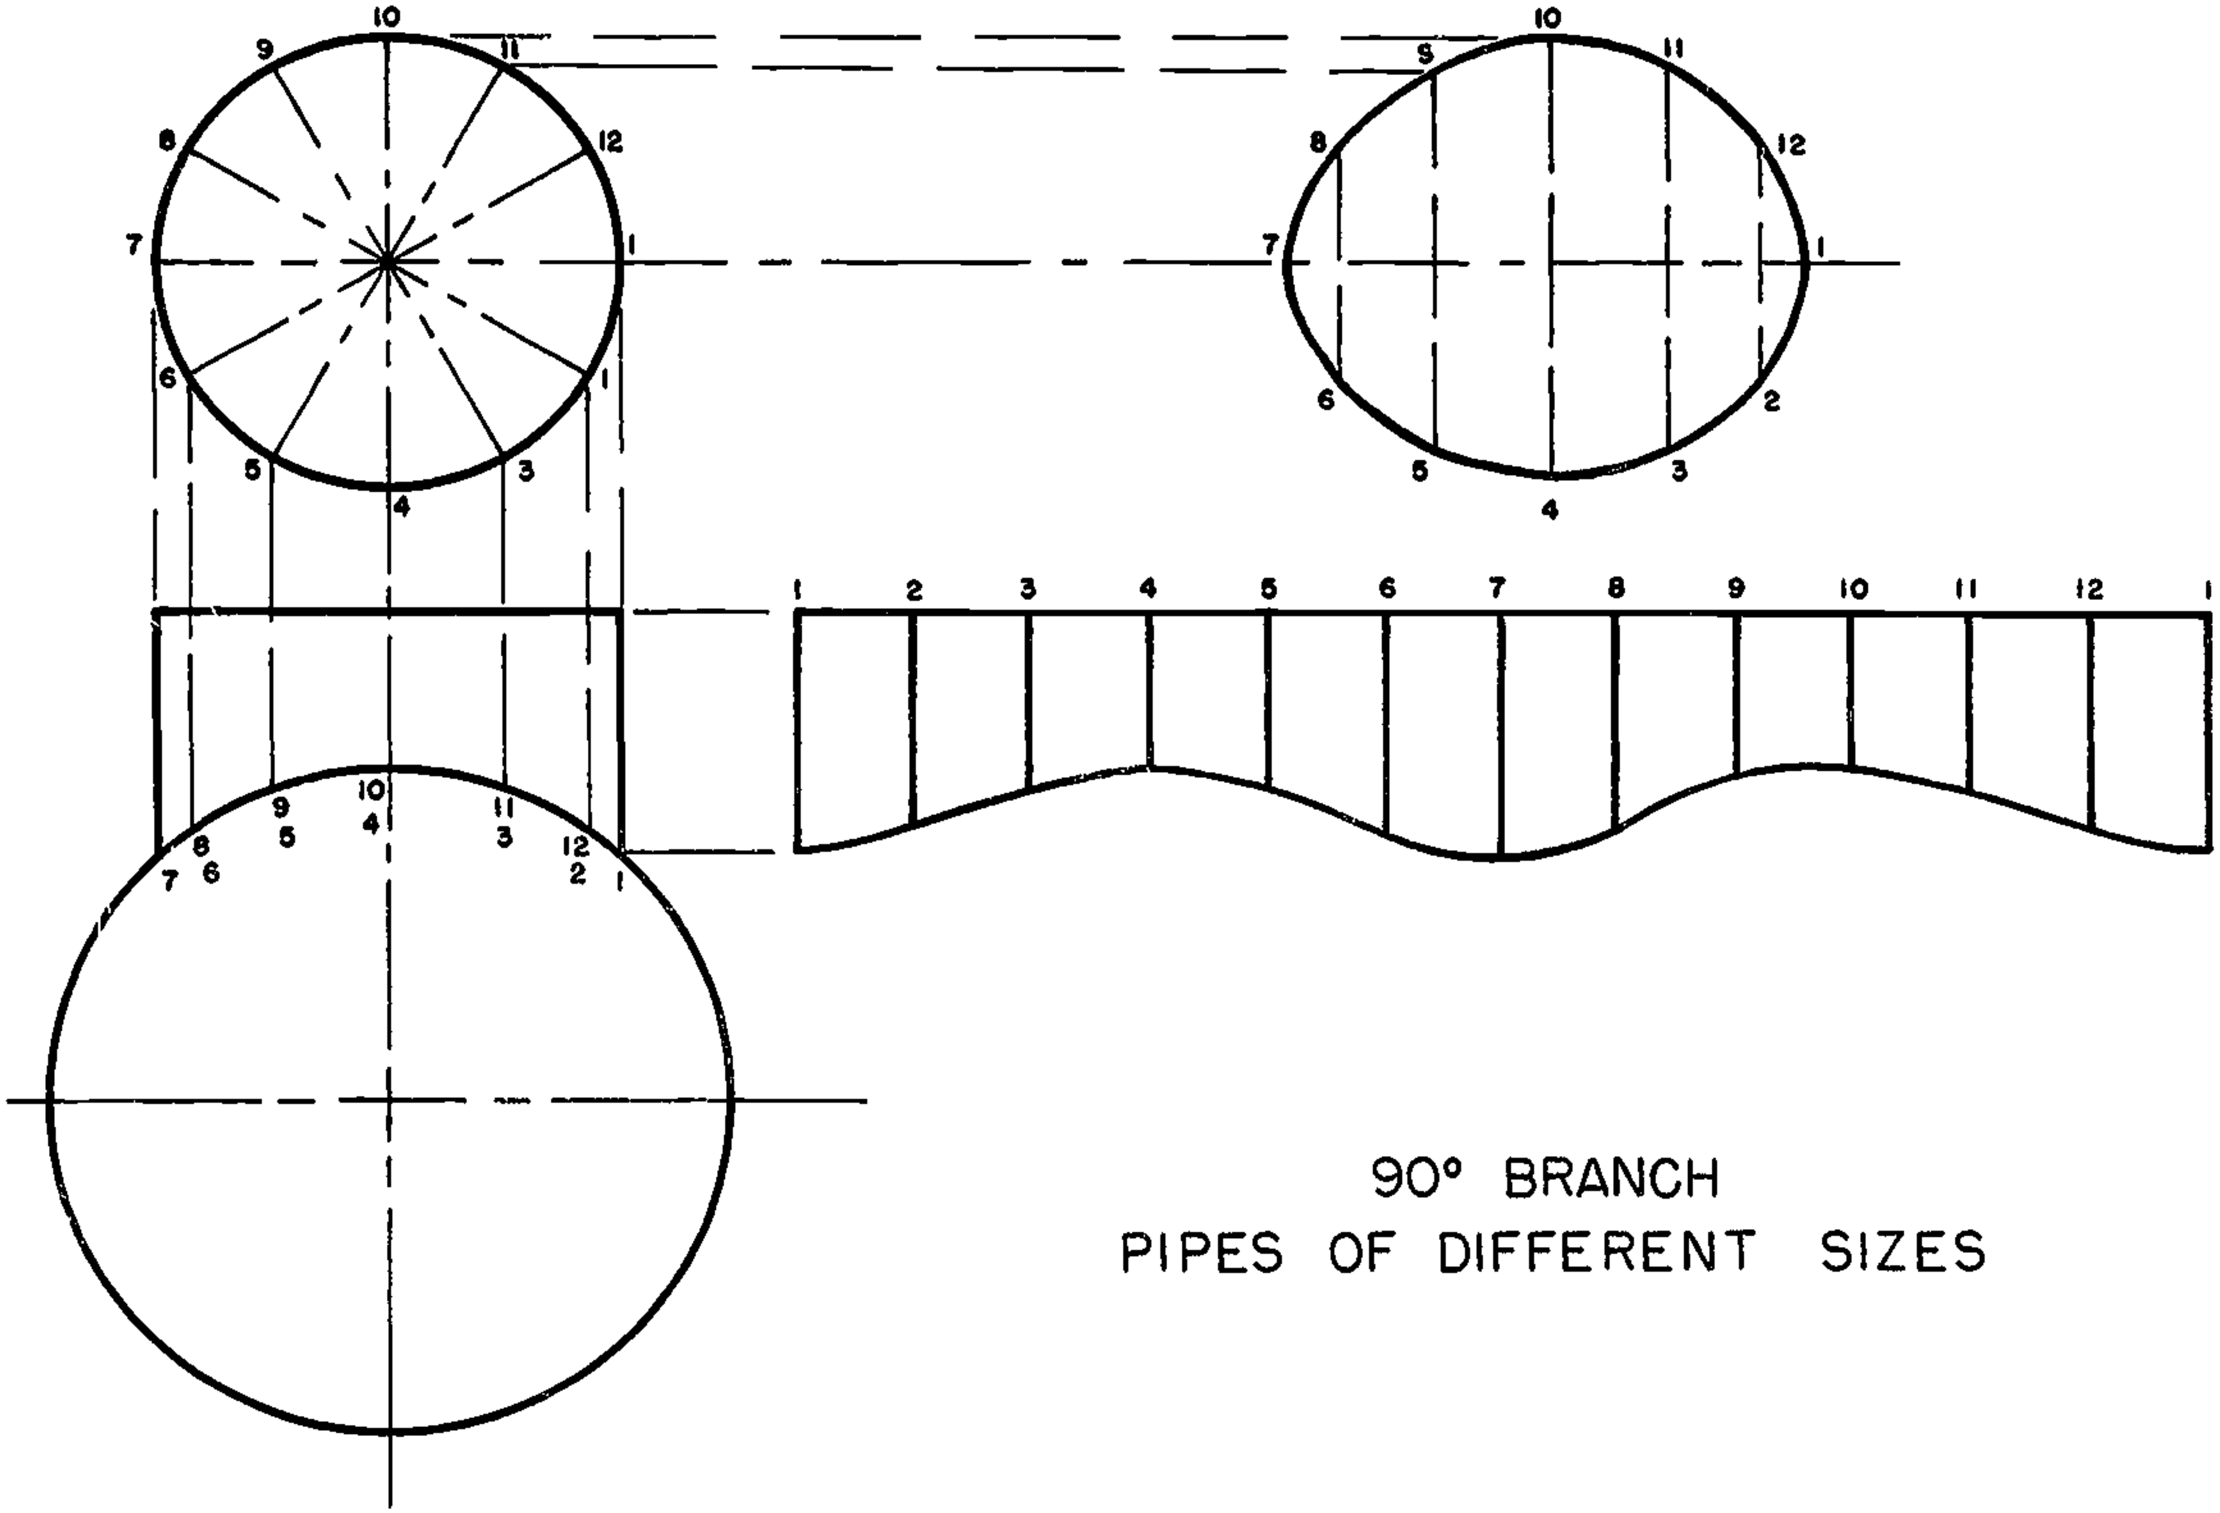
Find the angle of cut and lay out a three piece 80° turn with a 12 in. radius using the wrap around method; cut and weld.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Page 82

Job 5

Another type of pipe connection for which templets should be drawn, is intersections of pipes. Everyone is familiar with the common tee, in which a small pipe intersects a larger one at 90°. Figure 4 of this section shows the fundamentals of the development of templets for such an intersection. On the left side of the figure there is a drawing which shows the cross section of the larger pipe with a profile or elevation of the smaller pipe intersecting at the top. The cross section and elevation are drawn using the outside diameters of the pipes involved. Along the centerline and above the elevation a circle is drawn of the same outside diameter as the smaller pipe below. This circle is divided into 12 equal parts (or the number desired) by the same technique used in previous work. These points along the circle are numbered in the usual manner after which the points are projected downward with dashed lines to intersect the cross section of the larger pipe of the tee. Examine the elevation closely. It will be evident that the length of each line from the top of the piece to its intersection with the larger pipe is a true length and needs only to be transferred by projection to the right to intersect segment lines running downward from a base line. If these points of intersection are connected by a smooth curve, the templet for the smaller pipe is complete.

The drawing of a templet for the hole which must be cut in the larger pipe presents a little new thinking which must be understood.



90° BRANCH
PIPES OF DIFFERENT SIZES

FIG. 4

To facilitate this thinking, let the student imagine a piece cut out of the top of the larger pipe which appears to be a round piece when the eye is directly over the hole. Let a line running lengthwise through the piece which was removed be known as the longitudinal axis, and a line running across the piece (around the pipe) be known as the transverse axis. The piece of pipe which was cut out to form the hole is shaped exactly like the templet which will be needed for marking such a piece. If the piece which was cut out is flattened out it will be noted that the diameter along the longitudinal axis is the same as the diameter of the small pipe which will fit into the opening. Because this is true, we have a beginning place to start drawing the templet for the hole. Project the top and bottom edges and the center of the plan view of the smaller pipe to the right any convenient distance (at least two small pipe diameters out of the circle) and draw a perpendicular line which cuts all three of the horizontal lines. This perpendicular will be a centerline.

Re-examine the elevation of the smaller pipe and it will be seen that the lines projected down from the circle above intersect the cross section of the larger pipe. Measure with a compass the distance from the centerline of the elevation to the intersection of line 3-11 with the cross section. With the same setting of the compass, place the point at the intersection of the horizontal and vertical centerlines in the drawing of the hole templet and mark an arc on the horizontal centerline to the right and to the left of the vertical centerline. The mark to the right of the center will be used in locating points 3 and 11, while the mark to the left will be used in locating points 5 and 9. Points 4 and 10 are already located in the hole templet. Points 1 and 7 are located where the last arcs to the right and left of the vertical center line in the templet cross the horizontal center line. Project points 9 and 11 in the plan of the smaller pipe to intersect the vertical lines through the first mark to the right and left of the vertical center line in the templet, thus locating 9 and 11 on the templet curve. Next, project points 8 and 12 in the plan of the smaller pipe to intersect the vertical lines through the second mark to the right and left of the vertical center line in the templet, thus locating 8 and 12 on the templet curve. Next, project points 6 and 2, and 5 and 3 to intersect the proper verticals in the templet. When all the curve points have been located, join them with a smooth curve and the templet has been completed.

Draw the templets for the smaller branch and for the hole in the larger pipe necessary for marking for fabrication of a smaller 90 degree branch intersecting a larger pipe on the center line.

Assignment 1 of Job 5

Lay out a reducing tee using both methods.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Pages 90-94

Job 6

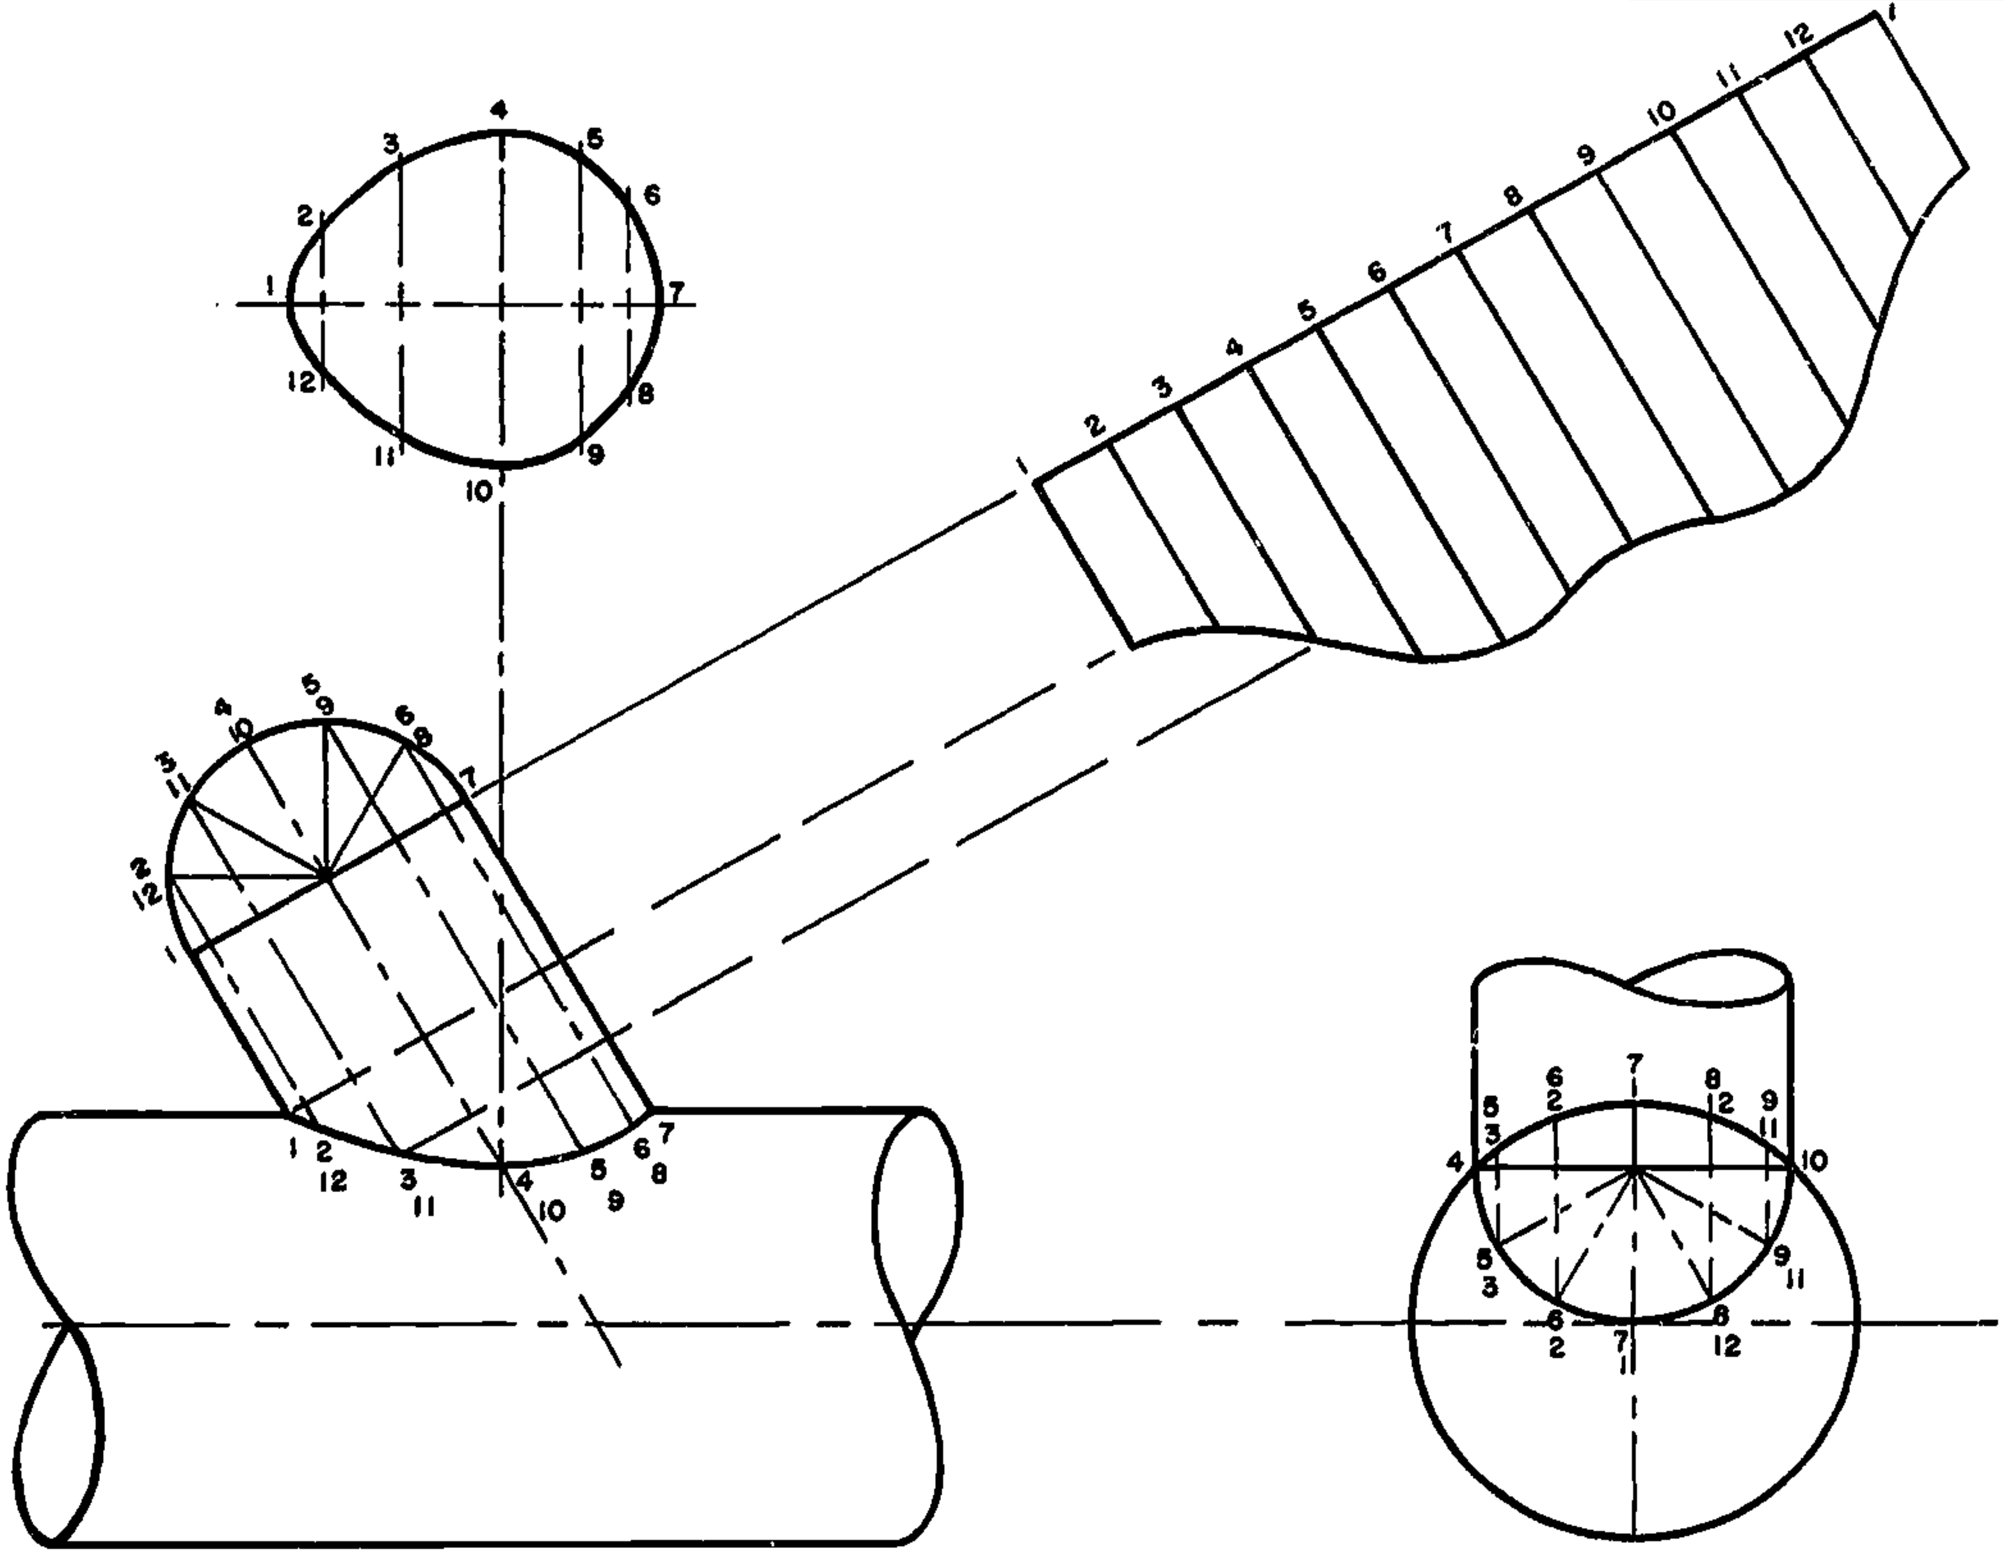
This assignment will give the student the method of laying out the templets necessary for marking the material for cutting to make an intersection of two pipes of different sizes at any angle other than 90 degrees.

Figure 5 of this section of the text gives the fundamentals of such a development. First, a front view is drawn showing the side of the larger pipe and the smaller branch intersecting at the desired angle. In this view the sides of the two pieces may be drawn, but the curve showing the intersection of the walls of the two pipes must wait to be established.

Using the intersection of the centerline of the small branch with its end as a center, draw a semi-circle with the same O.D. as the small pipe. This ½ circle is divided into 6 equal parts and numbered from left to right and back again. Here is seen the use of a semi-circle instead of a full circle for getting the points for projection. A full circle was used earlier to give the student a chance to understand the method which lies behind such technique.

Project each of the points on the semi-circle along lines parallel to the center line of the branch to intersect both the top end of the branch and the large pipe.

Extend the center line of the large pipe in front view to the right. On this center line, erect a perpendicular to serve as the vertical center line of the end elevation. Using the intersection of the two center lines as a center, draw an end view of the large pipe, using the outside diameter. Draw the sides of the small



INTERSECTION OF PIPES OF DIFFERENT SIZES AT ANY ANGLE

FIG. 5

branch. Draw a line connecting the points of intersection of the sides of the small branch with the walls of the large pipe. Using the intersection of this line with the vertical center line as a center, draw a semi-circle below the base line using the diameter of the small branch. Divide the semi-circle into 6 equal parts and number as shown in figure 5. Project these points upward to intersect the large pipe. Number these points of intersection to agree with the numbering of the semi-circle. Project these points horizontally to the left to intersect with correspondingly numbered lines at the lower end of the small branch. The intersections of these lines locate the curve of intersection of the walls of the two pipes. Draw the curve smoothly.

At this point, the templet for the small branch may be drawn. Extend the sloped upper end of the branch out a convenient distance upward to the right. Mark off 12 divisions, each equal to one segment on the semi-circle, and number them from the left to the right. Erect perpendiculars to the base line through each of these points extending downward.

To draw the templet for the hole which must cut in the large pipe, move above the front view and draw a horizontal center line. Project the points of intersection of the two pipes in the front view upward to intersect the horizontal center line just drawn. Measure the distance along the circumference of the large pipe in the end view from pt. 1-7 to 2-12. Set this distance off above and below the center line just drawn on all the lines except 1 and 7. This locates pts. 6, 8, 2, and 12. Measure the distance along the circumference of the large pipe in the end view from pt. 9-11 to 10. Set this distance off above and below the second arc on the middle line. This locates points 4 and 10.

Connect all the points so located with a smooth curve and the templet for hole is complete.

Draw the templets necessary for marking the pipe to make an intersection of smaller pipe with a larger pipe at an angle of 60 degrees.

Assignment 1 of Job 6

Lay out a reducing lateral with the branch at 60° to the header; cut and weld.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Pages 95-99

Job 7

Previous lessons in the making of templets were concerned only with changing the direction of a run of pipe or with the intersection of pipes. This assignment will bring in the idea of reducing the size of a pipe while continuing in the direction of run. The fitting which is used for this purpose is known as a swage, or reducer. The first to be considered will be the concentric swage, in which the center line of the run is maintained through the piece, while the walls of the pipe are necked in.

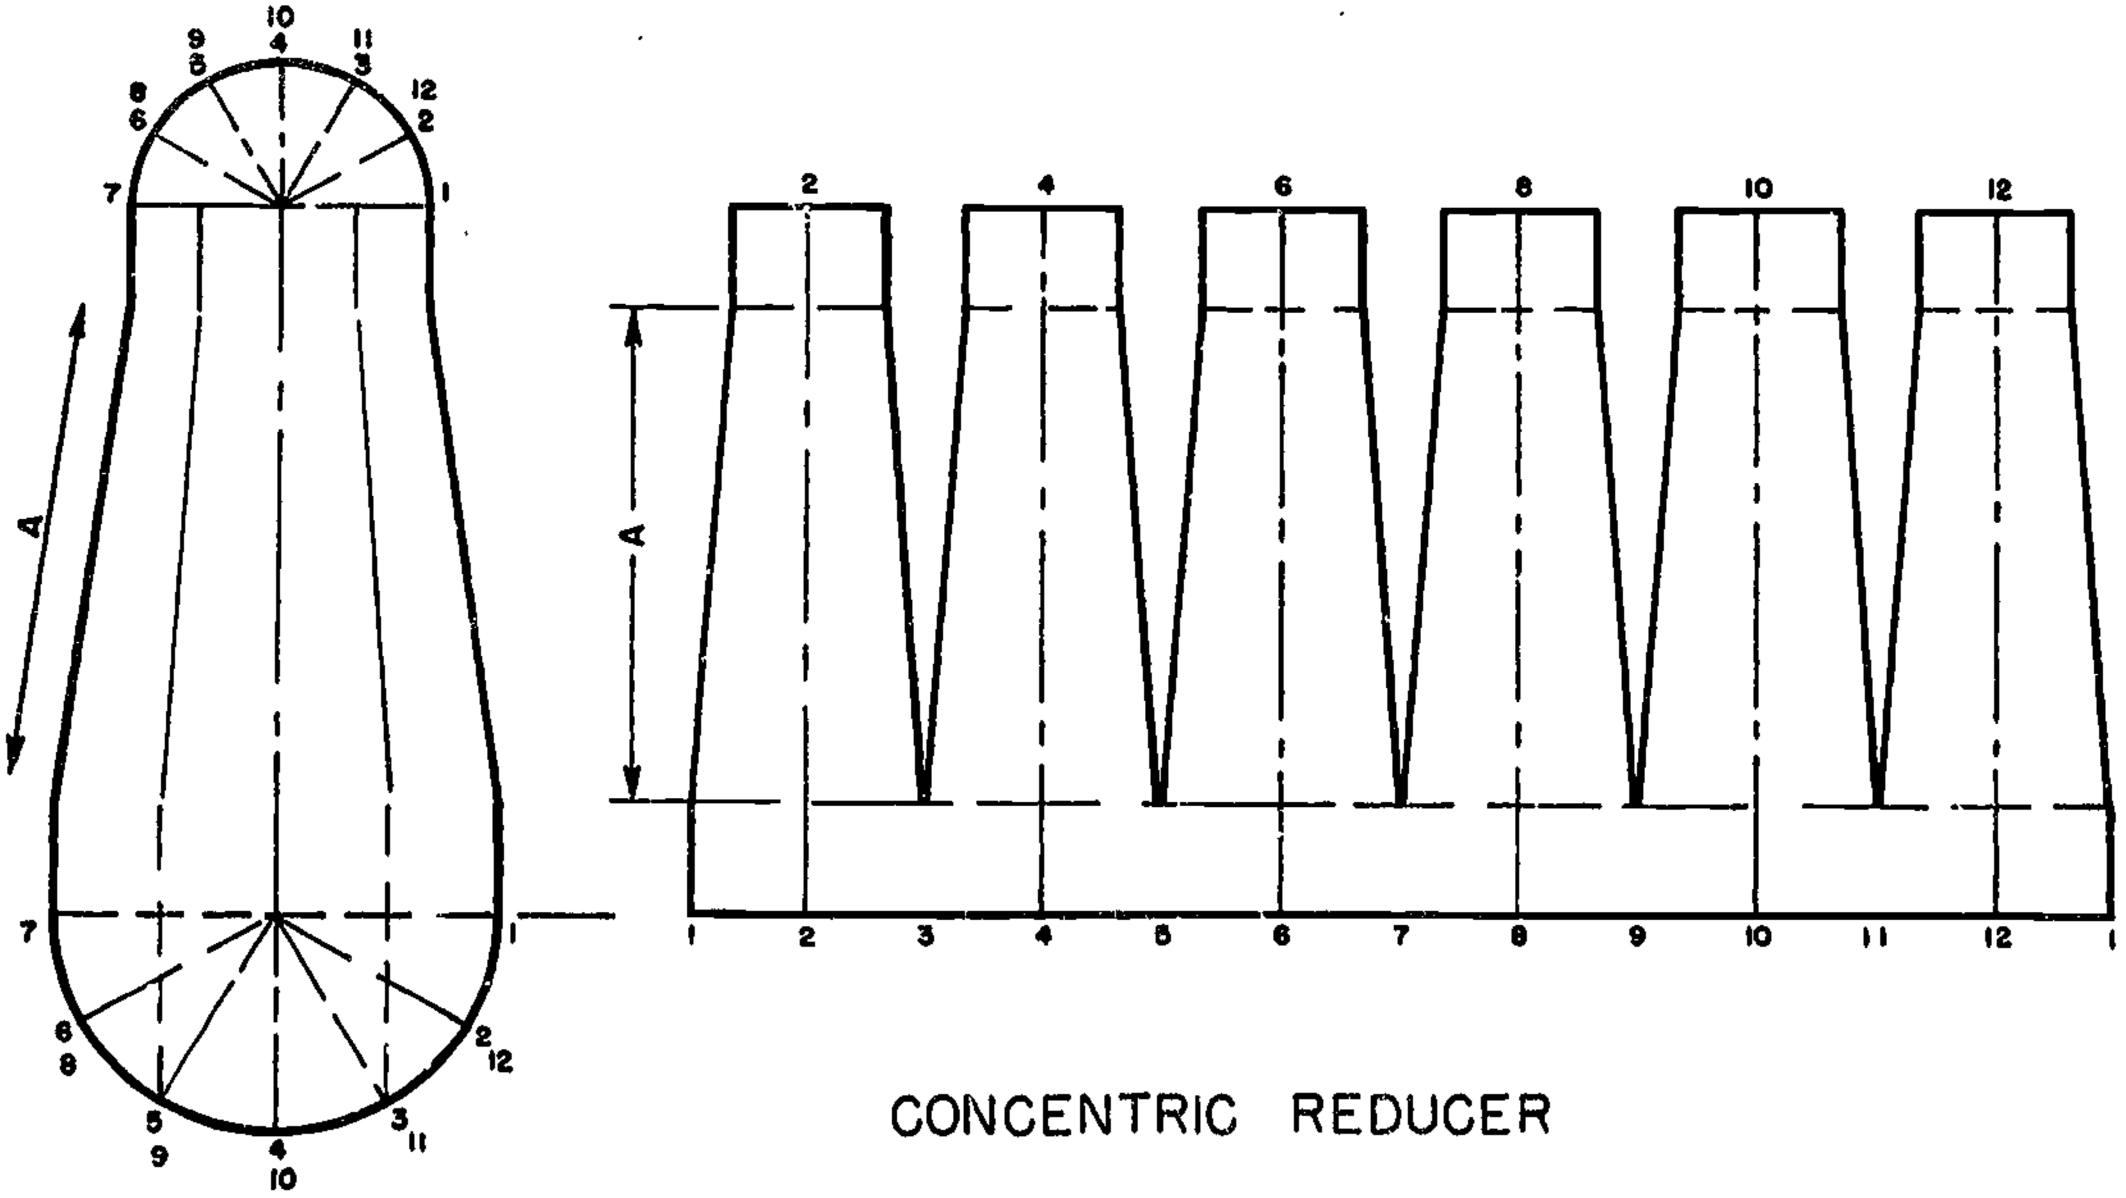
Figure 6 shows such a swage.

An elevation of the reducer desired is drawn, using the outside diameters of both pieces of pipe. The length of the piece of pipe in which the reduction is actually being made is left up to the worker or designer, but this distance should be long enough to enable the metal to be bent handily.

At the lower end of the elevation, a semi-circle using the larger diameter is inscribed. This semi-circle is divided into 6 equal segments using the previously described method.

At the upper end of the elevation, a semi-circle using the smaller diameter is inscribed. This semi-circle is divided into 6 equal segments.

The base line of the elevation is extended to the right and has 12 sections marked off along its length, each section equal in length to one segment of the lower semi-circle. Begin numbering with the mark at the left end, each even-numbered pt. serves as the location of a vertical center line.



CONCENTRIC REDUCER

FIG. 6

The beginning point of the reduction is projected to the right parallel to the base line.

The slant distance "A" is measured on the elevation and set off on the center line of the first section of the templet as shown in the figure. Project this pt. to the right and left of the length of the pattern.

The straight length of the smaller pipe is measured and added to the height of the pattern.

The length of a segment of the larger semi-circle is laid off to the right and left of each center line in the pattern along the horizontal line which marks the beginning of the reduction.

The length of a segment of the smaller semi-circle is laid off to the right and left of each center line in the pattern along the horizontal line which marks the end of the reduction.

The points located form the outline of the pattern.

Draw the templet for a concentric swage which reduces from 3" to 2" with a height along the center line of 6", 1" at each end is to be left straight.

Assignment 1 of Job 7

Lay out a concentric reducing swage.

Reference: The Pipe Fitter's and Pipe Welder's Handbook
By Thomas W. Frankland
Pages 103-104

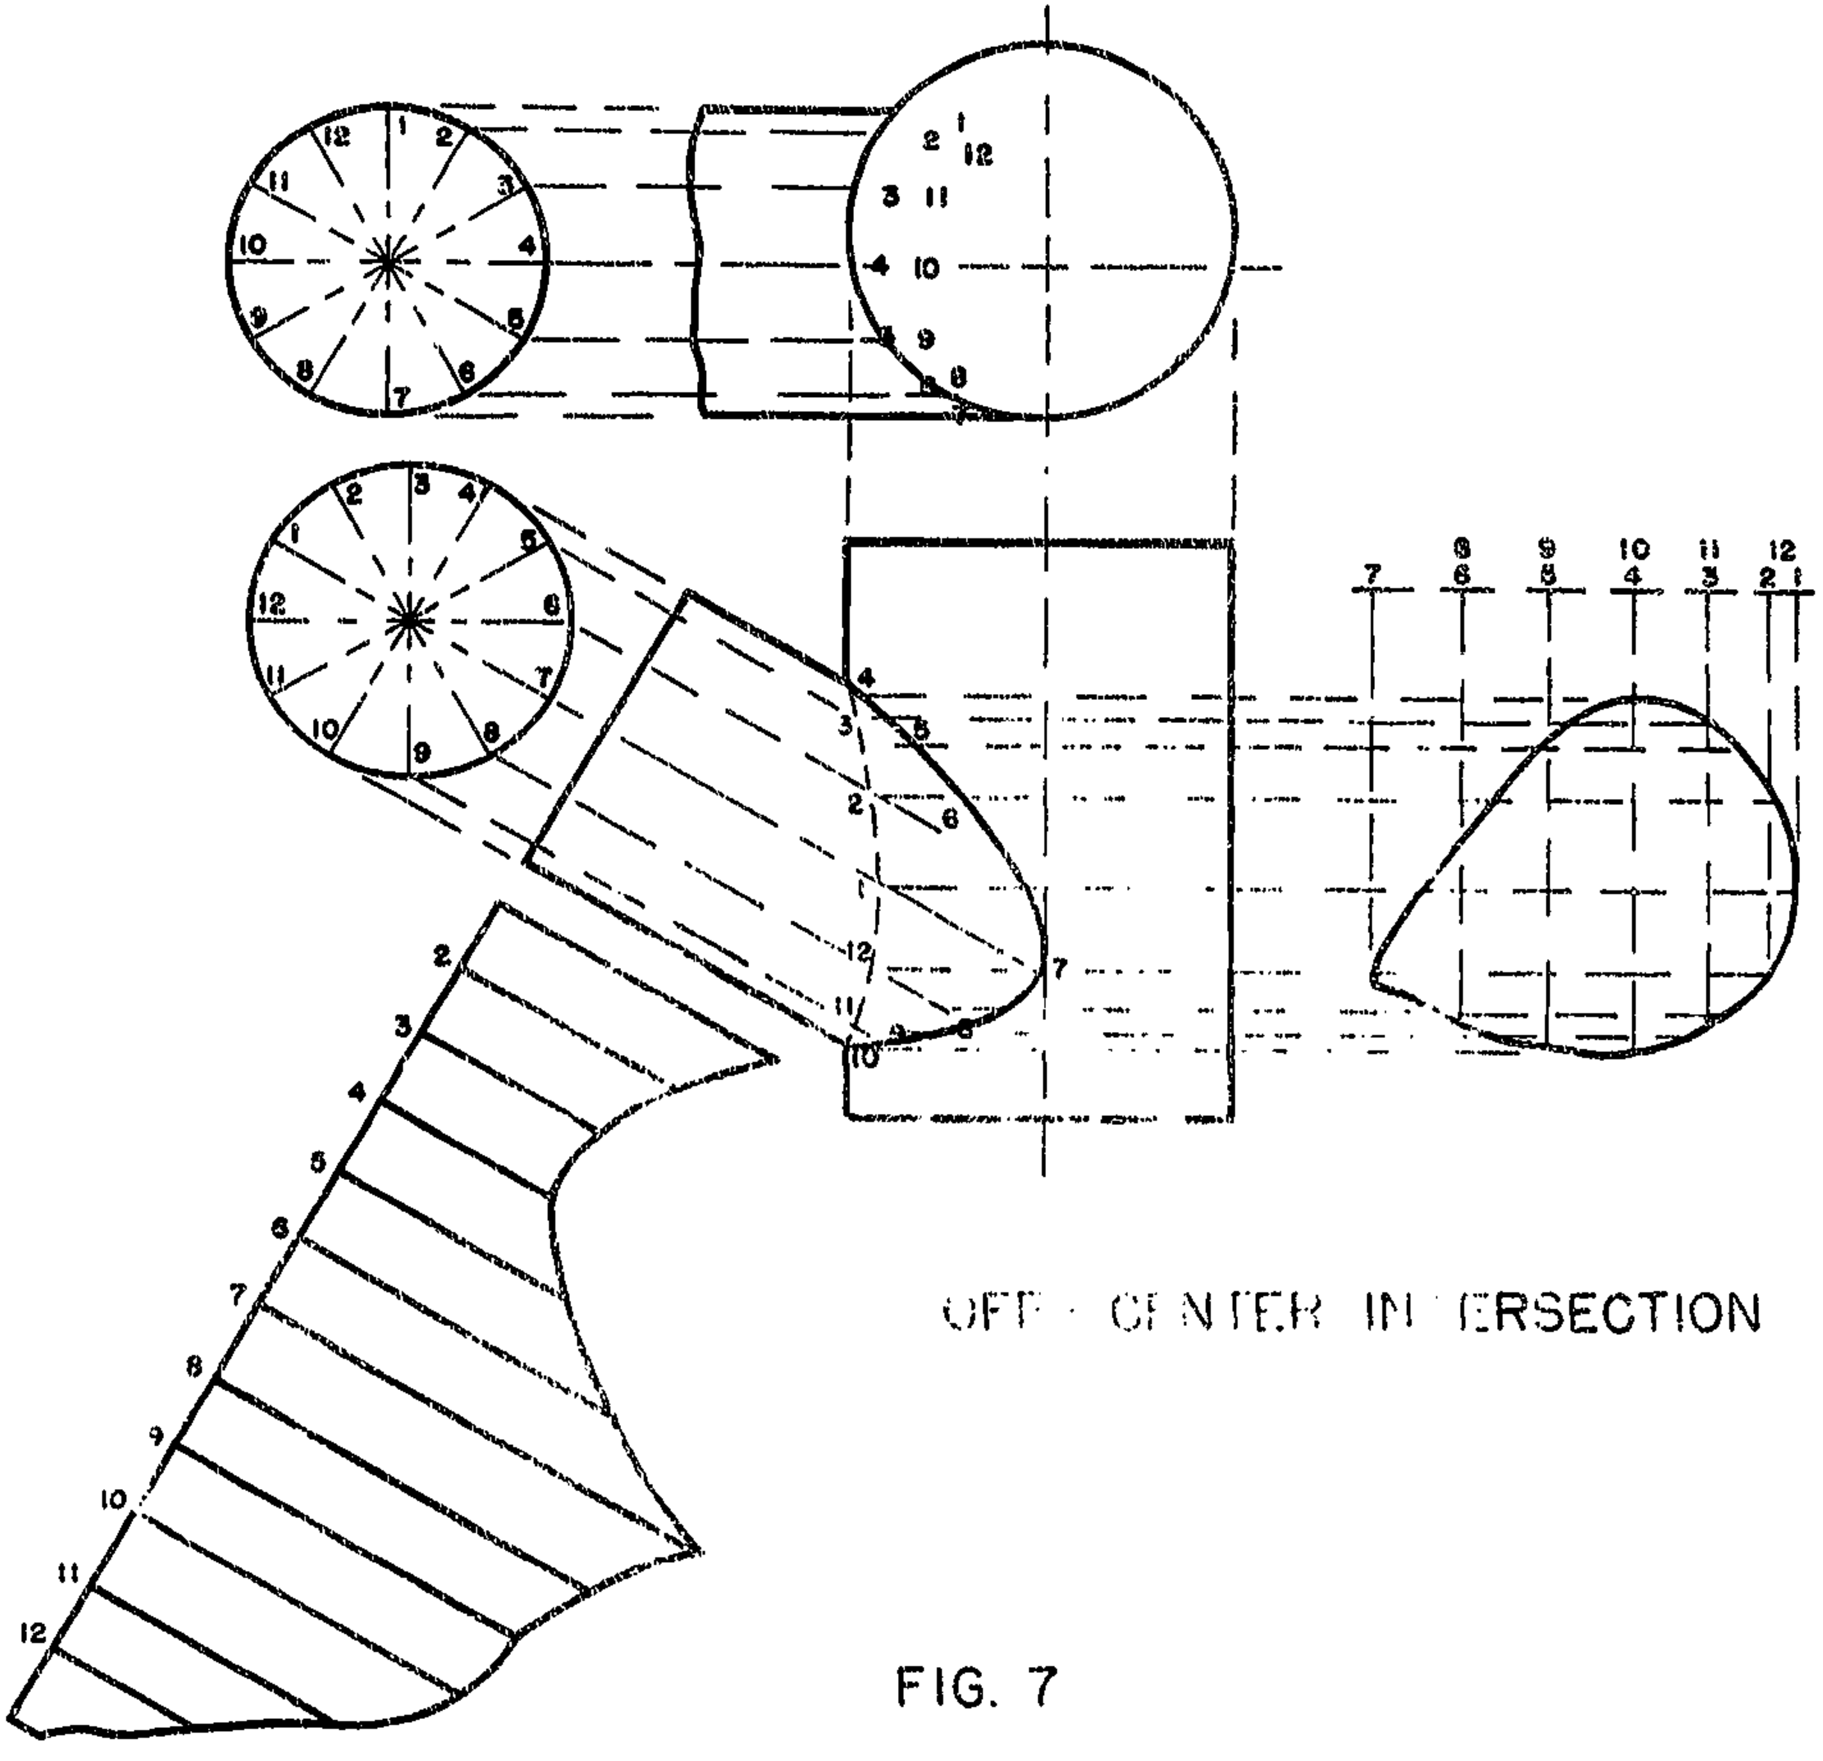
Job 8

A previous assignment describes the method of making the templets for a lateral when the branch is smaller than the header and when the centerline of the branch intersects the centerline of the header.

Another similar problem which arises is illustrated in Figure 7. In this case the smaller branch has its centerline missing the centerline of the header.

Draw the elevation of the lateral showing the sides and centerlines of both the branch and header. On the centerline of the branch, draw a circle using the smaller pipe's O.D. as the diameter. Divide the circle into 12 equal parts and number each pt. along the circumference as shown. Directly above the elevation draw the end view of the header and show the outer walls of the branch offset the amount desired. On the centerline of this branch, construct another circle using the O.D. of the branch as the diameter. Divide this circle into 12 equal parts and number each pt. along the circumference. Notice that the numbering on this circle appears to be different from the numbering on the circle in the elevation. Closer examination will show that the points represented are actually the same.

Now project the points on the circle in the plan view to the right to intersect the end view of the header. Number these points of intersection the same as they were in the branch circle. For example, pts. 2 and 12 in the branch circle are projected to the right to intersect the header pt. 2-12.



OFF - CENTER INTERSECTION

FIG. 7

Now bring a vertical line from pt. 1 on the end view of the header down into the elevation. Draw a line from pt. 1 of the branch circle of the elevation, parallel to the walls of the branch to intersect the vertical line from pt. 1 in the top view. Number this pt. of intersection 1 also. Proceed to pts. 2, 3, 4, etc. Connect the pts. thus located with a solid line where the pipe intersection can be seen and a dashed line where the pipe intersection cannot be seen.

These operations have been performed in order to secure a true elevation of the intersections of the two pipes. Now the templets for the branch and the hole in the header may be drawn.

To the right of the elevation, draw a horizontal line which will act as a base line for drawing the hole templet. Place pt. 1 near one end of the base line. With a compass, or dividers, measure the distance between 1 and 2-12 on the top view of the header and set this distance from 1 along the base line. Number the new pt. 2-12. Set each of the distances obtained from the top view of the header, along the hole base line, taking care that the numbering remains the same.

Now, drop perpendicular lines from these pts. on the base line. Project the pts. on the elevation horizontally to intersect the vertical construction line which bears the same number. Example: Pt. 6 on the elevation is projected horizontally to the right to intersect vertical line 6.

The pts. thus located must be joined together by a smooth curve (where possible) to give the templet for the hole which must be cut in the header.

The method of laying out the templet for the branch is obviously an adaptation of a technique used often before.

Draw the necessary templets for marking the pipe for making an off-center intersection of a smaller branch intersecting a larger header at 90 degrees. Offset the branch enough to put one surface of the branch tangent to one surface of the header.

Assignment 1 of Job 8

Make a 90° off-center lateral.

Job 9

There are often requirements in industrial piping for the construction of a true Y with the three pipes involved having the same diameter.

Such a Y is shown in Figure 8.

Draw an elevation of the Y with the two top pipes, known as branches, intersecting the main at the same angle.

Connect the pts. of intersection of the walls of the pipe and the pt. of intersection of the centerlines with straight lines.

Figure 8 shows the construction semi-circle on the end of the main pipe with division pts. projected parallel to the sides of the main to intersect the intersection line between the main and the branches.

The remaining technique for preparing the templet for the main is identical to that used many times before and requires no further explanation.

The templets for the two branches will be identical. The method of preparing these templets is obvious.

Draw the templets necessary for marking pipe to make a true Y. Let the angle between the main and each branch be 120 degrees.

Assignment 1 of Job 9

Lay out a full size true Y; cut and weld.

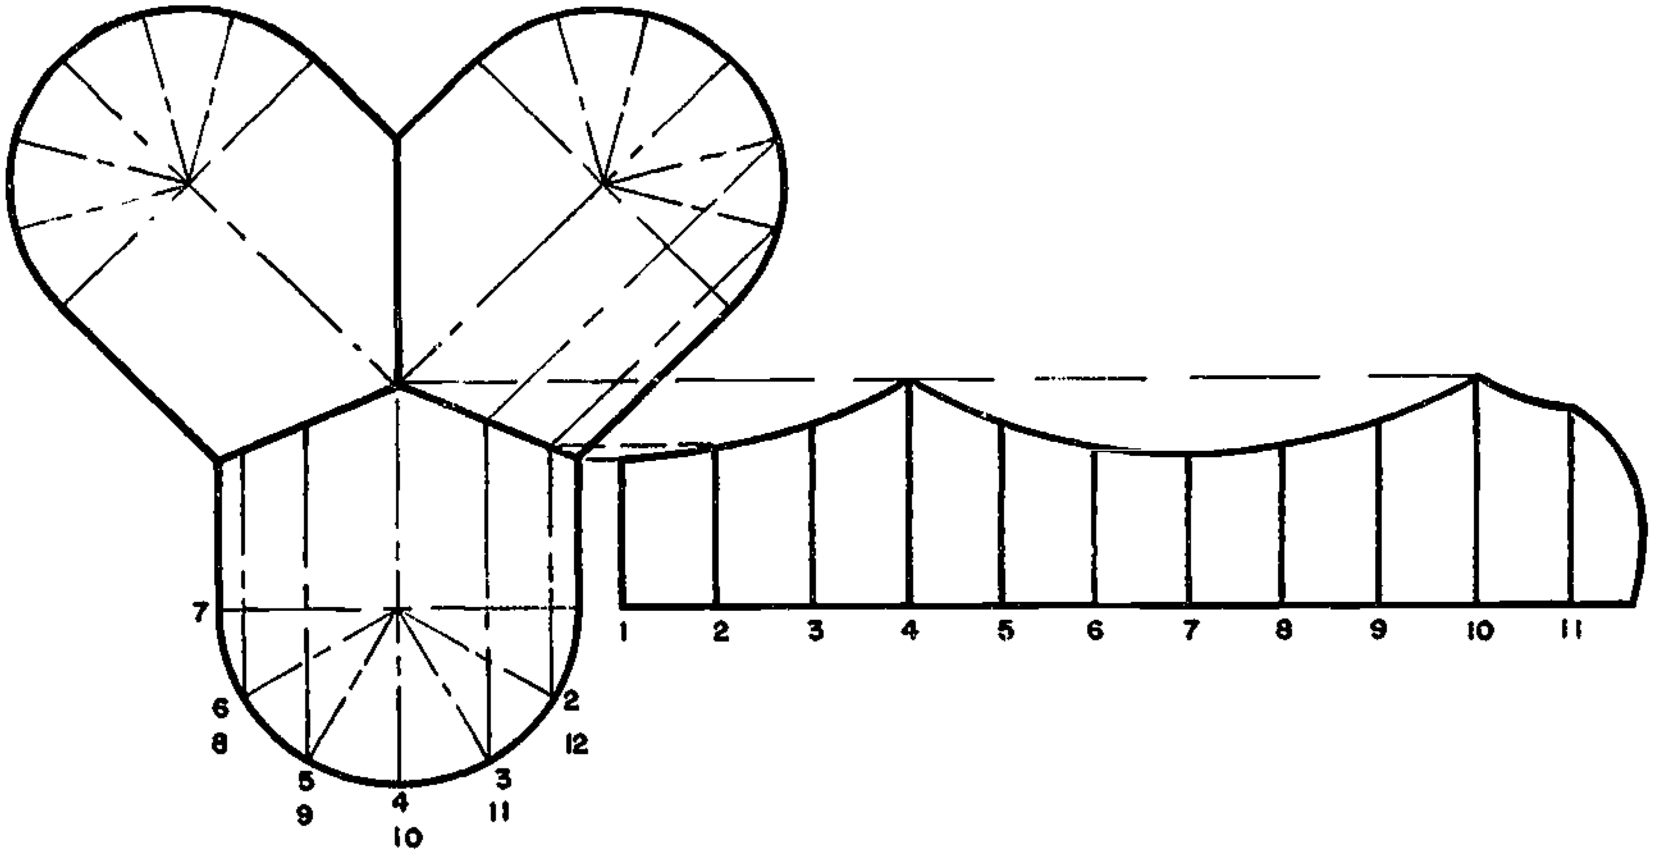
Pages 100-102



TRUE "Y", PIPES THE SAME SIZE

FIG. 8

Job 10

This assignment concerns itself with a study of how to draw the templet for an Orange Peel Plug or Head. This method is used to seal the end of a piece of pipe and is both effective and strong.

Figure 9 shows the construction of the templet necessary for marking the pipe to make such a piece.

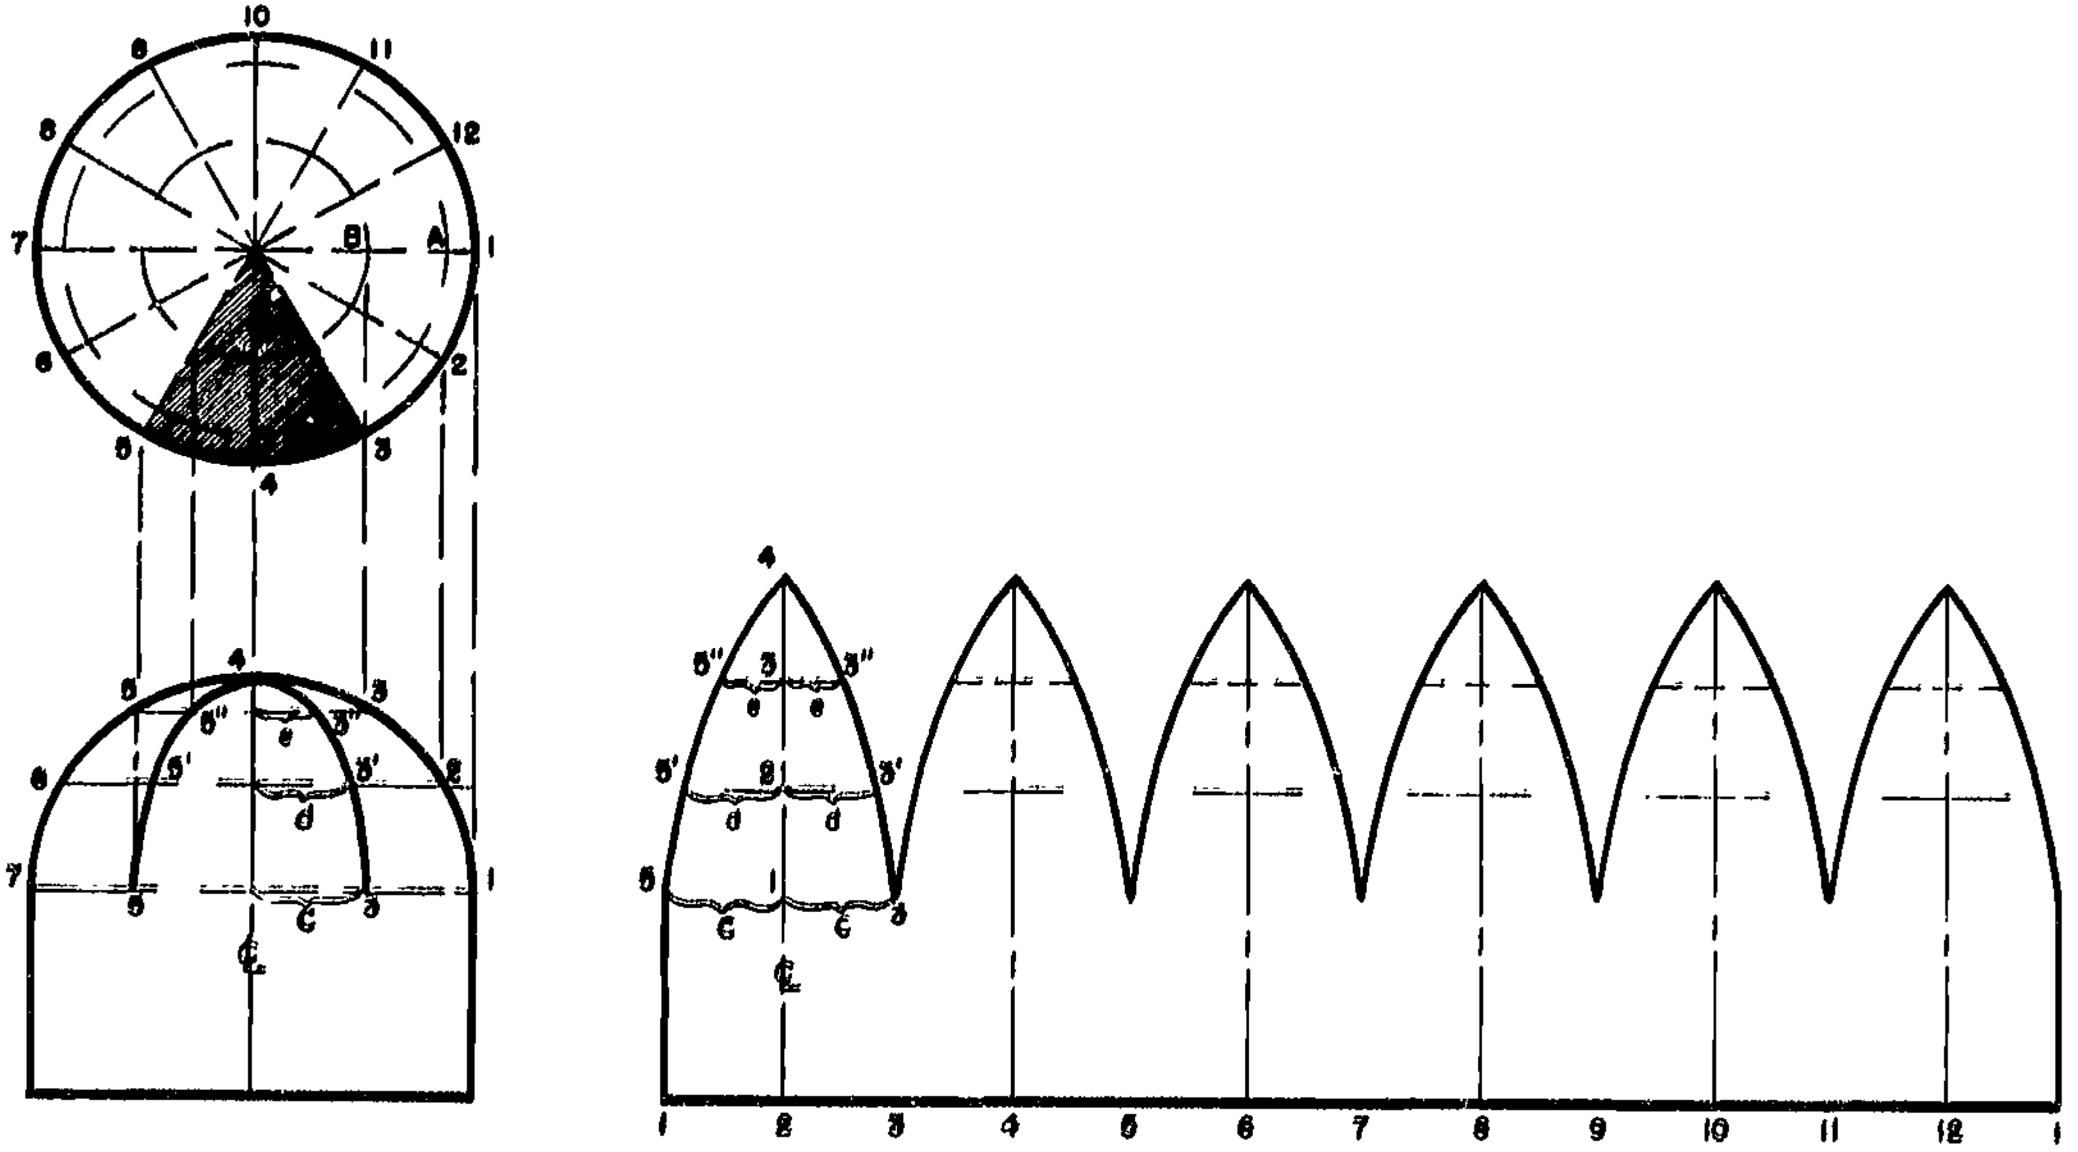
The following describes the procedure for making a similar templet.

Draw an elevation of the pipe, using the O.D. of the pipe. Show the centerline and let it extend well above the elevation.

With a compass, and using ½ of the O.D. of the pipe as a radius, place the point of the compass on the centerline at the top of the elevation, and draw the semi-circle touching both walls of the pipe. Draw a horizontal line through the center used in making this semi-circle. This line will be the line along which all bending is started when the "Orange Peels" are shaped.

Above the elevation, with the compass point set on the elevation centerline, draw a circle equal in diameter to the O.D. of the pipe. Divide this circle into 12 small segments which should be numbered as shown. In making an Orange Peel Plug from small pipe, 6 sections are enough; so use two of the small arcs of the circle to represent one section of the Orange Peel.

Drop a perpendicular line from each of the points on the circle to the horizontal centerline of the circle. With the



ORANGE PEEL PLUG

FIG. 9

same center as the large circle, draw small circles passing through these points on the horizontal centerline. This gives two smaller circles "A" and "B".

Drop vertical lines from points 1-7 to intersect the semi-circular top of the elevation. Number these points of intersection as shown.

On the elevation, draw straight lines connecting point 2 with 6 and 3 with 5. Drop pts. 3, 3', and 3" to intersect lines 1-7, 2-6, and 3-5 in the elevation. Connect these points of intersection with a smooth curve. Locate and draw curve 5-5'-5" in the same manner.

Draw a horizontal base line to the right of the elevation. Set off along this line 12 segments, each equal to the length of one of the 12 arcs on the outer circle in the top view. Number the points along the base line, beginning with 1 at the left end.

From pt. 1 on the elevation draw a horizontal line to extend over the base line. This is the bend line.

Erect vertical lines from each point on the base line to intersect the bend line. Let each even numbered line extend well above the bend line.

Measure the distance on the elevation from 1 to 2, and set this off on centerline number 2 of the templet above the bend line.

Measure 2 to 3 on the elevation and set off above the 1st segment on centerline number 2. Do the same with the distance 3 to 4.

Draw horizontal lines through pts. 2, 3, and 4. Let these lines cross each centerline of the templet sections.

Lay off distances d and e on each side of the centerlines in the templet.

Connect the points thus located by smooth curved lines. This completes the templet.

Draw the templet and the necessary construction views for making an Orange Peel Plug in a piece of pipe nominal size.

Assignment 1 of Job 10

Lay out an Orange Peel and a Bull Plug; cut and weld orange peel.

Pages 113-117

Job 11

Figure 10 shows the development of the templets for a Welded Tee with both pipes of the same size.

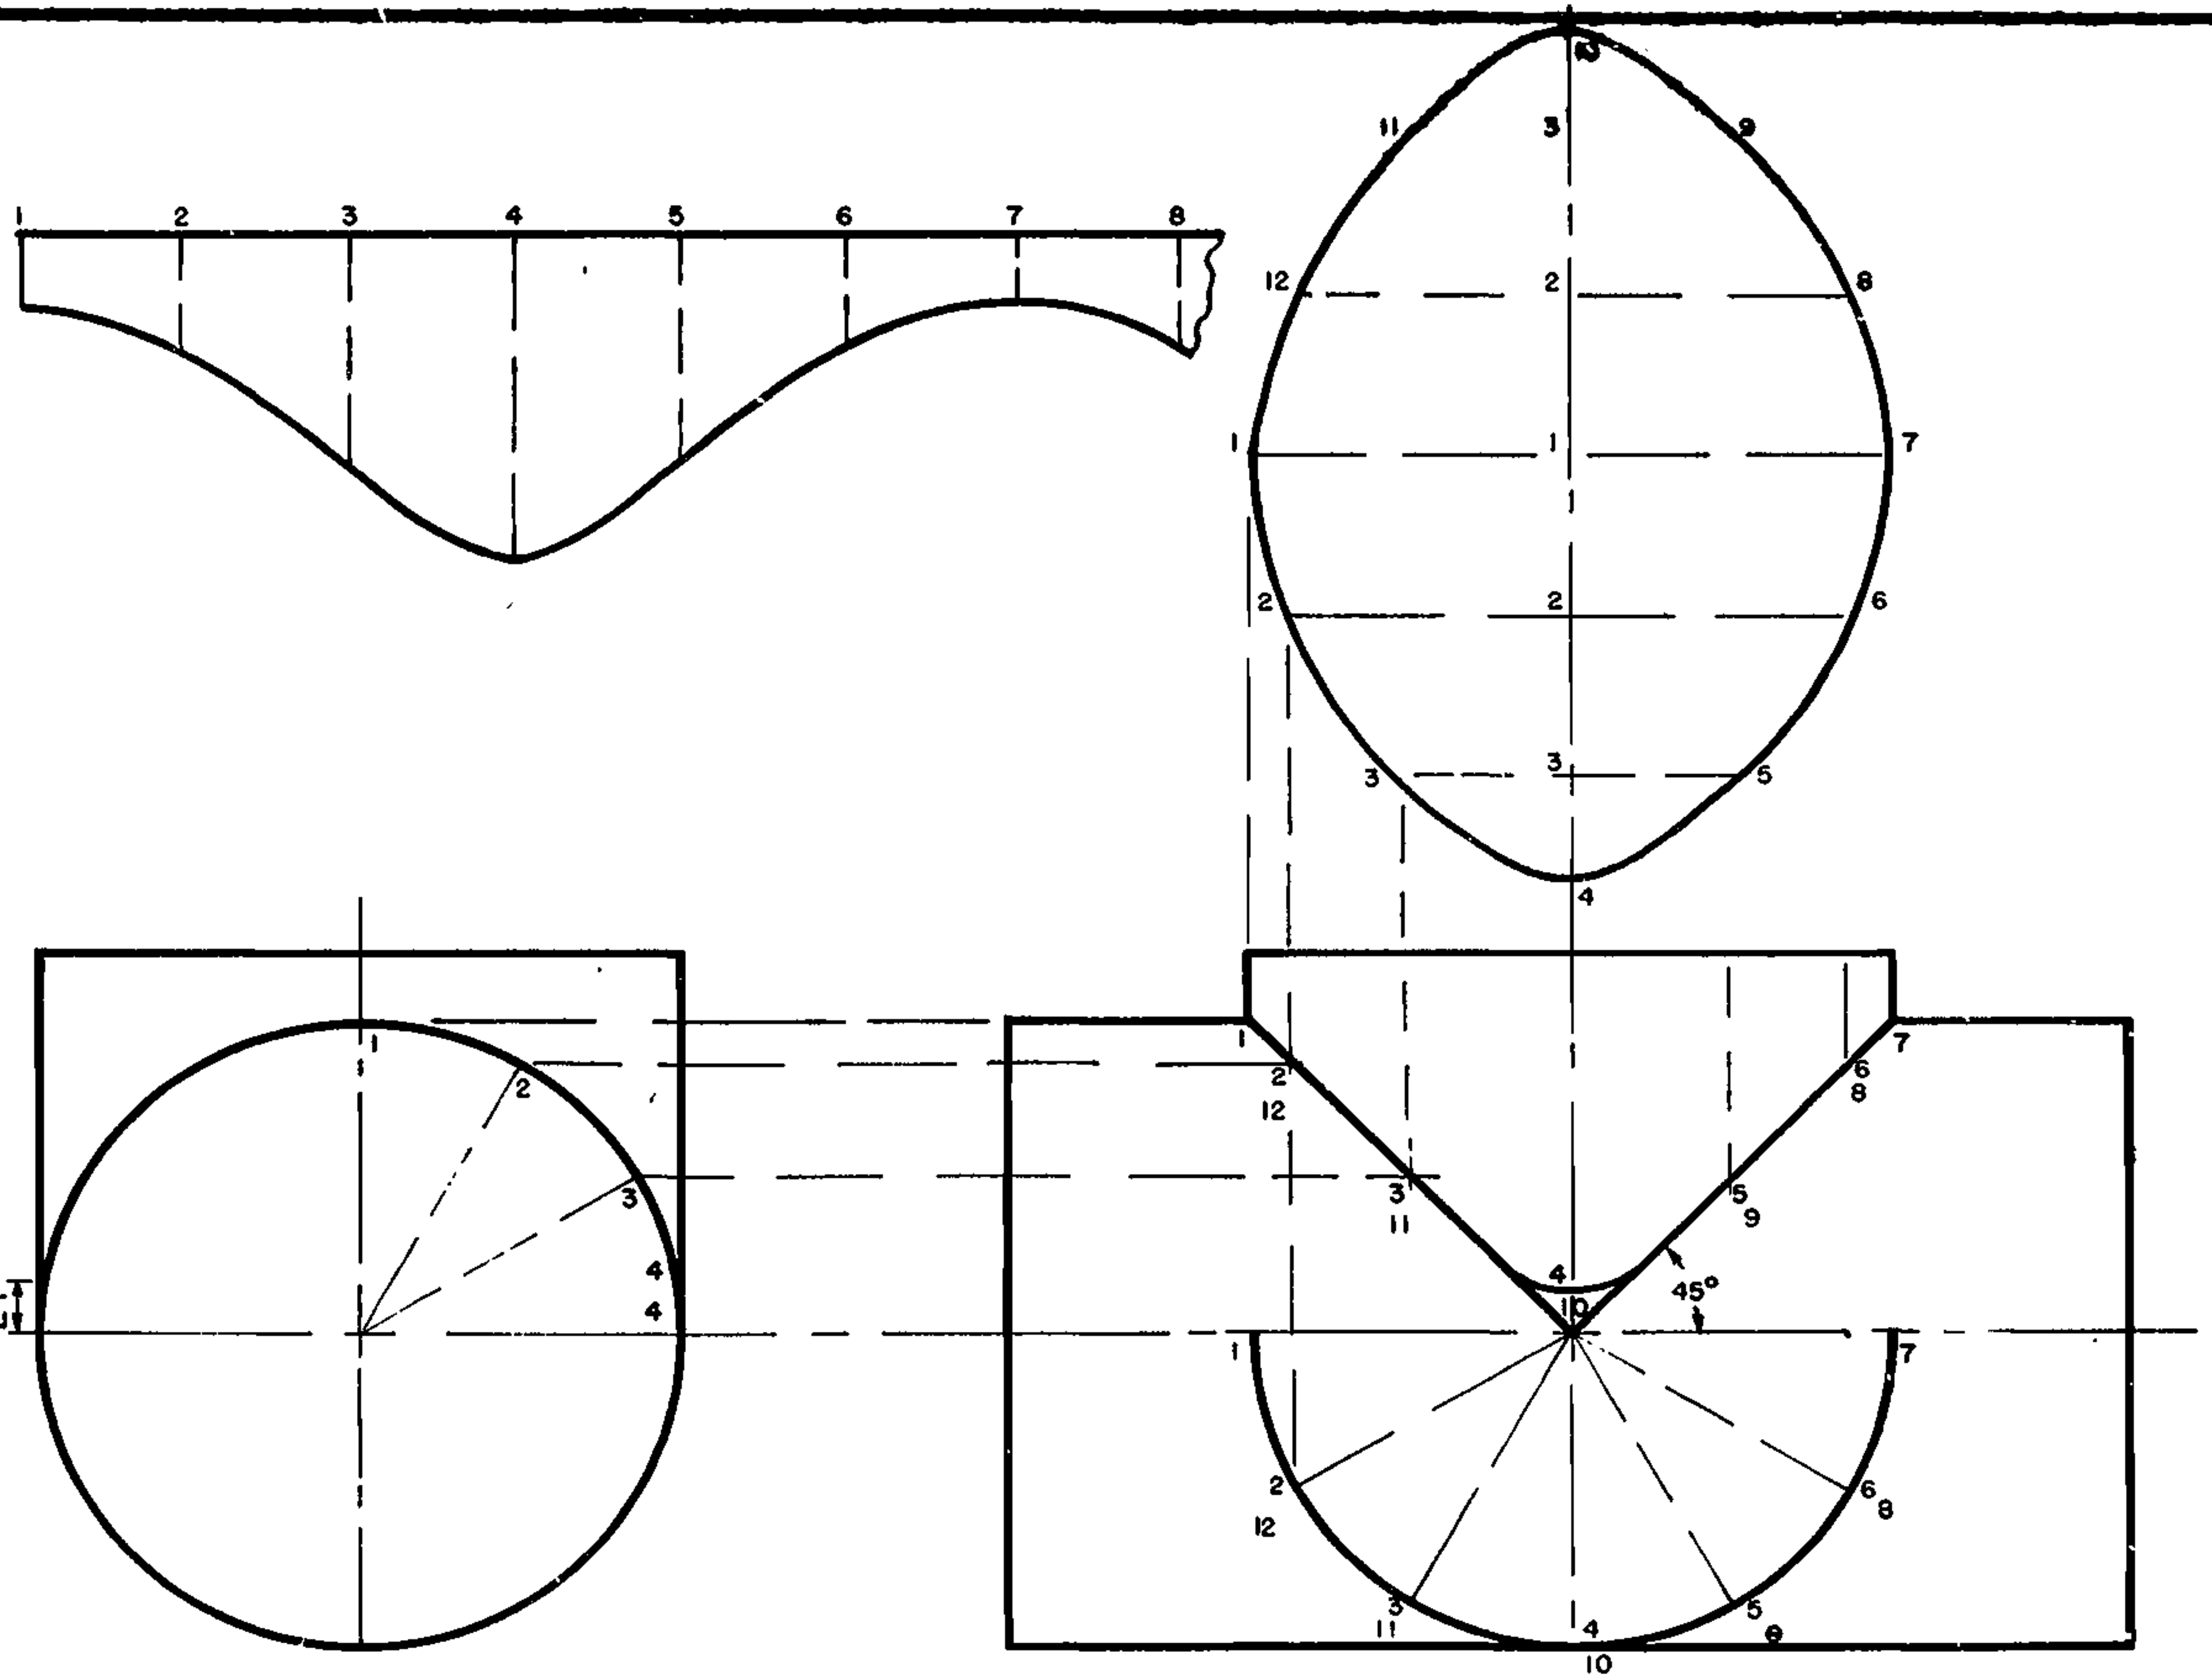
Draw the end elevation of the tee. Divide the upper right quadrant of the main into 3 equal parts. Number the points on the circumference 1 through 4 as shown.

Draw the elevation of the tee. Represent the intersection of the two pipes as straight lines at 45 degrees with the centerline of the main. If the cut in the main were made to pt. 4, it would mean making a sharp notch halfway through the main. Because of the resulting weakening of the main, it is desirable to stop the cut a distance of two times the thickness of the main before the half-way pt. has been reached. In figure 10 the cut is stopped at 4" and the line of intersection is rounded with a smooth curve.

In the lower half of the main in the elevation, draw a construction semi-circle with the compass set at the outside radius of the branch and with the needle point at the intersection of the two centerlines.

Divide the semi-circle into 6 equal parts and number the divisions as shown. Project these pts. up to intersect the pts. projected horizontally from the end view. These two projected lines will intersect along the weld line on the elevation.

Extend the centerline of the branch weld above the elevation. Draw a horizontal centerline cutting this vertical centerline at pt. 1.



TEE, PIPES OF SAME SIZE
FIG. 10

Above and below this pt. 1, locate pts. 2, 3, and 4' the same distance apart as the same numbers on the end view. Through these pts., draw horizontal lines extending past the centerline on both sides.

Project pts. 1 through 12 upward from the elevation to intersect the horizontal lines on the hole templet. Number these intersections with numbers as shown. Connect all these pts. with a smooth curve.

The templet for the branch is easily constructed using procedure which by this time is well known to the student.

Draw the templet necessary for marking the pipe for making a ninety degree intersection of two pipes.

Assignment 1 of Job 11

Lay out a full size tee; cut and weld.

Pages 87-89

Job 12

A previous lesson explained the method of drawing the templet for a concentric reducer.

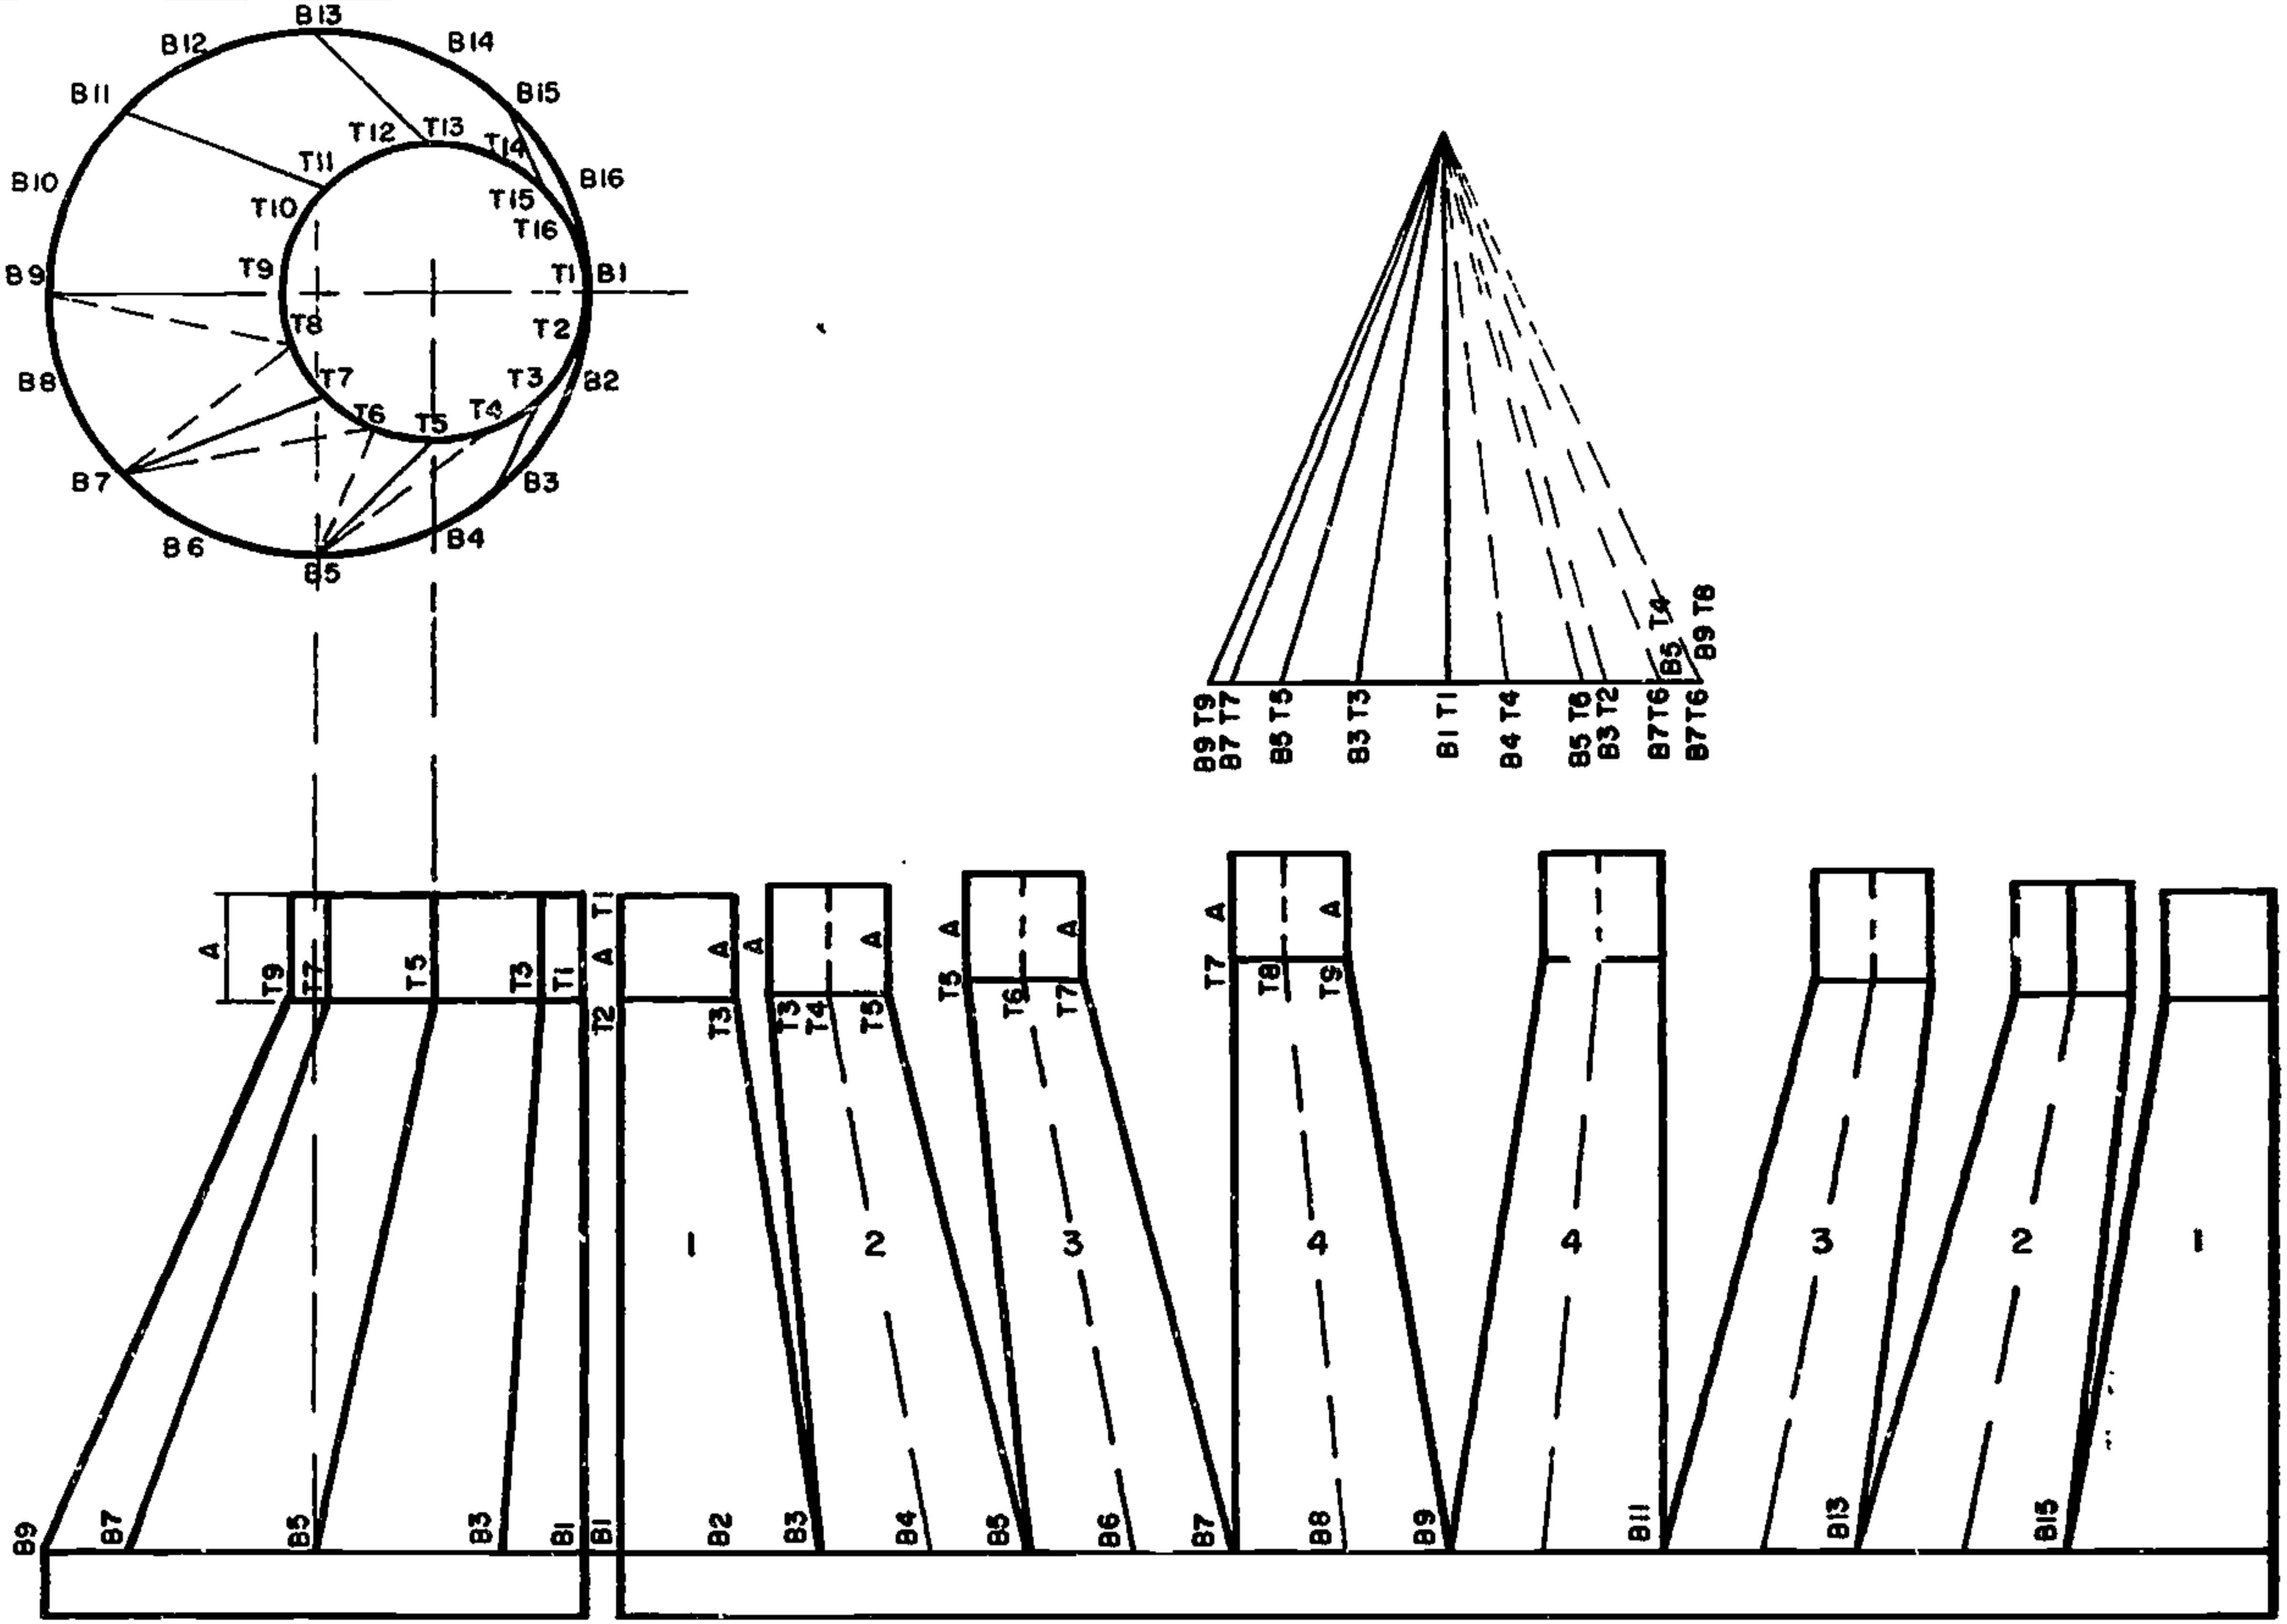
Another type of reducer has the centerline offset in such a manner that the bottom, or one wall, of the two ends lies in the same plane. This is called an eccentric reducer.

Figure 11 shows the development of the templet for such a reducer.

Draw the elevation of the large end using the O.D. of the pipe. Extend the right wall of the pipe upward. Draw the left wall of the reduction section at 22½ degrees with the vertical. Where this sloped line is the same horizontal distance from the right wall as the O.D. of the small section, draw a horizontal line cutting both walls of the reducer. Now draw in the small section of the reducer. The procedure to this pt. results in an outline of the reducer.

Above the elevation, draw a horizontal centerline. Extend the centerline of the large end of the reducer upward to intersect the horizontal centerline. With this pt. of intersection as the center, and the radius equal to ½ the O.D. of the large end of the reducer, draw a top view of the large end. Divide this circle into 16 equal parts and number as shown.

Extend the centerline of the small end of the reducer upward to intersect the horizontal centerline. With this pt. as center, draw a circle with a diameter equal to the O.D. of the small end. Divide this circle into 16 equal parts and number as above.



ECCENTRIC REDUCER
FIG. 11

In making a reducer such as this, it is advisable to have as few arms to cut and form as is practicable. For reducing small pipe, 8 arms are enough. Therefore, begin at pt. T1-B1 and proceed counter clockwise connecting every alternate number on the upper circle with alternate numbers on the larger lower circle. For example, T3 connects with B3; T5 connects with B5; etc. This completes the top view of the reducer showing the arms by means of which the reduction is made.

Drop each of the main pts. on the small circle to the top of the small section of the reducer and draw the vertical lines on the small end of the elevation. Number as shown.

Drop each of the main pts. on the large circle to the top of the large reducer section and number as shown.

Connect the pts. located in this manner with straight lines. Example; B3-T3 on the elevation, etc.

To the right of the elevation, draw a horizontal base line. Along this line, set off 16 small segments, each equal in length to one segment on the large circle in the plan view. Number all the pts. located as shown.

The remaining procedure is quite complicated and can only be mastered through careful inspection of figure 11, and systematic study of the written description to follow.

Erect a perpendicular line at B1 on the templet base line. Lay off distance B1-T1 the same as B1-T1 on the elevation. This is the only true distance which may be taken from the elevation. All other true distances are found by using B1-T1 as the height of a right triangle, and the horizontal distance taken from the top view as the base. The true length is equal to the hypotenuse of this triangle. For example, the true length of B3-T3 is found in the following manner. Measure the distance between pts. B3 and T3 in the top view. Set this off on the horizontal line in the triangulation figure to the left of the vertical line. Measure from this point to pt. 0 and this gives the true length of B3-T3. For convenience, all odd numbered points are placed to the left of the vertical centerline, and all even numbered points are placed to the right of the vertical centerline.

With B3-T3 as a radius and B3 on the templet as the center, strike an arc above B3. With T1-T3 from the top view as the radius and T1 on the templet as the center, strike an arc cutting the first arc at T3.

Extend B1-T1 the distance A (from the elevation) to pt. T1'. With T3 as center and A as the radius, strike an arc above T3. With T1' as center and T1-T3 as the radius, strike a second arc intersecting the first one at T3. Connect all pts. which have been located by heavy lines, thus outlining arm No. 1 at the left end of the templet. Arm No. 1 at the right end is identical to the one just explained except that it is reversed.

In drawing Arm No. 2, find true distance B3-T4 on the triangle. With this distance as the radius, and B3 on the templet as the center, strike an arc above the base line. With the true distance B5-T4 as the radius, and B5 as the center, strike a second arc intersecting the first one at T4. Connect B4 and T4 with a centerline.

With T4 as the center and the distance T3-T4 (from the top view) as the radius, strike arcs to the left and right of T4.

With B3 as the center and B3-T3 (from triangle) as the radius, strike an arc intersecting the small arc to the left of T4 at pt. T3. With B5 as the center, and B5-T5 (from triangle) as the radius, strike an arc intersecting the small arc to the right of T4 at T5.

Connect pts. T3 and T5. Erect a perpendicular centerline from pt. of intersection of the centerline B4-T4 and line T3-T5. Along this centerline, set off distance A from line T3-T5. This locates pt. T4'. With A as the radius and T3 and T5 as centers, strike arcs intersecting the first two at pts. T3' and T5'.

Connect all pts. with straight lines. This outlines arm No. 2 on the left side of the templet. No. 2 at the right side of the templet is identical except that it is reversed.

Development of the other arms is accomplished by the use of the same procedure as described for Arm No. 2.

Study and re-study this lesson; then develop the templet for a 3" x 2" eccentric reducer. The angle of greatest slope in the reducer is 22½ degrees. Have a short straight length at both ends of the reducer.

Assignment 1 of Job 12

Lay out a concentric reducer five inches long; cut and weld.

PART III

SUPPLEMENTARY INFORMATION

BLUEPRINT READING

REVISION - is a change made on a drawing because of:

1. Customer's request
2. Error by draftsman
3. Error in design

Revisions are stamped in red on the drawing with the date revised.

CUTAWAY SECTION - View taken as if the item was cut in half at some location shown by arrows. 
This designates a cross-sectional or cutaway view. This would be termed --- Section "A-A".

NOTES - Notes are written on drawings to simplify or explain or to point out certain procedures to be followed during fabrication. An example might be a note to galvanize or paint some object, or a note to refer the reader to another drawing.

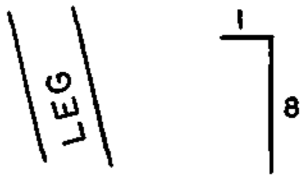
ELEVATION - An elevation is a view from the side or front of an object or structure.

PLAN - A plan is a view from the top (looking down) on the object.

SECTION - A section might designate a cutaway or cross-sectional view of the object. Also it may be a view of one side or end, or one part of a structure or object.

DETAIL - A detail is a closer or enlarged view of some particular part of an object or structure. A detail might clarify or explain the way something is built or the manner in which it is welded.

SLOPE SYMBOL - A slope symbol as shown on a drawing gives the angle of inclination or the amount of lean of a jacket leg. An example would be this symbol on a jacket leg:



This means that for every 8 feet down the pipe, the leg shifts 1 foot to the right.

FIELD INSTALLED - This designation means that the item is to be welded or fitted at the job sight where the structure is going to be erected.

BLUEPRINT READING

A line is the distance between two points and has only one dimension, length.

The end view of a line is a point and has position only. It has no dimensions.

A straight line does not change its direction at any point and is the shortest distance between two points.

A curve line changes its direction at every point.

A broken line changes its direction at some, but not all points.

Parallel lines never meet, regardless of how far they are extended.

A horizontal line is parallel to the horizon.

A vertical line makes an angle of 90 degrees (90°) with the horizon, or in other words, it extends straight up.

An angle is the difference in direction between two straight lines which meet.

The vertex of an angle is the point where the two lines meet.

The sides of an angle are the lines which meet to form it. The lengths of the sides have no effect on the angle, because the difference in direction between them is not related to their lengths.

Perpendicular lines are those which meet to form two 90° angles. The Babylonians believed that the heavens revolved around the earth and that the year contained 360 days, so they divided the circle (which represented the cycle of one year) into 360 parts, calling each part a degree and thus establishing our present-day system of circular measurement. If two lines meet in such a manner that they include 90 of these 360 degrees, they are perpendicular to each other. The angles thus formed are also called right angles.

An acute angle is smaller than a right angle. That is, it contains fewer than 90 degrees.

An obtuse angle is greater than a right angle.

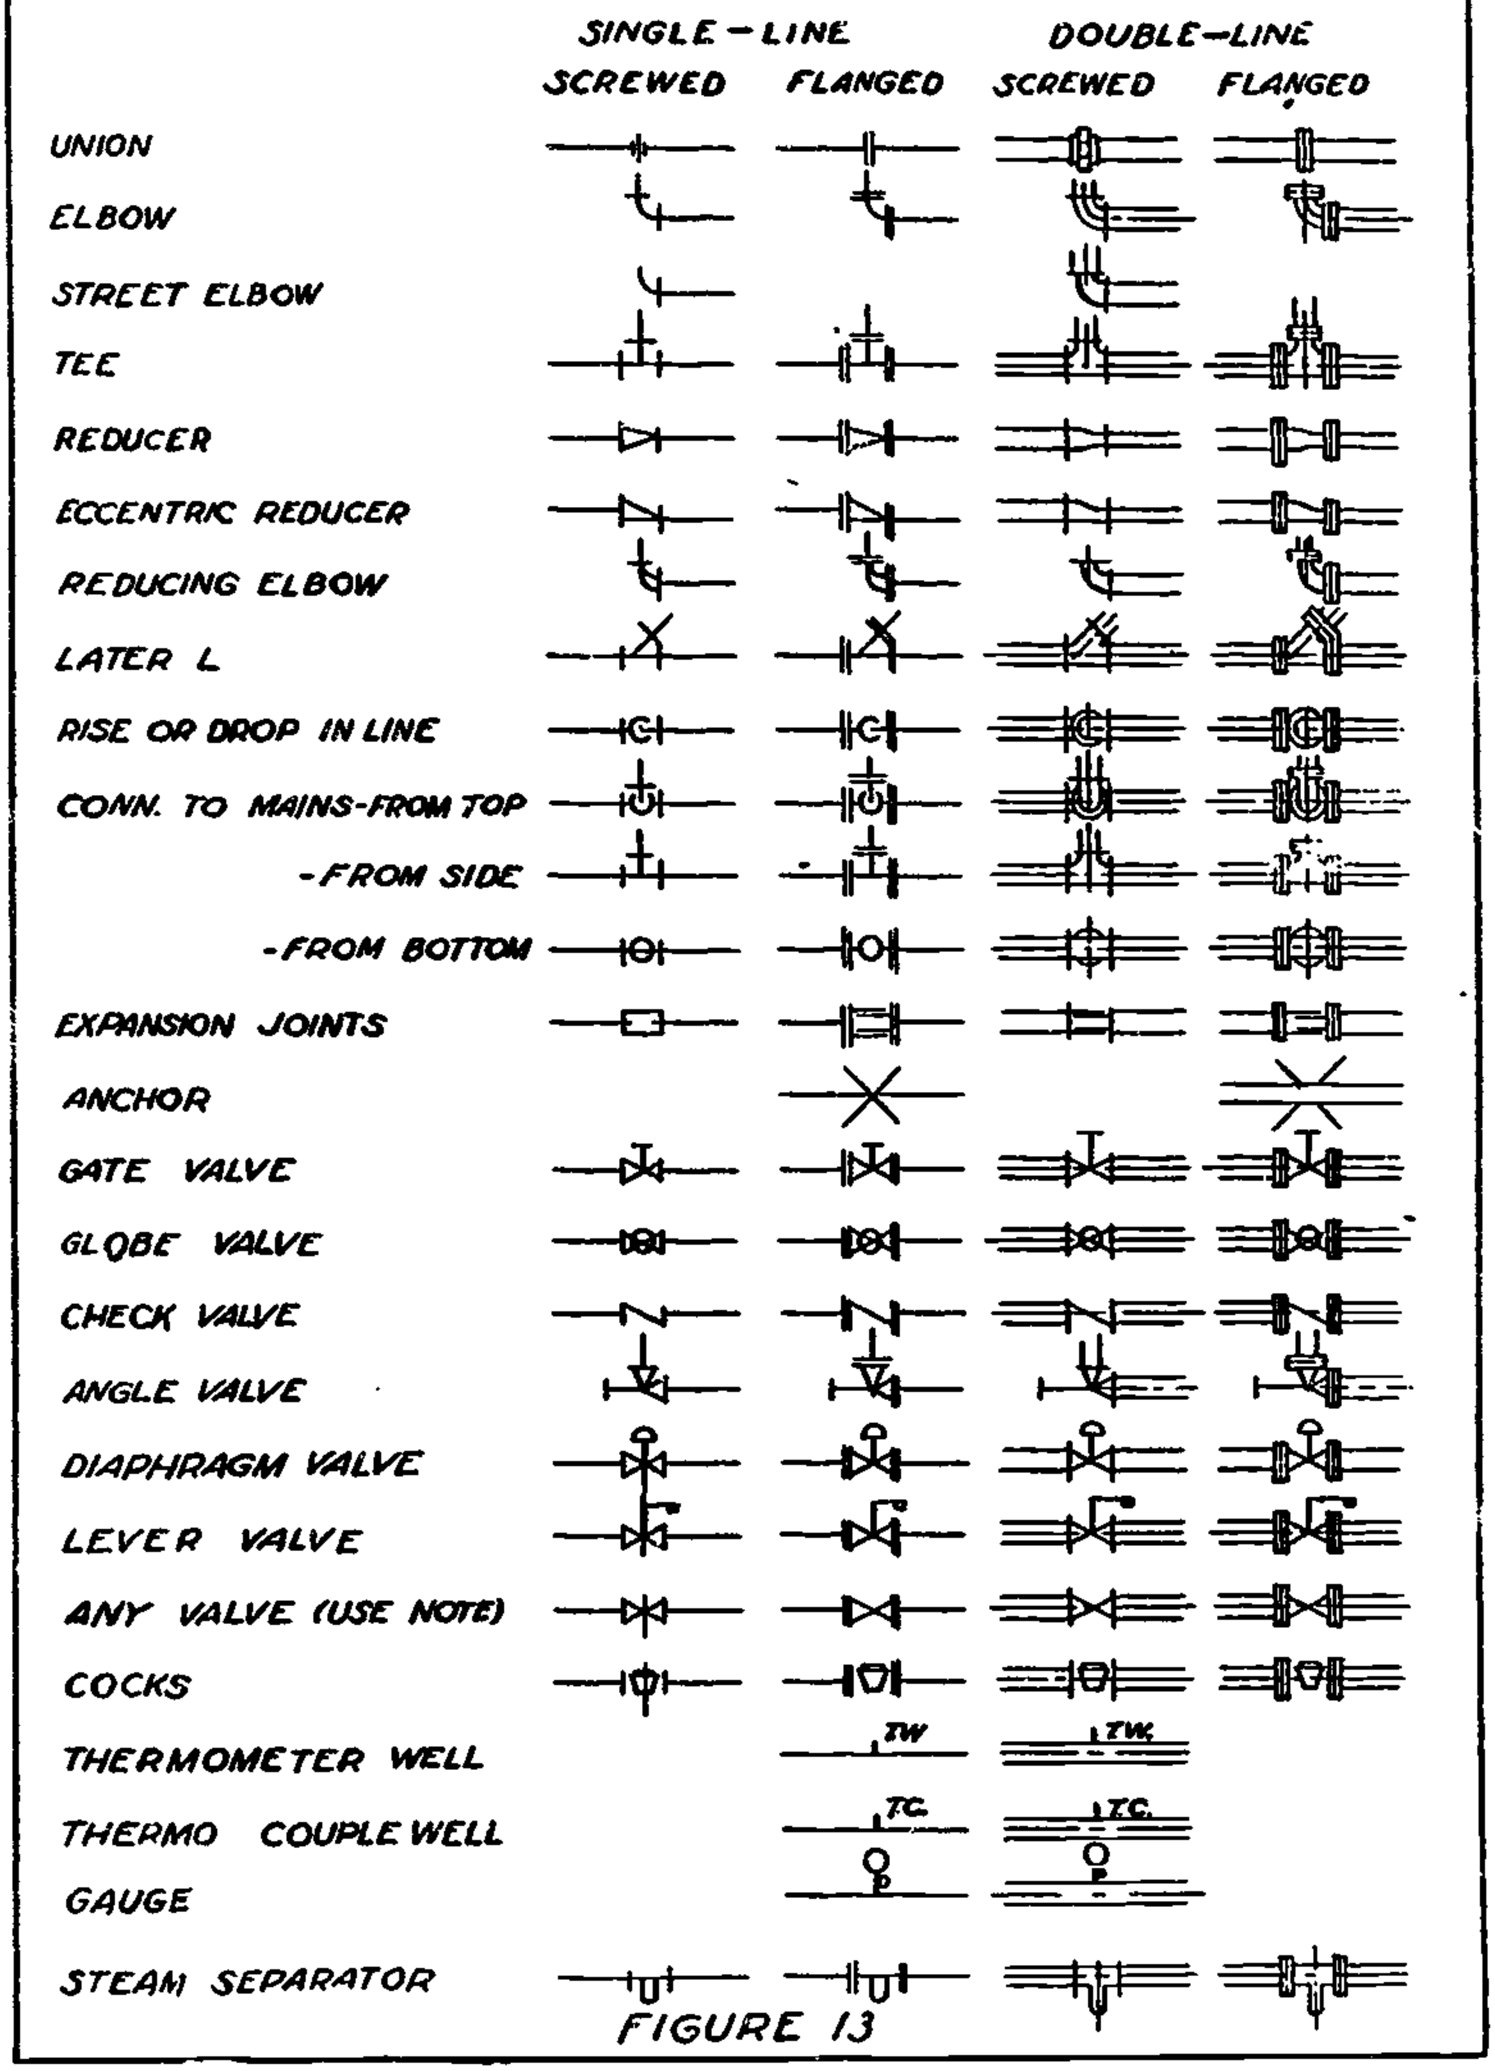

FIGURE 13

STRUCTURAL STEEL DRAWINGS

The importance of steel to industry cannot be over-stated. Structural steel is the very backbone of industrial enterprise. Structural steel sections make up the thousands of miles of steel rails over which thousands of tank cars of oil are transported each day. Structural steel sections go to make up the bridges over the rivers. Structural steel made possible the $35,000,000 Golden Gate Bridge at San Francisco, California, and so we find structural steel used in the derricks of the production department, in the towers and buildings of the refinery; in the pump stations of the pipe line company; and in every phase of the petroleum industry.

1. Symbols and Conventions:

Most of the symbols and conventions used in structural steel drawings are found in Fig. 12. These will be found to be very closely related to the things which they represent. A study of the symbols in the figure will show that a structural steel plate is indicated by a "P" with an "L" drawn through it. The I-beam is so-called because its section resembles an "I". The symbol for angle iron resembles the capital "L", and this is used because it forms an angle between two lines. The other symbols will be seen to be connected likewise with the structural members which they represent.

2. Abbreviations and Notes:

Many notes are required in order to explain fully the meaning of structural steel drawings. Due to the fact that drawings must be made to small scale in order to get everything on a small sheet of paper, the structural sections are very small and there must be a note by every structural member to give its full description. Notes are used also to indicate the method of assembly, that is to say, that all members should be welded in the field or that all shop work is to be riveted, and field work to be bolted, or whatever method of assembly that is specified by the engineering department. The workman must read all notes or writing on every blueprint because these are as much a part of the drawing as are the lines.

3. Structural Steel Sections:

The most common structural steel section is the angle iron. This is used for frame work and all light structural steel parts where a solid frame work is required but no great load is to be carried. The angle iron is always dimensioned in one particular way. The dimensions are always in the following order: the width of the wider flange by the width of the narrower flange by the thickness and the length. In many cases angle irons are used where the two flanges are the same so the proper method of dimensioning would be a 6" x 4" x ½" ∠ , 4' - 11" long. The channel iron is used for carrying greater loads than the angle iron, and where an I-beam is not required, channel irons may be used. The I-beam is used for load carrying purposes. The "H" section is used for columns, it being so constructed as to resist bending in either direction. Channel irons, I-beams, and "H" sections are dimensioned by giving the depth of the beam, that is, the distance over the flanges, and the weight of the beam per running foot. A channel iron would then be dimensioned by giving the measurement of the flanges, such as 10", and the weight per running, such as 15#. The strength of these sections depends upon the thickness of the flanges and web, and giving the weight per foot is the method of indicating the thickness of the parts.

VALVES

A. Basic Facts on Valves

Valves are used to start, stop and regulate fluid flow within a pipe line. The common valve consists of the following components:

1. A body to house the valve and gives a means of connecting it to the pipe.
2. A valve seat.
3. A valve or disc.
4. A valve stem and a means of operating the stem, usually a hand wheel.
5. A top.
6. A packing to prevent leakage around the stem as it emerges from the top.

Valves are sized by the nominal inside diameter of the pipe to which they are connected, i.e. 4" valve for 4" nominal pipe (4½" O.D. pipe). Valves are furnished for either screwed, flanged or welding connections.

Types of material used in valves:
1. Brass
2. Cast Iron
3. Cast Steel
4. Forged Steel
5. Alloy Steel
6. Malleable Iron

B. Valve Identification

In addition to the manufacturer's brand and size mark, a basic service rating appears on most valves. Pressure and temperature ratings are expressed in terms of steam, unless otherwise indicated.

1. Steam Ratings: (Iron & Brass Valves)
   Steam ratings are used as a basis for determining the suitability of a material for a given application. For lower temperatures the safe working pressure of a material is usually greater than the steam rating.

2. Cold Ratings: (Iron & Brass Valves)
   Most valves have two service ratings. In addition to the steam rating, explained above, cold service ratings are usually designated by the mark WOG, which stands for cold water, oil or gas, non-shock. Examples --
   2" - 125#S - 200#WOG
   3" - 250#S - 500#WOG

CONT...

3. Ratings - Steel Valves:
Cast and forged steel valves bear a mark such as 150, 300, 600, etc. These figures denote the maximum pressure at a certain maximum temperature for which an item is suited. A certain 600 pound steel valve, for example, may be suited for 600 pound pressure at temperatures up to 900°F. But, if the temperature exceeds that point up to 1,000°F., let's say, the valve is not recommended for pressure over 380 pounds. Other factors affecting the pressure for which the valve is suited are:

   1. shock.
   2. vibration.
   3. line stresses.

   Steel valves are intended to be used with steel flanges. A flanged 600# valve has flanges that make up with 600# ASA companion flanges.

TYPES OF VALVES

A. Gate Valves

This type is the most widely used in industrial piping. It gets its name from the gate-like disc that operates at a right angle or perpendicular to the path of flow through the valve. Gate valves function by raising or lowering the disc into the stream of flow. Most gate valves have a wedged disc with matching tapered seats. As a general rule, gate valves should be used only as stop valves, i.e. to turn off the flow, as opposed to regulatory or throttling the flow, since the flow meets the disc head on. Flow moves through the valve in a straight line with practically no resistance to flow when the disc is fully raised or open. A 6" gate valve fully closed having a gate or disc area of 28 square inches and holding a pressure of 300 pounds per square inch, subjects the disc to a total load of over 4 tons on one side, if there is only atmospheric pressure on the other.

Force equals Pressure x Area
F equals 300 psi x 24 in.^{2} equals 8400# or 4.2 tons

While seated tight, there is no wear or undue strain on the disc or the seats. But each time the valve is cracked open there is a threat of erosion of the seating surfaces by the high velocity of fluid flow. Repeated movement of the disc near the point of closure under high velocity flow may create a drag on the seating surfaces and cause galling or scoring on the downstream side. A slightly opened disc can cause turbulent flow with vibration and chattering of the disc.

CONT...

Types of Discs used in gate valves:

1. Solid Wedge Disc
2. Double Disc
3. Flexible Wedge Disc
4. Split Wedge Disc

B. Globe Valves:

The globe valve gets its name from the globular shape of its body. Unlike the perpendicular seating in gate valves, globe valve seating is parallel to the line of flow. The fluid undergoes a change in direction as it flows through the globe. All contact between the seat and the disc ends when the flow begins.

Globe valves are recommended for use in throttling or regulatory fluid flow. There is a directly proportional relation of the size of the seat opening to the number of turns of the handwheel. An operator can gauge the rate of flow by the number of turns of the wheel. Shorter disc travel, with fewer turns required to operate globe valves, saves considerable time and work. It also saves wear on the valve parts. The disc and seat in most globe valves can be conveniently repaired or renewed often without removing the valve body from the line. Some of the disadvantages of globe valves are:

1. They do not allow a line to drain completely.
2. They offer more frictional resistance than gate.

On lines where continuous flow is desired, it is safer to have the pressure below the disc. For example, a disc may become separated from its stem and automatically shut off flow if the pressure is above the disc.

In general, however, unless pressure under the disc is definitely required, a globe or angle valve will give more satisfactory service when installed with pressure above the disc.

C. Check Valves

Check valves are designed to permit the flow of fluids in one direction only. Fluid flow keeps these valves open and gravity or a reversed flow closes them automatically, thereby preventing backflow along the line.

There are two (2) basic types of check valves.

1. Swing Check
   A swing check valve consists of a disc on the inside which is hinged at the top and seats against a machined

CONT...

seat inside the valve in a tilted position. Fluid flow is approximately in a straight line, comparable to flow through a gate valve. The disc swings freely in an arc from a fully closed position to an open position providing an unobstructed flow. The valve is kept open by flow, with the size of the opening varying with the volume of flow. Gravity and a reversal of flow, seat the disc thereby preventing backflow. Generally used in combination with gate valves. Swing checks can be used in a horizontal or vertical line, but will not function properly unless installed with pressure under the disc.

2. Lift Check Valve
Constructed very much like a globe valve. Flow through a lift check valve is similar to the flow through the globe valve in that the flow follows a turning course. Lift checks will operate in horizontal lines only. Line pressure lifts the disc from the seat as fluid flows through the valve. The disc is equipped with a guide which allows it to move vertically. The disc is automatically seated by backflow, or by gravity when there is no flow and is free to rise and fall depending on the pressure under it. They are generally used in combination with globe valves.

D. Angle Valve

These valves have the same operating characteristics as globe valves. They are used when making a 90° turn in a line. It reduces the number of joints and saves make-up time.

E. Plug Valves

Plug valves operate by turning of a plug by means of a wrench or handle. There are two general types of plug valves which are lubricated and non-lubricated.

1. Lubricated Plug Valves
These are used in application where the possible contamination of the fluid flowing through the line is of no importance. They have either a tapered or cylindrical plug. A circulation of lubricant, under pressure as the valve is opened or closed, is maintained through sealing grooves machined on the surface of the plug. The function of pressure lubrication is to keep the plug in a freely working condition, to seal against leakage, and to protect the adjoining surfaces from wear and corrosion. Lubricant under pressure is provided and maintained by turning of the lubricant screw.

This valve makes use of a principle known as Pascal's Law whereby the pressure exerted by the lubricant screw on the

CONT...

lubricant is transmitted through the grooves and the resultant force multiplied depending on the area upon which the lubricant acts.

a. Proper lubrication - The use of the proper lubricant is most important since, in operation, the valve structure and the lubricant or sealing film are an integral unit, each component dependent on the other for effective performance.

For efficient hydraulic action and lubrication, the lubricant system must be kept completely full of the proper type of lubricant. The type of lubricant used is dependent on several considerations.

1. The material flowing in the line.
2. The temperature of the material.

A lubricant that is recommended for, let's say, water between 50° F. and 175° is not suitable for water below 50° F. or above 175° F. Nor is it suitable for, say, oil at 100° F. Each application has to be considered on its own merits and the proper lubricant determined from the service conditions of the valve.

New valves normally come with an "assembly" lubricant in the valve. This lubricant should be replaced with the proper lubricant as its only purpose was for use when testing the valve at the factory.

2. Non-Lubricated Plug Valves
These are used where contamination of the product, as foods or certain chemicals, must be avoided. It consists of a plug cock equipped with a mechanical device that lifts the plug from the body seats, turns it the required 90 degrees and reseats the plug tight in the body seats in a single operation. No lubrication is required to seal the valve. The valve is sealed against pressure by a packing gland.

FLANGES

Used for the joining of pipe and also for connecting pipe to valves and equipment. Flanged joints are made up by bolting the two flanges together with a gasket between their machined faces to assure a tight seal.

A. Types of Flanges

1. Weld Neck
2. Slip On
3. Lap Joint
4. Screwed
5. Socket Welding
6. Blind
7. Reducing

B. Pressure Ratings

1. A.S.A. (American Standards Association)
   - a. 150#
   - b. 300#
   - c. 400#
   - d. 600#
   - e. 900#
   - f. 1500#
   - g. 2500#
2. A.P.I. (American Petroleum Institute)
   - a. 2000#
   - b. 3000#
   - c. 5000#
   - d. 10,000#

The above ratings do not apply to cast iron flanges and do not indicate the actual allowable working pressure but only the Primary Pressure Rating based upon the relation between temperature and pressure of the fluid in the line.

3. Cast Iron Flanges
   - a. Class 125 (125# Steam)
   - b. Class 250 (250# Steam)

C. Types of Facings

1. Raised face
2. Flat face
3. Ring Joint
4. Male & Female
5. Tongue & Groove

Flanges come from the factory with a machine tool finish on the facing. This facing should be protected prior to use of the flange with a coat of grease and a cover plate. Dirt or

CONT...

sand, if allowed to come into contact with the face, may score or damage the machined finish. A coating of grease on the facing will prevent the formation of rust. All grease, dirt, sand, etc. should be removed by a thorough cleaning of the flange with a solvent prior to use of the flange.

Cleanliness of the flanged joint cannot be overemphasized. A pressure-tight connection is dependent upon a true seal between the machined faces of the flanges and a gasket between them. Any foreign material on the facing such as dirt or sand will prevent the joint from being made pressure tight. The fact that the joint is not pressure tight will not usually be discovered until pressure is applied to the joint in a hydrostatic test.

Flange facings should be alike. Do not attempt to get a tight flanged joint with flange faces which are not alike. Steel valves and fittings are normally manufactured with raised flange faces. Cast iron valves and flanged connections in equipment such as pumps have cast iron flanges with flat faces. Although the drilling templets of Class 125 case iron and 150# ASA steel are alike and Class 250 cast iron and 300# ASA steel are alike, cast iron flange should not be made up to steel flanges unless the raised face on the steel flange is removed and a full face gasket used. Unless this is done there is a very good chance of breaking the relatively brittle cast iron flange when the joint is made.

D. Identification

Flanges are stamped with the necessary information for easy identification and in compliance with code requirements as follows:

1. Nominal size
2. Primary Pressure Rating
3. Material Designator
4. Schedule number or bore of matching pipe

FLANGE STUDS

The number, size and length of flange studs are not arbitrarily selected as a result of what is handy or in stock. One particular size, quantity and length is specified by the American Standard Association (A.S.A) for each different flange size, type and rating. These sizes have been recommended by A.S.A. as those required to safely withstand the pressure for which the flange is intended. The recommended sizes are published in handbooks, catalogues, etc.

For example, a 2" - 150# A.S.A. Raised Face Weld Neck Flange requires 4 - 5/8" diameter x 3" studs. As a result all 2" - 150# Raised Face Weld Neck Flanges come with 4 - 3/4" diameter holes regardless of what company manufactures them. When any two of the above mentioned flanges are bolted together with the 3" length studs and two nuts, there is ample stud thread length engaged with each nut to safely withstand the working pressure of the flanges. This usually consists of a full nut with 1/4" of stud length extending past the nut on each end. If a shorter or smaller diameter stud is used, the studs could possibly fail while the flanges are in service. A longer stud should not be used due to the increased cost.

GASKETS

The kind of gasket used makes a big difference in flanged joints. What is good for one service may not last in another. Gaskets are made in various materials.

1. Rubber
2. Asbestos compositions
3. Metal

For low pressure and cold services rubber gaskets are generally used. For cold service at higher pressures and hot services up to about 750° F., asbestos composition are frequently used. Metallic gaskets are used for intermediate and high temperatures and pressures.

A. Flat Ring Gaskets

These cover the face of the flange to the inside of the bolt holes. The inside diameter of the gasket equals outside diameter of pipe. Their thicknesses range from 1/64" to 1/8". Their width ranges from 1/4" upwards. Narrow gaskets are preferable since they require lower bolt loads for joint tightness, but they must not be too narrow or the bolt load will crush them. Usually made of rubber, asbestos composition, or metal. Used when making up steel to steel flanges and cast iron to cast iron flanges.

B. Flat Full Face Gaskets

These cover the face and the outside edge of the flange. The inside diameter equals the outside diameter of the pipe. The stud-bolts are inserted through punched holes in the gasket. Usually made of rubber or asbestos composition. These are used when making up cast iron to cast iron flanges or cast iron to steel flanges.

Both the flat ring and the flat full face gaskets are specified by thickness for the size and rating of the flange on which they are to be used. For example:

1. 1/16" flat ring gasket for 3" - 150# R.F. flanges (3 1/2" inside diameter x 5 3/8" O.D.)

2. 1/16" full face gasket for 2" - 125# cast iron flange (2 3/8" inside diameter x 6" outside diameter.)

C. Ring Joint Gasket

Usually made of soft carbon steel or alloy steel. They are available in oval and octagonal cross section. Ring joint gaskets fit into the machined grooves in the matching flange faces, and form a pressure tight seal when the

CONT...

flange bolts are tightened. Ring gaskets are specified by number. For example, Ring Joint Gasket #R23 is used with 2" - 600# Ring Joint flanges. These gaskets should be thoroughly cleaned with a solvent prior to their use.

D. Male & Female Gaskets

These gaskets are the same as the flat ring gasket except that the outside diameter of the gasket extends to the outer edge of the large male face of the male flange. Usual thickness - 1/16".

E. Tongue & Groove Gaskets

These gaskets cover the bottom of the recess in the "Groove" flanges. Usual thickness - 1/16".

PIPE SCHEDULE NUMBERS

In 1939, the commonly used pipe terms "Standard," Extra Strong," and "Double Extra Strong" were made obsolete and, instead, pipe wall thicknesses were to be designated by Schedule Numbers.

The Schedule Numbers are an approximation of the value of the expression:

Schedule Number - 100 P/S

When P = internal pressure in pounds per square inch, gage.
S = allowable fibre stress in pounds per square inch

Thus it will be seen that the Schedule Numbers represent a rational relationship between wall thickness and pipe diameter this relationship determining into which Schedule Number the pipe falls.

Application of this formula places "Standard Pipe Thickness" pipe in Schedule Number 40 in sizes 10 inch and smaller. "Extra Strong Pipe Thickness" becomes Schedule Number 80 in sizes 8 inches and smaller. The formula is not applied to sizes smaller than one inch. Therefore, dimensions and weights which have been traditional in commercial lists for "Standard Weight" and "Extra Strong" have been retained in pipe sizes 1/8 inch through 3/4 inch.

*TEACHING GUIDES, HIGH SCHOOLS, TRANSPARENCIES, *DISTRIBUTIVE EDUCATION, *HYGIENE, *PERSONALITY, WORK ATTITUDES, *INDIVIDUAL DEVELOPMENT,

The purpose of this guide is to help teachers develop in high school distributive education students the personal characteristics, social skills, work habits, and attitudes essential to job success and advancement. It was developed by the Instructional Materials Laboratory at state level for use by certified distributive education teachers. Content areas are (1) importance of appropriate dress and grooming, (2) importance of good health habits, (3) appropriate etiquette for distributive employment, (4) practicing good ethics on the job, and (5) development of good work habits, attitudes, and relations with others. Information for student use, a bibliography, and 24 transparencies are included. (MM)

CAREER DEVELOPMENT

UNIT: PERSONAL DEVELOPMENT AND HUMAN RELATIONS

Major Teaching Objective

To develop the personal characteristics, social skills, work habits, and attitudes essential to job success and advancement

Suggested Learnings (Competencies) To Be Developed

1. To understand that appropriate grooming and dress are very important in the field of distribution
2. To understand the importance of practicing good health habits in the world of work
3. To exercise the etiquette appropriate for distributive employment
4. To understand the importance of practicing good ethics on the job
5. To develop work habits and attitudes that make work and relations with others easier

Prepared by
Mrs. Mavis C. Sparks
Specialist, Business and Office Education

980 Kinnear Road
Columbus, Ohio 43212

FROM: (Person) Gilbert E. Chancey (Agency) Instructional Materials Laboratory

(Address) Div. of Vocational Education, College of Educ., Univ. Of Ky., Lexington, Ky. 40506.

DATE: July 28, 1967

RE: (Author, Title, Publisher, Date) Mrs. Mavis C. Sparks, Specialist, Business & and Office Education and Gilbert E. Chancey, Specialist, Distributive Education, Personal Development and Human Relations, March, 1967, Instructional Materials Laboratory.

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Instructional Materials Laboratory, Div. of Voc. Educ., College of Educ.
Address University of Kentucky, Lexington, Kentucky 40506.
Limitation on Available Copies Price/Unit
Not available to teachers outside of Ky. One (quantity prices)
or two copies will be supplied to the professional staff in Voc. Educ. that is responsible for teaching materials in each state.

(2) Means Used to Develop Material:
Development Group Mrs. Mavis C. Sparks and Gilbert E. Chancey
Level of Group State
Method of Design, Testing, and Trial Developed for Distributive Education Programs in Kentucky by Instructional Materials Laboratory.

(3) Utilization of Material:
Appropriate School Setting High School
Type of Program Distributive Education first or second year.
Occupational Focus Distributive Occupations
Geographic Adaptability None
Uses of Material Guides for developing lesson plans for teachers use only.
Users of Material Distributive Education Teachers.

(4) Requirements for Using Material:
Teacher Competency Certified distributive education teacher
Student Selection Criteria First or second year - distributive education

CAREER DEVELOPMENT

UNIT: PERSONAL DEVELOPMENT AND HUMAN RELATIONS

Suggested Teaching Time

Time or class periods for teaching

Group teaching in classroom, at school ________ ________
Group teaching outside classroom ________ ________
Field trips (away from school) ________ ________

Time devoted to individual projects and training

In classroom, at school ________ ________
Total . . . . ________

Month(s) to be taught ________________

Place of the Unit in the Course of Study

Since personal traits account for about 90 percent of job success, this unit should be taught before employment is secured with the entire class participating. The knowledge and understandings acquired should be integrated with other classwork and should be practiced throughout the year.

The amount of time required for this unit will depend upon the students' need for this training. Factors of appearance and personality in which the students (the majority) are weakest should be given major consideration. Some students may require additional individualized training.

Attention should be given to improving the students' appearance and personality over a long period. This training should not be just a short one-time teaching function.

Suggestions for Introducing the Unit

"To be successful, you should look successful" is an old saying. Generally one can identify successful business people by the way they dress and act. Successful people know that it pays to be well dressed and they pay a great deal of attention to ensuring that their dress and actions are appropriate. A good position demands a good appearance. To secure a good position, your appearance should fit what is expected in a successful business. Often, employees fail to be considered for promotion because they do not exhibit the appearance desired in the organization.

There are many factors which affect appearance. Each of these factors can be enhancing or detracting to the impression that your appearance makes upon others. Often people are not aware of the factors that create unfavorable impressions. Each student should analyze his or her appearance to ensure that posture and bodily movements, facial expressions, physique, health, grooming, dress and mannerisms are positive rather negative factors.

Deciding What Is to be Taught

Since the area of personal development crosses all vocational and general studies areas, its study in distributive education classes should be devoted specifically to areas applicable to the distributive situations. Students having special problems may be referred to the home economics, speech, physical education or health teacher for further training. In some cases they may need to be referred to a specialist.

Competencies and learnings to be developed should be determined. The students may be well oriented in health and grooming, for example, but have little knowledge of work habits desirable in distributive situations. Knowledge of socio-economic background, content in other courses studied, subjective evaluations of the personal appearance of the individuals in the class, along with student checklists will be helpful in deciding what to teach. Arrangements should be made to provide appropriate instruction both for males and for females. Class activities should be planned so that both sexes are not embarrassed at being in the class, made to feel left out, or made to think that this is an area important only to one sex.

Introducing the Unit to the Class

Some approaches which may be used in beginning the unit with the class are:

a. Show and discuss the transparency "Will You Be A Success?" (DE 63 TM1)

b. State attention-getting facts such as those below to emphasize the importance of a desirable appearance and personality:

-- Experience and opinion surveys show that employers want workers who are sociably acceptable.
-- Analysis of factors relating to job success reveals that 90 percent of dismissals are due to poor personal traits rather than lack of skills.
-- A United States Government survey showed that girls with charm training make $50-$100 more per month than those with comparable training without the charm course.

c. Define personality and manners (everyday and dictionary). It is easier to recognize an unattractive personality than it is to define the specific items that makes acceptable personality. Constantine Panunzio in her Student's Dictionary of Sociological Terms gives this definition:

> "The totality of qualities and characteristics of a given person, ordinarily attributed to original nature, expressing themselves in modes of carriage, language, manners, clothes, ways of speaking, interest, attitudes, and other reactions to the social milien."
> (See transparency master DE 63 TM5)

d. Discuss appropriate quotations such as:

- -- "A false sense of humility is just as phony as a false sense of superiority." -- anonymous (See transparency master DE 63 TM2)
- -- "A genuine person has the same qualities at home and in his social life as he has on the job." -- anonymous (See transparency master DE 63 TM3)
- -- "Unless a garment fits well and is worn with grace, it cannot be made 'smart' by quality or cut." -- anonymous (See transparency master DE 63 TM4)

e. Have displays illustrating the whole picture of personal development.

- -- Manners are the "frosting" on your cake.
- -- On what are we judged? (Show picture of a judge)
  - (1) What we think
  - (2) What we say (Show illustrations of these)
  - (3) What we do
- -- "U" are Unique! (List and illustrate various personality traits)
- -- Formula for personality:
  - (1) Do more than exist -- Live
  - (2) Do more than look -- Observe
  - (3) Do more than read -- Absorb
  - (4) Do more than hear -- Listen
  - (5) Do more than listen -- Understand
  - (6) Do more than think -- Ponder
  - (7) Do more than talk -- Say something
  - (8) Do more than desire -- Do something about it!

f. To change one's personality and manners, one must adapt himself or herself to the acceptable modes of the society in which one exists. Harry H. Hepner is his Psychology Applied to Life and Work states:

> "Adaptability is far more than knowledge. It is a mental habit that can be acquired by anyone who really seeks it. Adaptability is the habit of finding and using opportunities in the environment and following not the line of least resistance but those of greatest opportunity. The habit of acquiring new points of view, new skills, new facts, and new habits can be learned." (See transparency master DE 63 TM6)

g. Have students analyze themselves to point up areas for individual and group emphases. A rating sheet may be used. Responses may be secured by reading a list of desirable traits and having each student indicate areas of weakness or areas in which he is interested in improving.

Learnings (Competencies) To Be Developed

1. To understand that appropriate grooming and dress are very important in the field of distribution

Before studying the fundamentals in grooming and dress, it should be pointed out that appearance is important in job success and that grooming and dress requirements may differ according to the type of position held.

This may be done by illustrating and evaluating, in terms of appearance, men and women holding important distributive positions. Some types of employment require conservative, expensive clothing while others require durable, inexpensive work clothes.

Standards of Good Business Dress

a. William Shakespeare wrote "For the apparel oft proclaims the man." Students' dress habits are normally swayed by the modes established within their group. Such fashions, although providing a sense of security when one is within his own group, are often not appropriate in the business world. Extremes in style have great attention value within one's own group but are questionable devices for gaining admiration in the business world. A young person entering the world of work should first observe what other employees are wearing. He should then confine his dress to similar items that will be considered appropriate to the activities required in employment. Young workers should abstain from loud and gaudy colors, excess ornamentations, current fads, extreme styles, and being too casual or too formal in dress.

b. Generally, business clothing is more subdued than the clothing students are accustomed to wearing. Students should carefully plan wardrobes that will be suitable to their employment and working conditions, to their physical build, and to their particular individuality. (For some persons certain colors are not appropriate.) Students should avoid the effect of cheapness in their dress. Neither should students strive to obtain the most expensive clothing. Careful study and research should lead to the development of good tastes in dress.

c. Persons when choosing clothing items should carefully consider:

- -- Appropriateness of dress, jewelry, footwear
- -- Distracting influence of dress
- -- Acceptable dress customs for employment and working conditions
- -- Overcoming physical characteristics through dress (See transparency master DE 63 TM7)

Standards of Good Business Grooming

a. There are few reasons why any person in the United States should be unaware of standards of good grooming. Advertising media constantly remind us of the importance of good grooming. A person cannot change his physical appearance to a great extent but he can keep himself groomed properly. "Body odor" or "halitosis" is unexcusable. Yet, there is a large number of persons who allow this offensive condition to exist. Frequently we offend others unknowingly with our bad habits of grooming and sanitation. We should constantly be on guard to insure that we are properly groomed at all times. Only if we are honest with ourselves and face up to the facts can we be sure that we possess no faults. (The checklist on page 22 of <u>How to Improve Your Personality</u>, 3rd edition, will assist in testing for proper grooming.) Every bad habit of grooming can be corrected. Students should become aware of the necessity for good habits pertaining to:

-- Cleanliness and personal hygiene
-- Proper use of daytime cosmetics
-- Attractive business hair styles
-- Well-kept hands and nails
-- Good posture
-- Distraction caused by grooming on the job
(See transparency master DE 63 TM8.)

Behavior Affecting Appearance

a. Even the best of appearances can be torn down if one has habits, attitudes, and mannerisms that antagonize others. An initial impression containing anatagonizing habits, attitudes, and mannerisms often cannot be overcome. (Pages 25 and 26 of <u>How to Improve Your Personality</u>, 3rd edition, contains a list of fifty habits and attitudes that are handicaps and which antagonize others. Page 59 of same book list some feminine and masculine gestures that should be avoided.)

-- Annoying mannerisms
-- Actions affecting personal appearance

Summary

One needs a yardstick to measure his achievement in proper grooming. It would be better if a person could see himself as others see him. (See transparency master DE 63 TM9.) This is not always feasible. To simplify the grooming process, one should establish certain tests and checks that will ensure proper grooming of himself. (Check lists for men and women are on pages 84 and 85 of <u>Business Behavior</u>, 3rd edition.)

<u>Suggested Teaching-Learning Activities</u>

a. An important objective is to arouse an awareness within each student to investigate and determine what is considered the well-dressed look for business.

b. Use lectures and demonstrations by local beauticians, barbers, the school nurse, representatives from make-up studios, home economics experts, personnel managers, teachers of "executive" courses in local business schools or other qualified people. (Some of your students may have taken charm courses or have done modeling.) Also have students complete over a period of time the tests as shown on pages 140 and 141 of Store Salesmanship, 6th edition.

c. Show advantages of simplicity in clothes--dark versus light colors for easy care; basic, classic, tailored clothes for good style through several seasons versus fads and short-lived styles. Teach the wisdom of keeping a clothing budget.

d. Discuss types of jewelry and dress which distract on the job.

e. Discuss uniforms and dress suited for working conditions; how to dress to disguise physical shortcomings.

f. Explain and illustrate mannerisms which annoy co-workers.

g. Explain reasons for a company policy regarding gum chewing, smoking or eating on the job.

h. Have students come to class dressed in proper business attire.

i. Have students demonstrate correct and poor posture.

j. Have students list the changes in their present wardrobe that will be necessary when they enter the business world.

k. Have students decide what "lines" of costume are most becoming to them. Have them decide what facial shape they have and what lines of hairdos or haircuts are best for their facial shape. (See pp. 60-67, How to Improve Your Personality for information pertaining to young women.)

Instructional Materials

a. Teaching aids

-- Good grooming charts for men and women. "Good Grooming Is Good Business" for girls. Available free from Lever Brothers Co., 390 Park Ave., New York, N. Y.
-- Color charts. Charts for girls available as basic references. A chart suitable for the boys is given in the supplement attached to the back of this unit. Also a chart is shown on page 70 of Business Behavior (3rd edition).
-- Stain removal charts. Lever Brothers Co., listed above, publishes a chart free to teachers which is very good on stains likely to be encountered by distributive workers. Cookbooks are also good sources for charts of this nature.
-- Pictures of up-to-date business fashions. Secretarial, office, women's and men's magazines are good sources for these.
-- Pictures of up-to-date hairdos and haircuts. Beauty shops and barber shops may be able to lend appropriate magazines and advertising posters. The magazines mentioned above are also good sources.

b. Booklets and leaflets for the students

-- For the girls
"Do You Pass the Model Test?" H. W. Gossard Company, 111 N. Canal St., Chicago 6, Illinois, (free)
"How to Dress Like a Model," H. W. Gossard Co., $.10.
"Secrets of Dress and Grooming," (Better Secretary Series) Prentice-Hall, Inc., 1961, Englewood Cliffs, N. J. 17632, small charge
-- For the boys
"Good Grooming Guide," Esquire, Circulation Dept., 488 Madison Avenue, New York, New York 10022, $1
"What Every Clerk Should Know." National Association of Retail Grocers, 360 North Michigan Ave., Chicago, Illinois 60601, free
-- For both girls and boys
Guide to Good Grooming (5-862), Science Research Associates, Inc., 259 E. Erie St., Chicago, Illinois 60611, $.65 each

c. Films

- -- "How to be Well Groomed," University of Kentucky, 1 reel, $1.50, for boys and girls
- -- "A More Attractive You," Modern Talking Pictures, 1212 Avenue of the Americas, New York, New York 10036, free. Accompanying beauty and health hint booklets are available free, for girls.
- -- "The Beauty Habit," Modern Talking Pictures
- -- "Good Looks," Association Films, 324 Delaware Ave., Oakmont, Pennsylvania 15139, boys and girls, 20 min. color
- -- "Dressin' Up," Association Films, boys and girls, 13½ min., color
- -- "Lessons in Loveliness," Association Films, girls (makeup), 12½ min., color

2. <u>To understand the importance of practicing good health habits in the world of work</u>

Good health is important

a. The first step in obtaining good health is the observation of good health habits. Many people do not appreciate good health until they are in danger of losing it. If one abuses his health, his health will eventually break down. Good health can build vitality and confidence which will reflect an attractiveness that can be magnetic. Good health provides the basis for physical endurance which is necessary for a successful career in distribution.

b. Health is important in job success in the areas of job advancement, enjoyment of work, and mental well-being. The effects of poor health on job success are seen in absenteeism, chronic afflictions, job dissatisfaction, and job dismissal due to health.

Workers should maintain good physical health. A good retail person is a person who takes pride in achieving a pleasing personal appearance that has evolved from good grooming, health habits, and personality development. To maintain good physical health, one should consider:

a. Cleanliness. Many men have a reputation of not bathing often enough. "B.O." is just as bad in a man as in a woman. Men often are careless about beard growth, dirty hands and fingernails. Some smokers often emanate tobacco odor. Some persons are guilty of permitting dandruff fallout to accumulate on their clothing. Frequent shampooing of hair normally will control dandruff. (See transparency master DE 63 TM')

b. Eating habits. (Food is fuel for efficiency, energy, and endurance.) Many distributive education students, having had numerous health classes throughout their schooling, may fail to see the necessity for health education. Good health habits, especially good eating habits, are very important to persons entering the distributive field of work. Students, because of working conditions and hours of employment, have inclinations to skip meals or to eat foods (especially sweets and starches) which do not provide the required energy for endurance. (See transparency master DE 63 TM11.)

c. Medical and dental examinations. One should not wait till something is wrong before visiting a doctor or dentist. Visits should be made to a doctor at least once a year and to a dentist twice a year. (See transparency DE 63 TM12.)

d. Posture. A habit that can be developed is good posture. Unless one has physical defects, there is no reason why an individual cannot develop good posture. A poor posture is often an indication of an apathetic, indifferent, disgruntled individual. One who walks tall, stands tall, and sits tall provides a reflection of an energetic, enthusiastic individual. Shoulders back, abdomen in, and ears reaching for the ceiling will help in developing a good posture. (See transparency DE 63 TM13.)

e. Rest. At least eight hours of sleep is required for growing youth. Distributive education students are usually growing youth. Proper rest is also reflected in one's personality and appearance. Sufficient rest is required if one is to be alert and efficient at work. (See transparency master DE 63 TM14.)

Aids to good mental and neurological health

a. Leisure-time activities. Participating sports provides one a key to recreation. Other extracurricular activities (such as those obtainable through DECA) can furnish enjoyable relaxation. Every person should exercise regularly and vigorously each day. (See transparency master DE 63 TM15.)

b. Emotions and mental health. Harry W. Hepner is his book Psychology Applies to Life and Work wrote that "those who distribute goods work in the dynamic area of ideas." Hepner believes distributive personnel should look upon such work as more than a way of earning a living. A career of this nature has social values which a person should regard as important and should respect. Yet, our distributive system contains many unrelenting pressures. Conflicts abound in the world of work. One must learn to control negative emotions that might arise. It would be much better if a person could substitute positive emotions before the tendency to submit to negative emotions. Individuals should plan a campaign to control negative emotions. The first step is identifying the emotions. The next step is determining when, how, and why (the circumstances surrounding) the emotions occur. The third step is to determine the actions required to control these destructive emotions. The fourth step is the application of positive measures required. The best defense against negative emotions is to develop enthusiasm for the work to be done. Anyone, who is confident, has faith in and possesses optimism about the job to be done, and strives to accomplish his beliefs, is a better mentally adjusted person. (See transparency master DE 63 TM16.)

Summary

To succeed in the world of distribution, one should develop good habits that will lead to advancements. Many of our faults can be corrected if we will take the time required to identify them, determine remedial actions, and apply positive measures to ensure desired changes. Often, mental alertness and the necessary desires for corrective actions will provide improvements that will develop greater job happiness and success.

Suggested Teaching-Learning Activities

a. Use talks by the health teacher, school nurse, home economics teacher, physical education teacher, or other qualified people.

b. Discuss the importance of breakfast, well-balanced meals, and dangers in unregulated diets and food fads. Point out the wisdom of regular physical, dental, and eye examinations.

c. Have students observe the effects of good and poor eating habits on themselves or others.

d. Explain health aspects of well-fitted, nonrestrictive clothing and shoes.

e. Explain the necessity of sufficient sleep to avoid job fatigue.

f. Evaluate recreation as counter-active to daily occupation; for example, active versus spectator sports; hobbies; cultural and intellectual activities.

g. Identify recreations not recommended, such as those similar to daily work, dissipating activities, and those which interfere with daily work.

h. Discuss the problem of submerging personal problems while working.

i. Have each student record his or her entire food intake for two days and evaluate his diet. (This could also be done for rest and exercise.)

j. Have the students list various places in the community where there are opportunities for regular exercise.

Instructional Materials

a. Teaching aids

- -- Calorie charts (Available in health books and cookbooks.)
- -- Exercise charts (Charm books and health books offer appropriate illustrations for girls. Consult with the physical education teacher for appropriate illustrations for boys.)
- -- Posture charts (Sources mentioned above, plus illustrations in the typewriting books and typewriting posture posters.)

b. Films

- -- "Improving Your Posture," University of Kentucky, 1 reel, $1.50, for boys and girls.

c. Booklets and leaflets for the students

-- For boys and girls (Available from Science Research Associates, Inc. for $.65 each.)
"Your Behavior Problems" (5-800)
"You and Your Health" (5-517)
"Growing Up Emotionally" (5-866)
"Enjoying Your Leisure Time" (5-515)

3. To exercise the etiquette appropriate for distributive employment

Many young people are especially weak in knowing specifically **what etiquette** is appropriate for distributive employment. Others **are indifferent** to or lax in using appropriate etiquette. Employees **who constantly** are before the public must be on guard at all times **to be sure** their actions will generate customer goodwill. Discovering **what is proper**, and then using mental alertness in applying appropriate **etiquette**, is of great importance for job success. Distributive **employees** should become familiar with several important areas of etiquette.

General behavior

a. A definition for behavior is "the manner of conducting oneself." Thus, behavior is the way we live our daily life. This daily living involves many activities, including our actions and our associations with others.

b. The manner in which we conduct ourselves daily stamps us with either good, poor, or bad behavior.

c. Some people appear to have been born with proper behavior patterns. Actually, behavior patterns are acquired from things we have observed and learned. Behavior patterns can be changed if one wishes them changed. General behavior has many aspects far too numerous to list. However, some general behavior patterns important in distribution are:

-- Common courtesies
-- Consideration of others, and their property
-- Degree of sincerity--compliment frequently and honestly
-- Tactfulness--consideration of others and their feelings
-- Cheerfulness--reflects confidence
-- Willingness to assume more than your share
-- Agreeableness--not demanding your way all the time
-- Avoiding faultfinding and discussion of others
-- Generosity--not so much with money but with your time, praise, thoughtfulness, kindness, smiles, understanding, empathy, appreciation, courtesy, work, and effort
-- Crudities of speech
(See transparency masters DE 63 TM17 and DE 63 TM18)

d. Alleen R. Russon in Business Behavior (pp. 31 and 32) states some excellent principles underlying business behavior.

Acceptable business and social customs

a. It has been stated that manners are a part of one's character. Manners evolve from customs.

b. One definition for custom is the usage or practice common to many or to a particular place or class.

c. Certain usages or practices have developed within our business and social worlds. Persons who do not conform to these are considered ill-mannered.

d. Some usages and practices which have evolved concern:

-- Formality in the business setting
-- Acceptable business ethics, behavior, and customs
-- Procedures concerning gifts and collections
-- Principles regarding the degree of separation of business life from the social life
-- Responsibility involving family life
-- Customs concerning table etiquette, expenses, and tipping
-- Telephone use

Maintaining harmony and morale

a. The "U" in you will determine how well your associations with others are accepted. A person who continues to improve his human relations skills should discover friendlier relationships with his fellow employees, as well as his superiors.

b. Assuming a fair share of the workload, being friendly with all persons regardless of their positions, being cheerful and maintaining a smile, and keeping a right frame of mind are some things which will assist a person in making necessary adjustments on his job.

c. Things to be aware of include:

   - -- Non-acceptance of group standards. Self-control is often required to accept rules and regulations that have been established. A person should not allow himself to seethe over trivial things.
   - -- Friction. Avoid feuds and cliques like you would a plague. Do not become involved in personal affairs and romances. Perform a fair share of the workload. Accept reprimands with thanks.
   - -- Conflicts in personalities. Accept the individualities of your fellow employees and supervisors. Keep your balance and do not react to facades that may not represent the real situation.
   - -- Difficulties of work. New employees usually are not expected to be perfect. Accept your errors and mistakes with grace. Avoid gossip, especially with a "tattletale." (See transparency master DE 63 TM19)

Summary

A constant awareness and a desire to succeed will greatly assist the new employee in adjusting to the working conditions he encounters. It may be well for the new employee to be somewhat impersonal and detached until he has become more familiar with the firm and his fellow employees.

Suggested Teaching-Learning Activities

a. Explain briefly differences that men and women may expect in business etiquette as compared to social etiquette.

b. Teach proper forms of business greetings, introductions, and common business courtesies.

   - -- Discuss several ways to begin a conversation with a new employee or a new acquaintance.
   - -- Discuss ways to help one remember names.
   - -- Have the students dramatize at least five types of introductions common to the business situations.

c. Discuss how a business employee should handle situations involving profanity, slang, and obscenities.

   - -- Have each student list ten "trite" expressions which he uses and for each write a proper substitute.

d. Discuss when not to use first names and nicknames, and the dangers of a social club atmosphere in business.

  -- Point out dangers of employees losing dignity at general holiday parties or special celebrations for co-workers.
  -- Discuss good or bad points in forming friendships with co-workers and in having business romances.

e. Distinguish between collections for organizations and co-workers (the times and places of each); distinguish between receiving personal gifts from co-workers or employers, and those from customers or salesmen.

f. Explain harm done by agitators and gossip and how irritability can be caused by fatigue, inequitable work distribution, salaries, and promotion.

  -- Explain techniques for dealing with difficult co-workers, moodiness, and temperaments.
  -- Discuss the necessity of working under pressure, meeting deadlines, building esprit de corps, and teamwork.
  -- Have the students describe a human-relations problem which exists among those they know and tell what might be done to correct the situation.
  -- Have each student choose a person with whom he has a "strained" relationship and attempt to improve this relationship.
  -- Have each student make a list of all the negative statements heard during a single day. Have the class discuss positive substitutes.

g. Mention the necessity for everyone to maintain an acceptable business appearance--dusting, supplies, cleaning equipment.

"How to Solve Your Problems" (5-561)
"Understanding Yourself" (5-152)
"Growing Up Socially" (5-510)
"Where Are Your Manners" (5-567)

4. To understand the importance of practicing good ethics on the job

Long-term job success, harmony, and good morals in any firm depend on all employees following the basic principles of good moral philosophy. Employees have as much responsibility as the owners of a firm to ensure that the money invested earns a profit. The ultimate goals of all should be to safeguard the success of the firm. Employees and employers should develop appreciation for the other's interests and problems. This appreciation must also be expanded to the firm's customers. The customer goodwill and satisfaction created will be the determining factor whether employment opportunities will continue to exist. Thus each employee must develop a set of moral principles and values which will fit harmoniously with the goals and objectives of the firm.

Good ethics in distributive businesses

a. Man, possessing knowledge, skills, and characteristics required for the operation of a firm, is also a religious, social, political, economic, and psychological creature.

Thus man is not a machine. He is a human and cannot eliminate other phases of his life from his employment situation. Distribution, being people-oriented, must involve itself with this qualitative, changing, and abstract human factor. There must be a mutual concern between employers and employees for the welfare of the other.

b. If mutual concern is to exist, each employee must develop good work habits. Some work habits that should be developed involve time, neatness, efficiency, integrity, judgment, loyalty, morality, honesty, responsiblity, dependability, trustworthiness, and adequate consideration for the rights of others. Many persons need to learn the dignity of a good day's work. Some things which affect good work habits are:

-- Absenteeism
-- Punctuality
-- Stalling or loafing on the job
-- Using company time for personal matters
-- Borrowing company equipment, supplies, or money
(See transparency master DE 63 TM20)

c. In addition to being loyal to one's employer, an employee must also be loyal to his fellow-employees. An employee should assume his fair share of the workload. He should not irritate his co-workers with negative habits. An employee should not blame or criticize his co-workers for mistakes or faults. Respect for the private lives of others should be observed at all times. Regardless of one's position, abilities, and knowledge, an employer should follow established procedures and respect the lines of authority. Employees should develop suitable beliefs concerning:

-- Loyalty to employers
-- Loyalty to co-workers
-- Actions to be undertaken where conflicting loyalty situations arise (working for several supervisors and decisions regarding resignations)

Summary

Teamwork is very important in the distributive world. When a person is not available to perform his share of the workload, other employees must assume responsibility for performing the functions required to service customers. Some workers, even though present, exert negative influences on their fellow-workers. Jealous, resentful, or tricky persons who are not ashamed of taking advantage of others can do tremendous damage to the future of any business. New employees, just beginning a career in distributive businesses, must remember that it is their responsibility to get into step with the basic principles of good moral philosophy which are necessary for a firm to be successful.

Suggested Teaching-Learning Activities

a. Teach the economic principles of employment: (1) The company has invested time and money in equipment, goods and in training employees to give service in return for a fair profit. (2) The employee has also invested his time and money in the company.

b. Use the moral precept that stealing time is similar to stealing money--a form of dishonesty or "biting the hand that feeds."

c. Contrast absences for sickness versus those for personal matters.

d. Show the unfairness of tardiness; unnecessarily prolonged lunch hours, coffee breaks, and time in restrooms; stalling or loafing.

e. Teach the unfairness of using company time for such personal matters as telephone calls, visitors, and personal work; and of using company supplies, equipment, or money for personal matters.

f. Point out wisdom of keeping information confidential, adhering to firm policies, and established lines of authority.

g. Show that loyalty includes avoiding outside activities which interferes with work; that it also includes obligation to work to capacity, with regard to quality and quantity of work.

h. Point out that loyalty to co-workers demands avoiding gossip and "under-cutting."

i. Point out that giving adequate notice to employer, training replacement, and speaking well of previous employer when leaving a job are considered ethical in the business world.

j. Questions for student discussion:

- -- Could you be loyal to an employer whose business practices you have learned are dishonest?
- -- Give some examples of how you can show loyalty on the job.
- -- What are some means of saving supplies and equipment?

k. Class discussion of case studies involving punctuality and use of company supplies. See "Case Studies" at end of unit.

5. To develop work habits and attitudes that make work and relations with others easier

A combination of many personal traits and attitudes is required to obtain success in life. Different persons have conflicting ideas about the meanings and the values of these traits and attitudes. These conflicting ideas are the result of many factors. Some of these factors are environmental influences (home and community in which one is raised, schools one has attended, etc.), level of education, religious background, association influences, and the like. There is no definite agreement about the depth and scope any given trait or attitude should encompass. Each person must arrive at his own understandings of the meaning and value of these traits and attitudes. (See transparency master DE 63 TM21.) Yet, a person's understandings and values must conform to those of the majority of our society or one will be looked upon as being a nonconformist. One should determine acceptable meanings for the terms used to designate characteristics. One should then compare his own understandings and values with those considered acceptable by society. From such evaluations, one should determine the place of these characteristics in his own life. Some of the many characteristics which have tremendous influence on a person's life are:

a. Characteristics which make work easier and involve the best method for accomplishing a job

accuracy
adaptability
alertness
awareness
common sense
dependability
discretion
efficiency
emotional stability
endurance
following directions
foresight
good habits
honesty
humor
industriousness
ingenuity
intelligence
interest
judgment
memory
organization
patience
persistence
pride in work
punctuality
resourcefulness
responsibility
thoroughness
versatility

(See transparency master DE 63 TM22)

b. Characteristics which make relations with others easier

acceptance
appreciation
cheerfulness
consideration
cooperation
courtesy
criticism
empathy
friendliness
generosity
loyalty
manners
poise
recognition
respect
refinement
sincerity
sympathy
tact
thoughtfulness
tolerance
understanding
unselfishness
voice tone
willingness

(See transparency master DE 63 TM23)

c. Characteristics which make job advancement easier

ambition
competitive spirit
imagination
initiative
inventiveness
public-relations ability
public-speaking ability
reputation
self-improvement

(See transparency master DE 63 TM24)

Summary

Traits and attitudes are not easy to explain or understand. Some traits and attitudes are more positive than others. Some may even be negative. The way we think of traits and attitudes is important. However, our beliefs can be changed. If we possess traits and attitudes that do not measure up to acceptable patterns, we should re-examine our beliefs to determine whether we should change. If we are unwilling to change, we should be willing to take the consequences that may result from these beliefs and attitudes.

Suggested Teaching-Learning Activities

a. Illustrate or define the above terms or have pupils look up their meanings.

b. Give an illustration of how each term fits into the business picture--its effect on working relations with others or advancement on the job.

c. Dramatize various conversations illustrating a lack of tact and failure in other traits. Suggest ways of improvement.

d. Have each student tactfully refuse an invitation to lunch with his employer when this is against his better judgment.

e. Have each student talk with an experienced worker in his field of job interest and list the qualities and the personal traits that would be helpful for the job.

f. Invite a local businessman to discuss the importance of personality development and to tell what business is looking for in people.

g. Ask a former student to discuss personality traits that are necessary for his position.

h. Have each student prepare for class discussion a list of the personality traits and behavior patterns for a job in which he is interested.

i. Have each student choose his weakest personality trait and for one week make a daily attempt to improve it. These efforts may be described in diary form as a written assignment.

j. Questions for discussion:

-- What attitude should a beginning worker take when his work is criticized?
-- What does teamwork mean in business?
-- Does attitude count before you go to work? In school? At home?
-- Can a student whose attitude in school is uncooperative suddenly change after he goes to work?
-- What are some things you should do in the morning before your regular duties?
-- If quitting time comes and you have not finished a job which will take 10 to 20 minutes longer, do you put it off or do you finish it before leaving.

k. Have each student meet, through his own efforts, five men and five women during a week and report to the class.

l. Discuss programs of self-improvement available to businessmen such as Dale Carnegie courses, Toastmasters' Club, etc.

m. Cause the student to become familiar with written materials that outline work responsibilities and procedures.

Instructional Materials

a. Case studies (attached at end of this unit)

b. Posters

- -- "Personality, UGH!" (Lemon Lizzie - Smile!--Gossipy Gussie, Keep Confidential Information Confidential--Messy Mary--Borrowing Bob, Draw Your Own Supplies--Noisy Nellie--Bossy Bess) $1 for set of 6, Poster Visual Aids, Dept. B-3, 58 Union Street, Milford, New Hampshire

c. Films

- -- "Mr. Finley's Feelings," Association Films, 10 min., color. Deals with the problem of mental stresses in daily living and discusses ways of understanding and handling tensions

d. Pamphlets and leaflets for students (From Science Research Associates, Inc. at $.65 each)

- -- "Guide to Good Leadership" (5-562
- -- "Getting Along with Others" (5-158)
- -- "Your Personality and Your Job" (5-1178)
- -- "How to Increase Your Self-Confidence" (5-833)

Simulated and Continued Practice Activities

a. Have students attend class in business attire at least once a month.

b. Have a standard system regarding absences and makeup work. Place upon the student the responsibility for reporting reasons for absences and for making arrangements for makeup work. Each student could fill out "an absence from work form," for example, as standard procedure.

c. Have each student keep a personal development notebook to be evaluated monthly.

Title: My Outline for Self-Improvement

Contents

1. Personal Appearance and Behavior Appropriate in the Business World*

    a. Grooming and dress
    b. Health habits
    c. Etiquette
    d. Ethics
    e. Work habits and attitudes

2. My Program for Self-Improvement**

    Evaluate yourself in each of the following areas. State phases which you need to improve and develop the plan you intend to follow.

    a. Personal appearance
    b. Wardrobe for school and work
    c. Health habits
    d. Etiquette and ethics
    e. Work habits and attitudes

3. Monthly Evaluation: What I Have Done Toward Self-Improvement This Month.***

    This should be a short description of the accomplishments the student has made in the program he has outlined. The teacher may ask that a standard rating sheet be prepared for evaluating all areas of personal development to accompany the student's special emphasis report.

* A short composition summarizing learnings may be written at the end of the unit and used as a part of the unit evaluation.

** May be outlined daily as each learning is secured. Leave space at end of each section for teacher comments.

*** Submitted the last day of each month without reminder by the teacher. Leave space at end of each section for teacher comments.

d. A smile and a friendly "Good morning" or "Good afternoon" should be a daily greeting between students and teacher.

e. Assignements in other units of study should require accuracy, following directions, use of common sense, teamwork, and imagination. Good work habits should be practiced in all phases of the classroom work.

f. Have students make a habit of writing instructions which are given or are to be given orally.

Evaluating the Unit

a. The student's self-rating by rating sheets and his program for self-improvement as outlined in his personal development notebook may be used daily and at the end of the unit to summarize his work.

b. Tests or ratings in the following areas may be used:

-- Personality traits
-- Emotional traits
-- Grooming
-- Business and social customs
-- Health

c. An objective test on basic understandings should be given.

d. Subjective evaluation by students and teacher of changes in behavior.

e. The Instructional Materials Laboratory, Division of Vocational Education, College of Education, University of Kentucky would appreciate suggestions by teachers for improving the unit.

DE 63 (3/67)

CASE STUDIES

1.

Judy, who had finished high school in June, was working for an advertising company. As she kept late hours at night, it was difficult for her to arrive at work on time. Even when she was punctual, she would take several minutes to freshen up before going to her desk.

She had been told by her older brother who owned a business that it was important to report at the proper time to begin work since tardiness is frowned upon by most supervisors. She would always reply, "Mr. Jones never says anything when I come in late."

Before long Mr. Jones called her in his office to reprimand her for being late. He said that he wanted her to be at her desk promptly at 9 a.m. and that she would have to be dismissed if she continued being late.

1. Should Judy have offered an alibi for being tardy?
2. Should she offer to make up the time she has lost?
3. What precautions might Judy make to assure being on time in the future?
4. How important it is to be on time anyway?

2.

Mary Jane and Sue Ellen are co-workers in the credit office of the ABC Company. On numerous occasions when Mary Jane had needed stamps for her personal correspondence, she has taken them from the roll of stamps in the petty cash box. Several times lately Mr. Henry, the credit manager, needed stamps and became suspicious because the supply was noticeably low. He knew these two girls were the only persons who had access to the box. He called these young women to his office and pointed out it is against the rules to use office stamps for personal use. He also warned them that if this practice continued, he would find it necessary to dismiss them.

Mary Jane continues to use the stamps since she does not care to be dismissed. She feels that a dismissal will not affect her career because she plans to move from the community in a few weeks.

Sue Ellen is alarmed because she needs to work and is interested in achieving success on her first job.

1. If you were Sue Ellen, would you say anything to Mr. Henry when you and Mary Jane were called to the office? If so, what would you say? If not, why?
2. If your answer is "no," would you say anything to Mr. Henry later?
3. Would you discuss the matter with Mary Jane in an attempt to influence her to stop the practice? If your answer is "yes," what argument or arguments would you use?

Written by Miss Margaret Moberly of Eastern Kentucky State University and Mrs. Maxine Shanks of Broward County, Florida Community College.

PERSONAL DEVELOPMENT AND WORK HABITS

Introduction

The Need for Training

That boys need training in personal development is pointed out by young men in business, employers, and teacher. Young men desiring promotion often lack the urge for more "polish." Surveys of executive opinion report that employers want sociably acceptable people. Employers find that a student is not of much use in the business world if he has A's and B's but is "uncouth in manners, vulgar in speech and actions, pitiful in choice of colors and style for his clothes, and appalling in his ignorance of fine arts and of world events."

Difficulties Encountered

The material man and the social man are difficult to match. Almost any young man who resents the effort necessary for self-improvement may point to people who have succeeded in business in spite of personality. Since this is a minority occurrence, any young man with this attitude should review successful businessmen in his community to discover the real truth of the matter.

Skill in handling people and executive ability do not come through reading books but through daily practice in dealing with janitors, sales clerks, teachers, fellow employees, friends, and members of the family. Role playing and case studies can be used to simulate employer-employee and employee-employee interaction so that necessary experience can be obtained.

Grooming and Dress

Many young men miss their opportunities because of the following:[1]

a. Improper wardrobe
b. Poor grooming (nicotine-stained hands, dirty nails, grimy collar, spotted tie)
c. Offensive odors--body and oral
d. Unshined shoes
e. Run down heels
f. Untidy socks
g. Extreme hair styles, greasy hair dressing, or the need of a haircut
h. "Five o'clock shadow"
i. Dandruff flakes on shoulders
j. Unpressed pants

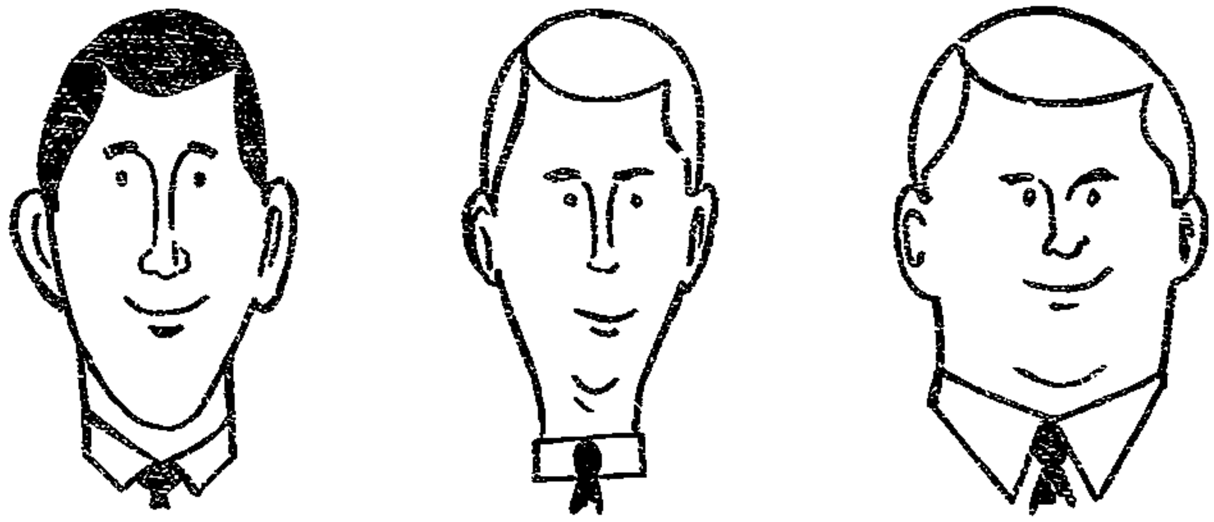
Clothing Selection

Suits, shirts, socks, ties, coats, handkerchiefs, shoes, and hats for men are well standardized. Masculine colors are subdued, but a touch of color in a tie, shirt, or handkerchief can be quite effective. To accomplish that "young executive look," and lift his personality as well, a young man needs only to make the proper choice of clothes. He should aim for harmony of ensemble. His tie, hat, shirt, and suit should have a color relation to one another. Bright, gaudy colors are not acceptable for business wear. The pamphlet "What Every Woman Should Know About Men's Fashions," and the chart "Appearance Counts" from The Van Heusen Company (attached as part of this unit) should be helpful. The color chart suggested by Curlee Clothes should prove a helpful guide in matching colors.

Choosing Suits. The choice of suit material depends upon the season. The fabric should be fade-proof; and the finish should give style, yet be such that cleaning and pressing will not be a problem. One-hundred percent wool is best for holding crease and for good wearing qualities. Darker suits are easier to combine with shirts and ties and may be used for evening dress when combined with white shirt, dark tie, black hose, and black shoes. A suit with a marked pattern is difficult to combine with a figured shirt. White shirts can usually be worn only one day to work. To be avoided are mix-match combinations with trousers and coats of different material and the high-cut trousers that seem to belt under the armpits.

Men who are underweight should wear lighter colors and loose-fitting jackets. Those who are overweight should favor dark, solid colors and stress vertical stripes. They should avoid suits of plaid or wide-striped material. Large-framed men should wear rough, heavy materials. Small-framed men should choose closely woven, smooth fabrics. Unbroken lines are best for those who are short.

Choosing Shirts. White shirts are always acceptable in business. However, styles in shirt colors vary; and soft pastels and patterned shirts are acceptable in some situations. Cotton material serves best for business hours and is the best bet for sending to the laundry. Collar styles, frequently taken for granted, are an important consideration. The illustration below will help in making a suitable choice.[2]



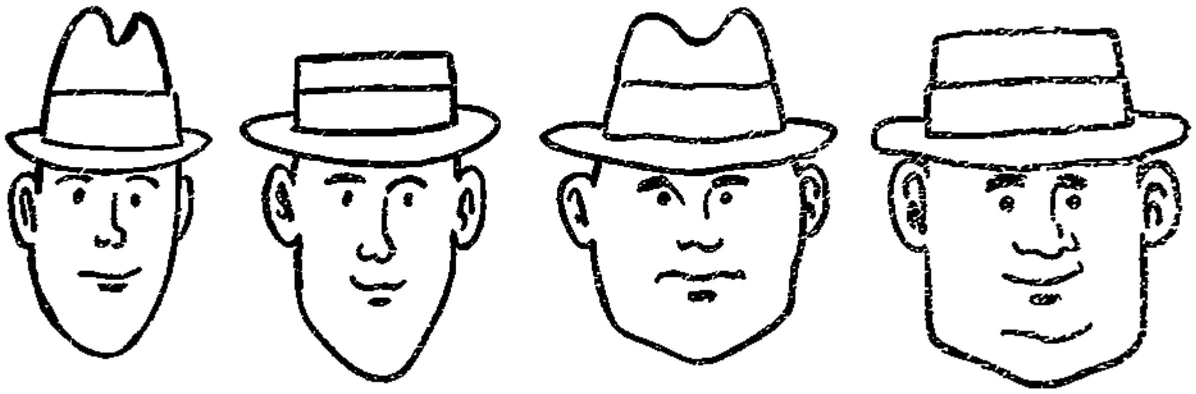
Choosing Ties. The tie should harmonize with the shirt and suit. Solid-color, knit ties or reps, challis, and foulards in neat stripes, small prints, or solid colors are always fashionable. Caution should be observed in attempting to match figured ties and patterned shirts.

Both shirts and ties should emphasize each man's good points in coloring. A pallid complexion requires shirts and ties that give color to the face, while a florid-colored complexion requires shirts and ties that subdue the face coloring.

Choosing Shoes. Shoes should be selected for comfort and wearing qualities. Leather plain toe, wing tip, or moccasin-stitched, lace types are best for business. Loafers and sport shoes are unacceptable.

Choosing Socks. These should harmonize with tie and suit. White should not be worn for business.

Choosing Hats. Hats are not as important as they once were. Young men in business, however, are better dressed when they wear appropriate head gear. The hat chosen should be the sort that a gentleman would wear and should be becoming to the shape of face.[3]



Black is recommended for heavy duty. Brown and gray are also appropriate.

Choosing Coats. The black Chesterfield (single or double breasted) is a good choice, and it can be worn no matter how formal the occasion. Other coats of simple lines and unobtrusive patterns, such as a black-and-gray herringbone coat, are also in good taste. Wearing a dingy, light-colored trench coat or rain coat in good and bad weather gives a business employee a slovenly look.

Choosing Gloves. Gray, black, or natural pigskin is appropriate for almost any business costume.

General Guidelines

The entire wardrobe should be selected according to working conditions. The lead of the company's executives may be followed. Archer suggests the following list of guiding questions for making wise purchases:[4]

a. Is it something I really need, or just a novelty that has caught my eye?
b. Does this style suit me?
c. Does it fit?

d. Is the fabric of good quality and easily cared for?
e. Is it well made?
f. Is it comfortable?
g. Does the color look well on me?
h. Will it combine with other clothing I already own?
i. Does the price represent a "good buy"?
j. Can I afford it?

Some things to avoid are:

a. The sweater-sport shoes combination on the job
b. Fads in the color and cut of clothing
c. Extremes in the selection of shoes
d. Loud sport-shirts and extreme clothing designs

Clothing Care

To look completely well dressed, everything worn should be clean and pressed. Clean gloves, a well-brushed hat, and a tie without spots are important details of the over-all, good-looking picture. Socks and handkerchiefs should be kept laundered, and underclothing should be changed each day.

Suits should be brushed and hung up after each wearing. All the pockets should be emptied, and the coat should be buttoned. If care is taken in hanging the trousers properly, the wrinkles will "hang out," the vertical crease will remain sharp, and the horizontal crease (usually caused by throwing the trousers carelessly over a thin wire hanger) will not form. All stains and spots should be removed before pressing.

A clean shirt should be worn each day. Frayed and soiled ends on collars and cuffs should be avoided. Nothing spoils the effect of a well pressed suit like a soiled shirt and faded, rolled down socks. Ties should be kept clean and free from wrinkles. They should be discarded when they become unsightly.

Since the shape of a hat gives it its style, it should be kept well blocked; and care should be taken to preserve its shape. For this reason, men should be careful to remove soft felt hats by lifting them from the top.

A weekly wardrobe inspection should be made for minor repair jobs--loose buttons, torn pockets, frayed cuffs, open seams or hems. Clothes should be pressed frequently. A man should learn to sew on buttons if there is no one to do it for him.

Wearing with Pride

A young businessman who wishes to represent himself and his company well should keep his collar buttoned and his tie in place. He should wear his suit coat at work.

Jewelry is out of place on a man. Buttons and service club pins may be effective. A wrist watch and a tie clasp are businesslike.

Health, Cleanliness and Personal Appearance

Health

Practicing good health habits is important to job success. The young man who feels well finds it easier to get along with his co-workers and to keep his work up to par. Because of the sedentary nature of distributive work, he will find that he needs to eat less fat, bread, potatoes, and rich desserts than those who perform heavy physical labor. He will also find himself in a better "frame of mind" for work if some of his recreational activities are of a physically active nature.

Cleanliness

A bath and the use of deodorant daily are a must. Sometimes, however, the problem may not be body cleanliness but the habit of wearing a shirt more than one day. Nails should be manicured at least once a week. Hands should be washed after using aftershave to prevent its being left on the hands of persons greeted during the day. The handkerchief and pocket comb carried should be clean.

Personal Appearance

Young men will find it wise to select a conservative hair style. A short, fairly close masculine haircut will give a smart, businesslike appearance. It should be trimmed regularly so that the neck will not get shaggy and an appearance of neatness will be given. Regular shampooing is an order. An effort should be made to select the hair style best suited to individual traits. For example, a crew cut is suitable for a boy whose hair is of coarse texture; for a round-shaped head, the hair should be of medium length at sides and top; fine-textured hair should be worn in a pompadour, relatively short. To be avoided are sideburns and extreme crew cuts.

To maintain an air of efficiency, a young men should avoid eating, chewing gum, or smoking on the job. He should not comb his hair or take care of other personal grooming functions in public.

He should shave at least once daily; twice, if going out in the evening. Some men keep an electric shaver in the office for just such occasions.

Checklist for Good Grooming

Bell provides the following checklist for men in her book Business Behavior.[5]

A man is well groomed when:

His body and teeth are clean and free from odors. He uses mouth wash and deodorants.
His skin is clear, not oily, and he is freshly shaven.
His hands have a cared-for look. His fingers are free of nicotine stain; the nails are clean and unchewed.
His hair is neatly trimmed, clean, and combed, not oily and sticky.
His underwear is clean.
His shoes are shined, and the heels are not run down.
His socks are clean and not allowed to wrinkle around his ankles.
His shirt is fresh daily and worn inside his trousers.
His suit is pressed; the trousers are well creased.
No spots stain his clothing.
His tie harmonizes with his shirt and suit.
His clothing fits the occasion and is odorless.
He wears a coat.

Etiquette[6]

The idea is to give a good impression for the company.

Making Introductions

1. Introducing one man to another.
   a. Say Mr. Joseph, Mr. Manning; Mr. Joseph, this is Mr. Manning; Mr. Joseph, this is my assistant, Mr. Manning (or John Manning).
   b. Avoid "Meet" Mr. Manning; "Shake hands with" Mr. __________; or "I want to make you acquainted with ________________."
2. Introducing an employee (man or woman) to a superior.
   a. Give the superior's name first.
3. Introducing a new employee to co-workers.
   a. Give first name and last name or personal title and last name.
   b. Avoid first names.

Acknowledging Introductions

1. The right response is "How do you do," ______________
2. Always stand when introduced.

3. Always shake hands with a man. Shake hands with a woman only if she offers her hand first. Make the handshake brief but firm. Don't pump the arm up and down.

Receiving a Caller

a. Do not keep him waiting whether he has an appointment or not.

b. Do not keep him standing or let him sit while you talk at length on the telephone, carry on a trivial conversation with your co-workers, doodle absent-mindedly, or shuffle through papers.

c. Do see him as promptly as possible if he has an appointment.

d. Do have the receptionist or secretary advise him when delay is unavoidable. Say, "I'm sorry to have kept you waiting," when you do see him.

e. Do stand when he enters your office. It is customary to shake hands. You offer your hand first. Ask him to be seated, and give him complete attention.

f. Do end the interview courteously if he stays too long. Stand when he leaves. Shaking hands at parting is optional, but customary.

Keeping an Appointment

a. It's wrong to arrive late. That means you have to start with an apology.

b. Do not:

- -- Joke with the receptionist or engage her in unnecessary conversation.
- -- Pace the floor, tap the table, chew gum, or whistle while you wait.
- -- Remain seated if a secretary or the man you are calling on appears.

c. Do:

- -- Be on time or a few minutes early.
- -- Have your briefcase in good order.
- -- Take off your hat as you approach the receptionist, identify yourself, tell her whom you want to see. Thank her, and follow her instructions.
- -- Keep your hat off while waiting; remove your overcoat, hang it on a rack or fold and place on your lap or a chair. Smoking is optional, only if an ash tray is available.
- -- Stand if a secretary or the person whom you are waiting to see approaches.

d. When you go into his office, introduce yourself and wait for him to shake hands. Stand until he tells you to sit, and smoke only if he suggests it. Be alert to signs that he wishes to end the interview.

e. Thank the receptionist on your way out.

Going to Lunch

a. When you give the invitation

- -- The right way is to set the date, place, and time by suggesting possible days, possible places, and possible times. Let your guest make the choice.
- -- Extend the invitation by: "How about having lunch with me?" "Could you have lunch with me next week?" It's wrong to say: "Let's have lunch together." This suggests that each person pay his own check.
- -- Make a reservation, if necessary. It's not proper to take a guest to a restaurant where you'll have to stand in line. If he is late, don't go to the table without him.

b. When you take care of the check

- -- Do not interrupt a conversation to study the amount audibly, check or comment on it, or refer to your expense account.
- -- Never permit a guest to pay all or any part of the check.
- -- Don't leave the tip in nickels and dimes -- never include pennies. Leave the tip in quarters and up, or add it to the bill.
- -- Glance at the check as casually and briefly as possible.
- -- Have money or credit card handy.

c. When you are the guest

- -- After you accept an invitation, choose a day your host suggests, if possible. Be specific as to time; arrive promptly.
- -- Ignore the check.
- -- Watch for signs your host has to get back to the office. Make the first move to leave.
- -- Don't feel obligated to invite your host to a return luncheon. This is not necessary or expected.

*STUDY GUIDES, *TEXTBOOKS, *TRADE AND INDUSTRIAL EDUCATION, *CARPENTERS, RAFTERS, HIGH SCHOOLS, *INDIVIDUAL INSTRUCTION, TESTS, Framing Square,

This study guide-textbook was developed to direct the individual study of the vocational high school student in a 1-year course of related technical instruction in carpentry. It explains, by means of illustrations and detailed instructions, the various markings on the framing square and the purposes for which it is used by the craftsman in the course of his daily work. The material was prepared by a vocational-technical high school department head and tested in classroom use. The units are (1) Description, Principles, Terminology, (2) Principles and Practices of Rafter Layout, (3) The Equal-Pitch Gable Roof, (4) The Equal-Pitch Hip Roof, (5) The Equal-Pitch Intersecting Roof, (6) Other Uses of the Framing Square, and (7) Summary of Roof Information. Each unit contains lesson assignment sheets with the specific lesson objective, the related information, and assignments. A test is provided at the end of each unit. The teacher should have a science and carpentry background. This document is available for $[illegible] from Vocational-Technical Curriculum Laboratory, Rutgers University, 10 Seminary Place, New Brunswick, N.J. 08903. (HC)

PREFACE

To the novice or uninitiated, a framing square is an inert piece of steel to be used for making a square cut. The markings are of little significance and the maze of figures is unfathomable.

To know the framing square is to trust it. In the hands of a skilled craftsman it becomes a living thing, providing the guide or direction for lines, angles, dimensions, and shapes. To know its secrets and its intricacies is to be able to lay out and control the course of most types of construction. As the transit is to the surveyor, so is the framing square to the craftsman - an instrument of accuracy and excellence. Adequacy and skill in its use separates those who are confident from those who are hesitant, the full journeyman from the apprentice, the master craftsman from the "hammer and saw" carpenter.

There is a feeling among carpenters and apprentices that one must have a knowledge of higher mathematics in order to be a good roof framer. This is simply not true. Despite its numerous scales and figures, there is nothing complicated about it.

This book tells the carpenter and apprentice "How to do it." It explains, by means of illustrations and detailed instructions, the various markings on the square, and the purposes for which it is used by the craftsman in the course of his daily work.

It is my sincere hope that this book will be a valuable aid to the young carpenter who is on his way to becoming a skilled craftsman.

James Giuliano

UNIT VII - SUMMARY OF ROOF INFORMATION

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

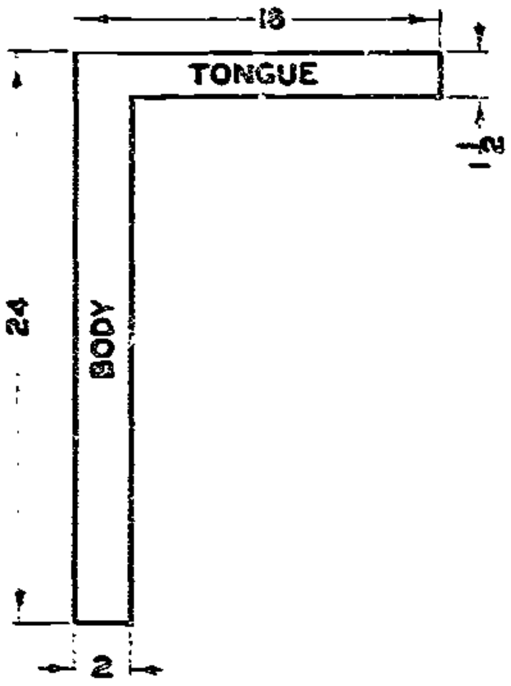
Description of the Framing Square Lesson 1

OBJECTIVE: To become familiar with the parts of the framing square.

INFORMATION:

Modern framing squares are made of steel in various finishes, such as polished blue, copper finished, aluminum, and stainless steel. These squares are marked with various scales and tables, such as rafter and framing tables, Essex board-measure table, octagon scale, and brace tables.

The framing square has many uses in measuring and spacing joists, studs, and rafters. The square is also used as a measuring device for determining the lengths and cuts of common, hip, valley, and jack rafters, and as a layout tool for stair building. The framing square in common use today is the Stanley R100, which is the one that this book is based upon.



THE FRAMING SQUARE

FIG. 1

The parts of the framing square are defined as follows:

Body -- The body is the longer and wider part and it is 24 inches long and 2 inches wide.

Tongue -- The tongue is the shorter and narrow part. It is 16 inches long and $1\frac{1}{2}$ inches wide.

Heel -- The outside edge where the body and tongue meet is called the heel.

Face -- The face of the square is the side on which the name "Stanley" is stamped.

Back -- The back is the side opposite the face.

ASSIGNMENT:

Study this lesson and be able to answer any questions the instructor may ask.

The Scales on the Framing Square — Lesson 2

OBJECTIVE: To become familiar with the scales on the inner and outer edge of the framing square.

INFORMATION:

The scales are the divisions found on the outer and inner edges of the square, marked in inches and fractions of an inch.

The Stanley square has the following scales and graduations:

1. Face of body -- outside edge: inches and sixteenths
   Face of body -- inside edge: inches and eighths

2. Face of tongue--outside edge: inches and sixteenths
   Face of tongue--inside edge: inches and eighths

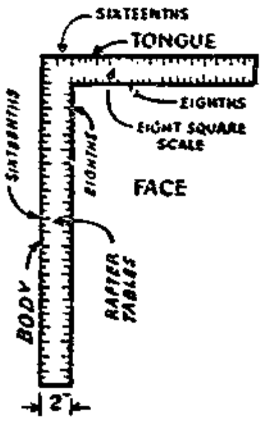


FIG. 2

3. Back of body -- outside edge: inches and twelfths
   Back of body -- inside edge: inches and sixteenths

4. Back of tongue--outside edge: inches and twelfths
   Back of tongue--inside edge: inches and tenths

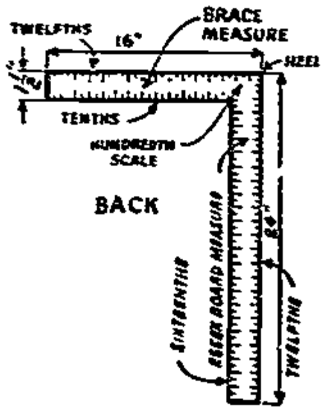

FIG. 3

5. Hundredth scale -- this scale is located on the back of the tongue, in the corner of the square. The hundredth scale is one inch divided into one hundred parts. The longer lines indicate 25 hundredths and the next shorter lines indicate 5 hundredths. Below the hundredths scale is one inch graduated in sixteenths, so the conversion from hundredths to sixteenths can be made at a glance without the need of dividers. This is a convenience when determining rafter lengths, using the figures of the rafter tables where hundredths are given

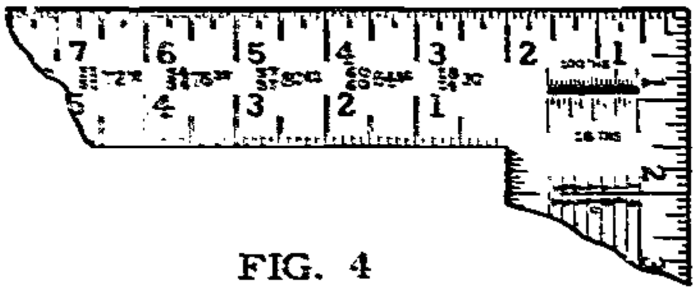

FIG. 4

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

The Rafter Tables Lesson 3

OBJECTIVE: To become familiar with the rafter and other tables on the framing square.

INFORMATION:

The framing square has tables for various framing and mathematical problems. Each table is used to solve a specific framing problem.

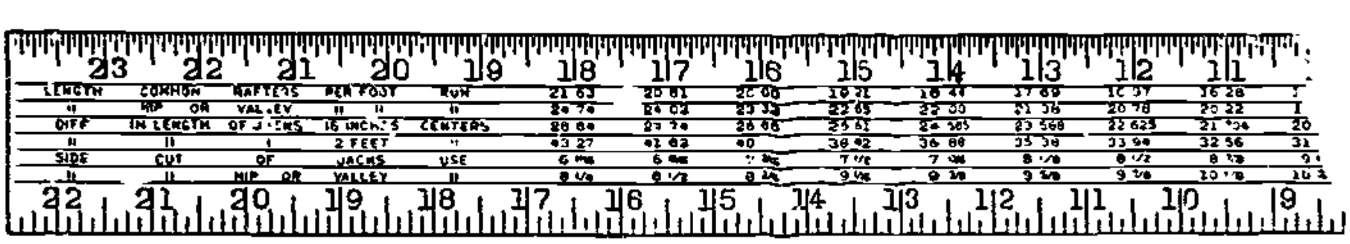

FIG. 5

1. <u>Rafter Tables</u>

   These tables are found on the face of the body, and are used to obtain the mathematical lengths of the various rafters, and their cuts. It consists of six lines of figures, and their use is indicated on the left end of the body.

   The first line gives the length of common rafters per foot of run.

   The second line gives the length of hip and valley rafters per foot of run.

   The third line gives the length of the first or shortest jack rafter and the difference in length of the other jack rafters when spaced 16 inches on center.

   The fourth line gives the length of the first or shortest jack rafter and the difference in length of the other jack rafters when spaced 24 inches on center.

   The fifth line gives the side cut of jack rafters for an equal-pitch roof.

   The sixth line gives the side cut of hip or valley rafters.

2. Octagon Scale

This scale is found along the center of the face of the tongue. As its name implies, this scale is used to lay out octagons, or 8-sided figures.

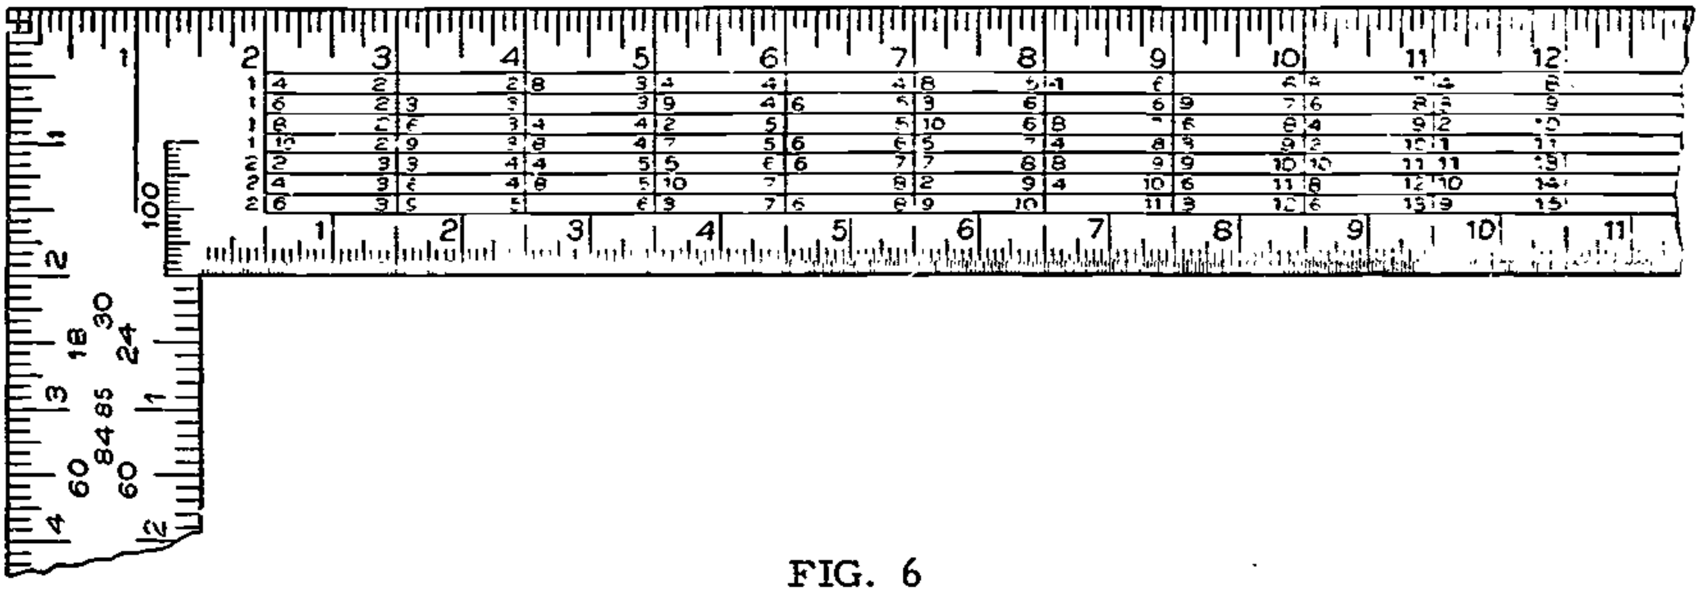

FIG. 6

3. Essex Board Measure Scale

This table is on the back of the body. By the use of this scale the board-foot measure of any size piece of timber can be found.

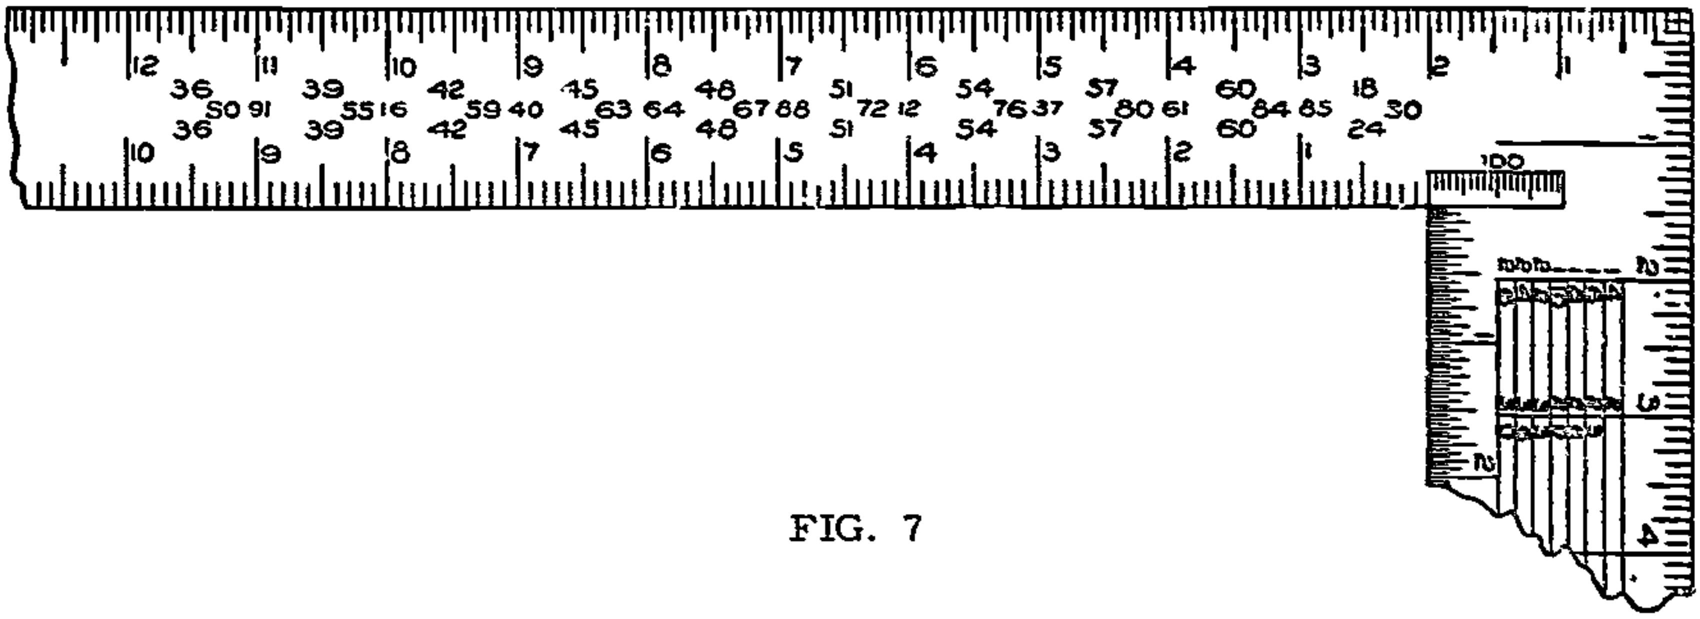

FIG. 7

4. Brace Measure Scale

This table is found along the center of the back of the tongue, and gives the length of the common braces.

ASSIGNMENT:

Study thoroughly the scales and tables on the square and be prepared to answer any questions your instructor may ask concerning them.

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

The Right-Angle Triangle Lesson 4

OBJECTIVES: To learn the principles of a right-angle triangle.
To learn the names of the parts of a right-angle triangle.

INFORMATION:

The basis of all roof framing is the geometrical figure called a right-angle triangle. Any gable, hip, or intersecting roof can be built using the fundamental principles of the right-angle triangle.

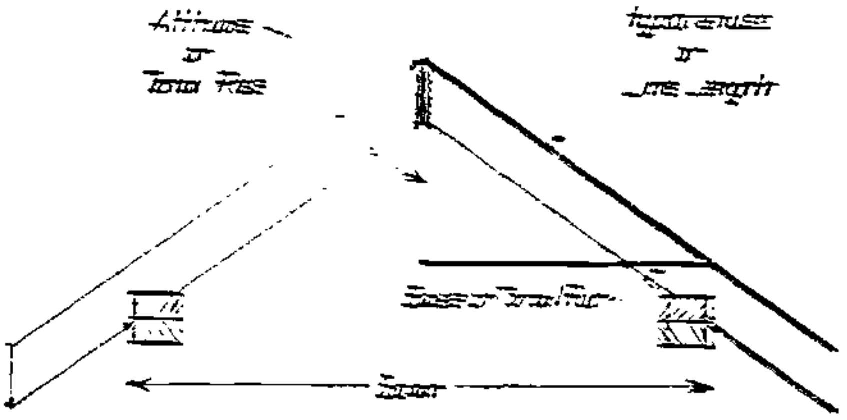

FIG. 4

A right-angle triangle always has one angle that is 90 degrees (the "right" angle), and two acute angles less than 90 degrees. The names of the parts of a right-angle triangle are the BASE, the ALTITUDE, and the HYPOTENUSE. The continued use of these terms would be appropriate if we were studying geometry, but since we are studying roof framing we will call the base TOTAL RUN, the altitude TOTAL RISE, and the hypotenuse the LINE LENGTH.

ASSIGNMENT:

Using the scale of 2 inches equals 1 foot, draw a right-angle triangle in which the run is 4 feet, the rise 3 feet. Find the line length of the triangle.

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

Terms Used in Roof Framing Lesson 5

OBJECTIVE: To become familiar with the terms total run, total rise, length, span, rise per foot, and pitch.

INFORMATION:

In order to really master the art of roof framing, it is of the utmost importance to become thoroughly familiar with the proper terms and definitions. These terms and definitions must be memorized, so that when a term or definition is used, a picture will form in your mind of the section of the roof defined.

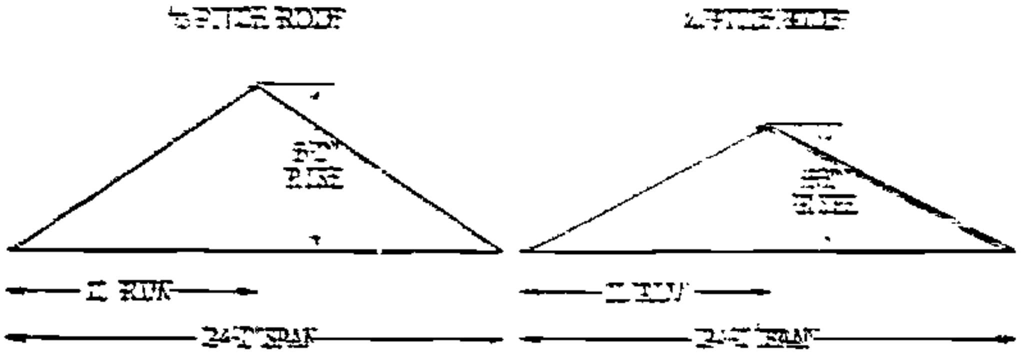

FIG. 1

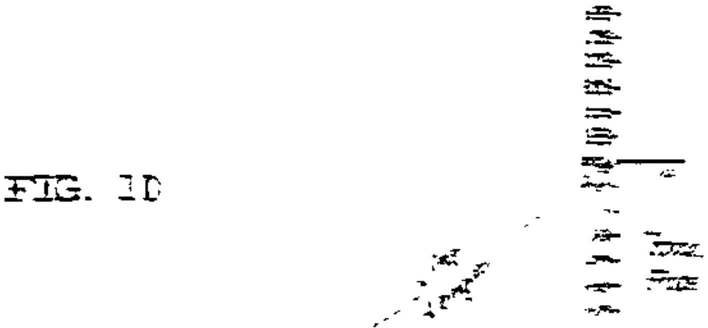
Terms and definitions:

1. Span
   The span of a roof is the distance between the outside edges of the wall plates on the two opposite sides of the building. The span distance is always given on the blueprint; therefore, to find the span of a roof, read the blueprint.

2. Total Run
   The term total run always refers to the shortest horizontal distance measured from a plumb line passing through the center of the ridge to the outer edge of the wall plate.

FIG. 1b



3. Total Rise
   The total rise is the vertical distance that the ridge is above the plate line.

4. Line Length
   The term line length as applied to roof framing is the hypotenuse of a right-angle triangle whose base is the total run and whose altitude is the total rise. Line length is just what its name implies; no thickness or width of material is considered; it is simply a linear measurement.

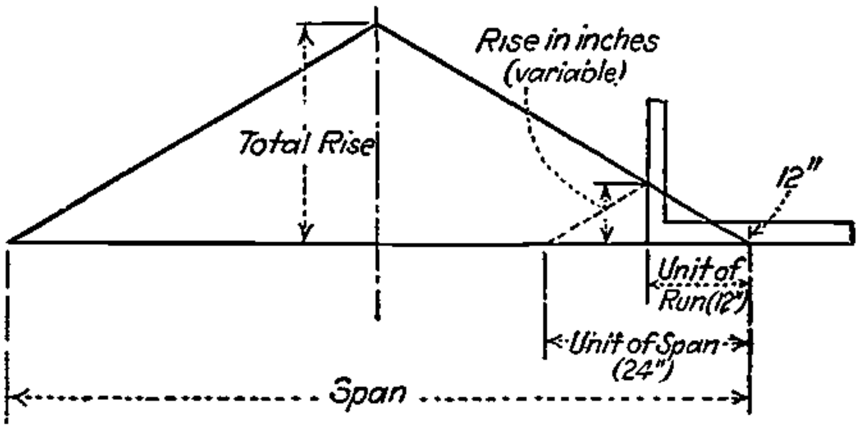


FIG. 11

5. Unit of Run
   The unit of measurement, 1 foot, or 12 inches, is the same for the roof as for any other part of the building. The principle underlying all roof framing is that all run measurements are taken on a level plane. The level plane distance is always spoken of as run; therefore the unit of run is 1 foot or 12 inches.

6. Rise in Inches
   The term rise in inches is the number of inches that a roof "rises" to every foot of run. (See Fig. 11.)

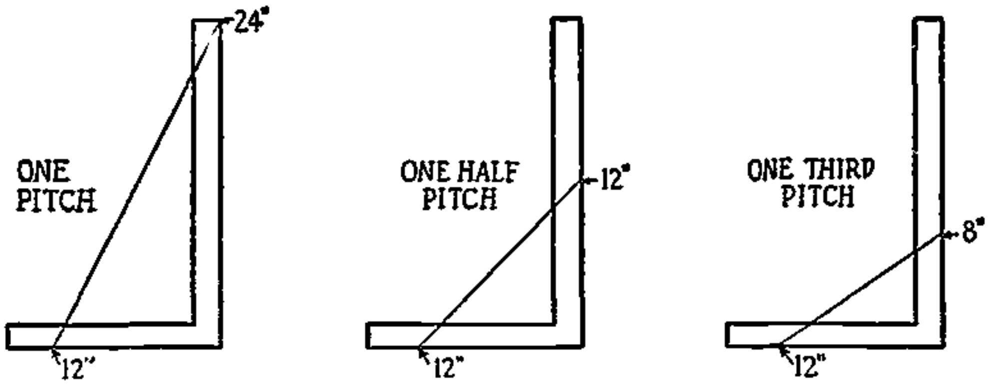

FIG. 12

7. Pitch
   The pitch of a roof is the term used to describe the amount of slope of the roof. It is expressed in terms of one pitch, one-half pitch, one-third pitch, etc.

ASSIGNMENT:

Memorize these terms and definitions and be able to answer any questions the instructor may ask concerning them.

The Pitch of a Roof

OBJECTIVE: To learn the meaning of the term "pitch."

INFORMATION:

Many times the term "pitch" is used when the term "rise per foot" should be used. Though both terms mean practically the same thing, there is a goemetrical difference.

Definition: The pitch of a roof is the angle of inclination that a roof makes with a horizontal plane. It is equal to the total rise divided by the span. The rule to find the pitch is:

Total rise divided by the span will give the pitch.

$$\frac{\text{Total Rise}}{\text{Span}} \text{ equals Pitch.}$$

Example: The span of a building is 32 feet, and the total rise is 8 feet. Following the rule,

$$\frac{\text{total rise}}{\text{span}} = \frac{8}{32} = \frac{1}{4} \text{ pitch.}$$

This means that the height from the level of the wall plate to the top of the ridge is $\frac{1}{4}$ of the total width of the building. To find the rise per foot, multiply the pitch by 24.

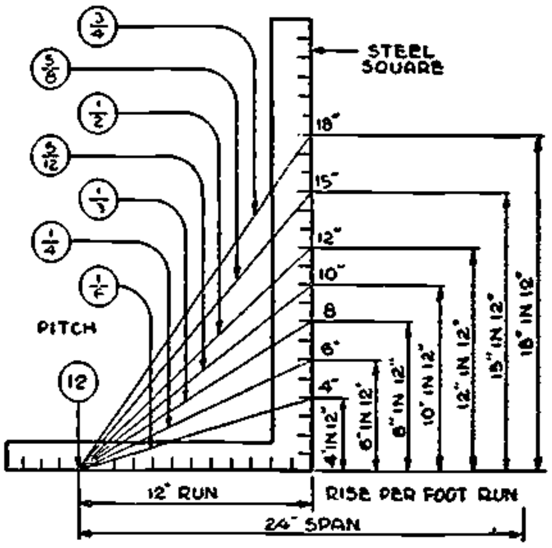

FIG. 13

Fig. 13 is a diagram in which the figures on the framing square are used to illustrate the relationship between the terms "pitch" and "rise per foot."

ASSIGNMENT:

Be prepared to answer any question the instructor may ask concerning "pitch" and "rise per foot."

Find the pitch for the following four roofs:

	Span	Total Rise
1.	27 feet	9 feet
2.	24 feet	8 feet
3.	28 feet	84 inches
4.	40 feet	120 inches

The Measuring Line — Lesson 7

OBJECTIVE: To learn the meaning of the term "measuring line."

INFORMATION:

The measuring line was used exclusively back in the days when lumber was not dressed on four sides as it is nowadays. It is now used only if a straight piece of lumber cannot be found to lay out the pattern rafter.

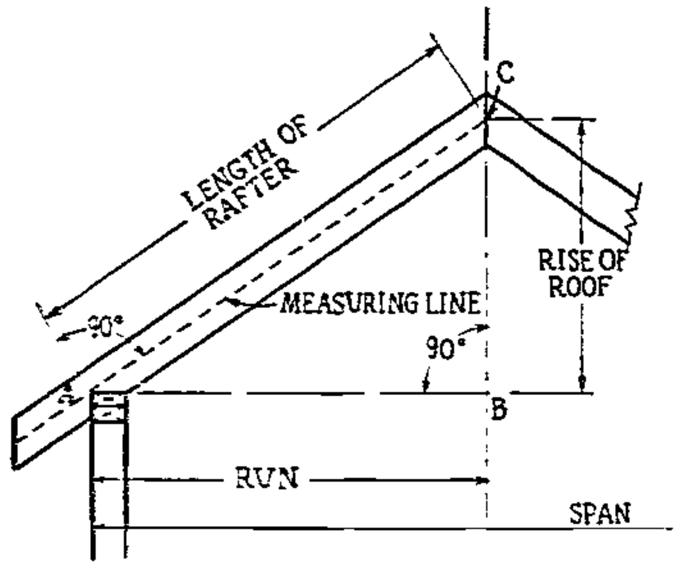

FIG. 14

Definition: A measuring line is a line drawn down the middle of the face of the rafter parallel to the edges. The best way to make the measuring line is by striking a chalk line at the proper place on the pattern material from end to end.

At the present time, when rafter material comes to the job site smooth and straight, the modern carpenter usually uses the edge of the lumber to step off the rafter.

ASSIGNMENT:

Be prepared to answer questions concerning this lesson.

The Structural Members of a Roof

Lesson 8

OBJECTIVE: To become familiar with the several types of rafters in constructing a roof.

INFORMATION:

There are three common types of roofs used in house construction, namely,

1. The gable roof
2. The hip roof
3. The intersecting roof

The gable roof requires only common rafters, but the hip and intersecting roofs require not only common rafters, but also several other types of rafters.

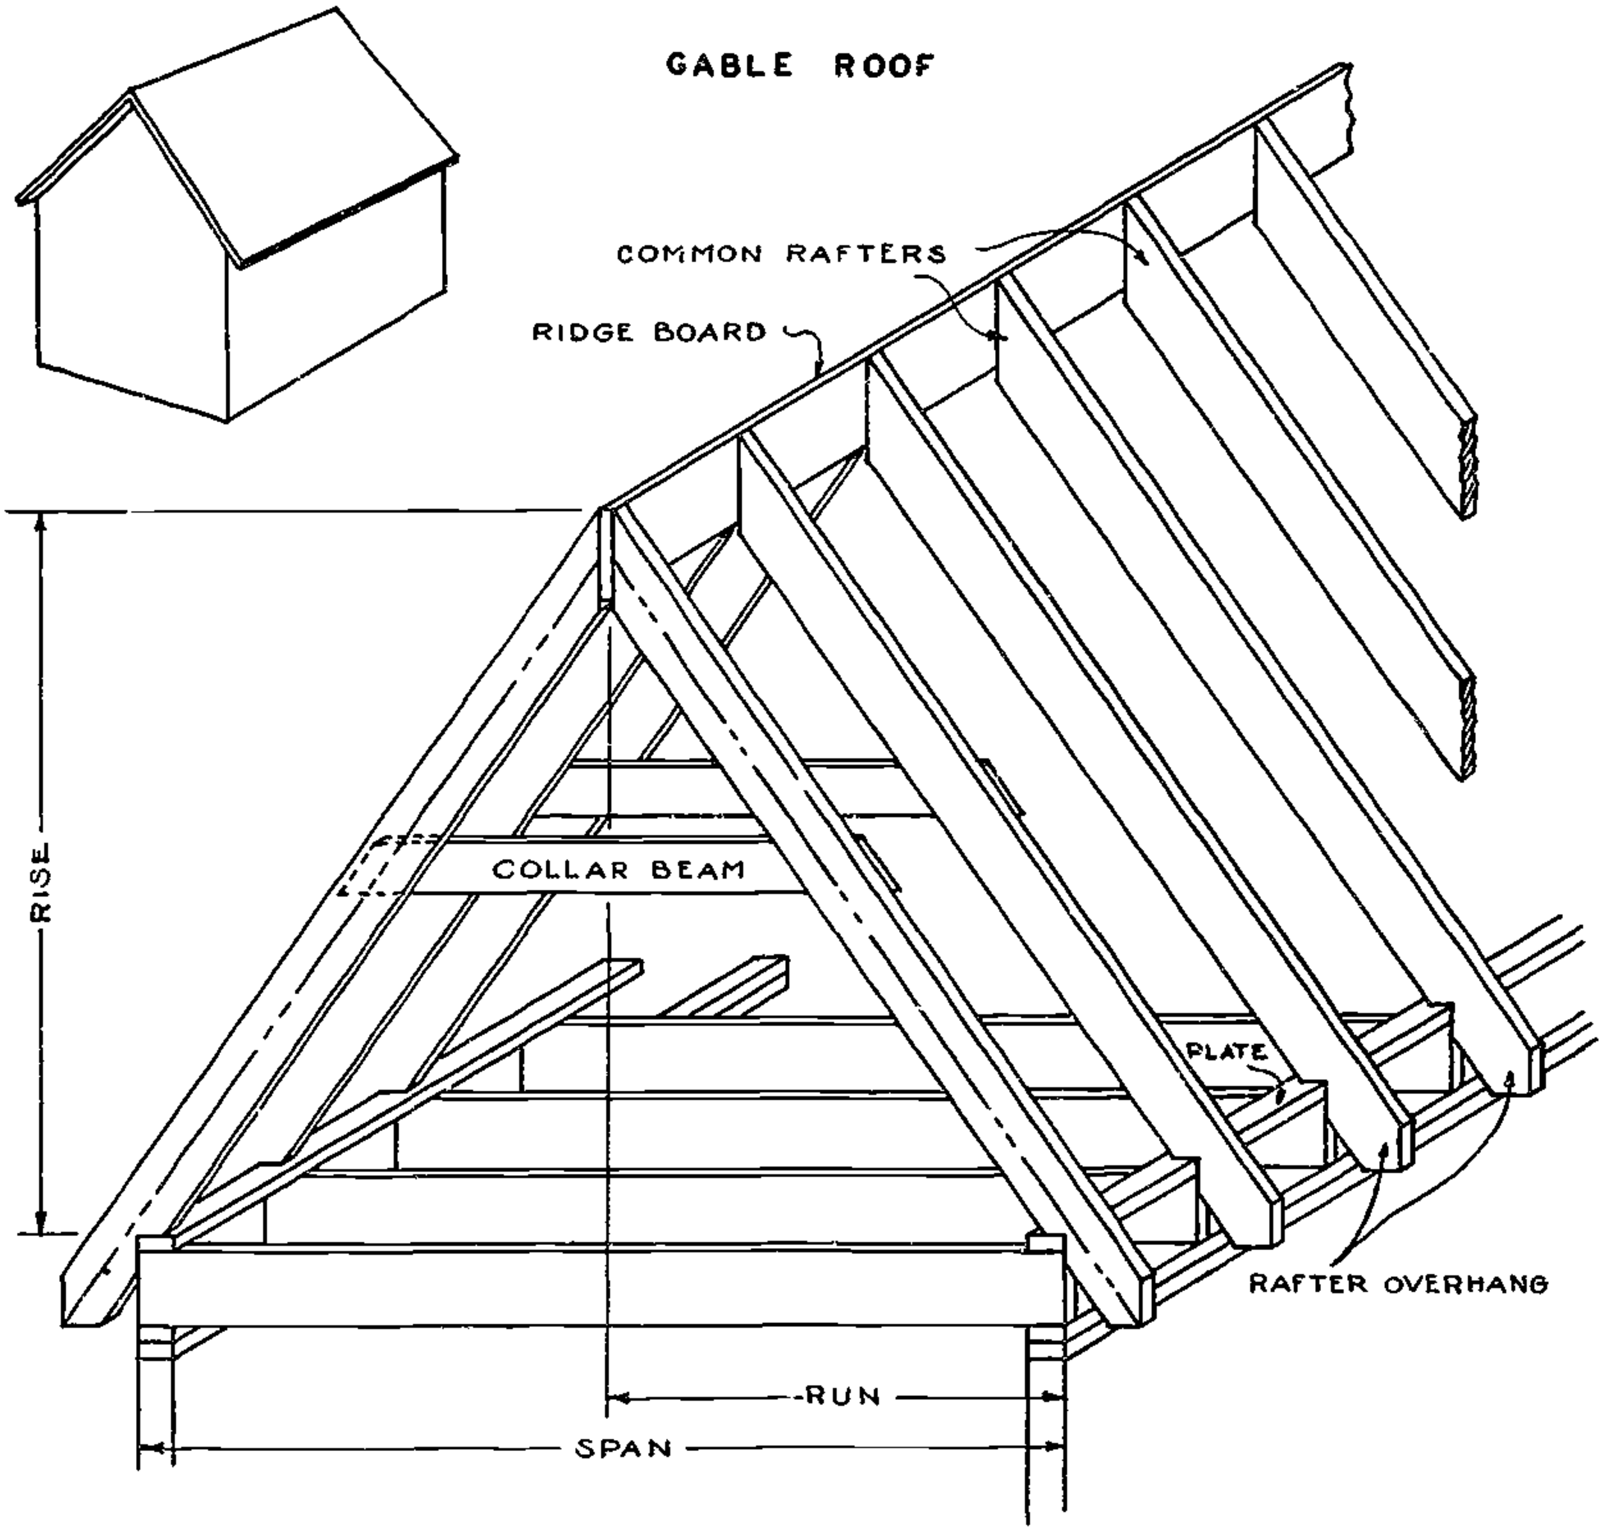

FIG. 15

Definition of roof rafters:

1. The common rafter
   Runs at right angles from the plate to the ridge.

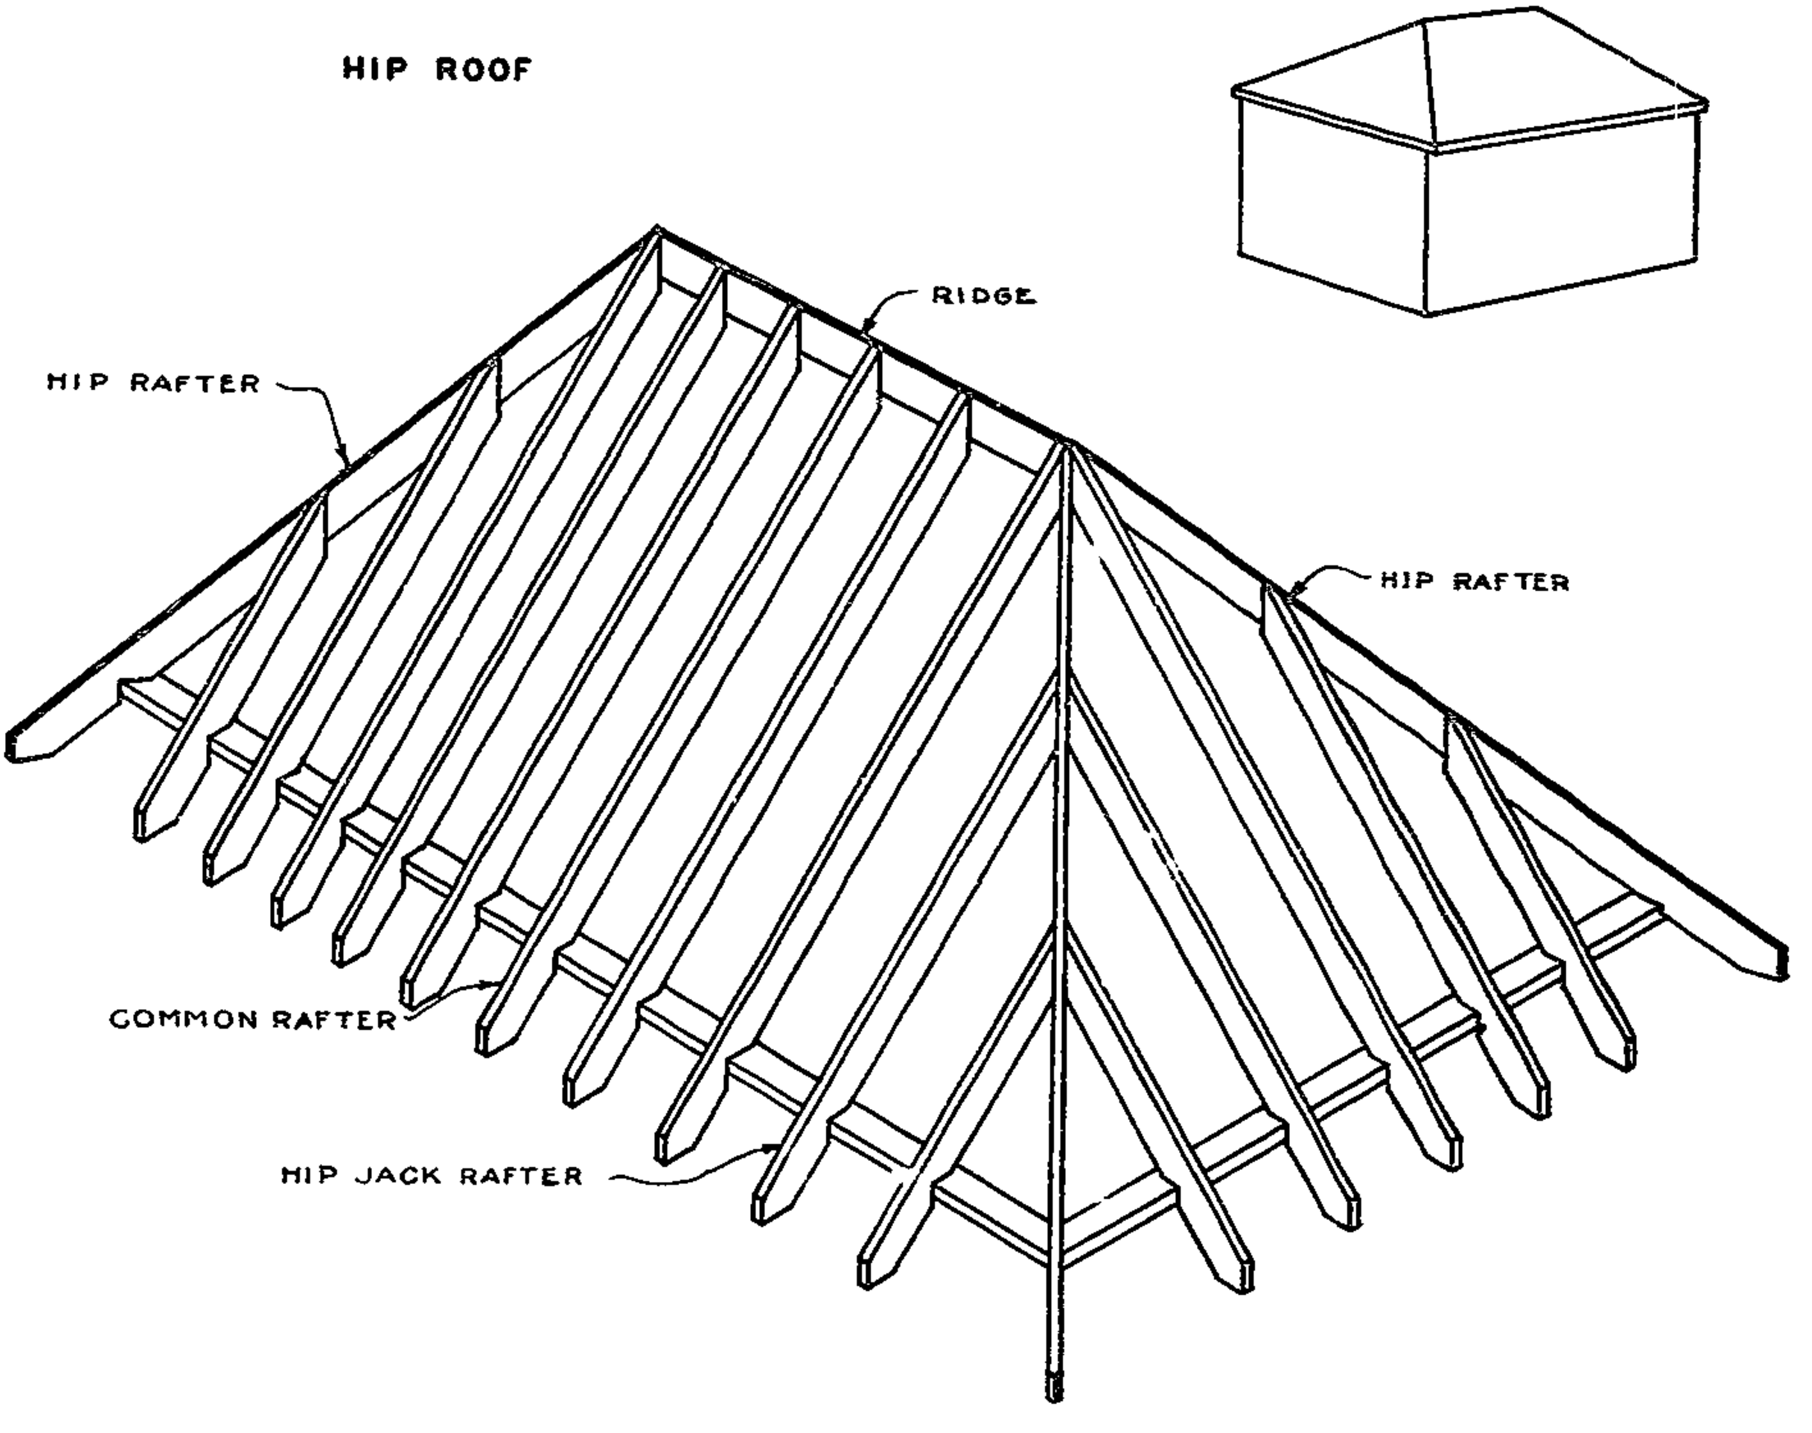

FIG. 16

2. The hip rafter
   Runs diagonally from the plate to the ridge.

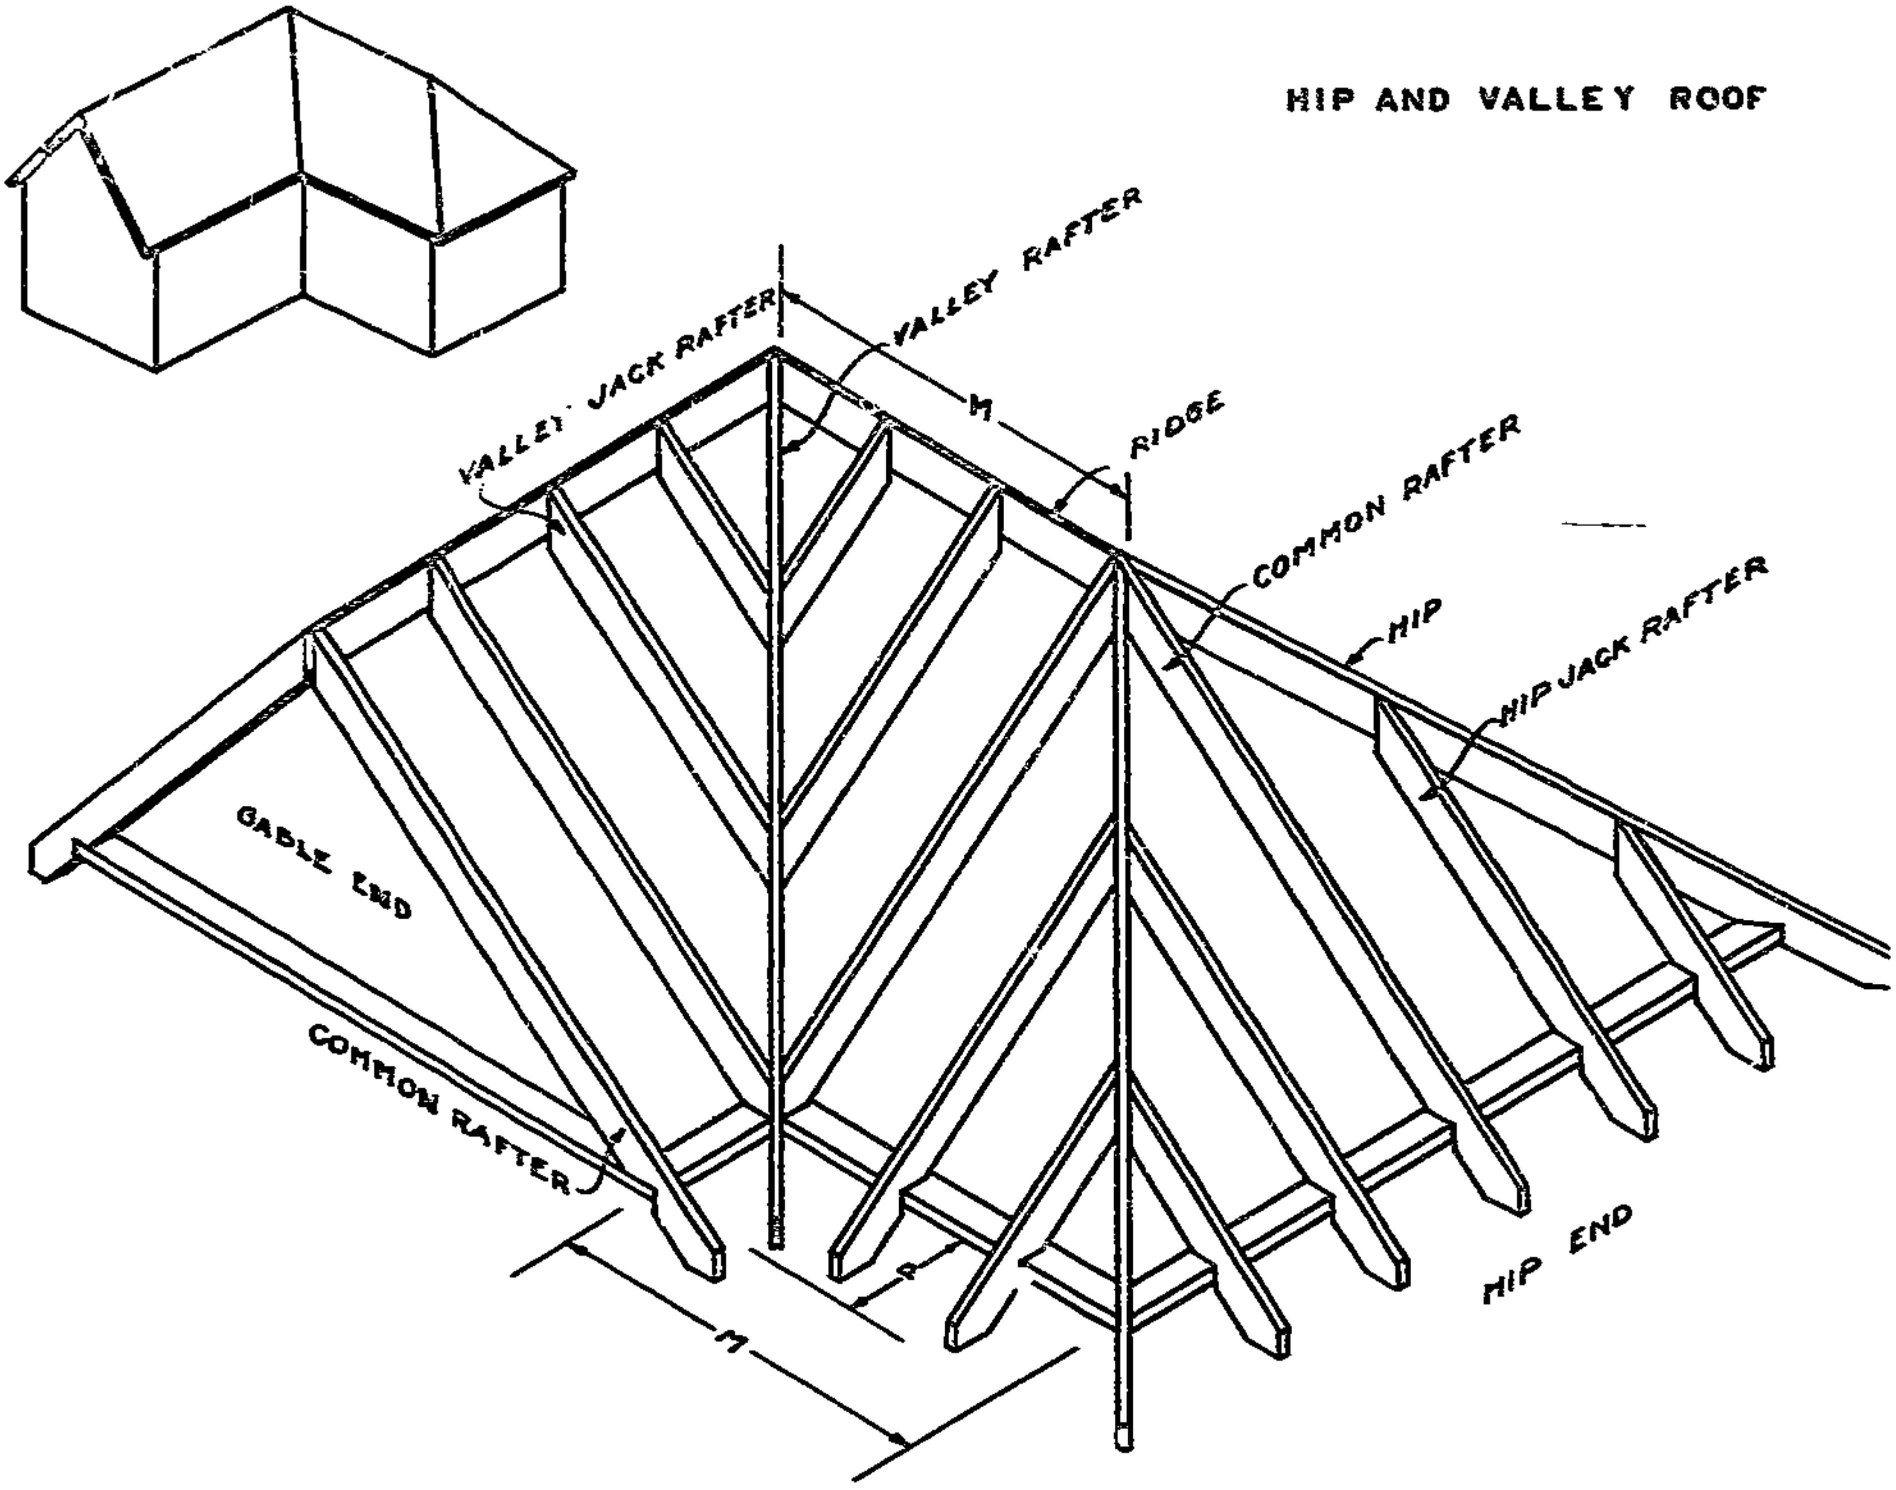

FIG. 17

3. The valley rafter
   Runs diagonally from the plate to the ridge along the line where two roofs intersect.

4. The hip jack rafter
   Runs from the plate to the hip rafter. (See Fig. 16.)

5. The valley jack rafter
   Runs from the ridge to the valley rafter. (See Fig. 17)

6. The cripple jack rafter
   A short rafter that does not touch either the plate or the ridge, usually running from the hip rafter to the valley rafter.

7. The overhang of a rafter
   The overhang extends over the edge of the plate. (See Fig. 15.)

8. The ridge board
   The ridge board is placed between the top ends of the rafters, and the rafters are nailed together on opposite sides of this board. It ties the rafters together. (See Fig. 15.)

9. The collar beam
   The purpose of the collar beam is to keep the rafters from spreading apart. (See Fig. 15.)

ASSIGNMENT:

Study and memorize the different types of rafters and be able to answer any questions the instructor may ask concerning them.

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

The Plumb, Level, and Side Cuts of Rafters — Lesson 9

OBJECTIVE: To become familiar with the different cuts of various rafters, and where they are to be made.

INFORMATION:

In order to make the various rafters fit into their proper places, certain cuts must be made. These cuts are called plumb cuts, level cuts, and side or cheek cuts. They must be made in their proper place on the rafter. Any cut that is vertical when the rafter is in its proper place is called a plumb cut, and any cut that is horizontal when the rafter is in its proper place is called a level cut.

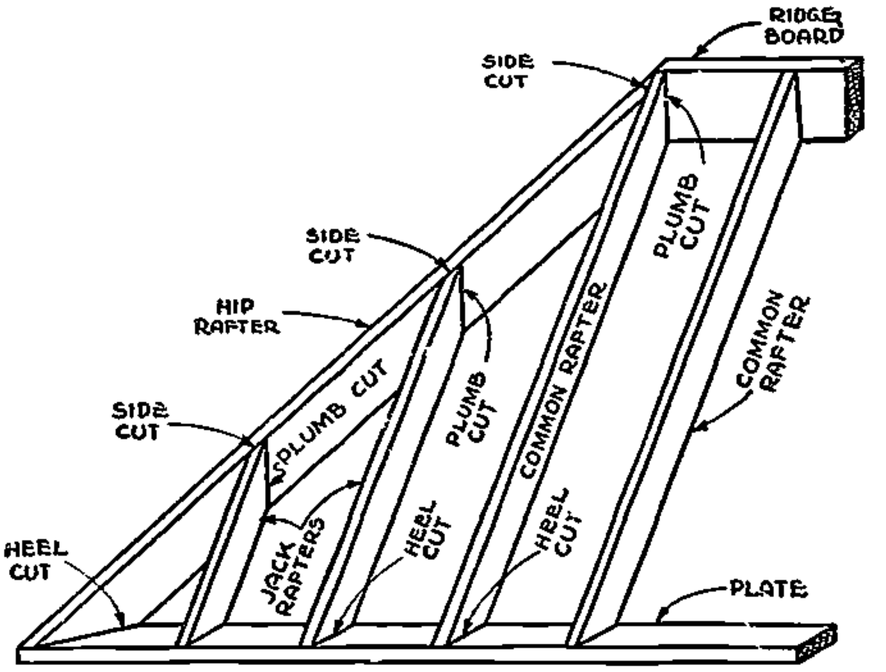

FIG. 18

Definition of rafter cuts:

1. Plumb cut
   The plumb cut is made at the end that is placed against the ridgeboard at the ridge. If the ridgeboard is omitted, which is very seldom, it rests against the opposite rafter.

2. Level or heel cut
   The level cut is sometimes called the heel cut, and rests on the wall plate.

3. Side cuts

   The side cut is sometimes called the cheek cut and is required when a rafter is not at a 90-degree angle to the particular member of the roof that it fits against. Hip and valley rafters require a combination plumb and side cut at the ridgeboard, due to the fact that they meet it at a 45-degree angle. Hip, valley, and cripple jacks also require combination plumb and side cuts.

ASSIGNMENT:

Draw a plan view (as seen from above) of an intersecting roof. (The dimensions will be given individually by the instructor.) Include all rafters - common, hip, valley, and jack. Specify where and what types of cuts are to be made.

UNIT I - DESCRIPTION, PRINCIPLES, TERMINOLOGY

TEST

Complete the following statements by writing in the correct word, number, or phrase.

1. The framing square consists of two parts, the __________ and the __________.

2. The __________ name is stamped on the __________ of the square.

3. The heel of the square is where the __________ and the __________ intersect.

4. The inches on the outside edge of the face of the body are divided into __________.

5. The rafter tables are located on the __________ of the __________ of the square.

6. Inches and twelfths are located on the back of the body on the __________ edge.

7. The hundredth scale is located on the __________.

8. The first line of the rafter tables gives the length of the common rafters __________.

9. Define the terms:

   Span

   Total run

   Total rise

   Unit of run

   Rise in inches

   Pitch

   Measuring line

10. Find the pitch of a roof that has these dimensions:

Span 28 feet   Total rise 7 feet

11. Name the three common types of roofs used in house construction.

12. Fill in the blanks.

A. The common rafter runs at __________ __________ from the __________ to the __________.

B. The hip rafter runs from the __________ to the ridge __________.

C. The ridgeboard is placed __________ the __________ __________ of the rafters.

D. The purpose of the collar beams is ____________________ ______________________________

13. Define the following rafter cuts, and specify on what part of the roof they are placed.

A. Plumb cut

B. Level cut

C. Side cut

Finding the Total Rise

OBJECTIVE: To learn how to find the total rise of a roof when it is not given on a plan.

INFORMATION:

In Unit I Lesson 5, the total rise was explained as "the vertical distance the ridge is above the plate line." Many times this distance is not given in the plan, yet the roof framer must know what the total rise of the roof will be, so that the roof will meet building code regulations and be in proportion to the rest of the house. It is a simple matter to find the total rise by following this mathematical formula:

Multiply the number of feet in the run by the rise per foot.

Example: Find the rise when the run is 14 feet, and the rise per foot is 8 inches.

14 x 8 equals 112 inches, or 9 feet 4 inches, total rise of the roof.

ASSIGNMENT:

Find the total rise for the following roofs:

Run	Rise Per Foot
16 feet	6 inches
18 feet	9 inches
15 feet 6 inches	10 inches

Give answers to the above problems in feet and inches, such as 9 feet 4 inches.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

Finding the Rise Per Foot — Lesson 2

OBJECTIVE: To learn how to find the rise per foot of a roof when it is not given on a plan.

INFORMATION:

Very often the architect will not give the rise per foot of a roof, yet it is essential that the roof framer know what the rise per foot is, as it is one of the figures used on the framing square to step off a rafter. Again it is a simple matter to find the rise per foot by following a mathematical formula:

> Divide the total rise (in inches) by the number of feet in the run.

Example: Find the rise per foot when the total rise is 9 feet 4 inches and the run is 14 feet.

Convert 9'4" to inches--- 9 x 12 equals 108 plus 4 equals 112 inches. Number of feet in the run is 14, so, following the formula, 112 divided by 14 equals 8. This means that 8 inches is the rise per foot.

ASSIGNMENT:

Find the rise per foot of a roof where the total rise in 10 feet 6 inches, and the span is 28 feet.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

The Unit of Run

Lesson 3

OBJECTIVE: To learn why the total run is broken down to units of run.

INFORMATION:

The term "run," whether it is used in conjunction with total run or unit of run, is applied to a horizontal rafter; no height is indicated. In Unit I Lesson 5, the total run was described as "the horizontal distance from the outer edge of the wall plate to the center of the ridge," or, in other words, the total run can also be described as being one-half the span. In order to use the framing square, which is only 24 inches by 16 inches, the total run must be broken down to figures that can be used on the square when stepping off a rafter to obtain its length.

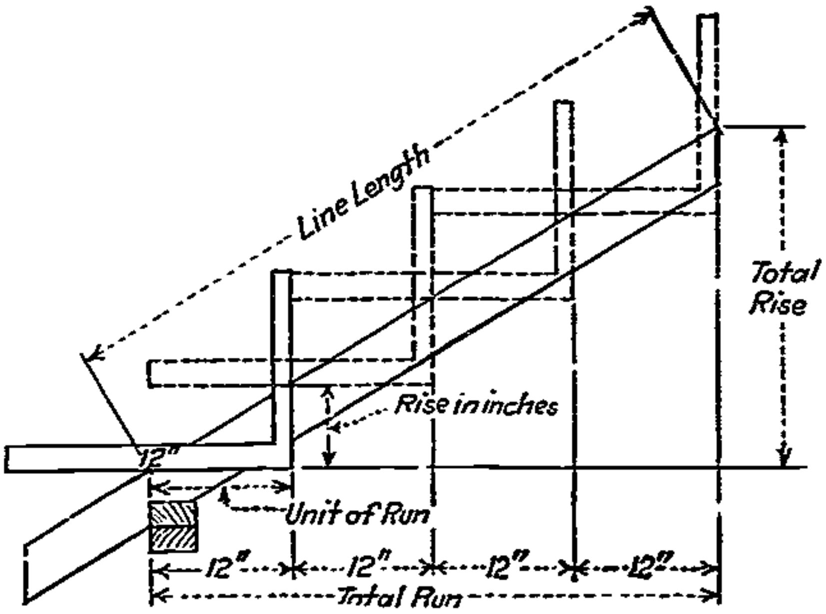

FIG. 19

The common unit of measurement is 12 inches or 1 foot. The total run is broken down into units of 12 inches or 1 foot. Thus, if the total run is 14 feet, it is broken down into 14 units, each unit consisting of 12 inches. Therefore in stepping off a rafter to obtain the length there will be 14 steps. In stepping off a common rafter, the 12-inch mark is always held on the body of the square, and the rise-per-foot mark is always held on the tongue of the square. The figure "12" will give the place for the level cut and the rise-per-foot figure will give the place for the plumb cut.

ASSIGNMENT:

Study Fig. 19 and be prepared to answer any question concerning this lesson.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

Length Per Foot of Run — Lesson 4

OBJECTIVE: To learn the principle of the length of the common rafter per one foot of run.

INFORMATION:

In the previous lesson, the total run was broken down into units of 12 inches or 1 foot. The rafter tables found on the Stanley R100 framing square are based on the "rise per foot run" which means that the figures in the tables indicate the lengths of rafters per one foot of run for common rafters for any rise of roof. For example, look at the 10-inch mark on the face of the body of the square. The first figure under the mark is 15.62. This means that a rise of 10 inches per foot of run gives a corresponding length of 15.62 inches for the common rafter.

The rafter length per foot of run is clearly illustrated in Fig. 20. The reason for using this "per foot run" method is that the length of any rafter can be easily determined for any width of building. The length per foot run will be different for different pitches; therefore before you can establish the length of a rafter, you must know the rise of the roof in inches, or the "rise per foot of run." (Unit II Lesson 2.)

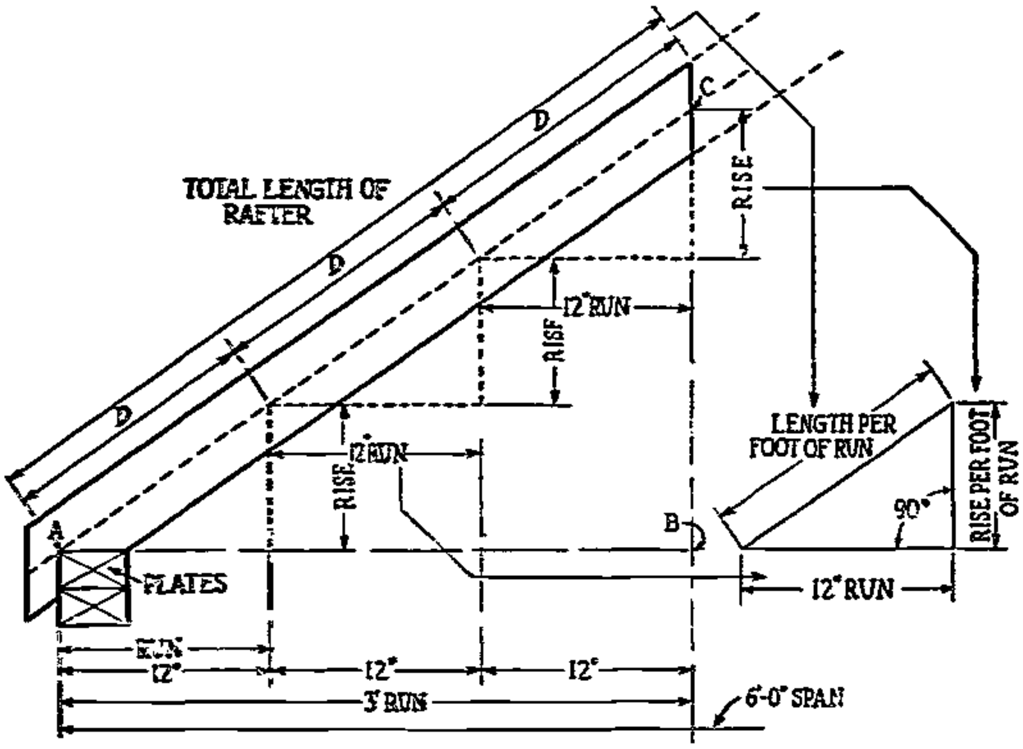

FIG. 20

Example (See Fig. 20):

A roof has a run of 3 feet and a certain rise per foot. The figure may be regarded as a right-angle triangle "ABC," having for its sides the run, rise, and the rafter. The run of the rafter has been divided into three equal parts, each part representing "one foot run." By drawing vertical lines through each division point of the run, the rafter also will be divided into three equal parts "D." Since each part "D" represents "the length of the rafter per one foot of run" and the total run of the rafter equals three feet, it is evident that the total length of the rafter will equal the length "D" multiplied 3 times.

Thus if the rise per foot of run were 10 inches, each length "D" would be 15.62 inches, and the total length of the rafter would be 3 times 15.62, or 46.86 inches.

ASSIGNMENT:

Using the square, find the mathematical length for the following common rafters:

1. Run is 14 feet 6 inches and the rise per foot is 9 inches.
2. Run is 16 feet and the total rise is 10 feet 8 inches.
3. Span is 27 feet and the total rise is 162 inches.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

Plumb and Level Lines — Lesson 5

OBJECTIVE: To learn the principles of plumb and level lines.

INFORMATION:

In order for any rafter to fit against another member of a roof, its lines or cuts must correspond to the particular member against which it must fit. These lines or cuts are known as plumb or level cuts. Any line that is vertical when the rafter is in its proper position is called a plumb line, and any line that is level when the rafter is in its proper position is called a level line.

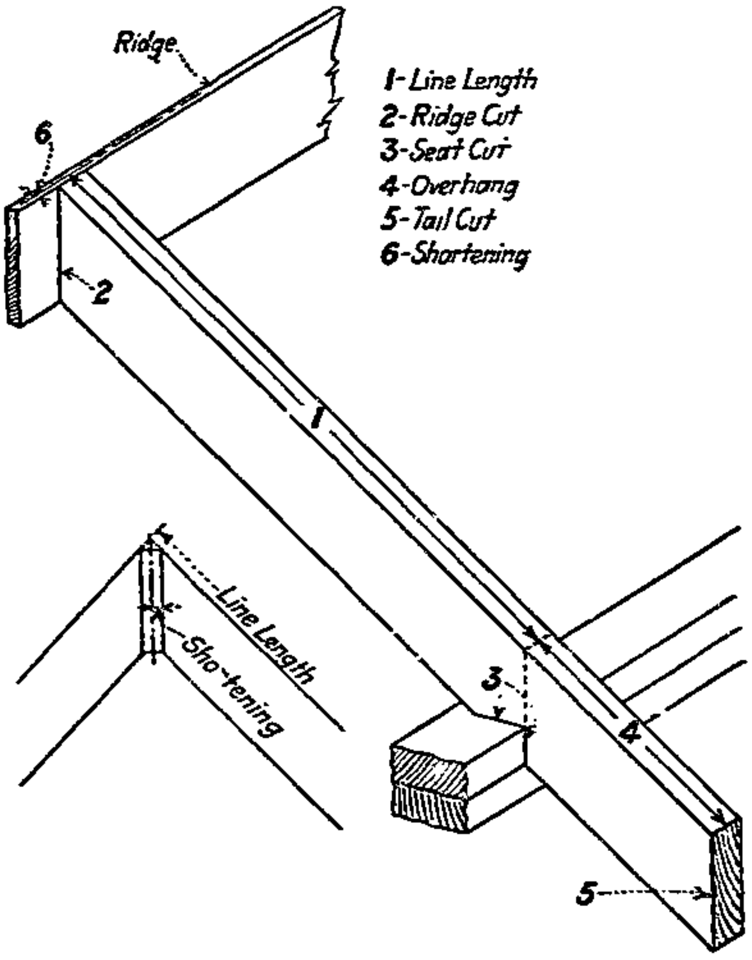

FIG. 21

The ridge cut of a common rafter (See Fig. 21)
The ridge cut of a common rafter is the cut at its top end. It fits against the ridgeboard. This cut, being vertical when the rafter is in its proper position, is called a plumb cut.

Seat cut of a common rafter (See Fig. 21)
The seat cut of the common rafter is the cut that permits the rafter to fit or rest on the top plate of the building. It consists of both plumb and level cuts.

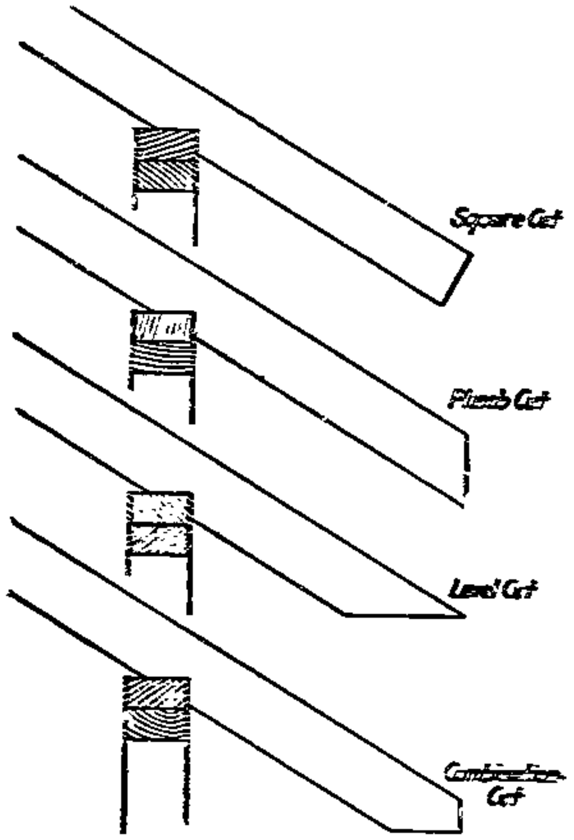

FIG. 21A

Tail cut of a common rafter
The shape of the cut at the exposed end of a common rafter can be a combination of several cuts. Fig. 21A illustrates a few typical cuts that are commonly used. Generally, they are a combination of the plumb and level cuts.

ASSIGNMENT:

1. Take a framing square and lay out a seat cut for a rafter that has a rise per foot of 9 inches, the level line to be the full width of the wall plate.

2. Lay out a ridge cut for a rafter with a rise per foot of 6 inches.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

Line Length of a Common Rafter — Lesson 6

OBJECTIVE: To learn the line-length principle of roof framing.

INFORMATION:

The term "line length" simply means the lineal measurement of a rafter: no thickness or width is considered. It is the hypotenuse of the right triangle whose base is the total run and whose altitude is the total rise. Knowing the line length of a rafter is necessary when ordering the material for the rafter.

The line length can be found by measuring across the square from a total rise to a total run, and multiplying the line length by 12. This gives the actual mathematical length.

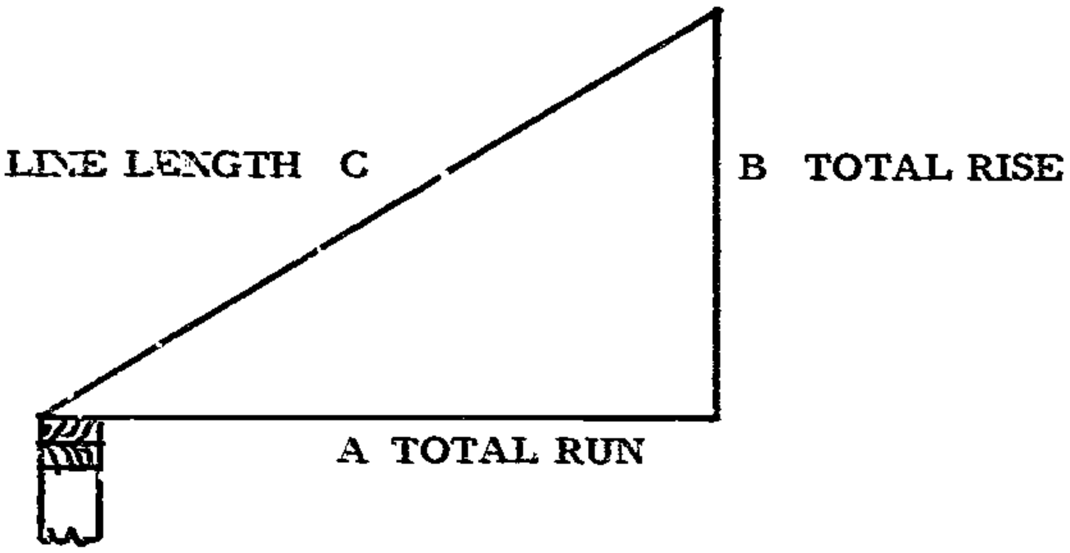

FIG. 22

Example: Total rise is 8 feet, and the total run is 8 feet.

Measuring across the square (hypotenuse) using the above figures will give $11\frac{5}{16}$ feet. Multiplying $11\frac{5}{16}$ by 12 gives $135\frac{3}{4}$ inches. This is the mathematical length of the common rafter. This length does not take into consideration the deduction for the ridgeboard or the extra for the overhang.

Another method of finding the mathematical length of a common rafter is to use the one-twelfth scale on the framing square. In using this scale, one inch stands for one foot, and each twelfth equals one inch. Use the total rise and the total run and measure diagonally across these two figures.

ASSIGNMENT:

Find the line length for the following common rafters:

1. Total rise 7 feet 6 inches, span 20 feet.
2. Total rise 9 feet 4 inches, total run 14 feet 6 inches.
3. Total rise 120 inches, span 22 feet.

Use both methods for each problem, as described in the lesson.

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

Determining Rafter Lengths Mathematically — Lesson 7

OBJECTIVE: To learn how to figure lengths of rafters using the rafter tables on the square.

INFORMATION:

In the previous lesson, the line length was found by measuring across the square diagonally. The figures given on the rafter tables can also be used to figure lengths mathematically.

Procedure: On the rafter table find the length of the rafter per foot of run for the rise per foot of the roof. Multiply the figure found on the rafter table by the total run. The answer is the mathematical length of the rafter.

Example: Find the length of the rafter if the rise per foot of the roof is 8 inches, and the total run is 11 feet 4 inches.

Under the figure 8 on the rafter table, find the length of the common rafter per foot of run; this will be 14.42 inches. Multiply 14.42 by the total run, $11\frac{1}{3}$ feet. The answer is 163.42 inches.

To find the number of feet, divide 163.42 by 12. This equals 13 feet 7.42 inches. To convert .42 to its fractional equivalent, multiply .42 by 16, which gives 6.72. Using the first number only, that is, 6, call it $\frac{6}{16}$ or $\frac{3}{8}$. (If a more accurate answer is needed, convert to thirty-seconds by multiplying by 32.)

The mathematical length of this rafter is therefore 13 feet $7\frac{3}{8}$ inches.

Note: The terms "line length" and "mathematical length" mean exactly the same.

For hip or valley rafters use the figures for hip and valley rafters on the square.

ASSIGNMENT: Use the rafter tables to find the mathematical length of the following common rafters.

Rise Per Foot	Total Run
8 inches	8 feet
10 inches	9 feet 6 inches
7 inches	14 feet 4 inches

UNIT II - PRINCIPLES AND PRACTICES OF RAFTER LAYOUT

TEST

---

1. Find the total rise for roofs that have the following dimensions: (Give answers in feet and inches.

    A. Run 18 feet; rise per foot 4 inches.

    B. Span 32 feet; rise per foot 11 inches.

    C. Run 19 feet 6 inches; rise per foot [illegible] inches.

2. Find the rise per foot for roofs that have the following dimensions:

    A. Total rise is 4 feet 4 inches; run is 14 feet.

    B. Total rise is 7 feet 2 inches; run is [illegible] feet.

3. Explain why the total run is broken down to units of run.

4. Find the mathematical length for the following common rafters, using the table on the framing square:

    A. Run 14 feet; rise per foot [illegible] inches.

    B. Run 18 feet; rise per foot 4 inches.

    C. Span 27 feet; total rise 162 inches.

UNIT III - THE EQUAL-PITCH GABLE ROOF

Length of the Common Rafter Lesson 1

OBJECTIVE: To learn the step-off method to obtain the length of a common rafter.

INFORMATION:

An equal-pitch roof is a roof that has an equal pitch on the two opposite sides. Picture two right-angle triangles opposite each other. This type of roof is the most common and easiest to build, as it consists of only two different parts, the common rafters and the ridge.

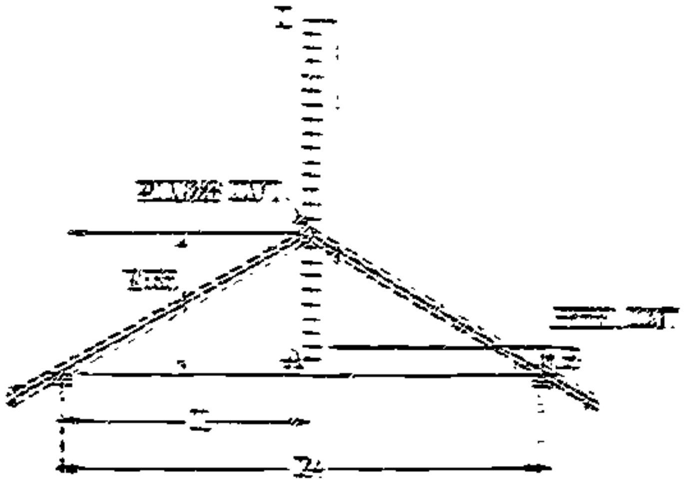

FIG. 25

There are several methods of finding the length of a common rafter, but the most practical on-the-job method is the step-off method. Some roof framers prefer to start at the ridge cut and work down to the seat cut, while others prefer to start at the seat cut and work up to the ridge cut. Both methods are correct. After many years of experience in on-the-job roof framing, I personally prefer the method of starting at the overhang or seat cut and working up to the ridge cut. It is very important that extreme care be used in applying the square; any carelessness will result in an incorrect rafter.

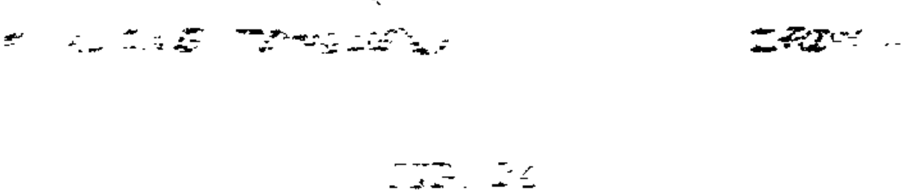

FIG. 26

Procedure:

Select a straight piece of stock and lay it so the crown is toward you. Start at the extreme left end of the stock, and work from left to right. Assume the run is 14 feet and the rise per foot is 8 inches. Hold the framing square face up, the tongue in the left hand and the body in the right hand, the heel toward you. On the edge of the stock hold the 8-inch mark on the tongue and the 12-inch mark on the body, and mark along the outer edge of the tongue. This is the plumb line for the seat cut.

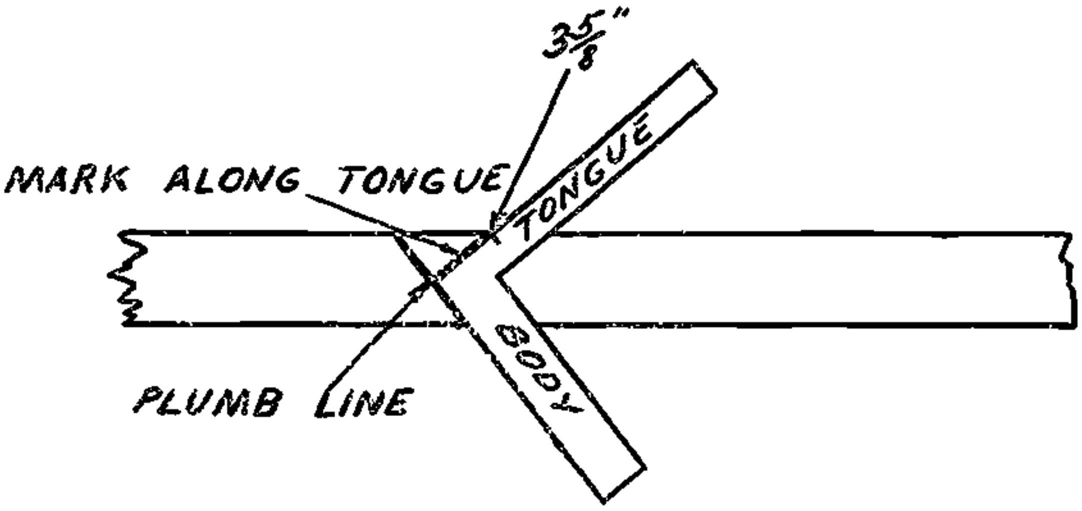

FIG. 25

Turn the square, still face up, and hold the body in the left hand and the tongue in the right hand. Holding the body parallel to the plumb line that was just made, slide the body along this line until the $3\frac{5}{8}$-inch mark on the outer edge of the tongue coincides with the edge of the stock. Mark along the outer edge of the tongue. This is the level line, and is the width of the 2 x 4 wall plate.

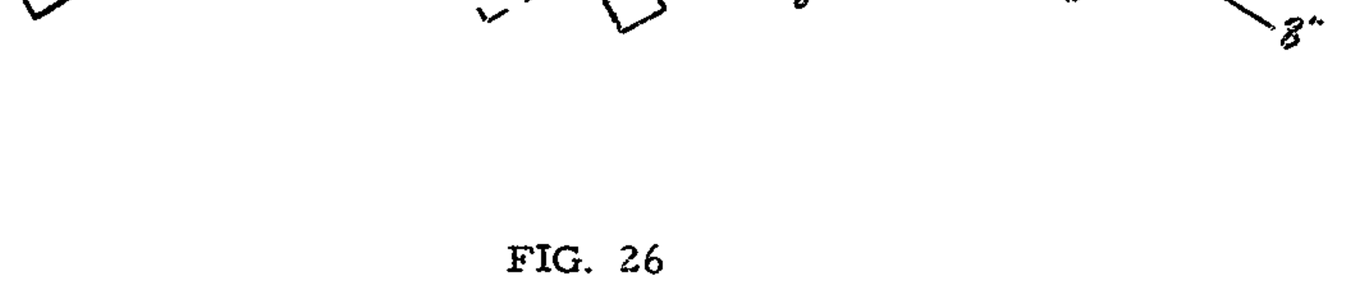

FIG. 26

Swing the square around again, still face up, and hold the body in the left hand, the tongue in the right hand, heel away from you. Hold the 12-inch mark on the body on the edge of the stock nearest you, coinciding with the plumb line of the seat cut, and the 8-inch mark on the tongue on the same edge of the stock; make a mark on the rafter where the 8-inch mark is being held. This is step No. 1. Hold the same figures and slide the square along the edge of the stock until the 12-inch mark on the body coincides with the mark made where the 8-inch mark was held, and make a new mark where the 8-inch mark is now being held. This is step No. 2. Repeat this process a total of 14 times (total run). At the 14th step, draw a full line along the tongue. This gives the plumb cut for the ridgeboard.

The length of rafter just laid out is the length to the center of the ridgeboard. Deduction must be made from this plumb line to allow for the thickness of the ridgeboard.

ASSIGNMENT:

Select a piece of stock 2 x 6 x 14 feet and lay out a common rafter. Total run and rise per foot will be assigned individually by the instructor.

UNIT III - THE EQUAL-PITCH GABLE ROOF

Odd Inches in the Run

Lesson 2

OBJECTIVE: To learn how to step off odd inches in the total run.

INFORMATION:

Many times, in fact most times, the total run of a rafter is not an even number of feet; in the great majority of times it also includes a certain number of inches. For example, if the span of a building is 29 feet, the total run will be 14 feet 6 inches. The 6 inches must be included in the step-off procedure in order to obtain the correct length. For convenience, 6 inches will be used; any other distance, even fractions of an inch, are handled in the same manner.

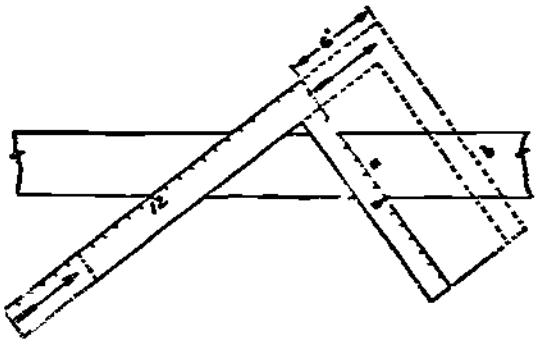

FIG. 27

Procedure:

The stepping-off process is exactly the same as in the preceding lesson up to the last full step. Assume that the total run is 14 feet 6 inches. This means that there are 14 full steps and one partial step. After marking the last full step, slide the square, still holding the 12-inch mark on the body and the 8-inch mark on the tongue until the 6-inch mark on the outside edge of the body is directly over the 14th step plumb line (see Fig. 27). Mark along the outside edge of the tongue. (Again, this measurement is to the center of the ridgeboard, and deduction must be made from this line to allow for the thickness of the ridgeboard.)

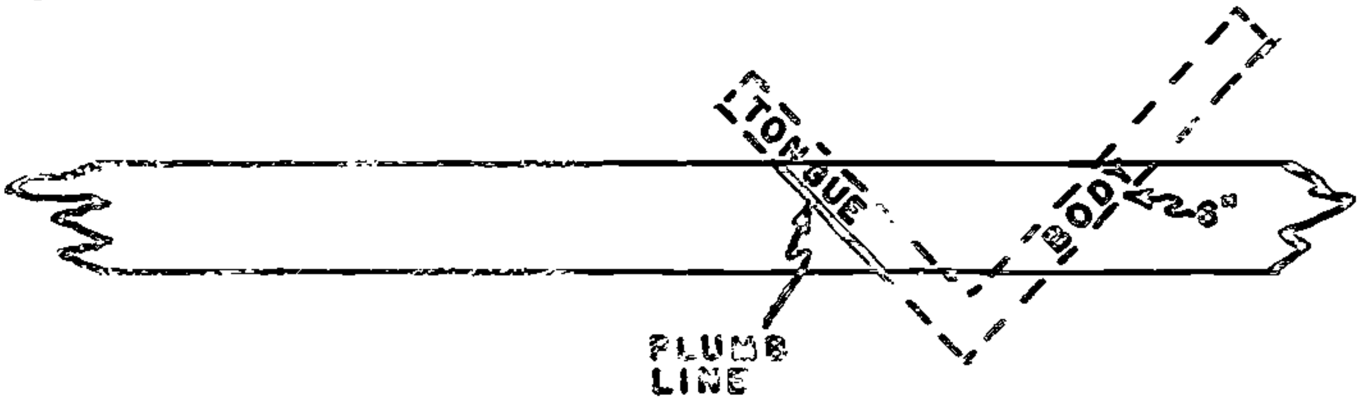

FIG. 28

Another method is to swing the square around and hold the outside edge of the tongue parallel to the last full-step plumb line and make a mark on the outside edge of the body at the required number of inches (see Fig. 28). Lay out a plumb line at this mark, parallel to the last line. (Again, deduction must be made from this line to allow for the thickness of the ridgeboard.)

ASSIGNMENT:

Step off on a piece of stock the lengths for the following common rafters:

Total Run	Rise Per Foot
[illegible] feet 4 inches	7 inches
12 feet 7½ inches	10 inches

Allowance for the Thickness of the Ridgeboard

OBJECTIVE: To learn how to deduct, from the total length of a common rafter, the thickness of the ridgeboard.

INFORMATION:

In stepping off a common rafter, the last plumb line is the length of the rafter if there is no ridgeboard - if the rafters are butted against each other. Since a ridgeboard is used in most cases, this length of rafter will generally be too long. It is necessary therefore, to deduct an amount from the rafter length to allow for the thickness of the ridgeboard. The rule is: "From the last plumb line, deduct one-half the thickness of the ridgeboard."

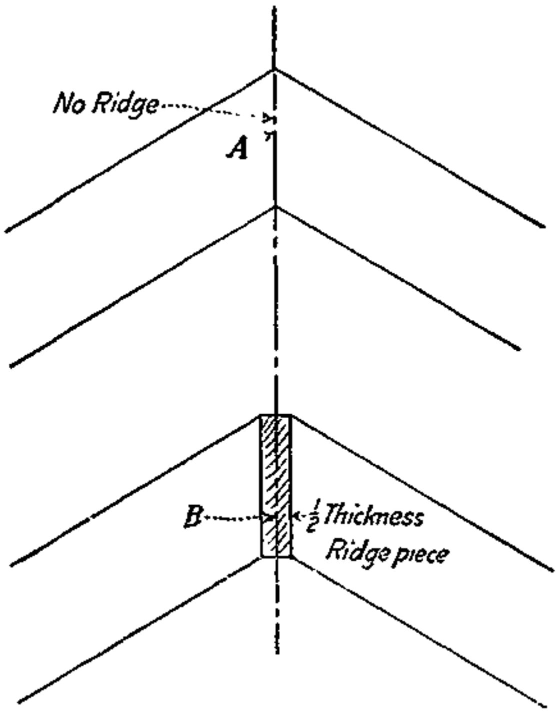

FIG. 29

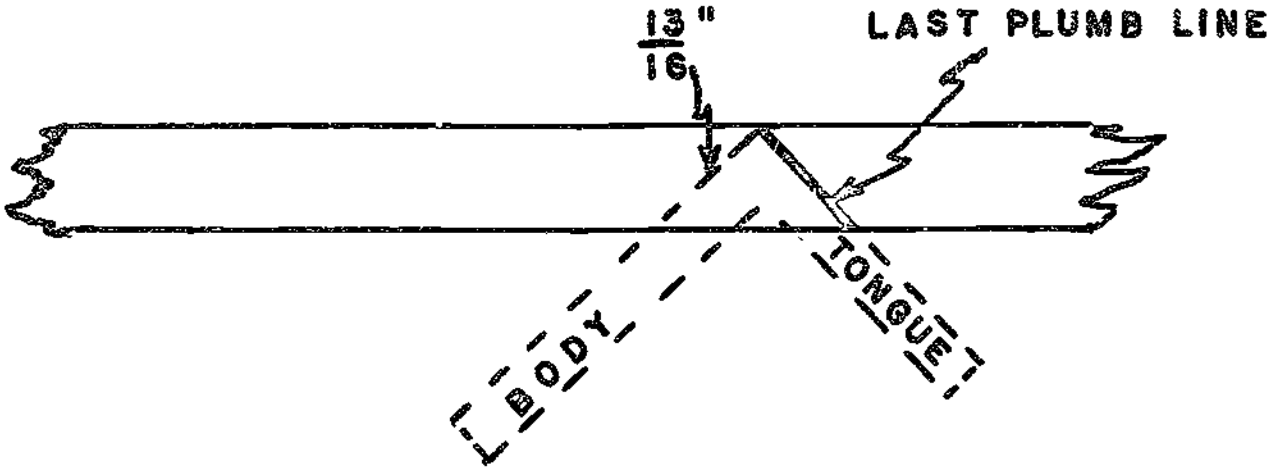

FIG. 30

Procedure:

Work from the last plumb line that was made on the rafter. Hold the square face up, tongue in the right hand, body in the left hand. Hold the outside edge of the tongue parallel to the last plumb line. The body of the square is now at a right angle to the plumb line. Assume the ridgeboard is $1\frac{5}{8}$ inches thick; one-half of $1\frac{5}{8}$ inches is $\frac{13}{16}$ inches. Mark off $\frac{13}{16}$ on the outside edge of the body, and lay out a plumb line on this mark, parallel to the previous plumb line. This is the exact length of the rafter, allowing for the thickness of the ridgeboard.

The figures $1\frac{5}{8}$ and $\frac{13}{16}$ inches were used merely to explain the procedure. Regardless of how thick the ridgeboard may be, one-half the thickness must be deducted to obtain the exact length. In deducting it, always measure at a right angle to the plumb line.

ASSIGNMENT:

Lay out the deductions for the following ridgeboards:

Rise Per Foot	Size of Ridgeboard
8 inches	2 x 8
10 inches	4 x 8
6 inches	6 x 10
$7\frac{1}{2}$ inches	4 x 10

OBJECTIVE: To become familiar with the two different types of overhangs.

INFORMATION:

The overhang of a rafter is the part that extends beyond the wall plate. The distance that the rafter extends beyond the wall plate is determined by either of two factors.

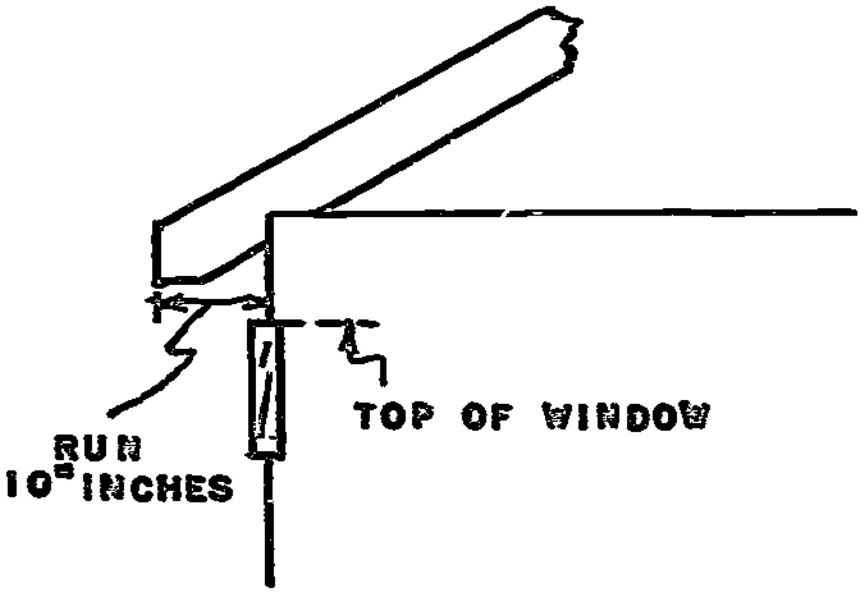

FIG. 31

1. The plan of the building will show the amount of projection (run) that the overhang is to extend beyond the wall plate.

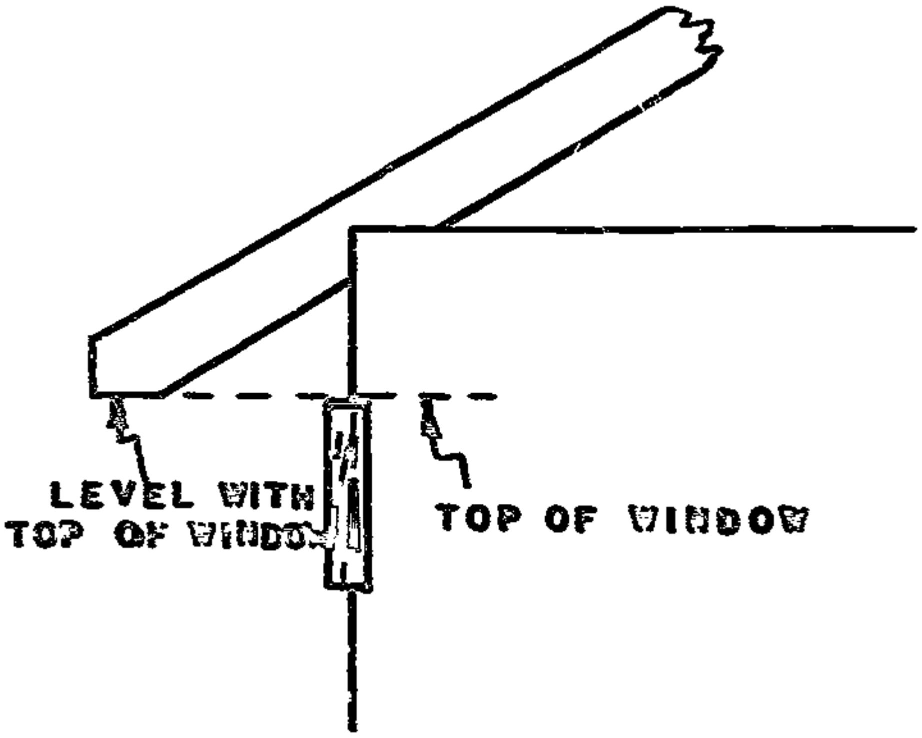

FIG. 32

2. The plan of the building will show that the level cut of the overhang is in a level line with the top of the window, regardless of the amount of projection beyond the wall plate.

In type 1, the blueprint will show that the overhang is to extend, let us assume, 10 inches from the wall plate. This means that it may or may not be on a level line with the top of the window.

In type 2, usually no measurement is given, but the blueprint will show that the level cut of the overhang is level with the top of the window. This type of overhang requires a combination plumb and level cut, the plumb cut to nail the fascia and gutter to, and the level cut to nail the soffit to. (In type 1 there are many types of cuts that can be made, several of which were shown in Fig. 21A).

ASSIGNMENT:

In approximately fifty words each, define the terms "fascia," "soffit," and "gutter." Explain the purpose that each serves on a building.

UNIT III - THE EQUAL-PITCH GABLE ROOF

Overhang When Run Measurement Is Given Lesson 5

OBJECTIVE: To learn how to lay out the overhang when the run measurement is given.

INFORMATION:

This type of overhang may or may not have a combination plumb and level cut. If a soffit, fascia, and gutter are to be nailed to it, then it must have plumb and level cuts, but sometimes, depending on the type of building, it may have only one cut -- either a plumb, or level, or a square cut. (See Fig. 21A.)

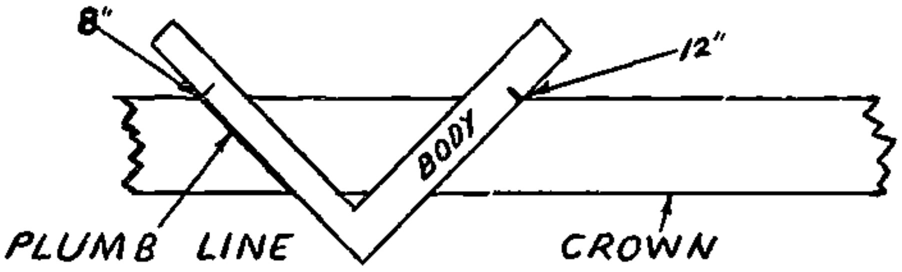

FIG. 35

Procedure:

Lay the stock from which the rafter is to be made, crown toward you. Assume that the run measurement as given on the blueprint is 10 inches, the rise per foot of the roof is 8 inches, and the overhang is to have a combination plumb and level cut. Hold the square, face up, tongue in the left hand, body in the right hand, heel toward you. Hold the 8-inch mark on the tongue and the 12-inch mark on the body, and on the extreme left end of the stock lay out a plumb line.

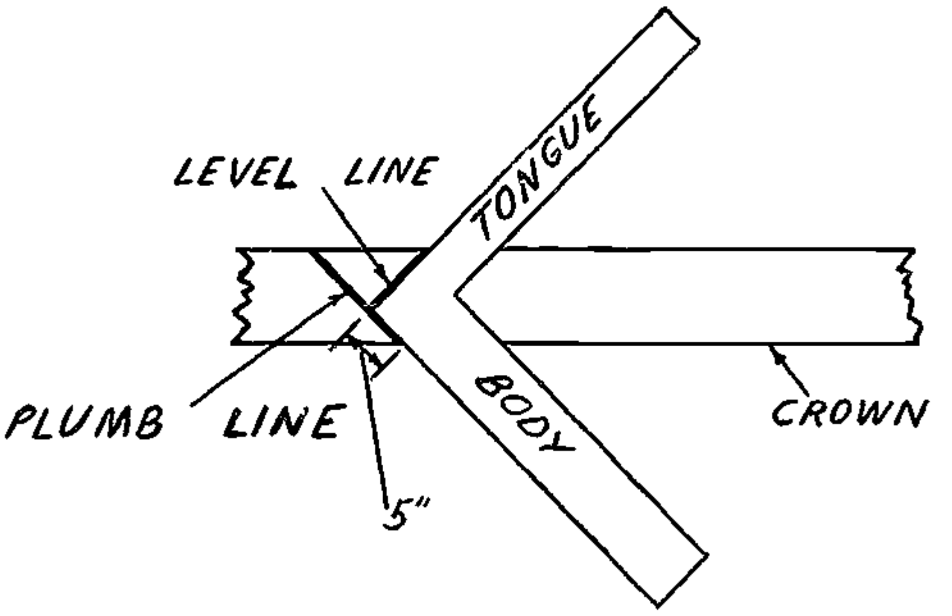

FIG. 36

Swing the square around, body in the left hand, tongue in the right, and hold the body parallel to the plumb line. The tongue is now at a right angle to the plumb line. The amount that is to be left on the plumb line depends upon the width of the fascia board, but usually 4 to 5 inches is left on the plumb line, as this is sufficient to nail the fascia to. We will assume that 5 inches is to be left on the plumb line to nail the fascia to. Hold the body parallel to the plumb line and measure from the crown side of the rafter 5 inches down. From this mark lay out a level line by marking along the outside edge of the tongue. This is the level cut to nail the soffit to.

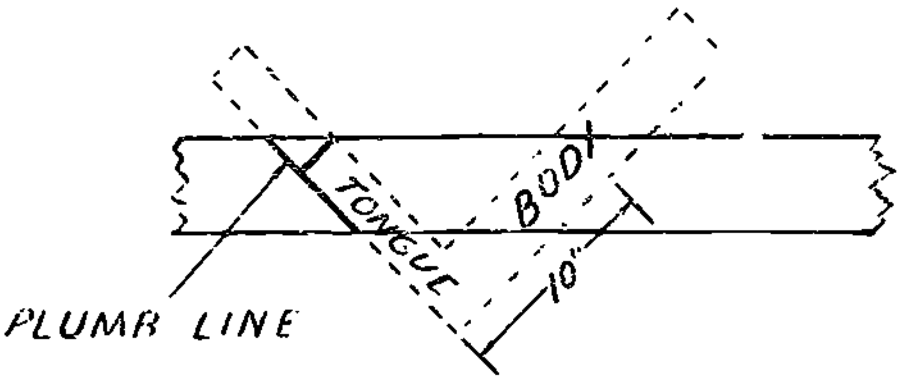

FIG. 37

Now hold the outside edge of the tongue parallel to the plumb line, and mark off on the outside edge of the body the run measurement of the overhang, 10 inches. From this point lay out a seat cut as described in Lesson 1 of this unit. When the rafter is in its proper position on the roof, the overhang will extend 10 inches from the outside wall plate on a level plane.

ASSIGNMENT:

Lay out the following overhangs, including seat cuts:

Rise Per Foot	Run of Overhang
9 inches	12 inches
10 inches	8 inches
12 inches	18 inches

UNIT III - THE EQUAL-PITCH GABLE ROOF

Overhang Level With Top of Windows — Lesson 6

OBJECTIVE: To learn how to lay out the type of overhang where the level cut is on a level line with the top of the windows.

INFORMATION:

This type of overhang (see Fig. 32) will always have a combination plumb and level cut, as the primary purpose is to have a soffit from the rafter overhang to the top of the windows. The drip caps are removed from the window frames so that the soffit can lie on the top rail of the window frame.

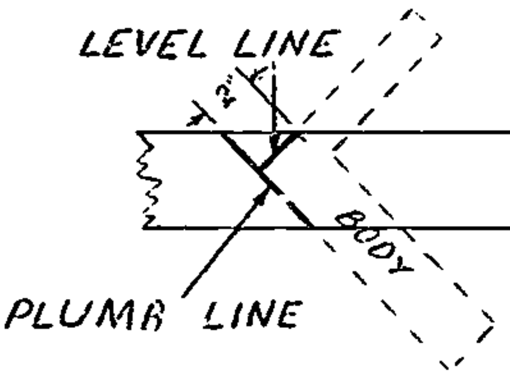

FIG. 39

Procedure:

Assume the rise per foot is 8 inches, and lay out a plumb line at the extreme left end of the stock as described in Lesson 5 of this unit. Hold the body of the square parallel to the plumb line and slide the square along this line until the 2-inch mark on the outside edge of the tongue coincides with the edge of the stock that is away from you. Mark along the outside edge of the tongue. At this stage of the layout procedure, the roof framer must know the vertical distance from the top of the window to the top of the wall plate. If the windows have been nailed in place, measure vertically from the top of the window (minus drip cap) to the top of the wall plate; otherwise obtain this measurement from the plans.

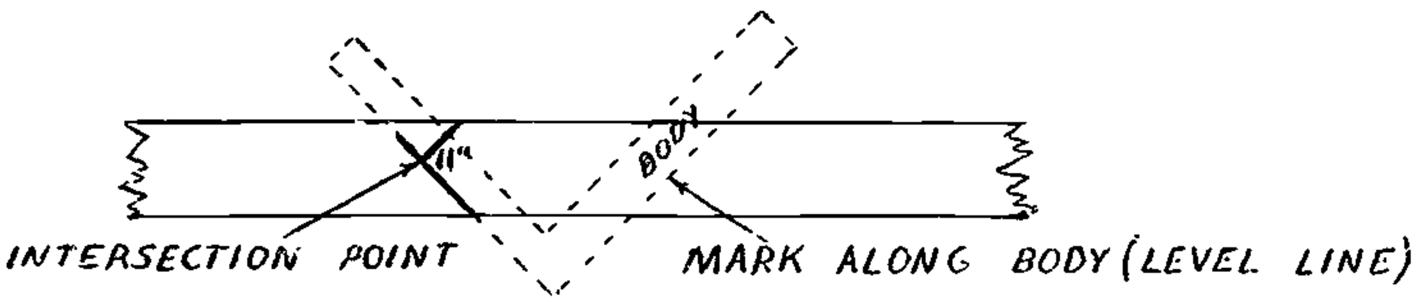

FIG. 40

Assume that the vertical distance is 11 inches. Hold the outside edge of the tongue exactly parallel to the plumb line. When the 11-inch mark on the outside edge of the tongue coincides with the intersection point of the plumb and level lines, mark along the outside edge of the body. This is the level line for the wall plate.

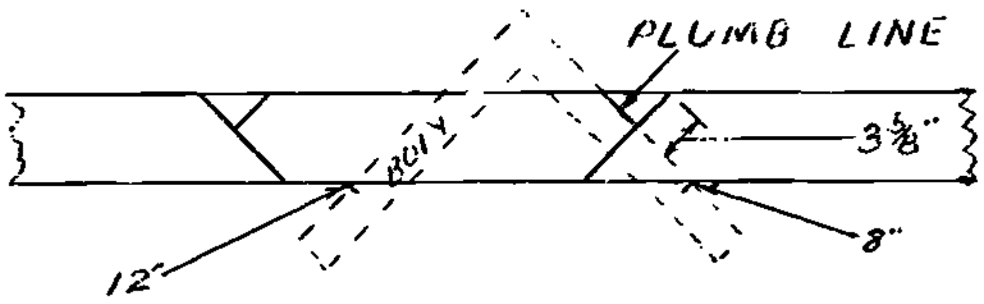

FIG. 41

From the edge of the stock that is away from you, measure along the level line, the width of the wall plate. If the wall plates are 2 x 4's, this measurement will be 3$\frac{5}{8}$ inches. At this mark lay out a plumb line. The stepping off procedure to obtain the length of the rafter starts from this line.

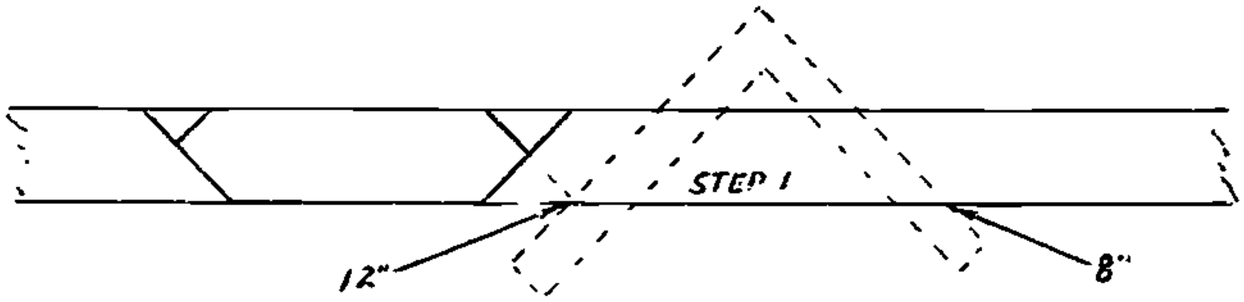

FIG. 42

When the rafter is in its proper position on the roof, the level cut of the overhang will be level with the top of the window. In order for the soffit to be perfectly level with the top of the window, however, the thickness of the stock of the soffit must be deducted from the level line of the overhang.

ASSIGNMENT:

Lay out the following overhangs, including one step of the run:

Vertical Distance	Rise Per Foot	Thickness of Soffit Stock
12 inches	9 inches	$\frac{1}{4}$ inch
14 inches	11 inches	$\frac{3}{8}$ inch
15 inches	6 inches	$\frac{1}{2}$ inch
10 inches	10 inches	$\frac{3}{8}$ inch
16 inches	12 inches	$\frac{1}{4}$ inch

UNIT III - THE EQUAL-PITCH GABLE ROOF

Length of the Ridgeboard   Lesson 7

OBJECTIVE: To learn how to obtain the length of the ridgeboard.

INFORMATION:

The ridgeboard is the horizontal member of a roof used for nailing the plumb cuts of the rafters on one side, to the plumb cuts of the rafters on the other side of the roof. Sometimes in cheap construction the ridgeboard is left out and the plumb cuts of the rafters are nailed together. This method is not recommended.

Procedure:

The length of the ridgeboard of a gable roof is always the same length as that part of the building to which it is parallel.

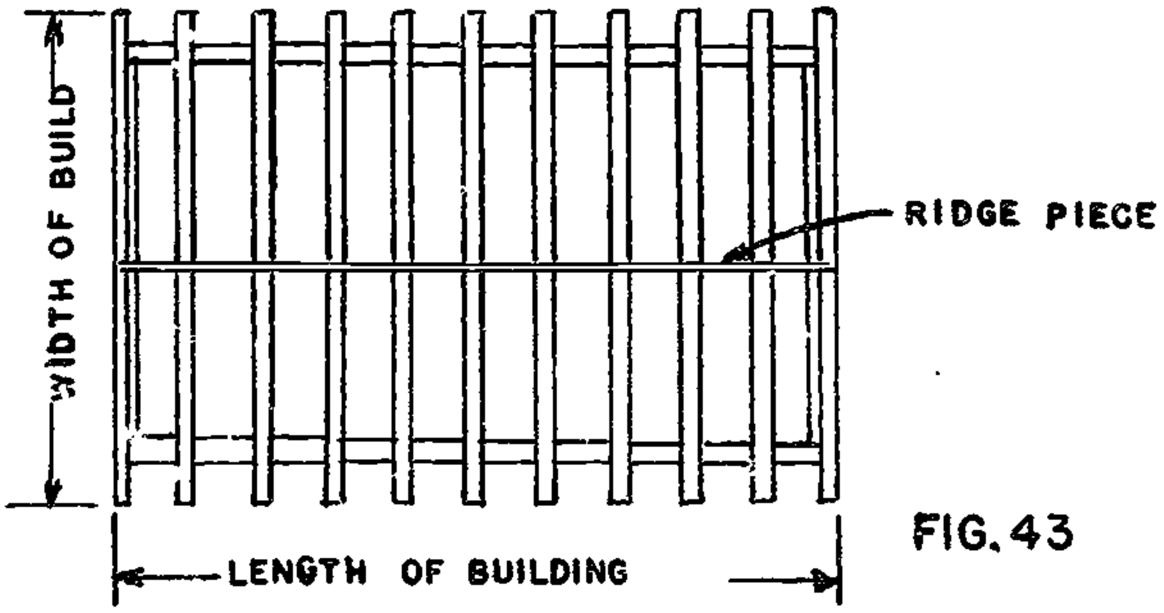

FIG. 43

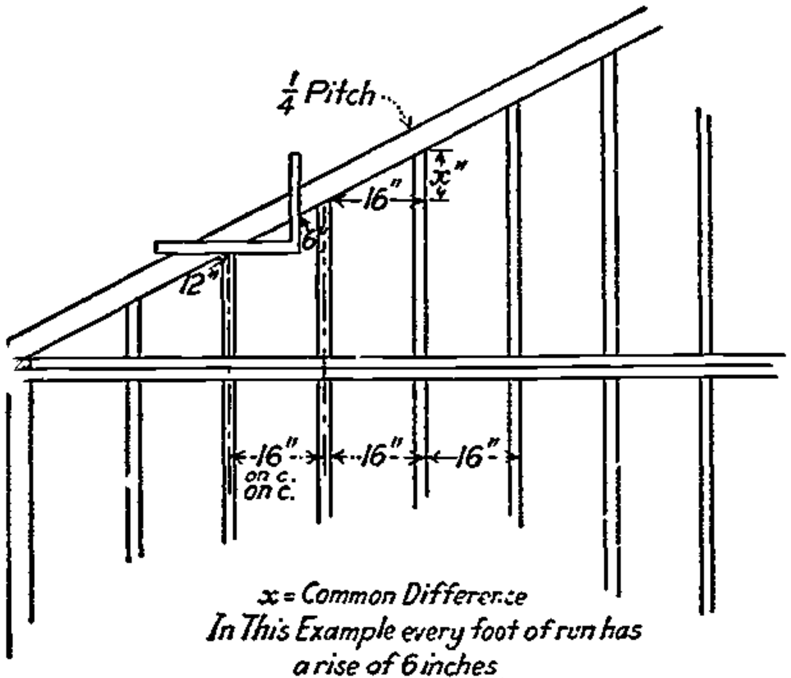
ASSIGNMENT:

Find the length of the ridgeboard if the building is 26 feet wide across the front and the length is 34 feet, the rafters to run from front to back.

UNIT III - THE EQUAL-PITCH GABLE ROOF

The Gable Studs | Lesson 8

OBJECTIVE: To learn how to lay out the gable studs.



x = Common Difference
In This Example every foot of run has
a rise of 6 inches
16" = $1\frac{1}{3}$ ft. Therefore $1\frac{1}{3} \times 6 = 8$, or
x = 8" (Common Difference)

FIG. 44

INFORMATION:

Gable studs are the studs that go from the end rafter to the wall plate. They require an angle cut on the top end to fit against the underside of the end rafter, and a square cut to rest on the wall plate. Cutting in the gable studs is, as a rule, an inconvenient operation, as most carpenters will do the measuring and cutting while standing on the ceiling beams. This inconvenient method of working can be eliminated, as the gable studs can be cut on the ground, provided the difference in length between the gable studs is known. The difference in length of the gable studs is found by applying the following rule:

> Multiply the rise per foot of the roof, expressed as a fraction, by the spacing of the studs.

Example: Assume the rise per foot is 6 inches and the stud spacing is 16 inches. Applying the rule, we get $\frac{6}{12} \times \frac{16}{1}$, which equal 8 inches. Therefore 8 inches is the difference in length.

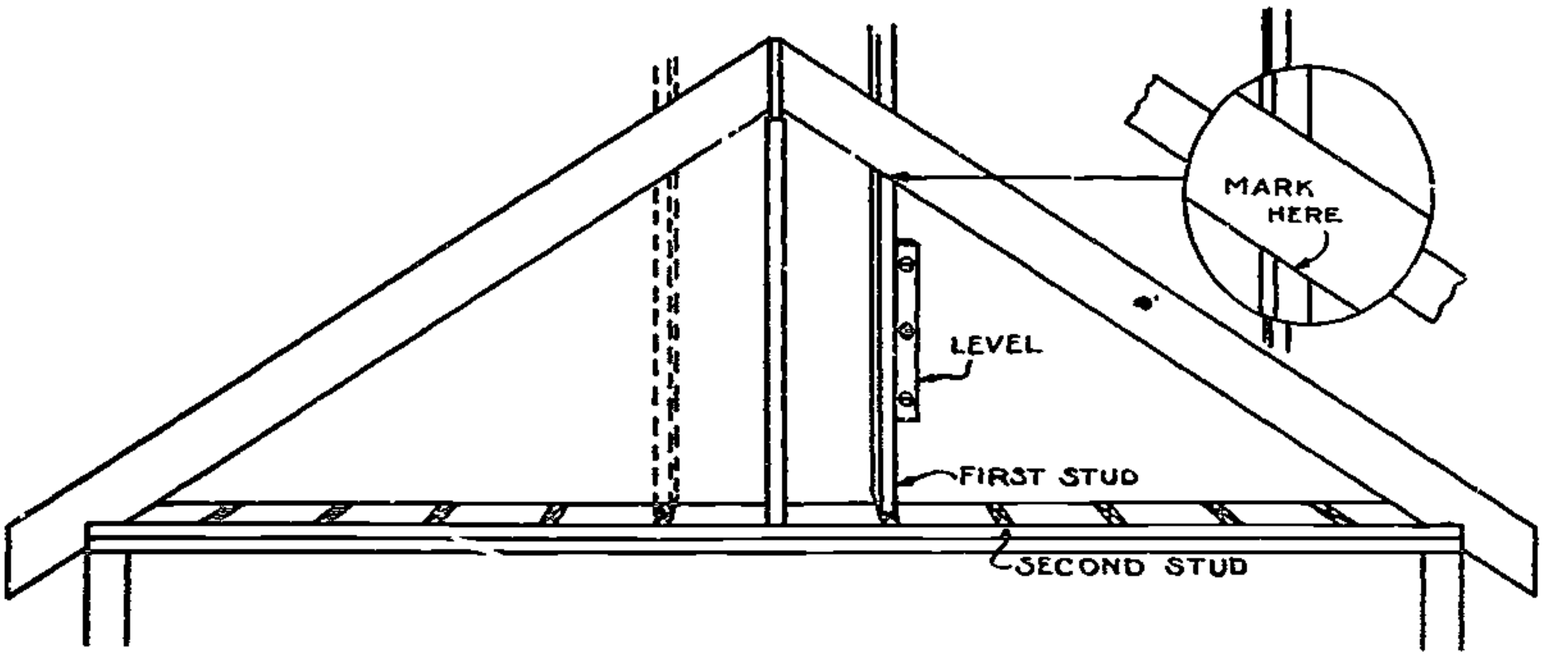


FIG. 45

To lay out the cut for the top end of the gable stud, use the rise per foot and the foot run (12 inches) on the square and cut on the rise. The quickest method of finding the length of the first gable stud is to place the stock in position and mark the length. Usually the first stud to cut is the longest one. The length of the other studs can be found by marking each the difference in length shorter than the previous one. In this example, each stud would be 8 inches shorter than the one next to it.

If a window is to be installed in the gable, measure one-half the opening size on each side of the center line. This is the starting point for the longest gable stud.

ASSIGNMENT:

Use a chalk line and on the floor of the shop lay out a gable and a set of gable studs. The total rise, total run, and spacing will be given to each student individually by the instructor.

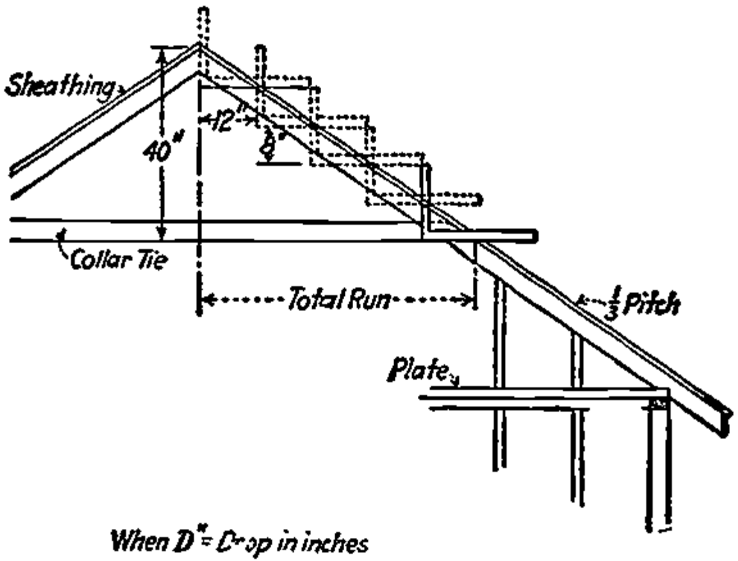
OBJECTIVE: To learn how to determine the length of a collar beam.

INFORMATION:

A collar beam is a piece of stock, usually a 1" x 6" or a 2" x 4", fastened to a pair of rafters in a horizontal position at a desired location between the ceiling joists and the ridge of the roof. The purpose of the collar beam is twofold -- to keep the building from spreading, and to add rigidity to the rafters. The lower the collar beam is from the ridge, the better it serves its purpose; also, the lower it is, the longer it is.

The rule to obtain the length of a collar beam is:

> Divide the "drop" in inches by the rise of the roof per foot of run. This will equal one-half the length of the collar beam. Multiply by 2 to get the actual length of the collar beam.



When D" = Drop in inches

- R" per Run = Rise in inches per foot of run
- L = Length Twice the total Run

$$2\left(\frac{D''}{R'' \text{ per } ' \text{ Run}}\right) = L$$

In this problem, 8 and 12 = cut

40" = Drop of Collar Tie (from peak of roof to under side of collar tie)

$\frac{40}{8} = 5.$ $2 \times 5 = 10$ Ans. 10 ft.

NOTE: For answer in inches multiply by 12

FIG. 46

Example: Assume an 8-inch rise per foot, and the collar beam to be 3 feet 4 inches from the ridge. Following the rule: The drop is 3 feet 4 inches, which equals 40 inches; $\frac{40}{8}$ equals 5. Multiplying 5 x 2 gives 10 feet, which is the length of the collar beam. The angle of the end cut is made by holding the square at the rise-per-foot mark and the foot-run mark (12), and marking along the 12-inch side of the square. The length can be either the top edge or the bottom edge of the collar beam.

Note: Dividing inches by inches does not give a number of feet as a result. What we are actually doing in following this rule is finding out how many steps of 8 inches each are required to step off 40 inches of drop. For every 8 inches of drop, there will of course be 12 inches of run. This represents one-half of the roof. Multiplying by 2 allows for the other half.

ASSIGNMENT:

Use the same roof as in Lesson 8 and lay out a collar beam. Individual figures will be given by the instructor.

UNIT III - THE EQUAL-PITCH GABLE ROOF

TEST

---

1. Use the step-off method described in Lesson 1 and lay out the common rafters (exact length) for roofs with the following dimensions:

RUN	RISE PER FOOT	RIDGEBOARD
9'6"	6"	2" x 8"
11'9½"	11"	2" x 10"

SPAN	TOTAL RISE	RIDGEBOARD
31'6"	7'6"	4" x 10"

2. Define the terms

   A. Fascia
   B. Soffit
   C. Gutter

3. Lay out the overhang, including seat cut:

RUN OF OVERHANG	RISE PER FOOT
14"	9"
9"	12"
15"	10"

4. The vertical distance from the top of the window to the top of the plate is 14½ inches. The rise per foot is 11 inches. The thickness of the soffit stock is ¼ inch. Lay out the overhang so that the soffit is exactly level with the top of the window. Allow 3 inches on the overhang level cut to nail the soffit to.

5. The longest gable stud is 7 feet 4 inches, and the rise per foot of the roof is 10 inches. The spacing required is 12 inches. Lay out the gable studs, using the longest gable stud as a pattern.

UNIT IV - THE EQUAL-PITCH HIP ROOF

Description of the Equal-Pitch Hip Roof Lesson 1

OBJECTIVE: To become familiar with the structural members of a hip roof.

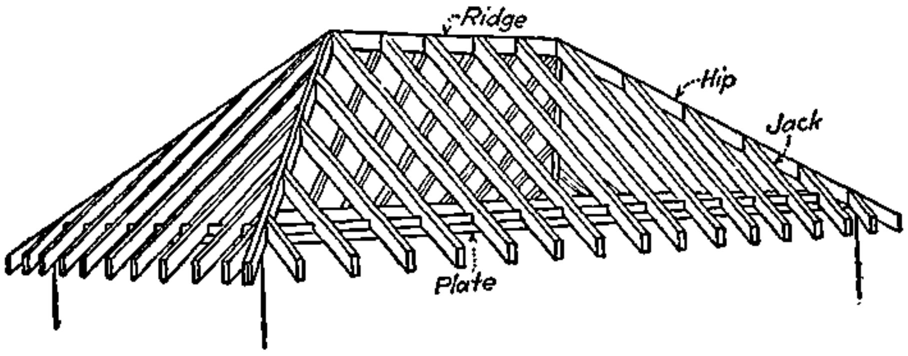


FIG. 47

INFORMATION:

In the preceding units, the gable roof was described as requiring only common rafters, with two slopes meeting at the ridge. An equal-pitch hip roof differs from a gable roof in that it has four slopes instead of two, all four slopes running toward the center of the building. A hip roof, like a gable roof, has common rafters and a ridge, but it also has hip rafters and hip jack rafters.

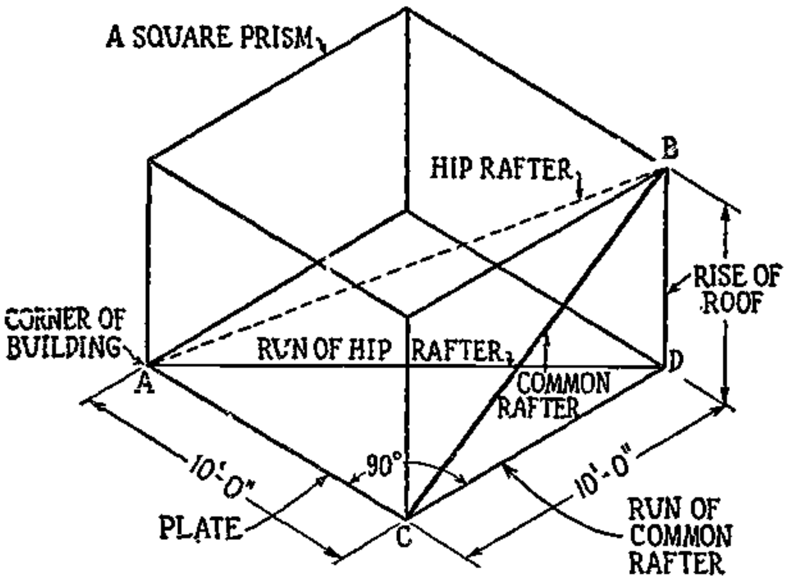

FIG. 48

The Hip Rafter

A hip rafter may be compared to the diagonal of a square prism. Its relation to the common rafter is the same as that of the hypotenuse of a right triangle to one of its sides. In a right triangle, if the sides forming the right angle are 12 inches each, the hypotenuse, that is, the side opposite the right angle, is equal to 16.97 inches, or, for practical purposes, 17 inches. The position of the hip rafter and its relation to the common rafter are clearly shown in Fig. 48.

The names of the cuts of a hip rafter are the same as in the common rafter, that is, a hip rafter will have a combination plumb and cheek cut at the ridge, a seat cut at the wall plate, and a tail cut at the overhang. The similarity ends here however, as the hip rafter cuts are different from the cuts of the common rafter.

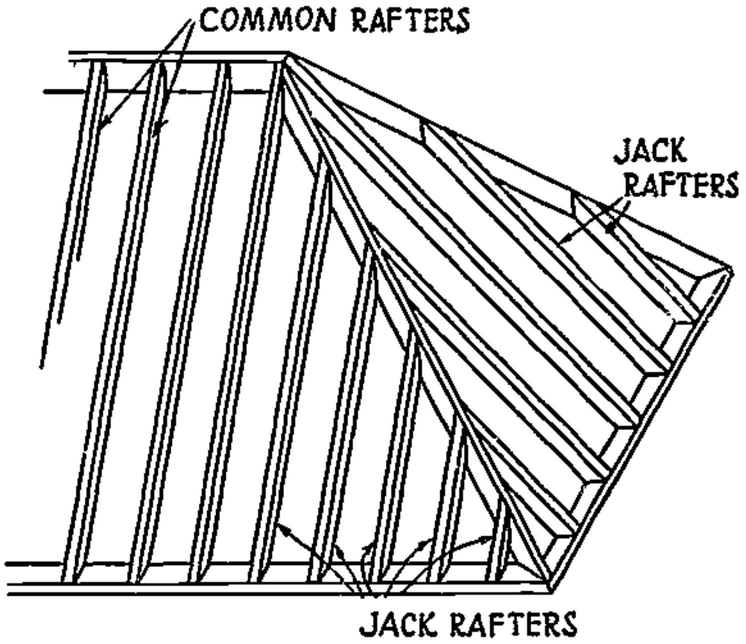

FIG. 49

Hip Jack Rafters

Hip jack rafters are basically common rafters that are progressively shortened to fit from the wall plate to the hip rafter. They are spaced the same distance apart as the common rafters, and, since they fill a triangularly shaped space on the roof, they must vary in length. The seat cut of a hip jack is the same as that of a common rafter. The top cut where it meets the hip rafter is a combination plumb and cheek cut. The combination cut will be described fully in the following lessons.

UNIT IV - THE EQUAL-PITCH HIP ROOF

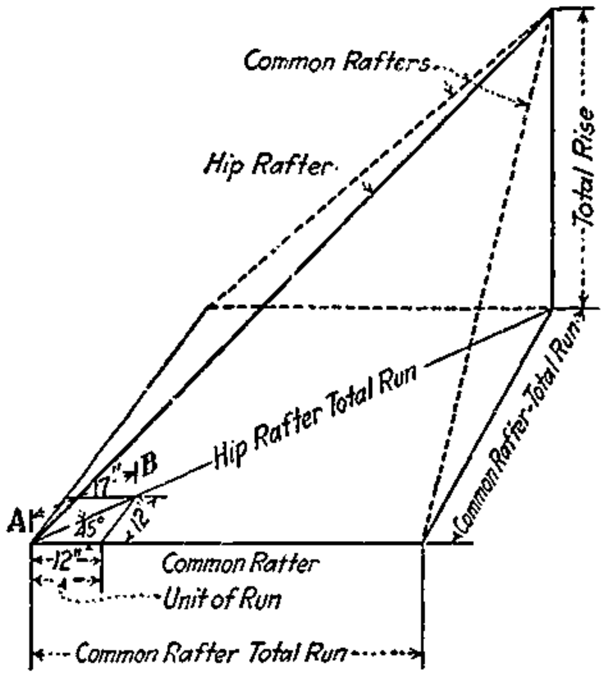
Unit of Run and Line Length

Lesson 2

OBJECTIVE: To become familiar with the unit run of the hip rafter.
To learn how to obtain the line length of the hip rafter.

INFORMATION:

In a gable roof the common rafters run at right angles to the wall plate, but in an equal-pitch hip roof, the hip rafters run at a 45-degree angle from the wall plate. This is the basis that determines the shape of the hip rafter cuts.



A-B Hip Unit of Run = 16.97" or 17"

FIG. 50

The Unit of Run

The unit of run of an equal-pitch hip rafter is based on the unit of run of a common rafter. That is, for every foot of run of the common rafter, the unit run of the hip rafter is the diagonal of a 12-inch square, which is 16.97", or, for practical purposes, 17 inches (see Fig. 50). This means that, instead of holding the 12-inch mark and the rise-per-foot mark to obtain level and plumb cuts, the 17-inch mark and the rise-per-foot mark are held.

Since the hip rafter will rise to exactly the same height as the common rafter, therefore the rise per foot is the same as for the common rafter. Plumb and level cuts are obtained by holding the 17-inch mark and the rise-per-foot mark on the square; the 17-inch mark will give the level cut and the rise-per-foot mark will give the plumb cut.

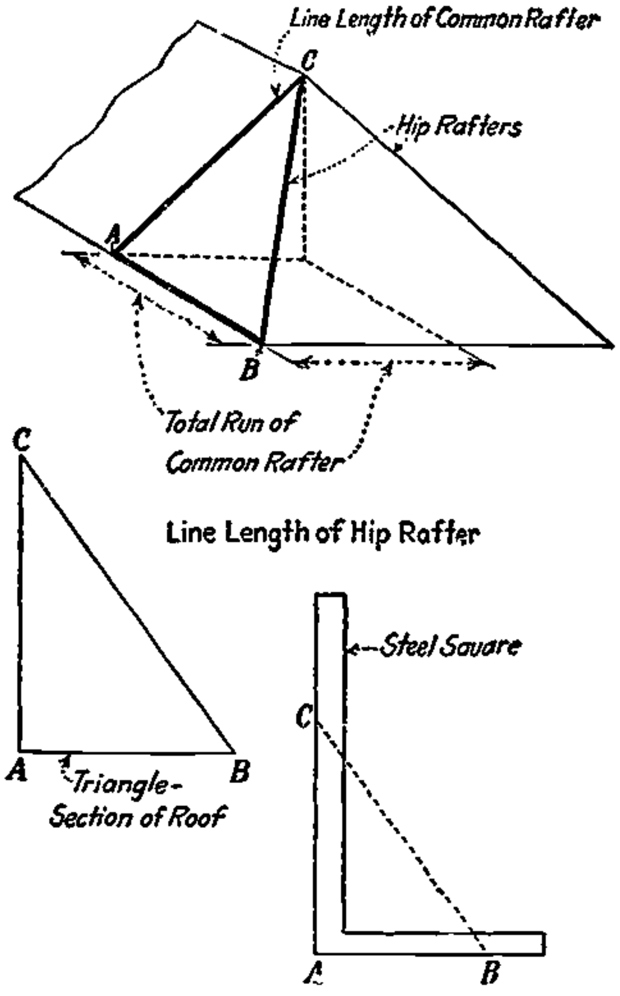


FIG. 51

Line Length

The rule for obtaining the line length of an equal-pitch rafter is:

> Line length equals the diagonal distance between the line length of the common rafter and the total run of the common rafter.

Use the $\frac{1}{12}$th scale on the framing square. The result equals $\frac{1}{12}$th the length of the hip rafter.

ASSIGNMENT:

Obtain the line length of a hip rafter in which the total rise is 8 feet, and the span is 30 feet. Check answer by also finding the mathematical length by using the rafter tables on the square.

Stepping Off the Length of a Hip Rafter

Lesson 3

OBJECTIVE: To learn how to step off a hip rafter.

INFORMATION:

The method of stepping off the length and obtaining the plumb and level cuts for a hip rafter is similar to the method used for the common rafter, except that the unit of run of the hip rafter is greater than that of the common rafter. This was explained in the previous lesson. Since both common and hip rafters are exactly the same height, the rise per foot and the total run are the same as for the common rafter. The hip rafter requires a "cheek" cut at the ridge, and also at the point where a fascia is to be nailed, whether it is at the wall plate or at the overhang. The stock for a hip rafter is almost always wider than the stock used for the common rafter; that is, if 2" x 6" stock is used for the common rafter, the stock for the hip rafter would be 2" x 8" or 2" x 10".

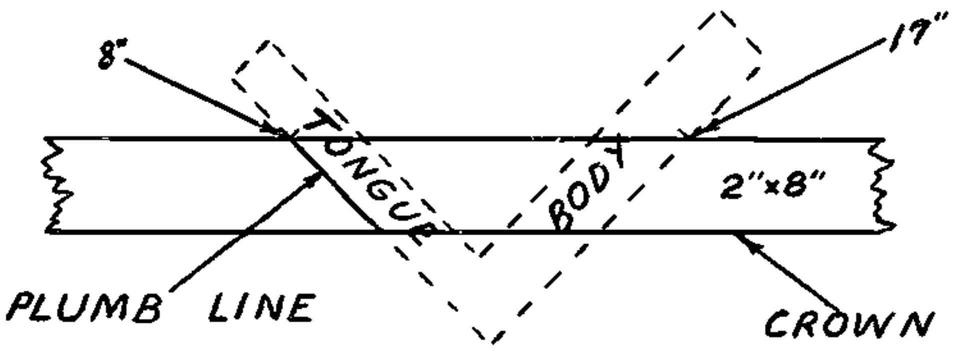

FIG. 52

Procedure:

Assume the rise per foot is 8 inches and the total run is 14 feet. Select the proper stock; in this case let us assume a 2" x 8". Place the crown edge toward you and start the layout at the extreme left end of the stock. Hold the square face up, tongue in the left hand, body in the right hand, heel toward you. Hold the 8-inch mark on the tongue and the 17-inch mark on the body, and mark along the tongue. This is a plumb line.

At this point, a slight difference in procedure in laying out the level line must be made. Since the hip rafter stock is 2" x 8", in order for the top

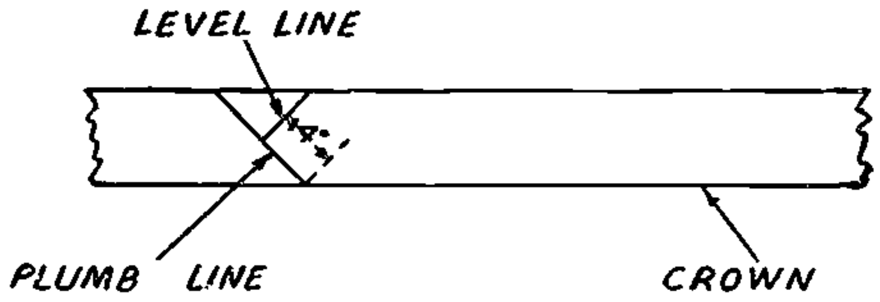

FIG. 53

edge of the common rafter and the top edge of the hip rafter to be exactly level with each other when in their proper positions on the roof, allowance must be made for the difference in width. To lay out the level line of the seat cut for the hip rafter, proceed as follows: At the seat cut of the common rafter, measure down from the top edge, along the plumb line, to the intersection point of the plumb and level lines. Assume this measurement is 4 inches. Then, on the plumb line of the hip rafter, measure along the plumb line, from the crown edge, the measurement found on the common rafter - in this case 4 inches. At this point lay out a level line. This level line will be longer than the level line of the common rafter. Now proceed with the step-off procedure.

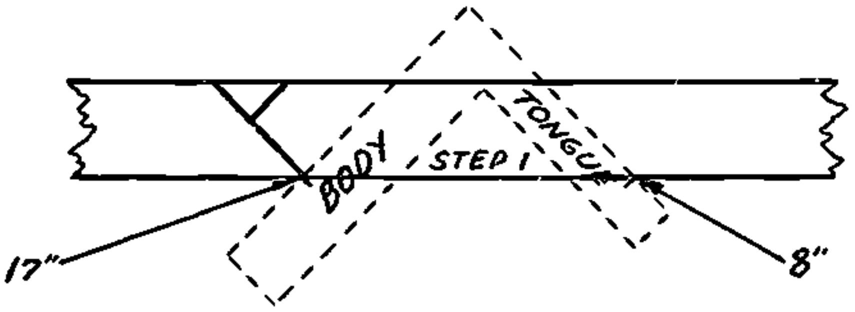

FIG. 54

Hold the square face up, the 17-inch mark on the body in the left hand, the 8-inch mark on the tongue in the right hand, heel away from you, the 17-inch mark coinciding with the plumb line. Step this off along the edge nearest you 14 times. This length is to the center of the ridgeboard.

ASSIGNMENT:

Using the step-off method, obtain the length for the following hip rafters:

Rise Per Foot	Total Run
7 inches	10 feet
9 inches	12 feet
10 inches	8 feet

UNIT IV - THE EQUAL-PITCH HIP ROOF

Backing Off a Hip Rafter — Lesson 4

OBJECTIVE: To learn how to back off a hip rafter.

INFORMATION:

If we were to nail the hip rafter in its proper position on the roof without "backing" it, and started to sheath up the roof, we would find that the sheathing would strike the outside top corners of the hip rafter and leave a space above the center of the hip rafter. Since all measurements in rafter layout work are always considered as being taken on the center line of the rafter, allowance must be made when laying out the hip rafter so that the sheathing will bypass the outside top corners and rest on the center of the hip rafter. This is called backing the rafter.

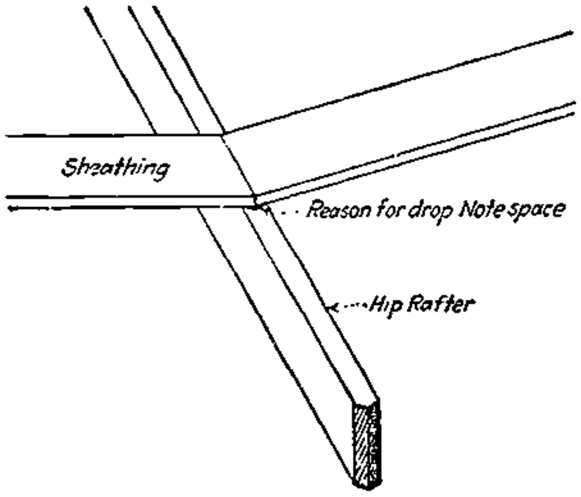

FIG. 55

There are two methods of doing this. Either "drop" the hip rafter by making the level part of the seat cut higher, thus letting the rafter drop, or else back the top edges of the hip rafter by planing them on a bevel, the high part of the bevel being in the center of the hip rafter. Dropping the hip rafter at the seat cut is much the easier method, and can be done when the seat cut is being laid out. The amount of the drop will vary according to the rise per foot of the rafter.

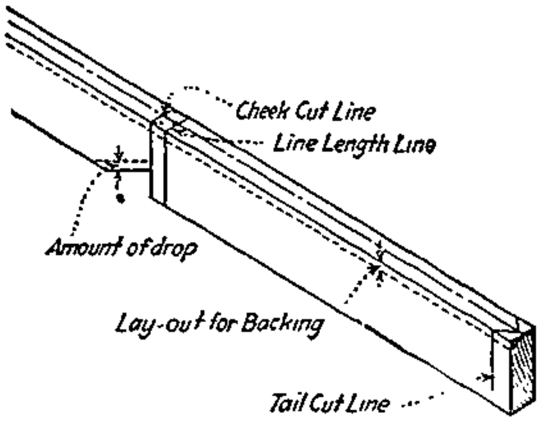

FIG. 56

Procedure for backing

Lay out a seat cut for the hip rafter as explained in the previous lesson. Stand the rafter on edge, crown up. Square a line across the edge at the plumb line, and find the center of the squared line. Mark the center by means of a dot, not a thick pencil line. On the sixth line of the rafter tables read "Side cut of hip or valley use"; look under the rise per foot, in this example 8 inches, and find the figure $10\frac{7}{8}$. Grasp the square, body in the left hand, tongue in the right hand, heel away from you. Hold the 12-inch mark on the body and the $10\frac{7}{8}$-inch mark on the tongue, the outside edge of the body passing through the center mark, and mark along the body of the square. Lay out a second plumb line from this mark. From this second plumb line measure down from the crown edge, the distance previously measured along the first plumb line (4 inches). From this point lay out a second level line. This is the level line to actually cut. Note that the second level line is higher than the first level line. The distance between the first and second level lines is the distance the hip rafter has been "dropped." The side cut made on the edge of the rafter is the side cut at the wall plate if there were no overhang.

ASSIGNMENT:

Lay out the seat cuts, including backing, for the following hip rafters. Common rafters are 2" x 6".

Rise Per Foot	Stock for Hip Rafter
9 inches	2" x 8"
6 inches	2" x 12"
12 inches	4" x 8"
10 inches	2" x 10"

UNIT IV - THE EQUAL-PITCH HIP ROOF

Overhang of the Hip Rafter

Lesson 5

OBJECTIVE: To learn how to lay out the overhang when run measurement is given.

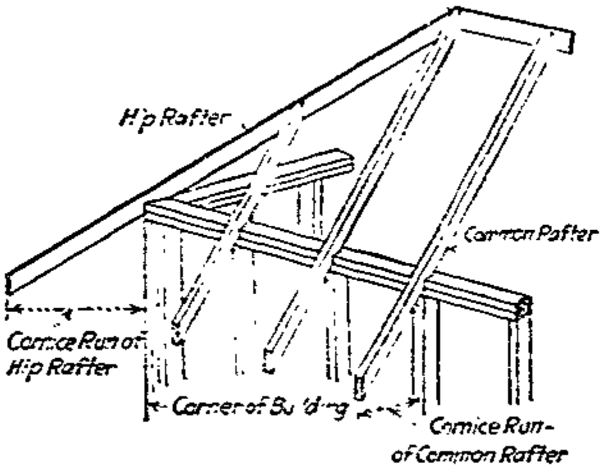

FIG. 57

INFORMATION:

Finding the overhang of a hip rafter is a separate procedure after determining the length. To find the exact overhang length of the hip rafter, the run of the common rafter overhang must first be known, because the overhang run of the hip rafter is the 45-degree diagonal distance based on the overhang run of the common rafter (see Fig. 57). The tail cut of the overhang is usually a double cheek cut, as shown in Fig. 55.

Procedure:

The method of laying out this type of overhang is the same as the method described in Unit III Lesson 5, except that allowance must be made for the difference in the width of the hip rafter stock. This was fully described in Lesson 3 of this unit.

ASSIGNMENT:

Lay out the overhang for the following hip rafters:

Overhang run of common rafter 8" - Rise per foot 9"
Overhang run of common rafter 10" - Rise per foot 12"
Overhang run of common rafter 6" - Rise per foot 8"
Overhang run of common rafter 12" - Rise per foot 6"

Common rafters are 2" x 6"; hip rafters, 2" x 8".

Overhang Level to the Top of Window — Lesson 6

OBJECTIVE: To learn how to lay out this type of overhang.

INFORMATION:

In this type of overhang, no run measurement is given for the overhang; the plan will show that the overhang is level with the top of the window, and a soffit is required from the overhang to the top of the window.

Procedure:

The procedure to lay out this type of overhang is the same as described in Unit III Lesson 6. Allowance must be made for the difference in the width of the hip rafter stock, as described in Lesson 3 of this unit.

ASSIGNMENT:

Lay out the overhang and seat cut for the following hip rafters. The common rafters are 2" x 6" stock; the hip rafter is 2" x 8" stock; soffit stock, $\frac{1}{4}$ inch.

Distance from top of plate to top of window 10"; rise per foot 9"

Distance from top of plate to top of window 14"; rise per foot 8"

Distance from top of plate to top of window 12"; rise per foot 6"

UNIT IV - THE EQUAL-PITCH HIP ROOF

Odd Inches in the Total Run

Lesson 7

OBJECTIVE: To learn the layout procedure for odd inches in the total run.

INFORMATION:

For obtaining the odd inches in the total run of a hip rafter, the procedure is the same as that explained for a common rafter in Unit III Lesson 2, except that, since the unit of run for a hip is 17 inches, the odd inches must also be figured as the fractional part of 17 inches.

To illustrate: Assuming the total run of the <u>common</u> rafter is 10 feet 8 inches, to get the fractional part of the last step for the common rafter, we would simply add 8 inches to the step-off procedure as described in Unit III Lesson 2. In a hip rafter, however, the unit of run is 17 inches. Since $\frac{17}{12}$ equals $1\frac{5}{12}$, we must multiply 8 inches by $1\frac{5}{12}$ if we are to get the correct fractional part of the last step.

$$\begin{array}{r} 8 \\ \times\ 1\frac{5}{12} \\ \hline 3\frac{4}{12} \\ +\ 8 \\ \hline 11\frac{4}{12} \end{array}$$

Thus, instead of 8 inches, add $11\frac{4}{12}$ inches. The rule for odd inches for a hip rafter is:

> Multiply the odd inches in the total run by $1\frac{5}{12}$ to get the number of inches to add.

The method of holding and marking the square is the same as described for the common rafter in Unit III Lesson 2.

ASSIGNMENT:

1. Figure mathematically the number of inches to add to the step-off procedure of a hip rafter if the runs are:

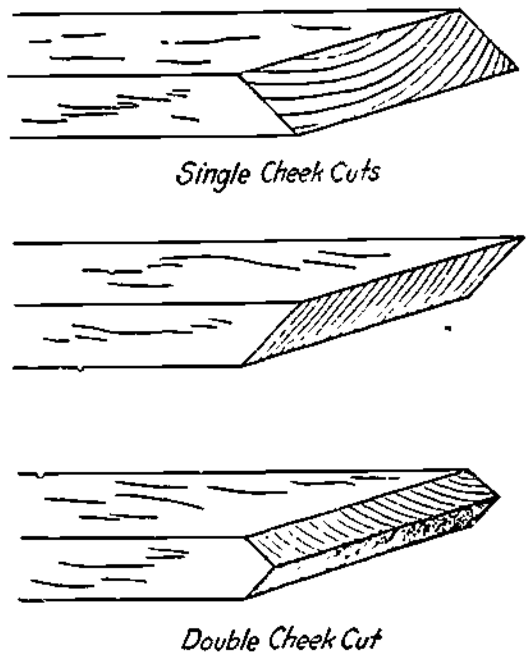
   9 feet 6 inches
   9 feet 9 inches
   9 feet $10\frac{1}{2}$ inches

2. Step off the length of a hip rafter where the rise per foot is 6 inches and the total run is 8 feet 5 inches.
   Use 2" x 6" stock for the common rafter and 2" x 8" stock for the hip rafter.

UNIT IV - THE EQUAL-PITCH HIP ROOF

Deduction for the Ridgeboard - Single Cheek Cut — Lesson 8

OBJECTIVE: To learn the methods of construction at the ridgeboard.
To learn the procedure for the single cheek cut.



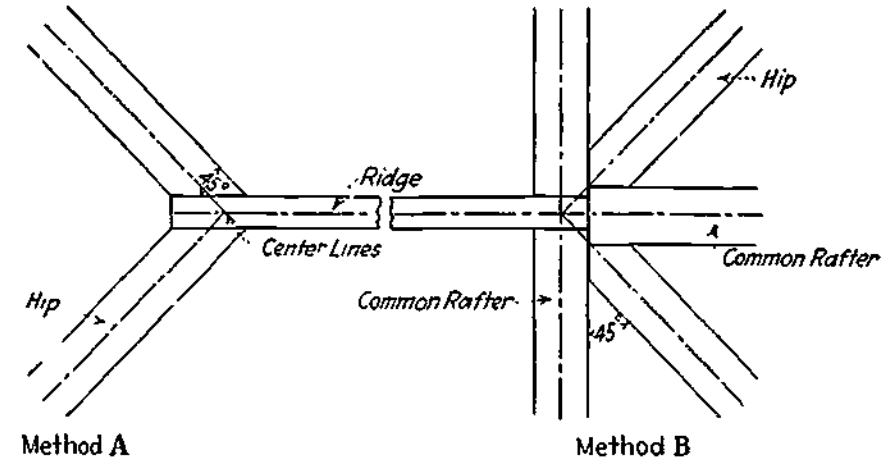
Single Cheek Cuts

Double Cheek Cut

FIG. 58

INFORMATION:

The ridge cut of a hip rafter is not a square cut, but a combination plumb and cheek cut. There are two types of cheek cuts: type A, the single cheek cut, also called a full cheek cut, and type B, the double cheek cut, also called a V-cut. The deduction to be made at the top of the hip rafter for the thickness of the ridgeboard is different from that of the common rafter.



Method A
Hip framed to Ridge

Method B
Hip framed to Common Rafter

FIG. 59

Allowance for the Thickness of the Ridgeboard for Type A

Note that the full thickness of the hip rafter fits against the ridgeboard. This requires a single cheek cut. To obtain the exact length of the hip rafter for this type of construction, apply this rule:

> After stepping off the rafter length (total run), deduct one-half the diagonal distance of the thickness of the ridgeboard, then add one-half the thickness of the hip rafter stock.

It is important that this rule be followed, since no universal figures can be given; the figures in each case will vary according to the thickness of the materials used for the ridgeboard and for the hip rafter. The length of the hip rafter found by applying the rule is to the long edge of the cheek cut.

Note: In applying the above rule, three-fourths of the thickness of the ridgeboard may be used instead of one-half the diagonal distance of the ridgeboard. This is easier to find and easier to figure with. The actual difference between half the diagonal distance of the thickness of the ridgeboard, and three-quarters of the thickness of the ridgeboard is less than the thickness of a pencil line.

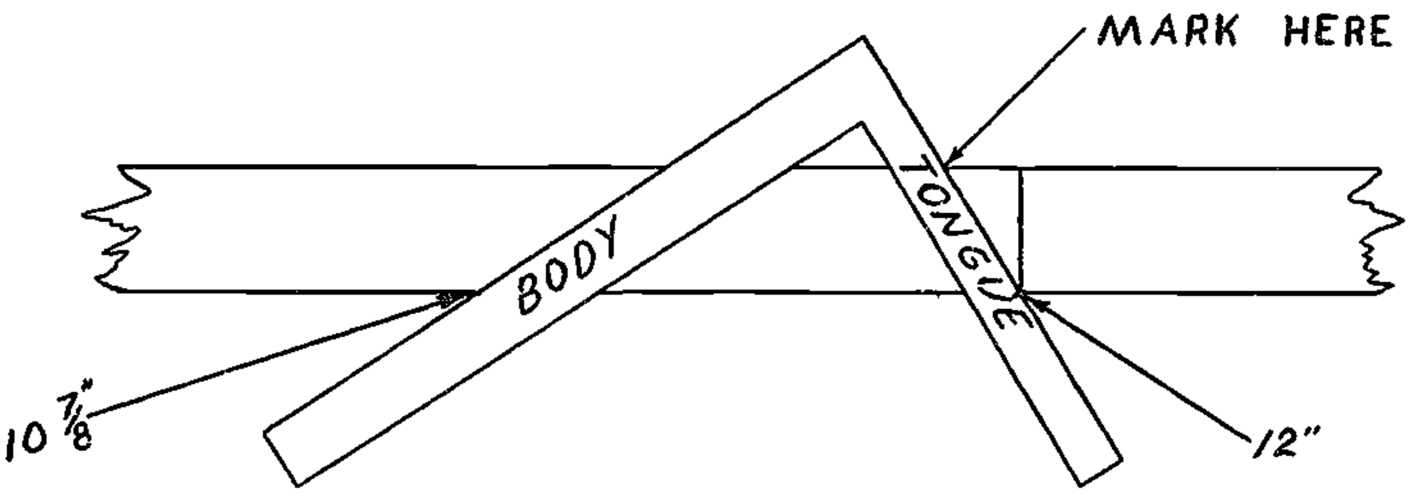


FIG. 60

Procedure To Obtain the Angle of the Cheek Cut

On the rafter table, sixth line down, find the line "Side cut hip or valley use." On the outside edge under the figure 8 inches - which is the rise per foot in this example - on the sixth line of the rafter tables find the figure $10\frac{7}{8}$.

From the plumb line, square across the top edge of the rafter. Hold the square with the tongue in the right hand, body in the left hand, heel away from you; hold the 12-inch mark on the tongue and the $10\frac{7}{8}$-inch mark on the body, so that the 12-inch mark on the tongue meets the line squared across the top edge. Mark along the tongue.

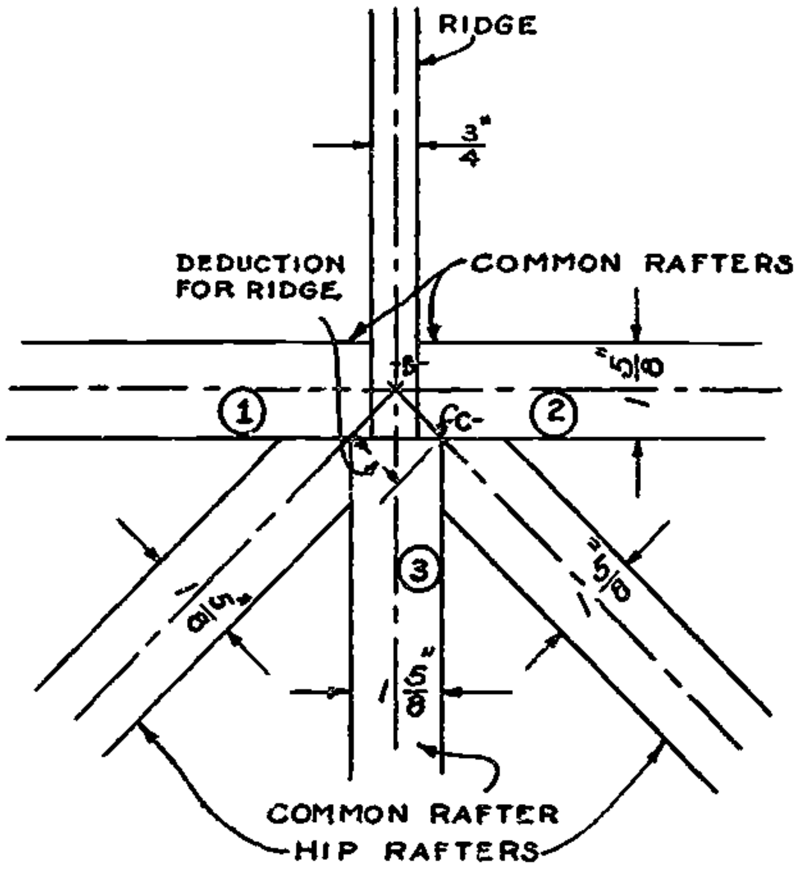
ASSIGNMENT:

Find the exact length of a hip rafter with a full cheek cut:
rise per foot is 10 inches, run is 5 feet 9 inches,
ridgeboard stock is 2 x 8, and the hip rafter stock is 2 x 8.
Include backing at the seat cut and no overhang.

UNIT IV - THE EQUAL-PITCH HIP ROOF

Deduction for the Ridgeboard - Double Cheek Cut Lesson 9

OBJECTIVE: To learn the procedure for the double cheek cut.



INTERSECTION AT RIDGE OF HIP AND COMMON RAFTERS

FIG. 61

INFORMATION:

Fig. 61 shows a plan view of the ridge at the intersection of the hip and common rafters. Common rafters 1 and 2 butt against the two sides of the ridgeboard. Rafter 3 butts against the end of the ridgeboard and acts as a ridgeboard between the two hip rafters. The hip rafters fit into the angles made by the three common rafters; thus a double cheek cut - also called a V-cut - is required. As may be seen, the length of the hip rafter is shorter than the length required for a full cheek cut.

To obtain the exact length of the hip rafter for this type of construction, apply this rule:

> After stepping off the rafter length (total run), deduct one-half the diagonal distance of the thickness of the ridge, or, as explained in the previous lesson, substitute three-fourths of the thickness of the ridge.

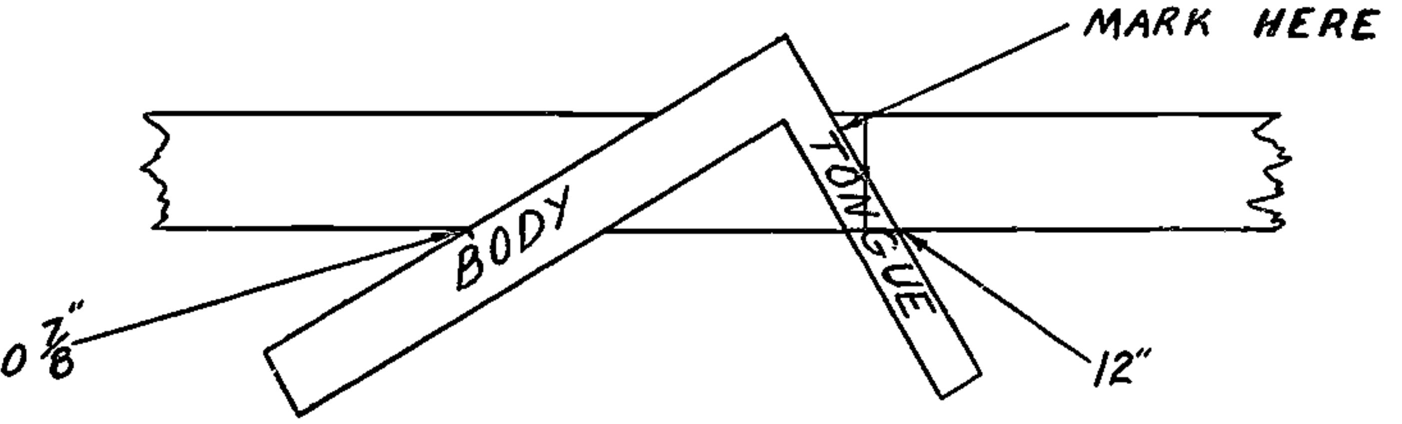


FIG. 62

Procedure to obtain the angle of the V-cut

On the rafter table, sixth line down, find the line "Side cut hip or valley use." On the outside edge, under the figure 8"(rise per foot) on the sixth line of the rafter tables find the figure $10\frac{7}{8}$. From the plumb line, square across the top edge of the rafter. Find the center of this squared line and mark it with a dot (do not make a thick pencil line). Hold the square, tongue in the right hand, body in the left hand, heel away from you; hold the 12-inch mark on the tongue and the $10\frac{7}{8}$-inch mark on the body; slide the square until the outer edge of the tongue passes through the center mark. Mark along the tongue. Mark only from the edge away from you to the center line; do not mark completely across the edge.

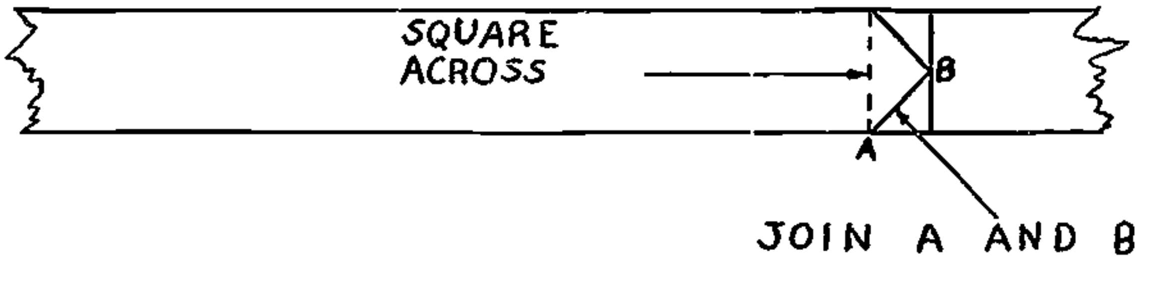

FIG. 63

From the angle line, square across to the edge nearer you; then join the center to the squared line. (See Fig. 63.) From the angle lines a plumb line must be made for cutting purposes.

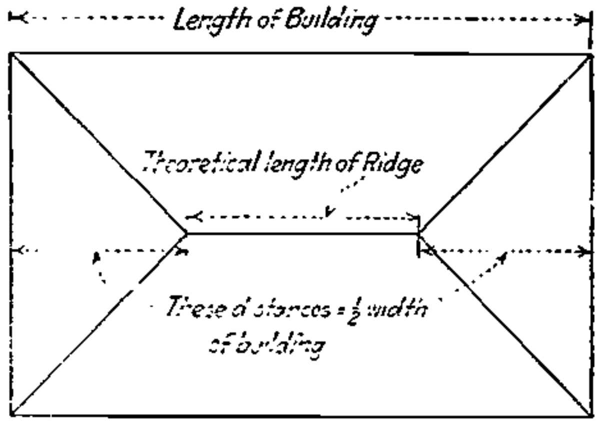
ASSIGNMENT:

> Find the exact length of a hip rafter with a V-cut. Rise per foot, 6 inches; run, 5 feet 10 inches. Ridgeboard stock is 2" x 8" and the hip rafter stock is 2" x 8". Include backing at the seat cut and overhang. The common rafter run for the overhang is 14 inches.

Length of the Ridgeboard

Lesson 10

OBJECTIVE: To learn how to obtain the length of the ridgeboard.



NOTE: Length of Building - Width of Building = theoretical length of Ridge

FIG. 64

INFORMATION:

There are two lengths for a hip-roof ridge: first the theoretical length, and second the actual length. The theoretical length is always the difference between the width and length of the building (see Fig. 64), while the actual length is based on the type of construction used.

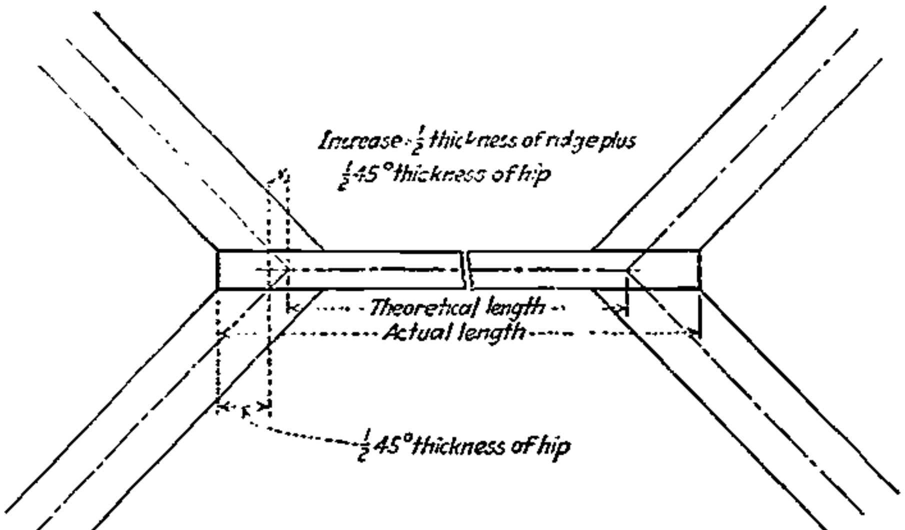


FIG. 65

Fig. 65 illustrates the actual length of the ridge when the hip rafter is framed to it. For this type of construction, to the theoretical length of the ridgeboard must be added the thickness of the ridge stock and the 45-degree thickness of the hip rafter. Fig. 65 shows one-half the thickness added to each end.

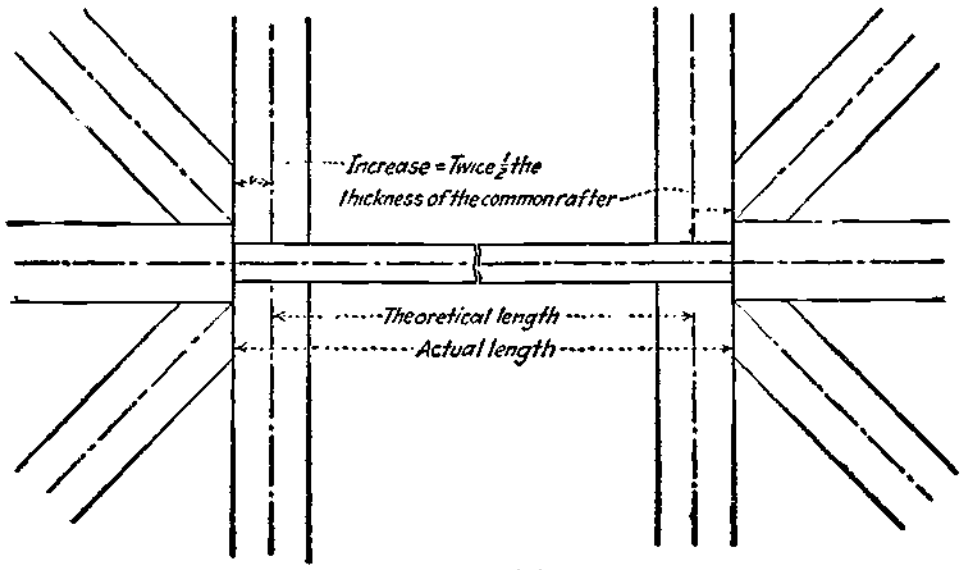

FIG. 66

Fig. 66 shows the ridgeboard length when the hip rafter is framed to the common rafters. In this type of construction only the thickness of the common rafter stock is added to the theoretical length of the ridgeboard.

If the roof is hipped at only one end, the ridgeboard length is increased one-half the amounts described.

OBJECTIVE: To become familiar with the principles of hip jack rafters.

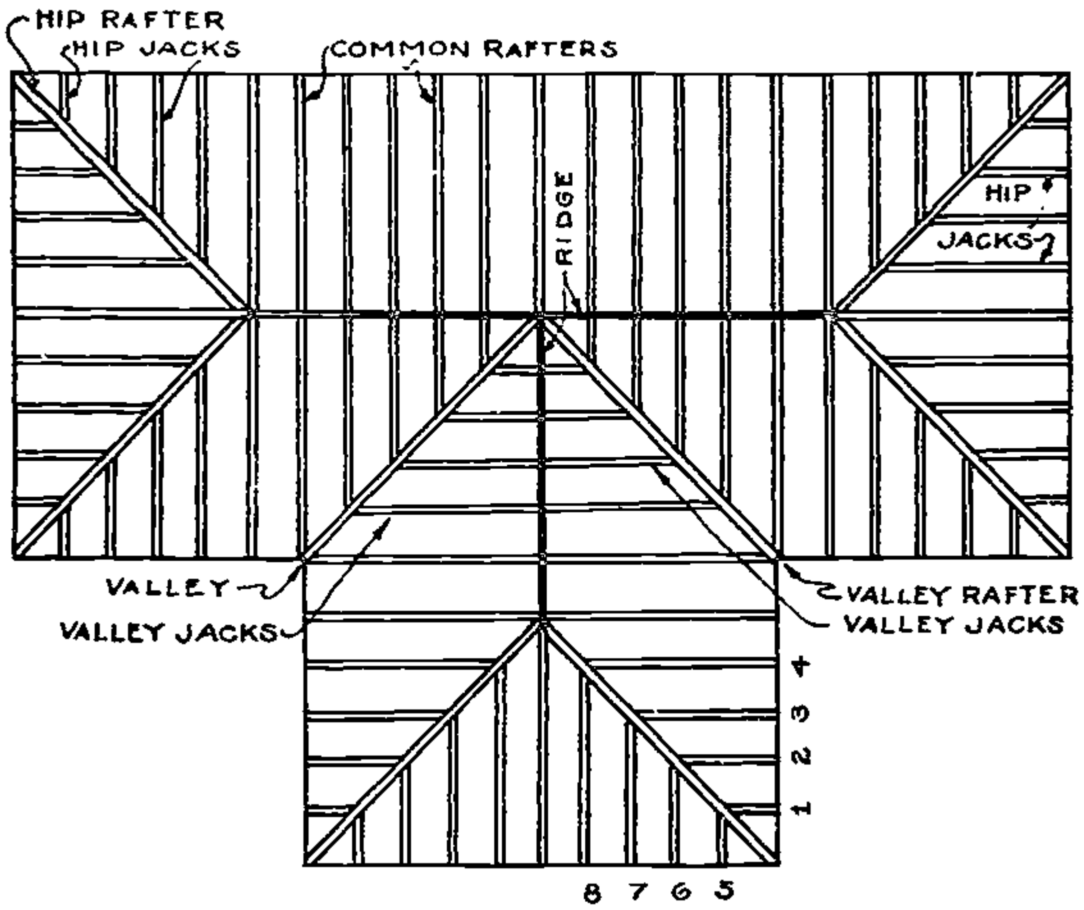

FIG. 67

INFORMATION:

Hip jack rafters are those rafters that extend from the plate to the hip and fill in the triangular spaces between the common rafters and the hip rafters. Basically they are "discontinued" common rafters, or common rafters cut off to fit against the hip rafter. The plumb and level cuts are the same for a common rafter, except that the plumb cut at the top end must be beveled to fit against the hip rafter. This angle is called a cheek or side cut. Since they fill in a triangular space, hip jack rafter lengths will vary, depending on their position on the roof.

Length of Jack Rafters

There are basically two methods to obtain the length of hip jacks, namely, the line-length method, and the step-off method, but there are several ways of doing each method. These methods will be fully explained later. For equal-pitched hip or valley roofs, the rafter tables on the framing square will give the required information to lay out hip jacks. On the rafter tables, 3rd line, is given "Difference in length of jacks 16 inches center," and the 4th line gives the "Difference in length of jacks 24 inches center." These figures indicate the length of the first or shortest jack, which is also the difference in length between the first and second, between the second and third jack, and so on until the longest jack is reached.

Rule: To find the length of a hip jack rafter, multiply the difference in length by the number indicating the position of the jack rafter. This will give the theoretical length. To obtain actual length, deduct three-fourths of the thickness of the hip rafter.

Example: Assume the rise per foot of the common rafter is 7 inches and the spacing of the hip jacks to be 16 inches. The problem is to find the length of the third jack. On the third line of the rafter tables under the figure 7 (rise per foot), find $18\frac{1}{2}$. This means the first or shortest jack is $18\frac{1}{2}$ inches long. It is also the difference in the length of each succeeding jack. Since the length of the third jack is sought, multiply $18\frac{1}{2}$ by 3, which equals $55\frac{1}{2}$ inches. From this length, deduct three-fourths of the thickness of the hip rafter. If the stock of the hip rafter is 2" x 10", $\frac{3}{4} \times 1\frac{5}{8} = 1\frac{7}{32}$ inches. Actual length will be $54\frac{9}{32}$ inches ($1\frac{7}{32}$ inches deducted from $55\frac{1}{2}$ inches), or, for practical purposes, $54\frac{1}{4}$ inches.

The same method is used when the length of jacks spaced 24 inches is required.

ASSIGNMENT:

Find the actual length of the following hip jacks. Use 2" x 8" as the stock for the hip rafter.

Rise per foot 9"	Spacing 16 inches	4th jack
Rise per foot 6"	Spacing 24 inches	3rd jack
Rise per foot 11"	Spacing 16 inches	5th jack

OBJECTIVE: To learn how to lay out hip jack rafters, using the common rafter pattern.

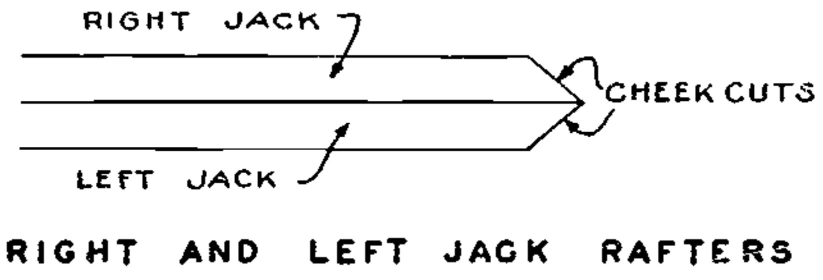

FIG. 68

INFORMATION:

Laying out a set of hip jack rafters is really a simple procedure. The previous lesson described the theoretical way of obtaining jack rafter lengths. In actual practice, the layout procedure is very simple when the common rafter is used as a pattern. The layout is always started from the longest jack for two reasons. The first reason is to make certain that the longest jack is the required number of inches away from the common rafter, and the second reason is to eliminate any waste of lumber, as the short jacks can be cut from the waste of the longer jacks. Two jacks are required for each length - a right and a left - with opposite cheek cuts.

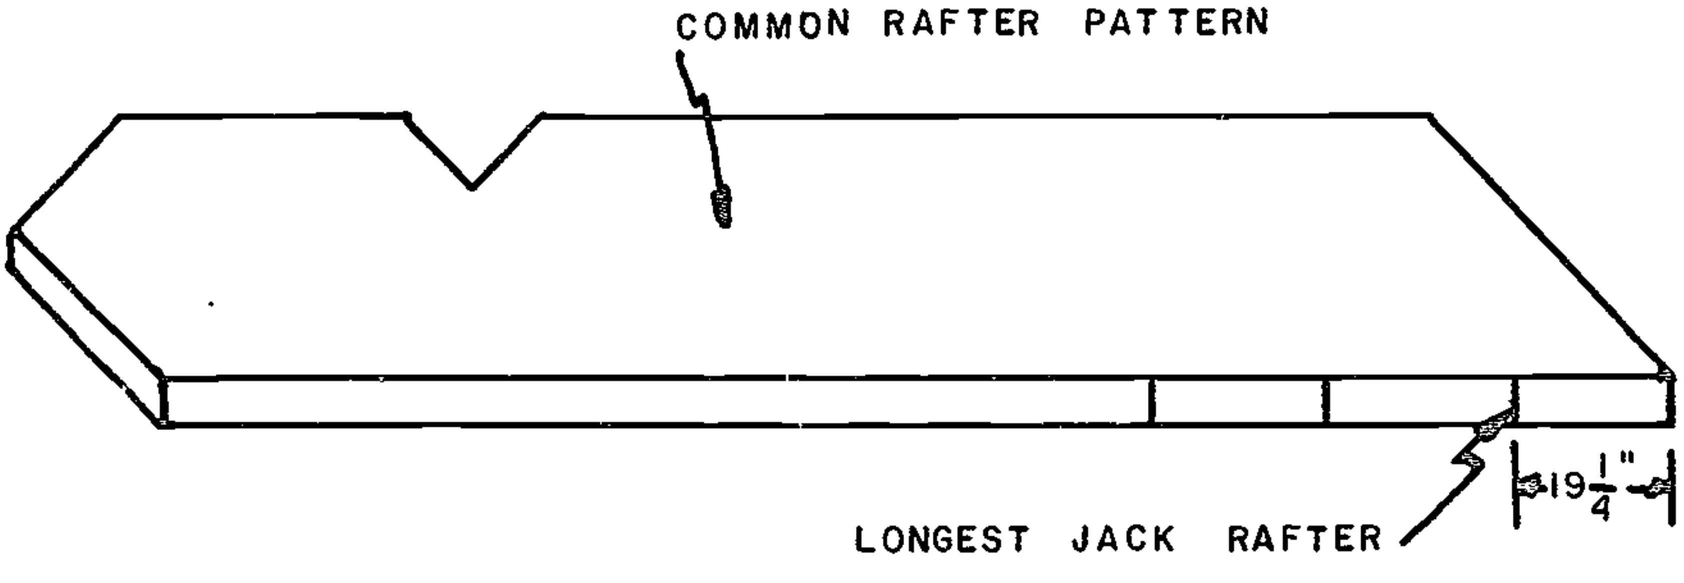

FIG. 69

Procedure:

Assume the rise per foot is 8 inches, the spacing 16 inches. Under the figure 8, third line of the rafter tables, find 19¼ inches. This is the difference in length. On the common rafter pattern, from the long point of the plumb cut, measure back along the top edge 19¼ inches. This is the length of the longest jack. From this point measure back another 19¼ inches. This is the length of the second longest jack. Repeat the procedure until the seat cut of the common rafter has been reached.

Square these marks across the top edge of the common rafter pattern. (See Fig. 69.) From these marks the entire set of hip jacks can be laid out.

ASSIGNMENT:

On the common rafter pattern, lay out the lengths of hip jacks for the following hip roofs:

Rise Per Foot	Span	Spacing
6 inches	22'0"	16 inches on center
9 inches	25'0"	24 inches on center
8½ inches	28'0"	16 inches on center

UNIT IV - THE EQUAL-PITCH HIP ROOF

The Top and Bottom Cuts of Hip Jack Rafters

Lesson 13

OBJECTIVE: To learn how to lay out the cuts of hip jack rafters.

INFORMATION:

As stated in a previous lesson, hip jack rafters are basically discontinued common rafters. As the hip jack rafters are parallel to the common rafters, the figures to use to obtain the cuts of the hip jack rafters are the same figures used for the common rafters. The seat cut, overhang, and overhang cuts are exactly the same as the corresponding parts of the common rafter, so that the common rafter pattern can be used to lay out the seat cut and overhang of the hip jacks. The end of the hip jack that fits against the hip rafter must have a combination plumb and cheek cut. The plumb cut is exactly the same for the common rafter, but the hip jack also has a cheek cut.

Procedure to obtain the cheek cut

RULE: To obtain the cheek cut for a hip jack rafter, take the figure shown on the rafter table, "Side cut of jacks use" under the rise-per-foot figure; hold this figure on the body of the square, and the 12-inch mark on the tongue and mark along the tongue.

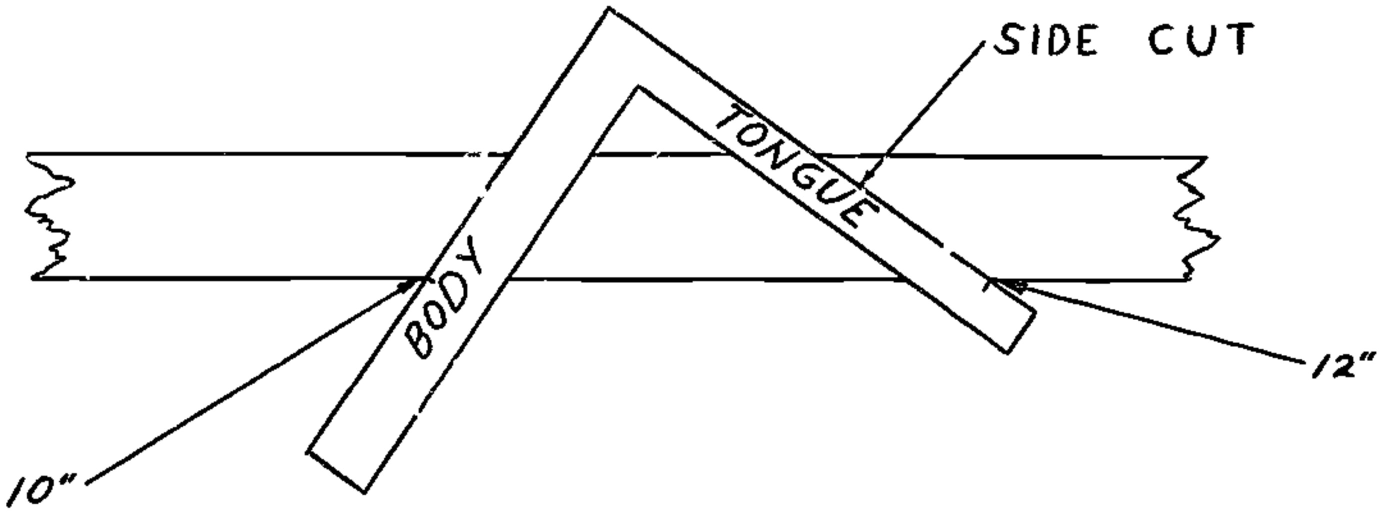

FIG. 70

EXAMPLE: Find the top cut for jack rafters where the rise per foot is 8 inches. Under the figure 8 on the fifth line ("Side cut of jacks use"), find the figure 10. Hold the 10-inch mark on the outside edge of the body of the square in the right hand, and the 12-inch mark on the outside edge of the tongue; mark along the tongue. This is the side cut for the hip jacks. (See Fig. 70.)

The plumb cut is marked across the face of the rafter from the long point of the cheek cut.

ASSIGNMENT:

Lay out the plumb and cheek cuts for the following hip jack rafters:

Rise per foot 9 inches

Rise per foot 12 inches

Rise per foot 15 inches

UNIT IV - THE EQUAL-PITCH HIP ROOF

TEST

---

1. Describe the structural members of a hip roof.

2. How does a hip roof differ from a gable roof?

3. A hip rafter may be compared to the __________ of a __________ __________.

4. In a right triangle, if the sides forming the right angle are 12 inches each, what is the length of the hypotenuse?

5. Describe the various cuts on a hip rafter and where they are placed on a roof.

6. The seat cut of a hip jack rafter is the same as that of a __________ __________.

7. Hip rafters run at a __________ angle from the __________ __________ to the __________.

8. What are the figures to use on the square to obtain plumb and level cuts for a hip rafter? State which figure will give the level cut and which figure will give the plumb cut.

9. Lay out the seat cuts, including backing, for the following hip rafters: Common rafters are 2" x 6".

Rise Per Foot	Stock of Hip Rafter
9"	2" x 8"
12"	2" x 12"
6"	2" x 10"

10. Obtain the length of the following hip rafters, using the step-off method. Use 2" x 8" stock.

Rise Per Foot	Total Run
7 inches	10 feet 4 inches
8 inches	12 feet 9 inches
10 inches	14 feet 10 inches

11. Lay out a complete hip roof, overhang to be level with the top of windows, spacing of rafters to be 16 inches on center. Use 2" x 6" for common rafters, 2" x 8" for hip rafters. The dimensions are as follows:

Total run, 9 feet 6 inches
Rise per foot, 7 inches
Vertical distance from top of window to top of wall plate, 10 inches
Double cheek cut at ridge cut of hip rafter
Soffit stock $\frac{1}{4}$ inch

UNIT V - THE EQUAL-PITCH INTERSECTING ROOF

Types of Rafters in an Intersecting Roof — Lesson 1

OBJECTIVE: To become familiar with the roof members of an intersecting roof.

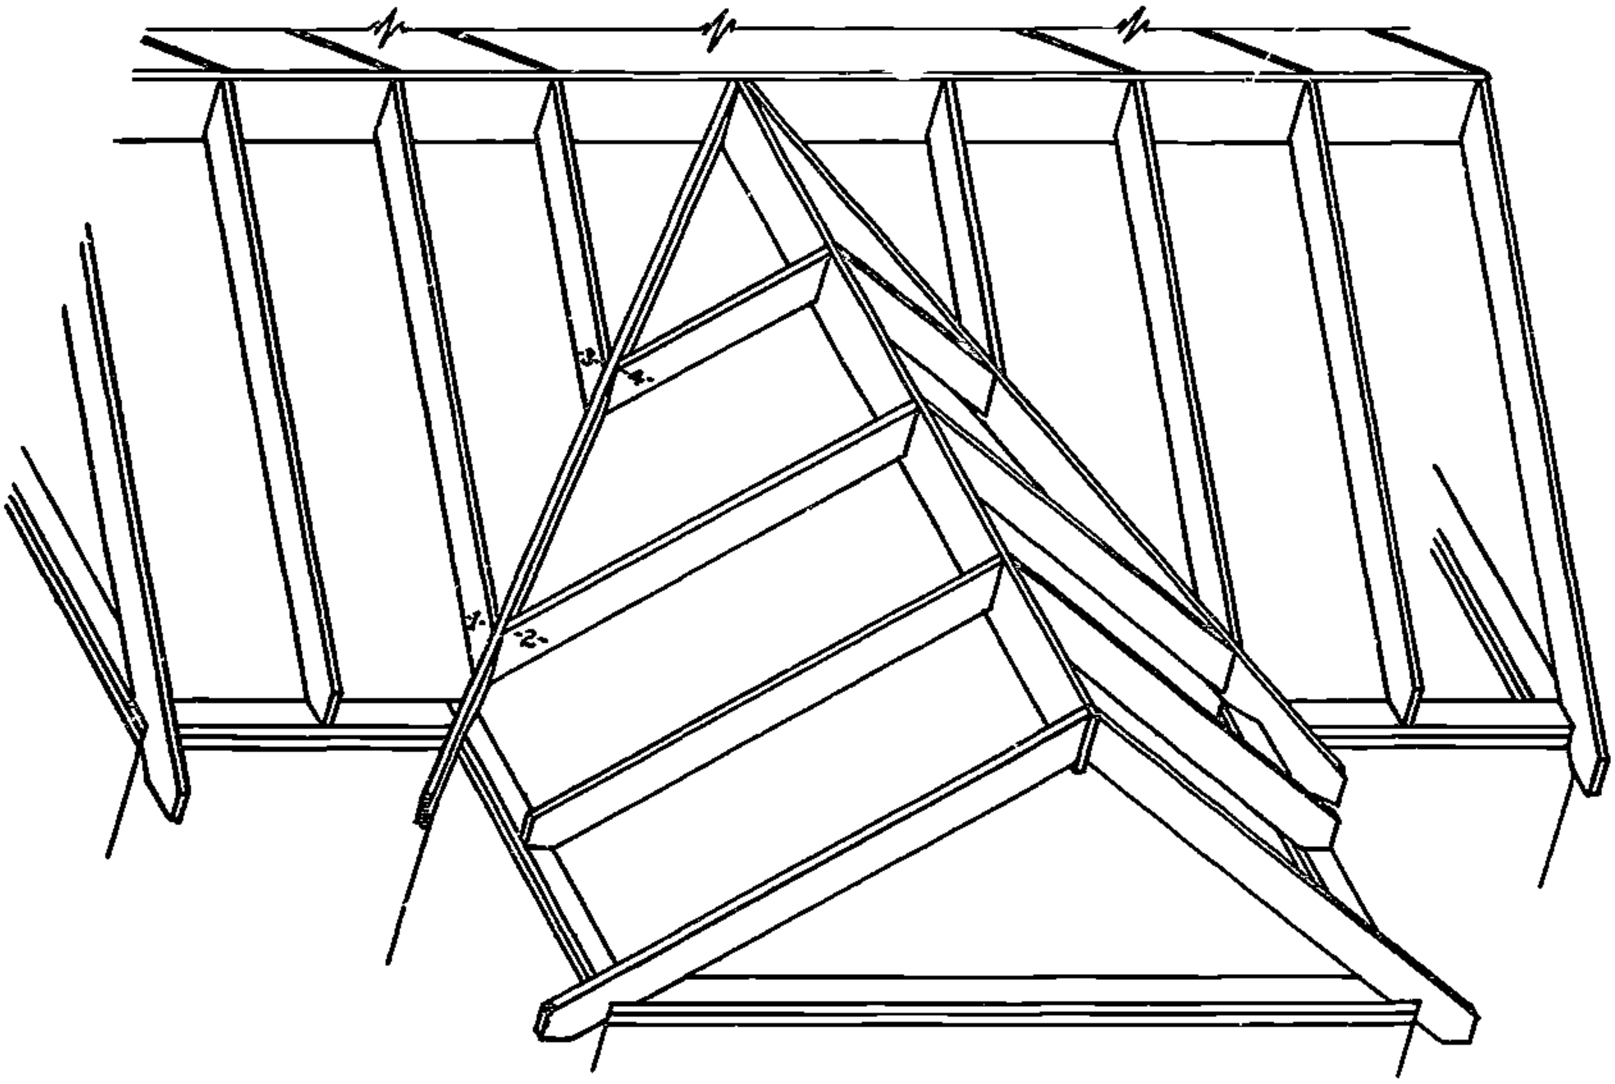

FIG. 71

INFORMATION:

Any building that is square or rectangular in shape will have either a flat, gable, or hip roof. A building that has a wing added to it requires an additional roof. Where any two roofs meet or intersect, several new types of rafters are required. These new rafters are valley rafters and valley jack rafters.

The Valley Rafter

The valley rafter lies at the intersection of the two roofs. The cuts of a valley rafter are similar to those of the hip rafter, that is, a combination plumb and cheek cut at the ridge, a seat cut at the wall plate, and the overhang cuts. The only difference between a hip and valley rafter lies in the seat cut. A hip rafter is "backed" or lowered at the seat cut; a valley rafter is "raised" or picked up at the seat cut. The reason for lowering a hip rafter (and raising a valley rafter) is for sheathing purposes, as explained in Unit IV Lesson 4.

The Valley Jacks

Valley jack rafters are the rafters that fill in the triangular space between the ridgeboard and the valley rafter. In a valley jack rafter, the plumb cut that fits against the ridgeboard is exactly the same as in a common rafter, and the bottom cut that fits against the valley rafter is a combination plumb and cheek cut. (See Fig. 71.)

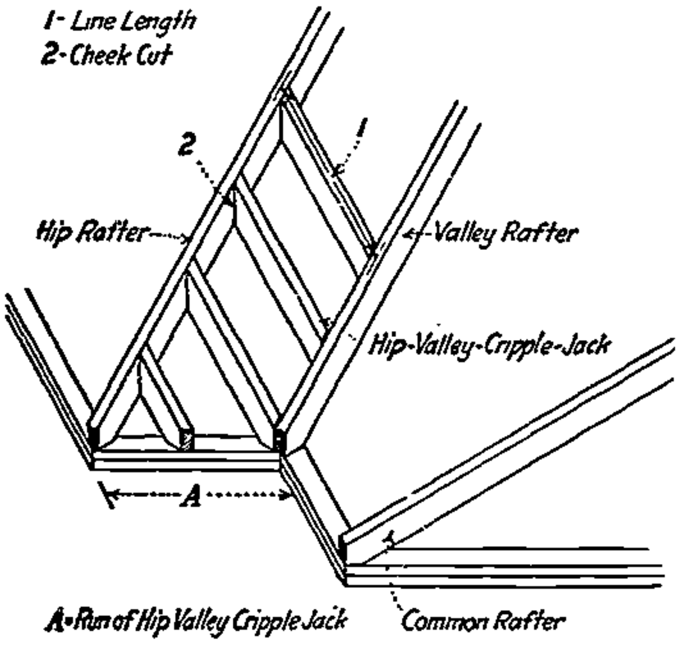

FIG. 72

The Cripple Jack Rafters

Cripple jack rafters can best be described as the jack rafters in an intersecting roof that do not touch either the wall plate or the ridgeboard. They are framed between a hip rafter and a valley rafter and are always required when distance "A" in Fig. 72 is less than one-half the span of the building. As hip and valley rafters in an equal-pitch intersecting roof are always parallel to each other, the length of all the cripple jacks framed between these two rafters will always be the same.

The cuts on cripple jacks are combination plumb and cheek cuts on both ends, the angle of the cuts being in opposite directions.

ASSIGMENT:

Be prepared to answer any question your instructor may ask concerning this lesson.

OBJECTIVE: To learn how to lay out a valley rafter.

INFORMATION:

The method of laying out a valley rafter is similar to the method used to lay out a hip rafter, as both run from the wall plate to the ridgeboard at a 45-degree angle. The only difference is at the seat cut. As explained previously, a hip rafter is lowered, while a valley rafter is raised. The unit of run, which gives the level cut, is the same as for a hip rafter (17 inches), and the rise per foot of the roof gives the plumb cut; cheek cuts are also the same as for a hip rafter.

Procedure:

The procedure in stepping off a valley rafter is the same as for the hip rafter, as described in Unit IV Lesson 3, except at the seat cut, where the valley rafter is raised.

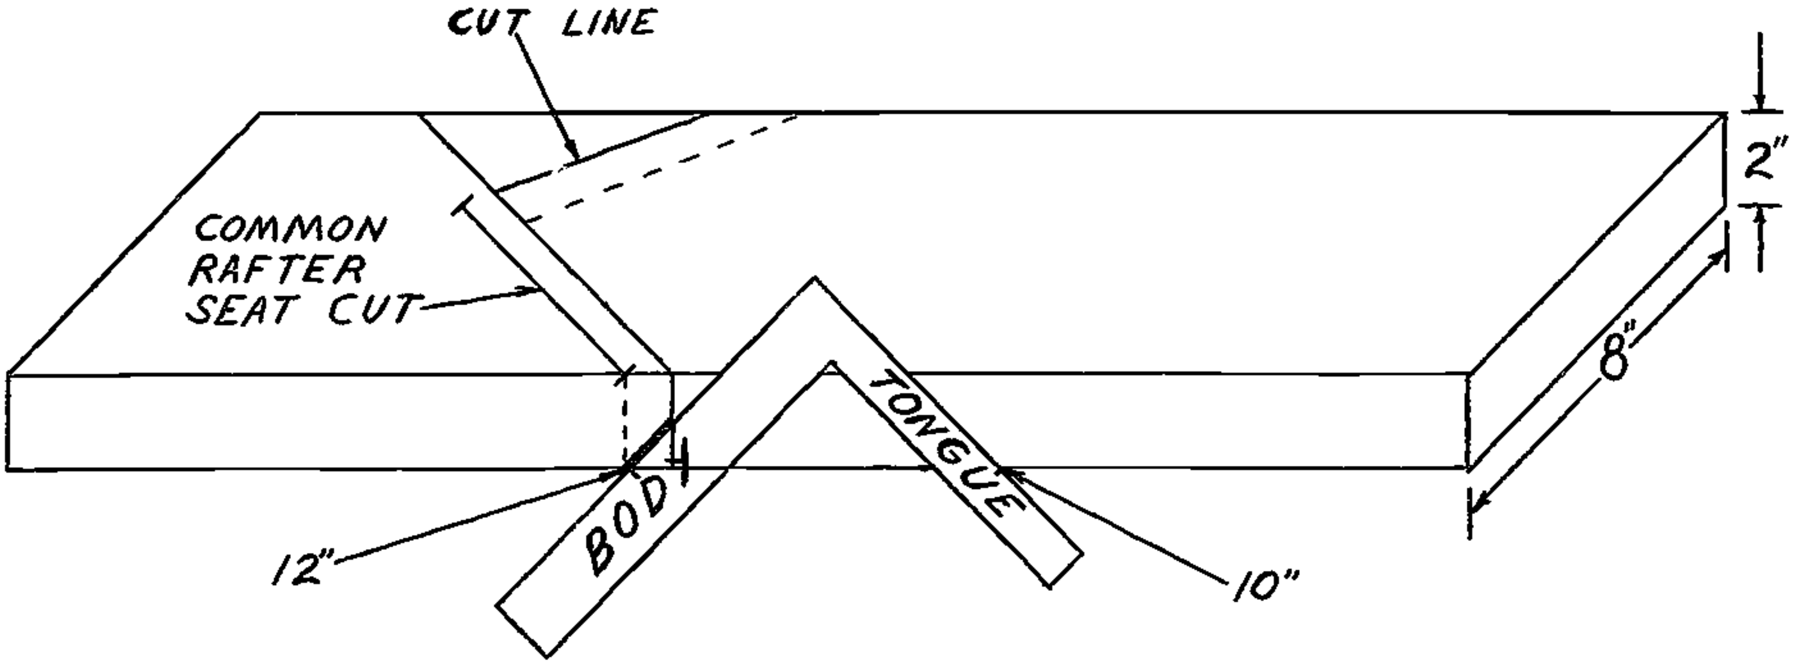

FIG. 73

Procedure in laying out the seat cut for a valley rafter

The procedure is the same as that described in Unit IV Lesson 4, except that the side cut on the top edge is made to the rafter edge nearer you. Square across from the side cut and lay out a plumb line on the face of the valley rafter. Parallel with this second plumb line measure down the required distance (amount left on seat cut of common rafter) and from this point lay out a level line. This level line will be below the first level line, and is the actual line to cut. (See Fig. 73.)

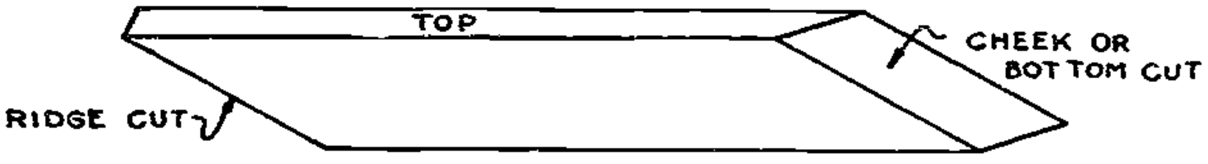
ASSIGNMENT:

Lay out a valley rafter including overhang.
Use 2" x 8" stock.
Rise per foot 8"; total run 5 feet 9 inches;
run of overhang 9".

The Valley Jack Rafter

Lesson 3

OBJECTIVE: To learn how to lay out the valley jack rafters.



VALLEY JACK RAFTER

FIG. 74

INFORMATION:

The valley jack rafters extend from the ridgeboard to the valley rafter. (See Fig. 71 in Lesson 1.) Their lengths are found in the same manner as those of the hip jacks. The ridge cut is exactly the same as for the common rafter, and the end that fits against the valley rafter has a combination plumb and cheek cut. (See Fig. 74.) Like the hip jacks, the valley jacks are also laid out in pairs.

Procedure:

The procedure to obtain the difference in length for the valley jacks is the same as the procedure for the hip jacks. Find the difference in length from the rafter tables, and use the common rafter pattern as described in Unit IV Lessons 12 and 13. The plumb and level cuts are obtained by using the same figures on the framing square as were used for the common rafter. The top end of the valley jack that fits against the ridgeboard requires a square plumb cut, exactly the same as for a common rafter. The bottom end that fits against the valley rafter requires a combination plumb and cheek cut. Valley jacks are also cut in pairs, a left and a right.

ASSIGNMENT:

Lay out a set of valley jack rafters, using the figures given in Lesson 2 of this unit.

The Cripple Jack Rafter — Lesson 4

OBJECTIVE: To learn how to lay out the cripple jack rafter.

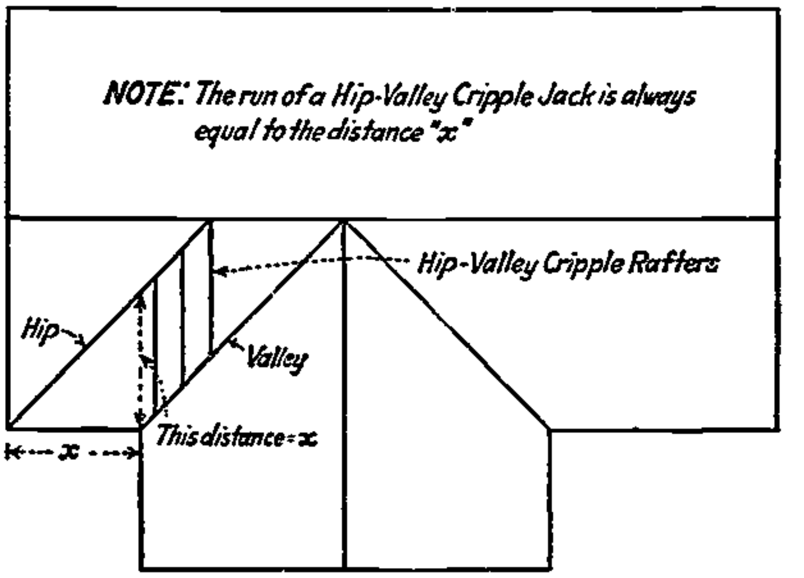


FIG. 75

INFORMATION:

The run of the cripple jack rafter shown in Fig. 75 is always equal to the distance between the seat cuts of the hip and valley rafters. (See X in drawing.) The cheek cuts are found in the same way as the cheek cuts for hip or valley jacks and are parallel to each other.

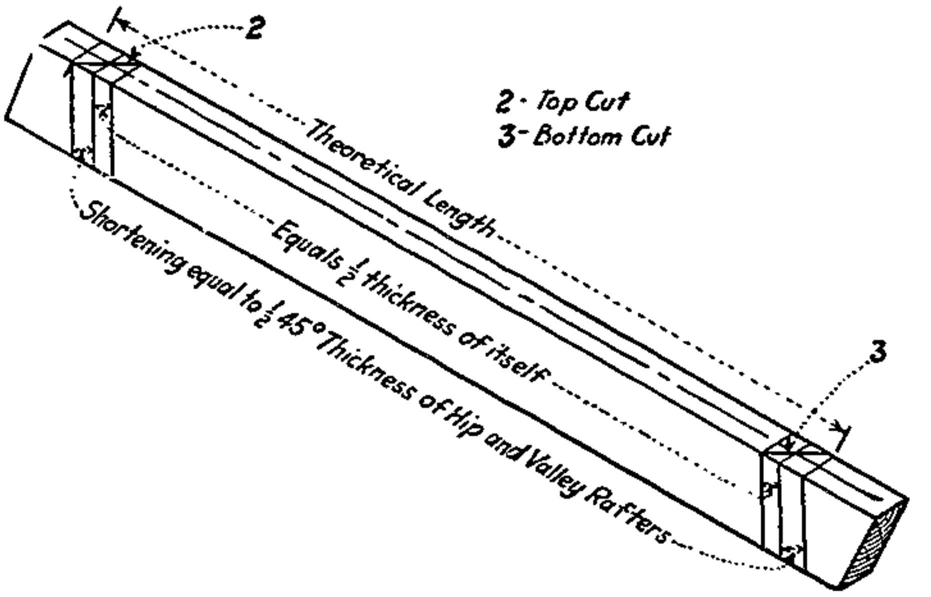

FIG. 76

Procedure:

Find the run of the cripple jack, and use the step-off method to obtain the length. The figures to use on the square are the same as for a common rafter. Deduct three-fourths of the thickness of the hip and valley rafters on each end. This deduction can be combined and deducted from one end. Lay out the side cuts, using the same figures on the square as were used to lay out the side cuts for the hip or valley jacks.

ASSIGNMENT:

Lay out a cripple jack rafter where the distance between the seat cuts of the hip and valley rafters is 3 feet 6 inches.

UNIT V - THE EQUAL-PITCH INTERSECTING ROOF

The Ridgeboards

Lesson 5

OBJECTIVE: To learn how to obtain the length for the intersecting roof ridgeboards.

INFORMATION:

An intersecting roof has two ridgeboards, the ridgeboard for the main roof and the ridgeboard for the wing or projection. There are two basic types of situations, which require different methods for obtaining the lengths: one, where the ridge heights are the same (Fig. 77, next page) and two, where the intersecting roof ridge drops below that of the main roof (Fig. 78).

1. Ridgeboard length when ridges are the same height

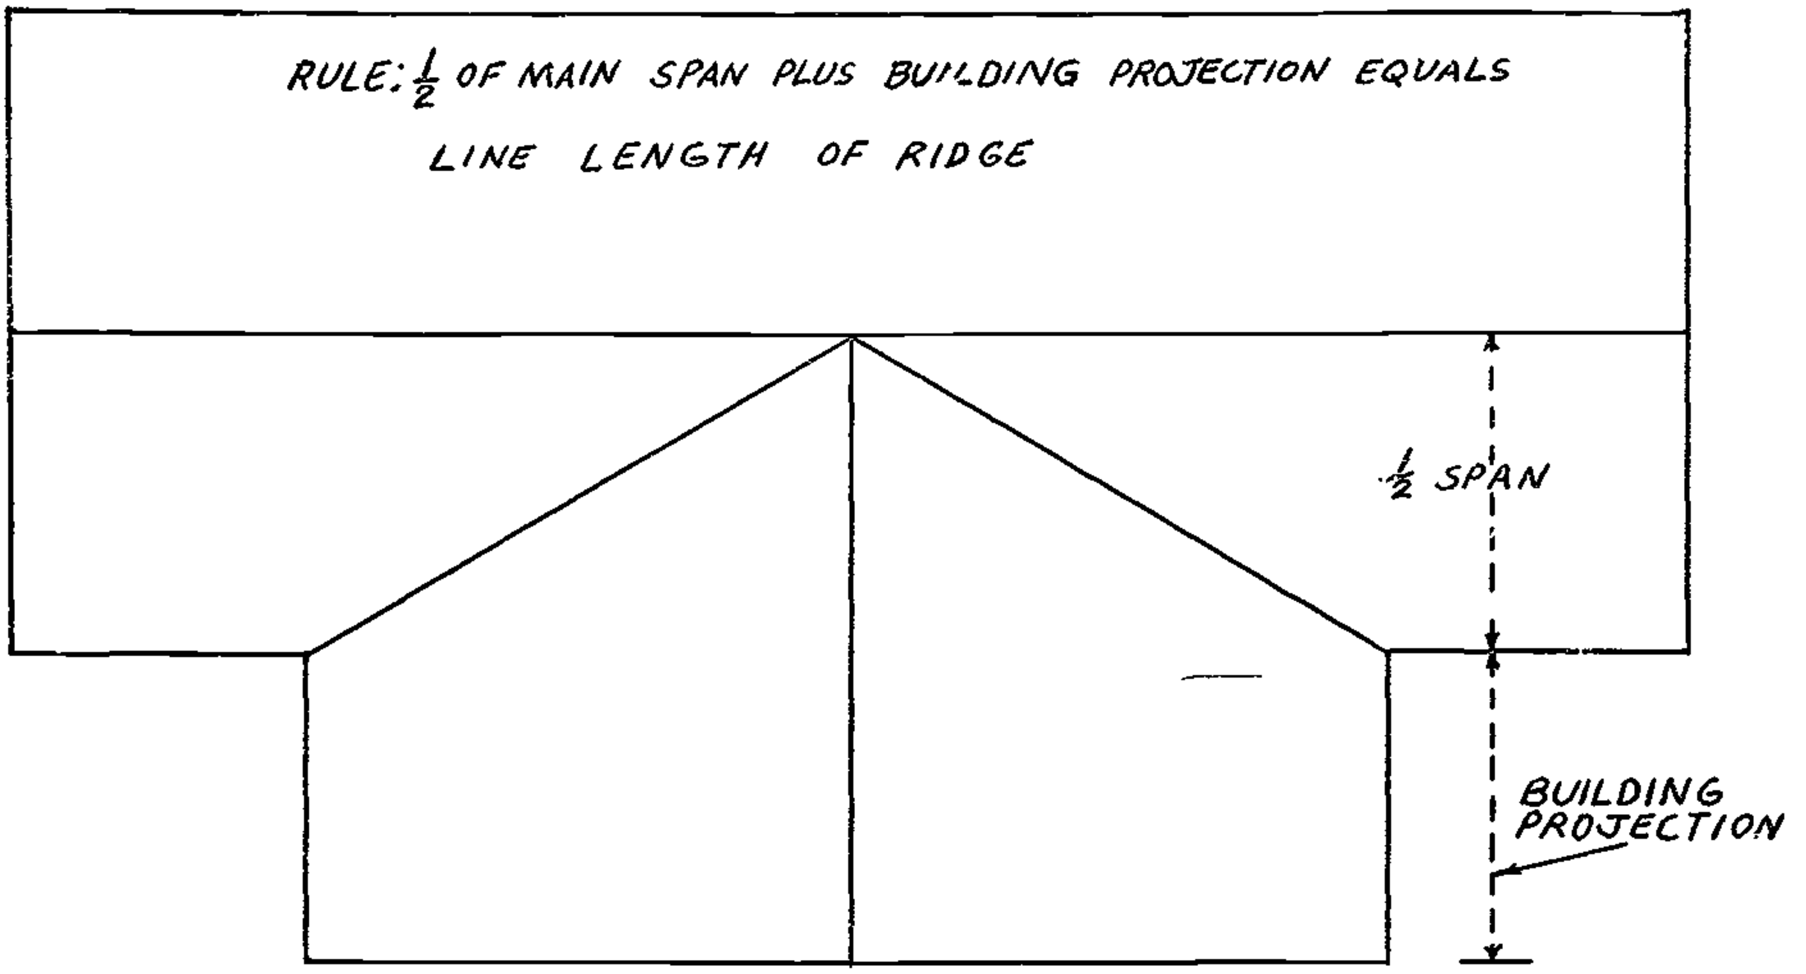
> Rule: To obtain the length of the ridgeboard for the projection roof, one-half the span of the main roof, plus the building projection, equals the theoretical length of the ridgeboard.

The actual length is shorter, as one ridge is framed to the other. In actual construction however, it is customary to make the intersecting ridge a few inches longer than its theoretical length. This is done so the common rafters at the gable end can be plumbed with the wall plate, as any extra length can be sawed off after the roof is up. The cut where the two ridges meet is simply a square cut.

2. Ridgeboard length when the ridges are not the same height

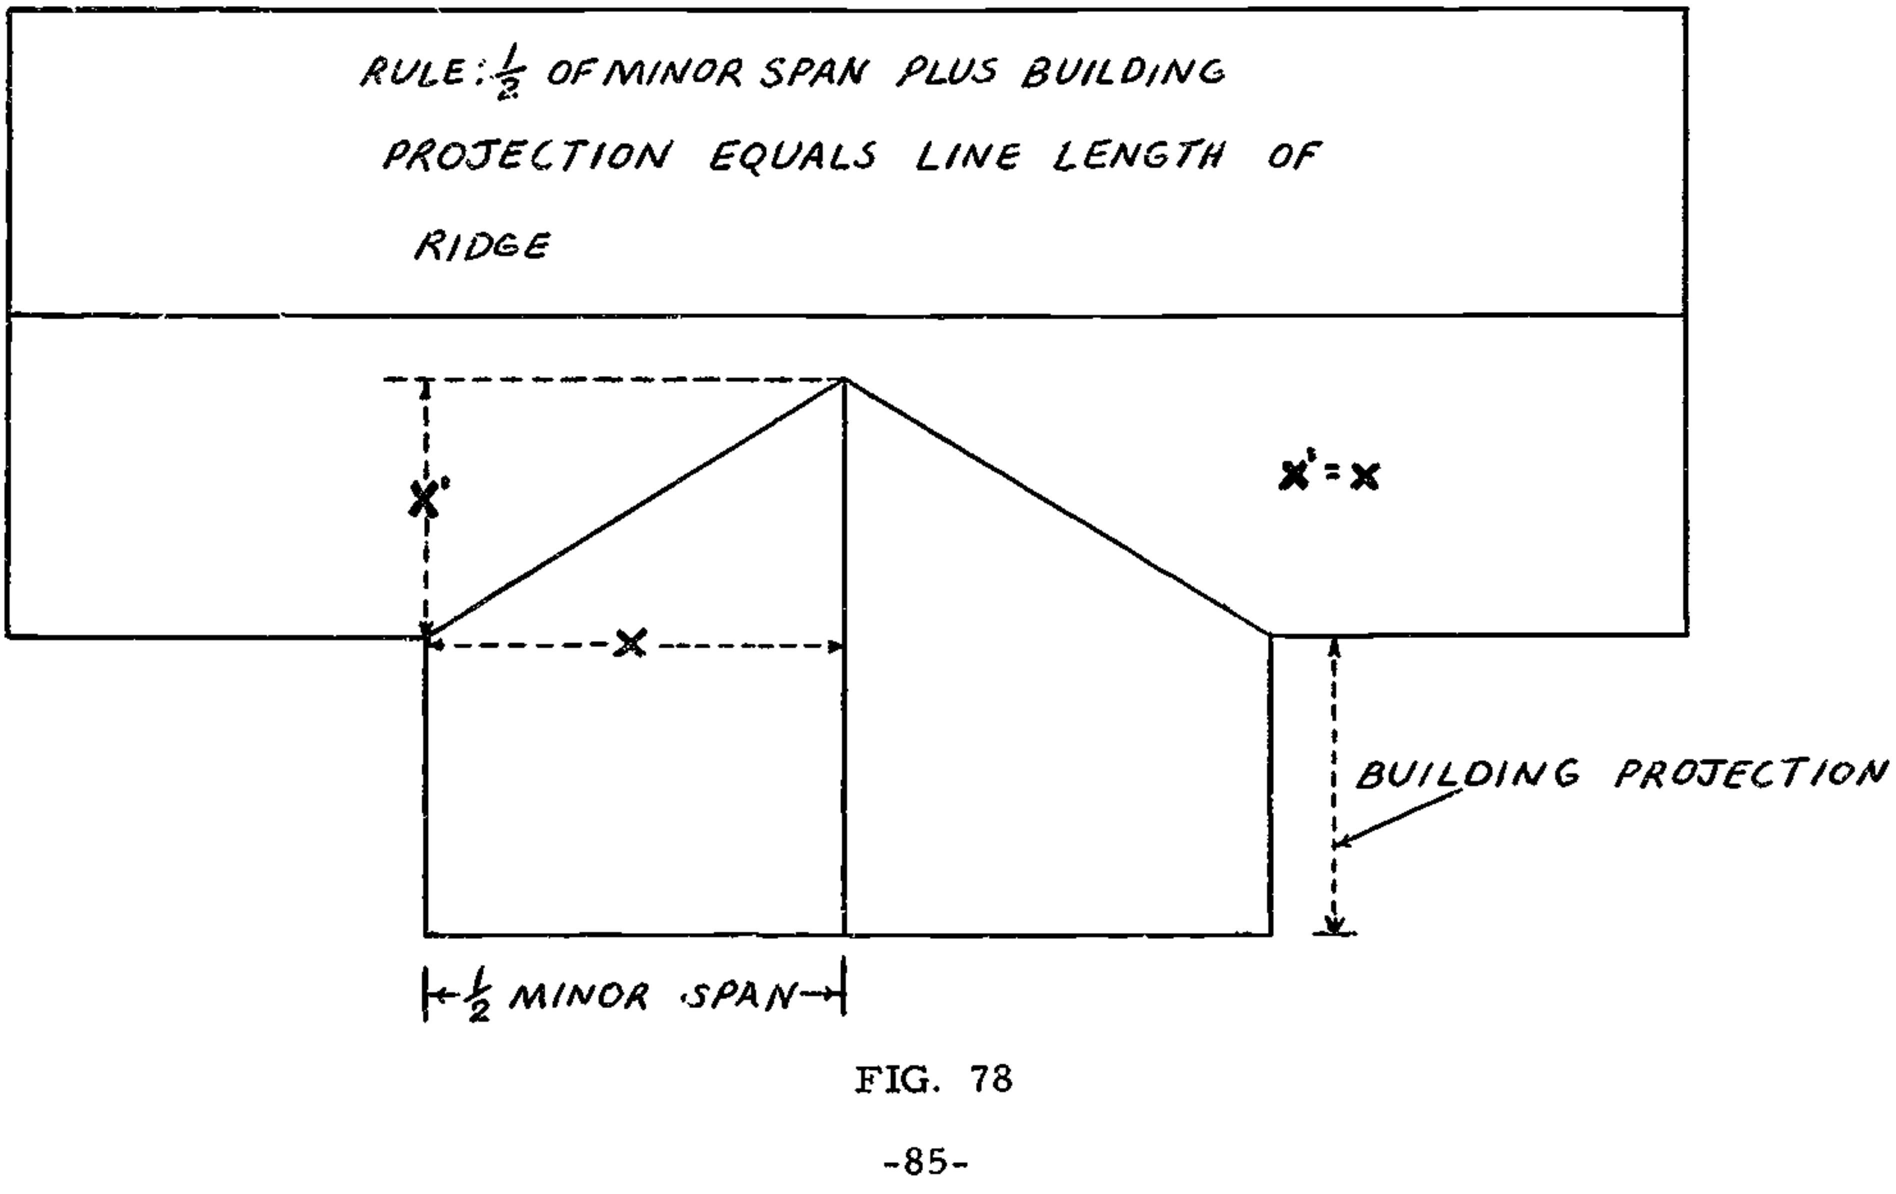
> Rule: One-half of the minor span, plus the building projection, equals the theoretical length of the ridgeboard.

As suggested before, the ridgeboard should be cut a few inches longer to allow for plumbing the common rafters at the gable end. The shape of the end of the ridgeboard is a double 45-degree plumb cut.



RULE: ½ OF MAIN SPAN PLUS BUILDING PROJECTION EQUALS LINE LENGTH OF RIDGE
½ SPAN
BUILDING PROJECTION

FIG. 77



RULE: ½ OF MINOR SPAN PLUS BUILDING PROJECTION EQUALS LINE LENGTH OF RIDGE
X'
X
X' = X
BUILDING PROJECTION
½ MINOR SPAN

FIG. 78

Special Ridge Cut

When the ridge rests on top of the sheathing boards, a special ridge cut is necessary. This is made by using the unit run and the rise per foot of the common rafters and marking on the run side of the square. (See Figs. 79 and 80, below.)

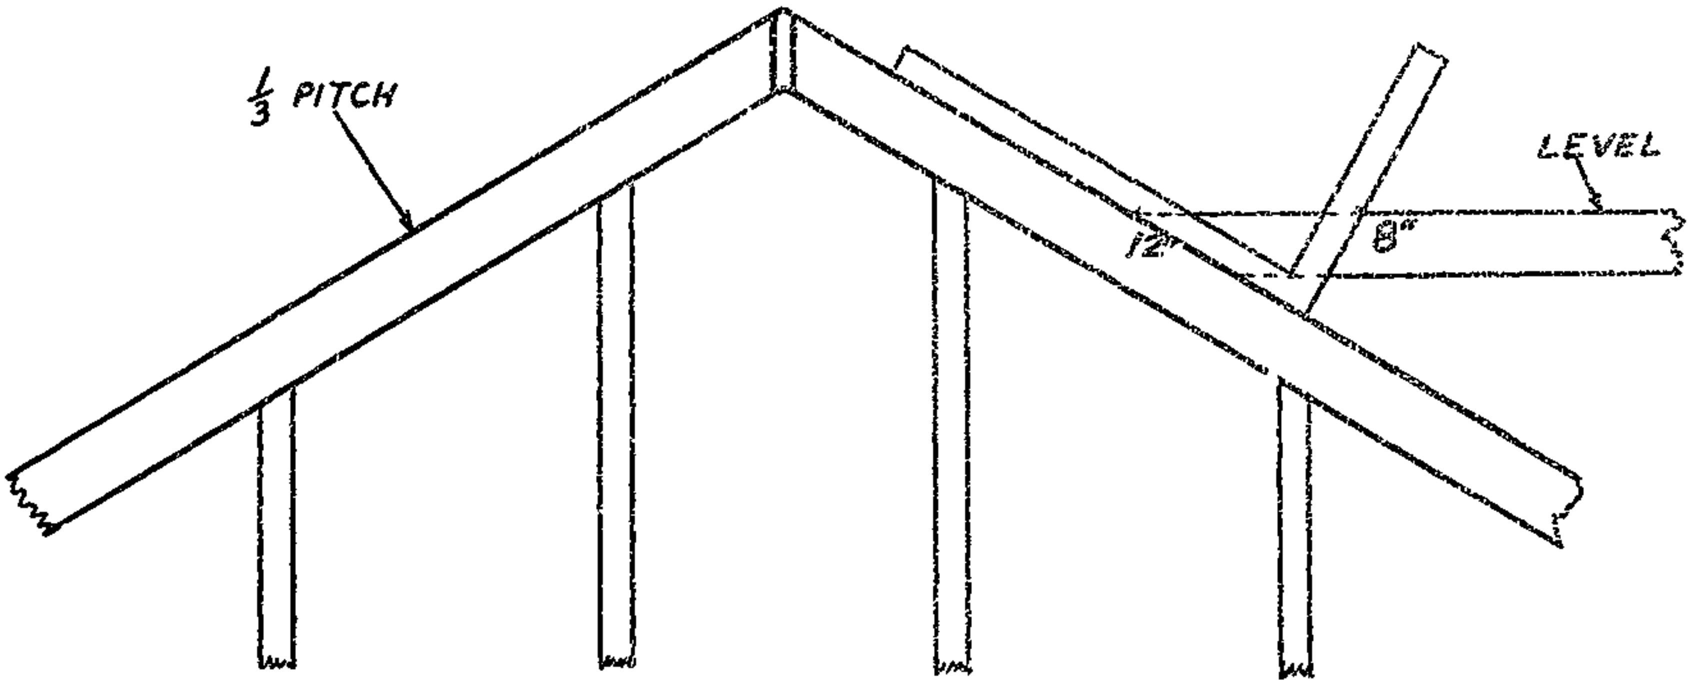


FIG. 79

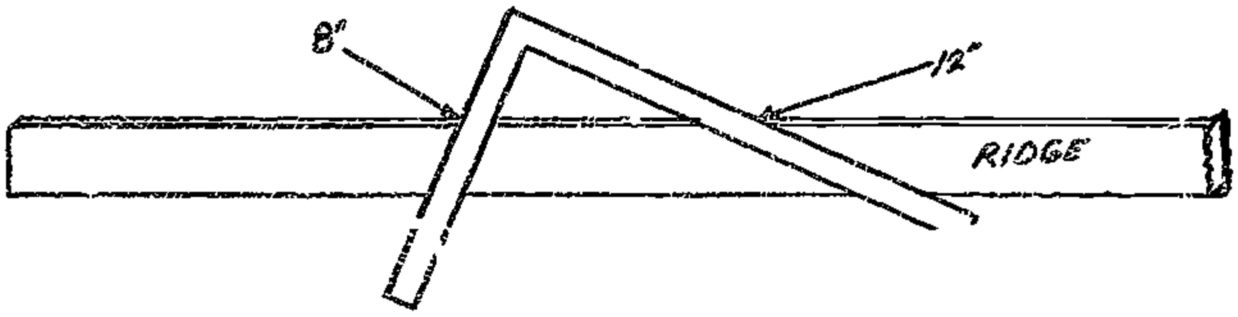

FIG. 80

UNIT V - THE EQUAL-PITCH INTERSECTING ROOF

TEST

---

1. Describe an intersecting roof, and tell what types of rafters are required.

2. Describe where a valley rafter is required.

3. What types of cuts are required in a valley rafter, and where do they fit on a roof?

4. What is the difference between a hip rafter and a valley rafter?

5. Valley jack rafters run from the ____________ to the ____________ ____________.

6. The plumb cut of a valley jack rafter is exactly the same as for a ____________ ____________, and fits against the ____________.

7. Describe the bottom cut of a valley jack rafter and where it fits.

8. Describe where cripple jack rafters are placed. What type of cuts are required?

9. Lay out a complete valley rafter:

   Run: 9'6"   Rise Per Foot: 10 inches

10. Lay out a complete set of valley jacks for the above valley rafter.

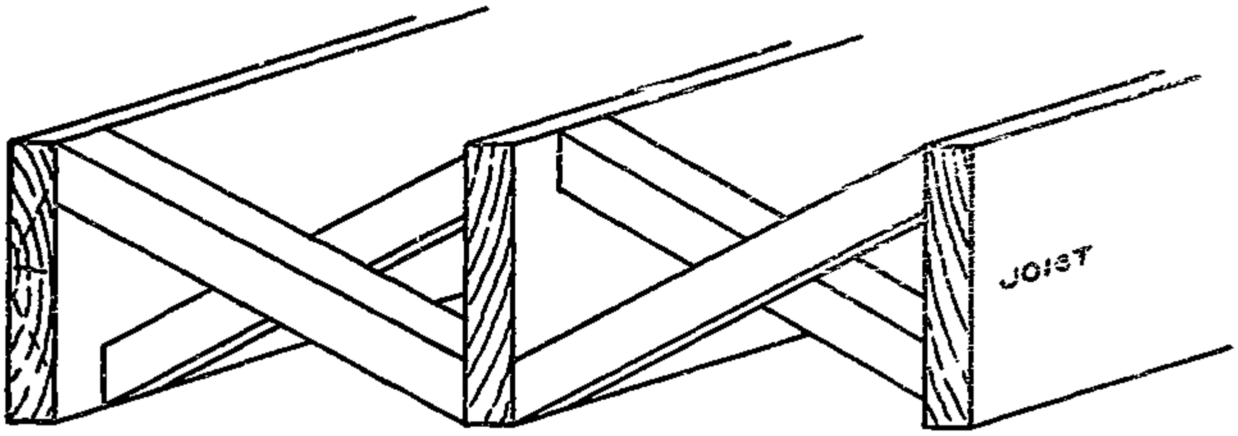
11. Lay out a cripple jack rafter:

    Run: 2 feet 4 inches   Rise Per Foot: 10 inches

UNIT VI - OTHER USES OF THE FRAMING SQUARE

Cross Bridging Lesson 1

OBJECTIVE: To learn how to lay out cross bridging.



BRIDGING IN PLACE

FIG. 80

INFORMATION:

Cross bridging can be defined as short pieces of $1\frac{1}{4}$" x 3" nailed between the floor joists to form a cross or "X" pattern. The primary purpose of cross bridging is to help distribute the load that the floor joists carry, and secondly to keep the floor joists from twisting. The cross bridging should be nailed in double rows, crossing each other from the top of one joist to the bottom of the next. (See Fig. 80.) The rows should be continuous, from one side of the building to the other, and they should be installed not more than 8 feet apart.

Procedure - Laying Out Cross Bridging

Measure the actual distance between the floor joists. This distance, if the floor joists are $1\frac{5}{8}$" thick and spaced at 16 inches on center, will be $14\frac{3}{8}$". Measure the actual width of the floor joists. If 2" x 10" floor joists are used, the actual width will be $9\frac{1}{2}$ inches.

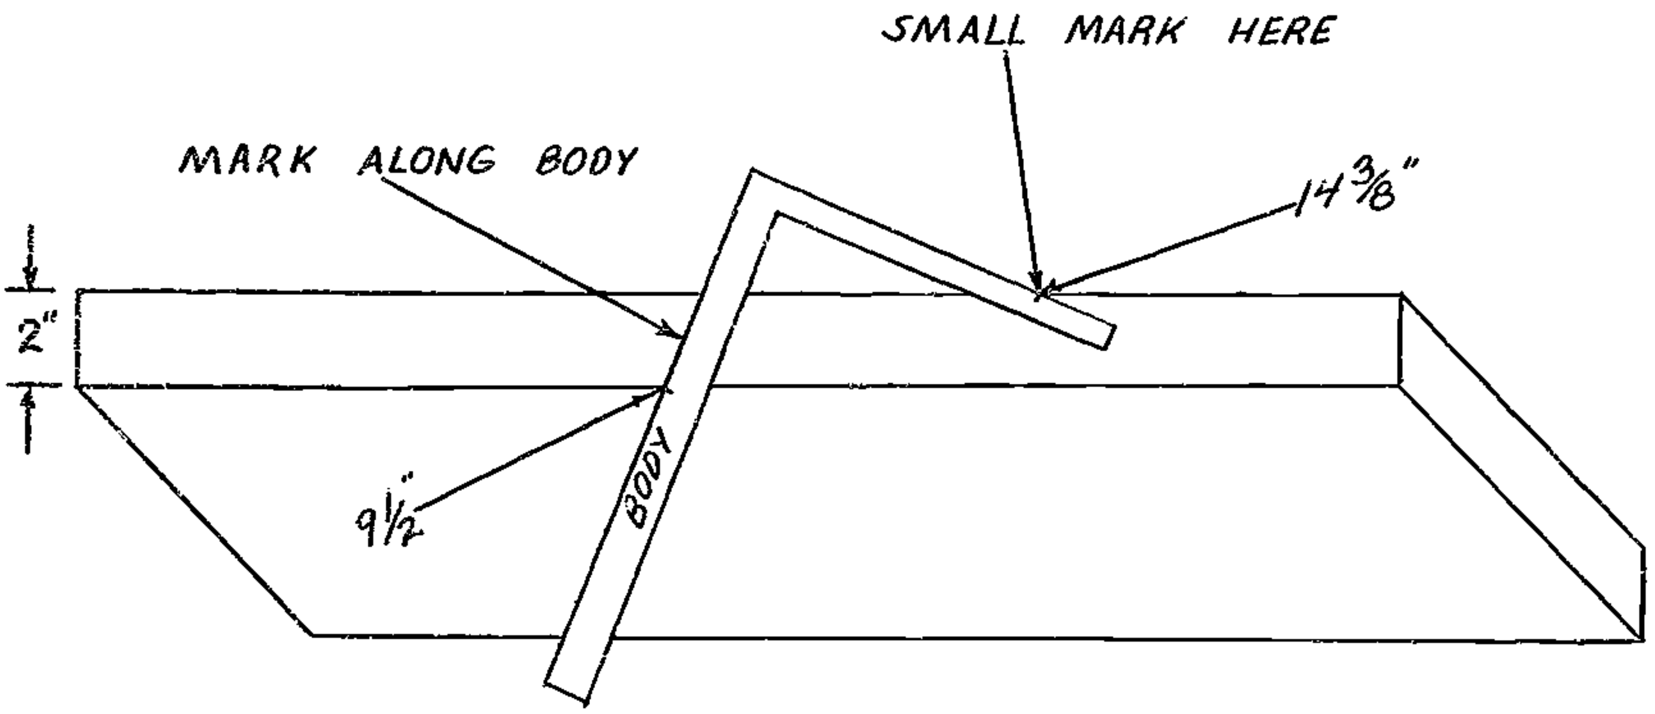


FIG. 81

Lay the square on the edge of the stock, holding the body in the left hand and tongue in the right hand face up; hold the 9½-inch mark on the body and the 14⅜-inch mark on the tongue, as shown in Fig. 81. Note that the marks are being held on opposite edges of the stock. Draw a line along the body of the square, and make a small mark on the edge where the tongue is being held.

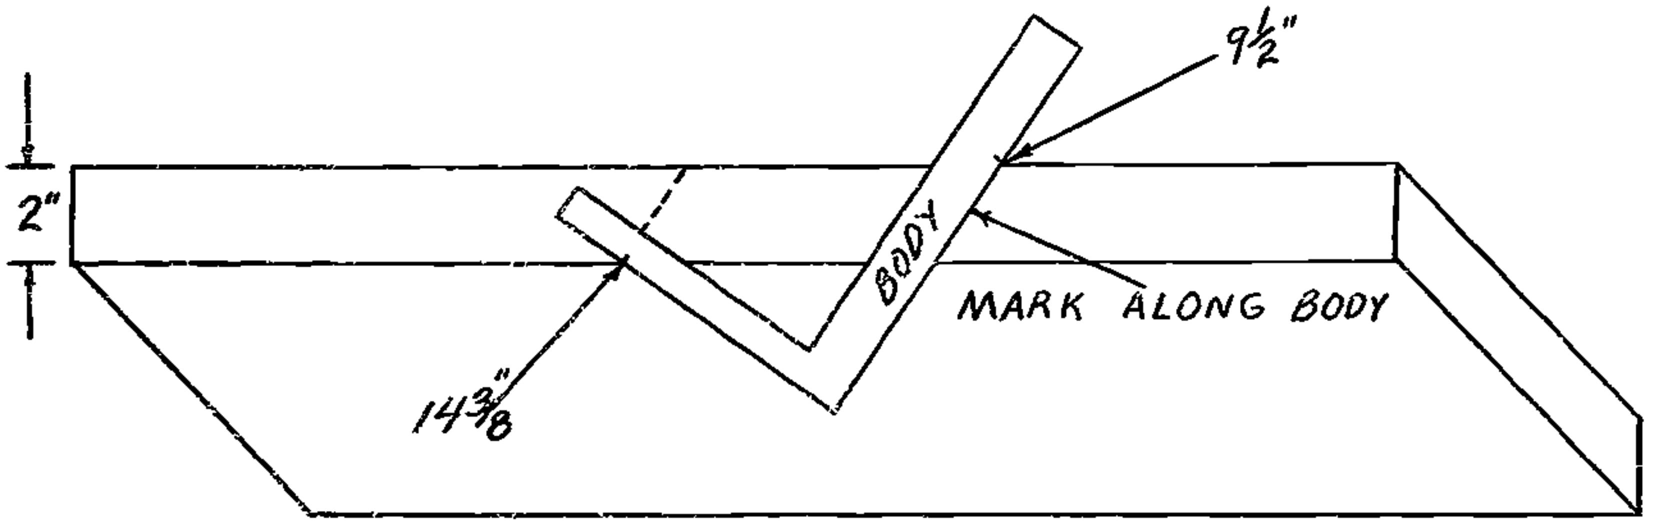

FIG. 82

Reverse the square, keeping the face up, so that the body is now in the right hand and the tongue in the left. Hold the $14\frac{3}{8}$-inch mark on the tongue at the point where the $9\frac{1}{2}$-inch mark had previously been held, and hold the $9\frac{1}{2}$-inch mark on the body at the point where the $14\frac{3}{8}$-inch mark had been held. Mark along the body (see Fig. 82). The two lines on the edge of the stock will be parallel. This is the exact length required for the bridging.

ASSIGNMENT:

Lay out cross bridging for the following floor joists:

Size	Spacing on Center
2" x 8"	16 inches
2" x 10"	14 inches
4" x 8"	16 inches
2" x 12"	12 inches

UNIT VI - OTHER USES OF THE FRAMING SQUARE

The Essex Board Measure Scale — Lesson 2

OBJECTIVE: To become familiar with the use of the Essex board measure scale.

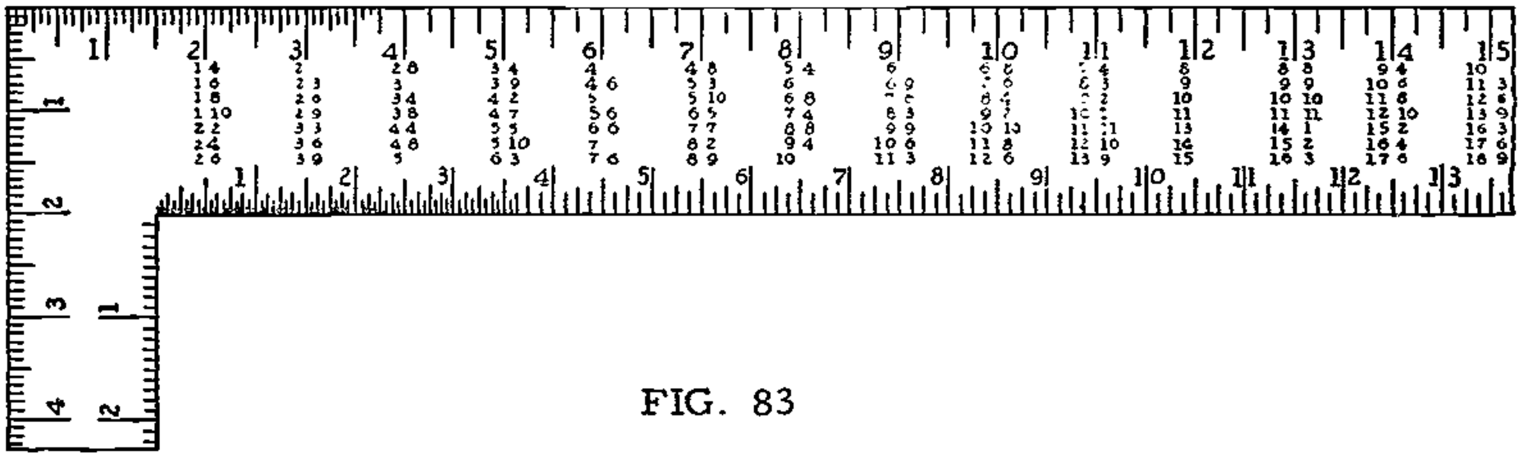

FIG. 83

INFORMATION:

The Essex board measure table is stamped on the back of the body of the square. It is used to figure out the board footage for almost any size of lumber or timber. The key to this table is the figure 12 inches on the outside edge of the square, which is the starting point for all calculations. Each number beneath 12 represents the width of the board, and each number on the edge of the blade from 2 to 24 represents the length of the board. These inch graduations are used in combination with the values given along the seven parallel lines.

Procedure - Finding Board Feet

Under the figure 12 find the number representing the width of the board. Follow horizontally along this set of figures to the figure under the number representing the length of the board. This figure is the total number of board feet for that particular piece of lumber. The board-feet answer will read on the Essex Board Measure Scale as 7 4, 5 10, 18 8, etc., which means $7\frac{4}{12}$ board feet, $5\frac{10}{12}$ board feet, $18\frac{8}{12}$ board feet. These figures are for lumber one inch thick. Multiply these figures by the thickness of the lumber.

Example: How many board feet in a piece of lumber 2 inches by 10 inches by 14 feet long? Under the figure 12 find the width of the board, in this example 10 inches. The figure 10 will be found on the third line down.

Follow horizontally along the third line to the figure under the number 14 (the length) and read $11\frac{8}{12}$. This would be the number of board feet if the lumber were 1 inch thick. Since the lumber is 2 inches thick, multiply $11\frac{8}{12}$ by 2. The amount of board feet in a 2" x 10" x 14'0" board is therefore $23\frac{4}{12}$ board feet.

ASSIGNMENT:

Find the board footage for the following:

1" x 8" x 16'0"

2" x 14" x 22'0"

1" x 4" x 18'0"

3" x 10" x 12'0"

2" x 10" x 20'0"

UNIT VI - OTHER USES OF THE FRAMING SQUARE

The Brace Measure Scale

Lesson 3

OBJECTIVE: To become familiar with the use of the brace measure scale.

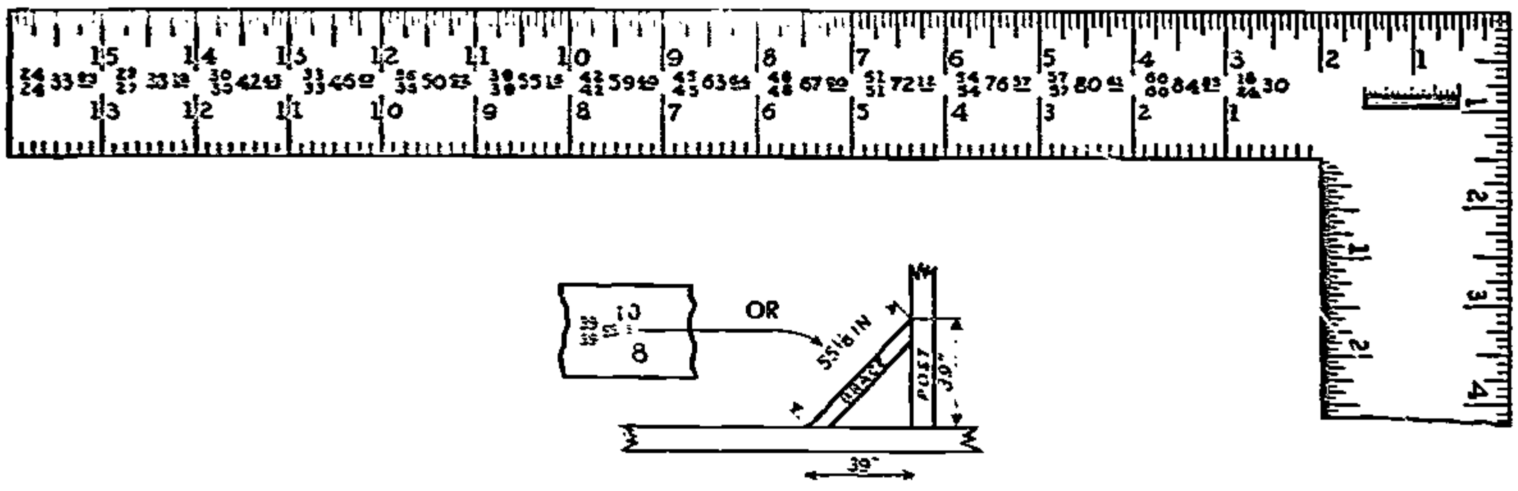

FIG. 84

INFORMATION:

The brace measure scale will be found along the center of the back of the tongue. It gives the lengths of corner braces placed at a 45-degree angle. An example of a brace size stamped on the brace measure scale is $\frac{36}{36}$ 50.91. This means that the length of the brace placed at a 45-degree angle against a 36" corner will be 50.91 inches. In other words, the diagonal distance between 36 inches and 36 inches is 50.91 inches. A brace put against a square angle, 60 inches away from the angle on each side, would be 84.85 inches long. In the same manner, the lengths of other braces are given on the scale.

Braces may be regarded as common rafters. When the brace run on the post is different from the run of the beam, the length of the brace, as well as the top and bottom cuts, may be determined by the figures given on the rafter tables for common rafters.

Note: One figure on the brace measure scale is for a brace not at a 45-degree angle, namely, $\frac{18}{24}$30.

ASSIGNMENT:

Find the length of the following braces:

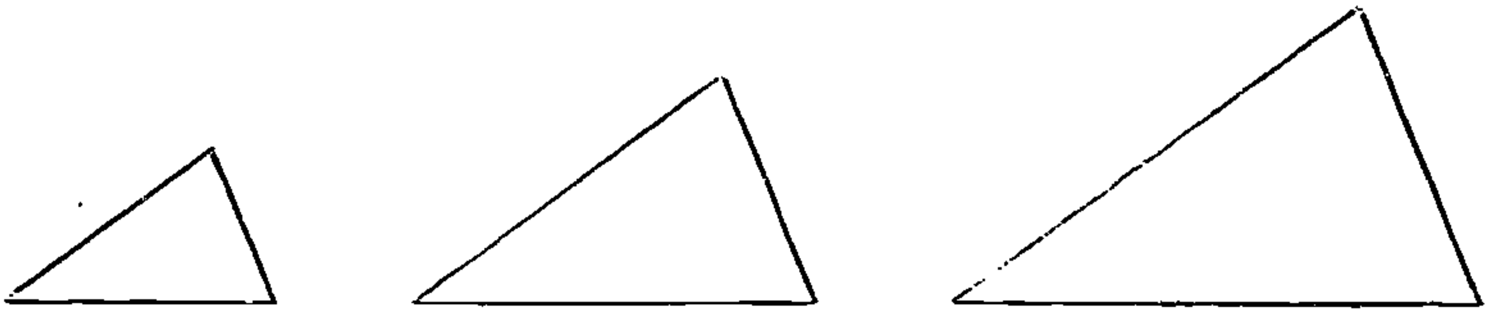
42" x 42"
51" x 51"
18" x 24"
16" x 24"
24" x 36"

UNIT VI - OTHER USES OF THE FRAMING SQUARE

Principles of Similar Triangles

Lesson 4

OBJECTIVE: To become familiar with the principle of similar triangles in rafter layout.



INFORMATION:

Many problems involving angles can be solved by using the geometric principles underlying similar triangles. Similar triangles have identical angles, but are not of the same size. A small triangle can be projected into a larger one or vice versa, with all angles of both remaining the same. (See illustration.) The carpenter can make similar right triangles with the framing square. This procedure is known as slipping the square. This procedure is sometimes used if it is applicable to the layout problem, as it is a practical method to use on the job.

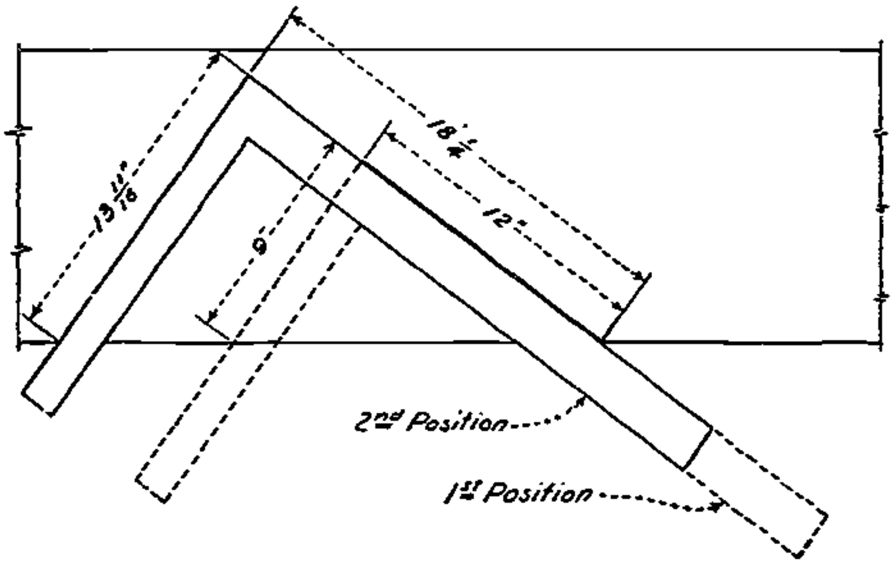


FIG. 85

How to "Slip" the Square

1. Select figures to represent a right-angle triangle, and lay out this triangle, using the $\frac{1}{12}$ scale.
2. Determine one dimension of the similar, larger right-angle triangle required.
3. Lay one edge of the square exactly along one of the lines of the smaller triangle, and "slip" the square along that line until it reaches the known dimension of the larger triangle.
4. Read the figure on the other leg of the square. This figure will be the required second dimension of the larger right-angle triangle.

Example:

Lay out a right-angle triangle with legs 9 inches and 12 inches. The longer leg of the larger similar triangle is 18¼ inches. To find the "rise" of the larger triangle, slip the square along the 12-inch side of the small triangle until the 18¼-inch mark coincides with the edge of the lumber. Read the other leg of the square. The answer (rise) will be $13\frac{11}{16}$ inches. This means that $13\frac{11}{16}$ and 18¼ inches will form the same angles with the edge of the board as 9 and 12 inches.

ASSIGNMENT:

Using the procedure explained above, find the figure to use to obtain the same angles?

Small Triangle	Run of Large Triangle
10" x 12"	17½ inches
6 x 12	20¼ inches
8 x 12	14¾ inches

Length of a Common Rafter By Slipping the Square

Lesson 5

OBJECTIVE: To learn how to obtain the length of a common rafter by slipping the square.

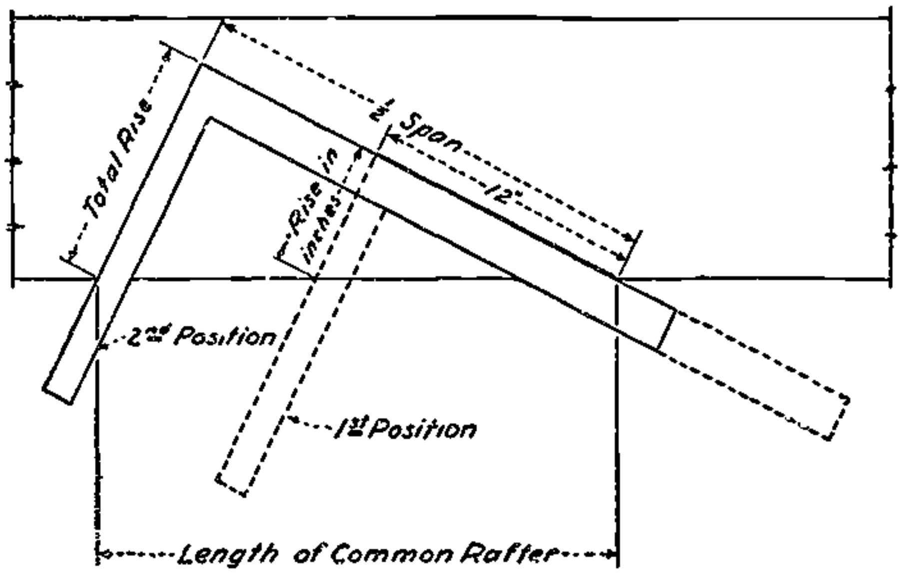

FIG. 86

Procedure:

Using the 12th scale, lay out a right triangle using the rise per foot on the tongue and the foot run (12 inches) on the body. Mark along the run side of the square. Slip the body, perfectly parallel to the 12-inch line, until it reaches the mark that is one-half the span. Read the tongue. This is the total rise of the roof. Measure diagonally from the total rise on the tongue of the square to the one-half-span figure on the body of the square. This measurement is the $\frac{1}{12}$th-scale length of the common rafter.

ASSIGNMENT:

Find the scale length for the following common rafters:

Rise Per Foot	Span
8 inches	30 feet
7 inches	27 feet
10 inches	31 feet 6 inches

Difference in Length of Jack Rafters By Slipping the Square Lesson 6

OBJECTIVE: To learn how to obtain the difference in length of jack rafters by slipping the square.

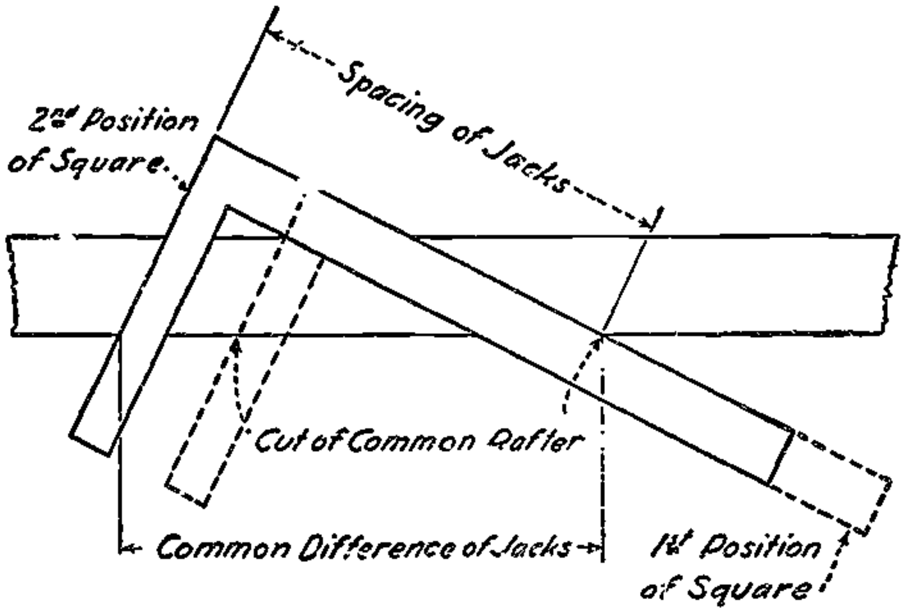

FIG. 87

INFORMATION:

The common difference in length of jack rafters is found on the rafter tables for 16- and 24-inch centers. By using the "slip" method, the difference in length can be found for any spacing.

Procedure:

Using the 12th scale, lay out a right triangle using the rise per foot on the tongue, and the foot run (12) on the body. Mark along the run (body). Slip the body, perfectly parallel to the run mark, until it reaches the figure representing the spacing of the jack rafters. Mark the tongue of the square. Measure from the tongue mark to the run mark. This is the difference in length of jack rafters.

The plumb, level, and cheek cuts are obtained in the same manner as previously described in Unit IV Lesson 13.

ASSIGNMENT:

Find the common difference in length for the following jack rafters:

Rise per foot 10 inches	12 inches on center
Rise per foot 12 inches	20 inches on center
Rise per foot 8 inches	14 inches on center
Rise per foot $6\frac{1}{2}$ inches	10 inches on center

UNIT VI - OTHER USES OF THE FRAMING SQUARE

Difference in Length of Gable Studs By Slipping the Square Lesson 7

OBJECTIVE: To learn how to obtain the difference in length of gable studs by slipping the square.

INFORMATION:

The procedure for laying out and finding the difference in length of gable studs was described in Unit III Lesson 8. The difference in length can also be found by "slipping the square." The same procedure as described in Unit III Lesson 8 is followed to obtain the cut to fit against the common rafter.

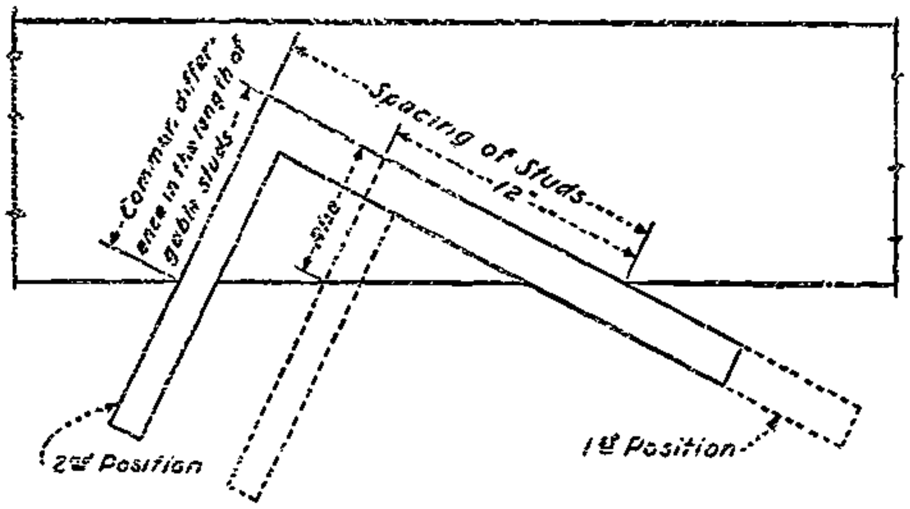

FIG. 88

Procedure:

Using the 12th scale, lay out a right triangle, using the rise per foot on the tongue, and the foot run (12) on the body and mark along the run side of the square. Slip the body, holding it perfectly parallel to the run mark, along the run mark until the body reaches the figure representing the spacing required, and read the dimension on the tongue of the square from the edge of the stock to the heel of the square. This figure is the difference in length of the gable studs.

ASSIGNMENT:

Find the difference in length for the following gable studs:

Rise Per Foot	Inches on Center
8 inches	16
10 inches	14
6 inches	24

Length of the Collar Beams By Slipping the Square

Lesson 8

OBJECTIVE: To learn how to obtain the length of collar beams by slipping the square.

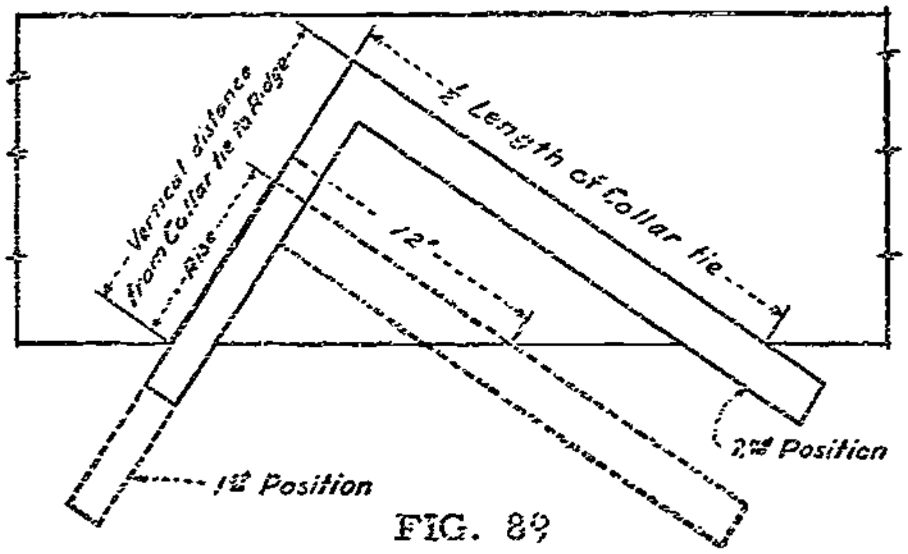

FIG. 89

Procedure:

Collar beam lengths can also be obtained by slipping the square.

Using the 12th scale, lay out a right triangle, using the rise per foot on the tongue and the foot run (12) on the body. Mark along the rise side of the square. Slip the square along the rise mark until the tongue reaches the figure representing the vertical distance that the collar beam is to be from the ridge. Read the new run (see Fig. 89). This represents one-half the length of the collar beam. Multiply this figure (new run, by two to obtain the full length. For the angle cuts on the ends, use the rise per foot and 12, and cut on 12.

ASSIGNMENT:

Find the length of the following collar beams; include the angle cuts.

Rise Per Foot	Vertical Distance from Ridge
9 inches	14 inches
7 inches	18 inches
14 inches	9 inches

Sheathing Cuts To Fit to Hip Rafters

Lesson 9

OBJECTIVE: To learn how to obtain the miter and face cuts on sheathing.

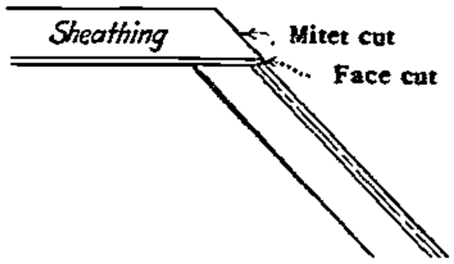

FIG. 90

INFORMATION:

In sheathing a roof with hip rafters, a combination miter and face cut is required. Each cut requires a separate layout, which can be made with the framing square.

The miter cut uses the unit of run (12 inches) and the length of common rafter per foot of run (diagonal of rise per foot and unit run).

The face cut is made on the edge of the board and uses the rise per foot and the diagonal of the cut, as above.

Rule: For the miter cut use run and length and cut on run.
For the face cut use rise per foot and length and cut on rise.

Example:

Assume a $\frac{1}{4}$-pitch roof. The cut for a $\frac{1}{4}$-pitch roof is 6 and 12. The diagonal of the cut is $13\frac{3}{8}$ inches. Therefore for the miter cut use 12 inches and $13\frac{3}{8}$ inches and cut on the 12-inch side of the square. For the face cut use 6 and $13\frac{3}{8}$ and cut on the 6-inch side of the square.

ASSIGNMENT:

On 1" x 6" sheathing boards, lay out the miter and face cuts for roofs with the following pitches:

$\frac{1}{3}$ pitch
$\frac{1}{2}$ pitch
$\frac{3}{8}$ pitch
$\frac{5}{12}$ pitch

The Level Cheek Cut That Fits on a Roof of the Same Pitch

Lesson 10

OBJECTIVE: To learn the procedure for laying out this particular level cheek cut.

INFORMATION:

Sometimes it is advisable to build a dormer gable after the main roof has been framed and sheathed. The advantage of this type of construction lies in the fact that valley rafters are eliminated and the common rafters can be used full length, making the supporting roof not only stronger but simpler to frame. The bottom cut of the rafters that rest on top of the main roof is called the level cheek cut.

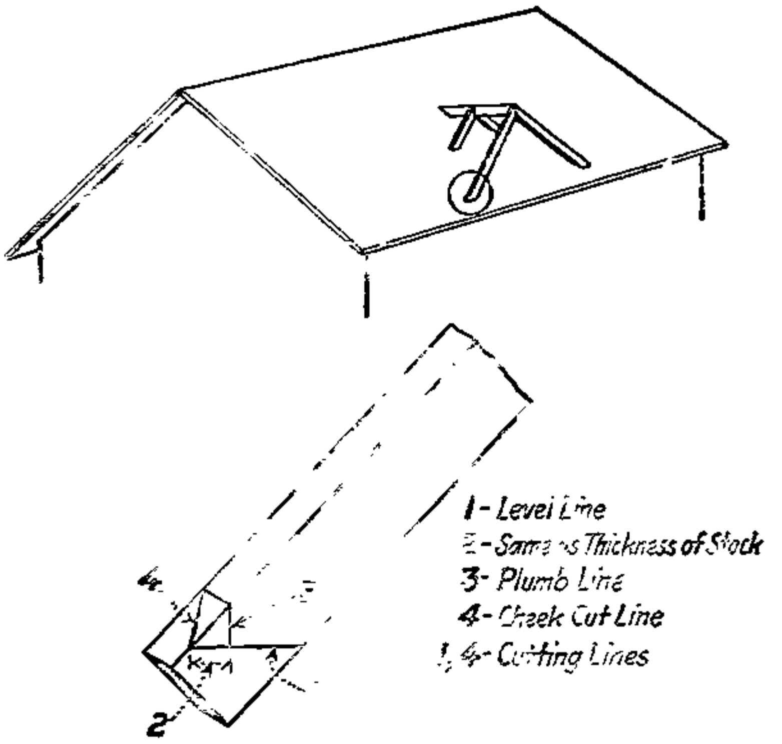

FIG. 91

Procedure:

1. Use the rise per foot and 12 and mark along 12, as at 1 in Fig. 91.

2. Measure on this line from the top edge of the rafter, the distance equal to the thickness of the rafter stock, as at 2.

3. Draw a plumb line at this point, carrying this line to the top edge of the rafter stock, and squaring it across the top (continuation of line 3).

4. Connect the ends of lines 1 and 3, as at 4. Cut on lines 1 and 4; this gives the level cheek cut.

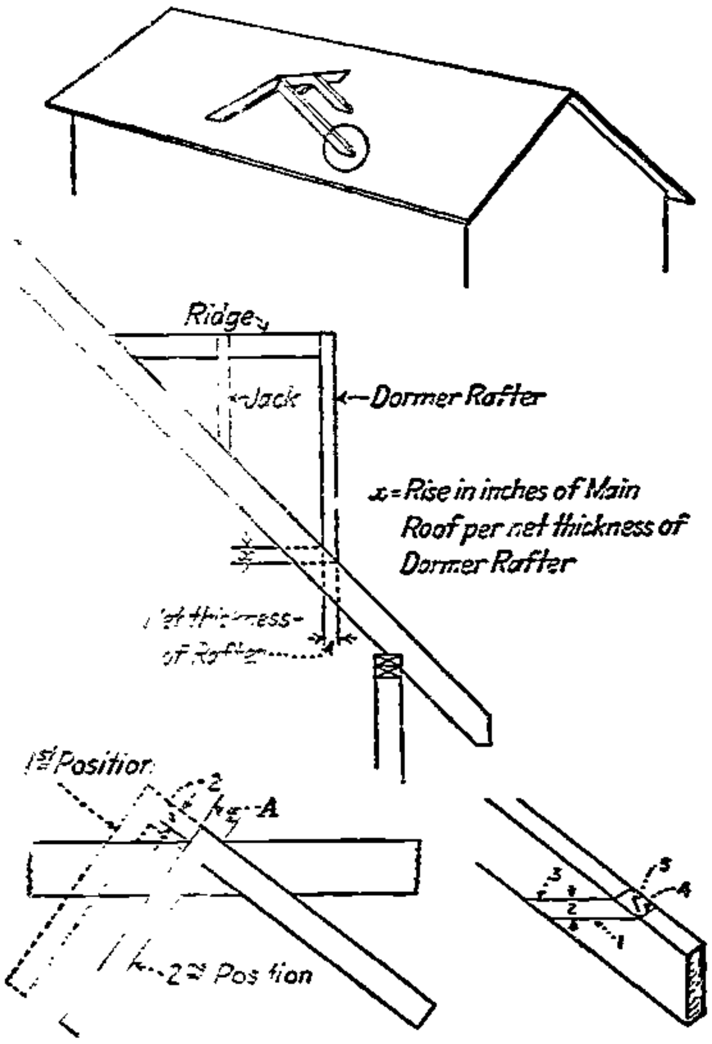
If correctly done, the faces of the rafters when put in position should be plumb, and the bottom cut should exactly fit the slant of the main roof.

ASSIGNMENT:

Lay out a level cheek cut for a roof where both the main roof and the dormer gable have a rise per foot of 8 inches.

The Level Cheek Cut That Fits on a Roof of a Different Pitch — Lesson 11

OBJECTIVE. To learn the procedure for laying out this particular level cheek cut.



NOTE: Rise of Cut at "2" Same Distance

FIG. 92

INFORMATION:

The shape of the level cheek cut that fits on a roof of a different pitch is the same as that of the level cheek cut described in the preceding lesson. The procedure of laying out the cut, however, as the drawing shows, is entirely different.

Procedure:

1. Use the rise per foot of the steep roof and 12; mark along the body to the 12-inch mark (first position of the square in Fig. 92).

2. "Slip" the square until the heel along the body side represents the thickness of the dormer rafter ("A" in illustration). Be sure the square lines up exactly with the run mark.

3. Read the rise figure from the tongue side of the heel. This is the "rise of the cut" at the bottom end of the dormer rafter (figure 2 in the illustration).

4. Lay out a level line on the dormer rafter as at 1 in the illustration.

5. Lay out a second level line above the first level line as at 3. The distance between the two level lines vertically (taken at right angles to the level line) is the distance found in step 3, that is, the "rise of the cut").

6. Make 90-degree (square) lines across the top of the rafter as at 4.

7. Connect these lines with a diagonal line, which will be the angle cut of the dormer rafter, as at 5.

ASSIGNMENT:

Lay out a level cheek cut for a dormer rafter; the main roof is $\frac{1}{3}$ pitch, and the dormer is $\frac{1}{4}$ pitch.

UNIT VI - OTHER USES OF THE FRAMING SQUARE

Making Circles with the Framing Square — Lesson 12

OBJECTIVE: To learn the procedure of laying a circle.

INFORMATION:

Sometimes it is necessary for the layout man to lay out a circle for a particular layout problem. There are several methods of making a circle. The roof framer can lay out a circle with the framing square.

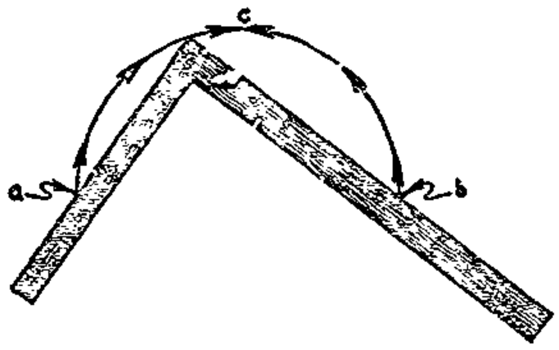


FIG. 93

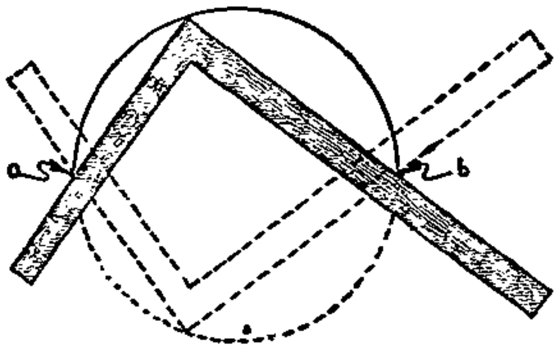

FIG. 94

Procedure:

Drive two nails, as at a and b in Fig. 93, as far apart as the diameter of the circle. Place the square in the position shown, and with a pencil at the heel, mark the circle as the square is moved in the direction of the arrows. When one-half of the circle is marked, place the square in the position shown by the dotted lines in Fig. 94, and proceed to mark the other half of the circle. In case a circle is required that is larger than the square can make, construct a wooden square as large as is needed to make the circle.

ASSIGNMENT:

Use the framing square and lay out a circle with a diameter of 20 inches.

Finding the Center of a Circle

OBJECTIVE: To learn how to find the center of a circle.

INFORMATION:

There are several methods of finding the exact center of a circle. The roof framer can do this easily with the framing square.

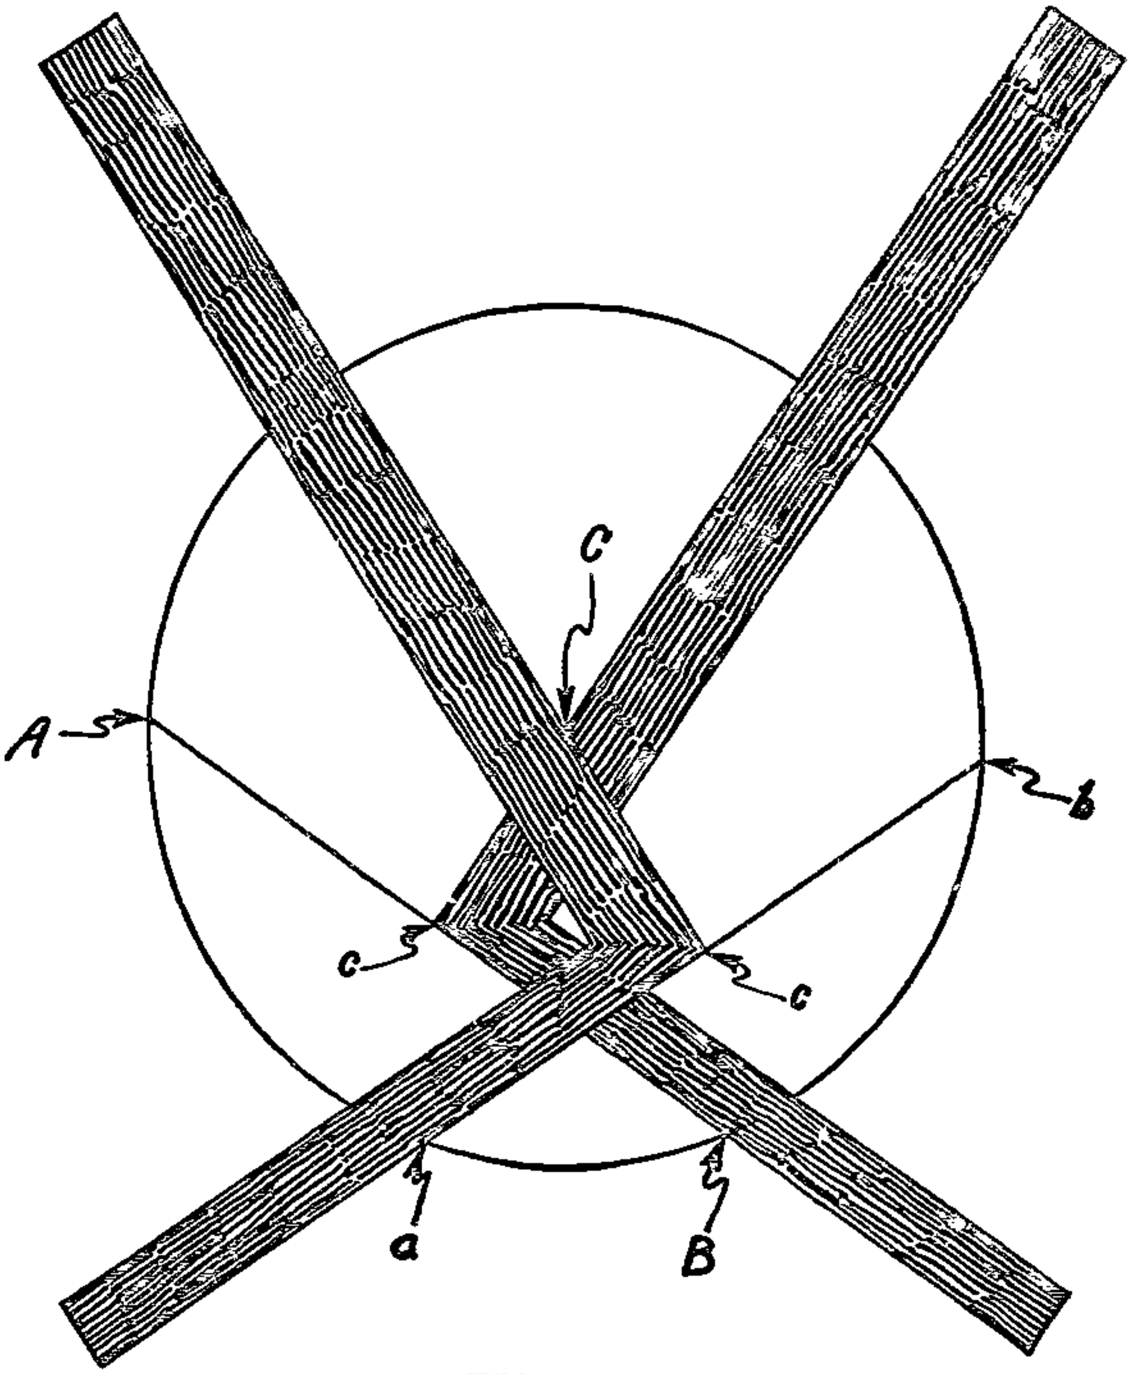

FIG. 95

Procedure:

Draw two lines, similar to lines A-B and a-b in Fig. 95, at any convenient position. Find the centers of the two lines, as at c-c, and place the square in the positions shown, drawing lines along the edge both times. The point at C, where the two lines intersect, will be the center of the circle.

ASSIGNMENT:

Find the center of the circle laid out in Lesson 12.

UNIT VI - OTHER USES OF THE FRAMING SQUARE

TEST

---

1. Lay out cross bridging for the following floor joists:

Size	Spacing on Center
2" x 10"	14 inches
2" x 8"	12 inches
4" x 8"	16 inches
2" x 12"	16 inches

2. Use the Essex Board Measure Scale to find the board footage for the following pieces of lumber:

2" x 10" x 20'0"
4" x 8" x 16'0"
4" x 10" x 14'0"
14" x 14" x 20'0"

3. By means of "slipping the square" find the second dimension of the larger triangles:

Small Triangle	Run of Large Triangle
6" x 12"	15 inches
10" x 12"	20¼ inches
8" x 12"	14¾ inches

4. Find the scale length for the following common rafters by "slipping the square":

Rise Per Foot	Span
9 inches	27 feet
10 inches	28 feet 6 inches
12 inches	26 feet
7½ inches	31 feet

5. Find the common difference in length for the following jack rafters by "slipping the square":

Rise Per Foot	Spacing
9 inches	12 inches
$6\frac{1}{2}$ inches	16 inches
12 inches	18 inches

6. By "slipping the square," find the common difference in the length of the gable studs for the following roof dimensions:

Rise Per Foot	Spacing
12 inches	16 inches
10 inches	14 inches
8 inches	24 inches
6 inches	20 inches

7. Find the length of these collar beams by "slipping the square":

Rise Per Foot	Vertical Distance from Ridge
9 inches	14 inches
12 inches	1 foot 4 inches
7 inches	1 foot 2 inches

8. The rise per foot of the main roof is 8 inches. The rise per foot of the dormer gable is also 8 inches. Lay out the level cheek cut for the dormer common rafter to fit on top of the main roof.

9. Use the framing square and lay out a circle with a diameter of 16 inches; find the center of the circle.

UNIT VII - SUMMARY OF ROOF INFORMATION

General Information Lesson 1

OBJECTIVE: To review the types of roofs and rafters.

INFORMATION:

This unit will serve as a review of the information covered in the preceding units. No explanation of procedures is given. The student should be sure he fully understands the various layout problems before he reads this unit. This review material is divided into three parts:

1. General information
2. Definitions
3. Basic rafter layout principles

Types of Roofs

1. Shed: Slants in one direction only
2. Gable: Slants in two opposite directions
3. Hip: Slants in four directions
4. Intersecting: On buildings that have offsets or angles

Kinds of Rafters

1. Common
2. Hip
3. Valley

Jack Rafters

1. Hip jack
2. Valley jack
3. Cripple

Basic Rafter Cuts

1. Ridge - at the ridge (a plumb cut)
2. Cheek - at top end of hips, valleys, and jacks (an angle cut)
3. Seat - at the plate line (combination plumb and level cut)
4. Overhang - at exposed lower end of rafter (usually a combination plumb and level cut)

Pitch

There are three applications of the term "pitch":

1. Mathematical relationship between total rise and span
2. Equal Pitch: roof has the same slope on all its parts
3. Unequal Pitch: roof has two or more different slopes

UNIT VII - SUMMARY OF ROOF INFORMATION

Definitions — Lesson 2

OBJECTIVE: To review the definitions used in roof framing.

INFORMATION:

The definitions are grouped according to the information required before actual layout work can begin.

Span

1. Total span - distance from outside edge of wall plate to the opposite outside edge of wall plate.
2. Unit of span - always 24 inches.

Rise

1. Total rise - vertical distance from top of wall plate to top of ridgeboard.
2. Rise per foot - number of inches that roof rises per foot of run.

Run

1. Total run - always one-half the total span.
2. Unit of run - always 12 inches

Rafters

1. Common rafter - the rafter that extends at right angles from plate line to ridge
2. Hip rafter - the rafter at the intersection of any two of the four sloping surfaces of a hip roof
3. Valley rafter - the rafter that is framed at the intersection of two slopes of an intersecting roof

Jack Rafters

1. Hip jack - a rafter that runs from the plate to the hip rafter
2. Valley jack - a rafter that runs from the ridge to the valley rafter
3. Cripple jack - a rafter that does not touch either the ridge or the plate

Ridge - the highest part of the roof (where the ridge cuts of the rafters meet)

Rafter Cuts

1. Ridge cut - at the top end of common, hip, valley, and valley jack rafters
2. Seat cut - the cut at the intersection of a rafter with the wall plate, on which it is to be nailed
3. Overhang cut - the cut at the bottom end of any rafter that overhangs to form a cornice
4. Cheek cuts - The single cheek cut: a slanting plumb cut on jack, valley, and hip rafters to make them fit against the piece to which they are framed.
   The double cheek cut: the same as a single cheek cut, except that the slanting cut is in two directions, such as a "V" cut on hip or valley rafters.

Deduction - The amount necessary to shorten each rafter, to allow for the thickness of the stock to which it is framed

Rafter Lengths

1. Mathematical - the exact mathematical length of each rafter, with no allowance made for deduction; also called line length
2. Actual - the actual length of a rafter after deduction has been made

Angle of Cut

1. For common rafter - use rise in inches, and 12 inches
2. For hip and valley rafters - use rise in inches, and 17 inches (for equal-pitch roofs).
3. For unequal pitch roofs - use total rise and total run measurements.

UNIT VII - SUMMARY OF ROOF INFORMATION

Basic Rafter Layout Principles — Lesson 3

OBJECTIVE: To review certain fundamental layout principles

INFORMATION:

Most of the difficulties of rafter layout will disappear as soon as the student has learned to visualize the rafter relationships in their plan view (as seen from above). The pitch of the roof need not be considered. The following rules apply to all rafters when considered in plan view.

1. Common rafters intersect the ridge at a 90-degree (right) angle.
2. Hip, valley, and jack rafters of an equal-pitch roof intersect the roof member to which they are framed at a 45-degree angle.
3. Cheek cuts for equal-pitch roofs are laid out at right angles to the plumb cuts.
4. Hip, valley, and jack rafters for unequal-pitch roofs intersect the member to which they are framed at any angle other than 45 degrees. This is the basic reason why unequal-pitch roofs are more difficult to lay out than equal-pitch roofs.

Principles of Deduction

All rafters that are framed against another roof member must be shortened to allow for the thickness of this member. The rules are as follows:

1. All deductions are on the principle of the plan view; therefore, all measuring is done at right angles to the plumb cut.
2. All deductions are on the basis of one-half the thickness of the stock to which the rafter is being framed.
3. For common rafters, the deduction is one-half the thickness of the ridgeboard.
4. For hip and valley rafters, the deduction is three-quarters of the thickness of the ridgeboard.

5. For jack rafters, if the mathematical length is found, then the deduction is the same as for hip or valley rafters. If the rafter tables on the square are used, then deduction is not necessary.

Note: When figuring out deductions, measuring on the rafter at right angles to the plumb cut automatically shortens it the correct amount, regardless of the pitch of the roof.

Principles of Similar Triangles

For an equal-pitch roof, the angle formed by the rise in inches and 12 inches of run is equal to the angle formed by the total rise and total run. The triangles so formed are known as similar triangles.

Future Farmers of America,

This document describes aids for teacher use in vocational agriculture classes, or for promoting the agricultural program. The aids were developed at an inservice institute by teacher committees who consulted subject matter specialists. Included are (1) overhead projection transparency masters on landscape planning, (2) information and directions for making soil monoliths, (3) a suggested form and pertinent information for teaching identification of 54 landscape plants, (4) questions and answers about vocational agriculture and the Future Farmers of America for a recruitment brochure, (5) a description of 51 slides for promotion of the agricultural program, and (6) plans for an electric quiz board. This document is available for $1.00 from Vocational-Technical Curriculum Laboratory, Rutgers University, 10 Seminary Place, New Brunswick, New Jersey 08903. (JM)

PREFACE

During the 1966 Inservice Summer Institute, "Instructional Aids for Teachers of Agriculture," a list of projects relating to teaching materials was developed. From the list the sixteen teachers of agriculture enrolled in the Institute selected the six projects described in this booklet as having the most utility to them in their programs.

Committees were formed to pursue the projects in such a way that the final report would be useful to fellow teachers of agriculture. Preliminary drafts of the materials were presented to class members for improvements, additional suggestions, and a degree of approval. Materials were then returned to committee, re-written, and submitted to the class for final approval.

Specialists from the College of Agriculture and Environmental Science, Rutgers - The State University and the New Jersey Department of Education were consulted by members of the committees. Special recognition is given to Mr. George W. Lange, Director of Agricultural Education, New Jersey Department of Education and to Mr. Robert M. Hanna, Associate Extension Specialist in Soils, College of Agriculture and Environmental Science, Rutgers - The State University, for their continued professional help during the two-week Institute.

The teachers of agriculture are commended for selecting meaningful projects which will help them and fellow teachers with their professional responsibilities.

Charles C. Drawbaugh
Assistant Professor
Vocational Education

TABLE OF CONTENTS

PART I

ORIGINALS FOR PREPARING OVERHEAD TRANSPARENCIES ON LANDSCAPE PLANNING

ORIGINALS FOR PREPARING OVERHEAD TRANSPARENCIES ON LANDSCAPE PLANNING

This series of originals is made available to the teacher for making transparencies. The teacher should not feel obligated to use each original in the set nor should he consider the set to be complete.

To use the originals in this booklet, remove the pages. A transparency is made by placing a piece of specially prepared transparent material over the original and putting both through a copying machine at the correct speed. The process results in a piece of transparent material with an image of the original fixed on it. It is known as a transparency and is used on an overhead projector as an instructional aid.

More than one original and/or transparency may be necessary to explain an idea or a principle of landscape planning. For that reason seventeen originals were prepared to explain ten ideas or principles. To help the teacher use the transparencies in a suggested sequence, a syllabus precedes the originals.

Syllabus of Originals

1. Plan before planting.

2. Plan for usefulness, convenience, safety, comfort, and beauty.

   A complete landscape plan illustrating the above concepts.

   An overlay (place on top of the complete landscape plan).

3. Survey the site - taking an inventory.

4. Measuring and locating points.

5. Draw the site plan to scale.

   A site survey drawn to scale.

6. Three areas of the home landscape.

   A diagram of the three main areas to be planned.

7. Planning the public area - The foundation planting.

   Planning the public area - Frame the house with trees.

   Planning the public area - A well planned public area.

8. Planning the private area.

9. Planning the service area.

10. Kinds of landscape design - Informal garden.

    Kinds of landscape design - Formal garden.

INFORMATION AND DIRECTIONS NECESSARY TO MAKE SOIL MONOLITHS

INFORMATION AND DIRECTIONS NECESSARY TO MAKE SOIL PROFILES

When teachers of agriculture observe soil monoliths on display at fairs and agricultural meetings, they often wish for one or more in their own classroom. Few teachers of agriculture make maximum use of soil monoliths for instructional purposes because they do not have them and they are not readily available.

This section of the booklet is written to encourage teachers and students to make their own soil monoliths. Be advised, however, that while soil monoliths are relatively inexpensive, they do require considerable time to make.

The collection and preservation of soil profiles begins with an interesting field trip and often culminates in an excellent laboratory or science fair project for several of the students. Close supervision by the teacher is necessary to insure success.

The finished profile, stable in a vertical position, adds to the classroom decor when displayed on the wall. In class the soil monolith can be used to teach soil type, structure, horizons, and characteristics relative to the living phase of the profile. It is a useful instructional aid when teaching land judging, doing a television program, or preparing a student demonstration.

Mounted soil profiles are invaluable instructional aids for teaching. The idea is to make them now, use them when the occasions arise, and hang them on the classroom wall until they are needed again.

Materials Needed:

Tools and materials needed to prepare soil monoliths include shovels, flat spade, mattocks, knives, scissors, measuring tape, cloth, string, and several squeeze bottles with solutions premixed. Two one-inch boards, one 6" and the other 8" wide, will be needed to support the profile. The length of the boards, approximately 48", will depend upon the depth of the soil from which the profile is taken.

Solutions Needed:

Solution No. 1 is a diluted solution of cellulose acetate in acetone. It is made by dissolving 140 grams of cellulose acetate in acetone to make one gallon of solution.

Solution No. 2 is a concentrated solution of cellulose acetate in acetone. It is made by dissolving 450 grams of cellulose acetate in acetone to make one gallon of solution.

Solution No. 3 is a mixture of vinylite resin, acetone, and methyl isobutyl ketone. It is made by dissolving 240 grams of the vinylite resin into a 2:1 mixture of acetone and methyl isobutyl ketone to make one gallon of solution.

The solutions are made by preparing a slurry first and then adding additional solvent to the slurry. Prepared solutions can be stored for several days before they are used. Since they solidify when exposed to air, it is important that solutions be kept in closed containers.

Solutions should be applied to soil monoliths with plastic squeeze bottles rather than a spray gun. The gun often becomes clogged and is difficult to clean. Place solution No. 1 in a plastic bottle overnight to test the reaction of the solution on the plastic. THE ACETONE MAY DISSOLVE THE BOTTLE.

Sources of Solution Materials:

Acetone and methyl isobutyl ketone can be purchased at almost any chemical supply house. A source for each of the other two materials is as follows:

Vinylite NYHH resin
Bakelite Corporation
230 North Michigan Avenue
Chicago 1, Illinois

Cellulose acetate
Hercules Powder Company
Cellulose Products Department
Parlin, New Jersey

Site and Soil Conditions:

Factors to consider when selecting a site for preparing a soil profile are as follows:

1. Make sure that all of the horizons are intact if an exposed profile is found at an excavation.

2. Avoid taking profiles in wooded areas because tree roots will interfere with obtaining a good monolith.

3. Do not take a sample from extremely stony or sandy soil if inexperienced at the task. Profiles are difficult to obtain from stony or sandy soils.

4. Make sure the soil is moist before taking the profile sample. If drought persists, soak the site thoroughly with water several days before exposing the profile.

5. Dig the pit large enough and deep enough to expose the full profile. The pit should be at least 3' wide and 5' long. When the pit is dug the strenuous work is done and the more tedious work begins. Slope one of the 3' sides of the pit approximately 5 degrees and plane the surface as smooth as possible. The smoothed surface should be 18" to 24" wide. The center 6" of the smoothed side should be used for the soil profile sample.

Removing the Sample:

Lay the 6" board in the center of the smoothed surface of the prepared pit. Use a knife to mark the soil around the edge of the board. Remove the board and treat the marked area with approximately 1 quart of solution No. 1. Permit the treated area to dry 10 to 15 minutes (longer for heavier soils and cooler days) and treat it the second time with about 1 1/2 quarts of solution No. 2.

Approximately 30 minutes after solution No. 2 has been applied, place the 6" board firmly against the treated area. Trench out the soil 6" to 8" wide and 3" to 5" deep on each side of the board. Next, cut behind the entire length of the soil profile from one of the side trenches. Start from the other trench to cut holes through to the first trench at 6" intervals. Tie the profile securely to the board at each hole. Finally remove the remainder of the soil that is holding the profile to the pit, and carefully lift the profile from the excavation.

Finishing the Monolith:

Carefully transport the soil profile in a horizontal position to the school shop so that the remainder of the work can be done indoors. Place the board which is supporting the profile on a laboratory table in a well-lighted part of the shop.

Apply Solution No. 2 liberally in strips to the 8" board and place it alongside the 6" board which is supporting the profile. Gently transfer, by sliding, the soil profile from the 6" board to the 8" board. Center the profile on the board, allowing space at the top of the board for the soil type name. Now gently press the profile to the 8" board, remove the excess solution, and allow to dry for 24 hours.

After the profile is firmly cemented to the 8" board, it should be trimmed to the desired thickness (1" to 1 1/2"). Natural structure of the soil can be 'brought out' only with considerable patience and time. An ice pick is useful in 'bringing out' the soil structure. Blow the loose soil particles from the profile with air. Brushing will damage soil structure at this point.

When completely satisfied that the soil profile is 'worked down' properly, saturate it with solution No. 3. Apply the solution from a squeeze bottle, allow it to soak in, and apply more solution. Do not apply this solution with a brush because it will result in a smearing of the surface and destroy the aggregate structure of the soil.

Adequate ventilation is needed at all times when using solutions indoors. Inhalation of fumes from the solutions may cause illness and headaches. Open flames and smoking should not be permitted because of the combustible nature of the solutions.

When solution No. 3 is fixed (2 to 3 days) the soil monolith can be framed with 3/4" x 3/4" quarter round moulding glued to the board. The board and moulding should be then sanded and finished with clear sander sealer, gloss lacquer, and varnish. Soil type, horizons, and other pertinent information should be painted neatly in black at the appropriate places on the board and moulding.

Additional free information can be gotten by writing the senior authors for the following publications:

PART III

A SUGGESTED FORM AND SOME PERTINENT INFORMATION FOR TEACHING IDENTIFICATION AND VALUE OF 54 COMMON LANDSCAPE PLANTS

A SUGGESTED FORM AND SOME PERTINENT INFORMATION FOR TEACHING IDENTIFICATION AND VALUE OF 54 COMMON LANDSCAPE PLANTS

New Jersey teachers of agriculture have identified what they believe to be the more common landscape plants used in the State. Each of the plants was classified as follows: (a) tree, (b) shrub, (c) small tree, or (d) vine. The plants were also appraised qualitatively for ornamental value. Foliage, flowers, fruit, and other ornamental considerations such as bark, growth habit and rate, texture, and fall coloration were measures of landscape value and also aids to identifying the plants. The list of common landscape plants with identifying characteristics outlined will aid teachers in preparing students for state FFA ornamental horticulture contests.

On the next page is a sample form which can be duplicated and used as an instructional aid. Completed forms, when done by students and kept in their notebooks, aid them in learning to identify landscape plants.

Several pages following the sample form provide the data for partially completing 54 of the school-duplicated forms. The teacher may wish to give the students additional information and encourage them to sketch the plants in the appropriate place on the forms.

Have the students attach several mimeographed forms to their clipboards before the class tours the school grounds, visits the arboretum, or makes a field trip to the local nursery. Use fresh plant samples, colored slides, and plastic nursery labels in class to augment the learning.

ACERACEAE:

1. Norway Maple (Acer platanoides) has leaves which are simple and opposite, and give a bright yellow autumn coloration. A milky sap is present when the petiole is broken. The flowers are small, yellow in color, and appear in late April. The bark, which is black to dark brown, has tight vertical and horizontal ridges. The tree reaches a mature height of 90 feet and is wide spreading. It is not recommended for a street or lawn tree because of a shallow root system.

2. Red Maple (Acer rubrum) has simple and opposite leaves. They are 3 to 4 inches long and wide, with petioles often red in color. The autumn color is a bright red. Young twigs are green but turn red as they mature. Flowers are tinted yellow to bright red, appearing early in the spring before the leaves appear. The 1 inch long, reddish, winged seeds are the fruit of this species. The tree will mature to 120 feet in height, with an upright, spreading shape. Red Maple has a silver gray scalelike bark.

3. Sugar Maple (Acer saccharum) has a simple and opposite leaf, which has autumn colors of scarlet, yellow and orange. This species is a desirable street tree because of its high, spreading branching characteristics. It will reach an average height of 120 feet. The bark is silver-gray in color and has a long and irregular strip configuration. The tree doesn't exfoliate.

APACYNACEAE:

4. Myrtle (Vinca minor) This evergreen has a simple and opposite leaf arrangement, which has a lustrous dark green color. The lilac blue flowers (1/2 - 3/4 inch) are present in late April and add to the species' ornamental value. This vine, which is about 6 inches high, produces excellent ground cover.

AQUIFOLIACEAE:

5. Japanese Holly (Ilex crenata) is an evergreen with a simple, alternate leaf arrangement. The upper surface is dark green and glossy, with the underside of a lighter green color. The black berry-like fruit is 1/4 inch in diameter. It ripens in the fall and lasts the entire winter. This 20 foot high, dense upright shrub makes it desirable for a hedge. It is also of ornamental value for use as a foliage specimen plant.

6. American Holly (Ilex opaca) This evergreen, like the Japanese Holly, has simple, alternate leaves. The leaves, however, have a spiny margin. The top of the leaf is green, with a yellow-green underside. The flowers are not showy and there are male and female plants. The berry-like fruit of a dull red color along with the glossy leaves, makes it of ornamental value. The berries, which are born singly or in small clusters, ripen in the fall and are present until early winter. The smooth light gray bark is characteristic of this pyramidal shaped tree which reaches a height of 45 feet.

7. Convex Leaf Holly (Ilex crenata 'convexa') is an evergreen with a simple leaf in an alternate arrangement. The cup shaped leaves are 1/2 to 1 1/2 inches long. The black berry-type fruit ripens in the fall. The 3 to 4 foot, compact, rounded shrub makes an excellent hedge. The lustrous dark green foliage and the numerous fruits add to its ornamental value.

ARALIACEAE:

8. English Ivy (Hedera helix) has simple leaves that are 4 inches long and have three to five lobes. This evergreen has black berries which ripen in the fall. The clinging vine will reach a height of 90 feet. It is of value for a ground cover and for its foliage.

BERBERIDACEAE:

9. Japanese Barberry (Berberis thunbergi) has simple, alternate leaves which are borne in fascicled spurs. The buds are small and the twigs are reddish to purple in color. Another feature of the twigs is that spines arise at the base of the leaf axils, one at a node. The yellow flower appears in mid May. The red berry fruit ripens in winter and sometimes remains on the shrub for the entire winter. The globe-shaped shrub reaches a height of 7 feet at maturity. In addition to the fruit, the foliage produces a scarlet autumn color.

BETULACEAE:

10. Gray Birch (Betula populifolia) has simple, alternate leaves and a catkin arrangement of the flowers. The smooth gray-white bark has black triangular markings. This small tree reaches a height of 30 feet, usually with several trunks growing in a clump. The ornamental values of the gray birch include the yellow autumn coloration, bark, and its ability to do well in both poor and good soils. It is a rapid growing tree, but has a short life.

BUXACEAE:

11. Boxwood (Buxus sempervirens) is an evergreen with a simple leaf with opposite arrangement. The leaf is glossy green with a yellow-green lower surface. The twigs tend to be green in color and the older twigs become somewhat angular. This slow growing shrub will reach a height of 20 feet. Its foliage makes it of value for a specimen plant or hedge.

CORNACEAE:

12. The leaves of the Flowering Dogwood (Cornus florida) have sharp pointed leaf tips with arched veins. The dense lustrous foliage is comprised of simple leaves on an opposite arrangement. They produce a scarlet fall color. The twigs are green in color when young. The flowers which are small and yellow are surrounded by large showy, white bracts and appear in April to mid-May. The fruit of the dogwood is a bright red drupe, which remains on the tree for most of the winter. The dark brown bark is rough and in broken plates. This small tree may reach a height of 40 feet.

CUPRESSACEAE:

13. Pfitzer Juniper (Juniperus chinensis 'pfitzeriana') This shrub has two types of foliage. The first is the needle-like foliage on the juvenile growth and the second is the scale-like foliage on the adult growth. The fruit is a blue berry which matures in the fall. This spreading, somewhat upright shrub reaches a height of 5 feet. The long, spreading almost horizontal branches and the foliage give the shrub ornamental value.

14. Arborvitae (Thuja occidentalis) is an evergreen with scale-like foliage. The back of the leaf contains a gland. Facial scales have a larger gland. A 1/2-inch long brownish-yellow cone is the fruit of this species. The bark of this tree is reddish brown. A mature tree will stand 60 feet high.

CAPRIFOLIACEAE:

15. Glossy Abelia (Abelia grandiflora) is a half evergreen with an opposite to whorled arrangement of simple leaves. Leaves have a dark green upper surface, a bearded appearance at the base of the midrib, and produce a bronze to purple autumn coloration. The flowers of this shrub are pink in color and persist throughout August. This dense, wide spreading shrub reaches a height of 5 feet and is useful as a hedge.

16. Double File Viburnum(Viburnum plicatum 'tomentosum') The foliage of this species is simple with an opposite arrangement. The underside of the leaf has a dense stellate pubescence with some on the midrib of the upper surface. The buds are scale-like and the twigs also have the stallate pubescence. White flowers appear in late May to early June. The red to blue-black showy drupe is also characteristic of this species. The shrub reaches 9 feet in height, and the horizontal, wide spreading branches are apparent in winter.

ERICACEAE:

17. Kalmia latifolia is the scientific name for the Mountain Laurel. The simple leaves of this evergreen are arranged in an alternate pattern. The [illegible] inch long leaves have a glossy, thick texture, with a yellow-green lower surface. The white to rose-colored flowers bloom in mid June. This globe-shaped shrub will reach a height of 30 feet. It may be used as a foundation planting in a naturalized landscape. It requires an acid soil and is susceptible to leaf spot.

18. Japanese andromeda(Pieris japonica) is similar to the Mountain Laurel in its leaf arrangement. These simple leaves have a glossy surface which adds to its ornamental value. The white flower blooms in mid-April and is long lasting. This upright spreading shrub will reach a height of 9 feet and grows better in the shaded conditions. It also does well in a variety of soils.

19. Catawba Rhododendron (Rhododendron catawbiense) is a simple leaf evergreen with an alternate arrangement. The leaves are thick with a shiny upper surface and a yellow-green lower surface. The buds are green the entire year and the branches are whorled. The 2 1/4 inch flower is a red lilac color which blooms in early June. Olive green spots in the upper most petals are also characteristic of the flower. A capsule fruit does little to add to the ornamental value. This shrub which reaches a height of 6 to 18 feet is wide spreading but not very dense. The species survives on low pH soils and is tolerant to shade.

20. Kurume Azalea (Rhododendron obtusum) has simple and alternately arranged foliage which produces a reddish fall color. The orange-red to bright red flowers bloom in mid May. This shrub will reach a height of 3 feet. It is of interest for its many valuable ornamental varieties.

FAGACEAE:

21. European Beech (Fagus sylvatica) has simple leaves arranged in an alternate pattern. These glossy, dark green leaves have 5 to 9 veins each. The buds are long with a gradual taper. The fruit of this species is a nut. The bark of the 90 foot tree is smooth and blue-gray in color. The European Beech is a good shade tree and has an autumn coloration of bronze. There are also several forms of this species available for ornamental use including the weeping, variegated leaf, and purple leaf forms.

22. Pin Oak (Quercus palustris) has a simple leaf in an alternate arrangement. The chestnut-brown twigs contains long, narrow, sharp pointed buds. The Pin Oak produces the smallest acorn of the oaks. The t[illegible] will reach a mature height of 75 feet and is pyramidal in shape with dro[illegible] branches. The ornamental values of this species are the fine texture of the foliage, growth rate, and the autumn coloration of brown to scarlet.

23. Fastigiate English Oak (Quercus robur 'fastigiata') has a simple leaf and an alternate leaf arrangement. The base of the leaf is heart shaped and the petiole is short. The large acorn fruit is borne on long stalks and has a small cup. The bark is dark gray to black and block-like in configuration. This narrow upright tree reaches a height of 75 feet. It may be used as an accent tree.

24. Red Oak (Quercus rubra) has bristles at the tips of the lobed, ten-inch simple leaf. The leaf arrangement is alternate. In winter the twigs have a red-brown color and contain the largest buds of the oaks. The large acorn has a shallow, flat cup. Red oak has dark brown to black colored bark. This 75 foot tree, which is wide spreading has a rounded top. The ornamental values of this species includes its use for shade and street plantings, and its autumn coloration of red to bronze.

GINKOACEAE:

25. Maidenhair Tree (Ginkgo biloba) The thick leaves of this species are simple with an alternate arrangement. Three to five leaves grow on short spurs. Reddish brown to orange colored twigs contain the blunt buds. Male and female plants are characteristic of this species. The female is undesirable because of the pungent odor of its fruit. The 1 - 1 1/2 inch yellow-brown fruit resembles a drupe. The tree will reach a height of 120 feet with wide spreading but irregular branching. It is resistant to insects and disease, and it makes a specimen tree for large lawns. The autumn color is bright yellow.

HAMAMELIDACEAE:

26. Hamamelis virginiana commonly known as Witch Hazel has a simple leaf with a smooth under surface. The leaf arrangement is alternate. The bright yellow flowers with ribbon-like petals form in clusters and appear in late Autumn to early Winter. This 15 foot shrub contains a capsule fruit. It is tolerant to acid soils and partial shade. The shrub is showy when the leaves have dropped.

27. The star-shaped leaves with a heart-shaped base are characteristic of the Sweet Gum (Liquidambar styraciflua). These simple leaves are alternately arranged. The fruit is a multiple of capsules in a globe-shaped head. They mature in fall and last into early winter. The 125 foot pyramidal-shaped tree has a deeply furrowed bark. The glossy foliage has an autumn coloration of orange to red. Sweet Gum can be planted in wet or moderately dry soils.

LEGUMINOSAE:

28. Silk Tree Mimosa (Albizzia julibrissin) has a compound, doubly pinnate leaf. These alternately arranged leaves contain small sickle-shaped leaflets, appearing feathery. The bright rose pink flowers are 1 to 1 1/4 inches across. The "Balls of Pinkish Thread" flowers appear in mid July to September. The brownish pod fruit is flat and about 6 inches long. These persist through most of the winter. The 36 foot tree is broad spreading with a flat top. The bark is smooth and brown in color. Its ornamental values are its foliage, flower and suitability for landscaping ranch-type houses.

29. Thornless Honey Locust (Gleditsia triacanthos 'inermis') has a compound leaf which is alternately arranged. The leaf is fine-textured and ranges from 7 to 12 inches long. This broad and open tree grows to a height of 125 feet and is lacking in flowers and fruit. It is a good shade tree and is easily transplanted.

30. The three-foliated, compound leaf is characteristic of the Golden Chain (Laburnum anagyroides). These alternately arranged leaves have a gray-green upper surface, with a silky pubescence underside. The yellow flowers develop in late May to early June hanging from the green twigs. A 2 inch long pod will develop. This small weeping tree (25 feet high) has a smooth bark.

31. The Chinese Scholar Tree (Sophora japonica) has dark green compound leaves, which are alternately arranged. The fragrant white or yellow flowers bloom in August and develop into green pod fruits. The 75 foot tree is vase shaped, rounded, and wide branching. It is a good shade tree and one of the larger trees to bloom in the fall.

MAGNOLIACEAE:

32. Saucer Magnolia (Magnolia soulangeana) produces simple leaves which range from 6 to 18 inches long. These leaves develop alternately on densely pubescent twigs. The flowers are white with a purple base and are 5 to 10 inches across. They are borne terminally in mid April to early May before the leaves appear. The smooth bark is characteristic of this 25 foot tree.

OLEACEAE:

33. Forsythia is both the common and genius name of this ornamental shrub. Simple leaves develop with an opposite arrangement on the yellow-brown twigs. A yellow flower appears in April. Depending on the species, the height will vary from 2 to 9 feet.

34. Common Privet (Ligustrum vulgave) has a 1 to 2 inch oblong simple leaf. These are opposite and have pubescents on the under surface. The twigs also have pubescents in the juvenile stage. The fragrant white flowers appear in mid-June and develop into black berries by September or October. This 15 foot shrub is of value for formal hedges.

35. Common Lilac (Syringa vulgaris) has a simple leaf which is borne oppositely on the twigs with a waxy, glossy upper surface. The twig also bears a twin terminal bud. The lavender or white fragrant flowers appear in late May on this 20 foot upright shrub.

PINACEAE:

36. White Fir is an evergreen with needle-like leaves. The 1 to 2 inch needles are blue-green in color, longest of the firs, and have a spiral arrangement. The 120 foot conical tree has a smooth gray bark. The fruit of the (Abies concolor) is a 4 inch cone which is purple to brown when it breaks apart.

37. European Larch (Larix decidua) has a deciduous needle which clusters with the bud at the tip of the spurs. Thirteen or more leaves form each cluster. A 2 inch long cone will persist on this 100 foot tree for several years. The leaves have a yellow autumn coloration.

38. The deep green and glossy needle lacking a petiole is characteristic of the Norway Spruce. The needles, rarely flat, are four-sided in cross section. The twigs tend to droop on this 150 foot pyramidal tree. The (Picea abies) cone is the longest of the family (4 to 6 inches). The species is often used as Christmas trees.

39. Austrian Pine (Pinus nigra) has two needles in a bundle which are 3 1/2 to 6 inches long. They are stiff but not brittle. Resinous buds form on the gray-brown to black twigs. The cone is about 3 1/2 inches long on this species. The dense pyramidal shaped tree (90 feet high) makes it desirable for screening or windbreak plantings.

40. (Pinus strobus) has a 2 1/2 to 5 1/2 inch long, soft, flexible needle. These green-white needles are arranged five in a bundle. The cone of the White Pine is 5 inches long and the bark remains smooth for a number of years. This 100 to 150 foot tree has a broad pyramidal to flat-topped shape, which makes it suitable for background foliage and landscape planting.

41. Douglas Fir (Pseudotsuga taxifolia) is also a needle-leafed evergreen. Sharp pointed buds form on the brown twigs. The cone persists throughout the fall and winter. Irregular gray appearance of the bark is characteristic of this 300 foot, broad, conical tree. The persistence of the leaves make it an exceptionally good Christmas tree.

42. Canada Hemlock (Tsuga canadensis) has needles which are flat and tapered from the base to the apex. They are 1/2 to 3/4 inches in length. Twigs are pubescent when young. This 90 foot pyramidal tree produces small cones and the bark is deeply furrowed. The branches have a tendency to weep.

PLATANACEAE:

43. London Plane Tree (Platanus acerifolia) has simple leaves, which are alternately arranged. The leaf is 5 to 10 inches wide, oval or maple shaped. The petioles hide the buds. The fruit is a multiple of nutlets (achenes) which persist throughout the fall and winter. They are borne in two's and three's. The bark is smooth, but exfoliating, and is gray to white, with a greenish underbark. The pyramidal tree when mature is upright and spreading. It will reach 100 feet in height. It is a rapid growing tree and is suitable for street planting, shore areas, and cities.

ROSACEAE:

44. Chokeberry (Aronia arbutifolia) has simple leaves arranged alternately. The 2 inch eliptic - oblong leaf has small black glands along the midrib on the upper surface, tomentose on the underside. The buds are red in winter and the twigs have a light tomentose condition. The white flower with some red on its petals, blooms late in May. The fruit, a pome, is bright red and is predominant in fall and winter. The 9 foot shrub has a red autumn coloration.

45. Cotoneaster or Creeping Cotoneaster has simple leaves with the alternate arrangement. They are 1/2 inch long, with a glossy upper surface and pubescence on the under surface. Twigs are greenish with pubescence and the branching habit is regular. The (Cotoneaster horizontalis) has small pink flowers which form clusters and appear in mid June. The red pome fruit persists sometimes all winter. The 3 foot shrub is low spreading making it suitable for ground cover. It will also weep over low banks and stone walls.

46. (Malus floribunda), the Japanese Flowering Crabapple, has simple, elliptic leaves with the alternate arrangement. The fragrant flower is deep red in the bud stage, fading to pink and finally white as it blossoms. Flowering occurs in early May. This 30 foot tree is wide spreading with a flat top. It produces a red pome which is apparent from August to mid October.

47. Oriental Flowering Cherry (Prunus serrulata 'kwanzan') has a 4 inch long simple leaf. There are 2 to 4 glands present on the petiole. The 2 1/2 inch double pink flowers tend to form clusters of 3 to 4 flowers which bloom in early May. A black drupe is the fruit of this species. The tree reaches a height of 12 to 18 feet with a characteristic vase shape.

48. The semi-evergreen Laland Firethorn (Pyracantha coccina 'lalandi') has 1 1/2 inch leaves in the alternate arrangement. The twigs are small with pubescents and usually thorny. Small white flowers appear in mid June. The orange-red pome fruit is predominate during the fall and winter. The 6 foot sprawling shrub may be used for wall and foundation plantings.

SALICACEAE:

49. (Salix babylonica), Weeping Willow, has a simple leaf on an alternate arrangement. The 3 to 6 inch leaf has a grayish green underside. The twigs are yellow or green, slender and weeping. The broad columnar tree has grayish brown bark and reaches a height of 90 feet. The branches tend to shed. Plantings near drains should be avoided.

SAXIFRAGACEAE:

50. Slender Deutzia (Deutzia gracilis) has an oppositely arranged simple leaf. This 1 1/4 to 3 inch leaf has stellate hairs on the upper surface. Small buds are present on the yellow to gray twigs. White flowers 3/4 to 1 inch are present in late May to early June. These flowers develop into small capsule fruits. This 3 to 6 foot shrub has a graceful weeping habit.

51. Mock Orange (Philadelphus lemoinei) has a 3/4 to 2 inch long simple leaf, with an opposite arrangement. Chestnut or red-brown twigs are also common. The fragrant white flowers appear in mid June. These are single and double flowers. The 4 to 6 foot shrub is upright and spreading.

TAXACEAE:

52. Yew is a needle-like evergreen with a spiral arrangement. The leaf shape is linear. The buds and the height are variable on small trees and shrubs of the (Taxus species).

TILIACEAE:

53. Little Leaf Linden (Tilia cordata) has a simple leaf 1 1/2 to 3 inches long. Leaves have a heart-shaped base and are arranged alternately. The buds are lopsided and the twigs are green turning to red. The yellow to white flowers appear in July and later produce a nutlet fruit. The narrow pyramidal tree reaches a height of 90 feet and is suitable for street plantings in urban areas.

54. Silver Linden (Tilia tomentosa) has an alternately arranged simple leaf 2 to 4 inches long. Leaves are silvery with white tomentose present on the lower surface. The buds are lopsided with pubescents on the younger twigs. The small yellowish blossoms produce nutlets which have a tomentose covering. The compact and dense tree reaches a height of 90 feet. It has a broad pyramidal shape.

PLANS FOR CONSTRUCTING AN ELECTRIC PANEL QUIZ BOARD

QUESTIONS AND ANSWERS ABOUT VOCATIONAL AGRICULTURE AND FFA HELPFUL IN DEVELOPING A RECRUITMENT BROCHURE

Teachers of agriculture are constantly aware of the fact that they must continually inform the public about their programs. One of a number of ways to promote vocational agriculture and the FFA is to prepare and distribute an attractive brochure which describes a practical and sound educational program.

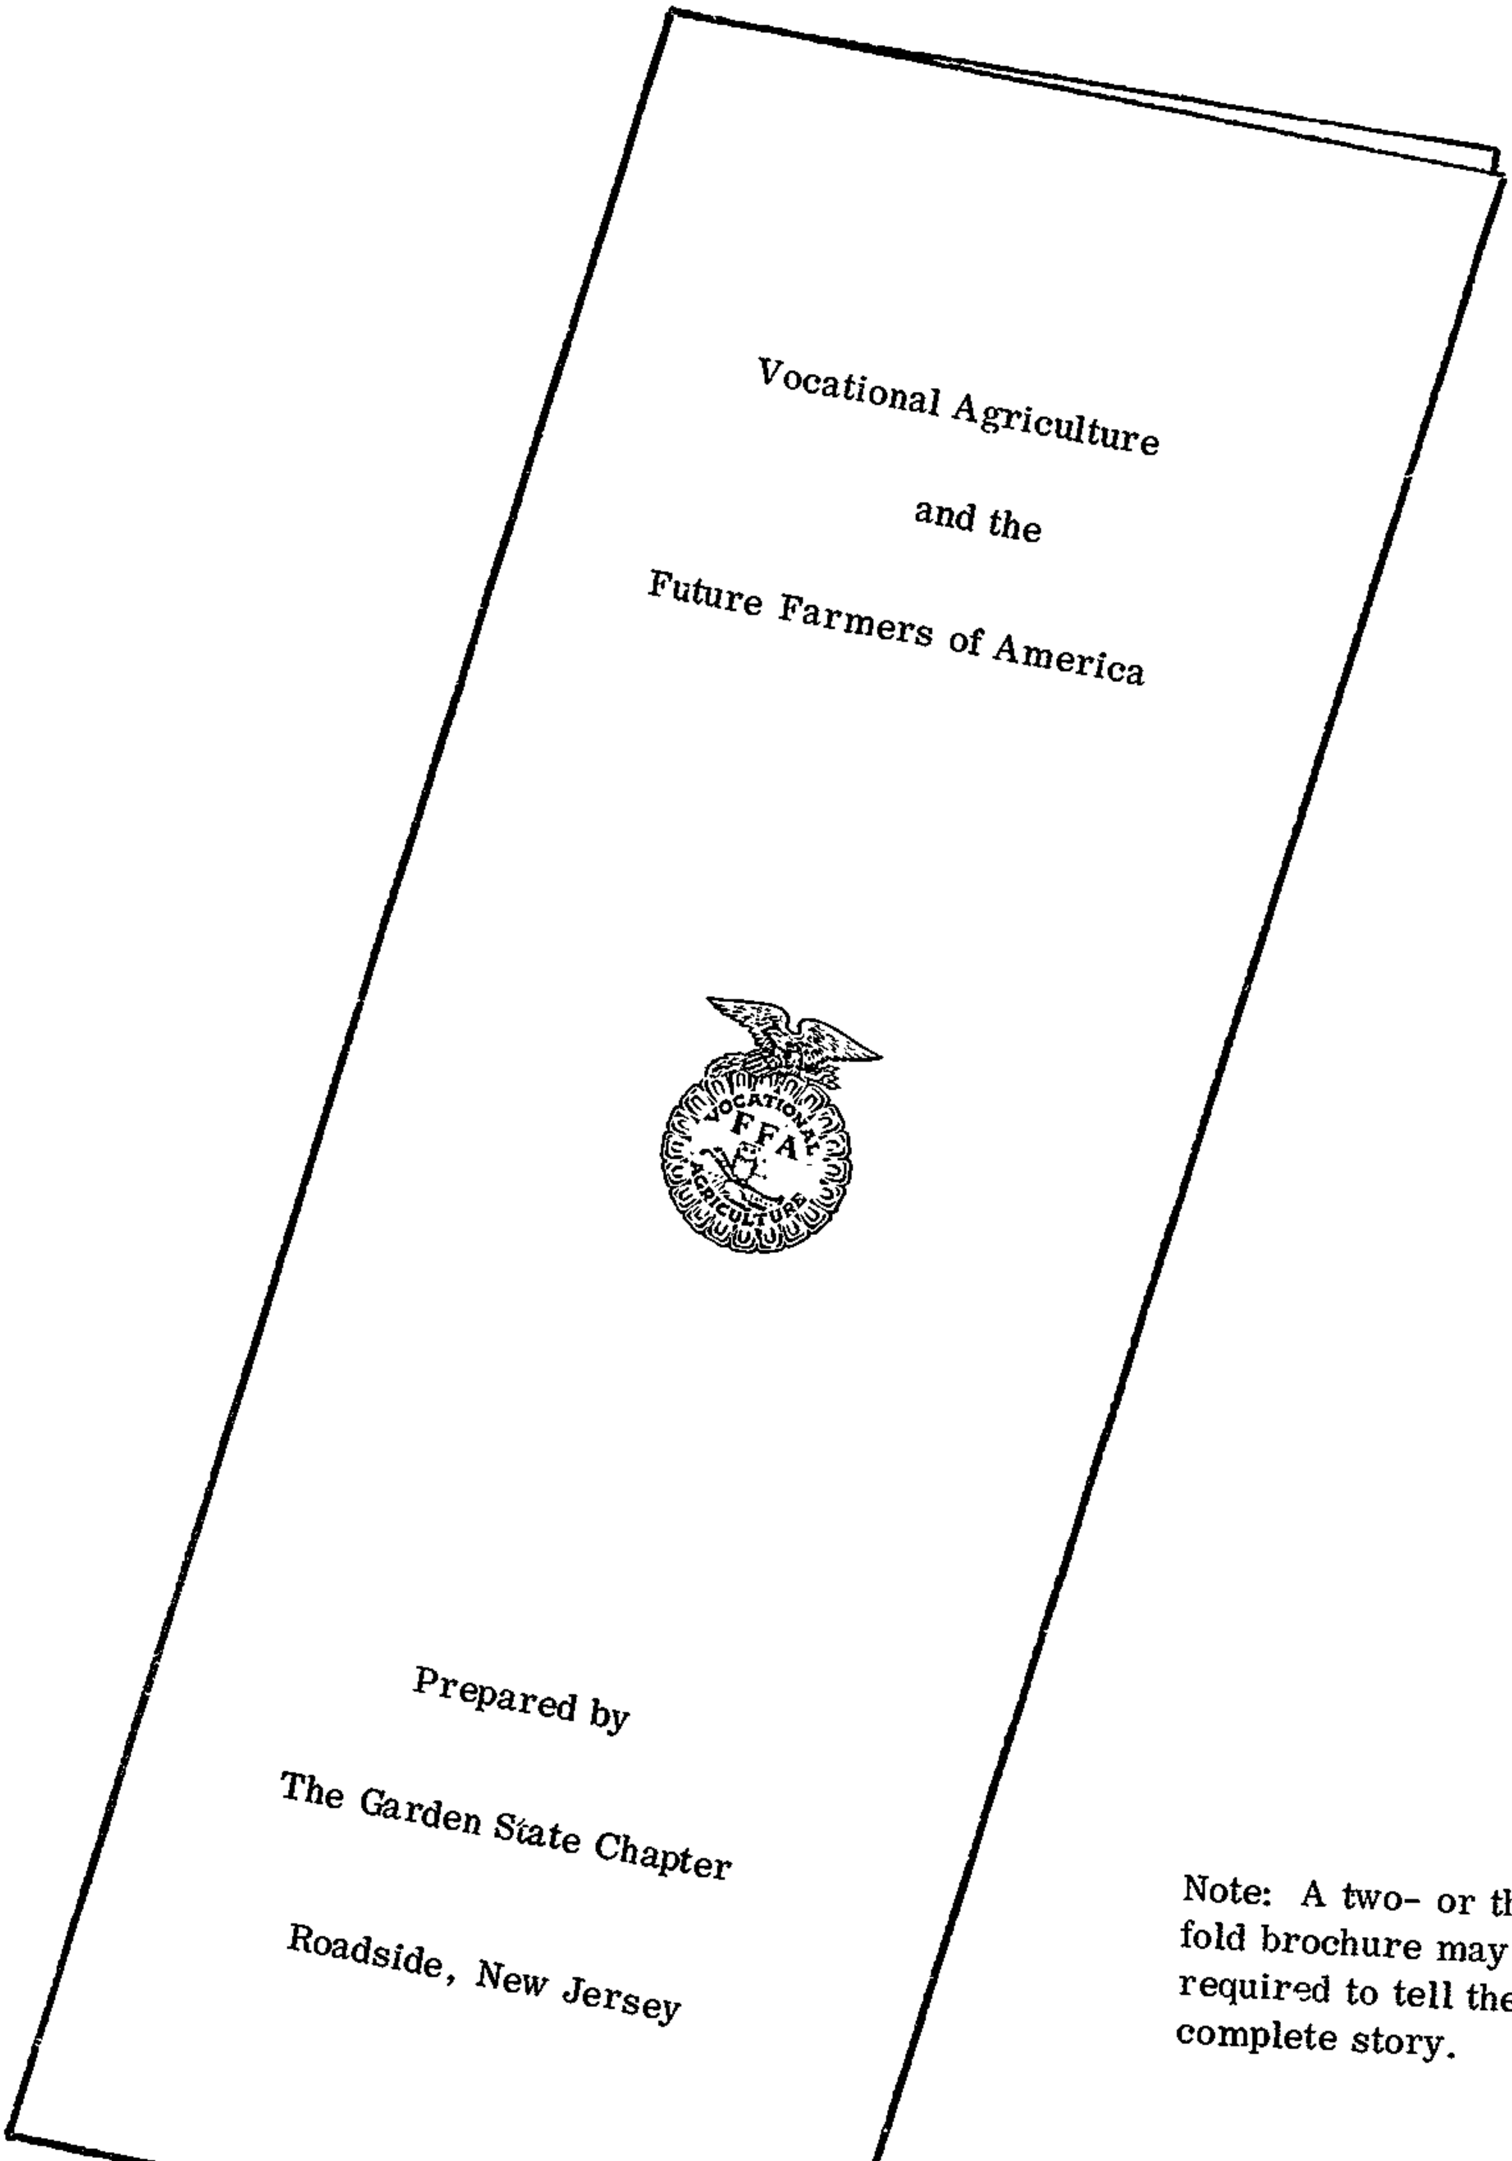
The questions and answers which follow were written to include in a brochure directed at potential vocational agriculture students and their parents. The brochure gives the future student and his parents tangible information to assess and evaluate the program.

The questions and answers were written to include both off-farm agricultural occupations and production agriculture. They are suggested as a guide for the teacher to prepare a brochure which will meet the needs of his own department.

To add appeal and interest, the brochure should contain pictures of successful students and outstanding graduates of the program engaged in agricultural pursuits. A total of four pictures appropriately placed in the brochure will tell the story. Suggested settings for the pictures are as follows:

1. In classroom or laboratory such as greenhouse
2. About supervised agricultural experience programs
3. In the agricultural mechanics shop
4. About a current or recent chapter FFA activity
5. The land laboratory, demonstration plot or school nursery.

Brochures are easy to distribute after they are prepared. They may be mailed, given as part of a packet during a recruitment visitation, or distributed at open house or other school, chapter and community functions.



Vocational Agriculture

and the

Future Farmers of America

Prepared by

The Garden State Chapter

Roadside, New Jersey

Note: A two- or three-fold brochure may be required to tell the complete story.

Questions and Answers About Vocational Agriculture and FFA

1. What is Vocational Education?

   Vocational education is preparation for employment in a useful occupation. It is practical instruction for a specific type of work usually offered as a part of the public school program.

2. What is Vocational Agriculture?

   It is an educational program in agricultural occupations conducted by public schools. It serves three general groups of people: high school students, out-of-school youths, and adults. It endeavors to help people solve their problems in agri-business, ornamental horticulture, conservation, agricultural mechanics, and all phases of local production agriculture.

3. What is Included in the High School Vocational Agriculture Program?

   The program includes scientific business, and agricultural mechanics instruction. Practical supervised agricultural experience and leadership training through the Future Farmers of America are integral parts of the program.

4. What is Included in Agricultural Mechanics?

   A portion of the student's in-school time is devoted to education in shop skills, power and equipment, structures, rural electrification and conservation practices. Mechanical skills and better judgment by students result from the training.

5. May I take Vocational Agriculture and Meet College Entrance Requirements?

   Yes. For students planning to enroll in college, there should be no difficulty in meeting requirements for college entrance. Students can complete vocational agriculture and the college required courses at the same time. Vocational education is not separate, but rather a part of general education. It should make your academic education more meaningful through practical application. Consult the school guidance counselor about your academic capabilities.

6. Can a Student Who Lives in Town Enroll in Vocational Agriculture?

   Yes. If he is interested in a future in agriculture, arrangements can be made to provide him with an adequate supervised agricultural experience program and guidance into the field of his selection.

7. Are Girls Permitted to Take Vocational Agriculture?

Sure. Many girls are interested in a future in agriculture. Girls are required to meet the requirements of the program. They are eligible to participate in FFA activities. Some agricultural opportunities are particularly adaptable to women.

8. What is a Supervised Agricultural Program?

It is a planned program of approved experiences in agricultural occupations. Each individual student plans his own program with the help of the teacher according to his needs and interests. Supervised programs may be in any of the following areas: production agriculture, cooperative occupational experience, farm and home improvement, and placement in the home farm business. Complete and accurate records on these programs are required annually.

The vocational agriculture instructor visits each student at his home, farm, or place of employment. The visit provides for individual instruction and guidance. By knowing the student, his parents, and his working environment, the teacher can adapt instruction to the needs, interests, and progress of the individual.

9. Why is a Supervised Agricultural Experience Program Needed?

It provides practical application to test those facts and concepts learned in the classroom. It is the "learning to do" part of the program.

10. Are Field Trips and Tours Included?

Yes. They create interest and are generally made to farms and agricultural businesses in the community. Educational tours are sometimes made to more distant points to study new developments in agriculture, and to attend state and National FFA leadership conferences and conventions.

11. What Opportunities are Open to Vocational Agriculture Graduates?

a. Continued education in Young Farmer Programs offered at the local high school.
b. Establishment in the business of farming or enterprises servicing agriculture.
c. Placement in an agricultural occupation other than farming--for example, government service.
d. Advancement to coursework in higher education and professional status.

12. What is the Future Farmers of America?

The Future Farmers of America is the largest agricultural youth organization in the world. Its 500,000 members are students who are enrolled in vocational agriculture in public schools. It is a non-sectarian, non-secret, and non-political organization designed to help the student develop his abilities as a member of an organized group. It develops leadership, initiative, integrity, responsibility, and cooperation. There are local chapters, state associations, and a National Organization.

13. What are Some of the Activities of the FFA?

There are chapter, regional, state, and National contests. These include public speaking, home and farm safety, agricultural mechanics, rural electrification, horticulture, crops, soil judging, conservation, livestock and others. Awards are provided by the Future Farmers of America Foundation, agricultural organizations, and individual doners. Members of the FFA may exhibit crops and livestock and in other ways participate in agricultural fairs and shows.

14. How May a Student Become a Member of the FFA?

Any vocational agriculture student may become a member by expressing a desire to join and by meeting the obligations set forth by the membership. Membership implies an obligation to attend chapter meetings and to participate in the activities of the chapter as a cooperative and responsible person.

YOUR LOCAL VOCATIONAL AGRICULTURE INSTRUCTOR AND SCHOOL ADMINISTRATORS WILL WELCOME THE OPPORTUNITY TO DISCUSS WITH YOU PERSONALLY THE LOCAL HIGH SCHOOL VOCATIONAL AGRICULTURE PROGRAM.

PART V

A DESCRIPTION FOR A SET OF 51 SLIDES USEFUL IN PROMOTING THE AGRICULTURE PROGRAM

A DESCRIPTION FOR A SET OF 51 SLIDES USEFUL IN PROMOTING THE AGRICULTURE PROGRAM

Fifty or a few more colored slides when carefully selected and placed in a logical sequence make an excellent fifteen to twenty minute program for promoting the agriculture program. A script of from two to four short, snappy sentences written about each slide adds to the effectiveness of the program. With a set of slides and an accompanying script, chapter officers are able to present an interesting program and answer questions following the presentation.

The set of slides with script may be used in the following situations:

1. Eighth grade introductory program
2. School assembly
3. FFA Week program
4. Agriculture I class
5. PTA, Grange, and other community organization meetings
6. Teachers' meetings
7. Service club meetings

Teachers and others cannot make an effective slide presentation unless they are intimately familiar with the slides they are using. For that reason it is suggested that slides for promoting a local agriculture program be about chapter activities, local department accomplishments, and outstanding students and graduates. The audience warms up quickly to familiar names and places.

The challenge here is not to create a general set of slides with script and have them reproduced for each chapter in the state, but rather to suggest descriptions for a set of slides which the teacher can take and discuss with authority and pride.

Suggestions for Slide Set

No. 1 - Title slide - The __________ High School Agriculture Program.

No. 2 - FFA slogan - such as: "Agriculture is more than farming."

No. 3) Facilities of the local agriculture department - classroom, agriculture
No. 4) mechanics shop, greenhouse, crop demonstration plot.
No. 5)

No. 6 - Classroom instruction - A typical classroom situation.

No. 7 - Laboratory work - Small group instruction in milk testing or soil testing laboratory.

No. 8 - Classroom demonstration - Demonstrate a manipulative skill which is pleasant to watch (not castration or docking).

No. 9 - Agriculture library - include books, magazines and other resource materials.

No. 10) Outdoor instructional activities - such as: pruning, land judging,
No. 11) weed identification, contour stripping, planting shrubs,
No. 12) fertilizing lawns, etc.

No. 13) Field trips - such as: milk plant, hatchery, farms and agricultural
No. 14) businesses, farm show, fair, nursery, State Department of
No. 15) Agriculture.

No. 16 - Agricultural shop program - A variety of shop projects.

No. 17 - A typical agriculture I shop project.

No. 18 - A student in the process of welding a project.

No. 19) Four slides illustrating the breadth of the shop program. Show
No. 20) projects in woodworking, tractor maintenance and repair,
No. 21) machinery repair, small engine reconditioning, concrete
No. 22) work, spray painting, etc.

No. 23 - Construction project - Major construction such as greenhouse construction or building a cinder block poultry house.

No. 24) Slides on plant propagation, greenhouse work, landscaping, nursery
No. 25) production, etc. Also slides illustrating the agri-business activities
No. 26) of boys in garden centers, floral shops and roadside stands.
No. 27)

No. 28) Depict some of the work the department of vocational agriculture has
No. 29) done for the school - such as maintaining the plantings, painting
No. 30) outdoor basketball bankboards and constructing fences.

No. 31) A community improvement project - The rat control campaign,
No. 32) landscaping the fire hall, building park picnic tables.

No. 33) Supervised agriculture experience program - Show the most common
No. 34) projects in your area relative to production projects, home improvement,
No. 35) and supervised occupational experience, animal projects, crop projects,
No. 36) home improvement projects, supplementary practices, and cooperative
No. 37) work experience programs.

No. 38 - Record keeping - A boy or group of boys working on record books.

No. 39) A minimum of ten slides are necessary to depict FFA activities.
No. 40) (Boys should wear jackets properly and white shirt and FFA tie
No. 41) when appropriate.) Suggested areas to depict are: crop demonstrations,
No. 42) cooperative chapter projects, community service activities, a chapter
No. 43) meeting, annual parent and son banquet, public speaking contest, typical
No. 44) committee at work, recreational activities, FFA judging contests, award
No. 45) programs, state FFA convention activities, FFA Week activities, National
No. 46) FFA convention activities, leadership training conferences, etc.
No. 47)
No. 48)
No. 49)
No. 50)

No. 51 - Closing slide - such as: FFA Motto.

PART IV

QUESTIONS AND ANSWERS ABOUT VOCATIONAL AGRICULTURE AND FFA HELPFUL IN DEVELOPING A RECRUITMENT BROCHURE

PLANS FOR CONSTRUCTING AN ELECTRIC PANEL QUIZ BOARD

The electric panel quiz board is an instructional device which lends itself well to individual instruction. It may be used during the student's free time and he can proceed to learn at a rate he chooses. Like programmed instruction, the student is rewarded immediately for a correct answer by seeing a light or by hearing a bell ring.

The electric panel quiz board appeals to the student who likes "gimmicks" and the one who enjoys manipulating machines.

Applications for use of the quiz board are numerous and limited only to the combined ingenuity of the teacher and his class. It may be used to identify plants, seeds, breeds of livestock, tools, weeds, insects, and varieties of vegetables, fruits, and field crops. Recognition of soil types, conservation practices, and plant deficiency symptoms may be learned by means of the quiz board.

The quiz board can be used at opportune times throughout the school year. It may be used just prior to introducing a new unit of instruction. On another occasion it may be used to supplement a unit of instruction. A student may be assigned the responsibility of setting it up to provide other students with a learning activity during those occasional idle moments before and after class.

The quiz board can be utilized effectively throughout the school and community. While it might be used primarily in the classroom and shop, teachers are encouraged to use it in school corridors, the library and study hall to acquaint the total school population with FFA or some other specially chosen agricultural topic. The panel board may be placed in a local farm supply store to inform the public. And, too, it may be taken to school sending districts after a recruitment presentation to stimulate potential vocational agricultural students to think further about the agriculture program.

Bill of Materials

Lumber

1 pc. 1" x 10" x 4'	White Pine	Base
1 pc. 1" x 4" x 8'	White Pine	Top and Bottom
2 pcs. 1" x 4" x 8'	White Pine	Horizontal Members
2 pcs. 1" x 4" x 8'	White Pine	Vertical Members
5 pcs. 1/4" x 1-1/4" x 40"	Lath or plastic	Facing
1 pc. 3/8" x 3' x 4'	Plywood	Back and Legend Panel

Hardware

25 sets of electrical jacks

60 feet of bell wire

1 lamp socket and/or 1 door bell

25 brass wood screws (Contacts for each box)

2 telephone switchboard jacks (Contacts)

1 six-volt transformer or dry cell battery

A quantity of nails

Finishing Materials

For natural finish:

1 pint sander sealer

1 pint varnish

1 pint gloss lacquer

Assortment of sandpaper

Steel Wool

Optional Materials

Glass or plastic (Coverings for each box)

Spotlights (Lighting for the exhibit)

Four 8" to 10" removeable legs (To adjust height of Quiz Board)

*STUDY GUIDES, TEXTBOOKS, *TRADE AND INDUSTRIAL EDUCATION, HIGH SCHOOLS, *BRICKLAYERS, *PRACTICAL MATHEMATICS, ASSIGNMENTS, *INDIVIDUAL INSTRUCTION,

This study guide-textbook was developed to direct the individual study of the vocational high school student in a 1-year course in mathematics related to masonry work. The material was prepared by a vocational-technical high school instructor and tested by classroom use. Units are Fractions, Decimal Fractions, Square Measure, and Cubic Measure. The lessons within each unit have information sheets and assignment sheets. Information sheets provide the student with the specific lesson objective, the related information, and sample problems. Assignment sheets present problems for student practice. A comprehensive test is provided for each unit. Answers to the assignment sheet problems and the unit tests are given in an answer section. The teacher should have a science and masonry background. This document is available for $1.50 from Vocational-Technical Curriculum Laboratory, Rutgers University, 10 Seminary Place, New Brunswick, New Jersey 08903. (HC)

UNIT II - DECIMAL FRACTIONS

UNIT III - SQUARE MEASURE

UNIT IV - CUBIC MEASURE

INTRODUCTION

Back in the beginning of brickmaking and bricklaying, when a builder had to make his own materials to build with, it was important that he know how many bricks and how much mortar he would need. The builder could not hop into his pick-up truck and go to the nearest supply yard when he ran short of material. He had to stop building and make more of the material he ran short of. If the builder made more than he needed, he was stuck with it. There were very few customers for masonry materials close by in those days, so whether he made too much or too little, the builder lost time and did extra work which he could have avoided.

Today in order to erect a building quickly, easily and economically we must know how to figure exactly how much material we will need. If we do not or cannot estimate our needs accurately, we will lose time and do extra work - which means losing money.

So you can see that even after thousands of years the only great change is money. Do you like to make money? You can make more money if you learn to figure accurately.

What you do with your head, you don't have to do with your back.

In the Masonry class you will work from individual lesson sheets. You will learn to do your work by following written instructions and explanations. No daily assignments will be made. As you complete each assignment you will start on the next one. There will be no waiting for some students in the class to learn a certain lesson before YOU can go ahead with a more advanced lesson. Each student can go ahead as rapidly as he is capable of going.

RULES

1. Be sure you read the instructions and explanations carefully and understand them completely.

2. Check with your instructor if you are not sure about how to do the problem. It is better to be sure and do it right than to do it wrong and have to unlearn the wrong way.
   CAUTION: Do not wear a path to the teacher's desk.
   Others need help also.

3. Be sure that you understand each step in a problem.

4. Do your own work. You cannot learn by copying. You only cheat yourself and keep yourself from learning as quickly as you are able.

5. All problems must be completely worked out on the work sheet which you turn in.

6. All work sheets will be graded for neatness as well as for accuracy. Those failing in neatness will be returned to be done over.

7. At the top of each work sheet you will write:

   Your Name Unit # Assignment # and the date.

UNIT I - FRACTIONS

Addition of Fractions | **Information Sheet No. 1**

OBJECTIVE: To learn the proper way of adding fractions.

INFORMATION:

You know that you cannot add things that are not alike. How would you add 10 bricks, 12 cinder blocks, and 3 bags of cement? You simply cannot combine these into any one figure.

Similarly, you cannot add fractions unless they are the same kind of fraction. You can add $\frac{1}{8}$, $\frac{3}{8}$ and $\frac{7}{8}$ (the answer is $\frac{11}{8}$ or $1\frac{3}{8}$). But you cannot add $\frac{1}{2}$, $\frac{2}{3}$, and $\frac{3}{8}$. However, in the case of fractions, it is possible to change the form of each one (without changing its value) so that they are all the same kind of fraction, and then they can be added.

To do this, you must first find the lowest common denominator (the denominator is the bottom figure of the fraction). This lowest common denominator is the smallest number that can be divided evenly by all the denominators. The denominators of $\frac{1}{2}$ and $\frac{3}{8}$ give us no trouble. Eight is a common denominator of both. But to get a common denominator with $\frac{2}{3}$, we multiply the denominators 8 x 3, giving us 24, which is evenly divisible by 2, 3, and 8.

PROBLEM: Add $1\frac{1}{2}$, $\frac{2}{3}$, $7\frac{3}{8}$.

1. List all the numbers to be added clearly and neatly. If you cannot list the numbers in straight columns, draw a straight line between them. Do not crowd the numbers. Leave a space between the column of whole numbers and the column of fractions.

$$\begin{array}{rr} 1 & \frac{1}{2} \\ & \frac{2}{3} \\ 7 & \frac{3}{8} \\ \hline \end{array}$$

2. Write your common denominator (24) to the right of the fraction column under a line. Do not list it opposite each fraction you are going to change.

$$\begin{array}{rrl} 1 & \frac{1}{2} & \\ & \frac{2}{3} & \\ 7 & \frac{3}{8} & \\ \hline & & \end{array}$$

(common denominator) -- $\overline{24}$

3. Change each fraction into an equal fraction having 24 as a denominator. In this case, $\frac{1}{2}=\frac{12}{24}$, $\frac{2}{3}=\frac{16}{24}$, $\frac{3}{8}=\frac{9}{24}$. List the top number only of the common fractions in a column alongside the original fractions.

$$\begin{array}{llcr} 1 & \frac{1}{2} & = & 12 \\ & \frac{2}{3} & = & 16 \\ 7 & \frac{3}{8} & = & 9 \\ \hline & & & \overline{24} \end{array}$$

4. Add the top numbers (numerators) of the common fractions and place the total above the common denominator. You now have an improper fraction $\frac{37}{24}$ which you must reduce to $1\frac{13}{24}$.

$$\begin{array}{llcrcl} 1 & \frac{1}{2} & = & 12 & & \\ & \frac{2}{3} & = & 16 & & \\ 7 & \frac{3}{8} & = & 9 & & \\ \hline & & & \frac{37}{24} & = & 1\frac{13}{24} \end{array}$$

5. Cross out the "1" and carry to the whole numbers column. Add the whole numbers. You get a total of 9.

Below the problem write the complete answer clearly.

$$\begin{array}{llcrcl} \overset{1}{1} & \frac{1}{2} & = & 12 & & \\ & \frac{2}{3} & = & 16 & & \\ 7 & \frac{3}{8} & = & 9 & & \\ \hline 9 & & & \frac{37}{24} & = & \cancel{1}\frac{13}{24} \end{array}$$

ANS. $9\frac{13}{24}$

No one can learn to add fractions quickly and accurately unless he practices. The following assignment sheets provide the practice problems to help you learn to add fractions.

List the numbers to be added clearly, neatly, and correctly.
Check to be sure that the numbers are listed properly.
Do all of your work on the work sheet.
Work carefully and accurately. Follow Information Sheet No. 1.

ADD:

1. $2\frac{1}{2} + \frac{3}{4} + 5\frac{1}{3} =$
2. $\frac{1}{4} + 11\frac{1}{2} + 3\frac{5}{8} =$
3. $2\frac{3}{8} + 18\frac{1}{3} + \frac{5}{6} =$
4. $\frac{3}{4} + \frac{1}{6} + \frac{2}{3} =$
5. $9\frac{2}{3} + 3\frac{7}{8} + 4\frac{1}{4} =$
6. $17\frac{1}{2} + 11\frac{3}{4} + 21\frac{7}{8} =$
7. $\frac{5}{8} + \frac{3}{4} + \frac{9}{16} =$
8. $49\frac{3}{8} + 26\frac{1}{4} + 67\frac{7}{16} =$
9. $37\frac{3}{4} + 75\frac{7}{8} + 9\frac{3}{16} =$
10. $\frac{15}{16} + 127\frac{3}{4} + 7\frac{7}{8} =$
11. $41\frac{1}{2} + 2\frac{7}{8} + 3\frac{3}{4} + 89\frac{9}{16} + 102\frac{5}{8} + 17\frac{1}{4} =$
12. $22\frac{2}{5} + 19\frac{3}{4} + 2\frac{5}{8} + 101\frac{1}{10} + 8\frac{3}{4} + 11\frac{1}{2} =$
13. $14\frac{2}{3} + 3\frac{3}{4} + 6\frac{7}{8} + 9\frac{1}{2} + 110\frac{5}{16} + 44\frac{1}{4} =$
14. $12\frac{1}{2} + 13\frac{1}{4} + 14\frac{5}{8} + 16\frac{1}{16} + 18\frac{1}{8} + 121\frac{3}{4} =$
15. $66\frac{2}{3} + 33\frac{1}{3} + 99\frac{9}{16} + 6\frac{7}{8} + 10\frac{2}{3} + 1\frac{1}{2} + 111\frac{1}{4} =$

REVIEW PROBLEMS:

16. How much would it cost to build a wall if you paid $375.50 for brick, $78.75 for concrete, $13.95 for sand, $21.25 for cement, and $195.45 for labor?

17. What is the total cost of the following equipment?
1 mixer $388.95, 1 mixing box $29.75, 6 mortar pans $5.50 each, 5 shovels $4.50 each, 1 mortar hoe $5.25.

18. How much is the total payroll if you paid $1,475.50 to bricklayers, $1,389.49 to carpenters, $1,187.28 to laborers, $169.75 to truck drivers, $642.75 to engineers, and $233.25 to timekeepers?

19. How much would a kit of tools cost if you spend $4.50 for a brick trowel, $1.75 for a pointing trowel, $1.15 for a jointer, $1.69 for a rule, $3.79 for a brick hammer, $2.75 for a brick set, $15.75 for a 4' level, $6.25 for a 2' level, and $4.99 for a tool bag?

20. How much is the total overhead if you paid $459.65 for compensation insurance, $265.00 for office rent, $27.59 for electricity, $35.50 for advertising, $215.50 for clerks, $17.75 for phone service, and $125.00 for legal fees?

ADD:

1. $1\frac{1}{2} + 15\frac{5}{8} + 86 + 23\frac{11}{16} + 8\frac{5}{8} + 10\frac{3}{4} =$
2. $101\frac{1}{16} + 2\frac{3}{4} + 7\frac{7}{8} + 46\frac{13}{16} + 211 + 9\frac{1}{2} =$
3. $\frac{3}{4} + \frac{1}{2} + \frac{9}{16} + \frac{15}{16} + \frac{7}{8} + \frac{1}{4} =$
4. $14\frac{3}{4} + \frac{7}{8} + 21\frac{15}{16} + 104\frac{1}{2} + 55\frac{5}{8} + 6\frac{9}{16} =$
5. $\frac{13}{16} + 121\frac{1}{2} + 32\frac{3}{4} + 3\frac{7}{3} + 19\frac{1}{4} + 1,019\frac{11}{16} =$
6. $196\frac{3}{4} + 2\frac{1}{2} + 48\frac{5}{8} + 67\frac{11}{16} + 99\frac{1}{4} + \frac{15}{16} =$
7. $1,848 + 123\frac{9}{16} + 7\frac{1}{2} + 86\frac{3}{4} + 27\frac{5}{8} + 12\frac{13}{16} =$
8. $18\frac{1}{4} + 96\frac{3}{4} + 1\frac{7}{8} + 206\frac{15}{16} + 45\frac{1}{2} =$
9. $2\frac{1}{2} + 4\frac{3}{4} + 6\frac{7}{8} + 8\frac{3}{8} + 10\frac{1}{2} + 2\frac{3}{8} =$
10. $\frac{1}{2} + \frac{3}{4} + \frac{5}{8} + \frac{13}{16} + \frac{19}{32} =$

11. How many cubic yards of concrete are needed for a job that requires $4\frac{1}{2}$ cu. yds. for column footings, $6\frac{3}{4}$ cu. yds. for step footings, $23\frac{5}{8}$ cu. yds. for foundation footings, $2\frac{2}{3}$ cu. yds. for areaways, and $7\frac{1}{2}$ cu. yds. for sidewalks?

12. How many cubic yards of sand are needed for a job that requires $12\frac{1}{4}$ cu. yds. for mortar for brick, $16\frac{3}{4}$ cu. yds. for mortar for block, $3\frac{1}{2}$ cu. yds. for concrete, $9\frac{2}{3}$ cu. yds. for plaster?

13. A truckman hauled $12\frac{1}{3}$ cu. yds. of sand, $17\frac{3}{4}$ cu. yds. of cinders, $9\frac{1}{2}$ cu. yds. of gravel, $6\frac{1}{4}$ cu. yds. of crushed stone, and $14\frac{2}{3}$ cu. yds. of fill. How many cu. yds. did the truckman haul altogether?

ADD:

14. $1\frac{1}{2} + 32\frac{7}{8} + 29\frac{3}{4} + 87\frac{1}{8} + 201\frac{5}{8} + 7\frac{1}{4} =$

15. $264\frac{3}{4} + 24\frac{5}{8} + 5\frac{11}{16} + 38\frac{1}{2} + 14\frac{7}{8} + 82\frac{13}{16} =$

16. $56\frac{7}{8} + 4\frac{3}{4} + 12\frac{1}{2} + 85\frac{5}{8} + 65\frac{3}{8} + 9\frac{7}{8} =$

17. $16\frac{1}{2} + 35\frac{7}{8} + 62\frac{5}{8} + 101\frac{7}{8} + 3\frac{3}{4} + 7 =$

18. $1{,}255\frac{3}{4} + 1\frac{9}{16} + 11\frac{15}{16} + 47\frac{7}{8} + 58\frac{7}{8} + 17\frac{1}{2} =$

REVIEW PROBLEMS:

19. A bricklayer spent $5.25 for overalls, $4.75 for a jumper, $11.95 for shoes, $4.39 for a shirt, and $1.99 for a cap. How much did his work clothes cost?

20. A contractor paid $4.30 per hr. for bricklayers, $3.45 per hr. for laborers, $4.05 per hr. for carpenters, $4.25 per hr. for waterproofers, $3.95 per hr. for roofers, $4.15 per hr. for ironworkers, and $4.30 per hr. for plasterers. How much was his total hourly cost for 1 man from each trade?

Dimensions - Addition of Feet, Inches and Fractions of an Inch

Information Sheet No. 2

OBJECTIVE: To learn how to add dimensions easily and accurately.

INFORMATION:

In the previous lesson you learned to add whole numbers and fractions. This was to prepare you to add dimensions. By following the information given below, you will learn to add dimensions easily and accurately.

PROBLEM: Add 7' $10\frac{3}{4}''$ + 3' $\frac{1}{2}''$ + $9\frac{3}{8}''$ =

1. List the dimensions to be added clearly and neatly. Each dimension must be listed in the 3 columns, feet, inches, and fractions of an inch.

Feet	Inches	Fractions of an Inch
7	10	$\frac{3}{4}$
3		$\frac{1}{2}$
	9	$\frac{3}{8}$

2. Find the common denominator. In the case of fractions of an inch, the lowest common denominator will always be the largest denominator (in this case, 8). Change the fractions to common fractions, then add the top numbers (numerators). You get $\frac{13}{8}$ inches, which you reduce to $1\frac{5}{8}$ inches.

7	10	$\frac{3}{4}$	=	6
3		$\frac{1}{2}$	=	4
	9	$\frac{3}{8}$	=	3
				$\frac{13}{8} = 1\frac{5}{8}$

3. Cross out the 1 inch and carry to the "inches" column. Add the inches column, which gives you 20 inches. You now reduce the 20 inches to feet and inches by dividing 20 inches by 12 inches (which equals 1 foot). This gives you 1 foot and 8 inches.

7	10	$\frac{3}{4}$	=	6
3		$\frac{1}{2}$	=	4
	9_1	$\frac{3}{8}$	=	3
	20	$\frac{13}{8}$	=	$1\frac{5}{8}$
	1' 8"			

4. Carry the 1 foot to the "feet" column and add up the number of feet. You get 11 feet for the total.

Now below the problem write the answer clearly and place the foot and inch symbols in their proper place.

7	10	$\frac{3}{4}$	=	6
3		$\frac{1}{2}$	=	4
1	1	$\frac{3}{8}$	=	3

	$\cancel{1}$' 8"			

ANS. 11' $8\frac{5}{8}$"

The lesson sheets which follow provide the necessary practice so you can learn to add dimensions easily and accurately.

List the dimensions to be added clearly and neatly. Make certain that the feet, inches and fractions of an inch are placed in the proper columns. Follow the instructions on Information Sheet No. 2 and solve the following problems.

ADD:

1. $42'\ \frac{1}{2}'' + 1{,}099'\ 6'' + 7'\ 3\frac{1}{8}'' =$
2. $6\frac{7}{8}'' + 1{,}000'\ 9'' + 9'\ 10\frac{3}{4}'' =$
3. $15'\ \frac{3}{4}'' + 11'\ 8\frac{1}{8}'' + 103'\ 6'' =$
4. $20'\ 5'' + 2{,}329' + 8\frac{1}{2}'' + 21'\ 7\frac{7}{8}'' =$
5. $29'\ 8\frac{1}{2}'' + 375'\ \frac{3}{8}'' + 4'\ 11\frac{3}{4}'' + 10'' =$
6. $7'\ \frac{1}{2}'' + 12'\ 8'' + 4'\ 6\frac{1}{8}'' + 33'\ 6\frac{1}{4}'' =$
7. $14' + 112'\ 6'' + 8'\ 9\frac{3}{8}'' + 8\frac{3}{4}'' =$
8. $9'\ 11\frac{5}{8}'' + 6\frac{3}{4}'' + 135'\ 2\frac{5}{16}'' + 78'\ 7'' =$
9. $102'\ 11\frac{9}{16}'' + 8\frac{1}{2}'' + 12'\ 3'' + 7'\ \frac{3}{4}'' + 4'\ 5'' =$
10. $8'\ \frac{1}{2}'' + 7'\ \frac{3}{4}'' + 201'\ 5\frac{7}{16}'' + 11'' + 9'\ \frac{5}{8}'' =$

11. What is the perimeter of a building whose dimensions are $29'\ 8\frac{1}{2}''$, $18'\ 6''$, $29'\ 8\frac{1}{2}''$, $18'\ 6''$?

12. The sidewalks around a building measure $21'\ 6\frac{1}{2}''$, $18'\ 10''$, $12'\ \frac{3}{4}''$, $43'\ 7\frac{1}{4}''$ and $9'\ 5''$. What is their total length?

13. An irregularly shaped patio has sides measuring $18'\ 3\frac{1}{2}''$, $20'\ \frac{3}{4}''$, $24'\ 6''$, $21'\ 2\frac{1}{4}''$, and $17'\ 11\frac{1}{4}''$. What is the distance around it?

14. A builder had to excavate $4\frac{1}{2}$ cu. yds. for column footings, $146\frac{2}{3}$ cu. yds. for the basement, $18\frac{1}{2}$ cu. yds. for the steps, $7\frac{3}{4}$ cu. yds. for areaways, $43\frac{1}{4}$ cu. yds. for the septic tank, $8\frac{1}{3}$ cu. yds. for sidewalks and $1\frac{3}{4}$ cu. yds. for the fireplace footing. How many cu. yds. did the builder have to excavate?

15. A mason worked $16\frac{1}{2}$ hours laying brick, $12\frac{3}{4}$ hours laying blocks, $8\frac{1}{3}$ hours on a sidewalk, $19\frac{1}{4}$ hours plastering, $5\frac{2}{3}$ hours putting in a tile drain, $7\frac{1}{2}$ hours pouring concrete, and $3\frac{3}{4}$ hours washing down the brickwork. How many hours did he work?

ADD:

16. $47'\ 8\frac{3}{4}'' + 7'\ \frac{1}{2}'' + 137'\ 6'' + 6'\ 6\frac{9}{16}'' + 8\frac{7}{8}'' =$

17. $6'\ \frac{1}{2}'' + 4\frac{3}{4}'' + 7'\ 11\frac{9}{16}'' + 5'\ 5'' + 22'\ 8\frac{5}{8}'' =$

18. $5'\ 8\frac{3}{4}'' + 129'\ 3'' + 15'\ 11\frac{5}{8}'' + 11\frac{13}{16}'' + 1{,}275'\ 4\frac{7}{8}'' =$

19. $625' + 2'\ 8\frac{3}{4}'' + 11\frac{1}{2}'' + 2{,}378'\ 9'' + 65'\ 7\frac{7}{16}'' =$

20. $16'\ 7\frac{11}{16}'' + 139'\ 10\frac{3}{4}'' + 278'\ 9\frac{7}{8}'' + 4{,}789'\ 1\frac{1}{2}'' + 2{,}865'\ 11\frac{15}{16}'' =$

Dimensions (Addition) Assignment Sheet No. 4

ADD:

1. $8\frac{1}{2}'' + 10'\ 5\frac{3}{4}'' + 72'\ 11\frac{13}{16}'' + 155'\ \frac{5}{8}'' + 29'\ 9\frac{3}{8}'' =$
2. $238'\ 4\frac{5}{16}'' + 7'\ \frac{3}{8}'' + 21'\ 9\frac{1}{4}'' + 145'\ \frac{7}{16}'' + 11\frac{1}{2}'' =$
3. $1{,}101'\ 4\frac{1}{4}'' + 7\frac{7}{16}'' + 247'\ \frac{13}{16}'' + 79'\ 11\frac{1}{2}'' + 33' =$
4. $8'' + 1{,}042'\ 6\frac{5}{16}'' + 198'\ \frac{5}{8}'' + 7'\ 3'' + 201'\ 11\frac{11}{16}'' =$
5. $141'\ 2\frac{3}{4}'' + 9\frac{9}{16}'' + 21' + 23'\ 11\frac{7}{8}'' + 7\frac{13}{16}'' =$
6. $7'\ 11'' + 100' + 42'\ 8\frac{15}{16}'' + 6\frac{7}{8}'' + 2'\ 9\frac{15}{32}'' =$
7. $627'\ 8\frac{5}{8}'' + 72'\ \frac{1}{2}'' + 9\frac{1}{4}'' + 17'\ \frac{7}{16}'' + 143'\ 7\frac{3}{8}'' =$
8. $569'\ \frac{3}{4}'' + 79'\ 6\frac{3}{16}'' + 125'\ \frac{9}{16}'' + 7'' + 47'\ 3\frac{7}{8}'' =$
9. $6'\ 8\frac{3}{4}'' + 257' + 32'\ \frac{13}{16}'' + 4'\ 11\frac{7}{8}'' + 11\frac{9}{16}'' =$
10. $11'' + 2'\ \frac{5}{8}'' + 826' + 9'\ \frac{9}{16}'' + 42'\ 11\frac{1}{2}'' =$
11. $16'\ 7\frac{3}{4}'' + 101'\ \frac{9}{16}'' + 1'\ 11\frac{1}{2}'' + 73'\ 3\frac{3}{4}'' + 8\frac{5}{8}'' =$
12. $112'\ \frac{1}{4}'' + 7'\ 6\frac{7}{8}'' + 122'\ \frac{7}{16}'' + 33'\ 9\frac{3}{4}'' =$
13. $8\frac{5}{8}'' + 100'\ \frac{1}{2}'' + 7'\ 6\frac{3}{4}'' + 1{,}018'\ 5\frac{7}{16}'' + 7'\ \frac{3}{8}'' =$
14. $12'\ 11\frac{5}{8}'' + 6\frac{3}{4}'' + 101'\ \frac{9}{16}'' + 3'\ 3'' + 17'\ \frac{7}{8}'' =$
15. $14'\ 10\frac{3}{4}'' + 6'\ \frac{7}{8}'' + 111' + 7'\ \frac{15}{16}'' + 18'\ 6\frac{5}{8}'' =$
16. $100'\ \frac{3}{4}'' + 5'\ \frac{9}{16}'' + 4'\ 9\frac{3}{4}'' + 7\frac{3}{8}'' + 6'\ 1\frac{3}{4}'' =$
17. $203'\ 5\frac{3}{4}'' + 23'\ \frac{9}{16}'' + 1'\ 3\frac{3}{8}'' + 15'\ 1\frac{11}{16}'' + 3'\ \frac{5}{8}'' =$

18. A builder installed 87' 6" of sidewalk on Monday, 136' $8\frac{1}{2}$" of sidewalk on Tuesday, 119' 7" of sidewalk on Wednesday, 93' 2" of sidewalk on Thursday, 158' $10\frac{3}{4}$" of sidewalk on Friday.
How many feet of sidewalk did the builder install?

REVIEW PROBLEMS:

19. A builder paid $879.75 for face brick, $426.95 for common brick, $179.38 for mortar cement, $88.57 for sand, $284.26 for concrete, $199.52 for blocks and $57.49 for gravel.
How much did the builder pay for the material?

20. A builder paid $4,753.69 for material, $1,926.87 for labor, $789.14 for overhead, $43.75 for advertising, $243.28 for trucking and $478.65 for scaffold rental.
How much did the job cost?

Subtraction of Fractions Information Sheet No. 3

OBJECTIVE: To learn the correct way of subtracting dimensions.

INFORMATION:

When you subtract dimensions, you must always start by subtracting the fractions of an inch first, next you subtract the inches, and last the feet.

List all numbers clearly and in neat columns. Cross out each number from which you borrow and write the correct number above it so that you do not make a mistake.

Do not crowd the figures. You will find it is much easier to work out a problem which is neatly and clearly written, with the numbers widely spaced.

PROBLEM: Subtract $127' \; 10\frac{5''}{8}$ from $168' \; 7\frac{5''}{16}$

1. Change the fractions of an inch so they both have the same common denominator.

$$\begin{array}{rrrl} & 168 & 7 & \frac{5}{16} = \frac{5}{16} \\ - & 127 & 10 & \frac{5}{8} = \frac{10}{16} \\ \hline \end{array}$$

2. Since you cannot subtract $\frac{10''}{16}$ from $\frac{5''}{16}$, you must borrow 1" from the 7". Cross out the 7 and write 6 above it. $1'' = \frac{16''}{16}$. You add $\frac{16''}{16}$ to the $\frac{5''}{16} = \frac{21''}{16}$. Cross out the $\frac{5''}{16}$ and write $\frac{21}{16}$ next to it. Then subtract $\frac{10''}{16}$ from $\frac{21}{16}$, giving $\frac{11''}{16}$. Write $\frac{11}{16}$ below the line.

$$\begin{array}{rrlcl} 168 & \overset{6}{\cancel{7}} & \frac{\cancel{5}}{\cancel{16}} = \frac{\cancel{5}}{\cancel{16}} & = & \frac{21}{16} \\ 127 & 10 & \frac{\cancel{5}}{\cancel{8}} = \frac{\cancel{10}}{\cancel{16}} & = & \frac{10}{16} \\ \hline & & & & \frac{11}{16} \end{array}$$

3. You cannot subtract 10" from 6" so you must borrow 1' from 168'. Cross out the 8 and write 7 above it. 1' = 12". Add 12 to 6" = 18". Cross out the 6 and write 18 above it. 18" - 10" = 8.

Write 8 below the line.

$$\begin{array}{rrlcl} 16\overset{7}{\cancel{8}} & \overset{\overset{18}{\cancel{6}}}{\cancel{7}} & \frac{\cancel{5}}{\cancel{16}} = \frac{\cancel{5}}{\cancel{16}} & = & \frac{21}{16} \\ 127 & 10 & \frac{\cancel{5}}{\cancel{8}} = \frac{\cancel{10}}{\cancel{16}} & = & \frac{10}{16} \\ \hline & 8 & & & \frac{11}{16} \end{array}$$

4. Subtract 127' from 167', giving 40. Write 40 below the line.

$$\begin{array}{cccc}
16\cancel{8}^{7} & \cancel{7}^{\overset{18}{\cancel{6}}} & \frac{\cancel{5}}{\cancel{16}} = \frac{\cancel{5}}{\cancel{16}} = & \frac{21}{16} \\
127 & 10 & \frac{\cancel{5}}{\cancel{8}} = \frac{10}{16} = & \frac{10}{16} \\
\hline
40 & 8 & & \frac{11}{16}
\end{array}$$

5. Write out the answer clearly with the foot and inch symbols in their proper places.

ANS. $40'\ 8\frac{11}{16}''$

Subtraction of Fractions (Dimensions) Assignment Sheet No. 5

SUBTRACT:

1. $6\frac{1}{2}'' - 3\frac{3}{4}'' =$

14. $2{,}059'\ 11\frac{13}{16}'' - 1{,}039'\ 6\frac{3}{4}'' =$
15. $298'\ \frac{3}{4}'' - 179'\ 4\frac{1}{2}'' =$
16. A builder ordered 293 cu. yds. of concrete. He used $201\frac{1}{4}$ cu. yds. for a foundation, $27\frac{1}{3}$ cu. yds. for column footings, $61\frac{1}{2}$ cu. yds. for the foundation footings, and $2\frac{3}{4}$ cu. yds. for areaways. How much concrete was left?

17. A builder was getting ready to pour a cellar floor.
When he checked, he found that the foreman had leveled the dirt at the finished floor height. He had to dig out $39\frac{1}{2}$ cu. yds. of dirt to get to the proper depth. He then filled in $19\frac{3}{4}$ cu. yds. of gravel and laid the concrete floor on top of the gravel.
How much concrete did the builder use for the floor?

REVIEW PROBLEMS:

18. A builder bought 58, 750 brick. He used 17, 850 on one job, 22,395 on a second job, and 18, 125 on the third job.
How many brick were left?

19. A builder had a total payroll of $3,989.68. The carpenters were paid $1,284.85, the bricklayers were paid $1,437.60, the laborers were paid $1,018.69.
How much were the timekeeper and superintendent paid?

20. A builder bought 389 bags of cement. He needed 108 bags on one job, 214 bags on the second job, 49 bags on the third job, and 47 bags on the fourth job.
How did he make out on the fourth job?

16. The dimensions of the sides of an irregularly shaped building are $17'\ 9\frac{1}{2}''$, $21'\ 6''$, $6'\ \frac{1}{2}''$, $18'\ 5\frac{7}{8}''$, $4'$, $18'\ 11\frac{1}{2}''$.
    What is the perimeter of the building?
17. A builder ordered 67 cu. yds. of sand. He had $18\frac{1}{2}$ cu. yds. delivered to the first job, $23\frac{3}{4}$ cu. yds. delivered to the second job, $16\frac{2}{3}$ cu. yds. delivered to the third job.
    How much sand was left for job #4?

REVIEW PROBLEMS:

18. A builder drew $3,859.67 from the bank. He paid the masons $1,246.89, the laborers $1,045.28, and the carpenters $1,258.67. How much was left for himself?

19. A builder ordered 79,500 face brick, 28,750 common brick and 9,850 blocks in all. He had 26,500 face brick, 2,750 common brick and 2,910 blocks delivered to job #1; 8,750 face brick and 2,290 blocks delivered to job #2; 12,450 common brick and 1,350 blocks delivered to job #3.
How many face brick, common brick, and blocks were delivered to job #4?

20. A builder paid $1,296.59 to the masons, $1,188.48 to the carpenters, $946.79 to the laborers, and $678.50 to the clerks, superintendent, and engineer.
How much was his total payroll?

Next assignment will be Test No. 1.

Multiplication of Fractions — Information Sheet No. 4

OBJECTIVE: To learn the methods of multiplying fractions.

INFORMATION:

There are various kinds of problems in the multiplication of fractions. By following the explanation below, you should be able to solve the different types of problems.

Neatness and careful placing of numbers is very important.

PROBLEM: $\frac{1}{3} \times 7 =$ (a fraction times a whole number)

Write both the whole number and the fraction as fractions. $\frac{1}{3} \times \frac{7}{1} =$

Multiply the upper numbers (numerators).
Multiply the lower numbers (denominators).
Reduce to the lowest terms.

$$\frac{1}{3} \times \frac{7}{1} = \frac{7}{3}$$
$$= 2\frac{1}{3} \quad \text{ANS.}$$

PROBLEM: $6 \times 1\frac{1}{4} =$ (a whole number times a mixed number)

Change both numbers to improper fractions. $\frac{6}{1} \times \frac{5}{4} =$

Multiply the numerator; multiply the denominators. $\frac{6}{1} \times \frac{5}{4} = \frac{30}{4}$

Reduce to the lowest terms. $\frac{30}{4} = \frac{15}{2} = 7\frac{1}{2}$ ANS.

PROBLEM: $\frac{3}{4} \times \frac{1}{2} =$ (a fraction times a fraction)

Multiply the numerators; multiply the denominators. $\frac{3}{4} \times \frac{1}{2} = \frac{3}{8}$ ANS.

In order to reduce the size of the totals when you multiply fractions, use cancellation whenever possible. If a numerator will divide evenly into a denominator, or a denominator into a numerator, do so. When a number can be divided evenly into both a denominator and a numerator, do so.

PROBLEM: $\frac{3}{4} \times \frac{8}{9} =$

4 divides into 8 twice. Cross out the 4 and write 1 under it. Cross out the 8 and write 2 above it.
3 divides into 9 three times. Cross out the 3 and write 1 above it. Cross out the 9 and write 3 below it.
This changes the numerators and denominators. Now multiply the new numerators and denominators.

$$\begin{array}{ll} \text{numerators} & \multirow{2}{*}{} \\ \text{denominators} & \end{array} \quad \frac{\cancel{3}^{1}}{\cancel{4}_{1}} \times \frac{\cancel{8}^{2}}{\cancel{9}_{3}} = \frac{2}{3} \quad \text{ANS.}$$

PROBLEM: $123 \times 14\frac{1}{4}$

Change to improper fractions. $\frac{123}{1} \times \frac{57}{4} =$

No cancellation is possible. Multiply the numerators, then multiply the denominators. Divide the denominator into the numerator.

$$\frac{123}{1} \times \frac{57}{4} = \frac{7011}{4} = 1752\frac{3}{4} \quad \text{ANS.}$$

Alternate method:

Set up problem as an ordinary multiplication example.

Multiply $\frac{1}{4} \times 123 = 30\frac{3}{4}$

Then multiply 14×123

$$\begin{array}{r} 123\phantom{\frac{1}{4}} \\ \times\ 14\frac{1}{4} \\ \hline 30\frac{3}{4} \\ 492\phantom{\frac{1}{4}} \\ 123\phantom{0\frac{1}{4}} \\ \hline 1752\frac{3}{4} \end{array} \quad \text{ANS.}$$

PROBLEM: $56\frac{1}{3} \times 29\frac{1}{4} =$

Change to improper fractions. Cancel. Multiply.

$$\frac{169}{\cancel{3}} \times \frac{\overset{39}{\cancel{117}}}{4} = \frac{6591}{4} = 1647\frac{3}{4} \qquad \text{ANS.}$$

Alternate method:

Multiply $\frac{1}{4} \times \frac{1}{3} = \frac{1}{12}$

Multiply $\frac{1}{\cancel{4}} \times \frac{\overset{14}{\cancel{56}}}{1} = 14$

Multiply $\frac{29}{1} \times \frac{1}{3} = \frac{29}{3} = 9\frac{2}{3}$

Multiply 29 x 56

Common denominator of the fraction is 12

$$\begin{array}{rll}
 & 56\frac{1}{3} & \\
\times & 29\frac{1}{4} & \\
\hline
 & \frac{1}{12} & = 1 \\
 & 14 & \\
 & 9\frac{2}{3} & = 8 \\
 & 504 & \\
 & 112 & \\
\hline
 & 1647 \qquad \frac{9}{12} & = \frac{3}{4} \\
 & 1647\frac{3}{4} & \text{ANS.}
\end{array}$$

To multiply dimensions (feet and inches), first change the inches in each dimension to a fraction of a foot. Then multiply as you do mixed numbers.

PROBLEM: 16' 9" x 18' 3" =

Change to feet and fractions of a foot. $16\frac{3}{4}' \times 18\frac{1}{4}' =$

Change to improper fractions and multiply.

$$\frac{67'}{4} \times \frac{73'}{4} = \frac{4891'}{16} = 305\frac{11}{16} \text{ \underline{sq.} \underline{ft.}} \qquad \text{ANS.}$$

When you multiply feet x feet, the answer is always in <u>square feet.</u>

Alternate method:

Multiply $\frac{1}{4} \times \frac{3}{4} = \frac{3}{16}$

Multiply $\frac{1}{4} \times \frac{\overset{4}{\cancel{16}}}{1} = 4$

Multiply $\frac{\overset{9}{\cancel{18}}}{1} \times \frac{3}{\underset{2}{\cancel{4}}} = \frac{27}{2} = 13\frac{1}{2}$

Multiply 18 x 16

Common denominator = 16.

$$\begin{array}{rll}
 & 16\frac{3}{4}' & \\
\times & 18\frac{1}{4}' & \\
\hline
 & \frac{3}{16} & = 3 \\
 & 4 & \\
 & 13\frac{1}{2} & = 8 \\
 & 128 & \\
 & 16 & \\
\hline
 & 305 \qquad \frac{11}{16} & \text{sq. ft.} \\
 & 305\frac{11}{16} & \text{sq. ft.} \quad \text{ANS.}
\end{array}$$

Remember, when changing inches to a fraction of a foot, that there are 12" in 1'.

Make a rough check of the answer by multiplying the whole numbers and comparing the rough answer with the exact answer.

Multiplication of Fractions — Assignment Sheet No. 8

Follow the directions on Information Sheet No. 4 so you will learn to multiply fractions quickly and easily. Try both methods and adopt the method which is easier for you. Make your rough check.

Multiply:

1. $4\frac{1}{3} \times 3\frac{1}{4} =$
2. $5\frac{1}{2} \times 6\frac{1}{2} =$
3. $6\frac{2}{5} \times 5\frac{1}{4} =$
4. $\frac{1}{2} \times \frac{1}{2} =$
5. $\frac{3}{4} \times \frac{1}{2} =$
6. $\frac{1}{3} \times 7 =$
7. $20 \times \frac{1}{6} =$
8. $5\frac{1}{3} \times 6\frac{1}{3} =$
9. $8\frac{3}{4} \times 12\frac{1}{4} =$
10. $9\frac{1}{6} \times 11\frac{1}{4} =$
11. $4\frac{5}{6} \times 12\frac{1}{2} =$
12. $6\frac{1}{4} \times 7\frac{2}{3} =$
13. $102\frac{1}{2} \times 11\frac{1}{3} =$
14. $76\frac{1}{3} \times 6\frac{3}{4} =$
15. $88\frac{1}{6} \times 7\frac{1}{2} =$
16. $81\frac{3}{4} \times 5\frac{2}{3} =$
17. $\frac{1}{5} \times \frac{5}{6} =$
18. $1\frac{1}{4} \times 2\frac{1}{2} =$
19. $42\frac{1}{2} \times 8\frac{3}{14} =$
20. $36\frac{2}{3} \times 51\frac{5}{12} =$
21. $16\frac{1}{3} \times 15\frac{3}{4} =$
22. $17\frac{1}{2} \times 9 =$
23. $21 \times 12\frac{1}{4} =$
24. $6\frac{1}{3} \times 7\frac{3}{4} =$
25. $10\frac{3}{4} \times 11\frac{2}{3} =$
26. $18\frac{1}{2} \times 17\frac{3}{4} =$
27. $9\frac{3}{4} \times 17 =$
28. $33\frac{1}{3} \times 44\frac{1}{2} =$
29. $\frac{7}{8} \times 2\frac{2}{3} =$
30. $19\frac{3}{8} \times 8\frac{1}{2} =$
31. $5\frac{3}{4} \times 6\frac{2}{3} =$
32. $21\frac{1}{3} \times 23\frac{2}{3} =$
33. $11\frac{3}{4} \times 3\frac{1}{2} =$
34. $15\frac{3}{8} \times \frac{8}{9} =$
35. $21\frac{3}{4} \times 12\frac{2}{3} =$
36. $14\frac{1}{2} \times 9\frac{1}{4} =$
37. $7\frac{1}{4} \times 4\frac{2}{3} =$
38. $3\frac{5}{6} \times 2\frac{1}{2} =$
39. $\frac{5}{8} \times 5\frac{1}{3} =$
40. $122\frac{1}{3} \times 97\frac{2}{3} =$

Multiplication of Fractions (Feet and Inches) Assignment Sheet No. 9

Do the work as directed on Information Sheet No. 4. Remember to make a rough check.

Multiply:

1. $\frac{3}{4} \times 5\frac{1}{3} =$
2. $\frac{3}{8} \times 1\frac{1}{3} =$
3. $\frac{1}{6} \times 1\frac{1}{5} =$
4. $\frac{2}{3} \times 3\frac{3}{4} =$
5. $2\frac{1}{2} \times \frac{3}{10} =$
6. $4\frac{1}{2} \times \frac{2}{3} =$
7. $7\frac{1}{2} \times 3\frac{1}{3} =$
8. $2\frac{1}{7} \times 2\frac{1}{3} =$
9. $1\frac{1}{3} \times 2\frac{1}{2} =$
10. $12\frac{3}{8} \times 11\frac{3}{5} =$
11. $2\frac{2}{3} \times 3\frac{3}{4} =$
12. $1\frac{4}{5} \times 3\frac{1}{3} =$
13. $3\frac{1}{4} \times 2\frac{2}{3} =$
14. $3\frac{7}{8} \times 3\frac{1}{5} =$
15. $1\frac{3}{4} \times 2\frac{1}{3} \times 1\frac{1}{2} =$

Next try Test #3.

Division of Fractions

Information Sheet No. 5

OBJECTIVE: To learn how to divide fractions.

INFORMATION:

When you divide a quantity, you separate it into portions which are the same size.

When you divide 6 by 2 $\left(\begin{array}{r}3\\ 2\overline{)6}\end{array}\right)$, you get the same answer as you do when you multiply

$$\frac{\cancel{6}^{3}}{1} \times \frac{1}{\cancel{2}} = 3.$$

This gives us another way of doing division problems, particularly convenient when we are dealing with fractions. In each case, this is what we do:

1. Change <u>both</u> numbers to fractions $(\frac{6}{1} \div \frac{2}{1})$.
2. <u>Invert</u> the divisor mentally $(\frac{1}{2})$.
3. <u>Multiply</u> the number by the inverted divisor $(\frac{\cancel{6}^{3}}{1} \times \frac{1}{\cancel{2}}) = 3$ ANS.

PROBLEM: $\frac{5}{8} \div 6$ (divisor) $=$

Change to fractions. $\frac{5}{8} \div \frac{6}{1} =$

Invert the divisor and multiply. $\frac{5}{8} \times \frac{1}{6} = \frac{5}{48}$ ANS.

PROBLEM: $7 \div 1\frac{3}{4}$ (divisor) $=$

Change to improper fractions. $\frac{7}{1} \div \frac{7}{4} =$

Invert the divisor and multiply, using cancellation. $\frac{\cancel{7}}{1} \times \frac{4}{\cancel{7}} = \frac{4}{1} = 4$ ANS.

PROBLEM: $5\frac{1}{3} \div 4 =$

Change to improper fractions. $\frac{16}{3} \div \frac{4}{1} =$

Invert the divisor, then multiply. Cancel. $\frac{\cancel{16}^{4}}{3} \times \frac{1}{\cancel{4}} = \frac{4}{3} = 1\frac{1}{3}$ ANS.

PROBLEM: $15\frac{7}{12} \div 3\frac{2}{3} =$

$$\frac{187}{12} \div \frac{11}{3} =$$

$$\frac{\overset{17}{\cancel{187}}}{\underset{4}{\cancel{12}}} \times \frac{\cancel{3}}{\cancel{11}} = \frac{17}{4} = 4\frac{1}{4} \quad \text{ANS.}$$

To divide dimensions (feet and inches) you change the inches to a fraction of a foot. Then solve the problem in the regular way. (You have not forgotten that 12" = 1' !)

PROBLEM: $10'\,6'' \div 4\frac{1}{2} =$

Change to feet and a fraction of a foot. $10\frac{1'}{2} \div 4\frac{1}{2} =$

Change to improper fractions. $\frac{21'}{2} \div \frac{9}{2} =$

Invert the divisor, then multiply. $\frac{\overset{7}{\cancel{21}}'}{\cancel{2}} \times \frac{\cancel{2}}{\underset{3}{\cancel{9}}} = \frac{7}{3} = 2\frac{1'}{3}$

Change the $2\frac{1'}{3}$ to feet and inches. $2\frac{1'}{3} = 2'\,4''$ ANS.

Make a rough check of your answer by multiplying the whole number of the answer by the whole number of the divisor. Or better still, multiply your entire answer by the divisor.

$$2'\,4'' = 2\frac{1'}{3} \times 4\frac{1}{2} = \frac{7'}{3} \times \frac{9}{2} = \frac{63'}{6} = 10\frac{3'}{6} = 10\frac{1'}{2} = \underline{\underline{10'\,6''}}$$

Division of Fractions **Assignment Sheet No. 15**

Be particularly careful when changing mixed numbers to improper fractions. Most errors are made at this point. Follow the directions of Information Sheet No. 5.

DIVIDE:

1. $\frac{9}{16} \div 3 =$
2. $\frac{15}{16} \div 5 =$
3. $\frac{3}{2} \div 3 =$
4. $\frac{27}{64} \div 9 =$
5. $\frac{63}{100} \div 9 =$
6. $\frac{48}{9} \div 4 =$
7. $\frac{56}{6} \div 4 =$
8. $\frac{72}{4} \div 6 =$
9. $10 \div 2\frac{1}{2} =$
10. $14 \div 3\frac{1}{3} =$
11. $21 \div 2\frac{2}{3} =$
12. $17 \div 1\frac{1}{4} =$
13. $18 \div 5\frac{1}{3} =$
14. $16 \div 1\frac{1}{2} =$
15. $9 \div 4\frac{1}{4} =$
16. $13 \div 1\frac{2}{3} =$
17. $27\frac{1}{2} \div 6\frac{1}{4} =$
18. $18\frac{3}{4} \div 2\frac{1}{2} =$
19. $22\frac{2}{3} \div 1\frac{3}{4} =$
20. $24\frac{3}{4} \div 8\frac{1}{4} =$

35. $139'\ 7'' \div 5 =$

Division of Fractions
(Feet and Inches, Quantities) Assignment Sheet No. 17

OBJECTIVE: To learn to divide fractions and to divide quantities and areas into the standard units of measure used in the trade.

INFORMATION:

There are 9 square feet in 1 square yard. When you divide a given number of sq. ft. by 9, the answer is always square yards. All plastering is estimated by the square yard.

There are 27 cubic feet in 1 cubic yard. When you divide a given number of cu. ft. by 27, the answer is always cubic yards. Quantities of sand, gravel, concrete, and excavating are always estimated and paid for by the cubic yard.

In problems 1-20 and 36-40, give your answer in feet and inches. In problems 21-35, give your answer in square yards or cubic yards, as required. Make a rough check.

Divide:

1. 110' 10" ÷ $8\frac{3}{4}$ =
2. 34' 10" ÷ $4\frac{3}{4}$ =
3. 55' ÷ $6\frac{2}{3}$ =
4. 97' 6" ÷ $4\frac{1}{2}$ =
5. 87' 10" ÷ $11\frac{1}{3}$ =
6. 33' 3" ÷ 7 =
7. 69' 4" ÷ $3\frac{1}{4}$ =
8. 55' 3" ÷ $4\frac{1}{3}$ =
9. 42' 8" ÷ $2\frac{2}{3}$ =
10. 71' 9" ÷ $3\frac{1}{2}$ =
11. 14' 4" ÷ 4 =
12. 80' 6" ÷ 6 =
13. 63' 4" ÷ 5 =
14. 124' 3" ÷ 7 =
15. 189' 4" ÷ 16 =
16. 53' 4" ÷ 4 =
17. 78' 4" ÷ 10 =
18. 88' 6" ÷ 6 =
19. 139' 7" ÷ 5 =

12. $526\frac{1}{2}$ cu. ft. $\div$ 27

13. How much will an I-beam $27\frac{1}{2}''$ long cost? It weighs 42 lbs. per lineal foot and costs 23¢ per pound.

14. It takes 620 lath to cover 40 sq. yds. of wall. How many lath are needed to cover 519 sq. yds. of wall?

15. It takes $6\frac{1}{4}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 137' 6" long and 9' high?

16. Seven men worked 8 hours per day for 9 days and earned $2,167.20. How much did each man earn per hour?

17. A builder put up a foundation for $12,500.00. His overhead was $1,376.85. He bought 18,500 brick @ $55.50 per 1,000, 2,850 blocks @ 24¢ per block, 29 cu. yds. of concrete @ $1[illegible] per yard, 23 cu. yds. of sand @ $5.45 per yard, 217 bags of mor[illegible]ement @ $1.24 per bag, 3 lally columns 8' long @ $1.65 per foot, and the I-beam in problem #13. His labor cost was $2,874.50.
How much did the builder make?

Now go on to Test #4.

UNIT II - DECIMAL FRACTIONS

Review of Meaning of Decimals

Information Sheet No. 1

OBJECTIVES: To review the concept of decimal fractions.
To learn to convert common fractions to decimal fractions, and decimal fractions to common fractions.

INFORMATION:

A decimal fraction is one which has no written denominator. The denominator of a decimal fraction is understood to be 10, or 10 multiplied by itself one or more times. The denominator of a decimal fraction is given by the position of the decimal point. There are as many zeros in the denominator as there are numbers to the <u>right</u> of the decimal point. Numbers to the left of the decimal point are whole numbers.

Decimal Fraction		Common Fraction	
.2	=	$\frac{2}{10}$	Two tenths
1.06	=	$1\frac{6}{100}$	One and six hundredths
25.159	=	$25\frac{159}{1000}$	Twenty-five and one hundred fifty-nine thousandths

You will need to know how to add, subtract, multiply, and divide decimal fractions. You add, subtract, multiply and divide decimal fractions exactly as you do whole numbers, BUT you must be certain to put the <u>decimal point</u> in the right place throughout your work and in the answer.

Here is a list of some of the common fractions and their decimal equivalents. As you can see, the decimal equivalentscan be obtained by actually dividing the denominator of the fraction into the numerator.

$\frac{1}{2}$	=	.5	$\begin{array}{r} .5 \\ 2/\overline{1.0} \end{array}$	
$\frac{1}{4}$	=	.25	$\begin{array}{r} .25 \\ 4/\overline{1.00} \end{array}$	
$\frac{1}{5}$	=	.2	$\begin{array}{r} .2 \\ 5/\overline{1.0} \end{array}$	
$\frac{1}{6}$	=	.167	$\begin{array}{r} .166\frac{2}{3} \\ 6/\overline{1.000} \end{array}$	= .167
$\frac{1}{8}$	=	.125	$\begin{array}{r} .125 \\ 8/\overline{1.000} \end{array}$	
$\frac{1}{10}$	=	.1	$\begin{array}{r} .1 \\ 10/\overline{1.0} \end{array}$	

Decimal values:

.2	3	4	5	6
Tens	Hundredths	Thousandths	Ten Thousandths	Hundred Thousandths

Addition of Decimal Fractions — Information Sheet No. 2

OBJECTIVE: To learn how to add decimals.

INFORMATION:

Adding decimals is just like adding whole numbers except that you must keep all the decimal points directly under each other in a straight line. If you do not list each number properly you will arrive at the wrong answer.

ADD: 6.1 + 362.007 + 23.12 + .86

If you cannot keep the numbers in their proper places, draw a line as a guide.

Be sure to put the decimal point of your answer in the right place before you add.

6.	1	
362.	007	
23.	12	
.	86	
392.	087	ANS.

Subtraction of Decimal Fractions — Information Sheet No. 3

OBJECTIVE: To learn how to subtract decimals.

INFORMATION:

Subtracting decimals is just like subtracting whole numbers. BUT- be certain that the numbers are listed with the decimal points directly in line with each other.

SUBTRACT: 12.56 - 8.29 =

List correctly. Place decimal point of the answer in the proper place before subtracting.

$$\begin{array}{r} 12.56 \\ \underline{8.29} \\ 4.27 \\ \uparrow \end{array} \quad \text{ANS.}$$

SUBTRACT: 18.6 - 12.43 =

List correctly. Having only 1 decimal place in the top number you have nothing from which to subtract the 3. so you add a zero to the right of the .6 making it .60. This does not change the value of the decimal ($\frac{60}{100} = \frac{6}{10}$) and now you can subtract to get the correct answer.

$$\begin{array}{r} 18.6 \\ -\ \underline{12.43} \end{array}$$

$$\begin{array}{r} 18.60 \\ -\ \underline{12.43} \\ 6.17 \end{array} \quad \text{ANS.}$$

SUBTRACT: 21.58 - 14.7 =

List correctly. Having 2 decimal places in the top number and only one in the bottom number, subtract as though there were a zero after the 7. Watch the decimal point.

$$\begin{array}{r} 21.58 \\ -\ \underline{14.7} \\ 6.88 \end{array} \quad \text{ANS.}$$

Addition and Subtraction of Decimal Fractions — Assignment Sheet No. 1

Follow the directions on Information Sheets 1, 2, and 3. List all numbers clearly, neatly and correctly. Be sure the decimal point is in the right place.

ADD:

1. .97 + 8.5 + 12.06 + .469 =
2. 9 + 6.15 + 11.869 + .7 =
3. .6 + 9.07 + 2.4 + 12.156 =
4. 123.3 + .775 + 26.9 + 1.23 + 14.246 =
5. 1.587 + 201.6 + .075 + 2.67 + 101.369 =
6. .69 + 17.874 + 1,828.25 + 13.3 + 9.99 =
7. 3.6 + 137.586 + 6.459 + 32.2 + 2,658.877 =
8. 47.4 + 6.579 + 1,825.6 + 39.85 + 4.327 =
9. 152.3 + 7.355 + 18.7 + 3,429.86 + 76.59 =
10. .08 + 6.763 + 125.68 + 7.9 + 2.318 =

SUBTRACT:

11. 23.05 - 16.6 =
12. 71.6 - 14.74 =
13. 6.783 - 2.867 =
14. 125.4 - 10.689 =
15. 17.66 - 8.4 =
16. 23.845 - 16.5 =
17. 5.89 - 3.799 =

Multiplication of Decimal Fractions — Information Sheet No. 4

OBJECTIVE: To learn the right way to multiply decimals.

INFORMATION:

To multiply decimals, again you must be careful to list your numbers neatly and correctly. You do not list the decimals so that the decimal points line up. Instead you place the numbers of the multiplier under the multiplicand starting at the right and working to the left.

2.895 x 3.2 is written:

$$\begin{array}{rrl} & 2.895 & \text{(multiplicand)} \\ \times & \underline{3.2} & \text{(multiplier)} \end{array}$$

17.2 x .46 is written:

$$\begin{array}{rrl} & 17.2 & \text{(multiplicand)} \\ \times & \underline{.4\ 6} & \text{(multiplier)} \end{array}$$

You multiply just as for whole numbers, and when you have the answer you must place the decimal point in the right place. The important point to learn in multiplication is to get the right number of decimal places in the answer.

PROBLEM: 2.895 x 3.2

To determine the number of decimal places in your answer, you add the number of decimal places in the multiplicand (3) and the multiplier (1). 3 + 1 = 4.

$$\begin{array}{rrl} & 2.895 & \text{(multiplicand)} \\ \text{X} & \underline{3.2} & \text{(multiplier)} \\ & 5790 & \\ & \underline{8685\ \ } & \\ & 9.2640 & \text{ANS.} \\ & \uparrow\ \ \ \ \ \ \ & \end{array}$$

Starting at the right in your answer, count off 4 places toward the left. Put the decimal point in front of the 4th number. To make a rough check on your answer, multiply the whole numbers in the problem and compare this with the answer. If the 2 results are reasonably close, you have the decimal point in the right place.

Multiplication of Decimal Fractions — Assignment Sheet No. 2

Follow the instructions on Information Sheet No. 4. List your figures neatly and clearly. Check each problem for accuracy. Be sure you place the decimal points properly and so that they can be seen easily.

MULTIPLY:

1. 1.47 x 7 =
2. 382 x .08 =
3. 840 x .005 =
4. .006 x .07 =
5. 1.56 x 7.2 =
6. 7.071 x 9 =
7. 12.4 x 3.5 =
8. 65.1 x 2.7 =
9. 3.08 x .45 =
10. 1.63 x 4.3 =
11. .6 x 5 =
12. .04 x .7 =
13. 875 x .016 =
14. 24.56 x 4.31 =
15. 17 x $40.83 =
16. 34 x $4.85 =
17. .41 x 51.2 =
18. 16 x $.79 =
19. .008 x 9.48 =
20. .512 x .305 =
21. $3.78 x 17.5 =
22. .9 x 3.33 =
23. 17.25 x $14.40 =
24. 238.5 x .12 =
25. 1.98 x 20.5 =

Division of Decimal Fractions — Information Sheet No. 5

OBJECTIVE: To learn the proper way to divide decimals.

INFORMATION:

In dividing decimals, it is most important to place the decimal point in the right place.

There are different kinds of division problems involving decimals, as you will see. But in all kinds, the most important point is the placing of the decimal point.

PROBLEM: 16.5 ÷ 6=

When you divide a decimal by a whole number, you place the decimal point in the answer directly above the decimal point in the dividend.

(Decimal point)
2.75 Answer
(Divisor) 6/16.5 Dividend

To check your answer you multiply your answer by the divisor. This should be the same as the dividend.

2.75 (Answer)
x 6 (Divisor)
16.50 (Dividend)

PROBLEM: 16.5 ÷ 4.4 =

(A decimal divided by a decimal). Move the decimal point to the right one place in both the dividend and the divisor. Your dividend will then be 165. The decimal point in your answer will be directly above the decimal point which you moved behind the 5. Since 44 will not divide evenly into 165, you add 0's to the right of the decimal point in the dividend to get your answer.

Decimal point)
3.75 (Answer)
(Divisor) 4‸4./16‸5.00 (Dividend)
13 2
3 3 0
3 0 8
2 2 0
2 2 0

Check your answer:

3.75 (Answer)
x 4.4 (Divisor)
150 0
150 0
16.50 0 (Dividend)

PROBLEM: 2.6 ÷ .08 =

The divisor has 2 decimal places and the dividend only 1. Before you can move the decimal point you must place a zero after the six. Then move the decimal point 2 places to the right in both the divisor and the dividend. In order to complete the division, you will find it necessary to add a zero to the right of the decimal point in the dividend. The decimal point in the answer is directly above the new position of the decimal point in the dividend.

```
                  ┌ (Decimal point)
                  ↓
                32.5        (Answer)
             ─────────
Divisor o08./2o60.0         (Dividend)
             2 4↓  |
             ───   |
              20   |
              16   ↓
              ──
               40
               40
               ──
```

Check your answer.

```
  32.5   (Answer)
x  .08   (Divisor)
──────
2.6 00   (Dividend)
↑
```

PROBLEM: .855 ÷ .05 =

Before you divide, you must move the decimal point in both divisor and dividend 2 places to the right. This changes .855 to 85.5, and .05 to 5. The decimal point in the answer is directly above the new position of the decimal point in the dividend.

```
                 ┌ (Decimal point)
                 ↓
               17.1   (Answer)
             ───────
Divisor o05./o85.5    (Dividend)
              5↓  |
              ──  |
              35  |
              35  ↓
              ─────
                  5
                  5
                  ─
```

Check your answer.

```
  17.1   (Answer)
x .0 5   (Divisor)
──────
  .85 5  (Dividend)
```

In all the sample problems, you will note that the same general procedure was followed. First the divisor was changed to a whole number. Then the decimal point in the dividend was moved to the right as many places as it was necessary to move the decimal point in the divisor. So long as you move both decimal points the same number of places to the right, you do not change the value of the division problem, and your answer should be correct.

Follow the directions on Information Sheet No. 5. Be sure the decimal point is in the right place. Carry out your answer to 3 decimal places where necessary. Remember to check your answers.

DIVIDE:

1. .72 ÷ .6 =
2. 2.55 ÷ 3 =
3. 16.75 ÷ .5 =
4. .9984 ÷ 3.84 =
5. 60.8 ÷ .008 =
6. 1.026 ÷ .19 =
7. 18.99 ÷ 1.5 =
8. 888 ÷ .048 =
9. 150 ÷ 5.5 =
10. 240 ÷ 6.75 =
11. 48 ÷ 2.5 =
12. 63 ÷ 4.25 =
13. 58 ÷ 1.8 =
14. 75.5 ÷ 6 =
15. 18.5 ÷ 2.25 =
16. 27 ÷ 1.5 =
17. 32 ÷ 3.8 =
18. 29 ÷ 2.3 =
19. 15.6 ÷ 1.4 =
20. 21.5 ÷ 2.25 =

OBJECTIVE: To learn the meaning of per cent and how to change per cents to common fractions and to decimals.

INFORMATION:

Per cents are fractions which are expressed in a different way from common fractions and decimal fractions. A per cent is a fraction with a denominator of 100. Instead of writing the complete fraction, only the numerator is written, with the % sign.

Per Cent		Common Fraction		Decimal Fraction
25%	=	$\frac{25}{100} = \frac{1}{4}$	=	.25
5%	=	$\frac{5}{100} = \frac{1}{20}$	=	.05
$3\frac{1}{2}$%	=	$\frac{3.5}{100} = \frac{35}{1000} = \frac{7}{200}$	=	.035
17.5%	=	$\frac{17.5}{100} = \frac{175}{1000} = \frac{7}{40}$	=	.175
100%	=	$\frac{100}{100} = 1$	=	1.00
150%	=	$\frac{150}{100} = 1\frac{50}{100} = 1\frac{1}{2}$	=	1.5

To change per cent to a fraction, you write it as the numerator of a fraction having a denominator of 100. $25\% = \frac{25}{100} = \frac{1}{4}$.

To change per cent to a decimal, multiply the per cent by .01.
$25\% = 25 \times .01 = .25$

When changing from per cent to a decimal or a fraction, you must drop the per cent sign. Here is what happens if you fail to drop the per cent sign after the change.

$$25\% = 25\% \times .01 = .25$$
$$.25\% = \frac{.25}{100} \quad \frac{25}{10{,}000} = \frac{1}{400}$$

You started with $25\% = \frac{25}{100} = \frac{1}{4}$. There is a big difference between $\frac{1}{4}$ and $\frac{1}{400}$. But, if you forget to drop the per cent sign, your answer will be only a hundredths of what it should be! So, be sure you do your work accurately, and don't forget to drop the per cent sign when changing a per cent to a fraction or a decimal.

Solve the problems below by following the instructions on Information Sheet No. 6.

Change the following per cents to common fractions. Reduce to lowest terms.

1. 6%
2. 10%
3. 25%
4. 30%
5. 40%
6. 75%
7. 60%
8. $33\frac{1}{3}\%$
9. $2\frac{1}{2}\%$
10. 12.5%
11. 125%
12. 250%

Change the following per cents to decimal fractions:

13. 5%
14. 15%
15. $12\frac{1}{2}\%$
16. 65%
17. 17.5%
18. $3\frac{1}{2}\%$
19. $7\frac{1}{2}\%$
20. 4%
21. $6\frac{3}{4}\%$
22. 78%
23. 100%
24. 175%
25. 1%

Change the following decimals to per cents:

26. .25
27. .50
28. .9
29. .85
30. 1.25
31. .06
32. .045
33. 2.5
34. .99
35. .375

Change the following fractions to per cents:

36. $\frac{1}{10}$
37. $\frac{3}{5}$
38. $\frac{1}{2}$
39. $\frac{1}{4}$
40. $\frac{1}{8}$
41. $\frac{7}{10}$
42. $\frac{1}{6}$
43. $\frac{2}{3}$
44. $\frac{4}{5}$
45. $\frac{1}{20}$

Multiplication and Division of Per Cents

Assignment Sheet No. 5

There will be a great many occasions when you will have to use per cents. Learning to work with per cents quickly and accurately will make your job easier. Follow the instructions on Information Sheets 7 and 8.

1. 5% of 275 =
2. 15% of 718 =
3. 25% of 15,894 =
4. $16\frac{2}{3}\%$ of 7,896 =
5. 6% of 15,275 =
6. $4\frac{1}{2}\%$ of 5,000 =
7. 7.5% of 4,270 =
8. $5\frac{1}{4}\%$ of 1,268 =
9. 10% of 15,789 =
10. 120% of 19,675 =
11. 6% of what number is 68?
12. 10% of what number is 27?
13. $12\frac{1}{2}\%$ of what number is 16%
14. 20% of what number is 49?
15. 77 is 40% of what number?
16. 126 is 8% of what number?
17. A man borrowed $2400, signing a promissory note to repay the money in a year at 6% interest. How much interest did he have to pay?
18. A contractor bought a truck listed at $3275, and was allowed a 7% discount from the list price. How much did he pay for the truck?
19. A contractor stated that 20% of his working capital was invested in a certain building project. If $13,500 was invested in it, what was the man's capital?
20. A salesman received a weekly salary of $85 and a commission of 2% on all his sales. His sales on Monday amounted to $510.50, on Tuesday, $740.15, on Wednesday, $315.80, on Thursday $418.00, and on Saturday, $1024.50. What were his total earnings for the week?

Review of Decimals and Per Cents

Assignment Sheet No. 6

ADD:

49. $\frac{3}{50}$
50. $2\frac{3}{4}$

Test #5 comes next.

OBJECTIVE: To learn how to multiply by per cents.

INFORMATION:

To multiply by a per cent, first you must change the per cent to a decimal or common fraction, then multiply.

PROBLEM: 25% of 160 =

A. Change to a fraction: $25\% = \frac{25}{100} = \frac{1}{4}$

$\frac{1}{4} \times 160 = 40$ ANS.

B. Change to a decimal: $25\% = .25$

$.25 \times 160 = 40.00$ ANS.

↑
decimal point

In solving the problems you will encounter in your work, you will find that sometimes it is easier to convert the per cent to a fraction, and sometimes to a decimal. You will naturally do whichever is simpler. But it is important to know and practice both ways.

OBJECTIVE: To learn when and how to divide by per cents.

INFORMATION:

To find a number when you know the per cent of the number, you must divide by the per cent. Proceed as in the problem below.

PROBLEM: 35% of a number is 7. Find the number.

$$35\% \times ? = 7$$

Change the per cent to a decimal fraction. $35\% = .35 \qquad .35 \times ? = 7$

Use the decimal fraction (.35) as the divisor. Use the number (7) as the dividend. Then divide.

$$\begin{array}{r} 20.\ \text{ANS.} \\ .35\overline{)7.00.} \\ \underline{7\ 0} \\ 00 \end{array}$$

Check the answer.

$$\begin{array}{r} 20 \\ \times\ \underline{.35} \\ 100 \\ \underline{60\ } \\ 7.00 \\ \uparrow \end{array}$$

decimal point

In some cases it is easier to convert the per cent to a common fraction rather than to a decimal before dividing.

PROBLEM: 25% of a number is 110. What is the number?

Changing to a common fraction, $25\% = \frac{25}{100} = \frac{1}{4}$

$$\frac{1}{4} \times ? = 110$$

Divide 110 by $\frac{1}{4}$: $110 \div \frac{1}{4} = \frac{110}{1} \times \frac{4}{1} = \frac{440}{1} = 440$ ANS.

Check the answer. $440 \times \frac{1}{4} = \frac{\overset{110}{\cancel{440}}}{1} \times \frac{1}{\cancel{4}} = 110$

UNIT III - SQUARE MEASURE

Areas of Perimeters of Squares,
Rectangles, Triangles, Circles

Information Sheet No. 1

OBJECTIVE: To learn how to find the area of the different shaped surfaces most often used in construction.

Think! What you can do with your brain you do not have to do with your back.

INFORMATION:

Square measure is the method of finding out how much space the surface of an object or building covers. This is done by figuring out how many squares of a certain size are needed to cover the surface. The size of the surface is called its area. The unit of measure used most often is 1 foot.

Surfaces have different shapes. Squares, rectangles, triangles, and circles are encountered most.

Surfaces have no depth or thickness. They have only 2 dimensions, length and width (or height).

Square: A square is a 4-sided figure whose sides are all the same length and are at right angles to each other. The sides of a square are known as the length and width (or height).

To find the area of a square, multiply the length by the width (or height).
Fig. 1:

Length 2'
Height 2'

2' x 2' = 4 sq. ft. area of Fig. 1

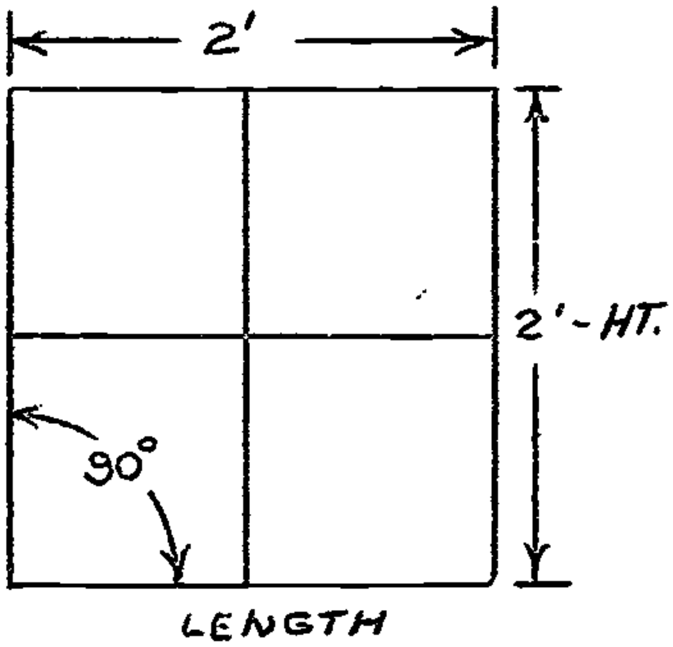

FIG. 1
SQUARE

Rectangle:
A rectangle is a 4-sided figure in which the sides opposite each other are the same size. The sides are at right angles to each other.

To find the area of a rectangle, multiply the length by the width (or height).
Fig. 2:

Length 3'
Height 2'

2' x 3' = 6 sq. ft. area of Fig. 2

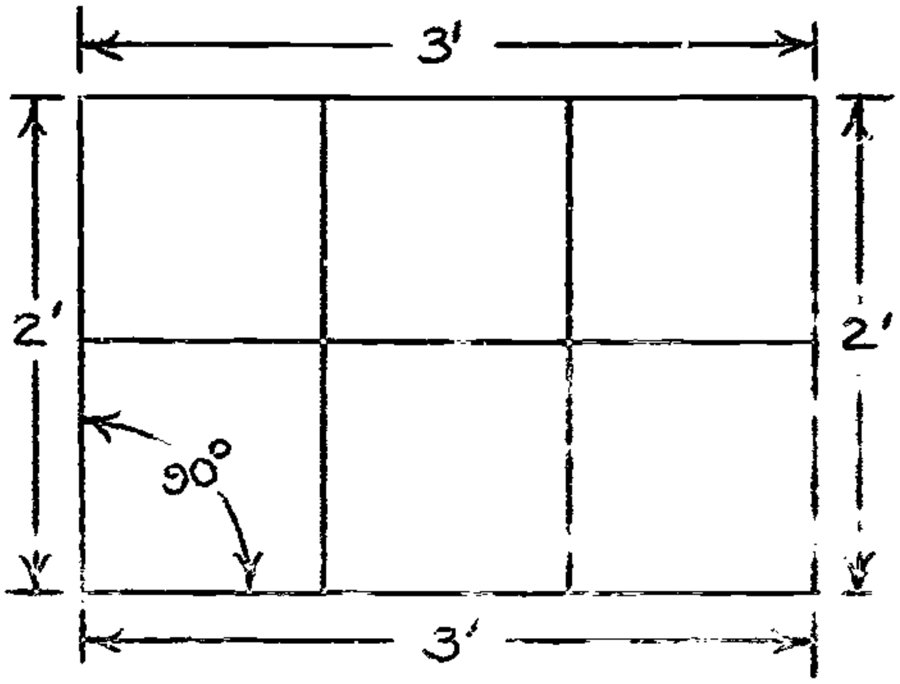

FIG. 2
RECTANGLE

Triangle: Triangles are 3-sided figures.

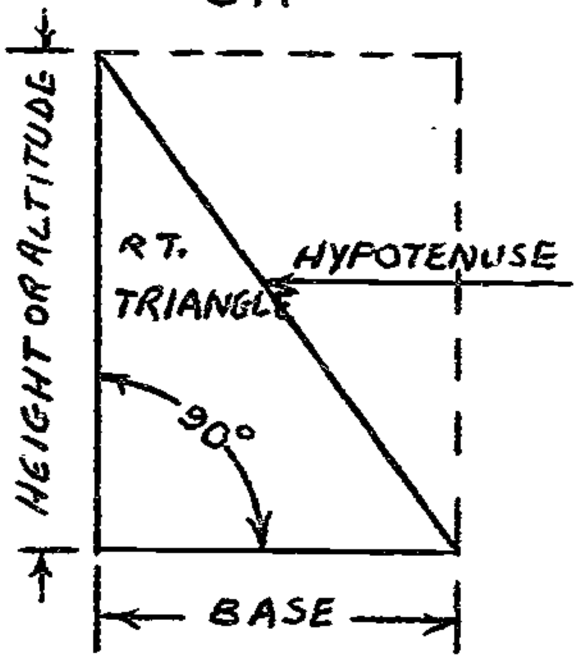
The bottom of the triangle is called the base.

The sides of the triangle are sometimes called legs.

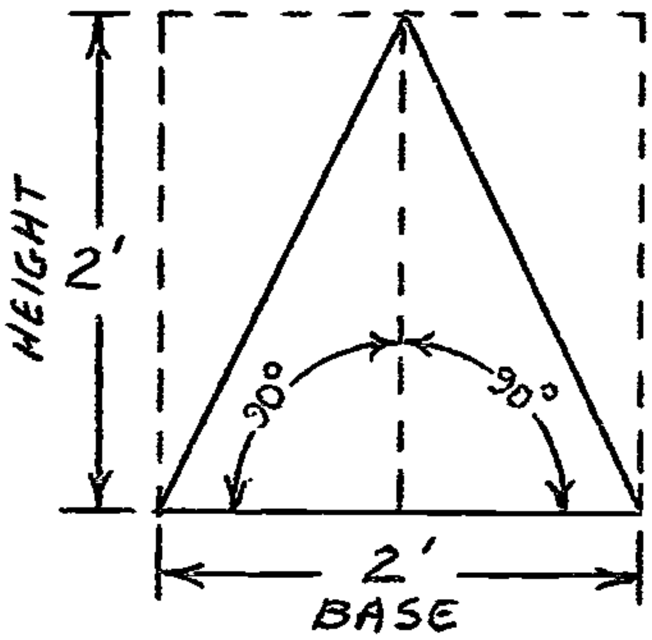
The distance from the base to where the other legs or sides meet is called the height or altitude.

The triangles which you will use in estimating will be right triangles. Right triangles are those triangles which have one angle which is 90°.

3A



3B



In Fig. 3A and Fig. 3B, you see that the triangles cover one half the area of the square and rectangle in which they have been drawn. The base of each triangle is the same size as the length of one side of both the rectangle and the square. The height of each triangle is the same as the length of the other side of the rectangle and square. Since the dimensions of the base and altitude (or height) of the triangles are the same as those of the square and rectangle, and since the triangles cover one half the area of the square and rectangle, to find the area of a triangle you multiply the base x height and divide the total by 2.

The standard formula is

Area = $\frac{1}{2}$ x Base x Height. Using the dimensions in Fig. 3B,
$\frac{1}{2}$ x Base x Height

$\frac{1}{\cancel{2}} \times \frac{\cancel{2}^{1}}{1} \times \frac{2^{1}}{1}$ = 2 sq. ft. area of Fig. 3B

In problems involving right triangles, many times you will have only 2 dimensions given. To find the third dimension you will use the "3-4-5" method.

In all right triangles, the square of the hypotenuse (the side opposite the right angle) is equal to the sum of the squares of the other 2 sides.

In Fig. 3C, the 2 sides are 3' and 4' long.

3 squared = 3 x 3 = 9
4 squared = 4 x 4 = $\underline{16}$
The sum of the squares of 3 and 4 = 25
5 squared = 5 x 5 = 25

When you multiply the 3-4-5 formula to increase the size of the sides, the results will be in the same proportion no matter what figure you use to multiply the sides by. Just be sure that you use the same multiplier for each side.

Let us increase a 3-4-5 right triangle so that each side will be 4 times this size.

3 x 4 = 12 12 squared = 12 x 12 = 144
4 x 4 = 16 16 squared = 16 x 16 = $\underline{256}$
the sum of the squares of 12 and 16 = 400
5 x 4 = 20 20 squared = 20 x 20 = 400

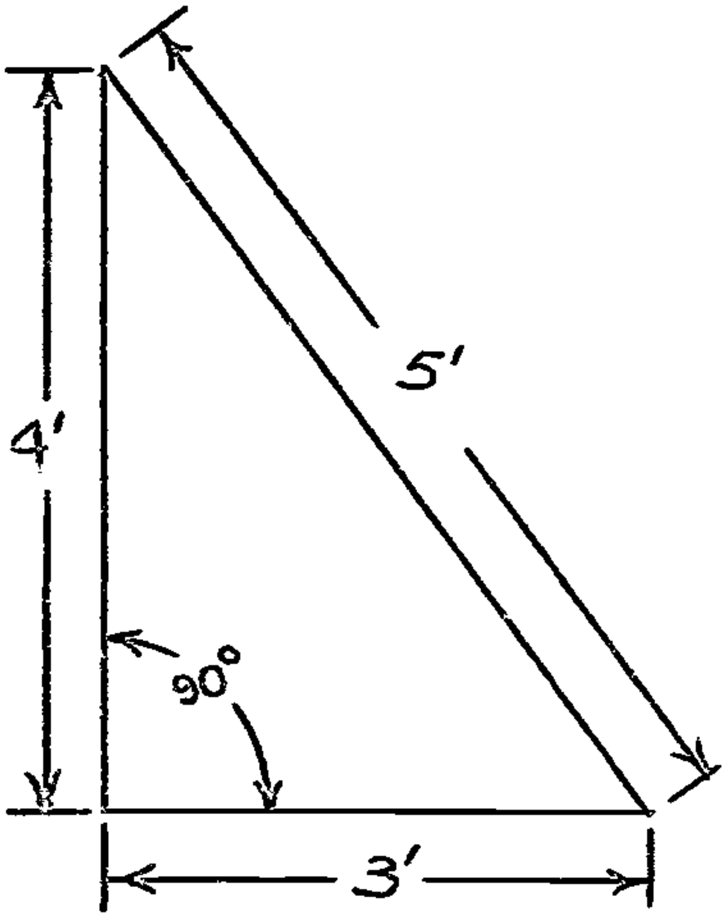


FIG. 3C

A <u>Circle</u> (Fig. 4) is a figure whose outside edge is the same distance from the center throughout its length. The outside edge of circle is a curve or arc. The entire curved edge of a circle is the circumference. The distance through the center of a circle is the diameter. The radius of a circle is the distance from the center of the circle to the circumference. The radius is $\frac{1}{2}$ the diameter.

To find the area of a circle, you must know the length of the radius, diameter, <u>or</u> circumference of the circle.

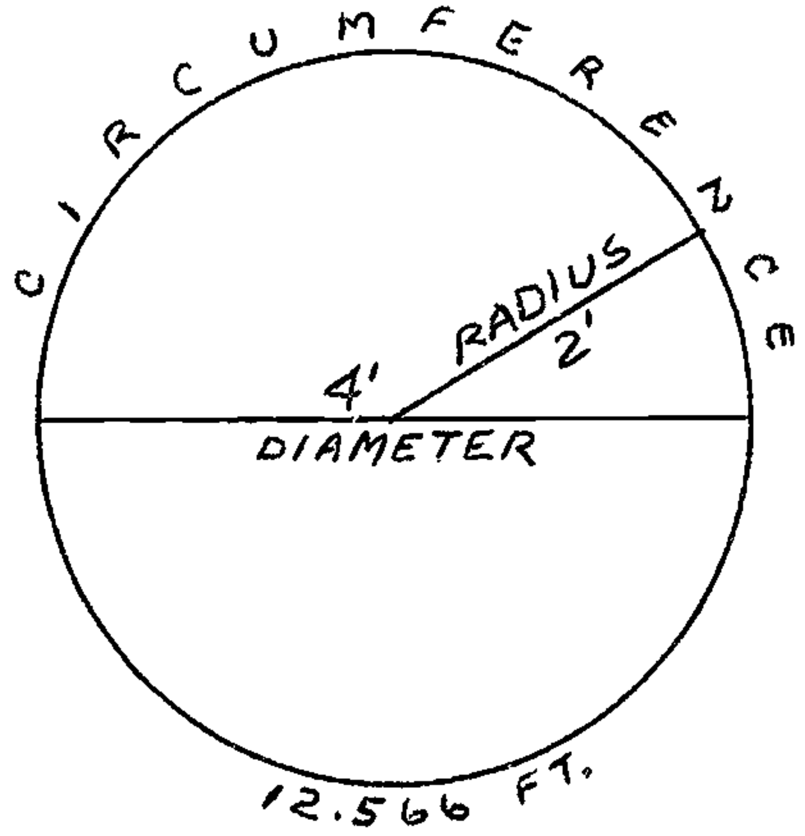

FIG. 4 - CIRCLE

If you were to measure the circumference of any circle and compare its length with the length of the diameter, you would find that the circumference is always a little over three times the length of the diameter. Mathematicians have calculated that the figure is actually 3.1416 and have given this the name <u>pi</u> (the Greek letter <u>p</u>, written π). In working with circles it is generally necessary to use π, which for rough work is sometimes approximated as 3.14 or even $3\frac{1}{7}$.

To find the <u>radius</u> of a circle, you divide the <u>diameter</u> by 2. In Fig. 4, <u>radius</u> = 4' ÷ 2 = 2' (<u>radius</u> of Fig. 4).

To find the <u>circumference</u>, you multiply the <u>diameter</u> by π, that is

circumference = 3.1416 x diameter

In Fig. 4, circumference = 3.1416 x 4' = 12.566 ft. (<u>circumference</u> of Fig. 4)

To find the <u>diameter</u> of a circle when you know the circumference, you divide the <u>circumference</u> by π

<u>diameter</u> = circumference ÷ 3.1416

In Fig. 4, diameter = 12.5664 ÷ 3.1416 = 4' (<u>diameter</u> of Fig. 4)

To find the area of a circle, you multiply π by the square of the radius (that is, π x radius x radius). This is written radius ^{2}.

$$\text{area} = 3.1416 \times \text{radius}^2$$

In Fig. 4, area = 3.1416 x 2' x 2' = 12.5664 sq. ft. (area of Fig. 4). This happens by coincidence to be the same numerical value as the circumference, but note that the area is always in square measure.

To summarize the above facts about a circle, we can let c stand for the circumference, d for the diameter, r for the radius, and A for the area.

Then: $r = \frac{d}{2}$ or $d = 2 \times r$

$c = \pi \times d$ or $c = \pi \times r \times 2$

$d = \frac{c}{\pi}$

$A = \pi \times r^2$

The perimeter is the distance around the outside edge of a surface or figure. (We have seen that the perimeter of a circle has a special name, circumference).

For a rectangle, the perimeter equals the sum of all four sides. But since the opposite sides are equal,

perimeter = 2 x length + 2 x width

In a square, all four sides are equal, so that

perimeter = 4 x length of a side

Follow the instructions on Information Sheet No. 1 to solve the problems in this assignment. If you study the instructions carefully you will have no trouble solving the problems quickly and accurately. Remember: Area is expressed in sq. ft.

1. Find the area of a 17' square.
2. Find the area of a rectangle 27' long and 19' wide.
3. Find the area of a rectangle 43' long and 29' high.
4. Find the perimeter of a rectangle 36' long and 27' wide.
5. Find the perimeter of a 28' square.
6. Find the area of a triangle whose base is 28' and whose height is 17'.
7. Find the area of a circle whose radius is 12'.
8. Find the circumference of a circle whose diameter is 12'.
9. Find the area of a circle whose diameter is 14'.
10. Find the area of a triangle whose base is 18' and whose altitude is 14'.
11. Find the perimeter of a right triangle whose base is 12' and height 16'. Use 3-4-5 method.
12. Find the area of a rectangle 27' 3" long and 14' 6" wide.
13. Find the area of a circle whose diameter is 17'.
14. Find the circumference of a circle whose radius is 19' 8".
15. Find the area of a triangle whose base is 13' and whose height is 13'.
16. Find the area of a 15' 4" square.
17. Find the radius of a circle whose circumference is 59.6904 feet.
18. Find the area of a circle whose circumference is 84.8232 feet.
19. Find the perimeter of a triangle whose base is 24' and height is 32'. Use 3-4-5 method.
20. Find the area of a triangle whose base is 19' 6" and whose height is 12'.
21. How many courses of brick are needed to build a wall 10' 1" high? The brick are to be laid 4 courses in 11".

In this assignment you will find the areas of irregularly shaped surfaces.

To find the areas of Fig. A and Fig. B, first find the areas of each section and then add them. For convenience, we shall combine the capital letters to indicate a portion of the figure. For example, AB will mean A + B, BCD (in Fig. D) will mean B + C + D, etc.

FIG. A

1. What is the length of dimension "X"?
2. What is the length of dimension "Y"?
3. What is the perimeter of Fig. A?
4. What is the area of A?
5. What is the area of C ?
6. What is the area of B ?
7. What is the area of AB?
8. What is the area of BC?
9. What is the area of ABC?

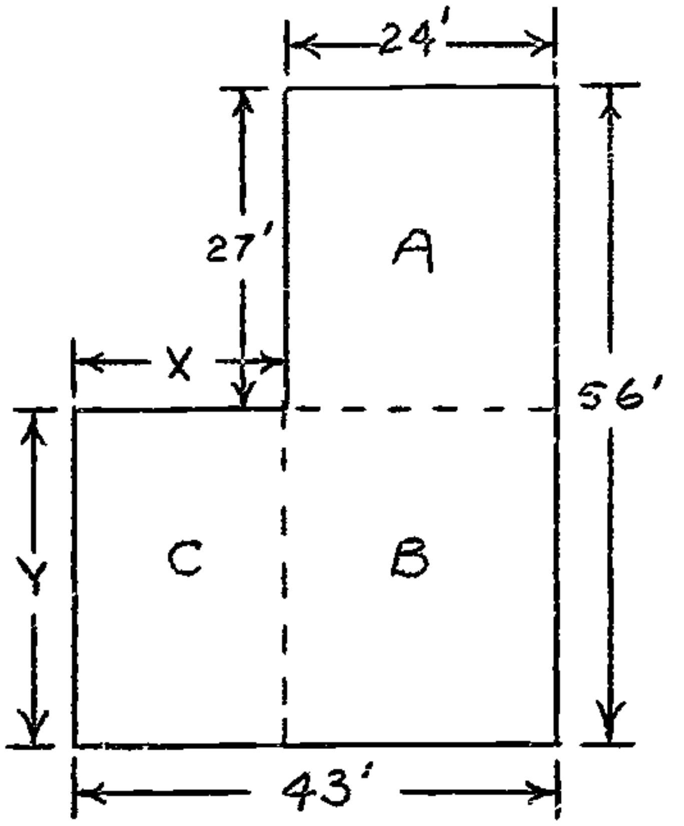

FIG. A

FIG. B

10. How long is dimension "Z"?
11. How long is dimension "Y"?
12. What is the perimeter of Fig. B?
13. What is the area of A?
14. What is the area of C ?
15. What is the area of AB?
16. What is the area of AC ?
17. What is the area of ABC?
18. What is the area of a triangle whose base is 17' and whose height is 13'?
19. What is the area of a circle whose circumference is 53.4072'?
20. What is the area of a 19' square?
21. How many courses of block are needed to build a wall 16' 6" high? Each block course is laid in $8\frac{1}{4}$".

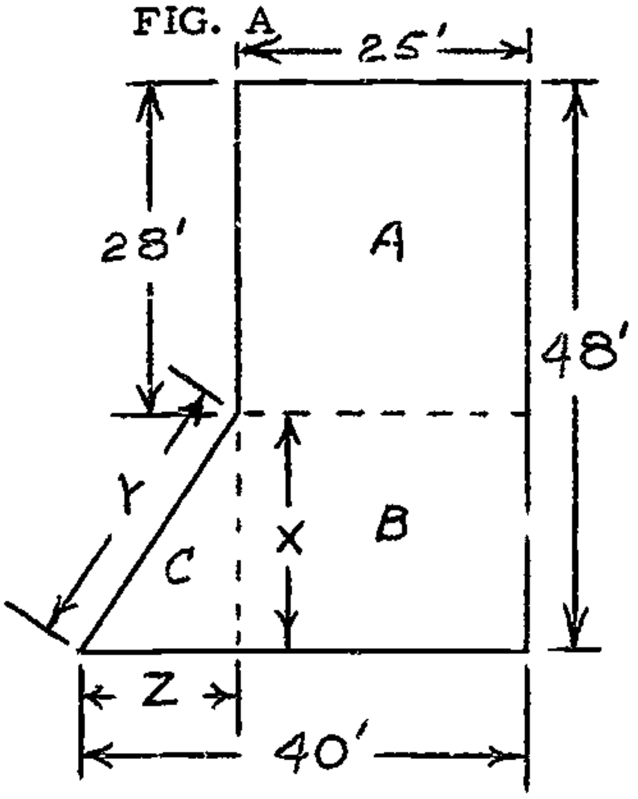

FIG. B

In working with Fic. C, note that A + C = a circle. B is a rectangle. To find the perimeter, add the circumference of AC and the 2 sides of B.

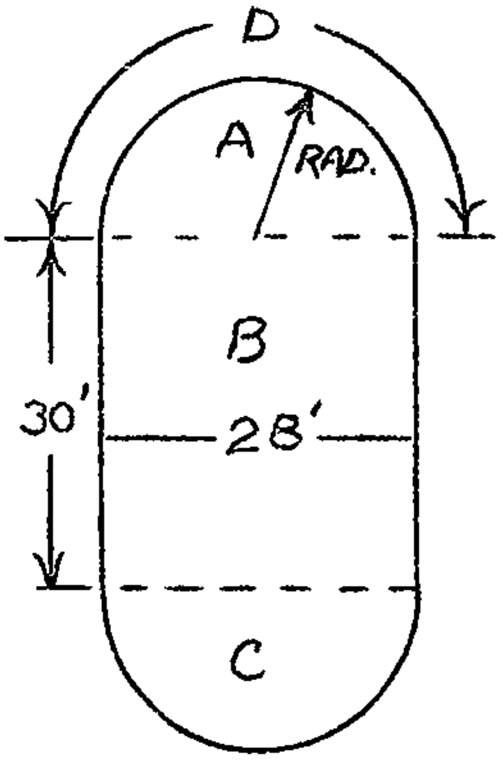

FIG. C

FIG. C

1. How long is the radius of A and C?
2. Find the area of AC.
3. Find the area of B.
4. Find the area of Fig. C.
5. How long is dimension D?
6. Find the perimeter of Fig. C.

FIG. D

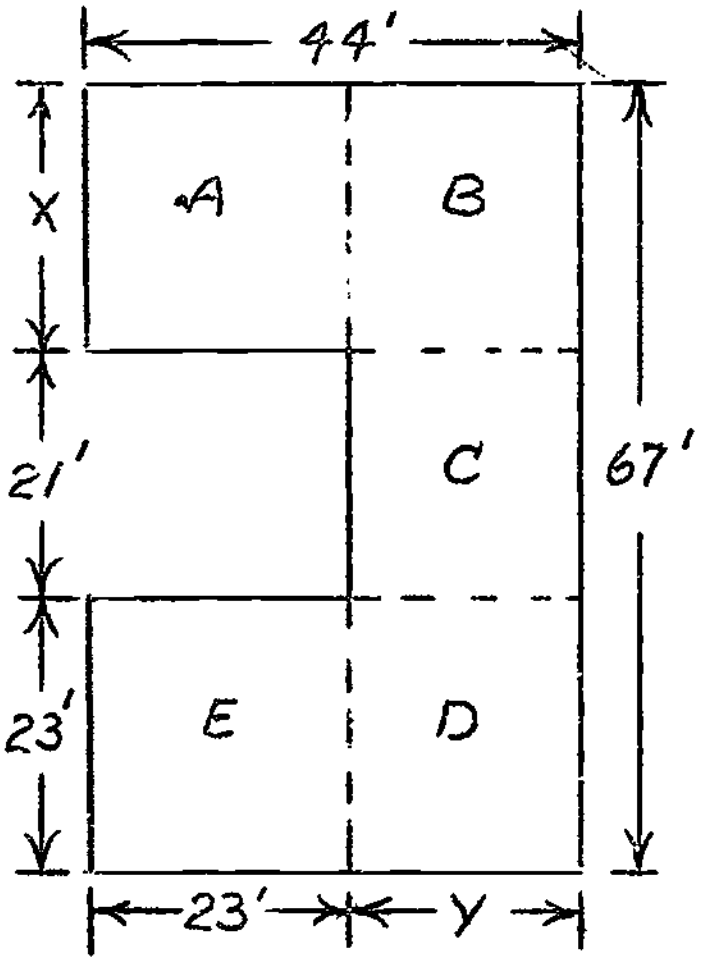

FIG. D

7. How long is dimension "X"?
8. Find the area of AB.
9. How long is dimension "Y"?
10. Find the area of BCD.
11. Find the area of Fig. D.
12. Find the perimeter of Fig. D.
13. Add:
    $345'\ 7\frac{1}{4}'' + 125'\ \frac{5}{8}'' + 6\frac{1}{2}'' + 8'\ 11\frac{7}{8}'' + 9'\ 11\frac{3}{16}''$
14. Multiply: 47' 8" x 39' 9" =
15. Divide: $36'\ 5'' \div 5\frac{3}{4}$ =
16. It takes $6\frac{1}{2}$ brick to cover 1 sq. ft. of wall. How many brick are needed to cover a wall 288' long and 8' 8" high?
17. A builder erected a foundation for $17,500.00. His labor cost was $6,928.65; he bought 23 cu. yds. of concrete @ $13.96 per yard, 37,510 brick @ $42.75 per 1,000, 1750 blocks @ 29¢ per block, 294 bags of mortar cement @ $1.17 per bag, and 29 cu.yds. of sand @ $3.95 per yard; his overhead was $2,826.50. How much did he make?
18. How many courses of brick are needed to build a wall 7' high? Brick are to be laid 4 courses in $10\frac{1}{2}$".

OBJECTIVE: To learn how to find the area of the walls and ceiling of a room.

INFORMATION:

It is necessary to know how to find the area of the walls and ceiling of a room, so that you can estimate the amount of plaster needed for the room. The area of a room is always given in square yards.

Square or rectangular rooms have 4 walls and a ceiling. You find the area of the walls just as you do for a square or rectangle. After you find the number of square feet in the room, you deduct the size of the openings (doors, windows, archways and all other parts of the wall which are not plastered). After you deduct the openings, you divide the remainder by 9 (1 sq. yd. = 9 sq. ft.) to get the number of square yards.

Think! Anyone can develop a strong back, even a mule.

If the numbers 1 and 3 are centered on the appropriate walls, and put into perspective, the diagram will be clearer. Also the words ceiling and floor.

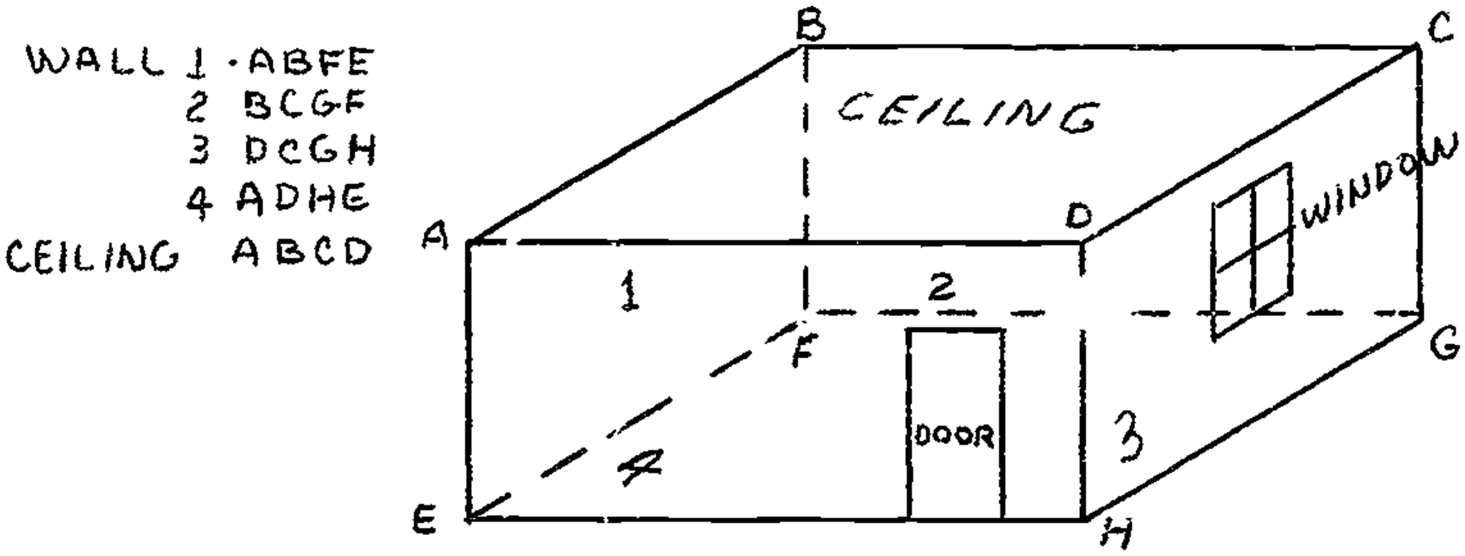

FIG. 5

Fig. 5 is a drawing of a room showing the walls and ceiling. In Fig. 6 we will take the walls and ceiling of a room apart and lay them out flat.

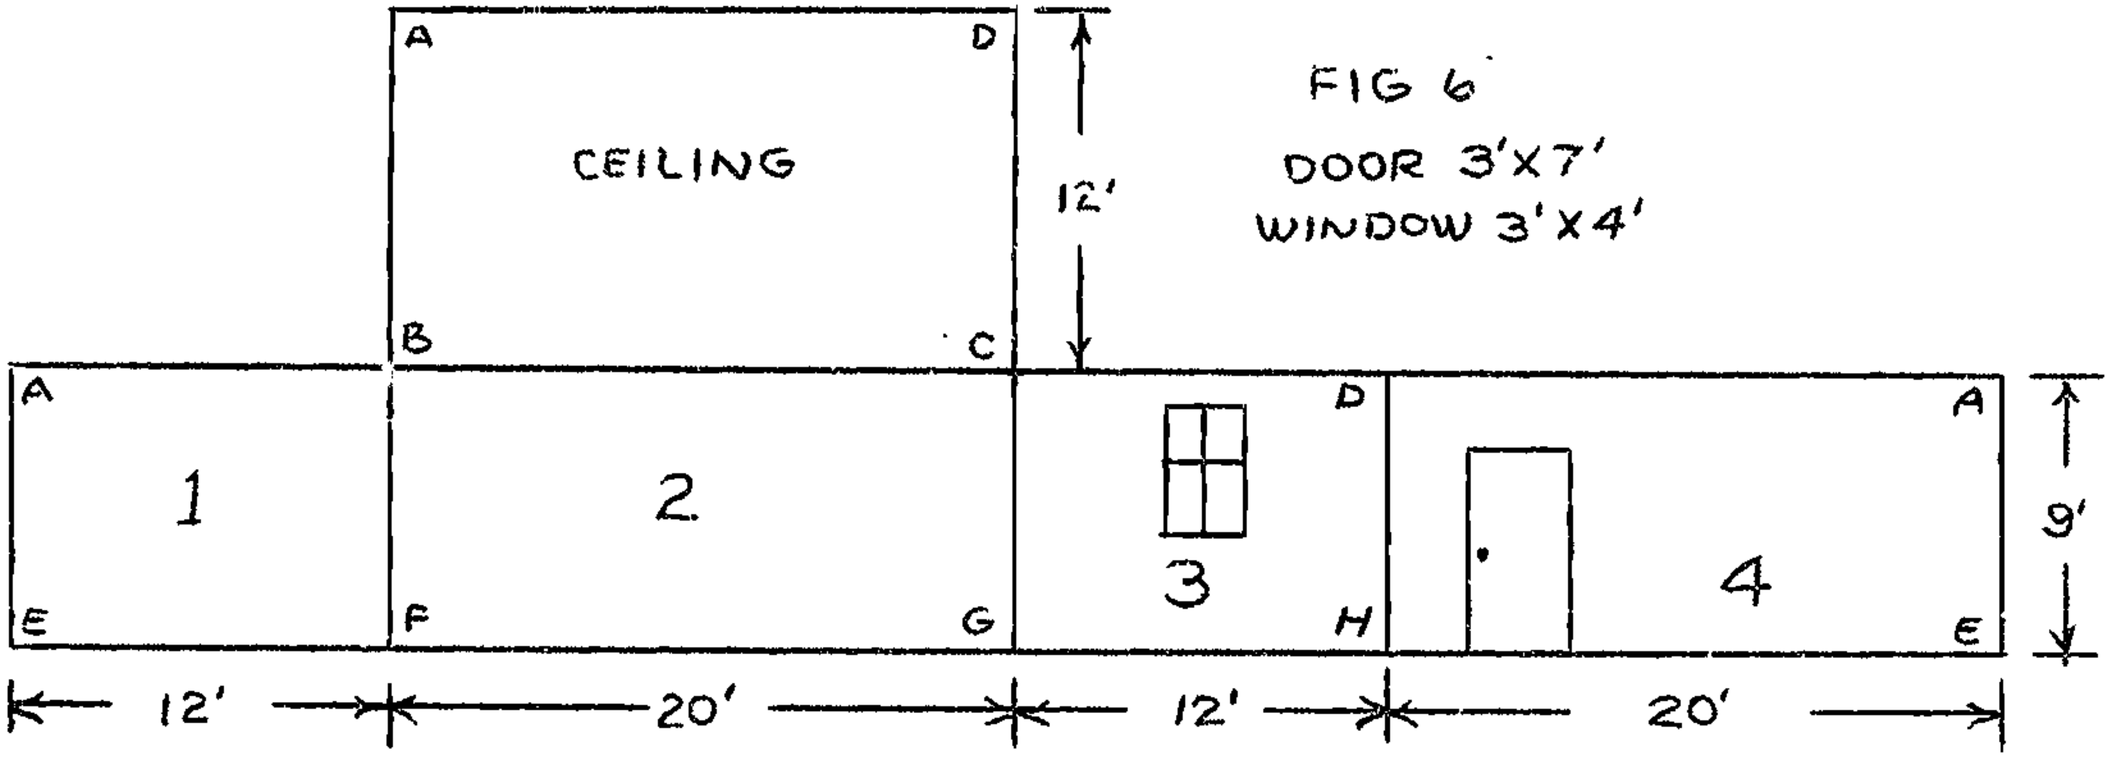

FIG 6

DOOR 3'X7'

WINDOW 3'X4'

PROBLEM: How many sq. yds. in the walls and ceiling of a room 20' long, 12' wide, and 9' high (dimensions of Fig. 6).

Fig. 6 shows that when you "flatten out" a room you will have 2 rectangular areas. One is the ceiling and the other is made up of the 4 walls.

First find the area of the ceiling by multiplying the length (20') by the width (12').

12' x 20' = 240 sq. ft. area of ceiling

All 4 walls are the same height, so instead of finding the area of each wall separately, add the lengths of the walls. (Wall 1 = 12'; wall 2 = 20'; wall 3 = 12'; wall 4 = 20'.)

12' + 20' + 12' + 20' = 64', length of walls (perimeter of the room).

length (64') x height (9') = area of walls.

64' x 9' = 576 sq. ft. area of walls.

Add area of ceiling + 240 sq. ft. area of ceiling.
816 sq. ft., total area of the room.

Remember you must deduct the size of the openings.

Openings: door: 3' x 7' = 21 sq. ft.
window: 3' x 4' = 12 sq. ft.
door and window = 33 sq. ft., total openings.

Subtract the total area of the openings from the total area of the room.

816 sq. ft., total area of room.
\- 33 sq. ft., total area of openings.
783 sq. ft. of walls to be plastered.

Plaster is always estimated in sq. yds., so divide the number of sq. ft. to be plastered by 9 (the number of sq. ft. in 1 sq. yd.)

9/783 sq. ft.
87 sq. yards in the walls and ceiling. ANS.

The above is not nearly so involved as it appears at first. Here is what we did:

Area of ceiling:	12' x 20' =	240 sq. ft.
Area of walls:	64' x 9' =	576 sq. ft.
Total area of room:		816 sq. ft. total
Deduct openings	-	33 sq. ft. openings
	9/	783 sq. ft. to be plastered
		87 sq. yds. ANS.

Solve the problems in this assignment by following the instructions in Information Sheet No. 2. Think a little; it doesn't hurt.

Find the number of sq. yds. in the walls and ceilings of the rooms listed below:

	Length	Width	Height	Doors	Windows
1.	15'	12'	8'	1-- 3' x 7'	2-- 3' x 5'
2.	29'	16'	8' 6"	1-- 3' x 6' 8"	4-- 2'6" x 4' 6"
3.	34'	19'	10' 6"	2-- 3' x 7'	7-- 3' x 5'
4.	22' 6"	16'	9'	2-- 3' x 6' 8"	5-- 3' x 4'
5.	17'	12' 6"	8' 6"	1-- 3' x 7'	3-- 2'8" x 4'
6.	21'	16' 4"	9'	3-- 2' 8" x 6' 8"	4-- 2'8" x 4' 6"

7. Find the area of a circle whose diameter is 23'.

8. Find the area of a triangle whose base is 17' and whose height is 14'.

9. Seven bricklayers worked 6 days, 7 hours per day and laid 32,046 brick. How many brick did each man average per hour?

10. Twelve bricklayers worked 14 days each, 7 hours per day and earned a total of $4,410.00. How much did each man earn per day?

11. A builder put up a foundation for $19,800.00. His labor cost was $6,127.65, he bought 35 cu. yds. of concrete @ $13.85 per yard, 39,000 brick @ $67.75 per 1,000, 2,600 blocks @ 27¢ each, 358 bags of mortar cement @ $1.16 per bag, 40 cu. yds. of sand @ $3.75 per yard; door bucks and window frames cost $467.50; overhead cost was $2,369.75. How much profit did the builder make?

12. How much would a 24' long I-beam, weighing $27\frac{1}{2}$ lbs. per lineal ft. cost, if each pound costs $19\frac{1}{2}$¢?

13. How many courses of block are needed to build a wall 22' $4\frac{1}{8}$" high? The block courses are laid in $8\frac{1}{8}$".

14. How many brick are needed for the first course of a foundation, 38' 6" long and 29' 6" wide? A brick with the cross joint measures $8\frac{1}{2}$".

Find the number of square yards in the walls and ceilings of rooms with the following dimensions:

	Length	Width	Height	Openings	
				Doors	Windows
1.	24' 6"	18'	9'	2-- 3' x 6' 8"	6-- 2'6" x 4'
2.	34'	21'	12' 6"	3-- 2'8" x 7'	8-- 3' x 5' 6"
3.	26'	19'	11'	2-- 2'8" x 6'8"	5-- 2 8" x 4' 6"
4.	45'	21'	13' 6"	3-- 2' 8" x 7'	6-- 2' 8" x 6'
5.	15' 6"	12'	9'	1-- 3' x 6' 8"	3-- 3' x 5'
6.	37'	22'	11' 6"	2-- 6' x 8'	9-- 2' 8" x 7'
7.	51'	26'	14'	6-- 2'8"x6'8"	12-- 2' 8" x 7' 6"

8. Seventeen men worked 14 days, 7 hours per day and laid 148,274 brick. How many brick did each man average per day?

9. It takes 720 lath to cover 40 sq. yds. of wall. How many lath are needed to cover 627 sq. yds. of wall?

10. A builder put up the walls of a building for \$18,600.00. His labor cost was \$7,425.50. He bought 31 cu. yds. of concrete @ \$15.75 per yard, 32,000 brick @ \$68.25 per 1,000, 8,000 blocks @ 24¢ per block, 415 bags of mortar cement @ \$1.17 per bag, and 53 cu. yds. of sand @ \$5.25 per yard; windows and door bucks cost \$529.89, lintels cost \$188.70, and his overhead was \$1,998.49. How much profit did the builder make?

11. A builder bought 136 ft. of 4" x 4" x $\frac{3''}{8}$ angle iron lintels. The angle iron weighed 7½ lbs. per lineal foot, and cost 18½¢ per lb. How much did the lintels cost?

12. It takes $6\frac{2}{3}$ brick laid with a $\frac{3''}{8}$ joint to face 1 sq. ft. of wall. How many brick are needed to face a wall 249' long and 8' 4" high?

13. How many porcelain glazed tile will it take to face a wall 33' 6" long and 8' high? Porcelain glazed tile cover 5¼" x 8" including the mortar joints

14. How many 16" long cinder blocks are needed to build a wall 38' long and 12' high? A 16" block covers $\frac{8}{9}$ sq. ft. of wall, including the mortar joints.

How many square yards are in the walls and ceilings of rooms having the following dimensions?

				Openings	
1.	Length	Width	Height	Doors	Windows
1.	21'	16'	9'	2-- 3' 7'	3-- 2' 8" x 5'
2.	47'	33'	11' 6"	3-- 2' 8" x 7'	10-- 3' x 5' 5"
3.	32' 6"	24'	10' 6"	2-- 6'6" x 8'	9-- 2' 8" x 6'
4.	25'	17'	8' 6"	2-- 3' x 6' 8"	4-- 3' x 4' 6"
5.	52'	27' 6"	12' 6"	3-- 7' x 8'	16-- 3' x 6' 6"
6.	19'	17'	9'	2-- 3' x 7'	3-- 2' 8" x 5'
7.	49' 6"	28'	13'	4-- 6' x 8'	16-- 2' 6" x 7'
8.	22'	17' 6"	8' 6"	2-- 3' x 6' 8"	6-- 2' 8" x 5'
9.	17'	13'	8'	2-- 2' 6" x 7'	3-- 2'6" x 4'

FIG. E

10. Find the area of BCD.

11. Find the area of F.

12. Find the area of FED.

13. Find the area of Fig. E.

14. Find the perimeter of Fig. E.

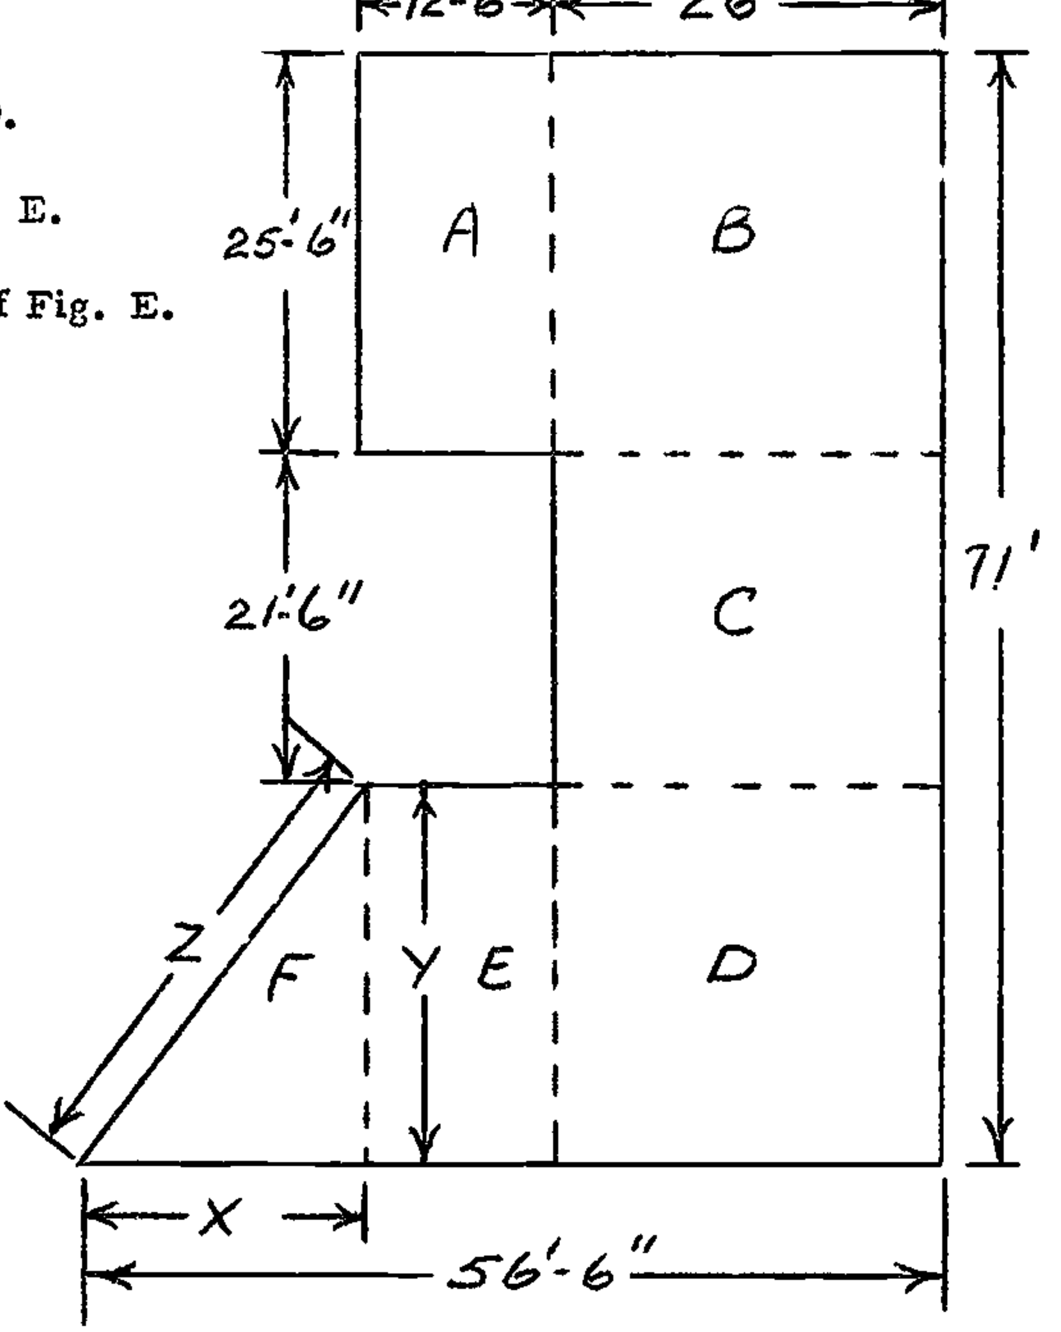

FIG. E

Next comes Test #6.

OBJECTIVE: To learn to find the surface area of a cube, rectangular prism, triangular prism, and cylinder.

INFORMATION:

1. To find the area of a cube:

A cube has 6 sides, all of which are equal squares. See Fig. 8. To find the area, you multiply the length (3') by the width (3') by the 6 sides.

3' x 3' x 6 = 54 sq. ft., area of Fig. 8.

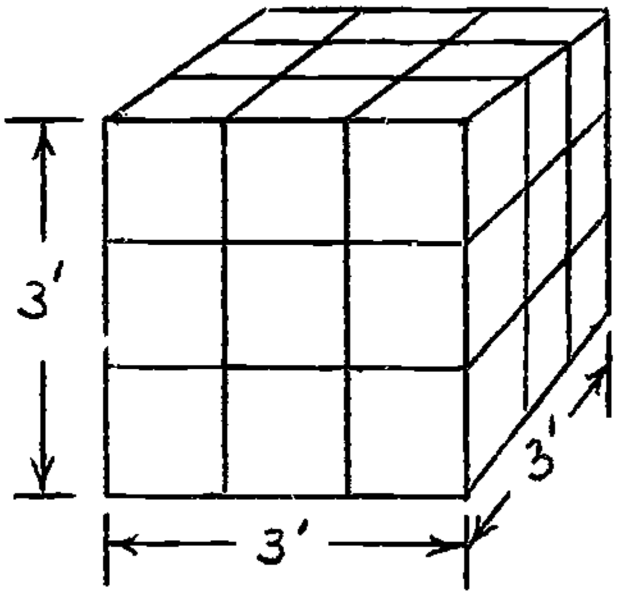

FIG. 8 - CUBE

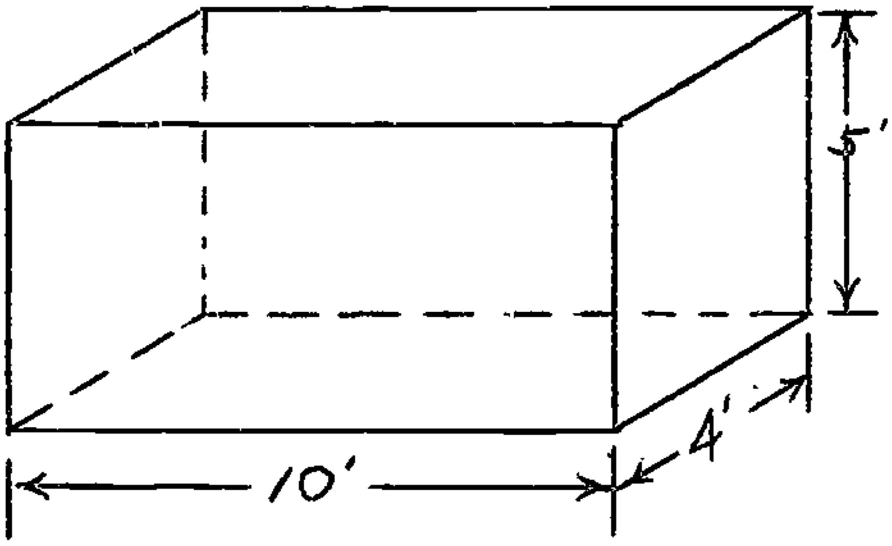

FIG. 9 - RECTANGULAR PRISM

2. To find the area of a rectangular prism (Fig. 9):

A rectangular prism has six sides. The sides opposite each other have the same dimensions.

Area of 2 sides (5' x 10') = 2 x 5' x 10' = 100 sq. ft.
Area of 2 sides (4' x 10') = 2 x 4' x 10' = 80 sq. ft.
Area of 2 sides (4' x 5') = 2 x 4' x 5' = 40 sq. ft.
220 sq. ft. area of Fig. 9.

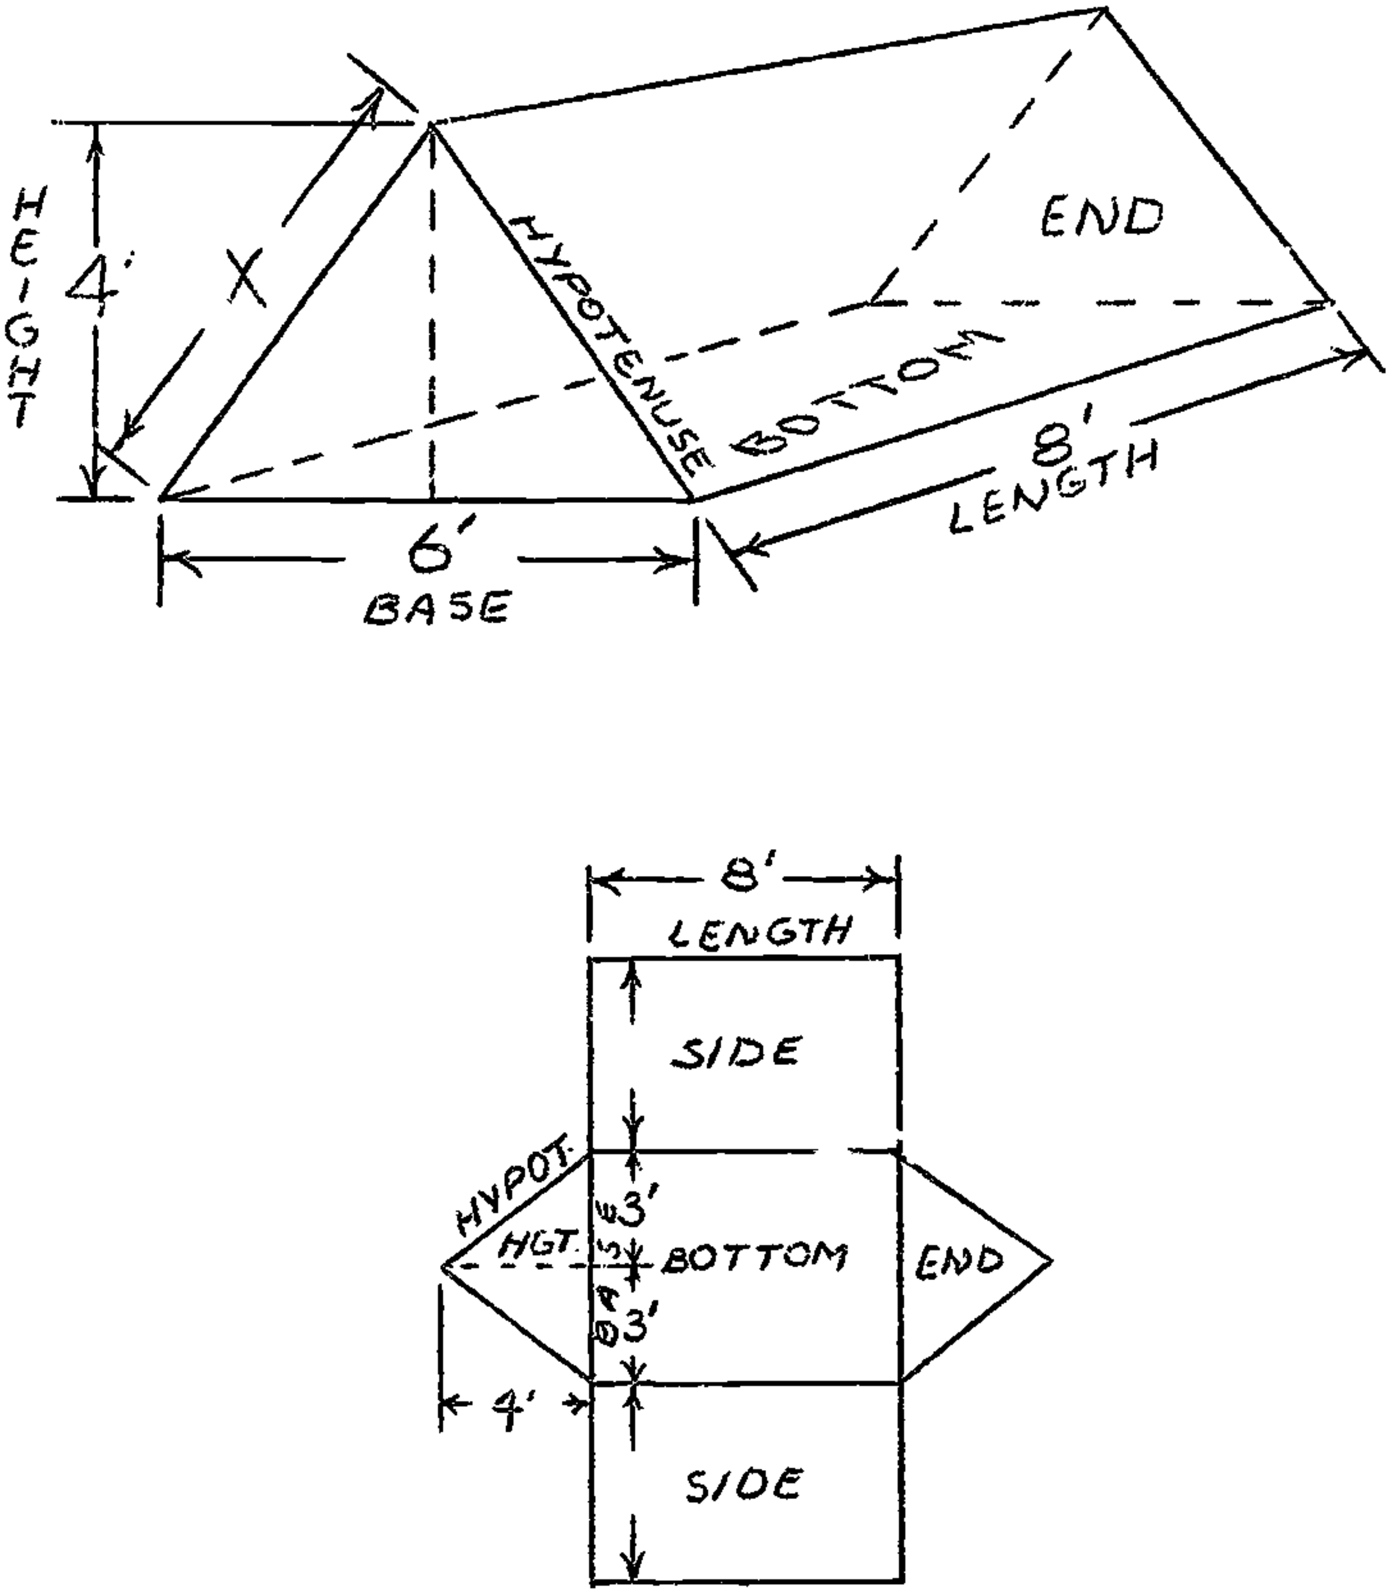

FIG. 10 - TRIANGULAR PRISM

3. To find the area of a triangular prism (Fig. 10):

A triangular prism has 2 triangular ends, a bottom and 2 sides.

Before you can find the area of Fig. 10, you must find the length of dimension "x". The dash line denoting the height of the triangle divides the triangle into 2 equal halves. Each half is a right triangle. Using the 3-4-5 method you find dimension x = 5'.

Area of 2 ends = $2 \times \frac{1'}{2} \times 6' \times 4'$ = 24 sq. ft.

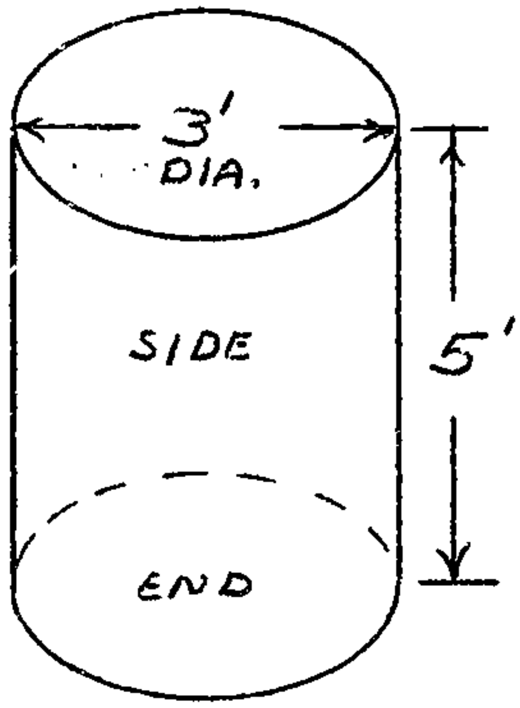
Area of bottom = $6' \times 8'$ = 48 sq. ft.

Area of sides = $2 \times 5' \times 8'$ = 80 sq. ft.

152 sq. ft., area of Fig. 10.

FIG. 11

CYLINDER



4. To find the area of a cylinder (Fig. 11):

A cylinder has 2 circular ends and 1 curved side which goes completely around it.

The cylinder ends in Fig. 11 have a radius of 1' 6".

Area of 2 circular ends = 2 x 1.5 x 1.5 x 3.1416 = 14.1372 sq. ft.

Circumference of an end = 3' x 3.1416 = 9.4248 ft.

Area of the curved side = circumference of the end x height
= 9.4248' x 5' = 47.1240 sq. ft.

$$
\begin{array}{lrl}
\text{Total area} = & 14.1372 & \text{sq. ft., area of ends} \\
+ & \underline{47.1240} & \text{sq. ft., area of curved side} \\
 & 61.2612 & \text{sq. ft., total area}
\end{array}
$$

To summarize:

1. Area of a cube = 6 x area of a side
2. Area of a rectangular prism = 2 x area of 1 pair of opposite sides
   \+ 2 x area of 2nd pair of opposite sides
   \+ 2 x area of 3rd pair of opposite sides
3. Area of a triangular prism = 2 x area of triangular ends
   \+ area of bottom
   \+ 2 x area of sides
4. Area of a cylinder = 2 x area of circular ends
   \+ area of curved side (equal to perimeter of end x height)

1. What is the area of a 7' 4" cube?

2. What is the area of a rectangular prism, 26' 6" long, 14' high, and 9' wide?

3. Find the area of a triangular prism whose base is 18', height is 12', and length is 19' 6".

4. Find the area of a cylinder whose diameter is 19' and height is 23'.

5. Find the area of Fig. F.

6. Find the perimeter of Fig. F.

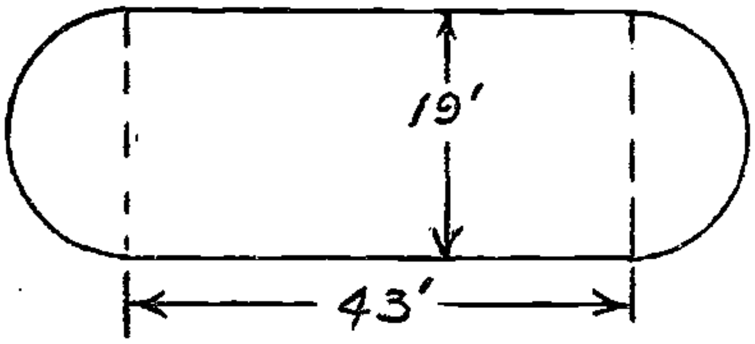


FIG. F

7. What is the area of a triangular prism whose base is 30', height is 20', and length is 26' 8"?

8. Find the area of a circle whose circumference is 72.2568'.

9. Find the area of a cylinder whose diameter is 24' and height is 18'.

How many sq. yds. are there in the walls and ceilings of rooms having the following dimensions:

	Length	Width	Height	Openings	
				Doors	Windows
10.	38'	29'	12'	2-- 3' x 7'	7-- 3' x 6'
11.	22'	14' 6"	9'6"	3-- 3' x 6' 8"	4-- 2' 6" x 4'

12. It takes $6\frac{1}{2}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 179' 6" long and 12' high?

13. It takes 728 lath to cover 52 sq. yds. of wall. How many lath are needed to cover 650 sq. yds. of wall.

14. If each bricklayer lays 445 brick per day, how long will it take 7 bricklayers to lay 59,185 brick?

1. Find the area of a rectangular prism which is 21' 6" long, 14' wide and 8' high.

2. Find the area of a 9' 6" cube.

3. Find the area of a cylinder which is 9' in diameter and 26' high.

4. Find the area of a triangle whose base is 36' and whose height is 27'.

5. Find the area of a circle 18' in diameter.

6. Find the area of a triangular prism with a 12' base, 8' altitude, and 39' length.

7. Find the area of Fig. G.

8. Find the perimeter of Fig. G.

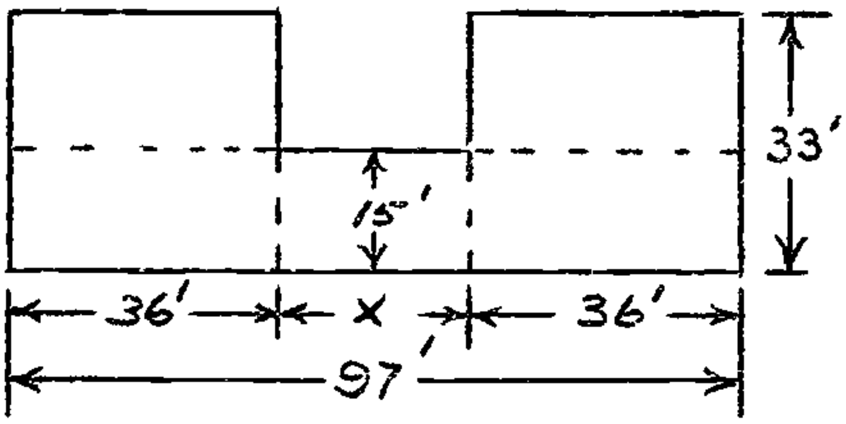

FIG. G

9. Find the area of Fig. H.

10. Find the perimeter of Fig. H.

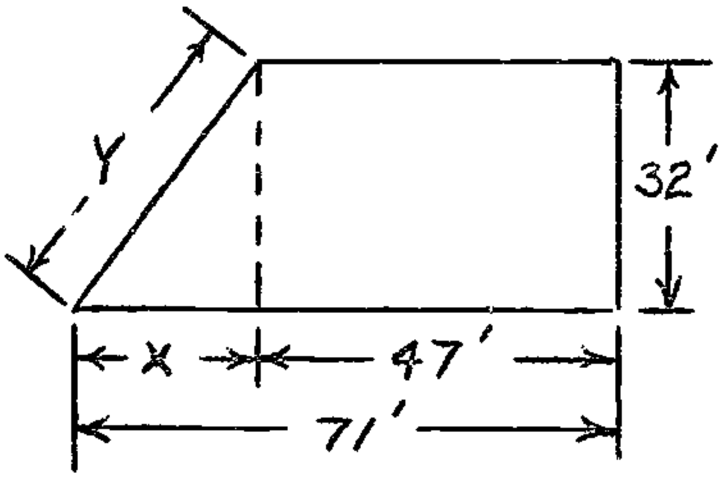

FIG. H.

How many square yards are there in the walls and ceilings of the following rooms?

				Openings	
	Length	Width	Height	Doors	Windows
11.	49' 6"	28'	13'	4-- 6' x 8'	16-- 2' 6" x 7'
12.	22'	17' 6"	8' 6"	2-- 3' x 6' 8"	6-- 2' 8" x 5'
13.	17'	13'	8'	2-- 2' 6" x 7'	3-- 2' 6" x 4'

14. How long will it take 3 bricklayers to face a wall 324' long and 7' 6" high? It takes $6\frac{1}{2}$ brick to face 1 sq. ft. of wall. Each bricklayer worked 7 hours per day and laid an average of 455 brick per day.

1. Find the area of a rectangular prism which is 33' 6" long, 9' wide, and 12' high.

2. Find the area of a 16' 6" cube.

3. Find the area of a cylinder which is 27' high and has a 13' diameter.

4. Find the area of a right triangle whose base is 47' and whose height is 35'.

5. Find the area of a circle which is 29' in diameter.

6. Find the area of a triangular prism whose base is 18', altitude is 12', and length is 47' 9".

How many sq. yds. are there in the walls and ceilings of rooms having the following dimensions?

	Length	Width	Height	Openings	
				Doors	Windows
7.	[illegible] 6"	24'	10' 6"	2-- 6' 6" x 8'	9-- 2' 8" x 5'
8.	49' 6"	28'	13'	4-- 6' x 8'	16-- 2' 6" x 7'

9. Find the area of Fig. I.

10. Find the perimeter of Fig. I.

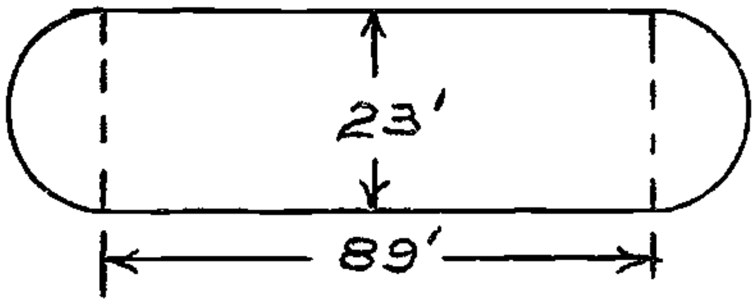

FIG. I

11. Deformed steel reinforcing rods cost 17$\frac{1}{2}$¢ per lb. Deformed steel reinforcing rods $\frac{5}{8}$" in diameter weigh 1.05 per lineal foot. How much will 1,989 lineal feet of $\frac{5}{8}$" deformed steel reinforcing rods cost?

12. How long will it take 7 men to veneer a wall 343' long and 9' high. It takes 7 brick to veneer 1 sq. ft. of wall. Each bricklayer worked 7 hours per day and laid an average of 441 brick per day.

13. How many courses of brick are needed to build a wall 10' 4$\frac{7}{8}$" high? The brick are to be laid 4 courses in 13$\frac{1}{2}$".

Now go on to Test #7.

UNIT IV - CUBIC MEASURE

Volumes of Cubes, Rectangular Prisms, and Walls Information Sheet No. 1

OBJECTIVE: To learn how to compute the cubic contents of solid objects, including cubes, rectangular prisms, and walls.

INFORMATION:

A solid object or figure is one which has 3 dimensions, variously known as length, width or height, and thickness or width.

A wall is referred to as having length, height, and thickness or width. For example, a wall may be said to be 12" wide or 12" thick.

A solid block is referred to as having length, width and height.

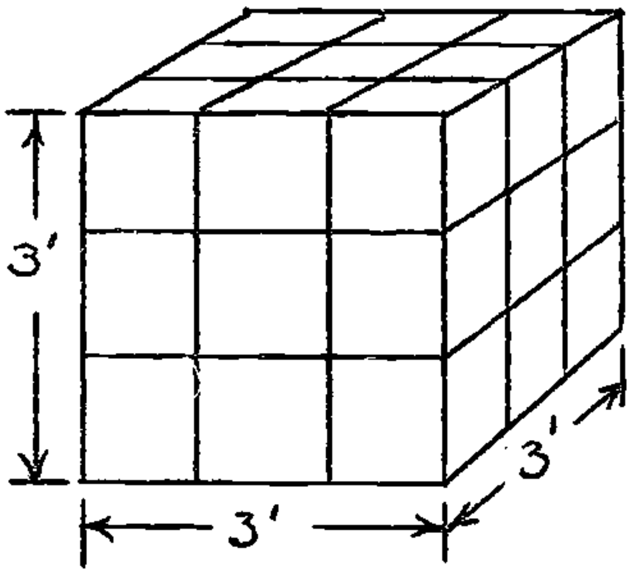

FIG. 12

CUBE

Cubic measure or volume tells how many cubic units of a certain size are needed to make a solid object. The units which you will be working with are cubic feet and cubic yards.

A cube is a solid object or figure which has all three dimensions the same length, for example, 3' long, 3' high, 3' wide.

Fig. 12 shows a cube which is 3' long, 3' high, and 3' wide. To find the cubic contents or volume of Fig. 12, you must multiply the length x the width x the height.

3' x 3' x 3' = 27 cubic feet

To understand better why this is true, divide the height into 3 layers of 1' each. Each layer is then divided into squares of 1' each. The surface of each layer has 9 squares of 1' each, so this gives you 9 one-foot cubes in the layer.

9 one-foot cubes in each layer multiplied by 3 layers = 27 one-foot cubes in a 3' cube.

One yard is 3' long, so a 3' cube equals 1 cubic yard.

The unit of cubic measure used to estimate excavating, or buy concrete, sand, and gravel is the cubic yard. So remember that 1 cubic yard is made up of 27 cubic feet. The solid figures which are used most in building are the cube, rectangular prism, triangular prism, and the cylinder. The estimating which you will do will deal mainly with rectangular prisms.

The footings and walls of a building are actually a series of connected rectangular prisms.

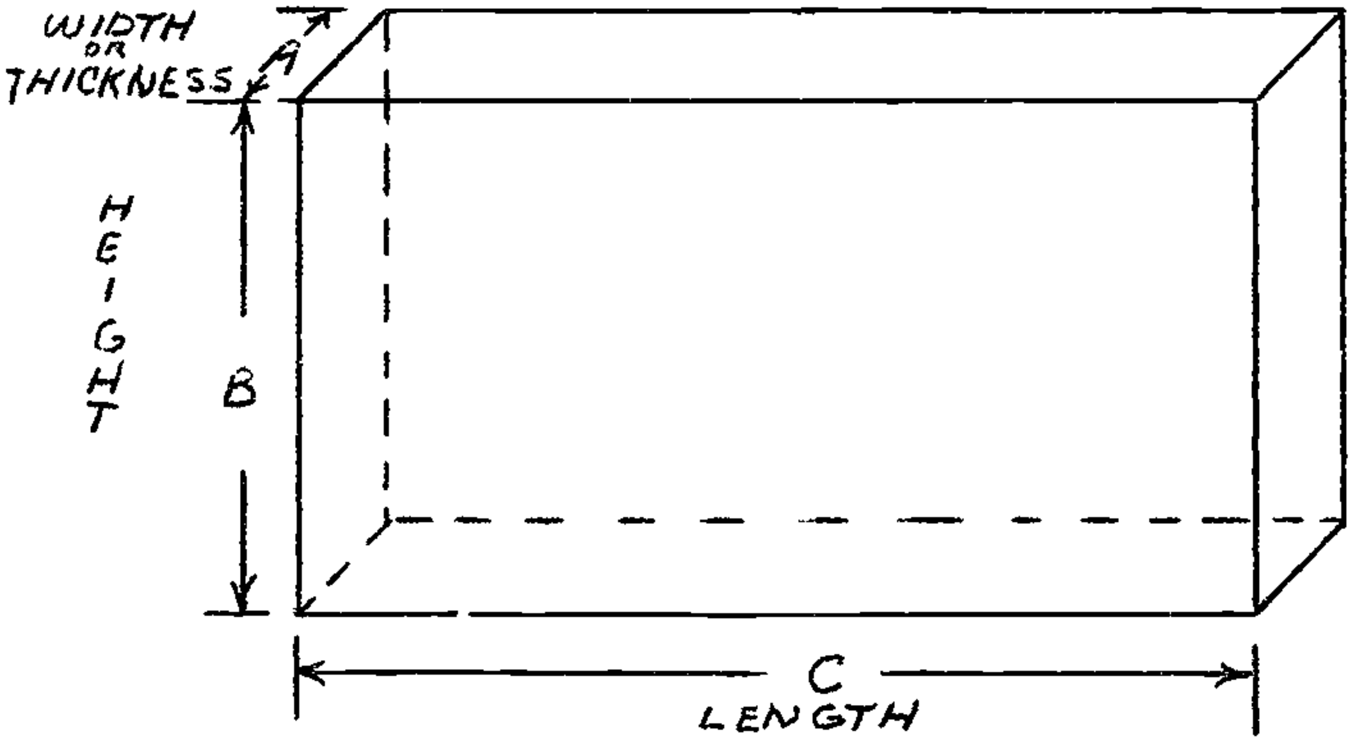

FIG. 13

To find the cubic contents or volume of Fig. 13, you do exactly as you did for Fig. 12.

Multiply: Length x Height x (Width or Thickness).
Dimensions: C x B x A

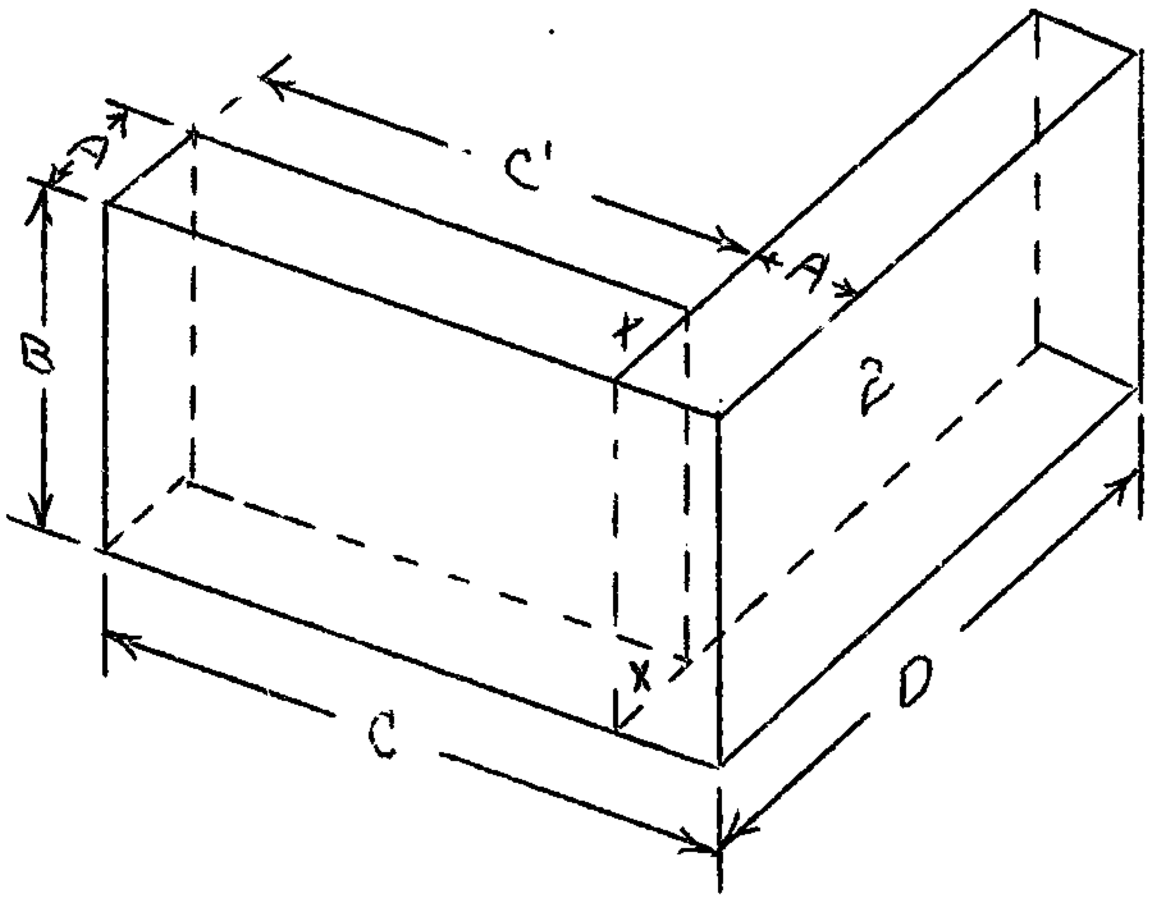

FIG. 14

Fig. 14 presents a different situation. On blueprints all dimensions for the outside walls of a building are given on the outside of the building. Fig. 14 is made up of 2 pieces of wall joined at right angles at point x - x. The length of piece 1 is C^1. On a blueprint you will not be given the dimension shown as C^1 in Fig. 14; instead you will be given dimension C. When you compare dimensions C and C^1, it is easy to see that they are not the same length. Dimension $C = C^1 + A$. Therefore, when you are taking your dimensions from a blueprint or sketch, you will add the dimensions and from this total you will subtract once the width of the wall (dimension A) for each corner. You can see that, if you did not subtract this width, when you multiplied the dimensions to get the cubic measure, you would be including the same corner twice. Therefore, for purposes of computing cubic measure, the <u>length</u> to be used in Fig. 14 is

$$C + D - A = \text{LENGTH}$$

To find the cubic contents, you do as you did for Fig. 12.

Multiply: Length x Height x Width

Let us give Fig. 14 numerical dimensions to better illustrate how you find the cubic contents.

Dimensions: A = 12", B = 4', C = 10', D = 8'.

First find the length: C + D - A. 10' + 8' - 1' = 17' LENGTH

Now multiply: Length x Height x Width. (Remember, you will get <u>cubic feet.</u>)

$$\begin{array}{rl} & 17' \text{ Length} \\ \times & \underline{4'} \text{ Height} \\ & 68 \text{ sq. ft.} \\ \times & \underline{1'} \text{ Width} \\ & 68 \ \underline{\text{cubic feet}} \end{array}$$

Divide the cubic feet by 27 to get <u>cubic yards</u>.

$$\begin{array}{r} 2 \\ 27\overline{)68} \\ \underline{54} \\ 14 \end{array}$$

$2\frac{14}{27}$ <u>cubic yards</u> ANS.

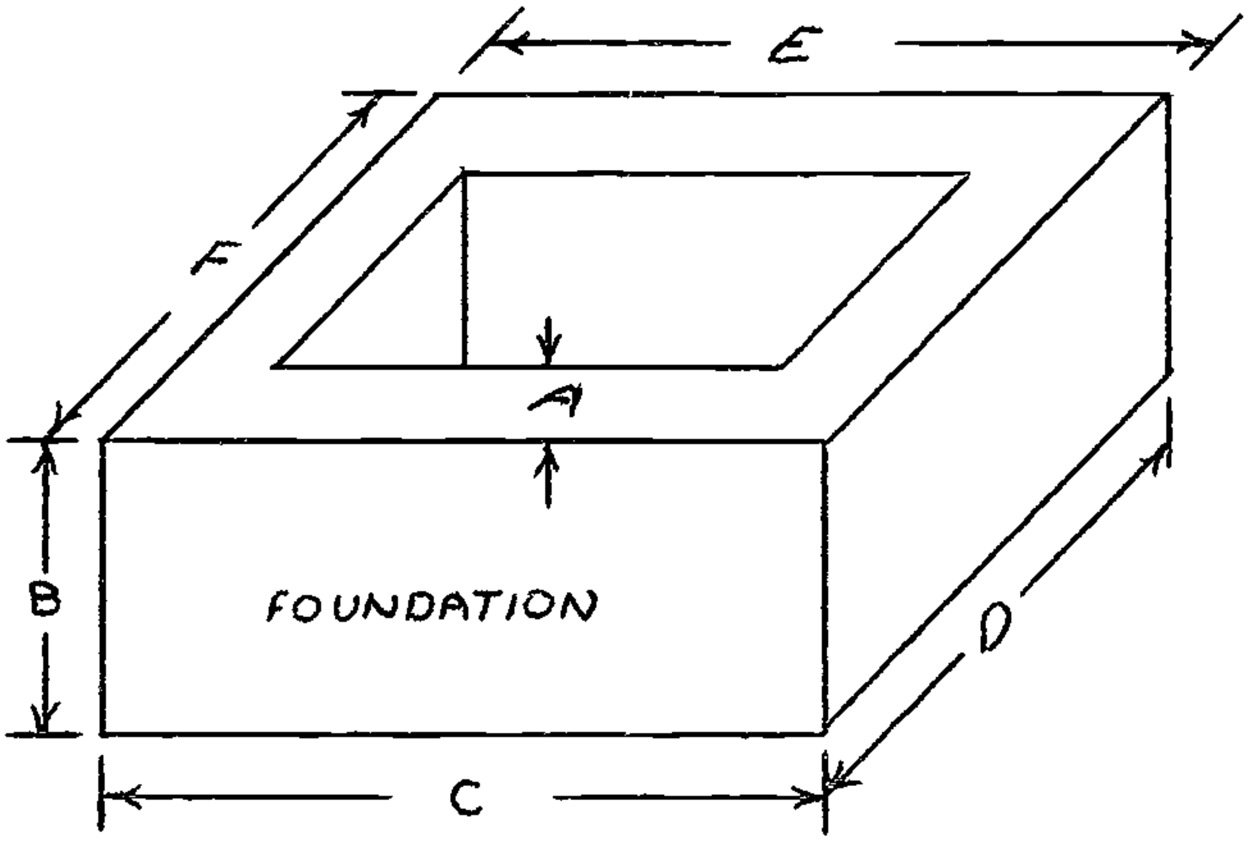

FIG. 15

Dimensions for Fig. 15: A = 12", B = 5', C = 16', D = 14', E = 16', F = 14'

To find the cubic contents of Fig. 15:

Find the length: C + D + E + F - (4 x A) = LENGTH

In Fig. 15 there are 4 corners and 4 sides. We have 4 sections of wall joined into one rectangular structure, so we must deduct the width of the wall once for each corner, or 4 times in all.

Add:	The dimensions of the 4 sides.	C		16'
		D		14'
		E		16'
		F		14'
				60' Perimeter
Subtract:	Once the width of the wall for each corner (4 x A)		-	4' Corners
				56' Length
Multiply:	Length x Height		x	5' Height
				280 sq. ft.
Multiply:	(Length x Height) x Width		x	1' Width
				280 Cubic Feet

Divide cubic feet by 27'

$$\begin{array}{r} 10 \\ 27\,\overline{)\,280} \\ -\;27 \\ \hline 10 \end{array}$$

$10\frac{10}{27}$ Cubic Yards

ANS.

The problems in this assignment are explained in Information Sheet No. 1. Check each problem to find out whether it refers to Fig. 12, 13, 14, or 15. Work carefully. Do not go ahead with your work unless you are certain that the work is being done correctly.

The estimating which you will do later is based on what you are learning to do now. Learning the right way now will save time and trouble later.

Label each step in every problem. You will have to refer back to parts of the work which you have finished, to get the information needed to estimate quantities of different materials. If you do not label your work, you cannot be sure that the figures you take are the correct ones. So, you either do the work over or take a chance that the figures are correct.

Estimating is way of figuring out the amounts of materials needed. You cannot afford to guess. Your estimate must be accurate.

PROBLEMS: How many cu. yds. are in the following walls?

		A	B	C	D	E	F
1.	(Fig. 13)	12"	10'	46'			
2.	(Fig. 15)	12"	9'	23'	47'	23'	47'
3.	(Fig. 14)	12"	6	42'	63'		
4.		16"	12'	46'	65'	46'	65'
5.		16"	11'	55'			
6.		8"	8'	73'			
7.		12"	9'	21'	27'	21'	27'
8.		9"	12'	45' 4"	48' 5"		
9.		16"	15'	38' 8"	45'	38' 8"	45'
10.		9"	12'	39'	60'	39'	60'

How many sq. yds. are in the walls and ceilings of the following rooms?

	Length	Width	Height	Doors	Windows
11.	52'	36' 6"	14' 6"	3-- 3' x 7'	7-- 4' x 6' 6"
12.	77' 6"	49'	16' 9"	2-- 7' x 8'	10-- 3' 6" x 7'

13. Three-quarter-inch round deformed reinforcing steel weighs 1.52 lbs. per lineal foot and costs $7\frac{1}{2}$¢ per lb. How much will 2,747 lineal feet cost?

14. It takes 19 brick laid with a $\frac{1}{2}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 75' 8" long, 8' high, and 12" wide?

15. How long will it take 3 bricklayers to lay the brick in problem 14, if they lay an average of 426 brick each per day?

How many cu. yds. are there in the following walls and prisms?

	A	B	C	D	E	F
1. (Fig. 13)	9'	6'	47'			
2.	12"	18'	57'			
3. (Fig. 15)	18"	16'	39'	66'	39'	66'
4.	16"	15'	38' 8"	45'	38' 8"	45'
5. (Fig. 13)	9"	12'	36'			
6.	11'	4' 6"	38'			
7. (Fig. 15)	12"	9'	75'	56'	75'	56'
8.	18"	12'	28'	36' 6"	28'	36' 6"
9. (Fig. 14)	18"	8'	40'	75' 6"		
10. (Fig. 12)	11'	11'	11'			

11. It takes $6\frac{2}{3}$ brick to veneer 1 sq. ft. of wall. How many brick are needed to veneer a wall 162' 8" long and 9' 6" high?

12. It takes 19 brick laid with a $\frac{1}{2}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 199' 8" long, 9' 6" high, and 12" wide?

13. It takes 15 cu. ft. of mortar to lay 1,000 brick with a $\frac{1}{2}$" mortar joint. How many cu. yds. of mortar are needed to lay the brick in problem 12?

How many sq. yds. are there in the walls and ceilings of the following rooms?

	Length	Width	Height	Openings	
				Doors	Windows
14.	48'	33' 6"	13'	4-- 3' x 7'	11-- 2'8" x 6'
15.	21' 6"	18'	10'	2-- 2'6" x 7'	6-- 2'6" x 3'

16. $5\frac{2}{3}$% of 17,988 = ?

17. How many courses of brick are needed to build a wall 9' $9\frac{7}{8}$" high? The brick are to be laid 4 courses in $11\frac{1}{2}$".

Cubic Measure — Assignment Sheet No. 3

How many sq. yds. are there in the walls and ceilings of the following rooms?

	Long	Wide	High	Openings	
				Doors	Windows
1.	89' 6"	46'	17' 6"	3-- 8' x 8'	17-- 3'6" x 7'
2.	27' 6"	23' 6"	9' 9"	2-- 3' x 6' 8"	7-- 2'6" x 5'

How many cu. yds. are there in the following foundation walls?

	A	B	C	D	E	F
3.	12"	10' 6"	43'			
4.	16"	11' 6"	57'			
5.	9"	9'	37' 4"			
6.	12"	11' 6"	55'	47' 6"	55'	47' 6"
7.	16"	13' 6"	47' 4"	33' 4"	47' 4"	33' 4"
8.	8"	7' 8"	32' 6"	28'	32' 6"	28'

9. It takes 20 brick laid with a $\frac{3}{8}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 77' 6" long, 9' high, and 12" wide?

10. It takes 19 brick laid with a $\frac{1}{2}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 98' long, 6' 6" high, and 8" wide?

11. It takes $13\frac{1}{2}$ cu. ft. of mortar to lay 1,000 brick with a $\frac{3}{8}$" mortar joint. How many cubic yards of mortar are needed to lay the brick in problem 9?

12. If a bricklayer averages 450 brick per day, how many working days will it take to build the wall in problem 9?

13. Three-eighths-inch deformed round reinforcing steel weighs .38 lbs. per lineal foot. Find the cost of 5,690 feet at $6\frac{3}{4}$¢ per lb.

14. It takes 1 cu. yd. of sand and 9 cu. ft. of cement paste or lime putty to make 1 cu. yd. of mortar. How much sand must you buy to make the mortar needed in problem 11?

15. Find the area of a cylinder whose diameter is 37', and whose height is 18'.

---

1. Find the area of a circle whose circumference is 53.4072'.

How many sq. yds. are there in the walls and ceilings of the following rooms?

	Length	Width	Height	Openings	
				Doors	Windows
2.	18'	12'	8' 6"	1-- 3' x 6' 8"	3-- 2' 6" x 4'
3.	28'	13' 6"	9'	2-- 3' x 7'	6-- 2' 8" x 5'

How many cu. yds. are there in the following foundations?

	A	B	C	D	E	F
4.	18"	18'	54'			
5.	16"	15'	63'			
6.	18"	12'	48'	54'	48'	54'
7.	12"	9'	39'	43'	39'	43'
8.	16"	15'	38' 8"	45'	38' 8"	45'
9.	9"	12'	39'	60'	39'	60'
10.	9"	18'	27'	75' 6"		
11.	17'	4' 6"	39'			

12. It takes 20 brick laid with a $\frac{3}{8}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 164' long, 9' high, and 12" wide?

13. It takes 19 brick laid with a $\frac{1}{2}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 259' 6" long, 7' 6" high, and 16" wide?

14. I-beams cost 18¢ per lb. Find the cost of an I-beam 27' 6" long, weighing 33 lbs. per foot.

15. Find the area of a triangular prism whose base is 18', whose height is 12', and whose length is 47' 6".

16. $16\frac{2}{3}\%$ of 49,305 = ?

Cubic Measure — Assignment Sheet No. 5

How many sq. yds. are there in the walls and ceilings of the following rooms?

	Length	Width	Height	Openings	
				Doors	Windows
1.	71'	46'	15' 6"	4 -- 3' x 7'	12-- 3' 6" x 8'
2.	47' 6"	54'	16'	3 -- 3' x 7'	9-- 4' x 8'

How many cu. yds. are there in the following foundations?

	A	B	C	D	E	F
3.	18"	12'	37' 6"	55' 6"	37' 6"	55' 6"
4.	12"	18'	49' 6"	43' 6"	49' 6"	43' 6"

8.	35'	2' 8"	48'			
9.	9"	11' 6"	56'			

10. It takes 19 brick laid with a $\frac{1}{2}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 93' long, 9' 6" high, and 12" wide?

11. It takes 20 brick laid with a $\frac{3}{8}$" mortar joint to build 1 cu. ft. of wall. How many brick are needed to build a wall 156' 6" long, 12' high, and 16" wide?

12. It takes $13\frac{1}{2}$ cu. ft. of mortar to lay 1,000 brick with a $\frac{3}{8}$" mortar joint. How many cu. yds. of mortar are needed to lay the brick in problem 11?

13. Ten bricklayers working 7 hours per day, laid an average of 626 brick each per day. How long will it take them to lay the brick in problem 11?

14. $5\frac{2}{3}\%$ of 50,080 = ?

15. Find the area of Fig. A.

16. Find the perimeter of Fig. A.

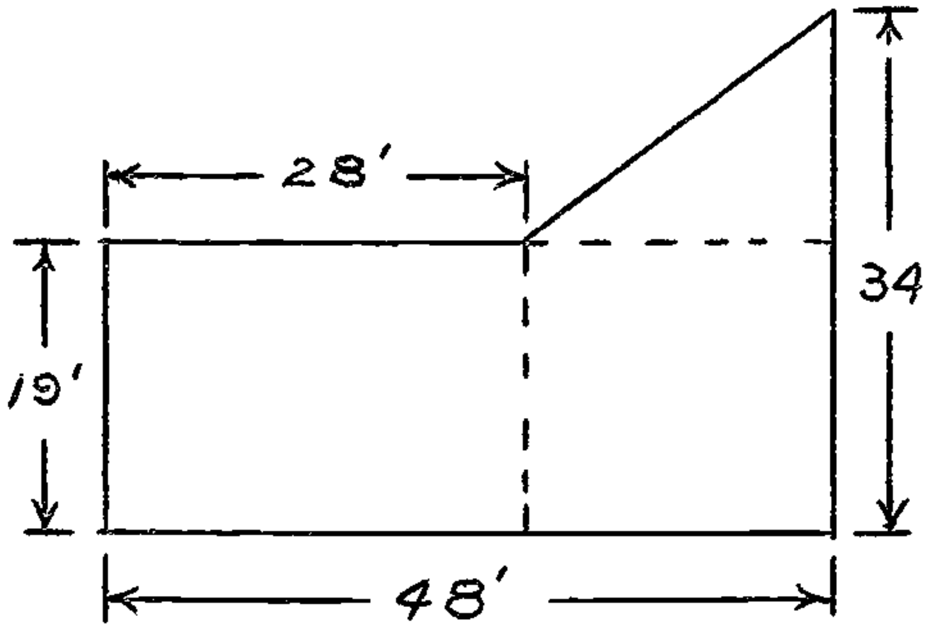

FIG. A

Quantities of Materials
(Brick, Mortar, Stone) Information Sheet No. 2

OBJECTIVE: To learn how to find the amounts of brick, mortar, and stone to build or veneer walls.

INFORMATION:

The following table will provide the information needed to estimate the amounts of materials needed to build walls. Remember, if you think first, you will save time and trouble.

Number of Brick Needed to Build 1 Cu. Ft. of Wall

Size of Mortar Joint	$\frac{1}{4}$"	$\frac{3}{8}$"	$\frac{1}{2}$"	$\frac{5}{8}$"
Number of Brick Needed	21	20	19	$18\frac{1}{4}$

Amount of Mortar Needed to Lay 1000 Brick

Size of Mortar Joint	$\frac{1}{4}$"	$\frac{3}{8}$"	$\frac{1}{2}$"	$\frac{5}{8}$"
Amount of Mortar Needed	9 cu. ft.	$13\frac{1}{2}$ cu. ft.	15 cu.ft.	18 cu. ft.

One Ton of Marble Veneer Covers 40 Sq. Ft. of Wall.

One Ton of Grained Stone Veneer Covers 44 Sq. Ft. of Wall.

To find the number of brick needed to build a wall:

First find the number of cu. ft. in the wall and label your work. Then multiply the number of cu. ft. of wall by the number of brick which are needed to build 1 cu. ft. of wall, using a certain size mortar joint.

Let us work it out in a problem. How many brick are needed to build a wall 15' long, 8' high, and 12" wide, using a $\frac{3}{8}''$ mortar joint?

Find the cu. ft. in the wall.
Length x Height x Width.
The table shows that it takes 20 brick laid with a $\frac{3}{8}''$ mortar joint to build 1 cu. ft. of wall.

$$\begin{array}{rl} 15' & \text{Length} \\ \times\ \underline{8'} & \text{Height} \\ 120 & \text{sq. ft.} \\ \times\ \underline{1'} & \text{Width} \\ 120 & \text{cu. ft. of wall} \end{array}$$

Therefore you multiply 120 cu. ft. of wall x 20 brick (in 1 cu. ft.)

$$\begin{array}{rl} 120 & \text{cu. ft. of wall} \\ \times\ \underline{20} & \text{brick per cu. ft.} \\ 2400 & \underline{\text{brick needed}} \end{array}$$

To find the amount of mortar needed to lay the brick, you check the table and find that, with a $\frac{3}{8}''$ mortar joint, you need $13\frac{1}{2}$ cu. ft. of mortar to lay 1,000 brick. So, divide the total number of brick into units of 1,000 brick each. To do this you start from the right and point off 3 decimal places.

2.400
decimal point

You now have 2.4 units of 1,000 brick each. Multiply the number of units of 1,000 brick each by the amount of mortar needed to lay 1,000 brick with a $\frac{3}{8}''$ mortar joint.

$$\begin{array}{rl} 2.4 & \text{units of 1,000 brick} \\ \times\ \underline{13\frac{1}{2}} & \text{cu.ft.of mortar needed to} \\ 12 & \text{lay 1,000 brick} \\ 72 & \\ \underline{24} & \\ 32.4 & \text{cu. ft. of mortar needed.} \end{array}$$

Always give the quantity of mortar in cu. yds. Divide 32.4 cu. ft. by 27.

$$\begin{array}{rl} \underline{1.2} & \text{cu. yds. of mortar needed} \\ 27/32.4 & \\ \underline{27} & \\ 54 & \\ 54 & \end{array}$$

ANS. 2,400 brick
1.2 cu yds. mortar

Stone veneer: To find the number of tons of stone veneer needed to veneer a house.

First find the number of sq. ft. of surface on the outside of the house.

Sq. ft. of surface = perimeter x height.

Then divide the sq. ft. of surface by the number of sq. ft. of wall covered by 1 ton of stone veneer.

Follow the instructions in Information Sheet No. 2. The work is not new; it is just being given you in a different way.

How many sq. yds. are there in the walls and ceilings of the rooms with the following dimensions?

	Length	Width	Height	Openings	
				Doors	Windows
1.	64' 6"	42'	15'	3-- 3' x 7'	11-- 4' x 7'
2.	33'	25' 4"	14' 6"	2-- 3' 6" x 7'	12-- 4' x 8'

How many cu. yds. are there in foundation walls having the following dimensions?

	A	B	C	D	E	F
3.	18"	18'	54'			
4.	16'	15'	63'			
5.	8"	15'	38' 8"	45'	38' 8"	45'
6.	12"	12'	42'	42'	42'	42'
7.	8"	9'	39'	43'	39'	43'
8.	16"	15'	60'	74' 8"	60'	74' 8"

9. It takes 1 ton of marble to veneer 40 sq. ft. of wall. Find the amount of marble needed to veneer a wall 192' long and 9' 8" high.

10. How many brick laid with a $\frac{3}{8}$" mortar joint are needed for the foundation walls in problem 5?

11. How many brick laid with a ½" mortar joint are needed for the foundation walls in problem 6?

12. How many cu. yds. of mortar are needed to lay the brick in problem 10?

13. How many cu. yds. of mortar are needed to lay the brick in problem 11?

14. How long will it take 8 bricklayers, working 7 hours per day, to lay the brick in problem 11 if the bricklayers average 389½ brick per day?

Quantities of Materials Assignment Sheet No. 7

---

1. Find the number of sq. yds. in the walls and ceilings of a room 31' long, 29' wide, and 12' high. There are two doors 3' 6" x 7' and 8 windows, 2' 8" x 6'.

foundation
How many cu. yds. are there in/walls having the following dimensions?

	A	B	C	D	E	F

7. How many brick laid with a $\frac{3}{8}$" mortar joint are needed for the foundation walls in problem #2?

8. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem #5?

9. How many cu. yds. of mortar are needed to lay the brick in problem #8?

10. How many cu. yds. of mortar are needed to lay the brick in problem #7?

11. How many tons of grained veneer stone are needed to face a house 48' 6" long, 28' 3" wide, and 9' high?

12. Find the area of a triangular prism whose base is 36', whose height is 24', and whose length is 58' 6".

13. How many cu. yds. of earth must be dug from an excavation which is 87' 6" long, 38' wide, and 7' 4" deep?

14. Find the cost of 4,650' of $\frac{1}{2}$" round, deformed reinforcing steel. Round, deformed reinforcing steel weighs .66 lbs. per foot and costs $6\frac{3}{4}$¢ per lb.

15. $5\frac{2}{3}$% of 52,054 = ?

16. $16\frac{2}{3}$% of 68,704 = ?

OBJECTIVE: To learn how to find the number of cu. yds. in a footing.

INFORMATION:

Because the footings of a building are the base which support the building, the footing is almost always wider than the foundation wall. On a blueprint, the length and width of a building are given on the outside of the foundation, but very rarely on the outside of a footing.

Figures 17 and 18, on the following page, show the dimensions necessary to compute a footing. The dimensions given are the width of the footing, A, and the height or depth, B. You use the same length to estimate both the footing and the foundation. To find the cu. yds. in a footing, you multiply the Length x Width x Height, just as you do to find the cu. yds. in a wall.

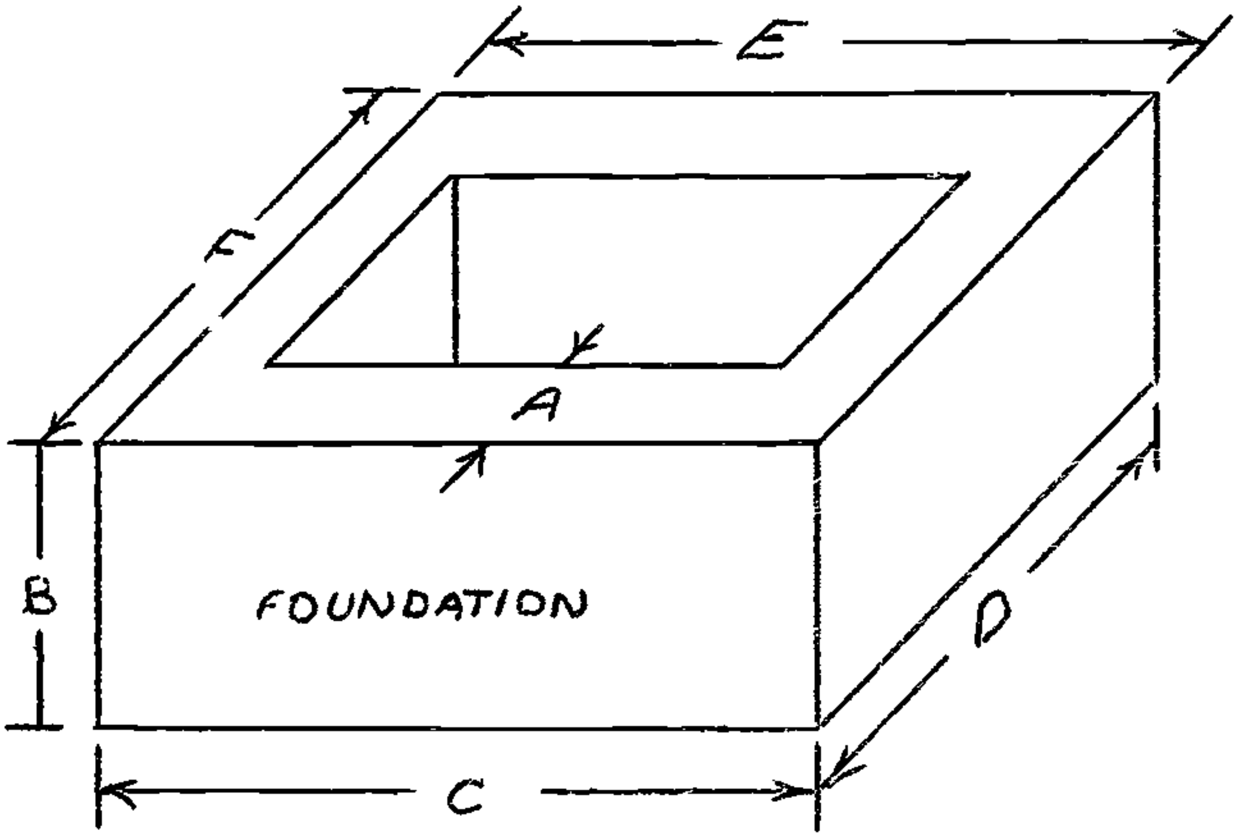

FIG. 16

FIG. 17

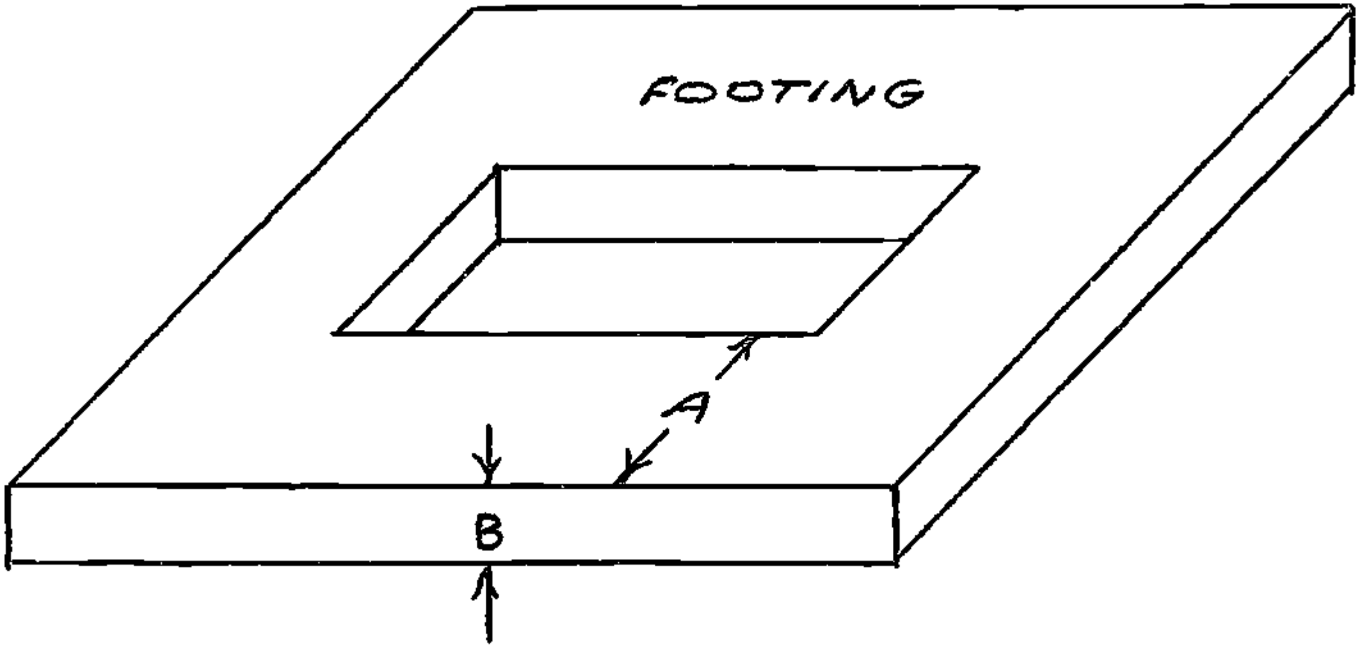

FIG. 18

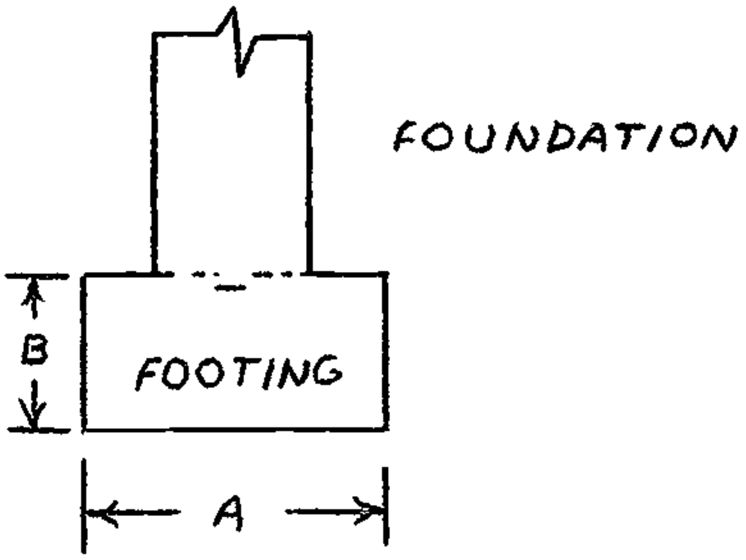

Footings and Quantities of Materials — Assignment Sheet No. 8

Follow the instructions on Information Sheet No. 3. Read each problem carefully to see whether the answer is required for the foundation only; footing only, or foundation and footing combined.

1. How many sq. yds. are there in the walls and ceiling of a room which is 38' long, 29' wide, and 12' high? Openings are 2 doors 3' x 7', and 7 windows 3' x 6'.

How many cu. yds. are there in the footings and foundation walls having the following dimensions?

	A	B	C	D	E	F	
2.	12"	9'	34'	37'	34'	37'	Foundation
3.	12"	9'	75'	56'	75'	56'	Foundation
4.	2'	1'	Footing for foundation in problem 2				
5.	2'	1'	Footing for foundation in problem 3				
6.	(16" (2' 6"	15' 1' 4"	60'	74' 8"	60'	74' 8"	)Foundation)and Footing
7.	(12" (2'	9' 1'	37'	34'	37'	34'	)Foundation)and Footing

8. How many brick laid with a $\frac{3''}{8}$ mortar joint are needed for the foundation walls in problem 2?

9. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 3?

10. How many cu. yds. of mortar are needed to lay the brick in problem 8?

11. How many cu. yds. of mortar are needed to lay the brick in problem 9?

12. How many working hours will it take to lay the brick in problem 9, if the bricklayers work 7 hours per day and average 378 brick per day?

13. How many tons of grained stone are needed to veneer a house 48' 8" long, 26' 4" wide, and 9' 8" high?

14. $5\frac{2}{3}$% of 44,118 = ?

How many cu. yds. are there in the footings and foundation walls having the following dimensions?

	A	B	C	D	E	F
1.	(12" (2'	13' 6" 1'	50'	38'	50'	38'
2.	15"	12'	38' 6"	48'	38' 6"	48'

4.	(16" (2' 8"	9' 1' 4"	45' 2"	39' 6"	45' 2"	39' 6"
5.	(12" (2'	9' 1'	45'	39'	45'	39'
6.	18"	12'	42'	63'	42'	63'

7. How many sq. yds. are there in the walls and ceiling of a room 31' long, 27' wide, and 10' 6" high?
Openings: 2 doors 3' x 7' and 8 windows 2' 6" x 4' 6".

8. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 1?

9. How many brick laid with a $\frac{3}{8}$" mortar joint are needed for the foundation walls in problem 5?

10. How many cu. yds. of mortar are needed to lay the brick in problem 8?

11. How many cu. yds. of mortar are needed to lay the brick in problem 9?

12. How many tons of marble are needed to veneer a house 47' 8" long, 33' 6" wide, and 9' 6" high?

13. $16\frac{2}{3}\%$ of 29,520 = ?

14. $\frac{5}{8}$" round, deformed reinforcing steel weighs 1.05 lbs. per foot and costs $7\frac{3}{4}$¢ per lb. Find the cost of 3,985 feet of round deformed reinforcing steel.

How many cu. yds. are there in the following footings and foundation walls?

	A	B	C	D	E	F
1.	(16" (2' 8"	12' 6" 1' 4"	41'	57'	41'	57'
2.	8'	5'	169'			
3.	12"	13'	39'	43' 6"	39'	43' 6"
4.	(16" 2' 8"	12' 1' 4"	38' 8"	45'	38' 8"	45'
5.	(15" (2' 6"	12' 1' 3"	50' 6"	45'	50' 6"	45'

6. How many brick laid with a $\frac{5}{8}''$ mortar joint are needed for the foundation walls in problem 1?

7. How many brick laid with a $\frac{3}{8}''$ mortar joint are needed for the foundation walls in problem 3?

8. How many cu. yds. of mortar are needed to lay the brick in problem 6?

9. How many cu. yds. of mortar are needed to lay the brick in problem 7?

10. How many sq. yds. are there in the walls and ceiling of a room 41' long, 32' wide, and 12' 6" high? Openings: [illegible] doors 3' 6" x 7' and 12 windows 3' x 5' 6".

11. How many working days will it take to lay the brick in problem 7 if the bricklayers lay an average of 520 brick each per day?

12. $5\frac{2}{3}\%$ of 57,995 = ?

13. Find the area of a rectangular prism 26' 6" long, 14' 6" wide, and 9' high.

14. Find the area of a cylinder 19' high, which has a diameter of 19'.

15. How many tons of grained veneer stone are needed for the foundation in problem 3?

How many cu. yds. are there in the following footings and foundation walls?

	A	B	C	D	E	F
1.	9' 6"	5'	189'			
2.	(12" (2'	13' 6" 1'	27'	38'	27'	38'

4.	(12" (2'	9' 1'	34'	37'	34'	37'
5.	(18" (3'	12' 1' 6"	29'	42'	29'	42'
6.	(8" (1' 4"	9' 8"	78' 4"	47' 6"	78' 4"	47' 6"

7. How many brick laid with a $\frac{1}{4}$" mortar joint are needed for the foundation walls in problem 6?

8. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 3?

9. How many cu. yds. of mortar are needed to lay the brick in problem 7?

10. How many cu. yds. of mortar are needed to lay the brick in problem 8?

11. How many sq. yds. are there in the walls and ceiling of a room 29' 6" long, 24' wide, and 11' 6" high?
Openings: 2 doors 3' x 7', and 8 windows 3' x 4' 6".

12. Find the area of a triangular prism whose base is 28', whose height is 17', whose sides are 21', and whose length is 46' 6".

13. Find the area of Fig. A.

14. Find the perimeter of Fig. A.

15. $16\frac{2}{3}\%$ of 44,688 = ?

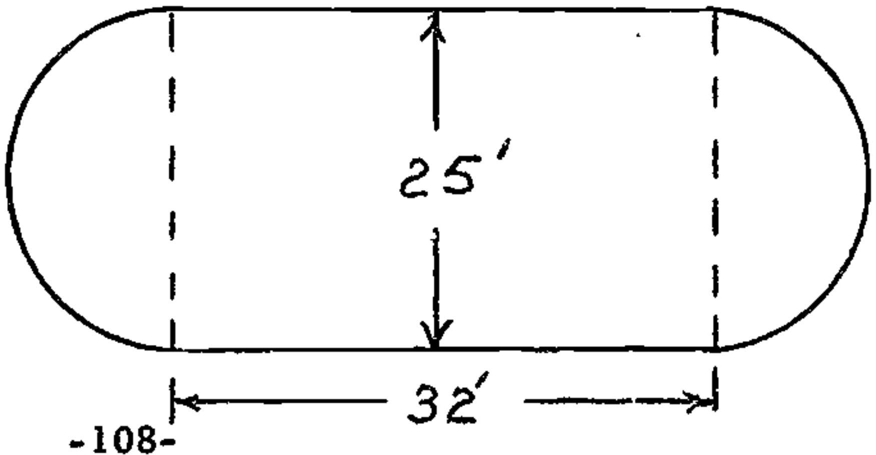

FIG. A

OBJECTIVE: To learn how to find the cubic contents of cylinders and triangular prisms.

INFORMATION:

In construction today, many round columns of concrete are used. Also many concrete walls have slanting sides. In the assignments which follow you will learn how to compute the cubic contents (volume) of both cylinders and triangular prisms.

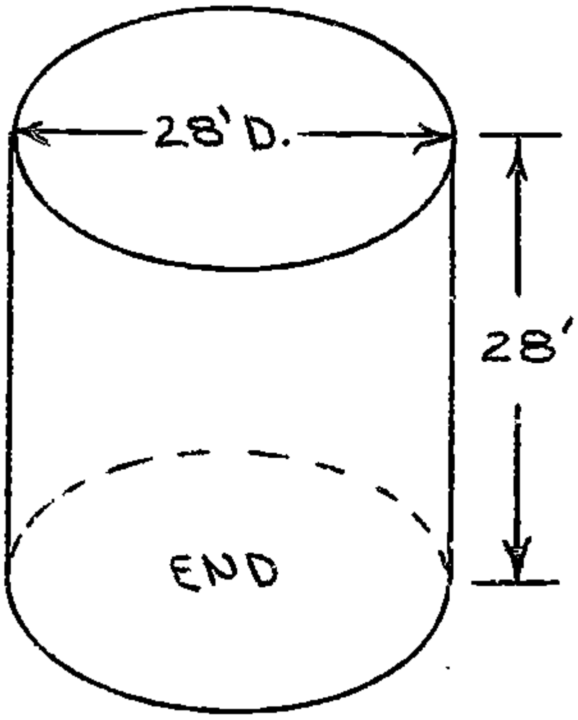

FIG. 19

CYLINDER

Fig. 19 is a round column or cylinder. To find the number of cu. yds. in Fig. 19:

First, you must find the area of one of the circular (ends either the top or the bottom). To find the area of a circle, you recall, you multiply the radius x radius x 3.1416.

The radius is $\frac{1}{2}$ of the diameter.
$\frac{1}{2}$ x 28' = 14'

$$\begin{array}{lr} \text{radius} & 14' \\ \text{radius} \times & \underline{14'} \\ & 56 \\ & \underline{14} \\ & 196 \text{ sq. ft.} \end{array}$$

$$\begin{array}{rl} & 3.1416 \\ \times & \underline{196} \text{ sq. ft.} \\ & 188496 \\ & 282744 \\ & \underline{31416} \\ & 615.7536 \text{ sq. ft. area of the end of Fig. 19.} \end{array}$$

Next, you multiply the area of the end of Fig. 19 by the height. You now have the number of cubic feet in Fig. 19.

$$\begin{array}{rl} & 615.7536 \text{ sq. ft. area} \\ \times & \underline{28} \text{ ft. high} \\ & 49260288 \\ & \underline{12315072} \\ & 17{,}241.1008 \text{ cubic ft. in Fig. 19.} \end{array}$$

Divide by 27 to get cubic yards.

$$\begin{array}{r} 638.55+ = \\ 27/\overline{17{,}241.1008} \\ \underline{162} \\ 1\,04 \\ \underline{81} \\ 231 \\ \underline{216} \\ 151 \\ \underline{135} \\ 160 \\ \underline{135} \end{array}$$

638.56 cu. yds in Fig. 19. ANS.

Summarizing, to find the cubic contents of a cylinder, multiply the area of the end x height.

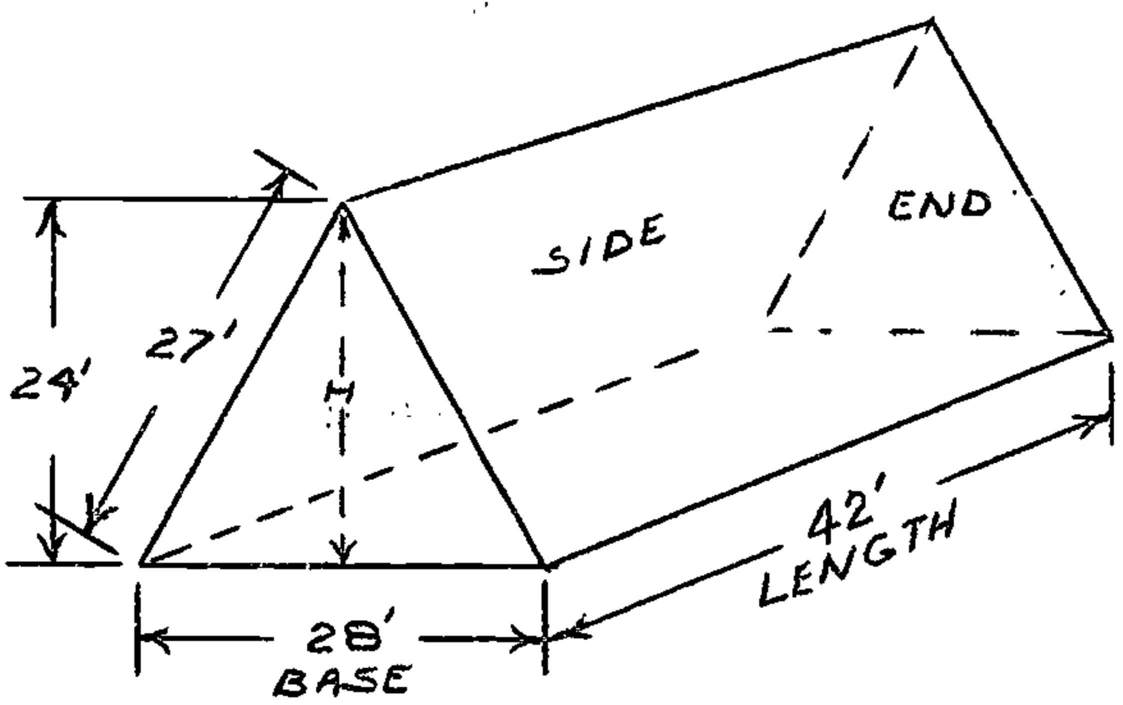

FIG. 20

TRIANGULAR PRISM

Fig. 20 is a triangular prism. To find the number of cubic yards in Fig. 20:

First, you must find the area of one end. To find the area of one end, which is a triangle, we multiply:

$\frac{1}{2}$ base x the height

$\frac{1}{2}$ x 28' = 14'

$\frac{1}{2}$ base 14'
x height x 24'
56
28
336 sq. ft. area of end of Fig. 20

Next, multiply the area of the end of Fig. 20 by the length.

336 sq. ft. of end of Fig. 20
x 42' length
672
1344
14,112 cubic feet in Fig. 20

Divide by 27 to get cubic yards.

$522\frac{2}{3}$ cu. yds. in Fig. 20
27/14112
135
61
54
72
54
$\frac{18}{27} = \frac{2}{3}$

$522\frac{2}{3}$ cu. yds. ANS.

Summarizing, to find the cubic contents of a triangular prism, multiply the area of the end x length.

1. Find the number of cu. yds. in a cylinder which has a diameter of 11' and which is 17' high.

2. Find the number of cu. yds. in a triangular prism which has a base of 15', sides 18', height 12', and which is 27' 6" long.

3. Find the number of cu. yds. in a cylinder whose radius is 15' and whose height is 23'.

4. Find the number of cu. yds. in a triangular prism whose base is 18', whose height is 12', and whose length is 27' 9".

5. Find the area of a cylinder which is 4' in diameter and 18' high.

6. Find the number of cubic yards in a column whose circumference is 10.2102' and whose height is 29' 9".

7. Find the area of a triangular prism which has a base 12' wide, whose sides are 10', whose height is 8', and which is 25' 4" long.

8. Find the number of cu. yds. in a triangular prisms whose base is 9', height is 6', and length is 18' 6".

9. Find the number of cu. yds. in a column 3' in diameter and 19' 6" high.

10. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	9' 6"	32' 2"	47' 4"	32' 2"	47' 4"
(2'	1'				

11. How many brick laid with a $\frac{5}{8}$" mortar joint are needed for the foundation walls in problem 10?

12. How many cu. yds. of mortar are needed to lay the brick in problem 11?

13. $16\frac{2}{3}\%$ of 26,670 = ?

14. How many cu. yds. are there in a slanted wall (section view) Fig. A, which is 57' long?

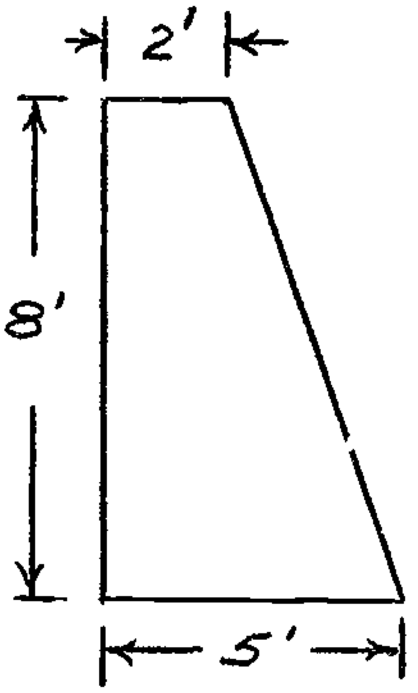

FIG. A
SECTION VIEW

1. Find the number of cu. yds. in 12 columns each of which has a circumference of 9.4248' and a height of 18'.

2. How many cu. yds. are there in a triangular prism (section view, Fig. A) whose length is 19' 6"?

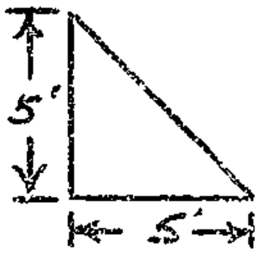

FIG. A
SECTION VIEW

3. How many cu. yds. are there in a slanted wall (section view, Fig. B) whose length is 88' 9"?

FIG. B
SECTION VIEW

4. Find the number of cu. yds. in a column whose radius is 1' and whose height is 21'.

5. Find the number of sq. yds. in the walls and ceiling of a room 21' long, 14' wide, and 8' 6" high.
Openings: 1 door 2' 8" x 7' and 5 windows 2' 6" x 4'.

6. How many cu. yds. are there in 8 columns 18" square and 18' high?

7. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	8' 8"	43' 6"	29'	43' 6"	29'
(2'	1'				

8. How many brick laid with a $\frac{3}{8}''$ mortar joint are needed for the foundation walls in problem 7?

9. How many cu. yds. of mortar are needed to lay the brick in problem 8?

10. $5\frac{2}{3}\%$ of 24,440 = ?

11. How many tons of marble veneer are needed to veneer the foundation walls in problem 7?

OBJECTIVE: To learn how to compute the number of cubic yards of concrete needed for sidewalks, basement floors, and patios.

INFORMATION:

In square measure, you learned how to find the area of different shaped surfaces. Floors, walks, and patios are surfaces which have depth. To find the number of cubic yards of concrete needed for a floor, walk, or patio, you must first find the area of the surface to be covered, then multiply that area by the specified depth or thickness of the concrete.

The concrete for basement floors, garage floors, walks, and patios is usually 4'' thick.

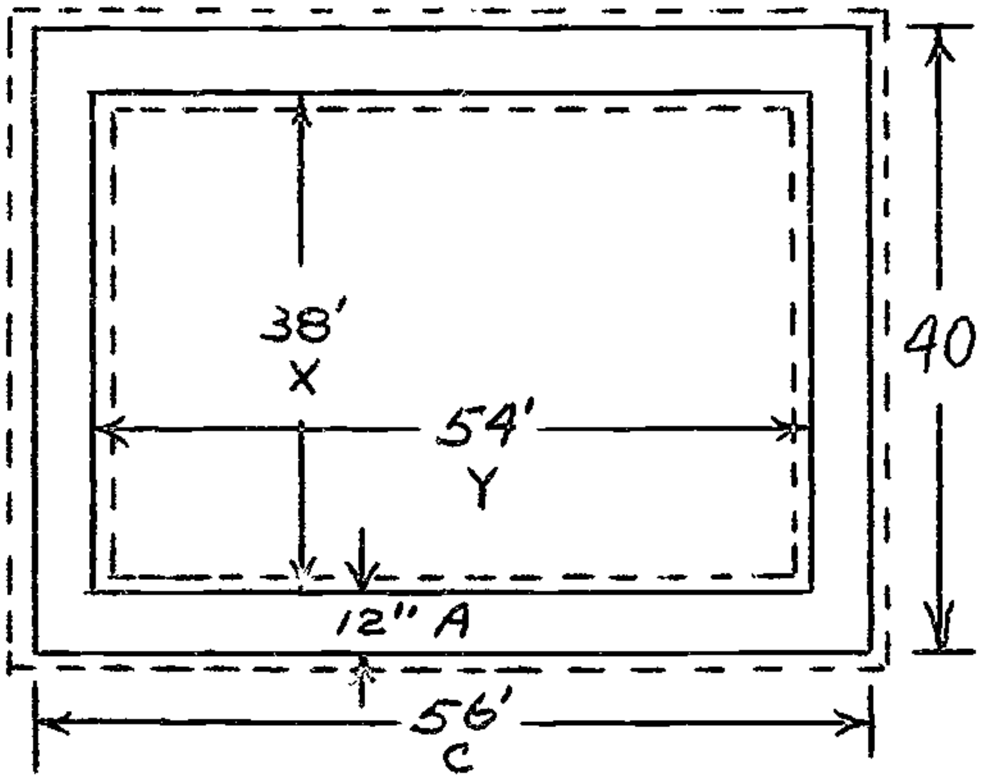
Basement floors are poured inside the walls of a building. On the plan (see Fig. 21) dimensions are always given on the <u>outside</u> of the building, as dimensions C & D. The dimensions you need in order to estimate the amount of concrete required are dimensions X & Y. To find dimension X, you subtract the width of the wall from each end of dimension D.

$$X = 40' - (1 + 1) = 38'$$

To find dimension Y, you subtract the width of the wall from each end of dimension C.

$$Y = 56' - (1 + 1) = 54'$$

$$Y = 54' \text{ (length)}; \quad X = 38' \text{ (width}$$



Note: Floor 4" thick

FIG. 21

To get the area of the floor, multiply the length by the width.

length (Y) 54'
width (X) x 38'
432
162
2052 sq. ft. area of floor

To find the number of cu. yds. of concrete needed, multiply the area by the thickness (change 4" to $\frac{1}{3}$ of a foot).

Note that the number of <u>cu. ft.</u> is <u>less</u> than the number of <u>sq. ft.</u>

$\overset{684}{\cancel{2052}} \times \frac{1}{\cancel{3}}$ = 684 cu. ft. in floor

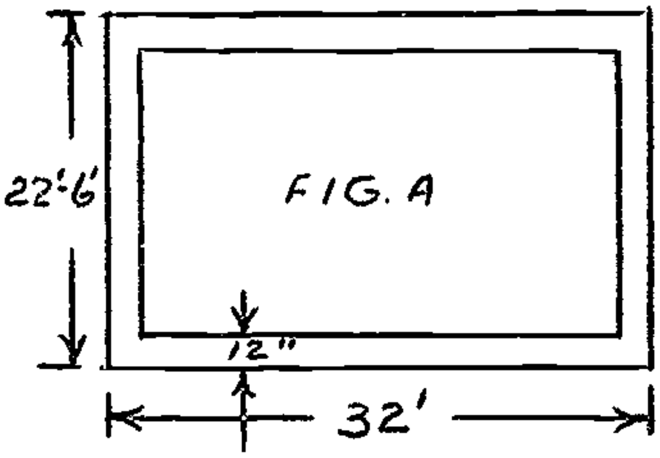
Divide by 27 to change the cu. ft. to cu. yds.

$25\frac{1}{3}$ cu. yds. of concrete needed
27/684 for the floor of Fig. 21
54
144
135
$\frac{9}{27} = \frac{1}{3}$

Sidewalks and patios cover the entire area given by the dimensions.

Follow the instructions on Information Sheet No. 5. Think before you work, it will save you time and effort.

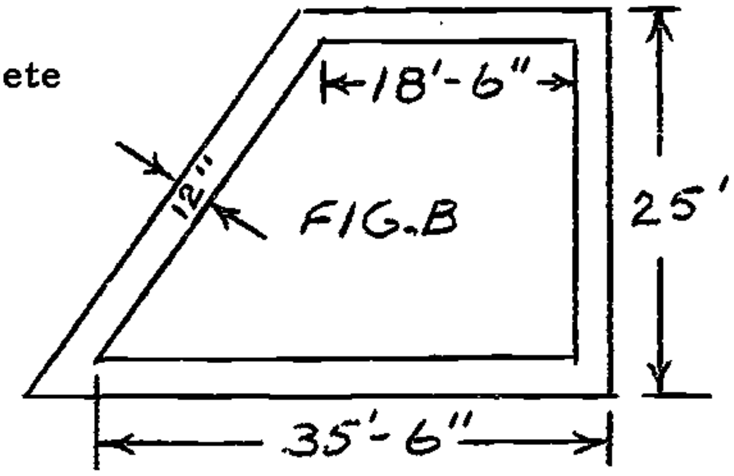
1. How many cu. yards of concrete are needed for the floor in Fig. A? Floor is 4" thick.



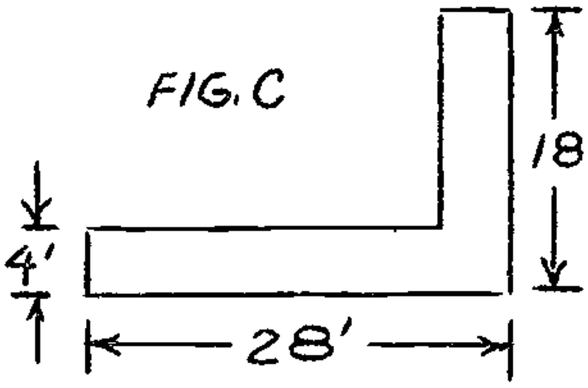
2. How many cubic yards of concrete are needed for a sidewalk 4' wide, 62' 6" long and 4" thick?

3. How many cubic yards of concrete are needed for a patio 23' long, 16' wide, and 4" thick?

4. How many cubic yards of concrete are needed for the floor in Fig. B? Floor is 6" thick.

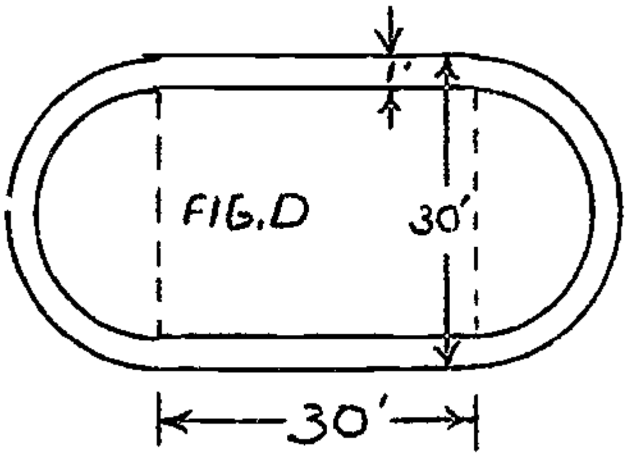


5. How many cubic yards of concrete are needed for the walk in Fig. C? Walk is 4" thick.



6. How many cubic yards of concrete are needed for a patio 29' long, 14' wide, and 4" thick?

7. How many cubic yards of concrete are needed for the floor of Fig. D? Floor is 8" thick.



8. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(8" (1' 4"	8' 6" 8"	33' 2"	27' 2"	32' 2"	27' 2"

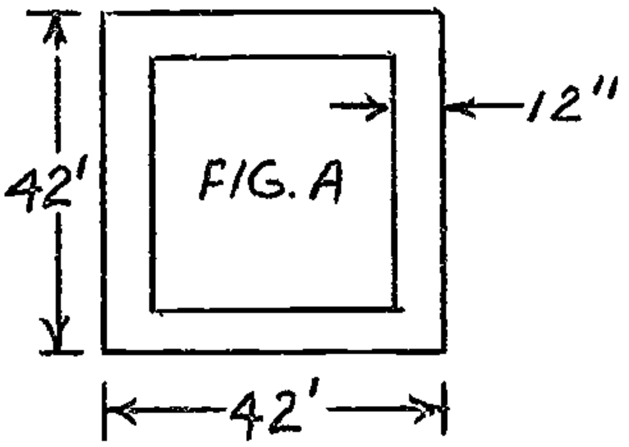
9. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 8?

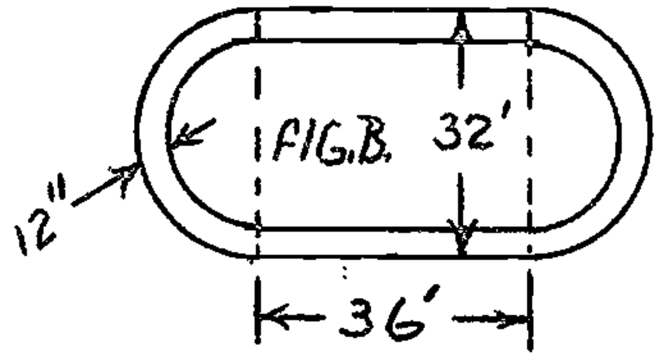
10. How many cubic yards of mortar are needed to lay the brick in problem 9?

11. How many cubic yards of concrete are needed for the floor in problem 8? Floor is 4" thick.

Concrete Floors, Walks, Patios — Assignment Sheet No. 15

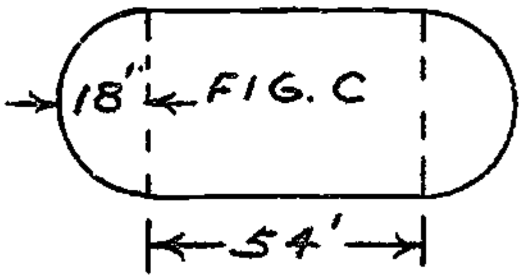
1. How many cu. yds. of concrete are needed for the floor in Fig. A? Floor is 6" thick.

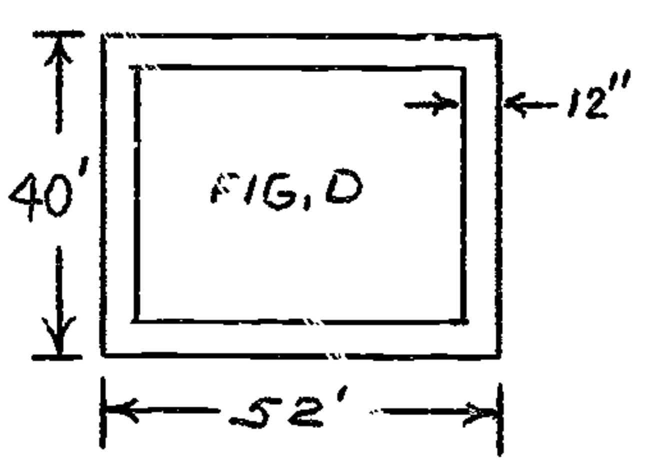




2. How many cu. yds. of concrete are needed for the floor in Fig. B? Floor is 8" thick.

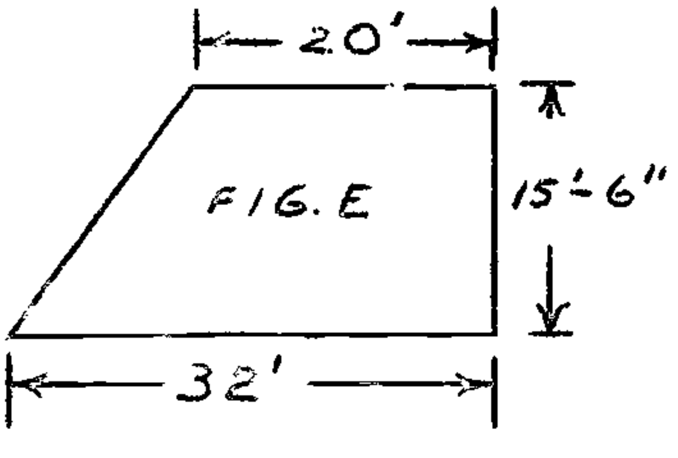
3. How many cu. yds. of concrete are needed for the patio in Fig. C? Concrete is 6" thick.





4. How many cu. yds. of concrete are needed for the floor in Fig. D? Floor is 4" thick.

5. How many cu. yds. of concrete are needed to cover Fig. E? Concrete is 4" thick.



6. How many cu. yds. of concrete are needed for a walk 39' 9" long, 4' 6" wide, and 4" thick?

7. How many cu. yds. of concrete are needed for the walk in Fig. F? Walk is 4" thick.

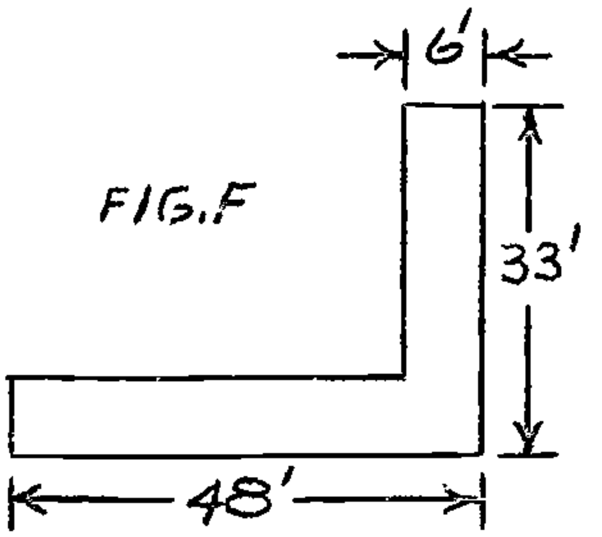


FIG.F

8. How many cu. yds. of concrete are needed for 18 columns 18' high and 2' 6" in diameter?

9. How many sq. yds. are there in the walls and ceiling of a room 26' 6" long, 19' wide, and 9' 6" high?
Openings: 2 doors 3' x 6' 8"; 8 windows 2' 6" x 5'.

10. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	10' 6"	67' 6"	52'	67' 6"	52'
(2'	1'				

11. How many brick laid with a $\frac{5''}{8}$ mortar joint are needed for the foundation walls in problem 10?

12. How many cu. yds. of mortar are needed to lay the brick in problem 11?

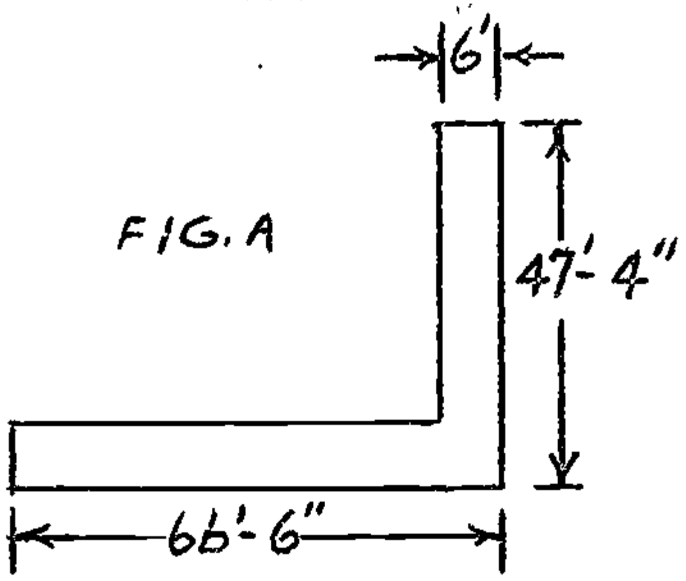
13. How many cu. yds. of concrete are needed for the floor in problem 10? Floor is 4" thick.

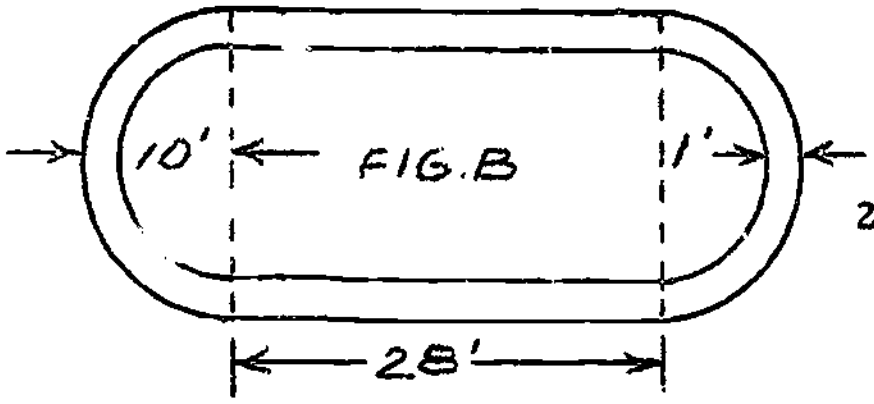
14. How long will it take 16 men, working 7 hours per day, to lay the brick in problem 11, if they lay an average of 433 brick each per day?

15. How many tons of grained veneer stone are needed for the foundation walls in problem 10?

16. How many sq. ft. of slate are needed to cover the surface of the patio in problem 3?

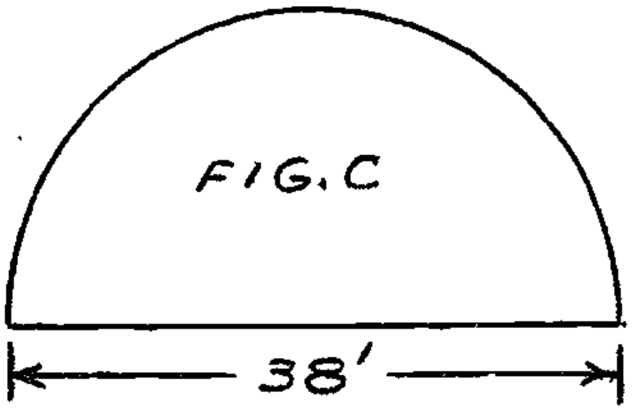
1. Find the number of cu. yds. of concrete needed for the walk in Fig. A. Walk is 4" thick.





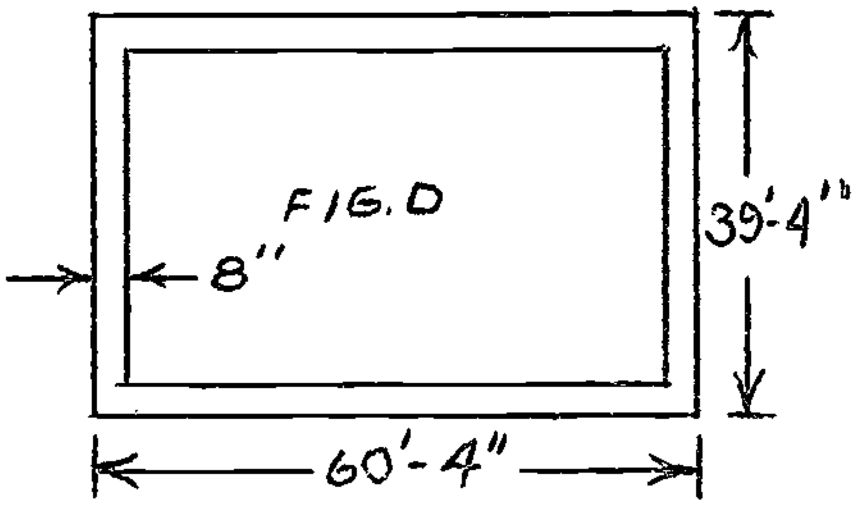
2. How many cu. yds. of concrete are needed for the floor in Fig. B? Floor is 6" thick.

3. How many cu. yds. of concrete are needed for the patio in Fig. C? Concrete is 4" thick.



4. How many sq. yds. are there in the walls and ceiling of a room 35' long, 26' wide, and 9' 6" high?
Openings: 3 doors 2' 8" x 6' 8" and 12 windows 2' 8" x 5' 6".

5. How many cu. yds. of concrete are needed for the floor in Fig. D? Floor is 4" thick.



6. How many cu. yds. are there in 18 columns 17' high and 2' 9" in diameter?

7. How many cu. yds. of concrete are needed for the patio in Fig. E? Concrete is 4" thick.

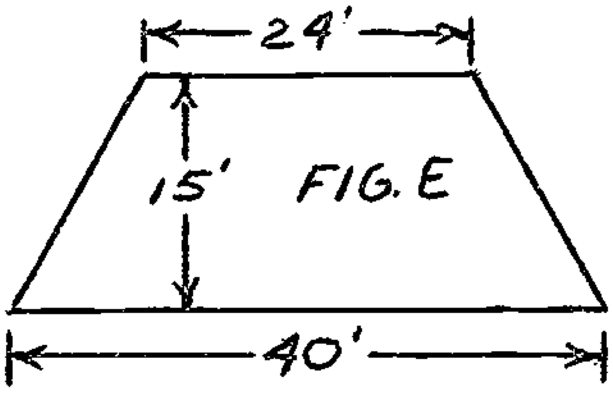


FIG. E

8. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	8' 4"	46' 6"	58'	46' 6"	58'
(2'	1'				

9. How many brick laid with a $\frac{1}{4}$" mortar joint are needed for the foundation walls in problem 8?

10. How many cu. yds. of mortar are needed to lay the brick in problem 9?

11. How many cu. yds. of concrete are needed for the floor in problem 8? Floor is 6" thick.

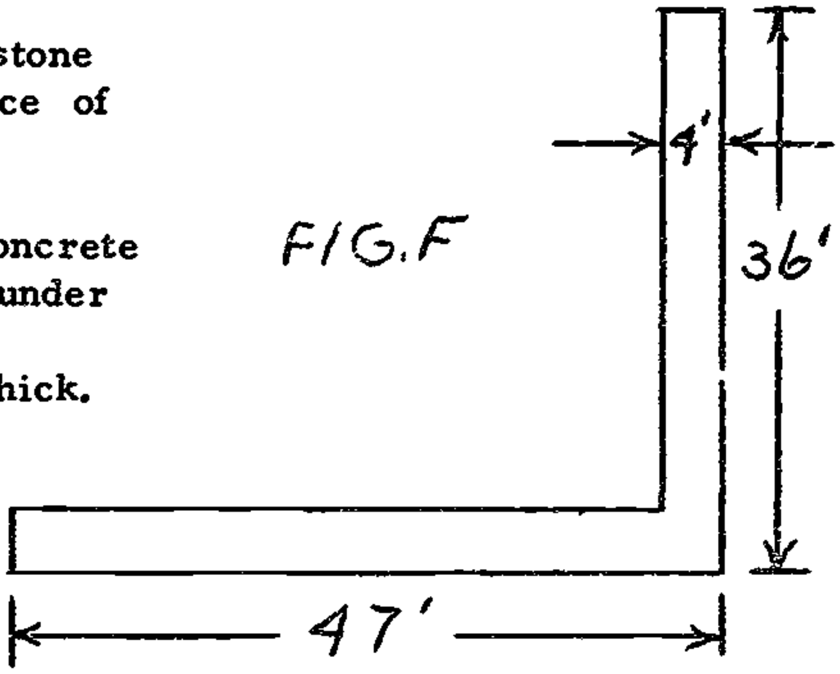
12. $16\frac{2}{3}\%$ of 35,875 = ?

13. How many tons of marble veneer are needed to veneer the foundation walls in problem 8?

14. How many sq. ft. of flagstone are needed for the surface of the walk in Fig. F?

15. How many cu. yds. of concrete are needed for the base under the flagstone in Fig. F? Concrete base to be 3" thick.

FIG. F



UNIT I

Addition and Subtraction of Fractions — Test No. 1 - A

Add:

1. $275'\ 6\frac{1}{4}'' + 1'\ 11\frac{3}{8}'' + 72'\ \frac{1}{2}'' + 1{,}429'\ 10\frac{13}{16}' + 14'\ 2\frac{5}{8}'' =$
2. $115'\ \frac{3}{8}'' + 29'$ [illegible]$\frac{1}{4}'' + 8\frac{9}{16}'' + 140'\ \frac{5}{8}'' + 56'\ 9\frac{1}{2}'' =$

Test No. 2A

Add:

1. $9\frac{5}{8}'' + 115'\frac{3}{16}'' + 7'\ 10\frac{3}{4}'' + 4'\frac{9}{16}'' =$

Subtract:

2. $298'\ 7\frac{7}{8}'' - 198'\ 6\frac{1}{2}'' =$

Multiply:

3. 66' 8" x 17' 3" =

4. 29' x 27' 4" =

5. Nine men worked 7 days each, 7 hours per day, and earned $3.45 per hour. How much was the total payroll?

6. Fourteen bricklayers worked 6 days each, 7 hours per day, and laid 64,092 brick. How many brick did each man average per hour?

7. A builder put up a wall for $11,500.00. His labor cost was $4,765.50. He bought 23,500 brick @ $46.50 per 1,000, 275 bags of mortar cement @ $1.09 per bag, 19 cu. yds. of sand @ $3.65 per yard, and his overhead cost was $969.50. How much did he make?

8. If it takes $6\frac{1}{2}$ brick to cover 1 sq. ft. of wall, how many brick are needed for a wall 185' long and 9' high?

Addition, Subtraction and Multiplication of Fractions

Test No. 2 - B

Add:

1. $229'\ 8'' + 1\frac{3}{4}'' + 17' + 125'\ 8\frac{1}{2}'' =$

Subtract:

2. $234'\ \frac{5}{8}'' - 133'\ 3\frac{1}{2}'' =$

Multiply:

3. $47'\ 8'' \times 39'\ 9'' =$

4. $23' \times 18'\ 8'' =$

5. Nine men worked 8 days each, 7 hours per day and earned a total of $1,839.60. How much did each man earn per hour?

6. Seven laying brick averaged 117 brick each per hour. How many brick did they lay in 7 days, working 8 hours per day?

7. A builder put up a wall for $12,200.00. His labor cost was $4,763.55. He bought 22,500 brick @ $46.25 per 1,000, 279 bags of mortar cement @ $1.09 per bag, 21 cu. yds. of sand @ $3.85 per yard, and his overhead cost was $983.25. How much did he make?

8. If it takes $6\frac{1}{2}$ brick to cover 1 sq. ft. of wall, how many brick are needed for a wall 173' long and 7' high?

Addition, Subtraction, and Multiplication of Fractions

Test No. 3 - A

Add:

1. $115'\ \frac{3}{8}'' + 29'\ 6\frac{1}{4}'' + 8\frac{9}{16}'' + 140'\ \frac{5}{8}'' + 56'\ 9\frac{1}{2}'' =$

2. $159'\ \frac{3}{4}'' + 7\frac{9}{16}'' + 81'\ 6\frac{5}{8}'' + 265'\ 4\frac{1}{4}'' + 2'\ \frac{1}{2}'' =$

Subtract:

3. $3{,}795'\ 4\frac{1}{4}'' - 2{,}694'\ 4\frac{5}{8}'' =$

4. $1{,}286'\ 3'' - 285'\ 4\frac{3}{4}'' =$

Multiply:

5. 19' 3" x 18' 4" =

6. 18' 4" x 17' 8" =

7. 39' 3" x 18' 9" =

8. Nine men worked 8 days each, 7 hours per day, and earned a total of $1,839.60. How much did each man earn per hour?

9. A builder put up a foundation for $15,600.00. His labor cost was $5,896.25. He bought 32,500 brick @ $48.75 per 1,000, 1,250 blocks @ 30¢ each, 289 bags of mortar cement @ $1.13 per bag, 30 cu. yds. of sand @ $3.45 per yard, and his overhead cost was $1,679.45. How much did he make?

10. It takes $6\frac{1}{2}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 298' 6" long and 8' 6" high?

Addition, Subtraction and Multiplication of Fractions

Test No. 3 - B

Add:

1. $125'\ 6\frac{3}{4}'' + 27'\ 2\frac{1}{8}'' + 4'\ \frac{1}{2}'' + 133'\ 11\frac{1}{4}'' + 22'\ 2\frac{9}{16}'' =$

2. $1{,}350'\ 5\frac{1}{2}'' + 35'\ 6\frac{3}{4}'' + 21'\ 11\frac{3}{8}'' + 131'\ \frac{1}{2}'' + 71'\ 10\frac{1}{4}'' =$

Subtract:

3. $385'\ 6\frac{1}{4}'' - 279'\ 8\frac{9}{16}'' =$

4. $1{,}784'\ \frac{1}{2}'' - 998'\ 4\frac{7}{8}'' =$

Multiply:

5. 48' 8" x 29' 9" =

6. 96' 4" x 32' 3" =

7. 33' 4" x 28' 9" =

8. It takes $6\frac{3}{4}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 319' long and 8' 6" high?

9. A builder put up a foundation for $15,750.00. His labor cost was $6,013.65, he bought 27 cu. yds. of concrete @ $13.75 per yard, 34,500 brick @ $39.50 per 1,000, 1,900 block @ 31¢ each, 269 bags of mortar cement @ $1.09 per bag, 27 cu. yds. of sand @ $3.95 per yard, and his overhead cost was $1,895.75. How much did the builder make?

10. What is the price of an I-beam 27' 6" long, which weighs $37\frac{1}{4}$ lbs. per lineal foot and cost $19\frac{1}{3}$¢ per lb.?

Addition, Subtraction, Multiplication, and Division of Fractions

Test No. 4 - A

Add:

1. $4'\ 6\frac{1}{8}'' + 12'\ 8'' + 7'\ \frac{1}{2}'' + 33'\ 6\frac{1}{4}'' =$
2. $14' + 112'\ 6'' + 8'\ 9\frac{3}{8}'' + 8\frac{3}{4}'' =$

Subtract:

3. $155'\ \frac{1}{2}'' - 97'\ 5\frac{3}{8}'' =$
4. $201'\ 9\frac{9}{16}'' - 102'\ 5\frac{3}{8}'' =$

Multiply:

5. $19' \times 29'\ 3'' =$
6. $18'\ 3'' \times 42'\ 8'' =$

Divide:

7. $21'\ 4'' \div 8 =$
8. $9'\ 6'' \div 1\frac{1}{2} =$
9. $607\frac{1}{2}$ sq. ft. ÷ 9 =
10. $1{,}019\frac{1}{4}$ cu. ft. ÷ 27 =

11. A contractor built a foundation for $9,465.00. His labor cost was $2,248.65. He bought 25,000 brick @ $49.50 per 1,000, 175 bags of mortar cement @ $1.15 per bag, 15 cu. yds. of sand @ $5.25 per yard, 69 cu. yds. of concrete @ $18.25 per yard, and his overhead cost was $1,105.75. How much did the contractor make?

12. It takes $6\frac{1}{2}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 157' long and 7' high?

Addition, Subtraction, Multiplication and Division of Fractions

Test No. 4 - B

Add:

1. $6' \, 6'' + 17' \, \frac{3}{4}'' + 8\frac{3}{8}'' + 36' \, 4\frac{9}{16}'' =$
2. $8\frac{1}{2}'' + 12' \, 3'' + 7' \, \frac{3}{4}'' + 102' \, 11\frac{9}{16}'' =$

Subtract:

3. $175' \, \frac{3}{8}'' - 88' \, 6\frac{1}{2}'' =$
4. $115' \, 3\frac{3}{8}'' - 111' \, 2\frac{9}{16} =$

Multiply:

5. $27' \times 37' \, 4'' =$
6. $14' \, 6'' \times 21' \, 9'' =$

Divide:

7. $15' \, 9'' \div 7 =$
8. $16' \, 3'' \div 4\frac{1}{3} =$
9. $717\frac{3}{4}$ sq. ft. ÷ 9 =
10. $1,248\frac{3}{4}$ cu. ft. ÷ 27 =

11. A contractor built a foundation for $9,645.00. His labor cost was $2,268.45. He bought 23,000 brick @ $49.50 per 1,000, 165 bags of mortar cement @ $1.15 per bag, 65 cu. yds. of concrete @ $18.50 per yard, 15 cu. yds. of sand @ $5.35 per yard, and his overhead cost was $1,205.75. How much did the contractor make?

12. It takes $6\frac{1}{2}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 169' long and 7' high?

Addition, Subtraction, Multiplication and Division of Fractions and Decimals

Test No. 5 - A

Add:

1. $4'\,4\frac{1}{8}''$ + $12'\,8''$ + $2'\,\frac{1}{2}''$ + $33'\,6\frac{1}{4}''$ =

2. .5 + 261.058 - 1. + 1.1 + .067 =

3. $5\frac{1}{2}\%$ + $16\frac{2}{3}\%$ + $3\frac{1}{3}\%$ + $4\frac{1}{4}\%$ + 25% =

Subtract:

4. $155'\,\frac{1}{2}''$ - $97'\,5\frac{2}{3}''$ =

5. 16.05 - 9.073

Multiply:

6. $18'\,3''$ x $42'\,8''$

7. $28\frac{3}{4}$ x 7.396 =

8. $5\frac{2}{3}\%$ of 26,988 =

Divide:

9. $9'\,6''$ ÷ $1\frac{1}{2}$ =

10. 164.2733 ÷ 25.39 =

11. It takes $6\frac{1}{2}$ brick to cover 1 sq. ft. of wall How many brick are needed for a wall 12' long and 8' 6" high?

12. It takes 600 lath to cover 40 sq. yds. of wall. How many lath are needed to cover 518 sq. yds. of wall?

13. Seventeen men worked 9 days each, 7 hours per day, and laid a total of 103,887 brick. How many brick did each man average per day?

14. A contractor built a foundation for $9,265.00. His overhead was $1,123.75. He bought 14,500 brick @ $37.50 per 1,000, 2,450 blocks @ 24¢ per block, 26 cu. yds. of concrete @ $18.75 per yard, 27 cu. yds. of sand @ $4.75 per yard, 197 bags of mortar cement @ $1.19 per bag, and a 27' long I-beam weighing 27 lbs. per lineal foot and costing 23¢ per lb.; his labor cost was $2,648.60. How much did the contractor make?

Division of Fractions and Decimals

Test No. 5 - B

Add:

1. $8\frac{1}{2}''$ + 12'3" + $7'\frac{3}{4}''$ + $102'\ 7\frac{9}{16}''$ =

2. .005 + 3.2 + 11 + 267.19 + 4.627 =

3. $5\frac{1}{4}\%$ + $16\frac{1}{3}\%$ + 4% + $3\frac{2}{3}\%$ + 35% =

Subtract:

4. $115'\ 3\frac{3}{8}''$ - $111'\ 2\frac{9}{16}''$ =

5. 27.03 - 18.246 =

Multiply:

6. 14' 6" x 21' 9" =

7. $26\frac{1}{4}$ x 8.487 =

8. $16\frac{2}{3}\%$ of 42,789 =

Divide:

9. 16' 3" ÷ $4\frac{1}{3}$ =

10. 210.1248 ÷ 27.36 =

11. It takes 560 lath to cover 40 sq. yds. of wall. How many lath are needed to cover $768\frac{1}{2}$ sq. yds. of wall?

12. It takes $6\frac{3}{4}$ brick to face 1 sq. ft. of wall. How many brick are needed to face a wall 245' 6" long and 7' high?

13 A builder put up a foundation for $15,700.00. His labor cost was $6,013.65. He bought 27 cu. yds of concrete @ $13.75 per yard, 34,500 brick @ $39.50 per 1,000, 1,900 blocks @ 31¢ each, 269 bags of mortar cement @ $1.09 per bag, and 27 cu. yds of sand @ $3.95 per yard.; his overhead cost was $1,985.75. How much did the builder make?

14. What is the price of an I-beam 27' 6" long which weighs $37\frac{1}{4}$ lbs. per lineal foot and costs $19\frac{1}{3}$¢ per lb.?

15. Twelve boys in the senior class were planning to become masons. If this represented 15% of the class, how many seniors were there in all?

16. Compute a year's interest on a government bond of $5,000 at $4\frac{3}{4}$%.

17. By building his own house, a mason estimated that he had saved himself 45% of its market value. If the house was estimated to be worth $19,500, what did it actually cost the mason?

18. A mason averaged 630 brick per day; the apprentice working with him averaged $\frac{2}{3}$ as many. How many bricks did the two men lay, working together?

19. How much of a saving is represented by a discount of 3% on materials costing $1428.10?

20. A mason bought a ladder marked $29.98 at a $12\frac{1}{2}$% discount. What did he pay for it?

UNIT III

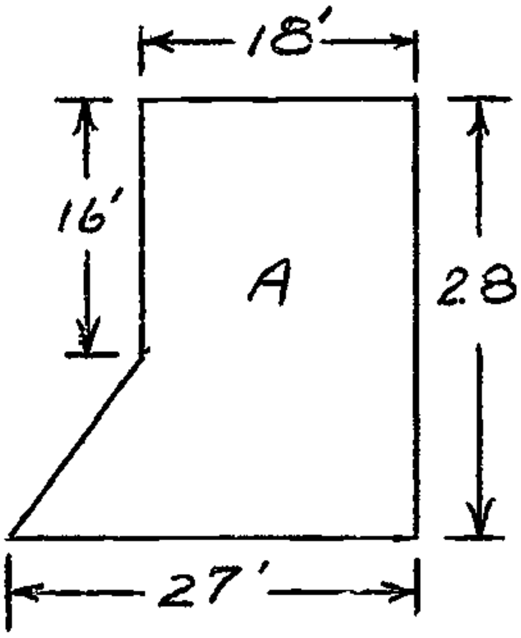
Test No. 6 - A

1. Find the area of a triangle which has a base 17' and is 12' high.
2. Find the area of a circle whose diameter is 27'.
3. Find the perimeter of a 21' 6" square.
4. Find the area of a circle whose circumference is 28.2744'.
5. Find the area of a triangle whose base is 24' and whose height is 16'.
6. Find the perimeter of a triangle whose base is 24' and whose height is 16'. The two other sides of the triangle are equal.
7. Find the circumference of a circle whose radius is 13' 4".

How many sq. yds. are there in the walls and ceilings of rooms having the following dimensions?

	Length	Width	Height	Openings	
				Doors	Windows
8.	32' 6"	18'	12'	2-- 3' x 6' 8"	5-- 3' 6" x 6'
9.	44'	31'	14' 6"	3-- 6' x 8'	4-- 4' x 5' 6"
10.	82'	46'	15' 6"	4-- 8' x 8'	12-- 3' x 6'

11. Find the area of Fig. A.
12. Find the perimeter of Fig. A.



13. How many courses of brick are needed to build a wall 14' $2\frac{1}{2}$" high? The brick are to be laid 4 courses in 11".
14. How many courses of block are needed to build a wall 29' $1\frac{3}{8}$" high? The block are laid in $8\frac{1}{8}$" for each course.

Test No. 6 - B

---

1. Find the area of a triangle which has a base 19', and is 14' high.

2. Find the area of a circle whose diameter is 29'.

3. Find the area of a 23' 6" square.

4. Find the area of a circle whose circumference is 21.9912'.

5. Find the area of a triangle whose base is 15' and whose height is 10'.

6. A triangle's sides are in the ratio of 3-4-5. If the smallest side is 15', what is the perimeter of the triangle?

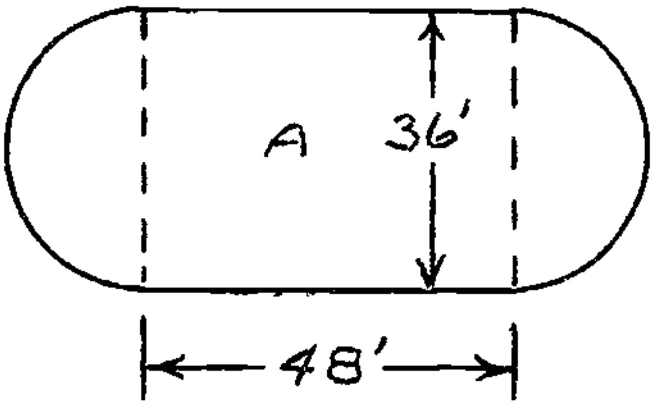
7. Find the circumference of a circle whose radius is 14' 4".

How many sq. yds. are there in the walls and ceilings of rooms having the following dimensions?

				Openings	
	Length	**Width**	**Height**	**Doors**	**Windows**
8.	21' 6"	18'	10'	2-- 2' 6" x 7'	6-- 2' 6" x 3'
9.	17'	13'	8' 6"	2-- 3' x 6' 8"	4-- 2' 8" x 3'
10.	72'	45' 6"	16'	4-- 7' x 8'	14-- 3' x 7' 6"

11. Find the area of Fig. A.

12. Find the perimeter of Fig. A.



13. How many courses of brick are needed to build a wall 14' $10\frac{1}{2}$" high? The brick are to be laid 4 courses in $10\frac{1}{2}$".

14. How many brick are needed for the first course of a building, 147' $6\frac{1}{2}$" long and 106' 6" wide? A brick with the cross joint measures $8\frac{3}{8}$".

Test No. 7 - A

---

1. How many sq. yds. are there in the walls of a room, 37' 6" long, 29' 9" wide, and 11' high?

2. Find the area of a triangular prism whose base is 24', whose height is 16', and whcse length is 37'.

3. What is the area of a rectangular prism, 32' 6" long, 17' wide, 11' high?

4. It takes $6\frac{3}{4}$ brick to cover 1 sq. ft. of wall. How many brick are needed for a wall 259' long and 9' high?

5. Find the area of a 7' 6" cube.

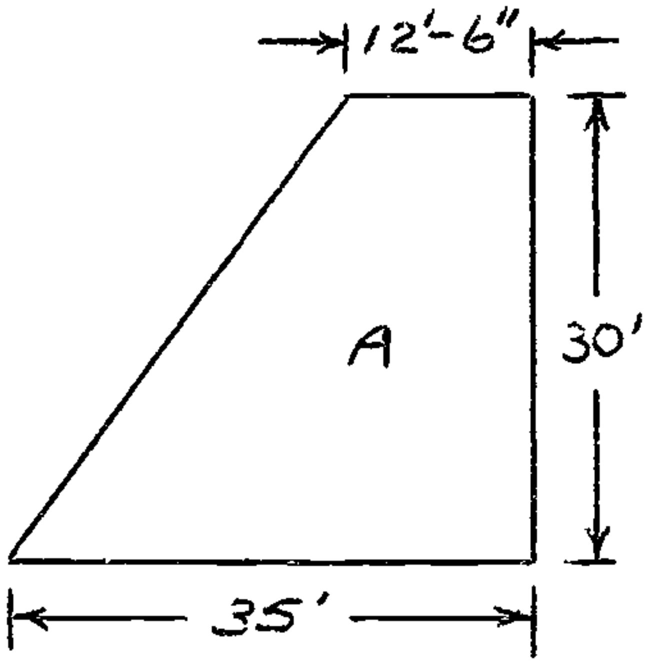
6. Find the area of a circle whose circumference is 26.7036'.

7. Find the area of a cylinder whose diameter is 24', and whose height is 18'.

8. How many sq. yds. are there in the walls and ceiling of a room 30' long, 20' wide, and 9' 6" high?
   Openings: 2 doors 3' x 7' and 6 windows 4' x 4'.

9. Find the area of Fig. A.

10. Find the perimeter of Fig. A.



Test No. 7 - B

---

1. How many sq. yds. are there in the walls of a room 37' 6" long, 27' 6" wide, and 11' high?

2. Find the area of a triangular prism whose base is 24', whose height is 16', and whose length is 37' 9".

3. Find the area of a rectangular prism, 32' long, 11' wide and 17' high.

4. It takes $6\frac{1}{4}$ brick to cover 1 sq. ft. of wall. How many brick are needed for a wall 259' long and 9' high?

5. Find the area of a 9' 6" cube.

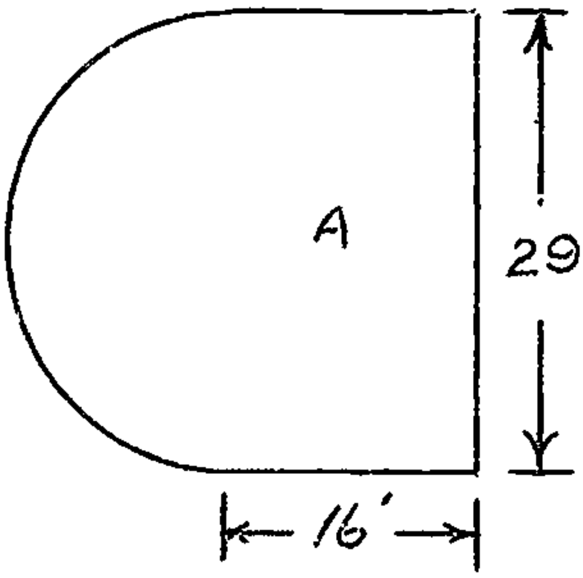
6. Find the area of a circle whose circumference is 32.9868'.

7. Find the area of a cylinder whose diameter is 24' and whose height is 16'.

8. How many sq. yds. are there in the walls and ceiling of a room 50' long, 25' wide, and 12' 6" high?
   Openings: 3 doors 2' 8" x 7' and 12 windows 3' x 4' 6".

9. Find the area of Fig. A.

10. Find the perimeter of Fig. A.



UNIT IV

Test No. 8 - A

1. How many sq. yds. are there in the walls and ceiling of a room 25' long, 15' wide, and 9' high?
Openings: 3 doors 3' x 7' and 6 windows 2' 8" x 5'.

How many cu. yds. are there in the following foundation walls?

	A	B	C	D	E	F
2.	12"	12'	89' 6"			
3.	12"	13' 6"	50'	38'	50'	38'
4.	16"	18'	36'	42'	36'	42'

5. How many brick laid with a $\frac{1}{4}$" mortar joint are needed to build the foundation walls in problem 3?

6. How many cu. yds. of mortar are needed to lay the brick in problem 5?

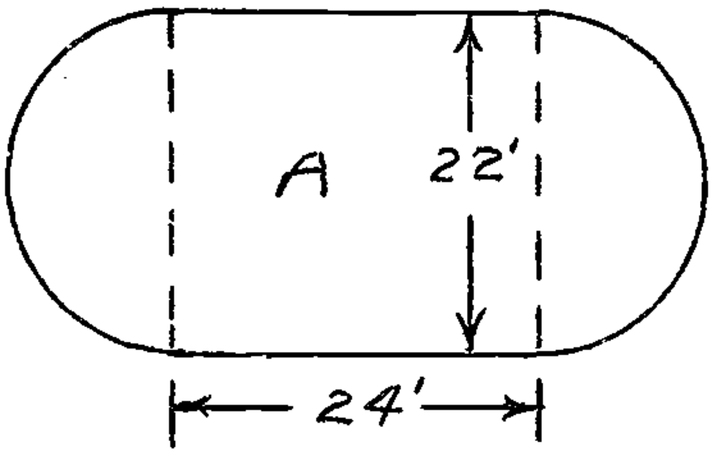
7. Find the area of a rectangular prism 27' long, 14' high, and 4' 6" wide.

8. Find the area of a cylinder whose diameter is 12' and whose height is 19'.

9. $5\frac{2}{3}$% of 48,762 = ?

10. Find the area of Fig. A.

11. Find the perimeter of Fig. A.



12. How many tons of marble veneer are needed to veneer the foundation walls in problem 3?

Test No. 8 - B

---

1. How many sq. yds. are in the walls and ceiling of a room 30' long, 22' wide, and 11' high? Openings: 3 doors 2'8" x 7' and 10 windows 3' x 5'.

How many cu. yds. are there in the following foundation walls?

	A	B	C	D	E	F
2.	12"	14'	79' 6"			
3.	12"	11' 6"	37'	29'	37'	29'
4.	16"	15'	38' 8"	45'	38' 8"	45'

5. How many brick laid with a $\frac{1}{2}$" mortar joint are needed to build the foundation walls in problem 3?

6. How many cu. yds. of mortar are needed to lay the brick in problem 3

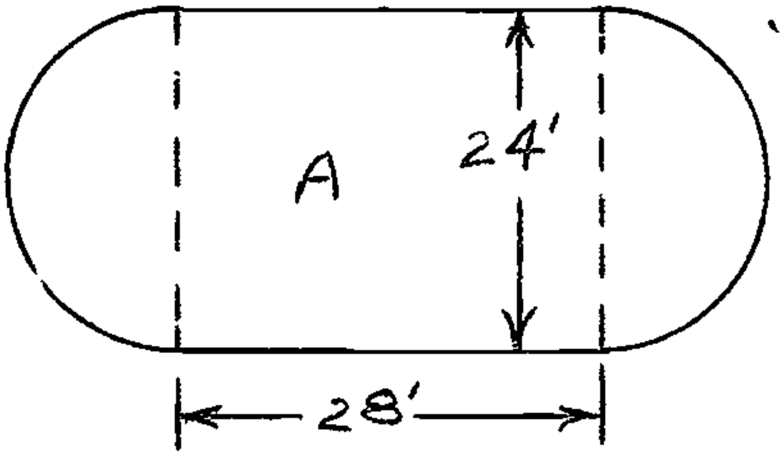
7. Find the area of a triangular prism whose base is 18', height is 12', and length is 29' 9".

8. Find the area of a cylinder whose diameter is 6' and whose height is 18'.

9. $16\frac{2}{3}\%$ of 27,968 = ?

10. Find the area of Fig. A.

11. Find the perimeter of Fig. A.



12. How many tons of grained stone veneer are needed to veneer the foundation walls in problem 3?

Test No. 9 - A

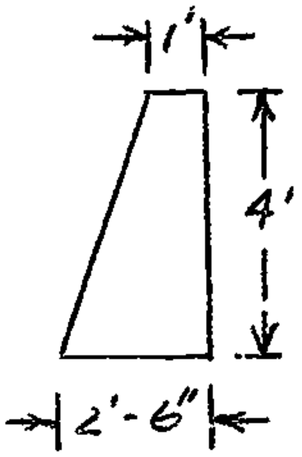
---

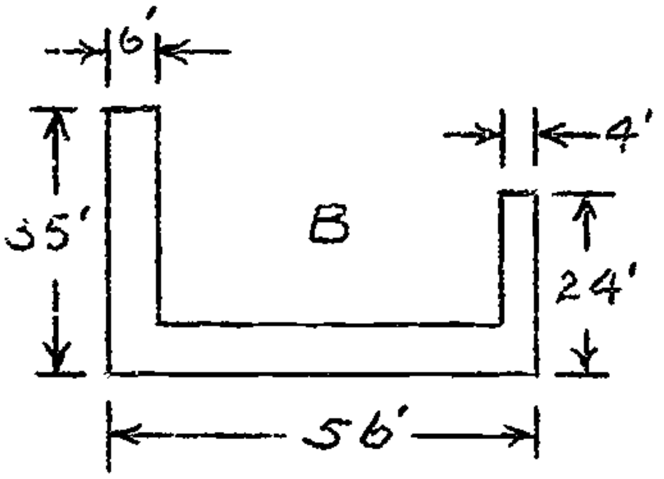
1. How many sq. yds. are there in the walls and ceiling of a room 18' 6" long, 14' wide, and 10' high? Openings: 2 doors 3' x 6' 8" and 4 windows 2' 6" x 4'.

2. Find the number of cu. yds. in 12 columns, 2' in diameter and 17' 6" high.

3. How many cu. yds. are there in a slanted wall which is 79' 6" long? See section view, Fig. A, for width and height.

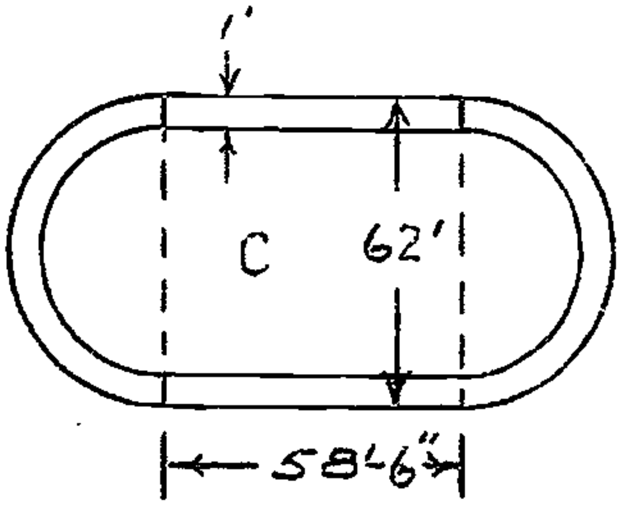
FIG. A
Section View





4. How many cu. yds. of concrete are needed for the walk, Fig. B? Walk is 4" thick.

5. How many cu. yds. of concrete are needed for the floor of Fig. C? Concrete is 6" thick.



6. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	8' 6"	43' 6"	71" 6"	43' 6"	71" 6"
(2'	1'				

7. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 6?

8. How many cu. yds. of mortar are needed to lay the brick in problem 7?

9. How many cu. yds. of concrete are needed for the floor in problem 6? Floor is 6" thick.

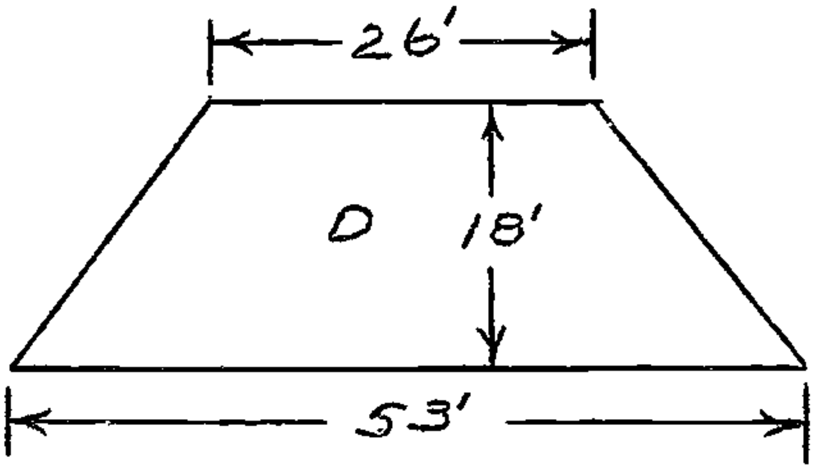
10. How many tons of grained stone veneer are needed to veneer the foundation walls in problem 6?

11. Find the area of a cylinder 3' in diameter and 16' 6" high.

12. How many cu. yds. of concrete are needed for 18 columns 18" square and 16' high?

13. How many cu. yds. of concrete are needed for the patio in Fig. D? Concrete is 4" thick.

14. Find the perimeter of Fig. D.



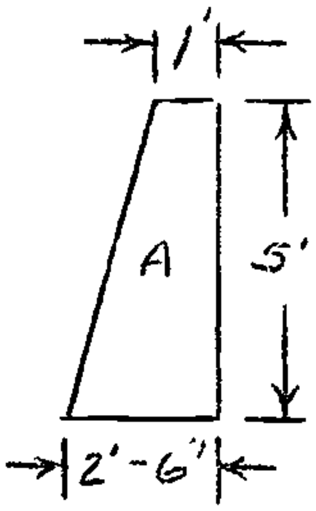
15. How many days will it take 6 bricklayers to lay the brick in problem 7, if they work 7 hours per day and lay an average of 56½ brick each per hour? Give the answer to the nearest half or full day.

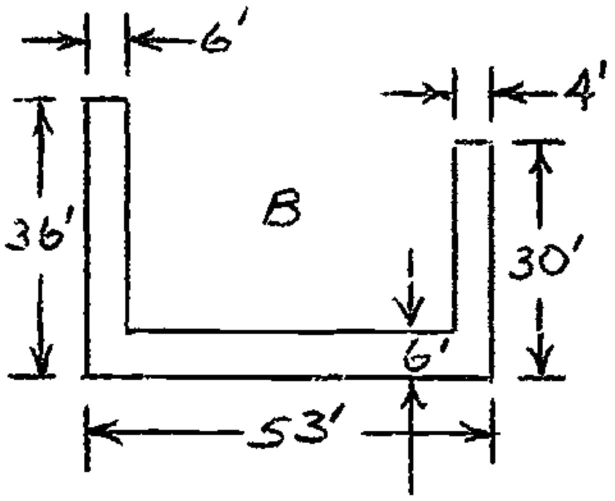
Test No. 9 - B

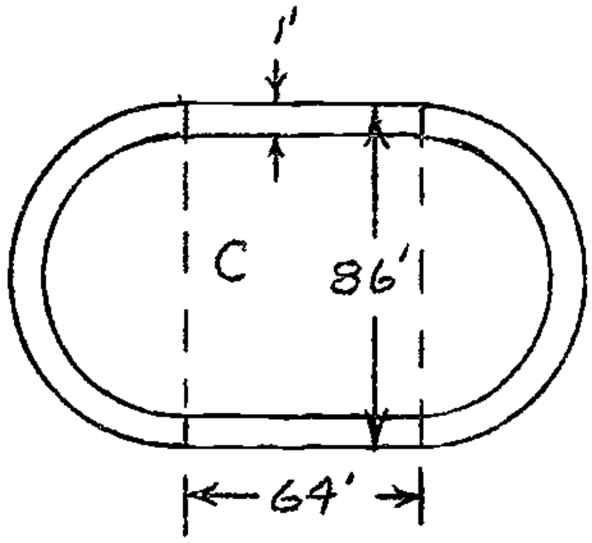
1. How many sq. yds. are there in the walls and ceiling of a room 29' long, 21' wide, and 12' 6" high?
Openings: 2 doors 2' 6" x 7' and 2 windows 3' x 5'.

2. Find the number of cu. yds. in 12 columns, 4' in diameter and 17' 6" high.

3. How many cu. yds. are there in a slanted wall which is 89' 6" long? See section view, Fig. A, for width and height.







4. How many cu. yds. of concrete are needed for the walk, Fig. B? Walk is 4" thick.

5. How many cu. yds. of concrete are needed for the floor of Fig. C? Concrete is 8" thick.

6. How many cu. yds. are there in the following footing and foundation walls?

A	B	C	D	E	F
(12"	9' 6"	54' 9"	61' 9"	54' 9"	61' 9"
(2'	1'				

7. How many brick laid with a $\frac{1}{2}$" mortar joint are needed for the foundation walls in problem 6?

8. How many cu. yds. of mortar are needed to lay the brick in problem 7?

9. How many cu. yds. of concrete are needed for the floor in problem 6? Floor is 6" thick.

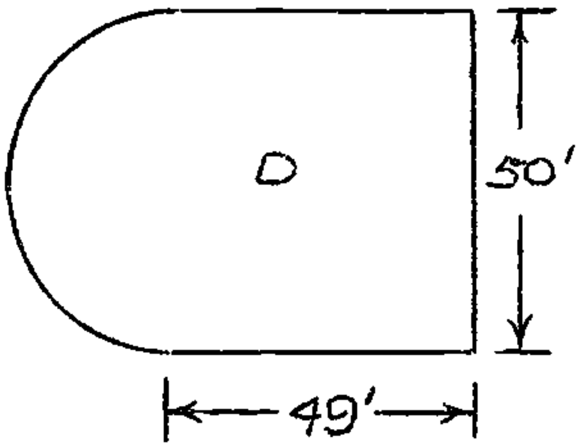
10. How many tons of marble veneer are needed to veneer the foundation walls in problem 6?

11. Find the area of a cylinder 6' in diameter and 16' 6" high.

12. How many cu. yds. of concrete are needed for 24 columns 18" square and 16' high?

13. How many cu. yds. of concrete are needed for the patio in Fig. D? Concrete is 4" thick.

14. Find the perimeter of Fig. D.



15. How many days will it tak 7 bricklayers to lay the brick in problem 7, if they work 7 hours per day and lay an average of $57\frac{1}{2}$ brick each per hour? Give the answer to the nearest half or full day.

ANSWERS

UNIT I

ASSIGNMENTS

	1.		2.		3.
1.	$8\frac{7}{12}$	1.	$146\frac{3}{16}$	1.	$1{,}148'\ 9\frac{5}{8}''$

*STUDY GUIDES, TEXTBOOKS, *TRADE AND INDUSTRIAL EDUCATION, *AUTO BODY REPAIRMEN, *MOTOR VEHICLES, HIGH SCHOOLS, *INDIVIDUAL INSTRUCTION,

This study guide-textbook was developed to direct individual student study in a 1-year course and serve as a reference manual and handbook for persons interested in learning the automotive body repair trade. It was prepared by the principal especially for the students at the New Jersey School for the Deaf and has been tested in the classroom. Various phases of the automotive trade which are closely allied to body repairing and found to be important to the overall development of the skilled craftsman are presented. The units are (1) Shop Orientation, (2) Care of Shop and Tools, (3) Materials and Parts of the Automobile, (4) Removal and Assembly, (5) Refinishing, (6) Care of the Finish, (7) Metal Repair, and (8) Acetylene Welding. Each unit contains lesson assignment sheets with the specific lesson objective, the related information with illustrations, and assignments. A test is provided at the end of each unit. To be most helpful, this material should be combined with teacher demonstration and supervision of the manipulative skills required by the trade. The teacher should have a science and automobile body repair background. A glossary of trade terms with phonetic spelling is given. Suggested classroom references are listed. This document is available for $1.50 from Vocational-Technical Division Curriculum Laboratory, Rutgers University, 10 Seminary Place, New Brunswick, New Jersey 08903. (HC)

INTRODUCTION

The purpose of this book is to serve as a text, reference manual, or handbook for persons interested in learning the Automotive Body Repair Trade. Especially prepared for the students at the New Jersey School for the Deaf, it is the first of two books designed to make the trade experience more meaningful. This book will deal with the various phases of the automotive trade, which are closely allied to body repairing and found to be important with regard to the overall development of the skilled craftsman.

The Auto Body Trade calls for a combination of skills requiring knowledge in removal and assembly, metal straightening, oxy-acetylene welding, electric arc welding, painting and upholstering. It is intended that, to be most helpful, this text be combined with instructor demonstration and supervision of the manipulative skills required by the trade. Information that is contained in this book is of necessity general in nature. It will be important for the instructor to bring out and develop special applications.

In vocational work it is an accepted fact that we learn best by doing. It is hoped that as a student is encouraged to read the factual information, which interests him in learning the skills, he can also attain a greater understanding of language and vocabulary.

J. E. RADVANY

ACKNOWLEDGEMENT

Grateful acknowledgement is given to those persons who assisted me in the preparation of this text. Mr. Benjamin Shapiro for his editorial work; Mr. Charles A. Radvany, Instructor of Auto Body Repair at the New Jersey School for the Deaf, technical assistance; and Charles Kent, a student at the New Jersey School for the Deaf for the many drawings which he prepared.

Rules and Procedures Lesson 1

OBJECTIVE: To learn the rules and procedures used in the Auto Body shop.

INFORMATION:

Before a person starts to play a game, whether it be football, basketball, checkers, or dominoes, the first thing he must do is to learn the rules.

Learning the rules will help you play the game with confidence and prevent your being penalized and possibly losing the game through ignorance of the rules.

In the world of work, many of the same principles are used as in sports, with a big difference. In sports, if you don't know the rules, you may lose the game, or you may have to play much harder to win. In the world of work you may lose something much more precious, your job. Ignorance of the rules can cause injury to you or someone else.

Read and study the following basic rules, which must be followed at all times.

1. NEVER TOUCH ANY TYPE OF EQUIPMENT OR MACHINE until you have been instructed in its use by the teacher.

2. PAY STRICT ATTENTION when the teacher is showing you an operation. If you do not understand, ask questions before you start your job.

3. FOLLOW DIRECTIONS CAREFULLY when you start your job and do only that which was told to you.

4. ALWAYS DO YOUR BEST. Do not hurry. The most important thing is to do your part correctly so that you can be proud of your work. Speed will come later.

5. KEEP YOUR WORK AREA CLEAN as you work. This is one way to cut down accidents and do a better job.

6. PUT YOUR TOOLS AWAY after your job is finished. This will prevent your losing tools which are expensive, and the wasting of time which is very valuable to you.

7. DO NOT LEAVE YOUR JOB AND DISTURB OTHERS. When you are working you are learning, but when you stop you are merely wasting time.

ASSIGNMENT:

1. Name a game which has no rules.
2. Why must you be taught how a machine operates before you can use it?
3. When the teacher is demonstrating something, what should you be doing? Why?
4. Do you know why tools must be put into their proper place?
5. Is it a good practice to talk to the other boys after you are finished with your job? Why?
6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

Safety Precautions Lesson 2

OBJECTIVE: To learn what safety precautions must be taken in the Auto Body shop.

INFORMATION:

Above all, in the shop, the first consideration is safety. To each one of us, work means the earning of a livelihood. The earning of this livelihood depends upon our ability to perform the tasks that are expected of us. We must be alert in order to compete with others and do a satisfactory job. To protect our lives and limbs, the watchword is always "CAUTION AND CARE." Do not take chances when you are not sure of what you are doing. Remember, "AN OUNCE OF PREVENTION IS WORTH A POUND OF CURE."

In addition to your own safety and welfare, there is another consideration. This is the fact that you will be working on property that does not belong to you. You will be entrusted with a valuable piece of another person's property, which must be given better care than even your own.

Automobile work is interesting and even fascinating, but at the same time you will be working with hazardous materials under hazardous circumstances.

There will be times when it is necessary for you to work with fire and flammable materials, operate power tools under pressure, and operate electrical power tools. Hazards can be created by your failure to follow the correct procedure.

FIG. 1

FIRE in the body shop is always a potential danger. Know where all the fire extinguishers are located; also know the location of sand buckets and water outlets. Your instructor will demonstrate the use of different types of extinguishers. Read the directions on the extinguisher and if you do not understand how they work, ask the instructor to explain it to you again. When working with flame, always keep the area clean and free of paper and rags. Place all discarded paper and rags into waste containers. Spontaneous combustion means a fire that starts by itself because of too much heat.

For this reason, oily and paint-soaked rags should always be put into safety cans. Be careful of the welding torch and where you point it. Treat the burning torch like a loaded gun. Never point it at anyone or anything that might catch fire.

POWER TOOLS operating under high pressure, such as hydraulic jacks or lifts, can be very dangerous if they are not handled properly. Make sure that jacks are always in proper position so that they will not slip out of place. If high pressure is being used, try to anticipate what will happen if something slips and stand clear to avoid such accidents.

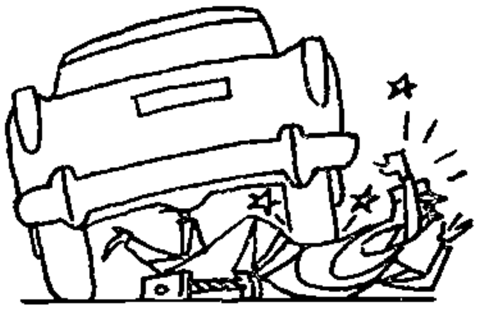

FIG. 2

ELECTRICAL TOOLS are commonly used in the shop, yet they present a very serious problem to those who will be careless. Most of the electrical tools are portable and have no safety guards on them. Tools such as sanders, grinders, drills, buffers, have spinning surfaces which are exposed. The best safety guard against accidents on this type of equipment is COMMON SENSE. Do not hurry with your work. Look for ways to avoid coming in contact with moving parts of the machine and getting caught in them. ELECTRICITY AND WATER NEVER MIX so never stand in water when using an electrical tool. If you must work in an area where there is water on the floor, be sure to place a piece of wood under your feet. This will act as an insulator and prevent a serious electrical shock.

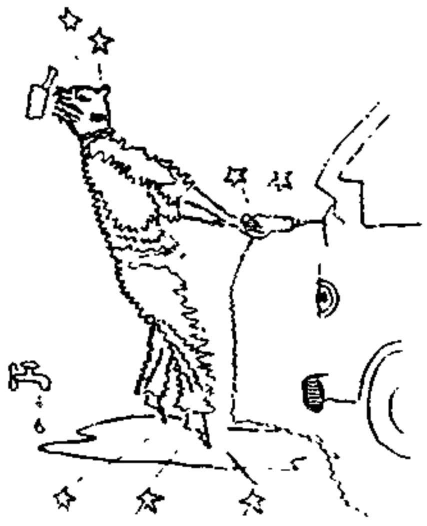

FIG. 3

SOLVENTS AND THINNERS are commonly used in the body shop. Always be sure that there are windows open for ventilation purposes when you use them.

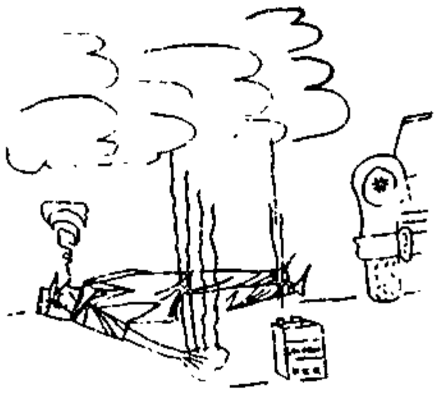

FIG. 4

If you are working in an area without windows, such as a spray booth, be sure the exhaust fan is operating so that obnoxious fumes can be drawn out. If you are working with solvents inside the car, do not close the doors and windows, but keep them open to give you better ventilation.

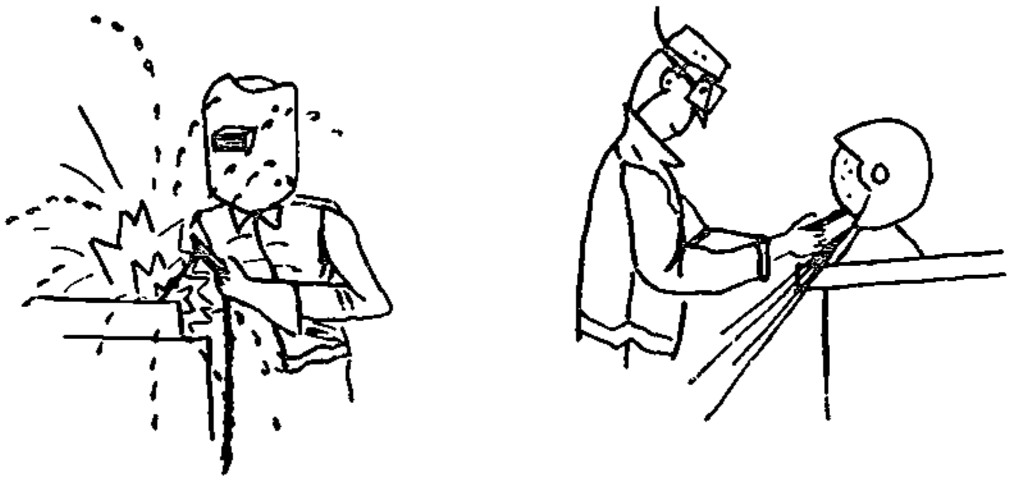

FIG. 5

PROTECTION OF YOUR BODY must always be uppermost in whatever you do. Your eyes are one of your most precious senses. Take every step to protect them. Use safety goggles whenever you are working with tools that give off flying chips, splinters, or sparks. If you must work under a car, wear goggles to protect your eyes from falling dirt. When welding always use welding goggles. NEVER LOOK AT THE ARC in the electric welding operation, for this arc is so brilliant that it can have a blinding effect on your eyes.

The floor in an auto body shop is generally constructed of concrete, because of its durability. There are times when a serious injury can come from a fall. Spilled oil or grease, tools and parts left in the middle of the floor, can be the cause of this type of accident. ALWAYS BE ALERT as you walk around the shop and look for these thing to prevent your falling.

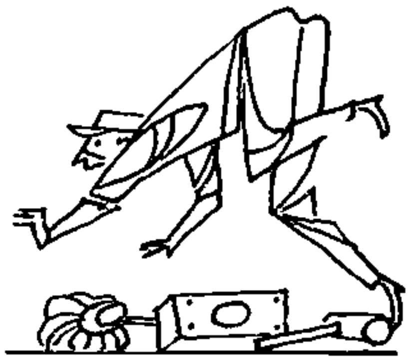

FIG. 6

Do your part in keeping the floor free from this hazard. If your work involves grease and oil, place something under the job so that the grease can be picked up and discarded. Do not leave extension cords and air hoses lying on the floor after you have finished with them. When you have removed parts from the car, do not leave them in the middle of the floor, but store them in a good place. A good rule is the slogan used by the New Jersey Bell Telephone Company, "No job is so urgent or important that we cannot take time to do it safely."

In the shop, it is best to use coveralls at all times. First of all they protect your good clothing, but more important they protect exposed parts of the body from things being spilled, flying particles and sparks. The coveralls eliminate loose clothing which may catch in machines which have exposed spinning parts on them.

FIG. 7

ASSIGNMENT:

1. List as many reasons as you can for being interested in safety.
2. List some ways of preventing fires.
3. What must you do when operating power tools under pressure?
4. List some of the dangers in using electrical tools. How can they be overcome?
5. What is the best guard for a portable machine?
6. What should you do when you work with solvents in a closed spray booth?
7. How can you protect your eyes from injury?
8. Is it wise to look at the electric arc for even a short time? Why?
9. Why is it important to wear coveralls in the shop?
10. What is meant by "an ounce of prevention is worth a pound of cure"?
11. There are some underlined words in the lesson. Find them and give their meanings. Use each one of these in a sentence.

UNIT I - SHOP ORIENTATION

ACHIEVEMENT TEST

1. Write three rules which must be followed in the school shop.

2. Name three general groups of hazards in the body shop.

3. What is the basic rule to use in any shop?

4. Name three protective devices that are available in the shop.

5. What is spontaneous combustion? How can it be prevented?

6. List five new words that you have learned in this unit.
   Use each one in a sentence.

UNIT II - CARE OF SHOP AND TOOLS

Shop Area   Lesson 1

OBJECTIVE: To learn how to keep the shop area clean.

INFORMATION:

In order for you to work efficiently and safely, your first important need is a clean shop. The dirty shop can be the cause of poor workmanship due to poor standards. It can also contribute to the loss of valuable tools. A great deal of time is required to find tools that are misplaced. This time could be spent on more productive work. The clean and neat appearance of a work area shows the work habits of the mechanic. If a shop looks dirty and untidy, more than likely the work done will be of the same type.

One big asset to the repairman is natural light, so be sure that windows are kept clean and unobstructed.

It is understood that the nature of automobile work is dirty. Therefore, a broom is an essential part of the shop equipment. When you are finished with your job, sweep around your area and place the dirt in a waste can. If you are working with oil and grease, be sure to place something under your job to catch any that is spilled. This in turn then, can easily be picked up and disposed of, leaving the floor as you found it.

When placing things on the floor, do not drop them, as this will chip the concrete, which only gets worse later.

Remember, the shop you work in, is in part, a reflection of your ability. Always do your best to keep it looking neat and tidy.

ASSIGNMENT:

1. What is the first thing we learn about the shop?

2. Why is it important to clean windows?

3. How can you prevent oil and grease from building up on the floor?

4. Who, do you think, should clean the shop?

5. What happens when objects are dropped on the floor? Why is this serious?

6. How does the appearance of the shop affect you? Why must you do your part?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT II - CARE OF SHOP AND TOOLS

Basic Hand Tools — Lesson 2

OBJECTIVES: To learn the names of the basic tools used.
To learn to identify basic tools used.

INFORMATION:

To list all the tools in the body shop and expect you to remember them is very impractical unless you have the opportunity to work with them.

There are, however, some basic hand tools which are common to most shops and these are the ones you will use most often. Hand tools are those that have no machinery attached to drive them. They are operated by the hands of the mechanic.

Study the picture carefully and learn all the different names so that when you are asked to use a certain tool you will understand the directions given. (Fig. II-1)

1. straight screwdriver
2. Phillips head screwdriver
3. clutch head screwdriver
4. aviation snips
5. metal shears
6. hacksaw
7. tire hammer
8. ball pein hammer
9. bolt cutter
10. Allen wrench
11. vise grip pliers
12. straight pliers
13. open end wrench
14. box wrench
15. center punch
16. pin punch
17. cold chisel

Tools help the mechanic work better and faster. They must always be kept in good operating condition. Parts that move should receive a drop of light oil to keep them moving freely. Frequently check the cutting edges of all the tools and make sure they are sharp before a job is started.

Tools that are not used often may be coated with a thin film of machine oil to keep them from rusting.

Above all, small hand tools must be stored in their proper places so that they can be found when needed without wasting valuable shop time.

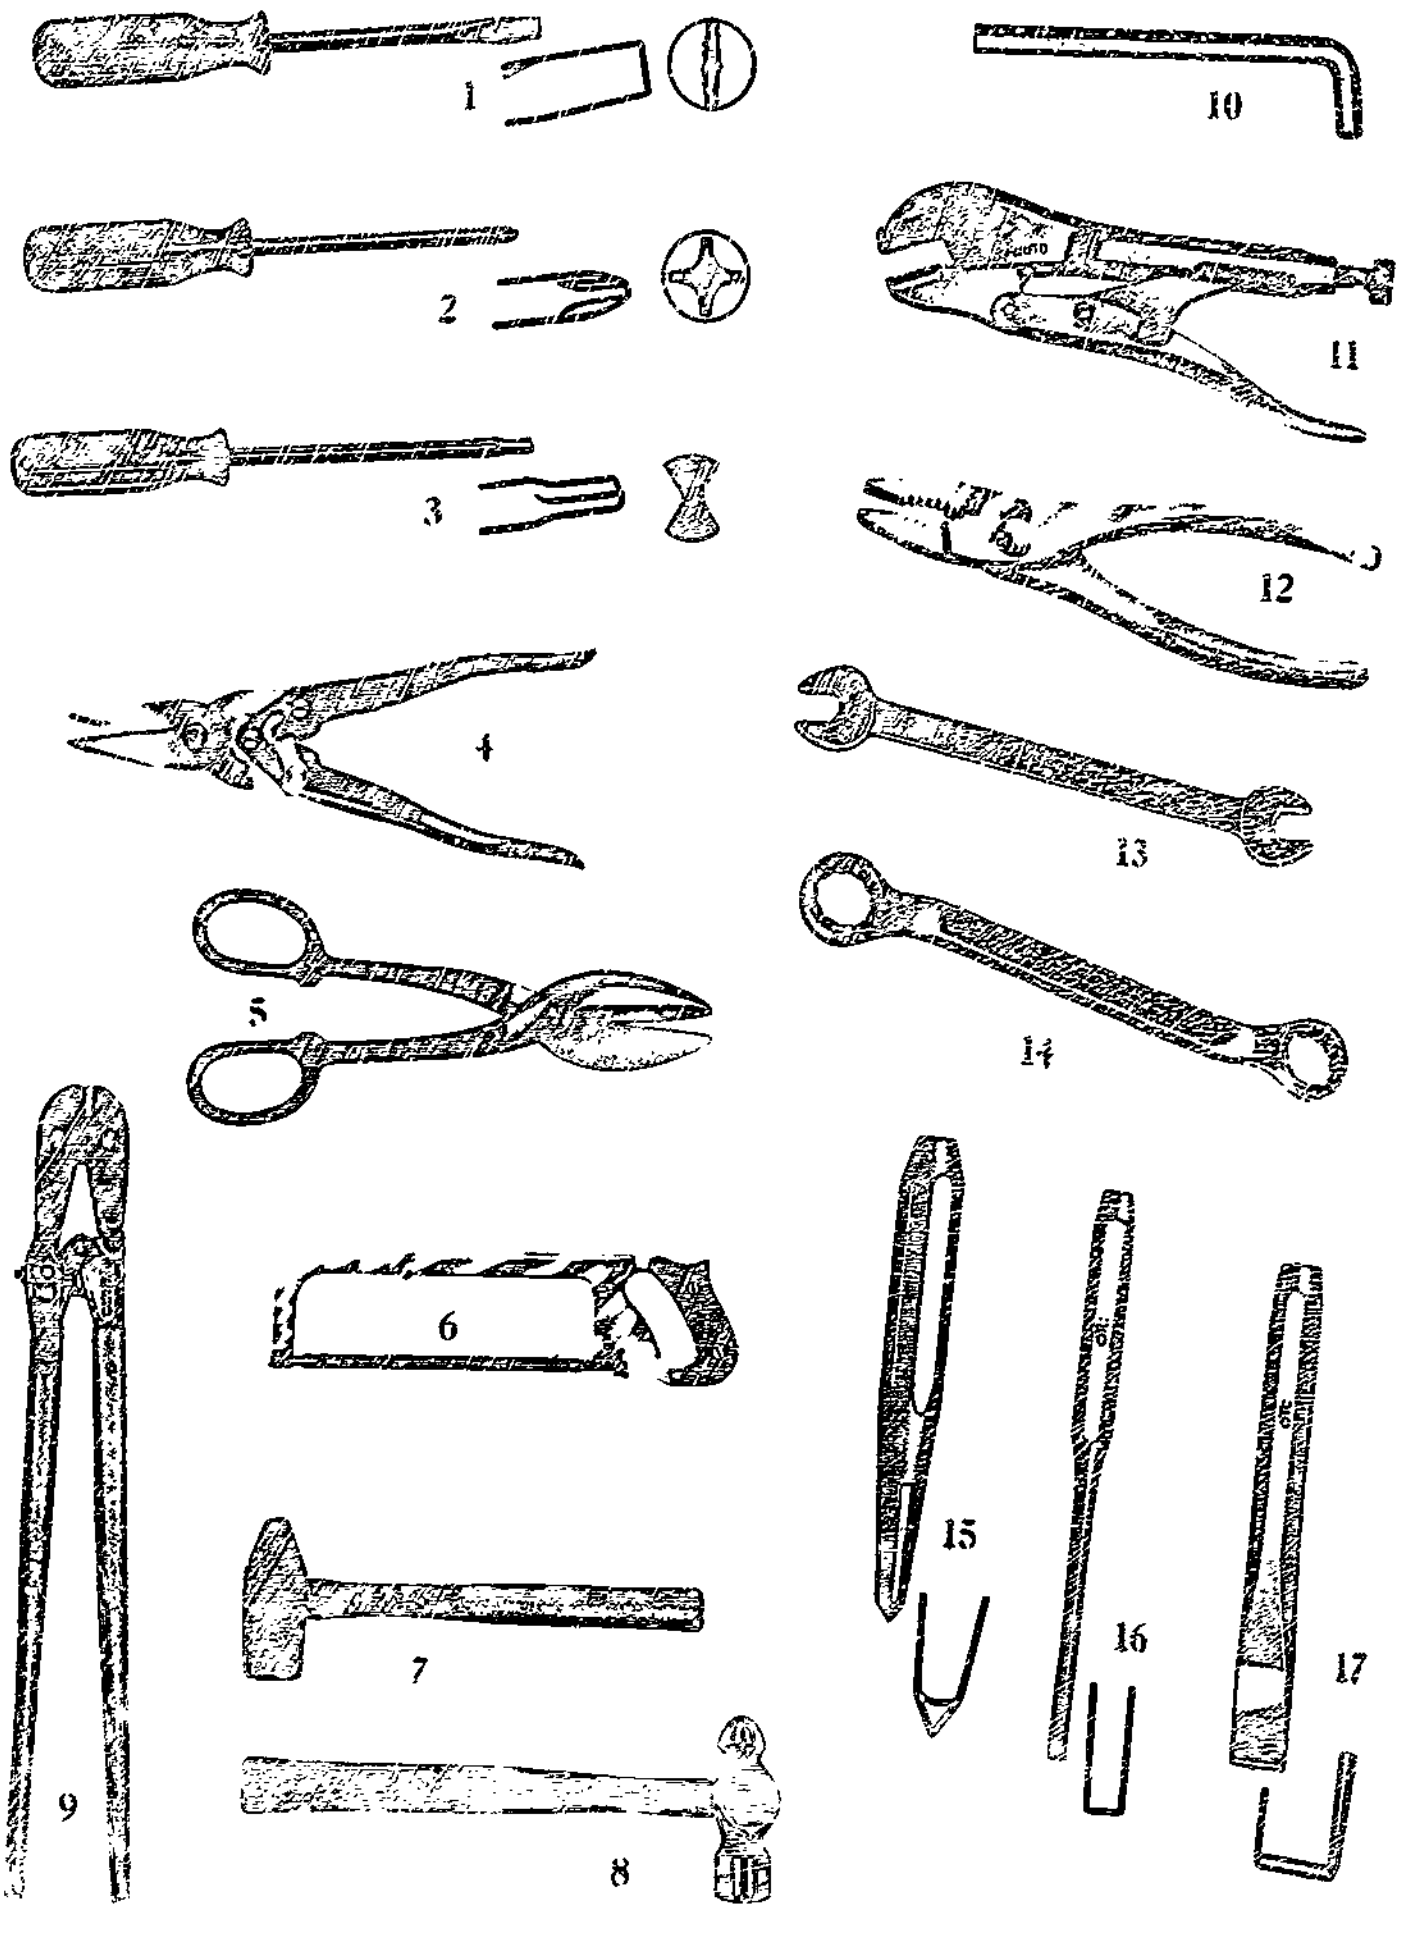

FIG. II-1

ASSIGNMENT:

1. Is it important to oil tools? Why?

2. What should you do with tools that have cutting edges? Why?

3. Do you think that storing tools on a tool board is a good idea? How can this help you?

4. What should be done with tools that are not used often?

5. Match the following names of tools with the correct numbers in the diagram. (Fig. II-1)

( ) ball pein hammer
( ) tire hammer
( ) straight screwdriver
( ) clutch head screwdriver
( ) Phillips head screwdriver
( ) center punch
( ) cold chisel
( ) pin punch
( ) hacksaw
( ) open end wrench
( ) box wrench
( ) pliers
( ) bolt cutter
( ) metal shear
( ) vise grip pliers
( ) Allen wrench
( ) aviation snips

6. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT II - CARE OF SHOP AND TOOLS

ACHIEVEMENT TEST

1. Explain why you think a clean shop is important.

2. How can clean windows help you?

3. What kind of accident can you prevent by keeping the floor clean?

4. What are hand tools?

5. What should you do with moving parts? cutting edges?

6. Name five basic hand tools that you have learned about in this unit.

7. List five new words that you have learned in this unit.
   Use each one in a sentence

UNIT III - MATERIALS AND PARTS OF THE AUTOMOBILE

Metals Lesson 1

OBJECTIVES: To learn about some of the different types of metal that go into the manufacture of an automobile.

To learn the reasons why so many different metals are used.

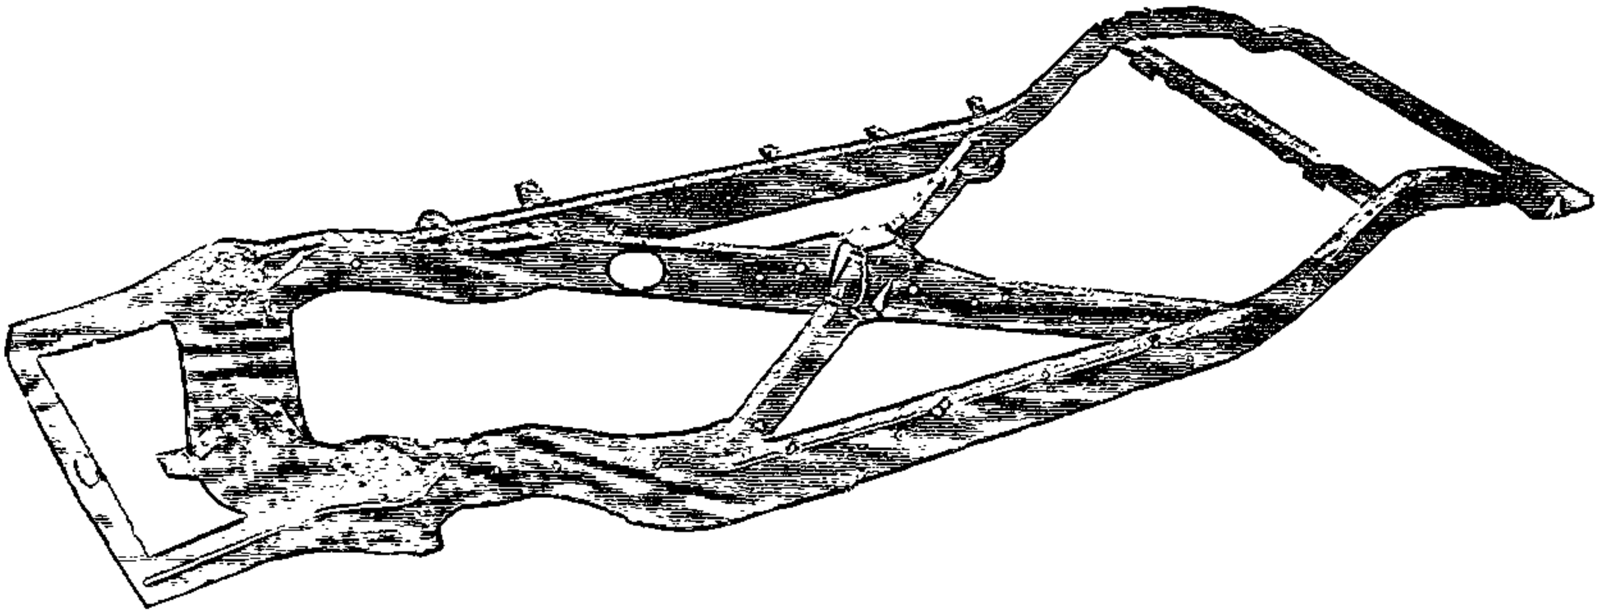
INFORMATION:

In order to learn how a part is to be repaired, we must first know what the part is made of. The automobile is a combination of many materials and each must be treated differently.

First let us look at the metals. In the manufacture of a car, a company uses steel, aluminum, chrome, brass, copper, nickel, cast iron, and white metal.

You may wonder why it is necessary to make use of so many different kinds of metal in one car, but let us look at some examples of the uses and the reasons they are used.

STEEL

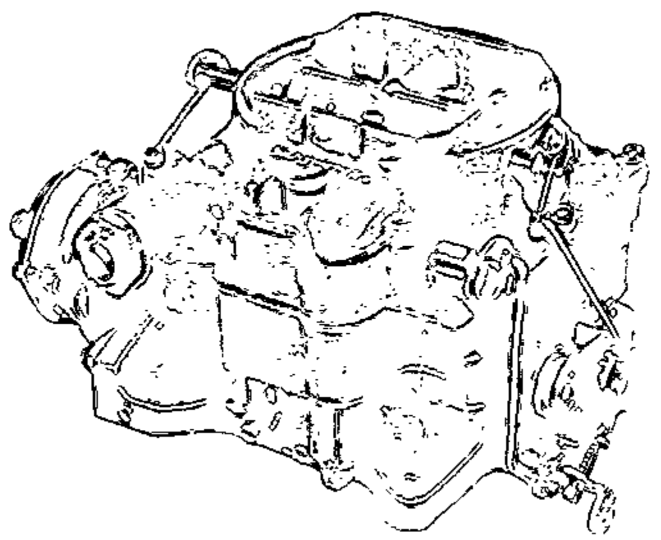


CHASSIS

FIG. III-1

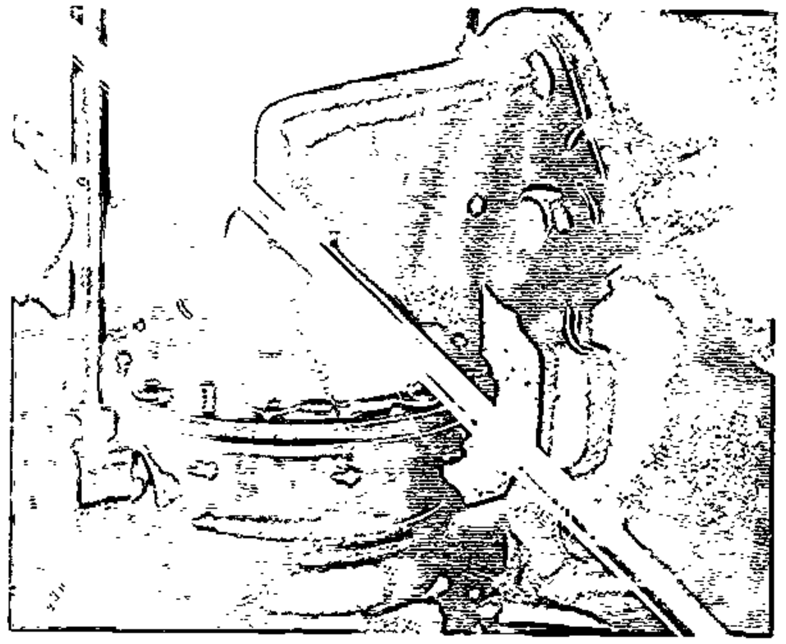
The body and chassis of the automobile are generally constructed of steel because steel is strong, long lasting, and reasonably economical. It can be bent or welded into almost any shape, resists the impact from a collision, and yet still is flexible enough to protect the people of the car from shock during an accident.

ALUMINUM



CARBURETOR

FIG. III-2

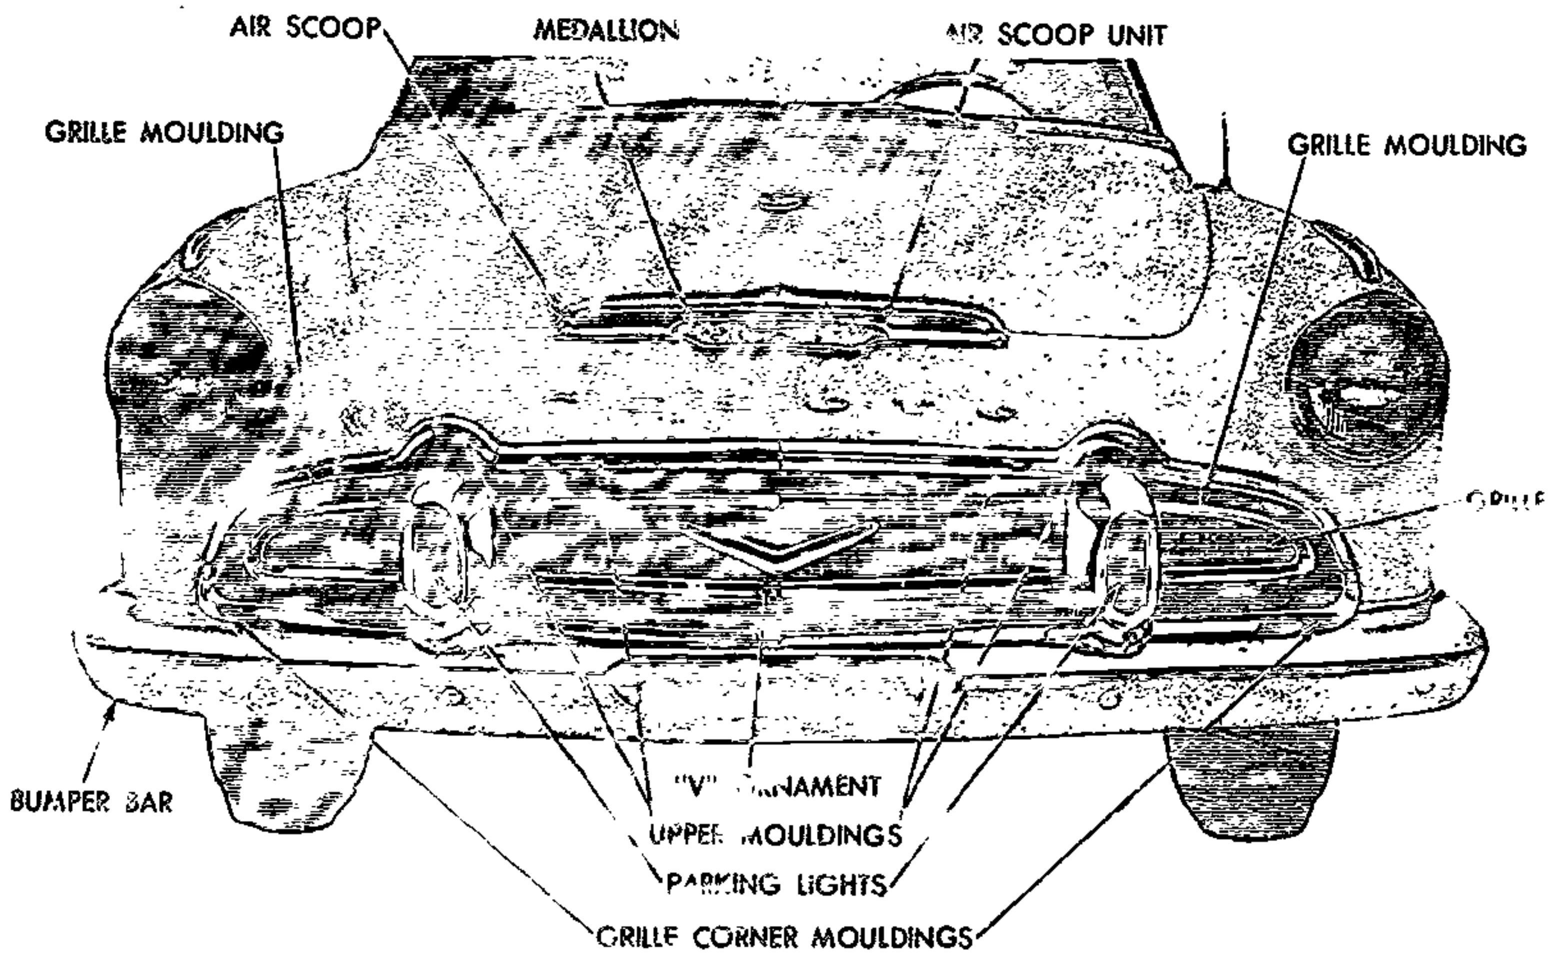


FUEL PUMP

FIG. III-3

Many parts of the car require little strength, but need durability and lightness. Aluminum is used for these parts. Engine parts such as carburetors and fuel pumps are made of aluminum because they add very little weight to the total weight of the engine and are long lasting because they do not rust. They are strong enough to withstand ordinary wear.

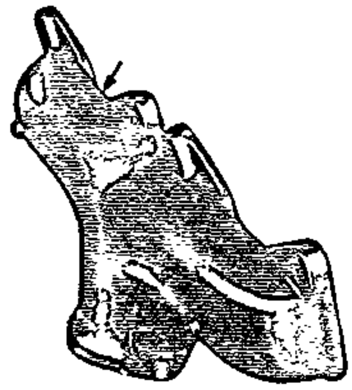
CHROME, NICKEL AND COPPER



GRILLE
FIG. III-4

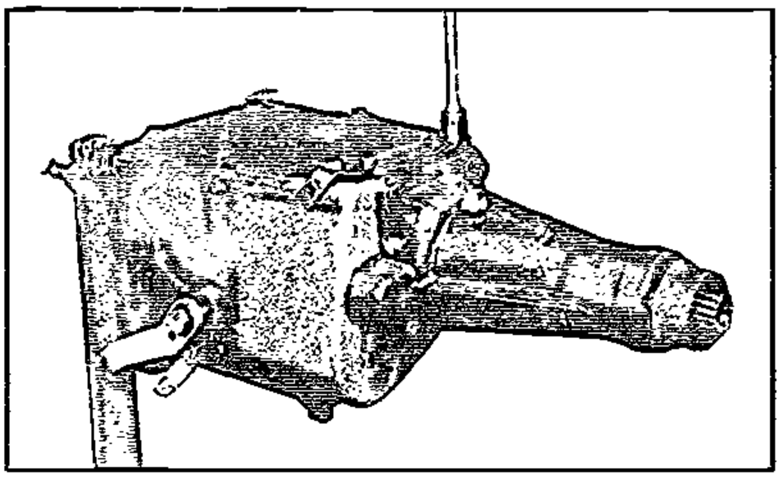
One of the most attractive parts of the car is the trim. In order to keep certain parts shiny and attractive they are coated with copper, nickel and chrome through the process of electroplating. This is a rather expensive process, therefore it is used mainly for trim which improves the appearance of the car.

CAST IRON



MANIFOLD

FIG. III-5



TRANSMISSION HOUSING

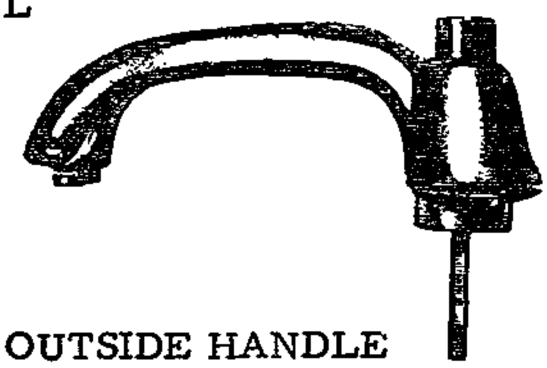
FIG. III-6

Parts such as the motor block, rear, and transmission housing are constructed of cast iron. This is a very heavy and strong material, which will resist heat, cold and shock from both ordinary use and the shock of accident. This resistance is very important for protecting the vital working mechanism of the automobile.

WHITE METAL

INSIDE HANDLE

FIG. III-7

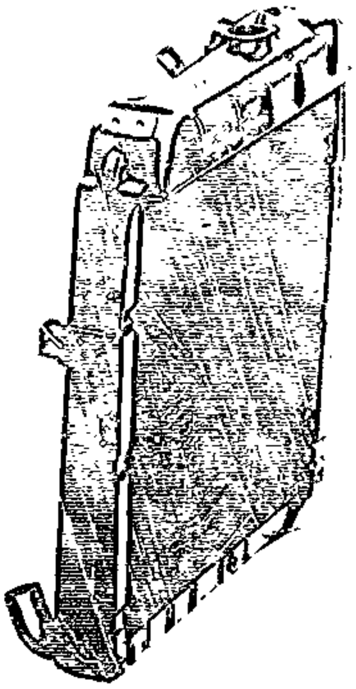


OUTSIDE HANDLE

FIG. III-8

Much of the hardware on the car is constructed of white metal. This is an alloy which is very light in spite of the thickness in which it is used. It will not rust and receives chrome plating very well. Due to its thickness it can be used for handles, headlight rims, taillight rims, and ornaments. It is very brittle and can break very easily if struck.

BRASS



RADIATOR

FIG. III-9

The heart of the cooling system on the automobile is the radiator. Without the radiator the car will overheat and be impossible to run. Most manufacturers use a combination of copper and brass for constructing a radiator. These materials are ideal because they do not rust and are excellent conductors of heat, which is the principle of the radiator - to release heat. Both metals are tinned easily and can be soldered.

We have mentioned only a few of the basic metals used on the car. These are the ones used most commonly and the ones you will be learning more about. There are also many other alloys used for special reasons, which we will omit at this time.

ASSIGNMENT:

1. What is the most common metal used on the automobile? Why?

2. Why is aluminum used on some parts of the car?

3. What is the reason for using cast iron?

4. Why are copper and brass used on the radiator of the car?

5. Why not use aluminum for the body instead of steel?

6. Why not use cast iron for the chassis instead of steel?

7. There are some underlined words in the lesson. Find them and give their meanings. Use each of these words in a sentence.

UNIT III - MATERIALS AND PARTS OF THE AUTOMOBILE

Body Parts Lesson 2

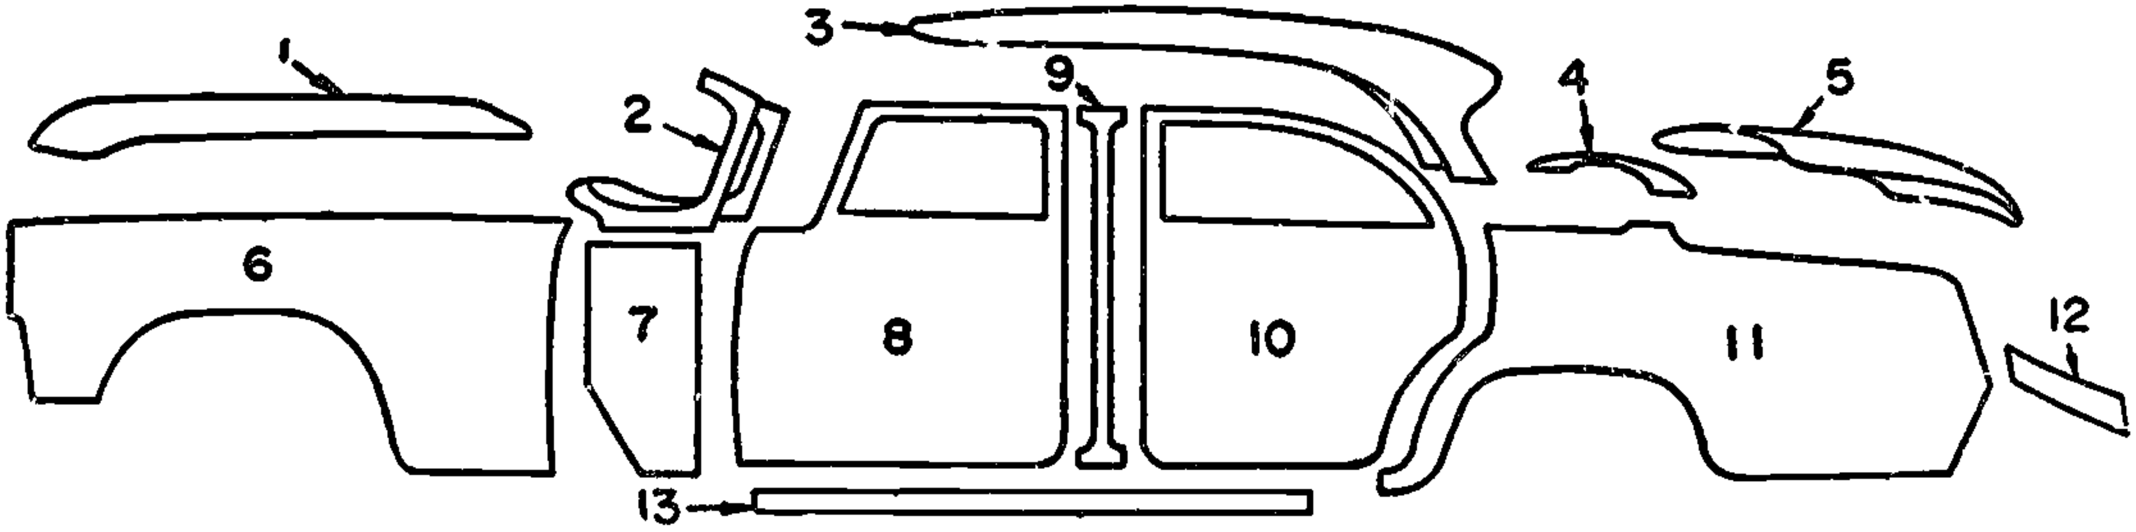
OBJECTIVE: To learn the basic body parts of the automobile.

INFORMATION:

From pictures of the early automobile you can see that there were very few parts as compared to the modern auto. The reason for the added parts on the modern car is the desire of the manufacturer to increase the sale of his product by providing added protection, convenience and appearance to the finished product. The modern automobile of today contains thousands of parts. In this section we will begin by studying the major body sections and those parts that are visible.

Study the picture carefully and identify the name of the part with a numbered section of the car. (Figs. III-10 and III-11)

97

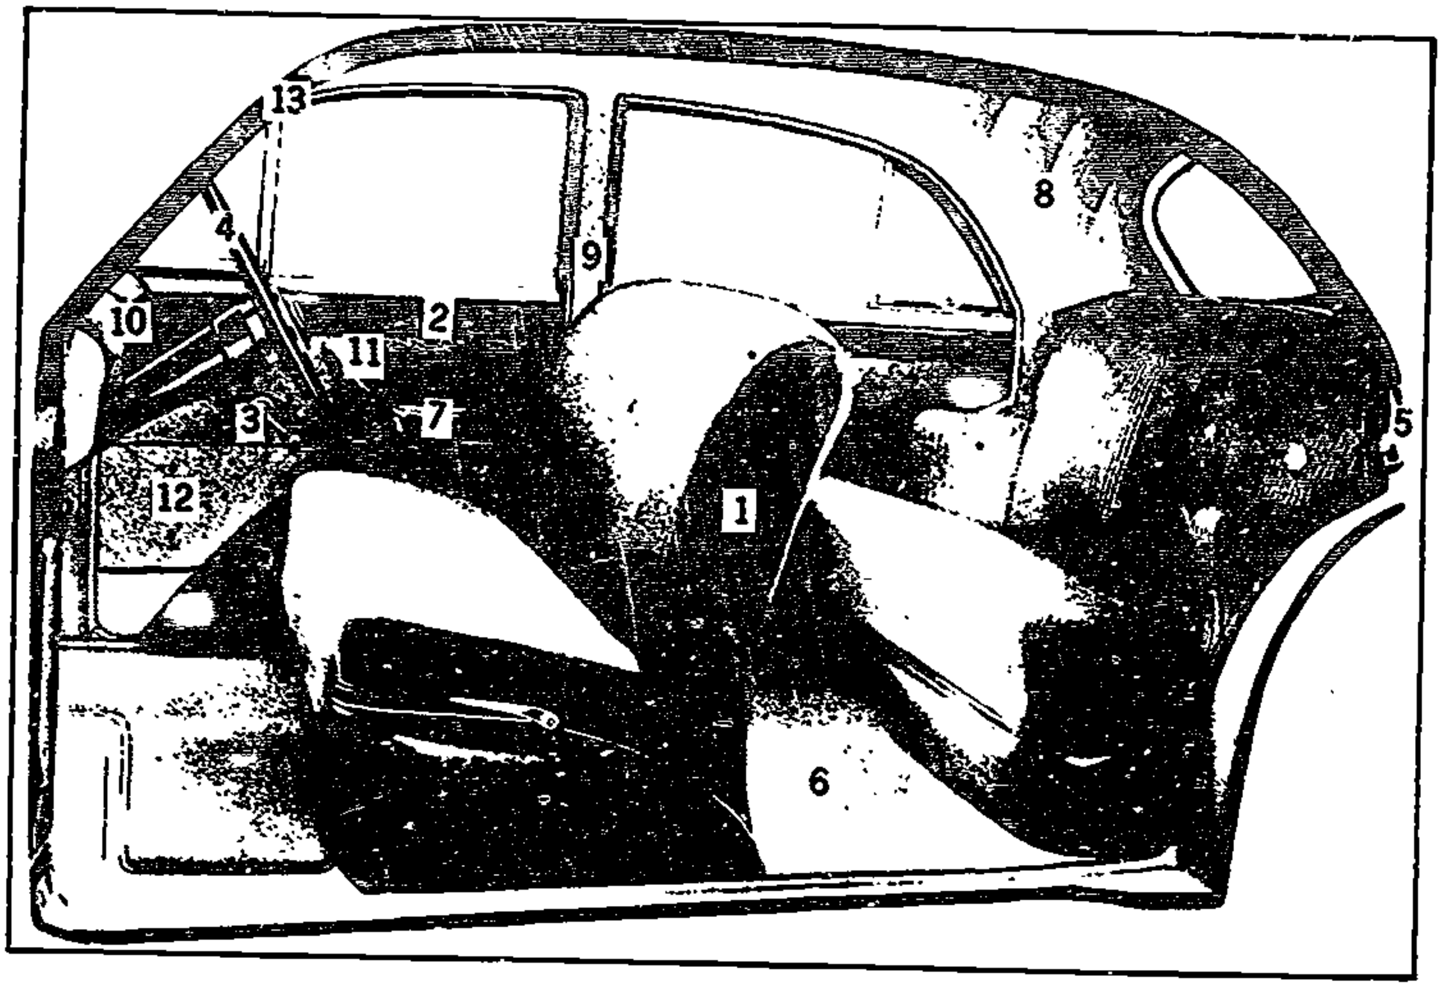


EXTERIOR PARTS

FIG. III-10

Exterior Parts

1. hood
2. cowl upper panel
3. roof panel
4. trunk upper panel
5. trunk lid
6. front fender
7. cowl side panel
8. front door
9. center pillar
10. rear door
11. quarter panel
12. trunk lower panel
13. rocker panel



INTERIOR BODY

FIG. III-11

Interior Parts

1.	seats	7.	arm rest
2.	garnish moulding	8.	headlining
3.	window regulating handle	9.	center post
4.	steering wheel	10.	instrument panel
5.	door jamb	11.	door handle
6.	rugs	12.	trim panel
		13.	sun visor

ASSIGNMENT:

1. Using the picture below and the following names, write the correct number of the part in front of the word which names that part.

( ) hood
( ) trunk upper panel
( ) cowl side panel
( ) rear door
( ) rocker panel
( ) cowl upper panel

( ) trunk lid
( ) front door
( ) quarter panel
( ) roof panel
( ) front fender
( ) center pillar
( ) trunk lower panel
