APPENDIX J

_________________ High School
Vocational Agriculture Department

(Sample Personal Data Sheet)

John Jones
Box 100
Farmville, U.S.A.

Personal Information

Age: 17
Height: 5'9"
Weight: 160
Health: Excellent
Telephone: 262-9038

Job Objective

I wish to secure a position in retail selling of agricultural products. My first preference is farm machinery and equipment sales. My second preference is in the area of agricultural chemical sales.

> Note: State the kind of position you desire or the specific interests you have. Clearness of objective and clarity of expression are both important. State your interest fully but be as brief as possible.

Education

High School: Senior at Farmville High School
Major: Vocational Agriculture
Technical Skill: Three years vocational agriculture, with specific instruction in repair and adjustment of farm equipment and machinery, farm welding, public speaking, parliamentary procedure, animal science, and crop science.
Leadership Activities: Secretary of FFA, Treasurer of Sophomore Class, member of Student Council.

Work Experience

Farmville Tractor & Equipment, Main Street, Farmville
Worked in the parts department during summer of 1965.
Jones Farm, Box 100, Farmville.
Worked as a general farm worker on my father's farm after school and during the summers from 1960 to 1964.

> Note: Briefly list all the jobs or positions you have held giving the employer's name, address, title of job, and length of service. Begin with your most recent job first.

References

Mr. Neal Groves, Manager, Farmville Tractor & Equipment Co., Main Street, Farmville.
Mr. Gilbert Andrews, vocational agriculture instructor, Farmville High School, Farmville.
Mr. Claude Rolloff, Box 101, Farmville.

Note: Obtain permission to use names. The following is acceptable if references are not listed: "Appropriate business and personal references will be furnished upon request."

APPENDIX K

AGRICULTURAL OCCUPATIONS OTHER THAN FARMING AND RANCHING

To give an idea of how broad the field of related agricultural occupations is, we give a partial list of agricultural occupations other than farming and ranching, classified by agricultural occupation families.

I. FARM MACHINERY SALES AND SERVICE OCCUPATIONS.

100 Blacksmith, welder, and general repairman
101 Custom farm machine operator
102 Farm machinery mechanic's helper
103 Farm machinery mechanics
104 Farm machinery service center foreman
105 Farm machinery parts helper or clerk
106 Farm machinery parts manager
107 Farm machinery salesman
108 Farm machinery fieldman
109 Farm tire service operator
110 Manager
111 Assistant manager
112 Office worker
150 Other

II. FARM SUPPLIES AND EQUIPMENT OCCUPATIONS

200 Country store clerk
201 Farm hardware and equipment store employee
202 Farm hardware and equipment store manager
203 Farm hardware and equipment store assistant manager
204 Farm hardware and equipment store office worker (bookkeeper, clerk)
205 Farm equipment fieldman
206 Farm equipment servicemen
207 Feed salesman
208 Feed mill employee
209 Farm cooperative service store employee
210 Farm equipment and supplies salesman
211 Truck driver for a feed mill or farmer cooperative
212 Truck driver for a rural gasoline and oil distributor
213 Truck driver for spreading bulk fertilizer
250 Other

III. LIVESTOCK AND POULTRY INDUSTRIES OCCUPATIONS

a. Dairying, dairy manufacturing and processing

300 Dairy herd supervisor
301 Dairy plant employee
302 Dairy plant manager
303 DHIA tester
304 Milk sanitarian
305 Milk truck driver
306 Other

b. Livestock Marketing and Processing

320 Butcher
321 Meat department manager
322 Livestock auction employee
323 Livestock auctioners
324 Livestock auction manager
325 Livestock buyer
326 Livestock dealer
327 Livestock truck driver
328 Slaughter house or locker plant manager
329 Slaughter house or locker plant employee
330 Stockyard employee
331 Other

c. Poultry Industry Occupations

340 Egg grader
341 Egg inspector
342 Hatchery employee
343 Hatchery manager
384 Poultry and egg buyer
345 Poultry debeaker
346 Poultry processing plant manager
347 Poultry processing plant assistant manager
348 Poultry sexer
349 Other

d. Livestock Industry Occupations
(Not elsewhere classified)

360 Animal industry laboratory technician
361 Animal industry laboratory assistant
362 Animal industry laboratory veterinarian
363 Apiary inspector
364 Livestock disease control worker
365 Veterinarian
366 Veterinarian's assistant
367 Other

IV. CROPS, FORESTRY, AND SOIL CONSERVATION OCCUPATIONS

400	Cannery or processing plant employee
401	Cannery or processing plant fieldman
402	Field crop, fruit and vegetable inspection employee
403	Forester
404	Fruit and vegetable produce buyer
405	Fruit and vegetable employee
406	Fruit and vegetable manager
407	Grain elevator employee
408	Grain elevator manager
409	Irrigation ditch rider
410	Lumberman or sawmill employee
411	Sawmill employee
412	Sawmill foreman
413	Manager
414	Soil conservationist
415	Soil conservationist aid
416	Soil conservation technician
417	State or national forest employee
418	Woodsman
419	Other

V. ORNAMENTAL HORTICULTURE OCCUPATIONS

501	City, state or national park employee
502	Florist or flower grower
503	Garden center employee
504	Garden center manager
505	Greenhouse employee
506	Greenhouse manager
507	Golf course superintendent
508	Golf course employee
509	Ground maintenance employee
510	Landscape architect
511	Landscape gardner
512	Nursery employee
513	Nursery manager
514	Tree pruner
515	Tree surgeon
516	Other

VI. WILDLIFE AND RECREATION OCCUPATIONS

601	Fish warden
602	Game bird propagator
603	Game management employee
604	Other

VII. FARM SERVICE OCCUPATIONS

701	Artificial inseminator
702	Country butchers
703	Crop duster
704	Crop pollinator
705	Crop sprayer
706	Custom farm machine worker
707	Farm appraiser
708	Farm building painter
709	Farm building renovator
710	Feed and hammer mill
711	Field supervisor (A.S.C.)
712	Fruit caretaker
713	Fruit sprayer
714	Lime spreader
715	Mobile blacksmith shop operator
716	Mobile repair shop operator
717	Rural insurance representative
718	Rural real estate representative
719	Sheep dipper
720	Sheep shearer
721	Other

VIII. AGRICULTURAL SERVICE OCCUPATIONS

801	Farm auctioneer
802	A.S.C. field superintendent
803	A.S.C. office manager
804	A.S.C. checker
805	Farm placement representative
806	Farm advisory work, consultant
807	Field representative for agricultural marketing business
808	Ag advertising
809	Ag newspaper and magazine work
810	Farm appraiser
811	Farm organization staff person
812	Agricultural economist
813	Agricultural engineer
814	Agricultural journalist
815	Agronomist
816	Agricultural college instructor
817	Entomologist
818	Extension work-county agent
819	Pathologist (plant)
820	Rural sociologist
821	Soil conservationist
822	Vocational agriculture instructor
850	Other

Study of Selected Curricula in Technical Education in Public Junior Colleges.

Guemple, John R.

Texas Education Agency, Austin. Vocational Education Div.

Pub Date - Sep64

MF AVAILABLE IN VT-ERIC SET 22p.

*CURRICULUM, *TECHNICAL EDUCATION, *JUNIOR COLLEGES,

Junior college courses, with hours per week and credit hours are listed for the following technologies--(1) air conditioning, refrigeration, and heating, (2) automotive, (3) chemical, (4) civil, (5) construction, (6) data processing, (7) drafting, (8) electrical, (9) electronic, (10) highway construction, (11) industrial, (12) industrial instrument, (13) law enforcement, (14) mechanical, (15) medical laboratory assistant, (16) medical x-ray, (17) metallurgical, (18) registered nurse, and (19) television production. The core curriculum common to most technical programs is included. The curriculums are representative of what junior colleges are doing in this field in various parts of the United States. (PS)

Auto Mechanics Group Instruction, Instructor's Guide for Use with a Course of Study for Students in Auto Mechanics.

Baugrud, Kim
Missouri Univ., Columbia. Dept. of Industrial Education
Missouri State Dep of Educ, Jefferson City. Ind Educ Sect
Pub Date - Oct66
MF AVAILABLE IN VT-ERIC SET 34p.

*TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO MECHANICS (OCCUPATION), *MOTOR VEHICLES, HIGH SCHOOLS, GROUP INSTRUCTION, *COOPERATIVE EDUCATION,

This instructor's guide provides an organized group instructional procedure for teacher use in high school or post-high school cooperative education programs in auto mechanics. It was developed by a statewide development committee and research assistants, designed by subject matter specialists and teacher educators, and field tested. It provides resource material to supplement class discussion topics in the student manual (VT 001 628). The assignment sheet keys provide answers to student assignment sheets, suggested supplementary assignments, and visual aids, and other resources. The material is to be used by the instructor in a 1-year program, and, since it is intended as a basic guide, should be adapted to the individual instructor's needs. The instructor should be a competent vocational teacher, and the students should be juniors in high school with proper prerequisites. The document is mimeographed. Lists of automotive instructional aids and specification manuals are included. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

AUTO MECHANICS GROUP INSTRUCTION, cooperatively with Indus. Educ.

Dept. (U. of Mo. at Columbia) and Mo. State Dept. of Ed. (1966)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Industrial Education Dept., Univ. of Mo. At Columbia
Address 103 Industrial Education Building
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's guide $1.50

(2) Means Used to Develop Material:
Development Group Development Committee and Research Assistants
Level of Group State
Method of Design, Testing, and Trial Subject matter specialist and teacher educators. Field tested.

(3) Utilization of Material:
Appropriate School Setting High School, post high school, area vocationa
Type of Program preparatory vocational industrial education progran
Occupational Focus job cluster covering various phases of auto mechanic
Geographic Adaptability United States
Uses of Material Study guide for related instruction on a group basis
Users of Material student guiding class discussio

(4) Requirements for Using Material:
Teacher Competency competent vocational instructor
Student Selection Criteria junior in high school with proper prerequisites
Time Allotment 180 days

FOREWORD

This instructor's guide has been prepared for the convenience of the auto mechanics instructor to provide source material in guiding class discussion as designated in the student's manual. For each discussion question provided in the student's manual the reference is given indicating the source of information which provides the answer by the letter indicating the particular text or reference in the assignment.

An attempt was made to keep the number of references at a minimum and still provide adequate coverage. The references were the most recent available at the time of preparation. Additional sources of references may be found under "supplementary assignments" which the instructor may find valuable in supplementing the basic material as well as in making assignments for advanced students.

Special credit is due to Mr. Kim Baugrud, Research Assistant in Industrial Education at the University of Missouri, who prepared the assignment sheets and compiled this material.

HUBERT WHEELER

Commissioner of Education

October, 1966

INTRODUCTION

The instructor's guide and student manual for Auto Mechanics were designed to provide an organized instructional procedure for the teacher. In preparing this material, it has been assumed that job skills and procedures will be learned through actual experience under the direction of a qualified mechanic. The technical and related information is to be given through the use of these manuals and the direction of the instructor, in the school.

Each of the student assignment sheets contain an introduction, a reading assignment, selected references, and a series of questions based on the readings. The question and the assignment sheets serve two purposes:

1. To guide the student to the important aspects of the reading.

2. To form a basis or guide for classroom discussion.

These questions may also be used as written assignments to emphasize some of the more important ideas.

The instructors guide should be used as a supplement to make his teaching more effective. It is intended to be used only as a basic guide and should be adapted to individual teacher's needs. Individual modification to fit your needs is encouraged.

Each student should be encouraged to start a notebook, and to keep it neat and as well organized as possible. A notebook can be useful in instruction, provided it is kept within bounds, i. e., diagrams drawn from an actual part, or questions from a job sheet, not available except in the shop, are proper materials for notebook work.

Your attention should be directed to the fact that there are two types of study guides available in auto mechanics:

1. An <u>individual</u> study guide having objective questions designed for self study.

2. A <u>group</u> study guide with discussion type questions covering the same material.

If the instructor chooses, he may use questions from either of the study guides as test material.

4

INFORMATION CONCERNING INSTRUCTIONAL MATERIALS

The intelligent use of instructional materials reinforces teaching and teaching methods employed by the teacher. It is therefore the responsibility of the teacher to select, with care, the proper aid to be presented for the lesson being given. A film, chart, or other aids should never be a substitute for good teaching nor just a means to occupy student time.

Annually, many excellent instructional materials are provided for the teachers across the nation on free loan or with a minor charge. Placing these sources in the hands of the teacher presents a problem. Catalogs represented by every major phase of industry supplying materials are to be had for just a nominal postage fee. The problem, therefore, seems threefold, they are to:

1. Have available a listing of the materials.
2. Place them into the hands of the users.
3. Schedule the material providing maximum utilization.

Wise planning of these materials may in some cases require a schedule of considerable flexibility and pre-planning, often as much as a year in advance.

The following instructional materials source listing is not complete, but is suggested as representive.

KEY--ASSIGNMENT SHEET NO. 1
INTRODUCTION TO THE AUTOMOBILE REPAIR BUSINESS

I. Key To Study Questions:

1.	B, C	4.	B, C
2.	B, C	5.	B, C
3.	B, C	6.	B, C

II. Suggested Supplementary Assignments:

1. Interview a successful local auto repair owner. Find out how he would suggest a young man of high school age work toward becoming a mechanic.
2. Report the advantages and disadvantages of owning your own business as obtained from a local garage dealer.
3. Write to Small Business Administration for information on starting your own business or starting an Automotive Service Station. (Free)

III. Suggested Visual Aids:

Booklet:

"GM Educational Opportunities"

A booklet explaining the procedure to be followed in applying for college undergraduate scholarships. (General Motors)

"In Planning Your Future"

This booklet outlines the opportunities available to young men and women in the retail automobile business. This booklet was written to tell students something about how the business operates, how they can get started, what they would do in various jobs and what the future is likely to be. (General Motors)

Film:

"Aim For the Top"

This film describes the opportunities available to young men and women in retail automative business. It depicts the present level of occupation and outlines the future opportunities that lie ahead for those who desire. (16 mm - sound - color - 15 min - General Motors)

IV. Suggested Speakers:

1. Local auto repair dealer to discuss his views on hiring youngsters, and his recommendations for job entry.

KEY--ASSIGNMENT SHEET NO. 2
BASIC COMPONENTS OF THE AUTOMOBILE

I. Key To Study Questions:

1. A-1
2. A-2
3. A-6
4. A-3
5. A-4
6. A-4
7. A-7
8. A-9
9. A-39
10. A-43
11. A-43
12. A-47
13. A-48

II. Suggested Supplementary Assignments:

1. Obtain several back issues of Life, Post, etc., magazines (the older issues). Compare the automobile advertisements of then to the present, noting particularly the body style.
2. Write to Ford Motor Co. for the booklet, "The Evolution of Mass Production." Study what effects of mass production of automobiles are noticeable today.

III. Suggested Visual Aids:

Booklet:

"A Car is Born"

A 32-page booklet describing all steps necessary to the design, development, manufacture, assembly and distribution of automobiles. Junior and senior high school classes. Available in quantities up to 30. (SS 105 - Ford Motor Co.)

Film:

"Member of the Family"

The revealing of the complex and unique process involved in styling, engineering and manufacturing the modern automobile. (16mm - sound - color - 19 min - Buick Motor Division)

"Mechanics of the Car"

Discusses the necessity of understanding simple car mechanics. Explains the power source, the cooling and electrical systems, lubrication, brakes, exhaust and power accessories. (30 min-Black & White - Indiana University)

"What It Takes to Make Your Car"

(Automobile Manufacturers Association)

"The World Makes an Automobile"

(Automobile Manufacturers Association)

2. Vocational School director to discuss post high school opportunities in auto mechanics.

3. Labor Union Official - Apprentice Director - to discuss entrance into work, apprenticeships.

KEY--ASSIGNMENT SHEET NO. 3
SHOP PROCEDURES AND SAFE PRACTICES

I. Key To Study Questions:

1. A-11
2. A-11
3. A-35
4. A-35
5. A-36
6. B-21-2
7. B-21-7
8. Ref. C

II. Suggested Supplementary Assignment:

1. Provide the student with a picture of a wrench or a nut. (Ref. C, p. 15) Have student show:

   A. How he could increase the leverage applied to the nut and not break the wrench.

   B. How would he apply two different methods to remove the nut if it was rusted on a manifold.

   C. How he would increase the torque on the nut in a confined space.

2. Interview a local garage mechanic on the procedure he uses to care for his tools.

3. Write to a tool supplier and ask to have a field representative discuss special tools for automotive use.

III. Suggested Visual Aids:

Film:

"ABC's of Hand Tools", I & II

A simple and informal film to accompany the booklet of reference C, telling the right and wrong ways of handling and using the more common hand tools. (General Motors Film Library)

"How to Install a School Eye Program"

Fendall Co., 2222 Diversey Parkway, Chicago, Ill. C0647

"Safety Packet"

National Safety Counsel, 425 N. Michigan Ave., Chicago, Ill.

KEY--ASSIGNMENT SHEET NO. 4
AUTOMOTIVE ENGINE DESIGN

I. Key To Study Questions:

1. B-1-7
2. B-1-7
3. B-1-7
4. B-1-9
5. B-7-4
6. B-7-6
7. B-7-6
8. B-7-9
9. B-7-1
10. A-61
11. A-64
12. A-74

II. Suggested Supplementary Assignments:

1. Obtain from several automobile dealers, pictures of V8 engines with various horsepower ratings. Compare the placement of the distributor, coil, fuel pump, oil filter, etc. of each to one another.

2. Discuss what effect the use of aluminum parts has on engine design.

III. Suggested Visual Aids:

Booklet:

"The Automobile Engine"

An illustrated text showing principles governing operation of internal combustion engines, and the way in which these principles are incorporated into a modern V8 gasoline engine. (32 pages, junior and senior high school classes, single copies, SS 103 - Ford Motor Co.)

Film:

"ABC's of the Automobile Engine"

Explains the parts and workings of the automobile engine. (13 min. - color - General Motors)

"ABC's of Internal Combustion"

Clearly describes the theory of the internal combustion engine and the four-stroke cycle. (13 min-color-General Motors)

KEY--ASSIGNMENT SHEET NO. 5
AUTOMOBILE ENGINE COMPONENTS

I. Key To Study Questions:

1. A-83
2. A-84

26. B-2-11
27. B-2-12
28. B-2-16
29. B-2-19
30. B-2-20
31. A-126
32. A-124

II. Suggested Supplementary Assignments:

1. Illustrate in sectional view sequence, the operation of a generator, a distributor.

2. Compare the valve angles of a V8 engine with the same manufacturer's 6 cylinder engine.

3. From an exploded view of an engine, identify the parts.

III. Suggested Vivual Aids:

Film:

"ABC of the Automobile Engine"

Explains the parts and workings of the automobile engine. (18 min.-color-General Motors)

"ABC of Internal Combustion"

Clearly describes the theory of the internal combustion engine and the four stroke cycle. (13 min.-color-General Motors)

"Know Your Car"

An excellent technical film on the parts and functions of the modern automobile. (15 min.-Black & White-Chicago Motor Club)

KEY--ASSIGNMENT SHEET NO. 6
ENGINE SERVICE

I. Key To Study Questions:

1. A-272
2. A-272
3. A-273
4. A-274
5. A-274
6. A-274
7. A-277

27. A-322
28. A-324
29. A-327
30. A-330
31. A-331

II. Suggested Supplementary Assignments:

1. Obtain six discarded valves from several engine types. Diagnose the probable cause of failure and suggest what steps might have been taken to prevent each trouble.

2. Write a brief page on the use and operation of a valve-seat run out gauge. Estimate the cost of a valve and ring "job".

3. Write for a free copy of "Just what is a piston fit?" Sunnen Products Co., 7910 Manchester Ave., St. Louis 17, Mo.

4. Describe an economical method that can be used to remove and replace a cylinder sleeve.

III. Suggested Visual Aids:

Film:

"It's Magic"

A detailed film showing how an engine is assembled in a modern automotive engine plant. (16 min.-Black & White-Modern Picture Service)

"Where Mileage Begins"

In a stop-motion sequence the engine is assembled without being touched by human hands. (22 min.-Black & White-General Motors)

Booklet:

"Principles of Valve and Valve Seat Reconditioning"

$.50 (Black & Decker, Jappa Road, Towson, Maryland, 21204)

Poster:

Ring installation Poster (Dana Co.)

16. A-253
17. A-257
18. A-258
19. A-269

II. Suggested Supplementary Assignments:

1. Prepare a chart on the distribution of energy as obtained from five gallons of gasoline. Ref. page A-59.

2. Estimate how much power is absorbed by the use of engine accessories, power equipment, etc.

III. Suggested Visual Aids:

Booklet:

"Tune-Up, Troubleshooting And Maintenance Information"

(TALL3) This booklet consists of a complete set of tune-up procedures covering all series engines and governors which are normally found in the Maintenance Manuals. Included are the maintenance recommendations and a set of trouble-shooting charts. (General Motors)

Film:

"Details Make the Difference"

35 MM sound slide film, color, with 33 1/3 RPM record on how to check out the overhaul of an automobile engine. Accompanying instructor's manual contains suggestions for classroom use of film and record. (Free. Sealed Power Corp. Muskegon, Michigan)

"Engine Tune-Up Procedure Filmstrips"

The following group of filmstrips is accompanied by a Meeting Leader's Guide. Each covers the complete tune-up procedure which includes valve adjustment, injector timing and governor adjustments. The procedures are described in a step by step method pointing out the simplicity of the correct tune-up procedure. 53 In-Line Engines with Limiting Speed Governor (25SE20). 6V-53 Engine with Limiting Speed Governor (25SE19--General Motors)

"Trouble Shooting"

(Federal-Mogual Co.)

15. A-133, 156
16. A-167

II. Suggested Supplementary Assignments:

1. Compare the thermostatic fuel gauge system with a balancing coil regarding the dash units.

2. Explain why an idle compensator is needed on engine carburetors when equipped with air conditioning and why it is not needed when air conditioning is not part of the equipment.

III. Suggested Visual Aids:

Chart:

"Automotive Fuel System"

The fuel system starts with the gasoline tank and this chart explains the fuel pumping and carburetion principles of today's automobiles. A textual discussion is on reverse side. (General Motors)

Manual:

"AC Fuel Pump Shop Manual"

This manual explains how the AC Fuel Pump works and outlines the complete service procedure for maintenance and overhaul. Single copies available free to automotive mechanics teachers; quantity prices upon request. (General Motors)

Film:

"Rochester Carburetor Film Strips"

Several 35mm. training films are available on Rochester GM Carburetors. These together with the availability of school carburetors, parts and service manuals, bulletins and basic schematics are listed in a training aids folder which includes an order blank. Address:

United Motors Service
Attn: Supply Purchasing Dept.
3044 West Grand Boulevard
Detroit, Michigan 48202

"Gasoline's Amazing Molecules"

This film illustrated the formation of petroleum molecules and shows the complete story of the manufacturing of gasoline. (Modern Picture Service)

Booklets:

"Facts About Gasoline"

$.07, (Ethyl Corp.,100 Park Avenue, New York, N. Y., 10017)

"The Story of Gasoline"

$.42, (Ethyl Corp., 100 Park Avenue, New York, N. Y., 10017)

KEY--ASSIGNMENT SHEET NO. 9
ENGINE LUBRICATION AND SERVICE

I. Key To Study Questions:

1. B-5-3
2. B-5-4
3. B-5-6
4. B-5-14
5. B-5-16
6. B-5-18

12. A-176
13. A-178
14. A-183
15. A-186
16. A-342

II. Suggested Supplementary Assignments:

1. Explain the difference between the fuel flow lubrication system and the by-pass system.

2. List the purposes of engine oil.

3. Obtain samples of various engine oils in each rating and list the visual differences between each. Test each with a blotter for impurities.

III. Suggested Visual Aids:

Film:

"Why of Auto Lubrication"

Shows chief units of car which needs lubrications. Shows use of engine oil in cylinder and on bearings. Also takes up need for lubrication in transmission. Brings about an application of the facts learned about lubrication. (21 min.-color- #209 Modern Picture Service)

"Basic Principles of Lubricating"

Shows underlying necessity of proper lubrication. (25 min-Black & White-General Motors)

"Kit of Educational Material"

Why change crankcase oil? The story of oil, and others. (Quaker State Oil Co., Box 989, Oil City, Pa., 16302)

"Handbook for Teachers"

Facts about oil. (American Petroleum Institute, 1271 Avenue of Americas, New York, N. Y., 10020)

KEY--ASSIGNMENT SHEET NO. 10
ENGINE COOLING SYSTEMS AND SERVICE

I. Key To Study Questions:

1. B-4-2
2. B-4-8
3. B-4-11
4. B-4-13
5. B-4-14
6. A-197
7. A-190
8. A-193
9. A-194
10. A-195
11. A-349
12. A-350
13. A-351
14. A-352
15. A-196

II. Suggested Supplementary Assignments:

1. Place each of the following in a separate laboratory beaker: plain water, 50% alcohol base antifreeze, 50% Ethylene Glycol base anti-freeze. Heat to a boiling condition, observe the temperature at which each boils by placing a thermometer in the beaker. Discuss which one would make the best lasting antifreeze.

2. Test the opening temperature of a thermostat by placing it in water and heat to a boiling temperature. Discuss the resulting effect on the coolant if the thermostat did not open at the proper temperature.

3. Place in a freezer container of solutions of various strength of antifreeze solutions. At what minimum strength will a solution not freeze over a period of 24 hours at the freezer temperature? Report your findings.

III. Suggested Visual Aids:

Manual:

"Automotive Cooling and Heating System Manual"

Basic service procedures for liquid and air cooled engines, car heaters and windshield defroster, and car air-conditioning systems. (Single copies-General Motors)

"Cooling System Service Manual"

($1.00-Warner Patterson Co.-600 S. Michigan Avenue, Chicago, Illinois, 60605)

KEY--ASSIGNMENT SHEET NO. 11
PRINCIPLES AND COMPONENT PARTS OF THE ELECTRICAL SYSTEM

I. Key To Study Questions:

1. B-19-25
2. B-19-22
3. B-19-24
4. A-203
5. A-204
6. A-205

10. A-219
11. A-222
12. A-225
13. A-229
14. A-220

II. Suggested Supplementary Assignments:

1. Explain the relationship of the electrical system to the economical operation of the automobile.

2. Produce a check list of common electrical trouble symtoms.

3. Prepare a chart on alternators vs. generators as a source of electrical power listing advantages of each.

III. Suggested Visual Aids:

Manual:

Training Manual Volume I
Electrical Systems, $.75, automotive
Electrical Association, 16223 Meyers Road
Detroit, Michigan 48235

Film:

"The Story of the Modern Storage Battery"

The film traces the history of the storage battery, introducing the scientists who contributed to its development and illustrating some of the problems they overcome. The narration portrays the principles of the battery and its evolution. (27 min.-color-Bureau of Mines)

KEY--ASSIGNMENT SHEET NO. 12
THE ELECTRICAL SYSTEM IGNITION & LIGHTING

I. Key To Study Questions:

1. B-3-5
2. B-3-7
3. B-3-12
4. B-3-14
5. B-3-18
6. B-3-21
7. A-236
8. A-239
9. A-241
10. A-240
11. A-243
12. A-245
13. A-246
14. A-384
15. A-387

II. Suggested Supplementary Assignments:

1. Prepare a comparison between spark plugs and their heat ranges.

2. Discuss the importance of headlight adjustment and the apparatus used to adjust the headlights.

3. Report on the legal restrictions placed on automobile lighting.

4. Discuss the effects of transistorizing the ignition system on engine efficiency.

III. Suggested Visual Aids:

Manual:

"Headlight Tester"
(#560, $.30, Bear Co.)

Handbook:

"Facts About Spark Plugs and Engines"
(Champion Spark Plug, Box 910, Toledo, Ohio, Free)

"Ignition Circuit Maintenance"
(324-3, $.80, Delco Remy) The Ignition System (5133D Delco Remy)

Film:

"A Spark in Time on the Firing Line"
(#2211, 20 min., color, Modern Picture Service) This is an excellent fully-animated educational film on the operation of an automobile ignition system.

"The Spark of Power"
(#2492, 13 min., color, Modern Picture Service) Here is a fully animated outstanding film on the function of spark plugs in the internal combustion engine.

KEY--ASSIGNMENT SHEET NO. 13
ELECTRICAL SYSTEM SERVICE

I. Key To Study Questions:

1. A-225
2. A-226
3. A-226
4. A-228
5. A-229
6. A-229
7. A-371
8. A-372
9. A-372
10. A-373
11. A-375
12. A-378
13. A-383

II. Suggested Supplementary Assignments:

1. Prepare a maintenance table on the electrical system.

2. Bring to class an article depicting recent advances in service procedures given to auto electrical systems.

III. Suggested Visual Aids:

Film:

"Commutation of DC Machines"

(Same principle as in automobile, 24 min., Black & White, Westinghouse, 411 N. 7th Street, St. Louis 1, Mo.) Clearly presents the theory and maintenance of communication of direct-current motors and generators. Animated drawings explain the theory of commutation and the troubles that arise from stray oil and grease, moisture, looseness of mounting, worn brusholder boxes, grooving, poor seating of new brushes and irregular inspection. How to prevent and mend these troubles is graphically demonstrated in detail.

Manuals:

"Alternator & Transister"

(Set of 3, $1.00 each, Detroit) (A. E. A.)

KEY--ASSIGNMENT SHEET NO. 14
CLUTCHES AND CLUTCH SERVICE

I. Key To Study Questions:

1. A-391
2. A-393
3. A-395
4. A-398
5. A-401
6. A-402
7. A-403
8. A-404
9. B-9-3
10. B-9-3
11. B-9-5
12. B-9-7
13. B-9-8
14. B-9-9
15. B-9-2
16. B-9-1
17. B-9-9
18. B-9-10

II. Suggested Supplementary Assignments:

1. Write a brief summary on why driving safety is economy.
2. Describe the advantages of purchasing an automobile with a clutch.

III. Suggested Visual Aids:

"Exploded View of Clutch Assembly"

Prepare a handout for class use from text book.

KEY--ASSIGNMENT SHEET NO. 15
TRANSMISSIONS AND THEIR SERVICE

I. Key To Study Questions:

1. A-409
2. A-406
3. A-407
4. A-411
5. A-409
6. A-416
7. A-421
8. A-428
9. A-430
10. A-434
11. B-10-2
12. B-10-12

II. Suggested Supplementary Assignments:

1. Investigate the duties, pay, location, opportunities, schools, training, etc. of a transmission specialist, report your findings to the class.

III. Suggested Visual Aids:

Chart:

"Three-Speed Gear Transmission"

Printed instruction on the back of this chart explains clearly the mechanics of shifting gears in the conventional automotive transmission. (General Motors)

"Typical Gear Combinations"

The many gears and gear combinations used by modern industry are outlined and explained in this interesting wall chart. (General Motors)

KEY--ASSIGNMENT SHEET NO. 16
AUTOMATIC TRANSMISSIONS AND SERVICE

I. Key To Study Questions:

1. B-12-7
2. B-12-8
3. B-12-8
4. B-12-10
5. B-12-13
6. A-448
7. A-448
8. A-450
9. A-451
10. A-455
11. A-454
12. A-456
13. A-459
14. A-469
15. A-500

II. Suggested Supplementary Assignments:

1. Read chapters 43,44 in supplementary reference.

III. Suggested Visual Aids:

Chart:

"Chrysler Corporation Automatic Transmission"

(Illustrations, 8 1/2 X 11, single to teachers)

Manual:

"Service Manuals for Various Heavy Duty Automatic Transmissions"

A series of seven service manuals describing the product; telling how and why it works. Words and pictures are used to show teardown and rebuild procedures. (Available singly, General Motors)

Book:

"Cruise-O-Matic"

These are 8 1/2 X 11 individually bound books containing schematics or gear train build ups designed to be colored (in) by the learner. It is felt by coloring these . . . the operation will be more firmly fixed in the mind of the student. ($1.10, Ford Motor Co.)

Film:

"Automatic Transmissions"

Stresses economy and comfort in the uses of automatic transmissions (13 min., Black & White, Ford Motor Co.)

KEY--ASSIGNMENT SHEET NO. 17
DRIVE MECHANISMS

I. Key To Study Questions:

1. A-502
2. A-505
3. A-506
4. A-506
5. A-509
6. A-510
7. A-511
8. A-512
9. A-513
10. A-515
11. A-515
12. A-515
13. A-515
14. B-14-8
15. B-14-7
16. B-14-8
17. B-14-8
18. B-14-12

II. Suggested Supplementary Assignments:

1. Discuss the importance of a heavy lubricant in the differential. Compare this lubricant with the type used in a universal joint.

2. Sketch the various universal joint types.

3. Report on the functions of the differential, slip-joint.

4. Relate the importance of the ring gear to the drive pinion while making a turn.

III. Suggested Visual Aids:

Chart:

"Rear Axle Assembly"

(General Motors) This chart shows views of the automobile rear axle assembly and presents a clear and simple explanation of this complicated mechanism.

Film:

"Indianapolis 500"

A recap of the 1963 auto racing classic in which Roger Ward, driving the Kaiser Aluminum Special, finished fourth. The film features the battle between the standard offenhauser driven, front engine cars and a new, lightweight, rear engine car using an 8 cylinder Ford engine. Race highlights the increasing importance of weight saving and the contributions being made by aluminum. (30 min., color, Kaiser Aluminum & Chemical Corporation)

KEY--ASSIGNMENT SHEET NO. 18
SPRINGS AND SUSPENSION SYSTEMS

I. Key To Study Questions:

1. A-517
2. A-519
3. A-519
4. A-520
5. A-523
6. A-524
7. A-525
8. A-526
9. A-531
10. B-15-5
11. B-15-6
12. B-15-6
13. B-15-10
14. B-15-10
15. B-15-14
16. B-15-14
17. B-15-18
18. B-15-18

II. Suggested Supplementary Assignments:

1. Discuss the relationship of the springs to the drive mechanism.

2. Explain the effect of placing a shock absorber inside a front end coil spring. Why are both items used on the front suspension?

III. Suggested Visual Aids:

Chart:

"Automobile Chassis"

The typical automobile chassis pictured in the chart makes it easy to show how the various mechanical parts fit together and operate as a single unit. (General Motors).

Booklet:

"Delco Automotive Suspension Products"

(Delco, Dayton, Ohio)

KEY--ASSIGNMENT SHEET NO. 19
SERVICING STEERING AND SUSPENSION SYSTEMS

I. Key To Study Questions:

1. B-17-2
2. B-17-5
3. B-17-23
4. B-17-6
5. B-17-8
6. B-17-10
7. B-17-12
8. B-17-14
9. B-17-15
10. A-543
11. A-544
12. A-546
13. A-561
14. A-562
15. A-569
16. A-570

II. Suggested Supplementary Assignments:

1. Compare the front end suspension system to a gyroscope.

2. Why should the tie rods be increased in diameter when power steering is a part of the system? Estimate the power consumption used by a power steering booster.

3. Report on the type fluid used in a power steering system and characteristics it must possess.

III. Suggested Visual Aids:

Manual:

"Wheel Alignment of Your Car--What it is--How it works"

$.30 (Bear Co.)

"Wheel and Steering Alignment"

Routine manual ($.30, Bear Co.)

"Fundamentals of Wheel Alignment"

Notebook ($.40, Bear Co.)

Chart:

"Steering System"

This schematic diagram pictures the automobile steering gear assembly and also shows how power steering is applied. (General Motors)

KEY--ASSIGNMENT SHEET NO. 20
BRAKES AND BRAKE SERVICE

I. Key To Study Questions:

1. B-18-1
2. B-18-2
3. B-18-4
4. B-18-6
5. B-18-8
6. B-18-10
7. B-18-13
8. B-18-16
9. B-18-20
10. A-571
11. A-573
12. A-576
13. A-577
14. A-577
15. A-580
16. A-573
17. A-576
18. A-587
19. A-590
20. A-592

II. Suggested Supplementary Assignments:

1. List the qualities a good brake fluid should possess.

2. What adjustments are possible on a master cylinder in a dual system?

3. List characteristics of brake shoe linings, and "clues" of brake trouble.

4. Report on the effects of oil, gasoline, water, and dust particles have on brake shoe lining.

III. Suggested Visual Aids:

Schematic:

Prepare a schematic of a single and dual brake system.

Manuals:

Fundamentals of Brake Service Notebooks $.40, (Bear Co.)

Chart:

"Brake System"

This schematic drawing clearly illustrates the operation of the hydraulic and mechanical principles involved in the brake system of the modern automobile. (General Motors)

Films:

"When the Chips Go Down"

(#2169, 22 min., color, Modern Picture Service) The importance of good brake linings is stressed in this film. We see how they are manufactured and the astonishing number of rigid tests they must pass. A brief and tragic episode shows what happened to a family when their brakes failed to work.

"It's All in the Brakes"

(#EG504) American Insurance Association, 85 St. John's Street, New York, N. Y., 10038

KEY--ASSIGNMENT SHEET NO. 21
WHEELS, TIRES, AND TIRE REPAIR SERVICE

I. Key To Study Questions:

1. A-564
2. A-595
3. A-595
4. A-596
5. A-599
6. A-600
7. B-16-2
8. B-16-2
9. B-16-3
10. B-16-4
11. B-16-5
12. B-16-5
13. B-16-7
14. B-16-7
15. B-16-8
16. B-16-9

II. Suggested Supplementary Assignments:

1. Discuss the advantages of each of the following:

   a. tire recapping
   b. tire rethreading
   c. wheel balancing
   d. tire chain usage
   e. tubeless tires

2. List the factors that cause variations in tire pressure.

3. What differences are required in wheel rim shapes when comparing tube type to tubeless tires.

III. Suggested Visual Aids:

Film:

"Tommy Looks at Tires"

(Free, 16mm, 20 min., color) Film giving information about research, development and testing in the manufacturing of tires. Stearling Movies, U. S. A., Inc., Central Booking Exchange, 43 West 61st St., New York 23, New York.

KEY--ASSIGNMENT SHEET NO. 22
AIR CONDITIONING

I. Key To Study Questions:

1. B-20-2
2. B-20-2
3. B-20-2
4. B-20-4
5. B-20-4
6. B-20-5
7. B-20-5
8. B-20-8
9. B-20-11
10. B-20-11
11. B-20-4
12. B-20-4

II. Suggested Supplementary Assignments:

1. Prepare a color coded sketch of the components of an air conditioning system.

2. Study the trouble shooting chart prepared on page 48-8 of the supplementary reference.

III. Suggested Visual Aids:

Manual:

"Frigidaire Service Home Study Course #1"

Covers basic food preparation and fundamentals of refrigeration. (General Motors)

"Frigidaire Service Home Study Course #2"

Covers the components which make up a refrigeration system. (General Motors)

Film:

"Chemical Stability in a Refrigerating System"

(Sound strip, 23 min., General Motors) This slide film illustrates how chemical stability and freedom from contamination is vitally necessary for the efficient operation of refrigerating products. The proper procedures to be followed by servicemen in maintaining chemical stability are thoroughly covered and the results of improper servicing techniques are graphically illustrated. Based on the booklet on the same subject.

"Fundamentals of Air Conditioning and Heating"

(Sound Strip, 30 min.,) Covers a study of air circulation, ventilation, filtration, sound and comfort of air conditioning. Also includes the testing of combustion as it applies to heating equipment.

Pub Date - Oct66
MF AVAILABLE IN VT-ERIC SET 75p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO MECHANICS (OCCUPATION), HIGH SCHOOLS, JOB ANALYSIS, GROUP INSTRUCTION, *COOPERATIVE EDUCATION, *MOTOR VEHICLES,

Students may use this guide in studying technical and related information in high, post-high, or area vocational school auto mechanics programs. It was developed at the state level by a committee and research assistants and has been field tested. The 23 assignment sheets contain introductory statements, assignments, references, and discussion questions. The questions guide the student to the important aspects of the reading assignments and form a basis or guide for classroom discussions. Representative assignment sheet titles are (1) Basic Components of the Automobile, (2) Automotive Engine Components, (3) Engine Service, (4) Clutches and Clutch Service, and (5) Air Conditioning. An information sheet is included on job management. The material is to be used on a group or class basis in conjunction with experience in actual repair situations of an automobile or component parts under teacher supervision for 1 year or 180 days. Teachers should be vocationally competent, and students should be in grade 11 or 12 and have proper prerequisites. Supplementary materials include a list of references and a trade analysis. A second study guide (VT 002 080) has been developed for individual study. It is based on the same references and has the same assignments with objective-type questions which may be used for test purposes with this study guide. An answer key (VT 002 081) which locates the question reference sources is available for both study guides. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

(1) Source of Available Copies:
Agency Industrial Education Dept., Univ. of Mo. At Columbia
Address 103 Industrial Education Building
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's guide $1.50

(2) Means Used to Develop Material:
Development Group Development Committee and Research Assistants
Level of Group State
Method of Design, Testing, and Trial Subject matter specialist and teacher educators. Field tested.

(3) Utilization of Material:
Appropriate School Setting High School, post high school, area vocational
Type of Program preparatory vocational industrial education programs
Occupational Focus job cluster covering various phases of auto mechanics
Geographic Adaptability United States
Uses of Material Study guide for related instruction on a group basis
Users of Material student guiding class discussion

(4) Requirements for Using Material:
Teacher Competency competent vocational instructor
Student Selection Criteria junior in high school with proper prerequisites
Time Allotment 180 days

FORWARD

This course of study, consisting of an analysis of AUTO MECHANICS GROUP INSTRUCTION, together with assignment sheets covering the related (occupational) information, has been prepared for teaching auto mechanics on a group or class basis in a trade preparatory program.

The original analysis for this course of study was developed in 1940 by Mr. R. W. Baker, Director of Vocational Education, Joplin, Missouri, and by Mr. Lloyd E. Estes, formerly coordinator, and Mr. Kenneth Epperson, Auto Mechanics Instructor, Hannibal, Missouri. The assignment sheets for this course of study are especially designed for group instruction and were prepared by Mr. Kim Baugrud, Research Assistant in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missour who supervised the preparation of the material and edited the manuscript Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Educatio Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUMBERT WHEELER

TABLE OF CONTENTS

Assignment Sheets:

Information Sheet:

INTRODUCTION

In preparing this course of study, it has been assumed that job skills and procedures will be learned through experience in actual repair situations of an automobile or component parts under the direction of a competent teacher. The technical and related information is to be given in conjunction with each associated assignment at the appropriate time. The teaching sequence set up in the manual is intended to be flexible.

Each assignment in the manual contains an introduction, reading assignment, and a series of discussion questions based on the reference pages assigned. The purposes of the introduction are to create interest, convey the importance of the assignment to the student, and tell him specifically what he is expected to learn. The reading assignments are keyed to the basic texts listed on page (6) six of this manual.

The questions on the assignment sheets serve two purposes: (1) to guide the student to the important aspects of the reading assignment, and (2) to form a basis or guide for classroom discussions. The questions may also be utilized as written assignments to emphasize a particular procedure as topic, as well as selected essay test items.

Your attention should be called to a second study guide on Auto Mechanics, one designed specifically for a single student doing individual study. It is based on the same reference material, has the same assignments, but the questions for each unit are of the objective type. These questions lend themselves very well to test purposes. A key is available for both study guides locating the reference source from which the questions were written.

As the student proceeds through the course, it is advisable for him to keep a well organized notebook. In this notebook, he would bring to the shop any information needed to perform the day's assignment. This will give added life to the text. Related information not found in the text would also be kept here.

TO THE STUDENT-WORKER

The auto mechanic's trade is a service type of trade which is concerned primarily with the adjustment, repair, and installation of parts, and general maintenance of the automobile. Auto mechanics are classified either as general mechanics or as specialists. The general auto mechanic is capable of performing the great majority of operations necessary to return a vehicle to its normal operating condition. A specialist is one who has all-around knowledge of the trade, but who has, in addition, become especially skilled in one or more particular phases of automotive repair, such as carburetion, brakes, or ignition.

Outlook and Opportunity for the Automotive Mechanic

An increasing number of competent automotive mechanics will be in demand throughout the forseeable future. This upward trend is certain to continue due to the rapidly rising number of cars, trucks and buses on the nation's highways. The increase in farm mechanization will also add to this demand. Today there are approximately one million automotive mechanics. For an occupation this size the Labor Department estimates that retirements and deaths alone create about 12,000 to 15,000 openings each year.

In addition to the increase in numbers needed, there will be a demand for mechanics with more skills and technical knowledge than has been required. The relatively new features such as automatic transmissions, power brakes, power steering, air conditioning and other mechanical innovations requires an understanding of numerous scientific principles and their application in the servicing and repair of motor vehicles.

Earnings for the auto-mechanic vary depending on the location and size of the community, the mechanic's specialty, the type of establishment and other factors. However, regardless of these factors the competent mechanic can look forward to earning good wages. A survey by the Department of Labor in 1958 showed that wages for mechanics ranged from $2.05 to $3.16 an hour, with the average being $2.50 an hour. More important than wages, perhaps, is the fact that the prospective mechanic will not be tied to a dead-end job. Instead, he can look forward to a life of challenging experiences as he repairs and services the complex motor vehicles of the future.

Personal-Social Traits Essential for the Auto Mechanic

Personality traits are of extreme importance, not only in securing and holding a desirable position but in life in general. Personal and social traits can be improved through training when the individual learns what to improve, how to improve and why improvement is advisable. Among the personal-social traits of chief importance to the auto mechanic are the following:

Patience. Much of the work of the auto mechanic is in "hard-to-get" places, and it requires patience as well as skill to make the necessary adjustments and repairs.

Personal Appearance. Clothing should be worn that makes for safety, efficiency, and a pleasing impression upon the people you serve.

Good Physical Condition. Physical requirements are not excessive, but the conditions of work are not always ideal. Often it is necessary to work in cold, drafty, and poorly ventilated places. One must be in good physical condition to keep at top efficiency. One must have good muscular coordination, mechanical dexterity, good eyesight, and steady nerves.

Cooperation. Auto mechanics requires a willingness to work cooperatively with fellow workers. This means an attitude of readiness to assist others when they need help, and to join in group undertakings.

Consideration of Others. A thoughtful attitude toward making things easy and pleasant for others, such as keeping things in order, putting tools away, and doing your full share of work is an important marketable trait of a good auto mechanic.

Industry. This character trait means a habit of careful, thoughtful, energetic attack upon the job without loitering or wasting time.

Initiative. The ability to see what needs to be done and to go ahead without constant supervision is an essential trait of an auto mechanic.

Reliability and Trustworthiness. Intrusted in your care are people's lives and valuable property. Negligence on your part as a mechanic can easily cause death and destruction.

ANALYSIS

Introduction to Auto Mechanics

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	1	1. Importance of automobiles in today's world
	1	2. Nature and opportunities in the auto-repair business
	1	3. Occupational and vocational guidance information
	1	4. Sources of auto repair information
	1	5. Things to consider before opening your own business
	2	6. Historical Review of the Automobile
	2	7. The Automotive Industry
	2	8. Automobile, Design and Major Components
	3	9. Auto-Repair Hand Tools
	3	10. Tool Safety and Usage

The Engine

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	4	11. Physical principles involved in engine construction
	4	12. Types of engines used in automobiles
	4	13. Engine classifications
	4	14. Gas turbine and experimental engines
	4	15. Engine component identification
	4	16. Engine mounting
	4	17. Two cycle engine operation
	5	18. Engine block design
	5	19. Principles of cylinder construction
	5	20. Piston and connecting rod design
	5	21. Piston ring design and cylinder installation
	5	22. Variations in cylinder head placement
	5	23. Types and purposes of gaskets
	5	24. Function of intake and exhaust manifold
	5	25. Construction and design of engine bearings

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	5	26. Cam, crankshaft design and function
	5	27. Kinds of engine valves
	5	28. Principles of the valve train
	5	29. Function of engine fly wheel
	5	30. Importance of proper valve timing
	5	31. Engine timing devices
	5	32. Crankcase design and function
	5	33. Types and operation of valve lifters
	6	34. Operating characteristics of valve trains and valves
	6	35. Diagnosing valve troubles
36. Free stickey valves	6	36. Methods of servicing valves
37. Adjust valve-tappet clearance		
38. Remove and replace valves		
39. Recondition valves and valve seat		
40. Replace a valve seat insert		
41. Test valve guide wear		
42. Check and repair hydraulic valve lifters		
	6	43. Cylinder head maintenance
44. Remove, clean, replace cylinder head		
45. Install gaskets		
46. Inspect piston for damage	6	46. Service to pistons and cylinders
47. Check cylinder walls for variation		
48. Remove ridge ring		
49. Refinish cylinder walls		
50. Remove, fit, install pistons		
51. Clean piston ring grooves		
52. Remove, fit and install piston rings	6	52. Types of piston rings
53. Remove, fit, and replace piston pin bushings	6	53. Ways of servicing connecting rods
54. Remove, align, install connecting rod		
55. Align connecting rod to piston		
56. Remove and replace connecting rod bearings		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
57. Remove and replace crankshaft	6	57. Methods used to check crankshafts
58. Test and align crankshaft		
59. Clean oil passages		
60. Check and adjust crankshaft end play		
61. Remove and install main bearings		
62. Remove and replace oil seals		
63. Remove and replace cam shaft		
64. Test and align cam shaft.		
65. Remove and replace camshaft bearings		
66. Measure engine efficiency	7	66. Engine measurements
67. Test engine compression	7	67. Testing instruments used in engine service
68. Measure engine vacuum		
69. Diagnose engine troubles	7	69. Principles of trouble shooting the engine

Fuel System

	8	70. Chemistry of engine fuels
	8	71. Effects of condensation on fuels
72. Check fuel lines	8	72. Fuel tank design
73. Remove and replace fuel pump, bowl	8	73. Operating theory of fuel pumps

Units 1-5

INTRODUCTION TO THE AUTOMOBILE REPAIR BUSINESS

Job opportunities in the automotive industry are expected to continue in a sharp rise over the next two decades. This is due primarily to the increase in the two-car families, general prosperity, and the population explosion. In addition, the increased complexity in the modern engine will open many doors to future jobs for the trained mechanic.

It is important to understand that your job is an investment for the future. As a prospective mechanic, it would be beneficial to know all the pitfalls and advantages of the trade. Such significant items as tools may be overlooked. Foolish is the person who spends hundreds of dollars, years of time and effort, in preparing for a trade that is of no interest to him.

In this assignment you will have an opportunity to learn about the significance of the automobile repairman in our society, and obtain an overall view of the future.

Assignment:

1. Read the references listed below.
2. From the classified section of a metropolitan newspaper, obtain six(6)different job opportunities in the automotive trade. What common requirements, if any, are stated?
3. Write a letter of application for the position you would like to have as obtained from the newspaper.
4. Answer the questions below and turn in the assignment by ____________________.

References:

A. Stockel, Auto Mechanics Fundamentals, Chapter 22
B. Occupational Outlook Handbook, (Obtain from Guidance Department) (D.O.T. 5-81.000 through .999)
C. either
    1. SRA -- Occupational Brief, # 610e, Automotive Mechanic.
    2. Chronicle -- Occupational Brief, # 5-81.01, Automobile Mechanic.

Questions:

1. Why should an auto mechanic know the advantages and disadvantages of the trade before entering it? What are some of the pitfalls you would expect to encounter when entering the trade?

2. What reasons can be attributed to the increased need of trained auto mechanics?

3. What type of training is necessary for success as an auto mechanic? Will an apprenticeship speed this process up? Who is an apprentice? Where can you obtain information about apprenticeships?

4. What are the primary duties of a general automobile mechanic? How do the tune-up specialist's duties differ from his?

5. Is it possible for a person to be a specialist and not have a general all-round mechanics background?

6. How much money can be earned per week on the average? As an apprentice? Journeyman?

Assignment
Sheet No. 2

Covering
Units 6-8

BASIC COMPONENTS OF THE AUTOMOBILE

The automotive industry, since it is keenly competitive, is highly specialized. It requires of its people a thorough up-to-date working knowledge of techniques and specializations. However, before specialization can take place, a broad background from which the mechanic can select his specialty must be acquired.

It is important for anyone going into a trade that he learn as much as possible about his trade. Unless the student draws ideas from many sources, his background will be limited.

The purpose of this assignment is to provide a brief overview of the component parts of an automobile.

Assignment:

1. Read the reference listed below.
2. Obtain from several new car dealers literature showing the new features on their new models, place them in a notebook.
3. Answer the questions below and turn in this assignment by ________________.

Reference:

A. Crouse, Automotive Mechanics, pp. 1-10, 38-48.

Questions:

1. What is meant by the term interchangable parts? How has this concept helped mass production?

2. How do the operating principles of the steam engine compare with those of the gasoline engine?

3. Compare an automobile frame with a chassis? Are the terms synonymous?

4. Is a complete fuel system absolutely necessary? Could an automobile operate without one of the parts? How does each part contribute to the whole system?

5. What purpose does oil serve in an engine? Why must oil be present within the engine at all times?

6. Explain what is likely to happen if the cooling system became inoperable. Trace the flow of coolant through an engine.

7. What components make up a brake system? By what principle does a hydraulic brake operate.

8. How does a slip joint differ from a universal joint? Where and for what purpose are each used?

9. Define reciprocating motion, rotary motion. How does an engine utilize these motions? How is rotary motion converted into reciprocating motion?

10. What was the purpose of placing two valves at the closed end of a cylinder? What is a valve seat? a stem? a valve guide?

11. If stroke refers to piston movement, what is meant by a four stroke engine? two stroke engine?

12. What is the relationship between the number of cylinders and engine power?

13. What basic physics principles are associated with the fly wheel? Why are teeth placed on the fly wheel?

Assignment
Sheet No. 3

Covering
Units 9-10

SHOP PROCEDURES AND SAFE PRACTICES

During the early days of the accident prevention movement the emphasis was placed on the task of providing proper safeguards for structures and machinery. Today, over 73 per cent of the accidents studied were found to be caused directly by unsafe acts of individuals.

Think twice before committing a foolish act. It may be you that ends up in the hospital or cemetary, not the machine. Safety is a way of life. Unless you practice safety with everyday awareness you may find it difficult to turn it on and off. Remember, you may last a life time if you take care of yourself.

In this assignment you will have an opportunity to learn some of the ways of avoiding accidents through the proper use of tools and equipment. Suggestions will also be given on how to cope with certain hazards that may arise in the shop.

Assignment:

1. Read the references listed below.
2. In a brief report discuss the procedure you would suggest to organize an effective program of safety for an auto repair shop.
3. A fellow worker is consistantly using a tool in the wrong manner, i.e. a wrench as a hammer. Discuss the method and tact you would suggest to help correct the bad work habits he has developed.
4. Answer the questions and hand in the report (2 or 3) prepared by ______________.

References:

A. Crouse, Automotive Mechanics, pp. 11-37.
B. Stockel, Auto Mechanics Fundamentals, Chapter 21.
C. General Motors Corporation, ABC's of Hand Tools, pp. 3-47.

Questions:

1. Discuss the six basic service classifications which all automotive jobs fall under.

2. What type of specifications are used in the modern automobile? Who is responsible for determining these specifications?

3. What significance is placed on working with clean, dry tools?

4. Explain the procedure to follow when using power driven equipment in the automotive shop.

5. Discuss the procedure used to handle and store highly flammable mixtures.
6. What characteristics should be looked for in quality automotive tools?
7. Discuss the safety practices applicable for student use in the shop.
8. Discuss the correct procedures associated with each of the hand tools, as depicted in Reference C.

Assignment
Sheet No. 4

Covering
Units 11-17

AUTOMOBILE ENGINE DESIGN

Basically, the engine may be thought of as the power source component of the automobile. It derives its power from the conversion of a fuel into mechanical energy within its walls, and the term internal combustion engine is used to denote such action.

The engine not only furnishes power for propulsion, but also, among other things, furnishes power to gererate electrical energy. The auto mechanic needs to know about the various parts that make up an engine, their function, and how to repair or replace a malfunctioning part. A large portion of the wages earned by the auto mechanic, as well as company profit, will be derived from work on the engine.

This assignment will provide the opportunity to learn some of the theories involved in engine operation. The function of the various parts and their relation to engine design will be introduced.

Assignment:

1. Read the references listed below.
2. Examine the literature obtained in Assignment Sheet No. 1. If possible, identify the various types of cylinder arrangements. Record your findings in a notebook.
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. Crouse, Automotive Mechanics, pp. 61-82.
B. Stockel, Auto Mechanics, Chapter 1, 7.

Questions:

1. How does an engine convert fuel into usable mechanical power?

2. What determines whether an engine is internal combustion or not?

3. What determines the fuel for engine operation?

4. What is the purpose of breaking up gasoline into smaller particles?

5. What causes an engine fuel to ignite?

6. What causes preignition?

7. Is the shape of the combustion chamber the same for all engines? Why?

8. What determines the classification of engine cylinder arrangements?

9. What advantages do the two-stroke engines have over the four-stroke engines?

10. Discuss in a brief paper the various methods of classifying internal combustion engines.

11. What is meant by the term pancake engine when referred to a chevrolet corvair?

12. How do the intake and compression strokes of a diesel engine compare with those of a gasoline engine?

Assignment
Sheet No. 5

Covering
Units 18-33

AUTOMOBILE ENGINE COMPONENTS

This assignment is a continuation of the last and we are going to continue our study by going into greater detail concerning some of the various parts that make up the internal combustion engine.

Auto repair deals with more than just taking a car apart and putting it back together again. The successful auto mechanic must learn to make wise use of his time without going up too many "blind alleys." This involves being able to determine what is wrong without taking the engine apart. The services of one who is a good "trouble shooter" will be much sought after. However, before one can do this, he has to know what the parts are that make up the engine and how they operate.

In this assignment you will have an opportunity to study the function, design, and terminology of certain parts that go together to make up the automobile engine.

Assignment:

1. Read the references below.
2. Select an automobile engine, and list the component parts, the kind of material each part is made from, and why that particular material was chosen. (A three column chart)
3. Answer the questions below and turn in this assignment by __________________________.

References:

A. Crouse, Automotive Mechanics, pp. 83-126.
B. Stockel, Auto Mechanics Fundamentals, Chapter 2.

Questions:

1. How is a cylinder block constructed? What materials go into the casting of a cylinder block?

2. What characteristic improvement is made to a cylinder block when it is plated with chrome? Which section is plated?

3. What advantage does an aluminum cylinder head have over iron?

4. Compare the L. and I head engines noting the physical differences

5. Why is a gasket put between a cylinder head and an engine block? What material is a head gasket made from?

6. What material is used for an oil pan? What purpose is the oil pan used for?

7. Differentiate between the exhaust manifold and the intake manifold?

8. What is the function of a vibration damper? Which type of vibration does it control?

9. What are sleeve bearings? How did they obtain their name?

10. Define oil clearance in an engine bearing. How may a bearing be lubricated?

11. How much clearance is permitted in a bearing? What happens as the clearance is increased?

12. What is a semifitted bearing?

13. Discuss the requirements placed on bearings for operation.

14. What materials are bearings made from? Are all bearings made of the same material?

15. What function does the crankpin end of a connecting rod perform? What three methods are used to attach a connecting rod with a piston pin?

16. What is meant by the term "blow-by?" How can this situation be corrected?

17. What is the purpose of a compression ring? What is the purpose of having the piston ring split?

18. What is an oil spit hole? Describe the relationship between oil control rings and cylinder lubrication. What effect does speed have on oil control?

19. Why is piston clearance necessary? How much clearance is needed for proper operation? What is the result of too much piston clearance?

20. Describe a cam ground piston.

21. Why is it important to keep a sodium-cooled valve away from your skin and water? What recommendation should you give for disposing of a sodium filled valve?

22. What is a slipper skirt in piston design? A partial skirt?

23. What is a piston pin boss?

24. How does a heat dam affect a piston? What effect does it have on the top ring?

25. Why is it necessary to use expander devices with some types of piston rings?

26. What is wear in? How long does it take? How can it be speeded up?

27. What effect does a special coating have on a piston ring?

28. What device is used to control crankshaft end play? How does this device allow for taking up the end play?

29. What is an oil gallery? Where is it used?

30. What is the purpose of a starter ring gear? Where is it located?

31. What dangers are present when valve movement and timing are way out of line? Especially in new car engines?

32. How do cams differ when using hydraulic lifters rather than mechanical lifters? Why is a cam "tear drop" in shape?

Sheet No. 6

Covering
Units 34-66

ENGINE SERVICE

The work of an automechanic might be compared to that of a doctor. For example, a doctor proceeds to diagnose the probable cause of his patient's illness before he prescribes a cure. The same procedure should be followed by the automechanic. First, he should determine the possible cause and then by process of elimination, locate the source of trouble.

It is important for the trouble shooter to plan a logical procedure before he starts work on the automobile. Such a plan will save considerable time and effort.

In this assignment you will have an opportunity to learn some of the procedures that are used in the repair of basic parts of engines.

Assignment:

1. Read the reference listed below.
2. On an 8 1/2 x 11 sheet of paper sketch the following and label the parts:
    a. a valve train
    b. a piston and rod assembly
    c. a crankshaft
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Crouse, Automotive Mechanics, pp. 272-332.

Questions:

1. What would result if dirt were allowed to remain within an engine after engine service?

2. What is the importance of having every portion of the engine functioning properly?

3. Discuss the conditions which cause valve burning?

4. What causes valve face wear?

5. Describe the services that could be included in a five hour valve service job.

6. What is the importance of tappet clearance on valves?

7. Is is permissable to interchange valve parts? Why?

8. What two main tests are performed on valve springs? Describe each test.

9. Describe the precautions to observe when installing valves.

10. Discuss the procedure for securing an engine head.

11. Describe the tests made on pushrods.

12. What precautions are necessary when removing carbon deposits from an engine.

13. What steps are used to service valves?

14. What service must be done to the valve seat? A valve guide?

15. What two types of valve listers are used? What is the main difference between them?

16. For what purpose is the bearing oil leak tester used? How does this device operate?

17. What is ridge ring? Why is it harmful to the removal of pistons?

18. Why is the alignment of a connecting rod important? What is likely to result from a rod being out of alignment?

19. Discuss the replacement of piston pin bushings.

20. Discuss the probable causes of bearing failure.

21. Explain the use or uses of plastigage.

22. What service is given to pistons? To piston rings?

23. Why are piston rings fitted for each cylinder?

24. What use is put to a piston ring compressor?

25. Discuss the effects of bearing wear and the condition of the crankshaft.

26. What are the main classifications of bearings? How are bearings fitted?

27. What correction is necessary to overcome crankshaft sag? What type of measurement will result from this condition?

28. When should main bearings and seals be replaced?

29. Discuss the service given to engine cylinders.

30. Why are the engine cylinders honed? Describe this process.

31. Under what conditions are the cylinder sleeves replaced?

Assignment
Sheet No. 7

Covering
Units 67-70

ENGINE TESTS, MEASUREMENTS, AND TROUBLE SHOOTING

Before an automotive tune-up specialist can diagnose an engine malfunction and tune the engine, he must know the basic ways in which engines are tested. An engine analysis cannot be done properly without the use of special instruments designed for each test.

Through these engine tests it is possible to diagnose the difficulty occuring within the engine and recommend a process to change the existing condition.

In this assignment you will have an opportunity to study various ways in which engines are measured, tested and prescribed for treatment.

Assignment:

1. Read the references listed below.
2. In a short paper discuss horsepower as related to engine torque.
3. Compare the engine tests performed on a combustion analyzer with the compression ratio of an engine cylinder. Discuss the changes as the compression ratio is increased.
4. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 49-61, 248-271.
B. Stockel, Auto Mechanics Fundamentals, Chapter 8.

Questions:

1. Compare dry friction with greasy friction.

2. Discuss the relationship between the bore of an engine and the engine stroke.

3. Explain how the compression ratio of an engine is determined. How does this compare with piston displacement?

4. What effects are noticed in engine output as the compression ratio is increased?

5. What does volumetric efficiency mean? How can one improve volumetric efficiency in an engine?

6. Compare the characteristics of brake, indicated, and friction horsepower in relation to each other.

7. Discuss the formula used to compare engines suggested by the Society of Automotive Engineers.

8. Do brake horsepower and torque have the same meaning? Why?

9. What types of engine efficiency are used to compare engines?

10. What percentage of the gasoline energy is generally used to propel the automobile? What happens to the rest of the fuel?

11. How does a tachometer operate? What measurement does it provide?

12. Compare the engine cylinder tester with the cylinder leakage tester. Which one gives the most accurate readings?

13. Of what significance is the intake manifold vacuum?

14. What information can be obtained by using an exhaust-gas analyzer?

15. What device is used to "see" around corners when working on an engine? How is this possible?

16. Discuss the importance of proper engine timing.

17. How can the test report sheet be used to benefit the mechanic?

18. What are the advantages of a systematic trouble-shooting chart?

19. What information can be obtained from an engine listening rod?

Assignment
Sheet No. 8

Covering
Units 71-97

FUEL SYSTEMS AND SERVICE

The fuel system is designed to furnish the engine with fuel. It is transferred from the fuel tank to the engine cylinders where it is ignited to furnish power to run the automobile.

There are certain adjustments and checks that the auto mechanic should be able to make on the various parts of fuel systems. It is important to have a knowledge of fuel systems so that one will be able to diagnose and correct troubles that may arise.

In this assignment you will have opportunity to study about the principles, functions, and the servicing of various parts of fuel systems.

Assignment:

1. Read the references listed below.
2. Make a pencil drawing or sketch of a simplified fues system on a sheet of 8 1/2x 11 paper. Label the main parts. On another sheet of 8 1/2 x 11 paper, explain in 200 words or less how a carburetor works.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 127-172, 333-342.
B. Stockel, Auto Mechanics, Fundamentals, Chapter 6.

Questions:

1. What are the differences between a circuit and a system in a carburetor? Explain the operation of each.

2. What type of manifold system uses a ram induction? How does this unique system operate?

3. What function does muffler design serve in relationship to a fuel system?

4. What is a choke stove? Where is it used? Why?

5. Compare a liquified petroleum gas (LPG) system with a gasoline fuel system. How are they similar? Differ?

6. What limitations do (LPG) systems have as a fuel?

7. What do the letters ONR refer to in a gasoline fuel? Is this desirable?

8. How do replacable air filter elements differ from the oil bath filter?

9. What is the procedure for reconditioning polyurethane air cleaner element?

10. What main advantage does an electrical fuel pump have over a mechanical pump?

11. What does a silencing chamber of an air cleaner do? What does an air cleaner remove from the air?

12. What troubles are eliminated in using an automatic choke and not a past conventional type?

13. How does an increase in the number of carburetor barrels or carburetors as a unit increase engine performance?

14. Describe a method which can be applied in a practical sense to promote increased evaporation as the fuel enters the engine.

15. Does a fuel injection system employ a carburetor? How is atomization obtained with fuel injection?

16. What means are used to control knocking in a cylinder?

Assignment
Sheet No. 9

Covering
Units 98-109

ENGINE LUBRICATION AND SERVICE

In the fieldof mechanics, there is no single item as important as the proper lubrication of moving parts. Automotive engines of today are lubricated by means of a lubrication system that is engineered to supply the right amount of oil to all bearing surfaces within the engine.

Adequate maintenance of the lubrication system is absoutely essential to the efficient operation of an engine. Irreparable damage may be done within a very few minutes to a bearing service that is operated at high speed without oil. Proper lubrication is the best form of precaution for one to take against undue wear of engine parts.

This assignment will provide you with an opportunity to become acquainted with the types of internal combustion engine lubrication systems, their parts and their functions. Information is also presented that deals with some of the more general aspects involved in servicing engine lubrication systems.

Assignment:

1. Read the references listed below.
2. Obtain two samples (approximately 1/4 cup) of engine lubrication oil. Sample No. 1 should be new oil. sample No. 2 should be oil that has just been drained out of an automobile engine. Put each sample in a small bottle. Filter each and show the filter and the material filtered out of each oil sample to your coordinator. (Filter paper from the chemistry department or a fine woven piece of cloth may be used for this purpose). Write a brief paper describing the differences in the material that has been filtered out of each oil sample excluding color.
3. When you have completed items 1 and 2, answer the questions below and hand in with item 2 on ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 172-189, 342-348.
B. Stockel, Auto Mechanics Fundamentals, Chapter 5

Questions:

1. What are the chief differences between friction and anti-friction bearings?

2. What is the purpose of classifying motor oils? Explain the three types of classifications used by the American Petroleum Institute.

3. How does the splash system of oiling an engine differ from the full pressure system?

4. What is the purpose of the by-pass valve in an oil filter? How does this function?

5. What is meant by forced ventilation of the crankcase? Will this reduce smog?

6. What does the dip stick indicate?

7. How can an oil effectively reduce engine power loss?

8. Given an oil rating of S. A. E. 10 W, what does "S. A. E." represent? What does the "W" represent?

9. Why are oil companies so careful of the viscosity index they assign an oil? What changes the index of a given oil?

10. How does viscosity index differ from viscosity rating?

11. How can a viscosity index be improved? Will an oil additive accomplish this?

12. How can we reduce sludge formations in oil?

13. How often do automobile manufactures recommend changing oil filters?

14. What is the function of a spring loaded by-pass valve in an oil system? Does this type oil system need filter changing?

15. Why is a crankcase ventilator valve necessary? Where is it located?

16. What service should be done to the lubricating system when an engine is overhauled?

Assignment
Sheet No. 10

Covering
Units 110-121

ENGINE COOLING SYSTEMS AND SERVICE

Did you know that enough heat can be produced by an ordinary six-cylinder internal combustion engine to heat a six room house? Yes, some experts claim this to be true, for temperatures over 4,000° F. are reached each time the fuel mixture is exploded within an engine's combustion chamber. Under such high temperatures the engine would not be able to continue operation without some means of dissipating a greater part of this heat into the air.

A cooling system is essential to keep an engine from "burning up." Temperatures that deviate too much from the normal should be investigated to find the cause.

In this assignment you will have an opportunity to become acquainted with types of cooling systems used on internal combusiion engines, their various parts and the functions of these parts.

Assignment:

1. Read the references listed below.
2. Obtain a cooling system thermostat and test it to see at what temperature the valve opens. (See A-349 for the procedure commonly used.) Write a brief paper summarizing the procedure and findings of your experiment.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 189-199, 348-355.
B. Stockel, Auto Mechanics, Fundamentals, Chapter 4.

Questions:

1. Discuss the three major purposes of a cooling system.

2. What are three types of radiator hoses in use? Why are the variations necessary?

3. What role does pressure play in a cooling system? What does a change in atmospheric pressure do to the boiling point of liquids?

4. Where is the bulb of a bourbon tube temperature gauge located? Explain the principles of operation of this instrument.

5. How does the operation of an electric temperature gauge differ from the operation of a bourbon tube gauge?

6. Where is a vapor-pressure indicator used? What is the purpose of it?

7. Are water jackets designed to cool an engine? What relationship do they have with a water pump?

8. Differentiate between a ribbon-cellular and a tube-fin radiator.

9. List 3 types of thermostats. How does each work? Are different principles involved with each type?

10. What difficulties may arise from a faulty radiator cap?

11. Why is it necessary to test a thermostat? Is the boiling water test a good one?

12. What is the purpose of a cooling system air suction test?

13. What are some leading complaints that lead a mechanic to check the cooling system?

14. Is afterboil harmful to an engine?

15. What advantage does ethylene glycol have over alcohol as a coolant?

Assignment
Sheet No. 11

Covering
Units 122-149

PRINCIPLES AND COMPONENT PARTS OF THE ELECTRICAL SYSTEM

The modern automobile has an extensive electrical system. Rapid advancement is being made in the number of electrically operated accessories and controls that are accepted as standard equipment.

The auto mechanic should be familiar with the main components and the principles upon which they operate. A major cause of faulty performance is defects in the electrical system.

In this assignment you will have an opportunity to become acquainted with the main components of the electrical system, some of the principles involved, and their relation to one another.

Assignment:

1. Read the references below
2. In a two page paper discuss the principles of operation of an alternator as you understand them.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 200-232, 356-370.
B. Stockel, Automotive Fundamentals, Chapter 19.

Questions:

1. Briefly describe several basic differences between an AC generator and DC generator.

2. What happens in a regulator as the generator speed is increased?

3. What is generator polarizing? When does a generator need polarizing? How is this accomplished?

4. What is an electrolyte? What is it made of?

5. How are batteries rated? What is the difference between a 20 and a 25 ampere hour rating in a battery?

6. How is the direction of rotation in a starting motor determined?

7. Distinguish between a bendix drive and a flo-thru drive in a starting motor.

8. What is the function of the overrunning clutch? How does it operate?

9. How is it possible to control a cranking motor?

10. What purpose is attached to a diode? Where is this part located?

11. Is a DC generator regulated the same as an AC generator? Why?

12. Why is temperature a factor to control in current regulation?

13. How does a fully transistorized regulator work? How does it differ from a conventional regulator?

14. In what ways can the three stator circuits of an AC generator be connected? Explain the necessity of more than one circuit connection.

Assignment
Sheet No. 12

Covering
Units 150-168

THE ELECTRICAL SYSTEM -- IGNITION AND LIGHTING

A knowledge of the structure, composition, arrangement and correct action of the component parts of an ignition system makes it easy to arrive at the cause of malfunctions and to prescribe a remedy.

The ability to read wiring diagrams and trace out electrical defects is important to the success of the auto mechanic.

In this assignment you will have an opportunity to become acquainted with the ignition and lighting as a part of the automobile electrical system.

Assignment:

1. Read the references listed below.
2. Sketch a typical ignition circuit, with the aid of colored pencils identify the high voltage and low voltage systems.
3. Draw a wiring diagram of an ignition coil and color code the primary and secondary windings.
4. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 233-247, 384-390.
B. Stockel, Auto Mechanics Fundamentals, Chapter 3 and Chapter 19, pp. 38, 39.

Questions:

1. What happens to the ignition system when negative polarity is used? How important is polarity?

2. Describe why points burn in a distributor. Will a condenser prevent the burning of points?

3. What is the difference between a standard spark plug and a resistor spark plug?

4. How does a mechanic set engine timing?

5. Where is a magneto ignition used? What is a flywheel magneto?

6. What type of coupling does a magneto utilize? How does this coupling operate?

7. How does a transistorized distributor system operate? What breaks the primary circuit contact?

8. How does the coil increase 12 volts to a very high voltage?

9. What is the name given to the device used to re-establish current flow in a distributor? Upon what principle does this device operate?

10. Compare the spark angle obtained from a centrifugal-advance distributor running at 1000 RPM to the same distributor running at 2000 RPM.

11. Why is an ignition coil resistor necessary? Where is it located?

12. What four indicating devices are located on most instrument panels? What functions do they perform?

13. What is the chief characteristic of a sealed beam headlight? What adjustments are necessary for its operation?

14. An oscilloscope may be compared to what device? What does an oscilloscope test?

15. Discuss the causes of ignition failure using the outline provided on page 387 of reference A.

Assignment
Sheet No. 13

Covering
Units 169-178

ELECTRICAL SYSTEM SERVICE

Since the generator does not include a means of self-regulation or distribution for its output, a device called a regulator is provided for this purpose. Usually a regulator has more than a single unit involved as components, for example, a typical regulator may have means to regulate current, voltage, or simply a cutout device.

To better understand the functions of this part of the system and to provide adequate service, a working knowledge of electricity is needed.

In this assignment, you will learn some of the methods and equipment used in regulating, testing, and servicing an automobile electrical system.

Assignment:

1. Read the reference listed below.
2. Examine a regulator for the control of current obtained from both AC and DC generators. With the aid of a sketch and colored pencils, distinguish the components by color coding.
3. Write a short paper discussing what you would test a regulator for and how malfunctions could be corrected occurring in each unit.
4. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Crouse, Automotive Mechanics, pp. 221-232, 371-383.

Questions:

1. What effect does temperature have on current regulation? What temperatures are taken into consideration?

2. Why are AC generators used without the traditional cutout relay? What accomplishes the task formerly done by the cutout relay?

3. Explain magnetic by-pass in a regulator.

4. How is the current limiter used in a three-unit AC regulator?

5. What is the function of the transistor when it is placed in a regulator circuit?

6. Describe the effects of combining a regulator and a transistor in the same circuit.

7. What steps should be taken when abnormal operations begin to show up in an electrical system?

8. Describe what happens when you ground a double contact regulator.

9. Explain the effects of a DC test on an AC regulator.

10. Why should you not polarize an AC generator? Why must a DC generator be polarized after any regulator work?

11. Why must a "load" be applied to a current regulator? How is this accomplished?

12. How is a generator tested for ground?

13. Discuss the operation of a belt tension tester.

Assignment
Sheet No. 14

Covering
Units 179-181

CLUTCHES AND CLUTCH SERVICE

In its simplest analogy the operation of a clutch may best be illustrated by placing your two hands firmly together and rotating the right hand. Notice how the left hand follows the movement. Now, separate your hands by at least one inch (as happens when the clutch pedal is depressed) and rotate your right hand again. Observe that there is no follow movement by the left hand. This is the action of a clutch.

If you were to place a grease layer on your hands and pressed them together, some slipping would occur as in the actual operation of the parts.

This assignment will give you an opportunity to become acquainted with various types of clutches used in the automobile, as well as their operating functions.

Assignment:

1. Read the references listed below.
2. Prepare a progress check list to be used when adjusting a clutch.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 391-405.
B. Stockel, Auto-Mechanics Fundamentals, Chapter 9.

Questions:

1. Briefly describe the actions taking place as the driver depresses the clutch petal.
2. How does a coil spring clutch differ from the remaining clutch types?
3. What two devices are associated with the friction disk to give a smoother performance? Explain how each operates.
4. What function do the weights on the clutch release levers have on a semicentrifugal clutch? What increases the pressure on the pressure plate in this unit?
5. Discuss the characteristics of the categories to which clutch troubles may be classified under.
6. Why are most clutch noises most noticable under idling conditions?

7. Describe the process of a clutch linkage adjustment.

8. Where are the general instructions for installing clutches given?

9. Of what material is a pressure plate made? Where is a pressure plate used?

10. Describe the action of the clutch release lever mechanism? What is the role of a throw-out fork?

11. Explain how a diaphragm clutch operates?

12. What procedure is followed to adjust clutch pedal linkage? Clutch pedal free travel?

13. What are the effects of clutch riding? What two types of springs are used in a typical pressure plate?

14. What is the function of a flywheel in a clutch assembly?

15. What is a slave cylinder in reference to hydraulic clutch control?

16. Why should you disconnect the battery when working on the clutch?

Assignment
Sheet No. 15

Covering
Units 182-186

TRANSMISSIONS AND THEIR SERVICE

Transmissions are a box of gears that are placed in the automobile power train to provide separate pre-selected power ratios between the engine and the rear wheels, as well as a device to reverse the direction of the gears to permit the backing of the auto.

Most transmissions are heavy and internally complex. Although they are not a frequent source of automobile failure, they do require minor repairs. Occasionally, the auto mechanic is called on to make a major transmission overhaul.

In this assignment you will have opportunity to learn about the various types of transmissions, how they operate, and the principles involved in their maintenance and repair.

Assignment:

1. Read the references listed below.
2. Sketch a planetary gear system indicating the direction each gear rotates in first gear and reverse.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 406-447
B. Stockel, Auto Mechanics Fundamentals, Chapter 10,11.

Questions:

1. How does a transmission accomplish various gear ratios between the engine and rear wheels? By what means can an automobile reverse its direction?

2. Give an example of a torque multiplier. What actually multiplies the torque?

3. Explain the difference between torque ratio and gear ratio. Give an example to prove this.

4. Explain how a 3 to 1 gear ratio might be obtained in a simple transmission. In what gear would the transmission be positioned?

5. What gears are engaged with the main transmission shaft when it is in neutral?

6. Could a transmission operate without a synchronizing device? What job does this device perform?

7. Compare the cone clutch and the pin type synchronizing device.

8. For what reasons are overdrives placed on automobiles? How much is gained by having one on your car?

9. Describe the action of a planetary gear system. Where does it get its name?

10. Explain what takes place as the driver momentarily releases the pressure on the accelerator to cut in an overdrive. With the overdrive locked out, what happens?

11. How is the engine helped by the transmission?

12. Summarize the action of a transmission.

Assignment
Sheet No. 16

Covering
Units 187-190

AUTOMATIC TRANSMISSIONS AND SERVICE

The automatic transmission is operated by fluid coupling. These principles in themselves, are not complicated. However, an understanding of their application requires considerable study. Transmission design is undergoing constant change which requires the mechanic to keep up-to-date. An understanding of the basic principles is absolutely essential before extensive work can be undertaken on automatic transmissions. This is usually done by a specialist.

In this assignment you will learn the basic principles and some of the methods of application which characterize many types of transmissions.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 448-501.
B. Stockel, Auto Mechanics, Fundamentals, Chapter 12.

Questions:

1. Explain the necessity of curving the pump vanes in a converter of a transmission. Are the turbine blades curved for the same reason?

2. How does a variable stator operate in a transmission? What is the difference between it and any other stator?

3. Why is vortex flow of oil increased in a torque converter as compared to fluid coupling?

4. What happens in a transmission as you press the accelerator to increase the speed of the auto?

5. What band is operated by a servo? What is a servo? What purpose does a servo band serve?

6. Explain how the engine power is transferred to the wheels using an automatic transmission.

7. What is a driving force? A driven force?

8. What is the function of a guide ring? What does it resemble?

9. Discuss how a speed reduction and a speed increase can be obtained with a planetary set.

10. How does the governor pressure control a transmission? Does the amount of governor pressure depend on engine speed?

11. Describe the action with a schematic diagram of a hydraulic control system for a brake band servo and clutch.

12. How is upshift and downshift accomplished in a hydra-matic?

13. List the variations between a two-coupling and a torque multiplier hydra-matic.

14. Discuss fluid coupling and torque converters noting any variations.

15. What are the implications of the stall test?

Assignment
Sheet No. 17

Covering
Units 191-203

DRIVE MECHANISMS

Essentially, there are two major problems that must be solved in the remaining drive train. They are: flexibility for rear end movement and variability to each wheel on turning curves.

The universal joint and the slip joint combined take care of the flexibility part of the problem. A differential handles the wheel rotation difficulty.

It is the purpose of this assignment to acquaint the student with the operating principles of the drive mechanisms.

Assignment:

1. Read the references listed below.
2. Write a brief report on multi speed axles including the shifting procedures used to change the axle ratios (this information may be obtained from a service manual at any automobile repair shop).
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 502-516.
B. Stockel, Auto Mechanics Fundamentals, Chapter 13 and 14.

Questions:

1. Discuss two main considerations used in propeller shaft design.

2. Compare the three types of universal joints used on automobiles.

3. What is a spline? Where is it used?

4. Explain the operation of a Hotchkiss drive. List the main differences between the Hotchkiss and torque-tube drives.

5. What would happen to each rear wheel on a corner if the automobile had no differential?

6. What happens to a pinion gear as an automobile turns a curve?

7. Is a differential necessary on a straight road?

8. How does a non-slip differential differ with a standard differential?

9. What determines the ratio of the differential gearing?

10. How is double reduction in an axle obtained?

11. What is the difference between a dead axle and a live axle? Give an example of how each are used.

12. Explain how a hum, growl, or a knock will indicate trouble in the drive mechanism.

13. How is blacklash in a power train detected?

14. How is it possible for a universal joint to fluxuate the shaft speed?

15. Compare the differentials on a Chrysler sure-grip rear axle with the non-slip differential of the Dodge division of the Chrysler.

16. When is it desirable to have one rear wheel rotating at a greater R. P. M. than the other?

17. Why are hypoid geared axles used? What is a swing axle? Where is it used?

Assignment
Sheet No. 18

Covering
Units 204-209

SPRINGS AND SUSPENSION SYSTEMS

Riding comfort is one of the chief characteristics that owners desire in their pleasure automobiles. Faulty springs and shock absorbers may make the control of an automobile difficult to maintain and make travel uncomfortable to the driver and passengers.

There are many different devices in use today for the purpose of absorbing shock created by irregularities in the roadbed. Some of these devices wear rapidly and requirerepair and replacement.

In this assignment you will have an opportunity to become familiar with the various types of springs and shock absorbers and how they are serviced and repaired.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 517-532.
B. Stockel, Auto Mechanics Fundamentals, Chapter 15.

Questions:

1. Discuss the differences between the four main types of springs used on automobiles.

2. What is the difference between a spring hanger and a spring shackel? How do each type hold the spring?

3. What happens to each spring leaf as pressure is applied?

4. Explain why an increase in the unsprung weight increases the roughness of the ride in the late model automobiles?

5. Why is a spring pad necessary?

6. Explain why rubber bushings are used in spring shackles?

7. Compare rear end torque in the Hotchkiss and torque tube drives.

8. What additional movements are needed in the front suspension that are not necessary in the rear end?

9. Describe the compression and rebound action in a shock-absorber.

10. What is threaded shackle? A bronze bushed shackle? A rubber bushed shackle?

11. Describe the action of a torsion bar spring.

12. Explain briefly the semi-elliptical leaf spring.

13. Explain the reasoning behind the adjustable shock absorber.

14. What is independent suspension? How does it differ from solid suspension? List an advantage of each type.

15. What care must be taken when dismantling a front suspension system?

16. How is an air compressor used in a suspension system?

17. Compare a stabilizer bar with a torsion bar.

18. What considerations must be considered when a design for a rear end is adopted?

Assignment
Sheet No. 19

Covering
Units 210-223

SERVICING STEERING AND SUSPENSION SYSTEMS

With the development of automobiles that operate at high rates of speed, the steering system has become increasingly important. Purchasers of automobiles are usually very critical of the quality referred to as "ease in handling", which is dependent to a large extent upon proper operation of the steering mechanism and suspension system.

The auto mechanic must be familiar with the principles involved in the various types of steering mechanisms and be prepared to diagnose mechanical difficulty and make repairs and adjustments.

In this assignment you will have an opportunity to learn about the various types of steering and suspension systems and how they are repaired and adjusted.

Assignment:

1. Read the references listed below.
2. Write a brief report describing either:
   a. The effects of power steering on the modern automobile, or
   b. The adjustments necessary to have proper alignment in the front end assembly.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 533-571.
B. Stockel, Auto Mechanics Fundamentals, Chapter 17.

Questions:

1. Discuss the importance of front end alignment .

2. What is the relationship between the center lines of the wheel axis and steering axis? How will toe-in be affected by this relationship?

3. Discuss the angles involved to obtain proper front end alignment. Explain each type of angle.

4. Explain the effects of slip angle when turning a corner.

5. What method of adjustment is used for toe-in?

6. Compare the steering linkage between a solid axle and independent suspension.

7. Discuss the action within a manual gear box.

8. How is the amount of steering gear reduction determined for each vehicle?

9. Compare the operating principles of the two general types of power steering units.

10. Discuss the advantages of having an adjustable angle for the steering wheel.

11. What types of pumps are used to obtain pressure for the steering gear?

12. Explain the principles in the operation of power steering.

13. Compare the various suspension troubles and the effects each has on the front tires.

14. What procedure or steps would you recommend to correct car wander and car pull to one side? Are these two conditions the same?

15. What are the preliminary checks that are necessary before any alignment should be adjusted?

16. What type of service is given to the steering gear?

BRAKES AND BRAKE SERVICE

It is important that an automobile moves, but even more important that it can be stopped. This means good brakes. One's safety is often dependent upon the effectiveness of the automobile's brakes. Because of the number of variables influencing braking action, a driver cannot afford to let his brakes get out of top working order. The auto mechanic failing in this responsibility to his customers may be directly responsible for a serious accident.

The assignment will deal with various types of brakes and some of the basic principles underlying their operation. Causes of brake failure are discussed, along with procedures for adjustment and repair.

Assignment:

1. Read the references listed below.
2. Construct two schematic sketches of a hydraulic master cylinder in a brake system.
   - A. Using a conventional master cylinder.
   - B. Using a tandem master cylinder. (Color code each of the split system separately.)
3. Answer the questions below and turn in the assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 571-594.
B. Stockel, Auto Mechanics Fundamentals, Chapter 18.

Questions:

1. Explain why a liquid is able to transmit both motion and force.

2. Describe the principles of operation in the hydraulic brake system. (Pascal's Law)

3. Why is the reservoir of a master cylinder vented?

4. Describe the cycle of events within a master cylinder as pressure is exerted on the brake.

5. What type of flexible hose is recommended for brake lines?

6. Explain how to remove air from a hydraulic system.

7. What is brake fade? How is it overcome?

8. What is an anti-roll device? How does it compare with an antiskid device?

9. What types of boosters are used in power systems? Explain each type.

10. What determines the amount of friction between the brake lining and drum?

11. Explain the operations of the two main components of a hydraulic brake system.

12. Compare a conventional master cylinder with a tandem master cylinder.

13. What feature determines whether a brake is self-adjustable?

14. Compare the action of a disk brake with that of an antiskid device. Are they the same?

15. Why must brake fluid be inert? What does inert mean?

16. How does a split hydraulic system work? What type of master cylinder does it use?

17. What are some of the troubles associated with brakes? What types of adjustments are given to brakes?

18. What precautions should be followed in replacing brake lines?

WHEELS, TIRES, AND TIRE REPAIR SERVICE

In the early stages of the development of inflated tires, the motorist expected frequent tire repair jobs on the road. He carried several spare tires and a tire repair kit. Much progress has been made in improving the pneumatic tire. Today, tire repair on the road is almost unheard of and the necessity of changing tires en route is rare.

Tires, though greatly improved, still require careful servicing. Tire failure at speeds reached by modern automobiles is extremely hazardous and, in most cases, can be prevented by proper maintenance and care.

In this assignment you will have opportunity to learn about the various types of tires and how they are constructed, serviced and repaired.

Assignment:

1. Read the references listed below.
2. Illustrate the two types of tire balance, describe the procedure used to overcome these malfunctions.
3. Complete the assignment below and turn in by ________________________.

References:

A. Crouse, Automotive Mechanics, pp. 563-566; 595-601.
B. Stockel, Auto Mechanics Fundamentals, Chapter 16.

Questions:

1. Discuss the abnormal effects occurring in tires, giving the probable cause of each. How would you correct the malfunction?

2. What is a four ply tire? How does it differ from a six ply tire?

3. Describe the two basic types of tires and give an illustration where each may be used.

4. What are the special features of a puncture-sealing tube? Compare this tube with a safety tube.

5. Why is safety such an important part of tire removal?

6. The text illustrates a method of rotating tires. Why? Is tire rotation important?

7. What types of rims are used to mount tires on most automobiles? What advantages does this rim offer? Explain the purpose of a safety ridge.

8. What two methods are common to secure a wheel to the hub? What method is used in race cars? Why?

9. What is a castle-nut? Where is it used? Why does a cotter pin secure this nut?

10. How does a front hub differ from a rear hub?

11. What materials go into the construction of a tire?

12. In what ways does a tubeless tire differ from a conventional tire?

13. What is the difference between static balance and dynamic balance in a tire?

14. Discuss the importance of proper tire inflation.

15. Interpret the chart on tire temperature and road speed as indicated on page B-16-8.

16. Describe a recommended tire rotation plan. Explain your choice of rotation.

AIR CONDITIONING

The automobile contains numerous examples of items which were past luxuries that are now rapidly becoming a necessity. The modern a r conditioner is an example of this new changing concept in driving comfort. Essentially this device performs two operations to the air within the automobile, which are filtering the air and removing excess moisture from the air. This process is similar to a household refrigerator.

In this unit you will have an opportunity to review the principles of refrigeration and their application to the air consitioner as used in today's automobile.

Assignment:

1. Read the references listed below.
   - A. Study the color coded schematic of the freon cycle on page B-20-12 A of your text.
   - B. In a short paper discuss the operation of each component of an air conditioning system.
2. Locate a book on refrigeration in the library, investigate why freon is used as the gas.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 602-604.
B. Stockel, Auto Mechanics Fundamentals, Chapter 20.

Questions:

1. Define air conditioning as used in an automobile.

2. Is air conditioning the same as cooling? What similarity between the two terms can be observed?

3. Discuss the three principles of heat transfer.

4. What does latent heat have in relationship to the B.T.U.

5. How does pressure affect liquid boiling and vaporization points?

6. What is the purpose of the sight glass in the refrigeration system? What observations may be made with the use of a sight glass?

7. Discuss the two functions of an expansion valve. What forces control this valve?

8. How does a magnetic clutch operate? What function does it perform?

9. Briefly describe the precautions necessary when handling freon.

10. What purpose does a muffler serve in an air conditioning system?

11. What process takes place in the receiver? How is this accomplished?

12. Discuss the functions of each component of an air conditioning system.

JOB MANAGEMENT AND PRICING

The principal reason automobile repair shops are in operation is to provide services for automobile owners. However, these services are continued only if the shop owners realize a reasonable profit on their investment.

Each shop owner strives to offer the greatest amount of services for the least cost to customers and, at the same time, realize a fair return from his investment. In order to accomplish this, management is required to employ sound principles of job management and of pricing services.

In this assignment you will have an opportunity to learn about methods of receiving and routing jobs through the shop and the various methods of pricing services.

Assignment:

1. Read the reference listed below.
2. Ask your employer for copies of business forms which are used in the service department. Complete the forms using an imaginary repair order.
3. When you have completed Items 1 and 2 answer the questions below and hand in with Item 2 on ____________________.

Reference:

Information Sheet No. 1, this manual, p. 64.

Questions:

1. What is the function of a service manager? Is the owner sometimes the service manager? Why?

2. What use is made of a job ticket? Who makes it out? Where is it recorded? What happens to the carbon copies?

3. How does a job ticket compare with a contract?

4. Where can job tickets be obtained?

5. What is the purpose of recording the mileage on the job ticket?

6. What other information is needed besides the work order?

7. What confusion can be brought out between an estimate and a contract?
8. Who is responsible for a loss due to a shop fire?

9. Who is responsible for additional work found while making repairs? How should this be handled?

10. Why is it important to have all copies of the job ticket the same?

11. What types of charge rates are usually in effect while working on a repair job?

12. Who generally assigns work to the mechanic in a large shop?

13. Discuss the responsibility of making work assignments.

14. Discuss the advantages of a good record system.

15. What determines profit? What conditions or factors should be included to insure some profit?

16. Why is the actual job time important? How does this time compare with unproductive time?

17. Who should pay for unproductive shop time? How should this time be absorbed within the profit, loss system?

18. Discuss the factors to be included in the cost estimate of a job.

19. How are flat rates for job repairs established? Do they vary much from each job?

20. Who makes flat rate time studies? For what purpose are they made?

21. Discuss the ways used to determine the hourly rate for repair shops. Compare the flat rate system of price fixing with that of time and material charges.

Information
Sheet No. 1

JOB MANAGEMENT

Owners and operators of small businesses often are not aware of the extent of the responsibilities that they incur. They feel that, if they do the work specified by the customer and pay their bills, they are meeting all their obligations. However, there are other things to be considered as many businessmen have realized after it was too lat

If a businessman fails to provide adequate protection for himself and his customers he can be sued for damages obtained by any person who is injured on his premises. Of course, it is first necessary for the injured party to prove in court that there has been negligence on the part of the owner.

Obviously, every repair shop owner will want to take every possible precaution for the safety of his customers and employees. Not only should he attempt to make his shop completely safe but, in addition, he should take out insurance so that he will be protected financially regardless of what may occur.

Selecting from over 55 types of insurance policies applicable to automative sales and service, the owner should only take out those policies which he can afford and those necessary to protect him adequately.

PROPERTY HAZARDS

Many of the safeguards that can be taken by the careful shop operator are easily arranged. Others are more complicated and difficult, and will require constant attention on the part of the owner to insure that the safety rules he has made are being observed.

One of the most difficult provisions that can be made for the safety of customers and employees is a clean, oil free floor on which people can walk without danger of slipping or stumbling. Law books are full of cases where damages have been granted to persons who have been injured from falls caused by negligence in the care of floors.

The cement floor of a repair shop requires constant attention, for only a slight spot of grease can easily result in a severe fall if walked on with rubber soles or heels. It is particularly important to make sure there is no grease or litter on the floor surrounding a pit, for a fall at such a point can be extremely serious.

Tools scattered on the floor, a jack handle left protruding from underneath a car, or similar careless and thoughtless handling of equipment can cause serious injury.

Safety precautions should be taken if the shop operates certain kinds of machinery. Many dangers must be guarded against. The gearing and belting on machines must be protected by a suitable guard so that it is impossible for anything to become entangled in the moving parts. Grinding wheels should never be operated without a guard.

It is essential that all tools be inspected frequently to make sure they are safe to use. Always be sure that jacks, horses, and lifts are in perfect working order and that there is no possibility of their failure, with consequent injury to anyone underneath. Never use makeshift blocking instead of a horse or a jack to support a car.

All types of fire-fighting equipment should be inspected frequently to insure that they are in good working order and of the proper type for use against garage type fires.

TYPES OF INSURANCE

To achieve full protection against accidents and other hazards in the operation of your business, be sure that you have all necessary types of insurance. Discuss your insurance needs with a reliable insurance agent, who will advise you regarding the kinds and amounts of insurance that you require.

In general, the types of insurance found adequate to cover hazards in automobile repair shop operation are public liability, workmen's compensation casualty, fire, and theft.

Public liability will insure against any accidents that happen to customers when they are on your premises. For instance, if a customer should slip and injure himself while in your shop, the damages awarded him by the court would be taken care of by your public liability insurance. This insurance is an important safeguard, since your action in opening a shop may be construed as an invitation to the public to ente with the assurance of safety. Public liability also covers damage or injury that might be caused by your truck or other equipment used away from the premises.

Workmen's compensation insurance is designed to compensate workmen for any injuries received while on a job. It is required by law in most states when a minimum number of workmen, usually four, are employed. However, it is a protection for you against claims, regardless of the number of your employees and would be advisable to purchase if you have less than the required number of workers.

Casualty insurance covers the risk of damage to such property as buildings, machinery, fixtures, boilers, and plate glass. The value of fire and theft insurance is obvious.

INJURIES

Probably few, even of the largest shops, could maintain a thoroughly equipped emergency room. However, every shop should be prepared to furnish emergency first aid to the injured.

The first-aid kit should be fitted out as recommended by the American Red Cross. It should be replenished immediately after being used, and its contents checked once a month. These supplies must, of course, be kept clean. Cases for first-aid supplies preferably should be made of metal, and be so constructed as to exclude dust.

The effects of an accident may be intensified through lack of immediate and proper care. On the other hand, unskillful handling of a severe injury may do further harm besides causing unnecessary pain. Therefore, the first thing to do in case of a major accident is to get a doctor. Pending his arrival, no first-aid treatment should be given beyond the necessities of the emergency.

Every injury that occurs, no matter how trivial, should be noted in a record book. All cuts, scratches, and bruises should be recorded as soon as they have received attention. Any injury involving lost time requires a more formal report. Such a report usually gives the name of the employer for whom the injured worked and the industry, the name, age, sex and occupation of the worker, cause of injury and designation of the part of the body injured, steps taken to prevent similar injuries and other pertinent data.

As a rule, workman's compensation laws require the reporting of industrial injuries to the appropriate workmen's compensation board. Some of these boards require the reporting all injuries, including those involving only first aid; others, all disabling injuries; still others, only those injuries which exceed the waiting period. Therefore, you should ascertain the requirements of the compensation act applicable to your employees and comply fully with those regulations.

If you carry your compensation insurance with an insurance company, you should, of course, learn the company's requirements for reporting injuries and abide by them.

RECORDING INCOMING JOBS

The success or failure of an automotive repair shop is dependent on many factors. Among the most important and ones that directly affect customer good will are prompt attention to the incoming customer and the careful recording of all work ordered.

To insure that none of the items of repair ordered by the car owner are overlooked and that all work is paid for, it is necessary that a detailed record be kept of the repairs authorized. Most shops use the job ticket or shop order for this purpose and it is the duty of the owner or service manager to make sure that the ticket is filled out in detail.

The repair order or job ticket constitutes an actual contract between you and the car owner and binds you to do a certain amount of work. Care in filling out the job ticket will prevent any misunderstanding later as to the amount of work for which you are contracted.

If you fail to do all of the work agreed upon, the car owner can hold you responsible. On the other hand, if you do more work than was originally contracted for, you cannot force the owner to pay for the additional labor.

There are many different types of printed job tickets available, some designated especially for the large shops and others for smaller ones. They can be obtained from companies manufacturing business machines, from specialty printers, or from the companies from whom you may be purchasing fuel and lubricants. It is advisable that you study the various forms and select the type best suited to your particular business.

The job ticket used in large shops is usually made out in triplicate. The first copy serves as the customer's invoice, the second goes to the repair shop's accounting department, and the third is given to the mechanic assigned to the job so that he will know what repairs are to be made.

Usually, the job tickets provide places for the name, address, and telephone number of the car owner, the date when the work was received, the time the completed job is promised, and important facts about the car, such as make, motor and license number, and the mileage indicated on the speedometer.

Such information is required in some states as a means of enabling the police to locate stolen vehicles, but it can also be of particular use to you. For instance, the owner's name can be put in your file of persons to whom direct-mail advertising is sent. The mileage reading helps the mechanics to determine what other repairs might be necessary. Furthermore, having a record of the mileage at the time of repair will help you to disprove any claims which the owner may later make to the effect that the car failed after a few miles of driving. Other information contained on the job ticket is of extreme importance for tax, social security, and other purposes.

The major portion of the job order is devoted to listing the various repairs that are to be performed. If the repair shop is operating on a flat-rate price basis, the repair operation number should be noted and the job should be described briefly. There is space provided for writing in the labor charges for each operation and the words "estimates for labor only, material additional" are usually included near this space. This explanation is important as it is impossible in most instances to estimate all the parts that will be required for a particular repair job.

Space is provided for the car owner's signature and a statement similar to the following is usually included: "It is understood and agreed that this company assumes no responsibility for loss or damage occasioned by fire, theft, demonstration, or while road testing, delivering, and/or calling for any vehicle placed with this company for storage, sale, repair, or otherwise."

Unless such conditions are included the car owner can be awarded compensation for damage to his car resulting from fire or other accidents while it is in possession of the shop.

On two copies of the job ticket space is provided for listing all parts used in repairing the car, and their prices. The list of parts can be obtained from the requisition forms made out by the mechanic who did the job. The total cost of the parts is added to the labor charge on the face of the order to indicate what the customer shall pay.

Whether stamped in by a regular time clock or written down by the shop owner or foreman, work-time information is particularly important where the mechanic is paid on a flat-rate or some other basis involving the actual time required for the repair operation. It may also be of value in determining the relative efficiency of the various mechanics as it constitutes a record of the time they require to do the different jobs.

Upon completion of the work, the third copy of the job order is sent to the accounting department so the mechanic's pay may be calculated.

The form described above, since it is to carry all the information required by large shops, is unduly complicated for use of the shop owner employing only a few men, particularly if they are paid a straight weekly salary. The smaller shops use a simpler form, a single copy of, at most, two copies, to serve the same purposes.

When this simpler type of job order is used, one copy is given to the customer and the other is retained by the shop to supply the information needed by the mechanic assigned the job and by the accounting or bookkeeping department.

ASSIGNING AND CHECKING WORK

The shop foreman or owner, as the case may be, must assign work to the mechanics. Naturally, if there are a large number of employees, some will be found to be more skillful than others on certain types of repairing. Therefore, when possible, jobs should be assigned to the mechanics best fitted to do them. In a small shop, assignment of work should not be much of a problem because presumably any mechanic hired would be capable of turning out a good job on all parts of the automobile.

The responsibility of making work assignments involves seeing that repair jobs are completed on schedule.

It is essential that the car be ready for the owner at the time recorded on the job ticket. If the shop fails to live up to its agreement, it will probably lose trade. It is up to the service manager of a large shop or the owner of a small establishment to make careful note of the delivery promise with respect to each car, and to see that all such promises are kept.

It isn't enough to have the delivery time written on the job sheet. A record of the time promised should be kept in plain view, on a blackboard for all the cars under repair. In general, the only information required for such a record is the name of each car owner and the date and time promised.

The owner or service manager must check frequently with the mechanics to make sure that the work on each car is progressing satisfactorily and that it will be completed at the time promised. If for any reason a car cannot be ready on time, the shop operator or service manager should phone the owner and explain the delay.

Keeping a record of this sort has another distinct advantage in that it will help to discourage the person who takes the order from making promises that cannot be kept. In other words, if a shop has only one motor mechanic, the operator should not promise any more work than can be performed by that one mechanic. For example, it requires approximately 6 1/2 hours to do a valve job on an 8-cylinder car. By working fast the mechanic can finish one such job in a day and with luck might start a second. Assuming that no other jobs take precedence, the shop operator should feel safe in promising the owner of the second car that it would be ready for him the following day.

CONTROLLING FOR PROFIT

Too frequently, the shop operator neglects to include all charges when he makes up the customer's bill. It should be remembered that failure to include the price of parts, lubricants, or other materials used on a repair job can change a profitable transaction into a loss. Mechanics should be impressed with the importance of noting either on requisition blanks or in the spaces provided on the job ticket, all parts and materials required for each piece of work.

An accurate record of the time the individual mechanic takes to do various jobs assigned him is important not only because the data needed in fixing charges to the customer, but also because of the growing use of incentive pay methods based on actual work time. Therefore, time clocks, formerly found only in the larger shops, are coming more and more into use.

If a shop operator does not feel justified in going to the expense of purchasing a time clock, he must then write in on each job ticket the time the mechanic starts and finishes the job. Unless the time is checked in each case with the mechanic, this method may result in disagreement between the mechanic and the operator.

FREE SERVICE AND UNPRODUCTIVE TIME

The owner of a repair shop soon finds that he is expected to give many small services on which there is no definite charge. For example, a car with a severe engine miss may be driven up to the shop. A quick diagnosis will disclose that the miss is caused by a shorted spark plug. Obviously, it will only take a minute to clean the spark plug. since actual time spent in doing the whole job would not exceed five minutes, the shop owner will be inclined to make no charge, particularly if the car owner is a regular customer.

Free service time mounts up and a practice of not charging could result in business failure. On the other hand, the good will gained by free service should not be overlooked. The shop owner will have to weigh the value of this good will against the time lost on such jobs.

There are many ways to avoid excessive free servicing. In the case of an engine miss, the shop operator could point out to the car owner that, while only one plug was shorted at the moment, the condition which caused that one cylinder to misfire would undoubtedly be found in the other cylinders, as well. He would be justified in saying that a complete tune-up should be done, and possibly new spark plugs to insure satisfactory operation. Be sure, in each instance, to suggest all the work that is required to overcome the trouble.

Unproductive time in a shop can cause considerable loss of profit. Among the factors that can cut deeply into a shop's earning capacity are lost tools, defective or inadequate equipment, lack of intelligent management, and failure to order necessary parts and to have them ready when needed. Another factor is the time spent in selling a small job that could otherwise have been devoted to selling a complete one. Such haphazard selling forces the car owner to make repeated trips to the shop for a lot of small jobs when all the work should have been sold and completed on one trip.

COSTS AND QUOTATIONS

In order to operate a successful shop you must be sure that your charge to the customer is sufficient to allow you a profit. Many repair shops have failed because they didn't take into consideration all the expenses that had to be met. Too frequently the dollars left over at the end of a week are looked on as profit even though the rent is unpaid and there are outstanding bills.

It is only when your books have been balanced at the end of your fiscal year that you can determine definitely the extent of your earnings above your salary, but if you fix prices that allow for all cost items, you will lessen the possibility of experiencing a loss.

National averages indicate that profits for successful automotive repair shops approximate 8 percent of net sales. Naturally, there are some automotive repair shops that have profits in excess of the average, many that have profits smaller than average, and still others that are operating at a loss.

Charges for many kinds of auto repair jobs are fairly well standardized, so you will probably have no particular difficulty in establishing your prices. Originally, the procedure was to charge the customer on a time-and-material basis. Owing, however, to pressure on the part of car owners who wanted to know the cost of repairs before they were actually made, repair shops gradually adopted what are known as flat-rate prices for most operations.

Such prices were tried out rather reluctantly by many operators, as they felt it was impossible to foretell accurately how long it would take to do the jobs. However, experience soon indicated that charges could be established which were fair both to the repair shop and the car owner.

FLAT-RATE PRICES

It is true that the time required to do repair jobs of the same kind may vary. But the variation is small and the advantages of being able to quote a price before the work is performed are so great that flat-rate prices are now charged by virtually all shops.

Repair shops owned and operated by car dealers use, for the most part, the prices established by the respective car factories. Independent repair shops, working as they do on all makes of cars, use flat-rate prices established by companies specializing in fixing such rates.

Experience has shown that flat-rate prices can be established for 85 to 90 percent of all the repair operations done on an automobile. For the remaining jobs, such as straightening fenders and repairing wrecks, which cannot be given a flat-rate price, the charge is based on actual time and material.

FIXING THE FLAT-RATE PRICE

A publishing company compiling a manual of flat-rate prices first makes time studies on the repair operation to get an average time for doing that particular work. The average hourly rate that could appropriately be charged by the majority of repair shops is then selected. The prices given in the manuals are based on this average hourly rate and the average time required to do that particular job. Conversion tables are provided so that, if the individual repair shop operates on an hourly rate other than the average rate selected by the publisher, he can revise the published rate.

While the published flat-rate prices figured on averages are convenient guides, it will still be necessary for you to determine the hourly rate you should charge to repair cars in order to obtain the desired profit. Furthermore, you will need to know your hourly rate to figure any time-and-material charges you may quote.

Obviously, a repair shop on the main street of a metropolitan area has a higher overhead and, consequently, has to charge a higher hourly rate than is feasible for a smaller repair shop in some rural section. Repair shop owners starting in business frequently make the mistake of selecting an hourly rate that is too small.

There are two ways to determine the hourly rate for an automotive repair shop.

The first method, used by virtually all car dealers on the recommendation of their respective car factories, is based on the hourly wages paid to the mechanic. To determine the hourly rate by this method the mechanics' hourly wage is multiplied by a factor which ranges from 2 to 2.5. Some car factories advocate the lower factor while others are in favor of the higher one.

As an example, suppose that you are paying your mechanic $1.00 an hour. To obtain the hourly rate on which to base your flat-rate charge to the customer, you have only to multiply $1.00 by 2 or 2.5. The results from this simple method check very closely with those obtained by the second and more complicated accountant's method based on the cost of doing business.

To obtain the hourly rate by the second method, you divide the total of all costs of doing business in a month's time by the number of productive hours during that same period. By "productive hours" is meant the total time actually spent by mechanics working on cars, and would not include the time of a stenographer, bookkeeper, attendants at the gasoline pumps, or the manager.

Suppose that for a shop employing a mechanic and requiring a small amount of nonproductive bookkeeping help, the itemized cost of doing business is as follows:

Rent	$ 100
Depreciation	30
Salary, mechanic	350
Salary, nonproductive	190
Electricity	10
Telephone	5
Mail and advertising	25
Bad debts	10
Unemployment and social security taxes	25
Miscellaneous	55
	$ 800

Most of the items of business cost included above require no explanation. However, it should be pointed out that salaries for everyone in the shop must be included. Remember that you should place yourself on the payroll at a definite salary. Taxes include unemployment taxes, social security taxes, and any municipal or other taxes incurred.

If you are renting your establishment, depreciation would include only the depreciation of equipment. The amount would depend on the length of time before the equipment would normally become obsolete. If you have $1,800 worth of equipment and wish to calculate depreciation on the basis of five years, you divide the amount of worth by 60, which gives $30 as the monthly depreciation. If you own the building, instead of a rent item you would have real estate taxes, interest on mortgage and on invested capital, and certain expenses for maintaining your building.

In large shops it is frequently necessary to make different hourly charges for the work done in different departments. For example, if a shop has wheel-aligning, tune-up, car-washing, brake, and engine-overhaul departments, it would probably charge on the basis of approximately $3.50 per hour for wheel aligning and $2.50 per hour for work in the other departments.

The charge can be calculated accurately for each department by using the same procedure as suggested above for the entire shop. The only difference is that each department is assigned a certain portion of the rent and other general expenses. Naturally, only the salaries of those mechanics who work in the department are used when calculating the hourly costs.

There are other reasons for variations in the hourly rate. For example, some specialty shops, because of a high investment in equipment, charge more per hour than do other specialty shops rendering other services.

TIME-AND-MATERIAL CHARGES

The foregoing discussion deals with the problem of fixing charges on an hourly time basis. For such jobs as repairing a wrecked car or straightening a fender, the charge will have to be made on a time-and-material basis. Do not attempt to fix the charges in advance unless you have had years of experience in such estimating and quote prices that are fair to the customer and yet will insure an adequate profit for yourself.

As the term implies, time-and-material charges are based on an hourly rate and the cost of the various parts installed in the car. Determining this charge when the job is completed presents little difficulty if a time record is kept on the repair order or job ticket, or the necessary requisitions are made out by the mechanic who does the work.

Some repairmen make the mistake of using a low hourly rate when calculating the price for such jobs, in the belief that there is sufficient profit in the discount they obtained on the purchase of the repair parts installed. This is a serious error because a great many repairs on modern cars require few parts. For instance, the installation of a detent spring in a transmission may require 5 hours of work but the spring itself will cost only 20 to 25 cents.

Obviously, very little profit can be realized from the parts in such an operation but if the shop is to be successful it must obtain a profit on labor.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *PRINTERS, *OFFSET LITHOGRAPHY, HIGH SCHOOLS, OCCUPATIONAL INFORMATION,

This guide is for teacher use in planning a course and developing instructional materials for trade preparatory offset printing in the secondary schools. It was developed by two trade instructors and the instructional laboratory staff by identifying the major areas of the trade and grouping the basic manipulative activities and information necessary for intelligent job performance into instructional blocks. This is a preliminary draft to be revised after review by instructors and an industrial committee. The course objective is to develop knowledges and skills that qualify the trainee for employment as an advanced learner in the trade. The analysis of operations and related instruction are outlined in instructional blocks--(1) Composition, (2) Camera, (3) Mashing and Stripping, (4) Platemaking, (5) Presswork, (6) Binding, and (7) Comprehensive Problem. The suggested number of hours assigned to each block indicates the relative amount of emphasis on each area in its relation to the total 1,080-hour training period. The teacher should be trade competent with teaching skills, and the students should be those who want, need, and are able to profit from the training. Student selection should be based on tests, school records, and personal interview. Supplementary materials include lists of recommended texts, suggested references, equipment, and supplies. This document is available for $1.00 from Curriculum Laboratory, Box NU, State College, Mississippi 39762. (HC)

ACKNOWLEDGMENTS

On August 21 and 22, 1967, the initial draft of this publication was developed by Mr. Raford Foster, Tupelo Attendance Center, Itawamba Junior College, and Mr. Robert Lowry, Perkinston College, in a meeting on the campus of Mississippi State University. After a review of job descriptions, these instructors of offset printing were assisted by members of the Laboratory staff as they identified major areas of the trade, called blocks, and then listed the operations, basic manipulative activities, within the blocks. Next, information necessary for intelligent job performance was listed. Then, training activities which incorporated these basic skills and knowledges were listed as "Suggested Jobs". Finally, items of equipment, tools, and supplies were listed which were necessary for effective instruction.

Mr. Foster and Mr. Lowry are to be commended for their efforts in developing this material and for promoting an interest in the offset printing trade. The Laboratory staff gratefully acknowledges the assistance of the public institutions which made these men available.

This publication is the starting point for the development of instructional materials to be used by the trade instructor. A definite part of the developmental process is an evaluation and authenticating by a representative industrial committee.

HOW TO USE THIS PUBLICATION

As a tool for teaching, this publication is primarily designed for use in planning, preparing, presenting, and evaluating instruction. As a tool, it lists operations, jobs, and informational topics--with the job as the focal point. Each job should be assigned to students, either as a group, a subgroup, or individually. The following procedure is recommended as an effective teaching sequence.

Step I. -- Tell how the job is done.
Give a full explanation of the steps necessary to perform the job. Emphasize the proper sequence; stress techniques requiring special care; point out the hazards to persons and the equipment.

Step II. -- Show how the job is done.
Demonstrate the proper procedure for performing the job. Re-emphasize the sequence, techniques, and hazards. Make sure each student can see what is being done and understand the steps.

Step III. -- Have the student do the job.
Assign each student the task of applying what he has just learned. Supervise his work; correct any variation from proper procedure or any hazardous techniques. Re-explain when necessary.

Step IV. -- Check the student for proficiency.
Assign a similar job to the student to be performed independently. Observe his work and examine the completed product or service. He is proficient when he can perform the job without supervision in a prescribed length of time.

Students who have demonstrated proficiency in one job move to the next job. The teaching steps *tell, show, do, check* are used again. Students who are not proficient perform additional jobs of a similar nature and are retaught in weak areas.

Additionally, this publication can be used (1) by the director and the instructor in a local program in communicating with their craft committee, (2) by the local director in supervising instruction and program operation, and (3) by the state supervisory staff in communicating with local school administrators and in supervising the operation of local programs.

How to Use This Publication

JOB DESCRIPTION

The offset printing trade offers many opportunities for young men and women. The offset processes, as one of the major printing methods, is a rapidly-growing, ever-expanding industry. Employment potential is wide since shop size varies from that of the one-man operation to the large plant employing over a hundred persons. Equipment used ranges from less than a $1000 for a table-model duplicator to a web press costing over $100,000. Yet all major and auxiliary equipment centers around the basic offset process.

The offset printing trade is essentially one of analyzing the job, selecting and cutting stock, preparing master copy or plates with direct-impression equipment or the process camera, printing copy, and collating and binding the finished job. In the small shop all of these steps are performed by one or two persons. In the large plant, there is much specialization, even to the point of having several duplicate machines, each of which requires one or more operators.

The following are typical descriptions of job opportunities. They have been abstracted from the Dictionary of Occupational Titles, third edition.

LAY-OUT MAN (print. and pub.) 141.081.

The layout man plans page layouts, for use in preparing newspaper advertisements, books, and technical manuals.

The layout man apportions space and roughly arranges positions of copy parts which includes sketches, photographs, diagrams, body and display type, and others. He determines sizes of type and illustration to be used to obtain maximum clarity and the most desirable effect. He indicates positions of various parts by sketching lines and marks worksheets for printing. The layout man may select illustrations and direct the activities of art personnel in preparing drawings, cartoons, and similar materials to accompany printed copy.

PHOTOLETTERING-MACHINE OPERATOR (print. and pub.) 652.885. typesetter.

The photolettering-machine operator tends the photolettering machine that photographically prints display type and headings onto film or photographic paper.

He loads the film magazine, selects and positions the film font, makes the exposure, develops the film, and removes the finished product from the machine.

PHOTOTYPESET OPERATOR (print. and pub.) 650.582. photosetter.

The operator "types" on the keyboard of an automatic phototypesetting machine to photographically print type matter onto strips of photosensitive paper to prepare paper flats for making printing plates. He loads rolls of photosensitive paper or film into the camera magazine and positions the magazine. He selects fonts for enlargements, reductions, etc. and depresses keys to "type" copy. The operator removes the copy from the machine for development.

PHOTOGRAPHER, LITHOGRAPHIC (print. and pub.) 972.382. cameraman; copy cameraman; lithographic-cameraman; photographer, stone; photographer, wet plate; photolithographer; photographic process man; process man.

The lithographic photographer, or cameraman, sets up and operates a process camera to photograph illustrations and printed materials to produce film or glass negatives or reversed negatives used in the preparation of photographic printing plates.

The cameraman mounts materials to be photographed on the copy board and focuses the camera for a shot the same size, or larger, or smaller. He may select and place screens and color filters over the negative for halftone and color separations. The cameraman exposes the film to copy for specified periods of time; he develops and dries film. He prepares film or glass plate positives by the contact method.

CONTACT-FRAME OPERATOR (print. and pub.) 976.884. darkroom man; process man; lithographic contact-frame operator.

The operator controls the contact printing process and developing to produce photographic film positives or negatives for transferring illustrations or designs to printing plates or rollers.

The operator evaluates the original copy to determine the proper exposure procedure, mounts the negative and film in a contact frame, and exposes it to transfer the image. He removes it from the frame and processes it through a series of chemical baths including developer, short stop, and fixer, then he dries it. The operator repeats the above process in making a positive.

NEGATIVE-CUTTER-AND-SPOTTER (any ind.) 976.884. stripper; type artist.

The stripper retouches film negatives to prepare them for printing.

The stripper examines negatives on a glass-topped table, over light, to detect flaws. He brushes opaque over negatives to blacken bare spots and scratches. He scrapes emulsion from film, using stylus, to sharpen outlines of designs, lettering, and illustrations. He mounts whole and parts of negatives on specially blocked, opaque paper. He replaces portions by cutting out unwanted segments and replacing them with prefered copy.

OFFSET PRESSMAN (print. and pub.) 651.782. lithographic pressman; offset-press operator.

The offset pressman washes the plate to remove protective gum coating; builds up the back of the plate, when necessary; installs the plate on the plate cylinder; places folio on the blanket cylinder to bring it up to the diameter of the plate cylinder; adjusts space between the blanket and impression cylinder according to the thickness of the stock. The pressman fills the moisture fountain and regulates the moisture delivery. He operates the press to secure proof copy; examines the proof and adjusts press controls to correct maladjustments. He starts the press and completes the production run. The pressman removes the plate and cleans the cylinders. He periodically lubricates the press.

OFFSET-DUPLICATING-MACHINE OPERATOR (print. and pub.) 651.782.

The operator runs an offset-duplicating machine to reproduce single or multicolor copies of charts, schedules, bulletins, and related matter, according to oral instructions or layout and stock specifications on the job order. He installs the master copy or printing plate, regulates flow of ink and moisture from the fountains he previously filled, and selects stock feed and speed. The operator starts the machine and runs proof copy, adjusts necessary controls, and makes a production run. He cleans and files master copy or plate. He periodically cleans and oils the machine. The operator may work with auxiliary machines such as the collators, the folding machine, copy camera, and others.

COLLATING-MACHINE OPERATOR (print. and pub.) 653.885. set-making machine operator.

COLLATOR (print. and pub.) 653.687.

The collator assembles and checks copy which has been printed. The assembly may be by hand or by semiautomatic or automatic machines and may include glueing and binding on some equipment. The collator may jog assembled copy and stack; also, may drill holes in completed sets, using a drilling machine.

FOLDING-MACHINE SET-UP MAN (print. and pub.) 753.780. folding-machine adjuster.

He sets up,according to blueprint specifications, a machine that automatically folds and cuts printed sheets into signatures (pages) for binding.

FOLDING-MACHINE FEEDER (print. and pub.) 653.886.

He feeds printed sheets into the fold guide of a machine that automatically folds and cuts into pages for binding.

FOLDING-MACHINE OPERATOR (print. and pub.) 653.782. folder, machine.

He operates a machine that automatically folds and slits printed sheets into signatures for binding. He makes all adjustments such as conveyor blades, feed rollers, creasing blades, and fold rollers. He may operate two or more machines simultaneously.

BOOKBINDER (print. and pub.) 977.884. binder; finisher and bookbinder.

BOOKBINDER, HAND (print. and pub.) 977.781. binder and finisher, hand; finisher and binder, hand.

The bookbinder attaches covers to books or pamphlets, and performs book finishing operations, determining production procedures from the job order. He compresses pages, applies glue to the back edges to stiffen, trims to size and shape. He applies color to the remaining edges, fabricates a cover, and he may emboss or impress a design or lettering on the cover.

COURSE DESCRIPTION

GENERAL OBJECTIVE

To develop knowledges and skills that qualify the trainee for employment as an advanced learner in the offset printing trade.

ASSUMPTIONS

1. That trainees have had no previous experience in the offset printing trade
2. That trainees have a vocational commitment to the offset printing trade
3. That trainees have a aptitude for the trade

DESIRABLE PREREQUISITES

1. That trainees have a background in elementary mathematics, in general science, and in communications skills
2. That trainees have a course in touch-typing and have a proficiency of at least 40 words per minute

NOTE: Those desiring to enroll who lack the above prerequisites should be counseled concerning their deficiencies and then assigned to remedial couses when these are available. It is not recommended that a person lacking the above prerequisites be denied training.

NATURE OF THE TRAINING

1. The duration of the training is normally three hours per day, five days per week, thirty-six weeks per year for two years; or, six hours per day, five days per week, thirty-six weeks per year for one year--a total of 1080 clock hours of training.

2. Related instruction by lecture, demonstration, the use of audiovisuals, and others immediately precedes application by the trainee in shop practice; instruction and its application are correlated as closely as possible at all times; and the major allotment of time is given to the development of manipulative skills.

3. No instruction directly related to the trade is offered outside the shop.

CONTENT OF RELATED INSTRUCTION

Systematic and purposeful presentation of the following:

1. A review of the typewriter keyboard and a comparison with the keyboard of strike-on or direct image composers; an identification of the basic type fonts including gothic, serif, italics
2. An introduction to the methods of composing display type, such as the type stick, pressure lettering, and photographic line composing
3. A working knowledge of the principles of photography as they relate to the use of the process camera, including screens, filters, and film, to make same-size shots, enlargements, and reductions
4. A general knowledge of the theory of film development, including the composition of chemical solutions, the nature of acids and bases, the correct mixing proportions, and the measuring systems used
5. An examination of techniques of layout and stripping, especially the planning of multipage signature
6. Detailed coverage of the offset process, including the types of inks, printing stock, and control of moisture
7. An introduction to methods of collating, folding, and binding

LEVELS OF SKILL

1. Immediately employable level of skill in keyboard composing for those trainees with the prerequisite typing
2. Moderate level of skill in manual photocomposing, with increased speed to be developed after employment
3. Moderate levels of skill in mounting and shooting line copy
4. Elementary levels of skill in shooting halftone copy from good photos
5. High level of skill in masking and stripping for small presses, which will allow adaptation to larger and more complex work
6. High degree of skill in platemaking
7. A high level of skill in running simple jobs of one and two colors on small duplicators
8. A moderate level of skill in binding techniques, except hard cover binding

INSTRUCTIONAL BLOCKS

The blocks listed show the major areas of instruction. The number of hours assigned to each block indicate the relative amount of emphasis on each area in its relation to the total training period. It should not be inferred that hour allotments be rigidly adhered to or that students be rotated on a clockwork basis. On the contrary, the emphasis is on individual proficiency. It is likely that students of lesser ability will require longer periods to attain skill in certain areas. These students may gain only the minimum proficiencies while more able students progress rapidly and engage in many enriching experiences. Consequently, the planning, sequencing, and alloting of time are not designed to standardize programs, but to assist local teachers to plan carefully: to select sequence, and assign learning experiences so that instruction may be conducted efficiently and the maximum use of available time may be obtained.

MAJOR INSTRUCTIONAL BLOCKS

		Contact hours
I.	Composition	135
II.	Camera	240
III.	Masking and Stripping	120
IV.	Platemaking	60
V.	Presswork	300
VI.	Bindry	105
VII.	Comprehensive Problem	120
	Total hours	1080

ANALYSIS OF OPERATIONS

1. COMPOSITION

    A. Keyboard composer

        1. Insert and/or change the type font
        2. Change the ribbon
        3. Set margins
        4. Set tab stops
        5. Set the justification code
        6. Set the vertical spacing (lead)
        7. Set the impression control

    B. Disc-type film printer for heads

        1. Set or adjust letter spacing
        2. Set or adjust word spacing
        3. Set light exposure
        4. Mount a disc

    C. Strip-type film printer for heads

        1. Insert film font
        2. Set letter spacing
        3. Set word spacing
        4. Set light exposure
        5. Adjust for enlarging or reducing of type font
        6. Adjust for slanting of type font
        7. Adjust for expansion or condensing of type font

    D. Stick type: mount letters, numbers, etc.

    E. Pressure type: impress letters, numbers, etc.

    F. Layout equipment and tools

        1. Position work on and fasten work to a layout table
        2. Attach copy with tape
        3. Lay out parallel lines with a T square
        4. Lay out standard angles with a T square and triangles

    5. Lay out odd angles with a straight edge
    6. Draw free-hand and straight lines with a ruling pen
    7. Draw regular arcs with a compass
    8. Attach copy to a layout sheet with rubber cement
    9. Attach copy to a layout sheet with a wax coater
    10. Trim paper, film, and copy with a make-ready knife
    11. Layout copy with a proportional spacing scale

II. CAMERA WORK

  A. Shooting layouts

    1. Mount a layout and hold with a cover glass and a vacuum holder
    2. Position a glass screen and adjust distance from the film
    3. Adjust the set up for shooting percent
    4. Set the f-stop
    5. Set the timer
    6. Mount the ground glass and determine the size of film
    7. Position film on vacuum back and turn on the vacuum
    8. Expose film

  B. Darkroom techniques

    1. Mix solutions with a plastic beaker
    2. Cut film on a cutting board
    3. Handle film with plastic tongs
    4. Hang film with clips or pins

III. MASKING AND STRIPPING

    1. Scribe lines by cutting the film emulsion with a scribe
    2. Apply opaque with a brush

IV. PLATEMAKING

  A. Exposing

    1. Position the negative and plate
    2. Turn on the vacuum
    3. Flip the exposure frame (optional)
    4. Set the timer and expose

B. Developing

1. Clamp the plate to the developing table
2. Apply desensatizer with a sponge
3. Apply developer with a sponge in a holder
4. Polish plate with a cheese cloth

V. PRESS WORK

A. Stock feed

1. Set the sheet separators
2. Manually raise and lower the paper feed table; set the table for automatic raise
3. Adjust the verticle magazine guides
4. Set and/or adjust the side stack guides for the stock
5. Set and/or adjust the end guide for the stock
6. Set and/or adjust the stock height control
7. Turn on and adjust the air blower; adjust the position of the blower tubes
8. Turn on and adjust the vacuum; adjust the suction feet
9. Adjust the pull-out rolls
10. Adjust the pressure of the friction feed rollers
11. Adjust the doubles eliminator

B. Set up

1. Apply fountain solution to the moisture rollers
2. Ink the fountain and the ink rollers
3. Engage all ink and moisture rollers
4. Set and/or adjust the moisture control
5. Set and/or adjust the ink control
6. Install a sleeve on a dampening roller
7. Install a blanket on the blanket cylinder
8. Install a mat or plate on the plate cylinder

C. Feed table

1. Adjust the spacing of the conveyor tapes
2. Adjust the conveyor paper retainer
3. Set the rider wheels
4. Adjust the stationary paper guide

5. Adjust the jogger guide with the thumb screw
6. Adjust the jogger guides with the micrometer
7. Adjust the paper stops

D. Stock delivery

1. Adjust the position of the ejector rollers
2. Adjust the position of the ejector rings
3. Change the static eliminator
4. Set the sides and/or the end of the paper receiving tray
5. Engage and disengage the receding stacker
6. Adjust the lowering rate of the receding stacker
7. Adjust the side jogger on a receding stacker (course)
8. Adjust the side jogger on a receding stacker (fine)
9. Adjust the rear jogger on a receding stacker
10. Manually raise and lower the dolly in a receding stacker

E. Pressure checks

1. Adjust the pressure of the dampener roller
2. Adjust the pressure of the ink form rollers
3. Adjust the pressure between the plate cylinder and the blanket cylinder
4. Adjust the pressure between the blanket cylinder and the impression cylinder

F. Press Operation

1. Turn on the printing head
2. Engage the moisture rollers, ink rollers, and the plate cylinder
3. Feed stock

G. Lubrication and cleanup

1. Remove ink fountain and wash it up
2. Wash up the ink rollers by hand
3. Engage automatic washup attachment
4. Drain the fountain solution
5. Change the oil and wash the filter in the vacuum and blower pump jars

VI. BINDRY

- A. Collating: gather copy
- B. Plastic binding
    1. Engage or disengage punching dies
    2. Punch holes
    3. Bind with plastic binding
- C. Cutting
    1. Change the cutting stick
    2. Set the split-back
    3. Change the cutting blade
    4. Engage the hold-down clamp
- D. Numbering
    1. Change numbers and letters
    2. Number with a hand stamp
- E. Folding
    1. Set the front stop
    2. Set the top guide
    3. Set the back stops
    4. Center the feed rollers
    5. Open the folding gates
    6. Set the fold stops
    7. Set the delivery
    8. Set the scorer and the perforator
- F. Padding
    1. Clamp in a padding press
    2. Apply glue with a brush
- G. Stitching
    1. Set the stitcher for thickness
    2. Change the sizes of wire
    3. Adjust the stop to position copy
    4. Mount the plate for saddle stitching
    5. Mount the safety stop for stitching

H. Taping back edges: apply water-soluable glue tape

I. Drilling copy

1. Set the back stop
2. Set the side stop
3. Change the drill bit
4. Sharpen the drill bit
5. Mount a slotter on a round-corner attachment

J. Counting stock: count stock by hand fanning

SUGGESTED JOBS

I. COMPOSITION

A. Keyboard composing

1. Set unjustified copy
2. Set justified copy
3. Set tabular work
4. Center heads
5. Fit copy to a specified area
6. Rule forms

B. Headlining

1. Set heads
2. Set ads

C. Using stick type and pressure lettering

1. Set heads
2. Set ads

D. Laying out (line copy, halftones, and combinations)

1. Lay out business forms
2. Lay out single-page copy
3. Lay out multiple-page copy
4. Lay out multiple-color copy
5. Lay out for gang printing

E. Marking copy: proof and mark copy

II. CAMERA AND DARKROOM WORK

A. Shooting copy: enlarge, reduce, one hundred percent

1. Shoot line work
2. Shoot line work through a filter
3. Shoot halftones
4. Shoot reverses
5. Shoot for gang printing

B. Working in the darkroom

1. Set up the developing sink and check solution temperatures
2. Mix solutions for developing film: developers, short-stop baths, fixers or hypos
3. Develop and dry negatives
4. Clean up developing sinks, trays, work tables, and floors

III. MASKING AND STRIPPING

1. Mask line work
2. Mask halftones
3. Mask combination halftones and line work
4. Mask for double burns
5. Mask for multiple-color runs
6. Strip for gang printing
7. Rule forms on a negative, using a film scribing tool

IV. PLATEMAKING

1. Burn a plate (single exposure)
2. Burn a plate (double exposure)
3. Burn a plate, using the step-and-repeat technique
4. Burn each plate in a multiple-color job
5. Process a plate

V. PRESSWORK

1. Make a single-color run of line work
2. Make a single-color run of a large halftone
3. Make a multiple-color run
4. Make a run of unbalanced copy

VI. BINDRY

A. Cutting stock

1. Cut stock to specified size
2. Trim books and pads

B. Folding copy

    1. Fold letters and brochures
    2. Fold signatures
    3. Fold signatures, using scorer attachment

C. Drilling, rounding corners, and slotting

    1. Drill a two-hole job
    2. Drill a three-hole job
    3. Trim a round-corner job
    4. Cut a slotted job

D. Assembling copy by hand (collate)

    1. Assemble a job by hand
    2. Assemble a multicolor flat job
    3. Assemble signatures for saddle stitching
    4. Assemble signatures for flat stitching

E. Binding copy

    1. Punch for and bind with plastic binding
    2. Bind a job by saddle stitching
    3. Bind a job by flat stitching
    4. Bind a job by padding

F. Wrapping: wrap and label a finished job

VII. COMPREHENSIVE JOB:

Print a 16-page signature, including preparing a dummy, composing, shooting line work and halftones, masking and stripping, burning plates, printing, binding, packaging, and labeling

RELATED INSTRUCTION

I. COMPOSITION

A. Layout

1. Job titles
    - a. Layoutman
    - b. Compositor
2. Equipment and materials
    - a. Drawing board
    - b. T square
    - c. Triangles: 30-60°, 45°
    - d. Drafting instruments: compass, dividers, others
    - e. French curves
    - f. Scales (rules)
    - g. Airbrush
    - h. Proportional rule
    - i. Copyfitting tables
    - j. Type specimens
    - k. Paper catalogs
    - l. Ink charts
    - m. Pencils and crayons of various colors
    - n. Erasers
3. Sources of composition work
    - a. Printing agencies
    - b. Composition shops
    - c. In-house
4. Layout considerations
    - a. Style of lettering
    - b. Letter and word spacing
    - c. Balance
        - (1) Formal
        - (2) Informal

d. Copy arrangement

(1) U
(2) T
(3) Y
(4) S
(5) Reverse S

e. Margins and borders
f. Border decorations
g. Illustrations

(1) Artwork
(2) Line drawing
(3) Halftones

h. Copy enlargement and reduction

(1) Diagonal line method
(2) Formula method

i. Ink color
j. Paper

5. Parts of a typical layout

a. Head
b. Text
c. Illustration
d. Signature
e. Borders and margins

6. Layout procedure

a. Thumbnail sketch
b. Rough layout
c. Comprehensive layout
d. Dummy (books)

B. Cold-type composition

1. Methods

a. Typewriters
b. Keyboard composers

- c. Photographic composers
  - (1) Disc-type
  - (2) Film-type
- d. Others
- e. Stick type
- f. Pressure lettering
- g. Freehand

2. Parts of type (hot)
   - a. Body or shank
   - b. Face
     - (1) Stem
     - (2) Serifs
     - (3) Kern
     - (4) Hairline
   - c. Counter
   - d. Beard
   - e. Shoulder
   - f. Pin mark
   - g. Groove
   - h. Feet
3. The point system
   - a. The inch
   - b. The pica
   - c. The nonpariel
   - d. The point
4. Standard type sizes
   - a. Body type: 6-, 8-, 12-point
   - b. Display type: 14-, 18-, 24-, 30-, 36-, 42-, 48-, 54-, 60-point
   - c. Cast type: 72-, 84-, 120-, 144-point and larger
   - d. Agate type: 5-1/2-point for newspapers
   - e. Others

5. Type fonts
    a. Gothic
    b. Serif
6. Typewriter composition
    a. Fabric or carbon ribbon
    b. Fixed or changeable type fonts
    c. Fixed type size
    d. Fixed or proportional letter spacing
    e. Fixed line spacing
7. Strike-on composition
    a. Fabric or carbon ribbon
    b. Changeable type fonts
    c. Variety of type sizes
    d. Proportional letter spacing
    e. Variable line spacing
    f. Semi-automatic justification
8. Photographic composition
    a. Virtually unlimited point range
    b. Virtually unlimited font range
    c. Single or multiple line copy
    d. Positive or negative copy
    e. Strip, page, or roll printout
    f. Single print key
    g. Magnetic- and punched-tape operation
    h. Memory bank available
9. Pressure lettering
    a. Wide range of fonts
    b. Wide range of point sizes
    c. Numerals, letters, pictures, decorations, etc. available
10. Methods of preparing ruled forms
    a. Set hot type
    b. Hand set type

- c. Draw lines on proof copy
- d. Scribe through emulsion

11. Proofreading and copy marking
    - a. Kinds of proofs
        - (1) Metal and wood type
        - (2) Photographic negatives and positives
        - (3) Direct image
        - (4) Pasteups or mechanicals
    - b. Proofreaders marks
        - (1) Size and style of type
        - (2) Position
        - (3) Spacing
        - (4) Insertion and deletion
        - (5) Diacritical marks, signs, symbols
12. Use of the line gage

II. CAMERA AND DARKROOM WORK

- A. Theory of photography
    1. Source and nature of light rays
    2. Reflection of light rays
    3. Effect or role of a camera lens
    4. Nature of the image in a camera
    5. Nature of an image on ground glass
    6. Nature of light sensitive film
- B. The process camera
    1. Basic camera parts
        - a. The copyboard and its features
            - (1) Method of attaching copy
            - (2) Method of tilting
            - (3) Methods of care and cleaning
        - b. The lensboard and its features

- (1) The lens
  - (a) Precision glass elements
  - (b) Focal length
  - (c) Cost factors
  - (d) Distortion
  - (e) Care and cleaning
- (2) The diaphragm or aperture opening
  - (a) Construction
  - (b) The nature of f-stops
  - (c) Manual and automatic controls
- (3) The shutter mechanism
  - (a) Lens cover
  - (b) Manual and automatic control
- (4) Waterhouse stop slot
- (5) Flash lamp

c. Bellows

- (1) Composition
- (2) Care and cleaning

d. Camera back

- (1) Ground glass
- (2) Film holder
  - (a) Adhesive
  - (b) Vacuum
- (3) Glass halftone screen

e. Light source

- (1) Incandescent bulbs
- (2) Quartz-iodine bulbs
- (3) Carbon arc
- (4) Pulsed xenon

f. Controls

- (1) Automatic timers

        - (2) Foot switch
        - (3) Vacuum pump controls
        - (4) Master electrical switch
        - (5) F-stops or diaphragm control
        - (6) Reduction-magnification scale

2. Types of cameras

    a. Position

        (1) Horizontal
        (2) Vertical

    b. Placement

        (1) Darkroom or built-in
        (2) Galley

    c. Other: roll film, overhead

3. Camera copy

    a. Types

        (1) Line copy
        (2) Halftones
        (3) Color

    b. Proper care

        (1) Protective cover
        (2) Handling and marking
        (3) Storing

4. Setting up the camera

    a. Same size copy

        (1) Determining basic exposure
        (2) Determining f-stop
        (3) Setting angle and distance of lights
        (4) Determining bellows extension
        (5) Determining copyboard extension

    b. Copy to be enlarged or reduced

        (1) Determining magnification: M

        - (2) Determining copyboard extension: CE
        - (3) Determining bellows extension: BE
        - (4) Determining exposure-time factor: F
    - c. Corrections
        - (1) For paper colors other than white
        - (2) For ink colors other than black
        - (3) For different films
        - (4) For different filters

C. The film

- 1. Composition
    - a. Base: acetate, polyester, glass; .003-.008" thick
    - b. Emulsion side: gelatin and silver salts
    - c. Base side: anti-halation coating
- 2. Types
    - a. Orthochromatic
    - b. Panchromatic
    - c. Monochromatic

D. Line copy

- 1. Definitions
    - a. Line copy
    - b. Line negative
    - c. Film positive
- 2. Examples
    - a. Printed type
    - b. Pen and ink drawings
    - c. Hand lettering
    - d. Previously screened photographs
    - e. Ruled forms
- 3. Setting up
    - a. Specifying size
        - (1) Giving either width or height, not both

(2) Using acceptable measuring units

(a) Picas
(b) Inches
(c) Percent
(d) Decimal
(e) Fraction

(3) Marking printed area, rather than margin

5. Other considerations

a. Using dull white paper
b. Using dense black ink
c. Judging imperfections to be enlarged or reduced
d. Judging line widths to be enlarged or reduced
e. Specifying for reverse printing

6. Commonly used abbreviations

a. SR: scale or reproduction
b. FL: focal length of lens
c. CE: copyboard extension
d. BE: bellows extension
e. OET: old exposure time
f. NET: new exposure time
g. f#: basic aperture setting or f-number
h. Nf#: new aperture setting or f-number
i. OD: original distance of lights
j. ND: new distance of lights

E. Halftone photography

1. Problem: graduation of tone

a. Impossible on offset
b. Illusion of graduation

2. Creating the halftone dot

a. The makeup of the screen
b Effects of screening
c. Percentage of black

3. Screen grading: lines per inch
   - a. 65 line: letterpress printing of newspaper
   - b. 100 or 120 line: offset printing on rough paper
   - c. 120, 133, 150 line: typical offset printing
   - d. 150 line and over: offset printing on coated papers

4. The glass screen
   - a. Makeup
   - b. Position of the screen in relation to the film
   - c. No limitation on reduction and enlargement
   - d. Camera requirements
   - e. Cost

5. Special considerations when using glass screens
   - a. Locating screen in the camera
   - b. Setting the aperture
   - c. Determining exposure

6. Contact screens
   - a. Makeup
   - b. Types
     - (1) Magenta for negatives
     - (2) Magenta for positives
     - (3) Gray
   - c. Use, handling, and care
   - d. Cost

7. Screen-pattern films
   - 1. Makeup
   - 2. Camera requirements
   - 3. Limitations on reduction and enlargement
   - 4. Exposure length
   - 5. Compensation for improper exposure
   - 6. Cost

F. Densitometry

1. Basic terms
    - a. Densitometry
    - b. Opacity
    - c. Density
    - d. Transmittance
    - e. Reflectance
    - f. Transmission density
    - g. Reflection density
    - h. Density range and scale

2. Classes of copy
    - a. Ideal photographic copy
    - b. Low-key photos
    - c. High-key photos
    - d. Drop-out halftones

3. Types of densitometers
    - a. Calibrated gray scale
    - b. Visual-type
    - c. Photoelectric-type

4. Film sensitivity factors
    - a. Contrast
    - b. Color
    - c. Speed

5. Contrast characteristics

6. Techniques of contrast control
    - a. Shadow flash exposure
    - b. Highlighting or bump exposure
    - c. till development
    - d. Filter employment

7. Evaluating negatives

8. Making a negative from a halfton print
    - a. Shooting as line copy
    - b. Rescreening

9. Combination prints

  a. Regular: black lettering on halftone
  b. Open: white lettering on halftone
  c. Rectangles: black or white rectangle with reverse lettering
  d. Lines and arrowheads

G. Color separation and color process

1. Preparation of negatives

  a. Use of the circular-dot halftone screen

    (1) 90° for yellow
    (2) 75° for red
    (3) 15° for blue
    (4) 45° for black

  b. Exposure times and methods
  c. Use of filters
  d. Types of film

2. Methods of development
3. Duotones, duographs, duotypes

H. Darkroom work

1. Essential feature of a darkroom

  a. Absolute darkness
  b. Light-tight storage

2. Highly recommended features

  a. Hot and cold running water, with a drain
  b. Developing sink

    (1) Corrosive resistant
    (2) Temperature control

  c. Electricity: 110v, single-phase, 60-cycle, alternating current
  d. Safe lights
  e. Ventilation
  f. Camera-back built in to one wall

3. Desirable characteristics
    a. Air control: temperature, humidity
    b. Shelving
4. Use and care of film
    a. Storage
    b. Age or shelf life
    c. Handling
    d. Loading camera and exposure cabinets
5. Units of measure
    a. Ounce
    b. Liter
    c. Gram
    d. Grain
6. Developing solution
    a. Function
    b. Content
        (1) Reducing agent
        (2) Accelerator
        (3) Governor
        (4) Preservative
        (5) Other
7. Short-stop bath
    a. Function
    b. Content
        (1) Acid
        (2) Other
8. Fixer
    a. Function
    b. Content
        (1) Acid
        (2) Hypo
        (3) Alum

9. Procedure for developing and fixing
    a. Formulas and mixing
    b. Temperature control
    c. Technique
        (1) Agitation
        (2) Still
        (3) Combination
10. Checking chemicals for strength and age
11. Methods of drying
    a. Line or natural
    b. Chemical or solution
    c. Forced
12. Photographic papers
    a. Uses
        (1) Pasteups
        (2) Paper negatives
    b. Types
        (1) Contact-printing
        (2) Enlarging
        (3) High-contrast

III. MASKING AND STRIPPING

A. Equipment

1. Layout table
2. Steel rules with beveled edges
3. Steel triangles: 30-60°, 45°
4. Scribing tools
5. Scissors
6. Assorted sizes of artists brushes
7. Magnifying glass
8. Steel square
9. Dividers

10. Compass
11. India ink
12. Opaque solution
13. Transparent tape with dispenser
14. Red photographic tape with dispenser
15. Stripping knife with replacement blades

B. Terms

1. Flat
2. Goldenrod
3. Stripping
4. Reference lines
5. Register marks
6. Gripper edge

C. Laying-out procedure

1. Cleaning up the layout surface
2. Laying-out the flat
    a. Cutting goldenrod to plate size
    b. Positioning and lining
    c. Locating, drawing, and labeling the center line
    d. Identifying the trim size
3. Stripping-in the negative
    a. Positioning the negative
    b. Inspection and opaquing
    c. Trimming
    d. Scribing reference marks
    e. Taping
    f. Cutting windows
    g. Scribing lines
4. Cutting reference marks
    a. Cylinder or register
    b. Trim, fold, and cut marks
    c. Other marks
5. Step-and-repeat layout

6. Combinations
    a. Positive lettering
    b. Reverse lettering
7. Stripping for two-color jobs

IV. PLATEMAKING

A. Plate characteristics

1. General types
    a. Masters, usually for duplicator sizes
    b. Plates, usually metal
2. Composition
    a. Paper
    b. Plastic-coated paper
    c. Acetate
    d. Zinc
    e. Aluminum
    f. Copper
    g. Steel
    h. Combinations: laminates
3. Methods of attaching to the cylinder
    a. Looped for posts
    b. Straight for clamping
    c. Oval holes for posts
    d. Punched for pin bars
4. Thickness
    a. Small size: .005-.012"
    b. Large plates: .020 and thicker
5. Other features
    a. Clear area
    b. Image area
    c. Surface grain

6. Main types by process: surface plates
    a. Direct image
    b. Presensitized
        (1) Contact printed
        (2) Photo-direct
7. Additional types
    a. Other surface plates
    b. Deep-etch plates
    c. Relief plates
8. Care of plates
    a. Unexposed plates
        (1) Avoid light
        (2) Handle by edges
        (3) Avoid any abrasive action
    b. Developed plates
        (1) Gumming: gum arabic
        (2) Putting under: asphaltum
    c. Storage
        (1) Drawers
        (2) Hangers

B. Plate and master making
1. Direct-image masters
    a. Construction
    b. Typing or composing
    c. Drawing and lettering
2. Plate-exposure in vacuum frames
    a. Construction of the equipment
    b. Light source
        (1) Mercury-vapor
        (2) Carbon-arc

c. Determining exposure

3. Presensitized masters

   a. Coatings

      (1) Diazo

      (2) Others

         (a) Silver halide
         (b) Biochromated
         (c) Ferric
         (d) Photo polymers
         (e) Photo-electrostatic
         (f) Thermographic

   b. Processing of negative-working plates

      (1) Exposing
      (2) Desensitizing
      (3) Gumming

   c. Processing of positive-working plates

      (1) Exposing
      (2) Staging-out
      (3) Developing
      (4) Intensifying
      (5) Gumming

4. Transfer plates

   a. Gelatin-silver-emulsion
   b. Silver-diffusion
   c. Electrostatic dry transfer

5. Repairing plates

V. PRESSWORK

A. Basic principles

1. Grease and water do not readily mix

        - a. Imaged plate area
            - (1) Attracts ink
            - (2) Repels water
        - b. Clear plate area
            - (1) Receptive to water
            - (2) Repels ink
        - c. A balance of ink and water
    - 2. The image transfer
        - a. The transfer (offset) of a positive image from the plate to a reversed image on the intermediate cylinder
        - b. The transfer (offset) of a reversed image on the blanket cylinder to a positive image on the paper

- B. Historical sketch
    - 1. Alois Senefelder
    - 2. Stone lithography
    - 3. Early presses
    - 4. Currier and Ives
    - 5. Daguerreotype pictures
    - 6. Early negatives
    - 7. The halftone screen
    - 8. Photo-offset lithography

- C. Offset press fundamentals
    - 1. The major systems
        - a. Dampening system
            - (1) Fountain solution
            - (2) Moisture control
            - (3) Moisture rollers
            - (4) Roller composition and covers
        - b. Inking system
            - (1) Ink fountain
            - (2) Ink control

- (3) Ink rollers
- (4) Roller composition

c. Combination ink - water delivery system

d. Main printing unit

- (1) Three cylinder design
    - (a) Plate cylinder
    - (b) Blanket cylinder
    - (c) Impression cylinder
- (2) Two cylinder design
    - (a) Plate-impression cylinder
    - (b) Blanket cylinder

e. Feeder unit

- (1) Friction feed
    - (a) Rubber feed rollers
    - (b) Stock-height guide
    - (c) Stop fingers
- (2) Vacuum feed
    - (a) Blower motor and blast tubes
    - (b) Vacuum motor and sucker feet
    - (c) Stock-height guide
    - (d) Pull-out rolls
    - (e) Doubles-eliminator

f. Register board

- (1) Conveyor tapes
- (2) Skid wheels
- (3) Jogger
- (4) Stop fingers
- (5) Forward feed rollers

g. Delivery system

- (1) Ejector rollers and stripper strap
- (2) Chain delivery and receding stacker

D Moisture control

1. Content of the moisture fountain solution

   a. Distilled water
   b. Acid
   c. Other

2. Checking and maintaining the pH

   a. pH scale
   b. Litmus paper check

E. Offset inks

1. Requirements

   a. Non-emulsifying
   b. High resistance to breakdown

2. Composition

   a. Vehicle: linseed oil
   b. Pigment: usually from coal tar
   c. Modifiers: control compounds

3. Manufacture

   a. Preparing
   b. Mixing
   c. Grinding
   d. Testing
   e. Packaging

4. Color mixing: basic colors required

   a. Yellow
   b. Red
   c. Blue
   d. Orange
   e. Green
   f. Purple
   g. White
   h. Black

        - i. Job black
        - j. Halftone black
        - k. Metallic ink
        - l. Water colors
    - 5. Terminology
        - a. Viscosity
        - b. Tack
        - c. Opacity
        - d. Permanence
        - e. Transparency
        - f. Fugitive
        - g. Resistance
        - h. Lakes
    - 6. Storing ink
- F. Maintenance
    - 1. Cleanup
        - a. Inking system
        - b. Moisture system
    - 2. Roller care and storage
        - a. Rubber rollers
        - b. Covered rollers
    - 3. Lubrication
        - a. Vacuum and air filters
        - b. Bearings
        - c. Others
- G. Troubleshooting
    - 1. Poor copy
        - a. Washed out
        - b. Scumming
        - c. Too dark
        - d. Blurred copy

- e. Streaks
- f. Uneven printing

2. Pressure checks

    - a. Form roller pressure
    - b. Plate-to-blanket pressure
    - c. Blanket-to-impression-cylinder pressure
    - d. Pullout roll pressure
    - e. Forward feed roller pressure
    - f. Skid wheel pressure

3. Additional checks

    - a. Ink
    - b. Moisture
    - c. Glazed rollers
    - d. Stripping of rollers
    - e. Other

VI. BINDRY

A. Paper

1. Requirements

    - a. Affinity for ink
    - b. Resistance to breakdown
    - c. Flat surface
    - d. Line- and fuzz-free

2. Pulp: raw material for paper

    - a. Kinds of pulp
        - (1) Mechanically-ground wood
        - (2) Old paper
        - (3) Chemical wood
        - (4) Rag
        - (5) Cotton
    - b. Process of making paper
        - (1) Reducing to fiber

        (2) Beating
        (3) Refining
        (4) Sizing
        (5) Loading
        (6) Forming
        (7) Calendering
        (8) Packaging

    3. Terms

        a. Ream
        b. Package
        c. Piece
        d. Sheet
        e. Felt side
        f. Wire side
        g. Grain
        h. Basis (substance)
        i. Weight
        j. Coated

    4. Testing the direction of grain
    5. Paper cutting

        a. Equipment

            (1) Manual
            (2) Power

        b. Figuring pieces from a sheet

    6. Controlling stretching and shrinking of paper

B. Jogging

    1. Hand methods
    2. Mechanical methods

C. Gathering and collating

    1. Distinguishing gather from collate
    2. Hand methods

        3. Mechanical methods
            a. Semiautomatic
            b. Automatic
    D. Stapling, stitching, and sewing
        1. Stapling
        2. Stitching (metal wire)
        3. Saddle stitching
        4. Sewing (cord or string)
    E. Punching and drilling holes
    F. Folding, scoring, slitting, and serrating
    G. Padding

VII. COMPREHENSIVE PROBLEM

    A. Receiving the job order
    B. Estimating supplies
    C. Planning layout
    D. Composing
    E. Shooting line work and halftones
    F. Making the plate
    G. Production running
    H. Binding

EQUIPMENT LIST

Quantity	Item
1	Offset press, 17 x 22; pinbar clamp, chrome-plated cylinders; pump and drive motor(s) minimum of 3/4 hp (total), 60 cycle, 120v, 1-phase; 3500-5500 iph running capacity; vacuum feed; chain delivery; spray gun attachment; double sheet eliminator; 2 work lights, one over cylinders, one in chain delivery
2	Offset duplicators, 11 x 17; pinbar clamp; chrome-plated cylinders; pump and drive motor(s) minimum of 3/4 hp (total), 60 cycle, 120V, 1-phase; 3400-8400 iph running capacity; vacuum feed; chain delivery; spray gun attachment; double sheet eliminator; 2 work lights, one over cylinders, one in chain delivery
1	Offset duplicator, 10 x 15; pinbar clamp; chrome-plated cylinders; pump and drive motor(s) minimum of 1/2 hp (total), 60 cycle, 120v, 1-phase; 3400-8400 iph running capacity; vacuum feed; friction-roller delivery; 8600 iph
	NOTE: Recommend one machine of each major manufacture
1	Camera, process; vacuum film holder, 16" x 20"; ground glass graduated in inches, 16" x 20"; one piece bellows, supported; multi-element, color corrected lens with 200% enlargement and 20% reduction; 21 x 25, glass covered copyboard with rotating and tilting features; manual iris diaphragm control; shutter control to include foot switch, lamp contactor, and electric timer; with 4 quartz-iodine lamps, 1500w; 115v, 60 cycles, single-phase, a-c current
15	Quartz-iodine lamps, replacement; for above camera
2	Composing machines, keyboard; differential letter spacing; variable line spacing; carbon ribbon; replaceable type fonts (elements) with 7-12 point range; electric, 115v, 60 cycle, single-phase, a-c current; with coders for keyboard
1 each (7-,9-,10-, 12-point)	Type fonts (elements); serif, san serif, gothic; italic, regular, bold
2	Ruling fonts
	NOTE: Recommend one composing machine of each major manufacture
2	Typewriter stands and chains for the above composers
1	Line composer, photographic; 6- to 84-point type size; single line composer acceptable, multiple line composer preferred; equipment preferred which will enlarge, reduce, and/or slant type font

3	Light tables; for layout and stripping; minimum glass area 24 x 36"; 60 watts of fluorescent lighting; graduated scales, both horizontal and vertical; steel T square for each table, 36"; 110-v, 1-phase, 60-cycle, a-c current; each table with a stool which has a back
2	Light tables for layout and stripping; tilt-top; minimum glass area 20 x 30"; 60 watts of fluorescent lighting; graduated scales, both horizontal and vertical; steel T square for each table, 36"; 110-v, 1-phase, 60-cycle, a-c current; each table with a stool which has a back
5	Tables or stands for the above light tables
1	Light table, precision; for layout and stripping; minimum glass area, 30" x 42"; horizontal and vertical straight edges, steel, geardriven, vernier spacing mechanism; minimum 60 watts of fluorescent lighting; 110-v, 1-phase, 60-cycle, a-c current; mounted on stand with drawers; with a stool which has a back
3	Triangles, plastic; 30-60°, 10"
3	Triangles, steel; 30-60°, 10"
3	Triangles, plastic; 45°, 10"
3	Triangles, steel; 45°, 10"
6	Scales, steel; level edges; 18"
2 sets (8 pieces ea.)	French curves; plastic; assorted sizes
3 kits (7 pens ea.)	Ruling pens; one each of the following sizes: 00, 0, 1, 2, 2-1/2, 3, 4; with handle, ink bottle, cleaner bottle, in a box
2 sets	Needle points
6 kits	Knives; for layout and stripping; one with fixed head, one with swivel head; both with replaceable blades
3 dozen assorted	Artists brushes, camels hair
3	Magnifying glasses, clamp-on type; 4-1/2 diameter; 24" flexible arm
3	Magnifying glasses; floor-model; 4-1/2" diameter; 24" flexible arm
1	Galley cabinet; for pressure lettering storage; single tier; 25 galleys, 8-3/4 x 13"
1	Cutting board; for paper; 24"; maple board, 1/2" scoring; with safety guard
1	Wax coater, electric; 110-v, 1-phase, 60-cycle, a-c current

1	Developing sink; temperature control; non-corrosive work areas; sink area must be large enough to hold three 18 x 24" trays
1	Viewing unit; minimum glass area 18 x 24"; unit may be combined with developing sink
3	Safelights; for darkroom; one amber, one red, one green; 15 watt, 110-v
1	Platemaker or exposure cabinet: carbon-arc light or equal; minimum 20 x 26", vacuum frame; flip-top design preferred; 220-v, 1-phase, 60-cycle, a-c current
1	Plate sink; 20" x 26" working area; with flushing line
1	Paper cutter; power; 30-1/2 cutting width; 2 hand safety control; 220-v, 1-phase, 60-cycle, a-c current
1	Paper folding machine; 17" x 22"; 2 front and 3 side folds; vacuum feed; perforating and scoring heads; stripping fingers; 110-v, 1-phase, 60-cycle, a-c current
1	Stitcher, wire (stapler) power; for both side and saddle stitching; range up to 3/4"; 110-v, 1-phase. 60-cycle, a-c current
1	Paper drill, power: foot-pedal-operated, automatic trip gage; capacity 2", 1/8-1/2" drill; to include electric switch, 24 assorted drills, 36 drill blocks, 2 sharpeners, slitting-slotting-and-round-corner attachments, straight knives (1/8, 1/4, 7/16"); 110-v, 1-phase, 60-cycle, a-c current
1	Cabinet; for unexposed plate and film storage; light-tight; 17 x 22"; may be built-in to darkroom
1	Hand numbering stamp; 1/4"; adjustable for repeat, duplicate, and consecutive numbering
1	Paper punch, 3 hole; for up to 8-1/2" x 11" stock; adjustable
1	Padding press; hand-operated screw; 18" wide
As req.	Storage cabinets, exposed offset plate· for standard size plates: 10 x 15", 11 x 17", 17" x 22"; with hangers
1	Punch, plastic ring binding; manually operated
1	Binder, plastic ring; manually operated
	NOTE: punch and binder may be ordered as a single unit
3	Tables, utility work; 30w x 901 x 30"h; laminated maple top; with steel legs and storage shelves
2	Gathering racks
	Tape dispensers

SUPPLIES LIST

The quantity and nature of printing jobs selected for training by the instructor are the factors which determine the supplies needed. The list which follows suggests typical items.

Quantity	Item
	Brushes: artists camel hair; assorted sizes
	Blanket, offset: rubber, in sizes for each type duplicator or press
	Cement: rubber (with thinner); padding
	Chemicals, darkroom: developer, stop-bath, fixer, dryer
	Erasers: art gum; ruby; offset-master
	Film, darkroom: in sizes to fit camera and work planned
	Hand cleaner: oil-emulsifying-type; abrasive soap; mild soap
	Ink, offset: job black, halftone black, opaque white, transparent white, red, green, blue, yellow, varnish; india ink for drafting and layout
	Lubricants: gear grease, light oil, and others as recommended by equipment manufacturer
	Masking and stripping paper
	Plates, offset: paper masters, acetate masters, and aluminum plates to fit duplicators and presses ordered
	Pencils: 4H, 2H, F, B; reproducing; non-reproducing
	Pens: reproducing, with refills
	Pressure lettering: a range of fonts, and point sizes
	Paper, wrapping: for packaging completed jobs
	Stock: card stock, paper, onionskin, etc; a range of sizes, colors, textures and other characteristics
	Sponges: for developing and cleaning plates

Solutions for plate making and preserving: etch; gum preservative; laquer; desensitizer

Solutions for the offset process: blanket cleaner; deglazer; fountain concentrate; pH (litmus) paper; spray fix

Tape: drafting; dummed wrapping; transparent; lithographic opaque

Mechanic, Electronic (Industrial), Suggested Guide for a Training Program.

Chambers, W. W.
Office of Education, Washington, D.C.
Pub Date - 65
MF AVAILABLE IN VT-ERIC SET 42p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRONIC MECHANICS, *ELECTRONICS, POST SECONDARY EDUCATION, PROGRAM PLANNING,
MDTA Programs,

This curriculum guide is for administrator and teacher use in organizing courses and developing course content for post-high school programs to prepare persons for employment as electronic mechanics. It was developed by the Ohio State University under contractual arrangements with the U.S. Office of Education Division of Vocational and Technical Education. The objectives of the course are to prepare trainees to (1) solve mathematics problems involved in electronic work, (2) read, interpret, and use electronic drawings, and (3) understand and make practical applications of the fundamentals of electricity, electronics, and electronic and magnetic controls. Some of the 7 units are (1) Basic Mathematics for Electronics, (2) Fundamentals of Electricity, and (3) Fundamentals of Electronic Controls. Each unit gives the suggested training time, objectives, and subject matter outlines. The time allocations for each unit within the 2,000 hour course may be changed to meet trainee and community needs. The teacher should understand the philosophy, objectives, and requirements of the program and meet state teacher certification requirements. Students should have a high school education or maturity as needed to profit from training and have satisfactory scores on the General Aptitude Test Battery B-359. Suggestions for teaching the course, a list of references, and suggested equipment, tools, supplies, and training facilities are included. (HC)

MECHANIC, ELECTRONIC (INDUSTRIAL)

Suggested Guide for a Training Program

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

John W. Gardner, Secretary

Office of Education

Harold Howe II, Commissioner

Manpower Development and Training Program

FOREWORD

There has been a tremendous growth and development in the practical applications of electronics in recent years. Industry is making increasing use of electronics in the development of modern technological improvements in methods of production. This has created a demand for mechanics who are qualified to install and service electronic apparatus and equipment.

This suggested guide has been developed for use by administrators and teachers in organizing courses and developing course content for programs designed to prepare individuals for employment as electronic mechanics. It was prepared under contract for the Division of Vocational and Technical Education by the Instructional Materials Laboratory, Trade and Industrial Education, The Ohio State University, under the direction of Dr. Robert M. Reese, Department Head, Trade and Industrial Education Services, and W.F. Stover, Consultant, Instructional Materials Development.

Appreciation is expressed to W.W. Chambers, Lima, Ohio, a former vocational teacher, teacher educator, and local supervisor of trade and industrial education, for the preparation of the content of this guide; and to the following persons who served as consultants in developing and reviewing the content: C.H. Ayers, Electronics Instructor, Lima Senior High School, Lima, Ohio; and H.K. Omer, Electronics Engineer, Westinghouse Electric Corporation, Lima, Ohio.

The sequence of units may be changed to meet local needs and requirements. This flexibility of content makes possible its use for initial development of untrained persons and also for upgrading and retraining workers already employed.

A suggested list of texts and references, training aids, equipment, tools, supplies, sources for purchase of same, and a floor plan of a suggested facility has been included to assist administrators and teachers in organizing new courses. The assistance of local advisory groups should be sought for guidance in selecting equipment which will best serve the local conditions. Modification of the suggested shop layout should follow advisory committee recommendations.

The increased applications of electronic principles to industry will probably continue at a high rate. This will assure a continuing demand for well-trained mechanics. Trade extension classes for workers in this field should expand to keep pace with the demand.

Walter M. Arnold
Assistant Commissioner
for Vocational and
Technical Education

CONTENTS

TRAINING PROGRAM FOR MECHANIC, ELECTRONIC (Industrial)

General Plan for the Course

The following suggestions are for training persons who are to become industrial electronic mechanics.

Teachers must adjust and adapt the suggestions in this guide to the needs of the particular group they are teaching because the duties of the electronic mechanic may differ from industry to industry, and the trainees will vary in education, experience and ability. In addition to having firsthand information concerning job requirements, the teacher must secure as much information as possible about the trainees. The specific objectives, teaching methods, and time allotted to each aspect of the training can then be adjusted to the local situation and to the trainees.

Job Functions

The industrial electronic mechanic repairs electronic equipment such as computers, industrial controls, transmitters, antennas, and servomechanisms following blueprints and manufacturers' specifications and using hand tools and test instruments; tests faulty equipment and applies knowledge of fundamental operation of electronic units and systems to diagnose cause of malfunction; tests electronic components and circuits to locate defects using instruments, such as oscilloscopes, signal generators, ammeters, and voltmeters. He replaces defective components and wiring and adjusts mechanical parts using hand tools and soldering iron; aligns, adjusts, and calibrates equipment according to specifications; calibrates testing instruments; maintains records of repairs, calibrations, and tests.

Program Objectives

To prepare trainees:

1. To solve the mathematical problems involved in electronic work.
2. To read, interpret, and use electronic drawings, symbols, and diagrams and to do simple sketching and drawing.
3. To understand and make practical application of the fundamentals of electricity.
4. To understand and make practical application of the fundamentals of electronics.
5. To understand and make practical application of the fundamentals of electronic and magnetic controls.

It is suggested that the teacher review carefully the "Criteria for Evaluating Trainee Readiness for Employment" (see page 23) prior to developing plans for teaching this course. The criteria will be useful throughout the course in setting up specific objectives, providing learning experiences, and making periodic evaluations.

Teacher Qualifications

A qualified teacher for this course is one who satisfactorily meets all the requirements for a State vocational trade and industrial education teaching certificate. He must understand the educational philosophy, the objectives and specific requirements that characterize this program. He must be flexible enough to adjust the course to the needs of the individuals enrolled and the occupation they are preparing to enter.

Trainee Qualifications

A trainee should have a high school education or such maturity as needed to profit from the training. Graduation from a vocational course in electricity would be most desirable. He should be required to make a satisfactory score on the U.S. Employment Service General Aptitude Test Battery B-359. He must have the patience to do very tedious work and the ability to perform the math problems involved.

Length of Course and Course Units

A basic course of approximately 2000 hours is suggested for the training. It is further suggested the course be taught 8 hours a day, 5 days a week, for 50 weeks. In all probability, much outside study will need to be done in order to complete the course in the time suggested. The following suggested time in hours for each of the units can be used as a guide for planning a course to meet trainee and employer needs.

Course Unit	Title	Hours
I.	Orientation to the Occupation of Mechanic, Electronic (Industrial)	10
II.	Basic Mathematics for Electronics	180
III.	Electrical and Electronic Drawing, Symbols, and Diagrams	50
IV.	Fundamentals of Electricity	780
V.	Fundamentals of Electronics	600
VI.	Fundamentals of Electronic Controls	260
VII.	Fundamentals of Magnetic Controls	120
	Total	2000

Course Unit I

ORIENTATION TO THE OCCUPATION OF MECHANIC, ELECTRONIC (Industrial)

Suggested Training Time 10 Hours

Objectives

To orient trainees to the development, nature and scope of the present-day electronic industry.

To provide trainees with an understanding of the importance of the occupation of electronic mechanic.

To assist trainees in a realization of the technical knowledge and manipulative skill required for successful employment as an electronic mechanic.

Unit Outline

A. Orientation

1. The history and background of the development of the electronic industry
2. The importance of the occupation of an industrial electronic mechanic to present-day industry.
3. The necessity of knowing the safety precautions peculiar to the electrical trade and the importance of observing them at all times. (See page 27 for suggested teaching aids.
4. The importance of acquiring the technical knowledge and the development of manipulative skill in the use of the tools and equipment in the analyzing and servicing of electronic equipment. It is suggested that the use of tools should be taught and required during the shop periods.
5. The job opportunities and promotion possibilities in the electronic industry.

B. Trainees Requirements

1. Have the patience and ability to correctly analyze electronic faults and to plan and execute an efficient approach to their successful solution.
2. Have the ability to make the necessary mathematical calculations.
3. Have the ability to read, interpret and make wiring diagrams, etc.
4. Are able to keep records.
5. Are able to work well with their fellow employees.
6. Know local, state, and national codes regarding electrical work.

C. Unit Achievement Test

Course Unit II

BASIC MATHEMATICS FOR ELECTRONICS

Suggested Training Time 180 Hours

It is suggested this unit be taught two hours each day until completed.

Objectives

To provide trainees with a general review of arithmetic.

To teach trainees to understand and use the basic fundamentals of mathematics in its application to the solution of electronic problems.

Unit Outline

A. Arithmetic

1. Addition
2. Subtraction
3. Multiplication
4. Division
5. Common fractions
6. Decimal fractions
7. Square root

B. Algebra

1. General numbers
2. Addition
3. Subtraction
4. Multiplication
5. Division
6. Factoring
7. Fractions
8. Equations
9. Fractional equations
10. Simultaneous equations
11. Exponents and radicals
12. Quadratic equations

C. The slide rule - powers of ten

D. Trigonometry

   1. Functions
   2. Solution of right triangles
   3. Periodic functions

E. Elementary plane vectors

F. Vector algebra

G. Logarithms - applications

H. Unit achievement test

Course Unit III

ELECTRICAL AND ELECTRONIC DRAWING, SYMBOLS, AND DIAGRAMS

Suggested Training Time 50 Hours

It is suggested this unit be taught one hour each day until completed.

Objectives

To teach trainees:

1. The techniques involved in orthographic projections and pictorial drawings.
2. To make simple free-hand sketches.
3. The importance of and ability to do lettering.
4. To have a working knowledge of electrical and electronic symbols.
5. To correctly interpret wiring and schematic diagrams.
6. To do the electrical drawing for building plans.

Unit Outline

A. Orthographic projections

  1. Two-view drawings
  2. Three-view drawings
  3. Auxiliary views
  4. Sectional views

B. Pictorial drawings

  1. Isometric
  2. Oblique
  3. Dimetric
  4. Perspective
  5. Sectional views

C. Free-hand sketching

  1. Making horizontal lines
  2. Making vertical lines
  3. Making curved lines
  4. Making circles

D. Lettering

1. Types
    a. Making vertical capital letters
    b. Making vertical lower case letters
    c. Making inclined capital letters
    d. Making inclined lower case letters
2. Numbers
    a. Making vertical numbers
    b. Making inclined numbers
    c. Making fractional numbers

E. Symbols

1. Battery
    a. Single cell
    b. Multi-cell
2. Capacitor
    a. General
    b. Variable
    c. Shielded
3. Contact
    a. Open
    b. Closed
    c. Electrically operated single-pole with series blowout coil
4. Chassis and ground
5. Relay coil
6. Resistor
    a. General
    b. Variable
    c. Tapped
7. Switch
    a. Single-throw, open and closed
    b. Double-pole, double-throw
    c. Push-button
8. Transformer
    a. General
    b. General with magnetic core
    c. General with one winding having an adjustable inductance
    d. Current transformer with polarity marking
9. Mechanical linkage
10. New device symbols
11. Electron-tube
12. Transistor

F. Wiring and schematic diagrams

1. Types
   a. Point to point
   b. Highway
   c. Airlane or base line
2. External - interconnection
3. Cabling
4. Panel or chassis
5. Block
6. Electronic schematic
7. Industrial electronic
8. Electric power drawing

G. Electrical drawing

1. Simple wiring diagram - one-story
2. Wiring symbols on a simple floor plan
3. Electrical plan for a small building
4. Fixture schedule and legend
5. Electrical rise diagram for a three-story building

H. Unit achievement test

Course Unit IV

FUNDAMENTALS OF ELECTRICITY

Suggested Training Time 780 Hours

It is suggested that the training in this unit be divided into 620 hours of classroom lecture, demonstration and discussion, and 160 hours of practical shop experience.

Objective

To teach trainees to have a working knowledge of the fundamentals of electricity as a prerequisite to the fundamentals of electronics.

Unit Outline

A. Introduction

1. History of electricity
2. Electron theory of electricity
3. Conductors and insulators
4. Terms and definitions
5. Sources of electricity
6. The closed circuit
    a. Potential
    b. Current
    c. Resistance

B. DC circuits

1. Ohm's law
    a. Simple circuits
    b. Practical units
    c. Power
2. Series circuits
3. Kirchhoff's law
4. Parallel circuits
5. Series - parallel circuits
6. Coefficient of resistance
7. Superposition theorem
8. Thevenin's theorem

C. AC circuits

1. Faraday's law
2. Sine wave power generation
    a. Sine wave voltages
    b. Sine wave currents
3. Linear circuit elements
    a. Resistor
    b. Inductor
    c. Capacitor
4. Inductive reactance
5. Capacitive reactance
6. Impedance
7. Simple resistive circuits
8. Simple inductive circuits
9. Simple capacitive circuits
10. Resistive - inductive circuits
11. Resistive - capacitive circuits
12. R-L-C circuits
13. Series resonance
14. Parallel resonance
15. Real and apparent power
16. Polyphase circuits

D. DC machines

1. Physical description
2. Electromechanical energy conversion principles
3. Characteristics of DC motors
    a. Shunt
    b. Series
    c. Compound
4. Characteristics of DC generators
    a. Shunt
    b. Series
    c. Compound
5. Performance of DC machines
6. Applications of DC machines

E. AC machines

1. Single-phase transformers
    a. Construction features
    b. Principle of operation
    c. Effect of core saturation

    - d. Equivalent circuit
    - e. Fundamental transformer constants
    - f. The open circuit test
    - g. The short circuit test
    - h. Voltage regulation

2. Polyphase transformers
    - a. Two-phase transformers
    - b. Three-phase transformers
    - c. Wye-wye transformation
    - d. Delta-delta transformation
    - e. Wye-delta transformation
    - f. Open delta transformation
3. Special purpose transformers
    - a. Instrument transformers
    - b. Potential transformers
    - c. Current transformers
    - d. Auto transformers
4. Polyphase induction machines
    - a. Introduction and physical description
    - b. Rotating field principle
    - c. Production of torque
    - d. Equivalent circuit
    - e. Circuit constants
    - f. Performance characteristics
        - (1) Starting
        - (2) Operating
    - g. Measurement of induction motor constants
    - h. Speed control
5. Synchronous machines
    - a. Introduction and physical description
    - b. The elementary AC generator
    - c. Revolving field
    - d. Single-phase windings
    - e. Three-phase windings
    - f. Generation of harmonics
    - g. Distribution factor
    - h. Pitch factor
    - i. Performance characteristics
        - (1) No-load saturation curve
        - (2) Short circuit saturation curve
        - (3) Construction of load saturation curves
        - (4) Torque angle characteristics
        - (5) Parallel operation of generators
        - (6) Starting of synchronous motors

        - (7) Synchronous motor characteristics
    6. Single-phase motors
        a. Introduction
        b. Single-phase induction motor
            (1) Cross-field theory
            (2) Revolving field theory
        c. Capacitor motors
        d. Universal motors
        e. Applications of single-phase motors

F. Instrumentation

1. Introduction
2. D'Arsonval galvanometer
3. DC ammeters
4. DC voltmeters
5. Ohm meters
6. Wheatstone bridge
7. Iron-vane instruments
8. Dynamometer instruments
9. Thermocouple instruments
10. AC bridges
11. Watt meters
12. Recording instruments
13. Shunts

G. Magnetic circuits

1. Magnetism
2. Magnetic circuit relations
3. Ohm's law of magnetic circuits
4. Magnetic potential gradient
5. Flux density
6. Air gaps
7. Magnetization curves
8. Saturation
9. Series magnetic circuits
10. Branched magnetic circuits
11. Hysteresis
12. Permanent magnetics
13. Flux leakage

H. Unit achievement test

Course Unit V

FUNDAMENTALS OF ELECTRONICS

Suggested Training Time 600 Hours

It is suggested that the training in this unit be divided into 300 hours of classroom lecture, demonstration, and discussion and 300 hours of practical shop experience.

Objective

To teach trainees to have a working knowledge of the fundamentals of electronics.

Unit Outline

A. Introduction

1. History of electronics
2. Methods of electron emission
3. Electron ballistics

B. Vacuum tubes

1. Diode
    a. Physical description
    b. Theory of operation
    c. Operation characteristics
    d. Ratings
    e. Applications
2. Triode
    a. Physical description
    b. Theory of operation
    c. Operation characteristics
    d. Ratings
    e. Applications
3. Other multi-element tubes
    a. The tetrode
    b. The pentode
    c. Beam power tubes

C. Gas filled tubes

1. Thyratron
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications
2. Ignition
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications

D. Semi-conductors

1. Selenium rectifiers
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications
2. Silicon diodes and rectifiers
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications
3. Transistors
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications
4. Silicon controlled rectifiers
   a. Physical description
   b. Theory of operation
   c. Operation characteristics
   d. Ratings
   e. Applications
5. Zenier diodes
   a. Physical description
   b. Theory of operation
   c. Operation characteristics

        - d. Ratings
        - e. Applications

E. Filter circuits

1. Simple R-C filters
2. Simple R-1 filters
3. Low-pass filters
4. Band-pass filters

F. Power supplies

1. Typical power supply circuits
    - a. Single-phase
    - b. Three-phase
    - c. Six-phase
2. Power supply rating
    - a. Input voltage
    - b. Output voltage
    - c. Output current
    - d. Ripple frequency and voltage

G. Amplifiers

1. Voltage amplifiers
    - a. Classification of amplifiers
    - b. Simple single-stage amplifiers
    - c. Equivalent circuits at low frequency
    - d. Equivalent circuits at high frequency
2. Audio-frequency power amplifiers
    - a. Introduction
    - b. Class "A" amplifiers
    - c. Parallel operation of tubes
    - d. Push-pull operation
    - e. Class "B" amplifiers

H. Magnetic amplifiers

1. General description
2. Theory of operation
3. Operation characteristics
4. Applications

I. Feed-back controls

1. Introduction
2. Examples of closed-loop servo systems
3. The reference signal
4. Effects of gain in circuit
5. Effects of feed-back on stability

J. Unit achievement test

Course Unit VI

FUNDAMENTALS OF ELECTRONIC CONTROLS

Suggested Training Time 260 Hours

It is suggested that the training in this unit be divided into 170 hours of classroom lecture, demonstration, and discussion and 90 hours of practical shop experience.

Objective

To teach trainees to have a working knowledge of electronic controls and their practical application and use.

Unit Outline

A. Introduction

B. Timing circuits

1. R-C discharge circuits
2. R-C charge circuits
3. Time-delay and time-constant calculations
4. Synchronous timers
5. Thermal timers

C. Photoelectric devices

1. Applications
2. Photoconductivity cells
3. Photoemissive cells
4. Photovoltaic cells

D. Electronic control of resistance welders

1. Basic principles of resistance welding
2. Electronic control of heat
3. Electronic timing control
4. Energy storage welding

E. High frequency heating

  1. Induction heating
  2. Dielectric heating
  3. Methods of generating high frequency current
  4. Vacuum tube oscillators

F. Electronic control of motors and generators

  1. Control of armature and field voltages
  2. Saturable reactors
  3. Automatic speed regulators
  4. Automatic voltage regulators

G. Light dimming control

  1. Reactor control of AC power
  2. Thyratron control of reactors
  3. Theater light dimming controls

H. Unit achievement test

Course Unit VII

FUNDAMENTALS OF MAGNETIC CONTROLS

Suggested Training Time — 120 Hours

It is suggested that the training in this unit be divided into 90 hours of classroom lecture, demonstration, and discussion and 30 hours of practical shop experience.

Objective

To teach trainees to have a working knowledge of magnetic controls and their practical application and use in electronics.

Unit Outline

A. Introduction

  1. Symbols
  2. Diagrams

B. DC contactors and relays

  1. Physical description
  2. Operating characteristics
  3. Specifications
  4. Time delay relays

C. AC contactors and relays

  1. Physical description
  2. Operating characteristics
  3. Specifications

D. DC control circuits

  1. Motor starters
  2. Jogging
  3. Reversing
  4. Shunt field control
  5. Armature control

   6. Protective devices
   7. Plugging

E. AC control circuits

   1. Motor starters
   2. Jogging
   3. Reversing
   4. Plugging
   5. Protective devices

F. Construction of control panels

   1. Types of construction
   2. Panel wiring
   3. Nema standards
   4. Draw-out controls

G. Unit achievement test

TEACHING THE COURSE

Planning the Lesson

The best guide or lesson plan is, of course, one that has been prepared by the individual teacher, based on personal experience and manner of teaching. Although teachers differ in their ways of organizing and coordinating important parts of their presentations they agree that the purpose of a lesson is to provide effective and meaningful classroom and shop instruction.

Written plans may be brief, but before the class starts the good teacher will know the following:

1. The goals or objectives of the lesson -- the kind of learning desired.
2. The outline and suggested time schedule for the lesson, including:
    a. An interest approach - method of introducing the lesson to obtain the interest of the trainees and direct their attention to the lesson's goals or objectives and to connect the lesson to knowledge already known by the trainee.
    b. Activities which involve the trainees in discovering new facts and principles, solving realistic problems, or practicing skills.
    c. A way to summarize the lesson -- to help trainees arrive at some valid conclusions and/or to evaluate the extent to which lesson goals have been achieved.
3. The subject matter content -- the facts and principles or main ideas to be brought out in the lesson.
4. The teaching materials and references to be used.

Suggested Teaching Aids

In addition to the training facility, suggested textbooks and reference materials being used to teach the class, the course should be supplemented by:

1. Providing a satisfactory demonstration table and equipment for the use of the teacher in the classroom.
2. Having a representative from the American Red Cross visit the class to discuss and demonstrate first aid techniques and artificial respiration.
3. Contacting the State industrial commission and division of safety and hygiene, for the use of safety films, charts, brochures, etc., as well as for a visit by one of their field men.
4. Field trips to local and/or area industrial electronic establishments.
5. Inviting local and/or area electronic personnel to discuss with the trainees the problems they are likely to encounter as electronic mechanics.
6. Contacting the local library, board of education, and State department of education for visual aids they have in their respective libraries for educational purposes at little if any cost.
7. Having a representative from the local fire department discuss and demonstrate for the trainees the correct method of fighting electrical fires.

Criteria for Evaluating Trainee Readiness for Employment

The criteria for determining whether the trainee is ready for employment as an industrial electronic mechanic will be quite largely the trainees' ability to quickly and correctly analyze electronic faults and to efficiently repair them. Understanding of human frailties and needs and insight into how to provide the various services required by employers are of such importance that every attempt should be made to evaluate trainee progress.

The use of various evaluative devices is necessary for the teacher and the trainee to accumulate objective information about the growth of the trainee. The following attributes and competencies need to be developed or strengthened during the training program:

A. Personal qualities:

  1. Courtesy, friendliness, and tact in dealing with fellow workers
  2. Acceptable appearance -- good grooming for the job to be done
  3. Good personal habits in speech, mannerisms, cleanliness, and methods of work
  4. Mature judgment in a variety of situations
  5. Acceptable attitudes -- calmness and patience in disorganized situations, positive attitude toward work, and cooperativeness
  6. Understanding and assuming the role of the industrial electronic mechanic.

B. Activities showing knowledge, understanding, and skills:

  1. Works effectively under supervision
  2. Demonstrates knowledge of electronic equipment maintenance and repair

3. Understands and carries out instructions or directions of employer
4. Understands problems of supply and cost and proper methods of keeping records and accounts
5. Understands need for safety in work -- recognizes danger areas and follows necessary safety precautions
6. Knows action to take in an emergency
7. Uses tools and equipment properly and safely
8. Demonstrates ability to develop and follow a work plan or schedule
9. Demonstrates proper techniques and methods of cleaning up work areas

1 - Philco. Color Code Wall Chart. LC-1

Appendix A

SUGGESTED LIST OF EQUIPMENT

Classroom Area

1 - Teacher's desk
1 - Teacher's desk chair
1 - Teacher's combination wardrobe and storage cabinet
1 - Filing cabinet
1 - Waste basket
1 - Chalkboard
1 - Chalkboard pointer
1 - Coat and hat rack for 20 trainees
20 - Tablet arm chairs
1 - Pencil sharpener
21 - Slide rules
20 - Notebook binders, 3 ring, 8 1/2" x 11"
1 - Electronics Fundamentals Units Complete - Item 1, Part number 463-4645, Philco
1 - Panel vacuum tube multimeter - Item 27, Part number 463-4527, Philco
1 - Transistor lecture demonstration unit complete - Item 20, Part number 463-4523, Philco
1 - Lecture demonstration unit complete - Item 2, Part number 453-5132-1, Philco
1 - Laboratory circuit analysis trouble shooting kit - Item 4, Part number 40-8744, Philco
1 - Voltage regulator lecture demonstration unit - Item 5, Part number 463-2528, Philco
1 - Industrial electronics demonstrator complete - Item 26, Part number 463-4720, Philco
1 - Slide rule demonstrator

Wash and Restroom Area

1 - Water closet
1 - Urinal
1 - Lavatory
1 - Hot water tank
1 - Bradley wash fountain
1 - Drinking fountain
2 - Mirrors
2 - Waste baskets

SUGGESTED LIST OF EQUIPMENT (Cont.)

2 - Paper towel dispensers
1 - Soap dispenser
1 - First aid kit, complete

Shop Equipment

10 - Laboratory circuit analysis units complete - Item 29, Part number 463-4760, Philco
10 - Transistor laboratory circuit analysis units complete - Item 21, Part number 463-4571, Philco
10 - Laboratory circuit analysis units complete - Item 3, Part number 453-5105-1, Philco
10 - Voltage regulator laboratory circuit analysis units complete - Item 6, Part number 463-2530, Philco
1 - Distribution panel equipped to supply:
    Single phase 120 Volt - AC - 200 Amp.
    Three phase 220 Volt - AC - 150 Amp.
    120 Volt - DC - 150 Amp.
    Motor generator set rating 200 Amp.
10 - Work benches, 60" x 30" x 32" high with 1 3/4" laminated maple top.
    Each bench equipped to supply:
    0 - 120 Volt - DC - 10 Amp.
    0 - 120 Volt - AC - 60 cyc. - 10 Amp.
    Single phase - 120 Volt - AC - 60 cyc. - 10 Amp.
    Three phase - 220 Volt - AC - 60 cyc. - 10 Amp
20 - All steel stools with wood seat - 24"
2 - Radio and television service benches complete, including accessory test equipment, 72" x 30" x 32" high with 1 3/4" laminated maple top.
    Model ET8B, Brodhead-Garrett Company
1 - Tool storage cabinet, 62" x 22" x 84" high, Model TS13, Brodhead-Garrett Company
1 - Drill press, 17" floor model, complete with 1/2 H.P., 115 Volt, 1725 RPM motor, pulleys, belt, belt guard, switch, 1/2" chuck and chuck key, cord and plug
1 - Grinder, 7" floor model, complete with 1/2 H.P., 115 Volt, 1725 RPM motor, wheel guards, water pot, safety shields, lamp bulbs, tool rests, wheels, switch, cord and plug
2 - Storage cabinets, 36" x 24" x 78" high with doors and drawers for small parts
30 - Multimeters, Simpson 631

SUGGESTED LIST OF EQUIPMENT (Cont.)

10 - Oscilloscopes, Textronix 504
20 - Ammeters, AC, Simpson 370
20 - Ammeters, DC, Simpson 375
6 - Watt meters, 0 - 500 - 1000 Watts, Weston 432 Series
5 - VTVM, Simpson 303
1 - Work bench, 64" x 54" x 32" high with 2 1/4" laminated maple top
1 - Woodworking vise - 4" x 7" jaw x 9" opening
1 - Bench vise, 4" jaw, swivel base
5 - Power supply units, Electro DC, Model EFB
1 - Motor-generator set, 200 amp. rating
10 - Bench dusters, 8"
4 - Floor sweeps, 18"
2 - Dust pans
2 - Trash cans, 50 gallon
- Several items of equipment electronically controlled
3 - Fire extinguishers, CO$_2$
1 - 2 1/2 H.P. AC induction motor, 3 phase, 220 Volt, L-L, 1800 RPM, 60 cps.
1 - IKVA transformer, 3 phase, 220 Volt L-L, primary Y connected, 120 Volt L-L secondary Y connected, 60 cps.
1 - 0.5 KVA transformer, single phase, 220 Volt L-L primary, 120 Volt L-L secondary, 60 cps.
1 - 1 H.P. DC motor, shunt field, 120 Volt DC

Appendix B

SUGGESTED LIST OF TOOLS

10 - Electric soldering irons, 1/2" tip
10 - Electric soldering guns, heavy duty
2 - Electric drills, 1/4" capacity
1 - Cable cutter
10 - Wire cutter and stripper
1 each - Cold chisels, 1/2, 5/8, 3/4
2 sets - Needle files
2 - Offset screwdrivers, 5"
2 - Offset screwdrivers, Phillips, 5"
6 - Screwdrivers, Xcelite, 1/8" x 4" blade
6 - Screwdrivers, Xcelite, 3/16" x 6" blade
6 - Screwdrivers, Xcelite, 5/16" x 8" blade
6 - Screwdrivers, Xcelite, 1/4" x 1 1/4" blade
4 - Screwdrivers, Xcelite Phillips, #1 point
4 - Screwdrivers, Xcelite Phillips, #2 point
4 - Screwdrivers, Xcelite Phillips, #3 point
8 - Alignment screwdrivers, 7/32" x 6"
8 - Screwholding screwdrivers, 6 1/4"
11 - Screw extractor set, Ezy-out
1 set - Allen wrenches
2 - Hex and spline wrench kits with case
4 - Adjustable wrenches, 4"
4 - Adjustable wrenches, 6"
2 - Adjustable wrenches, 8"
2 - Combination box and open end wrenches, 7/16"
2 - Combination box and open end wrenches, 1/2"
2 - Combination box and open end wrenches, 9/16"
2 - Combination box and open end wrenches, 5/8"
1 - Combination box and open end wrench, 3/4"
1 - Combination box and open end wrench, 7/8"
1 - Rivet set, Pexto, #00 to #8
4 - Sanding blocks 2 3/4" x 9" sanding sheets
1 - Tap and die set, complete with die stock, tap wrench, screw pitch gauge, screwdriver and 1 each tap and solid die as follows:
    4 x 36 - 6 x 32 - 8 x 32 - 10 x 24 - 10 x 32 - 12 x 24 M.S.S.
    1/4 x 20 - 5/16 x 18 - 3/8 x 16 - 7/16 x 14 - 1/2 x 13 U.S.S.
    1/4 x 28 - 5/16 x 24 - 3/8 x 24 - 7/16 x 20 - 1/2 x 20 S.A.E.
    1/8" pipe

SUGGESTED LIST OF TOOLS (Cont.)

1 set - Fractional size drills, straight shank, high speed, 1/16" to 1/2" by 32nds
3 - Tweezer kits with pocket case
1 - Nut driver set, hex sizes, 3/16", 7/32", 1/4", 9/32", 5/16", 11/32", 3/8"
1 set - Spade-type wood bits, sizes 3/8", 1/2", 5/8", 3/4", 7/8", 1"
1 set - Auger bits, 1/4" to 1" by 16ths
2 - Ratchet braces, 10"
1 - Expansion bit, #1 - 5/8" to 1 1/2"
2 - Countersinks, wood, 3/4"
10 - Diagonal cutting pliers, 6"
10 - Needle nose pliers, 6"
10 - Electrician's side cutting pliers, 7"
6 - Combination pliers, 6"
10 - Sloyd knives, 2 5/8" blade
10 - Assorted metal and woodworking files with handles
2 - File cards and brushes
1 each - Round chassis punches, 3/4", 1", 1 1/16", 1 1/8"
1 - Square chassis punch, 3/4"
1 - Combination square with center head
1 - Steel square, 8" x 12"
2 - Try squares, 6"
1 - "T" bevel square, 8"
10 - Steel rules, 12"
20 - Steel scales, 6"
1 - Block plane, 6"
1 - Smooth plane, 9"
1 - Combination India oil stone, 8 x 2 x 1
1 set - Letter stamps, 1/8"
1 set - Numeral stamps, 1/8"
1 each - Nail sets, 1/32", 1/16", 3/32", 1/8"
4 - Scratch awls, 3 1/2" blade
3 - Prick punches, 3/8" stock
3 - Center punches, 3/8" stock
3 - Pin punches, 1/8" point
1 - Compass saw, 12"
1 - Keyhole saw, 10"
1 - Bench drill vise, 2 3/8" jaws, open 2 5/8"
3 - Continuity testers with batteries
3 - Electric testers, 90-550 Volts, AC-DC
2 - Tin snips, straight cut, 3"
2 - Tin snips, curved cut, 3"

SUGGESTED LIST OF TOOLS (Cont.)

1 - Compound lever snips, 8", 1 5/8" cut
1 - Hawk bill snips, 3"
1 - Aviation snip, right cut, 10"
1 - Bolt clipper, 12", 3/16" capacity
1 - Scissors, 6"
1 - Scissors, 8"
2 - Nail hammers, 12 oz.
1 - Ball-pein hammer, 8 oz.
1 - Ball-pein hammer, 12 oz.
2 - Soft-face hammers, 8 oz.
2 - Magnetic hammers, 7 oz.
1 - Rubber mallet, head 1 1/2" D x 3 1/4"
1 - Wood mallet, head 2 1/2" D x 6"
2 - Hand drills, capacity 1/4"
1 - Handsaw, 10 point
1 - Handsaw, 5 1/2 point
2 - Coping saws, 6 1/2" pin end blade
1 - Wing divider, 8"
10 - "C" clamps, 3"
2 - "C" clamps, 4"
2 - Hacksaw frames, adjustable 12"
1 each - Wood chisels, 1/4", 3/8", 1/2", 3/4", 1"

Appendix C

SUGGESTED LIST OF SUPPLIES

3 ream - Notebook paper, 3 hole, 8 1/2" x 11"
1 box - White chalk
1 box - Colored chalk
6 - Chalkboard erasers
\- Paper towels
\- Cleaning cloths
1/2 gross Hacksaw blades, 12"
\- Rosin core solder
\- Sandpaper, assorted grades
\- Magnet wire, various sizes
\- Friction tape
\- Electrical tape
\- Insulated staples
1 gross - Coping saw blades, 6 1/2" pin end
\- Solderless terminals
\- 1.5 Volt dry batteries
\- Assortment of brads and nails
\- Assortment of wood screws

Appendix D

SUGGESTED SOURCES FOR THE PURCHASE OF BOOKS, TOOLS, EQUIPMENT AND SUPPLIES

Allied Electronics, 100 N. Western Avenue, Chicago, Illinois 60680

American Technical Society, 848 East 58th Street, Chicago, Illinois 60637

Brodhead-Garrett Company, 4560 East 71st Street, Cleveland, Ohio 44105

D. Van Nostrand Company, Incorporated, 120 Alexander Street, Princeton, New Jersey 08540

Electronic Engineers Master Catalogue, Tech Publishers, Incorporated, 645 Stewart Avenue, Garden City, New York 11533

Electronics Kits Supply Company, 1727 Glendale Boulevard, Los Angeles, California 90026

Electronics Teaching Laboratories, 5034 Wisconsin Avenue, N.W., Washington, D.C. 20016

Hampden Engineering Corporation, Shaker Road, East Longmeadow, Massachusetts

International Telephone and Telegraph Corporation, 67 Broad Street, New York, New York 10004

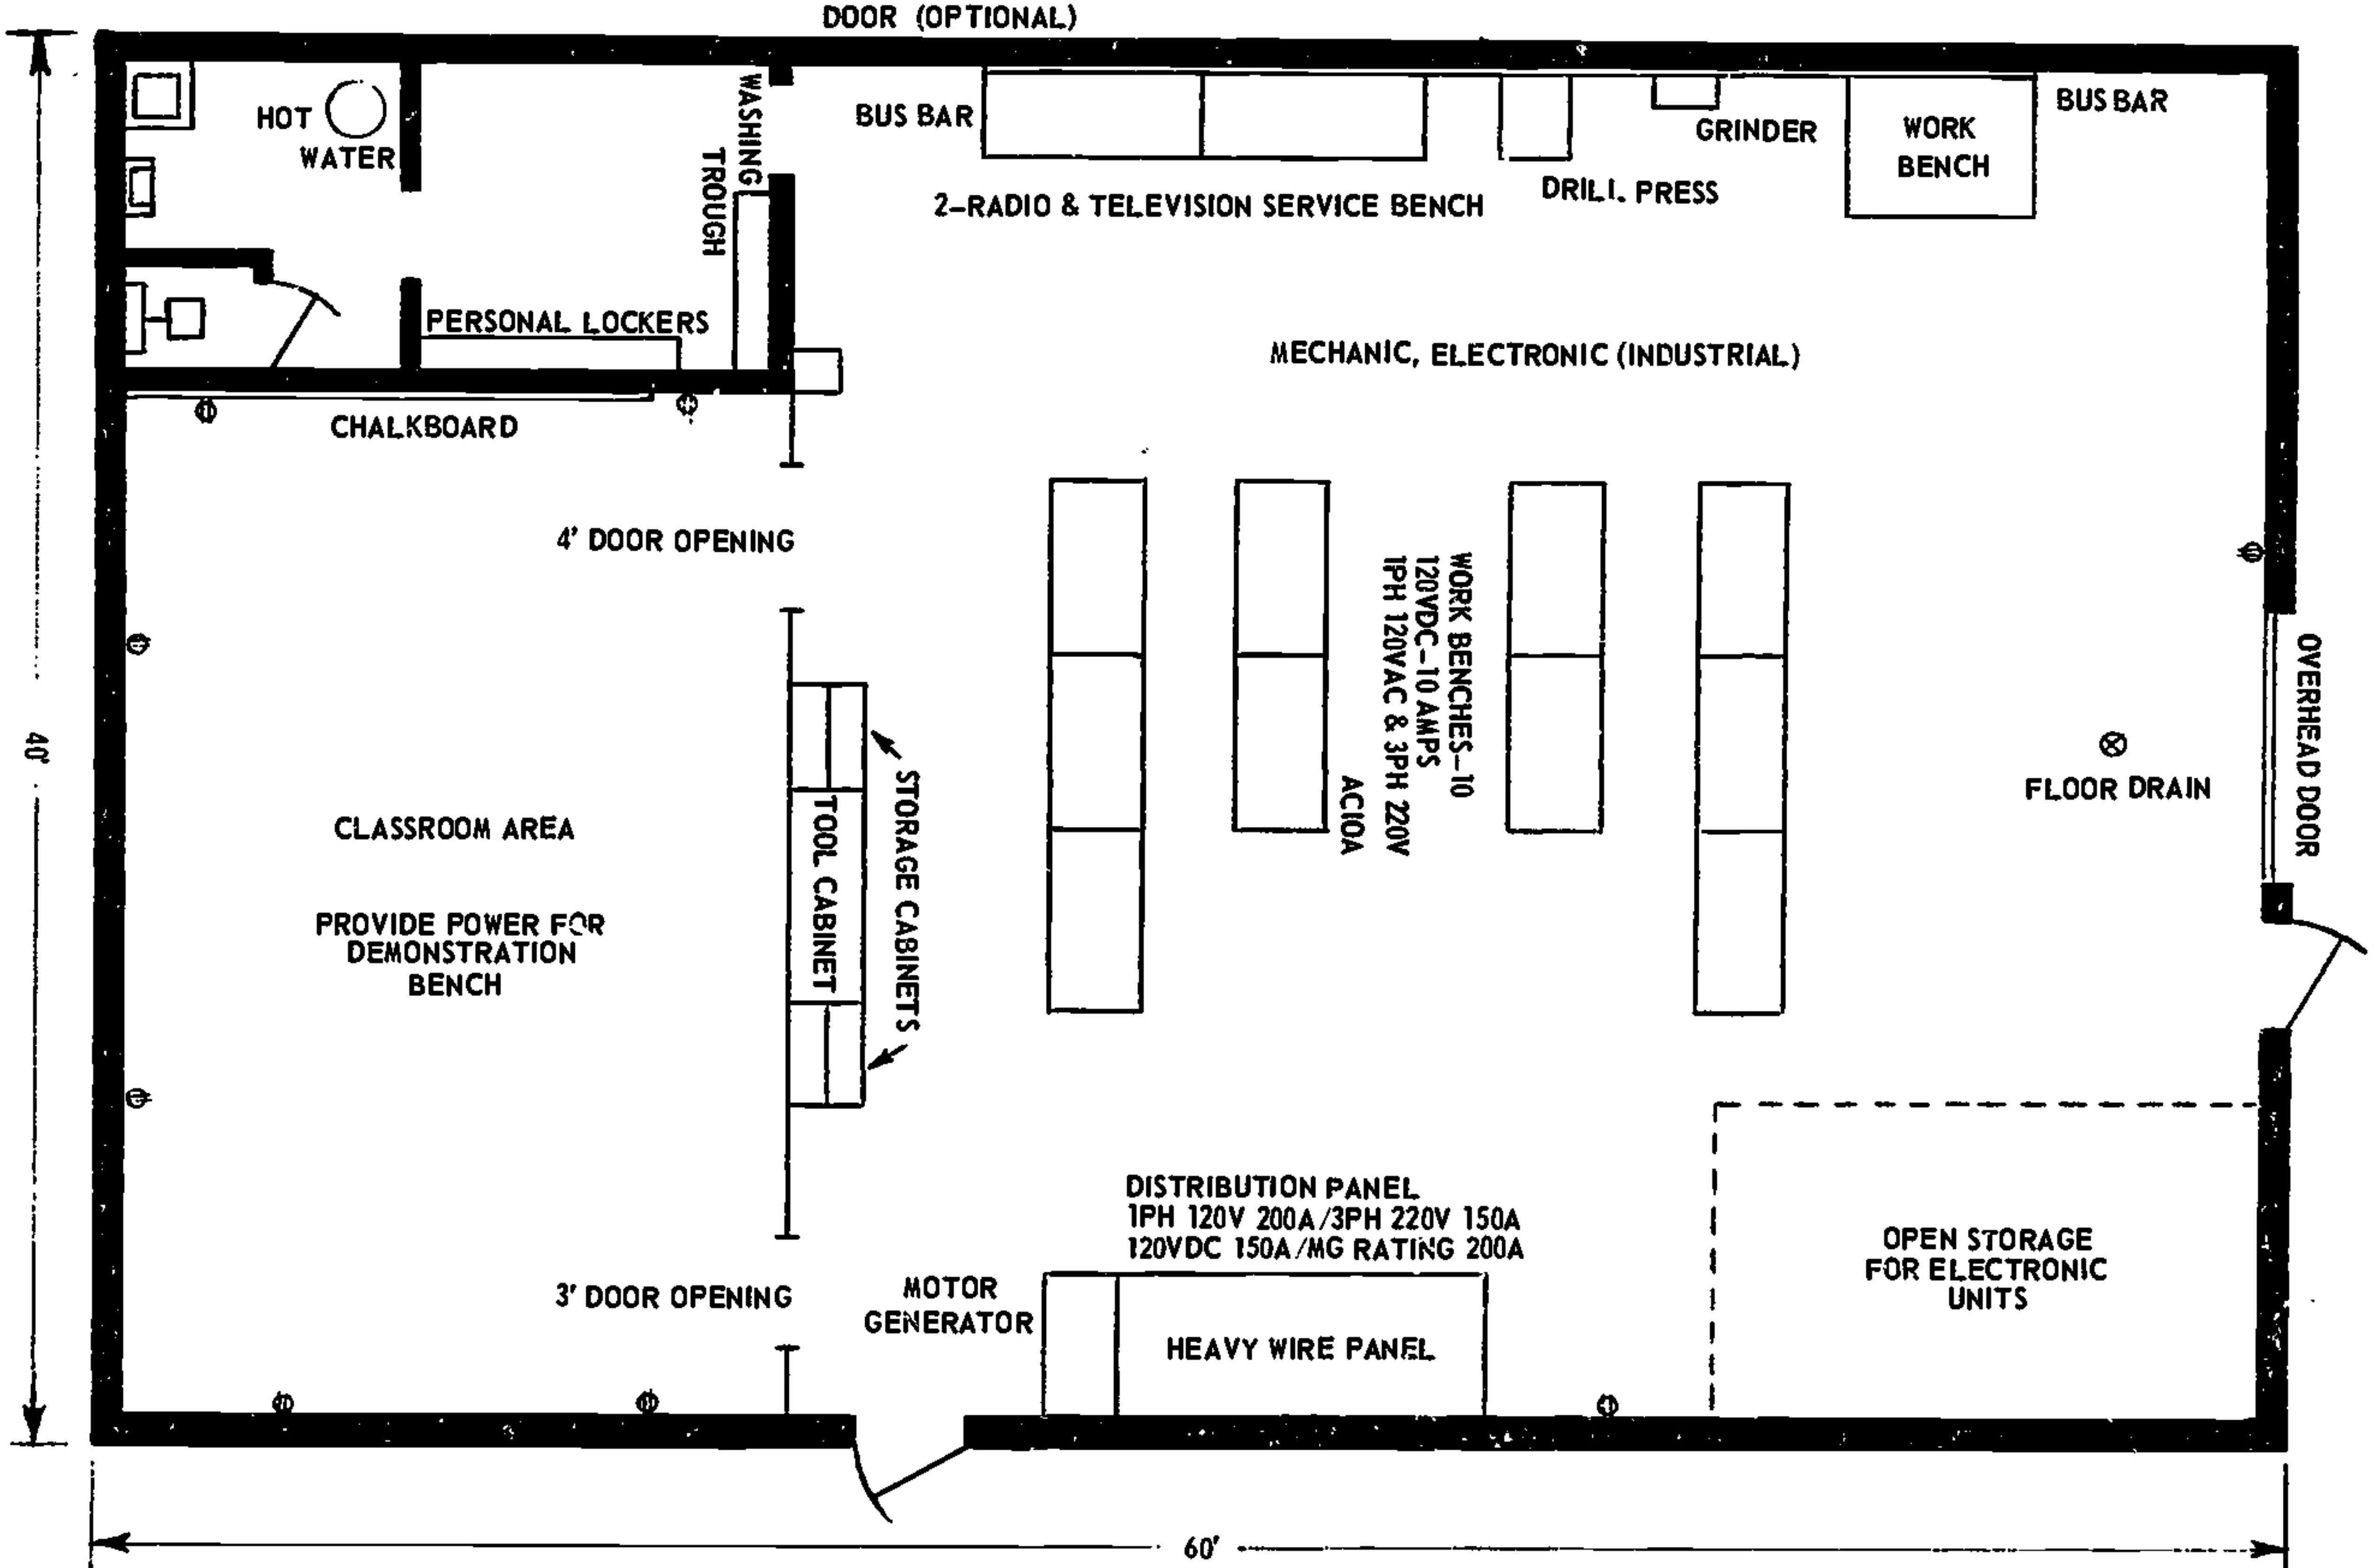
International Textbook Company, Scranton, Pennsylvania 18515

John Wiley & Sons, Incorporated, 605 Third Avenue, New York, New York 10016

McGraw-Hill Book Company, Incorporated, 330 West 42nd Street, New York, New York 10036

National Board of Fire Underwriters, 465 California Street, San Francisco, California 94104

Philco Corporation, P.O. Box 4730, Philadelphia, Pennsylvania 19134



Appendix E

Suggested Training Facility

DISCRIMINATION PROHIBITED - Title VI of the Civil Rights Act of 1964 states: "No person in the United States shall, on the ground of race, color or national origin, be excluded from participation in, be denied the benefits of, or be subject to discrimination under any program or activity receiving Federal financial assistance." Therefore, the Vocational Education program, like every program or activity receiving financial assistance from the Department of Health, Education, and Welfare, must be operated in compliance with this law.

MF AVAILABLE IN VT-ERIC SET 68p.

*BIBLIOGRAPHIES, *FILMS, *FILMSTRIPS, *EDUCATIONAL RESOURCES, *INDUSTRIAL ARTS, OCCUPATIONAL INFORMATION,

This guide contains a list of business and other establishments which provide guidance or educational resources, and an annotated bibliography of educational films. For each establishment information is given for (1) availability of tours, speakers, and reference materials, (2) contact persons, (3) products, and (4) employment requirements. The bibliography lists 219 films and filmstrips categorized under the subjects--(1) auto, (2) crafts, (3) electricity, (4) mechanical drawing, (5) metals, and (6) wood. The film annotations were written by industrial arts instructors. Film sources are given. (EM)

November 1966

Name of Firm	American Flotation
Product Information	Foam (plastic) products
Tours Available	yes
Who to Contact	Barbara Leach
Advance Notice needed	2 weeks
Size of Group	10 maximum
Age Limitations	none
Length of tours	1/2 hour
Reference Materials available	yes
Speakers available	yes
In what fields	Sales, molding
Who to contact	Barbara Leach
Advance notice needed	1 month
Audience level	no limit
Access to other speakers	no
In what fields	---
Are repeat lectures possible	no
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	High School. Non Union. High School Juniors - part-time.
Type of training needed	High School. Mechanical abilities

Name of Firm	American Pedodontic
Product Information	Specialized Dental Equipment
Tours Available	yes
Who to Contact	Mr. Atkinson
Advance Notice needed	none
Size of Group	10 maximum
Age Limitations	none
Length of tours	1/2 hour to 1 hour
Reference Materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible?	---
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	non-union
Type of training needed	Mechanical ability

Name of Firm	Barwick-Duttons
Product Information	Office supplies and equipment
Tours Available	Service facilities
Who to Contact	R. E. Barwick
Advance Notice needed	1 week
Size of Group	4 - 5 person
Age Limitations	none
Length of tours	30 minutes
Reference Materials available	yes
Speakers available	yes
In what fields	Commercial Stationery & office machines
Who to contact	R. E. Barwick
Advance notice needed	3 - 5 days
Audience level	Jr. High and up
Access to other speakers	yes
In what fields	Same as above
Are repeat lectures possible?	yes
Equipment available (to be lent to school for demonstrations)	Probable
Vocational training desirable for job entry	Delivery boys - sophomore Other - no experience necessary
Type of training needed	none

Name of Firm	Basalt Rock Company
Product Information	Rock products
Tours Available	possibly
Who to contact	George Stein
Advance notice needed	1 week
Size of group	5 - 10
Age limitations	Jr. High and up
Length of tours	Determined by interest in industry
Reference materials available	no
Speakers available	yes
In what fields	Sales, welding, machine shop
Who to contact	George Stein
Advance notice needed	1 week or more
Audience level	Jr. High and up
Access to other speakers	---
In what fields	---
Are repeat lectures possible?	---
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	Union [illegible]
Type of training needed	Machinist - no experience needed. Electrician apprenticeship program available.

Name of Firm	George Blaufuss & Son
Product information	Cider-making
Tours Available	yes
Who to Contact	Mr. Blaufuss
Advance Notice needed	1 week - work is seasonal
Size of Group	no limit - smaller children supervised
Age Limitation	no limit
Length of tours	1/2 hour
Reference Materials available	no
Speakers available	yes
In what fields	processing
Who to contact	Mr. Blaufuss
Advance notice needed	3 weeks
Audience level	no limit
Access to other speakers	---
In what fields	---
Are repeat lectures possible?	---
Equipment available(to be lent to school for demonstrations)	---
Vocational training desirable for job entry	Must be 18
Type of training needed	None - hard work

Name of Firm	C & H Sugar, Crockett
Product Information	Refined sugar
Tours available	yes
Who to contact	Mr. McKeown (ext. 283)
Advance notice needed	1 day
Size of group	10 people
Age Limitations	12 years to 60 years old
Length of tours	2 hours (10:00, 1:00, 3:00 on operating days)
Reference materials available	yes
Speakers available	yes - under certain circumstances
In what fields	Sugar refining or crafts
Who to contact	Mr. McKeown
Advance notice needed	1 week
Audience level	High School or older
Access to other speakers	no
In what fields	---
Are repeat lectures possible	yes
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	2 years of High School
Type of training needed	2 years of High School

Name of Firm	Cal-Napa Tanning Co.
Product Information	Leather tanning
Tours Available	Occasional
Who to Contact	Peter Manassi
Advance Notice needed	1 day or more
Size of Group	15 - 20
Age Limitations	Jr. High and Up
Length of tours	1/2hour
Reference Materials available	no
Speakers available	possible
In what fields	Leather tanning
Who to contact	Mr. Manasse
Advance notice needed	1 week
Audience level	Jr. High and up
Access to other speakers	---
In what fields	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	none
Type of training needed	None - train on the job

Name of Firm	Casell Co., Inc. Electro Flasher Div.
Product Information	Manufacturing flashing lights, barricades
Tours Available	Yes
Who to Contact	Jack Monroe
Advance Notice needed	1 week
Size of Group	15 - 25
Age Limitations	Jr. High and up
Length of tours	1/2 hour
Reference Materials available	no
Speakers available	yes
In what fields	Development of small business
Who to contact	Jack Monroe
Advance notice needed	2 weeks
Audience level	Jr. High and up
Access to other speakers	no
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	1 type of job requiring no H.S. Carpentry, handy skills
Type of training needed	none needed

Name of Firm	Christian Brothers
Product Information	Wine making
Tours Available	yes
Who to Contact	Mr. Wehr
Advance Notice needed	Less than 10 no notice necessary. 1 week for larger groups.
Size of group	10 and above
Age Limitations	none
Length of tours	45 minutes to 1 hour
Reference Materials available	yes
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	Packaging - only summer work Cellar work - no previous experience.
Type of training needed	Retired men for executive positions, ex-business men, small business owners.

Name of Firm	Ferro Glove Company
Product Information	gloves
Tours Available	yes
Who to Contact	Mr. Ferro
Advance Notice needed	1 week
Size of Group	small
Age Limitations	none
Length of tours	1/2 hour
Reference Materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	Non union
Type of training needed	Seamstress, not essential.

Name of Firm	General Mills, Vallejo
Product Information	Flour - all types
Tours available	no
Who to Contact	---
Advanc notice needed	---
Size of group	---
Age Limitations	---
Length of tours	---
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	High School education
Type of training needed	High School education. Union.

Name of Firm	J. W. Rice
Product Information	Formica
Tours available	yes
Who to contact	Mr. Marsh or Mr. Rice
Advance notice needed	1 week
Size of group	15 - 20
Age Limitations	none
Length of tours	1/2 hour
Reference materials available	no
Speakers available	maybe
In what fields	---
Who to contact	Mr. Rice
Advance notice needed	1 week
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	Apprenticeship through Union.
Type of training needed	Experience. Union member

Name of Firm	Kaiser Steel
Product Information	Heavy fabricated steel
Tours available	no
Who to contact	---
Advance notice needed	---
Size of Group	---
Age Limitations	---
Length of tours	---
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	High School. Union after 30 days employment
Type of training needed	Pre-apprentice and jorneymen

Name of Firm	Kitchen Fixtures
Product Information	cabinet manufacturers
Tours available	possible
Who to contact	George Grimm, Bob Hamilton
Advance notice needed	2 weeks
Size of group	20 - 25
Age Limitations	Jr. High and up
Length of tours	1 hour
Reference Materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	none
Vocational training desirable for job entry	Apprenticeship through union High School
Type of training needed	Wood shop good idea

Name of Firm	Mare Island Naval Shipyard
Product information	Warships - repairs
Tours available	Tours are available for a U.S.N.R. sub only
Who to Contact	Lt. Gaylord 646-2247
Advance Notice needed	10 days
Size of group	30 maximum - 8 years old minimum
Age Limitations	8 years old. Must be physically fit.
Length of tours	1½ hours
Reference materials available	no
Speakers available	yes-16mm sound films, slides
In what fields	All fields (deep submergence, construction, polaris subs)
Who to contact	Lt. Gaylord
Advance notice needed	10 days
Audience level	Tailored for any group
Access to other speakers	no
In what fields	no
Are repeat lectures possible	yes - under certain circumstances
Equipment available (to be lent to school for demonstrations)	no - but there are presentations for training division
Vocational training desirable for job entry	Yes - desirable
Type of training needed	Shop courses, pre-engineering

Name of Firm	Mervyn's
Product Information	Retailing
Tours available	yes - stock room
Who to Contact	Mr. Thompson or Mr. Lane
Advance notice needed	1 week
Size of Group	6 - 10
Age Limiations	17 or older
Length of tours	1/2 hour
Reference materials available	yes
Speakers available	no
In what field	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	No one under 17 hired. High School graduate. Union.
Type of training needed	On the job training.

Name of Firm	Montgomery Ward
Product Information	Retail Merchandising
Tours available	yes
Who to Contact	Bart Beeber
Advance notice needed	2 days
Size of Group	10 - 15
Age Limitations	17 minimum
Length of tours	1 hour
Reference materials available	yes (insurance, fringe benefits)
Speakers available	yes
In what fields	Merchandising, buying
Who to contact	Mr. Beebee, Mr. Williams
Advance notice needed	1 week
Audience level	17 or over
Access to other speakers	no
In what fields	---
Are repeat lectures possible	no
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	High School graduate. Non-union.
Type of training needed	Sales only - training program available Planning Career Trainee Program for employees.

Name of Firm	Napa Glove Co.
Product Information	Glove making
Tours Available	Occasionally
Who to Contact	Joe Greco
Size of Group	10-15
Age Limitations	none
Length of tours	1/2 hour
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	No high school necessary - non-union
Type of training needed	Factory experience for men Power sewing machine for women

Name of Firm	Napa Paper Box Co.
Product Information	Gift Boxes
Tours Available	yes
Who to Contact	Mrs. Emma Hayes
Advance Notice needed	7 - 10 days
Size of Group	no limit
Age Limitations	none
Length of tours	1/2 to 1 hour
Reference material available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	No training necessary - do hire machinists. All work
Type of training needed	none

Name of Firm	Napa State Hospital
Product Information	---
Tours Available	yes
Who to Contact	Dr. Rood
Advance notice needed	2 weeks
Size of Group	minimum 5 - 25 maximum 45 - 50
Age Limitations	High School minimum
Length of tours	High School 9:30 - 12:00 College 9:30 - 3:30
Reference Material available	no
Speakers available	yes
In what fields	Psychiatry
Who to contact	Dr. Rood 226-2011 ext. 466
Advance notice needed	2 weeks
Audience level	High School, Junior College
Access to other speakers	Staff members
In what fields	Rehabilitation - Children - Geriatrics
Are repeat lectures possible	no
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	High School. Pass test.
Type of training needed	On the job training. Trainee program.

Name of Firm	Robin Aids
Product Information	Artificial limbs - wheel chairs
Tours Available	Could make available
Who to Contact	Mr. George Robinson
Advance Notice needed	For evening tour 2 days - for day 1 mo.
Size of Group	No more than 25
Age Limitations	11th grade
Length of tours	Day 1 hour - evening 2 hours
Reference Msterials available	no
Speakers available	yes
In what fields	Prosthetics & Orthodontics
Who to contact	Mr. Robinson
Advance notice needed	As much as possible
Audience level	11th grade and up
Access to other speakers	no
In what fields	no
Are repeat lectures possible	no
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	High school - apprentice - non union
Type of training needed	All skills: welder, seamstress, design mechanics, machine shop, etc.

Name of Firm	Sawyer Tanning Co.
Product Information	Leather tanning - manufacturer of leather coats
Tours available	no
Who to contact	---
Advance Notice needed	---
Size of Group	---
Age Limitations	---
Length of tours	---
Reference materials available	---
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	none
Type of training needed	None - move along faster if some experience in machine operation, seamstress.

Name of Firm	Standard Tire
Product Information	tire rebuilding
Tours available	no
Who to contact	---
Advance Notice needed	---
Size of group	---
Age Limitations	---
Length of tours	---
Reference material available	---
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	High School
Type of training needed	Experienced Vulcanizer.

Name of Firm	Stoshner
Product Information	Steel Fabrication
Tours available	no
Who to contact	---
Advance notice needed	---
Size of Group	---
Age Limitations	---
Length of tours	---
Reference material available	---
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible?	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable	Welding - Shop course in High School
Type of training needed	Welding, Equipment operation - fork lift, truck. Union after 30 days.

Name of Firm	Sunsweet Growers
Product Information	Fruit Packers
Tours available	yes
Who to contact	Mr. O'Connor
Advance notice needed	1 week
Size of group	20
Age Limitations	High School or Jr. High
Length of tours	1/2 hour
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	no
Vocational training desirable for job entry	none
Type of training needed	No special training. Machine operators trained on job.

Name of Firm	Trade Fair
Product Information	Retailing
Tours Available	Can make available
Who to Contact	Harry Hamber - 255-0272
Advance Notice needed	1 week
Size of Group	any size
Age Limitations	High School only
Length of Tours	depending on objective
Reference materials available	no
Speakers available	yes
In what fields	Retailing
Who to contact	Harry Hamber
Advance notice needed	1 week
Audience level	any level
Access to other speakers	Mr. Sparlin
In what fields	Retail Clerk Union
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstations)	---
Vocational training desirable for job entry	Clerical work - High School graduate. Union.
Type of training needed	none

Name of Firm	Wells Fargo Bank
Product Information	banking
Tours available	yes
Who to Contact	Mr. C. C. Cady
Advance Notice needed	1 week
Size of Group	15 - 20
Age Limitations	17
Length of tours	1/2 hour to 1 hour
Reference Materials available	---
Speakers available	yes
In what fields	banking
Who to contact	Mr. Cady
Advance notice needed	2 weeks
Audience level	Jr. High & High School
Access to other speakers	---
In what fields	---
Are repeat lectures possible?	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	Must pass simple employment test
Type of training needed	Teller - clerical; Typist - 50 w.p.m.; Steno 100 wpm 50-60 typist. High School Graduate

Name of Firm	Wilkins Instr. & Research
Product Information	Tools and Dies
Tours available	occasional
Who to contact	---
Advance notice needed	---
Size of group	---
Age Limitations	---
Length of tours	---
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	----
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	---
Vocational training desirable for job entry	High School. Machinist.
Type of training needed	Experience preferred.

Name of Firm	Wilkins Inst. & Research
Product Information	Gas Chromographs
Tours available	yes
Who to contact	Sam Johnston
Advance notice needed	1 week
Size of group	15
Age Limitations	High School and up
Length of tours	1/2 hour to 1 hour
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	---
Audience level	---
Access to other speakers	---
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	none
Vocational training desirable for job entry	High School. Some electronic background.
Type of training needed	Electronics. Occasional trainees.

Name of Firm	Yuba Manufacturing, Benecia
Product Information	Heavy steel fabricating
Tours Available	Yes
Who to contact	Mr. Christo 745-2830
Advance notice needed	1 week
Size of Group	8 people at maximum
Age Limitations	High School or over 18
Length of tours	45 minutes
Reference materials available	no
Speakers available	no
In what fields	---
Who to contact	---
Advance notice needed	1 week
Audience level	---
Access to other speakers	no
In what fields	---
Are repeat lectures possible	---
Equipment available (to be lent to school for demonstrations)	none
Vocational training desirable for job entry	Welding training
Type of training needed	Welding

HOW TO OBTAIN FILMS FROM SOURCE

Care in selecting and requesting films is important to a good program. It is recommended that you utilize the following procedures:

1. Use school letter-head stationery.
2. If possible, indicate your official position.
3. Be sure to include:
    a. Title of film
    b. Complete shipping address
    c. First choice of showing date, and alternate showing dates when possible
    d. Allow 2 months to 10 weeks when possible.

It is suggested that you allow ample time between date of request and the showing date. Return the film promptly so as not to disappoint other users.

Note: The evaluation comments following the content synopsis were made by Industrial Arts Instructors.

AUTOMOTIVE

TITLE	TIME	COLOR OR BLACK & WHITE	SPONSOR NUMBER
ABC'S OF THE AUTOMOBILE ENGINE This film, in full color, combines cartoon and technical animation to illustrate the component parts of an automobile engine and how they operate.	18	C	31
ABC'S OF THE DIESEL ENGINE In simple primer book language, this film shows how the diesel engine works. Animated drawings in full color enable the audience to see right inside the engine, and three cartoon characters - Air - Fuel - Ignition entertainingly go through their paces to show how they work together to produce power.	20	C	31
ABC'S OF INTERNAL COMBUSTION An animated motion picture explaining the basic principles of the internal combustion engine.	13	C	31
AN INTRODUCTION TO THE AUTOMOTIVE ELECTRICAL SYSTEM This is a film strip rather than a 16mm film.			21
ATOMIZATION Schematic models and a high-speed camera (3,000 pictures a second) are used in explaining the principles involved in producing sprays and the need for precisely even distribution, especially in sprays from atomizers	17	B&W	56
AUTOMOTIVE ELECTRICITY Fundamentals and function of the magneto; advantage over battery ignition.	14	B&W	66
AUTOMOTIVE ELECTRICITY II Design, construction and operation of generator; how it converts mechanical energy to electrical energy; relationship between electricity and magnetism.	13	B&W	66
AUTOMOTIVE ELECTRICITY III Electrical and magnetic principles involved in operation; construction; how electrical energy is converted to mechanical energy.	12	B&W	66

AUTO (Cont'd)

AUTOMOTIVE ELECTRICITY IV

11 B&W 66

Function, components and operation; course of current traced through system; relationship of primary and secondary circuits, and magnetic field, to voltage intensity.

AUTO TROUBLE SHOOTING

33 B&W 66

Checks and tests of: manifold vacuum and compression, battery and ignition cable, spark plugs, distributor and ignition timing, battery clearance, manifold and heat control, fuel system, carburetor, idling speed and mixture adjustments.

BETTER IGNITION

19 21

This is a film strip rather than a 16mm film.

BIRTH OF AN OIL FIELD

30 C 56

Live action shots show oil men building a derrick and drilling crews moving with split-second timing as they operate heavy equipment. Models show the technique of fishing when the drill pipe breaks and the use of the shipstock in by-passing the break. Animated sequences show how natural underground forces make oil flow and how pumps or special drives are used when natural forces slacken.

CARBURETOR

25 B&W 66

Major components and functioning; utilization of air pressure differential; application of Venturi principles; operation of circuits.

COOLING SYSTEM

9 C 63

This film depects the construction and function of the cooling system and its various parts, such as the water pump, radiator, thermostat, hoses, and pressure cap. The effects of maintenance neglect, rust and scale are shown, and the value of anti-rust and anti-freeze is explained.

FIREBIRD III

13 C 56

In this film we see the car take form in the styling studios and research laboratories - then see the actual car being built. Best of all we see it actually performing out on the GM proving ground in Arizona.

HEAVY DUTY GENERATOR I

21

This is a film strip rather than a 16mm film.

HYDRAULIC CONTROLS	26	B&W	66

Basic shifting patterns; principles and applications in up-shifting and downshifting.

HYDRAULIC STEERING	14	B&W	66

Function of major components: reservoir pump, relief valve, control valve, power cylinder; how components assist steering.

INTRODUCTION TO THE HEAT ENGINE	23	B&W	56

The heat engine, which makes the conversion, began with 17th century experiments in steam. Progress toward greater efficiency came with the development of the gasoline engine, the steam turbine and the diesel. (Good for junior high)

JET AGE DRIVING	17	C	44

This film is a super highway safety film instructing drivers on proper methods of entering and leaving today's modern freeways.

PLANETARY GEARS I	18	B&W	66

Components, use and operation.

PLANETARY GEARS II	15	B&W	66

Principles governing operation of multiple sets; advantage of greater mobility and speed over single sets.

PROSPECTING FOR PETROLEUM	23	C	56

Three-dimensional animation helps tell the history of the oil industry and describe the techniques used in the search for oil.

REFINING OIL FOR ENERGY	20	C	56

The mystery of how a modern refinery converts crude oil into useful products is cleared up by means of animation to show how pipes, furnaces and fractionation towers separate the raw material into component parts - or fractions.

STORY OF OIL MARKETING	27	C	56

Eye-catching animation and live action are combined in an excellent introduction to the role of marketing in a modern economy.

AUTO (Cont'd)

STORY OF THE MODERN STORAGE BATTERY

32 C 73 or 45

Shows the processes used in the manufactur of a modern storage battery, including, the making of the grids, insulators, testing, sealing, filling and packing the batteries.

STYLING AND THE EXPERIMENTAL CAR

C Ford

Good for drafting and automotive design. Good student interest.

STRETCH OF IMAGINATION

27 C 32

Depicts how Goodyear's two new stereo synthetic rubbers are made, one a duplicate of natural rubber, the other a completely new versatile synthetic. From the tiny molecule to an eighty-pound rubber bale, the film is presented in an interesting and understandable manner.

SUPERCHARGING

20 B&W 66

Purpose, components, operation and effects of supercharging and fuel injection systems used to increase engine horsepower.

THE DIESEL STORY

19 B&W 56

The versatile, efficient diesel is an early result of the designer's effort to burn fuel inside the cylinder instead of under a boiler nearby. Development of the diesel is traced from Otto "silent" gas engine of 1877 to the machines that now drive ships, trains, tractors, trucks and even cars.

UP FROM CLAY

25 C 31

Dramatizes the scope of modern automobile body-building operations. Beginning with a new concept in the mind of the automobile stylist, the story touches on the refinement of the design on paper through sculpturing it in clay. Body engineers enter at this point meeting the challenge of capturing the form and beauty of the newly created design in a strong, sound structure of steel. (Good student interest)

WHERE MILEAGE BEGINS

26 C 31

Brilliant color photography, easy-to-understand animation, and fascinating stop motion technique combine to make this a most entertaining and explanatory picture on what makes a car go and how its engine is put together.

WILDCAT

28 B&W 69

This film follows two wildcatting brothers from Oklahoma, from the time they decide to drill right through to the suspenseful moments when they learn whether they have oil or just another duster.

CRAFTS

ALCHEMY OF FIRE

14 52

Different artists demonstrating the art of enamelling.

BLOCK CUTTING & PRINTING

60

(Good student interest for all ages above junior high school.)

BOOKBINDING

24 C 60

The objective of the film is to demonstrate a step by step procedure of two practical, durable and artistic methods for the case binding of the pamphlet by hand; to demonstrate how a simple pamphlet can be rebound to make a durable book with aesthetic appeal. (Good student interest.)

CRAFTS OF MY PROVINCE

12 C 19

The master craftsmen of New Brunswick, shown at work in this film, have made their province famous for its pottery, handloomed fabrics, silverware and jewelry of native stones.

CRAFTSMEN OF CANADA

27 C 19

This surveys the work of Canadian craftsmen in many fields, showing how the changing Canadian scene has been their constant inspiration and how business enterprises today is increasingly using skills of the artisan to enhance the decor of building interiors.

CRAFTSMEN YOUNG AND OLD

10 B&W 19

A film visit to the home workshop of Andre Bourgault, famous French-Canadian woodcarver whose sculptures have brought renown to the village of St. Jean Port Joli, Quebec.

DECORATION

10 C C.O.

Full emphasis on decoration.

HOW FILM IS MADE

19 C 26

This color film is a step-by-step portrayal of film production - from the raw cotton growing in the fields to the finished package on the photo counter. (Good student interest.)

HOW KODAKITH FILM IS MADE

20 C 26

This film is a step-by-step portrayal of film production, concentrating on Kodak films for the graphic arts (printing industry).

CRAFTS (Cont'd)

INSIDE STORY

33 C 26

Depicts the care, clearliness, and control methods used in producing sensitized materials for radiography and relates this care to their ultimate use by the darkroom technician and the radiologist.

NEW DESIGNS FOR AN OLD CRAFT

14 B&W 52

A perspective of work of some of the graduates of the Institute of the Applied Arts (formerly known as the School Furniture) of the Province of Quebec directed by Jean-Marie Gauvreau. Interior arrangements make the most of the work of these artisans.

PHOTOENGRAVING MEANS BUSINESS

16 C 26

Photoengravers use chemical, optical and mechanical means to convert color photographic images into four metal plates for printing millions of full-color reproductions. (Good student interest.)

PLASTICS FROM PETROLEUM

13 C 12

Laboratory demonstrations explain the derivation of certain synthetic resins from petroleum hydrocarbons, showing the different types of plastics obtainable from these resins and several methods used in manufacturing them into an amazingly varied number of articles used today in home and industry.

PLASTICS: INDUSTRIAL PROCESSES & PRODUCTS

24 C 60

Provides viewers with an understanding of the principles of the basic manufacturing processes of the plastics industry and their applications to the production of consumer goods. (Excellent - good student interest)

PUTTING A JOB ON A PLATTEN PRESS

11 B&W 14

Shows basic operations involved in press make ready. Included are inking, packing, inserting guides and sealing them. (Good student interest, but too much nonsense.)

QUALITY IN PHOTO LENSES

25 C 26

Film follows a typical lens through production at the Hawk-Eye Works of Eastman Kodak Company. Film stresses quality control in producing the very finest photographic lens, (Good for adults and upper grades.)

THE MAGIC BOX THAT REMEMBERS

16 C 26

Compares old-time, tedious, picture-taking techniques and equipment with today's push-button-easy procedures and trim, modern cameras. (Good student interest)

THE STORY OF OHIO LEATHER	30	B&W	48

Tanning of raw calfskin into finished leather products. (Very good student interest.)

ELECTRICITY

A CENTURY OF LIGHT

35 C 50-43

The development of the use of gas and electricity is traced over the century to present day conveniences.

A IS FOR ATOM

15 C 64

Explains the atomic structure of the ninety-two basic elements. It goes on to illustrate the process by which the energy within the atom is released through nuclear fission and the means of controlling this energy to supply power to a peace time world.

AMERICA'S RISING NEW GIANT

22 C 22

Demonstrates how and why Electronics has become one of America's most promising fields of opportunity. Sequences show how Electronics is now being used in industry; in fact, in many phases of everyday life.

AT YOUR COMMAND

32 C 50-43

Story of what happens when you snap a switch. Filmed in scenic mountain and valley areas, it focuses on power transmission.

BASIC ELECTRICITY - CAPACITANCE

5 B&W 35

Defines capacitance and demonstrates how a capacitor works, discusses the physical factors that effect capacitance and the effect of capacitance in an AC circuit. (Good student interest.)

BASIC ELECTRONICS

18 C 35

Meaning of atoms & electrons, vacuum tube, cathode, rectifier tube, amplifier tube, grid and bridge circuits.

BASIC TELEPHONY

23 B&W 65

Explains the electromagnetic theory as applied to basic telephony and describes the components, operation, and transmission range of the three fundamental telephone systems commonly used in tactical operations.

BIG BOUNCE

15 C 49

This film documents the original space communications experiment known as "Project Echo" and describes possible future TV and telephone satellite systems.

CAPACITANCE PT. I

16 B&W 35

Ohm's law as related to the effect of current flow of condensers, connecting condensers in parallel and series, dialectric constant(Good student interest)

ELECTRICITY (Cont'd)

CAPACITANCE. PT. II

15 B&W 35

Variations of a charge on a condenser in relation to time, and the behavior of capacitance with alternating current.(Good student interest)

CERAMICS AND ELECTRONICS

22 C 62

Shows the importance of ceramic materials in the electronics industry. It stresses the application of ceramic strips and other ceramic parts in the oscilloscope. It also presents the complete manufacturing process from the mixing of clays, firing and glazing to silvering the strips.

CIRCUIT TESTING - SIGNAL GENERATORS

26 B&W 66

Explains thetheory and operation of the signal generator, including oscillating circuits, audio-oscillators, radio frequency oscillators, and frequency oscillators, and frequency meters.

CURRENT & ELECTROMOTIVE FORCE

11 B&W 35

Explains electro theory, arrangement of molecules, building up current, conductors, electromotive forces, resistance, chemical & mechanical sources of electromotive forces.

CURRENT FLOW, WHAT IS IT?

4 B&W 35

Shows electrons move in chain reaction due to repulsion between electrons and positive atoms.

DAWN OF BETTER LIVING

15 C 50-43

A Walt Disney production showing the history of lighting and the growth of the electrical servants at home and work.

DIODE: PRINCIPLES AND APPLICATION

17 B&W 35

Principles of electron flow across a gap, basic features of diode tube, control of electron flow in tube, photoelectric cells, x-ray tubes, and the diode as a rectifier.

ELECTRIC FIELDS

24 B&W 27

Discusses electric field as a mathematical aid and as a physical entity.

ELECTRIC LINES OF FORCE

7 B&W 27

Shows how to produce electric field patterns using a neon sign transformer as a high voltage source.

ELECTRICITY (Cont'd)

ELECTRICAL SAFETY IN THE HOME

14 C 60

Demonstrates proper means of preventing or correcting electrical hazzards in the home.

ELECTRICITY AND HOW IT IS MADE

16 C 28

Demonstrates principle ways in which electricity can be produced. (Good for primary grades.)

ELECTRICITY AND MAGNETISM PT. I

14 B&W 66

Explains breakdown of molecule into atoms, and relation of protons and electrons to electricity.

ELECTRICITY AND MAGNETISM PT. III

18 B&W 66

Explains the principles involved in the voltaio cell, dry cell and storage battery.

ELECTRICITY AND MAGNETISM PT. IV

16 B&W 66

Charging, care and preparation of storage batteries; constant voltage and methods and modifications.

ELECTRICITY FOR BEGINNERS

11 C 20

Dramatized incidents are used to explain that electricity flows in only one continus pathway. Emphasizes importance of safety.

ELECTROCHEMICAL REACTIONS

14 C 20

Reviews ionization.

ELECTROMAGNETS

3 B&W 35

Shows current can be induced by use of magnetic field; current in turn induces magnetic field all along wire; shows components of electromagnet & how strength can be varied. (Good for junior high or below.)

ELECTRONICS IN SPACE TRAVEL

22 C 22

This film utilizes filmed sequences, animation and easily understood narration to cover the role which electronics is playing in man's conquest of space. Scenes filmed in beautiful color of Cape Canaveral, Florida, animation describing future manned flights to other planets, and a landing on the moon, make up some of the unique sequences in the film.

ELECTRICITY (Cont'd)

ELECTROSTATIC CHARGES & FORCES

25 B&W 20

Experimental check to show that electrons do acquire the predicted energy when they move in a vacuum tube for a known distance in a known electric force field.

HOW TO MAKE A MOTOR GO

20 C 4

Maintenance and installation using cartoon characters and illustrations. Motors discussed.

HOW TO TAKE STEP SEVEN

20 C 4

Maintenance and installation using cartoon characters and illustrations. Motors are serviced.

HUGHES ELECTRON NEWS I

15 C 33

A newsreel report including electron tube production, the GAR-3 Super Falcon, transister manufacturing, and the first fully automated production line and new diode production facilities and techniques.

HUGHES ELECTRON NEWS II

15 C 33

A newsreel report including the Ruby Laser, RAMAC, the missle monitor, ion engine, and freeways and electronics.

KILOWATT BUILDERS

30 C 50-43

Postwar construction program of new hydroelectric and steam generating plants. Fascinating shots of road building, tunneling, dredging, etc. in the high Sierra and elsewhere.

LICENSE NUMBER ONE

35 C 50-43

Dramatically portrays the pioneering accomplishments of scientists and engineers over the past century which led to the production of electricity from the atom at the P.G. & E. at G.E. Vallecitos Atomic Power Plant.

MAGNETISM

16 B&W 28

What magnetism is; difference between magnetism and electricity.

MAKING CONVERSATION

12 C 49

You'll see how telephones are made with the skill needed for this complex instrument as you tour the Western Electric factory, manufacturing arm of the Bell System.

ELECTRICITY (Cont'd)

MOTORS & GENERATORS PTS. I & II

60 B&W 66

Part I describes the construction, uses, and principles governing the operation of DC motors and generators. Part II describes the design, characteristics, and operation of AC generators and motors.

NIKE - HERCULES

28 C 49

The missile designed to seek out an enemy plane and destroy it. Narration and on-the-spot filming traces the Nike-Hercules from the engineer's drawing board to its elaborate testing by the Army Missile Command. This film emphasizes the cooperation necessary between the nation's industry and armed forces.

OHM'S LAW

21 B&W 66

Brief review of basic electronics, emphasizing theory and application of Ohm's Law. Describes current and current flow in electronic circuits. Explains principles and use of Ohm's Law in electronic circuits.

OHM'S LAW

19 B&W 35

Explains elements of electricity & electrical energy; composition of matter; use of force & energy; resistance: purpose & use of meters. (Basic, but good student interest)

OSCILLATORS

13 B&W 35

Explains the basic principles of electronic oscillation.

PRINCIPLES OF GAS-FILLED TUBES

15 B&W 35

Application of theory of ionization, control of current in circuits employing gas-filled tubes, gas diode as a rectifier, action of grid in a gas triode, gas triode as a gridcontrolled rectifier.

PRINCIPLES OF THE TRANSISTOR

21 B&W 35

Brief review of crystal set, invention of valve; detailed explanation of how germanium diode & transistor function. (Good student interest)

RADIO ANTENNAS: CREATION & BEHAVIOR OF RADIO WAVE

12 B&W 35

Explains electric and magnetic fields, behavior of radio waves in space, ground wave, electro-magnetic waves, reflection & refraction, ionosphere, and causes of fading.

RADIO RECEIVERS: PRINCIPLES OF THE RECEIVER

17 B&W 35

Shows principles & working of crystal and tube detectors, radio and audio frequency amplification, superheterodyne circuit.

ELECTRICITY (Cont'd)

RADIO SHOP TECHNIQUES
38 B&W 35

Shows radio technician's tools, orthographic projection, layouts, sawing and filing, drilling, bending metal, wiring, soldering in making regenerative receiver. (Introduction to construction project)

RCL
34 B&W 35

Relationship of current and voltage to time, curves, measurement at source, the addition of phase components, effect of impedance on resonance.

SAFETY WITH ELECTRICITY
C 28

(Very good for junior high school, but not high school, too elementary.)

SERIES & PARALLEL CIRCUITS
8 B&W 35

Illustrates series & parallel circuits, explaining current flow and voltage drop across each lamp. (Basic material, good student interest. Film might be well used for review work.)

SEVEN MILLION MILES OF WHITE POWER
14 C 37

Shows advantages in installation of aluminum building wire.

SIGNAL GENERATOR OPERATIONS
9 B&W 35

Shows how to use signal generator to align radio receiver.

SIMILARITIES IN WAVE BEHAVIOR
27 B&W 49

Using specially built torsion wave machines, Dr. J. N. Shive of Bell Telephone Laboratories demonstrates and discusses the following aspects of wave behavior: reflection of waves; superposition, standing waves and resonance; energy loss by impedance mismatching; and reduction of energy loss by quarter-wave and tapered-section matching transformers.

STORY OF THE MODERN STORAGE BATTERY
33 C 73 or C.O.

Shows the processes used in the manufacture of a modern storage battery, including the making of the grids, insulators, testing, sealing, filling, and packing the batteries. (Very good student interest)

TELEGRAM FOR AMERICA
20 B&W 72

This film shows modern telegraphy at work--exploring new frontiers with facsimile transmission, micorwave beam, and other modern development. It also includes some historical background of the industry.

ELECTRICITY (Cont'd)

TELEVISION - LAND OF NEW FRONTIERS

22 C 22

Takes the viewer behind the scenes in television. Interesting sequences show actual televising of both studio and remote programs. Scenes show trained technicians in action, and explain many studio operations which TV viewers seldom see. Primary purpose is to show the wide variety of opportunities in television. Perfect for high school vocational guidance programs and adult groups.

TELEVISION RECEIVERS

7 B&W 35

Explains specific functions of each section in a typical intercarrier sound receiver circuit, from antenna and transmission line to picture tube.

TELSTAR

27 C 49

The story of the Telstar I Communications Satellite, including the extensive research that went into it. (A good enrichment film for an electronics program. The film moves slow, but has good student interest.)

TESTING WITH METERS

33 B&W 66

Use of Voltohmeters, Wheatstone bridge, decibel meter, tube tester, etc; in testing transformers, capacitors, resitors, telephone loop circuits. (Good student interest, but slow moving.)

THE ELECTRON THEORY

5 B&W 35

Shows orbit of electrons around a representative atom, symbols used for neutral atom, electron, and atom with one positive charge and current flow. (Very elementary, but good for basic information.)

THE KINGS

27 C 50-43

Breathtaking photography takes you through the rich farm lands of the San Joaquin Valley on location with construction crews at work in the granite gorge of California's Kings River Canyon. Shows the building of dams, tunnels, penstocks and powerhouses on this project.(Good for general viewing)

THE MAGIC IN TELEVISION TUBES

10 B&W 22

Using easily understandable animation, this Hollywood produced film traces the development and shows the operation of the heart of a modern television set - the cathode ray "picture" tube.

THE MAGIC LINK

20 C 50-43

Adequate wiring in today's homes.

ELECTRICITY (Cont'd)

THE MIGHTY ATOM

17 C 50-43

Cartoon motion picture of the origin of electricity with "Reddy Kilowatt" as star and narrator. Particularly interesting to school children.

THE NEW GIANT

15 C 33

Present a look at the unbelievably complex world of military electronics. It examines the tremendous growth of a new industry. (Good general student interest.)

THEORY OF OPERATION OF THE FOUR-POLE MAGNETO

30 B&W 15

This film describes the use of the components of the four-pole, high tension magneto, and combines them into a working magneto. It gives the theory of the magnetic principle, the condenser, contact points, and coil and describes how each operates.

TRANSISTORS V

30 B&W 66

Basic Class A transistor amplifier circuit; fundamentals and variations of amplifier circuit operation. Conventional and complementary symmetry amplifiers; how transistor amplifiers are modified to become oscillators. (Technical, but good student interest.)

TRANSISTORS PART VI

39 B&W 66

Diverse uses of transistors in pulse application. Characteristics and application of basic types of waveforms, or pulses: square, saw tooth, and spiked. Shows how a transistor functions as a switch to make square waves first electromechanically and then electronically. (Technical and advanced, but good student interest.)

TRANSISTORS PART VII

31 B&W 66

Standard troubleshooting approach, as developed for vacuum tube circuits; visual inspection, checking for shorts, operation check, power supply check, sectionalizing and localizing and isolating. Procedure is then applied to transistorized equipment. (Technical repair, good student interest)

TRANSISTORS: HIGH FREQUENCY OPERATION

14 B&W 35

Describes how transistors operate in high frequency amplifiers and in oscillator circuits, shows influence of transit effect in the base.

TRANSISTORS: P-N JUNCTION FUNDAMENTALS

11 B&W 35

Explains theory and mechanisms of semi-conductor diode and transistor action, discusses fundamental principles that apply to all transistors and junction rectifiers. (Technical, but good student interest.)

TRANSISTORS: LOW FREQUENCY AMPLIFIERS

15 B&W 35

Shows how transistors are used to amplify low frequencies in common base, common emitter and common collector circuits. Explains transistor functions.

TRANSISTORS: SERVICING TECHNIQUES

17 B&W 35

Discusses common types of transistor failures. Demonstrates with over-shoulder camera views, the special techniques that must be used with transistorized equipment.

TRANSISTORS: SWITCHING

14 B&W 35

Examples of switching circuits in transistorized computers, explaining concept of digital computation and how transistors are used, how a simple transitor switch works.

TRIODE: AMPLIFICATION

14 B&W 35

Principles of diode and triode, electric fields, triode amplifier circuits, amplification of DC voltage changes, alternating voltages, distortion, amplification of audio frequency signals.

TROUBLEMEN

15 B&W 50-43

An absorbing story of electric serve maintenance during a severe electric storm, featuring George Kritsky, a P.G & E troubleman. Traces the restoration of power in the midst of a driving storm.

TUNED CIRCUITS

28 B&W 66

Theories of electronics of tuned circuits, application of theories to a practical radio receiver layout and a radio transmitter.

VACUUM TUBES: ELECTRON THEORY & DIODE TUBE

14 B&W 35

Explains electron behavior, electron sources in vacuum tubes, diode & duodiode as reflectors.

VACUUM TUBES: TRIODE AND MULTIPURPOSE TUBES

14 B&W 35

Triode tube, its structure, capacities, circuits in which tube functions. Functions of grid, grid bias, screen, suppressor grids, and multi-purpose tubes indicated.

VOLTAIC CELL, DRY CELL & STORAGE

18 B&W 35

Explains principles of voltaic cell, dry cell, storage battery.

ELECTRICITY (Cont'd)

WHAT IS ELECTRICITY?

12 C 50-43

Fundamentals of electricity are explained clearly and simply. Methods of generating electricity are described with emphasis on generation by magnetism.

YOUR FUTURE IN ELECTRONICS

21 C 53

Shows actual training of electronics technicians and depicts something of the opportunities in industry for person with this training. It will be of special interest to high school students who have an interest in electronics.

MECHANICAL DRAWING

A IS FOR ARCHITECTURE

30 C 19

Presents the romance of architecture, the story of man's buildings through the ages, perpetuating in stone the pride and spirit of his days.

ALUMINUM ON THE SKYWAY

28 B&W 2

Filmed over a three year period, the film shows step-by-step construction of the recently completed thirty-story Alcoa Building in Pittsburgh, Pennsylvania. (Good student interest.)

AMERICAN LOOK

29 C 36

Shows the progression of a specific design from the initial concept of the idea to the finished product, with artists at work on the project.

AUXILIARY VIEWS I

13 B&W 41

Reviews orthographic projection on three principal planes and on auxiliary planes; describes the theory of double auxiliary or oblique view, using animation techniques; demonstrates the steps in drawing an object with an oblique face. (Good student interest.)

AUXILIARY VIEWS II

23 B&W 41

Reviews orthographic projection and describes the true shape of an object with one or more slanting, faces. The film explains auxiliary projecting through three-dimensional technique. Discusses auxiliary elevations right and left auxiliary views and front and back auxiliary views. (Good student interest.)

BEHIND THE SHOP DRAWING

B&W 36 or CO

Discusses many aspects from elementary to complicated objects.

BLUE PRINT FOR ACTION

28 C 43

Shows the importance and need of the copy and reproduction industry and its role in today's business world. (Good student interest.)

DESIGN AGAINST THE SKY

38

DRAFTING TIPS

28 B&W Penn.State

Tips to look for in drawing. (Good student interest.)

MECHANICAL DRAWING (Cont'd)

HOUSES HAVE FOUR SIDES

30 C 2

Assists builders and home improvement contractors in selling and installing new Alcoa siding, a fast growing trend in the designs for contemporary home construction. Job estimates, accessory utilization and installation completion are shown in detail.

LANGUAGE OF DRAWING

10 B&W 41

Attempts to provide a sensible and acceptable answer to the question, "Why study Mechanical Drawing?" and to stimulate the beginning student's interest in the subject. (Good student interest.)

LEVER AGE

21 B&W 56

Primitive man discovered that it was easier to move heavy objects with the aid of a tree branch and rock than by hand alone. The development of this principle and its application in modern technology are the subjects of this motion picture.

MAKING A HOUSE MODEL

10 14

(Too elementary - good for fourth grade level.)

MEN, STEEL AND EARTHQUAKES

25 C 43

(Good student interest.)

PICTORIAL SKETCHING

13 B&W 41

Using a combination of animated drawings and live photography, it describes the three methods of pictorial sketching-axometric, oblique, perspective -- and explains where and how to use each method.

SECTIONS

10 B&W 41

Explains various symbols used in sectioning and demonstrates the construction of a full sectional view. (Good student interest.)

SHAPE DESCRIPTION I & II

19 B&W 41

Describes orthographic projection, utilizing a combination of animated diagrams and animated photography of specially prepared models to provide unusual three-dimensional effects. In Part II, the step-by-step procedure of constructing a drawing is demonstrated and reasons for each step are explained. (Good student interest.)

SHOP PROCEDURES

17 B&W 41

Shows how finished drawings are used as detailed instruction in every step of manufacturing. (Good student interest.)

MECHANICAL DRAWING (Cont'd)

SIMPLE DEVELOPMENT
11 B&W 41

Animated drawings are used in this film to explain what simple developments are and how they are made. Step-by-step development of a hexagonal prism, truncated cylinder, right rectangular pyramid, oblique pyramid, right circular cone and truncated right circular cone is shown. (Good student interest.)

SIZE DESCRIPTION
13 B&W 41

The method for describing complex drawings by breaking them down into simple geometric parts for dimensioning is shown. (Good student interest)

STEEL RULE
14 41

(Good student interest)

WHY STUDY I.A.
10 B&W 41

A discussion of why the study of industrial arts is important to the student now and in later life. (Good student interest.)

YOUR CAREER IN ARCHITECTURE
27 42

METALS

ABRASIVE CUTTING

33 C 5

This film describes and demonstrates abrasive cutting and its applications in industry. It shows four basic types of abrasive cut-off machines - copstroke, oscillating, horizontal, and rotary; and explains the type of operations to which each is especially adapted.

ALIGNMENT FOR BETTER INTERNAL GRINDING

30 C 16

Discussion of close tolerance work that can be produced on an internal grinder. The elements which contribute to its alignment are clearly defined and the correct relationship of the elements to each other is illustrated by models. The types of mis-alignment are also presented.

ALUMINUM ON THE MARCH

28 B&W 55

Aluminum production and application, from raw bauxite to finished aluminum products. (Good student interest.)

AGE OF PRECISION

30 C 17

Shows the impact of cyclindrical grinding improvements on all of our lives.

ARC WELDING STAINLESS STEEL

20 C 3

The principles and factors that govern arc welding of stainless steel are portrayed in this film. How and why the arc welder works are covered in detail. (Good for advanced welding.)

BURNING BLADES

29 C 1

Explains gas cutting, it graphically reveals the versatility of Airco's machine oxyacetylene cutting equipment. Actual producting scenes are used.

BRIGHT STEEL

30 C 43

Many uses of tin plate, exemplifing the making of tin cans. (Good student interest.)

CARE AND USE OF HAND TOOLS -- BARS, PUNCHES AND DRIFTS

14 B&W 66

Purposes, correct uses, and commom misuses.

CARE AND USE OF HAND TOOLS -- CHISELS

12 B&W 66

Various types of cold chisels; correct use and safety precautions.

METALS (Cont'd)

CARE AND USE OF HAND TOOLS -- HACKSAWS
18 B&W 66

Various types of hacksaw frames; proper and improper uses.

CARE AND USE OF HAND TOOLS - HAMMERS
11 B&W 66

Correct use of ball, straight, cross-peen, sledge and clawhammers.

CONTINENTAL PRODUCTION SAW
15 C 24

Describes how the need for higher cutting rates was met by using a two-inch wide saw blade on an advanced design, large capacity, cut-off machine. Animation is used to illustrate the unique design of the machine and split gram photography indicates the relatively fast cutting rates compared to other more common machines.

CUTTING EDGE
29 C 47

Demonstrates in detail the procedure in sharpening the four basic types of milling cutters.

DESIGN FOR ARC WELDED STRUCTURES
15 C 40

Animation is used to describe the development of structures through the ages and explains how the arc welding process allows designers and engineers to overcome previous limitations in building structures today. It describes the reasons for arc welding in buildings and bridges. (Good student interest)

DESIGNING MACHINERY FOR ARC WELDING
15 C 40

Describes the functional approach to machine design in a simple manner, suitable for school use. It explains how welded design permits greater strength and rigidity from less material. (Good outline and order, advanced, but good student interest)

DRAMA OF METAL FORMING
28 C 56

The excitement, noise and color of forming mills are presented in vivid sequences showing gigantic machines, operated with high precision, shaping metal into products ranging from a 100 ton rotor to fine copper wire. The metal-forming operations portrayed include hot and cold rolling, tube forming, wire drawing, forging, extrusion, deep drawing and pressing.

EASY DOES IT
24 C 54

Show the manufacture and application of Electrunite EMT conduit.

EUTALLOY
20 C 29

METALS (Cont'd)

EXTENDING THE RANGE OF MODERN SURFACE GRINDING

20 C 24

Reveals the capability of the modern surface grinder for the performance of tasks other than flat grinding. It shows form grinding and automatic grinding as well as attachments for obtaining automatic grinder operation.

FILES, HOW TO USE THEM

Tells what happens when a file cuts stock. How to file teeth work. Helps to clear up the use and function of the file as a basic cutting tool.

GOLDEN HORIZONS

32 C 10

Historical - early uses of copper, iron and aluminum. (Moves too slow, but good student interest.)

GRINDING CUTTER BITS

20 C 77

Shows how to grind cutter bits of various lathe operations including rough and finish turning, facing and thread cutting. Many clear close-ups make it easy for the beginner to understand how to grind the correct clearance and rake angles. (Good student interest.)

HACKSAWS: HOW TO USE THEM

30 C 57

Film teaches best methods of hacksaw cutting, hand and power. Shows how to choose and correctly use hacksaw blades.

HEAT TREATMENT OF STEEL

30 B&W 8

Shows the importance of heat treatment of steels in today's exacting requirements for tools, springs and machine components. The film describes the iron carbon and time-temperature transformation diagrams as these pertain to heat treating. (Technical and good student interest.)

HIGHWAY TO PRODUCTION

30 C 17

Tells the story of the construction of a milling machine. It shows machine tool patterns, founding and precision machining. Scientific know-how and planning of production are stressed. (Good student interest.)

HOW TO FORM ALUMINUM

15 B&W 65

Blanking and Piercing; This is one of the excellent "How to do it" series put out by ALCOA. It shows sheet metal layout, and the use of shears, saws and routers. Rubber pad forming is also displayed.

HOW TO FORM ALUMINUM

13 B&W 65

Tube & Shape Bending; Proper methods of bending aluminum tubes and shapes are demonstrated.

METALS (Cont'd)

LATHE-SOUTH BEND

20 C 77

Introduces the student to the standard back-geared screwcutting lathe by familiarizing him with the name of each individual part of the lathe, its purpose and operation. It is ideally suited for beginners before actual operation of the lathe. (Good student interest.)

MACHINE KNIVES IN INDUSTRY

30 C 57

Shows the manufacture of various kinds of machine knives and their employment in mills, factories, plants, etc.

MANUFACTURE OF DIES

11 C 3

Steps in manufacturing of lamination dies from oil-hardening, high-carbon, high-chrome tool steel. (Advanced, good student interest.)

MILES OF STAINLESS

27 C 3

Shows complete sequence of manufacturing bars and wire from melting to finished product.

MODERN STEEL MAKING

22 C 68

This is the story of basic steel making today in the blast furnace, open hearth and electric furnaces. Operations are illustrated by animation and live shots with on the scene sound effects. (Very good student interest.)

OLD AS THE HILLS

28 C 47

The story of man's learning from nature the techniques of abrasion, and how to develop abrasive material to care for his own needs.

ONE HOE FOR KALABO

25 C 43

Contrasts the making of one hoe in the heart of Africa with our modern industrial techniques. It also offers some historical development of machine tools. (Very good student interest.)

PLAIN TURNING

20 C 77

Illustrates all of the operation involved in machining a shaft held between the lathe centers. It teaches many of the basic procedures encountered in all lathe work. (Good student interest.)

RIBBONS OF STAINLESS

20 C 3

Manufacturing of strip including melting, blooming, hot rolling, etc.

METALS (Cont'd)

SAND AND STEEL

10 B&W 3

Covers the complete operation of the manufacture of stainless steel. It includes sand preparations, pattern making, molding, and the melting and pouring of heat resistant castings. (Good foundry film.)

STORY OF STAINLESS

21 C 54-43

Here is a fascinating record of the birth and growth of a great industry - stainless steel. Excellent scenes of the plants of stainless steel manufacturers and users are in this film.

THE LITTLE SHOW-OFF

20 C 39

Informative film describing the Tri-D Rotary Milling Head and its application.

THE MAGIC WAND OF INDUSTRY - ARC WELDING

25 C 40

How arc welding is used in all types of industry. (Good student interest.)

THE MAKING, SHAPING, TREATING OF STEEL (Series of 6 films)

50 C 68

This film series is more detailed than "Modern Steel Making" and is intended for audiences who either through interest or specific needs desire to know more about some of the technical aspects of steel. (Excellent series, good student interest, good order.)

THE PREVENTION AND CONTROL OF DISTORTION IN ARC WELDING

20 C 40

Showing how molten weld metal cools and contents. (Excellent, informative, good student interest.)

THE ROUGE

20 C 76

Show the men and machines of the Rouge performing the major steps in the building of cars, from the smelting of iron ore to the final assembly line. (Good student interest.)

THE SPIKED CANDLESTICK

13 C 71

Describes and illustrates in detail the complete operation involved in the casting and finishing of an authentic reproduction of the candlesticks.

TOOL FOR MANY USES

18 C 1

Shows the use of inert gas arc welding in a variety of industrial applications. Coil-fed rod and welding of many materials are displayed.

USES AND ABUSES OF TWIST DRILLS

30 B&W 18

Proper uses and common misuses of these tools. (Good student interest.)

WOOD

A SAFE SHOP

11 B&W 41

Discusses the safety problems and procedures for the school shop. (The film has a very broad scope; however, it has good student interest for use in safety instructions.)

AMERICAN WALNUT

22 B&W 9

History of the walnut tree and its many uses.

CHISELS & GOUGES

13 B&W 41

Demonstrates the nature, function, use and care of chisels and gouges used in woodworking. (Moves slow, but has good student interest.)

COMPARATIVE FIRE TEST ON TIMBER AND STEEL BEAMS

15 C 45

Illustrates an actual test on the fire resistance of glued-laiminated timber and steel "I" beams.(Quite technical, moves too slow and little student interest.)

COMPARATIVE FIRE TEST ON WOOD AND STEEL JOISTS

10 C 45

Provides building designers and owners with reliable information on the comparative behavior of unprotected wood and steel joists. Shows results of a fire test in which wood joists and steel joists were exposed simultaneously to identical fire conditions. (Quite technical, moves too slowly, little student interest.)

CONVENTIONAL & HOT SPRAY METHODS

25 C 23

(A technical film perhaps usable for T & I instruction: however, not appropriate for this area. It moves quite slow and has little student interest.)

FINE ART OF FURNITURE FINISHING

25 C 25

This film was made on the production line in a furniture factory. It describes how furniture is finished from bare wood to the end product. It shows various operations and the care that is taken to insure a durable and beautiful finish. (Moves slow and is technical, but has good student interest.)

FOREVER LIVING FORESTS

27 C 34

Where and how redwood grow, produce, etc. (A technical, slow moving film with good student interest.)

FROM TREES TO LUMBER

14 B&W 6

This film shows by dramatic photography and simple diagram how paper is made from trees. It also tells how scientific forest management assures growth of repeated tree crops. (Good for general school use or for adult audiences, good student interest.)

WOOD (Cont'd)

FROM TREES TO PAPER

12 B&W 6

This film shows by dramatic photography and simple diagram how paper is made from trees. It also tells how scientific forest management assures growth of repeated tree crops. (Good for general school use or for adult audiences, good student interest.)

HAND SAWS

10 B&W 41

Identifies common types of hand saws and explains the correct uses of each type. (Moves too slow, good student interest.)

HERE'S HOW

25 B&W 46

Features Norman Brokenshire demonstrating how to paint interiors, exteriors, masonry, as well as covering floor finishing.(Fair student interest, moves slowly.)

IT'S A TREE COUNTRY

14 B&W 6

America's forests are now adding more wood in new growth than is being removed each year. Shows the tree farming, forest fire prevention, research and utilization activities of wood-using industries and other timberland owners which have helped make this favorable balance possible. (Moves slowly, fair student interest.)

KNOWING WOODS & THEIR USES

20 B&W 41

Explains the classifications and characteristics of woods so that the craftsman can better select and order the woods he needs. (Moves too slowly, little student interest.)

JOINING AND GLUING

20 B&W 41

Demonstrates the techniques for joining and gluing wood surfaces. (Fair student interest.)

LIFE OF LEISURE

20 C 7

Plans are made by a young couple to build a "second home" in the mountains. (Too much nonsense, fair student interest in spots.)

MAKING THE MOST OF SPRAY PAINTING METHODS

30 B&W 23

This film shows how spray equipment works; the types of equipment and their adjustment, the elements of the spraying machines and their function. It Also shows how to use spray equipment, how to care for the equipment, and the cleaning of the gun, both hose and containers. It includes the locating and correcting of commom defects. (Moves too slowly with little student interest, might be good for advance classes.)

WOOD (Cont'd)

MEASURING AND SQUARING

12 B&W 41

Demonstrates the function and use of common types of shop measuring and squaring tools. (Moves slowly with fair student interest.)

MODERN WOOD SANDING

20 C Behr-Manning
Div. of Norton Co.
Troy, N.Y.

Filmed in leading furniture plants, this film takes you step-by-step through the machine rooms, to the sanding room and cabinet room on to final finishing. (Very good student interest.)

OLYMPIC VILLAGE U.S.A.

15 C 7

Winter sports action is woven in this story of changing a mountain meadow into an Olympic site. Emphasis is on unusual construction rather than sports. (Good student interest, but not a strong teaching aid for this area.)

PLANES.

13 B&W 41

Identifies the common types of hand planes, and shows the correct use and care of each. (Fair student interest.)

PLYWOOD FLEET

27 C 7

The use of plywood in commercial boats such as tunaclippers is illustrated as well as private pleasure boats. (Fair student interest, not good for this area of study.)

THREE APPRENTICES

33 19

TOMORROW'S TREES

25 C 43

A well illustrated story of forestry. (Good student interest, but may not be of extreme benefit in this area.)

UNICOM - METHODS OF HOUSE CONSTRUCTION

30 C 45

Shows how Unicom method of house construction provides a uniform basis for manufacturing house components. Features construction of two complete house shells, from installing floor joists to applying the siding. (Good technical carpentry film, little student interest in a general wood course.)

USING SCREWS AND NAILS

12 B&W 41

Identifies the common types of nails and screws used in woodworking, as well as function and uses of hammers, nailsets and screwdrivers. (Fair student interest.)

WEALTH OF THE WEST			
	30	C	75

Features the manufacture of box shock and the packing and shipping of fresh produce in standard nailed containers. (Fair student interest.)

WOOD FINISHING			
	16	B&W	41

Explains the common types of finishing materials used on wood, and demonstrates the procedures for each. (Good student interest.)

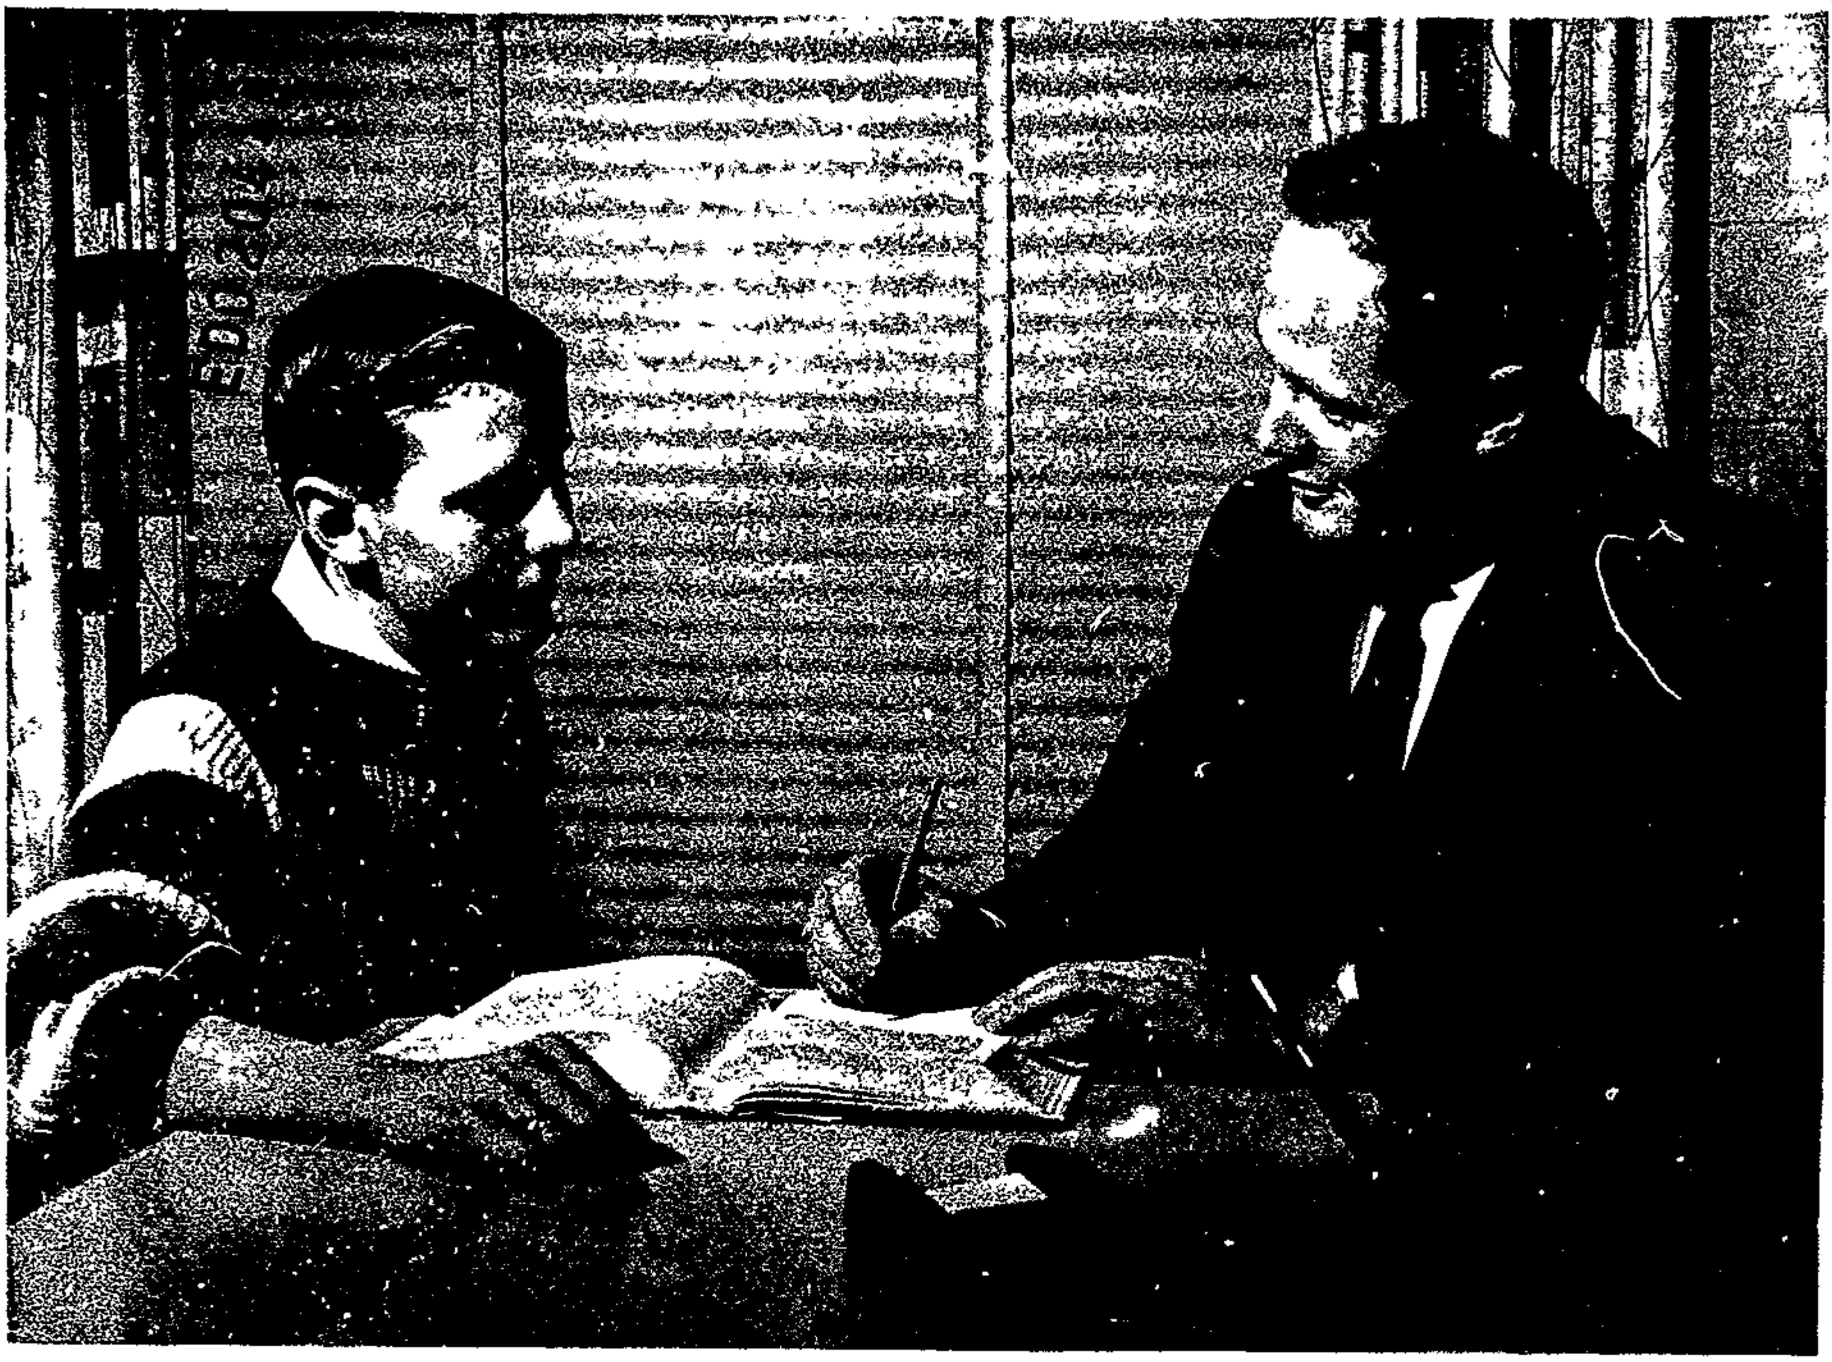
Choosing an Occupation, A Guide for High School Students.

Bail, Joe P. * Nelson, A. Gordon
New York State Coll. of Agriculture, Ithaca
Cornell Miscellaneous Bull-45
Pub Date - Jun63
MF AVAILABLE IN VT-ERIC SET 12p.

OCCUPATIONAL INFORMATION, INDIVIDUAL CHARACTERISTICS, *HIGH SCHOOL STUDENTS, *OCCUPATIONAL GUIDANCE, *OCCUPATIONAL CHOICE,

The purpose of this bulletin is to assist high school students in choosing an occupation. In planning a career, the student should (1) analyze his individual interests, abilities, values, personality, and physical characteristics, (2) investigate different occupational and professional requirements, and (3) weigh individual characteristics against the demands of the occupation or profession. A self-inventory and an occupational study worksheet are included. (WB)

New York State College of Agriculture • Cornell Miscellaneous Bulletin 45



CHOOSING AN OCCUPATION
a guide for high school students

Joe P. Bail and A. Gordon Nelson

CONTENTS

Authors:

Joe P. Bail, Associate Professor of Agricultural Education; A Gordon Nelson, Professor of Educational and Vocational Guidance, Rural Education Department, New York State College of Agriculture, at Cornell University, Ithaca, New York.

CHOOSING AN OCCUPATION

a guide for high school students

Joe P. Bail and A. Gordon Nelson

If you are in junior or senior high school, from time to time you probably ask yourself: How will I, someday, earn a living? How can I get information about various occupations? This bulletin has been written to help students in their search for answers to these questions.

A person's vocation is a very important part of his life. During at least five days of each week, over a period of 40 to 50 years, the average adult's job occupies more of his time than does any other activity. The surroundings in which he earns his livelihood, the kinds of people with whom he works, and the degree of satisfaction he gets from the work itself affect not only his enjoyment of life, but the quality of his service to other people. To drift into an occupation is to run the risk of becoming a vocational misfit. When junior and senior high school students become interested in exploring the ways in which people earn a living, and begin to think about the problem of choosing a suitable vocational goal, they are showing good judgment.

PLANNING FOR THE FUTURE

The fact that John's brother, Robert, decided when he was in the seventh grade that he wanted to become an architect (and eventually did become one), does not mean that there was something wrong with John because he did not decide on a vocation until he had almost completed his freshman year in college. It would be foolish to suggest that every student should choose an occupation before he enters senior high school. Some students know at a young age how they will earn a living, but many do not decide until they have investigated and thought about different types of work over a considerable period of time. It is because sound career planning does take time that we believe a student should begin to think about himself in relation to occupations while he is still in junior high school.

You may have observed that one kind of work seems right for some people but wrong for others. This does not mean, of course, that everyone is cut out for just one vocation, for all of us are capable of succeeding in a number of different jobs. It is true that an individual cannot learn to do equally well or with equal satisfaction every kind of work. Each one of us has weaknesses as well as strengths, and certain types of employment fit our characteristics and needs better than others. When we say that an occupation is suitable for a particular person, we mean three things: that *it requires abilities he possesses; that he enjoys the work itself; and that he is convinced, in his case, that its advantages outweigh its disadvantages.*

When you think about the preceding sentence, you see that it suggests a good approach to career planning:

1. Analyze yourself.
2. Investigate different types of work.
3. Balance your characteristics against the demands of the occupation to determine whether the occupation requires abilities you now have or can develop; involves activities that you would probably like; has advantages for you that outweigh its disadvantages.

We shall discuss this approach in detail in other sections of this bulletin.

WHAT PEOPLE DO FOR A LIVING

If you were to visit a typical town you would find that people's occupations can be classified into several major groups. The italicized words in the next two paragraphs are used by employment and governmental agencies to distinguish various groups of workers.

The drugstore has a manager, a pharmacist, a retail clerk, and a soda dispenser. All of these people are needed to perform the functions of this establishment. The *manager* is also the *proprietor* or a businessman; the pharmacist is a *professional* person; the retail clerk is a *salesman*; and the soda dispenser is a *service* worker. In another building are the offices of a doctor, a lawyer, and a real estate agent. The doctor and lawyer are, of course, *professional* men; the employees of the real estate firm are *salespeople*, with the exception of the receptionist, who is a *clerical* worker. In the doctor's or lawyer's office is a secretary, another kind of *clerical* worker. The doctor has a nurse who is a *professional* worker and an x-ray technician who is *semi-professional*.

Further along, in the supermarket, the *manager* is supervising the unloading of a trailer truck loaded with foodstuff, while several men are unpacking and preparing the products for display. The truck driver is a *semi-skilled* worker; the men unloading the truck, *unskilled* workers. The cashier has a *clerical* position. Where a new home is being constructed, *skilled* workers are painting, plumbing, laying bricks, and installing an electrical system. At the intersection, the policeman is directing traffic; he is performing a *service* job. Beyond the town are *farmers*.

In these and other occupations, regardless of the type of work they do, people are earning a living. All the jobs listed and many more, some glamorous and others not so glamorous, are necessary to furnish needed services and products. As long as it serves a useful purpose, all work is honorable.

If this hypothetical town were large enough to have thousands of workers, there would be the following breakdown into major occupational groups:

Number of Workers per 1000 in Major Occupational Groups, 1960*

Occupation	Number per 1000
Semi-skilled	173
Clerical	141
Skilled	124
Service	120
Professional and Technical	108
Proprietors and Managers	102
Farmers and Farm Laborers	80
Sales	63
Unskilled Workers	53
Armed Forces	36
	1000

*Based on reports of U. S. Department of Labor.

The trends in different types of work are as important as the number of workers. Professional, clerical, service, skilled, and managerial occupations are growing most rapidly; the proportion of unskilled jobs, both on and off the farm, is decreasing. The demand is for better people in all fields, indicating that more education and training are needed for today's specialized jobs.

You will want to think and study about where you may fit into this picture after graduation from high school or after further technical or college training. The final decision depends on you.

UNDERSTANDING YOURSELF

Understanding yourself as a step in vocational exploration means getting a clear idea of your interests, abilities, values, personality, and physical characteristics. The better you know yourself, the better you will be able to judge whether an occupation you investigate is likely to be satisfying to you.

Interests are your preferences, the activities that appeal to you, and the ones you enjoy. During your high school years you have many opportunities to analyze your interests—in school courses, extracurricular activities, part-time jobs, and spare-time hobbies.

When you discover that you enjoy a particular activity, it may suggest a field to explore. For example, if you like shop courses, you may want to investigate mechanical occupations as career possibilities. If agricultural courses interest you, you may decide to get information about the different vocational opportunities in this broad field. If you enjoy mathematics, you may become interested in studying occupations that demand a liking for this subject. Do you know anyone who had a part-time job or a hobby that later became his or her career? Do you have any school or outside interests that suggest occupations you might explore?

You may, of course, become interested in jobs that are not directly related to any of your present or past activities. Someone may tell you that a particular occupation would appeal to you, and so you find out more about it. A motion picture, a television program, or a book may suggest a career. You may see a person engaged in work that looks

These students are participating in a demonstration-lecture at a college during a special science program. Such programs to acquaint high school students with college life can be very rewarding.

interesting to you. In brief, interests may develop as a result of many experiences.

When you are studying an occupation to find out whether it might be satisfying, you also should keep in mind the kinds of activities you dislike. If you have never enjoyed mathematics or science, for example, you probably would not find much satisfaction in trying to become an engineer, a chemist, or a physicist, for these professions are based on mathematics and science. If a junior high school girl does not like to draw. what are some of the careers that probably would not appeal to her? What activities do you dislike?

Abilities. When you are trying to analyze yourself in relation to different types of work, you must consider not only what you like, but what you can do or can learn to do. Sometimes interests and abilities go together, but not always. Mary likes to sing and can sing very well; George, too, likes to sing, but he has a poor voice. It will be obvious to you which of these two might become a professional singer.

From participating in an activity, you can discover something about your abilities. When a boy studies French, he finds out how much ability he has for learning a foreign language. When a girl is making an evening dress to wear to the Junior prom, she is discovering her sewing ability. Your answers to the following questions will give you a better understanding of your abilities:

In what school subjects have you done your best work?

In what extracurricular and leisure-time activities have you excelled?

Have your parents or others praised you for doing particular jobs especially well?

Has a teacher or a school counselor told you that you performed well on certain achievement or aptitude tests?

In some vocations the ability to understand and use words is very important. In others, the ability to comprehend advanced mathematics is essential. In still others, the skillful use of tools is basic. When you investigate an occupation, you should ask yourself: Could I probably learn to do well what the workers in this occupation do? This is not the same as asking: Would I like to do what they do?

Values. People have different ideas about what makes a job attractive. You should ask yourself whether a vocation seems to offer the advantages you consider important.

Several years ago a large group of ninth-grade students were asked what they considered most important in a job. Below are some of the answers. After each reply, a phrase indicates the value that the student considered important:

> "I'd like to have a job where I could better myself and get ahead." (Chance for advancement)
>
> "I would like to find an occupation where I'd be doing different things all the time." (Variety in work)
>
> "I want to have a good income." (Financial reward)
>
> "I would like to be a missionary, because in that career you are working for the good of others, and not just for yourself." (Service to others)
>
> "I'd want an occupation that has long vacations, so I could enjoy myself quite a bit, and not just work all the time." (Leisure time)
>
> "I'd like a job where I could retire at 60 and have a nice little pension coming in." (Financial security)
>
> "I wouldn't mind doing routine clerical work if I had a clean place to work and good people to work with." (Working conditions)
>
> "I want to be a forest ranger or a farmer, because I want to work outdoors." (Location of work)
>
> " I want a career in which the duties are interesting." (Interesting work activity)

What other values might make a particular type of work attractive? What do you consider the most important advantages an occupation can offer?

Personality means personal qualities such as persistence, sociability, patience, cooperativeness, and aggressiveness. In the following remarks, students are thinking about the relation between their personalities and occupations:

> "I don't believe I would like that kind of work. I couldn't stand having a boss tell me what to do every time I turned around. I like to work on my own."
>
> "That job would suit me fine, because it would give me a chance to become friendly with many different kinds of people."
>
> "I wouldn't want to teach young children—they get on my nerves."
>
> "I would have a chance to become a leader in that kind of work; I have always enjoyed being the head of any organization I have ever joined."

What personality characteristics should you keep in mind when you explore various types of jobs?

Physical characteristics include personal appearance, general health, strength, endurance, height, and special physical abilities and disabilities. If you are in good health and have no handicapping disabilities, you are physically qualified for many occupations. Some students have physical limitations that they must consider; others have physical characteristics that will be assets if they decide to enter certain occupations. In the following statements students were thinking about physical factors that might affect their vocational planning:

> "I do not believe I could become an accountant—I have poor vision."
>
> "I'd like to be a bulldozer operator, but I don't have the strength and endurance for a job like that."
>
> "Our family doctor gave me a thorough examination, and he is certain that I can get into the Air Force."
>
> "I have always done well in all kinds of athletics, so I believe I can become a physical education teacher and coach, if I make satisfactory grades in college-preparatory subjects in high school."

What physical assets or limitations should you consider when exploring occupations?

A *Self-Inventory Worksheet* is given on page 7 to help you analyze your interests, abilities, values, personality, and physical characteristics. You may fill out this worksheet now, or you may wait until you have read the suggestions for studying occupations.

SELF-INVENTORY WORKSHEET

(Think carefully before you answer each question.)

Interests

Of all the school subjects you have taken since first grade, which have you enjoyed most?

....

....

Which subjects, if any, have you disliked?

....

....

Which extracurricular school activities have you especially liked?

....

....

....

What jobs or chores have you found very interesting?

....

....

What hobbies or other leisure-time activities do you especially enjoy?

....

....

What occupations have you observed, read about, heard about, or thought about that you would like to investigate?

....

....

Abilities

In which school subjects have you done your best work?

....

....

With which subjects, if any, have you had difficulty?

....

....

In which extracurricular activities, jobs and chores, hobbies and other leisure-time activities have you performed especially well?

....

....

....

What abilities, aptitudes, or talents have other people (your parents, teachers, school counselor, friends) mentioned?

....

....

Have you taken any special achievement or aptitude tests on which you have performed well? If so, what did the results of these tests suggest to you about your strong points?

....

What do you believe are your best abilities?

....

Values

Below is a list of advantages or values people consider important in careers. You may add others in the blank spaces provided. Check (√) three or four that you consider especially important:

( ) Interesting work activities
( ) Healthful working conditions
( ) Opportunity for service
( ) Opportunity for advancement
( ) Chance to be creative
( ) ....
( ) ....
( ) Security of employment
( ) Congenial co-workers
( ) High income
( ) Good job location
( ) Freedom from supervision
( ) ....
( ) ....

Personality and Physical Characteristics

Are there certain personality characteristics you should keep in mind when you are making career plans?

....

....

Have you any physical limitations which are important to your planning?

....

Have you any physical assets that might enable you to do certain kinds of work especially well?

....

EXPLORING AN OCCUPATION

Questions to Ask About Any Occupation

What then shall I be? In seeking an answer to this question, you will be looking for the facts about particular vocations. Call it exploring a career—finding out all you can about any occupation in which you have an interest.

Your primary concern is to do this in a systematic way that will uncover all the facts, that will reveal not only the favorable, but the unfavorable aspects of the job. We begin by asking a few pertinent questions:

What are the duties of the worker? Would you operate a machine, sell goods or products, manage a business, teach children, produce crops? There are thousands of jobs in the world of work, each with its own combination of duties. Many of these jobs are described in *The Occupational Outlook Handbook.* Ask your counselor about this excellent reference volume prepared by the United States Department of Labor.

What are the personal requirements for the occupation? Must I be of a certain age or sex? Are there special physical requirements of vision, hearing, and strength? What interests do I have that will contribute to my satisfaction and success in the occupation? Do I need special abilities or skills? What personality traits are important?

What are the educational requirements? Are certain courses in high school recommended for people planning

After you have made a tentative selection of a post-high school institution, a visit to the admissions office can be helpful and informative. This high school student is talking over his plans with an admissions counselor.

to enter this occupation? What post-high school education is required: trade school, college, technical institute, apprenticeship, or on-the-job training? How long will it take me to receive the necessary training? What will be the cost of getting the required education? Am I familiar with academic standards and admission requirements for entering college or a special school?

What are the advantages and disadvantages of the occupation? What are the hours and conditions of work? Will my earnings balance the training or educational expenses? Do earnings vary in different parts of the country? Is there a reasonable amount of security in the job? What are the opportunities for advancement? What satisfactions and joys does the occupation offer?

What is the present demand and the future outlook in the occupation? How many workers are employed locally, in the state, and in the nation? Is the present demand great, moderate, slight, or non-existent? What is the probable future demand? Are the jobs confined to certain areas of the country?

What are the minimum requirements for entrance into the occupation? Must I have graduated from high school, trade school or technical institute, college? Is an entrance examination required? Is experience necessary? Do I need my own capital to get started? Is licensing or union membership required?

Where can I get additional information about the occupation? Do I know anyone I can talk to who is employed in this occupation? What reference books or occupational literature are available?

Fill in the worksheet on page 11 with the answers to the questions raised in this discussion. Be sure to get factual information; do not fill out the blank simply because it is there. Wait until you have complete information before recording it.

Finding the Answers to Questions About Occupations

Within your school

The school guidance office. You should become familiar with the facilities and staff of the guidance department. In addition to attending the regular conferences and meetings with counselors, make it a habit to visit the guidance office to check the bulletin boards for announcements, brochures on job opportunities, and educational material. Most bulletins or brochures describing jobs, educational opportunities, and scholarships will be kept on file. Find out from the person in charge how students may use the materials on hand and how to request additional material. If an open file is maintained, learn to use it properly. The guidance office is ready to serve you; make the best possible use of it.

The school library. Most materials relating directly to jobs will probably be kept in the school guidance office. However, much that is useful will be found in the library. Biographies and autobiographies detail experiences in many careers. The stories of real people's lives are often vivid and revealing. The school librarian will help you select such books. Books of fiction, adventure, and travel broaden your outlook and may suggest career opportunities you have never thought about. The library is truly a collection of the experiences of people in the world about us.

The school staff. Counselors, working closely with all teachers, probably will refer you frequently to specific teachers. If you are interested in home economics, you will want to talk with the homemaking teacher; if in agriculture, with the teacher of agriculture. Whatever your field of interest, you will usually find a faculty member who can help you. Cultivate the friendship of your teachers and get information and suggestions from them.

Within your community

Resource people. Most adults are happy to discuss their work with young people. You should be prepared to ask specific questions instead of saying vaguely, "Tell me all about your job." Make an appointment so the person you want to see can be free to spend some time with you. The school counselor and teachers can suggest people for you to talk with.

Business and industrial concerns. Since many of you will stay in your present community, you should know about the local business and industrial concerns. In addition to discussing jobs with specific individuals, you will often find that a field trip, planned as a class activity, provides an overview of the total operation and answers questions about the variety of jobs, opportunity for advancement, and working conditions. These field trips may be part of the class program or they may be sponsored by civic and community organizations.

Within your home

Your parents, with the greatest interest in your choice of career, want you to be successful in all that you do—in school, in activities, and in the work you choose. Talk over your goals and aspirations with them. You may want to talk too with your school counselor, teachers, and minister. If necessary, explore opportunities for financial assistance. Your future and the future of the other young people of our nation will be determined by the amount and the kind of training and education you secure.

Your parents are interested in your future educational and vocational plans. Talk over your aspirations and desires with them whenever the occasion arises.

Career publications

Publications describing job opportunities must be looked at critically. There is much material. Many of these publications are attractive and give unbiased information. Some, however, paint a misleading picture of opportunity, high salary, and good working conditions. A few tips are presented below to help you select publications that meet desired standards. You will probably wish to ask your school counselor, teacher, or some other adult to help you in evaluating these publications. Some of the questions that should be asked are:

Has the publication been issued by a responsible agency or organization?

Does the information apply to the majority of workers in this occupation?

Is the publication free of flowery words and phrases?

Is the publication accurate and up-to-date?

Does the publication tell where you may get additional information about the occupation?

Does the publication present both advantages and disadvantages of the job?

Financing Farming Activities.

Farm Credit Banks of Louisville, Ky.
Pub Date - May63
MF AVAILABLE IN VT-ERIC SET 66p.

*VOCATIONAL AGRICULTURE, *CREDIT, *TEXTBOOKS, FARM MANAGEMENT,
FARMER COOPERATIVES, AGRICULTURAL PRODUCTION,

An outgrowth of a textbook entitled "Agricultural Credit" published in 1947, this publication was developed in consultation with teacher educators by farm bank personnel for use in vocational agriculture classes. It includes an introduction and chapters titled How the Farmer Uses Credit, Financing Farm Production, Financing

Farm Ownership, and Financing Farm Cooperatives. The textual material is supplemented by photographs, drawings, graphs, and specimens of credit instruments. A list of relevant movies is given. This document is available for 50 cents from Farm Credit Banks of Louisville, P.O. Box 239, Louisville, Kentucky 40201. (JM)

Second Printing — April, 1948

Third Printing — February, 1949
(with slight revision)

Second Edition — May, 1963
(New title, completely revised)
PRICE 50 CENTS

TABLE OF CONTENTS

Chapter I — HOW THE FARMER USES CREDIT

Chapter II — FINANCING FARM PRODUCTION

Chapter III — FINANCING FARM OWNERSHIP

Chapter IV — FINANCING FARM COOPERATIVES

Acknowledgment

In 1947 the Farm Credit Banks of the Louisville District published a textbook for high school classes in vocational agriculture and for veterans-on-the-farm-training classes under the title AGRICULTURAL CREDIT. This was so well received that a second printing was required in 1948 and a third printing with slight revisions in 1949.

This textbook, titled FINANCING FARMING ACTIVITIES, is published in response to demand for a new and up-to-date book on the same subject. This new textbook is an outgrowth of the earlier one. Through the years many leaders in the field of vocational agriculture have contributed to the development of this book. In particular, we wish to acknowledge and express our appreciation for the contributions made over the years by E. O. Bolender of Ohio; Harry W. Leonard of Indiana; the late W. R. Tabb and Dr. George L. Luster of Kentucky; Dr. J. W. Brimm and Dr. V. R. Cardozier (the latter now at the University of Maryland) of Tennessee; and to Dr. Paul Irvine of Alabama Polytechnic Institute for his special editing help.

We will be glad to receive from teachers using this textbook comments about its usefulness and suggestions for its improvement.

Introduction

Farming is business! Big Business! For any young man who expects to farm or do business with farmers the financing of the farming business is important. It will be more important in the future.

Looking ahead to 1975—not so far away—it is predicted that:

1. The nation's farms will have to produce 30 percent more food to meet the demands of our increasing population.

2. To meet this demand for greater production farmers will use more machines and equipment and better business methods.

3. Farms generally will tend to become "commercial" in these ways: they will use more money, invest more in equipment, borrow more, keep better accounts. In fact, farming will be a business, and the farmer will use many of the financial and accounting methods of the businessman.

4. Added capital the farmer will need for modern farming he will obtain by borrowing. The modern farmer needs to know how to borrow money. He must learn to manage his farm finances so that he makes more money by using borrowed money.

5. There will be fewer farmers to produce the increased amount of food; therefore, individual incomes and living standards of farm people will be higher in relation to other occupational groups than they are now.

6. Professional and commercial positions that call for understanding of farming and finance are increasing rapidly. These are open to young men who know farm life and understand financing. Among these positions are: bank adviser on farm financing, agricultural economist, manager of a cooperative, representative of implement, seed, fertilizer and food processing companies.

7. Along with more money and better financial methods the farmer of the future will enjoy more of the things money will buy—a better home, more conveniences, more contact with business enterprises, a larger place in the life of his community.

These are some of the reasons why it is important for young people who are growing up on farms to understand the why and the how of farm financing.

The Use of Money is Bought and Sold

CHAPTER I

HOW THE FARMER USES CREDIT

When we buy goods or services, we use either cash or credit. When we use cash we give the seller money—or a check as evidence of that money—at the time of the sale. When we use credit, we agree to pay for the goods or services at a later date.

Credit, then, is a means of obtaining goods, services or money in exchange for a promise to pay at some future date. Credit is based on trust; the word "credit" comes from the Latin word "credere" meaning to trust.

A wise man has said, "Credit has done a thousand times more to enrich mankind than all the gold mines in the world."

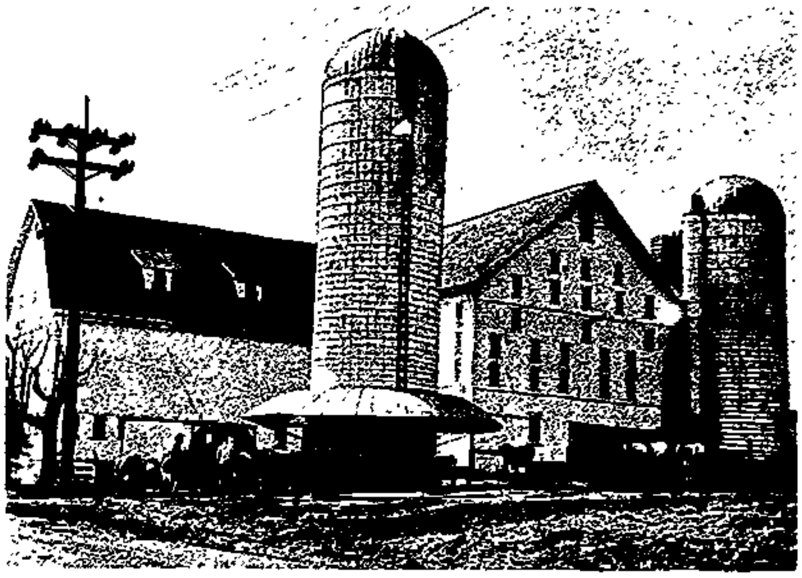
Farmers' Need for Capital and Credit

Farmers use large amounts of capital (including both cash and credit) to own their land, buildings, equipment, livestock and other things.

In its "Balance Sheet of Agriculture", The United States Department of Agriculture reports that American farmers owned real estate valued at $144.5 billion as of January 1, 1963. To own this real estate they were using credit in the form of $15.4 billion of real estate mortgages. These farmers also owned property other than real estate valued at $69.6 billion (including $17.8 billion of cash, bank deposits, savings bonds and investments in their cooperatives). They were using $12.3 billion of credit in the form of non-real estate loans. Thus, on January 1, 1963, American farmers were using at least $27.7 billion of credit. In addition, farmer-owned cooperatives were using vast amounts of credit in off-the-farm business jobs they do for farmers.

So we see that credit plays a large part in farmers' owning and operating their farms. Today, farmers *owe* more dollars than ever before in history; but the dollar value of what they *own* is also the highest in history.

Farmers having real estate loans from the Federal Land Bank of Louisville owed on these loans an average of $8,400 on December 31, 1962. Those having farm operating loans from their production credit associations owed an average of $4,500 on these loans.



Livestock, equipment, buildings, improvements, electrical power and land call for extensive use of credit.

How Farmers Use Credit

Farmers use credit (they borrow money) for many purposes. A farmer usually borrows money for one or more of the following purposes:

To buy a farm

To add new acreage to the farm he already owns

To build a house, barn, grain storage, or other farm building that will add to the efficient operation of the farm

To buy equipment with which to cultivate his land and operate his farm

To buy fertilizer, lime, or hire labor to make his land produce more and better crops

To add better sires or other breeding stock to improve and increase production

To buy feed for livestock he is raising, or to buy livestock to consume feed he is growing

Every farm boy who earnestly wants to farm faces the question — How can I reach my goal of owning enough land to provide a good living for me and my family? The wise use of credit will help him reach this goal earlier in life than would be possible if he waits to buy until he accumulates the full purchase price.

To buy other goods or services

> *Example: A farmer plans to send his son to college in September. He will not have the money to pay these expenses until he sells his tobacco crop in December, and some hogs the following March. He borrows the money from a lending institution and pays his son's expenses. Then, in December he pays off part of his loan from tobacco income and the remainder in March from hog income. He has thus bought services for his son's education in anticipation of income he expects to receive later.*

Successful farming today requires big capital investments. A young man owning or renting a small farm handicaps himself if he has not learned how to use credit. He can seldom save enough cash to buy all that he needs to own and operate his farm.

A farm boy should learn early in life how to use credit wisely. Without using credit, he cannot expect to make much progress. When he has saved enough cash to buy one gilt, or heifer, or lamb, he might borrow to buy the second. He will stand to make twice the profit from his labor. If one animal dies he still will have the second one to pay off his loan and return a profit. As the years pass he will be ready to start farming for himself much sooner than if he waited until he had saved all the cash he needed.

Most of the FFA members who have been named State Farmers have already learned to use credit as a means of getting ahead.

Cost of Credit

The cost of credit varies widely. Take, for example, a man whose ability to pay is not known and who has little to offer as security. He will have to pay a high rate of interest; he may not be able to get credit at all. On the other hand, the man with a strong financial position and plenty of collateral can get credit at low cost. Such men are often able to borrow money for operating expenses without giving even a chattel mortgage (that is, a mortgage on a chattel—movable property like livestock or equipment).

It often pays a farmer to shop around for his credit; in that way he will find his best source of credit. Usually he will find that the lender who specializes in the type of credit he needs will charge the lowest rate and allow him the most favorable terms. Suppose a farmer needs a loan to finance his farming operations. He will look up a lender—like the production credit association—which specializes in short-term and intermediate-term loans. If he needs a long-term loan to buy farm land, he will go to a lender, like the Federal land bank, which specializes in long-term loans.

If you should buy on credit from a feed and implement dealer or a hardware merchant you would probably find that you paid a high cost for your credit. The reason is that such merchants specialize in feed, implements and other farm supplies—not in credit. When they sell "on time" or "on credit," they are tying up capital they need in their farm supply business. Their costs of collecting on such sales are usually high, so they have to charge more to cover these costs and have a fair return on their capital.

The method of financing and the plan of repayment also figure in the cost. For example, a man needs $1,000 for this year's operations:

January 15	$ 400	for purchase of equipment
May 15	200	for labor, fertilizer and seed
June 15	200	for taxes
October 15	200	for insurance and fall expenses
	$1,000	

January 15	6% on $400 for 1 year	$24.00
May 15	6% on $200 for 8 months	8.00
June 15	6% on $200 for 7 months	7.00
October 15	6% on $200 for 3 months	3.00
	Total Interest	$42.00

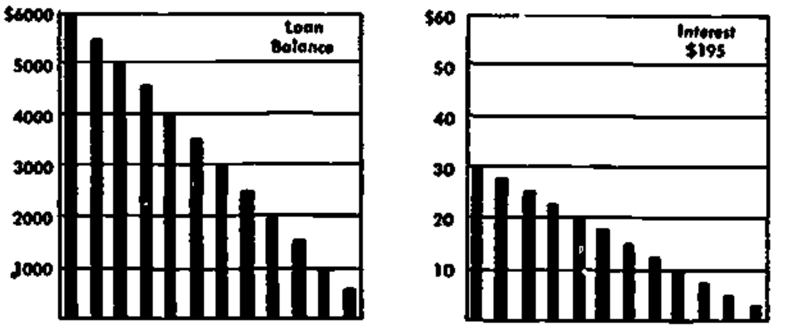
If he borrowed the full amount of $1,000 on January 15 at an interest rate of 6 percent for a full year, he would pay $60 in interest.

But, he can borrow on a budget plan; he will receive his loan in parts as needed and pay back all of the money at the maturity of the note, next January 15. This is the way the interest would be figured:

If, however, he had a wheat crop to sell August 15 for $400 and some hogs to sell September 15 for $200, the above-listed cost of $42.00 could be further reduced by making each payment at the time of the sale. He would save five months' interest on the wheat payment, or $10.00, and four months' interest on the hog payment, or $4.00. This would reduce the cost of the loan an additional $14.00 to $28.00.

SIMPLE INTEREST
Borrowed $6,000 at 6% For One Year To Be Paid In 12 Monthly Installments

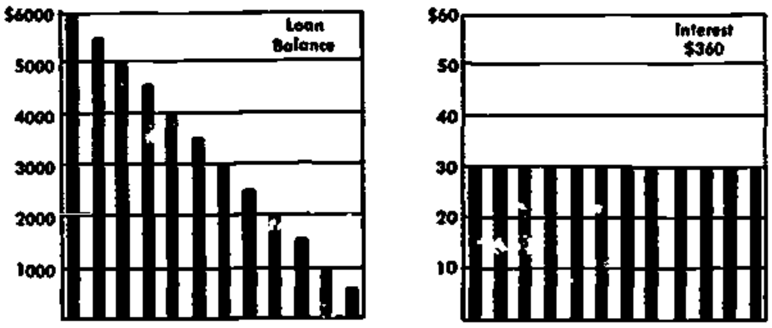
Interest at 6% figured on the unpaid balance for each month. Payments are $500 per month plus interest.



True Interest Rate—6%

INTEREST ON FULL PRINCIPAL
Borrowed $6,000 At 6% For One Year To Be Paid In 12 Monthly Installments

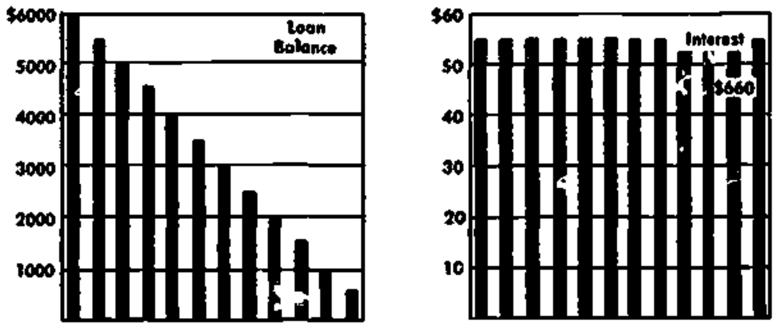
Interest is calculated at 6% for the entire year on the original balance with payments divided into 12 equal installments. Payments are $530 per month for one year.



True Interest Rate—11.1%

"EASY PAYMENT" PLAN
Borrowed $6,000 At 6% For One Year Payments Of $555 A Month For One Year

6% interest on the beginning amount borrowed plus 5% carrying charge is added to purchase price then divided over 12 equal payments.



True Interest Rate—20.3%.

Extending this type of credit is common practice for production credit associations.

Long-term credit, such as that used for the purchase of land, usually calls for rates of interest ranging from 5 percent to 6 percent. Commercial banks' long-term loans are usually made for periods of one to five years; Federal land banks and life insurance companies lend on an amortization basis up to 40 years. Amortization refers to the practice of regularly paying some on the principal each time an interest payment is made. Thus, long-term amortized loans allow the farmer to pay for his farm year by year out of the earnings of the farm.

We may say, then, that cost of credit depends partly, but not entirely, on the rate of interest. It depends, too, on the type of loan made and the methods used in advancing the funds, accepting payments, and figuring interest.

How Interest is Figured

Sometimes a lender quotes an interest "rate" that confuses or deceives the borrower. It is, therefore, important for the borrower to know the difference between the "cost" of the loan and the "rate" of interest charged. This isn't easy, because some lenders use unusual terms, charges and methods deliberately to confuse the borrower. You may find that, in addition to interest, there are added charges, such as: carrying charges, "time differential" charges, inspection fees, finance charges, sales commissions and difference in discount granted. When you are analyzing the cost of a loan, you should include all costs, including these "extras."

If interest alone is charged, you should determine whether it is charged on the unpaid balance, on the original or face amount of the loan, or whether interest is paid in advance.

1. Let's assume that you borrow $6,000 at 6 percent simple interest to be repaid in 12 equal monthly installments. If you were paying interest on only the unpaid balance each month, the charge would decrease from $30.00 the first month to $2.50 the twelfth month; altogether you would pay a total of $195 interest for the year. The average size of your loan outstanding during the year would be $3,250. Dividing $195 by $3,250 gives a true annual interest rate of 6 percent, the same as stated in the note.

2. If your interest charge is figured on the face amount of the loan each month, rather than the outstanding balance, you would pay 6 percent of $6,000 or $360 interest. Now divide the $360 paid as interest by the average amount outstanding during the year ($360 ÷ $3,250) and you find that you have been charged a true interest rate of 11.1 percent. This is nearly double the 6 percent rate shown in the note.

3. Or, the lender may "discount" the loan—that is, require you to *pay* the year's *interest*, $360 in *advance*. In this case you never have the use of the whole $6,000; you have the use of only $5,640 ($6,000 — $360) and you will be paying a true interest rate of 11.78 percent. The true interest rate on a discounted loan is always higher than on a non-discounted loan with the same "rate."

4. Where charges other than interest are made, sometimes called an "easy payment plan", you should give special attention to the full cost of the loan. Be just as careful about installment purchases where apparently there are no special charges. An example will illustrate what might be involved. Assume that you trade your old tractor for a new one and finance the balance due of $1,440. You have some current income from your dairy enterprise, so you sign a note calling for 24 monthly payments of $72.50 each. What rate of interest are you paying?

Total amount paid	$72.50 × 24 = $1,740
Principal amount financed	1,440
Loan or interest charge	300
Loan or interest charge per year	150
Average amount outstanding	750
True interest charge	$150 + $750 = 20 percent

There is a formula you can use to figure the true annual interest rate charged, when your note calls for evenly spaced payments:

Formula for Figuring the True Rate of Interest

$$\frac{\text{Total of finance charges}}{\frac{1}{2}\text{ original loan}} \times \frac{\text{No. of payments}}{\text{No. of years}} \times \frac{1}{\text{No. of payments} + 1} = \text{True annual interest rate}$$

Example: Substitute figures from the last example above:

$$\frac{300}{720} \times \frac{24}{2} \times \frac{1}{25} = 20 \text{ percent.}$$

The USDA Agriculture Handbook No. 230, "Farmers' Handbook of Financial Calculations and Physical Measurements," gives valuable information on figuring interest rates.

Farmers Use Different Kinds of Credit for Different Purposes

Farmers use the following kinds of credit:

- Short-Term Credit for year-to-year farm production
- Intermediate-Term Credit for larger production or capital outlays
- Long-Term Credit for farm ownership
- Credit for farmer-owned off-the-farm business
- Consumer Credit

Short-Term Credit

The very nature of the farming business, with its slow turnover, creates a need for credit. It takes from five to six months to bring a new litter of pigs to market, from six months to a year to make a crop, and from one to two years to grow out a steer. During these processes, the farmer is paying out money with the expectation of getting all of it back, plus a profit, at market time. During these periods of preparation, he may need credit. His income is seasonal while his operating and maintenance expenses go on throughout the year. With such a slow turnover in the things he produces to sell, he frequently needs and profits by the use of credit in his current operations. This kind of credit will be discussed in detail in Chapter II.

Intermediate-Term Credit

Farmers have some outlays for large production or improvement items that call for more than one season's income; they may require the income from 2, 3, 4 or 5 crop seasons to repay. Some examples are: a combine, baler, field chopper, crib, bulk milk cooler, milking parlor, breeding or milking herd, laying flock, fencing, irrigation equipment, extensive soil conservation measure, or some building improvement. This kind of credit also is discussed in Chapter II.

Long-Term Credit

Farm ownership and operation require large capital investments. An Ohio Agricultural Experiment Station official said in September, 1957:

"Some recent records from our Department of Agricultural Economics show that a general livestock farm averaging 218 acres in western Ohio represents an investment of $75,471, while a corn-hog farm (254 acres) is worth $103,969.

"As we break down these figures for the corn-hog farm we find investments represented as follows on an acre basis:

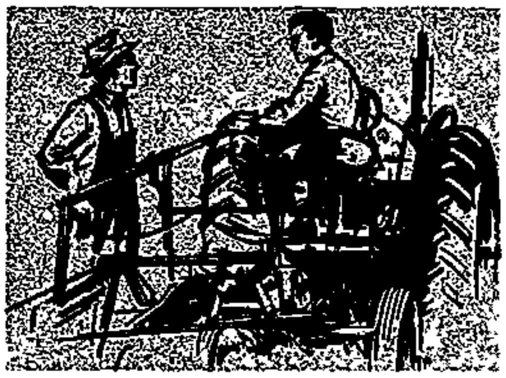
Land	*$202.39*
Buildings	*110.42*
Machinery	*34.52*
Livestock	*35.27*
Feed and Supplies	*21.79*
	$404.39 per acre."

The greatest part of this investment is in land and buildings. It takes many years to accumulate such a capital investment. Long-term credit used for this purpose is discussed in Chapter III.

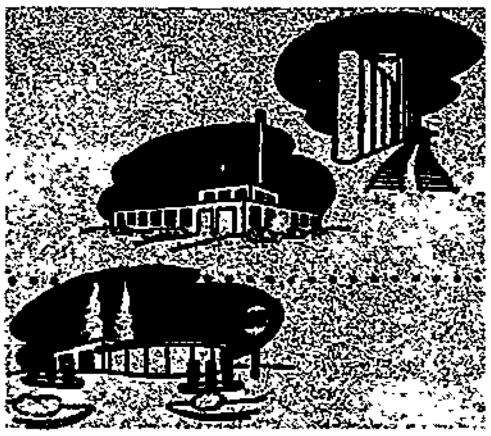
Credit for Farmer-Owned Off-the-Farm Business

Farmers join together in their cooperatives in order to do things they cannot do by themselves as individuals. These cooperatives usually perform jobs beyond the farmer's line fences. Through them the farmer conducts his off-the-farm business. Cooperatives also have to use money, part of it borrowed. We shall discuss this kind of credit in Chapter IV.

Long-term real estate mortgage loans provide low cost financing for the ownership of the farm.



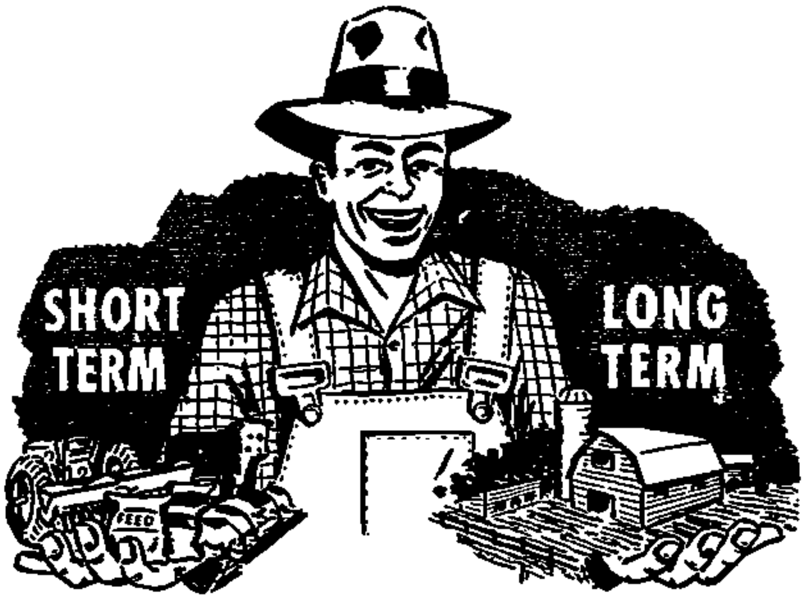
Short- and intermediate-term production loans provide financing for farm operation and improvement.



Farmer cooperatives need credit for plants, facilities and equipment — for operating purposes — and for orderly marketing of commodities.

Consumer Credit

Every farm family buys some things that provide enjoyment but are not necessary to the successful operation of the farm business. These are usually called consumer items, or consumer goods. A tractor is an essential production tool, while a television set is not essential. A pick-up may be useful in the farm business, whereas a new car might be a luxury. The distinction between necessities, needs and wants is brought out on page . Often luxury or consumer items are made so attractive that we allow ourselves to be "sold" something we do not need. When the "easy payments" begin coming due, we find that we cannot pay them without using income we need for necessary things. Monthly payments, usually called for in installment buying of consumer goods, do not suit farmers well, except possibly dairymen, poultrymen and a few others whose income is well distributed throughout the year. As you will see on page , such consumer or installment credit comes exceedingly high in cost. The wise farmer will avoid using any consumer credit that he cannot get from the same lender who supplies his sound, short- and intermediate-term credit needs.



A good lender will help you keep the proper balance between short-term and long-term credit.

The Proper Use of Credit

In using credit even for a right purpose it is important that it be used at the right time, in the right amounts, and over the right periods of time.

When to Use Borrowed Funds

Using credit for a sound, constructive purpose is a good business practice. A good test is to ask yourself: will I be better off after repaying the loan than I would have been without borrowing the money?

Example: A farmer has a good supply of corn. He knows that he can market this corn most profitably through a bunch of hogs. But he has no hogs nor the money with which to buy them. Then it's time for him to use credit. If he has sufficient grass to grow a bunch of calves or keep a flock of sheep but lacks funds to buy them, it is time to borrow the money for that purpose. Similarly, he may need more power to plant, cultivate, and harvest larger crops; or he may need more labor to operate the farm more efficiently. If he lacks cash to pay for all of these things, it is time to plan and arrange for credit to boost his current income.

On the average farm there are many needs which, if supplied through credit, will increase the producing power and income of the farmer. When such conditions exist, it is time for the farmer to use the right amount and right type of credit.

How Much to Borrow

Every person who borrows money realizes, of course, that he must pay it back with interest. He should know, when he makes the loan, from what income he will repay it. Certainly he should never borrow more than he actually needs for a specific purpose.

If a farmer needs only $925 to pay for cows, it would be unwise for him to borrow $1,000. The larger amount costs him more in interest and he has more to pay back at the maturity of the loan.

Never borrow more money than you feel reasonably sure you can repay within the period agreed upon. To be reasonably sure you should have a good margin of safety between your expected income and the amount you plan to pay. Few of our plans work out one hundred percent. You cannot tell exactly how many bushels of wheat or corn you will raise or what it will bring when sold; you have to depend on the seasons and the market. Neither can you tell how many lambs or pigs you can save and market from your ewes and sows. So, in borrowing money to be paid back from such sources, the amount you borrow should always be well within the amount of your anticipated income. Borrow only the amount of money you can put to work to increase your earnings; then you are operating on a sound basis. Plan your needs accurately and carefully; then borrow only enough to meet them.

A general purpose loan that includes a number of purposes distributed over the year should be made for a period of one year; it should be paid as and when income is available from the various projects.

In a long-term loan for the purchase of a farm, the repayment plan usually should be on a semi-annual or annual basis. In this way, the farm can be made to pay for itself.

What the Lender Looks for in a Borrower

When a lender is deciding whether to make a loan, he has to consider these five factors: the man; his financial position; his ability to repay; purpose of the loan; and security for the loan.

Planning Term of Repayment

A farmer should plan definitely how he is going to pay his loan when he first seeks it. His plan of repayment should provide for reducing the loan as soon and as often as his farm program will permit. If, for example, he asks for a current operating loan of $1,000 and is expecting a major part of his income monthly from a dairy herd, he should include in the payment plan a definite amount to be paid each month from this source. If he has lambs to sell in the spring and hogs in the fall and tobacco in the winter, he should use at least a part of income from these sales to pay on the loan. This is the easiest and cheapest way to use credit.

If a farmer borrows money to buy livestock to feed for market, the loan should be for the time needed to finish the feeding program. He will make payment on the loan whenever he sells any of the livestock. If he sells earlier than planned, he will save interest by paying his note before it matures. In all short-term operating loans, the period of the loan should correspond with the length of time estimated to complete the program being financed.

The Man

Of primary importance in any loan is the man who borrows the money. A lender wants, first of all, a borrower who has established a reputation for moral responsibility and who has demonstrated his ability as a farmer. If he does not already know the applicant, he will investigate these elements of character thoroughly. The loan should not be made unless there is mutual confidence between the lender and the borrower.

a. *His Moral Responsibility*

One of the best recommendations an applicant can have is his past record of honesty and fair dealing with all people. Such a reputation is built over a period of years, with the foundation being laid in one's youth. Would you favor approving a loan to a boy who has the reputation of being a "cheater"?

Or consider the young couple who, in order to set up housekeeping and live as they were accustomed to, have purchased a car and household goods on time. They have had a hard time meeting the payments. Recently they have been charging more and more farm production expenses. Would you lend money to this young couple?

Here are some of the factors that may indicate whether the applicant has a sense of responsibility about debts:

Unpaid bills of long standing, many small bills, or court judgments may show that he does not try very hard to pay his debts or that he obligates himself for more debt than he can ever expect to pay.

Items left out of the financial statement show that he is careless, does not understand the importance of the statement, or, in some cases, that he is dishonest. False statements are a definite warning signal to the lender.

Inaccurate or false statements about past production or sales are also danger signals.

Bankruptcy, compromise debts, and other legal means used to escape payment of debts have to be looked into. The circumstances under which such action was taken should be given proper weight.

So you see that a man's honesty and sense of responsibility are basically important in financial dealings.

b. *His Managerial Ability*

The man's ability to run a farm successfully is another important factor.

The lender wants to know whether the applicant is a good farm operator. For evidence on this point, he will consider how fast the applicant is getting ahead. If there is lack of progress, he will want to find out whether it is due to poor management or to misfortunes over which the farmer has no control.

The lender will try to determine whether the applicant is up to date in his methods, whether he keeps in close touch with market conditions, and whether he shows ability to manage the property he owns.

The applicant's family also is important. A capable, energetic, and intelligent wife is necessary to a man's success. Children eager to cooperate in farm work and fun add to the success of farm operations.

Financial Position

Unless the lender already knows from close acquaintance, every applicant for a loan is asked to furnish information regarding his financial position. He should prepare a statement which shows:

(a) an itemized list of all he owns—land, livestock, equipment, and other assets; (b) an itemized statement of all his debts; and (c) a statement showing his net worth, which is the difference between total assets owned and debts owed.

The lender uses this statement to answer a number of questions about the borrower: How much capital does the applicant control? How much ownership does he have in his assets? Are there debts that may interfere with the prompt payment of the loan being applied for? Does the applicant have property which could be quickly sold for cash to pay current expenses and debts (known as quick assets)? Has the applicant been going forward or backward financially in recent years?

Imagine now that you are a lender looking at these financial statements of two farmers:

ASSETS	FARMER A	FARMER B
Cash	$ 500	$ 2,000
Grain, feed on hand	2,000	3,500
Livestock	5,000	7,500
Equipment	3,500	5,000
Land	30,000	....
Total	$41,000	$18,000
LIABILITIES		
Store bills	$ 400	$ 100
Unpaid taxes	300	....
Chattel mortgage loan	3,500	....
Farm mortgage loan	22,000	....
Total	$26,200	$ 100
NET WORTH	$14,800	$17,900

Ordinarily, financial statements are submitted in greater detail than those above.

In the above illustration, notice that Farmer A has assets worth more than twice as much as Farmer B. But Farmer A is heavily in debt: he has a mortgage loan on his farm; he has a chattel mortgage loan on his livestock and other personal property; and he owes taxes and store bills of a considerable amount. Actually, his net worth is smaller than that of Farmer B. Farmer A has another problem; he has few quick assets (on which he could raise money quickly) as compared with the amount of his short-term debts; there is some doubt that he will be able to raise enough cash to meet both his short-term debts and his operating expenses.

Farmer B has few debts and a larger net worth. In addition to $2,000 in cash, he has grain and livestock to market in the near future; he should have ample funds to meet his operating expenses.

In view of the less favorable debt position, the small amount of quick assets, and the smaller net worth, you would consider Farmer A a less desirable credit risk than Farmer B.

Progress of the applicant as shown by financial statements over several years is important. If a man has inherited considerable property, for example, and has had a declining net worth since that time, it raises a danger signal since it suggests that he is a poor manager. Certainly the lender will want to look into the reasons for his losing ground. On the other hand, if the statements show steadily increasing net worth with no outside help, the applicant is judged to be successful in his farming.

The lender will examine how the value of assets has been figured. If prices above reasonable values have been used, the net worth will be too high. Such over-valuation means either poor judgment or an effort to deceive. Failure to list all debts also is a danger signal.

Ability to Repay

When making the loan, the lender will look into the borrower's capacity to repay it. An insurance company, for example, receives an application for a long-term loan of $10,000 to be secured by a mortgage on 240 acres. The annual payment on this loan covering principal and interest would be $770. The insurance company estimates that the farmer could sell products from the farm totaling about $8,000 per year, and that feed, labor, repairs, taxes, and other farm operating expenses will run about $5,000. This leaves a net income of $3,000. Can he support his family and pay $770 out of this amount? Does he have sufficient repayment capacity to carry such a loan?

Repayment capacity will depend upon the size of the farm and whether or not the farm business is organized and managed on a sound basis.

The farm shows the ability of the manager to a very large extent. The intelligence, energy, and resourcefulness of the applicant tell how well he will manage the business. Past success in the present or similar enterprise is an excellent guide. Remember, however, that the best manager cannot make a success of a hopeless business.

a. *Reasons for Poor Repayment Ability*

(1) Business is so small that it can yield only a small gross income.

(2) Production per unit is low: poor crop yields per acre, low percentage of cows calving, small pig crop, small returns from poultry.

(3) Price per unit for products sold is low, due to poor market, poor marketing, poor quality, unfavorable general price situation.

(4) Cash production costs are high, due to high feed costs, high labor costs, high replacement costs.

(5) Cash overhead costs are high, due to heavy debt load or high interest rate, heavy taxes, and high maintenance costs for buildings and machinery.

(6) Cash living costs are high due to extravagance, sickness, education of children.

(7) Applicant's record shows he borrows above ability to repay.

(8) He overestimates amount of the loan that can be repaid each year.

b. *Reasons for Good Repayment Ability*

(1) Business is large enough to yield an adequate gross income.

(2) Production or yield per unit is high.

(3) Price per unit for products sold is good.

(4) Cash production costs are low.

(5) Cash overhead costs are low.

(6) Applicant manages his home well.

Any one of these reasons may make or break your farm business if it is sufficiently good or bad. For instance, very low production per unit will wreck almost any agricultural enterprise, even though the size of the business, prices received, and costs are excellent. One or more factors may be sufficiently good to offset weakness in the other factors. For example, you may sometimes offset high costs by having high production per unit and selling at high prices. From the standpoint of repayment you would be the best credit risk if you excelled in all six factors. Such cases are rare. In deciding repayment ability a lender usually balances favorable factors against less favorable ones and weighs the net effect on the farm business.

Purpose of Loan

This subject is discussed in detail on page 5.

Security for Loan

Any financing program should be arranged so that the borrower can repay the debt from his farm income. As security for the loan, you may pledge to the lender such specific assets as land, livestock, machinery, stored products, or growing crops. The evidence of this pledge may be a mortgage, warehouse receipt, or bill of lading. When you pledge property as security or collateral for a loan, you give the lender certain rights to that property. When the debt is paid, he returns the evidence and his rights are canceled.

This pledging of assets by the borrower to the lender as security for the loan protects the lender in two ways. (1) It will prevent some other creditor from seizing the working capital of the borrower. (2) If the borrower does not repay the money he has borrowed, the lender may sell the collateral to recover his loan.

Collateral is not always required for short-term loans. High grade credit risks—honest, well-established farmers with a good record of debt payment—frequently can borrow without giving collateral of any kind.

What a Borrower Looks for in a Lender

As a borrower, you should study carefully the sources from which you may obtain credit. Find out about the services offered by each; on the basis of the facts you learn, decide which one can give you the credit best fitted to your needs. After you have selected your lender, you should establish a credit rating with him; then build up a working relationship over a period of years that will be mutually profitable.

A complete understanding is the basis for confidence between borrower and lender and is the only way a sound loan can be made.

There are five general aspects of the lender that you will wish to investigate: character; lending policies; permanence and dependability; experience and knowledge of farming; and cost of the loan.

Character

You will want a lender who has established a reputation for fairness and honesty in dealing with his borrowers. It is important that the lender have a good understanding of farming. If he is to work out financing programs that take account of the full needs of a farmer, he must recognize the possibility of unfavorable weather and price conditions and other factors over which the farmer has no control.

Lending Policies

Look into the past policies of the lender. Has he adapted his credit terms to the needs of farmers? For example, have the lender's loans called for repayment schedules that are fitted to the earnings of the farm and capacity of the farmer to pay? Is the period of time for which loans are made adjusted to the length of time required to complete the operation being financed? Do the capital loans call for large amounts coming due at any one time, or are the payments spread over a reasonable income period?

The policy toward borrowers during hard times also is important. Has the lender been interested enough in the welfare of the deserving borrower to carry loans during temporary periods of low income? Did he extend further credit when unusual conditions made it difficult for the farmer to repay on schedule?

Permanence and Dependability

Once you have established a credit rating and built up a satisfactory working relationship with the lender, you will usually wish to continue on a permanent basis. You want to be sure that the lender will be able to finance you year after year as your business requires loans.

Will your lender be able to serve you in times of trouble? This is particularly important. In the past, some sources of credit have dried up during periods of drought or financial depressions, just when farmers needed credit most. Where the lender obtains his funds may determine how dependable his credit service is.

Experience and Knowledge of Farming

There is an advantage in having a lender who has a broad, up-to-date knowledge of agriculture and who has had long experience in making loans to farmers. As a result of such knowledge and experience, the lender is in an excellent position to counsel with farmers regarding not only their financial affairs, but also their farming operations. A trained, experienced lender, who has had an opportunity to observe success and failure among his borrowers, can be a valuable adviser. He can be especially helpful to a young man who is just starting out to build up a farming business.

Cost of Loan

Re-read "Cost of Credit" beginning on page 6.

Compare Sources of Credit on These Points

Points of Comparison	SOURCE			
	A	B	C	D
Character				
Reputation with farmers				
Knowledge of farming				
Policies				
Security required				
Length of loan

Cost of Loan				
Interest charge				
Other charges				
Cooperative stock purchase				
Dividends paid				
Patronage refund				

Separate comparisons should be made of sources of (1) production credit, (2) longtime land credit, and (3) credit for cooperatives.

Credit Instruments: The Tools of Borrowing and Lending

Virtually all loans are supported by a written record or document. Such a record is tangible evidence that a contract has been made—something one can put a finger on and say, "This is proof that an agreement has been made." These records "in black and white," used in making loans, are called credit instruments. What are the various credit instruments?

Applications for Loans

A written application for a loan shows the lender how much money is wanted, for what purpose it is to be used, and how and when the borrower plans to pay it back. From this application the lender can set up the loan to fit the needs and the convenience of the borrower. He can arrange the loan so the borrower can get the amounts he needs when he needs them. It enables both lender and borrower to understand the program and work together to carry it out efficiently.

Checks

A check is a signed written order to a bank to pay a certain sum of money on demand to the person named on the check.

What are some of the advantages in using checks instead of cash in doing business?

a. There is less danger of loss or theft than when money is carried or sent through the mails.

b. Checks are much more convenient than money, except for small amounts.

c. The canceled check, though not a receipt, is good evidence of payment.

d. It is much easier to keep records when checks are used.

In writing checks the following instructions should be observed:

a. Write all checks in ink. They are much harder to change or "raise."

b. Write plainly. Neither the holder nor the bank should have any trouble reading it.

c. Leave no space between the dollar sign and the amount of the check. Also, fill in completely the line giving the amount in writing. This, too, prevents "raising."

d. Do not make checks payable to cash. Anyone getting the check can cash it.

e. Never sign a check in blank. You place your whole bank account in the hands of the holder.

f. If you make a mistake in filling out a check destroy it and write a new one.

g. Show for what the check is written. This makes a more complete record and may serve as a receipt.

William Jason Smith

What's your name? — Get in the habit of signing your name the same way every time you sign a check, note, mortgage, or any other legal paper. In a real estate mortgage or deed it is especially important that you sign your name exactly the same as it was spelled in the deed to you.

William J. Smith

Blank endorsement — When you endorse a check in the blank, simply by signing your name, you make it possible for anyone into whose hands the check may fall to cash it. Don't endorse checks this way if you send them in the mail. Endorse checks this way only when you hand the check personally to the individual or organization you want to receive the cash.

Payable only to
My Production
Credit Association
William J. Smith

Restrictive endorsement — Use this endorsement when you send checks through the mail. Only the person or organization to whom you endorse the check can cash it.

Drafts

A draft is like a check except that the order when paid by the bank is not charged to the signer but to a third person named on the face of the draft. Of course, before the bank will honor this kind of order it must know that the person against whom the draft is written will accept the charge of the amount named. Usually in the course of business this has all been arranged before the draft was written. Financial institutions such as banks and production credit associations sometimes give "letters of credit" to their customers agreeing to honor drafts drawn on them under conditions set forth in the letter.

A production credit association member who obtains a loan to finance the purchase of livestock or other property may be authorized to use a draft—sometimes called a bill-of-sale sight draft. The member completes and gives a draft to the seller of the property for the amount of the purchase price. The draft transfers title to the property purchased to the member and gives the seller the right to collect the stated amount from the production credit association through the bank which is named on the draft. draft pictured here shows how Mr. Hughes, whose loan is discussed in Chapter II, used a draft to pay for some shoats he bought.

Promissory Notes

A note is an unconditional written promise, signed by the maker—the person borrowing the money. He promises to pay, upon demand or at a definite future time, a certain sum in money to the holder or to a person he designates as payee.

This form of written contract is usually signed by a person borrowing money; also, it is often given in return for goods or services. A note may be signed by one or more makers. It tells how much is to be paid and should state the interest rate. It states where and when repayment is to be made, and normally it names the party to receive the money. The note assumes but rarely states a consideration (money, goods, services, rights, etc.) for which it is given. Sometimes the phrase "for value received" is used.

In connection with notes it is well to remember that:

a. A person who signs a note as maker establishes his liability, or responsibility, for payment. His failure to understand the provisions in the note does not prevent collection.

b. The maker of a note is still liable for payment of any balance not covered by the proceeds from the collateral he gave.

c. A person should never sign a note unless he stands ready to pay the obligation. This includes co-signing to accommodate someone else.

Mortgages

A mortgage is an instrument creating a lien, or legal claim, on property. Thus, when you mortgage your property you give the lender a legal claim against it for the amount of your debt, unless the debt is paid as set forth in the mortgage contract. You still have ownership and control of your property; the lender has the security of knowing that it may be sold if necessary to satisfy his claim.

One of the simplest forms of security is the pledge or pawn, such as a watch or other article of value, left with the lender when a loan is obtained. In case the borrower

$4,406.00

Utopia, Kentucky March 5 19 63

On or before March 5 19 64, for value received, I promise to pay to the order of Farmers Production Credit Association, negotiable and payable at the office of the payee, Four Thousand Four Hundred Six and 00/100 ($4,406.00)------------------------------Dollars, with interest at th rate of six per cent per annum from date of disbursement until paid.

In case of failure to perform any of the terms or conditions of the Financing Statement and Security Agreement or any mortgage securing said indebtedness, or in case the holde hereof deems itself insecure, the entire balance of principal shall, at the option of the holder hereof, be immediately due and payable. The makers and endorsers severally waive demand presentment for payment, protest, notice of protest, notice of nonpayment of this note and consent to any partial release of collateral and extension. This note is secured by a Financin Statement and Security Agreement of even date herewith.

Smith Hughes Helen Hughes

fails to repay his loan within the specified time he forfeits ownership of the article pledged. Another form of security is collateral. Collateral is a term used to include government or other bonds and readily salable stock. Banks often want this type of security for their loans.

A farmer, when borrowing money, usually does not have stocks, bonds or other quickly salable collateral to offer as security. In the place of this type of security he gives a mortgage (deed of trust in some states). On long-term loans he will offer a mortgage on his land; on a short-term loan he will offer a chattel mortgage on his personal property (equipment and livestock). This latter may provide for a lien on his crops, which in some states cannot be given before the crop is planted. These two kinds of mortgages gives the mortgagee (the lender) the right to take certain legal steps if the note or other contract is not met according to its terms. Such steps usually result in the public sale of the property, with the net proceeds (money received) of the sale being applied to pay off the debt. The debtor retains any property in excess of the sales necessary to repay the loan, or receives the money above that amount. The creditor usually has the right to sue the debtor for any unpaid balance on the debt after the proceeds of the sale of the collateral or mortgaged property have been paid on it.

Mortgages are filed on record in the county courthouse as a means of public notice that the lien has been established. Any lender who may be considering making a loan to be secured by mortgage or collateral may go to the courthouse records and determine whether the property in question is already mortgaged. Often he has an abstracter do this for him. Sometimes two or more mortgages are filed covering the same property. Filing dates determine the order of settling claims to such property. For example, it may become necessary to sell the property in order to pay loans secured by the mortgages. Proceeds of the sale usually are used first to satisfy loans secured by the mortgage filed first. Any proceeds left then may be used to satisfy other mortgages in the order in which they are filed.

Warehouse Receipts

A warehouse receipt is a receipt given by a warehouseman for goods received by him for storage in his warehouse. It is documentary evidence that the person named in the receipt has deposited with the warehouseman products of a specified quantity and quality.

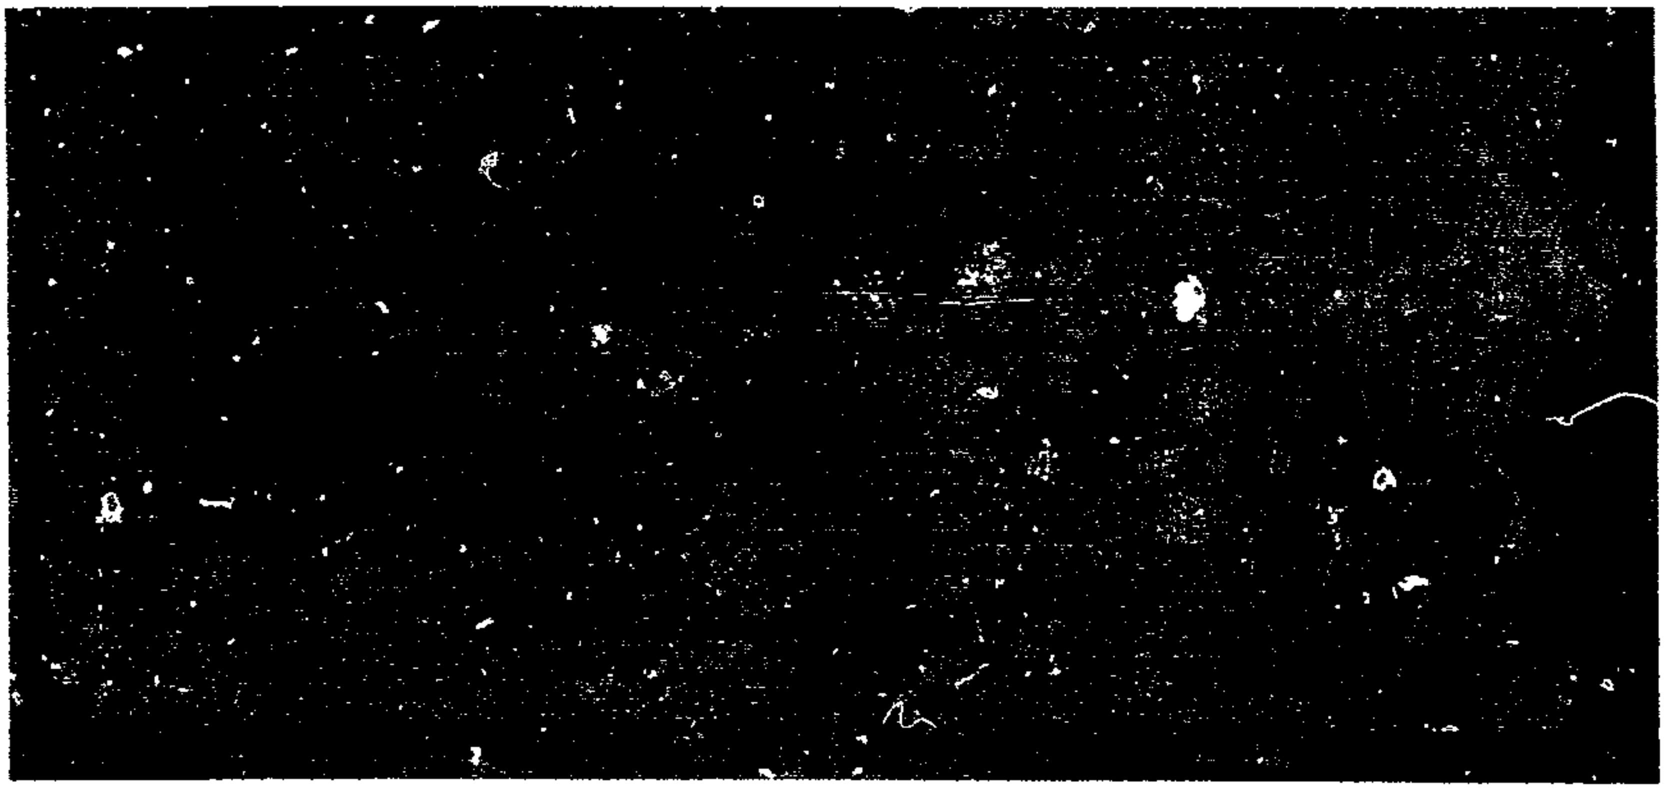
The practice of storing grain, wool, butter, honey, tobacco, cotton, soybeans and other storable farm products has become increasingly widespread in recent years. Farmers and their cooperative associations often borrow on the security of such stored products.

Two types of warehouses issue warehouse receipts: (a) those operated under the U. S. Warehouse Act, commonly called Federal Warehouses; and (b) those operated under a State Warehouse Act, commonly called State Warehouses.

This example illustrates the use of warehouse receipts.

A farmer may have more grain than he can store on his farm. By holding the grain he thinks he may get a better price. He puts his grain in a licensed elevator and receives a warehouse receipt specifying the quantity and grade. Usually he is protected against damage and can put the grain on the market when he chooses. In the meantime he may need to use part of the money he could obtain by selling the grain. In this case he can usually obtain a loan from a bank or production credit association by signing a note and attaching to it, as security, his warehouse receipt. The farmer may sell or dispose of his grain at any time he wishes, provided he surrenders the warehouse receipt to the elevator.

Warehouse Receipt



Bills of Lading

A bill of lading is a contract or receipt signed by a common carrier (such as a railroad or truck line) agreeing to deliver the described freight to a given person at a stated place.

Credit is often advanced on farm products at the time they are shipped; a bill of lading becomes the collateral for such credit.

The bill of lading states that the railroad, truck line, or other carrier: (a) has received the property which is described; (b) is shipping the property to a certain party located at a certain place; and (c) will surrender the property to that party when he presents the bill of lading under conditions stated in it, and pays the freight charges.

Releases and Satisfactions

A release is the transfer of a person's interest or right to a piece of property to another person. Usually this other person already has an interest in the property and may already possess it.

Suppose you have just paid off a mortgage on your farm. The mortgagee (lender) no longer has any claim to the property. As evidence of this, it is customary for him to return your canceled mortgage and note. It is also his duty to give you a receipt called a "release"; this shows that the debt has been paid in full. You should have this receipt recorded at once by the person in charge of mortgage records. In some states the law requires the lender to have the release recorded; but, since, it is your property that is affected, you should see that the release is recorded.

Sometimes a partial release is signed during the life of the mortgage. This release permits the mortgagor (the borrower) to sell some mortgaged livestock or other chattels, or timber, gravel, or mineral on the land, or even a certain portion of the land itself. Usually if considerable money is received from the sale, part or all of it must be applied on the debt. No matter what the amount, the borrower is legally bound to account for everything and to apply on the debt whatever the lender requires.

Often the mortgagee (lender) is willing to take a deed to the mortgaged property in satisfaction of the mortgaged indebtedness; in this event the mortgage is ordinarily released of record and the note returned to the borrower. Sometimes the mortgagee (lender) has to resort to court action, commonly known as foreclosure proceedings. In these proceedings the mortgaged land is sold by the sheriff and the proceeds of the sale applied on the debt. If the proceeds of the sheriff's sale do not fully pay the mortgaged debt, the borrower is usually still liable for payment of the balance.

In some states the law permits, when the mortgage so states, for land to be sold by the sheriff without the necessity of court proceedings. He needs only to advertise or give notice of sale. This procedure is known as foreclosure by advertisement.

Sales Contracts

A sales contract is an agreement by one party to sell property or a service to a second party for a stated consideration and under stated terms and conditions.

In farm financing, contracts of sale are often used in selling land and are commonly referred to as land contracts. In contracts of this type the person agreeing to purchase the land is commonly called the vendee or purchaser. The person agreeing to sell the land is commonly known as the vendor or seller. The contract, because it is related to the sale of real estate, must be in written form. The writing is then evidence of the obligations of the purchaser to the seller and the seller to the purchaser. Land contracts usually contain statements relative to the receipt of a down payment, the total purchase price, the dates and amounts of the other payments, the rate of interest to be paid on the unpaid portions, the conditions creating a default by either the purchaser or seller, the legal position of the parties to the contract if default occurs, and when legal title to the land is to be given the purchaser by deed or other instrument. It should be noted, however, that land contracts are not necessarily uniform and each one should be studied as to its particular contents.

CHAPTER II

FINANCING FARM PRODUCTION

Farmers' Need for Short-Term Credit

Success in operating a farm depends, to a large extent, upon the farmer's ability to have operating funds on hand when he needs them. Some farmers always have enough cash on hand or in their checking account at the bank to keep their operations going. Others have the money to provide only part of their operating funds; they have to borrow money to tide them over during certain seasons of the year. The kind and amount of credit they need will depend largely upon the type of farming operations they carry on.

A crop farmer does not cash in on his crop until late in the year; he may need to finance his business during the entire crop season. The combination crop and livestock farmer may need partial financing during the year; the income he receives from time to time from wool, lambs, milk, hogs and cattle may not meet all operating expenses; or it may not bring in money at the time he will need it most. By using his credit properly he will be able to carry on his operations successfully even though he has nothing to sell at the time certain expenses have to be met.

A young man who has chosen farming as his life's work may begin to accumulate property while he is still in high school. By using his credit wisely he can hasten the time when he can operate on his own. This will aid him in getting started in the farming business; it will help him learn how to use credit wisely and how to establish himself as a good credit risk.

As his program progresses, he may want to make investments that cannot be paid for rapidly; or he may decide to buy large pieces of equipment or breeder livestock. Now he is ready to look for an intermediate-term source of credit.

You can be sure that this FFA Star Farmer has learned how to use wisely one of today's most important farm tools — credit.

Farmers' Need for Intermediate-Term Credit

Farmers often need credit for capital purposes that could be repaid over a period of two to seven years. Only recently have lenders realized that neither short- nor long-term credit fully filled this need. Short-term lenders have adapted their policies to meet these needs; qualified farmers can now obtain the types of credit best adapted to their needs and repayment ability.

Purposes: Necessities, Needs and Wants

The purposes for which farmers borrow money have much to do with the profit they make by using credit. Lenders, likewise, consider some purposes more sound than others: quite often their decision to make a loan hinges on whether it is for a productive or non-productive purpose. Generally farmers are able to qualify for a greater amount of credit for livestock or crop production than they can for such purposes as refinancing old debts or buying things that will not produce income. The reason is obvious. In one instance, the loan enables the farmer to produce income; in the other it does not, within itself, increase income or contribute to increased profits.

For ease of analysis, we may well divide the purposes of loans into three classes—"necessities," "needs," and "wants."

Under "necessities" we would list things which are required for financing the year's operations. Sound loan policy requires that these "necessities" be provided first, before credit is used for any other purpose.

"Needs" are those purposes which, though not direct costs of producing any specific crop or livestock, are farm operation items which eventually must be met.

Under "wants" we would list those things which the farmer can easily get along without and which do not contribute directly to profitable operation of the farm business.

Here are some items for which farmers borrow money on a short-term basis:

Seed
Feed
Fertilizer
Labor
Fences
Repairs
Refinancing debts already owed
Farm equipment
Tiling and draining
Terracing
Digging Ponds
Feeder or grazing cattle
Breeding stock
Dairy animals
Repairing house or farm buildings
Home appliances
An automobile
Taking a vacation
Medical care
Education of children

Which of these items are "necessities"? Which are "needs"? Which are "wants"? You and your classmates may find it interesting and profitable to decide.

"Success in operating a farm depends, to a large extent, upon the farmer's ability to have operating funds on hand when he needs them."

Remember that statement made in the opening paragraph of this chapter? We repeat it because it has so much to do with the subject we are dealing with here. A good farmer is careful to see first that he has sufficient credit for the "necessities" he must have to operate his farm profitably. He does not first use up his basis for credit for "needs" or "wants"; he would run the risk of not having enough credit available for "necessities."

Look again at the list of items, above, for which farmers may borrow on a short-term basis. There are several items that involve capital investment. Whether or not borrowing for this purpose should be on a short- or intermediate-term basis would depend upon the farmer's repayment ability. If more than two years are needed to repay, then the farmer might be better financed with an intermediate-term loan.

Sources of Short- and Intermediate-Term Credit

A farmer desiring short- or intermediate-term credit has several sources from which he may borrow money. The wise farmer selects the source that he believes will give him the best service during bad times as well as good times. Hammonds and Tabb, in their book "YOUR FARMING PROGRAM," advise young farmers to consider:

"1. *Where you will likely want to continue to borrow. Start doing business where you want to build up your credit rating.*

"2. *The terms of the loan offered you:*
   (*a*) *Rate of interest and other costs.*

   (*b*) *Whether the notes are discounted (that is, whether interest is subtracted from the amount of the note).*

   (*c*) *Whether you must pay interest on the full amount for the entire time of the loan or pay interest only for the time the money is used.*

(d) *Whether payments can be made on the loan before the date of maturity.*

(e) *Whether the time of the loan is long enough to permit you to pay off the loan when it falls due.*

(f) *The security required."*

Following this advice, progressive farmers "buy" their credit just as they would buy other articles, such as a plow, a tractor or a herd of cows. They want to obtain credit that is useful and profitable to them. The following are common sources from which farmers may obtain their short- and intermediate-term credit. These sources cannot be discussed in much detail here, so you may want to broaden your knowledge of this subject by studying the sources of credit in your own community.

Merchants and Dealers

In some communities considerable credit is extended to farmers by firms selling farm supplies such as fertilizer, seed, fuel, provisions and the like. This is called "merchant" or "dealer" credit.

In obtaining this type of credit, there is usually no written agreement to support the transaction. The farmer simply buys his supplies "on time" and pays the "time" price. This means that the dealer does not charge interest on the money but rather he usually charges an increased price over that charged when a cash sale is made. Even though this type of credit ordinarily comes rather high, some farmers are willing to pay the price because:

1. It is convenient.
2. The funds are expected to be repaid in a few days.
3. They neglect to figure the cost.
4. Credir cannot be obtained elsewhere.

Merchants and dealers sometimes extend credit for longer periods of time, occasionally up to two years or more. Tractors and other items of farm equipment are often sold on this basis, the dealer taking a "title retention note" or a "conditional sales contract." These types of legal instruments usually provide for the dealer retaining actual title to the equipment until it is completely paid for. Many farmers feel that they lose their bargaining power when they are obliged to purchase from dealers who also do the financing. When farmers go to a lending agency, give a note for the amount they want to borrow, pay an agreed interest rate and then take the cash and "shop around" they are exercising good business judgment and are thus able to buy machinery for the "low dollar."

Commercial Banks

The extension of bank credit to farmers varies widely from place to place, depending on the extent of local bank resources and the attitude of the management toward financing agriculture. Many banks, particularly those located in the smaller cities and towns, take an active interest in financing the short-term needs of farmers. A few banks, some even in the larger cities, employ a man with an agricultural background to help them serve farmers.

To harvest or plant crops at just the right time, farmers use great amounts of credit for labor saving machinery.

Money loaned by banks is obtained principally from their depositors. This means that banks must fit their financing program to the possible demands of their depositors for funds.

Interest rates charged by banks vary widely by areas and depend somewhat on state laws. Generally speaking, though, the rate of interest runs from 6 to 8 percent on short-term loans. Large farm operators who periodically use sizeable amounts of credit are sometimes given lower interest rates than small borrowers.

Some banks prefer to make loans only for periods of from 90 to 120 days but many are willing to finance farm operations right on through to marketing time. The banks which follow the latter policy are the ones which are rendering the best service to agriculture. After all, farmers are interested in obtaining credit that is geared to fit their needs, and bankers interested in serving farmers recognize the importance of setting up farmers' loans on this basis.

"Small Loan" Companies

Several states have laws permitting small loan companies to charge 3 to 3½ percent a month on loans under a certain size, usually $300. The result is that such loan companies, often called "finance companies," have materially expanded their services until they now have offices in most towns. It takes very little calculation to figure that this type of credit is costing the farmer from 36 percent to 42 percent a year for the use of his credit. Farmers, who do business with these concerns, neglect to make full inquiry as to the loan terms and cost, or they are unable to obtain credit elsewhere.

Individuals

Most every community has certain individuals who extend credit from their own savings. Retired farmers or businessmen, landlords, persons with considerable wealth, or quite often members of the family are included in this group. This is not a dependable source of credit because too many things can happen to the individual—he may die; he may run out of funds; or he might suddenly decide to use his money for something else. Interest rates charged usually follow rather closely the rate prevailing in the community. Maturities range all the way from "one day after date" to several years on larger amounts or on real estate loans. The "one day after date" note, or "demand" note as it is sometimes called, means that the lender can demand payment any time he wants to. He is thus allowed to set the maturity or "call" date at will, without giving prior notice to the borrower. A young farmer may "get a start" by borrowing from members of his family. Even though the relative may not need to have the money repaid very soon, the important thing is to pay it back as soon as possible and develop the habit of handling credit in a business-like way. A promissory note should be given so both the lender and the borrower understand the terms of the loan.

Credit Unions

In many large corporations and industrial concerns, the employees band themselves together to form a credit union which may be organized either under a state or a Federal charter. The purpose of the credit union is twofold.

1. It provides a means of employees' saving by investing in shares and receiving dividends on them.
2. It enables employees who need additional funds to borrow from the credit union.

Since the interest rate is ordinarily quite reasonable, employeees often find it more profitable to borrow from their own credit union than purchase goods "on time" from dealers and merchants.

Although most credit unions are located in cities, a few serve rural members including farmers. The interest rate charged by a credit union is ordinarily somewhat higher than is paid at a production credit association, for instance. Farmers who use large amounts of credit that cannot be repaid quickly, prefer to borrow from lenders that are able to make loans at a lower interest rate than do credit unions.

Farmers Home Administration

The Farmers Home Administration is a government lending agency in the United States Department of Agriculture. It is required by law to make loans only to farmers who do not have the basis for adequate financing on reasonable terms from commercial banks, production credit associations, Federal land banks or other lenders. Loan funds are appropriated biennially by the Congress and all loans are supervised. FHA loans are not intended to provide permanent financing for those who can get credit from other sources.

The Farmers Home Administration makes both short- and long-term loans. Its short-term loans for operating purposes and for meeting emergency situations in disaster areas may be made for as long as seven years.

When you need money for your farm business or your farm home, you will be able to save by getting your loan from a lender which charges simple interest on the outstanding balance.

Production Credit Associations

A production credit association is an organization of farmers, who, through cooperative effort, obtain short- and intermediate-term credit at a reasonable cost to carry on their farming operations. A production credit association makes loans only to farmers and stockmen. It is operated by farmers and stockmen for their mutual benefit. A farmer who can qualify for membership in a production credit association is assured a permanent, dependable source of credit adapted to his needs as long as he maintains a sound basis for it.

Production credit associations obtain their loan funds from Federal intermediate credit banks. They thus have access to money markets all over the country. The 12 Federal intermediate credit banks in the United States began operation in 1923 under provisions of the Agricultural Credits Act of that year as "wholesalers" of credit to lenders making loans to individual farmers. In less than 40 years they have obtained more than $45 billion of loan funds through the sale of debentures on the money markets of the country. This experience has proved that funds obtained in this manner are available in bad times as well as good. Production credit associations are permanent sources of credit operating under Federal charter, authorized by Congress in the Farm Credit Act of 1933. They are subject to Federal examinations.

Loans are adapted to each individual farmer's needs. Farmers serve on the association's loan committee. They are able to adapt loans to the individual borrower because they themselves are farmers and understand the use of credit on a farm.

Each farmer who borrows from a production credit association becomes a voting member and stockholder. All the voting stock is held by these farmer-members, who elect a board of directors at the annual meetings of stockholders. Each farmer who borrows owns Class B or voting stock in the association equal to $5 for each $100 he borrows. This stock can be used over and over again, year after year. Collectively, the Class B stockholders own all the voting stock, but each member has only one vote regardless of the amount of stock he owns.

When production credit associations were first organized in 1933 and 1934, the Government invested in Class A or non-voting stock to provide them with beginning capital. Since that time, farmers have increased their ownership in the associations so that now nearly all PCAs in the United States are wholly farmer owned. As provided in the Farm Credit Act of 1956, the associations have been buying the Federal intermediate credit banks from the Government by retiring the Government's investment in these banks.

When an association accumulates enough reserves to take care of possible future losses, it may then pay dividends on both the voting and non-voting stock. After any declared dividends have been paid, any funds remaining may be distributed to the borrowers in patronage refunds.

How to Obtain a Production Credit Association Loan

In this detailed explanation of how a farmer goes about arranging for his short-term credit requirements, we are using a production credit association as an example. In obtaining a loan from other lenders some details may be different, but all the essential factors are included in this example.

Making Application

You make application for a production credit association loan with an association representative on the farm, or at the PCA field office. When members of such youth groups as Future Farmers of America or 4-H Clubs apply for loans, a representative of the association meets with the group and helps each member prepare his application.

Your application for a loan will contain all essential credit information. This is considered carefully by the association's loan committee. As an example, turn to page 26 and look at the application of Smith and Helen Hughes for a loan of $4,406. Notice that several important things have been said about their farm business: (1) what they own; (2) what they owe; (3) their net worth; (4) their crop program; (5) amount of credit they need and the purposes for which they will use it; (6) their plan of repayment; and (7) information about the amount of insurance they carry. All of this information appears above the signatures of the applicants, Mr. and Mrs. Hughes.

Preparing Field Report

The field report (page 27) contains credit information which has been developed by the person who has taken the application—in this case, Jack Armstrong. Here, the representative, Armstrong, records important credit information about the applicant and his family. He describes the farm which Hughes operates, and enters values of property to be used as security for the loan. The field report also has a statement of estimated income and expense which represents the combined thinking of both the applicant and the PCA representative. General credit information is shown under Item 9. Armstrong obtains this information either by talking with Hughes in the field office or by visiting the farm. A farm visit is always made on loans to farmers who are coming to the association for the first time. Thereafter, loans are usually closed without another visit to the farm. Field representatives keep themselves informed about each member's business through their annual farm visits. They can thus do a better job of financing the members.

Credit Factors Considered

Final decision on an application rests with the loan committee. This committee is made up of two directors who are farmer members and the manager. Two of these three members must be present to provide a quorum. An application can be approved only by unanimous approval of the committee members present.

In deciding whether a loan should be made, the loan committee considers five credit factors. Taking the Hughes case as an example, let us consider these five factors and examine the information which the application furnishes about them.

1. The Man. Item 3 of the field report (Form 203A) headed "The Man and Farm Family," provides facts concerning their reputation for honesty, their ability as managers, and other important information about their health, cooperation, credit record, age, number of children, how they were able to accumulate the property they now have, and an estimate of the current value of any real estate they may own.

2. Financial Position and Progress. Item 2 of the application furnishes most of the information that is needed on this credit factor. It shows that the Hughes' have a net worth of $19,739. We arrive at this figure by sub-

9. REMARKS: Explain anything that cannot be readily understood from information already furnished in this application and field report, including reasons for renewal and past performance. **(If there has been diversion of proceeds, explain and indicate action taken with the member.)**

Satisfactory reduction was made in loan last year which included $1135 for capital investment and a renewal of $820 of funds advanced in 1961 for purchase of additional dairy cows. Member expected to pay loan balance in full but had bad luck with sows farrowing. Has a good dairy and plenty of feed for hogs and cattle. Has a good line of equipment. While May 1 is set as the approximate date for advancing operating money, member follows the practice of requesting it at the times and in the amounts needed. The 65 acre farm listed in the financial statement is seeded down and used for pasture only. Member's parents live in house on this farm on Social Security income.

Date March 5 1963.

FINANCING STATEMENT AND SECURITY AGREEMENT

THIS AGREEMENT, by and between Smith and Helen Hughes whose address is Utopia, Route 1, Uno County, Kentucky (hereinafter called "Debtor," whether one or more) and the FARMERS Production Credit Association whose principal office is at Farmington Kentucky, (hereinafter called "Lender");

WHEREAS, the undersigned Debtor is indebted to the Lender and bereafter expects to seek additional loans and advances from the Lender and desires to give security for all such indebtedness and future advances;

NOW, THEREFORE, WITNESSETH: As security for the payment of existing and future indebtedness of the Debtor to the Lender, the Debtor hereby gives and grants unto the Lender a security interest in the property and goods described in the Schedule below, and further covenants and agrees with the Lender as follows:

1. That the statements contained in the Debtor's loan application or applications are true and correct and that the proceeds of the loan or loans secured hereby will be used solely for the purposes set forth in such applications.
2. That the Debtor holds title to the within-described property free and clear of liens and encumbrances and prior security interests.
3. That the Debtor will pay when due all indebtedness secured hereby with interest, together with any rent, taxes, levies, assessments or other claims which are or may become liens against the said property.
4. That the Debtor will care for and maintain the crops and property herein described in a good and husbandlike manner and will not further encumber, conceal, remove, sell or otherwise dispose of the same without the written consent of the Lender and, upon demand, will provide additional collateral acceptable to the Lender.
5. That he will insure the said crops and property in such amounts and in such manner as may be required by the Lender and will pay the premiums therefor.
6. That the Lender, or its agents, shall have the right to inspect the said property at any time.
7. That, upon the death or bankruptcy or insolvency of the Debtor the entire indebtedness secured hereby shall, at the option of the Lender, become immediately due and payable.
8. That, upon breach by the Debtor of any of the covenants or terms hereof, all indebtedness secured hereby shall, at the option of the Lender, become immediately due and payable and the Debtor hereby waives all notices and all exemptions and agrees that in the event this instrument be placed in the hands of an attorney for foreclosure or other legal action, the Debtor will pay all costs and attorney's fees incurred, and in the event the Lender pays any rent, taxes, assessments, levies, charges or any liens whatsoever affecting the said property or insurance premiums, the same shall become a part of the debt hereby secured and shall be payable on demand, PROVIDED, HOWEVER, if the Debtor shall pay the indebtedness hereby secured when due, including such further advances as may be made by the Lender to the Debtor, then this indenture and the estate and interest hereby granted in the said property shall cease and determine and become void, anything herein to the contrary notwithstanding.
9. The Debtor hereby instructs the Lender not to file a Termination Statement of this Financing Statement and Security Agreement until requested to do so by the Debtor in writing.
10. It is the intention of the parties that this instrument shall serve both as a "Financing Statement" and "Security Agreement" as authorized by law.

IN WITNESS WHEREOF the parties hereto have caused this Agreement to be executed this March 5 1963, at 10:35 AM/~~PM~~

(Debtor)

SCHEDULE OF GOODS COVERED BY THIS AGREEMENT AND STATEMENT:

1. CROPS—All of the debtor's interest in the following crops to be planted or growing within one year from the date hereof on the hereinafter described land:

Corn

2. EQUIPMENT on the hereinafter described land:

All farm equipment

3. LIVESTOCK, FARM PRODUCTS AND PERSONAL PROPERTY on the hereinafter described land:

Corn
All hogs

4. All property similar to that listed above, which at any time may hereafter be acquired by the Debtor including, but not limited to, all offspring of livestock, additions and replacements of livestock and poultry, and replacements of and additions to equipment and other personal property above described; and including the wool to be clipped from any sheep or goats, all milk produced by any cows, all products of any poultry, and all feed to be used in maintaining or fattening said livestock and poultry.
5. All proceeds of the sale or other disposition of any of the property described or referred to under Items 1 to 4, inclusive above, and of any offspring, wool, milk and poultry products derived from said property, together with all accounts receivable resulting from such sales.

All of the above-described crops and property are or will become located on the farms described as follows:

The Gibbs farm located on county road one mile northeast from the town of Utopia, County of Uno, bounded on the north by Webb, on the east by Johnson, on the south by Stone and on the West by Miller.

tracting their liabilities from their assets. Under assets are shown the various items of property they own. The liability side of the financial statement shows the Hughes' various debts. Note that the original amount of the debts is shown, and the date they were contracted. This information enables the loan committee to determine the progress the Hughes' are making in reducing their obligations. When passing on a loan application, the loan committee also reviews, from their files or other available sources, the applicant's progress and trends in his business over a period of years.

3. Repayment Capacity of the Farm Business. Next to the "man" factor, the loan committee gives most consideration to this factor. They are eager to see that member-borrowers repay their loans without harming their farm business. It is of prime importance that farmers use credit in ways that improve their financial position. This is so important that production credit associations endeavor at all times to make loans that are self-liquidating and help the farmer run his business efficiently.

Now look at Item 7 of the field report on the Hughes' application. You see that an operating statement of estimated income and expense has been worked out. By analyzing this statement the borrowing member and his production credit association are able to determine (a) the credit needed, and (b) how it is to be repaid. Notice that income from dairy products, cattle, and wheat will not be used to repay the loan; it will be available to pay family living and operating expenses. This income, plus operating funds provided in the loan, will cover all expenses shown in the operating statement. This is vital. The loan must be sufficient to cover expenses not met by unpledged income. This is absolutely necessary if the entire operation is to be financed on a basis that fits the needs of the farm family.

4. Purpose of Loan and Basis of Approval. On the Hughes' application the first item under "purpose of the loan" is renewal of the previous year's loan balance. This raises the question: Is this renewal justified? The explanation found under Item 9 of the field report shows that this member's record of performance is satisfactory. Remember in the preceding paragraph we saw that the operating expenses provided in the loan, together with income unpledged, was sufficient to cover the entire cost of operation. These are "necessities" and, therefore, are constructive loan purposes.

In addition to the renewal, another capital item in the loan purpose is to pay for a truck just purchased. This item of equipment is considered necessary in the operation of this particular farm business.

From this analysis, we see that the association's loan committee can determine that the purpose is sound. Now they are ready to examine the plan of repayment. The Hughes' plan calls for sale of hogs expected to bring $4,750. This is more than the amount applied for. They have the feed on hand and in prospect to finish the hogs. Adequate cash to carry the program to successful completion is provided by the loan and unpledged income from the sale of farm products. The plan of repayment, therefore, is sound.

5. Collateral Offered or Available as Security. The Hughes' have offered a mortgage on the corn crop, the hogs, the equipment and the feed. (See application form, Item 3, and field report form, Item 6.) Thus, the mortgage covers collateral that is to be sold to repay the loan, plus additional backlog-collateral to provide a margin of security and to enable the association to take care of unforeseen credit needs that may arise during the period of the loan. Of the security back of the loan, only the hogs are expected to be sold.

Closing the Loan

As an applicant for a loan you usually sign a note (page 17) and a mortgage or financing statement and security agreement (page 28) if the loan is to be secured by a lien — at the time you make your application. If you are getting your first loan from the association, this operation may be postponed until the association's loan committee has approved your application. As a "first-time" applicant you usually would not sign legal papers until you are assured the loan would be closed. The note represents the amount of money you applied for and is made to mature as specified on the application. The location and boundaries of the land on which the property is kept, and the description of the chattels being taken as security for the loan, are entered directly on the financing statement and security agreement (page 28). The other information, such as witnessing the signatures and recording of mortgages, is required by state laws.

Production credit associations do not always require you to give a chattel lien as security for a loan. If the loan committee decides the five credit factors are sufficiently strong, they will approve an unsecured loan, that is, not require a mortgage. In this event you will sign only the application and the note.

Members of the loan committee indicate their approval of a loan or a line of credit by placing their initials in the space provided on the application. The loan is now ready for closing. A chattel abstract is prepared showing that there are no prior liens against the property offered in the mortgage. The association is now ready to write a check for the first advance. In the Hughes' case this amounts to $2,601. Then the association places the financing statement and security agreement on record in the County Recorder's office. Remainder of the loan will be paid according to the loan agreement. If the Hughes' farming program should change, a different disbursement schedule may be agreed upon. If advances set up in the loan do not prove sufficient to meet the Hughes' needs they may get additional funds by filing an "additional advance" application and signing another note for the amount desired. It is not necessary to sign another financing statement and security agreement in the Hughes' case, as the original one is drawn to cover additional advances.

Budgeting Loans

Many loans made by production credit associations are set upon a fully or partially budgeted basis. By a plan agreed upon, loan funds are advanced as needed and repayments are made at the time farm income is expected. The Hughes' loan is an example. The budgeted loan has these advantages: it is well adapted to many types of operation; it results in considerable savings in interest cost; it eliminates the necessity for making arrangements for credit more than once a year.

Note: You and other members of the class may want to learn more about legal documents by talking with a county official or an attorney. Or you might invite one to visit your class for such a discussion.

Line of Credit

In the event the Hughes family has an approved line of credit with the association, the entire transaction up to this point would require no more than a half hour or so. Had they been new borrowers who had not established a line of credit, the loan usually would not have been closed before being approved by the association's loan committee.

Establishing a line of credit simply means that the loan committee has analyzed the Hughes' farm business, record of performance, and other credit factors. When these factors are favorable the loan committee sets an amount, called a line of credit, which the association manager or field representative has full authority to disburse for designated purposes should the member apply for it. The line of credit is indicated on the loan papers and may be changed or withdrawn by the committee when conditions warrant. Most PCA loan committees meet once or twice a week, but during heavy lending seasons, they may meet more frequently.

Repaying the Loan

Repayments are set up to be made on your loan at times you expect to have income from the sale of crops or livestock. This does not keep you from making additional payments when you have the money. Production credit associations charge no penalty for repayment ahead of schedule. This encourages members to repay loans as rapidly as possible. This not only helps your credit rating but is an effective means of reducing interest cost. Payments may be made either by mail or by calling at one of the association's offices. A receipt is issued for each payment so that you know exactly how your account stands at all times.

You may not always be able to make your repayment on schedule. If this should happen you should get in touch with your association representative promptly so that a substitute plan can be worked out.

Cost of the Loan

Production credit associations secure their funds for lending from private investors through the Federal intermediate credit banks at rates comparable to those paid by other large public borrowers. To the cost of this money the associations may add around 2 percent to pay their own operating expenses and build reserves. In 1962 most associations charged farmers 6 percent. Interest is charged only on the daily loan balance outstanding.

If the Hughes' had gotten all of their advances as scheduled and repaid their loan as originally set out in the plan of repayment, their total interest charges would have amounted to $144.15. If they had received all the loan at one time, and waited until maturity to repay, the interest would have amounted to $264.36. You can see at once the advantage of borrowing on a budgeted basis and repaying as farm products are sold. In the Hughes' case, it saved them $120.21 in interest charges.

In addition to the interest rate, most associations charge a nominal loan service fee. On the Hughes' loan this fee amounted to $25, which was included in the loan.

Period for Which a Loan May Be Made

Production credit association loans are usually made to mature at the end of the crop or livestock program being financed. This is usually from six to twelve months. In certain situations where the complete program financed extends over a period beyond twelve months, the loans may be made for a sufficient length of time to cover this longer period. The associations also make intermediate-term loans to finance capital investments over a two to seven year period. Loans involving both operating and capital investment credit are usually made to mature within twelve months, with renewal of certain portions expected at maturity. In such cases it is to the advantage of both the member and the association to arrange for financing the farm business on an annual basis. This will allow them to adjust the financing to changing conditions on the farm.

Educational Loans

Production credit associations make loans for financing the education of both boys and girls from farm families after graduation from high school. Such loans cover any costs in connection with an education, including tuition and other fees, books, room and board, and clothes. They are made to eligible individuals regardless of the professions they expect to follow after receiving their education.

Educational loans are made jointly to an eligible student and his sponsor. A sponsor may be a parent of the student, or other individual willing to share responsibility for the loan. The loan may be made either on a secured or unsecured basis. A loan agreemnt is signed by both the student and his sponsor and made a part of their loan file.

Repayment plans on educational loans are adapted to each individual's situation and his ability to repay. It would ordinarily be expected that such a loan would be repaid in full within seven years. The greater portion would be repaid after graduation when the young person would normally expect to be receiving some return from his investment in an education.

Factors that must be considered in making an educational loan include (1) the ability and desires of the student; (2) the arrangements for assistance and guidance by a sponsor; (3) the sponsor's financial responsibility; and (4) the student's agreement to repay the loan within a reasonable time after graduation.

CHAPTER III

FINANCING FARM OWNERSHIP

Using Long-Term Credit

Most people who buy farms need to borrow part of the purchase price. It is usually necessary that a loan made to purchase a farm be written for a long term of years. This is because it normally takes many years to produce and sell enough farm products from the average farm to repay the total purchase price of the farm.

In some cases farm owners borrow to refinance existing debts, to purchase additional land in order to expand operations and develop greater efficiency, or they may borrow to erect buildings or otherwise improve the farm. Again, the income produced by such expenditure will require a long time to repay the investment. In order to secure the repayment of a long-term loan, the farmer usually gives the lender a mortgage on the farm land and buildings as collateral for the note which he executes as evidence of the debt. Because the average farm is durable and salable, a mortgage on the farm affords the lender the greatest possible security. By reducing his lending risk it permits him to offer the borrower a longer time for repayment and a lower rate of interest.

Purposes of Long-Term Credit

Long-term mortgage credit is needed and used to finance investments in land, buildings and equipment which have a relatively long period of usefulness. Level farm land with deep topsoil may last for generations. On the other hand, steep, rolling land can lose a large part of its fertility and earning power in a few years. Farm buildings may last and remain useful 20, 50, or even more years depending upon how they are constructed and maintained. Some larger pieces of farm machinery may last for many years if properly maintained. Such purposes from which the farmer expects to reap benefits over a long period of time are well adapted to long-term credit. Most farm mortgage loans, then, are made for one or more of the following purposes:

To buy land;

To purchase equipment, fertilizer and livestock necessary for the operation of the farm;

To construct or repair buildings or other permanent improvements such as drainage or irrigation systems;

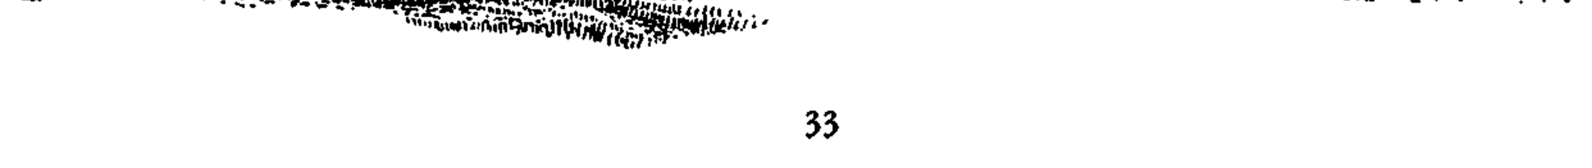
To build terraces and make other soil improvements; and

To refinance existing debts.

While these are the principal purposes for which long-term loans are made, there are others such as paying for the education of children and engaging in other forms of business.

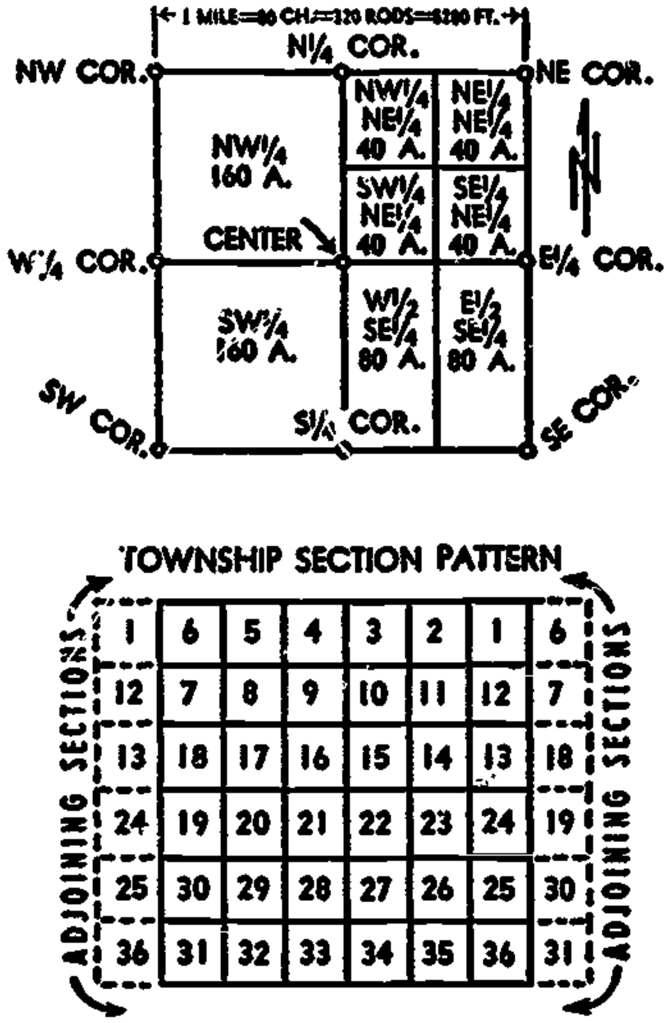
Some of the uses of mortgage credit by a farmer can be illustrated by relating the experience of one farm family. Although the name and sequence of events are fictional, this story illustrates experiences typical of many farmers.

As a young man, just married, Mr. Worth began operating a good 160-acre farm belonging to a relative. Through hard work and intelligent management Mr. Worth gradu-



LAND SURVEY CHART

Standard Section — 640 Acres



This chart is useful in describing accurately the extent and location of farm land.

ally accumulated and paid for enough farm machinery and equipment to operate the 160 acres efficiently. By frugality and with the cooperation of his wife he also managed to lay aside some savings in the form of cash, Government bonds, and shares in a local savings association. After some years the relative who owned the farm died. His will provided that the farm should be inherited equally by Mr. Worth and four other relatives. The other relatives were not farmers and each wanted his portion of the estate in cash. It thus became necessary to sell the farm to settle the estate. Mr. Worth then had to decide whether he should try to buy the farm he had been farming with good success, or take his part of the estate in cash and find another farm to buy, or operate as a tenant.

Mr. and Mrs. Worth set down on paper just what their situation was at that time. By working out a balance sheet, they established the information needed to make the best decision. The farm they had been operating was generally considered to be worth $200 an acre, a total of $32,000. The heirs and the executor of the estate agreed to sell for that amount. His inheritance of one-fifth of that amount gave Mr. Worth an equity of $6,400. This left $25,600 for him to pay in order to buy the farm. His savings, including his checking account, amounted to approximately $11,000. The present value (cost less depreciation) of his farming equipment was approximately $7,500. The fair market value of his livestock was estimated at $6,000. He consulted representatives of several companies in the long-term farm lending business and found he could get a long-term mortgage loan of $16,000. He and Mrs. Worth decided to take the $16,000 loan on the farm for a 25-year repayment period and to borrow $4,000 on their livestock and equipment for a shorter term of three years. Their total debts then were $20,000 The remainder of the purchase price ($5,600) came from their savings. They still had about half of their savings as a reserve fund for emergencies. After buying the farm they made up a new balance sheet. They now owned a farm worth $32,000, equipment worth $7,500, livestock worth $6,000 and had approximately $5,000 left in their checking account and savings, making total assets of $50,500. On the other hand, they now owed a long-term mortgage of $16,000 and a short-term chattel mortgage of $4,000, making a total indebtedness of $20,000. This left them a substantial net worth of $30,500, approximately 60 percent of their total assets.

After about five years the Worths found themselves in this situation. They had paid off the short-term debt and had reduced their long-term loan from $16,000 to approximately $14,000. Because of a rising trend in farm values and because of some improvements to the farm which they had made, they now considered their farm to be worth $36,000. Additional equipment purchased and paid for brought their inventory to $10,000 and they had about $9,000 worth of livestock on hand. Paying off the short-

The advice of an experienced farm lender can help you judge wisely the amount of debt a farm should be able to repay.

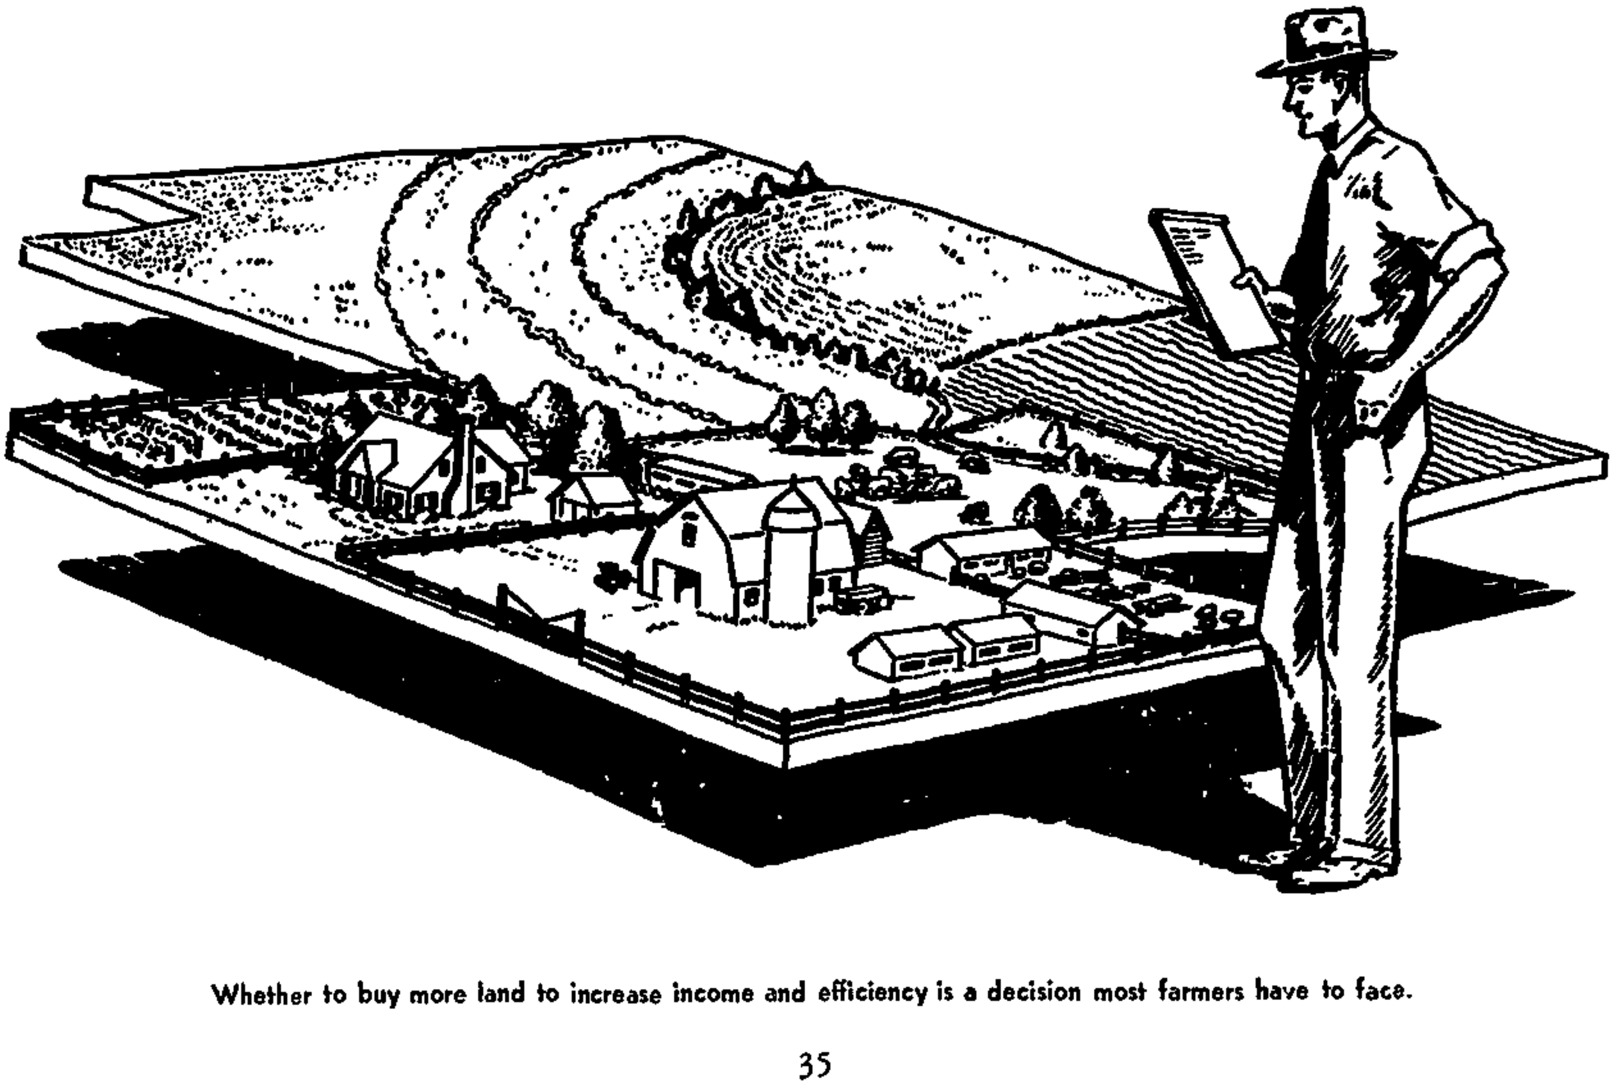
term debt, increasing their inventory and the expense of an operation for one of the children had prevented them from adding to their savings. Their balance sheet now showed assets of $59,000 and debts of $14,000. Their net worth had increased to $45,000, nearly 75 percent of their total assets.

The Worths now faced a new decision. A fairly good adjoining 80 acres could be bought for $250 an acre, a total of $20,000. This seemed a little high. But having ample equipment to operate more land, they believed their total net earnings could be increased materially by adding the 80 acres to their 160. All members of the family agreed.

The oldest boy in the family was a senior in high school. He planned to go to college to study agriculture with the hope that he could return home to go in business with his father.

This time the family worked out their balance sheet together. They tried to estimate their prospects for future earnings as well as the outlook for family expenses. They now had their home farm worth $36,000, plus the farm they intended to buy worth $20,000, plus $19,000 worth of equipment and livestock and $4,000 cash and savings—a total of $73,000. Their only indebtedness was the $14,000 still due on their long-term mortgage plus the $20,000 they proposed to invest in the 80 acres. This would make a total debt of $34,000. They found they could borrow on the combined farms of 240 acres a total of $27,000. This left them $7,000 short of the amount needed to buy the additional land. Because of expected expenses in sending the boy to college, they felt they should not dip into their savings any more but they did feel safe in borrowing the $7,000 on a five-year contract, secured by a lien on their livestock, equipment and crops. In negotiating their long-term loan they felt that repayment of the $7,000 short-term debt, plus the education of the son, would make it difficult to pay any portion of the principal on their long-term indebtedness for the first five years. They therefore arranged with the lender for a 30-year contract, with no principal payments required these first five years when they would be paying on their short-term loan and college expenses for the oldest boy. Repayment of the long-term loan would then be completed over a 25-year period. After buying the additional 80 acres the Worths had assets worth approximately $79,000 and debts of $34,000. Their net worth of $45,000 was now down to about 57 percent of their total assets. The Worths and their creditors agreed that stepping up their earning capacity at the time they were educating their children more than offset their weaker net worth position.

While this story is imaginary, it shows how farmers can expand their farming operations, increase their earning power and improve their standard of living through the wise use of credit.



Whether to buy more land to increase income and efficiency is a decision most farmers have to face.

Amount of Loan

A farmer using long-term credit should make sure the amount he intends to borrow will not be more than he will be able to repay systematically. He must consider what he can expect in the way of farm income in poor years as well as good or average years. He must take into account all expenses of operating his farm and maintaining it over the life of the loan as well as requirements for family living. He should consider what he wants to accomplish with the loan and, within his ability to repay, be sure that he borrows enough—but no more than enough—to get the job done. He should be particularly careful not to enter into a long-term contract for a part of what he needs and depend upon other credit with heavy repayments for the balance of the funds needed. Having to make heavy repayments on short-term debts while repaying long-term debts has caused many farmers serious trouble. In deciding how much he can expect to repay systematically and without undue sacrifice, the farmer should study such information as the accompanying chart. This chart shows the fluctuation over the years of the number of bushels of crops or pounds of livestock needed to pay debts. Could you not reasonably expect similar fluctuations in the future?

The amount of loan concerns both the lender and the borrower. The borrower is concerned about his ability to repay the loan. The lender is concerned about fluctuations in the value of the property. He wants his loan adequately secured by the future value of the farm during the life of the loan. A lender might consider a farm worth $250 an acre today and lend $150 an acre on the farm. A few years in the future the situation might change so the debt on the farm would amount to $140 an acre and the value have dropped to $125 an acre. The borrower then has security worth less than the amount of the debt.

Terms of Loans

Period of Years

Several factors affect the length of time a mortgage contract should run. The longer the term of years the smaller the periodical payments will be on the principal. At the same time, the longer the term of years the greater the total amount of interest the borrower will pay. This lower annual cost, over a longer term of years, would be an advantage to a young farmer: he normally would have many years of productive capacity. This would not be so with an older man. A man 45 years old may be near his peak in earning capacity. At the end of a 30-year mortgage contract he would be 75 and his earning capacity might be limited.

To the lender the characteristics of the farm offered as security are important in determining the length of time the contract should run. A farm of deep, fertile, durable soil, located in a community of similar farms and having reasonably new, well constructed and well maintained buildings, will permit the lender to contract for a longer term of years than would a farm of limited fertility, subject to natural hazards of erosion, overflow or other soil depletions, especially if the buildings are of poor construction, quite old or obsolete.

Interest Rate

The rate of interest on long-term mortgage loans varies considerably, depending upon such factors as location of the farm, the degree of risk and the extent of competition among lenders. Many lenders tend to be selective in the areas they serve. They confine themselves to communities where good, durable farms predominate and land values are

HOW THE AMOUNT OF FARM PRODUCTS REQUIRED TO PAY $1,000 OF DEBT VARIES

Years	200 lb. Hogs	1000 lb. Cattle	90 lb. Lambs	100 lbs. Milk	Cases Eggs	Bushels Wheat	Bushels Corn	Pounds Tobacco	Bales Cotton
1919	30	10	87	304	81	463	662	3,205	6
1922	60	17	112	474	133	1,035	1,366	4,386	9
1932	150	24	249	781	235	2,618	3,165	9,524	31

1962	30	5	63	243	100	495	926	1,672	6
1965	?	?	?	?	?	?	?	?	?

subject to less fluctuation. Competition for loans among lenders is likely to be keen in such areas and interest rates low. In other areas where less desirable and less durable farms predominate and where risk is greater, the lenders either will not compete for business or they will lend at higher rates of interest. Local bankers and individuals are influenced by local conditions more than by state or national conditions. The Federal land bank maintains a uniform rate throughout its lending area.

In addition to the interest rate paid on his loan, the farmer should consider any commissions, service fees or other charges imposed either at the time the loan is made or later. Such additional charges may add greatly to the cost of the loan.

Repayment Plan

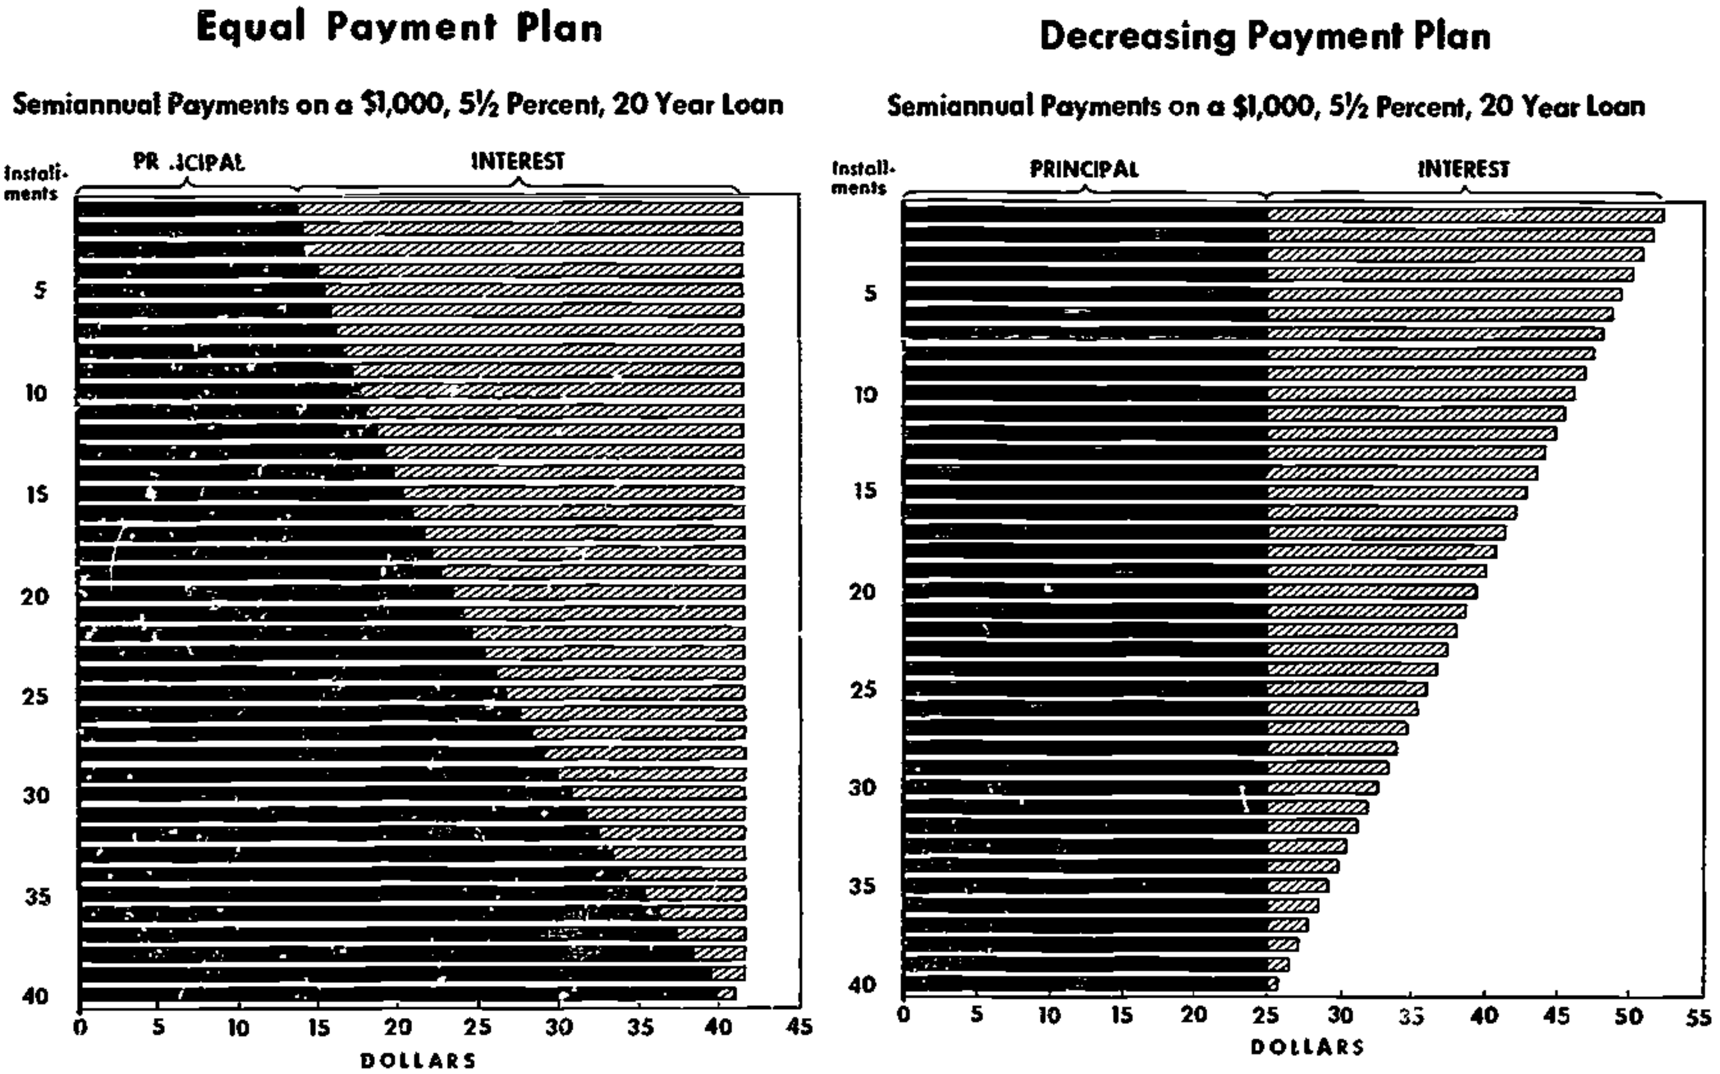
Practically all long-term mortgage loans on farms include in the contract a definite plan for repayment. Before the Federal land banks began operating in 1917, nearly all farm mortgage loans were made to mature in one, three or five years. The Federal land banks started making amortized loans, where a small portion of the principal was paid each six months with the interest payment. Now, practically all major lenders make amortized loans. Two general plans of amortization are offered. One is the equal payment plan. The borrower pays the same amount (principal and interest combined) on each installment date. Early in the life of the loan the major portion of the installment represents interest due on the unpaid balance of the loan. As payments are made the principal is reduced. The amount of interest included in each succeeding installment decreases and the amount of principal applied on the loan increases.

The other plan of amortization is the decreasing payment plan. It provides for equal amounts to be paid on the principal at each installment date. Interest on the unmatured balance is added to the principal portion. The installments are relatively heavy at first; then, as the loan is paid down, the installments become smaller. Regularly scheduled repayments help the borrower for he knows what he will be required to pay at each installment date and can plan accordingly. The lender also benefits for he knows what he can expect to collect in interest and principal at each installment date and can plan his lending operations accordingly.

The greatest advantage an amortized loan provides the borrower is systematic reduction of his debt, its final retirement and ultimate debt-free ownership of his farm.

Some lenders now offer other variations in amortization payments. These include partially-amortized, non-amortized and monthly repayment plans.

A few lenders, particularly the Federal land bank, permit advance payments on amortized loans without penalty.



Equal Payment Plan

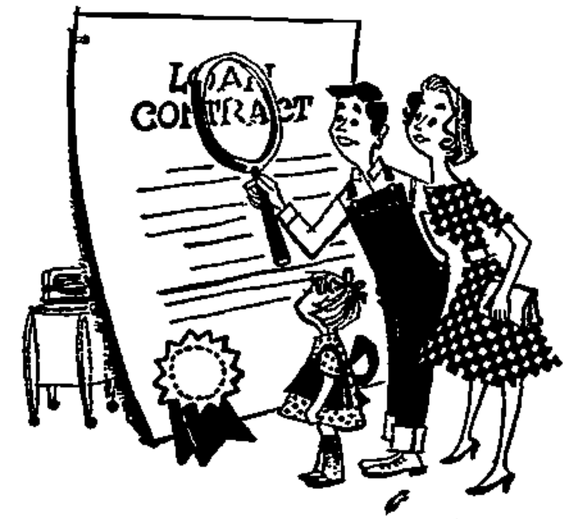
Semiannual Payments on a $1,000, 5½ Percent, 20 Year Loan

Decreasing Payment Plan

Semiannual Payments on a $1,000, 5½ Percent, 20 Year Loan

The farmer should select the loan repayment plan that fits his farm best.

This privilege enables the borrower to take advantage of good years, or outside income, or windfalls such as inheritances to make extra payments on the principal of his loan at times of his chosing. Most lenders permit such optional payments only after the loan has been in force for a certain length of time or only upon payment of a penalty or pre-payment privilege fee. This restriction is intended to protect the lender until he has recovered expenses incurred in making the loan.



Prepayment without penalty is assured only when written into the loan contract.

Another variation of an amortized loan, though rarely used, is the variable payment plan. Under such a plan payments are geared to earnings of the farm. In years of substantial income substantial payments are required on the loan; in years of meager income smaller payments are required. This plan requires close supervision by the lender and involves considerable administrative expense. At present the Farmers Home Administration is the only institutional lender known to be offering loans on the variable repayment plan.

Contract Financing

Contract financing is one form of long-term farm financing which has been used increasingly in recent years. It is frequently used where the seller finances the farm he is selling. Under contract financing the borrower does not have title to the property. The seller and buyer enter into a contract which usually provides for a relatively small down payment and retention of title to the property by the seller until the buyer shall have paid a stipulated amount. The buyer uses contract financing to get hold of a farm when he has limited funds to invest in the farm. The buyer's risk is greater because he will lose the entire amount that he has paid into the contract if he is unable to meet his payments when due. On the other hand contract financing is attractive to the seller because it gives him substantial control over the property until the buyer has paid substantial amounts. While the farm is under a contract and title remains in the name of the seller, no foreclosure or other legal action is necessary for the seller to regain possession of the farm. Under a sales contract, the borrower or buyer should assure himself of his ability to meet the contract terms and should have thorough assurance concerning the integrity and dependability of the seller.

Sources of Long-Term Credit

The five groups of long-term farm mortgage lenders are shown in the accompanying table. This table shows the amount of loans held by each group.

Individuals and Others

There are two general classes of individuals who frequently make farm mortgage loans. There is the individual who sells his farm either on a land contract or for a substantial down payment with a mortgage securing the balance. Oftentimes such a seller wishes to retire and expects the interest income on his mortgage to replace farm income as a source of livelihood. There are other individuals who have money to lend. These include successful business or professional men, widows, and others who have inherited substantial sums. They wish to invest in something they consider safe and personally can watch more closely than they could an investment in stocks or bonds . Before borrowing from an individual the farmer should thoroughly acquaint himself with the individual's reputation as a

Total	$535,317	$474,449	$236,737	$234,832

lender, consider his age, and be sure the terms fit his requirements.

A limited amount of credit is obtained from miscellaneous other sources such as county and state funds, trust funds established for colleges, various foundations, cemetery associations, orphanages and charitable institutions. The terms of credit available from these sources vary widely. Ordinarily such loans do not incorporate the service features most farmers consider desirable.

Life Insurance Companies

In many areas, life insurance companies are one of the most important sources of farm mortgage loans. A life insurance company must build up a reserve fund on each life insurance policy it writes in order to pay claims on that policy when called upon. Such reserve funds are invested in order to yield an income. Investment in farm mortgage loans is one way in which these funds are put to work. Life insurance companies which make farm loans usually have well organized loan departments staffed by capable people. In the better farming communities loans will be available from several insurance companies. Each will have a direct representative of the company working with local representatives over a rather large area. These local representatives may be local banks, insurance agents or real estate men. After an application has been filed with the local representative an employee of the insurance company appraises the farm. For many years insurance company loans were limited to relatively short terms. In recent years it has become common practice for such loans to be made for longer terms, especially on the better farms. Most insurance company loans are amortized. Interest rates are influenced by prevailing interest rates, the intensity of competition, the durability and stability of the farm, and the relation of the amount loaned to the value of the farm property

Banks

Commercial banks invest money deposited with them to produce income. Most such investments are in negotiable bonds or short-term loans so the bank can always be in a position to meet demands of its depositors. A small part of its funds, however, may be used for long-term farm mortgage loans. The interest rates and terms of such loans vary.

Bank loans generally, however, are made for relatively short periods. Should a renewal date come at a time when depositors need their money, a borrower may have to look elsewhere for a refinancing loan.

National banks may now lend not to exceed two-thirds of the appraised value of the farm for a term not longer than ten years provided 40 percent or more of the principal of the loan is amortized during that ten years, or for 20 years providing 100 percent of the loan is amortized. If no amortization payments are called for, no more than 50 percent of the appraised value of the farm may be loaned for a period up to five years. Some large city banks share in loans made by smaller country banks.

Through contacts with insurance companies some banks are able to offer long-term amortized loans. The insurance company simply purchases the loan from the bank under stated conditions.

Farmers Home Administration

Long-term credit may be obtained from the Farmers Home Administration. To be eligible to borrow, a farmer must be unable to obtain adequate credit at prevailing interest rates from other lenders. Such loans by Farmers Home Administration are made principally for the development, purchase and improvement of family type farms. The financing usually is carefully worked out and adapted to the needs and earning capacity of the farmer. The borrower receives a certain amount of counsel and supervision from the agency's representatives.

The amount of credit available from this source depends upon the appropriation made by Congress each year for this purpose.

The Farmers Home Administration also insures mortgages on loans made by private lenders. Insured farm mortgage loans are limited to 90 percent of the fair and reasonable value of the farm. Most counties in agricultural areas are served by a Farmers Home Administration supervisor or representative. Loans must be approved by a local FHA committee, prior to approval at the state level.

The Federal Land Banks

The Federal land banks and the Federal land bank associations are a nationwide system of credit institutions organized as a cooperative. They were established under authority of the Federal Farm Loan Act passed by Congress in 1916. For many years farmers and their organizations had needed better farm mortgage credit. There is a Federal land bank in each of the 12 farm credit districts in the United States. The Federal Land Bank of Louisville was chartered in March 1917 and makes loans in Ohio, Indiana, Kentucky and Tennessee.

How To Obtain a Federal Land Bank Loan

How a farmer gets a Federal land bank loan can be illustrated by the experience of Mr. and Mrs. Worth.

When Mr. Worth first decided to purchase the farm in which he had inherited an interest he talked with the manager of the Federal land bank association serving the county in which he lived. Together they made out an application on the regular form used by the Federal land bank. (See pages 40 and 41.)

A Federal land bank association is a cooperative owned entirely by those farmers who have obtained Federal land

I agree to carry at least the amount of insurance required by the bank and further agree to forward and assign the policies to the bank to be held during the life of the loan. If I fail to furnish the insurance by the time the loan is ready to be closed, the bank may place the insurance and deduct the premium therefor from the loan. It is understood that approval of this application, if granted, may be withdrawn at any time before said loan is made without any liability to me on the part of said bank.

This application is executed in duplicate and either copy may be treated as the original application; if accepted and a loan granted hereon I agree to furnish at my expense, an abstract or other evidence of title to the real and/or personal property offered as security for said loan, acceptable in form that will show the title perfect in me and the mortgage securing said loan a first lien on the property described. Said abstract or other evidence of title shall be considered a part of the security for said loan and shall be retained by the bank until I have paid said loan in full, or in the event said loan is not completed, until all expenses in connection with the application therefor shall have been paid. I agree to pay all fees for recording such instruments as are necessary to the loan. I hereby apply for membership and agree to purchase stock in the association through which the loan is closed, to the extent of $5.00 for each $100.00 loaned by the bank. I agree that the cost of the stock may be deducted from the loan. If title to the security is held jointly, said association (is—is not) hereby directed to issue said stock to said joint owners with right of survivorship; and authority is hereby given Ned Worth to act for and on behalf of the other joint owner(s).

Ned Worth

Mildred E. Worth
(Signatures of Applicants)

WITNESS: W. W. French

bank loans through it. The Federal land banks in turn are owned by the Federal land bank associations. Anyone obtaining a Federal land bank loan purchases stock in the local Federal land bank association in an amount equal to 5 percent of his loan. The association, in turn, purchases this same amount of stock in the Federal land bank. When Mr. Worth obtained a Federal land bank loan of $16,000 he purchased stock in the amount of $800 in the association. The association then purchased an equal amount of stock in the land bank. When Mr. Worth's loan is completely paid off the land bank will refund this stock to the association and the association will refund it to Mr. Worth When earnings of the Federal land bank and the land bank association permit, Mr. Worth will receive dividends on his stock.

Farmers serve on the association's loan committee to approve Mr. Worth's application.

The members of the association elect the directors at their annual meeting. The directors elect the association officers including the manager, who also is an employee. He has active charge of the office, meets and consults with farmers wanting loans, assists them in preparing applications for loans, brings their applications before the association's loan committee and follows through all the steps in making the loan. He also services the loan after it is closed. Should unforeseen developments prevent the farmer meeting his regular payment schedule, the association manager works with him in developing a solution to the problem.

The association pledges its assets for the payment of each loan it makes by endorsing each loan. An agreement between the land bank and the association provides that each will share half of the loss should any develop. To determine whether it will endorse a loan, the association's loan committee obtains an appraisal on the value of the security and a credit report on the applicant. The credit report is made by the manager and the appraisal of the value of the farm by a land bank appraiser or the association manager if he has been authorized to make appraisals. In the case of Mr. Worth, the credit references and his record were favorable and the value of the property permitted a loan in the amount he had requested. The association's loan committee, therefore, felt justified in recommending that the loan be made and in endorsing it. The application showing the loan committee's action, the credit report and the appraisal report were forwarded to the Federal land bank. In most instances where an association recommends a loan the Federal land bank concurs in that recommendation. That was the case with Mr. Worth's application.

The association's loan committee is composed of two directors and the manager. The directors are farmers living in the area. Their knowledge of local conditions and the people put them in a good position to give sound advice both in making loans and in servicing them after they are made.

Eligibility

A Federal land bank loan may be made to any person who is engaged in farming operations or is shortly to become engaged in farming operations or whose income is derived principally from farming operations. A person will be deemed to be engaged in farming operation if, in the capacity of owner, lessee or tenant of a farm, he actively participates personally or through an agent to a substantial degree in the management or conduct of the farming operations on any farm land. Subject to certain limitations, loans may be made to special classes of applicants such as executors and administrators, trustees, guardians, partners and farming corporations.

To be acceptable security for a loan a property must meet each of the following minimum standards:

1. It must be sufficiently desirable to be readily salable or rentable under normal agricultural conditions.

2. It must be sufficiently durable to maintain satisfactory production during the loan term specified.

3. It must have sufficient stability of value to assure that on a loan that would be proper to a typical owner of the property the bank could recover its investment should the property be foreclosed.

4. Under typical operation it must be capable of producing sufficient normal agricultural earnings to pay farm operating expenses, including taxes and other fixed charges, maintain the property and meet family living expenses and installments on a loan that would be proper to a typical operator, provided that where income from dependable sources other than farm earnings is available to a typical operator, such income may be relied upon to meet loan installments and family living expenses including that part of the taxes, insurance and maintenance costs chargeable to the dwelling.

The latter part of item 4 of the security standards permits loans to be made on part-time farms. Many Federal land bank loans are made on such properties.

Appraisal

The appraiser is a man of broad farm experience and special training in valuing farms. To do this job properly he must be open minded and impartial. He makes a careful examination of the farm. He goes over the farm looking carefully for both good and bad features and

APPRAISER'S REPORT

TO THE FEDERAL LAND BANK OF LOUISVILLE

Bureau of the Budget
Form No. 108-R019.1

Federal Land Bank Association of Springville (CITY OR TOWN) Indiana (STATE) Application No. 051525

I have made a personal examination of and identified the property described in above numbered application made by Ned and Mildred E. Worth of Rt. #3, Mayberry, Indiana for a loan of $ 16,000 and report as follows:

A. LOCATION, TYPE, AND QUALITY OF FARM

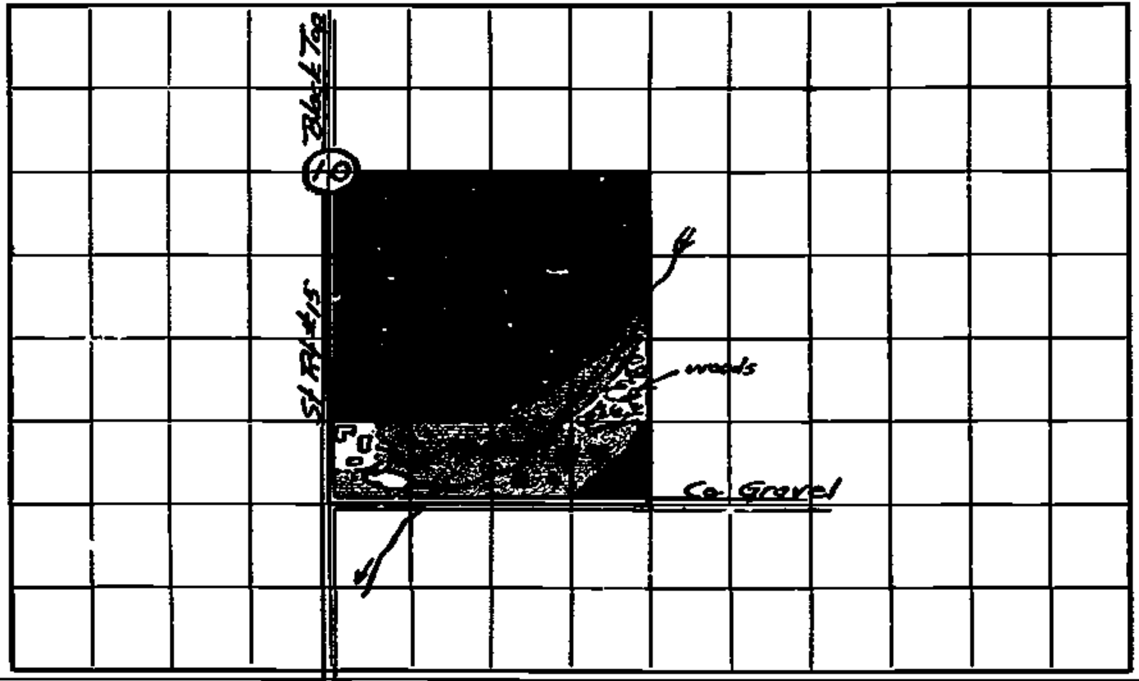
1. State Indiana County Penn Civil District or Section 10 Township Davidson Range 12W Total Acres 160
2. The farm is located 3 miles South (DIRECTION) from Mayberry (NEAREST TOWN) 12 miles North (DIRECTION) from Springville (COUNTY SEAT)
3. Farm is on State Road #15 blacktop (KIND, NUMBER, AND CONDITION OF ROAD) miles ____ (DIRECTION) from nearest highway ____ (GIVE NUMBER AND TYPE) Type of farming
4. in community is grain & livestock Conveniences available are (✓) ✓ ✓ ✓ ✓ ✓ (R.D., SCHOOL BUS, MILK ROUTE, POWER LINE, TELEPHONE, ETC.)
5. This farm is not (IS-IS NOT) in ____ (NAME) drainage or levee district.
6. Adequacy of drainage mostly natural Overflow hazards none
7. Adequacy of water supply (describe) deep well and pressure system, pond and small stream
8. A comparison of this farm with the average in the community is: Location above;
9. soils equal; Improvements equal; General desirability and salability equal
10. The general condition of farm is good (EXCELLENT, GOOD, FAIR, POOR); improved (BEING MAINTAINED, IMPROVED, NO CHANGE, DEPRECIATING—DISCUSS)
11. The farm is a class C (A-B-C-D-E) farm. It is in a class 3 (1-2-3-4-5) area. Land is not (IS-IS NOT) in a mineral area. (Discuss in Par. D)

B. PURCHASE DATA OF FARM

1. Applicant acquired this farm 1957 (YEAR) by Inheritance and purchase with this loan (PURCHASE OR INHERITANCE)
2. The purchase price was, without personal property, $ 32,000; with personal property - $ -
3. Cash payment $ 9,600 Changes since purchase (describe)
4. Contract $
5. Mortgage $ 16,000
6. Trade Inherited $ 6,400
7. TOTAL $ 32,000
8. Remarks

C. PLAT

1. The legal description given in the application is (IS-IS NOT) correct. Indicate corrections, if any, on plat and explain in remarks.
2. Extreme care should be used to ascertain location of corners if buildings are close to line. Indicate points of compass and show scale of map. Designate section number at section centers.



D. DESCRIPTION OF BUILDINGS

No. and Kind	Rooms	Size	Type of Construction	Type of Foundation	Type of Roof	Condition-Improvements and Adaptability to Probable Use for the Next Few Years. Also Any Other Features That Enhance or Reduce Salability, Including Conformity with Community Standards	*Value For Insurance Purposes
1. Dwelling	8	32 x 40 14 x 18L	frame	conc.	asb. Sh.	Bath, basement, new furnace, kitchen cabinets, modern	10,000

Int. on short term credit	$ 60	$
Total Expenses	$5,530	$2,070
Net Return	$3,354	$1,589

H. VALUATIONS AND ACCEPTABILITY

Normal agricultural value of farm $ 25,000

Normal market value of farm $ 25,000

Present market value of farm $ 32,000

1. Consideration has been given to total taxes, O&M, and B&I charges of $ - per acre and project debt liability of $ - against this land.
2. Any shortage in the acreage of this farm that may be developed upon examination of the title and verification of the plat which does not exceed 5 percent of the total acreage shown in my report and which is not caused by the exclusion of a specified part of the property will not affect my estimate of the normal agricultural value.
3. This property is (IS-IS NOT) satisfactory security for a loan not to exceed - years subject to the following requirements being fulfilled: none
4. Without the foregoing requirements being fulfilled the normal agricultural value of this property is $ - , it is a class - (A-B-C-D-E) farm, and it - (IS-IS NOT) satisfactory security for a loan not to exceed - years.

I. REMARKS (Explain any unusual features not sufficiently covered elsewhere. If security is not acceptable or if the term is limited, give reasons.)

This farm is located in an area of fair to good farms. Cropland is in good state of productivity with few low spots subject to freezing out when in winter wheat. Adequately fenced and reflects a good type of operation, with property being improved. Stream through pasture leaves some fields odd shaped. Buildings are in good condition and provide good facilities for operation of farm. Well located on good highway.

FLB 4-201-B

REPORT AND RECOMMENDATION OF

Federal Land Bank Association of Springville, Indiana

Name of applicant Ned and Mildred E. Worth Application No. 051525

This recommendation is based on the identical property described in the accompanying signed application.

A. APPLICANT:

Farming experience and/or education farmed all life

Ability as a farm and business manager Good, hard worker, manages well

Character (moral risk) Good Disabilities None

Credit risk (reputation for paying obligations) Excellent

The financial statement in application (does-xxxxxx) reflect applicant's true condition. (If not, explain:)

State plan for financing or refinancing balance, if any, of indebtedness and/or requirements:
Has arranged for PCA loan

B. REMARKS:

Elaborate on any special circumstances and other facts and/or conditions influencing your recommendation:
This is an attractive farm with good rentability and salability. Applicant has cooperative family, oldest boy good help in fields and with livestock. He inherits 1/5 interest in this farm. Will supplement proceeds of this loan with PCA loan of $4,000 on livestock and equipment and from salable bonds he owns. He has made very good progress as a tenant on this farm. Progressive and frugal.

C. RECOMMENDATION:

Based upon an investigation of the security, its normal value, durability and stayability; and the solvency, character and qualifications of the applicant, I recommend a Federal land bank loan of $ 16,000 for 20 years.

Date August 6, 1957

W. W. French
Investigator

ACTION OF LOAN COMMITTEE

We, the undersigned, being all the members of the Loan Committee of the above named Federal Land Bank Association who participated in the consideration of the application referred to herein, having made or caused to be made such investigation of the applicant and the security offered as is deemed necessary, do hereby agree that a Federal land bank loan of $ 16,000 for 20 years, including -0- years deferment of principal, should be made on equal semi-annual payment plan, with a requirement that a minimum amount of $ 18,000 insurance be carried. Other requirements, if any:

We hereby elect said applicant to membership in this association.

Any shortage in the acreage of this farm that may be developed upon examination of the title and verification of the plat which does not exceed 10 percent of the total acreage shown in this report and which is not caused by the exclusion of a specified part of the property will not affect our conclusions.

No member of this Committee or any person who made the investigation is interested directly or indirectly in the loan sought by the applicant.

Joe Knorr Frank Going Charles Wells
(All members of the Loan Committee must sign)

Capital stock proceeds issued in connection with Loan Number(s) - , being refunded, (xxxxxx should not) be applied on final payment of this loan.

Date August 8, 1957

sampling the soil with an auger where necessary. He inspects the buildings, fences, erosion hazards and soil fertility. He checks location of schools and churches and considers general community standards. He knows how farms have sold in the area where he works and is qualified to determine accurately the agricultural and market value of the property.

He estimates:

1. Long-time average crop yields on this farm. He must allow for the good and bad years, the possibility of erosion and similar factors.

2. The average value of the crop that will be grown each year on the farm or the value of the livestock which will be produced. In figuring this he estimates yields, the probable acreage of each crop and long run, "normal" prices. These prices have been determined by the Farm Credit Administration after a study of prices over a period of more than 100 years. They represent the best thinking of leading economists in the country. They take account of wide fluctuations in prices such as we have had in the past and probably will have in the future.

3. The average net income which will be received from the farm by a typical operator, and by the landlord if it is rented. Allowance must be made for the many things that will happen to a farm during a period of 20 to 35 years during which a loan might run. The applicant might die, he might decide to sell the farm, or he might move to town and rent the farm. It is, therefore, necessary that he determine the average net income produced by a typical operator rather than the operator presently on the farm.

When the appraiser has completed his inspection and completed his estimates, he sets down what he thinks the farm is worth (its normal agricultural value). He checks this value with his estimated net income to see if the net income represents a fair return on such value. He also compares it with local farm sales over recent years. His final decisions and recommendations are set out in his appraisal report. The appraiser's report on Mr. Worth's application is reproduced on pages 43 and 44.

Amount that may be Loaned

A Federal land bank loan may be made for an amount up to 65 percent of the normal agricultural value of the farm as set by the appraiser. Cost of the membership stock in connection with the loan may be added to this 65 percent. Less than 65 percent of the normal agricultural value is loaned where the applicant's financial position or the condition or type of farm does not warrant a full loan.

In the case of our friend Mr. Worth, the appraiser set a normal agricultural value of the security at $25,000. The Federal land bank loan which was closed, therefore, represented nearly 65 percent. Federal land bank loans are made in multiples of $100.

The law does not limit the amount the Federal Land Bank of Louisville may lend a single borrower except for the limit imposed by the normal agricultural value of the farms he can offer as security. It is probable that no individual in the four states served by the Louisville bank owns enough farm land to qualify for a loan greater than what the bank could lend.

Completing the Loan

After the appraiser's report, credit report and application bearing the recommendation of the association's loan committee have been approved by the bank, the applicant furnishes satisfactory evidence that he has a clear title to the property. This evidence may be an abstract of title, a title certificate by an approved attorney, or title insurance. Attorneys for the bank examine the title evidence. If it is found acceptable the closing papers for the loan are prepared. A draft for the loan proceeds to be disbursed goes to the association manager with the closing papers. Papers the borrower must sign consist of a note as evidence of the debt and a real estate mortgage securing that note. The real estate note executed by Mr. and Mrs. Worth and the mortgage executed by Mr. and Mrs. Worth are reproduced on pages 48, 49 and 50. When the note, mortgage and other necessary papers have been signed properly, the manager of the association issues checks to the proper payees to accomplish the purpose for which the loan was made.

The only expense incurred by the borrower in securing a loan from the Federal land bank is the cost of his title evidence and recording the mortgage. He has been charged no application or appraisal fee.

Source of Funds

Because the word "Federal" appears in its name some people suppose the Federal land bank is a Government agency, lending Government funds. This is not true. The Federal land bank system is a cooperative owned by farmers who have obtained Federal land bank loans. No one else shares in the ownership of the Federal land banks.

Money which Federal land banks lend through Federal land bank associations is obtained from the investing public by the sale of consolidated farm loan bonds. These bonds are issued jointly by the 12 Federal land banks in the United States. They are secured by first mortgages on the farms owned by the Federal land bank association members.

These consolidated bonds are sold as are Federal Intermediate Credit Bank debentures and Bank for Cooperatives debentures, through a fiscal agent employed by the 37 Farm Credit banks.

Repayment of the Loan

When Mr. Worth made his second loan ($27,000) to purchase the additional 80 acres he chose the equal payment plan of amortization. He also selected a repayment schedule with annual installments due February 1. Since he had a

$ 27,000.00

February 20, 19 62

PROMISSORY NOTE

(Standard Form)

For Value Received, the undersigned, jointly and severally, promise to pay to the order of THE FEDERAL LAND BANK OF LOUISVILLE at its offices in the CITY OF LOUISVILLE, KENTUCKY, the principal sum of ----TWENTY SEVEN THOUSAND---- Dollars, on an amortization plan, with interest from date at the rate of 5½% per annum on the whole amount of said principal sum remaining from time to time unpaid, as follows: A preliminary interest payment on the first day of May, 19 62, ten semiannual interest payments on the first days of November and May in each year, and thereafter forty-nine semiannual payments of principal and interest aggregating $ 1,000.10 each, on the first days of May and November of each year and a final payment of principal and interest aggregating $ 1,000.17 on the first day of May, 19 92, unless this note shall be matured sooner by additional payments on account of principal.

We further promise and agree to pay reasonable attorney's fees. This instrument is negotiable and payable without any relief whatever from valuation or appraisement laws.

The drawers and endorsers, and all parties to this instrument, severally waive presentment for payment, protest, notice of protest, notice of non-payment of this instrument, demand and all legal diligence in enforcing collection. The right is expressly reserved to the holder hereof to extend the time of payment of this instrument or of any installment herein provided.

This note is secured by a mortgage of even date herewith, executed by

----NED WORTH and MILDRED E. WORTH, husband and wife----

to THE FEDERAL LAND BANK OF LOUISVILLE, on land in Penn County, Indiana, which is the first lien on the property therein described.

If any default be made in any of the payments provided for in this note, or in case of failure to perform any or either of the terms or conditions of said mortgage, the whole indebtedness evidenced by this note, together with all interest on same shall, at the option of THE FEDERAL LAND BANK OF LOUISVILLE, its successors, or assigns, become due and payable at once without demand or notice, notice of the exercise of such option being hereby expressly waived, and any such defaulted payment or payments shall bear simple interest from the date of such default until paid at the rate of six per centum per annum.

The maker or makers of this note shall have the option of making, at any time, additional payments for the reduction of the principal or the payment of the entire principal. Such additional payments shall not reduce the installments of principal provided herein, but shall operate to mature the loan at an earlier date.

In accordance with the terms and conditions of the Federal Farm Loan Act, the undersigned association hereby endorses and becomes liable for the payment of the within note and the mortgage or mortgages given to secure said note.

Federal Land Bank Association of Springville

By W. W. French
Manager

This note covers the real estate loan obtained by the Worths to buy the additional 80 acres. Note the five-year deferment of principal. Note also the prepayment privilege clause in the last paragraph just above the Worths' signatures.

postponement of principal for five years, his annual installment for each of the first five years amounted to only $1,485.

Ordinarily his first payment would have been due the sixth year and would have amounted to $2,012.83. Of this, $527.83 would have been applied on the principal and $1,485 would have been interest. After paying two regular installments Mr. Worth found that his gross income was somewhat higher than usual because of favorable crop conditions and favorable livestock prices. His son was now home from college and helping him. This had reduced his operating expenses so that his net income was higher than he had been receiving. Because he had extra money for which he had no immediate need, he decided to pay an extra $2,000 on the principal of his loan. While this reduced his total debt it did not alter his repayment schedule except to shorten the total life of the loan. The following year Mr. Worth sustained a rather serious illness which proved expensive. At the same time adverse weather greatly reduced his crop production. He found himself short of funds to meet his installment. He talked the situation over with his association manager. It was agreed that having made advance payments on the principal he would be required at this time to pay only the interest while the principal portion of the installment would be deferred until final payment.

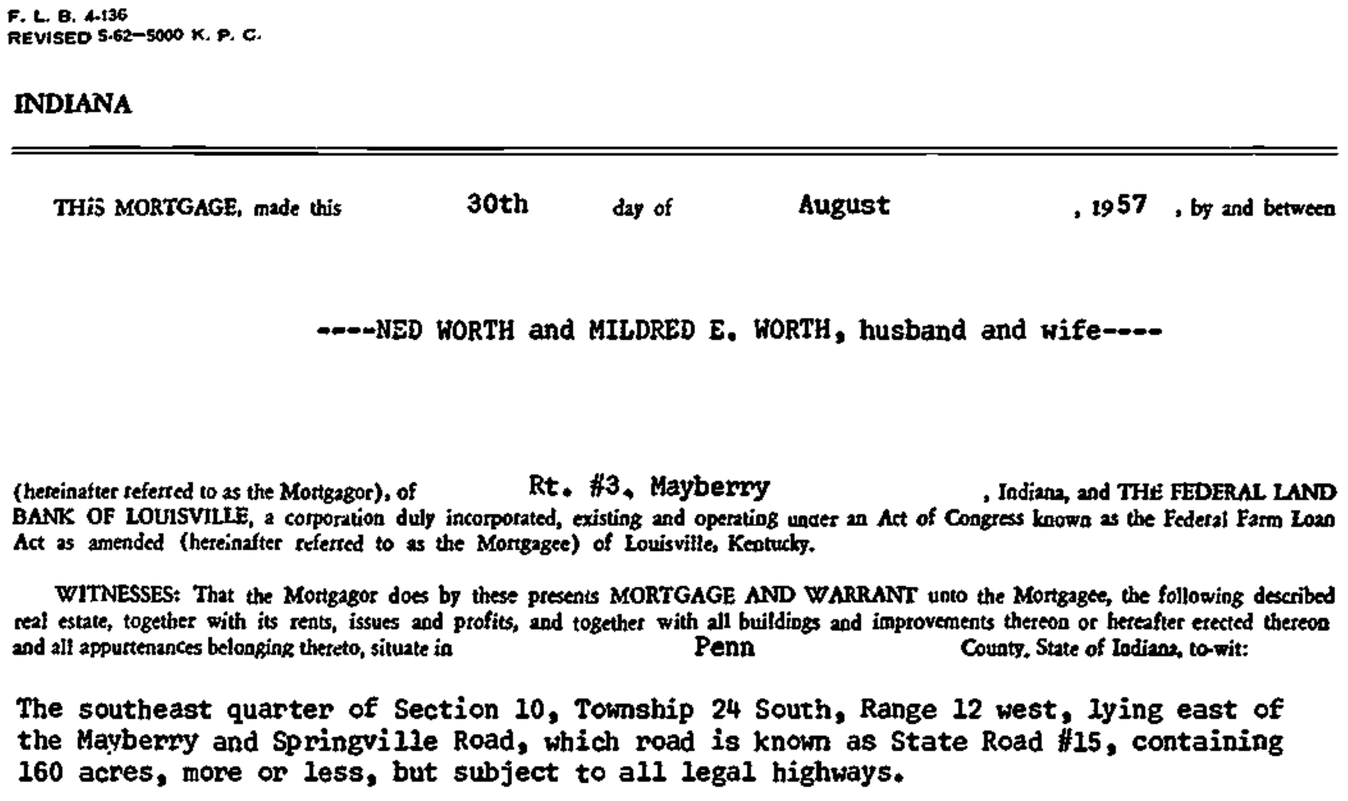
Generally speaking Mr. Worth has been a quite successful farmer. He has had no difficulty in making the payments on his loan. Not all farmers plan as well and are as frugal as Mr. Worth and his family. Nor are all so fortunate as the Worth family. A satisfactory lender must be able to help borrowers who at times may have difficulty in meeting their loan payments. Suppose a borrower is unable to meet a payment on time but is acting in good faith, doing his honest best and will soon have the money to pay. In such case his Federal land bank association will grant him an extension of time. Should his trouble be of a longer nature, such as drought, low prices or other misfortune over which the borrower has no control, a more formal method of giving more time for payment may be followed. Here are several such methods:

1. Written extension agreement.
   This merely gives the borrower more time to pay the delinquency and sets a new date for him to pay it at a time he expects to have money.

2. Deferment of principal.
   Under this form the borrower pays only interest for a certain period and then begins with the full installments as before. This results in prolonging the life of a loan but serves to carry him forward to a time when his income is expected to be better.

3. Reamortization.
   This form is necessary when the borrower cannot meet his loan installments as they mature and has little prospect of getting in a position to do so. If re-arranging his amortization schedule to call for smaller payments would enable him to keep the loan current, then the balance of his loan is reamortized

Real Estate Mortgage



F. L. B. 4-136
REVISED 5-62—5000 K. P. C.

INDIANA

THIS MORTGAGE, made this 30th day of August , 1957 , by and between

----NED WORTH and MILDRED E. WORTH, husband and wife----

(hereinafter referred to as the Mortgagor), of Rt. #3, Mayberry , Indiana, and THE FEDERAL LAND BANK OF LOUISVILLE, a corporation duly incorporated, existing and operating under an Act of Congress known as the Federal Farm Loan Act as amended (hereinafter referred to as the Mortgagee) of Louisville, Kentucky.

WITNESSES: That the Mortgagor does by these presents MORTGAGE AND WARRANT unto the Mortgagee, the following described real estate, together with its rents, issues and profits, and together with all buildings and improvements thereon or hereafter erected thereon and all appurtenances belonging thereto, situate in Penn County, State of Indiana, to-wit:

The southeast quarter of Section 10, Township 24 South, Range 12 west, lying east of the Mayberry and Springville Road, which road is known as State Road #15, containing 160 acres, more or less, but subject to all legal highways.

This Mortgage is given to secure the payment of a note of even date herewith executed and delivered by the Mortgagor to the Mortgagee in the principal sum of ----SIXTEEN THOUSAND---- Dollars with interest at the rate stated in said note, said principal being payable on an amortization plan, the last installment being due on the 1st day of November , 19 77, without any relief whatever from valuation or appraisement laws, and the Mortgagor further promises and agrees to pay reasonable attorney's fees

The Mortgagor covenants and agrees (1) to pay, when due, the several installments of interest and principal of the debt secured hereby, in accordance with the terms of this mortgage and of the promissory note hereby secured, and all taxes, liens, judgments or assessments lawfully against said property; (2) to use the proceeds of the loan secured hereby solely for the purposes specified in the Mortgagor's application for said loan; (3) to keep said property insured to the satisfaction of and under policies deposited with the Mortgagee, insurance proceeds, if not used in accordance with applicable regulations for reconstruction of buildings destroyed, to be applied on the indebtedness hereby secured as the Mortgagee may elect; (4) to maintain improvements in good repair, to refrain from the commission of waste, to cultivate said premises in a good husbandmanlike manner and not to cut, remove or permit the cutting or removal of timber therefrom except for domestic use; (5) to pay all expenses incurred by the Mortgagee in securing the original or supplemental abstracts of title and to pay all court costs, expenses and attorney's fees incurred by the Mortgagee in defending and enforcing the lien of the within mortgage; and any such costs, expenses or fees paid by the Mortgagee shall become a part of the debt secured hereby; (6) that if the Mortgagor fails to pay when due any tax, lien, judgment, assessment, court cost, expenses and attorney's fees or for any abstract of title, or to maintain insurance as hereinbefore provided, the Mortgagee may do so, and all amounts so paid and defaulted payments of principal and interest shall bear interest from date of payment or default at the highest rate authorized by law not exceeding six percent (6%) per annum and be secured hereby; (7) that there are hereby specifically assigned to the Mortgagee all rents, royalties, revenues, damages and payments of every kind at any time accruing under or becoming payable on account of any and all oil, gas, mining and mineral leases, rights or privileges of any kind now existing or that may hereafter come into existence covering the said property, or on account of any condemnation proceedings or other seizure of all or part thereof under the right of eminent domain or otherwise, and the Mortgagee, at his option, may collect and receive the same as the same become due and payable, and all moneys received by the Mortgagee by reason of this assignment may be applied, at the option of the Mortgagee, upon any unpaid amounts of principal and/or interest, whether or not the same shall be due and payable: provided that nothing herein shall be construed as a waiver of the priority of the lien of this mortgage over any such lease, rights or privileges granted subsequent to the date of this mortgage; (8) that the Mortgagee may extend and defer the maturity of and renew and reamortize said indebtedness, release from liability any party liable thereon, and release from the lien hereof portions of said property, without affecting the priority hereof or the liability of the Mortgagor or any other party for the payment of said indebtedness, all such extensions, deferments, renewals, and reamortizations to be secured hereby; (9) that if the Mortgagor shall sell the premises and the purchaser thereof does not assume and agree to pay the indebtedness secured hereby, or if the Mortgagor defaults in the payment of said indebtedness, or with respect to any warranty, covenant, or agreement herein contained, then, at the Mortgagee's option, the entire indebtedness secured hereby shall forthwith become due and payable and bear interest at the highest rate authorized by law not exceeding six percent (6%) per annum, and the Mortgagee shall have the right to enter upon and take possession of said premises and to foreclose this instrument; (10) that in any foreclosure action or other proper proceeding the court shall, at the request of the Mortgagee, appoint a receiver for said premises with the usual powers of receivers in like cases; (11) that the omission of the Mortgagee to exercise its option upon any default as aforesaid, or to exercise any other option or right hereunder, shall not preclude it from the exercise thereof at any subsequent time or for any subsequent default; (12) that the covenants, agreements and provisions herein contained shall be binding upon and inure to the benefit of the heirs, devisees, personal representatives, grantees, successors and assigns of the respective parties; (13) that wherever in this mortgage either the Mortgagor or the Mortgagee is named or referred to, such naming or reference includes all of the class and the assigns, heirs, personal representatives, grantees, or successors of either, as the case may be; and that the pronoun as used herein in the third person singular, includes the person, number and gender appropriate to the first designation of the parties.

THE CONDITION OF THIS MORTGAGE is such that if the Mortgagor shall well and truly make all payments called for in said note in accordance with its terms, and shall perform and comply with each and all the covenants, conditions and agreements, either in said note or in this mortgage contained, then this mortgage shall be null and void, otherwise the same shall remain in full force and virtue in law.

IN WITNESS WHEREOF, the Mortgagor has hereunto set his hand, the day and year first written above.

Before me, the undersigned, a Notary Public in and for said State and County, this day personally appeared

----NED WORTH and MILDRED E. WORTH, husband and wife----

who acknowledged the execution of the foregoing instrument, as their voluntary act and deed.

Witness my hand and seal this 30th day of August , 1957.

My commission expires April 4, 1959.

Betty Houston
Notary Public

over a longer period resulting in smaller payments. This plan frequently helps a borrower who has sold a portion of his farm thus reducing his earning capacity as well as the unmatured balance of his loan.

If the Loan Cannot be Paid

Any long term mortgage lender that does much business may have cases where the borrower cannot or will not repay the loan. In such cases foreclosure is the last resort. The rule followed by the Federal land bank is that no borrower will be foreclosed if:

1. He is doing his honest best.
2. He is applying the proceeds of production over and above necessary living expenses to his primary debts.
3. He is taking proper care of the farm.
4. He has the capacity to work his way out of a reasonable burden of debt under normal conditions.

THE FEDERAL LAND BANK
OF LOUISVILLE

Mortgage

Received for record on the 30th day of August 19 57, at 11 o'clock A M, and recorded in volume 20 of Mortgages, on pages 484-485

Luke Ballard

Recorder Penn County, Indiana.

The Recorder will, when this mortgage has been recorded, please return it promptly to THE FEDERAL LAND BANK OF LOUISVILLE, Louisville, Ky.

CHAPTER IV

FINANCING FARM COOPERATIVES

People have found that there are some things which they can do better by working together than by working separately. Such working together is called cooperation. Among farmers cooperation varies from simple tasks, such as helping each other in making hay and combining grain, to much more complicated arrangements, where groups of farmers own and operate grain elevators, creameries, farm supply stores, petroleum bulk plants, and other business concerns. The preceding chapters of this book are concerned primarily with financing for the individual farmer. This present chapter will deal with principles and practices used by farmers in financing the businesses they own cooperatively.

What Is a Cooperative?

Any group of farmers working together for their mutual interest may be considered a cooperative, or a "co-op" as we often call it in our conversation. If they engage in buying and selling and wish to own property on a cooperative basis, they should incorporate under the laws of their state. There are also Federal laws that relate to cooperatives. While this is not a legal definition of a cooperative,* we may use this one:

(1) A farmer cooperative is an association of agricul-

Through county cooperatives such as this farmers market their grain as well as buy a wide variety of farm supplies.

---

*From a Federal standpoint, there is no all-inclusive statutory definition of an agricultural cooperative. A generally accepted definition, however, is that given by the Agricultural Marketing Act and its revisions governing loans made by the banks for cooperatives.

tural producers that operates for the mutual benefit of its members.

(2) The value of the business done with members must be at least as great as that done with others.

(3) The association must use the one-man, one vote plan, or limit dividends on capital stock to not more than 8 percent.

Why Have a Cooperative?

The main reason for having "co-ops" goes back to the familiar principle that "in unity there is strength." Farmers have found that their position is much stronger when they act together than when each acts alone. Let us see why.

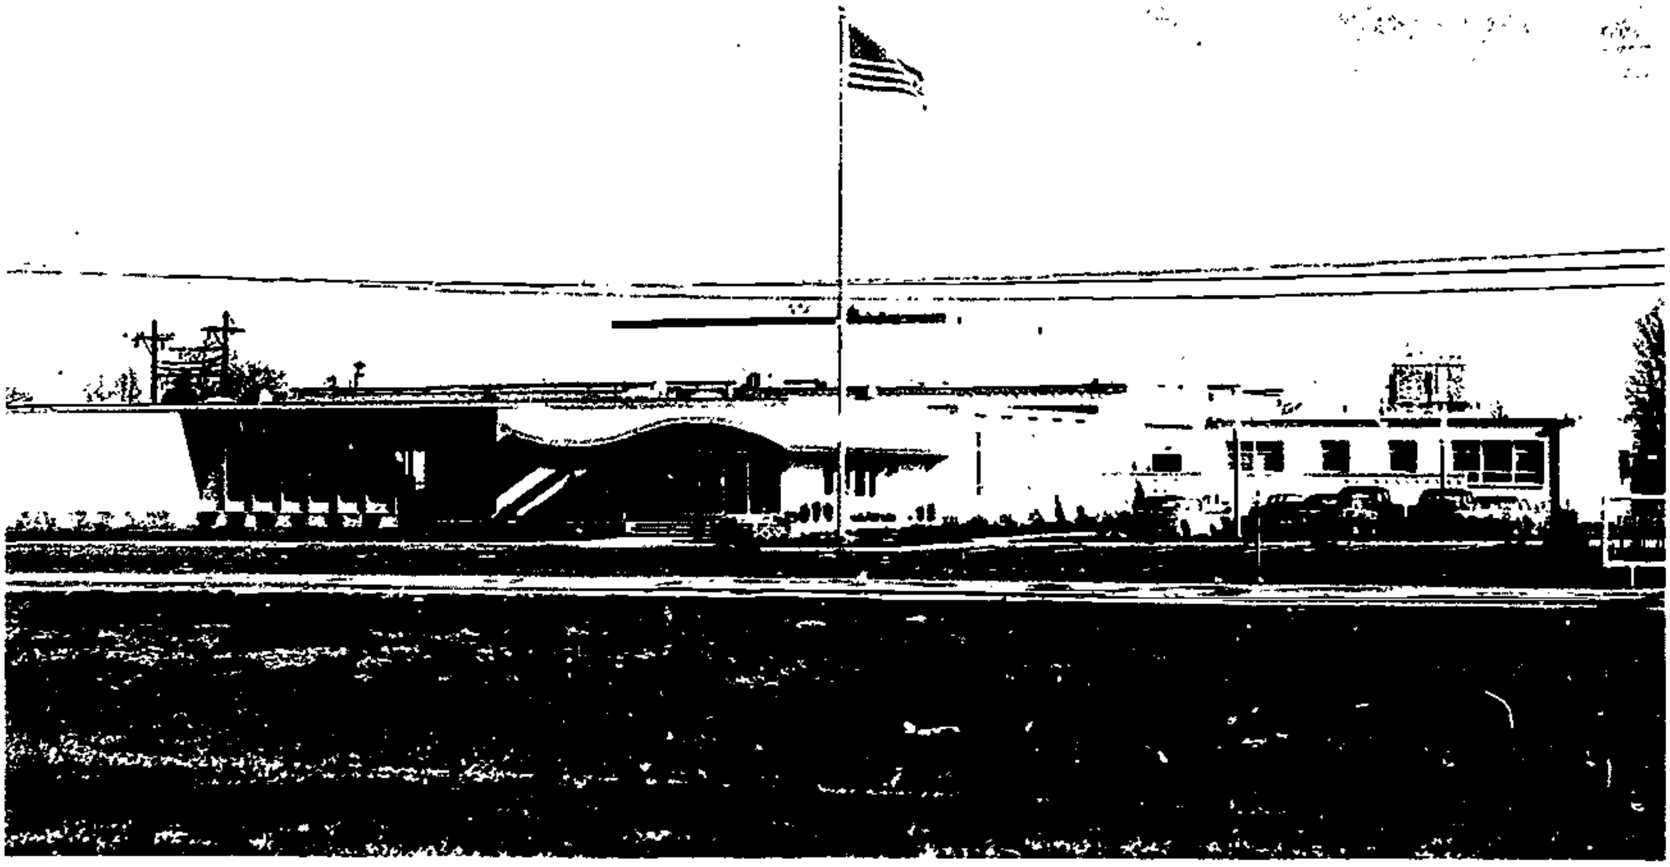
In marketing his products, purchasing supplies, or getting credit and needed services, the farmer deals with a highly organized business world. By himself, a farmer cannot bargain to advantage with a big corporation, especially when some of his neighbors may be competing with him. When he acts alone, the farmer sells his products at wholesale and buys his needed goods at retail.

Now suppose he and his neighbors join together in a "co-op." They strengthen their bargaining power when they avoid bidding against each other. Furthermore, by selling together, they learn sooner what customers want. By meeting these wishes through quality production, proper grading and packaging, they increase their own profits. They also gain similar advantages by buying together the supplies of goods they need. Through well managed cooperatives, farmers are more sure of getting top prices for their products and of paying no more than actual worth for the supplies and services they buy.

Although farmer "co-ops" are probably the best known, many other groups also use the cooperative form of business organization. The Associated Press is a cooperative news gathering agency, owned by most of the daily newspapers in the United States. The Railway Express Agency is another cooperative, owned by the nation's railroads. Mutual insurance companies operate on cooperative principles. Many groups of retail merchants, such as hardware dealers, grocers, and department stores, belong to cooperative wholesale organizations. They do this to pool their buying power and get the benefits of buying merchandise in large quantities. This gives them a better chance to compete with larger firms, such as chain stores.

Most cooperative organizations are incorporated. The basic differences between an ordinary corporation and a cooperative corporation are below. Both types of business organizations have been important in developing the American system of free enterprise.

Item	Ordinary Corporation	Cooperative Corporation
A. Purposes	To make money for stockholders as investors.	To benefit users. To make users' own businesses more profitable.
B. Control	Stockholders control in proportion to stock ownership. Usually one vote for each share of common stock.	Usually one-man, one vote or may control on basis of patronage.
C. Distribution of net earnings	Dividends on stock are returned to stockholders in proportion to stock owned.	Nominal rate of return on capital with remainder distributed on basis of patronage.



This large dairy cooperative bargains for its farmer-members and processes milk in peak seasons.

Cooperative Principles

The fundamental principles in the organization and operation of a cooperative can be traced back more than 100 years to ideas adopted by the Equitable Pioneers Society at Rochdale, England, in 1844. These fundamental principles are:

1. Open membership and ownership without regard to race, nationality, politics, or religion.
2. Democratic control, each member has one vote.
3. Limited returns on capital, and return of gains to members through patronage refunds.
4. Regular provision of funds for promotional and educational work.
5. Cash trading.
6. Trading at market prices (as opposed to price-cutting methods).
7. Regular provision for the building of substantial reserves.

Methods of Financing Farm Cooperatives

In general, farmers finance their cooperative businesses by using the standard methods of other business corporations. These include common stock, preferred stock, membership fees, bonds, various kinds of certificates, and borrowed capital. However, there is a basic difference. Customers of ordinary corporations supply little, if any, of the capital needed to run those businesses. But most of the money needed to establish and operate a farmer cooperative comes from farmer members who own and use it. Farmer members supply capital for their cooperative in one or more of the following ways:

1. They purchase capital stock or other securities
2. They authorize capital deductions from sales proceeds
3. They permit the cooperative to retain savings and margins.

The proportions of capital that come from each of these sources make up the capital structure of a cooperative. This is often supplemented by borrowed capital, but the financing methods used must be tailor-made to fit each organization. Furthermore, a sound financing program must be based upon continuous planning well in advance of requirements. Among cooperatives, sound financing also depends on an educational program. This program must inform the patron of the activities of the cooperative; it must acquaint him with his responsibility to provide the funds necessary for efficient operation.

In planning the financing for a cooperative, its officers and directors must first figure how much money will be needed for plant and equipment. Next they must decide how much will be needed for operating capital on a year-round basis and how much additional will be needed during busy seasons. When these needs have been determined, the cooperative should aim eventually to get from the members all of the capital needed to finance (a) fixed assets, (b) other assets of a long-term nature, and (c) inventories and receivables in normal or slack seasons. If members can supply these basic needs, the cooperative is in a good position to borrow the funds needed in busy seasons at reasonable interest rates and on desirable terms. Then, if expansion should become necessary or advisable, the cooperative is better able to obtain the necessary financing.

The board of directors (elected by the members) determines the co-op's policies including its use of borrowed capital.

In planning its financing a cooperative should try to establish and maintain a strong working capital position. This means that the current assets should substantially exceed current payables. Current assets consist of cash, accounts receivable, inventory, and other items which would normally be converted into cash within a relatively short time. This is especially important to a cooperative in which inventories are a major factor. Without adequate working capital, a cooperative may find that it cannot pay its bills soon enough to obtain the maximum discounts which are allowed or to purchase needed supplies and merchandise at favorable times. The credit standing of a cooperative, as of any other business, is determined to a great extent by its working capital position.

Capital Structure

There are two basic types of capital set-up used by cooperatives — permanent and revolving. It may use one or both. Many combinations of the two are found in successful use today. This pattern or method of getting its capital is called its capital structure. Each type has certain advantages and certain disadvantages. Therefore, the capital structure selected by any cooperative should be the one that best fits the conditions and circumstances under which it will operate.

1. *Permanent Capital*

The permanent capital of a cooperative consists of funds invested by members and operating margins retained by the cooperative on a permanent basis. For these invested or retained funds the co-op usually issues preferred or common stock certificates; it usually pays dividends of not more than 6 percent a year on this stock. When this method of financing is used, the net savings for each year can be paid in part as current cash patronage refunds. Then the co-op issues stock or permanent certificates for the balance, distributing this stock on a patronage basis. Most cooperatives have found that some permanent capital is desirable, at least to the extent of their investment in fixed assets. Some cooperatives use the permanent capital method for all of their capital needs. The biggest disadvantage of this method is that each member does not contribute capital in proportion to his use of the cooperative. Furthermore, cooperatives usually find it difficult to sell securities unless cooperative experience in their territory has been good. A considerable number of cooperatives that finance their organization on this basis have sold sizable amounts of capital stock to outsiders. Many cooperative leaders discourage this arrangement: they feel it tends to weaken the interest the members have in their own cooperative. It has been used to advantage where local townspeople and others desire to invest in the cooperative because they feel it is an asset to the community and desire to bring trade to their town.

2. *Revolving Capital*

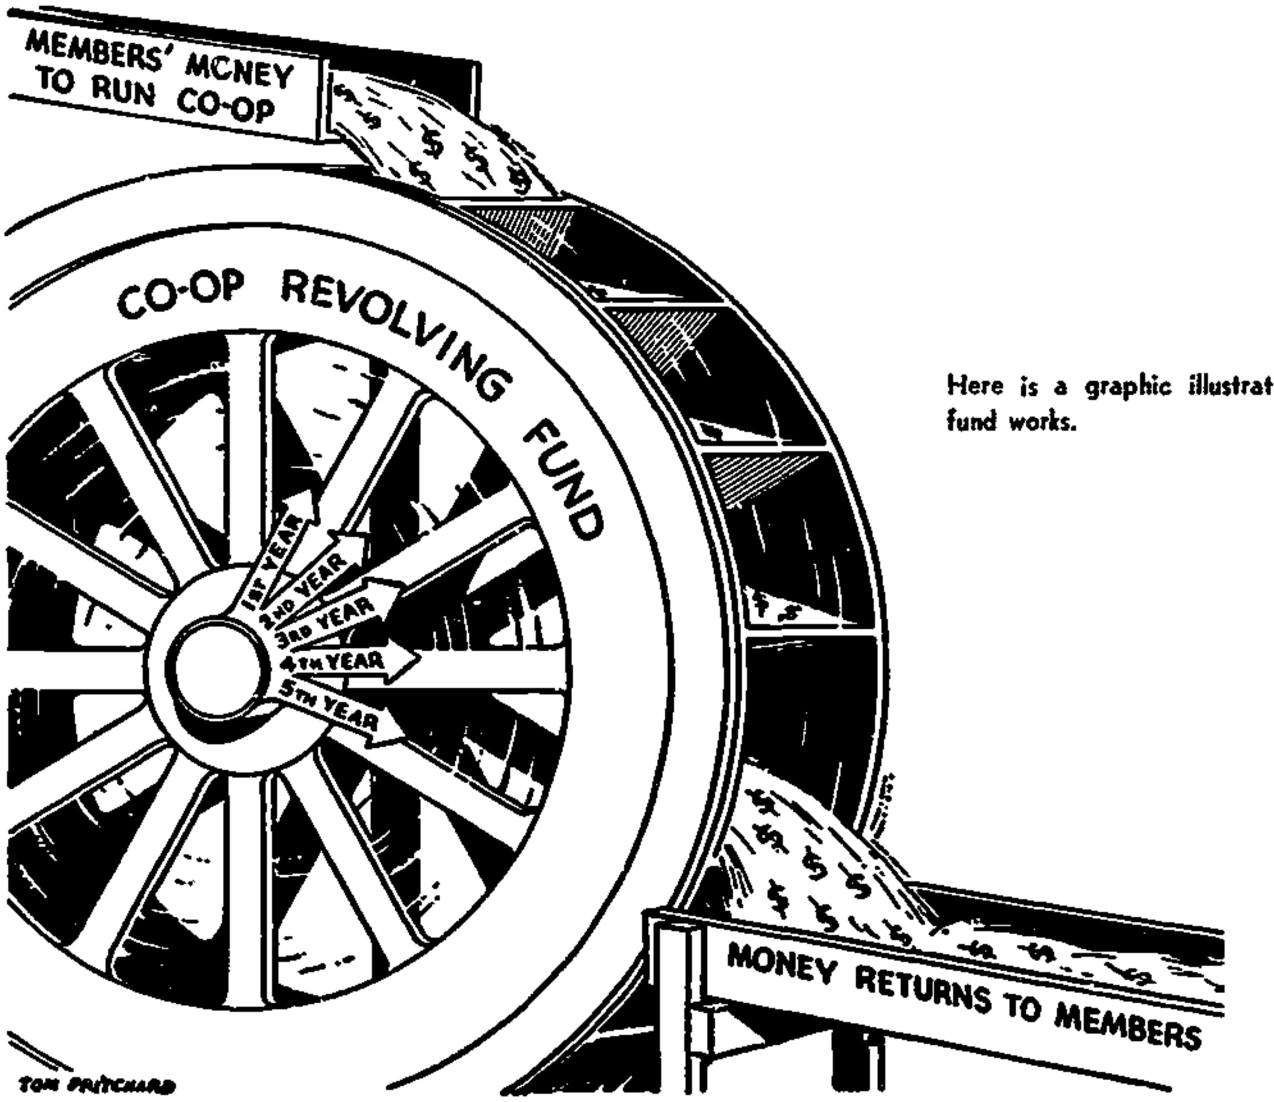
This method of building up and maintaining adequate funds for the operation of a business is a cooperative way of doing business. Many people regard it as the most effective plan for raising capital, maintaining cooperative practices, and keeping the control of an association in the hands of its current members and patrons.

With this plan of financing, funds are built up over a period of several years in two ways: (1) the co-op deducts a share of proceeds of farm products marketed for patrons; or, (2) it retains in the business net savings which are earned. Patrons are credited with their share of the deductions and net savings retained. When the manager and the board of directors believe that sufficient capital has been accumulated, they may retire the oldest deductions out of current deductions and savings. Thus, their capital keeps "revolving." In many cooperatives the patron receives shares of stock or certificates of indebtedness for the amounts retained by the cooperative. In others he receives only a notice that a certain amount of money has been credited to his revolving account. Where this revolving capital method is used:

a. Members and patrons provide financing in proportion to their patronage (i.e., the amount of business each does with the "co-op.")

b. Inactive patrons are systematically eliminated from membership.

c. Adjustments to changing financial needs of the cooperative can be made by increasing or decreasing the amounts retained or by lengthening or shortening the period of rotation.



Here is a graphic illustration of how the revolving fund works.

However, the revolving method of financing, when used alone, has certain disadvantages:

a. Patronage refunds in the form of certificates are less desirable than cash. Book credits, when used, are even less desired by farmers.

b. If the rotation period is lengthened too much to finance expansion of facilities, patrons lose confidence in their business.

In general, this method of financing is best suited to marketing associations and others having a large annual sales volume in relation to total assets and a relatively small investment in fixed assets.

Borrowed Capital

Loans from various sources have a sound place in financing a cooperative. Loans are used by cooperatives (a) to help finance the purchase or construction of facilities, (b) to provide permanent operating capital for inventories and accounts receivable, (c) to finance seasonal activities of marketing farm products, and (d) to finance seasonal increases in farm supply inventories and accounts receivable.

Many cooperatives, in the early stages of their history and during periods of rapid growth, make extensive use of long- and intermediate-term loans to finance fixed assets and provide operating capital. Many other cooperatives have enough membership capital to finance fixed assets and minimum operating capital requirements. They make excellent use of borrowed funds to finance seasonal activities.

Whatever the purpose for which funds are borrowed, it is important that the loan terms be adapted to the cooperative's repayment ability.

There is no fixed ratio between the amount of capital owned by the cooperative and the amount that may be borrowed. As a general rule, though, long-term loans should not exceed the amount of the patrons' investment in the cooperative. Long-term loans are generally repaid in regular periodic payments over a period of years. A cooperative should not borrow, under normal operating conditions, more than it can repay in five to ten years out of savings from operations, or from capital deductions.

Loans to finance seasonal activities are usually on a short-term basis. The cooperative should be able to repay them in full during its slack period.

Sources of Cooperative Credit

There are a number of sources from which cooperatives may borrow. It is a good idea for a cooperative to establish good relations with one or two lending institutions and look to them for loans when borrowed capital is needed. Usually an association is better able to meet its needs for borrowed capital by using only one or two sources than by trying to borrow from many sources.

Farmer cooperatives borrow principally from commercial banks, individuals, insurance companies, other cooperatives, and the banks for cooperatives.

Commercial Banks

Many cooperatives obtain at least part of their financing from commercial banks. In each case the rate of interest and the terms are agreed upon by negotiation between the cooperative and the bank. The rate of interest will depend upon the type of loan, the rates prevailing in the community for similar loans, and the credit standing of the cooperative.

One difficulty that may be met is the size of loan which a commercial bank can make to a single customer. A bank is permitted to lend only a limited percent of its capital and surplus to any one borrower. For this reason, the cooperative may not be able to obtain adequate financing from the local bank if the amount of credit needed is fairly large.

Individuals

Frequently a director or a member will lend funds to his cooperative. Rate of interest and terms are agreed upon and adapted to the particular situation. In the early days of cooperative history, individuals were about the only source of credit cooperatives had. In some communities they are still an important source. As cooperatives have become more firmly established and have improved their financial position, they obtain most of their credit from established lending institutions.

Through the sale of debenture bonds, or certificates of indebtedness with a prescribed rate of interest and a definite due date, numerous cooperatives obtain a considerable amount of financing from individuals.

Insurance Companies

Insurance companies furnish only a small percent of the borrowed capital used by cooperatives; however, they meet a definite need through their willingness in some cases to make long-term loans.

Other Cooperatives

Some cooperatives borrow from regional or federated cooperatives with which they are associated. Some of these loans are obtained for a period of several years to finance operations or expansion. More often, particularly with marketing associations, the loans represent merely advances on farm products awaiting processing and distribution.

Banks for Cooperatives

Because many financially sound cooperatives were unable to meet their needs from already existing lenders, the Congress of the United States in 1933 provided for the establishment of a permanent, nationwide system of 13 banks for cooperatives. This system is comprised of twelve district banks for cooperatives — one in each Farm Credit District, and one central bank for cooperatives located in Washington, D. C. These banks provide credit for agricultural cooperatives at reasonable interest rates, and on terms suited to the special needs of each borrower. Borrowing cooperatives have a part in both ownership and control of this specialized system of credit. In this way they carry the cooperative principle even into their borrowing program.

The 13 banks for cooperatives provide more than half of the credit used by farm cooperatives in the United States. The twelve district banks make both long-term and short-term loans to the individual cooperatives in their district. The Central Bank for Cooperatives participates with district banks in any loans that exceed the lending limits of the district banks.

How the Banks for Cooperatives Function

The general policies for the operation of the entire Farm Credit system, of which the banks for cooperatives are a part, are established by a thirteen-member Federal Farm Credit Board. In addition to the Federal Farm Credit Board in Washington, there is a district Farm Credit board composed of seven members for each of the twelve Farm Credit districts.

Congress passed the Farm Credit Act of 1955, which provides a means whereby the banks for cooperatives will eventually become borrower-owned and controlled. This act provides for three classes of capital stock for each bank for cooperatives:

> Class A stock is owned entirely by the United States Government. It carries no provision for dividends or voting rights. Instead of dividends the banks for cooperatives pay an annual franchise tax for the use of Government capital. The tax amounts to 25 percent of the annual earnings of each bank but not to exceed the cost of such money to the Government.
>
> Class B stock is an investment type stock which carries no voting rights. It provides for dividends of not to exceed 4 percent a year as declared by the district board of directors. Before any patronage refunds may be distributed, at least a 2 percent dividend must be paid on this stock.
>
> Class C stock is voting stock and may be owned only by farmers' cooperative associations. No dividends are paid on this stock.

The Government capital will be retired over a period of years principally from the bank's earnings and by purchase of Class C stock by the borrowers.

Banks for cooperatives operate on a cooperative basis. After paying operating expenses, providing for reserves and surplus, paying the franchise tax to the Government, and paying dividends on Class B stock, any remaining net savings of the bank are distributed to its borrowers on a patronage basis in Class C stock and allocated credits.

When all Class A (Government) stock in the bank has been retired, Class C stock may be retired in the order in which it was issued.

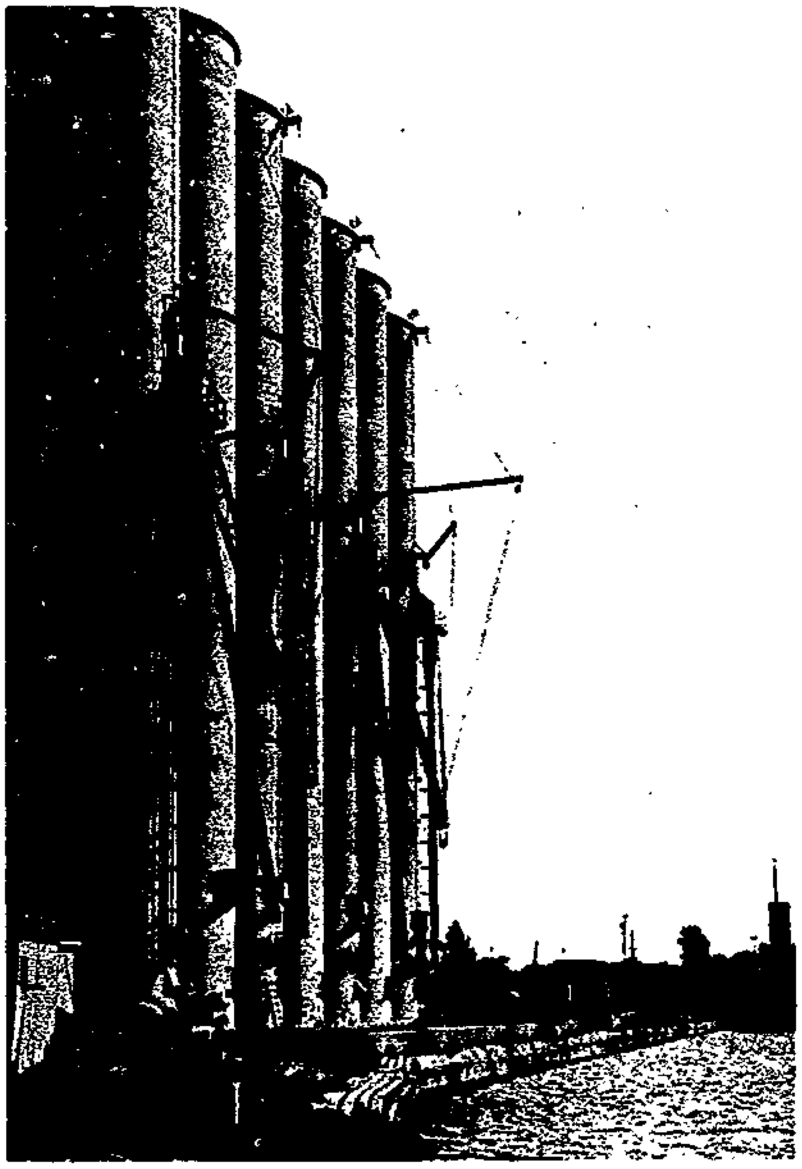
Sources of Loan Funds

The banks for cooperatives obtain their loan funds principally from the following sources:

a. The bank's' capital, consisting of stock owned by the United States Government, stock owned by the cooperative associations, allocated reserves, and surplus.

b. Consolidated debentures, which are sold to the investing public and for which all 13 banks for cooperatives are liable.

c. Loans from commercial banks, from other banks for cooperatives, or from other banks in the Farm Credit system.



Farmer cooperatives invested their own funds and also funds borrowed from the Louisville Bank for Cooperatives to build this $2½ million grain terminal. Through such cooperative facilities where ocean going boats can be loaded, farmers have access to world markets for their grain.

What Cooperatives May Borrow?

A cooperative must meet certain requirements if it is to borrow from a bank for cooperatives. It must be made up of farmers who are acting together to process, prepare for market, handle, or market farm products, or who are purchasing farm supplies or furnishing farm business services. It must not do more business with non-members than with members. No member may have more than one vote unless the dividends on capital stock or membership capital are limited to 8 percent a year. At least 90 percent of the voting rights of a cooperative must be held by farmer members or by associations owned and controlled by farmers. In the case of farmers' mutual insurance companies, members must control at least 75 percent of the voting stock.

Types of Loans

Loans made by banks for cooperatives are based on (1) economic need, (2) financial responsibility, (3) stability of organization, (4) operating policies, (5) management, and (6) repayment ability. They may be made either to provide operating capital or to help cooperatives acquire warehouses, elevators, equipment or other facilities.

Operating capital loans are of several types:

a. Long-term operating capital loans are made for such purposes as supplementing an association's own working capital funds used in carrying inventory and accounts receivable and paying operating expenses. Loans of this type may be repaid over a period of several years, depending upon the association's needs and its ability to repay.

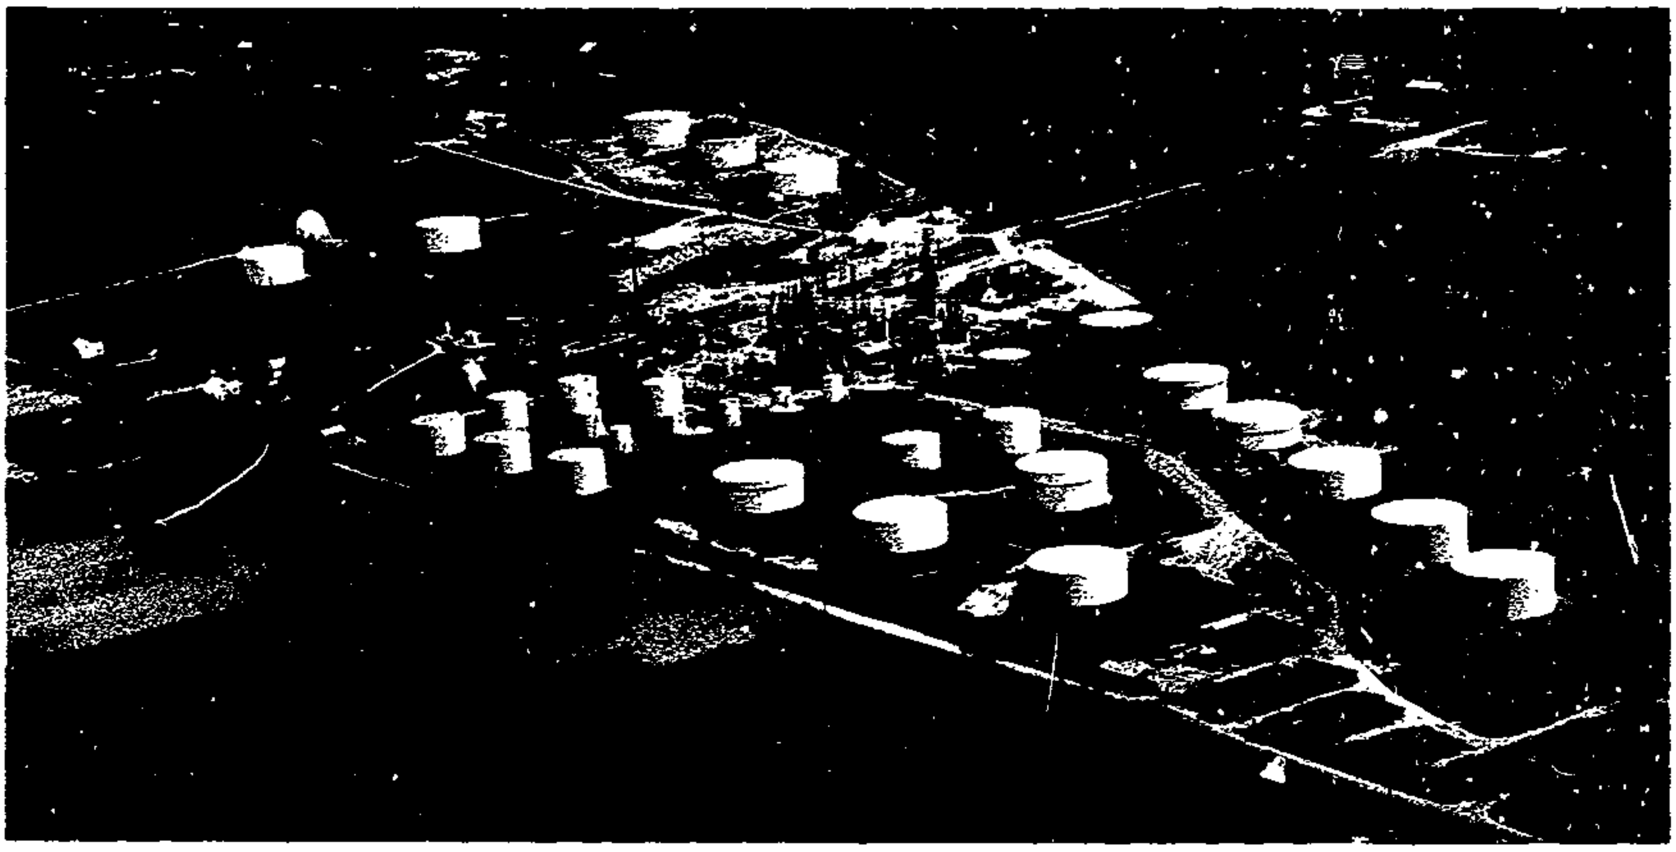
b. Short-term operating capital loans are made to assist an association in financing its seasonal requirements. They are usually granted for a period of not more than one year. These loans include a reinstatement privilege.

Facility loans may be made to purchase or build facilities or to refinance indebtedness created by acquiring facilities. Loans of this type must be secured by a first mortgage and may be repaid over a period of not more than ten years.

Commodity loans are made to finance inventories of such farm products as cotton, grain and wool from the time such products are delivered to the association until they are marketed. Loans of this type are usually secured by warehouse receipts. (See page 18.)

Application for Loans

Suppose you are an officer in a cooperative. How would your co-op apply for a loan? This depends in part on whether your cooperative is already organized and in operation or is a new cooperative, being organized and need-



This cooperative petroleum refinery cost farmers $7½ million. Through it they provide themselves low price, high quality gasoline and diesel fuels necessary to efficient farming operations.

ing credit to begin operations. In either case, your officers or leaders, before filing a written application for a loan, would meet with representatives of the bank for cooperatives to discuss your situation and needs.

In this preliminary discussion you would inform the representative of the bank of your association's plans and the purposes of the proposed loan. He would study briefly the association's financial condition and operating record. From long experience in financing cooperatives the officers of the bank can usually give sound advice in the organization, management, and financing of such associations. Their counsel is available not only at the time a loan is considered but also throughout the life of the loan.

If you are organizing a new cooperative, the bank's officers and fieldmen can help in drawing up the plans of organization and in planning the type of operation. They can also advise you about legal steps to take in organizing your cooperative so that it will be eligible for a loan from the bank.

After preliminary discussions are completed, the cooperative may then apply for a loan by using the bank's regular application form and submitting any additional information the bank may require.

A Soundly Financed Cooperative

In the four states of the Farm Credit District of Louisville, many cooperatives are engaged in the purchase of farm supplies. Some of these cooperatives have been in operation since the early part of this century. Others gut their start in recent years. The cooperative discussed here is an example of the latter group. No doubt it has profited from the experience of pioneer cooperatives in this area.

This organization was incorporated in 1945. During the first two years, it operated on a part-time basis and did not employ a full-time manager until the fall of 1947. During this period, it operated from a rented building. Its sales consisted almost entirely of fertilizer. With the employment of a full-time manager, the association's directors began a campaign to raise membership capital through the sale of capital stock. After a few thousand dollars had been subscribed, the association purchased a well-located business site at a cost of $12,000, paying for it partly with funds invested by members and partly with funds obtained through a mortgage loan from a local bank. The stock-selling campaign was continued and plans were made to build a warehouse at a cost of approximately $15,000 and a rail siding at a cost of approximately $3,700.

By the close of 1948, the association had an investment in fixed assets, including land, a truck, and some equipment, totaling about $16,000. The operation at this point was financed by approximately $21,000 in capital stock and by the mortgage loan from the local bank.

A schedule (page 59) illustrates the association's growth over a period of years, the net savings which it realized, and what it did with these savings. Another schedule (page 61) reflects the association's financial position following the completion of the principal expansion programs.

During 1949, the association built its warehouse and rail siding and, at the close of the year, had an investment of nearly $37,000 in fixed assets. The expansion in fixed assets was financed entirely through the sale of capital stock, and the association's net worth at the end of the

SUMMARY OF SALES, NET SAVINGS AND DISTRIBUTION OF NET SAVINGS

			Dividends on Stock and Patronage Refunds	
Fiscal Year	Sales	Net Savings	Cash	Allocation
1947	$ 26,100	$ 1,900	$ 1,575	$ 325
1948	202,900	9,935	8,640	1,295
1949	348,600	10,060	9,125	935
1950	430,960	17,440	12,165	5,275
1951	562,100	10,900	4,585	6,315
1952	618,000	40,250	17,465	22,785
1953	572,100	28,420	16,680	11,740
1954	675,100	45,690	18,295	27,395
1955	750,900	49,300	19,670	28,145
1956	876,100	69,340	22,900	44,710
1957	1,130,000	88,725	27,535	56,695
1958	1,354,000	101,310	32,320	66,520
1959	1,439,000	85,750	35,680	46,280
1960	1,532,800	113,120	37,530	73,125
1961	1,598,500	106,400	39,550	59,130

Note: Beginning with 1955 the association also set aside small tax-paid general reserves each year.

year amounted to about $62,800, an increase of nearly $31,000 over the net worth at the close of the preceding year.

Primarily because of its difficulty in getting enough financing through local banks, the association, in 1949, applied for and was granted a $10,000 short-term loan commitment by the Louisville Bank for Cooperatives. Loans under this commitment were secured by the pledge of stock which the association owned in the state wholesale organization of which it was a member.

During 1950, the association, in order to handle its rapidly expanding sales volume, built an $8,700 addition to its warehouse. This addition and the increased operating capital requirements were mostly financed by the sale of additional capital stock. However, at the close of the year, the association was indebted to the local bank in the amount of $4,200, to the Bank for Cooperatives in the amount of $9,000, and to an individual in the amount of $3,000. During the latter part of 1950, the association began planning for a petroleum products bulk plant to be in operation for the following spring. Before work was begun, the Louisville Bank for Cooperatives was asked about financing this venture. Representatives of the bank met with the association's manager and directors and discussed the over-all financing program. Based on the information available, it was estimated that the association would need additional permanent capital or long-term loans of approximately $42,000 and a $15,000 loan commitment to finance seasonal requirements. After it received a formal application from the association, the bank granted a $12,000 ten-year facility loan and a $15,000 five-year operating capital loan to be available as soon as the association had increased its own paid-in capital at least $15,000.

The bank also granted the association a $15,000 short-term operating capital loan commitment for seasonal requirements. During 1951, the bulk plant was completed and the proceeds of the loans from the bank were advanced.

The association's financial position at the close of the year is reflected in the balance sheet schedule presented on page 61. You will see that the association's patrons, at this point, had invested more than $96,000 (sum of preferred stock, common stock and allocated reserves) in the association to finance an investment in noncurrent assets of approximately $85,000 (sum of net fixed assets and total other assets). The remaining $11,000 was available for operating capital. The association's sales volume during 1951 passed the $500,000 mark, compared with $203,000 for its first full year of operation.

Following its first two full years of operation, the association had distributed in cash almost all its net savings for those years. Following its 1950 year, the association, in addition to dividends on stock, paid a substantial cash patronage refund and retained in an allocated form approximately $5,300. The major part of the association's net savings for 1951 were allocated.

Soon after the close of that year, the association employed a new manager. During the next three years, it devoted its efforts primarily to building its sales volume and strengthening its financial position. During this period, the association reduced its long-term note indebtedness from $24 900 to $13,350, realized more than $114,000 in net savings, of which nearly $62,000 was retained in the business on an allocated basis, and undertook no major fixed asset expansion.

It had become increasingly apparent that an efficient, up-to-date custom feed mill was needed in the territory. From preliminary plans, it was estimated that the type of facilities needed would cost about $40,000.

At this point, the association's board of directors was faced with perhaps its most important decision since the cooperative was organized. There was every indication that the association could proceed for a number of years with a satisfactory sales volume and annual net savings sufficient to retire its outstanding long-term indebtedness in a short time and pay substantial cash patronage refunds to its members. On the other hand, there was a great deal of evidence that, if the association did not act promptly, it might lose the initiative and eventually the influential position it had established. After considerable study, the board decided to proceed with the planned expansion and requested a conference with the Louisville Bank for Cooperatives in connection with the necessary financing.

After this conference, it was found that a complete revision in its loan program would be to the association's advantage. Soon thereafter, the association applied for and was granted a $68,650 line of credit, consisting of existing long-term loans of $13,350, a new $40,300 long-term facility loan, and a $15,000 short-term operating capital commitment to provide financing for seasonal activities. During 1955, the association completed its feed mill. Its financial position at the close of the year is shown in the balance sheet schedule on page 61. As of the close of its 1955 year, the association's patrons had invested in cash or in the form of retained savings more than $171,000 (sum of preferred stock, common stock and allocated reserves), but the association's investment in noncurrent assets at that time amounted to nearly $181,000. From the undistributed savings of that year, the association's directors subsequently decided to keep in the business on an allocated basis approximately $28,000, in order to improve the overall financial position.

Since then, the association has substantially enlarged and improved its feed mill and has constructed a modern seed cleaning facility. During 1959, when most of this expansion program was undertaken, the association applied for and was granted additional long-term loans of $100,000 by the Bank for Cooperatives to assist in financing the cost of the new facilities. By the time this expansion was completed, the association's total assets amounted to more than $708,000. Its net worth, consisting of common and preferred stock outstanding and allocated reserve, was almost

Working Capital	$18,793.88	$ 43,195.80	$ 71,700.58	$303,393.55

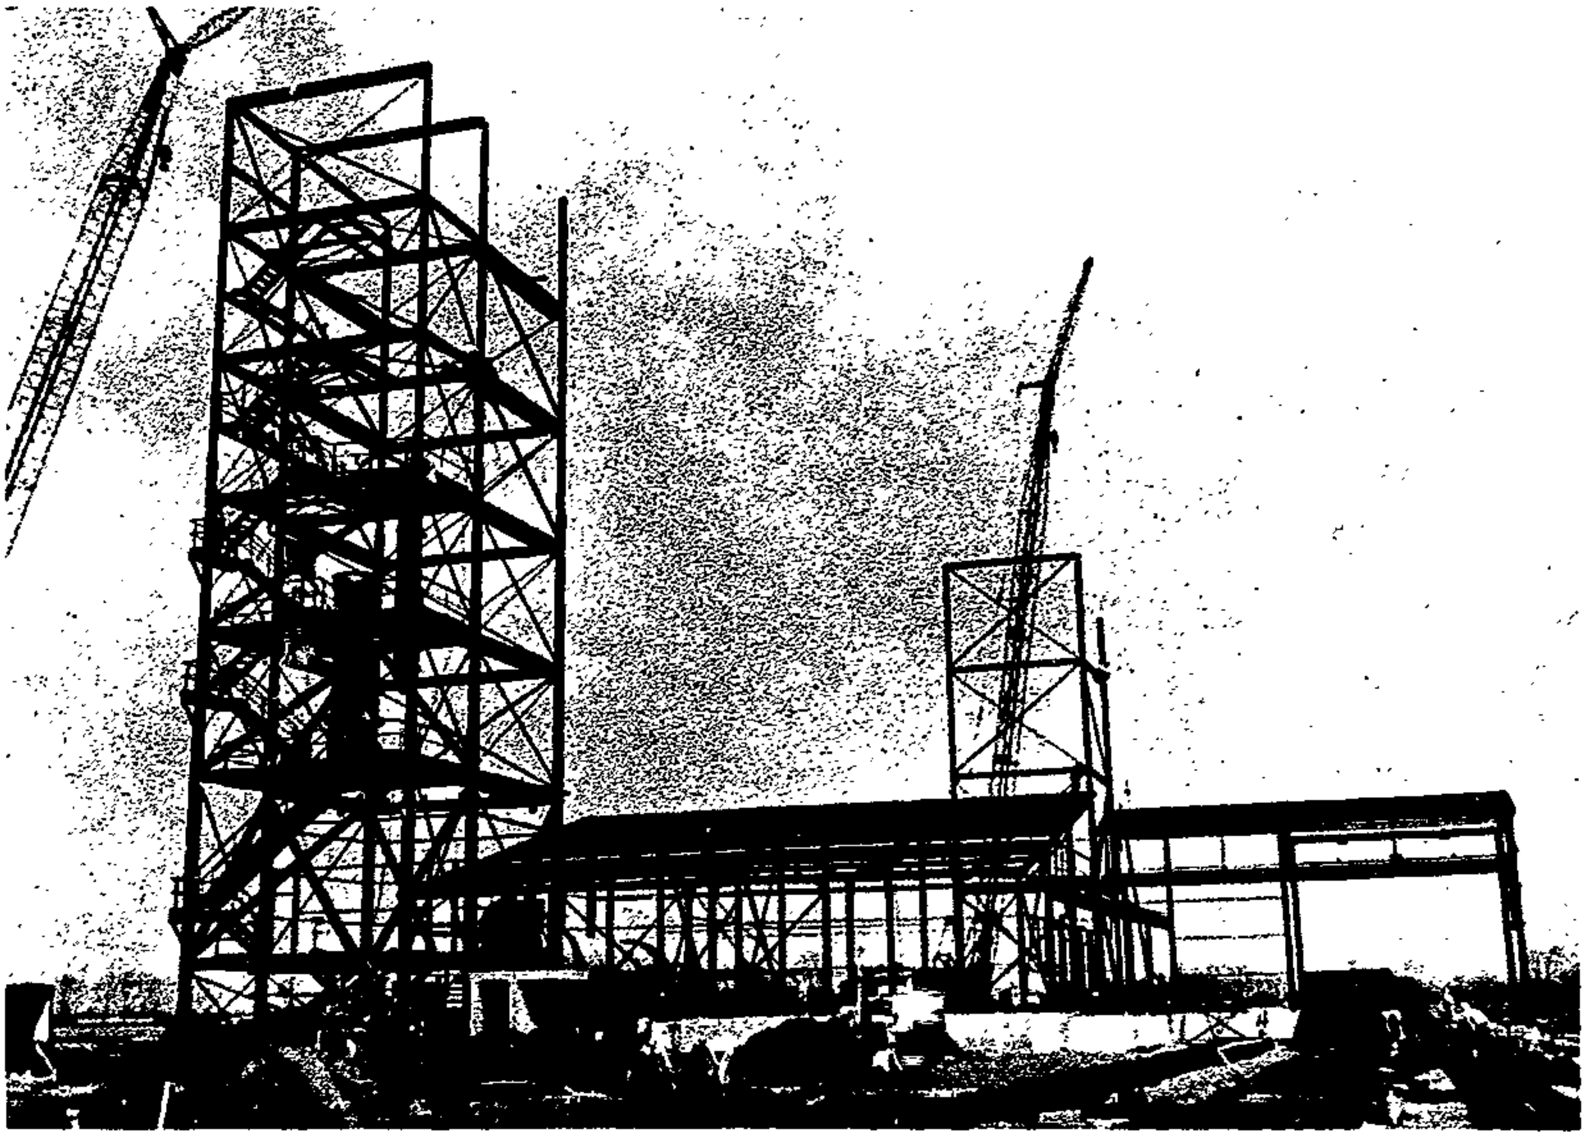
$552,000. Liabilities amounted to about $156,000, of which almost $120,000 was a long-term loan payable over approximately a ten-year period. During 1961, the association made additional investments in fixed assets, financed entirely by the sale of stock to patrons and other interested investors. Its financial position was further strengthened by retaining in the business about $60,000 of the net savings for that year. Its sales volume for that year reached nearly $1,600,000.

The association's operations are integrated to a considerable extent by membership in a regional cooperative that operates on a state-wide basis and manufactures fertilizer and feeds, operates seed cleaning and processing plants, and warehouses on a wholesale basis. Most of the other farm supply items are handled by the local retail cooperatives in the state. The association's investment in this regional cooperative is nearly $170,000.

Through an aggressive policy, the association has reached a point where it exercises a definite influence over the quality and price of merchandise offered in its territory. By attempting to realize a fair margin on the merchandise and services offered, the association has established an excellent operating record, has returned to its patrons each year a reasonable cash refund, and has strengthened its financial position through substantial allocations which are being retired on a revolving basis. The association's operation has been characterized by intelligent planning, careful financial analysis, sound pricing policies, and effective inventory control. Although it has been somewhat liberal in its credit policy, its bad debt losses have not been excessive in relation to its sales volume.

Although its growth has been rapid, the association has maintained a strong working capital position. It has done this by obtaining membership capital or long-term loans to take care of permanent and long-term investments and normal requirements for receivables and inventories.

For its borrowed capital, the association, since early in its history, has looked toward the Louisville Bank for Cooperatives. It has also maintained an excellent relationship with its local bank and has utilized that source upon several occasions to provide additional funds needed for a short period of time.



Under construction is this $20 million nitrogen plant. It will be owned and operated by cooperatives serving 550,000 farmers in four states. It is being financed by the purchase of stock and bonds by individual farmers together with funds borrowed from the Louisville Bank for Cooperatives. Such facilities are important to farmers because half of their fertilizer costs are for nitrogen.

MOVIES

The Farm Credit Banks of Louisville maintain a small library of educational movies for vocational agriculture classes and other farm groups at no cost except for return transportation. All are 16 mm. sound, color films. For any of the following movies: write to J. M. Heizer, director of information, Farm Credit Banks of Louisville, P. O. Box 239, Louisville 1, Kentucky. Requests should be made several weeks in advance of desired showing dates. List second choice film and give type and size of audience expected to see it.

Preparing for Employment in Child Care Services in Pennsylvania Schools.

Pennsylvania State Dept of Public Instruction, Harrisburg
Pub Date - 66
MF AVAILABLE IN VT-ERIC SET 63p.

*CURRICULUM GUIDES, *TEACHING GUIDES, *OCCUPATIONAL HOME ECONOMICS, *CHILD CARE OCCUPATIONS, CHILD CARE, *CHILD DEVELOPMENT, HIGH SCHOOLS, PROGRAM DEVELOPMENT, EDUCATIONAL FACILITIES, EDUCATIONAL EQUIPMENT, OBSERVATION, RESOURCE MATERIALS,

This curriculum guide is designed to help prepare students for employment in occupations of less than professional level in child care services. The resource materials are organized around 12 key concepts which could be easily adjusted to local situations and changing conditions. Examples of concepts are--(1) The care and guidance of children is a fundamental concern of society, (2) Concern for safety is a prime responsibility when caring for children, (3) Heredity and environment are cofactors in the growth process, and (4) Play helps a child move toward his full potential. Specific objectives, generalizations, and experiences are listed with each unit developed around a concept. The teacher must be certified to teach in a nursery or prekindergarten school and also at the secondary level. The 11th and 12th grade students should have the necessary personal qualifications, and have 1 year in a comprehensive homemaking course. The suggested time allotment is 2 years, and half the time should be spent in observation and work with young children. Also included are (1) requirements for space and facilities, (2) a list of guidelines for planning, equipping, staffing child care and development laboratories in secondary schools, (3) layout plans for child development laboratories, (4) resource lists, (5) sample evaluation instruments, and (6) certification regulations. (MS)

Preparing For Employment In Child Care Services In Pennsylvania Schools.

Miss Katherine Stooksbury, is the Assistant Director, Nursery Schools, The Pennsylvania State University.

MESSAGE FROM THE SUPERINTENDENT OF PUBLIC INSTRUCTION

The Vocational Education Act of 1963 opened avenues for the development of new home economics education programs to prepare youth and adults for employment in occupations of less then professional level. The area of Child Care and Development is one which merits special consideration since there is an increased need for public and private services to children in a period of accelerated social change. The rapid expansion of services and facilities concerned with the care of young children is creating an increasingly difficult problem of adequate staffing of trained personnel. The publication, "Preparing for Employment in Child Care Services in Pennsylvania Schools" includes resource materials for planning, initiating and conducting programs to prepare trained personnel for employment.

This bulletin is prepared for the use of teachers, administrators, vocational directors, advisory committee members and others interested in starting a Child Care and Development Center for training students to work with young children in nursery or pre-kindergarten schools, Headstart programs, day-care centers, recreation programs, summer camps, private homes and institutions.

J. R. Rackley

TABLE OF CONTENTS

APPENDIX

INTRODUCTION

This bulletin is designed to assist school districts in the implementation of a course leading to employment in occupations of less than professional level in child care services. A course of this type is especially timely because of the impact of the Vocational Education Act of 1963 which has focused attention on wage earning skills which stem from Home Economics subject matter; and because of the Economic Opportunity Act which has highlighted the need for increased services to young children. Other federal legislation such as the Elementary and Secondary Education Act is providing funds which may be used for educational services for pre-school children.

Job opportunities in the field of Child Care Services are increasing because of:

- the initiation of programs for disadvantaged children which involve the use of teacher aides. These aides have proved to be so useful in relieving teachers of non-professional duties that their widespread use throughout the elementary school seems imminent.

- the upward trend in the employment of working mothers which has resulted in an increased demand for public and private day-care centers.

- the increased personnel needs of public and private schools and institutions providing care for normal and atypical children.

- the general affluence of our society which enables many homemakers to pay for skilled assistance with the care of children in the home.

The resource materials in this publication are organized around certain key concepts which might well form the basis for any course in child development from the junior high school level upward into college. The teacher will need to use her judgment concerning the order in which these concepts are presented to students. After the trainees are participating in the nursery school program, it will be necessary for the teacher to continue to direct attention to the many ways in which these concepts are applied when actually working with children.

Evaluation devices should be used which will indicate the completeness of concept formation and the extent of application in the laboratory experience. A few suggestions for evaluation are given in the Appendix, but for the most part, evaluation techniques should be developed through teacher-pupil planning. Aiding the trainees in the art of self-evaluation should be considered one of the most important aspects of the training course.

Pertinent references have been given with each key concept. Other references of a more general nature are included in the supplementary bibliography in the Appendix. A special effort was made to list only films which are easily available to Pennsylvania teachers at little or no cost.

PROGRAM ORGANIZATION

Program Objectives

To train employees for child care services who will:

Be familiar with employment opportunities in this field.

Recognize that caring for children is an important worthwhile job.

Have a functional understanding of the basic concepts of child development.

Cooperate with all who are concerned with the welfare of children.

Be capable of interpreting and carrying out directions and instructions.

Have the ability to plan, prepare, and serve simple nourishing meals and snacks for children.

Assume responsibility for helping children to develop good personal habits relative to food, housekeeping, cleanliness, and safety.

Assist in keeping the children's surroundings clean, safe, and attractive.

Be capable of directing individual or group activities of children such as story telling, games, play, and various creative experiences.

Assume responsibility for the safety of children.

Handle emergencies calmly and intelligently.

Understand the selection, use, and care of various games, play apparatus, toys, and supplies.

Be resourceful in improvising play materials and activities.

Assist with the keeping of records.

Teacher Qualifications

The teacher will be certificated to teach in a nursery or pre-kindergarten school, as well as at the secondary level. She will meet the standards established by the Department of Public Instruction for "Comprehensive Certification of Teachers of Nursery Schools; or Child Care and Development in Child Development Laboratories in Secondary Schools including Vocational Schools (See page 56 of Appendix).

Since there is a scarcity of teachers in this field, it may be necessary for school districts to use teachers with interim certificates until properly certificated teachers become available.

Selection of Students

To major in Child Development, a pupil should be:

mentally and physically healthy,
interested in children,
capable of average intellectual achievement,
a pleasant cooperative individual.

It would be desirable for trainees to have the following courses as prerequisites:

one credit in comprehensive vocational home economics.
one credit in biology.

If this course is offered to out-of-school youth and adults, it may be necessary to give additional consideration to the screening of trainees.

Grade Level

This course would be offered at the 11th and 12th grade level in the comprehensive high school. It might also be offered in the Area Technical School on the 11th and 12th grade level or on the post-high school level. The resource material in this bulletin could also be adapted as a course offering in a junior or community college.

Length of Course

The minimum length of this child development program would be the equivalent of two class periods (90-100 minutes) per day for two years. Approximately one-half of the time should be spent in observation in laboratory work with young children. The program might be expanded by providing additional time for supervised laboratory experience with children and/or a work experience program in community child care centers or institutions. Adequate supervision and evaluation should be provided for work experience programs outside the school. Such programs should comply with health and labor regulations.

Scheduling

The scheduling should be flexible enough to permit the blocking of time for nursery school participation and field trips.

Program of Studies for Child Development Majors

Following is a suggested program of studies for students majoring in child development. This can be adapted to meet local education situations.

10th Grade

1 Credit	English
1 Credit	World Cultures
1 Credit	Biology
1 Credit	Mathematics
1/3 Credit	Health and Physical Education
1 Credit	Home Economics including Food and Nutrition, Management, Clothing, and Family Relationships

11th Grade

1 Credit	English
1 Credit	U.S. History
1 Credit	*Elective (suited to trainee's interest and ability)
1/3 Credit	Health and Physical Education
2 Credits	Child Development

12th Grade

1 Credit	English
1 Credit	P.O.D. including Economics
1 Credit	*Elective
1/3 Credit	Health and Physical Education
2 Credits	Child Development

*Typing is considered a desirable elective, but it is not listed as a requirement because it is considered desirable to allow some flexibility to meet individual needs and interests of pupils.

Advisory Committee

An advisory committee should be established before the program is initiated. This is a requirement of the Vocational Education Act of 1963 for all wage earning programs in home economics education.

In setting up the advisory committee, an attempt should be made to have it truly representative of the total community. People can be invited to serve from various economic levels, different racial and nationality groups, and varying educational levels. The teacher will need to keep in mind that the people on the committee will undoubtedly be busy people. Therefore, their time should not be wasted. Meetings should be well planned, efficiently conducted, and scheduled at a time most convenient for those concerned.

It would be desirable to include representation from the Board of Education and the school administration. Representatives from social agencies or institutions concerned with the care of children can make a valuable contribution to curriculum planning. They can also cooperate in arranging field trips, provide opportunities for realistic work experiences, and assist in the job placement of graduates. Mothers of pre-school children can assist in the recruitment of children for the nursery school group and in making arrangements for their transportation. Professional people such as pediatricians, nurses, and social service workers will be valuable resource people on the committee.

Parent Education

Nursery schools are usually more successful when there is a close working relationship with the parents of the children. This relationship can be promoted (1) through informal contacts with the parents as they bring the children to the school, (2) through home visits, and (3) through a planned program of parent education which would involve fathers as well as mothers.

It would be a worthwhile experience for the trainees in the class to assist the teacher in planning and conducting a series of meetings for parents. A survey of the community should reveal several resource people who could be asked to participate as speakers or consultants. The possibility of financing such a program with adult vocational education funds should be explored.

Financing

Programs which meet the criteria for reimbursement from Vocational Education funds will be financed according to the Federal Acts, State Laws and Regulations established by the State Board for Vocational Education. Requests for home economics programs and equipment funds will be submitted on the appropriate VE-Form. Additional information and directions may be secured from the Department of Public Instruction, Bureau of Vocational, Technical and Continuing Education, Section of Home Economics Education and School Food Service.

CURRICULUM GUIDE AND RESOURCES

The Curriculum Guide and the suggested resource materials are centered around twelve key concepts of child care and guidance. A curriculum that is structured on basic concepts and supporting generalizations can be easily adjusted to local situations and changing conditions. It can also be adapted to meet the individual needs of pupils of varying educational and ability levels.

Key Concepts

- The care and guidance of children is a fundamental concern of society.
- Evaluation is a continuous process of appraisal concerned with determining the extent and effectiveness of learning.
- Heredity and environment are co-factors in the growth process.
- Human growth has certain basic needs which must be satisfied through interaction with the environment.
- The entire growth process is a dynamic quest for maturity. (Individual differences).
- Food plays an important role in the growth process.
- Effective guidance of children's behavior helps them to move forward toward social maturity. (Discipline).
- Effective child guidance requires harmonious teamwork on the part of all people concerned.
- Play helps a child move toward his full potential.
- Retarded children can be helped to grow toward their fullest potential by proper care and guidance.
- Children with certain physical handicaps require special care.
- Concern for safety is a prime responsibility when caring for children.

Key Concept: The care and guidance of children is a fundamental concern of society.

Objectives:

The recognition that child care and guidance is an important responsibility of society.

An awareness of the various employment opportunities in the field.

The beginning of an understanding of certain basic terms and concepts.

Generalizations	Experiences
The family is the fundamental unit of our society. In our culture, the family assumes much responsibility for the care and guidance of children. The family has biologic, economic, and cultural functions. Family life provides a setting for the transmission of cultural patterns from one generation to another.	View a film such as, "Skippy and the Three R's," for the purpose of focusing attention of the class on a normal child with a favorable family background. Use the film as the basis for a circular response discussion on the role of the family during the pre-school years. Summarize the discussion by planning and arranging a bulletin board showing the contributions of the family to the child. Encourage pupils to generalize concerning the role of the family.
The feeling of security which a young child derives from his life within the family facilitates his development. The family situation should provide a setting in which a child can acquire an attitude of self-respect, as well as an attitude of respect for others.	View a film showing a child with a less desirable background such as, "A Desk for Billie," or "A Child Waits." Contrast this family with the one shown in the Skippy film. Analize the reasons for family failure to provide a suitable environment and atmosphere for its children. Through discussion begin to develop an understanding of such terms as: The "culturally deprived" child The "under-privileged" child The "disadvantaged" child

Generalizations	Experiences
Social change is constantly taking place. The process of social change is accelerated by rapid technological advance, and by changes in political theory. Families differ in their ability to cope with social change. Families differ in their ability to assume the responsibilities involved in the rearing of children. Society provides various agencies and individuals to help families with the rearing of children.	Make a survey of the community to determine the agencies, both public and private, which are concerned with the care and welfare of children. List these with a brief description of the service which they provide and a brief job description for each of the types of personnel employed. Issue this in mimeographed form for future reference regarding job opportunities. Arrange field trips to some of these agencies - or invite personnel from the agencies to visit the class and discuss the type of service provided.
The complexity of modern life sometimes makes it necessary for the family to call on other agencies to assist with the care of children.	Make a survey of the working mothers of young children to determine how the children are cared for while the mother is working. Using library research and/or the technique of interviewing older people, analyze some of the changes which have occurred in the American family during the past fifty years. Use the information obtained as the basis for a class discussion, relating it particularly to the effect which these changes have had on the rearing of children.

Generalizations	Experiences
Society must sometimes provide a substitute for the family.	Discuss the pros and cons of foster homes vs. institutional care for children without families of their own. A field trip to the Milton Hershey School would be a worthwhile experience.
Legal adoption makes it possible for many children to acquire a family.	View the film, "A Baby Named X."
The adoption of children is carefully regulated to protect both the child and the adopting parents.	Invite a representative from a child adoption agency to discuss the subject with the class.

NOTE: The films mentioned in this section may be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

The film "Skippy and the Three R's" may also be secured from the National Education Association.

Key Concept: Evaluation is a continuous process of appraisal concerned with determining the extent and effectiveness of learning (growth).

Objectives:

An appreciation of the importance of evaluation as an integral part of the educative process.

Some understanding of the many factors involved in evaluation.

The ability to assist in simple appraisals of the development of nursery school children.

A willingness to engage in self-evaluation.

The ability to use the results of evaluation as a guide to future action.

Generalizations	Experiences
Evaluation is a continuous process which begins with the formulation of objectives and continues as an integral part of the learning process.	The trainees should be given a chance to participate in establishing the objectives of the training course.
An awareness and acceptance of objectives is a necessary prerequisite for evaluation.	Various techniques can be used to keep the students aware of the basic objectives of the course.
Evaluation is more meaningful if pupils participate in setting up objectives and in devising ways in which their progress can be evaluated.	Students can suggest and develop various ways in which their progress can be evaluated.
Self-evaluation is essential to growth and improvement.	Use the check sheet in Hatcher and Andrews, "Adventuring in Home Living," Book II, pages 463-464.
Evaluation of the children's development is a responsibility of the "child guidance team."	Devise other types of evaluative devices and use them in the nursery school.

Generalizations	Experiences
Evaluation can point the way to future action.	Plan nursery school activities which will help bring about the desired learnings.

Handbook for Teachers. Evaluation in the Total Learning Process, Curriculum Bulletin No. IV, August 1962. Department of Education, Home Economics Education, Honolulu, Hawaii.

Evaluation Materials for Use in Teaching Child Development. Marjorie Brown and Jane Plihal. Burgess Publishing Company, 426 South Sixth Street, Minneapolis, Minnesota, 55415.

Key Concept: Heredity and environment are co-factors in the *growth process.

Objective:

An understanding of the role of heredity and environment in the growth process.

Generalizations	Experiences
The basic pattern or blueprint of human growth is determined by the laws of heredity.	Discuss the role of heredity and the role of environment in relation to the growth process. To provide background for the discussion, view two or three films dealing with heredity and human reproduction.
The element of chance plays a part in inheritance.	
Growth is a continuous process which begins at the moment when the egg cell is fertilized by the sperm.	Assemble a collection of books and pamphlets relating to human reproduction and arrange time for students to do free choice reading in the classroom.
The growth process occurs through the interaction of the organism with its environment.	
Adequate pre-natal care helps insure the health of the new baby.	Make a survey of community agencies which offer help during the pre-natal period. Ask a public health nurse to discuss the work of a pre-natal clinic.
	Discuss the problem of the unmarried mother and ascertain what the community is doing to deal with this problem.

---

*The terms "growth" and "growth process" as used here, and on ensuing pages, refer to the total development process, not to physical growth alone. The teacher may wish to consult "The First Five Years of Life," by Arnold Gesell, Harper Brothers, pages 6 to 9, for a discussion of "growth" as the key concept in child development.

Generalizations	Experiences
The diet of the mother before and during the pre-natal period influences the development of the baby.	Discuss "Diet during pregnancy." Plan a day's food pattern which would serve as a guide for meal planning during this period. Use the pattern to plan a day's meals. Set it up in visible form using food models such as those which can be obtained from the Dairy Council.
Birth defects result when something goes wrong, either in the blueprint (heredity) or in the mother's body (environment).	Ask a librarian's assistance in locating some of the excellent articles on this subject which have appeared in recent periodicals. Secure pamphlets and leaflets from national organizations such as the Kennedy Foundation. Divide the class into committees and have each committee prepare a report dealing with one type of birth defect.
	Visit a special education class or institution where children with birth defects are enrolled. Ask the special teacher to talk to the class concerning her work with these children.
	Ask a representative of one of the national organizations to speak to the class. The National Association for Retarded Children and the Cerebral Palsy Associati have volunteer members in most communities.
Some birth defects can be prevented.	Discuss the prevention of birth defects.

The following books and films will provide useful background information concerning heredity and environment during the early stages of the growth process.

Books:

DNA-Ladder of Life. Edward Frankel, McGraw-Hill, N.Y. 1964

The Genetic Code. Isaac Asinov, New American Library, N.Y. 1963

Life's Key - DNA. Carleen M. Hutchins, Coward-McCann, N.Y. 1961

The Coil of Life. Ruth Moore, Alfred A. Knopf, N.Y. 1961

Being Born. Francis Bruce Strain. Appleton-Century-Crofts. 1936

Films:

Biography of the Unborn. Traces the creation of life from the moment of fertilization to the moment when the infant begins independent life.

Blood Groups, Skin Color, and Gene Pools. Emphasizes the part played by chance in inheritance.

Cell Reproduction. The role of DNA is emphasized.

From Generation to Generation. Illustrates basic facts of human reproduction showing childbirth as an emotional and spiritual experience as well as a physical one.

Human Reproduction. Factual film on human reproduction.

Inheritance in Man. Illustrates how the laws of heredity apply to man.

Science of Genetics. More on DNA.

Baby Meets His Parents. Shows the relation of heredity and environment to personality.

NOTE: The first seven films mentioned above may be obtained from the film library of the regional Instructional Center serving Northeastern Pennsylvania and will probably be found in similar centers throughout the Commonwealth.

The film Baby Meets His Parents may be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

Key Concept: Human growth has certain basic needs which must be satisfied through interaction with the environment.

Objectives:

An understanding of the basic needs of growth.

An understanding of the type of environment which will best enable children to satisfy their basic needs.

A positive commitment to the improvement of environment as a means of facilitating growth.

The ability to assist in the establishment of a favorable environment.

Generalizations	Experiences
There are basic needs which all individuals seek to satisfy.	Through discussion, identify the basic needs of children and classify in a way which is meaningful to the trainees:
All individuals have certain needs in common, but there is a variety in their manifestation and satisfaction.	1. Physical 2. Mental 3. Social 4. Ego-integrative Plan and carry out the details of a nursery school experience which will provide a favorable environment for satisfying the basic needs of pre-school children. Ideally, the nursery school children should be representative of a variety of backgrounds - economic, cultural, racial, etc.
The needs and goals of maturing individuals are dynamic and have far-reaching consequences moving from immediate situations toward more remote situations.	Review a "case study," a movie, or biographical material which will indicate the far-reaching effects of unsatisfied needs. Plan a rotation of duties in the nursery school so that each trainee will have an opportunity to participate in: 1. Planning and preparation of meals and snacks for children.

Generalizations	Experiences
	2. Supervision of eating, rest periods, and toileting. 3. Assisting in the preparation and care of play materials. 4. Participating in the direction of play, story telling, music, art, and science experiences. 5. Laundering and caring for children's clothing. 6. Participation in parent conferences and group meetings for parents.
When the environment fails to enable a child to satisfy his basic needs, the child is termed "disadvantaged" or "underprivileged."	Discuss various ways in which a child may be "disadvantaged." "Disadvantaged" children may be found on all economic and cultural levels. Plan nursery school experiences which will be helpful to the disadvantaged children in the group. Keep a special record of their development. Develop cooperatively a code of ethics for trainees to follow when discussing the intimate problems of nursery school children and their families.

Teacher Reference:

Journal of Home Economics, Vol. 58, No. 2, February, 1966, p. 107. Implementing the Concept Approach in Teaching Child Development at the Secondary Level. Flossie M. Byrd.

__Key Concept__: The entire growth process is a dynamic quest for maturity.

Objective:

An understanding of the developing personality.

Generalizations	Experiences
Each child comes into the world with a unique individuality.	View two films dealing with individual differences. Part I - __Each Child is Different.__ Part II - __Discovering Individual Differences.__
Each child has a tempo and a style of growth which is characteristic of his individuality.	Use these films as a basis for the discussion of individual differences.
There are laws of sequence and maturation which account for general similarities and basic trends of development.	Assist the school nurse in weighing and measuring primary school children.
The child grows as an integrated whole - all aspects of growth are interrelated.	Weigh and measure the nursery school children and make plans to keep a record of their physical growth during the nursery school period.
The growth process is sparked by an innate dynamic urge to reach maturity.	Secure a table of normal heights and weights for young children. Compare with those of the children weighed and measured by the class. In the light of previous class discussions, discuss the use and misuse of norms. (See Gesell - __Infant and Child in the Culture of Today__, pp. 68-72.)
Growth is a patterning process which organizes the individual and brings him toward a state of physical, mental, emotional, and social maturity.	Discuss other aspects of the growth process which are not so easily measured. Ask the school psychologist to discuss the measurement of mental development in young (pre-school) children. View the film strip titled, "__Your Child's Intelligence.__"

NOTE: The film strip may be purchased from NEA in Washington, D.C. for $7.00. This price includes a recording of the script.

Generalizations	Experiences
Since no two children grow at the same rate or in exactly the same way, norms can be misleading.	Determine the meaning of the term, "Intelligence Quotient." Discuss the value and the danger of using it as an indication of mental growth. Compare its significance as an indication of normal mental growth with the height-weight table as an indication of normal physical growth.*
Each child's personality is a product of slow and gradual growth.	View and discuss two films which show the emerging personality patterns of pre-school children.
Personality patterns are influenced by many factors.	"The Terrible Twos - The Trusting Threes."
The most bewildering task for a young child is to discover his own self-identity and to relate his newly discovered self satisfactorily to other people.	"The Frustrating Fours - The Fascinating Fives."
Emotions are an integral part of behavior patterns.	Prepare an age chart of personality characteristics of pre-school children.
Emotions grow and mature in the same sense that perceptions, judgments, and concepts grow.	
Adults who understand and accept a child's immaturity are more capable of guiding him effectively.	

---

*Teachers wishing to update their own concepts of intelligence and personality will find the following books helpful:

"Productive Thinking in Education," edited by Aschner and Bish, National Education Association, 1201 Sixteenth Street, N.W., Washington, D.C. (paperback edition, $3.00).

"Personality" by J. P. Guilford, McGraw-Hill, N.Y., $7.95.

Note: The films mentioned can be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

Key Concept: Food plays an important role in the growth process.

Objectives:

An understanding of the nutritional needs of children.

The ability to prepare and serve nutritious and attractive meals for pre-school children.

The ability to assist children in the formation of desirable food habits.

The ability to make observations and keep records which will indicate the progress which the children are making.

Generalizations	Experiences
Learning to eat and enjoy a variety of nutritious foods is an important part of a child's development.	Observe the eating habits of a group of children in the school lunch program of a primary school. Use an observation sheet for each child observed. Discuss the observations in class and identify the differences found in the food habits of the children. Classify the habits observed as desirable or undesirable from the standpoint of the children's health and growth. Encourage pupils to generalize concerning the formation of food habits.
The formation of wholesome attitudes toward food begins during infancy.	View a film such as, "Babies Like to Eat," which will summarize the feeding of infants and provide a background of work with pre-school children.
Lasting food habits are formed during the pre-school years.	Discuss the factors which influence children's food habits. Decide how pre-school children can be encouraged to form desirable habits. Use these suggestions as a guide for nursery school procedure.
Food habits are influenced by many factors.	

Generalizations	Experiences
Children's meals must be carefully planned to include all the nutrients needed for health and growth. Meals for children should be simple, nutritious, attractive, and carefully planned.	Review the nutrients which are necessary for health and growth. Develop a "pattern" for a preschool child's daily meals similar to the Type-A pattern for school lunches. Using the pattern as a guide, plan meals for preschool children. Actually prepare and serve the noon meal for preschool children over a period of several weeks. (The amount of training given in actual food preparation prior to the preparation of meals for the children will depend on the background of the trainees.)
Mealtime can be a happy experience for children.	Trainees can take turns eating with the children at their small tables. "<u>Adventuring in Home Living</u>" by Hatcher and Andrews, Book II, pages 474-489, provides many suggestions for helping children with eating problems.
Making it possible for children to participate in the serving and clearing away of meals increases their interest in food and their sense of responsibility.	Plan ways in which children in the nursery school can participate in the serving and clearing away of meals.
	Develop a method of recording observations concerning the children's food habits. Use these records as a basis for determining corrective procedures and for evaluating progress.

NOTE: The film, "Babies Like to Eat" can be obtained from the National Dairy Council in Chicago or from any of its local branches.

Key Concept: Effective guidance of children's behavior helps them to move forward toward social maturity.

Objectives:

The ability to guide the behavior of children in ways which enable them to maintain their self-respect and move forward in their quest for social maturity.

The ability to discriminate between acceptable and unacceptable patterns of behavior - and to help the child learn to discriminate.

The ability to set limits for children's behavior and enforce them in those situations where they are too immature to judge the consequences of their own behavior.

Generalizations	Experiences
Adults differ in the way in which they guide children's behavior.	Discuss various ways in which members of the class have seen adults give direction to children's behavior. Role-playing of several situations might be used to stimulate discussion. The film, "*Preface to a Life*," shows a contrast between democratic and autocratic techniques. Discuss the difference.
Teachers guide behavior in many subtle ways.	View again the film, "*Skippy and* the Three R's." This time, focus attention on the teacher. Try to analyze the various ways in which she gave direction to the children's behavior.
Understanding the reason for misbehavior helps adults deal with it more effectively.	
Effective guidance helps the child establish a value structure which serves as a guide to his own self-control.	Make some generalizations concerning the effective guidance of children's behavior.
Effective guidance helps the child develop and maintain his self-respect.	

Generalizations	Experiences
Action is often more effective than words.	Discuss the use of words in guiding behavior. Describe specific situations and decide how words might be used to guide behavior in these circumstances.
Words have power in the guidance of behavior only if they are skillfully used and adapted to the tempo of the child's mind.	
Positive suggestions are more effective than negative ones.	View the film, "Helping a Child Accept the Do's and Don'ts."
Words are of little use when a child is emotionally disturbed. Words can be used to give encouragement.	Use situations which occur in the nursery school as a basis for class discussion and evaluation.
It is easier for a child to accept limits and restrictions which are consistently enforced by all adults concerned.	
Children accept guidance more readily from adults whom they respect.	Discuss punishment and decide on criteria which might be used to decide whether a certain type of punishment is desirable or undesirable. Use the criteria set up by the class to evaluate the following: physical punishment humiliation praise rewards threats natural consequences isolation removal of privileges
Children learn to accept limits and restrictions just as adults learn to accept regulations and laws.	
Once a direction has been given it should be complied with, or a follow-up suggestion should be made.	
Discipline should never be administered in a vicious or hostile manner.	
A child should never have occasion to doubt that he is loved and respected even though his behavior is not approved.	

NOTE:

The films, "Preface to a Life," "Skippy and the Three R's," and "Helping a Child Accept the Do's and Don'ts," may be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

The filmstrip, "Your Child and Discipline," including narration, may be secured from National Education Association, 1201 Sixteenth Street, N.W., Washington, D.C. (Price $7.00 - Order stock number 388-11710).

A pamphlet, "Your Child and Discipline," by Dreikurs and Soltz, may also be secured from the same source in packages of 35 for $1.00. (Order stock number 382-11708).

Reference Book:

Children: The Challenge by Rudolph Dreikurs and Vicki Soltz. 1964. Meredith Press.

Key Concept: Effective child guidance requires harmonious teamwork on the part of all people concerned.

Objectives:

An appreciation of the importance of teamwork in the guidance of the growth process.

The ability to plan cooperatively with others.

A willingness to understand and accept common goals in child guidance.

The ability to work harmoniously with others in the attainment of common goals.

The ability to communicate meaningfully with other members of the child guidance team.

Generalizations	Experiences
A child's development is facilitated when all those concerned with his guidance have common goals and work together as a team.	Use the establishment of a nursery school as an experience in teacher-pupil planning. An approach of this sort is suggested in "Adventuring in Home Living," Book II, by Hatcher and Andrews. If the nursery school is already in operation, involve the nursery school teacher in the planning sessions. View the film, "Family Circles," which points up the need for home and school cooper-tion, - and plan ways in which the nursery school parents can participate in this experience. Invite some parents to participate in the planning sessions.
Cooperative planning is one way of developing a spirit of teamwork.	Summarize the cooperative planning by generalizing concerning the value of cooperative planning as a technique in human relations.
Participation in planning increases interest in a project.	
Participation in planning develops an awareness of problems and objectives.	
Participation in planning develops a sense of responsibility for the success of the project.	

Generalizations	Experience
An understanding of other people's viewpoints is conducive to harmony in human relations.	Use the training film, "Role Playing in Human Relations Training - How to Do It."
Role-playing is a technique which can be used to increase our understanding of others.	Use role-playing as a teaching technique at an appropriate time during the training course. The movie will be more effective if it is shown immediately preceding the role-playing experience.
Communication with other people is an important part of working together.	Use a training film such as, "Let's Discuss It," to focus attention on ways to improve discussion techniques. Use the information or suggestions in the film to formulate a guide for class discussions.
Group discussion is a valuable form of communication.	Select an appropriate subject for class discussion and try to make use of the suggestions in the film. Decide on various ways to communicate with the parents of the nursery school children. Carry out these ideas throughout the course.
Written records provide (1) a means of communication, and (2) form a basis for evaluation of a child's progress.	Develop a plan for nursery school record keeping which will serve as a means of communication for members of the class, - and also provide a basis for the evaluation of each child's progress.
Objectivity is an important consideration when reporting nursery school observations.	Practice writing brief objective anecdotal reports of incidents occurring in the nursery school. Use these as the basis for class discussion and evaluation.

NOTE: The films mentioned in this section may be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

Key Concept: Play helps a child move toward his full potential.

Objectives:

An understanding of the role of play in the total growth process.

The ability to select play materials suited to the age, interests, and ability levels of the children concerned.

The ability to improvise play materials from inexpensive commonplace articles.

The ability to set the stage and supervise creative play experiences.

An understanding of the proper care of various play materials.

The ability to secure the cooperation of the children in caring for their play materials.

Generalizations	Experiences
Through play, a child discovers his senses and his muscles. Given proper materials and guidance, a child will work hard to improve his ability.	Discuss the various types of play such as: Block play Dramatic play Manipulative play Outdoor play Creative play.
Pre-school children need many opportunities for free play. Safety is an important consideration in the selection of toys. There should be little adult interference with play.	Develop criteria to be used in selecting toys and play materials for the nursery school. If the nursery school is not already equipped - plan the play materials needed. If it is already equipped - plan to add some new items specially planned by the group of trainees. The Pre-School Guide published by the Colorado Future Homemakers will be extremely helpful.
Pre-school children are in the large muscle stage of development and require vigorous body activity.	Prepare some improvised toys and play materials. Arrange an exhibit for a P.T.A. - or some other place where they may be seen by parents.

Generalizations	Experiences
Through play, children learn to cope with their environment.	Formulate a guide for trainees to use when guiding play activities in the nursery school.
If a child's introduction to stories and books is a happy one, he will be better prepared for future learning experiences.	Visit the children's department of a public library and ask the children's librarian to discuss the selection of books for children. Arrange for a skillful story teller to present a demonstration of story telling for the class. Have members of the group prepare simple stories and practice telling them to other members of the class. Select suitable books for the nursery school.
Creative art experiences are of great importance to the development of pre-school children.	Provide an opportunity for the trainees to become familiar with the art activities commonly used in a nursery school such as:) easel painting) finger) sponge) clay modeling) dough cutting pasting crayons sand water snow flannel board
The process is more important than the product in the development of the child.	
Adult standards and ideas should not be imposed on the child.	
	Assemble and prepare art materials for use in the nursery school.

Generalizations	Experiences
Children can be helped to become more aware of the world around them.	Plan science experiences suitable for nursery school children and carry them out.
	Plan a field trip for the older nursery school children.
Music activities provide a creative outlet for pre-school children.	Practice and carry out musical and rhythmic experiences suitable for pre-school children.

Excellent Reference:

Pre-School Guide published by the Colorado Association of Future Homemakers of America, 510 State Office Building, Denver, Colorado, 80203. Price $2.50 plus postage.

This book contains many illustrations of play equipment which can be constructed in the school shop or the home workshop.

Key Concept: Retarded children can be helped to grow toward their fullest potential by proper care and guidance.

Objectives:

An understanding of the nature of retardation.

An awareness of the special needs and problems of the retarded child.

A willingness to respect retarded children as individuals.

The recognition that helping retarded children attain happiness and further their development is a uniquely satisfying experience.

Generalizations	Experiences
The development of retarded children has been slowed down or arrested because of genetic or environmental factors.	Observe children in special education classes for (1) the educable retarded and (2) the trainable retarded. If possible, arrange a field trip to an institution caring for the totally dependent mentally retarded.
There are many levels of retardation.	
Classification of retarded children is difficult.	Discuss the observations in class and formulate the characteristics of the educable, the trainable, and the dependent.
It is important that retarded children be respected as individuals.	An outstanding member of the class (or the teacher) might give a book review of "The Child Who Never Grew" by Pearl Buck.
Most retarded children can be helped to develop independence in caring for themselves.	If possible, arrange for the trainees to have a part of their laboratory experience with children in a school or institution caring for retarded children. This is especially important if there are many job openings in this type of work for the graduates.
Each retarded child has a unique pattern of growth. Growth in all areas is not necessarily consistent.	

Generalizations	Experiences
Each child's level of development must be carefully observed for pressure to learn when applied too early leads to failure, and failure lessens the child's desire to learn the task when he is ready.	
Observation of the child's play will usually reveal those areas in which he is ready to grow.	
Retarded children have a slower rate of development, but the sequence of development is similar to that of normal children.	
Retarded children require many successful repetitions in order to acquire basic skills of self-help.	A part-time job caring for a retarded child in a home in the community would be an excellent supplemental experience for a trainee.
The retarded child requires more encouragement and recognition of his achievements than the average child.	
Success is more likely if only one skill is stressed at a time.	
Complexity of any kind overwhelms the retarded child and may result in a complete loss of interest in learning.	
Concentrating on strengths promote growth - calling attention to weaknesses retards growth.	
Individuals concerned with the care of retarded children must be unusually patient, calm, and pleasant.	

Generalizations	Experiences
Habits are more easily learned if the child feels some need for learning the habit.	The book, "You and Your Retarded Child" by Kirk, Karnes, and Kirk, will provide a wealth of material which can serve as a basis for class discussions and activities.
Retarded children generally have very short spans of interest.	
Drill periods should be short, and repeated at frequent intervals.	
Talking in simple statements to the child while he is practicing will facilitate learning.	Any of the films listed at the end of this unit may be used, especially if there is little opportunity for actual experience with retarded children.
Retarded children have difficulty in transferring learning from one situation to another.	
Controlling the behavior of retarded children requires special considerations.	

References for Teacher and Trainees:

The Child Who Never Grew. Pearl S. Buck. John Day, New York. 1950.

Play Activities for the Retarded Child. Bernice Carlson. Abingdon Press, New York. 1961.

Child in the Shadow. Edward L. French and J. Clifford Scott. Lippincott, Philadelphia. 1960.

Basic Lessons for Retarded Children. Lucy Hamilton. John Day, New York. 1965.

Retarded Children Can Be Helped. May A. Pines. Channel Press, Inc., Great Neck, New York. 1957.

Films:

The following films may be secured from the Bureau of Community Mental Health Services, Department of Public Welfare, Harrisburg, Pennsylvania.

Beyond the Shadow. Shows the program for diagnosing and training retarded children in Colorado.

Eternal Children. A descriptive film covering the nature and needs of retarded children from "basket" child to moron.

Forget Not These Children. A color film which shows what one state is doing to help retarded children become useful members of society.

One Small Candle. A color film showing examination, diagnosis, and education of retarded children.

Children Limited. A color film showing many children with a variety of causes of arrested mental growth. Suggests the need for special care and training.

<u>Key Concept</u>: Children with certain physical handicaps require special care.

Objectives:

An understanding of the various types of physical handicaps which require special care.

Generalizations	Experiences
Aside from their handicaps, physically handicapped children are normal children.	Discuss the common physical handicaps such as: Blindness Deafness Cerebral-palsy Muscular dystrophy
Specialized care can help the physically handicapped child become a more self-sufficient individual.	Review of the books, "<u>Karen</u>," and "<u>With Love from Karen</u>," by Marie Killilea will increase understanding of cerebral-palsy.
	Arrange field trips to special school classes or institutions caring for physically handicapped children. Ask individuals connected with these institutions - or associations such as the Cerebral Palsy Association, to talk to the class concerning the care of these children.

References:

"Karen" and "<u>With Love from Karen</u>" by Marie Killilea. Prentice Hall, New York.

Key Concept: Concern for the safety of children is a prime responsibility of the Child Care Aide.

Objectives:

The ability to recognize safety hazards.

The ability to decide on a proper course of action in an emergency.

The ability to apply simple first aid treatments.

The ability to help children acquire a concern for their own safety.

Generalizations	Experiences
Many accidents can be prevented.	List the major safety hazards and decide on preventive action.
	Use newspaper clippings to focus attention of trainees on hazards to child safety.
	Arrange bulletin boards and exhibits which emphasize important points.
Emergencies call for prompt effective action.	Formulate a course of action to be followed in common emergencies.
	Ask the school nurse to demonstrate effective first aid measures for minor injuries.
Fire is a prime killer of children.	View a film (or films) which deal with fire. The "Educators Guide to Free Films" will list many excellent films which are available from "The Underwriters" or the various insurance companies.
	Have practice fire drills in the nursery school.

Generalizations	Experiences
	Plan a course of action for dealing with a fire emergency in a private home.
	Collect newspaper clippings concerning fires in which children have perished and use them as the basis for discussion and for bulletin board arrangements.
As children grow toward maturity, they can acquire a concern for their own safety.	Discuss ways in which the nursery school experience can help a child begin to assume responsibility for his own safety.

Reference:

"<u>First Aid for Your Infant and Child</u>." Eric Northrup with foreword by Morris Fishbein, M.D. Henry Holt and Co., New York. 1958.

FACILITIES AND EQUIPMENT

The essential facilities and equipment are:

A classroom or discussion center with movable tables, chairs, chalkboard, reference books, and other teaching aids. If the discussion area can not be darkened for the showing of films and film strips, an additional room should be available for this purpose. Audio-visual equipment should be available.

A child study laboratory large enough to accommodate a minimum of 12 children. It should be equipped as follows:

a. facilities for indoor and outdoor play where the trainees may, under the supervision of a professional teacher;

    guide children during play activities.

    supervise children during mealtime, rest periods, and toileting.

    supervise creative activities such as painting, clay modeling, music, and puppetry.

    help children develop desirable habits of caring for clothing and play materials.

b. facilities for observation, preferably an observation booth with a one-way window or screen.

c. provision for trainees to assist in the keeping of records pertaining to the development of children.

d. kitchen facilities in which meals and snacks for the children can be prepared by the trainees.

Guidelines for planning, equipping, and staffing a child care laboratory will be found on the following pages.

GUIDELINES FOR PLANNING, EQUIPPING, AND STAFFING A CHILD CARE LABORATORY*

Indoor Play Area - 4 Trainees

General Suggestions

- 35 to 50 square feet per child
- A warm floor is desirable. In new buildings, radiant heating should be considered. Old buildings may need to use carpeting.
- Tables and chairs should be child-size. Trapezoidal tables make varied arrangements possible. Stacking chairs are more easily stored.
- Plenty of open shelving at low heights is desirable.

Specific Suggestions

Consideration should be given to equipment for each of the following activities:

- Art activities -
  - 2 easels
  - 1 table with 4 chairs
  - Display space
  - Storage space for paints, crayons, modeling clay, paste, etc.
- Science activities -
  - Aquarium
  - Shelving for science materials
  - Plants
- Quiet activities -
  - Carpeting is desirable
  - Shelves for books
  - Record player
  - Puzzles and hand manipulative toys
  - 2 tables with 8 chairs
- Housekeeping activities -
  - 1 table with 4 chairs
  - Play table with chairs
  - Dolls and doll clothing
  - Child-size kitchen equipment
  - Cupboard for play dishes
  - Doll bed
  - Child's rocker
  - Iron and ironing board
  - Dress-up clothes

*Adapted and expanded from "Guidelines for Planning and Equipping a Child Care Instruction Laboratory," prepared by Ata Lee of DHEW for the National Seminar on Home Economics Education, Columbus, Ohio, March 28-30, 1966.

Indoor Play Area (Continued)

	• Block activities - Preferably located near door to outside play area so that large blocks may be used in both areas. Large hollow blocks should be provided. Small boards for building. Various accessories such as animals, soldiers, tractors, trucks, traffic lights, etc. • Open space activities - Open uncluttered space should be provided for group play which requires movement.

Outdoor Play Area - The same 4 trainees who conducted the indoor play activity will move outdoors with the children. The observers will also move outdoors to continue their observation.

General Suggestions	Specific Suggestions
• Located where it gets sunlight during morning hours. • Fenced or inclosed for safety. Fencing can be concealed by shrubbery. • Hard smooth surface over part of the area is desirable. • Roof over part of area is desirable. • Large enough to permit varied activities. • Landscaped to stimulate creative play.	Jungle gym See-saws Boards and saw horses Large wooden boxes Hollow blocks Sandbox Wheel toys Balls Hoops If space permits - Play-house large enough for three or four children to get inside. Flower garden. Vegetable garden. Facilities for animals such as rabbits, chickens, etc.

Toilet Area and Related Storage - 1 Trainee

General Suggestions	Specific Suggestions
• Should be located so that it is accessible to both indoor and outdoor play area. • Should be located near entrance. • Equipment should be child-size. • Should meet state requirements for nursery or pre-kindergarten schools.	• Individual cubicles for storage of children's belongings such as soap, wash cloths, comb, etc., as well as outer clothing and boots. • First-aid equipment should be accessible.

Rest Area

General Suggestions	Specific Suggestions
• Indoor play space may be utilized for rest periods. In all-day schools it should be possible to partially darken the room.	• All-day schools should provide a folding or stack cot and blanket for each child. • Part-day schools may find washable individual floor rugs satisfactory for the short rest period before lunch.

Observation Area

General Suggestions	Specific Suggestions
• Should be located where observers can have a view of indoor play area and toilet area. • Adequate ventilation should be provided. • Can double as storage area when nursery school is not in operation.	• Four to six chairs, preferably of stacking variety. • Shelf in front of chairs for note-taking. • Shielded from pupil view by one-way mirror glass. • A sound system should be considered to pick up conversation in play area.

Workshop Area - 4 Trainees

General Suggestions

A workshop area should be provided where trainees can:

- Construct, launder, and repair the clothing of nursery school children.
- Construct and repair play equipment and materials for the nursery school.
- Prepare bulletin boards, exhibits and materials for parent education.

Specific Suggestions

- Table and chairs.
- Automatic washer and dryer.
- Sink for hand laundering.
- Ironing board and iron.
- Storage for clothing repair articles, and bulletin board supplies.
- Flannel Board.

Food Preparation Area - 3-4 Trainees

The 4 trainees who had charge of the play activities will eat with the children.

General Suggestions

- Should be located adjacent to the indoor play area which will double as dining space.
- The child-size tables and chairs used for play activities may be used for dining.
- The child-size tables and chairs used for play activities may be used for dining.
- The kitchen should be equipped for the preparation and serving of the noon-day meal for the nursery school children and the trainees who will eat with them.

Specific Suggestions

- Surface cooking units and oven. (One home-size range with 4 surface units and double oven will suffice.)
- Refrigerator.
- Frozen food storage.
- Double bowl sink.
- Dishwasher.
  (Home type should be satisfactory for small nursery schools.)
- Storage for dishes, cutlery, glassware, cooking utensils, and supplies.
- Storage for staple foods.

CHILD DAY CARE TRAINING QUESTIONNAIRE*

PART I The way I feel about children:
Read each sentence carefully.
If the sentence tells the way you feel...
Not any time - write 1 in the blank
Part of the time - write 2 in the blank
Half of the time - write 3 in the blank
A lot of the time- write 4 in the blank
All of the time - write 5 in the blank

_____1. When I work with children, I feel that they understand me and I understand them.

_____2. I feel that children do what I expect them to.

_____3. I wish children would act more like adults.

_____4. I feel easy and comfortable when I am working with children.

_____5. I feel that I can listen to children and talk with children.

_____6. I feel it is important to listen to children.

_____7. I feel that I can take care of most children's problems.

_____8. I like to work and play with children.

_____9. When children are noisy, I wish they would be quiet or go away where I cannot hear them.

____10. I feel that there is nothing like a good spanking to get results.

PART II What I know about children:
Read each of these sentences carefully. Write the age that you think fits the sentence in the blank.

1. Children seldom play with other children or share toys with other children before they are _________ years old.

---

*See page 48 for the source of this questionnaire and directions for its use.

2. The best time to start to teach a baby to use the toilet is when he is about _________ months old.

3. A child will usually ask to go to the bathroom or will go himself when he is about _________ years old.

4. Usually a baby will stop using a bottle when he is _________ year old, and should stop by the time he is _________.

5. Most children up to the age _________ need to sleep in the afternoon and also need to sleep 12 hours at night.

6. Most children between ages _________ and _________ will probably not sleep in the afternoon but should rest.

7. I would expect a baby as old as _________ months to cry often when he is unable to do what he wants to do.

8. A _________ year old child can understand punishment for wrong doing while diversion works better with younger children.

9. Most children are not ready to learn to read or write before they are _________ years old.

10. Most children can dress themselves by the time they are _________ years old.

PART III Things I know or can do in taking care of children:

Below is a list of things you know or can do in taking care of children. Rate your knowledge or ability by writing A, B, C, D, or E in the blank.

A - excellent
B - good
C - fair
D - poor
E - no knowledge

_____1. Telling stories to children.

_____2. Playing games with little children.

_____3. Singing simple songs.

_____4. Correcting children.

_____5. What to expect from children of different ages.

_____6. Arranging a schedule or routine for children.

_____7. Guiding play.

_____8. Knowing how to take care of a child who is hurt.

_____9. Looking for signs of illness in a child.

_____10. Getting ready for painting, working with clay or other art work.

This questionnaire was developed by Mrs. Mary York of Phoenix College and the Arizona State Department of Vocational Education and is reprinted with her permission. Following are her suggestions for using the device.

> This questionnaire is administered at the beginning of the training period and again at the end. The first set of questionnaires is kept by the instructor and may be used to determine areas of attitudes, knowledge, and skills where improvement is needed. At the end of the course the two sets may be compared to determine improvement. Usually the trainees mark their own papers to indicate that the answer given on the paper is the better, the same, or worse than on the first. If the answer is worse, the instructor may suggest that the trainees indicate whether or not this is the result of a more realistic self-appraisal.

EVALUATING PUPIL CONCEPTS

The following test is illustrative of the type of evaluative device which might be used:

. as a pre-test to determine the concepts which pupils already have before teaching takes place.

. as a means of introducing a concept and stimulating discussion.

. as a follow-up of teaching to evaluate changes which are taking place in pupils' concepts.

If you strongly agree with the statement, place a "2" in the Agree column.

If you somewhat agree, place a "1" in the Agree column.

If you strongly disagree, place a "2" in the Disagree column.

If you somewhat disagree, place a "1" in the Disagree column.

If you are puzzled as to whether you agree or disagree, place a question mark between the two columns.

Pre-test on Individual Differences

Agree	Disagree	
( )	( )	1. Each child has a tempo and style of growth which are as characteristic of his individuality as are the features of his face or his finger-prints.
( )	( )	2. The basic pattern of development is the same for all children.
( )	( )	3. Brothers and sisters in the same family are usually so similar that it is possible to treat them all alike.
( )	( )	4. Infants are individuals from the moment of birth.
( )	( )	5. Scientific studies show that the individual characteristics of infants do not persist into later life.

( ) ( ) 6. By the time a child reaches school (5 or 6 years of age) his ways of thinking and working are basically formed.

( ) ( ) 7. Children who are intellectually ambitious in their early years tend to remain so as adults.

( ) ( ) 8. Very little learning takes place during the pre-school years because the child is too immature.

( ) ( ) 9. It is difficult to measure human growth precisely because of its many variations.

( ) ( ) 10. Babies are very much alike at birth – the differences which become apparent as they mature are due entirely to environmental factors.

Directions for scoring:

1. Mark statements 1, 4, 6, 7, and 9 as positive (true) statements on your key copy. Mark statements 2, 3, 5, 8, and 10 as negative (untrue) statements on your key copy.
2. On positive statements give 10 points for each "2" in the Agree column and 5 points for each "1" in the Agree column.
3. On negative statements give 10 points for each "2" in the Disagree column and 5 points for each "1" in the Disagree column.
4. Give no score for question marks.

WHAT WOULD YOU SAY?
(A means of evaluating pupil concepts)

One Pennsylvania teacher devised a quick and subtle way to evaluate pupil concepts. She merely described a simple situation and asked the pupils what they would say to the child involved. Their responses were then placed on the blackboard (without names) and used as the basis for class discussion.

Following is a sampling of some responses which revealed some very inadequate concepts concerning the nature of a two year old:

The situation:

Johnny (age 2-1/2) was so busy playing he forgot to go to the toilet. Now his pants are wet and there is a puddle on the floor where he was playing. WHAT WOULD YOU SAY TO JOHNNY?

"Johnny be a good boy and try to make it next time."

"Oh, Johnny, you were working so hard that you forgot to go to the bathroom! Try and remember next time. You're getting to be a big boy now!"

"Johnny, you should have gone to the bathroom. Now go and change, and then clean it up."

"Don't be ashamed. All little ones do it."

"That's all right, Johnny, I'll clean it up."

"I would ask him to try and be careful, and I would say that he should not play unless he knows when to stop."

"I would say, Johnny, why didn't you tell me so that I could have taken you to the bathroom? The next time you tell me."

"I would say to Johnny that he is a big boy - and big boys don't do that. Tell me next time."

NOTE: A device of this sort can serve not only to evaluate the level of pupil concept formation, but also as an ideal starting point for developing a concept of what can be expected of a two-year old child.

COMPREHENSIVE CERTIFICATION OF TEACHERS OF NURSERY SCHOOLS; OR CHILD CARE AND DEVELOPMENT IN CHILD DEVELOPMENT LABORATORIES IN SECONDARY SCHOOLS INCLUDING VOCATIONAL SCHOOLS

I. BASIC REGULATIONS*

A. Graduation - See Basic Regulations
B. Citizenship, Character, etc. - See Basic Regulations
C. General Education - See Basic Regulations (60 semester **hours**)
D. Professional Education - See Basic Regulations (18 semester **hours**)

II. REGULATIONS GOVERNING THE ISSUE OF NEW CERTIFICATES

A. A certificate of standard grade valid for teaching in the elementary curriculum or home economics may be extended to include teaching in the nursery school upon the completion of 1 and 2. as given below.

B. A certificate of standard grade valid for teaching in the elementary curriculum may be extended to include child care and development in child development laboratories in secondary schools upon the completion of 1, 2, 4, and 5, as given below.

C. A college certificate valid for teaching child care and development in child development laboratories in secondary schools will be issued to college graduates not holding secondary certificates upon the completion of 1. 2, 3, 4, and 5 as given below.

D. A certificate valid for the teaching of home economics in the secondary field will be extended to include child care and development in child development laboratories in secondary schools upon the completion of 1 and 2, as given below.

1. Courses in each of the following areas:

Child Development. Growth, Health, Mental Hygiene. Such courses as Growth and Development of Young Children, Child Development, Child Hygiene, Mental Hygiene, Child Psychology. Minimum requirement—6 Semester Hours.

Family Life Education. Personal Relationships within the Family Group. The Family and the Community. Such courses as The Family, Marriage and the Family, Family Relationships. Minimum requirement—2 Semester Hours.

---

*Basic Regulations - Page 9

Nursery School Education. The Purpose, Function, and Administration of the Nursery School. Meeting the needs of two-to-four-year-old children.

Such courses as Nursery School Education, Nursery School Administration, Equipment and Materials for Children in the Nursery School. Minimum requirement—4 Semester Hours.

Nutrition. Basic Principles, including the Planning and Preparation of Meals for the Nursery School.

Such courses as Child Nutrition, Food for Children, Food Preparation for Nursery School Children. Minimum requirement—2 Semester Hours.

2. Student Teaching with children between the ages of two and four. Four semester hours of credit with a minimum of 120 clock hours.

3.	Introduction to Teaching	3 Semester Hours	
	Educational Psychology	3 Semester Hours	
4.	Secondary Education	6 Semester Hours	
	Adolescent Psychology or the equivalent		2 Semester Hours
	Principles of Secondary Education and Methods of Teaching in Secondary Education or the equivalent		4 Semester Hours

5. Student Teaching in home economics in Secondary Schools. Six (6) semester hours with a minimum of 180 clock hours.

ACKNOWLEDGMENTS

The Department of Public Instruction expresses its appreciation to the persons listed below for their valuable assistance and cooperation in the preparation of this publication.

Mrs. Katherine Bass, Hazleton Senior High School

Mrs. Marian Gillespie, Central Luzerne County Joint
High School

Dr. Hazel M. Hatcher, Professor, Home Economics Education,
The Pennsylvania State University

Miss W. Esther Hill, City Supervisor of Home Economics
Education, Philadelphia City Schools

Mrs. Lillian Jamgochian, Meyers High School, Wilkes-Barre

Miss Irene E. McDermott, City Supervisor of Home Economics
Education, Pittsburgh City Schools

Dr. Winona L. Morgan, Professor, Child Development and
Family Relationships, The Pennsylvania State University

Mrs. Grace Phillips, Meyers High School, Wilkes-Barre

Mrs. Mary Pistan, College Misericordia, Dallas

Mr. Vernon Shields, Good, Long & Associates, Harrisburg

Miss Katherine A. Stooksbury, Director, Nursery Schools,
The Pennsylvania State University

Department personnel responsible for this publication:

Mrs. Clio Reinwald, Coordinator, Home Economics Education
and School Food Service

The following Department of Public Instruction staff members assisted with the production of this publication:

Dr. Neal V. Musmanno, Deputy Superintendent

Dr. John W. Struck, Director, Bureau of Vocational, Technical
and Continuing Education

Special recognition is given to Mrs. Catharine W. Birth, Area Supervisor of Home Economics Education and School Food Service, who prepared the major part of the manuscript.

MF AVAILABLE IN VT-ERIC SET 139p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *PRINTERS, *OFFSET LITHOGRAPHY, *COOPERATIVE EDUCATION,

This study guide is for student use in preparatory or service training courses for offset lithographers. It was developed by research assistants and an advisory consultant. Assignment sheets cover (1) History of Offset Printing, (2) Offset Printing as a Vocation, (3) Accidents and Health Hazards, (4) Methods of Type Composition and Reproduction, (5) Job Planning, Artwork, and Layout, (6) Proofreading and Legal Restrictions, (7) Basic Photograph Processes in Lithography, (8) Line and Halftone Photography, (9) Film Developing, (10) Negative Corrections, Stripping, and Opaquing, (11) Platemaking, (12) Papers and Inks for Offset Printing, (13) Fundamentals of Offset Presswork, (14) Makeready on Offset Presses, (15) Operation of an Offset Press, (16) Offset Press Troubles, (17) Offset Duplicators, and (18) Bindery Operations. Assignment sheets give assignment, references, and questions. Instruction time required is 180 class hours. The instructor should be a qualified coordinator. Students should be at least high school juniors. Supplementary materials include a reference bibliography, an analysis of offset printing, and a progress record. Answers for this guide are available in VT 002 052 for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

FOREWORD

This course of study, consisting of an analysis of OFFSET LITHOGRAPHY, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching offset lithography on an individual basis in a cooperative part-time program.

The original analysis and assignment sheets were prepared by Dr. G. Pat Powers, formerly Research Assistant in Industrial Education at the University of Missouri. The present revision was made by Mr. Jack Kirby, Research Assistant in Industrial Education, University of Missouri. We acknowledge the assistance of Dr. Robert E. Goetz, Professor of Graphic Arts at Central Missouri State College, Warrensburg, Missouri, for his counsel and constructive critism of the manuscript.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." And the third group--the personal-social traits--has been listed under "Personal-Social Traits Essential for the Printer of Today" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the <u>specific job</u> of each student-worker. In order to be effective, this type of instruction must be <u>individualized</u>. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets, available in a separate pamphlet, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

Printing is one of our chief means of communication. Nearly every civilized person today uses printed products in some form.

For the printing industry to be able to produce the needed quantities of printed products, with the speed and economy necessary to remain in business, a number of different printing processes have been developed. This book that YOU are now beginning to study is a product of one of these several processes.

In this course you will learn the operations necessary to do offset printing. Offset printing or as it was known earlier, "Lithography", is one of the newer printing processes and one of the most important processes in our modern printing industry.

OPPORTUNITIES AND REQUIREMENTS:

Because of the need for printed matter in nearly all of man's activities, printing has in modern times ranked consistently high among the nation's great industries. The wide variety of products of the press and the demand for a constant supply requires the efforts of many skilled persons in printing firms ranging from the small "one-man" establishments to large plants employing hundreds of workers.

Offset Printing as a vocation attracts many young men and women because it offers genuine opportunities for steady work, good pay, and advancement. The trade has several branches and numerous allied industries such as: compositors, photographers, platemakers, commercial artists, retouchers, layoutmen, proofreaders, pressmen, and draftsmen.

Young people who enter the printing trade will find that it offer abundant opportunities. While there are more men than women in the trade, women find places in all branches except where heavy lifting is done. For printing the usual requirements include a good education -- a high school education is preferred and is rapidly becoming an essential--good health, good eyesight, and a sense of design and proportion. For the most part the work of printing requires exceptional patience and a greater than average interest and aptitude for creative work.

Opportunities for advancement are especially favorable at the present time when there are few apprentices in proportion to the total number of journeymen. The work is not heavy, as a rule, and the fact that it is indoors makes it attractive to many persons as a year-around occupation.

In spite of a former widespread belief that printing occupations are injurious to health, there is little evidence on which to base this belief. There are, of course, shops in which the best conditions still do not exist, and the worker must be able to recognize them. While there are accident hazards in the use of the machinery in a printing shop, exercising reasonable care, and using the safety devices which are provided will make serious accidents unlikely.

PERSONAL-SOCIAL TRAITS ESSENTIAL FOR THE PRINTER:

Personality traits are of extreme importance, not only in securing and holding a desirable position, but in life in general. Personal-social traits can be improved through training when the individual learns what to improve, and why improvement is advisable. Among the personal-social traits of chief importance to the printer are the following:

<u>Accuracy</u>: It is of prime importance that the printer be accurate, since accuracy is basic in the printing business.

<u>Honesty</u>: This means giving full value for pay received, truthfulness, unqualified loyalty to one's employer.

<u>Dependability</u>: The ability to do good work in a businesslike manner without supervision.

<u>Intelligence</u>: The printer must be above average in general intelligence, with at least a high school education.

<u>Cooperation</u>: This implies the ability and disposition to work harmoniously with others, to be helpful, to work together.

<u>Health</u>: A printer needs good health, especially good eyesight and endurance. One who is not physically and mentally able to stand long, irregular hours should not undertake the work.

<u>Personality</u>: A printer should be able to build up good will among his customers so that they will come back. He should be a go-getter, a person of ideas, ready with helpful suggestions for potential customers. He must possess a pleasing personal appearance, a good speaking voice, and a sense of humor.

<u>Alertness</u>: For the printer who operates his own machines, manual dexterity and mental alertness are essential.

<u>Ambition</u>: The printer must have love of his work, a singleness of purpose, and an ambition to expand his business, with caution in expanding beyond his capacity to make his business pay.

Tactfulness: The ability to do and say things without offending people.

Courtesy: This involves respect for the point of view, interests, and wants of others, and although at times it will require effort, it is essential in good business and human relations.

HISTORY OF OFFSET PRINTING

Printing is one of our chief means of communication. It is difficult to imagine a world without books, magazines and other printed material. Printing actually began with the Chinese who were printing from carved blocks as early as 840 A. D. It wasn't until 1453, when Johann Gutenberg invented a mold for casting raised letters on individual metal bodies that printing really got underway.

There are four basic methods of printing: letterpress or relief printing (printing from raised surfaces), intaglio or gravure printing (printing from depressed surfaces, stencil processes, and lithography (printing from a flat surface). Lithograph, which means "stone writing," was discovered in 1798 by Alois Senefelder and is based on the chemical principle that "grease and water do not mix." At first, all lithographic printing was done by forcing the paper against the stone or plate. In 1906, Ira W. Rubel developed a press which "offset" the image onto the paper instead of printing it on directly. The development of photography and the halftone screen gave offset lithography a fresh boost.

Today, high-quality chemicals, modern halftone glass and magenta contact screens, fine plates, precision presses, and highly-refined photographic processes make possible the productions of a large volume of beautifully printed materials in either black and white or color.

In this unit you will study the important events in the history of printing with particular emphasis on the evolution of offset-lithography.

<u>Assignment</u>:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________.

<u>References</u>:

A. Cogoli, <u>Photo-Offset Fundamentals</u>, pp. 8-19.
B. Department of the Navy, <u>Lithographer 3 & 2</u>, pp. 1-6.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The term "lithography" means "stone writing."

T F 2. The inventor of lithography first used stone for plates in his early experiments.

T F 3. One of the early problems of lithography was the necessity of reverse writing.

T F 4. Artists were among the first to apply the lithographic process.

T F 5. When metal plates were first used, the plate printed directly onto the paper.

T F 6. The first attempts at photography were confined to silhouette pictures.

T F 7. The Daguerreotype process made it possible to make additional prints or copies of the picture.

T F 8. The first photographic negatives were made of paper.

T F 9. The substitution of glass for paper in making photographic negatives reduced the length of time needed for exposure.

T F 10. The first halftone screen was made of glass.

T F 11. Modern halftone screens for process color work are circular.

T F 12. The only recorded works, up until a few hundred years ago, were those hand-lettered by the scribes in the monasteries.

T F 13. Although zinc and aluminum have proven satisfactory for making plates, stone is still used a great deal.

T F 14. Offset printing methods were used on tin before they were used on paper.

T F 15. Offset lithography was developed due to well planned, scientific work.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. ____________ ____________ invented a mold for casting raised letters in the year ________.

2. The lithographic process of printing was invented by ________ in the year ________.

3. The stones used for lithographic printing are a natural ____________ ____________.

4. The term ________ ____________ was applied to the process where the metal plate printed onto a second cylinder which was covered with a rubber blanket which printed on the paper.

5. The wet-collodion negative required an exposure time of ____________.

6. The ________ ____________ made it possible to print photographs and type on the same sheet.

7. Modern halftone screens are made from __________ or ____________ ____________.

8. The printing process combining photography and offset lithography is called ____________ ____________.

9. Small offset machines used in business offices are called __________ __________.

10. Printing from raised surfaces is called ____________ printing.

11. Printing from depressed surfaces is called ____________ printing.

12. The first lithographic presses were called ____________ presses.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Lithography is based on the principle that (A) like charges repel; (B) grease and water do not mix; (C) heat increases evaporation; (D) utilizes centrifugal force.

_____ 2. The first successful cylindrical metal plates were made of (A) aluminum; (B) steel; (C) copper; (D) tin.

_____ 3. The process of photo-offset lithography was first used in the period between (A) 1875 and 1900; (B) 1900 and 1910; (C) 1910 and 1920; (D) 1850 and 1870.

_____ 4. In lithography the design is (A) raised; (B) depressed; (C) neither raised nor depressed; (D) both raised and depressed.

_____ 5. Early lithographic stones often weighed as much as (A) one ton; (B) a half ton; (C) 100 lbs.; (D) 10 lbs.

_____ 6. Rotary type presses were a result of (A) the use of zinc and aluminum for plates; (B) the development of photography in printing; (C) new type inks; (D) better types of paper.

_____ 7. The person credited with the practical discovery of offset lithography was from (A) Europe; (B) England; (C) New York; (D) New Jersey.

_____ 8. The offset press was developed in (A) 1899; (B) 1903; (C) 1906; (D) 1913.

_____ 9. One primary advantage of offset printing is (A) no press is needed; (B) less ink is used; (C) embosses paper; (D) it does not require reverse image.

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

______ 1. Johann Gutenberg

______ 2. Alois Senefelder

______ 3. Ira W. Rubel

______ 4. Professor Mitterer

______ 5. Nathaniel Currier

______ 6. Daguerre

______ 7. William Talbot

______ 8. Claude Felix Niepce

______ 9. Frederick Scott Archer

______ 10. Mathew Brady

______ 11. Charles Bennett

______ 12. George Eastman

______ 13. Henry Talbot

A. Introduced the halftone screen

B. Substituted glass for paper in making negative

C. First movable type

D. First to use photography in warfare

E. Most famous American lithographer

F. Introduced a "dry plate"

G. Discovered lithographic process

H. Introduced the first flexible film

I. Discovered offset process

J. First practical photographic process

K. Discovered the first practical process for producing photographic negative

L. Developed a cylinder-scraper press

M. Introduced the wet-collodion negative

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the advantages of the offset process over direct contact lithography.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

Assignment
Sheet No. 2

Covering
Unit 3

OFFSET PRINTING AS A VOCATION

Printing is one of the world's largest industries; it is graphic communication on a mass scale. It directly affects the lives of every one of us. The printing industry was small 100 years ago; today it comprises over 32,000 establishments and employs over 850,000 workers in the United States.

If one expects to remain in, and advance in, the printing industry, it is not adequate merely to know of the existence of job openings. The extent of these opportunities, the requirements of the various jobs, wage trends, how the field of work compares with others in the nation, future expectations of the industry and vast amounts of other pertinent information relative to the printing industry must also be known.

That you will not fall into the category of uninformed workers, this unit is designed to acquaint you with various items of factual information which will enable you to become well-rounded in your knowledge of the printing industry as a whole, and also make you aware of the position of the industry in our national economy.

Assignment:

1. Read the references listed below.
2. Secure facts and figures on local employment; find the number of plants, the number of workers, wages and hours.
3. Answer the questions below and turn in this assignment by ____________________.

References:

E. Cogoli, Photo-Offset Fundamentals, pp. 1-4, 20-25.
F. Department of Labor, Occupational Outlook Handbook, pp. 301-303.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The advent of automation has eliminated the craftsman idea from the printing trade.

T F 2. Dollarwise, as of 1954, offset printing ranks second in the printing industry.

T F 3. From 1947-1954, offset printing made a greater growth in total value of its products than did letter press printing.

T F 4. The sales staff plan and direct the company operation.

T F 5. The sales staff must know printing procedure, what the plant can do, and how much it will cost.

T F 6. The customer sometimes furnishes part, or all, of the artwork.

T F 7. Cameramen make negatives of the desired size for all the type proofs, photographs and other illustrations.

T F 8. Feeders assist the pressmen on large presses.

T F 9. Some offset shops do only presswork.

T F 10. The value of the products of the printing industry has mounted to almost $1 billion.

T F 11. The printing industry provides employment for more than 900,000 workers.

T F 12. Better than one half of all printing employees work in the printing craft occupations.

T F 13. The largest printing division in terms of numbers employed is job printing.

T F 14. Although employment in printing can be found almost anywhere, most of the employees are located in just a few states.

T F 15. Lithographic employees make up the largest group of printing craftsmen.

T F 16. Apprenticeship is the most common means of entering the printing crafts.

T F 17. In some instances, formal apprenticeship is the only method of attaining journeyman status.

T F 18. It is predicted that the demand for pressmen will decrease in the immediate future.

T F 19. It doesn't appear that technology will have much effect on the printing industry.

T F 20. The average weekly pay of production workers in the printing and publishing industry is higher than the average of production workers in all manufacturing.

T F 21. The printing industry tends to be very unstable, varying with the yearly seasons.

T F 22. Most printing craftsmen are members of unions.

T F 23. Lithography work concerns a number of specialized jobs.

T F 24. The largest expansion in offset printing has taken place in the commercial printing field.

T F 25. Most lithographic work is heavy and requires much physical effort.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ______________ ______________ works with customers, determining their requirements and furnishing information about the work to be done in the plant.

2. The maintaining and cleaning of equipment and facilities is the job of ______________ ______________.

3. Sales promotional literature and campaigns are planned by ______________ and ______________ ______________.

4. Detailed layouts are made by ______________ ______________.

5. When the type is completely accurate, a ______________ or ______________ ______________ is taken, which will be used for camera copy.

6. A "stripped-up" arrangement of negatives is called a "______________."

7. Multiple exposures are made on a "______________" machine.

7. Printed sheets are sent to the ______________ where they are cut, folded, punched, assembled or otherwise finished as may be required.

8. The ______________ ________________ wraps the finished work and ships or delivers it to the customer.

9. Each printing method requires some special ______________ in performing the work.

10. Lithographic shops are among the approximately _______ thousand establishments included in the commercial or job printing field.

11. Commercial shops that employ more than half of the total workers in these shops will generally have less than ______ workers.

12. Printing craftsmen in 1960 numbered about ____________.

13. The term of apprenticeship for printing craftsmen is generally from ___________ to ___________ years.

14. Due to the increased use of photography in printing, two science areas that are becoming important to workers in the trade are ______________ and _________________.

15. It is generally necessary to be a __________ ________________ graduate to enter the printing crafts.

16. The 1962 union wage for cylinder pressmen was __________.

17. The majority of unionized lithographic plants are under contract with the _____________ _____________ of _______________.

18. To become an all-round lithographic craftsman, an apprenticeship of from _______ to _______ years is usually required.

19. In 1960 about ____________ journeymen lithographic workers were employed.

20. The widest range of hourly rates in the lithographic field tends to be for ______________ __________________.

21. It is expected that each year during the next ten to fifteen years that _________ to __________ new workers will be needed.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Who analyzes each piece to be printed, determines the time required for each production step, computes the value of materials used, and gives the sales department the total cost of the job to "quote" to the customer? (A) executives; (B) layout men; (C) compositors; (D) estimators.

_____ 2. What group of workers maintain correspondence and records of purchases? (A) sales staff; (B) office staff; (C) executives; (D) estimators.

_____ 3. Who sets the type from the copy? (A) cameramen; (B) layout men; (C) copy preparation workers; (D) compositors.

_____ 4. Who checks the trial printing to be sure that there are no errors? (A) compositors; (B) proofreaders; (C) copy preparation workers; (D) strippers.

_____ 5. Who assembles the etch proofs and prepares them in desired page layouts for the camera? (A) copy preparation workers; (B) strippers; (C) proofreaders; (D) layout men.

_____ 6. Who arranges and tapes all the negatives on goldenrod paper? (A) copy preparation workers; (B) strippers; (C) layout men; (D) compositors.

_____ 7. Who prepares the coating solutions and coats the plates? (A) pressmen; (B) storekeepers; (C) platemakers; (D) strippers.

_____ 8. Who maintains stocks of paper, ink, and other supplies? (A) shipping department; (B) storekeepers; (C) platemakers; (D) feeders.

_____ 9. Who attaches the plate to the press? (A) pressmen; (B) platemakers; (C) copy preparation workers; (C) compositors.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List three common methods of learning a printing trade.

(A) ____________________

(B) ____________________

(C) ____________________

2. Some printing trades require a good knowledge of:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

3. List four types of schools that offer courses in printing.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

4. The main groups of lithographic workers are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

5. Offset printing is expected to continue to grow due to the greater use of:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Assignment
Sheet No. 3

Covering
Unit 4

ACCIDENT AND HEALTH HAZARDS

As a general group, printers usually enjoy good health. Government surveys have shown that long and continuous employment in the printing trades is compatible with reasonably good health.

You who have elected to work in the printing industry and who will work in the printing shops should realize that accident and health hazards are found in the printing industry as in any other major production industry. Because these conditions do exist, the hazards, their results, and means of prevention must be known in order to provide a background of knowledge about the particularly dangerous machines, and personal conduct necessary to prevent injury or illness.

A diligent study of the references assigned in this unit will provide the information necessary to aid in accident prevention, and develop an attitude which will enable you to protect your personal health.

Assignment:

1. Read the references listed below.
2. Make a list of the possible accident and health hazards as you see them in the shop you are working in.
3. Answer the questions below and turn in this assignment by ________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 176-179.
C. Latham, Lithographic Offset Press Operating, pp. 241-253.
D. Latham, Advanced Pressmanship, pp. 42-44.
I. Information Sheet No. 1, "Accident and Health Hazards."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A standard operating plan should be worked out for the shop so that, in case of injury, each individual concerned knows exactly what should be done.

T F 2. First-aid kits should be kept locked to insure safekeeping of supplies.

T F 3. The first-aid kit should be assembled by the plant physician.

T F 4. People who work in the shop should be instructed in first-aid procedures.

T F 5. An injured person should never be left alone.

T F 6. A person should never be allowed to work alone in the darkroom.

T F 7. Unsafe practices by a worker should always be corrected.

T F 8. Paper cutters should always be operated by two people.

T F 9. You cannot expect to keep the floor clean and free from paper in a print shop.

T F 10. When making solutions, the chemical should be poured into the water.

T F 11. Chemicals and solutions should always be locked in the cabinet whenever they are not in use.

T F 12. Milk bottles and other food containers should never be used for storing chemicals.

T F 13. All work areas should receive a proper amount of illumination, but this is impossible because the glare cannot be controlled.

T F 14. Skin infections can result from the use of benzine for cleaning purposes.

T F 15. The lack of dust-control within the workroom may cause diseases of the respiratory system.

T F 16. Cleaning liquids may be stored in the workroom.

T F 17. In the composing room, a bellows should be used to clean the compartments of the type cases.

T F 18. A headache or feeling of weariness may be one of the first indications of the presence of carbon monoxide within a poorly ventilated shop.

T F 19. Proper ventilation and adequate washing facilities should be provided when benzine is used to wash presses.

T F 20. Lead poisoning, while causing discomfort, is not a serious health hazard.

T F 21. In the interest of health, sterilized wiping cloths should be used for cleaning presses.

T F 22. A thoughtless or careless workman can cause a well-guarded machine to become dangerous.

T F 23. Injuries occur when the worker has his attention diverted from his job.

T F 24. Very small cuts need not be treated to prevent infection.

T F 25. Fatigue and the weakening of body resistance are the results of improper ventilation.

T F 26. Poor housekeeping is the cause of many accidents.

T F 27. The wearing of gloves can be more dangerous than none at all if bichromates get inside them.

T F 28. All workers are likely to be affected by lithographic chemicals and inks.

T F 29. There is no real cure for occupational dermatitis.

T F 30. Some research is being done in efforts to develop remedies for dermatitis.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Before any repairs should be made on a machine, the switch should be ______________ ______________.

2. Plug-in appliances should be ______________ after use.

3. The press should never be operated without the ______________ ______________ in place.

4. Chemicals should be stored on the ______________ shelves in their cabinets.

5. Never pour ______________ into ________________.

6. Every container into which any chemical preparation is to be placed must be ______________________.

7. When the hands must come into contact with irritants, ___________ ______________ should be worn.

8. A ______________ ______________ should be worn to keep chemicals from staining clothing and prevent them from reaching the skin.

9. Chemicals should never be mixed in the darkroom unless there is an ____________ _______________ in operation.

10. When looking at the burning arc of an arc light, ______________ _________________ should be worn.

11. To eliminate having to climb up and down on a machine to check certain operations, an operator may install a _______________.

12. A worker will be investing in his own safety by learning to do the job the _____________ ___________ which is also the ____________ ______________.

13. Besides good housekeeping, the other important aspect of safety is the _____________ ______________ of the press.

14. Of the solvents used in lithography, ______ ____ causes more skin irritations than the others.

15. The only remedy for dermatitis at the present time, is ___________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List five safety precautions concerning fire prevention.

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

2. List four safety precautions concerning clothing worn around machinery.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. List the three steps in thinking through each job safely.

(A) ____

(B) ____

(C) ____

4. What five precautions should be taken when loading feeders of large presses?

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

<u>Matching</u>

<u>Directions</u>: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. Tripping and falling

_____ 2. Saws and trimmers

_____ 3. Paper cutters

_____ 4. Dust

_____ 5. Lead poisoning

_____ 6. Benzine

_____ 7. Talking with workmen

_____ 8. Fatigue

_____ 9. Platen presses

_____ 10. Handling paper

A. Colic, heart and kidney disease, death

B. Loss of fingers or hand

C. Cuts, rupture, strains

D. Bruises or broken bones

E. Getting caught in rollers and belts

F. Burns and mangled hands

G. Ill health

H. Skin infection, dizziness, headaches

I. Burns

J. Crushed fingers or hands

K. Mangled hands and eye injuries

L. Respiratory diseases

M. Getting out of time with machines

Information
Sheet No. 1

ACCIDENT AND HEALTH HAZARDS

This information sheet will present certain accident and health hazards as well as their ultimate results and means of prevention.

Accident Hazards

Saw and Saw Trimmers: Mangled hands can result from contact with the moving blade, or eye injuries can result from the eyes being struck by metal pieces thrown by the moving blade. To prevent hand injuries from saws and trimmers, use guards and work holders at all times. To prevent eye injuries, wear goggles whenever operating saws and saw trimmers, even though guards are provided.

Composing Machines: With careless and improper adjustment, composing machines can cause burns and mangled hands. To prevent such injuries, see that all automatic stops are adjusted and work correctly; do not throw pigs of metal into pot; guard molds, gears, and belts.

Paper Cutters: These machines can cause the loss of one or more fingers or a hand. To prevent these losses, work alone when cutting paper; do not catch scrap as it comes from the knife; see that nonrepeating devices work properly. Make sure that the machine is fit with proper safety guards.

Slug cutters and Mitering Machines: Although these machines are hand operated their use can result in crushed, torn or cut fingers or hands. Safety demands that great care be taken when using unguarded machines: When guards are provided, they should be used.

Unguarded Belts and Gears: To avoid being caught and injured by these means of power transmission, see that all belt and gear hazards are well guarded.

Staplers, Stitchers, Platen Presses and Cornering Machines: These machines can cause crushed fingers or hands. To avoid such injury, install guards where feasible and take care when operating.

Tripping and Falling: Painful bruises are a frequent result of this hazard, with broken bones or other serious injuries possible from falling against or into machinery. The prevention of these injuries requires all type cases to be closed when not in use. Trouser cuffs should be rolled inside.

Folding Machines: The greatest hazard with this machine is getting caught in rollers or belts. The prevention of these injuries demands that guards be placed at danger points. Make adjustments only when machine is not running.

Fire: From this hazard, burns are the usual result. To prevent fires and the subsequent injuries, use approved safety cans for benzene, gasoline and kerosene; do not keep stores of flammable liquids in the workroom; do not use a celluloid eyeshade if smoking on the job is permitted.

Paper Handling: From this activity paper cuts, ruptures, and strains are possible results. To avoid strains and ruptures, do not lift excessively heavy loads. When paper cuts occur, they should be properly treated to prevent infections.

Plate Handling: Cuts on the hands are the usual result from the careless handling of plates. To prevent these cuts, take care when removing offset plates, however, if they do occur, treat the cuts to prevent infection.

Horseplay: Childish actions are extremely undesirable in a plant employing men, and usually result in falls against workmen who are operating machines; or falling against or into the machine themselves. Horseplay can be prevented by refraining from wrestling or engaging in other play.

Talking with Machine Operators: The most serious result is usually to the machine operator who runs the risk of serious hand injuries if the conversation causes him to get out of time with the machine. To eliminate this hazard, do not talk to machine operators.

Press Adjustments: Making adjustments on the press while it is running can be very dangerous. It is a good practice to never make any adjustments on the press while it is running regardless of how minor they may be.

Unauthorized Use of Machines: The variety of injuries resulting from the unauthorized use of machinery and equipment is too enormous to make a specific list of them. In order to aviod injuries from this source, all workers should heed the danger signs posted to indicate those machines which require special instruction for their operation, and refrain from operating those machines, until given the proper instruction in their use or operation.

Health Hazards

Lead Poisoning: Depending upon the amount and length of exposure, this hazard may manifest itself in any one or more of the following ways: colic, constipation, paralysis, disease of the heart, blood vessels, and kidneys, insanity or death. To prevent lead poisoning, the following precautions should be taken: do not create lead dust by splashing pigs in the metal pot; keep pieces of type from the mouth; avoid dry sweeping; do not eat in the workroom; wash hands before eating; clean nails frequently; and do not chew or smoke while working.

Improper Ventilation: This hazard is especially dangerous during the winter months when windows and doors are kept closed against the cold. The results of improper ventilation are: fatigue, weakening of body resistance, poisoning from gas and fumes. To prevent this hazard all fumes and gases should be piped from the shop.

Carbon Monoxide: This hazard results from improper ventilation and causes headaches, dullness, lassitude, nervousness, insomnia, digestive ailments, and possible death. Proper ventilation and the piping of fume and gases from the shop will remove this hazard.

Tuberculosis: The result of this hazard is general sickness, and possible death. To offset the effects of this hazard, do not use a common drinking cup or towel; prohibit spitting on the floor; exercise in open air and in sunlight; have good ventilation in the workroom.

Benzene: This cleaning fluid is highly volatile, and therefore, can present hazards both as a liquid and a gas, causing skin infections, faintness, dizziness, headaches, and vomiting. To prevent these conditions, proper ventilation should be provided, use gloves when cleaning presses, and provide adequate washing facilities. Also, see fire discussed previously for the fire hazards of benzene.

Cleaning Mixtures: The use of cleaning solutions with anilin oil bases can cause convulsions and death. If these cleaning mixtures are used, gloves should be worn; proper ventilation provided, and the user should avoid splashing the mixture on hands or clothing.

Poor Blood Circulation: The result of this condition is general ill health. Exercise in sunshine and open air after working hours will usually correct this condition.

Bad Lighting: Improper lighting causes impaired eyesight, which can be prevented by the amount of illumination, shaded and located to prevent glare.

Unclean Wiping Cloths: The skin infections caused by the use of unclean wiping rags can be eliminated by the use of sterilized wiping cloths. Local laundries usually provide a towel and wiping cloth service for those establishments requesting this service. There are also towel services located in larger cities which also offer this service.

Fatigue: The ill health caused by fatigue can be eliminated by proper rest.

Dust: The inhalation of dust results in diseases of the respiratory system. These diseases may be prevented by eliminating dust from the workroom, by prohibiting dry sweeping, by cleaning pot plungers outside the plant, and by prohibiting the use of a bellows to clean type cases while the cases are in the workroom.

Assignment
Sheet No. [illegible]

Covering
Units 5-16

METHODS OF TYPE COMPOSITION FOR REPRODUCTION

There are many type styles from which the printer may choose. The first concern of a printer in selecting a type is, of course, clarity. Type styles, if used properly, can convey the feelings or mood of a message. There are also several methods of type composition that may be used for setting copy which is to be printed by photo-offset lithography.

There are no hard and fast rules governing the style of type that is to be used in most instances. It is primarily a matter of good taste and association. You must be familiar with the various styles of type and be able to recognize them in order to make wise selections. You must also be familiar with the various methods of type composition in order to select the best method for each job.

In this unit you will learn the styles of type available, their advantages and disadvantages, and the various methods of type composition.

Assignment:

1. Read the references listed below.
2. Make up a chart showing the most commonly used typefaces with which you will be working and explain an appropriate use for each.
3. Answer the questions below and turn in this assignment by ____________________________.

References:

1. Cogoli, Photo-Offset Fundamentals, pp. 33-55.
2. Department of the Navy, Lithographer 3 & 2, pp. 13-33, [illegible].

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Newly cast type should be used for making reproduction proofs.

T F 2. Enlarging or reducing type may destroy the original balance and beauty of the type.

T F 3. The current practice in industry is to send reproduction proofs to the cameraman all "made up" in page form.

T F 4. The shoulder is not included when measuring the body size of the type.

T F 5. It is necessary to see the type in actual printed form to determine how large it will appear when printed.

T F 6. Type that measures 4 picas is 24 point.

T F 7. Strips 6 points or more are called "leads."

T F 8. A brayer is used to measure type.

T F 9. Monotype is cast in complete lines of individual letters and spaces according to copy.

T F 10. Linotype and Monotype machines are similar in appearance, operation and final product.

T F 11. The Intertype machine casts individual characters.

T F 12. A line of type cast by a Linotype machine is called a "slug."

T F 13. Matrices are often referred to as "mats."

T F 14. Each matrix must be returned to its original place by hand when using the Linotype machine.

T F 15. Linotype slugs cannot be melted down and used in casting other slugs.

T F 16. The Ludlow machine produces a solid line of type.

T F 17. The Ludlow machine is faster than the Monotype machine.

T F 18. The Ludlow machine is not recommended where large sizes of type are needed.

T F 19. The Ludlow machine is a hand set system.

T F 20. Four-line wood type would measure 2 picas.

T F 21. Hand lettering is especially useful for display lines.

T F 22. The Vari-Typer is a machine used to cast type.

T F 23. A wide selection of type faces is available for the Vari-Typer.

T F 24. The Vari-Typer makes no provisions for line justification.

T F 25. Display lines are often composed by assembling printed characters.

T F 26. The Headliner is a portable phototype-composition machine for composing entire pages.

T F 27. The film must be removed from the Headliner for developing.

T F 28. The Monophoto will produce photo-composed type matter from 6 points to 24 points in size.

T F 29. The maximum film size for the Monophoto is 8½" by 11".

T F 30. The Monophoto is actuated by a perforated paper ribbon that is prepared on the same Monotype keyboard used for "hot-metal" composition.

T F 31. The Intertype Fotosetter photographs one line of type at a time.

T F 32. The ATF Typesetter will set only one size of type.

T F 33. One hundred eight different faces and sizes of type are available on the Linafilm system.

T F 34. The Linafilm system uses an automatic justification system.

T F 35. Unlike the ordinary typewriter, the IBM Proportional Spacing machine does not allow the same amount of space between each letter.

T F 36. The DSJ composing machine allows the same amount of space to all letters.

T F 37. Eight- to fourteen-point type is considered to be too small for good legibility.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Metal type may be set either by ______________ or by ______________.

2. Reproduction proofs are taken from metal type on dull-coated ______________ paper with ______________ ink.

3. Cellophane reproduction proofs are best made on a proof press equipped with a ______________ tympan sheet.

4. Many types have a space beneath the letter on its face, called the ______________.

5. ________ picas equal approximately one inch.

6. There are ___________ points in each pica.

7. All metal type used in the U. S. is ________ inches high measured from the feet to the face of the type.

8. Complete collections or assortments of foundry type are called ______________.

9. Blank units are called ______________.

10. Variations of any one type face design are known as a ______________.

11. Making lines equal in length is called ______________.

12. Wide spaces are called ______________.

13. Composed foundry type is placed on a ______________ which is placed on a bed of a proof press.

14. The Monotype system employs two machines: the ______________ machine and the ______________.

15. The Ludlow machine finds great use in ______________ composition.

16. Wood-type is employed instead of metal type for very ___________ sizes of type.

17. Wood-type is usually made of ______________ wood.

18. Sizes of wood-type are designated in ______________.

19. Typed copy that is to be photographed for reporduction is often called ____________________.

20. The Monophoto operates at the rate of ________ characters per minute.

21. The Linofilm composer performs two basic functions: ____________________ and ______________.

22. The first concern of a printer in selecting type is ____________.

23. The most commonly used type for the text of books is ___________.

24. The type face most commonly used for announcements, invitations, etc., is called ______________.

25. Text type face may be called ________________ ________________.

26. Italics are used in text matter to show ________________.

27. When an initial letter is used, the remainder of the word is generally ______________.

28. If a line is so short that the adjustment of space between words is not enough, it becomes necessary to place ______________ ______________ between the letters of each word.

29. The process of placing thin inserts between the letters in each word is known as ______________.

30. Paper or plastic plates used on smaller offset presses areknown as ____________________ plates.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List seven methods of type composition:

(A) __________________________ (E) __________________________

(B) __________________________ (F) __________________________

(C) __________________________ (G) __________________________

(D) __________________________

2. List four kinds of metal type:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. List four machines used for composing entire pages of type matter on film:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. Of what four units is the Linofilm system comprised:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

5. List the six main classes of types as classified by the references:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

6. List the six factors that have the greatest bearing on legibility:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

7. List five types of work that would be classified as copy preparation:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ ______________________

Assignment
Sheet No. 5

Covering
Units 17-25

JOB PLANNING, ARTWORK, AND LAYOUT

Good planning, which is an essential part of every job, is little more than proper organization. One aspect of planning involves determining the operations to be performed and estimating the time, men, and materials that will be required to do the job. Another aspect of planning involves a plan or "layout" of the job to be done. The layout may involve the preparation of artwork or at least touching up photographs or illustrations.

A lack of planning will result in the loss of time, money, effort and perhaps customers. It is of utmost importance that every job be analyzed and carefully planned. Each step must be planned to make the most efficient use of time and equipment. A full-sized layout will insure the customer of getting what he wants--he will be able to see what the finished product will look like. It also contains all instructions so that each worker knows exactly what is to be done.

In this unit you will learn techniques of planning and methods and procedure for making the layout. You will also learn of some of the procedures for preparing artwork.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 26-32, 61-67.
B. Department of the Navy, Lithographer 3 & 2, pp. 34-39, 64-82.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The layout contains instructions for the worker.

T F 2. Large firms usually employ specialists in layout.

T F 3. Some customers have their work planned and laid out by commercial advertising agencies.

T F 4. Type that is smaller than 14 point is generally referred to as display type.

T F 5. It is generally agreed that the most legible body type composition consists of 6- to 8- point type.

T F 6. Punctuation marks must be included when determining the total number of typewritten characters there are in the total copy.

T F 7. Some type manufacturers furnish information concerning the number of characters per pica for their type.

T F 8. A sketch or a proof of an illustration should always be put on the layout.

T F 9. It is not necessary to indicate type faces on a dummy.

T F 10. The dummy must be made to look as much like the finished work as possible.

T F 11. A dummy usually involves more than one page of printed work.

T F 12. Two different jobs should never be run at the same time.

T F 13. A layout should be made-up to the exact finished size of the job.

T F 14. Generally a fairly complete layout will save more time than can be eliminated by making just a very rough layout.

T F 15. You should not write on the back of camera copy.

T F 16. Halftone copy includes all work which has gradations in tone.

T F 17. Halftone screens come with just one size screen ruling.

T F 18. Usually line drawings are prepared larger than they will be printed.

T F 19. Line drawings require more care than tone copy.

T F 20. Retouching of photographs is generally done with watercolors.

T F 21. If photographs are not receptive to watercolors, they cannot be retouched.

T F 22. Airbrushing is particularly useful for retouching photographs with damaged emulsion.

T F 23. Photographs should never be rolled.

T F 24. Cropping means mounting photographs on stiff cardboard.

T F 25. Tone drawings should always be prepared to be used at full size.

T F 26. It is generally difficult to copy colored photographs and other colored illustrations for black-and-white reproductio

T F 27. Crayon drawings generally give good reproduction.

T F 28. Transparencies have their widest use for black-and-white reproduction.

T F 29. When making up combination copy, the overlay method is the most economical.

T F 30. If it is desirable to have white type show up on the final product, white letters must be put on the copy.

T F 31. Illustrations that are to be reduced or enlarged can be placed on the paste-up but a notation should be included to inform the camera man of this fact.

T F 32. Illustrations done by others should be used only as references and should never be copied.

T F 33. The separation of colors for color reproduction of tone copy normally is not done by the artist.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence.

1. A full-sized plan of the contemplated job is called a __________.

2. Before a full-sized plan is attempted, a number of ______________ ______________ are made.

3. When a rough layout seems promising, a ______________ layout is made.

4. The copy notation for a display line indicates the type size as "16/18"; this indicates a 16-point ______________ on an 18-point ______________.

5. Type faces 12 points and smaller are called ______________ or ______________ types.

6. The typewritten copy that is to go into a certain space on the layout is indicated by a ______________ or ______________ marking.

7. Determining whether or not the type will fit in the available space is known as ____________________.

8. The amount of space that display type will occupy is determined by means of a ______________ ______________ ______________.

9. When no leading is set between lines, the type is said to be set "______________."

10. A good selling point is to use ______________ on the layout in the same manner as it will be used for the finished illustrations on the job.

11. The body type in a dummy is indicated by ______________ ______________.

12. If it is desired to reduce an illustration with a width of 9 inches and a height of 12 inches so that the reduced height is 4 inches, then the reduced width will be ________ inches.

13. One advantage of reducing original drawing is that the ______________ are also reduced.

14. The proper physical form to be used for a job should be determined by the ______________ of the job.

15. Running small jobs two or more up reduces ______________ and cuts down ______________ ______________.

16. When a number of pages of a job are printed on one sheet, the sheet is referred to as a ______________.

17. Certain kinds of work, such as photographs and water color drawings are known as ______________ ______________.

18. In order to indicate instructions and specifications on artwork without marking up the copy, an _______________ should be used.

19. A group of photographs pasted together to form a new picture is called a _______________.

20. When an illustration is to bleed, it must be marked so that after reduction, it will be at least ________ points wider and higher than it is to appear after the page has been trimmed.

21. An inset is a small picture inserted into a _______________ _______________.

22. Quality work in combination copy is best achieved by using an _______________ _______________.

23. When colors are to overlap in a color reproduction, it is essential that some type of _______________ be used in preparing the copy.

24. When doing preliminary ruling for a paste up, a _______________ pencil should always be used.

25. The adhesive that should be used for pasting up is _______________ _______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Notations along side the layout of display type should indicate:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

2. List four examples of line copy:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

____

3. List three examples of halftone copy:

(A) ______________________________

(B) ______________________________

(C) ______________________________

4. List four methods of figuring reductions and enlargements:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

5. All artwork falls into one of three general classifications which are:

(A) ________________ (C) ________________

(B) ________________

6. Three types of halftone finishes are:

(A) ________________ (C) ________________

(B) ________________

7. Additional interest can be brought into page make-up by the use of:

(a) ______________________________

(b) ______________________________

(c) ______________________________

Sheet No. 6

Covering
Units 26-28

PROOFREADING AND LEGAL RESTRICTIONS

A universal language among printers exists in the system of marks used to indicate errors in composition and the changes necessary for the correction of these errors. It is essential that the compositor master the formation and the interpretation of these marks regardless of the size of the shop in which he works. Large commercial printing firms, such as those printing newspapers and magazines, employ trained proofreaders who check proofs for errors. The compositor must be able to interpret the proofreader's marks in order to make the indicated corrections in the composed form. In smaller printing establishments, the compositors also do proofreading, usually that which someone else has composed.

Because much of lithography work involves the copying of previously printed work, it is well for workers in the field to be familiar with the legal restrictions on copying. This will help to eliminate serious problems and possibly court action.

This unit will provide you with the general procedures of proofreading and also a knowledge of the Standard Proofreader's Marks. Further, you will learn of some of the legal restrictions that govern copying material.

Assignment:

1. Read the references given below.
2. Make a chart of the common proofreader's marks
3. Answer the questions below and turn in this assignment by ______________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 56-60, 180-184.
B. Department of the Navy, Lithographer 3 & 2, pp. 61-63.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Proof is usually pulled on paper which is larger than the type form.

T F 2. Photographically composed type is proofread directly from the positive or negative.

T F 3. Only the final camera copy of typewritten and pasted-up type is usually available for proofreading.

T F 4. Copy is usually proofread only once.

T F 5. A revised proof is taken after the compositor has corrected the errors.

T F 6. Mark-up instructions are not proofread.

T F 7. Special indentions are noted by the reader.

T F 8. The reader tells whether dates and amounts are indicated by figures or words.

T F 9. All errors are marked in the left-hand margin.

T F 10. As an extra precaution, the marker often reads aloud from the proof and the reader follows the original copy after the first proofreading.

T F 11. Sometimes one person performs the functions of both reader and marker.

T F 12. The only responsibility the proofreader or marker has is to see that the proof exactly matches the copy.

T F 13. The proofreader or marker may suggest improvements in the grammar of the copy.

T F 14. Some magazines are proofread twelve or more times.

T F 15. The proofreader is not supposed to make any changes except where there are typographical errors.

T F 16. Proofs should also be checked for type sizes.

T F 17. "Stet" indicates a change is to be made.

T F 18. The proofreaders' mark $\underset{\smile}{\#}$ means "equalize space between words."

T F 19. The proofreaders' mark "∽" when used in text, means to transpose.

T F 20. The proofreaders' mark sp. means to spell out.

T F 21. It is not possible to copyright everything.

T F 22. A copyright may not be renewed.

T F 23. It is best to get written permission to copy something.

T F 24. If no copyright is indicated on printed matter it can be assumed that permission is granted to copy.

T F 25. Any photographs which show clearly recognizable faces of persons cannot be used for advertising purposed without first obtaining written consent from the persons involved.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Proofreaders' marks are really a printer's ______________.

2. The ______________ reads aloud from the original copy to the ______________ who follows along on the proof.

3. The reader spells out ____________ — ______________ and ______________.

4. The marker indicated the necessary correction by using a system of symbols known as ______________ ______________.

5. The proofreaders' mark G? indicates a question of ___________.

6. The proofreaders' mark F? indicates a question of ___________.

7. The proofreaders' mark "flush ¶" means no paragraph ______________.

8. Proofreaders' marks should made with a ______________ pencil when marking copy.

9. To correct an error before the copy is photographed, it is merely a matter of ______________ the correction over the error.

10. The owner of the copyright has the exclusive right to ______________ his work, and to ______________ or ______________ copies of his work.

11. A copyright runs for a period of ________ years.

12. Protection on unpublished books, photographs, maps, etc. begins when the works are created and ends when they are published for ______________ or ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The marginal mark "bf" combined with a word underlined with a wavy line in the text of the proof means: (A) broken font; (B) delete word; (C) set in small italics; (D) set in bold face.

_____ 2. The mark "stet" in the margin of a proof means: (A) set this eliminated text; (B) let it stand; (C) second revise; (D) scrap time every time.

_____ 3. The mark "l.c." in the margin of a proof means: (A) lower caps; (B) less capitals; (C) lower case; (D) leaded counter.

_____ 4. The mark "#" in the margin means: (A) insert space; (B) equalize space between words; (C) close up partly; (D) close up entirely.

_____ 5. The proofreaders' mark "⁐" means: (A) close up partly; (B) close up entirely; (C) not leaded; (D) more space between words.

_____ 6. The proofreaders' mark "#" means: (A) no paragraph indention; (B) hanging indention; (C) no paragraph; (D) begin a paragraph.

_____ 7. The proofreaders' mark "fl L" in the margin means: (A) set in light face type; (B) move to left; (C) align type vertically; (D) less space.

_____ 8. The proofreaders' mark " $\frac{1}{M}$ " indicates to the compositor that: (A) one hyphen is to be inserted; (B) one em-quad is to be inserted; (C) one em-dash is to be inserted; (D) paragraph is to be indented one em-quad.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the three elements of a copyright notice.

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. List five groups of items that may not be reproduced in photographic or printed form:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

T F 24. Two or more individual lenses are usually fitted together for use in cameras.

T F 25. Depth of focus is quite important in process camera work.

T F 26. Focal lengths are fixed and do not change.

T F 27. Focal length of a lens is usually stamped on the lens barrel.

T F 28. Lenses with short focal lengths can produce larger images than those with long focal lengths.

T F 29. Enlarging an image requires a longer exposure time.

T F 30. The opening formed by the iris diaphragm is called the lens aperture.

T F 31. The fastest lens is the one with the smallest relative opening.

T F 32. The largest apertures always have the smallest f-numbers.

T F 33. Large apertures and short exposures will produce sharper pictures than small apertures and long exposures.

T F 34. Both the lens opening and the exposure time need to be adjusted for practically all exposures.

T F 35. Camera lenses should be cleaned with alcohol.

T F 36. Even the best lenses have some defects.

T F 37. Filters are used to alter the color and the intensity of light.

T F 38. All process cameras are equipped with shutters.

T F 39. Longer exposures are necessary when filters are used.

T F 40. Vertical process cameras are hardly ever focused visually.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Film is placed in the camera with the _______________ side facing the lens.

2. The transparent area on the film is called the ______________.

3. Two general classes of horizontal cameras are used for offset photography: the ______________ camera and the ______________ camera.

4. The most critical part of the camera is the ______________.

5. A lithographic worker should never take the lens ______________.

6. The abbreviation FL is used to indicate the ______________ ______________ of a lens.

7. Focal length of a camera lens is given in ______________.

8. A practical expression of focal length would be: ______________ of the distance from the camera copyboard to the ground glass. when the focused image on the ground glass is the ______________ ______________ as the object on the copyboard.

9. F-stop numbers indicate the size of the ______________.

10. A slot in the lens barrel to permit the use of filters for color work is called the ______________ ______________ slot.

11. The light source for the darkroom (or gallery) camera may be ______________ or ______________ ______________.

12. The ______________ of a camera focuses or projects the light rays onto the film.

13. The film used in cameras is a sheet of transparent acetate coated with a layer of gelatin in which are suspended millions of tiny particles of ______________ ______________.

14. The paper positive is called a ______________.

15. The camera used for copying is known to the trade as a ______________ camera.

16. There are two types of process cameras: ______________ and ______________.

17. The image formed on the film in a pinhole camera appears upside down because light travels only in ______________ ______________.

18. Tripling the distance between the film and the lens will enlarge the image ______________ times.

19. Doubling the distance between the film and the lens will require an exposure ______________ times longer than the original.

20. The focal length of a lens is 8"; if the collar is set at f4, the diaphrahm will form an opening in the lens barrel that is approximately ______________ in diameter.

21. Sharp visual focusing may not always agree with the scale positions because of flaws in the lens known as ______________.

22. The length of the exposure is controlled by the ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The five basic parts of a darkroom camera are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

2. List the three components of the camera back:

(A) ______________ (C) ______________

(B) ______________

3. List two types of film holders:

(A) ______________

(B) ______________

4. The five basic camera settings for same size are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

5. List the three parallel planes of a horizontal process camera:

(A) ______________________ (C) ______________________

(B) ______________________

6. The three items by which lenses are usually classified are:

(A) ____

(B) ____

(C) ____

7. List seven types of flaws in camera lenses:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

Assignment
Sheet No. 3

Covering
Units 36-43

LINE AND HALFTONE PHOTOGRAPHY

Lithographic photography is divided into two kinds: line photography and halftone photography. Line photography is the photography of copy which is composed entirely of solid areas or lines of a single tone. No shadow areas or gradations of tone may be present. Any work which contains gradations of tone must be reproduced by the halftone process. Gradations of tone are formed in such things as original photographs, oil paintings, crayon and pencil art.

Tone values are lost in line photography; the introduction of the halftone screen made possible the reproduction of original photographs and the like without loss of tone values. It wasn't until 1893 that photoengravers took up halftone work in earnest. The photographs in newspapers, magazines, and books are almost always printed by the halftone process.

In this unit you will learn about methods and procedures involved in shooting line and halftone copy.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by __________________________.

References:

A. Cogoli, *Photo-Offset Fundamentals*, pp. 75-90.
B. Department of the Navy, *Lithographer 3 & 2*, pp. 137-171.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The sharpness of focus should be checked with a magnifying glass.

T F 2. The camera must be focused before the film is loaded.

T F 3. Ortho Type 2 film is sensitive to red light.

T F 4. The emulsion side of the film should be facing away from the camera lens during exposure.

T F 5. The emulsion side of the film is darker than the base side.

T F 6. Standardization is important in process camera work.

T F 7. Most cameramen use the f/32 aperture for same size line work.

T F 8. If adjustments for size are necessary, the lensboard is first moved and then the copyboard is relocated to return the image to focus.

T F 9. When focusing the camera visually, the diaphragm should always be wide open.

T F 10. Fine line work should always be focused with the opening that is to be used for the exposure.

T F 11. The emulsion side of film can be determined in total darkness by moistening your lips and pressing a corner of the film between them.

T F 12. A notch on the corner of film indicates that the film is to be used for color reproduction only.

T F 13. White backgrounds and copy with smooth surfaces require more exposure time than dark backgrounds and copy with rough surfaces.

T F 14. The best way to determine the correct exposure is by shooting a trial negative with a series of different exposures.

T F 15. If lens aperture remains constant, exposure time must be varied for enlargements or reductions.

T F 16. Greater sharpness can be obtained with an f/32 aperture than with an f/45 aperture.

T F 17. In making line shots for color reproduction, a simple black-and-white drawing is all that is required if the colors do not overlap.

T F 18. Filters must be used in photographing all colored copy.

T F 19. When the subject is to be made dark against a light background, you should select a filter which will transmit the color of the subject and absorb the color of the background.

T F 20. The halftone is a smooth gradation of tone.

T F 21. Negatives used to make printing plates must contain no semi-opaque areas.

T F 22. The usual screen angle for a blue color is 45-degrees.

T F 23. Filters are not necessary in making color negatives if the angle of the screen is changed for each color.

T F 24. Halftone negatives are usually made with one exposure.

T F 25. The "flash" exposure is made by opening the camera back and exposing the film set-up to a flashing lamp.

T F 26. An already-printed halftone picture must always be "rescreened."

T F 27. It is not necessary to make a test negative when the Kodak exposure computer is used.

T F 28. The lines on the screen are generally the same width as the space between them.

T F 29. Halftone screens are placed in the screen holder with the marked side facing the lens.

T F 30. A wedge gage is used to set the screen parallel with the film.

T F 31. You should use the same screen distance for all exposures made with a given screen.

T F 32. The size of the openings in the screen has a direct bearing on the distance the screen is placed from the film.

T F 33. Waterhouse stops are used when large apertures are needed.

T F 34. The f/22 opening is generally used as a basis for the high-light exposure.

T F 35. Colors for halftone color separation are obtained by using colored film.

T F 36. Overprinting green with yellow produces blue.

T F 37. Color separation is only about 60 per cent accurate.

T F 38. Only one negative is necessary in combination work if the line does not overlap the tone copy.

T F 39. Masks are often used in combination work.

T F 40. The contact screen is composed of opaque lines.

T F 41. Magenta screen cannot be used for direct color separation.

T F 42. Generally it is not possible to get both good highlight separation and shadow detail with a magenta contact screen.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Copy that is composed of solids or lines is called ______________ ______________.

2. To determine the size of the film needed, measure the size of the ______________ on the ______________ ______________.

3. An image consisting of very fine lines should be examined with a ______________ to ensure a sharp focus.

4. The exposure time is figured directly as the ______________ of the distance from the light to the copy.

5. Process lenses are at their best when used with openings ranging from ______________ to ______________.

6. To ensure uniformly developed negatives, one should have a ______________ sink or a ______________ and a ______________ ______________ chart in the darkroom.

7. To make a positive print by the contact print method, the film should be exposed to ______________, ______________ light.

8. Most pictures in newspapers and magazines are printed by the ______________ process.

9. There are two general types of halftone screens: ______________ and ______________ ______________.

10. The usual screen angle for a yellow color negative is ______________.

11. ________________ screens for halftone photography are used in direct contact over the film in the camera back.

12. When making halftone negatives with the Kodak Magenta Contact Screen, the required detail exposure and the flash exposure can be determined by using the ____________ ____________ ____________ ____________ ____________ and the ____________ ____________ ____________ ____________.

13. The halftone screen was invented by ______________ ____________

14. Halftone screens are available in standard rulings of from ____________ to ____________ lines per inch.

15. When using a 133-line screen, the distance from the film to the glass surface should be about ____________.

16. The f/ ____________ lens opening is generally used as a basis for the detail exposure.

17. A ____________ scale is used for classifying contrast of copy.

18. Halftone negatives which have no dot at all in the highlights or in the white background are called ________________.

19. Halftone color separation is known as ______________ ______________.

20. If the copy is to be reproduced in full color, it is necessary to make ____________ separate negatives and ______________ separate press plates for it.

21. There are two methods of making color-separation negatives: the ______________ method and the ______________ method.

22. ________________ per cent of the paper is left as white space in a quarter tint.

23. When a halftone is rescreened and the new dot formation overlaps the old, a pattern called ______________ is formed.

24. There are two types of contact screens: the ____________ screen and the ______________ screen.

25. ____________ ______________ ______________ film does not require the use of a screen to produce a halftone negative.

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Color to be photographed

_____ 1. Red as white

_____ 2. Violet as black

_____ 3. Blue as white

_____ 4. Green as white

_____ 5. Yellow as black

_____ 6. Red as black

_____ 7. Green as black

_____ 8. Violet as white

_____ 9. Orange as white

_____ 10. Yellow as white

Color of filter

A. Green

B. Deep yellow

C. Red

D. Light green

E. Blue

F. White

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Exposure time is dependent on the:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

2. Full color-process printing generally requires four separate printing impressions -- one for each of the following colors:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. The formation of the dots produced by the glass halftone screen is dependent on:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

4. List the three common exposures in a multiple exposure of halftone work.

(A) ______________________ (C) ______________________

(B) ______________________

Assignment
Sheet No. 9

Covering
Units 44-51

FILM DEVELOPING

Reflected light during exposure of the film in the camera produces a latent image on the film. After the film has been exposed, it must be developed to make the latent image visible. There are four steps to developing: (1) the developing bath; (2) the shortstop bath; (3) the fixing bath; and (4) the washing of the film.

Photography is a scientific art based on chemistry and physics. As you have seen in previous assignments, a great deal of care must be taken in setting up the camera and making the exposure. But, regardless of the care that is taken in making the exposure, a good negative can result only from following the proper developing procedure. If the negative is ruined in the developing process, all of the previous work in setting up the camera and exposing the film is lost--this is a waste of time, effort, and material.

In this unit you will learn about the materials used and the processes involved in developing film.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 91-97.
B. Department of the Navy, Lithographer 3 & 2, pp. 113-136.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Materials used in photography are not noticeably affected by temperature changes.

T F 2. Darkrooms should be well ventilated.

T F 3. All chemicals should be stored in the darkroom.

T F 4. A blue safelight should be used for orthochromatic film.

T F 5. Panchromatic film emulsions are sensitive to all colors of light and must be handled in total darkness.

T F 6. The sharp detail obtained in contact printing is often lost in enlarging.

T F 7. Matte prints are usually dried on ferrotype plates.

T F 8. A pH value of 2 denotes alkalinity.

T F 9. A pH of 5 is ten times as acid as a pH of 6.

T F 10. The colorimetric method of determining pH is the most accurate method.

T F 11. The pH control in lithography is used chiefly for testing the coating solution for the zinc plates and the press fountain solution.

T F 12. Fast films are more grainy than slower films.

T F 13. Glass plates are usually used for close-register work.

T F 14. Wet plates are used more often in lithographic work than dry plates.

T F 15. Photographic papers are sometimes used for making negatives

T F 16. Paper negatives are not recommended for halftone work.

T F 17. Panchromatic film is sometimes used for color-separation jobs.

T F 18. Process film is generally used for continuous tone negatives.

T F 19. Process film forms sharper, more abrupt breaks between the highlight and shadow areas than does commercial film.

T F 20. Commercial film is usually used for halftone negatives.

T F 21. Line negatives are usually made with process film.

T F 22. Most process film is slow.

T F 23. The shortstop bath removes all unexposed particles of silver from the film.

T F 24. Too much accelerator will soften the emulsion and cause fog.

T F 25. The water used to dissolve developer powder should not be over 125° F.

T F 26. Distilled water is preferred for developers.

T F 27. Developer should not be used after it has set for more than ten hours.

T F 28. A highly concentrated developer will cause the film to develop too fast and may produce excessive contrast and fog.

T F 29. Too much dilution of the developer will increase fog.

T F 30. Developer is usually sold in concentrated powder form in two separate containers: Part A and Part B.

T F 31. Development may stop entirely if the temperature of the developer drops below 70° F.

T F 32. Film may be developed by inspection instead of a set time.

T F 33. Chemicals left on the film from the fixing bath will cause brown stains if they are not removed.

T F 34. Soft photographic papers are used if the negative is thin and flat.

T F 35. Number 1 photographic paper is softer than Number 5.

T F 36. It is better to control the contrast of the print by manipulating development time than by varying the exposure.

T F 37. Negatives that are to be kept for future jobs should be washed for at least thirty minutes.

T F 38. An image may be prepared on a mechanical negative by typing or drawing with a stylus.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Colored lights used in the darkroom are called ________________.

2. Entrance to the darkroom is by way of a ____________________ ________________.

3. Work should be kept at least ____________ feet away from the safelight.

4. Positive copies on film are called ______________ ____________.

5. Glossy prints are usually dried on thin metal plates called ______________ ________________.

6. One of the quickest ways of telling whether a solution is a base or an acid is by testing it with _____________ paper.

7. The degree of activity of the acid or alkali in a solution is known as its _______________ value.

8. There are two processes for determining pH: the ____________ method and the ______________ method.

9. The light-sensitive silver particles used in making films are suspended in _______________.

10. There are two types of glass plates: _____________ plates and ______________ plates.

11. The manufacturer of film generally places a coating of dye known as _______________ _______________ between the emulsion and the film base.

12. The _______________ bath stops the action of the developer solution.

13. A ________________, such as boric acid, is used in the developer solution.to control the activity of the paraformaldehyd

14. Developer solution should be about ___________ or ____________ degrees F. when used.

15. A negative that lacks density was most likely _______________ or _______________.

Multiple-Choice

Directions: In the space at the left of each statements, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The thickness of film ranges from: (A) 0.001 to 0.004 of an inch; (B) 0.003 to 0.015 of an inch; (C) 0.03 to 0.15 of an inch; (D) 0.4 to .8 of an inch.

______ 2. Orthochromatic film is sensitive to all colors except: (A) red and green; (B) orange and red; (C) green and blue; (D) orange and green.

______ 3. Panchromatic film is sensitive to: (A) red colors; (B) green and blue colors; (C) red and orange colors; (D) all colors.

______ 4. A film's ability to reproduce thin lines is known as its: (A) resolving power; (B) speed; (C) sensitivity to light; (D) density.

______ 5. Most process film has a high contrast ranging between a gamma of (A) 1 to 3; (B) 3 to 10; (C) 5 to 9; (D) 7 to 11.

______ 6. Which of the following baths causes the latent image to become visible on the film? (A) shortstop; (B) fixer; (C) developer; (D) water.

______ 7. An alkali is generally added to the developer to act as a/an (A) reducing agent; (B) accelerator; (C) buffer; (D) preservative.

______ 8. A generally satisfactory shortshop bath is composed of 15 parts water and one part: (A) acetic acid; (B) silver salt; (C) hydroquinone; (D) boric acid.

______ 9. Which solution dissolves all the underdeveloped silver salts and clears the film to prevent fogging? (A) developer; (B) shortshop; (C) fixer; (D) water.

______ 10. Water used in the water bath should be (A) 56° F; (B) 68° F; (C) 79° F; (D) 84° F.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List, in the order of their use, the four trays that are generally used in the developing process.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List the three most common bases for photographic emulsions.

(A) ______________________ (C) ______________________

(B) ______________________

3. What are the five main chemical agents in developing solutions?

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

4. Film emulsions are classified according to their:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

5. List three possible reasons, other than too short a developing time, for the image not developing on a negative.

(A) ______________________ (C) ______________________

(B) ______________________

Assignment
Sheet No. 10

Covering
Units 52-57

NEGATIVE CORRECTIONS, STRIPPING, AND OPAQUING

Few negatives are perfect. While you should do your best to produce a perfect negative -- follow the proper developing procedure and keep the darkroom clean -- you will often find that minor corrections need to be made on the negative. Pinholes, shadow lines and other undesirable marking on the negative must be corrected before the plate is made.

After the negatives for a job have all been made and corrected (if necessary), they are taped on a sheet of goldenrod paper. This paper, with its taped on negatives, is called a "flat;" arranging and mounting the negatives on the flat is referred to as "stripping." Much care must be taken in laying out the flat; after the exposed plate has been developed, the image on the plate is an exact duplicate of the image on the flat. Spacing cannot be changed after the plate is made.

In this unit you will learn the proper procedures for correcting negatives and stripping the flat.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by __________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 98-107.
B. Department of the Navy, Lithographer 3 & 2, pp. 172-190.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Chemicals spilled on the darkroom floor may cause undesirable markings on negatives in the darkroom.

T F 2. Shadow lines may be spotted out on negatives by opaquing.

T F 3. Opaque should never be applied to the back of a negative.

T F 4. The main disadvantage of black opaque is its tendency to chip and smudge.

T F 5. Red opaque covers larger areas better than black opaque.

T F 6. Red opaque is more likely to prevent absolute contact between the negative and the plate than black opaque.

T F 7. The primary disadvantage of turpentine opaque is its tendency to develop pinholes.

T F 8. Opaque is generally applied with a brush.

T F 9. Opaquing is an art job and requires the skills of an artist

T F 10. Halftones may be cropped by using opaque colors.

T F 11. In applying opaque, you should always start at the bottom of the negative and work up.

T F 12. All negative corrections should be made over a light table.

T F 13. Hand engraving is used extensively on negatives used in making maps.

T F 14. Goldenrod paper is used in stripping because it allows the penetration of actinic light.

T F 15. If enough space is not allowed between illustrations on the flat, this may be corrected by adjusting the plate on the press.

T F 16. A master layout is desirable when working with standard sizes.

T F 17. The same T-square should be used for all work on the same flat.

T F 18. Vertical lines should be drawn by moving the head of the T-square to the top of the table.

T F 19. Image areas of the negatives should not be placed in or below the gripper margin.

T F 20. Usually negatives are stripped, emulsion side up, on the golden-rod layout sheet.

T F 21. The page numbers on the goldenrod sheet should be just the reverse, left to right, from those on the imposition.

T F 22. If a negative is made correctly, the emulsion side is the unreadable side.

T F 23. Windows are cut in the goldenrod paper before the negatives are taped into position.

T F 24. Negatives are sometimes stripped for both the front and back-up pages on the same flat.

T F 25. In bookwork, you should not allow more than 1/16" for trim on the top of the page.

T F 26. The sides of the sheet that are to be fed to the guides should be indicated on the layout.

T F 27. The gripper edge of the layout is always marked.

T F 28. The left side of the layout is generally considered to be the guide side if the flat is not marked.

T F 29. Most jobs look best when the top margin is slightly greater than the bottom.

T F 30. Generally it is best to strip an insert into the main negative before attaching the main negative to the flat.

T F 31. Reverse lettering requires a film positive of the line negative.

T F 32. In stripping up line work to be printed in more than one color, you may use the flat for the main color as the master for the others.

T F 33. If support is used for positive film units the readable side should be up.

T F 34. A great deal of masking is required in stripping for film positive layouts.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Pinholes on negatives are spotted out by ____________________.

2. Except where there is a possibility of needing to remove the opaque, it is generally applied to the ____________________ ____________________ of the negative.

3. Flat chisel-edge brushes are used primarily for ________________.

4. The process of recutting weak lines on a negative is known as ________________ ________________ or ________________.

5. Goldenrod paper, with its taped-on negatives, is called the ____________________.

6. The paper generally used for stripping is an ________________-pound double coated goldenrod stock.

7. A negative that is stripped on the right side of the flat will print on the ________________ side of the plate.

8. Never tape the negative any closer to the image than ____________ inch.

9. A layout that calls for running a number of unrelated jobs on the same sheet of paper is called a ________________ imposition.

10. The goldenrod mask should be kept at least ____________ inch away from the working areas of the film.

11. When it is not possible to splice an insert into a master negative, a process called ________________ is used.

12. Proofs from flats may be contact printed on ________________ or ________________ paper.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. If negatives are to be used in making albumin plates, they are generally assembled on (A) goldenrod paper; (B) glass; (C) photographic paper; (D) acetate.

_____ 2. Arranging and mounting the negatives on the flat is referred to as (A) laying out; (B) negative cutting; (C) opaquing; (D) stripping.

_____ 3. The order in which the pages are to be placed on the layout is determined by a/an (A) flat; (B) imposition chart; (C) master layout; (D) surprint.

_____ 4. A layout in which the pages for one side of a signature is prepared on one flat and the back-up pages are prepared on another is called a (A) work-and-turn imposition; (B) gang imposition; (C) sheetwise imposition; (D) work-and-tumble imposition.

_____ 5. The creeping and spreading of light rays under the edge of a negative is called (A) scribing; (B) opaquing; (C) reduction; (D) halation.

_____ 6. An unwanted line that is accidently scribed on a negative may be corrected by (A) reduction; (B) opaquing; (C) halation; (D) taping.

_____ 7. Layouts that call for stripping the negatives for both the front and back-up pages on the same flat are called (A) work-and-turn impositions; (B) gang impositions; (C) back-up layouts; (D) sheetwise impositions.

_____ 8. Negatives are generally fastened to the flat with (A) rubber cement; (B) staples; (C) red cellulose tape; (D) thumb tacks.

_____ 9. The process of stripping up a job to expose one image a number of times on the same plate without duplicating the negatives for each unit area is called (A) combination work; (B) surprinting; (C) double printing; (D) step-and-repeat work.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the three most commonly used materials as supports in stripping.

(A) ____________________ (C) ____________________

(B) ____________________

2. List four types of impositions.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Units 58-68

PLATEMAKING

After the film has been stripped on the goldenrod layouts, it must be printed on a lithographic plate. The phenomenal growth of offset printing has brought about the development of many types of offset plates. Plates are made from zinc, aluminum, plastics, and other materials.

Before most plates can be used they must undergo a few preliminary operations, such as graining and coating. The surface of some offset plates is "grained" to make it water receptive and is coated with a light-sensitive solution. Some types of plates are coated by the manufacturer and used only once; but others are regrained and recoated so that they may be used many times. Exposure and development of the plates depend upon the type of plate being used. One of the most critical problems in offset printing is that of controlling the fountain solutions and dampening solutions.

In this unit you will learn about the type of lithographic plates and the correct procedure to follow in preparing, exposing, and developing the plates.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 108-129.
B. Department of the Navy, Lithographer 3 & 2, pp. 191-222, 460-471.
C. Latham, Lithographic Offset Press Operating, pp. 109-122.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Surface coated plates may be purchased with the plate coating solution already applied.

T F 2. The non-printing area of a deep-etch plate is etched to a depth slightly below that of the printing area.

T F 3. The deep-etch plate has a longer press life than the surface coated plate.

T F 4. Multi-metal plates require no fountain solution.

T F 5. The dry-offset plate requires a harder-than-usual ink-form roller.

T F 6. The direct image plate does not employ the photographic process in its preparation.

T F 7. All conventional plates can be regrained and used again.

T F 8. Stainless steel plates require deeper grains than zinc or aluminum.

T F 9. Aluminum plates may be grained chemically.

T F 10. Direct-image plates do not need to be grained.

T F 11. Pumice can be used for both removing the inked image and for graining.

T F 12. It usually takes about two hours to regrain a used plate.

T F 13. Ammonium bichromate is a deadly poison if taken internally.

T F 14. The flat should be taped to the coated metal plate so that the negatives are in readable form.

T F 15. Traces of scum cling to the plate and are removed by desensitizing.

T F 16. Ordinarily, a vacuum frame pressure of about 40 pounds is required to hold goldenrod flats.

T F 17. The relative humidity of the atmosphere tends to be the most difficult variable to control in determining exposure time.

T F 18. When developing the albumin plate, the ink should be completely dry before it is soaked in the sink.

T F 19. A piece of cotton will remove the ink from the image areas thus developing the plate.

T F 20. Gumming provides a film on the non-working areas.

T F 21. To store a plate, the ink should be removed from the image areas and the image then covered with asphaltum.

T F 22. The deep-etch process is very similar to the albumin process.

T F 23. It is not possible to make corrections on a used plate.

T F 24. Presensitized metal plates are ready for exposure when removed from their original carton.

T F 25. Presensitized plates will keep indefinitely.

T F 26. Presensitized plates should be opened only in subdued light.

T F 27. It is better to overexpose a presensitized plate than to underexpose it.

T F 28. Direct-image plates should not be handled in bright light.

T F 29. Xerography is a "dry" process.

T F 30. The "copy" to be reproduced by Xerography must be typed on a special copy machine.

T F 31. When Xerographic plates are exposed to the copy, electrical charges appear wherever light strikes it.

T F 32. The deep etch process requires a flat made of negatives.

T F 33. The areas that do not print and that are made to resist the acceptance of ink are called sensitized areas.

T F 34. With the introduction of halftones, coarse grained and albumin plates were no longer satisfactory.

T F 35. The cause of most cases of blinding is gum from the fountain solution that has accumulated on the image.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Surface coated plates that are purchased with the surface coating solution already applied are called ________________ plates.

2. The surface of some offset plates must be ____________ to make them water receptive.

3. Strong light ______________ the albumin solution.

4. The density of albumin stock solutions is measured with a ________________.

5. Two types of hydrometers are used in lithographic work: __________________ and ________________ __________________.

6. In exposing the albumin plate, the distance from the arc light to the frame should be equal to the ____________ measurement of the printing frame.

7. After the albumin plate is exposed, ______________ ________________ is applied to the image areas.

8. The albumin plate is developed in ____________.

9. As a final measure to remove all excess developing ink, the albumin plate can be placed in a solution of water and ________________ of ________________.

10. If the plate is not to be used for a day or two, or if it is to be used for color work, one should wash the developing ink off the plate and cover it with _______________.

11. A coating of _____________ ______________ solution should be applied to a plate if there is a prolonged interruption in the press run.

12. Preparing a stored plate for re-running involves washing the plate off with _______________.

13. A ___________-_____________ plate is a plate which has no sensitized coating, nor is one applied to its surface.

14. The ____________ ____________ gum stencil, which is free from albumin, has proved an effective desensitizer.

15. Improved desensitization resulting in finer grains means that ____________ ____________ can be used and better ____________ ____________ can be printed.

16. With new developments in plate making, less water may be used on the fine grain plates which means more ____________ ____________ with less ink.

17. On plates which require strong dampening solutions to keep them clean, under the influence of the acid the ____________ may ____________ and not be receptive to ink.

18. The indication that too much ink is being used will be filled halftones, ____________ ____________ and a tendency to catch up.

19. For good plate life and high quality work, the rollers must be ____________, ____________ and set light.

20. Even though the plates start to show signs of scumming, if the image is still good they may be ____________.

21. Any one handling offset plates should practice extreme care to avoid ____________ and ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The most popular plate in the smaller shop is the (A) Xerography plate; (B) multi-metal plate; (C) direct image plate; (D) surface-coated plate.

_____ 2. What type plate requires no fountain solution? (A) presensitized plates; (B) multi-metal plates; (C) dry-offset plates; (D) surface-coated plates.

_____ 3. The type of plate on which the image is typed, drawn, or printed directly is called (A) direct-image plate; (B) presensitized plate; (C) dry-offset plate; (D) deep-etch plate.

_____ 4. What plate is produced by a dry photographic-electrostatic process? (A) dry-offset plate; (B) surface-coated plate; (C) direct-image plate; (D) Xerography plate.

_____ 5. In multimetal plates, the metal used to repel water and accept ink is (A) copper; (B) zinc; (C) aluminum; (D) steel.

_____ 6. If a plate is not to be used for some time after it is grained, it should be covered with (A) trisodium sulphate; (B) gum arabic; (C) masking tape; (D) silica gel.

_____ 7. The etching solution is applied with a (A) rag ball; (B) piece of cotton; (C) brush; (D) sponge.

_____ 8. Gum arabic solutions should always have a Baumé reading of (A) 6 degrees; (B) 9 degrees; (C) 14 degrees; (D) 21 degrees.

_____ 9. What is used as a counter-etch solution for aluminum plates? (A) hydrochloric acid; (B) nitric acid; (C) boric acid; (D) acetic acid.

_____ 10. You may erase unwanted lines or words from the albumin plate after it has been developed and before it has been etched by rubbing it with (A) lithotine; (B) a sponge; (C) pumice powder; (D) the snake slip.

_____ 11. Solid areas or lines are usually painted on plates with a diluted ink called (A) tusche; (B) litholine; (C) dichromate; (D) asphaltum.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. What are the six main types of offset plates?

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

2. What are three methods of controlling the size of the grain in graining plates?

(A) ____________________

(B) ____________________

(C) ____________________

3. List the three main ingredients in an albumin coating solution:

(A) ____________________ (C) ____________________

(B) ____________________

4. List the eight main steps in preparation of a surface-coated metal plate by the albumin process.

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________ (H) ____________________

5. List the four main factors that influence the exposure time of the plate.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

6. List the steps in preparing a presensitized metal plate.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. List the steps in preparing an uncoated paper (cellulose base) plate.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

8. List the steps of procedure in making a deep etch plate.

(A) ______________

(B) ______________

(C) ______________

(D) ______________

(E) ______________

(F) ______________

(G) ______________

(H) ______________

(I) ______________

(J) ______________

(K) ______________

(L) ______________

(M) ______________

(N) ______________

(O) ______________

(P) ______________

(Q) ______________

9. The two main reasons for plates going blind on the press are:

(A) ____

(B) ____

Assignment

Units 69-74

PAPERS AND INKS FOR OFFSET PRINTING

There is a paper manufactured to fit almost every purpose; it is one of the lithographer's most important tools. Paper is actually a thin layer of wood or vegetable fibers which are pressed together and held by sizing and mineral filler. Another basic tool of the lithographer is ink; paper and ink go hand in hand. In letterpress work, there is an ink manufactured to suit each type of paper, but there is less variety in offset inks.

The lithographer must have a thorough knowledge of the characteristics of papers and inks if he is to use them effectively. Difficulties are often encountered with paper: it wrinkles, curls, shrinks, stretches, and waves. In order to control the paper and overcome difficulties encountered, the lithographer must study its makeup and understand its characteristics. Offset inks must be "doctored" and modified quite often to suit a particular kind of stock.

In this unit you will learn about the characteristics and uses of papers and inks used in offset printing.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 130-145.
B. Department of the Navy, Lithographer 3 & 2, pp. 380-396.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Fine paper stock will improve a printing job.

T F 2. Paper is apt to be more troublesome in printing than ink.

T F 3. Newsprint is a very high grade paper.

T F 4. Newsprint is usually made from cotton pulp.

T F 5. Mechanically-ground wood pulp makes very strong paper.

T F 6. Alpha-cellulose pulp forms into a strong paper with good folding qualities.

T F 7. Sulphate pulp makes a paper of high tear-test.

T F 8. All paper made from cotton pulp is high grade.

T F 9. Pulps for lithographic printing papers receive a very small amount of sizing materials.

T F 10. Newsprint is particularly suitable for fine halftones.

T F 11. Rag-content bond paper is used for business forms and letterheads.

T F 12. Twenty-pound stock is generally used for letterheads.

T F 13. Linen is a term printers apply to paper made from flax.

T F 14. Mimeograph paper is a paper with a highly polished surface.

T F 15. The most inexpensive form of book paper is called "super-calendered book."

T F 16. Coated papers have a supersmooth finish.

T F 17. Coated papers are very well suited for reproduction proofs.

T F 18. Antique paper is bulky, soft, and porous.

T F 19. Offset work requires special water-resistant book stocks.

T F 20. Plate finish covers have a uniform surface suitable for halftone reproduction.

T F 21. Cover papers cannot be run on the offset press.

T F 22. Chipboard is well suited for halftone reproductions.

T F 23. Paper should be printed on the felt side.

T F 24. The grain of paper should run vertically in a pamphlet or book.

T F 25. The usual way to determine the weight of the paper is to weigh 1000 sheets of stock cut to a certain size.

T F 26. When paper absorbs moisture, it will expand more across the grain than with the grain.

T F 27. Letterpress inks should never be used on the offset press.

T F 28. Lithographic inks depend on volume for their covering qualities.

T F 29. More prints can be obtained with opaque inks than with transparent inks.

T F 30. When running your finger across a sheet to check for drynes you should use the sheet on top of the stack since it was printed last and will indicate the dryness of the others.

T F 31. Cobalt is one of the most common driers used in ink.

T F 32. Yellow is considered a warm color.

T F 33. Blue is considered a cool color.

T F 34. When mixing inks, the color should always be added to white rather than white to the color.

T F 35. In speaking of ink, "viscosity" is a measure of "stickiness."

T F 36. Opacity is the "hiding" or "covering" quality of ink.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. ____________________ is the most widely used commodity in the world.

2. Paper is actually a thin layer of ____________________ or ____________________ fibers.

3. Most paper is designated according to its ____________________ or ____________________.

4. The process that roughens and frays the fibers so they may better cling together in the finished paper is called ____________.

5. The ultimate refinement of the pulp is done by a ________________ ________________.

6. If the sizing is added while the pulp is in the beaters, ________________ is used.

7. Calender rolls ________________ and ________________ the paper.

8. Colored newsprint is called ________________ ________________.

9. ________________ ________________ paper is used in most national magazines.

10. A ream of paper contains ______________ sheets.

11. A package of paper usually contains ______________ sheets.

12. The watermark is "readable" on the ________________ side.

13. Sixteen-pound bond paper is the equivalent of ______________ pound book paper.

14. Lithographic inks differ from letterpress inks in that they are ______________, ________________, and ______________________.

15. Inks are described as ______________ or ______________, depending on their body.

16. Inks are classified as ______________, ________________, or ________________, depending on the nature of the pigment and the extender used.

17. Ink dries in two ways: by ________________ and by ________________.

18. To regulate tack and other qualities, certain materials called ________________ are sometimes added to the ink.

19. When black is added, the color becomes a ________________.

20. If a color is added to white the result is a ________________.

21. ____________________ is the best color for attracting attention.

22. In ink terminology, ____________ ______ is the "resistance to flow."

Matching

Directions: The left hand column contains descriptive phrases. In the right hand column is a list of terms. Match the descriptions to the terms by placing the letter of the terms opposite the appropriate description.

_____ 1. Produced by grinding the entire log

_____ 2. Made by returning used paper to a pulp state by a chemical cooking process

_____ 3. Made by cooking wood chips in a digester

_____ 4. Suited only for handbills, newspapers and other items which are not permanent

_____ 5. Used to make the finest permanent paper

_____ 6. Made of wood of the beech, birch, maple, oak and poplar trees cooked with caustic soda

_____ 7. Long fiber pulp made from evergreens

A. rag pulp and cotton pulp
B. old-paper pulp
C. mechanically-ground wood pulp
D. chemical wood pulp
E. sulphite pulp
F. soda pulp

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the pulps in common use.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

2. List seven common kinds of paper.

(A) ____________ (E) ____________

(B) ____________ (F) ____________

(C) ____________ (G) ____________

(D) ____________

3. List the usual steps in making paper.

(A) ____________ (E) ____________

(B) ____________ (F) ____________

(C) ____________ (G) ____________

(D) ____________ (H) ____________

4. List four ways of testing the direction of the grain of paper.

(A) ____________ (C) ____________

(B) ____________ (D) ____________

5. Offset inks consist of:

(A) ____________ (C) ____________

(B) ____________

6. List five vehicles generally used in lithographic inks.

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

7. List the three primary colors used in mixing inks.

(A) ____________ (C) ____________

(B) ____________

8. List the three most likely causes of offsetting.

(A) ______________________________

(B) ______________________________

(C) ______________________________

Assignment
Sheet No. 13

Covering
Units 75-90

FUNDAMENTALS OF OFFSET PRESSWORK

An offset press is made of many parts; these parts form "units" and "systems," such as the printing unit, delivery unit, inking system, etc. Although the different makes of presses differ in construction details, there is a basic similarity in their fundamental parts and functioning.

In order to operate and service the offset press, the pressman must know how the various parts and systems function and what to do when they do not function properly. He must be able to make adjustments on the press and perform the routine maintenance duties.

In this unit you will learn the names and functions of the parts and systems of the offset press; you will also learn techniques of adjusting the press.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 5-7, 145-157.
B. Department of the Navy, Lithographer 3 & 2, pp. 223-248.
C. Latham, Lithographic Offset Press Operating, pp. 14-36.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The water fountain roller contacts the plate first.

T F 2. The image is in "readable" form on the blanket.

T F 3. The inked image on the plate replenishes the ink on the blanket image.

T F 4. The plate image must roll against the blanket image in exactly the same location every revolution of the press.

T F 5. The plate cylinder is usually twice the diameter of the blanket cylinder.

T F 6. The plate cylinder is always the uppermost cylinder.

T F 7. The plate cylinder should be the most accessible cylinder.

T F 8. The bearers on the ends of the plate cylinder have a slightly smaller diameter than the cylinder.

T F 9. The gear on the plate cylinder drives the gear on the blanket cylinder.

T F 10. When the width of the front margin on a sheet has to be changed, it is easier to change the cylinder in relation to the gear than to shift the plate.

T F 11. Contact is broken between the plate cylinder and the blanket cylinder by backing away the blanket cylinder.

T F 12. The impression cylinder must be parallel to the blanket cylinder.

T F 13. Packing sheets should be selected which, when added to the blanket thickness, will total .002" in thickness more than the undercut of the blanket cylinder.

T F 14. The blanket should be stretched as tightly as possible around the cylinder.

T F 15. An automatic oiling system usually takes care of the lubrication of the linkage and leaves that throw pressure on and off the cylinder.

T F 16. The printing unit is the most dangerous part of the press.

T F 17. Low spots can be found on most cylinders.

T F 18. The total thickness of the packing sheet and the plate should be .001" more than the undercut of the plate cylinder.

T F 19. The plate should be "gummed" before being removed from the cylinder.

T F 20. Most presses have automatic inking systems.

T F 21. Modern presses average about six rollers per unit.

T F 22. One of the weaknesses of most inking systems is the loss of fountain setting when the press idles.

T F 23. A roller that bumps at the gap is set too heavy.

T F 24. Ordinary ink solvents will clean rollers.

T F 25. The inking system requires no lubrication.

T F 26. The first thing to do in adjusting rollers is to determine which mounting system is used.

T F 27. Rubber and vulcanized-oil rollers must be covered with a thin film of oil before storing.

T F 28. A new dampening system is available that eliminates the use of molleton covers on dampening rollers.

T F 29. The fountain solution requires careful control.

T F 30. The feed table rises automatically as the sheets are fed into the press.

T F 31. The function of the feeder is to separate the top sheet from the rest of the pile, and then to move it forward into the forwarding device.

T F 32. The paper is placed on the stock table about 1/8" off the center line of the feeder.

T F 33. The height of the pile is of little importance to the performance of the feeder.

T F 34. The function of the delivery mechanism is to carry the sheets forward from the impression cylinder and deliver them face up on a pile and properly jogged.

T F 35. Worn chains and sprockets affect the gripper opening.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ________________ at the ends of the plate and blanket cylinders maintain the two cylinders parallel to each other.

2. During the operation of the press, the ____________ cylinder presses the sheet of printing paper against the blanket.

3. A set of automatic grippers is placed in the gap of the ________________ cylinder.

4. The blanket is made from a ______________ covered fabric.

5. The thickness of the blanket should be measured with a ________________ ________________.

6. Cylinders should be kept clean with ________________ and ________________.

7. The inking system is composed of an ____________ ______________ and a set of ________________.

8. Molleton-covered dampening rollers should be cleaned first with ________________ and then with ________________.

9. The fountain roller revolves in a pan of water mixed with a chemical solution known as ____________ ______________.

10. The water supply is controlled by a ____________ adjustment.

11. The conveyor tapes carry the sheet to the end of the feederboard where it is stopped by a set of pins known as the ____________ ______________.

12. The paper is loaded onto the feed table in small stacks called ________________.

13. After the sheet is "buckled" by the comber, it is lifted by the ________________.

14. If every sheet goes through the press and is printed in the same position relative to the gripper edge and the guide side, the press is said to be printing "________________ ________________."

15. The simplest register system is the ________________ ____________________________ system.

16. As the paper reaches the end of the feedboard, the ____________ ________________ moves in and pushes the sheet sidewise to its proper registering position.

17. The _____________ ________________ stop the sheet and hold it on the feedboard while the side guides move it into position sidewise.

18. Most of the trouble encountered in the delivery is poor ________________.

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The main part of the offset press is the (A) automatic inking system; (B) automatic feeder unit; (C) automatic delivery unit; (D) printing unit.

_____ 2. The plate is attached to the (A) top cylinder; (B) bottom cylinder; (C) impression cylinder; (D) blanket cylinder.

_____ 3. Most offset presses are (A) one-cylinder units; (B) two-cylinder units; (C) three-cylinder units; (D) four-cylinder units.

_____ 4. The total recommended squeeze between the blanket and plate should be (A) .001"; (B) .003"; (C) .010"; (D) .300".

_____ 5. What is a likely result of insufficient pressure between the plate and blanket? (A) slur; (B) fuzzy images; (C) no image; (D) double printing.

_____ 6. The film of ink varies in thickness with the setting of the (A) reservoir; (B) fountain roller; (C) vibrators; (D) fountain blade.

_____ 7. Small rotating wheels used to make the first sheet separation are called (A) suction feeders; (B) combers; (C) suckers; (D) spring separators.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The basic parts of an offset press are:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

2. List the four major classifications for designating offset presses.

(A) ____

(B) ____

(C) ____

(D) ____

3. List the six steps in setting bearers:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

4. List the steps in setting the rollers as stated in references:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

(H) ______________________________

Assignment
Sheet No. 14

Covering
Units 91-93

MAKEREADY ON OFFSET PRESSES

The term "makeready" refers to the preparatory steps taken by the pressman in preparing the press for running a job. Offset makereadies may be divided into three general classes: simple, partial and full makeready.

It is of utmost importance that the pressman properly prepares the press before starting the job. A job poorly started can be wasteful of material, time, and effort. Wasteful makereadies mean that the jobs must start with large overruns and, even then, wind up with shortages.

In this unit you will learn the proper procedure and steps to be taken in preparing the press for running a job.

Assignment:

1. Read the references listed below.
2. Read reference "A" below and outline the procedure for preparing the "Chief 20" press for operation, or obtain the manufacturer's instruction manual for the press on which you are training and outline the procedure for preparing it for operation.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 158-168.
B. Department of the Navy, Lithographer 3 & 2, pp. 249-255.
C. Latham, Lithographic Offset Press Operating, pp. 87-108, 175-189, 189-205.
D. Latham, Advanced Pressmanship, pp. 212-226.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The real difference between a simple job and a high quality job is in the makeready.

T F 2. The amount of makeready time required is determined by the make of the press and the type of work.

T F 3. The testing of new chemicals, plate materials, inks, etc. is classified as pre-makeready.

T F 4. Establishing some method of pre-positioning plates before washing is classified as pre-makeready.

T F 5. Simple makeready usually consists of only changing a plate.

T F 6. The ink rollers must be washed in a partial makeready.

T F 7. The partial makeready is often referred to as the No. 1 makeready.

T F 8. The press washup is not a part of the makeready.

T F 9. All steps in the full makeready are performed by the pressman.

T F 10. The changing and setting of dampeners at least once should be a step in every makeready for a color job.

T F 11. The final setting of the dampeners should be made before the plate is put on.

T F 12. The best time to check a blanket is just before a new job is run.

T F 13. A periodic rest period is good for blankets.

T F 14. When tightening the blanket clamp screws, you should start with the center one.

T F 15. The blanket packing must be changed even if the blanket is not changed.

T F 16. The surface of the blanket must be kept in a like-new condition at all times.

T F 17. New blankets have a tendency to stretch after they are put on the press.

T F 18. Modern blankets should be powdered with sulphur after they are cleaned.

T F 19. The blanket must be cut perfectly square.

T F 20. A new blanket must be scrubbed before using.

T F 21. Blankets should not be punched until you are ready to put them on the press.

T F 22. If the sides of the blanket print more heavily than the center, more ink should be used.

T F 23. The running of about 300 waste sheets is needed to break in a blanket to new plates.

T F 24. Packing is used to change the diameter of the cylinder.

T F 25. An ordinary machinist's micrometer should be used to check the thickness of a blanket.

T F 26. The first color should be printed shorter than the plate.

T F 27. When mounting a plate, the leading edge should be fastened first.

T F 28. If the size and the weight of the paper are different from that used on the last job, the feeder setting will be different.

T F 29. The pile height gauge must be readjusted for each new pile of paper.

T F 30. If the gripper opening cam needs to be reset, this should be done when the press is running at printing speed.

T F 31. The pressman usually does the matching of color in color printing.

T F 32. In making adjustments in the ink, the keys should be completely opened and then closed down as needed.

T F 33. Experienced pressmen often test the dampeners for moisture by touching them with their knuckles or the back of their hand.

T F 34. The ink rollers are dropped before the plate is dampened.

T F 35. A trial run is made with waste paper before the actual job is started.

T F 36. Small halftone dots do not ordinarily print until the plate is "broken in."

T F 37. Waste paper used in the trial run should be cut true to size and not torn or wrinkled.

T F 38. The purpose of the first trial sheets is to check the quality of the work.

T F 39. As a rule, the good pressman will keep his ink on the spare side while making ready.

T F 40. If the plate has been moved during makeready, the blanket should be cleaned before starting the run.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A properly prepared press and adequate makeready prevents waste of ____________, ______________, and ________________.

2. The biggest part of makeready is ________________.

3. Pre-makeready requires that a full set of ___________ ___________ be on hand.

4. Paper conditioning is part of _______________.

5. On large presses, each worker turns off his ________________ ________________ when he has completed his work on a cylinder.

6. Partial makeready consists of a ______________ change.

7. Blankets that are to be used for _____________ have to be scrubbed particularly clean.

8. The first color should be printed ______________ in case the paper stretches.

9. To print short you must use a ______________ blanket and a ________________ plate.

10. The back-cylinder pressure must be readjusted when a paper of different _________________ is used.

11. Joggers must be repositioned when a different ____________ of paper is used.

12. The pressman usually adjusts the ink for ______________ and ________________ only.

13. Scrubbing a blanket removes the slightly ______________ ________________ that prevents the blanket from picking up the full value of the fine halftones that are on the plate.

14. Absorption of the ____________ ________________ is responsible for embossing the blanket surface.

15. Tackiness is due to the formation of a sticky, plastic product as a result of the simultaneous _______________ of the rubber and the absorbed _______________ _______________.

16. The normal press tension of the blanket should be about ______________ pounds per inch of width.

17. The term ______________ refers to the paper sheets that are put under the blanket and plate.

18. About ________________ good sheets of paper should be put between every _______________ sheets of waste paper in the trial run.

19. If the work is cocked on a press that does not have movable guides, the ______________ must be swung.

20. When the image is off center sidewise, the pressman can generally adjust it by moving the _____________ ________________.

21. If the nonprinting areas of a plate have picked up ink, the pressman cleans the plate with a sponge dipped in the ________________ ________________.

22. Once a blanket has been properly mounted, no further adjustments will be required until it becomes ______________ or ________________.

23. During the run, the pressman should examine the work at regular intervals, by removing a sheet from the delivery pile about every ______________ to _________________ impressions.

24. At the end of the day, the pressman usually removes all ink from the fountain and cleans the ______________, ______________, and _________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List four methods of pre-positioning plates before washing them.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

2. List the three types of makereadies:

(A) ______________ (C) ______________

(B) ______________

3. What four factors determine the amount and type of driers used in ink?

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. The position of the image on the sheet depends on:

(A) ______________________________

(B) ______________________________

(C) ______________________________

5. List the procedure for restoring a "smashed" blanket.

(A) ______________ (C) ______________

(B) ______________ (D) ______________

6. List the three main reasons for wanting to control the cylinder body diameters by packing.

(A) ______________________________

(B) ______________________________

(C) ______________________________

Assignment
Sheet No. 15

Covering
Units 96-98

OPERATION OF AN OFFSET PRESS

Running an offset press is greatly simplified by having carefully made the press ready for running. Systematic and continuous maintenance operations will also make running the press much easier. Although a large part of the skill and efficiency of a pressman is evidenced by the way he makes ready his press for running, he still has to run it and come out with a good uniform job that matches his O. K. sheet.

The responsibilities of the pressman vary from shop to shop. In most cases, however, he is fully responsible for the cleanliness and safety of his station. He must keep a constant check on the press to see that it functions properly, and make notes of anything that needs attention after the job is run. Some adjustments and repairs must be made immediately.

In this unit you will learn the procedures involved in running the offset press and how to perform the various operations.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________.

References:

A. Cogoli, *Photo-Offset Fundamentals*, pp. 168-170.
C. Latham, *Lithographic Offset Press Operating*, pp. 190-198; 206-216.

Supplementary Reference:

D. Latham, *Advanced Pressmanship*. (Review as assigned by coordinator to fit specific needs of student.)

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The pressman is responsible for eliminating unnecessary running time.

T F 2. The efficiency of the offset press during the running is dependent to a great extent on the makeready.

T F 3. If the makeready has been slighted, the whole running of the job can be just a continuation of the makeready.

T F 4. If the pressman will use his ink knife freely in the makeready, it will eliminate many adjustments during the running of the job.

T F 5. A part of the pressman's job is to season the paper.

T F 6. The pressman is responsible for the paper behaving in such a manner as to insure good fit and register.

T F 7. In large plants the foreman is responsible for the paper.

T F 8. It is not necessary for the pressman to know about paper.

T F 9. It is possible that paper may vary within a single skid.

T F 10. During the running of a first color, there is nothing on the sheet to show whether or not the other colors will fit.

T F 11. The pressman is fully responsible for the cleanliness and safety of his station.

T F 12. The pressman is responsible for the acts and omissions of his helper.

T F 13. The pressman is not usually responsible for providing a list of what needs to be done on the press to keep it in top shape.

T F 14. Anything that would affect the quality of the job or the immediate performance of the press should be done right away.

T F 15. Small irregularities are more likely to show up on simple jobs than on an exacting job.

T F 16. It is well to check the register and ink coverage frequently.

T F 17. It is difficult to tell whether it is ink or water that is causing a tone change in the printed image.

T F 18. The front marks will tell the pressman whether or not the press registering devices are operating satisfactorily.

T F 19. Sheets that register across the front and back must continue to fit in the center of the sheet.

T F 20. Keeping the fountains filled is one of the duties of the pressman.

T F 21. Checks of the pH of the fountain solution should be made during the running of the job.

T F 22. On two-man presses, the operator has enough routine duties to keep him busy all of the time.

T F 23. Keeping the plate in good condition is part of the routine of running the press.

T F 24. It is permissible to make stops and let the plate dry up.

T F 25. Too frequent stops of the press can be harmful to the uniformity of the work.

T F 26. The plate is kept moist while the press idles.

T F 27. The vibrators of an idling inking system will level out the ink on the rollers so that it no longer coincides with the fountain setting.

T F 28. The pressman will not know much about his plate until he starts to run it.

T F 29. Kerosene is an effective ink solvent.

T F 30. A solution having a pH value of 10 is neutral.

T F 31. If a formula calls for a pH of 3.4, you may disregard the decimal points and make it an even 3.

T F 32. The pH of fountain solutions should be about 9.5.

T F 33. The pH of a fountain solution will never decrease unless acid is added.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The moisture balance of paper may be checked with the ________________.

2. If the paper for a multicolor job on a single color press is too dry, it will ________________.

3. During the running of a first color, the pressman should check the sheets for fan and draw by using a ________________ ________________.

4. Ordinarily, the pressman need only watch his ________________, his ________________, and his ________________ to keep the press running in good order.

5. A constant watch kept on the ________________ is the only thing that will insure uniformity of color.

6. Sheets are checked for strength of color in both the ________________ and the ________________.

7. When running yellow, an inspection booth lighted with ________________ is excellent for checking.

8. As the pressman pulls each sheet, he examines it for ________________ and ________________ register.

9. The pressman can check the rear marks to see if the paper is ________________ ________________, ________________ or ________________.

10. If there is dirt or ink skin along the edge of the blade, ________________ ________________ will show up on the roller.

11. If the press is stopped entirely, the plate must be ________________ again before starting.

12. Press cloths that have been used in cleaning up a press should be placed in a covered ________________ ________________ ________________

13. Traces of kerosene used in press wash-up must be removed with ________________.

14. Kerosene left on rollers will cause them to ________________.

15. The term pH is used in measuring the ______________ or ______________ of a solution.

16. The pH scale runs from ________ to ________.

17. Solutions having pH values above seven are ______________.

18. An acid solution with a pH of 4.0 is ________ times as acid as one having a pH of 5.0.

19. An acid solution with a pH of 3.0 is 100 times as acid as one having a pH of ________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the steps for starting the run.

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________

2. List the steps for stopping the press.

(A) ______________ (F) ______________

(B) ______________ (G) ______________

(C) ______________ (H) ______________

(D) ______________ (I) ______________

(E) ______________

3. To condition the press and make ready in such a way as to make it possible to run off a job with a minimum variation requires:

(A) ______________ (C) ______________

(B) ______________

4. List three applications of pH control.

(A) ______________________ (C) ______________________

(B) ______________________

Assignment
Sheet No. 16

Covering
Units 99-106

OFFSET PRESS TROUBLES

It is far better to prevent trouble than to try to correct it. If the press is properly installed, maintained and adjusted, and the plates are carefully prepared, many of the troubles often encountered in operating the offset press may be avoided.

The beginner may find it very difficult to locate the cause of trouble on the offset press. Some conditions may be caused by any of a number of things. Therefore, it is necessary for the pressman to know the possible causes of the troubles that are commonly encountered. Time lost looking for the cause of some difficulty can be very expensive.

In this unit you will learn about the common troubles encountered in operating the offset press and the most likely causes of these troubles.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________.

References:

A. Cogoli, Photo-Offset Fundamentals, pp. 171-175.
B. Reed, Offset Press Troubles, pp. 1-102.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. If the feeder is feeding more than one sheet, one reason may be that the pile is too high.

T F 2. If the sheets have a tendency to stick when in the feeder, the remedy is to increase the air blast.

T F 3. If the side guide contacts the sheet after the grippers have closed or sheet has started forward, it is necessary to correct the timing of the side guide.

T F 4. If the sheets tend to stick to the blanket it means that either the gripper tension is too weak or the ink is too tacky.

T F 5. Running too much ink on coated stock will usually result in slurring over the entire sheet.

T F 6. "Filling up" is evidenced on the printed sheet and plate by the type matter and halftones filling in with ink.

T F 7. If the ink is too tacky, you should add thin varnish or a non-pick compound.

T F 8. "Filling up" may be caused by too much ink.

T F 9. Lack of coloring matter in ink may be corrected by adjusting the ink fountain.

T F 10. The oscillating drums of the inking system should not have the same surface speed as the printing plate.

T F 11. Horizontal streaks in the printing may be caused by one or more of the form rollers being set too hard against the plate.

T F 12. To remedy stripping caused by the metal drums, it is essential to remove the drums and coat them with ebonite or copper.

T F 13. Uneven ink feeding can be prevented to some extent by being certain that the ends of the rollers and drums are dry after machine wash-up.

T F 14. Wash marks will appear when too much dampening water is used.

T F 15. Color variation due to the feed of the dampening solution can be remedied by maintaining a constant level of solution in the water fountain.

T F 16. Presensitized aluminum plates will generally produce the largest number of prints.

T F 17. If the image goes blind because a deep-etch plate was not completely developed, the only solution is to have the plate remade.

T F 18. A new blanket should not cause any troubles unless the blanket was defective before it was used.

T F 19. When the paper tends to stick to the non-printing areas of the blanket, the best remedy is to treat the blanket with blanket lacquer or hardener.

T F 20. A loose and slipping blanket will cause horizontal streaks in printing.

T F 21. Linty paper will tend to leave fibers on the blanket only.

T F 22. When paper picks or splits due to its being of low quality, and reducing the inks tack does not solve the problem, speeding up the press may correct the situation.

T F 23. The curling of sheets on delivery usually occurs with lightweight papers.

T F 24. Thin papers that curl downward on delivery will tend to curl toward the printed side after a period of time.

T F 25. "Set-off" may be caused by excessive ink.

T F 26. Too much drier in the ink may cause the sheets to stick together in the stacker.

T F 27. A fountain solution that is too strong may cause bare sections on the rollers.

T F 28. Mottling is usually caused by too much reducer in the ink.

T F 29. The most likely cause of chalking is thin varnish in the ink.

T F 30. The ink is said to "run" if it penetrates through the paper stock.

T F 31. Boiled linseed oil will speed up the setting of ink.

T F 32. Varnish will reduce the inks tack.

T F 33. Varnish will shorten the ink.

T F 34. Some troubles may be caused by ink being too fresh and therefore it should stand for a week or so before using.

T F 35. Not much is known as to exactly why mottling occurs.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The proper clearance for the fingers on the feeder for papers over .010" thick is ________ times the paper thickness.

2. Uneven color can result from either uneven or varying ____________ ______________ or ______________ cylinder pressures.

3. Ink picked up by the clear areas of a plate and transferring this ink to the clear areas of the sheet produces a condition called ______________.

4. A uniform, light-colored tint over the entire sheet of paper is referred to as ______________.

5. The building up of ink on the plate or blanket is called ______________.

6. The gradual disappearance of some lines and some halftone dots from the plate image is called ______________.

7. If vanishing occurs due to the composition of the ink, it can be corrected by adding a little ______________ acid to the ink.

8. When black solids are gray and color solids weak, it is a result of too much ______________ ______________.

9. Scum streaks are usually due to lack of sufficient ______________ or to excessive ______________ ______________.

10. The slurring of halftones usually results from excessive ______________ or excessive ______________.

11. If a blanket has lost its ink receptiveness due to its becoming glazed and hard it should be washed with solvent and water and then scrubbed with ______________ ______________ and solvent.

12. If the ink picks, splits or tears the paper, this can be either an ______________ or ______________ trouble.

13. For ink to dry properly, coated paper should have a pH above ________ and uncoated a pH above ________.

14. Improper drying of ink can be caused by the temperature of either or both the ______________ or the ______________ being too low.

15. If chalking occurs the vehicle's penetrating rate should be decreased with an acceptable form of ____________ __.

Matching

Directions: The probable causes of scumming are listed in the left hand column; a remedy for each of these causes is listed in the right hand column. Match the items on the right with the proper item on the left by placing the proper letter in each blank on the left.

		Probable Cause		Remedy
_____	1.	Clear areas of plate not etched properly--cannot repel the ink	A.	Re-set according to instruction book. Make new plate, if damaged
_____	2.	Too little fountain solution	B.	Maintain at recommended pH
_____	3.	Dampener form rollers not parallel, or set too far from plate cylinder	C.	Even out, recover if necessary
_____	4.	Dirty dampener rollers	D.	Re-etch the plate, or make a new plate
_____	5.	Unevenly applied molleton cover on dampener roller	E.	Replace rollers
_____	6.	Dampener roller not parallel with the plate	F.	Take up the slack
_____	7.	Dampener roller dragging or bouncing on plate	G.	Increase flow of fountain solution
_____	8.	Fountain solution too strong or too weak	H.	Make new plate
_____	9.	Plate and blanket cylinders not properly packed	I.	Cut down on ink, and re-etch the plate
_____	10.	Flatten form rollers	J.	Set according to instruction manual. Make new plate if damaged, or re-etch the plate

_____ 11. Plate not perfectly concentric with cylinder

_____ 12. Skidding form roller

_____ 13. Too much ink during make-ready

_____ 14. Loose blanket

_____ 15. Oxidation of plate

_____ 16. Over-developed plate

_____ 17. Residual coating solution on plate

K. Take up slack. Make new plate if the image is damaged

L. Clean or replace the dampener rollers. Check the pH of fountain solution Feed less ink. Replace ink if emulsified

M. Set according to instruction manual

N. Maintain proper contact between the rollers and their riders

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List five probable causes of tinting.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

2. List three probable causes of piling.

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. List three probable causes of "picking."

(A) ____________________

(B) ____________________

(C) ____________________

4. List three probable causes of gray type.

(A) ____________________

(B) ____________________

(C) ____________________

5. List seven causes of uneven cylinder pressures.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

(G) ____________________

6. The stripping of ink drums or rollers can result from:

(A) ____________________

(B) ____________________

(C) ____________________

7. An image will go blind or "walk off" because:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

8. Eight requirements of paper for satisfactory performance are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

(H) ______________________________

Units 107-109

OFFSET DUPLICATORS

Small offset presses are often referred to as "duplicating equipment." These smaller machines are well adapted to many uses. They require little floor space and they are relatively easy to operate.

Offset duplicators are generally used for jobs that are printed on sheets ranging from 10" x 14" to 3" x 5" in size. While the offset duplicator operates on a smaller scale than the large offset presses, the principle behind it is practically the same.

In this unit you will learn about operating and maintaining some of the common types of offset duplicators.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________________.

Reference:

B. Department of the Navy, Lithographer 3 & 2, pp. 256-334.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F." Items 1 through 10 refer to the Multilith Press.

T F 1. The Multilith has a printing area of 11" x 14".

T F 2. When the Multilith is in operation, the ductor roller contacts the plate, keeping it moist.

T F 3. To increase the water supply on the Multilith, the lever is pushed toward the delivery end of the press.

T F 4. At the beginning of the day it is best to distribute water over the rollers of the Multilith with a sponge.

T F 5. The blanket of the Multilith should always be underpacked with paper.

T F 6. The Multilith uses only paper plates.

T F 7. The blower tubes on the feeder of the Multilith should be in the front position for ordinary work.

T F 8. The Multilith is equipped with a device which will throw out the sheets if more than one is fed through.

T F 9. It is necessary for a sheet to be fed through the Multilith in order for the impression to print.

T F 10. The Multilith differs from the larger offset presses in that it does not have a continuous chain delivery.

T F 11. Being a small, percision-built machine, the Multilith requires continual adjusting.

T F 12. The Multilith is designed so that it is never necessary to change pressure between the impression cylinder and the blanket to accomodate different thicknesses of stock.

T F 13. When running very heavy stock on the Multilith, it is recommended that an old blanket be used.

T F 14. The Davidson Dualith differs from other offset presses in that it has only two cylinders.

T F 15. The impression-plate cylinder of the Dualith makes two revolutions to one for the blanket cylinder.

T F 16. The Dualith can be used for either offset or relief printing.

T F 17. The Dualith can be used to print on both sides of the sheet at once.

T F 18. The plate should be mounted from the feed end of the Dualith.

T F 19. The use of presensitized plates on older model Dualiths will require underpacking.

T F 20. The Davidson inking system is considerably different from that of the Multilith.

T F 21. The dampening systems of the Multilith and the Davidson press are quite similar.

T F 22. The roller cleaning unit of the Davidson should be left on while the press is in operation.

T F 23. On the A. B. Dick Offset Duplicator, the ink and water are fed to the plate from the same set of form rollers.

T F 24. The A. B. Dick machine requires special inks and fountain solutions for proper operation.

T F 25. The A. B. Dick machine will handle only paper plates.

T F 26. To raise or lower the image on the A. B. Dick machine it is necessary to reposition the plate.

T F 27. The feeder on the A. B. Dick machine is different from other presses.

T F 28. The speed of the A. B. Dick duplicator should be changed while the press is in operation.

T F 29. At the end of the day, all tension on all rollers should be relieved on the A. B. Dick duplicator.

T F 30. The "Whitin" presses have two forwarding rollers instead of one.

T F 31. The entire inking unit can be removed from the Photostat Offset Duplicator, allowing quick color change overs.

T F 32. The manual control knob of the "Whitin" presses should be turned only in a clockwise direction.

T F 33. If the image is not straight, the plate must be loosened and adjusted on the photostat machine.

T F 34. Although the Photostat Offset Duplicator has two moveable side guides, usually only one is used at a time.

T F 35. The vacuum pump on the "Whitin" presses should always be turned off when the feeder is shut down.

T F 36. It is possible to run small jobs in an off-centered position on the Photostat Offset Duplicator.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The fountain is kept at a constant level on the Multilith by means of a ______________ filled with water.

2. The blanket for the Multilith is provided with ______________ for attaching it to the blanket cylinder.

3. If the image is not straight on the plate of the Multilith, it is necessary to shift the ______________.

4. The paper supports on the Multilith should be adjusted so that they are about ________ inches from each edge of the stock.

5. The sheets being fed through the Multilith are carried to the printing unit by means of ______________ ______________.

6. Static from the paper is removed by stretching a piece of ______________ across the delivery end of the Multilith.

7. The two form rollers of the Multilith which distribute the ink over the plate must be ______________ for even distribution of ink.

8. When replacing the rollers of the Multilith after cleaning, the ______________ rollers should be inserted first.

9. On the Davidson Dualith, the plate and impression units are combined on a single ______________ cylinder.

10. The blanket for the Dualith must be mounted from the ______________ end of the press.

11. The Dualith has a speed range of from ________ to ________ impressions per hour.

12. Adjustments to the rollers on the Davidson press should be done with the aid of strips of ______________ bond paper.

13. The rollers of the dampening unit of the A. B. Dick Offset Duplicator do not need ______________ ______________.

14. If two sheets go through the A. B. Dick machine at the same time it shuts off the ______________ unit.

15. The Photostat Offset Duplicator is equipped with two side guides on the feeder but usually just the ______________ side is used as an active guide.

15. The Photostat Offset Duplicator is equipped with two side guides on the feeder but usually just the ______________ side is used as an active guide.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the rollers included on the dampening system of the Multilith.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

2. List the causes for most difficulties on the Multilith.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

3. List three specific printing operations that can be done on the Davidson Dualith that normally cannot be done on other duplicators.

(A) ______________________________

(B) ______________________________

(C) ______________________________

Assignment
Sheet No. 18

Covering
Units 110-120

BINDERY OPERATIONS

In small print shops it is common practice to require the learners, who have reached some acceptable degree of ability, responsible for the final operations which are performed on printed jobs. These operations - cutting, folding, gathering, binding, packaging, et cetera - are performed in the bindery section of the printing establishment.

To one who has never had occasion to perform any of the bindery operations, they may seem simple and of minor importance. However, having to report to the supervisor a job ruined by a careless error, will quickly amend any unfounded idea concerning the ease or simplicity of bindery operations.

In this unit you will learn about the machines and operations common to bindery rooms.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by
   ____________________.

Reference:

B. Department of the Navy, Lithographer 3 & 2, pp. 397-421.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The most common bindery operation is folding.

T F 2. Most paper cutters have a sliding metal tape that has 1/64" calibrations.

T F 3. The clamp on the paper cutter should apply more pressure to soft, springy stocks than to hard stocks.

T F 4. It is a good idea to place a piece of cardboard on top of the paper stack before clamping it in the paper cutter.

T F 5. The beginner's job usually includes sharpening the knives of paper cutters.

T F 6. When using the paper cutter, the web of the clamp should be low enough so that the sharp edge of the cutting knife is not exposed.

T F 7. When trimming paper on 4 sides, the first 2 cuts should be made slightly wider than the desired size.

T F 8. When books are to be trimmed, they are placed in the machine with the folded edge away from the back gage.

T F 9. Machine folding usually involves sheets laid out as signatures.

T F 10. The knife folder is faster and more accurate in folding large sheets than the roller-operated folder.

T F 11. The knife folder is more versatile than the roller-operated folders.

T F 12. The friction feeder is generally found on the smaller machines.

T F 13. The pile feeder must be stopped before loading.

T F 14. The continuous feeder requires that the sheets be loaded on it upside down.

T F 15. Roller pressure should always be kept the same for all rollers.

T F 16. The cross carrier can be removed and the stacker attached in its place at any point where no folds are required.

T F 17. Pasting units may be attached to folding machines.

T F 18. To ensure the use of a folding machine, the arrangement of the pages on a signature must be planned with the folding machine in mind.

T F 19. Padding is the process of putting covers on books or pamphlets.

T F 20. Two or three staples are sufficient for most booklets.

T F 21. Wire stitchers are more versatile than foot staplers.

T F 22. The wire stitcher is much faster than the stapler.

T F 23. Printers often tie books with cord.

T F 24. Spiral binding is a part of routine shop operations.

T F 25. Multiple punching machines are used for punching different sized holes simultaneously.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ________________ is the end of the road for the printing job.

2. The distance between the ____________ ________________ and the knife of a paper cutter regulates the width of the cut.

3. Sheets are loaded onto the cutter table in small stacks called ________________.

4. The process of getting the edges of a stack of paper even is called ________________.

5. The two types of folding machines used today are: ______________ folders and ________________ folders.

6. To enable a sheet to pass over certain fold plates, they are covered with ________________.

7. When right-angle folds are required on sheets that have 2 or 3 parallel folds, the sheet is usually scored with ________________ ________________.

8. The sheet emerges from the folding machine on a belt in a unit known as the ________________.

9. After the signatures have been folded, they must be assembled into proper order; this is known as ________________ or ________________.

10. Bookbinding has no place in the ____________ job shop.

11. The two most common methods of stapling books are: ___________ stapling and ____________ stapling.

12. Thick books are not _______________ before they are tied.

13. Friction on paper drills can be reduced by applying ___________ to the drill.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A long strip of maple wood or plastic which fits into a groove in the cutter table just below the knife is called the (A) clamp; (B) guillotine; (C) tape indicator; (D) cutting stick.

_____ 2. The average small paper cutter will take a stack of paper from (A) 1/2 to 1 inch high; (B) 1 to 2 inches high; (C) 2 to 3 inches high; (D) 4 to 6 inches high.

_____ 3. What will most likely be the result if the stack is too high? (A) The knife will stall in the middle of the cut. (B) The knife will break. (C) The machine will not start. (D) A fuse will be blown.

_____ 4. If an order calls for 200 3 x 5 cards, approximately how many extra should be cut to allow for spoilage? (A) 4; (B) 6; (C) 10; (D) 20.

_____ 5. The metal chute which causes the paper to buckle and pass through the fold rollers is called the (A) plate stop; (B) deflector; (C) fold plate; (D) register.

_____ 6. The process of making pads or tablets by cementing the edges of the stacks of sheets is called (A) stitching; (B) collating; (C) padding; (D) bookbinding.

_____ 7. How many holes are generally punched when a book is to be tied with cord? (A) 2; (B) 3; (C) 4; (D) 6.

_____ 8. The item that is sometimes used to reinforce a punched hole is a (A) grommet; (B) plastic binding; (C) spiral; (D) die.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three main types of folds that can be done on a folding machine are:

   (A) ______________ (B) ______________ (C) ______________

2. Three types of feeders for folding machines are:

   (A) ______________________ (C) ______________________

   (B) ______________________

3. List the two types of pressure used on folder rollers.

   (A) ______________________ (B) ______________________

4. List three methods of facilitating the making of right-angle folds on hard-to-fold sheets.

   (A) ______________________ (C) ______________________

   (B) ______________________

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *ELECTRICAL APPLIANCE SERVICEMEN, *HOME APPLIANCES, HIGH SCHOOLS, *GROUP INSTRUCTION,

This study guide is for 11th or 12th grade student use in a 180-hour electrical appliance service course. It was developed by research assistants and an advisory consultant for use in group instruction. Assignment sheets including reading assignments, references, and questions cover (1) Basic Tools and Materials and Their Uses, (2) Fundamental Principles of Electricity, (3) Safe Practices and Repair Procedures, (4) Home Electrical Wiring, (5) Signals and Alarms, (6) Electric Heaters, Blankets, Heating Pads, and Irons, (7) Electric Water Heaters, (8) Electric Toasters, Blenders, Coffee Makers, Shavers, Knife Sharpeners, Popcorn Poppers, Can Openers, Skillets, and Waffle Irons, (9) Electric Broilers, Roasters, and Ranges, (10) Electric Motors, Motor Trouble, and Repair, (11) Electric Fans, Blowers, and Vacuum Cleaners, (12) Food Mixers and Sewing Machines, (13) Electric Ironers, (14) Electric Garbage Disposers and Dishwashers, (15) Conventional Washing Machines, (16) Automatic Washer Operation and Service, (17) Automatic Clothes Dryers, (18) Theory of Electrical Refrigerator Operation, (19) Electric Refrigerator Components, Repair, and Servicing, (20) Home Freezers, and (21) Air Conditioners. An analysis of the course in two-column form correlates what the worker should be able to do and what the worker should know. An answer key (VT 002 046) is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

FOREWORD

This course of study, consisting of an analysis of ELECTRICAL APPLIANCE SERVICING GROUP INSTRUCTION, together with assignment sheets covering the related (occupational) information, has been prepared for teaching electrical appliance servicing on a group or class basis in a trade preparatory program.

The analysis for this course of study was originally prepared by Mr. Marion P. Stevens, then a graduate student in Industrial Education at the University of Missouri. The assignment sheets for this course of study are especially designed for group instruction and were prepared by Mr. Philip Epperson, Research Assistant in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

Commissioner of Education

TABLE OF CONTENTS

Assignment Sheets:

Information Sheet:

INTRODUCTION

In preparing this course of study, it has been assumed that job skills and procedures will be learned through experience in actual repair of appliances under the direction of a competent teacher. The technical and related information is to be given in conjunction with each associated assignment at the appropriate time. The teaching sequence set up in the manual is intended to be flexible.

Each assignment in the manual contains an introduction, reading assignment, and a series of discussion questions based on the reference pages assigned. The purposes of the introduction are to create interest, convey the importance of the assignment to the student, and <u>tell</u> him specifically what he is expected to learn. The reading assignments are keyed to the basic texts listed on page (6) six of this manual.

The questions on the assignment sheets serve two purposes: (1) to guide the student to the important aspects of the reading assignment, and (2) to form a basis or guide for classroom discussions.

The questions may also be utilized as written assignments to emphasize a particular procedure on topic, as well as, selected essay test items.

Your attention should be called to a second study guide on Electrical Appliance Servicing-Individual, designed specifically for a single student doing independent study. It is based on the same reference material, has the same assignments, <u>but</u> the questions for each unit are of the objective type. These questions lend themselves very well to test purposes.

A key is available for both study guides locating the reference source from which the questions were written.

As the student proceeds through the course, it is advisable for him to keep a well organized notebook. In this notebook, he would bring to the work station any information needed to perform the day's assignment. This will give added life to the texts. Related information not found in the text would also be kept in the notebook.

TO THE STUDENT

Within the past few years there has been a marked increase in the production, variety, complexity, and use of electrical appliances. There has also been a new conception of repair service in recent years. Successful electrical appliance store owners are now aware that the reputation of a store depends to a large extent on the quality of its servicing. No longer is service fundamentally an "extra" with the sale of a new appliance; it is a business of its own. This fact was brought in prominence during World War II when new appliances ceased to be manufactured. It was then that appliance servicing was of greatest importance not only to manufacturers, distributors, and dealers, but to customers as well.

Nature of Work

The main duties of the electrical appliance serviceman are to install, service, and repair large appliances such as ranges, washing machines, and refrigerators, and to service and repair numerous smaller appliances such as irons and toasters. Many sell appliances and replacement parts in connection with these services. Hand tools, power tools, and electrical instruments are used by the appliance serviceman.

Opportunities in Electrical Appliance Servicing

From all indications and reliable sources, the opportunities for electrical appliance service are good. Manufacturers and power companies are urging dealers to establish service departments or arrange for reliable service work. Sales of new appliances will no doubt continue to be on the increase, and this will mean much work for servicemen, especially in view of the guarantees given on new appliances. The appliance serviceman will likewise be in demand repairing old appliances especially in the event that the manufacture of new ones is curtailed.

Electrical appliance repairmen are employed mainly in service departments of stores and other concerns selling electrical appliances and in shops specializing in the repair of such appliances. Many trained and experienced men operate their own repair shops. Some are employed by appliance manufacturers and electric companies.

Opportunities are to be found in all parts of the country and jobs may be found in small towns or large cities. In some regions of the country where the electric rates are cheap, such as the Pacific Northwest and Tennessee Valley, more use is made of appliances than in other areas.

Requirements for Entry Into Electrical Appliance Servicing

On-the-job training is one of the best ways of entering the trade. Many employers offer opportunities for this by participating in the cooperative part-time program. Training in fundamentals of electricity and in operation and construction of various types and makes of appliances may also be secured from trade, correspondence, and other schools. To be considered fully qualified, it is necessary that a worker have had practical work experience. This may require several years.

High school courses particularly helpful to one planning to enter electrical appliance servicing include mathematics, physics, industrial arts shop and drawing courses, economics, and English.

The beginner should realize that in any electrical work there are dangers involved. If improper working procedures are followed, the result may be injurious to the worker, to the appliance, or both. However, once the fundamental safety principles of electrical work are understood, the worker may pursue his work with confidence. Work will be inside and will not be affected by seasons. The repairman will make numerous calls to homes and make repairs there. The complaints he will receive will be numerous and varied. He must be tactful in his dealings with these appliance owners.

To one interested in electrical and mechanical work, electrical appliance servicing will provide a challenge and an opportunity to earn good wages while performing a useful service to a community.

Personal-Social Traits Essential for the Electrical Appliance Serviceman

More and more, men who are seeking jobs or wanting to go into business for themselves need good personal qualifications. Holding a job is also largely dependent upon one's personality. Satisfaction on the job will be determined by the willingness, respect, and cooperative attitude that one has toward his job and his fellow workers.

With a conscientious effort one can improve his personal-social traits. In order to do this one must know what to improve, how to improve and why improvement is necessary.

Among the personal-social traits of chief importance to the electrical appliance serviceman are the following:

Honesty -- Give full value for every cent received, truthfulness in dealing with customers, and loyalty to one's employer or associates.

Health -- Observe habits that promote vitality and vigor.

Courtesy -- Respect the other person's point of view, his interests, and wants. This may require effort at times but it will eventually pay off.

Initiative and Industry -- The ability to see things that need to be done and to keep busy without constant supervision.

Alertness -- The ability to pay close attention, to respond quickly, and to concentrate on one's work.

Cooperation -- Work harmoniously with other, and be helpful.

Promptness -- Avoid being tardy or absent from your responsibilities.

Self-Control -- Maintain a pleasant disposition and keep temper under control.

Voice -- Use good English and speak in a pleasant manner.

Personal Neatness -- The appliance repairman has close contact with the general public and represents his employer to them. The work often requires calls at the homes of customers where one's clothes should be neat and reasonably clean. The work may require getting your hands dirty but they should be cleaned as the situation warrants to avoid damage to the customer's property.

Neat and Orderly Work Habits -- The customer may not have any technical knowledge of what you are doing but he easily recognizes slovenly work habits.

ANALYSIS OF ELECTRICAL APPLIANCE SERVICING

JOB TRAINING: What the Worker Should be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Basic Tools and Materials		
1. Lay out stock with dividers	1	1. Characteristics of dividers
2. Measure inside and outside dimensions with calipers	1	2. Types and use of calipers
3. Make measurements using micrometer	1	3. Micrometer settings and their meanings
	1	4. Proper care of precision measuring tools
5. Mark parts with prick punch	1	5. Types of punches and chisels
6. Cut holes in sheet metal using drive punch		
7. Drive out rivets and pins with punch		
8. Cut slots in metal with cape punch		
9. Cut metal with cold chisel		
10. Recondition worn or abused screwdrivers	1	10. Care and use of screwdrivers
11. Select, care for and use proper wrench for the job	1	11. Kinds, sizes and care of wrenches
12. Set rivets with tinner's hammer	1	12. Hammer specifications
13. Rivet with ball peen hammer		
14. Fasten materials in vise	1	14. Vises: their care and use
15. Select files	1	15. File and rasp specifications
	1	16. Care and use of files and rasps
17. Drill holes in metal	1	17. Drill specifications
18. Recondition drills	1	18. Cutting angles for drill bits
19. Cut inside and outside threads using taps and dies	1	19. Tap and die specifications
20. Clean and tin soldering copper	1	20. Electric soldering iron specifications

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
21. Solder joints	1	21. Types and uses of solders and fluxes
	1	22. Sizes, shapes and uses of rivets

Basic Electrical Principles

	2	23. Characteristics and properties of atoms
	2	24. Characteristics of electrons and protons
	2	25. The theory of electrons
	2	26. Difference between static and current electricity
	2	27. Conducting and nonconducting materials
	2	28. Cause of electron movement in a conductor
	2	29. Direction of current flow
	2	30. Effects of current flow
	2	31. Speed of electric current
32. Measure current, voltage, and resistance	2	32. The meaning of volt, ohm, ampere and watts
	2	33. Characteristics and difference of direct and alternating current
	2	34. Effect of wire size and length on resistance
	2	35. Effect of resistance in electric circuits
	2	36. Ohm's Law and its applications
	2	37. Characteristics and differences of series and parallel circuits
	2	38. The meaning of voltage drop: its causes and results

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Precautions and Safe Practices		
	3	39. Test equipment and tools needed in the electrical repair shop
	3	40. Methods used to locate troubles
	3	41. Nature of electrical troubles
	3	42. Safety precautions to be observed
	3	43. Points to be observed during disassembly and reassembly
	3	44. Possible substitutions in emergencies
	3	45. Typical faults in drive mechanisms
46. Lubricate appliance bearings	3	46. General precautions when lubricating
47. Attach cord to lamp socket	3	47. Importance and use of Underwriter's knot
48. Attach wires to terminals		
49. Attach cord to appliance plug	3	49. Types of appliance plugs and their uses
50. Attach resistance wire with terminal eyelets		
51. Repair resistance wire with mending sleeve		
	3	52. Types of appliance cords and their uses
53. Remove insulation from wire	3	53. Methods of removing insulation
54. Make a Western Union splice	3	54. Amount of insulation to be removed from wire for splices
55. Make a tap splice	3	55. Common uses of the different splices
56. Make a pigtail splice		
57. Make a solderless connection		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
		Safe Practices
58. Remove shocked person from electrical conductor		
59. Apply artificial respiration	3	59. Method of dealing with person receiving shock
	3	60. Safety factors in the use of electricity
	3	61. Advantage of grounding appliance
	3	62. The human body as a conductor
		Electricity in the Home
	4	63. Purpose of the National Electrical Code
	4	64. House-wiring systems
	4	65. Overload devices used in home wiring systems
66. Test and replace fuses	4	66. Function of fuses; their types and sizes
67. Trace house circuits	4	67. Types of wiring used
68. Troubleshoot electric wiring circuits		
	4	69. Method of specifying round wire sizes
	4	70. Causes of poor electrical service in homes
		Signals and Alarms
71. Install bells, buzzers and chimes	5	71. Operating principles of bells, buzzers and chimes
	5	72. AC and DC operated signals
73. Install bell transformer	5	73. Power sources for signals
74. Install multicontrol circuits	5	74. Common signal faults
	5	75. Circuits for signal operation

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	Electric Irons	
	6	76. Types of electric irons
77. Disassemble and assemble iron	6	77. Essential parts of an electric iron
78. Avoid scratching iron sole plate	6	78. Methods of preventing damage to iron while repairing
79. Test iron for complete circuit		
80. Test iron for ground		
81. Clean thermostat contact points	6	81. Function and operation of the thermostat in automatic irons
	6	82. Dangers involved in cleaning contact points
	6	83. Common troubles of irons and their causes
84. Check thermostat operation		
85. Test temperature setting of iron	6	85. Types of iron testers and their construction
86. Readjust thermostat		
87. Install new heating element	6	87. Types of heating elements
88. Change temperature setting	6	88. Operating temperatures of electric irons
89. Polish damaged sole plate	6	89. Materials used in polishing iron sole plate
90. Clean steam iron	6	90. Operating principles of electric steam irons
	6	91. Care of electric steam irons
	6	92. Effect of hard water on steam irons
	6	93. Effect of using an a.c. iron on d.c. current
94. Replace iron cord and plug		
	Electric Heaters	
	6	95. Types of electric heaters and their construction

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
96. Repair or replace heater element in bowl type heater	6	96. Service requirements of bowl type heater
97. Determine length and size of resistance wire needed	6	97. Effect of bunching of coils on heater insulator
98. Assemble and disassemble a convection heater	6	98. The operating principle of convection
99. Replace heating element in convection heater		
100. Remove and replace heater element in electric steam radiator	6	100. The operating principles of electric steam radiators
101. Fill electric steam radiators	6	101. Maintenance requirements of electric steam radiators
	Electric Blankets	
	6	102. Types of electric blankets and their construction
103. Repair or replace heating element in electric blanket	6	103. Service requirements of electric blankets
104. Making adjustments on a thermostat	6	104. The operating principles of a thermostat
105. Testing the action of the thermostats and temperature of the heating elements	6	105. Testing procedure for determining the effectiveness of an electric blanket
106. Correct control box defects and clean dirty thermostat points	6	106. Maintenance requirements of an electric blanket
	Electric Heating Pad	
	6	107. Types of electric heating pads
108. Repair or replace heating element in heating pad	6	108. Service requirements of a heating pad.
109. Adjust or replace a thermostat	6	109. The functioning principle of a thermostat
	Electric Water Heaters	
	7	110. Types and construction of electric water heaters
	7	111. Essential parts of an electric water heater

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	7	112. Sizes of electric water heaters
113. Check for complete circuit	7	113. Causes of opens in the heater circuit
114. Check for bad fuse		
115. Check time clock	7	115. Causes of insufficient hot water
116. Remove thermostat		
117. Clean thermostat contact points	7	117. Materials used in cleaning thermostat contact points
118. Adjust thermostat	7	118. Types of thermostats used in electric water heaters
119. Remove and replace thermostat well		
120. Install new thermostat	7	120. The operation of thermostats in water heaters connected for non-limited, limited or off-peak demand
121. Remove and replace heater element	7	121. Types and construction of heating elements for water heaters
122. Install magnesium rod in heater tank	7	122. Purpose of a magnesium rod in an electric water heater tank
123. Prevent heat loss	7	123. Causes of heat loss in hot water systems
	7	124. Purpose of gooseneck or heat trap
	7	125. Effect of steam on heater elements
126. Clean heater element	7	126. Methods of cleaning heater element
127. Clean heater tank	7	127. Materials used in cleaning and repairing heater tank
128. Repair a leaky tank		
129. Eliminate circulatory system	7	129. The principle of circulatory circulation in hot water systems
130. Install electric water heaters	7	130. Factors involved in the installation of electric water heaters
131. Install tempering tank	7	131. Functions and purpose of a tempering tank

Electric Toasters

	8	132. Types and characteristics of electric toasters
	8	133. Operating principles of electric toasters

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
134. Disassemble and assemble electric toaster		
135. Repair break in heating element	8	135. Types of heating elements used in toasters
	8	136. Arrangement of heating elements in toasters
137. Shorten elements in through-type automatic toaster		
138. Replace heating element in through-type toaster		
139. Check for faulty motor operation in through-type toaster	8	139. Factors involved in the repair or readjustment of through-type toasters
140. Locate troubles in pop-up toasters	8	140. Operating characteristics of pop-up toasters
141. Make adjustments and repairs	8	141. Timing devices used in toasters
	8	142. Causes of pop-up toaster failure or faulty operation
143. Clean thermostat contact points	8	143. Materials used in cleaning thermostat contact points
144. Replace cord and plug		
	8	145. Types of appliance cord used for toasters

Electric Waffle Irons

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	8	146. Types of electric waffle irons
	8	147. Automatic waffle iron operation
148. Avoid scratching or damaging finish		
149. Disassemble and assemble waffle iron	8	149. Essential parts of an electric waffle iron
150. Test for complete circuit		
151. Test for ground	8	151. Possible troubles of a waffle iron and their causes
152. Diagnose trouble		
153. Clean thermostat contact points	8	153. Principle of heat adjustment on electric waffle irons
	8	154. Materials used for cleaning thermostat contact points
155. Adjust thermostat		
156. Remove and install new elements		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
157. Test for thermostat operating temperature	8	157. Operating temperatures of waffle irons
	8	158. The result of operating an a.c. waffle iron on d.c.

Electric Coffee Makers

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	8	159. Types of electric coffee makers
	8	160. Essential parts of electric percolators
	8	161. Operating principles of electric coffee makers
162. Avoid scratching or damaging percolator finish		
163. Test for complete circuit	8	163. Common percolator troubles
164. Test for grounded circuit	8	164. Causes of grounds in electric coffee makers
165. Check and install new fuse	8	165. The object of a fuse in electric percolators
166. Remove heating element	8	166. Types of heating elements used in electric coffee makers
167. Check percolator heater plate for flatness	8	167. Importance of a tight heater element cover
168. Check and remove sediment in percolator well	8	168. Effect of accumulated sediment in percolator well
169. Disassemble and assemble brewer coffee makers	8	169. Essential parts of brewer coffee makers
	8	170. Varieties of brewer coffee makers
	8	171. Common troubles in brewer coffee makers; their causes and remedies
172. Adjust thermostat temperature control		
173. Test for correct thermostat adjustment		
174. Replace damaged parts		

Electric Shaver

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	8	175. Types of electric shavers
176. Disassemble to assemble electric shaver	8	176. Principle parts of an electric shaver
177. Clean and replace shaving head and blades	8	177. Causes of improper shaving
178. Lubricate motor precisely	8	178. Maintenance requirement of an electric shaver

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Electric Knife Sharpener		
	8	179. Types of electric knife sharpeners
180. Disassemble and assemble electric knife sharpeners	8	180. Principle parts of an electric knife sharpener
181. Replace worn brushes, switch, plug, and cord	8	181. Causes of poor operation of electric knife sharpener
182. Lubricate knife sharpener	8	182. Maintenance requirement of an electric knife sharpener
Electric Can Opener		
183. Disassemble and assemble electric can opener	8	183. Principle parts of an electric can opener
184. Replace dulled cutting edges, worn gears	8	184. Principle cause of inadequate operation of an electric can opener
185. Clean and lubricate electric can opener	8	185. Maintenance requirement of an electric can opener
Electric Popcorn Poppers		
	8	186. Types of popcorn poppers
	8	187. Types and sizes of heating elements used in popcorn poppers
188. Repair or replace heating and control units in popcorn poppers	8	188. Service requirements of an electric popcorn poppers
Electric Skillets		
	8	189. Types of electric skillets
	8	190. Types of heating elements used in electric skillets
191. Repair or replace heating and control units in electric skillet	8	191. Service requirements of an electric skillet
Electric Blenders		
	8	192. Types of electric blenders
193. Install new knives and repair motor	8	193. Service requirements of an electric blender

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Electric Broilers and Roasters		
	9	194. Types and construction of electric broilers
195. Disassemble and assemble broiler	9	195. Principal parts of electric broiler
196. Check for open circuit		
197. Check for ground		
198. Replace heating element	9	198. Method of determining length of replacement coil
199. Make temporary repairs to heating element	9	199. Number and location of heating elements
	9	200. How broilers and roasters operate
201. Disassemble and assemble roaster	9	201. Principal parts of electric roaster
202. Check thermostatic action	9	202. Causes of improper roaster operation
203. Check timing device		
204. Adjust thermostat		
205. Replace insulation	9	205. Type of insulation used in roasters
	9	206. Factors involved in reassembling a roaster
Electric Ranges		
	9	207. Types and construction of electric ranges
208. Check range for open circuit	9	208. Voltage requirements of electric range
209. Test range voltages with voltmeter	9	209. Reason for having a three-wire circuit for range
	9	210. Advantages of a separate light meter for large appliances
211. Check for loose connections		
212. Test for shorts		
213. Check and replace fuse		
214. Ground range according to electric code	9	214. Reason for grounding range
215. Check and replace surface element switch	9	215. Arrangements of electrical connections in switch to provide various heats
216. Check range surface elements	9	216. Types of surface heating units

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	9	217. Possible causes of range complaints and their correction
218. Replace range surface elements		
219. Straighten heating elements		
220. Replace surface element signal light

227. Clean oven element contact blades	9	227. Materials used for cleaning contact blades
228. Check and replace oven element switch		
229. Adjust oven temperature control	9	229. Equipment necessary for checking temperature
230. Replace or adjust oven switch		
231. Replace oven-unit insulating bushing	9	231. Types of insulating bushings used with oven heating elements
232. Remove and replace sheathed coil on tabular oven heating units		
233. Replace tabular-type contact blades of oven heating units	9	233. Types of contact spring assemblies used with oven heating units
234. Check operation of oven thermostatic heat control	9	234. Methods of checking the operation of oven thermostatic heat control
235. Adjust thermostatic oven control		
236. Replace timer unit	9	236. Types and construction of oven timers
237. Convert three-heat surface unit to five-heat	9	237. Factors involved in converting a three-heat surface unit to five-heat
238. Level range		
239. Adjust oven door for proper fit		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
240. Repair or replace oven door hinges, springs, or bearings		
241. Replace oven light switch		

Electric Motors

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	10	242. The nature of magnetism
	10	243. Characteristics and kind of magnets
	10	244. Characteristics of magnetic lines of force
	10	245. Principles of electromagnetism
	10	246. Factors determining the strength of electromagnets
	10	247. Types and uses of electric motors
	10	248. Operating principles of electric motors
	10	249. Characteristics of fractional horsepower motors
	10	250. Types of speed controls used for appliance motor
	10	251. Meaning of phase
252. Remove and replace brushes	10	252. Advantages and disadvantages of the types of motors
253. Remove and replace worn motor bearings	10	253. Effects of worn bearings on motor operation
254. Test motor armature	10	254. Methods of testing motor armature
255. Repair motor armature		
256. Repair or replace centrifugal switch in split-phase motors	10	256. Operating principle of centrifugal switch
257. Reverse induction motor	10	257. Location of switch in motor circuit
258. Rewind and install new field coils	10	258. Materials used in rewinding motors
259. Clean motor	10	259. The importance of a clean motor
260. Oil motor	10	260. Lubricating systems of motors
261. Ascertain starting torque of motor	10	261. Equipment necessary for testing motors.
262. Measure power output of motor		
263. Measure rpm of motor		
264. Make no-load, full-load, locked-torque, and breakdown tests		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
265. Test capacitor for short	10	265. Methods of testing capacitor
266. Polish dirty commutator	10	266. Materials used in cleaning commutators
267. Turn commutator in lathe	10	267. Importance of having a smooth commutator
268. Order replacement parts	10	268. Information necessary in ordering repairs

Fans and Blowers

269. Test for complete circuit and grounds	11	269. Types and construction of fans and blowers
	11	270. Types of motors used in fans
	11	271. Uses of blowers
272. Disassemble fan		
273. Clean motor		
274. Inspect and replace bearings		
275. Replace defective switch		
276. Install new cord		
277. Align fan blades		
278. Oil motor	11	278. Type of oil used in fans
	11	279. Purpose of kitchen ventilator
	11	280. Operating principles of attic ventilator
281. Repair motor windings		
282. Adjust or repair oscillating mechanism		

Vacuum Cleaners

	11	283. Types and characteristics of vacuum cleaners
284. Disassemble vacuum cleaner	11	284. Operating principles of vacuum cleaners
	11	285. Principal parts of vacuum cleaner
286. Adjust rotary brushes on upright cleaners	11	286. Methods of adjusting rotary brushes
287. Measure amount of vacuum developed in vacuum cleaner	11	287. Materials necessary to measure vacuum of cleaner
	11	288. Reasons why cleaner will not clean
289. Balance fans on tank type vacuum cleaner	11	289. Causes of cleaner noise or vibration
290. Replace belt and rotary brushes on upright cleaner		
291. Replace switch and cord		
292. Repair motor		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Food Mixers		
293. Disassemble mixer		
	12	294. Types and construction of food mixers
295. Adjust or replace governor switch	12	295. Function of the governor switch
296. Trace armature and field winding circuits		
297. Adjust speed settings	12	297. Types of speed controls used
298. Replace motor brushes	12	298. Possible causes of mixer troubles and their correction
299. Remove and replace worn bearings and gears	12	299. Methods of gearing used in electric mixers
300. Clean and repair armature		
301. Replace mixer switch		
302. Replace governor condenser		
303. Lubricate mixer		
Electric Sewing Machines		
	12	304. Power control on sewing machines
305. Clean and lubricate sewing machine	12	305. Causes for noisy operations
306. Replace needle	12	306. Points to be observed during inspection and adjustment
307. Adjust foot pressure		
308. Adjust bobbin winding mechanism		
309. Adjust belt tension		
310. Adjust thread tension	12	310. The effect of unequal thread tension upon stitc
311. Adjust foot pressure		
312. Adjust lift of feed dogs		
Electric Ironers		
	13	313. Types of electric ironers
314. Disassemble ironer	13	314. Principal parts of rotary ironer
315. Check ironer circuit for short	13	315. Operating principles of rotary ironers
316. Check for and eliminate open circuit	13	316. Wiring circuits of rotary ironers
317. Check and repair ironer heating elements	13	317. Characteristics of ironer heating elements

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
318. Check ironer motor circuit		
319. Readjust motor end thrust		
320. Replace main or handle switch	13	320. Types of switches and controls employed on rotary ironers
321. Check and replace rotary ironer motor switch		
322. Check and replace shoe thermostat		
323. Replace belt, chain, or coupling on rotary ironer	13	323. Ironer troubles and their corrections
324. Adjust or repair control linkage		
325. Adjust or replace roll-clutch mechanism on moving shoe type rotary ironer		
326. Remove roll and clean gears		
327. Repair or adjust roll drive chain, rachets, or roll clutch on stationary shoe type rotary ironer		
328. Readjust speed control lever on stationary shoe type ironer		
329. Replace roll padding	13	329. Materials used in replacing padding
	13	330. Factors involved in the replacement of ironer roll padding
331. Replace or adjust pressure spring

Units 1-22

BASIC TOOLS AND MATERIALS AND THEIR USES

Every occupation has what is known as the "tools of the trade." These are the basic tools that are essential to do the work required. Some tools are useful in a number of different occupations, hence the term "basic tools."

No doubt you are familiar with a number of the tools presented in this unit. Some of them may be new to you. You will find, as you progress in your work, that the electrical applicance repairman uses many different types and kinds of tools. He may need some of the tools used by the machinist, the woodworker, and the sheet metal and electrical workers.

In this assignment you will study the proper and safe use and care of the various tools used by the electrical appliance repairman.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Manly, How to Repair Electrical Appliances, pp. 11-58.

Questions:

1. Discuss the use of basic tools in electrical appliance work.

2. Explain how measurements are made with the micrometer caliper. Describe the graduations on barrel and thimble of a micrometer in relation to their measurement of a diameter.

3. Describe some of the various kinds of screwdrivers needed for electrical work. How are screwdrivers misused?

4. Discuss the styles of open-end wrenches used for electrical work. Describe the correct use of the adjustable wrench in turning a lock nut.

5. Explain the different types of pliers used for gripping and those used only for cutting.

6. Describe the types of hammer heads usually associated with electrical work. What safety precautions should be considered when using a hammer?

7. What are some of the different classifications of screws and bolts used for electrical repair work? What are self-tapping screws and drive screws?

8. What names are given to the various cuts of file teeth? What are some different shapes of files?

9. Describe the uses of various types of cold chisels.

10. Describe the procedure for determining drill bit sizes. Describe the correct procedure in grinding drill bits.

11. What tools are used for cutting threads and taping holes in metal?

12. Explain the uses of various kinds of soldering irons. How is their size specified?

13. Discuss the appropriate uses of rosin core and acid core solder. How are these solders different? Explain correct soldering procedure around finished joints, tacking a seam and sweating of solder joints.

14. How are rivets used in electrical appliance work? Describe the different kinds of rivets available.

Covering
Units 23-38

FUNDAMENTAL PRINCIPLES OF ELECTRICITY

Have you ever wondered what makes a light bulb glow, an electric motor run, and an iron heat? We would all agree that it is by electricity that these things are accomplished, but what is electricity?

There is much to learn and much to be accomplished in the field of electricity. To one interested, it offers a useful, enjoyable, and challenging career. The testing, servicing, and repair of even the simplest electrical appliance requires some knowledge of the fundamental electrical principles. These principles are the foundation blocks for every phase of electrical work. The more complex the electrical device, the better informed the serviceman must be if he is to do an intelligent and satisfactory repair job.

In this assignment you will study basic introductory material concerning electricity. This will involve a study of atoms and the electron theory, current electricity, and its fundamental quantities and measurements.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

Information Sheet No. 1 (this manual)

Questions:

1. Discuss the meaning of an electric charge. How has electricity effected our way of life?

2. Explain the characteristic of any material that makes for good conductors of electricity.

3. Discuss the electron theory. What is an electron path?

4. What is meant by direct current? How are alternating current and direct current different? What is meant by 60-cycle alternating current?

5. Explain what voltage represents. How is amperage different from voltage? What is amperage?

6. What is electrical resistance? What effect does the increased length, diameter, and temperature of a conductor have on electrical resistance?

7. What is meant by temperature coefficient of a conductor?

8. Describe the cause of voltage drop. How does it effect the amount of electricity used in the home?

Sheet No. 1

FUNDAMENTAL PRINCIPLES OF ELECTRICITY

Present theories indicate that all matter is composed of atoms, and the atoms are composed of subatomic particles called electrons, protons, and neutrons. The neutrons and protons are contained in the nucleus (the center of the atom), and the electrons spin in various orbits about the nucleus. All these electrons are tightly bound to the nucleus except those in the outer orbit of some atoms. These outer orbital electrons are free to move from their orbits if subjected to some external force. Such electrons are called "free electrons".

The simplest atom is the hydrogen atom. Normally its nucleus consists of a single proton with one electron in orbit. If this atom loses its electron, the remaining nucleus is said to have a positive electrical charge. This charge is equal to and opposite to the charge on the electron which was removed. Thus the charge on the electron is referred to as a negative charge. When the negatively-charged electron is in orbit about the positively-charged proton, the hydrogen atom is complete and has a neutral electrical charge. That is, the negative charge on the electron balances out the positive charge on the proton. An electron is impossible to see.

All other atoms have more electron-proton combinations than the hydrogen atom. The heavier the atom is, the more protons it has in its nucleus and hence more electrons in orbit about the nucleus. In addition, all these atoms except the normal hydrogen atom, have neutrons in their nuclei. For example, the copper atom has 29 protons and 39 neutrons in its nucleus plus 29 electrons in orbits about the nucleus. If an atom loses an electron from its outer orbit, it would have a single positive charge of electricity. If it lost two electrons, it would possess two positive charges. Thus, for each electron that escapes from the outer orbit, the atom gains a positive charge.

Atoms combine with other atoms to form molecules of matter. If all of the atoms in a particular piece of matter are the same kind of atom, the material is called an element. Examples of elements are copper, silver, gold, oxygen, hydrogen, and chlorine. On the other hand, if the atoms of a substance are made up from different kinds of atoms, the substance is called a compound, e.g., lead-oxide, water, copper-sulphate, and sodium-chloride (table salt).

The formation of molecules from atoms or from other molecules is called a chemical reaction. If two different kinds of elements combine chemically, the resulting product is a chemical compound.

Atoms or groups of atoms that possess an electric charge are called "ions". An ion which has a positive charge is called a cation. If it has a negative charge, it is called an anion.

If asked to define heat, a person might say that it is something that raises the temperature, keeps one warm, makes water boil, or melts ice. Heat does produce all these effects; but to understand what heat is, reference must be made again to atoms and molecules. Modern theory states that heat is caused by the increased speed of the atoms and molecules. As the speed of motion of the molecules in a piece of iron is increased, the temperature is increased. Similarly, if a piece of iron is heated, the velocity of the molecules is increased. This increased speed of the molecules (which are assumed to be in a constant circular-type motion) causes each molecule to revolve in larger orbital paths. This, in turn, causes the material to expand. Most solids, liquids, and gases will expand in this manner when heated.

STATIC ELECTRICITY

The early Greeks learned that a piece of amber, if rubbed, would attract small bits of dry wood shavings or lint. They also noted that the force around the piece of amber was different than the force around a piece of magnetized iron. That is, the amber and wood shavings were non-magnetic materials, whereas the magnetized iron will only attract magnetic materials.

Later, many other materials were found to exhibit the same characteristics as amber. In 1600 William Gilbert attempted to explain the nature of this force. He classified all known substances as electrics and non-electrics. An electric he considered to be any substance possessing the proberty of amber. A nonelectric was any substance not possessing the property of amber.

Later a Frenchman, DuFay, concluded that there were two opposite kinds of electricity. Benjamin Franklin named these forces positive (+) and negative (-). He said positive was the force (charge) associated with a piece of glass, and negative was the force associated with a piece of hard rubber.

If two light objects such as two pith balls (small flakes of aluminum foil will do) are both given a like charge, they will repel each other. If the two objects have unlike (opposite charges) they will attract each other. If there are no charges on the objects (both neutral) there will be no interaction between them. Therefore, it may be concluded that fundamental laws hold true: LIKE CHARGES REPEL EACH OTHER; UNLIKE CHARGES ATTRACT EACH OTHER.

ELECTRIC CURRENT

When free electrons are forced to move along a path, the flow of electrons is called an electric current. The force that causes these electrons to move in the path (conductor) is called voltage, potential, or electrical pressure. The potential is caused by a greater number of free electrons being massed at one point than another. If the two points are connected together by a conductor, electrons will flow from the point of higher potential (greater number of free electrons) to the point of lower potential (fewer electrons), but never reach the other point in practice.

An electric generator or battery is a device that removes large numbers of electrons from one place (positive terminal) and deposits them at another place (negative terminal). A generator does not produce electricity. It produces an electrical potential (pressure). When a conductor is placed between the two terminals, the electrical pressure will force electrons to flow through the conductor. The energy of these moving electrons can be used to run electric motors, heat toaster elements, and operate many other electrical devices.

Electrons can move through some substances more easily than through others. Some substances such as copper, iron, aluminum, and many other metals form good paths through which electrons may readily flow. Such substances, because they readily permit electrons to flow through them, are called conductors. Other substances, such as rubber and glass, do not readily permit electrons to flow through them; these substances are called nonconductors or insulators.

CONDUCTORS

The conductor of electricity has many free electrons. Hence, when an electrical potential is applied to the conductor, the free electrons move toward the point of lower potential. Electrons leave the higher point of potential and enter the conductor. Electrons at the point of lower potential are drawn away by the generating device and placed at the high potential end. Thus, there is a complete circuit (path) around which the electrons flow. The movement of any individual electron along the path is quite slow. It may only move a fraction of an inch per minute. But, the pressure when applied is exerted instantly (at almost the speed of light) from one end of the circuit to the other.

INSULATORS

Nonconductors are composed of atoms or molecules which have their electrons very tightly bound to their nuclei. Very high electrical potentials are required before electrons will force their way through such materials. Therefore, these materials are used as insulators. That is, they are placed in between two points of potential to prevent electron flow between them. Insulation over electrical wires is used for this purpose. It is also used as a safety measure so that animals and people do not come into contact with two wires of opposite potential. Wires are covered with such insulating materials as rubber, plastic, enamel paint, cotton, and silk. The type and thickness of the insulation is determined by the potential difference between the conductors. Current carrying parts in electric machines are often supported by mica, bakelite, or fiber insulators. Dry air is also a good insulator.

ELECTRICAL MEASUREMENTS

Electric current is a flow (sometimes referred to as a drift) of free electrons from one point to another. The more electrons in a motion past a given point in the circuit, the greater is the current. The practical unit of electrical current is the ampere. The ampere is the standard unit of the rate of flow of electrons in a circuit. An ammeter is used to measure electrical current.

Electrical pressure (potential) is the electrical force that causes electrons to move through a conductor. The unit of electrical pressure is the volt. A voltmeter is used to measure electrical pressure.

The opposition that a device or material offers to the flow of direct current is called resistance. The unit of resistance is the ohm A conductor has one ohm of resistance if it allows one ampere of current to flow when a voltage of one volt is applied. An ohmmeter is used to measure resistance.

ALTERNATING CURRENT

Direct current is a continuous flow of free electrons from one end of a conductor to another. When the electric current is caused to continuously vary in value and to reverse its direction of flow at regular intervals, the current increases from zero to maximum and back to zero in one direction. The number of cycles that occur in one second of time is called the frequency.

Both direct current (d.c.) and alternating current (a.c.) are used extensively. However, a.c. is most commonly used in industrial and home power applications, because it is more readily and economically transmitted over long distances. The most common frequency is 60-cycle.

SERIES CIRCUITS

In a series circuit there is only one path through which the current can flow. Therefore, the current is the same at any point in the circuit.

PARALLEL CIRCUITS

In a parallel circuit there are two or more paths through which the current can flow. Also, the current will divide up so that some current flows in each parallel path. The amount of current that flows in each path (or branch line) will be dependent upon the resistance of each path.

RESISTANCE IN SERIES AND PARALLEL

In a series circuit, the total resistance is equal to the sum of the individual resistances. In a parallel circuit the total resistance is less than the lowest value resistor in the parallel group. Parallel resistances are calibrated with somewhat more difficulty.

Resistance increases with temperature for the following reason. It can be supposed that as the atoms of a wire are set into more rapid motion (or in other words, as the wire becomes heated), the electrons do not move quite so easily between the atoms. The larger the number assigned to wire, the smaller is its diameter, and the more resistance it offers.

TEMPERATURE COEFFICIENT

It is desirable to know more exactly what temperature means in terms of increased resistance. There will be numerous occasions to use such information in appliance servicing work. Temperature coefficient gives the amount of change in resistance that a wire undergoes for each degree of temperature change. The resistance change per degree of temperature change is greater at low temperatures than at high temperatures.

Sheet No. 3

Covering
Units 39-62

SAFE PRACTICES AND REPAIR PROCEDURES

In the modern home, most of the appliances are operated electrically. These appliances are electrically driven, electrically heated, or may be a combination of the two.

It is impractical to discard a household appliance every time it ceases to operate. The fault may be either mechanical or electrical; therefore, it is necessary for the electrical appliance repairman to be able to diagnose and repair the electrical as well as the mechanical fault.

In this assignment, you will be able to learn some of the common procedures followed in first, locating the trouble and, second, making the necessary repair with greatest amount of safety.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Manly, How to Repair Electrical Appliances, pp. 59-96.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 1-19.
D. Tricomi, How to Repair Major Appliances, pp. 7-17.

Questions:

1. Describe the different types of fuses available for use in an electrical circuit. With what type of circuit is each used?

2. Explain the purpose of grounding a circuit. What is the best means of grounding?

3. What is the first rule of safety when working with an electrical appliance?

4. Discuss the four principal types of trouble in electric circuits?

5. Describe how you can locate an open, a ground, and an abnormally high resistance by using a test instrument?

6. Explain why it is important to use an underwriter's knot on an appliance cord when attaching a plug.

7. Discuss the two kinds of electric current.

8. Explain how test equipment for electrical work can be used to a great advantage for safety purposes.

Assignment
Sheet No. 4

Covering
Units 63-70

HOME ELECTRICAL WIRING

Improper functioning of an electrical appliance is often due to factors or defects other than the appliance itself. Many of these defects lie in the home wiring system. These defects will often cause serious damage to an electrical appliance.

Many times the appliance repairman will be called upon to service and repair certain appliances in the home. In some instances, he will need to check the wiring and make suggestions for improvement if needed. This will necessitate an adequate understanding of home wiring systems and the factors involved in order that he may accomplish these things.

In this assignment, you will cover material concerning home wiring which the electrical appliance serviceman should know. This will involve a study of circuits, wiring and wire sizes, protective devices, and other necessary factors.

<u>Assignment</u>:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

<u>Reference</u>:

C. Campbell, <u>How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances</u>, pp. 20-23.

<u>Questions</u>:

1. Explain what determines the capacity of a house wiring system. Describe the three main parts of a house wiring system.

2. Discuss the electrical distribution system in a home. What are "branch circuits"?

3. Describe what is meant by wire gauge. Why is wire gauge important in electrical work? What determines the wire gauge to be used?

4. Explain the purpose of an outlet box. What procedure should be followed to permit easy accessability to the contents of the box?

5. Describe the principle involved in using each of the following: (1) a single-pole, single-throw switch; (2) a double-pole, single-throw switch; (3) a single-pole, double-throw switch, and (4) a double-pole, double-throw switch.

6. What is the National Electrical Code? What restrictions are placed on the use of appliance cords by the NEC?

7. Discuss what the National Board of Fire Underwriters represent. Are they a law?

8. Explain the importance and meaning of the famous "UL" label placed on appliances.

9. What problems are potentially present when an antiquated fuse box is observed? How can these be solved?

Covering
Units 71-75

SIGNALS AND ALARMS

Door bells, buzzers, and chimes have a number of use in the home and industry. They may be used to indicate the presence of a friendly visitor or may be used for burglar alarms. Signals in offices, throughout industrial plants, and even between buildings often use small lamps, buzzers, bells, or chimes.

The signals and alarms may be operated from a relatively high voltage used in the lighting system which is "stepped down" or may be operated from batteries.

In this assignment, you will have placed before you information concerning the construction, installation, and repair of various signal and alarm systems.

Assignment:

1. Read the reference listed below.
2. Obtain a door bell. Observe its construction. Connect it to the proper voltage and observe its operation.
3. Observe the operation of door chimes.
4. Answer the questions below and turn in this assignment by __________________________.

Reference:

A. Manly, How to Repair Electrical Appliances, pp. 87-109.

Questions:

1. What are the main uses of bells and chimes? From what electrical sources may they be operated?

2. Discuss the operating principle of a bell system. Discuss the maximum voltage to be used with a bell or chime system.

3. Discuss the different size bell transformers used for bells, buzzers, and chime systems.

4. How does the chimes system differ in voltage requirement from other household systems? What are the voltage ranges for a chimes system?

5. Explain why bells and buzzers used with batteries must have circuit breakers. Does battery operation at a door chime require more or less voltage as transformer operation?

6. Describe two of the methods used in determining troubles in a bell and a buzzer system.

7. Why are chime systems so free of troubles?

Assignment
Sheet No. 6

Units 76-109

ELECTRIC HEATERS, BLANKETS, HEATING PADS, AND IRONS

The convenience and utility of many of the small electric appliances has brought about their widespread acceptance in the American home. In nearly every American home today, there can be found several electric appliances that depend for their action upon resistance wires which produce heat when current passes through them.

The increased use of these resistance appliances makes it more necessary than ever for the appliance repairman to have a good understanding concerning their operation. Much of his work may consist of the repair of these appliances. He needs to know how these appliances work and how they may be serviced and repaired.

In this and the three following assignments, you will have an opportunity to learn about resistance heating appliances commonly found in the home and which at times require servicing. You will study about the various types and essential parts of the different appliances together with their operating principles. Causes of failure or faulty operation and factors involved in the repair of each will also be covered.

Assignment:

1. Read the reference listed below.
2. Measure the wattage consumption of the following and compare the obtained values to the ratings listed with the appliance.
    a. an electric heater
    b. a heating pad
    c. an electric blanket
    d. an electric iron

References:

A. Manly, Electrical Appliance Repair and Servicing, pp. 123-129.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 136-139.
E. Darr, How to Repair Small Appliances, pp. 24-31, 50-54.

Questions:

1. Describe the working principle of a reflector-bowl type heater. Explain the replacement procedure for a heater-wire in a bowl type heater.

2. Explain the working principle of the steam iron. What are the main components? What is the purpose of each component?

3. Describe the procedure for testing the action of a thermostat in an automatic flatiron.

4. Discuss the correct dissassembly procedure for a flatiron. How does the disassemble procedure of an automatic iron differ from the non-automatic iron?

5. What preventive maintenance should be considered in the care of the automatic iron?

6. Describe the different types of heating elements used in electric irons. What are the advantages and disadvantages of each?

7. Explain the disassembly procedure of a steam iron.

8. Describe the function of the control box on an electric blanket.

9. Discuss the major troubles in electric blankets. How may they best be avoided?

10. Explain a testing procedure to determine if the electric blanket is working properly. How does this procedure compare with testing an electric heating pad?

Assignment
Sheet No. 7

Covering
Units 110-131

ELECTRIC WATER HEATERS

Electric water heaters are very popular in homes today. They offer to the homemakers a clean, safe, and economical method of heating water. Since the water is heated by the action of electric current passing through resistance element, this appliance is among those classed as resistance heating appliances.

Electric water heaters are relatively simple in construction and have few moving parts. Therefore, there is little that can go wrong with them. More often, user complaints arise from some cause outside the water heater itself. Other than knowing how to make repairs and replacements, the serviceman must know how to make correct installation so that he can diagnose a complaint of improper heater operation in the light of existing conditions. He must understand the purpose and operation of each heater part and know the possible causes of complaints regarding heater operation.

In this assignment, you will gain an understanding of electric water heaters and their operation. Factors involved in installation, diagnosing troubles, and repairing water heaters will be stressed.

Assignment:

1. Read the reference listed below.
2. Make wiring diagrams of a two-element hot-water heater connected for nonlimited-demand operation.
3. Make wiring diagrams of a two-element hot-water heater connected for limited-demand operation. Make a comparison between the two types of wiring situations.
4. After completing items 1, 2, and 3, answer the questions below and turn in this assignment by ____________________.

Reference:

D. Tricomi, How to Repair Major Appliances, pp. 194-203.

Questions:

1. Discuss the procedure for determining the average consumption of hot water in different size families. Will geographical location have any effect on water consumption?

2. What are the most common forms of hot-water waste. How can this type of waste be avoided?

3. Explain the induction method of heating water electrically. How is it different from the immersion heating method?

4. Describe the function of an electric hot-water heater in operation. What part does the thermostat play in an electric hot-water heater?

5. Explain the function of the control devices of an electric water heater. What safety factors should be considered here?

6. What are some of the factors to be considered, from the standpoint of electrical wiring, when installing an electric hot-water heater?

7. What are some of the most important points to check if the heater fails to produce hot water? Explain how they can be corrected.

8. What might be the causes of insufficient hot water? What checks should be made?

9. Discuss the possible causes for leaks in a hot water system. How may these leaks be corrected?

Assignment
Sheet No. 8

Covering
Units 132-193

ELECTRICAL TOASTERS, BLENDERS, COFFEE MAKERS, SHAVERS, KNIFE SHARPENERS, POPCORN POPPERS, CAN OPENERS, SKILLETS, AND WAFFLE IRONS

The convenience and utility of many of the small electric appliances have brought about their widespread acceptance in most homes. In nearly every American home today, there can be found several appliances whose action depends upon heat produced by current flowing through resistance wire or current flowing to create mechanical movement.

Many of the appliances were not available in quantity years ago. It becomes necessary for the electrical appliance repairman to have an understanding of their construction and operation. Much of his work will consist of the repair of many of the small items.

In this assignment, you will have an opportunity to learn about some of the small resistance heating and mechanical appliances commonly found in the home which at times need servicing.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Manly, How to Repair Electrical Appliances, pp. 110-123.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 130-135.
E. Darr, How to Repair Small Appliances, pp. 8-23, 32-33, 37-47, 57-60.

Questions:

1. Describe the construction and various arrangements of heating elements in electric toasters.

2. Explain the principle on which the automatic or clock-timed toaster operates.

3. Discuss the disassembly and repair procedure for an electric toaster. Is there a difference between the non-automatic and automatic toaster in the repairing procedure?

4. Describe the function of the electric percolator. What are some of the troubles that may develop with the electric percolator?

5. Discuss the principle on which an electric hot plate operates. What is the major cause of inoperation of an electric hot plate?

6. Describe each part and its function of a waffle iron. What precautions must be considered when reassembling a waffle iron?

7. Why is the correct preparation of the grids of a waffle iron good preventive maintenance?

8. Describe the principle of an electric shaver using a vibrator type driving mechanism. How does this differ with one which uses rotating blades?

9. Explain the causes for most shaver troubles. How can they be avoided?

10. What problems are usually encountered with an electric food blender? How can these problems be remedied?

11. Explain the wiring arrangement used on automatic coffee makers. Describe the change in the circuit when the brewing cycle occurs; warming cycle.

12. Describe the difference between the heating element of the repairable popcorn popper as to the popcorn popper with a sealed element.

13. Discuss the electrical operation of the plug-in type thermostatic control unit used with an electric skillet. What trouble might develop from this type of skillet?

14. What testing procedure may be used to determine correct functioning of an electric skillet after repair work is complete?

15. Discuss the problems that occur with a combination electric can opener and knife sharpener.

Assignment
Sheet No. 9

Covering
Units 194-242

ELECTRIC BROILERS, ROASTERS, AND RANGES

One of the larger electrical appliances that is classed as a resistance-heating appliance is the electric range. Electric broilers and roasters, while not as common to the average family as the electric range, are also used in the home. Each of these appliances require servicing and repairing at some time or another. Therefore, the serviceman needs to know the characteristics and operation of these appliances and the factors invovled in their repair. In connection with electric ranges, most service and repairs will be made in the homes. This necessitates quick diagnosis of the trouble and, in many cases, it will involve tact in giving the user instructions in correct use of the appliance.

In this assignment, you will study the various types, characteristics, and operation of the electric broiler, roaster, and range. Together with these you will study the factors involved in the servicing or repairing of each.

Assignment:

1. Read the references listed below.
2. In order to better acquaint yourself with the electrical circuits and operation of the range, do one of the following:

   Prepare a sketch for the following wiring diagrams.
   a. A surface-unit control switch
   b. A surface unit
   c. An oven thermostat

3. After completing items 1 and 2, answer the questions below and
q turn in this assignment by ____________________.

References:

A. Manly, How to Repair Electrical Appliances, p. 1.
D. Tricomi, How to Repair Major Appliances, pp. 136-138.

Questions:

1. Describe the principal parts of an electric roaster or oven. What effect does the insulating material have on the heating process?

2. Explain the method used in connecting an electric range to a house wiring system. How much voltage should be present for efficient operation?

3. Discuss the advantages of the wire-coil type surface units as compared to the tubular unit on electric ranges.

4. Explain the three-setting switch arrangement of contacts of an electric range at each setting. What coils become heated when switch is at medium high position; medium; and medium low position?

5. Describe the seven-position switch of an electric range. How does it differ from the three-position system?

6. Discuss the operation of the oven control selector switch and the oven control thermostat. Is the oven thermostat adjustable? How does the sensing bulb effect the thermostat?

7. Why are circuit breakers an important feature in an electric range circuit? What happens when the range wattage consumption exceeds the high limit set by the circuit breaker?

8. Why does the calibration of the oven in an electric range require the greatest servicing attention? How can this be avoided?

Assignment
Sheet No. 10

Covering
Units 243-269

ELECTRIC MOTORS, MOTOR TROUBLE, AND REPAIR

A large number of the electrical appliances which the serviceman will repair or service contain some type of electric motor. Quite often the trouble within these appliances will lie within the motor itself. The serviceman should be able to readily detect the various types of electric motors with which he may come into contact and know the characteristics of each.

Although motor repair work is considered a specialty within itself and done by someone other than the general electrical appliance serviceman, much of the service can be done easily by the appliance serviceman if he has an understanding of motor operation and is familiar with causes and remedies of motor troubles. He should be able to make simple repairs and diagnose major troubles even though he may not be equipped for all types of motor repair work.

In this unit, you will study the various types of motors commonly used in electrical appliances together with trouble-shooting procedures and service and repairs that can be made without special equipment.

Assignment:

1. Read the references listed below.
2. Make wiring diagrams of the various types of motor field winding connections presented in this assignment and place them in your notebook for future use.
3. Answer the questions below and turn in this assignment by ________________.

References:

B. Manly, How to Repair Electrical Appliances, pp. 145-174.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 34-43.
E. Darr, How to Repair Small Appliances, pp. 95-111.

Questions:

1. Describe the operation of the centrifugal switch for starting an induction motor. What are some of the principles employed in centrifugal switches?

2. Explain the working principle of a series motor. How is it different from an induction motor?

3. What changes are made in a series motor to obtain speed control? What is a rheostat?

4. Why do electric motors require a much greater flow of current while starting than after running at normal speed? How would this greater current requirement for starting an electric motor effect the fusing or circuit breaker system?

5. Discuss some of the preventive maintenance procedures necessary to eliminate motor troubles. How does motor lubrication effect the life of a motor? How can brushes be cared for properly? Commutators?

6. Describe the disassembly procedure of an electric motor. What parts should be examined as they are removed from the case?

7. Discuss the symptoms of motor troubles. What tests and remedies may be applied in each case to relieve the malfunction?

8. Describe the wiring schematic of a synchronous motor. Where is this type of motor most used?

9. Explain the two methods of connecting the field coils in an electric motor.

Assignment
Sheet No. 11

Covering
Units 270-293

ELECTRIC FANS, BLOWERS, AND VACUUM CLEANERS

Electric motors are one of the most important of all electrical devices. They perform innumberable tasks in this age of mechanized living. A great expansion in this respect has been in connection with the use of the electric motor for many appliances in and about the home.

In many electrical appliances, the motor is the sole electrical componenet of the appliance, and on it depends all of the action of the appliance. Although many of the difficulties that arise in these appliances are due to motor trouble, some complaints are the result of other parts which are worn, broken, or out of adjustment. The electrical appliance repairman needs to know how to repair or service these parts as well as the repair of the motor. This necessitates an understanding of the construction and operation of each appliance.

In preceding assignments, you have covered motors and motor repair. This assignment will cover only information on motors as related to fans, blowers, and vacuum cleaners. You will also study the types, construction, and operation of these appliances together with factors involved in the service and repair of each.

Assignment:

1. Read the references listed below.
2. Prepare a trouble shooting chart of each appliance covered in this assignment showing the common troubles, causes, and solution of each. Refer to text and service manuals. Keep charts in your notebook.
3. Answer the questions below and turn in this assignment by ____________________.

References:

B. Manly, How to Repair Electrical Appliances, pp. 188-198.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 44-55.

Questions:

1. Explain the function of each of the three basic parts of a vacuum cleaner.

2. Describe the operation of a separator vacuum cleaner. How does it differ from other vacuum cleaners?

3. Discuss the purpose of each part of an enclosed-separator mahcine which is in the motor and fan end of the outer shell.

4. Why do larger fans have a split-phase or capacitor-start motor?

5. Describe some of the complaints about the operation of electric fans. How can each complaint be corrected?

6. Explain the procedure for determining the trouble of an electric fan that will not run. What is the correct procedure in disassembling an electric fan?

7. Why are motors for household types of vacuum cleaners of the universal type? What are the RPM's that a motor will run at while cleaning is being done? Are all power ratings the same for all sizes and styles of cleaners? If not, what is the power rating range?

8. Discuss why the tank cleaner is inferior to the upright in cleaning carpets.

9. Describe some of the reasons why the cleaning action of a tank cleaner may be inadequate. Upright cleaner.

10. If the cleaner doesn't run at all, what testing procedure should be carried out? What test can be made to check the entire electrical path of a vacuum cleaner?

Assignment
Sheet No. 12

Covering
Units 294-313

FOOD MIXERS AND SEWING MACHINES

In electrical appliances, like food mixers and sewing machines, the motor is the sole electrical component and upon it depends the driving action. Although many of the difficulties that arise in these appliances are due to motor troubles, some complaints are the result of other parts which are worn, broken, or out of adjustment.

The electrical appliance repairman needs to know how to diagnose, service, and repair worn or broken parts as well as to repair the motor. This necessitates an understanding of the construction and operation of these appliances.

In a preceding assignment, you have covered motors and motor repair. In this assignment, emphasis is placed upon the construction and operation of food mixers and sewing machines having variable speed motors along with factors involved in the service and repair of each.

Assignment:

1. Read the references listed below.
2. Prepare a chart of one appliance covered in this assignment showing the common troubles, causes, and solution to each and place in your notebook.
3. Answer the questions below and turn in this assignment by ____________________.

References:

B. Manly, How to Repair Electrical Appliances, pp. 175-188.
C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 46-49.
E. Darr, How to Repair Small Appliances, pp. 34-36, 48-49.

Questions:

1. Describe the principle parts and their operation of an electric mixer.

2. Explain the operation of an electric food mixer speed selector switch.

3. How are mixer speeds varied? Describe how a three-speed drive gearing system works.

4. Discuss where most troubles are encountered with an electric mixer. What is a remedy for each?

5. Describe the working principle of a sewing machine foot control switch. What is the most common difficulty with the sewing machine foot control?

6. What are some of the main troubles encountered with a sewing machine? How can these be avoided?

7. Discuss the importance of preventive maintenance. How is it applied to a sewing machine?

8. Explain the disassembly procedure of a sewing machine in the correct order.

9. What is a bobbin? What difficulties may occur from the bobbin? Describe what cleaning may be done to eliminate problems with the bobbin case.

10. What are some of the problems caused by using dull needles? When should a needle be discarded?

11. Explain the effects on stitching of equal and unequal tensions on upper and lower threads. What correction can be made to avoid unequal stitching?

12. Describe how a bobbin is rewound.

13. What type of motor is best suited for a sewing machine? What driving mechanism is usually used on a sewing machine?

Assignment
Sheet No. 13

Covering
Units 314-337

ELECTRIC IRONERS

Ironers today are most often found in commercial cleaning establishments. This device turns out a fast professional ironing job while the operator remains relaxed.

There are many different types of electric ironers, some of which contain numerous parts, both stationary and movable. These parts have distinct functions to perform during the ironing process and must be understood by the appliance serviceman. He should also be familiar with the general ironer troubles, the possible causes of these, and the corrections that will be needed. The appliance serviceman cannot and should not rely on his mechanical intuition in repairing these electrical devices.

In this assignment, you will have an opportunity to study about the types of electric ironers, their construction and operation, and factors involved in service and repair of each.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

B. Manly, *How to Repair Electrical Appliances*, pp. 215-224.

Questions:

1. Describe how the shoe is held against and released from the roll in an electric ironer. What is the purpose of the shoe?

2. What is the eccentric wheel on an electric ironer? Describe its function.

3. Explain how longer periods of pressing can be obtained between the shoe and the roll of an electric ironer. When is this usually desired?

4. What are some of the checks that can be made if the shoe fails to heat on an electric ironer? What are some remedies for each check?

5. Explain what can be done to determine why the roll does not turn on an electric ironer.

6. Describe the electrical system for the shoe, motor, and switches of an electric ironer.

7. Discuss the procedure for replacing a heating element in an electric ironer. What special problems would you anticipate?

8. Explain the procedure for replacing roll padding on an ironer. Describe the different materials necessary for padding on a roll of an electric ironer.

Assignment
Sheet No. 14

Covering
Units 338-358

ELECTRIC GARBAGE DISPOSALS AND DISHWASHERS

Garbage disposers are relatively new to the long list of home electrical appliances. A few minutes operation of the disposal each day disposes unwanted food scraps. This feature makes the disposer a very practical appliance and one that is increasing in popularity.

Domestic types of electric dishwashers are also new; however, they may be found in many homes today. With the modern dishwashers of today, the pressing of a single button will wash, rinse, and dry the dishes automatically.

A distinguishing feature of a good electrical appliance repairman is his widespread knowledge of the many electrical appliances used today. More use is being made of the garbage disposal and the dishwasher in homes today. Therefore, the serviceman should become familiar with these appliances in order to render the service required of him. He must have a knowledge of the construction, operation, and repair of each of these appliances.

In this assignment, you will have an opportunity to study about the various types of garbage disposers and electric dishwashers. Included in this will be a study of the construction, installation, operation, and repair of each.

<u>Assignment</u>:

1. Read the reference listed below.
2. Prepare a step-by-step procedure for adjusting a staring switch on a garbage disposer.
3. After completing items 1 and 2, answer the questions below and turn the assignment in by ____________________.

<u>Reference</u>:

D. Tricomi, <u>How to Repair Major Appliances</u>, pp. 139-165.

<u>Questions</u>:

1. Describe the principle of operation of a dishwasher. What are some of the different styles of dishwashers?

2. Explain the functioning of an impeller-type dishwasher. What are the major components of this type dishwasher? Describe the function of each.

3. What type of motor do most dishwashers employ? What unique feature must this type of motor have?

4. Discuss the function of a spray-arm circulating-pump dishwasher. How does it differ from the impeller-type? What are the advantages and disadvantages of each?

5. Describe the filtering system of a spray-arm dishwasher.

6. Explain the wiring system for the impeller-type dishwasher. Describe the changes that take place in the circuit when washers change operations.

7. Discuss the wiring system for the spray-arm dishwasher. What is the purpose of the solenoid-operated water inlet valve on this type of system?

8. Describe the functional purpose of a dishwasher drain pump.

9. Explain the principal parts and working principle of a detergent-cup tripping mechanism.

10. What are some of the most frequent washing complaints that will be encountered with a dishwasher? How can they be avoided or correcte

11. What corrections need to be made when part of the cycle is omitted or shortened during a dishwashing operation?

12. Explain the possible causes of trouble for dishes not drying as they should in an automatic dishwasher. What adjustments should be made?

13. What is the basic purpose of a garbage disposal unit? Describe its basic function.

14. Describe the electrical system of a garbage disposal unit. Is any additional preparation electrically necessary to connect disposal unit into circuit?

15. Discuss the installation procedures of a garbage disposal unit. What special consideration must be given in order to have effective operation?

16. What are some of the causes of abnormal noise and vibration in a disposal unit? How may they be remedied?

17. Discuss reasons for slow disposing of garbage. What are possible remedies?

18. Explain the causes for erratic operation and/or disposal unit not starting. What are some remedies?

Assignment
Sheet No. 15

Covering
Units 359-362

CONVENTIONAL WASHING MACHINES

Although automatic washers have increased in numbers in recent years, there are still more washers of the conventional or non-automatic type found in the homes in the United States. This is an important fact to the electrical appliance serviceman.

Except for the electric motor and switch, the service and repair of non-automatic washers consist primarily of adjustment and replacement of mechanically operated parts. It is important for the serviceman to understand the general principles by which these mechanisms work. With the aid of specific manufacturers' service manuals, he can then perform the tasks necessary to keep the washer operating efficiently.

In this assignment, you will cover materials concerning the general operation of the conventional or non-automatic washers. Causes of washer troubles and factors involved in their adjustment and repair will be covered.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

B. Manly, How to Repair Electrical Appliances, pp. 199-215

Questions:

1. Describe the principal parts of an electric washing machine. What is the function of each?

2. When both agitator and wringer are disengaged and the belt or shaft cannot be moved, what possible troubles could exist in the transmission of a washing machine? How may this be corrected?

3. What are some of the possible causes why a conventional washing machine wringer rolls will not turn?

4. Describe some of the possible sources where noisy operation of parts would occur in a conventional washing machine. What are the remedies for the elimination of these noises?

5. Discuss the importance of lubrication of washing machines. How long will oil in transmissions last? What precautions should be considered when changing oil? What type of oil is specified? How much is usually needed?

6. Describe the disassembly procedure for the transmission of a washing machine. When completely disassembled, what preventive maintenance can be given to shafts, bearings, etc., before reassembling the unit?

Assignment
Sheet No. 16

Covering
Units 363-391

AUTOMATIC WASHER OPERATION AND SERVICE

The automatic washer has found its way into a number of homes. It has taken much of the drudgery out of the chore of doing the family laundry and has released the housewife to perform other required tasks at the same time the laundry is being washed.

Automatic washers are much more complicated than the non-automatic type, and hence, there is the possibility that more troubles are liable to occur. While there is a certain similarity in the construction and operation of all automatic washers, there are also differences in makes and differences in models of the same company. The appliance repairman must be familiar with the general operation of many machines and consult specific manufacturers' manuals in order to make himself a competent repairman of automatic washers.

In this assignment, you will cover material that every washer serviceman should know. The reference material is brief and general in nature. More specific information may be obtained by consulting manufacturers' manuals.

Assignment:

1. Read the references listed below.
2. Prepare a short paper discussing the various methods used to regulate amount of water an automatic washer uses with short fill and regular fill levels.
3. Answer the questions below and turn in this assignment by ______________________.

References:

C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 59-121.
D. Tricomi, How to Repair Major Appliances, pp. 60-66, 76-101.

Questions:

1. Why is the automatic clothes washer so complicated? What are the functions it performs?

2. Describe the functional operation of a single solenoid controlled off-on valve on an automatic washer; a double solenoid shut-off valve; and two-way valve.

3. How does the water pump on an automatic washer receive its driving power? What purpose does a water pump serve?

4. Discuss the purpose of filters in an automatic washer. Why are dispensers an important part of an automatic washer?

5. Describe the various devices controlled by the electrical system on an automatic washer.

6. Explain how the pressure switch controls the fill level of an automatic washer. What are the two basic types of fill switches?

7. What is the recommended temperature for water to produce a good wash? Why is this so important?

8. Describe some of the reasons why water will not enter an automatic washing machine. How may these be remedied?

9. Explain some causes for the motor of an automatic washing machine not to run. How can these be corrected?

10. Discuss some of the causes for the automatic washer agitator not to function. Give some solutions to each cause.

11. Give some of the reasons why the spin cycle of an automatic washer fails to function. What corrections may apply?

12. Describe how excessive vibration by the automatic washer can be avoided.

Assignment Sheet No. 17

Covering Units 392-409

AUTOMATIC CLOTHES DRYERS

To many persons, the automatic clothes dryer is as necessary to the modern home laundry as the washer itself. It completes the laundry and makes it independent of the weather, day or night. Crowded living conditions have created a clothes drying problem for many families. This and other factors have made the clothes dryer a most desirable appliance to own and one which is used in many homes today.

As with other appliances or mechanical devices, the automatic clothes dryer will at times need servicing or repairing. Most generally, these services will be performed in the owner's home. This necessitates a thorough knowledge of dryer construction, operation, and repair on the part of the serviceman.

In this assignment, you will have an opportunity to study the various types, construction, and operation of automatic clothes dryers and factors involved in servicing these appliances.

Assignment:

1. Read the reference listed below.
2. Explain in a brief paper why it is necessary to provide an auxiliary fuse circuit for most dryers. Sketch a fuse circuit for a dryer; label the proper fuse designation for adequate service.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

D. Tricomi, How to Repair Major Appliances, pp. 102-108, 116-125.

Questions:

1. Describe the drying principle of an automatic clothes dryer.
2. Discuss how the drying cycles of an automatic dryer are controlled. Can they be changed easily? If so, how?
3. How is the heat for drying produced in an electric dryer? What are the average watts used at 230 volts?
4. Explain the procedure for converting a 230-volt dryer to 115-volt operation. What is the purpose of doing this?
5. Describe some of the reasons why a clothes dryer does not start? What are some remedies that can be applied?
6. Explain why the motor of an electric dryer will run, but drum will not turn.
7. Why would there be no heat in the drum of an electric dryer but the turns? How may this be corrected?

8. Discuss reasons for dryer not turning off.
9. When the drying process is unusually slow, what may be the causes?

Assignment
Sheet No. 18

Covering
Units 410-413

THEORY OF ELECTRICAL REFRIGERATOR OPERATION

Refrigerators are electrical appliances which are designed to keep food cool and to help prevent its spoilage. There are many kinds and types of electrical refrigerators. However, their primary purpose is to remove heat from the storage compartment. Therefore, the basic theory of refrigeration is about the same for all of them.

The electrical appliance serviceman will be called upon to service refrigerators. In order to properly diagnose, to explain what is wrong to the customer, and to repair the refrigerator, it is very important that the electrical appliance service repairman has an understanding of the theory of refrigerator operation.

In this assignment, you will have an opportunity to learn about the theory of refrigerator operation and, in turn, discover how this theory applies to the repair and servicing of refrigerators.

Assignment:

1. Read the references listed below.
2. Inspect the condenser on a frigerator; note that when the refrigerator is running, the condenser appears to be giving off heat. Explain why you think this happens.
3. Answer the questions below and turn in this assignment by ____________________.

References:

B. Manly, <u>How to Repair Electrical Appliances</u>, pp. 225-231.
D. Tricomi, <u>How to Repair Major Appliances</u>, pp. 18-26.

Questions:

1. Discuss the scientific principle of how heat is changed. What is cold? Describe the states of matter.

2. What is a refrigerant? What type of refrigerant is most commonly used in refrigerators?

3. What is evaporation? What is meant by sensible heat? What is latent heat?

4. List the three stages of refrigerant in cooling tubes of a refrigerator. What causes the refrigerant to change?

5. Describe the principal parts of a typical electric refrigerator. What is the function of each?

6. Discuss what and how the bellows and bulb effect the operation of the switch in a control unit of a refrigerator.

7. Explain the difference between a plate condenser and a gravity-flow condenser in a refrigerator. What is a condenser?

8. How are foods cooled in the food compartment of a refrigerator? Where are the warmest places in the food compartment?

9. Describe some of the problems encountered with the compressor unit of a refrigerator.

10. What are some causes for the cabinet of a refrigerator to be too warm? What corrections should be made?

11. Why do foods sometimes not freeze in a freezer compartment of a refrigerator? How may this be corrected?

12. Explain why noisy operation would exist with an electric refrigerator.

13. How may an excessive load on a refrigerator unit be lessened?

14. Describe how patching of porcelain or enamel on a refrigerator can be done.

Assignment
Sheet No. 19

Covering
Units 414-436

ELECTRIC REFRIGERATOR COMPONENTS, REPAIR, AND SERVICING

In most homes, the electric refrigerator is considered an essential electrical appliance. The refrigerator allows the housewife to preserve, buy at times most convenient, and more efficiently use many perishable foods.

Today's electrical refrigerators are almost trouble free and, because of this, many people have become accustomed to depending on them all of the time. Therefore, when his refrigerator is in need of service or repair, the customer wants quick, efficient, and reliable attention to his problem.

The electrical appliance serviceman should be thoroughly informed on the theory of refrigeration, refrigerator systems, their component parts, and a fundamental knowledge of basic refrigerator repair and servicing techniques if he is to do a good job.

In this assignment, you will have an opportunity to study different refrigerator systems, the various parts of these systems, and the symptoms of different types of refrigerator troubles and the necessary procedures for diagnosing, servicing, and repairing them.

<u>Assignment</u>:

1. Read the references listed below.
2. Prepare a schematic diagram of a refrigerator unit showing and color coding all components. Indicate the refrigerant directional flow through each part.
3. Answer the questions below and turn in this assignment by ____________________.

<u>References</u>:

B. Manly, <u>How to Repair Electrical Appliances</u>, pp. 225-240.
D. Tricomi, <u>How to Repair Major Appliances</u>, pp. 26-59.

<u>Questions</u>:

1. Discuss the function of the thermostat in controlling the compressor cycling. How can the setting on the thermostat be changed?

2. Describe how the freezer unit of a refrigerator is defrosted; nonautomatic type; automatic type.

3. Explain the two-compartment cooling system of a refrigerator-freezer combination. Does this type of unit have two evaporators?

4. What is the function of a differential pressure-control valve of two-compartment cooling in a refrigerator?

5. Describe the evaporator area method of cooling two compartments in a refrigerator unit.

6. Explain the cooling system in a refrigerator when the freezer compartment is converted into an ordinary refrigerated section.

7. Describe the electrical system of a refrigerator that runs on 110-volt, 60-cycle, single-phase alternating current. What is the purpose of the voltage relay? Current relay?

8. Discuss how performance checks can be made to determine the operation of an electric refrigerator.

9. Explain the procedure for recharging a refrigeration system with refrigerant. What precautions are necessary?

10. Describe some of the causes for the refrigeration unit not to operate. What can be done to remedy these causes?

11. Explain why the defrosting cycle would not take place in a refrigerator unit. How can this be corrected?

12. What are the causes of trouble when refrigerator unit runs continuously but the cabinet remains warm? Give the possible remedies for this problem.

Covering
Units 437-451

HOME FREEZERS

An increasingly large number of families are using freezers in the home for storage of food. The convenience and economy of these food freezers have changed the eating habits of a large portion of our citizenry.

The actual working of the freezer is similar to that of the refrigerator although lower temperatures are maintained. In most cases, there is a greater investment in the piece of equipment itself and its contents.

In this assignment, you will learn those things that pertain to the servicing of home and farm freezers, along with information concerning the properties of the frozen food.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by _____________________.

Reference:

B. Manly, How to Repair Electrical Appliances, pp. 241-263.

Questions:

1. Discuss the importance of constant storage temperature in an electric home freezer. What happens when the freezing temperature varies?
2. Describe the different types of cabinets used as home freezers.
3. What are some of the more common complaints usually made by users of home freezers?
4. Explain the methods of placing and attaching Evaporator Tubing to the liners of food compartments in home freezers.
5. Describe the path of refrigerant through a system having separate compartments for freezing and for storage in home freezers.
6. Discuss the electrical circuit as found in a home freezer. Should a freezer be connected to the same electric line that serves other electrically powered devices? If not, why not?
7. What are some of the possible electrical troubles that might be encountered with a home freezer?
8. How does a battery-operated freezer alarm system compare with an alarm system with which A-C line power is used to operate the signal? What are the advantages and disadvantages of each?

9. How might measurement of operating temperatures and pressures in a freezer provide rather definite clues to the kinds of trouble which may be present?

10. Whenever a freezer system is being examined and tested for causes of trouble, why should you make every effort to locate faults outside of the motor-compressor unit before replacing that unit?

Units 452-460

AIR CONDITIONERS

Air conditioners are newly developed appliances which are designed to make people more comfortable by cooling and removing moisture from the air in homes, offices, stores, schools, and other buildings.

In view of the importance of and demand for air conditioning, it is important that the electrical appliance serviceman know how to install and service air conditioners.

In this assignment, you will have an opportunity to learn about the theory, function, and operation of air conditioners. You will also study about installing and servicing air conditioners.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

C. Campbell, How to Repair Washing Machines, Clothes Dryers, Refrigerators, Vacuum Cleaners, Fans, Mixers, Toasters, and Other Home Appliances, pp. 122-130.
D. Tricomi, How to Repair Major Appliances, pp. 166-193.

Questions:

1. Describe the refrigeration system in a typical room air conditioner. Explain briefly what happens to the warm air in the room. Does the cooled air have less moisture than the warm air? If so, what happens to the moisture?

2. Discuss the typical electrical system in an air conditioner. What is the function of the thermostat?

3. Describe the power supply and capacity of a typical room air conditioner. What is meant by BTU? How many BTU's would a half-ton air conditioner represent?

4. Explain the cooling phase of the heat-pump air conditioner. Why is it important that de-icer be introduced into such a system?

5. What two things are of uppermost importance when installing an air conditioner?

6. Describe the heating phase of the heat-pump air conditioner.

7. Explain the de-icing phase of the heat-pump air conditioner.

8. Discuss the installation procedure for an air conditioner in a: double-hung window construction; casement window; transom installations; and through-the-wall installation. Explain the advantages and disadvantages of each.

9. Describe the procedure for evacuating a system in an air conditioner.

10. What are some possible causes for the compressor and fan motor not to run on an air conditioner? What checks may be made to determine the possible causes?

11. Discuss some reasons for a fan to run but compressor not to function on an air conditioner.

12. What are some causes for noisy operation of an air condition system? How may each be eliminated?

13. Why would there be insufficient cooling by an air conditioner? Explain how to correct this.

14. Discuss what causes excessive sweating on the suction line of a room air conditioner.

This study guide is for use by junior and senior high school students in preparatory programs for the vocation of chef. It was developed by an advisory consultant and research assistants at the local and state levels and has been field tested and revised periodically. Twenty-one assignment sheets, each containing information, assignment, references, and questions, cover 97 units in the subject areas--(1) The Chef, (2) Operation and Care of Equipment and Facilities, (3) Selection and Preparation of Food, and (4) Organization, Planning, and Purchasing. A two-column analysis form correlates what the worker should be able to do and what the worker should know. This material is to be used by individual students under teacher supervision for 180 hours. A bibliography of references and self evaluation forms are included. An answer key (VT 002 051) is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (FP)

FOREWORD

This course of study consisting of an analysis of CHEF together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching chefs on an individual basis in cooperative part-time programs.

The original course of study was prepared by Mr. Robert F. Shrader, formerly Research Assistant in Industrial Education, University of Missouri. This revision was prepared by Mr. Jack Kirby, Research Assistant in Industrial Education, University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education, University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education, University of Missouri, who supervised the preparation of this manual and edited the manuscript. We wish to acknowledge the assistance of Dr. Pauline Garrett, Associate Professor of Home Economics, and Dr. John M. Welch, Professor of Agricultural Economics, both of the University of Missouri, for their consultation and advice. Credit is due Dr. H. Pat Wardlaw, Assistant Commissioner of Education, Mr. Merton C. Wheeler, Director of Industrial Education, and to other staff members for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Assignment Sheets:

Information Sheets:

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." And the third group--the personal-social traits--has been listed under "Personal-Social Traits Essential for the Chef" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction. but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learn activities and a series of objective-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The answer-key which is available as a separate manual, has been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. This key gives the correct answers to the questions, as well as the reference and the page on which each answer can be found. The answer key should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

Each year many young people enter the field of restaurant occupations of which the chef is one type. The chef in a restaurant is responsible for the preparation of food in large quantities. The skills required and the types of preparation vary with the size and type of establishment.

The art of gracious food preparation is one of the oldest and most respected of occupations. The standard of living in this country has made it possible for increasingly large numbers of people to eat somewhere other than at home. Whether from choice or from necessity, this situation demands good eating houses and restaurants. Many of the people who eat away from home choose an establishment by physical appearance alone, but few people return to any particular place unless the food is nourishing, attractive, tasty, and served in ample portions.

This course of study will consider, but not preclude, only the normal duties of a head cook, and not all the administrative possibilities that could develop over a period of time due to any particular ability or resourcefulness of the individual.

Personal Qualifications of the Chef

The type of work performed by the chef demands someone who is dedicated to the job and one who is highly concerned with the satisfaction, health, and welfare of all with whom contact is made.

Among the personal-social traits essential for the chef are the following:

Professional Attitude. Professionalism is revealed by the sincerity with which the chef promotes the welfare of and interest in his profession.

Intelligence. Average or above intelligence is desirable for successful performance.

Responsibility. The chef must know the responsibilities of his job and perform them to the best of his ability at all times.

Dependability. The chef should be punctual, regular in his work habits and do his work well.

Health. The job of chef requires a person who is healthy and practices and promotes good health habits.

Courtesy and Friendliness. A chef should be courteous and polite in all situations. He should have friendliness and a spirit of cooperation toward all those with whom he comes in contact.

Precision and Accuracy. The health and welfare of many depend on the precision and accuracy with which the chef performs his work.

Appearance. It is essential that the chef be suitably dressed, scrupulously clean and generally well-groomed in this field of food preparation and service.

Units 1-4

THE EXPANDING FIELD OF FOOD PREPARATION

The social and economic welfare and standard of living of the people of a country are closely tied together. This is true in America, and has great implications for the art of food preparation.

In order to be an efficient and well-informed chef, it is well to know some of the eating habits and customs of people. Also, it is well to know how these habits have changed in recent years.

In this unit you will have an opportunity to become acquainted with the background of food preparation and get a look at many of the food service occupations.

Assignment:

1. Read the references listed below.
2. Check in the school library for source material and write a very brief history of man's eating habits up to the present time.
3. Answer the questions below, and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 2-4.
I. Information Sheet No. 1, "Food."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the "T." If it is false, draw a circle around the letter "F."

T F 1. In large establishments, it is quite possible to become a specialist in a certain area of food service.

T F 2. The chef usually has not performed any other food service duties.

T F 3. Food, or lack of food, has determined destinies of nations.

T F 4. The earliest known trade, or barter, was in food.

T F 5. Food transportation is local business or hauling.

T F 6. There are no people left who still get all of their food by depending on nature.

T F 7. The kind of food people eat depends to a large extent on what kind of food they grow.

T F 8. The religion of some people influences the choice of foods they eat.

T F 9. Moslems eat pork but never eat beef.

T F 10. Americans have not borrowed eating customs from others, but organized a unique set of their own.

T F 11. The idea of the "chafing-dish" comes from the Africans.

T F 12. Arabs use only the left hand for dipping food.

T F 13. People in warm-climate countries are the ones that tend to eat outside more.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A person with little or no training in food service may start out as a ______________ ______________.

2. One of man's oldest occupations is the hunt for ______________.

3. New ways of preparing food by primitive people were advanced after the discovery of ______________.

4. City dwellers depend solely on ______________ ______________ for almost everything they eat.

5. When man learned to make weapons, he also found he could kill larger ______________ and ______________.

6. Western civilization had a great start in ______________ about ________ years ago.

7. One of the reasons for the expanding of the Greek and Roman Empires was the search for ______________.

8. History usually credits the Romans as the first people to set out ______________ beds.

9. ______________ was discovered accidentally in the search for food by the Spaniards.

10. ______________ countries usually eat the food they have, while ______________ countries may import a more varied diet.

11. In some countries the people eat as many as ________ regular meals per day.

12. The French people usually breakfast on a ______________ and ______________ or ______________ ______________.

13. The English people like ______________ and ______________ for their breakfast.

14. Pancakes are usually considered an ______________ breakfast dish.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The different titles that a chef may have are:

(A) ________________________ (D) ________________________

(B) ________________________ (E) ________________________

(C) ________________________

2. Early man found that from domesticated animals he could have:

(A) ________________________ (C) ________________________

(B) ________________________

3. The landing in America brought discovery of such new foods as:

(A) ________________________ (E) ________________________

(B) ________________________ (F) ________________________

(C) ________________________ (G) ________________________

(D) ________________________

4. Although they seem repulsive to people in this country, some people eat such odd things as:

(A) ________________________ (C) ________________________

(B) ________________________ (D) ________________________

Information
Sheet No. 1

FOOD

If a person who lived in the Middle Ages could come to life again, he would find the common American grocery store one of the most wonderful things in the modern world. The grocery store is the latest stage in man's oldest occupation--the hunt for food.

Every living thing--plant, animal or human being--must have food to live. Abundance or lack of food has for centuries influenced the destinies of nations. People hungry are people dissatisfied. The United States has made its biggest bid for friendship throughout the world by sending food to foreign countries.

Our earliest known trade was in food. The first men ate only what they found and prepared for themselves. But after so long a time they found that they could exchange food with their neighbors. After the discovery of fire, new ways of preparing food were discovered and this, no doubt, started the exchange of "recipes" or various methods of preparing the same foods. Then, as people began to travel from one country to another, they found that foods would grow in one place, but not in another. And so began another type of barter. Today, millions of people earn their living by processing or distributing food in such industries as dairies, mills, packing plants and canneries. The greatest business of our transportation networks is the carrying of food. Through this great network exchange, we can drink tea from India and coffee from Brazil. We can have sugar from Puerto Rico, spices from the Orient, and all of the foods that grow in various sections of our own U. S. Millions of town and city dwellers depend solely on food stores for everything they eat. All of their food must be processed and delivered to the stores for their purchasing.

Food Through the Ages

Primitive man ate what food he could find. There are still people in the jungles of Africa and South America who live in the same manner. They depend entirely on nature to supply their needs. However, successive discoveries have given us our present system. Man first discovered how to make weapons. Thus, he could kill larger animals and fish. Then he discovered fire and how to make pots in which to cook food. Then he learned that he could partly control his food supply by scratching the ground and planting seeds, and that they would grow food for him. Then he learned that he could domesticate animals to work for him, and that animals supplied him with milk and meat. Such discoveries caused man to settle in one place and develop his own land. This is the beginning of modern civilization, of communities living together, of the developing of towns and of nations.

Western civilization was born about 6,000 years ago in Egypt. The yearly flood waters of the Nile left behind much rich soil. The warm climate meant that farmers could grow crops all year round--and this was the basic reason for Egypt's being the first great Western civilization. The Egyptians learned to roast and charcoal-broil meat. They learned the art of preserving food in brine, and of smoking and salting meat.

Other great centers of civilization developed different kinds of food. The ancient Hebrews in the Holy Land lived much more simply on grain, vegetables and rice. Bread was made from barley, lentils or beans, and baked in tiny loaves. A favorite food was a thick soup of lentils or beans, called pottage. The Bible tells us that Esau sold his birthright to his brother Jacob for a mess of pottage.

The foods of the early Greeks and Romans were sea foods and the meats of tamed animals, with porridge, flat round loaves of bread, figs and olives. They developed olive oil and later grew grapes and learned to make wine. One of the main reasons for the growth of the Greek and Roman empires was the shortage of food in the homeland. They learned to bring back delicacies from other lands and to raise these new foods at home. The Romans were the first to set out oyster beds. They grew fish in ponds and learned to use new meats and nuts.

America was discovered in the search for food. A route to India was sought so that spices could be brought back to Spain for preserving meats. Their landing in America by mistake brought them many new food adventures--such as maize, potatoes, sweet potatoes, pumpkins, squash, tomatoes and pineapples.

Today most of the foods of the world are shared by all civilized countries. Each region of the world has its own special food which it grows in abundance and sells to other parts of the world in order to have food from all over the world.

However, the kind of food a people eat depends to a large extent on what kind of food they grow. Poor countries usually eat the food they have, and richer countries can buy more food from other lands and so have a more varied diet.

People of different countries do not always agree on what is good food. Some people eat lizards, beetles, grasshoppers, the eyes of fish, and foods that seem repulsive to us. Also, people of different locales prepare the same food differently. The French make coffee by the drip method, while in Sweden a big pot of coffee is kept hot and black on the stove all day, and Turkish coffee is served black and very thick.

Religion and food have always been closely connected in the lives of people. Most religions thank their Gods for food. Many religions have food laws which do not allow their followers to eat certain foods. Buddhist will not eat meat; the cow is sacred in India, and beef is seldom eaten there. Moslems do not eat pork. Orthodox Jewish food laws forbid the eating of pork, scaleless fish such as oysters and catfish, and wild animals such as deer, and they eat only the forequarters of domesticated animals. The animals must be killed in a certain way to be regarded as clean. Other religions forbid the eating of certain foods on certain days.

Each country has its own ways and manners of eating. In Europe and America people eat at tables and use separate plates, with a knife and fork; Arabs dip their food out of a central bowl using only the left hand; Chinese and Japanese eat with chopsticks; and primitive people eat with their fingers. On some tropical islands, large leaves are used as plates. Orientals sit on the floor and eat from low tables. Many people in tropical or warm climates prefer eating outdoors. Some countries eat two or three meals a day, but others eat as many as five.

Americans are great borrowers of customs from other lands, especially since World War II, when soldiers were in countries all over the world and observed and brought home new ideas in eating. The French prepare food in chafing dishes at the table, and this is now a prevalent custom in our country. We eat outside more, as the Latin Americans do; we use bamboo place mats and Oriental-flavored dishes in the style of the Chinese and Japanese; and we borrow our breakfast habits from several countries. It is the French who have a roll and coffee or hot chocolate; the people of the Netherlands eat cereals such as oats, wheat and barley; the English like meat and eggs; and the Syrians always include fruit in their breakfast. Pancakes seem typically American, but the Mexicans start the day with sweet bread and tortillas, which are corn cakes.

Sheet No. 2

Covering
Units 5-10

PERSONAL REQUIREMENTS

The success or failure of any project depends primarily upon the individual involved. His abilities and personality will govern the degree of success or failure that will result.

The modern chef has a variety of duties and therefore needs numerous talents and abilities. Aptitude, initiative, training, and personal health habits will have a definite influence on the work of the chef. The amount of education and past experience will also have a bearing on how well a chef will get along with his work.

In this unit you will learn of some of the desirable characteristics that are necessary for success in the food preparation field.

Assignment:

1. Read the references listed below.
2. Interview your employer and secure information on the following: (a) how he received his training, (b) personal qualities necessary, (c) technical requirements, (d) opportunities for the future, and (e) financial remuneration. Do his answers sound similar to your own plans?
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 1, 4-5.
C. Smith, A Handbook on Quantity Food Management, pp. 209-211.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The chef is usually in the kitchen and therefore, his personal appearance is not important.

T F 2. A good chef must have average or above average intelligence.

T F 3. A good chef needs to be physically strong and well coordinated.

T F 4. Todays chef is expected to be a good leader and organizer.

T F 5. Dirt under the fingernails is in such small amounts that it requires no attention.

T F 6. A physical examination for a communicable disease is usually unnecessary because the chef does not come in contact with other people very often.

T F 7. Past work experience can be important in work as a chef.

T F 8. The opportunity to be creative no longer presents itself in chef's work.

T F 9. A chef's duties are concerned only with preparing the food.

T F 10. This is one area where pride of workmanship is not very important.

T F 11. Formal education is of little help in work as a chef.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Assurance that instructions are being followed and good habits have been developed can be accomplished by ______________.

2. Usually there is a definite relation between wages and ______________ of work.

3. On-the-job training is essential to all workers, but ______________ and past experience are decided assets.

4. The manager should know the worker's qualifications so as to best fit him for the ______________.

5. Sometimes it is best to start from the beginning in a line of work than have to unlearn ______________ work habits.

6. The worker should be shown around the plant to give him some idea of his part of the ______________ enterprise.

7. Good morale is important for the worker so he can get along with ______________ other workers.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The orientation of a worker can be helped by:

   (A) ____

   (B) ____

   (C) ____

   (D) ____

2. Training for an operation should be accomplished by:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

3. In addition to actual cooking of food the chef, or head cook, may supervise or participate in:

(A) ____________ (E) ____________

(B) ____________ (F) ____________

(C) ____________ (G) ____________

(D) ____________

Assignment
Sheet No. 3

Covering
Units 11-17

CARE AND OPERATION OF KITCHEN EQUIPMENT

Care and operation of kitchen equipment in an eating establishment is a very important part of the workers' duties. This equipment can save time and money as well as make your job easier when it functions correctly. A breakdown through neglect can be costly for the management and disrupting to the kitchen schedule.

There are hazards involved with improperly functioning equipment as well as delays. A dull or misaligned unit can contribute directly or indirectly to accidents.

In this unit you will learn some of the more desirable practices concerning equipment care and operation.

Assignment:

1. Read the references listed below.
2. List and write a brief description and function of the equipment found in the kitchen at your work station.
3. Construct a flow chart as it now applies to your establishment. Could this be made more efficient in the food handling process?
4. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 8-12.
C. Smith, A Handbook on Quantity Food Management, pp. 97-110, 190-191.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Modern equipment is expected by customers, so therefore all of it should be out front where it can be seen.

T F 2. Logical arrangement of machines is important for sequence of operations.

T F 3. It is not desirable for food workers to help plan a work area since architects have been trained for all types of planning.

T F 4. There is no logical order for receiving, storage, service and preparation of food as long as they are convenient.

T F 5. A machine should always be a large size to allow for future expansion

T F 6. Need for a machine should be established before purchasing.

T F 7. A slicing machine can help with standardization of portions.

T F 8. A slicing machine is always a time saving device.

T F 9. Time taken to sharpen a machine will usually pay in the long run.

T F 10. Machines can contribute to work simplification.

T F 11. The use of the proper size machine will result in efficient operation.

T F 12. Volume of food is unaffected by power-driven machines.

T F 13. The quality of food is unaffected by power-driven machines.

T F 14. Nutritive values are sometimes better maintained when power-driven machines are used.

T F 15. Most power-driven machinery needs nothing but periodic cleaning.

T F 16. Instructions should be given and the worker should observe before he is allowed to operate any equipment.

T F 17. Vegetable peelers should run just long enough to remove skins.

T F 18. Vegetable peelers will do an excellent and economical job on any size or shape vegetable.

T F 19. The biggest advantage of a coffee urn is that coffee can be kept warm for hours.

T F 20. Steam cooking, even when properly done, is detrimental on nutrients and color.

T F 21. A spoon is recommended for stirring or whipping.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. To efficiently use modern food machines, good floor ______________ is needed.

2. If quantity food production is to be efficient, the arrangement should be planned for good ______________ and ______________.

3. All work should have logical sequence with no ______________ of steps.

4. Correct use of machines will eliminate ______________ of ______________ and allow more time for high quality and finesse.

5. There should be a ______________ for any machine purchase.

6. Small quantity in a large machine very often results in an ______________ product.

7. Beyond saving work, any machine that eliminates ______________ will be an asset.

8. Cost control can be anticipated by standardizing ______________, ______________, ______________, and ______________.

9. Instructions for proper use of machines can be obtained from the ______________.

10. Instructions should be ______________ for all machines, and the worker should be trained to ______________ them.

11. An experienced cook will value a good set of ______________.

12. A block should never be scrubbed with ______________.

13. After cleaning a wooden block, a covering of ______________ should be applied.

14. The tool used to keep knives sharp is called a ______________.

15. Knives should not be used for anything except that which they were ______________.

16. Tampers for grinders should be of wood or a certain metal otherwise they might ______________ the equipment.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Before purchasing a particular machine, two things that should be determined are:

   (A) ____________________ (B) ____________________

2. Advantages of the proper machines may be:

   (A) ____________________ (D) ____________________

   (B) ____________________ (E) ____________________

   (C) ____________________ (F) ____________________

3. A food mixer may be used for:

   (A) ____________________ (C) ____________________

   (B) ____________________

4. When using a food mixer, the worker should:

   (A) ____________________ (C) ____________________

   (B) ____________________ (D) ____________________

5. Four rules for running a vegetable peeler are:

   (A) ____________________ (C) ____________________

   (B) ____________________ (D) ____________________

6. Five important points in cleaning a slicing machine are:

   (A) ____________________ (D) ____________________

   (B) ____________________ (E) ____________________

   (C) ____________________

Assignment
Sheet No. 4

Covering
Units 18-22

SANITATION AND ACCIDENT PREVENTION

Most states have sanitation laws and regulations to help protect both reputable businesses and customers. These laws and regulations are available from the Department of Health or similar agency and copies should be on hand in public food serving establishments.

It is the responsibility of the manager and employees to ensure the serving of safe food to the public. All workers should be required to read the laws and regulations and to abide by them. A clean and well kept place or work should also be emphasized and maintained.

In this unit you will become familiar with desirable practices which should lead to better standards and be beneficial to all concerned.

Assignment:

1. Read the references listed below.
2. Note any items in your establishment that may not conform to your state regulations, and report them to your employer in a helpful way.
3. Answer the questions below, and turn in this assignment by ______________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 4-7, 10-12.
C. Smith, A Handbook on Quantity Food Management, pp. 173-178.
D. Division of Health of Missouri, Sanitation Laws and Regulations Covering Eating and Drinking Establishments.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. When buying food, unwrapped bread or pastry not in covered containers should be avoided.

T F 2. Food should not be stored on the floor at any time.

T F 3. Service workers but not kitchen workers need to have immunization tests.

T F 4. Workers with common colds should not be allowed to work until well.

T F 5. Very hot rinse water can eliminate the necessity of toweling pots and pans.

T F 6. A regular schedule for cleaning of the kitchen is unnecessary as it is "everybody's" work.

T F 7. Sharp tools should always be washed separately.

T F 8. A worker should have on a long-sleeved shirt to reach in the oven.

T F 9. A fat fire should be immediately removed from the stove.

T F 10. Walls should be washable up to any level reached by normal splash or spray.

T F 11. Openings to outer air (doors and windows) must be screened to keep out flies or else other measures taken to prevent the entrance of flies.

T F 12. Hot and cold running water must be easily accessible wherever food is prepared or dishes washed.

T F 13. Cyanide is a good polishing material, recommended for stainless steel.

T F 14. The use of tobacco in any form is prohibited in food preparation rooms.

T F 15. The actual bacteria must accompany food when eaten to cause food poisoning.

T F 16. Left overs should not be kept over 3 days.

T F 17. A stove or oven should be cleaned immediately after using.

T F 18. After sharpening a knife, be sure to wipe it off before using.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Dishes should be rinsed with water at a temperature of at least __________ or __________ degrees F.

2. Cups and glasses should be stored in an ________________ fashion.

3. After washing hands it is good practice to use a sanitizing agent such as __________________.

4. Minimum refrigerator temperature should be about ____________ degrees F.

5. No live animals or fowls may be kept or allowed in any room in which food or drink is __________ or __________.

6. Annual __________ __________ are no longer required for employees handling food, and the responsibility now falls on the __________ to assure himself that the health situation is good.

7. The chief means of fighting bacteria is by controlling __________.

8. A temperature of ________F. or above will kill most bacteria.

9. For safety, floors should be __________ and __________.

10. When not is use, knives should be properly ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Accidents can be costly to:

(A) ______________ (B) ______________ (C) ______________

2. It is sound practice to have within easy reach in emergencies a:

(A) ______________________ (C) ______________________

(B) ______________________

3. Foods that in the past have created the greatest number of cases of food poisoning are:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

4. Prevention of food poisoning can be accomplished by:

(A) ____

(B) ____

5. Three conditions that appeal to bacteria are:

(A) ______________________ (C) ______________________

(B) ______________________

6. Four carriers of germs are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

7. Three things that can be done to food to ensure its being healthful are:

(A) ______________________ (C) ______________________

(B) ______________________

8. Accidents are caused by:

(A) ____

(B) ____

MEAT SELECTION AND GRADING

Meat constitutes an important share of food intake. Cutting, handling, and processing of meat can be a field alone, but one must know some basic elements of the trade to be a competent chef.

It is very important that the correct grade of meat be selected to ensure customer satisfaction and efficient operation. Once it is selected it needs to be properly cared for to take maximum advantage of the meat with regards to appearance, tenderness, taste, and sizes of portions.

In this unit you will learn about the common kinds of meat, how it is graded, where it comes from, and how to care for it.

Assignment:

1. Read the reference listed below.
2. List the typical beef cuts used and what servings come from them.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. The Culinary Institute of America, The Professional Chef, pp. 27-34, 43-51, 71-77.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Meat not marked with a purple stamp still might be government inspected.

T F 2. Meat from all packing houses is graded the same.

T F 3. Fat content distinguishes veal from other meats.

T F 4. Cuts of veal are generally smaller than those of beef.

T F 5. A recently added grade of meat is called AVERAGE.

T F 6. The public now demands leaner pork than it used to.

T F 7. Written specifications are used by most beef buyers.

T F 8. There are just five government grades of beef.

T F 9. The hind shank of beef tends to have the most bone per cut.

T F 10. Variety meats are parts other than regular cuts that can be eaten.

T F 11. Aging has no effect upon meat other than darkening the color.

T F 12. Veal comprises about 20% of the meat consumed.

T F 13. The ink left on the meat by the inspection stamp must be removed before cooking.

T F 14. Good quality pork is a light, greyish pink color.

T F 15. Meats of all kinds have standard grades.

T F 16. The better grades of meat have considerably better nutritional value.

T F 17. Beef is one of the largest profit makers on the menu due to its low initial cost.

T F 18. Single cuts of veal may be cooked without first defrosting.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Veal actually is young ________________.
2. The beef loin is customarily used for ________________.
3. Meat is very high in ________________.
4. Cooking tends to destroy or weaken ________________ ________________ of the meat.
5. The top grade of beef is called ______________.
6. Meat comprises about ___________ per cent of the food budget.
7. The most popular meat, and therefore that which will require the greater portion of the chefs' time is ________________.
8. Meat is actually the ________________ of animals
9. A variety meat that is extremely perishable is ________________.

10. Pork is usually preferred with a ______________ of fat.

11. The meat that has a fairly stable quality is ______________.

12. Two meats that should always be cooked well done are ______________ and ______________.

13. A chef can particularly display his skill in preparing ______________ meat.

14. It is best to defrost veal in a ______________.

15. Pork and most fresh meat should be stored at __________ degrees F.

16. The preparation of veal in America has a ______________ influence.

17. Edible lining of the stomach is called ______________.

18. Because it contains a great deal of fat and results in considerable waste, the ______________ grade of beef is not used in the average eating place.

19. A grade of beef that was introduced in 1959 but is still relatively unknown is ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Meat is cooked to:

(A) ________________________ (C) ________________________

(B) ________________________ (D) ________________________

2. Federal laws do not apply to packing houses which do not ship their meat out of state and which are governed by:

(A) ________________________ (C) ________________________

(B) ________________________

3. The common grades of beef and lamb are:

(A) ________________________ (C) ________________________

(B) ________________________ (D) ________________________

4. Written specifications for purchasing meat indicate:

(A) ________________________ (C) ________________________

(B) ________________________ (D) ________________________

5. The nutritional value of meat lies in its abundance of:

(A) ____________________ (C) ____________________

(B) ____________________

6. Variety meats include:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

Assignment
Sheet No. 6

Covering
Units 26-32

MEAT COOKERY

The cooking of meat is extremely important because it is usually the main dish around which the whole meal is organized. If this portion of the meal is not cooked correctly and according to the customers' wish, the rest of the meal can seem very poor as well, no matter how carefully these other foods may have been prepared.

In this unit you will study about the various methods of cooking meat and some of the techniques used.

Assignment:

1. Read the references listed below.
2. Find the approximate percentages of beef, veal, pork, lamb and mutton that is served where you work. How does this affect your buying and storage problems?
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 27-90.
B. American Home Economics Association, Handbook of Food Preparation, pp. 24-27.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The cooking of meat generally causes it to shrink.

T F 2. The more economical cuts of meat generally require the dry method of cooking meat.

T F 3. Boiling actually means simmering.

T F 4. Steaming is one of the more popular methods of cooking.

T F 5. Poaching might be considered as a modified method of boiling.

T F 6. Cooking meat at a constant low temperature has been proven to be the best.

T F 7. Preheating of the oven is important when roasting.

T F 8. In roasting meat, the fat side is usually placed up to provide a natural basting condition.

T F 9. In testing meat for doneness with the fingers, if the meat reacts like a piece of soft rubber it is too done.

T F 10. For ease of carving, roasts should be sliced immediately after removing them from the oven.

T F 11. The only recognized method of testing roasted meat for doneness is with the fingers.

T F 12. In general, the cheaper grades and cuts of meats require more time and effort to prepare properly.

T F 13. The addition of vegetables tends to raise the nutritional value of braised meats.

T F 14. It is best to use a little too much seasoning than none at all.

T F 15. In braising and broiling, the heat causes the juices to leave the meat immediately.

T F 16. It is important in stewing to add vegetables at the proper time so that both meat and vegetables are done at the same time.

T F 17. It is recommended to leave excess fats in a stew.

T F 18. Veal chops and steaks should generally be braised.

T F 19. Tripe should always be precooked.

T F 20. Cold water aids in bringing out flavor and juice of meat whereas warm or hot water tends to keep it in.

T F 21. Extensive boiling of meat will produce a clear, undesirable stock.

T F 22. Sautéing is similar to pan frying.

T F 23. Meat should be tested for doneness frequently.

T F 24. Roast meat should be heated to the desired temperature and then left in the oven about 15 minutes longer.

T F 25. Grilled meat is not directly exposed to open heat.

T F 26. Meats should be broiled about half of the indicated time on one side after which it should be turned and broiling completed.

T F 27. A 7 1/2 pound smoked picnic shoulder should be cooked approximately 1 1/2 to 2 hours.

T F 28. The meat thermometer should be inserted in the center of a roast so that it rests on the bone for the most accurate testing of doneness.

T F 29. A pork loin requires a higher temperature (for well done) than a veal loin of same weight and same cooking time.

T F 30. If proper thawing and cooking temperatures are followed, very little difference will exist between meat that has been cooked from the frozen or thawed state.

T F 31. The safest temperature for thawing meat is the generally accepted refrigerator temperature.

T F 32. Thawed meat should never be refrozen.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A meat thermometer is used to determine the degree of ______________ in a roast.

2. Salt has a tendency to draw the ______________ out of meat.

3. Barbecuing as we know it today was previously referred to as ______________.

4. For best quality food, it is recommended that economical cuts of meat be cooked by the ______________ heat method.

5. The inclusion of strips of salt pork to allow proper cooking and to provide additional flavor is called ______________.

6. Meats generally are roasted between ________ and ________ degrees Fahrenheit.

7. Sticking to the broiler or grill rack can be prevented by making sure that the rack is ______________ before cooking the meat.

8. Foods for broiling should have considerable ______________.

9. The only useful method of testing the doneness of broiled meat is with the ______________.

10. Two methods of cooking meat that are classified as combinations of dry and moist methods are ______________ and ______________.

11. To increase browning when braising, a covering of ______________ should be used.

12. When broiling meats, the top of the meat should be ________ inches below the flame for a one inch cut and ________ inches for thicker cuts.

13. Meats that should not be broiled are ______________ and ______________ ______________.

14. The cooking of frozen meat requires extra ______________ ______________

15. All meats should be sliced ______________ the grain.

16. A popular serving of lamb is called ______________ ______________.

Listing

<u>Directions</u>: List the items called for in each of the following. Select your answers carefully.

1. Dry heating methods of cooking are:

   (A) ______________ (C) ______________

   (B) ______________ (D) ______________

2. The recommended methods of cooking veal are:

   (A) ______________ (D) ______________

   (B) ______________ (E) ______________

   (C) ______________

3. Methods of determining the degree of doneness of meat are:

   (A) ______________ (C) ______________

   (B) ______________ (D) ______________

4. Searing and then applying moisture to meat tends to:

   (A) ______________________________

   (B) ______________________________

5. Seven advantages of cooking meat at low temperatures are:

   (A) ______________ (E) ______________

   (B) ______________ (F) ______________

   (C) ______________ (G) ______________

   (D) ______________

6. A mirepoix contains:

(A) ____________________ (C) ____________________

(B) ____________________

Assignment
Sheet No. 7

Covering
Units 33-35

SEA FOOD COOKERY

Although the United States is not mainly dependent upon sea food as are some other countries, sea food is still an important part of our diet. Fish are valuable as a source of proteins and other nutrients. However, most people do not include enough sea food in their diet.

Sea food properly prepared and served can be very appetizing and healthful. For the most part, sea food is inexpensive and the good chef will make good use of it in his menus.

In this unit you will learn the secrets of preparing the various kinds of fish so that they are appetizing and desirable.

Assignment:

1. Read the references listed below.
2. Investigate the most common kinds of sea foods served in your establishment. List the sources (suppliers) from whom these seafoods are obtained.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 123-156.

B. American Home Economics Association, Handbook of Food Preparation, pp. 29-30, 40.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Some fish are difficult to digest, therefore, they need to be cooked well.

T F 2. Fish should never be refrozen.

T F 3. Fish are generally considered a high priced luxury item.

T F 4. Fish are extremely perishable and spoil rapidly unless refrigerated.

T F 5. Long cooking times are required for most fish.

T F 6. Fish are usually prepared and served in individual portions.

T F 7. Fresh water fish comprise most of the fish that are cooked and served commercially.

T F 8. It is always necessary to add a liquid of some sort when baking fish.

T F 9. The fat content of all fish is quite constant.

T F 10. When broiling fish, it is necessary to apply an oil before cooking even if the fish have been coated with flour.

T F 11. It is desired to have lobsters of about 10 lbs. for public serving.

T F 12. Shrimp requires just a short cooking time.

T F 13. Lobsters that are not pre-cooked should be cooked live.

T F 14. Oysters are purchased by the pound.

T F 15. Broiling is preferred over grilling as a method of preparing fish.

T F 16. The stewing of fish is not a very popular method.

T F 17. Overcooking of fish needs to be watched carefully, otherwise a useless product will result.

T F 18. If water is not used, fish should be simmered directly in court bouillon.

T F 19. When simmering or poaching large fish, the cooking should start in a very hot liquid.

T F 20. The sauce to be served with fish is actually more important than the fish itself.

T F 21. The eggs of fish are sometimes used as food.

T F 22. The cooking time for most fish to be simmered in water will not be more than 20 minutes.

T F 23. The baking of dressed fish requires the longest cooking time.

T F 24. All frozen fish should be thawed before cooking.

T F 25. It is safest to thaw frozen fish in a refrigerator.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two categories of fish are ____________ ____________ and ____________.

2. Salt water fish are valuable nutritionally as a source of ____________.

3. To refrigerate fish it is best to use ____________ ____________.

4. The most popular fresh water fish used by food service institutions is ____________.

5. Cooking fish en papillote means cooking in ____________.

6. Fish cooked in papillote should be coated with ____________, ____________ ____________, and ____________ before it is sealed up.

7. An extremely fast method of cooking fish is called ____________.

8. It is best to keep live shellfish in ____________.

9. The color of fresh lobster meat is ____________.

10. The most expensive scallops come from the ____________.

11. King crabs are obtained from the Pacific Ocean near ____________.

12. A common method of preparing small, whole fish is ____________ ____________.

13. Fish which have just the inside removed are referred to as ____________.

14. For easier handling, fish should be ____________ before they are breaded and fried or stuffed.

15. Fillets are for the most part, without ____________.

16. Shell fish that have been removed from their shells are referred to as ____________.

17. Cooking temperatures of fish and shellfish normally do not exceed ________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Characteristics of fresh fin fish are that they:

(A) ____________ (D) ____________
(B) ____________ (E) ____________
(C) ____________

2. Six forms in which fin fish may be purchased are:

(A) ____________ (D) ____________
(B) ____________ (E) ____________
(C) ____________ (F) ____________

3. The individual cutting, cooking, and serving of fish results in:

(A) ____________ (D) ____________
(B) ____________ (E) ____________
(C) ____________ (F) ____________

4. Court bouillon is made of:

(A) ____________ (E) ____________
(B) ____________ (F) ____________
(C) ____________ (G) ____________
(D) ____________

5. Shellfish include:

(A) ____________ (E) ____________
(B) ____________ (F) ____________
(C) ____________ (G) ____________
(D) ____________

Assignment
Sheet No. 8

Units 36-38

POULTRY AND GAME COOKERY

Poultry is considered meat due to the nutritive values and the methods used for cooking. Domesticated birds such as chicken, turkey, ducks, geese, guineas, squabs, and pigeons are those classified as poultry although some game birds are used to some extent.

Chicken is popular the world around and fried chicken is surpassed only by beef in popularity in food service establishments. Because of its constant availability and the many variations of preparation, chicken is always found on the menu and enables the chef to display his skill.

In this unit you will study the various kinds of poultry and game and how to properly prepare them.

Assignment:

1. Read the references listed below.
2. Investigate and report on sources, and inspection of fowls purchased for serving in your establishment.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 91-122.
B. American Home Economics Association, Handbook of Food Preparation, p. 28.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Nutritive value of poultry is lower than other meats.

T F 2. Poultry should be cooked well done.

T F 3. The tenderness of poultry all depends on the cooking.

T F 4. Before poultry can be shipped to another state, all non-edible parts need to be removed.

T F 5. Poultry is cooked much the same way as meat.

T F 6. Large turkeys are more economical than small ones.

T F 7. Turkey contains a large amount of fat.

T F 8. Poultry spoils readily and is easily recognized by the undesirable odor that is produced.

T F 9. Turkey is generally frozen and can be cooked that way.

T F 10. Since all poultry needs to be dressed before shipping, it is not necessary to clean it before cooking.

T F 11. It is possible that two fowl of the same size and weight may require different cooking time.

T F 12. Game is a very common item in most public eating places.

T F 13. Capon is a type of duck.

T F 14. Stuffing should be packed tightly into the body cavity.

T F 15. Stuffing should not be seasoned too heavily.

T F 16. It generally takes about 1 1/2 hours to roast a 4-5 pound duckling.

T F 17. Fresh bread should be used for stuffing.

T F 18. A meat thermometer is the only recommended method for testing the doneness of poultry.

T F 19. A 2 1/2 pound chicken will normally provide two servings of fried chicken.

T F 20. When testing a fowl for doneness, it should be removed from the pot by sticking a fork next to the backbone.

T F 21. When a number of fowl are cooked at the same time, it is necessary to test only one for doneness.

T F 22. Vegetables should be cooked very little if at all before insertion in the stuffing since considerable cooking takes place as the poultry is being cooked.

T F 23. A 24 pound turkey will take about 4 hours to roast.

T F 24. The cooking of fried chicken is completed in an oven.

T F 25. Poultry that has been stuffed should not be frozen.

T F 26. It is best to stuff poultry for roasting a day ahead of time.

T F 27. Roasted poultry can be tested for doneness by moving the leg joints

T F 28. Thawed uncooked poultry should never be refrozen.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The preferred grade of poultry for food service is ____________.
2. The more expensive types of poultry are usually prepared by ______________.
3. To obtain uniform cookery to ensure customer satisfaction, poultry should be of uniform ______________ and ______________.
4. The shape of broilers and fryers is maintained by ______________.
5. Ducks should be placed on racks when roasting, due to the large amount of ______________.
6. An economical way to make chicken stock is to use ______________ ______________.
7. Characteristics of good stuffing are that it is ______________ and ______________.
8. About one hour of cooking time can be saved if turkeys are not ______________.
9. Two types of fancy stuffings are called ______________ and ______________.
10. A 24 pound turkey should produce about ________ servings.
11. In roasting, steaming, or boiling chicken, the chicken is broken down into serving portions ______________ cooking.
12. Care must be taken when broiling or grilling turkey since turkey is quite ______________.
13. Poultry will become dry, stringy, and not very tasty when ______________.
14. Duckling will taste best when the skin is ______________.
15. When using bread for stuffing, the ______________ should be removed.
16. Ducklings should be cut into eight equal portions which provides servings for __________ people.
17. Color and crispness can be added to the skin of duckling and goose by ______________ the heat near the end of roasting.
18. You should plan to finish cooking poultry about ________ to ________ minutes before serving to enable easy carving.

19. It will generally take from ________ to ________ days to thaw frozen poultry in a refrigerator.

20. If the bird and the stuffing are prepared the day before cooking, they should be refrigerated ________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Tenderness of poultry is determined by:

(A) ____________________ (C) ____________________

(B) ____________________

2. Game birds that might be cooked and eaten are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

3. Edible trimmings of poultry are:

(A) ____________________ (C) ____________________

(B) ____________________

4. Distinguishing features of broilers and fryers are that they are:

(A) ____________________ (C) ____________________

(B) ____________________

5. The basic ingredients of most stuffings are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

6. Domestic birds used for food are:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

Assignment
Sheet No. 9

Covering
Units 39-41

SAUCES, GRAVIES AND CONDIMENTS

Proper seasoning is an extremely important part of good food preparation. Chinese and French cooks have always been highly rated in this art. There are no definite rules to be laid down, as tastes differ, condiments vary in strength, and different foods require varying amounts of supplemental flavoring.

Almost all foods require condiments. Others are condiments in themselves. Whichever be the case, they should be used sparingly. Some are made into sauces, and most gravies obtain their distinctiveness from proper proportions of condiments, correctly combined with the basic stock.

In this unit you will study some of the basic condiments and their uses, as additives, as sauces, and as a part of gravies.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. The Culinary Institute of America, The Professional Chef, pp. 279-291, 322-325.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The primary purpose of a sauce is to increase nutrition.

T F 2. A sauce will not cover up poor food.

T F 3. Most sauces are entirely different from each other.

T F 4. White sauce might be called cream sauce.

T F 5. Hollandaise sauces should be used within one and one-half hours after preparation.

T F 6. Hollandaise sauces contain large amounts of butter and eggs.

T F 7. Hollandaise sauces are among the easiest to make.

T F 8. Salt is a very important ingredient in stocks since it controls the flavor.

T F 9. The cooking time of roux is governed by the ingredients that are used in making it.

T F 10. Roux can generally be prepared long before its intended use and stored until needed.

T F 11. Roux should be cooked before it is added to other ingredients to form the sauce, soup, or gravy.

T F 12. The process of making a sauce can be speeded up, if necessary, by having the liquid and the roux hot before mixing.

T F 13. Gravy should have a taste that is similar to the meat from which it is made.

T F 14. Sage is used mainly for added color.

T F 15. Shallots are used for basically the same reason as garlic.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Sauces are used primarily to improve the ______________ and ______________ of the food.

2. Seasoning needs to be just right so that the final food product is not ______________ nor excessively ______________.

3. As tastes differ, seasoning of food is an art which takes some amount of ______________.

4. The discoloration of eggs prevents the use of ______________ cookware when making a hollandaise sauce.

5. Demi-glaze consists of a combination of espagnole and brown stock along with ______________ ______________.

6. Roux is composed of ______________ and ______________.

7. A simple but flavorless thickening agent is composed of ______________ and ______________.

8. When a somewhat clear sauce is desired, ______________ is the most economical thickening agent to use.

9. Any sauce with eggs in it must not be heated over ________ F.

10. Hollandaise sauce cannot be regrigerated because it contains ______________ nor can it be excessively heated because of the ______________ it contains.

11. Cloves can be used either ______________ or ______________.

12. A common flower of which the leaves are used in salads and sandwiches is the ______________.

13. Meat and poultry juice obtained by dry heat methods are used to produce ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The basic warm sauces are:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

2. Tomato sauce is composed of:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

3. Fats that might be used in making roux are:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

4. Those spices and herbs that are used both whole and ground are:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

(H) ______________________

Assignment
Sheet No. 10

Covering
Units 42-43

COOKING WITH FATS AND OILS

Deep fried foods, properly prepared, can add variety to a menu and are quite adaptable in situations requiring fast service. Fats and oils are also used for other methods of cookery.

A major problem in cooking with fats and oils is that of preventing too much fat or oil to be absorbed into the food. It is therefore necessary to understand the current methods of cooking with these products and the various characteristics of them.

In this unit you will learn some of the characteristics of fats and oils and the proper use of them. Special emphasis will be given to deep fat frying and the preparation of food for this and other methods of cooking with fats.

Assignment:

1. Read the references listed below.
2. Find what type of fat or oil is used by your employer in the kitchen for: table use, deep frying, pan frying, additives for cooked dishes and pastries.
3. Answer the questions below and turn in the assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 157-170.
B. American Home Economics Association, Handbook of Food Preparation, pp. 31, 39-40.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Generally foods that are to be fried are first coated in some manner.

T F 2. Oils are solid at room temperature.

T F 3. Even though deep fried foods are properly prepared and do not absorb much fat, the fact that they are prepared in fat makes them difficult to digest.

T F 4. One reason for coating deep fried food is to keep the juices in the product.

T F 5. Products coated with bread generally result in a crisper and better crust than those dipped in batter.

T F 6. The amount of fat absorbed is in direct ratio to the exposed surface of the product.

T F 7. Products of high water content originally will tend to repel the absorption of fat.

T F 8. If the temperature of the fat is too low the food will tend to become greasy.

T F 9. Fat will eventually "wear out" from continued use and will not hold correct temperatures.

T F 10. A frequent lowering of the fat temperature will help to preserve the life of the fat.

T F 11. Unserviceable fat can be made usable again by adding new fat to it provided that the new fat at least equals the old.

T F 12. Generally vegetable shortening can be used longer than most other types.

T F 13. Fried foods should be allowed to cool slightly before serving so that they can be eaten as soon as they are received.

T F 14. A deep fat fryer should be drained and cleaned at least once a week.

T F 15. Since the food itself will have a somewhat irregular surface, uniform covering when breading is not important.

T F 16. Wash, with reference to breading, is concerned with the washing of the food before coating it.

T F 17. It is best to bread products shortly before they are to be fried.

T F 18. If fried foods are covered during the cooking process, they will tend to become soggy.

T F 19. Chicken must be deep-fried at a greater temperature than french fried potatoes.

T F 20. Oleomargarine packages must indicate the type of fats used to produce it.

T F 21. Oils that are edible and commonly used in the American home are of vegetable origin.

T F 22. Salad oils have been processed and will remain clear at refrigerator temperatures.

T F 23. Fats and oils have been bleached to remove coloring materials.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. As commonly used, the term "fats" refers to those that are ____________ at room temperature and the term "oil" refers to those that are _______________ at room temperature.

2. Although the quality of the fat has very little to do with the quality of the finished product, the selection of a fat is usually based on its ability to remain __________ at frying temperatures.

3. Deep fat frying temperatures range from _____ F to ______F.

4. Lard is fat that is processed from a ___________.

5. Foods with high _________ content will generally absorb more fat than those with low content.

6. The temperature of the fat used when making french fried potatoes will tend to be lowered considerably when the potatoes are first placed in the fryer due to the high _____________ content of raw potatoes.

7. The determining of the proper temperature for frying various products will best be accomplished with ____________.

8. The life of the fat will be lengthened if it is _____________ daily.

9. At least one hand should be _________ when breading food.

10. A process for solidifying fats and oils by the addition of hydrogen is known as _______________.

11. Margarine must contain _______ per cent fat.

12. Oils are subdivided into __________ oils and __________oils.

13. Lard is obtained from the fatty tissue of ___________.

14. The changing of an oil from a liquid to a solid is called ________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Common frying substances are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

2. Factors that affect the degree of fat absorption in deep fat frying are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

3. Length of cooking time is determined by:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

4. Five classifications of food that may be deep fried are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

5. Wash for breading may be composed of any of the following:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

Assignment
Sheet No. 11

Covering
Units 44-48

MILK AND MILK PRODUCTS

Milk is the food nature provided for mammals to feed their new-born young during the first stage of life. It contains many nutrients needed for body-building during this time. For human beings, cow"s milk is probably the most important when considering total life span. Milk from other animals is used but primarily in other countries.

No food is complete in itself and this applies to milk as well, although milk is one of the most nearly complete foods. The need for milk and milk products has been reasonably established as essential throughout the average person's lifetime.

In this unit you will learn some of the important characteristics of these products, their use and procedures in preparation for serving.

Assignment:

1. Read the references listed below.
2. Interview your employer, and secure information on the following: (a) how much fresh milk is used per week, (b) how much condensed or evaporated milk is used per week, (c) how much dried (whole skim or buttermilk) is used per week? Does this present a storage problem? Could the problem be improved by using different forms of milk? Why or why not?
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 22-23.
B. American Home Economics Association, Handbook of Food Preparation, pp. 36-38.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Whole milk must contain at least 3.25 per cent butter fat.

T F 2. Pasteurization has no effect on the food value of milk.

T F 3. Homogenization is a process of breaking up the fat into uniform size globules that remain evenly distributed throughout the milk.

T F 4. Whole milk is much more nutritious than skim milk.

T F 5. Evaporated milk is an economical way to transport whole milk.

T F 6. Dry milk might be used in the dry form for some types of cooking.

T F 7. If salt is added to butter, the butter tends to keep better.

T F 8. An advantage of processed cheese is its ease of combining with other foods.

T F 9. It is recommended that when cooking with cheese, a high temperature and long cooking time be used.

T F 10. Some milk products are made by adding bacteria to milk.

T F 11. Half and half consists of a mixture of milk and cream.

T F 12. Concentrated milk is classified as evaporated milk.

T F 13. Ice milk is the same as ice cream except that the proportions of ingredients is different.

T F 14. Sour milk can only be obtained by letting fresh milk stand at room temperature until sour.

T F 15. Whole milk contains about 60 per cent water.

T F 16. Chocolate milk is made from skim milk.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Milk is made healthful by a process called ______________.

2. When the butterfat has been removed from milk the result is ______________ ______________.

3. Condensed milk differs from evaporated milk in its ______________ content.

4. The cheapest form of milk and quite acceptable for use is ____________ ____________ ____________.

5. Quality ice cream will have more than ________ lb. per gallon butterfat weight.

6. Most milk has ______________ added.

7. Cottage cheese is popular with people who are trying to ________________ weight.

8. The mixture of two or more cheeses is called __________________ ____________________.

9. Additions to butter that are not required by law are ____________ and _________________.

10. The most popular cheese in the United States is _______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four classifications of cheese are:

(A) ______________________________ (C) ______________________________

(B) ______________________________ (D) ______________________________

2. Three common forms in which milk may be purchased are:

(A) ______________________________ (C) ______________________________

(B) ______________________________

3. Three types of semi-soft cheese are:

(A) __________________ (B) ___________________ (C) __________________

4. Vitamins added to multivitamin milk are:

(A) ______________________________ (C) ______________________________

(B) ______________________________ (D) ______________________________

5. Fermented type milks include:

(A) ______________________________ (D) ______________________________

(B) ______________________________ (E) ______________________________

(C) ______________________________ (F) ______________________________

6. Evaporated milk is obtained by the process of:

(A) ______________________________ (C) ______________________________

(B) ______________________________ (D) ______________________________

Assignment
Sheet No. 12

Covering
Units 49-52

CEREALS, EGGS, AND BREAKFAST DISHES

The foods in this unit include variations of some of the basic foods of people the world over. Grains and seeds of grasses supply high percentages of the total diets for many countries. The egg, with its functions to develop into a fowl, therefore, contains all the materials necessary for body building, and can supply many vital elements for the well-being of humans.

These foods are usually associated with the breakfast meal, but are served very often for other meals, or as an added ingredient in many combinations of dishes. In your preparation as a chef, you should be familiar with these foods.

In this unit you will gain some knowledge of these foods, as they stand alone for foods and how they mix and combine for selected dishes.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 18-22.
B. American Home Economics Association, Handbook of Food Preparation, p. 38.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Eggs are a good source of iron.

T F 2. Eggs are generally easy to digest.

T F 3. There are times when the shells of eggs will be beneficial as decoration and nutritional value.

T F 4. Only pure white eggs should be used for quality cooking.

T F 5. The difference in weight between size classes of eggs is three ounces.

T F 6. The shells of eggs will prevent the penetration of odors but not dirt.

T F 7. Grade B eggs should never be used for cooking.

T F 8. There are various methods that may be used to simmer eggs.

T F 9. Eggs that are not turned over during the frying process are called sunny-side up eggs.

T F 10. Some sort of liquid should always be added to eggs when scrambling.

T F 11. A green ring around the yolk after simmering is a result of the feed used and cannot be changed.

T F 12. It is important that an omelette be served as soon as it is cooked.

T F 13. Cereals have no use other than as a breakfast item.

T F 14. Granular cereals should always be mixed in cold water before cooking.

T F 15. Too much stirring in cooking whole grain cereals can result in an inferior product.

T F 16. Bacon and ham will not spoil as easily as sausage.

T F 17. It is generally desirable to purchase bacon that is already sliced.

T F 18. Bacon should be pre-cooked and then cooked quickly at a high temperature just before serving.

T F 19. Pancakes and other such products will not tend to rise as much if the batter is mixed up too far ahead of using time.

T F 20. The continental breakfast originated in Asia.

T F 21. The advantage of the continental breakfast is the absence of extensive cooking.

T F 22. Frozen egg whites generally have ingredients added to improve keeping qualities.

T F 23. Special mixtures of eggs and milk or eggs and shortening are available for use.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Eggs are many times used as a substitute for ______________.
2. Twelve medium size eggs will weigh about _________ ounces.
3. The grade of eggs is determined by their ____________ and _______________.
4. When poaching eggs with thin whites, it is helpful to add _______________ to the water.
5. The green ring around the yolk of boiled eggs may be eliminated by placing the eggs in ___________ _____________ immediately after cooking.
6. Fried eggs will tend to be ___________ if fried in an excessive amount of fat.
7. To make a dinner omelette, ____________ eggs should be used.
8. Two distinct characteristics of cereal are the ample supply of _______________ and the lack of ____________.
9. The two basic types of cereals are the _______________________ cereals and the ___________ cereals.
10. Two common types of breakfast sausage are __________ sausage and sausage _________________.
11. Meats used for breakfast service are usually ___________________ to enable better service.
12. In blanching bacon, the slices are usually cooked until about ___________ done and then kept until serving, at which time they are completed to order.
13. Potatoes are usually served ______________ for breakfast.
14. The quality of syrup used for pancakes can be improved by _______________.
15. Putting small holes in a sausage prior to cooking will prevent _________________.
16. Frozen egg yolks usually have ______________ or ______________ added.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The various uses of eggs for cooking are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

2. The six sizes of eggs and their weight per dozen are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

3. The four grades of eggs by U. S. standards are:

(A) __________ (B) __________ (C) __________ (D) __________

4. The most common methods of cooking eggs are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

5. Poor quality fried eggs can result from:

(A) ____

(B) ____

(C) ____

(D) ____

6. Country style eggs are prepared by cooking eggs with:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. The three methods of making omelettes are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

8. The most common meats offered on breakfast menus are:

(A) __________ (B) __________ (C) __________

9. A continental breakfast is composed of:

(A) __________ (B) __________ (C) __________

10. The classifications fo food that are common on breakfast menus are:

(A) __________ (E) __________

(B) __________ (F) __________

(C) __________ (G) __________

(D) __________

Assignment

Units 53-56

APPETIZERS, SOUPS AND SANDWICHES

The food in this unit may be served alone as lunches or snacks, or may be complements to a complete dinner. They, like other foods, should be prepared and served properly and attractively. Since they generally precede the main meal, they can do much to determine the customer's attitude towards the rest of the meal. When served alone they need to satisfy the customer's immediate appetite.

In this unit you will learn what different appetizers, soups, and sandwiches are commonly used in food establishments and how to prepare them.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 14-15, 243-278.
C. Smith, A Handbook on Quantity Food Management, p. 68.
E. Sealtest, Know Your Job, pp. 36-39.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A sweet appetizer should be served prior to a meal that is basically light.

T F 2. Canapes are much like hor d'oeuvres except that the ingredients are served on bread or crackers.

T F 3. In preparing appetizers, speed is not important since appearance is the main consideration.

T F 4. French Bouillabaisse is a common soup to be served along with the main meal.

T F 5. Quality soup is based on the stock that is used.

T F 6. Broth and bouillon both mean the same thing.

T F 7. All soups should be served extremely hot.

T F 8. To obtain clarification, it is important that the stock is simmered rather than boiled to extremes.

T F 9. Continuous stirring is required to obtain clear consomme'.

T F 10. The garnishes are the foods that are put into the stock to make the soup.

T F 11. The decline of actual stock making in the kitchen is due to the fact that the public prefers the manufactured bases.

T F 12. Cooking time to obtain stock should be at least eight hours.

T F 13. Stocks should never be salted since they are generally cooked with other foods which may tend to change their salt content.

T F 14. In cooking stock it should be boiled and then allowed to simmer.

T F 15. Fat that forms from cooling stocks should be left on during refrigeration since it will act as protection.

T F 16. If stock is placed in the refrigerator directly from the store, it will result in poor quality stock.

T F 17. Bones should be chopped up into small pieces before using in stock.

T F 18. Soup stock may be kept on top of the stove indefinitely.

T F 19. Meat for sandwiches should be sliced about 1/16 inch thick.

T F 20. The filling of a sandwich should not be spread to the very edge of the bread.

T F 21. A small sized work space is all that is needed for efficient sandwich service.

T F 22. All chopping, slicing, and spreading of bread should be done on a special board.

T F 23. A separate spreader should be used for each different sandwich spread mixture.

T F 24. Sandwich ingredients should be prepared well ahead of time for use.

T F 25. It is most practical to use cheaper grades of mayonnaise for making sandwiches.

T F 26. Bread or other sandwich materials should not be handled with the hands.

T F 27. More bone than meat should be used for stock soups.

T F 28. Stock soups should be simmered for a long time.

T F 29. Soup stocks should be cooled quickly.

T F 30. Cream soup should be salted just before serving.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. An appetizer is a food that is served ____________ the meal.

2. Canapes and hor d'ouervres can provide a good profit provided the __________ cost is kept down.

3. Canapes are similar to hor d'ouevres except that the mixture is served on a ______________.

4. Bouillabaisse should be served both as __________ and ___________.

5. It is important to have good ___________ in order to produce a good soup.

6. Most consomme's are obtained from ___________ stock or _________ stock.

7. In obtaining a clear liquid, the coagulation of _____________ _____________ and _____________ causes the other food particles to form a solid mass.

8. Soups are usually served accompanied by a ____________ item.

9. Modern processing of meat has eliminated ____________ which creates problems in making stock.

10. For better nutritional value, vegetables are added __________ the cooking process when making stock.

11. Meat bones should be added _____________ pieces to give more flavor.

12. The main difference between brown stock and white stock is that in white stock the bones have not been _______________.

13. When it is desirable to bring the flavor out of a food while cooking, that food should be placed in ______________ water to start cooking.

14. One very important rule in cooking is: ____________ hot foods as quickly as possible; and ___________ cold foods as quickly as possible.

15. When cooling stock, it is recommended that the stock be ______________ occasionally.

16. An item that may be useful for dipping sandwich filling is the __________ ___________ ___________.

17. Butter may be softened for spreading by adding a small amount of ___________ ______________ and then whipping.

18. The testing of seasoning of sandwich fillings should be done by the ___________ _____________.

19. Two pints of mayonnaise should be enough to spread about _________ slices of bread.

20. Food such as chicken, greens, and cheese can easily be cut up with _____________.

21. Flavor or color of soup stock can be influenced by ___________ some of the meat used.

22. When making soup stock, the juices of the meat are extracted by adding ____________ _______________.

23. Cream soup uses a _____________ sauce.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The five basic appetizers in the U. S. are:

(A) _________________________ (D) __________________________

(B) _________________________ (E) __________________________

(C) _________________________

2. The main classifications of soup are:

(A) _______________ (B) _______________ (C) ________________

3. Garnishes fall into the commonly used categories of:

(A) ____________________ (F) ____________________

(B) ____________________ (G) ____________________

(C) ____________________ (H) ____________________

(D) ____________________ (I) ____________________

(E) ____________________

4. Possible accompaniments of soup are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

5. Stocks are usually derived from:

(A) ____________________ (C) ____________________

(B) ____________________

6. The four main stocks are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. Methods of cutting bread for sandwiches are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

8. Types of bread that might be used for sandwiches are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

9. Seven ways in which sandwiches might be served are:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

10. Seven main classifications of sandwiches under which most varieties fall are:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

Assignment
Sheet No. 14

Covering
Units 57-59

FRUIT PREPARATION AND COOKERY

Fruits contribute important nutrients to the diet and are excellent sources of natural sugars. In addition to these features, most fruits also help with the natural elimination processes of the body.

Fruits are seldom used as the complete meal but rather as appetizers, desserts, or "snacks" in their fresh form. They play an important part in the making of certain salads which will be covered in a later unit.

In this unit just a brief study will be made, primarily concerned with preparing and cooking fruits either prior to use with other foods or as they would be served separately.

Assignment:

1. Read the reference listed below.
2. Make a list of fresh fruits available in your area. Which of these are available all year round and which are seasonal in nature?
3. Answer the questions below and turn this assignment in by ____________________.

Reference:

I. Information Sheet #2, "Preparing and Cooking Fruits."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Most fruit should be washed before preparing.

T F 2. The same procedure is used to obtain both grapefruit and orange sections.

T F 3. Oranges should be chilled before cutting into slices.

T F 4. In removing the core from apples for baking, a cut should be made around the core all the way through the apple and the core removed.

T F 5. Discoloration of bananas after peeling can be prevented by covering them with an acid fruit.

T F 6. Apples should be baked in a deep pan.

T F 7. It is important when baking apples that all the apples are completely covered with water.

T F 8. Applesauce should never be served hot.

T F 9. Cranberries should be cooked until their skins burst.

T F 10. Dried apricots and prunes should be washed in warm water before stewing.

T F 11. Canned fruits should be opened 30 minutes before serving and cooled.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Seeds are removed from orange juice by ____________.

2. Before cutting orange slices, the oranges should be placed in ____________ ____________ for 5-8 minutes.

3. Orange slices should be ____________ before cutting to thickness.

4. Badly damaged and ____________ berries should be discarded in preparation.

5. Discoloration of apple sections can be prevented by covering them with ____________ ____________ ____________.

6. The skins of peaches can be removed easily by first placing them in ____________ ____________.

7. After baked apples have cooked, a form of ____________ should be placed on the top and then broiled to form a glaze.

8. In making applesauce, the sugar should be added just before the apples are ____________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four acid fruits are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Three things that bananas are covered with before baking are:

(A) ______________________ (C) ______________________

(B) ______________________

3. The creamed mixture for baking peaches consists of:

(A) ______________________ (C) ______________________

(B) ______________________

Information
Sheet No. 2

PREPARING AND COOKING FRUITS*

How To Prepare Fresh Fruit

Juice Extraction from Citrus Fruits

1. Cut the fruit crosswise into halves or lenghtwise into halves and quarters.
2. Hold the glass reamer with one hand and the half section of the fruit with the other hand.
3. Invert the half section over the top of the glass reamer. Rotate the fruit back and forth while pressing firmly against the blade of the reamer.
4. Strain to remove seeds and particles of pulp.

Grapefruit Halves

1. Wash grapefruit and cut crosswise into halves. Use a sharp pantry knife.
2. Using scissors or grapefruit knife, cut the center core free from the tough membranes which separate the sections and also from the rind. Remove the core and seeds.
3. Loosen each section from the membranes and the rind, using a small knife.

Grapefruit Sections

1. Cut off the rind from the top and bottom. Stand upright on the work table or cutting board.
2. Remove the rind from the sides, starting at the top and cutting downward toward the table. Cut the layer deeply enough to remove the white membrane.
3. With the left hand, turn the fruit from right to left, as necessary, until the rind is removed.
4. With the back of the knife, lift out the whole segments of pulp. Remove the seeds.

Orange Sections

1. Cut off the rind from the top and bottom. Stand upright on the work table or cutting board.

---

*Adopted with permission from Food Service by Helen Livingstone, McKnight & McKnight Publishing Company, Bloomington, Illinois, 1950.

2. Remove the rind from the sides, starting at the top and cutting downward toward the table. Cut the layer deeply enough to remove the white membrane.
3. With the left hand, turn the fruit from right to left, as necessary, until the rind is removed.
4. With the back of the knife, life out the whole segments of pulp. Remove the seeds.

Orange Slices

1. Let whole oranges stand in boiling water from 5 to 8 minutes.
2. Cut through the rind around the orange lengthwise twice. This will divide the rind into four parts.
3. Cut a thick layer of skin from the top.
4. Remove the rind in four strips lengthwise.
5. Chill.
6. Cut crosswise to the thickness desired (¼ to ½ inch).
7. Remove the seeds.

Diced Oranges

1. Remove the rind and cut into sections.
2. Cut sections crosswise into uniform pieces the size desired (about ¼ inch).
3. Remove the seeds.

Lemon Sections

1. Cut a layer of rind from top and bottom.
2. Cut lengthwise into halves.
3. Cut halves lengthwise into sections of the desired thickness.
4. Remove the seeds.

Lemon Slices

1. Cut a thick slice from the top and bottom of the lemon.
2. Cut crosswise into slices of the desired thickness (¼ to ½ inch).

3. The rind is scored with a fork before cutting the slices. This gives a fluted edge to the slice.

4. Remove the seeds.

Raspberries, Blackberries, Blueberries

1. Inspect the berries carefully. Discard overripe and badly damaged berries.

2. Cut off the damaged, discolored portions from the good berries.

3. Place the berries in a colander and lift up and down in a quantity of cold water.

4. Handle carefully to prevent bruising.

5. Drain them well.

Strawberries For General Use

1. Place the berries in a colander and wash under running water.

2. The perfect berries are sorted from those with spots or blemishes.

3. Remove the stems, soft or discolored portions, and blemishes, and drain the berries well.

Strawberries To Be Served Whole

1. Select large, perfect berries.

2. Wash as already suggested.

3. The stems are not removed.

4. Drain well and chill them until serving time.

Apples For Baking

1. Select large red apples.

2. Wash and dry them.

3. With a small, sharp-pointed knife cut through the pulp around the stem, making a circle 3/4 to 1 inch wide. Extend the cut to within 1/2 inch of the bottom. At this point cut across the core and remove it whole.

4. Pare a band of skin 1/2 to 3/4 inch wide off the top around the opening made by removing the core.

Apple Sections

1. Wash and drain the apples.
2. Cut into halves from top to bottom. Cut the halves into quarters.
3. Cut the core from each quarter. Remove the skin, bruises or blemishes.
4. If smaller sections are desired, cut the quarters into uniform pieces, lengthwise.
5. Place sections in lemon or other acid fruit juice to prevent discoloration until ready to use.
6. Drain well.

Diced Apples

Place several sections close together on work table and cut crosswise into cubes of the desired thickness (¼ to ½ inch). Use French knife.

Apple Slices

1. Prepare the sections.
2. Cut the sections crosswise into slices from 1/8 to 1/4 inch wide, according to use.

Bananas

1. Cut the banana from the bunch.
2. Cut off stem and remove the skin.
3. Remove all the inner white membrane which may adhere to the pulp.
4. Cut off soft or discolored portions.
5. Cut into halves or strips lengthwise; into wedges, or slices, as desired.
6. Cover the pieces with an acid fruit or salad dressing.
7. If acid fruits such as oranges, pineapple or grapefruit are prepared at the same time, the bananas are covered by the other fruits to prevent discoloration until ready to use.

Peaches

1. If the fruit is very ripe, the skin is easily removed. Pierce the skin with the point of the knife and lift it from the pulp. Begin peeling at the bottom of the peach. Use short, quick strokes.

2. If the skin is not easily removed, dip the peach into boiling water long enough to loosen the skin (about one minute or less), and then peel.

3. Cut into halves lengthwise and remove the pit.

4. Cut the halves into wedges or slices, as desired.

5. Peaches are prepared only a short time before using, or are covered with acid fruit juice to prevent discoloration.

Pears To Be Served Uncooked

1. Cut the pear into halves lengthwise. Cut out the core and remove the skin.

2. The halves are cut into wedges or slices, as desired.

3. Prevent discoloration. Refer to peaches, apples, etc.

Pears For Baking

1. Remove the skin and stem.

2. Small pears or those having a soft pulp are baked whole.

3. Hard pears are pared, cut into halves lengthwise, and the core removed.

Pears For Stewing

1. Small pears are stewed whole after removing the skin.

2. Large pears are prepared as for baking.

How To Cook Fruits

Baked Apples

1. Arrange the prepared apples in a shallow baking pan.

2. Poor one-half to one inch of water into the pan and cover closely.

3. Cook slowly on top of the stove, keeping the water below the boiling point. Continue cooking until the apples are tender when pierced with a toothpick.

4. Remove the cover. Spread the tops of the apples with sugar or heavy syrup.
5. Place under the broiler until the sugar melts and forms a glaze.
6. One serving -- one apple.

Applesauce

1. Place the prepared apple sections in a saucepan and add one-half their measure of cold water or place in a steamer.
2. Cover and cook slowly until the apples are tender.
3. Remove from the fire or steamer and add sugar to taste--about 1 tablespoon per apple.
4. Beat with a spoon or mixer. Strain if preferred.
5. Spplesauce is served hot or cold.
6. One serving -- 1/3 cup.

Baked Bananas

1. Cut the bananas in halves lengthwise.
2. Place in a buttered baking pan. Brush with lemon juice; brush with melted butter; cover with sugar or heavy syrup.
3. Bake in a moderate oven (350° F.) 15 to 20 minutes.
4. One serving -- 1/2 banana.

Cranberry Sauce

1. Place the prepared berries in a saucepan or kettle with one-third their measure of water.
2. Add one-half their measure of sugar and stir until the sugar is dissolved.
3. Cover and cook slowly until the skins burst.
4. Remove the foam, which forms on top of the pan, with a cooking spoon.
5. One serving -- 1/4 cup.

Cranberry Jelly

1. Place the prepared berries in a saucepan or kettle with one-third their measure of water. Cover and cook slowly until the skins burst.

2. Strain through a sieve, pressing the berries against the sides with a wooden spoon or use the strainer attachment of the mixing machine.

3. Put the strained berries into the saucepan again and add one-half their measure of sugar. Cook slowly, stirring until the sugar is dissolved. Continue cooking for five minutes.

4. Pour into molds and let stand until firm before serving.

5. One serving -- 1/4 cup.

Baked Peaches

1. Prepare a creamed mixture of sugar, butter and lemon juice, allowing the following proportions for 6 peaches: 4 tb. sugar; 2 tb. butter; 1½ t. lemon juice.

2. Place the prepared peaches in a buttered baking pan. Fill each cavity with the creamed mixture.

3. Bake in a moderate oven (350° F.) for 15 to 20 minutes.

4. Nutmeg or cinnamon is sprinkled over the peaches before baking, if desired.

5. One serving -- 2 halves.

Baked Pears

1. Place the prepared pears in a baking pan.

2. Pour one-half inch layer of water into the pan.

3. Sprinkle pears with sugar, allowing 1/2 tb. for each pear.

4. Bake in a moderate oven until tender.

5. Baste the pears several times with the liquid in the pan while baking.

6. One serving -- 2 halves.

Stewed Pears

1. Prepare a syrup in the following proportion: 1/2 c. water; 1/2 c. sugar; 6 pears.

2. Cook the syrup for 5 minutes.

3. Add the prepared pears to the syrup and cook slowly until tender.

4. Remove the pears and continue cooking the syrup until it is thick.
5. Pour syrup over the pears before serving.
6. Add vanilla, nutmeg, or lemon juice to the thick syrup if desired.
7. One serving — one pear.

Stewed Dried Apricots And Prunes

1. Allow 4 or 5 halves for serving.
2. Wash with warm water. Drain them.
3. Cover the fruit with warm water and soak for two or three hours. Cook slowly in the same water until plump and tender. Keep the water below the boiling point.
4. Add sugar if desired.
5. Cook a piece of lemon or orange rind with the fruit if desired.

Stewed Figs

1. Allow 4 medium dried figs for each serving.
2. Inspect the figs and remove stems and inedible portions.
3. Wash in warm water and drain.
4. Cover with water and cook slowly until the figs are plump and tender. Keep the water below the boiling point.
5. No sugar will be needed.
6. Add lemon juice or the rind to the figs while cooking, if desired.

Raisins

1. Inspect the raisins and remove stems or foreign substances.
2. Wash in warm water and drain.
3. For salads, soak in warm water until plump. Dry before using.
4. When added flour mixtures, raisins are washed, soaked until plump, dried, and covered with flour before using.
5. For fillings and sauces, cover with water and cook slowly until plump. Sugar is added if desired.

Canned Fruits

Canned fruits are already cooked and may be served as they come from the can. It is a good plan to open them at least 30 minutes before serving and also cool them in the refrigerator. They may be used in place of cooked fresh fruits as an accompaniment for the main course and in various desserts such as puddings and gelatins.

Canned fruits may be used also in combination with fresh fruits for fruit cups and salads.

Assignment
Sheet No. 15

Covering
Units 60-64

VEGETABLE PREPARATION AND COOKERY

Vegetables are becoming more and more important in today's menus. Their richness in food value is publicly known and, therefore, customers demand vegetables that are of good quality and properly prepared.

In comparison with other food, the cost of vegetables is relatively low. Therefore, they should be attractively presented to increase sales.

In this unit you will learn the characteristics of vegetables and study the methods of cooking.

Assignment:

1. Read the references listed below.
2. Make a list of vegetables used in your establishment in a week's time. Show which are fresh, which are canned, and which are frozen. How does this affect purchasing, storage, and cost? Are facilities adequate for keeping a reasonable supply on hand? How could they be improved?
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 171-198.
C. Smith, A Handbook of Quantity Food Management, pp. 72-73.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Vegetables that taste better and look better when cooked generally do not contain the most food value.

T F 2. It is necessary to wash all vegetables before cooking.

T F 3. All frozen vegetables should be cooked without thawing.

T F 4. Generally frozen vegetables require less cooking time than fresh vegetables.

T F 5. Canned vegetables are cooked before canning and therefore need only to be reheated.

T F 6. Dried legumes are becoming more important in today's cookery.

T F 7. It is recommended that baking soda be used in cooking green vegetables in order to intensify their color.

T F 8. Vegetables may be classified by their color.

T F 9. A vegetable plate should always contain just vegetables.

T F 10. Newsprint is a good material to cover vegetables with when storing.

T F 11. In cooking vegetables, the water should be salted.

T F 12. Sugar can add to the flavor of vegetables if added just before serving.

T F 13. Newly cooked vegetables added to previously cooked vegetables will provide a satisfactory product.

T F 14. The roots of beets should be removed before cooking.

T F 15. Large steam cookers generally need preheating so that the cold metal does not absorb the heat of the steam.

T F 16. Frozen vegetables should always be thawed before steaming.

T F 17. When washing leaf vegetables, the leaves should be removed from the water so that dirt and grit will not remain on the leaves.

T F 18. Due to opposite chemical reactions, most red vegetables are cooked covered while green vegetables are cooked uncovered.

T F 19. Most vegetables require only a small amount of water for cooking; however, it is necessary to cook a few with considerable water.

T F 20. Potatoes and squash require storage by refrigeration.

T F 21. Frozen vegetables should be stored just below 32° F.

T F 22. If vegetables are not to be used immediately after cooking, they should be cooled with cold water.

T F 23. Vegetables should be cooked without being cut whenever possible.

T F 24. Dried milk should never be used in making mashed potatoes.

T F 25. Fresh potatoes should be used for making french fried potatoes.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Precooking of fresh vegetables is referred to as ______________.

2. Worms can be removed from cauliflower and broccoli by soaking in cold salt water or ______________ ______________.

3. Frozen squash will cook unevenly unless thawed first due to the large amount of ______________ it contains.

4. Canned vegetables usually require the addition of ______________ and ______________ before serving.

5. Pod bearing vegetables are classified as ______________.

6. The main use of dried legumes is in ______________ ______________.

7. Green vegetables should generally be cooked ______________ whereas red vegetables are normally cooked ______________.

8. If white vegetables are overcooked they will tend to appear ______________.

9. Vegetable plates should be made up of at least ________ vegetagles or equivalents.

10. Acids added to red vegetables to intensify the color should be added at the ______________ of the cooking period.

11. Vegetables should be cooked until they are ______________.

12. The absence of ______________ and ______________ in pressure cooking helps to preserve the vitamins in the vegetables.

13. The addition of small amounts of ______________ when pressure cooking will help keep in the minerals.

14. Steam cooking of fresh potatoes usually takes about ________ minutes.

15. Steam cooking of fresh corn on the cob takes only about ________ minutes.

16. Cooking pressure for a pressure cooker generally is about ______ pounds.

17. The cover or door of a pressure cooker should never be removed until all of the ______________ has been removed.

18. Frozen vegetables should not be _______________ once they are thawed.

19. Fresh vegetables should be cut nearly the same size in order to insure _______________ _______________.

20. Unnecessarily large amounts of _______________ should be avouded when cooking vegetables.

21. Pressure cooking times depend upon the degree of _______________ and the type of _______________.

22. Prepared vegetables should be covered with a _______________ _______________ until ready to use.

23. When baking potatoes the temperature of the oven should be about ________ F.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The nutritional values of vegetables are:

(A) __________________________ (C) __________________________

(B) __________________________

2. Four "don'ts" with regard to vegetable selection for the menu are:

(A) ____

(B) ____

(C) ____

(D) ____

3. Three values of cooking vegetables are:

(A) __________________________ (C) __________________________

(B) __________________________

4. Three changes that occur as vegetables cook are:

(A) __________________________ (C) __________________________

(B) __________________________

5. Four classifications of vegetables are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

6. Overcooking of vegetables will result in:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. Spoilage of canned vegetables can be discovered by:

(A) ____

(B) ____

(C) ____

(D) ____

8. Three grains that might be used as substitutes on a vegetable plate are:

(A) ____________________ (C) ____________________

(B) ____________________

9. Three frozen vegetables that should be thawed before cooking are:

(A) ____________________ (C) ____________________

(B) ____________________

10. Common methods of cooking vegetables are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Units 65-68

SALADS AND SALAD DRESSINGS

Salads may be classified as appetizers or as the main dish for a light luncheon. Originally a salad was designated as a dish of raw greens, with oil and seasonings, and some of the better salads today are the simple, attractive, appetizers that supplement regular meals.

Salads generally do not get the attention that they deserve in preparing a meal. They provide a good opportunity to display the artistry of the chef and should add something to the meal. A salad should be attractive, crisp, and tasty and should be accompanied by an appropriate dressing.

Completion of this unit should enable you to prepare and present attractive and desirable salads and dressings.

Assignment:

1. Read the references listed below.
2. What types of salads does your establishment serve? Are they made up ahead of time? If so, how long are they held? Are they properly covered to prevent wilting and deterioration? Could your process be improved? How? Report your findings to your coordinator.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 199-242.
C. Smith, Handbook on Quantity Food Management, pp. 74-75.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Salads are always served cold.

T F 2. Salads should hang over the edge of the plate to give the customer the impression of a large amount.

T F 3. It is a good idea to place salad plates into a refrigerator before placing the salad on them.

T F 4. In attempting to get eye appeal in a salad, generally the flavor will suffer; therefore, it is extremely important to prevent this.

T F 5. Salad dressings are always served separate from the salad enabling the customer to apply it to his desires.

T F 6. If too much gelatin is used to make a gelatin salad, the salad will be come soft and sloppy.

T F 7. A better gelatin salad will generally result if natural fruit juices are added along with the water.

T F 8. Hot water should be used only to dissolve the gelatin after which cold should be used.

T F 9. Fruit acids tend to speed up and aid the action of the gel and therefore should be used whenever possible.

T F 10. As the volume of gelatin increases, its power to gel decreases.

T F 11. Ice can be used as a means of speeding up the gelling process.

T F 12. Parsley is a garnish that is used considerably with fruit salads.

T F 13. A menu generally should contain only one choice of salad.

T F 14. Romaine is a salad green that must be treated with care since it is highly perishable.

T F 15. After greens have been washed in a pan of cold water, the water should be poured out and the greens refrigerated.

T F 16. Practically all fresh fruits and vegetables except bananas should be refrigerated until used.

T F 17. Generally salads should be made up well in advance and refrigerated until time of service.

T F 18. Aluminum storage equipment should not be used since they tend to discolor food.

T F 19. Since mayonaisse is high in fat content, it is desirable and possible to make potato salad with other materials.

T F 20. French dressing is generally used with most tossed salads.

T F 21. Dressings have no food value but are used for flavor, appearance, and ease of eating.

T F 22. Boiled dressings contain little or no fat.

T F 23. Good french dressing will not have a separation of oil and acid after a period of standing.

T F 24. Mayonnaise should be made in the kitchen whenever possible.

T F 25. In making mayonnaise in the kitchen it is important to add oil slowly and in small amounts.

T F 26. French dressing, although a dressing in itself, is also a prime ingredient for other dressings.

T F 27. A general rule is: The stronger the salad, the milder the dressing should be.

T F 28. French dressing needs to be shaken well before using.

T F 29. Fruit and vegetable salads should be assembled by the assembly line method.

T F 30. If a gelatin salad is to be kept overnight, a greater proportion of gelatin should be used.

T F 31. Congealing time for gelatin can be shortened by dissolving the gelatin in a cold liquid.

T F 32. Fruits, vegetables, and other such ingredients should be added after the gelatin is partially congealed.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Salads will tend to loose some of their flavor if they are served too ________________.

2. That part of the salad which is included primarily for appearance is called the ________________.

3. Flavorless gelatin should be soaked in ________________ ________________ before using.

4. A garnish that is commonly used with all salads is ________________.

5. The most common salad green used for a salad base is ________________.

6. Because of their water content and the fact that they will tend to wilt the greens and make them soggy, ________________ are seldom used in the main part of a salad.

7. Over-handling and cleaning of greens may result in the formation of ________________.

8. The cutting of fresh fruits to prepare them for salads should be done with ________________ ________________ knives to prevent discoloration.

9. From the standpoint of customers selection and preparation time and effort, salads should generally be kept ______________.

10. A combination of raw or cooked vegetables with greens is referred to as a ______________, ______________ or ______________ salad.

11. The oil content of salad dressings is primarily for ______________.

12. Fruit french dressing is a variation of french dressing that is accomplished by substituting a fruit juice for some of the ______________.

13. Products similar to mayonnaise but which do not meet government regulations are termed simply ______________ ______________.

14. Probably the most important job in making mayonnaise is the ______________ of the eggs and oils.

15. It is important when making mayonnaise to prevent the ______________ of the ingredients.

16. French dressing can be stabilized by adding ______________ or ______________.

17. Salad greens that are refrigerated prior to assembly in a salad should be covered with a ______________ ______________.

18. Salad dressings should be added to salads just before ______________.

19. If the emulsion of mayonnaise breaks, it should be combined with more ______________ ______________.

20. Mayonnaise should be combined with ______________ ______________ for fruit and vegetable salads to prevent leaking.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The first innovation of Ceasar's salad was composed of:

(A) ______________________ (C) ______________________

(B) ______________________

2. Individual salads fall into the catagories of:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. The four main parts of a salad are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. The purposes of the base of a salad are:

(A) ____

(B) ____

(C) ____

5. Products that will hinder the action of the gel in preparing a gelatin salad are:

(A) ______________________ (C) ______________________

(B) ______________________

6. The three basic types of salad dressings are:

(A) ______________________ (C) ______________________

(B) ______________________

7. Four required ingredients of mayonnaise are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

8. When making mayonnaise, the oil and eggs may separate because:

(A) ____

(B) ____

(C) ____

FLOUR AND GRAIN PRODUCTS

Flour and grain products comprise an important part of our everyday diet. They provide us with carbohydrates which are necessary for energy.

Although some of the products can be obtained ready-to-use, there are a number of popular menu items that require skillful preparation and cooking.

This unit will familiarize you with these various flour and grain products and the correct methods of preparation.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 23-25.
B. American Home Economics Association, Handbook of Food Preparation, pp. 40-44.
I. Information Sheet #3, "Preparing and Baking Flour Mixes."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Yeast is the most common leavening agent used in flour mixes.

T F 2. The liquid that is generally used in flour mixtures is milk.

T F 3. Wheat flour is used to provide most of the flour used in flour mixtures.

T F 4. Juices should never be used to thin down a flour mixture.

T F 5. The types of flour mixes are determined primarily by the ratio of liquid to flour that is used.

T F 6. All of the methods of preparing flour mixes require that the liquid be added to the dry ingredients.

T F 7. The readiness of cooking griddles and irons can be tested by putting water on them.

T F 8. Pastry should be chilled before using.

T F 9. An 8-inch pie should provide eight servings.

T F 10. Whole wheat flour has not been ground.

T F 11. The main difference between whole wheat flour and white flour is that white flour is sifted.

T F 12. General purpose flour has less protein content than bread flour.

T F 13. Soy flour has good gluten forming characteristics and therefore is good for breadmaking.

T F 14. All leavening agents produce a gas which causes the dough or batter to rise.

T F 15. Pastas many times take the place of potatoes and vegetables.

T F 16. Pastas are generally served along with some other food to provide more nutrition to the meal.

T F 17. Most pastas should be cooked in a liquid to aid digestion and appearance.

T F 18. Soft noodle doughs should be used as soon as they are prepared so that they don't dry out.

T F 19. As with other foods, pasta products should be simmered rather than extreme boiling to preserve the flavor and nutritional value.

T F 20. It is best to cook pastas covered so that the steam and heat will not escape, thus permitting better cooking.

T F 21. Rice is not classified as a flour product.

T F 22. Although rice may take the place of potatoes or vegetables, the loss of nutrition needs to be replaced with some other food.

T F 23. The amount of coating or layers removed from rice in the milling process determines to a great extent the nutritional content.

T F 24. Pre-cooked rice is preferred over other rice because of the fact that it does not require a great deal of further preparation.

T F 25. In preparing rice, the rice is always poured into the water or liquid no matter which method of preparation is being used.

T F 26. Rice may be cooked over open heat or in an oven.

T F 27. When paste products are cooked and need to be held for service, cold water should be run on the outside of the pot to cool and prevent sticking.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two most common wheat flours are ______________ ______________ and ______________.

2. Soft doughs require about ________ part liquid to ________ parts flour

3. Pastry should be baked at about ________ F.

4. The wheats used for macaroni and other pastes are called ______________ wheats.

5. Rice that has had only the hull removed is called ______________ rice.

6. A general rule in cooking paste products is to use about ________ or ________ parts of salted water to 1 part paste.

7. Spaghetti will usually require about ________ minutes of cooking time.

8. Rice that has been ______________ should be washed before cooking to remove the ______________.

9. A high priced rice that is used with poultry is called ______________ rice.

10. In preparing rice by the boiling-steaming method, the rice is ______________ into boiling water.

11. The most common method for preparing rice is the ______________ method.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The basic ingredients of flour mixtures are:

(A) ______________ (B) ______________ (C) ______________

2. The four types of flour mixtures are:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

3. The three common methods of mixing batters and doughs are:

(A) ____________ (B) ____________ (C) ____________

4. Flours that are low in gluten-forming proteins and need to normally be used with wheat flour are:

(A) ____________ (E) ____________ (H) ____________

(B) ____________ (F) ____________ (I) ____________

(C) ____________ (G) ____________ (J) ____________

(D) ____________

5. Enriched flour has the following ingredients added:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

6. The three main varieties of rice are:

(A) ____________ (B) ____________ (C) ____________

7. The germ of rice contains:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

8. Rice or grain is composed of three parts, namely:

(A) ____________ (B) ____________ (C) ____________

Information
Sheet No. 3

PREPARING AND BAKING FLOUR MIXES*

Flour Mixtures

1. The chief ingredient in flour mixtures is flour. Many ingredients such as sugar, fat, eggs, flavoring, fruits and nuts, are added to flour mixtures, but their essential ingredients are flour liquid and leavening.

2. Leavening results from one or more sources, such as air beaten or folded into the mixture; steam from the liquids used; gas from baking powder, soda or yeast.

The steam created from one cup of liquid will leaven one cup of flour. Soda is used with sour milk or molasses. One-half teaspoon of soda is required for one cup of sour milk or molasses and leavens one cup of flour.

The amount of yeast required for a bread is dependent upon the time allowed for fermentation. More yeast is used to shorten the time, which varies from 2 to 10 hours. Two cakes of yeast for each cup of liquid are used for bread process requiring four hours or less.

Baking powder is the most commonly used leavening agent. Several types are available: slow acting, quick acting, and composite or double-acting. For best results, the amount specified by the manufacturer is used.

Milk is the liquid most commonly used in flour mixtures: sweet, sour or buttermilk. Evaporated, condensed, or dried milk is often substituted for fresh milk. Sour milk and buttermilk are used in recipes in which soda is the leavening agent. Water and fruit juices are used in some types of quick breads and cakes.

3. Flour is made from wheat, buckwheat, rye, corn, rice, barley, potatoes, and soya beans. Many variations in all types of batters and doughs are possible. Wheat flour, however, is the most extensively used. There are two kinds of wheat flour used extensively -- whole wheat and white flour. Whole wheat flour is prepared by grinding the whole wheat grain. White flour is the finely milled product which consists chiefly of starch and gluten. Gluten is the elastic substance which forms the framework or structure of a product. Flour made from other grains that do not contain enough gluten to form a structure is, therefore, used with flour from wheat in certain types of products.

---

*Adapted with permission from Food Service by Helen Livingstone, McKnight and McKnight Publishing Company, Bloomington, Illinois, 1950.

An all-purpose flour is one that contains a moderate amount of gluten and is used for all types of mixtures. Pastry flour or cake flour contains a small amount of gluten. Raw or cooked cereals, such as rolled oats, corn meal and rice also are used with wheat flour.

Principal Types of Flour Mixtures

The proportion of liquid to flour is the chief factor in determining the four principal types of flour mixtures -- thin batters, thick batters, soft doughs and stiff doughs.

1. Thin batters, such as griddle cakes, are thin enough to pour easily from a pan or pitcher.
2. Thick batters, such as muffins and drop cookies, are thick enough to drop from a spoon.
3. Soft doughs, such as biscuits, yeast bread and rolls are thick enough to be handled on a mixing board or table.
4. Stiff doughs, such as pie crust and noodles, are stiff enough to be rolled.

Flour Mixtures Classified According to Consistency

Type	Proportion of Liquid to Flour	Examples	Variations
Thin batters	1 c. to 1 c.	Popovers, griddle cakes	Waffles, cream puffs
Thick batters	1 c. to 2 c.	Muffins, cakes	Gingerbread, cup cakes, drop cookies
Soft doughs	1 c. to 3 c.	Baking powder biscuits, breads rolls	Strawberry, shortcake, cinnamon rolls, nut bread
Stiff doughs	1 c. to 4 c.	Noodles, pastry, rolled cookies	Tarts, cheese straws, icebox cookies

COMPARISON OF INGREDIENTS IN TYPICAL BATTERS AND DOUGHS

Product	Flour	Liquid	Leaven	Salt	Fat	Sugar	Eggs	Flavoring
Popovers	2 c.	2 c.		1/2 t.			2	
Griddle cakes	2 c.	1 1/2 c.	4 t. baking powder	1 t.	4 tb.		1	
Waffles	2 c.	1 1/2 c.	4 t. baking powder	1 t.	4 tb.	1 to 2 tb.	2	
Muffins	2 c.	1 c.	4 t. baking powder	1 t.	4 tb.	2 to 4 tb.	1	
Ginger-bread	2 c.	3/4 c. water & 3/4 c. molasses	2 t. baking powder and soda	1/2 t.	4 tb.	1/2 c.	1	1 t. ginger and cinnamon
Cup cakes	2 c.	3/4 c.	4 t. baking powder	1/4 t.	4 tb.	1 c.	1	1 t. vanilla
Drop cookies	2 c.	1/2 c.	2 t. baking powder	1/2 t.	1/2 c.	1 c.	1	1 t. vanilla
Baking powder biscuit	2 c.	2/3 c.	4 t. baking powder	1 t.	4 tb.			
Yeast rolls	2 c.	2/3 c.	1 yeast cake	1/2 t.	2 tb.	2 tb.		
Pastry	2 c.	1/2 c.		1 t.	1/2 c.			

How to Prepare Typical Flour Mixtures

There are three ways commonly used for mixing batters and doughs. They are the muffin way, the batter way, and the biscuit way. Many variations of these three ways are possible, but the following procedures are simple and satisfactory.

The Muffin Way

This one may be used for either thick or thin batters.

1. Measure the dry ingredients. Sift them together in a mixing bowl.
2. Prepare the liquid ingredients as follows: measure the milk; beat the eggs until light; measure and melt the fat.
3. Mix the liquid ingredients together.
4. Pour the liquids all at once into the dry ingredients. Mix lightly until all the dry ingredients are moistened. The batter will have a lumpy appearance.
5. For large amounts -- use the mixing machine.

The Biscuit Way

This one may be used for either soft or stiff doughs.

1. Measure the dry ingredients and sift together into a mixing bowl.
2. Measure the fat and add to the dry ingredients.
3. Cut the fat into the dry ingredients, using two knives, scissor-fashion by hand, or use the mixing machine.
4. Measure the liquid and add gradually to the flour and fat mixture.
5. Mix the dough until it is the proper consistency.
6. Remove the dough to a floured board or work table and prepare for baking.

The Batter Way

This one is the one most commonly used for cakes made with fat.

1. Measure and cream the fat by hand or machine.
2. Measure the sugar and add to the fat, a little at a time. Continue creaming until the mixture is light and smooth.

3. Add the eggs, beating well after each is added.
4. Measure and mix the dry ingredients together. Sift several times.
5. Measure the liquid.
6. Beginning with dry ingredients, add the dry ingredients and the liquid alternately to the creamed mixture.
7. Mix well after each addition. The batter should be smooth and light.

How to Bake Typical Flour Mixtures

Griddle Cakes

1. Heat the griddle gradually. It is hot enough for baking when drops of water poured on it form into balls and roll across its surface.
2. Pour enough batter from a pitcher or large spoon to form a cake two or three inches in diameter. Leave space between the cakes so they will not touch when spread.
3. As the cakes bake, bubbles form at the edges and the batter rises. When the cakes are slightly set, turn them over with a spatula or pancake turner.
4. Continue cooking until the cakes are browned on the under side. Griddle cakes are turned only once to insure lightness.
5. Serve while hot.
6. One serving -- 3 cakes.

Waffles

1. Close the baker and heat the electric waffle iron gradually. If the iron is not equipped with a heat indicator, use the water test as indicated for testing a hot griddle.
2. Pour the batter from a pitcher onto the center of the baker. Fill the grids within one inch of the edge to allow for spreading of the batter.
3. Close the baker at once and keep it closed throughout the baking period. Steam escapes during the baking. When steaming ceases, the waffle is baked.
4. Open the baker and lift the waffle from the grid with a fork.
5. Serve hot.
6. One serving -- 2 sections

Muffins or Cup Cakes

1. Grease the muffin pans.
2. Use a spoon to lift the batter into the pans.
3. Fill cups 2/3 full.
4. Bake cup cakes in a moderate oven (350° F. to 375° F.).
5. Bake muffins in a hot oven (400° F. to 425° F.).
6. One serving -- 2 muffins or 1 cup cake.

Drop Cookies

1. Grease the baking sheets.
2. Use two spoons for shaping the cookies. Fill one spoon with the batter. Use the other spoon to remove it to the baking sheet and to shape the cookies.
3. Place the cookies in rows, allowing one to two inches between them for spreading.
4. Bake in a moderate oven (375° F.)
5. One serving -- 2 cookies.

Biscuits

1. Place the dough on a floured board or work table.
2. Flour the hands and press or knead the dough lightly for thirty seconds.
3. Pat or roll the dough to 1/2 inch thickness. Light handling is necessary to keep the dough light and springy. If a rolling pin is used, push the dough lightly, lifting the pin upward at the end of each roll.
4. Use a floured cutter to cut the biscuits.
5. Place biscuits on a baking sheet or in a shallow pan about 1/2 inch apart.
6. Bake in a hot oven (450° F.).
7. One serving -- 2 biscuits.

Pastry

1. Pastry is chilled before using.
2. Roll only enough dough for one crust at a time.

3. Place the dough on a floured board or work table.

4. Press the dough lightly with a floured rolling pin to flatten and shape it into a circular form.

5. Use short, light strokes to roll the dough from the center toward the edge to 1/8 inch thickness. Lift the dough carefully with a spatula if it sticks and lightly flour the board. Keep the dough circular by moving it as needed. The pastry should be about 2 inches larger than the pie pan.

6. Fold the dough double and lift it onto the ungreased pie pan with the fold in the center. Unfold the pastry and fit it loosely to the bottom and sides, leaving no air between the pastry and the pan. Avoid stretching.

7. Fold back the dough that extends beyond the edge of the pan. Form a fluted rim by pressing the dough firmly between two fingers.

8. When a top crust is used, the bottom crust is cut around the edge to fit the pan.

9. Moisten the edge of the lower crust before adding the top crust. Press the two crusts together with a fork or flute the rim with the fingers.

10. Pastry is baked in a hot oven (450° F.).

11. Servings — 6 single servings in an 8-inch pie; 8 servings in a 10-inch pie.

DESSERTS

Desserts are becoming more and more popular and are important to the chef since the dessert generally represents the end of the meal. This, then, will have a more lasting effect on the customer. They are served at the end of a meal since their high sugar content tends to dull the appetite.

Desserts can generally be classified into two groups: frozen and fruit desserts, and pastries, although there are others such as custards and puddings. The popularity of frozen desserts has increased primarily because of transportation and storage facilities and the ingenuity of some chefs. Pastries are old favorites with pie heading the list. It is important to keep pastries quite light even when they follow a light meal. A good understanding of parts of the previous unit will help in studying this phase of desserts.

This unit will provide you with some information and experiences in the techniques of dessert making.

<u>Assignment:</u>

1. Read the reference listed below
2. Answer the questions below and turn in this assignment by ____________________.

<u>Reference:</u>

A. The Culinary Institute of America, <u>The Professional Chef</u>, pp. 293-321.

<u>Questions:</u>

True-False

<u>Directions:</u> The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. In selecting desserts for a menu, only the customers desires and satisfaction should be considered.

T F 2. Pastries and desserts provide a good chance for a chef to display his ability and to be original in his work.

T F 3. Yeast will react more favorably when a temperature of about 140° F is used.

T F 4. Placement of the pans and products in the oven for baking can have an effect on the final result.

T F 5. It is important, even for the experienced chef, to weigh out the ingredients for baking.

T F 6. A formula sheet should be used for all quantity baking.

T F 7. Experience and proper teaching are all that is necessary to obtain great skill and craftsmanship in baking.

T F 8. Unusual though it may seem, there are some ice cream desserts that require a certain degree of baking.

T F 9. Appareil a Bombe, which is a base for other desserts, can be prepared as much as a week in advance.

T F 10. Ice Cream Bombes were named because the shape of the original ones resembled a bomb.

T F 11. An Ice Cream Bombe should be removed from the mold by running cool water over the mold until the mold breaks free.

T F 12. A common mistake in making cream puff paste is the use of the wrong number of eggs.

T F 13. Paper or grease may be used to cover the pans when making cream puff paste.

T F 14. Puff paste contains no sugar but rises due to the addition of cream of tartar.

T F 15. Great care should be taken in preparing, rolling, and folding puff paste.

T F 16. Turnovers may be made by baking with or without the filling.

T F 17. Meringue is a difficult item to make but well worth the effort.

T F 18. Great care and effort should be used in folding and handling meringue.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In order to insure customer satisfaction and increased sales, ______________ in desserts should be offered.

2. An important characteristic of a chef to enable him to obtain good results is ______________.

3. One prerequisite for good desserts is to use the ______________ ingredients

4. Yeast will not be functional at just any ______________.

5. All baking should be done with the aid of a ______________ ______________.

6. To be a skillful chef, one needs to have the right experience and a ______________ of baking.

7. A popular dessert that is easy to prepare is ______________ ______________.

8. The basic ingredients for the base for mousses are ______________ ______________, ______________, and ______________.

9. Ice Cream Bombes are usually topped with ______________ ______________.

10. Ice Cream Bombes should be sliced with a knife that has been dipped in ______________ ______________.

11. Cream puff paste should be cooked at about ________ F.

12. The folding of puff paste should not be done until all loose ______________ has been removed.

13. After puff paste dough is cut, it should ______________ for about 30 minutes before baking.

14. Puff paste should be rolled at least ________ times.

15. The main ingredients of meringues are ______________ ______________, ______________, and ______________.

16. In making meringues, the pans should be coated with ______________ when possible.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four areas that a baker or pastry chef should be informed on are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Three critical temperatures for yeast are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. The information on or parts of a formula sheet are:

(A) ______

(B) ______

(C) ______

(D) ______

(E) ______

(F) ______

(G) ______

(H) ______

(I) ______

(J) ______

(K) ______

(L) ______

4. Puff paste contains:

(A) ______ (D) ______

(B) ______ (E) ______

(C) ______ (F) ______

BEVERAGES

A beverage of some sort is usually a part of every meal. Although some beverages have nutritional value, their chief function is as a stimulant.

Coffee is perhaps the most popular commercial beverage and the people of the United States are great coffee drinkers. Other common beverages are tea, milk, and milk drinks such as cocoa, etc. One should not overlook water as a beverage, possibly as a second beverage with many meals. You have already studied some of the values and uses of milk in another unit, and since it and water require little or no preparation, no further mention of them will be make.

This unit will enable you to study the ingredients of beverages requiring preparation.

Assignment:

1. Read the references listed below.
2. Compute the approximate percentages of coffee, tea, and milk in relationship to the total beverages served in your establishment, not including water. Are these made and kept fresh? Does this involve problems of storage or waste? How could this be improved?
3. Answer the questions below and turn in this assignment by____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 16-18.
I. Information Sheet #4, "Chocolate and Cocoa."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The roasting of coffee beans is done primarily to allow the coffee to be ground.

T F 2. For best results, no more than three kinds of coffee should be blended together.

T F 3. Most coffee is ground before it is purchased by eating establishments.

T F 4. No matter what method is used, when preparing coffee accurate measurement is important.

T F 5. Generally speaking, fresh coffee should be made every hour.

T F 6. A coffee urn should always be cleaned as soon after use as possible

T F 7. It is recommended that water be left in an urn when not in use but that this water should be replaced when making coffee again.

T F 8. Steel wool or some stiff brush should be used to scour the urn baskets during the semi-weekly cleaning.

T F 9. The equipment available will determine to a large extent what grind of coffee to use.

T F 10. Once the grounds have released their properties and they are removed, the coffee is ready to drink.

T F 11. Urn bags should be replaced at least once every two weeks.

T F 12. Coffee that is held lower than 185° F. will tend to lose its flavor.

T F 13. Only pure cream should be used with coffee.

T F 14. Iced coffee should be made double strength.

T F 15. The common tea in the United States is black tea.

T F 16. There are only three types of teas.

T F 17. Teapots should be preheated before making hot tea.

T F 18. Cocoa is used more than chocolate in preparing a beverage.

T F 19. Chocolate should not be exposed to too much heat as this will cause it to spoil.

T F 20. Either milk or water may be used in making a beverage from cocoa.

T F 21. In mixing a beverage, using cocoa and other ingredients, the dry ingredients should be added separately to the liquid.

T F 22. Chocolate drinks should always be served hot.

T F 23. The entire seed is ground up to produce chocolate.

T F 24. The main difference between cocoa and chocolate is that cocoa is chocolate with most of the fat removed.

T F 25. Cocoa and chocolate should never be refrigerated since this tends to make them bitter.

Completion

Directions: Fill in the blank(s) in each sentence with the word(s) required to complete the sentence correctly.

1. The United States receives most of its coffee from ______________.

2. A coffee of outstanding flavor in the better grades comes from ______________.

3. The quality, flavor, and taste of coffee will be degraded by ______________ heating.

4. Ground coffee will tend to become stale and useless when exposed to ______________ and ______________.

5. Good coffee should have ______________, ______________, and ______________.

6. The cleaning of coffee making equipment should always be done with ______________ water.

7. Bitter coffee is generally a result of too ______________ a grind for the equipment available.

8. Coffee should always be made with ______________ water.

9. It is important to spread coffee ______________ in the equipment when preparing.

10. Filters that have been used should be stored in ______________ ______________ when not in use.

11. Generally the ratio of water to coffee should be ________ gallons of water to 1 pound of coffee.

12. The grind of coffee that requires the longest brewing time is ______________.

13. The lowest butterfat content that any pure cream can have is ________ per cent.

14. Extra light cream is a combination of ______________ and ______________.

15. It is best to make tea in equipment that is made of ______________.

16. The steeping of tea should not be longer than ________ minutes.

17. Improper storage of cocoa will result in it becoming ______________.

18. The flavor of beverage made from cocoa and chocolate can be improved by the addition of ______________ and possibly some ______________.

19. One problem in preparing hot chocolate beverages is the accumulation of ______________ on the top.

20. A cup of hot cocoa or chocolate can be dressed up by the addition of ______________ ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four characteristics of coffee that may vary depending on where the coffee was grown are:

   (A) ______________ (C) ______________

   (B) ______________ (D) ______________

2. The three kinds of roasting for coffee beans are:

   (A) ______________ (B) ______________ (C) ______________

3. Three pre-requisites of good coffee are:

   (A) ______________ (C) ______________

   (B) ______________

4. The three common grinds of coffee are:

   (A) ______________ (B) ______________ (C) ______________

5. The three main types of tea are:

   (A) ______________ (B) ______________ (C) ______________

6. An accompaniment of tea might be:

   (A) ______________ (B) ______________ (C) ______________

7. The formation of skum on the milk when preparing hot chocolate beverages can be avoided by:

   (A) ______________

   (B) ______________

   (C) ______________

Information
Sheet #4

CHOCOLATE AND COCOA

Chocolate and cocoa are made from the seed of the cacao tree. The seeds are quite bitter in the raw state and must be roasted. After roasting they are split open and the germ removed. This is the form in which the product is shipped to this country. It is then ground, forming the chocolate which contains considerable fat. The removal of some of this fat and then pulverizing results in cocoa. Both chocolate and cocoa may be used in the preparation of beverages. However, cocoa is the most commonly used.

Both cocoa and chocolate should be stored in a dry, cool place, even refrigerated if necessary. Cocoa tends to lump if stored in a moist atmosphere or at high temperature. When chocolate is stored at high temperature, some of the cocoa butter softens and forms a grayish film on the outside of the chocolate; this makes the product appear stale but the flavor may not be impaired.

A smooth well blended product is the goal in preparing a beverage with cocoa and chocolate. The addition of sugar and some salt will improve the flavor some. Although milk is generally used as a liquid due to the fact that it will improve the flavor and nutrition, water may also be used. Normal procedure for mixing is to mix the dry ingredients together and then add this to the liquid. To save time in preparing either a hot or cold chocolate drink, a chocolate syrup might be prepared ahead of time and kept refrigerated until used.

One difficulty in preparing these hot beverages is the formation of skum on the milk. This can be avoided by eliminating unnecessary heating of the milk, by keeping the milk covered during heating, and by beating or whipping. Whipped cream is a common addition to a cup of hot chocolate or cocoa.

KITCHEN ORGANIZATION AND PLANNING

The selection of food may depend upon availability, economics, and needs and desires of both management and clientele. Food should meet individual needs, both physical and emotional, for good nutrition and satisfaction of hunger. Abundant health requires not just food, but the right food properly prepared. With so many people eating away from home, part of the responsibility for adequate menus must be assumed by the food establishment.

Although all chefs may not get the opportunity nor be required to do any organizing or planning, they should nevertheless be prepared should the situation demand it. Some plan of organization is needed to efficiently operate a kitchen, particularly large ones. Planned buying and planned menus are also necessary for efficient operation.

In this unit you will study some of the factors involved in the organization and planning of the kitchen activities.

Assignment:

1. Read the references listed below.
2. Does your establishment keep up-to-date records similar to those found in Reference C, pp. 9-39, 129-133? What are the strong points of your record system? How could it be improved?
3. Determine the cost for 30 portions of a simple recipe used in your establishment by the method indicated in Reference A, p. 13. They convert this recipe to provide for 10 portions.
4. Answer the questions below and turn in this assignment by ____________________.

References:

A. The Culinary Institute of America, The Professional Chef, pp. 12-13.
B. American Home Economics Association, Handbook of Food Preparation, pp. 1-21.
C. Smith, A Handbook on Quantity Food Management, pp. 5-63, 113-137.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The purchasing of food is the most important consideration in kitchen planning.

T F 2. A food cost percentage needs to be figured for each item in order to get the total average food cost percentage.

T F 3. A 40% food cost means that the selling price will be 40% more than the cost of the food.

T F 4. It is important to have standardized and consistant portions in order to obtain a reasonable profit.

T F 5. Not only does the standardization of recipes help to control costs and profits but it also benefits the customer by providing the same product each time it is ordered.

T F 6. Abbreviations should be used whenever possible in the construction or the re-working of recipes.

T F 7. If specific tests or temperatures are written into a recipe, general tests need not be included.

T F 8. A quarter pound bar of butter or similar fat will generally be equal to about one half cup of fat.

T F 9. An equal amount of cornstarch may be substituted for flour in a recipe.

T F 10. The nutritional value of a menu is not the responsibility of the chef, but rather that of the customer.

T F 11. When different types of groups are to be served, it is necessary to have an entirely different menu planned for each group.

T F 12. It is best not to repeat a dish on the menu for at least eight days.

T F 13. It is good practice to utilize seasonal foods primarily when they are in season rather than year round.

T F 14. A master work sheet that all can see is preferable over individual work sheets for each worker.

T F 15. The processes of food preparation that best preserve the natural qualities of the food will also ensure the best food value.

T F 16. Storage or holding of unprepared and prepared foods should be kept to a minimum.

T F 17. Reheated foods tend to become flavorless.

T F 18. The use of substitutes in a recipe will usually cheapen or make the product inferior.

T F 19. The advantage of prepared mixes is that they need not be checked ahead of time.

T F 20. Each serving should be standardized and the customers should be able to tell this by observing the servings.

T F 21. Obtaining standard portions only affects the cost.

T F 22. Tabulation studies should be made frequently.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. All items on a menu may not necessarily result in a ____________ for the establishment.

2. The cost of the raw food is multiplied by ________ to obtain a 45 per cent food cost.

3. The cost of each item on a menu must be based on the ____________ of each food.

4. Recipes are usually kept on _______________.

5. The constant or number that each ingredient of a recipe should be multiplied by to convert 15 portions to 45 portions is ________.

6. The abbreviation "tsp." means _______________.

7. A recipe contains a list of _______________ and the method of _______________ the product.

8. When constructing a recipe the yield should be included, giving both the _______________ and _______________ of servings.

9. To replace 1 tablespoon of flour in a recipe, it requires ________ teaspoons of tapioca.

10. A well worked out menu pattern to ensure well planned menus should be _______________ to the clientele and _______________ as related to the staff and equipment available.

11. As a guide to menu planning, a chef should study _______________ _______________.

12. A menu chart will help to ensure _______________ and _______________ in type of menu items.

13. A detailed check on the amount of food purchased, prepared or cooked, and the number of servings obtained is the result of a _______________ study.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three important considerations for efficient management of food are:

(A) ____________ (B) ____________ (C) ____________

2. Non-profit items may be put on a menu for:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. The three most common forms for presenting recipes are:

(A) ____________ (C) ____________

(B) ____________

4. Techniques of good menu planning consider the following:

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

5. An individual work sheet should show:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

6. Standard recipes help to:

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

7. Three imporcant aspects of organization and planning are:

(A) ____________ (C) ____________

(B) ____________

Assignment
Sheet No. 21

Covering
Units 92-97

WORK SIMPLIFICATION AND WASTE CONTROL

To cut down on the drudgery and routine of jobs, most businesses try to simplify operations. Properly done, this simplification helps to control waste, both in human resources and material products, thus minimizing hackneyed efforts and utilizing maximum efficiency.

In this unit you will study some aspects of this problem to see how they can benefit your establishment and yourself.

Assignment:

1. Read the reference listed below.
2. Has your employer tried to show you how to minimize waste motion? Have you learned to apply these principles to everything you can do? Does your establishment have a suggestion box for this purpose? Make a list of items with which you are familiar that could help the efficiency of the whole business and you personally. Check with your instructor and employer to see if they are valid, and can be incorporated into your work.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

C. Smith, A Handbook on Quantity Food Management, pp. 139-159.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. One aim of work simplification is to produce more effectively with less worker fatigue.

T F 2. A worker should never sit down while working in the kitchen.

T F 3. Good habits may be formed by continual use of correct motions.

T F 4. Finger motions are too minute to make a difference in standard motions.

T F 5. Straight line motions are the best since they will result in the shortest distance.

T F 6. Work simplification can be accomplished to some extent by preparing some items ahead of time.

T F 7. Wasted food generally costs more in the long run than used food.

T F 8. A large variety of foods does not affect waste.

T F 9. A curved work space will generally provide a better work area.

T F 10. Ventilation is unimportant for accomplishment of standard results.

T F 11. Adequate lighting is important for accomplishment of standard results.

T F 12. A work area should be organized so that the worker can use both hands at the same time.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Work simplification toward improvement should involve ____________________ of techniques.

2. Before working, the worker should ________________ the equipment around the work space.

3. To accomplish standard results, a worker should be provided with sufficient and well-planned ________________ ________________ and proper ________________ and ________________.

4. Food waste will fall into two main classifications: that of ________________ waste and that of ________________ waste.

5. Checks for waste control should include waste from both the ________________ ________________ and the ________________.

6. Edible leftovers should be classed under ________________ waste.

7. Discarded food is classed under ________________ waste.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three logical steps in work simplification are:

(a) ________________ (b) ________________ (c) ________________

2. Proper waste control should be concerned with:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

3. Avoidable waste will include all foods, or parts, that should be edible but are not because of poor:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. Unavoidable waste may include such items as:

(A) ______________ (B) ______________ (C) ______________

*STUDY GUIDES, *DISTRIBUTIVE EDUCATION, *HARDWARE STORES, HIGH SCHOOLS, *RETAILING, INDIVIDUAL INSTRUCTION, *COOPERATIVE EDUCATION,

This study guide is for directed individual student use in acquiring job skills and procedures, related information, and personal-social traits necessary for a career in hardware retailing. It was developed by advisory consultants and research assistants at local and state levels. Major content areas include--(1) salesmanship, (2) management, (3) merchandising, (4) hardware, (5) tools, (6) sporting goods and recreational equipment, (7) paint and paint sundries, (8) electrical fixtures, supplies, housewares, and gifts, (9) housewares, (10) cleaning and laundry supplies, and (11) plumbing, heating, and building materials. A two-column form correlates elements of the job analysis and related information. Each of the 23 assignment sheets, covering 154 units, contains introductory information, assignment, a list of required references, and objective-type questions. Students should be juniors and seniors in high school, and the teacher should be a qualified coordinator. The suggested time allotment is 180 hours. A training plan and progress record are included. A necessary reference book, "Advanced Course in Hardware Retailing (1964 Edition)," is available for $10.00 from National Retail Hardware Association, 964 North Pennsylvania Street, Indianapolis, Indiana. The study guide is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (MM)

REFERENCE FOR HARDWARE RETAILING

1. <u>Advanced Course in Hardware Retailing</u>, National Retail Hardware Association, 964 North Pennsylvania Street, Indianapolis 4, Indiana, 1964 edition, (Specify: ungraded - Reference only), $10.00

   The original series of 16 booklets for the advanced course in HARDWARE RETAILING has been rewritten into one volume, contained within one loose leaf binder. It should be ordered direct form the publisher for $10.00 for each volume.

FOREWORD

This course of study, consisting of an analysis of HARDWARE RETAILING together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching hardware retailing on an individual basis in a cooperative part-time program.

The original analysis was prepared by Dr. John W. Horine, while Research Assistant in Industrial Education at the University of Missouri. The assignment sheets in this revision were prepared by Mr. Grant Ree Wood and Mr. Roy Roberson, Research Assistants in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

Assignment Sheets:

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical Job Skills and Procedures performed by the worker in the occupation.

2. Comprehension of the Technical and Related Information basic to an intelligent understanding and practice of the occupation.

3. Development of those Personal-Social Traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." The third group--the personal-social traits--has been listed under "Personal Qualifications" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

In the back of this course of study will be found three copies of the TRAINING PLAN AND PROGRESS RECORD FOR HARDWARE RETAILING. One copy is marked "Student" in the upper right hand corner. On this copy, in the space Time in Hours, the student will keep a tally of the hours he spends on his job performing operations in each area. The next copy marked "Employer," should be given to the employer for recording the student's job performance in each area. The third copy may be used by the coordinator for his record.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared under twenty-three major areas of the hardware retailing trade. Some section sections of the reference material were quite long, therefore, they are broken down into a part I and part II assignment. Each assignment contains certain record data as to number and range of units covered; introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets, available in a separate manual, have been prepared to enable the coordinator to score quickly the questions included in each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key skeets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

In the past many workers, especially youth, have entered the retail trades largely by chance. Few have chosen the vocation as a result of definite investigation and planning. Now, however, retail marketing and merchandising have advanced to the point where it is advantageous to make systematic preparation if one wishes to enter and advance in these occupations.

Opportunities in Hardware Retailing

There are more than 100,000 dealers, store managers, and salespeople in hardware retailing in the United States. Advantages, other than regular employment offered in this field, include the opportunity to meet many types of people, to serve society in a useful manner and, through study and effort, to advance to the position of manager of a store. Wages in the hardware retailing business are quite varied. Wages in rural areas are generally less than those in urban areas. Experienced salespersons will receive $10 to $25 more per week than beginners in the same stores.

Requirements for Entering Hardware Retailing

In order to enter the hardware business as a full-time worker, one must be sixteen to eighteen years of age and in good health. He must be industrious and interested in selling.

The youth of high school age who plans to enter the hardware business as a career, or who has already entered the business on a part-time basis, should first acquire a broad general education. In addition, he must acquire a wealth of information regarding merchandise, a working knowledge of business English, commercial arithmetic, commercial art, economics, general science, and bookkeeping. Much of this information may be acquired through work on the job and through study in his COE class. Some may best be acquired through special courses.

Personal Qualifications

Desirable personality traits are of extreme importance for success in life. They are the factors by which one primarily is judged when meeting people and when attempting to obtain a job. They are vitally important in holding a job. In fact, studies reveal that the chief cause for ninety per cent of the persons being discharged from their jobs is due to a lack of desirable personal-social traits, while only ten per cent of the discharges are due to a lack of job skills. It should be noted, however, that without job skills it is exceedingly difficult to find employment.

The following are some of the more important personal-social traits which a hardware worker should possess:

Personal Cleanliness - Dirty hands or clothing repel customers.

Good Health - The hardware retailer must have a vigorous constitution, abundant energy, and the ability to stand on his feet for long hours. He must have no health problems that are offensive to customers.

Pleasing Personality - The hardware retailer must be pleasant to meet, approachable, emotionally stable, and have a sense of humor.

Courtesy - The practice of being polite, considerate, and sympathetic with others will pay dividends in any business, especially the hardware business.

Attentiveness - The ability to pay close attention, to respond quickly and to concentrate on his work is essential to the hardware retailer.

Cooperation - The ability and disposition to work harmoniously with others, to be helpful, and to do one's share are necessities.

Honesty - The groceryman must give full value for every cent received, be strictly accurate in giving merchandise information, and scrupulous in every way.

Initiative - The ability to see things that need to be done and to keep busy doing them without constant supervision is one of the most marketable traits of the hardware salesman.

REFERENCE FOR HARDWARE RETAILING

1. Advanced Course in Hardware Retailing, National Retail Hardware Association, 964 North Pennsylvania Street, Indianapolis 4, Indiana, 1964 edition, (Specify: ungraded - Reference only), $10.00.

The original series of 16 booklets for the advanced course in HARDWARE RETAILING has been rewritten into one volume, contained within one loose leaf binder. It should be ordered direct form the publisher for $10.00 for each volume.

Units 1-22

SALESMANSHIP

If you, as a sales trainee, are to become an effective hardware salesperson, it will be necessary for you to fully understand the components of any selling situation you might possibly be confronted with. You will benefit both your store and yourself by studying and putting into practice the sales techniques portrayed in this assignment.

By studying the material on hardware salesmanship you will learn that desirable personal qualities a salesman should possess and how he can best utilize these qualities to make sales. While working this assignment you should begin to realize how essential it is for a salesman to be well versed in hardware merchandise information and how this knowledge can be effectively demonstrated to the prospective buyer. The climax of this assignment is the analysis of the customer; how to discover his wants and needs, and the techniques involved in serving him. Study the material presented in this assignment, practice the techniques that are presented, and you should begin to master the merchandising techniques necessary to making a good sales record, along with a long list of satisfied customers.

This assignment will point out many sales techniques that have worked well for other salespeople. Many variations of the sales situation itself are discussed. This lesson is designed to help you become more acquainted with: (a) yourself as a salesperson; (b) your customer as a buyer; (c) the product you are selling; and (d) customer motives for buying.

Assignment:

1. Read the reference listed below.
2. Objectively analyze your own personality and knowledge of salesmanship. In a paper not exceeding three pages, identify four of your major weaknesses and list steps which you will take to correct and strengthen them. At the end of one month, turn in a one page report to your your coordinator evaluating your progress; attach an a additional page or two outlining four problem areas and corrective steps which you will work on over the next four weeks. Continue these monthly papers for the entire length of the course.
3. Answer the questions below and turn in this assignment by ________________________.

A. ACHR, "Salesmanship," pp. 1-32.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Almost all the experts state that salesmanship is not needed in this era of mass merchandising.

T F 2. Salesmanship in independent retail hardware stores is just about the same as it was thirty years ago.

T F 3. Modern hardware retailing requires only attractive displays coupled with quick processing at the check out counter.

T F 4. Most independent hardware stores cannot compete pricewise with discount and mass merchandising chain stores.

T F 5. Many of today's customers differ from the customers of years ago in that present customers possess little knowledge about the product they wish to buy.

T F 6. Good salesmanship is especially effective on high priced merchandise as opposed to incidental, inexpensive, or impulse purchases.

T F 7. Most star salesmen are not born that way but develop their talents through training.

T F 8. Salesmen with pleasant personalities should continually strive to develop and improve them still more.

T F 9. Saleswork is generally considered to be relatively easy work by most successful salesmen.

T F 10. A salesman who is enthused with his work and his merchandise can make this apparent to the customer with a charming smile and pleasant voice.

T F 11. Poor scheduling of work leads to hurried, pressured, and harassed salesmen.

T F 12. Formal schooling is unimportant in saleswork as practical sales experience is the best teacher.

T F 13. Practice makes perfect only if the techniques to be mastered are repeated correctly with a constant desire to eliminate errors.

T F 14. John Wilson of the National Cash Register Company attributes his success as a salesman to his natural sales ability.

T F 15. It is more difficult for a salesman to obtain product knowledge than it was in the past.

T F 16. Many manufacturers spend thousands of dollars in research to learn what factors influence people to buy.

T F 17. Even expert salesmen must devote regular study time to keep up-to-date on merchandise knowledge.

T F 18. Customers would rather listen to facts about a product than simply see it operate.

T F 19. Common features of a product should be played up and exclusive ones downstaged during demonstrations.

T F 20. Ordinarily it is best not to have the customer take part in a demonstration.

T F 21. General customers are interested in hearing about the product's utility, service, satisfaction, economy and beauty; while contractors and business customers are more interested in profits, quality, consumer demand and satisfied customers

T F 22. As applied to merchandise, features and benefits are synonymous terms.

T F 23. Because customer needs can be categorized into several major areas, it is possible to present any one specific item to all customers in the same manner.

T F 24. Most "lookers" are easily recognized by the salesman and therefore can be ignored in favor of the "buyers."

T F 25. One of the best customer greetings, though somewhat old, is the traditional, "May I help you?"

T F 26. Lookers who have nothing specific in mind should be encouraged to pursue some specific area, such as lady lookers to the kitchenware or to some special display or sale item.

T F 27. It is best to stay with lookers constantly so as to be able to explain the benefits of any item in which the customer may become interested.

T F 28. Generally speaking, the lower the price of the merchandise, the less need there is for a salesman.

T F 29. It is generally true that the average customer wants the lowest priced item he can find.

T F 30. A salesman who believes in the high quality of his products radiates his confidence to his customer.

T F 31. Cheap products sold by other businesses should be pointed out and criticized when discussing the benefits of high quality merchandise.

T F 32. Quality products go hand-in-hand with quality service.

T F 33. A tenable assumption is that if a customer needs something, he will always realize it and make the purchase.

T F 34. Customer objections should be quickly counteracted or ignored.

T F 35. Objections are hinderences which sometimes exist and should be avoided at all costs by the salesman.

T F 36. Objections can give valuable information to the salesman for closing the sale.

T F 37. It is an acceptable practice to prod a customer into buying by asking him to make a choice between two models of the item.

T F 38. It is generally not wise to contact a customer following the sale of a major item since correcting any complaints and dissatisfactions can add considerable expense to the store's overhead.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A lot of the modern hardware store's merchandise is ______________ before the customer enters the store.

2. The two greatest advantages that a hardware store can capitalize on over other retail outlets are good ______________ and good ______________.

3. A basic principle that salesmen should capitalize upon is that, "people buy from people they ______________."

4. Only a few ______________ of the ______________ to ______________ items normally carried in a hardware store are ______________ by advertising.

5. The success of a retail store is in the hands of its salesmen because "Customers buy ______________ from ______________ salesmen."

6. Some sales authorities estimate that ________ per cent of retail selling is accomplished by ________ per cent of the salesmen.

7. A salesman should always be ______________ as this will be transmitted to his customer and an ______________ customer is a buying customer.

8. The progressive salesman must first acquire a thorough knowledge of the basic fundamentals of salesmanship and then put these fundamentals into ______________.

9. When a sales effort falls through, the salesman should ______________ what he did wrong and make concentrated efforts to correct his mistakes.

10. A systematic learning device useful for improving salesmanship is a ______________ ______________ of important points upon which to work for perfection.

11. It is imperative for the salesman to know what products his store handles and exactly ______________ they are ______________.

12. A demonstration should be ______________ so every point will be portrayed in an effective, dynamic manner to hold and attract the customer's attention.

13. Successful demonstrations should create customer ______________ in the product.

14. Complete the following axiom: "Customers buy the ______________ they will gain from using, owning, or giving the product."

15. A customer may be defined as a person who is willing to ______________ his ______________ for products on sale.

16. Merchandise should be discussed, and demonstrated from the ______________ viewpoint.

17. The salesman makes a sale when he is able to point out why a ______________ thing will satisfy a ______________ need for a ______________ prospect at a ______________ time.

18. The salesman convinces the prospective customer to buy by turning a ______________ into a ______________.

19. It is imperative for independent hardware retailers to emphasize ______________, ______________, and offer more to every customer for their money if they are going to successfully compete with mass merchandisers and discount houses.

20. Common major objections should be anticipated, brought up and answered ______________ the ______________ raises them.

21. Customer objections should be rephrased into the form of a ______________ and then turned into a reason for buying.

22. A salesman can increase his sales ________ to ________ per cent by making a continuous ________________ of why a customer bought or didn't buy.

Listing

MANAGEMENT

Controlling the expenses of the store, along with well-planned merchandise buying, is very important to your store if it is to maintain a profitable operation. This is a fundamental responsibility of store management. Upon management falls the responsibility for setting the selling price of goods. Management sets the policies of credit sales and other store services designed to increase profits. The salesman who understands the problems of management can better serve the store and help to increase profits. Increased profits for the store can mean more take-home pay for employees.

You, as a salesperson, will have an opportunity to assist management in planning the operation of the store. You can help through the keeping of accurate records and inventories. As an employee embarking upon a career in hardware retailing, you should be interested in the managerial processes involved in your newly chosen occupational field. In fact, if you expect to advance to a responsible and well paying position, it will be an absolute necessity to be well grounded in the employee-employer aspects of hardware management.

This assignment will give you the opportunity to gain a good bit of basic management knowledge. It should help you to better understand the tools of management. You should become aware of how you might develop your talents so that you will be eligible for promotion when openings occur.

<u>Assignment</u>:

1. Read the reference listed below.
2. Your reference book on page 11 states that school textbooks often leave the wrong impression in the student's mind regarding profits. It specifically notes the example that school texts imply that the difference between cost price and selling price is all profit. Examine five different retailing texts and five general mathematics books used in your school to see if this statement is true. Write and turn in to your coordinator a report of your investigation giving bibliographical data of the books you surveyed, your findings, and your conclusions.
3. Answer the questions below and turn in this assignment by ______________________.

<u>Reference</u>:

A. <u>ACHR</u>, "Management," pp. 1-18.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Trade unions were organized to correct the abuses of labor by management.

T F 2. The abuses of labor by management in the early 1900's and the unscrupulous actions of many labor unions at the present time are due to the misuse of power.

T F 3. Recent technological improvements have lessened the importance and the complexity of the management process.

T F 4. The amount of local, state and Federal taxes that are paid depend upon, in part, the nature of the business.

T F 5. The degree to which a boss successfully solves his problems, though directly affecting himself, have little or no impact upon his employees.

T F 6. Some employees feel there is no need to study management.

T F 7. Employees who are given departmental responsibilities sometimes feel that overall management decisions are not within their scope.

T F 8. The assignment of new duties or jobs to an employee usually indicates that the manager is displeased with him and wishes to harrass the employee into quitting.

T F 9. A good way to develop management ability is to develop the capabilities of a good employee.

T F 10. Employees are important to management in that the former reflect the store image either good or bad, to the customer.

T F 11. Regardless of their ability, most new employees represent a loss to the business during the initial period of employment.

T F 12. All good salespeople have about the same degree of efficiency.

T F 13. An employee should exhibit self-centeredness and confidence, keeping in mind that it takes more than just doing your job to improve your position.

T F 14. You should always work to perfect your talents regardless of your future plans.

T F 15. A switch from employee status to managerial positions is usually accompanied with a complete change of viewpoint.

T F 16. Regarding profits, in the minds of some people there presently seems to be somewhat of a trend toward a "something for nothing attitude."

T F 17. The major reason for successful farming in this country as opposed to the rather dismal results of Communist countries is due to our rich soil and excellent climatic conditions.

T F 18. The cost of merchandise paid to the suppliers is paid out of net sales.

T F 19. Salaries, taxes and other expenses are paid out of net earnings.

T F 20. An increase in a salesman's daily gross sales record will result in a higher margin, more store profit and an increased chance of a promotion and salary increase.

T F 21. Dissatisfied customers undoubtedly will not return and may, in fact, contribute toward driving other customers away from your store.

T F 22. Ignoring assignments and losing or damaging merchandise may result in such a decrease in profits that the employee will lose his job.

T F 23. Generally efficiency is viewed alike by both employer and employee.

T F 24. Adverse discussion of management should be avoided by employees as it builds up a negative attitude which may influence his saleswork.

T F 25. Engaging in lengthy time consuming conversations is just as dishonest as taking money from the till.

T F 26. Most firms pay all or part of the cost of various kinds of insurance for employees.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The term ______________ ______________ was used at the turn of the century to denote the abuses of labor by management.

2. Labor and management are both essential with labor supplying ______________ and usage of tools and management providing the ______________ and tools for the job.

3. A major cause for failure of independent hardware retail stores is ______________ ______________.

4. The portion of the average hardware stores total operating expenses devoted to payroll expense is about ________ per cent.

5. Some types of businesses must pay Federal taxes as high as ________ per cent of their total yearly profits.

6. Some of the erroneous viewpoints held by both management and labor are the result of ______________ opinions.

7. Even beginning employees should have a knowledge of management responsibilities as there is a direct relationship between this knowledge and future ______________.

8. The manager of a hardware store makes job assignments according to a careful evaluation of the ______________ and ______________ of his employees.

9. A good way to gain experience to lead to promotions and management positions is through training and undertaking new ______________.

10. The difference between the cost of an item and its selling price is defined as the gross ______________ or is sometimes called ______________.

11. It has been proven that over ________ per cent of all hardware store purchases are impulse sales.

12. The cost to store a hundred dollars worth of goods which does not move averages about ________ dollars per year.

13. Payroll deductions for tax purposes generally range from ________ to ________ per cent of total earnings.

14. For $1.00 per year you can subscribe to the ______________ ______________ trade magazine.

15. Of the three categories of people described in your text, star sales people should be in the group which ______________ ______________ ________ ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List six erroneous views of management which are often held by employees.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

2. List seven items which portray the owners view of management.

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________

3. List four attributes upon which your employer is likely to judge your efficiency.

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. List items which make up, from managements viewpoint, an employee's salary.

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________

5. List four ways in which store managers may undertake to increase employee efficiency.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

Assignment
Sheet No. 3

Covering
Units 51-73

MERCHANDISING

"Merchandising" may be described as the act of utilizing all available store space and every piece of merchandise in the store for the most effective display for all of the seasons of the year. It is from this viewpoint that this assignment approaches hardware merchandising.

A study of the development of hardware merchandising will show the progress that has been made through the years. Information such as this enables the hardware store owner to evaluate his merchandising techniques and keep them up to date. Only by use of modern devices and techniques can the hardware retailer expect to stay in competition and expect to make a profit. When the prospective customer enters your store, he should be able to locate the department he wants. The general atmoshpere of the store should be pleasant with the merchandise arranged in a pleasing, eye-catching manner.

This assignment is designed to make you, the student, aware of the fundamentals of store layout, to show you appealing and efficient ways to effectively "merchandise" your merchandise. You will study factors that should be considered when planning a store layout; techniques in using color, lighting, motion, close-out items and similar display ideas; methods for constructing window displays, and factors that should be considered in the efficient utilization of display materials furnished by merchandise manufacturers.

Assignment:

1. Read the reference listed below.
2. Make a scale floor plan of your hardware store showing fixture, gondola, check out, door storage, window, and departmental locations. Then, using the data gleaned from the reading assignment, evaluate the floor plan. Make another plan showing any changes which you believe should be made to make merchandising more effective. Write a justification for each suggested change. Submit both the plan and the justification first to your employer for his comments and then to your coordinator.
3. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. ACHR, "Merchandising," pp. 1-24.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The interior of a hardware store should be arranged to conform to the customer's shopping habits.

T F 2. Merchandise stacked in the isle can result in lost sales as it restricts customer mobility to other merchandise in the store.

T F 3. Modern housewives pay little attention to the arrangement or appearance of the hardware store as long as quality goods are displayed.

T F 4. Employees should be encouraged to try out new merchandising procedures and techniques even if the management is skeptical.

T F 5. Most hardware customers are lookers and do not have a definite clear-cut need in mind.

T F 6. Bulk and service items should always be displayed above the minimum height used for impulse items.

T F 7. Merchandise displayed along the wall should never be placed at a height exceeding six feet.

T F 8. The floor plan shown in your text is meant to be a general guide and not an ideal plan to be adopted by all hardware stores.

T F 9. It doesn't seem to make too much difference if ladies' impulse items are displayed on the left or right hand of the store.

T F 10. Although items of interest to men are usually located in different departments from ladies' interest items, tests have proven that sales will rise if the items are on mixed display.

T F 11. Impulse items are generally the same for customers who come in to pay bills and those who are electricians or plumers.

T F 12. Though sales may go up if departments are shifted about as the seasons change, the cost of moving the merchandise more than eats up any additional sales due to the move.

T F 13. It is not necessary to have the store's better known items of merchandise on display.

T F 14. The N R H A's Basic Stock List and Merchandising Arrangement is useful only for ordering stock.

T F 15. Items which are not marked may cause lost sales because customers usually imagine the price as being higher than the actual retail value.

T F 16. Unmarked items are frequently sold at a price below the actual replacement cost of the item.

T F 17. Unsightly ceilings may be disguised by painting them a light color.

T F 18. Generally all displays received from manufacturers have been tested for customer appeal and therefore should be used by the hardware retailer.

T F 19. Modern retailing has little or no use for display windows.

T F 20. An advantage to the modern visual front windows where the whole store is on display is that they do not require attention.

T F 21. Gondolas should not be used in visual display windows.

T F 22. Despite modern merchandising and mass advertising, window space is still very valuable for displaying products.

T F 23. Fixtures are designed primarily to provide shelf storage space for the merchandise.

T F 24. Items lost through theft from open displays are less costly than lost sales due to merchandise under the counter or in glass showcases.

T F 25. A tax credit allowance of 7 per cent can be taken the first year that modern fixtures are installed in a store.

T F 26. Good hardware fixtures should be designed specifically to display hardware merchandise.

T F 27. Fixtures should be purchased from merchandisers who know hardware retailing.

T F 28. A store that undertakes a do-it-yourself fixture installation can loose money if customer confusion is created over a long period of time.

T F 29. Do-it-yourself fixture installations may lack flexibility and appearance.

T F 30. Surplus stock which can't be placed on the fixture should be stored in the back room.

T F 31. Gondolas and sidewall displays made available to the retailer by merchandise manufacturers should always be taken advantage of because they usually are offered at or below cost.

T F 32. Many manufacturers design either or both of their shipping and inner cartons for display purposes.

T F 33. Display kits supplied by manufacturers are specialized and have no re-use value.

T F 34. Prepackaged merchandise is handy and saves wrapping time but have very little or no display value.

T F 35. Printed materials have a rather potent value in hardware retailing.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The one purpose of the interior of a retail hardware store is to ______________ ______________ effectively.

2. The responsibility for the overall merchandise arrangement of the store rests with the ______________.

3. Gondola-type display fixtures should not exceed ________ inches in overall height so that other departments can easily be seen.

4. Impulse merchandise should be displayed between ________ inches and ______ inches.

5. Bulk and service merchandise may be displayed ______________ the standard ________ inch minimum height for impulse items.

6. Wall fixtures should not exceed ________ feet in height though ______________ displays may extend to the ceiling in some departments.

7. Impulse items are placed at the ______________ of the store.

8. Most hardware retailers display ladies' impulse items on the ______________ side of the store.

9. The rear wall of a store is most effective when the entrance of the store is located at the ______________ of the store.

10. The heaviest travel is usually around the ______________ ______________ and would thus be an ideal location to display ______________ items.

11. Except in large stores, it is generally the task of the ______________ to keep the merchandise clean.

12. The name of the booklet published by the National Retail Hardware Association dealing with the display of merchandise is called ______________ ______________ and ______________ ______________.

13. Store aisles should range in width from ________ to ________ inches.

14. Slow moving merchandise can be turned into profitable traffic builders by advertising them as "______________ ______________ ______________."

15. Stores having complex and confusing layouts should have permanent ______________ to direct ______________.

16. Displays may be effectively lighted with ______________, ______________ ______________, and ______________.

17. Long narrow stores may be given an illusion of width by painting the side walls a ______________ color and the rear wall a ______________ color.

18. The use of mirrors to make displays seem larger is especially effective for ______________ or ______________ merchandise.

19. Mass displays are useful in building future sales because their impact on the customer has a high ______________ value.

20. Many useful tips for displaying merchandise are contained in the "______________ ________ ______________" section of the ______________ ______________ trade magazine.

21. Window displays formerly were used to show ______________ items to attract ______________ and customers who usually were quite familiar with the store.

22. Many modern hardware stores utilize the entire ______________ of the store to attract ______________ traffic.

23. A closed display window that is converted by removing either part or all of the back is called an ______________ ______________ display window.

24. Merchandising requires certain display heights, lighting effects and flexibility which are obtained through the use of ______________.

25. Merchandise which does not sell costs the store about ________ dollars per year per thousand just for storage.

26. The cost to install modern merchandise fixtures for an average size hardware store range from ________ to ________ dollars.

27. The average life of a hardware fixture is ________ years.

28. If the average minimum cost to install hardware fixtures are amortized over the average life of the fixtures, the cost of the fixtures will be ________ or ________ dollars per day.

29. Wide stores may obtain convenient surplus item storage space by placing their wall fixtures ________ feet from the wall with access aisles located every ________ to ________ feet.

30. The nation's hardware manufacturers spend about ______________ dollars annually for displays and point-of-sale materials.

31. Special unit displays generally are very ______________ and yield a maximum ______________ for a minimum of ______________.

Matching

Directions: In the left hand column is a list of hardware departments. The right hand column contains colors recommended for various hardware departments. Match the colors to the department by placing the letter of the color in the blank at the left of the appropriate term.

_____	1. Builders' hardware	A. Burgundy
_____	2. Carpenter's tools	B. Rose
_____	3. Cleaning supplies	C. Yellow or green
_____	4. Garden tools	D. Green
_____	5. Giftware	E. Blue
_____	6. Housewares	F. Yellow
_____	7. Sporting goods	G. Blue or green

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the two general catagories into which most hardware items can be grouped and give four examples of each.

(A) ______________________ (B) ______________________

(1) __________________ (1) __________________

(2) __________________ (2) __________________

(3) __________________ (3) __________________

(4) __________________ (4) __________________

2. Where are service items placed in the hardware store and why are they placed there?

Where: __________________________________

Why:

(A) __________________________________

(B) __________________________________

3. List five factors that must be considered when locating departments within a store.

(A) __________________________________

(B) __________________________________

(C) __________________________________

(D) __________________________________

(E) __________________________________

4. List six items which must be determined before choosing the best window treatment.

(A) __________________________________

(B) __________________________________

(C) __________________________________

(D) __________________________________

(E) __________________________________

(F) __________________________________

5. What are the characteristics of a good fixture arrangement?

(A) __________________________________

(B) __________________________________

(C) __________________________________

(D) __________________________________

6. List the eleven basic rules for maintaining valuable window displays.

Assignment
Sheet No. 4

Covering
Units 74-86

PROMOTION AND ADVERTISING

It takes more than quality merchandise, good management personnel and a trained sales staff to make a retail hardware store a going concern -- customers are needed "to purchase your wares." But how does the customer know about your store and the products within its walls offered for sale? Constant advertising and sales promotional activities are needed to keep the public informed of what you have for sale.

The advertising and promotional activities of a store must be very carefully formulated, for the carrying out of these activities will be one of the strongest, most powerful influences on the general public's impression of the store's personality. The growth--sometimes, even the survival--of any store may ultimately depend on effective advertising and promotion. Advertising and promotional activities in almost every conceivable form make up today's message to the buying public. Any person employed in business today needs a basic knowledge of advertising. To be effective, advertising and sales promotion must be well planned and tied in with the total selling process of the store. Effective advertising pays while advertising without planning is costly.

This lesson is meant to introduce advertising and sales promotion fundamentals essential to the novice hardware man. This assignment should give the student a working knowledge of the importance of advertising, local and national aspects of hardware promotion, co-op funds and their place in modern hardware retailing, and the philosophy and methodology of promotional activities.

Assignment:

1. Read the reference listed below.
2. Make a list of the manufacturers, wholesalers and associations with which your store is engaged in co-op advertising programs. Ascertain what products your store carries which are advertised by this means. Conclude your written report by showing how you can turn this information into use when making face-to-face customer sales.
3. Compose a second list of the different advertising media which your store utilizes. In light of your reference readings, examine the list to pinpoint strong and weak areas. Report your findings in a 2-3 page report along with suggested changes in the store's master advertising plan. Turn in the paper to your coordinator for his suggestions, revise the paper if necessary, and then show and discuss your report with your employer.
4. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. ACHR, "Promotion and Advertising," pp. 1-36.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is normal for a hardware store to have a steady loss of customers.

T F 2. Each and every ad should have a very specific goal.

T F 3. It is best to hand over all advertising in the form of long-range plans to the local newspaper.

T F 4. National advertising can be very valuable if the retailer "ties in" his store at the local level.

T F 5. Ads designed to sell specific items of merchandise should be slanted toward long-range appeal.

T F 6. Items featured in ads should be displayed along with related merchandise.

T F 7. Perhaps the best manner in which you can utilize the step-up sales method is to possess a complete product knowledge of your department or store.

T F 8. Institutional ads are effective only if the store lives up to the image it wishes to portray.

T F 9. Advertising programs should be continuously designed, tested, and remodeled to find the most effective methods for a particular store in its particular area.

T F 10. Dead stock can be effectively advertised to sell it to the customer.

T F 11. Advertising should be timely, truthful and emphasize quality.

T F 12. The emphasis of ads should not be too heavy on cheap product leaders since you can't say many good things about low quality merchandise.

T F 13. All ads should emphasize price which in turn should project the store image as a high priced outlet.

T F 14. Newspaper ads should never be crowded as customers often "don't get the message."

T F 15. The ad copy and layout usually should be simple and plain with an emphasis on current, up-to-date merchandise.

T F 16. Many stores fail to fully capitalize on such items as credit purchases and delivery services in their advertising.

T F 17. The amount of money spent for advertising should be spread out evenly throughout the year.

T F 18. Co-op funds distributed through wholesalers have conditions tied to them to make them undesirable to independent hardware retailers.

T F 19. An advantage of the NRHA co-op advertising program is its proported lack of red tape and fast repayment of funds.

T F 20. Manufacturers are more interested in what happens to their product after it leaves their hands than they were formerly.

T F 21. A retailer's reputation can be built up by selling well-known quality brands.

T F 22. Costs per exposures of ads in national magazines are quite cheap and reasonable.

T F 23. Your text claims that good national advertising lowers distribution costs, creates new markets and adds jobs.

T F 24. Independent, chain, and syndicate hardware retailers cannot pay the high cost for individual national advertisements.

T F 25. Modern communications have brought national advertising to every town, village, community and remote rural areas.

T F 26. National advertising helps to sell items which are not usually considered as being "presold."

T F 27. Though expensive, the large circulation of large city newspapers make them especially valuable as an advertising media for independant retailers.

T F 28. The "free" circulation type of paper is not effective for independent hardware advertisements.

T F 29. An occasional change-of-pace by advertising in the classified ad column is often effective.

T F 30. Radio advertising in areas where there is good newspaper coverage is of little value.

T F 31. For best results, radio ads should be on a constantly changing time schedule.

T F 32. Retailers should not advertise on FM stations because the audience is too small for the cost involved.

T F 33. Under no circumstance should the retailer make the mistake of relating his radio promotions to his newspaper ads.

T F 34. Retailers make very little use of billboards as an advertising media.

T F 35. All advertising methods must be tried and evaluated before an effective, consistent master advertising pattern is set up by any one retailer.

T F 36. Manufacturers believe co-op advertising is the most effective method for stimulating sales at the local level.

T F 37. Small independent hardware retailers do not get their fair share of co-op funds.

T F 38. Co-op funds are included in the cost of the product to the dealer.

T F 39. Manufacturers are quite satisfied in how their co-op funds are used.

T F 40. There are a great many hardware dealers who do not know that co-op funds are available.

T F 41. Some people feel that co-op advertising is not worth the red tape involved in the normal rebate method.

T F 42. Manufacturers are doing little to correct the problems involved with co-op advertising.

T F 43. The co-op program of the NRHA rebates the retailer 25% of the local advertising rate.

T F 44. All mats handled by the NRHA co-op program are furnished by the manufacturers.

T F 45. Under the NRHA co-op program, the retailer is required to send in a tear sheet of the ad along with the paid advertising invoice to eliminate the possibility of cheating.

T F 46. The NRHA co-op program is intended to replace present manufacturer and wholesale co-op programs.

T F 47. Free news items about the hardware store or its personnel are valuable advertising for creating a desirable store image.

T F 48. A retailer should make it a point to dig up items so as to build his reputation as a publicity seeker with the news media.

T F 49. Departmental promotions are easier and less expensive than store promotions.

T F 50. The best person to evaluate the effectiveness of a store is the customer.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Advertising may be defined as all ______________ other than personal salesmanship which help to motivate a sale.

2. A store which is little known or has a poor service reputation may drive customers to ______________ firms when engaging in ______________ advertising to create desire on the part of the customer.

3. The pooled effort of most of the area retailers in advertising such as "Dollar Day" is a ______________ type of advertising and is most effective if used only ____________ or ____________ a year.

4. An excellent example of advertising to sell specific merchandise items is the annual ____________ ______________ sale.

5. Your text notes the advertising consists of three basic ingredients, the ______________, the ______________ and the ______________.

6. It is imperative to have adequate ________________ stock of items which are featured in ads.

7. Consumer interest can be built by advertising groups of merchandise in related ______________.

8. An advertising schedule should be set up on a ____________ basis.

9. Written copy should be aimed or addressed to a select ____________ group.

10. Copy should always be ______________ but the store ____________ should remain the same to build customer identification and ad retention.

11. Hardware manufacturers spend approximately ___________ dollars each spring to advertise ____________ ______________.

12. Wholesalers tie-in to the manufacturers spring advertising campaign by printing circulars with the "_______________ ______________ ______________" theme.

13. The average amount of money devoted to advertising is about ___________ per cent of gross sales.

14. The NRHA has a co-op advertising kitty of over __________ dollars.

15. Despite modern advertising, it is estimated that there are over ____________ items in the average hardware store which are not presold.

16. Advertisements in issues of such nationally known magazines as the ______________ ______________ ______________ often cost as much as ______________ dollars.

17. Independent hardware retailers can afford advertising on a regional basis by joining advertising ________________ plans.

18. About ____________ per cent of the merchandise handled in the hardware store is not presold.

19. The most effective advertising medium is at the _______________ level.

20. All retailers should _______________ all of his local ads along with an evaluation of its __________________.

21. One of the most effective radio programs on which to schedule ads is the _______________ ______________ program.

22. The most common type of hardware circular is a multi-colored wholesale ______________ of __________ to ____________ pages.

23. A popular circular is the toy and gift ________________ of __________ to ___________ pages which often contain reduced price ________________.

24. The retailer must have a ________________ _________________ ________________ in order to make direct mail promotions pay off.

25. Box holder mailing has a rather _______________ readership level.

26. Inequity creeps into the use of co-op advertising funds when ________________ keep the funds as a rebate.

27. Sometimes retailers cheat manufacturers out of co-op funds by _______________ billing or by printing _______________ papers.

28. Retailers receive about __________ per cent of the printing cost for running a manufacturers co-op mat.

29. Possible cheating on the part of suppliers is eliminated in the ______________ ______________ ______________ as they are not involved in the system.

30. A retailer should be cautious not to overdo his efforts in obtaining ________________ news releases and incur customer ________________.

31. Your text defines promotion as ______________ effort which encourages buying by ______________ ______________ ______________.

32. The final responsibility for planning the usual one or two yearly promotional programs rests with the ______________.

33. The NRHA publishes a brochure useful in planning promotions entitled ______________ ______________.

34. Good promotions depend on the ______________ of the efforts of the manufacturer, wholesaler and retailer to make the maximum use of national, regional and local advertising.

35. A promotion requires that sufficient merchandise is ______________, ______________, and displayed in ______________ so no customer will be disappointed due to sell outs.

Listing

Assignment
Sheet No. 5

Covering
Units 87-89

HARDWARE -- PART I

The hardware area of the retail hardware store is usually the largest single department and should account for the highest departmental sales volume. The "jewelry" of the hardware business is cabinet hardware that comes in matched sets to harmonize with designs, finishes and quality of construction. Sterling quality provides an extra value that customers would not refuse if the salesperson can talk intelligently about design, finish, construction, features, and types of hinges, knobs, pulls and catches. Only those stores which stock a wide variety of hardware items as well as many sizes, styles, designs, etc., of any single item can be considered true hardware stores.

Locks are required as barriers to stop the meddler or thief. A lock customer is seeking the peace of mind that comes from security. Hardware sales personnel should know what types of locking mechanisms are available on the market and for what type of installation each is most appropriate.

This assignment is an introduction to the importance of the hardware department. The material puts special emphasis on two of the basic merchandise areas: (1) cabinet hardware, and (2) locks. This lesson will help the student increase his knowledge of and sales of cabinet hardware.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by _________________________.

Reference:

A. ACHR, "Hardware," pp. 1-24.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Such merchandise as paint and housewares are usually included in the basic hardware group.

T F 2. The hardware department is complex and is composed of thousands of different items of all sizes and variations.

T F 3. Some hardware department items may consume considerable selling time without adding much to sales volume but are considered to be good traffic builders.

T F 4. Hardware items tend to move slower than merchandise sold in other departments.

T F 5. The lack of emphasis on built-in cabinets in today's modern home has led to a decrease in retail sales volume of cabinet hardware.

T F 6. There is little opportunity for selling cabinet hardware to owners of older homes.

T F 7. People who are "price buyers" simply cannot be convinced or "see" the features of quality cabinetware as in other lines of hardware merchandise.

T F 8. Chemical cleansing agents must be used to clean most cabinet hardware.

T F 9. Semi-concealed hinges are available for both lip (overlapping) and flush cabinet doors.

T F 10. The most popular size for semi-concealed hinges is for 3/4" lip doors.

T F 11. Semi-concealed hinges come in plated finishes only and therefore are not well suited for painting.

T F 12. Quality hinges should always be sold if possible because the cost of the hinge is less than the labor cost for replacing a worn out hinge.

T F 13. Surface type hinges are available for flush cabinet doors but not for offset doors.

T F 14. A flush overlay cabinet door completely covers the cabinet frame.

T F 15. Concealed hinges are decreasing in popularity for modern type kitchen cabinets.

T F 16. A quality craftsmanship installation of concealed flush overlay hinges requires mortising out the wood for the hinge.

T F 17. There are no concealed hinges available for overlapping or lip type cabinet doors.

T F 18. Most concealed hinges for ordinary flush cabinet doors (not flush overlay) expose the pin knuckle joint when the installed door is closed.

T F 19. A very pleasing decorative effect can be created by choosing cabinet pulls with patterns, designs, or finishes different from that of the hinges.

T F 20. From the labor standpoint, knobs are considered as being cheaper to install than are pulls.

T F 21. The lever spring action friction catch cannot be mounted on a door to shelf type of installation.

T F 22. All spring roller cabinet catches have two rollers between which the catch is "pinched" or caught.

T F 23. Though magnetic catches are both novel and popular, they really are not too practical or functional.

T F 24. Magnetic catches are available in styles that permit the magnetic units to be mounted on the frame, door, or shelf.

T F 25. Elbo catches may be used on either one (but not both) of a pair of doors.

T F 26. Cabinet locks are available in either mortised or half-mortised style.

T F 27. An important selling feature of pull-up shelves is to point out to the housewife how much valuable counterspace they can save.

T F 28. Sample panels for displaying cabinet hardware are useful for lumber yard outlets but have little to offer in retail hardware stores.

T F 29. The disc tumbler lock has a limited number of key changes.

T F 30. The warded lock can be keyed alike and master keyed.

T F 31. A great selling feature of pin tumbler locks is that they can be keyed alike, master keyed, and grandmaster keyed.

T F 32. To protect the purchaser of a master key system, manufacturers may register the system to prevent the keys from duplication.

T F 33. Standard duty locks are usually installed as original equipment on medium cost homes.

T F 34. Heavy duty locks are generally installed as original equipment on high cost homes.

T F 35. Locks for industrial plants, schools, or office buildings generally should be recommended only after consulting the manufacturer for specifications.

T F 36. On the outside of a mortise cylinder lock, the knob turns the dead bolt and the key controls the latch bolt.

T F 37. Spring latch locks are mounted to the inside of the door and are primarily to perform a latching function.

T F 38. Padlocks come in the same basic locking mechanism types as those used for door locks.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Hardware sales account for ________ percent of the stores gross sales.
2. The hardware department makes the hardware store ______________ from other retail outlets.
3. The hardware department is considered to be the most ___________ of all the departments within the store proper.
4. The hardware department builds the _______________ image of the store.
5. Retailers must order much of the hardware stock in ____________ rather than carrying just a few sizes of merchandise.
6. Hardware items are considered excellent for _______________ sales by recommending items _______________ to the initial customer request.
7. Aside from quality, the most important point in selling cabinet hardware is emphasis on _______________ features.
8. Cabinet hardware can be divided into _______________ basic _______________ designs.
9. The most practical and easiest finishes to take care of are _______________ plating and _______________ finishes.
10. Quality copper, brass, and bronze platings have heavy _______________ and are protected with a _______________ liquid _______________ coating.
11. The most popular cabinet hinge on the market today is the _______________ type showing only the small _______________ and joint.
12. The hinge which has three knuckle joints and "V" shaped edges usually has a _______________ _______________ finish designed for _______________.
13. Surface type hinges are mounted on the _______________ of the cabinet _______________ and _______________.
14. The hinge which is very useful for covering up holes and marks from old hinges when doing remodeling work is the _______________ type.
15. There are ________ types of concealed hinges for overlay doors.
16. The most popular size of concealed hinges for ordinary flush doors have ________ inch insets.

17. Two cabinet pulls or knobs are required for drawers over ________ inches wide.

18. Usually cabinet ______________ are installed on doors and drawers where cabinet ______________ would look too large.

19. Knobs are installed for their ______________ effect and/or to serve a ______________ purpose.

20. The two parts of a friction catch are the ______________ which is located on the ______________ and the ______________ which is located on the ______________, ______________, or ______________.

21. The friction catch which often exposes dangerously sharp edges when broken is the ______________ type.

22. A magnetic catch should have a pull of ________ to ________ pounds for the average cabinet door.

23. To assure perfect contact and maximum holding power of magnetic catches, either the ______________ ______________ or the ______________ should have a built-in ______________ action.

24. Elbo catches are generally installed with the ______________ attached to the shelf or frame of the cabinet.

25. A catch designed for furniture where concealment of the catch is necessary is the ______________ catch.

26. A very important consideration when selling cabinet locks is how ______________ the ______________ is into which the lock will be installed.

27. Many hardware retailers make a nice profit from the sale of the fingertip or ______________ hardware, such as revolving shelves, wanted by many housewives.

28. Sticking cabinet drawers can be eliminated by installing ______________ and ______________.

29. An important sales aid for prepackaged cabinet hardware is the use of ______________ packages.

30. The lock which has the greatest capacity for key changes is the ______________ ______________ type.

31. The primary purpose for purchasing locks is for ______________.

32. A key that will unlock several "keyed alike" and some "all different" locks but which will not unlock all the locks in the building is called a ______________ key.

33. Master and grandmaster key systems are usually designed and made up special by the ______________.

34. A lock set usually contains a ____________ which gives the exact size, shape, and location of the mounting hole(s).

35. A desirable selling feature found on many exterior and bathroom locks is a __________ ____________ lock mechanism to prevent ____________ ____________.

36. Cylinder locks on bath and bedroom doors are installed mostly for the purpose of ______________.

37. Some owners of older homes try to reproduce an antique effect by installing ____________ ______________ locks.

Matching

Directions: The right hand column is a list of cabinet hardward designs. The left hand column contains hardware finishes or phrases which describe the various cabinet hardware designs. Match the design to the descriptions by placing the letter of the design in the blank at the left of the appropriate item. You may use the letters of the designs as often as you wish.

_____ 1. hand hammered pattern

_____ 2. polished chromium

_____ 3. polished brass with black accents finish

_____ 4. elegance and grace of period styling

_____ 5. black copper finish

_____ 6. gold finish

_____ 7. for baths and kitchens

_____ 8. the modern look

_____ 9. antique brass plated finish

_____ 10. antique copper finish

_____ 11. ivory finish

_____ 12. lovely as fine china

_____ 13. satin copper finish

_____ 14. baked finish

_____ 15. up-to-the minute styling

_____ 16. weathered look

A. Modern Contemporary Design

B. Colonial or Early American

C. Modern Provincial Design

D. Ceramic Design

Group II

<u>Directions:</u> The left hand column is a list of terms. The right hand column contains definitions of these terms. Match the definitions to the terms by placing the letter of the definition in the blank at the left of the appropriate term.

______ 1. Escutcheon

______ 2. Pin tumbler

______ 3. Master-keyed lock

______ 4. Tumbler

______ 5. Changes of a key

______ 6. Box strike

______ 7. Key way

______ 8. Spring latch

______ 9. Cylinder

______ 10. Strike

A. the opening to receive the bolt is completely enclosed to prevent rear access

B. number of different combinations of key and tumbler arrangements possible

C. a round case containing the key way and tumbler mechanism

D. ornamental plate

E. aperture running the length of a cylinder into which the key fits

F. one key which opens a set of locks which may all use different keys

G. cut in two or more sections and, when actuated by the key, allow the tumbler to turn in the case of the key plug

H. one which automatically closes and latches when the door closes

I. fastened to the frame to engage the bolts

J. the part which prevents the bolts from sliding, until operated by the key.

Listing

<u>Directions:</u> List the items called for in each of the following. Select your answers carefully.

1. What are the three major classifications of cabinet hardware?

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. In what inset sizes can semi-concealed hinges be obtained?

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

3. List the desirable features of good quality pin type hinges.

(A) ____

____

(B) ____

____

(C) ____

____

(D) ____

____

4. What are quality features of unconcealed flush overlay hinges?

(A) ____

(B) ____

(C) ____

(D) ______________________________

(E) ______________________________

Assignment
Sheet No. 6

Covering
Units 90-93

HARDWARE -- PART II

"Hard selling" does not apply to selling hardware. Customers come in this department looking for items to do a specific job and to fill a specific need. If the "right" merchandise is presented to them in an effective manner, they will buy.

This is the second and last assignment dealing with hardware merchandise. As the reference text points out, no single book can discuss the thousands of hardware items on the market. Therefore, you, as a student salesman, should study the material presented in these two assignments as being but an introduction to hardware merchandising. It is important that you continue to accumulate product knowledge of hardware throughout your career as a hardware man. You can do this by daily exploring the stock on the shelves, reading manufacturer's brochures, catalogues and other printed matter sent out by suppliers. You will also find hardware buyers' trips, shows, and conventions useful for gaining new product knowledge. Above all, you should maintain an outgoing curiosity about all merchandise in the hardware retail market.

This assignment is designed to help you increase sales by giving you product information. In this unit you should gain valuable information about window and door hardware, fasteners, and such other hardware items as casters, glides, mail boxes, etc. In addition, you will explore the importance, need, benefit, use, and cost of factory and in-store prepackaging.

Assignment:

1. Read the reference listed below.
2. Visit other hardware retail stores in your area. Note what lines of merchandise they carry, what items generally are prepackaged, and how various goods are displayed. Write a report pointing out weak and strong areas of your store in comparison to the other outlets you visited. Point out those features your store has which should be especially capitalized upon to build new customer traffic.
3. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. ACHR, "Hardware" pp. 25-62.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. One of the first steps in selecting a correct door hinge is to determine the type of door and frame on which the hinge will be installed.

T F 2. Handy charts are available to help determine the correct type of hinge to be choosen for a particular job.

T F 3. Regular weight bearing hinges are required for doors classified as large.

T F 4. The weight of doors is calculated in pounds per cubic foot.

T F 5. The width of a hinge is measured across the leaves when the hinge is fully opened.

T F 6. The hinge width is standardized in proportion to the hinge length for half mortise, half surface, and full surface hinges.

T F 7. If you are standing outside and the door opens to the right, it takes right hand butt hinges.

T F 8. A half mortise hinge can be adapted for either right or left hand mounting by reversing the pin and plug.

T F 9. Though "T" hinges come in light, heavy and extra heavy weights, only the first two are generally carried in hardware stores.

T F 10. The statement in your text which says the three by-pass sliding doors "provide a passage way equivalent to the approximate width of two of the door sections" is incorrect.

T F 11. Locks are available for sliding doors.

T F 12. There is a trend toward streamlining and completely concealing both pneumatic and liquid closures.

T F 13. Door closers should not be applied to the outside of exterior doors unless they are protected by a canopy or similar device.

T F 14. Barn door accessories such as flush pulls, stay rollers, bow handles, etc., are generally zinc or cadmium plated.

T F 15. Ventilating sash locks permit the window to be locked in an open position.

T F 16. Windows may be opened by a bar, flush or hook sash lifts.

T F 17. Sale of window hardware may be stimulated by pointing out to the customer the desirability for all pieces in the room to match in design.

T F 18. Most customers know exactly what type and size fasteners they need for their job.

T F 19. Box nails are thicker than common nails and therefore are considerably more heavy.

T F 20. The majority of nail sales will be for common nails.

T F 21. The length of a flat head bolt is from the extreme end of the threaded section to the top of the flat of the head.

T F 22. One of the most commonly used bolts is the machine bolt.

T F 23. Cap screws are high quality fasteners designed for conditions requiring maximum holding power.

T F 24. Machine screws come only in fine cut threads.

T F 25. Nuts are furnished with matching bolts, carriage bolts, and stove bolts, but not with machine screws (i.e., must be purchased separately.)

T F 26. Anchors such as toggle bolts are to fasten things to solid masonry walls or floors.

T F 27. There are at least five styles of lock washers on the market.

T F 28. Usually square nuts come plain or chamfered on one side only whereas hex nuts always have at least one side chamfered.

T F 29. A socket set screw has a hole with eight sides for special keys or wrenches.

T F 30. All masonry drive anchors are used to permanently fasten objects into place.

T F 31. Sheet metal screws are designed to self thread themselves into sheet metal.

T F 32. The hardware items not covered in the hardware section of your text are also important; therefore, you should make every effort to obtain information about them as you work, i.e., learn as you earn.

T F 33. Spherical casters are most popular for household items which roll on linoleum and tile floors.

T F 34. Tea wagon casters are the ultimate in design and quality.

T F 35. Truck casters are designed to carry up to as much as 1000 pounds per caster.

T F 36. Plastic caster wheels have excellent non-marking qualities.

T F 37. The cushion glide is the most economical glide to initially purchase.

T F 38. The large size rural mail box enjoys the largest sales volume, especially in suburban areas.

T F 39. Key making machines are an economical addition to the stores' service feature and is a profitable traffic builder.

T F 40. Prepackages are designed to present the goods to maximum advantage while occupying a minimum of space.

T F 41. All items shipped in bulk should be prepackaged in the store to encourage customer sales.

T F 42. It takes more time and money to in-the-store prepackage small items like wood screws than it does to quickly count out and bag exactly what the customer orders.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Most house doors fall into a ______________ frequency of use and require ______________ ______________ ______________ bearing hinges.

2. Most commercial building doors fall into either ______________ or ______________ frequency of use categories.

3. A door ________ inches or more in thickness and over ________ feet in width is classified as a large door.

4. The length of a hinge is determined by the ______________ and ______________ of the door.

5. Doors under ________ inches in height require two hinges and doors ________ to ________ inches require three hinges.

6. In order to look up the correct height of butt hinges (length of joint) on the chart provided in the text, you must know the door ______________ and door ______________.

7. A left hand reverse door means it is a left hand door which opens ______________.

8. Continuous or ______________ hinges are available in a minimum width of ________ inches and a maximum length of ________ inches.

9. Strap hinges are intended for rough work and come in ______________ and ______________ weights.

10. Ornamental "T" and strap hinges generally are reversible for ______________ or ______________ ______________ applications with the most popular finishes being ______________ or ______________.

11. Sliding door hardware generally comes ______________ to eliminate the chance of errors.

12. A liquid closure generally requires a minimum space of ________ inches between doors for installation and a pneumatic closure requires ________ inches.

13. Barn door hangers are available with ______________ or ______________ bearings and are designed to carry weights from ________ to ________ pounds.

14. Window rattles and drafts may be eliminated by installing crescent ______________ ______________ sash locks.

15. The bolt which has a square section beneath a rounded head is called a ______________ bolt.

16. Stove bolts are available in ______________, ______________ and ______________ heads with ______________ nuts and are used to assemble small parts and in ______________ ______________ work.

17. Lag bolts can be fastened into wood or into masonry with the aid of lag bolt ______________.

18. A very common anchor which utilized wood screws for fasteners is the ______________ ______________ ______________ anchor.

19. Hammer set or lead anchors generally use ______________ ______________ as the fastening agent.

20. Holes can be hand drilled into masonry by using a **hammer** and ______________ drill.

21. Turn buckles are used for tightening wire, straightening warped screen doors, or many other applications where ______________ is required.

22. The most common wood screw sizes range from ________ to ________ inches in length and from ________ to ________ in diameter.

23. Wood screws come with ___________, ______________ or ______________ heads.

24. Type A sheet metal screws are for fastening sheet metal under 18 gauge in thickness and type B is for sheet metal up to ________ gauge.

25. The two types of casters are the ______________ and ______________ types.

26. Casters are mounted on ______________ to provide directional ______________.

27. Most caster sales will be for ______________ ______________ casters designed for light furniture usage.

28. The new type spherical caster uses a completely enclosed ______________ to eliminate fouling and has ______________ bearings.

29. Spherical casters treads are available in either ______________ or ______________.

30. Some caster glides have a ________ degree range of movement or tilt suitable for replacing casters in the modern, splayed furniture legs.

31. Rural mail boxes come in ________ sizes and are made of heavy gauge ______________ ______________.

32. The two major purposes of packaging are to ______________ the merchandise while in ______________ and to ______________ it on arrival.

33. Over ________ manufacturers have used the NRHA laboratory store at ______ _________, ______________ to test prepackaging and display ideas.

34. Bags suitable for in-store prepackaging made from ______________ and printed with the store's name and address can be purchased from retail ______________ ______________ or ______________ ______________.

35. It costs about ________ cents per package to place small items in prepackaged containers.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the four types of door hinges and tell how each is mounted.

(A) ____

(B) ____

(C) ____

(D) ____

2. What are the three most common types of sliding doors?

(A) ____________________

(B) ____________________

(C) ____________________

3. List the most important feature for each of the following terms as they apply to sliding doors.

(A) Aluminum track - ____________________

(B) Nylon rollers - ____________________

(C) "T" frames - ____________________

(D) Information necessary to choose closing door hardware - ____________________

4. List the attributes of liquid and pneumatic closures.

Liquid	Pneumatic
(A) ________	(A) ________
(B) ________	(B) ________
(C) ________	(C) ________
(D) ________	(D) ________
	(E) ________

5. What common faults are responsible for door closure malfunctions?

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

6. List 4 types of screen door closures.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

7. What four different types of screen door catches are available?

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

8. List 6 of the most common shapes of bolt and screw heads:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

9. The three main parts of a caster are as follows:

(A) ____________________ (C) ____________________

(B) ____________________

10. List the three types of bearings available in casters and the conditions for which each is recommended.

	Bearing type	Recommended Use
(A)	____________________	____________________ ____________________
(B)	____________________	____________________ ____________________
(C)	____________________	____________________ ____________________

11. What are some items which must be considered when selecting casters?

(A) ____

(B) ____

(C) ____

(D) ____

12. What are the two purposes of glides?

(A) ____

(B) ____

13. List some of the major assets of prepackaging.

(A) ______________________________

(B) ______________________________

____

(C) ______________________________

(D) ______________________________

(E) ______________________________

____

(F) ______________________________

(G) ______________________________

____

(H) ______________________________

____

(I) ______________________________

(J) ______________________________

____

Matching

Directions: The left hand column is a list of materials used in mail box construction. The right hand column contains descriptive phrases regarding quality and price. Match the descriptions to the types of construction materials by placing the letter of the description in the blank at the left of the appropriate term.

Material

_____ 1. sheet metal stampings

_____ 2. aluminum

_____ 3. brass and forged iron

_____ 4. solid forged iron

_____ 5. wrought sheet metal

_____ 6. solid brass

Quality-price

A. Top quality, high priced

B. Medium quality and price

C. Functional, economically priced

Assignment
Sheet No. 7

Covering
Units 94-99

HAND TOOLS -- PART I

Hand tools, like candy bars, come in many shapes, sizes, and weights. They have many uses and it is the responsibility of the seller to properly advise the customer in the selection of these hand tools. "Coming to grips" with things is an everyday situation we all face. Avoiding "skinned knuckles" is a real challenge in removing and replacing nuts and bolts. Having the right tool to get a job done is what the customer wants.

The hand tool department of any retail hardware store is a very important section since it helps establish the store "image" in the customer's mind. If the tools are well displayed in a manner which will stimulate customer interest and encourage purchases, this area can add materially to the profit of the store. Hand tools that are sold will encourage repeat business if they are the correct tools for the customer's job. They can also cause the customer to go elswehere for his next tool purchase if they are not adequate. A thorough knowledge of all the hand tools in the department is absolutely necessary to aid the customer in wise and intelligent choices.

In this assignment, the student will find specific information about saws, drilling tools, cutting tools, and hammering tools. This unit covers hand tool specifications, terminology and usage. This unit is very important to a student salesman's success in the hardware retail business.

Assignment:

1. Read the reference listed below.
2. Visit the hand tool departments of other hardware stores in your area. Make a list (and sketch if needed) of the desirable features which you see where tools are displayed to good advantage. Especially note any "unique" or unusual sales "tricks" which stimulate interest.
3. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. ACHR, "Hardware," pp. 1-24.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Widespread use of power equipment has led to a declining hand tool market.

T F 2. Buyers of hand tools to fill an immediate need generally are hard to please and poor prospects for step-up sales.

T F 3. Planned project customers generally have their own tools and are poor prospects for new or additional hand tool sales.

T F 4. Sales of tools to planned project buyers represent a relatively small share of the stores gross sales volume.

T F 5. The tool lover is a small but steady source of sales in the tool department.

T F 6. Cultivation of tool lovers can lead to additional traffic from new customers in the tool department.

T F 7. Carpenters know what they want in a tool and are hard to change but are excellent prospects for new tools.

T F 8. Carpenters should always be given discounts since they purchase many tools.

T F 9. The tool department is popular for browsing which leads to impulse purchasing.

T F 10. At least one sample tool should be on display but carefully fastened down to prevent breakage and stealing.

T F 11. An 8 point saw means it has 8 teeth per inch.

T F 12. The greater the number of teeth on a saw the finer the cut it will make.

T F 13. A miter box saw is an extra long back saw with an attachment for cutting various angles.

T F 14. The blades which come in a nest of saws are intended to saw only soft materials like wood or plastic.

T F 15. Kitchen saws are the same thing as butcher saws but the former is of lower quality.

T F 16. The standard hack saw has a rigid frame which takes 16" disposable blades.

T F 17. The power chain saw is displacing the 5 to 6 foot hand crosscut saw.

T F 18. A saw set is used to sharpen saw teeth.

T F 19. When a customer asks for a "drill" you can be certain that he wants to purchase a mechanism with a crank needed to turn a tool for boring a hole.

T F 20. The breast drill is identical in size and use to the hand drill except for the substitution of the breast plate and its support.

T F 21. Breast drills come in both left and right handed versions.

T F 22. High speed drills or drills marked "HS" are usually used in power driver tools.

T F 23. Bit stock square shank drills have a square tapered shank 1¼ inches long.

T F 24. Fractional size taper shank twist drills require the use of a special three jaw chuck even on machines for which they are suitable.

T f 25. Because of the nature of the tool, one type of hammer is all that is needed in the average household; and the curved claw, nail hammer best fills the need.

T F 26. The poll or neck of the hammer is the upper part of the handle.

T F 27. Because hammers are so common, good quality hammers which break are discarded by the homeowner.

T F 28. Better quality hammers can usually be identified by a baked enamel finish on the head and/or handle.

T F 29. In both the curved claw nail hammer and the ball pein hammer the 16 oz. size is the most popular.

T F 30. A soft faced hammer or mallet should be recommended whenever the blows of a steel hammer might tend to damage the surface area.

T F 31. The newest model tackers are so efficient that they can be used for relatively heavy work.

T F 32. The hand drilling hammer is usually recommended where the customer has a considerable amount of drilling to do with a star drill.

T F 33. The hand drilling hammer and the sledge hammer differ only in the length of the handle.

T F 34. All hatchets can be identified by a cutting blade on the head which runs parallel to the handle.

T F 35. The "wallboard hatchet" is the only hatchet which does not have some provision for pulling nails.

T F 36. Since axes are all used for the same purpose customers will usually accept any pattern as long as the weight and handle are correct.

T F 37. The wedge is a cutting tool designed for splitting tough wood which cannot be split with an ordinary axe.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Immediate need purchases of hand tools are in the ______________ price range and account for a ______________ share of the store's total tool sales.

2. Customers who purchase tools for planned projects are ______________ prospects for ______________ and ______________ sales.

3. Tool lovers are ______________ buyers and are interested in the ______________ tools and attachments.

4. A ______________ saw is designed to cut across the grain and a ______________ saw is used to cut with the grain.

5. A back saw is a ______________ type saw and is designed to do accurate ______________ work.

6. A compass saw has a ________ to ________ inch ______________ blade and is used to cut ______________ or ______________.

7. A smaller version of the compass saw which is used for the same general type of work is the ______________ saw.

8. Very intricate irregular shapes may be sawn from soft materials using a ________________ saw with a ________ inch wide blade.

9. A good saw set tool should be able to set a ______________ of kinds of saws and anywhere from ________ to ________ points per inch.

10. "Bits" or "drills" used for light work and for small holes are usually called ______________, for heavier work they are called ______________ ______________ or ______________ ______________.

11. The handles of push drills and hand drills are often used for the storage of various sizes of ______________.

12. The expansive type of auger bit is recommended for holes of approximately 2 inches to ________ in diameter.

13. Blacksmith drills have a shank diameter of ________.

14. A masonry drill is used for drilling holes in ____________ materials such as ____________ or ____________.

15. Reamers are used for ____________, ____________ and ____________ holes in a variety of materials.

16. Since the non-professional purchaser of a hammer seldom knows anything about hammer types, he will usually depend upon the ordinary ____________ ____________ for all his jobs.

17. The cheapest hammers have ____________ ____________ heads and can actually be classified as ____________ while the quality hammers have heads made from ____________ ____________ steel.

18. The curved claw type hammer is designed for easy nail pulling while the ____________ ____________ or ____________ hammer is designed for prying boards apart.

19. Claw hammers are available in weights from ________ to ________ ounces with ________ being the most popular.

20. Tack hammers come in sizes ranging from ________ to ________ ozs.

21. The center body portion of a soft faced hammer is made from ____________ to which the ____________ faces and the handles are attached.

22. The entire head of a mallet is made from ____________, ____________, ____________ or ____________.

23. Hammer tackers and automatic tackers both utilize ____________ rather than tacks or nails as the holding media.

24. The "hand drilling" hammer is described as having an extremely ____________ handle with a head weight of ________ to ________ pounds.

25. Hatchets actually combine some of the features of several different tools, the ____________, the ____________ and the ____________.

26. The two basic categories of axes are ____________ ____________ and ____________ ____________.

27. Almost all good quality full size axe handles are about ________ inches in length and have been made from fire hardened ____________.

28. The handle on the ____________ ____________ axe is slightly curved while the ____________ ____________ axe handle is straight.

29. The belt axe is also referred to as the ______________ axe and is a small ______________ bit axe weighing about ________ to ______ pounds.

30. Wedges have two uses, ______________ while sawing and ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List some important techniques which can build hand tool sales volume.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

____

2. List the five main parts of a handsaw.

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

3. List the blades usually available in a nest of saws:

(A) ______________ (C) ______________

(B) ______________

4. List some features of a good miter box.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

5. List the different categories of hand powered "drills."

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

6. The brace is basically a crank used to turn and guide:

(A) ______________________ (C) ______________________

(B) ______________________

7. List the different types of drills or drill bits the tool department must carry.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

8. List the types of nail hammers (as classified by handles) available to the customer.

(A) ______________________ (C) ______________________

(B) ______________________

9. List the most common types of hatchets which <u>do</u> <u>not</u> have some provision for removing bent nails.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

Assignment
Sheet No. 8

HAND TOOLS -- PART II

Covering
Units 100-102

Today, the home craftsman is constantly adding to, taking away, or in some way changing the size or shape of something around the house. This "do-it-yourself" movement has seen tremendous growth since World War II. The results of this trend has caused many manufacturers to initiate constant product improvement and development programs. They bring out new annual models as well as make constant changes in their products. Any good salesman must read and keep up with new product sales information and specifications to keep abreast of the latest tool developments and products.

This is the second and last assignment dealing with hand tools carried for sale in the hardware store. Techniques of aiding the customer in the proper selection of measuring tools, screwdrivers, chisels, ad punches, holding and shaping tools, pliers, wrenches, and other hand tools, are very important to know if one is to be an effective hand tool salesman. A satisfied customer is one that will return and thus be an asset to the business. Persistance, patience and product knowledge is necessary to sell hand tools because there are so many uses for the kinds, sizes, and types that are available. The main objective in selling any hand tool is--will it fit the customer's need?

This lesson will acquaint the student with the many types, sizes, uses and selling points for various hand tools. This assignment will provide sales tips and product information that will enable a sales trainee to do a better job of serving his customers' needs.

Assignment:

1. Read the reference listed below.
2. Read through any recent advertising literature available to you from your place of employment or school especially the advertisements in the mechanics, woodworking and home construction journals and trade journals such as the Hardware Retailer.
3. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. ACHR, "Hardware," pp. 25-62.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Because of the simplicity of the common carpenters square, practically anyone knows how to read it properly.

T F 2. The first step in filling the customers need is to ask what kind of a tape measure he wants to look at.

T F 3. The two way flat reading rule can be read either from left to right or right to left depending on which end is opened first.

T F 4. The brick mason's rule is marked with its scales on a 16" module with scales on both sides starting at the same end.

T F 5. The two foot boxwood rule folds in such a way that it is only 8" long when folded.

T F 6. Boxwood calipers are available in both left and right hand types.

T F 7. Some new types of steel tape rules have mechanisms which lock the blade in the desired position.

T F 8. The narrower (3/8 inch or less) tapes are preferred because they have less tendency to sway in the wind.

T F 9. In recent years woven fabric tapes have been improved to the point where stretching is no longer a serious disadvantage in ordinary use.

T F 10. Replacement tapes are available for tape rules and they are widely utilized by carpenters and engineers.

T F 11. The pin in a marking gauge actually cuts a line for the saw to follow.

T F 12. The framing table on the square is also referred to as the rafter table.

T F 13. Decimals of an inch cannot be obtained from a steel square.

T F 14. The head of the try square usually contains a scratch awl which is used for marking on the various materials.

T F 15. The vials in most good quality levels are held in place by putty.

T F 16. A good quality carpenters level can always be read in any position and from either side.

T F 17. The quality of a screwdriver will be determined by the type of material from which the handle is made.

T F 18. The "Phillips" type screwdriver is now the most popular type.

T F 19. Cabinet tip screwdrivers and regular tip screwdrivers come in all of the comparable size ranges.

T F 20. Good quality straight slot screwdrivers have been cross ground.

T F 21. Some screwdrivers have square or octagon bits (blades) which enable a wrench to be used for additional torque.

T F 22. Offset screwdrivers can provide additional leverage for removing stubborn screws.

T F 23. The spiral rachet screwdriver is only useful where the user must drive many identical screws.

T F 24. The "screw holder" type screwdriver has a mechanism for holding the screw when starting it in an inaccessible position.

T F 25. The term "wood chisel" refers to the material from which the handle is made.

T F 26. The pocket chisel has the lightest and thinnest blade of the four varieties of chisels.

T F 27. The paring chisel is used for light paring cuts after the work has been roughed out.

T F 28. Butt chisels have a very short blade which enables them to be used in extremely close quarters.

T F 29. Due to the type of use a chisel receives it is always a good idea to recommend chisels of high quality.

T F 30. The pointed end of the nail set is hollowed out or cupped slightly to prevent the nail head from splitting.

T F 31. Awls come in both heavy duty types for use with a hammer and lighter types for use with only hand pressure.

T F 32. "C" clamps were originally developed for the carriage trade and are only found in old type workshops today.

T F 33. The bar clamp is only an extended "C" clamp or vise.

T F 34. Usually the size of the vise is not proportional to the jaw width.

T F 35. The pipe vise is designed for holding any type of round material such as round rods or bar stock.

T F 36. When doing finish sanding the customer should be advised not to jump more than two grit sizes for each sanding step.

T F 37. When measuring the length of a file the tang is included.

T F 38. The majority of files have parallel edges and faces throughout their length.

T F 39. A "safe edge" file has one or more edges (or sides) which have no teeth.

T F 40. A file handle fits onto the part of the file called the heel.

T F 41. File handles should not be recommended for customers who purchase files with a ready made handle in place of a tang.

T F 42. File cards and file brushes are used for the same purpose.

T F 43. The first step in serving a customer who wishes to purchase a plane is to ask him what kind of a plane he wishes to purchase.

T F 44. The block, jack, fore and jointer planes are all variations on the same basic pattern.

T F 45. The jointer plane is especially valuable for smoothing the face of rough boards.

T F 46. The circular plane can cut concave and convex surfaces down to a minimum radius of 20 inches.

T F 47. Forming files use the same blades as the surface forming plane.

T F 48. Replacement blades for the surface forming tools are available in fine to coarse cuts.

T F 49. Some long nose pliers are made with a bent or curved nose to enable easy access to awkward places.

T F 50. Diagonal pliers are always of the curved nose variety.

T F 51. End cutting pliers are designed as dual purpose pliers, to both hold and provide cutting action.

T F 52. Side cutting pliers include both long and short nose varieties.

T F 53. Pliers should be suggested only for cutting or holding action or for nut removal when very small nuts are used.

T F 54. Open end wrenches must be selected which fit the head exactly if damage to the wrench is to be avoided.

T F 55. The box end wrench handle is usually practically straight in order to obtain maximum leverage.

T F 56. The jaws of the open end of combination wrenches are set at a 15° angle for general purpose tools but may be set at any angle for special purpose wrenches.

T F 57. The advantage of the locking type adjustable wrench is that the lock eliminates the slipping of the adjustment after it is once set.

T F 58. Wrenches of various sizes must meet a minimum set of government specifications before they can be sold on the open market and even the lowest quality tools meet this standard.

T F 59. Pipe wrenches are designed so that they bite into the surface of the work which makes them unsuitable for installing plated or polished surfaces.

T F 60. Aluminum pipe wrenches are gaining in popularity and should be recommended only for work in close quarters.

T F 61. The socket is turned by means of a handle which is inserted into its top.

T F 62. The set screw in the handle end enables the plier wrench jaws to be locked in any desired position.

T F 63. Due to its design the plier wrench can be used as a vise or as pliers.

T F 64. The offset ripping chisel is a light duty ripping bar.

T F 65. The electric soldering iron is used primarily by the workers such as plumbers, who must use it extensively.

T F 66. The names Philadelphia and London refer to the locality of manufacture for the two patterns of brick masons trowels.

T F 67. Cement trowels can easily be identified because they are usually narrower and longer than plastering trowels.

T F 68. Utility knives are designed to use easily inserted replacement blades.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The carpenter routinely must make accurate measurements up to ________ feet.

2. Folding rules have been adapted to suit the needs of the ______________, the ______________, the ______________, the ______________, as well as the carpenter or woodworker.

3. As each additional section of a folding rule is unfolded ________ inches is added to the length of the rule.

4. The engineers rule is graduated to ______________ of a foot on the inside and ______________ of an inch on the outside.

5. The extension rule contains a sliding scale insert ___________ ___________ long which allows accurate ______________ measurements.

6. The Boxwood calipers have scales and are designed for both ______________ and ______________ measurements and are usually found in ___________ or ___________ sizes.

7. The tape rule provides a flexible measuring device for ______________ or ______________ measurements.

8. The tape rules are available in widths of ___________ to ___________ and lengths of ___________ to ___________.

9. Calibrations are imposed on the tape either by ______________ or ______________ directly on the tape.

10. Marking gauges are made from ______________ or ______________ and have a bar about _______ inches long.

11. The two more common and usable tables found on a carpenters steel square are the ______________ and ______________ tables.

12. The carpenters steel square has a body ___________ long and a tongue which is ___________ long.

13. The combination square can be used as a miter square to lay-out or test _______ or _______ angles.

14. Metal levels are usually made from ______________ or ______________.

15. The torpedo level is usually about _______ inches long and is valuable to those working in close quarters.

16. Screwdriver handles are made from ______________ or ______________ and some heavy duty types have a one piece blade which extends through the handle and is ______________ ______________ on the end.

17. The cabinet tip screwdriver is easily identified since it has no ______________ which could mar the surface when driving a recessed or deeply countersunk head screw.

18. Phillips head screws come in _______ sizes ranging from _______ (the smallest) to _______ (the largest) with the number _______ being the most popular.

19. Bit brace screwdriver bits are designed primarily for driving or removing ______________ ______________ size screws.

20. Whenever a customer purchases a nail set he will likely also need to purchase some type of ______________, ______________ ______________ or other filler material.

21. Nail sets are manufactured in sizes ranging from ___________ to ___________.

22. The cheaper cold chisels are made from ______________ ______________ ______________, while the better quality chisels are made from ______________ ______________.

23. Cold chisels come in lengths up to __________ and widths (or diameters) of ___________ up to ___________.

24. Center punches have a ______________ point of _______ to ________ ______________.

25. Bar clamps are available in lengths of from ____________ to ___________.

26. Home workshop vises have jaws ranging in size from ___________ to ___________ in widths.

27. Swivel bases are available on the ______________ or ______________ ______________ vise.

28. The two general categories of abrasive tools are ______________ ______________ and ______________ ______________.

29. The common bench stone is classed as a ______________ ______________ and has one side which is ______________ grit and the opposite side is ______________ grit.

30. The most common size of coated abrasive paper for the workshop is the _______ x ________ size, however, "flint" or "sand" paper comes in 9" x 10" sheets.

31. Coated abrasives are available in ______________, ______________ and ______________ ______________ for use on portable power driven tools.

32. The most popular size bench stone is approximately _______ inches x ________ inches with many other sizes and shapes available.

33. Files are classified according to ______________, ______________ and ______________.

34. A "contact" file refers to a file used to dress ______________ ______________ ______________ or automobile points.

35. ______________ ______________ or ______________ ______________ ______________ are small files of various sizes and shapes used by tool and die makers and also by watch and clock makers.

36. A slim taper or extra slim taper file will most likely be sold for the purpose of sharpening ______________.

37. ______________ gouges are inside ground, while the ______________ gouge is ground on the outside or inside.

38. Sweep refers to the arc of the gouge. Firmer gouges are available in ______________, ______________ and ______________ sweeps.

39. The ______________ plane is the most common size and is usually recommended for general work.

40. The simplest and smallest of the common planes is the ______________ ______________.

41. ______________ planes are used to cut rectangular recesses out of either edges or faces of flat material.

42. The surface forming plane (or tool) is available with either a ______________ (regular) or ______________ pattern cutter.

43. Pliers are generally divided into two categories determined by the joint type, they are sliding or slip joint and ______________ ______________ and can be classified further by their ______________, ______________ ______________ and ______________ ______________.

44. The purpose of plastic coating on plier handles is to minimize ______________ danger and also provide more ______________ for the user.

45. If a production worker needed to clip many wires on his work he would likely select pliers with a ______________ ______________ in the handle.

46. The text refers to the size of the openings in an open end wrench as the "______________."

47. Box end wrenches come in both ________ point and ________ point types.

48. Aluminum pipe wrenches are approximately ________ as heavy as steel wrenches and are available in both the ______________ and ______________ types.

49. In actual operation a socket and handle can most nearly be compared to a ______________ ______________ ______________.

50. Plier wrenches or "vise grips" are available in various sizes running from ________ to ________ inches in length.

51. The "pinch" bar or ripping bar is most commonly found in the ______________ pattern and is used to remove nails too large for the ______________ ______________.

52. Both the __

52. Both the ____________ ____________ type of soldering iron and the ____________ ____________ or ____________ type are rated by the ____________ of the unit.

53. The pistol grip or instant heat soldering iron is often ________________ controlled and is available in a kit with all the necessary components contained in a box.

54. ____________ trowels are usually forged from one piece of steel while ____________ trowels have the post riveted to the blade.

55. The ____________ ____________ blade is often slightly convex but most other trowels have flat blades.

56. Mechanics' tool boxes come in sizes ranging from ________ to ________ inches in length.

57. Users of ____________ tools often prefer wooden tool chests because of the moisture absorbency of the wood which helps prevent moisture condensation and rusting.

58. Utility cabinets are purchased for the storage of small parts such as ____________, ____________ etc.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Folding rules fall into the following eight categories:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

2. The end ring serves the following functions.

(A) ____

(B) ____

(C) ____

3. The types of squares covered by the reference are:

(A) ______________________ (C) ______________________

(B) ______________________

4. The combination square consists of the following parts:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

5. The better grade wood levels usually can be distinguished by the following features.

(A) ______________

(B) ______________

(C) ______________

(D) ______________

6. Special purpose levels include:

(A) ______________ (C) ______________

(B) ______________

7. Metal levels offer the advantages of being:

(A) ______________

(B) ______________

(C) ______________

8. List the three most common basic types of screwdriver tips.

(A) ______________ (C) ______________

(B) ______________

9. The three basic types of wood chisel handle types are:

(A) ______________ (C) ______________

(B) ______________

10. List the classification or types of vises:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

11. The materials, both natural and man made, used in abrasive products are:

Natural Abrasives	Artificial or Manufactured Abrasives
(A) ____________	(E) ____________
(B) ____________	(F) ____________
(C) ____________	
(D) ____________	

12. List the file types (cross sectional shapes) available.

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________ (F) ____________

13. The four groupings or characteristics of file tooth types are:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

14. The standard "cuts" of regular files from the coarsest to the finest are:

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

15. The three broad classifications of planes are:

(A) ____________ (C) ____________

(B) ____________

16. The three categories of cutting pliers are:

(A) ____________ (C) ____________

(B) ____________

17. List the three head patterns or types for slip or sliding joint pliers.

(A) ____________ (C) ____________

(B) ____________

18. List the different types of wrenches offered in the hand tool department of the hardware store.

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

19. The two basic types of adjustable "crescent" pattern wrenches are the :

(A) ____________________ (B) ____________________

20. Desirable features of small parts utility cabinets are:

(A) ____________________ (C) ____________________

(B) ____________________

Matching

Directions: In the left hand column is a list of tools. The right hand column contains descriptive phrases or synonymous terms. Match the tool descriptions to the tools by placing the letter of the tool in the blank at the left of the appropriate description. Note: Any item in the left hand column may be used more than once.

1. Wood chisels

   A. Tang chisel

   B. Socket chisel

   C. Heavy duty chisel

_____ steel shank extends completely through the handle

_____ some types intended for very light use with hand only

_____ handle is capped with a steel cap

_____ handle is usually plastic--not wood

_____ has washers on handle to prevent splitting in heavy use

_____ thin blade and light construction

_____ handle is driven into a socket

_____ hammer blow is transmitted directly through the shaft to the cutting edge

2. Punches

   A. Hand punch

   B. Pin punch

   C. Center punch

_____ resembles a hand punch except for the point and the size

_____ used for making small indentations on layout lines

_____ not likely to wedge itself ininto a hole when removing a long pin or rivet

_____ often used for lining up bolt and rivet holes

_____ are not measured by the diameter of the flat point

_____ has a conical point

_____ has a blunt taper from the point

3. Abrasives

   A. Garnet

   B. Silicon carbide

   C. Flint

   D. Aluminum Oxide

   E. Corundum (emery)

_____ hardest and sharpest manufactured abrasive

_____ grayish white--often used by painters

_____ reddish brown natural abrasive

_____ black--used in metal working

_____ for use with carbon and alloy steel

_____ used on low tensile materials, cast iron, copper, aluminum, and plastics

_____ used almost exclusively in woodwork

4. File tooth patterns

A. single cut

B. double cut

C. rasp cut

D. curved tooth

_____ rapid stock removal on harder metals

_____ smooth finish is primary concern

_____ rapid stock removal with reasonably good finish

_____ rapid stock removal on very soft materials or metals

_____ chisel cut teeth intersecting at an angle

_____ should be recommended for saw teeth

_____ large individually punched teeth

_____ milled teeth

Assignment
Sheet No. 9

Covering
Units 103-107

POWER TOOLS

The tool users of our nation can generally be divided into three classifications: (1) those who obtain their livelihood by the use of tools; (2) those who are classified as "tool-lovers" and largely fall into the "do-it-yourself" category; and (3) the property owners who must make repairs and do maintenance from an economic standpoint. The ability of a power tool department to make sales to all three groups will be dependent upon the sales promotion methods used, the types, qualities, and prices of the tools and equipment available for sale. It is especially important that the power tool salesman understand the various features and quality ranges of the items he sells. Good customer relations and continued sales will be dependent upon these factors.

Opportunities for selling power tools have been increasing rapidly in recent years and outlook for the future appears even better. What is the significance of this expanding market to the power tool salesman today? The person selling power tools has the obligation of becoming familiar with all of the many kinds of power tools and their operation and use if he and his store are to profit from the sale of these items.

This assignment will help the student become familiar with many of the power tools sold today, with their uses and the accessories that can be sold for use with the tools to increase their effectiveness and versatility. This unit will show which power tools are most popular and will suggest ways of more adequately serving customers and increasing store profits. The student's ability to be successful as a power tool salesman will depend to a large extent upon how thoroughly he learns this material and the effectiveness with which he uses it in serving his customers.

Assignment:

1. Read the reference listed below.
2. Write to the various power tool manufacturers and obtain their sales promotion literature and latest catalogs.
3. Assume that you have been instructed to organize and conduct a "sawdust carnival." Make a complete list of all the things you would have to arrange and prepare. Submit this list to your instructor for evaluation or approval.
4. Prepare a list (with addresses) of the service centers
4. to which you can send tools for adjustment of guarantee or repairs.
5. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. ACHR, Hardware, pp. 1-39.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Due to the high cost of repairs almost every home owner must do some home repair and is therefore a good prospective power tool purchaser.

T F 2. Although power tools are mass produced in large quantity, the high cost of production prevents ownership by the average wage earner.

T F 3. An excellent prospective customer is the man with a home workshop who will often purchase new power tools just for the joy of owning them.

T F 4. If your store is to compete in the power tool market, a full range of tools and accessories must be carried for sale.

T F 5. The power tool salesman must realize that many jobs must still be done by hand because no power tool exists to do the job.

T F 6. The desire to own and operate power tools and equipment is an almost universal feeling.

T T 7. Due to "cut" pricing of many tools the profit level for the power tool line will likely be below average.

T F 8. Most power tools are displayed on dealer made racks.

T F 9. Only the customer needs to be conscious of the service and repair reputation of a power tool manufacturer.

T F 10. For promoting sales, mass tool displays showing how to use a tool by pictures are more effective than letting the cust customer handle the tool.

T F 11. When the manufacturer is conducting a demonstration in the "sawdust carnival", customer should not be allowed to participate or handle the tools.

T F 12. Power tool manufacturers do not usually make annual model changes but rather constant improvements through the year.

T F 13. The store manager may be assured that some type of power tool or its attachment has an excellent sales potential during all seasons..

T F 14. A telephone call or post-card advising prospective customers of new power tools or accessories is a good approach for extra sales.

T F 15. A power drill is usually the first power tool purchased by a customer.

T F 16. A power drill can be made more versatile by the use of inexpensive attachments.

T F 17. A power drill should be selected on the basis of how much the customer can afford to pay for it.

T F 18. The "precision helical gears" reduce high motor speed to the much lower figure at which the drill chuck must turn.

T F 19. 3/8 inch and 1/2 inch drills usually have detachable size or top handles which provide extra holding power.

T F 20. The "key" on the "Jacobs" chuck is actually part of a double gear reduction which provides tremendous closing force.

T F 21. The sale and use of drill kit usually leads to reduced interest and sales of drill attachments.

T F 22. Saw attachments for drills are sold which can be used for heavy duty sawing.

T F 23. Jig saw attachments are for light duty work on material of one inch thickness or less.

T F 24. The screw driver attachment will only fit the special heavy-duty drills.

T F 25. Wire wheel brushes can only be used for the removal of paint.

T F 26. A polishing attachment can be used with a horizontal bench stand for polishing small objects.

T F 27. Hole saws with adjustable bars must be "set" for the desired hole size.

T F 28. An "abrasive kit" consists only of an assortment of arbors or pads; the coated abrasives must be purchased separately.

T F 29. A paint mixing attachment can be used for stirring any type of liquid in a small container.

T F 30. Power saws will do practically any job formerly done by hand saws.

T F 31. Power saws will pay for themselves in time and convenience on any job.

T F 32. An 8¼" blade can be used on an 8" portable hand power saw.

T F 33. The 6½" to 7¼" saw is the most inexpensive size.

T F 34. Medium quality and price saws come in the entire size category.

T F 35. When selling a blade for use where nails may be encountered, the largest size which the saw will take should be recommended.

T F 36. Some jig saws can be adjusted for bevel cuts up to 45°.

T F 37. Sabre saws are similar to jig saws except for the position of the blade and their increased power and cutting capacity.

T F 38. Battery operated tools are priced within the range of "quality" tools and above the cheapest lines.

T F 39. Battery powered tools usually lack power or performance when compared to conventional tools.

T F 40. Special extra efficiency accessories must be purchased for use with the battery operated drill.

T F 41. Cordless tools have been largely limited to drills and lawn and garden type tools.

T F 42. A heavy duty professional orbital sander should always be recommended if the user is likely to sand continuously over a long period of time.

T F 43. Power sanders (except disc sanders) cannot be used for flush sanding or feather edging.

T F 44. A rotary disc sander or a disc sanding attachment for a drill both perform exactly the same function.

T F 45. The router is a popular power tool with home workshop users.

T F 46. The ownership and use of portable power tools tends to create a desire for more tools and the ability to use them.

T F 47. The purchase and use of stationery power tools by the homeowner can often be offset by the savings in repair and maintenance costs.

T F 48. Most purchasers of stationary power tools will not pay cash so credit terms must be available.

T F 49. Most newer suburban homes have a basement or activity area which can be used for a workshop and is large enough to accommodate stationary power tools.

T F 50. An experienced tradesman is the best person to hire for a "sawdust carnival" in the store.

T F 51. Stationary power tools manufactured today show a definite trend toward light weight and compactness.

T F 52. The same principles of blade selection and use apply to the power hand saw or the stationary circular saw.

T F 53. The saw-jointer combination tool has a lower cost than comparable quality units purchased separately.

T F 54. The drill press can be used for both metalworking or woodworking.

T F 55. The drill press cannot be used for routing since a router is available for the purpose.

T F 56. The stationary disc sander can be recommended when an individual has an unusual amount of sanding to be done.

T F 57. The scroll saw is safe enough that even children may be allowed to use it.

T F 58. According to the reference, the band saw is essentially a heavier variation of the scroll saw which can cut thicker material.

T F 59. The band saw does not have the same table tilting features of the scroll saw.

T F 60. The wood lathe is a machine on which the carving (or turning) tool is held by a toolholder.

T F 61. The radial arm saw has been considered a production tool and not primarily a tool for the do-it-yourself enthusiast.

T F 62. The reference suggests that the complete stationary workshop should be recommended for the workshop addict.

T F 63. The grinder can be recommended for use in practically any workshop for maintaining tools in good condition.

T F 64. Stationary power tools are often not kept in stock by most hardware stores.

T F 65. Sales promotion of stationary power tools should be combined with sales promotion of portable power tools in order to take advantage of the market potential.

T F 66.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Customers are usually very "brand name" conscious when purchasing ____________ ________ ____________ tools.

2. A good ____________ ____________ by a manufacturer means the customer can be sure that repairs are readily available and dependable.

3. Due to the sizable investment involved many purchasers of power tools will prefer to use ____________ ____________ rather than pay ____________.

4. Since power tools maintain their value over a long time they represent a good ____________ ____________.

5. Add-on sales potential exists for ____________ and ____________ for the original power unit purchase.

6. When new tool improvements or products which the salesman does not understand are placed on the market the people to ask for explanations are the ____________ ____________ or the ____________ ____________.

7. ____________ ____________ or ____________ are excellent places to obtain new ideas which will assist in promoting sales and increasing profit.

8. The sale of ____________ ____________ power tools will ofte cost the dealer a great deal in lowered customer goodwill and future sales of extra attachments.

9. Power drills come in various qualities and prices ranging from ____________ ________ to more than ____________.

10. Drills are usually rated by the ____________ ____________ and the ____________ ____________ of the motor.

11. A ____________ ____________ drill with a ________ chuck is satisfactory for most homeowners maintenance jobs but ________ and ________ heavy duty drills should be recommended for professional use.

12. A quality drill can usually be recognized by a ____________ ____________ ____________ and ____________ ____________ ____________.

13. The ____________ and size of a heavy duty ¼" drill, and the compact ½" drill are very comparable.

14. The price of a compact ½ inch drill is very comparable to the price of a heavy duty ________ inch drill.

15. 1/2 inch drills of the heavy duty type usually have a ______________ ______________ ________ ______________ on the back housing which can be used to force the drill into the material.

16. The ______________ chuck is found usually on the very low cost economy drills.

17. A drill ______________ enables the user to apply more pressure and to apply it more evenly to the drilling jobs.

18. Saw attachments for drills often are sold with a combination blade which can be used for ______________ or ______________ work.

19. The ______________ ______________ is the most common type of sanding attachment, with the drum or sleeve type also being used.

20. A grinder attachment works most effectively if used with a ______________ ______________ ______________ which keeps the drill from moving.

21. Screwdriver bits are available for the screwdriver attachment to drive ______________ and ______________ ______________ screws.

22. Most wire wheel brushes will fit a ________ wheel arbor.

23. Polishing jobs are best carried out with a sanding pad over which a ______________ ______________ is fastened.

24. Hole saws with saw tooth cutters can be used to drill holes ________ inch to ________ inches in diameter.

25. When framing buildings the principal advantage of using a power saw are ______________ and ______________.

26. A safety feature which should be found on all power saws is the ______________ ______________ ______________.

27. Electric hand saws are rated according to the maximum ______________ ________ ______________ which can be used on the saw.

28. A saw of at least ________ blade diameter is necessary to cut through two inch dressed lumber at a 45° angle.

29. Large or heavy duty electric saws carry blades up to ________ in diameter and weigh almost ________ ______________ what light duty saws weigh.

30. The electric hand jig saw is designed for ______________, ______________ or straight cuts on soft woods up to ________ thick.

31. Blades available for the hand jig saw include fine and coarse tooth blades for metal and wood and _____________ _____________ for rubber and leather.

32. A gear driven gasoline powered chain saw has a cutting speed of approximately _______ feet per minute and the direct driven chain saw runs at _______ feet per minute.

33. An important safety feature of all _____________ _____________ electric hand tools is the absence of a shock hazard.

34. The two approaches to battery type power for tools are the _______________________________ and _____________ _____________ _____________ either of which can be recharged from a _______ to _______ _____________ outlet.

35. A "cordless" drill is capable of drilling over _______ holes in two inch plank and _______ holes in light steel before recharging.

36. Sanding belts are either _______ or _______ in width and normally travel at about _______ feet per minute.

37. Sanding pads or sheets for orbital sanders are usually of two sizes _____________ which is 1/3 of a standard 9 x 11 sheet and 4 1/2 x 11 which is 1/2 of a standard 9 x 11 sandpaper sheet.

38. Grades of sandpaper for orbital sanders range from _____________ _____________ to _____________ _____________.

39. Good merchandising practice dictates that stationary power tools be priced at the _____________ rate rather than the total cash price.

40. A good prospect for the sale of a stationary power tool is the owner of a _____________ _____________ _____________.

41. The jointer is designed to do the work formerly done by the _____________ _____________.

42. Good quality jointers have _______ or _______ knives in each head while the lower quality tools have only _______.

43. Accessories for the drill press enable it to be used for _____________, _____________, _____________, _____________, and many other tasks.

44. The scroll saw features a _____________ _____________ which can be tilted for various cutting angles and a blade which makes about _______ cutting strokes per minute.

45. Both the _____________ _____________ and the _____________ _____________ can be adjusted on the lathe-bed to fit the size of the material.

46. The radial arm saw can be set for both ______________ miters and ______________ miters.

47. The entire weight of the radial arm and saw mechanism is supported by the ______________ and stand.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The customer should be permitted to "get the feel" of the portable power tool by being allowed to (A) attend the sawdust festival; (B) try the tool himself whenever possible; (C) look at the tools in a glass show case; (D) watch the salesman demonstrate the tool.

_____ 2. The sawdust carnival's major disadvantage is that (A) the manufacturers representative must do the demonstrating; (B) sawdust will get on the customers; (C) sawdust will be spread all over the store; (D) it brings many non-purchasers into the store.

_____ 3. Chucks on the electric drills range in size from (A) 1/4" to 1/2" capacity; (B) 1/4" to 3/4" capacity; (C) 1/16" to 1/2" capacity; (D) 3/8" to 1/2" capacity; (E) 1/4" to 3/8" capacity.

_____ 4. For an additional source of power for cordless tools, farmers and other workmen can use a (A) 9 volt radio or fence charger battery; (B) 12 volt auto battery; (C) 6 volt fence charger battery; (D) 6 volt auto battery.

_____ 5. Power to drive the belt on a belt sander is transmitted by (A) both front and back pulleys; (B) direct drive from the motor; (C) the front pulley; (D) chain or belt drive.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. When a power tool such as a drill is sold to a customer the sales potential for attachments and accessories may be just beginning and may include such items as:

(A) ______________________ (C) ______________________

(B) ______________________

2. List the advantages of tool kits.

(A)

(B)

(C)

3. Power tools can be advertized in window displays as gifts on such occasions as:

(A)

(B)

(C)

(D)

4. A "heavy duty" or "production" type quality drill of any size will usually have the following features:

(A)

(B)

(C)

(D)

5. The accessories and attachments contained in a deluxe drill kit will likely include the following:

(A)

(B)

(C) +

(D)

(E)

(F)

6. The three basic types of electric drill chucks are:

(A)

(B)

(C)

7. The horizontal bench stand holds the drill stationary in such a position that the user can perform:

(A)

(B)

(C)

8. The three parts of a grinder attachment are:

(A)

(B)

(C)

9. List the eight most common types of power saw blades.

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________ (H) ____________________

10. Hand electric jig saw attachments include:

(A) ____________________ (C) ____________________

(B) ____________________

11. The factors which will determine the time between battery recharges on any battery operated tool are:

(A) ____

(B) ____

(C) ____

12. The three types of portable electric sanding tools are the:

(A) ____________________ (C) ____________________

(B) ____________________

13. Routers are particularly effective for such jobs as:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

14. The more common routing bits which are available for different cuts are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

15. The factors which have stimulated the sale of power tools are:

(A) ____

(B) ____

(C) ____

16. The stationary circular saw has the following operator controls or adjustments.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

17. List the major parts of a drill press.

(A) __________ (C) __________

(B) __________ (D) __________

18. The advantages of purchasing a combination tool rather than all of the individual tools include the following:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

Matching

Directions: In the right hand column is a list of items. The left hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. Crosscuts in soft wood

_____ 2. General rough carpentry use

_____ 3. Cut off on very hard wood

_____ 4. Ripsaw on very hard woods

_____ 5. Reclaimed lumber

_____ 6. Crating or repairing flooring

_____ 7. Finish carpentry work

A. Combination blade

B. Crosscut blade

C. Flooring blade

Assignment
Sheet No. 10

Covering
Units 108-110

LAWN, GARDEN AND FARM TOOLS -- PART I

With the increased leisure time of the middle and upper class, more time is available for the homeowner to work in his yard and develop his own "private recreational area" or patio. Every year the call of spring brings the urge to people to get out-of-doors and work in their yards. No matter how small a home or how varied the interests of a homeowner, they are nearly all in the market for several items of lawn or garden equipment. The area of farm tools should not be overlooked just because the number of farmers is declining in this day of mechanization.

Sell the customer the idea of doing a better job with the correct tools. In order for the hardware salesman to be successful in selling lawn, garden, and farm tools, he must know the capabilities and limits of his tools and equipment. Helpful suggestions and planned displays will help a great deal in completing many sales. Spring will be the time of the year when most lawn, garden, and farm tools will be sold. In order to have a steady return of satisfied customers, it is as important to be able to answer their questions concerning tools as it is to supply the actual tools.

This unit will introduce the student to tools used for digging, to seeds, fertilizers, and cultivation and garden tools. This material should help the student become aware of the wide variation in personal preference for the different styles and types of lawn, garden, and farm tools. Success in this department will be dependent not only upon how well the student becomes acquainted with all aspects of the lawn and garden department in his store, but is also dependent upon how well he knows and can serve the needs of the community.

Assignment:

1. Read the reference listed below.
2. Contact either your local County Agent's Office or the Extension Division of your State University and obtain the latest literature on lawn and garden care. (This material is usually free.)
3. Prepare a list of lawn grasses and/or mixtures for the different types of soils found in your area, and list the best soil conditioning methods for each.
4. Answer the questions below and turn in this assignment by _________________________.

Reference:

A. ACHR, Lawn Garden and Farm, pp. 1-15, Chapters I, II and III.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Because farm population is decreasing each year the sales of agricultural hand tools are also decreasing.

T F 2. Since the lawn is considered a prestige symbol in suburbia, many residents spend hundreds of dollars each year for seeds and lawn care tools and supplies.

T F 3. There is a constantly growing sales potential for tools among the rapidly increasing urban and suburban population.

T F 4. In a city or surburban area the majority of the tools sold will be those intended for use with gardens.

T F 5. The highest quality shovels are made from good quality carbon steel.

T F 6. Quality and construction features for the long handle square point shovel and the long handle round point shovel are considerably different due to different usage.

T F 7. It can safely be said that square point shovels have far less cutting power than comparable round point shovels.

T F 8. The "handle lift" of a shovel is the distance from the floor to the handle tip when the back of the blade is flat on the floor.

T F 9. Spades are often sold for post hole digging.

T F 10. Two-handle post hole diggers are available in several types but all have hinged frames which allow a hinge action.

T F 11. Most post hole augers have wooden grips on a steel handle.

T F 12. Both the "bow" rake and the "level head" rake have 16 to 18 teeth.

T F 13. Since level head rakes are of forged steel construction, they are used for heavier work than bow rakes.

T F 14. The best quality level head rakes are tempered to prevent breakage near the shank.

T F 15. The mattock hoe is designed for heavier work than the sprouting hoe and has the same type of handle.

T F 16. The rotating action of the tines of a gasoline powered tiller can pulverize almost any type of soil.

T F 17. All cutting tines on gasoline powered tillers are the same.

T F 18. Riding model garden tractors usually have larger motors than walking models.

T F 19. Garden tractors have attachments available only for snow removal and mowing.

T F 20. City and suburban areas are now consuming much of the fertilizer and seed formerly sold only in rural areas.

T F 21. Since 1950 the sale of lawn and garden products has increased exactly four times.

T F 22. Almost all hardware stores sell some type of garden or grass seeds.

T F 23. An important reason for selling individual pre-packaged garden seeds is the excellent possibility for the sale of related lawn and garden tools and materials.

T F 24. The sale of packaged seeds from displays requires as much knowledge as the sale of hybrid seed.

T F 25. The lawn seed business has about reached its peak and is not likely to increase significantly.

T F 26. The seed distributors have developed lawn seed mixtures which are suitable for the different geographical areas of the country.

T F 27. Fertilizer can become a big business item but may profitably be sold only in a rural or farm market area.

T F 28. Pre-mixed and packaged fertilizers which are suitable for most lawn needs are available "off-the-shelf."

T F 29. Fertilizer-weed control mixtures are considerably higher in cost than fertilizers.

T F 30. A lawn-type fertilizer spreader will quickly pay for itself by spreading the fertilizer more evenly with less waste.

T F 31. The "weeder hoe" has a blade which is usually about 1 3/4" in height from the cutting edge.

T F 32. The "warren hoe" has a single sharp edge and can be used as a cultivating tool or a mortar hoe.

T F 33. The "scuffle hoe" is designed for light weeding and only comes in a square pattern.

T F 34. The three or five prong cultivator has a long handle and diamond shaped tines.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. On the average less than ________ per cent of hardware store sales come from the garden and farm tool department.

2. In a city or suburban area the majority of the tools sold will be those intended for the care of ________________ or ________________ ________________.

3. The largest selling shovel type is the ________________ handle ________________ point model.

4. The best quality shovels are manufactured from one piece of steel by ________________ and the lower quality shovels are manufactured by ________________ the stamped parts together before inserting the handle.

5. Most shovels have handles made from straight grain ________________ and are approximately ________ inches in length.

6. Square point shovels are usually intended for use in handling ________________ soil and not for digging.

7. Handle length for the "D" handle shovel is usually approximately ________ or ________ inches.

8. The only square pointed shovels designed primarily for digging are called ________________.

9. Scoop shovels are designed primarily for handling of ________________ or ________________ ________________ on the farm.

10. Spading forks have ________ tines and a ________ type handle.

11. The push plow has been largely replaced with ________________ and other power equipment.

12. The ________________ rake is the most popular type rake.

13. Walking model garden tractors usually have from ________ to ________ horsepower engines.

14. Lawn seed mixtures are basically mixed and pre-packaged according to the ________________ ________ ________________ and the ________________ ________ ________________ the lawn will receive.

15. Fertilizers fall into the three general classifications of ________________, ________________ and ________________ ________________.

16. The average lawn requires two feedings per year generally near ______________ and again near ______________ ______________.

17. Two-wheel lawn type seeders can be used for spreading both ______________ and ______________.

18. The two types of all purpose cultivating hoes are the ______________ ______________ and ______________, both of which have a blade ________ inches in width.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The "D" handle shovel will likely sell better in the (A) city where flower beds predominate; (B) rural areas; (C) suburban and urban areas; (D) construction industry.

_____ 2. The most effective shovel for hard digging or cutting is is a shovel with (A) long handle and high blade lift with a square point; (B) long handle, low blade lift and square point; (C) "D" handle and round point with low blade lift; (D) long handle, low blade lift and round point.

_____ 3. Shovel handle lengths are measured from the tip of the handle to the (A) top of the blade; (B) tip of the blade; (C) socket or shock band; (D) first rivet.

_____ 4. The sale of bulk seed is largely confined to stores serving (A) rural or city areas; (B) rural and suburban areas; (C) suburban and city areas; (D) only suburban areas.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the various shovel classifications.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

2. The three types of shovel shanks are:

(A) ______________________ (C) ______________________

(B) ______________________

3. List the three categories of lawn-garden products which exceed one billion dollars in sales each year.

(A) ______________________________

(B) ______________________________

(C) ______________________________

4. In addition to flower seeds the three basic categories of seeds sold by the hardware stores are:

(A) ______________ (C) ______________

(B) ______________

5. The disadvantages of selling bulk seeds are that they:

(A) ______________________________

(B) ______________________________"

6. The three types of seeders available for spreading lawn seed are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

7. The three major plant foods contained in fertilizers are:

(A) ______________ (C) ______________

(B) ______________

8. List the short handled tools which areprimarily intended for use in confined areas.

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

Matching

Directions: In the right hand column is a list of items. The left hand column contains descriptive phrases or synonymous terms. Match the description to the terms by placing the letter of the description in the blank at the left of the appropriate phrase or description.

Group I

_____ 1. fastest acting

_____ 2. least likely to "burn"

_____ 3. definitely will burn the lawn if applied too liberally

_____ 4. most expensive

_____ 5. most concentrated

_____ 6. can be combined with the agents for weed control

A. organic fertilizer

B. chemical fertilizer

Group II

_____ 1. 4 or 5 tines and 12 inch handle

_____ 2. 3 to 5 slightly curved tines

_____ 3. blade with three tines opposite

_____ 4. blade 2½ x 6 inches and curved

_____ 5. 3 or 4 tines, 12 inches overall

_____ 6. long blade with a "V" notch in ends.

A. trowel

B. fork (short handle)

C. cultivator (short handle)

D. hand rake (short handle)

E. hoe (short handle)

F. dandelion digger

Assignment
Sheet No. 11

Covering
Units 111-114

LAWN, GARDEN AND FARM TOOLS -- PART II

When many people talk about a "Hardware Store" they are referring to a store that sells tools, equipment and materials used on the lawn, garden or farm. This unit covers material which includes many of the tools used for lawn care, water pumps, farm hardware, and equipment used for chemical pest control.

The student should realize that the more rural his customers are, the more probable it will be that his store will carry heavy inventories of lawn, garden, and farm tools and supplies. A store doing business of this type will need to offer wide selections of merchandise. To do a good job of supplying his customers a student should study them and their buying habits carefully. The student must be thoroughly familiar with the many types, qualities, and features of water pumps and chemical spray equipment. A customer who is contemplating the purchase of a deep well pump or sprayer will not patronize an establishment whose workers are not able to supply him with technical and operative information.

This assignment presents material designed to acquaint the student with many tools, materials and pieces of equipment, used on the lawn, the farm or in garden work. This unit is an introduction to the type of information a proficient salesman will need. After doing this assignment the student should be more capable of studying and understanding the tools and equipment his store sells. In turn, he should be able to present knowledgeable information to his customers.

Assignment:

1. Read the reference listed below.
2. Obtain from your county agent's office the latest literature on powder and liquid spray methods of insect control and fertilizing.
3. Study the manufacturers literature concerning the various items covered in this assignment.
4. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. ACHR, pp. 15-52, Chapters IV to VII.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The average lawn has about the same amount spent per square foot each year as the average farm land.

T F 2. The backyard rarely receives much attention compared to the front yard.

T F 3. The reel mower is not suitable for mowing rough lawns or grass of greatly varying height.

T F 4. The reel mower is the easiest to keep adjusted.

T F 5. The reel type mower is the most popular design.

T F 6. The electric lawn mower is usually preferred only by people with small lawns.

T F 7. Power mowers are all essentially of the same quality for a given engine or blade size.

T F 8. Quality mowers use the motor exhaust to help discharge the grass and cuttings.

T F 9. Most power mower users are primarily interested in purchasing a mower made by a reputable manufacturer rather than a mower with many convenience features which cannot be repaired when broken.

T F 10. Self-propelled mowers are available in both rotary and reel types.

T F 11. Riding mowers are not all self-propelled.

T F 12. Under-powered riding mowers will likely suffer from short engine life and repeated complaints.

T F 13. Lawn sweepers are available only in the push type but these can be attached or pulled behind self-propelled mowers.

T F 14. Wheels can be displayed on convenient manufacturers displays which are attractive and occupy very little floor space.

T F 15. Electric hedge trimming attachments powered by electric drills are available.

T F 16. Electric hedge trimmers have motors which develop 1 H.P. or more.

T F 17. Lawn rakes and garden rakes have the same general shape and tooth length.

T F 18. Some models of 2-wheel lawn carts are designed to be attached behind power riding mowers and garden tractors.

T F 19. One-wheel wheelbarrows which have bodies of both steel and wood are available.

T F 20. Areators have a handy tray which enables the user to add weight to push the spikes deeper into the lawn.

T F 21. Many suburban homes must be equipped with their own private water systems by drilling a well and installing a pump on it.

T F 22. "Jet" or "ejector" pumps operate by means of a piston action.

T F 23. The standing water level in a well and the amount of draw down both have the same initial reference point.

T F 24. The submergence of the pump refers to the amount (in feet) of pipe or pump which is below the lowest water level after drawdown.

T F 25. The "setting" refers to the vertical distance from the storage tank to the standing water level.

T F 26. It takes 4 horses to consume as much water as one person uses when figuring water use for a farm.

T F 27. Service pressure and discharge pressure in a water system are the same valve.

T F 28. Rubber hose is reinforced with one or more layers of fabric between the layers of rubber.

T F 29. Plastic hose is usually from 7/16" to 1/2" inside diameter.

T F 30. A 3/4 inch hose has over 4 times the capacity of a 7/16 inch hose.

T F 31. Industrial hose is usually sold by the foot, but only in 25 and 50 foot lengths.

T F 32. A hose hanger is hung on a wall so it may be used to carry the hose into the yard.

T F 33. A "flow-through" reel allows the hose to remain attached to the faucet with the water turned on while the hose is being unreeled for use.

T F 34. Flow-through reels are available in "wall hung" types only.

T F 35. The pistol grip nozzle should only be sold for use with hose which can stand the "line" water pressure.

T F 36. Hand sprinklers are used for small areas where heavy pressure is not needed.

T F 37. All non-rotating sprinklers or sprayers operate by water pressure which creates a fine mist.

T F 38. Plastic sprinkler hose comes in lengths of 30 feet or longer.

T F 39. The four types of "self-powered" sprinkler heads are all operated by air pressure.

T F 40. The "best" of the new chemical weed-pest controls only require two to three applications.

T F 41. Most chemicals have been developed to the point where they are no longer of a poisonous nature.

T F 42. Manufacturers recommendations must be followed religiously in suggesting chemicals for the home gardner to use in weed or plant disease control.

T F 43. Chemicals are available to control only the soft shell insects.

T F 44. A homeowner will readily spend a large sum of money to keep an attractive lawn looking its best.

T F 45. The dry chemicals leave no visual residue after application if properly applied and they can be more effectively controlled when applied in the wind.

T F 46. Aerosol cans of liquid plant chemicals are becoming so efficient they can be used for large areas.

T F 47. The continuous hand sprayer has a liquid capacity ranging from 20 oz. to three quarts.

T F 48. Slide pump sprayers are made only in "continuous acting" types.

T F 49. A pressure of 180 lbs. can spray liquid 20 to 25 feet.

T F 50. Hose nozzle sprayers lack the ability to accurately place the solution when compared to other types of sprayers.

T F 51. Plunger dusters hold only 1/2 lb. of pesticide.

T F 52. The National Sprayer and Duster Association makes recommendations for sprayer and duster applications.

T F 53. Although labeled as poisonous, most dusting chemicals do not require careful handling if they are not allowed to get wet.

T F 54. A hand type continuous sprayer is not recommended for use inside the house.

T F 55. In the type of chain in which the links are made without welding, only flat stock is used from which the links are stamped and folded.

T F 56. Twist link welded chain is as popular as straight link welded chain.

T F 57. Chain display racks tend to increase impulse buying if well located.

T F 58. Swivel repair links, when properly applied, are as strong as an unbroken link in the chain.

T F 59. Ready-cut chain is uneconomical since most users want special lengths.

T F 60. Pre-packaged rope units only come in multiple 100 feet lengths which can be separated for individual sales.

T F 61. Coils of rope are marked at 10 foot intervals and are available only in coils of 2000 feet length.

T F 62. In farm fencing the bars may be closer together at the bottom than the top.

T F 63. Barbed wire is only made with two sharp points on the barb.

T F 64. Electrical fence controls are designed to electrify an entire multiple strand permanent farm fence.

T F 65. Fence stretchers are designed for two-man operation.

T F 66. A 16 x 10 mesh is the most popular size for screen wire.

T F 67. Shade screening is made from thin sheets of aluminum.

T F 68. Wrist type gloves have a long open cuff.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two basic cutting actions of lawn mowers are _______________ and _______________ which is always power driven.

2. A mower attachment used to shred leaves and weeds for compost is the _______________ attachment.

3. The three methods of powering mowers are: _______________, which is the most popular, _______________ and _______________.

4. Lawn experts and discriminating homeowners prefer the _______________ type _______________ cutting action lawn mower fo for the professional quality lawn care.

5. The main disadvantage of the electric lawn mower is the _______________ _______________ which restricts its area of use.

6. The two basic categories of gasoline engines used to drive lawn mowers are ________________ ________________ and ________________ ________________.

7. A crankcase which holds the lubricating oil is always present on ____________________________ gasoline engines.

8. Oil and gasoline are mixed together for use in a ________________-________________ engine.

9. A self-propelled mower engine must provide the power to drive the ________________ and the ________________.

10. During the manufacture of the mower, quality control is much more important for a ________________ ________________ mower than for a push type mower.

11. A yard and garden tractor can be used for ________________ ________________, ________________ and many other tasks by adding attachments.

12. Lawn sweepers usually have a hopper capacity of ________ bushels.

13. "V" belts are used widely on ________________ machines and units around the home and come in A, B and C widths.

14. Hand type hedge shears have a scissor type cutting action with blades ________ inches to ________ inches in length.

15. The most popular models of electric hedge shears have a blade length of ________ inches or over and operate at approximately ________ strokes per minute.

16. The battery powered hedge trimmers are capable of trimming a hedge ________ feet in length on the top and both sides before recharging is necessary.

17. Lopping shears are designed for ________________ and trimming with handles ________ to ________ inches in length for cutting heavy growth.

18. Hand type pruning shears have blades from ________ to ________ inches in length.

19. Weed whips are recommended when cutting tall ________________ and ________________ on rough ground.

20. Lawn rollers usually consist of a large drum ________ to ________ in diameter which can be filled with ________________ to provide the necessary weight.

21. Pumps for "shallow" wells are built to raise water up to ________ feet.

22. Average pump discharge pressure is usually ________ lbs.

23. A properly designed pump set up should have enough capacity so that it does not need to operate more than the equivalent of ________ hours per day.

24. "Drawdown" refers to the difference between the ________________ level and the ________ ________ ________________ level with the pump operating.

25. The material from which the largest footage of garden hose made today is ______________________ or ________________.

26. Garden hose is ordinarily sold in ________ foot and ________ foot lengths.

27. Hose reel carts have a capacity of ________ feet of garden hose.

28. High quality nozzles are made of ________________.

29. Soil soakers are usually made of ________________ and are used where water must not be applied to the foliage.

30. Underground sprinkler systems are used primarily on ________________ ________________ and ________________ ________________.

31. A root irrigator consists of a ________________ which can be inserted near the roots of a large plant to force water into the soil to water the tree roots.

32. Knapsack and Compressed Air Sprayers both have capacities of up to ________ gallons.

33. The ________________ type dusters provide a continuous flow of dust from one or two outlets.

34. ________________ dusters are especially suited for treating individual plants and small trees.

35. The two basic types of chains are ________________ and ________________ link type.

36. Sash chain is the common name for ________________ ________________ ________________ and is especially suited for use where the chain must lay flat.

37. ________________ ________________ ________________ chain is made by forming or knotting wire into links and is suitable for many ordinary jobs.

38. Heavy-duty chain with great tensile strength is made with ________________ ________________.

39. The advantage of twist link chain is that during use the slight twist in the links tends to prevent ________________ and ________________.

40. Chain hooks are usually attached to chains by the use of a ____________ ____________.

41. Snaps are available in both ____________ and ____________ end types.

42. Most rope displays carry rope from ________ to ________ in diameter.

43. Twine is made from sisal, ____________ and ____________.

44. Fencing is classified into two categories according to whether it will be used for ____________ or ____________ needs.

45. Double loop ornamental fencing is both tighter and more ornamental than ____________ ____________ fencing.

46. Chain link and ____________ ____________ fencing is more popular for public areas because of its ____________ and ____________ ____________.

47. Farm fencing is manufactured in heights of ________ to ________.

48. Barbed wire is made with ________ or ________ gauge strands.

49. Poultry netting comes in mesh sizes of ________ to ________ and heights up to ________ feet.

50. Hardware cloth is available in ________ to ________ foot widths and rolls of ________ foot length.

51. Glass substitutes are sometimes made from plastic coating over ____________ ____________ or ____________ mesh.

52. Better quality gloves (work) are made from ____________ ____________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the two main types of lawn edgers.

(A) ____________________ (B) ____________________

2. Battery powered edgers and shears have the following basic advantages:

(A) ____

(B) ____

(C) ____

3. The electric hedge shear is very suitable for use by the homeowner and also:

(A) ______________________ (C) ______________________

(B) ______________________

4. List the two categories which include all pumps.

(A) ______________________ (B) ______________________

5. The four basic questions which must be answered before the proper pump can be selected are:

(A) ____

(B) ____

(C) ____

(D) ____

6. When figuring the "total head," list the factors which must be considered.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

7. List the common types of hose clamps and repair connectors.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

8. The four types of self-directing sprinklers are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

9. List the factors needed to decide how economical one method of chemical weed-pest control is compared to a former method.

(A) ____

(B) ____

10. List the objections to liquid chemical mixtures.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

11. All sprayers and dusters consist of the following basic parts:

(A) ____________________

(B) ____________________

(C) ____________________

12. List the most popular types of hand liquid sprayers.

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

13. Self-contained dusters fall into three general types:

(A) ____________________ (C) ____________________

(B) ____________________

14. For fruit trees 1 to 5 feet in height, the sprayers or dusters which are recommended by the National Sprayer and Duster Association are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

15. Repair links are generally grouped as follows:

(A) ____________________ (C) ____________________

(B) ____________________

16. Screen wire is made from:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Matching

Directions: In the right hand column is a list of items. The left hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Group I

_____ 1. swivel head for flat or vertical work

_____ 2. one fixed and one movable blade

_____ 3. hollow ground blades

_____ 4. scissor action-multiple blade

_____ 5. similar to sheep shears

_____ 6. top handle moves vertically

_____ 7. blades can be locked together

_____ 8. clutch protected motor

_____ 9. should only be used for lightest trimming

_____ 10. easiest operation--least effort

_____ 11. 6" width self-sharpening blades

A. hand trimmer

B. scissor type trimmer

C. draw-cut type trimmer

D. electric trimmer

E. heavy-duty electric trimmer

Group II

_____ 1. common chickweed

_____ 2. thistle

_____ 3. dock

_____ 4. spotted spurge

_____ 5. burckhorn plantin

_____ 6. dandelion

_____ 7. mouse ear chickweed

_____ 8. oxalis

A. easy to kill variety

B. hard to kill variety

Assignment
Sheet No. 12

Covering
Units 115-116

SPORTING GOODS -- PART I

The sale of sporting goods is usually surrounded by a pleasant atmosphere. Now days hunting and fishing is thought of as a leisure time activity. Certainly you will take pride in and find great satisfaction in helping people to enjoy themselves.

Remember, the longer you work in a sporting goods department, the more effective you will become, both in sales and in passing on helpful "hints". The finer details of knowledge about hunting and fishing require years of actual experience to master. You, as a salesperson, might need to substitute some reading at first to suppliment personal experience.

This assignment is designed to give the learner a basic knowledge of the better known phases of sporting goods so he may serve his customers more confidently.

Assignment:

1. Read the reference listed below.
2. Prepare a paper, not over one page, fully explaining how the "gauge" of a shot gun is determined. Be sure to include in the explanation information to show understanding of gauges. Cover the 410 gauge in your paper, too.
3. Answer the questions below and turn in this assignment by ________________ .

Reference:

A. Advanced Course in Hardware Retailing, Unit 9, "Sporting Goods", pp. Intro-37.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Sporting goods departments in hardware stores are becoming more important with the increase of leisure time and income for the average worker.

T F 2. The sale of sporting goods is most usually confined to men.

T F 3. Many men look upon relaxation as a form of therapy.

T F 4. Most Americans do not have to be concerned with the overweight problem.

T F 5. A full line of merchandise is required to attract sports men to this department.

T F 6. Low quality sporting goods is where the retailer makes big profits.

T F 7. Your sporting goods displays should create a proper rustic, outdoors mood.

T F 8. Hunting licenses yield no profit and render no significant benefit to the retailer for selling them.

T F 9. Unit of gauge measurement is based on the number of shot in the shell a shot gun uses.

T F 10. A 410 shot gun is actually a 67 gauge.

T F 11. Most shot patterns of the same type shotgun shells will be the same.

T F 12. Hunters use different degrees of choke boring to control shot patterns.

T F 13. For greater shot spread, it is best to cut off your shotgun barrel.

T F 14. For best results a shooter should add his own recoil pad to his gun.

T F 15. Most hunters consider the large shell capacity of the pump shot gun a desirable feature.

T F 16. The auto-loader shot gun is a true automatic.

T F 17. Lever action .22 rifles are better suited for left rather than right-handed shooters.

T F 18. Auto-loader .22 rifles require more attention and maintenance than other .22's.

T F 19. Many hunters feel the pump action rifle is the fastest manually operated big game rifle.

T F 20. The rim fire cartridge is most popular of rifle ammunition.

T F 21. A #2 shot is much smaller than the #12 shot.

T F 22. Most hunters find it easy to skillfully imitate the call of a duck with a plastic or wood caller.

T F 23. Bait casting rods are used mostly for still fishing.

T F 24. When spin casting one can use a lighter tackle than possible with a regular casting rod.

T F 25. Fly rods were originally designed for casting of bass bugs and lightweight metal spinners.

T F 26. The more experienced fisherman, when fly casting, reels his catch in rapidly.

T F 27. Lighter type salt water fishing is frequently done with fresh water equipment.

T F 28. Casting reels are used primarily for game fishing.

T F 29. Most of today's fishing reels have to be reeled in with the left hand.

T F 30. Single action reels are usually double geared.

T F 31. A wet linin line is stronger than a dry one.

T F 32. Wet flys are used for fishing on the surface of a lake.

T F 33. Better tackle boxes have one or more trays hinged to lift as the box lid is opened.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In this study, sporting goods are classified as those items used in ________________ games.

2. Some men are not so much interested in what high cost sporting equipment will do but the ________________ it will make on fellow club members.

3. To compete successfully in attracting sportsmen to your store for sporting goods, your merchandise has to be ________________ and ________________ promoted.

4. To do an effective job of selling guns, one must ________________ guns.

5. Shot pattern is the ________________ of shot pellets at any given yardage.

6. Full choke boring is meant to be used for ________________ ________________ shooting.

7. Longer barrels permit more ________________ shooting.

8. The type shotgun stock needed by a customer depends on his ________________ ________________ and ________________ ________________.

9. The .22, by far the most popular rifle, is ____________ weight and ________________ to maintain.

10. The bolt of bolt action rifles is manually operated for ________________, ______________, and __________________ the cartridge.

11. Pistol and revolver sales are regulated by _____________ .

12. A newly developed handgun for target shooting will continuously place accurate shots beyond __________ yards.

13. The gas gun, operating on a CO^2 cartridge, can fire from _______ to _______ shots per cartridge.

14. In either rim fire or center fire cartridges or shotgun shells, the _____________ performs the function of firing the ammunition powder.

15. The drams of powder in the total charge of a shell determines its _____________ .

16. Shot size is determined by the type _____________ the shooter plans.

17. The sighting device of a telescopic sight is called a ________________ .

18. Anyone who purchases a good gun should also be a prospect for a ________________ ________________ .

19. Lower quality duck decoys are made from ______________ ________________ .

20. The better quality hunting knives have light weight blades from _______ to ________ inches long.

21. The most important parts of any fisherman's gear for a fishing trip will be a _____________ and ______________ .

22. Salt water spinning rods range in length from _______ to _______ feet.

23. Salt water rods will generally be _______________ than fresh water rods.

24. To avoid winding a fly line in small coils, the fly reel should be a ______________ ________________ spool type.

25. For removing sand and grit from a reel while fishing, it is necessary that the reel have quick ________________ features.

26. A casting line serves as a _______________ between the angler and his bait.

27. The pound test of a line indicates it will withstand that number of pounds strain in a ____________ pull.

Multiple-Choice

<u>Directions</u>: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. (A) Status seekers; (B) Men looking for relaxation; (C) True lovers of sports are considered the best all around sporting goods customers.

_____ 2. When a gun operator has to work a mechanism to load a new shell into the chamber after each shot, the gun is (A) a manual; (B) a semi-automatic; (C) an automatic.

_____ 3. Choke is the partial constriction of the (A) receiver end; (B) muzzel end; (C) extractor end of a shotgun barrel.

_____ 4. A shotgun shell fired with modified choke would project (A) 70; (B) 60; (C) 40 per cent of its shot pellets inside a 30 inch circle.

_____ 5. In hunting turkey, fox, and ducks, a (A) full choke; (B) modified choke; (C) improved cylinder is recommended.

_____ 6. Most single shot shot guns are of the (A) lever action; (B) magazine load; (C) break-open type.

_____ 7. Bolt action shot guns are best for (A) trap shooting; (B) fast field shooting; (C) beginners.

_____ 8. Automatic pistols are (A) magazine loaded; (B) bolt action loaded; (C) gas loaded.

_____ 9. Almost all fishing rods, tubular or solid, are made of (A) bamboo; (B) steel; (C) glass.

_____ 10. Most reel handle grips are made of (A) plastic; (B) hard-rubber; (C) cork.

_____ 11. (A) Boat rods; (B) Surf rods; (C) Big game rods are used for deep sea trolling for marlin, tuna, and sail fish.

Listing

<u>Directions</u>: List the items called for in each of the following. Select your answers carefully.

1. List four sources of display ideas:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List eleven ideas in promoting a sporting goods department:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

(G) ____________________

(H) ____________________

(I) ____________________

(J) ____________________

(K) ____________________

3. List the five well-known shotgun gauges:

(A) __________ (C) __________ (E) __________

(B) __________ (D) __________

4. List the two styles of double barrel shot guns:

(A) __________ (B) __________

5. List the two basic rifle types:

(A) __________ (B) __________

6. List the three type magazines found on lever action rifles:

(A) __________ (C) __________

(B) __________

7. List the four pistol and revolver calibers, telling which one is best for target practice and which two are used mostly for protection:

Caliber	Use	Caliber	Use
(A) ______	______	(C) ______	______
(B) ______	______	(D) ______	______

8. List the four advantages of the new steel and plastic shotgun shel

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

9. List the four rod and reel classifications:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

10. List the two types of fresh water spin casting rods:

(A) ____________________

(B) ____________________

11. List the four basic types of fishing reels:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

12. List four desirable features of a spinning reel:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

13. List the four types of fly lines:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

14. List the three types of plug lures or bait casting lures:

(A) __________ (B) __________ (C) __________

Assignment

SPORTING GOODS -- PART II

One does not have to know how to play basketball or baseball to sell equipment for the two sports, but it certainly would help! The next best thing in increasing sales effectiveness would be to "know your merchandise."

When customers come in to buy sporting goods such as a baseball, boxing gloves, even a flashlight for "snipe" hunting, the sales person should be able to adequately match his merchandise according to their needs and their budget. Some people want quality and never question price. Others let the price factor determine the quality they receive and want all they can get for a certain amount of money.

This lesson is geared toward helping the student understand the meaning of "quality" sporting goods. He should learn to judge which equipment is best for a certain use.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

Reference:

A. Advanced Course in Hardware Retailing, Unit 9, "Sporting Goods", pp. 38-54.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Many hardware stores promote complete sets of basketball equipment as backyard practice sets.

T F 2. Volley balls are approximately the same size and weight as basketballs.

T F 3. Quite often the sale of one football helmet will lead to the sale of another.

T F 4. Shoulder pads offer good protection for boys during a backyard football game.

T F 5. The design of a catcher's mitt varies considerably.

T F 6. A baseball is larger and softer than a softball.

T F 7. A softball bat is longer and more slender than a baseball bat.

T F 8. A softball glove is very similar to a baseball glove, but has more padding.

T F 9. Low quality catcher's mitts have felt padding.

T F 10. The wire or magnesium frame type softball catcher's mask is much lighter than the baseball type.

T F 11. A woman's sand iron golf club is the same length as the woman's number 9 iron.

T F 12. Golf bags are generally designed to carry only ten clubs.

T F 13. Most hardware retailers feel that flashlights are truly sporting goods.

T F 14. The uses of a flashlight are very limited.

T F 15. Dry batteries contain no moisture and should be stored in a cool place.

T F 16. The zinc container of a dry battery not only serves as the protective covering but also acts as a fuel.

T F 17. Flashlight batteries today have a shorter life than those of a few years ago.

T F 18. Of necessity today, at the very first signs of weakening, batteries have to be removed to prevent corrosion.

T F 19. The popular six volt sportsman lantern battery can be used underwater.

T F 20. The flashlight is made for much rougher treatment than the sportsman light.

T F 21. The heavy duty industrial flashlight is practically unbreakable.

T F 22. A marine lantern is completely waterproof and resistant to salt water corrosion.

T F 23. A two cell flashlight requires a two volt bulb.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A basketball should be _______ inches in diameter.

2. Basketball shoes should be made with canvas tops and have rubber soles with ________________ quality.

3. For inflating basketballs and volleyballs, a hand type ______________ __________________ is handy.

4. Punching bags are usually made of ______________ with ________________ seams.

5. Football pants should be made with ____________ ____________ material with ______________ padding on the inside.

6. Fielder's gloves come in ______ or _______ finger types, made for ____________ or ____________ handed fielders.

7. The quality of leather in a baseman's mitt is determined by the ________________ of the mitt.

8. Cnly catcher's masks with ________________ __________________ approval should be carried in the junior size group.

9. Baseball bats are listed according to their _______________, _________________, and _______________ .

10. Baseball bats will vary in length from ________ to ________ inches.

11. Tennis balls made of nylon and web fabric, have a ___________________ cover.

12. Quality tennis balls are shipped in _________________ sealed cans.

13. A racket press is designed to hold a tennis racket under pressure to prevent its _______________ .

14. Golf clubs are classified as ______________ and ______________.

15. The most popular of golf club sets is of the ______ piece set variety.

16. Improper storage of a flashlight battery can result in ______________ lived batteries.

17. Usable energy in the form of electricity is created within a dry battery through a _______________ reaction.

18. The zinc covering of a dry battery acts as a _______________ pole.

19. Electrical current flowing through a lamp heats the ________________ until it glows.

20. Batteries are kept fresh over a long period of time by a steel, ________________ case.

21. Most batteries in the heavy duty category develop ________ volts of power.

22. To fit most battery operated lanterns, the six volt lantern battery is made ______________ shaped.

23. During the past few years the ________________ ________________ has developed a large market for the smaller type battery.

24. Sportsman lanterns are designed for use under normal ________________ and ________________ conditions.

25. The headlight type of battery light is popular with workers who need to keep ______________ __________________ free.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Most official size basketballs are made of (A) leather; (B) rubber; (C) plastic.

_____ 2. Quality footballs are made of (A) plastic; (B) rubber; (C) leather.

_____ 3. The lowest quality baseballs are covered with (A) rubber; (B) rubberized fabric; (C) leather.

_____ 4. Quality baseball bats are made of (A) ash; (B) walnut; (C) hickory wood.

_____ 5. Quality tennis rackets have (A) leather; (B) rubber; (C) wooden grip handles.

_____ 6. A standard number 7 golf club iron is (A) 38; (B) 37; (C) 36 inches in length.

_____ 7. High quality golf balls have (A) rubber; (B) liquid; (C) plastic centers.

_____ 8. The best place to display flashlights is (A) in the sporting goods department; (B) near the automobile accessories; (C) not certain.

_____ 9. The (A) zinc covering; (B) paste filler; (C) carbon rod collects dry battery electrical current and makes it available to an outside circuit.

_____ 10. (A) Regular; (B) Heavy duty ignition; (C) hot shot batteries account for the majority of dry battery sales.

_____ 11. The ignition dry cell was primarily designed to be used (A) in automobiles; (B) in lanterns; (C) for rural telephones.

_____ 12. Flashlights are classified according to the (A) number of batteries required; (B) size of the bulb; (C) the type of the batteries used.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the component parts of a Tether Ball set:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

2. List the three categories of boxing gloves:

(A) ______________ (B) ______________ (C) ______________

3. List three uses for the penlight battery:

(A) ____________________ (C) ____________________

(B) ____________________

4. List three primary uses of the hot shot batteries:

(A) ____________________ (C) ____________________

(B) ____________________

Assignment
Sheet No. 14

Covering
Units 120-122

RECREATIONAL EQUIPMENT

In the past few years outside living has expanded from that of fishing and hunting on to cooking, eating and sleeping under the open sky. Equipment for the new leisure past-time extends from portable refrigerators to barbeque ovens. All work and no play is not the practice of children or adults in this modern day of leisure living.

This lesson will widen the student's knowledge about camp stoves, lanterns, grills, ice chests, vacuum bottles, boats, motors, recreational games, and toys for children. These items can be sold effectively in hardware stores if the salesperson has the "know how."

The student should obtain information from this lesson to help him recommend recreation equipment to his customers. This lesson will help him to be more effective as a salesperson with needed "know how" rather than being just an "order taker."

Assignment:

1. Read the reference listed below.
2. In not more than one page, list advantages and disadvantages of the charcoal, gasoline, and propane camp stoves you might point out in helping a customer decide which type he should buy.
3. Answer the questions below and turn in the assignment by ______________________ .

Reference:

A. Advanced Course in Hardware Retailing, Unit 10, "Recreational Equipment," pp. 1-32.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Outdoor living has become an established way of life in our country.

T F 2. Quite often it is easier to sell things that customers want but do not need rather than what they actually need.

T F 3. In the spring, retailers have to create customer desire for more outdoor living items.

T F 4. National advertising has little or no effect on creating demand for items in any one area.

T F 5. The power of demonstration is very important in selling outdoor living merchandise.

T F 6. Women do most of the outdoor cooking.

T F 7. Only people in the warmer climate, such as "down south" prefer charcoal cooking.

T F 8. Rotisseries are usually standard equipment on most deluxe portable grills.

T F 9. The briquet form of charcoal is more expensive than the regular form and will not burn as long.

T F 10. Caps, aprons, and gloves not only add color to cook-outs but they are good protection against grease and cooking stains.

T F 11. The folding chair is the most popular type of outdoor furniture.

T F 12. The plastic covered chaise lounge is most popular because it can withstand bad weather.

T F 13. Three point hammocks have two suspension points at the head and are the more stable of the two types made.

T F 14. A camper's tent is light weight and easy to carry.

T F 15. Aluminum treating a tent fabric can reduce the inside temperature up to 15 degrees.

T F 16. Pup tents are designed for protecting three or four people while sleeping.

T F 17. Camp stools and chairs offer some of the comforts of home on a camping trip.

T F 18. Sleeping bags will provide sleeping comfort only under ideal weather conditions.

T F 19. Suction cups hold car utility racks secure in such a way that there is no danger of slippage.

T F 20. Propane camp stoves can be purchased in either one or two burner styles.

T F 21. Charcoal camp stoves are lightweight and very convenient for camping trips.

T F 22. A gasoline camp lantern requires a special type fuel for its operation.

T F 23. In most areas, the pint size vacuum bottle is most popular.

T F 24. Most hardware stores will experience sales with the small fishing and towing type boats.

T F 25. The three to five horsepower model outboard motors weighs about 17 pounds.

T F 26. Marine paint displays should be separated from regular paint lines for greater impulse sales.

T F 27. Boat hardware should be galvanized for longer life around salt water.

T F 28. Snorkel masks permit the swimmer to breathe underwater by means of a self-contained air supply.

T F 29. A kapok boat cushion serves as a life preserver also.

T F 30. The walker stroller is very convenient for mothers with small babies on shopping trips.

T F 31. Better quality gym sets are made of heavy tubular steel.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Many manufacturers of quality merchandise provide advertising ______________ designed to create desire for their products.

2. In offering terms on large items, it is a good idea to price the merchandise according to how much it will cost the customer per ____________ .

3. A permanent outdoor grill is usually made of ____________ or ______________ .

4. Deluxe portable grills are usually made of ____________ ______________, ______________, or ______________ ______________ .

5. Medium range grills will average _______ to ________ dollars in price.

6. Grill covers are made from ______________ or ______________ fabric.

7. The cast iron hibachi charcoal gril is patterned after the ______________ ______________ grill.

8. Grill brushes can be used to clean grill tops by using the ____________ on one side and a brush usually made of ____________ ______________ on the other.

9. The popularity of patios has brought in a new market in patio ____________________.

10. The seat and back of patio chairs provides the user ____________, ________________, and ________________.

11. Quality picnic tables and benches are made of solid ____________.

12. Inexpensive picnic tables and benches are made of solid ________________, stained to look like higher quality wood.

13. Lawn torches burning ________________ helps to drive away insects.

14. The average retail hardware store usually carries only tents of the ________________ and ________________ type.

15. The house-type tent has a base usually about _______ by _______ feet.

16. A portable electric refrigerator weighs only about _________ pounds and will hold up to _________ pounds of food.

17. Ice chests, kept cold with crushed ice or ice cubes in the chest, are made of ______________, ________________, and __________________.

18. Picnic jugs, of the vacuum type, can keep food ______________ or ________________ for hours.

19. Picnic baskets usually have enough plates, cups and saucers for from ________ to _________ people.

20. The most popular size boat sold through hardware stores is from ___________ to _________ feet in length.

21. For general trolling purposes, a ________ horsepower motor is all that is needed.

22. Most 3 to 1 gear ratio trailer wenches are capable of handling loads up to _________ pounds.

23. Most aluminum or steel frame boat seats are of the __________________ type.

24. The better type swim goggles have water-tight rubber frames with _________________ lenses.

25. Most popular wood or fiberglas water skies vary in length from ________ to _________ feet.

26. The _____________ model preserver can be worn at all times, either in the boat or in the water.

27. The size of a bicycle is determined by the ______________ of the ______________ .

28. The most popular size bicycle is the adult ______ inch size.

29. Velcipedes are often called __________________ .

30. The most popular models of juvenile automobiles are the ____________________, the ______________, and the ______________ car.

31. The rigid frame type wading pool is built to hold up to ________ gallons of water.

32. During the past few years the trend in toys has been toward __________________ and ________________ operated types.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Outdoor living merchandise displays should be (A) scattered; (B) grouped; (C) small.

_____ 2. The (A) deluxe grill; (B) hibachi grill; (C) propane grill offers the easiest of charcoal cooking.

_____ 3. (A) Electricity; (B) Newspaper; (C) Fluid is used in the funnel type starter to get charcoal ignited.

_____ 4. The (A) house-type tent; (B) camper's tent; (C) pup tent usually have zippered doors and nylon screen windows.

_____ 5. (A) Low priced; (B) Medium priced; (C) Deluxe higher priced air mattresses are made with two layers of waterproof cloth and two layers of rubber.

_____ 6. Camping and picnic supplies are considered as (A) a "necessity"; (B) an "only for the rich" (C) an impulse variety of merchandise by hardware retailers.

_____ 7. (A) Plywood; (B) Aluminum; (C) Fiberglas boats are the lowest in purchase price.

_____ 8. (A) Plywood; (B) Aluminum; (C) Fiberglas boats are designed for use with powerful motors at very high speeds.

_____ 9. Outboard motors are rated according to their (A) size; (B) horsepower; (C) speed.

_____ 10. Water skiers require (A) 3 to 5 horsepower; (B) 12 to 25 horsepower; (C) electric trolling motors for their sport.

_____ 11. Quality canoe paddles are made from (A) hickory; (B) oak; (C) laminated wood.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List three extra features one might expect to find on a deluxe grill.

(A) ____________________ (C) ____________________

(B) ____________________

2. List the three types of charcoal starters.

(A) ____________________ (C) ____________________

(B) ____________________

3. List the three parts of a "fire tool set".

(A) ____________________ (C) ____________________

(B) ____________________

4. List the three basic fuels used to fire camp stoves.

(A) ____________________ (C) ____________________

(B) ____________________

5. List the three categories of camp lanterns.

(A) ____________________ (C) ____________________

(B) ____________________

6. List component parts of a picnic set.

(A) ____________________ (C) ____________________

(B) ____________________

7. List two reasons many retailers do not handle boats.

(A) ____

(B) ____

8. List three materials most boats are made of.

(A) ______________________ (C) ______________________

(B) ______________________

9. List the three types of ski ropes and give the obvious advantage of each.

(A) ____

(B) ____

(C) ____

10. List five types of recreational game sets stocked by most hardware retailers.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

Assignment
Sheet No. 15

Covering
Units 123-124

PAINT AND PAINT SUNDRIES — PART I

Statistics show that the paint department in many hardware stores is the second in total sales and that with the increasing number of homeowners and the continuous advertising campaigns of the paint manufacturers, paint consumption is likely to rise considerably in the next few years.

New products and application techniques are constantly under development. However, the store, which has a good paint stock and well-trained paint salesmen with a thorough understanding of the many products and merchandising methods, will be the local sales leader.

To remain abreast of the trends and products in this field will require constant reading and attention to manufacturers' literature concerning paint developments, applications and the various sundries associated with painting.

In this assignment you will study sales and merchandising aids, the proper application of paint finishes and the common causes of paint failure, both inside and outside the structure.

Assignment:

1. Read and study the reference listed below.
2. Study the manufacturers literature that is available to you.
3. Read the trade journals and write for sales information dealing with any unfamiliar new products or sundries.
4. Make a "painting layout," both interior and exterior, for (1) a new unpainted home and (2) an older home with unknown finishes on such items as floors, clear finished windows and doors. Have your employer check it with you then give it to your instructor.
5. Answer the questions below and turn in this assignment by ________________________.

Reference:

A. ACHR, "Hardware Study Unit Eleven Chapters I to V, pp. 1-33.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The average house requires 6 to 10 gallons of paint for a two coat exterior paint job.

T F 2. The cost of paint and sundries for the interior of a house is more than double the cost of paint for the exterior.

T F 3. Since the modern farmer has a larger investment in buildings and equipment he is also likely to use more protective coatings on them.

T F 4. Large industrial paint users will usually contact you in your store but you must be able to sell on a discount basis if you are to have repeat orders.

T F 5. Most paint manufacturers will not cooperate in shipping large quantities directly to your customers.

T F 6. The do-it-yourself paint customer accounts for the largest percentage of retail paint sales.

T F 7. A homeowner will likely purchase better grades of paint than a renter.

T F 8. Paint advertising has always been poorly done because of the many manufacturers.

T F 9. The local retailer must devise all his own advertising mats and layouts.

T F 10. Paint sundries must be promoted vigorously at all times and are usually difficult to make.

T F 11. It is always inadvisable to place a sundries check list where the customer may see it since he may feel it is a reflection on his intelligence.

T F 12. The best shelf arrangement for paint is with the largest cans on the lower shelves and the smallest on the very top shelf.

T F 13. The non-use and mis-use of free sales aids by retailers disturbs the paint manufacturers.

T F 14. Paint and paint sundries items should not be advertised together since this often creates confusion in the customer's mind.

T F 15. Local sales promotions should come at the same time as the paint manufacturers advertising programs.

T F 16. Displaying the ads (or reproductions) which appear in national magazines is an unwise practice in selling a nationally known product.

T F 17. Massed displays of paint may use ribbon to draw attention to the ad and the product.

T F

T F 18. "Spot" radio announcements should be used to back up other advertising efforts.

T F 19. Color cards are too large to be mailed and must be distributed as handouts from the store.

T F 20. Battery operated motion-displays should be used all year around to stimulate interest.

T F 21. Billboard advertising is usually offered to the retailer on a cost sharing basis.

T F 22. Promotional movies are often available from paint manufacturers and can be used or offered for use free to large groups.

T F 23. Store clinics for teaching customers the use of paint sundries and painting techniques can be especially effective in increasing paint sales.

T F 24. The use of substandard paint may eventually cost many times what it saves.

T F 25. Good quality paint will usually last twice as long as poor quality paint.

T F 26. The term "latex" is very confusing and refers to a group of paints using synthetic oil vehicle.

T F 27. The customer should always be allowed to make up his mind on painting materials without any suggestions from the salesman.

T F 28. Three coats of paint make the best job when painting "new" exterior wood surfaces.

T F 29. Paint wear is uniform for all outside surfaces if the paint is the same thickness.

T F 30. For copper, brass and aluminum screens spar varnish is recommended by the paint selection chart.

T F 31. Latex flat wall paint should only be applied to walls since it is difficult to apply to ceilings.

T F 32. Alligatoring may be painted over if it is firmly attached to the house.

T F 33. Discoloration from atmospheric fumes can be removed with a strong bleach.

T F 34. Brown staining of Redwood or Cedar siding is the result of excess moisture within the structure.

T F 35. Once the checking in house paint has cracked completely through the film it must be removed.

T F 36. Crawling is a problem encountered when painting flat horizontal surfaces.

T F 37. Good quality house paints are made so they will not chalk.

T F 38. The only cure for fading paint is to seal the old surface and repaint.

T F 39. Mildew discoloration is caused by fungi that feed on the oils in the paint film.

T F 40. Peeling and blistering of paint is commonly due to water accumulating behind the film.

T F 41. All flat finishes should be brushed in straight parallel strokes.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In the United States there are _______ paint manufacturers who produce over _______ million gallons of paint annually.
2. It costs about _______ for the materials to paint the exterior of the average house.
3. The paints used during an earlier period were primarily made from _____________ and _____________.
4. During the painting season _____________ magazines and _____________ _____________ in newspapers carry articles and advertisements which stimulate the paint sales.
5. Paint sold to customers for application by professional painters often involves at least a _______ rebate to the painter.
6. Promotion literature and handouts includes _____________ _____________ and hand bills.
7. The main advantage of paint mixing machines is that they enable a retailer to satisfy any color requirement for paint with a limited number of _____________ _____________.
8. "On the spot" demonstrations by factory trained paint experts are good ways to demonstrate the _____________ _____________ features of paint and _____________ techniques.
9. Alligatoring is caused by a paint film that hardens on top with a _____________ layer below.

10. Painted exterior surfaces which have collected excessive dirt may be cleaned with ______________ ______________ ______________, ______________ ______________, or ______________ ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The annual average cost per home for paint and paint sundries is (A) $45 to $90; (B) $120 to $150; (C) $20 to $30; (D) $10 to $20.

_____ 2. Labor costs when repainting are approximately (A) 75 per cent of the total; (B) 50 per cent of the total; (C) 25 per cent of the total; (D) 85 per cent of the total.

_____ 3. Paint manufacturers will usually reimburse the advertising costs of the local retailer at least (A) 35 per cent; (B) 50 per cent; (C) 85 per cent; (D) 100 per cent.

_____ 4. A single coat of paint usually forms a layer with a thickness of about (A) 1 1/2/1000 inch; (B) 2/1000 inch; (C) 4/1000 inch; (D) 6/1000 inch.

_____ 5. "Bleeding" of undercoats may be corrected in severe cases by applying (A) one coat of shellac; (B) two coats of aluminum enamel; (C) two coats of good exterior undercoat; (D) applying a strong bleach.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List four factors responsible for the wide use of paints in the do-it-yourself movement.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Selling aids which manufacturers generally provide paint retailers free of cost include:

(A) ______________________ (C) ______________________

(B) ______________________

3. Give away items which are usually available from paint manufacturers at little or no cost include:

(A) ______________________ (C) ______________________

(B) ______________________

4. The four qualities which a customer expects of the paint he buys are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

5. The major faults of poor quality paint are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

6. The operations which may be necessary to prepare a surface or area of a house for painting include:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

7. From every customer you must find out the following concerning the use of the paint:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

8. Crazing, cracking or checking may be caused by:

(A) ____

(B) ____

(C) ____

(D) ____

9. Flaking or scaling away of large areas or flakes of paint is caused by:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

10. Wrinkling of the paint surface is caused by:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

11. Listed below are interior paint problems which are different from those of exterior paint. Give the major cause:

(A) bloom ____________________

(B) brush marks ____________________

(C) cement floor paint peeling ____________________

(D) clouding ____________________

(E) cotton blush ____________________

(F) crazing ____________________

(G) deadening ____________________

(H) grain showing ____________________

(I) hot spots ____________________

(J) poor adhesion to enamel ____________________

(K) non-drying ____________________

(L) non-uniform color ____________________

(M) orange peel ____________________

(N) pinholing ____________________

(O) streaks and shadows ____________________

(P) water spots ____________________

Matching

Directions: From the numbered list at the left of the page select the proper type paint and insert in the blank on the left of the page.

_____ 1. usually water thinned

_____ 2. combine pigments in a varnish type base

_____ 3. The fastest drying of all finishes

_____ 4. used to produce a hard, glossy, transparent film

_____ 5. use pigments in alkyd resin vehicle

_____ 6. contain natural oils

_____ 7. odorless very quick drying

_____ 8. replaced the oils in oil base paint to provide better drying cycle

_____ 9. slowest drying with soft finish

_____ 10. include calsomine and emulsion paint

_____ 11. oil pigment

_____ 12. often dry in four hours or less and was developed because natural resin supplies were exhausted

_____ 13. usually baked to speed drying

_____ 14. not-water proof, thinned with alcohol.

Type of Paint or Finish

A. oil base paint

B. alkyd resin paint

C. water thinned paints

D. enamels

E. lacquers

F. stains

G. varnishes

H. synthetic resin varnish

I. shellac or shellac varnish

J. latex (vinyl or acrylin)

K. industrial varnish

Units 125-128

PAINT AND PAINT SUNDRIES -- PART II

A thousand things can go wrong with a paint job. An ounce of prevention by the advice or information from the seller is worth a pound of cures in the task of repeating the job. Customers will return happily for more paint and supplies if they are correctly given what they need along with some good advice (if asked for) on how to use what they buy.

Your success in selling paint will to a large degree depend upon your ability to correctly estimate the amount needed and establish the confidence of your customer in your ability, good judgement and understanding of his problems. A colorful paint salesman may be one who is full of color information. To talk intelligently with paint customers who know their colors, requires color knowledge. To help poor souls who know not their colors, also requires color knowledge.

This assignment will help you become more aware of the paint salesman's responsibility to his customer. This unit presents information on how to correctly estimate the amount of paint needed for a particular customer's use. You will become acquainted with many of the vario various sundries a painter may use or need. Many of the various terms used in a painter's vocabulary are in this lesson.

Assignment:

1. Read the reference listed below.
2. Prepare a list of painter's terms and definitions with which you are not thoroughly familiar.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. ACHR, Hardware, Chapter 11, pp. 34-55.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Accurate estimating on painting jobs can help forestall complaints by customers.

T F 2. The size of regular windows and doors should be subtracted from the area to be painted on all estimates.

T F 3. Estimating is simply a matter of determining the area (length by width or height) of a series of flat squares and adding together.

T F 4. To find the area of a 1/2 pitch gable and a 1/4 pitch gable different formula must be used.

T F 5. A bicycle will likely take approximately 1/2 pint of paint per coat.

T F 6. When suggesting paint sundries to a customer <u>always</u> suggest first an item he is likely to buy.

T F 7. Modern paint removers dissolve the paint surface.

T F 8. The new water washable chemical paint removers are generally promoted as being non-toxic and "safe."

T F 9. Propane torches are widely used on oil base paint for paint removal.

T F 10. The finish quality will ultimately depend upon the surface preparation.

T F 11. Nylon brushes are now seriously challenging the imported bristles in quality.

T F 12. The most popular width of paint rollers is nine inches.

T F 13. Roller extension handles are only for painting ceilings.

T F 14. Roofing brushes are often made from tampico fibre.

T F 15. Sandpaper is made from a backing, a bonding material and sand.

T F 16. Double strength window glass is 3/32 inch thick.

T F 17. "Alky" refers to alkyd base paint.

T F 18. "Sand finish" is a rough finish plaster wall.

T F 19. "Short paint" has a uniform thin appearance.

T F 20. "Stretch" refers to the flexibility of the paint.

T F 21. "Tooth" refers to the roughness of the paint which will cause the next coat to adhere.

T F 22. "Turps" is painter's language for lacquer thinner.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The formula for finding the gable area of a 1/2 pitch roof is ____________ x ____________ = the area.

2. When estimating the interior area of a room the area of ________ ________ ________ is found, then doubled, the area of one ________ ________ is found and then doubled, and the ________ times the ________ of the room will give the area of the ________ and ________.

3. The formula given for finding the size of a square is ________.

4. The area of a tank (cylinder) mounted on a stand will be the same as a ________ with two ________.

5. Paint removers must be washed off with ________ or ________ ________ if you are cleaning veneers.

6. A good quality paint roller may be used for applying ________ ________ paint and also ________ and ________ paint.

7. Sanding discs come in ________ inch and ________ inch diameters.

8. The grades of window glass are ________ select quality, ________ commercial and ________ general purposes.

9. Boiled linseed oil is called "________".by painters.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. If your customer has a room with an area of 2850 square feet and the finish coat of paint covers 500 to 600 square feet per gallon, you should recommend the purchase of (A) 4½ gallons; (B) 5 gallons; (C) 5½ gallons; (D) 6 gallons.

_____ 2. When suggesting sundries, a good lead in statement is (A) "Why don't you buy some...?" (B) "You'll also need some...." (C) "The last customer bought some..." (D) "Will you also need some...?"

_____ 3. An artists round brush is often made from (A) camel bristle; (B) nylon bristle; (C) fibre; (D) Chinese pig bristle.

_____ 4. Most sandpaper is sold in (A) sheets; (B) rolls; (C) belts; (D) discs.

_____ 5. "Back priming" refers to (A) priming the back of the house; (B) painting back over the old primer; (C) painting the inside of an outside wall; (D) touching-up a previously primed surface.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Estimating the correct amount and type of paint involves knowing the answers to such questions as:

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. For the surfaces listed below fill in the blank with the approximate number of square feet which the first coat can be expected to cover.

(A) Wood frame siding ______________ square feet

(B) Cement block ______________ square feet

(C) Shingle siding ______________ square feet

(D) Medium texture stucco ______________ square feet

(E) Asbestos wall shingles ______________ square feet

(F) Brick ______________ square feet

(G) Shingle roof ______________ square feet

3. List in the blank space the formula for

(A) Circle ______________

(B) Sphere ______________

(C) Triangle ______________

(D) Rectangle ______________

4. List the groups of paint sundries which may be suggested to the customer.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

5. The woods which require that the wood grains be filled with a paste wood filler are:

(A) ______________________ (C) ______________________

(B) ______________________

6. Paint brushes are made with:

(A) ______________________ (C) ______________________

(B) ______________________

7. List the different types of paint roller covers.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

8. List the different grit types of sandpaper.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

Assignment
Sheet No. 17

Covering
Units 129-131

ELECTRICAL FIXTURES AND SUPPLIES

Bright lights at special events attract many people. Hardware retailers would like to make their electrical fixture and supply department attract people in a similar manner. In part, this can be done through advertising, mass display, and various departmental promotions.

Electricity is playing an increasingly important part in our daily lives. Most homes that are over ten years old have outgrown their original wiring facilities. Homeowners are constantly replacing circuits, fixtures, and outlets with more adequate and up-to-date materials. After customers come into the store and over to the electrical department, the electric supply salesman's job begins. A salesman must not only be able to identify customer wants from their requests but he should be capable of making helpful suggestions to customers on the safe and proper use of electrical supplies. Sales personnel must possess a superior knowledge of the products they sell by knowing how they are manufactured and for what purpose they are made. Don't be the "bull in the china shop!" Know your products!

This assignment is designed to help the student learn more about light fixtures and electrical supplies. With knowledge gained in working this lesson, a hardware sales trainee should be able to serve his customers better and help his store to increase sales. After working this assignment the student should feel more competent and be more capable of giving advice to his customers as to which fixture or electrical part is right for a particular job.

Assignment:

1. Read the reference listed below.
2. Present to the instructor, either written or oral, information showing you fully understand the make-up of an electrical fuse and the part it plays in an electrical circuit.
3. Answer the questions below and turn in this assignment by ________________________ .

Reference:

A. Advanced Course in Hardware Retailing, Unit XII, "Electrical Fixtures and Supplies," pp. 1-53.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The majority of homes today are adequately wired for their electrical demands.

T F 2. Modern electrical fixtures are attractive and decorative, as well as being functional.

T F 3. Electrical appliances are only as efficient as the electrical wiring in a home.

T F 4. Electricity is a low cost commodity that serves the public well.

T F 5. Raising lighting levels is a good practice in safeguarding eyesight.

T F 6. Flourescent lamps lend themselves well to decorative treatment.

T F 7. Always use several small bulbs instead of one large one.

T F 8. Colored inside light coatings improve light quality and improves the quantity of light produced.

T F 9. Retailers should stock the new tinted decorative incandescent bulbs since they bring better than average bulb profits.

T F 10. Flourescent and incandescent lamps should never be used in the same room.

T F 11. Miniature appliance and heater connectors are all equipped with an off-and-on switch.

T F 12. The type cord used for extension cords is determined by the kind of cord connector used on it.

T F 13. If starting a motor consistantly blows a fuse on a circuit, use a higher amp ordinary fuse.

T F 14. Voltage will drop when current is run through an extra long extension cord.

T F 15. Silent mercury switches are becoming quite popular.

T F 16. Pig-tail weather-proof lampholders make electric contact with the power line by forcing contact plugs into the wire.

T F 17. Surface wiring devices generally should be flush-mounted in a wall.

T F 18. Wall plates can be made decorative with pieces of drapery or wallpaper to blend into the room color scheme.

T F 19. When a customer indicates a need for a lighting fixture, first show him all you have available then ask questions.

T F 20. "Upright" exterior lanterns look better if the outside outlet is below 2/3 height of the door.

T F 21. If the customer insists on a wrong type fixture for his house, it is the salesperson's duty to sell him the correct fixture.

T F 22. Using a hanging lantern fixture over the table will do little to separate a dinette area from the kitchen unless there is some type of wall separation.

T F 23. Dens with wood interior walls should have a green, copper, or some other type decorative lighting piece.

T F 24. Light bulb wattage is etched on the bulb itself.

T F 25. Bayonet base type incandescent bulbs are used in automobiles.

T F 26. The higher the wattage the more light an incandescent bulb gives.

T F 27. Clear glass bulbs help to reduce glare, diffuse the light, color and control it.

T F 28. Light colored walls help homeowners save money in consumption of electricity.

T F 29. Frosting is painted inside most bulbs.

T F 30. Natural colored light bulbs are excellent for decorative purposes since they are less expensive than color-coated bulbs.

T F 31. Too low voltage will lengthen bulb life and increase its output.

T F 32. It is possible that early excessive bulb blackening is caused from an incorrect burning position.

T F 33. The type of flourescent base used is dependent upon the diameter of the bulb.

T F 34. Floruescent lamps produce three times as much light as an incandescent bulb of similar wattage.

T F 35. Like the incandescent bulb, too frequent starting will not affect the life of a fluorescent lamp.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. For the general public to safely take advantage of electrical conveniences, many homes should be ________________ .

2. New homes are being built at the rate of about a ______________ a year.

3. Good lighting can often be accomplished by combining the proper lighting ______________ with sufficient lamp ____________.

4. Eye efficiency depends upon eye ____________ .

5. There is a trend to use lights to produce a _______________ and an _______________ effect in the home.

6. Many homeowners have hesitated to introduce flourescent lighting because they feel it gives a ____________ appearance.

7. Wiring materials that transfer current from the source to the point of use are thought of as ____________ devices.

8. Three-prong grounding plugs are now required for supplying power to portable tools by the _______________ _______________ _______________ .

9. Fuses or circuit breakers used to protect wiring from becoming overloaded are known as _______________ devices.

10. ______________ _______________ trip and break the circuit when overloading occurs.

11. Most wall outlets are of the type with two _______________ .

12. Outdoor outlets are designed to be completely ________________ .

13. Attachment plugs with _____________ blades assure a firmer, more positive electrical contact.

14. Ceiling lampholders should be mounted on ______________ _______________ .

15. When using pipe heating cable, in all cases, it is recommended the _________________ control be used.

16. For exterior lighting, suggest copper or brass to go with _______________ house exterior.

17. The type lighting fixture needed for a breezeway will depend upon whether the breezeway is open, ________________, or _________________ .

18. For lighting a garden or barbecue area, recommend ________ watt PAR 38 flood lamps.

19. The amount of lighting needed for a front vestibule or reception hall is determined by its actual ______________ .

20. The __________ fixture is considered conventional for kitchen incandescent lighting.

21. Suspended fixtures may be used in the living room if the ceiling is higher than __________ .

22. Perimeter lighting, consisting of recessed ________________, has become popular for living room use.

23. To increase your related sales, never sell a fixture without the __________ or __________ that it should use.

24. The base of an incandescent lamp holds the lamp firmly in the socket and it _____________ the __________ through the lamp.

25. The most widely used incandescent base type is the __________ base.

26. Three contact base incandescent lamps contain two separate ________________ in one bulb.

27. Daylight bulbs yield a more approximated daylight through use of a ______________ glass.

28. PAR and reflector type bulbs have a reflecting surface of ____________ or _____________ sealed inside the bulb.

29. Stores, factories, and schools have made ________________ lighting their standard source of illumination.

30. A flourescent lamp needs its own _____________ operating _____________ control to maintain proper current operating limits.

31. The average home has _______ wired sockets for lighting.

32. Electricity carried by a wire is measured by ___________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Modern homes today have well over (A) 19; (B) 30; (C) 50; electrical appliances.

_____ 2. Incandescent bulbs produce light cast that is (A) blue; (B) orange; (C) red in character.

_____ 3. Bulbs that give off a (A) pure white; (B) cool green; (C) warm red coast are best for general use.

_____ 4. (A) Thanksgiving; (B) Christmas; (C) New Year holidays will bring the biggest demand for colored bulbs and outdoor reflector lamps.

_____ 5. Electrical devices recessed in or attached to the wall of a home are in the (A) portable; (B) permanent; (C) speciality wiring device group.

_____ 6. Generally speaking, electrical speciality devices will (A) produce; (B) transfer; (C) consume electricity.

_____ 7. An amateur would probably prefer a (A) quick clamp device; (B) multiple tap; (C) multiple socket for making an outlet repair.

_____ 8. The most popular type appliance cord is (A) super flexible HPH cord; (B) meoprene covered No. 16 cord; (C) No. 18 carton jacketed asbestos insulated HPD cord.

_____ 9. For a circuit with an electric motor on it (A) an ordinary; (B) a time-lag; (C) a cartridge fuse is recommended.

_____ 10. For wires rated to carry 30 amps, a (A) 20; (B) 30; (C) 40 amp fuse will give best protection.

_____ 11. (A) Double pole; (B) Three-way; (C) Single pole switches are used to control one circuit from two points.

_____ 12. A new surface wiring device using a flat, rectangular cable, with nail holes pre-punched, now on the market should prove to be useful for lighting the (A) living room; (B) dining room and kitchen; (C, cellar, attic, or garage.

_____ 13. For the best kitchen flourescent lighting use (A) 2 watts; (B) 1 1/2 watts; (C) 1 watt per square foot of floor space.

_____ 14. (A) Tan; (B) Ivory; (C) Primrose Yellow colored walls will help provide more usable light in a room.

_____ 15. Efficiency of a flourescent lamp increases with the (A) diameter; (B) length; (C) color of the tube.

_____ 16. (A) Starter switches; (B) The ballast; (C) The bipin base preheats the standard flourescent lamp to make the lamp light.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List six different electrical supply products a man might need in converting his basement to a den:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

2. List the three separate product catagories of hardware store electrical supplies:

(A) ____

(B) ____

(C) ____

3. List three examples of portable wiring devices:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

4. List the two basic types of outlet terminals:

(A) ____

(B) ____

5. List three switching mechanisms for incandescent lampholders:

(A) ____________________ (C) ____________________

(B) ____________________

6. List the three most commonly used types of wiring boxes:

(A) ______________ (B) ______________ (C) ______________

7. List five different places where lighting may be placed in a kitchen and dinette area:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

8. List four possible places for light fixtures in a bathroom:

(A) ____

(B) ____

(C) ____

(D) ____

9. List four questions to be answered when selecting a dining room light fixture:

(A) ____

(B) ____

(C) ____

____

(D) ____

10. List four good forms of retail advertising:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Multiple-Response

Directions: The following are advantages of either (A) Incandescent lighting, or (B) flourescent lighting. Mark either A or B by the statement, whichever correctly applies.

_____ 1. Longer life.

_____ 2. Greater economy.

_____ 3. Offers a concentrated light source.

_____ 4. Cooler light.

_____ 5. Operates reliably at all temperatures.

_____ 6. Operates on either direct or alternating current.

_____ 7. Life is not reduced by frequenting starting.

_____ 8. More light per watt.

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. Alternating Current

_____ 2. Ampere

_____ 3. Candle-power

_____ 4. Cycle

_____ 5. Direct current

_____ 6. Frequency

_____ 7. Indirect lighting

_____ 8. Kilowatt

_____ 9. Ohm

_____ 10. Volt

_____ 11. Watt

A. 1,000 watts

B. denotes rate of flow

C. electrical power unit of measurement

D. point where reflected light meets

E. a complete alternation of AC current

F. one square foot of illumination

G. flows many times per second, one way, then the other way

H. number of AC cycles per second

I. measures intensity of light

J. unit of pressure for supply of electrical current

K. light first reflected to ceiling

L. unit of electrical resistance

M. current flowing in only one direction at all times

Assignment

Units 132-134

HOUSEWARES -- PART I

Today housewares are not only highly decorative, but they are also well engineered. The agressive hardware merchant will find housewares to be important in producing extra profit. However, here is a field that is becoming very crowded and highly competitive. This makes a knowledge of the selling techniques in this lesson an absolute necessity.

When Mrs. Jones enters a store to shop for cookware, she has every right to expect honest, factual, and up-to-date information on the products offered for sale. To be an expert in this field requires a great deal of knowledge.

This assignment will acquaint the student with the difficulty of handling varieties needed in the housewares and cookware department, in deciding what should be stocked, of what will sell and what might not. The student will learn much of the knowledge needed in making explanations of the use and value of houseware products to his customers.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Advanced Course in Hardware Retailing, "Housewares," Unit 13, Chapters I and II, pp. Intro.-24.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Even though profit made through the sale of "housewares" is below average, it does account for 10.9% of total gross sales.

T F 2. Store location plays an important part in determining housewares' volume of sales.

T F 3. Today's housewife is looking for the easiest, quickest, and most efficient method of doing things.

T F 4. The kitchen is considered the "workshop" for the housewife.

T F 5. Cookware today is decorative enough to serve the kitchen much in the same way as pictures do other rooms.

T F 6. Plastics have enabled manufacturers to bring new, exciting colors to the retailers' shelves.

T F 7. The sale of a houseware item seldom leads to the sale of related items.

T F 8. The retailer aims at having his store window and interior displays reflect the same high spirited atmosphere as his accompanying advertising creates.

T F 9. Housewares are considered "seasonal" merchandise.

T F 10. Most new kitchenwares will require little demonstration.

T F 11. One should begin with the most expensive sets in showing customers sets of cooking utensils.

T F 12. Large covered pans and similar large items should be placed on top shelves where they are easier to reach.

T F 13. Customer-participation displays lead to more sales.

T F 14. One should always be sure his interior displays are adequately stocked to backup the store window themes.

T F 15. The term "gadget" suggests quality to the housewife more so than the word "tool."

T F 16. Housewives are continually searching for new and better means of preparing food.

T F 17. Aluminum cookware discoloration is harmful and should be removed as quickly as possible.

T F 18. A dull finished pan will bake pastry quicker than a highly polished finish.

T F 19. Most pie recipes call for an eight inch pie pan.

T F 20. Abrasive-type cleaners will not mar the finish of colored aluminum.

T F 21. Steel wool is necessary and highly recommended for cleaning stainless steelware.

T F 22. In the past few years the copper bottomed stainless steel cookware has become a top seller.

T F 23. The visual attraction of glass makes it a "natural" for a full line display.

T F 24. Glass cookingware will withstand quick temperature changes.

T F 25. Opaque Glass is outstanding with its fashion colors and decorative designs.

T F 26. Goods baked in embossed tinware should not stick to the pan.

T F 27. Pores in cast iron become well lubricated through constant use.

T F 28. Porcelain enameled ware is one of the newer types of cookware.

T F 29. Porcelain enamel ware is highly recommended for coffee makers by those who know good coffee.

T F 30. Waterless cooking is truly cooking without the benefit of water.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The hardware retailer classifies such items as cutlery, dinnerware, stemware, etc., as ______________.

2. Many housewives express their pride in their new kitchens in the ______________ and ______________ ______________ which they purchase, for this room.

3. The increased use of color in housewares helps to provide more ______________ surroundings for the housewife.

4. Women today do not like to shop in dimly lit, ______________ ______________, __ ______________ merchandise stores.

5. Many leading manufacturers encourage retailers to advertise housewares by reimbursing ________ per cent or more of the cost.

6. A salesperson should keep in mind at all times that a ______________ customer is the best advertisement a store can have.

7. Promoting sales of additional items to a housewife to go with her initial purchase, such as a rubber drainboard with a dishdrainer, is called ______________ selling.

8. In the housewares department, all cookwares should be grouped together according to the ______________ and the ______________ from which they are made.

9. Pans with lids should be displayed with handles pointing to the ___________ so the housewife might use her ___________ hand to remove the lid.

10. A specially designed metal stand for floor displaying of ______________ ______________ and ______________ ______________ can be purchased from manufacturers.

11. A good way to display kitchen tools and cutlery sets is to hang them on a vertical sheet of perforated board called a ______________ ______________ ______________.

12. Related plastic items, merchandised into family groupings, will spur customers into greater use of the "______________________" idea.

13. To show that their products are virtually unbreakable, Melamine manufacturers often use ______________ displays.

14. One important way to get customers into the housewares department is through ______________ displays.

15. Although Thanksgiving is a short season for extra promotions, an interior mass display of ______________, ______________, etc. will help create extra business.

16. Cookware is very suitable as gifts for such occasions as ______________, ______________, and ______________.

17. To make sheet aluminum more decorative for giftware lines with a large array of colors, an ______________ ______________ can be applied.

18. Bakeware utensils are designed primarily for ______________, ______________, and ______________.

19. Sizes of the better quality baking utensils will be shown either on their ______________ or on the outside ______________.

20. For an average sized oven a ______________ size cookie sheet is best.

21. The average recipe calls for the ______________ - ____ size muffin pan.

22. Such items as dishpans, colanders, and food mills are considered ______________ ware items.

23. Top-of-the-range aluminum ware is usually made from ________ to ________ gauge material.

24. Quality grades of stainless steel utensils usually are of three-ply construction or are made with special ______________ to ______________ heat evenly.

25. Copper plating on stainless steel will insure an even distribution of heat, thus preventing ______________ and ______________ spots.

26. Glass manufacturers use borax in the formulation of glass cookware and ______________ each individual piece to specific hardness.

27. Ceramic cookware is more expensive but is selling fast because it is both ______________ and ______________.

28. Since Mayflower days, cooks have chosen cast iron cookware because it is ______________ and ______________.

29. The pressure cooker saves the housewife time by cooking foods ________ to ________ times faster.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Cast iron kitchenware should be placed on lower shelves because of (A) appearance; (B) poor sales; (C) weight.

_____ 2. When you point out the uniform finish and attractiveness of a cooking utensil, you are selling (A) cost; (B) quality (C) utility.

_____ 3. (A) Aluminum; (B) Glass; (C) Cast iron cookware has one of the highest rates of heat conductivity of all cookware materials.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the places a newspaper ad might be posted in the store to best remind you and your customers of the kitchenware specials.

(A) ____

(B) ____

(C) ____

2. In using the 3-D approach to sales, design, display, and demonstration, which one means:

(A) good merchandising - ______________________

(B) wise buying - ______________________

(C) good salesmanship - ______________________

3. List the four types of display that might be used for selling rubber housewares.

(A) ________________ (C) ________________

(B) ________________ (D) ________________

4. In merchandising rubber houseware items, what are four basic rules to follow?

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

5. List the three types of cooking utensils on the market today:

(A) ______________ (C) ______________

(B) ______________

6. List the different materials that cooking utensils are available in.

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________

7. List the four principle types of aluminum cookware.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

8. List the uses of stainless steel bowls.

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________ (F) ______________

9. List the three extraordinary selling points to be used in selling glass cookware.

(A) ______________ (C) ______________

(B) ______________

10. Quality waterless cookware must have what three features?

(A) ______________________________

(B) ______________________________

(C) ______________________________

Units 135-137

HOUSEWARES -- PART II

The slogan "Home Sweet Home" has a new meaning today, since modern housewares dress up the kitchen and help to eliminate drudgery. Beautiful and practical are the by-words for the hundreds of housewares now available to the housewife. Synthetic rubberware and plastic products come in beautiful decorative colors. Glassware is more practical to use and is easier to clean. The housewife now has a cutting tool to fit the job rather than one cutting instrument to do all the cutting duties that she performs.

"A housewife's work is never done" is an expression quoted quite often. The salesman who keeps this in mind in selling kitchen tools could become a volume leader. The salesman must be willing and able to demonstrate the effort and time saving features of newer products. This requires a thorough knowledge of the product and its special features and functions.

This unit will acquaint the student with a variety of household items, including glassware, stainless steel flatware, rubber mats, and scales.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Advanced Course in Hardware Retailing, "Housewares," Unit 13, Chapters III, IV, V, and VI, pp. 25-57.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Rubber and plastic housewares have outstanding appeal to the consumer.

T F 2. Color plays a very small part in the sale of rubber and plastic goods.

T F 3. Larger manufacturers of rubber and plastic housewares offer dealers well designed display units.

T F 4. Attractive displays can greatly add to the overall consumer image of your store.

T F 5. "Rubber" housewares means the article is made solely of rubber.

T F 6. Rubber housewares are seldom changed in their styles, however, colors frequently are changed.

T F 7. Housewives can utilize undersink storage to a maximum with a self-stacking storage bin.

T F 8. Products such as diaper pails, door mats, and laundry baskets can only be purchased in metal or fiber materials.

T F 9. The rubber garbage can has a short life and should be replaced in the home often.

T F 10. Intense heat has very little effect on thermoplastic articles.

T F 11. Research shows that a basic housewares department should carry a minimum number of 20 groups of items.

T F 12. Modern bathrooms are more compact yet more functional.

T F 13. When showing a customer a quality bath scale, shake the scale to show absence of rattles.

T F 14. Stainless steel bath scales offer less resistance to rusting than triple-plated chrome.

T F 15. Bathroom scales with fur covers are available.

T F 16. Better toilet seats are made of hardwood, kiln-dried with tongue and groove fitting.

T F 17. To add to sales impact and to increase impulse sales, items used primarily in the bathroom should be featured together.

T F 18. Many houseware items lose their sales appeal merely because something newer has been introduced to fill the same need.

T F 19. Modern glassware items seldom experience a style change.

T F 20. The general style and shape of each barglass will be the same regardless of the manufacturer.

T F 21. Discriminating buyers of glass stemware require more than just an ordinary sales approach.

T F 22. Manufacturers have found hardware stores to be good outlets for metal folding tables and chairs.

T F 23. Stainless steel is taking over the flatware market.

T F 24. Barometers and thermometers make excellent gifts to just about anyone.

T F 25. Kitchen tools are designed to fill certain needs and can be put into groups according to their function.

T F 26. The clamp-on opener is portable, more expensive, and quite an improvement over the knife opener.

T F 27. The single action opener is not portable but it does open any can easily.

T F 28. With so many homes having electric mixers, there is little need for a hand type beater.

T F 29. Quality cooking tools such as turners, spatulas, forks, and ladles, are made from stainless steel.

T F 30. An "outsider" demonstrating an article will project more sales impact than someone well known.

T F 31. Wider bladed knives are best for slicing cold meat or fowl.

T F 32. The American cutlery industry is the world leader in use of accurate methods and the finest steel in mechanically producing quality cutlery.

T F 33. A knife should have a few strokes on a sharpening steel before each use.

T F 34. Scalloped and saw-tooth edges are used only for slicing bread.

T F 35. Balance has no particular significance in the better knives.

T F 36. Shears and pocket knives are considered a part of kitchen cutlery.

T F 37. New type stainless steel pocket knife blades are easy to resharpen.

T F 38. A quality feature of a knife would be its comfortable and secure feeling in the hand.

T F 39. As a knife is opened or closed, a sharp "click" is a sure sign of a well-made knife.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Display space allowed different groups of merchandise is determined by the ______________ ______________ of that merchandise.

2. For retailers maintaining a certain level stock of their products, some manufacturers will give merchandising ______________.

3. Products such as dishpans, drainers, and sink mats are designed for use in the ______________ ______________.

4. Many colorful counter and stove mats are topped with ______________ to make them ______________ ______________.

5. Hardware dealers and employees can keep current or new items offered by reading ______________ ______________ or ______________ ______________.

6. Plastic materials which soften with the application of heat are called ______________.

7. Polyethylene, nylon, and vinyl, are examples of the ______________ basic type of plastic.

8. Good bath scales should be sold with the thought that they often will last from _______ years to a lifetime.

9. In selling bath scales, approach your customer on a ______________ basis by showing your ______________ priced scales first.

10. A new-type clothes hamper is designed to hang on the back of the ______________ ______________.

11. Not only do tub mats add to bath decor, they contribute a safety feature by helping to prevent ______________.

12. Housewives may lighten many kitchen chores and save many hours of weary standing with a kitchen ______________.

13. A kitchen tray table can be used for ______________, ______________, and ______________.

14. Most housewives share the housekeeping headache of having cluttered, inconvenient ______________ and ______________.

15. Stove mats provide an inexpensive means of preventing ______________ of fine surfaces in the kitchen.

16. Folding tray tables that provide the homemaker with additional serving space are often called ______________ trays.

17. Houseware stock that is out of style should be sold at a ______________ to make room for new items.

18. One disadvantage of the knife type opener is that it leaves ______________ edges that can ______________ the hand.

19. There are two wall type openers on the market, the ______________ and the ______________ ______________.

20. Most of the latest, labor-saving kitchen devices are ______________ in cost and are bought on ______________.

21. Better cooks demand a good ______________ ______________ to know the temperature of the inside of a roast.

22. To provide specific service for several uses, kitchen knives should possess high ______________ and ______________.

23. The two major types of grind for kitchen cutlery are ______________ and ______________.

24. A principle handle material known as mother-of-pearl is used in the manufacture of fine ______________ knives.

25. Scissors are designed for the ______________ tasks of hand cutting.

26. The best selling feature of a pocket knife is the ______________ ______________.

27. Light small, compact knives are called ______________ knives.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Plastics that become hard and brittle with the simultaneous application of high pressure are called (A) rubber housewares; (B) thermoplastics; (C) thermosetting materials.

_____ 2. Many television cabinets are made from (A) rubber; (B) thermoplastics; (C) thermosetting plastics.

_____ 3. To make a sale, a salesman should be prepared to demonstrate a (A) beater; (B) cooking thermometer; (C) food slicer in the store.

_____ 4. Shears usually measure (A) 4; (B) 6; (C) 8 inches or more in length.

_____ 5. Shears made by the (A) hot-forged; (B) cast; (C) cold-forged method are used for barbering and light household work.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the three general categories for classifying rubber houseware.

(A) ____________________

(B) ____________________

(C) ____________________

2. List the three groups included in rubber products for the kitchen.

(A) ____________________

(B) ____________________

(C) ____________________

3. List the five points that should be stressed in selling bath scales.

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

4. List the types of glassware that most glassware sales will be in.

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

5. List the five selling points that good quality juvenile furniture will possess.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

6. List the three basic types of non-electric can openers.

(A) ____________ (C) ____________

(B) ____________

7. List the "basic seven" kitchen set.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

8. List the four types of edging for flat or hollow types of blade grind:

(A) ____

(B) ____

(C) ____

(D) ____

9. List the four main parts of a fixed blade knife.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

10. Three of the principle wood handle materials for fixed-blade knives are:

(A) ______________________ (C) ______________________

(B) ______________________

11. List the three ways handles are made to hold on fixed-blade knives.

(A) ______________________ (C) ______________________

(B) ______________________

12. List the eight types of shears:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

13. List the five types of scissors.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

14. Pocket knives generally fall into what three categories?

(A) ______________________ (C) ______________________

(B) ______________________

Assignment
Sheet No. 20

Covering
Units 138-142

ELECTRIC HOUSEWARES AND GIFTS

Proper buying of electrical housewares and gifts is a difficult problem for the manager of a hardware store. New products are being introduced to the market daily. The manager must choose products wisely and use skillful advertising techniques followed up with good interior displays if this department is to be of maximum value to the store.

How does a retailer stay ahead of his competitor? Why do customers come into your store to buy an electrical appliance? Are your products better than the other store's line? What factors make for repeat sales in this department?

This assignment will present some of the information needed to answer the above questions. This is done by taking a look at duties involved in serving customers along with suggestions for increasing the sales and profits from electrical housewares and gifts.

Assignment:

1. Read the reference listed below.
2. Make a list of at least ten electrical houseware items that have come on the market during the past 10-15 years. By each one list the advantages it has in use as compared to to the household item used prior to its introduction. Example: Electric tooth brush - more thorough brushing of teeth, messages gums, faster than the old style manual tooth brush.
3. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Advanced Course in Hardware Retailing, Unit 14, "Electric Housewares and Gifts," pp. Intro.-43.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Sales of electric housewares are decreasing.

T F 2. Competition for electric appliance is intense.

T F 3. There is no profit in electrical appliances today.

T F 4. Electric housewares is a type of business that requires a great deal of promotion.

T F 5. Discounting is a relatively new sales trend.

T F 6. Manufacturers show little concern at their products being "footballed" by retailers.

T F 7. The discount store usually features all brand name merchandise.

T F 8. A customer with ready cash, looking for the lowest price, is anyone's customer.

T F 9. Seldom is an electric houseware item purchased on impulse.

T F 10. A display has to be large to really say something or convey an idea.

T F 11. Electric housewares serve very effectively as practical gifts.

T F 12. Most new electric items introduced each year become basic stock items.

T F 13. The majority of coffee drinkers like their coffee brewed the same way.

T F 14. The better automatic percolators keep the coffee at the right serving temperature.

T F 15. The ceramic electric skillet is made with the heating unit in the bottom of the skillet.

T F 16. Today, the electric mixer is considered a luxury.

T F 17. Portable electric mixer sales are increasing each year.

T OF 18. It seems that electric toaster sales have reached a saturation point.

T F 19. The user can make buttered or cinnamon toast on the reflector type toaster.

T F 20. The party type electric grill simplifies the making of hor d' oeuvres.

T F 21. Blenders are considered a very versatile appliance.

T F 22. Use of electric housewares is mostly limited to the kitchen.

T F 23. Housewives would prefer heat degree markings on electric irons rather than the fabric markings.

T F 24. Most electric clocks have a bell type alarm.

T F 25. Customers are likely to spend less for an electric clock when it is to be a gift.

T F 26. Plastic clock cases are more flexible in design than metal.

T F 27. With so many types of hair dryers on the market, personal choice will largely determine which hair dryer a customer purchases.

T F 28. Automatic electric blankets assure comfort by compensating for all changes in the room temperature.

T F 29. The size of the electric heater sold should be based on the size room to be heated.

T F 30. Baby bottle warmers are widely used as gifts to mothers.

T F 31. The electric corn popper is inexpensive and makes a good promotion item.

T F 32. Window fans move cool air from outside into a house and force inside hot air out.

T F 33. When selling air conditioners always be sure to sell a unit large enough for the area to be cooled.

T F 34. There are more cord plug-in type electric toothbrushes sold than the cordless type.

T F 35. Before stocking up on a new electric item it is always wise to buy a limited supply to test customer acceptance.

T F 36. Giftware items in a hardware store are easily catagorized from other items for sale in the store.

T F 37. Many hardware dealers readily admit that buying for the giftware department is a gamble.

T F 38. Your customers will often want new and different gift items.

T F 39. Men seem to supervise gift ware departments best because they are better judges of what appeals to women.

T F 40. Many people pay almost as much attention to the wrapping of a gift as to the gift itself.

T F 41. A bow tying machine requires considerable experience for the operator to turn out professional looking work.

T F 42. A store's ability to provide electric appliance service and repair will often be a determining factor in the success of its electric housewares business.

T F 43. The word "guaranteed" has a set, standard meaning.

T F 44. If possible, customers should be told in advance what an appliance repair bill will be.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. If a retailer is to successfully compete for the consumer dollar, his sales promotion and advertising program will have to be ______________ and well ______________.
2. Quite often a manufacturer will pay up to _______ per cent of the retailer's cost of advertising that manufacturer's line.
3. The automatic coffeemaker is becoming virtually a necessity in the home because _______ per cent of American homes make coffee daily.
4. The ______________ ______________ of quality percolators allows the coffee to be brewed either mild or strong.
5. Each manufacturer's percolator has a distinctive shape and design to give it ______________, which often is its best sales feature.
6. The _______ to _______ cup size percolator is the best seller in many areas.
7. Electric mixers save work by completely ______________ the mixer's hand to do other work.
8. Mixer attachments are all considered to be ______________ ______________ devices for the housewife.
9. The most popular electric toaster is the ______________ model
10. The more practical electric sauce pans should be ______________ in shape.
11. The electric kettle should appeal to the customer who likes to prepare ______________ drinks.
12. Tests have shown that electric irons produce best results with ______________, not ______________.
13. Most spring alarm clocks have _______ hour movements.
14. The most widely used electric fan is the _________________ type.
15. For maximum comfort in hot climates, air should be completely circulated in a room every _______ or _______ minutes.

16. As a first step toward increasing giftware sales, the retailer should make his sales personnel gift ______________.

17. A definite factor in selling more expensive giftware items is ____________________.

18. Two very good low-cost aids for bringing in additional gift business are __________________ and __________________ services.

19. The average charge for gift wrapping, when a charge is made, is ________ cents.

20. An important thing to consider in building a good service reputation is to handle merchandise made by a ______________ manufacturer.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Window displays should function as (A) decoration; (B) a place for out-of-date items; (C) traffic-stopping for the store.

_____ 2. Most percolators are made of (A) ceramic; (B) chrome; (C) steel or aluminum.

_____ 3. The party size percolator makes up to (A) 35; (B) 50; (C) 80 cups of coffee.

_____ 4. (A) 40; (B) 60; (C) 80 per cent of a home's cooking is done on the top of the range.

_____ 5. The most popular models of the electric irons are the (A) steam; (B) steam and dry; (C) dry types.

_____ 6. As wedding gifts, clocks rank (A) first; (B) second; (C) third in popularity.

_____ 7. Strike and chime clocks are usually the (A) lower; (B) medium; (C) higher priced clocks.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List six special events many retailers tie-in their promotions with:

(A) ________________________ (D) ________________________
(B) ________________________ (E) ________________________
(C) ________________________ (F) ________________________

2. List four uses of the electric fry pan, other than frying:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

3. List three characteristics of the quality electric can opener:

(A) ____________

(B) ____________

(C) ____________

4. List the two types of steam irons:

(A) ____________ (B) ____________

5. List the three types of clocks on the market today:

(A) ____________ (C) ____________

(B) ____________

6. List five advantages your store will realize in setting up a giftwares section:

(A) ____________

(B) ____________

(C) ____________

(D) ____________

(E) ____________

7. List three neighborhood factors to consider when buying for a giftware department:

(A) ____________

(B) ____________

(C) ____________

Assignment

Units 143-147

CLEANING AND LAUNDRY SUPPLIES

Housecleaning could be a dull chore for the housewife, however, today a home can be kept clean much easier with the aid of dozens of helpful items of every design, style and brand. Brooms and brushes are available in a wide variety of types and sizes. Even rust proof garbage cans and light weight ladders play a part in our high standard of easy living.

The purpose of this lesson is to point out ways to inform the housewife of modern devices and supplies and thereby to increase your sales from this department.

Every housewife needs an assortment of labor-saving devices to adequately meet her needs. If you are to be of assistance to your customers in this regard you must know something about the cleaning and laundry supplies you have for sale. This lesson is designed to help you acquire this information.

Assignment:

1. Read the reference listed below.
2. Prepare a paper, for your instructor, of not more than one page, of questions you might use and answers needed for you to make a sale of one or more items to a customer who "has a floor to wax," keeping in mind the need to serve him properly so he will be satisfied and will return to your store as a customer. You do want the customer to have adequate supplies for his task.
3. Answer the questions below and turn in this assignment by ____________________ .

Reference:

A. Advanced Course in Hardware Retailing, "Cleaning and Laundry Supplies," Unit 15, pp. Intro.-61.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Cleaning and laundry departments in the average retail hardware store have shown increases in sales.

T F 2. Cleaning and laundry supplies offer the opportunity for bringing customers back into the store.

T F 3. For most homemakers cleaning is a pleasant task.

T F 4. Beautiful floors and furniture are very important to the decorative features of a pretty house.

T F 5. Housewives are finding electric floor polishers and waxers to be easy to use and more thorough than older methods of cleaning floors.

T F 6. Hardware stores have very little competition in the cleaning and laundry business.

T F 7. Holiday seasons are good times to feature cleaning supplies.

T F 8. A salesperson working in the cleaning supply department should be an expert on giving house cleaning advice.

T F 9. The old fashioned cotton yarn mop still offers more advantages than the cellulose sponge yarn mop.

T F 10. The saran dust mop's static charge is dissipated into the air when the mop is shaken out, releasing the dust and dirt.

T F 11. Dust mops should not be washed too frequently.

T F 12. Rough floors with heavy dirt should be swept with brooms filled with soft natural or synthetic fibers.

T F 13. Brooms are used in all business and industrial buildings.

T F 14. Many brushes, dirty from use, may be washed thoroughly with soap and water to make them fresh again.

T F 15. All hard-surface floor coverings can be improved in appearance by waxing.

T F 16. Water is used as a carrier for the small solids in self-polishing waxes.

T F 17. Self-polishing waxes should be recommended for most wood floors.

T F 18. The solvent in polishing wax hardens the old wax on floors, resulting in increased beauty with each new application.

T F 19. It is good advice to caution your customers to thoroughly shake self-polishing waxes before using.

T F 20. The amount of traffic has a lot to do with the type wax to be used on a floor.

T F 21. Only self-polishing wax should be used on vinyl.

T F 22. A wax coating on a tile floor reduces the amount of soil embedded in the tile.

T F 23. One should always use a polishing type wax on asphalt tile floors.

T F 24. Concrete floors in homes should be waxed so as to minimize its dirt catching characteristics.

T F 25. The use of waxes, cleaners and polishes is mostly limited to use on floors.

T F 26. Silicone wax is highly recommended for use on floors.

T F 27. No polish or wax on the market will completely protect furniture from abuse and neglect.

T F 28. A creamy white self-polishing wax will remove the yellowing on old ivory piano keys.

T F 29. Since a supply can be used over and over, the continued use of calcium chloride in controlling humidity will result in its costing less and less.

T F 30. The modern housewife of today, with the latest tools and cleansers, can keep a cleaner house than even the wealthiest could yester year.

T F 31. The electric polisher-scrubber can save the housewife many hours of back-aching work.

T F 32. The non-electric floor washer has been found to perform as well as the electric model.

T F 33. The savings realized by a housewife in using an electric rug cleaner will more than pay for the cost of the machine.

T F 34. The solid top ironing board is best fo. steam ironing.

T F 35. Some drying racks, although very compact, offer as much as fifty feet of drying space.

T F 36. Magnesium ladders are of a rigid structure and will break before bending.

T F 37. Weight is always a symbol of quality in galvanized products.

T F 38. Galvanized steel garbage cans are required for households by the health and sanitation ordinances of most American cities.

T F 39. The smaller the spacing between trash burner wires, the more wires used, the more rigid and longer lasting the container will be.

T F 40. The natural sponge is the skeleton of an animal.

T F 41. The cellulose sponge has not been accepted as a good substitute for the natural sponge.

T F 42. Present day chamois is made of certain types of sheepskin.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A clean home is a symbol of a ____________ housekeeper.

2. Many housewives prefer the nylon dry mop because it is highly ________________, enabling it to pick up and hold more dust.

3. For factories, where sweeping areas are larger than in the home, ________________ brooms are easier to use.

4. Solvent waxes come in ____________ or ______________ form and must be rubbed to a shine.

5. For the prettiest, most durable and lasting floor protection, ________________ wax is best.

6. Less rubbing will be required if wax is polished before it is ______________ .

7. Floor experts tell us that the life of a linoleum floor would be extended ______ to _________ times if kept waxed.

8. After cork flooring is sanded a good coating of floor ______________ should be applied before waxing.

9. Paste wax offers a ________________ protection for wood floors.

10. Only use self-polishing wax for wood floors that are well sealed and that have a good ______________ .

11. Waxing is recommended for marble and terrazzo floors to bring out the ______________ and _______________ .

12. On the "Use and Care" chart, it is recommended that ________________ floor surfaces be cleaned and waxed more than three times a year.

13. For best protection, oil polishes should be applied at least once a _______________ .

14. Dust will not stick to a ____________ and ____________ surface.

15. In the average home every year, cooking will vaporize about __________ pounds of grease that will condense upon touching exposed surfaces.

16. To retard tarnish and enhance the beauty of silver, brass, or copper, the housewife should use a _____________, ___________________ cream wax.

17. Some oven cleaners contain a high percentage of ______________, a chemical that could cause skin burns or eye injury if carelessly used.

18. Electric brooms and vacuum sweepers can best be sold by ___________________ their power to the customer.

19. The portable vacuum sweeper is primarily designed for use on items such as drapes, furniture, etc., but can be used on floors on a _ _____________ basis.

20. Good displays in your store can ______________ sales and _________________ demands for products you do not stock.

21. The type of ladder purchased should be determined by the _____________ intended for it.

22. Manufacturers do not paint ladders so inspection for
________________ __________________, __________________
failures and ______________ wood can be made.

23. The most common objection to the metal ladder is the
________________ ________________ .

24. An excellent opportunity for related sales is to suggest a matching _______________ to go with the purchased clothes hamper.

25. When selling water soluble weed killers, there will often be an opportunity to sell a _______________ can.

<u>Multiple-Choice</u>

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Broom sales in hardware stores account for (A) 6; (B) 15; (C) 25 per cent of total broom sales.

_____ 2. Advertising for cleaning supplies should be held (A) every spring; (B) every season; (C) consistently.

_____ 3. The number of sales a store ultimately makes is dependent upon its (A) advertising; (B) sales force; (C) management.

_____ 4. Bath brushes are not made with (A) horsehair; (B) bronze wire; (C) synthetic bristles as filling materials.

_____ 5. (A) Polishing; (B) Self-polishing; (C) Water-emulsion wax for floors can also be used on furniture.

_____ 6. Excessive humidity, or too much air moisture, is a problem faced by homeowners in approximately (A) 1/3; (B) 1/2; (C) 2/3 of the United States.

_____ 7. Clothes hampers should be (A) well ventilated; (B) air-tight; (C) made of chrome.

_____ 8. (A) Aluminum; (B) Galvanized steel; (C) Polyethylene garbage cans are noiseless, break-resistant, non-rusting, non-denting, light weight, colorful and easy to clean.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the two general categories of floor mops:

(A) ______________________ (B) ______________________

2. List four uses for the block sponge mop:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

3. List four disadvantages of the wool mop:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. List the four types of brooms:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

5. List the two basic types of brushes and brooms:

(A) ______________________ (B) ______________________

6. List the eight types of brush filling materials:

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________ (H) ______________

7. List four advantages of waxing floors:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

8. List the four types of furniture polishes:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

9. List the two newer waxes that enjoy the largest sales volume of all wax polishes:

(A) ______________ (B) ______________

10. List the four major types of commercial glass cleaners:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

11. List the two main reasons accounting for the popularity of home rug and upholstery cleaners:

(A) ______________________________

(B) ______________________________

12. List three related items a housewife might need with her new ironing board purchase:

(A) ______________ (C) ______________

(B) ______________

13. List the three broad classifications of ladders:

(A) ______________________ (C) ______________________

(B) ______________________

14. List four advantages of using zinc-coated steel for galvanized cans, pails, and tubs:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

Assignment
Sheet No. 22

Covering
Units 148-151

PLUMBING, HEATING AND BUILDING MATERIALS -- PART I

Through advertising, proper merchandising, and a service attitude of store personnel, sales of plumbing, heating, and building materials can be increased. New building and home construction is a major factor in helping our economy to grow. Building costs are high as well as repair costs to homeowners. During the past few years many home craftsmen, along with those that are not handy with tools, are doing most of the minor repairs around the house. Most retail hardware sales will be to the homeowner who is doing his own repair work.

An important aspect of the do-it-yourself movement is the changing and improvement of the facilities in the home which are dependent on plumbing. Fittings, fixtures and tools for home repair work must be stocked and displayed in an adequate and proper manner. A sales trainee needs to be thoroughly familiar with the tools, materials, and equipment in his department. A detailed study of manufacturer's literature and a review of trade publications will help the student become more proficient in sales. Manufacturer's literature on new items, such as the new plastic pipe and fitting lines, will be most helpful.

Repairs and accessories and heating are the major part of the sales of plumbing and heating materials. This lesson will help the student become acquainted with home plumbing and heating problems. It will show him how he can help customers solve their problems and, at the same time, increase sales.

Assignment:

1. Read the reference below.
2. Study manufacturers literature and other reference books to determine the methods of pipe measurement and terminology until you can identify the various sizes by sight.
3. Study manufacturers information dealing with the new types of plastic pipe.
4. Answer the questions below and turn in this assignment by ________________ .

Reference:

A. ACHR, Hardware, Unit 16, pp. 1-33.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Burring is the same operation as reaming.

T F 2. Chamfering is the process of tapering the inside edge of a pipe so it will not obstruct the flow of water.

T F 3. A hex pipe wrench has serrated gripping cuts on the jaws like a regular pipe wrench.

T F 4. A stillson wrench is more subject to damage from abuse than a one piece regular pipe wrench.

T F 5. There is a metal to metal contact when using a strap wrench.

T F 6. A monkey wrench has no teeth.

T F 7. The chain wrench slips in one direction and grips in the other.

T F 8. All pipe reamers are cone shaped.

T F 9. The most commonly used pipe and tubing cutters differ only in size and have a single cutting wheel.

T F 10. Grooved rollers are found on tubing cutters designed to cut close to the flare.

T F 11. Four wheel pipe cutters are made only for rapid cutting action on pipe 2 1/2 inches or larger.

T F 12. Pipe vises which hold the work piece with the aid of a chain usually have a greater range of uses than those with fixed and movable jaws.

T F 13. Power threading and cutting tools are carried by most hardware stores since professionals use them.

T F 14. The sale of a faucet washer can lead to the sale of other items needed to complete the job--such as hand tools.

T F 15. Swing spout washers have a steel retaining ring.

T F 16. A bibb screw holds the bonnet packing in place.

T F 17. Pipe joint compounds must be carefully selected to adequately do the job in <u>each</u> particular case.

T F 18. Penetrating solvent is available which can loosen or free pipes and parts which are frozen and can be profitably sold even when it is not prominently displayed and an unknown brand.

T F 19. Bath accessories can be sold just as effectively and profitably if they are kept in the stock room as on an open self-service display.

T F 20. Water pipe comes only in galvanized finish.

T F 21. Plastic pipe is suitable only for use in carrying water.

T F 22. Plastic pipes cannot be joined with metal plumbing.

T F 23. Manufacturers say that plastic pipe should not be used at temperatures over 120-130 degrees F.

T F 24. Some rigid plastic pipe must not be exposed to freezing temperatures.

T F 25. All plastic pipe can be used to carry liquids for human consumption.

T F 26. Copper pipe and tubing has some of the same advantages as plastic pipe over steel or iron pipe.

T F 27. Fibre soil pipe is joined with threads and couplings or "O" rings.

T F 28. Streel elbows have an inside thread on both ends of the bend or elbow.

T F 29. A side outlet elbow is the same shape as a tee with three outlets.

T F 30. A side outlet cross has five threaded openings.

T F 31. Copper pipe fittings always have at least one end which is smooth so they can be soldered.

T F 32. Soil pipe fittings are the same basic patterns whether for use with plastic or cast iron pipe.

T F 33. An angle valve and a globe valve are built with the same inside construction and design.

T F 34. Check valves are so installed that the ball or clapper will fall shut by gravity.

T F 35. Flush valves use less water than flush tanks.

T F 36. Common mixing faucets can always be depended upon to mix cold and hot water to a uniform temperature.

T F 37. In frost free hydrants the valve is located in the head under the handle.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Plumbing tools fall into two groups: those which (a) __________ the parts for the job and those which (b) __________ the parts.

2. Pipes are joined by __________, __________ and __________ and __________ or __________.

3. Regular pipe wrenches are offered in sizes from ______ to ______ in length.

4. A "hex" pipe wrench may be used on ______ sided or ______ sided fittings.

5. A strap wrench is the preferred type for use on __________ pipe or tubing and on pipe made from __________, __________ and __________.

6. The two types of pipe reamers are the __________ and the __________.

7. Pipe reamers can be used to __________ __________ from pipe and __________ __________ __________ __________ __________.

8. Steel pipe may be cut with a __________ but a straight, clean cut is difficult.

9. The tool used to thread pipe is called either a __________ __________ or a __________ __________.

10. The two types of pipe vises are __________ and __________.

11. The most common plumbing problem is __________ __________.

12. To prevent premature faucet washer failure, scored or pitted faucet seats must be __________.

13. Two causes of broken pipes are __________, and __________ __________ or __________.

14. Beveled slip joint washers or cone washers should have a brass __________ __________ under them.

15. Sink frames are made from two types of material: __________ __________ and __________.

16. Because plastic pipe is easily cut and scarred ____________ wrenches must be used when installing.

17. Plastic pipe is about ________ the weight of iron pipe.

18. Copper tubing or pipe is commonly sold in sizes from ________ to ________ for plumbing use.

19. Soil pipe is made in both __________ and ____________ _______________ types.

20. Unions with ____________ ____________ seats are used primarily where high steam pressures are encountered.

21. Insert type plastic fittings use a _____________ _____________ to hold the plastic pipe in place.

22. ____________ valves and ____________ or ____________ valves both allow unobstructed water flow especially for low pressure applications.

23. Flush valves should generally be installed only on pipe of ________ or larger diameter.

24. Flush valves should only be sold where _____________ _______________ in g.p.m. and the pressure is adequate.

25. Automatic mixing valves are used mostly for ______________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The chief advantage of an end pipe wrench is the ability to (A) stand great strain for disassembling pipes; (B) stand stillson pattern; (C) ability to work in close quarters; (D) ability to fit a wider range of pipe sizes.

_____ 2. Recent trends in bath accessories have not included (A) gift sets of multiple items; (B) self-service displays; (C) pre-packaging of individually carded items; (D) display panels with accessories permanently attached; (E) development of unique items such as ash trays, etc.

_____ 3. Floor flanges are used when (A) fastening a pipe structure to the wall or floor; (B) making a neat joint of pipes which enter the floor; (C) joining lengths of pipe which go through a wall; (D) flanging pipe at a union.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Fittings into which threaded pipe may be screwed are:

   (A) ____________________ (D) ____________________
   (B) ____________________ (E) ____________________
   (C) ____________________

2. Give the full name and the initials for the three common types of pipe threads.

   (A) ____
   (B) ____
   ____
   (C) ____
   ____

3. The more common types of sink frames are the:

   (A) ____________________ (C) ____________________
   (B) ____________________

4. Pipes used by the homeowner fall into the following broad categories:

   (A) ____________________ (C) ____________________
   (B) ____________________ (D) ____________________

5. List the three types of flush valves.

   (A) ____________________ (C) ____________________
   (B) ____________________

Assignment
Sheet No. 23

Covering
Units 152-154

PLUMBING, HEATING AND BUILDING MATERIALS -- PART II

This section of Study Unit 16 covers chapters IV, V, VI and VII and will seek to acquaint you with building materials, floor and wall coverings, heating equipment and other miscellaneous supplies.

Whenever you are selling items in these areas the changes for related sales are particularly good. You must learn to always be watchful for an appropriate opportunity to suggest items of this sort and demonstrate or at least discuss their benefits.

The do-it-yourself movement has created great demand for aluminum products and supplies related to covering floors, walls, counter tops and bathroom areas.

This assignment sheet attempts to cover this important area of hardware supplies and materials.

Assignment:

1. Read the reference listed below.
2. Collect information from the various floor covering manufacturers concerning the tile and adhesives appropriate for specific applications.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. ACHR, Hardware, Unit 16, pp. 34-68.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The word sash when referring to wood products means a single unit with any configuration or pattern of movement.

T F 2. The sash used in home construction are 1¼" thick.

T F 3. When sash is "glazed" the choice of glass is usually left up to the purchaser.

T F 4. Awning windows and jalousie windows both pivot open to admit ventilating air.

T F 5. Asphalt roofing is simply cellulose fibres saturated with asphalt.

T F 6. "Roll roofing" and "saturated felt" are different names for the same product.

T F 7. Hip roofs require 15% more material because of waste.

T F 8. An entirely different procedure <u>must</u> be followed when estimating roof area for roofing materials than when estimating for painting.

T F 9. Reducing house cleaning is an important advantage in insulating.

T F 10. Cement which contains hard lumps is all right to use if the lumps are removed.

T F 11. Aluminum requires special finishing techniques and materials if painting is necessary.

T F 12. Home workshop aluminum has been especially tempered for easy workability.

T F 13. All the common woodworking tools can be used on the do-it-yourself aluminum materials.

T F 14. Aluminum nuts, bolts and screws are only plated so they must be handled carefully to avoid damaging the plating and causing corrosion after short exposure to the weather.

T F 15. Linoleum may be installed on concrete which is in contact with the ground.

T F 16. Plastic flooring may be installed on any type of suspended floor.

T F 17. "Tile" flooring refers only to the shape of the section not the material.

T F 18. Asphalt tile was developed for use on concrete floors the dampness and alkali from the cement were problems

T F 19. Most types of floor tile are sold in 9 x 12 squares.

T F 20. Cork tile is the least resilient of all flooring materials.

T F 21. Cork tile is unaffected by oils, fats and greases.

T F 22. "Felt base" floor coverings with printed enamel surface patterns are low in cost and suited for people who do not want a permanent installation.

T F 23. High pressure plastic laminates are used for floor coverings in high traffic areas.

T F 24. A feature of many new tiles and floor coverings is that they can be installed over rough and worn floors after proper cleaning so the adhesive will stick.

T F 25. The seasonal expansion of floor boards can crack linoleum or sheet flooring.

T F 26. The same adhesive may be used to install both rubber tile and vinyl tile.

T F 27. Some adhesives will stain the tile with which they are used if excess is spilled on the surface.

T F 28. The unvented gas circulating heater cannot be equipped with automatic controls.

T F 29. Some models of the electric heaters can be equipped with automatic thermostat and controls.

T F 30. Portable room heaters are often sold to heat an area not covered by a home's normal heating system.

T F 31. Fibre glass insulation material can be sold for sound control in hi-fi equipment.

T F 32. Furnace filters (renewable) are usually replaced at least once during the year.

T F 33. Related merchandise should be grouped in one area of the store.

T F 34. Door mats can be sold for use wherever floor wear is heavy.

T F 35. The primary function of metal mouldings is that of decoration.

T F 36. Metal mouldings which are installed before the panel of material is put into place do not hide the fastening method from view.

T F 37. Stainless steel mouldings are more popular than aluminum.

T F 38. Counter edgings may be applied with drive screws.

T F 39. Angle strips cannot be bent; they must be mitered for a corner.

T F 40. Cap sections are usually of the under-applied type.

T F 41 Some inside corner and cove mouldings are the same shape.

T F 42. Aluminum door saddles are used primarily for inside areas where traffic is not a factor.

T F 43. The door must usually be cut to get the proper clearance over an aluminum saddle.

T F 44. Cushion type weather strip comes in rolls and is cut to length as needed.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When estimating the amount of plywood needed to cover a large area ________ per cent should be added for scrap.

2. Unit type windows may be made from ______________, ______________ or ______________.

3. For a roof with a slope of ________ to 1" or more, 16" or 18" cedar shingles may be used if they are installed with the correct exposure.

4. Only the number ________ grade of cedar shingles is recommended for the roofing of permanent buildings.

5. All roof coverings except those made from ______________ are packaged to cover 100 square feet of surface per package.

6. Aluminum bar stock and shapes for do-it-yourself work come in either ________ or ________ foot lengths.

7. Linoleum consists of a "mix" bonded to a ______________ or ______________ backing.

8. Tiles (floor) are sold in ________ or ________ thickness or gauges.

9. Linotile and rubber tile are both sold in ________ x ________ oblongs and ________, ________ and ________ squares.

10. Tiled granulated cork wall coverings come in sizes of ________, ________ and ________.

11. When determining the size of a heater the ______________ ______________ must always be known.

12. Fibre glass batts can be cut with ______________, ______________ ______________ or a ______________.

13. Fibre glass insulation comes in rolls ________ feet long and ________ inches wide.

14. The adequacy of an attic fan will depend upon two factors: (1) the ______________ of the house and (2) the ______________ of desired air changes per minute.

15. The cost of ______________ and the ______________ cost are the two largest factors when considering a fan type cooling system.

16. The two types of metal mouldings are the ______________ type and the under-applied type.

17. Moldings are fastened with either __________ __________ or __________ __________ screws.

18. Caps sections are made with openings for material of ______, ______ and ______ thickness.

19. __________ __________ channel is made so that no fasteners are required to hold it in place on the counter edge or sink top.

20. Spring type metal weather strip is sold in rolls ______ feet in length.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the kinds of materials normally sold through a hardware store for roofing purposes.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

2. The five general types of insulation materials are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

3. The four types of dry pre-mixed cement or lime products are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

4. The three types of Portland Cement are:

(A) ____________________ (C) ____________________

(B) ____________________

5. List the materials used in an aluminum screen.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

6. The different types of linoleum which are available are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

7. The tools required for properly installing tile could include the following:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

8. Gas heaters are divided into four categories.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

Cabinetmaking, A Course of Study Designed for Cooperative Part-Time Students Employed in Cabinetmaking Trades.

Kirby, Jack * Robinson, Orin
Missouri Univ., Columbia. Dept. of Industrial Education
Missouri State Dept. of Education, Jefferson City

Pub Date - Jan65
MF AVAILABLE IN VT-ERIC SET 166p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *CABINETMAKERS, *CABINETMAKING, GRADE 11, GRADE 12, *COOPERATIVE EDUCATION,

This study guide is for use by preparatory or cooperative students at the secondary or post-secondary level. It was developed by teacher educators and research assistants with help from a consultant committee. Unit titles are (1) The Cabinetmaker and His Work, (2) Selection, Use, and Care of Hand Tools, (3) Selection, Use, and Care of Basic Power Equipment, (4) Specialized Cabinetmaking Equipment, (5) Safety for the Cabinetmaker, (6) Tool Sharpening, (7) Reading Drawings and Planning the Work, (8) Estimating Material and Calculating Costs, (9) Lumber and Lumber Processing, (10) Plywood, Veneers, and Special Materials, (11) Framing Square and Geometric Layout, (12) Wood Joinery, (13) Construction of Cabinets and Built-Ins, (14) Construction of Cabinet Parts and Special Features, (15) Furniture Manufacturing, (16) Finishing Procedures, (17) Doors, Windows, and Sash Construction, (18) Sash, Trim, and Frames, (19) Fasteners and Hardware, (20) Adhesives, (21) Furniture Restoration and Refinishing, and (22) The Small Woodworking Enterprise. Assignment sheets for each unit include the assignment, references, and objective-type questions. Supplementary materials include a job analysis and a progress record. Students should be at least high school juniors, and the teacher should be a qualified coordinator or trade teacher in this 180-day course. An answer key (VT 002 073) is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

Phoenix, Arizona 85017.

FOREWORD

This course of study, consisting of an analysis of CABINETMAKING, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching cabinetmaking on an individual basis in cooperative part-time programs.

The original analysis was prepared by Mr. Robert C. Rosenquist, formerly of Illmo-Fornfelt High School, Illmo, Missouri and the original assignment sheets were prepared by Dr. Merlin H. Kleinbach, formerly Research Assistant in Industrial Education at the University of Missouri.

Special credit is due to Mr. Jack Kirby and Mr. Orin Robinson, Research Assistants in Industrial Education at the University of Missouri, who prepared the present revision.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education, University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education, University of Missouri, who supervised the preparation of this manual and edited the manuscript. Credit is due Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

TABLE OF CONTENTS

Assignment Sheets:

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.

2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.

3. Development of those personal-social traits which are essential for the successful worker.

The first group of the "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." And the third group--the personal-social traits--has been listed under "Personal Qualifications of the Cabinetmaker" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker-s training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets available in a separate manual, have been prepared to enable the coordinator to score quickly the objectives tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT WORKER

Cabinetmaking is one of the most highly skilled of the woodworking trades. The cabinetmaker has been called "the aristocrat of the carpenters." The finished work of the cabinetmaker is subject to much closer inspection by the purchaser than is the work of others in the field of woodworking. The cabinetmaker works with the finer hardwoods and fits them together with close accuracy and attention to details of grain and color.

The term cabinetmaker originally meant one who could produce a finished article from plans to the completed product without the assistance or the skills of any other person. The term has come to mean any person who performs any one of the operations of the processing of wooden cabinets, furniture or other specialty items.

With the increase in specialization in all phases of industry today, the individual with the greatest amount of training in an occupation is the one most likely to be hired and promoted on a particular job. With this in mind, the youth who desire to enter the cabinetmaking field will find it advisable to be well prepared for entrance into that field.

Opportunities in Cabinetmaking

The cabinetmaker has the opportunity to work with both hand tools and power equipment to produce articles of beauty and function. His work, though comparatively specialized, covers a relatively wide range of activity. The nature of the work of a cabinetmaker places him indoors much of the time so that he is not exposed to the elements as other building trades workers are.

The wages of the skilled cabinetmaker are in general among the highest in the building trades. It is not unusual for a cabinetmaker to earn over $4.00 an hour. The work-week is usually forty hours, with time-and-a-half paid for any time worked beyond a standard workday of eight hours. Building trades workers are ordinarily included in health and insurance programs paid for primarily by the employer. Some have the benefit of pension plans.

Requirements for Cabinetmaking

A broad general education on the high school level will aid the individual who has entered cabinetmaking on a part-time basis. His course work should have included such subjects as industrial arts drafting and blueprint reading, woodwork, mathematics applicable to layout work, general science or elementary physics. He may, if possible, take a preparatory course in vocational cabinetmaking and enter on the job training as a more advanced learner.

An apprentice cabinetmaker must be between 16 (and in some cases 17) and 24 years of age. The training usually extends over a four-year period and covers the use of tools, materials and machines used in the trade, instruction in drafting and blueprint reading, mathematics, standards of construction and design, as well as standards for wood and other materials. This type of training enables one to become a journeyman cabinetmaker. Although the standards for these requirements are high they may be expected to increase in view of the technological developments which have and are continuing to take place.

Personal Qualifications of the Cabinetmaker

More and more, men who are seeking jobs or wanting to go into business for themselves need good personal qualifications. Holding a job is also largely dependent upon one's personality. Satisfaction on the job will be determined by the willingness, respect and cooperative attitude that one has toward his job and his fellow workers.

With a conscientious effort, one can improve his personal-social traits. In order to do this, one must know what to improve, how to improve, and why improvement is necessary.

Among the personal-social traits of chief importance to the cabinetmaker are the following:

Good Health. The cabinetmaker must have a healthy physical make-up with abundant energy, muscular coordination, mechanical dexterity, good eyesight, and steady nerves.

Industry. This character trait means a habit of careful, thoughtful energetic attack upon the job without loitering or wasting time.

Cooperation. Cabinetmaking requires a willingness to work cooperatively with fellow workers. This means an attitude of readiness to assist others when they need help, and to join in group undertakings.

Personal Appearance. Clothing should be worn that affords safety and efficiency on the job and makes a pleasing impression upon the people he serves.

Consideration of Others. A thoughtful attitude toward making things easy and pleasant for others, such as keeping things in order, putting tools away, and doing his full share of work is an important trait for a cabinetmaker to possess.

Initiative. The ability to see what needs to be done and to go ahead without constant supervision is an essential trait of a cabinetmaker.

Patience. Much of the work of the cabinetmaker is with small parts and involves delicate manipulation, and it requires patience as well as skill to do the things necessary to complete a product.

Alertness. The ability to pay close attention, to respond quickly and to concentrate on one's work.

Self-Control. Maintain a pleasant disposition and keep your temper under control.

Courtesy. Respect the other person's point of view, his interests, and wants. This may require effort at times, but it will pay off.

Readiness to Assume Responsibility. This means that you should not refuse to undertake a task because it is difficult and when once undertaken you should carry it through to completion.

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
44. Set nail or brad		
45. Select and drive screws	2	45. Kinds and types of sharpening tools
46. Clamp stock for gluing		
47. Dress screwdriver		

Power Equipment and Safety Rules

Circular Saw

48. Adjust circular saw	3	48. Types and sizes of saws
49. Make finger board for ripping on circular saw	3	49. Range of work which can be done on saws
50. Rip stock to width		
51. Cut stock to length		
52. Cut coves on circular saw		
53. Taper rip on circular saw		
54. Change saw blades		
55. Sharpen, set and gum circular saw blade	5	55. Rules for safe operation of a circular saw

Band Saw

56. Adjust band saw	3	56. Types and sizes of band saws
57. Make circle cutting jigs for the band saw	3	57. Range of work which can be done on a band saw
58. Saw curves	5	58. Rules for safe operation of a band saw
59. Rip stock		
60. Cut off stock		
61. Resaw stock		
62. Make patterns for cutting duplicate parts		
63. Repair broken blades		
64. Sharpen and set blades		

Jig Saw

65. Adjust jig saw	3	65. Types and sizes of jig saws
66. Saw inside curves	3	66. Range of work which can be done on a jig saw
67. Saw outside curves	5	67. Rules of safe operation of a jig saw
68. File with jig saw		
69. Sand with jig saw		

JOB TRAINING What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Jointer		
70. Adjust jointer	3	70. Types and sizes of jointers
71. Joint an edge	3	71. Range of work which can be done on jointers
72. Square stock	5	72. Rules for safe operation of a jointer
73. Cut chamfer or bevel		
74. Surface narrow stock		
75. Cut rabbet		
76. Cut taper		
77. Sharpen and replace jointer knives		
78. Adjust planer	3	78. Range of work which can be done on planers
79. Surface stock to thickness	5	79. Rules for safe operation of a planer
80. Sharpen and replace planer knives		
Drill Press		
81. Adjust drill press	4	81. Types and sizes of drill presses
82. Change drills	4	82. Range of work which can be done on drill presses
83. Drill holes with drill press	5	83. Rules for safe operation of a drill press
84. Make L-shaped and inclined jigs for production drilling		
85. Rout with drill press		
86. Sharpen drill bits		
Shaper		
87. Adjust shaper	4	87. Range of work which can be done on wood shapers
88. Shape straight edges	5	88. Rules for safe operation of a shaper
89. Make guide fences for shaping circular stock		
90. Shape inside and outside curves		
91. Make patterns and set-ups for shaping irregular designs		
92. Change shaper knives

Assignment
Sheet No. 1

Covering
Units 1-6

THE CABINETMAKER AND HIS WORK

One of the more attractive occupations open to individuals interested in the woodworking industry is that of the cabinetmaker. Even though mass production methods and specialization of jobs are used extensively, the individual with a broad background of training and experience in the field will always find an outlet for his talents. There is enough variety of work, also, to keep the job interesting.

The occupation requires an individual who can make intelligent use of his ability to use arithmetic. He needs keen vision and a high degree of eye-hand coordination where precision work is concerned. The minimum age limit is usually specified by state and federal requirements but the maximum age of the working cabinetmaker is limited only by a person's physical and mental ability to perform competently on the job.

In this assignment you will have an opportunity to learn the general classifications of the cabinetmaker's work, the divisions of the industry, and the general working situation.

<u>Assignment</u>:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

<u>References</u>:

A. Feirer, <u>Woodworking For Industry</u>, p. 25.
B. Dahl and Wilson, <u>Cabinetmaking and Millwork</u>, pp. 1-9.
C. Towers, <u>Cabinetmaker's Manual</u>, pp. 11-22.

<u>Questions</u>:

<u>True-False</u>

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Cabinets of years ago were quite elaborate and fancy.

T F 2. The work of the cabinetmaker and the millman are very close to being the same.

T F 3. A knowledge of blueprints and the ability to use them is essential to the cabinetmaker.

T F 4. The present trend in cabinetmaking is toward specialization.

T F 5. The items supplied by the millwork plants are generally attached to a building and become a part of it.

T F 6. Unlike other industries, cabinetmaking has not been placed on a mass-production basis.

T F 7. A cabinetmaker needs to be able to perform all of the basic arithmetic processes easily.

T F 8. A knowledge of the various products used in the wood industry is essential for the cabinetmaker.

T F 9. Cabinetmaking is ordinarily a seasonal job, even for the highly skilled worker.

T F 10. A cabinetmaker works only with hand tools.

T F 11. The training and education of the cabinetmaker should be more than just a regular high school education.

T F 12. The outlook for employment in the cabinetmaking field is extremely good.

T F 13. As the requirements grew for a variety of home furnishings, skills evolved which became known as cabinetmaking.

T F 14. Specialized woodworking functions were beginning to emerge in France as early as Fifteen Hundred A.D.

T F 15. Today, the cabinetmaker may build a variety of products, such as, store fixtures, office equipment, and household furnishings.

T F 16. Wood turning is a specialized function in furniture manufacturing.

Completion

Directions: Fill in the blank's) in each statement with the word(s) required to complete the sentence correctly.

1. Woodworkers who specialize in trim work are known as ______________ carpenters.

2. A cabinetmaker, to be successful, must perform his duties with ______________ and ______________.

3. Items such as sash, cabinets, and paneling are all included under the heading of ______________.

4. Display and storage cases, show windows, and paneling are produced in a(an) ______________ plant.

5. The individual who specializes in the set up, maintenance, and the operation of power equipment and the shaping of wood with machines is called the ______________.

6. Planning the sequence of assembly is the job of the ____________.

7. The work of the layout man involves laying out and marking the stock and many times is classified as a __________ ____ job.

8. The minimum age requirements for cabinetmakers is subject to ______________ and ______________ laws.

9. The number of workers in cabinetmaking is about ______________.

10. A cabinetmaking apprenticeship usually takes from __________ to __________ years.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In the more specialized shops the work of the benchman usually involves just (A) layout; (B) assembly; (C) cut out work; (D) drawing.

_____ 2. Work including making up bills of material, making working drawings, and deciding construction details is usually done by the (A) benchman; (B) layout man; (C) detailer; (D) foreman.

_____ 3. The maximum age limit for a cabinetmaker is (A) 60; (B) 65; (C) 70; (D) usually not set at any particular age.

_____ 4. Cabinetmakers are usually paid (A) on an hourly basis; (B) on a piece rate basis; (C) at the completion of the job; (D) on a yearly basis.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Cabinetmaking became a fine art in the eighteenth and nineteenth centuries because of the work of such men as:

(A) ________________________ (D) ________________________

(B) ________________________ (E) ________________________

(C) ________________________

2. The four general classifications of workers in the cabinetmaking field are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

3. Speciality plants in the woodworking industry include those making:

(A) ____________________ (F) ____________________

(B) ____________________ (G) ____________________

(C) ____________________ (H) ____________________

(D) ____________________ (I) ____________________

(E) ____________________ (J) ____________________

Assignment
Sheet No. 2

Covering
Units 7-47

SELECTION, USE, AND CARE OF HAND TOOLS

One of the best ways to judge a fine craftsman is by the way he chooses, handles, and cares for his equipment. Carefully chosen equipment will assure the cabinetmaker of quality tools and these, in turn, will facilitate better work. Careful use and maintenance of these tools will insure their accuracy and long life.

While it is true that many operations in cabinetmaking are performed with power equipment, a good deal of hand fitting is still necessary in certain phases of the industry. It is therefore essential that the cabinetmaker have a good knowledge of hand tools and their uses.

In this assignment one will have an opportunity to learn the names and types of the most important hand tools used in cabinetmaking. One will further learn how to use and care for them. One will also observe how certain jigs and fixtures can be used to facilitate and permit certain work.

Assignment:

1. Read the references listed below.
2. On page 22 of Reference B is a table showing the various files to be used in sharpening hand saws. Make a list of the different saws by type and size at your place of employment and opposite each type indicate the file that should be used for sharpening it.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking For Industry, pp. 173-184.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 17-41.
C. Towers, Cabinetmaker's Manual, pp. 153-195.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Rules used in woodworking are usually divided into fractions of 1/32 of an inch.

T F 2. A bench rule should not be used as a straightedge.

T F 3. The marking gauge is used to mark off lines parallel to the grain of stock.

T F 4. The auger bit file is made with both ends alike.

T F 5. In general, the larger the teeth of a saw, the larger the file needed to sharpen it.

T F 6. The number of points per inch on a saw is always equal to the number of teeth per inch.

T F 7. A coarse-tooth saw would be better for cutting green lumber than a fine-toothed saw.

T F 8. A skew-back saw can be used as a straight edge in an emergency.

T F 9. A crosscut saw can be used to cut with the grain.

T F 10. The backsaw receives its name from the fact that it cuts primarily on the back stroke.

T F 11. The cabinet saw is a rip saw and crosscut saw combined.

T F 12. The smooth plane is used to smooth the edge of a long board to make a close-fitting joint.

T F 13. A draw knife is used for removing small amounts of wood.

T F 14. The cutter of a block plane is set at a low angle.

T F 15. The Surform tool comes only in the flat file shape.

T F 16. Scrapers are used to smooth a surface after it has been sanded.

T F 17. A hand scraper should actually remove shavings when used to scrape a surface.

T F 18. A socket type chisel is better to use with a mallet than a tang type.

T F 19. A cabinet scraper is used to shape irregularly shaped objects or edges.

T F 20. The expansion bit is used to enlarge holes.

T F 21. A bit stock drill may be used to drill holes in either wood or metal.

T F 22. Straight shank twist drills are available in both fractional and decimal sizes.

T F 23. A bit gauge is used to check the size of a bit.

T F 24. A sixteen-ounce hammer is preferable for use with heavier nails.

T F 25. A nine-ounce ball peen hammer is used to drive brads and small nails.

T F 26. Mallets are used to provide an impact which will not cause damage to the head of a tool handle.

T F 27. Nail sets are sets of nails containing a variety of sizes.

T F 28. A nail punch is used to drive nails below the surface of the wood.

T F 29. Calipers may be used to step off equal distances.

T F 30. A good rule to follow when sawing is to always saw on the waste side of the line.

T F 31. The block plane has its plane iron set at a lower angle than other bench planes.

T F 32. The duplex rabbet plane gets its name from the fact that its blade may be placed in two different positions.

T F 33. The jointer plane gauge is used to measure the angle of bevels cut with a jointer plane.

T F 34. The edge of a cabinet scraper blade is sharpened to an angle of 45 degrees.

T F 35. The cabinet scraper is pushed rather than pulled for ordinary work.

T F 36. A chisel should be driven into the wood at a slight angle.

T F 37. When chiseling end grain always work away from the center.

T F 38. In cutting along the grain of the wood, the chisel is used with the bevel side up.

T F 39. Mallets can be used to drive tight-fitting joints together.

T F 40. A regular wing-tip screw driver may be used to drive screws into counterbored holes.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Tools used to measure distances and to lay out circles, angles, plumb lines, and level lines are called _______________ tools.

2. Steel square gauges or clips are technically called _______________ _______________.

3. When circles of a large radius are to be drawn, ____________ ____________ attached to a straight rod are used.

4. Measurements of cylindrical surfaces are taken with the aid of ____________.

5. The mortise gauge has ________ marking pins.

6. The edge of a scraper blade is turned by using a(an) ____________

7. For average work a rip saw should have from ________ to ________ points per inch.

8. A general purpose crosscut saw should have about ________ points per inch.

9. Small openings in wood are cut with a ____________ saw.

10. Very smooth joint cuts can be made with a ____________ saw.

11. The length of a hand saw is measured from the ____________ to the ____________.

12. Work is held and sawed to specified angles in a(an) ____________ ____________.

13. It is best to have a plane with a ____________ bottom for cabinetmaking.

14. The longest of the hand planes is the ____________ plane.

15. The plane used for all-around purposes is the ____________ plane.

16. The jointer plane is used primarily on the ____________ of boards.

17. End grain is best planed with a ____________ plane.

18. Cabinet scrapers are used to remove ____________ or ____________ ____________ left by a plane.

19. The two types of chisels are the ____________ type and the ____________ type.

20. In chisels which measure from ________ to ________ inches in size, the blade widths are graduated.

21. A 5/8 inch hole would be bored by a number ________ auger bit.

22. Expansion bits with 2 cutters will bore holes from one inch to ________ inches.

23. Wood is removed to receive the heads of flat head screws by using a(an) ______________ bit.

24. Sizes of hammers are indicated by the weight of the head which is given in ______________.

25. Phillips head screwdrivers are available in __________ sizes.

26. Measurements of cylindrical surfaces are taken with the aid of ______________.

27. The try square has its blade set permanently at __________ degrees.

28. Angles needed for miter fitting of trim and moulding may be easily determined with the use of the ______________ ______________.

29. The teeth of the ______________ look and perform like a series of little chisels in the sawing action.

30. Curved saw cuts can be made with the ______________ saw or the ______________ saw.

31. When possible, planing should be done ______________ the grain.

32. Rough boards are cleaned up with a(an) ______________ plane.

33. Bench planes are available with either ______________ or ______________ bottoms.

34. The grooving plane is used most by men engaged in installing ______________.

35. The grooving plane is equipped with __________ cutters and cuts grooves ranging in width from __________ of an inch to __________ of an inch.

36. When boring a hole, a piece of waste stock may be placed on the side opposite where the hole was started in order to prevent ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The tool used to measure and lay out angles of any desired degree is the (A) steel square; (B) sliding T-bevel; (C) try square; (D) steel square gauge.

_____ 2. A level is used to check a surface for (A) true horizontal; (B) true vertical; (C) both true horizontal and true vertical; (D) small deviations from horizontal.

______ 3. To establish a vertical line of considerable length, you should use (A) a plumb bob and line; (B) trammel points; (C) a sliding T-bevel; (D) a framing square.

______ 4. A common size cross cut saw is (A) 20", 18 point; (B) 22", 10 point; (C) 26", 10 point; (D) 30", 8 point.

______ 5. The number found on the heel of the saw indicates the (A) number of teeth per inch; (B) width of saw in inches; (C) number of points per inch; (D) inspection number.

______ 6. Curves in wood can be cut with a (A) back saw; (B) cross-cut saw; (C) coping saw; (D) dovetail saw.

______ 7. The router plane is used to (A) level the bottom of dadoes; (B) cut dadoes and rabbets; (C) rout rough places out of wood; (D) cut a variety of shapes in molding.

______ 8. Irregularly shaped edges are formed with a (A) cabinet scraper; (B) draw knife; (C) handscraper; (D) spokeshave.

______ 9. A number 8 auger bit will bore a hole with a diameter of (A) 1/8"; (B) 1/2"; (C) 5/8"; (D) 8/32".

______ 10. Partial turns with a brace can be accomplished because of a: (A) bit extension; (B) gimlet; (C) ratchet; (D) pinion.

______ 11. An automatic drill is designed to use drills that are (A) fluted twist; (B) fluted without twist; (C) double twist; (D) single twist.

______ 12. Edge clamping of large pieces is usually done with (A) bar clamps; (B) hand screws; (C) C-clamps; (D) braces.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The four broad classifications of hand tools are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Three main uses for a try square are:

(A) ____

(B) ____

(C) ____

3. Three uses of dividers are:

(a) ______________________________

(b) ______________________________

(c) ______________________________

4. The most commonly used planes for flat surface work are:

(a) ________________ (d) ________________

(b) ________________ (e) ________________

(c) ________________

5. Four uses of a Forstner bit are:

(a) ______________________________

(b) ______________________________

(c) ______________________________

(d) ______________________________

6. Two important considerations when selecting a claw hammer are:

(a) ________________ (b) ________________

7. Four types of clamps generally used by a cabinetmaker are:

(a) ________________ (c) ________________

(b) ________________ (d) ________________

SELECTION, USE, AND CARE OF BASIC POWER EQUIPMENT

Power equipment has come to play an important part in the work of the cabinetmaker. Most cabinet shops will have a certain amount of this type of equipment, some more than others. While power equipment will not replace hand tools entirely, they do enable the cabinetmaker to speed up his work, to perform the work easier, and to permit better accuracy and precision.

However, power equipment is expensive and can be dangerous if not used properly. It is important that the cabinetmaker know what kinds of power equipment are available, what their uses and limitations are, and how to operate them safely. Advancement in cabinetmaking can depend a lot on the correct use of woodworking machines.

In this assignment you will have the opportunity to study the basic power machines, to learn what they can do for the cabinetmaker and to learn how to correctly and safely operate them.

Assignment:

1. Read the references listed below.
2. Make a list of the various jigs and fixtures available at your work station for use on machines. Indicate their uses.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking For Industry, pp. 191-244, 252-258.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 41-44.
C. Towers, Cabinetmaker's Manual, pp. 207-258.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. When surfacing a board, it is best to have more rather than fewer knife marks.

T F 2. Rate of feed is very difficult to control when planing wood.

T F 3. Extremely cross-grained or curly-grained wood requires a slower feed than straight-grained, dry lumber.

T F 4. Too light a cut will tend to cause poor quality work.

T F 5. Wood that is cut with carbide-tipped saws can usually be glued together without jointing.

T F 6. When connected by the same belts, the larger of two pulleys always turns the faster.

T F 7. On machines with step-pulleys, if the belt is placed on the largest pulley of the motor and the smallest of the machine, the machine will run at its highest speed.

T F 8. When a machine has variable-speed pulleys, the speed must be changed only when the machine is stopped.

T F 9. Some machines have more than one type of driving mechanism.

T F 10. All work on the radial arm saw is done with the work stationery and the blade moved through the work.

T F 11. The blade of a radial arm saw should be mounted so as to turn away from the operator at the point of cutting.

T F 12. One should adjust the saw blade on the radial arm saw so as not to cut into the table.

T F 13. The single surfacer is more common than the double surfacer.

T F 14. The purpose of the chip breaker on a surfacer is to break up the chips of wood as they are cut.

T F 15. The surfacer differs from most other woodworking machines in that the stock is fed through automatically.

T F 16. Stock to be put through the single surfacer should first have one surface faced on the jointer.

T F 17. The distance between the infeed and outfeed should determine the minimum length of board to run through a planer.

T F 18. To reduce warpage, cuts should all be made from the same surface of the stock if many cuts are necessary.

T F 19. When squaring up legs on a planer, all four surfaces should be planed on the surfacer.

T F 20. Stock less than 1/2" in thickness should not be run through a surfacer.

T F 21. On some circular saws the table tilts rather than the arbor and blade.

T F 22. The trim saw is used primarily for production work.

T F 23. All combination blades are hollow ground in design in order to do both crosscutting and ripping.

T F 24. All arbors have lefthand threads.

T F 25. The blade guard should always be used on the circular saw.

T F 26. The rip fence serves as an excellent gauge for cutting a number of small pieces to length.

T F 27. The stop rod fits on the miter gauge.

T F 28. A mitering jig must be used to cut miters on a circular saw.

T F 29. While ripping, the stock should have one smooth face and one smooth edge.

T F 30. A roller support is used to hold up the end of a long board when ripping.

T F 31. When cutting plywood on a circular saw, the good side of the plywood should be up.

T F 32. Dadoes can be cut using just the fence as a stop.

T F 33. Tenons should never be cut with a dado head.

T F 34. When cutting a tenon on a circular saw, the shoulder cuts should always be made first.

T F 35. Large band saws are used to cut logs into planks and timbers.

T F 36. The band saw is a relatively complicated machine.

T F 37. The tables on the band saw will tilt only in one direction.

T F 38. The wheel-tilting mechanism of the band saw is used to tilt the wheel for bevel cutting.

T F 39. There should be more "give" on the tension of a wide blade than for a narrow blade on the band saw.

T F 40. The blade support wheels on a band saw should be adjusted so that they just touch the blade when it is not running.

T F 41. The sharper the curves to cut, the narrower the band saw blade should be.

T F 42. A narrow blade should be used when resawing on the band saw in order to reduce friction.

T F 43. As a general rule, short cuts should be made first on a band saw.

T F 44. When sawing several pieces that are identical in shape, they may be nailed together and cut as one piece on the band saw.

T F 45. The jig saw does the same type of work as is done with the hand coping saw.

T F 46. The scroll saw can do fancier cutting than the jig saw.

T F 47. Only wood should be cut on the jig saw.

T F 48. Narrow blades should be used for cutting sharp curves on the jig saw.

T F 49. When inserting the blade in a jig saw, you should make sure that the teeth point towards the table.

T F 50. Too little tension on a jig saw blade will cause it to buckle.

T F 51. The jig saw table can tilt in two directions.

T F 52. Long stock can be cut on the jig saw by turning the chucks that secure the blade 90 degrees.

T F 53. The size of a jointer is indicated by the length of the knives.

T F 54. Most jointers are fed by a system of pressure feed rolls.

T F 55. When a jointer leaves a small, concave cut at the end of the stock, it means that the rear table is too low.

T F 56. Jointer blades may be honed without removing them from the cutter head.

T F 57. One should never run end grain on a jointer since it will cause the wood to splinter at the edges.

T F 58. A taper may be cut on the jointer and requires only the lowering of the infeed table.

T F 59. Bevel sawing should always be done with the bevel cut on the lower side of the work.

T F 60. Too much tension on a band saw blade may cause it to break.

T F 61. Too little tension on a band saw blade will allow the blade to wander from side to side on the wheels.

T F 62. Setting the guides on the band saw too far forward will cause the saw teeth to be dulled.

T F 63. The only change necessary in order to cut metal on a band saw is to change to a metal cutting blade.

T F 64. Stock should be fed into a jointer in the direction of the grain.

T F 65. For narrow boards, an auxiliary fence is fastened to the regular fence of a jointer and serves to support the stock during edge jointing.

T F 66. In general, a faster rate of feed is used for jointing rough work than for finish jointing.

T F 67. The smaller sized planers ordinarily surface stock on both surfaces, while the larger sizes ordinarily surface one side only.

T F 68. Warp and wind cannot be removed from a board with a planer because of the spring back after it passes through the feed rolls.

T F 69. With the surfacer properly adjusted, feed roll marks should be removed with each cut.

T F 70. It is not always possible to avoid tearing out the grain when using a surfacer.

T F 71. Equal amounts of material should be removed from both sides of stock, whenever possible, to prevent warping.

T F 72. The end of the circular saw arbor is threaded so that when the saw is running the nut has a tendency to tighten against the collar and blade.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A rectangular-shaped opening in a piece of wood is called a ________________.

2. When machining end grain, it is important that the cutter head of the machine be running at ________________ speed.

3. Machines usually transmit less force than is put into it due to ________________.

4. Drive on a machine serves to either obtain a gain of ______________ or a gain in ________________.

5. When two pulleys are linked together with a belt, the one on the motor is referred to as the ________________ while the one on the machine is called the ________________ pulley.

6. The prime purpose of the cut-off saw is to cut ____________ ____________ to approximate length.

7. When crosscutting, the anti-kickback device on the radial arm saw should be set about ________ inch above the wood surface.

8. Compound bevel and miter cuts are referred to as ____________ cuts.

9. Each turn of the handle on the radial arm saw will lower the blade ____________ inch.

10. When swinging the motor and blade on the radial arm saw for ripping, make sure the blade is turning ____________ the operator before feeding the board.

11. Planers range in size from ________ inches to ________ inches.

12. A planer designed to surface all four sides of stock in one operation is called a ____________.

13. The normal thickness of cut on a planer is ________ inch.

14. On a single surfacer, the jointed face of the stock should be placed ____________ when feeding it into the machine.

15. The cut that a surfacer makes should be ____________ the grain when possible.

16. A circular saw which has two arbors is called a ____________ saw.

17. A saw blade used on a circular saw for both crosscutting and ripping is called a ____________.

18. Before cutting wood which contains considerable pitch or resin, it is a good idea to place some ____________ on the blade.

19. The saw blade on a circular saw should be adjusted so that it extends about ________ inch above the stock before cutting.

20. One should never cut cylindrical stock on a circular saw without using a ____________.

21. When cutting a number of short pieces to the same length on a circular saw one should clamp a ____________ or ____________ block to the front end of the fence.

22. If a blade heats up while making a cut, the best way to cool it off is to remove the stock and keep the saw ____________.

23. Sawing a thick board into two or more thinner boards is called ____________.

24. With the proper combination, the dado head will cut a groove from __________ inch(es) to a maximum of __________ inch(es) wide.

25. When putting a new blade in a band saw one should make sure that the teeth point _______________ the table.

26. The blade guide on the band saw should be adjusted so that it is about __________ inch above the work.

27 When cutting a sharp curve it is helpful to make a series of _______________ cuts first.

28. Circles can best be cut on a band saw by using a _______________ _______________.

29. When replacing a blade in the jig saw, the blade should be secured in the lower chuck and then the pulley turned by hand until the blade is at the _______________ of the stroke.

30. The hold-down on a jig saw should be just _______________ the work.

31. Jointers range in size from __________ to __________.

32. The _______________ table of the jointer is usually not moved except for special cuts or alignment.

33. The rear table alignment on the jointer can be checked with a _______________.

34. The fence on a jointer should be checked for perpendicularity to the table with a _______________ _______________.

35. When surfacing on a jointer, one should always use a _______________ _______________.

36. Before surfacing stock on a jointer, the stock should be checked for _______________ and _______________.

37. For a very smooth finish on the jointer, the cut should be about __________ or less.

38. When surfacing on a jointer, if the board is warped, the concave side should be placed _______________.

39. Safety features of the circular saw should include a guard to cover the _______________, and a _______________ which keeps the saw kerf open.

40. The dado head or set is usually equipped with __________ outside cutters, __________ inch(es) in thickness, and __________ inside cutters ranging from __________ inch(es) to __________ inch(es) in thickness.

41. Stock less than three inches in width should be fed through the saw with a ______________ ______________.

42. When making a miter cut, the stock has a tendency to move into the blade a distance equal to the ______________ or to the ______________ ______________ of the blade.

43. If the band saw blade rubs against the support bearings constantly, it will become ______________ and may ______________.

44. Jig saw blades held only in the lower chuck are called ______________ blades.

45. When the outfeed bed of a jointer is too high, a ______________ will be cut on the stock.

46. Jointer knives are ground at an angle of __________ degrees.

47. Jointer knives are held in place with a ______________ while the set screws are tightened.

48. The most common jointer operation is ______________.

49. The depth of cut for jointing end grain should be __________ to __________ inch(es).

50. Band saw blades most widely used, range in width from 1/8" to 3/4" and are __________ to __________ thick.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A disadvantage of carbide-tipped tools is that (A) they last so long that they become outdated; (B) they do not cut well on wood; (C) they must be resharpened on special equipment; (D) they come in only a few sizes.

_____ 2. A 3" motor pulley turns at 1500 rpm to drive a 6" pulley on a jigsaw. How many strokes per minute will the jigsaw make? (A) 750; (B) 7500; (C) 75; (D) 3000.

_____ 3. A jointer has a 3" pulley on the motor that operates at 1750 rpm and you want the jointer head to revolve at 3000 rpm. What size driven pulley do you need? (A) 6"; (B) 1 3/4"; (C) 2 1/2"; (D) 5".

_____ 4. A shaper has a driven pulley of 3" and must operate at 3600 rpm. If the motor operates at 1725, what diameter drive pulley must be used? (A) about 5"; (B) about 1 1/2"; (C) about 4"; (D) about 6".

_____ 5. If the stock should stick as it goes through the planer, the first thing that one should do is (A) turn off the power. (B) increase the depth of cut; (C) get behind the stock and push; (D) lower the table.

_____ 6. To rip narrow stock on a circular saw one should use a (A) push block; (B) push stick; (C) stop rod; (D) feather board.

_____ 7. When resawing on a circular saw it is advisable to support the stock against the fence with a (A) feather board; (B) stop rod; (C) stop block; (D) roller support.

_____ 8. When cutting a dado on the circular saw, it requires the use of a special (A) miter gauge; (B) jig; (C) insert plate; (D) fence.

_____ 9. A tenon should not be cut on the circular saw without a jig or dado head unless the stock is at least (A) 4" wide; (B) 2" wide; (C) 6" wide; (D) doesn't matter.

_____ 10. The tendency for a band saw blade to pull to one side while making a straight cut is called (A) crossfeed; (B) wind; (C) drift; (D) lead.

_____ 11. When the band saw blade pulls to one side, it is usually caused by (A) wrong size blade; (B) improper adjustment of guides; (C) too much tension on the blade; (D) blade support wheels stuck.

_____ 12. The number of teeth on a jig saw blade that should be in contact with the stock at all times is (A) 2; (B) 8; (C) 10; (D) 3.

_____ 13. For regular work, the rear or outfeed table on the jointer should be (A) slightly below the height of the knives; (B) the same height as the knives; (C) considerably lower than the height of the knives; (D) slightly above the height of the knives.

_____ 14. If the outfeed table on a jointer is too high, it will tend to cut (A) a taper; (B) a "snipe"; (C) a bevel; (D) a chamfer.

_____ 15. One should never attempt to surface on the jointer a piece of stock that is shorter than (A) 6"; (B) 8"; (C) 12"; (D) 4".

_____ 16. You should never attempt to end plane stock on a jointer if the stock is narrower than (A) 10"; (B) 5"; (C) 12"; (D) 8".

_____ 17. Wobble washers are used to (A) level a saw frame; (B) cut dadoes with a single blade; (C) equalize the load of a molding head; (D) cut material with resin content.

_____ 18. A band saw blade which twists while sawing indicates (A) the guide pins are too far back; (B) the guide pins are too far forward; (C) the guide pins are not in line; (D) the ball-bearing supports are too close to the blade.

_____ 19. In order to eliminate strain on a blade while sawing sharp curves on the band saw, the cabinetmaker would best make use of (A) rough sawing; (B) relief cuts; (C) a 270 degree turn; (D) changing to a narrower blade.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The "trim saw" is also known as:

(A) ____________________ (D) ____________________
(B) ____________________ (E) ____________________
(C) ____________________

2. List the common cuts made on woodworking machines.

(A) ____________________ (E) ____________________
(B) ____________________ (F) ____________________
(C) ____________________ (G) ____________________
(D) ____________________ (H) ____________________
(I) ____________________

3. Four things one should know when machining wood are:

(A) ____
(B) ____
(C) ____
(D) ____

4. Common troubles encountered when surfacing wood are:

(A) ____________________ (D) ____________________
(B) ____________________ (E) ____________________
(C) ____________________

5. Raised grain on surfaced wood is usually caused by:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

6 List the six basic machines that make up all machines.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

7. List five devices for transmission of energy on machines.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

8. The radial arm saw is better than the circular saw for the operation of:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

9. List four types of saw blades used on a circular saw:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

10. List three jigs that can be used for cutting tapers on the circular saw.

(A) ____

(B) ____

(C) ____

11. List four main uses for a jointer.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

12. The smoothness of cut on a jointer depends on:

(A) ____

(B) ____

(C) ____

13. Dull knives on a jointer will usually be indicated by:

(A) ____

(B) ____

(C) ____

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. crosscut blade

_____ 2. planer blade

_____ 3. abrasive blade

_____ 4. combination blade

_____ 5. rip blade

_____ 6. dado head

_____ 7. molding head

A. makes any type cut

B. cuts at right angles with wood grain

C. chisel shaped teeth for cutting with the grain of the wood

D. hollow ground

E. cuts 1/2 inch grooves

F. cuts metal

G. cuts special shapes

SPECIALIZED CABINETMAKING EQUIPMENT

While the basic woodworking operations can be done on certain machines, more specialized operations are done with special purpose equipment. Some of these specialized machines have been in use for many years while some others are fairly recent. Lately many new developments in portable machines have been a real aid to the cabinetmaker.

It is important for the cabinetmaker to know how to operate these special purpose machines since many of the operations that they perform are important in the cabinetmaker's work. It is the quality of these specialized operations that determine, to a large extent, the success of the cabinetmaker.

In this assignment you will have the opportunity to study some of these more specialized machines. You will see how valuable they are to a skilled cabinetmaker and learn what they can do and how you should use them.

Assignment:

1. Read the references listed below.
2. Make a complete list of the machines covered in this unit that are available at your work station.
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. Feirer, Woodworking for Industry, pp. 245-251, 259-295, 372-377.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 44-48.
C. Towers, Cabinetmaker's Manual, pp. 258-351.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The electric cut-off saw has the same types of blades as a circular saw.

T F 2. When using the electric cut-off saw you should always turn on the switch before placing the saw on the work.

T F 3. If the electric cut-off saw slows down or stalls while cutting, one should first back it out of the work.

T F 4. When cutting plywood with the electric cut-off saw, the best side of the plywood should be down.

T F 5. The depth of cut possible when bevel cutting with the electric cut-off saw is less than for a straight cut.

T F 6. It is permissible, when making a pocket cut, to lower the electric cut-off saw into the work with the blade revolving.

T F 7. The saber saw will only cut straight lines.

T F 8. The ripping guide of a saber saw can be used to cut circles.

T F 9. The power block plane can be used only on edges of work.

T F 10. A floor-type router is used for routing flooring.

T F 11. The portable hand router should be fed into the work as slowly as possible to insure smooth clean cuts.

T F 12. The portable hand router can be used for making mortise-and-tenon joints if power tools for this purpose are not available.

T F 13. The shaper is a machine that requires great care when operating.

T F 14. The spindle shaper is designed to shape moldings on both straight and curved stock.

T F 15. The fence should never be removed for cutting on the shaper.

T F 16. Shaping can also be done on the drill press provided a speed of at least 5,000 r. is possible.

T F 17. The bit of a mortiser will cut a square hole.

T F 18. The chisel of the mortiser should be inserted so that its shoulder is tight against the socket before inserting the bit.

T F 19. When cutting a mortise it is best to skip a space between cuts rather than cut continuously.

T F 20. Mortising attachments are available for drill presses.

T F 21. The vertical boring machine differs from the drill press in the type of cutters it uses.

T F 22. Some carbon steel drills are designed to be used only on wood.

T F 23. The auger bit used with a brace can also be used in a drill press.

T F 24. A plug cutter cuts plugs to fill up holes.

T F 25. The size of a drill press is determined by the largest drill that can be used in it.

T F 26. Both twist drills and specially designed auger type bits can be used in the drill press.

T F 27. It is important that the skilled cabinetmaker be quite proficient at operating a lathe.

T F 28. The operation of the automatic lathe requires a high degree of skill.

T F 29. Cutting is easier than scraping on a lathe.

T F 30. The live center of the lathe is the moving center.

T F 31. The larger the stock that is being turned on the lathe the slower the speed should be.

T F 32. Rough cutting or scraping on the lathe should always be done from left to right.

T F 33. Once the tool rest is positioned it should not be moved until the stock has been turned to with 1/8" of the finished dimension.

T F 34. All faceplate turning is done by the scraping method.

T F 35. Special tools are required for faceplate turning.

T F 36. Stock revolving at high speed is fed into the stationery cutters of the back-knife lathe.

T F 37. Belt and disc sanders are sometimes combined into one machine.

T F 38. A portable belt sander should be kept moving to prevent gouging the wood.

T F 39. Orbital action is the best for very fine finish sanding.

T F 40. The single-end tenoner is more adaptable for custom work than the double-end tenoner.

T F 41. Drilling in metals requires a slower speed than drilling in wood.

T F 42. The safest of the four basic shaper operations is the operation making use of the fence.

T F 43. The direction of feed with the shaper should always be into the rotation of the cutter.

T F 44. Disk sanding is generally confined to end grain operations.

T F 45. Sanding should be performed on the side of the disk which is moving upward.

T F 46. Disk sanding allows the use of a coarser grit to produce the same finish as a finer grit would provide on a belt sander.

T F 47. Stock should be cut on the radial arm saw by pushing the blade toward the column.

T F 48. Variety saws usually are equipped with a tilting table.

T F 49. Boring machines generally have a greater capacity than the drill press.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Most electric cut-off saws have a ____________ ____________ which allows the motor to run even though the blade may be stopped.

2. The corners of a pocket cut made with the electric cut-off saw will have to be cleaned out with a ____________ ____________.

3. The teeth on a saber saw should be pointing forward and ____________.

4. Curve cutting with a saber saw is done ____________.

5. Making inside cuts with a saber saw without first drilling a hole is called ____________ ____________.

6. A good portable tool designed for cutting rabbets in cabinet doors is the ____________ ____________ ____________.

7. If the motor of a portable router screws into the base, each revolution will change the depth of cut ________ of an inch.

8. For irregular or circular cutting with the portable router, the router should be moved in a ________________ direction.

9. A router cutter with a pilot end will aid in preventing too ____________ a cut.

10. Routing without the use of a guide is called _______________ routing.

11. The safest type of shaper cutter is the _______________, solid type.

12. Stock should be fed into a shaper cutter in a direction that is ___________________ to the cutter rotation.

13. When shaping irregular work, a _______________ _______________ ___ should be used.

14. When shaping completely around rectangualr stock the end grain should be shaped _______________ .

15. When shaping the entire edge of the stock, the _______________ fence should be even with the edge of the cutter.

16. A mortiser cuts a _______________ opening in wood.

17. Two of the most commonly used sizes of mortising chisels are ________ and ________ .

18. Besides the bit and chisel, a _____________________ for the chisel must be used when setting up the mortiser.

19. The bit on a mortiser should extend below the chisel slightly so the bit will cut the hole _______________ the chisel squares it up.

20. A drill press should run at ________ rpm for mortising.

21. Two types of boring machines are _______________ and _______________ .

22. Probably the fastest and cleanest cutting bit for making holes in wood is the _______________ _______________ bit.

23. A bit with a _______________ should not be used in a power drill.

24. Circle and hole cutters will cut holes up to ________ inches in diameter.

25. The most common sizes of portable electric drills are ________ and ________ .

26. For boring or drilling holes in wood, the drill press should be run at speeds from ________ to ________ rpm.

27. A 9" lathe will handle work that is ________ inches in diameter.

28. Stock is roughed out on a lathe with a _______________.

29. Spindle turning requires a speed of about ________ rpm whereas faceplate turning can be done at about ________ rpm.

30. You should always remove the ____________ ______________ when sanding between centers on a lathe.

31. The two basic methods of wood turning are ____________ and ____________ .

32. When work is held between both centers for work on the lathe, it is called ____________ turning.

33. The correct position for the tool rest for turning on the lathe is about _______ from the work and about _______ above the center of the work.

34. The part of the stock that is fastened to the ______________ center when spindle turning should be lubricated before starting to work.

35. The single screw center faceplate should be used on stock that is ____________ than 4" in diameter

36. The belt sander is used to sand ____________ surfaces and edges.

37. Large surfaces are usually sanded with _________________ or _______________ sanders.

38. Besides moving up and down, a spindle sander also ___________ .

39. An excellent sander for assembled cabinet work is the ____________ _______________ sander.

40. When using the portable belt sander, the _______________ of the sander should touch the work first.

41. The standard drill press is equipped with a ______________ chuck which will handle drills up to ________ inch(es) in diameter.

42. Twist drills used for metal are sharpened at an angle of ________ degrees, while those used exclusively for wood are sharpened at a _________ degree angle.

43. A ________ ________ is used to start the cut when shaping against a collar.

44. Long, slender work is supported on the lathe by the ___________ _______________ .

45. The ____________ _________ is used to cut into stock to mark it for further cuts.

46. Scraping cuts on the lathe are made primarily with ____________ and ______________ nose chisels.

47 Portable electric drills are rated by the capacity of their ________________ .

48. Production shapers are available in both _________________ and ____________________ .

49 The chief advantage of double-spindle shapers is in the use of ____________________ spindles.

50. The machine designed to surface all four sides of stock at once is the ____________________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When using a 100 ft. extension cord with the electric cut-off saw, the cord should be at least (A) 6 gauge; (B) 8 gauge; (C) 10 gauge; (D) 12 gauge.

_____ 2. When cutting plywood with a saber saw, the blade should have (A) 6 teeth per inch; (B) 10 teeth per inch; (C) 12 teeth per inch; (D) 16 teeth per inch.

_____ 3. The shortest peice that should be run on a shaper is (A) 6"; (B) 8"; (C) 10"; (D) 12".

_____ 4. When using a collar on the shaper, it is best to have it (A) below the cutter; (B) above the cutter; (C) between two cutters; (D) on both sides of the cutter.

_____ 5. Work to be turned on the lathe should be cut to octagon shape before turning if it is larger in diameter than (A) 2"; (B) 3"; (C) 4"; (D) 5".

_____ 6. Before working on the lathe after setting it up, one should (A) turn the stock over by hand; (B) run it at slow speed; (C) run it at high speed; (D) sand off sharp edges.

_____ 7. Wood turned on a lathe should be checked for size frequently with a (A) micrometer; (B) dividers; (C) ruler; (D) calipers.

_____ 8. To install a new sanding disc on the disc sander, the old disc should be (A) peeled off with a putty knife; (B) removed by running a stick on it; (C) soaked in water; (D) left on.

_____ 9. When sanding with a portable belt sander on fir or other woods with soft and hard spots, you should (A) always sand with the grain; (B) sand cross-grain first; (C) always sand cross-grain; (D) sand with the grain first.

_____ 10. When using the portable disc sander, it should be (A) tipped slightly; (B) held as flat as possible; (C) rocked back and forth; (D) moved sidewise.

_____ 11. A long, wide board could probably be crosscut most easily and safely with the (A) table saw; (B) variety saw; (C) portable electric hand saw; (D) radial arm saw.

_____ 12. The most commonly used portable electric tool used by the cabinetmaker is the power (A) hand drill; (B) hand saw; (C) sander; (D) jig saw.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List five methods of controlling the sidewise movement of the portable router.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

2. List four joint cuts that can be made with the portable router.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

3. List six operations that can be done with a portable electric drill and attachments.

(A) _______________ (D) _______________

(B) _______________ (E) _______________

(C) _______________ (F) _______________

4. List the five basic lathe tools and indicate their main uses.

	Tool	Use
(A)	____________________	____________________
(B)	____________________	____________________
(C)	____________________	____________________
(D)	____________________	____________________
(E)	____________________	____________________

5. List the three kinds of action possible with a finishing sander.

(A) ____

(B) ____

(C) ____

6. Special operations which may be performed on the drill press include:

(A) ______________ (C) ______________ (E) ______________

(B) ______________ (D) ______________

7. The four methods of shaper operation are:

(A) ____

(B) ____

(C) ____

(D) ____

SAFETY FOR THE CABINETMAKER

A good worker is characterized by his knowledge and application of safety to his particular job. Safety involves safeguarding of machines as well as preventing personal injury. However, your safety comes first. Safety begins with the worker and has its basis in the attitude of the worker toward his job.

Attitude is a state of mind based on the correct knowledge of working conditions, the range and limitations of the equipment, and the extent of the worker's own skill. Rules of safety and their application must be learned and practiced as each phase of work is learned. Safe practice can only be as effective as the worker desires them to be.

Although this unit is organized to give you an opportunity to learn some of the common general rules and practices of safety, safety practices for specific applications will be stressed in most of the units. Safety is a continuous thing and should not be studied here and then forgotten.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 28-31.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 10-16.
C. Towers, Cabinetmaker's Manual, pp. 369-374.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. First aid is necessary no matter how slight the injury.

T F 2. Objects may be tossed from worker to worker if they are not sharp.

T F 3. Waste and debris should be swept off benches and machine and onto the floor.

T F 4. A sharp tool is easier to control than a dull one.

T F 5. It is dangerous to speak to someone while he is operating a machine.

T F 6. The hand should be placed palm down and flat on the stock while feeding stock through the saw.

T F 7. Freehand cutting may be done on the circular saw if the stock is small.

T F 8. Fingers should not project over the edges or ends of stock being jointed.

T F 9. Stock of different thicknesses should not be run through the planer at the same time.

T F 10. One should not look into the planer while it is running.

T F 11. If the upper guide wheels of the band saw need to be adjusted, the machine should be stopped.

T F 12. An unbalanced set of shaper knives can be a hazard.

T F 13. When grinding on the grinder, it is best to hold small objects with a rag to prevent burns.

T F 14. Safe practices aid efficient work.

T F 15. One should always wear a short-sleeved shirt when working around machines.

T F 16. Good housekeeping affects safety.

T F 17. Sharp tools should not be left on machines while working but rather should be placed in your pocket.

T F 18. 110 volts will not kill you but it can cause serious burns.

T F 19. A machine should be turned off before any adjustments are made.

T F 20. One should not operate a machine without first receiving instructions.

T F 21. Chips from a mushroomed chisel head can break off with enough force to cause serious injury.

T F 22. Nails should be held with the fingers placed near the wood to prevent serious injury if the hammer should slip off the head of the nail.

T F 23. Never leave a machine which is running unattended, unless you are going to return in a few seconds.

T F 24. Wear gloves when sawing or jointing rough stock.

T F 25. Saws should be completely shielded to prevent contact with moving parts.

T F 26. The power saw operator should stand directly behind the stock he is feeding into the machine.

T F 27. Work to be mortised should be clamped to the table.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Most personal injuries received in accidents are caused by ____________.

2. Heavy objects should be lifted by using the muscles of the ____________ for most of the power.

3. Lumber stacks will have less tendency to fall if one ____________ the load.

4. If one should have an accident, one should ____________ it immediately and seek ____________ ____________.

5. Rotating machinery will catch on loose objects such as ____________ ____________, ____________, or ____________ ____________ of any sort and pull them into the machine.

6. A good foot protection against sharp objects is ____________ shoes.

7. When using sharp-edged hand tools, one should be sure to always cut away from the ____________.

8. Never use a file without a ____________.

9. Crowding a saw blade may result in ____________ the saw.

10. Stock should be examined for ____________ and ____________ before running it on the jointer.

11. Cuts should be made on the tenoner while the sliding bed is moving away from the ____________.

12. Whenever possible one should use a ____________ when working on the shaper.

13. Do not operate a grinder without ____________ ____________ and the use of ____________.

14. Small stock should not be ground on the grinding wheel without a proper ____________.

15. A ______________ shop is usually a safe shop.

16. Be sure that a portable electric tool is ______________ before using it.

17 When unplugging a portable electric tool, one should pull the ______________ not the ______________.

18. When spraying one should use a ______________.

19. For proper use, a ladder should be placed at an angle of about ______________ degrees.

20. Oily rags should be kept in covered ______________ containers.

21. When two or more people are carrying a load, they should be on the ______________ side of the load and should stay in ______________.

22. The tool rest of a grinder should never be more than ______________ inch from the wheel.

23. Remove dust and scraps from benches and machines with the ______________ ______________.

24. The second largest number of woodworking injuries occur on the ______________.

25. The heavier the cut on a jointer, the greater the danger of ______________.

26. Adjustments should be made on the tool rest or the tail stock only when the lathe is ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. If violations of safety rules occur, one should (A) correct the situation himself; (B) change the rule; (C) notify his immediate superior; (D) assume his boss will see it.

_____ 2. The most important thing to remember to do before turning on the power for a machine is to (A) be sure all guards are in place; (B) check all adjustable parts; (C) be sure the stock to be worked is close enough to reach; (D) be sure the power cord is plugged in.

_____ 3. Only an experienced operator using the proper accessory should use a band saw for cutting (A) cylindrical stock; (B) rough stock; (C) sharp curves; (D) plywood.

_____ 4. When using portable electric tools it is especially important to avoid (A) holding the tool with both hands; (B) standing on damp or wet surface (most usual); (C) hardwoods; (D) wearing rings.

_____ 5. Most shop accidents (A) are serious; (B) are too minor to worry about; (C) occur in the afternoon; (D) can be avoided.

_____ 6. Most woodworking injuries happen on the (A) band saw; (B) jointer; (C) circular saw; (D) planer.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Most accidents can be prevented by following these general rules:

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. Hand tool injuries are usually caused by:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. Before using a portable electric tool one should check it for:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. Most accidents on the circular saw occur when doing the following things while the saw is running:

(A) ______________________________

(B) ______________________________

(C) ______________________________

Assignment
Sheet No. 6

Units 110-113

TOOL SHARPENING

Good workmanship and sharp tools go hand in hand. The cabinetmaker must have sharp tools in order to turn out quality work. Without sharp tools mediocre work will result and much more effort will be required. Also, as has been pointed out before, dull tools are dangerous and tend to cause accidents.

It is therefore essential that the cabinetmaker keep his tools sharp at all times. Some will require professional sharpening but most can be done by the cabinetmaker himself. This will save time and the expense of extra tools and will result in more profits in the end.

In this assignment you will have the opportunity to learn how the common tools of the cabinetmaker are sharpened. You will also study the equipment that is used and the precautions that must be observed when sharpening tools.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________.

References:

A. Feirer, Woodworking for Industry, pp. 185-190.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 21-23.
C. Towers, Cabinetmaker's Manual, pp. 352-369.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Natural abrasive stones come in varying grades of hardness.

T F 2. Artificial stones will sharpen tools faster than natural stones.

T F 3. Silicon-carbide stones are the best for sharpening high-carbon tool steels.

T F 4. The oil used when sharpening with a stone should be left to soak into the stone after using.

T F 5. When sharpening a plane iron it should always be ground on the grinder.

T F 6. Friction causes a tool to heat up and it will lose its hardness if it gets too hot.

T F 7. Whetting means to dip the tool in water to cool it off.

T F 8. When honing a plane iron, the bevel should be kept flat on the stone.

T F 9. When honing a plane iron, only a figure-eight motion should be used.

T F 10. When honing the non-beveled side of a plane iron, it should be kept flat on the stone.

T F 11. A countersink should not need any sharpening.

T F 12. Rounded edges on the screwdriver will not permit easy and correct use of the screwdriver.

T F 13. When sharpening a gouge, the first grinding should be at right angles to the grinding wheel.

T F 14. One should never grind on the side of a grinding wheel.

T F 15. Woodturning tools should be sharpened in much the same manner as chisels.

T F 16. Machine tools should always be ground when sharpening them.

T F 17. The honing of jointer knives should be done often.

T F 18. Honing jointer knives can be done with the knives left in the cutter head.

T F 19. Carbide-tipped saw blades will need more frequent grinding than regular blades.

T F 20. A mortising chisel should be ground while it is in the drill press.

T F 21. A saw set has the correct angle permanently set on it.

T F 22. A saw clamp is used to hold a saw when the handle is broken or when two people are using the saw together.

T F 23. Some oil stones have both a coarse and a fine side.

T F 24. A heavier cut can be taken with an aluminum oxide grinding wheel without drawing the temper of the tool being sharpened.

T F 25. Nicks in chisels and plane irons should be removed by grinding the edge square to the depth of the nicks.

T F 26. Chisels, when hollow-ground, may be honed several times before regrinding.

T F 27. Light reflected from a cutting edge indicates that it is sharp.

T F 28. Plane irons should be ground square with sharp corners.

T F 29. Handsaw teeth are usually set equal to a depth of one-half the length of the tooth.

T F 30. Woodturning tools have perfectly flat bevels.

T F 31. Carbide-tipped tools may be ground on ordinary grinding wheels.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two classes of sharpening stones are ______________ and ______________.

2. The two common types of artificial stones are ______________ ______________ and ______________ ______________.

3. A new stone should be soaked a few hours in ______________ before using.

4. An abrasive stone should be cleaned occassionally with ammonia or ______________.

5. The angle on a plane iron should be between ________ and ________ degrees.

6. When grinding a tool, it should be dipped frequently in ______________.

7. When sharpening a draw knife it should be drawn diagonally across the stone so that all parts of the edge are ______________ honed.

8. When sharpening an auger bit the spurs should be sharpened on the ______________ only.

9. A gouge should be deburred with the ______________ ______________ ______________.

10. When sharpening a shaper cutter, care must be taken not to change the ______________ of the cutter.

11. The file that should be used for sharpening scraper blades is a ______________ ______________.

12. The tool used to adjust the teeth on the handsaw to provide clearance for the blade while sawing is called a ______________ ______________.

13. The temper of a tool is being drawn when ______________ ______________ appear along the edge of the tool while grinding.

14. When honing, oil stone wear may be equalized by using a(n) __________________ motion.

15. An extremely fine edge may be produced on a tool by strapping it on a piece of ______________.

16. Rough, torn edges of a bored hole indicate the auger bit ______________ need sharpening.

17. Chips of uneven thickness indicate the auger bit ______________ are dull.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A grinder for ordinary tool sharpening would have a (A) 40 grit aluminum oxide; (B) 40 grit silicon carbide; (C) 60 grit aluminum oxide; (D) 60 grit silicon carbide grinding wheel.

_____ 2. The length of the honed bevel should be approximately (A) one-fourth; (B) one-third; (C) one-half; (D) three-fourths the length of the ground bevel.

_____ 3. The process of leveling the teeth of a handsaw is known as (A) evening; (B) smoothing; (C) milling; (D) jointing.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Lubricating oil should be used on sharpening stones to:

(A) ____

(B) ____

(C) ____

2. List two machines on which jointer knives can be sharpened other than the grinder.

(A) _________________________ (B) _________________________

3. List three kinds of files used for sharpening tools:

(A) ______________ (B) ______________ (C) ______________

4. List the four taper sizes of saw files:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. List the three grits of oil stones.

(A) __________ (B) __________ (C) __________

6. The sharpening of tools involves two types of operations:

(A) ______________ (B) ______________

7. A wood chisel should be reground if:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

8. The steps in sharpening a circular saw blade are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

9. A twist drill will not drill to correct size unless:

(A) ______________________________

(B) ______________________________

(C) ______________________________

Matching

Directions: Place the letter of the correct angle indicated in the right hand column in front of the correct sharpening process in the left hand column. Answers may be used more than once.

_____ 1. plane iron grinding

_____ 2. chisel

_____ 3. skew cutting edge

_____ 4. flat nose bevel

_____ 5. plane iron honing

_____ 6. round nose bevel

_____ 7. jointer knive angle

_____ 8. gouge bevel

_____ 9. pocket knife

_____ 10. included angle of parting tool

A. 30-35 degrees

B. 30 degrees

C. 20-30 degrees

D. 45 degrees

E. 40 degrees

F. 60 degrees

G. 25 degrees

H. 36 degrees

Units 114-11[illegible]

READING DRAWINGS AND PLANNING THE WORK

Drawings are the means by which the designer conveys his ideas to the worker. Drawings give a picture of the object, showing what it looks like, how it will be built, and its size. The great variety of objects requires that different types of drawings be used for the various objects.

It becomes very important for the craftsman to be able to read and understand drawings. Without this ability it would be difficult to understand what the customer wants and to produce it as he desires it. Reading and understanding drawings also permits the worker to plan and prepare his work. From the drawings he will be able to determine what materials he will need, what operations need to be performed, and to plan his work in an efficient manner.

In this assignment you will have the opportunity to learn the various kinds of drawings and what information can be found on them. Also you will learn how to plan your work by utilizing the drawings and the information that they contain.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 43-77.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 57-80.
C. Towers, Cabinetmaker's Manual, pp. 23-38.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The term "blueprint" usually refers to any type of print no matter what the method of reproduction.

T F 2. Actual blueprints (white lines on blue paper) are not used much anymore because they tend to fade when exposed to light for a long time.

T F 3. Copies of the original drawing are printed so that there will be copies available if the original is lost out on on the job.

T F 4. The perspective drawing will give the most realistic appearance of the object of any of the pictorial drawings.

T F 5. A cabinet drawing is the type of drawing that a cabinetmaker will usually work from.

T F 6. Pictorial drawings usually just show how the finished object will look and usually are not used to work from.

T F 7. Working drawings show surfaces as they would appear when the line of vision is at right angles to that surface.

T F 8. Cylindrical objects can sometimes be drawn and described in one view.

T F 9. A dotted line on a drawing represents an edge of the object that is not visible when looking at the surface of the object that is shown in that particular view.

T F 10. Knowledge of the alphabet of lines is of value only to the person making the drawing.

T F 11. A drawing that is drawn to scale is drawn full size.

T F 12. When a drawing is drawn to scale the dimensions that are used are the actual dimensions of the finished object.

T F 13. In a woodworking drawing the views are not always in their proper position as would be expected in conventional orthographic projection.

T F 14. In a woodworking drawing the kind of joint or fastener to be used is always shown.

T F 15. It is not necessary for a cabinetmaker to be able to read architectural drawings since they do not contain any information of value to him.

T F 16. If details of construction are not shown, the cabinetmaker can use the type of construction that he prefers.

T F 17. Usually certain information will be found in the same place on drawings for different objects.

T F 18. A multiview drawing is also called an orthographic projection.

T F 19. Symbols are used to show some millwork on drawings.

T F 20. In determining the amount of wood needed for a job, some amount needs to be added to the dimensions on the print.

T F 21. Specifications are not likely to contain any information of value to the cabinetmaker.

T F 22. The height of an object can be determined from the top or plan view.

T F 23. Dimensions shown on a drawing are actual drawing dimensions.

T F 24. Construction sections are quite often shown on architectural drawings.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Drawing is a ________________ which describes an object in sufficient detail so that the workman can ________________ the object without having actually seen it.

2. Drawings are composed of ________________, ________________, and ________________.

3. A print is an exact copy of a ________________.

4. The techniques used in preparing woodworking drawings and prints depend largely on the ________________ involved.

5. An elevation drawing is one that shows the ________________ and width.

6. The view looking directly down on an object from above is called the ________________ view.

7. Besides hidden lines, inside details can be shown by means of ________________ views.

8. The drawings of a house are called ________________ drawings.

9. The construction of kitchen cabinets would most likely be found on drawings called ________________.

10. The key to blueprint reading is the ability to visualize the ________________ from which the draftsman was viewing the object.

11. The location of cabinets, windows, and doors can be found on the ________________ plan of a house.

12. A tabulated list of the materials required for a particular job is called a ________________ of ________________.

13. A list of the steps for making an object is called a ________________ of ________________.

14. The construction of each part of a piece of furniture is planned on a ________________ ________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The true size and shape of objects is shown on (A) pictorial; (B) isometric; (C) cabinet; (D) working drawings.

_____ 2. The minimum number of views of an object usually necessary to describe it is (A) 1; (B) 2; (C) 3; (D) 4.

_____ 3. A view looking directly at a slanted surface is the (A) auxiliary; (B) scale; (C) section; (D) plan view.

_____ 4. On a drawing that is drawn to a scale of ¼"=1"-0", a true measure of 5/8" on the drawing will represent (A) 1"-6"; (B) 2"; (C) 2"6"; (D) 2"-10" of the object.

_____ 5. A chart including information and specifications regarding certain units or parts is the (A) symbol chart; (B) specifications; (C) schedule; (D) detail.

_____ 6. The term "square" represents (A) 10 square feet; (B) 25 square feet; (C) 50 square feet; (D) 100 square feet.

_____ 7. The usual allowance added to the finished length to get the cut-out size is (A) 1/4"; (B) 1/2"; (C) 3/4"; (D) 1".

_____ 8. Two square feet of area will require (A) 1.5 feet of 12" material; (B) 2.0 feet of 8" material; (C) 2.5 feet of 10" material; (D) 3 feet of 8" material.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four types of drawings used in cabinetmaking are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. Specifications usually contain:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

3. A set of drawings will usually consist of:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

4. In order to properly estimate material needs and plan the method of doing the work, the woodworker needs to know:

(A) ____

(B) ____

(C) ____

5. A materials list shows in detail the:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

6. List three items of planning that a cabinetmaker should have before beginning to work.

(A) ______________________ (C) ______________________

(B) ______________________

7. A route sheet includes:

(A) ____

(B) ____

(C) ____

(D) ____

Matching

Group I

<u>Directions</u>: Match the line description in the left hand column with the name of the line in the right hand column.

_____ 1. Heavy solid line

_____ 2. Short dashes for invisible parts

_____ 3. Center of symmetrical objects

_____ 4. Part outline extended

_____ 5. Fine line with arrowheads

_____ 6. Heavy dashed line with arrowheads

_____ 7. Fine spaced lines usually inclined

A. Section line

B. Cutting plane line

C. Center line

D. Dimension line

E. Extension line

F. Break line

G. Ditto line

H. Hidden line

I. Part outline

Group II

<u>Directions</u>: Place the letter of the material symbol in the blank in front of the correct term in the left hand column.

_____ 1. Brick

_____ 2. Tile

_____ 3. Concrete

_____ 4. Concrete block

_____ 5. Cut stone

_____ 6. Plaster

_____ 7. Wood

_____ 8. Wall partitions

_____ 9. Glass

_____ 10. Metal

A 
B. 

C. 

D.

Short-Answer

Directions: Study the drawing of the desk on page 45 in reference A. Then answer the questions below.

1. What are the total dimensions of the desk top? ______________
2. Is the top made of one solid piece of wood? ______________
3. Are all of the drawers the same size? ______________
4. What are used to fasten the frame to the legs? ______________
5. What is the total height of the desk? ______________
6. To what radius are the corners of the legs rounded? ______________
7. How many drawers are there? ______________
8. What is the total length of the legs? ______________
9. How far from the bottom of the desk should it be to the center of the stretchers? ______________
10. How far in from the front and back edges of the top should the inside of the legs be located? ______________

Assignment
Sheet No. 8

Covering
Units 118-122

ESTIMATING MATERIAL AND CALCULATING COSTS

Cabinetmaking materials come in a wide variety of kinds and grades. When obtaining these materials it is necessary to designate exactly what is wanted in order to get the materials needed to do the job correctly. The addition of new materials on the markets has necessitated the use of systematic and accurate orders.

The cabinetmaker, therefore, must have a good knowledge of how materials are bought and sold. He must have some basic mathematical ability in order to calculate material amounts, their costs, and the cost of the total job.

In this assignment you will have an opportunity to learn how materials are designated with regard to size, grade, quantity, etc. You will also learn how to calculate the amount of material, the cost, and some of the methods of recording this information.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 122-126.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 81-111.
C. Towers, Cabinetmaker's Manual, pp. 50-58.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Certain kinds of lumber are cut to odd numbered lengths.

T F 2. The finished size of a board is referred to as the nominal size.

T F 3. Finished lumber sizes have been standardized so that lumber of a given size from one mill can be used interchangeably with lumber from another mill.

T F 4. Dressed hardwood generally will be smaller in thickness than dressed softwood of the same nominal size.

T F 5. The term "tally" refers to the actual count of pieces of stock and the amount of lumber contained.

T F 6. The first thing to determine is the board length when figuring board measure with a board rule.

T F 7. It is possible to use certain framing squares for figuring board measure.

T F 8. All fractions of a board foot are dropped when tallying lumber.

T F 9. The tally sheet is used whether the board rule is used or not.

T F 10. In tallying random widths and lengths no record is made of the size of each particular piece.

T F 11. Lumber less than 1" in thickness is still considered 1" whereas lumber over 1" is figured at its exact thickness.

T F 12. All boards less than an even number of inches in width are counted as the next even width.

T F 13. Lumber that is milled to detail or odd measure is figured to the next larger rough nominal size.

T F 14. Plywood is figured the same as solid stock lumber.

T F 15. Full size details and supporting stock bills are received by the cabinet shop with the contract order.

T F 16. Shop drawings for specially designed items are made by the detailer.

T F 17. The stock biller and the detailer may be the same person.

T F 18. The stock cutter is a power tool specialist.

T F 19. The term "net" refers to stock which must be cut to the exact dimensions listed.

T F 20. Stock bills ordinarily carry all three dimensions in net size.

T F 21. Both the foot mark and the inch mark are underscored with a horizontal line to prevent mistaking them for numbers.

T F 22. The stock cutter always selects the lumber to be used.

T F 23. When material is routed to the trim sawyer it means that a decorative cut is put on by the trim sawyer.

T F 24. The stock biller need not be concerned with milling allowances.

T F 25. The efficiency of the stock cutter can be determined by inspecting the stock pile.

T F 26. Board measure is figured on the basis of the size of the board as it is cut at the sawmill.

T F 27. Any board less than one inch in thickness is figured as one inch in determining its board measure.

T F 28. Hardwoods can be purchased in specified widths.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The order of dimensions of lumber should always be ____________ first, ____________ second, and ____________ third.

2. Lumber is usually sold by the ____________ ____________.

3. A piece of lumber that is 1" thick, 12" wide, and 12" long is referred to as a ____________ ____________.

4. The number of board feet contained in a piece of stock can be measured by placing the ____________ ____________ across the width of the stock and reading the measurement on the scale which corresponds to the ____________ of the board.

5. The numbers on the left hand side of a tally sheet represent the ____________ ____________ content in a single piece of lumber, 1" ____________ thickness.

6. Random lengths and widths are common with ____________ because of their scarcity.

7. Lumber prices are usually based on quantities of ____________ ____________ board feet.

8. Plywood and veneers are priced by the ____________ ____________.

9. A list giving the exact number and finished size of every item required for a mill order is called the ____________ ____________.

10. Before the stock billing is made a(n) ____________ ____________ should be made.

11. Factory orders are also known as ____________ or ____________ orders.

12. Measurements of cabinetwork and openings of a building are checked by the ____________.

13. Lists of items of hardware are placed in the ____________ ____________ of the stock bill.

14. Moldings are usually listed by ______________ feet.

15. The name identifying the stock bill order is that of the ______________.

16. The additional amount of material added to dimensions of stock to allow for finishing is the ______________ ______________.

17. Accurate estimating of lumber needed for a job should result in very few ______________ ______________.

18. A "two-by-four" will actually measure about ________ by ________ after it has been ______________ and ______________.

19. Standard thicknesses of softwoods are figured in ______________ while hardwood thicknesses are figured in ______________ of an inch.

20. Lengths of hardwood lumber vary from ________ feet and up and are usually ordered as ______________ length.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The measurement of stock used in a particular job is given in board feet according to (A) exact; (B) finished; (C) approximate; (D) nominal size.

_____ 2. A board foot contains (A) 12; (B) 24; (C) 128; (D) 144 cubic inches.

_____ 3. A board 1" x 10" x 72" contains (A) 2; (B) 3; (C) 5; (D) 7 board feet.

_____ 4. A board 1" x 8" x 12' contains (A) 4; (B) 8; (C) 10; (D) 12 board feet.

_____ 5. A board 1½" x 4" x 14' contains (A) 2; (B) 5; (C) 7; (D) 10 board feet.

_____ 6. If certain lumber sells for $370 per M it will cost (A) $.037; (B) $.37; (C) $3.70; (D) $10.40 for one board foot.

_____ 7. In cabinetmaking language FAS means (A) front and side; (B) firsts and seconds; (C) for all sides; (D) file and saw.

_____ 8. A group of readings obtained by using a tally stick that read 3½, 7½, 2½, 6½, 5½, and 4½ would have a total board foot amount, that would normally be used, of (A) 29; (B) 29½; (C) 30; (D) 30½.

_____ 9. Milled lumber lengths are figured as (A) even foot lengths; (B) odd foot lengths; (C) odd foot lengths under 8'; (D) odd and even foot lengths under 8'.

_____ 10. The cost of 130 bd. ft. of lumber that sells for $.21 per bd. ft. is (A) $2.73; (B) $27.30; (C) $273; (D) $25.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Items to consider when ordering softwood lumber are:

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________ (H) ______________

2. The detailer's responsibilities include:

(A) ______________ (C) ______________

(B) ______________

3. Factory orders may include three types of orders; namely:

(A) ____________________________

(B) ____________________________

(C) ____________________________

4. The first four items listed in order of take-off for stock cutting are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. The information that a tally lists is:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

Short Answers

Directions: Indicate, in the blank space following the abbreviation, what the abbreviation represents.

1. rgh. ____________________
2. M ____________________
3. Bd. ft. ____________________
4. S2S ____________________
5. S4S ____________________
6. KD ____________________
7. T ____________________
8. L ____________________

Assignment
Sheet No. 9

Covering
Units 123-139

LUMBER AND LUMBER PROCESSING

Wood is, of course, the most important material used in cabinetmaking. There are a number of different kinds of wood and each one has certain characteristics and properties that make it more suitable for certain jobs than for others. Wood also varies within the same kind, is processed differently, and comes in various grades.

It is important for the cabinetmaker to know about wood so that he can select the right kind for the right job. He also needs to know how to handle certain wood that may have defects, undesirable features, and the like. This ability comes from a thorough understanding of the composition and processing of lumber.

In this unit you will have an opportunity to learn the structure of a tree, how it is processed, how to recognize certain woods and their uses, how lumber is graded, and some of the important things to consider when working with various woods.

Assignment:

1. Read the references listed below.
2. Select five different types of wood used at your place of employment. On a separate sheet of paper, using the form indicated below, list the names of the woods and the other information called for by referring to pages 79-85 in Reference A, pages 186-187 in Reference B and pages 8-9 in Reference C.

Name of Wood	Where Grown	Color of		Grain or Pattern	Good Qualities	Primary Uses
		Heartwood	Sapwood			

3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, *Woodworking for Industry*, pp. 78-122.
B. Dahl and Wilson, *Cabinetmaking and Millwork*, pp. 163-188, 206-215.
C. Towers, *Cabinetmaker's Manual*, pp. 59-81, 433-435.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Only about 100 varieties of trees in the forests of the United States have commercial value.

T F 2. Hardwoods differ considerably from softwoods in some of their uses and properties.

T F 3. Hardwoods are harder than softwoods but softwoods usually are tougher.

T F 4. Hardwoods tend to shrink more than softwoods.

T F 5. Some softwoods are actually harder than some hardwoods.

T F 6. The weight of wood tends to be a pretty good indicator of the relative strength of wood.

T F 7. There are some woods that are so heavy that they will not float in water.

T F 8. Since wood is cut so that the length is with the grain, most shrinkage occurs in length.

T F 9. With the newer drying methods that are now being used, very little waste of lumber results from warping.

T F 10. It is extremely important that the wood used in cabinetmaking and furniture production does not change in size.

T F 11. Woods that are dense and hard usually have the best nail-holding power.

T F 12. Of the commonly used nails, the barbed has the best holding power.

T F 13. When nailing lumber, it is best to have high moisture content in the wood to prevent splitting which reduces holding power.

T F 14. Defects in wood such as knots and checks seriously affect the stiffness of the wood and therefore should be avoided when stiffness is a desired quality.

T F 15. There are no softwoods that are high in toughness.

T F 16. Wood must contain about 7 per cent moisture, otherwise "dry rot" will set in.

T F 17. Wood will decay only when too much moisture is present.

T F 18. Wood that has been quarter-sawed will generally have better grain appearance than if it were plain-sawed.

T F 19. Wood has a natural, weather protecting surface and does not need to be painted to prevent decay.

T F 20. A knowledge of the structure of wood will be helpful in understanding how to work with wood.

T F 21. Imported woods are not important in the United States since we have all of the types of wood that we need.

T F 22. Heartwood is generally darker than sapwood and located in the center part of the tree.

T F 23. Hardwoods are usually composed of relatively larger cells which causes open or porous grain.

T F 24. Heartwood does not contribute to the growth of the tree.

T F 25. The vertical arrangement of wood cells results in the straight grain of wood.

T F 26. The amount of water that a wood cell contains is the same for both heartwood and sapwood.

T F 27. A tree usually grows more in the spring than in the summer.

T F 28. When both are dry, heartwood tends to be heavier and stronger than sapwood since heartwood is older and found near the center of the tree.

T F 29. "Quarter-sawed" is a term used mainly to describe hardwood boards that have been sawed a particular way.

T F 30. Plain-sawed lumber has a high tendency to shrink and warp.

T F 31. Close-grained woods are generally stronger than open-grained woods.

T F 32. Hardwoods are obtained from deciduous trees which means they shed their leaves annually.

T F 33. For purposes of use, woods are grouped according to their actual hardness and other properties rather than whether they lose their leaves or not.

T F 34. About the only products that wood can be used for are lumber and paper.

T F 35. The fiber saturation point is reached when each cell is filled with free water.

T F 36. Wood begins to shrink when the moisture content gets below the fiber saturation point.

T F 37. Cell walls shrink uniformly in all directions.

T F 38. Wood shrinks most in the direction of the annual rings.

T F 39. Wood tends to increase in strength, hardness, and stiffness as it dries.

T F 40. It is never desirable to both air dry and kiln dry lumber.

T F 41. The drying of lumber tends to cause some defects that lower the quality of the lumber.

T F 42. Wood that has been properly dried will tend to remain at the moisture content that was obtained by the drying process.

T F 43. Air-dried lumber is preferred when strength is desired.

T F 44. Moisture meters will give a more accurate reading than will oven samples.

T F 45. The best lumber is usually found in the lower part of the tree.

T F 46. There is usually quite a range within a lumber grade.

T F 47. Lumber is initially graded in the rough but may be put into a different grade if surfacing reveals some defects.

T F 48. Stain is a defect that is any color other than the natural color of the wood.

T F 49. A sound knot will usually have some decay.

T F 50. The number and size of defects in a piece of lumber are used to determine its grade.

T F 51. The first two grades of hardwood are usually sold as a group called firsts and seconds.

T F 52. Cypress and eastern red cedar are termed commercial hardwood but are actually softwoods.

T F 53. Softwood lumber may be graded differently in different parts of the United States.

T F 54. Hardwood interior trim and molding are listed only in a single grade.

T F 55. It is usually best to purchase lumber that is better than that which is actually needed.

T F 56. Retail lumber yards handle only softwood.

T F 57. Due to standardization, a cabinetmaker can move from one locality to another with little difficulty of adjusting to new technical problems.

T F 58. Standardized items of millwork are somewhat difficult to obtain.

T F 59. Although methods of door construction change, the sizes are fairly well standardized.

T F 60. Window and sash sizes are quite inconsistent throughout the various parts of the country.

T F 61. Paneling is a standard mill item usually carried in stock.

T F 62. Since the dimensions of a stairway cannot be exactly determined until a building has been constructed, details of stairway construction cannot be determined in advance.

T F 63. Dimension lumber is often kiln dried.

T F 64. A single log can produce lumber of several grades.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Extensive use is being made of about ________ species of softwoods and about ________ species of hardwoods.

2. Prime requirements of wood for furniture construction are _______________ appearance and desirable _______________ _______________.

3. Softwoods are used primarily for _______________ _______________.

4. One of the main disadvantages of hard woods is the difficulty of _______________ them.

5. The best direct method of checking the moisture content of wood is with a _______________ _______________.

6. Any variation from a true or plane surface in lumber is referred to as _______________.

7. For wood to remain in place after being used, there must be a minimum of _______________ and _______________.

8. The weakest parts of any construction are the _______________.

9. The wood which is considered to have the most toughness is _______________.

10. One of the most important imported woods is _______________.

11. The actual wood of a tree is composed of just the _______________ and _______________.

12. Growth rings are composed of ________ distinct parts.

13. Thin, hard growths radiating out from the center of the tree are called _______________ _______________.

14. When the fibers of wood are not straight, the wood is said to have _______________ _______________.

15. One cause of cross grain might be that the board was not cut parallel to the _______________.

16. When a log is cut so that the cuts are tangent to the annual rings it is said to be _______________ _______________ if hardwood or _______________ _______________ if softwood.

17. Quarter-sawed lumber is produced by cutting so that the cuts are approximately _______________ to the annual rings.

18. Quarter-sawed lumber tends to shrink, warp, and swell less and usually costs _______________ than plain sawed lumber.

19. Conifer is a term used in connection with softwoods and actually means _______________ _______________.

20. Moisture content of wood is indicated as a _______________.

21. Wood that contains over ________ per cent of moisture for an extended period of time will tend to decay.

22. Shrinkage across a plain-sawed face is about _______________ that across an edge-grained face.

23. The process or treatment used to reduce the moisture content of lumber to required limits is called _______________.

24. Lumber containing the moisture of the growing tree is said to be _______________.

25. Lumber may be dried either by _______________ drying, _______________ drying, or both.

26. The recommended moisture content for interior finishing of woodwork in the United States ranges from ________ per cent to ________ per cent.

27. A knot is formed where a _______________ once joined the trunk of the tree.

28. An unsound knot has some _______________.

29. Wane is the presence of _______________ or lack of _______________ on the corners of a board.

30. When grading firsts and seconds, it must be done from the _______________ side of the board.

31. Hardwood lumber that is classified as firsts must be ________ inches or more in width and from ________ to ________ feet in length.

32. The first step in grading a board for firsts is to determine the ______________ ______________.

33. A set of the grades of hardwood lumber is available from the ______________ ______________ ______________ ______________.

34. Yard lumber is classified into two grade qualities: ______________ and ______________ grades.

35. The major differences in the common grade of yard lumber are in the number of ______________ and the amount of ______________.

36. Structural lumber is ________ inches or more in thickness and width.

37. Pieces of strip lumber cut to common shapes and used for a finished appearance are called ______________.

38. When sections, parts, or units of a building are constructed to conform to a specific unit of measure or its multiples, it is called ______________ construction.

39. The most widely accepted unit for this purpose is a ________ ______________.

40. Door construction is usually of either ______________ ______________ ______________ or ______________ type.

41. The shape of interior and exterior trim items is always some variation of a ______________ ______________.

42. The cabinets usually required for a four or five room house are usually termed ______________ cabinets.

43. A large surface of wood enclosed in a narrow wooden frame is called a ______________.

44. Store fixtures designed to fit a particular wall space are called ______________ ______________.

45. Store fixtures that are generally standardized are those classified as ______________.

46. Wood is composed of about ________ per cent cellulose, ________ per cent lignin and 12 per cent other materials.

47. A 10 per cent moisture content can usually be maintained in cold, damp weather by heating the lumber to about ________ degrees above the outside temperature.

48. The noted diameter of a knot is found by adding its ______________ and ______________ diameters and dividing by ________.

49. Pitch pockets are found in certain species of ______________ and ______________ ______________.

50. Checks are commonly found in kiln dried ______________ and ______________ lumber.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two things you should know in order to select wood properly are:

(A) ____

(B) ____

2. Three considerations for furniture construction are that the wood:

(A) ____

(B) ____________ ________________________________

(C) ____

3. List three hardwoods that are considered easy to work with hand tools.

(A) ______________________ (C) ______________________

(B) ______________________

4. Characteristics of wood which may be considered in identifying them are:

(A) ______________ (D) ______________ (G) ______________

(B) ______________ (E) ______________ (H) ______________

(C) ______________ (F) ______________

5. The advantages of kiln drying are:

(A) ____

(B) ____

(C) ____

(D) ____

6. Defects that may result from seasoning are:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

7. The five standard grades of hardwood are:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

8. The three main classifications of softwood lumbers are:

(A) ____________________

(B) ____________________

(C) ____________________

9. The decorative value of wood depends upon its:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

10. Built-in cabinets can be classed into groups such as:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

11. The six most important hardwood lumber trees in the United States from the standpoint of volume logged are:

(A) ______________

(B) ______________

(C) ______________

(D) ______________

(E) ______________

(F) ______________

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. pitch pocket

_____ 2. check

_____ 3. split

_____ 4. heart shake

_____ 5. wind shake

_____ 6. pith

_____ 7. cross grain

_____ 8. crook

_____ 9. bow

_____ 10. cup

_____ 11. twist

_____ 12. warp

_____ 13. bark pocket

_____ 14. decay

_____ 15. stain

_____ 16. wane

A. soft, spongy, cullular tissue from the center of the tree

B. turning or winding of the edges of a board

C. holes caused by insects

D. disintegration of wood from any cause

E. an opening parallel to the annual rings, containing pitch

F. bark, or lack of wood, on a board edge

G. a lengthwise separation of the wood

H. grain not parallel to the length of the board

I. any deviation of a board from a straight line

J. discoloration caused by fungi or chemical action

K. a curve across the width of the board

L. tearing apart of cells because of improper handling

M. a board with the edge either convex or concave

N. shrinkage at the center of a log caused by decay

O. a board with the face warped along its length

P. a parch of bark encased by wood

Q. separation of annual rings

Assignment
Sheet No. 10

Covering
Units 140-145

PLYWOOD, VENEERS, AND SPECIAL MATERIALS

Many varieties of solid wood have a combination of strong points and defects which makes it difficult or impossible to use the wood to its best advantage. Much of the top grade of lumber in our forests is being rapidly depleted. To help preserve the lumber still available and to make more efficient use of the wood which is cut, new methods of manufacture have been devised. The cutting of veneers and the construction of plywood has permitted the use of many of these woods which might not be desirable nor strong enough as solid lumber. Also, recent research has developed many new materials that can be used very much like wood and now are an important part of cabinetmaking.

It is essential that the present day cabinetmaker be familiar with the other wood and wood related products. In most cases they require a somewhat different method of handling and use. Their use enables the cabinetmaker to expand his designs and to produce articles of more desirable appearance and construction.

In this assignment you will have the opportunity to become familiar with these products, especially how they are made and used.

Assignment:

1. Read the references listed below.
2. Make a list of the materials, other than solid wood, that are used in your place of employment and indicate some of the uses of each.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 127-172.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 194-205.
C. Towers, Cabinetmaker's Manual, 93-112, 116-122.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Veneers are thin sheets of wood usually cut from poorer grades of weak structured softwoods.

T F 2. Laminating layers of wood for additional strength is an old practice.

T F 3. The use of plywood is still largely restricted to the making of cabinets and built-ins.

T F 4. Plywood is usually made up of an odd number of layers.

T F 5. Softwood plywoods are made entirely of plies of veneer.

T F 6. Rotary cutting of veneer is done on a lathe.

T F 7. Quarter slicing is desirable on most of the finer, imported woods.

T F 8. The greater number of plies for any one thickness, the greater the chance of splitting.

T F 9. The face and the back of plywood should always be of the same kind of wood.

T F 10. During and after redrying of face veneers, they are kept in the same order as when they were cut, to facilitate matching.

T F 11. A strip of plywood is not as strong in tension or compression as a strip of solid wood the same size.

T F 12. Plywood is stronger than steel of the same weight.

T F 13. The Sound Grade of hardwood plywood would be desirable for all cabinetwork.

T F 14. Type III plywood is best for exterior use.

T F 15. Hardwood plywood panels are usually sanded on both sides.

T F 16. Most softwood plywood in the United States is made of Douglas fir.

T F 17. Compreg is highly resistant to solvents.

T F 18. Regular woodworking equipment should be used when cutting Compreg.

T F 19. In order to protect the surface, plywood should be stored vertically, on edge when possible.

T F 20. No matter what method is used for cutting plywood, the good side should always be up.

T F 21. Nails and screws do not hold well in plywood.

T F 22. Tempered hardboard contains more than just wood fibers.

T F 23. Hardboard is available either with two smooth surfaces or with one smooth surface and one rough surface.

T F 24. Hardboard can be worked with regualr woodworking tools.

T F 25. Hardboard may be bent but should be bent in one direction only.

T F 26. Particle board contains larger bits of wood than hardboard and, due to these large bits and the adhesive, it is difficult to work with regular wood tools.

T F 27. Sheetboard is made from the lower grades of lumber.

T F 28. Since sheetboard has a covering of paper, it is not suitable for any type of cabinet.

T F 29. Plastics play an important part in modern cabinetmaking.

T F 30. When using contact cement to apply plastic laminate, it is necessary to apply the contact cement to both the laminate and the surface to which it is to be secured.

T F 31. When applying plastic laminate it is not possible to position the material once the cemented surfaces touch.

T F 32. On areas where it is impossible to use a roller to apply pressure on applied plastic laminate, it should be hammered directly with the face of the hammer.

T F 33. Once plastic laminate has been secured with a contact cement it cannot be removed.

T F 34. When using plastic laminate on a kitchen counter, it is best to make the sink cutout after the laminate has been bonded to the counter.

T F 35. Plastic laminate edge-banding can be used on round corners but should always be heated before bending.

T F 36. The cost of veneered furniture is higher than for solid furniture of the same wood.

T F 37. Duplicate grained veneers obtained from adjacent sheets is limited to four recognized matched designs.

T F 38. Almost all hardwood veneers are produced by slicing.

T F 39. Exterior plywood is moisture resistant and may be used for boats and other outdoor uses.

T F 40. Contact cements permit the installation of laminated plastic sheeting without the use of clamps.

T F 41. A disadvantage of laminated plastic is that it cannot be cut with the aid of power tools.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Several thin sheets of wood glued with the grain of adjacent sheets at right angles to each other is called ____________ .
2. Matched designs of figured wood are made with veneers that come from the ____________, ____________, or ____________ part of the tree.
3. Logs too hard to be easily cut for veneers are conditioned by the use of ____________ or ____________ ____________ .
4. Hardwood plywoods are classified as either ____________ core or ____________ core.
5. The most common method of cutting veneer for plywood is ____________ ____________ .
6. Standard American veneer is ________ inches thick.
7. The center layer or layers in plywood is known as the ____________ .
8. Strong, but unattractive wood can be used for cabinets when it is ____________ .
9. Resin-treated modified wood is made in two forms: uncompressed or ____________ and compressed or ____________ .
10. Plywood that is covered with hardboard is called ____________ .
11. When working with plywood after it has been cut, the face corners can be protected from chipping by applying ____________ to them.
12. Due to the thinness of veneer, it is important in preparing the surface not to ____________ the surface of plywood too much.
13. Particle board combines the better utilization of wood with the new developments in ____________ .
14. Particle board is used to considerable extent as ____________ stock in cabinetwork.
15. Particle board has screw holding power that is similar to ____________ .
16. The letters EXT-DFPA stand for ____________ ____________ ____________ ____________ ____________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The layer just under the face ply of a 5-ply panel is the (A) module; (B) flitch; (C) feather; (D) crossband.

_____ 2. Many problems of plywood manufacture are eliminated by the use of (A) balanced; (B) sandwich; (C) striated; (D) matching construction.

_____ 3. Hardwood veneer core plywood that is ½" thick is usually composed of (A) 3; (B) 5; (C) 7; (D) 9 plies.

_____ 4. A special plywood product that contains a thin layer of aluminum foil for beautifying effects and resistance to heat is (A) plyron; (B) striated plywood; (C) finishield; (D) prefinished plywood.

_____ 5. When nailing plywood, the nails should usually be spaced (A) 3; (B) 6; (C) 8; (D) 10 inches.

_____ 6. When using screws with 3/4" plywood, the length of the screws should be (A) 3/4" or longer; (B) 1" or longer; (C) 1 1/4"; (D) 1 1/2" or longer.

_____ 7. The best joint for plywood corners is the (A) miter; (B) butt; (C) rabbet; (D) lap joint.

_____ 8. Plastic laminates are made of (A) polyethylene; (B) vinyl; (C) melamine and phenolic; (D) polyester.

_____ 9. Plastic laminates are usually (A) 1/32"; (B) 1/16"; (C) 3/32"; (D) 1/8" thick.

_____ 10. When edge-banding with plastic laminate around a corner, there should be a flat surface on each side of the curved portion of at least (A) 2"; (B) 4"; (C) 6"; (D) 8".

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The major parts that make up a piece of plywood are the:

(A) ____________________ (C) ____________________

(B) ____________________

2. The wood grain and figure pattern of face veneers are determined primarily by:

(A) ______________________________

(B) ______________________________

(C) ______________________________

3. The three methods of cutting veneer from logs are:

(A) ______________________ (C) ______________________.

(B) ______________________

4. Matching plywood involves the selecting of plies that are nearly identical in:

(A) ______________________ (C) ______________________

(B) ______________________

5. Matching of veneers falls into three main classifications, namely:

(A) ______________________ (C) ______________________

(B) ______________________

6. List five advantages of plywood.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

7. List the five grades of hardwood plywood.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

8. List the seven items that should be specified when ordering hardwood plywood.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

9. List seven advantages of hardboard.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

10. List five items to specify when ordering hardboard.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

11. Four trade names for laminated plastics are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

Assignment
Sheet No. 11

Covering
Units 146-149

FRAMING SQUARE AND GEOMETRIC LAYOUT

The framing square, sometimes called "steel square," is a very versatile tool. Its use is not restricted to building construction but rather is a valuable tool for cabinetmaking, also. Its use will enable the cabinetmaker to be more efficient and will help in some of the mathematical computations.

Geometry also plays an important part in a cabinetmaker's work. Most layout and design work can be divided into relatively simple geometric problems. A good knowledge of geometry will enable the cabinetmaker to vary his designs and to expand his abilities. Application of such knowledge has a direct bearing on the competency of the cabinetmaker.

In this assignment you will have the opportunity to study the ways in which the steel square can aid the cabinetmaker. You will also learn how geometric constructions can be used to advantage for layout and fitting of cabinets.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

Reference:

B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 120-125, 132-162.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A steel square to be used for cabinetmaking should have scales graduated in tenths, twelfths, and sixteenths of an inch.

T F 2. The hypotenuse of any right-angle triangle can be found on the steel square.

T F 3. The diagonal of a 12-inch square measures about 20 inches.

T F 4. The diagonal of a rectangular solid can be found on the steel square.

T F 5. Certain layouts will require the use of the inside edge of the tongue of the square with the outside edge of the body of the square.

T F 6. The body and the tongue of a steel square are the same width.

T F 7. When butt joints are used on square hoppers, two of the sides are smaller by the thickness of the material of the other two sides.

T F 8. The construction of a hexagon should begin with a circle.

T F 9. The drawing of a spiral starts with a small circle.

T F 10. Miter cuts on boards of unequal widths are laid out by laying one board on top of the other at the desired angle, marking the edges at the outside and inside intersections and connecting the points.

T F 11. A circle may be drawn by using a steel square, two nails, and a pencil.

T F 12. When laying out a large, accurate ellipse by means of a wooden trammel, the trammel should be constructed a little longer than the major axis.

T F 13. A pipe that is to pass through a board at an angle will require an elliptical opening in the board.

T F 14. A pediment is a triangular frame resembling a gable crowning the front of an entrance.

T F 15. The layout of an inclined die counter with a curved end should be done on large paper and transferred to the stock.

completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A steel square with a tongue that is __________ inches long is best for cabinetmaking.

2. Since the body and tongue of a steel square are at right angles to one another, it can be used for solving any __________________ problem.

3. The square of the hypotenuse of a right triangle is equal to the _______________ of the _______________ of the other two sides.

4. When working with triangles larger than are possible full size on the steel square, it may be necessary to perform _____________ ______________________ in order to get the desired accuracy.

5. The job of laying out miter and butt joints for polygons can be simplified by the use of a ______________ of polygon cuts.

6. A hopper is wider at the ______________ than at the ____________.

7. Jointing on a hopper requires a butt joint of ________________ than 90 degrees and a miter cut of ____________ than 45 degrees.

8. The area of mathematics that is of great value for cabinetmaking layout is ______________.

9. A plane surface intersecting a cylinder at an oblique angle forms a(n) ______________ at the intersection.

10. The distance from one end of the minor axis of an ellipse to the focus on the major axis is equal to ______________ the major axis.

11. Molding placed in a slanting position is known as ______________ molding.

12. The vertical front face of a counter is called a(n) ____________ .

13. Folding leaves of table tops are usually fastened with ______________ joints.

14. Practice in layout work is usually done on the ______________ ______________ .

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List three types of polygons.

(A) ________________ (B) ______________ (C) ________________

2. Some of the more commonly used layout tools for cabinetwork are:

(A) ________________________ (F) ________________________

(B) ________________________ (G) ________________________

(C) ________________________ (H) ________________________

(D) ________________________ (I) ________________________

(E) ________________________

3. Measurements that must be available in order to layout a curved and slanted counter front are the:

(A) ____________________

(B) ____________________

(C) ____________________

Assignment
Sheet No. 12

Covering
Units 150, 151

WOOD JOINERY

Every construction project which is made of more than one part must be fastened in some way with one or more types of joints. Sometimes these joints need special additions to make them effective and acceptable. The type of wood, the way that the parts come together, and the function of the finished object are considerations that must be made in selecting the joint to use. Some joints can be constructed quite rapidly but will not stand up over a period of time.

It is important that the cabinetmaker select the proper joint to use so that the object will have a pleasing appearance and will hold together for the desired time. Selection of the wrong joint or poor workmanship on the joint will quickly hurt the cabinetmaker's reputation if this results in poor appearance or the object pulling apart.

In this assignment you will have an opportunity to learn what some of the common joints are that are used in cabinetmaking. You will learn the advantages and disadvantages of each, when they should be used, and how to construct them.

Assignment:

1. Read the references listed below.
2. Examine a completed piece of cabinetwork and list the different joints that were used. Indicate the place on the object where they were used and whether it was the best choice of joint.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 296-320.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 49-56.
C. Towers, Cabinetmaker's Manual, pp. 123-145.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. When making duplicate parts, one should perform the same operation on all parts before starting a new step.

T F 2. When selecting a joint it is a good idea to select the simplest one that will do the job.

T F 3. The holding power of a joint depends primarily on the use of good, strong glue.

T F 4. Since a mortise-and-tenon joint requires considerable work and effort the butt joint reinforced with dowels and corner blocks is sometimes used.

T F 5. Dowels used for strengthening joints should be cut so that they fit right up to the bottoms of the holes.

T F 6. The spiral groove on dowel pins is a result of the manufacturing process and it does not serve any functional purpose.

T F 7. For proper strength the diameter of the dowel should be about three-fourths the thickness of the stock.

T F 8. All splines should be made of wood.

T F 9. An end-butt joint by itself has very little, if any, strength.

T F 10. The angle for a scarf joint should be very shallow.

T F 11. Edge joints, correctly made with a good grade of glue under proper conditions, will be as strong as the wood.

T F 12. Milled joints are usually stronger than non-milled edge-to-edge joints.

T F 13. Milled joints permit faster assembly time.

T F 14. The rabbet is cut easiest on the circular saw.

T F 15. The dado joint can usually be secured with glue alone.

T F 16. The plain lap joint is only as strong as the fasteners used.

T F 17. A lap joint should be used only when the two pieces cross at right angles.

T F 18. The miter joint is a relatively strong joint.

T F 19. A miter joint must always be cut at 45 degrees.

T F 20. Even though the lock miter joint is a strong joint and somewhat complicated, it can be cut on the circular saw.

T F 21. The dovetail joint provides great strength.

T F 22. The miter joint by itself is particularly weak when used with plywood.

T F 23. The dovetail dado joint requires special equipment to make.

T F 24. The time needed to construct a joint is an important thing to consider.

T F 25. Bottoming is a term used to describe the cutting of a groove or mortise.

T F 26. Milled glue joints are cut by passing each piece through the shaper with the face down.

T F 27. End-grain glue joints are very weak.

T F 28. End- and middle-lap joints are seldom used in exposed construction.

T F 29. The miter joint needs no further reinforcement.

T F 30. The maximum mortise width on thin stock should be about one-half the thickness of the stock.

T F 31. The tenon member requires no machining in the case of the housed mortise and tenon.

T F 32. Inferior cabinetwork is usually fastened with glue.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In cabinetmaking, stock is brought to correct thickness and width by planing and jointing, and to correct length by ______________.

2. Before stock is rough cut to size it should be checked for ______________ and ______________ ______________.

3. When selecting the type of joint to use for construction, you should consider its final ______________ and its ______________.

4. The best joint for fastening the front of a drawer to the sides is a ______________ joint.

5. Coped joints are often used in ______________ work and in ______________ work.

6. A new and important joint for end grain that has had an important influence in industrial woodwork is the ______________ joint.

7. The simplest and easiest joint to construct is the ______________ joint.

8. A rabbet joint should be cut to a ______________ equal to the thickness of the material and to a ______________ of one-half to two-thirds the thickness.

9. A groove cut across grain to receive the butt end of another piece is called a ______________.

10. An angle joint that hides the end grain of both pieces is a ______________ joint.

11. Grooves cut into the edges of stock to be joined are used when the ______________ joint is constructed.

12. The angle for the ordinary dovetail joint is one to ____________.

13. The lock corner joint is used in ______________ manufacturing.

14. Off-center dowel holes will make surfaces ______________.

15. Dowel holes which are not perpendicular will cause the surfaces to be ______________ ______________ ______________.

16. Dowel ends should be ______________ to make them easier to drive.

17. Dowel stock may be purchased in diameters from __________ inch to __________ inch.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The maximum that the angle for a scarf joint should be is (A) 6; (B) 12; (C) 18; (D) 30 degrees.

_____ 2. A good joint to use to fasten the backs of cabinets and bookcases would be the (A) rabbet; (B) dado; (C) miter; (D) lap joint.

_____ 3. A dado that goes only part way across the board is called a (A) dovetail; (B) partial; (C) blind; (D) half dado.

_____ 4. A good joint for leg-and-rail construction is the (A) mortise-and-tenon; (B) dovetail; (C) dado; (D) rabbet joint.

_____ 5. A spline should usually be about (A) 1/16"; (B) 1/8"; (C) 3/16"; (D) 1/4" thick

_____ 6. The distance that the tenon of a mortise-and-tenon joint should project into the other piece is (A) about 1/4 the thickness of the stock; (B) always 1/2"; (C) about 1/2 the thickness of the stock; (D) at least 3/4".

_____ 7. The length of a tenon should be at least (A) 1"; (B) 1 1/4"; (C) 1 1/2"; (D) 2".

_____ 8. The depth of the mortise of a mortise-and-tenon joint should be (A) the same as the projection of the tenon; (B) 1/8" less than the tenon; (C) 1/8" deeper than the tenon; (D) 1/4" deeper than the tenon.

_____ 9. A joint with both parts having their grain parallel is (A) an end joint; (B) an edge joint; (C) a parallel joint; (D) a mitered joint.

_____ 10. The thickness of a spline should be equal to (A) one-eighth; (B) one-fourth; (C) one-third; (D) one-half the thickness of the stock.

_____ 11. The width of the spline should be (A) one-fourth; (B) one-half; (C) equal to; (D) twice the thickness of the stock.

_____ 12. Cleated edge joints are used for (A) sub-assembly work; (B) finished surfaces; (C) building up stock to width; (D) structural reinforcement.

_____ 13. A sloping cut made on the end of each piece of stock to be joined is called the (A) end-lap; (B) face-lap; (C) finger; (D) scarf joint.

_____ 14. A spline running at right angles to a miter joint creates the (A) slip-feather; (B) slip; (C) miter-spline; (D) miter-feather joint.

_____ 15. One of the strongest joints is the (A) doweled; (B) mortise and tenon; (C) miter; (D) scarf.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The type of joint to be used on a particular project depends upon:

(A) _____________________ (D) _____________________

(B) _____________________ (E) _____________________

(C) _____________________

2. List six methods, other than glue, nails, and screws, for strengthening joints.

(A) _____________________ (D) _____________________

(B) _____________________ (E) _____________________

(C) _____________________ (F) _____________________

3. List the nine basic types of joints.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

(H) ______________________

(I) ______________________

Assignment
Sheet No. 13

Covering
Units 152-154

CONSTRUCTION OF CABINETS AND BUILT-INS

Actual construction of cabinets can be broken down into two divisions--the cabinet or built-in carcass, and the individual parts that are included in most cabinets. This assignment is concerned with the first division named, that of the cabinet or built-in itself. Since more than one worker may work on the entire cabinet, it is necessary that some means of layout and measurement be used to assure uniformity and correct assembly. The layout rod is used for this purpose. There are also different ways of constructing the main part of a cabinet, the type and style of cabinet determining which methods should be used.

The cabinetmaker needs to be familiar with rod layout in order to perform his duties and work with others.. He also needs to know the various ways of constructing cabinets in order to understand how a cabinet is constructed and to construct those that are required of him.

In this assignment you will learn how to use rod layout for laying out cabinet work. You will also study the various ways of putting cabinets together.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 388-400, 418-424, 553-558.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 112-119, 240-246.
D. Siegle, Cabinets and Built-Ins, pp. 9-13, 19-27, 32-41, 46-50, 71-79.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A layout rod is a long piece of flat stock on which measurements are made for stock layout.

T F 2. Layout rods are used only on jobs that will have repeat orders.

T F 3. One face of the rod is trued up and used for all dimensions.

T F 4. A definite order of layout is followed in marking with the rod.

T F 5. The rod goes with the stock through its route in the shop.

T F 6. The dimensions of the various layouts are not written on the rod.

T F 7. In skeleton construction the legs are almost always joined to the rails with the mortise-and-tenon joint.

T F 8. A drawer is an example of simple case construction.

T F 9. Case construction is found in most cabinets and built-ins.

T F 10. Carcass construction contains fewer internal details than case work.

T F 11. Since panel construction is composed of different parts there tends to be more warpage than with solid stock.

T F 12. Drawer guides are sometimes made as a part of the case.

T F 13. Generally, in panel construction, just the joints of the frame should be glued and not the panel in the groove.

T F 14. Some doors are constructed much like panels.

T F 15. In case construction, the first problem is to decide the means of fastening the bottom.

T F 16. An open frame is usually found on more expensive construction.

T F 17. Glue blocks should never be nailed.

T F 18. Building a built-in for a particular house and making a standard piece of cabinetwork involves about the same work.

T F 19. Factory-built kitchen units tend to have more elaborate construction in the base cabinets than do carpenter-built.

T F 20. The use of plywood for built-ins has practically eliminated the need for moldings and panelwork.

T F 21. Plywood doors can be reinforced and given a nice edge finish by grooving and inserting a strip of wood.

T F 22. The mortise-and-tenon joint is a typical joint used on the rough frame of a cabinet.

T F 23. Remodeling of old kitchens represents a real challenge to the cabinetmaker and a source of good business.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When laying out the height, width, or length of the cabinet and its parts, the ____________ dimension should usually be laid off first.
2. A rod layout consists of ____________ only.
3. The overall dimensions of a cabinet do not include any ____________ or ornamentation.
4. The vertical parts of the frame in panel construction are called ____________ and the horizontal parts are called ____________.
5. The center rails of a panel, if they are included, are called ____________.
6. When assembling a panel construction, the edges of the panel should be covered with ____________ before final assembly.
7. Great care must be taken in leg-and-rail construction since the legs have a tendency to ____________ _________ ____________.
8. Dividers used in case construction should be ____________ into the other members.
9. The corners of a frame should be made with ____________ joints.
10. Built-ins must be made to ____________ the irregular surfaces.
11. The construction of cabinets depends to some degree on the ____________ of the house.
12. Old-style medicine chests are many times being replaced by ____________.
13. Tile used on the tops of bathroom cabinets are bedded in cement which is reinforced with ____________ ____________.
14. Toe room around cabinets and built-ins is usually ____________ x ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write th letter of the item which will provide the correct answer to comple the statement.

_____ 1. The shell of a cabinet is known as the (A) cabinet frame; (B) casework; (C) carcass (D) cabinet standard.

_____ 2. When gluing up stock to make a large area of solid stock, the pieces to be glued should be about (A) 1 to 2; (B) 2 to 4; (C) 4 to 6; (D) 6 to 8 inches wide.

_____ 3. The most common method of treating the edges of plywood is with (A) veneer; (B) thin solid stock; (C) tongue and groove; (D) molding.

_____ 4. The most common method of joining legs to cross rails is with (A) a blind mortise-and-tenon; (B) dowels and a corner block; (C) an open mortise-and-tenon; (D) a dovetail joint.

_____ 5. The standard dimension for the height of kitchen cabinet counters above the floor is (A) 25; (B) 30; (C) 36; (D) 42 inches.

_____ 6. The standard distance from the top of the refrigerator to the bottom of a cabinet above the refrigerator is (A) 6; (B) 8; (C) 10; (D) 12 inches.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the five basic ways in which cabinetwork is put together.

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

2. List three common ways of covering large areas or surfaces in cabinetmaking.

(A) ____________________ (C) ____________________

(B) ____________________

3. List four considerations in arranging pieces to be glued up to make wider stock.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

4. List three methods of taking care of space above wall cabinets in a kitchen.

(A) ______________________ (C) ______________________

(B) ______________________

5. List three important requirements of any bathroom.

(A) ______________________ (C) ______________________

(B) ______________________

6. List two requisites of a cabinetmaker who intends to work in the modernizing of old kitchens.

(A) ____

(B) ____

Assignment
Sheet No. 14

Covering
Units 155-158

CONSTRUCTION OF CABINET PARTS AND SPECIAL FEATURES

The quality of the finished cabinet will usually be no better than the quality of the parts that make up the cabinet. Some parts are machined and go directly into the casework while others are assembled to form separate units that fit into the total cabinet. There are also special features that the cabinetmaker is called on to do which require a somewhat specialized knowledge and skill.

It is important for the cabinetmaker to be able to construct the various parts of the cabinet and to understand the functions of these parts. It is also essential that the cabinetmaker, in order to maintain his job, perform some of these specialized duties.

In this assignment you will learn what the various parts of a cabinet are used for and how they are constructed to become part of the cabinet. You will also learn of some of the special features that are sometimes part of cabinets and the cabinetmaker's work.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 400-418.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 222-239.
D. Seigele, Cabinets and Built-Ins, pp. 14-18, 80-88, 93-100.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The top of a cabinet is usually constructed in only one way.

T F 2. A skeleton frame usually consists of stiles and rails only.

T F 3. The edge of an open shelf may be faced with material of the same type as the exterior.

T F 4. The finish thickness of a face frame is made the same thickness as the doors which fit in it.

T F 5. Cabinetmakers, in some parts of the country, refer to all paneled or flush cabinet doors as china closet doors.

T F 6. The correct order of listing drawer dimensions is width, height, and depth.

T F 7. Square sticking refers to sash or frame stock cut in square or rectangular cross-section with no decorative edge cuts.

T F 8. A drawer kicker is used to prevent a drawer from being pulled out too far.

T F 9. Before constructing a door for a cabinet it is important to determine what type of hinge to use.

T F 10. Butt hinges tend to be rather plain with not much eye appeal and therefore are not used much for fine construction.

T F 11. Surface hinges are easier to use on flush doors than butt hinges.

T F 12. If an opening for a flush door is not square, it must be corrected before the door is cut.

T F 13. The hinge side of a flush door is usually cut at a slight bevel so that the door will open and close without striking the frame.

T F 14. A lip door is easier to fit than a flush door.

T F 15. Semi-concealed hinges are good to use on lip doors made from plywood.

T F 16. Sliding doors should always have purchased tracks to run on.

T F 17. Doors should usually be hung with at least three hinges.

T F 18. The simplest drawer utilizes a dovetail joint to fasten the front to the sides.

T F 19. The drawer-corner joint is not too strong but is easy to make.

T F 20. If a center guide and runner are used for a drawer, the bottom of the drawer should not be any higher than 1/4" from the bottom of the sides.

T F 21. The bottom of a drawer should not be glued into the grooves.

T F 22. If a side guide and runner are used for a drawer, the groove on the side of the drawer should be below center in order to best support the weight that may be put into the drawer.

T F 23. The best drawer guide to use is the center drawer guide and runner.

T F 24. When using the center guide and runner, the drawer can be prevented from being pulled out too far if the runner opening is not extended through the back of the drawer.

T F 25. The guide and runner of a drawer should never be painted or finished.

T F 26. Complicated cabinets should be assembled in stages.

T F 27. A cabinet should be clamped up temporarily without fasteners or glue to see if it will assemble properly before fastening permanently.

T F 28. A door that is closed and has concealed hinges will not reveal any portion of the hinges.

T F 29. When using commercial roller guides for drawers, the commercial guides come in one piece and the bottom edges of the drawer sides ride on the guides.

T F 30. A cabinet that is to be hung on the wall must have a back in order to hang it.

T F 31. Cabinet work today is still done almost entirely by hand and requires exceptional skill with hand tools.

T F 32. A soffit can be constructed after the cabinets have been hung.

T F 33. Drawer bumpers are added to the drawers to prevent the lip from cracking or breaking.

T F 34. The primary purpose of a cabinet should never be to conceal other constructions.

T F 35. Lazy susan or revolving shelves can be placed directly above one another and supported on the sides.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A cabinet end is sometimes called a(an) ________________ if it is covered, or a(an) ________________ or side if it is exposed.

2. If a paneled end is butt jointed to the face frame, the front stile is made ________________ than the back stile to compensate for the thickness of the face frame.

3. Dividers of solid glued-up stock placed between shelves are known as ________________ or ________________.

4. The bottom shelf of a cabinet is supported in the center by _______________.

5. Shelves can be fitted into a cabinet so that they are either _______________ or _______________.

6. Cupboard door and sash dimensions are listed, in order, as _______________, _______________, and _______________.

7. Drawers are usually classified as _______________ front or _______________ front.

8. A drawer should have a clearance of __________ inch in height and __________ inch in width.

9. The cheapest type of drawer will probably have the sides fastened to the front by means of a _______________ joint.

10. A butt hinge must be mortised in and requires that a _______________ be cut in both the door and the frame.

11. A drop door will function best when a _______________ hinge is used.

12. When space is limited, _______________ doors are commonly used.

13. When cutting grooves to install sliding doors, the _______________ groove should be cut twice as deep as the _______________ so that the doors can be removed.

14. A gain is the opening made for a _______________.

15. A dropleaf table joint is sometimes called a _______________ joint.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A pre-assembled unit which forms the opening into which doors are fitted is called a (A) face frame; (B) carcass; (C) cabinet case; (D) cupboard sash.

_____ 2. Drawer bottoms should be cut to allow a clearance in the grooves of the drawer sides of (A) 1/8"; (B) 1/16"; (C) 1/32"; (D) none.

_____ 3. The depth of a drawer should be less than the depth from the face to back of the case by (A) 1/16"; (B) 1/4"; (C) 1/2"; (D) 1".

____ 4. If a door binds on the hinge side when using butt hinges it requires (A) a deeper gain; (B) the position of the hinge to be changed; (C) a piece of material glued under the hinge; (D) a bevel cut on the hinge side of the door.

____ 5. From grooves for the drawer bottom to the bottom edge of the drawer, there should be at least (A) 1/16; (B) 1/8; (C) 1/4; (D) 1/2 inch.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The purposes of the skeleton frame are:

(A) ____________________

(B) ____________________

(C) ____________________

2. Methods used to guide a drawer as it slides include:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

3. The four most common joints for fastening the front of a drawer to the sides are:

(A) __________ (C) __________

(B) __________ (D) __________

4. List three methods of installing tops to tables.

(A) ____________________

(B) ____________________

(C) ____________________

5. List four ways of installing shelves.

(A) __________ (C) __________

(B) __________ (D) __________

Assignment
Sheet No. 15

Covering
Units 159-164

FURNITURE MANUFACTURING

There are some who consider furniture manufacturing as part of cabinetmaking and there are others who do not. In a sense, it is quite similar to the making of cabinets, utilizing the same types of joints, layout, finishing, etc. There are, however, some differences, particularly in mass production shops. It should be noted that the general procedure is much the same in either mass production or small job shop production.

This unit will give you an opportunity to study furniture manufacturing in a limited sense, particularly from the large industrial standpoint.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Feirer, Woodworking for Industry, pp. 425-443.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Machines used in industry for furniture making are larger and faster than those found in schools but they perform the same operations.

T F 2. The double planer and surfacer combines the operations of the power jointer and the planer and trues up all four sides of a board in one operation.

T F 3. A single-end tenoner will only cut tenons.

T F 4. A double-end tenoner is capable of making many different types of cuts and on both ends of the board at the same time.

T F 5. Some automatic lathes will do everything except load the machine.

T F 6. The double-spindle shaper has two cutters rotating in opposite directions.

T F 7. Automatic shapers are used primarily for custom work and therefore are not too important in furniture production work.

T F 8. A gang borer is a machine that bores several holes, one after the other, automatically.

T F 9. Drum sanders have a single large disk against which the ends of boards are sanded.

T F 10. The furniture designer of today relies entirely on his own creativity for his designs.

T F 11. As a last step in the design of a piece of furniture, the designer makes a full-size working drawing.

T F 12. Cabinetmakers who work on experimental models must also make their own jigs and fixtures.

T F 13. A sample must always be made before the final product is produced.

T F 14. The length of time from the purchase of the lumber to the making of it into furniture is normally about one month.

T F 15. Most furniture manufacturers make their own lumber-core plywood.

T F 16. Core stock for inner layers of plywood is usually made from cheaper woods.

T F 17. Structural parts of furniture such as legs and arms are made of solid stock rather than plywood.

T F 18. Only about 60% of lumber is finally usable in the finished furniture.

T F 19. With the advent of new and better machines, skilled hand work is not necessary any more except to operate the machines.

T F 20. Even with new machines, hand sanding of furniture is still required.

T F 21. Most commercial furniture is finished with varnish.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Boards that have been run through the double planer should be perfectly ________________ and uniformly ________________.

2. The molding machine or sticker is a variation of the ______________.

3. Boring machines are commonly used to bore holes for ______________ work.

4. A coat of adhesive may be applied to wood surfaces by means of ______________ ______________.

5. The designer's first step in the actual designing of a new piece or line of furniture is to make several ______________.

6. An elevation is usually the ______________ view drawing of the proposed design.

7. The moisture content of raw lumber should range from __________ to __________ per cent just before processing.

8. The cutting of lumber to rough length in a factory is called ______________.

9. Although machines now do much of the work in furniture construction, skilled hand woodworkers are still needed for ______________ and ______________.

10. Rubbing is handwork that takes place during the ______________ operations.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Wood used in manufacturing, especially furniture manufacturing, must be carefully checked regarding its variable features. These are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List three operations the gang rip saw will do.

(A) ______________________ (C) ______________________

(B) ______________________

3. The process route sheet is prepared by the engineering department and contains such items as:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

Assignment
Sheet No. 16

Covering
Units 165-170

FINISHING PROCEDURES

The finishing of cabinets and other items is extremely important to all cabinetmakers. An excellent finish can, in some instances, cover up some flaws in the workmanship of a mediocre cabinetmaker. It can also complete a high quality product of the expert craftsman.

It may be that the cabinetmaker is not required to do the finishing. However, a good cabinetmaker should be ready to perform this duty if need be.

Finishing can be divided into two phases - preparation for finish and application of the finish. One is as important as the other and they both require skill and hard work. In this unit you will learn what materials are used in the preparation for finishing and how to properly prepare surfaces for finishing. Further, you will study different kinds of finishes and the techniques involved in their application.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

A. Feirer, Woodworking for Industry, pp. 367-372, 576-591, 596-597, 598-610.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Flint is considerably harder than quartz.

T F 2. Paper backing for abrasives comes in different weights.

T F 3. A grit size of 120 in regard to garnet paper would be very coarse.

T F 4. Paper and cloth are sometimes used together as backing for abrasives.

T F 5. Mesh number and grit sizes are one and the same.

T F 6. The larger the number designation on abrasives, the finer the grit.

T F 7. The very fine grade of abrasive should be used just before staining and sealing.

T F 8. 2/0 is a finer abrasive than 3.

T F 9. 1/0 and 0 indicate the same grit size of abrasive.

T F 10. Sheet abrasives come only in the 9" x 11" size.

T F 11. To do finish sanding with a portable sander a 2/0 to 5/0 abrasive should be used for most hardwoods.

T F 12. Surfaces that are to be glued should not be sanded.

T F 13. Since pencil marks are liable to go into the wood somewhat, a coarse abrasive should be used to sand them off.

T F 14. The sanding of curved or irregular surfaces must still be done largely by hand.

T F 15. An abrasive with a cloth backing is best for curved or irregular surfaces.

T F 16. Extra sanding must be done to adequately prepare wood when a clear or natural finish is applied.

T F 17. A new brush should be broken in before using by soaking in a solvent for a period of time.

T F 18. Rollers commonly used to apply paint may also be used to apply such finishes as shellac and lacquer.

T F 19. Most industrial finishes are applied with a brush.

T F 20. Forty per cent of all furniture items is finished with a sprayed-lacquer finish.

T F 21. External mix refers to the mixing of air and fluid outside the gun.

T F 22. Spraying in a spray booth with proper ventilation will eliminate the need to wear a respirator.

T F 23. There are various types of nozzles for spray guns that need to be used if different spray patterns are desired.

T F 24. A spray gun should always be kept at right angles to the surface being sprayed.

T F 25. Spray strokes should always be horizontal.

T F 26. Once the spraying has been started, the trigger of the gun should not be released until the surface has been completely sprayed.

T F 27. If the holes become clogged in the cap of the spray gun, they should be cleaned with a toothpick.

T F 28. There are some woods that take paint better than others.

T F 29. Enamel will produce more of a gloss finish than a latex paint.

T F 30. Plywood will usually require three coats of paint for good protection.

T F 31. Applying a good finish generally will not serve to cover up mistakes.

T F 32. When preparing the wood for finishing, all of the excess glue should be sanded off.

T F 33. Small dents in wood can be removed by putting water on the dented area and allowing it to dry.

T F 34. Open-grained wood should be scraped before sanding.

T F 35. Mineral spirits serves the same purposes as turpentine.

T F 36. Pumice comes in just one grade.

T F 37. Rottenstone is a finer abrasive than pumice.

T F 38. Oxalic-acid crystals will do an excellent job of bleaching and, although difficult to use, are far superior to any other materials.

T F 39. There are available now finishes that can be applied with a cloth.

T F 40. Most industrial finishing is done with a stain having naphtha and turpentine as its solvent base.

T F 41. A washcoat of shellac serves as a good sealer for many stains.

T F 42. Mahogany is a wood that requires a paste filler.

T F 43. Lacquer can be either sprayed or brushed on.

T F 44. It is extremely difficult to obtain an outstanding finish on plywood.

T F 45. To obtain a high-gloss paint finish, a second coat consisting of equal parts of undercoat and high-gloss enamel should be used.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The abrasive that is reddish-brown in color is ______________.

2. Flint and ______________ papers are generally used for sanding ________________.

3. Abrasives that also work well on metal are ______________ ______________ and ______________ ______________.

4. Drum sanding and spindle sanding each involve the use of abrasive sheets mounted on ______________.

5. When hand sanding one should always sand ______________ the grain.

6. One should sand only in one direction when sanding ______________ ______________.

7. Furniture finishing in large factories is broken down into a series of jobs including the preparation of surfaces, ______________, ______________, ______________, ______________, and rubbing.

8. Knots in wood should be covered with ______________ before applying the paint.

9. The bristles of brushes that have been used and cleaned should be covered with ______________ before storing.

10. The air pressure delivered to the spray gun is reduced to the proper pressure by a ______________ or regulator.

11. When spraying, the spray gun should be kept about __________ to __________ inches from the work.

12. When spray painting, the ______________ are always done first.

13. The most popular interior paints are ______________ paints.

14. In painting cabinets or other interior work all ______________ should be removed or covered with masking tape.

15. The solvent for shellac is ______________.

16. The main disadvantage in using water stains is that they ______________ the wood and ______________ the grain.

17. Paste wood filler should be applied with a ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. In most woodworking plants sanding of the product and its finishes is classified in three ways:

(A) ______________________________

(B) ______________________________

(C) ______________________________

2. Three things that you should be familiar with concerning coated abrasives are:

(A) ______________ (C) ______________

(B) ______________

3. List the five kinds of materials used for abrasives and indicate if they are natural minerals, or man-made (synthetic).

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

4. The four common backings for abrasives are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. Five different types of bonds for abrasives are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

6. Four kinds of sanding in relation to grit size are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

7. Abrasives come in the following forms:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

8. Four things to consider when selecting an abrasive are:

(A) ____

(B) ____

(C) ____

(D) ____

9. List four materials that can be used to fill nail holes, cracks, etc.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

10. Give three purposes of washcoating.

(A) ____

(B) ____

(C) ____

Assignment
Sheet No. 17

Covering
Units 171-174

DOORS, WINDOWS, AND SASH CONSTRUCTION

Doors and windows have an important place in all buildings although modern ventilation systems have reduced somewhat the importance of windows. Mass production methods have also created a standardization of door designs and have reduced the large varieties formerly available.

It, however, is still important that proper doors and windows be installed and that they perform their intended function properly. Considerable skill and knowledge is required to adequately construct and install doors and windows, especially those custom ordered.

In this assignment you will have the opportunity to learn the names of the various parts of doors and windows, the different types of doors and windows, and some of the procedures necessary to construct them.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking for Industry, pp. 528-537.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 247-287.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The cost of specially designed or odd size doors is only slightly more than for standard construction.

T F 2. A "standard" door design is standard throughout the cabinetmaking industry.

T F 3. Door dimensions are listed in order as: width, height, and thickness.

T F 4. A diagonal line drawn between two numbers of a door listing indicates a separation of feet and inches.

T F 5. A detail drawing usually accompanies an order for special or odd size doors.

T F 6. On standard doors, the mortise is centered, and the molded reveal is the same on both sides.

T F 7. Solid hardwood doors are expensive but are the most desirable and practical.

T F 8. A hollow core door is not as durable as a solid core door.

T F 9. No light should pass through the crack between two doors hinged to the same frame.

T F 10. A door-standards catalog is available outlining the requirements for materials, workmanship and construction.

T F 11. The louver door is used where ventilation is desired.

T F 12. The major difference between interior and exterior doors is in the thickness.

T F 13. The overall dimensions of sash and windows are based only on even sizes of glass.

T F 14. The thickness dimension of sash is always given before the width.

T F 15. The number of lights specified for a pair of casement windows refers to the number in one window.

T F 16. Horns are trimmed off just before assembly.

T F 17. The height of casement windows in pairs should usually be one and one half times the height of standard windows.

T F 18. Hardwood sash are usually veneered.

T F 19. Manufacturers of windows and sash who do not belong to lumber associations often follow traditional methods of construction which vary considerably from those of the associations.

T F 20. Both Eastern and Western standards specify that the width of a window or sash be even to the inch in size.

T F 21. The height of the Eastern Standard window is based on even-inch glass sizes.

T F 22. The height of the Western Standard window is based on odd-inch size glass.

T F 23. Western Standard provides for either dowel or mortise-and-tenon construction.

T F 24. Awning type windows and jalousie windows both open in much the same manner.

T F 25. The wood double-hung window is still the most commonly used window.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Doors are classified by the manufacturer according to __________ and the problems of ____________.

2. The width and height of doors are listed in units of __________ and ____________.

3. Stiles and rails of a door may be made of either ____________ or ____________ stock.

4. Door panels may be made of ____________ or ____________ stock.

5. The length of the mortise is determined by the ____________ of the rail.

6. To prevent cutting into a dowel when fitting a door, the outside dowel should be placed no closer than ____________ ____________ ____________ from the outside edge of the rail.

7. A door in which the two faces form a flat surface is called a ____________ door.

8. Of particular importance in door layout is the direction of ____________.

9. One type of face mark resembles the figure ________ with the tail pointing to and ending at the ____________ ____________.

10. Glazed doors are doors that utilize ____________.

11. Doors which receive panes of glass must have the inside edges of the stiles and rails ____________.

12. Doors which are not standard in design are called ____________ doors.

13. Many leading woodwork manufacturers belong to the ____________ ____________ ____________ Association (USA).

14. Interior doors are usually ________ inches thick.

15. Main entrance doors should not be less than ________ feet ________ inches high.

16. Glass used for normal window purposes is usually ____________ strength ____________ quality.

17. D.S.A. is the designation for ____________ strength ___________ quality glass.

18. Eastern standards call for a _________ inch depth rabbet on stock sash.

19. In sash layout the mortise is usually cut in the ____________ and the tenon is cut on the _____________.

20. Lugs are used to _____________ the sash of a double-hung window.

21. The most common wood for sash throughout the United States is _____________ ______________.

22. The standards published by the National Woodwork Manufacturers Association are referred to as _____________ ______ ________ and those published by the Southern California Lumber Dealers Association as _____________ ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A door design not ordinarily carried in stock but for which designs are readily available would be considered as (A) standard size; (B) standard design; (C) special design; (D) stock size.

_____ 2. Doors of a particular size and design which are carried in stock are (A) standard design; (B) standard size; (C) stock size; (D) detail design.

_____ 3. A door which is 1 1/2 inches thick would require dowels with a diameter of (A) 1/8"; (B) 1/4"; (C) 3/8"; (D) 1/2".

_____ 4. The overall size of a double-hung window with two 20" x 20" lights is (A) 1'8" x 1'8"; (B) 2'0" x 3'10"; (C) 2'0" x 4'0"; (D) 2'4" x 4'2".

_____ 5. The size of the glass opening in a sash should be (A) the same as; (B) 1/16" larger than; (C) 1/8" larger than; (D) 1/16" smaller than; the glass.

_____ 6. Lumber is selected for sash and windows primarily because of its (A) toughness; (B) ease of working; (C) availability; (D) appearance.

Listing

Directions: List the item called for in each of the following. Select your answers carefully.

1. The following information is necessary when listing doors:

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(F) ______________ ________

(F) ______________________

(G) ______________________

(H) ______________________

2. A door consists basically of:

(A) ______________________

(B) ______________________

(C) ______________________

3. Face marking is used to:

(A) ____

(B) ____

(C) ____

(D) ____

4. Light is prevented from passing through the crack between matching doors by using either:

(A) ______________________

(B) ______________________

5. List four styles of doors common for both interior and exterior doors.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

6. List <u>five</u> types of windows found in homes.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

7. Significant differences between the two accepted standards of construction for double-hung windows include:

(A) ____

(B) ____

(C) ____

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Group I

_____ 1. muntin

_____ 2. rail

_____ 3. sticking

_____ 4. stile

_____ 5. panel

_____ 6. opening

_____ 7. mullion

_____ 8. raised panel

_____ 9. bar

_____ 10. face

_____ 11. reveal

A. outside vertical member of a door

B. inside full length horizontal member

C. inside full length vertical member

D. short, light member, running either vertically or horizontally

E. light member extending through glazed openings

F. portion of filled space between stiles, rails, or muntins.

G. thick panel with shaped edges

H. offset measurement from panel surface to stile or rail face

I. pane of glass or its opening

J. exposed surface of a door member

K. molded edge of a stile or rail

L. size of the frame into which a door or window is to be fitted

Group II

______ 1. edge strip

______ 2. rabbet

______ 3. spline

______ 4. finished size

______ 5. core

______ 6. planted molding

______ 7. haunch

______ 8. raised molding

______ 9. face veneer

______ 10. relish

______ 11. backing

______ 12. ripping size

A. a rectangular cut made in the face or edge of a board to receive another member

B. base or center of a veneered piece of stock

C. layer of veneer next to the core

D. exposed finish layer of veneer on face of plywood

E. exposed layer of veneer on the back of plywood

F. piece of finished material glued to edges of core of plywood

G. separate piece of molding fastened in place after a door is assembled

H. planted molding flush with face of stile or rail

I. planted molding projecting above face of stile or rail

J. strip of wood fitted into opposed grooves of two pieces of wood to be joined

K. part of tenon cut out to form a haunch

L. shoulder formed by relishing a tenon

M. rough-ripped width of stock before milling and sizing

N. over-all dimension of finished stock

Group III

______ 1. plain rail window

______ 2. face puttying

______ 3. casement sash

______ 4. double hung window

______ 5. glazed sash

______ 6. light

______ 7. transom sash

______ 8. back puttying

______ 9. open sash

______ 10. bedding

A. pane of glass or an opening for a pane of glass

B. application of putty in a rabbet before the glass is set

C. filling the rabbet with putty to make an exterior water-tight joint

D. forcing putty between the glass and the rabbet to fill voids due to unevenness of the glass

E. two sash made to slide vertically and separated by a parting stop or bead

F. same as (E) above but without a parting stop

G. a single sash made to fill an opening over a door or window

H. one or more sashes made to fill an opening and to swing in or out

I. casement sash extending to door height, usually hinged in pairs

J. sash frame in which glass has not been installed

K. sash frame in which glass has been installed

SASH, TRIM, AND FRAMES

Each wall opening in a building presents an individual problem concerning its finish construction and the factors involved in its layout. The opening must be considered with such features as the overall exterior construction and placement of other openings if it is in an exterior wall. Interior decor and the trim of related rooms or areas must be considered for openings through inside walls.

A new building is designed and constructed with these considerations in mind but when rooms or entire buildings are being rebuilt, the original structure limits, to a certain extent, the type of frame and trim to be used.

In this assignment you will have an opportunity to learn the names and functions of the more commonly used frame and sash parts, the manner in which they are combined and used, and the basic principles of molding design.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

References:

A. Feirer, Woodworking For Industry, p. 553
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 288-318.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Mullions separate the openings vertically in all multiple-opening frames.

T F 2. The head jamb is usually the same width as the side jamb.

T F 3. The term "jamb" may refer to the entire side assembly of a window frame.

T F 4. The groove in a drip cap serves only as a decorative feature.

T F 5. There is considerable difference between sash jambs and door jambs.

T F 6. Exterior doors on all buildings swing out to permit quick opening in an emergency.

T F 7. The transom bar is always a single solid piece of stock.

T F 8. Both edges of a window sill are beveled to make them parallel to the edge of the jamb.

T F 9. An interior door usually has no sill.

T F 10. Horns on sills must always be trimmed to finish frame size.

T F 11. Coil spring sash balances are used to reinforce sash weights.

T F 12. Trim refers to decorative and finish woodwork applied both to the interior and exterior of a building.

T F 13. Modern molding designs are based on traditional types of Roman and Greek architecture.

T F 14. Standing trim refers to trim items used in a vertical position.

T F 15. Base, baseboard, and mop board all refer to the same thing.

T F 16. Running trim is ordinarily ordered in linear amounts.

T F 17. Ceiling molding is not used much in modern homes.

T F 18. The corners of baseboard are always mitered.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A frame with one opening is called a ______________ frame.

2. Archway or cased opening frames are used for openings in partition walls that will not have __________ .

3. Jambs form the ______________ and ______________ of the frame.

4. Outside casings are either ________ inch(es) or ________ inch(es) thick.

5. The rabbet for a door or sash is made 1/16" to 1/8" ____________ than the thickness of the door or sash.

6. A window sill is usually sloped to permit ______________ __________.

7. A typical door sill has a pitch of ________ inches to 12 inches.

8. Stock window frames sold wholesale by the members of the National Woodwork Manufacturers Association are designed for ______________ construction.

9. The extra stock extending beyond the sill and head of a jamb is called the ______________ .

10. The width of a frame is measured between the ______________ of plain jambs and between the ______________ of rabbeted jambs.

11. A plain inside door frame consists simply of two ______________ and a ______________ .

12. Split frame construction is used to accommodate walls of ______________ ______________ .

13. Moldings get their names from their ______________ or their ______________ .

14. Cornice mold refers to moldings used for ______________ cornices.

15. Interior trim is classified as either ______________ trim or ______________ trim.

16. A solid or built-up projection which appears to be supporting weight but is primarily decorative is called a ______________ .

17. Interior trim might also be referred to as ______________ .

18. Base molding consists of a __________ and a __________ __________ .

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Frames may be classed as:

(A) ______________________ (C) ______________________

(B) ______________________

2. Frame design is determined by factors such as:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

3. The basic parts of a single-opening frame are:

(A) ________________ (B) ________________ (C) ________________

4. The width of a jamb is determined by:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

5. Two advantages of horns are:

(A) ______________________________

(B) ______________________________

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. parting stop

_____ 2. drip cap

_____ 3. outside casing

_____ 4. stucco mold

_____ 5. sill

_____ 6. blind stop

_____ 7. brick mold

A. forms one side of the sash groove

B. pulley stile against which the sash is fitted

C. separates the top and bottom sash

D. outside trim used with a framed wall covered with lath and plaster

E. used to finish a frame set in a concrete, brick, or brick veneer-wall

F. head jamb for the lower of two openings

G. encloses the space between the jambs and the framed wall

H. prevents seepage into the wall

I. horizontal bottom member of a sash, door, or window frame

Assignment

Units 181-185

FASTENERS AND HARDWARE

There are many different kinds of fasteners used in cabinetmaking. Although some have very specific uses, most of them can be used for many different situations. The selection of the proper fastener for the particular situation is the responsibility of the cabinetmaker.

Hardware also comes in a large variety of styles and sizes and it is important for the cabinetmaker to select the proper hardware and to install it correctly so that the cabinet functions easily and properly. The hardware should also add to the appearance of the cabinet.

In this assignment you will have an opportunity to learn the names of some of the more common fasteners and the types of hardware used in cabinetmaking. You will also have an opportunity to learn the uses and limitations of these items and how the use of each depends upon the type and quality of construction.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Feirer, Woodworking For Industry, pp. 336-355, 378-387.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 215-221.
C. Towers, Cabinetmaker's Manual, pp. 145-152, 436-442.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. In cabinetwork the nail should not be driven flush with the surface with just the hammer.

T F 2. Stationary nailing machines require specially designed nails.

T F 3. A 10d nail is smaller than a 6d nail.

T F 4. A 10d common nail is larger in diameter than a 10d finishing nail.

T F 5. If nails are driven at a slight angle they will have greater holding power.

T F 6. In selecting nails for fastening where there is a likelihood of splitting the wood, choose the smallest diameter that is suitable for the job.

T F 7. Holding power and the possibility of splitting both increase with the diameter of the nail.

T F 8. A sharp, taper-pointed nail will tend to cause less splitting than a blunt-pointed nail.

T F 9. A pre-bored hole for a nail should be slightly larger than the shank of the nail.

T F 10. If a nail bends you should first try to straighten it since pulling it out will tend to leave a large hole.

T F 11. Casing nails are heavier than finishing nails.

T F 12. Nails are purchased by the gross.

T F 13. A 6 gauge wood screw is larger than a 4 gauge wood screw.

T F 14. Different size screws require different size screwdrivers.

T F 15. The length of all wood screws includes the head.

T F 16. A 1 1/2 inch wood screw is available in gauges from 6 to 18.

T F 17. The head of a screw should never be hammered into a hole.

T F 18. A Phillips head screw requires a special screwdriver.

T F 19. Steel screws should not be used where corrosive action might occur.

T F 20. Screws are available in at least a dozen different finishes.

T F 21. A lag screw is secured with a wrench.

T F 22. The size of the hole for a bolt is not too important as long as it isn't larger than the bolt head nor smaller than the body of the bolt.

T F 23. Bolts are used where great holding strength is required.

T F 24. One advantage of molly bolts over toggle bolts is that the supported material can be removed and replaced without the loss of the anchor.

T F 25. Most of the hardware that is available can be obtained in the hardware stores.

T F 26. Semi-concealed loose pin hinges are good to use on flush plywood doors.

T F 27. Piano hinges come in a large variety of lengths.

T F 28. Magnetic catches are quite popular for kitchen cabinets.

T F 29. Roller catches work better than friction catches.

T F 30. The cabinetmaker usually installs the hardware on all types of cabinets.

T F 31. Heavy window glass or Crystal Sheet is similar in quality to plate glass but lighter in weight.

T F 32. Distortion of vision is a problem with polished plate glass.

T F 33. Mirrors can be made from any quality glass.

T F 34. Crystal mirrors are first quality mirrors.

T F 35. Shock mirrors are made to withstand high impact.

T F 36. Metal fasteners are often used in joining parts of wood products of low quality.

T F 37. The size designation of a nail is believed to have come from the price paid by the English for 100 nails.

T F 38. Wire brads are of finer gauge wire and usually shorter than ordinary nails.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The tool used to sink the heads of nails below the surface of the wood is called a ______________ ______________ .

2. General purpose nails are made of either ______________ ______________ or ______________ .

3. The letter "d" in nail designations means ______________ .

4. The nail designation (2d, 4d, etc.) represents the ______________ of the nail.

5. The two common methods of nailing are ______________ ______________ and ______________ .

6. A Phillips head screw might also be called a ______________ head.

7. Two holes needed for pre-boring for screws are the ______________ hole and the ______________ hole.

8. Screws are standardized according to ____________, ____________, and ____________ .

9. Two common types of miter joint fasteners are ____________ and ____________ ____________ .

10. The standard glazing quality glass is grade ________ .

11. Obscure sheet glass is a result of one surface of the glass being ____________ .

12. Plate glass has both surfaces ____________ and ____________ .

13. Standard plate glass is ______ inch(es) thick with slight variations.

14. The quality of a mirror is governed by the ____________ of ____________ used.

15. First quality mirrors are made from a top grade of ____________ glass.

16. When hinges have a slight offset to permit the leaves to come close together they are said to be ____________ .

17. Hinges that are very good for cabinets without frames are ________ hinges.

18. A catch that will hold one side of a double door closed while the other is pulled open is called a ________________ catch.

19. Common nail sizes range from ________________ to ________________ .

20. Wire brads are used in ________ ____________ work and for fastening ____________ ____________ .

21. Escutcheon pins are usually made of ____________ in lengths from __________ inches to ________ inches.

22. Wood will not split as easily when screws are driven if a ____________ ____________ is made.

23. The parts of a hinge include the ________, ____________ and ____________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Nails ideal for most cabinetwork would be (A) casing; (B) box; (C) finishing: (D) common.

______ 2. For toenailing the angle of the nail should be about (A) 10; (B) 15; (C) 30; (D) 45 degrees.

______ 3. The range of the guage of wood screws is (A) 0 to 24; (B) 0 to 15; (C) 2 to 60; (D) 5 to 30.

______ 4. A number 22 gauge wood screw would be (A) .286; (B) .346; (C) .350; (D) .436 inches in diameter.

______ 5. A properly selected screw will project into the second part about (A) one-fourth; (B) one-third; (C) one-half; (D) two-thirds its length.

______ 6. Which of the following wall fasteners would not be used on solid masonry walls? (A) rawl plug; (B) molly bolt; (C) anchor bolt; (D) lead shield.

______ 7. Most clear window glass is produced in (A) AA quality; (B) A quality; (C) B quality; (D) C quality.

______ 8. Tacks are used primarily (A) where holding power is necessary; (B) where they can be covered; (C) for fastening light hardware; (D) in upholstery work.

______ 9. Double pointed U-shaped fasteners are called (A) tacks; (B) escutcheon pins; (C) staples; (D) corrugated fasteners.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. General purpose nails include:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List five types of nails commonly used in cabinetmaking.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

3. Common head shapes of screws are:

(A) ______________________ (C) ______________________

(B) ______________________

4. Materials that screws might be made of include:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

5. Four things that a screw-mate drill countersink will do are:

(A) ____

(B) ____

(C) ____

(D) ____

6. List four types of heavy screws and bolts.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. List four types of hinges.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

8. List the five common kinds of door catches.

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

9. Cabinet hardware includes items such as:

(A) ______________ (C) ______________ (E) ______________

(B) ______________ (D) ______________ (F) ______________

10. Hinges are available in several styles including:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

11. Hinges are available in several finishes includeing:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

Assignment
Sheet No. 20

Covering
Units 186-189

ADHESIVES

The Egyptians used glue as an adhesive thousands of years ago. Museums today contain cabinets made by the ancient Greeks and Romans with the glue joints still intact and holding. Only a few types of glues were available in those days; today many types of adhesives are available with many recent developments creating new possibilities for the cabinetmaker.

Although the many new developments in the field of adhesives have aided the work of the cabinetmaker, they have also required that the cabinetmaker have a knowledge of these various adhesives in order to properly perform his work. He needs to know the correct adhesive to use for a particular situation, the conditions that will ensure proper gluing, and the procedure for gluing. Quality work demands good gluing.

In this assignment you will have an opportunity to learn the names and uses of the glues commonly used in cabinetwork. You will also learn the characteristics of these adhesives and the conditions under which each can be used.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________ .

References:

A. Feirer, Woodworking For Industry, pp. 321-335.
B. Dahl and Wilson, Cabinetmaking and Millwork, pp. 188-194.
C. Towers, Cabinetmaker's Manual, pp. 112-116.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. No glue will do a good job of holding if the joint fits loosely.

T F 2. It is usually desirable to have an unsanded surface for gluing.

T F 3. Lighter wood is usually easier to glue than heavier wood.

T F 4. Hand screws are permanent fasteners that strengthen a glued joint.

T F 5. Water-resistant glues will withstand exposure to moisture better than waterproof glues.

T F 6. White liquid resin glues are easily affected by temperature.

T F 7. Powdered resin glue requires less clamping time than does powdered casein.

T F 8. Liquid hide glue is considered a good cabinetmaking glue.

T F 9. One of the advantages of liquid hide glue is that it gives strength to poorly fitted joints.

T F 10. The moisture content of the wood is less of a problem with casein glues than it is with other glues.

T F 11. Epoxy resins can be used to join wood to other materials.

T F 12. It should be assumed that the moisture content of the wood will increase slightly upon application of glue.

T F 13. It may sometimes be necessary to sand plywood surfaces before gluing.

T F 14. Most glues that require mixing will have directions for mixing on the container.

T F 15. End grain requires a low glue-to-water ratio.

T F 16. Double spreading means putting glue on a surface, allowing it to become tacky, and then putting on another layer.

T F 17. Double spreading will result in better gluing than single spreading.

T F 18. Some glues have a longer assembly time than others.

T F 19. As much pressure as possible should be obtained when clamping up a joint.

T F 20. Dry bits of glue should be removed from an assembled object with a knife or chisel.

T F 21. A properly made glue joint will be stronger than the wood itself.

T F 22. The term animal glue usually refers only to glue made from the skin and bones of cattle.

T F 23. Bacterial action is necessary for animal glue to reach its highest strength.

T F 24. The term "synthetic resin" currently applies just to synthetic chemical compounds that resemble resins.

T F 25. Casein glues will produce joints that are waterproof for short periods of time.

T F 26. Vegetable glues are not usually used in cabinet work.

T F 27. Starch glues stain some woods.

T F 28. Relatively high temperatures are required to cure melamine resin glue.

T F 29. Polyvinyl resin glue can be applied and dried at room temperature.

T F 30. Tests by the Forest Products Laboratory show that a surface to be glued up should be roughened by sanding for the strongest joint.

T F 31. Heating with high frequency currents will completely cure a glue line in a few seconds.

T F 32. Most glues, if correctly applied, will provide a bond for an indefinite period of time within the limits of the service conditions.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When using C clamps for clamping wood, ______________ should also be used to protect the wood.
2. Large surfaces are usually clamped with ______________ clamps.
3. Until recently the only two types of glue used were ______________ or ______________ and ______________ or ______________.
4. Glues can be grouped either according to their ______________ or according to their ______________ to ______________.
5. Resorcinol glues are highly resistant to ______________.
6. A big problem with resorcinol glues is the creation of a ____________ ____________ ____________.
7. Powdered resin glue will set faster at __________ degrees than it will at 70 degrees.
8. When mixing powdered casein glues, the proportions of glue and water should be equal by ______________.

9. An adhesive that is particularly good for applying plastic laminate countertops is ______________ ______________ .

10. Top quality glue joints cannot be made on ___________ wood.

11. Mixed glues are at the right consistency when they are about as thick as ______________ ______________ .

12. When assembling a cabinet one should always make a ______________ ______________ before applying glue.

13. The curing or setting of glue can be speeded up by the use of ______________ and ______________ .

14. Proper gluing temperature is usually between __________ and __________ degrees.

15. The higher grades of flake animal glues are usually ____________ in color and nearly ______________ .

16. Low grade animal glues are sometimes ______________ to make them appear to be of high quality.

17. Thin glue requires a setting up pressure of about __________ to __________ pounds per square inch.

18. Substances furnished by the manufacturer to be added to synthetic resin glue to modify or improve the working properties are called _______________ .

19. Materials added to synthetic resin glues to reduce the cost are called _______________ .

20. Casein glues have a tendency to ______________ some woods such as oak and maple.

21. Vegetable glues are used primarily for making ______________ .

22. A glue joint is satisfactory when the strength of the ______________ is equal to that of the ______________ .

23. Animal glues are available in ______________ form which can be used without _______________ .

24. Veneers for furniture manufacturing are often glued with ______________ ______________ glue.

25. Where a colorless, moisture-resistant glue line is desired ________________ ________________ glue is used.

26. Water resistant plywood is glued with ______________ ______________ glue.

27. Polyvinyl glue joints are strong enough to be worked after ______________ _______________ .

28. Clamping pressures of ______________ to ______________ pounds per square inch are considered best for glue of meduim consistency.

29. End to end grain joints or end to side grain joints seldom are as much as ______________ as strong as the wood itself.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When gluing edge to edge, clamps should be placed every (A) 5 to 8; (B) 8 to 10; (C) 10 to 12; (D) 15 to 18 inches.

_____ 2. At 70 degrees F., most synthetic resin glues have a working life of (A) up to 1 hour; (B) 1 to 3 hours; (C) 4 to 6 hours; (D) 6 to 8 hours.

_____ 3. Resin glued surfaces in closed assembly permit a working time up to (A) two minutes; (B) ten minutes; (C) thirty minutes; (D) one hour.

_____ 4. The curd of sour milk is the principal ingredient of the type of glue known as (A) casein; (B) synthetic resin; (C) animal; (D) starch.

_____ 5. Joints made with animal glues will be (A) strong, water resistant; (B) strong, not water resistant; (C) weak, water resistant; (D) weak, not water resistant.

_____ 6. The moisture content of lumber for interior cabinetwork should be about (A) one to two per cent; (B) five to six per cent; (C) 10 to 12 per cent; (D) 14 to 16 per cent.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Problems to be understood in order to obtain a good gluing job include:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

2. Five important points to consider in making a good glue joint are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

3. List three common types of clamps used in gluing.

(A) ______________ (C) ______________

(B) ______________

4. The spreading of glue can be done with a:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. List three conditions related to gluing that will cause a weak joint.

(A) ______________ (C) ______________

(B) ______________

6. Proper gluing practice requires consideration of:

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________ (H) ______________

(I) ______________

7. The strength of glue joints is dependent upon:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

(E) ______________

Matching

Directions: In the left hand column is a list of several types of woods. The right hand column contains phrases describing the ease or difficulty with which these woods may be glued. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

________ 1. oak

________ 2. hard maple

________ 3. yellow poplar

________ 4. pine

________ 5. basswood

________ 6. soft maple

________ 7. birch

________ 8. western red cedar

________ 9. ash

________ 10. Douglas fir

________ 11. redwood

________ 12. walnut

A. glues very easily under a wide range of gluing conditic

B. glues well under a moderately wide range

C. glues satisfactorily under well controlled gluing conditions

D. very close control of gluing conditions required

Sheet No. 21

Covering
Units 190-195

FURNITURE RESTORATION AND REFINISHING

Many custom cabinet shops are called upon to repair and refinish furniture and cabinets which have been damaged or worn through long years of use. Many people prefer older furniture and cabinets to the newer and modern ones. However, the repair and refinishing of older items can be as much work and as costly as making a new one.

Although the repairing and refinishing procedures are much the same as when constructing new pieces, there are certain techniques that are different. It is important, in many cases, for the cabinetmakers to duplicate exactly the repaired parts which may require more skill and knowledge than for ordinary cabinetwork.

In this assignment you will have an opportunity to learn some of the techniques used in restoring, repairing, and refinishing older items.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________.

Reference:

C. Towers, Cabinetmaker's Manual, pp. 375-388.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Restoration commonly means the complete rebuilding of an article of furniture.

T F 2. Minor surface blemishes often enhance the beauty and charm of old or antique furniture.

T F 3. Old lumber is used in best quality restoration work.

T F 4. Wood for restoration of old furniture can usually be obtained from local lumber dealers.

T F 5. Early pieces of antique furniture depended upon much glue joint construction for fastening parts together.

T F 6. Small veneer blisters may be flattened and reglued with moisture, heat, and pressure.

T F 7. At no time should a blister in veneer be cut in order to repair it.

T F 8. Two or more shellac sticks may be melted together to get an exact color to match the wood.

T F 9. Veneer patches should be made so the cuts are at right angles to the grain.

T F 10. If the correct shade of wood cannot be located to match a corresponding piece, then a lighter colored piece should be used.

T F 11. Careful consideration must be given to the edges of wood that has been used to replace damaged pieces.

T F 12. A sliver of wood from the bottom side of a table is often used to fill in a crack in the top surface which cannot be closed by clamping.

T F 13. Wood putty repairs can be satisfactorily made where transparent finishes are used.

T F 14. The cost of restoration may often be reduced considerably by using screws to replace glued joints.

T F 15. Brads and finishing nails may be used to reinforce splits and cracks near the edge of a surface.

T F 16. An enlarged socket may be repaired by drilling it out large enough to receive a plug, then redrill the plug to proper size.

T F 17. One method of repairing a damaged tenon is to cut off the tenon, mortise it out, and replace it with a spline or dummy tenon.

T F 18. Glue blocks may be held in place by brads until the glue has set.

T F 19. The most severe warping or cupping in old furniture usually occurs on the top side of a surface.

T F 20. Badly warped boards can usually be straightened by clamping.

T F 21. It is always best to refinish just those areas that are in need of refinishing.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In the last one hundred years _______ _______ glue has been widely used in furniture construction.

2. Furniture fastened with this type of glue can be loosened with the aid of _______________ .

3. Large veneer blisters must sometimes be _______________ _______________ and fresh _______________ worked into the opening.

4. Stick shellac is _______________ until it starts to flow and then is forced into place with a _______________ .

5. A veneer patch which is wider at the bottom than at the surface and which must be sprung into place is called a(n) _______________ _______________ .

6. Loose glue joints can often be secured by forcing _______________ into the joint.

7. Cracks or breaks in wood surfaces must be cleaned of ____________, _______________, _______________, or _______________ before fresh glue can be applied.

8. Old screw holes should be plugged with _______________ _______________ or _______________ _______________ before replacing the screws.

9. Screws which cannot be removed by ordinary means may be loosened with the application of _______________ or _______________ _______________ .

10. Extremely loose glue joints are often reinforced with _______________ _______________ .

11. A tenon which is worn too small may be _______________ to the required size.

12. A broken tenon may be repaired by replacing it with a(n) _______________ _______________ .

13. Padded chair frames can be reinforced with the use of _______________ _______________ .

14. The most stubborn cases of warp may be removed with the use of _______________ without damaging the board.

15. When a restored surface cannot be finished immediately, it should be given a coat of _______________ _______________ _______________ and _______________ to prevent moisture absorption.

16. Shellac finishes may be softened with ____________ ____________ before refinishing operations.

17. Finish remover should be allowed to stand from __________ to __________ minutes before the finish is removed with a(n) ____________ ____________ ____________.

18. Wax from the old finish or from the finish remover can be removed with ____________ ____________.

19. Stains or dirt which cannot be removed should be ____________ to make them less noticeable.

20. Grease stains may be removed with ____________ or any ____________ ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Small holes, scars or blemishes in the surface of wood may be filled with (A) sealing wax; (B) stick shellac; (C) sawdust and glue; (D) veneer slices.

_____ 2. In patching veneer work, the best quality of patch is obtained when the sides of the recess are (A) straight up and down; (B) tapered with the largest part of the opening at the top; (C) tapered with the largest part of the opening at the bottom; (D) irregular.

_____ 3. A method of marking joints for ease in matching for reassembly that is least likely to be lost in refinishing is (A) pencil marks; (B) knife cut; (C) punch marks; (D) paint spots.

_____ 4. One of the fastest methods of removing warp from a table top is to (A) steam the entire piece; (B) saw into narrow boards and reglue; (C) clamp the surface down with screws; (D) saw grooves into the underside.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Table tops and other wide surfaces may be prevented from warping by using techniques such as:

   (A) ______________________________

   (B) ______________________________

   (C) ______________________________

2. Furniture should be refinished when:

   (A) ______________________________

   (B) ______________________________

   (C) ______________________________

   (D) ______________________________

Assignment
Sheet No. 22

Covering
Units 196-204

THE SMALL WOODWORKING ENTERPRISE

After you have worked in the cabinetmaking field for a time, you may consider going into business for yourself, or in partnership with someone else. To be successful in either instance, you must have information concerning a business and take the time and effort to plan each phase of that business.

In this assignment you will have an opportunity to learn what information it is necessary to have before a business can be set up. In addition, you will have an opportunity to learn some of the advantages and disadvantages of the different forms of business, how to select a location, how to plan for production and the importance of being a good manager of your business.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ____________________.

Reference:

C. Towers, Cabinetmaker's Manual, pp. 389-425.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The sales market for specialty items is often unpredictable.

T F 2. Most of the products of a general cabinet shop will have a relatively long life which may prevent potential customers from purchasing replacements.

T F 3. Cabinet shops, to be successful, must be located in the surburbs of large cities.

T F 4. The advantage of leasing or renting lies in the ease of relocation of a business.

T F 5. The ideal production shop layout is in the form of a straight line.

T F 6. Hardware and finish items should be stocked in large quantities as soon as a cabinet shop is opened.

T F 7. All of the personal property of an individual proprietor is subject to payment for business debts.

T F 8. The corporation form of business has the greatest amount of personal control.

T F 9. A partnership agreement need not be in written form.

T F 10. Each partner in a partnership can be held liable for all the debts and liabilities of the business.

T F 11. When one partner in a partnership dies, sells his interest or is declared bankrupt the partnership is generally automatically dissolved.

T F 12. Nails and sandpaper to be used in the construction of an article are included in the bill of materials.

T F 13. The costs for overhead often equal the cost of labor.

T F 14. Membership in church, business and technical organizations is a good means of obtaining business publicity.

T F 15. Advertisements, even when carefully worded, seldom pay for themselves.

T F 16. A good product will always sell, even if it isn't marketed in the best manner.

T F 17. In order to be sure of covering all of a retail sales territory, it is best to sell the same product to several retailers in that area.

T F 18. A merchant's opinion on the saleability of an article is better than that of friends or relatives.

T F 19. A man with limited working capital and a small volume of business should encourage a large number of credit sales.

T F 20. Unpaid accounts should be turned over to a lawyer for legal action only as a last resort.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In order to succeed in the operation of a woodworking shop, a person must have both ______________ ability and ______________ ability.
2. One of the largest job costs will be the ______________ costs.
3. Over __________ per cent of small businesses fail in their first year of operation because they lack adequate ______________.

4. The money used in financing your work until the customer pays for it is called ______________ ______________.

5. The radial arm or cutoff saw is usually placed near the ______________ ______________ area.

6. When installing a spray booth for finishing, the local ______________ ______________ should be used as a source for health and safety regulations.

7. When a business is operated under a company name, both the ______________ and ______________ of the company should be registered in the ______________ ______________ office.

8. An association of two or more business owners is called a(an) ______________.

9. A form of business in which you invest your money without becoming personally liable for the overall business is called a(an) ______________.

10. Scrap, rippings and board ends may add up to __________ per cent of the lumber cost of an article.

11. Profit on a particular article is usually set between __________ and __________ per cent of the total cost.

12. When all costs of the production of an article are not known, the manufacturer will sometimes produce the article on a(an) ______________ basis.

13. The two general types of selling are ______________ and ______________.

14. Where only a few items need to be sold, ______________ selling is best.

15. Slow paying accounts should be followed up with a(an) ______________ ______________.

16. The largest single cause of business failure is the failure to keep adequate ______________ ______________.

17. Items such as machinery are depreciated at the rate of about __________ per cent per year.

18. Small hand tools are usually depreciated within a __________ year period.

19. The most important accounting record is the ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The qualifications needed in order to be successful in a small business include:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

2. Some of the taxes a businessman may be expected to pay include:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

3. Capital requirements include the costs of:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

4. Three forms of organization for small businesses are:

(A) ____________________ (C) ____________________

(B) ____________________

5. The advantages of a partnership include the pooling of:

(A) ____________________ (C) ____________________

(B) ____________________

6. The advantages of a corporation include:

(A) ____

(B) ____

(C) ____

7. Disadvantages of incorporating are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

8. The cost of an article must include these items:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

9. A bill of materials includes columns indicating:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

10. The labor cost on an article may be subdivided according to the time needed for:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

11. Overhead costs include items such as:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

12. The small businessman should be familiar with the following types of insurance:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *PRINTERS, *PRINTING, GRADE 11, GRADE 12, *COOPERATIVE EDUCATION,

This study guide is for use by individual preparatory or cooperative students at the secondary or post-secondary level. It was developed by teacher educators and research assistants with help from a consultant committee. Assignment sheet titles are (1) History of Printing, (2) Printing as a Vocation, (3) Accident and Health Hazards, (4) The California Job Case, (5) Characteristics of Type and Spaces, (6) The Printer's System of Measurement, (7) The Process of Setting Type, (8) The Handling of Type, (9) Processing Good Proofs, (10) Standard Proofreaders' Marks, (11) Distribution, (12) Printing Layouts, (13) Paper, (14) Job Composition, (15) Imposition and Lock-Up, (16) Letterpresses, (17) Platen Press Preparation, (18) Bindery Room Operations, (19) Printing Plates, (20) Typecasting Machines, (21) Linotype Matrix Mechanisms, (22) Linotype Casting Mechanism, (23) Linotype Distribution Mechanisms, (24) Problems in Linotype Operation, and (25) Printing--Buying, Selling, and Producing. Each assignment sheet gives the assignment, references, and objective-type questions. Suggested time allotment is 180 days. An analysis of the necessary jobs and related information and progress records for use by student, teacher, and employer are included. An answer key (VT 002 075) is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

FOREWORD

This course of study, consisting of an analysis of the work of the printer, together with the assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching printing on an individual basis in part-time Cooperative Occupational Education programs.

The original course of study was prepared by Mr. Ewell S. Thurman, formerly coordinator at Marshall, Missouri; subsequent revisions were made by Mr. Norman Crouch, while on the staff of the State Department of Education, Jefferson City, Missouri, Dr. Charles Rischer and later by Dr. Charles Bunten, both formerly Research Assistants in Industrial Education at the University of Missouri. The present revision of this course of study was prepared by Mr. Jack A. Luy, Research Assistant in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Dr. H. Pat Wardlaw, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Information Sheets:

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training". The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information". And the third group--the personal-social traits--has been listed under "Personal-Social Traits Essential for the Printer" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemplo ment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job This means that the two phases of the student-worker's training shoul parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

At the back of this course of study will be found three copies of the TRAINING PLAN AND PROGRESS RECORD FOR PRINTING. One copy is marked "Student" in the upper right hand corner. On this copy, in the space <u>Time in hours</u>, the student will keep a tally of the hours he spends on his job performing operations in each area. The next copy marked "Employer". should be given to the employer for recording the student's job performance in each area. The third copy may be used by the coordinator for his record.

In selecting instructional materials for this course, an effort was made to restrict the number to only those including information considered to be most important for the printer to know. Among other criteria, the recency of publication was considered. It is recommende that these materials be purchased and made available for student use.

Key answer sheets have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questio and should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

For thousands of years men have exchanged their thoughts and ideas by means of symbols or marks. These symbols or marks have been scratched in stone, burned in wood, painted on skins, marked on paper, etched in metal, and signaled with smoke.

The purpose of printing is to record ideas and thoughts in a legible and attractive style, suited to the purpose intended. In the simplest kinds of printing, type is set in lines, locked in a form, placed in a press, inked, and impressed on some medium. The result of this process may be a calling card, letterhead, program or printed item.

In this course you will learn the operations in typesetting and presswork used in the production of the printed page. You will also study the methods used in printing books, magazines, and newspapers, as well as the materials, processes, and machines used in commercial plants in the manufacture of printed products.

The art of printing has contributed more to man's progress than any other art. By means of printing the knowledge accumulated through the ages is made available to all, regardless of class, caste, or creed.

Opportunities and Requirements

Because of the need for printed matter in nearly all of man's activities, printing has in modern times ranked consistently high among this nation's great industries. The wide variety of products of the press, and the demand for a constant supply requires the efforts of many skilled persons in printing firms ranging from the small "one-man" establishments to large plants employing hundreds of workers.

Printing as a vocation attracts many young men and women because it offers genuine opportunities for steady work, good pay, and advancement. The trade has several branches and numerous allied industries. The most familiar area, letterpress printing, has three distinct branches of work: composition, the preparation of the printing surface; presswork, the actual printing of the composed matter; and binderywork, the folding or joining together of the printed sheets so they may be distributed to the public.

Young people who enter the printing trade will find it offers abundant opportunities. While there are more men than women in the trade, women find places in all branches except where heavy lifting is done. For typographic printing the usual requirements include a good education--a high school education is preferred and is rapidly becoming an essential--good health, good eyesight, and a sense of design and proportion. For the most part the work of printing requires exceptional patience and a greater than average interest for creative work.

Opportunities for advancement are especially favorable at the present time when there are few apprentices in proportion to the total number of journeymen. The work is not heavy as a rule, and the fact that it is indoors makes it attractive to many persons as a year-around occupation.

In spite of a former widespread belief that printing occupations are injurious to health, there is little evidence on which to base this belief. There are, of course, shops in which the best conditions still do not exist, and the worker must be able to recognize them. While there are accident hazards in the use of the machinery in a printing shop, exercising reasonable care, and using the safety devices which are provided will make serious accidents unlikely.

Personal-Social Traits Essential for the Printer

Personality traits are of extreme importance, not only in securing and holding a desirable position, but in life in general. Personal-social traits can be improved through training when the individual learns what to improve, and why improvement is advisable. Among the personal-social traits of chief importance to the printer are the following:

Accuracy: It is of prime importance that the printer be accurate, since accuracy is basic in the printing business.

Honesty: This means giving full value for pay received, truthfulness, unqualified loyalty to one's employer.

Dependability: The ability to do good work in a businesslike way without supervision.

Intelligence: The printer must be above average in general intelligence, with at least a high school education.

Cooperation: This implies the ability and disposition to work harmoniously with others, to be helpful, to work together.

Health: A printer needs good health, especially good eyesight and endurance. One who is not physically and mentally able to stand long irregular hours should not undertake the work.

Personality: A printer should be able to build up good will among his customers so that they will come back. He should be a go-getter, a person of ideas, ready with helpful suggestions for potential customers. He must possess a pleasing personal appearance, a good speaking voice, and a sense of humor.

Alertness: For the printer who operates his own machines, manual dexterity and mental alertness are essential.

Ambition: The printer must have love of his work, a singleness of purpose, and an ambition to expand his business, with caution in expanding beyond his capacity to make his business pay.

Tactfulness: The ability to do and say things without offending people.

Courtesy: This involves respect for the point of view, interests, and wants of others, and although at times it will require effort, it pays well in business and human relations.

ANALYSIS OF PRINTING

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
		Fundamental Information
	1	1. History of printing
	2	2. Opportunities, requirements and future outlook of printing industry
	3	3. Accident and health hazards in the printing shop
		Elementary Composition
	4	4. Kinds of type cases and cabinets
5. Set type from type case	4	5. Layout of California Job Case
6. Lay type case		
7. Clean type case		
8. Identify type characters	5	8. Type materials; parts, size, fonts, faces, families, and series
9. Identify spaces and quads	5	9. Names and sizes of spaces and quads
10. Identify leads and slugs	5	10. Sizes of leads and slugs
	5	11. Market units of type
	5	12. Cleaning and care of type materials
13. Measure type and space material	5	13. Standard type material sizes
14. Calculate with point system	6	14. Printing system of measurement
	7	15. Styles and care of composing sticks
16. Set a composing stick to measure		
17. Set a composing stick with half-pica level	7	17. Half-pica marks
18. Set a sliding knee stick to measure	7	18. Characteristics of Buckeye Stick
19. Center line	7	19. Techniques of centering line
20. Test for line justification	7	20. Methods of justification
21. Set straight matter	7	21. Rules for word division
22. Justify by spacing in	7	22. Substitution of spaces
23. Put line on its feet		
24. Space out line	7	24. Arrangement of spaces and quads in line
25. Quad out line	7	25. Arrangement of spaces and quads at the end of line

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
26. Work at bank	8	26. Position of compositor and galley at bank
27. Dump stick	8	27. Methods of lifting type from stick
28. Tie small form	8	28. Methods of blocking and typing straight matter
29. Tie large form		
	8	30. Care of string

Proofing and Distributing Type

	9	31. Proof presses; kinds used and advantages
32. Ink proof press	9	32. Care and use of brayer
33. Position and ink form	9	33. Principles of positioning and inking
	9	34. Function of bearers
35. Pull proof		
36. Operate proof press with grippers		
37. Eliminate proof slurs		
38. Wash form	9	38. Solvents and their uses
39. Keep type on its feet	9	39. Causes of type getting off its feet
40. Make minor corrections	9	40. Methods of correcting in galley
41. Make corrections effecting justification	9	41. Methods of correcting in stick
42. Overrun type	9	42. Method of correcting lines involving resetting of lines
43. Mark revised proof		
44. Wash proof press	9	44. Care of proof press
45. Take planer proof	9	45. Principles of stone proofing
46. Proofread and proofmark	10	46. Standard proofreaders' marks and usage
47. Identify type for distribution	11	47. Methods of distinguishing cases and type for distribution
48. Distribute type	11	48. Distribution techniques for type, leads, and slugs

Commercial Display and Special Composition

49. Make working layout for job of printing	12	49. Basic considerations of good layout
	12	50. Principle of fitness
	12	51. Principle of balance

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	12	52. Principle of proportion
	12	53. Principle of shape harmony
	12	54. Principle of tone harmony
	12	55. Legibility of type faces
	12	56. Use of decorations in printing
57. Select appropriate paper	13	57. Paper manufacture
	13	58. Paper varieties and characteristics
59. Identify paper	13	59. Kinds of paper, standard sizes, care and uses
60. Specify and estimate paper	13	60. Calculations for cutting paper
61. Cut leads and slugs with slug cutter	14	61. Functions of the micrometer gauge
62. Set mitering machine		
63. Miter rectangularly	14	63. Selection of proper material for mitering
64. Miter other shapes		
65. Operate power saw trimmer		
66. Build border	14	66. Styles of border material
	14	67. Methods of aligning rule with type
	14	68. Methods of butting corners of rule
69. Set initial letter	14	69. Typographical considerations of initial letter
70. Set hanging indention	14	70. Uses of hanging indention
71. Set lines for poetry	14	71. Rules for indention of poetry
72. Set quoted paragraph	14	72. Rules for placing quotations in "quoted" paragraphs
73. Set cut-in notes	14	73. Typographical considerations of cut-in notes
74. Construct tabular forms	14	74. Various divisions and characteristics of tabular forms
75. Set column to odd measure	14	75. Application of odd measure in tabular composition
76. Set a job for work and twist run	14	76. Advantages of work and twist methods with tabular forms
77. Set a job with leaders	14	77. Functions of leaders in programs and tabular forms
78. Set a business card	14	78. Standards of business card composition and display
79. Set a letterhead	14	79. Standards of letterhead composition and display

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
80. Set a bill-head-statement	14	80. Standards of bill-head-statement composition and display
81. Set envelope corner card	14	81. Standards for envelope composition and display
82. Set calendar	14	82. Vertical alignment of type and figures
83. Set ticket	14	83. Standards for ticket composition and display
84. Set program	14	84. Standards for program composition and display
85. Set menu	14	85. Standards for menu composition and display
86. Set cover and title page	14	86. Standards for cover and title page composition and display
87. Set informal booklet	14	87. Standards for booklet composition and display
88. Set advertisement	14	88. Standards for advertisement composition and display
89. Plan composition for book	14	89. Legibility of type faces for books
	14	90. Proper order of contents of book
	14	91. Technique of figuring ems of type for paging
	14	92. Application of color to printing
Lock-Up and Imposition		
93. Position form for lock-up	15	93. Basic factors involved in positioning form
	15	94. Characteristics of wood, reglet,and metal furniture
95. Place furniture for lock-up	15	95. Different methods of lock-up
	15	96. Disadvantages of pyramid lock-up
97. Place quoins for lock-up	15	97. Types of quoins and quoin keys; their position and use
98. Make preliminary test on lock-up	15	98. Methods of testing for "lift" and "spring"
	15	99. Methods of planning forms
100. Make final lock-up of form	15	100. Proper order of locking quoins
101. Handle standing forms	15	101. Methods of handling and storing forms

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
102. Unlock form	15	102. Order of unlocking form
103. Break up form	15	103. Methods of material storage
104. Lock up form for work and turn run	15	104. Arrangement of forms for work and turn jobs
105. Lock up form for sheetwise run	15	105. Arrangement of forms for sheetwise run
106. Lock up rule border	15	106. Care of mitered corner in lock-up
107. Impose form for two-page lock-up	15	107. Arrangement of forms for margin
108. Lock up form for two-color run		
109. Impose form for four-page lock-up	15	109. Compute allowances for fold, guide, grippers and trim
110. Impose form for eight-page lock-up	15	110. Function of dummy layouts
	15	111. Function of signature marks

Platen Press Operations

	16	112. Kinds of presses; their advantages and uses
113. Wash platen press	16	113. Methods of washing press
	16	114. Care and composition of rollers
	16	115. Methods of mixing colored inks
116. Oil platen press and motor	16	116. Qualities and use of lubricants
117. Start platen press	16	117. Functions of parts of platen press
	16	118. Safety precautions to observe when working on platen presses
119. "Throw off" press		
120. Stop platen press		
121. Put on tympan	17	121. Types of packing
122. Put chase in press	17	122. Precautions when lifting and handling forms
123. Position grippers	17	123. Function of grippers
124. Prepare platen	17	124. Steps in preparation of platen
	17	125. Purpose of friskets
126. Ink press	17	126. Composition, kinds, colors and care of inks
127. Position guide pins	17	127. Kinds of guide pins
128. Makeready composed forms	17	128. Method of marking out and making ready

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	17	129. Preparation of underlays, interlays, and overlays
130. Makeready for illustrations and half-tones		
131. Feed platen presses	17	131. Methods of positioning, fanning out and handling stock
	17	132. Kinds of automatic press-feeders
133. Maintain even color	17	133. Precautions when regulating ink supply
134. Handle fresh printed sheets	17	134. Purpose of slip sheeting
	17	135. Suiting ink to paper
136. Remove chase from press	17	136. Methods in caring for and storing forms
	17	137. Uses of color in printing
138. Print two-color job	17	138. Value of good register
139. Print with numbering machine	17	139. Kinds of automatic numbering machines; their care and use
140. Perforate sheets	17	140. Methods of making ready for perforating
	17	141. Special precautions for rollers
142. Score sheets	17	142. Methods of making ready for scoring
143. Cut out blanks	17	143. Methods of making ready for cutting
144. Print on ribbons		
145. Print on felt		
146. Print on celluloid		
147. Print on aluminum		

Stockroom and Bindery Work

148. Care for and handle paper stock	18	148. Cautions to be taken in paper handling
149. Cut paper	18	149. Kind of paper cutters; their care and use
150. Handle fresh printed sheets		
151. Job paper	18	151. Methods of jogging paper
152. Count paper		
153. Make pads	18	153. Kinds of tabbing compounds their care and use
154. Side stitch (staple)	18	154. Kinds of stapling machines their care and use
155. Saddle stich (staple)	18	
156. Run folder	18	156. Methods of folding booklets
	18	157. Various types of spiral bindings

	25	271. Factors in production management and operations
272. Prepare proof press logotype		
273. Design job jacket		

Assignment Sheet No. 1	Covering Unit 1

HISTORY OF PRINTING

Printing is a dynamic industry, contributing greatly to our means of communication. Originating in China over ten centuries ago, printing techniques were advanced in Germany, making possible the further extension of human knowledge. As printed books, newspapers, and pamphlets were published in ever increasing numbers, they played a vital part in the spreading of ideas, influencing public opinion and aiding the people to obtain a voice in government. The contribution of the printed word to the growth of democracy is so fundamental that freedom of the press has become one of America's "Four Freedoms."

Although challenged by radio, motion pictures, and television, the printed page has continually held its place as an important means of exchanging information and providing a permanent record of human effort.

As one who will carry on the traditions of the printing industry, you will be interested in exploring the past history of your chosen work. This assignment will give you a valuable background of the history of printing.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by ______________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 128-130; 139-149; 162.
B. Karch, Graphic Arts Procedures, pp. 13-21.
C. Polk, The Practice of Printing, pp. 1-12.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The first printed books were attempts to reproduce the manuscript books which had been hand written by scribes.

T F 2. The earliest printing was done from hand carved wooden blocks.

T F 3. The Chinese had developed inks for printing as early as 400 A.D., but printing did not develop in China because the knowledge of paper-making was lacking.

T F 4. The Chinese used movable type for printing many years before Gutenberg's time.

T F 5. Papyrus was used as the raw material for the first paper.

T F 6. The first book printed in English was The History of Troy.

T F 7. England permitted freedom of the press as early as the middle 1500's.

T F 8. The Oxford University Press has operated continuously since 1585.

T F 9. Because of the printed account of the voyage of Vespucci, we live in a country known as America.

T F 10. The oldest continuously operating printing establishment in America is the Harvard University Press.

T F 11. The first printing establishment and the first regularly published newspaper originated in what is now the state of Massachusetts.

T F 12. Printing had moved to what is now Missouri by 1808.

T F 13. Prior to 1700 the British government had suppressed two attempts to publish newspapers in American colonies.

T F 14. For the 25 years it was published, Poor Richard's Almanac had an average yearly circulation of 10,000 copies.

T F 15. A book published over 150 years ago remains the best source book on colonial printing.

T F 16. The early printing presses resembled the wine and cheese presses of that period.

T F 17. Joseph Niepce made the first engraving on metal by photographic methods.

T F 18. Photo-engraving has been commercially profitable for around 75 years.

T F 19. Movable types were first used in Europe around the middle of the 1400's.

T F 20. The Bible was the first book to be printed in England.

T F 21. The carved stone tablets of the Assyrians represent the earliest attempt of man to record an important event.

T F 22. The twenty-six character alphabet as we use it today was developed by the Phoenicians.

T F 23. Hieroglphics, a very elaborate system of picture writing, was developed by the Assyrians.

T F 24. Johann Gutenberg is generally given credit for the first book printed from movable type.

T F 25. William Caxton introduced printing into England.

T F 26. William Caslon is best known for his printed works.

T F 27. The first printing in North America was done in Mexico.

T F 28. The <u>Freeman's Oath</u> was printed in 1639 and was the first material printed in Colonial America.

T F 29. Benjamin Franklin was one of the most widely known printers of early America.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The printing establishment which has had the longest continuous operation in history is the ______________ ______________ ______________ in ______________.

2. William Caslon made his most notable contribution to the progress of printing in the field of ______________ ______________.

3. The first printer in the American colonies was ______________ ______________.

4. The American printing establishment which has the longest period of continuous operation is the ______________ ______________ ______________.

5. The oldest continuously published newspaper in America is the ______________ ______________.

6. The first regularly published newspaper in America was established in the opening years of the ______________ century.

7. The forerunner of the modern printed book was the ______________ ______________.

8. Gutenberg's first known work was the ________________________.

9. The modern style of type faces was designed by ______________.

10. The first book printed in the Western Hemisphere was published in ______________ in the year ______________.

Matching

Directions: In the right column are descriptive words and phrases, and in the left, various words. Match the letters of the item on the right with the word(s) on the left by placing the proper letter in each blank on the left.

I.

_____ 1. Cuneiform

_____ 2. Egyptian

_____ 3. Phoenicians

_____ 4. American Indians

_____ 5. Jan de Printere

_____ 6. Churches and monasteries

_____ 7. Gutenberg

_____ 8. Pannartz and Sweinheym

_____ 9. Manutius

_____10. Jenson

A. Books and scrolls were written by scribes

B. Developed Roman to its finest form and beauty

C. Development of alphabet

D. Wedge-shaped characters

E. Hand carved wooden block in 1417

F. Invented Italic type

G. Papyrus scroll

H. Originated first Roman type

I. Genesis of typefaces

J. Picture writings

K. First movable metal type

II.

_____ 1. Caslon

_____ 2. Caxton

_____ 3. Garamond

_____ 4. Tory

_____ 5. Bodoni

_____ 6. Franklin

_____ 7. Bradford

_____ 8. Cromberger

_____ 9. Stephen Daye

_____10. Printing Education Week

A. Promoted early French printing

B. Introduced printing into England

C. Page from the "Diamond Sutra"

D. Benjamin Franklin's birthday

E. Became famous American colonial printer

F. Originated modern-face type

G. First colonial printer

H. Began type foundry as a separate activity

I. Became first printer in Pennsylvania

J. America's first printer

K. Became famous English printer and type founder

Assignment
Sheet No. 2

Covering
Unit 2

PRINTING AS A VOCATION

In the printing industry, sometimes called the graphic arts industry, there is a great need for well-trained workers. Although there exists a vast array of machinery, materials, and appliances of the trade, there is a shortage of skilled printers who can use this equipment to turn out products of the quality demanded by today's consumers of printed materials.

If one expects to remain in, and advance in, the printing industry, it is not adequate merely to know of the existence of job openings. The extent of these opportunities, the requirements of the various jobs, wage trends, how the field of work compares with others in the nation, future expectations of the industry and a vast amount of other pertinent information relative to the printing industry must also be known.

In order that you will not fall into the category of uninformed workers, this unit is designed to acquaint you with various items of factual information which will enable you to become well rounded in your knowledge of the printing industry as a whole. It is also designed to make you aware of the position of the industry in our national economy.

Assignment:

1. Read the references given below.
2. Answer the questions and turn in this assignment by ____________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. xi-xiv, 13-16, 184-188.
B. Karch, Graphic Arts Procedures, pp. 337-353.
F. Pollack, Printing: Careers and Opportunities for You, pp. 13-39.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Printing is the fourth largest industry in the United States in terms of the number of establishments.

T F 2. Most printing craftsmen are employed by newspapers.

T F 3. Printing employment tends to be less affected by declines in general business activity than employment in manufacturing as a whole.

T F 4. Printing is a seasonal occupation.

T F 5. One of the primary disadvantages of employment in the printing industry is forced retirement at an early age due to the nature of the work.

T F 6. Most printing craftsmen are members of trade unions.

T F 7. Few technological changes are expected in printing processes within the next twenty-five years.

T F 8. In the past, technological advancements in the printing industry have caused a decrease in the number of people employed in the industry.

T F 9. The training of workers has kept pace with the employment demands of the printing industry.

T F 10. The majority of workers in the printing industry are women.

T F 11. The purposes of printing is to record messages on paper or other surfaces.

T F 12. Printing has a broader context than graphic arts.

T F 13. The proportion of skilled workers to other workers in printing is about twice that for other industries.

T F 14. Unlike other industries, workers in printing establishments have not become specialists.

T F 15. The copyholder holds the copy so the proofreader can mark any corrections.

T F 16. A worker familiar with platen and job cylinder presses should be able to enter any of the printing fields as a pressman without further experience or training.

T F 17. The majority of men employed in the printing industry perform jobs requiring little or no special skill.

T F 18. In 1950, over 65,000 persons employed in the printing industry were under twenty years of age.

T F 19. The supply of professionally qualified personnel for the printing industry falls far short of the demand.

T F 20. Printing is a stable industry.

T F 21. Too many apprentices are being trained for the printing industry.

T F 22. The graphic arts industry has many small establishments.

T F 23. In general, graphic arts work is clean.

T F 24. In order to impress a prospective employer, the printing school graduate should claim to be able to perform all of the skills of the trade, regardless of his actual ability to do these things.

T F 25. Most employers are satisfied with a job well done regardless of the time taken to complete the job.

T F 26. The minimum requirements for a compositor is the completion of a five-year apprenticeship as a hand compositor or the equivalent.

T F 27. The proofreader must have a thorough knowledge of the English language.

T F 28. Pressroom positions require a thorough knowledge of the mechanics of the press operated.

T F 29. Photoengravers never perform all of the operations required in making letterpress original plates.

T F 30. Lithographic artists perform the work of dot etching, Ben Day, tusching, and opaquing.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The term of apprenticeship in printing is generally from ______ to _______ years and must be supplemented by courses of study amounting to a minimum of _______ hours for each year of training.

2. The two largest printing centers in the United States are _______________ and _______________ .

3. Printing plants that employ such workers as photographers, strippers, printers, tint layers, artists, etchers, finishers, and proofers are known as _______________ plants.

4. The greatest number of men workers in the specialized printing crafts are _______________ _______________ or _______________ _______________ _______________ .

5. Normally, the printing industry has over _______________ _______________ apprentices in training.

6. Graphic arts workers number about _______________ in the United States.

7. The ______________ sets type and assembles the products of type composing machines into pages for books, newspapers, and commercial printing of all kinds.

8. The ____________ ____________ draws and writes exact typographic specifications to scale for the other workers in the shop.

9. The minimum requirements for a linotype operator include the completion of a ________ ____________ apprenticeship in a composing room, including ____________ ____________ as a linotype operator or completion of a school course in __________ ________________ and ________________.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. Three methods of entering the printing industry are:

(A) ____

(B) ____

(C) ____

____

____

2. The composing room jobs are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

3. The jobs in letter press are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

4. The major fields of offset-lithographic tasks are in:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

5. The professional positions are:

(1) ____________________

(2) ____________________

(3) ____________________

(4) ____________________

(5) ____________________

(6) ____________________

(7) ____________________

6. Graduates of vocational and printing schools generally secure employment by:

(1) ____________________

(2) ____________________

(3) ____________________

(4) ____________________

Assignment
Sheet No.3

Covering
Unit 3

ACCIDENT AND HEALTH HAZARDS

Considered as a general group, printers usually enjoy good health Government surveys have shown that long and continuous employment in the printing trades is compatible with reasonably good health.

You who have elected to work in the printing industry, and who will work in the printing shops should realize that accident and health hazards are found in the printing industry as in any other major production industry. Because these conditions do exist, the hazards, their results, and means of prevention must be known in order to provide a background of knowledge about the particularly dangerous machines, and personal conduct necessary to prevent injury or illness.

A careful study of the references assigned in this unit will provide information necessary to aid in accident prevention, and develop an attitude which will enable you to protect your personal health.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by ____________________

References:

B. Karch, Graphic Arts Procedures, pp. 273-274.
I. Information Sheet No. 1.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A worker in the printing trades must expect to work around numerous accident and health hazards which cannot be corrected or prevented.

T F 2. Long neckties and loose clothing constitute a serious hazard around moving machinery.

T F 3. Because individuals do similar tasks in different ways, it is advisable to lift all forms, light and heavy, alone.

T F 4. Because it lies flat, paper on the workroom floor presents an insignificant accident hazard.

T F 5. Machinery must be oiled or wiped while in operation.

T F 6. When lifting, the leg muscles, not the abdominal muscles, should be used.

T F 7. Talking to a beginning pressfeeder should be prohibited, but standing behind him to watch him at work can do no harm.

T F 8. Oil should be kept on the workroom floor at all times in the interest of safety.

T F 9. An open knife can be safely carried in a worker's pocket so long as the point of the blade is down.

T F 10. If a sheet slips from the platen when hand feeding a press, the operator should quickly reach into the press to recover it.

T F 11. Wrestling and horseplay in the plant should be absolutely prohibited.

T F 12. All work areas should receive a proper amount of illumination, but this is impossible because the glare cannot be controlled.

T F 13. Skin infections can result from the use of benzine for cleaning purposes.

T F 14. The lack of dust control within the workroom may cause diseases of the respiratory system.

T F 15. To avoid being burned, pigs of metal may be pitched into the pot for melting.

T F 16. Once they have been adjusted, automatic stops need not be checked for adjustment.

T F 17. Cleaning liquids may be stored in the workroom.

T F 18. The worker who smokes while at work should not wear a celluloid eyeshade.

T F 19. Tuberculosis may be spread by the use of a common drinking cup or common towel.

T F 20. Spitting on the floors of the plant should be prohibited of all workers.

T F 21. In the composing room, a bellows should be used to clean the compartments of the type cases.

T F 22. A headache or feeling of weariness may be one of the first indications of the presence of carbon monoxide within a poorly ventilated shop.

T F 23. Proper ventilation and adequate washing facilities should be provided when benzine is used to wash presses.

T F 24. The fumes from gas heated pots should be vented to the back of the linotype.

T F 25. Pot plungers should be cleaned at the machines.

T F 26. Lead poisoning, while causing discomfort, is not a serious health hazard.

T F 27. In the interest of health, sterilized wiping cloths should be used for cleaning presses.

T F 28. When cases are left for only a few minutes, they may be left open, but when left for 15 minutes or longer, they should be closed.

T F 29. A thoughtless or careless workman can cause a well-guarded machine to become dangerous.

T F 30. Injuries occur when the worker has his attention diverted from his job.

T F 31. Open type cases, especially the lower ones, constitute a serious accident hazard.

T F 32. Paper stock should be cut by teams of two or three workers.

T F 33. Holding a piece of type in the mouth is permissible if the dust is first rubbed off with the fingers.

T F 34. Very small cuts need not be treated to prevent infection.

T F 35. Fatigue and the weakening of body resistance are the results of improper ventilation.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Colic, constipation, heart and kidney diseases are the results of ____________ ____________.

2. Headache, nervousness, and digestive ailments may result from the continued exposure to ____________ ____________.

3. A common drinking cup and spitting on the floors are means of spreading ____________.

4. Sterilized wiping cloths can usually be secured from a ____________ ____________ or ____________ ____________.

5. Convulsions and death may result from the use of cleaning solutions with a base of ____________ ____________.

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the words on the left by placing the proper letter in each blank on the left.

_____ 1. Tripping and falling

_____ 2. Saws and saw trimmers

_____ 3. Paper cutters

_____ 4. Dust

_____ 5. Lead poisoning

_____ 6. Benzine

_____ 7. Talking with workmen

_____ 8. Fatigue

_____ 9. Platen presses

_____ 10. Handling paper

A. Colic, heart and kidney diseases, death

B. Loss of fingers or hand

C. Cuts, rupture, strains

D. Bruises or broken bones

E. Getting caught in rollers and belts

F. Burns and mangled hands

G. Ill health

H. Skin infection, dizziness, headaches

I. Burns

J. Crushed fingers or hands

K. Mangled hands and eye injuries

L. Respiratory diseases

M. Getting out of time with machines

Information
Sheet No. 1

ACCIDENT AND HEALTH HAZARDS

This information sheet will present certain accident and health hazards as well as their ultimate results and means of prevention.

Accident Hazards

Platen Presses: Careless press feeding can result in crushed hands or fingers. To prevent injury install proper guards; do not try to feed very small or odd-shaped sheets. Do not reach for falling sheets.

Cylinder and Rotary Presses: Crushed or cut hands or feet result from carelessness when using these machines. To eliminate injuries, guard all hand and foot hazards; get aid when removing and replacing rollers.

Saw and Saw Trimmers: Mangled hands can result from contact with the moving blade, or eye injuries can result from the eyes being struck by metal pieces thrown by the moving blade. To prevent hand injuries from saws and trimmers, use guards and work holders at all times. To prevent eye injuries, wear goggles whenever operating saws and saw trimmers.

Composing Machines: With careless and improper adjustment, composing machines can cause burns and mangled hands. To prevent such injuires, see that all automatic stops are adjusted and work correctly; do not throw pigs of metal into pot; guard molds, gears, and belts.

Paper Cutters: These machines can cause the loss of one or more fingers or a hand. To prevent these losses, work alone when cutting paper; do not catch scrap as it comes from the knife. See that non-repeating devices work properly.

Slug Cutters and Mitering Machines: Although these machines are hand operated, their use can result in crushed, torn or cut fingers or hands. Safety demands that great care be taken when using unguarded machines. When guards are provided, they should be used.

Unguarded Belts and Gears: To avoid being caught and injured by these means of power transmission, see that all belt and gear hazards are well guarded.

Staplers, Stitchers, and Cornering Machines: These machines can cause crushed fingers or hands. To avoid such injury, install guards where possible and take care when operating.

Tripping and Falling: Painful bruises are a frequent result of this hazard, with broken bones or other serious injuries possible from falling against or into machinery. The prevention of these injuries requires all type cases to be closed when not in use. Trouser cuffs should be rolled inside.

Folding Machines: The greatest hazard with this machine is getting caught in rollers or belts. The prevention of these injuries demands that guards be placed at danger points.

Fire: From this hazard, burns are the usual result. To prevent fires and the subsequent injuries, use safety cans for benzine, gasoline and kerosene; do not keep stores of inflammable liquids in the workroom. Do not use a celluloid eyeshade if smoking on the job is permitted.

Paper Handling: From this activity paper cuts, ruptures, and strains are possible results. To avoid strains and ruptures, do not lift excessively heavy loads. When paper cuts occur, they should be properly treated to prevent infection.

Plate Handling: Cuts on the hands are the usual result from the careless handling of plates. To prevent these cuts, take care when removing plates from the patent base; however, if they do occur, treat the cuts to prevent infection.

Horseplay: Childish actions are extremely undesirable in a plant employing men and usually result in falls against workmen who are operating machines, or falling against or into the machine themselves. Horseplay can be prevented by refraining from wrestling or engaging in other play.

Talking with Machine Operators: The most serious result is usually to the machine operator who runs the risk of serious hand injuries if the conversation causes him to get out of time with the machine. To eliminate this hazard, do not talk to machine operators.

Press-Feeding Difficult Jobs: This is closely akin to the injuries which result from careless platen press operation - crushed hands or fingers. The prevention of these injuries requires that narrow, long jobs be run two or more up; and no reaching through the press to save a fallen sheet.

Static Electricity: The flinch from a static electricity charge, or the "stickiness" of charged sheets can cause a loss of timing when pressfeeding and can cause crushed hands or fingers. These injuries can be prevented by not attempting to pressfeed electrically charged sheets by hand.

Unauthorized Use of Machines: The variety of injuries resulting from the unauthorized use of machinery and equipment is too enormous to make a specific list of them. In order to avoid injuries from this source, all workers should heed the danger signs posted to indicate those machines which require special instruction for their operation, and refrain from operating those machines, until given the proper instruction in their use or operation.

Health Hazards

Lead Poisoning: Depending upon the amount and length of exposure this hazard may manifest itself in any one or more of the following ways: colic, constipation, paralysis, disease of the heart, blood vessels, and kidneys, insanity or death. To prevent lead poisoning, the following precautions should be taken: do not create lead dust by splashing pigs in the metal pot; keep pieces of type from the mouth; avoid dry sweeping; do not eat in the workroom; wash hands before eating; clean nails frequently; and do not chew or smoke while working.

Improper Ventilation: This hazard is especially dangerous during the winter months when windows and doors are kept closed against the cold. The results of improper ventilation are fatigue, weakening of body resistance, poisoning from gas and fumes. To prevent this hazard all fumes and gases should be piped from the shop.

Carbon Monoxide: This hazard results from improper ventilation and causes headaches, dullness, lassitude, nervousness, insomnia, digestive ailments, and possibly death. Proper ventilation and the piping of fumes and gases from the shop will remove this hazard.

Tuberculosis: The result of this hazard is general sickness, and possible death. To offset the effects of this hazard, do not use a common drinking cup or towel; prohibit spitting on the floor; exercise in open air and in sunlight; have good ventilation in the workroom.

Benzine: This cleaning fluid is highly volatile, and therefore can present hazards both as a liquid and a gas, causing skin infections, faintness, dizziness, headaches, and vomiting. To prevent these conditions, proper ventilation should be provided, use gloves when cleaning presses, and provide adequate washing facilities. Also, see fire discussed previously for the fire hazards of benzine.

Cleaning Mixtures: The use of cleaning solutions with anilin oil bases can cause convulsions and death. If these cleaning mixtures are used, gloves should be worn, proper ventilation provided, and the user should avoid splashing the mixture on hands or clothing.

Poor Blood Circulation: The result of this condition is general ill health. Exercise in sunshine and open air after working hours will usually correct this condition.

Bad Lighting: Improper lighting causes impaired eyesight, which can be prevented by the amount of illumination, shaded and located to prevent glare.

Unclean Wiping Cloths: The skin infections caused by the use of unclean wiping rags can be eliminated by the use of sterilized wiping cloths. Local laundries usually provide a towel and wiping cloth service for those establishments requesting this service. There are also towel services located in larger cities which also offer this service.

Fatigue: The ill health caused by fatigue can be eliminated by proper rest.

Dust: The inhalation of dust results in diseases of the respiratory system. These diseases may be prevented by eliminating dust from the workroom, by prohibiting dry sweeping, by cleaning pot plungers outside the plant, and by prohibiting the use of a bellows to clean type cases while the cases are in the workroom.

Covering
Unit 4

THE CALIFORNIA JOB CASE

In the five hundred years that movable type has been in use, numerous systems and containers for type storage have been developed. Although applying some of the terminology of earlier systems, the California Job Case is in this country, the most widely used container for storing type at the present time.

These cases are unique in that none of the individual compartments or "boxes" are marked to identify the characters they contain. The compositor must rely wholly upon his memory to determine the location of specific "boxes" when selecting or distributing type characters. Because of this, it is necessary for the beginner to develop a complete knowledge of the location of the various type characters within the job case.

This assignment will provide you with an opportunity to extend your knowledge of the printing industry by learning the location of the various type characters in the California Job Case.

Assignment:

1. Read the references listed below.
2. Draw, freehand, three plans of the California Job Case. Learn the location of the various characters by the method described on page 23 of reference A. Use the lay of the case shown in Fig. 8-A of reference A. Submit the third sheet to your coordinator for use in checking your knowledge of the lay of the case.
3. Answer the questions, complete item 2 above, and turn in this assignment by ______________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 22-23.
B. Karch, Graphic Arts Procedures, pp. 129-130.
C. Polk, The Practice of Printing, pp. 26-30.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Font is the term used to designate an assortment of one size and face of type.

T F 2. The "lay of the case" refers to the position of the type case on the work bank.

T F 3. A "dirty" type case is one which has many pieces of broken type in its compartments.

T F 4. When learning the position of the various characters in the case, the position of the fractions, commercial signs, etc., should be learned first.

T F 5. A "pied" type case and a "dirty" type case are the same.

T F 6. The New York Job Case and News Cases are used in some printing plants.

T F 7. The California Job Case is made after the pattern of News Cases.

T F 8. The letters J and U were added to the alphabet after type cases were designed.

T F 9. The upper News Case held only large capitals.

T F 10. News Cases were used in pairs.

T F 11. The California Job Case occupies a space 32 3/16 x 16 5/8 x 1 1/16 inches, and holds approximately twenty pounds of type.

T F 12. The California Job Case is divided into compartments of equal size.

T F 13. The lower News Case contains both lower case characters and small capitals.

T F 14. The largest compartment in the California Job Case contains the most frequently used type character.

T F 15. The California Job Case is a triple case.

T F 16. The numerals in the California Job Case are placed out of sequence.

T F 17. The capitals in the California Job Case are placed in sequence.

T F 18. For storing ordinary type, the California Job Case is almost universally used.

T F 19. It is customary to place type made only in upper-case into what is termed an "all cap case."

T F 20. New schemes must be learned for each new type case used.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper number in the blanks at the left.

1. Steps of procedure to follow when learning the "lay of the case."

____ A. Locate the lower case letters of the alphabet several times.

____ B. Learn the location of the capitals.

____ C. Take a blank diagram and mark the spaces from memory.

____ D. Draw a diagram of the California Job Case.

____ E. Learn the location of the figure.

____ F. Learn the location of the punctuation marks, special characters and spaces.

____ G. Mark the letters in their proper area.

____ H. Check for errors and concentrate on their correction.

2. Steps of procedure to follow when working with a type case.

____ A. Pull out halfway, the case immediately below the desired case.

____ B. Locate the case containing the desired type.

____ C. Place desired case on work bank.

____ D. Pull out desired case.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The last of the letters to be added to the alphabet were the ________ and the ________ .

2. The time necessary to learn the position of the various type characters within the case should be approximately ________ ________________ .

3. The New York Job Case contains ________ sets of capital.

4. The most frequently used of the letters is the ________________ ________ .

5. The letters used least are the ________, ________, ________, ________, and ________ .

The following questions refer specifically to the California Job Case.

6. The capitals are found in the ______________ section.

7. The numerals are found in the ______________ section.

8. The quads are found in the ______________ section.

9. The punctuation marks are found in the ______________ and ______________ sections.

10. The least frequently used lower case letters are found in the ______________ section.

Assignment
Sheet No. 5

Covering
Units 8-13

CHARACTERISTICS OF TYPE AND SPACES

One of the earmarks of a good worker centers around the fact that he or she is well informed as to the nature of the materials in daily use in the industry.

Since printers build their results from a display of type faces which are in turn printed into thousands of copies, it is most important that each of these type faces be analyzed to the extent that the worker will be able to select suitably designed type to carry the message to be delivered to the public.

In this unit you will learn various type faces as well as the various types and kinds of spacing material. You will also learn of the manner in which these are kept, cared for and used.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by ______________________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 19-22.
C. Polk, The Practice of Printing, pp. 18-25, 31-38, 182-190.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The nick on a piece of type is the depressed area between the feet of the type.

T F 2. The point size of type corresponds to the distance in points between the back and the belly of the type.

T F 3. The very large type used for poster printing is cut from wood.

T F 4. Spaces are shorter than type and have no characters on them.

T F 5. Three 3-em spaces and one em quad occupy the same amount of space in a line of type.

T F 6. Two en quads will occupy the same amount of space in a line of type as an em quad.

T F 7. Leading refers to the separating of lines of type by means of leads and slugs.

T F 8. Leads and slugs more than 10 picas long are cut in half-pica graduations.

T F 9. The most commonly used leads are two points thick.

T F 10. The face of the type serves as the printing surface.

T F 11. The beard of a piece of type may be the serif or the finishing stroke.

T F 12. All type in North America is of uniform height, approximately 11/12 of an inch or .918 inches.

T F 13. The nicks on the type body serve only to indicate the correct position of the type in composition.

T F 14. A font of type is an assortment of type, in a single style and size, as put up by the type founders.

T F 15. A type series is made up of the various sizes of any one kind of type.

T F 16. A type family is composed of a number of type series bearing the same name and design characteristics.

T F 17. Body type is more legible than display type and is designed to attract the attention of the reader.

T F 18. The "em quad" is always the square of the type body, regardless of the size of the type.

T F 19. A 3-em quad will occupy the same amount of space in a line of type as 9 3-em spaces.

T F 20. Leads and slugs are stored in the type case.

T F 21. Reglets and slugs are made from the same material.

T F 22. Modern-face types may be identified by the contrast of heavy and light strokes.

T F 23. Nicholas Jenson first developed a modern-face type.

T F 24. A modern-faced type may be identified by the serifs which join the strokes at right angles.

T F 25. Oldstyle types are characterized by angular serifs and heavy, uniform body elements.

T F 26. Text letter types are most legible when set in capitals.

T F 27. In the sans-serif types, the letters have no serifs and the strokes are of uniform weight.

T F 29. Because of the kerns present on script types, they require special handling.

Multiple Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. Kerned letters refer to (A) sans-serif letters; (B) letters with portions of the face extending beyond the body; (C) sized letters of any one kind; (D) arrangement of type in a stick.

____ 2. Groove on a piece of type is the (A) area between lines of type; (B) area across belly of piece of type; (C) depressed area between the feet; (D) slanting area from face to shoulder.

____ 3. Sorts are (A) assortments of type within a font; (B) individual type characters packed separately and usually included with each purchase of type; (C) individual type characters that may be obtained separately on special order; (D) mixed groups of kerned letters.

____ 4. An en quad is (A) one-half the size of one 2-em quad; (B) the same size as three 3-em spaces; (C) the same width as three 3-em spaces; (D) one-half the size of one em quad.

____ 5. Swash letters refer to (A) uncial letters; (B) sans-serif letters; (C) ornamental italic letters; (D) square-serif letters.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully

1. The parts common to all pieces of type.

(A) ____________________ (G) ____________________

(B) ____________________ (H) ____________________

(C) ____________________ (I) ____________________

(D) ____________________ (J) ____________________

(E) ____________________ (K) ____________________

(I) ____________________ (L) ____________________

2. Types are classified into five groups according to method of composition. They are

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

3. List in order of decreasing size the spacing material normally found in the type case.

(1) ______________________ (5) ______________________

(2) ______________________ (6) ______________________

(3) ______________________ (7) ______________________

(4) ______________________

4. All type faces may be divided into seven groups. List these seven groups.

(1) ______________________ (5) ______________________

(2) ______________________ (6) ______________________

(3) ______________________ (7) ______________________

(4) ______________________

Unit 14

THE PRINTER'S SYSTEM OF MEASUREMENT

At one time in the development of measurements, an inch was equal to one-eighteenth the length of the human forearm. Later a royal decree made an inch equal to the combined lengths of three barley-corns. This lack of any definite standard of measurement made it necessary that craftsmen adopt some system of measurement to avoid poor workmanship. In 1878 American type founders adopted a uniform standard system for type sizes.

As you work at the printing trade you will have occasion to use the terms which make up this measuring system, both in conversation and composition. Until you are completely familiar with these terms, you will not be capable of performing the job situation which will be presented to you, nor will you be able to discuss the problems which will arise.

In this unit you will learn to use the terms which make up the printer's system of measurement, and work out basic problems with which the printer must cope.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by ______________________.

References:

A. Cleeton and Pitkin, General Printing, p. 17.
B. Karch, Graphic Arts Procedures, p. 125.
C. Polk, The Practice of Printing, pp. 67-71.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Wooden line gauges are preferred by printers because they are lighter in weight than brass or steel gauges.

T F 2. There are two "nonpareils" in one "pica" and six "picas" in one inch.

T F 3. Agate lines are used when setting up newspaper advertisements.

T F 4. The "pica" is the smallest unit of measure used by printers.

T F 5. A "pica" is made up of two "nonpareils."

T F 6. There are approximately 72 "picas" to the inch.

T F 7. A line of 8-point type set 24 picas wide contains 36 ems of type.

T F 8. A line of type set 19 picas wide contains 228 points.

T F 9. A line of 6-point type set 24 picas wide contains 24 ems of type.

T F 10. The number of ems per page can be calculated by multiplying the size of type by the number of lines.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A line 2 inches long will equal ________ nonpareils.
2. One-fourth inch will equal __________ points.
3. A line 5 1/2 inches long will equal _________ picas.
4. A good type rule will usually measure up to _________ picas.
5. The smallest common type is _________ point.

Matching

Directions: In the right column are various terms used in printing measurements. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. Pica
____ 2. Inch
____ 3. Page sizes
____ 4. Nonpareil em
____ 5. Small pica
____ 6. Long Primer
____ 7. 1000 ems
____ 8. 24 picas wide
____ 9. 6 points
____10. Ems per page

A. 11 points
B. Inches
C. 12 points
D. Unit of calculating printed matter
E. 24 ems of 12 point
F. Ems per line x number of lines
G. 6 points
H. 48 ems in 24 pica line
I. 13 inches
J. 6 points thick
K. 10 picas
L. 72 points

Assignment
Sheet No. 7

Covering
Units 15-25

THE PROCESS OF SETTING TYPE

Although much of the type today is set by machines, the most satisfactory way to learn printing thoroughly is to begin with the elementary processes of hand composition and build on this solid foundation. In addition to this consideration, many sizes and faces of type, as well as special job plans, will always be set by hand.

Despite the fact that many trades require the use of a large number of hand tools, the printer needs but a few to work at this trade. The most important of these is the composing stick in which single pieces of type are assembled and justified by the compositor.

Just as the first movable types were carved of wooden blocks, so were the first composing sticks also carved of wood. As type size became standardized with the progress of the printing industry, the composing sticks were also improved until they became an expensive, precision hand tool of brass or steel. Modern composing sticks are usually made of alloy steel or are plated to prevent rust or corrosion.

This unit will provide an opportunity for you to acquire information concerning the care of the composing stick and its use in composition. In connection with the use of the composing stick, you will also learn about the process of setting straight matter composition, and of the typographical considerations involved in the division of words.

Assignment:

1. Read the references listed below, noting in particular the various illustrations.
2. Answer the questions and turn in this assignment by ______________________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 24-34.
B. Karch, Graphic Arts Procedures, pp. 138-145.
C. Polk, The Practice of Printing, pp. 39-52, 72-84.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The location of the composing stick knee determines the width of the composition.

T F 2. The composing stick is sometimes referred to as a "job stick" or merely as a "stick."

T F 3. The Rouse and micrometer composing sticks require the use of metal furniture to set the knee.

T F 4. The Rouse composing stick is adjusted to six-point graduations by means of the half-pica lever.

T F 5. The majority of the references prefer the placing of a slug, rather than a lead, in the composing stick before the first line of type is set.

T F 6. A line is correctly justified when it cannot be removed from the stick without releasing the knee.

T F 7. Each line of type should be corrected, if necessary, before it is justified.

T F 8. Insufficient space between words will cause them to run together and form "lakes" and "rivers."

T F 9. Properly spaced composition will present a uniform tone of gray to the eye of the reader.

T F 10. A line of type may be perfectly justified, and yet be poorly spaced.

T F 11. When it is necessary to alter the spacing between words, "spacing out" is preferable to "spacing in."

T F 12. The original spacing in a line of type may be altered to facilitate justification.

T F 13. When "quading out," the largest pieces of type are placed nearest the punctuation mark.

T F 14. Sentences should be separated by two 3-em spaces.

T F 15. The comma face and the nick are on the same side of a piece of type.

T F 16. Squared indentions are used to give prominence to a certain section of composition.

T F 17. Indention for poetry consists of having each of the rhyming lines indented equally.

T F 18. The half-diamond type of indention is used to give display properties to a section of printed matter.

T F 19. A square and centered paragraph is indented an equal amount on each side.

T F 20. Letterspacing between lowercase letters is considered good form and is desirable due to the improved appearance of the composition.

T F 21. Regular paragraph indention consists of having the first line set full measure and each of the other lines indented an equal amount.

T F 22. Figures set in vertical composition should always be aligned at the right.

T F 23. When setting type, the thumb is used to hold the type against the knee of the composing stick.

T F 24. The hand which holds the stick should "follow" the hand which selects the pieces of type.

T F 25. Type should always be read in the stick, upside down, and from left to right.

T F 26. An "out" is a repeated word which should be removed.

T F 27. Any of the "four demons" may be identified by holding the piece of type with the nick up, and imagining the straight stem running in the opposite direction.

T F 28. In spacing of lines, it is more important to have equal spaces between words than it is to vary the spaces so that the printed matter appears to have equal spaces.

T F 29. When there is no way to avoid dividing a word at the end of a line of type, the word may be divided anywhere.

T F 30. The word align may be divided between the first and second letters.

T F 31. The indention of a paragraph 18 picas wide should be one em of the type.

Completion

Directions: The following spaces and combinations of spaces represent divisions of an em quad. Place in the blanks the correct fractional and percentage values of the indicated spaces and combinations of spaces.

	Fraction of em	Per cent of em
1. 5 em space	____________	____________
2. 4 em space	____________	____________
3. 3 em space	____________	____________
4. 5 em + 5 em	____________	____________
5. 5 em + 4 em	____________	____________
6. en quad	____________	____________
7. 5 em + 3 em	____________	____________

7. 5 em + 3 em __________ __________
8. 3 em + 4 em __________ __________
9. 3 em + 3 em __________ __________
10. en quad + 5 em __________ __________
11. en quad + 4 em __________ __________
12. en quad + 3 em __________ __________

Listing

Directions: List the items called for in each of the following statements. Select your answer carefully.

1. The common ligatures found in the type case.

(A) __________ (D) __________
(B) __________ (E) __________
(C) __________

2. The punctuation marks found in the type case.

(A) __________ (F) __________
(B) __________ (G) __________
(C) __________ (H) __________
(D) __________ (I) __________
(E) __________ (J) __________

Assignment
Sheet No. 8

Covering
Units 26-30

THE HANDLING OF TYPE

Throughout the years in which the printing trade has developed, certain practices in the handling of type have become standardized through use. Unlike many procedures, only one school of thought has been developed regarding these practices indicating the total agreement of past and modern printers as to their desirability.

To advance in the printing trade it is essential that the beginner master the techniques of handling type from the very beginning of his training. Any deviations from standard practice usually result in poor workmanship and damage to the equipment in the shop. The manner in which he stands at his work station, removes the composed matter from the composing stick, or ties up the form must conform to the standard practices of the trade. The manner in which beginners master and use these practices will distinguish those who are working to advance in the printing trade from those who are just working.

In this unit you will learn some of the standard practices used in the handling of type, as well as the names and uses of equipment involved in further preparation of composed material for the initial inked impression.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by ______________________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 35-39.
B. Karch, Graphic Arts Procedures, pp. 144-147.
C. Polk, The Practice of Printing, pp. 53-56.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is advisable to "dump" the stick only when it is full.

T F 2. The composing stick may be unclamped for the easier removal of composed matter.

T F 3. The majority of the references agree the composed matter should not be lifted when being transferred from stick to galley.

T F 4. When quadding out a line, the wider quads and spaces are placed next to the punctuation mark.

T 5. A "bank" is a slanted or flat working surface in the composing room.

T F 6. The "alley" is a storage for unused spacing material.

T F 7. A line of type which seems tight when off its feet will become loose when put on its feet.

T F 8. The "galley" is the lower corner of the bank where type is stored after being removed from the stick.

T F 9. The make-up galley is very carefully made and has pica graduations on its side.

T F 10. A small form may be kept on its feet in the galley by increasing its size with metal furniture.

T F 11. Twice around the form with a string is sufficient to hold it.

T F 12. When tying up a form, the typing process is begun at the open corner and ended at the opposite corner.

T F 13. The majority of references agree a knot should be tied in the string when a form is tied up.

T F 14. Excess string should be cut off the tied form.

T F 15. When transferring type from the composing stick, the second finger of each hand is placed against the ends of the lines of type.

T F 16. Any type form should have a slug at both the head and the foot before it is handled.

T F 17. When placing type in the galley, the head of the type should always be in contact with the head of the galley.

T F 18. When tying up a form, the string will be kept taut if it is drawn tightly just prior to passing it around each corner.

T F 19. Type forms, which have been tied, are carried from the galley and placed on the stone.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Nearly all type cabinets have a working surface, either flat or slanted, called a ________________ .

2. The ______________ should always be placed in one of the lower corners of the bank.

3. When the form has been tied up, the excess string is cut off with the sharp edge of the ______________ ______________ .

4. Mixed or jumbled type is referred to as ______________ .

5. Type should be placed in the galley with the head of the type against the ______________ end of the galley.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. The following steps are involved in dumping the composing stick.

____ A. Place fingers and thumbs in possition for pressing type from the stick.

____ B. Move type so the head of the type engages the head of the galley.

____ C. Allow thumbs to go to the bottom of the stick.

____ D. Place galley in position on the bank.

____ E. Slide type from stick to the bottom of the galley

____ F. Set stick against lower edge of galley.

____ G. While holding the stick against the galley, push the lines forward in the stick.

2. The following steps of procedure are involved in tying up a form.

____ A. Begin at proper corner and wind string clockwise around form.

____ B. Place necessary slugs or furniture around form.

____ C. Wind string around form a sufficient number of times.

____ D. Place head of form against head of galley.

____ E. Select string of adequate length.

____ F. Push string down to center of the form.

____ G. Draw loop tight.

____ H. Cut off excess string.

____ I. Push a loop between the string and the form

Units 31-45

PROCESSING GOOD PROOFS

It is a well-known fact that "Pride of Workmanship" is one of the basic factors which motivate the workman to develop his ability to the highest possible level. One of the advantages printing offers a conscientious worker is the comparative ease by which the results of his work may be checked at any step of the job through the medium of a printed proof.

Whether the proof is designed for a simple check by the compositor, or as a final sample to be reviewed by the foreman of the shop or the customer, it is very important that the compositor develop techniques leading to correct, clear, and well-margined proofs. Offset, lithographic, and photo processes also make it imperative that letter-perfect proofs be struck by the compositor.

In this unit you will learn the accepted standards of the printing trade in regard to processing proofs, as well as certain techniques for the correction and review of proofs.

Assignment:

1. Read the references given below.
2. Answer the questions and turn in this assignment by ______________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 39-47, 51-54, 60-61.
B. Karch, Graphic Arts Procedures, pp. 148-150.
C. Polk, The Practice of Printing, pp. 57-63.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A brayer is used to remove ink from the composed form.

T F 2. Commercial writing ink is used to take proofs.

T F 3. When using the brayer, the lugs point downward.

T F 4. String or thin spacing material is often placed under one corner of the galley to make it level.

T F 5. The galley substitute plate is used when the proof is made of a form not a galley.

T F 6. The brayer is applied to the form from the open corner to the closed corner.

T F 7. Type high bearers are placed outside the galley to make the inking of forms for proofing easier.

T F 8. A register bar is used to obtain correct margins on proof presses not equipped with grippers.

T F 9. Proof slurs may be eliminated by using two strings of rubber bands to secure the proof paper to the cylinder.

T F 10. The type should be cleaned immediately after pulling the proof.

T F 11. Kerosene is a very good solvent for cleaning the type.

T F 12. A type brush with copper wire bristles is used to scrub out the counters of the type.

T F 13. The type form is washed by wiping with a solvent-dampened cloth from open to closed corners.

T F 14. The washing process may be hastened by flooding the form with solvent.

T F 15. It is necessary to replace a line in the stick to make corrections, regardless of the kind of correction.

T F 16. Corrections which do not affect justification may be made in the galley.

T F 17. If the "ff" ligature is substituted for two "f" pieces of type, the justification is not affected.

T F 18. Over-running is the resetting of composed type to permit the insertion or elimination of words.

T F 19. Re-running is the taking of another proof due to slurring on the previous proof.

T F 20. A proof "planer" is used to take stone proofs.

T F 21. The proof planer may be used as a substitute for the type planer.

T F 22. Planer or stone proofs are always taken with damp or wet paper.

T F 23. The proof planer is always laid on the imposing table felt side down to prevent its collecting dust particles from the air.

T F 24. The midget planer is used for "pulling proofs" from small forms.

T F 25. The quality of a stone proof makes it almost impossible to distinguish from a proof taken on a proof press.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Spreading the ink on the ink plate by means of the brayer is called ______________.

2. If an accident should occur to equipment or shop personnel, it should be reported immediately to the ______________.

3. A proof press equipped with grippers will smash any part of the form placed beyond the ______________.

4. A plate brush contains two kinds of bristles, ______________ ______________ bristles and ______________ bristles.

5. The three most common causes of getting type off its feet are ______________ ______________, ______________ ______________, and ______________ ______________.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper number in the blanks at the left.

1. The following steps are involved when taking a wet paper stone proof with the type in a chase.

____ A. Take impression of middle of form

____ B. Tighten quoins with fingers

____ C. Place proof sheet on form

____ D. Ink the form

____ E. Unlock quoins

____ F. Plane type with type planer

____ G. Dampen one side of proof paper

____ H. Lift sheet by one corner

____ I. Take impression of outer edges of form

____ J. Relock form

____ K. Wash form

____ L. Check proof for slurs (assume proof shows none)

Matching

Directions: In the right column are descriptive words and phrases, and in the left, various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. Proof reader
____ 2. Brayer
____ 3. Bearers
____ 4. Grippers
____ 5. Register bar
____ 6. Type brush
____ 7. Plate brush
____ 8. Gasoline
____ 9. Proof planer
____ 10. Type planer (midget planer)
____ 11. Over-run
____ 12. Proof
____ 13. Sheet off
____ 14. Revised proofs
____ 15. Tweezers

A. First inked impression
B. Proof taken after making correction
C. One who checks proofs for errors
D. Felt-bottomed planer
E. Inking device
F. Proofs of long columns of body composition
G. Fiber and copper wire bristles
H. Benzine or naptha
I. Corrections involving two or more lines of type
J. Oily deposit on type
K. Kerosene
L. Supports brayer when inking form
M. Counter
N. Remove excess ink from form
O. Logotype
P. Holds sheet when press proof is taken
Q. Tool for removing damaged letters
R. Ligature
S. Correct margins without grippers
T. Fiber bristles
U. Used for leveling type in chase

Assignment
Sheet No. 10

Covering
Unit 46

STANDARD PROOFREADERS' MARKS

A universal language among printers exists in the system of marks used to indicate errors in composition, and the changes necessary for the correction of these errors. This system is known as Standard Proofreaders' Marks.

It is essential the compositor master the formation and interpretation of these marks regardless of the size of the shop in which he works. Large commercial printing firms, such as those printing newspapers and magazines, employ trained proofreaders who check proofs for errors. The compositor must be able to interpret the proofreaders' marks in order to make the indicated corrections in the composed form. In smaller printing establishments, the compositors also do the proofreading. To correctly indicate errors on the proof, and then make the corrections, the formation and interpretation of proofreaders' marks must have been mastered by the compositor.

The reference material in this unit outlines the general procedures of proofreading and provides the information necessary for a working knowledge of proofreading marks. You will have the opportunity to acquire additional knowledge of your chosen occupation, and the unusual distinction of knowing the printers' "shorthand." You will need a thorough knowledge of this system to perform your duties as a compositor.

Assignment:

1. Read the references given below.
2. Answer the questions, do the exercise, and turn in this assignment by ____________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 48-50.
B. Karch, Graphic Arts Procedures, pp. 189-196.
C. Polk, The Practice of Printing, pp. 85-89.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. An "office reading" is the proofreading done by the author in his own office.

T F 2. Proofs are taken on paper at least three inches wider than the type.

T F 3. Ink or dark colored pencil should be used to mark proofs.

T F 4. Newspaper proofs are usually proofread only once.

T F 5. A proofreader is responsible for errors only on the proofs he reads.

T F 6. The copyholder holds the copy while the proofreader compares it with the "first proof."

T F 7. The "first revise" is taken after the "first proof" has been marked and the corrections made in the form.

T F 8. A "railroaded" type form is one printed without being proofread.

T F 9. A "horsed" type form has been proofread by the proofreader without the assistance of the copyholder.

T F 10. "Out; see copy," refers the compositor to the original copy.

T F 11. A comma is placed in a capital V to distinguish it from an apostrophe.

T F 12. A word underscored once is to be set in Italic letters.

T F 13. Letters underscored twice are to be set in large capital letters.

T F 14. Letters underscored three times are to be set in small capital letters.

T F 15. No notes are necessary when proofreading marks are used to correct a proof.

T F 16. The proofreader should make corrections in the author's original copy if it is obviously wrong.

T F 17. When marking a proof, the errors are indicated in the top and bottom margins.

T F 18. To mark a proof with a (?) is to call attention to the author's copy.

T F 19. If two or more errors are marked in the same margin, they are separated by diagonal lines.

T F 20. If a proof contains no errors, then mark "O.K." and the reader's initial or signature will appear in the lower right hand corner of the sheet.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The copyholder spells out unusual words and proper names, and also indicates ______________, ______________, and ______________.

2. When a proof is first read, it is checked for consistency with the original copy, as well as for ____________ ____________.

3. The proof taken after the composition has been corrected from the second revise is marked ____________ ____________ .

4. When the compositor has omitted a number of words, the marginal mark on the proof will be ____________ ____________ ____________ .

5. If the proof of a job is to be sent out for reading, such information will appear on the ____________ ____________ .

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. The marginal mark "bf" combined with a word underlined with a wavy line in the text of the proof means (A) broken font; (B) delete word; (C) set in small italics; (D) bold face.

____ 2. "Follow copy, even if it goes out the window," means (A) check proof with copy; (B) follow the copy from the composing room, to press, to loading dock; (C) when in doubt about copy, compose according to copy; (D) go after the copy if the wind blows it away.

____ 3. The proofreaders' mark $\frac{2}{M}$ should indicate to the compositor (A) one hyphen is to be inserted; (B) one em quad is to be inserted; (C) two-em dash is to be inserted; (D) paragraph is to be indented one en quad.

____ 4. The mark "stet" in the margin of a proof means (A) set this eliminated text; (B) let it stand; (C) second revise; (D) scrap time every time.

____ 5. The mark l.c. in the margin of a proof means (A) lower caps; (B) less capitals; (C) lower case; (D) leaded counter.

Exercise in Proofreading

Directions: Immediately below is an excerpt from an author's copy submitted for publication. After the author's copy is the first proof pulled from the composed form. Indicate the errors in composition as are shown in the proof and place the appropriate proofreaders' marks in the margins.

PURPOSE OF PART-TIME COOPERATIVE EDUCATION

The controlling purpose of the part-time cooperative program is to provide both general and vocational education for youth to the end that they may become economic assets and good citizens in their communities at the completion of their school training.

The great majority of youth enter directly into the business and industrial world at the completion of their high school work. It is highly essential therefore, that every opportunity be provided for a practical education which will fit high school youth into the world of work. Although the primary purpose of the part-time cooperative program is to serve this need, many students enrolled in the course may change their plans and continue their educational training in college. The work is accepted as entrance credit by the colleges of Missouri.

Purposes of te Part-time Cooperative Education

The controling purpose of the part-time cooperative progorm is to provide both General Education and vocational education for youth, to theend that they may become economic asets and good citizens in there communities atthe completion of their school training.

The great majority of yuth enter directly into the business and industrial work at the completion of their highschool work. Itis highly essential therefore, that every opportunity be provided for a practical education which will fit high school yuth for the world of work.

Although the primary purpose of the part-time cooperative program is to serve this nede, many students enrolled in the course ma change their planns and continue thei educational training in college. This work is acepted as entrance credit by the coleges of Missouri.

Assignment
Sheet No. 11

Covering
Units 47-48

DISTRIBUTION

One of the most trying jobs to confront the printing industry has been the distribution of materials. In any well-organized shop, upon the completion of a job, the tools and materials used are returned to their proper places, the scrap materials discarded, and the shop made ready for the next job. A shop engaged in printing utilizes this same sequence of events.

It is not the usual policy of printing establishments to sell the composed form with the printed job. Because many fonts or assortments of type contain only one or two of certain characters it is very important the characters be returned, in good condition, to their proper places for later use. The returning of the pieces of type to their proper compartments is called "distribution."

Although many printing firms make use of type setting machines, certain of the heading and display materials are set by hand, and, therefore, must be distributed by hand. This fact, coupled with the knowledge that small printing establishments will always depend upon the hand distribution of type materials, makes evident the importance of this segment of the printing trade.

In order that you will have the opportunity to study operations involved in this vital part of the printing industry, this unit is designed to acquaint you with the accepted techniques in regard to the distribution of type.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by
   ________________________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 54-59.
B. Karch, Graphic Arts Procedures, pp. 147-148.
C. Polk, The Practice of Printing, pp. 64-66.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. To check the type before distributing, it is best to select some narrow letter.

T F 2. All ink should be removed from the type before it is distributed.

T F 3. The checking of type prior to distribution should include both upper and lower case characters.

T F 4. The nick in a piece of type is the most certain individual check to use when comparing type for distribution.

T F 5. The test of type width is the check requiring the most care.

T F 6. Type characters are distributed by picking them up, one at a time, from a galley.

T F 7. The "lift" is held in the hand for distribution with the nick down.

T F 8. A "lift" is the portion of the type form transferred to the hand for distributing.

T F 9. The hand, which holds the stick when composing, selects the type character for distributing.

T F 10. Extreme care must be exercised when placing type characters in the type case.

T F 11. Spacing material, as well as leads and slugs, should be sorted in the galley and distributed after the type has been distributed.

T F 12. Live matter is type held for reprinting.

T F 13. Dead matter is type in a form which has not yet been printed

T F 14. Standing matter is type ready for distribution.

T F 15. "Throwing-in" refers to those pieces of type material which may be thrown into the type cases without serious damage.

T F 16. If a form contains more than one font, the fonts should be separated and distributed separately.

T F 17. When type is to be distributed from the stone, it should be supported by furniture on three sides.

T F 18. To avoid "pi-ing" the lines, lifts of type should be taken from the head of the matter.

T F 19. When leads and slugs are sorted in the proper manner, they resemble stairsteps.

T F 20. In the distribution of type, speed is considered more important than accuracy.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follc are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. To prevent mixing type fonts in distribution (A) the composi tor should ask the foreman; (B) nicks should be compared; (C) faces should be compared; (D) compare upper and lower case characters from form and case.

____ 2. In general practice, small sections of straight matter or display lines are distributed directly from the (A) imposinc table; (B) galley; (C) hand; (D) chase; (E) stick.

____ 3. The best practice in distributing leads and slugs is (A) pla them back in the rack one by one as found in the distributic (B) measure them first in a galley and arrange them in sizes for distribution; (C) stand them first in a galley and arrar them in sizes for distribution; (D) stand them on the bank.

____ 4. During distribution, the spaces in the form are (A) placed c the galley; (B) placed with the em quads; (C) distributed wi the type characters; (D) placed in the chase.

____ 5. Type matter ready to go to press is called (A) straight matter; (B) dead matter; (C) live matter; (D) real material; (E) copy material.

Sequence

Directions: The lists which follow are the steps involved in perforn ing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

____ A. Slide "lift" away from rest of form

____ B. Position fingers for "lift"

____ C. Check characters from type form and type case

____ D. Place slugs so "lift" is between them

____ E. Execute "lift"

____ F. Remove top slug

____ G. Select two slugs of same measure as lines of type

____ H. Read, spell out, and distribute first word

____ I. Return spaces to galley

____ J. Continue distributing this font, allowing spaces to collect in hand

____ K. Place slugs in proper case

____ L. Sort leads and slugs

____ M. Separate leads from slugs

____ N. Sort and distribute spaces

Covering
Units 49-56

PRINTING LAYOUTS

Printed displays which attract one's attention and are pleasing in appearance are not accidental in their creation. These displays are the result of careful planning, based upon the combined knowledge of those who have worked with displaying of printed matter.

Before setting type for a display job, the arrangement of the various printed areas is carefully planned to show how the finished job will appear. This carefully planned arrangement is called a printing layout. In large establishments the layouts are made by layout men, or typographers as they are sometimes called. In smaller printing shops the layouts will be made by the foreman or chief compositor. The time required to make a layout for any display job is justified by the elimination of waste and delay which results when jobs are set and reset by the trail and error method.

This unit will provide you an opportunity to study examples of well-planned composition and to learn the rules which have been applied in the planning of these examples.

Assignment:

1. Read the references listed below.
2. Answer the questions, do the exercise, and turn in this assignment by ______________________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 111-116, 122-125.
B. Karch, Graphic Arts Procedures, pp. 65-94.
C. Polk, The Practice of Printing, pp. 148-157, 170-181, 191-217.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The most pleasing contour shapes for printed groups are those suggesting ovals or inverted pyramids.

T F 2. Layouts are classified as being either conventional or old-style.

T F 3. A dummy is always a plan, but all layouts are not dummies.

T F 4. The terms copy and layout are two different names for the same thing.

T F 5. On a layout, matter to be set in small type is handlettered.

T F 6. In simple terms, display means a contrast of shape, color, size or weight.

T F 7. When special effects are desired, the layout man may use handlettering.

T F 8. Centered line layout is easiest for beginners, and the most used form today.

T F 9. The selection of border and type should be labeled by name and point size on the layout.

T F 10. A cut is a photoengraved plate.

T F 11. Soft surface papers tend to thicken type.

T F 12. For the more complex jobs, an accurately drawn layout should be made.

T F 13. For books and other general straight matter composition, oldstyle Roman is the most legible.

T F 14. So-called text type is easily scanned by the reader.

T F 15. Because of their uniform shape, words composed of capitals are easily read.

T F 16. The principle of fitness refers to the suitability of the type style and size to the job at hand.

T F 17. Fitness tends to select the important content of a copy and eliminate the unimportant.

T F 18. Fitness suggests the use of many sizes and styles of type.

T F 19. The term "balanced" means the optical center of a page is identical to the mathematical center.

T F 20. A design centered on a vertical or through the center axis is said to be in an "out-of center balance."

T F 21. When doing bordered work, the portion of the margin outside the border should be three-fifths of the total margin.

T F 22. Contrast and variety are necessary in printing.

T F 23. One of the most pleasing page sizes has its length 1 1/2 times its width.

T F 24. A 9 x 6 inch page is longer than it is wide.

T F 25. On a wide page, the best form is to use narrow type groupings.

T F 26. The shape of the total page determines the shape of the form placed on it.

T F 27. Bold type requires the use of dainty or ornamental letters to give a pleasing contrast.

T F 28. Squared groups are most pleasing when words have been wide spaced to maintain the squareness of the group.

T F 29. A plain type requires an elaborate border as an aid to carry the desired message.

T F 30. Good tone harmony in composition refers to a high degree of contrast in the appearance of ornaments, borders, and rules.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. If a mimeographed form of advertising content were submitted to widely scattered printing concerns, the ____________ in each case would be the same, but the resulting ____________ would be different.

2. The customer's okay of a layout may be secured on either the ____________ ____________, sometimes referred to as the visual, or the ____________ ____________.

3. Too much display is the same as ________ ____________.

4. On a printing layout using more than one type family, __________ type name is designated.

5. The abbreviation c & lc refers to ____________ ____________ ____________ ____________.

6. Center-face, double-face, and most patterned rules cannot be formed into boxes without the use of ____________ corners.

7. Because we read words and not letters ____________ ____________ are less legible than ____________ ____________.

8. The width of the most effective composition is ________ times the length of the lower-case alphabet being used.

9. Traditionally, oldstyle type has been associated with __________ __________ and its appearance is most pleasing when printed on __________ papers.

10. Legibility is decreased and eye strain is increased by the use of ____________ ____________ finish papers.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. The most pleasing contour pattern for printed groups is the (A) square; (B) round; (C) pyramid; (D) inverted pyramid

____ 2. For unity, type should be massed around (A) one or two main points; (B) two or three main points; (C) three or four main points; (D) exactly three main points.

____ 3. A dummy is similar to a layout, but (A) it contains less information; (B) it contains fewer pages; (C) is made on slick paper; (D) contains more than one page.

____ 4. Display is considered to mean (A) pleasing proportion; (B) pleasing harmony; (C) pleasing contrast; (D) pleasing similarity.

____ 5. Type faces reproduce heavier when printed on (A) coated paper; (B) antique paper; (C) sized paper; (D) enameled paper.

____ 6. The printing process, which always screens type faces, is (A) letterpress; (B) lithography; (C) gravure; (D) stone composing.

____ 7. Layout measurements are made in (A) picas and points; (B) inches and fractions of inches; (C) picas and half-picas; (D) elites and half-elites.

____ 8. The thumbnail sketches and made by the layout man are (A) comprehensive; (B) smaller than the printed job; (B) the same size as the printed job; (D) larger than the printed job.

____ 9. The type size affording the maximum legibility when properly leaded is (A) 12 point; (B) 8 point; (C) 6 point; (D) 10 point.

____ 10. Proportion refers to (A) the optical center of a page; (B) the mathematical center of the page; (C) having largest areas of white toward the top of the page; (D) margins, page dimensions, and the relative sizes of the type page and paper page.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. The following steps are involved when laying out and setting up a display job.

____ A. Make the rough layout

____ B. Make the comprehensive layout

____ C. Secure customer's approval

____ D. Secure all information relative to the job of printing to be done

____ E. Make the finished layout

____ F. Make a number of thumbnail sketches

____ G. Set the type

____ H. Decide upon the device or devices to be used to attract attention

Layout Exercise

Directions: Make a layout for a two-column ad from the copy given below. All the words need not be used. See page 122 of reference A and page 172 and 253 of reference C for accepted layout techniques.

> Learn while you earn. Boys and girls should take advantage of Cooperative Occupational Education offered by (name of your school). It has the following advantages for you: places you in part-time work of your interest; helps you learn a business or a trade; earn two to four units of high school credit; earn a weekly salary; prepares you for the future by giving you actual work experience. For additional information, contact the local school officials. (Name of proper person)

Composition Exercise

Directions: After completing the above exercise to the satisfaction of your coordinator and employer, make the necessary arrangements to reproduce the ad. Secure two revised proofs and submit one copy to your coordinator and one to your employer.

Assignment
Sheet No. 13

Covering
Units 57-60

PAPER

Tree bark, animal skins, beaded belts, cloth, plant fibers -- each has been used at some time to carry messages, and to record memorable events. In modern times, man-made paper fills this all-important function.

The annual production of paper in this country alone is in excess of twenty-one million tones -- enough to give every man, woman, and child two-hundred fifty pounds. Approximately one-half this total production, at some time, passes through the hands and machines of the printing industry. With the wide public consumption of printed products and the printing industry's wide use of paper as a raw product, you will want to know how paper is produced as well as the various types and characteristics of paper products.

This unit will give you an overview of the paper-producing processes, as well as providing you the opportunity to learn additional technical information necessary for your advancement in printing industry.

Assignment:

1. Read the references listed below.
2. Answer the questions, and turn in this assignment by ____________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 169-177.
B. Karch, Graphic Arts Procedures, pp. 279-295.
C. Polk, The Practice of Printing, pp. 133-140.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Rag pulp papers are more durable than cellulose pulp papers.

T F 2. Antique finish paper is produced on special calendering rolls

T F 3. Papers used for lithographic or offset printing must be resistant to the effect of water.

T F 4. Inches are the units used to express the size of paper in sheet form.

T F 5. The weight of paper may be indicated by the "old" basis -- the weight per thousand sheets, or the "new" basis -- the weight per ream.

T F 6. Paper will expand on a cool, dry day and contract on a hot, humid day.

T F 7. Paper contains 4 per cent to 8 per cent of moisture after leaving the papermaking machine.

T F 8. It is common practice to make allowances for spoilage.

T F 9. The allowance for spoilage increases as the length of the press run increases.

T F 10. Paper was first manufactured in America in 1690.

T F 11. Papyrus was made of animal skin.

T F 12. The process of making paper such as we have today was developed by the Chinese.

T F 13. Paper boxes and cartons utilize just under one-half the country's paper production.

T F 14. Calendering rollers are used to print calendars on continuous rolls of paper.

T F 15. The felt side of paper is the better printing side.

T F 16. The manufactured sizes of paper are based on the sizes of printing presses, etc.

T F 17. Very thin sheets of paper are measured for thickness by the weight.

T F 18. Paper of 70 pound substance will weigh 70 pounds per 1000 sheets.

T F 19. Paper may be purchased by the pound, hundred weight, or ton.

T F 20. Seasoned paper contains more moisture than the air in the press room.

T F 21. Paper folds easier against the grain than with the grain.

T F 22. Paper will expand and shrink a greater amount across the grain than with the grain.

T F 23. A wet sheet of paper, when drying will curl in the direction of the grain.

T F 24. S. & S. C. designates paper which has been smoothed and slick calendered.

T F 25. Coated papers are given a smooth finish by the addition of clay during the calendering process.

T F 26. A penalty is imposed when paper is purchased in less than standard package amounts.

T F. 27. When using a paper cutter, a piece of cardboard should be placed between the gauge and the clamp to avoid creasing the paper.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The durability of a paper is dependent upon the quantity of ______________ it contains.

2. Paper made of ground wood pulp contains about _______ per cent cellulose.

3. Paper that has not been run between calenders has a soft blotter-like finish known as ______________ .

4. The ornamental edge appearing on some uncalendered papers is called a ______________ .

5. The basic size of writing and ledger papers is _______ x _______ inches.

6. The basic size of cover papers is _______ x _______ inches.

7. All the papers have two sides, the _______ side and the _______ side; however, the _______ side is best for printing.

8. In the paper designation 28x44 -- M, the grain lies parallel to the _______ inch dimension.

9. The printer's product is composed of four items: technical skill, ______________, ______________, and ______________ .

10. Two commonly used abbreviations referring to paper are M.F., meaning ______________ ______________, and S.&S.C., meaning ______________ ______________ ______________ .

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. When comparing 17 x 22-13 paper with 17 x 22-26M paper, the 17 x 22-13 paper will be (A) heavier than the 17 x 22-26M; (B) lighter than the 17 x 22-26M paper; (C) darker in color than the 17 x 22-26M paper; (D) the same weight as the 17 x 22-26M paper.

____ 2. If one thousand sheets of paper 25 x 38 inches weigh 90 pounds, the substance weight of the paper is (A) 90 pounds; (B) 180 pounds; (C) 45 pounds; (D) 22 1/2 pounds.

____ 3. The basic size of bond and writing paper is (A) 17 x 22 inches; (B) 16 x 21 inches; (C) 34 x 28 inches; (D) 21 x 32 inches.

____ 4. The purpose of the calendering rollers is to (A) dry the web of paper; (B) apply casein and coloring to the paper; (C) press the paper against the watermarking screen; (D) produce the desired finish on the paper.

____ 5. The purpose of the dandy roll is to (A) coat the paper; (B) produce a felt finish; (C) watermark the paper; (D) glaze the paper.

____ 6. Newsprint is used most frequently for newspapers and (A) folders; (B) handbills; (C) booklets; (D) stickers.

____ 7. The cost of 1200 sheets of 20 x 26-50 at thirty cents per pound is (A) $3.60; (B) $36.00; (C) $360.00; (D) $12.00.

____ 8. Bond paper is used most frequently for (A) letterheads; (B) postal cards; (C) card files; (D) booklets.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. Steps involved in the manufacture of paper.

____ A. Web of paper moves to calendering rolls
____ B. Pulp moved to "Jordans"
____ C. Pulp made finer by iron bars in beaters
____ D. Pulp moves to Fourdriniers
____ E. Water removed by pressure and heat
____ F. Clay or coloring materials added
____ G. Pulp screened, strained, and large amounts of water added
____ H. Surface sizing applied
____ I. Pulp produced by mechanical grinding or chemical "digestion"
____ J. Sizing added to make paper stiffer

2. Steps involved in cutting paper with a paper cutter.

____ A. Back gauge is set proper distance from knife
____ B. Blade is brought into motion to cut paper stock
____ C. Paper is placed on strawboard or tag
____ D. Clamp is brought to bear on paper stock
____ E. Paper is placed snugly against back gauge
____ F. Place strawboard or tag on cutting table
____ G. Strawboard or tag is placed on top of paper

3. Steps involved when finding the cost of paper for a job.

_____ A. Ascertain size of stock from which finished sheets are to be cut

_____ B. Calculate number of full stock sheets required for job

_____ C. Determine how many finished sheets can be cut from one full sheet of stock

_____ D. Multiply cost per thousand stock sheets by the number of stock sheets used divided by one thousand

_____ E. Ascertain size of finished sheets required for the job

_____ F. Multiply per pound cost of stock sheets by weight per M of stock sheets

_____ G. Find total number of finished sheets required for job plus spoilage allowance

_____ H. Cost of printing job has been calculated

_____ I. Mark off three decimal places in the number of full stock sheets required for job

_____ J. Mark off decimal places and use first two significant figures

_____ K. Double the weight of one ream of stock sheets used for job

Assignment
Sheet No. 14

Covering
Units 61-92

JOB COMPOSITION

From time to time printers are called upon to compose specialty printing jobs involving elements and techniques not ordinarily found in straight composition. For the purpose of this unit, these specialty printing jobs have been classified as "special composition."

It is not uncommon for a printing shop to specialize in a particular sort of composition if the compositor is unusually adept at that type of composition. As all printing shops are called upon at some time to do "special composition" jobs, it is essential that you learn some of the rules, principles, and special techniques used in this type of printing job. By composing these various specialty jobs, a definite ability for some type of composition may reveal itself.

In this unit the basic typographical considerations of "special composition" are outlined; and you will learn interesting and useful technical facts about initial letters, borders, decorations, and various other details of this specialized composition.

Assignment:

1. Read the references listed below, directing special attention toward the illustrations.
2. Answer the questions which follow, and turn in this assignment by ______________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 62-69, 99-101, 104-108, 112-115.
B. Karch, Graphic Arts Procedures, pp. 55-61, 72-75, 132-133, 142-144.
C. Polk, The Practice of Printing, pp. 148-169, 218-272.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Even at best, butted rule joints are seldom satisfactory.

T F 2. After rule is cut on the lead and rule cutter, the ends should be trimmed to make more satisfactory borders.

T F 3. A narrow strip of cardboard inserted under the work holder near the knife of a mitering machine will cause the top of the rule to be cut slightly shorter than the bottom.

T F 4. Poorly formed rule corners do much to make the appearance of any printing job unsatisfactory.

T F 5. Even by exercising the utmost care, it is difficult to make perfect corner joints with mitered rule.

T F 6. When the mitering machine is used to trim rule for the sides of an equilateral triangle, the spring projection of the work holder should be in the number three notch.

T F 7. A make-up widow falls at the top of a page and should be three-fourths the width of the type line in length.

T F 8. The purpose of multiple justification is to bring about the vertical alignment of adjacent columns.

T F 9. Brass rule is available in lengths from ten to thirty-six picas by half picas.

T F 10. A line or nick is scribed near the registering edge of most brass rule.

T F 11. Brass rule is available in lengths from one to ten picas by points.

T F 12. Rule should be pieced as infrequently as possible.

T F 13. Hairline rule is used for the cross lines on most forms.

T F 14. When short rule is used between words, the face of the rule need not be aligned with the base line of the words.

T F 15. The border skeleton of an ad is a layout containing only the main elements exclusive of any border or marginal material.

T F 16. Work-and-twist printing jobs are printed twice on the same side of the sheet used.

T F 17. Work-and-turn describes a printing technique consisting of two different registers on the same side of the sheet, the sheet being rotated 90° between impressions.

T F 18. To decrease the decorative qualities of an initial letter it is advisable to use a condensed initial letter on a wide page.

T F 19. Initial letters are usually followed by caps or small caps and must align with the top and bottom of the lines covered by the letter.

T F 20. Cool colors must be used sparingly, whereas, warm colors may be safely used over large areas.

T F 21. Four words which will describe a well-designed letterhead are neat, dignified, simple, and orderly.

T F 22. Standard letterheads are printed on standard size paper, 8 1/2 x 11 inches.

T F 23. Standard newspaper columns are 12 picas wide with 6 point spaces between columns.

T F 24. Although most programs carry leaders, some styles of program composition make them unnecessary.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The rule holder setting to cut rule to form a square or rectangle should be ________ in order to produce an angle of ________ degrees.

2. The definition of a printing job is a (an) ____________ for a (an) ____________ of ____________ ____________ .

3. Cross lines on most forms are made by ____________ ____________.

4. Vertical lines on most forms are made by ____________, ____________ point or ____________ point face rule.

5. Rule forms should be set in the ________ ________ , rather than in a stick.

6. Head and foot rules usually have ____________ or ____________ faces.

7. A type face which contrasts sharply with the regular body type of a paragraph is called a ____________ face.

8. Rule is made of either ____________ or ____________ ____________ .

9. Quotation marks used at the left end of a line are placed ____________ the alignment.

10. To carry a reader's eye across a type line, especially in tables, ____________ are used.

11. Big starting letters are called ____________ letters.

12. Roman numerals set in vertical columns are always aligned at the ____________ .

13. Colors which attract and enliven interest but which may become irritating when over-used are ____________ ____________ .

14. The three colors producing a sense of ease and comfort for the reader are ____________, ____________, and ____________.

15. The usual size range of tickets is from ______ x ______ to ______ x ______ inches.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. The purpose of a "sinker" is to (A) make printed jobs heavier; (B) correct inaccuracies of machine slugs; (C) make ink penetrate paper; (D) emboss paper.

____ 2. Of the printed material that comes before him, the average reader has time to read (A) less than 5 % of it; (B) about 10% of it; (C) about 20 % of it; (D) about 25 % of it.

____ 3. Machine-made borders are made in (A) strips; (B) single units; (C) specific lengths; (D) strips and single units.

____ 4. Foundry-made borders are made in (A) strips; (B) single units; (C) specific lengths; (D) strips and single units.

____ 5. Leaders are used on a printed sheet to (A) form wide stroke letters; (B) lead the eye across the page; (C) form the spacing material between lines; (D) take the place of slugs.

____ 6. The style of rule which may be used to form panels without mitering is (A) face in center; (B) doublefaced; (C) face on side; (D) patterned.

____ 7. The primary colors are (A) blue, green, and violet; (B) red, yellow, and orange; (C) red, yellow, and blue; (D) orange, green, and violet.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. The methods of securing color harmonies in printing are:

(A) ____

(B) ____

(C) ____

(D) ____

2. In order to fulfill its purpose an advertisement must:

(A) ____

(B) ____

(C) ____

3. In order of decreasing prominence the items contained on the title page of a book are:

(A) ____

(B) ____

(C) ____

4. The details frequently marring a printed page are:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

(G) ____

(H) ____

(I) ____

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. Steps in setting up a job with a border.

____ A. Compose type

____ B. Tie up the form

____ C. Place type on galley

____ D. Place right and bottom border in position

____ E. Study job requirements on job ticket

____ F. Place top and left border into position

____ G. Space out type

____ H. Cut and miter border material

2. Steps in setting up a rule form.

_____ A. Measure copy depth
_____ B. Make allowance for rule
_____ C. Measure width of copy
_____ D. Compose heading and place in galley
_____ E. Make rough sketch of form
_____ F. Place foot rule in position
_____ G. Make list of rule needed for top
_____ H. Place head rule in position
_____ I. Secure needed rule or cut needed lengths
_____ J. Complete form and tie up
_____ K. Compose box headings and insert vertical rule
_____ L. Make list of needed spacing material
_____ M. Collect spacing material and bring to bank

Assignment
Sheet No. 15

Covering
Units 93-111

IMPOSITION AND LOCK-UP

Since the invention of the printing press, it has been necessary to place composed type forms on some rigid platform prior to locking the forms in the chase. For many centuries this rigid platform was a smooth slab of stone set on a wooden frame. The stone and its supporting structure was known as the imposing stone. Those workers who arranged or imposed the forms on this stone came to be known as stonemen, and the activities in which they engaged were called stone work. Although in the present day precision imposing surfaces of iron and steel are fast replacing the stone slabs, the time-honored names which have grown up around these stones remain as a part of the terminology of the trade.

The stone is the proving ground for the work of the compositor. On these oblong tables, topped by their smooth surfaces, the forms are imposed and made secure for the presses that turn out the thousands of copies of printed material.

The stoneman, whether he is a specialist or a multiple duty man, holds a key position. He must not only possess the ability to apply the technical knowledge required to arrange the forms in their relatio to each other, but must also compute and allow for margins and trimming on the finished job. Expert stonemen are very scarce and rank next to the shop foreman in taking responsibility for eliminating costly errors and maintaining a smooth production flow. Becoming a stoneman is a worthy goal for anyone beginning in the printing industr

In this unit you will study material regarding imposition and lock-up, and you will have an opportunity to learn many technical "know how s" concerning the arrangement and lock-up of composed forms.

Assignment:

1. Read the references listed below.
2. Answer the questions below, and hand in this assignment by

______________________________.

References:

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The point of maximum impressional strength of the press on the platen must be considered when positioning a form.

T F 2. When locking up a form, the string is removed just after the outside quoins have been inserted and the reglets placed in position.

T F 3. The solid side of a lock-up is the side containing the quoins.

T F 4. An electrotyper's finishing rubber rubbed over the joints of a ruled form can improve the corners.

T F 5. With the exception of that near the form, the furniture used in lock-up should be the widest available.

T F 6. The pyramid lock-up is as unsatisfactory as the method of filling the entire chase with furniture.

T F 7. Warped or twisted furniture may be as effective as straight furniture for locking a form.

T F 8. The "chaser" method of positioning is likely to produce bind.

T F 9. Between the form and the quoins, the furniture should be from four to six picas wide.

T F 10. When locking-up a form in a chase, the available space determines the number of pairs of quoins which may be used.

T F 11. Binds usually result when forms are locked up by the squared up method.

T F 12. The chaser method of lock-up seldom causes "binds."

T F 13. When locking-up a small form, the area enclosed by the chase should be filled.

T F 14. Cuts out of square will cause a springy form.

T F 15. Squeeze can often be increased by the insertion of an extra lead at the bottom of a page form.

T F 16. The use of sinkers may cause the edges of a chase to spring up when locked, and this must be avoided.

T F 17. The insertion of sinkers around a form will eliminate spring.

T F 18. Stone and imposing table refer to the same item in a print shop.

T F 19. Type resting firmly on the composing stone will cause a springy form.

T F 20. Patent base is made of marble.

T F 21. There are three different ways of locking-up a four-page form.

T F 22. The line-up table is used for positioning of forms for lock-up.

T F 23. Wood furniture is cut to accurate pica measurements, and is reliable where accurate spacing is required.

T F 24. A groove is found only on wood furniture four and one-half picas wide.

T F 25. Wood furniture lengths are stamped on the end of each piece.

T F 26. Wood furniture is impervious to moisure or atmospheric change.

T F 27. Reglet is thin wooden furniture.

T F 28. Stone is a term used when speaking of furniture.

T F 29. Experienced stonemen will usually rub a stone with a wire brush before using the stone for lock-up.

T F 30. Quoins are key tightened before the form is planed.

Completion

Directions: Fill in the blank(s) with the word(s) required to complete the sentence correctly.

1. Preparatory to planing, quoins are tightened with the ____________.

2. Quoins are considered as being composed of one and two pieces; and example of the one piece quoin is the ________________ and of the two piece quoin is the ________________ .

3. The object used to force type to rest on its feet is called a ________________ .

4. A form locked-up in a chase for a platen press should be located near the ________________ of the chase.

5. Quoins are placed at the ________________ and ________________ side of the chase.

6. A form locked up in a chase for a cylinder press should be positioned so it will not be struck by the ________________ ________________ .

7. A large sheet of paper on which a number of page forms are printed is called a ________________ .

8. Placing pages properly in a form, allowing for spacing, and locking-up the form is called ________________ .

9. The signature is folded at the back, or ________________, margin of a book.

10. If two pages, each having equal side margins are locked in a chase, the space between the two forms should be ____________ the width of each side margin.

11. The allowance made in imposition for trimming the pages of books is usually ______________ inch.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. To protect wood furniture from the pressure of the quoins (A) paper is placed on each side of the quoins; (B) leads are placed on each side of the quoins; (C) letterboards are placed on each side of the quoins; (D) reglets are placed on each side of the quoins.

____ 2. The term, "imposition," means (A) locking up a form in a chase; (B) proofing on the imposing table with the form in a chase; (C) the proper placing of two or more pages in a chase; (D) breaking up a form while still in a chase.

____ 3. Quoins are (A) small iron tools which act as wedges in locking forms; (B) an iron or steel frame which holds forms in position on a press; (C) nonpareil and pica lengths of spacing material used in locking forms for the press.

____ 4. Furniture consists of (A) small iron tools which act as wedges in locking forms; (B) iron or steel frames which hold forms in position on a press; (C) spacing material.

____ 5. Reglet refers to (A) an iron or steel frame which holds forms in position on a press; (B) narrow strips of wood used when locking forms in a press; (C) nonpareil and pica lengths of spacing material used in locking forms for the press; (D) a block used to knock type in a form to its feet.

____ 6. A chase consists of (A) a group of small iron tools used to lock up forms; (B) an iron or steel frame which holds forms in position on a press; (C) any spacing material used in locking forms in a press; (D) a block used to knock type in a form to its feet.

____ 7. A sheet-wise form is (A) a form backed up with the same form; (B) a book form, printed on one side of paper only; (C) printe on one side then turned and backed up with another form; (D) a ruled form, with crossed lines, printed in two impressions.

____ 8. In a two page lock-up, if the type is to be in the center position of each page, the space between the printed areas must be (A) one and one-half the width of one page margin; (B) twice the width of one page margin; (C) four times larger than one page margin; (D) two and one-half the width of one page margin.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. Steps involved in locking up a form.

____ A. Lower to composing table
____ B. Lock form more securely and check for spring
____ C. Insert quoin key under end of chase
____ D. Clean imposing stone
____ E. Position quoins
____ F. Make sure all type is in down position
____ G. Raise one end of chase
____ H. Unlock, make corrections, relock, plane, and recheck
____ I. Tighten quoins slightly
____ J. Place furniture around form
____ K. Remove string from form
____ L. Plane lightly
____ M. Check loose elements in lock-up
____ N. First planing for spring
____ O. Place chase around form on stone
____ P. Insert reglets between quoins and furniture

2. Steps followed when locking up a form with a border

____ A. Loosen quoins and make finger tight
____ B. Place form in chase
____ C. Test for lift
____ D. Plane the form
____ E. Tighten quoins
____ F. Tighten quoins so form will lift
____ G. Place three corners of border into position
____ H. Tighten quoins slightly with key

Matching

Directions: In the right column are descriptive words and phrases, and in the left, various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. Check for alignment after sheet is printed

____ 2. Imposition

____ 3. Imposition dummy

____ 4. Oblong books

____ 5. Bottom of chase

____ 6. Inside quoins

____ 7. Side quoins placed at left of form

____ 8. Work-and-back

____ 9. Work-and-turn

____ 10. Layout of four-page folder work-and-turn

A. Lock-up for cylinder press

B. Same form on both sides of printed sheet

C. Used for figuring margins and trim

D. Any quoin used inside a chase

E.

1	4	3	2

F. Incorrect lock-up

G.

1	3	4	2

H. Concise knowledge of paper qualities and sizes

I. The long side nearest the stoneman

J. Line-up table

K. Quoins pointing to solid side of lock-up

L. Different form on each side of sheet

M. Positioning of pages in the form or positioning of form in chase

N. Long dimension across the top

Units 112-118

LETTERPRESSES

With proper use and servicing, printing presses will last indefinitely; they are seldom sold for scrap. The practice common to the printing industry is to sell the replaced presses, rebuild or recondition them, and put them in service again in other parts of the country. One press has been traced from the beginning of the Missouri territory, through Kansas and Oregon settlements where it dropped from sight, only to be found again in California. Thus, by tracing printing presses, one can almost trace the progress of civilization.

In establishments where the number of workers is limited, the number of jobs each worker does is increased. This is especially true in many small printing concerns where it is actually necessary for a compositor to be a pressman also. Certainly a competent compositor should be familiar with the operations of a press, and the quality of workmanship demanded in a printed form.

Because cylinder and rotary presses are usually manned by highly specialized crews, this unit will place emphasis upon the platen type presses. In this unit you will study the care and operating principles of platen presses.

Assignment:

1. Read the references listed below.
2. Answer the questions and turn in this assignment by

   ____________________.

References:

A. Cleeton and Pitkin, General Printing, pp. 88-91, 147-153.
B. Karch, Graphic Arts Procedures, p. 1-2, 253-256, 273-274.
C. Polk, The Practice of Printing, pp. 112-121.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Water will cause blisters to appear on ink rollers.

T F 2. When an ink roller has been washed, it should be rubbed briskly to restore the polish.

T F 3. Rollers should be stored in an upright position and away from excessive heat.

T F 4. Cleaning solutions deteriorate the rollers and they should never be cleaned more often than once a day.

T F 5. It is important to clean and oil the ends of the ink rolle

T F 6. Letterpress printing began in the western world nearly five centuries ago.

T F 7. Letterpresses print from relief surfaces.

T F 8. Letterpress printing is one of the slowest printing processes.

T F 9. The Kelly Press is capable of delivering fifty to seventy printed sheets per minute.

T F 10. The bed and platen move toward each other on a clamshell action press.

T F 11. The drum type cylinder press revolves twice for each impression it makes.

T F 12. The web on platen presses should be cleaned daily.

T F 13. The two-revolution cylinder press will print a different form during each revolution.

T F 14. A web perfecting press prints on both sides of the paper a it passes through the press.

T F 15. Type forms used on rotary presses are composed of pieces of type especially shaped for use on rotary press cylinder

T F 16. The majority of rotary presses print on a continuous strip of paper.

T F 17. The platen of a rotary press is a flat metal surface.

T F 18. When a web perfecting rotary press is used, the sheets are cut to size after printing.

T F 19. When a sheet-fed rotary press is used, the sheets are cut to size before printing.

T F 20. Most of the small job presses for general work are of the rotary type.

T F 21. Glycerin and paraffin are the major ingredients of the rollers.

T F 22. Syrup is used in the composition of rollers to increase the friction between them and the paper.

T F 23. The platen press should be oiled daily.

T F 24. When a press is idle, the ink rollers should be left in contact with the type form.

T F 25. The first signs of wear on a press will show up on the cams and rollers.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. Ink should be washed off the press with (A) water; (B) benzene; (C) kerosene; (D) light oil.

____ 2. One of today's major printing processes is (A) collotype printing; (B) silk screen printing; (C) letter press printing; (D) engraved copper plate printing.

____ 3. The only hand fed press in the following group is (A) Kelly No. 1; (B) Miehle Vertical 50; (C) Miller Simplex; (D) Lee No. 38.

____ 4. In the interests of safety, one should not (A) bend the knees when lifting or carrying heavy loads; (B) lubricate machinery when it is not turning; (C) miss an opportunity to play a practical joke on a fellow-worker; (D) smoke when cleaning a press.

____ 5. Grippers on the cylinder press (A) hold the sheet being printed on the type form; (B) hold the sheet being printed on the cylinder; (C) hold the printed sheet on the tympan; (D) hold the sheet to be printed on the feed board.

____ 6. The letterpress which prints all of the type form at once is the (A) cylinder press; (B) platen press; (C) rotary press; (D) drum press.

____ 7. Gripper fingers on a platen press (A) hold the printed sheet against the tympan; (B) hold the sheets to be printed on the feed board; (C) hold the sheets being printed on the type form; (D) hold the printed sheets on the delivery board.

____ 8. The throw-off lever is operated to (A) set the press in motion; (B) build up pressure on a "perfecting press"; (C) keep the flywheel in motion; (D) cause the press to miss an impression.

____ 9. The rollers for year-round use are (A) manufactured from glue, glycerine and some other materials; (B) Sommers rollers; (C) synthetic rollers; (D) rubber rollers.

____ 10. After finishing a run, rollers should be (A) stopped on the beginning of the type form; (B) stopped just below the ink fountain; (C) coated with an emulsion of benzene and light oil; (D) cleaned and coated with light oil.

Matching

Directions: In the right column are descriptive words and phrases, and in the left, various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. Drum cylinder press

____ 2. Two-revolution press

____ 3. Platen

____ 4. Chase clamp

____ 5. Tympan

____ 6. Draw-sheet

____ 7. Ink disc

____ 8. Grippers

____ 9. Ink Rollers

____ 10. Throw-off lever

____ 11. Feed board

____ 12. Flywheel

____ 13. Delivery board

____ 14. Ink fountain

A. Flat metal surface which swings to vertical position during the impression

B. Distributes ink to form

C. Cylinder rises during alternate revolutions

D. Hold paper sheet against tympan

E. Holds steel rim in which type is locked securely against press bed and lugs

F. Packing placed on platen

G. Holds sheets to be fed into press

H. Heavy oiled manila paper

I. Feeds ink to rollers

J. Holds sheets which have been printed

K. Surface upon which ink is evenly distributed

L. One impression per revolution

M. Causes press to have steady motion while in operation

N. Causes press to miss an impression

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. Steps involved in cleaning a press.

____ A. Use kerosene to wash ink disc

____ B. Wash rollers while on ink disc

____ C. Check ink disc for any spots missed on rollers

____ D. Wipe ink disc dry

____ E. Dry rollers individually

____ F. Release tension on roller springs

____ G. Clean off ink or kerosene that may have dropped on press

Assignment
Sheet No. 17

Covering
Units 121-143

PLATEN PRESS PREPARATION

To run a press job, two carefully prepared surfaces are necessary. One of these is prepared when the form is planed and locked in the chase. The other must be prepared on the platen to back up the sheet being printed. The preparation of the surface on the platen, inking the press, and placing the chase in position are a few of the operations which must be performed prior to running a press job.

Some large printing establishments employ specialized workmen to perform the highly skilled operations, however, the worker who is most valuable is the one capable of performing the processes and activities which take place in the shop. The conditions which enable the worker to secure a good general knowledge of printing shop processes are best provided by the smaller shop manned by competent workmen.

To enable you to further expand your knowledge of the printing trade, this unit will provide the opportunity to study the processes and activities which must be performed on the platen press before a job can be run.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 76-89, 95-97.
B. Karch, Graphic Arts Procedures, pp. 256-272.
C. Polk, The Practice of Printing, pp. 122-128.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A hard packing consists of a draw sheet, a pressboard, and four sheets of 50 pound super.

T F 2. The thickness of the platen packing depends upon the amount of wear to which the type in the form has been previously subjected.

T F 3. A thin packing may cause type to be smashed on the platen.

T F 4. Reaching into a moving press to retrieve fallen sheets should be barred in the interest of safety.

T F 5. Leaving the press while the tympan bails are unclamped may cause the press to be seriously damaged.

T F 6. The press should be inked with the type form in place to insure even distribution of ink on the type form.

T F 7. The guides are driven through the packing to prevent them from moving during a press run.

T F 8. As an additional precaution to prevent guide pins moving during a press run, they are secured to the draw sheet with sealing wax.

T F 9. Make-ready with a soft packing not only enables jobs to be started more quickly on the press, but also causes a minimum of wear on the type.

T F 10. Make-ready with a soft packing consists of adding additional sheets to the packing, until the center of the form prints.

T F 11. Fifty pound super is a good weight paper for marking out a type form for make-ready.

T F 12. An out-of-parallel platen can be detected by one edge of a sheet of printing uniformly light, while the other prints uniformly heavy.

T F 13. When the platen packing is damaged, only the draw sheet need be replaced.

T F 14. A sheet used in make-ready is first spotted and then marked out before cutting.

T F 15. When the spot-up sheet swells and wrinkles, too much paste has been used.

T F 16. To insure adequate pressure for printing, no sheets are removed from the packing when a spot-up sheet is inserted.

T F 17. A spot-up sheet should be inserted into the packing from the bottom of the platen to avoid moving the upper tympan bail.

T F 18. When quads are used as guides, fenders are utilized to prevent the sheets going over the guides.

T F 19. When press feeding, two inches should be the maximum height of the pile of paper on the feed board.

T F 20. While a job is being run in the press, the pressfeeder is the one who is responsible for presswork of high quality.

T F 21. Sandpaper is placed on the right middle finger as an aid to pressfeeding.

T F 22. Interlaying is one method used to raise the height of the wood backed printing surfaces.

T F 23. An underlay is added to the bottom of a wood based cut.

T F 24. Work-up refers to the pressfeeder when he increases his speed of placing sheets into the press.

T F 25. Driers are added to ink to make them thicker.

T F 26. Ink reducers are used to make ink dry faster.

T F 27. Paste driers shorten the time needed for an ink to dry.

T F 28. When printing a job on an ink blotter, japan drier should be added to the ink.

T F 29. A letterhead printed on a bond paper should be printed with ink to which cobalt has been added.

T F 30. If ink is to be added during a run, it should be placed on the rollers to insure quicker distribution.

T F 31. Guides must be placed so they will not strike the gauge pins.

T F 32. There is danger of "set-off" if too high a lift of freshly printed sheets are placed on the delivery board.

T F 33. Papers with soft or rough finishes offset very readily.

T F 34. Speed and the mechanics of pressfeeding are best learned by diligent practice at the press.

T F 35. Hard finished and smooth paper should be slip-sheeted.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The activities involved in modifying the pressure between the form and the sheet to be printed so the complete form will be produced in ink is called ________________ .

2. The conditions which cause the edges of a level form to exert more pressure against the platen than the center of the form make necessary the process of ________________.

3. Too little ink results in a ________________ print; whereas too much ink will cause ________________ and ________________ .

4. So heavy cover stock will fold smoothly without breaking, they are usually ________________ .

5. When two or more colors of ink are to be used on a printed job, the best effects are secured by the use of ______________ inks.

6. All printing inks are composed of two classifications of materials, the ______________, which produces the color, and the ______________ which acts as a binder.

7. For one color runs ______________ inks are used.

8. To produce brown ink, the colors to be mixed together should be ______________, ______________, and ______________ .

9. The original guides for positioning sheets on the platen were ______________ .

10. Placing sheets of coarse paper between freshly printed sheets is called ________________ and is used to eliminate ____________ and slur.

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. The purpose of make-ready is (A) to put thicker packing on the platen; (B) to prepare the press for placing the chase; (C) to be certain the grippers and gauge pins are in place; (D) to equalize the height of the various parts of the form to the paper.

____ 2. When a sheet does not contact all three gauge pins, the operator should (A) attempt to straighten the sheet before the platen closes; (B) trip the throw-off lever; (C) let the sheet print crookedly; (D) stop the press.

____ 3. When a pressfeeder adds color, he (A) mixes two or more inks; (B) adds blank ink to the ink on the press; (C) adds more ink to the color being used; (D) re-runs the job using a different color of ink.

____ 4. If there is a doubt about the amount of packing to be used on the platen, one should (A) leave it out and add later if the impression is too light; (B) put it in and remove later if the impression is too heavy; (C) put it in and remove some ink from the disk if the impression is too heavy; (D) leave it out and add ink to the disk if the impression is too light.

____ 5. The term set-off is used to describe (A) the transfer of fresh ink from the face of one sheet to the back of the sheet above it; (B) the interleaving of [illegible] sheets between two freshly printed sheets; (C) setting a lift of printed and jagged sheets off the delivery board; (D) the placement of a lift of sheets from the stockpile to the feedboard.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. Steps involved when preparing a platen press for a job run.

____ A. Remove dust, lint, and oil from ink plate and rollers

____ B. Move grippers to outer ends of gripper bars

____ C. Remove old packing from platen

____ D. Clamp top bail in position

____ E. Insert chase behind lugs at bottom of chase bed

____ F. Pull an impression on the tympan sheet

____ G. Ascertain the type of packing to be placed on the tympan

____ H. Turn press over by hand, and then turn on power and run press at slow speed.

____ I. Cut, clip, and crease packing sheets and tympan

____ J. Insert the pressboard

____ K. Pull impression on stock size sheet and secure a "position o.k."

____ L. Clamp lower bail in place

____ M. Sight grippers to be certain they will not strike form

____ N. Place a small amount of ink on the left side of the ink disc

____ O. Wipe chase bed and back of form after testing form for spring and lift

____ P. Raise and engage chase clamp to hold chase securely

____ Q. Make certain tympan bails are in place

____ R. Check position of guides and stripping devices and proceed with the make-ready

____ S. Position guides

____ T. Turn off power to press and turn over by hand until rollers are at lowest point

2. Steps involved in pressfeeding.

____ A. Fingers drag sheet to left while resting on bottom guides

____ B. Jog printed sheet as it is placed on delivery board

____ C. Drag top sheet from pile on feed board

____ D. Sheet contacts bottom guides

____ E. Grasp printed sheet between thumb and finger of left hand

____ F. Place sandpaper covered finger on margin of printed sheet and draw sheet over edge of platen

____ G. Pile printed sheet on delivery board

____ H. Fingers move sheet to left until stopped by side guide and fingers continue sweeping motion out of press and back to pile on feed board

____ I. Withdraw thumb from sheet

____ J. Grasp second sheet in pile on feed board and allow finger to rest on feed board

____ K. Fan out pile of stock and place on feed board

Assignment
Sheet No. 18

Covering
Units 148-157

BINDERY ROOM OPERATIONS

In small printing shops it is common practice to make the learners, who have reached some acceptable degree of ability, responsible for the final operations which are performed on printed jobs. These operations -- gathering, binding, packaging, and so forth -- are performed in the bindery section of the printing establishment.

To one who has never had occasion to perform any of the bindery operations, they may seem simple and of minor importance. However, having to report to the supervisor a job ruined by a careless error will quickly amend any unfounded idea concerning the ease or simplicity of bindery operations.

This unit will enable you to study and learn of the machines and operations common to bindery rooms, and to learn of the operations necessary after the press-run to complete a printed job.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 180-183.
B. Karch, Graphic Arts Procedures, pp. 300-316.
I. Information Sheet No. 2, "Gathering and Binding"

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Most printing jobs require no trimming because they have been run on standard size sheets or paper.

T F 2. "Off angle" cutting results when paper is improperly clamped in the cutting machine.

T F 3. Finishing operations for both pamphlet binding and bookbinding are quite similar.

T F 4. Even though there has been considerable mechanization in other phases of the printing industry, bookbinding has remained largely a hand process

T F 5. Mechanical bindings are being more widely used for library and school books than for commercial documents.

T F 6. When gathering, an error is of little importance as one can depend on the checkers to correct any such error.

T F 7. If a book is to be side-wire bound, the signatures are placed one upon the other.

T F 8. Sections and pages are usually gathered in the order of consecutive page numbers.

T F 9. The construction of a book will determine the method of gathering.

T F 10. The original book signatures were composed of four pages.

T F 11. Stephen Daye developed the first paper folding machine.

T F 12. The book <u>General Printing</u> by Cleeton and Pitkin is saddle-wire bound.

T F 13. A side-wire bound book must have narrower inside margins than a saddle-wire bound book.

T F 14. <u>Graphic Arts Procedures</u> by Karch is an example of a "perfect binding."

T F 15. Book sections are commonly known as signatures.

T F 16. Signatures are not necessary when books are constructed with loose-leaf bindings.

T F 17. Overwire is a type of spiral binding.

T F 18. A bone folder is used in hand folding to prevent wear on the thumb.

T F 19. When printed sheets are folded to register, the edges of the sheets are always kept even.

T F 20. When a pile of paper is jogged, the pile is straightened.

T F 21. Paper should be stored flat and kept clean by leaving covers intact.

T F 22. Modern folding machines can deliver only 16 page signatures.

T F 23. Two men can work on a hand-lever cutter with more safety than one.

T F 24. When using a power paper cutter, a straw board should be placed at the top of the pile of paper to protect the paper from being marred by the clamp.

T F 25. Padding and tabbing are two terms which refer to the same operation.

T F 26. A paper punching machine can handle more sheets at one time than a paper drill.

T F 27. Staplers use ready-made staples and can be used to fasten work to one inch of thickness.

T F 28. Books and other printed material, to a maximum thickness of one-half inch, can be bound on a stitcher.

T F 29. Folding machines may be safely adjusted while in operation.

T F 30. When lifting heavy lifts of paper, the body and not the knees should be bent.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The first folding machine was used by the ____________ ____________ in the year ________ .

2. The type of binding which is simple, cheap, and used for small thicknesses is the ______________ .

3. The "perfect binding" holds the book together with a special type of ____________.

4. The type of binding which offers maximum permanence is the ____________ ____________ .

5. A rounded back will indicate a book has been ____________ ____________ .

6. When signatures have been folded so the printed pages are aligned, the pages are said to have been ____________ ____________ ____________ .

7. Paper may be delivered to the printer in ________ sheet packages, ________ sheet packages, or ________ sheet packages.

8. The aligning of sheets delivered from the press in a haphazard pile is called ____________ .

9. Printed materials which are made of stiff papers and are to be subjected to severe usage usually are ______________ to prevent damage.

10. The colored lines found on various types of printed forms are ____________ ruled on special bindery equipment called ____________ ____________ .

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

____ 1. Stiff covers are used on books which (A) have sewn casebindings; (B) utilize binding posts to hold the sheets together; (C) are saddle-wire bound; (D) are side-wire bound.

____ 2. Packages or cases of paper should be stored (A) on end; (B) on edge; (C) flat; (D) leaning at an angle.

____ 3. When a cutting machine is used, the paper is protected by clamping the paper (A) as tight as the second machine operator states; (B) sufficiently tight to hold the paper; (C) very loosely; (D) as tight as possible.

____ 4. When gold leaf is applied to a book, the type used is (A) brass type; (B) Ludlow type; (C) monotype; (D) factory type.

____ 5. Books of blank forms which contain many colors of lines have the lines produced by a (A) rotary press; (B) lithographic stone; (C) stripping machine; (D) ruling machine.

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. The following are the steps for tabbing "scratch pads."

____ A. Insert straw boards

____ B. Place heavy weight at top of carefully aligned piles

____ C. Remove weight

____ D. Count sheets into piles of 50 or 100 sheets

____ E. Allow glue to dry

____ F. Combine piles, carefully jog, and trim binding edge if necessary

____ G. Apply tabbing glue as often as necessary

____ H. Cut pads apart with sharp knife

____ I. Secure and prepare tabbing glue

[illegible]

Information
Sheet No. 2

GATHERING AND BINDING

Most books are composed of folded sections which are of a definite and consistent number of pages, usually 16 or 32. Before the pages are bound, they must first be gathered or assembled in the order of consecutive page numbers.

When gathering sections for books, stacks of the separate sections are placed in consecutive order on a table, and one section after another is collected from each pile to form the printed part of a book.

Extreme care must be taken to keep the sections in their proper sequence. An error in sequence, missing a section, or selecting two sections from any pile will mean an error in the book. Usually each book is checked for accuracy of gathering before it is bound.

The method of construction of the book determines not only the manner in which the forms are locked up, but also the method of gathering. If a book is to be side-wire bound, the folded sections are placed one upon the other in sequence; if, however, the book is to be saddle-wire bound, the sections are inserted one within the other in consecutive order. When this second type is completed, the outside section will contain the first and last pages of the book, and the center section will contain the pages which come numerically together.

Units 158-164

PRINTING PLATES

An ancient Chinese proverb states, "One picture is worth a thousand words." The wide circulation of weekly magazines, which present news coverage in pictures, provides much basis for the assumption that one picture conveys a message it would be extremely difficult to duplicate with only a thousand words.

The widespread use of pictures to supplement news stories and advertising has made it necessary for the worker in the small print shop to be familiar with the various plate types used in the production of printed illustrations. In larger plants, where these plates are produced, it is necessary that the processes used to manufacture these plates be known and understood.

The increasing use and popularity of illustrations in conjunction with printed material and the expected continuation of this trend, makes necessary the study of this essential part of the printing industry.

In this assignment you will learn the different types of plates, the principles involved in producing each type, and the special adaptabilities of each.

Assignment:

1. Read the references listed below.
2. Locate and identify ten types of plate illustrations.
3. Answer the questions, turn in this assignment and the identified illustrations by ____________________ .

References:

A. Cleeton and Pitkin, *General Printing*, pp. xv-12 92-93, 162-168.
B. Karch, *Graphic Arts Procedures*, pp. 1-9, 208-240, 246-251, Colophon.
C. Polk, *The Practice of Printing*, pp. 272-316.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It may be expected in the near future that offset printing may supercede letter-press printing.

T F 2. The dots in a highlight area of a halftone are very small, surrounded with large areas of white.

T F 3. The range of highlights, middle tones and deep shadows on a halftone photoengraving is achieved by cross-hatching and varying the widths of the lines.

T F 4. Fine-screen halftones may be offset printed on soft antique papers.

T F 5. An engraver can produce solid black areas on a halftone plate.

T F 6. Coarse screens are needed for plates which are to print on rough papers.

T F 7. Wood cuts were the original means of producing book illustrations.

T F 8. Intaglio engraved copper plates have only been in use since 1850.

T F 9. Colored illustrations were not successfully produced prior to 1892.

T F 10. Halftone plates print from relief surfaces.

T F 11. The original lithographic process made use of a porous stone upon which designs were drawn in reverse.

T F 12. The white areas in a gravure illustration are produced by the paper itself.

T F 13. Gravure plates print from ink which is carried in wells in the plate.

T F 14. Offset plates register with the paper sheets being printed as do letterpress plates.

T F 15. Offset printing eliminates the need of performing make-ready

T F 16. A genuine engraving may be distinguished from an imitation engraving by the indention in the back of the former.

T F 17. Plates for line engraving are etched with "dragon's blood."

T F 18. Coarse screen halftones are made with screens having 50 to 100 lines per inch.

T F 19. A halftone plate is prepared from a photograph made through a fine silk screen.

T F 20. The Ben Day Process is a mechanical method for producing a shaded effect on line plates after they are etched.

T F 21. Odd shaped photoengravings are less expensive than regular shapes.

T F 23. For process color printing, opaque inks are used.

T F 24. Wax electrotype molds are sprayed with graphite to make them electrical conductors.

T F 25. In the production of electrotypes, the positive power source is attached to the mold.

T F 26. Nickeltypes wear longer than copper electrotypes.

T F 27. Stereotype plates are cast from paper matrices.

T F 28. National advertisers usually ship stereotypes rather than stereotype matrices to newspapers.

T F 29. The foremost advantage of plastic duplicating plates is their lightness in weight.

T F 30. Aniline dyes do not attack rubber duplicating plates.

T F 31. Acetate proofs are dusted with powder to prevent their sticking together during shipment.

T F 32. Offset lithographers prefer deep-etch plates to albumen plates because of the longer life and sharper detail they give.

T F 33. Both ink and moisture are used on offset presses.

T F 34. Dots of gravure plates and cylinders prepared by the Dultgen process vary in size and depth.

T F 35. Prior to etching, the hardened gelatin on gravure plates is thickest on highlight areas.

T F 36. Zinc etchings are also commonly known as line engravings.

T F 37. Usually, finished plates are somewhat smaller than original copies.

T F 38. Reducing or enlarging a copy will alter the proportion of height to width.

T F 39. After electrotype shells have been backed with lead, they are shaved to a thickness of 11 points if they are to be used unmounted.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Social custom demands the elegance of work produced from ______________ or ______________ plates.

2. The only printing process which gives a continuous printing tone without the use of a screen is ______________ or ______________.

3. The colors of the plates used in process color printing requires the use of ______________, ______________, ______________, and ______________ colored plates.

4. The most used processes for duplicating printing plates are ______________ and ______________.

5. Stereotypes are produced type high or in ______________ ______________.

6. The proofs of type made for offset printing are called ______________ ______________.

7. The offset-lithographic press prints from a ______________ surface, whereas a letter press prints from a ______________ surface.

8. Offset presses operate on the principle that ______________ and ______________ do not mix.

9. An illustration in which the gray tone fades into white at the edges is called a (an) ______________.

10. The term used to include all types of printing from flat surfaces is ______________.

Sequence

Directions: The list which follows contains significant developments in the history of printing plates. Show the sequence of these developments as indicated in your references by placing the appropriate numbers in the blanks at the left.

1. Events in the history of printing plates.

____ A. Engraving on metal by means of photography
____ B. Development of photoengraving sensitizing method
____ C. Wooden blocks cut with the grain
____ D. Application of color printing to halftone process
____ E. Hand engraving of copper plates
____ F. Discovery of screen principle

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

1. Certain events and discoveries related to plates for printing.

____ 1. Senefelder

____ 2. 1894

____ 3. Imitation copperplate engraving

____ 4. 1892

____ 5. Steel plates

A. Successful color process

B. Rotogravure

C. Maso Finiguerra

D. U. S. Bureau of Engraving and Printing

E. Photoengraving commercially profitable

F. Slow-drying ink, resinous powder, and heat

G. Writing on stone

Assignment

Covering
Units 165-166

TYPECASTING MACHINES

Not too long ago, a controversy existed among compositors regarding the question of Machine vs. Man in the accomplishment of work in the composing room. Many old printers, upon the advent of the linecasting machine around the turn of this century, raided large newspaper plants and destroyed machines that were to produce six times the daily amount of composition that a man could produce. Yet, today, the linecasting machine has embedded itself into the compositor's world, and contrary to his original thoughts, has made composition less expensive and more plentiful -- hence more in demand, and in turn demanding more compositors to arrange and display it to the public.

Certain machines, in their infancy today, will revive the old question again. One of these is the teletype attachment for the linecasting machine which operates the machine by tape, eliminating the need for an operator. Another, is a machine to produce cuts (newspaper photos) for the trade whereby electrically heated needles drill dots into plastic plates and thus eliminate photo engravers.

A careful survey of modern compositors will indicate to you that the linecasting and lettercasting machines are regarded as necessary to their world. Very few would desire to return to the old hand-set straight-matter days. Because these machines are a part of his world, the compositor finds it necessary to learn their basic operations; therefore, the principles involved must be understood by the craftsmen for daily production of quality work.

In this unit the principles of operating linecasting machines will be studied. This will provide you with background information, an appreciation of the machine, and the introduction of its product into your work.

Assignment:

1. Read the references listed below.
2. Observe the operation of the linecasting machine where you work, noticing particularly the operation principles outlined in the references.
3. Answer the questions below and turn in this assignment by ____________________ .

References:

A. Cleeton and Pitkin, General Printing, pp. 153-158.
B. Karch, Graphic Arts Procedures, pp. 151-173.
C. Polk, The Practice of Printing, pp. 141-147.
D. Mergenthaler Linotype Company, Linotype Machine Principles, pp. 3-37.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Typecasting machines were first introduced by William A. Reade in 1862.

T F 2. The first typesetting machine was designed in 1822.

T F 3. Perforations on a paper ribbon cause a complete font of Monotype matrices to move over a mold.

T F 4. The Linotype system requires two machines, one for composin and one for casting.

T F 5. It was not until composing preceded casting that a satisfactory typesetting machine was developed.

T F 6. Typecasting metal is composed of lead, tin, and silver.

T F 7. Linotype machines cast lines of type whereas Intertype machines cast individual letters of display type.

T F 8. A Linotype matrix is a small piece of brass having one or two characters cut into one edge.

T F 9. A magazine is the storage compartment for matrices while they are not being used.

T F 10. Most Linotype matrices will cast two type faces.

T F 11. The spacing between words on Linotype slugs are equal.

T F 12. A row of composed matrices and spacebands form the mold for a Linotype slug.

T F 13. The galley of a Linotype machine holds the cast and trimmed slugs.

T F 14. Each Linotype matrix must have the same combination distributor of teeth to be carried along the distributor bar.

T F 15. The quadder enables the Linotype operator to cast a line flush right, flush left, or indented equally at each end.

T F 16. Linotype and Intertype machines are identified by model designations consisting of various letters or number combinations.

T F 17. The Monotype keyboard produces a paper strip into which holes are punched by compressed air.

T F 18. The Monotype, like the Linotype, contains the keyboard and casting mechanism in one machine.

T F 19. The Monotype composition caster casts single letters.

T F 20. Ludlow Typograph matrices are hand set in a stick.

T F 21. Most of the type used in present day printing is set by composing machines.

T F 22. Spacebands provide the space between words on the Linotype slugs.

T F 23. Cast slugs are apt to become mixed and individual matrices are likely to become pied in a linecasting machine.

T F 24. When the cast slug is delivered to the Linotype galley, it is ready for use.

T F 25. The magazine of a linecasting machine serves the same purpose as the type case used in hand composition.

T F 26. The printer who owns a Linotype machine is his own type founder.

T F 27. The Linotype machine is a typesetting machine.

T F 28. Spacebands are wedge-shaped pieces of metal tapered in opposite directions.

T F 29. The assembling elevator is the "composing stick" of the Linotype machine.

T F 30. Because of the complex system of levers and links, a very firm pressure is required on Linotype keys to release a spaceband or matrix.

T F 31. The average Linotype operator is able to release one hundred-fifty matrices per minute.

T F 32. Depressing any two adjacent keys on a Linotype keyboard will release a spaceband.

T F 33. Mold disks normally have accommodations for six molds, but disks accommodating four molds can be secured for special needs.

T F 34. All matrices must be replaced by hand.

T F 35. Conveyor screws automatically stop if a matrix becomes jammed on the distributor bar of the Linotype.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The Monotype composition caster is actuated by a ______________ ______________ .

2. The Monotype system uses two types of matrices, ______________ matrices and ______________ matrices.

3. Each Monotype matrix case can cast ______________ type faces.

4. The Monotype system of composition produces ______________ ______________

5. The purpose of the Ludlow Supersurfacer is to produce a ______________ ______________ for printing.

Matching

Directions: In the right column are descriptive words and phrases, and in the left, various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. William Reade

____ 2. Intertype

____ 3. Teletypesetter

____ 4. Overhang slug composition

____ 5. Ludlow Typograph

____ 6. Justification bar

____ 7. Back knife

____ 8. Automatic font distinguisher

____ 9. Conveyor screws

____ 10. Seldom used characters

A. Prevents mixing of two sizes of matrices

B. Trims bottom of slug to type height

C. Matrix slide box

D. Activates spacebars to expand line full width of measure

E. Utilizes Linotype principle

F. Ride entire length of distributor bar

G. Spaceband box

H. Moves matrices along distributor bar

I. Advertising composition

J. Trims back of slug to type height

K. Perforation of casting machine types by electrical impulses

L. Hand distributed matrices

M. Developed Ludlow Typograph

Listing

Directions: List the items called for in each of the following statements. Select your answer carefully.

. The four major divisions of the Linotype are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

2. The advantages which recessed slugs have over solid slugs are:

(A) ____

(B) ____

(C) ____

Sequence

Directions: The lists which follow are the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. The course of Linotype matrices from the magazine, through the mechanism and back to the magazine.

____ A. Matrices assembled on assembling elevator

____ B. Matrices lifted by elevator to distributor box

____ C. Matrices drop into proper slot in magazine

____ D. Operator depresses keys on keyboard

____ E. Matrices fed to distributor screws

____ F. Matrices fall from magazine

____ G. Spacebands are separated from the matrices

____ H. Matrices go to casting mechanism

____ I. Matrices carried by conveyor belt

____ J. Slug is cast and matrices travel to point above casting machanism.

Assignment
Sheet No. 21

Covering
Units 172-197

LINOTYPE MATRIX MECHANISMS

During the training period of every ambitious learner in the printing industry, the time arrives when he is ready to learn to operate a linecasting machine.

If this learning opportunity is carelessly handled by the learner, another opportunity to operate the machine will be long postponed, if ever occurring again. A Linotype machine represents a sizable investment and is of extreme importance in keeping the presses of the printing establishment operating. The production of cast slugs, or the lack of them, may well determine the daily schedule of the press room and bindery. The selection of the proper magazine, its safe positioning, proper care of the machine, and correct keyboard operation must all be performed in an orderly manner with an economy of time.

In this unit, information has been selected which; if studied thoroughly, will provide the information needed to enable you to assemble the first line of matrices in the machine. In addition to learning this information, you will also learn of the various machine mechanisms which manipulate the matrices as they are made ready for the casting of the Linotype slug.

Assignment:

1. Read the references listed below and study the illustrations carefully.
2. Memorize the Linotype keyboard.
3. Arrange with your employer for time to operate a Linotype machine under the direction of an experienced operator.
4. Answer the questions below and turn in this assignment by ____________________.

References:

D. Mergenthaler Linotype Company, Linotype Machine Principles, pp. 38-132, 348-353.
E. Mergenthaler Linotype Company, Linotype Keyboard Operation, pp. 1-16, 29-33.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A "pi" matrix will drop off the distributor bar and fall into a channel in the middle of the magazine.

T F 2. Spacebands must be cleaned a minimum of once during each eight hours of operation.

T F 3. Excessive amounts of oil on the matrices will create conditions causing the matrix side walls to be damaged.

T F 4. A good quality of oil should be placed on the distributor screws once every eight hours to prevent excessive wear on the matrix teeth.

T F 5. A firm pressure is required on the keybutton to release a matrix.

T F 6. The sequence of operations from the release of the matrix to the casting of the slug is activated by the touch of a keybutton.

T F 7. Keybuttons never contain more than one character.

T F 8. The first step in swinging the keyboard is to remove the keyboard roller driving belt.

T F 9. There are three ways to clean cams and yokes, but if there is no oil on the yokes, dry cleaning is best.

T F 10. The rubber keyboard cam rollers should be cleaned with alcohol.

T F 11. As a safeguard to prevent damage to the machine, the keyboard should be locked when not in use.

T F 12. A gummy residue on the sides of key levers may cause unwanted "doublets" to be deposited on the assembling elevator.

T F 13. Magazine channels are all the same width, and .010" wider than the matrices which slide in them.

T F 14. There are two general types of magazines which are of equal size, but vary in general construction.

T F 15. The magazine channels are wider at the back than at the front.

T F 16. The "Model 20" magazine is a 90-channel magazine.

T F 17. The 90-channel magazine contains 91 channels.

T F 18. Main magazines contain two channels for the lower case "e," and the matrices may be released from either channel independently of the other or alternately from both.

T F 19. Main magazines are of three length: full length, three-quarter length, and one-half length.

T F 20. A "split" magazine contains either the right or left half of a main magazine.

T F 21. When the open end of the multiple key rod shifter handle reveals the symbol "e-e," lower case "e" matrices are released alternately from each "e" channel of the magazine.

T F 22. Linotypes which are not equipped with auxiliary magazines will not be equipped with bail boxes.

T F 23. Graphite should be used instead of oil for lubricating the magazine channels.

T F 24. New magazines require more cleaning attention than magazines which have been used for a considerable length of time.

T F 25. An excessive amount of oil in the magazine is preferable to no oil at all.

T F 26. If a matrix clogs the star wheel in the assembler block, the matrix will be either bent or broken.

T F 27. The chute finger at the entrance of the assembler block holds the matrix close to the assembler rails and causes the matrix to strike the star wheel at the proper angle.

T F 28. The "regular" spaceband is identified by a single line on the lower front edge.

T F 29. The kinds of spacebands may be distinguished by the lines which appear on the lower front edge of the spaceband.

T F 30. The matrix releasing mechanism has more lost motion in its linkage than the spaceband releasing mechanism.

T F 31. The delivery slide receives a line of assembled matrices from the assembling elevator between a short fixed finger on its right and long movable finger on the left.

T F 32. From the assembling elevator to the first elevator jaw, the line of assembled matrices travels about nine inches.

T F 33. The first elevator jaw consists of a front jaw, a back jaw, and a separating block.

T F 34. All of the five different movements of the first elevator are controlled solely by the shape of the first elevator slide cam.

T F 35. The trimming knives are cleaned by a brass wiper called a "flag."

T F 36. Theoretically squirts can occur, but in actual practice they do not.

T F 37. The process of second justification causes the spacebands to again be pushed upward, thereby forcing the spacebands and matrices to be wedged tightly between the vice jaws.

T F 38. Accuracy and good spacing are the basic considerations in keyboard operation.

T F 39. A swift operator is always the most desirable type of operator.

T F 40. Speed at the keyboard can only be secured by a combination of practice plus experience.

T F 41. The keyboard layout of the capital alphabet is the same as the arrangement of the lower case alphabet.

T F 42. The third finger of the left hand is used to strike the spaceband key.

T F 43. When fingering the keyboard, the striking motion should be made from the wrist.

T F 44. When double letters are necessary in a word, these may correctly be secured by holding down the particular key-button.

T F 45. A slow, even operating speed is better than speedy, jerky movements when fingering the keyboard.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The "Model 5" magazine was first used on the ____________ Linotype and is a ________ channel magazine.

2. Auxiliary or side magazines are also called ____________ or ____________ magazines, which are ____________ in shape, having matrix channels ____________ to each other.

3. When a single lower case "e" shows at the open end of the multiple key rod shifter lever handle, lower case "e" matrices are released from the ____________ "e" channel only.

4. The bail box permits the regular keyboard to operate ____________ ____________.

5. Linotype operation requires the trained coordination of the eyes, ____________, ____________, and ____________ .

6. The first essential for Linotype operation is familiarity with the ____________ .

7. Shop production of slugs is in terms of ____________ ____________ .

8. When studying the keyboard, only one ____________ should be attempted at a time, studying the buttoms first ____________ and then ____________ .

9. Of the fingers of the right hand, the ______________ finger strikes the largest number of lower case keys.

10. Variable fingering of certain words will result in faster and smoother keyboard fingering only when a speed of ______________ ______________ per hour has been attained.

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the words on the left by placing the proper letter in each blank on the left.

____ 1. Extra thick spaceband

____ 2. Wide range spaceband

____ 3. Thick spaceband

____ 4. Extra thin spaceband

____ 5. Roman position

____ 6. Italic position

____ 7. Squirt

____ 8. Linotype

____ 9. Hang the elevator

____ 10. Black keys

A. Five lines

B. Auxiliary position

C. Upper case matrices

D. Two lines

E. Regular position

F. Figures and miscellaneous marks

G. First elevator

H. Three lines

I. Not tolerated in first-class shops

J. Regular spaceband

K. Tool for more rapid assembling of line of type

L. Disagreement of theory and practice

M. Keyboard locking plate

N. Lower case matrices

Sequence

Directions: The list which follows contains the steps involved in performing a certain job. Indicate the order recommended in your references by placing the proper numbers in the blanks at the left.

1. The course of the matrices prior to the casting of the slug.

____ A. Matrices taken by first elevator jaw for alignment and justification

____ B. Matrices are forced onto assembler slides

____ C. Matrices pass through assembler block

____ D. Assembling elevator carries the matrices vertically about 5".

____ E. Matrices move horizontally about nine inches through the delivery channel

Assignment
Sheet No. 22

Covering
Units 198-230

LINOTYPE CASTING MECHANISM

The casting mechanism is potentially the most dangerous part of the Linotype. It is in this mechanism that molten type metal is released by the operator. If this molten metal is properly channeled by a well-adjusted machine, the metal is an obedient servant; however, if the machine is permitted to remain out of adjustment, and is carelessly used, the molten metal will not only clog the casting mechanism, but will also place the operator in danger of serious injury.

Casting is a continuous operation and it is necessary that proper care be given the casting mechanism. Linotype operators so frequently shift mold positions and adjust slug widths that the practice becomes automatic and an auditory alertness must be developed to check the casting operations at all times. While the operator is reading the copy and fingering the keyboard, this auditory alertness must enable the operator to know by the sound whether the operations of the casting mechanism, casting, trimming, and ejecting are taking place properly.

In this unit information is presented which will enable you to gain a complete picture of the casting operation. The information secured here will advance you in the development of a keen auditory perception necessary for the continuous checking of the casting operations.

<u>Assignment</u>:

1. Read the reference listed below.
2. Observe a Linotype operator cleaning the mold disk.
3. Observe a Linotype operator removing and replacing liners for casting different slug lengths and body sizes.
4. Secure permission from your employer to remove and replace mold liners <u>under the direction of the operator</u>.
5. Answer the questions which follow and turn in your paper by ______________________.

<u>Reference</u>:

D. Mergenthaler Linotype Company, <u>Linotype Machine Principles</u>, pp. 133-149, 152-173, 206-231.

<u>Questions</u>:

<u>True-False</u>

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is possible to set up a regular mold disk to cast four different sizes of slugs without further adjustment.

T F 2. The universal adjustable mold may be adjusted in terms of both picas and points.

T F 3. The liners are held firmly in place by mold cap screws and keys on the bottom of the liners.

T F 4. When the length of a line is to be changed, only one liner must be changed.

T F 5. When large body sizes are cast, the universal adjustable mold will produce more perfect slugs than the recessed mold.

T F 6. Mold liners may be secured for bodies from 5 to 18 points in thickness and from 4 to 30 picas by picas in length.

T F 7. The left liner for a recessed mold is interchangeable and may be used in any other type mold.

T F 8. Liners may be removed by placing a screwdriver in the mold slot and freeing the liner by prying.

T F 9. The mold cap of a recessed mold carries projections which form cavities in the recessed slug.

T F 10. The weight of a recessed slug is about two-thirds that of a solid slug of the same dimensions.

T F 11. A screwdriver is the only tool necessary to change mold liners.

T F 12. The back mold wiper has little effect upon the prevention of back squirts.

T F 13. The back knife must be kept razor sharp.

T F 14. While the mold disk is making the three-quarter revolution between casting and ejection, the back knife trims the slug to type height.

T F 15. The molds for a four mold disk and those for a six mold disk can be distinguished only by part numbers.

T F 16. The mold disk is properly timed so long as any timing mark on the mold disk matches any mark on the pinion.

T F 17. Vents in the pot mouthpiece are for the purpose of allowing metal to form the base of the slug.

T F 18. The gas governor is based upon the principle of the equal expansion of two pieces of metal when heated.

T F 19. If a gas burner is used to heat the type metal, the air mixing valve should be adjusted until the flame is blue with a yellow tip.

T F 20. Gas governors for natural gas cannot be used on artificial gas line; however, an artificial gas governor may be used on natural gas lines.

T F 21. All the fittings and materials used in the electric pot heaters conform to the requirements of the National Electrical Code.

T F 22. The Linotype electric pot heater has not been approved by the National Board of Fire Underwriters.

T F 23. Electrically heated pots have four heaters -- two crucible heaters within the pot, one at the mouth, and one on the throat of the pot.

T F 24. The envelope heaters are sealed by autogenous welding.

T F 25. Throat and mouth heaters designed for 110 volt circuits cannot be used on a 220 volt circuit.

T F 26. Crucible heaters are connected in parallel for 110 volt circuits and in series for 220 volt circuits.

T F 27. The expansion element of the mechanical thermostat must be free to expand in all directions.

T F 28. The pot control panel is located to the right and slightly to the rear of the keyboard.

T F 29. When fuses in the control panel blow, they should be replaced by fuses with higher amperage ratings.

T F 30. When using a bank of lamps as an emergency resistance coil for the pot circuit, only lamps bearing the trademark "NOMA" should be used.

T F 31. After long periods of use, mouthpiece holes should be reamed to remove accumulated metal, dross, or burrs.

T F 32. Mouthpiece vents may be scraped to remove accumulated metal or dross.

T F 33. If a "back squirt" occurs, the first thing to check is the lockup of the pot mouthpiece against the mold.

T F 34. The Micro-Therm controls may be damaged in the temperature of the mouthpiece exceeds 525 degrees Fahrenheit.

T F 35. Best casting results are secured when the temperature of the type metal is between 575 degrees Fahrenheit and 600 degrees Fahrenheit.

T F 36. Ejector blades may be arranged to eject any size slug the machine will cast.

T F 37. The ejector serves two functions: it pushes the cast slug from the mold, and it also forces the slug between knives which trim the slug to accurate point thickness.

T F 38. The slug has completely cleared the mold before the trimming is begun.

T F 39. The right knife shaves the ribs of the slug to make the slug the proper thickness.

T F 40. The left knife removes "fins" or overhang from the smoot side of the slug.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The back of the molds are kept clean by the ______________ ______________ ______________.

2. The mold disk and pinion gear are aligned by means of the ______________.

3. Two devices that have been used to control the heating of electric pots are the ______________ ______________ and the ______________ ______________.

4. When a magnet switch resistance coil has burned out on a 115 volt, 60 cycle alternating current line, an emergency 40 ohm resistance may be produced by substituting ________ 150 watt lamps wired in ______________.

5. Molten metal splashing over the back of the mold disc is called a ______________ ______________

6. The best casting results are secured when the temperature of the type metal is between ________ and ________ degrees Fahrenheit.

7. Slugs are pushed from the mold by the ______________ ______________.

8. If the trimming blades are dull but not nicked, they may be dressed with a ______________ ______________ and a (an) ______________ which has been moistened with ______________.

9. Early Linotype machines used the ______________ galley.

10. If a metal deposit forms under the slug buffer and interferes with the slugs as they slide onto the galley, the difficulty can be remedied by rubbing the deposit with a ______________ on which ______________ has been placed.

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the word(s) on the left by placing the proper letter in each blank on the left.

____ 1. Recessed mold

____ 2. Body size of line changed

____ 3. Type high

____ 4. Length of line changed

____ 5. Back squirt

____ 6. Ejector

____ 7. Slugs 4-points thick

____ 8. Right-hand knife

____ 9. Reversible galley

____ 10. Short measure slugs

A. Back knife

B. Right and left liners changed

C. Secondary stop strip

D. Body size of slug

E. Vertical galley

F. Left liner replaced

G. Forces slug between trimming knives

H. Water circulation

I. Uncontrolled molten metal

J. English and Hebrew composition

K. .040" ejector blades

L. Cavities or recesses in slug

Assignment
Sheet No. 23

Covering
Units 231-238

LINOTYPE DISTRIBUTION MECHANISMS

Having previously studied how the matrices are assembled and how the slugs are cast and ejected onto the galley, you are now ready to study the final movements of the matrices as they travel through the various mechanisms which carry them back to the magazine for storage until needed.

This final part of the matrices' cycle is referred to as "distribution" in that it includes not only the return of the matrices to the magazine, but also the return of the spacebands to the spaceband box. In this respect, the distribution function of the Linotype is quite similar to the distributing of type and spacing material by the hand compositor.

In this unit you will further develop your understanding of the Linotype by learning the function and operating principles relative to the distribution of matrices and spacebands after the slugs are cast.

Assignment:

1. Read the reference listed below.
2. While a Linotype is in operation, observe closely several groups of matrices and spacebands as they move from the mold disk to their proper storage places.
3. Answer the questions below and turn in this assignment by ______________ __________ .

Reference:

D. Mergenthaler Linotype Company, Linotype Machine Principles, pp. 232-275.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Distribution includes all those mechanisms which return spacebands and matrices from the first elevator jaw back to the magazines from which they came.

T F 2. The teeth of pi matrices are used during the casting operation.

T F 3. The second elevator conveys the matrices and spacebands to the distribution box.

T F 4. The distributor shifter pushes the matrices from the second elevator bar into the distributor box.

T F 5. The sole function of the distributor box is to lift the matrices onto the distributor screws.

T F 6. A primary distributor box is found on all single distributor Linotypes.

T F 7. The function of the upper distributor box is to separate matrices and spacebands.

T F 8. Before being distributed, all matrices pass through the distributor box.

T F 9. Matrices and spacebands are pushed along the distributor box rails and lifted by the matrix lift into the distributor screws.

T F 10. The clutch of the distributor screw driving mechanism is disengaged by the retardation of the back distributor screw.

T F 11. A single distributor Linotype may be described as having only one distributor screw.

T F 12. A "Two-in-One" model Linotype will distribute matrices to 90-channel and 72-channel magazines simultaneously

T F 13. The Linotype designated as a "Two-in-One" mixing machine carries six distributor screws and two distributor bars.

T F 14. Spiral automatics magnify any drag on the lower distributor screw to such proportions that the distributor clutch disengages.

T F 15. The primary purpose of the spiral automatics is to lock the front distributor screws.

T F 16. The spiral automatics consist of an application of two sections of coarse pitch V-screw threads.

T F 17. The distributor bar contains seven levels of combination rails.

T F 18. The brass plate at the back of the distributor bar is designed to keep excess dust from falling into the channel entrance.

T F 19. Kerosene will generally clean gummy distributor screw bearings.

T F 20. The clutch of the distributor screw driving mechanism is referred to as "the spiral automatic."

T F 21. Once the obstruction in the distributor has been cleared, the distributor clutch will automatically remesh and start the distributor screws.

T F 22. To start the distributor after it has been locked by the spiral automatics, one need only to grasp the starting lever flange and turn it slightly backward.

T F 23. The spiral automatics are unlocked by turning the starting flange lever backward slightly.

T F 24. The rails of the distributor bar provide for 127 different combinations of matrix teeth.

T F 25. On the distributor bar for a 90-channel main magazine, the "l" matrix will travel a greater distrance than the "f" matrix.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Spacebands are not lifted to the level of the distributor box, because they lack a ______________ ______________ .
2. The matrix teeth are first used during the movement into the ______________ ______________ where they engage the ______________ ______________ ______________ .
3. Matrices are pushed from the ______________ ______________ ______________ into the distributor box by the ______________ ______________ .
4. In order to engage the clutch after clearing the spiral automatic the starting flange lever must be ______________ ______________ to mesh the ______________ ______________ ______________ .
5. The type of matrix which has none of its teeth removed is called a (an) ______________ ______________ .

Sequence

Directions: The list which follows is the steps involved in performing certain jobs. Indicate the order recommended in your references by placing the proper number in the blanks at the left.

1. Trace the path of a single matrix as it approaches a main magazine.

____ A. Conveyed to level of distributor box

____ B. Moves into distributor box

____ C. Carried onto railed bar

____ D. Rises to level of transfer channel

____ E. Moved by distributor shifter

____ F. Lifted by matrix lift

____ G. Pushed onto second elevator bar

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the words on the left by placing the proper letter in each blank on the left.

____ 1. Transfer mechanism

____ 2. Second elevator bar

____ 3. Second elevator

____ 4. Distributor shifter

____ 5. Distributor box

____ 6. Font distinguisher

____ 7. "Two-in-One" model

____ 8. Starting lever flange

____ 9. Teeth

____ 10. Pi matrix

A. Receives matrices in transfer channel

B. Matched full projections inside V notch of matrix

C. Transports matrices from intermediate channel to level of distribution box.

D. Matched projections on front and back of distributor bar.

E. Pushes matrices into distributor box

F. Two sets of distributor screws and two distributor bars

G. Carries matrices and spacebands to and from casting

H. Removes matrices and spacebands from vise jaw, places spacebands in spaceband box and matrices in distributor box

I. Matched full or partial projections inside V notch of matrix

J. Guides matrices and lifts them into distributor screws

K. Pulled out to mesh clutch stop blocks

L. Carries matrices and spacebands to first elevator

M. Stops turned matrices or wrong font matrices.

PROBLEMS IN LINOTYPE OPERATION

The Linotype machine will present operational problems due in part to the manner in which the operator uses the machine, and in part to the wear which is normal for a machine in daily use.

The Linotype operator in a smaller printing establishment is expected to develop a technical background which will enable him to make minor adjustments and otherwise get his machine back into production. Usually production stoppages are due to type metal deposits, dirt, gum, or improper lubrication. The operator who is capable of caring for the maintenance and repair requirements of his machine is designated as an "operator machinist." Large printing establishments which require the use of many Linotypes employ a Linotype machinist for every five machines. His sole responsibility is to adjust and place new parts on the machines in his care.

In this unit the points where work stoppages most frequently occur are considered. By studying the reference material, you will learn the technical information necessary to enable you to correct minor mechanical difficulties as they occur.

Assignment:

1. Read the reference listed below.
2. Observe the Linotype operator as he corrects machine difficulties from time to time.
3. Ask for the extra duties of cleaning spacebands, matrices, and general oiling and care of the machine.
4. Answer the questions and turn in your paper by ______________________________.

Reference:

D. Mergenthaler Linotype Company, Linotype Machine Principles, pp. 34-35, 43-46, 53-56, 75-78, 81-84, 87-89, 119-122, 163-196, 206-212, 216-218, 246-249, 260-263, 267-268, 382-386, 410-435.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Several styles of racks are available for the storage of full-length magazines, but as yet no racks are available for split or auxiliary magazines.

T F 2. The magazines rest upon the keybuttons when being changed.

T F 3. Matrix sidewalls may be crushed as a result of excessive oil on the back mold wiper.

T F 4. "Hair lines" are common when new matrices are first used.

T F 5. Spacebands in constant use should be cleaned once each week.

T F 6. Metal which does not readily rub from spacebands may be removed by scraping with a piece of brass.

T F 7. The matrix holder and buffer provide a quick means of polishing a font of matrices.

T F 8. Misalignment of the first elevator jaw and second elevator will cause excessive wear on matrix teeth.

T F 9. The magazines on the three-magazine-model Linotype must be brought to the operating position before they can be removed

T F 10. To remove the middle magazine of a three-magazine-model Linotype, the upper magazine must be removed.

T F 11. When the machine or the matrices are new, the magazines must be cleaned frequently to remove oil and grit.

T F 12. Oil in the magazine may be washed out with alcohol.

T F 13. A pencil rubbed over the escapement verge at the point where it contacts the escapement plunger will provide adequate lubrication if the parts are not worn excessively.

T F 14. Star wheels are excessively expensive and should be replaced only when adjustments fail to prevent "oversetting."

T F 15. The oil hole for the star wheel shaft can be reached when the assembling elevator is raised.

T F 16. A long strip of metal formed between the duplex rail and the matrix adjusting bar as a result of a squirt can be driven out with a piece of brass or a six-point Linotype slug.

T F 17. Clutch leathers should be gritty in order that they may have increased friction on the clutch faces.

T F 18. Electric crucible heaters for 110 volt A.C. circuits can also be used on 220 volt A.C. circuits.

T F 19. When electrical fuses burn out, they should be replaced with a fuse of exactly the same rating.

T F 20. A strip of smooth cardboard may be used to clean the metal contact surfaces of a magnetic switch.

T F 21. When scraping mouthpiece vents to remove dross, the vents should be scraped toward the bottom of the mouthpiece.

T F 22. The lockup of the mouthpiece against the mold is the first thing to check when a back squirt occurs.

T F 23. A ring of dross in the well will prevent the pot pump plunger from making a full stroke.

T F 24. One cause of back squirts is using type metal which is not at the proper temperature.

T F 25. The back distributor screw may be opened in order to locate distribution difficulties.

T F 26. The distributor beam may be adjusted vertically as well as horizontally.

T F 27. The distributor is started after being cleared of matrices by revolving the spiral automatics by hand.

T F 28. The matrix delivery belt is kept tight by adjusting the idler pulley.

T F 29. The release of all matrices in a particular magazine channel will usually indicate a broken keyboard cam stop pin.

T F 30. Hair lines are caused by metal accumulations on the spaceband sleeves.

T F 31. If the pot mouthpiece rests against the mold for an excessive length of time, the mold may warp or have the temper drawn from it.

T F 32. Mold wipers are lubricated with oil.

T F 33. If the pot well is worn oversize, the entire metal pot assembly must always be replaced.

T F 34. The plunger should be cleaned daily while the machine is new, but as the machine becomes broken in and the plunger fits more loosely in the well, daily cleaning becomes more detrimental than beneficial.

T F 35. If slugs do not eject properly due to the trimming knives being set to a smaller size than the body of the slug cast, the slug must be forced through the knife block before trimming knives can be adjusted.

T F 36. Burrs on the magazine channel may be removed with a fine file.

T F 37. When the matrices and magazine are cleaned, the channel entrance should also be polished.

T F 38. If matrices stick in the magazine channels, the channels may be lubricated with graphite.

T F 39. When placing a magazine on the machine frame, it must be moved into place without excessive jarring or slamming.

T F 40. Inexpensive vegetable oils are as satisfactory for Linotype lubrication as expensive machine oils.

Matching

Directions: In the right column are descriptive words and phrases and in the left various words. Match the letters of the items on the right with the words on the left by placing the proper letter in each blank on the left.

_____ 1. Star wheels

_____ 2. Three-cornered file

_____ 3. Hollow slug

_____ 4. Short distributor box bar point

_____ 5. Back and front distributor gears

_____ 6. Heavy mark off-center

_____ 7. Start distributor

_____ 8. Distributor box lift

_____ 9. Locking bar

_____ 10. Linotype X-24

A. Opens safety latch when magazines are raised from escapement

B. S. A. E. 20

C. Raises matrices into distributor screws

D. Turn knurled flange backward, then pulled outward

E. Turn knurled flange forward, then pull outward

F. Used on machines with 90-channel magazines

G. Meshed by means of locating pin and cut-out portion

H. Method of aligning spiral automatics to maintain timing when being reassembled.

I. Used on machines with 90-channel magazines

J. Cause of failure of slug to eject

K. Can be ground to ream holes in pot mouthpiece

L. Inexpensive and should be replaced rather than adjust assembler slide stop screw

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Before any magazine can be changed, the magazine must be in its ____________ ____________ .

2. If oil should get into the magazine channels, the channels should be cleaned with a brush and ____________ .

3. If distributor screws do not turn due to gummy bearings, the gum may be cut by the use of ____________ .

4. Spacebands should be cleaned with graphite once during each _______________ _______________ period of operation.

5. The misalignment of the pot mouthpiece and the mold will cause _______________ _______________ .

6. When removed from the machines, the magazines should be placed in a _______________ position on special racks.

7. The partitions of the channel entrance must be in line with the _______________ of the _______________ .

8. A substitute equivalent in viscosity and quality to Linotype oil X-24 can be found in standard _______________ ________ motor oil.

9. The bearings of the assembling elevator lever shaft should be lubricated with Linotype approved lubricant No. ________ .

10. The second elevator guide (lower) should be lubricated with Linotype approved lubricant No. ________ .

PRINTING: BUYING, SELLING AND PRODUCING

Printing opportunities exist for the young apprentice-compositor who has mastered the trade. True to American ideas of free enterprise, he may decide to "go out on his own" and establish and operate his shop.

The success or failure of such a business will depend upon your ability to price your work correctly. You must acquire the knowledge and skill necessary in estimating printing costs before advancing very far as an employee, or before going into business for yourself. If you price your work too high, you will not get the necessary business. Pricing it too low, you are doomed to failure.

In this unit you will have the opportunity to study information relative to establishing and operating a print shop. Review this material with care. Double check your answers by talking to experienced persons in your community.

Assignment:

1. Read the reference listed below.
2. Answer the questions which follow and turn in this assignment by ________________ .

References:

I. Information Sheet No. 3, "Price Policy and Estimating."

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A press may run only 50 to 60 per cent of the time.

T F 2. Every job must help pay for maintenance and eventual replacement of equipment.

T F 3. Cost of paper should include the cost of spoilage and unused remnants.

T F 4. The cost of ink in a job does not include the cost of ink wasted in cleaning presses, or otherwise.

T F 5. Idle time of workers is not figured into the costs of an individual printing job.

T F 6. It is better to do something at any price than to do nothing at all.

T F 7. It is not necessary to provide for a profit on every job.

T F 8. The margin of profit on most jobs will be around 35 to 50 per cent.

T F 9. Making accurate estimates is a major problem for every printer, but it is one which all successful printers find themselves able to solve.

T F 10. Price cutting is a good basis to use for securing business.

T F 11. Low prices have a tendency to increase the number of print jobs.

T F 12. The lack of quality in your work, and promptness and reliability of service, cannot be offset by lower prices.

T F 13. Too much emphasis on low prices may mark you as a cheap printer and actually lose business for you.

T F 14. The chief reason a large number of new printing establishments fail each year is a lack of adequate equipment.

T F 15. The safest approach to meeting competitive prices is through careful use of the cost system.

T F 16. The cost system furnishes the facts about your business which make remedial action relatively simple.

T F 17. If your competitor can seriously undersell you on certain classes of printing, it would be better for you to drop this phase of work rather than to take a loss on the jobs.

T F 18. One satisfactory way to arrive at printing prices and meet competition is to learn your competitor's prices and cut yours slightly.

T F 19. The published schedules of average printing costs are of little value to most printers.

T F 20. In order to assure that every item is taken into account in a printing job, all estimates should be figured on an estimate sheet.

T F 21. The limitations on jobs that can be handled work a hardship on the small print shop owner.

T F 22. Labels, tags, and tickets cannot be produced economically in a small print shop.

T F 23. Printers who practice making estimates by the calculating method will find this sufficient.

T F 24. Experienced printers sometimes make gross errors with decimal places in figuring paper.

T F 25. It is never considered good business to send a customer to another printer.

T F 26. When you honestly indicate to a customer you are specialists in the type work about which he has inquired, this is a better approach than price.

T F 27. You are not apt to be successful at selling printing without knowing every phase of printing.

T F 28. Most printing jobs coming into the shop will have already been designed.

T F 29. Since the production manager in a print shop deals with jobs, men, and machines, little imagination and artistic talent is required to do his job successfully.

T F 30. The production manager has many details to check and coordinate for every printing job in the shop.

T F 31. Every job that comes in does not require a production check sheet.

T F 32. A daily calendar should be maintained for every press and every other production unit, man, or machine.

T F 33. A common mistake in printing shops is failure to provide enough spacing material, with constant loss of time by compositors.

T F 34. Completed jobs should be distributed as soon as possible rather than held for possible rerun.

T F 35. It is the responsibility of the production manager to plan the work of the men and machines so that both may produce profitably.

T F 36. Work should be planned so that at least one press is rolling all the time

T F 37. Even though there is work to do, it is sound business to operate printing presses at moderate speeds to conserve on wear.

T F 38. Sloppy proofs usually indicate sloppy printers.

T F 39. If possible, color work should be held until afternoon when other work is out of the way.

T F 40. Packaging work as soon as possible after it is completed often prevents its being soiled or damaged.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The only sound price policy for a print shop is one based on charging ______________ plus ______________ ______________ on every job.

2. The real basis for estimating printing jobs in your shop is the ______________ ______________ .

3. You may analyze your costs against a schedule of printing ratios published periodically by the ______________ ______________ ________ ______________ .

4. Your calculated estimate of a printing job should be double checked by making a ______________ ______________ estimate.

5. One of the prime responsibilities of the printing salesman is to assist the buyer in ______________ the ______________ of printing which is best adapted to the purpose of his particular job.

6. It is the duty of the production manager to translate the customer's ______________ into an attractive, practical printed job.

7. A proof which makes a good impression on the customer will often forestall troublesome ______________ and ______________ .

8. Nothing creates a better impression than a ______________ ______________ tied, and labeled package.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. In figuring the labor cost of a printing job it is necessary to figure the time spent

   (A) ______________________ (C) ______________________

   (B) ______________________ (D) ______________________

2. Factors which affect the placing of printing orders and their order of importance are:

   (A) ______________________ (C) ______________________

   (B) ______________________ (D) ______________________

3. Three items suggested by the information sheet which may prohibit a shop from meeting competitive prices:

(A) ______________________________

(B) ______________________________

(C) ______________________________

4. Three general factors which can enable a printer to buy at an advantage are:

(A) ________________ (C) ________________

(B) ________________

Multiple-Choice

Directions: Listed with each of the incomplete sentences which follow are several responses, one of which will complete the statement and make it true. Indicate your choice by placing the appropriate letter in the blank on the left.

____ 1. The average small print shop owner prices his work (A) too low; (B) according to the customer's means; (C) too high; (D) slightly less than larger shops.

____ 2. A delivery receipt for 5000 copies of letterheads packed in ten packages of 500 each should be specified (A) Letterheads--5000 total; (B) Letterheads--10 pkgs.; (C) Letterheads--5000 total--10 pkgs.; (D) Letterheads--10pkgs.; 500 each.

Information
Sheet No. 3

PRICE POLICY AND ESTIMATING*

The success or failure of your business will depend upon your ability to price your work correctly. If you price your work too high, you will not get, or at least will not hold, your necessary business. Pricing it too low, you are doomed to failure.

Correct Pricing: For example, the labor cost of a job includes not merely the time spent on it directly, but also the time spent getting ready for it and cleaning up after it, distributing type, etc.; moreover the idle time of your workers must be paid out of the charges for work. The press may run only 50 to 60 per cent of the time, but the pressman must be paid for 100 per cent of his working day.

The cost of paper is not merely the cost of the paper in the completed job, but includes the cost of spoilage and unused remnants of quantities purchased. The cost of ink includes cost of ink wasted in cleaning presses, or otherwise. Good management will hold all waste down to a minimum.

Your equipment is constantly wearing out and becoming obsolete. Every job must help pay for its maintenance and eventual replacement. Type and spacing material must be constantly replenished and each job must pay its share toward this.

Unless you provide for a profit on every job you had better be working for someone else free from the risk of loss.

The small print shop owner is prone to price his work too low, particularly at times when work is hard to get. He usually reasons that anything is better than nothing.

The difficulty is that low prices seldom actually create much printing business. But generally, there is just so much printing to be done at any particular time. Lower pricing may divert work from one print shop to another, but it won't make two print jobs grow where one grew before.

Printing orders are generally placed on the basis of quality, service, price, and personalities; probably in that order of importance. It is necessary that you operate your shop efficiently enough that you can charge reasonable prices; but unless the quality of your work and the promptness and reliability of your service meet competitive standards, low prices are unlikely to attract business.

A little thought will indicate that price-cutting is not a very sound basis for securing business. The margin of profit in printing is narrow; 6 per cent on volume is considered excellent in the industry.

---

*Adapted from Establishing and Operating a Small Print Shop, U.S. Department of Commerce, U.S. Government Printing Office, Washington, D.C., 1947.

On a $50 printing order, few customers are as much persuaded by a $3 price reduction as they are by a consideration of the quality you may provide. Too much emphasis on price in seeking work may mark you as a cheap printer, and actually lose more business for you than it gains.

All of the weight of experience in the industry points unanimously to the conclusion that the only sound price policy for a print shop is one based on charging cost plus a fair profit on every job. A big percentage of all new printing businesses fail within a year or two of their opening; failure to charage adequate prices is the major cause of their failures.

There are many systems used in estimating; but to be of practical value, they must be reinforced with a cost system which will enable yo to check on your estimates and revise your system to make it correspon with your actual costs. The cost system is the real basis for your estimating. The published schedules of average printing costs, which you will undoubtedly make use of, are practical only when modified to fit your own special conditions. Often it is possible to revise the book prices downward, and sometimes it is necessary to revise them upward. Your prices must be based on the actual costs in your plant, not someone else's. If you exhaust every means possible to bring costs down, and find that on certain classes of printing your competitor can still seriously undersell you, you had better get out of that particula category of printing. Why do business at a loss?

The right kind of a cost system turns the printer from a policy of ruinous price-cutting to a constructive effort to cut costs. Your equipment may not be turning out work at a rate which permits profits at competitive rates, your production techniques may need improvement, or your overhead may be excessive. The Printing Industry of America publishes, periodically, a schedule of printing ratios against which you may analyze your costs. The cost system furnishes the facts about your business; these available printing cost ratios show what the facts about your business; these available printing cost ratios show what the facts are in other and successfully operated print shops. Remedial action becomes relatively simple when you are supplied with facts.

All estimates, large and small jobs included, should be systematically prepared on a proper estimate sheet which will list every item to be taken into account. Omit nothing and carefully recheck your estimate after it is made. Watch your decimal places in figuring pape It is a good idea to make an additional check on every estimate by making a short cut estimate, independent of your calculated estimate. If there is much variation in the results, recheck your figures.

Specialization: Specialization in the printing industry calls for narrowing down the kinds of printing done to those that the shop is capable of doing well, promptly, and economically. Your specialities must lie in the field of small work. Other types of work are barred to you because they are produced on highly specialized machinery at a cost so low that you are unable to compete in their field without identical machinery. Labels, tags, and tickets are examples of this class. This limitation of scope is not a bad thing for you by any means. You must determine not only what kind of work you can do well and economically, but the kind of work you can do best and most ecomically. Do not hesitate to send a customer to another printer if you know that he can serve the customer better than you in the particular field involved. By doing so you will make a friend of the customer and the printer alike.

Selling and Buying

Knowing Your Business: An experienced printer once said, "You only have to know three things to sell printing; one, all about printing; two, all about salesmanship; three, all about your customer's business." His analysis covered lots of territory, but was exceedingly sound. In order to sell printing, you must know every phase of printing.

A piece of printing which is overelaborate, or overexpensive, for the job in question is not good work, no matter how tricky or interesting it may be. A primary responsibility of the printing salesman is to assist the buyer in selecting the type of printing which is best adapted to the purpose of his particular job.

Knowing Your Customer: Know your customer and his business. This is commonplace advice to salesmen, and is considered without question to be an essential. If you are selling hardware, you need only learn about the hardware business and you can talk to all of your customers about their business problems with reasonable authority. But you are a printing salesman. Your customers are in every line of business in the world, and you cannot expect to know all about every business. When you advise a buyer about one of his printing jobs, you are getting into his business, and you had better know as much about it as you can. The more you know about what the customer wants to accomplish with a piece of printing, why he is trying to accomplish it and how, the better service you will be able to render.

Buying: Prices for printing supplies are generally standardized for any particular item, and there is little advantage in shopping around. But the following three general factors can enable a printer to buy to advantage:

(1) Quantity purchases -- There are certain grades of paper and envelopes that can be bought cheaper in quantities. As long as you are certain that you will be able to use all of it, you should purchase such items in the quantities which gain the best rate, subject only to your available storage space, and your cash or credit position. (2) Another possibility of advantageous buying for the small printer is in watching the price lists on seconds, or job lots. (3) Finally, to buy properly you should know exactly what grade of paper and ink a job calls for.

Considering the narrow margin of profit in printing, it is obvious that the printer must have the most intimate and exact knowledge of costs and values of every commodity that enters into his finished product.

Production Management and Operations

Effective production management is vitally important to all print shops, regardless of size. Whether the proprietor of a small shop undertakes these duties himself or assigns them to an assistant, he must see that they are carried out with great skill and efficiency.

Duties of the Production Manager: It is the production manager's job to take the customer's copy or ideas and translate them into an attractive, practical, and effective printed job, at a cost that will make the job profitable to the shop. Occasionally, jobs have already been designed before they come to the plant. However, a great deal of the work coming into a shop is not in such good shape, and the production man must be able to handle whatever kind of copy is presented.

The production man must make a mental review of all the ways a job might be handled, select the most promising, and develop this into a general design. Usually the customer will be called upon to approve the initial design. After his approval has been secured, the working layout must be prepared. The lay-out is the blueprint of the job. It must be accurate, or the job will not turn out as desired. It must be clear and simple, so that the work to be done can be accomplished without hesitation, or the necessity for constant questions from the compositor.

Having passed from the design to the layout, the production manager must assign the work for performance. Art work may be involved and engravings may be required. It is the production man's responsibility to have all of these details worked out at the correct time. The text and display type must be set and everything assembled into the make-up of the forms. Again it is the production man's responsibility to see that no errors slip by, and that the design has been adhered to in every respect. He is responsible for seeing that the paper and ink are on hand and that a press is available when the forms are ready to be printed. He must arrange that the bindery be ready to handle the work when the pressroom is through with it. He is responsible for the job being done on time. He must control the job at every point from the hour it is received until the time it is delivered

Coordination: Thus, it is his responsibility to coordinate the efforts of every man and every machine in the production department.

Check Sheets: A production check sheet should be made out for every job that comes in . Then as the details are taken care of, the sheet is checked. It is thus possible at any moment to glance at a sheet and see if anything has been omitted. Similarly, a daily calendar should be maintained for every press and every other production unit, man, or machine.

The Composing Room: The composing room of a small shop often fails to show a profit, although there is no good reason why it should not be as profitable as any other branch of the business. Operate your composing room efficiently and it will show a profit.

Keep your furniture racks, lead, slug, and reglet cabinets well fonted up, and maintain at all times ample spacing materials. Distribute completed jobs as soon as possible. The place for movable type is in the case, not tied up in standing jobs, waiting for possible rerun.

A proof which makes a good impression on the customer will often forestall troublesome changes and criticism. The less allowance the customer has to make for the difference between the proof and the finished job, the better off you will be. Sloppy proofs are the trademark of sloppy printers.

Pressroom: The success of a print shop hinges on the ability of its presses to turn out quality work in volume. A competent pressman, working with a good press, can certainly achieve quality work. Good management will enter into the matter of the volume produced. Necessary repairs can usually be made at convenient times and without the necessity for a shut-down, interfering with operations. When running your presses, run them at near maximum speeds to assure maximum production.

Plan your work so that at least one press is rolling all the time. If one press is turning out impressions for you while another is being set, or the pressman is making ready on it, the second press will, in turn, be in operation while the first one is being serviced. Keep long- and short-run jobs running at the same time to avoid having more than one press idle at a time.

Watch your order of colors in scheduling your presses. Start color work in the morning, if possible, when the presses have first been cleaned. All of this will sound pretty elementary and perhaps unnecessary to the pressman; but these are little points often overlooked in shops where they are well known. The small shop can't afford to overlook anything.

Bindery Operations: When setting up your bindery, the first consideration is to provide enough space. It is doubtful if there ever was a bindery that had enough room. If you do not have sufficient space, the next best thing is to make the most effective use of what you have through good layout design and through good use of the layout.

Shipping and Receiving: In a small shop it may appear absurd to describe the organization of a shipping department. It is quite likely that the functions of this so-called department may be divided among everyone in the plant.

Even in well-operated printing plants, it is amazing how often the receipt of shipments is handled rather casually. As a small operator, you can't afford this. Paper and everything you buy is expensive. When it is received it must be carefully checked as to quantity and condition, then verified that it is what was ordered and is all alike. Suppliers can, and do, make mistakes. In your position you must know whether they have done so or not.

Nothing creates a worse impression on a customer than a sloppily wrapped package. Nothing creates a better impression than a neatly wrapped, tied and labeled package. One of your most effective advertisements may be your shipping label on packages of printing that reach your customer's hands, provided that the package and label are attractive and professional looking. See that work is packaged as quickly as possible after it is completed. It is not unusual for work to become soiled or damaged from lying around unprotected.

Deliver your work promptly! There is no sense in rushing to complete a job and then allowing it to lie around the plant for hours, undelivered.

PRINTING

Employer's Copy

JOB TRAINING: What the Worker Should Be Able To Do	Proficiency Shown	RELATED INFORMATION: What the Worker Should Know

Fundamental Information

	☒	Opportunities, requirements and outlooks in printing industry, accident and health factors

Elementary Composition

Set type from case, set composing stick, space out, justify lines, tie up forms. Measure with point system. Time in hours ________	☒	Types of cases, sticks, materials. Sizes of spaces, leads, materials. Type varieties and nomenclature.

Proofing and Distributing Type

Ink and position forms, pull proofs, make corrections, wash forms and press, identify and distribute type. Time in hours ________	☒	Types and kinds of proof presses and brayers. Clean and care for proof press and brayers. Principles of proofing, standard proofreaders' marks, distribution techniques

Commercial Display and Special Composition

Make layouts, select paper, cut and set borders, set different types of special composition jobs, plan book composition. Time in hours ________	☒	Basic considerations and principles of good layout, selection and styles of border material. Characteristics and rules of spacing, types of and standards of special composition jobs. Types and kinds of papers.

Lockup and Imposition

Position form, place furniture and quoins, test lockup, impose forms. Time in hours ________	☒	Characteristics of and types of furniture and quoins, methods of lockup, arrangements, computations of allowances, functions of dummy layouts and signature marks.

JOB TRAINING: What the Worker Should Be Able To Do	Proficiency Shown	RELATED INFORMATION: What the Worker Should Know
Platen Press Operations		
Wash and care for platen press, operate platen press, perform makeready operations, feed and print various jobs. Time in hours ________	☒	Types, kinds and care of presses, types and selection of inks, press safety, principles, purposes, and materials used in makeready, methods of cutting and scoring.
Stockroom and Bindery Work		
Handle, count, and job paper and printed matter, make pads, staple and fold paper. Time in hours ________	☒	Kinds and types of cutters, stapling machines, and folders types of tabbing compounds and spiral bindings.
Printing Plates		
Make engravings, stereotypes, and lithographic plates. Time in hours ________	☒	Principles of platemaking, offset, gravure and photo-gelatin processes.
Linecasting Machine Operations		
Set, operate, adjust and care for linecasting machine. Time in hours ________	☒	Kinds, methods, principles, functions, and maintenance of linecasting machines, specifications, precautions to be observed.
Printing Shop Operations		
Estimate jobs, prepare logotypes, design job jackets, order supplies, meet customers. Time in hours ________	☒	Factors and considerations of price policy, buying and selling, production management and operations.
