*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *SHEET METAL WORKERS, *SHEET METAL WORK, HIGH SCHOOLS, JOB ANALYSIS, *COOPERATIVE EDUCATION, INDIVIDUAL INSTRUCTION,

This study guide is for student use in related occupational instruction for the sheet metal trade in high school cooperative education programs. It was developed by a committee of teacher coordinators and teacher educators from an analysis of the trade and has been field tested and periodically revised. The 18 assignment sheets are designed to facilitate individual instruction and contain introductory paragraphs to develop interest, explanations of the importance of the assignments, references, learning activities, and objective-type study questions. Representative titles are (1) Sheet Metal Fabricating Materials, (2) Sheet Metal Seams and Hems, (3) Measurement, Linear and Angular, (4) Layout Tools, and (5) Triangulation. Information sheets are provided on Fire Extinguishers, First Aid, Safety, and Establishing and Operating a Sheet Metal Business. The material is to be used by individual students under teacher supervision for 1 year of 180 days. The teacher should be a qualified coordinator or competent trade teacher, and the student should be in the eleventh or twelfth grades and employed as a cooperative education student in the sheet metal trade. Supplementary materials include a list of references, an analysis of sheet metal work, and progress records for use by the student, teacher, and employer. Answers to study questions are available in VT 002 058. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Industrial Education Dept., Univ. of Mo. at Columbia
Address 103 Industrial Education Building
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's key $.50

(2) Means Used to Develop Material:
Development Group Development Committee of Teacher-Coord. & Teacher-Educ.
Level of Group State
Method of Design, Testing, and Trial Subject matter specialist and teacher educators based on an analysis of the trade tested in the field over several years and periodically revised

(3) Utilization of Material:
Appropriate School Setting H.S. and post high school, and area vocational
Type of Program Cooperative education and preparatory programs
Occupational Focus job cluster covering various phases of sheet metal
Geographic Adaptability United States
Uses of Material Study guide for related instruction
Users of Material Student

(4) Requirements for Using Material:
Teacher Competency qualified coordinator or competent trade teacher
Student Selection Criteria junior in high school with proper prerequisites
Time Allotment 180 days

FOREWORD

This course of study, consisting of an analysis of Sheet Metalwork, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching sheet metalwork on an individual basis in part-time cooperative occupational education programs.

The original course of study for sheet metalwork was prepared by Mr. E. C. Minnick, Coordinator, Richmond, Missouri, while a graduate student in Industrial Education at the University of Missouri. Subsequent revisions were made by Dr. Charles R. Hill in 1952 and by Dr. Austin G. Loveless, in 1962, while Research Assistants in Industrial Education at the University of Missouri. The present revision was prepared by Mr. Tommy R. Koonce, Research Assistant in Industrial Education at the University of Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

Commissioner of Education

Assignment Sheets:

Information Sheets:

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of "learning units"--the technical and related information--has been arranged under the heading of "Related Information." And the third group--the personal-social traits--has been listed under "Personal Qualifications of the Sheet Metal Worker" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies, the school and the employer, to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of this course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes, and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student--worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, the series of assignment sheets has been prepared. They contain certain record data as to number and range of units covered; introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn; specific assignments including readings, learning activities, and a series of objective-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well-adapted to this end. He can select from day to day the assignment which covers the units with which the student is working. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting reference books for the course, an effort was made to restrict the number to only those including information considered to be most important for the sheet metal worker to know, and to those of recent publication. It is recommended that these materials be secured and kept in the coordinator's classroom for ready use by the student.

Key answer sheets have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answer to the questions, as well as the reference and page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

The beginning of the sheet metal trade dates back to the early trade guilds of the Middle Ages, when the tinsmith was an important worker. He was the craftsman responsible for making and repairing of the knights' armor. As time went on and the manufacture of metals increased, new uses were introduced which created a greater need for sheet metalworkers.

Persons engaged in the sheet metal trade vary greatly in the amount of training and skill required to do their respective jobs. Some jobs are in semi-skilled factory occupations where articles are manufactured from sheet metal by stamping, die-forming, and other repetitive methods. However, the sheet metalworker **is usually considered** to be one skilled in layout, fabrication, installation, or repairs sheet metal products, fixtures, or equipment. Although specialization in these areas is on the increase, it is highly desirable for the skilled worker to be proficient in all branches of the trade.

Opportunities in Sheet Metalwork

Employment of sheet metalworkers during the 1960's is expected to increase rapidly. In addition to job openings arising from the growth of the trade, opportunities for new workers will result from the need to replace the experienced workers who will retire, or those transferred to other fields of work.

A large increase in the employment of sheet metalworkers is expected mainly as a result of the anticipated large expansion in new residential, commercial, and industrial construction with permanently installed air-conditioning systems.

The largest field for specialization is in that of heating and air conditioning. Others include roofing, design and layout work, and intricate cutting. Most of this work is done by skilled sheet metalworkers in contractors' shops rather than by semi-skilled factory operatives.

Wage rates established through collective bargaining in the principal cities of the United States average $4.50 an hour. This rate is usually somewhat lower in the small towns and villages than in the large cities. Apprentice wages average about half the journeyman rate. The work week is usually forty hours.

Those in the building trades may work only 9 or 10 months each year, because of the seasonal nature of construction. As a result, these workers frequently turn to maintenance and repair work during the off-season.

Requirements for Entry into Sheet Metalwork

Entry into the sheet metal trade is usually accomplished through on-the-job training, such as that provided by the Cooperative Occupational Education program, or through apprenticeship. Apprenticeships usually run for a period of four years. Each year they include

144 hours of related classroom instruction in such things as shearing, punching, rolling, bending, seaming, soldering, and layout. Apprenticeships may be shortened somewhat for persons who have had certain vocational courses.

High school courses particularly helpful to one planning to enter the sheet metal trade include industrial arts shop and drawing courses, mathematics, physics, chemistry, economics, and English.

Although no license is required to work in the sheet metal trade, one is generally required to join a union in the larger cities.

The beginner should be aware of the working conditions he will be exposed to in this trade. Forming and shaping operations are noisy. Occasionally installation or repair work must be done in a cramped position. Other inconveniences may be encountered due to inclement weather, since installation and repair work are frequently done outside. Cuts and burns are not uncommon. Falls from ladders and scaffolding used for installation purposes may result in serious injuries. Even though these inconveniences are apparent, persons interested in shop work and drawing will find that sheet metalwork provides a challenge and an opportunity to earn good wages, while performing a useful service.

<u>Personal Qualifications for the Sheet Metalworker</u>

Desirable personality traits are of extreme importance for success in life. They are the factors on which one is most largely judged when meeting people and when attempting to secure a job; they are also vitally important in holding a job. In fact, studies reveal that the chief cause for 90 per cent of the discharges is due to the lack of desirable personal-social traits, while only 10 per cent is due to lack of job skills. It must be noted, however, that without job skills one would find it exceedingly difficult to become employed. Personal-social traits can be improved only through conscientious effort, when one knows what to improve, how to improve and why improvement is advisable. Among the personal-social traits of chief importance to the sheet metalworker are the following:

<u>Carefulness</u>--Conserve tools, equipment, and materials.

<u>Cooperativeness</u>--Works harmoniously with others.

<u>Courtesy</u>--Respects other's opinions, interests, and desires.

<u>Dependability</u>--Performs as agreed.

<u>Health</u>--Observes habits that promote vitality and vigor.

Initiative--Ability to see what needs to be done and does it without constant supervision or prodding.

<u>Promptness</u>--Seldom tardy or absent from his responsibilities.

<u>Self-Control</u>--Maintains a pleasant disposition and keeps temper under control.

<u>Voice</u>--Uses good English and speaks in a pleasant manner.

Covering
Units 2-4

SHEET METAL FABRICATING MATERIALS

The success or failure of a particular job does not depend entirely upon the manual skills possessed by the workman. Other factors must be considered. Among them is the nature of the material itself. If the material specified for a job will not stand up under the conditions it is exposed to, expert workmanship is wasted.

Probably the chief factor to consider in attempting to make an intelligent choice of material for a job is its ultimate use. In some cases appearance will be the main determinant, in others it may be corrosion-resistant qualities or ease of fabrication. The important thing is to weigh all the advantages and disadvantages of a particular metal against those of others, and then make the final choice in light of these comparisons.

You are expected to become acquainted with the basic fabricating materials used in the sheet metal trade while completing this assignment. This acquaintance should include knowledge of these materials' outstanding characteristics and uses, as well as the specifications related to them. Additional reading is assigned concerning processes involved in the manufacture of sheet metal fabricating materials.

Assignment:

1. Read the references listed below.
2. (a) Send a postcard to the address below requesting a free copy of the handbook, The Pocket Reference Book.
   Carnegie-Illinois Steel Corporation
   Carnegie Building, 434 Fifth Avenue
   Pittsburgh, Pennsylvania
   (b) Gather and prepare sample pieces of various types of sheet stock used in the sheet metal trade. Cut sample pieces 3" x 5" in size. Note each material's main uses and characteristics on a 3" x 5" card that is to be glued to the back of each sample.
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ____________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 40-55
B. New York, Hand Processes, pp. 1-7, 121-122.
F. Smith, Sheet Metal Work, pp. 10-22.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. High-carbon steel is harder than low-carbon steel.

T F 2. The base weight of tin plate varies with its thickness.

T F 3. Black iron sheets are available in standard widths ranging from 2 to 3 feet.

T F 4. An IC coating on tin plate is heavier than a 5X coating.

T F 5. The price for wire and rod is based upon a fixed rate per pound.

T F 6. Galvanized iron is easier to work than black iron.

T F 7. Galvanized wire should generally be used for wired edges on galvanized jobs.

T F 8. Terne plate is used extensively for food containers because of its corrosion-resistant qualities.

T F 9. Tin plate is made from sheets of iron or steel that have been coated with tin.

T F 10. Iron and steel stock should be kept in a dry place to reduce its tendency to corrode.

T F 11. When ordering wire, it is recommended that the diameter be expressed in terms of a gage number.

T F 12. There would be more 18-gage black iron sheets in a bundle than there would be in a bundle of 32-gage black iron.

T F 13. Hard drawn, rather than annealed, steel wire is the type generally used in the sheet metal trade.

T F 14. The base plate of galvanized iron will corrode if the coating comes off.

T F 15. Blooms are rolled from ingots.

T F 16. Coated wire is generally used for jobs made of black iron.

T F 17. Jobs made from uncoated sheet steel should ordinarily be painted.

T F 18. Galvanized iron runs slightly thicker than the corresponding gages of black iron.

T F 19. Wire is usually less expensive than rod.

T F 20. Terne plate has a brighter finish than coke tin plate.

Completion

Directions: Fill in the blank (s) in each statement with the word (s) required to complete the sentence correctly.

1. The "32" of the figures "32 x 36 x 96" which appear on the top sheet of a bundle of black iron refers to the metal's ________.

2. More care is required in working galvanized iron than black iron because the brittle ____________ coating is apt to ____________ ______.

3. The cost of galvanized iron is determined at a fixed rate per ______________.

4. The tool used to measure the thickness of sheet metal is called a ______________.

5. Black plates coated with a mixture of lead and tin are called ______________ plate.

6. Tin plate is a thin sheet of ____________ coated on both sides with pure tin.

7. Round stock obtained in coils is usually called ____________.

8. The primary use of limestone in the manufacture of iron and steel is to remove __________________.

9. Tin plate made with a coating weighing less than two pounds per case is called ______________ tin plate.

10. Round stock obtained in straight lengths is usually called ______________.

11. Galvanized iron is coated with molten ______________.

12. The heating device used in producing pig iron from iron ore is called a ______________ furnace.

13. The finish of sheet and strip steel usually requires no further treatment, when the ___________ rolling process is used.

14. Band iron and angle iron are made from ____________ carbon steel.

15. Sheet steel that has a thickness of ____________ or over is called a plate.

16. Wire is made by drawing rod through a series of consecutively smaller holes in plates which are called ______________.

17. Grades of iron or steel with relatively few impurities have ______________ tendency to corrode than those grades with higher amounts.

18. A sheet of 18-gage galvanized iron is ______________ than a sheet of 32-gage tin plate.

19. Black iron sheets come in bundles weighing approximately ________________ pounds.

20. Sheet metal similar to galvanized iron but with a dull finish of zinc, and does not crack or peel is known as ________________ iron.

21 The price charged for black iron is fixed at so much a ________.

22. The substance that remains after baking coal in ovens to remove its volatile substances is called ________________.

23. The coating on the better grades of galvanized iron is less apt to ________________ than that on the poorer grades.

24. From the open hearth furnace the molten steel is poured into ________________ ______________________________.

25. The process that softens the metal and releases strains caused by rolling is called ________________.

26. Congress adopted the ________________ ________________ ________________ Gage in 1893 as the standard gage for measuring the thickness of iron and steel sheets.

27. The two methods used to plate steel with tin are ______________ and ________________.

28. Sheet steel that has a light coating of tin is referred to as ______________; those with a heavy coating as ___________ tin plates.

29. The greater proportion of tin plate is of the ________________ variety and is used primarily in the manufacture of ______________________.

30. Steel wire may be purchased in gage sizes from ________ to ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Black iron sheets are available in standard lengths ranging in feet from (A) 4 to 6; (B) 6 to 8; (C) 8 to 10; (D) 10 to 12.

_____ 2. The uncoated sheets rolled from iron or a low-carbon steel are referred to by the sheet metalworker as (A) sheet steel; (B) sheet iron; (C) black iron; (D) sheet metal.

_____ 3. Tin plate made with a coating weighing between 7 and 14 pounds per case is called (A) coke tin plate; (B) charcoal tin plate; (C) dairy plate; (D) terne plate.

_____ 4. The unit of measurement for 112-14 x 20-inch sheets of tin plate is called (A) double box, (B) case; (C) base box; (D) base weight.

Matching

Directions: Read statements listed alphabetically in the right hand column, and match them with the appropriate item by placing the letters from the right hand listing in the space provided adjacent to the numbers in the left hand column.

_____ 1. strength
_____ 2. ductility
_____ 3. malleability
_____ 4. hardness
_____ 5. toughness
_____ 6. brittleness
_____ 7. cold-work
_____ 8. corrosion

A. ability of metal to be stretched without breaking
B. ability of metal to resist penetration, wear or cutting action
C. causes metal to become harder and more brittle
D. ability of metal to resist high shock impact
E. ability of metal to hold loads without breaking
F. caused by exposing metal to fumes, water, acids, and moist air
G. shatters easily
H. metal can be rolled, forged, or hammered without cracking
I. ability of metal to retain its original shape
J. ability of metal to resist tearing or shearing

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the reasons for galvanizing sheet steel.

(A)______________________ (C)______________________

(B)______________________

2. List the metals that are generally used to coat iron and steel in order to protect their surfaces from corrosion.

(A)______________________ (C)______________________

(B)______________________ (D)______________________

3. List the reasons why wired edges are used on some jobs.

(A)______________________________ (C)____________________________________

(B)______________________________

Assignment
Sheet No. 2

Covering
Units 5-8

HAZARDS AND SHOP PRACTICES

Your chances for being injured are greater than you realize! Did you know that some statisticians estimate that industrial workers average nearly five injuries each year? Moreover, it is claimed that eac year one out of every six industrial workers will have one lost-time accident, and one out of every 780 persons involved in an accident wi be fatally injured. What will be your record in regard to these figures at the end of the next year?

Fortunately, there is something we can do about accidents. The National Safety Council reports that improper attitudes and lack of skill and knowledge are the chief causes of personal accidents. By following certain precautions and suggestions you can help to reduce the annual loss of nearly one billion dollars that is incurred throug lost wages, medical treatment, and insurance expenses.

In this assignment you will have an opportunity to learn some of the ways of avoiding accidents through the proper use of tools and equipment. Suggestions will also be given on how to cope with certain hazards that may arise in the shop.

Assignment:

1. Read the references listed below.
2. Prepare a list of things you would look for if you were to make a safety inspection of a sheet metal shop.
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ________________.

References:

F. Smith, Sheet Metal Work, pp 9-10.
I. Information Sheets No. 1, No. 2 and No. 3 (this manual).

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Small metal parts should not be placed in one's mouth because of the chance for infection.

T F 2. The gas should be turned on before striking a match when lighting a gas furnace.

T F 3. In order to prevent burns from soldering coppers, it is good practice to always assume that they are hot.

T F 4. A person with long hair should wear some kind of hat or cap to keep the hair from being caught in moving machinery.

T F 5. Most accidents involving squaring shears occur when one person handles the material and the other operates the foot treadle.

T F 6. Loose neckties and open sleeve cuffs are frequently responsible for accidents in the shop.

T F 7. The soda-acid type of fire extinguisher is recommended for use on class "B" fires (oils, greases, and paints).

T F 8. Carbon dioxide type fire extinguishers are used to extinguish class "B" fires (oils, greases, and paints) and "C" (live electrical equipment).

T F 9. Rings worn on fingers frequently cause shop accidents.

T F 10. Fire extinguishers are recommended for extinguishing clothing fires.

T F 11. One should avoid breathing the fumes that are given off when tinning a copper on a salammoniac block.

T F 12. A tool with a mushroomed end is apt to chip.

T F 13. It is good shop practice to hold parts to be ground or buffed with a cloth in order to prevent the fingers from being burned.

T F 14. The first thing to do in the case of a major accident is to render first aid treatment.

T F 15. A person may be seriously injured from a blast of air that is under high pressure.

T F 16. Regular shop-safety inspections will help reduce the occurrence of accidents.

T F 17. Class "A" fires (wood, rubbish, textiles, etc.) should be extinguished with the dry-powder type of fire extinguisher.

T F 18. If a tool needed for a job is not available, one should use the best substitute handy to get the job done.

T F 19. Individual lack of precaution is the chief cause for most of the accidents that occur in the shop.

T F 20. When two workers operate a slip roll forming machine together, the likelihood for accidents decreases.

T F 21. Scrap material should be placed in suitable containers to avoid cluttering up floor space.

T F 22. Acid should always be added to water when making an acid solution.

T F 23. The work should be held on the top part of the wheel when buffing.

T F 24. The face of a sheet metal stake should not be struck directly with a steel-face hammer.

T F 25. Every shop should have first-aid supplies available and someone trained to administer first aid.

T F 26. If a person receives a second or third degree burn, he should be taken to a physician immediately.

T F 27. Winking is a good way to remove foreign particles from one's eye.

T F 28. Concentrated acid that comes in contact with skin will cause burns.

T F 29. The danger of electrical shocks may be reduced when connecting electrical appliances by not touching any pipes.

T F 30. Acid will eat holes in clothing.

T F 31. It is good practice to stand directly in front of a grinder or buffer when turning on the power.

T F 32. No matter how slight a cut or bruise may appear, first aid should always be applied.

T F 33. The soda-acid type of fire extinguisher is recommended for use on class "C" fires (live electrical equipment).

T F 34. Class "A" fires (wood, rubbish, textiles, etc.) are extinguished with either the foam or soda-acid type of fire extinguisher.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Removal of coats or sweaters while working in the shop will help to reduce the danger of catching ____________________.

2. Large sheets of metal should be carried on ________________.

3. Oily rags should be stored in closed ________________ containers.

4. The best way for a person to extinguish the flames when his clothes have caught fire is to roll up in a ________________.

5. Chisels with wooden handles should be driven with a ___________.

6. Steel-face hammers should not be struck against each other because they may ___________________.

7. When drilling holes in metal it is sometimes necessary to use a ____________ or ______________ to hold the material.

8. When the tools and machines in a shop are used by several people, you should wash your hands ____________ and ________________ work to keep from spreading ____________ ______________.

9. A person who has a low accident record may be classified as habitually ______________, ______________, ______________, and ______________.

10. The safe way is the ______________________ way to use a tool or machine.

11. The chance for back injuries is less if the knees are __________ when lifting a heavy object.

12. In order to keep one's fingers from being smashed when cutting sheet metal, they should be kept out of the space between the tin snip's ____________.

13. When carrying edge tools, the cutting edges should point toward the ________________.

14. All grinding should be done on the ___________ of most grinding wheels.

15. Of all the accidents that occur in school shops and industrial plants, approximately ____________ per cent are caused by human carelessness.

16. There is less danger of shop apron strings getting caught in machine parts if they are tied in the ______________.

17. Hand injuries may be reduced when handling large sheets of metal by using ______________ or pads of heavy _______________.

18. The danger of electrical shocks may be reduced when connecting electrical appliances if one's hands and feet are ____________.

19. Oil or water that has been spilled on the floor should be cleaned up immediately to prevent _______________ hazards.

20. When a cold chisel is used for cutting or chipping, ____________ should be worn.

21. In order to reduce hand injuries, files should be furnished with _________________.

22. Burrs should be removed from the edges of sheet metal with a _________________.

23. Stairways should be adequately lighted and kept ______________ of all materials.

24. A person should never use a cold chisel that has a ______________ head.

25. A person should never turn or start a machine without first making sure all safety appliances are in ______________ and ______________ ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List two cases where speed is essential in administering first aid

   (A) ______________________ (B) ______________________

2. List four precautions that should be followed before connecting any electrical appliance.

   (A) ____

   (B) ____

   (C) ____

   (D) ____

3. List the things that must be considered in order to keep from being hurt in the shop.

   (A) ____

   (B) ____

   (C) ____

FIRE EXTINGUISHERS

Fire is a danger that must be constantly guarded against. Good housekeeping and habits of work will serve as important deterrents, but they will not eliminate the chance of fire occurring. Therefore, the know-how of what to do in the case of fire must be clearly understood.

Fire extinguishers can well be worth their weight in gold during the first few minutes after a fire starts and the time the fire trucks arrive. Since different types of extinguishers are used for different classes of fires, it is important to know the types of extinguishers that may be used on a particular class of fire. For example, the use of an extinguishing agent that conducts electricity on a fire in live electrical equipment is apt to produce fatal results. Directions concerning the use, precautions, charging, and inspection are usually shown on the front of the extinguisher.

The chart shown below summarizes the types of extinguishers that are suitable for extinguishing various classes of fire.

<u>Fire Extinguisher Chart</u>

Types	Foam	Dry Powder	Anti-Freeze	Soda and Acid	Carbon Dioxide
<u>Class "A",</u> <u>Fires</u> (Wood rubbish, Textiles, etc.)	x		x	x	
<u>Class "B"</u> <u>Fires</u> (Oils, Greases, and paints)	x	x			x
<u>Class "C"</u> <u>Fires</u> (Live electrical equipment)		x			x

Information
Sheet No. 2

Covering
Units 5-8

FIRST AID

The primary purpose of school or industrial plant first aid is t give prompt treatment to all who suffer injury while at school or work. Every other consideration is secondary to this. First aid is the immediate and temporary care administered to the victim of a serious accident or sudden illness until the services of a doctor can be obtained. Often an accident victim is hurt rather than helped by persons who want to do something but have not had adequate training in giving first aid properly. Competent first-aid people must be abl to find out what the injuries are and must know how to give temporary care for the injuries.

Unless it is known that the injury will not be further aggravate an injured person should not be moved. Improper, careless moving may increase the severity of the injury and may even cause death. It is important to know not only what should be done for an injured person but also what NOT to do.

All schools and industrial plants should have first-aid material available to provide emergency first aid, and they should also have someone on hand at all times who is especially trained to use these materials. Students and workers should report all injuries to their instructors or foremen, no matter how small the injury may seem to be Many small injuries have developed into rather serious cases.

27B
Information
Sheet No. 3

Covering
Units 5-8

SAFETY

Safety in the school shop and in industrial plants is the responsibility of everyone. Regular inspections of the facilities will do a great deal to reduce accidents. This may be accomplished by removing potential causes of accidents, as well as making the people who work in the shops and plants more safety-conscious.

In most of the cases, injury could have been avoided if the proper precaution had been taken. Keeping from being hurt consists of three major ideas:

1. Knowing where an accident might happen.

2. Using safe practices to reduce the chances of an accident.

3. Taking precautions to keep from being hurt if the accident happens in spite of your efforts to prevent it.

Each precaution or safety practice applies to you personally. Remember, learning to use a tool or machine the correct way is learning to use it the safe way.

Listed below are some precautions and suggestions one should observe in his everyday routine. You can not turn on and off safety practices at your convenience; they must become an established habit.

1. Occasionally you may find it convenient to place rivets or screws in the mouth. This procedure is unwise because of the chance of infection from objects which are not sterile.

2. To light a soldering furnace, have the match, or preferably a spark lighter ready, and stand to one side.

3. You can not tell if a soldering copper or piece of metal is hot or cold by looking at it. To prevent a burn, always assume that the object in question is hot.

4. Only one person should be permitted to operate the squaring shears at one time. Most accidents on the squaring shears occur when one person is handling the material and another is operating the foot treadle.

5. Jewlery worn on the hands may get caught in moving parts of machines and cause serious injury. Always remove your rings and wrist watch before going to work, either keeping them in your pocket or locking them in a safe place.

6. In shops which contain open-flame soldering equipment, gas forges, gas furnaces, and welding equipment, there is always a chance that your clothing may catch on fire. The recommended procedure for extinguishing a clothing fire is to smother the flames with the fire blanket.

7. Fumes are given off when a hot copper is placed on a cake of sal-ammoniac during the tinning process. Stand to one side and avoid breathing them. Fellow workers should be protected by proper ventilation.

8. Cold chisels, rivet sets, hand groovers, and punches driven with a hammer become mushroomed with use. A piece from the end could break off when struck by a hammer and cause an injury. To prevent this, periodically grind a bevel on top.

9. Buffing causes most materials to become uncomfortably warm. To prevent the fingers from being burned, students sometimes attempt to hold the work with a cloth or apron. This is a very dangerous practice, since the cloth may be caught in the machine. This situation can be reduced if a container of water is available for cooling the work.

10. Before using a pneumatic tool such as a riveting hammer, blow out any moisture and dirt from the airline prior to attaching the hammer. This prevents clogging the air passages in the hammer. Make sure no one is in line with the blast of air because serious accidents have occurred because of the released pressure of air lines.

11. Always select the correct tool and use it as at was intended to be used. Accidents happen when an improper or a makeshift tool is substituted for the correct tool.

12. Most equipment and power machinery was designed to be operated by one person. Serious accidents may happen when two people try to use or operate equipment or machinery at the same time. This is especially true with the squaring shears, slip roll former, power grinder, and drill press.

13. One of your responsibilities is to keep the floor around you free of scrap material. Place scrap material in containers provided for that purpose. Make a habit of keeping the floor clean.

14. Acid is destructive if allowed to splash on clothing. Acid causes severe and painful burns, especially if not diluted. If it is splashed on the skin, wash it with water at once and report to the teacher. To avoid accidents, always add sulphuric acid to the water. Never add water after the acid is placed in the container.

15. The buffer is a power machine used for polishing the surface of copper, brass, pewter, plastic, and art metals. The operator must know the safe practices that are to be observed before he attempts to use this machine.

    A. Never attempt to use power to attach a buffing wheel to the motor shaft.

    B. Inspect the mounting and shaft fastening to make sure both are in good operating condition.

C. Always wear a good pair of goggles.

D. As the power is turned on, there is rapid increase in the speed and a great strain is placed upon the buffing wheel. It is a good practice to stand to one side when turning on the power.

E. Hold the work being buffed securely with both hands to keep the work from being pulled from the operator.

F. Hold small pieces of work with an approved jig.

G. Hold the work being buffed below center as the wheel revolves toward you.

H. Use a small wheel when polishing the inside of a bowl.

I. Only one person at a time is permitted to use the buffing wheel.

J. Do not use a cloth to hold material being buffed.

K. Do not permit others to stand behind a revolving buffing wheel.

L. Give your full attention to the job.

16. In forming sheet metal with a stake, one should use the hands or a mallet, but never a hammer. Misplaced hammer blows leave marks on the stake and tend to break down the sharp edges.

17. If dust or a small piece of material gets into your eye, hold your eye closed. Never irritate your eye by rubbing it with your hand or blinking your eyelid.

18. Shops often contain a number of electrical appliances having electrical cords, such as lamps, soldering coppers, and portable drills. Four precautions must be taken before connecting any electrical appliances:

A. Your hands must be dry.

B. The switch, if any, must be turned off.

C. The electrical cord should be in good condition.

D. You must not be standing in a damp place or touching a plumbing fixture or any metal pipe.

19. Good personal habits that help prevent accidents are:

A. Wear a shop apron. Always tie your apron in the back.

B. Remove outer garments. When you leave at the end of the work period, there is less chance of catching cold if you have a coat or sweater to put on.

C. Wash your hands. Washing your hands before going to work and again at the end of the work period is good practice.

D. Roll long sleeves or button securely and tuck in or remove your tie.

E. Keep long hair in place. Loose hair may cause distraction and may be caught by belts or revolving parts.

F. Remove your rings and wrist watch.

G. Report all injuries at once.

H. Always walk in the shop.

I. No horseplay.

20. When handling large sheets of galvanized or black iron, always protect your hands with a pad made by folding a piece of heavy paper or heavy gloves. Carry large sheets of metal on edge.

21. Always put oily rags and cleaning cloths into a safety metal container. This will prevent spontaneous combustion.

22. Several safe practices that apply to hand tools are:

A. Carry edge tools and tools with sharp points with the point or cutting edges down.

B. Never use a tool with a loose part or broken handle.

C. Use a mallet to drive tools with wooden handles.

D. Wear goggles when cutting rivets or when chipping with a cold chisel.

E. Always put a handle on a file before using it.

F. Never strike a hardened steel surface with a hammer because the faces may chip and cause injury.

G. Keep your fingers from between the handles when finishing a cut with tin snips. This will prevent them being smashed.

23. Safe practices that apply to machine tools for sheet metal are:

A. Use a vise and clamp to hold material when drilling holes in sheet metal.

B. Grind only on the face of the grinding wheel.

C. Always wear goggles to trim metal.

24. When lifting a heavy object, keep your back straight and bend your knees.

25. Spilled oil and paint make floors slippery. Remove any oil or paint at once. If you find that the floor around your work station is not safe, report it to the foreman or instructor.

26. Some precautions concerning stairways and ladders are:

    A. Never use a defective ladder.

    B. Be sure the ladder has a solid footing.

    C. Avoid standing on the top of a stepladder.

    D. Always face the ladder when going up or down.

    E. Keep stairway landings free of all materials; do not place tools or materials on stair treads.

Assignment
Sheet No. 3

Covering
Units 10-20

BASIC NON-CUTTING HAND TOOLS AND PROCESSES

In ancient times a man's skills depended mainly upon the strength of his hands, for there were no tools as we know them today. They influenced directly his freedom and nature of living. Gradually man discovered that he might obtain certain added advantages by using various implements which he developed along with his skills. It was through this combination of invention and development of skill that our forefathers were able to give birth to our present-day industrial system.

Although industry is considered by some to be simply a combination of men and machines, it involves far more. It includes, among other things, skills in the care and use of tools. Tools are not only vital in manufacturing, but also in repair and maintenance work. Some individuals tend to disregard the importance of learning how to use and care for tools properly, since they are relatively simple compared to the ingenuity of mass-production machines. This point of view is a mistake because it is essential for the well-trained tradesman to be proficient with tools as well as machines.

You will be expected to use the basic non-cutting sheet metal tools correctly and to care for them properly after studying this assignment and practicing on the job.

Assignment:

1. Read the references listed below.
2. Send a post card to the address below requesting a free copy of the booklet, A B C's of Hand Tools.
   General Motors Corporation
   Detroit, Michigan
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by ________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 1-21
B. New York, Hand Processes, pp. 8-25, 33-47.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Bench plate and stakeholder are synonymous.

T F 2. The face of a hammer used for setting down an edge is slightly concave.

T F 3. A job's stretchout is the same as its layout.

T F 4. Allen wrenches are usually of the adjustable type.

T F 5. A half pattern would not ordinarily be used to lay out each part for a job, if several duplicate parts are required.

T F 6. The maximum number of 5½" x 9" pieces that may be cut from a 30" x 96" piece of sheet metal is 40.

T F 7. The tip of a screw driver should be hardened and tempered.

T F 8. Care should be taken to clean dirt and burrs from the surfaces that are to be clamped.

T F 9. For best results a hammer handle should be grasped rigidly.

T F 10. The quality and condition of a mechanic's tools are frequently an indication of the quality of his work.

T F 11. The peen end of a hammer used for riveting is single-tapered.

T F 12. A thoughtful sheet metalworker never uses a stake to back up stock that is to be cut with a cold chisel.

T F 13. The better sheet metalworkers use both faces of a soft-head hammer to facilitate more equal wear.

T F 14. Brake lines should be scribed with a scratch awl.

T F 15. The point of the tool used for scribing around a pattern should be sharpened at approximately 60 degrees.

T F 16. The range of weights for ball-peen hammers is less than that for riveting hammers.

T F 17. Wedges are used as a means of holding the hammer head on its handle.

T F 18. Setting hammers are available in a greater range of sizes than those used for riveting.

T F 19. The use of too large size monkey wrench is apt to result in a broken fastener.

T F 20. Copper is a satisfactory material for soft removable vise jaw coverings.

T F 21. A hard pencil (9H) is recommended for layout work on such metals as stainless steel, monel, and aluminum.

T F 22. The cheek of a hammer used for setting down an edge is slightly convex.

T F 23. It is impossible to grip work rigidly between vise jaws that have been serrated.

T F 24. The tip of a screw driver is tanged to prevent turning in the handle.

T F 25. The best grade wrenches are made from a high-quality steel that has been alloyed with chromium and vanadium.

T F 26. It is advisable to place sheet metal upon a ferrous metal surface when laying out a job.

T F 27. Poor judgment in applying force to small tools is apt to result in injury to one's hands or fingers.

T F 28. To facilitate its efficient use, the sides of a screw driver tip should be slightly convex.

T F 29. A paper pattern should not be used to lay out a series of duplicate parts.

T F 30. A screw driver is apt to be broken if it is used as a chisel or pry bar.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. An improperly shaped screw driver tip is apt to burr or damage the screw ________________.

2. The tip of a Phillips screw driver is shaped like a _____________.

3. A nut that does not start easily may generally be loosened by striking the handle of the wrench with the heel of one's ________.

4. Hammers that have heads made entirely of soft material are called ________________.

5. The jaws of a monkey wrench should be placed so that they point in the ____________ direction in which the work is being turned.

6. For best results the hammer handle should be grasped near the ________________.

7. Conservation of material may be achieved in layout work by ________________ irregular-shaped patterns.

8. Usually it is best to place a pattern at one ________________ of a piece of sheet metal for economy in layout.

9. The surface of aluminum should not be ________________ because it is apt to weaken it or ruin its surface.

10. Soft removable vise jaw coverings are used to prevent ____________ material that is to be clamped in a vise.

11. The handle of a screw driver is apt to split when struck with a ________________.

12. Patterns involving many details and accurate fitting may be held in proper place most satisfactorily by means of ______________.

13. Soft-head hammers will not damage the surface of a material that is ______________ than the head of the hammer itself.

14. Special care must be taken in using a ____________ clamp to see that both jaws are in complete contact with the work.

15. Pliers are used by sheet metalworkers for the purpose of holding and ____________ sheet metal parts.

16. A light application of _______ on the threads of a machine screw will facilitate its being driven into a tapped hole.

17. The size and shape of screw drivers are largely determined by the ____________ for which they are intended.

18. Stakes are used primarily when machines are not ____________ or ______________for the job at hand.

19. A stake that is square on one end and round on the other and flat on top will probably be a _____________________stake.

20. A universal holder is used for _________________.

21 Stakes are used as an aid in ____________________ sheet metal.

22. Screw drivers are used primarily for ___________________ or ___________________ slotted screws.

23. The accuracy of a pattern may be ______________ by using a dull prick punch for layout work.

24. The portable anvil which is used for backing or bucking up rivet heads and straightening out kinks, is called a hand____________.

25. When striking a center punch with a hammer the point of action should be watched, rather than the head of the _______________.

26. The tip of a screw driver blade should be in ________________ condition.

27. It is advisable to keep one face of a soft-head hammer ________ for flat work.

28. One who tightens a vise by striking its handle with a hammer is apt to be accused of possessing _______________ work habits.

29. The handle of a file is protected from splitting by a ________ ________________.

30. The proper size Phillips screw driver will not ______________ and burr the end of a Phillips head screw.

31. The final adjustment of a ____________ clamp is made with the rear screw.

32. It is important to keep prick punches ____________ for layout work.

33. The use of too large a size open-end wrench frequently results in ____________ to one's hands and the fastener.

34. Layout work on ordinary metals is done with a sharp ________________.

35. The maximum number of 9" x 11" pieces that may be cut from a 30" x 96" piece of sheet metal is ____________.

36. In transferring a pattern to a piece of sheet metal, the pattern should usually be held in position with ______________ or ________________.

37. A high degree of accuracy may be achieved in transferring a pattern by tilting the scratch awl with the point ____________ the pattern.

38. The points where holes are to be punched are marked with a ______________ ______________.

39. Tools will last longer, give better service, and be less expensive over a long period of time if they are properly ____________ and ____________ for.

40. The chisel used most by sheet metalworkers is a (an) ____________ ____________ ____________.

41. The instrument used to draw large arcs and circles is called a (an) ____________ ____________ or ____________ ____________.

42. The cup-shaped hole in a rivet set is used to form the ____________ ____________ of a rivet.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. The types of clamps used in bench work are:

(A) ______________________ (B) ______________________

2. List the component parts of a standard blade screw driver.

(A) ______________________ (C) ______________________

(B) ______________________

3. List the common-shaped pieces of iron that are usually found around any metal shop.

(A) ________________ (C) ________________ (E) ________________

(B) ________________ (D) ________________

4. List the three types of patterns used in sheet metalwork.

(A) ________________ (C) ________________

(B) ________________

5. The commonly used types of pliers for sheet metalwork are:

(A) ________________ (C) ________________

(B) ________________

6. The materials used for soft-head sheet metal hammers are:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________ (F) ________________

7. Five types of hammers that the sheet metalworker should have for his work are:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________

8. List the different kind and shapes of files used most commonly in sheet metalwork.

(A) ________________ (E) ________________

(B) ________________ (F) ________________

(C) ________________ (G) ________________

(D) ________________

Matching

<u>Directions:</u> In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. square stake

_____ 2. hatchet stake

_____ 3. conductor stake

_____ 4. needlecase stake

_____ 5. hollow mandrel stake

_____ 6. candlemold stake

_____ 7. beakhorn stake

_____ 8. creasing stake

_____ 9. double-seaming stake

_____ 10. bottom stake

A. has two cylindrical horns of different diameter which are used for seaming, riveting, and forming

B. straight stake with hard-handed edge which may be used for making straight, sharp bends

C. has a slot in which a bolt slides permitting the stake to be clamped rigidly to the bench

D. has one horn tapered for forming conical work, and the other horn has grooved slots for turning, wiring, and heading operations

E. has a fan-shaped end which is used for dressing a flanged circular bottom

F. available in three different shapes of heads; coppersmith, bevel edge and common

G. consists of two horns with elongated heads which are used for backing up small cylindrical jobs when laying down double seams

H. a general purpose stake having a round tapered horn on one end and a square tapered horn on the other

I. has a round slender horn for small tubes and wire rings and a heavier horn of rectangular cross-section for square work

J. has a large diameter horn for general purposes, and a small diameter horn for tube forming or reshaping.

Units 21-28

HAND CUTTING TOOLS

Sheet metalworkers require many different types of cutting tools in doing their work. Such tools are available in a great many different styles in order to meet the various requirements. They are designed for the purpose of cutting both straight and curved parts.

Every job that is made from sheet metal involves a certain amount of cutting at some time or other. Different types of snips and shears are available for cutting material into the desired shapes. Rough edges are frequently removed with a file. Punches and drills are used to shape holes for fasteners. It is essential that one desiring to learn the sheet metal trade become familiar with and develop skills in the performance of such operations.

In this assignment you are being given an opportunity to learn how to use correctly and care for properly the various types of hand cutting tools that are used in the sheet metal trade.

Assignment:

1. Read the references listed below.
2. (a) Make a list of the hand type cutting tools a good sheet metal worker should have in his tool box.

   (b) Estimate the cost of each tool listed above.
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ______________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 8-17, 66-79.
B. New York, Hand Processes, pp. 26-32, 48-55, 76-80, 89-105, 115-120

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Movable parts of a hand punch should be oiled frequently.

T F 2. A new hack saw blade is apt to be broken if it is started in an old cut.

T F 3. A chisel that does not maintain a sharp cutting edge probably needs to be rehardened and properly ground.

T F 4. The better grade of files will cut on both the forward and return strokes.

T F 5. Hack sawing should be done approximately one-fourth of an inch away from the end of the vise jaws.

T F 6. One set of teeth is cut deeper than the other in a double cut file.

T F 7. The head rather than the cutting edge, should be watched when using a chisel.

T F 8. It is advisable to clamp material in such a way that the greatest number of teeth possible come in contact with the surface being sawed.

T F 9. The center should be marked with a prick punch before a hole is cut with a solid punch.

T F 10. For best results in cutting sheet metal one should use the entire length of the hand-snips blades for each cut.

T F 11. It is permissible to allow hand-snips to be in contact with the bench top when cutting sheet metal.

T F 12. Single-cut teeth form an angle of from 65 to 85 degrees with the edge of a file.

T F 13. The teeth of a file are apt to be damaged if they are allowed to come in contact with other tools.

T F 14. Material that chatters while being filed is apt to result in the breakage of the file's teeth.

T F 15. Files break or chip easily.

T F 16. It is sound shop practice to cut thick sheet metal with the bull dog snips.

T F 17. A drill is likely to stay sharp longer if a lubricant is used.

T F 18. A drill will cut over size if its lips are unequal in length.

T F 19. Punches can be used more successfully on light-gage sheet metal than drills.

T F 20. It is recommended that when light-gage materials are filed, they be filed in a crosswise direction whenever possible.

T F 21. It is recommended that hack sawing be done with only the middle half of a blade.

T F 22. The bend should be started in the middle when forming a round job by hand.

T F 23. A 10-inch hack saw blade would measure 10 inches from end to end.

T F 24. The chuck of a hand drill will hold larger size twist drills than the breast drill.

T F 25. A single-cut second file will cut more rapidly than a single-cut bastard file.

T F 26. A blowhorn stake would be satisfactory to form a square corner by hand.

T F 27. A properly formed job will not have any kinks or marks on its surface.

T F 28. Machine cutting tools frequently cannot be used on a particular job because of its shape, construction, location, or position.

T F 29. Hack saw blades will become soft and useless if one saws too fast.

T F 30. A little oil applied to the sides of a hack saw blade when making a deep cut will help prevent binding.

T F 31. The hardness is apt to be removed from a file if it is heated.

T F 32. The lips of a twist drill must have a clearance angle of 59 degrees for average work.

T F 33. Single-cut files remove material faster than double-cut files.

T F 34. No cutting lubricant is necessary when hack sawing by hand.

T F 35. A piece of scrap metal should be inserted in the groove for a groove seam of a job prior to its being formed round by hand.

T F 36. The full length of the cutting edge of a chisel should be used in starting a cut in light sheet metal.

T F 37. A setting down hammer should be used to form a square corner when using a stake.

T F 38. The lower speed breast drills are used for the smaller size twist drills.

T F 39. A center punch mark should be used to draw the center of an improperly started hole into its correct position.

T F 40. Lard oil is a suitable lubricant to use in drilling a hole in mild steel.

T F 41. A pair of aviation snips may be used to cut either to the right or left.

T F 42. The center portion of vise jaws should be used generally for clamping narrow band iron.

Completion

Directions: Fill the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. If possible, waste material should be cut from a sheet metal part in ______________ continuous piece.

2. The diameter of a stake horn should be ___________ than the diameter of the job formed.

3. A hand punch can be used only when the holes to be punched are near the ___________ of the sheet.

4. The wire brush that is used to clean files is called a file ____________.

5. A cold chisel is used to cut cold metal _________ than itself.

6. The cutting edge of a cold chisel is ground to form an included angle of between _________ and ___________ degrees.

7. The tendency of a chisel to damage the jaws of a vise while cutting light-gage sheet metal is prevented by protecting the jaws with two pieces of angle ___________.

8. The centers of holes to be laid out on 24-gage or less material should be marked with a ___________ punch.

9. Chipping refers to the operation for removing stock from _____________ surfaces.

10. The wire brush used to clean a file should be moved in a direction ____________ to the file's teeth.

11. Files with loose handles, or no handles at all, frequently cause injury by causing the file's _____________ to be drawn into the palm of a workman's hand.

12. A wingnut is used to tighten the blade in a __________ _________ type of hack saw frame.

13. Every other tooth is bent slightly to the right on an __________ set hack saw blade.

14. The number of teeth required per inch for a hack saw blade should be determined in light of having a minimum of ________ or more teeth in contact with the surface being sawed.

15. The edges of hand snips should be held at _________ angles to the material being cut.

16. When cutting sheet metal with straight snips, one should grasp the ________________ part of the sheet with his free hand.

17. Short sections of teeth are bent in opposite directions on a ___________ set hack saw blade.

18. The edge of a file which does not have any teeth is called a ________________ edge.

19. Single-cut files are used for thin work and _________________.

20. All standard mill files are ______________ cut.

21. The cutting surface of a file is referred to as the ___________.

22. R.P.M. refers to _____________ ______________ _____________.

23. Chisels should be cooled periodically while they are being ground to prevent drawing the _______________.

24. Hand snips should be adjusted when the blades _____________ or are too far apart.

25. The tendency to tear light sheet metal at the corners while it is being cut with a chisel is reduced by starting the cut at the ________________ of the line rather than at the end.

26. A hack saw blade with no set would __________________.

27. Every third tooth is straight on a ________________ set hack saw blade.

28. The pressure should be released on the _______________ stroke of a hack saw.

29. If the teeth in a hack saw blade are too fine for a particular job they will _______________.

30. One handle remains stationary in the operation of ____________ ________________ shears.

31. Bail is the trade term for a ______________ _______________.

32. The metal around a punched hole is flattened with a ____________.

33. Snips for heavy-gage materials have ______________ handles than those used for light materials.

34. The tendency of teeth on a new file to catch and break is reduced if the file is broken in on a ________________ surface.

35. Soft metal particles may be removed satisfactorily from a file with a piece of ______________ _____________.

36. The cutting end of a cold chisel is ________________ and ______________ to make it stand up longer.

37. It is dangerous to use a chisel with a ________________ head because the burrs might fly off and cause an injury.

38. Files designed especially for smoothing lead, solder, aluminum, and stainless steel are called ________________ files.

39. The centers of holes to be laid out on 22 gage or heavier material should be marked with a ________________ punch.

40. Hack saw blades are classified by hardness as being either _________ hard or ________________.

41. The end of the file opposite the portion that fits into the file handle is called the ________________.

42. The all-purpose file particularly adapted for finishing purposes is called a ________________ file.

43. The ease with which a piece of metal may be cut depends on the speed and ________________ applied to the saw.

44. Fine tooth hack saw blades are ________________ set.

45. The necessary opening to start an inside curved cut with hand snips is made with a hammer and ________________ or hollow ____________________.

46. When cutting a circle from sheet metal, handling may be facilitated by cutting off the ________________ of the stock first.

47. Hand punches are used extensively for punching _____________ and bolt holes.

48. Ragged edges or "fins" are removed from sheet metal with a ________________ cut file.

49. When the levers of a properly adjusted hand punch are closed, the punch should enter into the die approximately ______________ to ________________ inch.

50. The included angle of a chisel should be _____________ for hard metals that it is for soft metals.

51. Carbon steel twist drills cannot be operated at as high speeds nor do they stand up as long as drills made from _____________ ________________ steel.

52. The length of a file is specified as the distance from its ________________ to ________________.

53. Nicking sharp corners that are to be hack sawed reduces the tendency to ________________ the blade of its teeth.

54. The starting point on material to be hack sawed should be marked with a ________________.

55. Material can be conserved when cutting large holes, by cutting within ______________ inch of the line with a hammer and chisel.

56. When cutting heavy flat stock with a chisel, the material should be cut approximately ________________ the way through from each side.

57. Holes that are to be punched in sheet metal should be backed up with the ________________ ______________of a block of hardwood or a ________________ cake.

58. The teeth of a properly inserted blade should point away from the hack saw ____________________.

59. A circle the size of the hole to be punched should be scribed on the metal when the hole is to be cut with a ___________ punch.

60. Carbon steel hack saw blades usually have a carbon content varying between _____________ to ___________ per cent.

61. A file should be ________________ a little on its return stroke.

62. The material from which files are made is usually a high grade of ______________ __________________.

63. The number of teeth used for hack saw blades range from ________ to ___________________ per inch.

64. A hack saw cut should be started with the ___________ end of the blade.

65. Holes that have been drilled in light sheet metal are apt to have _________________ on their edge.

66. Adjustable hack saw frames are designed to accommodate blades of _______________ to ____________inches in length.

67. A new file should always be _____________ to reduce the tendency of the teeth to clog.

68. "Pins" should be removed from a file with a wire ______________.

69. There is less tendency for the corners of a cold chisel to dig into a surface if the cutting edge of the chisel has been ground slightly _____________________.

70. Snips that have blades shaped so they will cut either irregular or straight outlines are called ______________________ snips.

71. The compound-lever shears are constructed with handles so arranged as to give sufficient _________________ for cutting______________ gage metal.

72. Snips specially designed for cutting scrolls and circles of any diameter are called ______________ _________________.

73. Hollow punches are used to punch __________ holes than those made with a solid punch.

74. Button punching is done with a __________ __________ punch.

75. In button punching, the die is set so the punch makes __________ but does not punch ________________ the metal.

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Among the various types of hand snips available (A) straight snips; (B) circle snips; (C) hawk's-bill snips; (D) aviation snips; are the most practical because they may be used for a greater variety of work.

_____ 2. Cold chisels are usually made from steel containing approximately (A) 0.20%; (B) 0.40%; (C) 0.60%; (D) 0.80%; carbon.

_____ 3. The largest size hole that can be cut with a hand punch is approximately (A) 1/4"; (B) 1/2"; (C) 3/4"; (D) 1".

_____ 4. Bulldog snips, rather than straight snips, are recommended for cutting mild steel between (A) 28 and 32; (B) 24 and 28; (C) 20 and 24; (D) 16 and 20; gage.

_____ 5. The teeth of a double-cut file form angles of approximately (A) 50 to 55 and 80 to 90 degrees; (B) 40 to 45 and 70 to 80 degrees; (C) 30 to 35 and 60 to 70 degrees; (D) 20 to 25 and 50 to 60 degrees; with the edge of the file.

_____ 6. Sheet metalworkers generally find greater use for the (A) cape; (B) round nose; (C) flat; (D) gage; type of chisel.

_____ 7. The included angle of a twist drill used for average work should be approximately (A) 30; (B) 60; (C) 90; (D) 120; degrees.

_____ 8. Among the following types of hand snips, the least satisfactory for cutting an inside curve is the (A) hawk's-bill; (B) circular; (C) trojan; (D) aviation.

_____ 9. The capacity of hawk's-bill snips is (A) 10; (B) 15; (C) 20; (D) 25; gage mild steel.

_____ 10. Manufacturers recommend a cutting speed for hack sawing of between (A) 20 to 30; (B) 40 to 50; (C) 60 to 70; (D) 80 to 90; strokes a minute.

_____ 11. The various size holes that may be made with solid punches range from (A) 3/32" to 1/2"; (B) 3/16" to 3/4"; (C) 1/8" to 1"; (D) 1/4" to 1/2".

_____ 12. The various size holes that may be made with hollow punches range from (A) 3/8" to 2"; (B) 1/2" to 6"; (C) 1/8" to 3"; (D) 1/4" to 4".

_____ 13. Among the following types of hand snips, the least satisfactory for notching is the (A) straight; (B) combination; (C) bulldog; (D) stock.

_____ 14. The capacity of aviation snips is (A) 8; (B) 16; (C) 24; (D) 30; gage mild steel.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the two most common types of cuts used for files.

(A) ____________________ (B) ____________________

2. The speed at which twist drills should revolve depends upon:

(A) ____________________ (C) ____________________

(B) ____________________

3. List the commonly used types of hack saw frames.

(A) ____________________ (B) ____________________

4. Sheet metalworkers generally use a cold chisel for:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

5. List the four common types of shanks used for twist drills.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

6. Systems for designating drill sizes are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

7. Types of alloys steels used for hack saw blades are:

(A) ____________________ (C) ____________________

(B) ____________________

8. List the three main parts of a twist drill.

(A) ______________________ (C) ______________________

(B) ______________________

9. Methods for determining the size of a drill are:

(A) ____

(B) ____

(C) ____

10. Factors in determining the size handle to use for a file are:

(A) ______________________ (B) ______________________

11. Major groups in which hand snips may be classified are:

(A) ______________________ (B) ______________________

12. Shapes of the commonly used files are:

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

13. The functions of twist drills flutes are:

(A) ______________________ (B) ______________________

14. A file is made up of the following parts:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

1. Stakes used for various operations:

_____	1.	creasing stake	A.	form square jobs
_____	2.	beakhorn stake	B.	form cylindrical jobs
_____	3.	blowhorn stake	C.	form conical jobs
_____	4.	conductor stake	D.	form end of bail

2. Teeth per inch required for hand hack sawing various materials: (Note: Each letter may be used more than once.)

_____	1.	mild material	A.	14 teeth per inch
_____	2.	thin tubing	B.	18 teeth per inch
_____	3.	angle iron	C.	24 teeth per inch
_____	4.	tool steel	D.	32 teeth per inch
_____	5.	iron pipe		
_____	6.	sheet metals		
_____	7.	brass		
_____	8.	electrical conduit		
_____	9.	high speed steel		

3. Type of snips used for various jobs: (Note: Each letter may be used more than once.)

_____	1.	bulldog snips	A.	valuable for cutting holes in pipe
_____	2.	stock shears	B.	12-gage mild steel maximum capacity
_____	3.	circle snips	C.	blade inlaid with special alloy for cutting stainless steel
_____	4.	hawk's-bill snips	D.	cuts irregular compound lever type and straight patterns with less effort
_____	5.	aviation snips		
_____	6.	trojan snips

Units 29-39

SHEET METAL SEAMS AND HEMS

Construction materials of industry have at least one characteristic in common--they all must be of such a nature that they can be fabricated. Without this characteristic they would be of relatively little use. Whether the materials be wood, plastic, or ceramic, they all involve special processes that are used in their fabrication. Similarly, sheet metal has special processes that are used in its fabrication.

Seaming and hemming are basic operations in the sheet metal trade. They are used as a means of joining edges together, stiffening, strengthening, and eliminating sharp edges. Every sheet metal worker should be familiar with the uses of the more common types and the procedures for making them, since many jobs will involve their use.

Information is included in this assignment which will enable you to become acquainted with the more common types of seams and hems used in sheet metalwork. Descriptions and specifications, as well as uses and procedures, will be studied concerning the grooved, single, double, dovetail, and Pittsburg types of seams, and single, double, and wired-edge hems.

<u>Assignment</u>:

1. Read the reference listed below.
2. In this assignment you are to complete either part (a) or (b).
    - (a) Prepare a series of small sample seams and hems from scrap stock. Base your selections on the types that are most commonly used in the shop where you work. Indicate on each sample the necessary specifications and formulas.
    - (b) Sketch a series of sample seams and hems that are most commonly used in the shop where you work. Use a small card for each sketch. Indicate below each sketch the necessary specifications and formulas.
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ____________________.

<u>References</u>:

A. Bruce and Meyer, <u>Sheet Metal Shop Practice</u>, pp. 9, 43, 54, 81-172.
B. New York, <u>Hand Processes</u>, pp. 71-75, 81-88, 106-114, 122-145.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A combination hammer resembles a setting-down hammer more than a riveting hammer.

T F 2. The depth for notching a dovetail seam varies from ¼ to ½ inch.

T F 3. A single seam may be used as a stop on a cover to prevent its slipping into a container.

T F 4. The inner edges of a double seam should be approximately one thirty-second of an inch larger than the over-all width of the seam.

T F 5. Cylindrical jobs having straight sides are usually wired before they are formed.

T F 6. The designated weight of tinners' rivets decreases as the shank diameter size increases.

T F 7. A dovetail seam may be used to join two sections of pipe together.

T F 8. Metal must be shrunk when making an outside circular flange.

T F 9. A rivet set is used to upset a rivet.

T F 10. Double seams are sufficiently strong so that it is not necessary to use rivets or bolts to hold them in place.

T F 11. Wide double seams are easier to form on rectangular than on cylindrical jobs.

T F 12. A double seam is frequently referred to as a hammer lock.

T F 13. The edges of a grooved seam will be cut if the groover is not wider than the seam.

T F 14. Tinners' rivets are available in lengths ranging from approximately 1/8 to 1/2 inch.

T F 15. Wider circular flanges can be formed from light-gage sheet metal rather than heavy-gage.

T F 16. The large ends of tapered jobs are usually wired after they have been formed.

T F 17. A setting hammer is recommended for completing the final fold of a double seam.

T F 18. A hand groover is used to finish a Pittsburgh lock after its edges have been joined.

T F 19. A rivet should not be upset too much because it will distort the metal around it.

T F 20. Soldering is required to make double seams watertight.

T F 21. A hollow mandrel stake may be used for grooving both cylindrical and flat stock.

T F 22. Metal becomes thicker as it is shrunk.

T F 23. The curvature of stake horn should be greater than the curvature of a job on which a grooved seam is to be locked.

T F 24. The ends of the wire for a wired edge should meet at the center of a cylindrical job's grooved seam.

T F 25. The flanged edge of a Pittsburgh lock should always be less than the depth of the pocket.

T F 26. A wavy seam is apt to result on curved work or fittings if the lap of a Pittsburgh lock is more than one-fourth inch wide.

T F 27. The edges of a job with a grooved seam should be folded before its wired edge is completed.

T F 28. The Pittsburgh lock is used frequently in heating and ventilating work.

T F 29. Cracks are less apt to develop in stretching metal than the tendency to buckle.

T F 30. A hard-head rather than a soft-head hammer is recommended for stretching metal.

T F 31. The total allowance for a grooved seam should be added to each side of the pattern.

T F 32. The hole in the main member of a tee-joint is usually laid out and cut before fitting the tee.

T F 33. The allowance for double and single seams are the same.

T F 34. A cross-peen hammer should be used to complete a wire edge.

T F 35. When making a grooved seam, the groove should be started in the middle of the seam.

T F 36. A rivet set may be used to head either countersunk or flat head rivets.

T F 37. The cutting edges of snips and squaring shears will be nicked if they are used to cut wire.

T F 38. Riveting would be more satisfactory than a groove seam for joining 10-gage sheet metal.

T F 39. Collars may be dovetailed to another part of a job without the use of solder, bolts, or rivets.

T F 40. In order for a person to use a micrometer, he will need a good background in mathematics.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Malleable iron rivets are made more corrosive resistant and easier to solder by coating them with ____________.

2. A space grooving rail is used to ____________ inside grooved seams.

3. The body of a rivet is called the ____________.

4. Grooved seams are seldom formed on material heavier than ________ gage.

5. Dovetail seams must be ____________ if they are to be watertight.

6. The shallow cup-shaped hole in the end of a rivet set is used to ____________ the ____________ on the rivet.

7. A wired edge on 24-gage or lighter material requires an allowance equal to __________ times the diameter of the wire.

8. The hand tool used for locking an outside grooved seam is called a ____________ ____________.

9. Metal must be shrunk when making an ____________ circular flange.

10. Hand riveting may be done either with a hammer and rivet ________ or a pneumatic riveting ____________ and die.

11. Allowances for grooved seams on sheet metal 24-gage or lighter, are equal to __________ times the width of the seam.

12. Rivet holes should be made slightly ____________ than the diameter of the rivet.

13. The ends of a wire for a wire edge should meet approximately ________ to ________ inches from one end of the sheet metal.

14. The head of a flat rivet is thicker and smaller in diameter than the similarly shaped head of a _______________ rivet.

15. The tendency for a flange to buckle may be reduced by using a _______________ head hammer.

16. The depth for notching a dovetail seam varies from __________ to __________ inch.

17. A wide inside circular flange is more apt to _______________ than a narrow flange.

18. Dovetail seam locks can be formed with either _______________ or a hammer and _______________.

19. The length of a _______________ rivet is not equal to the length of its shank.

20. Hammering tends to make metal hard and _______________.

21. Five hundred 8-ounce rivets would actually weigh __________ounces.

22. Theoretically, the metal at the inner edge of the outside circular flange is _______________ than it is at the outer edge.

23. Center lines for rivet holes should not be laid out closer than __________ times the diameter of the rivet from the edge of the stock.

24. Allowances for grooved seams on sheet metal 22-gage or heavier, are equal to __________ times the width of the seam plus ________ times the thickness of the material.

25. The deep hole in the end of a rivet set is used to ______________ the metal and rivets together.

26. The deep hole in the end of a rivet set should be slightly larger in diameter than the _______________ of the rivet to be headed.

27. The peen ends of a combination hammer are slightly ______________ to prevent damage to the metal.

28. Single seams are frequently referred to as _______________ seams.

29. After a seam has been grooved, it should be finished by flattening it with a _______________.

30. Wired edges are _______________ where they cross seams to eliminate the appearance of bulges.

31. In heading a rivet, the set should be held at _______________ _______________ to the job to prevent marring the metal.

32. Wired edges should always be formed on the _______________ of a job unless otherwise specified.

33. The diameter of a flanged bottom to be joined to a cylinder by means of a single seam should be __________ inch larger than the outer diameter of the body flange.

34. The Pittsburgh lock has an advantage over the double seam in that it can be assembled on the job without the use of _______________.

35. The distance between the slits to be cut for a dovetail seam varies from __________ to __________ inch, depending upon the size of the job.

36. The recessed portion of a hand groover should be approximately __________ of an inch wider than the seam to be locked.

37. The allowance for heading a rivet should be equal to __________ times the rivet's diameter.

38. In fitting a tee-joint of less than 90 degrees the ______________ of the tee should be notched and bent over the inside of the main pipe.

39. The length of wire required for a circular opening wired edge is equal to ____________ times the _______________ of the job plus the ______________ of the wire.

40. The flange part of a dovetail seam is held in position between the bent edges known as ________________ and _______________.

41. As a general rule, flanges should be made as narrow as possible to reduce the tendency of ______________.

42. Soft malleable iron is used for rivets because it will not _______________ while the heads are being formed.

43. Tinners' rivets are specified by their type of head and their weight per _______________.

44. The most common types of wire used in wire edges are ____________ and _______________.

45. The manufacturers of wire recommend using ~~the~~ _______________ _______________ _______________ _______________ to determine size of wire when ordering.

46. To get an accurate measurement of thickness of wire one should use a _______________.

47. The Pittsburgh seam is sometimes referred to as a _______________ _______________ or _______________ _______________.

48. The type of seam generally used for assembling cross seams of ducts is called a (an) _____________ _____________ _____________.

49. Generally, rivets should protrude through the pieces being joined from __________ to __________ times the diameter of the rivets.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The smallest size of common hand groovers are approximately (A) 3/64; (B) 3/32; (C) 3/16; (D) 3/8, inch in width.

_____ 2. After notching the end of a pipe for a dovetailed seam, alternate pieces of metal are bent out to form (A) locks; (B) stops; (C) seams; (D) a flange.

_____ 3. A No. 686 rivet set should be used for heading a (A) 10 ounce; (B) 2 pound; (C) 8 pound; (D) 14 pound rivet.

_____ 4. The largest size common hand groovers are approximately (A) 1/4; (B) 1/2; (C) 3/4; (D) 1 inch in width.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the two main uses of a circular flange.

(A) ____________________

(B) ____________________

2. List the ways used to form sheet metal for wired edges.

(A) __________ (C) __________

(B) __________ (D) __________

3. The most common types of rivets used in sheet metalwork are:

(A) __________ (C) __________

(B) __________ (D) __________

4. List the methods of further locking grooved seams on pipes that are to be crimped.

(A) ____________________

(B) ____________________

(C) ____________________

5. List the points that should be carefully observed in making a good grooved seam:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the items by placing the letter of the description in the blank at the left of the appropriate item.

_____ 1. L.W. = 4S + 2d

_____ 2. bottom = 2W

_____ 3. L.W. = 2L + 2W + 2d

_____ 4. 3 times width of lock

_____ 5. W + W + 3/16"

_____ 6. 2½ times diameter

_____ 7. hand groover

_____ 8. grooving rail

A. edges of dovetail seam

B. wire allowance

C. allowance for single seams

D. offset an inside grooved seam

E. allowance for Pittsburgh lock pocket

F. allowance for grooved seam

G. rectangular

H. circular

I. small flanges on outside of cylinders

J. Pittsburgh lock

K. offset an outside grooved seam

L. square

M. heel

Procedure-Rearrangement

Directions: In the column at the right appear various steps or operations involved in completing a job. Indicate the order in which your readings recommend that they be done by placing the proper number in each blank at the left.

1. Procedure for making a grooved seam:

_____ A. Hook edges together.

_____ B. Groove entire seam.

_____ C. Fold edges to proper width and form job.

_____ D. Place hand groover over one end of seam and strike with hammer.

_____ E. Groove other end.

_____ F. Flatten seam closely with mallet.

_____ G. Flatten seam slightly with mallet.

2. Procedure for riveting a seam:

_____ A. Insert rivets in holes.

_____ B. Head rivet.

_____ C. Select rivet and proper rivet set.

_____ D. Draw rivet and material together.

_____ E. Upset rivet.

Assignment
Sheet No. 6

Covering
Units 40-46

THE SOLDERING PROCESS

Soldering is a process that requires careful attention to details in order to secure satisfactory results. Among such details, the temperature of the soldering copper is of prime importance. If the copper is either too hot or too cold, proper fusion is impossible. The temperature of the base metal must be sufficiently high to cause the solder to flow--but not too high. However, proper heat control is not the only factor involved. Joints must be properly formed. Fluxes and solders must be selected in accordance with job requirements. When these conditions have been satisfied, successful soldering will be more likely to result.

Soldering is a vital process in sheet metalwork, just as it is in communication, transportation, and lighting. It is highly probable that without solder, development in these fields would be hampered considerably. In sheet metalwork solder is used mainly to join metals together and to make seams watertight. Although other processes such as welding may be used, solder has several outstanding advantages that contribute to its continued use. It is comparatively inexpensive in terms of equipment and materials as well as being adaptable to a great many uses. Furthermore, soldering does not require much time and it may be done with comparatively little heat.

In this assignment you will be given an opportunity to learn about some of the more important aspects involved in soldering. Information will be included concerning the use and care of gas furnaces and soldering coppers. You will also be expected to know the characteristics and uses of the various types of fluxes, dipping solutions, and solders.

<u>Assignment</u>:

1. Read the references listed below.
2. Send a postcard to the address below requesting a free copy of the bulletin <u>Soldering and Soldering Techniques</u>.
   Kester Soldering Company
   4201 Wrighthood Avenue
   Chicago 39, Illinois
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by ____________________.

<u>References</u>:

A. Bruce and Meyer, <u>Sheet Metal Shop Practice</u>, pp. 138-148.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The fumes from a gas furnace are harmful to breathe.

T F 2. Zinc will dissolve in cut acid.

T F 3. The tinning will be ruined on a soldering copper that is allowed to become red hot.

T F 4. A grooved seam that is to be soldered should be tacked first.

T F 5. Heat causes zinc chloride flux to liberate acid.

T F 6. A 60-40 solder has a higher melting point than 40-60 solder.

T F 7. Zinc chloride fumes are inflammable.

T F 8. Many sheet metal shops prepare their own solder by melting the correct proportions of tin and lead together.

T F 9. The required shape and size of a copper varies with the job to be soldered.

T F 10. Zinc chloride has a corrosive action on the metals for which it is recommended for use as a flux.

T F 11. On jobs where the last traces of flux cannot be removed after soldering, zinc chloride should not be used.

T F 12. The most commonly used soldering coppers range in size from 5 to 10 pounds per pair.

T F 13. Old materials that are to be soldered with rosin flux should first be cleaned with muriatic acid.

T F 14. Zinc chloride is recommended as a flux for soldering black iron.

T F 15. The amount of oxide that forms on the surface of metal being soldered tends to increase as the temperature decreases.

T F 16. Better results will be achieved if a seam can be soldered in one continuous stroke.

T F 17. Copper may be forged without injury to its properties.

T F 18. Muriatic and hydrochloric acids are essentially the same chemically.

T F 19. Excess acid flux should be removed from a soldered seam.

T F 20. A double-cut bastard file is recommended for filing a soldering copper.

T F 21. Flux is used to dissolve oxides from the surface of metal being soldered.

T F 22. Zinc chloride fumes are harmful to breathe.

T F 23. Zinc chloride should be made either near an open window or outdoors.

T F 24. Most wire solders are 40-60 solders.

T F 25. Rosin is used as a flux because it cleans the surface of the metal being soldered.

T F 26. Soldering coppers that are to be tinned should be heated to a temperature that will just melt solder.

T F 27. Flux is used so that solder will adhere to metal.

T F 28. Aluminum cannot be soldered to other metals, such as copper brass, or tin.

T F 29. Acid core solder is recommended for soldering electrical connections.

T F 30. When soldering aluminum a special solder and soldering flux is recommended.

T F 31. When a soldering copper is to be used to solder a joint in a vertical position, the copper should be tinned only on the side that will be in contact with the work.

T F 32. A damp rag is recommended to remove excess solder from the point of a copper.

T F 33. Aluminum is easier to solder than galvanized steel.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Soft solders have relatively low ______________ points.

2. Soft solder is an alloy composed of ______________ and __________.

3. Soft soldering fluxes are usually made up of solutions or pastes containing ______________ ______________.

4. Rosin is used as a flux for soldering ______________ plate, ______________ plate, and lead.

5. Zinc chloride should be kept in a closed ______________ container.

6. A soldering copper should be heated to a ______________ ________ color before it is filed.

7. Metals used in making 50-50 solder have ______________ melting points than solder itself.

8. Sal ammoniac cakes are apt to be ______________ from grooves cut in them by careless workers.

9. Wire solders may be obtained with either ______________ or ______________ cores.

10. Sal ammoniac may be purchased in either the crystalline or one-pound ______________ form.

11. Zinc chloride should be kept away from machines and tools, because it will cause them to ______________.

12. Soldering copper heads are manufactured out of copper because it ______________ and ______________ heat readily.

13. The operation concerned with coating the point of a copper with solder is referred to as "______________."

14. A satisfactory dipping solution requires about one-half of an ounce of ________ ______________ to each quart of water.

15. The handle of the ______________ copper is inclined in the direction the solder is to flow.

16. The copper end of a soldering copper is called the ______________ or ______________.

17. Light-weight soldering coppers should not be used for heavy-gage metal because they do not hold enough ______________.

18. Black discoloration around soldered joints on galvanized iron can be prevented by adding ______________ to muriatic acid flux.

19. The main alloying element in 60-40 solder is __________.

20. The more tapered the point, the more rapidly a soldering copper will lose its ______________.

21. The head of a 6 pound soldering copper actually weighs __________ pounds.

22. Improperly shaped soldering-copper points should be ____________ and ______________.

23. Solders composed of lead are not recommended for repairing kitchen utensils because of the danger of lead ______________.

24. On jobs where the last traces of flux cannot be removed after soldering, ____________ flux is recommended.

25. The residue that is left after removing the turpentine from the sap of certain pine trees is called ____________.

26. Coppers should not be cleaned in flux used for soldering because the work will be ____________.

27. Soldering coppers should be ____________ often to keep the point smooth and to remove burnt substances.

28. A soldering copper must be retinned every time it is ____________

29. A properly heated soldering copper may be tinned after its point has been rubbed on sal ammoniac by melting a little ____________ on the point.

30. A gas furnace will produce a heat of nearly ________ degrees Fahrenheit.

31. Dipping solutions are used to ____________ the points of soldering coppers.

32. The flame of a gas furnace should be adjusted by turning the ________________ valve.

33. Rivets must be soldered on jobs that are to be __________ tight.

34. The tip of a soldering copper may be changed to meet the needs of of particular job by ______________.

35. It is recommended that ________ seams be tacked before they are soldered.

36. The surface of a common brick is used when tinning a copper with ____________.

37. The melting point for solder goes up as the proportion of ________ is increased.

38. The tip of a ____________ copper is wedge-shaped.

39. Solder used for light-gage metals should have a larger proportion of ________ than __________.

40. If solder is to be easily applied, the surface it comes in contact with must be ____________.

41. Heavy-weight soldering coppers are apt to ____________ light-gage metal.

42. The size of soldering coppers is designated by the weight in pounds for ____________________.

43. Zinc chloride is formed by dissolving zinc in __________ acid.

44. After zinc chloride is formed, the solution should be ________.

45. The acid swab used for applying flux is actually a small________.

46. The hood of a gas furnace is __________ to facilitate cleaning its bed.

47. A copper should be moved along a seam slowly enough so that the metal will_______________enough heat to melt the solder.

48. Cold solder beads or shots are frequently used in soldering cylindrical _______________.

49. In soldered joints or seams where the flux may penetrate into joints more deeply than the solder, a (an) ______________flux should be used.

50. Aluminum can be soldered with 50-50 solder if a _____________ _____________ flux is used.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The tendency for light-gage sheet metal to buckle is reduced by using (A) 60-40; (B) 40-60; (C) 50-50; (D) 30-70 solder.

_____ 2. The best method of heating soldering coppers for use within the shop is by means of (A) a charcoal fire pot; (B) a gasoline torch or furnace; (C) electricity; (D) a gas furnace.

_____ 3. The melting point for soft solder is approximately (A) 212; (B) 400; (C) 600; (D) 1,000 degrees Fahrenheit.

_____ 4. Among the various special types of soldering coppers are included (A) hammer; (B) chisel; (C) hatchet; (D) saw.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. The composition of 50-50 solder is:

(A) ________________________ (B) ________________________

2. The period of usefulness will be increased for a pair of coppers by:

(A) ________________________ (B) ________________________

3. The types of soldering coppers most used in the shop are:

(A) __________ (B) __________

4. List three things a copper should do in soldering:

(A) __________ (C) __________

(B) __________

5. Methods used for cleaning heated soldering coppers are:

(A) __________

(A) __________

(C) __________

6. List the names of the valves on a gas furnace that should be closed at the end of each work day.

(A) __________ (C) __________

(B) __________

Matching

Directions: In the right hand column appear various types of metal used in the sheet metal trade, and in the left hand colum are listed various fluxes. Match the letter of the metal with the appropriate flux, by placing the proper letter in each blank at the left. (Note that some of these fluxes may be used for more than one metal.)

_____	1. muriatic acid	A. black iron
_____	2. zinc chloride	B. galvanized iron
_____	3. rosin	C. tin plate
_____	4. soldering salts	

Procedure-Rearrangement

Directions: In the column at the right appear various steps or operations involved in forging a soldering copper. Indicate the order in which your readings recommend that the operations be performed, by placing the proper number in the blank at the left.

_____ A. Reheat soldering copper to a bright red.

_____ B. File and tin soldering copper.

_____ C. Heat soldering copper to a bright red.

_____ D. Form copper on anvil by striking with a large hammer.

_____ E. Clamp copper in vise and remove burnt tinning and pits by filing.

Units 47-53

MACHINE FORMING: FOLDERS, BRAKES, ROLLS, AND ROTARY MACHINES

Mechanical devices have enlarged the scope of work that may be done profitably by the sheet metalworker. The tedious work that would be involved in forming certain jobs by hand has been speeded up by the use of machines. Since machines used for working sheet metal are available in many different types and capacities, they frequently create problems that confuse the beginning worker.

Persons intending to learn the sheet metal trade need to know about these various mechanical devices, if they are to become proficient in the trade. They need to know about the limitations and capacities of the various machines, as well as how to set and adjust them.

In this assignment you will have an opportunity to study the basic hand operated machine tools that are used in forming sheet metal. Information will concern types and uses of folders, brakes, rolls, and rotary machines.

Assignment:

1. Read the references listed below.
2. (a) Make a list of the sheet metal machines a general sheet metal company should have in order to do their work efficiently.

   (b) Make a list of the size and approximate cost of each machine you selected above.
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ________________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practices, pp. 89-133.
G. New York, Machine Processes, pp. 1-28, 38-48, 56-66, 155-187.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The maximum thickness metal-crimping machines for light work can generally handle is 24-gage.

T F 2. Molds are used on brakes for the purpose of forming curved shapes.

T F 3. A certain amount of slippage between the metal being formed and the rolls of a forming machine is necessary when forming tapered shapes.

T F 4. The maximum number of thicknesses that can be formed in a bar folder is between two and three.

T F 5. Wire or rod should not be formed in a bar folder.

T F 6. A special angle iron is used on hand brakes when forming long or heavy-gage sheet metal.

T F 7. Heavier-gage materials are easier to form in a slip-roll-forming machine equipped with two-inch diameter rolls than three-inch diameter rolls.

T F 8. Burred edges differ from turned edges in that the burred edge has a sharper radius.

T F 9. A wider edge may be turned on a cylinder than a disc.

T F 10. When burring an edge, the machine-operating handle should be turned rapidly after the first revolution of the job.

T F 11. The upper jaw and bending leaf blades are apt to be damaged if one attempts to bend wire or seamed pieces in a hand brake.

T F 12. The forming of a flange on a disc with a turning machine is essentially a stretching process.

T F 13. The maximum-gage sheet metal that may be formed in a hand brake increases for every one-quarter inch deduction in flange width.

T F 14. The bending leaf of a hand brake should be returned graduall to its usual position.

T F 15. Pipe may be joined together easier if one end of each sectio has been crimped.

T F 16. Wire should never be formed in a slip-roll-forming machine.

T F 17. The edge of a job that is being crimped by a machine should be held in contact with the gage before it passes through the rolls.

T F 18. The upper front roll of a slip-roll-forming machine deflects the metal upward to form the curvature.

T F 19. A knurled nut at the end of the beading machine's crankshaft is used to align the beading rolls.

T F 20. Sheet metal is apt to corrode when exposed to moisture or certain types of fumes if its coating has been injured.

T F 21. The sharpness of the folded edge is controlled by lowering or raising the wing of the bar folder.

T F 22. The gage on a bar folder should be set slightly less than the desirable width when making a grooved seam.

T F 23. The blade of a bar folder is designed to withstand hammering with a mallet.

T F 24. Brakes are used in the process called "braking tin."

T F 25. Hand-brake mold sizes range from approximately five-eighths to three inches in diameter.

T F 26. The work will tend to draw away from the gage of a beading machine as the bead is made deeper.

T F 27. The starting edge of a cylindrical job to be formed in a slip roll forming machine should be prepared by lowering the opposite edge of the metal after it has been just started into the rolls.

T F 28. The seam of a cylindrical job should not be run through the rolls of a beading machine under pressure.

T F 29. The coating on sheet metal is apt to crack or flake if a bead is rolled on its surface in one pass.

T F 30. If the wing binds on the folding blade of a bar folder, it should be adjusted so that it is closer to the blade.

T F 31. Truss rods are used as a means for making adjustments on hand brakes so that sheet metal may be bent evenly.

T F 32. Balancing weights are used in connection with the clamping bar of a hand brake to facilitate its operation.

T F 33. The width of a flange may be increased when using a hand brake as the gage number of the sheet metal increases.

T F 34. The minimum width of fold that can be made on a bar folder is greater for 24-gage than 22-gage mild steel.

T F 35. The wing setting of a bar folder produces the desired sharp or rounded fold.

T F 36. The stops on a bar folder are used in making angles of 45 and 90 degrees.

T F 37. The smaller the diameter of a job to be formed in a slip roll machine, the greater the starting bend should be.

T F 38. Edges for double seams and Pittsburgh locks may be formed in a hand brake.

T F 39. Standard hand brake ratings are determined by the maximum-gage mild steel they are capable of forming a flange one inch or wider, when the angle iron is in place on the bending leaf.

T F 40.. The forming of slight impression on the surface of sheet metal with a turning machine prior to flanging an edge by hand is called "creasing" or "scoring."

T F 41. Grooved seams on jobs to be crimped should be run through the crimping machine at least twice to insure best results.

T F 42. The spacing between the top and bottom front rolls of a slip-roll-forming machine determines the curvature of the job being formed.

T F 43. The width of a bend is limited when using a brake.

T F 44. It is recommended that hand brakes be oiled at least once a week with medium grade machine oil.

T F 45. Bar folders are particularly useful in forming reverse bends at close distances.

T F 46. It is necessary to open both clamping bar handles when feeding a small piece of sheet metal into a hand brake to be bent.

T F 47. The material is clamped between the blade and the jaw of a bar folder by pulling the operating handle.

T F 48. Hand brakes are available in lengths of approximately ten feet.

T F 49. The circular grooves in the top roll of a slip-roll-forming machine are used in forming jobs with an outside wired edge.

T F 50. The gage setting of a bar folder should be increased slightly when making the second fold of a double hem on light material.

T F 51. The distance between the inner edge of the upper roll and the shoulder of the lower roll on the burring machine should be equal to two and one-half times the thickness of the metal to be burred.

T F 52. The wing of a bar folder is not properly adjusted if it binc

T F 53. A screw driver is the only tool required in setting the gage of a bar folder.

T F 54. A special one-quarter inch wide steel bar is used on hand brakes for the purpose of making narrow, reverse bends.

T F 55. The width of an edge that can be formed on a disc by a turning machine decreases as the diameter of the disc increases.

T F 56. Generally, burred edges must be made narrower than it is possible to make turned edges.

T F 57. The desired depth of crimp should be produced in one revolution of the work through the crimping machine.

T F 58. A properly turned edge should have a wavy appearance.

Completion

Directions: Fill the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Folds for lock seams and wired edges are prepared on the _________ folder.
2. If a series of 54-degree angle folds were to be made in a bar folder, it would necessitate adjusting the split _______________ which clamps on the end of the shaft.
3. The appearance of wrinkles on finished tin plate jobs can be avoided by first ____________________ the tin.
4. Care should be taken to protect the highly polished rolls used in forming aluminum and stainless from _______________ when they are not in use.
5. Formed jobs may be withdrawn from a slip-roll-forming machine without distortion by swinging the upper roll clear of its ______.
6. Basic parts of the brake are: the bed; top leaf; and ____________.
7. When making a wired edge, the gage of a bar folder should be set at a distance equal to _________times the diameter of the wire.
8. One end of the rear roll should be adjusted so that it is slightly higher than the other, when forming ___________shapes in a slip-roll-forming machine.
9. The 9/64 inch thick upper roll of a turning machine is used in forming edges for ________inch or smaller diameter wire.
10. The maximum number thicknesses of sheet metal that may properly be formed at one time in a hand brake is __________________.
11. Bar folders are not generally used for sheet metal over __________ gage in thickness.
12. The type of bead most frequently used as a stop on pipes, to prevent one part of the job sliding over the other, is the _________________bead.
13. The inside bead is placed towards the middle of the job when the ______________bead is used as a stop.
14. A burred edge will be cut if the _____________is tightened too much at one time.

15. The diameter of jobs formed in a slip-roll-forming machine is controlled by raising or lowering the ______________roll.

16. A turning machine may be used to form the narrow edge called a ____________________on a circular job.

17. In order to allow for the spring-back of sheet metal, it is sometimes necessary to raise the bending leaf of a hand brake slightly __________________than the required angle.

18. Friction clamps are used as a means for attaching __________ to a hand brake.

19. The diameter of the end of a pipe that has been crimped will be ________________in diameter.

20. The proper clearance for the pocket of a Pittsburgh lock may be insured by inserting a ________of_________material in the upper fold before the pocket is squeezed together.

21. The chief disadvantage of straightening out flanges and then rebending them in the opposite direction is that it __________the sheet metal.

22. The proper material allowance in turning a wired edge is equal to ___________times the diameter of wire.

23. Two machines commonly used in bending or folding sheet metal to form edges or locks for seams are _______________and_____________.

24. The essential differences between burring and turning machines are the shape of the _________and the location of the ___________.

25. The special wrench used to change the rolls on a turning machine is called a ___________________wrench.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A turning machine comes equipped with two sets of upper rolls. One is 9/64" thick, the other one is (A) 3/16"; (B) 1/4"; (C) 3/8"; (D) 5/8" thick.

_____ 2. The maximum-gage sheet metal beading machines are capable of handling is approximately (A) 12; (B) 18; (C) 22; (D) 28.

_____ 3. The maximum-gage mild steel that a one-half inch wide flange could be formed in a hand brake rated to bend a 1" flange on 18 gage would be (A) 20; (B) 18; (C) 16; (D) 14.

_____ 4. The most commonly used size of bar folder has a working length of approximately (A) 12"; (B) 18"; (C) 36"; (D) 54".

_____ 5. Ordinarily the maximum width fold that can be made in a bar folder is (A) ½"; (B) 1"; (C) 3"; (D) 6".

_____ 6. The strain on the blades of a hand brake may be equalized by placing the short pieces of sheet metal to be bent near the (A) adjustable collar; (B) angle iron; (C) center of the brake; (D) right balancing weight rod.

_____ 7. The maximum capacity for slip-roll-forming machines is usually limited to (A) 10; (B) 14; (C) 18; (D) 22-gage material.

_____ 8. In setting the gage on a turning machine for wiring an edge, one should measure from the gage to the (A) inner edge of upper roll; (B) outer edge of upper roll; (C) center of upper roll; (D) outer edge of lower roll.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. Crimping rolls are obtainable in the following types of corrugations:

(A) ______________________ (B) ______________________

2. List the most common shapes of beads used in sheet metal work.

(A) ______________________ (C) ______________________

(B) ______________________

3. List two reasons for rolling curved impressions in sheet metal.

(A) ______________________ (B) ______________________

4. List three types of folders.

(A) ______________________ (C) ______________________

(B) ______________________

5. List the adjustments that should be checked before using a bar folder.

(A) ______________________ (B) ______________________

6. List two factors that are necessary to consider in making an evenly burred edge.

(A) ____

(B) ____

7. List the factors necessary to consider in making a good bead in sheet metal.

(A) ______________________________

(B) ______________________________

(C) ______________________________

8. The maximum thickness of metal that slip roll forming machines will form depends on the jobs:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

9. The causes for an edge being improperly formed by a turning machin are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

Procedure-Rearrangement

Directions: In the column at the right appear various steps to be followed in forming the pocket of a Pittsburgh lock in a hand brake. Indicate the order which your readings recommend these steps be done, by placing the proper number in the blanks at the left.

_____A. Raise bending leaf slightly, offset pocket by striking the outer edge with mallet.

_____B. Insert sheet in brake; close upper jaw flush with prick punch marks; raise bending leaf until sheet is formed slightly less than 90 degrees.

_____C. Insert sheet in brake with upper edge flush with outer edge of upper jaw; close upper jaw.

_____D. Turn sheet over; insert in brake with outer edge of bending leaf; close upper jaw.

_____E. Insert sheet in brake; hold 90 degree bend against edge of upper jaw; close upper jaw; raise bending leaf as far as possible.

_____F. Insert formed edge (small end of job) in brake; hold sheet against bending leaf; close upper jaw; raise bending leaf as far as possible.

Covering
Units 54-59

MACHINE SHAPING: SHEARS, DRILL PRESSES, AND GRINDERS

Mechanical devices have not only been developed to facilitate the forming of sheet metal, but also to facilitate the shaping of metal as well. Among such machines are included various types of shears, drill presses, and grinders, which were designed to enable the tradesman to do more and better work.

Workers in the trade need to know how these machines are used to enable them to do better work. Without such an understanding these machines will not be of much value in the efficient performance of work; in fact, they may actually be detrimental in not only performing the work, but to the physical well being of all shop personnel. It is only through intelligent, well-trained workers that such machines can be put to their fullest use.

In this assignment you are to study about some of the machines commonly used in the shaping of sheet metal or tools used in sheet metal work. Specific information concerning the squaring shear, drill press, and grinder will be included.

Assignment:

1. Read the references listed below.
2. (a) Describe the manufacture of abrasive wheels.

   (b) Give the advantages and disadvantages of the various materials used as abrasives in grinding wheels.
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by ____________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 69-70.
G. New York, Machine Processes, pp. 29-37, 49-55, 67-85.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false draw a circle around the letter "F".

T F 1. Abrasive grains that are closely spaced together are less apt to clog than those with wider spacing.

T F 2. The spindle speed of a drill press is too high if the cutting edge corners of a drill wear away too rapidly.

T F 3. The abrasive grains of a grinding wheel should be bonded closer together for rough grinding than finishing grinding.

T F 4. The upper blade of a squaring shear is set at a slight angle with the lower cutting blade so that the force necessary to cut sheet metal is reduced.

T F 5. One should stand directly in front of a grinding wheel when operating a power grinder.

T F 6. Steel washers are placed between the sides of a grinding wheel and the flanged collars to reduce the danger of the wheel cracking.

T F 7. Accuracy of graduations appearing on the bed of a squaring shear may be checked by measuring with a rule from a graduation to the outer edge of the lower cutting blade.

T F 8. A harder wheel should be used for hard metals than soft metals.

T F 9. Alignment is facilitated when cutting sheet metal with a squaring shear by cutting two short notches and bending them down at the end of the line to be cut.

T F 10. The device used to hold straight-shank cutting tools in a drill press is called a sleeve.

T F 11. A slitting gage is used when making straight cuts with a circle-cutting machine.

T F 12. To prevent work from losing its temper while being ground, it should be cooled in water when it becomes heated.

T F 13. The possibility of sheet metal moving while it is being cut with a squaring shear is eliminated through the use of a hold-down attachment.

T F 14. Both types of circle-cutting machines can be used for making irregular cuts.

T F 15. The value of natural abrasives is limited because of the difficulties involved in producing similar grinding wheels in quantity.

T F 16. Aluminum oxide rather than silicon carbide grinding wheels are preferred for grinding copper and aluminum.

T F 17. Centers of circles to be cut with a circle-cutting machine should be prick punched.

T F 18. The distance between the upper and lower cutters of a circle cutting machine must be adjustable for cutting outside circles.

T F 19. The lower cutting blade is fastened to the crosshead of a squaring shear.

T F 20. Lard oil is recommended as a cutting lubricant for low carbon steel.

T F 21. Burrs and abrasions should be removed from the shank of a drill with a file or oilstone.

T F 22. Silicon carbide crystals are less easily fractured than aluminum oxide.

T F 23. The chief disadvantage of circle shears is that only cuts starting from the outside edge of a sheet can be made.

T F 24. It is a sign that too much pressure is being applied if the drill chips at the cutting edges.

T F 25. Seamed edges should not be cut with a squaring shear because of the danger of damaging the cutting blades.

T F 26. The grit size of an abrasive is determined by the number of openings per inch in the mesh of the smallest screen through which the grains will pass.

T F 27. The graduations marked on the face of a squaring shear bed will remain accurate after the upper cutting blade is reground.

T F 28. The minimum amount trimmed from a sheet with a squaring shear should not be less than the thickness of the sheet being cut.

T F 29. The hardness of a grinding wheel depends on the hardness of the abrasive it is composed of.

T F 30. Sometimes it is considered good practice to insert sheet metal from the rear of a squaring shear to allow more freedom when operating the foot treadle.

T F 31. The sensitive drill press usually requires a tapered-shank cutting tool.

T F 32. When cutting very small circles with a circle-cutting machine, the sliding circle arm should be set nearer on center than when cutting large circles.

T F 33. The lead-bushed hole of a grinding wheel should be scraped to make it fit freely, if it is too tight to fit the spindle of a grinder.

T F 34. The type of cutting lubricant varies with kind and hardness of the metal being drilled.

T F 35. For best results a grinder should be in operation while adjusting the tool rest.

T F 36. The practice of holding work with one's hand while using a drill press usually results in broken drills and injury to the operator.

T F 37. Sheet metal may be cut most rapidly with a squaring shear that is equipped with a hand operated hold-down attachment.

T F 38. The number of thicknesses of sheet metal that may be cut at any one time with a squaring shear is determined by their combined thickness in relationship to the maximum capacity of the machine.

T F 39. A properly adjusted grinding wheel should be drawn tightly enough against its flanged collar to prevent the wheel from turning on the spindle.

T F 40. It is a recommended practice to grind on the side of a grinding wheel.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. Slots are provided in the face of a squaring shear bed so that the front____________may be clamped to it.
2. When cutting sheet metal that has been marked, the line to be cut should be placed flush with the edge of the________________ cutting blade.
3. Extension arms are attached to the__________of a squaring shear.
4. Foot-operated squaring shears will cut_______gage or less mild steel.
5. Burrs on the shank of a drill will cause it to run out of________.
6. The majority of grinding wheels are made by the__________________ bonding process.
7. The type of grinding wheel particularly suited for tool grinding has a________________________bond.
8. Twist drills are held in a chuck or sleeve which is attached to the____________________________of the drill press.
9. Lateral clearance between the cutters of a circle-cutting machine is obtained by adjusting the________________shaft.

10. Before any cutting is done with a squaring machine, the __________ should be cleaned.

11. The abrasive grains of a grinding wheel are held together with a binding material called_________________.

12. The wear on the teeth of a drill press chuck will be reduced by pressing____________ ___while turning the key.

13. Aluminum oxide is made by heating _____________ in an electric furnace.

14. Forcing a wheel on the spindle of a power grinder is apt to set up strains which might cause it to _____________.

15. Equipping a grinder with an ________-sized wheel frequently results in the wheel bursting.

16. The clay used to bond abrasives which is converted into a glass-like substance upon being heated in a kiln, is known as a ________________ type of bonding material.

17. The structure of a grinding wheel refers to the _____________ of the abrasive grains.

18. Grinding wheels are attached to the ends of a powergrinder spindle with left and right-hand thread fasteners in order to safeguard against their becoming_______________.

19. The tool post of a grinder should be set so that it is not more than _________inch away from the face of the wheel.

20. The tenacity with which abrasive particles are held in a grinding wheel under grinding pressure is referred to as _______________.

21. In reference to the cutting speed of a drill press, the abbreviations, R.P.M., refer to the number of _______________ ________ __________________ the spindle makes.

22. When cutting light materials with a circle cutting machine, the cutter should be adjusted so that they just ________________.

23. A gap shear is essentially the same as a squaring shear except for the __________________.

24. The wedge-shaped tool used for removing a sleeve, socket, or drill from the spindle of a drill press is called a drill________.

25. The possibility of the sheet moving while being cut is reduced by placing it on the ________ side of the squaring shear.

26. Drill-press spindle speed is adjusted by means of two stepped ________________.

27. Cold chisels should be ground to have an included angle of between ______________ and ____________ degrees.

28. After abrasive particles have been prepared and molded, they are treated with__________to form the grinding wheel.

29. The type of artificial abrasive that is recommended for grinding alloy steels is called_____________ _____ _______.

30. Lubricants are used when drilling to reduce the tendency of _______________the drill.

31. The process of restoring the sharpness of a grinding wheel by breaking away the dulled abrasive crystals is known as__________.

32. When using a grinder that is not equipped with safety glass shields, the operator should wear safety ______________________.

33. The work should be moved back and forth across the face of a grinding wheel to prevent wearing a ____________in the wheel.

34. The side gage on a squaring shear is used for squaring the _______________of the sheet metal.

35. The bevel gage that is attached to the bed of a squaring shear is used to make_____________ _____________.

36. When cutting with a square shear, a common accident to be avoided is putting one's___________under the foot treadle.

37. The back gage that is mounted on the rear of the squaring shear is used for cutting__________ _____________of metal.

Multiple-Choice

Directions: Listed with each of the incomplete sentences that follow are several responses, one of which will complete the statement to make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

_____1. The maximum width of a series of long strips that may be cut from a piece of sheet metal with a gap shear is (A) 18 inches; (B) 22 inches; (C) 36 inches; (D) unlimited.

_____2. The spindle speed of a drill press should be reduced to approximately (A) 25; (B) 50; (C) 75; (D) 90; per cent of that recommended for high speed drills when using carbon steel drills.

_____3. The maximum length of cut that can be made in a gap shear is (A) 36 inches; (B) 72 inches; (C) 120 inches; (D) unlimited.

_____4. A quarter-inch drill should be operated in a drill press at a speed approximately (A) one-half; (B) three-quarters; (C) twice; (D) equal; that recommended for a half-inch drill.

____5. The top of a grinder tool rest should be set at such a height that it is approximately (A) on the same level with; (B) ¼ to ½ inch above; (C) ¼ to ½ inch below; (D) flush with the center of the grinding wheel.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. The most widely used types of artificial abrasives for grinding wheels are:

(A)______________________________ (B)______________________________

2. List the more commonly used types of off-hand dressers.

(A)______________________________ (B)______________________________

3. List the two types of circle-cutting machines used in sheet metal work.

(A)______________________________ (B)______________________________

4. List the various types of gages with which squaring shears are equipped.

(A)______________________________ (C)______________________________

(B)______________________________ (D)______________________________

5. List the various devices that are available for holding work to be shaped in a drill press.

(A)______________________________ (C)______________________________

(B)______________________________

6. List the general types of bonds used in grinding wheels.

(A)______________________________ (D)______________________________

(B)______________________________ (E)______________________________

(C)______________________________

7. List the materials that are heated together in an electric furnace to produce silicon carbide.

(A)______________________________ (C)______________________________

(B)______________________________ (D)______________________________

8. List the factors that should be considered in selecting a grinding wheel for a particular job.

(A)________________ (D)________________ (G)____________

(B)________________ (E)________________

(C)________________ (F)________________

9. List the principal parts of a squaring shear.

(A)________________ (F)________________

(B)________________ (G)________________

(C)________________ (H)________________

(D)________________ (I)________________

(E)________________ (J)________________

Assignment
Sheet No. 9

Covering
Units 60-64

MEASUREMENT: LINEAR AND ANGULAR

It is practically impossible for one engaged in the sheet metal trade to avoid using some form of mathematics in his work. For this reason a summary of the basic mathematical concepts relating to sheet metal work is included in this course of study.

The information presented in this assignment will be limited to the study and application of linear and angular measurement. It will include principles and problems pertaining to fractions and decimals. When these are clearly understood by the student, it should help him to become a more adept layout man.

You will be expected to master the fundamentals of linear and angular measurement while reviewing the basic principles and solving the drill problems that are included in this assignment. Particular attention should be given those principles and problems with which you need extra practice.

Assignment:

1. Read the reference listed below. (Omit actually solving the problems in the Assignment Series at this time.)
2. In this assignment you are to confer with your coordinator and with his help select six Assignment Series Units to solve. It is suggested that you work out two Assignment Series Units in each of the three Sections assigned. Your selection should be made in light of the problems for which you feel a need for more practice. (Refer to the table of contents in Reference E, pages vii-ix, for the Assignment Series Units.) Check your answers by referring to the appropriate Basic Principle and then recheck your work.
3. Complete items 1 and 2; answer the questions listed below and turn in this assignment by__________________________.

Reference:

E. New York, Sheet Metal Mathematics, pp. 2-109

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Confusion and errors will be reduced in problems involving feet and inches if such information is indicated with the computation.

T F 2. The complement of a 65 degree angle is 115 degrees.

T F 3. Vertical angles formed between two straight intersecting lines are equal.

T F 4. The center of the lower edge of a protractor should be placed at the vertex of the angle to be measured.

T F 5. If an answer is to be corrected to three decimal places, three places must be used throughout the computations.

T F 6. Ratio is a method used to show the relationship between two numbers.

T F 7. It is generally best to change decimals to fractions before averaging them.

T F 8. Number 8 gage metal is twice as thick as number 16 gage metal.

T F 9. The quotient is obtained by dividing the dividend into the divisor.

T F 10. Inch marks are frequently omitted from the dimensions of a drawing.

T F 11. A Decimal Equivalent Table speeds up the computation and reduces the possibility of error in the conversion of fractions.

T F 12. The denominators are subtracted from each other when subtracting fractions.

T F 13. Two triangles will be equal in size when their corresponding sides are equal in length.

T F 14. The number of decimal places in the product of two numbers should equal the number of places in the multiplicand.

T F 15. Net price is determined in single discounts by subtracting the amount of discount from the list price.

T F 16. 1C tin plate is a heavier gage metal than 1X tin plate.

T F 17. The product of two or more fractions is equal to the product of the numerators over the lowest common denominator.

T F 18. The lowest common denominator must be found when subtracting fractions.

T F 19. Extreme accuracy is not required for many sheet metal processes.

T F 20. Inches should be divided by 12 to be changed to feet in the decimal form.

T F 21. A mixed number can be changed to an improper fraction by multiplying the whole number by the numerator and adding the denominator.

T F 22. Two triangles will be equal in size when two of their corresponding sides and the included angle are equal.

T F 23. To change .385 inches to 64ths, it is necessary to divide.

T F 24. A tangent touches the circumference of a circle at one point.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. If .6 of a number is equal to 42, the whole number is__________.

2. The average of several numbers is obtained by____________their sum by the number of quantities.

3. The symbol for an angle is________________.

4. The variation permitted between the upper and lower limits for a job is called_________________.

5. Mixed numbers should be changed to_______________fractions before dividing.

6. The maximum number of pieces 4 3/8 inches long that can be cut from a piece of wire 20 inches long is____________.

7. If a segment of a line one and one-quarter inches long represents 56¼% of the total, the length of the whole line is______________.

8. Seventy-five per cent of 3 inches is__________inches.

9. The sum of the angles of a triangle equal_________degrees.

10. The altitude of a triangle is measured from the vertex___________ to its base.

11. Feet are designated with a single_______________.

12. The distance measured by one complete revolution of a micrometer's thimble is equal to___________of an inch.

13. When dividing one fraction into another, the divisor should be ______________.

14. Fractions cannot be added unless they have a common______________.

15. The value of a fraction is not changed by________________or ______________the numerator and denominator by the same quantity.

16. In order to change a decimal to a per cent, it is necessary to move the decimal point_________places to the___________and add a per cent sign.

17. A drawing made to the scale of 1/4" = 1'-0" would be reduced to __________ of its full size.

18. An angle containing less than ninety but more than zero degrees, is called an __________ angle.

19. The amount left over after cutting the maximum number of pieces 10'8½" long from a roll of wire 180' long, would be __________ inches.

20. There are three and __________ thirty-seconds inches in .289 feet.

21. The answer when rounding the number .672453 to three decimal places would be __________.

22. When 3 1/8 is multiplied by 3 1/4, the product is __________.

23. An improper fraction can be reduced to a __________ __________ by dividing the numerator by the denominator.

24. The least common denominator of 1/6, 1/5, and 1/4 is __________.

25. One and one-quarter inches is __________ per cent of five and one-half inches.

26. The complement of a 31 degree angle is equal to __________ degrees.

27. The amount of wire required for nine pieces 10' 7 3/4" long, would be ninety-five feet __________ inches.

28. A common fraction is changed to a __________ by dividing its numerator by the denominator.

29. Division may be checked by multiplying the quotient by the __________ and adding the remainder.

30. A fraction is at its lowest terms when the numerator and denominator cannot be __________ by the same number.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the groups of triangles as classified according to the lengths of their sides.

(A) __________ (C) __________

(B) __________

2. List the factors that must be considered in determining the selling price of an article.

(A) ____________________ (C) ____________________

(B) ____________________

3. List the names of the fixed parts of a micrometer.

(A) ____________________ (C) ____________________

(B) ____________________

4. List the conditions that determine the degree of accuracy necessary when making a particular job.

(A) ____________________ (B) ____________________

5. List the factors that determine the degree of accuracy in measuring.

(A) ____________________ (C) ____________________

(B) ____________________

Matching

Directions: Read statements listed alphabetically in the right hand column, and match them with the appropriate item by placing the letters from the right hand listing in the space provided adjacent to the numbers in the left hand column.

1. Concerning definitions of common fractions:

____(1) Numerator
____(2) Terms
____(3) Proper fraction
____(4) Improper fraction
____(5) Unit fraction
____(6) Mixed number
____(7) Complex fraction

A. Written above the line
B. Numerator less than denominator
C. Numerator larger than denominator
D. 7½
E. Denominator and numerator
F. One or both terms are fractions or mixed numbers.
G. Shows number of parts whole is divided
H. Numerator is one.

2. Concerning angular measurement:

____(1) Semicircle

____(2) Arc

____(3) Concentric circles

____(4) Vertex

____(5) Minutes

____(6) Polygons

____(7) Obtuse angle

____(8) Parallel

____(9) Rectangle

____(10) Trapezoid

A. Intersection at the ends of two straight lines

B. Designated with a single prime

C. One-half of a circle

D. Opposite sides equal and each angle equal to 90 degrees

E. Greater than 90, but less than 180 degrees

F. Less than 90, but more than 0 degrees

G. Lines that are equidistant

H. Curved section of a circle

I. Plane figures formed by three or more straight lines

J. Circles having same centers

K. Four-sides plane figure with only two sides parallel

L. Opposite sides parallel

M. Straight line between ends

N. Opposite sides equal and parallel

O. Scalene

Assignment
Sheet No. 10

Covering
Units 65-67

MEASUREMENT: PERIMETER, AREA, AND VOLUME

Sheet metal workers are confronted with many different types of problems in the practice of their trade. Among the problems that they must be able to solve are the following types: amount of material required, material costs and weights, proper size of sky lights, and the capacities of heating and ventilating pipes. The solution to such problems is an essential phase in the work required before layout and construction can proceed.

Mathematics is essential in solving many of these problems. Perimeter and circumference formulas are used to determine the distance around an object so that stretchouts for jobs may be drawn. Formulas for area are used in calculating costs, weights, and the number of square units in plane surfaces. Formulas for volume are used to determine capacity of tanks and containers. Employees capable of solving such problems will certainly be able to progress much further in their trade than those that cannot.

You will be expected to master the methods for determining perimeter, area, and volume while reviewing the basic principles and solving the drill problems that are included in this assignment. Particular attention should be given those principles and problems with which you need extra practice.

Assignment:

1. Read the reference listed below. (Omit actually solving the problems in the Assignment Series Units at this time.)
2. Confer with your coordinator and with his help select six Assignment Series units to solve. It is suggested that you work out one or two Assignment Series Units in each of the four Sections that are assigned. Your selection should be made in light of the problems for which you feel a need for practice. (Refer to the table of contents on Reference E, pages ix-x and xiii, for the Assignment Series Units.) Check your answers by referring to the appropriate Basic Principle and then recheck your work.)
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by ________________.

Reference:

E. New York, Sheet Metal Mathematics, pp. 112, 161, 244-259.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The horizontal scale for a line graph should be approximately twice as long as its vertical scale.

T F 2. The area of a parallelogram and rectangle with the height and length would be equal.

T F 3. The use of squared paper will make the construction of graphs more convenient and accurate.

T F 4. When dividing exponential expressions, the exponents are added together.

T F 5. Parallel-sided solids may be prism-shaped or cylindrical-shaped.

T F 6. Two pi times the radius equals the circumference of a circl

T F 7. When multiplying exponential expressions, the exponents are multiplied together.

T F 8. All the edges of a cube are equal in length.

T F 9. The reasoning underlying the method used for calculating the area of a circle is similar to that used for parallelograms.

T F 10. In order to change square inches to square yards, it is necessary to determine the number of square feet.

T F 11. The cross sections of a parallel-sided cylinder are equal.

T F 12. The bases of a solid right cylinder are equal in area and parallel with each other.

T F 13. Graphs are used frequently because they show relationships more readily than numbers.

T F 14. The length of a oblique cylinder's axis will always differ from its altitude.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. The gage number for a piece of sheet metal labeled 26 x 24 x 120 is__________.
2. The distance around a polygon is called the________________.
3. A piece of galvanized iron containing an area of 420 square inches, would equal__________square feet.
4. When $5a^2$ is multiplied by $3a^3$, the product is equal to___________
5. The area of a triangle that has an altitude of 5 3/4 inches and base of 12 1/2 inches is equal to__________square inches.

6. In order to change cubic inches to gallons, it is necessary to divide by____________.

7. A prism that is cut by a plane at an angle to its base, is said to be________________.

8. In order to change 11,928 cubic inches to cubic feet it is necessary to divide by____________.

9. In the construction of a circle graph the decimal equivalent of the total for each quantity to be represented should be multiplied by____________.

10. In order to change square feet to square inches, it is necessary to ______________by 144.

11. When $6a^4$ is divided by 2a, the quotient is equal to_____________.

12. The upper and lower bases of a prism form polygons that are equal in area and________________to each other.

13. When $12x^2$ is subtracted from $24x^2$, the remainder is equal to ____________.

14. The altitude of a parallel-sided solid is always measured ______________to its base.

15. Volume is expressed in terms of units of___________measure.

16. An abbreviated rule expressed in symbols is called a_____________.

17. The number of square units that a plane figure contains is referred to as______________.

18. In order to change square inches to square feet, it is necessary to divide by____________.

19. When dividing exponential expressions, the exponents are ______________________.

20. A parallelogram 12 inches long and 3 1/2 inches high would have an area of_________square inches.

21. The area of a trapezoid with bases 8 1/2 inches and 9 1/2 inches long and an altitude of 3 3/4 inches is equal to______________ square inches.

22. In order to change 763 cubic yards to cubic feet it is necessary to___________________by______________.

23. Lengths are expressed in terms of units of______________measure.

24. A tank one cubic feet in size is capable of holding____________ gallons.

25. The product of three to the fourth power is equal to____________.

26. The approximate value of pi is ______________________.

27. The equivalent number of cubic yards in 282,921 cubic inches is approximately ____________.

28. When the axis of a cylinder forms an angle of other than 90 degrees with its base, it is called an ______________ cylinder.

29. A line that connects the center of the bases of a cylinder is called the ____________.

30. The area of a circle that has a diameter of 20 inches is equal to _______________ square inches.

Multiple-Choice

Directions: Listed with each of the incomplete sentences that follow are several responses, one of which will complete the statement to make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

_____ 1. The number of quarts in one peck is (A) 2; (B) 4; (C) 8 (D) 12.

_____ 2. The number of quarts in one gallon is (A) 2; (B) 4; (C) 8; (D) 12.

_____ 3. The relationship of the parts to the whole is shown especially well in the (A) pictorial; (B) bar; (C) circle; (D) line; type of graph.

_____ 4. Approximate values may be found without computation in the (A) pictorial; (B) bar; (C) circle; (D) line; graph.

_____ 5. The perimeter of a rectangle 2 1/2" by 15" is (A) 5; (B) 15; (C) 25; (D) 35; inches.

Matching

Directions: In the right hand column appear methods for calculating various unknowns and in the left hand column are listed various unknowns. Match the letters of the right hand column with the unknowns, by placing the proper letter in each blank at the left.

_____ 1. Perimeter of squares

_____ 2. Perimeter of rectangles

_____ 3. Circumference of circles

_____ 4. Perimeter of semi-circular-sided figures

_____ 5. Area of squares

A. Two times length plus two times width

B. Pi times diameter

C. Length of side to second power.

D. Product of length and width

_____ 6. Area of rectangles

_____ 7. Area of triangles

_____ 8. Area of trapezoids

_____ 9. Area of circles

_____ 10. Volume of parallel-sided solid

E. Area of base times average height

F. Four times length of side

G. Pi times radius

H. Pi times diameter plus two times distance between half circles

I. Pi times radius plus two times distance between half circles

J. Pi times diameter times altitude

K. One-half sum of base lengths times altitude

L. One-half base times height

M. Pi times radius squared

N. Pi times diameter

Assignment
Sheet No. 11

Covering
Units 68-73

EQUATIONS: FORMULAS AND PROPORTION

What is the allowance for a riveted lap seam? How is the stretchout for the heel of a square elbow determined? Can a grinding wheel rated at 2000 f.p.m. be used safely on a motor that turns at 2000 r.p.m.? What are the lengths of the sides of right triangle when the size of two angles and a side are know.? These problems are not difficult if one has developed a practical working knowledge of a few basic relationships.

Before attempting to solve such problems, one should analyze each problem to gain a clear understanding of what is to be found and the method for its solution. Quantities should be expressed in their proper relationships. Answers should be checked. By doing these things, time and energy can be saved.

You will have an opportunity to become acquainted with some of the basic formulas and specifications that are used in sheet metal layout work in this assignment. In addition you will be expected to master the methods for solving problems involving proportion and trigonometry. Particular attention should be given to those principles and problems with which you need extra practice.

Assignment:

1. Read the reference listed below. (Omit actually solving the problems in this Assignment Series Units at this time.)
2. Confer with your coordinator and with his help select six Assignment Series Units to solve. It is suggested that you work out one or two Assignment Series Units in each of the four Sections that are assigned. Your selection should be made in light of the problems for which you feel a need for more practice. (Refer to the table of contents in Reference E, pages xi-xii, for the Assignment Series Units.) Check your answers by referring to the appropriate Basic Principles and then recheck your work.
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by________________.

Reference:

E. New York, Sheet Metal Mathematics, pp. 164-241, 259-262.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Machines operated at speeds above their maximum rating are dangerous.

T F 2. The slant height of a right pyramid is equal to the shortest distance between its apex and base edges.

T F 3. A truncated cone has two parallel surfaces.

T F 4. An equation will balance if the square root is extracted from both members.

T F 5. The span of a roof corresponds to half the length of the hypotenuse of a right isosceles triangle.

T F 6. The linear distance which a point on the edge of a wheel travels as it revolves about its axis in a given period of time is referred to as surface speed.

T F 7. A greater allowance is required for a burred bottom seam than a set-in bottom seam.

T F 8. The members of both sides of an equation will be equal when increased, decreased, multiplied, or divided by the same number.

T F 9. The approximate formula for bend allowance is used for bends with an inside radius.

T F 10. The span is usually less than the rise for most roofs.

T F 11. The slant height of a right circular cone forms a right angle with the plane of the base.

T F 12. In inverse proportion as contrasted with direct proportion, both ratios are inverted.

T F 13. One of the angles of a triangle that has sides drawn to the ratio of 3, 4, and 5 units, will always equal 90 degrees.

T F 14. A truncated pyramid has two parallel surfaces.

T F 15. Trigonometric formulas can be used to calculate the size of the angles or the length of the sides of any triangle.

T F 16. In direct proportion an increase in one ratio produces a decrease in the other.

T F 17. The altitude of a pyramid is equal to the perpendicular distance from the plane of the base to the apex.

T F 18. The base portion remaining after passing a cutting plane through an oblique cone perpendicular to the axis is called a frustum.

T F 19. One-half the metal thickness is added as an allowance to the outside dimensions of a job for each sharp 90 degree bend.

T F 20. Sections of dovetailed seams are similar to corner lap seams.

T F 21. The allowance for a single hem is the same as the width of the hem.

T F 22. Formulas may be used to determine the exact allowances required for bends with large radii.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. The allowance for a wired edge is equal to ______ times the diameter of the wire.

2. The acute angles of a triangle with an opposite side and hypotenuse equal to 5 1/2 and 13 1/2 inches respectively, are equal to ______ and ______ degrees. (See Table of Trigonometric Functions, Reference E, p. 231)

3. The maximum number of 7" x 20" pieces that can be cut from a piece of sheet metal 30" x 96" in size is ______.

4. The letters f.p.m., that are used in expressing surface speed, mean ____________ per ____________.

5. The hypotenuse of right triangle is equal to the ____________ ____________ of the sum of ____________ of the two sides.

6. A cone would be classified as oblique when its ____________ forms an angle other than ninety degrees with its base.

7. If the sine of an angle and the opposite side equals .8391 and 3 inches respectively, the hypotenuse will be ______ inches long. (Calculate to closest 64th of an inch.)

8. An allowance equal to three times the width of the seam is required for both edges of a ____________ ____________ seam.

9. If the tangent of a 40 degree angle and the adjacent side equals .8391 and 3 inches respectively, the opposite side will be _______inches long. (Calculate to closest 64th of an inch.)

10. If a rectangular pipe is to be constructed that has a cross-sectional area of 137 square inches and one side four times the length of the other, the dimensions will be ________ by ________ inches. (Use decimals.)

11. The trigonometric function obtained by dividing the opposite side by the adjacent side of a triangle is called the _________.

12. The length of opposite side of a right triangle is equal to square root of the _______________ between the square of the hypotenuse and the square of the adjacent side.

13. The number which equals the original number when taken twice as a factor is called the ________________ ________________.

14. If the cosine of a 40 degree angle and the adjacent side equals .7660 and 3 inches respectively, the hypotenuse will be ________ inches long. (Calculate to closest 64th of an inch.)

15. The allowance required for each edge of a riveted lap seam is equal to ________ times the diameter of the rivets.

16. The trigonometric function obtained by dividing the opposite side by the hypotenuse is called the ________________.

17. The length of an arc of a circle is equal to the ratio of its central angle to 360 degrees, times the _______________.

18. An allowance equal to two times the width of the pocket plus 3/16" is required for making the pocket of a ________________ __________________.

19. The ratio of rise to span is called ________________.

20. To determine the size of an angle by using a table of trigonometric functions, the corresponding ratio should be carried out to ________decimal places.

21. The axis of a tapered solid is drawn from the ______________ of its __________________ to the apex.

22. The letters L. S. and W. S. are used to designate the length and the width of __________________.

23. The size of an angle that has a tangent of .4768 is approximately _______degrees. (See Table of Trigonometric Functions, Reference, Reference E, p. 231.)

24. The sides of a square ventilating pipe must be ___________inches long, if it is to have a cross-sectional area of 75 square inches.

25. When a width and cross-sectional area of a rectangular pipe are 9 inches and 63 square inches respectively, its height is _____ inches.

26. The stretchout radius for a right cone 8 inches high and 6 inches in diameter will be _________ inches. (Use decimals.)

27. The angle of a right cone's stretchout is equal to the ratio of the _________ of its base to the ________________ of the stretchout circle times ________________.

28. The acute angles of a right triangle with opposite and adjacent sides equal to 7 13/16 and 3 9/32 inches respectively, are equal to __________ and __________ degrees. (See Table of Trigonometric Functions, Reference E, p. 231.)

Multiple-Choice

Directions: Listed with each of the incomplete sentences that follow are several responses, one of which will complete the statement to make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

_____ 1. If 107 feet of wire weighs 17 pounds, 159 feet will weigh approximately (A) 20; (B) 25; (C) 30; (D) 33.5 pounds.

_____ 2. The length of the intercepted arc of a 7 inch diameter circle that has a central angle of 45 degrees is equal to (A) 2 45/64; (B) 2 23/32; (C) 2 3/4; (D) 2 25/32 inches.

_____ 3. The angle of the stretchout for a right cone 8 inches high and 6 inches in diameter is equal to 126 degrees and (A) 12; (B) 18; (C) 24; (D) 30 minutes.

_____ 4. The surface speed of a 5 inch diameter grinding wheel that travels at 1000 r.p.m. is equal to (A) 1167; (B) 1273; (C) 1309; (D) 1719; feet per minute.

_____ 5. If an 80 degree elbow is to be made in four pieces the size of the angle for the larger pieces will be approximately (A) 13; (B) 23; (C) 27; (D) 34 degrees.

_____ 6. If the maximum permissible surface speed for a 10 inch diameter grinding wheel is 8000 feet per minute the maximum r.p.m. it can revolve is approximately (A) 2000; (B) 2500; (C) 3000; (D) 3500.

_____ 7. If an 11 inch diameter driver pully of a motor turns at 1200 r.p.m., the driven pulley must be (A) 7 1/2; (B) 12 1/2; (C) 14 1/2; (D) 16 1/2; inches in diameter to turn 800 r.p.m.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the reasons why the various types of edges are used on sheet metal jobs.

(A) ______________________ (C) ______________________

(B) ______________________

2. List the methods used to form edges on sheet metal.

(A) ______________________ (C) ______________________

(B) ______________________

Procedure-Rearrangement

Directions: In the column below appear various steps involved in extracting the square root of a number. Indicate the order that the steps should be performed, by placing the proper number in each blank at the left.

1. Procedure for computing the square root:

____A. Separate digits into pairs working in both directions from decimal point

____B. Determine the closest and smaller square root and square of the first pair

____C. Double answer for trial division

____D. Repeat process for double the partial answers

____E. Locate decimal point and add two digits for each decimal place desired in answer

____F. Subtract and bring down next pair

____G. Square result before rounding off and then add the remainder

____H. Determine next number for answer and trial division

____I. Multiply

LAYOUT TOOLS

Proficiency in drawing, shaping, and forming are all important aspects of the sheet metal trade. However, due consideration must be given to the proper procedures for transferring a pattern to metal. This step should be done carefully as inaccuracies will lead to the production of an unsatisfactory job.

In order to transfer a pattern accurately, it is important for the sheet metal worker to know something about the various types of layout tools. This means that he should know how to use and care for them properly. Thus, chances for tool damage will be reduced. He should know how to sharpen layout tools so that they will mark properly and accurately. If the worker knows how to do these things properly, better results will be obtained in the end results.

In this assignment you will be expected to become acquainted with the various types of tools commonly used in sheet metal layout work and the proper methods for using them.

Assignment:

1. Read the reference indicated below.
2. Gage the thickness of five different weight pieces of scrap sheet metal with a U. S. Standard Gage. Compare the decimal equivalent of the gage number with the readings you obtain with a micrometer caliper. (See New York, Hand Processes, p. 4 for table of decimal equivalents of gage numbers.)
3. After completing items 1 and 2, answer the questions below and turn in this assignment by ____________________.

Reference:

C. New York, Measurement and Layout, pp. 1-23.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The usual trade practice for drawing a series of parallel lines involves clamping a straight edge parallel to a base line.

T F 2. A micrometer should always be opened before removing a part that has been measured.

T F 3. The point of a center punch should be ground to a smaller angle than the angle for the point of a prick punch.

T F 4. The blade of a square should be held in full contact with a surface of an inside right angle that is to be tested for squareness.

T F 5. Dividers should be swung in a clockwise direction when scribing arcs or circles.

T F 6. When a micrometer is closed, the zero mark on the thimble should be even with the horizontal line on the barrel.

T F 7. A center punch is used to make lighter indentations than those ordinarily made by a prick punch.

T F 8. Reading a micrometer is usually the chief difficulty in becoming proficient in its use.

T F 9. A flat steel square may be checked for squareness by placing the square against a straight edge, drawing one line, reversing the square and drawing a second line from the same point.

T F 10. The tendency for dividers to slip is reduced if they are inclined in the opposite direction in which they are rotated.

T F 11. Greater accuracy may be achieved when measuring if the broad part of the scale is held in contact with the work.

T F 12. The points should not be allowed to come in contact with a metal rule when setting a pair of dividers.

T F 13. When drawing a line through two points, the straight edge should be moved into position before the scriber.

T F 14. Inches may be properly designated with a single prime (').

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. American industry uses the ____________________ system of linear measurement as a standard.

2. The device used for measuring and laying out angles is called a ____________________________.

3. Layout work on paper should usually be done with a pencil of ____________________ hardness.

4. The tool used for layout work on most types of metal is called a ____________________________.

5. The center point of a semicircular protractor should be placed at the ____________ point of an angle that is to be drawn.

6. When smaller units of measurement than sixty-fourths are required, the ________________ system is used.

7. Two straight lines meeting at a vertex are called an ___________.

8. Layout work on stainless steel and aluminum should usually be done with a pencil of ___________ hardness.

9. The final sharpening of a scriber should be done on an ______________________.

10. The point of a scriber will mark closer to the edge of a rule if its top is tipped ___________________.

11. Arcs and circles that are too large to be drawn with dividers are made with _________________ points.

12. The measuring device used to determine the distance around a circle is called a ___________________ rule.

13. Greater accuracy may be achieved when measuring short lengths if the ____________ of the rule are not used.

14. The tool used when transferring a pattern to a piece of metal is called a ______________ punch.

15. The point of a scriber should be ______________ while it is being sharpened.

16. When using an irregular curve in connecting the points of a line, the curve should be set so that it touches at least _______________ of the points.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the principal movable parts of a micrometer.

(A) _______________________ (B) _______________________

2. List the uses that may be made of a steel scale.

(A) _______________________ (C) _______________________

(B) _______________________

3. List the principal fixed parts of a micrometer.

(A) _______________________ (C) _______________________

(B) _______________________

Assignment
Sheet No. 13

Covering
Units 84-90

SIMPLE LAYOUT WORK

Drawing, the language of industry, is an essential phase in the work of anyone who justly calls himself a sheet metalworker. The ability to read and interpret drawings is of prime importance. The skills and ability to render or execute drawings of varying degrees of complexity have a powerful influence on wages earned.

Practically every job that comes into the shop will necessitate knowledge of drawing, whether it is sketching, patternmaking, or layout work directly on metal. Therefore, trainees in the field of sheet metal work should make special efforts to become proficient in drawing.

In this assignment you will be given an opportunity to review briefly some of the basic principles involved in orthographic projection. Suggestions will be included concerning layout procedures for stretchouts of square, cylindrical, and semicircular jobs, boxes, and square or rectangular elbows.

Assignment:

1. Read the references listed below.
2. Make a pattern of a four piece square-to-round as in Plate 13, page 18, of reference H. Do your layout on heavy paper, then cut out the pattern, fold and tape together. If possible, also do this layout on light gage sheet metal and fold together.
3. Use the calculation method to lay out a 90 degree square elbow on heavy weight paper. (Do not allow material for seams.) Cut out pieces and assemble with cellulose tape. Dimensions are as follows:
   Throat radius. . . 4 inches
   Heel radius. . . . 8 inches
4. After completing items 1 and 2, answer the questions below and hand in this assignment by ______________________.

References:

A. Bruce and Meyer, <u>Sheet Metal Shop Practices</u>, pp. 56-60, 156-162.

C. New York, <u>Measurement and Layout</u>, pp. 24-38.

H. Kaberlein, <u>Triangulation, Short-cut Layouts</u>, pp. 18-19.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Portions of construction lines parallel to the sides of an angle are used when scribing corner radii.

T F 2. Thin sheet metal is represented by a single heavy line.

T F 3. The front view of an orthographic drawing may differ from the actual front of the job drawn.

T F 4. The shape of the tee of an inclined T-joint is shown in a profile view.

T F 5. It is good practice to place dimensions between the views of an orthographic drawing.

T F 6. The method used for laying out work depends upon the type of job to be done.

T F 7. A broken line is used when only part of a job is shown in a view.

T F 8. Square and rectangular pipe seams should ordinarily meet at a corner.

T F 9. The plan view of an orthographic drawing should be placed to the right of the elevation view.

T F 10. Allowances for edges and seams are referred to as stretchouts.

T F 11. Any view which shows width of a job is called an elevation.

T F 12. A minimum of two views is required to describe the shape of an object completely.

T F 13. A scale should be used to determine the size of dimensions not indicated on a drawing.

T F 14. Pattern drafting is an important part in the development of patterns for sheet metal projects.

T F 15. Much of the layout work for patterns can be done by applying the principles of geometrical construction.

T F 16. One of the most important aspects of pattern development is the ability to visualize the finished job from the flat layout.

T F 17. A pictorial drawing is very good for sheet metal work because it gives accurate information for the fabrication of the project.

T F 18. Seldom will an experienced workman do layouts directly on metal.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. Laying out lines on flat surfaces of paper or metal is involved in____________________layout work.
2. Any orthographic view which shows the height of a job is called an____________________.
3. A flat piece of sheet metal cut to the correct shape and size for a job is called a________________before it is formed.
4. One of the chief advantages of an orthographic drawing is that a job may be represented in its true____________________.
5. The heel radius of a rectangular elbow is equal to the throat radius plus the____________________width.
6. The length of the stretchout for the heel is________________ than that for the throat of an elbow.
7. A decimal equivalent table is used to convert decimals to ____________________.
8. Holes to be drilled or punched in sheet metal layouts are marked with____________________.
9. The ends of lines on a stretchout which must be bent or folded are marked with the letter____________________.
10. When laying cut sheet metal work all lines are drawn solid and of the same____________________.
11. A straight line that touches a circle at only one point is called a____________________.
12. Decimals may be converted to nearest sixteenth part of an inch by________________the decimal by________________.
13. A drawing showing the interior construction of a job that is partly cut or broken away, is called a________________.
14. The amount of variation above or below a basic size that is permissable in layout work is called________________.
15. For layout purposes it is more convenient to show the end view of the top of an inclined T-joint as a________________line.

16. A half-size drawing would be made to the scale of ______ = 1'-0."

17. The method of dividing a line into a number of equal parts used in radial line development and triangulation is known as the ______________ method.

18. The metal worker of today must not only be able to perform mechanical operations by hand and by machines, but he must be able to ______________ and ______________ his own patterns.

19. Layout refers to the method of developing the ______________ which form the ______________

20. When tracing around a metal pattern the pattern should be held in place on the metal with ______________ or ______________.

21. Notching and clipping are used to cut away portions of the metal to prevent ______________ and ______________ on seams and edges

22. One of the first steps in preparing to lay out a pattern on the metal is to ______________ the ______________.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the methods for drawing lines parallel when laying out sheet metal.

(A) ______________________ (B) ______________________

(B) ______________________

2. List the methods that may be used to determine the length of patterns for cylindrically shaped jobs.

(A) ______________________ (C) ______________________

(B) ______________________

3. List the four general methods for laying out sheet metal patterns.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

Matching

<u>Directions</u>: In the right hand column appear descriptive phrases concerning various terms, and in the left hand column are listed various terms. Match the letter of the descriptive phrases with the terms, by placing the proper letter in each blank at the left.

1. American Standards Association line conventions for blueprints:

_____ 1. outline of parts

_____ 2. section lines

_____ 3. hidden lines

_____ 4. center lines

_____ 5. dimensional extension lines

_____ 6. cutting plane lines

_____ 7. break lines

_____ 8. adjacent parts and alternate positions lines

_____ 9. ditto lines

A. medium weight broken line made up of uniformly spaced long dashes

B. light weight unbroken lines, except at dimensions

C. medium weight broken line made up of uniformly spaced short dashes

D. medium weight free hand line for long breaks

E. heavy weight broken line made up of one long and two short dashes, alternately spaced

F. light weight line made up of long and short dashes, alternately spaced.

G. light weight and uniformly spaced

H. heavy weight line

I. medium weight paired series of short dashes

J. light weight long dashes connected with freehand zigzags

2. Computations for stretchouts:

_____ 1. 4S
_____ 2. 2H + 2W
_____ 3. L + 2H
_____ 4. W + 2H
_____ 5. Pi D
_____ 6. Pi D + 2W
_____ 7. $\frac{\text{Angle}}{360}$ x Pi D

A. length of rectangular box equals
B. square job equals
C. circular job equals
D. width of rectangular box equals
E. semicircular job equals
F. elbows throat equals
G. cone shaped job equals
H. rectangular job equals
I. prisms shaped job equals

Procedure-Rearrangement

<u>Directions</u>: In the column at the right appear various steps or operations involved in sheet metal layout. Indicate the order that your readings recommend that the steps or operations be done, by placing the proper number in each blank at the left.

1. Procedure for laying out square or rectangular jobs:

_____ A. mark brake lines

_____ B. form upper base by connecting points

_____ C. layout lines with flat steel square and straight edge

_____ D. add seams and edges

_____ E. draw stretchout lines slightly longer than sum of sides

_____ F. mark length of job on two end lines with rule dividers

Assignment
Sheet No. 14

Covering
Units 91-102

SEAM AND HEM LAYOUT

As a sheet metal trainee you will frequently see or hear the words, "allowance to be added for seams and hems," when making the stretchouts for various jobs.

These words imply an understanding of not only where the more common types of seams and hems are used, but also a knowledge of the procedures to lay them out. Size specifications for seams and hems may be worked out in advance and indicated on the drawing, or left up to the judgment and experience of the tradesman. Regardless of who determines the size specifications, the competent worker needs to know the proper allowances and layout procedures.

This assignment includes descriptive material pertaining to the more important types of seams and hems along with suggested procedures to be used in layout.

Assignment:

1. Read the references listed below.
2. Complete additional sample models or sketch cards that you started in Assignment Sheet No. 5. (See page 46 in this manual.) Select remainder of samples to be used from material presented in this assignment or other materials you desire.
3. After completing items 1 and 2, answer the questions listed below and hand in this assignment by ________________.

References:

C. New York, Measurement and Layout, pp. 39-54.
D. Daugherty, Sheet Metal Pattern Drafting and Shop Problems, pp. 24-37.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The strength of lap seams fastened with rivets is greater than those held with solder.

T F 2. The allowance for one side of the bottom of a job with a single seam should equal the width of the seam.

T F 3. The allowance for the flange on the body of a cylindrical job to be joined with a single seam should equal one half the allowance for one side of the bottom.

T F 4. The allowance for a double seam is twice that for a single seam.

T F 5. The allowance for one side of the bottom of a set-in bottom seam should equal one half the allowance for one side of the body.

T F 6. The Pittsburgh lock may be used to join the edges of light weight sheet metal to form flat sections.

T F 7. Notches should be laid out before seams or edges on a pattern.

T F 8. Single hems should generally be wider on heavy sheet metal than on light sheet metal.

T F 9. The allowance for a single hem should be equal to twice the width of the hem.

T F 10. Grooved seams are offset.

T F 11. The allowance for a lap seam is equal to twice the width of the seam.

T F 12. The allowance for one side of the body of a set-in bottom seam should equal the width of the seam.

T F 13. The width of a burred bottom seam should be approximately 3/8 inch.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. The allowance for the pocket of a Pittsburgh lock is equal to W + W + ________ inch.

2. Double seams that must be waterproof are ______________.

3. A lap seam must be ______________ when a smooth flush surface is required.

4. The allowance for a wired edge on 24 gage or lighter metal is equal to ______ times the diameter of the wire.

5. A double hem requires an allowance equal to ______ times the width of the hem.

6. The distance between the lock and stop slits of a dovetailed seam may vary from a minimum of ______ to a maximum of ______ inch.

7. The total allowance for a grooved seam is equal to______times the width of the lock.

8. The allowance for each edge of a piece of metal to be joined with a 1/2 inch wide grooved seam is__________inch.

9. The clearance allowed on the straight piece of a riveted corner lap seam is usually__________inch.

10. The total allowance for a lap seam to be fastened with quarter inch diameter rivets should be_______inch.

11. The dimensions required to lay out edges and seams are usually given on the___________________or specifications for a job.

12. The spaces left when pieces of metal are cut from seams and the edges of patterns are called________________________.

13. The sides of a full "V" notch should form a_____________angle.

14. The angle of the notch for a wired edge should start at a distance from the edge of the pattern equal to________times the diameter of the wire.

15. The lower part of the notch for a wired edge usually forms an angle of___________degrees with the edge of the pattern.

16. The kind of edge used on sheet metal is determined by the ___________________and strength of edge required.

17. The width of the flanged edge for a Pittsburgh lock should be ___________________than the width of the seam.

18. The type of clip most widely used to join sections of duct work together is known as a_____________________clip.

19. The allowance for the "S" clip is______________________.

20. The allowance for the government clip is_________________.

Listing

Directions: List the items called for in each of the following statements. Select your answers carefully.

1. List the methods that may be used to form single and double hems.

(A)___________________________ (C)___________________________

(B)___________________________

2. List the advantages derived from notching seams and edges.

(A)___________________________ (B)___________________________

3. List the reasons why various types of edges are formed on sheet metal.

(A) ______________________ (C) ______________________

(B) ______________________

4. List the materials that may be used to form edges on sheet metal.

(A) ______________________ (C) ______________________

(B) ______________________

5. List the factors that must be considered in selecting the types of seams and edges to use on sheet metal problems.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

1. Types of notches; their uses and characteristics:

_____ 1. square

_____ 2. straight

_____ 3. slant

_____ 4. "V"

_____ 5. half "V"

_____ 6. wire

A. dovetailing or outside corner flange

B. double seamed box ends and inside flanges on 90 degree bends

C. combination of square and half "V" notches

D. box and pan corners

E. combination of straight and half "V" notches

F. Pittsburgh lock

G. cut at 45 degrees when single hems are to meet at right angles

Units 103-108

PARALLEL LINE DEVELOPMENT

Sheet metal drafting necessitates more than a knowledge of mechanical drawing. It requires a knowledge of the specialized methods used to develop the various types of jobs that confront the sheet metalworker. Among these specialized methods is included parallel line development.

The parallel line method is one of the principal methods of development used in sheet metal drafting. It is used primarily for that group of jobs having uniformly shaped ends. Such jobs include tee-joints, elbows, and cornices. By gaining a thorough understanding of the fundamental principles involved in this method, it should enable one to develop a wide range of sheet metal jobs.

In this assignment you will be expected to gain a clear understanding of the parallel line method by reading about the principles involved and following the step-by-step procedures concerning the development of typical problems. In addition, representative problems of each type are assigned to be developed.

Assignment:

1. Read the references listed below. (It is suggested that you use dividers to follow the step-by-step procedures shown in the references on layout problems that are difficult for you to understand.)
2. Develop each of the jobs listed below on either drawing or heavy weight wrapping paper. Follow the step-by-step procedure shown in the reference to which the job is keyed. Specifications are indicated between the parentheses that succeed the name of each job. The reference and page number are enumerated first, followed by numbers that are used to indicate size dimensions for the letter distances shown in the reference illustration. Make no allowance for seams. Check the layout for each job after completion by cutting it out and assembling it with tape.

   (a) Square pipe and flange (Reference C, page 60: H = 4"; S = 2"; angle = 45 degrees; flange = 6" square)

   (b) Cylindrical pipe and flange (Reference C, page 62: H = 4"; D = 2"; angle=45 degrees; flange = 6" square)

   (c) Straight tee joint (Reference C, page 65: H = 2"; d = 2"; l = 2"; L = 4"; D = 2")

(d) Inclined tee joint (Reference C, page 68: H = 4"; d = 2"; g = 4"; L = 8"; D = 2"; angle = 45 degrees.)

(e) Elbow (Reference C, page 71: D = 2"; r = 2"; angle = 90 degrees)

(f) Ogee gutter miter (Reference C, page 74: H = 4"; W = 4"; w = 2"; L = 4"; l = 4")

3. After completing items 1 and 2, answer the questions listed below and hand in this assignment by ____________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 58-60, 188-194.
C. New York, Measurement and Layout, pp. 55-75.
D. **Daugherty**, Sheet Metal Pattern Drafting and Shop Problems, pp. 24-54.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The plan view may be omitted when developing all square-return miters.

T F 2. There is little relationship between geometry which relates to the surfaces of solids and sheet metal pattern drafting.

T F 3. The pattern for a cone could be developed by the parallel line method.

T F 4. Parallel line development is used in developing patterns for tapered forms.

T F 5. Element lines should usually be drawn one-half inch apart.

T F 6. Corresponding element lines are given the same identification number or letter in both the plan and elevation views.

T F 7. Paper patterns are required for most of the simple pipe fittings encountered in duct work.

T F 8. In developing a pattern for a square pyramid you would use the parallel line method.

T F 9. The only difference in developing patterns for oblong pipes as compared with developing round pipes, lies with the profile or plan view.

T F 10. The length of element lines is usually obtained from a drawing in the view represented as a circle.

T F 11. The only difference in developing a pattern for a square-face miter as compared with a square return miter is in the position of the stretch-out line.

T F 12. Plan views are generally drawn first when laying out sheet metal jobs.

T F 13. The number of element lines used in developing a pattern depends on the size of the job.

T F 14. The parallel line method of developing patterns for sheet metal is used very little because so few articles have parallel sides.

T F 15. The irregular cut edge of a pattern for the end pieces is the same as that for middle pieces of an elbow.

T F 16. A face miter rather than a return miter could be made on a cornice by changing the position of the miter line.

T F 17. Element lines run parallel to stretchout lines.

T F 18. The stretchout line should be drawn at right angles to the elevation view in parallel development.

T F 19. Prisms and cylinders are usually developed by the radial line method.

T F 20. The line of intersection between two parts of a job must be determined before the stretchout can be made.

T F 21. In sheet metal work the term elevation view applies to any view which shows the height of the object.

T F 22. A common group of round pipe fittings laid out by parallel line developments are intersecting pipes, commonly called tees.

T F 23. The true lengths of element lines are obtained from a plan view.

T F 24. A knowledge of geometrical constructions is important for the sheet metal draftsman because they are the basis of all developments.

T F 25. The length of a stretchout for a cylindrical pipe is based upon the true length of element lines.

T F 26. The terms girth and stretchout may be used interchangeably in ogee gutter layout work.

T F 27. On a round elbow, the inside radius is called the throat and the outside radius is called the heel.

T F 28. Plan views may be drawn either above or below front elevation views in sheet metal layout work.

T F 29. For developing the round elbow the miter lines are curved and must be developed.

T F 30. In developing a round elbow, the first gore pattern is the only pattern needed if the angles are the same.

Completion

Directions: Fill the blanks in each statement with the word or words required to complete the sentence correctly.

1. The line at which two parts of a job meet is called an__________.

2. The most important step in developing patterns for elbows is the development of the true__________ __________.

3. The length of element lines may be transferred to a stretchout by projecting them at an angle of__________degrees from the proper elevation view.

4. The lengths of element lines are transferred to a pattern in the pickoff method with__________.

5. The more accurate way for determining the length of stretchout lines involves the use of the__________method.

6. In developing patterns for intersecting pipes, the layout of the hole is done by__________.

7. The points along a six-inch steel scale that would ordinarily be marked when dividing a line 3 3/4 inches long into 5 equal parts by the scale method, would be located next to numbers__________, __________, __________, __________.

8. Development of a pattern for a tee joint consists of laying out the true lengths and proper spacing of__________lines.

9. If the line of intersection between two pipes is straight, it is called a__________ __________.

10. The straight line formed between two parts of a job, such as a gutter is called a__________.

11. The plan view of a single cylinder may be represented as a __________ __________in order to save time and space.

12. The layout made to show the actual shape of all the surfaces of an object is called a__________.

13. The parallel line method is used to develop irregularly shaped patterns for jobs with__________sides.

14. In radial line development, the_____________meet at a common center as with____________and___________________.

15. The parallel construction lines used in the development of a cylinder that has been cut off at an angle are called___________.

16. Spacing for element lines as determined from a view represented as a________________________or part thereof.

17. The length of stretchout lines for small diameter circles and arcs should usually be determined by the_____________method.

18. The intersection points between corresponding element lines of a tee joint will locate the_______________of________________.

19. For plain rectangular duct, the measuring lines on the elevation view are the_____________lines of the duct.

Multiple-Choice

Directions: Listed with each of the incomplete sentences that follow are several responses, one of which will complete the statement to make it true. Indicate your choice by placing the appropriate letter in the blank at the left.

_____1. In developing a round elbow, it is standard practice to (A) Keep the seams on the side; (B) Keep the seams staggered; (C) Do both A and B; (D) Keep the seams on the side of the heel.

_____2. The angle formed between the stretchout line and elements for a pattern should equal (A) 30; (B) 45; (C) 3; (D) 4.

_____3. The minimum number of views required to develop a pattern by the parallel line method is (A) 1; (B) 2; (C) 3; (D) 4.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the methods used to determine the length of stretchout lines.

(A)______________________ (B)__________________________

2. List the methods used to develop sheet metal patterns.

(A)______________________ (B)__________________________

(C)______________________

3. List the measurements necessary when developing a pattern for an elbow.

(A)______________________ (C)______________________

(B)______________________

Procedure-Rearrangement

Directions: In the column at the right appear steps or operations involved in sheet metal work. Indicate the order that your readings recommend they be performed, by placing the proper number in each blank at the left.

1. Procedure for laying out a cylindrical pipe cut off at an angle:

____A. Divide plan view into equal spaces and number points

____B. Draw stretchout line

____C. Draw element lines

____D. Draw front elevation

____E. Add material for seams

____F. Project points from plan view to elevation view

____G. Divide stretchout line into equal number of parts

____H. Determine and mark length of element lines

____I. Draw plan view

____J. Connect points with curved lines

2. Procedure for laying out a rectangular pipe cut off at an angle:

____A. Draw plan view, number corners, locate and label seams

____B. Layout and number lines representing edges

____C. Draw front elevation

____D. Project lengths of lines for edges from elevation view

____E. Connect points

____F. Draw stretchout line

RADIAL LINE DEVELOPMENT

A sheet metal layout man needs to have more than a knowledge of simple layout procedures and parallel line development methods. He requires a knowledge of other specialized methods to develop the various types of jobs that confront the sheet metal worker. Among these specialized methods is included radial line development.

The radial line method of drawing is one of the principal methods of development used in sheet metal drafting. It is used primarily for that group of jobs with tapered sides which meet at a point or are prolonged to meet at a point. Such jobs include funnels, hoppers, and transition pieces. By gaining a thorough understanding of the fundamental principles involved in this method, it should enable one to develop a wide range of jobs.

In this assignment you will be expected to gain a clear understanding of the radial line method by reading about the principles involved and following the step-by-step precedures concerning the development of typical problems. In addition, representative problems of each type are assigned to be developed.

<u>Assignment</u>:

1. Read the references listed below. (It is suggested that you use dividers to follow the step-by-step procedures shown in the references on layout problems that are difficult for you to understand.)
2. Develop each of the jobs listed below on either drawing or heavy weight wrapping paper. Follow the step-by-step procedure shown in the reference to which the job is keyed. Specifications are indicated in some instances between the parentheses that succeed the name of each job. The reference and page number are enumerated first, followed by numbers that are used to indicate size dimensions for the letter distances shown in the reference illustration. In order to reduce confusion, use the corresponding notations on your drawing that appear in the reference illustration. Make no allowance for seams. Check the layout for each job after completion by cutting it out and assembling it with tape.

   (a) <u>Irregular frustum of cone</u> (Reference C, Page 84: H = 6"; h = 4"; D= 3"; angle = 30 degrees.)

   (b) <u>Irregular frustum of pyramid</u> (Reference C, Page 86: H = 6"; h = 4"; S = 3"; angle = 30 degrees.)

   (c) <u>A cone intersected by a vertical cylinder</u> (Reference D, Page 94, Problem 58.)

   (d) <u>A cylinder intersecting frustum of a cone obliquely</u> (Reference D, Page 100, Problem 63.)

3. After completing items 1 and 2, answer the questions below and turn in this assignment by______________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 161, 162, 215.
C. New York, Measurement and Layout, pp. 76-87.
D. Daugherty, Sheet Metal Pattern Drafting and Shop Problems, pp. 78-103.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Stretchout arc is a term used to refer to the distance around the base of a cone.

T F 2. The elevation view of the true projection of the line of intersection between a cone and cylinder would appear as a straight line.

T F 3. Knowledge of parallel line development is necessary to develop the parts for an intersecting cone and cylinder.

T F 4. A plan and elevation view is necessary to develop a pattern by the radial line method.

T F 5. The length of element lines for a cone will vary if the base is located perpendicular to the axis.

T F 6. The radius of the stretchout arc should be drawn equal to the true length of the distance around the base.

T F 7. True lengths are usually projected into the plan view.

T F 8. Plan and elevation views are required to determine the line of intersection between a cone and cylinder.

T F 9. Two element lines will appear in their true length on the plan view of a cone.

T F 10. The development of parts for a job may require the use of several layout methods.

T F 11. The length of a stretchout for a pattern developed by the radial line method is determined from the elevation view.

T F 12. The radius of the stretchout arc for a cone should be equal to the altitude of the cone.

T F 13. The position for the plan view of a right pyramid may be selected so that the edges will be shown in their true length in the elevation view.

T F 14. It is usually more convenient for sheet metalworkers to place the plan view above the elevation view.

T F 15. A cylindrical pipe cannot be developed by the radial line method.

T F 16. Developmental procedures for a pyramid will be simplified if the job is placed so that the two closest corners of the base are equal distance from the front plane of projection.

T F 17. Measuring lines and edge lines of a pattern are always radii of the stretchout arc.

Completion

Directions: Fill the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. To develop a pattern by radial line method the stretchout arc must be described with a radius __________ to the length of the __________ __________ of the solid.

2. The spacing of element lines on the stretchout of a cone is determined from the __________ view.

3. The length of the stretchout arc for a cone is equal to the __________ of its base.

4. Radial line developments make __________ shaped patterns.

5. The cross section produced by passing an oblique cutting plane through a cone would be __________ in shape.

6. The portion remaining after the top part has been cut off parallel to the base of a cone or pyramid is called a __________.

7. When the upper portion of a right cone is cut off on an angle with the base, a cone is said to be __________.

8. Dividers are used in the __________ method for laying out the length of arcs for patterns developed by the radial line method.

9. The radius used for the stretchout of a right pyramid is based on its __________ __________.

10. In order to develop a job by the radial line method, its sides or extensions must meet at a __________.

11. All the element lines of a __________ cone are equal in length.

12. The radial line method is used to develop jobs with __________ sides.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the methods used for laying out the length of arcs for patterns developed by the radial line method.

(A)________________________ (B)________________________

Procedure-Rearrangement

Directions: In the column at the right appear various steps involved in laying out jobs by the radial line method. Indicate the order which your readings recommend that these steps be done by placing the proper number in the blank at the left.

1. Layout procedure for cone-shaped jobs cut at an angle:

____A. Connect points from base line to apex of cone

____B. Number true lengths of element lines

____C. Draw elevation view of cone showing apex

____D. Project points where element lines intersect miter line to side of cone

____E. Draw element lines on stretchout and number

____F. Scribe stretchout arc

____G. Project points for elevation view of element lines from plan view

____H. Compute length of stretchout

____I. Mark points on element lines where cone is to be cut off and connect points with a curved line

____J. Add allowance for seams

2. Layout procedure for pyramid-shaped jobs cut at an angle:

____A. Draw a plan view

____B. Add allowance for seams

____C. Determine true length of edges remaining after pyramid is cut off.

____D. Layout perimeter of base on stretchout arc

____E. Draw lines representing edges on stretchout and number

____F. Draw elevation view of job showing apex

____G. Scribe stretchout arc

____H. Connect points indicating where pyramid is to be cut off

____I. Mark points on lines representing edges where pyramid is to be cut off

____J. Mark brake lines

Assignment

Units 115-123

TRIANGULATION

A knowledge of parallel and radial line development is not enough for the well-trained sheet metal layout man to know. He must have a knowledge of another specialized method to develop the various types of jobs that confront the sheet metalworker. This method is known as triangulation.

Triangulation is one of the principal methods of development used in sheet metal drafting. It is used for irregular-shaped jobs that cannot be developed by either the parallel line or radial line methods, that is jobs having surface lines that are neither parallel nor that converge to a common point. Such jobs include transition pieces, reducers, and Y branches. By gaining a thorough understanding of the fundamental principles involved in this method, it should enable one to develop a wide range of jobs.

In this assignment you will be expected to gain a clear understanding of the triangulation method of development by reading about the principles involved and following the step-by-step procedures concerning the development of typical problems. In addition, representative problems of each type are assigned to be developed.

Assignment:

1. Read the references listed below. (It is suggested that you use dividers to follow the step-by-step procedures shown in the reference on layout problems that are difficult for you to understand.)
2. Develop each of the jobs listed below on either drawing or heavy weight wrapping paper. Follow the step-by-step procedure shown in the reference to which the job is keyed. Reference and page numbers are indicated between the parentheses that succeed the name of each job. In order to reduce confusion, use the corresponding notations for the job you develop as appear in the reference illustration. Make allowance for seams. Check the layout for each job after completing by cutting it out and assembling it with tape.

   (a) Transition piece, square to square (Reference D, page 106, Problem 65).

   (b) Transition piece, rectangular to round (Reference D, page 108, Problem 66).

   (c) Elbow-boot center taper (Reference H, page 49, Plate 29).

   (d) Roof collar having round top and square base (Reference D, page 128, Problem 81).

   (e) Three-piece offset fitting (Reference D, page 130, Problem 82).

(f) Furnace Boot, round to rectangular (Reference D, page 134, Problem 86).

(g) Two-branch Y-joint, round to round (Reference D, page 138, Problem 88).

3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by____________________.

References:

A. Bruce and Meyer, Sheet Metal Shop Practice, pp. 195-209.
D. Daugherty, Sheet Metal Pattern Drafting and Shop Problems, pp. 24, 104-158.
H. Kaberlein, Triangulation, Short-Cut Layouts, pp. 48-49.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The selection of the layout method may be optional with the sheet metal patternmaker.

T F 2. The triangulation method is just a matter of dividing the surface of a project into triangles, finding the true lengths of the sides of the triangles and then drawing the triangles in proper order.

T F 3. Many projects are too complicated to be developed by the parallel line, radial line, or triangulation methods.

T F 4. Triangulation method of development is used for articles with non-parallel sides.

T F 5. A square-to-round transition on center requires both elevation and full plan view for its development.

T F 6. A diagram of triangles for true lengths can be drawn if the altitude in the elevation and the base lines in the plan are known.

T F 7. The construction of a triangle when only three sides are given is a difficult problem.

T F 8. A single altitude and base line extension may be used to layout right triangles required to find the true lengths of scalene cone element lines.

T F 9. Both a plan and elevation view are necessary to produce the true surface lines for a job when the halves are not symmetrical.

T F 10. A pattern may be developed by using only the plan view in the simplified method of triangulation.

T F 11. Arcs are drawn to step off the distances between the outer ends of the true length lines when laying out a scalene cone.

T F 12. A full view of the upper and lower bases of an irregular flaring roof collar will be exact circles.

T F 13. Triangulation is the method used to develop patterns for irregular forms which cannot be developed by either the radial line method or parallel line method.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. All kinds of irregular forms which cannot be developed by parallel line development and radial line development may be developed by the ______________________________ method.

2. On an elevation view, all lines in a vertical plane which are perpendicular to the line of vision are ____________ ____________.

3. The sheet metal layout man must design duct systems so they will handle large quantities of air________________ and ______________.

4. When radical air flow direction changes must be made, duct turns must be installed in the fitting which directs the air through the fitting with the __________________ amount of______________.

5. A layout man can do a more effective job in the design and layout of all types of air conditioning systems if he thoroughly understands all of the types of __________________ __________________.

6. To find the true length, one method used by sheet metalworkers is to draw the line in a ____________ view and then __________ it.

7. The first process in laying out a triangulation pattern is to find the _____________ for all lines.

8. To find the true length of a foreshortened line by the simplified method, in the elevation view, make the foreshortened line the base of a _______________ _________________, the altitude is the _________________ in heights taken from each end of the line in the ______________ ____________, the hypotenuse will be the _________________ _______________ line.

ELBOW-BOOT CENTER TAPER

Directions: The following questions are based on Plate 29, page 49 of Kaberlein, Triangulation Short-cut Layouts. Place the proper word or words in the blanks provided.

1. This type of fitting is generally used on ______________________ ______________________ where small round pipes may be used very efficiently as basement runs.
2. The top view and side view are drawn in this Plate to show _______ and _________ of the fitting.
3. Line A to B in Figure 3 is equal in length to line _______ and is _____ inches long.
4. Point ________ is used as a center to draw an arc from point 1, 2,3,4,5, and 6 on the circle to intersect the base line of the triangle thus obtaining the ______________________ of the lines.
5. To layout the pattern as in Figure 5, draw line A to A. The length of this line is _________.
6. To get the true-length of the slant (A to 1'), use the triangle, Figure 3 line _________.

Assignment

Covering
Units 124-133

ESTABLISHING AND OPERATING A SHEET METAL BUSINESS

Did you know that on the average for all kinds of new businesses started, approximately one-third fail within the first year, and by the end of five years nearly three-fourths fail? More than half of the metal working shops that failed were established with a capital investment of less than $1,000 and failed in the first year of operation.

Before you think too seriously about entry into the sheet metal business, learn the trade first. Skill and experience are qualifications necessary for success. Obtain all the training that is practical for you to receive. Read and keep up with new developments in the field. Get at least three or four years of all-round work experience in the trade.

Skill and good workmanship alone are not going to insure one success in business, other attributes are necessary. In order to attract business into the shop, one must be able to get along well with people and be a good salesman. He must have a head for figures and a satisfactory system for recording information that will enable him to operate his business efficiently.

Assignment:

1. Read the reference listed below.
2. Assume that you are actually going to enter the sheet metal business in the very near future. Prepare a written report based upon your studies and investigations that includes all data, information, and sketches that you feel are necessary for your entry into business. You might include data in your report concerning the following:
    - (a) Community need and demand for the business
    - (b) Select and justify location
    - (c) Tentative floor plans of shop
    - (d) Supplies and equipment required
    - (e) Organization plans of business
    - (f) Financial problems
    - (g) Business advisors
    - (h) Record forms
    - (i) Education and preparation desired before entering business
3. After completing items 1 and 2, answer the questions listed below and turn in this assignment by ____________.

Reference:

I. Information Sheet No. 3, this manual.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Offerings of established metal working businesses should ordinarily be considered before entering into competition with them.

T F 2. More than half of the metal working shops established with a capital of less than $1,000 fail within the first year.

T F 3. A light intensity meter may be used to help determine whether general and special lighting are properly arranged.

T F 4. A simple production analysis is necessary to make certain that the shop layout is satisfactory for a particular business.

T F 5. Wood floors are recommended for metal working shops because they are less tiring on the feet.

T F 6. A good method for checking shop layout is by arranging scale "cut outs" of equipment on a scale drawing of the shop's floor plan.

T F 7. There are many desirable localities free of competition in metal working business.

T F 8. Ordinarily when starting a new business it is better to buy than to lease a building.

T F 9. The size and character of a locality's population determines to a large extent the amount and kind of business which can reasonably be expected.

T F 10. A specialized metal working shop generally has a greater chance for success in a small community than in a large city.

T F 11. Zoning restrictions are used to keep stores out of choice residential districts.

T F 12. Generally, it is more feasible to locate a small metal working shop adjacent to a traffic artery than a side street.

T F 13. Mechanical training and experience are essential qualifications for successfully establishing and operating a metal working business.

T F 14. Explanations concerning rule-of-thumb methods for estimating job costs may generally be obtained from supply warehousemen and salesmen.

T F 15. U.S. Department of Commerce surveys reveal that a large proportion of the small businesses that fail each year do not keep adequate records.

T F 16. It will be necessary for a metal working shop to have dealings with a bank as long as it is in business.

T F 17. Business organizations need adequate financial records so that taxes can be accurately calculated.

T F 18. It is considered a poor business practice to charge a customer more than the regular price for a "rush job".

T F 19. Costs based on rule-of-thumb methods differ because of variations in labor costs, rents, competition, and other items in different sections of the country.

T F 20. The original copy of a job sheet used for record keeping purposes is retained for office records.

T F 21. Court action should be used only as a last resort in collection of bad debts.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. One of the best types of advertising for a metal working shop is that which appears in ______________ directories.
2. Jobs for which there is no particular hurry to complete can be used as filler to keep a shop ______________ during slack periods.
3. Rule-of-thumb methods for estimating job costs are based largely on ______________.
4. The lightweight cardboard third carbon copy of a job sheet used for record keeping purposes is known as a ______________ sheet.
5. It is advisable before entering into a legal agreement to obtain the advice of a ______________.
6. Double-entry record books provide spaces for recording ______________ and ______________.
7. Probably the best bookkeeping system for a small new business to adopt would be a ______________ entry system.

8. An important book in a simplified system of accounting is the ________________.

9. An estimate of expected competition for a new business may be determined by glancing at the classified section of a ________ ________________.

10. The lessee should reserve the right to renew a lease by giving notice some ________ days before the lease is expired.

11. Business expenses are usually significantly __________ in the small community than in the large city.

12. A successful sheet metal working shop will generally have a trading area population of not less than _____________persons.

13. The buyer of a business should engage a competent _____________ to draw up the purchasing agreement.

14. The saw-tooth type of roof was developed to permit more _____________ to enter the interior of a building.

15. For the ease of handling materials in and out of the shop, it should be located on the ________________ floor.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the types of organizations helpful in revealing information concerning business opportunities and limitations.

(A)__________________________ (D)__________________________

(B)__________________________ (E)__________________________

(C)__________________________

2. List the two basic methods of keeping accounts.

(A)__________________________ (B)__________________________

3. List the type of information that should be recorded in each of the three main sections of a job sheet record form.

(A)__________________________ (C)__________________________

(B)__________________________

4. List the two principal factors that must be kept in mind when making estimates and quoting prices.

(A)__________________________ (B)__________________________

5. List the most important methods to attract business into a metal working shop.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

6. List the sources of information that ordinarily provide the most reliable data concerning a prospective customer's credit standing.

(A) ______________________ (C) ______________________

(B) ______________________

Information
Sheet No. 4

ESTABLISHING AND OPERATING A SHEET METAL BUSINESS

You have learned from the previous assignment sheets that the **sheet metalworker** works with tinplate, iron or steel sheets, and light plates. Generally, they do roofing and skylight work, install ventilators and ducts for heating or air-conditioning, and make any number of things which the public demands to be fashioned from sheet metal. It would be possible for you to get into this field with no more than a building, a source of heat such as a blow torch, a few soldering irons, and a pair of tin snips. A person starting out with nothing more than the above would be severely handicapped, however, and would probably not make a success of it. To be able to do the range of work needed to succeed, you would need such machines as shears, bending brakes, work tables of good size, and welding equipment, plus an adequate assortment of hand tools. Mechanical training and experience are also essential. In fact, to be successful in running a sheet metal shop you should have had well-rounded training, because in the beginning you may be faced with the problem of making a minimum of equipment do for a large variety of jobs.

CHOICE OF A LOCATION

In any locality, the size and character of its population and its business activities determine to a large extent the amount and the kind of business which can reasonably be expected. Large metropolitan cities, with their great concentrations of population and immense variety of occupations, offer many opportunities for the proprietor of a sheet metal shop. But competition is likely to be keen because others will surely be equally aware of the chance for business there. One method of getting ahead in a large city is to establish a reputation for expert handling of certain difficult or unusual work. Becoming known as an expert in some area will usually result in considerable business.

Smaller factory cities have many potential sources of business for sheet metal shops. Rural communities that are predominantly agricultural present problems for a person who is interested in sheet metal work only. It is doubtful that there would be enough demand to make a successful business. Business expenses are usually much lower in the small community. Taxes are not as high as they are in the larger cities and overhead is generally less. However, it is generally agreed that one should have a trading area population of not less than 20,000 persons for a sheet metal business to succeed.

If you are thinking of setting up a business in a certain city, in addition to the existing competition there are a number ofother things that you should know about the locality. The telephone directory can give you valuable information about the number of competitors in addition to the number of business concerns and contractors that might be potential customers. Bankers, Chambers of Commerce, businessmen's clubs, and other organizations for the promotion of business, usually have a good deal of helpful data bearing on local commercial prospects. The number of motor vehicles registered in an area in proportion to the population is to some extent an indication of the general level of prosperity. This information is available from the state motor vehicle department. The Bureau of the Census also has a great deal of information on the manufacturing and business activities of a given area.

CHOOSING A SPOT FOR YOUR SHOP

One of the first important business decisions a person must make after deciding to open a shop is the selection of a place to do business. One of the considerations one must think about is checking the zoning ordinances to determine if the location you are considering is restricted. Many sections close to a residential area are zoned to prevent business from moving in. The direction of growth of the city is another important consideration. It is well to locate your shop where the money is being spent. Rental rates is another item that is important. Rent has to be paid every month whether your business is making a profit or not. High rent can strangle your business, especially during a slump. It might pay to check the advantages of leasing your shop rather than renting or buying. Some of the advantages of leasing over buying are that your initial investment will be lower, leaving you more cash for equipment and operating costs, and you will also enjoy freedom from such ownership risks as fires, tornadoes, and value changes. Another important factor to consider in the selection of a building for your shop is the available parking space, and the ease with which the customer can get to your shop. A busy traffic artery is not necessarily the best location. Usually a side street off these busy highways is best.

If the location has been carefully selected, and the rights and obligations of owner and tenant are fully and clearly agreed upon in writing, you need have no hesitation in signing a lease for one year or longer. You should reserve the right to renew it for a similar period by giving notice some 60 days before the end of the period.

Before signing any leases or contracts in starting your business you should see a lawyer. His services will cost you something, but chances are it will save you in the long run.

Once the arrangements on the building have been completed, the next step is to arrange the equipment in the building. A good method for doing this is to draw to scale, on a large sheet of paper, the floor plan of the shop showing all windows, doors, partitions, and columns. Then, to the same scale, cut out of heavy paper the plan of each piece of machinery, equipment, work benches, and storage space. Arrange them on the floor plan for the most efficient flow of work, taking advantage of such things as natural light, power supply, etc.

In the selection of your shop you should also avoid a room with wood floors. In a shop where there is a possibility of grease and oil being spilled on the floor, and where heavy machines are to be used, concrete floors are a <u>must</u>. For the ease of getting material and finished work in and out of the shop, it should be located on the ground floor.

The building should have good window area, or the roof should be of the saw-tooth type to provide a good source of natural light. If not, enough lighting fixtures will need to be installed to insure a light supply adequate for the type of work being done. The light intensity can be easily checked with a light meter available from all electrical supply houses, or most power companies.

Once your business is set up, you will need all the publicity you can get for your shop. Some of the ways of obtaining publicity are by personal contacts with potential customers, telephone solicitation and advertising in the local newspaper. One of the best ways of advertising is to have your business listed in the yellow pages of the telephone directory. As your business gets under way a satisfied customer is an excellent way to increase your future business.

QUOTING PRICES

Your ability to estimate the cost of a job so that your shop makes a profit and your customer is happy will determine whether or not you stay in business. When making estimates and quoting prices you must keep two principal factors in mind: how much it will cost you to do the job, and what the customer is willing to pay. How much to charge is not always easy to determine because the decision rests in part upon things that are beyond your knowledge or control. Actual market prices for various jobs are determined by the prevailing practices in your locality. The extent of your competition will depend on the number of available shops that can do the job. Only the customer will know what the work to be done is worth to him.

In every locality there are rule-of-thumb methods for estimating costs andare learned largely through experience. The salesman from whom you purchase your machinery, or the supply house, will be able to acquaint you with these and will be glad to explain these methods to you. However, if a customer comes in with a rush job, do not hesitate to charge more than your usual rate for such a job. This usually involves changing your routine and may increase costs. Also, if a customer wants quick preferred service, he should be willing to pay for it.

RECORD KEEPING

In a survey made by the United States Department of Commerce to determine why so many small businesses fail in the first, second, or third year, it was found that a large percentage of them kept inadequate records or no records of their business.

There are two basic methods of keeping accounts - the single-entry system and the double-entry system. The single-entry system is a simple system for accounting for the receipts and expenditures of cash. The checkbook, an accounts receivable ledger, and a day book for entering memorandum-type information are all the equipment required.

The double-entry system is more complete and to keep it properly requires a knowledge of bookkeeping and accounting methods. Double-entry means that the accounts are split into two sections - debit and credit. The debit side is always the left and the credit side is the right. For each debit entry a credit entry is made also, and the books must always balance. This system provides the bookkeeper with a means for checking his accuracy.

Although an elaborate bookkeeping system is not necessary for a small shop, you must have certain record-keeping procedures if the shop is to be properly managed. A job sheet is essential and is best handled by utilizing a form which has one original copy and three carbon copies. The original serves as the customer's copy, the first carbon is the customer's receipt, the second carbon is the office copy and the third carbon is a shop card or job ticket. This third carbon in usually printed on lightweight cardboard. These job sheets are usually divided into three sections; the left section is for a description of the work to be done, the middle section is for the estimate of material, and the right section is the estimate for labor.

From the day you open and as long as you stay in business you will have dealings with a bank. Therefore, it is wise to choose one that will best service your needs from the standpoint of convenience and services offered. The best way to build a good reputation with your banker is to operate in a businesslike manner. This means you must pay your bills promptly and keep your account receivable collecte

The need for the small businessman to extend credit to his customers raises a very important issue. A large number of businesses have failed because they were too lenient in granting credit. Knowing this, you will probably be tempted to adopt a "no credit" policy. However, such a course would limit your field of business opportunities to such an extent that you would never be able to earn more than a very meager living. The effectiveness of your collection system will determine the credit that you will be able to extend. No one can afford to give credit unless he is able to collect later. You will have a few bad accounts, but they should be collected because accounts written off come directly out of your profits. If all other means of collecting fail, it may be necessary to bring court action; however, avoid this if at all possible. If it does seem necessary, consult a good lawyer.

To avoid too many bad accounts, it is wise policy to investigate a customer;s credit standing before extending credit. Your bank and other credit organizations can furnish you with helpful information, and also, you can examine your customer's business habits.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO MECHANICS (OCCUPATION), *MOTOR VEHICLES, HIGH SCHOOLS, JOB ANALYSIS, *COOPERATIVE EDUCATION, INDIVIDUAL INSTRUCTION,

This study guide is for individual student use in related instruction in high school cooperative education programs in auto mechanics. It was developed by a committee of teacher coordinators and teacher educators through an analysis of the trade and has been field tested and periodically revised. The 23 assignment sheets are designed to facilitate individual instruction and contain introductory paragraphs to develop interest, explanations of the importance of the assignments, references, learning activities, and objective-type study questions. Representative assignment sheet titles are (1) Basic Components of the Automobile, (2) Automobile Engine Components, (3) Engine Service, (4) Clutches and Clutch Service, and (5) Automotive Air Conditioning. An information sheet is included on job management. The material is to be used by individual students under teacher supervision for 1 year of 180 days. The teacher should be a qualified coordinator or competent trade teacher. The students should be grade 11 or grade 12 students who are enrolled in a cooperative education program and employed in a phase of auto mechanics. Supplementary materials include a list of references, an analysis of the auto mechanics trade, and progress records for use by student, instructor, and employer. A second study guide (VT 001 628) has been developed for group study. Answers to study questions are available in VT 002 081. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

FOREWORD

This course of study, consisting of an analysis of AUTO MECHANICS, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching auto mechanics on an individual basis in a cooperative part-time program.

The original analysis was developed in 1940 by Mr. R. W. Baker, Director of Industrial Education, Joplin, Missouri, and by Mr. Lloyd E. Estes, Coordinator and Mr. Kenneth Epperson, Auto Mechanics Instructor, Hannibal, Missouri. The original course of study was prepared at the 1947 Summer Conference for Coordinators at the University of Missouri by a committee under the chairmanship of Mr. Lloyd E. Estes. Subsequent revisions of the analysis and the assignment sheets were made by Dr. Charles R. Hill in 1949, Dr. Charles G. Risher in 1951, Dr. James H. Mahoney in 1955, Dr. John W. Horine in 1961, formerly Research Assistants in Industrial Education at the University of Missouri.

Special credit is due to Mr. Kim Baugrud, Research Assistant in Industrial Education at the University of Missouri, who prepared the present revision of the course of study.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

HUBERT WHEELER

TABLE OF CONTENTS

Assignment Sheets:

Information Sheet:

INTRODUCTION

In preparing this coruse of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their reqirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method

But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each student enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets, available in a separate manual, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

The auto mechanic's trade is a service type of trade which is concerned primarily with the adjustment, repair, and installation of parts, and general maintenance of the automobile. Auto mechanics are classified either as general mechanics or as specialists. The general auto mechanic is capable of performing the great majority of operations necessary to return a vehicle to its normal operating condition. A specialist is one who has all-around knowledge of the trade, but who has, in addition, become especially skilled in one or more particular phases of automotive repair, such as carburetion, brakes, or ignition.

Outlook and Opportunity for the Automotive Mechanic

An increasing number of competent automotive mechanics will be in demand throughout the forseeable future. This upward trend is certain to continue due to the rapidly rising number of cars, trucks and buses on the nation's highways. The increase in farm mechanization will also add to this demand. Today there are approximately one million automotive mechanics. For an occupation this size the Labor Department estimates that retirements and deaths alone create about 12,000 to 15,000 openings each year.

In addition to the increase in numbers needed, there will be a demand for mechanics with more skills and technical knowledge than has been required. The relatively new features such as automatic transmissions, power brakes, power steering, air conditioning and other mechanical innovations requires an understanding of numerous scientific principles and their application in the servicing and repair of motor vehicles.

Earnings for the auto-mechanic vary depending on the location and size of the community, the mechanic's specialty, the type of establishment and other factors. However, regardless of these factors the competent mechanic can look forward to earning good wages. A survey by the Department of Labor in 1958 showed that wages for mechanics ranged from $2.05 to $3.16 an hour, with the average being $2.50 an hour. More important than wages, perhaps, is the fact that the prospective mechanic will not be tied to a dead-end job. Instead, he can look forward to life of challenging experiences as he repairs and services the complex motor vehicles of the future.

Personal-Social Traits Essential for the Auto Mechanic

Personality traits are of extreme importance, not only in securing and holding a desirable position but in life in general. Personal and social traits can be improved through training when the individual learns what to improve, how to improve and why improvement is advisable. Among the personal-social traits of chief importance to the auto mechanic are the following:

Patience. Much of the work of the auto mechanic is in "hard-to-get" places, and it requires patience as well as skill to make the necessary adjustments and repairs.

Personal Appearance. Clothing should be worn that makes for safety, efficiency, and a pleasing impression upon the people you serve.

Good Physical Condition. Physical requirements are not excessive, but the conditions of work are not always ideal. Often it is necessary to work in cold, drafty, and poorly ventilated places. One must be in good physical condition to keep at top efficiency. One must have good muscular coordination, mechanical dexterity, good eyesight, and steady nerves.

Cooperation. Auto mechanics requires a willingness to work cooperatively with fellow workers. This means an attitude of readiness to assist others when they need help, and to join in group undertakings.

Consideration of Others. A thoughtful attitude toward making things easy and pleasant for others, such as keeping things in order, putting tools away, and doing your full share of work is an important marketable trait of a good auto mechanic.

Industry. This character trait means a habit of careful, thoughtful, energetic attack upon the job without loitering or wasting time.

Initiative. The ability to see what needs to be done and to go ahead without constant supervision is an essential trait of an auto mechanic.

Reliability and Trustworthiness. Intrusted in your care are people's lives and valuable property. Negligence on your part as a mechanic can easily cause death and destruction.

ANALYSIS OF AUTO MECHANICS

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
Introduction to Auto Mechanics		
	1	1. Importance of automobiles in today's world
	1	2. Nature and opportunities in the auto repair business
	1	3. Occupational and vocational guidance information
	1	4. Sources of auto repair information
	1	5. Things to consider before opening your own business
	2	6. Historical review of the automobile
	2	7. The automotive industry
	2	8. Automobile, design and major components
	3	9. Auto repair hand tools
	3	10. Tool safety and usage
The Engine		
	4	11. Physical principles involved in engine construction
	4	12. Types of engines used in automobiles
	4	13. Engine classifications
	4	14. Gas turbine and experimental engines
	4	15. Engine component identification
	4	16. Engine mounting
	4	17. Two cycle engine operation
	5	18. Engine block design
	5	19. Principles of cylinder construction
	5	20. Piston and connecting rod design
	5	21. Piston ring design and cylinder installation
	5	22. Variations in cylinder head placement
	5	23. Types and purposes of gaskets
	5	24. Function of intake and exhaust manifold

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
	5	25. Construction and design of engine bearings
	5	26. Cam, crankshaft design and function
	5	27. Kinds of engine valves
	5	28. Principles of the valve train
	5	29. Function of engine fly wheel
	5	30. Importance of proper valve timing
	5	31. Engine timing devices
	5	32. Crankcase design and function
	5	33. Types and operation of valve lifters
	6	34. Operating characteristic of valve trains and valv
	6	35. Diagnosing valve trouble
36. Free sticky valves	6	36. Methods of servicing valves
37. Adjust valve-tappet clearance		
38. Remove and replace valves		
39. Recondition valves and valve seat		
40. Replace a valve seat insert		
41. Test valve guide wear		
42. Check and repair hydraulic valve lifters		
	6	43. Cylinder head maintenanc
44. Remove, clean, replace cylinder head		
45. Install gaskets		
46. Inspect piston for damage	6	46. Service to pistons and cylinders
47. Check cylinder walls for variation		
48. Remove ridge ring		
49. Refinish cylinder walls		
50. Remove, fit, install pistons		
51. Clean piston ring grooves		
52. Remove, fit and install piston rings	6	52. Types of piston rings
53. Remove, fit and replace piston pin bushings	6	53. Ways of servicing connecting rods
54. Remove, align, install connecting rod		

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
55. Align connecting rod to piston		
56. Remove and replace connecting rod bearings		
57. Remove and replace crankshaft	6	57. Methods used to check crankshafts
58. Test and align crankshaft		
59. Clean oil passages		
60. Check and adjust crankshaft end play		
61. Remove and install main bearings		
62. Remove and replace oil seals		
63. Remove and replace camshaft		
64. Test and align camshaft		
65. Remove and replace camshaft bearings		
66. Measure engine efficiency	7	66. Engine measurements
67. Test engine compression	7	67. Testing instruments used in engine service
68. Measure engine vacuum		
69. Diagnose engine troubles	7	69. Principles of trouble shooting the engine
	Fuel System	
	8	70. Chemistry of engine fuels
	8	71. Effects of condensation on fuels
72. Check fuel lines	8	72. Fuel tank design
73. Remove and replace fuel pump, bowl	8	73. Operating theory of fuel pumps
74. Test fuel pump pulsation for output		
75. Remove, clean, replace fuel filter	8	75. Types of fuel filters in use
76. Test venturi tube	8	76. Principles of carburetion
77. Adjust air bleed		
78. Test carburetion with analyzer		
79. Check and adjust discharge jet		
80. Adjust choke lever	8	80. Principles of the choke
81. Adjust automatic choke		
82. Adjust choke control cables		
83. Position the throttle valve	8	83. Throttle valve principles

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
84. Test engine RPM		
85. Test engine combustion	8	85. Principles of fuel combustion
	8	86. Malfunctions occurring i carburetion
	8	87. Carburetor types and their functions
	8	88. Manifold design for carburetion
89. Remove, clean, replace air filter	8	89. Air filteration principl
90. Inspect and interpret fuel injector chart	8	90. Fuel injection systems
	8	91. Diesel fuels and their operating principles
	8	92. Carburetion using liquified petroleum
93. Test fuel consumption	8	93. Test instruments used ir fuel system service
94. Analyze exhaust gas		
95. Measure manifold vacuum		
96. Diagnose fuel system troubles	8	96. Trouble shooting the fue system

Engine Lubrication

97. Check, drain, fill crankcase	9	97. Characteristics of engir lubricating oils
	9	98. Principles of crankcase ventilation
	9	99. Function of engine lubri cating system
	9	100. Types of lubricating systems
101. Check oil cooler	9	101. Types and functions of oil coolers
102. Check, repair, oil line damage		
103. Replace oil filter	9	103. Types and function of oil filters
104. Replace oil gauge	9	104. Principles of oil gauge operation
105. Correct low oil pressure	9	105. Testing instruments used in lubrication system
106. Correct excessive oil pressure		
107. Replace diluted oil		
108. Diagnose lubrication troubles	9	108. Introduction to engine lubrication trouble diagnosis

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know

Cooling System

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
109. Check antifreeze solution concentration	10	109. Types and characteristics of antifreeze solutions
110. Drain cooling system	10	110. Care of cooling systems
111. Examine radiator for restrictions, leaks		
112. Flush radiator rust and scale		
113. Test and install thermostat	10	113. Function of thermostats
114. Examine, replace cooling system hoses		
115. Remove, replace water pump	10	115. Water pump operation
116. Test radiator cap pressure	10	116. Pressurized cooling systems
117. Check overflow line		
118. Check fan blade	10	118. Engine fan operation
119. Adjust fan belt tension		
120. Test hot water heater	10	120. Hot water heater operation

Electrical Systems

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
	11	121. Electrical terminology
	11	122. Function of electrical system
	11	123. Ohms law and its application
	11	124. Battery construction and operation
125. Determine battery ratings	11	125. Battery ratings and efficiency
	11	126. Wet and dry-charge battery stock maintenance
127. Remove and replace a battery	11	127. Installation procedures of batteries
128. Recharge a battery	11	128. Principles of recharging a battery
	11	129. Factors affecting battery life
130. Test battery specific gravity		
131. Test battery output		
132. Check, fill battery liquid level		
133. Readjust specific gravity of battery		

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
134. Determine battery rating		
	11	135. Safety precautions used with batteries
136. Remove, replace a generator	11	136. Servicing a generator
137. Test generator for short		
138. Turn commutator segments on a lathe		
139. Remove mica between commutator segments		
140. Remove, replace generator brushes		
	11	141. Operating principles of three brush generator
142. Test alternator output	11	142. Principles of an alternator
	11	143. DC-AC conversion practices
144. Test starting current voltage	11	144. Starter motor principle and operation
145. Remove, replace starter motor		
146. Check, repair bendix drive		
147. Bench test starter motor		
148. Test starter solinoid		
	12	149. Coil construction and operating principles
150. Test coil polarity	12	150. Functions of coil polarity
151. Test coil primary voltage		
152. Test coil secondary voltage		
153. Remove, replace coil		
	12	154. High voltage theories
	12	155. Principles of rotor action
156. Record engine firing sequence	12	156. Firing sequence theory of engines
157. Remove, replace distributor		
158. Time distributor to engine		
159. Adjust vacuum advance	12	159. Operating principles of vacuum advance
160. Adjust centrifugal advance		
	12	161. Condenser construction and operation

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
162. Remove, replace condenser		
163. Remove, replace spark plug	12	163. Construction of spark plugs and relationship of parts
164. Clean and adjust electrode gap	12	164. Spark plug electrode classification
165. Analyze spark plug condition	12	165. Principles of testing and techniques of cleaning spark plug
166. Select spark plug for a specific engine	12	166. Spark plug chart interpretation
	12	167. Pre-ignition factors of a spark plug
	13	168. Regulation of generator output
	13	169. Functions of circuit breakers and relays
170. Remove, adjust, replace regulator	13	170. Voltage and current regulation through separate devices
171. Test regulator input, output		
172. Remove, replace charging circuit wires		
173. Trace regulator circuits		
	13	174. Functions of a three unit regulator
	13	175. Principles of double contact regulation
176. Test indicator light	13	176. Devices to indicate generator output
177. Test ammeter		
	Clutch	
178. Adjust clutch linkage	14	178. Types of clutches and their operation
179. Remove, replace clutch friction disk	14	179. Clutch components
180. Diagnose clutch troubles	14	180. Clutch trouble-shooting
	Transmissions	
181. Adjust fluid level	15	181. Function, types, and operation of transmissions

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
182. Adjust control linkage	15	182. Gearshift mechanism operation
	15	183. Synchromesh transmission operation
184. Diagnose transmission troubles	15	184. Operating procedures of transmissions
185. Test an overdrive	15	185. Function and operation of an overdrive
186. Adjust liquid level of transmission	16	186. Operation of fluid overdrive
187. Adjust hydramatic drive	16	187. Operation of hydramatic drives
188. Remove, repair, replace transmission	16	188. Planatory gearing in transmissions
	16	189. Principles of torque conversion and multipliers

Drive Mechanisms

	17	190. Function, types of propeller shafts
191. Remove, replace universal joint	17	191. Selection and operation of universal joint
	17	192. Function of slip joints
193. Remove, replace axle shafts and bearings	17	193. Types of rear-axle drive mechanisms
194. Adjust axel-shaft end play		
195. Remove, replace axle assembly		
196. Remove, replace differential assembly	17	196. Principles of the differential
197. Disassemble, assemble differential	17	197. Service to differentials
198. Remove, replace drive pinion		
199. Remove, replace oil sela and bearings		
200. Adjust pinion bearing		
201. Replace ring gear		
202. Diagnose rear axel trouble	17	202. Trouble shooting the drive mechanism

Springs and Suspension Systems

203. Replace leaf spring	18	203. Types and functions of springs
204. Replace coil spring		

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
205. Replace stabilizer bar	18	205. Front end stabilization
206. Adjust shock absorber	18	206 Types and function of shock absorbers
207. Replace shock absorber		
	18	208. Independent wheel suspensions

Servicing Steering and Suspension Systems

	19	209. Operating principles of steering systems
210. Test, adjust camber	19	210. Front end geometry
211. Test, adjust caster		
212. Test, adjust toe-in		
213. Test, adjust king-pin inclination		
214. Remove, replace front-suspension system		
215. Repack wheel bearings		
216. Balance wheels	19	216. Procedures of wheel balancing
217. Adjust steering gear	19	217. Steering system operation and function
218. Adjust fluid level in steering reservoir		
219. Check, adjust fluid level	19	219. Principles of power steering
220. Adjust steering unit belt tension		
221. Inspect system for leakage		
222. Diagnose steering system troubles		

Brakes and Brake Service

	20	223. Role of friction in brake operation
224. Adjust brake linkage	20	224. Types of brake systems
225. Check cylinder fluid level		
226. Make wheel brake adjustments		
227. Recondition brake drums		
228. Replace brake lining		
229. Check, repair master cylinders		
230. Bleed brake system		
231. Adjust parking brake	20	231. Principles of brake operation

JOB TRAINING: What The Worker Should Be Able To Do	Assign. No.	RELATED INFORMATION: What The Worker Should Know
232. Test, adjust vacuum booster	20	232. Types and operation of heavy-duty brakes
233. Adjust air brakes		
234. Test electric brakes		
235. Diagnose brake trouble	20	235. Trouble-shooting the brake system

Wheels, Tires, Tire Repair Service

	21	236. Function and types of tire construction
	21	237. Sources of tire failur
238. Analyze tire condition	21	238. Physical features of abnormal tire wear
239. Sketch tire rotation pattern	21	239. Methods of tire rotatio
240. Repair tube damage	21	240. Repair service given to tires, tubes
241. Repair tubeless tire		
242. Install minor tire boot		

Air Conditioning

243. Trace freon flow in air-conditioning unit	22	243. Principles of air-conditioning
244. Test, adjust component parts	22	244. Functions of air-conditioning component parts
245. Adjust freon level	22	245. Uses of freon gas as a coolant

Job Management and Pricing

	23	246. Essentials of advertising
247. Establish customer rapport	23	247. Methods of attracting business
248. Prepare central location for receiving customers	23	248. Techniques of selling service
249. Prepare service order		
	23	250. Sources of off-season income
251. Clean and repair service area	23	251. Off-setting free servi time
252. Estimate and establish prices	23	252. Factors determining price quotations
253. Determine profit loss ratio-scale	23	253. Importance of shop overhead
254. Prepare records and make reports	23	254. Methods used to keep good records

Assignment
Sheet No. 1

Covering
Units 1-5

INTRODUCTION TO THE AUTOMOBILE REPAIR BUSINESS

Job opportunities in the automotive industry are expected to continue in a sharp rise over the next two decades. This is due primarily to the increase in the two-car families, general prosperity, and the population explosion. In addition, the increased complexity in the modern engine will open many doors to future jobs for the trained mechanic.

It is important to understand that your job is an investment for the future. Therefore, as a prospective auto mechanic, it is advisable to acquire as much knowledge as possible about the trade before you spend hundreds of dollars and years of time in preparation and then discover it is not what you want as your life's work.

In this assignment you will have an opportunity to learn about the significance of the automobile repairman in our society, and obtain an overall view of the future.

Assignment:

1. Read the references listed below.
2. From the classified section of a metropolitan newspaper, obtain six (6) different job opportunities in the automotive trade. What common requirements, if any, are stated?
3. Write a letter of application for a position you would like to have as obtained from the newspaper.
4. Answer the questions below and turn in the assignment by ________________.

References:

A. Stockel, Auto Mechanics Fundamentals, Chapter 22
B. Occupational Outlook Handbook, (Obtain from Guidance Department) (D.O.T. 5-81.000 through .999)
C. either
    1. SRA -- Occupational Brief, # 610e, Automotive Mechanic.
    2. Chronicle -- Occupational Brief, # 5-81.01 Automobile Mechanic.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". It it is false, draw a circle around the letter "F".

T F 1. The skilled auto mechanic is usually not trained in diagnosing engine trouble.

T F 2. Automotive specialists usually have an all around knowledge of repair in general

T F 3. Mechanics usually work independently of each other.

T F 4. Mechanics at gasoline service stations are primarily concerned with minor repairs and adjustments.

T F 5. Most auto mechanics learn their trade in a school.

T F 6. It takes from three to four years to become a reliable all -round mechanic.

T F 7. One of the best ways to become an auto mechanic is through an apprenticeship.

T F 8. Most garages furnish the mechanic with hand tools.

T F 9. Experienced mechanics will have under $100 invested in tools.

T F 10. Apprentices are usually paid a percentage of the journeyman's rate.

T F 11. In large shops the mechanic prepares the cost estimate of the job.

T F 12. A knowledge of automobile construction and operation is preferred when starting a young man in auto mechanics.

T F 13. It is often necessary to attend service schools to learn about new features on automobiles.

T F 14. Shop courses in auto repair are not considered valuable in securing jobs.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A mechanic is usually called upon to _______________ and _______________ the trouble.

2. In large shops the _______________ pr _____________________ assigns each repair job to a mechanic.

3. The normal work week of the mechanic is ________ to ________ hours.

4. If there are no apprenticeship councils or organizations in your state, you may obtain valuable information from this address: _________________________, _________________________ _________________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Body and fender repairmen are specialists who do:

(A) ______________________ (C) ______________________

(B) ______________________

2. The automobile mechanic usually makes repairs on:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

Assignment
Sheet No. 2

Covering
Units 6-8

BASIC COMPONENTS OF THE AUTOMOBILE

The automotive industry, since it is keenly competitive, is highly specialized. It requires of its people a thorough up-to-date working knowledge of techniques and specializations. However, before specialization can take place, a broad background from which the mechanic can select his specialty must be acquired.

It is important for anyone going into a trade that he learn as much as possible about his trade. Unless the student draws ideas from many sources, his background will be limited.

The purpose of this assignment is to provide a brief overview of the component parts of an automobile.

Assignment:

1. Read the reference listed below.
2. Obtain from several new car dealers literature showing the new features on their new models, place them in a notebook.
3. Answer the questions below and hand in by ______________.

Reference:

A. Crouse, Automotive Mechanics, pp. 1-10, 38-48.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The engine is usually supported on the frame at three or four places.

T F 2. Shock absorbers are used to restrict spring and wheel movement.

T F 3. Transmissions in "low gear" position permit the wheels to rotate at the same speed as the engine.

T F 4. The rear wheels of an automobile are turned by two separate axles.

T F 5. The up and down movement of a piston is called reciprocating motion.

T F 6. The term "stroke" refers to piston movement.

T F 7. There are three cams for each piston in the engine.

T F 8. The letters "BDC" in auto mechanics mean "bottom dead center."

T F 9. The exhaust valve opens between the intake and compression strokes.

T F 10. A pressure of 600 pounds or more per square inch is placed on the piston when the piston is forced down by combustion.

T F 11. The flow of power produced is more continuous as the number of cylinders increases.

T F 12. A vehicle equipped with springs alone will provide a satisfactory ride.

T F 13. It is necessary for a piston to fit tight to obtain good compression.

T F 14. The terms frame and chassis refer to the identical part of an automobile.

T F 15. The four strokes of an engine require two crank shaft revolutions.

T F 16. As the piston moves down the cylinder, the vacuum created draws the fuel mixture into the cylinder.

T F 17. As a flywheel rotates, it resists any changes that slow down or speed up the rotation process.

T F 18. A valve lifter and a rocker arm perform the same duties.

T F 19. Pressure in a container is due to molecules in motion.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Because gasoline is burned within its cylinders, the automobile engine is usually referred to as a(an) ______________ ______________ engine.

2. A wrist pin is used to attach the ______________ to a ______________ ______________.

3. Reciprocating motion is transferred into ______________ motion by the connecting rods and crankshaft.

4. The two valves in the enclosed end of the cylinder are designed so that one permits entrance of the ________________ mixture and the other the escape of ______________ gases.

5. The camshaft revolves at ______________ the rate the crankshaft does.

6. The cams on the camshaft raise the valves off their ______________

7. On the ______________ stroke a mixture of ______________ and vaporized ______________ is drawn into the cylinder.

8. During the compression stroke, the fuel mixture may be compressed to less than ___________________ of its original volume.

9. The heavy wheel attached to the crankshaft used to level power impulses is the ______________.

10. Ignition is part of the ______________ system of an automobile.

Listing

<u>Directions</u>: List the items called for in each of the following. Select your answers carefully.

1. The basic components of the automobile are:

   (A) ________________________ (C) ________________________

   (B) ________________________ (D) ________________________

2. The accessory systems necessary to furnish the engine the substances required to operate it are:

   (A) ________________________ (C) ________________________

   (B) ________________________ (D) ________________________

3. Four major parts of a fuel system are:

   (A) ________________________ (C) ________________________

   (B) ________________________ (D) ________________________

4. Four types of springs used on automobiles are:

   (A) ________________________ (C) ________________________

   (B) ________________________ (D) ________________________

5. The parts that make up the power train are:

   (A) ________________________ (D) ________________________

   (B) ________________________ (E) ________________________

   (C) ________________________

6. Cross bracing the frame makes it rigid enough to withstand, while in operation, the following;

(A) ______________________________ (C) ______________________________

(B) ______________________________ (D) ______________________________

Assignment
Sheet No. 3

Covering
Units 9-10

SHOP PROCEDURES AND SAFE PRACTICES

During the early days of the accident prevention movement the emphasis was placed on the task of providing proper safeguards for structures and machinery. Today, over 73 per cent of the accidents surveyed in one study were found to be caused directly by unsafe acts of individuals.

Therefore, always be on the lookout for possible accident situations in your shop. Develop a habit of observing all safety rules. If these rules are well observed by you and your co-workers, many accidents <u>can</u> be prevented.

In this assignment you will have an opportunity to learn some of the ways of avoiding accidents through the proper use of tools and equipment. Suggestions will also be given on how to cope with certain hazards that may arise in the shop.

<u>Assignment</u>:

1. Read the references listed below.
2. In a brief report discuss the procedure you would suggest to organize an effective program of safety for an auto repair shop.
3. A fellow worker is consistently using a tool in the wrong manner, i.e., a wrench as a hammer. Discuss the method and tact you would suggest to help correct the bad work habits he has developed.
4. Answer the questions and hand in the report (2 or 3) prepared by ____________________.

<u>References</u>:

A. Crouse, <u>Automotive Mechanics</u>, pp. 11-38.
B. Stockel, <u>Auto Mechanics Fundamentals</u>, Chaper 21.
C. General Motors Corporation, <u>ABC's of Hand Tools</u>, pp. 3-47.
D. Information sheet No. 1. This manual.

<u>Questions</u>:

<u>True-False</u>

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Tools should be wiped dry of oil before using them.

T F 2. The terms bolts, screws, and studs have the same meaning.

T F 3. To facilitate rapid assembly, the tip of the screwdriver should be one-half the thickness of the screw slot.

T F 4. To keep a screwdriver blade from slipping out of a screw slot, dress the blade so that the faces taper out from the tip.

T F 5. Phillips head screwdrivers and screws are desirable because less downward pressure is required driving them.

T F 6. When driving with a hammer, one should not hold it close to the head.

T F 7. Pliers have been developed to such an extent that they are gradually taking over the work done by various sorts of wrenches.

T F 8. When chipping a piece held in a vise, one should chip toward the stationary vise jaw.

T F 9. File teeth are designed to cut only on the forward stroke.

T F 10. The teeth of a hacksaw blade should point toward the front of the frame.

T F 11. The pressure should be applied on both the forward and backward strokes when using a hacksaw.

T F 12. A micrometer is a device for taking precision measurements.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The tool used for cutting internal threads is called a ________________.

2. The tool used for cutting external threads is called a ________________.

3. A measuring device for use in setting tappets is a ________________ ________________.

4. One of the first tools developed by man was the ________________.

5. Painful burns may be reduced, if one does not wear ______ ________ when working around batteries or starting motors.

6. Loose hammer heads are dangerous because they may ________________ ________________ and cause an accident.

7. The size of a wrench is specified by the distance across the ________________ of the nut or bolt head it is to be used on.

[illegible]

[illegible] wrench, it should usually be ______________ rather [illegible] ______________ to avoid injury to one's hand.

[illegible] most out of an adjustable wrench, the force [illegible] against the ______________ jaw.

[illegible] for the wrench which is inserted into the head of [illegible] is a (an) ______________ wrench.

[illegible] with a cold chisel, ______________ should [illegible] the eyes.

[illegible] ______________ file is frequently used for [illegible] fitting in the auto repair shop.

[illegible] should be equipped with a tight fitting ______________ [illegible] to use them.

Listing

[illegible] called for in each of the following. [illegible] carefully.

[illegible] of wrenches frequently used in an auto repair [illegible]

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

(E) ______________________

[illegible] chisels most generally used by auto mechanics are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

[illegible] punches most generally used by auto mechanics are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

[illegible] of coarseness or fineness of files are:

(A) ______________________ (D) ______________________

Assignment
Sheet No. 4

Covering
Units 11-17

AUTOMOTIVE ENGINE DESIGN

Basically, the engine may be thought of as the power source component of the automobile. It derives its power from the conversion of a fuel into mechanical energy within its walls, and the term internal combustion engine used to denote such action.

The engine not only furnishes power for propulsion, but also, among other things, furnishes power to generate electrical energy. The auto mechanic needs to know about the various parts that make up an engine, their function, and how to repair or replace a malfunctioning part. A large portion of the wages earned by the automechanic, as well as company profit, will be derived from work on the engine.

This assignment will provide the opportunity to learn some of the theories involved in engine operation. The function of the various parts and their relation to engine design will be introduced.

Assignment:

1. Read the references listed below.
2. Examine the literature obtained in Assignment Sheet No. 1. If possible, identify the various types of cylinder arrangements. Record your findings in a notebook.
3. Answer the questions below and turn in this assignment by ____________________.

References:

1. Crouse, Automotive Mechanics, pp. 61-82.
2. Stockel, Auto Mechanics Fundamentals, Chapters 1 & 7.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Only air is compressed during the compression stroke of a diesel engine.

T F 2. Engine cylinder valves are placed directly opposite each other in two cylinder engines.

T F 3. The crankshaft of a four cylinder engine is supported in two places by bearings.

T F 4. Engines are classified by the type of cooling system used.

T F 5. Ignition takes place as the piston nears "BDC".

T F 6. Slant type engines are placed 30 degrees to one side to allow lower hood lines.

T F 7. The "fins" on a two cycle engine provide for a large radiating surface in cooling.

T F 8. A two cycle engine produces a power stroke on each crankshaft revolution.

T F 9. A free piston engine operates like a diesel engine.

T F 10. The wonkel engine has three power cycles for each revolution.

T F 11. The two cycle engine has one valve and one exhaust part.

T F 12. Compression ratio is compared to the distance a piston moves.

T F 13. The exhaust valve opens when the piston reaches the bottom of the firing stroke.

T F 14. A cam on the camshaft "times" the valves.

T F 15. A flywheel will cause an engine to run more smoothly.

T F 16. Four stroke engines, regardless of size operate on the same principles.

T F 17. Manufactures of V-8 engines designate the engine firing sequence in numerical order of 1 through 8.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Engines in the American passenger cars have usually ________, ________, or ________ cylinders.

2. The fuel used in a diesel is ignited by ______________ resulting from the compression of ______________.

3. The radial engine is used largely with ______________ and is ______________ cooled.

4. The Chevrolet Corvair uses a ______________ engine.

5. The two timing gears are called the ______________ gear and the ______________ gear.

6. Gasolines are measured in quality ratings called ______________ the higher the rating number, the better the ______________.

7. The engine that is built more rigid permits higher ______________ ______________ and ______________ ______________ with less difficulty from ______________, or ______________ of the block or crankshaft.

8. The I head engine is the same as the ______________ valve engine.

9. A single ______________ actuates all valves regardless of arrangement.

10. "TDC" and "BDC" refer to a ______________ of the piston.

11. A fuel represented by LPG used for some bus and truck engines is the abbreviated form of ______________ - ______________ ______________.

12. The parts of a valve system in their proper position form a ______________ ______________.

13. The ______________ on the timing gears help to line up the ______________ if it is removed.

14. A removable top for a cylinder block is called a ______________ _____ ________.

15. The amount of clearance used when setting hydraulic lifters is ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The characteristics of a good automotive engine fuel are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

2. Three types of valve arrangements used in automotive engines are:

(A) ______________________ (C) ______________________

(B) ______________________

3. The seven ways to classify internal combustion automobile engines are:

(A) ______________________________ (E) ______________________________

(B) ______________________________ (F) ______________________________

(C) ______________________________ (G) ______________________________

(D) ______________________________

Assignment
Sheet No. 5

Covering
Units 18-33

AUTOMOTIVE ENGINE COMPONENTS

This assignment is a continuation of the last and we are going to continue our study by going into greater detail concerning some of the various parts that make up the internal combustion engine.

Auto repair deals with more than just taking a car apart and putting it back together again. The successful auto mechanic must learn to make wise use of his time without going up too many "blind alleys." This involves being able to determine what is wrong without taking the engine apart. The services of one who is a good "trouble shooter" will be much sought after. However, before one can do this, he has to know what the parts are that make up the engine and how t they operate.

In this assignment you will have an opportunity to study the function, design, and terminology of certain parts that go together to make up the automobile engine.

Assignment:

1. Read the references below.
2. Select an automobile engine, and list the component parts, the kind of material each part is made from, and why that particular material was chosen. (A three column chart).
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 83-126.
B. Stockel, Auto Mechanics Fundamentals, Chapter 2.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Aluminum cylinder blocks have cast iron or steel cylinder sleeves.

T F 2. Normally, the supporting bearings for the crankshaft are found in the upper part of the cylinder block.

T F 3. Cylinder heads are usually cast in one piece.

T F 4. There are four main types of cylinder heads in general use.

T F 5. A gasket is placed between the cylinder block and cylinder head to prevent leakage.

T F 6. The intake manifold is essentially a tube used for carrying the fuel-air mixture from the carburetor to the engine cylinders.

T F 7. The intake manifold is attached to the cylinder head in an L-head type engine.

T F 8. Crankshafts have drilled oil passages through which oil can flow from the main bearings to the connecting rod bearings.

T F 9. The journals of a crankshaft generally are fitted with counterweights.

T F 10. Vibration dampeners are used in an attempt to control torsional vibration.

T F 11. Oil is carried to bearings by the friction of a rotating journal.

T F 12. A journal must be smaller in diameter than its corresponding bearing.

T F 13. Main bearings for crankshafts are frequently made of brass.

T F 14. A large oil clearance is desired in a bearing for more throw off.

T F 15. A bearing back is usually made of steel.

T F 16. There are three different methods of attaching a connecting rod to a piston.

T F 17. The crankshaft end of a connecting rod is attached by means of a wrist pin.

T F 18. Vibrations are likely to occur if the connecting rods are not matched in sets.

T F 19. Piston slap is caused by having too much clearance between the piston and cylinder wall.

T F 20. The heads of some pistons have a rather complex curved surface to aid in obtaining better combustion of the fuel mixture.

T F 21. The intake and exhaust valves are operated by the camshaft.

T F 22. An attempt is made to create as many "hot spots" as possible within the engine, to insure complete combustion of the fuel mixture.

T F 23. A special steel insert ring is used for the intake valve.

T F 24. The clearance on a hydraulic valve lifer is zero.

T F 25. The dimensions of a cylinder wall must be kept extremely accurate.

T F 26. The piston produces a vacuum to draw a fuel charge into the cylinder.

T F 27. A cast iron piston expands more than an aluminum piston.

T F 28. The ring gap of a piston ring closes as the piston gets hot.

T F 29. Compression rings are used to prevent cylinder leakage.

T F 30. The oil ring is used to scrape oil from the cylinder wall.

T F 31. The purpose of the holes in a timing sprocket are for balance.

T F 32. The angle of the valve and the valve seat may vary one degree.

T F 33. Valves are closed through the cam rotation and springs.

T F 34. Mechanical valve lifters are adjustable.

T F 35. Valve rotation increases valve life.

T F 36. Valve timing angles are the same for most engines.

T F 37. A gasket will adapt itself to expansion and contraction.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. One type of gasket consists of two thin sheets of copper with ______________ between them.

2. Counterweights are used on crankshafts to reduce ______________.

3. Flow of engine power is smoothed out by using a ______________ on the rear end of the crankshaft.

4. It is not always necessary to remove the crankshaft when replacing ______________ bearngs because they are so __________ made.

5. The connecting rod is attached to the piston by means of a ______________ or ______________ pin.

6. The oil hole in the connecting rod is used to lubricate the ______ ______ ______ ______________.

7. The upper end of a connecting rod is mounted to the ____________ while the lower end is attached to a ______________ on the ______________.

8. Engine vibration is reduced by having the connecting rods carefully ______________.

9. The expression used to describe the escape of burned gases from the piston chamber to the crankcase is ______________.

10. The rings located on the upper end of the piston are called ______________ rings.

11. The lower portion of the piston is called a ______________.

12. A common device used to convert rotating motion into linear motion is called a ______________.

13. The most generally used valve used in engines is known as the ______________ or ______________ valve.

14. To cool valves in heavy duty engines, a _____ __________-________ valve may be used.

15. Special heat resistant insert rings are often used for the ______________ valve seats.

16. The type of valve that is rotated by engine vibration is known as the ______________ ______________.

17. The hydraulic valve lifter functions using ______________ from the ______________ ______________.

18. The complete cycle of valve timing requires a ________ degree spiral.

19. A ______________ rotator causes the valve to turn a few degrees when the engine is in operation.

20. The valve assembly is held in place through the use of a ______________ and ______________.

21. A piston that is slightly oval in shape when cold is called a ______________-______________ piston.

22. Engine blocks are usually cast from either ______________ ______________ or ______________.

23. The cut end of a piston ring is known as the ______________ ______________.

24. Cylinder sleeves are of the ______________ type and the ______________ type.

1. [illegible] *Automotive Mechanics.* pp. 272-332.

[illegible]

True-False

[illegible] The following statements are either true or false. If [illegible] true, draw a circle around the letter "T." If it [illegible] around the letter "F."

T F 1. [illegible] enemy of engine service is dirt.

T F 2. [illegible] ratio is not an important factor connected [illegible] valve burning.

T F 3. [illegible] valve spring is tested for squareness.

T F 4. [illegible] manifold the sequence for tightning nuts [illegible] is from right to left.

T F 5. The cylinder head must be removed on an I-head engine in order to check valve-tappet clearance.

T F 6. Valves should be rotated from one cylinder to another during each overhaul to insure better engine performance.

T F 7. Modern automobile engines equipped with hydraulic valve lifters require no valves tappet clearance checks or adjustments.

T F 8. To prevent valve assembly parts from accidentally falling into the crankcase, it is recommended that such openings be covered temporarily with clean cloths.

T F 9. The rocker-arm mechanism must be removed from an overhead valve engine before it is possible to remove the valves.

T F 10. Valve spring tension affects engine performance.

T F 11. When the cylinder head is replaced, it is usually necessary to replace the head gasket.

T F 12. A torque wrench is recommended and used to secure correct tension.

T F 13. Lapping is the recommended procedure for reconditioning valves.

T F 14. Valves that are not too badly damaged may be reconditioned by refacing.

T F 15. The lapping of valves and of valve seats is usually done separately.

T F 16. A simplified procedure has been worked out whereby it is unnecessary to remove the valves in order to install a valve-seat insert.

T F 17. Valves should be removed from the engine in order to clean the valve guides.

T F 18. An integral valve guide is the type that is bored directly in the head.

T F 19. Bearing clearance may be checked with a material known as plastigage.

T F 20. The position that the chain should be put on the sprockets of a chain-drive camshaft is indicated by the manufacturer.

T F 21. It is necessary to remove the pistons from the engine when servicing connecting rods.

T F 22. Connecting rods must be removed from the engine to check them for alignment.

T F 23. When testing a connecting rod for alignment the piston pin should be removed.

T F 24. Piston rings must be fitted for each cylinder.

T F 25. New pistons are always semi-finished.

T F 26. It is the usual practice of rebuilders to replace engine bearings when the engine is "torn down".

T F 27. Oversize pistons are available for use in cylinders that have been refinished.

T F 28. Finished pistons must be ground to fit the cylinder rather than having the cylinder ground to fit the piston.

T F 29. The piston, piston rings, and connecting rod are assembled before they are installed into the cylinder of an automobile engine.

T F 30. When adjusting the main bearings on a crankshaft, it is desirable to start with the middle bearings and work toward the end.

T F 31. The journals of the crankshaft may wear as much as 0.008 of an inch without causing trouble.

T F 32. A bent crankshaft cannot be straightened.

T F 33. Factory-installed connecting rods and bearing caps are stamped with a number to indicate the cylinder in which they are to be assembled.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The ______________ ______________ must be removed before any valve can be removed.

2. The two types of valve seat grinders in use are the ______________ and the ______________.

3. Valve springs should be tested for ______________ and ______________.

4. Care should be exercised when cleaning oil and grease off an engine with steam to avoid getting moisture into the ______________ units.

5. The time required for a complete valve service job on a six-cylinder, overhead-valve engine is approximately ________ hours.

6. Valve-tappet clearance is measured with a ______________ gauge.

7. Valve clearance on an L-head engine may be measured after the valve ______________ ______________ on the side of the engine block have been removed.

8. Variations in cylinder-bore diameter may be measured with a cylinder-bore ______________.

9. If the valve seat faces are badly cracked, pitted, or burned, the valves should be ______________.

10. The first step in servicing valves after they have been removed from an engine is to remove the ______________ from them.

11. Cylinders may be covered with masking tape to prevent their damage from ______________ during the grinding of valves.

12. Servicing camshafts includes checking for cam ______________ and for shaft ______________.

13. Camshafts may be straightened by means of a ______________ ______________.

14. When removing connecting rods without removing the crankshaft, one should first remove the ______________ ______________, if any, from the cylinder bores to avoid damage to pistons or piston-rings.

15. Connecting rods may be restored to proper alignment with a ______________ bar.

16. Any dirt particles that get under a precision insert bearing shell on a crankshaft are apt to cause it to ______________ ______________ and soon fail.

17. Expanders for piston rings are used to advantage for cylinder bores that are ______________.

18. The clearance between the crankshaft journals and the main bearings should usually be less than ________ of an inch.

19. The purpose of an oil seal at the rear main bearing of a crankshaft is to prevent ______________ ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Seven causes of bearing failure are:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

2. Types of valve trouble include:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

Units 66-69

ENGINE TESTS, MEASUREMENTS, AND TROUBLE SHOOTING

Before an automotive tune-up specialist can diagnose an engine malfunction and tune the engine, he must know the basic ways in which engines are tested. An engine analysis cannot be done properly without the use of special instruments designed for each test.

Through these engine tests it is possible to diagnose the difficulty occuring within the engine and recommend a process to change the existing condition.

In this assignment you will have an opportunity to study various ways in which engines are measured, tested and prescribed for treatment.

Assignment:

1. Read the references listed below.
2. In a short paper discuss horsepower as related to engine torque.
3. Compare the engine tests performed on a combustion analyzer with the compression ratio of an engine cylinder. Discuss the changes as the compression ratio is increased.
4. Answer the questions below and turn in this assignment by ______________________

References:

A. Crouse, Automotive Mechanics, pp. 49-61, 248-271.
B. Stockel, Auto Mechanics Fundamentals, Chapter 8.

Questions:

True-False

Directions: The following statements are either true or false. If the statement if true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F."

T F 1. Supplying the engine with sufficient oil greatly reduces engine friction.

T F 2. Energy is the rate of work being done.

T F 3. Chrome plating an engine cylinder improves the resistance to wear.

T F 4. Roller bearings provide for sliding friction.

T F 5. The terms bore and stroke refer to the engine cylinder.

T F 6. The compression ratio of an engine cylinder is the same as the piston displacement.

T F 7. A higher engine compression ratio will give more "power" on the power stroke.

T F 8. If the engine cylinder only fills up half-way with air, the engine has a low volumetric efficiency.

T F 9. To improve the air intake efficiency, simply, provide larger valve stems.

T F 10. The brake horsepower measurement of an engine is taken while the engine speed is restrained.

T F 11. Another name for brake horsepower is indicated horsepower.

T F 12. The amount of power needed to surpass all friction in the engine is power horsepower.

T F 13. An engine tachometer measures primary circuit interruptions.

T F 14. A high compression ratio indicates a leak in the cylinder.

T F 15. An engine vacuum gage is concerned with the intake manifold.

T F 16. The combustion efficiency of an engine is directly related to the fuel ratio under normal conditions.

T F 17. The ignition of an engine is timed for full power speeds.

T F 18. Trouble shooting an automobile engine requires a logical approach.

T F 19. A listening rod will help to locate the source of engine noise.

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

________ 1. Smoky exhaust

________ 2. Engine noisy

________ 3. Engine backfires

________ 4. Engine will not turn over

________ 5. Engine overheats

________ 6. Rough idle

________ 7. Low oil pressure

A. Excessive oil comsumption

B. Lack of water

C. Ignition timing off

D. Worn engine bearings

E. Valve and tappet

F. Vapor lock

G. Carburetor idle adjustment

H. Run down battery

I. Automatic choke stuck

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three classes of engine friction are:

(A) ____________________ (C) ____________________

(B) ____________________

2. Engine horsepower may be classified according to the following three headings:

(A) ____________________ (C) ____________________

(B) ____________________

3. The energy loss of a fuel is distributed over the following items.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

Assignment
Sheet No. 8.

Covering
Units 70-97

FUEL SYSTEMS AND SERVICE

The fuel system is designed to furnish the engine with fuel. It is transferred from the fuel tank to the engine cylinders where it is ignited to furnish power to run the automobile.

There are certain adjustments and checks that the auto mechanic should be able to make on the various parts of fuel systems. It is important to have a knowledge of fuel systems so that one will be able to diagnose and correct troubles that may arise.

In this assignment you will have an opportunity to study about the principles, functions, and the servicing of various parts of fuel systems.

Assignment:

1. Read the references listed below.
2. Make a pencil drawing or sketch of a simplified fuel system on a sheet of 8 1/2 x 11 paper. Label the main parts. On another sheet of 8 1/2 x 11 paper, explain in 200 words or less how a carburetor works.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 127-172, 333-342.
B. Stocket, Auto Mechanics, Fundamentals, Chapter 6.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The fuel tank should be kept near full to reduce water condensation within the tank.

T F 2. The bimetal-thermostat fuel gauge is of the hydrostatic type.

T F 3. The rocker arm of a fuel pump is operated by the camshaft.

T F 4. Modern fuel systems use a fuel pump that creates a vacuum to draw the fuel from the tank.

T F 5. The diaphragm in a fuel pump must remain absolutely rigid to give the best service.

T F 6. A combination fuel and vacuum pump offers the advantage of more uniform windshield-wiper operation.

T F 7. A richer fuel mixture is required for initial warm-up of an engine than for operating at intermediate speeds.

T F 8. The fuel nozzle of a carburetor does not feed any gasoline during operation with a closed or only slightly opened throttle.

T F 9. The idle port of a carburetor is located between the venturi and throttle valve.

T F 10. Vacuum producad by the engine, pulls gasoline through the low-speed port of a carburetor only when the throttle valve is closed.

T F 11. The opening of a low-speed port of a carburetor may be regulated by the throttle valve.

T F 12. If a very rich fuel mixture is placed in the cylinders, flooding is likely to occur.

T F 13. Gasoline for the high-speed circuit in a carburetor is supplied through the fuel nozzle.

T F 14. An accelerator-pump system is used to provide extra fuel for quick powerful acceleration.

T F 15. The choke is opened when an engine is being started.

T F 16. The choke is a type of butterfly valve that is used to regulate the amount of air that goes through the air horn.

T F 17. A bimetal thermostatic spring and a vacuum piston are linked together to control the operation of an automatic choke.

T F 18. The bimetal thermostatic spring in the automatic choke is operated by engine heat.

T F 19. The automatic choke may go into operation at any time after the engine has been warmed up.

T F 20. Air bleeds are utilized in the high-speed circuit of many carburetors to facilitate better combustion.

T F 21. The volatility of a liquid decreases as the boiling temperature decreases.

T F 22. The anti-knock value of gasoline will be increased as its octane rating goes up.

Units 98-103

ENGINE LUBRICATION AND SERVICE

In the field of mechanics, there is no single item as important as the proper lubrication of moving parts. Automotive engines of today are lubricated by means of a lubrication system that is engineered to supply the right amount of oil to all bearing surfaces within the engine.

Adequate maintenance of the lubrication system is absolutely essential to the efficient operation of an engine. Irreparable damage may be done within a very few minutes to a bearing service that is operated at high speed without oil. Proper lubrication is the best form of precaution for one to take against undue wear of engine parts.

This assignment will provide you with an opportunity to become acquainted with the types of internal combustion engine lubrication systems, their parts and their functions. Information is also presented that deals with some of the more general aspects involved in servicing engine lubrication systems.

Assignment:

1. Read the references listed below.
2. Obtain two samples (approximately 1/4 cup) of engine lubrication oil. Sample No. 1 should be new oil. Sample No. 2 should be oil that has just been drained out of an automobile engine. Put each sample in a small bottle. Filter each and show the filter and the material filtered out of each oil sample to your coordinator. (Filter paper from the chemistry department or a fine woven piece of cloth may be used for this purpose.) Write a brief paper describing the differences in the material that has been filtered out of each oil sample excluding color.
3. When you have completed items 1 and 2, answer the questions below and hand in with item 2 on ______________________.

References:

A. Crouse, Automotive Mechanics, pp. 172-189, 342-345
B. Stockel, Auto Mechanics Fundamentals, Chapter 5.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Most engine lubricating systems are cooled by allowing air to circulate around the engine oil pan.

T F 2. The problem of water sludge necessitates more frequent oil changes in warm weather than in cold weather.

T F 3. The formation of water sludge in an engine crankcase is generally caused by water leaking out of the cooling system.

T F 4. Cars that are equipped with oil filters should have the oil changed periodically.

T F 5. One of the common causes for excessive oil consumption is due to worn cylinder walls and worn piston rings.

T F 6. A cracked vacuum-pump diaphragm may cause excessive oil consumption.

T F 7. The floating oil intake is a device used to keep the circulation of foreign particles through an engine lubrication system down to a minimum.

T F 8. The device that is used to strain out dirt and other foreign matter in an engine lubrication system is called an oil filter.

T F 9. A pressure-type bearing oil-leak detector will indicate worn bearings.

T F 10. Most engine lubrication troubles are intimately related to engine troubles.

T F 11. Oil should be changed more often in cold weather.

T F 12. Most oil-level gauges use an electrical device to register the oil level in the engine crankcase.

T F 13. Badly worn bearings will help cause excessive oil pressure.

T F 14. Ordinarily, the oil pump does not require much servicing.

T F 15. A lubricated bearing actually rides on a film of oil, rather than on the metal of the bearing.

T F 16. Crude petroleum is refined by a process of distillation.

T F 17. Crude petroleum is the source of lubricating oil.

T F 18. An S. A. E. number 20 oil is more fluid than a number 30 oil.

T F 19. An oil with a high viscosity rating changes considerable as the temperature fluctuates.

T F 20. A multi-grade oil has a high viscostiy index (S. A. E.).

T F 21. An oil with a rating of S.A.E. 10 is an winter grade oil.

T F 22. The main difference between summer and winter grade oils is the temperature at which the oils are tested.

T F 23. An oil filter that is hot to touch is functioning properly.

T F 24. Oil relief valves are adjusted as the engine gets older.

T F 25. Oil filters tend to eliminate the need for oil changes.

T F 26. The length of time between oil changes should be based primarily on mileage.

T F 27. The American Petroleum Institute has two basic oil classifications, winter and summer, for gasoline engines.

T F 28. An oil that meets S. A. E. requirements for both high and low temperature requirements is S. A. E. 10 W - 30.

T F 29. The purpose of an oil pan baffle is to prevent sloshing.

T F 30. Small one cylinder engines use the splash type oil system.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Viscosity refers to the tendency of oil to resist ________________

2. The type of oil ventilation used on the crankcase to help in smog control is ________________.

3. Oil is lost from the engine in ________________ different ways.

4. A gear pump is commonly used in the ________________ ________________ type of engine lubricating system.

5. A ________________ ________________ is used on the pressure feed type of engine lubrication system to prevent excessive oil pressure build up.

6. The type of oil pressure indicator that uses a hollow bourdon tube is called the ________________ ________________ type.

7. The oil pressure indicator reveals the oil pressure in the ________________.

8. Some cars use a light to indicate ________________ ________________ in the oil system.

9. The device used to indicate the level of oil in the sump is known as ______________ ______________.

10. ______________ is the term used when two objects rub together and produce wear.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The things a good lubricating oil should do for an engine are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________ (F) ______________

2. Of the many additives used in oil the chief ones used today are:

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________ (H) ______________

3. The four main jobs that a good oil must do are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. List the main types of engine lubrication.

(A) ______________ (C) ______________

(B) ______________ (D) ______________

5. Two main factors that affect oil consumption are:

(A) ______________ (B) ______________

6. Two types of oil filters are:

(A) ______________ (B) ______________

7. Two general types of oil-pressure indicators that are used are:

(A) ______________ (B) ______________

8. Four of the most commonly experienced lubrication system troubles are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

9. The three elements necessary to form engine sludge are:

(A) ____________________ (C) ____________________

(B) ____________________

10. The four most common types of oil pumps in use are:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

ENGINE COOLING SYSTEMS AND SERVICE

Did you know that enough heat can be produced by an ordinary six-cylinder internal combustion engine to heat a six room house? Yes, some experts claim this to be true, for temperatures over 4,000° F. are reached each time the fuel mixture is exploded within an engine's combustion chamber. Under such high temperatures, the engine would not be able to continue operation without some means of dissipating a greater part of this heat into the air.

A cooling system is essential to keep an engine from "burning up." Temperatures that deviate too much from the normal should be investigated to find the cause.

In this assignment you will have an opportunity to become acquainted with types of cooling systems used on internal combustion engines, their various parts and the function of these parts.

Assignment:

1. Read the references listed below.
2. Obtain a cooling system thermostat and test it to see at what temperature the valve opens. (See A-349 for the procedure commonly used.) Write a brief paper summarizing the procedure and findings of your experiment.
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. Crouse, Automotive Mechanics, pp. 189-199, 348-355.
B. Stockel, Auto Mechanics Fundamentals, Chapter 4.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Engine efficiency is increased by keeping the cylinder walls as cool as possible.

T F 2. Temperatures within the combustion chambers of an automobile engine may be in excess of 4000° F.

T F 3. Nearly 75% of the heat liberated in the combustion chamber is removed by the engine's cooling system.

T F 4. Most automobile engines are classified as being air cooled.

T F 5. A water pump is used on a forced circulation cooling system.

T F 6. Most of the water pumps now used are of the diaphragm types.

T F 7. Most internal combustion engine water pumps are electrically operated.

T F 8. A shroud is used on some engine fans to increase their efficiency.

T F 9. Air is used to cool the water as it flows through the radiator of a liquid-cooled engine.

T F 10. The valve of a thermostat usually is opened at temperatures above 162°F.

T F 11. A thermostat is used to enable an engine to reach operating temperature quickly.

T F 12. A thermostat is needed more to cool an engine than to provide a constant temperature in the engine.

T F 13. The thermostatic valve begins to close when the engine's operating temperature is nearly reached.

T F 14. Water that freezes in a radiator may cause it to burst.

T F 15. A vapor pressure type of temperature indicator system is based upon the action of a bourdon tube.

T F 16. Rust and scale that have formed in an engine's cooling system may cause it to overheat.

T F 17. Exhaust gas leakage into an engine's cooling system may be caused by a defective cylinder head gasket.

T F 18. There are three methods of accurately testing the action of an engine's water pump.

T F 19. A clogged radiator may cause an engine to be slow in warming up.

T F 20. Radiator water passages should be reverse flushed occasionally to insure most effective operation.

T F 21. The fan becomes less important to an engine's cooling system as the speed of an automobile increases.

T F 22. If the circulation within a cooling system were to stop completely, dead spots would form.

T F 23. Fins on air-cooled engine cylinders are primarily for looks.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The metal shield placed around a fan to prevent air recirculation is called a ______________.

2. The oil film on an engine's cylinder walls will lose its lubricating properties, if the temperature of the cylinder wall is in excess of ______________ degrees.

3. The device used to cool valve seats and guides is called a ______________ ______________ tube.

4. The part within a water pump that forces the water through the cooling system is known as the ______________.

5. A hose is used to connect the inlet of the water pump to the ______________ of the radiator.

6. An engine's cooling system is improved by having a ______________ create a greater draft of air through the radiator.

7. Fan belts are usually of ______________ type.

8. The water in a radiator that is operating properly should be at a ______________ temperature at the top than it is at the bottom.

9. The device used to reduce the temperature at which the water will boil is called a radiator ______________ cap.

10. The temperature may be checked at which the valve of a thermostat will open or close by varying the temperature of the ______________ in which it is suspended.

11. A car engine should be ______________ ______________ before testing a radiator for cold spots with one's hand.

12. Cold spots in the radiator of a car that has been warmed up indicates ______________ sections.

13. Exhaust gas leakage into an engine's cooling system will cause a harmful ______________ solution to form.

14. The instrument used to measure the specific-gravity of a liquid is called a (an) ______________.

15. Radiator air passages should be cleaned with ______________ ______________ to remove dirt accumulation.

16. The part that should be removed from an engine's cooling system before flushing is called a ______________.

17. An accurate method of checking a radiator for leaks includes draining, removing, and then submerging the coil in ______________

18. A series of fins or ribs is generally used on the ______________ cooled type of cylinder.

19. The control unit that operates the temperature gauge on the instrument panel is generally fastened into the water ____________ of the automobile engine.

20. Ethylene glycol base antifreezes have a _______________ boiling point than alcohol base antifreezes.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two general types of cooling systems used on internal combustion engines are:

(A) ___________________________ (B) ___________________________.

2. Two main types of radiators are:

(A) ___________________________ (B) ___________________________

3. The most common bases used for antifreezes are:

(A) ___________________________ (B) ___________________________

4. The general types of temperature indicators are:

(A) ___________________________ (B) ___________________________

5. Five factors relating to an engine's cooling system that may cause it to overheat are:

(A) ___________________________ (D) ___________________________

(B) ___________________________ (E) ___________________________

(C) ___________________________

[illegible] The [illegible] of a battery plate grid is made from an alloy of ________________ and ________________.

[illegible] The electrolyte of a fully charged battery is a solution containing approximately 40 per cent ________________ [illegible] ________________.

8. Each cell of a battery produces approximately ____________ volts of electrical potential.

9. Three two-volt battery cells connected in ____________ would provide six volts at the end terminals.

10. The number of minutes a battery at 0° F will deliver 300 amperes of current, before the cell voltage will drop to 1.0, is known as its ____________ rate.

11. A starting motor is operated on ____________ produced by the battery.

12. The starter drive pinion must make approximately ____________ complete revolutions to cause the flywheel to turn one complete revolution.

13. The shock of meshing the drive pinion with the flywheel is taken up by a ____________ on the Bendix drive.

14. A generator is used to convert ____________ energy into electrical energy.

15. A cutout relay is used to prevent the battery from becoming ____________ when the generator is not in operation.

16. Regulators employ the use of electrical ____________ to reduce the output of generators.

17. A regulator that is ____________ uses vibrating contact points to control generator output.

18. Most regulators are temperature compensated so they will allow the generator to ____________ voltage output during cold weather.

19. When the magnetic field of a cutout relay is reduced to nothing, the contact points are forced apart by means of a (an) ____________.

20. Two methods to wire an AC generator internally are ____________ and ____________.

21. An explosion can occur if a flame is brought near a battery due to the ____________ and ____________ gases given off when the battery is being charged.

22. To determine the polarity of a coil, the ____________ hand rule is used.

23. The insulation material between the copper commutator segments is ____________.

24. Alternating current which has been converted to direct current is said to have been ____________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three ways in which batteries are rated are:

(A) ________________ (C) ________________

(B) ________________

2. List three examples of static components as used in a transistorized regulator.

(A) ________________ (C) ________________

(B) ________________

3. The three devices within a double contact regulator which utilize coil windings are:

(A) ________________ (C) ________________

(B) ________________

4. The conditions that cause a terminal voltage increase as a battery is being charged are:

(A) ________________ (C) ________________

(B) ________________

Assignment

THE ELECTRICAL SYSTEM -- IGNITION AND LIGHTING

A knowledge of the structure, composition, arrangement and correct action of the component parts of an ignition system enables the mechanic to arrive at the cause of malfunctions and to prescribe a remedy.

The ability to read wiring diagrams and trace out electrical defects is important to the success of the auto mechanic.

In this assignment you will have opportunity to become acquainted with the ignition and lighting as part of the automobile electrical system.

Assignment:

1. Read the references listed below.
2. Sketch a typical ignition circuit, with the aid of colored pencils identify the high voltage and low voltage systems.
3. Draw a wiring diagram of an ignition coil and color code the primary and secondary windings.
4. Answer the questions below and turn in this assignment by ______________________.

References:

A. Crouse, Automotive Mechanics, pp. 233-247, 384-390.
B. Stockel, Auto Mechanics Fundamentals, Chapter 3 and Chapter 19, pp. 38, 39.

Questions:

True-False

Directions: The followingstatements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Every cylinder is fired during one complete revolution of the distributor breaker cam.

T F 2. Spark advance mechanisms are used to give the fuel a shorter time to burn at high speeds.

T F 3. Battery voltage must be stepped up to cause the current to jump the spark plug gap.

T F 4. It is possible to induce a current into a wire that is a conductor of electricity by means of magnet.

T F 5. Self-induction is not possible in an ignition coil.

T F 6. The strength of an electromagnet will increase as its number of coils of wire and the amount of current flowing through them increases.

T F 7. The primary coil of an ignition coil is wired directly to the spark plugs.

T F 8. The current from the battery flows through the condenser when the contact points of the ignition distributor are open.

T F 9. In a transistorized system of ignition, points are necessary to break the coil primary circuit.

T F 10. Longer "cam dwell" in an ignition system results in a hotter spark.

T F 11. A strobe light is used to time an engine.

T F 12. In order to burn a leaner fuel mixture, some spark plugs have a special built-in resistor.

T F 13. A resistor in the coil primary circuit protects the contact points.

T F 14. A relay switch is magnetically operated.

T F 15. Sparks created in each cylinder must be timed earlier at high engine speeds.

T F 16. A balast resistor in a primary circuit operates at a constant temperature.

T F 17. A hot spark plug has a short insulator tip.

T F 18. A spark plug which is too hot for the engine may cause pre-ignition.

T F 19. Magneto action depends on a rotating magnet to produce electricity for a spark.

T F 20. Sealed beam headlights are air tight and need only aiming for adjustment

T F 21. A fuse has a hard steel strip of metal that melts when overheated.

T F 22. The temperature of a spark plug is determind through the distance the heat must travel.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The device that opens and closes the circuit between the battery and the ignition coil is called a (an) ______________ __________

2. The drive shaft of an ignition distributor is usually operated by the engine ______________.

3. The device used to transfer the high tension voltage from the center of a distributor to each spark plug terminal is a ______________.

4. Spark plugs are adjusted to provide a gap up to ________ of an inch.

5. The instrument used to indicate the amount of current being drawn from or being put into a battery is called a (an) ______________.

6. An induced current is set up in the ______________ wiring of an ignition coil.

7. Condensers are made up of alternate layers of paper and ______________ and ______________.

8. An ignition coil has two circuits, they are the ______________ and ______________ circuits.

9. As the current is shut off in the primary circuit the ______________ ______________ collapses.

10. ______________ and ______________ are two general types of spark advance mechanisms.

11. The two types of ignition coil testers in use are ______________ and ______________.

12. A spark plug cleaner may use both an ______________ blast and a ______________ blast to clean a spark plug.

13. The longer the ______________ path the hotter a plug will operate.

14. Another name for cam angle is ______________ or ______________ angle.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The six main items included in an ignition system are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________ (F) ______________

2. A good condenser tester should be able to test the following:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

3. A spark plug may be divided into three basic parts

(A) ______________ (C) ______________

(B) ______________

Assignment
Sheet No. 13.

Units 168-177

ELECTRICAL SYSTEM SERVICE

Since the genrator does not include a means of self-regulation or distribution for its output, a device called a regulator is provided for this purpose. Usually a regulator has more than a single unit involved as components, for example, a typical regulator may have means to regulate current, voltage, or simply a cutout device.

To better understand the functions of this part of the system and to provide adequate service, a working knowledge of electricity is needed.

In this assignment, you will learn some of the methods and equipment used in regulating, testing, and servicing an automobile electrical system.

Assignment:

1. Read the reference listed below.
2. Examine a regulator for the control of current obtained from both AC and DC generators. With the aid of a sketch and colored pencils, distinguish the components by color coding.
3. Write a short paper discussing what you would test a regulator for and how malfunctions could be corrected occuring in each unit.
4. Answer the questions below and turn in this assignment by ________________.

Reference:

A. Crouse, Automotive Mechanics, pp. 221-232, 371-383.

Questions:

True-False

Directions: The following statements are either true or false. if the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A temperature compensator is a feature of most voltage regulators.

T F 2. A vibrating contact regulator is used for AC generator regulation.

T F 3. When generated voltage reaches the valve set in a regulator, the points close.

T F 4. A fully transistorized regulator has no moving parts.

T F 5. The same tests are used on AC regulators as DC regulators.

T F 6. Grounding the generator field circuit on some regulators may cause the points to burn.

T F 7. The generator must be polarized after any regulator tests on D. C. components.

T F 8. Generators may be operated on an open circuit.

T F 9. Heat does not affect a diode.

T F 10. Excessive belt tension on a generator will cause bearing wear.

T F 11. Solvents should be kept away from generator windings.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The first two components to check for electrical trouble in an automobile are the ____________ and ____________.
2. The purpose of the voltage regulator is to keep circuit voltage from exceeding a safe ____________.
3. As the current passing through the circuit reaches a predetermined value, the regulator causes a ____________ to become part of the current load.
4. The two meters used to check the cutout relay are ____________ and ____________.
5. Brushes in an AC generator are of the ____________ type.
6. When it becomes necessary to replace field windings in a generator a ______________ screw driver and spreader is used.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Typical generator service may fall into one of the following three categories.

   (A) ______________ (B) ____________ (C) ____________

2. The three main components of a DC regulator are:

   (A) ____________________ (C) ____________________

   (B) ____________________

3. The three terminals on a DC regulator represent leads to the:

   (A) ____________ (B) ____________ (C) ____________

CLUTCHES AND CLUTCH SERVICE

In its simplest analogy the operation of a clutch may best be illustrated by placing your two hands firmly together and rotating the right hand. Notice how the left hand follows the movement. Now, separate your hands by at least one inch (as happens when the clutch pedal is depressed) and rotate your right hand again. Observe that there is no follow movement by the left hand. This is the action of a clutch.

Clutch slipping may be similarily demonstrated by placing a layer of grease on each hand. As you turn the right hand there is a little slippage. The more resistance given, the greater the slippage.

This assignment will give you an opportunity to become acquainted with various types of clutches used in the automobile, as well as their operating functions.

Assignment:

1. Read the references listed below.
2. Prepare a progress check list to be used when adjusting a clutch.
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. Crouse, Automotive Mechanics, pp. 391-405.

Units 181-184

TRANSMISSIONS AND THEIR SERVICE

The transmission is a box of gears included in the automobile power train to provide separate pre-selected power ratios between the engine and the rear wheels, as well as a device to reverse the direction of the gears to permit the backing of the automobile.

Most transmissions are heavy and internally complex. Although they are not a frequent source of automobile failure, they do require minor repairs. Occasionally, the auto mechanic is called on to make a major transmission overhaul.

In this assignment you will have an opportunity to learn about the various types of transmissions, how they operate, and the principles involved in their maintenance and repair.

<u>Assignment:</u>

1. Read the references listed below.
2. Sketch a planetary gear system indicating the direction each gear rotates in first gear and reverse.
3. Answer the questions below and turn in this assignment by ______________________.

<u>References:</u>

A. Crouse, <u>Automotive Mechanics,</u> pp. 406-447.
B. Stockel, <u>Auto Mechanics Fundamentals,</u> Chapters 10, 11.

<u>Questions:</u>

<u>True-False</u>

<u>Directions:</u> The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The gear ratio for two gears having the same number of teeth is one to one. (1:1)

T F 2. Torque and gear ratio are the same.

T F 3. As speed increases, the torque in a gear system also increases.

T F 4. The measured torque at the transmission will be the same as the measured torque at each wheel

T F 5. The spur gear teeth are parallel to the center line of of the gear.

T F 6. Gears within the transmission are moved by the use of a shifter fork.

T F 7. A smooth mesh is obtained by having equal speeds of the gears.

T F 8. Gear synchronizing may be accomplished with a pair of stop rings.

T F 9. Torque is converted within the gears of a transmission.

T F 10. The larger the driving gear, the greater the torque multiplication.

T F 11. Direct drive provides a 3 to 1 ratio of torque conversion in a three speed transmission.

T F 12. For quieter operation helical gears are used in transmissions.

T F 13. A transmission is lubricated with a grease fitting.

T F 14. The overdrive permits the main shaft to turn faster than the clutch shaft in high gear.

T F 15. An overdrive will reduce engine speed 60 percent and maintain the same road speed.

T F 16. The type of transmission which uses a servo piston is the E-Stick system.

T F 17. Transmission overhaul procedures are essentially the same for practically all models.

T F 18. A good mechanic can expect to take 5 to 7 hours for transmission overhaul time.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Transmission gears are one of two types, the ______________ or the ______________.

2. A ______________ unit is provided to select gears without gear grinding.

3. The main use of four speed transmission is to give a wider selection of ______________ ______________.

4. An ______________ ______________ prevents the heavy gear oil from leaking out the ends of a transmission.

5. The two components of an overdrive are the ______________ ______________ and the ______________________________ .

6. The transmission provides a means of varying the ______________ ______________ between the engine and the rear wheels.

7. The crank shaft makes about twelve revolutions for each turn of the rear wheel in ______________ gear.

8. An engine produces 100 pounds foot. The torque exerted at each wheel of a 10 to 1 power train ratio will be ______________ torque.

9. A four speed transmission will have ______________ gears forward.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The main parts that make up an overdrive planetary gear system are:

(A) ________________________ (C) ________________________

(B) ________________________

2. The four gear ratios of a three speed taansmission with overdrive are:

(A) ________________________ (C) ________________________

(B) ________________________ (D) ________________________

3. The three drive stages of an overdrive system are:

(A) ________________________ (C) ________________________

(B) ________________________

Assignment
Sheet No. 16.

Covering --
Units 158-189

AUTOMATIC TRANSMISSIONS AND SERVICE

The automatic transmission is operated by fluid coupling. These principles in themselves, are not complicated. However, an understanding of their application requires considerable study. Transmission design is undergoing constant change which requires the mechanic to keep up-to-date. An understanding of the basic principles is absolutely essential before extensive work can be undertaken on any automatic transmissions. This is usually done by a specialist.

In this assignment you will learn the basic principles and some of the methods of application which characterize many types of transmissions.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 448-501.
B. Stockel, Auto Mechanics Fundamentals, Chapter 12.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Automatic transmissions use fluid coupling in one form or another for power flow.

T F 2. Oil is used as the coupling fluid to increase efficiency.

T F 3. The driving and driven members of the coupling are attached to the transmission.

T F 4. As the driving and driven members of the coupling approach synchroness speeds the effective oil force is reduced.

T F 5. Extra rotary members are included in some types of transmissions to increase torque.

T F 6. A brake band associated with an automatic transmission is operated by the use of a servo.

T F 7. Releasing the brake band and applying the clutch at the same time in an automatic transmission produces an upshift.

T F 8. "Governor" pressure is a decrease in pressure against the shift valve.

T F 9. An up or down shifting in the planetary system is obtained through a shift valve.

T F 10. A sprag is a one-way clutch.

T F 11. A multiplier coupling multiplies torque to equalize coupling input and output.

T F 12. Hydra-matic transmissions contain only one planetary unit.

T F 13. A torque converter can transmit a torque ratio of 1:1.

T F 14. If torque output is greater than input in a converter, there is torque multiplication.

T F 15. A key to successful transmission overhaul is cleanliness.

T F 16. The two torus members are fastened to the same shaft.

T F 17. Upshifting with the use of a governor is at a fixed point.

T F 18. Transmission oil is a special type of oil.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Each circuit of a hydra-matic transmission handles one ________________.

2. Torque lost through fluid coupling is due to the effect of ________________.

3. In a torque converter the driving member is known as the ________________ while the driven member is the ________________.

4. The unit that provides braking by the engine through the transmission on steep down grades is the ________________.

5. A transmission may easily be ruined if towed at ________________ speeds.

6. Each of the two halves of a fluid coupling are called a ________________.

7. The two directions of oil flow in a fluid coupling are the ______________ and the ______________ flow.

8. Another name for a converter blade is a ______________.

9. A ______________ ______________ is used to lock the stator.

10. "For every action there is an equal and opposite action" is from ______________ law.

11. The two types of pumps to obtain oil pressure are the __________ and the ______________ in an automatic transmission.

12. Upshifting may be delayed from low to high by the use of a ______________ in the shifter valve.

13. Transmission oil is cooled generally by circulating it through the lower ______________ ______________.

14. Automatic transmissions shift according to ______________ and ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The types of couplings to which all hydra-matic transmissions may be classified are:

(A) ______________________ (C) ______________________

(B) ______________________

2. The three members of a planetary gear set are:

(A) ______________________ (C) ______________________

(B) ______________________

3. The five preliminary checks and adjustments to a transmission before a road test is given should be:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

List two sets of primary considerations to be considered when towing a vehicle with an automatic transmission.

(A) ______________________ (B) ________________________

Optional answers:

(C) _____________________ (D) ________________________

Assignment
Sheet No. 17

Covering
Units 190-202

DRIVE MECHANISMS

Essentially, there are two major problems that must be solved in the drive train. They are: flexibility for rear end movement and variability to each wheel on turning curves.

The universal joint and the slip joint combined take care of the flexibility part of the problem. A differential handles the wheel rotation difficulty.

It is the purpose of this assignment to acquaint the student with the operating principles of the drive mechanisms.

Assignment:

1. Read the references listed below.
2. Write a brief report on multi speed axles including the shifting procedures used to change the axle ratios (this information may be obtained from a service manual at any automobile repair shop).
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 502-516.
B. Stockel, Auto Mechanics Fundamentals, Chapter 13 and 14.

Questions:

True-False

Directions: The following statements are either true or false. If the statement if true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Road irregularities cause fluxuations in the propeller shaft angle of the drive line.

T F 2. A propeller shaft may be hollow as well as solid.

T F 3. A slip joint is used on a propeller shaft to permit its effective length to change.

T F 4. The rotation of a propeller shaft is in the same direction as the differential.

T F 5. When removing a universal joint the parts are marked for balance in reassembly.

T F 6. The rear wheels revolve at different speeds while an automobile is rounding a curve.

T F 7. Each wheel would be required to skid if it were not for a universal joint.

T F 8. On a straight road the differential pinion does not rotate as both wheels are at the same speed.

T F 9. A convertional differential delivers the same torque to each wheel.

T F 10. A differential with a clutch plate within is a non-slip device.

T F 11. Differential ratio and axle ratio have different meanings.

T F 12. A universal joint is needed for drive line flexibility.

T F 13. The use of a hollow drive tube in the driving mechanism is to promote light weight.

T F 14. Ring and pinion gears are sold as matched sets.

T F 15. Oils in a differential are circulated by the hypoid gear.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The device that permits torque transfer at various angles is the ____________ ____________.

2. Two types of universal joints in use are ____________________ and ____________________.

3. A ____________ ______________ permits the drive line to adjust for variations in length.

4. A simple universal joint consists of a ____________ and ____________.

5. Bearings used in a spider and yoke design are frequently of the ____________ type.

6. To assure proper part relationship when reassembling a universal joint the two parts should be ____________.

7. Most of the maintenance required on universal joints is limited to ____________.

8. The smaller section of a ring gear tooth is called the ________.

9. The two types of axle housing are the ____________ and the ____________.

[illegible] functions to dampen out spring oscillations.

[illegible] suspension, the wheel spindle [illegible].

Completion

[illegible] in the blank(s) in each statement with the word(s) [illegible] correctly.

[illegible] steel plate in a leaf spring are [illegible] ______________.

[illegible] type of leaf spring used on automobiles is the ______________ spring.

[illegible] that a spring will be compressed in direct [illegible] the ______________ applied.

[illegible] steel plate in a leaf spring is called the ______________________.

[illegible] leaf spring is usually attached to a ______________ on the car frame.

[illegible] kept from separating by means of rebound ______________.

[illegible] bushing used to attach one end of a leaf [illegible] acts to dampen ______________ and ______________.

[illegible] leaf spring is usually attached to a car [illegible] (and ______________.

[illegible] use the ______________ type of front suspension.

10. The wheel assembly is attached to the steering knuckle by means of a (an) ________________.

11. Better body roll control is achieved by means of a (an) ________________ bar providing a form of linkage between the two front lower spring seats.

12. When an automobile attempts to make a curve at high speed, centrifugal force will tend to cause ________________ ________________.

13. Sideward movement of the rear axle housing assembly with respect to the car frame is prevented in rear coil spring suspension system by means of a ________________ bar.

14. Relative forward and backward movement of the rear axle housing is prevented in a rear coil spring suspension system by means of two rear-axle ________________ ________________.

15. Most shock absorbers are based upon ________________ principles.

16. A double-acting telescopic shock absorber consists of three concentric ________________, a (an) ________________, valves, and assembling parts.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four basic types of springs used in automobile suspension are:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

2. The reasons why some leaf springs are covered with a metal sheathing are:

(A) ________________ (B) ________________

3. Three essential components of an air suspension system are:

(A) ________________ (C) ________________

Units 209-222

SERVICING STEERING AND SUSPENSION SYSTEMS

With the development of automobiles that operate at high rates of speed, the steering system has become increasingly important. Purchasers of automobiles are usually very critical of the quality referred to as "ease in handling," which is dependent to a large extent upon proper operation of the steering mechanism and suspension system.

The auto mechanic must be familiar with the principles involved in the various types of steering mechanisms and be prepared to diagnose mechanical difficulty and make repairs and adjustments.

In this assignment you will have an opportunity to learn about the various types of steering and suspension systems and how they are repaired and adjusted.

Assignments:

1. Read the references listed below.
2. Write a brief report describing either:
   a. The effects of power steering on the modern automobile or,
   b. The adjustments necessary to have proper alignment in the frontend assembly.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 533-571.
B. Stockel, Auto Mechanics Fundamentals, Chapter 17.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The angular relationship between the front wheels, the front wheel attaching parts, and the car frame is referred to as "front end geometry."

T F 2. When adjusting the wheels, the camber angle should be slightly positive.

T F 3. A backward tilt of the kingpin from the vertical is called negative caster.

T F 4. When both front wheels have positive caster, the car tends to roll out or lean out on turns.

T F 5. Late model vehicles, and particularly heavy-duty trucks, tend toward a negative caster.

T F 6. The movement of the pitman arm is transmitted to the front wheel steering knuckles by the steering linkage.

T F 7. The conventional steering gearbox increases the torque necessary to turn the wheel.'

T F 8. Adjustable tie rods are necessary to compensate for caster angles.

T F 9. The recirculating ball-and-nut type of steering gear is designed to reduce friction to a minimum.

T F 10. Negative caster causes the car to lean in on turns and decreases the effect of centrifugal force.

T F 11. Most automobiles should have a toe-in of only a fraction of an inch.

T F 12. The proper toe-out for both front wheels of an automobile making a sharp curve to the right should be equal.

T F 13. The outside-front wheel should be adjusted so that when going around a curve it will turn through a larger angle with the automobile frame than the inside front wheel.

T F 14. The manufacturer's shop manual should be followed when adjusting or overhauling a steering gear.

T F 15. The driver of a motor vehicle need not sense the "feel" of the road through the steering mechanism.

T F 16. Front wheel shimmy and front wheel tramp are one and the same.

T F 17. The camber angle should be adjusted so that it will approach zero when the vehicle is loaded and rolling along the road.

T F 18. If considerable steering wheel movement is required to set the pitman arm in motion, it indicates linkage connections are worn out or out of adjustment.

T F 19. One of the most common causes of front-wheel tramp is unbalanced wheels.

T F 20. Steering feel is produced by a reaction seal in the hydraulic reaction assembly.

T F 21. The angle of the wheels and automobile path angle are the same when taking a corner.

T F 22. Gear reduction in a steering unit has the same ratio for each vehicle.

T F 23. The tie-rods are generally equal to or longer than the distance between the centers of the two front kingpins.

T F 24. The valve that feeds the oil to the cylinder and pistons of a power-steering system is operated by the turn of the steering wheel.

T F 25. There are many basic differences in the various power steering designs.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The lower end of the steering shaft has a (an) ______________ type of gear on it.

2. The vast majority of power-steering mechanisms today utilize ______________ pressure.

3. ______________ - arm is another name for steering gear arm.

4. Excessive ______________ of the wheel causes one side of the tire tread to wear more rapidly than the other.

5. The ______________ ______________ furnishes most of the effort required to steer the car in a linkage-type power-steering system.

6. The two general types of power steering are ______________ ______________ and ______________ ______________

7. A steering unit pump generates pressures up to ________ lbs.

8. The type of oil used in power steering units is ______________ ________ ______________ ______________ ______________.

9. ______________ caster will cause the car to lean in on turns.

10. When the rear wheels follow in the tracks of the front wheels, they are said to be ______________.

11. ______________ wear, caused by taking curves at excessively high speeds, may be mistaken for camber wear or toe-in or toe-out wear.

12. A tilting of the steering wheel is made possible through the use of a ______________ ______________.

13. The camber angle is usually about ______________ degree in most automobiles.

14. A sway that is observed when taking a corner may be due to a loose ______________ ______________.

15. Toe-in usually varies between as little as a ______ of an inch to nearly ________ inch.

16. The angle formed between a vertical line and the vertical center line of a front wheel, when looking at the front of an automobile, is referred to as ______________ angle.

17. The ratio between the steering gear worm and the pitman arm have been increased to as much as ______________ to 1.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Eight preliminary checks which should be made and corrected before front end alignment is done are:

(A) ________________________

(B) ________________________

(C) ________________________

(D) ________________________

(E) ________________________

(F) ________________________

(G) ________________________

(H) ________________________

2. The angles involved to obtain proper front end alignment include:

(A) ________________________

(B) ________________________

(C) ________________________

(D) ________________________

(E) ________________________

(F) ________________________

(G) ________________________

3. The type of pump design used for power steering will be one of the following:

(A) ________________________

(B) ________________________

(C) ________________________

(D) ________________________

Assignment
Sheet No. 20

Covering
Units 223-235

BRAKES AND BRAKE SERVICE

It is important that an automobile moves, but even more important that it can be stopped. This means good brakes. One"s safety is often dependent upon the effectiveness of the automobile"s brakes. Because of the number of variables influencing braking action, a driver cannot afford to let his brakes get out of top working order. The auto mechanic failing in this responsibility to his customers may be directly responsible for a serious accident.

The assignment will deal with various types of brakes and some of the basic principles underlying their operation. Causes of brake failure are discussed, along with procedures for adjustment and repair.

Assignment:

1. Read the references listed below.
2. Construct two schematic sketches of a hydraulic master cylinder in a brake system.
   A. Using a conventional master cylinder
   B. Using a tandem master cylinder. (Color code each of the split system separately.)
3. Answer the questions below and turn in the assignment by ______________________________.

References:

A. Crouse, Automotive Mechanics, pp. 571-594.
B. Stockel, Auto Mechanics Fundamentals, Chapter 18.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The hydraulically operated parking brake has largely replaced the mechanically operated type.

T F 2. Static friction between the road and tires is considerably more effective in braking than kinetic friction.

T F 3. Hydraulic wheel cylinders are located in the master brake cylinder.

T F 4. The force applied to a master cylinder is increased from your foot pressure by levers.

T F 5. Varying road conditions will result in varying coefficients of friction between the brake drum and the brake shoe.

T F 6. Brake fluid should be chemically inert.

T F 7. The anchor pin holds the brake shoe securely in place.

T F 8. Air is non-compressible.

T F 9. Mineral oil should never be put into the brake system.

T F 10. Slight traces of grease on brake linings may cause faulty brake action.

T F 11. Power brakes are vacuum assisted.

T F 12. Only the toe end or the heel end of the brake shoe is moved when making a minor adjustment.

T F 13. The use of a pressure tank to fill and bleed the brake system eliminates the need for an assistant.

T F 14. Cast iron is the only material used for brake drums on modern cars.

T F 15. The lines and cylinders in a hydraulic brake system should be flushed with mineral oil.

T F 16. Static friction means friction at rest.

T F 17. If over 25 percent is removed from the brake drum, it would be advisable to replace it.

T F 18. A tandem brake cylinder provides fluid at two wheels for braking.

T F 19. The transmission brake is not usually found on automobiles having a brake shoe emergency brake.

T F 20. An exposed transmission brake is normally dependent upon the action of four brake drums.

T F 21. Brake tubing may be cut properly with a hacksaw.

T F 22. If the left wheel brake lining becomes soaked with brake fluid, the car will tend to pull to the left.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The basic material used for brake linings is ________________.

2. Brakes make use of a (an) ____________ drag on the brake drums to slow the car down.

3. The parking brake on most automobiles is ____________ operated.

4. Removing the air from hydraulic brake lines is called ____________ the brakes.

5. The only material acceptable for brake lines is double ____________ plated ____________.

6. If the brake fluid drops below the ____________ ____________ air will be drawn in by the hydraulic system.

7. The device that permits brake bleeding is known as a ____________ ____________.

8. ____________ and ____________ are two methods used to hold brake linings to their shoes.

9. One of the best sources for information pertaining to the servicing of a particular kind of automoiile is the applicable ________________.

10. The primary brake shoe is a term given the ____________ brake shoe.

11. Brake linings which are being replaced are fastened to the brake shoes with ____________ or ____________.

12. A device used to prevent skidding is known as an ____________ device.

13. When a brake loses its frictional properties, it is called brake ____________.

14. The brake drum should not be reduced by more than ____________ percent of its original thickness.

15. Brake drums which are too ____________ will tend to overheat and warp.

16. Mineral oil should not be used in a hydraulic brake system because it makes rubber parts __________.

17. Hydraulic brake systems are bled to release any ____________ that may have gotten into the lines.

18. Steel tubing, used in the lines of a hydraulic brake system must be double-____________ to prevent splitting.

19. Brake lining material is frequently interwoven with a fine ________________ and ________________.

20. The piston in the master cylinder is linked to the brake pedals through a ____________ arrangement which provides a considerable ____________ advantage.

21. Light score marks on brake drums can be removed with fine ____________ ____________.

22. Power brake designs may be classified as ____________, ____________, and ____________ types.

Listing

<u>Directions</u>: List the items called for in each of the following. Select your answers carefully.

1. The four means used to operate brakes are:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. The characteristics a brake fluid should possess are:

(A) ____

(B) ____

(C) ____

(D) ____

3. Three types of brakes commonly used on heavy duty vehicles are:

(A) ______________________ (C) ______________________

(B) ______________________

4. The possible reasons why the brake pedal of a hydraulic system might go all the way to the floor boards are:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

Assignment
Sheet No. 21

Covering
Units 236-242

WHEELS, TIRES, AND TIRE REPAIR SERVICE

In the early stages of the development of inflated tires, the motorist expected frequent tire repair jobs on the road. He carried several spare tires and a tire repair kit. Much progress has been made in improving the pneumatic tire. Today, tire repair on the road is almost unheard of and the necessity of changing tires en route is rare.

Tires, though greatly improved, still require careful servicing. Tire failure at speeds reached by modern automobiles is extremely hazardous and, in most cases, can be prevented by proper maintenance and care.

In this assignment you will have an opportunity to learn about the various types of tires and how they are constructed, serviced and repaired.

Assignment:

1. Read the references listed below.
2. Illustrate the two types of tire balance, describe the procedure used to overcome these malfunctions.
3. Complete the assignment below and turn in by ______________.

References:

A. Crouse, Automotive Mechanics, pp. 563-566; 595-601.
B. Stockel, Auto Mechanics Fundamentals, Chapter 16.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Most heavy-duty truck and bus tires are inflated to about 30 pounds.

T F 2. Oil and grease will damage rubber.

T F 3. Both tire beads should be slipped over the rim flange simultaneously when removing a tire from its rim.

T F 4. An innertube should be completely deflated while mounting it and the tire on the rim.

T F 5. Better alignment of the tire, tube, and rim may be achieved by deflating the tire after it has been installed and then reinflate it.

54

T F 6. The left front tire wears at the same rate as the left rear tire.

T F 7. Overinflation causes a tire to wear in the center tread.

T F 8. The chief safeguard in servicing tubeless tires is to handle the casing in such a way as to prevent any damage to the sealing ridges.

T F 9. Improper front alignment causes a tire to have a feathered edge.

T F 10. The "drop center" of a tire permits easy, placement on the hub.

T F 11. The tubeless tire has become standard equipment for passenger cars.

T F 12. Wheels must be balanced to give the best performance.

T F 13. The ply rating of a tire is dependent upon the number of fabric layers.

T F 14. Front wheel "tramp" is a term describing high-speed wander.

T F 15. Tire tread design is primarily for looks.

T F 16. Under-inflation is a common cause for sidewall separation in tires.

T F 17. Tire pressure specified by car manufacturers should be adhered to.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Tire casings are reinforced with layers of ______________ that have been impregnated with rubber.

2. Plies refer to the number of layers of ______________ in a tire casing.

3. The term used to describe the process of heating rubber under pressure is called ______________.

4. The highest number of plies used for tires is ______________.

5. Tires used for passenger cars usually have at least ______________ plies.

6. Care must be exercised when removing a tire from its rim to avoid injury to the tire bead or ______________ ______________.

7. It is recommended that the tires on an automobile be rotated every ______________ miles to equalize tire wear.

8. The process of vulcanizing new tread material to a tire casing is known as ______________.

9. In the procedure for rotating tires, the ______________ ______________ wheel would be next in line as a spare.

10. In the procedure for rotating tires, the right rear wheel would be next used as a (an) ______________ ______________ wheel.

11. The tire that receives the most wear is on the ______________ ______________ wheel.

12. Two types of balance affecting road performance are ______________ and ______________.

13. The grease used for wheel bearings should contain ______________ ______________ material.

14. The type of valve stems used in tubeless tires are ______________

15. The type of nut used to hold the front wheel hub on is a ______________ and it is locked in place with a ______________ ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two basic types of tires are:

(A) ______________ (B) ______________

2. The major functions that tires serve are:

(A) ______________ (B) ______________

3. Four mechanical conditions that cause abnormal tire wear are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

4. Five parts of tubeless tires are:

(A) ______________ (D) ______________

(B) ______________ (E) ______________

(C) ______________

5. The four ways tire inflation is important are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

AUTOMOTIVE AIR CONDITIONING

The automobile contains numerous examples of items which were once luxuries. These are now rapidly becoming a necessity. The air conditioner is an example of this new changing concept in driving comfort. Essentially this device performs two operations to the air used within the automobile; it filters and removes excess moisture.

In this unit you will have opportunity to review the principles of refrigeration and their application to the air conditioner as used in today's automobile. The process is similar to a household refrigerator.

Assignment:

1. Read the references listed below.
2. A. Study the color coded schematic of the freon cycle on page B-20-12 A of your text.
   B. In a short paper discuss the operation of each component of an air conditioning system.
3. Locate a book on refrigeration in the library, investigate why freon is used as the gas.
4. Answer the questions below and turn in this assignment by ____________________.

References:

A. Crouse, Automotive Mechanics, pp. 602-604.
B. Stockel, Auto Mechanics Fundamentals, Chapter 20.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. An air conditioner removes moisture from the air.

T F 2. An increase in atmospheric pressure will increase the boiling point of a liquid.

T F 3. Freon under pressure has an increased boiling point.

T F 4. A refrigeration system uses gases under low pressure.

T F 5. An air conditioning sight glass indicates the level of freon.

T F 6. Moisture is removed from freon in a receiver.

T F 7. An evaporator is used to dehumidify the air.

T F 8. Freon passing into the evaporator is under high pressure.

T F 9. As a compressor increases the pressure it also raises the temperature of freon.

T F 10. The compressor pulley is running at all times when the automobile engine is running.

T F 11. Refrigeration is dependent upon control of freon pressures.

T F 12. The process of removing heat from an object is cooling.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The operations performed by air conditioners are to remove ______________ and ______________ from the air.

2. The purpose of the compressor is to ______________ the ______________.

3. It is the purpose of the ______________ to remove dirt and moisture from the system.

4. The device that controls the action in a refrigeration system is called the ____________ ______________.

5. A ____________ ______________ provides a visual means of inspecting the flow of freon.

6. Pressure raised above the normal ______________ pressure will raise the boiling point of a liquid.

7. The pressure range of freon as it enters the line from the compressor is _______ to _______ pounds.

8. Tubes and fins best describe the components of a ______________ and ______ _______.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The essential components of an air conditioner system are:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

2. Heat may be transferred from one substance to another by:

(A) ____________________ (C) ____________________

(B) ____________________

3. The action of an expansion valve is controlled by the following three factors:

(A) ____________________ (C) ____________________

(B) ____________________

4. The three characteristics of freon which make its presence hard to verify are:

(A) ____________________ (C) ____________________

(B) ____________________

JOB MANAGEMENT AND PRICING

The principal reason automobile repair shops are in operation is to provide services for automobile owners. However, these services are continued only if the shop owners realize a reasonable profit on their investment.

Each shop owner strives to offer the greatest amount of services for the least cost to customers and, at the same time, realize a fair return from his investment. In order to accomplish this, management is required to employ sound principles of job management and of pricing services.

In this assignment you will have an opportunity to learn about methods of receiving and routing jobs through the shop and the various methods of pricing services.

Assignment:

1. Read the reference listed below.
2. Ask your employer for copies of business forms which are used in the service department. Fill them in using an imaginary case.
3. When you have completed Items 1 and 2 answer the questions below and hand in with Item 2 on ________________________.

Reference:

Information Sheet No. 1, this manual.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Customers are usually willing to spend money for car maintenance.

T F 2. It is essential that repair shops have someone on hand that will give the customer courteous attention.

T F 3. A job must receive careful attention from the time it is accepted until it is completed if the customer is to feel that his money is well spent.

T F 4. It is considered good practice to have a mechanic give attention to incoming jobs.

T F 5. In large shops the service salesman meets the customer and discusses the nature of his problem.

T F 6. One of the duties of the head mechanic is to fill in job tickets.

T F 7. The job ticket, or repair order, is a contract between the service shop owner and the car owner.

T F 8. The customer can be forced to pay the entire bill even though work not originally contracted was done.

T F 9. Job tickets in large shops are usually made out in triplicate.

T F 10. The customer can collect compensation for damages to his automobile in a repair shop unless he signed a statement relieving the owner.

T F 11. Job tickets usually do not include a list of repair parts and their prices.

T F 12. If the repair job cannot be completed on schedule, the owner should be notified at the earliest possible time.

T F 13. Carefully kept records of time required to complete jobs are of value in estimating completion dates of similar jobs in the future.

T F 14. The public no longer expects small service jobs at no cost.

T F 15. Profit is usually thought of as the difference between the amount the owner pays the mechanic and that which he receives from the customer.

T F 16. In the past, charges to the customer were established on a time-and-material basis.

T F 17. All jobs done in a general automobile repair shop are based on the flat-rate system.

T F 18. Flat-rate prices are established on the average hourly rate and average time to complete the job.

T F 19. Repair shop owners starting in business frequently make the mistake of selecting an hourly rate which is too small.

T F 20. A low hourly rate for labor charged by some shops is easily offset by profit on repair parts.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In addition to pleasing customers, careful attention to each job safeguards ________________.

2. In small shops the ________________ gives attention to incoming jobs.

3. To aid in preventing replacement parts of repair jobs from being overlooked and/or not being paid for, a ________________ ________________ is prepared for each job.

4. A job ticket is also known as a ________________ ________________.

5. Upon the completion of a job, the mechanic's copy of the job ticket showing labor time is sent to the ________________ department.

6. Most small shops use a simplified form of job ticket in which one of the two copies is retained by the company and the other goes to the ________________.

7. Incoming jobs are assigned to the various mechanics by the owner or shop ________________.

8. Only when books have been balanced at the end of the ____________ can profit be definitely determined.

9. The system of pricing services now generally accepted, in which a fixed amount is paid for a job regardless of the time required to complete it, is known as the ________________ system.

10. The price paid by the customer per hour is _________ to _________ times the rate paid the mechanic.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two important factors that directly affect customer good will are:

   (A) __________________________ (B) ____________________________

2. Three sources from which printed job tickets may be secured are:

(A) ______________________ (C) ______________________

(B) ______________________

3. The three uses of a job ticket are:

(A) ______________________ (C) ______________________

(B) ______________________

4. Items that are included in total operating costs are:

(A) ______________________ (F) ______________________

(B) ______________________ (G) ______________________

(C) ______________________ (H) ______________________

(D) ______________________ (I) ______________________

(E) ______________________

Information
Sheet No. 1

JOB MANAGEMENT

Owners and operators of small businesses often are not aware of the extent of the responsibilities that they incur. They feel that, if they do the work specified by the customer and pay their bills, they are meeting all their obligations. However, there are other things to be considered as many businessmen have realized after it was too late.

If a businessman fails to provide adequate protection for himself and his customers he can be sued for damages obtained by any person who is injured on his premises. Of course, it is first necessary for the injured party to prove in court that there has been negligence on the part of the owner.

Obviously, every repair shop owner will want to take every possible precaution for the safety of his customers and employees. Not only should he attempt to make his shop completely safe but, in addition, he should take out insurance so that he will be protected financially regardless of what may occur.

Selecting from over 55 types of insurance policies applicable to automotive sales and service, the owner should only take out those policies which he can afford and those necessary to protect him adequately.

PROPERTY HAZARDS

Many of the safeguards that can be taken by the careful shop operator are easily arranged. Others are more complicated and difficult, and will require constant attention on the part of the owner to insure that the safety rules he has made are being observed.

One of the most difficult provisions that can be made for the safety of customers and employees is a clean, oil free floor on which people can walk without danger of slipping or stumbling. Law books are full of cases where damages have been granted to persons who have been injured from falls caused by negligence in the care of floors.

The cement floor of a repair shop requires constant attention, for only a slight spot of grease can easily result in a severe fall if walked on with rubber soles or heels. It is particularly important to make sure there is no grease or litter on the floor surrounding a pit, for a fall at such a point can be extremely serious.

Tools scattered on the floor, a jack handle left protruding from underneath a car, or similar careless and thoughtless handling of equipment can cause serious injury.

Safety precautions should be taken if the shop operates certain kinds of machinery. Many dangers must be guarded against. The gearing and belting on machines must be protected by a suitable guard so that it is impossible for anything to become entangled in the moving parts. Grinding wheels should never be operated without a guard.

It is essential that all tools be inspected frequently to make sure they are safe to use. Always be sure that jacks, horses, and lifts are in perfect working order and that there is no possibility of their failure, with consequent injury to anyone underneath. Never use makeshift blocking instead of a horse or a jack to support a car.

All types of fire-fighting equipment should be inspected frequently to insure that they are in good working order and of the proper type for use against garage type fires.

TYPES OF INSURANCE

To achieve full protection against accidents and other hazards in the operation of your business, be sure that you have all necessary types of insurance. Discuss your insurance needs with a reliable insurance agent, who will advise you regarding the kinds and amounts of insurance that you require.

In general, the types of insurance found adequate to cover hazards in automobile repair shop operation are public liability, workman's compensation casualty, fire, and theft.

Public liability will insure against any accidents that happen to customers when they are on your premises. For instance, if a customer should slip and injure himself while in your shop, the damages awarded him by the court would be taken care of by your public liability insurance. This insurance is an important safeguard, since your action in opening a shop may be construed as an invitation to the public to enter with the assurance of safety. Public liability also covers damage or injury that might be caused by your truck or other equipment used away from the premises.

Workmen's compensation insurance is designed to compensate workmen for any injuries received while on a job. It is required by law in most states when a minumum number of workmen, usually four, are employed. However, it is a protection for you against claims, regardless of the number of your employees and would be advisable to purchas if you have less than the required number of workers.

Casualty insurance covers the risk of damage to such property as buildings, machinery, fixtures, boilers, and plate glass. The value of fire and theft insurance is obvious.

INJURIES

Probably few, even of the largest shops, could maintain a thoroughly equipped emergency room. However, every shop should be prepared to furnish emergency first aid to the injured.

The first-aid kit should be fitted out as recommended by the American Red Cross. It should be replenished immediately after being used, and its contents checked once a month. These supplies must, of course, be kept clean. Cases for first-aid supplies preferably should be made of metal, and be so constructed as to exclude dust.

The effects of an accident may be intensified through lack of immediate and proper care. On the other hand, unskillful handling of a severe injury may do further harm besides causing unnecessary pain. Therefore, the first thing to do in case of a major accident is to get a doctor. Pending his arrival, no first-aid treatment should be given beyond the necessities of the emergency.

Every injury that occurs, no matter how trivial, should be noted in a record book. All cuts, scratches, and bruises should be recorded as soon as they have received attention. Any injury involving lost time requires a more formal report. Such a report usually gives the name of the employer for whom the injured worked and the industry, the name, age, sex and occupation of the worker, cause of injury and designation of the part of the body injured, steps taken to prevent similar injuries and other pertinent data.

As a rule, workman's compensation laws require the reporting of industrial injuries to the appropriate workmen's compensation board. Some of these boards require the reporting all injuries, including those involving only first aid; others, all disabling injuries; still others, only those injuries which exceed the waiting period. Therefore, you should ascertain the requirements of the compensation act applicable to your employees and comply fully with those regulations.

If you carry your compensation insurance with an insurance company, you should, of course, learn the company's requirements for reporting injuries and abide by them.

RECORDING INCOMING JOBS

The success or failure of an automotive repair shop is dependent on many factors. Among the most important and ones that directly affect customer good will are prompt attention to the incoming customer and the careful recording of all work ordered.

To insure that none of the items of repair ordered by the car owner are overlooked and that all work is paid for, it is necessary that a detailed record be kept of the repairs authorized. Most shops use the job ticket or shop order for this purpose and it is the duty of the owner or service manager to make sure that the ticket is filled out in detail.

The repair order or job ticket constitutes an actual contract between you and the car owner and binds you to do a certain amount of work. Care in filling out the job ticket will prevent any misunderstanding later as to the amount of work for which you are contracted.

If you fail to do all of the work agreed upon, the car owner can hold you responsible. On the other hand, if you do more work than was originally contracted for, you cannot force the owner to p pay for the additional labor.

There are many different types of printed job tickets available, some designated especially for the large shops and others for smaller ones. They can be obtained from companies manufacturing business machines, from specialty printers, or from the companies from whom you may be purchasing fuel and lubricants. It is advisable that you study the various forms and select the type best suited to your particular business.

The job ticket used in large shops is usually made out in triplicate. The first copy serves as the customer's invoice, the second goes to the repair shop's accounting department, and the third is given to the mechanic assigned to the job so that he will know what repairs are to be made.

Usually, the job tickets provide places for the name, address, and telephone number of the car owner, the date when the work was received, the time the completed job is promised, and important facts about the car, such as make, motor and license number, and the mileage indicated on the speedometer.

Such information is required in some states as a means of enabling the police to locate stolen vehicles, but it can also be of particular use to you. For instance, the owner's name can be put in your file of persons to whom direct-mail advertising is sent. The mileage reading helps the mechanics to determine what other repairs might be necessary. Furthermore, having a record of the mileage at the time of repair will help you to disprove any claims which the owner may later make to the effect that the car failed after a few miles of driving. Other information contained on the job ticket is of extreme importance for tax, social security, and other purposes.

The major portion of the job order is devoted to listing the various repairs that are to be performed. If the repair shop is operating on a flat-rate price basis, the repair operation number should be noted and the job should be described briefly. There is space provided for writing in the labor charges for each operation and the words "estimates for labor only, material additional" are usually included near this space. This explanation is important as it is impossible in most instances to estimate all the parts that will be required for a particular repair job.

Space is provided for the car owner's signature and a statement similar to the following is usually included: "It is understood and agreed that this company assumes no responsibility for loss or damage occasioned by fire, theft, demonstration, or while road testing, delivering, and/or calling for any vehicle placed with this company for storage, sale, repair, or otherwise."

Unless such conditions are included the car owner can be awarded compensation for damage to his car resulting from fire or other accidents while it is in possesion of the shop.

On two copies of the job ticket space is provided for listing all parts used in repairing the car, and their prices. The list of parts can be obtained from the requisition forms made out by the mechanic who did the job. The total cost of the parts is added to the labor charge on the face of the order to indicate what the customer shall pay.

Whether stamped in by a regular time clock or written down by the shop owner or foreman, work-time information is particularly important where the mechanic is paid on a flat-rate or some other basis involving the actual time required for the repair operation. It may also be of value in determining the relative efficiency of the various mechanics as it consitutes a record of the time they require to do the different jobs.

Upon completion of the work, the third copy of the job order is sent to the accounting department so the mechanic's pay may be calculated.

The form described above, since it is to carry all the information required by large shops, is unduly complicated for use of the shop owner employing only a few men, particularly if they are paid a straight weekly salary. The smaller shops use a simpler form, a single copy of, at most, two copies, to serve the same purposes.

When this simpler type of job order is used, one copy is given to the customer and the other is retained by the shop to supply the information needed by the mechanic assigned the job and by the accounting or bookkeeping department.

ASSIGNING AND CHECKING WORK

The shop foreman or owner, as the case may be, must assign work to the mechanics. Naturally, if there are a large number of employees some will be found to be more skillful than others on certain types of repairing. Therefore, when possible, jobs should be assigned to the mechanics best fitted to do them. In a small shop, assignment of work should not be much of a problem because presumably any mechanic hired would be capable of turning out a good job on all parts of the automobile.

The responsibility of making work assignments involves seeing that repair jobs are completed on schedule.

It is essential that the car be ready for the owner at the time recorded on the job ticket. If the shop fails to live up to its agreement, it will probably lose trade. It is up to the service manager of a large shop or the owner of a small establishment to make careful note of the delivery promise with respect to each car, and to see that all such promises are kept.

It isn't enough to have the delivery time written on the job sheet. A record of the time promised should be kept in plain view. on a blackboard for all the cars under repair. In general, the only information required for such a record in the name of each car owner and the date and time promised.

The owner or service manager must check frequently with the mechanics to make sure that the work on each car is progressing satisfactorily and that it will be completed at the time promised. If for any reason a car cannot be ready on time, the shop operator or service manager should phone the owner and explain the delay.

Keeping a record of this sort has another distinct advantage in that it will help to discourage the person who takes the order from making promises that cannot be kept. In other words, if a shop has only one motor mechanic, the operator should not promise any more work than can be performed by that one mechanic. For example, it requires approximately 6 1/2 hours to do a valve job on an 8-cylinder car. By working fast the mechanic can finish one such job in a day and with luck might start a second. Assuming that no other jobs take precedence, the shop operator should feel safe in promising the owner of the second car that it would be ready for him the following day.

CONTROLLING FOR PROFIT

Too frequently, the shop operator neglects to include all charges when he makes up the customer's bill. It should be remembered that failure to include the price of parts, lubricants, or other materials used on a repair job can change a profitable transaction into a loss. Mechanics should be impressed with the importance of noting either on requisition blanks or in the spaces provided on the job ticket, all parts and materials required for each piece of work.

An accurate record of the time the individual mechanic takes to do various jobs assigned him is important not only because the data needed in fixing charges to the customer, but also because of the growing use of incentive pay methods based on actual work time. Therefore, time clocks, formerly found only in the larger shops, are coming more and more into use.

If a shop operator does not feel justified in going to the expense of purchasing a time clock, he must then write in on each job ticket the time the mechanic starts and finishes the job. Unless the time is checked in each case with the mechanic, this method may result in disagreement between the mechanic and the operator.

FREE SERVICE AND UNPRODUCTIVE TIME

The owner of a repair shop soon finds that he is expected to give many small services on which there is no definite charge. For example, a car with a severe engine miss may be driven up to the shop. A quick diagnosis will disclose that the miss is caused by a shorted spark plug. Obviously, it will only take a minute to clean the spark plug. Since actual time spent in doing the whole job would not exceed five minutes, the shop owner will be inclined to make no charge, particularly if the car owner is a regular customer.

Free service time mounts up and a practice of not charging could result in business failure. On the other hand, the goodwill gained by free service should not be overlooked. The shop owner will have to weigh the value of this goodwill against the time lost on such jobs.

There are many ways to avoid excessive free servicing. In the case of an engine miss, the shop operator could point out to the car owner that, while only one plug was shorted at the moment, the condition which caused that one cylinder to misfire would undoubtedly be found in the other cylinders, as well. He would be justified in saying that a complete tune-up should be done, and possibly new spark plugs to insure satisfactory operation. Be sure, in each instance, to suggest all the work that is required to overcome the trouble.

Unproductive time in a shop can cause considerable loss of profit. Among the factors that can cut deeply into a shop's earning capacity are lost tools, defective or inadequate equipment, lack of intelligent management, and failure to order necessary parts and to have them ready when needed. Another factor is the time spent in selling a small job that could otherwise have been devoted to selling complete one. Such haphazard selling forces the car owner to make repeated trips to the shop for a lot of small jobs when all the work should have been sold and completed on one trip.

COSTS AND QUOTATIONS

In order to operate a successful shop you must be sure that your charge to the customer is sufficient to allow you a profit. Many repair shops have failed because they didn't take into consideration all the expenses that had to be met. Too frequently the dollars left over at the end of a week are looked on as profit even though the rent is unpaid and there are outstanding bills.

It is only when your books have been balanced at the end of your fiscal year that you can determine definitely the extent of your earnings above your salary, but if you fix prices that allow for all cost items, you will lessen the possibility of experiencing a loss.

National averages indicate that profits for successful automotive repair shops approximate 8 percent of net sales. Naturally, there are some automotive repair shops that have profits in excess of the average, many that have profits smaller than average, and still others that are operating at a loss.

Charges for many kinds of auto repair jobs are fairly well standardized, so you will probably have no particular difficulty in establishing your prices. Originally, the procedure was to charge the customer on a time-and-material basis. Owing, however, to pressure on the part of car owners who wanted to know the cost of repairs before they were actually made, repair shops gradually adopted what are known as flat-rate prices for most operations.

Such prices were tried out rather reluctantly by many operators, as they felt it was impossible to foretell accurately how long it would take to do the jobs. However, experience soon indicated that charges could be established which were fair both to the repair shop and the car owner.

FLAT-RATE PRICES

It is true that the time required to do repair jobs of the same kind may vary. But the variation is small and the advantages of being able to quote a price before the work is performed are so great that flat-rate prices are now charged by virtually all shops.

Repair shops owned and operated by car dealers use, for the most part, the prices established by the respective car factories. Independent repair shops, working as they do on all makes of cars, use flat-rate prices established by companies specializing in fixing such rates.

Experience has shown that flat-rate prices can be established for 85 to 90 percent of all the repair operations done on an automobile. For the remaining jobs, such as straightening fenders and repairing wrecks, which cannot be given a flat-rate price, the charge is based on actual time and material.

FIXING THE FLAT-RATE PRICE

A publishing company compiling a manual of flat-rate prices first makes time studies on the repair operation to get an average time for doing that particular work. The average hourly rate that could appropriately be charged by the majority of repair shops is then selected. The prices given in the manuals are based on this average hourly rate and the average time required to do that particular job. Conversion tables are provided so that, if the individual repair shop operates on an hourly rate other than the average rate selected by the publisher, he can revise the published rate.

While the published flat-rate prices figured on averages are convenient guides, it will still be necessary for you to determine the hourly rate you should charge to repair cars in order to obtain the desired profit. Furthermore, you will need to know your hourly rate to figure any time-and- material charges you may quote.

Obviously, a repair shop on the main street of a metropolitan area has a higher overhead and, consequently, has to charge a higher hourly rate than is feasible for a smaller repair shop in some rural section. Repair shop owners starting in business frequently make the mistake of selecting an hourly rate that is too small.

There are two ways to determine the hourly rate for an automotive repair shop.

The first method, used by virtually all car dealers on the recommendation of their respective car factories, is based on the hourly wages paid to the mechanic. To determine the hourly rate by this method the mechanics' hourly wage is multiplied by a factor which ranges from 2 to 2.5. Some car factories advocate the lower factor while others are in favor of the higher one.

As an example, suppose that you are paying your mechanic $1.00 an hour. To obtain the hourly rate on which to base your flat-rate charge to the customer, you have only to multiple $1.00 by 2 or 2.5 The results from this simple method check very closely with those obtained by the second and more complicated accountant's method based on the cost of doing business.

To obtain the hourly rate by the second method, you divide the total of all costs of doing business in a month's time by the number of productive hours during that same period. By " productive hours" is meant the total time actually spent by mechanics working on cars, and would not include the time of a stenographer, bookkeeper, attendants at the gasoline pumps, or the manager.

Suppose that for a shop employing a mechanic and requiring a small amount of nonproductive bookkeeping help, the itemized cost of doing business is as follows:

Rent	$ 100
Depreciation	30
Salary, mechanic	350
Salary, nonproductive	190
Electricity	10
Telephone	5
Mail and advertising	25
Bad debts	10
Unemployment and social security taxes	25
Miscellaneous	55
	$ 800

Most of the items of business cost included above require no explanation. However, it should be pointed out that salaries for everyone in the shop must be included. Remember that you should place yourself on the payroll at a definite salary. Taxes include unemployment taxes, social security taxes, and any municipal or other taxes incurred.

If your are renting your establishment, depreciation would include only the depreciation of equipment. The amount would depend on the length of time before the equipment would normally become obsolete. If you have $ 1,800 worth of equipment and wish to calculate depreciation on the basis of five years, you divide the amount of worth by 60, which gives $30 as the monthly depreciation. If you own the building, instead of a rent item you would have real estate taxes, interest on mortaage and on invested capital, and certain expenses for maintaining your building.

In large shops it is frequently necessary to make different hourly charges for the work done in different departments. For example, if a shop has wheel-aligning, tune-up, car-washing, brake, and engine-overhaul departments, it would probably charge on the basis of approximately $3.50 per hour for wheel aligning and $2.50 per hour for work in the other departments.

The charge can be calculated accurately for each department by using the same procedure as suggested above for the entire shop. The only difference is that each department is assigned a certain portion of the rent and other general expenses. Naturally, only the salaries of those mechanics who work in the department are used when calculating the hourly costs.

There are other reasons for variations in the hourly rate. For example, some specialty shops, because of a high investment in equipment, charge more per hour than do other specialty shops rendering other services.

TIME-AND-MATERIAL CHARGES

The foregoing discussion deals with the problem of fixing charges on an hourly time basis. For such jobs as repairing a wrecked car or straightening a fender, the charge will have to be made on a time-and-material basis. Do not attempt to fix the charges in advance unless you have had years of experience in such estimating and quote prices that are fair to the customer and yet will insure an adequate profit for yourself.

As the term implies, time-and-material charges are based on an hourly rate and the cost of the various parts installed in the car. Determining this charge when the job is completed presents little difficulty if a time record is kept on the repair order or job ticket, or the necessary requisitions are made out by the mechanic who does the work.

Some repairmen make the mistake of using a low hourly rate when calculating the price for such jobs, in the belief that there is sufficient profit in the discount they obtain on the purchase of the repair parts installed. This is a serious error because a great many repairs on modern cars require few parts. For instance, the installation of a detent spring in a transmission may require 5 hours of work but the spring itself will cost only 20 to 25 cents.

Obviously, very little profit can be realized from the parts in such an operation but if the shop is to be successful it must obtain a profit on labor.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *MEAT CUTTERS, HIGH SCHOOLS, POST SECONDARY EDUCATION, JOB ANALYSIS, *COOPERATIVE EDUCATION, INDIVIDUAL INSTRUCTION, *MEAT,

Related occupational information for meat cutting students in high school or post-high school cooperative education programs is presented. It was developed by a committee of teacher coordinators and teacher educators through an analysis of the trade and has been field tested and periodically revised. The 16 assignment sheets, designed for individual instruction, contain informative paragraphs, explanations of the importance of the assignments, references, learning activities, and objective-type questions. Examples of assignment sheet titles are (1) Sanitation in the Meat Department, (2) Preparing Retail Beef Cuts, (3) Preparing Fish and Shellfish, (4) Refrigeration, Curing, and Storage of Meat, and (5) Advertising, Displaying, and Selling Meat. Information sheets are included on retail meat cutters, fresh and frozen fish, and selling meat products. The material is to be used by individual students under the supervision of a qualified coordinator or competent trade teacher for one year or 180 days. The student

should be in grade 11 or grade 12, have proper prerequisites, and be employed in meat cutting in a cooperative education program. Supplementary materials include a list of references, an analysis of the retail meat cutting trade, and a student progress record. Answers to assignment sheet questions are available in VT 002 084. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (HC)

Agency Industrial Education Dept., Univ. of Mo. at Columbia
Address 103 Industrial Education Building
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's key $.50

(2) Means Used to Develop Material:
Development Group Development Committee of Teacher-Coord. & Teacher-Educ.
Level of Group state
Method of Design, Testing, and Trial Subject matter specialist and teacher educators based on an analysis of the trade tested in the field over several years and periodically revised.

(3) Utilization of Material:
Appropriate School Setting H.S. and post high school, and area vocational
Type of Program Cooperative education and preparatory programs
Occupational Focus specific job
Geographic Adaptability United States
Uses of Material Study guide for related instruction
Users of Material student

(4) Requirements for Using Material:
Teacher Competency qualified coordinator of competent trade teacher
Student Selection Criteria junior in high school with proper prerequisites
Time Allotment 180 days

FOREWORD

This course of study, consisting of an analysis of MEAT CUTTING, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching this occupation on an individual basis in a cooperative part-time program.

The original analysis was developed by Mr. Robert C. Ferguson, while Coordinator at Columbia, Missouri, and later revised when the assignment sheets were written by Dr. Hugh L. Oakley, while a Research Assistant in Industrial Education at the University of Missouri. A later revision was made by Dr. Denis J. Kigin, formerly Research Assistant in Industrial Education. The present revision was made by Dr. J. Eldon Yung, Research Assistant in Industrial Education at the University of Missouri.

Special recognition is given to Mr. Bill Stringer, Assistant Professor of Animal Husbandry, and Dr. Donald Naumann, Professor of Animal Husbandry, University of Missouri for their assistance and counsel in preparation of this material.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Dr. James B. Karnes, Assistant Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Marion Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

TABLE OF CONTENTS

Assignment Sheets:

Information Sheets:

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical Job Skills and Procedures performed by the worker in the occupation.

2. Comprehension of the Technical and Related Information basic to an intelligent understanding and practice of the occupation.

3. Development of those Personal-Social Traits which are essential for the successful worker.

The first group of these "learning units" -- the job skills and procedures -- has been arranged in the analysis under the heading of "Job Training." The second group of learning units --the technical and related information -- has been arranged under the heading of "Related Information." The third group -- the personal-social traits -- has been listed under "Personal Qualifications" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies -- the school and the employer -- to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

In the back of this course of study will be found three copies of the TRAINING PLAN AND PROGRESS RECORD FOR MEAT CUTTING, RETAIL. One copy is marked "Student" in the upper right hand corner. On this copy, in the space Time in Hours, the student will keep a talley of the hours he spends on his job performing operations in each area. The next copy marked "Employer," should be given to the employer for recording the student's job performance in each area. The third copy may be used by the coordinator for his record.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets, available in a separate manual, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

Meat retailing structure is a combination of basic principles of operation. Every business is made up of basic principles. The major principles that confront a meat retailer include keeping his market clean, organizing his many jobs into an efficient pattern, buying effectively, selling effectively, maintaining gross profit, maintaining and using operating records and controlling expenses.

What You Will Do as a Retail Meat-Cutter

In brief, you will display and sell meat and fish (performing the duties of a salesperson); cut meat to size desired for display or desired by the customer, using a knife, saw, and various types of power equipment, and attempting to utilize every portion of the carcass. You will clean fish and poultry; suggest various cuts of meats to customers and indicate the best manner to cook the meat, basing your comments on experience in handling all cuts of meat.

Retail meat-cutting is classified by the United States Employment Service as a skilled occupation, which means you must have a thorough and comprehensive knowledge of the trade, must be able to exercise considerable independent judgement, and possess a high degree of manual dexterity. These qualifications you will acquire with diligent application to learning while on the job and in the classroom.

Requirements for Entry Into Retail Meat Cutting

The meat-cutting occupation is entered through on-the-job training. This may include a three-year apprenticeship program, although it is not generally required. According to U.S.E.S., beginners need two or three years to learn the trade and must receive such training as: buying and grading meats; refrigeration and storage of meats; care and use of equipment; cutting, boning, trimming, and rolling of meats; killing, dressing and drawing poultry; and preparing fish. You will cover all these operations and more in this course.

Have you had any experience in animal dressing or cooking? If so, you will find it helpful in getting started and progressing in this occupation. Should you be called into service after you have received training as a meat-cutter, the Army has three types of jobs in which you might well fit: mess sergeant, meat cutter, or cook. The Navy uses men with such experience as "ship's cooks." Certain civilian occupations are open to trained meat cutters which may interest you later, such as executive chefs or kitchen supervisors in large restaurants, a short-order cook or cook in any eating establishment, or opportunities in the meat-packing industry.

Working Conditions

Working conditions are excellent in the large self-service stores of today. You will work inside the year around with other meat cutters in a well lighted and well ventilated (if not air conditioned) building.

The hours are in keeping with other retail jobs and the wages will be commensurate with wages paid for similar work in the locality which requires substantially the same amount of training.

Whether you can take advantage of the opportunities which lie before you in this field depends upon the skill you obtain in the first few years of your training and experience. Under this part-time program which you are entering, you have the opportunity to master those basic operations and facts upon which you can build with experience to the highest degree of competency. Just how far you wish to go toward this goal depends upon the effort expended toward mastery of the fundamentals. Your future is in your hands.

Personal Qualifications

Honesty - This means giving full value for every cent received; truthfulness in imparting merchandise information; a sense of loyalty to both the employer and the customer.

Tact - This means knowing what to do and say in dealing with others so as not to give offense and thus to win good will for the firm.

Courtesy - This means considerate behavior towards others, respecting their points of view, interests and wants. Though difficult to accomplish in all situations, its many benefits in human and business relations make it well worth constant effort.

Personality - This means those magnetic personal qualities that bring customers back: helpful suggestions made, information gladly given, self-control, emotional stability and reserve tempered with a sense of humor and understanding.

Cleanliness - The clothing and person of the meat cutter must be kept spotlessly clean. Dirty hands and untidy clothing of any food handler repel customers.

Pleasing Appearance - This includes manners and posture, neatness and good habits in personal grooming.

Industry - This is the ability to see things that need to be done and keep busy doing them without supervision. Such as enthusiastic interest is the most salable trait a beginning worker has.

Dependability - This means reporting for work punctually, carrying a fair share of the work load, carrying out an assigned task without supervision and in a commendable manner.

Cooperation - This means a real desire to work harmoniously with others and to be helpful.

Intelligence - The meat cutter must be of average or better general and social intelligence and should have a high school education. He should be able to interpret current market trends and purchase wisely.

Alertness - Manual dexterity and mental awareness of potential dangers are requirements of the meat cutter dealing with razor-sharp equipment.

Health - The meat cutter needs good health to meet legal requirements of food handlers and to insure sanitation. He must have a high degree of stamina, which requires a vigorous constitution, abundant energy, and the ability to stand for long hours. He will frequently lift and carry heavy cuts of meat to and from the refrigerator room. Here he will be exposed to sudden temperature changes as he goes in and out of the refrigerator room, with the possibility, in some instances, of injury to health. Keen eyesight is essential.

Assignment
Sheet No. 1

Covering
Units 1-3

THE EXPANDING MEAT INDUSTRY

The production, processing and distribution of meat and meat products has become one of the principle industries in America. It has had distinct bearing upon the economic development of modern civilization.

In order to be an efficient and well informed meat cutter, it is well to know through what stages meat passes prior to arriving in the retail store. It is also beneficial to know something of man's eating customs and habits.

In this unit you will have an opportunity to become acquainted with the historical background of the meat industry, the development and growth of the industry, and some of the organizations which promote the continued growth of the industry.

Assignment:

1. Read the references given below.
2. Write a short paragraph (100 words or less) on the relationship of the consumer and the retailer.
3. Answer the questions below and turn in this assignment by ________________.

References:

A. Ziegler, The Meat We Eat, pp. 1-8, 506-513.
B. Bull, Meat for the Table, pp. 1-18.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The American Indian was largely a meat eater which may have been due to the work associated with obtaining vegetable foods.

T F 2. Most vegetables can be eaten raw without disastrous results, while most meats require cooking for safe eating.

T F 3. Meats were more prominent in the early Greek diet than in the later Greek diet.

T F 4. The diet of the Romans was similar to that of the early Greeks.

T F 5. More people can be fed from an acre of land when the products of the land are fed to livestock and these products, meat, milk or eggs, are then used for human food, rather than when the land products are used directly for human food.

T F 6. Almost 85 per cent of the corn grown annually in the United States is fed to livestock.

T F 7. Henry Ford got his idea for the automobile assembly line from the meat packing industry.

T F 8. "Porkopolis" was a nickname given to the city of Minneapolis when it was an early center of the pork packing industry.

T F 9. Before the development of better transportation, the farmer moved his excess grain to market by feeding it to livestock and then driving the livestock to a slaughter center.

T F 10. The first mechanical refrigeration railroad car for transporting fresh meat was used in the year 1880.

T F 11. The inedible parts of the slaughtered animal have little commercial value.

T F 12. The consumer's present trend is toward the purchase of meats which contain less fat.

T F 13. The fat in a piece of meat adds nothing to the aroma, flavor, or moistness of the meac.

T F 14. Lean meats are primarily protein in nature.

T F 15. The United States ranks third among the countries of the world in the total consumption of meat per individual.

T F 16. The National Livestock and Meat Board was organized in 1922 to combat unfavorable propaganda and to provide information concerning the nutritional value of meat.

T F 17. As a result of the National Cooperative Meat Investigation Project many old cooking methods have been discarded and new ones adopted.

T F 18. Home study courses are available from the American Meat Institute.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The favorite type of meat in the early Greek diet was ____________.

2. According to Bull, "Eating as an art was really developed by the ______________."

3. Perhaps the greatest change in the eating habits of modern man has been in regard to the ______________ meal.

4. The theory of economics which states that unless an increase in population be checked by prudential restraint, poverty is inevitable, is the ______________ theory.

5. Of the farm land in the United States, pasture crops occupy _________ per cent.

6. Because of the importance of soil conservation there is likely to be a/an _______________ in the amount of pasture land in the United States.

7. The sale of livestock and its products accounts for over _________ per cent of the farmer's total income.

8. In the processing of its finished product, the meat packing industry utilizes what might be called a _______________ line.

9. The term "meat packing" resulted from the practice of shipping meat by packing it in barrels and boxes with a ______________ ______________ or ______________.

10. The Chicago Union Stock Yards were opened on Christmas Day in the year _________.

11. The transportation of livestock to slaughter plants was greatly improved with the construction of ______________ after the Civil War.

12. Two men who founded meat packing companies in Chicago in 1867 and 1875, and who greatly stimulated the industry were ______________ ______________ and ______________ ______________.

13. In addition to being a waterway, Lake Michigan also supplied the early meat packing industry with ______________.

14. In a years' time the average American consumes about eight times as much beef as ______________.

15. In terms of total cash volume of business the meat industry now ranks ______________ among the industries in the United States.

16. The American Meat Packers Association, organized in 1906, is now known as the _______________ ______________ ______________.

17. The American Meat Institute consists of ______________ service departments.

18. The agencies which probably do the greatest amount of work, in terms of finding new facts about meat and disseminating these facts to the public, are the various ______________ ______________ ______________ ______________ and the ______________ ______________ ______ ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. It is generally found that as the density of the population increases in a country, the meat consumption per individual will (A) decrease; (B) increase; (C) remain constant; (D) be more affected by other factors.

_____ 2. It is estimated that roughage, i.e., hay and silage, which humans can not eat, produces (A) 40; (B) 50; (C) 80; (D) 95 per cent of our beef products.

_____ 3. A major portion of the crops produced in China and India are used for (A) feeding their livestock; (B) export to other countries; (C) human consumption; (D) feeding their work animals.

_____ 4. In 1850 the center of the pork packing industry was in the city of (A) Chicago; (B) Cincinnati; (C) Detroit; (D) Minneapolis.

_____ 5. In the early days of the meat packing industry, livestock was slaughtered only in the (A) winter; (B) spring; (C) summer; (D) early fall.

_____ 6. The first refrigerated car in which fresh meat could be shipped long distances was designed in 1875 by (A) J. P. Morgan; (B) Philip D. Armour; (C) Gustavus F. Swift; (D) G. H. Hammond.

_____ 7. According to Bull, the price of meat is determined by (A) the farmer; (B) the meat packing industry; (C) the retail butcher; (D) the consumer.

_____ 8. Generally speaking our eating habits are governed in large measure by (A) spendable income; (B) the doctor; (C) both A and B; (D) exclusive of A and B.

_____ 9. Which of the following income groups are the greatest consumers of meat products? (A) low income; (B) middle income; (C) high income; (D) they are all about equal.

_____ 10. Meat contains all the necessary minerals for human body metabolism with the exception of (A) calcium; (B) iron; (C) phosphorus; (D) iodine.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The so-called "big four" of the meat packing companies are:

   (A) ____________________ (C) ____________________

   (B) ____________________ (D) ____________________

2. Define what the word "ruminant" refers to.

   (A) ____

3. What were the findings of the Hormel Institute at Austin, Minnesota, concerning the roles of fat and cholesteral in heart disease?

   (A) ____

   ____

4. List some of the findings of the research program promoted by the National Livestock and Meat Board concerning the food value of meat.

   (A) ____

   (B) ____

   (C) ____

   (D) ____

   (E) ____

5. The nine divisions of the National Livestock and Meat Board which coordinate the work of the organization are:

   (A) ____________________ (F) ____________________

   (B) ____________________ (G) ____________________

   (C) ____________________ (H) ____________________

   (D) ____________________ (I) ____________________

   (E) ____________________

VOCATIONAL OPPORTUNITIES IN MEAT CUTTING

Will I be able to find a job as a meat cutter after I complete my training? Where can I expect to find this type of employment? What can I expect my salary to be? Under what conditions will I be working? What things must I know to be a good meat cutter?

Many of these questions you have probably already answered, but in case you haven't, now is the time to find out. Knowing what this type of work has to offer you and what demands it will make of you will help determine your success and satisfaction in the job. All jobs have unpleasant aspects. This should be expected and you should be willing to adjust to them. There are probably very few people who enjoy every aspect of their job.

Meat cutting has become a skilled trade, having made significant progress since the days of the butcher. Much research has gone into cutting methods, sanitation practices, packaging materials and selling techniques, as well as the development of meat animals. This is a progressive occupation that continues to search for methods and techniques to improve its efficiency.

This is an occupation that contributes to the satisfaction of one of man's basic needs--food. It is also an occupation that will probably not be replaced by automation in the near future. In order for a machine to do the job of the meat cutter, the meat carcasses and wholesale cuts must be uniform in size, and we just don't "grow" animals that way, yet.

In this unit you will have an opportunity to find the answers to your questions about this occupation--the employment opportunities, nature of the work, earnings, training required, personal qualifications and a look into the future.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________.

Reference:

I. Information Sheet No. 1

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Employment as a retail meat cutter is a steady year-round job.

T F 2. Automation has greatly reduced the need for meat cutters.

T F 3. The self-service department makes no effort to provide personal customer service.

T F 4. The meat cutter should know how to arrange meat packages in a display so they will appeal to the customer.

T F 5. A knowledge of meat cookery is of little value to the self-service meat cutter.

T F 6. The meat cutter is not responsible for the sanitary condition of the meat department.

T F 7. Most of the meat cutter's work is done while standing.

T F 8. The salary for meat cutters has been standardized throughout the country as a result of union action.

T F 9. Meat cutting is a good occupation for those individuals who are unable to do much physical work, because of poor health.

T F 10. Some states require a physical examination for all people who handle food.

T F 11. There are nearly as many women employed as meat cutters as there are men.

T F 12. Meat packers have done little to upgrade the efficiency of their operation.

T F 13. The centralized pre-packaging plant system appears to be applicable only to large multi-unit operations in a community.

T F 14. Store-prepared meats have not been well accepted by the customers.

T F 15. The delicatessen type of service is possible in the small independent stores as well as in the larger chain stores.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In addition to making cuts from various meat carcasses, the retail meat cutter will also ______________ poultry and fish.

2. When a shipment of meat is received at the store, it should be ______________ and ______________ before it is placed in the cooler.

3. Carcasses and wholesale cuts are usually broken down into retail cuts in the ______________ room.

4. Meat cutters will work at their job about ________ to ________ hours per week.

5. The salary of an apprentice meat cutter will be about ________ to ________ dollars per month.

6. The apprentice training period for meat cutting is from ________ to ________ years.

7. Retail meat cutting can be a rewarding career for the person who enjoys working with his ______________ and being of service to ______________.

8. The employed meat cutter must be of service to both his ______________ and the ______________.

9. In order for the meat cutter to have a job and receive a salary, the results of his work must yield a ______________ for the employer.

10. The meat cutter who desires employment in a meat department that also contains a delicatessen should develop a mastery of meat ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Which one of the following has not been a result of the introduction of self-service? (A) a change in cutting methods; (B) more strict inspection regulations; (C) a change in packaging methods; (D) new job classifications in the meat department.

_____ 2. Meat department supervisors may expect to receive a salary of about (A) $480; (B) 520; (C) $560; (D) $600 per month.

_____ 3. Meat cutting as an occupation is classified as being at the (A) technical; (B) skilled; (C) semi-skilled; (D) unskilled level.

_____ 4. Most of the training for meat cutters is gained through (A) high school courses; (B) trade schools; (C) correspondence schools; (D) on-the-job.

_____ 5. In order to profitably compete in the retail meat business the retailer must (A) provide his customers with extra-services; (B) purchase at the lowest wholesale price available; (C) reduce his operating costs; (D) price all products lower than his competitor.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List some common tools and equipment used on the job by the retail meat cutter.

(A) ____________________ (C) ____________________

(B) ____________________

2. List the equipment and materials found in the cutting room.

(A) ____

(B) ____

(C) ____

3. In addition to the duties of cutting, wrapping, and selling, the owner or manager of a meat department will also be responsible for:

(A) ____________________ (C) ____________________

(B) ____________________

4. List some places where meat cutters might expect to find employment.

(A) ____________________ (F) ____________________

(B) ____________________ (G) ____________________

(C) ____________________ (H) ____________________

(D) ____________________ (I) ____________________

(E) ____________________ (J) ____________________

5. List some personal qualities which the meat cutter should possess and practice if he desires to succeed.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

6. List some advantages of the centralized pre-packaging plant system.

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

(G) ____

(H) ____

(I) ____

Information
Sheet No. 1

RETAIL MEAT CUTTERS*

Outlook Summary

There will continue to be openings for meat cutters in this large occupation. The demand will be for replacements for those who die, retire, or change occupations. It is also expected that the increase in population, the ever-rising standard of living, and the possiblility of a shorter work week will increase the need for skilled meat cutters. There is also little possibility that automation will replace the meat cutter. With the exception of meat cutters in the packing industry, there is steady year-round work in the occupation.

Nature of the Work

The retail meat cutter is involved with breaking down a meat carcass, or wholesale cut, into various retail cuts. He will also prepare fish and poultry for sale, make sausage, and prepare other special products. This is done by the use of a knife, meat saw, or various types of power equipment.

Meat cutters today do not slaughter the animals or fowls. This is done by butchers or slaughters who are State licensed in packing plants and fish and poultry plants that are subject to sanitary inspection and other regulations.

When the meat is delivered to the retail meat department, the meat cutter weighs and inspects the shipment. He then removes any covering which does not serve as protection during storage before storing the meat on racks or hooks in the refrigerated cooler room.

In recent years, the trend has been toward self-service meat departments. This has resulted in new job classifications for men and women and forced new cutting and wrapping techniques on the meat industry. For the meat cutter this trend has meant a partial release from selling responsibilities.

In the self-service department, processing of the meat into retail cuts is usually done in the cutting room, which will probably be refrigerated. The cutting room contains the cutting blocks or tables, tools and power equipment, and wrapping materials. Here the meat is cut, trimmed, and sometimes boned. Some cuts are rolled, tied, sewed, or skewered; some are cut into small pieces to be ground and made into patties or loaves.

In the more traditional service type of department the meat cutter removed the wholesale cut from the cooler or display case and cut,

---

*Adapted by permission from Occupational [illegible] No. 5-58.10, Meat Cutter, Chronicle Guidance Publications, Inc., Moravia, New York, 1965.

ground, or boned, and wrapped as the customer ordered it. In the self-service department this service is still provided but it is not requested by every customer.

In addition to knowing how to make the various retail cuts, the meat cutter also has other responsibilities. He must know how to wrap and effectively display the packages in the self-service display. He must have a knowledge of various meats, their grades and quality, and how they may best be cooked. Customers expect him to be knowledgeable of meat cookery as well as meat cutting. If the meat cutter is the proprietor of his own shop, or if he is a department manager, he must also place orders, compute prices, and maintain other records.

Meat cutters are also responsible for keeping their equipment, counters, cutting areas, and themselves clean and sanitary. The meat cutter handles food eaten by other people and the consequences from selling unwholesome meats should be a major concern. For the meat cutter there is no such thing as being too clean!

Working Conditions

The working conditions for the meat cutter will vary according to the size and the facilities of the establishment. Modern cutting rooms will be air-conditioned and equipped with power equipment, monorail conveyors, and packaging and pricing machines; all of which make the work easier.

The working hours will vary from 40 to 48 hours a week. In areas that are unionized, there are regulations governing the number of hours, rate of pay, vacations, and overtime payments.

The meat cutter must be on his feet most of the time; he will be subjected to cold from time to time; there may be some heavy lifting, and it may be messy. However, the meat cutter soon learns to dress comfortably and he protects his clothing with an apron. There is the hazard of injury from machinery and knives, but with proper precautions, most injuries can be avoided.

Earnings

Like working conditions, earnings of meat cutters vary according to the size and location of the establishment. The meat cutter who owns his own shop, and who establishes a good reputation for quality and service can make a very good living. However, it is becoming increasingly difficult for relatively small retail shops to succeed in competition with the large chain markets.

In general, the earnings for apprentice meat cutters range from about $70 to $90 a week; the average journeymen pay rate is $130 per week. Meat cutters working in supervisory capacities earn as high as $150 and up per week depending on the extent of their responsibility and length of service.

There are very definite wage standards, which vary with localities, for unionized meat cutters. Wages vary more among non-union workers than they do among union workers. Some employers pay annual bonuses; others pay on the commission basis. Local boards usually set the standards.

Where Employed

Meat cutters may find employment in retail meat shops, grocery store meat departments; wholesale supply houses, hotels, restaurants, meat-packing plants, hospitals, schools and other institutions, on ocean liners, and in railroad dining-ca headquarters.

Training and Qualifications

Most meat cutters enter the occupation at the helper or apprentice level and receive on-the-job training. The apprentice training must meet union requirements and is usually for a period of from two to three years.

A high school education is becoming increasingly important in helping individuals secure and maintain employment. It provides a background of general knowledge, understanding, and experiences which most persons would not have otherwise. Employers investigate the high school record and the school's evaluation of the prospective employee. It is difficult, if not impossible, for young people under the usual age of high school graduation to secure a full-time job; the increasing automation of industry is continually resulting in fewer jobs for unskilled workers. Meat cutting is considered to be a skilled occupation and pre-employment training is desirable.

The individual who selects retail meat cutting as a career should like to work with his hands and enjoy being of service to people. The occupation requires good physical health, physical and mental stamina, and manual dexterity. Some states require all workers who handle food to have a periodic medical examination.

The meat cutter who is employed, rather than working for himself, serves both his employer and the customers. He must be efficient in his work habits as the employer must make a profit if the meat cutter is to have a job and receive a salary. In addition, he must provide the type of service to the customer that will make him a steady customer.

Such personal qualities as honesty, neatness, cheerfulness, amiability, and dependability are as important to the meat cutter as they are in any work, especially work which brings the worker in contact with the public. Initiative and imagination are also valuable in a competitive business world.

Meat cutting is almost entirely an occupation for men. Some women are employed in packing plants at light production jobs. In the retail meat department, and especially in the self-service, women may be employed as weighers and wrappers or be responsible for arrangement and stocking of the display case.

Trends

The meat industry is continuing to improve both the quality of its product and the methods of preparing and selling it to the customer at the lowest price possible.

Meat is not manufactured, it grows. Although there is some uniformity from carcass to carcass, no two are probably alike. Breeding practices have done much to develop animals which will yield the highest quality and quantity meat in proportion to the amount of feed provided and in relation to the inedible portions of the animal.

Packers have and are still adjusting their operations to obtain the most efficient operation.

The retailer too has had to meet competition by developing the most efficient operation possible; the same quality meat is available in almost any meat department. His customers must be attracted and held by the service he offers and the prices at which he sells the meat. There is little variation in the wholesale prices so this means that the retail meat department must cut its operating cost in order to sell at a competitive price.

The self-service department has been one means devised to reduce operating costs. The details of this operation are covered more thoroughly in assignment number five.

Another operation that is being tried by some chain stores is the centralized pre-packaging plant. This is possible when the chain has several stores in the community or surrounding area. A centralized plant is built where cuts are made and packaged for all of the stores. Each day the meat cutter at the store determines his needs for the following day and then calls in his order. The meat cutters at the central plant begin work early in the morning and have the orders ready for delivery by the time the retail store is opened for business.

Operating costs are reduced because (1) less floor space is required at the retail store; (2) there is less duplication of equipment; (3) wholesale shipments are received at one location rather than stops at each store; (4) it is easier for one man to order from the wholesaler for several stores than for each store to order separately; (5) pricing is uniform throughout the stores; and (6) profits are more easily controlled and computed.

In addition to reducing operating costs, the system has other advantages. These include (1) a greater control over sanitary conditions in the facilities; (2) better utilization of the meat cutter's time, rather than cutting a dozen chops at a time he can cut any number needed; and (3) the meat cutter's time at the store can be devoted to customer service and promotions.

As the "bugs" are worked out of this system it will probably be adopted by more and more companies that have several stores in a community.

Another service that is being incorporated into more and more meat departments is the preparation of pre-cooked meats. These are prepared in the store and include such items as barbecued ribs, steaks, and chickens. This service has been welcomed by the busy housewife, working people who prefer eating at home but don't have time to cook, and the "last minute" shopper. Being able to purchase meat dishes that are ready to be eaten upon arrival at home has been well received. Some stores have included other prepared foods besides meats. Names, such as Country Kitchen or Southern Kitchen, have been used to advertise this delicatessen type of service. This type of service will undoubtedly grow in the next several years. It can be utilized by the smaller independent store as well as the larger chain operation.

This trend toward store-prepared meats have implications for the meat cutter. In a store that also utilizes the centralized packaging plant, it is conceivable that the meat cutter may spend a great part of his day preparing and cooking these meats. The meat cutter in training, who prepares himself in meat cookery as well as meat cutting will be in demand for such positions.

The retail meat industry is also contemplating the use of vending machines for selling meats. These machines may be coin operated but it is rather doubtful because our coin operated machines have already created problems with coin shortages. It is conceivable that the customer would be provided with a personal key to fit all machines. He could make his selection from any department in the store with his key, the products would be waiting at the check-out counter where he could pay cash or use his key as a credit card. Payment could be made weekly or monthly by check.

Whether or not these innovations will come to pass, only time will tell. Some people say they won't work, but there were skeptics of the automobile, airplane, space travel, and even self-service retail stores. The imagination, initiative, and ingenuity of today's and tomorrow's business men will determine the means by which the customer is provided with the products he desires and at the lowest prices possible.

Assignment
Sheet No. 3

Covering
Units 8-22

SANITATION IN THE MEAT DEPARTMENT

No meat cutter, regardless of his skill, can hope to succeed in his occupation unless he develops and practices good habits of cleanliness! The meat cutter must be aware that this involves both personal habits of cleanliness and work habits which reflect his understanding and concern for cleanliness.

Although health agencies make periodic checks of food preparation areas, sanitation standards should not be met just to satisfy these requirements. Practices which exceed these requirements should be the department's goal.

The degree of sanitation which is practices will also be reflected in sales. Most of the work area is visible to the customer and both your personal and work habits are under observation at all times. You can not afford to lose a customer because of carelessness! Your personal appearance; the packages and their arrangement in the display case; your work habits; and the condition of the tools, equipment, and work surfaces must all reflect good practices by the meat department personnel. Just as any team is only as good as the weakest player, so will be the meat department unless sanitation is practices throughout. The individual meat cutter is the "key" to a sanitary department!

In this unit you will have an opportunity to learn about some of the factors which promote meat spoilage: their causes and prevention. This unit must not be taken lightly because while on the job any negligence on your part could have serious consequences. Ignorance is no excuse!

Assignment:

1. Read the reference listed below.
2. Prepare a list of "do" and "don't" personal habits which should be followed by the retail meat cutter. These should be in terms of promoting sanitation in the meat department. After your list is prepared, check with your employer for additional suggestions.
3. Answer the questions below and turn in this assignment by ____________________.

Reference:

E. University of Wisconsin, Retail Meats: Storage, Handling, and Sanitation, pp. 3-20.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. An effective product control program in the meat department depends upon the sanitation practices of the employees.

T F 2. Molds may be identified by the color, and the dry, fuzzy appearance of the growth.

T F 3. The action of the enzymes during the aging of meat can cause souring of the meat.

T F 4. An increase of only 10 degrees above the freezing temperature will have little effect on the growth of microorganisms in meat.

T F 5. It is more difficult to control the relative humidity in a self-service display case than in a cooler.

T F 6. Sanitizing compounds are the same as cleaning compounds.

T F 7. Sawdust is one of the most sanitary materials which can be used on the floors of cutting rooms and coolers.

T F 8. If the floors and ceilings have been washed with a good cleaning solution it is not necessary to also use a sanitizing compound.

T F 9. When possible, all equipment and tools should be dismantled for proper cleaning and sanitizing.

T F 10. The oil applied to metal surfaces should be removed before bringing meat in contact with that surface.

T F 11. The surface which contacts the meat is the only area on wood equipment that must be sanitized.

T F 12. Washing the hands twice with soap is no more effective in reducing bacteria on the hands than washing them only once.

T F 13. At no time should the meat cutter smoke in the meat department.

T F 14. The practice of not allowing cuts of meat to touch one another in the cooler is done primarily to allow better air circulation.

T F 15. It is recommended that meats be grouped in the cooler according to the date received.

T F 16. Roasts held over the weekend may be rewrapped for sale on Monday.

T F 17. If beef cuts have been prepared on the cutting block, the block should be thoroughly cleaned before other types of meats are prepared on it.

T F 18. Salt pork processed for self service will have a case life of about one week.

T F 19. The higher the degree of acidity in the meat, the more favorable will be the growth of microorganisms.

T F 20. Of the numerous spoilage organisms mentioned, Clostridium botulinum is of least concern to the retail meat cutter.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Profit in the meat department depends upon the effectiveness of good sanitation practices in controlling losses due to meat _______________ and _______________.

2. A slippery or greasy film on the meat surface may be identified as either _____________ or _______________.

3. If a soft, creamy material gathers on the knife blade when it is drawn over the surface of the meat it can be identified as ________________.

4. When fat becomes rancid, the characteristic white color will change first to ______________, then to ______________ and later becomes _______________.

5. The major advantage in terms of sanitation, of plastic cutting boards over wooden boards, is the fact that they do not _______________ or ______________ as easily as does wood.

6. Cleaned and sanitized cutting boards should be stored in the _______________.

7. Facilities for washing the hands should be placed _______________ the meat department.

8. Meat storage racks for fresh meats should be made of ______________ ______________ and be at least __________ inches off the floor.

9. The most perishable cuts of meat should be stored in the ________________ part of the cooler.

10. The code date to be stamped on a self-service package of ground beef should be __________ day(s) after it is processed and packaged.

11. Most organisms which cause spoilage will be found on the _______________ areas of the meat.

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Display cases should be defrosted only when (A) the build-up of frost hinders air circulation; (B) the store is closed to customers; (C) there are a few packages on display; (D) the case is fully stocked.

_____ 2. The relative humidity in the cooler and cutting room should be (A) 30%; (B) 50%; (C) 65%; (D) 80%.

_____ 3. A good rule to follow when using cleaning compounds is to (A) use them at full strength; (B) never bring them in contact with the skin; (C) follow the manufacture's directions; (D) use them only on metallic surfaces.

_____ 4. Sodium hypochlorite and quaternary ammonium are types of (A) sanitizing compounds; (B) cleaning compounds; (C) mold; (D) acids in meat.

_____ 5. After cleaning and sanitizing all metal surfaces (except stainless steel) on power equipment, hand tools, trays and work surfaces they should be covered with (A) light machine oil; (B) cheese cloth; (C) Packer's Technical Oil; (D) castor oil.

_____ 6. The water used to rinse and loosen soil and blood from wood equipment should not be over 120 degrees F because hotter water will (A) set the blood; (B) split the wood; (C) be too dangerous for the user; (D) all of the preceding.

_____ 7. When the code date on a cut has expired, the cut should be (A) removed from sale and classified inedible; (B) processed into another type of cut; (C) reduced in price to encourage quick sale; (D) inspected and given a new code date if found to be edible.

_____ 8. After cuts of meat have been placed on backing boards or trays, the meat cutter should allow 15 or 20 minutes to pass before they are wrapped in order to permit (A) excess juices to flow from the meat; (B) shrinkage to take place; (C) a thin crust to form on the cut surface; (D) the meat to bloom.

_____ 9. Which one of the following self-service packaged cuts has the longest case life? (A) fresh poultry; (B) veal patties; (C) pork sausage; (D) variety meats.

Matching

Directions: In the left hand column is a list of cleaning compounds commonly used in the meat department. The right hand column contains statements of uses for these compounds. Match the use statement with the compound by placing the letter of the statement in the blank to the left of the appropriate cleaning compound.

_____ 1. General alkaline

_____ 2. General heavy duty alkaline

_____ 3. General inorganic acid

_____ 4. Heavy duty inorganic acid

_____ 5. Abrasives

A. Removing stains, scale or deposit

B. General cleaning of equipment

C. Remove metallic corrosion, protein, and water hardness film deposits

D. Remove protein-carbohydrate-water hardness deposits with scrub brush

E. Remove water-insoluble soils or films

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The problem of controlling discoloration and spoilage of meats in the self-services and pre-packaging retail meat department is increasing. List three reasons for this increase.

(A) ____________________

(B) ____________________

(C) ____________________

2. What characteristics are present in meat which makes it highly susceptible to spoilage?

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

3. List the types of meat spoilage which may take place without the presence of air.

(A) ______________ (B) ______________ (C) ______________

4. As a means of controlling the growth of microorganisms which cause spoilage, meat should be kept in refrigerated places. List the proper temperatures for the following meat areas.

(A) Cooler ____________________________ degrees F.

(B) Display case ______________________ degrees F.

5. List the desirable qualities of a good cleaning compound. It will:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

6. Following each area of the meat department listed below indicate the frequency in which it should be cleaned and sanitized.

(A) Floors in cutting room and cooler ____________________

(B) Meat storage racks in the cooler ____________________

(C) Power equipment ____________________

(D) Hand tools ____________________

(E) Knife racks ____________________

(F) Metal tables, trays, & work areas ____________________

(G) Wood surfaces and equipment ____________________

(H) Display cases ____________________

7. List the personal appearance factors which every meat cutter should be aware of and try to achieve in his work.

(A) ________________________ (D) ________________________

(B) ________________________ (E) ________________________

(C) ________________________ (F) ________________________

Assignment
Sheet No. 4

Covering
Units 23-27

CLASSES, GRADES, AND INSPECTION OF MEAT

An understanding of the various classes and grades of meats and meat products sold in the retail meat department should be gained by the meat cutter. Not that he will be required to qualify as a meat inspector, but it is well for him to be familiar with the system of meat inspection and the significance of the various inspection stamps found on meat. Having this understanding will help in answering customer's questions, checking the correctness of meat shipments and his professional relations with other meat cutters.

What is the purpose of meat inspection and grading? When, where, and by whom is it done? What determines whether or not a beef carcass is graded Prime or Choice? Should the purple stamp mark be removed before the meat is cooked?

In this unit you will have an opportunity to learn the answers to the above questions and others concerned with classes, grades, and inspection of meat. The unit covers beef, pork, lamb, mutton, veal and calf. The classification and grading of poultry is covered in assignment 10; fish is covered in assignment 11.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

Reference:

A. Ziegler, The Meat We Eat, pp. 18-29, 410-434.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The Meat Inspection Act was passed in the year 1960.

T F 2. Meat inspectors work for the U. S. Government.

T F 3. After the animal has been slaughtered, both the carcass and internal organs must be inspected.

T F 4. About one-third of the meat consumed per year has not been Federally inspected.

T F 5. Most states make no provisions for the inspection of meats and meat products which are slaughtered and sold within their state.

T F 6. Carcasses of animals suffering from pneumonia will be condemned by a Federal meat inspector.

T F 7. The legislation for Federal grading of meat was passed at the same time as legislation for Federal meat inspection.

T F 8. The U. S. Department of Agriculture is responsible for the grading of meat and meat products.

T F 9. In order for a meat product to be given a government grade stamp the meat must also have been inspected by the Federal or other authorized agency.

T F 10. All wholesale cuts from a Choice beef carcass must also be graded Choice.

T F 11. In order to be graded Prime, the beef lean must be well marbled.

T F 12. The chine bones of a Prime beef carcass will be well ossified.

T F 13. Beef carcasses with moderately soft and slightly watery flesh will be graded Choice.

T F 14. Beef carcasses graded Standard will have little marbling in the lean meat.

T F 15. The lean meat of Cutter and Canner grade beef carcasses will range from dark red to brownish black.

T F 16. The break joint on a Prime grade young lamb carcass will have the same appearance as the break joint of the same grade mature lamb.

T F 17. A No. 1 grade barrow or gilt pork carcass will have less fat coverage in proportion to lean than will No. 2 or No. 3 grade carcasses.

T F 18. Both the lean and fat of No. 1, 2, and 3 grade barrow and gilt carcasses will be firm.

T F 19. A Cull grade barrow or gilt carcass will show no marbling in the lean cut.

T F 20. The grades assigned to sow carcasses are the same as those for barrow and gilt.

T F 21. The government grade stamp is placed on the carcass in such a way that the label will appear on all of the principal retail cuts from the carcass.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The agency of the government which is responsible for carrying out the provisions of the Meat Inspection Act is the United States Department of ________________ .

2. The number which appears on the inspector's stamp identifies the ________________ for which the inspection is made.

3. Meat inspectors are divided into two classes: the ________________ and ________________.

4. The term which refers to the checking of animals before they are slaughtered is ________________ inspection.

5. The government grade stamp on a meat cut is a guarantee to the consumer that the purchase is of the ________________ designated.

6. The fat on a Good grade beef carcass may be somewhat ________________ or slightly ________________ to the touch.

7. The conformation of a Standard grade beef carcass will be ________________ and ________________ .

8. The rounds from a Commercial grade beef carcass may be slightly ________________ and ________________ .

9. On a Utility grade beef carcass the flesh or lean will be ________________, the fat is usually ________________ and the bones ________________ and white.

10. In a Cull grade barrow or gilt carcass the ratio of fat and lean to bone will be ________________ .

11. In addition to a certain number of required years of suitable practical experience or substituted college training, a candidate may only obtain a permanent appointment as a government meat grader by first serving training period commonly called a ________________ period.

12. The letters "HJ", as a part of the grade stamp shown on page 411 identified the ________________ .

13. The ink used in stamping meat is made from a ________________ dye.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. The establishments which are affected by the provisions of the Meat Inspection Act are (A) all slaughter houses, and retail and wholesale meat departments serving the public; (B) those which prepare meats and meat products for interstate shipment or foreign commerce; (C) only those which desire the service; (D) all those which slaughter, pack, render and prepare meats and meat products

______ 2. The cost of meat inspection is paid indirectly by the customer by means of (A) state sales taxes; (B) Federal sales taxes; (C) state income taxes; (D) Federal income taxes.

______ 3. Which one of the following is not a factor to be considered in assigning a grade to a carcass or cut? (A) breed; (B) finish; (C) quality; (D) conformation.

______ 4. The grading factor which is considered the most important of the three factors is (A) breed; (B) finish; (C) quality; (D) conformation.

______ 5. A significant relationship which exists between the proportion of edible meat to bone in a carcass or cut is attributed to (A) breed; (B) general build; (C) outline of carcass; (D) conformation.

______ 6. Which one of the following beef grades is not assigned to a cow carcass? (A) Cutter; (B) Standard; (C) Choice; (D) Prime.

______ 7. The external fat coverage on a Prime grade lamb carcass will be (A) practically no fat; (B) thick throughout; (C) thin, barely hiding back muscles; (D) thick, practically hiding back muscles.

______ 8. Which one of the following grades are not assigned to mutton carcasses? (A) Cull; (B) Good; (C) Choice; (D) Prime.

______ 9. A Medium grade barrow or gilt carcass will have flesh and fat that can be described as being (A) firm; (B) firm but watery; (C) soft; (D) well marbled.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the purposes of the Meat Inspection Act.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

2. List the grades assigned to steer and heifer beef carcasses.

(A) ____________
(B) ____________
(C) ____________
(D) ____________
(E) ____________
(F) ____________
(G) ____________
(H) ____________

3. List the grades assigned to lamb and yearling sheep carcasses.

(A) ____________
(B) ____________
(C) ____________
(D) ____________
(E) ____________

4. List the revised grades assigned to veal and calf carcasses.

(A) ____________
(B) ____________
(C) ____________
(D) ____________
(E) ____________
(F) ____________

5. List the grades assigned to barrow, gilt and sow carcasses.

(A) ____________
(B) ____________
(C) ____________
(D) ____________
(E) ____________

Assignment
Sheet No. 5

Covering
Units 28-39

SELF-SERVICE MEAT OPERATIONS

Self-service is a relatively new development in the field of retail meat selling and although it was not the first department in the store to utilize the practice, it has been widely accepted. In fact, it is so wide spread that many in your generation will have known no other system.

The practice of self-service is able to survive only if there is volume sales and this demands heavy customer traffic. Competition in the retail meat business is not in terms of cuts and types of meats, but it is rather competition for customer traffic. This traffic can be gained by providing the customer with well-prepared cuts, attractively packaged and displayed for the convenience of shopping.

Another factor upon which the success of self-service is dependent is efficient operation. A department which is well organized to handle the operations from the time the meat shipment is received until it is sold to the customer demands well-trained personnel who know their responsibilities and work as a team.

In this unit you will have the opportunity to learn about the various phases of a self-service operation and the parts for which the meat cutter is responsible. You will also learn how self-service cuts are prepared, wrapped and displayed.

<u>Assignment</u>:

1. Read the references below.
2. Answer the questions below and turn in this assignment by ______________________ .

<u>References</u>:

C. American Sheep Producers, <u>Lamb Cutting and Merchandising Manual</u>, Ch. 13.
D. NARGUS, <u>Self-Service Meats</u>, pp. 3-59, 109-112.

<u>Questions</u>:

True-False

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The idea of self-service meat departments has developed primarily because retail business men feel it is more profitable.

T F 2. Practices found successful for promoting the sale of meat products in one meat department will also be successful in any other meat department.

T F 3. Meat departments have found that the greater the volume of meat handled, the smaller will be the share of overhead to be added to each pound.

T F 4. The floor space needed for cutting and wrapping will be greater for a self-service meat department than for the service type.

T F 5. Self-service meat buyers tend to buy more in terms of the unit price of the cut rather than be concerned with the price per pound.

T F 6. The type of cuts to be wrapped should be the primary concern in arranging the equipment and materials in the self-service wrapping room.

T F 7. Although two medium sized wrapping tables are more desirable than one large wrapping table, one "central" set of tools and equipment is sufficient.

T F 8. Wrapping materials are available only in rolls.

T F 9. Special scales are available for pre-packaged meat work.

T F 10. Attaching a label, which contains the weight and price, to a pre-packaged meat product is done for the convenience of the customer rather than because of any regulations.

T F 11. Wrapping machines are presently adaptable primarily to cuts which are uniform in size and shape.

T F 12. The meat cutter should determine which side of a cut is to be visable to the customer before it is wrapped.

T F 13. If there is a choice the less attractive side of a cut should be visable to the customer.

T F 14. A self-service meat cutter will be most successful if he limits himself to only one method of preparing cuts from a carcass.

T F 15. Customers are usually reluctant to buy brand name meat products from the self-service display.

T F 16. Inventory control is more important in a self-service department than in the service type operation.

T F 17. Because taking inventory in the meat department is complicated, a new meat cutter will generally not be asked to assist.

T F 18. Plain cellophane is not moistureproof nor can it be heat sealed.

T F 19. Fresh meats should be wrapped in a material which will allow oxygen to enter and carbon dioxide to escape from the package.

T F 20. A retailer should stock a wide variety of wrapping paper widths.

T F 21. Both rolls and sheets of wrapping film are sold by the pound.

T F 22. Self-service meat retailing has promoted the development and improvement of backing boards.

T F 23. Backing boards which extend beyond the edge of the meat cut should be trimmed to fit the shape of the cut.

T F 24. Backing boards and trays are interchangeable terms for the same package wrapping accessory.

T F 25. Of the two types of labels used with self-service meat packaging the label which is placed on the outside of the package seems to have more advantages than the label placed inside the package.

T F 26. Since the customer's knowledge about meat cuts is limited, it is not necessary to place the name of the cut on the label.

T F 27. To the customer the price per pound is usually more important than the total price of the packaged cut.

T F 28. The space beneath the display area of a display case is wasted space in most models.

T F 29. One of the major problems created by lighting in the display case is the discoloration of meat.

T F 30. Considerable planning should be given to the placement of each facility within a cutting room.

T F 31. One of the major problems in meat retailing is the fact that most of the operating expenses must be met each week, regardless of the amount of meat sold.

T F 32. All self-service meat departments are required to code date the packages on display.

T F 33. Once the package has been code dated it will not be necessary to remove it from the display until the date has expired.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The first self-service systems developed in the departments selling ______________ and ______________ products.

2. Some retailers have found that during the last three days of the week they do ________ to ________ per cent of their total weekly volume.

3. Of the total dollar volume of a retail store, it is recommended that the meat department account for at least ________ per cent.

4. Heat-sealed packages should not be stacked immediately because the heat from the fresh seal will ______________ the meat in the package below.

5. The "hub" of the self-service meat department is the ______________ operation.

6. Pre-packaged meats wrapped with a transparent film are heat sealed by using a sealing ______________ or sealing ______________.

7. After a new shipment of carcasses have been weighed and stored in the cooler, the meat cutter should remove from them the parts which will ______________ fastest.

8. A tool which tends to splinter bones and therefore should not be used in the preparation of self-service cuts is the ______________.

9. The brightness of color that develops on the surface of meat cuts after exposure to air for several minutes is referred to as ______________.

10. A general rule to follow in determining the amount of meat supplies to be carried over the weekend is an inventory which costs no more than ________ per cent of the sales volume for the week.

11. Meat inventories may be taken weekly, monthly or quarterly, the most successful practice is on a ______________ basis.

12. Two terms used to describe a wrapping material which allows oxygen to enter the package and carbon dioxide to escape are ______________ or ______________ ______________ wraps.

13. The side of cellophane film which has been treated to preserve the bloom of fresh meat is placed next to the meat when wrapping; this side is referred to as the ______________ side.

14. Sheet wrapping film is generally sold in packages containing ________ sheets.

15. In addition to being clean in color, backing board materials must also be ________________ and ________________.

16. To be of value in sealing meat packages, transparent tape must be resistant to ________________ and have holding-power over a wide range of ________________.

17. It is suggested that an inventory of wrapping materials be taken ________________.

18. A portable self-contained display case is useful for promoting ________________ sales with other departments.

19. The most satisfactory lighting for the self-service display case is a soft ________________ fluorescent light.

20. The display case should be thoroughly cleaned at least once a ________________.

21. The sink should be out of the way, and because of being a focal point for heavy activity should have adequate ________________ for the various activities.

22. In addition to protecting the meat product, packages in the self-service must also ________________ the product.

23. When restocking a display case, the fresh packages should be placed at the ________________ or on the ________________.

24. Two systems may be used to code date packages in the display case: one code is the day the package was ________________ and the other the day the package should be ________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Which of the following is not an advantage of a self-service meat department over a service type department? (A) More customers can be handled at one time; (B) It is more flexible; (C) it is easier to operate; (D) It requires more concern about cutting and trimming.

_____ 2. Which of the following is not a factor contributing to the efficient operation of the cooler in a self-service meat department? (A) Walls, floors and equipment should be cleaned once a week; (B) Temperature and humidity should remain constant; (C) Responsibility should be assigned to one person; (D) Germicidal lamps are a necessity; (E) Meats should be arranged in a systematic way.

_____ 3. The elimination of sharp or protruding bones which will tear the wrapping is the responsibility of (A) the meat cutter preparing the cut; (B) the wrapper; (C) the head meat cutter; (D) the person in charge of the display case.

_____ 4. When self-service meat department personnel observe that a particular cut is not selling, they should (A) reduce the price to make it more attractive; (B) change the method of wrapping; (C) change the cutting method; (D) disguise it as a more popular cut.

_____ 5. It is generally agreed that the development of bloom should take place (A) before the cuts are made; (B) after the cuts are prepared but before wrapping; (C) after wrapping but before displaying; (D) while the packaged cuts are in the display case.

_____ 6. While bloom is taking place, the meat should be kept within a temperature range of (A) 20 to 25; (B) 34-38; (C) 42-45; (D) 58-63 degrees F.

_____ 7. In describing Pliofilm (a wrapping material) which one of the following qualities was not covered? (A) The surface to be placed next to the meat; (B) Its dimensional stability; (C) Methods used to seal; (D) Degree to which it is moisture proof.

_____ 8. Which of the following is <u>not</u> an advantage of sheet film wrapping over rolled film wrapping? (A) It speeds-up the wrapping operation; (B) Wrapping material costs are more easily controlled; (C) Less storage space is required; (D) There is less waste.

_____ 9. In addition to giving rigidity to the packaged meat the backing board also has the primary function of (A) hiding the less attractive side of the cut; (B) protecting the cut surface from light and air; (C) providing a surface on which to place the weight and price label; (D) providing a surface on which to heat-seal the film wrapping material.

_____ 10. Retailers generally agree that the self-service meat system has been successful because (A) there is greater profit per cut of meat; (B) it has appealed to customers; (C) it requires less sales personnel; (D) expanded advertising has increased the sales volume.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List some reasons why the temperature in the wrapping room should not fluctuate or be above 55 degrees F.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

2. A good wrapping material must meet the following qualifications. It must be:

(A) __________ (B) __________ (C) __________

3. Using the DuPont system of describing the qualities of their cellophane wrapping material, interpret designation "LSAC 450".

(A) "L" ____________________

(B) "S" ____________________

(C) "A" ____________________

(D) "C" ____________________

(E) "450" ____________________

4. Backing boards produced by laimination are so designed that each layer has a specific purpose. After the layers listed below, indicate their function.

(A) First sheet - ____________________

(B) Coating of adhesive - ____________________

(C) Next layer - ____________________

(D) Outer covering - ____________________

5. List the factors which should be considered when choosing the location of the meat display case in the store.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

6. List the equipment and supplies found in a self-service meat department; those which are unique to self-service.

(A) ____________________ (G) ____________________

(B) ____________________ (H) ____________________

(C) ____________________ (I) ____________________

(D) ____________________ (J) ____________________

(E) ____________________ (K) ____________________

(F) ____________________

7. List some things which might be done to increase the sale of slow moving cuts.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

Assignment
Sheet No. 6

Covering
Units 40-67

PREPARING RETAIL BEEF CUTS

Today's beef cattle usually belong to one of three breeds: the Shorthorn, the Hereford, the Aberdeen Angus. From these breeds of cattle come many classes and grades of beef with which the meat cutter must be familiar if he is to buy wisely and eliminate waste while satisfying the demands of customers.

In this unit you will learn the good points of a high-grade beef carcass, how wholesale cuts are prepared, and the best techniques in cutting beef for the retail trade. In addition you will learn basic preparation of the most popular cuts of beef.

Assignment:

1. Read the references listed below.
2. Read pages 65-86 of Reference A and, in outline form, list the steps involved in dressing the animal from the stunning process through the placing of the carcass in the cooler.

References:

A. Ziegler, The Meat We Eat, pp. 63-92, 330-344.
B. Bull, Meat for the Table, pp. 55-60, 67-93.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Most of the high-grade beef sold on the market today comes from beef steers which are one and one-half and two and one-half years old.

T F 2. A carcass of beef must be quartered before it can be handled for shipment.

T F 3. Dressed carcasses are not susceptible to foreign odors so other items may be stored in the cooler with the meat.

T F 4. The cuts from a side of beef are standardized across the United States.

T F 5. When three ribs are left on the hind quarter the side has been divided into two nearly equal parts.

T F 6. A right fore quarter is carried on your left shoulder and a left fore quarter is carried on your right shoulder.

T F 7. The style to be used in cutting will determine how the fore quarter is placed on the cutting block.

T F 8. There is no variation in the way the brisket in the fore quarter can be divided into retail cuts.

T F 9. The wholesale cut in the forequarter, known as the chuck, may be divided into retail cuts of both steaks and roasts.

T F 10. The wholesale rib cut will contain five to eight ribs.

T F 11. When placing the hind quarter on the cutting block the inside is placed up.

T F 12. The flank steak is a pear-shaped muscle removed from the outside of the flank.

T F 13. The most satisfactory method of cutting round steaks is to make them as one large slice from the round.

T F 14. Eye and bottom round cuts are of lower quality than the top round cuts.

T F 15. The heel of the round is very suitable as a pot roast.

T F 16. The rump cut is best divided into T-bone and club steaks.

T F 17. Since boning the rump is a simple operation, the beginning meat cutter will need little instruction.

T F 18. The various sirloin cuts get their name from the shape of the bone they contain.

T F 19. Steaks cut from the short loin are the least desirable of the loin cuts.

T F 20. Some people use the terms T-bone and porterhouse steaks interchangeably.

T F 21. The nutritional value of a beef cut will vary with the grade of the carcass.

T F 22. A carcass with good conformation will contain more meat and less bone than one with poor conformation.

T F 23. The fat in a cut of beef adds much to its flavor and tenderness.

T F 24. The quality of a beef carcass is concerned with the lean meat, the fat and the bones.

T F 25. The fat on high-grade beef will be spongy and white.

T F 26. To obtain the advantages of aging, low-grade beef should be aged considerably longer than prime or choice grades.

T F 27. The porterhouse steak is one of the most economical sources of lean meat in the hind quarter.

T F 28. Rib roasts should be cut to contain at least two ribs.

T F 29. Short plate and brisket cuts usually contain only a small smount of bone.

T F 30. The miscellaneous cuts - such as liver, tongue, sweetbreads, and oxtail - are of little nutritional value.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Yearling steers in the heavy-weight market class will weigh __________ pounds and up.
2. Prime grade cattle should give a dress yield of from __________ to __________ per cent.
3. The penetrating type compression stunner for cattle is to be aimed at the ____________ ____________.
4. When the kidney hangs away from the carcass, the side is known as the ____________ or ____________ side.
5. A quartered beef may also be referred to as being ____________.
6. When a side of beef is quartered, most cutters will leave __________ rib(s) on the hind quarter.
7. When the Chicago or National style of cutting is used the chuck rib and plate are the wholesale cuts found in the ____________ quarter.
8. The sixth rib in the rib cut is not desirable as a part of the standing rib roast because it contains a tip of the ____________ bone.
9. When carrying a hind quarter the shank should be to the ____________.
10. When removing the kidney from the hind quarter, care must be taken so as not to remove the ____________ next to the loin.
11. A one to two inch cut of top round is an excellant cut for ____________ steak.
12. Five or six wafer-thin slices cut from the round and then put together make a ____________ steak.
13. When dividing the loin into the two wholesale cuts the cut is made in front of and close to the ____________ bone.

14. Sirloin steaks are cut from the wholesale loin cut which contains the ______________ bone.

15. The steaks which are cut from the short loin but contain no tenderloin muscle are called ______________ steaks.

16. A high quality cut from a mature beef should be ________________ in color.

17. After being cut, beef will reach its maximum brightness in about __________ hour(s) time.

18. The storage of beef carcasses under less than freezing temperature for a period of one to two weeks for the purpose of improving the flavor is known as _____________ or _____________.

19.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The dressed yield of a heifer carcass will be slightly lower than for a like quality steer carcass mainly because (A) of the smaller bone structure; (B) of the larger bone structure; (C) of the greater amount of internal fat; (D) they are shorter but thicker.

_____ 2. In which section of the country are the methods of cutting beef the most standardized? (A) East; (B) South; (C) Midwest; (D) no difference throughout the country.

_____ 3. In the forequarter, the arm, shank, brisket, and short plate together make up the (A) chuck; (B) loin; (C) rattle; (D) flank.

_____ 4. A retail cut from the rib which has the back bone cut off and the rib sawed at the end of the rib eye muscle is known as a (A) club steak; (B) standing rib roast; (C) rib roll; (D) folded rib roast.

_____ 5. The eye muscle cut from the round is often mistakenly referred to as (A) chip steak; (B) cube steak; (C) New York cut; (D) tenderloin.

_____ 6. One of the disadvantages of using the bottom round muscle as a roast is that it is (A) dry; (B) fatty; (C) small; (D) better suited for chip steaks.

_____ 7. Porterhouse steaks are cut from the (A) round; (B) flank; (C) rump; (D) loin.

_____ 8. The finish of a beef carcass refers to the (A) number of wholesale cuts obtained; (B) quality of the skinning process; (C) the amount and distribution of fat; (D) the percentage of retail cuts obtained.

_____ 9. Which of the following is most descriptive of the bones of young beef? (A) flinty and white; (B) flinty and dark red; (C) porous and white; (D) porous and dark red.

_____ 10. According to Bull, one of the major advantages of using the New York style of cutting is that it (A) produces smaller cuts; (B) produces cuts preferred by commercial eating establishments; (C) reduces the amount of waste; (D) is faster and easier to utilize.

Listing

Directions: List the item called for in each of the following. Select your answers carefully.

1. List the eight grades of slaughter cattle in the correct order from the best to the poorest.

(A) ____________ (D) ____________ (G) ____________

(B) ____________ (E) ____________ (H) ____________

(C) ____________ (F) ____________

2. List the three methods or styles used in cutting beef.

(A) ____________________ (C) ____________________

(B) ____________________

3. List the five wholesale cuts in the hind quarter, excluding the kidney.

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________

4. What two advantages does Ziegler give for using the National style to remove the round from the rump and loin?

(A) ____

(B) ____

5. List the five classes of beef animals:

(A) ____________ (C) ____________ (E) ____________

(B) ____________ (D) ____________

Assignment
Sheet No. 7

Covering
Units 68-87

PREPARING RETAIL PORK CUTS

Pork is one of the most economical meats the retailer can provide the consumer. Because hogs are bred and raised for the sole purpose of meat, their quality and conformation will generally be uniform and high. In addition, several of the wholesale cuts can either be cured or sold fresh. This means that the retail meat-cutter must become familiar with the types of cuts from both cured and fresh pork if he is to provide his customers with the best service.

In this unit you will have the opportunity to learn the wholesale pork cuts and how they are prepared for retail sales. In addition you will learn some things which will broaden your knowledge about pork.

Assignment:

1. Read the references listed below.
2. Write a one or two page paper concerning the term Trichinosis, what it is, its relationship to pork and the value of this understanding for the retail meat cutter and the customer.
3. Answer the questions below and turn in this assignment by ________________________.

References:

A. Ziegler, The Meat We Eat, pp. 281-306.
B. Bull, Meat for the Table, pp. 94-95, 99-119.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is a desirable practice to leave a large portion of the jowl on the shoulder.

T F 2. The Boston style butt is a retail cut made from the shoulder.

T F 3. The Boston butt should have a minimum fat covering of 3/4 inches.

T F 4. Since the bacon from the belly is of little value as a sales commodity it can be sacrificed when separating the loin from the belly.

T F 5. "Short cut" pork loins are regular loins minus the blade bone.

T F 6. Buttons(nipples) on bacon are not an indication of high quality bacon.

T F 7. The percentage of lard rendered from rinded fat is greater than from unrinded fat.

T F 8. Retailers usually buy wholesale cuts of pork rather than the entire pork carcass.

T F 9. Hams are always cured or smoked rather than sold fresh.

T F 10. The butt or heavy half of a ham is less economical than is the shank half.

T F 11. A boneless ham will cost more per pound than a regular or skinned ham.

T F 12. Fresh picnics may be sliced to make pork steaks.

T F 13. The ends of the loin are better suited for roasts than for pork chops.

T F 14. The fat cuts of pork are frequently used to add flavor to other foods.

T F 15. Bacon is one of the cheapest pork cuts.

T F 16. "Hotel style" bacon is sliced thicker than bacon purchased by the housewife.

T F 17. Pork liver usually sells at a higher price per pound than does either beef or veal liver.

T F 18. Pork liver is a better source of iron for the diet than is either beef or veal liver.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Pork cuts which are cured, rendered into lard, or made into meat products before they are sold to the consumer make-up about ________ to ________ per cent of the carcass.

2. The jowl is frequently cured and smoked and then sold as jowl ________________ .

3. A California Picnic shoulder is sometimes incorrectly referred to as a Cala ________________ .

4. By trimming the spareribs lean, more of the belly is left for the making of ________________ .

5. The killing fat is used by some people for the making of ________________ .

6. When rendering lard the temperature should not be allowed to exceed _________ degrees F.

7. According to Bull, a pound of ham containing the bone will serve about _________ to __________ people.

8. An unskinned ham is generally referred to as a _________________ ham.

9. Picnics are cut from the lower part of the _________________ .

10. Pork chops are cut from the ________________ .

11. If they are to be fried, pork chops should be cut about ___________________ inch thick.

12. When the large muscle along the top of the loin has been rolled, cured, and smoked, it is sold as ____________________ bacon.

13. A pound of bacon is usually sliced to obtain about __________ to __________ slices.

14. The best grades of bacon will contain about ______ per cent fat.

15. Overlapping the slices of bacon so the lean appears more prominent when packaged is referred to as ________________ .

16. The better quality sausage will contain about ________ per cent lean and about _______ per cent fat pork.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the five grades of pork carcasses.

(A) ________________ (C) ________________ (E) ________________

(B) ________________ (D) ________________

2. List five retail cuts from a pork loin.

(A) __________________________ (D) __________________________

(B) __________________________ (E) __________________________

(C) __________________________

3. What type containers are recommended and what types are not recommended to be used for rendering lard?

Recommended	Not recommended
(A) ____________	(A) ____________
(B) ____________	(B) ____________
(C) ____________	

4. What things have the packing industry had to do to lard to make it acceptable as a shortening by the housewife?

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

5. Upon what quality is a shortening substance being evaluated when reference is made to its shortening value?

(A) ____________________

____

____

6. To what two factors does Bull credit the low degree of variation in pork tenderness and flavor as compared to other types of meat?

(A) ____________________

(B) ____________________

7. What pork cuts are commonly considered to be the lean cuts?

(A) __________ (D) __________ (F) __________

(B) __________ (E) __________ (G) __________

(C) __________

8. What pork cuts are commonly considered to be the fat cuts?

(A) __________ (B) __________ (C) __________

9. List the variety meats found in the pork carcass.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

(G) ____________________

Assignment
Sheet No. 8

Covering
Units 88-101

PREPARING RETAIL VEAL CUTS

Although veal is an economical meat product it is not too widely utilized because it is more profitable for the livestock producer to retain the animal and fatten it for sale as beef. The retail meat cutter, in order to be of greater service to his customers, should understand the difference between veal, calf, and beef: the cuts available and the general characteristics of the meat. Care must be taken not to confuse veal with calf as there are some definite differences.

In this unit you will have an opportunity to become familiar with the characteristics of veal and the wholesale and retail cuts from the carcass. The differences between veal and calf will also be pointed out.

Assignments:

1. Read the references below.
2. Answer the questions below and turn in this assignment by ______________________ .

References:

A. Ziegler, The Meat We Eat, pp. 351-356.
B. Bull, Meat for the Table, pp. 120-121, 124-141.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Because of the heavy fat coverage on a veal carcass it is necessary to age it longer than beef.

T F 2. There is no difference between veal and calf, they both refer to the same size animal.

T F 3. The grades assigned to veal and calf carcasses are the same.

T F 4. A veal carcass is usually cut into a fore and hind saddle rather than being quartered.

T F 5. Veal liver is a good retail sale item.

T F 6. The methods of cutting veal sides is very similar to the methods employed in cutting beef sides.

T F 7. The seasoning of mock chicken is done by the retail meat cutter before it is sold to the customer.

T F 8. The seasoning of veal loaf is done by the customer.

T F 9. A veal crown roast is best made from the smaller veal carcass.

T F 10. The loin veal chops correspond to the porterhouse and T-bone steaks of beef.

T F 11. As in beef, the veal tenderloin is usually removed and made into special cuts.

T F 12. The veal cutlet is the most expensive cut in the veal carcass.

T F 13. Most veal calves are of the beef breed variety.

T F 14. The fat on and in a high quality veal carcass will be milky white in color.

T F 15. The bones of a veal carcass can be identified by their white interior.

T F 16. Veal is an easy meat for the cook to prepare because of its natural high flavor and tenderness.

T F 17. Because of its qualities, veal should be cooked long and slow.

T F 18. Chops from lower grade carcasses should be cut thinner than those from the higher grade carcasses.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A medium weight veal carcass will weigh from __________ to __________ pounds.
2. A medium weight calf carcass will weigh from __________ to __________ pounds.
3. The part of the veal carcass which includes the anterior to the twelfth rib is known as the ______________ saddle.
4. The unsplit posterior portion of a veal carcass is known as the ______________ saddle.
5. The unsplit posterior portion of a veal carcass which includes nine ribs is known as a ______________ saddle.

6. One inch cubes of veal alternated with pieces of pork and secured with a skewer are known as ______________ chicken.

7. The breast is generally considered to be a part of the wholesale ________________ cut.

8. The weight of a four-rib shoulder, which includes the neck, shank, and breast, represents about ________ to ________ per cent of the veal carcass.

9. When one and one-half to two inches of the meat has been removed from the end of a rib chop the process is called _______________.

10. Sirloin veal cutlets are cut from the large or _______________ end of the loin.

11. Another term used for veal round steak is veal _______________ .

12. Veal cutlets to be breaded are normally cut about ______________ inch(es) thick.

13. Most young calves killed for veal are usually of ______________ breeding.

14. The approximate maximum age for killing calves for veal is from _________ to _______ weeks.

15. The veal cuts which are located immediately behind the loin chops and roasts are the ________________ ________________ ______________ ______________ .

16. Steaks are usually cut with a knife and a _____________ .

17. Chops cut from Good to Choice grade carcasses should be cut about ________________ to _____________ inch(es) in thickness.

18. As an edible meat product, the Thymus gland of veal is sold as _____________________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. Which of the following is not a grade of veal carcass? (A) Choice; (B) Standard; (C) Good; (D) Perfect; (E) Cull; (F) Prime.

______ 2. Veal loaf is the combination of ground veal and (A) beef; (B) lamb; (C) pork; (D) seasoning.

______ 3. The wholesale veal rib is divided into retail cuts of either (A) steaks and roasts; (B) stew meat or roasts; (C) chops or steaks; (D) roasts or chops.

______ 4. When slicing veal cutlets from the round the meat cutter should stop when (A) the cutlets are less than three inches across; (B) no bone remains in the cut; (C) the shank knuckle bone is reached; (D) the first vertebrae is reached.

______ 5. The lean meat of a high quality veal carcass can be identified by the following characteristics (A) bright red, watery, soft, and fine-grained; (B) light pink, watery, soft, and fine-grained; (C) dark red, dry, solid, and coarse-grained; (D) cream colored, watery, olid, and coarse-grained.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the wholesale cuts in a side of veal.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List the retail cuts found in a veal shoulder that includes the neck, shank, and breast.

(A) ______________________ (H) ______________________

(B) ______________________ (I) ______________________

(C) ______________________ (J) ______________________

(D) ______________________ (K) ______________________

(E) ______________________ (L) ______________________

(F) ______________________ (M) ______________________

(G) ______________________

3. List the retail cuts found in the leg or round and rump.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

Assignment
Sheet No. 9

Covering
Units 102-110

PREPARING RETAIL LAMB AND MUTTON

The changing eating habits and tastes of the American public have made it necessary for the successful meat cutter to adjust his business to meet these demands. Since 1940, the consumption of mutton has made up only a small part of the ovine meat diet. The general dislike for the taste of mutton has resulted in lamb being the dominant ovine meat. The public's demand for smaller meat cuts has also reduced the sale of mutton and increased the demand for lamb.

Although lamb and mutton sales may not be a large part of the retail sales, the preparation of cuts should be well understood by the meat cutter. Several of the lamb cuts command a high price and thereby attract a rather exclusive and quality trade. The meat cutter who unde stands the various lamb cuts will be a real asset to his employer.

In this unit you will have an opportunity to gain an understanding of the various lamb and mutton classes and grades, the types of wholesale and retail cuts, and the techniques to be used in preparing these cuts for the retail customer. The emphasis in the unit is on cuts from the lamb carcass but the mutton cuts are very similar. Your employer can probably point out any variations that may exist.

<u>Assignment:</u>

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

<u>References:</u>

A. Ziegler, <u>The Meat We Eat</u>, pp. 357-373.
B. Bull, <u>Meat for the Table</u>, pp. 143, 149-167.
C. American Sheep Producers, <u>Lamb Cutting and Merchandising Manual</u>, Chapters 2-10.

<u>Questions:</u>

True-False

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The lean meat of a young lamb will be light pink in color.

T F 2. Sheep which are over one and one-half years old are usually classed as mutton.

T F 3. The buck carcass produces the highest quality mutton.

T F 4. It is not possible to keep even a high grade lamb or mutton carcass for the purpose of aging or ripening.

T F 5. The Saratoga chop is a boneless shoulder cut.

T F 6. The retail cuts from a lamb back consists of either chops or roasts.

T F 7. According to Bull, lamb retail sales will vary considerably from season to season.

T F 8. A high grade loin lamb chop is one of the most expensive cuts of meat provided the customer.

T F 9. The best lamb roasts come from the leg.

T F 10. The American style leg of lamb roast is shorter in length than is the French style.

T F 11. The weight of the lamb carcass will determine the breaking method used to divide it into wholesale cuts.

T F 12. When a lamb saddle is split the resulting pieces are referred to as quarters.

T F 13. Tests have shown that when dividing a leg of lamb the preferred method is to cut straight across rather than at an angle.

T F 14. If the top portion of a divided leg sells better than the lower it is better to sacrifice the lower cut even if it doesn't sell.

T F 15. Calling the lower portion of a divided leg the "shank end," will probably increase its sale appeal.

T F 16. The removal of a sirloin roast or slices from the end of a leg is done primarily to reduce the size of the leg and make it more saleable.

T F 17. The steps to be used in rolling and tying a boneless leg have been standardized and should be followed closely.

T F 18. The loin is generally considered to be the ribless portion of the back.

T F 19. The general practice is to bone the loin and sell it as a boneless roast.

T F 20. It is recommended that the blade bone found in the rack always be removed.

T F 21. To increase the profit from rib chops it is suggested that they be mixed with loin chops.

T F 22. The preferred method of cooking lamb chops is to broil them.

T F 23. It is suggested that the size of a shoulder roast be determined on the basis of the price per package rather than on specified weight.

T F 24. The method used to remove the neck will depend upon the shape and size of the shoulder desired.

T F 25. The size of the breast of lamb will be determined by the type of saddle from which it is taken.

T F 26. Riblets cut from heavy carcasses will always contain a higher proportion of fat than those cut from smaller carcasses.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Hot house lambs are those born during the months of ____________ through ______________ .
2. The most desirable weight for a lamb carcass is between _______ and ________ pounds.
3. Yearling sheep carcasses will weigh approximately _______ pounds.
4. The higher grade loin chops should be cut about _______ inch(es) thick.
5. A double loin chop cut from an unsplit loin is known as a(an) _________________ chop.
6. Sirloin roasts are difficult to carve because they contain a large amount of ________________ .
7. The process of cutting a lamb carcass into wholesale cuts is referred to as _________________ .
8. To obtain a fore and hind saddle of approximately the same weights, the lamb carcass should be cut to leave ________ rib(s) on the hind.
9. When a packer removes the shanks, breast, and flanks from a lamb carcass the portion remaining is referred to as a _______________ or _________________ carcass.
10. The flavor of a lean, boneless, rolled leg can be improved by adding some ______________ in the roll.

11. In addition to making a roast, the boneless leg can be sliced for ____________ .

12. If properly wrapped and low temperatures maintained lamb can be kept in the food-freezer for as long as _______ months.

13. One of the first things to be done before cutting the rack into retail cuts is to remove the thin parchment-like membrane known as the ____________ .

14. When cutting chops from the rack the recommended procedure is to follow the contour of the ____________ .

15. When preparing the rack as a roast, the meat cutter should always remove the ____________ and ____________ bones.

16. If a Crown Roast of lamb has not been sold the day it was prepared, it should be removed from the display and sliced into ______________ .

17. Two highly perishable parts of the lamb carcass are the ____________ and the ____________, and they should be merchandised as soon as possible.

18. Because of the danger of losing a good customer, it is better to take a ___________ than sell him poor quality meat.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Lamb carcasses are shipped hog-dressed for the following purposes (A) to keep the carcass from absorbing outside odors; (B) to reduce the chances of bruising the meat; (C) to increase the weight and value of the carcass; (D) to preserve bloom and reduce shrinkage.

_____ 2. Sirloin chops are cut from the (A) ribs; (B) leg; (C) shank; (D) flank.

_____ 3. Sirloin roasts are cut from the (A) loin; (B) leg; (C) shank; (D) flank.

_____ 4. When the legs are removed from the carcass the remaining portion is referred to as a (A) trunk; (B) long hind-saddle; (C) triangle; (D) streamlined carcass.

_____ 5. A cleaver should never be used to remove the bone from a sirloin slice because (A) it may splinter the bone; (B) it leaves a ragged meat edge; (C) too much meat is removed with the bone; (D) the small size of the slice makes it a dangerous operation.

______ 6. When cutting chops from the rack it is most important that the meat cutter (A) remove all of the fat from the lean; (B) remove the bone; (C) make each chop uniform in thickness; (D) include one rib in each chop.

______ 7. When rolling a shoulder, or other cut, the good meat cutter strives to make the roll in such a way that (A) there is a good coverage of fat on all outside surfaces; (B) the ends have good eye appeal without being faced; (C) the fat on the inside is not visable; (D) no bones protrude that might tear the wrapping.

______ 8. The shank and breast meat is usually removed before making the shoulder roll because (A) they contain excessive amounts of fat; (B) they can be sold for higher prices; (C) they make the roast too large; (D) they make the roast difficult to carve.

______ 9. When it becomes necessary to slice a shoulder roll, the meat cutter should start from the leaner end because (A) it is easier to slice than the neck end; (B) the lack of fat causes greater shrinkage; (C) it can be sold at a greater profit; (D) the method used for tying makes it necessary.

______ 10. The most common cause of juice seepage from rolled shoulders is (A) excess fat on the inside of the roll; (B) tying the strings too loosely; (C) failure to keep the meat at the proper refrigerated temperature; (D) keeping the meat in the display case for an excessive period of time.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the five grades of spring lamb.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

2. List the retail cuts found in a wholesale lamb shoulder cut that also contains the shank and breast.

(A) ______________________ (I) ______________________

(B) ______________________ (J) ______________________

(C) ______________________ (K) ______________________

(D) ______________________ (L) ______________________

(E) ______________________ (M) ______________________

(F) ______________________ (N) ______________________

(G) ______________________ (O) ______________________

(H) ______________________ (P) ______________________

3. List the four methods or styles of cutting the retail leg of lamb.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. List the variety meats available in the lamb carcass.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

5. In reference to the process of breaking a lamb carcass into wholesale and retail cuts, the meat cutter should be aware of the two general observations made by the Lamb Division of the American Sheep Producers Council. These are:

(A) ____

(B) ____

6. When the meat cutter breaks the lamb carcass by removing the shoulders, breasts and foreshanks as one piece, the result is known by different names. These are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

7. List the steps for removing the legs from the lamb carcass.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

8. The amount of meat to be left covering the sirloin bone when removing the leg will follow one of three general practices. These are:

(A) ______________________________

(B) ______________________________

____

(C) ______________________________

9. The sirloin slices removed from the end of a leg of lamb are known by various names throughout the country. List the more popular names for these slices.

(A) ______________

(B) ______________

(C) ______________

(D) ______________

(E) ______________

(F) ______________

(G) ______________

(H) ______________

10. List the advantages of a boneless leg as a sales item for the home food-freezer trade.

(A) ______________________________

(B) ______________________________

(C) ______________________________

11. The lamb shoulder yields a variety of retail cuts. List the common types of cuts from a lamb shoulder.

(A) ______________

(B) ______________

(C) ______________

(D) ______________

12. List the various causes for the excessive seepage of juices from a rolled shoulder.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

Assignment
Sheet No. 10

Covering
Units 111-117

PREPARING POULTRY FOR THE RETAIL MARKET

Poultry is generally considered to include all domestic birds which have been grown for either eating purposes, egg supply or exhibition. The most common of these birds, used for meat purposes, include chickens, turkeys, ducks, geese, and guineas. Of these various types of poultry used for meat consumption, chicken is by far the most popular.

When buying poultry to be used for retail sale the meat cutter must consider four factors which will affect the price and the method used to prepare the cuts. These are: (1) the kind or breed; (2) the class; (3) the grade; and (4) the market style of processing.

In this unit you will have an opportunity to become familiar with the grades and classes of dressed poultry and the various methods used to process the poultry for retail sale.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

References:

A. Ziegler, The Meat We Eat, pp. 203-226
D. NARGUS, Self-Service Meats, pp. 103-108.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Broiler chickens are smaller than fryers.

T F 2. The use of poultry for meat depends to a great extant upon the breed.

T F 3. When the turkey's skin becomes bluish in color it is ready to be taken off feed and processed as a meat product.

T F 4. The most widely used and approved method of bleeding poultry is to cut the throat inside the bird's mouth.

T F 5. The use of the debraining method to kill the bird makes dry picking easier.

T F 6. Dry picking is the most widely used method of removing the feathers from the bird.

T F 7. A blood or feather dressed carcass contains all of the inner organs or entrails.

T F 8. Special sanitized cord is used to truss up the dressed bird.

T F 9. The average family finds the hen turkeys better suited for roasting than tom turkeys.

T F 10. The practice of quartering or halving a large turkey is not recommended under any circumstances.

T F 11. It is very difficult to dry pick waterfowl.

T F 12. The process of dressing guineas is very similar to that used for dressing chickens.

T F 13. The weights of dressed guinea and pheasant carcasses will be very similar.

T F 14. In order to be assigned a U. S. Grade and tagged, a turkey carcass must have an internal temperature of at least 36° F.

T F 15. Turkey carcasses which show bad effects from being frozen can not be graded higher than Grade A.

T F 16. The sale of large tom turkeys to the housewife may be increased by dividing and selling the carcass as individual pieces.

T F 17. Boned and rolled turkey roasts are tied in a manner similar to a boneless cut of beef or pork.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. All poultry products moved in interstate or foreign commerce, or in major consuming areas, have been Federally inspected since the passage of legislation in the year _______ .
2. Chicken fryers will weigh from _________ to __________ pounds.
3. Heavy capons will weigh over _________ pounds.
4. Green ducks and geese are about _______ months old.
5. Chickens should be kept off feed from ________ to ________ hours before killing.

6. An instrument used to sever heads, necks or shanks is known as a ____________ shears.

7. One of the most successful methods used to remove pin feathers, hair, and scale from the carcass is __________ picking.

8. To remove the entrails from a broiler, the meat cutter may make the first cut on either side of the ____________ bone.

9. The greatest sale of tom turkeys for roasting is to the ________ and _____________ trade.

10. Because of the tight feather cover on waterfowl, the recommended process for removing the feathers is to ___________ them.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. One of the primary reasons that the prices and demands for poultry remain rather steady throughout the year is (A) the greater number of farmers raising poultry for meat sale; (B) the successful use of freezer storage; (C) improved methods of dressing poultry; (D) the public acceptance of poultry as a meat product.

_____ 2. A poultry carcass with a high blood content may result from (A) the type of feed provided; (B) the withholding of water for a day or longer prior to slaughter; (C) allowing the bird to become over-heated prior to slaughter; (D) the method used to kill the bird.

_____ 3. Hot scalding to remove feathers is not used on birds to be sold because (A) it is a slow, expensive process; (B) the feathers can not be reclaimed for sale as a by-product; (C) it destroys the natural bloom of the carcass; (D) all of the preceding.

_____ 4. The method now used rather universally in large poultry packing plants for removing the feathers from the birds is (A) dry picking; (B) hard scalding; (C) hot scalding; (D) slack scalding.

_____ 5. One of the meatiest birds, in terms of the ratio of meat to bones, used for human consumption is the (A) chicken; (B) turkey; (C) duck; (D) guinea; (E) pheasant.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the various classes of chickens.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

(H) ______________________

(I) ______________________

(J) ______________________

(K) ______________________

(L) ______________________

(M) ______________________

2. List the various classes of turkeys.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

3. List the various classes of ducks and geese.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

4. Beginning with the step after rough picking, list the steps in the wax picking process.

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

5. List the steps to be followed in preparing a full dressed carcass.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

(G) ____________________

6. List the individual parts of a cut-up chicken in the order of their monetary value.

(A) ____________ (C) ____________ (E) ____________

(B) ____________ (D) ____________ (F) ____________

7. List in order, highest first, the U. S. Standard Grades for chickens and turkeys.

(A) ________ (B) ________ (C) ________ (D) ________

Assignment
Sheet No. 11

Covering
Units 118-133

PREPARING FISH AND SHELLFISH

Fish and shellfish are delicately flavored, have high food value and are adaptable to a variety of cooking methods. They are available fresh, frozen, and in some cases, cured. The fresh products can be displayed attractively in refrigerated cabinets with ice. The frozen products must be displayed and maintained in a frozen condition.

These meats are highly perishable and so need very careful handling from the time they are caught until they are prepared for eating by the customer. The first principle in the fish section is freshness and this calls for frequent inspection and close quality control.

Although the retail meat cutter may have few opportunities to process fish products for sale, he should be familiar with the techniques.

Customers are probably less familiar with cooking methods for fish than they are of other meats. This is probably more true of interior areas than coastal. In either case the retail meat cutter should become as much of an expert on fish cookery as he is of other meats. Being able to answer customer's questions makes sales and repeat sales.

In this unit you will have an opportunity to become familiar with some of the techniques of dressing and cutting fish, the market forms of fish and shellfish, their food values, handling methods, and cooking procedures.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ______________________ .

I. Information Sheet No. 2

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The proteins found in fish are not easily digested.

T F 2. The mineral content of fish is similar to that of beef.

T F 3. A pound of salmon will contain the same amount of carbohydrates as does a pound of beef or poultry.

T F 4. Salmon is a better source of Vitamin A than is beef.

T F 5. Drawn and whole fish may be cooked with or without the head, tail, and fins being removed.

T F 6. The cut for a fillet is made perpendicular with the backbone.

T F 7. The butterfly fillet is more common in the retail market than is the single fillet.

T F 8. Fish sticks may be made by cutting either parallel or perpendicular to the backbone.

T F 9. Lake trout and catfish are both classified as fat fish.

T F 10. The main market area for yellow perch includes only the states bordering the Great Lakes.

T F 11. Shellfish are classified as lean fish.

T F 12. Fresh fish of most varieties are abundant throughout the year.

T F 13. The gills of fresh fish will be bluish-green in color.

T F 14. If the retail meat department receives a shipment of frozen fish which has thawed during shipment, it should be refrozen immediately.

T F 15. Frozen fish must always be thawed before being placed in the container for cooking.

T F 16. Scaling of fish is more easily done if the fish is wet.

T F 17. When filleting, the rib bones are removed with the fillet.

T F 18. When skinning a fillet, the fillet is placed on the cutting board with the skin side down.

T F 19. Both fat and lean fish are considered suitable for frying.

T F 20. The oxidation of fish can be retarded by sealing the meat from contact with the air.

T F 21. The action of enzymes on fish products can be controlled by sanitary handling practices and low storage temperatures.

T F 22. Finely crushed ice is better for packing fresh fish than large pieces of ice.

T F 23. The ice glazing on some frozen fish products is done by dipping the product into cold water <u>after</u> it has been frozen.

T F 24. Frozen fish are inferior to fresh fish in both flavor and food value.

T F 25. A strong fishy odor is characteristic of top quality frozen fish.

T F 26. The larger the shrimp the higher will be its selling price per pound.

T F 27. The size of the oyster will determine the quality but not the selling price.

T F 28. Lobster meat will have a clear whitish color.

T F 29. Fresh shellfish can be kept at room temperature for several hours without affecting its quality or wholesomeness.

T F 30. Thawing procedures for frozen shellfish are the same as for frozen fish.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. There are approximately __________ varieties of fish sold in the United States, but the average consumer is familiar with only about __________ different species.

2. A pound of canned salmon will contain about _________ calories.

3. By weight, the fat content of fish will vary from __________ to ____________ per cent.

4. Before the whole or round fish can be cooked it must be ______________ and __________________ .

5. Fish steaks may be cut from the larger sizes of ________________ fish.

6. The largest bone in a fish steak will probably be a cross section of the ______________ bone.

7. Fish sticks are cut from either ______________ or _______________ portions of the fish.

8. The market range of round haddock is from __________ to _________ pounds.

9. The main market area for shrimp is the __________ __________ __________ .

10. The average edible serving of fish per person will be about __________ to __________ pound.

11. The preferred method of thawing frozen fish is in an atmosphere ranging from ________ to ________ degrees F.

12. One of the most frequent causes of fish cooking failures is __________ .

13. After fried or deep fat fried fish have been cooked, they should be allowed to drain by placing them on __________ paper.

14. When properly cooked, the flesh of fish will __________ easily when tested with a fork.

15. If the quality and wholesomeness of either fresh or frozen fish is to be maintained it must be kept under constant __________ .

16. The preferred temperature for preserving the wholesomeness of fresh fish is ________ to ________ degrees F.

17. Frozen fish products placed in storage without a moisture-vapor-proof covering will deteriorate because of a gradual loss of __________.

18. If purchased in the shell, the shellfish must be __________ or the meat must be __________ in the shell.

19. Shellfish marketed as cooked meat is ________ per cent edible.

20. When cooked, the shells and meat of shrimp will turn a __________ tint.

21. Shucked oysters will be __________ in color and have a __________ liquid.

22. High quality, wholesome oysters will have a pH factor of ______ .

23. When cooked in the shell, crabs and lobsters will be __________ __________ in color.

24. Thawed frozen scallops and fresh scallops will have a __________ odor.

25. The most common crab specie on the market is the __________ crab.

26. Fresh shellfish should be stored in a temperature near ________ degrees F.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. The mineral needed by the body and which is found in greater amounts in fish than in beef is (A) iron; (B) copper; (C) magnesium; (D) iodine.

______ 2. An average serving of salmon or mackeral will supply the body with the daily requirement of Vitamin (A) A; (B) B; (C) C; (D) D.

______ 3. Fish marketed with only the entrials removed are known as (A) shucked; (B) dressed; (C) drawn; (D) carcass; fish.

______ 4. Fins should never be removed by cutting or shearing them flush with the skin surface because (A) the root bones are left in the meat; (B) excessive bleeding will occur; (C) the bones are very hard and will dull the blade; (D) it is difficult to do a smooth job.

______ 5. When filleting, the first cut is made from (A) the tail to the head and along the belly; (B) the tail to the head and along the backbone; (C) from the head to the tail and along the belly; (D) from the head to the tail and along the backbone.

______ 6. Which one of the following is not a preferred method of cooking fat fish? (A) planking; (B) steaming; (C) baking; (D) broiling.

______ 7. The result of oxidation can be detected on fish by the appearance of (A) fungus growth; (B) greenish mold growth; (C) yellow discoloration; (D) a shrunken, dried-out surface.

______ 8. The best preservative for fresh fish is (A) salt; (B) ice; (C) sugar; (D) warm water.

______ 9. Top quality frozen round or dressed fish are usually protected from the air by being covered with (A) salt; (B) moisture-vapor-proof wrapping film; (C) a glaze of ice; (D) heavy waxed paper.

______ 10. When the shellfish meat has been removed from the shell and marketed in this form, it is referred to as being (A) drawn; (B) headless; (C) dressed; (D) shucked.

______ 11. The edible portion of shrimp is its (A) tail; (B) legs; (C) claws; (D) head.

______ 12. "Green shrimp" refers to (A) any uncooked shrimp; (B) the color of the shell; (C) the wrapping material used; (D) very small young shrimp.

______ 13. When a live lobster is picked up, the tail will (A) curl over the top of the body; (B) curl under the body; (C) hang down from the body; (D) extend straight up from the body.

______ 14. Soft crabs are (A) king; (B) rock; (C) dungeness; (D) blue; crabs which have lost their hard shell.

______ 15. Scallop meat consists of (A) the legs; (B) the back muscle; (C) the muscle that closes the shell; (D) the muscle of the claw.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The best known market forms of fish are:

(A) ______________ (E) ______________

(B) ______________ (F) ______________

(C) ______________ (G) ______________

(D) ______________

2. List the species of fish included in the shellfish group.

(A) __________ (C) __________ (E) __________

(B) __________ (D) __________ (F) __________

3. List the amount of fish required for the following market forms to yield one average serving.

whole-- (A) __________

dressed-- (B) __________

sticks-- (C) __________

fillets-- (D) __________

steaks-- (E) __________

4. List the steps involved after scaling to prepare a dressed fish.

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________

5. List the three main causes for the breakdown in quality of fishery products.

(A) ______________________ (C) ______________________

(B) ______________________

6. List two methods used to retard the action of oxidation.

(A) ____

(B) ____

7. The market forms for shellfish include:

(A) ______________ (C) ______________ (E) ______________

(B) ______________ (D) ______________

8. List the four species of crabs on the market and the general areas from which they are obtained.

FRESH AND FROZEN FISH*

Fish, being a perishable commodity, should be kept under refrigeration at all times. Only in this way can the quality of fresh or frozen fish be maintained. The three primary causes of breakdown in quality of fishery products are (1) bacterial action, (2) oxidation of the oil or fat in the flesh, and (3) enzymic action in the flesh.

Bacterial action contaminates fishery products when there is poor sanitation in handling and high temperature after the fish have been removed from the water. It is almost entirely arrested when fish are frozen and stored at very low temperatures. It can be considered practically eliminated as long as the fish are kept in this condition.

Oxidation of the oil or fat can cause spoilage of frozen fish even in cold-storage rooms of low temperature. Oxidation is indicated by a yellow discoloration on the surface of the skin or on the flesh in areas exposed to the air. This action is greatly retarded when the fish are properly glazed with a thin coating of ice, or are covered with any of several moisture-vapor-proof wrappings available.

Enzymes responsible for the third type of spoilage are substances in the flesh which build up and tear down the body tissues during the normal life processes. These reactions are common to all forms of animal life and are automatically controlled as long as life is maintained. Although the temperature at which fish are stored has a definite effect on the speed of the digestive reaction of the enzymes after death, the enzymic action cannot be stopped completely during handling and storage. Under good storage conditions, however, the action has no important effect on quality.

Handling and Storing Fresh Fish

Fresh fish should be kept constantly below 40 degrees F., and preferably at 31 or 32 degrees F. to insure maximum storage life. Ice is the best preservative yet devised for keeping fresh fish, since it not only holds the temperature but also keeps the surface of the fish moist and in good condition.

Shipments of fresh fish should be examined immediately upon receipt for signs of spoilage and body damage. They should be packed in ice for delivery, and should be well iced when received. Finely

---

*Adapted with permission from Fresh and Frozen Fish Buying Manual, Circular No. 20, United States Department of the Interior, Superintendent of Documents, U. S. Government Printing Office, Washington 25, D.C.

crushed ice is preferable to large pieces, as it does not bruise the fish. Fish packed in orderly arrangement hold their natural shape longer and better. Rough handling should be avoided, since bruises and punctures of the flesh induce and hasten breakdown in quality.

Handling and Storing Frozen Fish

Frozen fish should be kept solidly frozen until ready for use. Do not refreeze fish that have been thawed. Maximum storage life can be obtained by maintaining a temperature of zero degrees F., or below, and by providing adequate moisture-vapor-proof wrapping or glazing. In commercial practice, frozen whole fish, and sometimes dressed fish, are coated with a layer of ice by dipping in cold water after freezing. If fish are placed directly in the refrigerated space without suitable protective treatment, undesirable changes will take place during cold storage: a gradual loss of moisture will occur until the fish are shrunken and dried; this dehydration not only causes an unsightly appearance and alteration in texture, but also results in loss in weight and flavor.

Buying Frozen Fish

Frozen varieties are usually packed during seasons of abundance at reasonable prices, and now are available the year around in practically all sections of the country. Since frozen fish are the equal of fresh fish in appearance, flavor, and food value, the two forms may be used interchangeably.

Frozen fish of good quality have the following characteristics:

1. Flesh: Should be solidly frozen when bought. Virtually all deterioration in quality is prevented when fish is properly held in the frozen state. Unless care is taken, frozen fish thawed and refrozen is poorer in quality. There should be no discoloration, or brownish tinge in the flesh.
2. Odor: Frozen fish should have little or no odor. A strong fishy odor means poor quality.
3. Wrapping: Most frozen fillets and steaks are wrapped either individually or in packages of various weights. The wrapping should be of moisture-vapor-proof material. There should be little or no air space between the fish and the wrapping.
4. Glazing: Whole fish frozen in the round or dressed forms are usually not wrapped, but covered with a glaze of ice to protect them from drying out, or from "freezer burn." This glaze should be on these forms of frozen fish when bought.

Buying Shellfish

Shellfish are marketed in many different forms. Some are marketed alive, and other forms, depending on the variety, include cooked whole in the shell, fresh meat(shucked), headless, and cooked meat.

In shell: Shellfish, such as hard and soft blue crabs, lobsters, clams, and oysters should be alive if bought fresh in the shell. Crabs and lobsters may also be cooked in the shell.

Shucked: Clam, oyster, and scallop meats may be bought free of the shell, commonly known as shucked. In this form the portion is 100 per cent edible.

Headless: Only the tail part of shrimp is commonly marketed. Spiny-lobster tails are also a common market form. About 85 per cent is edible.

Cooked meat: The edible portion is picked from the cooked shellfish, and crab, shrimp, and lobster meat is marketed in this way. Cooked meat is perishable, although packaged in containers, since it is not further processed by heat. It is 100 per cent edible.

Market forms of some of the most important species are described here.

<u>Shrimp</u>: Shrimp is sold in the following forms:

1. Fresh, whole (heads on).
2. Fresh or frozen, headless, but with shells on.
3. Fresh or frozen cooked, generally peeled (shells removed) and cleaned.
4. Frozen, breaded with a coating of crumbs or cornmeal after being peeled and cleaned.

Fresh shrimp have a mild odor, and the meat is firm in texture. The color of the shell may be grayish green, pinkish tan, or light pink. When cooked, the shells turn red, and the meat takes on a similar attractive reddish tint, with possibly some dark-red spots. When shrimp are sold as "green shrimp," this does not refer to the color or species, but is a term used in the trade to describe shrimp that have not been cooked. Shrimp are usually sold on a size basis, with the larger sizes bringing the higher prices.

<u>Clams and Oysters</u> -- Clams and oysters in the shell should be alive--the shells should close tight when tapped gently.

Shucked oysters should be plump and should have a natural creamy color and clear liquid. If in the original package or can, there should be not more than 10 per cent of liquid (by weight). Oysters with an excess amount of liquor should be avoided, as this indicates that they have been improperly handled. Excessive water results in bloating of the oyster meat, and partial loss of flavor and food value. For purchasers who use a chemical test for freshness, the pH should be at least 6.0.

Oysters are sold on a size basis. The price differential between the various sizes does not reflect their quality. The sizes generally adopted by dealers conform to the Government classifications and specifications.

Crabs and Lobsters -- When bought alive, crabs, lobsters, and spiny lobsters should show movement of the legs. The "tail" of live lobsters curls under the body and does not hang down when the lobster is picked up.

Spiny-lobster or rock-lobster tails, forzen, should have meat of clear whitish color. There are several kinds on the market. Those from Florida, Cuba, and the Bahamas have a smooth, brownish-green shell, with white spots; those from South Africa, Australia, and New Zealand have a rough shell with the color varying from dark maroon to brown; those from Southern California and the west coast of Mexico are smooth and yellow green. As is true with other frozen fish and shellfish, frozen lobster tails should be hard-frozen when bought and should have no odor.

Crabs and lobsters, cooked, should be bright red and should have no disagreeable odor. By lifting slightly the lid under the body section of crabs it is possible to smell any strong, disagreeable odor very easily.

Crab meat, cooked, is marketed from four varieties of crabs:

1. Blue crabs: The meat from blue crabs is packed as--
   Lump meat--whole lumps of white meat from the large body muscles that operate the swimming legs.
   Flake meat--small pieces of white meat from the body.
   Flake and lump--a combination of the first two kinds.
   Claw meat--brownish-tinted meat from the claws.

The blue crab is found along the Atlantic and Gulf Coasts and accounts for about three-fourths of all crabs marketed in the United States.

2. Rock crabs: Crab meat from the New England rock crab is marketed in only one grade, and is brownish in color.
3. Dungeness crabs: Crab meat from the Dungeness crabs of the Pacific coast includes that from both the body and the claws. The claw, or leg, meat is reddish; the body meat is white.
4. King crabs: Crab meat from the king crabs of Alaska is taken mostly from the legs, then frozen and packed. The entire leg sections, cooked and frozen, are also marketed.

Soft crabs are Atlantic-coast blue crabs that have shed their old, hard shells. They should be alive when bought fresh. They are also obtainable frozen.

Scallops -- Scallop meats consist of only the muscle that closes the shell of the sea scallop or the bay scallop. The meat of the large sea scallop is white; the meat of the smaller bay scallop is creamy white, light tan, or pinkish. Fresh scallops, and frozen scallops when thawed, should have a sweetish odor. When bought in packages, they should be practically free of liquid.

Handling and Storing Shellfish

When storing fresh shellfish, the temperature should be maintained near 32 degrees F. A few degrees higher can cause a considerable loss in quality in a few hours. Shellfish meats, either fresh or cooked, should not be exposed to bacterial contamination.

Frozen shellfish should receive the same care as that given frozen fish. Thawing methods for frozen shellfish are the same as those for frozen fish.

Assignment
Sheet No. 12

Covering
Units 134-138

PREPARING GROUND AND READY-TO-SERVE MEATS

One of the first responsibilities a new meat cutter may be given in the meat department is to grind or slice meat products, wrap them, and stock the self-service display. Being knowledgeable about the processes, types of sausages, and care of these products will get the new meat cutter off to a good start with his employer.

The ground and ready-to-serve meats are an important part of the profits in the meat department. The extent of this profit will depend in part upon the meat cutters understanding of the products, his observation of customer needs, and suggestions he may make to increase these profits.

In this unit you will have an opportunity to gain some background information on the development of sausages, learn about the various types of sausage products and their composition, and become acquainted with some techniques for preparing and displaying these meat products.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ____________________.

References:

A. Ziegler, The Meat We Eat, pp. 307-329.
B. Bull, Meat for the Table, pp. 178-183.
C. American Sheep Producers, Lamb Cutting and Merchandising Manual, Chapter 11.
D. NARGUS, Self-Service Meats, pp. 96-102.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Cold cuts or luncheon meats are not considered to be sausage.

T F 2. The processing of meats into sausages has been developed within recent years.

T F 3. The Federal government does not permit the use of harmless dyes for the coloring of sausage casings.

T F 4. Casings used for sausages are classified as either natural or artificial.

T F 5. According to Bull, the most popular type of fresh sausage is hamburger.

T F 6. Weiners must be cooked before they are eaten.

T F 7. Dry sausages have very poor keeping qualities.

T F 8. All meat loaves are cooked during the process of manufacture.

T F 9. Summer sausage (Wisconsin style) is predominatily beef which has been cooked but not smoked.

T F 10. Country style, fresh pork sausage is an all-pork product.

T F 11. Natural casings for sausages may be made from the small and large intestines of hogs, sheep, and cattle.

T F 12. When beef and pork are to be combined into a sausage product, they should be ground separately.

T F 13. The terms "frankfurters" and "weiners" refer to the same type of meat product.

T F 14. Scrapple is a combination of various meats, cereals and seasoning.

T F 15. In most cases, dry and semi-dry sausages must be cooked before being eaten.

T F 16. Semi-dry sausages should be stored in a humid place with an even temperature below 50 degrees F.

T F 17. Caserta Peperoni is a fancy sausage originating in Italy.

T F 18. Nearly all salami sausages contain garlic.

T F 19. There are over twenty different varieties of salami on the market.

T F 20. Tripe is made only from the stomachs of cattle.

T F 21. Chitterlings are the cleaned and cooked intestines of swine.

T F 22. Head cheese, liver pudding, and blood pudding are considered to be sausage.

T F 23. Because of the cost of lamb cuts, the meat used for ground lamb should come from those cuts which have not sold and have lost their fresh appearance.

T F 24. Grinding lamb a second time will make it more tender and improve its appearance.

T F 25. Ground lamb sells best when made into one pound packages.

T F 26. Ground lamb for meat loaves will sell best during cool weather.

T F 27. It is not advisable to display two grades of ground lamb because only the cheaper grade will sell.

T F 28. When used alone, the breasts are the best source of meat for ground lamb.

T F 29. The presence of some fat in ground lamb will improve its flavor and greatly reduce shrinkage when cooked.

T F 30. Semi-moisture proof film should be used for wrapping ready-to-serve meats.

T F 31. It is a good practice to wrap ready-to-serve meats in packages containing various numbers of slices.

T F 32. When not on display, packaged luncheon meats should be stored in a dark place or covered with an opaque material.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The meat industry considers sausage to be any ______________ or ____________________ meat.
2. The Latin word "salsus", from which the term sausage is derived, means ________________ .
3. The German term for sausage is _______________ .
4. Cereal and flour, which are added to sausages, are added for _________________ or holding purposes.
5. Crackers may be added to the sausage mixture in the process of manufacture to hold the mixture together, improve the ________________, and absorb ________________ .
6. When a part of the digestive tract from hogs, cattle or sheep is used as casings for sausages, the casing is classified as __________________ .
7. The type of casing which is not edible and must be removed from the sausage is known as __________________ .
8. The most popular cooked sausage is the ____________________ .

9. Another term sometimes used to designate dry sausages is ________________ sausages.

10. Sausages prepared according to the rules and regulations of the Jewish faith are referred to as _______________ sausages.

11. The consumption of sausage in the United States constitutes about one out of every _________ pounds of meat produced.

12. In the production of luncheon meats the product may or may not be smoked but it will always be ______________ .

13. A 200-pound, dressed hog carcass which is ground into sausage will yield about _____________ pounds of sausage, ___________ pounds of fat and _____________ pounds of bone.

14. Shaved ice is added to the sausage mixture in the silent cutter for the purposes of adding moisture and reducing ______________ .

15. The original wiener was made from a combination of ___________ and pork.

16. The major meat item found in braunschweiger is pork ____________.

17. Cervalet is the name of a semi-dry sausage originating in the country of ______________ .

18. Salami is characterized by its ______________ chop and _________________ flavor.

19. Two methods of promoting lamb patties is to sell them by the pound and at _______________ prices.

20. Ground lamb which is too lean will be ___________ when cooked.

21. Twisting the ends of the film used to wrap luncheon meats, rather than heat-sealing them, is referred to as ___________ -wrapping.

22. The problem of discoloration of luncheon meats can be reduced by the use of _________________ packaging.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. The original reason for producing sausage was to (A) make a more economical meat product; (B) utilize the unmarketable meat scraps; (C) preserve fresh meat; (D) reduce storage space required for meat cuts.

______ 2. Spices are added to the chopped or ground meat for the purpose of (A) adding flavor; (B) preserving the meat; (C) adding color to the product; (D) counteracting the acids generated by the meats.

______ 3. Which one of the following is <u>not</u> one of the main classes of sausages? (A) fresh; (B) cooked; (C) dry; (D) smoked.

______ 4. The meats most commonly used in the making of weiners are (A) pork and lamb; (B) pork and beef; (C) beef and lamb; (D) beef and veal.

______ 5. Kosher sausages will contain no (A) beef; (B) pork; (C) lamb; (D) fish.

______ 6. The production of sausage products is of such quantity as to provide each person in the United States with approximately (A) 13.5; (B) 21; (C) 28.5; (D) 43.2 pounds.

______ 7. Most of the dry and semi-dry sausages originated in Europe and their names are derived from (A) the method used to wrap them; (B) the family name of the originator; (C) the seasoning which is used most predominately; (D) the town in which they originated.

______ 8. Storing fancy sausages under temperatures which vary greatly will result in (A) loss of flavor and color; (B) sweating and mold formation; (C) a loss of juices and shrinkage; (D) the proper aging of the product.

______ 9. Goteborg sausage was named after the town of Goteborg in (A) Germany; (B) Austria; (C) Italy; (D) Sweden.

______ 10. The principal meat used in salami is (A) beef; (B) veal; (C) pork; (D) mutton.

______ 11. One of the major disadvantages of shingling slices of ready-to serve meat when wrapping is (A) the extra time required; (B) that a larger package is required; (C) that a greater cut surface is exposed to the light; (D) the tendency for the edges to cur.

______ 12. One of the major problems the retail meat cutter encounters with self-service luncheon meat products is (A) keeping the packages at a constant temperature; (B) discoloration of the meat because of exposure to light; (C) breakage of wrapping because of excessive customer handling; (D) providing a variety of products to meat customer demands.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the types of meats commonly used in the making of sausage.

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

2. List the non-meat "binders' used in the manufacture of sausages.

(A) ______________ (C) ______________ (E) ______________

(B) ______________ (D) ______________ (F) ______________

3. In addition to fresh or cured meats, meat loaves may also include:

(A) ______________ (C) ______________ (E) ______________

(B) ______________ (D) ______________ (F) ______________

4. List the types of sausages Ziegler classified as "Domestic Sausages."

(A) ______________________ (E) ______________________

(B) ______________________ (F) ______________________

(C) ______________________ (G) ______________________

(D) ______________________ (H) ______________________

5. List the miscellaneous meat items which may be used as fillers or binders in sausage.

(A) ______________________ (F) ______________________

(B) ______________________ (G) ______________________

(C) ______________________ (H) ______________________

(D) ______________________ (I) ______________________

(E) ______________________ (J) ______________________

6. Equipment used in sausage production includes the following:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

Assignment
Sheet No. 13

Covering
Units 139-142

PREPARING AND SERVING MEATS

Not only should the retail meat cutter know how to break down a carcass into retail cuts but he should also be somewhat of an expert on cooking methods for meats.

What is the best way to cook porterhouse steak? Can all grades of the same type cuts be cooked in the same way? At what temperature should the oven be set to roast a ten-pound goose? Will aging a Good grade beef carcass for three weeks improve its tenderness and flavor? What meat cuts are a good source of Vitamin A? These and many other questions will be asked by customers, and they ask the meat cutter because they expect him to know.

The introduction of the delicatessen as a part of the retail grocery store also makes it imperative that the meat cutter understand meat cooking methods. Being able to purchase prepared meats has been well accepted by the busy housewife. This aspect of the retail meat business may grow rapidly in the next few years, but to do so will require individuals who know meat cookery.

The skills of the meat cutter may also be called upon to carve the turkey or roast at the dinner table. At this task he should be as much of an expert as he is at making fresh meat cuts. Developing the "art of carving" can be a real asset to the individual. It is an art at which few people excell and one which makes a favorable impression when skillfully done.

In this unit you will have an opportunity to become familiar with the composition and nutritional values of meat, methods used in meat cookery, and meat carving techniques. This unit is not a thorough coverage of these aspects, but rather it is hoped that the reading will stimulate further study and skill development. The only way you will become proficient in cooking or carving meat is to actually do it. You don't develop the skill by just reading about it!

<u>Assignment</u>:

1. Read the references listed below.
2. Make a chart of the various meat cuts at your work station; the methods used to cook them, the temperatures required, and the length of cooking time when appropriate. Become familiar with the chart and refer to it when needed. (See Reference B, pp. 52-54) It is also suggested that you start a card file of recipes for various meat dishes, sauces, bastings, and stuffings. Become more conscious of meat cooking methods used at home and offer to carve at every opportunity.
3. Answer the questions below and turn in this assignment by ______________________ .

A. Ziegler, *The Meat We Eat*, pp. 248-284, 374-409.
B. Bull, *Meat for the Table*, pp. 213-227.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The heart is classified as an involuntary, striated muscle.

T F 2. The most tender cuts of meat will contain a great amount of connective tissue.

T F 3. Meats contain all of the essential amino acids needed by the human body.

T F 4. Pork usually contains a lower percentage of protein than does either beef or lamb.

T F 5. The digestibility of animal fats is very low.

T F 6. In the live animal lactic acid changes to glycogen.

T F 7. A fat beef carcass will contain less water than a lean carcass.

T F 8. A high myoglobin content in older beef will result in a dark-colored meat.

T F 9. Aging of meat will reduce its tenderness.

T F 10. The color of the lean and fat of a meat cut is a reliable method to determine the quality of the cut.

T F 11. A high degree of marbling will generally be associated with a highly finished, mature animal.

T F 12. Liver is one of the best sources of Vitamin B_6

T F 13. Meats are the best source of Vitamin C.

T F 14. When cooking meat on a charcoal grill, the individual is employing the broiling method of cooking.

T F 15. The dry heat method of cooking meat is recommended for the more tender cuts.

T F 16. The recommended oven temperature for roasting fresh beef, veal, or lamb is 200 degrees F.

T F 17. Cuts which have not been boned will require less time per pound to cook than boneless cuts.

T F 18. Fresh pork should never be broiled.

T F 19. Refreezing meat should not be done because it will seriously affect the quality of the meat.

T F 20. As long as meat freezing occurs below 10° F., the quality of the meat is not materially affected.

T F 21. The flavor of fat will be more affected by freezer storage than will the lean.

T F 22. When preparing ducks or geese for roasting, it is NOT necessary to rub the outside surface with a fat prior to placing the bird in the pan.

T F 23. When steaming or braising an old bird prior to roasting, the lid of the roaster should be removed.

T F 24. It is recommended that giblets to be used in the stuffing of a bird be pre-cooked.

T F 25. Old birds are better suited for broiling than young birds.

T F 26. The flavor of an old bird is superior to that of a young bird when they have both been stewed.

T F 27. For carving purposes a bird may be placed either on its back or side.

T F 28. After all is said and done it actually makes no difference which way the bird is pointed as you carve the meat.

T F 29. One of the most effective ways for a carver to show his guests that he is using a sharp knife is to sharpen it at the table.

T F 30. The blade of the knife used to carve steaks is shorter than that used to carve roasts or fowl.

T F 31. A steel is used for the purpose of sharpening dull knives.

T F 32. Very little pressure should be applied when steeling a knife blade.

T F 33. A leg of lamb is a recommended cut for the amateur carver to make his debut.

T F 34. If steaks are of sufficient size that carving is required for servings, the carver should remove the bone first.

T F 35. The tenderloin portion of the porterhouse steak should be placed closest to the carver when carving.

T F 36. The position of the leg of lamb on the platter for the purpose of carving will depend upon whether it is a right or left leg.

T F 37. Slices from the thick side of a leg of lamb are made first.

T F 38. The first slices are removed from the leg of lamb for the purpose of making a flat surface on which the roast can rest as the leg is carved.

T F 39. When carving a pork loin roast the ribs are used as a guide for slicing.

T F 40. Steaks may be carved with the grain because their meat fibers are more tender and shorter than those in roasts.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The breakdown of proteins through the digestive process results in changing them to ________________ acids.

2. The melting point of fats from pork, beef, and lamb will fall in a range from ________ to ________ degrees F.

3. An exceptionally rich source of iron and phosphorus in a carcass is found in the ________________ meats.

4. The color pigment in meat is known as ________________.

5. The bright red color of meat, referred to as "bloom", is the result of myoglobin changing to oxymyoglobin when exposed to ________________.

6. Meat which has turned dark after being cut for some time may often be brightened by removing a ________________ inch slice from the darkened surface.

7. The lower grades of beef and lamb must be aged for a shorter period of time than the higher grades because they generally lack sufficient ________________ ________________.

8. The color of the bone in a meat cut is an indication of the ________________ of the animal.

9. The degree of marbling in a beef cut is a good indication of the ________________ of the cut.

10. A rich source of Vitamin A is ____________ and ____________ liver.

11. The absence of Vitamin B_1 in the diet may cause the nervous disease known as ____________.

12. If meat to be roasted is placed in the pan with the fat side up, a ________________ action will result.

13. The "doneness" of a roast can best be determined by using a meat ____________.

14. A simmer temperature is from ______ to ______ degrees F.

15. A medium-done, broiled, two-inch steak will require ______ to ______ minutes cooking time.

16. The effect of freezer burn can be partially overcome during cooking by adding ____________.

17. When roasting poultry the bird should be turned and basted about every ______ minutes.

18. The three primary bulk ingredients which are used for bird stuffing are ____________ ____________, ____________ ____________, or ____________ ____________.

19. When carving a bird that is positioned on its side, the first portion to be removed is the ____________.

20. The length of the knife blade for carving roasts or fowl should be about ________ to ________ inches.

21. When steeling a blade the stroke is begun with the ____________ of the blade against the ____________ of the steel.

22. When possible, roasts should be carved by cutting ____________ the grain of the meat.

23. The thickness of the slices carved from a rolled rib roast should range from ____________ to ____________ inches.

24. The thickness of the slices carved from a leg of lamb should range from ____________ to ____________ inches.

25. Before carving slices from a center-cut roast ham, it should be divided into ____________ pieces.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Visceral muscles are associated with the organs of (A) the respiratory system; (B) the intestinal tract; (C) skeletal system; (D) circulatory system.

_____ 2. The proteins found in meat that, along with fat, provide aroma and flavor to meat and thereby stimulate the flow of gastric juices are known as (A) nucleoproteins; (B) globulin; (C) albumins; (D) nitrogeneous extractives.

_____ 3. A large portion of the carbohydrates in the animal body is in the (A) pancreas; (B) heart; (C) liver; (D) kidney.

_____ 4. The retail meat cutter should remember that the MOST important aspect of the business is (A) his skill in preparing meat cuts; (B) customer satisfaction; (C) the quality of the meat; (D) competitive prices.

_____ 5. One of the primary reasons given for the tenderness of the tenderloin muscle is the fact that it (A) contains no bone; (B) can be aged more successfully; (C) receives little or no exercise; (D) is one of the larger muscles on the carcass.

_____ 6. The term "gravy cuts" refers to (A) only Choice grade cuts; (B) cuts with a high degree of marbling; (C) soft veal cuts; (D) low grade cuts.

_____ 7. One of the best sources of Vitamin B_1, thiamine, is (A) beef; (B) pork; (C) lamb; (D) fowl.

_____ 8. The vitamin which is essential for normal bone growth and teeth development is (A) Vitamin B_1; (B) Vitamin C; (C) Vitamin D; (D) Vitamin K.

_____ 9. The method of cooking meat which places the meat in direct exposure to the heat source is known as (A) braising; (B) roasting; (C) broiling; (D) basting.

_____ 10. Shrinkage of the meat can be reduced when roasting by (A) using a low temperature; (B) using a high temperature; (C) placing a lid on the roasting pan; (D) placing loose fat or bacon strips over the meat.

_____ 11. Another term commonly used for braising is (A) broiling; (B) panbroiling; (C) basting; (D) pot roasting.

_____ 12. When roasting poultry the bird is placed in the roaster (A) with the breast up; (B) on its side; (C) with the breast down; (D) any of the above may be used.

_____ 13. When carving a bird from the standing position and with the bird on its back, the legs of the bird should point (A) (A) toward; (B) away from; (C) to the left of; (D) to the right of the carver.

_____ 14. Which one of the following is NOT considered an advantage of carving a bird on its side? (A) It eliminates handling the second wing joint and thigh as separate pieces; (B) It makes removal of the drumstick easier; (C) It makes the breast easier to carve.

_____ 15. When used properly, the steel is pointing away from the body at about a (A) 30; (B) 45; (C) 60; (D) 90 degree angle.

_____ 16. Before a standing rib roast is carved, it is recommended that the (A) ribs; (B) cords; (C) backbone; (D) fat be removed.

_____ 17. When carving a standing rib roast, the cut is made (A) from right to left, always; (B) downward, toward the platter; (C) with the grain of the meat and toward the ribs; (D) across the grain of the meat and toward the ribs.

_____ 18. The loin roast of pork is positioned on the carving platter with the ribs (A) to the left of; (B) to the right of; (C) toward; (D) away from the carver.

_____ 19. The method used to carve a roast ham is very similar to that used to carve a (A) crown roast of lamb; (B) leg of lamb; (C) standing rib roast; (D) porterhouse steak.

_____ 20. The method used to carve a lamb crown roast is very similar to that used to carve a (A) standing rib roast; (B) rolled rib roast; (C) porterhouse steak; (D) loin roast of pork.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the glands and organs which are considered variety meats.

(A) ______________ (D) ______________ (G) ______________

(B) ______________ (E) ______________ (H) ______________

(C) ______________ (F) ______________ (I) ______________

2. List the percentages of the following elements found in a lean muscle.

Water (A) __________ per cent Fat (C) __________ per cent

Protein (B) __________ per cent Ash (D) __________ per cent

3. List the minerals commonly found in animal meat.

(A) ____________

(B) ____________

(C) ____________

(D) ____________

(E) ____________

(F) ____________

(G) ____________

(H) ____________

(I) ____________

(J) ____________

(K) ____________

4. In addition to aging, list some materials and methods used to tenderize meat.

Materials

(A) ____________________

(B) ____________________

(C) ____________________

Methods

(D) ____________________

(E) ____________________

5. List the factors which should be considered in judging the quality of a meat cut.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

6. The two fundamental methods used to cook meat are by the use of

(A) ____________________

(B) ____________________

7. List the materials which may be used to furnish moisture when braising.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

8. The loss in weight of cooked meat can be attributed to

(A) ____

(B) ____

9. List the method of cooking the following meats and the time required for the cooking.

Meat		Method	Time
Corned beef	(A)		
Beef tenderloin	(B)		
Beef Swiss steak	(C)		
Fresh pork ham	(D)		
Pork chops	(E)		
Bacon	(F)		
Lamb chops (1 in.)	(G)		
Leg of lamb	(H)		
Lamb stew	(I)		
Rolled veal shoulder	(J)		
Veal chops	(K)		

10. The doneness of a roasted bird can be determined by

(A) ____________________

(B) ____________________

(C) ____________________

11. List in order, the parts to be removed and sliced when carving a roast pig.

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

12. List the oven temperature and roasting time for the following birds.

Bird		Oven Temperature (degrees F)	Time (Hours)
4 to 5 lb. chicken	(A)		
14 to 17 lb. turkey	(B)		
5 to 6 lb. duck	(C)		
10 to 12 lb. goose	(D)		
18 to 25 lb. turkey	(E)		

Assignment
Sheet No. 14

Covering
Units 143-149

REFRIGERATION, CURING, AND STORAGE OF MEATS

In the past, one of the major problems confronting the meat industry was keeping meat over a period of time in a condition suitable for its use as a food. In earlier days the principal method used to preserve meat was to pack in salt and/or submerge in a pickling solution various selected portions of the animal carcass.

Modern methods of meat preservation are far more successful than the former, but they do present problems which must be understood by the meat cutter. With the advent of mechanical refrigeration, in addition to the improved methods of canning, drying, salting, pickling, and other methods of curing, the industry has made rapid progress.

In this unit you will have the opportunity to learn the various methods of curing and storing meats; and the precautions which must be taken by the retail meat cutter in order to provide the customer with a quality product and service.

Assignment:

1. Read the references listed below.
2. Using any type of paper of sufficient size, wrap one of your textbooks with a butcher's wrap and another textbook with the apothecary or drug store wrap. Refer to your text or check with your employer for the procedures.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. Ziegler, The Meat We Eat, pp. 141-202.
B. Bull, Meat for the Table, pp. 168-177, 199-205.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The early explorers from Europe introduced the dried meat called "jerky" to the Indians in the new world.

T F 2. The dry salting process for preserving meats was first used about 1500 A. D.

T F 3. Getting the curing pickle to the center of the fresh ham as quickly as possible greatly reduces the danger of loss from spoilage when curing hams.

T F 4. One of the advantages of using the artery method of curing hams is the uniform flavor which results.

T F 5. The tenderness of a ham will depend upon the type of curing pickle used.

T F 6. Canadian bacon is made from the sirloin muscle of heavy pork.

T F 7. Dried beef is usually made from the rounds of thin beef animals.

T F 8. A "pH" of 5 indicates the degree of acidity of a substance.

T F 9. Fresh meat with a high pH will have good color and keeping quality.

T F 10. Ingredients used in curing mixtures will slow down the action of bacteria in meat but will not destroy them entirely.

T F 11. Long cured hams generally have more flavor than do quick cured hams.

T F 12. The wood from resinous trees is used in the smoking of meats.

T F 13. The temperature in the smokehouse will determine the length of time required to smoke meat.

T F 14. The outside surface of smoked meat should be trimmed before cooking.

T F 15. The smoke deposits formed on the smokehouse walls are best removed by using a blow torch or similar flame device.

T F 16. The flavor of smoked turkey is very similar to that of a fresh roasted turkey.

T F 17. The keeping quality of cured and smoked turkey is <u>not</u> as good as that of cured and smoked pork.

T F 18. A satisfactory method for storing smoked meats without refrigeration does not appear to be available.

T F 19. The growth of mold on untreated smoked meats can be retarded by hanging the meat in a dry, well ventilated room with a temperature range from 45 to 55 degrees F.

T F 20. The tapeworm larva can be destroyed by thorough cooking or zero freezing.

T F 21. Little or no lamb is cured commercially.

T F 22. During the period from 1955 to 1960 there has been a decrease in the number of locker plants in the United States.

T F 23. Meat juices will freeze solid at 32 degrees F.

T F 24. Meat that has been aged prior to freezing will have a longer storage life than unaged meat.

T F 25. It is recommended that meat to be frozen and stored for some time before being eaten should have the fat trimmed close before freezing.

T F 26. Pork has a longer frozen storage life than beef.

T F 27. Tests have shown that removing the bones from cuts to be frozen and stored will affect the flavor and moistness of the meat.

T F 28. The drug store wrap is the most preferred method to use for meats to be frozen and stored.

T F 29. It is actually considered quite desirable and business-like to use "economy" wrapping paper.

T F 30. Properly prepared and wrapped fresh eggs may be kept at zero temperature for as long as one year.

T F 31. The oxidation of the fats accounts for spoilage of frozen fish just as it does in warm blooded animals.

T F 32. Frozen fish should not be stored with other meats because the odor and fish flavor will be absorbed by the other meats.

T F 33. Very few states have laws regulating the operation of locker plants.

T F 34. Frozen meats must be thawed before they are cooked.

T F 35. Frozen meats thawed slowly in the refrigerator will loose less juices than those thawed at room temperature.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. "Pemmican", a food prepared by the Indians, was a combination of dried ______________, ______________, and ______________ .

2. The practice of preserving meat by salting has been replaced by the process of ________________ the meat.

3. The two primary ingredients of a curing formula are ___________ and ______________ .

4. The addition of sugar to a salt and water brine or pickle makes a _______________ brine or pickle cure.

5. The length of time required to properly cure a ham will depend upon the ______________ of the pickle cure and the _______________ of the ham.

6. One of the best methods used to get the curing pickle to the center of the ham is by _______________ .

7. Beef which has been preserved by the use of salt is known as ________________ beef.

8. The pH of fresh meat will range from _______ to ________ .

9. The pH of fresh meat will depend upon the ______________ content of the muscle at the time of slaughter.

10. The ingredients of the curing pickle for turkey differs from that for pork in the ________________ used.

11. Sliced ham or bacon should not be kept in frozen storage for over ________ month(s).

12. The pork quality which makes it a good curing meat is its _____________ content.

13. The temperature in a commercial meat cooler is usually held at _____ to ________ degrees F.

14. The practice of renting cold storage lockers to customers for the storage of their meats and other items is reported to have been started in the year ________, in the city of ___________ __________________ .

15. The fat will oxidize and become rancid more quickly on a beef carcass that has been ___________ -fed as opposed to being ____________-fed.

16. Boning the cuts of meat to be placed in frozen storage can reduce the space needed by as much as ______ per cent.

17. One of the weaknesses of aluminum foil as a wrapping material is its lack of _______________ .

18. The method of wrapping meats for the freezer which is quick and provides a double thickness of paper over the meat is the _________________ wrap.

19. It is recommended that the storage period for frozen meats not be over ______________ months.

20. Properly wrapped fowl stored at zero temperatures may be kept from _________ to __________ months.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. Two popular woods used to smoke meat for preservation have been (A) cypress and gum; (B) walnut and gum; (C) walnut and hickory; (D) oak and hickory.

______ 2. The woods used in smoking Virginia Ham (Smightfield) are (A) oak and hickory; (B) hickory and apple; (C) oak and apple; (D) jumper and beechwood.

______ 3. In addition to increasing the salt content of the product, prolonged exposure of meat to the salt action will result in (A) deterioration of the bone; (B) excessive darkening of the meat; (C) excessive shrinkage; (D) softening of the fat.

______ 4. The meat product most applicable for curing in the pressure box process is (A) hams; (B) sausage; (C) bacon; (D) liver.

______ 5. The process used to cure bacon by the use of numerous fine hollow-stemmed needles to inject the curing pickle into the meat is know as (A) injection cure; (B) artery cure; (C) immersion cure.

______ 6. Since most causes for bacterial contamination of meat come from outside sources the best control is (A) purchasing only Government graded and inspected meats; (B) rigid sanitation practices; (C) to never allow customers in the cutting room; (D) to require a health certificate from each employee.

______ 7. Which of the following materials is not recommended for use in smoking meats? (A) cedar wood; (B) maple wood; (C) corn cobs; (D) hickory wood.

______ 8. The greatest shrinkage of smoked hams and bacon will take place (A) during the smoking process; (B) one to two hours after removal from the smoke house; (C) during the first week after removal from the smoke house; (D) during the first month after removal from the smokehouse.

______ 9. The percentage of lean meat which is water will average about (A) 10 to 15; (B) 25 to 30; (C) 60 to 65; (D) 85 to 90 per cent.

______ 10. Which of the following is not a cause of vitamin loss in meats? (A) loss of juices; (B) light; (C) exposure to air; (D) low temperatures.

______ 11. An effective means for reducing "freezer burn" of frozen meats is (A) to use moisture-proof and air-tight wrapping material; (B) to keep the temperature between zero and ten degrees above zero; (C) to freeze the meat slowly rather than quick freezing; (D) to never season the fresh meat prior to freezing.

______ 12. One of the primary advantages of using the apothecary method of wrapping freezer meats is that it (A) requires less paper; (B) results in a good air seal; (C) is quick and easy to make; (D) eliminates juice seepage.

______ 13. The storage life of frozen meats containing salt, in comparison with fresh meats, will be (A) the same; (B) shorter; (C) longer; (D) almost twice as long.

______ 14. It is recommended that the amount of freezer storage space in a home freezer should be about (A) 3 to 5; (B) 7 to 9; (C) 12 to 15; (D) 18 to 20 cubic feet per person.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Meat has been preserved by various methods. List the most common methods used.

(A) ______ (C) ______

(B) ______ (D) ______

2. List the functions of sugar as an ingredient in a curing formula.

(A) ______

(B) ______

(C) ______

3. List five of the more common methods of curing meats.

(A) ______ (D) ______

(B) ______ (E) ______

(C) ______

4. In addition to proper sanitation practices, list the factors which promote satisfactory frozen meat results.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

5. List two reasons for trimming the fat from meat that is to be frozen and stored for any length of time.

(A) ______________________

(B) ______________________

6. List the qualities required of a good wrapping material to be used for freezer storage.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

(E) ______________________

(F) ______________________

(G) ______________________

(H) ______________________

(I) ______________________

7. List the general rules to be followed in preparing and wrapping meat cuts for freezer storage.

(A) ______________________

(B) ______________________

(C) ______________________

(D) ______________________

Assignment
Sheet No. 15

Covering
Units 150-157

WHOLESALE PURCHASING, SELLING PRICES AND RECORD KEEPING

The profit to be realized from the retail meat department will depend in great part on the individual's ability to purchase the proper types and grades of meat at the right prices. This purchase is usually made from the wholesale supplier or packer. Larger firms have buyers or agents whose duty it is to select and purchase for the department. In the smaller operation the manager must develop the ability to buy wisely.

After the purchase has been made, it must be processed and priced to meet competition and yield a profit. The department manager must be aware of the factors which effect pricing and the methods he can employ to establish prices.

The keeping of accurate and current records is a must if the department is going to be successful. If efficiently kept the records can serve as a guide for purchasing, processing and pricing the meat products. Without them the manager is only "guessing" when he places an order or decides on a selling price.

An understanding of purchasing, pricing, and record keeping techniques makes the retail meat cutter a greater asset to his employer His understanding and concern may eventually be a deciding factor on his promotion within the department or securing a position with another firm.

In this assignment you will have an opportunity to learn some techniques used in buying, setting selling prices and keeping records. You should not assume that the NARGUS system is the only method available for setting prices and keeping records, but the techniques employed will have application in other systems.

Assignment:

1. Read the references listed below.
2. Complete the cutting test sample problem on page 4-a of Reference F. The method to use in computing the pounds-per-hundred figures will be found on the back of the NARGUS Cutting Test Form. The sales value total should be $63.13 rather than the $63.02 figure shown in the problem.
3. Answer the questions below and turn in this assignment by ____________________.

References:

C. American Sheep Producers, Lamb Cutting and Merchandising Manual, Chapters 16-21.
D. NARGUS, Self-Service Meats, pp. 70-76.
F. NARGUS, Meat Department System Manual, pp. 1-20.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. A retailer's buying problems are usually a result of the sales policies of his packer supplier.

T F 2. The retail meat manager should understand and take into consideration the problems of the packer when making wholesale meat purchases.

T F 3. If at all possible, the retailer should buy from the wholesaler on a standing order basis.

T F 4. The retailer should make his wholesale purchases from the supplier with the lowest prices even though this may mean a frequent change from one company to another.

T F 5. Desirable lamb carcasses are available only a few months out of the year.

T F 6. Retailers have found that it is sometimes cheaper to make up carcasses from saddles when buying lamb.

T F 7. All lambs have 13 ribs.

T F 8. The theory behind handling two grades of meat is to satisfy both the quality trade and the price conscious trade.

T F 9. A retailer may purchase wholesale cuts as well as carcasses from the packer.

T F 10. By using the factor system to compute carcass costs and prices, the retailer has a much closer control over his operation.

T F 11. An efficient retailer should concentrate on his department operation and not be concerned with the operating methods of his wholesale suppliers.

T F 12. The factor system of computing costs is more accurate for figuring small retail cuts than for larger wholesale cuts.

T F 13. There are standardized cutting test figures available which the retailer should use to figure the cost of retail cuts.

T F 14. There are times when a packer will promote the sale of trimmed lamb just to reduce his loss

T F 15. The use of percentages has proven to be a desirable pricing system for meat cuts.

T F 16. When the cost per package is computed and found to be 10¢, the price of all packages should then be raised 10¢.

T F 17. The retail meat department manager will probably spend several hours a day on bookkeeping regardless of the pricing system used.

T F 18. Cutting tests should be made and records kept on both carcasses and wholesale carcass cuts purchased by the meat department.

T F 19. Once a cutting test has been made using a particular cutting method it is not necessary to make additional tests of the same method.

T F 20. It is advisable to have cutting test results from the products of different packer suppliers.

T F 21. Cutting tests on bacon and luncheon meats are not necessary because they will not vary from week to week.

T F 22. There is little advantage to assigning responsibility for invoices to any particular individual in the meat department

T F 23. A NARGUS Operational Summary form or similar form is of value only in a large multiple-unit operation.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The largest market for lambs is usually during the months of _______________ and _______________.

2. A lamb carcass which has been divided into two equal weight saddles will have __________ rib(s) left on the ____________ saddle.

3. In actual practice, a retailer figuring prices on items will think and figure mainly in terms of price ______________.

4. When the lamb carcass is split to produce a 4-rib yoke, the long hind saddle will account for about ______________ of the total carcass weight.

5. In order for a retailer to have a practical system of figuring prices, he must be able to use figures based upon his own _____________ methods.

6. When computing the price relationship between carcasses and cuts, the retailer should remember that it is the cost of the _____________ that counts, not the cost of the ____________.

7. When utilizing the cost per package method of pricing the retailer needs figures on the dollar cost of operating the department and the number of ______________ ______________.

8. When pulling business away from a competitor, an attempt should be made to pull only the ______________ business.

9. Sales on which very little profit is made is estimated to be about _________ to _________ per cent of the retail meat business.

10. Large volume sales is desired in a self-service department but it is of no value unless it is ______________ volume.

11. Operating costs which do not vary with the volume of meats sold are generally considered to be ______________ costs.

12. Taking an inventory of the meat in the department is usually done in two steps: (1) the meat in the ______________, (2) the meat in the ______________.

13. When taking an inventory it is usually necessary to record only the ______________ of the product.

14. When computing the value of the inventoried products, it should be done in terms of the ______________ cost rather than the ______________ or ______________ cost.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The best way for the retailer to insure the selection of the wholesale purchases he desires is to (A) visit the packers plant and make all selections himself; (B) accept and utilize the carcasses shipped by the packer; (C) place the order far enough in advance that the packer can do a good job of selection; (D) purchase, slaughter and process his own meat animals.

_____ 2. The heaviest marketing of California lambs is made during the month of (A) March; (B) April; (C) May; (D) October.

_____ 3. A 50-50 split lamb foresaddle costing 26¢ per lbs., and a hindsaddle costing 58¢ per lbs., will make up a carcass with a cost of (A) 84¢; (B) 42¢; (C) 32¢; (D) 13¢; per pound.

_____ 4. One of the better pricing methods being used in the meat department is (A) percentages; (B) cost per package; (C) cost per carcass; (D) factors.

_____ 5. When the cost of operating the department for a week is $286.50 and there are 2150 packages sold during the week, the cost per package will be approximately (A) 8; (B) 10; (C) 13; (D) 15 cents.

____ 6. The use of pricing charts is not recommended because (A) (A) no allowance is made for seasons of the year; (B) personnel become confused when reading them; are devised by wholesalers and the markup is too small; (D) no two carcasses ever have the same cutout value.

____ 7. Which one of the following is not a factor in setting the price level of meats in a community? (A) the department's variable operating costs; (B) the stores operating in the area; (C) the price customers are willing to pay.

____ 8. Making the cutting test for a beef carcass by recording the data in terms of the wholesale cuts is advantageous because (A) it is easier to do; (B) there is less loss from shrinkage; (C) the data is easier to compute; (D) data is then available for both wholesale cuts and the whole carcass.

____ 9. When summarizing the weeks business the difference between the sales value as computed on records should not differ from the cash register reading by more than (A) two to four; (B) eight to ten; (C) twelve to fifteen; (D) eighteen to twenty per cent.

____ 10. One of the greatest advantages to keeping accurate, current records (weekly is preferred) of the meat products purchased and sold is that they (A) discourage stealing; (B) make yearly summaries easier to compute; (C) are required for auditing; (D) can be used to detect trouble spots early.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List some things a retailer can do to get better service from his packer on wholesale purchases.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

(E) ____________________

(F) ____________________

(G) ____________________

____

(H) ____________________

2. List some reasons for lamb being a year around profitable meat.

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

3. Meat products which have the highest mark-up per package are those which:

(A) ____

(B) ____

4. List some pricing policies which have been developed recently.

(A) ____

(B) ____

(C) ____

(D) ____

5. List the values advocated by the NARGUS Meat Department System.

(A) ____

(B) ____

(C) ____

(D) ____

6. Two key features of the NARGUS system are:

(A) ____

(B) ____

7. List the steps for making a cutting test as outlined by the NARGUS system.

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

(H) ______________________________

(I) ______________________________

8. When the variation between cash register receipts and the computed cash value of the meat products is excessive, the source of trouble might be found by checking:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

Assignment

Units 158-161

ADVERTISING, DISPLAYING, AND SELLING MEAT

Being a skilled meat cutter is only part of the total job of merchandising meat. Before any profit can be realized, the meat must be sold to customers in such a manner that they will return. Salesmanship then is another important responsibility of a meat cutter in a retail meat department.

The successful selling of meat and meat products is a result of effective advertising through the use of outside agencies such as newspapers, radio, television or mail. In the store it involves window display, show cards and case displays. Whatever means are used to advertise, they must be accurate and "attention getting."

The meat cutter must also remember that his personal appearance, habits, and knowledge and skill are advertisements for the meat department. This makes the individual not only a meat cutter but also a "display" and a salesman.

In this unit you will have the opportunity to learn some of the techniques of selling, effective methods of advertising and the building and care of meat displays.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in this assignment by ________________.

References:

C. American Sheep Producers Council, Lamb Cutting and Merchandising Manual, Chapters 12 and 14.
D. NARGUS, Self-Service Meats, pp. 60-69, 77-95.
I. Information Sheet No. 3.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. There is little variation from store to store as to the type of meat and cuts of meat which sell most readily.

T F 2. There appears to be no single method of building a display that is superior to all others.

T F 3. Late afternoon or evening shoppers should have as wide a selection of meat cuts as the early morning shoppers.

T F 4. As a general rule, fast moving items should be placed first in the flow of traffic past the display case.

T F 5. Mixing rows of fast and slow moving products throughout the display case has been found to be successful.

T F 6. Uniformity and consistency in packaging meat items can contribute to the building of sales volume.

T F 7. There is little to be gained from the practice of making special cuts at a customer's request, and therefore this practice is not generally recommended for a self-service department.

T F 8. If code dating is used an effort should be made to inform the customer of correct interpretation.

T F 9. Customers of self-service meats are generally more aware of and make their purchase in terms of the total price of a package rather than the cost per pound of the cut.

T F 10. In a self-service meat department the continued and long time sales to a customer is usually more desired than the amount of profit to be made on a particular sale.

T F 11. Self-service has done little to increase the sale of lamb and veal cuts which are slow movers in a service type department.

T F 12. Packaging different kinds of ground beef together in the same package is not recommended.

T F 13. In a service meat department the cuts remaining on a tray after a sale should be rearranged to maintain eye appeal.

T F 14. In a service meat department the wrapping of meat purchases need not be concerned with meeting the eye appeal of the purchaser.

T F 15. It is recommended that every item available in the self-service meat department be on display at all times.

T F 16. Brand name meat products have been found to be no better sellers than those with no brand.

T F 17. There is no advantage to having more than one thermometer in the display case.

T F 18. Cold air usually has a high moisture content.

T F 19. The type of lighting used above the display case can cause the fluctuation of temperatures in the case.

T F 20. Fresh meats should be kept in an atmosphere of relatively high humidity.

T F 21. Smoked and cooked meats should be kept in an atmosphere of relatively low humidity.

T F 22. Lighting of meat display cases is to be considered as an element of good salesmanship.

T F 23. Self-service has done little to change the ways in which meats are sold.

T F 24. Most customers know as much about the quality, care and preparation of meats as does the meat cutter.

T F 25. When a customer is wrong the salesperson should tell them so, even though they insist they are right.

T F 26. A clean appearance is probably more important for the meat cutter in a self-service department than in a service type.

T F 27. Inaccuracy in weighing and pricing packages in a self-service department is not as serious as in a service department.

T F 28. Bad habits are noticed more than are good habits.

T F 29. The meat cutter's selling ability, work habits, and personal cleanliness will probably have little effect on his promotions or raises.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The manager of a self-service meat department organizes the operation and the personnel for the purpose of _______________ sales.

2. The self-service meat department displays its meat products, the equipment, and the _______________ .

3. Homemakers usually plan their meals around the _______________ dish.

4. Keeping displays simple helps to reduce _______________ and _______________ to the packages.

5. Early morning shoppers are generally looking for meat items such as _______________ or _______________ .

6. Demand items should be placed close to profitable ____________ items.

7. Shoppers who come to the store just before noon or evening meal are usually looking for meat items that are ____________ or ________________ .

8. A porterhouse steak is really just a large __________ steak.

9. The largest display of roast should be made at the __________ of the week.

10. Low temperatures in the display case will retard _________ of bloom and ______________ action.

11. An excessive amount of juices in the display case and its packages is an indication that the temperature in the case is too ____________ .

12. Fluorescent lights which are most popular for lighting the display case are either soft ____________ or a ____________ tint in color.

13. One of the best means to control meat shrinkage due to loss of moisture is with uniform and appropriate ________________ control.

14. There is less personal contact between the customer and the meat cutter in a ________________ type meat department than in a ______________ type department.

15. The proper wind-up to all transactions with customers should be a sincere ______________ .

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A good salesman for the self-service meat display is (A) the department manager; (B) the most experienced meat cutter; (C) the most inexperienced meat cutter; (D) each item in the case.

_____ 2. Many customers are of the opinion that the only reason a backing board is used on a package is to (A) absorb the meat juices; (B) hide the less attractive side of the cut; (C) give rigidity to the package; (D) add weight to the package.

_____ 3. Which one of the following is usually not the responsibility of the individual assigned to display case supervision during rush hours? (A) re-wrap damaged packages; (B) answer questions and assist customers in making purchases; (C) relocate items in the display; (D) inform cutters and wrappers of fast and slow moving items.

_____ 4. When a variety of display techniques fail to move an item it is best to (A) reduce the price; (B) disguise it as a popular cut; (C) increase its prestige by raising the price; (D) change the cutting method.

_____ 5. The term "hot spot" as used in the reading refers to (A) items under a spotlight; (B) the warmest temperature area of the display case; (C) the area in the display case from which items seem to sell the quickest; (D) the area in the display case where all of the spicy meat products are displayed.

_____ 6. Apart from wages, one of the highest items of expense in the meat department is (A) wrapping materials; (B) meat shrinkage from loss of moisture; (C) making special cuts for customers; (D) spoilage because of high temperature.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List some basic approaches which have been used in display building.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

2. List some "silent salesman" ideas which can be used to promote sales in the meat department.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

3. List some causes for poor air circulation and temperature control in the display case.

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

4. Allowing temperatures in the display case to vary several degrees during the day may result in an increase in:

(A) __________ (B) __________ (C) __________

5. The formation of moisture beads on the inside of a transparent film package may be caused by changes in temperature. This may have resulted because the package was:

(A) ____________________

(B) ____________________

(C) ____________________

6. List some reasons for the discoloration of fresh lamb.

(A) ____________________

(B) __________ __________

(C) ____________________

(D) ____________________

7. List the characteristics of a salesperson with whom most customers like to be served. They are:

(A) __________ (E) __________

(B) __________ (F) __________

(C) __________ (G) __________

(D) __________ (H) __________

8. List some factors of personal cleanliness with which the salesperson in the meat department must be aware and practice.

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

Information
Sheet No. 3

SELLING MEAT PRODUCTS

The growth of self-service meat departments has changed the emphasis in selling meat products in the retail store. In the service type department there is the face-to-face contact with the customer on every sale. Whether or not the customer returns is dependent upon her satisfaction with the salesperson and the product she purchased. With the self-service type of department the return of the customer is more dependent upon her satisfaction with the product she purchases. Most sales are made without the customer or meat cutter seeing each other. This means that the packaged product and the way in which it is displayed must be the "salesman." In the service department the meat cutter can make suggestions for other purchases, but in self-service the package and display must attract the customer's attention.

The less personal selling emphasis of the self-service department does not mean that the meat cutter should be unconcerned with selling techniques. There is still frequent face-to-face contact with customers and there will be some customers who will desire special cuts. This face-to-face contact, although less frequent, is as important in self-service as in service selling.

Whether you are "waiting on" the customer in a self-service or a service type department your mannerisms and techniques should be the same. In addition to being pleasant the salesperson must remember that only wholesome meats or other products are sold to customers. The average customer has a somewhat limited knowledge of meats and depends upon the salesperson to answer questions about the selection, preparation, and care of the purchase.

In addition to selling only wholesome products and assisting with the purchase, the customer likes to be served by a salesperson who is:

1. Courteous
2. Cheerful and pleasant
3. Takes an interest in them and their purchase
4. Uses proper language
5. Has no unfavorable habits
6. Is clean
7. Is willing to wait on them
8. Is patient and considerate

Being courteous means to be just plain nice to customers. Treat them as you would like people to treat you. Make them feel welcome and at ease. The salesperson should avoid arguments with customers; he can only lose, because one of the quickest ways to lose customers is to argue with them.

Customers do not need any particular retailer; there are always others they can go to, but the retailer does need customers.

The successful meat salesperson keeps his feelings to himself even though the customer is discourteous. Quick retorts, rude mannerisms, and facial expressions have no place in meat selling. Lost customers is the price of not being courteous. The salesperson should remember that all people are not alike. Some are sensitive, some are not. Because the salesperson is unable to tell who is sensitive, fussy, peculiar, or unusual, and since he does not have any idea what makes them one way or the other, he should be courteous to all customers. Remember that a sincere "thank you" is an act of courtesy. It is the proper wind-up of all transactions.

Using proper language is an important part of building customer acceptance. This does not mean that the salesperson must be a master of English, rather it means to avoid the use of slang, smart alecky remarks and wise cracks. Some customers don't mind but others do, and since there is no way of telling who objects, be on the safe side and always use proper language. No one objects to proper language.

A clean appearance is a must in selling. This is especially true in the self-service department where the customer must often judge the meat cutter by his appearance since he may never have need or reason to talk to him. No one likes to buy food from a person whose appearance is uninviting and they will hesitate about buying from the self-service display when the people behind the counter are untidy. Customers do not come to the store to evaluate the meat cutter, but anything they see about the person that is not up to standards of cleanliness is quickly reflected in their purchases. The meat cutter may never know why he lost the customer.

Personal cleanliness should include: (1) clean face and hands, (2) clean fingernails, (3) well groomed hair, (4) hair nets for women, and (5) a clean shave for the men. In addition, a spotless apron and uniform, clean shirt, and a tie are as much a part of proper selling as is a wholesome, attractive product.

A cheerful and pleasant attitude is another trait customers like to find in salespeople. They are not one bit interested in how salespeople feel or why. They usually have troubles of their own. Harshly spoken words, short answers, and a sour face make few sales.

Willingness to wait on customers means that they are more important than any job you might be doing. Many self-service departments have installed a buzzer or bell for the customer to sound when they desire personal service. This call should be answered promptly. The job can wait but the customer won't! A grumpy greeting, leaning on the counter, or a sloppy lazy-like posture are not indications of a willingness to wait on the customer. The real salesperson is alert and wide awake, and these characteristics impress customers of his willingness to be of service to them.

Patience with customers also makes sales. The questions they ask or the requests they make are important to them and any indication of irritation or a "don't bother me" attitude on the part of the salesperson must be avoided.

Like all people, customers appreciate being recognized and to have the salesperson show an interest in their purchases and in them as individuals. In a self-service department this personal interest and recognition is more difficult, but a greeting or friendly nod to a steady customer does wonders. If a conscientious effort is made the number of familiar faces will increase. Your recognition of them also impresses the "first time" or "infrequent" customer of the friendliness of the department and may result in them becoming steady customers.

Sales are also made when the customer finds she can place confidence in the department from which she buys her meats. This is as true in the self-service as the service department. At no time should meats be misrepresented, packages inaccurately weighed or priced, or unwholesome products sold to the customer. When a mistake of this type occurs the customer will probably say nothing, but she has lost confidence and will likely take her trade elsewhere.

Like the products that are on display, so is the equipment and personnel of the meat department. The personnel in the self-service department must remember that although their contacts with customers are few they are on constant display while working. Bad habits seem to be more quickly noticed than good habits. The personnel must remember that they and the equipment are in contact with food, and customers are extremely particular about their food. If a salesperson runs his hands through his hair or across his face, uses a handkerchief improperly, spits or smokes while cutting or wrapping meat, don't be surprised if the customer cancels his order or replaces the package in the display case and disappears, never to be seen again making meat purchases in that department.

To do a top selling job the meat department personnel must observe all factors. You can be ever so pleasant and courteous but lax in the matter of clean appearance and the customer forgets how courteous you were. A meat salesperson is any person who waits on customers and the traits outlined in this information sheet apply to all regardless of position or title. It is entirely up to the individual to use or not to use these qualities. Persons who develop and practice these selling qualities will find meat selling more interesting and pleasant, more productive for sales, increased profits and very likely, promotions and raises in pay.

It takes no more time to do a proper meat selling job than it takes to merely "wait on" and "get rid of" customers. Proper selling can become a profitable habit.

Missouri State Dep of Educ, Jefferson City. Ind Educ Sect
Pub Date - Jun63
MF AVAILABLE IN VT-ERIC SET 120p.

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *BUILDING TRADES,
GRADE 11, GRADE 12,

This guide is for student use in related instruction classes for the building trades job cluster covering carpentry, masonry, electricity, plumbing, plastering, and painting. It was developed by a committee and research assistants. Of the 46 assignment sheets 24 are on carpentry. Representative titles are (1) Essential Preparation for Building a House, (2) Principles and Methods of Framing for Floors, (3) Principles of Partitions Construction, (4) Special Roof Framing Problems, (5) Interior Trim and Finish, (6) Mixing, Pouring, and Finishing Concrete, (7) Fundamentals of Electrical Work, (8) Layout and Installation of House Sewers and Drains, (9) Applying Plaster, and (10) Application of Paint and Wall Coverings. Each assignment gives introduction, assignment, reference, and questions. Instructors should be vocationally competent, and students should be juniors with proper prerequisites. The suggested time allotment is 180 days. An analysis of the skills and knowledge for each of the major areas and a reference bibliography are included. An instructor's guide (VT 002 087) is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

(Address) 103 Industrial Education Building, Columbia, Mo.

DATE: October 19, 1967

RE: (Author, Title, Publisher, Date) Indus. Ed. Dept., Univ. of Mo. at Columbia BUILDING TRADES, cooperatively with Indus. Educ. Dept. (U. of Mo. at Columbia) and Mo. State Dept. of Ed. (1963)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Industrial Education Dept., Univ. of Mo. at Columbia
Address 103 Industrial Education Building
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
instructor's guide $.50

(2) Means Used to Develop Material:
Development Group Development Committee and Research Assistants
Level of Group State
Method of Design, Testing, and Trial Subject matter specialist and teacher educators. Field tested.

(3) Utilization of Material:
Appropriate School Setting High school, post H.S., area voc.
Type of Program preparatory vocational industrial education programs
Occupational Focus job cluster covering various phases of building trades
Geographic Adaptability United States
Uses of Material Study guide for related instruction on a group bases
Users of Material student guiding class discussion

(4) Requirements for Using Material:
Teacher Competency competent vocational instructor
Student Selection Criteria junior in high school with proper pre-requisites
Time Allotment 180 days

FOREWORD

This student's manual is designed to serve as a guide in providing related instruction in the Building Trades. It is designed to cover six areas most generally found in Building Trades programs.

A number of individuals were consulted in the perparation of this material. Special credit is due Mr. Roland W. Best, Instructor in Building Trades, Hickman High School, Columbia, Missouri, and Mr. Ray Walsh, Chairman of Practical Arts and Vocational Education, Hickman High School, Columbia, Missouri.

Much credit is due Dr. H. Pat Wardlaw, Assistant Commissioner and Director of Vocational Education; Mr. Merton C. Wheeler, Director of Industrial Education; and other staff members of the Department of Education for their efforts in developing the Industrial Education Curriculum Series of which this study is a part.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education, University of Missouri, for the direction and administration of the curriculum materials laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education, who supervised the preparation of this manual and edited the manuscript. This manual was prepared by Dr. Robert L. Prater, formerly Research Assistant in Industrial Education, and Mr. Richard E. Ginther, Mr. Donald E. Maurer, and Mr. Robert J. Spinti, all Research Assistants in Industrial Education at the University of Missouri.

TABLE OF CONTENTS

CARPENTRY (AREA 1)

Assignment Sheets:

MASONRY AND CONCRETE (AREA 2)

Assignment Sheets:

ELECTRICAL CONSTRUCTION (AREA 3)

PLUMBING AND PIPEFITTING (AREA 4)

PLASTERING (AREA 5)

PAINTING AND DECORATING (AREA 6)

INTRODUCTION

This BUILDING TRADES manual has been designed as an aid in guiding the student's learning. In preparing this material, it has been assumed that job skills and procedures will be learned by the student through the actual construction of a house or some similar building under the direction of a competent instructor. The technical and related information that is necessary to know in order to carry out the construction project is to be given through the use of this manual and whatever other techniques the teacher may indicate is desirable.

The course of study is divided into the following six trade areas: (1) carpentry, (2) masonry and concrete, (3) electrical construction, (4) plumbing and pipefitting, (5) plastering, and (6) painting and decorating. Each of these areas is furnished with a complete analysis of the trade and a series of assignments.

The analysis is a systematic breakdown and listing of the instruction units that a craftsman of that particular trade must know to properly perform his work. The left hand column contains a list of the manipulative skills the student must be able to perform and with which he will become familiar through the practical activities experienced in the construction of the house. The right hand column contains the related information topics. These will be taught through the assignments in this manual. The center column of numbers in the analysis denotes the assignment where that particular element will be covered. Each assignment is also cross-keyed to the analysis indicated by the numbers found under the heading "Covering Units" in the upper right hand corner of each assignment.

Each assignment has an introduction, a reading assignment, and a series of questions covering the readings. The introduction is to tell the student specifically what he is to do and to convey the importance of the material to be covered. The reading assignment is keyed by letter to the Basic Reference List which is found in the front of the student's manual. The questions on the assignment sheets serve two major purposes: (1) to guide the student to the important aspects of the reading assignment, and (2) to form a basis or outline for classroom discussions.

Assignment Sheet No. 1 of the carpentry unit (the first assignment that the student will do) is to introduce the student to the over-all scope of the building trades. This assignment deals, in a generalized manner, with such topics as: what the building trades are; where the workers are employed; training and other requirements; the employment outlook; earnings and working conditions; and where to obtain more detailed information. Each of the six trade areas will have additional information as part of the first assignment for each area, dealing specifically with application to the particular trade being studied. It is hoped that the student will be able to make a firm and knowledgeable occupational choice through the experiences of the classwork and the occupational information in the student assignments.

The instructor will make assignments in addition to those found in the student's manual. He will also supplement them with lectures, discussions, field trips, movies, slides, film strips, outside speakers, etc. The building trades student can look forward to a year of interesting and profitable experiences.

BASIC REFERENCES USED IN BUILDING TRADES COURSE OF STUDY

ADDENDUM SHEET

Since all assignment sheets are keyed to 1956 revision, Fundamentals of Carpentry, Volume II; when using the 1963 edition of this reference, the assignment sheets should have the following page changes:

Assignment Sheet No. 5, 1963 Ed. pp. (12-33) (47-56)
Questions 1,2,3, and 4 are not answered in 1963 Edition.

Assignment Sheet No. 12, 1963 Edition, pp. (116-123)

Assignment Sheet No. 13, 1963 Edition, pp. (123-129)

Assignment Sheet No. 14, 1963 Edition, pp. (102-111)

Assignment Sheet No. 16, 1963 Edition, pp. (158-165)

Assignment Sheet No. 17, 1963 Edition, pp. (12-14)

Assignment Sheet No. 18, 1963 Edition, pp. (176-189)

Assignment Sheet No. 19, 1963 Edition, pp. (190-228)

Assignment Sheet No. 20, 1963 Edition, pp. (228-247)

Assignment Sheet No. 21, 1963 Edition, pp. (358-379)

Assignment Sheet No. 22, 1963 Edition, pp. (266-297)

Assignment Sheet No. 24, 1963 Edition, pp. (386-404)

ANALYSIS OF CARPENTRY

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Introduction		
	1	1. Types of work done by building tradesmen.
	1	2. Employment opportunities and working conditions
Introduction to Carpentry		
	2	3. Amount and type of training needed by carpenter
	2	4. Effects of technological developments on demand for carpenters
	2	5. Apprenticeship program
	2	6. Carpentry unions
Building Preparations and Preliminaries		
	3	7. Factors to consider in selecting sites and locating homes
	3	8. Types of houses
9. Read local building codes	3	9. Content and purpose of building codes
10. Read local zoning laws	3	10. Types of public services
11. Read a legal contract	3	11. Sources of legal advice
12. Select location of building	5	12. Items to consider in locating a building
13. Lay out building lines	5	13. Significance of building lines
14. Establish grade levels	5	14. Methods and instruments used in staking out buildings
15. Erect batter boards	5	15. Kinds and uses of batter boards
16. Locate and mark excavation lines	5	16. Methods and precautions of excavation work
Concrete and Concrete Forms		
17. Mix concrete	7	17. Standard concrete mixtures and their uses
18. Form and anchor reinforcing steel	7	18. Cement and its uses

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
19. Construct straight foundation segments	7	19. Materials used for forms and their relative advantages
20. Plumb, level, and brace forms	7	20. Methods of constructing foundation forms
21. Construct and insert openings, offsets and irregularities	7	21. Details of form construction
22. Set shoring and braces	7	22. Methods of bracing forms
23. Build forms for steps and stairs	7	23. Characteristics and uses of metal forms
24. Insert spreaders and wire ties	7	24. Treatment of forms to decrease warping and swelling
25. Remove forms from concrete	7	25. Precaustions in removing forms
	7	26. Method of calculating board feet
	Blueprint Reading	
	8	27. Types of architectural drawings
	8	28. Purpose of blueprints
29. Calculate distances from drawings	8	29. Principles of drawing to scale
30. Locate walls and openings from drawings	8	30. Types of lines and symbols
31. Assemble milled materials	8	31. Factors to consider when interpreting details
	8	32. Principles to follow in reading and interpreting floor plans
33. Follow specifications in construction	8	33. Purpose of specifications and their interpretation
	Insulating and Dampproofing	
34. Adapt framing to receive insulation	15	34. Types and composition of insulation materials
35. Install building paper	15	35. Uses and comparative values of insulation materials
36. Install various types of insulation	15	36. Procedures for installing insulation
	15	37. Vapor barrier condensation zones
	15	38. Attic ventilator requirements
39. Install weatherstripping	15	39. Types of weatherstripping
	15	40. Method of protecting insulation from dampness

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	Scaffolding	
41. Saw to a line with cross-cut or rip-saw	4	41. Uses and types of hand-saws
42. Drive, set and draw nails	9	42. Sizes and uses of common nails
43. Construct upright outrigger scaffolds	16	43. Types and uses of scaffolds
44. Construct and use suspended scaffolds	16	44. Advantages and limitations of scaffolds
45. Assemble cantilever scaffolds		
46. Assemble permanent scaffold units		
47. Construct and hang bracket scaffold		
48. Construct window bracket scaffold		
49. Construct framed portable (supported) scaffold for high work on interiors	16	49. Details of framed portable scaffolds
50. Construct saw horse, trestle, and miter box	5	50. Types, uses, and construction procedures of horses, vices, benches, ladders, etc.
	17	51. General safety rules and practices
	11	52. Sources of lumber, characteristics and kinds of wood
	11	53. Methods of seasoning lumber
54. Surface stock to thickness	11	54. Classification of lumber
55. Select lumber for specific parts	11	55. Grading of lumber
56. Scale lumber	11	56. Commercial sizes of lumber
	Framing of Floor, Ceiling and Wall	
57. Splice and join joists, beams and girders	10	57. Joints and splices used in framing
58. Trim or pare with chisel	4	58. Types and uses of chisels
59. Cut and place joists, beams and headers	10	59. Methods of assembling joists
	4	60. Care and selection of carpentry tools

61. Sharpen saws	4	61. Types and sizes of saw files
62. Sharpen tools, such as chisels, planes, bits, etc.	4	62. Care and use of oilstones abrasives, grinding wheels, and files
	4	63. Types and uses of portable power tools
64. Lay out square cuts, bevels, chamfers, tapers and miters	4	64. Types and uses of layout tools
65. Measure and divide spaces with rule, square, scale, etc.	4	65. Types and uses of measuring tools
66. Lay out sills and girders for joists and headers	10	66. Comparison of balloon, braced, and western types of framing
67. Frame around wells and openings in floors and ceilings	12	67. Details of wall framing
68. Frame unsupported corners and landings		
69. Cut studs and build corner studs	12	69. Methods of constructing corner posts
70. Lay off plates for studs	12	70. Purpose and types of plates and studding
71. Double plates; double studs at openings		
72. Frame openings in walls	12	72. Methods of framing wall openings
73. Truss over wide openings		
74. Raise, plumb and brace walls	12	74. Methods of nailing walls
75. Lay out and frame porches		
76. Frame bay windows		
77. Frame dormer windows		
78. Lay out and frame trussed partitions	14	78. Principles of partition construction
79. Adapt framing to receive plumbing, wiring, plastering, tiling, and heating	13	79. Special framing problems related to plastering, plumbing, tiling, heating, and fire hazards
80. Locate and bore holes; set and grout sills	12	80. Importance of properly set sills
81. Lay and level joists	12	81. Methods of assembling joists
82. Brace and bridge joists	12	82. Purpose and methods of bridging between joists
83. Lay and high-joint subflooring	12	83. Methods of laying subflooring

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	Framing of Roofs	
84. Lay off plate and ridge to receive rafters	18	84. Types of rafters and their relations
	18	85. Definition of terms peculiar to roof framing
86. Read and interpret steel square tables	18	86. Interpretation and use of tables and scales on steel squares
87. Lay off and cut common rafters	19	87. Methods of laying off common rafters
88. Lay off and cut jack rafters	19	88. Methods of laying off jack rafters
89. Lay off and cut hip and valley rafters	19	89. Methods of laying off hip and valley rafters
90. Lay off and cut "cripple" jack rafters		
91. Raise and align rafters	18	91. Relationship of span and run, rise, and pitch
92. Frame roof openings		
93. Frame flat roof	18	93. Types and characteristics of roofs
94. Frame lookout or overhang	20	94. Construction of overhang, eaves, and gutters
95. Frame unequal pitch intersections	20	95. Requirements and calculations for different pitches
96. Brace rafters and ceiling joists	20	96. Construction and use of roof trusses and braces
97. Frame gambrel roof		
	Roofing	
98. Cut and nail sheathing and lath	22	98. Kinds of roofing materials and advantages
99. Apply wooden shingles on straight runs	22	99. Relative costs of roofing materials
100. Apply rooled composition roofing	22	100. Procedures of applying roofing
101. Apply valley tin, flashing, and ridge rolls	22	101. Methods of flashing chimneys and dormers
102. Install gutters	22	102. Principles of gutter construction
103. Shingle valleys and curved surfaces	22	103. Techniques of finishing hips, valleys, and ridges
104. Repair wooden shingle roof	22	104. Procedures for calculating roofing areas and costs

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
105. Apply processed composition, asbestos, sheet metal, and tile roofing	22	105. Comparison of methods used in applying various roof coverings
106. Trim open cornice	22	106. Kinds of cornices
107. Finish gable cornice	22	107. Cornice construction
108. Cut, fit and nail crown and bed molding	22	108. Types of cornice materials
109. Trim box or closed cornice	22	109. Relative costs of cornices
110. Rake crown molding	22	110. Lay out for raking molding
	Exterior Wall Covering	
111. Apply sheating horizontally	22	111. Comparison of siding materials
112. Apply sheathing diagonally	22	112. Comparison of horizontal and diagonal sheathing
113. Cut and butt siding against outside trim	22	113. Comparison of methods of applying siding
114. Shingle outside wall	22	114. Types of shingles used for siding
115. Apply building paper	22	115. Kinds and uses of building paper
116. Cut and apply asbestos and other types of manufactured wall coverings	22	116. Methods of applying processed siding
117. Cut and nail corner boards	22	117. Practices in the construction of corner boards
118. Apply base and water table	22	118. Purpose and construction of water tables, belts, and courses
	Exterior Door and Window Finish	
119. Determine size of frame from door and window schedule	21	119. Types of door and window frames and their relative advantages
120. Construct simple window frames for double-hung check-rail sash	21	120. Details of window frame construction
121. Cut and apply outside casings, headers, mullions, and brick mold to frames	21	121. Terms peculiar to windows and doors
122. Set window frames	21	122. Methods of setting window frames

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
123. Assemble milled door and window frames	21	123. Kinds of milled window frames
124. Flash caps over doors and windows		
125. Construct window screens		
126. Construct door frame with rabbeted jamb	21	126. Details of outside door frame construction
Interior Ceiling and Wall Coverings		
127. Hang shiplap on ceilings	23	127. Characteristics and advantages of the different materials for covering interior walls and ceiling
128. Cut and nail shiplap or lath on interior walls	23	128. Specifications of lumber
129. Cut and apply panel	23	129. Types of plywood panels and methods of joining panels
130. Set grounds for trim on plastered walls		
131. Apply commercial wall boards on ceiling, using ceiling jack	23	131. Application procedures for wall and ceiling materials
132. Cut and nail commercial wall boards		
Finish Flooring		
133. Lay finish flooring with butt joints	23	133. Kinds of finish floors and special floor coverings
134. Lay end-matched flooring	23	134. Methods of nailing flooring
135. Draw and nail crooked pieces of flooring	23	135. Types of jacks for drawing and nailing crooked pieces of flooring
136. Dodge joints systematically on long runs of flooring	23	136. Standard grades and sizes of flooring
137. Lay block flooring	23	137. Effects of moisture on flooring and how to minimize them
138. Lay flooring over building paper	23	138. Methods of insulating floors

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Interior Trim and Finishes		
139. Fit and hang window sash	21	139. Methods of fitting and hanging sash
140. Fit and hang doors	21	140. Methods of fitting and hanging doors
141. Install double-acting door	21	141. Stock sizes and styles of doors and windows
142. Set inside door frames	21	142. Methods of setting door jambs
143. Case door and window openings	21	143. Procedures for installing door and window casings
144. Install inside and outside door locks	21	144. Types of door locks and procedures for installing
145. Fasten with screws and bolts	9	145. Specifications and uses of bolts and screws
146. Countersink screw and bolt heads	9	146. Kinds of finishing hardware
147. Install hardware on windows, doors, and cabinets	9	147. Types, sizes and location of hinges, pulls, and latches
	21	148. Types of casings
149. Fit and install thresholds	21	149. Types of thresholds and methods of installing
	21	150. Types of millwork
151. Finish outside and inside curves	21	151. Methods of milling lumber
152. Cut, fit, and nail baseboards and base shoe	23	152. Types of baseboard and shoe
153. Cut and nail picture mold	23	153. Methods of joining molding
154. Trim interior cornice and ceiling beams	23	154. Types of interior cornice and ceiling beams
155. Apply wainscoting and wainscot cap mold	23	155. Types and details of wainscoting
156. Assemble milled cabinets and built-in fixtures	23	156. Care and precautions in handling millwork
157. Prepare surfaces, for application of stain, fillers, shellac, varnish, lacquer, enamel and paint	23	157. Specifications and kinds of finish for inside wood surfaces
158. Kerf trim for bending around curved surfaces	23	158. Names and stock sizes and shapes of interior molding and trim
159. Miter crown or spring molding	23	159. Methods of mitering molding
160. Cope crown or spring molding	23	160. Methods of coping molding

164. Lay out and cut routed stringers	24	164. Types of stringers and their uses
165. Assemble milled stairway	24	165. Effects of shrinkage on various types of tread and riser construction
166. Cut and fit skirting board	24	166. Types of tread and riser construction
167. Miter risers into stringer	24	167. Methods of joining steps
168. Return nosing on steps	24	168. Precautions for safety in stairway construction
169. Assemble newel, handrail and balustrade	24	169. Types of platforms and landings, newels, balustrades and handrails
	24	170. Types of standard stairway trim; milled stairways
171. Frame opening and fit disappearing stairway	24	171. Advantages of disappearing attic stairways

Assignment
Sheet No. 1

Covering
Units 1-2

INTRODUCTION TO THE BUILDING TRADES

The largest single group of skilled workers in the nation's labor force is the building tradesmen's group. Their craftsmen are employed mainly in construction, maintenance, repair and alteration of homes and other types of buildings, highways, airports, and other structures.

The prospects for employment in the building trades are very promising for the next decade. Opportunities for employment are expected to rise because of the expected continued expansion in the building industry, retirements, and deaths, and because automation and other technological advances are expected to have limited effects on employment in the building trades.

This assignment is designed to acquaint you with the crafts in which you are expected to study in this program. You will also get acquainted with the wages, working conditions, qualifications needed, and the type and amount of training needed to become a skilled worker in one of the several crafts.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

M. U.S. Department of Labor, Occupational Outlook Handbook, 1961, pp. 339-346.
I. Information Sheet No. 1 (this manual).

Questions:

1. What are the three broad classifications of building trades journeymen? Which craftsmen are in each classification?

2. In what type work are building tradesmen employed? Where is the largest group employed?

3. In what trades is the growth for the next decade expected to be more than average?

4. What training is required to become a skilled craftsman? What advantages will a high school education and a certificate in the building trades be to you when you apply for an apprenticeship?

5. Who supervises apprenticeship programs at the local level?

6. From what two sources may an apprentice applicant get information about apprenticeship openings at the local level?

Information
Sheet No. 1

THE BUILDING TRADES PROGRAM

The Meaning of the Building Trades Program

The program in which you are now enrolled is designed to provide you with the background and experience needed to secure employment as an advanced apprentice in one or more of the several building trades crafts, such as carpentry, brick masonry, electricity, etc. The major crafts in the building trades are carpentry, painting, plumbing, bricklaying, electricity (construction), structural iron work, plastering, roofing, cement finishing, heating and air conditioning. However, the crafts emphasized in this course will be carpentry, bricklaying, plumbing, plastering, painting, and electricity. Your trainin will involve on-the-job experience in building a structure, as well as related classroom instruction and home assignments.

The Importance of the Program to You

You are entering the building trades class in a period when skill and know-how are becoming a "must" for those who wish to secure and maintain employment. Through this program you may train for an occupation in which you will be able to learn a livelihood as well as make a contribution to the welfare of your community, state and nation. It will also help you to decide whether or not this is an appropriate occupation for you.

Your high school diploma, along with a certificate of completion from the building trades program, and the endorsement of your instructor, will be a valuable asset when you apply for an apprenticeshi card. This will indicate to the union members that you do possess some of the endurance and drive necessary for becoming a member of their <u>select</u> group.

The Nature of the Building Trades Field

Building trades craftsmen are employed mainly in the construction, maintenance, repair, and alteration of homes and other types of buildings, highways, airports, and other structures.

The work of building trades journeymen may be grouped into three broad classifications--structural, finishing, and mechanical. However, a good craftsman should become familiar with all of these.

Building trades workers concerned mainly with structural work are carpenters, bricklayers, cement finishers, operating engineers, and ornamental-iron workers. Those concerned mainly with finishing work are plasterers, lathers, tile setters, paperhangers, painters, hard-floor layers, glaziers, roofers, and asbestos workers. Those concerned mainly with mechanical work are construction electricians, sheet-metal workers, plumbers, pipefitters, heating and air-conditioning workers and elevator constructors.

Where Building Trades Workers Are Employed

The largest portion of building trades workers are employed by contractors in the contract construction industry. Some are employed as maintenance workers in manufacturing industries. Some work for government agencies, and others are self-employed.

An important consideration for those of you entering the building trades field is that building trades craftsmen are employed in almost every community. However, the industrialized and highly populated states provide the best employment prospect.

Employment Outlook and Wages

Building trades craftsmen make up the largest group of skilled workers in the nation's labor force. In mid-1960 there were about 3 million such craftsmen, which was approximately a third of all skilled workers.

The favorable employment prospects for building trades workers will result primarily from the approximate 50 per cent increase anticipated in the level of construction activity. Another important factor which will affect the growth of employment in the building crafts is that technological changes have limited effects on these workers. Building trades have generally been able to adapt to technological changes and continue to grow.

Building Trades Unions

Most workers in the building trades are union members. This is especially true in large towns and cities. A large proportion of building tradesmen are members of unions affiliated with the American Federation of Labor--Congress of Industrial Organizations (AFL-CIO).

Most local unions have local joint apprenticeship committees and sponsor various apprenticeship programs which should be of interest to you.

Assignment
Sheet No. 2

Covering
Units 3-6

INTRODUCTION TO CARPENTRY

The largest single group of building trades workers are the carpenters. Their work is commonly divided into two broad categories--"rough" carpentry and "finish" carpentry. However, a skilled carpenter should be able to do both types of work.

In building a typical house, the rough carpenters would build forms, erect the sills, girders, floor joists, subflooring, studding, ceiling joists, rafters and sheathing. They would also erect scaffolding and temporary buildings on the construction site. The finish carpenters would do such things as install molding, wood paneling, cabinets, window sash, door frames, doors and hardware.

In this assignment you will have an opportunity to become acquainted with the carpentry trade and to become aware of what is required of you if you wish to become a journeyman carpenter.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

M. U. S. Department of Labor, Occupational Outlook Handbook, 1961 edition, pp. 346-349.

Questions:

1. What are the two broad categories into which the carpenter's work is divided? What types of work are done in each category?

2. What are some of the major fields of construction in which carpenters work?

3. What is considered a desirable amount of high school education for an apprentice carpenter? What age is the apprentice generally required to be?

4. How many clock hours of on-the-job training are required to complete the carpentry apprentice program? How many hours of related classroom instruction are required?

5. What per cent of the journeyman's wage does an apprentice usually earn? How many months are usually required before he gets an increase in pay? What is the usual per cent increase?

6. Why do carpenters have greater opportunities, than most other building tradesmen, to become general construction foremen?

7. How have technological developments affected the carpenter? What is the national average hourly wage rate? What were the national <u>minimum</u> and <u>maximum</u> hourly wage rates in 1960?

Sheet No. 3

Covering
Units 7-11

ESSENTIAL PREPARATIONS FOR BUILDING A HOUSE

The house which a family builds or buys probably will represent one of their largest investments. If the house is planned with foresight and built with care, it will prove to be a very worthwhile investment.

If you are to be recognized as a good carpenter, you will not only have to be a good craftsman, but you will have to know about building preparations and where to refer individuals for further information about building. By helping the future homeowner you will make friends and build good will in the community.

In this assignment you will have the opportunity to learn about factors which should be considered when selecting a location, complying with building codes and zoning regulations, investing wisely, financing wisely, and cooperating effectively with other individuals.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 221-228.

Questions:

1. What advice should the carpenter be able to give the prospective homeowner?

2. What is generally the largest single item of expense in building a house? Who receives it?

3. What factors should be considered when choosing a location and deciding what type of home to build?

4. What are the purposes of zoning laws and building codes?

5. Who should be contacted to determine the height and adequacy of the sewer? If public sewers are not available, what type of drainage systems may be used as a substitute?

6. What are some of the things which must be checked to insure a clear and unquestionable title to a piece of property you purchase?

7. Why is it necessary to have adequate drawings and specifications when building a home?

8. What precautions should the homeowner take before signing contracts with an architect, carpenter, or other interested parties? Why is the lowest bid not always the best bid?

Assignment
Sheet No. 4

Covering Units
41, 58, 60-65

TOOLS FOR THE CARPENTER

Much of the carpenter's success, and the quality of his work, depends upon his ability to select and care for his tools. In an age when we are constantly bombarded with high-powered advertising, there is urgent need for the tradesman to be able to judge the quality and utility of the tools that he must purchase.

This assignment is designed to acquaint you with the tools used by the carpenter, and to familiarize you with some of the desirable characteristics of high-quality tools.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 7-36, 59-72.

Questions:

1. Why is a carpenter required to own fewer tools today than was required in the past?

2. What type of work should the apprentice's tools be suited for? What two major classifications of tools are suggested for the carpenter's apprentice? Which tools are listed under each classification?

3. What are the major groups of hand tools when classified according to their use? Give three examples from each major group.

4. What are the names of the power tools which must be used in the shop, or must be stationary if on the job? Which one of these is most frequently used?

5. What are two important accessories for the table saw? What use are they to the carpenter?

6. What size blades are available for the electric hand saw? What are two accessories available for the electric hand saw?

7. What are two other names given to the portable jig saw? What are some of the materials which can be cut with the special blades available for this saw?

8. Which power tool may be used to enable carpenters to do butt mortising and lock mortising at production speed?

9. What are the three types of portable sanders? What type work is each best suited for?

Assignment
Sheet No. 5

Covering
Units 12-16

STAKING OUT AND EXCAVATING FOR BUILDINGS

The initial, and possibly the most important step in erecting a structure, is to lay out the foundation. Efficient performance of this task demands that the carpenter possess certain technical knowledge.

Subsequent jobs in erecting the structure will depend upon the "staking out" for its accuracy and stability. Any incorrect placement of footings and foundation walls or piers will affect the strength and stability of the building.

In this assignment you will learn about the procedures, techniques and materials used in foundation layout. Precautions and methods of excavating will also be covered.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 10-19, 32-35
E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 15-26, 416-467.
J. Mix, Practical Carpentry, pp. 57-62, pp. 10-12.

Questions:

1. What factors should be considered in selecting a home site?

2. What are some of the recent trends in designs and styles for homes?

3. What tools and instruments are needed for laying out a foundation? How are they specified?

4. What major steps must be taken in the process of laying out a foundation?

5. Why is it necessary to determine the size girders to be used and the spacing of girder posts and piers before the foundation is laid out?

6. What are the functions of batter boards? What building lines are established on the batter boards? How are these lines indicated?

7. What methods may be used to square the foundation?

8. What special layout requirements are necessary for excavation work? What precautions are necessary in excavation work?

Assignment
Sheet No. 6

Covering
Unit 50

PROCEDURES FOR CONSTRUCTING CARPENTRY EQUIPMENT

When a carpenter starts out on a job, his mechanical ability is often judged by the type of sawhorse or miter box he builds. Not only is the carpenter's reputation affected by his equipment, but his job efficiency will also depend, to a large extent, upon devices he uses in his work.

In this assignment you will learn some facts about the sawhorse, saw vice, workbench stepladder, miter box, straightedge and other items of equipment frequently constructed by the carpenter.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 36-58.

Questions:

1. How is the size of construction lumber referred to? Can the builder be sure that lumber purchased from the mill is the exact size that is specified?

2. What should determine the length and height of a sawhorse? What material is recommended for building a sawhorse?

3. What numbers on the framing square are used to get the top and bottom cuts on the sawhorse legs? (Page 37 in the reference) How should the sawhorse be tested to see if the legs have been cut at the proper angle?

4. What is the advantage of having a workbench? For what type work is it especially useful?

5. What is the approximate height of a convenient stepladder?

6. What is a miter box used for? What material is recommended for constructing permanent miter boxes?

7. What are door jacks used for? What size material is recommended for their construction?

8. What are the names given to two toolboxes recommended for every carpenter? What is the purpose of each?

Assignment
Sheet No. 7

Covering
Units 17-26

CONCRETE AND CONCRETE FORMS

The modern trend in construction seems to be toward larger and more functional buildings which require the use of concrete for strength and protection against fire.

The quality of the concrete work will, to a large extent, determine the strength of the entire structure.

The design and construction of concrete forms is also important because they must hold and support the semi-liquid concrete until it has hardened. These forms must be located accurately and must be able to withstand heavy pressure.

In this assignment you will have an opportunity to become familiar with the various ingredients for concrete and concrete mixes. You will also learn what materials should be used for concrete forms and how forms should be built.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

A. Concrete Form Construction, pp. 15-105.
J. Mix, Practical Carpentry, pp. 15-32.

Questions:

1. What are the major ingredients of concrete? What proportions of each ingredient are recommended for good concrete? In what order are the ingredients specified?

2. What size aggregates are recommended for concrete? What effect does the amount of water have on a concrete mixture?

3. What are the names of the concrete form members needed for a typical concrete wall? What are the functions of each? What materials are used in form construction?

4. What precautions should be taken when building forms?

5. What are the functions of wall ties and spreaders? What types and sizes are found on the market today?

6. How are the quantities of the following materials for forms figured? Studs? Sheathing? Nails?

7. What is the purpose of anchor bolts in foundation walls? How are they installed in the concrete forms?

8. What thickness stock is recommended for construction footing forms? Under what conditions may the earth serve as a footing form? What methodsmay be used to tie the foundation wall to the pier or footing? How are pier and footing forms braced?

9. Under what conditions may a builder use an inside form wall <u>only</u>? What are the disadvantages of using only one foundation wall form? How are wall forms braced?

10. How are openings in concrete walls formed? What methods may be used to provide for easy removal of forms from openings?

11. What are the two general types of concrete steps? What special precautions, if any, must be taken when building each type?

12. What is meant by each of the following terms: Riser? Tread? Pitch board?

13. What size stock is generally used for sidewalk forms? What is the recommended spacing for sidewalk form stakes?

14. What materials should be used for building curved forms?

15. What are the names of forms and centers used for arched openings?

Assignment
Sheet No. 8

Covering
Units 27-33

INTERPRETATION OF BUILDING PLANS AND SPECIFICATIONS

Much of the success of a builder depends upon his ability to read, interpret and follow plans and specifications. The ability to read and interpret plans also will be of value in making estimates of construction costs and thus improve his chances of being a successful bidder.

This chapter is designed to acquaint you with some of the basic fundamentals of blueprint reading, which will enable you to improve your blueprint reading ability when you enter the building industry.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 229-262.

Questions:

1. Why is it so important that the carpenter be able to read and interpret blueprints and specifications?

2. What are some of the things the beginning carpenter should learn to do in order to gain a basic knowledge of how to read blueprints?

3. What are the purposes of a set of drawings, blueprints, and specifications?

4. What is meant by "making a drawing to scale"? What scale is usually used to make house drawings?

5. What four types of drawings are needed for architectural construction? Briefly describe each type.

6. What is the meaning of each of the following: Schedule? Specifications? Symbols?

THE FOLLOWING QUESTIONS PERTAIN TO DRAWINGS AND SPECIFICATIONS OF "A TYPICAL AMERICAN HOME," Reference D, pp. 245-262.

7. What is the pitch of the main roof?

8. How long is the fireplace mantel? How deep is it? What is its height from the finished floor?

9. What are the inside dimensions of the laundry? How many ceiling lights are in the laundry?

10. What material is used for partition walls in the laundry? What type and size basement windows are to be used in the basement?

11. What size joists are to be used for the first floor? What is the recommended spacing?

12. What are the over-all dimensions of the first floor plan? How many windows are to be on the first floor?

13. What are the dimensions for footings and foundation of the north wall? South wall?

14. What is the specified type and grade for the dimension lumber?

15. How is the exterior wall to be finished? What is specified for exterior trim?

TYPES OF WOOD FASTENERS AND BUILDERS' HARDWARE

It is the carpenter's job to fit and fasten many odd-shaped pieces of wood together or in place. Modern science has made this job easier by contributing many improvements, such as the development of special treatments for nails, water resistant qualities of glue, new inventions in fasteners, and many other progressive aids in this phase of construction.

Wood fastening devices include nails, screws, bolts, timber connectors, dowels, anchors, glues, and other building hardware. An efficient carpenter must know the advantages and limitations of these fastening devices.

This assignment provides you with an opportunity to learn about the types, specifications, and uses of the various wood fastening devices and about the common items of building hardware.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 183-215.

Questions:

1. What are the different fastening devices used today? What three main characteristics of nails should the builder be familiar with?

2. What are the reasons for the special coatings and finishes put on nails? What are the names of these coatings and finishes?

3. What are the different kinds of nails? What is the purpose and function of each kind of nail? How are nail sizes designated?

4. In what ways are wood screws considered superior to nails? How is the diameter of screws designated? What are the three different kinds of wood screws, when classified according to the shapes of their heads?

5. What are the uses of each of the following: Metal screws? Bolts?

6. What are the general categories of anchors used for fastening wood to concrete and masonry? What are the names of anchors that belong in each category?

7. What are the four basic hinge classifications? What other types of hardware may be installed on doors?

8. What general types of glue are available for joining wood? What are the advantages and disadvantages of each?

57, 59, 66

PRINCIPLES AND METHODS OF FRAMING FOR FLOORS

No homeowner wants the floors in his house to vibrate every time someone walks across a room. This vibration is annoying, but even more important, it indicates that the floors are unstable. The presence of this type of floor is one of the most obvious signs of poor construction in a home. Of course, it takes more than the use of stronger or larger timbers to avoid this problem. The carpenter has to master many of the principles of joinery, bridging, crowning, and other operations before he can be assured of having a level floor of maximum stability.

The information in this assignment has been selected to give you an opportunity to study the methods, procedures, problems, and common practices involved in modern floor framing.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

J. Mix, Practical Carpentry, pp. 57-73.

Questions:

1. What are girders? What percentage of the building weight do they usually support?

2. What factors must be considered in determining girder sizes?

3. What rule may be used in deciding the proper size wood post needed to support girders? Why should girder post footings extend above the basement floor level?

4. What are foundation sills? What are the usual sill sizes? How should they be secured to the foundation wall?

5. What treatment should be given to sills in order to protect them against termites? What other means of termite protection may be used?

6. What is the function of floor joists? What is the usual spacing of joists. What factors must be considered when figuring joist spans?

7. What is the purpose of bridging floor joists? What size stock is recommended for cross bridging? Which end of cross bridging should be nailed first? Why?

Assignment

Covering
Units 52-56

KINDS, PROPERTIES, AND STOCK SIZES OF LUMBER

Lumber is a very important item in all forms of construction work. In fact, the selection and utilization of lumber will be one of the carpenter's greatest responsibilities. There is a great deal of variation in lumber as to kinds, strength, durability, grain, texture, defects, color, beauty, cost, and wearing qualities; the successful carpenter must have a sufficient knowledge of these conditions to make the proper choices. It is just as important for him to know where and when he can use lumber with certain defects without impairing the structure as to be able to select superior pieces for special uses.

This assignment will give you some information about the characteristics, kinds, grades, properties, stock sizes, shapes, and costs of lumber which will help you to become a successful carpenter.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 113-153.

Questions:

1. What is meant by the following terms: Defect? Cross grain? Pith? Warp?

2. What is yard lumber? What is it generally used for?

3. What are the three grades of yard lumber? What are the grades of factory or shop lumber?

4. What three types of measure are used in selling lumber? Give examples of the types of building materials sold by each type of measure.

5. What portion of the house is generally built from softwood? What are the most common species of softwoods that may be found in a lumber yard?

Assignment
Sheet No. 12

Covering Units
67-74, 80-83,
111-112

METHODS OF WALL FRAMING

Any structure depends upon its skeletal framework for strength and support. It is the framing that supports and holds in place all sheathing, siding, roofing, and flooring. Without a strong frame, you can see how difficult it would be to have a stable building. The accuracy of the entire construction job will bear a direct relationshi to the degree of accuracy maintained in the framing. Therefore, errors in the superstructure can "show you up" as a good or bad workman not only during its erection, but also at any time in the later phases of construction or in later years of service.

In this assignment, you will study about the various methods of framing, their uses, as well as the advantages and disadvantages of each.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 78-84.
J. Mix, Practical Carpentry, pp. 51-55, 76-92.

Questions:

1. What are the commonly used house framing methods? What are the distinguishing characteristics and advantages of each method?

2. What are studs? What size stock is generally used for studs? When is it desirable to use a larger size stock other than what is usually used? How should studs be nailed in place?

3. What is a sole plate? What is the recommended method of nailing it in place?

4. What are corner posts? What are the different methods of assembling corner posts? How should corner posts be nailed to the plate or sill? What size nails should be used?

5. What methods may be used to brace wall studs? What are the specific reasons for stud braces?

6. How are openings in walls framed? Distinguish between load-bearing headers and non-bearing headers? Why are trussed headers recommended for wide openings?

7. What are fire stops? What is their function? What are some methods of fire stopping?

8. What are the principal purposes for applying sheathing? What types of materials may be used as sheathing? What are the advantages and disadvantages of each type?

9. What construction methods may be employed to sheath a wall? What are the advantages and disadvantages of each method? What do the tests made by the Forest Products Laboratory indicate as to ridgidity and strength of various wall construction procedures?

Unit 79

SPECIAL FRAMING PROBLEMS RELATIVE TO THE WORK OF OTHER TRADESMEN

There are very few, if any, carpenters who do all of the work that is called for in present day construction. The building trades, like other phases of industry, are in an era of specialization. Electricians, plumbers, stone masons, and many other tradesmen will be your teammates as you work at the job of completing a house that meets the specifications set up by the homeowner.

The success of the related tradesmen depends in part upon your cooperation and your understanding of their duties and responsibilities. It is not necessary for you to master their special skills, but by gaining special information about their problems you will be able to save time, as well as your reputation, and your employer's money.

This assignment considers special framing problems related to plastering, plumbing, tiling, heating, and electrical work.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 84-90.

Questions:

1. Why is the carpenter considered the key man in the construction of wooden frame buildings? What are some of the things he should know concerning the work of other tradesmen?

2. What does the carpenter need to know concerning brickwork, in regard to framing around chimneys?

3. What are probably the most difficult framing problems for the carpenter in regard to making provisions for other tradesmen? Why must the partition wall that houses the soil stack be built of 2 x 8 studs?

4. Why does the carpenter need to have adequate drawings and layouts of the work of such tradesmen as plumbers, heating and ventilating workers, tilesetters, etc?

5. What are plaster grounds? What is their purpose? Why is it so important that they be placed in the correct places? What determines the required thickness for grounds?

6. Why must the concrete base for a tile floor in the bathroom, lavatories, etc., be dropped between the joists? How is it done?

Assignment
Sheet No. 14

Covering
Unit 78

PRINCIPLES OF PARTITION CONSTRUCTION

The erection of the exterior walls of a house is very important, but it takes more than that to make the house livable. For example, the floor space within those walls must be suitably divided by interior partitions, and openings must be made in the partitions to allow for accessibility and circulation. The construction of such walls and openings calls for careful planning and efficient construction.

The carpenter is often called upon to aid the home builder in planning room arrangement and the positioning of door openings. It is important therefore, that the carpenter should be familiar with the principles that guide the placement of rooms in a home as well as the procedures of constructing the partitions that separate the various rooms.

Your goal in completing this assignment should be to learn the principles, procedures, precautions, and special techniques used in partition construction.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 65-73.
J. Mix, Practical Carpentry, pp. 92-96.

Questions:

1. What is meant by a bearing partition? Non-bearing partition?

2. How should a bearing partition be placed in relation to the floor joists beneath it?

3. What type of floor joist assembly and support must be provided for partitions which run parallel to the joists?

4. How are partition posts assembled? Why is it so necessary that partition walls be tied together firmly with solid anchorage?

Assignment
Sheet No. 15

Covering
Units 34-40

THE NATURE OF INSULATION AND ITS INSTALLATION

Years ago your great-grandfather may have stood before an open fireplace absorbing the warmth from the fire while across the room this same warmth was not prevalent. At the same time enough heat went up the chimney to have warmed this other side of the room with enough heat left over to do the family cooking. Today, you may be supplying a furnace with plenty of fuel and sitting in comfort; however, many dollars worth of heat may be seeping through the walls and ceilings.

By modern means of insulation, any homeowner can prevent excessive loss of heat and thus save money on his yearly heating bill. The carpenter is often called upon to give advice about insulation and to install the types of insulation the homeowner selects.

From this assignment, you may learn about the types, composition, comparative values, installation procedures, and the fundamental principles behind the use of insulating materials.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 155-182.
J. Mix, Practical Carpentry, pp. 207-236.

Questions:

1. What is meant by "thermal insulation"? What results are produced by using this material process?

2. What are the various types of building insulation? What are the characteristics of each?

3. What are the comparative values of insulation?

4. Whereare the recommended places to insulate a residential building?

5. What is a vapor barrier? What conditions cause a need for a vapor barrier? What materials are recommended for use as vapor barriers?

6. What type of construction details and techniques may be utilized to control condensation?

7. What materials may be used for acoustics and sound control? What are other methods of controlling and reducing sound in addition to using soundproof materials?

Assignment
Sheet No. 16

Covering
Units 43-49

TYPES AND USES OF SCAFFOLDING

Most of a carpenter's work has to be done above the ground level. Such jobs as putting on siding and roofing as well as the installation of windows demand that he have some sort of elevated platform for himself and his tools. Ladders are often used to help the carpenter reach high places; however, they have the disadvantage of restricting his horizontal movement. Scaffolds are usually constructed on jobs to avoid these and other disadvantages. Of course, there are many types of scaffolds for different jobs, and it is necessary for the carpenter to know the merits of each in order that he may be able to do his job more efficiently. Not only should the types and uses of scaffolding be known, but a competent carpenter must also know the safest methods of constructing them to prevent injury on the job.

The information in this assignment will give you an opportunity to learn something about the types, uses, limitations, and advantages of scaffolding.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 122-128.
J. Mix, Practical Carpentry, pp. 370-377.

Questions:

1. What factors must be considered in determining the type of scaffold you need?
2. What are the principal parts of a carpenter's scaffold? What size stock should each part be made of?
3. How may steel brackets be used in building scaffolds? Why have they become so popular?
4. What are ladder jack scaffolds? Under what conditions can they be used advantageously?
5. What types of supports may be used for roof construction and repairing?

Sheet No. 17

Covering
Unit 51

SAFETY IN THE BUILDING TRADES

Work in the building trades is generally more dangerous than work in manufacturing, but the risk of injury is lessened considerably when proper work practices are followed. In recent years, the safety record of construction workers in contract construction work has improved as a result of safety programs established by employers and unions.

Not only does an individual who is thoughtless or negligent risk personal injury, but he also increases the possibility of his fellow workers becoming injured. Remember that a good carpenter seldom gets hurt. So don't let constant injury brand you as a poor craftsman. It is always a good practice to follow the old adage that an ounce of prevention is worth a pound of cure. Learning safety rules and practicing them will increase your ounces of prevention.

In this assignment you will have the opportunity of learning general safety rules and practices which are beneficial to carpenters.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 56-57.
E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 16-18, 129-130.

Questions:

1. What is the basic requirement for reducing accidents to a minimum? What is the major cause of accidents in the building industry?

2. What are the major points to be remembered in regard to work clothes? What type of shoes and shoe-soles are recommended for the builder?

3. What are the other hazards that should be guarded against? What habit should the young carpenter form regarding protruding nails?

4. What is the minimum supply of first aid items that should be included in a carpenter's first aid kit?

5. What are a few "safety conscious" suggestions that should be remembered by builders?

Assignment
Sheet No. 18

Covering Units
84-86; 91-93

PRINCIPLES OF ROOF FRAMING

A good roof must not only look nice and stay in place, but it must also serve its primary purpose of keeping out wind and rain. It must be able to support heavy snow and ice and stand firm against blowing winds and rain. These and other factors go together to make roof framing and design one of the carpenter's most difficult construction problems. When reckoning with these factors, the carpenter must select the proper style of roof as well as the most satisfactory pitch for economy, efficiency, and appearance.

An important part of this assignment is the use and function of the framing square. Therefore, it is necessary for the carpenter to acquaint himself with the fundamental operations performed and the special layouts done with the square in solving construction problems.

This assignment is designed to acquaint you with the various styles and variations in roofs, the terms and relationships of roof members, the requirements and calculations for determining proper pitch, the use of scales and tables found on the framing square, and factors regarding overhand, eaves and gutters.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

D. Durbahn, Fundamentals of Carpentry, Vol. I, pp. 73-96.
E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 134-147.

Questions:

1. What are the names of the various roof styles? Which ones are most commonly used for modern residential buildings?

2. What is meant by the following terms: ridge? rafter plate? rafter? What are the names of the different kinds of rafters?

3. Define the following terms: span? run? rise?

4. What constitutes the total rise of a rafter? What constitutes the total length? What methods may be used to determine the total lengths of rafters?

5. What are the principal parts of the framing square? How may a framing square be tested for accuracy of a right angle?

6. What are the names and uses of the various tables on the framing square? On what part of the square may they be found? How may a square be used to calculate proportions? What are other uses and functions of the framing square?

7. What is meant by each of the following terms: unit runs? unit rise? unit length of rafter? How are these unit measurements applied to rafter cutting?

Assignment
Sheet No. 19

Covering
Units 87-89

PROCEDURES AND PRACTICES OF ROOF FRAMING

To the beginner or casual observer, roof framing seems extremely difficult; however, to the carpenter who thoroughly understands a few principles of geometry and can apply them, the problem of framing a roof becomes less and less difficult.

The roof serves as the backbone of a building and must be able to withstand snow, wind, and rain. For this reason, the job of framing a roof is extremely important and must be done with skill and care. To develop the skill that is needed to do this job properly, the carpenter needs more than practice. He must have a thorough understanding of the principles which form the foundation for the procedures he should follow.

This assignment directs your learning toward the methods of laying off rafters, types and nature of overhang, proper use of roof trusses and braces, and practice in the use of tables and scales found on the steel square.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 147-182.
J. Mix, Practical Carpentry, pp. 99-124.

Questions:

1. What is a roof plan? Of what value is a roof plan to the carpenter?

2. What principal purposes does the ridge serve? What is the difference between the "theoretical length" of the ridge and the "true length" of the ridge?

3. What is the difference between plumb and level lines as used with rafter cutting?

4. What three factors should be considered in determining the size of rafters? What are considered safe spans for the various loads, sizes, and spacings of rafters?

5. What is meant by the following rafter terms: ridge cut? seat cut? tail cut? and overhand?

6. What is meant by roof pitch? What is the relationship between unit rise, unit run and pitch? What unit runs and unit rises are required to make up each of the following pitches: 1/6? 1/4? 1/3? 5/24?

7. How can the unit length of a rafter be determined if pitch is known? How is the total length of the rafter determined?

8. If rafter stock has a crown, how should the crown be placed when the rafter is in position? Why is this important to observe in cutting the rafter?

9. What method is commonly used to find the length of rafters? What is a suggested procedure for laying out common rafters? Why is it necessary to shorten a common rafter at the ridge? How should this be done?

10. What is the relationship between the hip rafters and the common rafters? Why must the unit run for hip rafters be 17 inches instead of 12 inches?

11. What is meant by "backing" hip rafters? What methods may be used to back hip rafters?

12. What two methods are used to frame hip rafters at the plumb cut? How much must the hip rafter be shortened for each method of framing?

13. What are the major differences between a hip rafter and a valley rafter? In what ways are they alike?

14. What are the types of jack rafters? What framing members does each type touch when placed in position in the roof? What is meant by the "common difference" of jack rafters? What procedure may be used to find the common difference in jack rafters?

15. What is the most common spacing for rafters used in ordinary roofs? Why is it better to frame a building so that rafters and ceiling joists are side by side at the plate?

16. What methods can be used to provide support for rafters? At what position on the rafters should collar beams be placed? How may the length of a collar beam be determined, without measuring the length, when the height of the beam above the plate is known?

Assignment
Sheet No. 20

Covering
Units 94-96

SPECIAL ROOF FRAMING PROBLEMS

Many of the more complicated aspects of roof framing do not confront the carpenter now because modern roofs tend to follow more simple designs in contrast with roofs on older homes.

However, a highly skilled carpenter should be familiar with some of the special roof framing problems such as framing dormers, lean-to roofs, gambrel roofs, chimney saddles, and bay-window roofs. The ability to skillfully execute these types of framing problems will make the distinction between the highly skilled craftsman and the less skilled.

In this assignment you will have the opportunity to become familiar with some of the special problems relating to roof framing and the procedure used to solve these problems.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 182-214.
J. Mix, Practical Carpentry, pp. 122-124.

Questions:

1. What is the procedure that should be used in laying out rafter spacing on the plate and ridge?

2. On a hip roof how far should the first common rafter be placed away from the corner of the building? Are the hip and jack rafters nailed in place before or after the common rafters? Why is it not necessary to plumb the ridge of a hip roof?

3. What are the different types of shed roofs? What special problems are involved in framing a dormer roof? What problems arise when erecting an intersecting roof?

4. What are the characteristics and construction procedures of a lean-to roof? Gambrel roof? Chimney saddles? Bay window roof?

5. How may the framing square be used to determine the common difference in the lengths of gable-end studs? What figures should be used to get the angle cut used on gable-end studs?

6. What is a layout tee? What size stock should be used for making it? Why is it especially useful for laying out hip, valley, and jack rafters?

7. How is the slope of a roof defined? What slope is required for a flat roof? What method may be used to frame the overhang of flat roofs.

8. Describe the following: transverse beam system of roof framing? longitudinal beam framing?

9. What is a truss roof? What are the advantages of using roof trusses for framing roofs? What are the principal parts of a roof truss?

Assignment

Covering Units
119-126, 139-144,
148-151

TYPES OF WINDOWS AND DOORS, THEIR FRAMING AND INSTALLATION

We would all certainly have to agree that a home or any other building is not complete without windows and doors. Windows allow for natural lighting and ventilation, while doors are necessary for the obvious reasons of gaining entrance and exit. This area of work is especially critical for the carpenter since nothing shows up his skill quite as quickly as a door that drags or one that will not close tight enough to engage the lock. To avoid these and other difficulties, you will have to learn how to construct door and window frames, how to fit, hang, and lock doors and windows, as well as the process of casing openings.

In addition to these skills which you will master, there is much information about doors and windows that you will need to know in connection with the performance of these operations. This assignment is designed to assist you in learning this related information.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 307-326.
J. Mix, Practical Carpentry, pp. 237-282.

Questions:

1. What are door jambs? What are the parts of door jambs? What type of joint is used in building door jambs? What is the usual thickness of door jamb stock? What is the procedure for installing a door jamb?

2. What is a hollow core door? What are some of the unique advantages of a hollow core door? What are the characteristics of other types of doors? What are the popular sizes of exterior and interior stock doors?

3. What three methods are commonly used in hanging doors? What are four types of side hinges?

4. What are the names of the various parts of a door frame? When should the trimming of a door opening take place? What is the procedure to be followed in trimming a door opening?

5. What preliminary precautions should be observed before attempting to fit a door? Approximately how much clearance should be allowed on each side of a well-fitted door? Between the door and the threshold (for exterior doors)? Between door and door stop?

6. What are the two most commonly used types of windows? What are the characteristics of these windows? How do they operate? What are some important facts to remember while installing these windows?

7. What are awning windows? What are the advantages of awning windows?

8. What are gliding windows? How do they operate? What are some important points to remember when installing gliding windows?

9. What are insulating glass units? What useful purposes do they serve? What is one of the recommended procedures for installing insulating glass in picture windows?

10. What precautions should be observed in handling and installing metal framed windows?

Sheet No. 22

Covering Units
98-110, 113-118

EXTERIOR TRIM AND FINISH

The personality of a house depends not so much upon the quality of construction as upon the outward appearance it makes. Your face, physical features, dress, and actions reveal your personality. Figuratively, a house relies on all of these except actions to reveal its personality. The shape of the roof, the location and composition of the front door are important features, but the outer covering and the finish really determine the labels of quality, durability and individuality.

As a carpenter, your responsibility is to build the base for certain features that are to be brought out in painted surfaces such as shadow effects, "scalloped" shingles, half-timbered work, and many others. Therefore, you must know the types of finishes available, but more important, you must know how to construct them so that the desired effects are attained.

The information covered in this assignment will increase your knowledge of the types and characteristics of siding materials as well as the construction procedures followed in applying such material.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 215-246, 254-274.
J. Mix, Practical Carpentry, pp. 125-206.

Questions:

1. What are the principal purposes of the exterior finish? What are the principal parts of the exterior finish?

2. What factors must be considered in choosing the wood for exterior finish? What woods are commonly used for exterior finish?

3. What two useful purposes does building paper serve? Of the various types of building paper, which types are commonly used to cover walls?

4. What are the various kinds of materials that may be used as siding on a house? What are the characteristics and merits of each in relation to the other types?

5. What are the various types of wood siding? What are their different characteristics? What are the advantages and disadvantages of each? What construction methods are employed?

6. What are the different styles of corners and corner board construction that may be used with siding? What are battens and where are they used?

7. What unit of measure is used in estimating wood siding? What are the minimum laps for the various widths of siding?

8. What are the characteristics of wood shingles for wall coverings? What are shakes and how do present day "shaved shakes" differ from shakes of years ago? What are the best woods for making shingles? What portion of a shingle is left exposed?

9. What is asbestos cement siding made from? What are the two commonly used types? What are the usual sizes of asbestos shingles?

10. What is a brick veneer wall? Why should brick veneer be used with balloon type framing instead of platform type? What construction procedures are involved in a brick veneer wall?

11. What are water tables? Describe the three types.

12. What is the cornice trim? What are commonly used styles of cornices? What are the merits and characteristics of each? What are rake moldings?

13. What are the principal roofing materials? What are the three major types of asphalt roofing? What are the various weights and shapes of asphalt roofing materials?

14. What is "flashing"? On what parts of the roof is it required? Why is it used? What are two methods of flashing around chimneys?

15. What is a built-up roof? What materials are required for a built-up roof? What are the various procedures employed in applying each different roofing material? What are the characteristics of a wood shingled roof? How is it constructed?

16. What are the commonly used roof tiles made from? What are the two styles of roof tiles?

17. What are the advantages and disadvantages of each of the following types of roofs: galvanized sheet metal? aluminum?

18. What are the various styles, types and shapes of gutters and downspouts? How are these installed? How is the correct size of gutter and downspout determined?

Assignment
Sheet No. 23

Covering Units
127-138, 152-161

INTERIOR TRIM AND FINISH

To be able to build a sturdy, well designed home is very important; however, much of this good work will be overlooked by the owner if the house is not properly finished on the inside. Finishing the interior is very critical since improper selection of floor, wall, and ceiling coverings, molding, wainscoting, etc., can spoil the effect that the rest of the construction processes tried to create

Some carpenters become so proficient at this phase of their work that they specialize in finish work only. As a young carpenter, it will be profitable for you to be well rounded in your trade so that you will be able to perform or supervise work in any of the phases of building.

This assignment is designed to help you become familiar with some of the principles of interior trimming such as the types and structures of doors, window sashes, casings, molding and wainscoting, and the procedures followed in their installation.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

J. Mix, Practical Carpentry, pp. 295-309, 319-339

Questions:

1. What are the two principal types of finishes for walls and ceilings?

2. What are four different plaster bases? What are plaster grounds? How are the different plaster bases and grounds applied?

3. What materials are used for a "dry wall" finish? What are its characteristics as to application? What are the advantages and disadvantages of "dry wall" construction?

4. What are the sizes of ceiling tile and planks? What are the three methods that may be used to fasten ceiling tile?

5. What procedure should be followed in laying out ceilings for tiling? What is a "starting strip"? What is a recommended method of fitting tile around fixtures, etc.?

6. Why must the base be clean when preparing a surface to receive tile? Approximately what size adhesive spots should be used for applying tile? Where should they be placed on the tile?

7. What is hardboard? What materials may be used as a base for applying hardboard? When applying tile board in bathrooms, which walls should be covered first?

8. How should studs be braced when ceramic tile is to be installed? What are some acceptable bases for receiving ceramic floor tile? If a concrete base is used for installing ceramic tile, what should be its minimum thickness?

9. What is a baseboard?What is its purpose? What is the difference in a base mold and a shoe mold. What are the corner construction details that may be used in installing baseboard?

10. What are the names of the parts of interior trims around windows and doors?

11. What size stock is used for building kitchen cabinet units? What type joints are used in building kitchen cabinets? What are the construction features of built-in cabinets? What "finish" woods may be used in cabinets?

12. What hardwoods are most commonly used for flooring? What softwoods are sometimes used for finish flooring? What is the difference in methods of cutting quarter-sawed lumber and plain-sawed lumber?

13. What are the sizes and grades of oak flooring? What steps should be followed in determining the amount of flooring needed for a room?

14. How may floors be soundproofed? What purpose does asphalt felt serve when laid between the subfloor and the finish floor?

15. What is the step-by-step procedure for installing asphalt floor tile?

Assignment
Sheet No. 24

Covering
Units 162-171

CALCULATIONS AND PROCEDURES FOR STAIRWAY CONSTRUCTION

Our early forefathers used ladders to move from one floor to another. This is a relatively inexpensive stairway, but as you can imagine, it was not very safe or appealing to the eye. A well designed and safely constructed stairway is a real asset to any home whether it is to be used in the basement, between floors, or for the back porch. Stairwork is a special phase of carpentry, and some of the more elaborate stairways are made up in special shops. However, the regular carpenter will be called upon to build ordinary staircases which are found in most homes so it will be advantageous for you to have a knowledge of stairway layout and the skill necessary to construct them.

This assignment is designed to give you certain information that will enable you to calculate for stairway location and layout, as well as to understand some of the more common construction procedures used in stairwork.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

E. Durbahn, Fundamentals of Carpentry, Vol. II, pp. 327-342.
J. Mix, Practical Carpentry, pp. 283-294.

Questions:

1. What are the types of stairs? What are the advantages and disadvantages of each type? What are the safety rules pertaining to stairway building?

2. What is the recommended angle of incline for stairs? What is the recommended height and width for risers and treads?

3. What is headroom? How is it measured?

4. What are stringers? Distinguish between the various types of stringers.

5. What are the basic steps of procedure in laying out the plan for a straight flight of stairs?

6. What procedure should be used to lay out a stair stringer?

7. Why is a four-winder stair safer than a three-winder stair? What is the line of travel? What is considered the average distance (perpendicular) the line of travel should be from the newel post?

8. What is the recommended minimum width for residential stairways?

9. What are the names of stair parts which can be purchased from lumber and millwork dealers?

10. What is the purpose of a disappearing attic stairway? What is the procedure for installing a disappearing stairway?

ANALYSIS OF MASONRY AND CONCRETE

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know

Covering
Units 1-11

TYPES AND DESIGNS OF FOOTINGS AND FOUNDATIONS

Footings and foundation walls comprise the first structural work to be done in building homes and other structures. These two parts of the building are of utmost importance to the strength, appearance, usefulness and safety of any structure which requires them.

Without good footings and foundations, a building may develop unsightly cracks, off-level floors, and cause malfunctions of doors, windows, and other moving parts.

This assignment is designed to acquaint you with the types of footings and foundation walls and the methods used in their constructio

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

C. Dalzell and Townsend, Masonry Simplified, Volume II, pp. 53-135.
M. U. S. Department of Labor, Occupational Outlook Handbook, pp. 356-358, 372-375.

Questions:

1. What is the importance and theory of footings? What kinds of footings are commonly used in building? What are the common footing designs? How are footings made?

2. What concrete mixes are generally recommended for plain concrete footings? What mix is recommended for reinforced footings?

3. What is meant by the dead load? Live load?

4. What four important functions are performed by foundations?

5. What kinds of foundations are recommended by engineers and building codes? Which type is most generally used? What are the advantages and disadvantages of each type? What factors must be considered when designing each type of foundation?

6. What various types of concrete and mortar mixes are recommended for ordinary foundations? What steps of procedure are recommended in building foundations?

7. Why is waterproofing important? What materials and types of waterproofing are available? What factors are important in designing waterproofing systems?

8. What steps of procedure should be followed when waterproofing foundations?

9. What is the nature of the work done by bricklayers? By cement masons? Where are most of the bricklayers employed? The cement masons?

10. What training is required to become a journeyman bricklayer? Cement mason? Where may the training be obtained for each field? What additional qualifications are necessary for each field?

11. How many people are employed in the bricklaying fields? The cement masonry field? How many job openings occur yearly for bricklayers? Cement masons? What is the employment trend for bricklayers? Cement masons?

12. What are the wages generally paid to bricklayers? Cement masons? How do they compare with other skilled building trades workers? Where can you obtain more occupational information about bricklayers and cement masons?

Assignment
Sheet No. 2

Covering
Units 12-18

TYPES, PROPERTIES, AND USES OF LIME AND MORTAR

A good builder, like any skilled tradesman, must have a thorough knowledge of all aspects of his trade. One of the important needs the mason has is a knowledge of the characteristics and properties of cementitious materials which are required in his work.

The functions and requirements of mortar in masonry construction are that it must be of high quality, it must possess sufficient plasticity, it must be of adequate strength, it must provide a cohesive bond for all units, and it must provide a uniform bedding. These and other requirements accentuate the need for a thorough knowledge of high quality cementitious materials.

In this assignment you will have an opportunity to get acquainted with the types, uses, functions and desirable characteristics of lime and mortar.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

B. Dalzell and Townsend, Masonry Simplified, Volume I, pp. 1-59.

Questions:

1. What is lime? What are the different classes and types of limestone and lime? How is lime quarried and processed?

2. What are the major physical and chemical characteristics of lime? What is the effect of lime on mortar? What is hydrated lime? How is lime slacked? What are the uses and functions of lime in construction?

3. What is meant by the terms mortar and grout? What are the functions and requirements of mortar?

4. What are the five general types of mortar? On the basis of proportions, how are cement-lime mortars usually classified? What types of cementitious materials are available and what are their characteristics? What desirable properties should aggregates have? Water? Clay? Admixtures? Mortar colors?

5. What are the commonly used proportions of cementitious materials to sand in average mortars? What are the effects of too much sand in mortar? Too little sand? What are the common proportions of the components of cementitious materials? What precautions should be observed in preparing and mixing mortars?

6. What are the properties of mortars? How is each property attained? What precautions should be followed in selecting and applying mortars?

7. In what type construction are special mortars required?

8. What are the types of mortar according to the A.S.A. designation? What mortar mix proportions are required for each type?

Assignment
Sheet No. 3

Covering
Units 19-28

MIXING, POURING AND FINISHING CONCRETE

Concrete is one of the most important materials the builder will work with. It is extremely valuable as a building material and can be adapted to a variety of uses.

Although concrete possesses many outstanding qualities that are needed in building materials, its success depends upon the people who mix and pour it. Selection of quality ingredients, accurate proportioning, careful mixing, and proper pouring are essentials in the making of good concrete.

In this assignment you will have an opportunity to become familiar with concrete ingredients and the recommended procedures for mixing, pouring and curing concrete.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

B. Dalzell and Townsend, Masonry Simplified, Volume I, pp. 61-104, 313-354.
K. Portland Cement Association, Cement Mason's Manual, pp. 4-35.

Questions:

1. What is concrete? What are the two principal requirements of hardened concrete? What is the major factor in determining the strength of concrete?

2. What are the different kinds of concrete in terms of the quality and characteristics of the ingredients used?

3. What is meant by the terms "compressive" and "tensile" strength of concrete? What is the purpose of pouring steel rods or bars in concrete? What are two types of steel rods?

4. What are examples of coarse aggregates? Fine aggregates? What determines the proper proportions for mixing concrete?

5. What tools and equipment are needed for measuring concrete? What is needed for mixing concrete? How is concrete poured and finished?

6. What is the purpose of admixtures? What are the major groups into which they may be classified?

7. What is the recommended minimum mixing time for concrete in a mixer? When mixing concrete in a mixer, when should the water be placed in the mixer?

8. What tools are needed for finishing horizontal surfaces? Briefly discuss the purpose and use of each tool.

9. Why should concrete be poured in the forms at a point close to where it is to be in its final position?

10. What is meant by "bleeding"? How can it be avoided?

11. What are the purposes of floating? What are the recommended types of floats?

12. What is troweling? Why should the trowel be held flat against the surface for the first troweling? What method can be used to produce a non-slip surface?

13. How does the finishing procedure for air-entrained concrete differ from the procedure for non-air-entrained concrete? Why should it differ?

14. What is meant by curing concrete? How is it done?

15. What are the names of some of the special surface finishes for concrete? What are some of the causes of surface defects?

16. What factors are to be observed when concreting in cold weather? Hot weather?

17. Why is concrete said to be fireproof? What thickness of concrete is required for fireproofing?

18. What aspects should be considered when designing masonry sidewalks? Driveways? Floors? Steps?

19. What kinds of materials are used to make sidewalks, driveways, floors and steps?

20. What additional design factors are discussed in your Masonry Simplified, Volume I text on pages 332-339?

21. What steps should be followed when constructing concrete sidewalks? Flagstone sidewalks? Driveways? Concrete floors? Concrete base flagstone terraces? Concrete porches? Steps? Rear-entranced platforms?

Assignment
Sheet No. 4

Covering
Units 29-36

BUILDING WITH CONCRETE BLOCK

Concrete masonry units are usually referred to as concrete blocks These concrete units are made by mixing Portland cement with water and such materials as sand, pebbles, crushed stone, cinders, slag, burned shale or clay, or other types of aggregate.

Concrete blocks are extensively used in building stores, garages, farm buildings and residences. They are adapted to easy planning and quick erection.

This assignment is designed to acquaint you with the uses of concrete block and of the method used in laying block.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

References:

B. Dalzell and Townsend, Masonry Simplified, Volume I, pp. 141-195.
L. Portland Cement Association, Laying Concrete Block, pp. 1-16.

Questions:

1. From what materials are the most commonly used kinds of concrete masonry units made

2. What terms are used to describe the various sizes and shapes of concrete blocks? Explain the difference between the actual size of concrete blocks and the nominal size of concrete blocks. What are some typical uses of concrete masonry?

3. What are the two general groups of wall patterns for block? What are the advantages of each? How thick should horizontal joints be? Vertical joints? In what proportions should mortar be mixed?

4. Why is it a good practice to string out the first course of block without mortar? What factors must be considered when planning window details? Door details? Concrete floor supports? Beam supports? Block wall intersections? Duct details? Cornice details?

5. What is the correct procedure for "laying up" a block wall?

6. What is the procedure for setting door and window frames in place and laying blocks around them?

7. What is meant by "tooling"? What tool is required for tooling? What are control joints and how are they constructed?

8. What type ties should be used for intersecting bearing walls? Intersecting non-bearing walls?

9. What is a cavity wall? How can the cavity be kept clean while the wall is being laid?

10. How are 8" and 12" walls with concrete block backup constructed?

11. How are block walls cleaned and patched? How are block basements waterproofed?

12. How are concrete block chimneys laid? Pilasters?

13. What types of paint are recommended to paint masonry walls? What are the best methods of applying paint to a masonry wall?

Assignment
Sheet No. 5

Covering
Units 37-44

BUILDING WITH BRICKS

The use of brick as a building material was one of the earliest indications that man had risen above the position occupied by his ancestors.

Brick may be used in a variety of ways to create many different wall patterns and designs. However, a high degree of skill is required to lay brick and no other type of masonry offers the same possibilities for the exhibition of skill and perfection.

In this unit you will have an opportunity to become acquainted with the kinds of brick and their application. You will also gain information which should be of value in developing skill in laying brick.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

B. Dalzell and Townsend, Masonry Simplified, Volume I, pp. 252-312.

Questions:

1. What is meant by the term "brick masonry"? What materials are used to make brick? What are the names of the various kinds of brick? How are bricks manufactured?

2. Briefly describe each of the following physical characteristics of brick: size, weight, quality, color, and surface finish.

3. What is the meaning of each of the following brick masonry terms: backing, brick veneer, buttering, fat mortar, fire clay, grout, header, jointing, lintel, stretcher, pointing trowel?

4. What is meant by the term "bonding" as used in brick masonry? What are the 11 types of bonds? Be able to identify the various types.

5. What tools are used by bricklayers? What is each used for?

6. Describe the procedures that should be followed in making the following joints: (1) bed, (2) head, (3) cross, (4) closure. Describe the types of joint finishes. How thick should joints be?

7. What supports are provided for a brick veneer wall? What purposes do metal ties serve on brick veneer walls? How close together are they spaced along the wall?

8. What are the major steps in laying an 8" common bond brick wall?

9. What procedure is used to lay brick around window and door openings? How are the frames secured to the walls? How is a 4" brick wall laid on a wood frame?

10. What are pilasters? What size should they be? How are they laid out? How are columns and piers laid up?

11. What are the steps involved in laying a chimney? Bricks around joist bearings?

12. What are the functions, characteristics and properties of mortar used for laying brick?

13. What are the four reasons for wetting bricks prior to laying?

Assignment
Sheet No. 6

Covering
Units 45-50

WALL AND PARTITION CONSTRUCTION

Since the dawn of history, walls have protected man and his belongings from the elements and from his enemies. Today walls play just as an important a role in the life of man. In view of this, it is extremely important that careful consideration be given to the planning and construction of walls and partitions.

In planning and constructing walls and partitions, the builder should be able to select the kinds of walls needed, materials, mortar joints and anchors. He must also make decisions on many other important features.

This assignment is designed to acquaint you with the kinds of masonry walls, their design and some suggestions for their planning and construction.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

References:

B. Dalzell and Townsend, Masonry Simplified, Volume I, pp. 196-251.
C. Dalzell and Townsend, Masonry Simplified, Volume II, pp. 315-373.

Questions:

1. What are parapet walls? What is the purpose of wall coping? Corbeling? Chase? Buttress?

2. What are the principle causes of cracks in masonry walls and partitions? What factors affect watertight walls? Strength of walls and partitions?

3. Discuss the important construction details of the following kinds of walls and partitions: (1) solid brick walls, (2) brick partitions, (3) pier and panel walls, (4) rolok-bak and all-rolok walls, (5) cavity walls, (6) tile walls, (7) tile partitions, (8) brick and tile combination walls, (9) glass block, (10) concrete block walls and partitions, (11) brick veneer walls, (12) stucco walls, and (13) stone walls.

4. What design factors must be considered for each of the walls and partitions mentioned in question 3 above?

5. What steps of procedure should be followed when building the walls and partitions mentioned in question 3 above?

6. What is the difference between side construction tile and end construction tile? What is load-bearing wall tile? What are the physical properties of load and nonload-bearing tile? What is common tile? Scored tile? Face tile? Cored-shell tile?

7. What is the method used to designate the dimensions of wall tile? Discuss the sizes, shapes, and uses of the many types of structural clay tile units.

8. What are some typical uses of structural clay tile? In what surface finishes and colors is clay tile available?

9. What aspects of bonding, mortar, joints and pointing are important in clay tile construction?

10. Why is it difficult to plan and lay out walls which are constructed of clay tile? Why should the builder know what manufacturer's tile is available before window and door locations are determined? What items are important considerations in detail planning of walls? Windows? Corners? Flashings? Ties? Lintels? Pilasters? Partition foundations? Nailing strips? Wall draining? Tile beam floors? Parapet walls? Cornices? Fireproofing? Termite shields? Lateral supports? Door bucks?

11. What are the suggested steps in laying tile walls? Veneered and cavity walls? Partitions? Around window and door openings? ~~Reinforced lintels~~? Tile beams?

Assignment
Sheet No. 7

Covering
Units 51-59

CHIMNEY AND FIREPLACE DESIGN AND CONSTRUCTION

A well-built, fire-safe chimney and fireplace are assets to a home and, if well designed, will add a touch of distinction to its appearance.

The location, design and construction of chimneys require careful planning and consideration of many details. These are important factors because they determine the beauty, functionality, safety and durability of the structure.

The purpose of this assignment is to acquaint you with some of the principles of good fireplace and chimney design and construction.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

C. Dalzell and Townsend, Masonry Simplified, Volume II, pp. 228-314.

Questions:

1. What are the two main purposes of chimneys? Why is draft an essential factor in chimney design? Under what conditions will a chimney have flues? From what materials are chimneys constructed?

2. What theoretical factors must be considered in planning chimney flues? Weather resistance? Insulation? Connections? Soot pockets? Flashing? Spark arrestors? Caps? Hoods? Pots?

3. Discuss the important facets of the different kinds of chimneys noted in your text on pages 246-263.

4. What factors should be considered in designing chimney foundations? Unlined and lined flue sizes? Chimney height? Chimney locations? Chimney walls? Chimney bottoms?

5. What procedures should be followed in constructing chimneys?

6. What are the over-all functions of a fireplace? How do fireplaces heat a room? What are the principle parts of a fireplace and what is the function of each part?

7. What are the main features of plain and modified fireplaces?

8. What important facets must be considered when selecting and designing fireplaces?

9. What steps should be followed when building fireplaces?

10. Explain the method used to estimate the number of bricks required to build chimneys and fireplaces.

ANALYSIS OF ELECTRICAL CONSTRUCTION

FUNDAMENTALS OF ELECTRICAL WORK

One of the fastest growing trades in the construction field in terms of employment opportunities is that of the electrician. Over 130,000 are presently employed and between 3,000 and 3,500 job openings occur annually.

Electricians lay out, assemble, install, and test electrical fixtures, apparatus, and wiring uses in electrical systems. These systems are used to provide heat, light, power, air conditioning, and refrigeration in residences, office buildings, factories, hospitals, schools, and other structures. They also install and connect electrical machinery, equipment and controls.

In this assignment you will learn what qualifications are needed to enter the electrical trade, the nature of the work and working conditions of electricians, safety precautions relating to electricity and the fundamental concepts underlying electrical theory.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

F. Graham, Interior Electrical Wiring, pp. 1-21.
M. U. S. Department of Labor, Occupational Outlook Handbook, pp. 361-364.
Information Sheet No. 2, Hazards of Electricity, this manual.

Questions:

1. What is the National Electrical Code? Why were electrical codes developed? What purposes do they serve?

2. What are some preliminary considerations to keep in mind before starting electrical construction work? Who plans the job? Why?

3. What is Ohm's Law? How is it used? Why is it necessary?

4. What is the power equation? How is this formula used?

5. What are the two common types of circuits? How do they differ? How are they used?

6. What is voltage drop? What causes voltage drop? How is the voltage drop of a wire ascertained?

7. What symbols are used to represent electrical fixtures? What purposes do they serve?

8. What two instruments are most commonly used to measure electricity? What is the function of each? How are they used?

9. What training is necessary to become a journeyman electrician? How may this training be obtained?

10. What wages are generally paid electricians? How do their wages compare with other skilled building trade workers? Where can you get more occupational information about the electrical trade?

11. What are the general working conditions for construction electricians?

12. Under what conditions may a person be severly shocked or killed with 120 volt current. Are these conditions prevelant on house construction work?

13. What rules should a workman follow in regard to electrical safety?

Information
Sheet No. 1

HAZARDS OF ELECTRICITY

It is an accepted fact that electricity, if not handled properly, is extremely hazardous. This fact has contributed greatly to the progress that has been made in its control. Through cooperation of manufacturers of electric equipment, governmental bodies, insurance companies and others, the National Electrical Safety Code has been developed. This Code has played an important part in accident-prevention work.

Frequently, construction electricians working with the comparatively low voltage used in house wiring do not have the same respect for it as they do for the high voltage used in delivering current to transformers. They fail to realize that the relationship between the voltage and the resistance of the material serving as ground is the determining factor, and therefore, danger is not determined solely by the voltage. It should be thoroughly understood that the 110 volt current used in lighting circuits is sufficient to kill under many ordinary situations in which the electricians will be working. Potentials of 50 volts or less are capable of killing a person under certain conditions, so extreme caution is necessary.

If the material to which the worker is grounded has low resistance to the flow of electricity, the amperage will be high, resulting in severe electric shock. Electric shock ranges from mild discomfort to actual stoppage of the heart beat and breathing. Serious burns may also result.

The following chart[1] will give some idea of the approximate injury that 60 cycle 120 volts alternating current can cause.

Current	Effect
.0005 or less amperes	No sensation
.0005 to .002 amperes	Threshold of perception
.002 to .010 amperes	Muscular contraction (mild to strong)
.005 to .025 amperes	Painful shock, inability to let go
.025 or more amperes	Violent muscular contraction
.050 to .200 amperes	Ventricular fibrillation (convulsive movement of the heart--fatal)
over .100 amperes	Paralysis of Breathing (apply artificial respiration *immediately*

---

[1] U. S. Department of Labor, *Control of Electric Shock Hazards*, Bulletin 216, 1961, p. 6.

The amount of current flowing through the body is governed by the resistance of the body and the insulation of the person from the ground. If a person's skin is dry his resistance may be about 250,000 ohms (a great variation can be expected). If a person is wet from perspiration this may drop to less than 1,000 ohms. Using Ohm's Law with a 120 volt source and 1,000 ohms, the current is .120 amperes, more than enough to kill.

As one can see, the extent of the injury received from electric shock is controlled mainly by the amount of current, the path of the current through the body, and the duration of the shock. The physical and mental condition of the victim may also have a bearing. This fact should never be interpreted to mean that a strong individual should take chances with electricity.

The frequency of the current and the type of current--direct or alternating--are also factors affecting the nature of shock. High frequency current tends to produce heat instead of shock. This is also the case with direct current. Shock hazards may be less, but more severe burns can be expected from direct current accidents. Accident reports indicate minor electric shock has caused serious accidents In these cases, involuntary contraction of the muscles has caused workmen to fall from ladders and scaffolds.

While accidents with electricity are frequently serious, there are fewer safety precautions to be considered than in many other industries. The following rules should be carefully observed by all workmen employed as construction electricians.

1. Assume a circuit is alive until tested and proved dead.

2. Test circuits with proper testing equipment. (110 volt test lamp placed across a 440 volt line will blow up.)

3. Use safety equipment, such as insulated tools, rubber mats and rubber gloves.

4. Main switches should be locked open and a tag attached indicating workmen are working on some part of the circuit before work is started.

5. Before closing a circuit, check carefully to see that workmen are clear of the circuit.

6. Observe the rules of the National Electrical Safety Code.

7. If minor repair of a live circuit cannot be avoided, arrange to have a qualified helper present.

8. Make all parts of a job safe even though they are temporary.

Aside from the hazards of electric shock, the construction electrician is subject to accidents similar to those encountered by other workmen in the building trades. Such as falling from ladders and scaffolds, accidents in manipulation of tools, etc.

Falling is a major cause of industrial accidents. Workmen should avoid improvised steps and ladders. Dependable ladder and scaffolding equipment is available and should be used. Ladders should be of a type designed for the particular purpose. The design of step ladders is an importnat factor in stability. Frequently, improper placing of ladders results in their slipping or the workman trying to reach too far and becoming offbalanced.

Assignment
Sheet No. 2

Covering
Units 27-65

ELECTRICAL WIRING PRACTICES

The major portion of an electricians work deals with installing wires and conduits. Therefore, he must know how to run wire and conduit, how to make connections, and the different methods and materials available for the various aspects of this part of his job.

In this assignment you will have an opportunity to learn about the various methods, materials, and tools available for use in wiring buildings.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

F. Graham, Interior Electrical Wiring, pp. 22-75, 94-111, 126-151.

Questions:

1. What are the three most commonly used wire splices? What are some other types of connections?

2. What is the proper way to skin wire with a knife? What can happen if it is done improperly?

3. Into what sections or classifications may the electrical wiring system of a residential building be divided? What is the function or purpose of each?

4. How should wire be bent around the screw which fastens it to switches, receptacles, and sockets? Why should it be done this way?

5. What is polarity wiring? Why is it considered important?

6. There are four types of switches which are commonly used for house wiring. List these and explain the operation and function of each.

7. What is nonmetallic sheathed cable?

8. What are seven essential requirements which apply to running nonmetallic sheathed cable.

9. What is armored cable? What are the four recognized types and when should each be used?

10. What is the correct way of designating wire size and number of conductors in flexible armored cable?

11. How is armored cable secured to boxes? What is an antishort bushing?

12. What are the three types of conduit used for general purpose wiring? What are the characteristics and purposes of each?

13. How do conduit ells differ from gas pipe elbows? Why are they made differently? How are ells bent on the job?

14. How are two pieces of conduit fastened together? How is conduit secured to junction boxes?

15. What is the basis for determining the number of wires that may be installed in a conduit?

16. How many bends are permitted in a run of conduit? What might happen if there were more than this number in a run?

17. What are some rules to observe when installing thin-wall conduit in a house?

18. What is fish tape? What is it used for? What is the purpose of a fish tape leader?

19. What could be used to lubricate wires before they are pulled through conduit? Why is this procedure sometimes necessary?

20. What is a hickey? What types of pipe benders are used to bend conduit? What techniques are involved in bending conduit?

21. What types of outlet and junction boxes are available? Where should they be used? Discuss the types of purposes of hangers, covers, and extension rings available for use with outlet boxes.

22. What different fastening devices and anchors are available?

Assignment
Sheet No. 3

Covering
Units 66-82

SPECIAL PROBLEMS FOR ELECTRICIANS

In addition to running wires, conduit, and hooking up lighting circuits, electricians are often called to hook up and/or install various other types of electrical devices.

While these jobs may not be the major part of an electricians work they nevertheless add variety, are challenging, and must be done as skillfully as any other job.

In this assignment you will have an opportunity to learn about some of the special problems which confront electricians and how they can be handled efficiently.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

F. Graham, Interior Electrical Wiring, pp. 152-173, 190-214, 226-247.

Questions:

1. What considerations must be given in wiring circuits for electrical ranges?

2. Why is it usually necessary to run a three wire 120-240 volt circuit to an electric dryer?

3. What is a thermostat? What determines where it should be placed? How does the operation of a low voltage thermostat differ from that of a line voltage thermostat?

4. Why shouldn't the average electrician or contractor lay out an electric heating system?

5. What are the four basic components of a motor circuit? How is the size of each component determined?

6. What types of automatic control equipment, besides thermostats, are used to control heating systems? What is the purpose of each?

7. What is remote-control wiring? What are its purposes and advantages?

8. What equipment is necessary for remote-control wiring? What is the function of each part?

9. What are the three general methods of arranging remote-control relays? What are the advantages and disadvantages of each method? What procedures are followed when wiring remote-control systems?

10. What are the basic NEC electrical wiring design requirements? How are these requirements used to ascertain the wiring requirements of a house?

11. What is an estimate? What are the essential factors that enter into an estimate? What steps are involved in making an electrical estimate?

Assignment
Sheet No. 1

Covering
Units 1-4

AN INTRODUCTION TO THE PLUMBING AND PIPEFITTING TRADE

Employment opportunities for plumbers are expected to continue at a very high rate during the next decade. This is expected to occur because of the high rate of increase in population and because a higher proportion of the population will demand more and better sanitary facilities.

Although plumbing and pipefitting are sometimes considered to be a single trade, most journeymen tend to specialize in either one or the other, especially in large cities. The principal jobs of plumbers deal with water, gas and waste disposal systems, whereas pipefitters install both high and low-pressure pipes that carry hot water, steam and other liquids and gases.

In this assignment you will have an opportunity to become acquainted with the plumbing and pipefitting trade. You will also have an opportunity to get an understanding of the qualifications needed for entry into this occupation as well as the means by which one may get the training needed.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

H. Matthias and Smith, How to Design and Install Plumbing, Introduction.
M. U. S. Department of Labor, Occupational Outlook Handbook, pp. 352-356.

Questions:

1. What is the difference in the type of work performed by plumbers and pipefitters?

2. Where are most plumbers and pipefitters employed?

3. What is the recommended number of years of high school education for the plumbing and pipefitting apprentice? What are the recommended high school courses for the apprentice?

4. What is the length of the apprenticeship program? Years? Hours of on-the-job training? Hours of related classroom instruction?

5. What is the nature of the instruction which the apprentice receives in his related classroom instruction?

6. What are the factors which will cause an increase in employment of plumbers and pipefitters?

7. What is the wage range for plumbers? How do they compare with other skilled building trades workers?

8. Breifly describe the history of plumbing from early Roman times until the present.

Assignment
Sheet No. 2

Covering
Units 5-10

TYPES AND FUNCTIONS OF SEWAGE DISPOSAL SYSTEMS

Adequate disposal of sewage is absolutely necessary in today's highly concentrated urban population. Sewage disposal systems are of two general types - public and private. Even though the installation of public sewage systems does not come under the jurisdiction of the plumber, he should be familiar with their general layout and design since he must use them as terminals for the private sewage systems he installs.

This assignment is designed to give you an opportunity to become acquainted with the various types of sewage disposal systems and to acquaint you with the types of knowledge and skills required in this phase of plumbing.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 1-32.

Questions:

1. Why is it important for the plumber to be familiar with the public sewage disposal system?

2. How many types of public sewers are there? What are their names? How are they classified? What are intercepting and tributary sewers?

3. Who should be in charge of the design and construction of modern sewage disposal plants? Name and briefly explain the operating principles of municipal sewage treatment plants.

4. What type of soil is most suitable for the disposal of waste from a septic tank? Why is it important that the septic system be installed close to the surface of the soil?

5. What is the purpose of a septic tank? What materials are commercially built septic tanks made from? What should determine the size septic tank required?

6. What is the minimum distance that should be allowed between the septic tank and the building? What is the minimum distance the tank should be from the source of water supply?

7. What methods may be used to dispose of the effluent of a septic tank? How is each generally constructed? What factors govern which method should be used to dispose of effluent?

8. What is a distribution box? What purpose does it serve?

~~Assignment~~
Sheet No. 3

Covering Units
11-17, 19-23

LAYOUT AND INSTALLATION OF HOUSE SEWERS AND DRAINS

The layout and installation of the house sewer and drain is one of the most important phases of the plumber's job. Much of the efficiency of the entire drainage installation depends on this part of the plumber's work.

Efficient layout of this portion of the plumbing system requires the selection of proper materials as well as the use of well-made pipe joints.

In this assignment you will have an opportunity to learn some of the basic requirements for installing sewers and drains as well as the materials and tools needed for doing the job.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 53-106.

Questions:

1. What type of fitting is usually provided for connecting the house sewer to the main sewer? How is the grade of the house sewer determined? What is the usual pitch of a house sewer? How is the size of the house sewer determined?

2. What is the house drain? What are the classifications of drains?

3. How is the size of house drains determined? What is the recommended grade for the house drain?

4. What is the purpose of cleanouts? Where should they be placed in a drainage system? How many are required? How are cast iron and clay house drains installed?

5. What are house drain appliances? Describe the types commonly used today.

6. What is the function of the storm drain? How is its size determined? How are they installed?

7. Describe the function of roof leaders and roof terminals. How is the size of the roof leader determined?

Assignment
Sheet No. 4

Covering
Unit 18

TOOLS AND MATERIALS USED IN HOUSE SEWER AND DRAIN CONSTRUCTION

One of the distinguishing marks of a competent craftsman is his having a thorough knowledge of the tools and materials required to do the most satisfactory job. A thorough knowledge of the tools and materials of the trade enables the plumber to (1) make intelligent estimates of jobs, (2) select the materials most appropriate for a given job, and (3) select materials that will meet code regulations and specifications.

In this assignment you have an opportunity to become acquainted with the tools and materials most often used by the plumber.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 33-52.

Questions:

1. How is the sewer and drain defined? What kinds of pipe are generally used for sewers and drain?
2. What materials are most commonly used for waste, soil and vent installations?
3. What provisions must be made if clay pipe has to be laid in swampy, unstable soil?
4. What are the names of some of the commonly used clay fittings? What are the purposes of each of these fittings?
5. What are the required lengths for clay pipe? What is the minimum socket taper required by the A.S.T.M.?
6. What are the advantages and disadvantages of cast iron pipe?
7. What fittings are used with cast iron pipe?
8. What are the other kinds of pipe that may be used for sewer and drain installation? What are the advantages and disadvantages of each?
9. What two types of joints are used for joining vitrified clay pipe? Why must these joints be air tight? How may cast-iron pipe be joined to clay pipe?

10. What tools and materials are required to make a vertical calk joint? Horizontal calk joint? Screw thread joint?

11. What tools are needed for cutting cast-iron pipe? What procedure should be followed in making the cut? Describe the special chain-type cast iron cutter.

12. What is the usual composition of the solder used for solder joints on copper pipe? What four steps should be followed in making solder joint on copper pipe? What are the advantages of soldered joints?

13. What are the commonly used wiped joints? What tools and materials are required for wiping joints? What are the steps of procedure for making wiped joints?

Assignment
Sheet No. 5

Covering
Units 24-37

INSTALLATION OF SOIL AND WASTE PIPE

Two of the most important units of the drainage system are the soil and waste pipe installations. Proper installations of these two units requires a knowledge of basic scientific principles, and thorough knowledge of what constitutes good soil and waste pipe practice, as well as a thorough knowledge of rough-in requirements.

The soil pipe is designed to receive the discharge of water closets and other fixtures and convey it to the house drain. On the other hand, waste pipes are designed to convey the discharge of fixtures, other than water closets, to the soil-pipe branch or house drain.

Some of the most important factors in soil and waste pipe installation are: selection of proper size and type of material, proper use of appropriate fittings, location of cleanouts, pitch and proper joints.

In this assignment you will have an opportunity to get acquainted with the problems involved in installing adequate systems of soil and waste pipe.

<u>Assignment</u>:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 107-146, 197-213.

Questions:

1. What is the function of soil pipe? What material is the soil pipe made from? What type joints are recommended for soil stacks?

2. What are the purposes of "change of direction" units? What are the names of those that are commonly used? Why should a cleanout be installed whenever there is a change in direction?

3. How is the size of the soil pipe determined? What factors, other than pipe size, effect the efficiency of soil pipe?

4. How is the actual installation of the soil pipe started? Where is the soil pipe usually terminated?

5. What is the purpose of roof terminals? What methods may be used to protect them against freezing?

6. What is the soil branch? How is it sized? Why must it be provided with an adequate number of cleanouts? What type of supports and hangers are required? At what grade should soil branch be extended? How is the soil branch installed?

7. What is the function of the waste pipe? What materials are waste pipe made from?

8. What are the common fittings used in the waste pipe system? Where do cleanouts need to be installed?

9. What types of supports and hangers are available for waste pipe? At what location are they mounted for the different kinds of pipe? At what grade is waste pipe installed?

10. What method may be used to determine the size of waste pipe? What is meant by direct waste? Indirect waste? What fixtures belong to each type?

11. What fitting is best to use where the waste pipe joins the soil pipe under the floor? What are the various types of underfloor waste pipe used for domestic buildings?

12. What may be considered to be some of the advantages and disadvantages of the different types of underfloor waste pipe? What provisions must be made for supporting lead pipe?

13. What size vent pipe is used for the laundry tray and sink in the diagram on page 199?

14. What types of tests are given plumbing systems to insure their efficiency and high quality workmanship?

Assignment
Sheet No. 6

Covering
Units 38-50

LAYOUT AND INSTALLATION OF THE WATER DISTRIBUTION SYSTEMS

The proper functioning of plumbing fixtures depend, to a large extent, on an adequate supply of water under adequate pressure. If the pressure is not sufficient, the plumber must be able to select and install pumps so as to raise the pressure to the required level.

In order to provide an adequate supply of hot water, the plumber must be able to determine the required hot water storage tank capacity.

Efficiency in installing both cold and hot water distribution systems requires a thorough knowledge of the proper pipe and fittings available to the plumber.

In this assignment you will have an opportunity to become familiar with the principles and practices regarding the installation of the water distribution systems.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 215-298.

Questions:

1. What are the two units of the cold water distribution system?

2. At what angle should a riser be connected to the main? At what angle should a branch connect to the main? How are water distribution systems supported?

3. What are the names of the various types of water valves? Which type is best known? What is its chief advantage? What precautions should be observed when installing water distribution systems?

4. What is the function of a pump installed on a water supply system? What are the three types of piston pumps and the operating principles of each? What is the purpose of an air chamber? How does a centrifugal pump operate?

5. What are the two cold water distribution systems used in tall buildings? What are the advantages and disadvantages of each? How does each system operate? How does an air power system operate and where is it used?

6. What are the two types of hot water tanks? What three factors should be considered when determining the proper size for a hot-water tank?

7. What are the advantages and disadvantages of the common water heating devices discussed in your text?

8. What should determine whether the hot water tank will be set in a vertical or horizontal position? How is hot water circulated in the various systems discussed in your text?

9. What is the purpose of temperature-pressure relief valves? Where should they be installed?

10. What is a hot water distribution system? What are the three types in common use today? What are the general construction procedures for each system?

11. What is the house service? What depth is recommended for the installation of the house service? What factors must be considered in determining demand and sizing the water service?

12. What is the function of a corporation stop? Curb stop? Meter stop? Water meter?

13. What are some of the common scientific terms that a plumber should know and what does each mean?

14. How is a municipal water supply purified and disinfected? Briefly describe the direct and indirect pressure distribution systems.

15. What materials, pipe, and fittings are used in water distribution systems?

16. What types of joints are used in water supply systems? What tools are needed to do water supply work?

Assignment
Sheet No. 7

Covering
Units 51-64

SELECTION AND INSTALLATION OF PLUMBING FIXTURES

The type and size of plumbing fixtures should be selected before the plumber begins his work. This decision must be made in order to be able to select the proper size soil, waste, and vent systems. The size and design of the fixtures to be installed must also be known in advance so that rough-in requirements can be known by all mechanics on the job.

Two of the most important requirements for the plumber when setting fixtures are a thorough knowledge of the proper traps to be used for the various fixtures as well as the acceptable ventilation systems.

In this assignment you will have an opportunity to become familiar with the various plumbing fixtures and requirements for proper installation.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

Reference:

H. Matthias, How to Design and Install Plumbing, pp. 147-195, 330-372, 380-386.

Questions:

1. What is the basic function of traps used on plumbing fixtures? Describe the two types of water-sealed traps. What can be done to prevent trap seal loss?

2. What materials are used in the construction of traps? What is the design and shape of permissible traps? What are the recommended size traps for the various fixtures?

3. What is a drum trap? On what fixtures are they generally installed? What sizes are they? What is its major advantage? What other traps are available and when should or shouldn't they be used?

4. What is the importance of ventilating the plumbing system? What causes trap seal loss? How can these causes be prevented?

5. What are the two types of ventilation methods? What is the primary purpose of each method? What materials may be used to construct the vent system? How is the vent system supported and at what grade is it installed?

6. What factors must be considered when sizing vents? What is the main soil and waste vent and how is it sized? What is an individual vent and how is it sized? How are plumbing fixtures individually ventilated?

7. What is a unit vent? What special fitting is needed for a unit vent installation? What is a circuit vent? Relief vent? Wet vent? Looped vent? Local vent? Utility vent?

8. From what material are modern plumbing fixtures made? What are they coated with?

9. What are the two types of water closets? What types of closets are unsanitary? What steps of procedure should be followed in installing a closet bowl?

10. What are the two types of flush devices for water closets? How many different kinds are there of each type? How do they operate? What are the advantages of a flush tank over flush valves? What are the operating principles of high and low tanks? What are frost-proof closets and how do they operate?

11. What are the types of lavatories and basins? What type faucets may be used with the lavatories and basins? What waste connections are required?

12. What are the types of bathtubs? What type of trap is used on bathtubs? What steps of procedure are used in installing bathtubs?

13. What are the two types of shower baths? What is the function of the water mixing valve? How is lead safing installed?

14. What factors must be considered when selecting and installing the different types of sinks?

15. What are the three types of urinals? What precaution must be taken when repairing urinals? What type and size trap should be used on urinals?

16. What factors must be considered in selecting and installing laundry tubs? Drinking fountains?

17. What are rough-in drawings? Who makes them? How does the plumber obtain them? What information do they contain?

ANALYSIS OF PLASTERING

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
Introduction to Plastering		
	1	1. Nature of work done by plasterers
	1	2. Training requirements
	1	3. Physical and mental requirements
	1	4. Employment outlook
	1	5. Earnings and working conditions
Lath and Bases		
6. Apply wood lath	1	6. Types of plaster bases
7. Apply metal lath	1	7. Advantages of board (rock) lath
8. Figure house yardage		
9. Break joints	1	9. Purposes of different kinds of metal lath
10. Tie metal lath	1	10. Advantages of metal lath
11. Apply board (rock) lath	1	11. "Floating" system of lath attachment
	1	12. Nails and nailing specifications
	1	13. Commonly used Masonry bases
Tools and Materials of the Plastering Trade		
	1	14. General purpose tools
	1	15. Tools for ornamental work
	1	16. Tools furnished by the contractor
	1	17. Basic plaster ingredients
	1	18. Qualities of lightweight aggregate
	1	19. Types of cementitious materials
Grounds and Corner Beads		
20. Apply wood grounds	1	20. Thickness of grounds
	1	21. Types of tools required
22. Apply metal, screeds, and casings	1	22. Kinds of metal beads, screeds, and casings

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
	1	23. Methods of applying grounds straight and true
	1	24. Methods of grounding out doorways and other openings

Reinforcements

	1	25. Tools required
26. Install reinforcements	1	26. Types of reinforcing used
	1	27. How to estimate amount required
	1	28. Why reinforcement is needed

Base-Coating

29. Mix base-coat materials	2	29. Methods of mixing plaster mortar
30. Trowel on scratch coat	2	30. Effect of proper proportioning
31. Trowel on brown coat	2	31. Types of plaster mortar
32. Rod the wall	2	32. Types of plaster finishes
33. Darby plaster	2	33. Advantages of lightweight aggregate materials
34. Mix colors and tint plaster	2	34. Methods of mixing color
	2	35. Drying conditions
	2	36. Causes of cracking
	2	37. How to estimate materials needed
	2	38. Types of plaster

Finish Coating

	2	39. Tools required
40. Mix finish coat plaster	2	40. Proper mixture
41. Apply finish coat	2	41. Methods of mixing
42. Trowel finish coat	2	42. Thickness of finish coat
43. Float finish coat	2	43. Manufacture of materials
	2	44. Suitability of finishes for different jobs
	2	45. Comparison of smooth and sand finishes

Assignment
Sheet No. 1

Covering
Units 1-28

APPLICATION OF THE PLASTERING BASE

The permanency and appearance of the finished work of the plaster depends to a large extent on having a firm sound base on which to apply the plaster. One of the oldest forms of plaster bases is wood lathing. However, many new types of lath are now on the market and have many improved qualities.

In this assignment you are expected to learn what types of plaster bases are available and how to properly apply them, the use of the common plastering tools and equipment, and the nature of the work, entrance requirements and other occupational information related to the plastering trade.

Assignment:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems, and projects as assigned by your instructor.

References:

M. U. S. Department of Labor, Occupational Outlook Handbook, pp. 367-370.
N. Van Den Braden, Plastering Skill and Practice, pp. 1-143.

Questions:

1. What was the oldest form of lathing for plaster base? Why is it seldom used today?

2. From what materials is board lathing made? What are some of the major advantages of board lathing?

3. What is considered to be the most popular plaster base in use today? What are its primary advantages?

4. What are the commonly known types of gypsum board lath? How are they applied? What are the commonly known types of insulation board lath? How are they applied?

5. What systems of reinforcements may be used for gypsum board? What material is used as reinforcements?

6. What are the principle advantages of metal lath? What are the four groups of interior metal laths? Why should metal lath used on the interior be of a smaller mesh size than for exterior use?

7. What are corner beads used for? Metal Casings? What three types of corner beads are illustrated in your text?

8. What is a ground? What is its purpose?

9. What are channel irons? How are they sold? What two sizes are most commonly used for plastering?

10. How is metal used to make partitions? What are the three types of wall partitions used to reinforce plaster?

11. What are suspended ceilings? How are they installed?

12. When should exterior metal lath be used? What are the types of exterior metal lath? What are some of the other uses of metal lath?

13. Masonry bases are classified into three classes. What are these classes or groups? What types of masonry materials are included in each group? What are the important characteristics of each group?

14. What is the nature of the work done by plasterers?

15. What training is necessary to become a journeyman plasterer? Where may this training be obtained? What additional requirements are necessary?

16. How many people are employed as plasterers? How many job openings occur each year? What is the employment trend for this trade?

17. What are the wages generally paid to plasterers? How do their wages compare with other skilled building trades workers? Where can you obtain more occupational information about the plastering trade?

18. What are the "tools of the trade" that are used by plasterers? What is each used for?

19. What three ingredients are used to make plaster? What is the purpose of each?

20. What types of aggregates are used to make plaster? What are some of the advantages of each?

21. What are the three main types of cementitious materials that can be used in a plaster mixture? What are the advantages and disadvantages of each.

22. What is an admixture? What three kinds are there? What are the major characteristics of each?

23. How and in what proportions is lime mortar mixed? Gypsum mortar? Keene's cement?

24. What types of finish coats are listed in the text? How and in what proportions are each mixed?

Assignment
Sheet No. 2

Covering
Units 29-45

APPLYING PLASTER

The plasterer must have a knowledge of the tools, plastering materials, and the types of plastering bases in order to do a good job of plastering. However, the most important job of the plasterer is the application of plaster mortar.

In this assignment you will have an opportunity to learn techniques for applying scratch, brown, and finish plaster coats to walls, ceilings, beams and arches lathed with the various plaster bases.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

N. Van Den Branden, Plastering Skill and Practice, pp. 144-249,

Questions:

1. What two principal tools are used by the plasterer to apply mortar? What is the purpose of each? What techniques are involved in using each of them?

2. What is a darby? What does it do? How is trimming done?

3. What are dots and screeds? How are they used? Why are they used?

4. How does three-coat and two-coat plaster work differ? What are the purposes of the base coat?

5. What steps are involved in applying a finish coat of putty? Sand? Keene's cement? Interior Portland Cement? What are the advantages and disadvantages of each?

6. What techniques are involved in applying color? Texturing surfaces?

7. What materials are imitated in plaster work? What different techniques are utilized to imitate materials?

8. What is a dryout? What causes it? How can it be prevented?

9. What is a sweatout? What causes sweatouts? How can they be prevented?

10. What happens to plaster if it freezes before it sets? How can you tell if the plaster has been frozen? What is oversanding? Overly retarded plaster?

11. What causes plaster to crack? What steps can the plasterer do to avoid this problem?

12. What is meant by soffit? Arris? How is a beam lined? Dotted? Stripped?

13. What is meant by squaring a room? Why is it done? Explain the following methods for squaring a room: (1) right-angle triangle method, (2) square method, (3) center-line method.

14. What techniques are involved in applying the scratch coat to diamond-mesh lathing? Gypsum and insulating board lathing? Wire lathing? Paper-backed lathing? Tarred surfaces? Concrete surfaces?

15. What is browning? What aspects of browning apply in three-coat work? Two-coat work?

16. Discuss the important aspects of scratch and brown coats as they apply to: (1) lime mortar, (2) lightweight aggregates, (3) portland cement, (4) acoustic plaster.

ANALYSIS OF PAINTING AND DECORATING

Covering
Units 1-36

TOOLS, EQUIPMENT, MATERIAL SELECTION AND SURFACE PREPARATION

An important aspect of the building trades is the painting and decorating field. Approximately 425,000 people are employed in the United States as painters and paperhangers. Though there is somewhat less growth in this field in comparison to the growth of the whole building trade industry, nevertheless 10,000 job openings occur every year. Thus the employment outlook is good in this field.

One of the first steps in learning the painting and decorating trade is to become thoroughly familiar with the tools and equipment and use these items in order to provide reliable service without undue expense and trouble. It is also essential that he learn the proper techniques in preparing all types of surfaces prior to applying the desired finish. He must be well informed on different types and colors of opaque, translucent, and wall covering finishes so that he can expertly advise customers in their choice. The importance of this function of the painter and decorator cannot be overemphasized. If the customer is dissatisfied with the end result, he will not hesitate to complain to you and to his friends. Conversely, a happy customer will gladly pay his bill, compliment you and proudly show off the completed work to his friends and acquaintances.

In this assignment you will learn about employment information dealing with painters and paperhangers, important aspects of tools and equipment, how to prepare surfaces for decorating and factors involved in selecting colors and finishing materials for various surfaces

<u>Assignment</u>:

1. Read the references listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

<u>References</u>:

G. Jarvis, <u>Painting and Decorating Encyclopedia</u>, pp. 49-58 73-76, 78-79, 81-93, 158-162, 165-166.
M. U. S. Department of Labor, <u>Occupational Outlook Handbook</u>, pp. 349-352.

<u>Questions</u>:

1. Contrast the nature of the work done by painters with that of paperhangers. Where are most of them employed?

2. What training is necessary to become a journeyman painter or paperhanger? Where may he obtain this training? What additional qualifications are necessary?

3. How many people are employed in the painting and decorating fields? How many job openings occur each year? What is the employment trend for this trade?

4. What are the wages generally paid to painters? Paperhangers? How do they compare with other skilled building trades workers? Where can you obtain more occupational information about the painting and decorating trade?

5. What are the qualities of a good brush? Where are bristles obtained? What are the different types of brushes available and for what purpose is each type used?

6. List the technique for cleaning brushes. What are the solvents used for cleaning brushes? How can hardened brushes be renovated?

7. What are the techniques involved in the correct use of a brush?

8. Discuss the merits of the three types of paint rollers. How are paint rollers cleaned?

9. What units of equipment are necessary to do spray painting? How do the two principal types of compressors work?

10. What are the two types of spray guns? Discuss the operating principles and also the advantages and disadvantages of each type of gun.

11. What materials are drop cloths made from? Discuss the important aspects of masking tapes, blow torches, moisture meters, and electric sanders.

12. What factors are involved in the preparation of interior woodwork prior to applying the finish? Exterior woodwork?

13. What techniques are used to prepare new plaster walls for painting? How are wallboard and plasterboard prepared?

14. When should new masonry be neutralized prior to applying paint? What materials are necessary to do this?

15. Why must metal surfaces be prepared before painting? What methods are used to clean metal? Discuss the various methods and materials used to clean steel, galvanized iron, zinc, copper and aluminum.

16. On what exterior surfaces may house paint be used? Exterior enamels? Natural finishes? Cement paints? Rubber base paints? What types of exterior wood primers are available and where may they be used? Discuss the proper use of the exterior painting chart on page 90 of the <u>Painting and Decorating Encyclcpedia</u>.

17. List the types and uses of transparent and semi-transparent interior finishes. What opaque interior finishes are available and under what conditions should they be used? Discuss the proper use of the interior painting chart on page 91 of the <u>Painting and Decorating Encyclopedia</u>.

18. What is meant by the term "paint styling?" What factors are involved in good paint styling?

19. How may a color scheme be selected to produce desirable eye appeal for house exteriors? What principles of paint styling are involved in selecting an interior room color scheme? How may the reflecting power of paint colors be used effectively?

20. What are the basic paint styling points? Why should current color trends be studied and constantly watched?

Assignment
Sheet No. 2

Covering
Units 37-75

APPLICATION OF PAINT AND WALL COVERINGS

The major portion of the work day of the painter and paperhanger is spent in the application of paint or wall covering material. He must fully understand the techniques and skills involved in order to produce an acceptable finish. Even though the surface is adequately prepared and a wise choice of materials has been made, an inferior and dissatisfactory job will result if the application is not properly carried out.

Different types of paints and wall coverings require, in many instances, slightly different methods of application. Also, different surfaces may require different methods for applying the same type of paint or wall paper.

This assignment is concerned with the procedures and practices that should be observed when applying paint and coverings. You will learn which paints to use on different surfaces, procedures for applying paint, techniques in the operation of spraying equipment, types of wall coverings, the use and care of wall covering tools, and proper hanging techniques for different types of wall covering materials.

<u>Assignment:</u>

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

<u>Reference:</u>

G. Jarvis, <u>Painting and Decorating Encyclopedia</u>, pp. 95-96, 103-123, 126-131, 167-173, 176-186.

<u>Questions:</u>

1. What different methods are used to mix paint? When is thinning required?

2. List the general brushing techniques discussed in the text. What suggestions are offered for applying exterior oil paint? Flat oil paint? Enamels and varnishes? Shellac? Latex paints? Casein and calcimine? Texture paints?

3. What types of paint rollers are available? What kinds of material are the rollers made of and for what purposes may each be used?

4. What procedure should you use to paint a ceiling? A wall? How should rollers be cleaned?

5. What property protection precautions should be observed when decorating new surfaces? What materials are available for protection?

6. What properties of wood affect the durability of paint? What are the painting characteristics of each of the five classifications of wood as grouped in the text? By what other properties may wood be selected?

7. What suggestions does the author make for painting softwood? Exterior siding and trim?

8. Discuss the procedures to follow for painting windows, doors, and exterior house siding.

9. What procedure should be followed when painting or enameling ceiling? Walls?

10. When applying paint to new plastered walls, what precautions must be observed? List the types of paints that may be used for new plaster walls.

11. Why should masonry surfaces be painted? What paints are suitable for masonry walls and concrete floors?

12. Why is the proper prime coat so important when painting metal surfaces? What suggestions are offered for painting galvanized iron? Copper? Tin? Storage tanks?

13. When should floors be painted rather than varnished? What changes of procedure are necessary when painting open-grained wood floors as contrasted to closed-grained floors?

14. How may checking and grain lifting be prevented when painting fir plywood? Is this technique adaptable to other woods?

15. When may a spray gun be used for painting? Why must painting materials be carefully controlled for viscosity and temperature?

16. What are the techniques for setting the spray gun pattern? For gun stroke? For triggering? Discuss the various trouble shooting aspects of spray painting listed on page 130 of the <u>Painting and Decorating Encyclopedia</u>.

17. What is flock finishing? How may this finish be applied?

18. How should spray equipment be cleaned and maintained? What safety precautions should be followed when spraying?

19. How are wallpapers identified? What are the different types of wallpaper? How is wallpaper measured?

20. What wall coverings are available other than wallpaper?

21. List and explain the use of different tools and equipment utilized by a paperhanger.

22. What is sizing? Why is it applied? What procedure should be followed when applying size? Discuss the various aspects of wallcovering paste.

23. What preliminary steps should be followed when setting up the physical arrangement for paper hanging? Name the items to be checked when inspecting paper.

24. How is paper cut and matched? How is curl removed? What procedure is used to paste, fold and trim paper?

25. What are the three types of seams? Under what conditions is each seam used?

26. What techniques are involved in hanging the first strip? How are the different papers and wall coverings smoothed?

27. How is paper trimmed at doors, windows and baseboards? How is the second strip hung? What precautions must be taken when rolling seams?

28. What techniques are involved in hanging borders? Streamline hanging? Hanging on ceilings?

29. Discuss the other types of wall coverings available and the important hanging aspects for each type.

Sheet No. 3

Covering
Units 76-101

INTERIOR FINISHING AND COST ESTIMATION

Finishing the interior walls and woodwork of a home calls for a thorough knowledge of modern materials and step-by-step procedures. The painter and paperhanger must be able to advise his customers so that they may select the finish that will appropriately fit their decor. Closely allied to the choice of an interior finish is the cost for applying the finish. The customer wants a nice and professional appearing job and at a low cost. The painter can competitively bid for jobs and still give a satisfactory finish if he knows the application procedures of modern materials. He can often under-bid and still turn a handsome profit by substituting a modern 2 or 3 coat finish for an older 5 coat finish. The newer finishes often are more enduring than the older ones and also have a greater aesthetic appeal.

In this unit you will study the basic step for achieving a fine finish on interior woodwork, the different types of modern materials that are available, the correct step-by-step procedure for applying the different finishes, special effects that can be selected for interior walls and various aspects of cost estimation.

Assignment:

1. Read the reference listed below.
2. Be prepared to discuss the study questions listed below.
3. Work out the questions, problems and projects as assigned by your instructor.

Reference:

G. Jarvis, Painting and Decorating Encyclopedia, pp. 187-204, 213-217, 221-223, 259-263.

Questions:

1. What are the basic steps involved in achieving a fine finish? Why is it important to know wood classifications? What are some of the closed and open grained woods?

2. Why is sanding required as the first step in finishing? What procedure should be followed in sanding interior woodwork?

3. For what purpose may a tack rag be used? How can a tack rag be made?

4. Why is wood bleached? What bleaches are available and how is each applied? What safety precautions must be followed when bleaching?

5. For what three reasons is wood stained? What are the major classifications of stains? List the advantages and disadvantages for each type?

6. What is paste wood filler composed of? What thinners are used for thinning filler and when would you use each type? How is wood filler applied?

7. Why is sealer applied and what are the three principal types? How are sealers applied?

8. Discuss the advantages and disadvantages of shellac finishes. What is meant by a "four pound cut?" What procedure is followed in applying a shellac finish?

9. What types of varnishes are available and for what purposes would you use each type? What special techniques should be followed when applying varnish?

10. What defects may develop in varnish finishes? How may they be prevented?

11. For what purposes may penetrating stain waxes be used? A plain wax? A colored wax? How is each applied?

12. What are penetrating wood finishes used for? How are they applied?

13. List the various types of floor finishes and discuss the advantages, disadvantages and general procedures for applying each type.

14. Study the step-by-step procedures for the many wood finishes described on pages 201-204 of the Painting and Decorating Encyclopedia. Which ones would be most applicable for interior woodwork?

15. What is a spatter finish? By what different hand methods may spatter finishes be applied? How is multi-color spraying done?

16. What is stippling and how may this finish be applied? For what purpose is the twin roller used?

17. When may texture paints be used advantageously? What different methods may be used to apply texture paints?

18. Explain the different methods used to apply stripes or lines.

19. When are stencils cut by the painter rather than purchased from paint stores? What are the steps of procedure for doing stenciling work?

20. What is the basic unit of measure usually used for estimating materials? How are interior surface areas measured? Exterior areas? Roof areas?

21. What reference book is an important aid to estimating labor costs? What is meant by overhead expenses? How is profit estimated?

22. What are the two kinds of estimates and what is the purpose of each? Why is it important to have a copy of each on file?

23. What precautions should be observed when estimating from blueprints?

24. What are the two methods for figuring wallpaper materials? How may ceilings be estimated?

25. What factors are involved in estimating the time required to do paperhanging?

*TEACHING GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *BUILDING TRADES, GRADE 11, GRADE 12,

This instructor's guide is for teacher use with a companion study guide (VT 002 086). It is divided into the same areas in the same sequence as the student's manual--carpentry, masonry and concrete, electrical construction, plumbing and pipefitting, plastering, and painting and decorating. Key sheets correspond to the 46 assignment sheets in the student manual, and each contains a key to the study questions by reference to a specific text and page, suggested supplementary assignments, suggested visual aids, and other instructional aids. In addition, 11 objective-type tests with answers are included. This document is available for 50 cents from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

FOREWORD

This instructor's guide has been prepared for the convenience of the Building Trades instructor to provide source material in guiding class discussions outlined by the student's manual, and suggesting evaluation and instructional procedures to be used. For each discussion question provided in the student's manual the reference is given indicating the source of information providing the answer by the letter used to designate the particular text or texts in the assignment sheet.

Although the course of study is keyed to a variety of references, an attempt has been made to keep the number of references at a minimum and still provide adequate coverage. The references were the most recent available at the time of preparation. Additional sources of reference may be found under supplementary assignments which the instructor may find valuable in supplementing the basic material and in assignments for advanced students.

Special credit is due Dr. Robert L. Prater, formerly Research Assistant in Industrial Education, and Mr. Richard E. Ginther, Mr. Donald E. Maurer, and Mr. Robert J. Spinti, all Research Assistants in Industrial Education at the University of Missouri, who prepared assignment sheets and compiled this material.

Key To Assignment Sheets:

CARPENTRY (AREA 1)

MASONRY AND CONCRETE (AREA 2)

ELECTRICAL CONSTRUCTION (AREA 3)

PLUMBING AND PIPEFITTING (AREA 4)

PLASTERING (AREA 5)

PAINTING AND DECORATING (AREA 5)

INTRODUCTION

The instructor's guide and student's manual for BUILDING TRADES are designed to provide organized instructional aids to the teacher of building construction classes and are to be used in conjunction with each other. In preparing this material, it has been assumed that job skills and procedures will be learned through actual experience in the construction of a house or some similar building, under the direction of a qualified instructor. The technical and related information is to be given through the use of these two manuals, also under the direction of the instructor.

The student's manual is divided into the following six trade areas: (1) carpentry, (2) masonry and concrete, (3) electrical construction, (4) plumbing and pipefitting, (5) plastering, and (6) painting and decorating. Each of the areas covered in the student's manual has a complete analysis and a series of assignments. Each instruction unit in the analysis is arranged under the assignment in which that particular item is to be covered; the numbers of these assignments are found in the center column in the analysis.

Each assignment is also cross-keyed to the analysis. The numbers found in the upper right corner on the first page of each assignment under the heading "Covering Units--" refer to the instruction units found in the analysis.

Each of the student assignment sheets contains an introduction, a reading assignment, and a series of questions based upon the readings. The purpose of the introduction is to create interest, convey the importance of the assignment to the student, and tell him specifically what he is expected to learn. The reading assignments are keyed to the Basic Reference List found in the front of the student's manual. These texts were chosen because they covered the material adequately and at a desirable reading level.

The questions on the assignment sheets serve two major purposes: (1) to guide the student to the important aspects of the reading assignment, and (2) to form a basis or guide for classroom discussions. These questions, though designed specifically for the foregoing two reasons, may also be utilized as written assignments to emphasize some particular procedure or topic.

The instructor's guide is divided into the same six areas and in the same sequence as the student's manual. Each student manual assignment has a correspondingly numbered and titled key sheet. Each key sheet is divided into sections which are described below:

I. <u>Key To Study Questions</u>:

This section contains the source of the answers to the study questions. The letter denotes the text as it is listed on the assignment sheet and on the basic reference list. The numbers indicate on what page(s) the answer is to be found.

II. Suggested Supplementary Assignments:

Contained in this section are extra readings, discussion questions, written assignments, special projects and problems, etc. These items will be especially helpful where first and second year building trades students are mixed together in the same class. These suggested assignments may then be made to the advanced students only.

However, the instructor may want to occasionally supplement a particular phase of the major assignment by choosing one or more of the supplementary suggestions and have all of the students complete it. These assignments may also be done on either an individual basis, such as for make up work, or as class projects.

III. Suggested List of Visual Aids:

All types of aids are listed--mock-ups, movies, films, posters, film strips, slides, etc. This list is suggestive and is not complete; therefore, the instructor should add to the list. Further, he should carefully choose and use only those aids which best fit his objectives.

IV. Other Instructional Aids:

Essentially this part of the key contains suggestions of speakers and field trips as well as other aids. Again, the instructor should carefully choose those which are appropriate for his particular course. He also should add to this list any item that he finds effective as a teaching aid.

V. Test No. -- Covering Assignments -- and --:

The first four parts of the key described above are found on each key; however, part V is included periodically covering several preceding assignments. These tests are meant only as a guide or model for the instructor to follow when he constructs his own evaluation devices. The individual test item samples are scattered throughout the reading assignments and do not necessarily cover the readings in depth. The instructor will want to make his own tests so that he can test on the principles, procedures, and other technical knowledge that he himself has emphasized in his daily instruction.

The instructor's guide should be used as an aid to make his teaching more effective. It is a guide and not intended to set a formal structure within which a building trades class is to operate. The instructor should feel free to modify, as his experience will allow, by adding or deleting material in both the student's and the instructor's manuals so that they may better fit his particular needs and objectives.

BASIC REFERENCES USED IN BUILDING TRADES COURSE OF STUDY

Listed below are the basic references used in the course of study for Building Trades. The alphabetical designation for each reference remains the same throughout this publication.

A. Concrete Form Construction, Delmar Publishers, Inc., Albany, New York, $1.75* Area 1*** (1)**

B. Dalzell, J. Ralph and Townsend, Gilbert, Masonry Simplified, Volume I, American Technical Society, Chicago, 1958, $5.75* Area 2 (2)

C. Dalzell, J. Ralph and Townsend, Gilbert, Masonry Simplified, Volume II, American Technical Society, Chicago, 1957 Area 2 (3)

D. Durbahn, Walter E., Fundamentals of Carpentry, Volume I, American Technical Society, Chicago, 1961, $4.75* Area 1 (10)

E. Durbahn, Walter E., Fundamentals of Carpentry, Volume II, American Technical Society, Chicago, 1960, $4.95* Area 1 (12)

KEY--ASSIGNMENT SHEET NO. 1
(CARPENTRY)
INTRODUCTION TO THE BUILDING TRADES

I. Key to Study Questions:

1. M-339-340
2. M-344
3. I-1
4. I-1
5. M-345
6. M-345-346

II. Suggested Supplementary Assignments:

A. Prepare a report on one of the building trades and present it to the class. Be sure to cover such topics as employment opportunities, training and qualifications needed, working conditions, and wages.

III. Suggested List of Visual Aids:

A. Film: CAREERS IN THE BUILDING TRADES--(16mm, 11 min., B & W, sound, $1.00)-Coronet, University of Missouri, Audio-Visual Department, Columbia, Missouri. Bob, a high school boy working on a construction job during the summer, observes all the building tradesmen and discovers that his interests and aptitudes fit him for a vocation in the building trades. When he returns to school, he finds that each of his subjects will contribute to his future work.

B. Film: KNOWLEDGE AND SKILLS--(16mm, 20 min., color, sound, free)--Modern Talking Picture Service, Kansas City 11, Missouri, or St. Louis 11, Missouri. This film brings you a special report on tomorrow's skilled people--the men and women, young and not so young, in the trade and industrial program of our public schools. It is a special report on what we are doing in our schools to provide the skilled and technical workers of the future.

IV. Other Instructional Aids:

A. Speakers:
1. Invite a local building contractor to speak on "The Contractor--Responsibility and Functions of his Job."
2. Invite an official of the local union to speak on "Unions and the Building Trades."
3. Invite a representative of the Bureau of Apprenticeship Training to speak on "The Apprenticeship Program in the Building Trades."

B. Field Trip: Visit a large construction site and observe the various tradesmen at work in their specific job operations.

KEY--ASSIGNMENT SHEET NO. 2
(CARPENTRY)
INTRODUCTION TO CARPENTRY

I. Key to Study Questions:

1. M-346
2. M-347
3. M-347
4. M-347
5. M-347
6. M-347
7. M-348

II. Suggested Supplementary Assignments:

A. Read: Durbahn, Walter E., Fundamentals of Carpentry, Vol. I, American Technical Society, Chicago, Illinois, 1956, pp. 1-6.

   1. Write out the answers to the ten questions on page 6. Be specific with your answers.

III. Suggested List of Visual Aids:

A. Film: THE CARPENTER--(16mm, 50 min., color, $3.00)--United Brotherhood of Carpenters and Joiners, 222 E. Michigan St., Indiaiapolis 4, Indiana. Carpenters are shown in modern saw mills, high-speed plywood mills, and on jobs where wood goes into the construction of everything from dams to kitchen cabinets. The film demonstrates the wide scope of the carpenter's skills.

IV. Other Instructional Aids:

A. Speaker: Invite a local carpenter to speak on the topic, "Working Conditions and Earnings of Carpenters."

B. Field Trip: Visit a large commercial building under construction and observe the various types of work that carpenters do.

KEY--ASSIGNMENT SHEET NO. 3
(CARPENTRY)
ESSENTIAL PREPARATIONS FOR BUILDING A HOUSE

I. Key to Study Questions:

1. D-221
2. D-222
3. D-222
4. D-223
5. D-225
6. D-225
7. D-226
8. D-226-227

II. Suggested Supplementary Assignments:

A. Read: Lair, E. A., Carpentry for the Building Trades, McGraw-Hill Book Company, Inc., New York, 1953, pp. 255-284.

1. Be prepared to lead a class discussion on the various topics such as blueprints, specifications, and contracts.

III. Suggested List of Visual Aids:

A. Film: WHAT IS A CONTRACT?--(16mm, 10 min., B & W, $1.00)--Coronet, University of Missouri, Audio-Visual Department, Columbia, Missouri. Two youngsters take summer jobs to buy the things they have always wanted, only to find themselves jobless and debtors in the middle of the summer. But by contract, their problems are happily solved. Through this story, your students will have a splendid opportunity to study the elements of mutual assent, competent parties, legal bargains, consideration, in both oral and written contracts.

IV. Other Instructional Aids:

A. Obtain copies of blueprints, contracts and specifications from local contractors. Distribute these among the class and then discuss the various major topics and questions.

B. Speaker: Invite a bank manager, broker or architect to talk on " Financing a Home, Legal Requirements, Building Codes and Contracts."

KEY--ASSIGNMENT SHEET NO. 4
(CARPENTRY)
TOOLS FOR THE CARPENTER

I. Key to Study Questions:

1. D-8
2. D-8-9
3. D-9-35
4. D-59-66
5. D-59-62
6. D-67
7. D-68
8. D-69
9. D-69-70

II. Suggested Supplementary Assignments:

A. Prepare a list of carpentry tool manufacturers and write for literature and tool catalogs which describe the purposes, functions and advantages of the various tools.

III. Suggested List of Visual Aids:

A. Charts: Stanley Tools, Division of Stanley Works, "Stanley Instruction Charts," (38--19" x 25")--$6.00 per set. These charts cover all woodworking tools and seven commonly used metal working tools.

B. Write to: Stanley Tools, Division of Stanley Works, Catalog No. 34--(112 pp.)--Free. New Britain, Connecticut. This paper-bound book illustrates a complete line of tools and also a price list insert.

IV. Other Instructional Aids:

A. Speaker: Invite your local hardware dealer or a district representative from one of the tool manufacturing companies to speak on the topic, "Essential Features of Quality Tools."

KEY--ASSIGNMENT SHEET NO. 5
(CARPENTRY)
STAKING OUT AND EXCAVATING FOR BUILDINGS

I. Key to Study Questions:

1. E-416-426
2. E-429-454
3. D-10-19; D-32-35; E-456-467
4. E-18-22
5. J-57-62
6. J-10-12;
7. E-456-467; E-18-22; J-11-12
8. E-22-26

II. Suggested Supplementary Assignments:

A. Select a floor plan from a home builder's magazine and make a sketch of the complete excavation layout required to build the house.

B. Make a list of the materials and tools you would need to make the above building layout.

C. Divide students into small groups and have them stake out a small building near the school.

III. Suggested List of Visual Aids:

A. L. S. Starrett Company, The Starrett Transit Book, Educational Division, Athol, Massachusetts, free, 47 pages. This book contains brief, concise instructions on how to set up and use a transit and level. One section deals with laying out and setting batter boards with the transit and level. (For advanced students.)

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 6
(CARPENTRY)
PROCEDURES FOR CONSTRUCTING CARPENTRY EQUIPMENT

I. <u>Key to Study Questions</u>:

1. D-36
2. D-26
3. D-37-39
4. D-41-42
5. D-44
6. D-47
7. D-48
8. D-48-49, 52, 54

II. <u>Suggested Supplementary Assignments</u>:

A. Utilizing the written assignment for this unit, have students construct one or more of the pieces of equipment described in the assignment, Vol. I, pp. 36-58.

III. <u>Suggested List of Visual Aids</u>:

IV. <u>Other Instructional Aids</u>:

A. Field Trip: Visit different construction sites and observe the various types of carpentry equipment used by the carpenters "on the job." Make note of the ideas that would be of use to the class members.

KEY--ASSIGNMENT SHEET NO. 7
(CARPENTRY)
CONCRETE AND CONCRETE FORMS

I. Key to Study Questions:

1.	J-16-17	6.	A-23	11.	A-73-78
2.	J-16-18	7.	A-30-35	12.	A-79-81
3.	A-14-15	8.	A-39-52	13.	A-90-91
4.	A-16	9.	A-53	14.	A-91
5.	A-18-23	10.	A-65	15.	A-94-98

II. Suggested Supplementary Assignments:

A. Read: Federal Housing Administration, Minimum Property Standards, U. S. Government Printing Office, Washington, D. C., pp. 76, 80-81.

1. Read the requirements for concrete construction in the reference.

2. Be prepared to answer oral questions concerning federal requirements for concrete construction.

B. Make a list of materials required to build sectional forms for a 10 inch thick foundation wall, 50 feet long and 8 feet high.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Field Trip: Visit several construction sites, commercial and residential, taking note of the various methods used in the construction of footing and foundation forms.

KEY--ASSIGNMENT SHEET NO. 8
(CARPENTRY)
INTERPRETATION OF BUILDING PLANS AND SPECIFICATIONS

I. Key to Study Questions:

1. D-229
2. D-231
3. D-231
4. D-231-232
5. D-234-236
6. D-237
7. D-251
8. D-251
9. D-254
10. D-254
11. D-254
12. D-256
13. D-258
14. D-259
15. D-260

II. Suggested Supplementary Assignments:

A. Obtain actual construction blueprints and study them in order to become more adept at the interpretation of drawings.

B. Survey magazines and newspapers for house plans of different styles of building architecture.

III. Suggested List of Visual Aids:

A. Using either an opaque or overhead projector, show slides of sample house plans and use this to give direction to class discussion.

IV. Other Instructional Aids:

A. Write to: Eugene Dietzgen Company, The Use and Care of Drawing Instruments, Chicago, Illinois, 1954, (Free). This booklet contains architectural symbols, electrical symbols and plumbing symbols. It also contains information on the use and care of drawing instruments.

V. Test No. 1, Covering Assignments 1-8:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. Batter boards should be located at the exact point where the corners of the building are to meet E-19,22

(T) F 2. The ground around a building should slope away from the building. E-23

(T) F 3. The ability to use a transit may lead the way to advancement for the builder. E-456

T (F) 4. An error in adjustment of the leveling instrument is not very costly when sights are taken over a short distance. E-459

(T) F 5. The 6-8-10 method will prove inaccurate when squaring large buildings E-464

T (F) 6. When staking out irregular shaped buildings, the offsets should be laid out first. E-465-466

(T) F 7. Foundation footings should be poured separately from the walls. J-15

(T) F 8. In specifying a concrete mix, the first number refers to the proportion of Portland cement, the second number the sand and the third the gravel. J-16

T (F) 9. If water supply lines are placed under a floor slab, they do not need to be put in trenches. J-28

T (F) 10. The keyhole saw and the backsaw are similar in shape and are used for about the same purpose D-16

T (F) 11. The fewer teeth a saw has the finer the cut it will make. D-17

(T) F 12. The jack plane is probably the best plane for all-around work. D-20

T (F) 13. Miter boxes should always be made of softwood. D-47

(T) F 14. As the amount of open space around a building decreases, the fire hazard increases. D-223-224

T (F) 15. A lot survey should be made by the homeowner. D-225

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Each one cubic foot volume sack of Portland cement weighs approximately 94 lbs. J-16

2. Form marks can be removed from foundation wall surfaces by rubbing with a carborundum stone and a mixture of cement and water. J-19

3. Metal or wood sleeves can be inserted in the basement wall form to provide openings for utility connections. J-23

4. Bolts used to anchor sills to foundations should be not more than 12 inches from the corners and on 4 foot centers. J-24

5. It is recommended that metal reinforcement in concrete slabs be placed 1 1/2 inches from the top surface of the slab. J-30

6. The standard framing square has a 24 inch blade and 16 inch tongue. D-12

7. The crosscut saw most widely recommended for rough construction work has eight points per inch. D-17

8. The countersink bit is used to produce a cone-shaped recess at the top of a drilled hole to receive a flathead woodscrew. D-28

9. The 16 ounce hammer is recommended for general all around carpentry work. D-32

10. The term "plan view" and floor plan mean the same. D-234

11. Drawings are simplified by the use of symbols which represent materials as wood, stone, brick and concrete. D-237

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

B 1. The recommended distance between studs when erecting foundation forms is (A) 16 inches; (B) 24 inches; (C) 32 inches; (D) 48 inches. D-28

B 2. The primary use of the band saw is (A) making straight cuts; (B) cutting curved surfaces, (C) ripping, (D) cutting angles. D-61

D 3. The operation of straightening the edge of a board on a jointer is called (A) facing; (B) smoothing; (C) planing; (D) jointing. D-62

C 4. Power planes are available which will finish surfaces up to (A) 1 inch wide; (B) 2 inches wide; (C) 2 1/2 inches wide; (D) 4 inches wide. D-68

A 5. Slots which are formed in footings to lock or tie the footing and foundation wall together are called (A) keyways; (B) grooves; (C) trenches; (D) slides. A-41

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four items in which a builder should be able to advise the prospective homeowner are:

(A) securing an architect

(B) choosing a suitable location

(C) drawing up of contracts

(D) handling financial problems D-221

2. The four major types of architectural drawings are:

(A) plans (C) details

(B) elevations (D) sections D-234

3. Three types of portable sanders are:

(A) disc (C) orbital

(B) belt D-69

4. The two most common methods for establishing right angle corners when laying out building lines are:

(A) 6-8-10 method

(B) level-transit and plumb bob E-464; E-20

KEY--ASSIGNMENT SHEET NO. 9
(CARPENTRY)
TYPES OF WOOD FASTENERS AND BUILDERS' HARDWARE

I. Key to Study Questions:

1. D-184
2. D-187
3. D-188-193
4. D-193-194
5. D-196-198
6. D-198
7. D-205-212
8. D-212-214

II. Suggested Supplementary Assignments:

A. Visit local building hardware dealers and obtain literature on various types of fasteners and hardware. Write manufacturers of hardware and request literature on their products. Catalog these into file form.

III. Suggested List of Visual Aids:

A. Film: USING SCREWS AND NAILS--(16mm, 12 min., B & W, $1.50)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Identifies the common types of nails and screws used in woodworking, as well as the function and uses of hammers, nail sets, and screwdrivers.

B. Use an overhead projector to show the various fasteners on the screen. Have the class identify and discuss each type.

IV. Other Instructional Aids:

A. Speaker: Invite a local established hardware store or building supply company manager to speak on "The Kinds, Types and Functions of Materials and Trends in the Area of Building Hardware."

KEY--ASSIGNMENT SHEET NO. 10
(CARPENTRY)
PRINCIPLES AND METHODS OF FRAMING FOR FLOORS

I. Key to Study Questions:

Questions:
1. J-57
2. J-57
3. J-60-61
4. J-62, 65
5. J-64
6. J-64-70
7. J-70, 72

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. F., Fundamentals of Carpentry, Vol. II, American Technical Society, Chicago, Illinois, 1956, pp. 94-101.

1. Write out the procedure used to frame the sill, locate the joist, and frame joists.

B. Make scaled mock-ups of the various styles of sill construction detail and joist and girder construction detail.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Field Trip: Visit a construction site and view the sill and joist construction while they are being framed.

KEY--ASSIGNMENT SHEET NO. 11
(CARPENTRY)
KINDS, PROPERTIES, AND STOCK SIZES OF LUMBER

I. Key to Study Questions:

1. D-113-119
2. D-120
3. D-120-121
4. D-121, 125-127
5. D-127

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. I, American Technical Society, Chicago, Illinois, 1956, pp. 102-113.

1. Discuss the growth of wood: (A) hardwood and softwood; (B) heartwood and sapwood; (C) growth rings; (D) spring wood and summer wood; (E) grain and texture; and (F) moisture content.

B. Write to lumber companies and associations requesting literature on and samples of the kinds of lumber used in the building construction industry.

III. Suggested List of Visual Aids:

A. Film: KNOWING WOODS AND THEIR USES--(16mm, 13 min., B & W, $1.50)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Explains the classifications and characteristics of woods so the craftsman can better select and order the woods he needs.

IV. Other Instructional Aids:

A. Speaker: Invite a local lumber dealer to speak on the topic, "Selection, Utilization, and Care of Lumber."

KEY--ASSIGNMENT SHEET NO. 12
(CARPENTRY)
METHODS OF WALL FRAMING

I. Key to Study Questions:

1. J-51-55
2. J-76-77, 81
3. J-78-81
4. J-81-82
5. J-84-85
6. J-85-89
7. J-90-92
8. E-78-81
9. E-81-84

II. Suggested Supplementary Assignments:

A. Make a scale model, sectional mock-ups of the various styles of house framing details as found in the reference for this unit.

B. Make large detailed scale models of corner post constructions, wall partitions, window and door details, and flooring details.

III. Suggested List of Visual Aids:

A. Film: BUILDING FOR SAFETY--(16mm, 14 min., color, free)--Underwriters' Laboratories, Inc., Public Relations Division, 207 E. Ohio Street, Chicago 11, Illinois. Applies science and engineering to the study of fire hazards of building materials. Floors, walls, ceilings, roofs, and doors are tested. Shows testing of floor constructions, roof shingles, glass block walls and building insulation.

IV. Other Instructional Aids:

A. Field Trip: Visit a construction site and observe actual methods and procedures of wall framing.

KEY--ASSIGNMENT SHEET NO. 13
(CARPENTRY)
SPECIAL FRAMING PROBLEMS RELATIVE TO THE WORK OF OTHER TRADESMEN

I. Key to Study Questions:

1. E-87
2. E-87-88
3. E-88-89
4. E-87-90
5. E-84-86
6. E-90

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., *Fundamentals of Carpentry*, Vol. II, American Technical Society, Chicago, Illinois, 1956, pp. 91-93.

   1. Lay out an ellipse using the string method. When might you have occasion to utilize this procedure? Investigate into and determine other practical methods for the layout of an ellipse. What are some other geometric constructions which are applicable to the carpenter's job?

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Speaker: Invite a local building trades representative to speak on the topic, "The Necessity of Cooperation Between Workers of Various Occupational Areas on a Construction Job."

KEY--ASSIGNMENT SHEET NO. 14
(CARPENTRY)
PRINCIPLES OF PARTITION CONSTRUCTION

I. Key to Study Questions:

1. J-92-96
2. E-66-67
3. E-65-66
4. E-71-73

II. Suggested Supplementary Assignments:

A. Read: Mix, F. M., Practical Carpentry, The Goodheart-Willcox Company, Inc., Chicago, Illinois, 1960, pp. 93-94.

   1. What are some methods of attaching partitions to a wall? Draw sectional views of the various methods.

B. Make a scale model mock-up of various interior wall partition constructions.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Speaker: Invite a local architect to speak on the topic, "The Considerations Necessary in the Location, Placement, and Construction of Partitions."

KEY--ASSIGNMENT SHEET NO. 15
(CARPENTRY)
THE NATURE OF INSULATION AND ITS INSTALLATION

I. Key to Study Questions:

1. D-156
2. D-157-175
3. D-175-182
4. J-210
5. J-211-213
6. J-216-222
7. J-227-236

II. Suggested Supplementary Assignments:

A. Read: Mix, F. M., Practical Carpentry, The Goodheart-Willcox Company, Inc., Chicago, Illinois, 1960, pp. 373-378.

  1. What purposes does an attic fan serve? How is air discharged to the outside of the building?

  2. Why is "free circulation" of air required? How is this obtained in the construction of the building?

B. Have members of the class write to the manufacturers of insulation materials to obtain pamphlets, booklets, brochures, and other interesting data.

III. Suggested List of Visual Aids:

A. Obtain samples of thermal and acoustical insulation from local building materials dealers, mount on appropriate panels, and use as visual displays.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 16
(CARPENTRY)
TYPES AND USES OF SCAFFOLDING

I. Key to Study Questions:

1. E-122
2. E-122-125
3. E-125
4. J-370-372
5. J-372

II. Suggested Supplementary Assignments:

A. In a one-page paper summarize the need for and the importance of erecting safe, dependable scaffolding.

B. Find out what types of steel and other scaffolding are available in your local area.

III. Suggested List of Visual Aids:

A. Film: THE WOODWORKER--(16mm, 10 min., B & W, $1.00)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Shows carpenters erecting scaffold and setting forms for concrete foundations and walls. The building of a house and millworking operations are also portrayed.

IV. Other Instructional Aids:

A. Field Trip: Visit various construction sites and note the different types of scaffolding in use. Notice the various scaffolds in use by the different types of tradesmen.

KEY--ASSIGNMENT SHEET NO. 17
(CARPENTRY)
SAFETY IN THE BUILDING TRADES

I. Key to Study Questions:

1. E-16-17   2. E-17   4. D-56
3. E-17-18   5. D-57

II. Suggested Supplementary Assignments:

A. Read: Manual of Accident Prevention in Construction, The Associated General Contractors of America, Inc., Washington, D. C., 1958, Sections 15-19.

1. Write summaries of the five different sections on safety emphasizing the main facts. Report to the class on this paper.

III. Suggested List of Visual Aids:

A. Film: SAFE USE OF TOOLS--(16mm, 10 min., color, $3.00)--Audio-Visual Extension Service, 115 T.S.M., University of Minnesota, Minneapolis 14, Minnesota. Shows the safe use of tools such as scissors, knives, hammers, saws, files, clamps and other small tools in school and home situations.

IV. Other Instructional Aids:

A. Using the Missouri Revised Statutes, chapters 286-295, look up and discuss the industrial safety provisions.

B. Obtain from local building trades union representative a list of union regulations dealing with safety.

V. Test No. 2, Covering Assignments 9-17:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. An 8d nail is larger than a 10d nail D-189

(T) F 2. When installing wood screws in hardwood, it is necessary to bore pilot holes. D-194

T (F) 3. The standard spacing for joists is 24" O.C. J-64

T (F) 4. Sills are set in place after the joists have been laid. J-62

T (F) 5. Checks that occur in wood are usually caused by a wracking and wrenching of the tree due to high winds. D-114

(T) F 6. The greatest amount of lumber used in construction comes from the softwood classification. D-127

T (F) 7. A sole plate may be referred to as the member used to "tie" the tops of the studs together J-82

(T) F 8. The 2 x 4 is the most common dimension lumber used as studs. J-76

(T) F 9. Grounds serve as a straight edge and guide for the plasterer. E-86

(T) F 10. Rough floors to be used as a base for concrete and tile must be "dropped" between the joists. E-90

(T) F 11. When constructing partition corners, provision must be made to provide a nailing base for interior trim. E-72

T (F) 12. Plates on non-bearing partitions should be doubled for added strength. J-92

(T) F 13. Economy of construction may be achieved by placing bearing partitions directly over one another. J-93

T (F) 14. When flexible insulation is used, it is not necessary to allow "air spaces" in the wall. D-158-159

T (F) 15. Fill insulation may be applied before the inside wall is built up. D-160

(T) F 16. A major purpose of scaffolding is to provide a place to work without unnecessary loss of time. J-370

T (F) 17. Clothing one wears has little effect upon an individual's safety on the job. E-17

(T) F 18. All workers should become safety conscious about themselves, their co-workers, and their jobs. D-57

(T) F 19. Protruding nails should be removed or bent over to prevent injury to workmen. E-18

(T) F 20. The building industry has one of the highest accident rates. E-16

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The symbol used to designate the term penny is "d". D-189

2. The means of stiffening and distributing loads on floors is called bridging. J-70

3. Any board that varies from being a true or plane surface is warped. D-117

4. Materials such as dowels, moldings, interior trims, and furring strips are sold by the linear foot. D-125-127

5. Another name for the platform method of framing is the western frame. J-51

6. Wall framing to accomodate a soil stack requires the wall to be designed so the stack may be enclosed. E-88

7. If a partition runs parallel to the joist, it should be supported by a double joist. J-92

8. Thermal insulation means the use of materials which possess a hig degree of heat resistance. D-156

9. Ladders should not be used for work stations except in case of emergency or for short periods of time. E-129

10. To protect oneself against electric shock, all electric tools should be grounded. E-131

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

C 1. The kind of nail most frequently used in framing construction is the (A) box nail; (B) casing nail; (C) common nail; (D) cut nail. D-189-190

B 2. How many board feet are in a piece of red oak, 2" x 4" x 9'? (A) 4 bd. ft.; (B) 6 bd. ft.; (C) 8 bd. ft.; (D) 10 bd. ft. D-125

C 3. Most loose fill insulation materials are made from (A) wood fibers; (B) grass fibers; (C) mineral substances; (D) cotton batting. D-159

D 4. The majority of serious accidents in the building industry are caused by (A) nails in boards; (B) protruding wires and bolts; (C) broken tools; (D) falling objects. E-16

A 5. The steps on a general purpose ladder should be uniformly spaced at a distance of (A) 12 inches; (B) 14 inches; (C) 16 inches; (D) 18 inches. E-129

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four basic hinge classifications are:

(A) full mortise
(B) half mortise
(C) full surface
(D) half surface D-205

2. Warp may be divided in four general categories, they are:

(A) bow
(B) crook
(C) cup
(D) twist D-117

3. The common classifications of insulation found on the market today are:

(A) flexible blankets
(B) fills
(C) bats
(D) rigid
(E) slabs
(F) reflective D-157

4. Many materials used in construction have insulative qualities. Name three of these materials.

(A) lightweight aggregate block
(B) sprayo-flake
(C) glass block D-174-175

KEY--ASSIGNMENT SHEET NO. 18
(CARPENTRY)
PRINCIPLES OF ROOF FRAMING

I. Key to Study Questions:

1. E-134-136
2. E-136-137
3. E-141-143
4. E-142-146
5. D-74-76
6. D-75-102
7. E-143-147

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. I, American Technical Society, Chicago, Illinois, 1956, pp. 99-102.

1. Work out the problems on pages 100, 101 and 102 of the reference.

B. Lay out an octagon on a 16" piece of stock using the eight square scale on the framing square.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Obtain: How to Use the Stanley Rafter Square, Stanley Tools, New Britain, Connecticut. (Free)

KEY--ASSIGNMENT SHEET NO. 19
(CARPENTRY)
PROCEDURES AND PRACTICES OF ROOF FRAMING

I. Key to Study Questions:

1. E-147
2. E-147-150
3. J-101
4. J-101
5. J-102-103
6. J-103
7. J-104-105
8. J-105
9. E-151-156
10. E-156-157
11. E-162-163
12. E-164-165
13. E-169-170
14. E-173-182
15. J-108-109
16. J-110-112

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. I, American Technical Society, Chicago, Illinois, 1960, pp. 86-90.

1. Using the framing square, lay out miter joints, butt joints, hopper joints, and other appropriate joints applicable to roof framing.

B. Make scaled models of various roof framing construction details.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Speaker: Invite a skilled and experienced carpenter who has specialized in roof framing to speak on "Problems and Procedures in the Framing and Construction of Roofs."

KEY--ASSIGNMENT SHEET NO. 20
(CARPENTRY)
SPECIAL ROOF FRAMING PROBLEMS

I. Key to Study Questions:

1. E-182-183
2. E-183-184
3. E-184-186
4. E-188-196
5. E-198-199
6. E-199-200
7. J-122
8. J-123-124
9. J-124

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. II, American Technical Society, Chicago, Illinois, 1956, p. 492.

1. Study the varied types of roof trusses and think of an application of where each might be used. What are some construction problems these trusses might present?

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Field Trip: Visit various commercial buildings and churches observing the various types of roof trusses used and problems concerned in their construction.

KEY--ASSIGNMENT SHEET NO. 21
(CARPENTRY)
TYPES OF WINDOWS AND DOORS, THEIR FRAMING AND INSTALLATION

I. Key to Study Questions:

1. E-307-309
2. E-311-314, J-268-277
3. E-314-317
4. E-310-311

6. J-237-246
7. J-247-249
8. J-250-258
9. J-259-264
10. J-265

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. I, American Technical Society, Chicago, Illinois, 1956, pp. 205-212.

   1. Identify the four basic hinge classifications. Identify the materials from which hinges are made. List the styles and finishes available on hinges.

   2. Describe the different styles of bolts, holders, catches, handles, etc, used on doors and windows.

B. Make scale model mock-ups of window and door framing details; also, models of the various types of door construction details.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Obtain information on types of windows from: Anderson Window Corporation, Bayport, Minnesota, (Free).

B. Builders' hardware catalogs may be used to show the variety of items available for use in interior and exterior door and window installation.

KEY--ASSIGNMENT SHEET NO. 22
(CARPENTRY)
EXTERIOR TRIM AND FINISH

I. Key to Study Questions:

1. E-216
2. E-216-217
3. E-217
4. J-128-132, 136-161
5. J-128-135, E-258-265

15. J-187-195
16. J-198-200
17. J-200-201
18. J-202-206

II. Suggested Supplementary Assignments:

A. Have students collect various types and kinds of exterior trim, sidings, etc., and use for class discussion.

B. Make a scaled detailed mock-up of cornice trims and exterior window and door construction details.

III. Suggested List of Visual Aids:

A. Film: SIDING SENSE--(16mm, 14½ min., color, free)--Western Pine Association, 510 Yeon Building, Portland 4, Oregon. This film uses animation to tell the history of the shelter of man. Discusses the requirements of wood exterior siding, beauty, durability, function, and ease of maintenance.

IV. Other Instructional Aids:

A. Obtain samples of various types of roofing materials from local building materials dealers.

B. Obtain samples of various types of sheathing and siding from local building materials dealers.

C. Obtain samples of exterior moldings and trims from local building materials dealers.

KEY--ASSIGNMENT SHEET NO. 23
(CARPENTRY)
INTERIOR TRIM AND FINISH

I. Key to Study Questions:

1. J-295
2. J-295-297
3. J-297-298
4. J-299
5. J-300-302

7. J-304-306
8. J-308-309
9. J-319-321
10. J-322-323
11. J-324-328
12. J-329
13. J-329-330
14. J-331-333
15. J-336-337

II. Suggested Supplementary Assignments:

A. Read: Durbahn, W. E., Fundamentals of Carpentry, Vol. II, American Technical Society, Chicago, Illinois, 1956, pp. 275-290, 303-307.

1. What are six common methods for joining interior plywood panels?

2. What designs can be used to install sheetrock panels on the ceiling?

3. What are the various types of interior trims and moldings used in a house?

B. Draw a sectional view of a double hung window. Of a door jamb and frame.

III. Suggested List of Visual Aids:

A. Film: FLOORS WITH A FUTURE--(16mm, 23 min., color, free)--The Bruce Flooring Company, Box 397, Memphis, Tennessee. A floor mechanic shows proper installation techniques for strip hardwood flooring and block hardwood flooring in both conventional and concrete slab construction. Includes a brief sequence of manufacturing and factory finishing of floors, 1957.

IV. Other Instructional Aids:

A. Invite a local floor covering expert to speak to the class on the topic, "Types of Floor Coverings and Their Installation."

B. Invite a local lumber dealer to speak on the topic, "Millwork, Its Manufacture and Variety."

C. Obtain samples of various types of interior moldings, trims, and floor and wall coverings from local building materials dealers.

KEY--ASSIGNMENT SHEET NO. 24
(CARPENTRY)
CALCULATIONS AND PROCEDURES FOR STAIRWAY CONSTRUCTION

I. Key to Study Questions:

1. E-327-330
2. E-330-331
3. E-331
4. E-333
5. E-335-338
6. E-338-340
7. E-340-342
8. J-283
9. J-290-291
10. J-293-294

II. Suggested Supplementary Assignments:

A. Lay out a stringer board for a basement stairs. The total rise is 7' 10", and the total run 11'6".

B. Make scale model mock-ups of the various types of stair construction.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Obtain drawings and blueprints of older period style architecture showing details of the many kinds and types of stair constructions.

V. Test No. 3, Covering Assignments 18-24:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

(T) F 1. The simplest type of roof is called the "shed" or "lean-to" roof. E-134

T (F) 2. A "bird's mouth" is the joint formed when the rafter and ridge come into contact. E-137

(T) F 3. The unit span is twice the length of the unit run. E-144

(T) F 4. Collar beams are horizontal members used to strengthen roof rafters. E-197

T (F) 5. The pitch of a roof is changed when the rafters are shortened to allow for a two inch ridge. E-156

T (F) 6. The tail cut is made horizontal to the rafter plate and is a part of the "bird's mouth." J-102

(T) F 7. For ordinary roof sheathing, a 20 inch spacing of rafters is commonly used. J-108

(T) F 8. When framing flat roofs, the overhang may be framed by the use of transverse beam rafters. J-122

T (F) 9. Split rings are an example of a circular truss rafter design. J-124

(T) F 10. The vertical grain wood shingle is a better grade than the flat grain shingle. E-219

T (F) 11. Building paper is used primarily to act as a thermal insulation material. E-217

(T) F 12. The length of life and value of roof covering depends to a great extent upon the way in which it is laid. E-232

(T) F 13. Unless a home is to be completely carpeted, hardwood floors are desirable. J-329

(T) F 14. When laying finish flooring parallel to a wall, an expansion space of at least 1/2 inch should be allowed. J-333

T (F) 15. When applying most gypsum board to interior walls, common nails are used extensively. J-298

(T) F 16. The "center line" approach is the best to follow when applying ceiling tile. J-300

T (F) 17. Window and door frames should be fitted prior to completion of the exterior sheathing. J-237

T (F) 18. A 60 degree angle is a preferred slope for stairway construction. E-330

(T) F 19. Casement windows are usually side hinged and of the outswing type. J-238

(T) F 20. The desired height of staircase risers is 7 inches. E-331

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A carpenter would be seriously handicapped without a ___ framing ___ square in his tool kit. D-74

2. The primary function of any roof is to ___ shed ___ water. E-134

3. The highest horizontal framing member of a roof is called the ___ ridge ___. E-147

4. Any type of window protruding from a roof may be called a ___ dormer ___. J-119

5. Joints in vertical siding may be covered with strips called __battens____. E-222

6. When shingling against dormers or chimneys, the _flashing___ must be worked in with the shingle courses to prevent leaking behind the courses. E-239-240

7. Except for the length of the pieces, _clapboards___ are the same as common or bevel siding. E-219

8. A board which provides a finish at the junction of a floor and wall is called a _baseboard____. J-321

9. A door jamb is the part of the frame that forms a __lining___ for the opening that receives the door. J-268

10. In an ordinary house a space of about __7__ feet is preferred for headroom. E-331

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

__C__ 1. The established unit of measurement for the unit run is (A) 1/4 pitch; (B) 6 inches; (C) 12 inches; (D) 24 inches. E-144

__B__ 2. In an equal-pitch hip roof, the hip rafter always meets the ridge at an angle of (A) 30 degrees; (B) 45 degrees; (C) 60 degrees; (D) 90 degrees. E-149

__A__ 3. Pieces of plywood used to assemble roof trusses are called (A) gussets; (B) batters; (C) slabs; (D) strips. J-124

__D__ 4. The core of a veneered door would probably be made up of (A) birch; (B) oak; (C) redwood; (D) pine. E-311

__B__ 5. The parts of a new door which must be sawed off are the (A) rails; (B) stiles; (C) panels; (D) lugs. J-278

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Basically, there are five roof styles in common use. These five types are:

(A) __shed or flat____ (D) ____gambrel____

(B) __gable____ (E) ____mansard____

(C) __hip____ E-135

2. Rafter spacing is determined by:

(A) stiffness of sheathing

(B) weight of roof

(C) rafter span

(D) snow and wind loads to be carried J-108

3. Factors to be considered when choosing wood for exterior finish are:

(A) decay resistance (C) lumber grade

(B) paint holding quality E-216

4. There are three common methods of hanging doors. They are:

(A) side hinges on edge of door

(B) pivot hinges on top and bottom of door

(C) roll away or sliding track E-314

5. The two most commonly used types of windows are:

(A) casement or hinged (B) double hung J-237

KEY--ASSIGNMENT SHEET NO. 1
(MASONRY AND CONCRETE)
TYPES AND DESIGNS OF FOOTINGS AND FOUNDATIONS

I. Key to Study Questions:

1. C-54-85
2. C-81
3. C-93
4. C-91-96
5. C-96-114
6. C-114-123
7. C-123-128
8. C-129-133
9. M-356, 372-374
10. M-356-357, 374
11. M-358, 374
12. M-358, 375

II. Suggested Supplementary Assignments:

A. Write a paper stressing the importance of footings and their relationship to a structurally sound house.

III. Suggested List of Visual Aids:

A. Film: NATION'S BUILDING STONE--(16mm, B & W, 19 min., $1.00) --University of Michigan, Audio-Visual Education Center, Ann Arbor, Michigan. Quarrying and cutting limestone in preparing building stone; its use in various types of buildings.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 2
(MASONRY AND CONCRETE)
TYPES, PROPERTIES, AND USES OF LIME AND MORTAR

I. Key to Study Questions:

1. B-2-11
2. B-11-18
3. B-21
4. B-24-32
5. B-32-36
6. B-36-47
7. B-48
8. B-49-56

II. Suggested Supplementary Assignments:

A. Prepare a list of the types and properties of mortar needed in masonry construction.

B. Outline the tools, materials, and steps of procedure for mixing mortar.

III. Suggested List of Visual Aids:

A Film: HOW TO MAKE QUALITY CONCRETE--(16mm, color, sound, 33 min., Free)--University of Missouri, Audio-Visual Department, Columbia, Missouri. This film describes the essential steps in making quality concrete from the design of the mix to the time it comes from the mixer.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 3
(MASONRY AND CONCRETE)
MIXING, POURING, AND FINISHING CONCRETE

I. Key to Study Questions:

1. B-62-65
2. B-66-67
3. B-62-73
4. B-76-90, K-7-9
5. B-90-101, K-14-20
6. K-6-7
7. K-11
8. K-11-13
9. K-17
10. K-17
11. K-19
12. K-19-20
13. K-20
14. K-20
15. K-25-33
16. B-101-102, K-21-24
17. B-102-103
18. B-314-324
19. B-324-332
20. B-332-339
21. B-339-354

II. Suggested Supplementary Assignments:

A. In a one-page paper, summarize the importance of concrete as it affects our daily lives and our security.

III. Suggested List of Visual Aids:

A. Film: CONCRETE EXAMPLE--(16mm, B & W, sound, 16 min., Free)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Teaches the five simple rules of quality concrete. Features such as air-entrainment, the extensive use of ready mixed concrete, and modern construction methods are included.

IV. Other Instructional Aids:

A. Speaker: Invite mason contractor to speak on the topic, "The Preparation, Mixing, and Pouring of Concrete."

V. Test No. 1, Covering Assignments 1-3:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. Lime is not an important ingredient for mortar which is to be used for laying brick. B-13

(T) F 2. Some limes should be soaked overnight to get the best results from it. B-25

T (F) 3. The consistency of mortar refers to its ability to hold on to water. B-36

(T) F 4. A mortar joint should not be tooled to such an extent that the face is completely sealed. B-47

T (F) 5. The amount of water used in a concrete mix does not have much effect on the strength of the concrete. B-64

(T) F 6. Flat steel reinforcement rods are not satisfactory for reinforcing concrete. B-72

T (F) 7. Cement mixed with sand and water is called concrete. B-73

(T) F 8. Well graded sand ranges in size from very fine up to 1/4 inch. B-82

(T) F 9. The amount of water held by the sand must be considered when figuring the amount of water needed for a concrete mix. B-84

T (F) 10. If a mechanical mixer is to be used, cement should be the first ingredient placed in the mixer. B-87

T (F) 11. The maximum size gravel or stone to use in a concrete mix depends on weather conditions in the area. K-8

(T) F 12. The soil on which concrete is to be poured should be dampened before the concrete is poured. K-16

(T) F 13. Screeding and darbying should be performed before bleeding takes place. K-17

T (F) 14. Less bleeding occurs in non-air-entrained concrete than in air-entrained concrete. K-20

(T) F 15. Scaling can be caused by early cycles of freezing and thawing of newly poured concrete. K-30

T (F) 16. Street walks should be at least 4 feet wide in residential neighborhoods. B-315

(T) F 17. Soft pine boards may be used for expansion joints in sidewalks. B-317

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When enough water has been added to mortar so that it flows easily, it is called ____grout____. B-21

2. The consistency of a mortar refers to its degree of ____wetness____ B-36

3. A mixture of sand, crushed gravel or stone, and cement is called ____concrete____. B-62

4. The two principal requirements of hardened concrete are ____strength____ and ____durability____. B-63

5. A material other than water, aggregate, and Portland cement that is used as an ingredient of concrete is called an ____admixture____. K-6

6. Regardless of exposure conditions, air-entrained concrete is strongly recommended for all concrete work. K-7

7. A darby is used to float the concrete surface immediately after it has been screeded. K-12

8. Most cement masons prefer a fanning trowel for troweling the concrete slab the last few times. K-13

9. In northern climates where concrete flat surfaces are subject to freezing and thawing, the builder should use air-entrained concrete. K-16

10. If joints are to be cut in concrete slabs with a power saw, they should be cut 4 to 12 hours after the slab has been poured. K-18, 19

11. Watertight paper and polyethylene film may be used as coverings for concrete that is being cured. K-20

12. The occurrence of numerous fine hair cracks in the surface of newly hardened concrete is called crazing. K-31

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

C 1. Those portions of a building which comprise the first actual structural work are the (A) foundation walls; (B) columns; (C) footings; (D) reinforcement rods. C-54

C 2. One of the most important factors concerning footings is the (A) grade of sand to be used in the concrete mix; (B) size of the aggregates; (C) shapes of their sides and bottoms; (D) size of reinforcement. C-56

D 3. The recommended mix for reinforced concrete footings is (A) 1:2:4; (B) 1:3:5; (C) 1:3:4; (D) 1:2½:3½. C-81

A 4. In reinforced concrete footings, the reinforcing rods should be placed (A) 1½" to 3" from the bottom of the footing; (B) 1" to 2" from the bottom of the footing; (C) 1½" to 3" from the top of the footing; (D) in the center of the footing. C-86

B 5. The recommended concrete mix for ordinary concrete foundations is (A) 1:2:4; (B) 1:2 3/4:4; (C) 1:3:5; (D) 1:1:2. C-114

C 6. If drain tiles are used as a method of waterproofing foundations, gravel or cinders should be backfilled at least (A) 18 inches below the tile; (B) 10 inches above the tile, (C) 18 inches above the tile; (D) 6 inches below the tile. C-133

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three admixtures most commonly used by cement masons are:

(A) accelerators

(B) retarders

(C) air-entraining agents

K-6

2. The most common tools used for finishing horizontal concrete surfaces are:

(A) straightedge

(B) hand tamper

(C) darby

(D) bull float

(E) edger

(F) jointer or groover

(G) power join cutter

(H) hand and power floats

(I) hand and power trowels

K-11-13

3. The purposes of floating concrete surfaces are:

(A) to embed large aggregates just beneath the surface

(B) to remove slight imperfections

(C) to consolidate mortar at the surface in preparation for other finishing operations K-19

4. The names of some of the special concrete finishes are:

(A) exposed aggregate

(B) dry-shake color surfaces

(C) geometric design

(D) leaf impression

(E) circle design

(F) swirl design

(G) wavy broom design

(H) keystone finish

K-25-28

KEY--ASSIGNMENT SHEET NO. 4
(MASONRY AND CONCRETE)
BUILDING WITH CONCRETE BLOCK

I. Key to Study Questions:

1. B-142-143, L-2
2. B-143-152, L-2
3. B-153-156, L-3
4. B-156-179, L-4
5. B-179-184, L-4-6
6. B-184-187, L-10
7. L-7-8
8. L-9
9. L-12
10. L-13-14
11. L-15-16
12. B-187-190
13. B-192-193

II. Suggested Supplementary Assignments:

A. Write out an outline of the steps required to lay a block wal without windows or doors.

1. Explain how the sizes of concrete block affect the location of doors and windows? Sketch the construction details of placing a door and window in a block wall.

III. Suggested List of Visual Aids:

A. Film: BUILD WITH CONCRETE MASONRY--(16mm, B & W, sound, 19 min., Free)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Typical examples of concrete masonry farm construction; how masons build with concrete masonry; painting masonry; wall patterns; use of block as a backing.

IV. Other Instructional Aids:

A. Speaker: Invite a local concrete products firm manager to speak on the topic, "Manufacturing of Block, Tile, and Brick."

KEY--ASSIGNMENT SHEET NO. 5
(MASONRY AND CONCRETE)
BUILDING WITH BRICKS

I. Key to Study Questions:

1. B-255-258
2. B-259
3. B-260-261
4. B-263-269
5. B-269-271
6. B-274-279
7. B-281
8. B-291-301
9. B-301-303
10. B-303
11. B-306-308
12. B-272-273
13. B-273

II. Suggested Supplementary Assignments:

A. Write a brief paper on "The Process of Manufacturing Brick."

B. Draw up a series of sketches showing the principal methods of bonding brick.

III. Suggested List of Visual Aids:

A. Film: BRICK AND STONE MASON--(16mm, B & W, sound, 10 min., $1.50)--University of Minnesota, Audio-Visual Extension Service, 115 T.S.M., Minneapolis 14, Minnesota. Features many types of structures using brick and stone: homes, churches, steel mills, round houses, etc. Covers educational requirements, working conditions, and steps in advancement of the masonry trade.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 6
(MASONRY AND CONCRETE)
WALL AND PARTITION CONSTRUCTION

I. Key to Study Questions:

1. C-317-322
2. C-323-326
3. C-326-353
4. C-353-367
5. C-367-373
6. B-198-204
7. B-204-212
8. B-212-218
9. B-218-219
10. B-219-239
11. B-239-249

II. Suggested Supplementary Assignments:

A. Class Project:

1. Obtain a set of plans for a house and make out a complete bill of materials for all cement and masonry work.

2. Obtain prices for the needed items and compute the cost of all materials.

3. Estimate the amount of man hours required to construct the cement and masonry work and compute the labor costs.

III. Suggested List of Visual Aids:

A. Using an overhead projector, show and discuss photos and sketches of construction details of footings, foundations, walls, chimneys, etc. It would be especially beneficial if the items chosen are directly applicable to the house that the class will construct.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 7
(MASONRY AND CONCRETE)
CHIMNEY AND FIREPLACE DESIGN AND CONSTRUCTION

I. Key to Study Questions:

1. C-229-237
2. C-238-246
3. C-246-263
4. C-263-270
5. C-270-274
5. C-278-290
7. C-290-295
8. C-295-306
9. C-306-311
10. C-311-312

II. Suggested Supplementary Assignments:

A. In a short paper discuss the effect of weather upon chimneys and the many factors that need to be considered in reducing the effect of weathering.

B. Make a list of the various parts of a fireplace and the function of each.

C. Read: Mix, Floyd, Practical Carpentry, Goodheart-Willcox Co., Chicago, 1960, pp. 355-368.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Speaker: Invite a local mason contractor or mason to speak on the topic, "Working with Block, Brick, and Stone."

V. Test No. 2, Covering Assignments 4-7:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

(T) F 1. Concrete masonry permits easy planning and quick erection. B-142

(T) F 2. The three-core block is the one most commonly used. B-143

(T) F 3. A good mortar for the "average" concrete block construction is: one part Portland cement, one part lime and three parts sand. B-156

(T) F 4. Vertical joints for blocks should not be over 3/8 inch thick B-156

(T) F 5. It is possible to carry a heating duct inside a 4 inch partition made of 3 inch blocks and plastered on both sides. B-175

T (F) 6. Units from different tile manufacturers are fairly interchangeable. B-212

T (F) 7. Tile partitions can be used over wood framing or floors. B-213

T (F) 8. Architects prefer end-construction tile over side-construction tile. B-219

(T) F 9. In tile construction the baseboards are nailed directly to the grounds. B-232

T (F) 10. Side-construction tile should be used with metal door bucks B-239

(T) F 11. Fat mortar is sticky and contains little sand. B-260

T (F) 12. In figuring the length of a brick wall, there will be as many mortar joints as brick used. B-291

(T) F 13. Before starting corners, it is best to test the wall length with dry brick. B-293

T (F) 14. Flue linings need not be installed in brick chimneys where gas-fired heating appliances are used. C-235

(T) F 15. Round flues are more efficient than rectangular flues. C-237

T (F) 16. An exterior chimney is more efficient than an interior chimney. C-239

T (F) 17. A flue lining should stop about 2 inches below the top of the chimney cap. C-245

(T) F 18. Chimney locations should be planned when the building is being designed. C-269

T (F) 19. The modified fireplace is more difficult for the mason to build than the conventional type. C-281

T (F) 20. Fireplace lintels should always be steel angles. C-287

(T) F 21. The over-all dimension of the face of the fireplace should be such that whole bricks can be laid up without any cutting being necessary. C-305

T (F) 22. One-half inch joints make stronger masonry work than 1/4 inch joints. C-307-308

(T) F 23. The basic purpose of coping is the same as that of flashing. C-320

(T) F 24. Brick veneer on a frame wall consists of stretcher bonding throughout. C-350

(T) F 25. The concave, "V" and weathered mortar joints are considere the approved types of tooled joints for masonry walls. C-354

(T) F 26. Openings in walls built of masonry units should be planned in order to avoid or eliminate the necessity of cutting the units. C-365

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In concrete masonry, the horizontal joints are called ___ bed ___ joints. B-156

2. A concrete block wall 20 feet long, using standard blocks 8" x 8" x 16" nominal size and 3/8 inch mortar joints, would contain ___ 15 ___ stretchers. B-157

3. Courses of blocks directly under joists, beams, and slabs should have their ___ cores ___ filled with concrete. B-170

4. The builder can check the designer's dimensions by setting one course around the footing without using ___ mortar ___. B-179-180

5. Two or three courses of ___ bricks ___ are recommended for the top of concrete block bearing partitions so that loads may be evenly distributed. B-184

6. The cells are ___ vertical ___ in end-construction tile. B-198

7. Mortar joints for tile can be from ___ 1/4 ___ inch to ___ 1/2 ___ inch in thickness. B-212

8. Drain holes in the vertical mortar joints of bottom courses are called ___ weep ___ holes. B-226

9. Tile units should be ___ wet ___ before they are laid. B-243

10. The inexperienced mason should not apply mortar for tile bed joints in advance of more than ___ one ___ unit(s). B-247

11. The standard depth of a brick is ___ 2 1/4 ___ inches. B-259

12. In a ___ rowlock ___ course, the bricks lay on edge with only their ends exposed. B-268

13. A mortar joint ___ 1/4 ___ inch thick is generally recommended for ordinary bricklaying. B-279

14. Brick columns may have a load applied after ___ two ___ days. B-306

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

B 1. If a flue lining is not used, the thickness of a chimney wall should be (A) 4 inches; (B) 8 inches; (C) 6 inches; (D) 12 inches. C-235

C 2. A flue lining should extend above the top of the chimney cap at least (A) 1/2 inch; (B) 1 inch; (C) 2 inches; (D) 8 inches. C-245

A 3. The minimum amount of space that should be left between the outside faces of chimneys and all wooden beams and joints is (A) 2 inches; (B) 3 inches; (C) 1 inch; (D) 6 inches. C-241

D 4. The recommended minimum height that a chimney should extend above a flat roof is (A) 2 feet; (B) 1 foot; (C) 4 feet; (D) 3 feet. C-268

C 5. A fireplace needs about (A) 14; (B) 15; (C) 17; (D) 20 square inches of chimney flue area for each square foot of fireplace opening. C-267

A 6. A practical height for any fireplace if the width of the opening is less than six feet is (A) 30 inches; (B) 36 inches; (C) 27 inches; (D) 24 inches. C-296

B 7. A more watertight wall will result if the joints are (A) flush; (B) thin; (C) thick; (D) recessed. C-324

D 8. The thickness of solid brick walls is in multiples of (A) 2 inches; (B) 3 inches; (C) 5 inches; (D) 4 inches. C-327

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The two kinds of concrete masonry units are:

(A) regular concrete units (B) lightweight concrete units
B-142-143

2. The common surface finishes of concrete blocks are:

(A) plain finish (C) rough finish

(B) smooth finish B-152-153

3. The kinds of brick most commonly used are:

(A) common brick

(B) face brick

(C) pressed brick

(D) fire brick

(E) glazed brick

(F) imitation brick

B-257-258

4. The tools needed by the bricklayer are:

(A) plumb rule

(B) trowels

(C) brick hammer

(D) brick set

(E) jointer

(F) line

(G) square

(H) mortarboard

B-269-271

5. The most common types of joint finishes are:

(A) flush joints

(B) weather joints

(C) concave tooled joints

(D) "V" tooled joints

B-278

KEY--ASSIGNMENT SHEET NO. 1

4. F-13-15
5. F-15-18
6. F-18-19
7. F-4-7
8. F-11-19
9. M-362-363
10. M-364
11. M-364
12. I
13. I

II. Suggested Supplementary Assignments:

Read:

A. Abbott, Arthur L., and Stetka, Frank, National Electrical Code Handbook, Tenth Edition, McGraw-Hill Book Co., New York, N. Y., 1960, pp. 1-32.

B. Mullin, Ray C., Electrical Trades, Blueprint Reading and Sketching, Delmar Publishers, Inc., Albany, N. Y., 1961, pp. 1-30.

C. Simplified Electric Wiring Handbook, Sears, Roebuck and Co., 1960, pp. 1-11.

D. Select a set of house blueprints.

1. Prepare a list of the circuits.
2. Compute the expected consumption of electricity.
3. Ascertain the size of the service equipment needed.
4. Make sketches of all wire runs and show placement of switches, outlets, and lighting fixtures.
5. Make a list of all tools and equipment needed to wire the complete house.

III. Suggested List of Visual Aids:

A. Film: THE ELECTRICIAN--(16mm, B & W, sound, 10 min., $1.50)--University of Minnesota, Audio-Visual Extension Service, Minneapolis, Minnesota. A broad overview of electrical jobs in the home, power plant, telephone, radio and electrical transportation. Also discusses occupation entrance requirements.

IV. Other Instructional Aids:

A. Speaker: Invite a local employment office person to discuss the occupational outlook and requirements of the local labor market area.

8. F-205-208
9. F-208-213
10. F-226-231
11. F-233-247

II. Suggested Supplementary Assignments:

Read:

A. Mullin, Ray C., Electrical Trades, Blueprint Reading and Sketching, Delmar Publishers Inc., Albany, N.Y., 1961, pp. 150-295.

B. Simplified Electric Wiring Handbook, Sears, Roebuck and Co., 1960, pp. 45-63.

C. Utilizing the blueprints and the other problems from assignments 1 and 2, prepare a complete estimate for the electrical work.

   1. Include cost of labor, material, overhead, and expected profit. Enter all data on an estimating form.

   2. Make out a purchase order for wire, fixtures, boxes, and all other necessary materials.

III. Suggested List of Visual Aids:

A. MY POP'S A LINEMAN--(16mm, color, sound, 15 min., $4.50)--University of Minnesota Audio-Visual Extension Service, Minneapolis, Minnesota. The film deals with high voltage safety and depicts a typical workday with several dangerous situations.

IV. Other Instructional Aids:

A. Speaker: Ask a local wholesaler of electrical products to discuss purchasing techniques and procedures, electrical materials, discounts, and other related information.

V. Test No. 1, Covering Assignments 1-3:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. One 25 watt lamp in each room of a house is adequate.
F-1

(T) F 2. The National Electrical Code manual is revised every two years. F-2

(T) F 3. Even though wiring is carefully installed, the materials and devices themselves can be sources of hazard. F-2

T (F) 4. In most places it is not necessary to obtain a wiring permit. F-2

(T) F 5. On smaller jobs, the electrical engineer's services are seldom needed. F-2

(T) F 6. Current will not flow unless the circuit is complete. F-10

(T) F 7. Soldering paste should be non-corrosive F-24

(T) F 8. The neutral wire is connected to the screw shell of the lamp socket. F-55

(T) F 9. The neutral wire should never be run to a switch. F-55

(T) F 10. If the hot conductor is in one conduit and the neutral conductor is in another, induction will take place. F-57-58

(T) F 11. The number of wires permitted by the National Electrical Code is the same for rigid and thin-walled conduit, size for size. F-138

T (F) 12. A two wire 115-230 volt circuit is required for an electric range.

T (F) 13. Armored cable cannot be used to wire a range circuit. F-152

T (F) 14. The home type of electric hot water heater usually has three heating elements. F-158

(T) F 15. Rigid conduit is not used extensively at the present time in dwellings. F-175

(T) F 16. With a remote control, low voltage, wiring system it is possible to turn a light on and off from several different places providing the control switches are hooked up in parallel. F-204

(T) F 17. A current of .05 to .20 amperes is sufficient to kill a grown person. I

T (F) 18. Under ordinary working conditions, there is usually no danger of getting a killing shock from 120 volt current. I

(T) F 19. Most construction electricians work for electrical contractors. M-362

(T) F 20. The electrical apprenticeship program usually requires over 8,000 hours of on-the-job training. M-363

T (F) 21. Approximately 310,000 men are employed as construction electricians. M-363

T (F) 22. The hourly rate for electricians is slightly less than the average of all journeymen in the building trades. M-364

(T) F 23. The injury rate for electricians is lower than that for general construction work. M-364

T (F) 24. An experienced construction electrician cannot easily transfer to another type of electrical work such as a shipbuilding electrician. M-363

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The unit of electrical pressure is the ____volt______. F-10
2. The unit of electrical current is the ____ampere______. F-10
3. The unit of ____electrical____ ____resistance____ is the ohm. F-10
4. The rate at which electrical energy is delivered and consumed is called ____power____. It is measured in ____watts______. F-13
5. The rule for the power equation states that: Power equals the ____amperes______ flowing in a circuit times the ____volts______ of the circuit. F-14
6. There are two common types of circuits: ____series______ and ____parallel______. F-15
7. Conduit elbows are called ____ells______. F-128
8. The National Electrical Code permits not more than a total of ____four______ 90° bends in a run of conduit. F-138
9. A ____reamer______ is used to remove burrs from the inside of freshly cut pipe. F-140
10. A hacksaw blade used to cut thin-walled conduit should have ____24-32____ teeth per inch. F-140
11. The transformer used in remote-control wiring has a ____24____ volt secondary winding. F-205
12. The National Electrical Code provides that ____three______ watts be provided for each square foot of living quarters in residential occupancies. F-226

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

A 1. If you were asked to install a lighting fixture which could be controlled from five different locations, you would use (A) two 3-way switches and three 4-way switches; (B) two 2-way switches and three 3-way switches; (C) two 4-way switches and three 3-way switches; (D) three 3-way switches and two 4-way switches. F-69

C 2. If a lighting fixture was to be controlled independently from two different locations, you would need (A) 1-way switches; (B) 2-way switches; (C) 3-way switches; (D) 4-way switches. F-61

B 3. A type of electrical wire covered with a spiral of metal is (A) ampex; (B) BX; (C) Romex; (D) Conduit. F-98

D 4. In comparing No. 8 and No. 12 copper wire one would discover that the No. 8 wire has lower (A) weight; (B) cost; (C) strength; (D) resistance. F-19

B 5. If the proper size of wiring is not available, the best practice is to (A) use smaller wire; (B) use the next larger size of wire; (C) install fewer outlets per circuit; (D) use two smaller wires. F-19

C 6. The ground wire should be connected to a (A) gas pipe; (B) steam pipe; (C) water pipe; (D) vent pipe. F-40-41

C 7. The wire which is connected to a terminal should be bent so that it passes around the screw in the direction that the screw is turned when it is tightened becuase (A) the wire acts like a locknut; (B) the screw will be easier to loosen; (C) the wire will not turn off; (D) it will be easier to loosen the screw. F-56

C 8. When skinning a wire, the insulation should be "penciled down" rather than cut square to (A) prevent the braid from fraying; (B) save time; (C) avoid nicking the wire; (D) to make a neater looking splice. F-22

D 9. Ohm's Law is written (A) $E = IR$; (B) $R = \frac{E}{I}$; (C) $I = \frac{E}{R}$; (D) all of the above. F-12

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three primary circuit elements are:

(A) volts (B) amperes (C) ohms

F-10

2. Three different kinds of splices are the:

(A) pigtail (B) Western Union (C) tee tap
F-24

3. List three different types of tape used to insulate splices.

(A) rubber tape (C) plastic tape

(B) friction tape F-26

4. List the three general methods of arranging remote-control relays.

(A) outlet-mounted (C) zone-mounted

(B) gang-mounted F-209

5. The main divisions of a complete wiring installation are:

(A) service drop (D) grounding

(B) service wires (E) metering

(C) service switch F-33

6. The three types of conduit used for general purpose wiring are:

(A) rigid conduit

(B) flexible

(C) electrical metallic tubing F-126

7. The three general classes of outlet boxes are:

(A) square (B) octagon (C) rectangular
F-131

8. An estimate of the cost for doing a wiring job is arrived at after considering factors such as:

(A) cost of material (C) overhead cost

(B) cost of labor (D) expected profit
F-233

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the items by placing the letter of the description in the blank at the left of the appropriate item.

G	1.	BX	F-98
D	2.	Fish tape	F-149
H	3.	Fuse	F-39
K	4.	KW	F-13
I	5.	I	F-10
J	6.	Voltmeter	F-11
M	7.	White wire	F-55
B	8.	4-way switch	F-67
A	9.	Hickey	F-142
C	10.	Acqustat	F-190

A. Used to bend conduit

B. Needed for three or more controlling points

C. Controls temperature of water

D. Flat, narrow steel wire which is used to pull conductors

E. Controls temperature of air

F. Hooked up in parallel with a circuit

G. A term used to identify flexible armored cable

H. Safety device to prevent overloading a circuit

I. Amperes

J. Hooked up in series with a circuit

K. Kilowatt

L. Hot wire

M. Neutral

KEY--ASSIGNMENT SHEET NO. 1
(PLUMBING AND PIPEFITTING)
AN INTRODUCTION TO THE PLUMBING AND PIPEFITTING TRADE

I. Key to Study Questions:

1. M-352-353
2. M-353
3. M-353
4. M-353-354
5. M-354
6. M-354-355
7. M-355
8. H-Introduction

II. Suggested Supplementary Assignments:

A. Prepare a list of all local sources of employment for plumbers and pipefitters. Include the approximate number employed at each plant and company.

III. Suggested List of Visual Aids:

A. Film: PLUMBING--YOUR LIFE'S WORK--(16mm, B & W, sound, 11 min., free)--National Association of Plumbing Contractors, 1016-20th Street, N.W., Washington, D.C. Vocational guidance for a boy wanting to become an apprentice plumber.

IV. Other Instructional Aids:

A. Speaker: Invite a local plumbing contractor to speak on the topic, "Employment Opportunities for Plumbers."

KEY--ASSIGNMENT SHEET NO. 2
(PLUMBING AND PIPEFITTING)
TYPES AND FUNCTIONS OF SEWAGE DISPOSAL SYSTEMS

I. Key to Study Questions:

1. H-1
2. H-1-6
3. H-6-16
4. H-20
5. H-21-25
6. H-26
7. H-26-32
8. H-32

II. Suggested Supplementary Assignments:

A. Read: Federal Housing Administration, Minimum Property Standards, FHA No. 300, Superintendent of Documents, Washington, D. C., pp. 217-230.

B. Make a sketch of a layout for a distribution field for a septic tank. Estimate the material you would need to build the field.

C. Obtain copies of the recommended layout and installation of the septic system from the local county health department.

III. Suggested List of Visual Aids:

A. Film: MODERN PIPE FOR MODERN LIVING--(16mm, color, sound, 27 min., free)--National Association of Plumbing Contractors, 1016-20th Street, N.W., Washington 6, D.C. The manufacture and use of fiber pipe for sewage and septic tank disposal and for drainage and irrigation use.

B. Film: GUARDIAN OF COMMUNITY HEALTH--(16mm, color, sound, 20 min., free)--National Association of Plumbing Contractors, 1016-20th Street, N.W., Washington 6, D.C. Shows sewage and sewage treatment in communities of all sizes.

IV. Other Instructional Aids:

A. Field Trip: Arrange a trip to the local sewage disposal plant.

V. Test No. 1, Covering Assignments 1-2:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. The plumber does not need to be concerned with understanding the public sewage system. H-1

T (F) 2. Sanitary sewers carry both sanitary waste and rain water. H-2

(T) F 3. One of the most common methods by which sewage is treated is the activated sludge process. H-7

(T) F 4. Sandy soil is the most favorable soil for the disposal of waste from a septic system. H-20

T (F) 5. The septic tank should be installed at least five feet below the surface. H-20

(T) F 6. Commercially made tanks may not always meet standards required by state or local agencies. H-25

T (F) 7. The septic tank should be located close to the lot line. H-26

(T) F 8. The distribution field is less expensive to construct than the filter trench. H-30

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The treatment of sewage has made it necessary to have ___storm___ sewers to take care of rain water. H-2

2. Manholes serve as ___cleanouts___ and make the public sewer accessible for inspection and repair. H-6

3. ___Filter___ ___bed___ ___blocks___ are laid on the floor of a filter to supply ventilation. H-14

4. The ___septic___ ___tank___ is a device used in rural sewage systems to expedite the decomposition of the elements contained in raw sewage. H-21

5. A family of six needs a septic tank of approximately ___50___ cubic feet capacity. H-25

6. For residences serving more than six persons, ___5___ to ___6___ cubic feet of tank content per person is recommended. H-25

7. In most cases there is a lack of free ___oxygen___ in septic tanks. H-26

8. The ___filter___ ___trench___ is the best purification unit to use with clay soil and where a natural drainage terminal is available. H-28

9. There should be ___10___ feet of space between the rows of tile in a distribution field. H-30

10. The distribution field uses the ___earth___ as a means of purifying the discharged effluent. H-30

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The types of public sewers, classified according to the type of waste they handle, are:

   (A) combination public sewers (C) storm sewers

   (B) sanitary sewers H-1-2

2. Two common methods by which municipal sewage may be treated are:

   (A) activated sludge process (B) sprinkling filter process H-7

3. The three types of rural filtration units are:

   (A) dry well (C) distribution field

   (B) filter trench H-27

KEY--ASSIGNMENT SHEET NO. 3
(PLUMBING AND PIPEFITTING)
LAYOUT AND INSTALLATION OF HOUSE SEWERS AND DRAINS

I. Key to Study Questions:

1. H-54-59
2. H-63-64
3. H-64-69
4. H-70-74
5. H-75-94
6. H-95-100
7. H-103-106

II. Suggested Supplementary Assignments:

A. The instructor should prepare duplicate copies of a set of house blueprints and a lot plan.

   1. Students should make a sketch layout for the house sewer, house drain, and storm drain.

III. Suggested List of Visual Aids:

A. Film: HERE'S HOW WITH CLAY PIPE--(16mm, color, sound, 20 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Detailed description of all steps involved in laying trunk and main sewer lines.

B. Film: ONCE AND FOREVER--(16mm, color, sound, 14 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Portrays value of installing cast iron soil pipe in residence and in sewer laterals.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 4
(PLUMBING AND PIPEFITTING)
TOOLS AND MATERIALS USED IN HOUSE SEWER AND DRAIN CONSTRUCTION

I. Key to Study Questions:

1. H-33
2. H-33
3. H-34
4. H-34-35
5. H-35
6. H-35-36
7. H-36-37
8. H-38-42
9. H-43-45
10. H-45-48
11. H-47,52
12. H-49
13. H-49-52

II. Suggested Supplementary Assignments:

A. Utilizing the house blueprints and sketch layout for the suggested advanced assignment of unit 3, make a bill of materials for the house sewer, house drain, and storm drain.

III. Suggested List of Visual Aids:

A. Film: WHITE PIPE--(16mm, color, sound, 35 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Illustrates the manufacture use and installation of four transit pipes for the home; building sewer pipe, plumbing, vent pipe, warm air duct and gas vent pipe.

B. Film: LITTLE KNOWN FACTS ABOUT A WELL-KNOWN PRODUCT--(16mm, color, sound, 32 min., free)--National Association of Plumbin Contractors, 1016 20th Street, N.W., Washington 6, D.C. Shows the processing of a malleable iron casting, manufacture of drop forgings, and manufacture of pipe tools.

IV. Other Instructional Aids:

A. Field Trip: Visit a local wholesale plumbing distributor to inspect the various types, sizes, and qualities of traps, pipes, valves, fixtures, etc.

V. Test No. 2, Covering Assignments 3-4:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T (F) 1. The plumber has a wide variety of materials to choose from for drainage construction. H-33

(T) F 2. Fittings used on waste lines should be of long radius. H-33

T (F) 3. Cast iron pipe is recommended for drainage on buildings more than twenty-five stories high. H-35

T (F) 4. The plumber needs more manipulative skill than most other building tradesmen. H-43

T (F) 5. The separation of cast iron soil pipe into two pieces is a sawing process. H-47

(T) F 6. Sweated joints should be made of solder that is approximately 50 per cent tin and 50 per cent lead H-49

T (F) 7. The house sewer should enter the main sewer at a 90 degree angle. H-54-55

(T) F 8. If located back to back, one house sewer may serve two buildings on the same lot. H-61

(T) F 9. A 1/8 bend is classified as a long radius fitting. H-70

(T) F 10. The interior house drain installation is usually begun by calking a Y-fitting into a length of cast iron pipe. H-71

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Sewers and drains are generally constructed with cast iron soil pipe or vitrified clay pipe. H-33

2. The chief use for galvanized steel pipe is for venting. H-38

3. Waste installations in buildings constructed under federal specifications are usually made with brass pipe. H-41

4. It is necessary to use a pouring rope when making a horizontal calk joint. H-47

5. It is not necessary for a wiped lead joint to be longer than two inches. H-50

6. The part of the drainage system beginning just outside the foundation wall is the house sewer. H-53

7. When a house sewer is installed in soil containing tree roots, cast iron pipe should be used. H-53

8. The usual pitch of a house sewer is not less than 1/4 inch to the foot. H-58

9. The plumber can prevent earth walls from caving in by shoring. H-60

10. The collection line is also referred to as the house drain. H-63

11. The most practical method of determining the size of a house drain is by the ___unit___ system. H-65

12. A 4-inch ___P-trap___ installed not more than two feet under the basement floor makes a desirable floor drain. H-80

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. (A) cement joint on vitrified clay pipe

   (B) mechanical seal joint

   (C) cast iron pipe to vitrified clay pipe

   (D) composition joints

   (E) vertical calk joint

   (F) horizontal calk

   (G) acid-resistant calk joints

   (H) screw thread joint

   (I) sweat or solder joint

   (J) wiped joint

   H-43-49

2. The two things that must be known in order to determine the grade of the house sewer are:

   (A) the depth of the house drain outlet

   (B) depth of the connection in the street

   H-57

KEY--ASSIGNMENT SHEET NO. 5
(PLUMBING AND PIPEFITTING)
INSTALLATION OF SOIL AND WASTE PIPE

I. Key to Study Questions:

1. H-107-109
2. H-110
3. H-111-113
4. H-114
5. H-115-118
6. H-119-124
7. H-125-126
8. H-126-128
9. H-128-130
10. H-131-133
11. H-140-144
12. H-141-146
13. H-199
14. H-209-213

II. Suggested Supplementary Assignments:

A. Read: Federal Housing Administration, Minimum Property Standards, Superintendent of Documents, Washington, D.C., pp. 212-214, Section 1006-1 to 1006-6, FHA No. 300.

1. Be prepared to give a class report on the above sections.

B. Utilizing the house blueprints and sketch layout for the suggested advanced assignments of units 3 and 4, make a layout plan and bill of material for the soil and waste pipe systems.

III. Suggested List of Visual Aids:

A. Film: TOWARD A UNIFORM PLUMBING CODE--(16mm, B & W, sound, 37 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Explains fixture-unit system, stack loading, venting and other factors influencing the report of the Uniform Plumbing Code Committee.

B. Film: PENNY WISE--(16mm, color, sound, 18 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Shows layout and illustratic of copper stacks and waste systems.

IV. Other Instructional Aids:

KEY--ASSIGNMENT SHEET NO. 6
(PLUMBING AND PIPEFITTING)
LAYOUT AND INSTALLATION OF THE WATER DISTRIBUTION SYSTEMS

I. <u>Key to Study Questions</u>:

1. H-248
2. H-249-250
3. H-251-255
4. H-256-261
5. H-263-271
6. H-274-276
7. H-277-282
8. H-283-289
9. H-289-290

12. H-245-247
13. H-215-217
14. H-217-219
15. H-221-226
16. H-227-232

II. <u>Suggested Supplementary Assignments</u>:

A. Utilizing the house blueprints, lot plan, and sketch layout for the suggested advanced assignments of units 3 through 5, make layout plans and bills of material for the water distribution systems.

III. <u>Suggested List of Visual Aids</u>:

A. Film: RHYTHM OF INSTALLATION--(16mm, B & W, sound, 15 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Installation of hot water heating system and factors such as heat-loss calculations, boiler sizing, water temperatures, etc.

B. Film: SAFE WATER IN THE HOME--(16mm, B & W, sound, 11 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Shows several ways in which home water supply can become contaminated.

IV. <u>Other Instructional Aids</u>:

KEY--ASSIGNMENT SHEET NO. 7
(PLUMBING AND PIPEFITTING)
SELECTION AND INSTALLATION OF PLUMBING FIXTURES

I. Key to Study Questions:

1. H-147-151
2. H-151-152
3. H-153-157
4. H-159-167
5. H-169-170
6. H-170-182
7. H-182-195
8. H-330
9. H-331-335
10. H-335-342
11. H-343-347
12. H-347-354
13. H-354-357
14. H-358-365
15. H-365-368
16. H-369-372
17. H-380-386

II. Suggested Supplementary Assignments:

A. Work out the following assignments utilizing the house blueprints and sketch layouts for the suggested advanced assignments for units 3 through 6:

1. Make layout plans and bills of material for the ventilation systems.

2. Compile a list of all plumbing fixtures.

3. Obtain rough-in blueprints for the plumbing fixtures.

III. Suggested List of Visual Aids:

A. Film: DESIGN FOR BETTER LIVING--(16mm, B & W, sound, 35 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Traces the history of sanitation and plumbing and then portrays the manufacture of modern plumbing fixtures.

B. Film: BARRIER AGAINST DISEASE--(16mm, color, sound, 15 min., free)--National Association of Plumbing Contractors, 1016 20th Street, N.W., Washington 6, D.C. Explains siphonage, blow-back, and general principles of venting.

IV. Other Instructional Aids:

A. Speaker: Invite a local building inspector to speak on the topic, "Local Plumbing Code Requirements."

V. Test No. 3, Covering Assignments 5-7:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

(T) F 1. Partitions which house soil stack may require 2 x 6 studs or larger. H-108

T (F) 2. The soil pipe is generally installed after partitions are constructed. H-108

(T) F 3. Accessible cleanouts should be installed for every change of direction of the soil pipe. H-110

T (F) 4. The soil branches are generally installed before the main soil pipe is run through the roof. H-114

T (F) 5. A cleanout may be of a smaller diameter than the soil branch which it serves. H-120

(T) F 6. The proper grade for a soil branch is 1/4 inch per foot. H-121

(T) F 7. Acid-resistant pipes are not usually required for domestic or commercial kitchens. H-126

(T) F 8. The problem of what constitutes satisfactory size and grade for waste pipe has been solved by scientific tests. H-130

T (F) 9. The minimum diameter for kitchen sink waste pipe is 1 3/4 inches. H-133

(T) F 10. When copper or brass pipe is used for underfloor work, it should often be assembled above floor. H-143

T (F) 11. Putty is the best material to use for setting closet bowls. H-335

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. That portion of the plumbing system which receives the discharge of water closets is the soil pipe. H-107

2. A tee for ventilation purposes must be left 3 feet above the last floor when installing the soil pipe. H-114

3. That part of the drainage system which conveys the discharge of fixtures other than water closets is the waste pipe. H-125

4. The method used to determine the size of waste pipe is called the unit system. H-132

5. The galvanized underfloor work may either terminate into a soil pipe terminal or a closet bend terminal. H-141-142

6. The device used to prevent the passage of sewer air is called a trap. H-147

7. Improper ventilation may cuase trap seal loss. H-161

8. Vent pipe should be graded lightly so that no water will accumulate in it. H-170

9. The main soil and waste vent is that portion of the soil-pipe stack above the highest installed fixture branch. H-172

10. That portion of the vent pipe system which serves as a terminal for the small vents is the main vent. H-174

11. Two fixture traps that are installed back to back are called unit vents. H-182

12. The factor that determines the type of pipe to be used for water distribution systems is the mineral content of the water. H-221

13. Most cities and water services use heavy cast iron pipe, known as corporation pipe. H-221

14. A water distribution pipe that does not rust or corrode is asbestos-cement pipe. H-223

15. One of the ends of a galvanized iron street ell is threaded on the outside. H-224

16. That part of the plumbing system installed underground between the water main and the house meter is called the house service. H-233

17. A fitting which may be installed on the water main without cutting the pressure off is a corporation stop. H-246

18. The boiling point for water at sea level is 212° F. H-273

19. Where power rates are low, the electric hot water heater provides the cleanest and most trouble-free method of heating water. H-282

20. Temperature pressure relief valves are used on hot water heaters to prevent explosion. H-289

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Common causes of trap seal loss are:

(A) siphonage

(B) back pressure

(C) evaporation

(D) capillary attraction

(E) wind effect

H-161

2. Some of the most important factors to consider in installing a waste line are:

(A) selection of proper material

(B) conservative use of fittings

(C) adequate support

(D) location of cleanouts

(E) pitch

(F) size

(G) properly made joints H-125

3. The four types of permissible traps are:

(A) p-traps (C) anti-siphon traps

(B) drum traps (D) bell traps H-151-156

4. Ventilation of the plumbing system prevents at least three major difficulties. They are:

(A) trap seal loss (C) material deterioration

(B) retardation of flow H-159

5. The types of plumbing system tests are:

(A) cast iron drain water test

(B) vitrified clay pipe water test

(C) house drain air test

(D) soil, waste and vent pipe water test

(E) soil, waste and vent air test

(F) smoke test H-210-212

6. The parts which the municipal water departments furnish the plumber for the water system are:

(A) corporation cock (C) meter stop

(B) curb cock H-245

7. The three factors which must be considered in determining the size of a hot water storage tank are:

(A) the design of the building

(B) the number of occupants

(C) heating capacity of the supply device H-275

8. According to Matthias, the steps to be followed in setting closet bowls are:

(A) sweep bathroom floor clean

(B) inspect floor flange and insert closet bolts

(C) set bowl in place temporarily to study its appearance

(D) place wax or putty in recess of bowl

(E) wipe bolt holes clean and put bolts in place

(F) set bowls in permanent position

(G) place bolt flange and nuts on each bolt and tighten

H-334-335

9. The advantages of flush tanks over flush valves for residences are:

(A) they produce less noise

(B) require less pressure

(C) require smaller volume of water

(D) served with smaller supply piping H-337-338

KEY--ASSIGNMENT SHEET NO. 1
(PLASTERING)
APPLICATION OF THE PLASTER BASE

I. Key to Study Questions:

1. N-103-106
2. N-107
3. N-107
4. N-107-118
5. N-110-112
6. N-118-124
7. N-125-126
8. N-7
9. N-127-128
10. N-128-132
11. N-132-136
12. N-136-139
13. N-139-143
14. M-367-368
15. M-368-369
16. M-369
17. M-369-370
18. N-19-44
19. N-45-46
20. N-47-55
21. N-55-71
22. N-71-75
23. N-81-86
24. N-86-94

II. Suggested Supplementary Assignments:

A. Read: Van Den Branden, Felicien, and Mark Knowles, Plastering Skill and Practice, American Technical Society, Chicago, 1959, pp. 275-289.

1. Write out the answers for the five questions on page 275.

2. Be prepared to discuss the review questions on pages 288-289.

III. Suggested List of Visual Aids:

IV. Other Instructional Aids:

A. Speaker: Invite a lather to speak to the group about his work in preparing the plaster base.

T (F) 5. The moisture content of the sand used in a plaster mix has no bearing on the amount of water used in the mix. N-49

(T) F 6. Lightweight aggregates are free from foreign matter. N-51

(T) F 7. Both Keene's cement and plaster of Paris are calcined gypsums. N-56

(T) F 8. Quicklime requires extended soaking. N-66

(T) F 9. Quicklime should be added to water. N-67

(T) F 10. Portland cement is used in plaster mixtures that are designed to be water resistant. N-68

T (F) 11. Screeds and grounds are made of the same material. N-148

(T) F 12. Screeds and grounds serve the same purpose. N-148

(T) F 13. The water level is a highly accurate and sensitive instrument. N-156

T (F) 14. Cornices are moldings that are attached where the walls and floor meet. N-157

(T) F 15. The purpose of rodding is to produce plumb walls and level ceilings. N-157

T (F) 16. Atmospheric conditions have little, if any, effect on a plastering job. N-232

(T) F 17. Chip cracking is caused by faulty suction. N-239

(T) F 18. Large cracks in plaster are usually caused by poor construction beneath the lathing and plaster. N-242

T (F) 19. The best interior plaster work is put on in two coats. N-5

T (F) 20. The primary purpose of the scratch coat is to present a smooth unit surface to succeeding coats. N-5-6

T (F) 21. Grounds are used almost exclusively on ceilings. N-7

(T) F 22. Dense plaster is stronger than plasters with less density. N-9

(T) F 23. Much plaster work now consists of only two coats. N-9

T (F) 24. One disadvantage of stucco is that it is greatly affected by climate. N-11

(T) F 25. The careless plasterer is a dangerous worker. N-15

(T) F 26. White clothing is the trademark of the plasterer. N-16

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The process of producing a plastic or pliable mortar from lime is called ___soaking___ ___lime___. N-65

2. Lime that has been soaked is called ___putty___ because of its plasticity. N-65

3. The two principal tools used by the plasterer to apply mortar are the ___hawk___ and ___trowel___. N-145

4. Grounds are made of ___wood___ ___ ___ or ___metal___. N-143

5. Screeds are made of ___plaster___. N-148

6. Exterior plaster work is called ___stucco___. N-11

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Plaster is made up of three main ingredients. These are:
   - (A) ___water___
   - (B) ___aggregate___
   - (C) ___cementitious material (or binder)___

   N-45

2. The three main cementing agents used in plaster mortars are:
   - (A) ___gypsum___
   - (B) ___lime___
   - (C) ___Portland cement___

   N-55

3. Admixtures are divided into three kinds. These kinds affect:
   - (A) ___setting time of the plaster___
   - (B) ___the strength of the plaster___
   - (C) ___the color of the plaster___ N-71

4. Three methods which may be used to square a room are:
   - (A) ___right angle method___
   - (B) ___square method___
   - (C) ___center-line method___

   N-167

5. The names given to the coats of plaster in three-coat work are:
   - (A) ___scratch (or base coat)___
   - (B) ___brown coat___
   - (C) ___finish coat___

   N-5

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

B	1.	Hawk	N-20
G	2.	Trowel	N-21
H	3.	Float	N-23
C	4.	Paddle	N-24
A	5.	Level	N-27
D	6.	Scratcher	N-30
E	7.	Feather edge	N-36
F	8.	Rod	N-36
I	9.	Darby	N-37
K	10.	Finishing boards	N-37

A. A device used to establish a horizontal line

B. Used to hold and carry mortar

C. Used to clean out and finish corners

D. Used to score the first coat of plaster

E. Used to straighten angles (corners)

F. A straightedge

G. Used to apply, spread, shape, and smooth the various plastering mortars

H. A straightening device used by the plasterer to level off the humps and fill in the hollows left by the other tools

I. Used to float freshly rodded brown mortar

J. Used to apply water to the plastered surface

K. Used as a surface on which to mix plaster mortar

KEY--ASSIGNMENT SHEET NO. 1
(PAINTING AND DECORATING)
TOOLS, EQUIPMENT, MATERIAL SELECTION, AND SURFACE PREPARATION

I. Key to Study Questions:

19. G-158-162
20. G-165-166

II. Suggested Supplementary Assignments:

A. Read: Kent, Lonore, Paint Power, Thomsen-Ellis-Hutton Co., Baltimore, Md., 1957, pp. 125-127.

  1. Discuss in detail the aspects of color harmony and paint styling.

B. Select a set of house blueprints and prepare a color scheme for the interior and exterior surfaces.

C. Make a list of all tools and equipment needed to apply the paint and wall coverings for the house in "B" above.

III. Suggested List of Visual Aids:

A. Film: PAINTING AND DECORATING--(16mm, 11 min., sound, B & W, $2.00)-University of Michigan, Audio-Visual Education Center, Ann Arbor, Michigan. Vocational guidance covering exterior and interior work, tools of the trade, requirements, opportunities, ect.

IV. Other Instructional Aids:

A. Speaker: Invite a local interior decorator to speak on "Color Dynamics and Selection."

KEY--ASSIGNMENT SHEET NO. 2

II. Suggested Supplementary Assignments:

A. Read: Kent, Lonore, Paint Power, Thomsen-Ellis-Hutton Co., Baltimore, Md., 1957, pp. 63-97.

1. Discuss the information on painting interior and exterior surfaces as well as the necessary tools, equipment, and safety measures.

B. Utilizing the house blueprints from assignment number 1, make a list of each major painting and paperhanging job, when it should be done, and the approximate time it will take to complete each job. Show how this plan will dovetail into the overall construction period for the whole house

C. Prepare step-by-step procedure lists for each type of finish to be used for the house.

III. Suggested List of Visual Aids:

A. Film: BUILDING A HOUSE--(16mm. B & W, sound, 11 min., $2.00)--University of Michigan, Audio-Visual Education Center, Ann Arbor, Michigan. Step-by-step process in constructing a woodframed home from excavating through the completed home.

IV. Other Instructional Aids:

A. Speaker: Have a local paint dealer speak on new finishes that are available as well as other materials, tools, and equipment handled by local stores.

KEY--ASSIGNMENT SHEET NO. 3

25. G-262-263

II. Suggested Supplementary Assignments:

A. Read: Kent, Lonore, Paint Power, Thomsen-Ellis-Hutton Co., Baltimore, Md., 1957, pp. 100-121, 280-313.

1. Discuss the various aspects for estimating jobs and how to start and operate a contractor painting and decorating business.

B. Utilizing the house plans from assignment sheet number 1, make out a complete estimate for the job.

C. Make out a purchase order for the paint, wall coverings, interior wood finishes, solvents, and all other necessary materials.

III. Suggested List of Visual Aids:

A. Film: WOOD FINISHING--(16mm, B & W, sound, 16 min., $2.00)--University of Missouri, Audio-Visual Department, Columbia, Missouri. Explains the common types of finishing materials used on wood and demonstrates the procedures for each.

IV. Other Instructional Aids:

A. Speaker: Invite a local paint and paperhanger contractor to speak on the local labor market, nature of the work done in the area, union and apprenticeship requirements, and other local occupational information.

V. Test No. 1, Covering Assignments 1-3:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

(T) F 1. A good brush will cost more initially, but longer serviceability will offset the extra cost. G-49

T (F) 2. Hog bristles are not as suitable for painting as other natural bristles as they lack "flag ends." G-49

(T) F 3. A non-bleeder type spray gun cannot pass air until the trigger is pulled. G-57

T (F) 4. An external mix spray gun indicates that the paint is mixed inside the spray gun pot. G-58

(T) F 5. Knots should be sealed with shellac after the prime coat. G-76

(T) F 6. New plaster walls may be painted with casein and emulsion paints without regard to moisture content. G-78

(T) F 7. Emulsion and alkyd enamels usually produce a flat finish. G-92

T (F) 8. Good points of a room should be emphasized by painting them a highly contrasting color. G-166

T (F) 9. Shellac should be thinned with turpentine. G-96

T (F) 10. Paint should be mixed in the paint roller tray. G-107

(T) F 11. A ceiling is usually painted across the shortest dimension of the room. G-107

T (F) 12. In two coat exterior work, one gallon of house-paint primer is thinned with one pint of turpentine. G-112

T (F) 13. A thick prime coat provides good anchorage for the finish coats. G-114

(T) F 14. Latex masonry paint may be applied directly onto new masonry surfaces. G-119

(T) F 15. A phenolic-resin primer-sealer is recommended for the base coat on fir plywood. G-123

(T) F 16. Multi-colored spatter type paints are usually sprayed onto wall surfaces. G-126

T (F) 17. A heavy center spray pattern results from a clogged fluid tip. G-130

(T) F 18. New plaster walls should be neutralized with a zinc sulphate water solution. G-176

(T) F 19. Wallpaper sizing is made from a glue foundation. G-176

(T) F 20. The paperhanger hangs the ceiling first so that glue does not get on the sidewalls. G-177

T (F) 21. The first wallpaper strip should be hung adjacent to a door casing to ensure straightness. G-179

T (F) 22. Wall coverings should be hung continuously around corners if at all possible. G-182

T (F) 23. The first wallpaper strip that is hung on a ceiling is applied in the center of the room. G-183

(T) F 24. A special commercial solvent is used with non-grain-raising stain powder. G-190

T (F) 25. Open grain wood pores are filled with stick shellac. G-192

(T) F 26. Two coats of varnish will produce a good surface if the work has been properly prepared. G-195

(T) F 27. A penetrating stain wax finish is a two-coat finish on closed grain woods. G-197

(T) F 28. Floor seal is a penetrating finishing coat for floors. G-199

(T) F 29. Paneling should be backprimed to prevent moisture absorption. G-204

(T) F 30. Designs may be created on walls with a twin paint roller. G-215

T (F) 31. A fountain pen striping tool feeds paint to a rectangular wick. G-215

T (F) 32. The bristles of a stencil brush are dipped into the paint about 1/4 of an inch. G-222

T (F) 33. A copy of cost estimates is kept in the contractors file as a protective service to the customer. G-261

(T) F 34. Painting and paperhanging are separate skilled building trades though a craftsman may do both types of work. M-349

(T) F 35. Most painters and paperhangers work for contractors on new construction work. M-350

T (F) 36. The recommended length of time for a formal apprenticeship is four years for the painter and paperhanger. M-350

(T) F 37. The employment trend for painters and paperhangers during the 1960's will rise slowly. M-351

T (F) 38. The hourly rate for paperhangers and painters is generally more than the average rate for all building trades journeymen. M-351

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the statement correctly.

1. A nylon fiber brush with exploded tips will outlast a hog bristle brush approximately three times. G-50
2. The three principal types of paint rollers are the fountain, dip, and pressure. G-56
3. A device used to check the moisture content of wood or masonry is called an electronic moisture meter. G-74
4. Wall and plaster board joints should be covered with perforated joint tape. G-79
5. A wash coat used to neutralize alkalinity in new concrete is made of two pounds of zinc sulphate crystals dissolved in one gallon of water. G-81
6. A roof line that seems too high may be "lowered" by painting the roof a dark color. G-160
7. A ceiling of a room is painted before the walls are painted. G-104
8. Emulsion paints may be cleaned from paint rollers by washing them in water. G-108
9. The ideal moisture content of wood when painting should be 12-15 per cent. G-110
10. Masonry surfaces are painted both for decorative and waterproofing purposes. G-119
11. Masonry should season for about 6 months before painting with oil-base paints. G-119
12. American made wallpaper contains 36 square feet in a single roll. G-167
13. Moisture in the paste causes wallpaper to expand. G-176
14. When cutting wallpaper to length, allow at least 2 inches at top and bottom. G-178
15. Wallpaper that is hung horizontally on walls is called streamline. G-183
16. Sanding should be done with the grain. G-187
17. The most frequently used mild wood bleach is oxalic acid. G-188

18. Surplus paste wood filler is removed ___across___ the grain with a coarse cloth. G-192

19. Sealer coats on interior woodwork are applied to prevent stain from ___bleeding___ into the top finish coats. G-193

20. The room temperature when applying varnish should be ___70___ degrees or higher. G-195

21. A "flit" spray gun is used to produce a ___spatter___ painted surface. G-214

22. Two or three different colors may be sprayed at one time from one gun by using a ___multi-color___ spray enamel. G-214

23. Painted stippling may be done with crumpled newspaper, a stippling brush or a ___sponge___. G-214

24. The unit which the estimator bases his prices on is ___100___ square feet. C-259

25. A valuable reference book for estimating is the ___Price Guide___ published by the Painting and Decorating Contractors of America. G-260

26. Wallpaper is estimated by either the square footage method or the ___strip___ method. C-261

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

__D__ 1. Brushes that are to be stored should be washed with (A) alcohol; (B) linseed oil; (C) gasoline; (D) soap and water. G-55

__D__ 2. Before painting galvanized iron which has been exposed to weather for six months or more (A) wash it with aluminum oxide; (B) scrape or brush until shiny; (C) apply a coat of asphalt; (D) no special preparation is necessary. G-84

__B__ 3. A self-cleaning house paint means that (A) the paint will deteriorate quickly; (B) the chalk and dirt will easily wash away; (C) it isn't necessary to wire brush the surface before repainting; (D) the homeowner can clean the house himself. G-88

__A__ 4. To make a large room seem smaller, paint (A) the walls and ceiling a dark color; (B) the walls light and the ceiling dark; (C) the walls and ceiling a light color; (D) the floor dark and the ceiling and walls a light color. G-159

C 5. A brush should be dipped into the paint (A) 3/4 of the bristle length; (B) at a 60° angle; (C) 1/2 of the bristle length; (D) horizontally. G-103

D 6. New wood such as cedar, redwood, and white pine are usually given (A) an oxide primer and one coat of house paint; (B) a wash coat of linseed oil and two coats of house paint; (C) an emulsion primer and two coats of house paint; (D) a white lead primer and two coats of house paint. G-112

A 7. Below grade concrete floors should be painted with (A) latex-base paints; (B) oil-base paints; (C) casein paints; (D) porch and deck enamel. G-120

D 8. The spray gun pattern should overlap the previous stroke by about (A) 1/8; (B) 1/4; (C) 1/3; (D) 1/2. G-129

C 9. American made wallpaper varies in widths of (A) 12 to 36 inches; (B) 18 to 36 inches; (C) 18 to 48 inches; (D) 24 to 48 inches. G-167

A 10. A paperhanger uses a brush that is about 12 inches long with 2 1/2 inch bristles to (A) smooth the paper to the wall; (B) apply paste; (C) apply size; (D) remove dust from the wall. G-170

B 11. Wallpaper should be trimmed around woodwork and casings (A) after the glue sets; (B) before the glue sets; (C) with a boardknife; (D) with a drawknife. G-181

D 12. If too much pressure is applied when using a seam roller, the (A) glue will curdle; (B) glue will become watery; (C) paper will have air pockets; (D) paper will become shiny. G-182

A 13. A tack rag is made by sprinlking a wet cloth with (A) turpentine and varnish; (B) linseed oil and shellac; (C) benzine and lacquer; (D) lacquer thinner and linseed oil. G-188

B 14. The final "clean-up" wiping when doing paste wood filler work is done (A) across the grain; (B) with the grain; (C) with a linseed oil dampened rag; (D) with a benzine dampened rag. G-192

D 15. Texture paint may be used to (A) decorate floors; (B) paint lawn furniture; (C) stipple walls; (D) create a plaster effect on dry wall. G-215

C 16. The number of painters and paperhangers employed in 1960 was approximately (A) 275,000; (B) 390,000; (C) 425,000; (D) 680,000. M-350

D 17. The number of yearly job openings during the 1960's for painters and paperhangers will be (A) less than 5,000; (B) about 6,000; (C) between 7,000 and 8,000; (D) somewhat over 10,000. M-351

A 18. Painters and paperhangers have an injury rate that is (A) lower than the average contract construction as a whole; (B) higher than the average contract construction as a whole; (C) lower than for all manufacturing industries; (D) about the same as for all manufacturing industries. M-352.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The two types of compressors suitable for spraying are:

(A) piston (B) diaphragm

G-57

2. The two principal types of spray guns are:

(A) suction (B) pressure

G-57

3. Four specially prepared materials for masking are:

(A) masking paper (C) masking paste

(B) masking tape (D) liquid masking

G-73

4. In paper hanging, three types of seams or joints are used:

(A) butt (C) lapped

(B) wire edge G-179

5. The principal types of stain as classified by their solvent are:

(A) water (C) spirit or alcohol

(B) oil G-190

6. To properly estimate a job, four main factors must be considered:

(A) labor costs (C) general overhead

(B) material costs (D) profit expected

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *PAINTERS, GRADE 11, GRADE 12, *COOPERATIVE EDUCATION,

This study guide is for use by preparatory or cooperative students in painting and decorating courses. It was developed by teacher educators and research assistants with help from a consultant committee. Assignment sheet titles are (1) The Paint Industry, (2) Health and Safety, (3) Tools and Equipment, (4) Surface Preparation, (5) Paint Mixing, (6) Paint Application, (7) Finishing Wood with Shellac, Varnish, and Lacquer, (8) Color Harmony, (9) Color Styling, (10) Special Finishes, (11) Wall Coverings, (12) Estimating, and (13) The Paint Contractor. Each assignment sheet gives an assignment, reference, and objective-type questions. The suggested time allotment is 180 days. The teacher should be a qualified coordinator or trade teacher and students should be at least high school juniors with the proper prerequisites. A job and information analysis and progress records for use by student, teacher, and employer are included. An answer key VT 002 088 is available for 50 cents. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (EM)

Agency Industrial Education Dept., Univ. of Mo. at Columbia
Address 103 Industrial Education Bldg.
Limitation on Available Copies quantity Price/Unit $1.50
(quantity prices) same
Teacher's Key $.50

(2) Means Used to Develop Material:
Development Group Consultant Committee, teacher educators, research assistants
Level of Group State
Method of Design, Testing, and Trial Analysis of occupation, consultation with specialists, periodic revisions after use in the field.

(3) Utilization of Material:
Appropriate School Setting High school or post high school including area vocational
Type of Program cooperative or preparatory
Occupational Focus Limited job family
Geographic Adaptability United States
Uses of Material Study Guide for related instruction on individual basis
Users of Material student

(4) Requirements for Using Material:
Teacher Competency Qualified coordinator or competent trade teacher
Student Selection Criteria junior in high school with proper prerequisites

Time Allotment 180 days

FOREWORD

This course of study consisting of an analysis of PAINTING AND DECORATING, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching painting and decorating on an individual basis in a cooperative part-time program.

Credit is due Mr. Carl Putman and Mr. Kim Baugrud, Research Assistants in Industrial Education at the University of Missouri, for preparing the present revision of this course of study.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

TABLE OF CONTENTS

Assignment Sheets:

Information Sheet:

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of the "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." The third group--the personal-social traits--has been listed under "Personal Qualifications" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

In the back of this course of study will be found three copies of the TRAINING PLAN AND PROGRESS RECORD FOR PAINTING AND DECORATING. One copy is marked "Student" in the upper right hand corner. On this copy, in the space Time in Hours, the student will keep a talley of the hours he spendson his job performing operations in each area. The next copy marked "Employer", should be given to the employer for recording the student's job performance in each area. The third copy may be used by the coordinator for his record.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. If the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort,has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be obtained and kept in the coordinator's classroom for ready use by the student.

The key sheets, available in a separate manual, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

Definite proof of the use of color for decoration dates back to around 20,000 years ago. Color has been used in the decoration of living quarters and has been extensively used in the adornment of religious surroundings.

Only in comparatively recent times has paint been used because of its protective qualities. Dwellings, business establishments, and industry make extensive use of paint for decoration, property protection, health, and safety.

Opportunities in Painting and Decorating

The painting trade is a large and overcrowded field of work. In 1950 there were approximately 390,000 painters, of which almost one-third were self-employed. Opportunities may be rather limited for the mediocre painter, but as in any trade, the outstanding workers are always in demand.

The COE student will most likely start as a painter-helper in which his duties will consist primarily of:

1. Assisting painter by cleaning, scraping, and sanding surfaces
2. Preparing paint
3. Mixing colors
4. Cleaning brushes
5. Cleaning spray guns

Later, he may advance to an apprentice painter or to a journeyman painter after extended on-the-job training. Once the trade has been mastered, he may go into business on his own.

Most painters are employed in construction, but all industries have maintenance painters.

The work is highly seasonal but with proper planning, many of the seasonal aspects may be eliminated.

Requirements for Entering

The youth who contemplates entering the painting and decorating occupation should have acquired a rather broad general education with emphasis upon industrial arts, art, mathematics, language usage, and chemistry. Some of this information may be acquired through work on the job and through the COE class. Some may best be acquired through special general education courses.

Personal Qualifications

Desirable personality traits are of extreme importance for success in life. They are the factors by which one primarily is judged when meeting people and when attempting to obtain a job. They are vitally important in holding a job. In fact, studies reveal that the chief cause for 90 per cent of the persons being discharged from their jobs is due to a lack of desirable personal-social traits, while only 10 per cent of the discharges are due to a lack of job skills. It should be noted, however, that without job skills it is exceedingly difficult to find employment. Personal-social traits can be improved through conscientious effort. One should know what to improve, how to improve, and why improvement is necessary.

There are a number of personal-social and native traits which the painter and decorator will find important. Some of the more important are the following?

Honesty - Because the painter and decorator is working with a material that can be easily camouflaged and the inadequacy not discovered until sometime later, honesty is of prime importance.

Dexterity - The painter and decorator is called upon to work on small areas requiring him to be nimble with his hands and effective with his tools.

Artistic Ability - The importance of colors and their relation to surroundings requires persons with considerable artistic ability.

Good Vision - A person who is color blind has a definite disadvantage in his effort to become a successful painter and decorator.

Thoroughness - Each task should be done in detail--there is no place for laxity or short-cuts.

Industry - Careful, thoughtful, energetic attack upon each job without loitering or wasting time is important to fulfill committments to customers.

Initiative - The nature of the work of the painter and decorator requires individuals who can see what needs to be done and can go ahead without constant supervision.

	11	158. Need for sizing
159. Prepare size for application	11	159. Composition of sizing
160. Apply size to walls		
161. Prepare wallpaper paste	11	161. Paste for wallpapering
162. Estimate material	11,12	162. Cost estimation
163. Estimate time required to do the job		
164. Get material and supplies in readiness for applying wallpaper	11	164. Procedures to follow when applying wallpaper

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
165. Cut paper to match		
166. Apply paste		
167. Fold and trim paper		
168. Make chalk line for starting course	11	168. Points to be observed to keep paper straight
169. Make butt joints	11	169. Types of seams
170. Make wire edge joints		
171. Make lapped joints		
172. Apply and smooth out paper		
173. Trim around casings, baseboard, etc.		
174. Roll seams		
175. Paper around inside and outside corners	11	175. Points to be observed when turning corners
176. Hang borders		
	11	177. Wallpaper care

Estimating

	12	178. Review of mathematics
179. Estimate painting costs from blueprints	12	179. Blueprint reading for the painter
180. List kinds and amounts of materials needed for jobs	12	180. Techniques of estimating materials
	12	181. Techniques of estimating [illegible]or costs
	12	182. Factors in estimating overhead and profit

Paint Store Operation and Contracting

	13	183. The painting contractor
	13	184. Formulation of plans preparatory to becoming a painting contractor
	13	185. Deciding factors in location of the business
	1,3, 13	186. Equipment and tools needed
	13	187. Workers for the industry
	13	188. Manpower utilization
	13	189. Insurance and other protectic
	13	190. Factors pertaining to credit
	13	191. The selling phase of the contracting business
	13	192. Records needed in the operation of the business

Assignment Sheet No. 1 — Covering Units 1-24

THE PAINT INDUSTRY

The products produced by the paint industry are varied and many. So uniformly important are these products that they affect all phases of our daily life. If we stop to analyze their importance, we find we do not eat, sleep, work, or travel without relying upon these products in some way.

As you will see as you progress through your assignments, the painter and decorator needs to be familiar with these products and with the materials necessary for their application or use.

This assignment is designed to give you an overview of the paint industry and provide information on opportunities for painters and decorators.

Assignment:

1. Read the reference listed below.
2. In the block where you live, make a list of the buildings that need painting. If you can, find out when these buildings were painted last. List the types of finishes you would recommend for each building.
3. Select a particular building to be used in subsequent assignments.
4. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 9-48.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Pigment is a powdery solid which is dissolved in a vehicle to make paint.

T F 2. A pigment is essential for an opaque coating.

T F 3. Extender pigments are especially useful because of their covering and hiding abilities.

T F 4. White pigments provide the basis for most shades and tints.

T F 5. White lead is seldom used for interior work.

T F 6. Extender pigments are less costly than other pigments.

T F 7. Colored pigments absorb a portion of the light which falls upon them.

T F 8. Earth colors are found as natural deposits.

T F 9. Precipitation colors are the same as earth colors.

T F 10. Pigments obtained in the fire process are fused in a furnace.

T F 11. Rust is a formation of oxygen and water.

T F 12. Aluminum paint is light fast.

T F 13. Pigments influence only the color of paint.

T F 14. Cost seldom has any bearing on which pigments are used.

T F 15. In general, the finer the pigment is ground, the greater is its hiding power.

T F 16. The function of the binder is to cause the paint film to adhere to the surface.

T F 17. Rosin produces a film that is tough, hard, and glossy.

T F 18. Shellac is soluble in alcohol, turpentine, and lacquer thinner.

T F 19. Paint makers make extensive use of turpentine in the manufacture of paint.

T F 20. Driers continue to act all through the life of the coating.

T F 21. Shellac is a spirit varnish.

T F 22. Short-oil varnishes are recommended for floors.

T F 23. In applying shellac, a few heavy coats are recommended over many thin coats.

T F 24. Wiping stains are best suited for use on close-grained wood.

T F 25. Pigment stains are recommended over dye stains because of their ability to bring out the satin-like quality of woods.

T F 26. Filler is not required on close-grained woods.

T F 27. Semi-gloss enamel contains a higher proportion of pigment than does gloss enamel.

T F 28. Flint paper is made of ground quartz applied to paper with an adhesive.

T F 29. Powdered pumice is used to rub down finishes.

T F 30. Castor oil in its natural state is a non-drying oil.

T F 31. Tung oil is quick drying.

T F 32. An advantage of soybean oil is its excellent color retention

T F 33. Fish oil is easily recognized by its unpleasant odor.

T F 34. Latex paint may be used on exterior masonry.

T F 35. Baked varnish surfaces have a superior hardness.

T F 36. Shellac may be used directly from the can.

T F 37. Lacquer is a fast drying finish.

T F 38. An advantage of oil stain over other types of stain is its non-bleeding qualities.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The principal ingredients of paint are the ________________ and the ________________.
2. Colored materials used in paint which will dissolve are known as ________________.
3. The covering and hiding power of a pigment is known as the ________________.
4. An anti-corrosive pigment used extensively for iron and steel is ________________.
5. Our most important metallic pigment is ________________.
6. Linseed oil comes from the ______________ ________________.
7. Because of its high moisture resistant qualities, marine finishes use ______________ oil.
8. Paint solvents are used to reduce the ________________ of paint products.
9. Driers are known as ______________.
10. The ratio of oil to resin in varnish is known as the ____________ of the varnish.
11. Varnish containing less than ________ gallons of oil per ________ pounds of resin is known as a short-oil varnish.

12. The principal ingredient in lacquer is ________________.

13. Paste filler is composed mostly of silex, linseed oil and ________________ ________________.

14. Cabinet coated abrasives are sold by the ____________ and range in grits from ________ to ________.

15. Steel wool comes in degrees of fineness from _________, which is very fine, to No. ________,which is very coarse.

16. Paint and varnish removers may be typed as either ____________ or ______________ ________________.

17. The paint finish which gives a high-grade, smooth, finish is ____________________.

18. Inexpensive paints will use ________________ as a binder.

19. A paint that uses no binding vehicle is a ________________ ________________ paint.

20. A good bleach which dissolves in hot water and is expensive is ____________________ ________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

______ 1. Spirit varnishes are composed of resin and (A) gasoline or naptha; (B) linseed oil or turpentine; (C) alcohol; (D) nitrocellulose or ethyl cellulose.

______ 2. Four pound cut shellac means the proportions are (A) four gallons of shellac to one gallon alcohol; (B) four gallons alcohol to one gallon shellac; (C) one gallon alcohol to four pounds shellac; (D) four gallons alcohol to four pounds shellac.

______ 3. On new work, undercoats are applied (A) after the primer; (B) before the primer; (C) both before and after the primer; (D) need not be applied on new work.

______ 4. To slow the hardening process of plaster of Paris, it is recommended that (A) turpentine; (B) Japan drier; (C) ethyl acetate; (D) vinegar be mixed with it.

______ 5. When water is used with waterproof abrasive paper, the abrasive (A) cuts faster; (B) cuts easier; (C) clogs less; (D) all of these.

______ 6. Extreme care should be taken when using a paint remover as it may (A) burn the skin; (B) destroy clothing; (C) damage other surfaces; (D) all of these.

______ 7. Varnishes are typed as (A) spirit varnishes; (B) oleoresinous varnishes; (C) both of these; (D) none of these.

______ 8. Pigments are ground finest for (A) enamel; (B) white lead; (C) latex; (D) varnish.

______ 9. To stain a surface that has a closed grain, one would use a (A) spirit stain; (B) water stain; (C) wiping or oil stain; (D) varnish stain.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Vehicles are composed of a combination of:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

2. The use made of extender pigments:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________ (F) ________________

3. The four main groups of color pigments:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

4. Metals that have value as metallic pigments:

(A) ________________ (D) ________________

(B) ________________ (E) ________________

(C) ________________

5. The advantages of pigmented wiping stains:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

6. The ingredients of putty in general usage:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

7. The desirable properties of undercoating are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

8. One of the most importa parts of a repainting job is to remove the following:

(A) ________________ (B) ________________ (C) ________________

Assignment
Sheet No. 2

Units 25-34

HEALTH AND SAFETY

No matter who the workman is or what he does, the job should be done in the safest manner possible. The development of safe work habits should be a "must" for everyone. The painter is no exception. Although his occupation is not considered as dangerous as some others, he must work with highly inflammable combustible, and poisonous materials. If proper precautions are not taken, he may be in constant danger of falling or having objects to fall upon him. Poison may enter his body through his mouth, his nose, or even through his skin, causing extreme discomfort or possible death.

This is in no way presented to discourage you in your chosen occupation. It is given, however, as a reminder of some of the health and safety precautions that are imperative for a continuously successful career.

You will find, in this assignment, information relative to personal health and safety and the importance of safeguarding the lives of your co-workers. Study the assignment carefully--"The life you save may be your own."

Assignment:

1. Read the reference given below.
2. On page /1 of your reference you will find examples of some knots and hitches frequently found wherever ropes and lines are used. Practice each of these until you are thoroughly familiar with it. Ask your employer to show you any other knots or hitches he considers essential.
3. Answer the questions below and turn in this assignment by ______________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 229-232.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. About 25 per cent of all painting injuries are the result of falls from elevations.

T F 2. Most falls from elevations occur as a result of inferior ropes or lines.

T F 3. If the inner yarns of a rope are bright, clear, and unspotted, there is an indication that the rope has had excessive wear and should be replaced.

T F 4. For scaffolding, the fibers of a rope should be dry and brittle and difficult to bend with the hand.

T F 5. Three or four broken wires in a foot of wire rope is considered too many for safety.

T F 6. About 50 per cent of painting injuries result from slips and falls on the same level.

T F 7. Uneven walkways and working surfaces are the most frequent causes of slips and falls.

T F 8. About 25 per cent of all painting injuries are caused by painters striking objects or being struck by objects.

T F 9. Over-exertion causes approximately 15 per cent of painting injuries.

T F 10. Care should be taken to open windows with the hands only.

T F 11. Persons with liver, heart or other illnesses are very suceptible to exposure to solvents.

T F 12. Heavy drinkers are not particularly affected by exposure to solvents.

T F 13. Grinding wheels may produce a spark sufficient enough to ignite solvent vapor fumes.

T F 14. If there is no fire or source of ignition within the immediate vicinity of the solvent, one may be guaranteed of safety from fire.

T F 15. When cleaning electric outlets with solvents, use steel wool because of its grounding qualities.

T F 16. About the only safe solvent to use in a place with inadequate ventilization is benzol.

T F 17. Never throw down a solvent-saturated rag; it should be placed in a pocket of the uniform until it can be discarded into a metal container.

T F 18. It is advisable to treat all exterior paint as if it contained lead, unless the label specifically states otherwise.

T F 19. Zinc is non-poisonous.

T F 20. It is advisable to thoroughly flush with solvent when cleaning paint from the skin.

T F 21. The painter should drink as little water and milk as possib possible.

T F 22. Overall pants should not have cuffs.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The inner fibers of rope used for scaffolding should be inspected by ______________ the rope in several places.

2. Around sandblasting, ______________ rope should be used.

3. Where there is exposure to chemical washing solutions, __________ rope should be used.

4. Liquid solvent may act as skin irritants by removing the ______________ ______________ from the skin and leaving it open to ______________ infections.

5. Solvent vapors are ______________ and ______________ than air.

6. Solvent should be kept in ______________ or cans with __________ openings.

7. When burning off paint containing lead, one should wear a ______________.

8. When acid or alkali comes in contact with the skin, it should be washed with ______________ or a ______________ ______________ solution.

9. Before starting to work, a ______________ ______________ should be applied to the skin.

10. Underclothes should be changed at least ______________ a ______________ and overalls at least ______________ a ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A good workman (A) never spills solvent; (B) may spill solvent but wipes it up immediately; (C) calls an apprentice to clean up solvent he spills; (D) does not use solvent in the first place.

_____ 2. When mixing acid and water; pour (A) the water into the acid (B) the acid into the water; (C) both at the same time; (D) none of these.

_____ 3. Oxalic acid is especially harmful to (A) hands; (B) tools; (C) brushes; (D) nasal passages.

_____ 4. The best possible way to be safe from injury from electricit is to (A) turn off the lights; (B) don't use it; (C) cut it off from its source; (D) wear rubber soled shoes.

_____ 5. When through with wiping cloths, they should be (A) placed in a closed metal container; (B) placed in a pot of water (C) burned; (D) any of these.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four main causes of injury:

(A) _____

(B) _____

(C) _____

(D) _____

2. Causes of injuries resulting from workmen striking or being struck by objects or structures:

(A) _____

(B) _____

(C) _____

(D) _____

3. Signs of excessive exposure to solvent vapor:

(A) _____ (C) _____

(B) _____ (D) _____

4. Forms by which lead poison may be taken into the body:

(A) _____ (C) _____

(B) _____ (D) _____

5. Methods by which lead poison may enter the body:

(A) ______________________________ (C) ______________________________

(B) ______________________________

6. Three essential items for protecting the body when using acids for cleaning, surface preparation, degreasing metal, etc.,

(A) ______________________________ (C) ______________________________

(B) ______________________________

TOOLS AND EQUIPMENT

In order for the painter or decorator to do good work he must have adequate tools and equipment. He must also know how to select, care for, and use these items in order to provide reliahle service without undue expense and trouble.

Certain items, such as paint applicators, have a direct bearing upon the job. Others, such as scaffolds, may improve the painter's efficiency but have a more indirect relationship. It is important, however, that the painter or decorator be aware of the factors necessar to maintain an adequate supply of tools and equipment along with their relationship to the health and safety of the user.

In this assignment you will become aware of some of the more impor ant considerations to be followed in selecting, caring for, and using various types of paint applicators, ladders, scaffolds and miscellaneou tools and equipment.

Assignment:

1. Read the reference listed below.
2. Select the building in need of paint from Assignment Sheet 1. Prepare a list of all the tools and equipment you would recommend in order to do an adequate paint job.
3. Using No. 8 or 9 wire, make a hook as shown in illustration B-33, page 62 of Reference "A".
4. After completing assignments 1, 2, and 3, answer the questions below and turn in this assignment by __________.

References:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 49-74

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false draw a circle around the letter "F".

T F 1. The initial cost of good brushes is greater than brushes of inferior quality.

T F 2. Horse hair makes the best quality brushes for general painti

T F 3. Hog bristles have a flag end.

T F 4. Nylon bristle has about three times the wearing power as hog bristle.

T F 5. Nylon bristle tends to soften in shellac thinned in ethyl alcohol.

T F 6. Nylon bristle cannot be used satisfactorily with water paint

T F 7. The bristle in camel hair brushes comes from North African camels.

T F 8. The bristles in a good brush should all be of the same length

T F 9. Sashtools are used to clean old putty form window frames.

T F 10. A stippling brush does not have a handle like general purpos paint brushes.

T F 11. The chisel shape of a brush helps provide smoother flow and prevent lap marks.

T F 12. Semi-oval brushes should never be used for fine enameling.

T F 13. Before it is used, a new nylon brush should be soaked for at least 12 hours in the thinner of the material in which it will be used.

T F 14. Brushes that have been used in calcimine, whitewash or paste should be stored in water when not in use.

T F 15. It is recommended that after the brush has been dipped in the paint, the surplus be removed by wiping across the edge of the container.

T F 16. Almost all types of protective coatings can be applied faster with spray equipment than with brush or roller.

T F 17. A suction feed spray gun is recommended for spraying heavy paints.

T F 18. A bleeder type spray gun will not pass air until the trigger is pulled.

T F 19. Ladder rungs should be made of red oak, hard maple, or walnut

T F 20. Magnesium and aluminum ladders weigh less than wood ladders of the same size.

T F 21. A trestle ladder is not adjustable to length.

T F 22. Ladders should not be painted.

T F 23. Load carrying capacity for aluminum is less than for steel.

T F 24. The term ridge hook and a roof hook have the same meaning.

T F 25. A steel scaffold is reusable.

T F 26. A canvas drop cloth should not be laundered.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Solidity in paint brushes is obtained by using more ____________ ____________ than ____________ ____________.
2. Brushes used for the application of paint and stain to large surfaces are flat and range in widths from ____ to _____ inches.
3. A brush which is beveled on both sides is said to have a ________ edge.
4. Calcimine brushes vary in width from _______ to _______ inches.
5. Brushes which have been used for applying shellac or spirit stain should be cleaned in ________________.
6. Brushes used for applying calcimine or casein paint should be cleaned with _________________.
7. A ladder at an angle of ________degrees or more should be lashed at the top.
8. A ladder, with a safety factor of 4, made to support a live load of 200 pounds should not break under loads up to ________pounds.
9. The space from the foot of the ladder to the vertical wall should be ________the length of the ladder.
10. Ropes supporting scaffolds should have a safety factor of at least _________.
11. Sisal rope is about ________per cent as stong as Manila rope.
12. A device used to check the moisture content on the surfaces of wood or masonry is called an ____________ ____________ ____________.
13. The divided end of a hog bristle brush is known as the _________ end.
14. The part of the brush that holds the bristles to the handle is the ______________.
15. Inactive brushes should either be stored in a container of ____________ ____________, or in a _________ _________ ____________ when stored dry.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Brushes should be obtained which have gristles (A) set in chemically inert cement; (B) set in rubber; (C) vulcanized; (D) any of these.

_____ 2. Dusting brushes have (A) soft bristles; (B) stiff bristles; (C) fibre bristles; (D) the same type bristles as regular paint brushes.

_____ 3. A brush clogged with old paint where the butt ends of bristle go into the ferrule is said to be (A) butted; (B) heeled up; (C) fish tailed; (D) gummed.

_____ 4. Brushes that are to be stored should be washed with (A) alcohol; (B) linseed oil; (C) gasoline; (D) soap and water.

_____ 5. When too wide a brush is used on narrow surfaces, it is likel to become (A) beetled; (B) heeled up; (C) fish tailed; (D) gummed.

_____ 6. Lumber used in the construction of scaffolds should be of a strength equal to (A) clear white pine; (B) No. 2 red oak; (C) No. 1 common Douglas fir; (D) No. 1 select maple.

_____ 7. An outrigger scaffold is supported by (A) vertical poles from the ground; (B) ladder jacks; (C) overhead ropes or cables; (D) thrustouts from or through a wall.

_____ 8. Excessive pressure while using a brush will result in a (A) fish tail; (B) plow; (C) heel; (D) comb.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Properties possessed by a good brush:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

2. The two principal types of air compressors:

(A) ______________________ (B) ______________________

3. The two principal types of spray guns:

(A) ______________________ (B) ______________________

4. The main advantages of steel scaffolding:

(A)____

(B)____

(C)____

(D)____

5. Four specially prepared materials for masking:

(A)______________________ (C) ______________________

(B)______________________ (D) ______________________

Assignment
Sheet No. 4

Covering
Units 54-79

SURFACE PREPARATION

To produce a successful paint job, the surface must be properly prepared. Different surfaces need different preparations. The painter must study the surface and plan the treatment necessary for proper adhesion of the paint. Improper adhesion, especially of the first coat, will result in scaling, cracking, or other subsequent imperfections.

Although there may be cheaper methods of doing a paint job, the painter should never risk his reputation by haphazard methods. If he must compete against inferior procedures, it is better he lose the job than to risk his good name by producing inferior work.

In this assignment you will become familiar with the proper preparat n of new and old surfaces of walls, wood, concrete, and metal. Also you will learn pertinent facts relating to the proper relation of paints for various surfaces.

Assignment:

1. Read the references listed below.
2. For the building selected in Assignment 3 of Assignment Sheet 2, prepare a schedule of things that should be done to properly prepare the surfaces to be painted. In one column on a piece of paper list the things you would do. In the opposite column list the tools and equipment you would need for each operation.
3. After completing 1 and 2, answer the questions below and turn in this assignment by ____________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 75-93

Questions:

True-False

Directions: The following statements are either tuue or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. A successful paint job cannot be done without proper surface preparation.

T F 2. When sanding with 2/0 or 3/0 sandpaper, sand with a rotary motion.

T F 3. When filling nail holes with putty, leave the surface slightl convex.

T F 4. Paste filler should be used on maple, gum, and fir.

T F 5. Surfaces should be slightly moistened for good paint adhesion.

T F 6. Nail holes should be filled with putty before applying the prime coat.

T F 7. It is not safe to apply paint over varnish.

T F 8. Chalking of paint is a normal weathering process.

T F 9. Paint burning should be done on days in which there is a strong breeze.

T F 10. Casein and emulsion type paints should never be applied over moist surfaces.

T F 11. Unless the defects are large, paint can adequately hide them without prior preparation.

T F 12. Caulking compound is used to fill cracks around bathtubs where moisture crumbles the plaster.

T F 13. Large cracks should be undercut and deepened until firm plaster is reached.

T F 14. All patched areas should be spot primed before painting.

T F 15. Walls should be patched before they are washed preparatory to painting.

T F 16. Special paints called calcicoaters are used to cover calcimine treated plaster walls.

T F 17. Latex-base paint cannot be satisfactorily applied over wallpaper.

T F 18. Wallpaper cleaner should be used to clean wallpaper before painting.

T F 19. Concrete surfaces are painted for decorative purposes only.

T F 20. No matter how much concrete has cured there is always active alkali on the surface which causes deterioration of paint.

T F 21. Neutralizer is not necessary when painting concrete surfaces with latex-base paint.

T F 22. When rust is painted over without first removing it, the rusting continues.

5

T F 23. Abrasion cleaning of metal is an adequate method of cleaning oil and grease from metal.

T F 24. Weathered galvanized iron holds paint better than new galvanized iron.

T F 25. Rust inhibiting pigments should not be used on articles handled by small children.

T F 26. The oxide surface of aluminum should be removed before painting.

T F 27. Dark colored pigments, in general, have a high oil absorption.

T F 28. Four or five years is considered the normal period that a coating of outside white will remain durable.

T F 29. Repainting at intervals less than three years is usually considered inadvisable.

T F 30. In humid climates, harder types of paint are usually more durable than softer types.

T F 31. In general, present day paints are not as durable as those manufactured fifty years ago.

T F 32. The majority of the outside light colored paints are self-cleaning.

T F 33. House paint cannot be satisfactorily used on anything but wood.

T F 34. House paint should not be used on garden furniture.

T F 35. Natural finishes, in general, are not as durable as good quality house paint.

T F 36. Paint wear is most pronounced on northern exposures.

T F 37. Controlled penetration primers seal the pores and prevent moisture from entering.

T F 38. Shellac may be satisfactorily used as a coating for floors and stair treads and risers.

T F 39. Flat enamels are more mar-resistant than gloss or semi-gloss enamels.

T F 40. Lacquers must be spray applied.

T F 41. Aluminum paint on sheet metal heating ducts tend to reflect out of the duct and cause heat loss.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A continuous surface is necessary in order to obtain a _______________ paint film.
2. To obtain proper adhesion of paint over varnish an _______________ should be added to the _______________ to soften the varnish.
3. When removing paint, a _______________ should be worn to prevent inhaling dust.
4. Dry mold may be removed by washing with a solution of _______________ _______________.
5. Before oil paint is applied to new plaster, the plaster should be _______________ and _________ ___________.
6. Cracks and crevices in walls should be filled with _______________ _______________ or _______________ _______________ before painting.
7. Alkalinity in concrete may be removed by washing with a solution of _______________ _______________ _______________ dissolved in _______________.
8. Concrete and cinder block surfaces that are too porous to be sealed with paint may be filled by applying a grout coat of _______________.
9. Concrete etching is done by applying a solution of _______________ _______________ and _______________.
10. Fireplace surfaces that do not clean properly may be freshened up by applying a solution of equal parts of _______________ and _______________ _______________ with _______________ _______________ added.
11. If white is painted over dark colors it will usually _______________.
12. In dry climates the _______________ paints are generally more durable.
13. To give concrete floors opaque coatings, _______________ _______________ floor enamels are considered best.
14. Reflectivity of paint is in relation to color or light and _______________.
15. Paint represents ________% of the cost of a job and not over ________% of the total cost of restoration.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Puttying of cracks, nail holes, and other defects should be done (A) after priming; (B) before priming; (C) before sanding; (D) after painting.

_____ 2. The most common reason paint chips or scales is (A) it is too elastic; (B) it becomes hard and brittle; (C) it was applied over moisture; (D) too much stain was in the wood.

_____ 3. The type of paint film defect which is caused by excessive moisture behind the film is (A) blistering; (B) cracking; (C) extra fine cracking; (D) allegatoring.

_____ 4. To paint walls on which the wallpaper and size have been removed (A) no special preparation is necessary; (B) a coat of paste filler should be applied; (C) sized and primer-sealed should be used; (D) they should be washed with muriatic acid .

_____ 5. Brick surfaces which are in poor condition because of excessive salting should be washed with a solution of (A) sulphuric acid and vinegar; (B) vinegar and water; (C) muriatic acid and water; (D) muriatic acid and vinegar.

_____ 6. When mixing acid and water, pour (A) the acid slowly into the water; (B) the acid quickly into the water; (C) the water slowly into the acid; (D) the water rapidly into the acid.

_____ 7. Mildew may be removed with a solution of (A) zinc oxide; (B) copper chloride; (C) phosphoric acid; (D) trisodium phosphate.

_____ 8. Before painting galvanized metal which has been exposed to weather as much as six months (A) wash it with aluminum oxide; (B) scrape or brush until shiny; (C) apply a coat of asphalt; (D) no special preparation is necessary.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four types of paint suitable for masonry surfaces:

(A) ____________________

(B) ____________________

(C) ____________________

(D) ____________________

2. The first coat used for galvanized metal should contain any one of four rustinhibitive primers. They are:

   (A) ______________ (C) ______________

   (B) ______________ (D) ______________

3. The two types of natural finishes may be classified by their method of coating:

   (A) ______________ (B) ______________

4. The type or colors of paint which will provide maximum reflective properties are:

   (A) ______________ (C) ______________

   (B) ______________

5. Primers recommended for use by painters on most metal finishes are:

   (A) ______________ (C) ______________

   (B) ______________ (D) ______________

PAINT MIXING

The mysteries and secret formulas for mixing paints which the apprentice of days gone by had to learn are now considered technical information. The basic white pigment, drying oils, and thinners are only a portion of what you will be able to learn concerning the formulation of paints for specific uses.

A customer who has received high quality painting service from a paint contractor will be sure that his contractor is a technician of his trade. Today the manufactures have furnished us with the best products their research money could develop. The customer of today deserves and expects to employ a painting contractor who does know all of the technical knowledge necessary to obtain maximum utility from his products.

In this assignment you will learn technical information concerning paint in ready-to-use paste and semi-paste forms, oils, driers, thinners and colors-in-oils. You will also learn how to use formula tables manufactures furnish, which adapt their paints to nearly every specific situation you may need.

<u>Assignment</u>:

1. Read the reference given below.
2. With the knowledge you presently have before reading this assignment, make a three column chart and list in the left hand column the various types of surfaces on a house which are to be painted. These types of surfaces might include an outside porch with a section with a new repaired section stone foundation, outside white walls, colored window trim, painted eve trough with a new repaired section, wood shingle roof with repaired section, and brick chimney. In the middle column list your present method of painting these various areas. After completing No. 3 below, complete the right hand column with the benefit of the technical information obtained in this assignment.
3. After completing 1 and 2 as directed, answer the questions below and turn in this assignment by ________________.

<u>References</u>:

A. Brushwell, <u>Painting and Decorating Encyclopedia</u>, pp. 95-102.

<u>Questions</u>:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Proper balance within paint between pigments in relationship to other ingredients is necessary to maintain durability.

T F 2. The amount of pigment present in a paint just slightly affects the intensity of its color.

T F 3. A thorough mixing job can most likely be obtained by paddle stirring the bottom and corners of a can.

T F 4. A little stirring and pouring of the paint back and forth between two cans is usually adequate preparation before using.

T F 5. Brushing qualities are hampered by straining newly mixed paints.

T F 6. Medium speed stirring and pausing for the disappearance of bubbles is adequate preparation before applying clear finishes.

T F 7. The manufacturers of paints and varnishes world not feel responsible if the directions on the can label were not followed.

T F 8. Oil must be added to regular paint when used as a first coat due to absorption by the wood.

T F 9. If a thick skin needed to be removed from a stored can of enamel, you most likely would need to thin the enamel.

T F 10. A considerable amount of thinner should be added to oil-based flat finish paints.

T F 11. Porch enamel most likely has had raw linseed oil mixed with its pigments.

T F 12. It is advantageous to prime the back of new siding before it is put in place.

T F 13. Red lead paint is used to test for "bleeding" on stained shingles.

T F 14. Stained interior woodwork which is to be painted will likely show evidence of maple stain bleeding through more so than walnut stain.

T F 15. When a prepared enamel is to be used, a three-coat prime covering should always be used on new wood.

T F 16. While repainting interior plaster to a sharp stipple finish, paint should be mixed at the ratio of 1 1/2 gallons of flatting oil to each 100 pounds of white lead.

T F 17. The prime coat to be used on unpainted wood floors should always contain more oil than is required for for a second coat.

T F 18. Tongue and groove edges of boards on porch floors need not be primed since they are not exposed to the weather.

T F 19. One tube of colors-in-oil for exterior colors is equal to 1/4 pint.

T F 20. For formulas for interior colors, one liquid ounce equals 1/2 pint.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The two forms in which house paint is now furnished to the painting trade are ____________ and ____________.
2. Paints may be tinted to the desired shade by adding ________________.
3. The kind of paint which usually should not be used immediately after agitating is ________ ________.
4. Pigment irregularities in the finished job can be avoided by __________ the paint.
5. Paint which has been excessively thinned will not ________, ________, or ________ the surface.
6. The proper thinner for shellac is ________ ________ ________ or ________ ________.
7. A special thinner is required for most ______________ type floor enamels.
8. To mix the powdered casein paint, the direction should be from __________ to __________.
9. For exterior use gloss paint is made by mixing white lead with __________ __________.
10. Colors-in-oil are made from two materials: __________ __________ and __________ __________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. While repainting asbestos cement shingles with a flat coat, the number of gallons of lead mixing oil which should be used per 100 pounds of white lead would be (A) 3 1/4; (B) 1; (C) 2 1/2; (D) 4 to 5.

_____ 2. When repainting concrete with an oil base paint, the area per gallon for priming should cover the following number of square feet (A) 200; (B) 300; (C) 400; (D) 500.

_____ 3. The prime coat formula to be used for three-coat work on wallboard should be (A) 25d; (B) 17d; (C) 22d; (D) 14d.

_____ 4. The number of months concrete floors must age before a zinc sulfate solution is not required when painting is (A) 6; (B) 8; (C) 10; (D) 12.

_____ 5. Before painting exterior galvanized steel, surfaces should weather (A) 6 months; (B) 8 months; (C) 10 months; (D) 12 months.

_____ 6. The venetian red content of "Ashes of Rose" is (A) 1 oz.; (B) 3 oz.; (C) 5 Oz.; (D) 6 oz.

_____ 7. The trim color "Seal Brown" contains how much white lead (A) a lot; (B) 1 pint; (C) 3/4 pint; (D) none; (E) painters 1/2 measure.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the Dutch Boy ingredients used in the formula for a black, second coat, exterior metal paint using paste red lead.

(A) ________________________________

(B) ________________________________

(C) ________________________________

(D) ________________________________

(E) ________________________________

(F) ________________________________

Assignment
Sheet No. 6

Covering
Units 89-101

PAINT APPLICATION

Paint application and surface preparation are so closely related that they are almost inseparable. If the surface is properly prepared but the paint is not applied properly, an inferior job will result.

Different types of paints require, in many instances, slightly different methods of application. Even different surfaces may require different methods for applying the same or similar types of surface coverings. Some surfaces may be satisfactorily painted by brush only while others lend themselves more readily to spray painting.

This assignment is concerned with procedures and practices which should be observed when applying paint and related surface coverings. Also included is information pertaining to types of surfaces as they relate to paint application.

Assignment:

1. Read the reference given below.
2. Using the building you chose for Assignment 2 of Assignment Sheet 3, prepare a schedule you would follow for painting. Show what parts you would paint first, second, etc., and indicate all materials you would use in each step.
3. After completing 1 and 2, answer the questions below and turn in this assignment by ________________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 103-132.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Spray painting is never as satisfactory as brush painting.

T F 2. The thickness and smoothness of a coat of paint can be governed largely by the amount of paint carried in the brush during application.

T F 3. Brushes with bristles all the same length will carry more paint than those with bristles with varied lengths.

T F 4. When applying house paint, one should daub in spots and immediately spread using long strokes.

T F 5. The oval brush is often preferred for use on small mouldings.

T F 6. When painting a room with a brush, the ceiling should be painted after the walls have been painted.

T F 7. When painting a wall, apply paint evenly with a well-filled brush, first brushing horizontally, then brush with light vertical strokes.

T F 8. Enamel and varnish should be brushed with long even strokes.

T F 9. Shellac should be applied with a soft varnish brush.

T F 10. Shellac should be brushed well, making sure the last brushful of shellac is brushed well into the preceding application.

T F 11. It is considered advisable to use slightly curved strokes when applying casein paint to ceilings.

T F 12. Casein paint should be brushed out more thoroughly than oil paint.

T F 13. Sponge rubber paint rollers prove satisfactory for applying water-base texture paints, but are not satisfactory for applying oil-base paints.

T F 14. When a tray is used with a paint roller, mix only as much paint as needed to sufficiently fill the tray, mixing it as needed.

T F 15. When painting a room with a roller, the ceiling should be painted first.

T F 16. When painting with a roller, use a back and forth motion, changing direction as desired, but lifting the roller when changing direction.

T F 17. A right-handed worker usually starts painting a wall in the upper left-hand corner.

T F 18. When painting a wall with a roller, the first loaded stroke should be upward.

T F 19. The painting characteristics of softwoods depends primarily upon the amount and distribution of summerwood.

T F 20. Paint is more likely to come loose from the summerwood than from the springwood.

T F 21. The best hardwoods for painting are those with pores such as found in walnut.

T F 22. The oils found in cypress and some cedars delay the drying of paints and shorten the life of the coatings.

T F 23. Paints containing zinc oxide are most durable when applied to woods such as eastern white pine, sugar pine, and western white pine.

T F 24. Woods such as ash, chestnut, elm, and hickory require wood filler before being painted or enameled.

T F 25. It is considered good practice to allow wood to weather for a few weeks before being painted.

T F 26. If a paint coating cracks or peels it can be reasonably assumed that the paint was of inferior quality.

T F 27. When painting exterior surfaces it is usually best to paint the highest places first.

T F 28. It is inadvisable to paint shingle roofs.

T F 29. Enamel is more difficult to apply than wall paints.

T F 30. A glue size should be applied to new plaster walls before applying oil paint.

T F 31. Oil-type primers cannot be used satisfactorily under water-thinned paints.

T F 32. The refinishing of acoustical surfaces requires that the pain be thinned to a lower viscosity than normal and applied in a thin coat.

T F 33. Iron and steel surfaces do not require a prime coat.

T F 34. When filling the pores of wood with filler, surplus filler should be removed by wiping with the grain.

T F 35. New porch flooring should be primed on all surfaces before being laid.

T F 36. Calcimine should not be applied over old calcimine.

T F 37. In general, any material that can be applied with a brush can be applied with a spray gun.

T F 38. Heavier coatings can be applied by spray gun when the finishing material is heated.

T F 39. The edges of objects should be sprayed after other surfaces have been sprayed.

T F 40. When cleaning out small holes in fluid tips, one should use a firm object such as a piece of wire or a nail.

T F 41. Spray painting involves hazards from explosion and fire.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. It is advisable to dip the brush into the paint not more than ______________ of the length of the bristles.

2. For applying oil paint to exterior surfaces, a flat brush ______ to ______ inches wide with ________ inch bristles is generally recommended.

3. For painting trim, a flat ________ brush ______to_______ inches wide is recommended.

4. The professional type paint roller is usually ______ inches in length and the type used by amateurs is ______ inches in length.

5. Paints last longer on well seasoned lumber with a moisture content of between ______and______ per cent.

6. Discoloration and oil absorption can be prevented by applying ____________ or spirit ____________ over knots before painting.

7. Blue stain in sapwood is caused by ______________.

8. Copper which comes in contact with wood should be ___________ to prevent staining the paint finish.

9. For painting windows, a _______brush _____or_____ inches wide is needed.

10. When painting from a ladder, one should never go higher than the ____________rung from the top.

11. Painting should not be done in temperatures below ________ degrees F.

12. Surfaces to be enameled or varnished should be wiped only with a specially prepared ____________ rag.

13. Spackled areas should be touched up with ________ or ________ ____________ before applying the second coat of paint.

14. The priming coat applied to ceilings and walls should be sanded to remove the ___________.

15. Enamel should be strained through a very fine mesh screen or a ___________ ____________.

16. Wicker furniture can be painted quickly with a ________ _______.

17. The presence of water, alkali, salts, and hydrated lime on new plaster may cause a chemical reaction with paint called_________

18. Extreme alkaline conditions in new plaster may be neutralized by applying a solution of __________ __________ ______________ dissolved in water.

19. A semi-gloss finish may be obtained on masonry by adding a small amount of _________ _____________ to the paint used for the finish coat.

20. Concrete basement floors should age for _________ ____________ prior to painting.

21. To aid in preventing the fir plywood grain from showing through and hair line checking of paint, it is recommended that a primer-sealer coat of __________________ be applied.

22. When using a spray gun, a pattern six and eight inches wide when the gun is held _________ to _________ inches from the surface is about right for most work.

23. Extension cords for electrically driven air compressors should be No. _______wire up to 25 feet in length and No._______ wire for length 50 feet or over.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Mohair rollers are designed for applying (A) heavy-bodied enamels; (B) varnish; (C) wash coat shellac; (D) light-bodied water paints.

_____ 2. To prevent rollers from drying during short intermissions of non-use, they should be (A) wrapped in brown paper; (B) wrapped in newspaper; (C) wrapped in aluminum foil; (D) wrapped in cheese cloth.

_____ 3. Blistering and peeling of paint is causedby (A) applying too heavy a coat of primer; (B) not applying a primer; (C) too much alkali in the wood; (D) expansion of air and water in the wood.

_____ 4. On new wood, the most important paint coat is the (A) priming coat; (B) sealing coat; (C) second coat; (D) finish coat.

_____ 5. Shingles treated with creosote stain cannot be satisfactorily painted with light-colored paint because (A) the paint won't stick; (B) a chemical reaction will cause the wood to rot; (C) the creosote will bleed through; (D) a chemical reaction will cause injury to the painter.

_____ 6. When applying enamel, start each succeeding strip of painted surface (A) where the last one left off; (B) on bare surface a few inches from last and work into previously painted work; (C) a few inches inside previously painted surface and work out taking in more surface each time; (D) the same as applying house paint.

_____ 7. New dry plaster which is in good condition and is to be coated with water paint, should be first given a coat of (A) glue size; (B) suitable water soluble primer; (C) sealer; (D) thinned material of the same type to be applied later.

_____ 8. A fresh Portland cement paint coating should be kept moist for at least (A) 12 hours; (B) 24 hours; (C) 48 hours; (D) 56 hours.

_____ 9. When spraying with a gun, the spray strokes should (A) overlap about one-half; (B) overlap about one-third; (C) overlap about three-fourths; (D) not overlap but just meet.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The principal tools used in applying paint:

(A) ________________ (B) ________________ (C) ________________

2. Possible causes of brush marks in paints, enamels, and varnish:

(A) ____

(B) ____

(C) ____

(D) ____

3. Things to be done to protect occupied property while painting:

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

Procedure

Directions: The following list contains parts to be painted. Indicate the proper sequence to follow when painting the following areas by placing 1, 2, 3, etc. in the appropriate blank.

A. A Window

____ sash verticals

____ frame and sills

____ mullions

____ sash horizontals

____ frame verticals

B. A Door

____ moulded edges of the panels

____ vertical side boards

____ panels

____ horizontal crossboards

Assignment
Sheet No. 7

Covering
Units 102-119

FINISHING WOOD WITH SHELLAC, VARNISH, AND LACQUER

It must be remembered that the painter and decorator is called upon to suggest, apply, and repair surfaces with finishes other than paint. For this reason he must be familar with the various other transparent and opaque finishes. He must be aware of the characteristics of different words and the preparation necessary preceding the application of a finish.

The painter and decorator may also be called upon to repair finished and unfinished surfaces of woodwork, furniture, floors, etc. Certain relatively simple procedures may be followed to obtain satisfactory results.

In this assignment, you will have an opportunity to increase your knowledge of finishes and finishing materials, other than paint and enamel. Study your assignment well, for it is very difficult to hide mistakes while using shellac, varnish or lacquer.

Assignment:

1. Read the reference listed below.

2. On pages 201-204 of your reference you noticed some step-by step procedures to follow to obtain particular finishes. On 3" x 5" index cards, copy these directions, placing the steps as Step 1, Step 2 etc. Refer to these cards periodically until you become thoroughly famililar with these procedures and keep them handy so you can refer to them when called upon to produce one of these finishes.

3. After completing assignments 1 and 2, answer the questions below and turn in this assignment by ____________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 187-211

Questions:

True-False

Directions: The following statements are either true of false. If the statement is true, draw a circle around the letter "T". If the statement is false, draw a circle around the letter "F".

T F 1. It is very difficult to tell whether wood is open or close-grained.

T F 2. After wood has once been sanded, it should never be allowed to come in contact with water until the last coat of finish has thoroughly dried.

T F 3. Hydrogen peroxide, which is sold for antiseptic purposes, makes a very good wood bleach.

T F 4. Stain is not a protective finish.

T F 5. The main disadvantage of water stain is its limitations on available colors.

T F 6. Wood must be sanded following the application of water stain.

T F 7. Before water stain is applied, the surface should be moistened with water, allowed to dry and sanded.

T F 8. The same powders used for making water stain may be used in non-grain-raising stains.

T F 9. The primary disadvantage of NGR stains is the slowness of drying.

T F 10. Pigmented type oil stains are actually thinned paints.

T F 11. Pigmented oil stains will not bleed.

T F 12. Pigmented oil stains do not cover up grain pattern as much as NGR stains.

T F 13. Excess pigmented oil stain should be removed by wiping across the grain.

T F 14. The main advantage of oil stain is its ease of application.

T F 15. Spirit stains are used when brush marks and streaks must be avoided.

T F 16. The degree of dilution of wood filler depends upon the size of the pores of the wood to be filled.

T F 17. Naptha is used to thin filler when it is desirable for it to dry slowly.

T F 18. When applying filler, brush with the grain.

T F 19. When removing the surplus filler, wipe across the grain.

T F 20. Oil varnish may be used over oil stain, never over water or spirit stains.

T F 21. Lacquer sealer must always be used before applying lacquer.

T F 22. Not over a six month's supply of shellac should be purchased at one time.

T F 23. Using a type of mixer by which the container can be vibrated is recommended for mixing varnish.

T F 24. All types of varnish may be applied by spraying.

T F 25. An advantage of varnish-stain is, if the varnish is chipped or worn off, the color will remain.

T F 26. Wax finishes are recommended for surfaces exposed to water or heat.

T F 27. Wax should be applied rather heavy; one heavy coat being more desirable than two or three thin coats.

T F 28. The penetrating finishes are very desirable but are difficult to keep from streaking.

T F 29. When applying penetrating wood finishes, both the first and second coats may be applied with either a brush or a cloth.

T F 30. Floor seal, a relatively new product, looks well and wears well but is susceptible to scratching and chipping.

T F 31. Shellac does not darken with age as quickly as varnish.

T F 32. Shellac finished or wax polished floors should not be scrubbed with water.

T F 33. Lacquer is highly volatile and there is always danger of an explosion when spraying.

T F 34. Pitch and asphaltum are mixed to form a water proof seal for masonry and concrete walls before installing wood paneling.

T F 35. Shellac is sometimes applied to the back side of paneling to afford additional moisture protection.

T F 36. Scratches and blemishes in wooden furniture should be repaired with professional materials from a furniture repair kit.

T F 37. Iodine should be diluted to match maple finish by mixing with spirits.

T F 38. The rubbing down of furniture with rottenstone and oil should be executed by using a four inch diameter circular motion with a specially prepared pad.

T F 39. Scratches may be "filled-up" by using shellac.

T F 40. Natural finishes on exterior surfaces are more durable than paint.

T F 41. In general, houses with extensive overhanging roofs will need to be painted more often than those with no or extremely short eaves.

T F 42. Moulding strips should be placed on the lower ends of vertical siding for protection.

T F 43. Oil finishes are recommended in areas of prolonged periods of dampness.

T F 44. Wood sealer finishes do not penetrate the wood as deeply as oils but will impart more glossiness than oil.

T F 45. Spar varnish may be used satisfactorily on galvanized and copper surfaces.

T F 46. The best varnish to use on large areas is one that disintegrates by a very fine crazing, followed by fine crumbling.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. When abrasive paper is used, the direction of sanding is always ____________ the grain.

2. A soft, lintless cloth, especially prepared to pick up dust before applying finishes is called a/an _________ _________.

3. The coloring material used in water stain is usually a/an ________ ________ obtained in powder form.

4. Spirit stains are made by dissolving a dry powder in ____________ or ____________.

5. Filler is used on woods with open pores except when applying what is known as a true ________ ____________ finish.

6. When changing the color of filler to match a particular color of wood, the professional painter usually prefers to mix ___________ oil ____________ to the filler.

7. The number of pounds of shellac gum that has been dissolved in each gallon of alcohol is known as _________.

8. The number of gallons of oil used for each 100 pounds of varnish resin is known as _________ ____________.

9. In obtaining a fine finish, ____________ is the standard abrasiv for rubbing the final coat.

10. When using a powdered abrasive on carvings and moldings use a ____________ ____________ for rubbing.

11. A powdered abrasive used to give a finished surface a near-gloss is ______________________________.

12. Blistering is usually caused by ____________________.

13. A cause of bloom in a varnish finish may be due to rubbing the finish with ______________ and __________ instead of ___________ and ______________.

14. A thin film of ____________________ over the top of varnish will prevent it from skinning over.

15. Wax comes in two principal forms, ______________ and ______________.

16. If shellac remains too long in a metal container it is likely to accumulate salts of __________ which discolors hardwoods containing ______________.

17. To protect a varnished floor and increase its wear, wax should be applied about __________ __________ after the final coat has been applied.

18. A soft cotton floor map, dampened with a mixture of three parts ______________ and one part ______________ __________, is recommended for dry mopping of shellaced floors.

19. Deep blemishes in wood may be repaired with melted ____________ ____________________.

20. The oldest and probably the simplest penetrating finish is ______________ ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. To increase the solvent ability of the water so that a stronger oxalic acid bleach will result, it is recommended that (A) the water be chilled; (B) the acid be heated; (C) alcohol be added; (D) distilled water be used.

_____ 2. To neutralize an oxalic acid bleach use (A) a borax solution; (B) kerosene (C) heat; (D) a mixture of linseed oil and turpentine.

_____ 3. When using a hydrogen peroxide bleach, the wood is first coated with (A) hydrogen peroxide; (B) turpentine; (C) sodium hypochlorite; (D) sodium hydroxide.

_____ 4. It is recommended that this first coat of hydrogen peroxide bleach be neutralized with a solution of (A) vinegar and water; (B) gasoline and oil; (C) turpentine and water; (D) sodium bisulphite and naptha.

_____ 5. When applying water stain with a brush, use (A) long straight strokes with the grain; (B) short rotary strokes; (C) strokes with the grain followed by strokes across the grain; (D) do not apply water stain with a brush.

_____ 6. A disadvantage of penetrating oil stain is that it (A) raises the grain; (B) is not light fast; (C) cannot be used on open grained wood; (D) all of these.

_____ 7. Orange shellac is satisfactory for (A) oak; (B) pine; (C) maple; (D) mahogany.

_____ 8. A satisfactory varnish sealer can be made by mixing (A) two parts varnish to one part thinner; (B) two parts thinner to one part varnish; (C) one part shellac to one part varnish; (D) one part varnish to one part thinner.

_____ 9. A satisfactory sealer for lacquer can be made by mixing (A) two parts lacquer to one part thinner; (B) one part lacquer to one part thinner; (C) six parts thinner to one part lacquer; (D) three parts thinner to one part lacquer.

_____10. Four pound cut shellac can be reduced to a three pound cut by adding (A) one pint alcohol to 1/2 gallon shellac; (B) one pint alcohol to one quart shellac; (C) one-half pint alcohol to two quarts shellac; (D) one pint alcohol to one pint shellac.

_____11. When applying varnish, the room temperature should be above (A) 32°F; (B) 60°F (C) 70°F; (D) 95°F.

_____12. The first coat of varnish should be rubbed (A) with pumice and oil; (B) with 6/0 abrasive paper; (C) wet, with rottenstone; (D) with 2/0 abrasive paper.

_____13. The second and succeeding coats of varnish should be rubbed (A) with pumice and oil; (B) with water and 6/0 abrasive paper; (C) with 3/0 abrasive paper; (D) with rottenstone and water.

_____14. Before applying an additional coat of wax, the first coat should be allowed to dry at least (A) 24 hours; (B) 12 hours; (C) 1 hour; (D) 15 minutes.

_____15. Before applying additional finish coats, filler should be allowed to dry (A) 24 hours; (B) 12 hours; (C) 1 hour; (D) 15 minutes.

_____16. The process involved in the inter-action of chemical compound found in paints and varnishes causing them to "set up" in the presence of heat, air, and sunlight to form solids is called (A) distillation; (B) polymerization; (C) pigmentation; (D) demodulation.

_____ 17. Rot or decay in wood is caused by (A) an insect; (B) moist air; (C) fungi; (D) water.

_____ 18. One of the best ways of obtaining protection against rot, termites, and beetles is to give the wood an application of (A) linseed oil; (B) polymerzite; (C) chlorinated phenol; (D) catalytic benzine.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three commonly used bleaches for woods, excluding the commercial bleaches:

(A) ____________ (C) ____________

(B) ____________

2. The advantages of water stain:

(A) ____________ (C) ____________

(B) ____________ (D) ____________

(E) ____________

3. The reasons for applying sealer to wood:

(A) ____________

(B) ____________

(C) ____________

(D) ____________

4. Disadvantages of shellac finishes:

(A) ____________ (C) ____________

(B) ____________

5. The five principal types of varnishes:

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

6. The characteristics of a good finish for hardwood floors:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

Assignment
Sheet No. 8

Covering
Units 120-131

COLOR HARMONY

The power of color is reflected in everything we see. Form and proportion are affected by color. Every finished job will appear at its best only if the colors are in harmony with each other in the setting in which they are found.

Skillful choice of color is one of the most important functions of the painter and decorator. In addition to the choice of color, choice of tint or shade may enhance the beauty or ruin the effect of the whole job.

There are several rules which have been found basic to color selection. Although these are not hard and fast, they do act as guides and provide aids upon which the decorator may build a reputation.

You will find in this assignment information concerning color theory, color harmony, and guides for mixing pigments in order to obtain the desired color. Some of the material may seem rather involved but study it carefully; it may be the difference between your remaining a mediocre painter or becoming highly competent.

Assignment:

1. Read the referencesbelow.
2. Prepare a color wheel similar to that shown on page 15 of reference "B", using the colors suggested in the parpgraph below the wheel. Place one inch circles of yellow, red, and blue in triad position on the circumference of a six inch circle and then position the remaining three primary colors in proper order at appropriate distance.

3. Answer the questions below and turn in this assignment by ______________________.

References:

B. National Paint, Varnish and Lacquer Association, Inc., Color...and How to Use It, pp. 7-10, 14-18.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Purple does not exist in the spectrum of colors found in normal daylight, but is a sensation of the observer.

T F 2. Red paint is red because it selectively absorbs blue and yellow rays.

T F 3. Linseed oil has no effect on the color of the pigment used in paint.

T F 4. Light is reflected away from a surface at an angle equal to the approaching light.

T F 5. Gloss paints have more purity and brilliance when seen with the light striking at an angle other than perpendicular to the surface.

T F 6. Mat surfaces are never seen as pure colors.

T F 7. Every time a light ray passes from one medium to another it is refracted in a new direction.

T F 8. Except for the light absorbed, a pigment will reflect all light received.

T F 9. Mat surfaces are affected more by light than are smooth surfaces.

T F 10. By the Ostwald system of color identification, any color can be identified by a number and two letters.

T F 11. A shade of color is always darker than the color.

T F 12. With no intermediate hue classes being considered the number of principal hue classes is six.

T F 13. The hue notation of a color indicates the degree of lightness or darkness of the color in relation to a neutral gray scale.

T F 14. While thinking in terms of the Munsell color chart and having ten hue values as indicated in Figure G-5, the proper method of indicating the red of strongest saturation in Figure G-7 is R 5/14.

T F 15. The value notation indicates its relation to the five principal and intermediate hues.

T F 16. Lighter value colors are indicated by numbers above five.

T F 17. The degree of departure of a particular hue from a neutral gray of the same value is indicated by the color notation chroma.

T F 18. The color notation H V/C was developed and popularized by Ostwald about 1900.

T F 19. The devise to measure reflectance of the three standard illuminants developed by Munsell is a chart photometer.

T F 20. For some hues it is impossible to have complementary hues.

T F 21. When two complementary colors are placed near each other they tend to dull each other.

T F 22. It is generally advisable to make colors a little too bright than too gray when attempting to produce color harmony.

T F 23. It is impossible to create color harmony with one single col

T F 24. Nearly all natural woods are yellow-orange.

T F 25. People are able to see smaller differences in the high reflective range of illuminations than in the low reflection range.

T F 26. Most colors shift toward green when they are "let up."

T F 27. Whenever complements are mixed together, there is a corresponding increase in light reflection.

T F 28. Mat paints tend to gray as they dry.

T F 29. Latex paints tend to become more yellow as they dry.

T F 30. Colors-in-oil should never be used in large quantities in any paint.

T F 31. The best way to mix colors-in-oil with paint is to put a dab of color in the paint and stir well.

T F 32. It should be kept in mind, especially for large surfaces that the finished paint job will appear lighter than the sample.

T F 33. Wall areas tend to reflect each other causing the colors to seem more pure.

T F 34. Each room should be decorated as a unit, disregarding other rooms, which should also be decorated as units.

T F 35. When talking to the customer, it is not advisable to use fancy names for color.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Light reflected from a surface is known as _______________ reflection.

2. When white is added to a color, a ______________ of the color results, and when black is added, the result is a _______________ of the color.

3. By the Munsell system of color notation, the three attributes of color become ______________ by which color may be ______________ and ______________.

4. The complement of a color is the color the observer tends to see when ______________ ______________ sets in.

5. Color linked by resemblance and found next to each other on the color wheel are known as ________________ colors.

6. Items found in a room which serve as a basis for a color scheme are known as ______________ ______________.

7. Every color combination is affected by the ________________ ______________ of the observer.

8. It is seldom necessary to use more than __________ pigments to match any color; __________ as a base, __________ to bracket the hue, and __________ to gray the color.

9. The process of squeezing the lightweight, fine particles in a paint mixture to the free surface is known as ________________

10. Bleaching action in mat finishes is partly due to the scattering of ______________ ______________ and partly to a lack of difference in the refraction indexes of the ______________ and the ______________ to which it is exposed.

11. Pigments, finely ground in oil, used for tinting various opaque coatings are known as ________________.

Multiple Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. When tinting, it is suggested that the color to be added be (A) put in the base color and stirred; (B) thinned befor being added to the base color; (C) mixed with alcohol before being added to the base color; (D) placed in the color and allowed to set for 24 hours.

_____ 2. When making the final decision on color for large areas it is important to remember that the finished job will appear (A) darker than the sample; (B) lighter than the sample; (C) exactly like the sample; (D) less intense than the sampl

_____ 3. It is important to test colors under (A) lighting conditions in which they will be used; (B) actual daylight lighting conditions; (C) daylight fluorescent lighting; (D) incandescent lighting.

Listing

Directions: List the tiems called for in each of the following. Select your answers carefully.

1. The five colors that compose the visible spectrum of color of normal daylight are:

(A) ____________ (D) ____________

(B) ____________ (E) ____________

(C) ____________

2. The five most widely used types of color schemes, based on the color wheel, used to produce color harmony are:

(A) ____________

(B) ____________

(C) ____________

(D) ____________

(E) ____________

3. The two major recognized color systems which bear the names of their creators are:

(A) ____________ (B) ____________

4. The two primary ways of preparing custom or special colors are:

(A) ____________

(B) ____________

5. Three basic rules to follow in mixing colors for matching are:

(A) ____________

(B) ____________

(C) ____________

Assignment
Sheet No. 9

Covering
Units 132-136

COLOR STYLING

One of the most important functions of the painter and decorator is to offer advice on planning color combinations to fit various situations. He must know something of the types of furniture, decorating trends, and other situations that govern color selection. Although primarily concerned with surface decoration, he must also be aware of other factors that enter the decorative process.

The painter and decorator is likely to be called upon to offer suggestions for decorating a room in the style of some particular period or it may be his responsibility to simply carry out suggestions made by someone else. In any event he should be ready to offer wise suggestions when asked.

It is the purpose of this assignment to provide you with information that will help guide your thinking in color styling. Although there are few concrete rules that can be followed, you will become familiar with some of the guides used by the professional painter and decorator.

Assignment:

1. Read the references listed below.
2. Look through a number of catalogues, magazines, newspapers, etc., and select pictures and articles on period and contemporary decoration. Start a notebook in which these pictures and articles are organized in an orderly fashion. Continue this collection, discarding articles and pictures as they become obsolete or trends change.
3. Answer the questions below and turn in this assignment by _______________.
4. Show your coordinator the progress you have made with your notebook.

B. National Paint, Varnish and Lacquer Association, Inc., Color . . . and How to Use It, pp. 26-57.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. When a light colored house and a dark colored house of the same size are the same distance, the light colored house will seem to be the farthest.

T F 2. If the walls and ceiling of a room are painted a light tint, the room will appear to be larger than if it were painted a dark color.

T F 3. The brighter an area is painted the larger it seems.

T F 4. If a chimney is too large in relation to the rest of the house, painting it with a contrasting color will make it look more the proper size.

T F 5. Filament lamps produce light which is rich in red but relatively deficient in blue.

T F 6. Although paint styling has considerable effect upon the safeguarding of health and safety in dwellings, it has little effect upon these items in other buildings.

T F 7. Yard fences and natural surroundings are of minor consideration for exterior house color styling.

T F 8. To properly integrate indoor with outdoor living, proper design would call for repeating an exterior color on the interior of a house.

T F 9. Overly massive protruding type chimneys, in most cases, can be camouflaged by painting them dark brown.

T F 10. For some reason men seem to appreciate working with color schemes more than women do.

T F 11. The do-it-yourself concept has fertile ground in which to grow when it comes to home decorating.

T F 12. Woodwork around doors and windows should contrast with the wall color when in a large room.

T F 13. Ivory would be an appropriate color with which to decorate a large room.

T F 14. End walls can be made to recede in a long narrow room by painting them with a warm color.

T F 15. Good features in a room may be camouflaged by painting a different color.

T F 16. An attractive but rather small fireplace should most likely be painted the same color as the walls.

T F 17. High ceiling should be painted a deep color.

T F 18. The luster and texture of fabrics are of very minor significance in regard to visual interest in a room.

T F 19. In most cases we may decorate a room as we see fit and then consider it adequate for almost any family.

T F 20. Woods of extreme lightness or darkness can be used with any color scheme employing colors of medium values.

T F 21. Color has little effect upon the job efficiency or emotional well being of employees.

T F 22. In offices where too light or too dark a surface would be an eye irritant a good color to use is blue-green.

T F 23. Within a dark office a fine means to promote maximum light reflectancy is to carry the gloss white of the ceiling down onto the upper wall areas.

T F 24. The key to attracting customers and increasing sales is to use colors which harmonize.

T F 25. The side walls within a school classroom could most likely be painted deep yellow.

T F 26. Wall colors within a factory should not contrast with machinery colors.

T F 27. The name of the scheme used to attempt standardization of colors in industrial plants is the Color Code for Safety in Industry.

T F 28. Farmers have a lower accident rate compared to workers in other occupations.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The one major key element when planning a color scheme for a house is the color of the ________________.

2. Shutters of turquoise color will go well with a ________________ roof.

3. A house with cream as a main body color may have roof colors of ________________, ________________, or ________________.

4. Painting the shutters of the upper story windows the same color as the roof color will ________________ the roof line.

5. Many times it is necessary to paint over the natural colors of building materials in order to achieve ________________.

6. When an architectural defect such as a radiator is painted the same color as the walls this technique is called ______________________.

7. The size of house which would most likely necessitate using color flow would be a ________________ house.

8. While choosing between northeast or southwest rooms, a red color would most likely be used in the ________________ room.

9. In a room that has a ceiling which is too high ________________ lines should be emphasized.

10. A background color which would be excellent for almost any color of wood furniture is ____________.

11. In regard to emotional well-being in industry color has been used to relieve ____________, ____________, and ______________.

12. The best color to be used where jobs require strict visual or mental concentration is ____________.

13. In an office where rust red and turquoise furnishings are to be used one of the best wall colors would be ____________ ____________ ____________, ____________ ____________.

14. Operating rooms are usually styled in green because the surgeon's field of operation is predominantly ____________.

15. While considering hospital color styling the "institution look" can be eased by using ____________ colors.

16. Switches on industrial machines should be painted a/an __________ color.

17. The piping code divides plant piping into categories of color totaling _________ in number.

18. The most common safety color code plan to be used on farms would be the colors ____________ and ____________.

19. A hay fork color of handle would be ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Good features of a piece of furniture may be emphasized by surrounding it with an area of (A) the same color as the surroundings; (B) a different color from the surroundings; (C) the same color as the dominate color found in the piece of furniture; (D) horizontal lines.

_____ 2. A roof that seems too high may be "lowered" by (A) painting the shutters a contrasting color; (B) painting the shutters the same color as the roof; (C) painting the roof a darker color than the body of the house; (D) painting the roof a lighter color than the body of the house.

_____ 3. The colors known as advancing colors are (A) red, orange, and yellow; (B) blue, black, and aqua green; (C) turquoise, jade, and lime; (D) orange, white, and chartreuse.

_____ 4. Warm colors are (A) red, yellow, and orange; (B) blue, black, and Nile green; (C) turquoise, jade, and lime; (D) orange, white, and chartreuse.

_____ 5. Since various departments within a retail store lend themselves to specific color schemes, a department which would be more apt to use light or grayed walls with black, brown, or blue showcases is (A) Millinery; (B) Better Dresses; (C) Lingerie; (D) Jewelry; (E) Furs.

Matching

<u>Directions</u>: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Group I The color of the following items, if painted according to the color code of industry would be:

_____ 1. cutting devices A. red

_____ 2. first aid cabinets B. green

_____ 3. fire extinguishers C. blue

_____ 4. crane hooks D. yellow

_____ 5. pumps and compressors E. orange

Group II Select the color you would most likely use in a room with the following natural light.

_____ 1. cold northern light A. cool blue

_____ 2. a neutral eastern light B. tan

_____ 3. warm southern light C. cool green

_____ 4. light from the west D. neutral gray

Group III The color of the tinted filament bulb which will effect colors, rooms, and other objects in the suggested manner is:

_____ 1. enhances reds

_____ 2. lengthens rooms

_____ 3. goldens copper more

_____ 4. enhances complexions

_____ 5. warms neutral colors

_____ 6. cools down warm colors

_____ 7. restful bedroom color

_____ 8. desirable for light colored woods

A. sun gold

B. sky blue

C. dawn pink

D. spring green

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Five factors that must be considered when presenting the best color design possible are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

2. Knowing how to "style" with paint is based on the following concept

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

3. The three main considerations that must be kept in mind when color styling house exteriors are:

(A) ______________________________

(B) ______________________________

____

(C) ______________________________

4. House exteriors may be accented or minimized by consideration of physical features such as:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

5. Before advising your customer about a painting situation it is necessary to obtain the following information:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

6. Examples of stimulating colors which seem to convey a feeling of warmth are:

(A) ______________ (C) ______________

(B) ______________ (D) ______________

7. The complementary colors used with the following types of artificia light are:

(A) white fluorescent light ______________

(B) mercury vapor light ______________

(C) incandescent light ______________

(D) combination of fluorescent, mercury and incandescent ______________

8. The points which should be kept in mind while helping a merchant plan a color scheme in his retail store are:

(A) ______

(B) ______

(C) ______

(D) ______

(E) ______

(F) ______

(G) ______

9. Two sources upon which to draw while prescribing colors for a church would be:

(A) ______

(B) ______

10. List ten ways in which paint and color styling aid industry:

(A) ______

(B) ______

(C) ______

(D) ______

(E) ______

(F) ______

(G) ______

(H) ______

(I) ______

(J) ______

11. List six types of businesses or buildings in which both safety and color styling are applicable.

(A) ______ (D) ______

(B) ______ (E) ______

(C) ______ (F) ______

Assignment
Sheet No. 10

Covering
Units 137-151

SPECIAL FINISHES

Often times the painter and decorator is called upon to finish surfaces in an unusual or special manner. He may be requested to match or repair an existing finish or to make a wood surface resemble a metal or stone surface.

Although considerable experience is required to produce some of these finishes, it must be remembered that there has to be a beginning.

For this reason, this assignment is provided. You will have an opportunity to become acquainted with various special finishes and how they are produced. Some of them you may have previously done; others may be new to you. No doubt you will be able to add to your store of knowledge by careful study of the following assignment.

Assignment:

1. Read the reference listed below.
2. As you did for Assignment Sheet No. 7, list on 3 x 5 cards the steps to be followed in producing the various special finishes discussed in your readings. Any other special finishes your employer may use should also become a part of your collection.
3. On the reverse side of each card, list the tools required to produce the finish.
4. After completing parts 1, 2, and 3 of your assignment, answer the questions below and turn in this assignment by __________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 213-228.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. A glaze finish may be applied over a stain but not over an enamel finish.

T F 2. Antique glazing is sometimes used over stain to give the effect of greater age than is possible by the stain above.

T F 3. Glaze is applied with a brush and wiped off with a cloth.

T F 4. One must be very careful when applying glaze for it cannot be glazed again without first removing the old glaze.

T F 5. To make the glaze finish durable it should be covered with shellac, varnish, or lacquer.

T F 6. Antique highlighting is done to emphasize the grain of the wood.

T F 7. When producing a spatter finish, a base coat must be applied before the spatter coat.

T F 8. When applying a two or three color spatter coat with a brush, each color should dry before the next color is applied.

T F 9. It is possible to obtain multi-colored enamel in which the different colors exist separately in solution.

T F 10. A stippled or mottled finish may be produced either by putting paint on to a surface or by taking it off of a surface.

T F 11. The only recommended method of striping is by application with a brush.

T F 12. When using masking tape as an aid to striping, the tape must remain in position until the paint is dry.

T F 13. When applying bronze powder and liquid finish, it should be brushed well, first applying the finish and then going over the entire surface to make sure each lap does not show.

T F 14. Gold leaf may be obtained in powder or liquid form.

T F 15. If gold leaf is to be burnished, oil size is most generally used.

T F 16. Silver leaf requires a stronger adhesive than does gold leaf.

T F 17. Before gilding is applied to glass, the glass should be thoroughly washed with kerosene.

T F 18. It is recommended that the highest or top portion of a gilding job be done first.

T F 19. A sharp pair of painters' shears should be used to cut gilding leaf.

T F 20. The better gilding tips are made of copper.

T F 21. Silver and gold leaf are put on in exactly the same manner.

T F 22. Wood must be sealed before gold or silver leaf are applied.

T F 23. No special preparation, other than thorough cleaning, is necessary prior to applying gold leaf to sheet metal.

T F 24. Aluminum leaf is more delicate and must be handled with greater care than gold or silver leaf.

T F 25. Blue chalk lines such as those used in the building trades are recommended for marking lines to follow when stenciling.

T F 26. When graining to resemble oak, the pores are produced after the grain.

T F 27. When graining to produce figured walnut swirl, care must be exercised to get an even distribution of color.

T F 28. One coat is all that is necessary for producing a wrinkle finish.

T F 29. Wrinkle finish can not be satisfactorily applied to wood surfaces.

T F 30. Crackle finishes are produced by applying crystallizing lacquer over French varnish.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Antique glazing may be applied over stain, provided the stain is sealed with ______________.

2. Glaze may be made by thinning down __________________________.

3. Under lacquer glaze finishes, _____________ colors thinned with ________________ should be used.

4. Antique highlighting is applied to give the appearance of ________

5. When spatter finishing, the __________________ of the paint has considerable bearing upon the size of the spots.

6. When doing mottling or stippling, a _________ of _______________ may be used in place of a sponge.

7. To darken the depressions or low spots found on objects made of brass, copper or bronze, clean with a ______________ __________ solution, dip in a _________ of ______________ solution and polis the high spots with ______________ ______________.

8. The green color that appears on metal as a result of oxidation is called __________________.

9. To apply gold leaf to glass, __________ size, which comes in ______________ form, is used.

10. Before gilding glass, it is washed and when dry, polished with ____________ ____________.

11. Sometimes a bit of yellow color is used in the size to help cover up small imperfections in the gold leaf which are known as ____________.

12. When making stencils, a space of ____________ ____________ should be left all around the design.

13. Oil used to prepare heavy paper for stencils is composed of ______ part ____________ ____________ and ______ part ____________ ____________ ____________.

14. With most wrinkle finishes, the heavier the coat, the ____________ the wrinkles.

15. A crackle finish is obtained by applying a specially prepared ____________ drying finish over a ____________ drying ____________ finish.

16. French polish is produced by using refined ____________ or ____________ ____________ applied with a cloth pad and lubricated with ____________ ____________.

17. After the desired film of French polish has been built up, it is recommended that the surface be polished with the ____________ of the ____________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Texture paint may be obtained with a (A) latex base; (B) rubberized alkyd base; (C) oil base; (D) all of these.

_____ 2. After darkening metal with acid, the color should be protected with (A) white lead; (B) linseed oil; (C) shellac; (D) lacquer.

_____ 3. Brown color on brass may be simulated by using (A) burnt sienna; (B) burnt umber; (C) Vandyke brown; (D) all of these.

_____ 4. Gilding is the process of obtaining a finish by using (A) metal powder in a binder; (B) metallic paint in oil; (C) thin sheets of metal; (D) a wash coat of stain thinned with shellac.

______ 6. To lay gold leaf on glass, use a (A) camel's hair brush; (B) badger's hair brush; (C) hog's bristle brush; (D) nylon brush.

______ 7. To lay silver leaf on glass, use a (A) camel's hair brush; (B) badger's hair brush; (C) hog's bristle brush; (D) nylon brush.

______ 8. When cutting stencil designs, the knife should be (A) drawn toward the operator; (B) pushed away from the operator; (C) drawn or pushed depending upon the direction of the lines to be cut; (D) scissors are used, not a knife.

______ 9. When graining a surface, the ground or base color should match (A) the darkest color to be imitated; (B) the lightest color to be imitated; (C) the color that covers the greatest area; (D) none of these.

______ 10. Ground color for graining may be a mixture of white lead tinted with the proper color-in-oil and thinned with (A) equal parts of linseed oil and turpentine; (B) three parts naptha to two parts cylinder oil; (C) two parts Japan dryer to one part alcohol; (D) two parts turpentine to one part spar varnish.

Listing

__Directions:__ List the items called for in each of the following. Select your answers carefully.

1. The essentials for doing a good job of striping and lining:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

2. Two special items the painter should wear when working with acid:

(A) ______________________ (B) ______________________

3. Four methods of applying metallic paint:

(A) ______________________ (C) ______________________

(B) ______________________ (D) ______________________

4. The two principal kinds of size used for gilding:

(A) ______________________ (B) ______________________

5. The tools used for graining and marbelizing:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

Assignment
Sheet No. 11

Covering
Units 153-177

WALL COVERINGS

A knowledge of and skill in selection and application of wall coverings are essential factors inherent in most successful painters and decorators. The painter will find the demand for his services, in addition to painting, less seasonal and in greater demand if he is proficient in other phases of home decoration.

Because of the prevalency of the use of wallpaper and other wall coverings in modern home decoration, the painter and decorator should know what coverings are available, how they are sold, the tools and equipment used in preparation, application and care, and methods of cost estimating.

This assignment, therefore, presents information essential to the individual who is called upon to make suggestions or do the actual work connected with selection, application, and care of wall coverings.

Assignment:

1. Read the reference listed below.
2. After reading the reference carefully, prepare two lists in a similar fashion as the Analysis found in the front of this study guide. In the left-hand column indicate the steps to follow when applying wall paper and in the right-hand column, across from each step, indicate the tools and equipment necessary in its performance. Have your employer check your work for accuracy and make any additions or corrections he thinks necessary.
3. Answer the questions below and turn in this assignment, together with the above lists, by ____________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 167-186, 258-259

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. When wall paper is printed, a separate roller is required for each color.

T F 2. Duplex paper is wall paper consisting of two separate papers pasted together to create a highly embossed effect.

T F 3. A single roll of wallpaper is sometimes referred to as a bolt.

T F 4. The narrowest domestic wallpaper is purchased in rolls or bolts 18 inches wide.

T F 5. The International Society of Wallpaper Manufacturers has been successful in standardizing the width and length of wallpapers for home decoration.

T F 6. Some expensive wallpaper may be applied to a muslin base so it may be removed and rehung.

T F 7. Silk fabric coverngs are hand-painted after they are hung.

T T 8. Japanese grasscloth is a special cloth made from shredded grass and rice pulp.

T F 9. Linen is difficult to apply because of its shrinking qualities.

T F 10. Shears made of high carbon steel are preferred over those made of forged steel.

T F 11. A pair of 12 inch shears would actually measure 16 1/2 inches from the tip of the blades to the end of the handles.

T F 12. All smoothing rollers should have smooth surfaces that are slightly convex.

T F 13. The brushes found in the paperhanger's tool kit should all be very soft.

T F 14. Paperhanger's knives should have firm blades beveled on one side only.

T F 15. Screw type straightedges made with trimmer tracks are considered safer than those made with clamps.

T F 16. Wood straightedges should be laid on flat sufaces for storing.

T F 17. The uniform of the paperhanger is of little importance.

T F 18. One of the most important requirements for a good job of paperhanging is the proper preparation of the walls.

T F 19. Enameled walls cannot be papered successfully.

T F 20. Wallpaper will not adhere to calcimine.

T F 21. Walls painted with resin or casein paint can not be papered successfully.

T F 22. If old wallpaper has been removed with water or steam the walls should be allowed to dry before any holes or cracks in the walls are repaired.

T F 23. The need for open windows or some other means of air circulation is necessary when hanging wallpaper.

T F 24. An important point to remember in checking the paper with a floral design is that the heavy leaves hang down and the heaviest shading is found at the lower part of the design.

T F 25. Ceilings should be hung first.

T F 26. The apprentice or learner will find the walls easier to hang.

T F 27. When cutting strips of paper to length, care should be exercised to make them the exact length of the surface to be covered in order to avoid waste.

T F 28. The point at which the papering is started determines the pattern arrangement.

T F 29. If possible, papering should be started near a door or window casing or corner in order to use one of these items as a guide to make the paper true.

T F 30. When smoothing out paper after it has been applied, work down the centers first.

T F 31. If too much pressure is used when smoothing, the paper is likely to have air pockets when it drys.

T F 32. The entire sidewall should be hung before the excess paper is trimmed.

T F 33. Spaces over and under windows and doors should be hung as they are approached.

T F 34. When turning inside or outside corners, the strip of paper should not extend more than 1/4 inch onto the next wall.

T F 35. It is recommended that a border be applied in one continuous strip.

T F 36. Varnished or plastic coated paper should always have butt seams.

T F 37. When applying muslin, the materials is usually applied dry to a pasted wall.

T F 38. Seams on oiled fabrics should be pressed down firmly with a seam roller.

T F 39. A low water content paste should be used with Japanese grasscloth.

T F 40. Walls should be lined with paper before burlap is applied.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Wallpaper may be identified by the ______________ ______________ the color and the design.

2. Papers with a hard finish are known as ______________ papers.

3. The standard measurement for American-made wallpaper is the ______________ which contains ________ square feet.

4. Paperhanger's shears come in lengths of ________ to________ inches.

5. Smoothing brushes are made in widths of ________ to________ inches.

6. The most popular widths for paste brushes are ________ to________ inches.

7. A yardstick is used for measuring but may be used also as a ______________ ______________.

8. Size, used to prepare surfaces for wallpaper, has a foundation of ______________.

9. To make paste harder when drying, add a small amount of ________.

10. Unless paper is allowed to expand before being hung, ______________ and ______________ are likely to result.

11. The vertical starting line should be made with a ______________ ______________ and a ______________ ______________.

12. When paper is put horizontally on walls, it is known as ______________ hanging.

13. A bolt of 18 inch paper contains________ square feet, and a bolt of 30 inch paper contains ________ square feet.

14. Border paper is sold by the ______________ ______________.

15. Paperhanging is paid for at a certain rate per ______________.

Multiple Choice

<u>Directions</u>: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. An elastic size for an enameled surface may be made by adding sugar or syrup to glue size; (B) sal soda to glue size; (C) trisodium phosphate to glue size; (D) any of these.

______ 2. An enameled gloss may be removed by washing the surface with a solution of (A) ammonia and water; (B) kerosene and detergent; (C) liquid wax and naptha; (D) any of these.

______ 3. Glue may absorb water as much as (A) 2; (B) 5; (C) 10; (D) 15 times its own weight.

______ 4. Glue size may be preserved and prevented from souring by adding (A) pulverized borax; (B) carbolic acid; (C) formaldehyde; (D) any of these.

______ 5. Materials added to wheat flour paste to make it more adhesive and elastic also cause it to (A) dry fast; (B) dry slowly; (C) sour more quickly; (D) be difficult to apply.

______ 6. If too much pressure is applied when using a seam roller, the (A) glue will curdle; (B) glue will become watery; (C) paper will have air pockets; (D) paper will become shiny.

______ 7. To press down the seams on heavy embossed papers, use a (A) seam roller; (B) plumb bob; (C) smoothing brush; (D) cloth.

<u>Matching</u>

<u>Directions</u>: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

______ 1. a room seems cramped

______ 2. pencil marks

______ 3. ceiling seems too low

______ 4. ceiling seems too high

______ 5. crayon marks

______ 6. irregular walls and ceiling

______ 7. oily spots

A. art gum

B. vertical climbing pattern

C. naptha

D. all-over pattern

E. horizontal pattern

F. scenic panel

G. Fuller's Earth and cleaning fluid

H. ink eradicator

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Materials from which wallpapers are made:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

2. Types of bristles used for smoothing brushes:

(A) ____________________ (C) ____________________

(B) ____________________ (D) ____________________

3. Reasons for applying size:

(A) ____

(B) ____

(C) ____

4. Information that may be found on the selvedge of wallpaper:

(A) ____________________ (E) ____________________

(B) ____________________ (F) ____________________

(C) ____________________ (G) ____________________

(D) ____________________

5. Types of joints used in paperhanging:

(A) ____________________ (C) ____________________

(B) ____________________

6. Two principle methods of figuring the amounts of paper needed:

(A) ____________________ (B) ____________________

7. Items to be figured when establishing a price per roll for hanging wallpaper:

(A) ____________________ (D) ____________________

(B) ____________________ (E) ____________________

(C) ____________________ (F) ____________________

Assignment
Sheet No. 12

Covering
Units 178-183

ESTIMATING

A very important activity of the painter and decorator is to be able to estimate accurately the amount of material needed, the cost of the material, and the time required to complete a job. He must know all the things which should be considered. In addition to the materials and the actual time involved in application, he must consider overhead time, time involved in surface preparation, profit and other items which may "make or break" his good reputation.

An understanding of arithmetic is essential. If you have forgotten some basic mathematical manipulation, it will be worth your while to go over the material a second time. Your reference provides you with material suitable for review. Bids for painting new construction or on remodeling jobs may require some knowledge of blueprint reading.

You will find, in this assignment, some practical problems regarding estimating. Do your figuring carefully and check all answers. Get in the habit of rechecking your own work before submitting it to your teacher, your employer, or to anyone else.

Assignment:

1. Read the reference listed below
2. Using the building selected in assignment sheet 1, estimate the total cost of restoring the exterior surfaces. Be sure to allow for surface preparation and restoration, cost of materials, depreciation of equipment, wages, profit, and any other items you consider necessary.
3. After you complete assignment 2, submit it to your employer for comments and suggestions.
4. Answer the questions below and turn in the assignment, together with item 2 above, by ______________________.

Reference:

A. Brushwell, Painting and Decorating Encyclopedia, pp. 256-259; 236-242; 249-254.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. In order to ascertain the amount of paint or finishing material needed, it is necessary to know the cubic feet of the surface to be finished.

T F 2. The amount of paint required for the usual width of trim is one gallon per three hundred feet.

T F 3. The term "square" refers to a measure of lineal length often used by estimators in figuring costs.

T F 4. The slant of a roof is of little concern when figuring surface area of a roof.

T F 5. The cost of paint is usually the largest item in a painting contract.

T F 6. Records of past experiences usually serve as guides when determining the cost of an entire job.

T F 7. Various types of surfaces can not be estimated with equal ease or accuracy.

T F 8. General overhead includes all costs that can not be charged directly to a job.

T F 9. The gross payment received for a job represents the contractors profit.

T F 10. Two types of estimates are made by the contractor to show to his prospective customer.

T F 11. The prospective client receives a less detailed estimate than is filed with the contractor.

T F 12. Frequently customer suggested adjustments made during the job would consume the contractors profit.

T F 13. The height of a job can sometimes add extra labor which reduces the contractor's profit if overlooked.

T F 14. The strip method is used to calculate the amount of wall paper needed.

T F 15. The addition of the minuend and subtrahend is the remainder.

T F 16. Five tens is greater than 36 units.

T F 17. Problems in division may be checked by multiplying the two factors.

T F 18. An improper fraction has the larger number below the line.

T F 19. Since two is one half of four, you may multiply the numerator of a fraction by four and the denominator by two without changing its value.

T F 20. 37/32 is a mixed number.

T F 21. Multiplying 5/8 by 1/2 is the same as dividing 5/8 by 2.

T F 22. You may multiply frantions by inverting them and dividing.

T F 23. While adding mixed decimal fractions, the decimal point of each should line up one above the other.

T F 24. Decimal points should usually line up one above the the other while multiplying decimal fractions.

T F 25. The number of decimal places in the sum is always the product of those in the multiplier and the **multiplicand**.

T F 26. When we change a number from .25 to 25, we have actually multiplied the decimal number by 100.

T F 27. The fractional equivalent of .4 is 400/1000.

T F 28. Tablespoon measurement may be converted into gill measurement.

T F 29. Altitude is taken into consideration when figuring the area of a rectangle.

T F 30. All closed curves are circles.

T F 31. All circles are closed curves.

T F 32. Pi is equal to 3.1416.

T F 33. A circle with a radius of four inches has a diameter of 12.

T F 34. To enable figuring the lateral area of a cylinder you should figure the area of the sides of the cylinder.

T F 35. Multiplying two times the radius of a circle by pi will give the circumference.

T F 36. The size of a diameter or radius of a circle is not needed while figuring the lateral area of a round **semetrical** pointed cone.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The unit of measure on which the estimator usually bases his prices is the ____________.

2. To obtain extreme accuracy for highly competitive estimating on a large job, the rules laid down by ________________ should be used to calculate the area.

3. A valuable reference for many types of estimating is distributed by the ____________ _______ ____________ _____________ _______ ____________.

4. The height of a gable in a one-quarter pitch roof is ___________ the width of the house.

5. The multiplicand and the multiplier can be classified under one term called the ____________ of the product.

6. When a number consists of a whole number and a decimal fraction, it is called a ____________ ____________ ____________.

Short Answer

Directions: Using the plates found on pages 249-254 of reference A, fill in the following blanks with the requested information.

1. What are the overall outside dimensions of the house? ____________

2. What is the lineal dimension of outside wall of the garage? ________________

3. What is the roof pitch of the garage? ________________

4. What are the overall dimensions of the kitchen? ______________

5. What is the width of the stairs to the basement? ______________

6. What is the floor area of the recreation and hobbies area? ________________ square feet

7. What is the floor area of the basement disregarding any inside partitions? ____________ square feet

8. What kind of material is used for the siding of the house? ______________

9. What is the height of the inside walls of the garage? ___________

10. To the nearest foot, what is the height of the following walls?
Basement ________ feet. First floor ________ feet.
Second floor ________ feet.

Estimating

Directions: Fill in the blanks with the information requested.

1. A room 15' x 20' with 8' walls will have how many square feet of wall surface? ______________ square feet.

2. Suppose that one gallon of paint will cover 500 square feet. How much paint would be required for two coats for ceiling and walls of the above room? __________________ gallons.

3. A rectangular building, 20' x 30'; 10' to the rafter plate with a 1/4 pitch roof, (gable ends on the 20' sides) will have how many square feet of surface, disregarding openings? ______________ square feet. How much roof surface? ______________.

4. Figuring a "two coat" job, how much paint will be required to paint the outside walls of the building if one gallon of paint will cover 500 square feet? __________________ gallons.

5. You have been called to estimate the cost of painting a smoke stack that has an outside diameter of 9' and a height of 52'. The walls are perpendicular. What is the area of the outside surface? _________ square feet. How much paint will be required for a one coat job if one gallon will cover 200 square feet? __________ gallons. The paint you need is $4.60 per gallon or $1.75 per quart How much paint would you suggest buying? _________ gallon. Why? ____

____

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four main factors which may be considered estimating essentials are:

(A) __________________ (C) __________________

(B) __________________ (D) __________________

2. Items which can be considered as overhead costs are:

(A) __________________ (G) __________________

(B) __________________ (H) __________________

(C) __________________ (I) __________________

(D) __________________ (J) __________________

(E) __________________ (K) __________________

(F) __________________ (L) __________________

3. Percentage of profit can be based somewhat on:

(A) ________________ (C) ________________

(B) ________________ (D) ________________

4. A contractor who can read blueprints and plans can obtain details and plans such as:

(A) ________________ (F) ________________

(B) ________________ (G) ________________

(C) ________________ (H) ________________

(D) ________________ (I) ________________

(E) ________________ (J) ________________

Assignment
Sheet No. 13

Covering
Units 183-192

PAINT STORE OPERATION AND CONTRACTING

No matter how great is the need for paint, people have to be told what to use where. This is the job of the painting contractor. Potentially, everyone working as a painter or decorator could venture on his own and become a contractor.

Before assuming the responsibility of being on your own, there are a number of pitfalls that should be avoided. It is also necessary to investigate all phases of the business to identify these and to become aware of those elements which contribute to future success. Although you are not presently considering going into business at this time, you should begin thinking about the possibility of doing so in the future. Observe the actions of your employer and learn all you can from him.

This assignment will help you identify the areas where pitfalls are abundantly located. As you become more knowledgeable of this phase, the appreciation of what goes into your employer's decisions will become more evident.

Assignment:

1. Read the information sheet provided.
2. Prepare a list of problems you would expect to encounter by going into business as a paint contractor and briefly explain how you would attempt to overcome these problems.
3. Complete the questions below and turn in this assignment by ____________________.

Reference:

C. Information Sheet No. 1.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T". If it is false, draw a circle around the letter "F".

T F 1. The location of a painting contractor's shop is important.

T F 2. Natural light is preferred in the showroom.

T F 3. The shop may have "islands" for display purposes.

T F 4. A large sign should be placed in the front window of the shop for advertising.

T F 5. As much information as possible should be given on your truck advertisement.

T F 6. Going into business for yourself means you have all the responsibilities.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The life of your business, especially at the start will be ____________ and ____________.
2. Historically, the profession is one of great pride in one's ____________ and ______________.
3. The shop is a reflection of your own __________________.
4. Lighting facilities that are up-to-date will correct for __________ ____________ and ____________ ____________.
5. A good motto to follow in design is _________________.
6. The accessories sold in the shop depend on the type of _________ offered to the people.
7. One of the greatest human factors toward the success of the painting contractor is that of ________________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Formulate a list of points to consider when hiring a future employee: (add from your own experiences)

(A) ____

(B) ____

(C) ____

(D) ____

(E) ____

(F) ____

2. Items which are considered a liability to the business are:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________

3. A good businessman requires a knowledge of:

(A) ______________________ (D) ______________________

(B) ______________________ (E) ______________________

(C) ______________________ (F) ______________________

(G) ______________________

PAINT STORE OPERATION AND CONTRACTING

After you have spent some time in the occupation of painting and decorating, you may take it upon yourself to go into business as a painting contractor. Historically the profession is one of great pride-pride not only in one's work, but one's self as well. To uphold the image of leadership in the community requires that type of self pride. Respect is not automatic, it is earned. As a prospective businessman it would be well worth your time to go over many of the details of this new responsibility as possible before you assume your own business. This will save many hours of hardship later on, and possibly help to make your business successful.

Naturally, among the many details you must know about your product and its application are basic knowledges about going into business in general. Good business management requires a thorough knowledge of locating space, financing, and equipping the operation; including insurance, how to hire, to fire, to advertise, to display and to sell. There must be in you a little of the artist, the banker, the salesman, the bookkeeper, the diplomat, the mechanic, and the horse trader. On top of all this you must have confidence in yourself and the personality to overcome any prospective buyer. The factors of personal qualifications form a large part of the assets to which success may be balanced.

Your capital and credit supply will be the life of your operation, especially during the starting years. Choose with careful thoughts both your associates, if any, and the particular "brand names" of products you will be handling. It may be necessary to stand behindyour product and your work. The location of your business is of prime importance. The actual street where the "shop" is located may be determined by several factors. If you plan to sell other supplies as a side line, careful consideration as to the accessability of the shop is needed. Typical questions that should be asked are: How will people get to the shop? Is it on a bus line? Is a car needed, or will people just happen to pass by? Secondly, is the street itself well known, or is it a short passage in some off-section of town and very hard to find? And to what extent are the competitors located in the immediate area or section is also a problem. An equitable balance among these factors determined by the type of service you want to offer the people.

The shop, both inside and out, is a direct reflection of your personality. It should be neat and attractive. Do not have it cluttered with supplies, ladders, etc. Simplicity in design is a good motto to follow. A paint contractor should show good taste, and by all means set a good example. This also holds true for the large sign in front of the shop as well as the writing on your company truck. The sign should be large enough to be easily read, yet, conservative. Avoid the splashy-gaudy line. That is not to say, you should not have a clever idea for the shape or a slogan for advertising purposes. Often a small attractive sign may be placed at the job site advertising who is doing the work and where you or your shop can be located.

In the front portion of the shop an attractive showroom, well-lighted, carefully planned, will be of the utmost necessity to the selling of your product. The latest up-to-date lighting facilities will correct for dark days and color hue. If you are going to sell, you must sell with enthusiasm and feeling. The showroom that transmits such feelings to the buyer as he walks into it is going to sell its product. The first impression is very important for it is lasting. It may mean the difference between a sale or just an inquiry. The shop should reflect good housekeeping practices at all times.

A partition between the display room and the working area or laboratory will convey a personal touch. No mess, tools, paint spots, etc., will distract the effectiveness of the display. Equally important, is the fact that too much material on display will destroy the central idea of the showroom. It would be a good practice to have the front windows, if you have them, clear to permit the person walking or driving by to have a clear view of your showroom. There should be ample space on the remaining three walls and the inclusion of one or more islands for display materials. Let the store "sell itself" rather than be a hindrance to the business.

If you are in business for yourself, you will soon discover that it becomes necessary to attend to all aspects of the business personally. The careful budgeting of your time is then vital. It may seem that there are not enough hours in the day to get accomplished all that you would like. Perhaps it is then advisable to have part-time help with the books, showroom, taking of orders, and selling. Unless oou are anticipating a one-man operation, help of one kind or another will be needed.

The selection of a needed employee is one of the most difficult tasks which a manager is confronted with. Not only must you know how to hire, but hire the person most suitable for the job opening. People are more important than products. If you have developed a good live file of applicants, a vacancy is easy to fill. Once you have the type of qualifications you are desiring, approach the task of future hiring with these points fixed in your mind.

1. Be sure to look for the same qualities in the applicant as previously set up.
2. Give the applicant sufficient opportunity to reveal his true self.
3. Be aware of the first impression.
4. Check on his previous work experiences.
5. Do not fill a position with a candidate if there are reservations in your mind.

If all conditions are favorable, to both parties, chances are that the person hired will be an asset to your firm. The firing of an employee is unpleasant for both parties. For this reason, few people should be hired on a trial basis. As the hiring is your responsibility, so is the responsibility to inspire your people. Your employees look to you for job leadership. The development of a team is not by accident. It does not just happen. Study the people in your organization and select a few that you feel would be good leaders, foremen. Give as many people as possible a sense of sharing in the success of the store. Such items as, incentive pay, promotion, increased responsibility and a "pat on the back" are but a few ways to let your employee know you are happy he is working for you and not a competitor.

Just as you need to watch your people, your merchandise, and your customers, it is necessary to look out for your invested interest. There is little profit in building a successful business and letting it dwindle away through careless bookkeeping, poor collection of bills or even a liability suit. At any given time, you should be able to know what materials are on hand, what is ordered, and how much money is involved. The day to day expenses must be met, sometimes with cash. It is awkward to be caught in a financially embarrasing situation. This situation may be offset by following a few simple rules, yet important ones.

1. Keep careful control over your records.
2. Do not over stock materials unless an apparent demand is forth-coming.
3. Keep current tabs on bills which may become overdue; set a time limit.
4. Pay employees at a prescribed interval.
5. Provide adequate insurance against possible liable lawsuits.

This list is far from complete, and is provided only to stimulate further thoughts of profit, loss, and unnessary drains on the business.

When suddenly you realize it is you who are faced with the responsibility of keeping the store going, you will then know what is meant by the trite phrase, "Happy is the man who has found his work."

*TRADE AND INDUSTRIAL EDUCATION, *FOOD SERVICE SUPERVISORS, *STUDY GUIDES, *FOOD, *COOPERATIVE EDUCATION, GRADE 11, GRADE 12,

This course of study is designed for use by junior and senior high school students preparing for the occupation of institutional food service supervisor. Local and state subject matter specialists developed, tested, and periodically revised the program. Eighteen assignment sheets, each containing information, assignment, references, and questions, cover (1) The Food Service Supervisor, (2) Nutrition, (3) Function and Source of Food, (4) Menus and Diets, (5) Food Purchasing, (6) Principles of Food Preparation, (7) The Preparation of Food, (8) Serving the Food, (9) Records and Costs, (10) Sanitation, Safety, and Equipment, and (11) Advancement and Career Opportunities. What the worker should be able to do is correlated with what the worker should know in 2-column form. A bibliography of references and progress records for use by teacher, student, and employer are included. The material is to be used by the individual student under teacher supervision for 180 hours. This document is available for $1.50 from Industrial Education, 103 Industrial Education Building, University of Missouri, Columbia, Missouri 65201. (FP)

INSTITUTIONAL FOOD SERVICE SUPERVISOR

A Course of Study

Designed for
Cooperative Part-Time Students
Employed in Institutional Food Service

Issued by

Department of Industrial Education

FOREWORD

This course of study, consisting of an analysis of INSTITUTIONAL FOOD SERVICE SUPERVISOR together with the assignment sheets covering the related (occupational) information to be taught by the school has been prepared for teaching Institutional Food Service Supervisor on an individual basis in a cooperative part-time program.

The original analysis and assignment sheets were prepared by Dr. Carl R. Bartel, formerly Research Assistant in Industrial Education at the University of Missouri. This revision was prepared by Mr. Nevin E. Andre, Research Assistant in Industrial Education at the University of Missouri.

We acknowledge the assistance of Mr. Ted O. Lloyd, Executive Director, Missouri Hospital Association, Jefferson City, Missouri; Miss Evelyn Carter, formerly Dietary Consultant, Missouri Division of Health, Jefferson City, Missouri; Dr. Margaret W. Mangel, Professor of Home Economics at the University of Missouri; Miss Dorothy L. Vorhies, formerly Director, Department of Nutrition and Dietetics, University Medical Center, Columbia, Missouri.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Dr. H. Pat Wardlaw, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Information Sheets:

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of these "learning units"--the job skills and procedures--has been arranged in the analysis under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." And the third group--the personal-social traits--has been listed under"Personal-Social Traits Essential for the Food Service Supervisor"in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies--the school and the employer--to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job sills and procedures through practical work on the job under the immediate supervision of the employer,and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including, reading, learning activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets available in a separate manual have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT-WORKER

Each year many young people enter the field of health service occupations of which the institutional food service supervisor is one type. The food service supervisor has a very important job and carries a great responsibility with regard to the health services of the institution.

The position of the food service supervisor has become increasingly important in the last several decades. The reason for this rise in importance is the increase in skill, techniques and knowledge required concerning nutritional values and acceptable service which is beyond that expected of the head cook or chef. Another eason is the increased responsibilities of the dietitian making it necessary to delegate some of these, concerning food service, to some one responsible individual.

Personal Qualifications of the Food Service Supervisor

The type of work performed by the food service supervisor demands someone who is dedicated to the job and one who is highly concerned with the health and welfare of all with whom contact is made.

An important asset to this type of work is a sound training in and knowledge of food preparation. As important as this is, it is valueless if the trainee is lacking in the appropriate personal and social traits necessary for this work. Before entering into the occupation, the individual should be aware of what is expected in the way of personal characteristics and have the desire to further develop these traits.

Among the personal-social traits essential for the institutional food service supervisor are the following:

Professional Attitude. Professionalism is revealed by the sincerity with which the food supervisor promotes the welfare of and interest in her vocation.

Intelligence. Average or above intelligence is necessary to successful performance.

Responsibility. The food service supervisor knows the responsibilities of the job and performs her duties to the best of her ability at all times.

Dependability. The food service supervisor is punctual, regular in her work habits and does her work well.

Health. The job of the food supervisor requires one who is healthy and an individual who practices and promotes health habits.

Courtesy and Friendliness. A courteous supervisor is civil and polite in all situations. She also exhibits friendliness and cooperation, and has a genuine interest in the welfare of those with whom she comes in contact.

Precision and Accuracy. The health and welfare of many depend on the precision and accuracy with which the food service supervisor performs her work.

Appearance. It is essential to be suitably dressed, scrupulously clean and generally well groomed in this field of food preparation and service.

	2	11. Improving food diets and habits
12. Identify food groups	2	12. Food groups
	3	13. Reasons for food fads
	3	14. Relation between food fads and food costs
15. Secure foods and information from reliable sources	3	15. Fallacies about foods and nutrition
16. Follow accepted procedures only	3	16. Misconception and myths about foods and food preparation
Function and Source of Food		
	4	17. Function and source of carbohydrates
	4	18. Function and source of fats

JOB TRAINING: What the Worker Should be able to Do	Assign. No.	RELATED INFORMATION What the Worker Should Know
	4	19. Function and source of protein
	4	20. Function and source of minerals
	4	21. Function and source of vitamins
	4	22. Function and source of water and cellulose
23. Choose foods that contain necessary food components	4	23. Energy needs
	5	24. Function and source of meat, poultry and fish food groups
	5	25. Function and source of milk, cheese and egg food groups
	5	26. Function and source of vegetable, fruit and salad food groups
	5	27. Function and source of desserts, beverage and appetizer food groups
	5	28. Function and source of sandwich, bread and cereal food groups
29. Select essential food of desired values	5	29. Food values
	Menus and Diets	
	6	30. Nutritional needs during pregnancy
31. Consider nutritional needs in menu planning	6	31. Nutritional needs for various age groups
	6	32. Nutritional adequacy
	6	33. Normal or regular diets
	6	34. Modifications of normal diets
	7	35. Relation of menu planning to cost
36. Follow acceptable planning procedures	7	36. Principles of menu planning
37. Plan weekly menus	7	37. Master menus and basic food patterns
38. Plan full liquid and soft diets		
39. Plan menus suitable for various age groups	7	39. Menu patterns for various age groups
40. Plan acceptable menus	7	40. Food acceptance

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
41. Check variety, color, and nutritional adequacy in menu planning		
42. Construct suitable recipes	7	42. Construction of recipes
43. Measure ingredients accurately		
44. Record recipes and menus		
45. Use correct menu terminology	7	45. Terminology in menu planning

Food Purchasing

46. Follow institution's purchasing policies	8	46. Policies and procedures in food purchasing
47. Follow acceptable purchasing procedures		
48. Purchase food products with aid of buying guide	8	48. Buying guides to food products
	8	49. Sources of supply
	8	50. Seasonal purchasing
51. Select and purchase quality food products	8	51. Quality, size, grades and checking of food products
52. Check food products carefully before purchasing		
53. Calculate exact food needs	8	53. Calculation of food needs
54. Write food specifications		
55. Check foods received	8	55. Receiving, storing and preservation of purchased foods
56. Plan the storage and store foods carefully		
57. Control humidity and temperature for storage		

Principles of Food Preparation

58. Maintain a clean kitchen	9	58. Principles of food preparation
59. Assist kitchen personnel		
60. Plan, post and follow work schedule	9	60. Planning and facilities for food preparation
61. Plan for food preparation		
62. Deliver food to work units		

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION What the Worker Should Know
63. Initiate and use standardized recipes	9	63. Use of standardized recipes
64. Maintain recipe file		
65. Check quality of food before serving	9	65. Factors affecting quality and food appeal
66. Measure and weigh food accurately	9	66. Weight and volume measurement of food
67. Determine and measure standard portions		
68. Convert measurements		
	9	69. Cooking temperatures

The Preparation of Food

70. Follow correct timing and temperatures in meat, poultry and fish preparation	10	70. Timing and temperature control in meat, poultry and fish preparation
71. Prepare and cook meats	10	71. Methods of cooking meats
72. Prepare and cook poultry	10	72. Methods of cooking poultry
73. Prepare and cook fish	10	73. Methods of cooking fish
74. Place meats, poultry and fish in storage	10	74. Storage of meats, poultry and fish
75. Freeze meats, poultry and fish		
76. Prepare and use meat, poultry and fish leftovers		
77. Follow correct timing and temperature in milk, cheese and egg preparation	11	77. Timing and temperature control in milk, cheese and egg preparation
78. Prepare milk products	11	78. Methods of cooking and uses of milk
79. Cook with milk		
80. Cook with cheese	11	80. Methods of cooking and uses of cheese
81. Prepare and cook eggs	11	81. Methods of cooking and uses of eggs
82. Place meat, cheese and eggs in storage	11	82. Storage of milk, cheese and eggs
83. Follow correct timing and temperatures in vegetable, fruit and salad preparation	12	83. Timing and temperature control in vegetable, fruit and salad preparation
84. Prepare and cook vegetables	12	84. Methods of cooking and preparing vegetables
85. Prepare and cook fruits	12	85. Methods of cooking and preparing fruits
86. Prepare raw fruits		
87. Prepare salads	12	87. Methods of preparing salads

JOB TRAINING: What the Worker Should Be Able to Do	Assign. No.	RELATED INFORMATION: What the Worker Should Know
88. Place vegetables, fruits and salads in storage	12	88. Storage of vegetables, fruit and salads
89. Prepare and use vegetable, fruit and salad leftovers		
90. Follow correct timing and temperatures in dessert, beverage and appetizer preparation	13	90. Timing and temperature control in dessert, beverage and appetizer preparation
91. Prepare desserts	13	91. Methods of cooking and preparing desserts
92. Prepare beverages	13	92. Methods of preparing beverages

142. Orientate staff members	18	142. Staff relations
143. Acquaint self with nearby food serving institutions	18	143. Opportunities as a food service supervisor
	18	144. Opportunities in the dietary field
	18	145. Other health occupation opportunities
	18	146. Training and experience requirements

Assignment
Sheet No. 1

Covering
Units 1-7

THE FOOD SERVICE SUPERVISOR

There are many facets which need to be considered by the person preparing to become a food service supervisor. You, as a food service supervisor, have the opportunity to associate with many congenial people all of whom, like yourself, have a genuine interest in people and their welfare, and a devotion to the service of humanity. The rewards received are not only monetary, but a feeling of being associated with others in a worthwhile undertaking.

The job of the food service supervisor is one that is considered very important and essential in every institution which provides for quantity food preparation. You must know the responsibilities and duties of your job and the relationship it has to the over-all institution. Your success in this occupation requires that you obtain a high degree of skill in not only operating the food area, but also working with and supervising other employees. To do this you must have the ability to make everyone feel a part of the total organization.

In this assignment you will have the opportunity to learn the duties and responsibilities of the food service supervisor and food service employees, the qualifications considered essential to success and the relationship of this occupation to the total institution.

Assignment:

1. Read the given references listed below.
2. Periodically, throughout your training, rate your progress as a food service supervisor using the "Food Service Supervisor Rating" chart given in Information Sheet No. 1.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 250-260.
I. Information Sheet No. 1.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is essential for the dietitian as well as the food service supervisor to have a basic knowledge and skill in the supervision of workers.

T F 2. Presently, all hospitals have a trained dietitian in charge of the food preparation department.

T F 3. In actual practice, dietitians may serve two or more institutions in a given area.

T F 4. It is essential for a supervisor to delegate certain responsibilities to effect efficient operation.

T F 5. One of the accepted responsibilities of the dietitian is to step in as a "relief" for routine chores and duties.

T F 6. One of the first things to determine when training employees is to decide what you want done and how you want it done.

T F 7. The employee being trained need not follow correct procedures at first because she will have ample time to correct these procedures as she becomes more familiar with her job.

T F 8. Employee training is important both in the large and small hospital, but much more so in the large hospital.

T F 9. One of the steps of procedure in determining the number of workers required is the classifying of workers needed.

T F 10. The administration of general food service is considered the responsibility of the dietitian.

T F 11. The management of therapeutic diets is one of the responsibilities of the supervisor.

T F 12. It is not essential for the food service supervisor to be qualified to assume responsibilities of routine administrative details.

T F 13. One of the responsibilities of the cook may be that of giving instruction to and supervising kitchen helpers.

T F 14. It is desirable for the same person who removes soiled dishes from the eating area to be responsible for returning clean dishes to proper storage area.

T F 15. Duties of a counter worker may be the responsibility of the kitchen helper in some institutions.

T F 16. It is necessary for the dietitian's office to have a record of position and rate of pay for each employee in the department.

T F 17. One advantage of a budget card, in record keeping, is that it gives a continuous listing of individuals successively employed in a particular position.

T F 18. Terms of employment and promotional opportunities are only two of the items which are included in "job specifications."

T F 19. The "work schedule" is designed and used primarily by the dietitian for the control of supervisory staff.

T F 20. Actually, "work schedules" are a means of standardizing work output.

T F 21. College education is not only desirable, but is necessary in order to succeed in the job of food service supervisor.

T F 22. Some experience and training in food preparation will greatly aid one in food service supervisory work.

T F 23. Two personality traits of a food service supervisor are: a genuine interest in people and an interest in the position.

T F 24. Even though good personal appearance is essential for the work which a food service supervisor does, it has little relation to her promotions.

T F 25. It is not necessarily the obligation of the food service supervisor to keep up with current information related to her field.

T F 26. Never should the food service supervisor give out personal information that has come to her attention in the course of her work.

T F 27. The food service supervisor must have the ability to understand individual needs and interpret their attitudes.

T F 28. The total evaluation program of an institution often includes an individual rating of the food service supervisor.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Dietary consultation programs in recent years have been developed by many ____________ ____________ departments for hospitals and similar institutions.

2. Food service employees should have the ____________ to acquire necessary skills if they do not already have them when employed.

3. In the use of delegated responsibility, each worker must know what ____________ duties are and to ____________ he or she is directly responsible.

4. It is helpful for delegated duties to be put in written form, because written duties are ______________ whereas oral instructions usually ______________ each time they are repeated.

5. The training of employees may be of two major methods; one is by ______________ instruction and the other by ______________ ______________ instruction.

6. Training in a small hospital is usually given as ______________ instruction, whereas it is more frequently given as ______________ instruction in the large hospital.

7. Ideally, the supervisor works under a professionally qualified ______________.

8. The duties of the porter in smaller institutions may be assumed by the ______________ or by an employee from the ______________ or ______________ department.

9. Upon the termination of employment, the employee's personnel record card is placed in the ______________ file.

10. Essential information concerning ______________ of the job and ______________ of the workers are contained in "job specifications."

11. A copy of the "work schedule" should either be ______________ to each employee or ______________ where she can easily see it.

12. Probably the most important purpose of the food service supervisor position is to perform ______________ and ______________ functions delegated by the dietitian.

13. The "watchword" in personal appearance is ______________ ______________.

14. The integrity of the food service supervisor reflects not only on herself but also on her ______________ with whom she works and the ______________ in which she is employed.

15. One of the most important intangible aptitudes of a food service supervisor is the ability to get employees to work ______________, whether under ______________ or not.

16. The service rendered by the food service supervisor must be ______________ and ______________ centered.

17. The greatest value, in rating the food service supervisor as well as other employees, lies in the ______________ to which it has been put after it has been made.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. One of the duties not considered that of the dietitian is (A) menu-planning; (B) typing; (C) supervision of departmental sanitation; (D) food purchasing.

_____ 2. One of the duties not considered that of the food service supervisor is (A) employee orientation; (B) efficiency ratings; (C) messenger service; (D) refrigerator inventories.

_____ 3. One of the duties not considered that of the kitchen helper is (A) salad making; (B) testing of recipes; (C) assigned cleaning; (D) pantry work.

_____ 4. One of the duties not considered that of the clerical assistant is (A) issuing supplies; (B) record keeping; (C) periodic inventories; (D) writing requisitions.

_____ 5. One of the duties not considered that of the storekeeper is (A) receiving supplies; (B) storage of supplies; (C) periodic inventories; (D) typing.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Qualifications which food service employees should have are:

(A)______________________________

(B)______________________________

(C)______________________________

(D)______________________________

2. The four factors that determine the number of workers in a dietary department are:

(A)_______________ (C)_______________

(B)_______________ (D)_______________

3. Three groups to whom the dietitian often teaches courses are:

(A)_______________ (C)_______________

(B)_______________

4. Information to be provided employees at the time of their employment concerning institutional policies and regulations is:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

(H)____

5. Records of each employee must be kept in the dietary or personnel office and should include:

(A)____________________

(B)____________________

(C)____________________

(D)____________________

(E)____________________

(F)____________________

(G)____________________

6. Instructions especially concerning diets given to patients, staff, etc., whether written or oral need to be:

(A)____________________

(B)____________________

(C)____________________

(D)____________________

7. The four main items or factors on which a food service supervisor is rated are:

(A)____________________

(B)____________________

(C)____________________

(D)____________________

Information
Sheet No. 1

THE FOOD SERVICE SUPERVISOR

For the individual who is planning to become a food service supervisor, there are many facets to the work which need to be considered.

Some college education is very desirable for this type of work, but is not absolutely essential. One should be familiar with and have had some training and experience in foods and nutrition, and also supervisory work. Any additional knowledge and experience along the lines of the assignments of this course will be very beneficial to the one entering the position of food service supervisor.

Probably the most important purpose of this position is to perform those supervisory and managerial functions which are delegated by the dietitian. The performing of these functions helps to relieve the dietitian of routine administrative duties and allows the dietitian to focus her attention on major administrative functions of the dietary department.

Ethical and Personal Qualities

Certain ethical and personal qualities are essential if one is to be a success at her work. This is especially true for the food service supervisor.

Personality Traits

1. Must have a genuine interest in people and their welfare.
2. Must be able to work harmoniously with others on the institutional staff.
3. Must be willing to work and shoulder the responsibilities of the position.
4. Must be willing to learn and to accept new responsibilities gracefully.
5. Must be sincere in helping others through avenues of her job.
6. Must have a liking and interest for the position of food service supervisor.

Personal Appearance

1. The food service supervisor must maintain a neat appearance at all times.
2. Personal cleanliness should be the "watchwork."
3. Personal appearance is an indication to others of the work performed in the food area.
4. The personal appearance of the food service supervisor very often is a determining factor in future promotions.

Ethical Conduct

1. The food service supervisor should devote herself to the service of humanity.
2. The food service supervisor should show a devotion to those under her direction.
3. It is the responsibility of the food service supervisor to keep pace with new information which is being continually added to the field.
4. The food service supervisor should be interested in and contribute to the welfare of the community.
5. The food service supervisor should be loyal to the institution in which she is employed.
6. The food service supervisor should cooperate fully with all associates to attain the objectives of the institution.
7. The integrity and devotion of each food service supervisor reflects not only on herself, but also on the associates with whom she works and the institution in which she is employed.
8. The food service supervisor should hold in confidence all personal matters which come to her attention except those which are pertinent to the welfare of the individuals whom she serves and, in this case, should be relayed to responsible persons only.
9. The food service supervisor must always exercise good judgment in all her dealings with people.

Relations With Others

Since the food service supervisor is definitely concerned with the over-all preparation and the serving of foods, she must constantly be aware of and encourage friendly relations with both the kitchen and staff personnel, and others for whom the food is prepared. It must be remembered that friendly relations must be maintained with whomever the food service supervisor comes in contact. It has been said that one of the most important aptitudes of a food service supervisor is intangible, this being the ability of making employees work harmoniously whether they are under pressure or not. It is very essential that a pleasant atmosphere exists throughout the institution. To this end the food service supervisor can contribute greatly.

The food service supervisor should constantly bear in mind that the service, which she is rendering, must be patient-, customer-, and staff-centered, and that one must understand individual needs and be able to interpret the attitude of the people with whom she works and serves.

Normal and modified diets are designed for individuals. These individuals need to be considered especially in light of their ability to understand and to follow the various types and kinds of diets prescribed. All instruction to patients, staff, etc., whether written or oral, should be presented in such a way as to hold special interest to the one being instructed. These instructions need to be accurate, factual, brief and to the point, and adaptable to the particular individual.

Rating of the Food Service Supervisor

The work of the food service supervisor is often rated as part of the total evaluation program of the institution. The rating may be performed by either the supervisor, herself, or by those under whom she works. The value of the rating lies in the use to which it is put after it has been made. The food service supervisor should review the ratings made and make an honest effort to improve on those points which were rated low and continue to perform well on those points on which she was rated high.

A typical rating scale is shown below. Study it carefully. Remember each point as you begin your training for food service supervisor and continually evaluate your work on each item as you progress.

Food Service Supervisor Rating*

Items	Excellent	Good	Fair	Unsatisfactory	Remarks
A. Skill					
1. Knows and applies principles of good nutrition and diet therapy					
2. Knows and applies principles of good cookery					
3. Has developed accuracy and reasonable speed and is able to meet deadlines					
4. Is skillful in clerical procedures. (Can chart food orders and order supplies accurately)					
5. Can arrange work for self and others					

Items	Excellent	Good	Fair	Unsatisfactory	Remarks
6. Practices economy in use of material and time					
7. Insists upon principles of good sanitation					
8. Is concerned with safety of patient and personnel					
9. Directs tray setups, cafeteria lines and table service using guides provided					
B. Dependability					
1. Reports on and off duty at scheduled time					
2. Never leaves work area except with supervisor's approval and can always be found in area where needed most					
3. Is conscientious about using sick leave					
4. Completes work even though not under immediate supervision					

Items	Excellent	Good	Fair	Unsatisfactory	Remarks
5. Is careful in checking and receiving supplies and does not issue food or supplies without proper authorization					
6. Follows through on assignments					
C. Personal Qualifications					
1. Is well groomed and in correct uniform					
2. Knows and practices good health habits					
3. Is in good physical and mental health					
4. Is loyal to supervisor and respects authority					
5. Is well mannered (toward patients, visitors, staff and co-workers)					
6. Is co-operative (good team- worker)					
7. Accepts re-assignment and varied tests willingly to achieve maximum production					

Items	Excellent	Good	Fair	Unsatisfactory	Remarks
D. Leadership					
1. Works well with others					
2. Listens to employees' grievances and refers them to proper channels					
3. Accepts constructive criticism and follows through					
4. Instructs each new employee carefully and correctly					
5. Develops employees and helps them to be ready for advancement					
6. Plans work impartially so that the bulk of work is divided fairly among the employees					
7. Has the respect of those supervised					
8. Is able to discipline employees when necessary					
9. Is able to make decisions and adjust to new situations					

Items	Excellent	Good	Fair	Unsatis-factory	Remarks
10. Develops skill in management techniques					
11. Continues to improve by study and self-evaluation					
12. Is industrious and displays initiative

Assignment
Sheet No. 2

Covering
Units 8-12

NUTRITION FOR GOOD HEALTH

Good food selection is the cornerstone of good nutrition. In fact, nutrition is one of the most important single environmental factors affecting our personal well-being. We, as human beings, are unfortunate in the respect that we do not have any automatic mechanism to guide us in the proper choice of the foods we eat.

Nutrition may be defined as "the science of nourishing the body properly" or may be a term used to refer to the "nutritional status, that is the condition of the body." Another definition which is more comprehensive is "the combination of processes by which the living organism receives and utilizes the materials necessary for the maintenance of its functions and for the growth and renewal of its components." From this the food service supervisor can see that a knowledge and correct use of nutitional principles are essential.

In this assignment you will have the opportunity to learn the importance of nutrition and how it is related to good health.

Assignment:

1. Read the references listed below.
2. Rate your present diet for at least one day. Use the "Food Selection Score Card" (See B p. 16).
3. Answer the questions below and turn in this assignment by ______________________.

References:

B. Peyton, Practical Nutrition, pp. 3-17.
I. Information Sheet No. 2.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The purpose of food is nourishment for the human body and it has very little effect on a person's morale.

T F 2. Presently much emphasis is placed on the relation of one's weight to his height as a means of judging nutritional status.

T F 3. Nutritional facts as related to health are changing constantly due largely to new discoveries being made.

T F 4. School lunch programs are helping to improve the nutrition of many people.

T F 5. Education concerning nutrition is an accepted function of various health agencies, but very seldom thought of as a function of hospitals.

T F 6. One may often find a nutritional program operating in various kinds of larger industries.

T F 7. Many large companies conduct or sponsor research in nutrition; the public seldom benefits from this since very little of it is made available to them.

T F 8. The Food and Nutrition Board was established to advise the government on matters of food nutrition.

T F 9. According to <u>Food, The Yearbook of Agriculture 1959</u>, about 25 per cent of our nation's households have poor diets.

T F 10. Ascorbic acid-rich fruits are grapefruit and oranges.

T F 11. It is generally accepted that one can work and think better when enjoying good health.

T F 12. Nutrition may be defined as the science of food and its relation to health.

T F 13. The combination of foods with the indicated number of servings (from the "Basic 7 Group") supplies the essential nutrients to meet daily requirements.

T F 14. "A Daily Food Guide" plan is a more recent guide to meal planning than the "Basic 7 Plan."

T F 15. When using the "Daily Food Guide," one should choose at least the minimum number of servings from each broad group.

T F 16. Foods chosen to round out the meals (using the "Four Group Plan") should be from foods not listed in these groups.

T F 17. Each individual should attempt to have some meat, poultry, fish, eggs, or milk at each meal.

T F 18. Communities have developed in certain areas largely due to the settling of people to work the land in order to grow the foods needed.

T F 19. There have been comparatively few discoveries involving minerals and vitamins during the present century.

T F 20. Individuals may survive a week or more without food and with little or no bodily changes occurring.

T F 21. It is true that some individuals who follow poor dietary practices may look healthier than those who follow prescribed diets.

T F 22. Individuals must continually adjust their food habits as they grow older since their nutritional needs are constantly changing.

T F 23. The average life span has increased approximately 20 years since the beginning of this century.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. A person who is in good physical and mental health should have a radiant _______________ ___ and abundant _______________.

2. An effective measure in the improvement of a child's health is the serving of a _______________ _______________, in a school lunch program, to supplement the home diet.

3. Nutritional programs in industry have helped to cut down _______________ and _______________ and generally have increased the output of workers.

4. Guides for various nutrients needed have been set up by a board in the United States called the _______________.

5. In the guide for meal planning, "Basic 7 Food Groups," the foods are divided into groups which are _______________ in food composition and which serve the _______________ function in the body.

6. The "Basic 7" was developed to be used as a guide for the selection of _______________ foods.

7. Sugar, cream, salad dressing, starchy foods and rich desserts should be used sparingly in the diet because they do not always carry added _______________ and _______________.

8. Even though there is an abundant food supply in the U.S., surveys show that diets could be improved, particularly by including more nutrients such as _______________ and _______________.

9. A Daily Food Plan requires a ______________ or a ______________ vegetable at least every other day.

10. As early as the 18th century scientists were aware of the relationship between respiration and the ______________ of food.

11. The human body has many ______________ and ______________ devices which aid it in compensating for poor dietary practices.

12. Poor diets have less effect during ______________, a period of slow growth, than they do during ______________ , a period of rapid growth.

13. At the present time more and more emplasis, as concerned with health, is being placed on ______________ measures and less and less on ______________ measures.

14. Individuals who do not eat properly become less active, their eyes become ______________, their growth is ______________, their life is ______________ and their muscles tend to ______________.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The American Dietetic Association lists 13 outward signs of good nutrition; these are:

(A) ______________________________

(B) ______________________________

(C) ______________________________

(D) ______________________________

(E) ______________________________

(F) ______________________________

(G) ______________________________

(H) ______________________________

(I) ______________________________

(J) ______________________________

(K) ______________________________

(L) ______________________________

(M) ______________________________

2. The three international groups who are interested in nutrition are:

(A)______________________________

(B)______________________________

(C)______________________________

3. After the nutritive values are satisfied in the selection of foods from the "Basic 7," it may be necessary to provide for additional caloric requirement. This may be done by:

(A)______________________________

(B)______________________________

4. Nutrients found most frequently below the recommended amounts are:

(A)_______________ (C)_______________

(B)_______________ (D)_______________

5. Diseases rarely seen in this country because people can afford good diets are:

(A)_______________ (D)_______________

(B)_______________ (E)_______________

(C)_______________

6. A food is a substance which meets the following needs of the body:

(A)______________________________

(B)______________________________

(C)______________________________

7. Eight factors which stand in the way of good nutritional practices and food habits are:

(A)_______________ (E)_______________

(B)_______________ (F)_______________

(C)_______________ (G)_______________

(D)_______________ (H)_______________

Information
Sheet No. 2

NUTRITION FOR GOOD HEALTH

Background

All human beings have been and still are greatly concerned with three basic factors: shelter, clothing and food. People in early times obtained their needed nutrition through the gathering of wild native foods as they moved from one place to another. There is evidence that communities, towns and cities have developed due to the settling of people in particular areas for the purpose of cultivating and working land so as to derive the foods needed.

There were many theories developed in these early days as to the values of various food. Some of these have actually been recorded in different chapters of the Bible as well as in other historical writings. During the eighteenth century, when many concepts were changing, scientists began to recognize the relationship of the respiration process to the metabolism of food. Later a great amount of interest developed in the energy or calorie value of foods, especially the carbon-bearing carbohydrates, fats and proteins. During the first half of this century, many discoveries have been made concerning minerals and vitamins and their important role in bodily environment. One of the chief contributions during this period was a caloric requirement chart for different age groups.

Nutrition, a Concern of All

Food does maintain life. A man can live for quite some time without food although profound chemical changes occur within three days without food. Death is an inevitable result of starvation, and even today it is true that many are dying because of starvation.

Good nutritional status is noted when man benefits from the intake of a well-balanced diet. Many of the ailments that befall our population, especially the middle-aged as compared to youth, may be the ultimate toll being paid for poor diets. The human body has many reserves and safety devices, but it cannot stand an indefinite amount of abuse. The poorly nourished individual is a focal point of infection. Often the effects of a poor diet are not evident. It is true that at times individuals, whose diets have been poor, look healthier than those who seem to follow good dietary practices. This may be due to the fact that some can adjust, temporarily, to poor diets and also that all individuals do not have the same needs.

Poor diets definitely have different effects on individuals at varying ages. At an age when growth is slow, such as during childhood, poor dietary practices have less effect than at ages in which spurts of growth take place, such as during adolescence. This indicates that individuals must adjust their food habits as they grow older since nutritional needs and food habits do change with age.

Several factors which tend to stand in the way of improving nutritional practices and the changing of food habits are the following:

1. Food propaganda (fads)
2. Poverty
3. Public that is not informed
4. Prejudices and biases
5. Public unconcern
6. Fraudulent practices
7. Lack of food legislation
8. Food habits of different races

Progress in Nutrition

Public health, scientific research and medical care have brought dramatic changes and progress in the health of the world's people. The increase in longevity is indicative of this improvement. The average life span in 1900 was about 50 years whereas today it is approximately 70 years. The control of preventable diseases has been one of the most important factors in the progress and especially is this true for the young people. Nutrition has played a large part in this. More and more attention is put on preventative measures and less and less on curative. This has brought nutrition to the front as all-important to our civilization.

Individuals who do not eat properly tend eventually to result in the following:

1. Behavior and personality changes
2. Deterioration of the muscles
3. Individual becomes less active
4. Skin becomes dry and grey
5. Growth of individual is usually stunted
6. Eyes and hair usually become dull
7. Shortened life
8. Susceptible to illness
9. A lack of coordination
10. A loss of radiant health

Assignment
Sheet No. 3

Covering
Units 13-16

FOOD MISINFORMATION

There are no magical properties contained in the foods we eat. Superstitious beliefs about foods have been handed down through the ages, and people tend to hold onto these beliefs and to champion them with unreasoning prejudice. Most of the "old wives' tales" concerning certain foods and their so-called special properties are highly fanciful and generally can be shown to be absurd.

Often due to food faddists, sound and competent advice about food has been discredited since the average person seems unable to discriminate between those who know what they are talking about and those who do not. This is especially true during the present century with the great increase in advertising. Food misinformation not only deprives believers of adequate diets, but also encourages the waste of money.

In this assignment you will become acquainted with fallacies about foods and nutrition and will have the opportunity to learn the facts concerning these fallacies.

Assignment:

1. Read the references listed below.
2. Make a list of any prejudices that you have against the eating of certain foods or combinations of foods. Are these prejudices warranted in light of the facts?
3. Make a list of superstitions, prejudices, fads, etc., which you find among other people. Which of these have some basis in fact and which do not?
4. Answer the questions below and turn in this assignment by ____________________.

References:

B. Peyton, Practical Nutrition, pp. 135-143.
D. American Dietetic Association, Food Facts Talk Back, pp. 1-32.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. One reason why food fads and fallacies flourish is that many people want them, like them and blindly follow them.

T F 2. The so-called new "medicine man" often uses the radio and television rather than the newspaper largely because of legal reasons.

T F 3. The problem with food fads is not that they are harmful, but that they are so costly to the individual who believes in them.

T F 4. Taking all factors into consideration, it is just as beneficial to take vegetables in liquid form as it is to eat the raw food.

T F 5. The major claim made for "raw sugar" is the iron content which it has.

T F 6. There are many claims made for blackstrap molasses; one statement which is definitely true is that it has a high laxative quality.

T F 7. It is possible for normal individuals to get an adequate supply of needed vitamins from a balanced diet without taking vitamin concentrates.

T F 8. Many of the reducing drugs are scientifically unsound and potentially dangerous; in fact, there is no known drug which will directly cause weight loss.

T F 9. One acceptable way to aid reducing is by the use of laxatives.

T F 10. Due to the tremendous development in science and medicine there are very few people who believe in the magical properties of food.

T F 11. In early days it was believed that the souls of people resided in certain foods.

T F 12. Besides herbs, flowers and fruits have also been considered to possess various kinds of medicinal powers.

T F 13. The grinding of flour at home as compared to commercial grinding has an advantage in that more food value is retained.

T F 14. The use of rice plus a regular diet is considered by authorities as a cure for high blood pressure.

T F 15. Pinworm is caused by contaminated food and not by the eating of raw potatoes as many believe.

T F 16. Dry cereals do supply body energy but are not considered as more important than cooked cereals.

T F 17. Lemon juice added to sugar tends to lower the caloric value, therefore allowing it to be used in a diabetic diet.

T F 18. It is an accepted fact that the color of the eggshell is related to the nutritive value of the egg.

T F 19. The practice of eating an egg every day can be harmful even to a healthy individual.

T F 20. Even under normal circumstances, it is considered dangerous to eat when taking sulfa drugs.

T F 21. The meat of wild rabbits, which is diseased caused by bacterium tularense, may be rendered harmless by thorough cooking.

T F 22. Gelatin could very easily be used as the sole source of protein in the diet.

T F 23. We do have foods which are specifically designed to build special tissues of the body.'

T F 24. It is not too difficult to obtain an adequate supply of protein from fruits and vegetables.

T F 25. It is true that starvation for a few days has little if any effect on the mental activity of an individual.

T F 26. Generally, proteins and starches should not be eaten together at the same meal.

T F 27. Fats from all foods are digested equally well; that is, fat from one food is not harder to digest than from another.

T F 28. Actually, frozen orange juice is very similar to fresh, as to nutritive value.

T F 29. It is an accepted fact that some foods destroy body tissue.

T F 30. One must be very careful in serving certain fruits and vegetables since some do cause polio.

T F 31. After having opened a can, food should not be left in it as this will be dangerous to those who consume the food.

T F 32. Less milk per day is recommended for adults than for children.

T F 33. It is true that boiled milk is more digestible than raw milk.

T F 34. Foods that can be safely eaten separately can also be eaten in combination without harm.

T F 35. Water is fattening since two-thirds of the total body weight is made up of water.

T F 36. The addition of cream changes the stimulating effect of coffee.

T F 37. Excessive quantities of certain vitamins can be harmful, especially to young children.

T F 38. It is true that fat is the body's way of storing excess foods.

T F 39. The advantage of the three-day prune diet as compared to the banana and skim milk diet is the provision of needed vitamins.

T F 40. There are certain drugs available that do aid a person to lose weight.

T F 41. It is advantageous to use toast in a reducing diet because it has fewer calories than bread.

T F 42. It is as important <u>when</u> you eat foods as <u>what</u> you eat in attempting to lose weight.

T F 43. There is no such thing as fattening or non-fattening foods.

T F 44. We now have scientific proof that certain foods taken during pregnancy will mark the child.

T F 45. Cravings for certain foods indicate a need of these foods.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The main difference between a food fact, a fad and a fallacy is that a food fact has some ______________ ______________, a food fad is like a fashion and will soon be replaced by some ______________ ______________, a fallacy is one handed down from one ______________ to another.
2. "Live salt," a food quack's product, is a mixture of __________ ______________ with ordinary table salt.
3. Weight reduction is possible only when the food intake is ______________ than the ______________ expended.
4. Whether one food can be substituted for another depends upon the similarity in ______________ ______________.
5. In so-called "de-starched" or "low calorie" potato chips, the ______________ contributes more calories than the ____________ does.

6. Both beef and pork liver compare favorably to protein and calorie content, although beef liver contains more ___________ whereas pork liver contains more _______________.

7. The fertility of soil affects both quality and quantity of food products, although if affects the _______________ more than it does the _______________.

8. Vegetable juices and vegetables themselves are similar in nutritive values; the importance of whole vegetables is that they are a _______________ of _______________ in the diet.

9. Extensive corrosion on the inside of cans of certain canned fruits or vegetables imparts a _______________ taste and usually indicates that they have been packed for a ____________ or more.

10. Carbonated beverages contain ________ to _________ calories per cup.

11. Fat furnishes approximately ______________ times as many calories as proteins.

12. A safe and efficient diet is built around liberal amounts of _______________, _______________, _______________, ____________, and _______________ and limited amounts of _______________ and _______________.

13. The disadvantage of the egg diet is the inadequate provision of _______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Profits which a food quack receives from his enterprises are (A) considered average; (B) small; (C) large; (D) enormous.

_____ 2. The American Dietetic Association has recorded approximately (A) 150; (B) 175; (C) 200; (D) 225 baseless food superstitions.

_____ 3. Vitamin preparations (A) cannot; (B) may; (C) often do; (D) seldom do take the place of foods.

_____ 4. Of the following foods, all are high in starch, vary in vitamin and mineral content, but only one contains vitamin C; this is (A) white rice; (B) spaghetti; (C) macaroni; (D) white potatoes.

_____ 5. Properly cooked meat has more nutritive value when prepared (A) rare; (B) medium rare; (C) well done; (D) any of the three methods.

_____ 6. The calorie content of butter as compared to margarine (A) is the same; (B) is higher; (C) is lower; (D) always varies.

_____ 7. Homogenized milk (A) is superior to pasteurized milk; (B) contains no fat; (C) contains more cream than whole milk; (D) is actually whole milk.

_____ 8. Weight for weight, sugar has (A) less; (B) same; (C) more; (D) either less or more caloric value than starch.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. "Pseudoscientists" or "food quacks" are a group of people who have taken the place of the former "medicine man" and often call themselves:

(A)_____________________ (C)_____________________

(B)_____________________

2. Many current reducing "nostrums" are actually candy and food, the ingredients of which are:

(A)_____________________ (E)_____________________

(B)_____________________ (F)_____________________

(C)_____________________ (G)_____________________

(D)_____________________ (H)_____________________

3. The chemical names for energy producing foods are:

(A)______________ (B) ______________ (C)______________

Assignment
Sheet No. 4

Covering
Units 17-23

FUNCTION AND SOURCE OF FOOD I

The human body's needs can easily be compared with the needs of an automobile engine. As the engine can operate for awhile without fuel, repairs, lubrication, etc., so can the body operate without the necessary and essential foods; but the lack of them will definitely interfere with bodily processes and eventually do permanent damage.

Most of the foods we eat contain a combination of constituents necessary and essential for the nourishment of the human body. Each one of these furnished by food has a specific contribution to make but the use of any one by the body is dependent on a proper balance of all the others. No one is more important than any other. These constituents, specific substances, chemical units, etc., of foods are important to all individuals for health, energy and growth.

In this assignment you will have the opportunity to learn the functions and sources of the food components; carbohydrates, fats, proteins, vitamins, minerals, water and cellulose.

Assignment:

1. Read the references listed below.
2. Calculate the fuel value (calories) which you consume at each meal for a period of time. (See A pp. 4-18; B p. 38)
3. Answer the questions below and turn in this assignment by ________________________.

A. American Hospital Association, Hospital Food Service Manual, pp. 4-18.
B. Peyton, Practical Nutrition, pp. 18-79.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter"F."

T F 1. Carbohydrates furnish a supply of energy more quickly than either proteins or fats.

T F 2. Carbohydrate foods make up a larger percentage of American diets than diets of Europeans.

T F 3. The consumption of sugar in the last three decades has decreased considerably.

T F 4. Sugars depress the appetite and if taken in large amounts are actually detrimental.

T F 5. Beet sugar has a greater sweetening power than cane sugar.

T F 6. The cooking of foods containing starch does very little to aid digestion.

T F 7. Fats give off more heat in the body burning process than either carbohydrates or proteins.

T F 8. Fat is primarily an energy food.

T F 9. The excess consumption of fat may be advantageous or not, depending on the particular individual.

T F 10. It is true that there are some foods which are almost pure fat.

T F 11. All fats are solids at room temperature and need to be heated in order to convert them into liquids.

T F 12. Butter and lard have better keeping qualities and become less rancid than hydrogenated fats.

T F 13. The lower the melting temperature of fats, the more easily they are digested.

T F 14. Lard and most hydrogenated fats have lower smoking temperatures than butter and margarine.

T F 15. Older people who gain weight easily or who have high blood chlorestrol are advised to raise their fat consumption.

T F 16. Margarine is cheaper and contains less food value than butter.

T F 17. A substitute for oils in salad dressings is mineral oil, which is used primarily because it has no caloric value.

T F 18. For all practical purposes, the composition of proteins are the same as fats and carbohydrates.

T F 19. The body can actually manufacture some of the amino acids needed while others have to be furnished by foods.

T F 20. On the average, fruits, vegetables and cereals contribute approximately one-half the daily intake of protein.

T F 21. Timing is very important when supplementing certain protein foods with other protein foods to secure the full value.

T F 22. We have definite proof that diets too low in protein will cause malnutrition.

T F 23. An adult needs approximately three times as much protein per pound of body weight as a growing child.

T F 24. It is commonly accepted that the requirements of protein for one doing muscular work as compared to one who is not, is practically the same.

T F 25. As compared to protein, carbohydrates are a comparatively cheap source of energy.

T F 26. It makes a great difference in protein content whether one uses whole or skim milk.

T F 27. A protein deficiency for a prolonged period of time will cause a loss of weight, strength and appetite.

T F 28. The body stores excess amino acids from protein in the same manner as it stores fats and carbohydrates.

T F 29. One of the factors which may affect the appetite of an individual is being emotionally upset.

T F 30. A calorie is the amount of heat required to raise one gram of water one degree centigrade.

T F 31. It is usually true that foods high in water content are generally low in fuel value.

T F 32. When a person eats the right number of calories to meet his energy needs, his weight does not change.

T F 33. The most important factor which determines the energy requirements of an adult above the basal is the muscular work.

T F 34. Experimentation has shown that purified food nutrients alone are not sufficient to promote good health, but that vitamins are also essential.

T F 35. It is generally conceded that most of the vitamins have been already isolated.

T F 36. Two functions of vitamin A are that it is essential to good health in tissues and necessary for formation and maintenance of tooth enamel.

T F 37. Approximately the same amount of vitamin A is recommended for adolescent boys and girls as for normal adults.

T F 38. A medium sized egg has less vitamin A than one cup of milk.

T F 39. Overdosing with vitamin A may cause serious injury to health.

T F 40. Large amounts of vitamin D are available in a variety of different foods.

T F 41. An overdosage of vitamin D can result in death.

T F 42. It is highly improbable that one will experience a deficiency of vitamin E since it is found in so many of the foods we eat.

T F 43. The need for vitamin C is decreased during the period of adolescence.

T F 44. Citrus fruits are richer in vitamin C, generally, than vegetables.

T F 45. It is recommended that at least one raw food, preferably both a green salad and a fresh fruit, should be taken daily in meeting vitamin C requirements.

T F 46. A food that contains vitamin C very seldom contains any appreciable amount of other vitamins.

T F 47. Water-soluble vitamins cannot be stored, therefore, a sufficient amount must be supplied daily.

T F 48. Pork is a rich source of vitamin B_1.

T F 49. A characteristic of both thiamine and riboflavin is that they aid in releasing the energy of carbohydrates.

T F 50. Minerals, as proteins, help to furnish heat and energy as well as to build bones and teeth.

T F 51. There are indications that calcium aids in extending the life span.

T F 52. As compared to adults, growing children need a higher percentage of calcium.

T F 53. We can assume, if the body has sufficient calcium and protein, that the phosphorus will be adequate.

T F 54. Beans are considered a good, inexpensive source of iron.

T F 55. Sodium and potassium influence all types of muscles in the body.

T F 56. An excess amount of flourine in water tends to increase tooth decay.

T F 57. Due to the acid-base relationship, citrus fruits and milk should not be taken at the same meal.

T F 58. The body can last only three or four days without water, but may go for many weeks without food.

T F 59. Although the intake of water should be from 6 to 8 cups, none of this should be taken with the meal.

T F 60. One disadvantage of cellulose is that it absorbs water which adds to the bulk of digestive residue.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Carbohydrates and fats are composed of ______________, ______________ and ______________.

2. The germ and outer coating of wheat contain valuable ______________ and ______________ which are removed in making white flour.

3. Not more than _____ to _____ per cent of the daily calories should come from sugar or other sweets.

4. Energy is stored in plants in the form of ______________.

5. Fats should make up at least _____ per cent of the total needed calories.

6. Fat acts as a ______________ in the intestinal tract in the elimination process.

7. As to fat content, one bacon slice equals _____ ______________ of butter, or _____ ______________ of cream cheese.

8. The overheating of fats to be consumed causes irritation to the ______________ of the ______________ and the ______________.

9. Margarine is composed chiefly of ______________ ______________ and must be labeled with the work ____________________.

10. Foods contain many different kinds of proteins, each of which is made up of ______________ ______________.

11. "Complete" or adequate proteins come largely from ______________ sources, whereas "incomplete" proteins come largely from ______________ sources.

12. As a protection against infection, protein is essential to build ______________ and to form antibodies.

13. Factors that have a direct influence on the protein needs of an individual are __________ and __________.

14. The difference between appetite and hunger is that appetite is the ______________ for food while hunger is the ___________ for food.

15. The unit used to measure energy contained in food is the ______________.

16. The Basic 7 Food Plan contains approximately _____ calories, and for an active person it generally varies from _____ to _____ calories.

17. Fat-soluble vitamins may be stored in the body to a greater extent than ______________ vitamins.

18. Skin that is _______ and ________ is an early indication of vitamin A deficiency.

19. A rich source of vitamin A is the ___________ of animals.

20. Green and yellow vegetables are sources of _____________ which is converted into vitamin A by the body.

21. Vitamin _____, that is produced in the skin and in some foods by the rays of the sun, is called _____________.

22. Three factors that influence the thiamine needs are ________ ____________, ______________ and number of ______________ burned daily.

23. It is a good practice to save the water in which vegetables have been cooked since it is often rich in _________________ that are water-soluble.

24. A disease called _______________ results from a deficiency of niacin (B complex group vitamin).

25. Of the various minerals in the body, ____________ is found in largest amounts, most of which is contained in the ______________ and ______________.

26. The most widely distributed mineral in the body is ____________.

27. Hemoglobin is formed by two minerals, _________ and ___________ which combine with protein.

28. The daily requirement of iron for an adult woman is ______ mg. which should be increased to ______ mg. during pregnancy.

29. Iodine is necessary for the normal functioning of the ____________ ______________ which regulates body processes.

30. The chief function of water in the body is its usefulness as a ______________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The major source of calories for all people is (A) carbohydrates; (B) fats; (C) proteins; (D) vitamins.

_____ 2. Fats are (A) soluble in water; (B) heavier than water; (C) lighter than water; (D) none of the above three.

_____ 3. A food considered protein-rich is (A) egg; (B) cooked cereal; (C) fish; (D) peanut butter.

_____ 4. The vitamin most essential for bone formation along with calcium and phosphorus is (A) A; (B) B; (C) C; (D) D.

_____ 5. The vitamin that has the property necessary for the coagulation of blood is (A) A; (B) K; (C) E; (D) D.

_____ 6. Exposure of milk to sunlight causes great loss of vitamin (A) A; (B) B_2; (C) D; (D) E.

_____ 7. The formation of intercellular substances is a major function of vitamin (A) A; (B) B; (C) C; (D) D.

_____ 8. Vitamin C (A) is easily; (B) is not easily; (C) cannot be; (D) is most easily destroyed as compared to the other vitamins.

_____ 9. A food not considered rich in vitamin C is (A) shrimp; (B) enriched bread; (C) ice cream; (D) milk.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Sugars are classified as simple (monosaccharides) and complex (disaccarides). Three classifications under each of these respectively are:

(A)__________________________ (D)__________________________

(B)__________________________ (E)__________________________

(C)__________________________ (F)__________________________

2. Three food groups which yield calories are:

(A)__________ (B)__________ (C)__________

3. Three general uses of vitamins in the body are:

(A)__________

(B)__________

(C)__________

4. Two minerals and one vitamin necessary to prevent rickets respectively are:

(A)__________ (B)__________ (C)__________

5. Cellulose may be found in the following three desirable food sources:

(A)__________ (C)__________

(B)__________

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Group I

_____	1.	lactose	A.	fatty substance found in blood
_____	2.	sucrose	B.	contained in protein
_____	3.	cellulose	C.	amount of energy necessary to live
_____	4.	cholesterol	D.	prevents scurvy
_____	5.	amino acids	E.	readily soluble sugar
_____	6.	basal metabolimm	F.	One of the first vitamins to be discovered
_____	7.	thiamine	G.	gives rigidity to bones
_____	8.	vitamin A	H.	sugar found in milk
_____	9.	calcium	I.	vitamin necessary for healthy nerves
_____	10.	vitamin C	J.	indigestible

<u>Group II</u>

_____	1.	biotin	A.	rich sources are organ meats
_____	2.	B_{12}	B.	deficiency symptoms of convulsions
_____	3.	folic acid	C.	rich sources are eggs and milk
_____	4.	choline	D.	member of B complex family
_____	5.	pyridoxine (B_6)	E.	deficiency associated with gray hair
_____	6.	pantothenic acid	F.	name means "widespread"
_____	7.	para-aminobenzoic acid	G.	widely distributed in plant and animal tissue

Sheet No. 5

Covering
Units 24-29

FUNCTION AND SOURCE OF FOOD II

Why can you feed yourself and others well just by depending on a variety of recommended foods is a question asked by those who are aware of and greatly interested in the function and source of food. What is known today about these various foods is of immeasurable value to our nation's health.

All living things need food, from the tiniest simple-cell spore to man with his highly complex organism. The food man chooses not only supplies his physical but also his emotional needs. The foods we eat can be produced plentifully, kept a long time by various methods and transported great distances. All these factors play a large role in the selection made by the consumer, because it must be remembered that people are not born with certain food likes and dislikes, they are developed. This makes it essential for you, as one engaged in food preparation and service work, to know the function and source of the more common foods.

In this assignment you will have the opportunity to learn the functions and sources of various foods normally consumed in daily diets.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by __________________________.

Reference:

B. Peyton, Practical Nutrition, pp. 255-261, 264-267, 271-273, 276-287, 294-300, 302-309, 310-317.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The sole function of milk in nature is to serve as a food for the young.

T F 2. It has actually been found that milk is relatively high in vitamin C and iron content.

T F 3. The breed of cow is one of the factors which determines the butterfat content of milk while vitamin A content is determined by the feed given the cow.

T F 4. Boiled and raw milk do not have a laxative effect, but boiled milk is more constipating.

T F 5. When on a reducing diet, it is a good practice to cut down on the milk intake since it is considered a fattening food.

T F 6. A cup of fresh whole milk has fewer calories than a cup of ice cream.

T F 7. Cheese that we use in this country is made mostly from raw milk.

T F 8. Eggs not only have a high quality of protein, but also may serve as a meat substitute.

T F 9. Practically all of the minerals and vitamins are found in the yolk of an egg.

T F 10. The size of an egg affects the retail price but does not affect the quality of the egg.

T F 11. Eggs kept in cold storage are desirable for baking purposes rather than table use mainly because of their lower nutritive value.

T F 12. Meat has "satiety" value to which the saying "it sticks to the ribs" may be applied.

T F 13. The consumption of beef in the U.S. is practically equal to all other meats.

T F 14. The fat content of a cut of meat determines the protein content.

T F 15. Liver is not only a good source of some minerals, but also of some vitamins.

T F 16. Even though fish does contain protein it should not be used as a meat substitute.

T F 17. Beef is a meat than is lean, bright red and liberally marbled with fat.

T F 18. Since lamb is a tender meat many of the cuts may be cooked rapidly.

T F 19. Calf liver is more expensive than beef liver mainly because it contains more nutritive values.

T F 20. The liquid in which the fish has been canned should not be used.

T F 21. The cuts of meat that come from the part of an animal receiving the most exercise is the least tender.

T F 22. In using boneless meats, one pound will yield approximately three to four servings.

T F 23. Generally the cheaper grades of meat are just as nutritious as the more expensive.

T F 24. Among the various kinds of cheese, Cheddar cheese is probably the most widely used in this country.

T F 25. Cottage cheese and cream cheese are very similar in nutrient content.

T F 26. All cheese products are a good source of calcium.

T F 27. It has been shown by studies that cheese is much more easily digested than meat.

T F 28. The consumption of cheese, as other foods, varies with different sections and nationalities of this country.

T F 29. Cereal, as a source of calories, is decreasing in this country.

T F 30. Whole-grain bread is a good source of iron.

T F 31. Valuable nutrients are lost in the process of milling flour but all are replaced through the enrichment program (which began and developed during World War II).

T F 32. Enriched flour products are unchanged in flavor when compared to whole-grain products.

T F 33. The keeping qualities of prepared flour mixes have been greatly improved by including a substance which retards rancidity.

T F 34. There is a tendency more and more to add nutrients to breakfast cereals.

T F 35 We have very few quick-cooking variety cereals.

T F 36. It is generally true that cooked cereals are higher in price than ready-to-serve cereals.

T F 37. All commercially made white bread today is enriched.

T F 38. At the present time it is possible to buy a variety of fresh fruits the year around.

T F 39. Fruits may be considered as a rather high energy food.

T F 40. Fresh fruits are very rich in vitamins as well as fat content.

T F 41. Dried peaches, weight for weight, as compared to fresh, have a greater vitamin A content.

T F 42. Fruit is not too easily digested and, therefore, should not have an important place in a patient's diet.

T F 43. Fruit has laxative qualities.

T F 44. Apples not only vary in flavor and firmness, but also in keeping qualities.

T F 45. Bananas should be stored in a cold area such as a refrigerator immediately after purchasing.

T F 46. Fruits to be placed in the refrigerator should be washed thoroughly first.

T F 47. In recent years there has been an increase in use of frozen foods and especially of frozen fruit juices.

T F 48. Due to the concentrated sugar content of dried fruits, they are a wholesome substitute for candy for children.

T F 49. There is no waste in the use of frozen fruit products, which should be considered in computing cost.

T F 50. Fruits and vegetables should be purchased by weight whenever possible.

T F 51. Most of the vegetables contain less than 80 per cent water.

T F 52. Although thin, leafy green vegetables are important for roughage, they contain very little vitamin and mineral values.

T F 53. The nutrient content of vegetables such as beets, celery, corn or onions is small; their contribution to the diet being largely the addition of bulk and flavor.

T F 54. An advantage of green vegetables is that they retain their nutritive content better than other vegetables.

T F 55. "Brand" buying of canned vegetables is one of the best guides to use.

T F 56. One can assume that there is little difference in nutritive value between fresh, frozen and canned vegetables.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The American Medical Association allows _____ U.S.P. units of _____________ to be added per quart of milk since milk is an ideal food for dispensing it.

2. Adults should have at least _____ cups of milk daily, or its equivalent as evaporated or dried _______ or _______ cheese.

3. The rapidity of digestion and absorption of milk depends on the fineness of the _____________.

4. The composition of an egg is approximately 3/4 water, _______ protein and _______ fat.

5. The color of the yolk is determined principally by the type of ___________ used.

6. Normally grade _____ eggs are used for cooking, while grade ________ eggs are for table use.

7. Meat is not only a valuable source of certain minerals and vitamins, but also a complete source of _____________.

8. It is recommended that ______ ounces of meat should be included in the daily diet.

9. Three factors on which meat is graded are _______________, _____________ and _____________.

10. The U.S. Government grade stamp indicated probably cooking ___________ and _____________.

11. Indications of high-quality pork are greyish pink to rose color and the flesh is ________ and _________-grained.

12. A term used to include heart, liver, etc., (those that are not classed as regular cuts of meat) is __________ ____________.

13. The shrinkage for chickens from live to ready-to-cook weight is approximately ______ per cent.

14. When comparing costs of meat, the lean as well as the amount of ___________, ___________ and ____________ must be taken into consideration.

15. Cheese is actually the __________ of milk which has been separated from the ___________.

16. The cheese lowest in caloric content is _____________ cheese.

17. It is estimated that bread and cereals contribute about ______ per cent of total daily protein and calories.

18. More than ________ per cent of the mineral and _________ per cent of the thiamine is lost in the refined white rice.

19. The reason winter wheat is better for bread making than spring wheat is that it contains a higher _________ content.

20. The nutritive value of breakfast cereals depend upon the degree of ___________ used in preparation and how highly the product is ________________.

21. Fruits are similar to vegetables in that they are an important source of ___________ and _____________.

22. The characteristic flavors of various fruits are due to a number of different organic __________.

23. Of the two types of oranges, the ____________ are juicier while the ___ __________ oranges are seedless.

24. Fruits should be selected for heaviness as compared to size, as this indicates ____________.

25. Dried fruits come in ___________ or _____________ form for jellies and desserts and in ___________ or ____________ form to be cooked like fresh fruits.

26. The _________ of vegetables are high in nutrients; the __________ and __________ are high in energy value; and the shoots and leaves are high in ____________ content.

27. It is generally assumed that the deeper shade of green or yellow in a vegetable, the higher the vitamin ________ value.

28. Large amounts of vitamin C are lost through improper storage and _____________, especially in the case of cabbage.

29. One reason for perforated packages, in which vegetables are packed, is to prevent _____________.

30. Canned vegetables compare favorably with freshly cooked if the canning __________ is used.

31. A disadvantage in the use of dried vegetables for cooking is the loss of ___________ and vitamins, especially vitamin ______.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The content of water in milk is approximately (A) 67; (B) 77; (C) 87; (D) 97 per cent.

_____ 2. Meat obtained from a young calf is (A) veal; (B) lamb; (C) pork; (D) beef.

_____ 3. One and one-half cups of cooked cereal approximates (A) one; (B) one and one-half; (C) two; (D) two and one-half servings.

_____ 4. Fruits are an important source for vitamin (A) A; (B) B; (C) C; (D) D.

_____ 5. Fruit has (A) a high; (B) a low; (C) no; (D) about 50 per cent water content.

_____ 6. Canned orange drink contains (A) more; (B) same; (C) less; (D) no vitamin C as compared to canned citrus fruit juice.

Matching

Directions: In the left hand column is a list of terms. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

_____ 1. homogenized milk

_____ 2. vitamin D milk

_____ 3. fluid skim milk

_____ 4. chocolate milk

_____ 5. concentrated milk

_____ 6. cultured milk

_____ 7. evaporated milk

_____ 8. condensed milk

_____ 9. nonfat dry milk

_____ 10. whole milk powder

A. removal of two-thirds of water content

B. removal of one-half of water content

C. contains large amount of sugar

D. buttermilk

E. size of milk fat globules reduced

F. removal of nearly all fat and water

G. subject to rancidity

H. fortified with the antirachitic vitamin

I. contains almost no fat

J. whole or skim milk

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three important nutrients contributed by milk are:

(A)____________________ (C)____________________

(B)____________________

2. Eggs are selected on the basis of external and internal quality. External quality is determined by:

(A)____________________ (C)____________________

(B)____________________ (D)____________________

Internal quality is determined by:

(A)____________________ (C)____________________

(B)____

3. In the usual sense of the work, meat includes:

(A)______________ (C)______________ (E)______________

(B)______________ (D)______________

4. Characteristics of good fresh fish are:

(A)____

(B)____

(C)____

5. The general types of cheese are:

(A)____________________ (D)____________________

(B)____________________ (E)____________________

(C)____________________

6. The term "grains" includes:

(A)______________ (C)______________ (E)______________

(B)______________ (D)______________ (F)______________

7. The principal parts of a kernel of grain are:

(A)________________ (B)________________ (C)________________

8. Four different flours produced for special purposes are:

(A)________________________ (C)________________________

(B)________________________ (D)________________________

9. Two main reasons for washing fruits after purchasing are:

(A)____

____

(B)____

____

Assignment
Sheet No. 6

Covering
Units 30-34

ADEQUATE DIETS

An adequate diet is one that is nutritionally adequate; one that provides foods essential for good health. The food supply, especially in this country, is such that everyone should be able to obtain a sufficient variety and amount of food to provide nutrients recommended for good nutrition.

The individual preparing to become a food service supervisor must have a basic knowledge of food values and requirements necessary for various age groups. The supervisor must also know basic food patterns and various modification of these to meet individual and group needs.

In this assignment you will have the opportunity to learn the basic requirements necessary for nutritional adequacy.

Assignment:

1. Read the references listed below.
2. Compare your daily food consumption to the recommended basic food pattern for nutritional adequacy, and discuss the findings with your coordinator. (See A, pp. 19-23.)
3. Answer the questions below and turn in this assignment by ________ ________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 2-3; 19-23; 30-34.
B. Peyton, Practical Nutrition, pp. 95-134.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. One purpose of meal planning is to provide foods essential for good nutrition.

T F 2. For an adequate diet (according to the basic food pattern) an individual should have two servings of vegetables as well as two servings of fruit.

T F 3. Skim milk has the same food value as buttermilk.

T F 4. Two servings of meat or meat alternate are recommended daily (according to the basic food pattern).

T F 5. The outer leaves of cabbage contain less vitamin A than the inner leaves.

T F 6. Cantaloupe and raw pineapple are supplementary sources of ascorbic acid but should not be counted as recommended servings of other fruits.

T F 7. Jellies and rolls are generally considered as additional foods which are used to supplement the basic food pattern for nutritional adequacy.

T F 8. The regular or normal hospital diet is actually the same as a normal diet for adults.

T F 9. Due to the low fiber and connective tissue content, the soft diet is not generally considered adequate.

T F 10. Since protein is important in convalescence, more meat than normally required may be included in the soft diet.

T F 11. It may be assumed that all beverages are allowed in a soft diet.

T F 12. The full liquid, like the regular hospital diet, includes the nutrients required for an adequate diet.

T F 13. Baked custard may be included in a full liquid diet.

T F 14. Orange juice is included in all four standard hospital diets as a breakfast item.

T F 15. Some form of milk product is included in all four standard hospital diets.

T F 16. Studies show that there is a definite relationship between a good diet during pregnancy and good physical condition of the infant at birth.

T F 17. It has generally been found that the pregnant woman is the best fed member of the family.

T F 18. The caloric needs are greatest during the early part of pregnancy.

T F 19. There is a continuous protein need during pregnancy, not only for the mother but also for the growing fetus.

T F 20. Due to the fact that doctors generally prescribe iron salt for expectant mothers, iron-rich foods need not be emphasized in the diet.

T F 21. It is an erroneous belief that increasing the nursing mother's fluid intake will increase the milk supply.

T F 22. Foods high in carbohydrates have been found beneficial in preventing nausea.

T F 23. The caloric requirements of infants is relatively high when compared to the body weight.

T F 24. An advantage of breast feeding is that it provides a safe, suitable milk supply of the right temperature for the baby.

T F 25. Human and cow's milk are both good sources of protein, although human milk contains a greater amount.

T F 26. A baby's formula should be sterilized after it has been put in the bottle and not before.

T F 27. The yolk of an egg is a valuable addition to the baby's diet and is often given when the baby is 3 to 5 months old.

T F 28. Meat, in a baby's diet, is generally started at about the same age as strained vagetables.

T F 29. The recent trend in infant feeding is that of a fixed hourly schedule.

T F 30. The weight of a child may be taken as the reliable factor in judging the nutritional status of the child.

T F 31. Lunches between meals may be desirable for preschool children.

T F 32. Children, one to six, usually prefer their food separate rather than in combination with others.

T F 33. It is generally considered a good practice to use flavored milk to coax a young child to drink milk.

T F 34. The digestion process is affected by over-fatigue and strong emotions.

T F 35. Generally the main difference between the diet of a young school child and the preschool child is that of increasing the quantity.

T F 36. Eating a scanty breakfast is not too detrimental to the school child since he can make up for it easily through the other two meals during the day.

T F 37. During the adolescent period it is perfectly normal for the girl to eat more than her mother.

T F 38. Current fads and styles tend to influence the foods consumed by the adolescent girl.

T F 39. Adolescent boys use up more nutrients than girls, although girls generally do consume more fat and vitamin A.

T F 40. Adolescent girls have a special need for foods rich in protein and iron as well as other nutrients.

T F 41. It is currently recognized that nutrition is a major factor in determining the length of life.

T F 42. The caloric needs and rate of body metabolism both increase for the older age group.

T F 43. It is recommended that the protein intake of an older person continue on the same level as that of a young adult.

T F 44. The vitamin intake of older people should be on the same level or above that taken during the earlier years of life.

T F 45. Limited income and living alone has a great influence on the nutritional habits of older people.

T F 46. It is often desirable to divide the food for a day (for older people) into five light meals rather than three larger ones as this will aid digestion.

T F 47. Older people tend to take liquids in cold form more readily than warm.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The daily dietary need of both boys and girls 14 years of age is ______ mg. of iron and ________ I.U. of vitamin A.

2. One should have at least ______ servings per day of the "bread and cereal" groups of foods, for nutritional adequacy, (according to the basic food patterns).

3. The recommended amount of milk and milk products for children is from _______ to _______ quart per day (according to the basic food pattern).

4. When a substitution of food is made in the menu of a regular hospital diet, it should be made so as to maintain _____________ value.

5. The soft diet is a modification in ________________ of the normal diet.

6. The basic food pattern for soft diets recommends ______ serving(s) of eggs and _____ serving(s) of fruit.

7. The __________ __________ diet is served postoperatively as a transition diet between the clear liquid and soft diets for patients unable to accommodate solid foods.

8. The __________ __________ diet is intended for short duration and often used postoperatively for 1 to 2 days to supply fluids to the body.

9. Protein needs during pregnancy should come largely from __________ sources.

10. Not only does a quart of milk supply a large calcium percentage but also _______ per cent of daily protein and _______ per cent riboflavin.

11. The lack of iodine during pregnancy may cause cretinism, a disease of retarded ____________ and ____________ development in the young.

12. A nursing mother's diet should include approximately _________ calories above her normal needs.

13. The stomach capacity of a two-week-old baby is _____ ounces or _______ tablespoonsful.

14. An infant at birth has enough of the mineral, __________, to last for several months.

15. Normally, babies are put on simple formulas which include cow's milk, __________ and ______________.

16. A substitute such as ____________ or ____________ milk is sometimes used if the baby is allergic to cow's milk.

17. In the preparation of infant formulas, the cow's milk is diluted with water to reduce the percentage of ____________ and sugar is added to raise the amount of ______________.

18. Orange juice, which is high in vitamin _________, is commonly given as one of the first supplementary foods for infants.

19. A daily food plan for children one to six should include _______ serving(s) of meat and _________ to _______ cups of milk.

20. A "Type A" school lunch, emphasized by the Government is designed to provide from 1/3 to ________ of the growing child's needs.

21. For adolescence, overweight and underweight are both problems, the overweight condition often being due to ______________ problems.

22. Two minerals which are apt to be low in the diet of an older person are __________ and ___________.

23. The recommended weekly allowance for older men and women is __________________ pounds of meat and ______________ pounds of citrus fruits, using the low-cost plan.

24. Foods such as cabbage, beans and fried food should generally be avoided for older people as they might cause ____________ disturbances.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the sentence.

_______ 1. The following is considered a meat alternate (A) lamb; (B) brains; (C) cheese; (D) turkey.

_______ 2. An individual should have (A) 1; (B) 2; (C)3; (D) 4 servings of butter or margarine per day for nutritional adequacy.

_______ 3. An edentulous diet is (A) same as a regular diet; (B) designed for those who have trouble chewing; (C) one containing no solids; (D) one containing only solids.

_______ 4. A food that should be avoided in a soft diet is (a) milk; (B) egg; (C) grapefruit; (D) corn.

_______ 5. The calcium needs during pregnancy is increased about (A) 50; (B) 40; (C) 30; (D) 20 per cent above that of normal

_______ 6. The first vitamin given to a baby in concentrate form, whether breast or formula fed, is (A) A; (B) B; (C) C; (D) D.

_______ 7. Cereals or fruits are usually the first solid foods given an infant, at about (A) 2-3; (B) 3-4; (C) 4-5; (D) 5-6 months of age.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The four standard hospital diets are:

(A)____________________ (C)____________________

(B)____________________ (D)____________________

2. A refusal of food by a young child may be a first sign of an infection; two other factors that may influence a child's appetite are:

(A)____________________ (B)____________________

3. Conditions common to older people that cause a lowered ability to digest, assimilate or eat foods are;

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

Assignment
Sheet No. 7

Covering
Units 35-45

MENU PLANNING

Meals that are both healthful and attractive do not just happen. Good meals need to be carefully planned. A well-planned menu not only takes into consideration the essential nutrients for various individuals and groups of individuals, but also is concerned with planning that has individual appeal.

Many advantages result from careful menu planning. The successful operation of the food service department is largely dependent on the factor of skillful menu planning in which the food service supervisor plays a major role. Much time and worry is avoided by adequate planning which permits one to take advantage not only of quantity buying, but also special and seasonal buying. It must be remembered that the final stamp of approval or disapproval of menu planning rests with the consumer of foods prepared, whether they be patients, staff members or general public.

In this assignment you will have the opportunity to learn the importance of menu planning, its relation to diets and its relation to the use of basic food patterns or master menus. You will also learn terminology helpful to menu planning.

Assignment:

1. Read the references listed below.
2. Plan or aid in planning a weekly menu for the institution in which you are employed. Discuss the planned menu with your coordinator. (See A pp. 19-29; 35-42.)
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. American Hospital Association; Hospital Food Service Manual, pp. 1-2; 23-29; 35-42.
C. American Home Economics Association; Handbook of Food Preparation, pp. 16-22; 36-49.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter"F."

T F 1. In the process of planning menus, the special needs of the person being served must be carefully considered.

T F 2. If interest and variety are desired, potatoes and noodles should not be served together.

T F 3. The number of food service employees available definitely has an effect on menu planning, whereas the amount of equipment available has very little.

T F 4. In menu planning, a basic menu pattern should be followed.

T F 5. The basic menu pattern generally includes a breakdown of foods to be served for each meal, each day of the week.

T F 6. The week's menu should be planned first, after which the storeroom should be checked for available foods and ordering those foods not on hand.

T F 7. The main course (or meat) is often written in the menu first, after which vegetables and other appropriate foods are added.

T F 8. It is considered good practice to rotate weekly menus in order to have like or similar foods on the same days of each week.

T F 9. The same basic menu could very possibly be served to everyone with modifications of the regular hospital diet for specially prescribed diets.

T F 10. The weekly menu planning sheet generally includes a vertical column containing information concerning the food pattern for the day's menu.

T F 11. When planning meals for children, new foods should be introduced in combination.

T F 12. The weekly menu planning sheet for children is quite different than the one usually used for general hospital use.

T F 13. It is generally true that highly seasoned foods, as well as beverages such as tea and coffee, should be avoided in children's menus.

T F 14. One difference between the basic menu pattern of 10 to 20-month and 20-month to three-year-old children is the inclusion of ice cream in the older children's menu.

T F 15. The menu of a pre-school child should include some foods which require the child to chew.

T F 16. When fish are served to pre-school children, they need not be boneless as in the case of children younger than three years of age.

T F 17. It is considered good practice to serve large enough helpings to children so that they need not ask for seconds.

T F 18. The soft diet is often recommended for the older person who has difficulty in chewing.

T F 19. Serving meals on time and providing for individual differences are two important suggestions which need to be followed when serving older people.

T F 20. Abbreviations should be used whenever possible in the construction or the re-working of recipes.

T F 21. If specific tests or temperatures are written into a recipe, general tests need not be included.

T F 22. The water displacement method may be used when measuring fats or oils used as ingredients in recipes.

T F 23. A one-half teaspoon of powdered foods may be measured accurately enough by using a teaspoon.

T F 24. The difference between processed butter and other butter is that processed butter is made from farm butter and rechurned in fresh milk.

T F 25. A light whipping cream (between 30 and 36 per cent milk fat) is classified as "medium cream."

T F 26. Concentrated milk is classed as evaporated milk.

T F 27. Frozen egg whites generally have ingredients added to improve keeping qualities.

T F 28. Lard is a fat rendered from the fatty tissue of pork and may be light or dark in color.

T F 29. Margarine is actually butter that has been kneaded by machine.

T F 30. Oils that are edible and commonly used in the American home are of vegetable origin.

T F 31. One important difference between durum wheat flour and buckwheat flour is the percentage of gluten-forming proteins.

T F 32. Soy flour is often used for breadmaking, mainly because it has a high protein content.

T F 33. A characteristic of compressed yeast is that the presence of moisture will make it perishable.

T F 34. Soft bread crumbs are generally used in coating foods for frying.

T F 35. Refiner's sirup is the "mother liquor" from which raw cane sugar has crystallized.

T F 36. Of the two sirups, honey contains less water content than maple sirup.

T F 37. The terms "fine granulated" and "extra fine granulated" sugar refer to definite particle size.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Interest in meals may be stimulated by providing ones that reflect contrasts in flavor, ____________, ____________ and ____________.

2. Of the two meals, dinner and supper, menu planning is often more effective if the ____________ meal is planned first; this is due mainly because it is more ____________ to plan this meal.

3. The weekly planned menu should be posted in the ____________.

4. The weekly menu planning sheet usually contains four horizontal columns which are labeled ____________, ____________ ____________, ____________ ____________ and notes.

5. Meals for children should not only provide daily food essentials but should also satisfy their ____________.

6. The beverage recommended at each meal for children is ________.

7. Foods for children, 10 to 20 months of age, are essentially the same as those included on the ____________ diet.

8. In an effort to stimulate an older person's appetite, ________ is often served as the first course.

9. The constructing of recipes consists of two major parts- a list of ____________ and the method of ____________ the product.

10. When constructing a recipe the yield should be included, giving both the ____________ and ____________ of servings.

11. The basic proportion, for use in menu planning, of tea is ________ cup.

12. The unqualified term "cheese," as used in the United States, means ____________, also called American and American ____________.

13. Frozen blended whole eggs are whole eggs that have been fortified with added ______________.

14. As commonly used, the term "fats" refers to those that are ______________ at room temperature, while the term "oils" refers to those that are ______________ at room temperature.

15. The term ______________ refers to fats that have been rendered in the process of cooking fat meats such as bacon, etc.

16. Unless otherwise stated, the term flour refers to __________ flour.

17. Flour, that may be used for all general cookery purposes, is classed as ______________ or ____________________ flour.

18. A type or class of rice, which is a long, brownish grain and has been hulled but not milled, is called _________ rice.

19. The two forms of tapioca are ____________________ and ________________.

20. A leavening agent produced in a batter or dough by chemical or biological reactions is called ____________ _______________.

21. The unqualified term "sugar" refers to refined sucrose which has been derived from __________ ___________ or ________ _____________.

22. Powdered sugar, which is often used in frosting, usually contains a small amount of ______________ to prevent caking.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The menu planning responsibility is usually delegated (A) to one person; (B) to a small group of kitchen personnel; (C) to two or more administrative staff members; (D) is not delegated.

_____ 2. The following is a description of the "action form" recipe pattern: (A) economical of space; (B) especially food for recipes using many ingredients; (C) not economical of space; (D) none of the above three.

_____ 3. In the construction of recipes, three tablespoons butter plus about seven-eighths cup milk may be substituted for (A) 1 cup honey; (B) 1 cup coffee cream (20 per cent); (C) 1 cup heavy cream (40 per cent); (D) 1 cup butter.

_____ 4. Cultured buttermilk is classed as (A) dry milk; (B) evaporated milk; (C) fermented milk; (D) fresh milk.

_____ 5. Fish that are marketed just as they come from the water are called (A) fillets; (B) dressed; (C) drawn; (D) whole or round.

_____ 6. Flour to which leavening ingredients and salt have been added is (A) whole wheat flour; (B) flour; (C) self-rising flour; (D) enriched flour.

_____ 7. Corn with the hull and germ removed, left whole, or broken into particles is a corn product called (A) corn meal; (B) cornstarch; (C) hominy; (D) corn cereal.

_____ 8. A wheat product which has been prepared from durum wheat and designed for making macaroni is called (A) wheat germ; (B) semolina; (C) farina; (D) cracked wheat.

_____ 9. A chocolate product made from slightly sweetened chocolate and often used in baking is (A) semi-sweet chocolate; (B) cocoa; (C) chocolate; (D) sweet chocolate.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Five important factors in menu planning are:

(A)____________________ (D)____________________

(B)____________________ (E)____________________

(C)____________________

2. Advantages of planning menus in advance are:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

3. The usual procedure in planning and recording menus is to select:

(A)______________________________

(B)______________________________

(C)______________________________

(D)______________________________

(E)______________________________

(F)______________________________

(G)______________________________

(H)______________________________

(I)______________________________

(J)______________________________

(K)______________________________

(L)______________________________

4. In the construction of recipes, the three most used forms of presenting them are:

(A)________________ (C)________________

(B)________________

Matching

Directions: In the left-hand column is a list of terms. The right-hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

Group I - Processes

_____	1.	blend	A.	cut into pieces with sharp tool
_____	2.	parboil	B.	to cook in oven or oven type appliance
_____	3.	chop	C.	to sprinkle or coat with flour
_____	4.	whip	D.	brown or cook in small amount of fat
_____	5.	simmer	E.	to destroy microorganisms

_____	6.	bake	F.	free fat from connective tissue at low heat
_____	7.	render	G.	to beat rapidly to produce expansion
_____	8.	fricassee	H.	to moisten foods while cooking
_____	9.	saute	I.	mix two or more ingredients thoroughly
_____	10.	mask	J.	to cook in liquid below boiling point
_____	11.	broil	K.	to boil until partially cooked
_____	12.	dredge	L.	to cook by braising
_____	13.	sterilize	M.	to cover completely with sauce, etc.
_____	14.	baste	N.	to cook by direct heat

Group II - Baking Utensils

_____	1.	sauce pot	A.	large covered cooking utensil with side handles and equipped with jar holder
_____	2.	french fryer	B.	covered or uncovered cooking utensil with bail handle
_____	3.	casserole	C.	round open utensil with flared sides
_____	4.	kettle	D.	consists of two saucepans, each with handle but only one lid
_____	5.	canner	E.	measures a capacity of one-half liquid pint or less
_____	6.	pie pan	F.	a utensil especially designed for baking cake
_____	7.	measuring cup	G.	a covered utensil in which food may be baked or served
_____	8.	double boiler	H.	a covered or uncovered cooking utensil equipped with two side handles
_____	9.	cake pan	I.	uncovered, perforated cooking utensil with meshed insert basket

Assignment
Sheet No. 8

Covering
Units 46-57

FOOD PURCHASING

The purchasing of food products is generally done either by the food service supervisor, the dietitian or a designated purchasing agent. The determination of the placing of responsibility for purchasing depends largely upon the size of the institution as well as the type of institution.

The importance of methods and procedures of purchasing cannot be overstressed. Raw food alone makes up approximately one-fourth of the total outlay for the institution; and, therefore, efficient procedures in purchasing must be followed. The one who is responsible for purchasing must be familiar with writing specifications, grading standards, current prices, marketing procedures, processing procedures, storage of purchased raw food and the keeping of necessary records.

In this assignment you will have the opportunity to learn the many responsibilities involved in purchasing food products and their storage.

Assignment:

1. Read the references listed below.
2. Calculate one week's food requirements (market orders) for the institution in which you are employed. Follow examples given in references. (See C 7-15; A 44-92)
3. Answer the questions below and turn in this assignment by ____________________________.

References:

A. American Hospital Association. Hospital Food Service Manual, pp. 43-132.
B. Peyton, Practical Nutrition, pp. 148-156.
C. American Home Economics Association, Handbook of Food Preparation, pp. 7-15, 55-59.

Questions:

True-False

Directions: The following statements are either true of false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Yield and price of food must both be considered in purchasing, although price is considered more important.

T F 2. Criteria for determining the best buy should include both the cost per portion and an inspection of quality.

T F 3. Generally the person who prepares food purchase orders is also best qualified to specify the unit of purchase and weight that produce most economical portion serving cost.

T F 4. In calculating the food needs for planned menus, the first step is to prepare a written list of the standard serving portion size for each food.

T F 5. It is generally considered the responsibility of the dietitian to determine the type and quality of food to be used in relation to the menus planned.

T F 6. Direct buying by the individual who is in charge of food service is seldom efficient and economical.

T F 7. More importance should be placed on unit purchase cost than on cost per serving, in making buying decisions.

T F 8. Wholesale suppliers are a good source for food supplies since they carry a variety of food products as well as sort, grade, store and deliver their products.

T F 9. One important factor in determining the frequency of buying is the delivery schedule of the firms.

T F 10. Usually only two purchase orders are made out, one for the dealer and one for the accounting department.

T F 11. In some institutions the checking of foods received is the responsibility of the purchaser.

T F 12. When food products are received, a responsible individual should first sign the receipt after which the delivery should be checked for size, count, weight, quality, etc.

T F 13. The inspection of meats is always done by either federal or state agencies.

T F 14. Meat packers may either use government grading or may use their own system.

T F 15. The term "finish" as used in connection with meats, refers to the general build, shape and contour of the carcass.

T F 16. Processed beef meat products are generally made from USDA Good grade.

T F 17. Almost half of the forequarter of beef is made up into chuck (wholesale) cuts.

T F 18. Commercial grades are very seldom specified for institutional use.

T F 19. The difference in weight is the main basis for distinguishing between veal and calf carcasses.

T F 20. The carcass of lamb is equally divided between hind saddle and fore saddle.

T F 21. The flesh of the best grade of pork is a characteristic dark red in color.

T F 22. Manufactured meat products are generally not graded, and therefore are purchased by brand name only.

T F 23. In specifying poultry products, the terms "dressed" and "ready-to-cook" may be used interchangeably.

T F 24. Federal and/or state inspection is required of all poultry products.

T F 25. Some discoloration is allowed on the breast and legs of chicken for "A" quality.

T F 26. Cuts and tears are permitted for both "A" and "B" quality turkeys.

T F 27. Dressed chicken is usually packed one dozen to a box and, if graded, will indicate weight and quality.

T F 28. Turkeys are packaged like chicken, but may only be purchased as ready-to-cook.

T F 29. On the average, the weight loss of chickens from live to dressed is practically the same as from dressed to ready-to-cook.

T F 30. The shell color of eggs does not have any effect upon the food value of eggs but may have an effect on the price.

T F 31. Although frozen eggs save labor, they are more expensive when compared to equal quantity of fresh eggs.

T F 32. Fresh milk purchased for institutional use should be from an approved dairy and should also be pasteurized.

T F 33. Even though dried milk is economical to use in the preparation of food, one disadvantage is that it is neither graded nor inspected.

T F 34. The American Cheddar cheese is a type of cheese which is largely used on hospital menus.

T F 35. The brand name is often used to indicate the quality of both fresh fruits and vegetables.

T F 36. The recommended standard grade of frozen fruits or vegetables is U.S. Grade AA.

T F 37. It is not only practical but economical to order and purchase canned fruits and vegetables by use of specifications.

T F 38. The use of quality standards for most products is optional.

T F 39. Cheese sold in the retail market seldom includes a quality rating.

T F 40. The quality and weight of eggs are judged together and are so indicated on egg cartons.

T F 41. The grading of fresh fruits and vegetables has been designated primarily for use in the wholesale rather than retail outlets.

T F 42. The cost of meat inspection, whether federal or state, is borne by the packer.

T F 43. The purple shield stamped on a carcass by federal graders must be removed before using the meat.

T F 44. A hardwood floor is the most desirable type for a "dry storage room."

T F 45. Among other items of storage equipment, a worktable should be included in the storeroom.

T F 46. For the storage of dried fruits the humidity should not be more than 45 per cent.

T F 47. Slime and stickiness is formed on meat that has been stored at too low a temperature.

T F 48. Packaged meat should be unwrapped before placing in the refrigerator.

T F 49. Paper wrappings should not be removed from fruit for refrigeration.

T F 50. An indication that bananas have been stored in too cool a temperature is the darkening of the skins.

T F 51. Sweet as well as white potatoes should be stored at a temperature of between 35 to 40 degrees.

T F 52. The development of harmful bacteria in foods is prevented by freezing.

T F 53. There are fewer laws today concerning food processing and sale than during the early part of the nineteenth century.

T F 54. All meat in interstate trade must be federally inspected, whereas meat sold and consumed within a state does not.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The basic unit on which food orders should be calculated and purchases made is the standard ______________ ______________.

2. Institutional purchasing should be done through competitive bidding, therefore, quotations should be secured from at least _______ desirable suppliers on large orders.

3. In comparing meats to staples, the frequency of buying is greater for _____________ than for ________________.

4. Foods such as milk and bread should be purchased by standing orders, stating the name of firm, unit of purchase, as well as _______________ and_________________________.

5. The hindquarter is _______ per cent while the forequarter is ________ per cent of a beef carcass.

6. The hind saddle of a veal carcass is made up of the __________ and _____________.

7. Cuts of meat made according to buyer specifications are called ____________________ cuts.

8. The two grades of beef, veal and lamb that are most often available in the markets are USDA ___________ and USDA _______________.

9. Fish that have the internal organs and scales as well as head, tail and fins removed are called _____________ fish.

10. The grading of oysters and lobsters is according to __________.

11. The grading of eggs, by the federal government, for quality, is according to ___________ and ______________ appearance.

12. The grading of eggs according to size is based on the __________ per dozen.

13. The two grades of eggs considered most satisfactory for frying are grades ___________ and __________.

14. The three kinds of grades of cream, according to fat content, are ___________, ____________ and ________________ or whipping cream.

15. The classification of cheese intended for use as sandwich spreads are the __________ cheese varieties.

16. Ice cream should contain about ________ per cent butterfat, and should weigh _________ pounds per gallon.

17. Not only must the buyer specify good quality fruits and vegetables, but should also check the ____________ and ___________ or count, as these are important in determining expected number of servings.

18. The term staples refers to foods that are not readily perishable and are kept in __________ __________.

19. U.S. Standards for grades of foods are set up by the U.S. Department of _____________.

20. Large and medium size eggs are commonly found on the market, the difference in weight per dozen is __________ ounces.

21. The food storage area should be located with special relationship to two areas, the ___________ and food ____________ areas.

22. Foods to be stored on the floor level should be placed on racks _______ inches above the floor.

23. Foods, such as cereals and dried vegetables, should be stored in ____________ ___________ ______ with tight-fitting lids.

24. The arrangement of foods in the storeroom should be according to type of ___________.

25. A humidity of from ________ to ________ per cent is recommended for refrigerated storage.

26. The shrinkage of large pieces of meats is about _______ per cent per week, whereas it is _______ per cent for processed meat.

27. Frozen poultry should be stored at a temperature of ________ degrees F. or lower.

28. The Federal Food and Drug Administration approves and issues regulations concerning ____________ additives in foods.

<u>Multiple-Choice</u>

<u>Directions</u>: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. In buying staple foods, the method of buying often considered least efficient is (A) by telephone; (B) through salesman; (C) by mail; (D) by visiting the market.

______ 2. The meat which has the softest fat with lowest melting point is (A) beef; (B) lamb; (C) veal; (D) pork.

______ 3. The grade of beef which is produced more than any other grade is (A) USDA Peime; (B) USDA Choice; (C) USDA Good; (D) USDA Commercial.

______ 4. The grade of veal which has the characteristics of smooth exterior fat and large deposits of fat in the breast and chest is (A) USDA Prime; (B) USDA Choice; (C) USDA Good; (D) other grades.

______ 5. The grade of lamb which has the characteristics of no fat streakings in the inside of the flank muscles, and lean that is dark pink is (A) USDA Prime; (B) USDA Choice; (C) USDA Good; (D) other grades.

______ 6. There are usually (A) 2; (B) 4; (C) 6; (D) 8 fish steaks to the pound.

______ 7. The quality grade of eggs which have the characteristics of reasonably firm whites and yolks free from serious defects is (A) US AA; (B) US A; (C) US B; (D) US C.

______ 8. The grade of butter considered satisfactory for use in institutions is (A) US Grade AA; (B) US Grade A; (C) US Grade B; (D) US Grade C.

______ 9. The box capacity of citrus fruits packed in California is slightly (A) larger; (B) same as; (C) smaller; (D) greatly larger than that in Florida.

______ 10. The temperature in a dry storage room should be (A) 90-100; (B) 80-90; (C) 70-80; (D) 60-70 degrees F.

______ 11. In order to prevent bacterial spoilage of refrigerated foods, the temperature, in general, should be kept at (A) 20-30; (B) 30-40; (C) 40-50; (D) 50-60 degrees F.

______ 12. Bulk or brick ice cream should be kept at (A) 2-6; (B) 6-10; (C) 10-14; (D) 14-18 degrees F. for ease of dipping.

______ 13. In the purchase and use of various dehydrated food products, one must take into consideration the almost complete destruction of vitamin (A) A; (B) B; (C) C; (D) D.

Listing

Directions: List the itmes called for in each of the following. Select your answers carefully.

1. The purpose of systematic planning of food orders is to insure:

(A)____

(B)____

2. The type, kind, amount, etc., of food purchased depends on the following items or factors:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

(H)____

(I)____

(J)____

(K)____

3. Types of food purchases are usually broken down into four categories, which are:

(A)____________________ (C)____________________

(B)____________________ (D)____________________

4. The quotation sheet used for bids should not only group foods by type of commodity, but also provide space for indicating.

(A)____________________ (C)____________________

(B)____________________ (D)____________________

5. Three factors considered as yardsticks in grading meat are:

(A)______________ (B)______________ (C)______________

6. The term poultry includes:

(A)__________ (C)__________ (E)__________

(B)__________ (D)__________ (F)__________

7. The grading of cheese is based on:

(A)__________ (C)__________ (E)__________

(B)__________ (D)__________ (F)__________

8. The grades of butter depend on the following quality factors:

(A)_______________ (C)_______________

(B)_______________ (D)_______________

9. Three factors that determine the amount of storage space needed for "dry stores" are:

(A)__________ (B)__________ (C)__________

10. The six common ways of preserving food are:

(A)__________ (C)__________ (E)__________

(B)__________ (D)__________ (F)__________

Assignment
Sheet No. 9

Covering
Units 58-69

PRINCIPLES OF FOOD PREPARATION

The manner in which food is prepared has a definite effect upon the success of a meal and its acceptance by those who consume it. A well-organized plan and efficiently arranged facilities make food preparation much more enjoyable to both supervisory and kitchen personnel.

Good food preparation increases the attractiveness of food, conserves nutritive values, increases digestibility, enhances flavor and frees food from injurious organisms and substances. Good food preparation is not possible unless sound principles of food preparation are observed.

In this assignment you will have the opportunity to learn the importance of planning as it applies to food preparation and the various items which must be considered in order that it may be done effectively and efficiently.

Assignment:

1. Read the references listed below.
2. Select one or more recipes and standardize them for use in quantity service (See A: pp. 135-37).
3. Answer the questions below and turn in this assignment by ______________________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 133-138, 193-194, 233-236.
C. American Home Economics Association, Handbook of Food Preparation, pp. 1-6, 22.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Quality food is not only satisfying to the patient, but also plays a highly important role in restoring his health.

T F 2. The techniques for good food preparation are the same for quantity as for individual or family food preparation.

T F 3. The ideal temperature for bacterial growth is room temperature.

T F 4. In no area in the institution food department is supervision so important as in the kitchen.

T F 5. The scale is used to save time and assure greater accuracy in determining the needed amount of shredded vegetables and other like foods.

T F 6. Standard recipes give complete directions and thus eliminate all guesswork in cooking.

T F 7. It is not necessary to taste all foods before serving.

T F 8. Foods need to be checked routinely for appearance, temperature and acceptability.

T F 9. Garnishing food adds color to the food, which in turn improves the appearance and adds interest.

T F 10. The preparation area should be located between the storage and pre-preparation area.

T F 11. A partition should be placed between the cooking facilities in the kitchen.

T F 12. Cooking facilities should be located in the center of a kitchen to make it more accessible around which employees may work.

T F 13. An aisle space of about six to seven feet should be between the range and the cook's table in the kitchen.

T F 14. As menus become more complex and institutions increase in size, less cooking equipment will be needed.

T F 15. It is desirable to have the baker's work table with bins for flour and sugar near the cook's unit.

T F 16. A refrigerator is a desirable piece of equipment in the salad preparation area.

T F 17. Food served to patients requiring a diabetic diet is regarded as more important than the food to other patients.

T F 18. The elimination of the "special kitchen" to care for the preparation of modified diets has resulted.

T F 19. The abbreviation for teaspoon is "tsp."

T F 20. Cream, 40 per cent, doubles volume when it is whipped.

T F 21. The volume measure of one pound of whole milk and dry whole milk is practically the same.

T F 22. Five to six medium-sized whole bananas weigh one pound.

T F 23. Coarser grinds of coffee weigh somewhat less than fine grinds do for the same volume.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The foremost concern in food preparation should be the development of a perfect product; the best in ____________, ____________ and ____________.

2. The "watchword" of every kitchen staff member should be ____________ ____________.

3. Consideration in developing skilled workers must be given to ____________ for the job and special attention paid to innate ____________ to work dextrously with the hands.

4. A practice adopted from industry which involves the placing of equipment and supplies in a manner so that there will be few waste motions on the part of the workers is a well-planned ____________ ____________.

5. Standardized recipes are particularly important in the production of ____________ ____________.

6. Duplicate copies of recipes, which are filed according to ____________ of foods, should be kept in a ____________ file.

7. When planning for the preparation of foods a ____________ ____________ ____________ should be prepared and posted a day in advance.

8. Hot foods deteriorate rapidly in ____________, ____________ ____________ and ____________ when held for long periods in hot food units.

9. Prepared cold foods should be ____________ until served.

10. Before serving prepared foods, two qualities that need to be checked, are the correct amount of right ____________ and the proper ____________.

11. The ice cream scoop may be used to measure ____________ and ____________ and also for measuring ingredients of certain ____________ and ____________ fillings.

12. Facilities for the pre-preparation of such foods as meat and vegetables should be located between the ____________ and ____________ areas.

13. The minimum equipment requirements for meat preparation are a ____________ and a ________________.

14. "Lb." is an abbreviation which is used in recipes and stands for the word ____________.

15. One gallon equals _________ quarts, _________ pints, or ____________ peck.

16. Corn flour weighs approximately ________ ounces per cup.

17. In cooking food, a temperature of 75 degrees centigrade is equivalent to _____________ degrees Fahrenheit.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Patterns of conformity and uniformity in food preparation should be followed and insured by the use of:

(A)_________________________ (C)___________________________

(B)_________________________ (D)___________________________

2. Kitchen workers must use all possible precaution to safeguard the cleanliness of food and, there fore, should be instructed to:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

3. Responsibilities of a well-trained supervisor in the kitchen are:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

4. Tools for measuring and weighing with which kitchen workers should be equipped are:

(A)____

(B)____

(C)____

(D)____

(E)____

5. Standardized recipes should include the following:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

6. Items that should be included on a work sheet or schedule are:

(A)____

(B)____

(C)____

(D)____

7. The minimum equipment requirements for cooking in a small institution are:

(A)____________________ (C)____________________

(B)____________________

8. The appearance of and added interest in food on the cafeteria counter is improved by the appropriate use of:

(A)____________________________ (D)____________________________

(B)____________________________ (E)____________________________

(C)____________________________ (F)____________________________

Assignment
Sheet No. 10

Covering
Units 70-76

PREPARATION OF FOOD: MEAT, POULTRY AND FISH

The present day modern methods of feeding, selecting and packaging of meats, poultry and fish have been scientifically studied and mastered by suppliers throughout the world. This factor, along with improved methods of cooking of meats, poultry and fish helps to provide prepared foods of high quality and high nutritive value.

The preparation of meats, poultry and fish necessitates one to know and follow accepted food preparation practices concerning timing and temperature controls and methods of cooking. A knowledge of meat, poultry and fish storage and preservation, both before and after cooking, is also essential.

In this assignment you will have an opportunity to learn accepted procedures and various methods of food preparation as it applies to meats, poultry and fish and methods of caring for and storing these foods.

Assignment:

1. Read the references listed below.
2. In a short paper discuss the various cooking methods that are used for the different cuts of meat.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 140-155.
B. Peyton, Practical Nutrition, pp. 290-293.
C. American Home Economics Association, Handbook of Food Preparation, pp. 24-31.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. It is recommended that all meats should be cooked at moderate to low temperatures.

T F 2. Roasts should be carved immediately after removing from the oven for best results.

T F 3. Pan or griddle-broiling may be a preferred method over the broiling method for thin cuts of meat.

T F 4. Meat that is coated with flour, or egg and crumbs will require more fat for pan frying than meat that has not been coated.

T F 5. Meat should be brought to room temperature before deep-fat frying.

T F 6. Braising and simmering are methods of cooking generally used for the more tender cuts of meat.

T F 7. Adding water after meat is browned gives more flavor to the vegetables that are cooked with the meat, using the stewing method of cooking.

T F 8. Larger cuts of frozen meats, that need to be defrosted, should not be defrosted in water.

T F 9. "Dressed weight" means that feathers, head and feet are off, and the bird drawn and cleaned ready to cook.

T F 10. In most institutional cooking, it is recommended that the dressing be baked while stuffed in the bird.

T F 11. "Doneness" of a bird, when roasting, may be tested by pressing the fleshy part of the drumstick with the fingers.

T F 12. A "dredging mixture" is a coating used in frying chicken which is generally composed of seasoned flour or crumb mixture.

T F 13. Braising or fricasseeing is one of the better methods to be used for less tender poultry.

T F 14. Fish should be baked in a preheated oven at 350° F. for about 20 to 30 minutes.

T F 15. Fish should be pan-fried rapidly so as to retain the desired flavor.

T F 16. Meats should be broiled about half of the indicated time on one side after which it should be turned and broiling completed.

T F 17. A 7 1/2 pound smoked picnic shoulder should be cooked approximately 1 1/2 to 2 hours.

T F 18. The meat thermometer should be inserted in the center of a roast so that it rests on the bone for the most accurate testing of doneness.

T F 19. A pork loin requires a higher temperature (for a well done) than a veal loin of same weight and same cooking time.

T F 20. If proper thawing and cooking temperatures are followed, very little difference will exist between meat cooked from frozen or thawed state.

T F 21. The safest temperature for thawing meat is the generally accepted refrigerator temperature.

T F 22. Packaged meats received in market paper must be re-wrapped loosely so that a circulation of air will partially dry the surface.

T F 23. Poultry, generally, need not be thawed completely before roasting.

T F 24. Meat after thawing should be cooked immediately and refrozen only under an emergency.

T F 25. Fish, poultry and meat may be preserved and flavor retained in a variety of ways, of which freezing is one of the best.

T F 26. More nutrients are lost in cooking by the dry heat method than by the moist heat method.

T F 27. The protein value of meats is not affected by the average cooking or processing of it.

T F 28. There is less loss of B vitamins in the broiling of meats than in braising or stewing meats.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Minimum shrinkage is an important consideration in meat cookery; three others are that the finished product should be ____________, ________________ and __________________.

2. To make certain that roasts are neither undercooked nor overcooked, a ____________ _______________ should be used.

3. Meat juices which give it a characteristic flavor are contained in the _____________ of the meat.

4. The rack for broiling tender steaks and chops, which are two inches thick, should be adjusted about _________ inches below the flame.

5. Two general methods of cooking fryers and ______________ and ____________________.

6. In order to prevent birds from becoming too brown during roasting, they should be covered with ______________ dipped in fat or with ______________ ________________.

7. All fresh meat to be stored should be placed in the coldest part of the refrigerator, at a temperature of ________ to ____________ Fahrenheit.

8. Meats to be kept in the freezer should be quickly frozen and kept at ______________ degrees Fahrenheit or colder.

9. Increasing the heat near the end of roasting time for duckling and goose adds ___________________ and _____________ to the skin.

10. Because of its _______________, fish should be wrapped completely or placed in a covered container before refrigerating.

11. The principle of the various preservation methods is to destroy or inhibit the growth of bacteria so that _____________ does not occur.

Multiple-Choice

Directions: In the space at the left of each statement write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. One of the methods of moist heat cooking meat is (A) frying; (B) broiling; (C) braising; (D) roasting.

_____ 2. The total time in minutes for cooking 1" steaks (rare) should be (A) 5-10; (B) 10-15; (C) 15-20; (D) 20-25.

_____ 3. The approximate time necessary for broiling large broilers is (A) 20; (B) 30; (C) 40; (D) 50 minutes.

_____ 4. Fish fillets should be broiled at moderate heat for approximately (A) 2-5; (B) 5-8; (C) 8-11; (D) 11-14 minutes.

_____ 5. In roasting turkey halves or quarters which are five to eight pounds (ready to cook weight) with approximately 1 to 1 1/2 pounds of stuffing at 325°F.: the cooking time should be (A) 3-3 1/2; (B) 3 1/2 - 4; (C) 4 - 4 1/2; (D) 4 1/2 - 5 hours.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Four advantages of cooking meat at a low temperature are:

(A)____

(B)____

(C)____

(D)____

2. Four advantages of cooking poultry at low temperatures are:

(A)__________________ (C)__________________

(B)__________________ (D)__________________

3. Cooked fish that is dry and lacks flavor is the result of two factors, which are:

(A)____

(B)____

4. Four reasons for cooking meat are:

(A)__________________ (C)__________________

(B)__________________ (D)__________________

5. Liquid that may be used for braising meat cuts are:

(A)__________________ (D)__________________

(B)__________________ (E)__________________

(C)__________________

Assignment
Sheet No. 11

Covering
Units 77-82

PREPARATION OF FOOD: MILK, CHEESE AND EGGS

The inclusion of milk, cheese, and eggs in food preparation, in combination and individually, is increasing in importance and use. These foods not only help in making meals more attractive and increase acceptance, but are also high in nutritive value and are economical substitutes for other foods normally used in food preparation.

In this assignment you will have the opportunity to learn accepted methods and procedures of food preparation as it applies to milk, cheese and eggs and the storing of these foods.

Assignment:

1. Read the references listed below.
2. In a short paper, discuss the differences between "Evaporated Milk," "Dry Milk Solids" and "Nonfat Dry Milk" and list one or two advantages for each.
3. Answer the questions below and turn in this assignment by ________________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 156-164
B. Peyton, Practical Nutrition, pp. 261-264; 266-267; 274-275.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Eggs may be used in a variety of ways, such as in combination with other foods, like cheese, ham, or dried beef.

T F 2. The major difference between soft and hard cooking of eggs in the shell, using the cold water method, is the amount of time the eggs are allowed to remain in the water after the fire has been turned off.

T F 3. The liquid used for poaching eggs may be either milk or water.

T F 4. It is considered good practice to cook eggs at relatively high temperatures.

T F 5. A sure indication that separated whites are thoroughly beaten is stiffness and dryness.

T F 6. Fresh whole eggs removed from the shell may be frozen as whole eggs, yolks or whites.

T F 7. Frozen eggs should be placed in warm water to thaw.

T F 8. One fresh egg is equivalent to two-thirds ounce of frozen eggs.

T F 9. By weight, fresh eggs are 50 per cent yolk and 50 per cent whites.

T F 10. Eggs which are either whole or separated may be secured in dehydrated form.

T F 11. It is very important to remember that in whatever way dehydrated eggs are used, they should be cooked at a moderate temperature.

T F 12. The addition of sugar to egg mixtures aids in the prevention of coagulation due to high temperatures.

T F 13. Undercooking mixtures that contain eggs results in toughening of the egg protein.

T F 14. Eggs should be thoroughly washed before putting into storage.

T F 15. Milk is high in nutritive value, the disadvantage of it being that it is hard to digest.

T F 16. Foods that have been prepared with milk generally should be cooked at low temperatures in order to avoid coagulation of protein.

T F 17. At times, flavorings or coloring may be added to milk to make it more acceptable.

T F 18. A reduction of cost may be realized if whole dry milk is used in place of whole fresh milk.

T F 19. Nonfat dry milk is very seldom used in the preparation of foods.

T F 20. In the preparation of baked goods, dry milk is usually mixed with the other dry ingredients first and then water is added.

T F 21. The good flavor of milk can be retained for as long as two weeks if it has been pasteurized and properly cared for.

T F 22. The scum which forms on milk due to cooking cannot be eliminated.

T F 23. Cheese, which is flavorable, is often used in cooking, but has a disadvantage in that it lacks nutrients.

T F 24. Cheese to be used as a topping for foods should be applied near the end of the baking time.

T F 25. A soft white cheese which is mild and may be purchased in small or large curds is called "Camembert" cheese.

T F 26. Processed cheese and cheese foods have higher nutritive value and lower moisture content than cheddar cheese.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Basting top of eggs when frying may be done with ____________ in pan or by adding small amounts of _____________ and covering pan tightly.
2. The basic causes which make eggs tough and less palatable are long cooking and __________ ___________________.
3. Ten fresh eggs are equivalent to _________ ounces of frozen yolks and __________ ounces of whites.
4. Replacing water in dried-egg powder is called ________________ dried eggs.
5. Hot liquids or mixtures should be added showly to the beaten eggs in order to prevent _______________.
6. Evaporated milk may be used the same as whole fresh milk by adding an equal quantity of _______________.
7. The ___________ and __________ have been removed from whole milk in the preparation of nonfat dry milk.
8. Milk that has been exposed to sunlight for a relatively short time develops "sunlight" flavor with a loss of ___________ and _______________ ______________.
9. A means whereby scorching may be eliminated is the use of a ___________________ ___________________.
10. Cheese is less expensive than and also may be used as a substitute for ___________ in food preparation.
11. In cooking cheese, a layer of _____________ ______________ may be applied to protect the cheese from direct heat.

12. A hard cheese which has a mild to sharp flavor and may be used in baked dishes is the __________ __________ cheese.

13. Semi-hard brick cheese is __________ in color and may be used with crackers or fruit pie or in __________.

14. Cheese should be stored in a refrigerator and may be placed in a special container to protect it from absorbing __________ __________.

15. When including cheese in food preparation, it will blend much more easily with other ingredients if __________ or __________ through a coarse seive.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. To increase the volume of eggs and hasten beating, they should be removed from the refrigerator (A) 1/4; (B) 1/2; (C) 3/4; (D) 1 hour before using.

_____ 2. The best temperature for storing eggs and retaining their quality is (A) 15-25; (B) 25-35; (C) 35-45; (D) 45-55 degrees with a humidity of 85 per cent.

_____ 3. Milk that is used in cooking is (A) seldom; (B) always; (C) never; (D) often boiled.

_____ 4. Because cheese contains a great amount of protein and tends to toughen, it should be cooked at (A) very high (B) high; (C) medium; (D) low temperatures.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The basic ways of preparing eggs are:

(A)__________ (C)__________ (F)__________

__________ (D)__________ (G)__________

(B)__________ (E)__________

2. Eggs serve in one or more of the following ways, when used as an ingredient of a recipe.

(A)____

(B)____

____

(C)____

(D)____

____

(E)____

(F)____

(G)____

(H)____

3. Three methods of preserving eggs besides refrigeration are:

(A)____________ (B)____________ (C)____________

4. Four precautions or principles well to remember for keeping milk at its best are to keep it:

(A)__________________ (C)__________________

(B)__________________ (D)__________________

5. Milk may be boiled for the following reasons:

(A)__________________ (B)__________________

Assignment
Sheet No. 12

Covering
Units 83-89

PREPARATION OF FOOD: VEGETABLES, FRUITS, AND SALADS

Vegetables, fruits and salads are not only high in nutritive values, but also contribute much to the attractiveness and acceptance appeal of the meal. These foods may be prepared in a variety of ways but great care must be taken so as not to destroy their food value. The storage of these foods, both before and after preparation, also requires special attention of the food service supervisor.

In this assignment you will have the opportunity to learn the various accepted methods of vegetable, fruit and salad preparation and the necessary precautions that need to be observed.

Assignment:

1. Read the references listed below.
2. From your observation of various institutions which do quantity serving, discuss in a one-page paper methods used to increase salad "sales appeal."
3. Answer the questions below and turn in this assignment by ______________________.

References:

A. American Hospital Association, <u>Hospital Food Service Manual</u>, pp. 165-175.
B. Peyton, <u>Practical Nutrition</u>, pp. 316-320; 308-309.
C. American Home Economics Association, <u>Handbook of Food Preparation</u>, pp. 23-24.

Questions:

True-False

<u>Directions</u>: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Some nutritive values of vegetables are destroyed in the process of cooking.

T F 2. The length of time between cooking and serving vegetables has a definite effect on the retention of minerals and vitamins.

T F 3. Even though leafy vegetables have become wilted, they still retain most of their nutritive value.

T F 4. The washing of vegetables is essential and may be done either before or after paring, scraping or shelling.

T F 5. Care must be taken when paring or scraping various vegetables since valuable nutrients be just beneath the skin.

T F 6. The cooking of vegetables actually improves their flavor and palatability.

T F 7. The use of a pressure cooker helps to retain nutrients in the vegetable but the cooking time is generally longer than other methods.

T F 8. The flavor of vegetables is improved by boiling in a closed kettle.

T F 9. Freshly washed greens require no additional water for boiling and should be cooked quickly for best quality.

T F 10. Eggplant and tomatoes may be either broiled or pan fried.

T F 11. Long soaking of vegetables results in a loss of minerals and vitamins.

T F 12. It makes little difference whether vegetables are placed in the water before or after it starts to boil, on the amount of nutrients they retain.

T F 13. As long as vegetables are kept warm after preparation there is little loss of food value.

T F 14. Vegetables should be removed immediately from the steam kettle when cooking time has expired to prevent further cooking.

T F 15. The overcooking of vegetables causes loss of color.

T F 16. Soda should never be used in the cooking of fresh vegetables.

T F 17. Cooking green vegetables in a minimum amount of water generally aids in color retention but causes loss of nutrients.

T F 18. The pigment of yellow vegetables compared to green is more stable as to acid and heat.

T F 19. The red pigment in red vegetables is soluble in water and is greatly affected by acids and alkali.

T F 20. All vegetables should be cooked only until tender.

T F 21. The cooking of strong-flavored vegetables in a covered container actually makes them more difficult to digest.

T F 22. Cooking rules are generally quite different for cooking frozen vegetables as compared to fresh.

T F 23. Generally the cooking rules for canned vegetables follow those of fresh vegetables.

T F 24. Not only are fruits, in many instances, more attractive when served raw, but their nutritive values are higher than when cooked.

T F 25. Many fruits may be cooked in the same way as vegetables.

T F 26. The cooking of dried fruits should never be done in the same water in which they were soaked.

T F 27. Salads are desirable because they are attractive and contain refreshing flavors, but have the disadvantage of low nutritive value.

T F 28. A salad is at its best when served immediately after preparation.

T F 29. Crispness, color and balance in salad preparation are very important factors to consider.

T F 30. The body of the salad is selected on the basis of the place it occupies on the menu.

T F 31. The main purposes of garnishes are to flavor and to increase palatability of salads.

T F 32. In the preparation of mixed vegetable salads, one should never combine raw and cooked vegetables.

T F 33. Molded salads are often used to add variety to the main course of the meal.

T F 34. For best results head lettuce should be placed in a refrigerator for several hours after washing and before using.

T F 35. Cut celery and carrots are kept fresh in a similar manner.

T F 36. Gelatin salads will have better consistency if they are made a day previous to serving.

T F 37. The dressing for a salad may be combined just before or during the serving of the salad.

T F 38. An excellent method to use of making salads in large quantities is the assembly line method.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. One reason for cooking vegetables is to improve the texture; two other reasons are to soften the __________ and to increase ________________.
2. The selection of uniform size and regualr shape vegetables will cook more ____________.
3. The lack of freshness of green leafy vegetables results in loss of _____________.
4. Vegetables should be covered during storage to keep the loss of _________ _________ to a minimum.
5. The addition of either sugar or salt to corn before cooking will cause the corn to ____________.
6. A vegetable which has been baked in its skin retains practically all of its ____________ content and flavor.
7. Generally, vegetables need not be thawed before cooking, with the exception of _____________________ which needs to be thawed completely.
8. The addition of _________ at the beginning of the cooking process aids fruit to retain its shape.
9. Two general classifications of salads are according to their ______________ on the menu and by the basic _____________.
10. A salad green which is most often used as the base for the salad is ______________.
11. In the preparation of main course salads, materials are often arranged at different levels to avoid a ________ appearance.
12. A salad which is used as a main dish should contain food that is rich in ____________.
13. One essential piece of equipment, especially necessary for quantity salad preparation, is the __________ _____________.
14. The skins of tomatoes are more easily removed if they are first placed in _________ water and then plunged into ______ water.
15. Salad ingredients should not only be planned for nutritive values, but also for _________ , __________, ____________ and texture contrast.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The most common method of cooking vegetables is (A) pan frying; (B) broiling; (C) boiling; (D) baking.

_____ 2. During the cooking time, vegetables should (A) never; (B) seldom; (C) frequently; (D) constantly be stirred.

_____ 3. Generally, green vegetables can be held at serving temperature without loss of color or flavor for about (A) 5-15; (B) 15-25; (C) 25-35; (D) 35-45 minutes.

_____ 4. Pressure in the pressure saucepan should be reduced by placing it under (A) cold water; (B) hot water; (C) warm water; (D) either of above three ways.

_____ 5. Frozen fruits in the carton usually take about (A) 1-2; (B) 2-3; (C) 3-4; (D) 4-5 hours to thaw.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Methods commonly used for cooking various vegetables are:

(A)_____________________

(B)_____________________

(C)_____________________

(D)_____________________

(E)_____________________

2. Each of the green, yellow, red and white vegetables contains pigments which are respectively:

(A)_____________________

(B)_____________________

(C)_____________________

(D)_____________________

3. Some fruits when cut discolor quickly; this may be prevented by covering them with:

(A)_____________________

(B)_____________________

(C)_____________________

(D)_____________________

4. All salads consist of four parts which are:

(A)_____________________

(B)_____________________

(C)_____________________

(D)_____________________

5. Three basic salad dressings are:

(A)______________________________ (C)________________________________

(B)______________________________

6. Various kinds of salads which help to balance the food value of the menu are:

(A)________ ____________________ (D)________________________________

(B)______________________________ (E)________________________________

(C)______________________________

Assignment

Covering
Units 90-96

PREPARATION OF FOODS: DESSERTS, BEVERAGES AND APPETIZERS

The ingredients for desserts, beverages and appetizers need to be carefully selected and the foods properly prepared as they can be the most colorful and most appetizing entries on the menu. One probably has no wider choice of methods of preparation as in these foods. The food supervisor will want to especially make use of the many variations which are possible, but should always remember to maintain a well-balanced meal.

In this assignment you will have the opportunity to learn the importance and place which desserts, beverages and appetizers have on the menu and also various methods which may be used in their preparation.

Assignment:

1. Read the references listed below.
2. Select four fruit desserts and explain several variations in the preparation of each. (From your readings or observations.)
3. Answer the questions below and turn in your assignment by ______________________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 139; 180-188.
B. Peyton, Practical Nutrition, pp. 268-270.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Beverages are not only a source of nourishment, but also provide the fluid needs of the body.

T F 2. Black coffee has very little caloric value.

T F 3. Instant coffee is considered to be more stimulating than standard coffee.

T F 4. Coffee substitutes have a stimulating effect similar to standard coffee.

T F 5. Tea, as such, has no food value.

T F 6. One difference between tea and coffee is that tea has no stimulating effect.

T F 7. The strength of tea depends upon the length of time which it is steeped.

T F 8. Cocoa is only mildly stimulating.

T F 9. Three teaspoons of cocoa and one teaspoon of fat are equal to one square of chocolate.

T F 10. In preparing cocoa, the powder should be mixed with milk and heated for a short time before adding water.

T F 11. Sweetened carbonated beverages contain no nutritive value aside from the added sugar.

T F 12. It is very possible that some carbonated beverages may cause damage to the enamel of the teeth.

T F 13. One reason for using appetizers is to add variety in food preparation.

T F 14. Fruit cocktail, as an appetizer, should be served very sweet in an effort to bring out the individual flavor of the fruits.

T F 15. Fruit juices make excellent appetizers, but should very seldom if ever be used in combination.

T F 16. Tomato juice is high in nutritive value, but is very seldom used as an appetizer.

T F 17. Beef or chicken broth is often added to cream soups to make up an appetizer.

T F 18. Characteristics of a perfect cake are that the crust is golden brown, thin and crisp.

T F 19. Cookies baked in a pan which is too deep will cause them to be burned on top.

T F 20. Flour should be packed slightly when measuring, whereas brown sugar should not.

T F 21. One indication of a good piecrust is one that is rich and flaky.

T F 22. For quantity pastry making, dough should be used as soon as possible after it has been prepared.

T F 23. Fruits are often served in combination for dessert.

T F 24. Sliced apples, pears and peaches have a tendency to discolor, but there is no way to avoid this.

T F 25. Oranges for slicing should be peeled deep enough to remove the white membranes.

T F 26. The red varieties of rhubarb to be used as dessert should be peeled for best results.

T F 27. Raspberries and blackberries should be washed, then placed in a covered container and stored at room temperature until use.

T F 28. Canned fruits should be chilled before serving as a dessert.

T F 29. All dry fruits, used as desserts, need to be soaked before cooking.

T F 30. Frozen fruits are quick-frozen with sugar and, therefore, none should be added before serving.

T F 31. After frozen fruits have been thawed, they may be served with no further preparation.

T F 32. Egg-and-milk desserts are more expensive as compared to other kinds.

T F 33. Of the various desserts, frozen desserts have the most universal acceptance.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The roasting of coffee beans develops volatile oils which in turn give ________________ and __________________ to coffee.
2. Coffee stimulates, raises blood pressure and tends to prevent fatigue; this is due to a substance in coffee called __________.
3. Coffee which has been ground should be kept in a tightly covered container and stored in a ______________ place.
4. The making of good coffee greatly depends on the use of _________________ utensils.
5. Too great an extraction of tannin from tea results in a _______________ _________________.
6. Chocolate contains a stimulant called _____________________.
7. Some carbonated beverages are undesirable for children because they contain _______________ ________________.
8. Synthetic fruit-flavored soft drinks are essentially ___________ ___________________ solution.

9. Lemon syrup is often added to fruit such as pear and apple slices, used as appetizers, to prevent ______________.

10. In the use of chicken soups as appetizers, the quantity of chicken stock should be ________ quarts to a four- or five-pound fowl.

11. A ___________ dessert is recommended if the meal is light, whereas a ___________ dessert should be served with a heavy meal.

12. If the pan is too small, the cake may ________ while baking; if the pan is too large, the result will be a ____________ cake with a ___________ texture.

13. Butter and shortening to be used as an ingredient in a cake should be warmed to __________ degrees to give it better texture.

14. Pouring a thick liquid such as syrup from a spoon or cup is made easier if the utensils are ____________.

15. Beating a cake mixture too long causes it to have ____________ holes and ______________ texture.

16. Cooky pans should be placed in the oven so as to allow for free ____________ of ______________.

17. Pie dough that is sticky and hard to roll is caused by too ______________ water, whereas dough that is crumbly and hard to roll is caused by too __________ water.

18. In preparing baked piecrusts, a fork is used to prick the pastry thoroughly then chilled before baking to prevent ________________.

19. One reason for not adding sugar at the beginning of cooking dried fruits is that it interferes with the ________________ of ____________ by the fruit.

20. Costs may be reduced in the preparation of egg-and-milk desserts by substituting ____________ ____________ ____________, ____________ ____________ ____________, or ____________ ____________ for fluid milk and ____________ or ____________ ____________ for fresh eggs.

21. One reason why fresh pineapple is not used in gelatin desserts is that it will prevent gelatin ________________.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. The type of coffee grind purchased depends largely upon the (A) cost; (B) menu planned; (C) method of preparation; (D) type of service.

_____ 2. "Breakfast cocoa," by government regulations, must contain at least (A) 16; (B) 18; (C) 20; (D) 22 per cent fat.

_____ 3. Unsifted flour measures (A) same as; (B) less than; (C) 1/3 more than; (D) 2/3 more than sifted flour.

_____ 4. Commercially prepared ice cream mixes should contain a minimum of (A) 10; (B) 12; (C) 14; (D) 16 per cent milk fat by weight.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The bitter flavor of coffee is due to:

(A)______________________________

(B)______________________________

2. Three different classes of tea are:

(A)__________ (B)__________ (C)__________

3. Desserts are chosen for the following reasons:

(A)______________________________

(B)______________________________

(C)______________________________

4. Two ways to tell if a cake is done are:

(A)______________________________

(B)______________________________

5. A heavy syrup used to glaze apples is made of:

(A)__________ (B)__________ (C)__________

6. Two methods of cooking dried fruits are:

(A)________________________ (B)________________________

7. Three methods of preparing gelatin desserts to make them more appealing are:

(A)________________________ (C)________________________

(B)________________________

Assignment
Sheet No. 14

Covering
Units 97-103

PREPARATION OF FOODS: SANDWICHES, BREADS AND CEREALS

As in other types of food preparation, the selection of ingredients for sandwiches and breads, and the selection of cereals must be done carefully; also the accepted preparation procedures should be followed for good results. Since breads and cereals are quite common and are placed on the menu at least once daily, they should be given special consideration in over-all food preparation. Sandwiches, too, are included on the menu especially for luncheon or supper serving and prove popular if not used excessively.

In this assignment you will have the opportunity to learn the various methods of cooking and preparing sandwiches, breads and cereals and their proper place on the menu.

Assignment:

1. Read the references listed below.
2. Select ten ready-to-eat cereals, state their source and how they are processed from raw material to finished product. (See A, pp. 190-191)
3. In a one-page paper, compare hot cereals to ready-to-eat cereals, indicating advantages and disadvantages of each.
4. Answer the questions below and turn in this assignment by _________________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 175-179; 188-192.
B. Peyton, Practical Nutrition, p. 301.
C. American Home Economics Association, Handbook of Food Preparation, p. 30.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The cooking of cereals causes them to decrease in bulk.

T F 2. Cereal to be cooked should be placed in a pan of cool water and then brought to a boil with constant stirring.

T F 3. For best results, cereals should be stored in a cool dry place.

T F 4. Whole wheat breads are more susceptible to mold than other breads.

T F 5. Standardized recipes can generally be secured from distributors of yeast and shortening products.

T F 6. Tested or standardized recipes need not be followed for quantity baking of breads.

T F 7. The ingredients of baked goods, handled at room temperature, are highly susceptible to bacterial growth.

T F 8. Cooked cereals which contain disodium phosphate are primarily designed for low-sodium diets.

T F 9. The stirring of cereal while it is cooking will help prevent it from sticking.

T F 10. A coarse grain, loose texture bread, is most desirable for sandwiches.

T F 11. Salad dressings are often used to add color to sandwich fillings.

T F 12. For more efficiency in quantity sandwich making, the assembly line method should be used.

T F 13. Sandwich fillings should always be kept refrigerated when not in use.

T F 14. A high heat should be used to brown both sides of the sandwich, if it is to be made on a grill.

T F 15. A toasted ham and cheese sandwich should be broiled until the cheese puffs.

T F 16. Rolled sandwiches should be prepared just prior to serving.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Cereals are not only cooked to render starch more easily digested but also to improve the ____________ and soften the ____________________.

2. Cereal grains, while cooking, stick to the utensil and burn easily; this can be avoided with the use of a ________________ ____________________.

3. Warm weather makes the storage of cereals difficult due to insects such as __________________.

4. Standardized recipes for breads generally give measures both of __________ and ____________.

5. Cereal thickens as it cooks, due to __________ and __________ in size.

6. Cereals which have been processed so that they may be cooked in a few minutes are called __________________.

7. The proper term for rolled oats is ____________.

8. By weight, _______ ounce(s) of dry weight cereal to be cooked will yield slightly more than one serving.

9. The acceptable weight for one serving of most ready-to-eat cereal is ________ ounce(s) and for volume from _______ to __________ cup.

10. For sandwich making, the ___________ or __________ loaves are desirable.

11. Butter should not be melted for spreading but rather should be ____________ or ____________.

12. A thin layer of _____________ spread on both slices of bread will prevent moist sandwich filling from soaking the bread.

13. A _____________ should be used for measuring out and placing sandwich filling on the bread.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Bread, to be stored, should be (A) warm; (B) hot; (C) slightly cool; (D) completely cool.

_____ 2. The baking time and oven temperature of corn bread is most nearly the same as (A) muffins; (B) biscuits; (C) yeast bread; (D) cream puffs.

_____ 3. "Old-fashioned" cooking of rolled oats, per pound, in a double boiler, for 20-30 minutes, should be done in (A) 1 1/3; (B) 2 1/3; (C) 3 1/3; (D) 4 1/3 quarts of water.

_____ 4. Salt should be added to the water, in which cereal is to be cooked, (A) before; (B) after; (C) during; (D) before or after the cereal is added.

_____ 5. A pullman loaf of about 2 pounds will provide for approximately (A) 10; (B) 20; (C) 30; (D) 40 slices.

_____ 6. A pound of butter which has been whipped will spread about (A) 100; (B) 80; (C) 60; (D) 40 slices of bread.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Different types of cereals absorb varying amounts of water; this depends on:

(A)______________________________

(B)______________________________

(C)______________________________

2. There are five generic types of breakfast cereals that require cooking; they are:

(A)________________ (D)________________

(B)________________ (E)________________

(C)________________

3. There are 15 generic name descriptions for ready-to-eat cereals, which are:

(A)________________ (I)________________

(B)________________ (J)________________

(C)________________ (K)________________

(D)________________ (L)________________

(E)________________ (M)________________

(F)________________ (N)________________

(G)________________ (O)________________

(H)________________

4. Generally, sandwiches may be served in the following ways:

(A)____________________________

(B)____________________________

(C)____________________________

(D)____________________________

5. Three important uses of salad dressing in sandwich fillings are:

(A)________________ (C)________________

(B)________________

6. Tools generally considered necessary for making sandwiches are:

(A)________________ (D)________________

(B)________________ (E)________________

(C)________________

Assignment
Sheet No. 15

Covering
Units 104-115

SERVING THE FOOD

The manner in which a meal is served is of great concern to the patient or customer. Excellent food preparation of high quality accomplishes little if the food service has not also been carried out with extreme care. The ease and efficiency in which serving the food is carried out is dependent on many factors, some of the most important being the method of food distribution and the available physical facilities.

Many institutions have a double problem concerning food service in that they not only serve resident patients and other institutional personnel, but also serve customers who do not dine regularly at the insitution. This problem demands an organization which is well planned as to the physical layout of equipment and the efficient handling of the type of food service in use.

In this assignment you will have an opportunity to become familiar with the various methods and types of organizations concerned with the serving of food.

Assignment:

1. Read the reference listed below.
2. Write a two-page paper on the relative advantages and disadvantages of various types of patient tray service in use. Use examples, for illustration, from experiences in institutional food service you are now having.
3. Answer the questions below and turn in this assignment by ______________________________.

Reference:

A. American Hospital Association, Hospital Food Service Manual, pp. 195-209; 225-231; 237-241.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Centralized patient tray service refers to the type of service where food is sent in bulk to serving pantries and distributed on small tray carts.

T F 2. Heated lowerators are considered essential in the patient tray service area.

T F 3. The food preparation summary sheet should provide space for indicating both hot and cold foods to be prepared.

T F 4. Diagrams of accepted patient tray set-ups should be posted in the serving units.

T F 5. A napkin is generally not included in the patient tray set-up.

T F 6. It is a recommended and accepted practice to serve a greater quantity of cream on the patient's tray than will be needed for coffee.

T F 7. The plates in which hot foods are placed on a patient's tray should be preheated and covered.

T F 8. Cooperation with the nursing department is essential for efficient patient food service.

T F 9. The only difference between food service for the general patient and isolated patient is that the service articles are sterilized.

T F 10. The cafeteria service in an institution may be of either a pay or non-pay type.

T F 11. The cafeteria serving facilities are often adjacent to the dining room whereas the waitress serving facilities are often in the preparation area.

T F 12. Hot foods should always precede cold foods in cafeteria service.

T F 13. It is improper for the counter worker to offer suggestions to customers in the cafeteria.

T F 14. The waitress should serve the appetizer from the left.

T F 15. The trend for including a snack bar in the planning of institutional service is declining.

T F 16. There is a trend for providing meals as part of the employee's salary.

T F 17. The operation of a pay cafeteria is usually on an all-cash basis.

T F 18. A food requisition sheet for the pay cafeteria should include space for entering the quantity, item, unit cost and total cost of foods.

T F 19. Such foods, as mashed potatoes, should be served with an ice cream scoop to aid in portion control.

T F 20. It is generally assumed that there is a relation between the dietary department layout and quality and cost of food prepared and served.

T F 21. Although employees working in well-equipped dietary units perform tasks more efficiently, they still fatigue as readily as in ill-equipped units.

T F 22. The materials that are used in the construction of walls and floors have an effect on the efficiency of food service.

T F 23. One of the important steps in planning or improving the food service department is the collection and evaluation of structural materials.

T F 24. The preparation of a food service flow chart is essential in the planning or improving of food service.

T F 25. Trays are often transported by subveyor, dumbwaiter, or tray trucks in centralized service.

T F 26. Tray trucks which contain heated ovens are generally kept at a temperature of 130 to 140 degrees F.

T F 27. Tray trucks are usually designed for either hot food delivery or cold food delivery, seldom is a truck designed to handle both.

T F 28. An advantage of centralized tray service as compared to decentralized is that the completed trays are transported a relatively short distance.

T F 29. A greater uniformity of service is obtained by use of the centralized tray service organization.

T F 30. The tray assembly unit, in centralized tray service, should be in close proximity to transportation facilities.

T F 31. An electric plate on the counter, in centralized tray service, is considered an advantage.

T F 32. Pantries for use in decentralized tray service should not be located on floors one directly above the other, as this will reduce efficiency.

T F 33. It is advantageous to have the dining room for the cafeteria so located that guests can return soiled trays to the dishwashing unit.

T F 34. A grill and hot plate are desirable pieces of equipment for cafeteria service.

T F 35. A dispenser for milk, with measuring dial, is considered an important piece of equipment in cafeteria service although it is rather uneconomical to use.

T F 36. Food trucks used for cafeteria service should be of open-type construction.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In an effort to get the ideal "home-cooked" meal in instutitions, a minimum time lapse must be achieved between ______________ and ______________.

2. Smaller institutions use the ____________ type of patient tray service.

3. The coffee service, cold-food unit and hot-food unit, for patient service, are generally arranged in the following sequence for tray service: _________________ _____________, ___________________ ____________ and, last, the ____________ ______________.

4. The type of institutional service most often used for staff personnel and guests is ______________ service.

5. The principal difference between cafeteria or waitress service concerning facilities is the ______________ of equipment.

6. A good guide for waitresses to follow is that all foods except ______________ should be served and removed from the left.

7. The snack bar supplements the cafeteria and provides food for those who want a _________ __________ or ______________.

8. Control concerning value of meals in a non-pay cafeteria is usually accomplished through a registrar or by use of __________ _______________.

9. A meal census, in a non-pay cafeteria, is obtained from ______________ _____________ or from the signed register.

10. When planning a food department, the first step is to define in writing the _________ and __________ of the service.

11. For a 100-bed hospital, an area of ________ square feet is recommended for the dietary department.

12. The maximum time between patient tray assembly and service, when using unheated trucks for delivery is ____________ minutes.

13. In a decentralized service, the time between the assembly of the tray and service should be from _______ seconds to ______ minutes.

14. The serving area of the cafeteria should be about one-fifth to ________ the size of the dining room.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A food preparation summary sheet usually does not include the following: (A) hot foods; (B) cold foods; (C) coffee service; (D) number of servings.

_____ 2. The suggested arrangement for a breakfast tray for patients, places the creamer in the (A) center; (B) lower left corner; (C) upper right corner; (D) lower right corner of the tray.

_____ 3. The vegetable dish on a dinner tray for patients should be placed in the (A) lower center; (B) upper center; (C) right center; (D) left center of the tray.

_____ 4. The salad plate, on the supper tray for patients, should be placed in the (A) upper right; (B) lower right; (C) upper left; (D) lower left corner of the tray.

_____ 5. For waitress service, foods should be arranged so that they can be picked up in the following order. (A) cold foods, hot foods, hot beverages; (B) hot foods, cold foods, hot beverages; (C) hot beverages, cold foods, hot foods; (D) cold foods, hot beverages, hot foods.

_____ 6. A duty not considered that of a cafeteria-counter worker is (A) make coffee; (B) put away utensils used for serving; (C) replace food as needed; (D) clean tables in dining room.

_____ 7. The bread and butter plate, for dining service, is placed in the (A) lower left; (B) upper left; (C) lower right; (D) upper right of the place setting.

_____ 8. A number 16 scoop is equivalent to a (A) 1-cup; (B) 3/4-cup; (C) 1/2-cup; (D) 1/4-cup size ladle.

_____ 9. Elevators for transporting food trucks in decentralized service should open up, on each floor, (A) adjacent to the serving kitchen; (B) in front of the serving kitchen; (C) in the serving kitchen; (D) as far away from serving kitchen as possible.

_____ 10. Whenever possible, the cafeteria should be adjacent to the (A) kitchen; (B) washing area; (C) receiving area; (D) none of these.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three types of organization concerning patient tray services are:

(A)________________________ (C)________________________

(B)________________________

2. Arrange the following units from A to G in the sequence which they should be located in the dietary department (dishwashing, receiving, pre-preparation, serving, storage, disposal, preparation).

(A)________________________ (E)________________________

(B)________________________ (F)________________________

(C)________________________ (G)________________________

(D)________________________

3. The type of food distribution and service used in an institution will affect the following four items:

(A)________________________ (C)________________________

(B)________________________ (D)________________________

4. Space necessary for a cafeteria may be determined through an analysis of:

(A)____

(B)____

(C)____

(D)____

Assignment
Sheet No. 16

Covering
Units 116-128

COST CONTROL AND FOOD SERVICE RECORDS

A problem which often arises in institutions that serve meals is the conflict that exists between the dietitian department and the accounting office. This conflict is due largely to a misunderstanding and can be resolved if carefully handled.

It is very important for the food service supervisor to have a knowledge of the various kinds of records kept in the dietary department and the relation of these records to the over-all accounting set-up of the institution. Accurate accounting records must be kept for the purpose of determining costs and in controlling these costs so as to aid in a more efficient operation of the institution.

In this assignment you will have an opportunity to become familiar with the accepted accounting procedures used in institutions serving meals and the relation of these procedures to the efficient operation of the institution.

Assignment:

1. Read the reference listed below.
2. For the institution in which you work, calculate or help to calculate the monthly cost of raw food consumed and the raw food cost per meal served per month. Do this for several months and compare results. (See A, pp. 263-264.)
3. Answer the questions below and turn in this assignment by ______________________________.

Reference:

A. American Hospital Association, Hospital Food Service Manual, pp. 261-296.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. Cost accounting is actually a management control device which is of interest and importance both to institutional administrators and dietitians.

T F 2. One of the major purposes of food cost accounting is that it is a method for controlling storeroom stock and minimizes over- and under-buying.

T F 3. Generally speaking, a system of cost accounting adapted to one institution will be applicable to other institutions.

T F 4. A knowledge of the number of meals served is essential to figure raw food costs per meal per month.

T F 5. A cumulative total of meals served from day to day is generally kept on a meal census report.

T F 6. Invoices are considered very important for calculating raw food costs.

T F 7. An inventory of the storeroom taken less than once each year, is sufficient for aiding in calculating raw food costs.

T F 8. There is an indication that detailed cost records cause the administration of the dietary department to operate on an uneconomical basis.

T F 9. As the institution becomes larger, management becomes less dependent on costs as a measure of dietary department efficiency.

T F 10. The dietitian is the one responsible for meal census, daily food report, etc., for her department.

T F 11. The purchase order authorizes the vendor to deliver merchandise according to specifications.

T F 12. Telephoning orders for staples rather than written orders is accepted practice for large institutions.

T F 13. One difference between a purchase order and quotation sheet is that the quotation sheet has more than one vendor's name on it.

T F 14. The procedure which a receiving clerk of staple goods should follow is to sign the delivery slips after which the goods should be checked for quality, omissions, etc.

T F 15. A very important reason for promptness in completing records of purchases is to secure allowed cash discounts.

T F 16. A separate daily expense sheet is used for each day on which deliveries are made.

T F 17. It is highly advisable to have as many purchases as possible issued directly to the kitchen rather than the roundabout way from vendor to storeroom to kitchen.

T F 18. A perpetual inventory card includes space for entering the requisition number.

T F 19. A perpetual inventory record is recommended for both staple and perishable foods.

T F 20. An up-to-date unit price on the perpetual inventory record may be determined in several different ways.

T F 21. The daily cost of food issued from the storeroom may be secured from the amount column of the requisitions.

T F 22. Some institutions classify foods by type of food commodity, for reporting costs.

T F 23. A major limitation of food cost control is the inability to compare quantity and cost of foods to nutritional adequacy.

T F 24. The monthly report of the dietary department contains only two major items, that of raw food costs and adjusted inventories.

T F 25. In case the actual count does not agree with the perpetual inventory, the actual count is written in red on the inventory card.

T F 26. The accounting department is usually responsible for keeping accurate time for each employee, whereas the dietary department is responsible for entering the rate of pay and amount earned for each pay period.

T F 27. The cost of wages of employees who work in several different areas should be prorated to these areas.

T F 28. The maintenance and repair of equipment in the dietary department are generally not included in the operating expense of the department.

T F 29. The total costs of each of the four expense classifications are included in the dietary department monthly cost report.

T F 30. The previous month's costs of each classification of expense is necessary for comparative purposes.

T F 31. It is not essential for dietary personnel to know accounting and statistical terms since the use of these is the responsibility of the accounting office.

T F 32. Comparing meal costs is easily done for hospitals because they all use a uniform meal ticket.

T F 33. The meal count should not include infant formulas.

T F 34. The expenses for special functions as well as those incurred by pay cafeterias should be kept in the same group of accounts and considered as dietary expense.

T F 35. Amounts paid to outside firms for repairs of dietary equipment should be charged to the institution's general maintenance fund.

T F 36. Wages of part-time dietary department workers should not be included in the same expense account as the regular employees.

T F 37. The classification of expenses "other operating expense" refers to items such as paper goods, office supplies and replacement of minor equipment.

T F 38. Stock in the storeroom should be classified into groups of similar items under which the food items should be listed alphabetically.

T F 39. It is considered a good practice to mark the price of each food item as it is placed on the shelf of the storeroom.

Completion

<u>Directions</u>: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Cost accounting serves as an aid in preventing irregularities in purchasing, ____________, ______________ and dispensing supplies.

2. The cost in the dietary department which is most significant is the cost of ___________ ___________ per meal per month.

3. An accounting of the number of meals served daily should be kept in the ___________ or __________ department.

4. The total raw food purchases must be adjusted to ____________ the cost of items actually ______________ rather than items received.

5. Accounting procedures to be used should be worked out by a person familiar with dietary department organization and with the cooperation of the ____________ office.

6. The meal census form should be designed and set up by ____________________ of meals served.

7. Types of order suggested to use for the food department are ______________ orders for staple foods and __________________ sheets for perishable foods.

8. Usually the original copy of the quotation sheet is placed in the office of the _________________ _________________.

9. In case a question arises concerning the quality of any goods received, the receiving clerk should notify either the ___________ or ____________.

10. The food ledger is arranged alphabetically by _____________ name, whereas the daily expense sheets are filed by __________.

11. The monthly consumption card is filed by name of ____________.

12. An authorization for the storekeeper to issue foods is provided by a written record called a _____________.

13. Such foods as coffee, sugar and cereal are usually placed under the broad heading of __________ for reporting of cost purposes.

14. In large institutions, it is the responsibility of the ____________ office for the preparation of the final monthly report.

15. When taking monthly inventories of stored food products, the unit price is taken from the __________ __ __________ __________ and copied on the inventory sheets.

16. The value of food on hand at the end of the month is the sum of totals of the _____________ inventory and the __________ inventory.

17. A ___________ sheet is set up for each employee's salary deductions and amount paid.

18. The overhead costs are usually allocated by the __________ office at a flat rate determined by cost studies.

19. The monthly dietary department cost report is prepared to show an ___________ of total costs and _________ costs.

20. Utility expenses such as gas and light used in the dietary department are generally charged to the __________ of __________ account or in some cases is subclassified and charged to the dietary department.

21. The first step to take in the arrangement of stock in the storeroom is to make a _________ count and record all _____________ on hand.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. A good food cost accounting method is one which provides information desired by management and one which is (A) complex and inexpensive; (B) simple and expensive; (C) complex and expensive; (D) simple and inexpensive.

_____ 2. The following item is not on a purchase order: (A) name of vendor; (B) standard portion for serving; (C) quantity and description of food; (D) terms of payment.

_____ 3. A storekeeper for perishable foods checks goods received against the (A) purchase order; (B) requisition sheet; (C) quotation sheet; (D) vendor's catalog.

_____ 4. The following item is not on a daily expense sheet: (A) name of vendor; (B) date; (C) distribution of purchases; (D) type of delivery.

_____ 5. The food ledger sheet does not contain the following item: (A) name of vendor; (B) distribution of food; (C) amount of invoice; (D) month's total.

_____ 6. The purchase record card does not include (A) percentage of discounts received; (B) amount of invoice; (C) order number; (D) quantity ordered.

_____ 7. The requisitions properly filled out are, at the end of the day, taken to the office of the (A) accounting; (B) supervisors; (C) dietary; (D) storeroom department.

_____ 8. The figure entered in the column marked "food to storeroom" in record of daily cost of raw food per meal served is secured from the (A) purchase order; (B) daily expense sheet; (C) requisition sheet; (D) perpetual inventory.

_____ 9. The figure for "number of meals served today" column in the record of daily cost of raw food per meal served is secured from the (A) storeroom issue sheet; (B) perpetual inventory; (C) daily meal census; (D) none of the above three.

_____ 10. The comparative statement of budget and actual costs does not include the item of (A) total number of meals served; (B) unit cost and expenses; (C) total cost for previous months; (D) total budget and actual costs.

_____ 11. Foodstuff received as donations or grown by the institution should be charged to the dietary department (A) at; (B) above; (C) below; (D) at or below fair market value.

_____ 12. The following is not considered a duty of the storeroom worker: (A) assist with inventories; (B) verify quantities received; (C) deliver commodities to kitchen; (D) purchase needed food commodities.

_____ 13. Hot chocolate powder is included under the following classification - food stores index - (A) condiments, seasonings, spices; (B) fountain and ice cream supplies; (C) beverages, milk products, mineral waters; (D) sugar, syrups, candy.

_____ 14. Sage is included under the following classification - food stores index - (A) condiments, seasonings, spices; (B) fountain and ice cream supplies; (C) beverages, milk products, mineral waters; (D) sugar, syrups, candy.

Listing

Directions: List the items called for in each of the following. Select your answers carefully

1. A suggested cost accounting plan provides information concerning daily food cost per meal and the monthly dietary department costs under which are included four major items; they are:

(A)____________________

(B)____________________

(C)____________________

(D)____________________

2. Staple food invoices are generally recorded in three places:

(A)____________________

(B)____________________

(C)____________________

3. A set of three cards should be maintained for each item stocked, as a perpetual inventory record of storeroom stock:

(A)__________ (C)__________

(B)__________

4. Information necessary to be included on each requisition is:

(A)__________ (D)__________

(B)__________ (E)__________

(C)__________ (F)__________

5. In some institutions a comparison is desired of quantities of food purchased with recommended quantities of food to buy for nutritionally adequate diets which are classified in eleven groups:

(A)______________________________

(B)______________________________

(C)______________________________

(D)______________________________

(E)______________________________

(F)______________________________

(G)______________________________

(H)______________________________

(I)______________________________

(J)______________________________

(K)______________________________

6. The following items are usually recorded on the monthly inventory sheet:

(A)_______________ (E)_______________

(B)_______________ (F)_______________

(C)_______________ (G)_______________

(D)_______________ (H)_______________

7 The count for the meal census usually comes from three sources, which are:

(A)______________________________

(B)______________________________

(C)______________________________

Assignment
Sheet No. 17

Covering
Units 129-140

SANITATION, SAFETY AND CARE OF EQUIPMENT

The role of the food service supervisor, in cooperation with the dietitian, is of ever-increasing importance with reference to the responsibility for the instruction in sanitation and the safe use and care of dietary equipment. The dietary department, as a whole, must be ever mindful of the health and welfare of those whom they serve.

The supervisor should have a thorough understanding and knowledge of accepted equipment installation procedures, selection of quality products and their preparation, safe working procedures, sanitary food handling techniques and other like items of concern to the food service area. The safe and efficient operation of the dietary department depends to a large extent on the skill and supervisory ability of the food service supervisor.

In this assignment you will have the opportunity to become acquainted with and gain an understanding of accepted sanitation policies and procedures, and the selection, care and safe use of food service equipment.

Assignment:

1. Read the references listed below.
2. Use the sanitation check list on A pp. 222-223, or one furnished by the institution, and make a complete check of the dietary (food area) department. Discuss results with the coordinator.
3. Answer the questions below and turn in this assignment by ____________________.

References:

A. American Hospital Association, Hospital Food Service Manual, pp. 210-224; 243-249.
B. Peyton, Practical Nutrition, pp. 144-147.

Questions:

True-False

Directions: The following statements are either true or false. If the statement if true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. The proper cleaning and maintenance of food service equipment will lengthen its life.

T F 2. Often some of the routine inspection is assigned to the maintenance department.

T F 3. One advantage of an equipment inventory is that the amount lost, broken and on hand can easily be determined.

T F 4. It is a good policy to clean a range while still warm as this permits faster cleaning.

T F 5. After cleaning, and not in use, the deep-fat fryer should be covered.

T F 6. Baking soda is effective in removing discoloration on coffee urns.

T F 7. Toasters should be wiped at least once a week with a coarse wet cloth.

T F 8. Dishwashing machines should be thoroughly cleaned after each washing period.

T F 9. We may assume that adequate lighting is important in institutional sanitation.

T F 10. It is best to locate employee washing facilities as far away from the food preparation area as possible.

T F 11. The control of insects and rodents not only should, but must be carried out.

T F 12. Food employees must be instructed that harmful bacteria do exist, although not seen, and that sanitation practices must be developed to eliminate them.

T F 13. Rinse time in machine dishwashing should be a minumum of 20 seconds.

T F 14. The temperature of the water for both manual and machine dishwashing should be about the same.

T F 15. Chlorine is not effective for bactericidal treatment if the utensils are not thoroughly cleaned.

T F 16. A detergent-sanitizer has been found very effective for the job of sanitizing.

T F 17. The posting of safety materials and signs is considered one effective means of gaining employee awareness to safety hazards.

T F 18. It is true that dull knives are more dangerous than sharp ones.

T F 19. Cleaning equipment should not be stored in the kitchen or cafeteria areas.

T F 20. Approximately four square feet per person should be allowed for lockers and rest rooms.

T F 21. Office space for the dietitian is preferably located in the patient area.

T F 22. The most satisfactory flooring for the food preparation area is of the hard surface flooring type.

T F 23. The intensity of lighting recommended for working surfaces in the food area is 50 footcandles.

T F 24. Ease of operation is one important factor in the selection of a particular piece of equipment.

T F 25. Equipment cost is reduced and flexibility gained by purchasing uniform equipment.

T F 26. Very little of the equipment used in the food area is mobile, nor does it have a dual purpose.

T F 27. When considering desirable changes, one important aspect to consider is the relation of working conditions to employee turnover.

T F 28. Food poisoning is not only promptly evident, but the severity has a relation to the amount of the food consumed.

T F 29. Diseases such as diphtheria and tuberculosis may be carried by both food and water.

T F 30. Trichinosis, a serious infection obtained from "pink pork," will be avoided by eating governemnt inspected meat.

T F 31. Prompt refrigeration of foods susceptible to staphylococci is a preventative measure against its development.

T F 32. Epidemics due to bacteria of the salmonella group may be traced to the soil.

T F 33. Generally speaking, bacteria are killed at high temperature and are prevented from multiplying at low temperature.

T F 34. A person can usually tell by tasting whether a food is safe or not.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The planning of routine care and cleaning of equipment is the responsibility of the ________________.

2. If possible, it is best to have the ____________ of the firm who supplied the equipment give initial instruction to employees using the equipment.

3. One should use warm water and a __________ soap or __________ for removing grease from an electric range.

4. If food particles have hardened on steam kettles, the valves should be closed and filled with ________ _____________ and let stand until particles are softened.

5. Bowls in which egg mixtures or flour batters have been mixed should be soaked in __________ ___________ before washing.

6. When oil is applied on parts of the slicing machine which come in contact with food, it should be of the ________ type.

7. For good sanitary practices _______ __________ are the first step.

8. The most recent answer to the garbage disposal problem is the mechanical _________ _______________.

9. Less than _______ organisms per utensil surface is a minimum requirement for effective dishwashing procedure.

10. Dishes should be washed in water not less than ________F. and for at least ________ seconds in multitank machines.

11. In machine dishwashing, if the hardness of the water is _______ grains per gallon, a softener should be used; if it exceeds 10 grains it should be softened to ________ grains.

12. When a garbage disposal (grinder) is not used, a _____________ area may be required.

13. When possible, the lockers and restrooms for employees should not only be convenient to _______ areas, but also near the ___________ entrance.

14. A glazed tile wall in the kitchen and service area should be at a height of ________ to ________ feet.

15. One disadvantage of using daylight fluorescent lamps is that food assumes an __________ __________ under it.

16. The working heights for equipment should be from ______ to ______ inches.

17. Electrical equipment purchased for institutional use should be approved by the _________ _____________.

18. The responsibility for periodical appraisal of physical facilities and the initiation of changes is considered to be that of the head of the __________ _____________ department.

19. The most frequent cause of food poisoning is ___________ which affects the gastro-intestinal tract.

20. Fruits and vegetables are occasionally infected by ___________ ______________ which produces a serious poisoning known as botulinus.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. An equipment record does not contain the following item of information: (A) type of operation; (B) purchase date; (C) maintenance requirements; (D) trade name.

_____ 2. The equipment inventory record contains the following item of information: (A) maintenance procedures; (B) date of purchase; (C) free service period; (D) classification.

_____ 3. After thoroughly cleaning a broiler, one should apply and rub equipment with (A) oil; (B) soap; (C) warm water; (D) detergent to prevent rust.

_____ 4. The urn bag from the coffee urn should be emptied (A) before; (B) after; (C) during; (D) during or after each meal.

_____ 5. Refrigerators should be cleaned at least (A) once each week; (B) twice a week; (C) once each month; (D) twice a month.

_____ 6. Valves for machine dishwashing equipment should withstand (A) 50; (B) 75; (C) 100; (D) 125 pounds of pressure.

_____ 7. If the storage area for cleaning equipment is enclosed, approximately (A) 28; (B) 32; (C) 36; (D) 40 square feet is required.

_____ 8. The bacteria that grow most commonly in egg and milk mixtures are (A) salmonella; (B) trichinosis; (C) botulinus bacillus; (D) staphylococci.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. When ordering new parts for a piece of equipment the following data need to be indicated:

(A)____________________ (C)____________________

(B)____________________ (D)____________________

2. The minimum space allotted for the office should be ninety square feet to accommodate the following items:

(A)____________________ (C)____________________

(B)____________________ (D)____________________

3. Some factors which determine the amount and type of equipment purchased are:

(A)____

(B)____

(C)____

(D)____

(E)____

ADVANCEMENT AND CAREER OPPORTUNITIES

The demand for adequately trained food service supervisors in various types of institutions that serve food is great and will continue to increase. This type of work offers opportunity for advancement to those who have the essential personal traits and who are willing to make the necessary preparation to obtain the required skills.

In this assignment you will have the opportunity to learn the requirements and advancement opportunities in the food service supervisor field, as well as in related fields.

Assignment:

1. Read the reference listed below.
2. Answer the questions below and turn in this assignment by ________________________.

Reference:

I. Information Sheet No. 3.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

T F 1. One of the reasons for the increase in demand for food service supervisors is the transfer of functions formerly performed by the home to manufacturing or service industries.

T F 2. The skill of the supervisor to obtain the cooperation of workers has very little relation to the success and efficient operation of the food service department.

T F 3. The ability to get along with others is not nearly as important for the food supervisor as in other related health occupations.

T F 4. It is important for the supervisor to be competent in areas of work over which supervision is given.

T F 5. The food service supervisor's work is a type of work devoted to the serving and care of others.

T F 6. The demand for food service supervisor is great in institutions where the serving of food is of secondary importance.

T F 7. There is very little demand for food supervisors in nursing homes.

T F 8. The major duties of the food supervisor are similar in the different types of food serving institutions.

T F 9. The food service supervisor should not be expected to adjust menus for individual needs.

T F 10. A college degree in foods and nutrition is considered as a minimum educational requirement for food service supervisors.

T F 11. A trained food service supervisor receives training in supervision and management as well as in foods and nutrition.

T F 12. An adequately trained food supervisor is qualified to take the place of the dietitian in an institution serving food.

T F 13. All institutions must be approved by the American Dietetic Association in order to conduct training programs for food service supervisors.

T F 14. The financial return and prestige depends to a great extent upon a person's education and background.

T F 15. It is considered necessary to have adequate formal college training to advance and succeed in commercial food service work.

T F 16. The hours of work are generally longer in the industrial food service field than in most other types of food serving institutions.

T F 17. Food service supervisors often work their way up through the ranks in the industrial food service field.

T F 18. The food service supervisor in school food service is often asked to teach related classes but seldom required to supervise part-time student help.

T F 19. It is essential that a food supervisor employed in a hospital have both formal training for this type of work as well as some previou experience.

T F 20. The duties for which a hospital food service supervisor should train are those delegated by a trained dietitian.

T F 21. The responsibilities of a supervisor in a nursing home are similar to those performed in a hospital.

T F 22. The rapid growth and demand for food service supervisors is largely due to the excessive number of available dietitians.

T F 23. A knowledge of bookkeeping is considered essential for the dietitian.

T F 24. The salary of a dietitian is usually above that of others having similar educational and experience backgrounds.

T F 25. There is very little demand for specialized nutritionists.

T F 26. One of the responsibilities of a nutritionist is to advise patients in prenatal clinics.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The food service supervisor is responsible for the ____________ and ____________ of work produced by those working in the kitchen and those who serve foods.

2. Good supervision is the effective use of the ___________ of others to get things done.

3. The surest guarantee for success and advancement in the food service field is good ____________ and __________________ background.

4. The minimum experience that a food service supervisor should have is _________ months to __________ year(s).

5. An adequately trained food service supervisor for hotel work should have training in nutrition as well as in _______________ and ________________.

6. One advantage for factories providing food service to employees is to keep up the workers' ______________.

7. A type of food service which makes it unnecessary for a firm to establish its own food service program is the ______________ food service.

8. A food service supervisor is under the supervision of a ____________ in large hospitals.

9. The food supervisor in hospital service is responsible for instruction to those whom she supervises and also to both ______________ and _________________.

10. An individual planning to obtain a job in a hospital as food service supervisor should obtain formal training as well as a year's internship in a hospital approved by the ____________ ____________ ____________.

11. The dietitian has the over-all responsibility for the ______________ of the food served.

12. A bachelor's degree or above in ____________ ________________ is required to become a dietitian.

13. To become a nutritionist one should have at least ___________ years of college education in the specific phase of ___________ chosen.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

_____ 1. Because of a predicted shorter work week, the demand for food service supervisors will (A) decrease; (B) increase; (C) remain the same; (D) reamin the same or decrease.

_____ 2. A responsibility not considered that of the food service supervisor is (A) interviewing employees; (B) assist in menu planning; (C) delegate responsibilities to workers; (D) calculate and make out payroll.

_____ 3. The hours of work in a large institution are usually (A) shorter; (B) longer; (C) same; (D) more irregular than in small institutions.

_____ 4. An institution that serves food and is classified as commercial food service is a (A) bank; (B) department store; (C) secondary school; (D) nursing home.

_____ 5. The value of a trained food service supervisor is probably most recognized in the field of (A) school food service; (B) industrial food service; (C) nursing home food service; (D) none of these.

_____ 6. That which is not a duty of the dietitian is (A) keeping records; (B) making policy decisions; (C) cashiering; (D) instructing.

_____ 7. Following formal training, a dietitian serves an internship for (A) 6; (B) 12; (C) 18; (D) 24 months.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. A person deciding upon a career as food service supervisor must have a sound knowledge of:

(A)____

(B)____

(C)____

(D)____

(E)____

2. Either of two organizations generally approve institutions that provide for apprenticeship or internship; they are:

(A)____

(B)____

3. Six major areas or institutions in which a food service supervisor may find employment are:

(A)____________________ (D)____________________

(B)____________________ (E)____________________

(C)____________________ (F)____________________

4. Some advantages of working in educational institutions are:

(A)____

(B)____

(C)____

(D)____

(E)____

5. Some of the advantages of food service work in hospitals are:

(A)____

(B)____

(C)____

(D)____

(E)____

6. Dietitians may find employemnt in the following:

(A)__________________ (E)__________________

(B)__________________ (F)__________________

(C)__________________ (G)__________________

(D)__________________ (H)__________________

7. Employment opportunities for nutritionists exist in the following fields:

(A)____

(B)____

(C)____

(D)____

(E)____

(F)____

(G)____

Information
Sheet No. 3

ADVANCEMENT AND CAREER OPPORTUNITIES*

The long-time trend in our economy has been toward the transfer to manufacturing or service industries many of the functions formerly performed in the home. This trend has definitely increased the importance of and created a demand for the food service supervisor.

One must first understand the term "supervisor" as it pertains to food service. A supervisor of food services is one who is responsible for the quantity and quality of work produced by the kitchen and serving personnel as well as their general conduct. The success of the food service department depends largely upon the skill of the supervisor in obtaining cooperation from the workers.

One who is to advance in any type of occupation must have the ability to get along with others. Human relations is all-important for the work of food supervisor, as it is in other related occupations. The effectiveness of an organization depends largely upon the workers' morale, and this in turn is determined by the supervision which they receive. It has often been said that good supervision is the effective use of the ability of others to get things done.

The job of the food supervisor is in many ways like that of a teacher in that the supervisor must know the information and have the skill which she is trying to teach her employees. The supervisor must be competent in the areas of work performed over which she supervises.

Deciding on a Food Service Supervisor Career

Good educational and experience background is the surest guarantee for success and advancement in the food service field. One should have desirable personality traits which are considered necessary when dealing with people. The supervisor must use tact and be courteous, alert and attentive; she must cooperate with workers, receive supervision graciously, etc.

The supervisor must have a sound knowledge of the principles of nutrition, sanitation and service, food preparation, purchase of food, cost and record control, etc. Without this type of knowledge, the supervisor will find herself at a great disadvantage in her relationship with workers and for future advancement possibilities.

---

*Adapted from The Outlook for Women as Food-Service Managers and Supervisors, Bulletin 234-2, Womens Bureau, U.S. Department of Labor, 1952; and Job Descriptions and Organizational Analysis for Hospitals and Related Health Services, U.S. Department of Labor, U.S. Employment Service, 1952, pp. 210-212; 236-237.

One must enter this field as a career and not merely as another job, in order to be able to advance and succeed. The work is satisfying and offers interesting contact with people who also have devoted their time to the serving and care of others.

Need and Demand for Food Service Supervisors

There is a great demand for food service supervisors in various types of institutions where the serving of food is primary, as well as in places where the sale of food is of secondary importance. Due to the predicted shorter work week, this demand will undoubtedly continue to increase.

Some of the specific needs are in hospitals, nursing homes, schools, restaurants, commercial and industrial fields, and various other types of institutions that provide for group feeding. The demand for these needs can be met by an adequately trained supervisor.

Work and Responsibilities of a Food Service Supervisor

The work and responsibilities vary some according to the type of institution in which one works. Generally, however, the major duties are quite similar in these institutions. Some of these major duties are:

1. Direct supervision of food service activities
2. Prepare time and work schedules
3. Delegate responsibilities to workers
4. Maintain courteous and prompt service
5. Coordinate activities for efficient operation of the institution
6. Assist in worker activities
7. Conduct on-the-job instruction for employees
8. Maintain clear food area
9. Requisition food products and supplies
10. Check and receive deliveries
11. Take inventories
12. Maintain department records
13. Assist in menu planning
14. Maintain standards for food preparation
15. Adjust menus for individual needs
16. Interview employees

Working Conditions: The food supervisor generally preforms her work in a well-lighted, heated, ventilated and clean environment. The length of the work week varies considerably from one kind of institution to another. In the larger establishments more regular hours are maintained and generally fewer hours per week, whereas in smaller food serving institutions the supervisor may put in longer hours and there is a tendency toward irregular hours.

Education and Experience

Minimum Education: Many food service supervisors have come up through the ranks and may have had very little formal education. It is considered desirable to have some educational training in foods and nutrition as well as management or supervisory training, which may be obtained informally and in adult classes. A high school education with courses in home economics and other related courses is generally thought to be a minimum educational requirement for any kind of food service supervisory work.

Minimum Experience: A broad background of experience is necessary to effectively perform the job of a food supervisor. One should have six months to one year of supervisory training in either a hospital dietary department, cafeteria, dining room, hotel, restaurant, or similar institutions engaged in quantity food service. The greater amount of experience a person has the more probably will be the chance for advancement and success, especially if one lacks the desirable educational training.

The Trained Food Service Supervisor: The trained food service supervisor receives training in schools of home economics by taking a general home economics course or by specializing in foods and nutrition and institutional supervision and management. A course in foods and nutrition (often termed dietetics) includes training in institutional management as well as in the preparation of various types of diets.

Those trained as supervisors cannot take the place of a dietitian but oftentimes a dietitian will directly supervise the food service area. The trained supervisor is one who has completed a home economics course and has served some from of apprenticeship or internship before undertaking supervisory work. Institutions in which internship is done should be approved by the American Dietetic Association or the National Restaurant Association. Some institutions carry on their own training programs for food service supervisors. These generally have not been approved by any particular approving agency. One may also secure training in this line of work through various types of vocational and technical schools.

The greater amount of actual practical experience one can get while attending formal classwork in college, the better prepared she will be to work in her chosen occupation after her training is completed.

Areas of Opportunities

There are a great number of career opportunities open to persons trained as food service supervisor, one of the health occupations. The financial return, as well as prestige and status, depends to a great extent upon the training and experience background as well as the ability of the individual to do the work in the chosen field.

Commercial Food Service Field: There are not enough trained food supervisors to adequately staff the many openings in hotels, restaurants, and like institutions that serve food. These types of jobs require that one have training in nutrition as well as in supervision and management. Often the larger institutions make a distinction between administration and food service, the graduate of home economics and / or business being placed in the administrative positions with responsibilities such as purchasing and accounting.

Restaurants, cafeterias, hotels, department stores, clubs, inns, tearooms, camps, airports, and airlines are some of the possibilities of employment in the commercial food service field. Working conditions naturally vary with each one, depending on many factors, a few of which are size and type of institution.

One who is engaged in commercial food service work will perform the general duties of a supervisor as outlined previously. It is considered essential that one have adequate formal college training to advance and succeed in commercial food service work.

Industrial Food Service: This type of work is connected with factory, bank, utility and like establishments, the food service department being of secondary importance to the main product of the particular company. Industrial feeding has many advantages to management, one of which is to keep up worker morale.

This type of food service is large and is expanding. It has shorter hours of work than most types of food serving institutions. Salaries of top food supervisors compare favorably with those in school and hospital service. The policies, control, etc., is determined by management, which the supervisor is expected to carry out.

The industrial food service supervisor could expect to work in restaurants, cafeterias, canteens, lunchrooms, mobile canteens, etc. Those employed in this type of work are often not formally trained to as great an extent as those in school and hospital programs. They have, instead, worked their way up through-the-ranks.

School Food Service: The value of a trained food service supervisor is probably more recognized in school food service than in most other areas. One may be employed in the lower grades lunch program, the secondary, or on the college level. The duties often vary, especially in colleges.

The supervisor may be requested to teach related classes along with the accepted duties of a supervisor. She may assume home-management duties, supervise part-time student help, provide catering service, etc. The supervisor is often responsible for various methods and types of service being carried on simultaneously, such as cafeteria, dining hall, fountain service, etc.

There are many advantages to working in educational institutions, some of which are a pleasing environment, comparable pay to teachers, comparable rank, working with youth, and a feeling of accomplishment in a growing enterprise.

Concessionaires: This is a type of food service which cuts across all areas found in commercial, industrial and school food service. This service obviates the necessity of a firm to establish and run a food service program. The headquarters is usually located in large cities, out of which the concessionaire caters to various establishments.

Often the management and supervisory staff have come up through-the-ranks. The salary depends largely on the location of the concessionaires as well as the location of the particular institutions being served, and is also dependent on seasonal changes.

Hospitals: The food service supervisor who is employed in a hospital is under the supervision of a dietitian in large hospitals, and very often performs many of the dietitian's duties in the small hospitals. It is considered quite essential for the supervisor in a hospital to have formal training in nutrition and supervisory techniques, and also to have had previous related experience.

Hospital food service work has many advantages, some of which are: work in pleasant surroundings, healthful environment, association with other professional people, variety of services, and the feeling of contributing to the great cause of serving mankind.

The hospital food service supervisor has a very responsible position: as it is her duty to see that food is well cooked, has maximum palatability, and is acceptable by the patients who use this food for recovery from illness, as well as to maintain health. Food must also be prepared for and accepted by staff personnel who often eat at the hospital cafeteria or dining room.

The supervisor also participates in nutrition instruction to both patients and interns. She is responsible for instruction to those whom she supervises. She is generally concerned with the continual improvement of all types of food services.

The supervisor planning to enter hospital work should obtain formal training in food service work in colleges and universities, and should serve a year of internship in a hospital approved by the American Dietetic Association. Training should center around nutrition, food preparation techniques, food personnal supervision, food selection and purchasing, meal planning, and similar duties that are delegated to the supervisor by the trained dietitian.

The salary received for food service supervision is comparable to other occupations of equivalent training and experience.

Nursing Homes: The duties and responsibilities connected with the work of a food supervisor in a nursing home are similar to those experienced in hospitals. One who is planning to enter this work should obtain formal college training in nutrition, supervision and management techniques and in related areas.

Institutions are generally not quite as large as hospitals, but many of the same advantages are present. The greatest joy received in this type of work is the service rendered to humanity and the appreciation received from others for this service.

Dietitian

There exists a great shortage of dietitians in the United States today which accounts, in part, for the rapid growth and demand for food service supervisors. The dietitian enjoys very favorable working conditions and has the opportunity to associate with fellow professional people with like interests.

Types of Work Performed: The dietitian has the over-all responsibility for the quality of food served. She must be up-to-date in the field of nutrition as well as administrative and supervisory techniques. Her special duties include supervising food preparation, formulating menus, determining dietary needs, controlling costs, keeping records, instructing, conferring with physicians, making policy decisions, and generally supervising through the food service supervisor.

Knowledge Required: The dietitian must have a thorough knowledge of the organization and operation of the dietary department. She must also have a knowledge of practices of dietetics, nutritional requirements, special diet requirements, physiology and digestion processes, bacteriology principles and new developments in the dietetic field. The dietitian must be very familiar with and have ability to apply principles of personnel administration. A knowledge of mathematics and bookkeeping is also essential.

Employment Opportunities: A large percentage of dietitians are found in hospitals, as well as in the following fields of work:

1. Teaching fields
2. School lunch programs
3. Commercial food service
4. Industrial food service
5. Public health nutrition
6. Consulting work
7. Writing and research

Training and Experience Requirements: A bachelor's degree or advanced degree in home economics from an accredited college or university, with a major in foods, nutrition and/ or institutional management, is required. This field of study should be supplemented by courses in chemistry, food preparation, meal planning, management, diets, diseases, and methods of teaching.

Following the formal training, the dietitian serves an internship of a year in a hospital or other institution offering dietetic internship approved by the American Dietetic Association.

The salary which a dietitian receives is comparable to that of other professional people of similar training and experience.

Nutritionist

Well-trained nutritionists, especially with graduate training in certain phases of human nutrition, are in demand. The food service supervisor desiring to become a nutritionist must secure the required formal education as well as the necessary experience.

The nutritionist may find employment in the following fields:

1. Nutrition clinic
2. State and local public health departments
3. Federal government services
4. Red Cross
5. International work
6. Nutrition instructor
7. Nutritionist in industry

Some of the duties which a nutritionist performs are:

1. Assist the training of nurses and student nurses
2. Advise patients in prenatal clinics
3. Plan school nutrition projects
4. Aid in health meetings
5. Consultation work
6. Research and experimentation
7. Teaching responsibility both in general college courses as well as in medical and dental schools

Training and Experience: One should have at least four years of college education in the particular phase of nutrition chosen. The college or university must be selected with care, one that enjoys the respect of the employing institutions. The course generally consists of training in the sciences and nutrition and their practical application, and training in educational methods as applied to nutrition. One should also, and in many cases is required to, have practical experience in related work so as to provide a better background for the work.

Automotive Body Repairman, Suggested Guide for a Training Course.

Roney, Maurice W.
Office of Education, Washington, D.C.
Pub Date - 65
MF AVAILABLE IN VT-ERIC SET 38p.

*CURRICULUM GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *AUTO BODY REPAIRMEN, *MOTOR VEHICLES, POST SECONDARY EDUCATION, PROGRAM PLANNING,
MDTA Programs,

This curriculum guide is for administrator and teacher use in planning and developing a post-high school course to prepare persons for employment as auto body repairmen. It was developed by the Oklahoma State University under contractual arrangements with the U.S. Office of Education Division of Vocational and Technical Education. Some of the nine instructional units are (1) Automotive Metals, (2) Frame Straightening, (3) Refinishing Processes, and (4) Glass Removal and Replacement. Each unit gives the classroom and shop time allocation, objectives, unit outline, suggested shop exercises, and study references. The time allocations serve to indicate the relative emphasis to be placed on each area and may be changed to adapt the course to local conditions and to the background of the trainees. The course is designed for 245 hours of classroom and 1,515 hours of shop work. The teacher must have experience in automotive body repair, and the student should have manual dexterity and an appreciation of quality workmanship. The U.S. Employment Service General Aptitude Test Battery for automotive body repairmen is suggested as an aid in trainee selection. Suggestions for teaching the course, a list of references and films, and suggested machines, tools, equipment, supplies, and training facilities are included. (HC)

Training Course

AUTOMOTIVE BODY REPAIRMAN

U.S. Department of Health, Education, and Welfare

Office of Education

AUTOMOTIVE BODY REPAIRMAN

(D.O.T. Occupational Code 807.381)

Suggested Guide for a Training Course.

U.S. Department of Health, Education, and Welfare
John W. Gardner, Secretary

Office of Education
Harold Howe II, Commissioner

Manpower Development and Training Program

FOREWORD

The automotive body repairman is one of the more highly skilled and better paid mechanics in the automotive field. The demand for body repairmen far exceeds the present supply due to the ever-increasing number of automobiles and their use in our mobile society. The major portion of the automotive body repair business is conducted by small shops; therefore, the opportunities for eventual self-employment in this field are very good.

The purpose of this guide is to assist administrators and teachers in organizing courses and developing course content in preparing workers for employment in this occupation.

The guide was prepared for the Division of Vocational and Technical Education under contractual agreements with the Oklahoma State University. Recognition is given to Maurice W. Roney, Director, School of Industrial Education, Oklahoma State University, for supervising the development of content; to L. Carl Love, Oregon State College, for his assistance as consultant during the preparation of this guide; and to Dennis N. Chapman, Head, Automotive Department, Oklahoma State Technical Institute, as well as selected teachers in vocational schools and auto body specialists who contributed to the development of technical content.

This guide contains nine major units covering 1,760 hours of instruction in the classroom and laboratory-shop. The sequence of units and the hours assigned to each unit are flexible; therefore, both the time and content may be adjusted to better meet local needs.

A suggested list of machines, tools, equipment, supplies, textbooks, films, and a floor plan of the training facility have been included to assist school administrators and teachers in organizing the course. The assistance of local advisory groups should be sought for guidance in selecting equipment which will best serve the local conditions. Modifications of the suggested shop layout should follow advisory committee recommendations.

Walter M. Arnold
Assistant Commissioner for
Vocational and Technical Education

TRAINING COURSE FOR AUTOMOTIVE BODY REPAIRMAN

COURSE UNITS

TEACHING THE COURSE

APPENDIXES

TRAINING COURSE FOR AUTOMOTIVE BODY REPAIRMAN

Purpose of the Guide

This training guide has been prepared to assist in planning and developing a course of training for workers who will be employed to repair or replace parts of the automobile body and chassis. The guide has been organized in a manner to be of maximum value to school administration personnel who may not themselves be specialists in the occupation. Sufficient detail has been included, however, to provide an outline of instruction for the instructor who will be responsible for the operation of the training program.

The suggestions outlined in the training guide are not meant to delineate instruction in every detail. Supplemental material can be found in the suggested textbooks, references, and films. Further, the suggested course outline may require modification to meet special needs. The sequence of presentation as well as the final selection of topics for special emphasis should be determined by the instructor and will vary, depending on the needs and background of the trainee group.

Although this guide has been developed primarily for use in the Manpower Development and Training program, it includes instructional material that can be useful in planning similar programs for secondary school vocational students. Some of the related material included in the course outline has been added to assist the trainee to progress beyond the entry level job.

Job Description

The work of the automotive body repairman consists of those jobs which require a knowledge of automotive construction and a relatively high degree of manual dexterity. In the larger shops, repairmen are generally assigned to special phases of the work. However, in the small shops, one person may be required to do satisfactory work on several jobs ranging from complete body rebuilding to frame straightening. Since there is so much diversity in requirements, the good repairman should have a broad background of training, even though he may, at some point, be required to specialize.

Any one or all of the specializations described below may be performed by the automotive body repairman, depending on the size of the shop.

1. Estimating - examines automobiles driven into garage by customers and determines need and cost of repairs; attempts to sell needed repair service to customers, estimating and quoting costs of repairs.
2. Metal working - straightens or replaces damaged body areas by hammering, jacking, picking, filing, buffing, filling with lead or synthetic material, shrinking, welding, using metal screws and various cutting methods.
3. Sanding - prepares all of the original finish for repainting in addition to sanding and resanding surfaces coated with primer.
4. Painting - masks areas to be free of over-spray. Sprays required coats of metal primer and surfacer to extablish adequate base and finish coats. May control drying lights or baking ovens.
5. Upholstering - repairs or replaces upholstery and fabric tops of automobiles and trucks, following written or verbal orders. Removes old upholstery, rebuilds springs and padding, and may sew patches over small holes in upholstery. Cuts covering material to size, stretches covering over roof, and replaces gutters and molding.
6. Aligning frame - checks frame alignment and makes adjustments as necessary by straightening members or replacing old members by welding and riveting.

7. Installing front end parts - estimates when parts are damaged beyond repair and installs new front end parts or assemblies.
8. Installing glass - removes old glass, checks glass channel and guide, replaces or repairs faulty window mechanisms, installs new glass, seals and waterproofs windows and windshield.

The automotive body repairman is employed in practically every community, large and small. The Occupational Outlook Handbook, 1966-67 Edition, states that approximately 90,000 auto body repairmen were employed in early 1965. This handbook also states that trained men are not available to fill the existing positions. This condition has existed for a number of years, primarily because a great deal of experience is necessary in order to become a skilled body repairman. Poor workmanship is exposed to view in automotive body repair, therefore, only top quality work is acceptable.

Earnings depend upon the workers skill and efficiency since they are generally paid on a commission basis. This commission may range from 40% to 60% of the customer's cost. Workers in various locations can expect from $2.50 to $4.30 per hour while some yearly earnings reach $10,000. Well-trained and experienced workers may fill better paying positions as shop foremen, insurance claims adjusters, or may go into business for themselves.

The opportunities are expected to increase as the number of vehicles grows. A leading automotive magazine showed 81,557,060 privately owned vehicles in the U.S. in 1963, a gain of 4.6% over 1962.

Length of Course and Course Units

The training program, as outlined, covers a period of 44 weeks and includes a total of 1,760 hours of class instruction and laboratory-shop practice. The training is intended to progress at a rate of 8 hours per day, 5 days per week.

Major Divisions of Instruction

Unit	Title	Suggested class hours	Suggested laboratory hours
I.	Orientation to Automotive Body Repair	10	20
II.	Automotive Metals	20	20
III.	Body Panel and Fender Straightening	50	480
IV.	Welding and Leading	30	240
V.	Frame Straightening	25	155
VI.	Front End Repair and Alignment	10	40
VII.	Refinishing Processes	50	350
VIII.	Removing and Replacing Upholstery and Trim	20	60
IX.	Glass Removal and Replacement	30	150
	Sub-total	245	1515
			245
		Total	1760

The allocation of hours to each unit of instruction serves to indicate the relative emphasis to be placed on these areas. Since this program represents a typical situation, changes in the distribution of time may be necessary to adapt this program to local conditions and to the background of the group in training. The instructor should use his own discretion in applying the stated ratio of classroom time to actual shop practice.

Qualifications of Trainees

Although no reliable method has been found to identify persons who will be successful in this field, there are certain qualities and abilities an individual should possess. Manual dexterity and an appreciation of quality workmanship are of great significance if the trainee is to succeed. The work of an automotive body repairman must frequently be done in an environment which at times is contaminated with dust and paint spray. Persons who are allergic to paint fumes associated with this type of work should not be admitted to the training program.

An aid in the selection of trainees, the U.S. Employment Service General Aptitude Test Battery B-593 for Automotive Body Repairman, should be utilized.

Teacher Qualifications

The instructor for this program must have experience in automotive body repair, and preferably, should have business experience as manager of an automotive body repair shop.

If the person selected for this teaching assignment has no teaching experience, he should be given certain fundamental principles of lesson planning and presentation.

Suggestions for the Organization of Instruction

The program in this training guide is intended to develop a marketable skill and, at the same time, to provide the trainee with a background that will permit him, at some appropriate time, to specialize in one of the many areas of work found in the automotive body repair industry.

Laboratory experiences, as well as classroom instruction, should be carefully selected by the instructor to furnish work experiences of the many tasks that challenge the trainee after he becomes employed in the trade. It is advisable to inform local automotive body shops of the nature of the program and to arrange for visits to local industries to observe work of special related interest.

It should be noted that this training guide is designed for a class of twenty persons, while the optimum trainee-teacher ratio in the laboratory-shop would be about 10:1. A great deal of individual instruction and close supervision is required to teach the skills of such a divergent field, expecially during the early part of the program.

Course Unit I

RELATED INSTRUCTION

Training Time — Classroom, 10 hours; shop, 20 hours

Objectives

To orient the trainee to the automotive body repair trade
To provide a basic understanding of automobile body and chassis construction
To familiarize trainees with the tools of the trade, including, nomenclature, use, maintenance and safety

Unit Outline

A. The automotive body repairman
   1. Primary duties (skills)
   2. Opportunities (locally and nationwide)
   3. Pride in workmanship
   4. Wages
B. Types of body construction
   1. Manufacturer (model, make)
   2. Materials
      a. Types
      b. Shapes
      c. Size or gauge
      d. Characteristics
C. Types of chassis - frames
   1. Ladder
   2. X Frame
   3. Offset
   4. Offset with X members
   5. Unitized
D. Hand tools
   1. Nomenclature
   2. Uses
   3. Care and maintenance
   4. Safety
E. Power tools and special equipment
   1. Nomenclature
   2. Uses
   3. Care and maintenance
   4. Safety
F. Parts manual
   1. How to use
   2. Estimating
   3. Ordering
G. Safety in the shop
   1. Rules and regulations
   2. Good housekeeping

Suggested Shop Exercises

1. Demonstrate and practice the proper use and maintenance of hand and power tools, and special equipment.
2. Practice use of the parts manual in ordering specific parts and making cost estimates.

Motor Service's Automotive Encyclopedia.
Crouse, William Harry. Automotive Chassis and Body: Construction, Operation and Maintenance.

Course Unit II

AUTOMOTIVE METALS

Training Time — Classroom, 20 hours; shop, 20 hours

Objectives

To develop skills in analyzing damage patterns and provide practice in shrinking body and fender sections.

Unit Outline

A. Types of metals
   1. Properties
   2. Uses
B. Physical metallurgy
   1. Weldability
   2. Hardening
   3. Annealing
C. Strength of automobile body members
   1. Door panels
   2. Fenders
   3. Hood
   4. Trunk
   5. Cowl
   6. Floor Panel
D. Damage pattern
   1. Analyzing procedures
   2. Corrective measures
      a. Repair
      b. Replace
E. Shrinking procedures

Suggested Shop Exercises

1. Make an analysis of damage patterns
2. Practice shrinking body and fender sections

References

Athanson, William J. Automobile Body Repair and Paint Guide.

Venk, Ernest, Edward D. Spicer, and Ewart J. Davies. Automotive Collision Work.

Course Unit III

BODY PANEL AND FENDER STRAIGHTENING

Training Time — Classroom, 50 hours; shop, 480 hours

Objectives

To develop skills in the straightening of body panels and fenders.

Unit Outline

A. Analyzing damaged areas
   1. Impact area
   2. Type of damage

B. Roughing-out sequence

C. Tools required
   1. For raising low spots
   2. For removing deep bends
   3. For flattening high spots

D. Files and buffing equipment
   1. Proper use
   2. Care and maintenance

E. Estimating damage
   1. Flat rate manual
   2. Time and materials cost

Suggested Shop Exercises

1. Roughing-out and straightening body damages utilizing dollies and hammers (manual and air).
2. Exercises in metal finishing procedures using files and buffer.
3. Submit job estimates on each assignment.

Course Unit IV

WELDING AND LEADING

Training Time — Classroom, 30 hours; shop, 240 hours

Objectives

To develop selected skills in oxyacetylene and arc welding, and leading.

Unit Outline

A. Principles of welding and brazing
B. Oxyacetylene procedures
   1. Use and care of equipment
   2. Proper flame adjustment
   3. Welding techniques
   4. Cutting techniques
   5. Safety practices
C. Arc welding equipment
   1. Operation of arc welding machine
   2. Use and care of equipment
   3. Welding techniques
   4. Safety practices
D. Brazing
   1. Advantages and disadvantages
   2. Brazing techniques
E. Leading (soldering)
   1. Principles
   2. Types of filler
   3. Preparation of body for leading
   4. Leading procedures
   5. Leading finishing
      a. Grinding
      b. Filing
      c. Sanding
F. Safety procedures
G. Safety equipment

Suggested Shop Exercises

1. Practice oxyacetylene welding, and brazing of body and chassis metals
2. Practice metal arc welding of frame and cross member sections
3. Practice cutting of body and chassis metals using oxyacetylene equipment
4. Use filling materials to repair auto bodies
5. Practice grinding, filing and sanding filled body sections

Vale, John W. Modern Auto Body and Fender Repair.

Course Unit V

FRAME STRAIGHTENING

Training Time — Classroom, 25 hours; shop, 155 hours

Objectives

To develop skills in the straightening of automotive frames and bumpers.

Unit Outline

A. Frame testing and checking equipment
  1. Steel rule
  2. Tram gauge
  3. Self-centering gauge
  4. Principles of body-frame correction machine
B. Replacement versus repair
  1. When
  2. Why
C. Bumper straightening and arm alignment
  1. Tools required (hand and power)
  2. Procedures
D. Estimating
  1. Flat rate manual
  2. Time and material cost

Suggested Shop Exercises

1. Exercises in frame and arm alignment, bumper straightening
2. Remove and replace cross members
3. Demonstrations showing frame replacement
4. Exercises for holding and applying pressure to frame members
5. Submit job estimate for each assignment

References

Crouse, William Harry. Automotive Chassis and Body: Construction, Operation, and Maintenance

Venk, Ernest, Edward D. Spicer, and Ewart J. Davies. Automotive Collision Work.

Course Unit VI

FRONT END REPAIR AND ALIGNMENT

Training Time — Classroom, 10 hours; shop, 40 hours

Objectives

To develop skills in the installation and alignment of front end parts.

Unit Outline

A. Front end section alignment
   1. Tools and equipment
   2. Checking alignment procedure
   3. Straightening sequence

B. Steering mechanism
   1. Operating principle
   2. Assembly
   3. Nomenclature

C. Estimating
   1. Front end section repair and alignment
   2. Steering assembly repair

Suggested Shop Practices

1. Check front section alignment and use necessary tools and equipment to align
2. Repair and assemble steering assembly
3. Submit job estimates on front end section and steering assembly repair

References

Crouse, William Harry. Automotive Chassis and Body: Construction, Operation, and Maintenance.

Venk, Ernest, Edward Spicer, and Ewart J. Davies. Automotive Collision Work.

Course Unit VII

REFINISHING PROCESSES

Training Time Classroom, 50 hours; shop, 350 hours

Objectives

To develop selected skills in refinishing automotive body panels and fenders.

Unit Outline

A. Types of Paint
  1. Lacquer base
    a. Advantages
    b. Disadvantages
    c. Precautions when using
  2. Synthetic base
    a. Advantages
    b. Disadvantages
    c. Precautions when using
B. Prepainting procedures
  1. Remove all rusty surfaces
  2. Patch all holes or breaks
  3. Fill and smooth all indentations
  4. Sand all flaking and chipped paint areas
  5. Apply primer coat properly
  6. Properly mask areas not to be painted
C. Operating techniques of paint sprayers
  1. Nomenclature
  2. Spray adjustment
  3. Proper spraying techniques
  4. Disassembly and cleaning
  5. Maintenance and care of spraying equipment
D. Drying
  1. Bake dry process
  2. Air dry process
E. Rubbing, polishing, and waxing
  1. Materials
  2. Procedures
F. Job estimating
  1. Flat rate manual
  2. Time and materials cost
G. Safety
  1. Ventilation
  2. Flammable material
  3. Personnel protective equipment
    a. Gloves
    b. Mask
    c. Goggles

Suggested Shop Exercises

1. Prepare body surfaces using files, grinders, and sanders (hand and power equipment)
2. Practice proper and efficient masking procedures
3. Practice painting portions of auto body and spot painting, using the sprayer
4. Disassemble, clean, and reassemble spray equipment
5. Use rubbing compound, wax, and polish, by hand, and with buffing equipment
6. Practice refinish shop job estimating

Course Unit VIII

REMOVING AND REPLACING UPHOLSTERY AND TRIM

Training Time — Classroom, 20 hours; shop, 60 hours

Objectives

To develop skills in removing and replacing upholstery and trim.

Unit Outline

- A. Seat construction
  - 1. Adjustment assembly
  - 2. Springs
  - 3. Padding material
  - 4. Upholstery and trim material
  - 5. Buttoning
- B. Interior head lining
  - 1. Proper care
  - 2. Removal techniques
  - 3. Replacement techniques
- C. Door and quarter panel
  - 1. Door operating assembly
  - 2. Nomenclature
  - 3. Removal and replacement
- D. Moulding and trim
  - 1. Construction
  - 2. Installation
- E. Estimating
  - 1. Flat rate manual
  - 2. Time and material cost

Suggested Shop Exercises

1. Remove and adjust seats
2. Remove and replace head lining
3. Remove and install new interior panels
4. Remove and replace moulding and trim
5. Recover front and back seats and arm rests
6. Submit job estimates for each job

References

Motor Service's Automotive Encyclopedia.

Venk, Ernest, Edward D. Spicer, and Ewart J. Davies. Automotive Collision Work.

Course Unit IX

GLASS REMOVAL AND REPLACEMENT

Training Time — Classroom, 30 hours; shop, 150 hours

Objectives

To develop skills in the removal and replacement of automotive glass.

Unit Outline

A. Types of automotive glass
  1. Safety
  2. Laminated
  3. Tinted
B. Window regulators
  1. Nomenclature
  2. Assembly operation
C. Glass removal and installation
  1. Wind shield and rear window
  2. Door windows
D. Job estimating
  1. Flat rate manual
  2. Time and materials cost

Suggested Shop Exercises

1. Make trial orders for glass replacement
2. Exercises in repairing window regulators
3. Assignments of removing glass without damage
4. Install glass and glass channels
5. Submit job estimate with each assignment

References

Athanson, William J. Automobile Body Repair and Paint Guide.

TEACHING THE COURSE

Planning the Lesson

The best guide or lesson plan is, of course, one that has been prepared by the individual instructor, based on personal experiences and manner of teaching. Although instructors differ in their ways of organizing and coordinating important parts of their presentations, they agree that the purpose of a lesson is to present effective and meaningful classroom instruction.

Written plans may be brief, but the good instructor will know before the class starts:

1. The goals or objectives of the lesson - the kind of learning desired
2. The outline and suggested time schedule for the lesson, including:
   a. An interest approach - a way to introduce the lesson, to capture the interest of the trainees and to direct their attention to the lesson's goals or objectives
   b. Activities which will involve the trainees in discovering new facts and principles, solving realistic problems, or practicing skills
   c. A way to summarize the lesson - to help trainees arrive at some valid conclusions and/or to evaluate the extent to which lesson goals have been achieved
3. The subject matter content - the facts and principles or main ideas to be brought out in the lesson
4. The teaching materials and references to be used

Training Facility Considerations

The intent of this section of the training guide is to describe typical training facilities. It is recognized, however, that flexibility is required in order to meet local requirements. Shop layouts and equipment lists illustrate the minimum rather than optimum programs. The training facility floor plan, see Appendix E, represents what can be done with a minimum size physical plant. However, if existing buildings are utilized, the vehicle stalls may not be accessible from the outside. In this case, the building should be wide enough to permit locating a center driveway 25 feet wide. If the working stalls are located at a 45 degree angle, the aisle width could be reduced to 16 feet.

A separate classroom is recommended for this training program. This will permit trainees to concentrate much better than would be possible in the environment of the working area where many distractions may exist. Also, this classroom will permit shelf space in a convenient location for a reference library, encouraging greater use of reference materials.

The parts and tool room, as shown, would be stocked with a few common parts and speciality tools which may be used to give trainees experience in writing requisitions. A service counter, opening to the parts and tool room, should be available to control and access to tools.

Items necessary for personal comfort would include lighting, heating, cleanliness, and control of contaminated air. Optimum lighting conditions would require illumination of 50 foot candles at 30 inches above floor level. Radiant heating in the floor is recommended for geographical areas of severe cold. However, any environment control system capable of maintaining 68°F (plus or minus 4°F) for the cold season, and a summer temperature control which provides good ventilation will suffice. An air filter system for the general working area to trap spray and dust particles is recommended, especially during cold weather when all doors and windows are closed. The welding booths should be connected to the exhaust system by a hood with a 6" x 14" intake opening. The hood should be located within 12 inches of the welding zone. In addition to this, the spray booth should have its own exhaust system. It is advisable to consult local regulations before construction of the spray booth. A system of floor drains or gutters (not shown) would be conducive to good housekeeping.

In maintaining the policy of indicating a minimum facility, no space has been designated for an air compressor or a parts cleaning tank. It would be highly desirable to have available extra room for these two pieces of equipment although it is not mandatory. The parts cleaning tank should have at least a 100 gallon capacity, and should be provided with a circulating pump and filter.

Since specific items of equipment have been chosen to represent a typical training situation, instructors responsible for particular programs may wish to adapt this training guide to meet the needs of local conditions and the background of their trainees.

In the list of equipment, see Appendixes A, B, and C, prices have been included for the purpose of indicating approximate quality of each item; and, again, considerable flexibility must be recommended. More detailed specifications will be needed should this list be used for writing purchase orders.

Criteria for Judging Trainee Readiness for Employment

The criteria which serve as guides for determining whether the trainee is ready for employment as an automotive body repairman may be more rigorous than in some other occupations. However, some understanding and insight into how to provide various services are of such importance that every attempt be made to evaluate trainee progress.

The use of various evaluative devices is necessary for the instructor and the trainee to accumulate objective information about the growth of the trainee. The following personal qualities and characteristics should be developed or strengthened during the training program.

A. Personal qualities:

1. Courtesy, friendliness, and tact in dealing with supervisors, fellow workers, and the general public
2. Acceptable appearance - good grooming, cleanliness and neatness in dress, sensible choice of clothing
3. Good personal habits in speech, mannerisms, neatness and method of work
4. Acceptable attitudes - calmness in disorganized situations, cooperativeness, willingness to work with others
5. Understanding the role of the Automotive Body Repairman

B. Activities showing knowledge, understanding, and skills:

1. Demonstrates knowledge of automotive body repair work
2. Understands and conforms to instructions or directions
3. Demonstrates ability to work with minimum immediate supervision
4. Demonstrates the ability to keep repair facilities clean and orderly
5. Demonstrates the ability to properly use and maintain tools used in automotive body work
6. Demonstrates the ability to develop and follow a work plan or schedule
7. Demonstrates understanding of basic safety precautions

Appendix A. SUGGEST LIST OF MACHINES

Quantity	Description	Total cost estimated
1	Compressor, air, 15 h.p.	2,075.00
1	Shear, metal cutting, bench model	250.00
6	Welding and cutting units, gas, portable	1,050.00
4	Machines, arc welding, 250 amp capacity	1,100.00
1	Drill press, ½" chuck capacity	450.00

Appendix B. SUGGESTED LIST OF TOOLS

Quantity	Description	Total cost estimated
20	Hammers, double faced dinging	62.00
20	Hammers, pecking	60.50
20	Hammers, long body finishing	71.00
20	Hammer, finishing for fender bends	57.00
20	Dolly assortments, 6 pieces	420.00
20	Hammers, sledge, 3 lbs	95.00
20	File, assortments and file holders, 8 pieces	442.00
20	Plier assortments, 8 pieces	490.00
20	Screw driver sets, standard tip, 5 pieces	185.00
20	Screw driver sets, phillips head, 5 pieces	157.00
20	Punch and chisel sets, 12 pieces	165.00
20	Snips, combination pattern sheet metal, 13½" length	140.00
20	Snips, aviation, sets(1 right hand, 1 left hand)	75.00
20	Wrench sets, combination, box and open end, 15 wrenches	820.00
20	Wrench, socket, ½ square drive, 25 piece set	825.00
1 pr.	Cutters, bolt, with 24 inch handle	10.50
12	Clamps, "C", 6 inch opening	72.00
1	Punch and drift set, 6 pieces	6.00
6	Chisels, cold, 1 inch wide blade	6.00

Quantity	Description	Total cost estimated
2 sets	Drills, twist, high speed, with metal index	60.00
6	Hammers, 2-ball peen, 2-sledge, 2-soft face	14.00
2	Bars, pry	10.00
10	Frames, hack saw, adjustable to 12 inches	30.00
8	Saws, hole, 3/4 inch to 3 inch diameter	38.00
1	Saw, saber	50.00
1	Cutter, panel, pneumatic, complete with one set of 3 chisels	250.00
2	Soldering irons, 200 watt	25.00
2	Soldering guns, 250 watt	24.00
2	Rules, steel	2.00
2	Tapes, steel, 25 ft. long	10.00
1	Tap and die set, $\frac{1}{4}$" to $\frac{1}{2}$" size, in N.C. and N.F. and 4 x 36 to 12 x 24 size in machine screw thread	38.00
1	Insert tool, head lining	2.25
1	Aiming machine, head light	15.00
2	Socket sets, $\frac{1}{4}$" drive, 19 pieces	42.00
1	Wrench set, metric, 3/8" drive, to 27 mm	35.00
2	Drills, portable, electric, $\frac{1}{4}$" capacity	65.00
1	Drill, portable, electric, $\frac{1}{2}$" capacity	50.00
6	Sanders, body, 9" disk, electric	590.00
2	Sanders, block type, electric or air	180.00
2	Buffer-polishers	180.00

Quantity	Description	Total cost estimated
3 doz.	Files, assortment	49.00
1	Flaring tool, 3/15 to 4/8" O.D. tubing	15.00
6	Wrenches, adjustable 4" to 16"	28.00
2	Wrenches, pipe, 14" length	9.00
24	Clamps, body	250.00
36	Pliers, vise grip	90.00
6	Spoons, pry	20.00
6	Spoons, bumping	15.00
6	Spoons, body	15.00
6	Spoons, general	24.00
6	Spoons, rough service	24.00
6	Spoons, combination	24.00
2	Pry rods	15.00
2	Gauge, tram, length 114"	50.00
6	Gauge, self-centering	200.00

Appendix C. SUGGESTED LIST OF EQUIPMENT

Quantity	Description	Total cost estimated
20	Lighters, torch, with one flint	7.00
20	Goggles, welding	60.00
20	Cabinets, tool, mounted on heavy duty rollers	600.00
1	Desk, 5 drawer	120.00
20	Chairs, tablet arm	240.00
10	Lockers, personnel, steel, double compartments 72" x 24" x 18"	400.00
1	Projector, motion picture, 16 mm sound	220.00
1	Projector, still, for slides	135.00
1	Projector, overhead	120.00
1	Screen for showing pictures, 6' x 6'	36.00
2	Jack, body, complete with pump and ram, 10 ton capacity	338.00
2	Jacks, body, complete with pump and ram, 2 ton capacity	404.00
1	Jacks, frame, 10 ton capacity	650.00
3	Jacks, floor, hydraulic, 2 ton capacity	525.00
24	Stands, floor, automotive	420.00
6	Rick racks, for holding body panels 24" x 48"	140.00
6	Benches, for metal work, metal top, 30" x 72"	540.00
7	Air pressure regulators, with moisture traps, 0-100 lb gage	350.00
1	Table, demonstration, 30 x 62" top	60.00

Quantity	Description	Total cost estimated
7	Hoses, air, 3/8" I.D., 50 foot length	120.00
2	Racks, paper	60.00
1	Press, hydraulic, 5 ton capacity	250.00
12	Creepers, low profile	120.00
4	Vises, 4" jaw, 6" opening, swivel base	170.00
4	Extinguishers, fire	190.00
1	Hoist, chain, 2 ton capacity	367.00
1	Light, drying, complete set with 8 heating elements	150.00
8	Hoses, water, 5/8 I.D., 25 feet long	64.00
3	Pans, drain, 3 gallon capacity	12.00
3	Containers, waste, with lids	15.00
12	Covers, fender, with rubber backs	72.00
6	Covers, seat, spread	36.00
6	Guns, spray, siphon cup type	360.00
1	Gun, spray, hot spray type	86.00
6	Brushes, wire, 12" length	3.60
6	Brushes, striping	4.80
9	Brushes, paint, assorted sizes	22.00
12	Paddles, solder	12.00
1	Trimmer, sanding disc	17.50
4 doz	Brushes, flux	6.00
12	Lights, extension, moulded rubber handle	36.00
12	Plates, tension, solder-on type	48.00

Appendix D. SUGGESTED LIST OF EXPENDABLE SUPPLIES

Quantity	Description	Total cost estimated
20 gal	Stripping material, (paint remover)	110.00
20 gal	Primer	120.00
55 gal	Paint thinner, enamel	88.00
5 doz	Masking tape, ½", 1", 1½"	60.00
55 gal	Paint thinner, lacquer	54.00
3 gross	Sanding discs, 24, 36, and 50 grit	95.00
200 lbs	Body solder, 50-50 (60-40 optional)	160.00
12 jars	Solder flux	14.00
144	Tack rags	36.00
144	Steel wool, pads	15.00
24	Solder paddle lubricant	12.50
6 cyl	Oxygen	24.00
6 cyl	Acetylene	24.00
500 lbs	Welding rods and electrodes	150.00
100 lbs	Brazing rods	130.00
1500 sheets	Sand paper, 80, 200, 400 grit	150.00
200	Shop towels (wiping rags optional)	20.50
2 qts	Jack fluid, hydraulic	1.20
12	Buffer pads, wool	36.00
1 assortment	Machine bolts and nuts, ¼" through 5/8", ½" to 2½" length	60.00
1 assortment	Machine screws, 6 x 32 through 10 x 24, ½" to 1" length	20.00

Quantity	Description	Total cost estimated
10 gross	Sheet metal and selftapping screws	15.00
20 lbs	Steel washers	7.50
500	Lock washers	5.00
20 gross	Hack saw blades	60.00
20	Practice fenders (used)	60.00
20	Practice panels (used)	60.00
4	Practice paint boards, paper covered	120.00
50	Sheet metal, 12" x 18", practice, 20-22 gauge	25.00
2	Stretchers, sheet metal strip	18.00
1	Cutaway section, roof rail	12.00
1	Cutaway section, rocker panel	12.00
6	Lock mechanisms, door	24.00
4	Lock mechanisms, trunk	12.00
1	Cutaway section, floor pan and drain	14.00
4	Window regulators, side	8.00
3	Window regulators, vent	6.00
1	Window regulators, rear, station wagon	8.00
24	Moulding clips, assortment	6.00
10 gal	Synthetic filler material	60.00
5 gal	Glass sealer with dispenser	20.00

*OCCUPATIONAL HOME ECONOMICS, HOME MANAGEMENT, FAMILY LIFE, PROGRAM DEVELOPMENT, *CURRICULUM GUIDES, TEACHING GUIDES, PUBLIC HOUSING, *MANAGEMENT AIDES,
MDTA Programs,

Resource material is provided for use in developing a training program for management aides, persons who assist housing managers of local housing authorities in orienting residents to living in a new environment. The program objective is to prepare trainees to establish working relationships with people of varying backgrounds, interpret regulations and provide information regarding community services, instruct tenants in the best methods of home management, and assist the manager in keeping records, preparing reports, and handling problems. Units are Achieving Effective Working Relationships with People, Assisting Tenants with Family Living Problems and Housing Project Life, and Additional Tasks of the Management Aide. Each unit consists of suggested training time, objectives, course unit outline, and references. The student should be a high school graduate with a background in home economics, experience in wage earning and homemaking, and sufficient maturity to deal with a variety of problems. The teacher should have home economics training, experience in teaching adults, and ability to adapt materials and methods to the level of the group. Suggested training time is 360 hours. Suggestions for planning lessons and learning experience, evaluating achievement, securing teaching facilities, and judging trainee readiness for employment are included. This document is available as FS5.287--87001 for 20 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (MS)

FOREWORD

THE MAJOR ROLE of home economics training in vocational education has been to assist youth and adults to prepare for the responsibilities and activities of homemaking and the achievement of family well-being. Although this role will continue to be a responsibility of home economics education, many socioeconomic changes affecting women and families require that home economists now assume, to a greater extent than in the past, the responsibility of providing training for wage earning. An increasing number of women find it necessary to spend part of their lives in some wage-earning occupation. In addition, many employed homemakers and community agencies find it necessary to secure assistance in the care of family members or in the provision of other services that contribute to more satisfactory family life.

A series of work conferences held in 1963, under the direction of the Professional Services Section of the Manpower Development and Training Program, U. S. Office of Education, brought together national leaders in adult education in home economics, who, in cooperation with workers in other branches of vocational education and several national organizations and agencies, selected nine service occupations for which to prepare training materials. These occupations, based on home economics knowledge and skills, provide a service to families within an institutional or community setting or within the home. Suggested resource material from which to develop a training program that meets the needs of a particular group of trainees have been prepared for each of the nine occupations. The job analyses and job descriptions used in the suggested training programs were prepared for inclusion in the revised edition of the Dictionary of Occupational Titles, issued by the U. S. Department of Labor.

This guide for the Management Aide in Low-Rent Public Housing Projects provides resource material from which a local training program can be developed. It is recognized that the experience and education of trainees will vary, as will the aims and needs of the local Housing Authority that will employ and supervise the trained Management Aide. A suggested schedule for training is included, but the program should be adapted to each group of trainees. This publication will be useful for the development of training programs that will enable women to acquire competencies having a valid wage value and needed in serving families.

Walter M. Arnold
Assistant Commissioner for
Vocational and Technical Education

CONTENTS

TRAINING PROGRAM FOR THE MANAGEMENT AIDE IN LOW-RENT PUBLIC HOUSING PROJECTS

Developing Course Plans

The following suggestions are for training persons who are to be employed to assist housing managers in low-rent public housing projects. Nationally, this job has been given a variety of descriptive titles. In this training guide the title Management Aide in Low-Rent Public Housing Projects is used.

Teachers must adjust and adapt the suggestions in this guide to the needs of the particular group they are teaching because the duties expected of the Management Aide may differ from community to community, and the trainees will vary in education, experience, and ability. In addition to having first-hand information concerning job requirements, the teacher must secure as much information as possible about trainees. The specific objectives, teaching methods, and time allotted to each aspect of the training can then be adjusted to the local situation and to the trainees.

Job Functions

The Management Aide assists housing managers of local housing authorities in orienting residents in housing projects to living in a new environment and to making effective use of the resources, facilities, and services provided in the project and in the community for achieving a satisfying family life.

Program Objectives

To prepare trainees:

1. To establish working relationships with people of varying socioeconomic backgrounds, cultural and racial heritages, and age groups; and to orient them to living in a housing project;
2. To interpret regulations;
3. To show location of project facilities; to demonstrate the use of kitchen, bathroom, and laundry equipment;
4. To provide information to tenants regarding community health services, child welfare services, churches, schools, adult education centers, and recreation centers;
5. To assist the manager of the local housing authority in handling special managerial and human relations problems; keeping records; preparing reports; and referring individuals or families requiring special counseling or other services to the management staff;
6. To instruct tenants in the best methods of planning homemakers' work schedules; selecting, buying, storing, and preparing food; selecting, buying, and caring for clothing; managing money; caring for children; and observing sanitary housekeeping practices.

It is suggested that the teacher review the "Criteria for Judging Trainee Readiness for Employment" prior to developing plans for teaching this course. The criteria will be useful throughout the course in setting up specific objectives, providing learning experiences, and making periodic evaluations.

Teacher Qualifications

A person qualified to teach is a competent homemaker who has had home economics training. She should also have had experience teaching adults, and should be able after inservice training to adapt teaching materials and methods to the level of the group. She should be emotionally mature, in good health, and should have sufficient understanding of human relations to help trainees relate themselves to the tenants and staff of a housing project.

Background of Trainee

A trainee should be a high-school graduate, preferably with two or more years of home economics study in high school or junior college. She should be experienced as a homemaker and wage earner, and should have some experience working with groups on a voluntary or paid basis. The trainee should be able to help people help themselves, and should be well-adjusted, even-tempered, and possessed of much patience. She should have sufficient maturity to work effectively with the housing management staff, the different groups represented in the housing project, and the representatives of community agencies and organizations.

Length of Course and Course Units

A course of 360 hours is suggested for training. The following suggested time for each of the three units may be used as a guide for planning the course to meet trainee and community needs.

Course Unit	Title	Hours
I	Achieving Effective Working Relationships with People	90
II	Assisting Tenants with Family Living Problems and Housing Project Life	192
III	Additional Tasks of the Management Aide	78
	Total	360

COURSE UNIT I

ACHIEVING EFFECTIVE WORKING RELATIONSHIPS WITH PEOPLE

Suggested Training Time 90 Hours

Objectives

To help trainees achieve effective working relationships with people by developing an understanding of basic human needs. Particular attention is focused on the differences among various ethnic, cultural, age, and socioeconomic groups. The unit also provides training in skills needed for communicating effectively with people.

Course Unit Outline

A. Some important understandings basic to working effectively with people

1. Basic needs and desires of individuals
   a. Love and affection
   b. Security
   c. Recognition for achievement
   d. Self-confidence and self-respect
   e. To be liked and to be with others
2. Some evidence of emotional maturity—achieving basic needs
   a. Ability to face facts
   b. Acceptance of others at their present growth level
   c. Acceptance of criticism—avoidance of blaming or taking out feelings on others
   d. Ability to face difficulties
   e. Acceptance of disappointments
3. Self-understanding as a prerequisite for sympathetic understanding of and effective work with people
4. Some possible characteristics of people from varied ethnic, cultural, age, and socioeconomic groups
   a. Aspiration level is often low—individuals have seldom experienced success
   b. May care about education, but dislike school
   c. Not particularly interested in the community
   d. Traditional festivals may be important to older people, but are rejected by youth, resulting in possible conflicts
   e. Dress may differ from generally accepted standards
   f. The man may have nebulous position in family or may be autocratic head of family
   g. Food customs may differ from those of the American middle class
5. Many facts must be recognized and accepted, including
   a. Patterns of behavior and family practices differ
   b. Differences in behavior, within socially acceptable limits, result in uniqueness of individual personalities
   c. Basic human needs and the way they are met influence the quality of relationships within the family and the attitudes of the individual in the community
   d. Ways to meet basic human needs can be learned at any age

B. Some methods of communicating with tenants

1. Illiterate tenants
   a. Friendly conversation

    - (1) Choose the right time and place
    - (2) Begin with an expression of interest, a question, or reference to some successful achievement
  - b. Individual or group discussions
  - c. Demonstrations to show "how"
  - d. Exhibits of how to use housing facilities
- 2. Functionally literate tenants
  - a. Illustrated talks
  - b. Simple direction sheets
  - c. Group discussions
  - d. Role playing
- 3. Important skills for effective communication—friendly manner, distinct speech, clearly stated ideas, simple vocabulary, presentation of only a few directions at one time, repetition to insure understanding

COURSE UNIT II

ASSISTING TENANTS WITH FAMILY LIVING PROBLEMS AND HOUSING PROJECT LIFE

Suggested Training Time 192 Hours

Objectives

To develop the trainee's skills in and knowledge of ways to assist homemakers orient themselves to housing project living—regulations, problems concerning household schedules, food, clothing, money-management, care of children, sanitation, repair and replacement of equipment, prevention of accidents, and simple home decoration.

Course Unit Outline

- A. Helping families become oriented to living in a housing project
  - 1. Interpretation of regulations
  - 2. Location of project facilities for family living—laundry, play area for toddlers, and community center
  - 3. Use and care of equipment in kitchen, bathroom, laundry, and refuse-disposal areas
- B. The household work schedule for the full-time homemaker and the woman who is both a homemaker and a wage earner

1. Household routines essential for family well-being
2. Division of responsibilities within the family
3. Sequence of work and job tasks to save time and energy
4. Ways to determine the priority of home activities for family well-being or satisfaction

C. Family problems concerning food

1. Spending the food dollar wisely—procedures for controlling the food budget
2. Ways of preparing food in the time available
3. Methods of storing food
4. Use of food in promoting happy relations with family and friends

D. Problems concerning clothing the family

1. Family clothing plan
2. Ways of renovating and methods of care
3. Purchasing—thrift shops, rummage sales, and clothing stores
4. Good grooming

E. Money management plan

1. Essential weekly and monthly expenditures
2. Family planning for use of income
3. Ways to stay within planned expenditures
4. Savings—one use of money
5. Credit—guides for use

F. Care of children

1. Need for good food, adequate rest, healthy play, and cleanliness
2. Normal behavior of children of different age groups
3. Types of facilities provided for children of different ages within the housing project
4. Plans for care and safety of children whose mother works
5. Protecting children from hazards—stairwells, broken playground equipment, open windows, matches, poisons (cleaning fluids), and medicines
6. Health protection by immunization

G. Sanitary housekeeping

1. Cleaning
   a. Stoves and refrigerators
   b. Suitable methods and materials for each room and type of surface
   c. Frequent laundering to avoid accumulating soiled linens and clothing
2. Pest Control—preventive practices, extermination service provided by the housing management
3. Garbage and trash—proper handling in the apartment; use of project facilities for disposal; care of family garbage containers

H. Repair and replacement of equipment

1. Tenant responsibilities in using any project-owned equipment
2. Procedures for reporting needed repairs—leaking faucets, broken windows, clogged plumbing, or suspected gas leaks
3. Tenant responsibility for complying with housing management requirement regarding repairs and installations

I. Prevention of accidents

1. Proper use of equipment—stoves, laundry, lighting, gas heaters
2. Use of improvised stepladders
3. Storage of toys and small household equipment
4. Removal of slippery spots on floor caused by water, grease, or excess floor wax
5. Care of yard adjacent to home unit

J. Simple home decoration

1. Project regulations concerning decorating, hanging pictures, structural changes
2. Use of community center rooms or a model apartment to demonstrate inexpensive ways to make an apartment livable and attractive

COURSE UNIT III

ADDITIONAL TASKS OF THE MANAGEMENT AIDE

Suggested Training Time 78 Hours

Objectives

To develop an understanding of the Management Aide's role in a low-rent public housing project; to emphasize knowledge and skills important in dealing effectively with tenants.

Course Unit Outline

A. Serving as an information clearinghouse to tenants about available services and their location in the community
   1. Community health services
   2. Family and child-welfare services
   3. Schools and churches
   4. Adult education centers
   5. Recreation centers

B. Serving as an assistant to the manager of the local housing authority
   1. Work of the housing authority
   2. Organization of the staff
   3. Work of all staff members
   4. Work of the Management Aide
   5. When to refer individuals or families to the management staff
   6. How to keep records and prepare reports

TEACHING THE COURSE

Planning the Learning Experiences

The objectives of a training program are achieved by learning experiences designed to help the trainees develop those behaviors and abilities designated in the objectives. Each experience should serve a definite function and should not be introduced because it is traditional or "modern" or because it is satisfying to the teacher.

A good teacher constantly reminds herself that "covering" the topics outlined for a course does not automatically result in learning. She knows that effective learning experiences should be planned by visualizing what the trainee must be able to do on the job. The job analysis will be an important guide, because the class experiences must be realistic and based on work situations for which the training is being given. Each trainee needs opportunity to apply her understandings and abilities to the different kinds of problems she may face.

A variety of learning experiences will be needed to develop the kinds of abilities required in home and community service occupations. Creativity is a key in providing meaningful experiences for a particular group. The successful teacher will see new ways to synthesize, adapt, and revise experiences to fit the unique characteristics of the group and fulfill the requirements of the job.

These are some planned experiences to be considered:

A. Experiences that will add to and enrich the background of trainees

1. Bringing employers to class to give information on nature of the job
2. Using persons from special fields such as mental health, geriatrics, nutrition or dietetics, child development, medicine, public health, and housing to extend basic knowledge and answer questions
3. Providing reading material appropriate to age and reading ability
4. Using movies, filmstrips, charts, tape recordings, or other audiovisual materials to present specific information (it will be necessary for teachers to preview films, filmstrips, and tapes for appropriateness of and familiarization with the content)

B. Experiences which help develop insight and desirable attitudes

1. Playing out roles of people who might be involved in a work situation
2. Visiting with prospective employers who are to benefit from services to be given by trainees
3. Comparing methods of doing a task by making simple time and motion studies
4. Reacting to situations illustrated in movies, cartoons, or short dramas
5. Making planned trips to representative places of employment

C. Experiences in analyzing work situations and solving problems

1. Considering a specific employment problem or work situation. The situation presented must be realistic. (If actual cases are studied, anonymity should be maintained.) The teacher should ask questions which lead trainees to recognize the problem, to decide what additional information might be needed, and to suggest and evaluate solutions.
2. Developing step-by-step work schedules for some aspects of the job
3. Working out typical problems in a laboratory situation

D. Experiences to develop specific skills and abilities

1. Watching demonstration of a technique, with follow-up practice in class, laboratory, in own home, or in a situation provided by cooperating employer(s)
2. Observing and participating in specific activities in places similar to those where trainee will be employed
3. Experimenting with different arrangement or placement of equipment and supplies, or different techniques for completing a job
4. Acting out situations such as interviewing a prospective employer, repeating directions given, or getting help from a supervisor

E. Some teaching methods which help trainees draw conclusions and summarize important ideas

1. Circle discussion—each member tells of something she observed on a field trip or in a film that would be useful to an employee
2. Buzz group—a small group of trainees applies a principle to new situations
3. Summarizing panel—2 to 5 members of the class review important ideas presented in a class session
4. Summary sheets—brief summaries of major ideas. important facts, or steps in a work process, prepared by the teacher for distribution to trainees at the end of a lesson

Evaluating Achievement

Major functions of evaluation in a program designed to prepare individuals for wage-earning:

1. Assessing basic abilities of persons desiring to enroll in the training program as a basis for selection
2. Determining needs and backgrounds of trainees as one basis of setting up specific goals for the course
3. Measuring the extent to which trainees achieve the goals

Evaluation made for these purposes also will give the teacher a basis for developing learning experiences, modifying course plans, and selecting appropriate references and teaching materials. The needs, backgrounds, and abilities of potential trainees can be assessed by teachers in informal interviews with each person. Personal data sheets and more formal measurement of reading ability and aptitudes for the job may be supplied by vocational counselors or employment service offices.

An integral part of planning a course is selecting some means for checking the progress of each trainee. The desired understandings, attitudes, and abilities are described in the objectives. Course plans must include:

1. Ways of observing each trainee's progress toward achieving objectives
2. Methods of recording observations so progress may be assessed

A teacher can obtain some clues to progress from the trainee's participation in class and from individual conferences. An "anecdotal record," which is a factual report of what the trainee says or does, needs to be written at frequent intervals. Evaluation of the anecdotes should not be attempted until a number of observations has been recorded and at a time when the teacher's feelings and emotions are least likely to influence her judgment.

A rating scale may be used to indicate the level or quality of trainee accomplishment. Three levels are commonly used such as "very good," "acceptable," "not acceptable." (An experienced teacher may use one with 5 to 7 levels, but those used by trainees should be less complex.) The accomplishments being evaluated should be stated specifically and the meaning of the different levels on the scale should be indicated clearly so that all persons using the scale have a common understanding of the meaning of each rating. A check-off type of list can be used by both teacher and trainee to record completion of learning activity or achievement of some measurable skill. Rating scales, sometimes called "score cards," may also be developed to rate a completed task.

Evidence of trainee accomplishments should be compiled throughout the training course. Since observations are more valid if made in realistic situations, much of the evaluation will usually take place in laboratory and practice sessions.

Planning the Lesson

The best guide or lesson plan is, of course, one that has been prepared by the individual teacher, based on personal experience and manner of teaching. Although teachers differ in their ways of organizing and coordinating important parts of their presentations, they agree that the purpose of a lesson is effective and meaningful classroom instruction.

Written plans may be very brief, but the good teacher will know before the class starts:

1. The goals or objectives of the lesson—the kind of learning desired
2. The outline and suggested time schedule for the lesson, including
   a. An interest approach—a way to introduce the lesson, to capture the interest of the trainees and to direct their attention to the lesson's goals or objectives
   b. Activities which will involve the trainees in discovering new facts and principles, solving realistic problems, or practicing skills
   c. A way to summarize the lesson—to help trainees arrive at some valid conclusions and /or to evaluate the extent to which lesson goals have been achieved
   d. Assignments of additional study or practice
3. The subject matter content—the facts and principles or main ideas to be brought out in the lesson
4. The teaching materials and references to be used

Teaching Facilities

In addition to home economics departments, there are various types of public and private facilities which, if available locally, could be used to enhance the effectiveness of this course. Trainees, for example, could profit from visits to housing facilities to observe techniques used in tenant orientation, home management, housekeeping, and similar course-related activities.

Because all of the suggested facilities will not be available in every community, it remains for the teacher to modify or supplement the following suggestions:

1. Rooms in housing projects, public schools, recreation centers, YWCA's, libraries
   Rooms in any of these institutions may provide space and facilities for class meetings and group discussions. Of particular interest are rooms which contain bulletin boards, chalkboards, and are suitable for the use of audiovisual aids.
2. Facilities within housing projects
   Through visits to furnished apartments in low-rent public housing projects, trainees can observe typical facilities and decor. The teacher can point out examples of how inexpensive furniture obtained from thrift shops, Good Will Industries, the Salvation Army, or similar sources may be used to advantage. Apartments may also be used for demonstrating and practicing good housekeeping techniques, the use and care of house-

hold equipment (stove, refrigerator and bathroom fixtures), and home safety measures. Visits to project laundry, playground, and refuse-disposal areas will familiarize trainees with other typical project facilities.

3. Local appliance stores and utility companies

   These stores and firms usually employ trained specialists who give demonstrations in the use and care of common household appliances, not all of which may be available for class practice sessions or demonstrations. Much can be learned about the use, operation, and care of these appliances through a well-planned visit to these facilities.

4. Schools and child-care centers

   A visit to a kindergarten, nursery, or primary grade offers trainees an excellent opportunity to observe children and their activities. Particular attention can be focused on techniques used in obtaining the cooperation of children.

5. Local stores

   Field trips to local stores can help trainees learn more about desirable shopping techniques, general price levels, characteristics of various products, and methods of selection of clothing, food, and furnishings.

6. Other community resources

   Visits to other community resources—community health centers, child-welfare centers, adult education centers, recreation centers—can acquaint trainees with some resources outside the housing project which may be available to project residents.

Criteria for Judging Trainee Readiness for Employment

The criteria which serve as guides in determining whether the trainee is ready for employment as a Management Aide will be more intangible than in some other occupations. However, some understanding of human frailties and needs, and some insight into how to establish effective working relationships with people, are of such importance that every attempt should be made to evaluate trainee progress.

The use of various evaluative devices is necessary for the teacher and the trainee to accumulate objective information about the growth of the trainee. The following kinds of competencies are important to develop or strengthen during the training program.

A. Personal qualities
   1. Courtesy, friendliness, and tact in dealing with housing project residents and staff members
   2. Acceptable appearance—good grooming, neatness in dress, sensible choice of clothing
   3. Good personal habits—speech, mannerisms, cleanliness, methods of work, punctuality
   4. Mature judgment in a variety of situations
   5. Acceptable attitudes—interest in people, ability to relate easily to different kinds of people, cooperativeness, patience
   6. Understanding of own role and that of others

B. Activities showing knowledge, understanding, and skills
   1. Works effectively under supervision—understands and carries out instructions given by the management staff
   2. Demonstrates ability to understand and interpret housing project regulations—explains tenant and management responsibilities
   3. Demonstrates procedures for preparing reports and keeping records
   4. Exhibits knowledge of people to contact and action to take in an emergency

5. Demonstrates some recommended methods for obtaining and giving information
6. Demonstrates ability to instruct people of varied abilities and backgrounds
7. Demonstrates an understanding of basic needs and desires of individuals and differences among various groups—cultural, age, socioeconomic
8. Demonstrates ability to establish working relationships with all kinds of people
9. Demonstrates ways to help homemaker with household routines, efficient scheduling, and methods of work
10. Demonstrates knowledge of family shopping—preparation of a shopping list, selection of items, problems related to weights and measures, money and change, other shopping practices
11. Demonstrates ability to help families with money-management problems
12. Demonstrates some understanding of elementary techniques for working with children—their needs, typical problems, the care of infants
13. Demonstrates some techniques and methods of keeping home clean, sanitary, orderly
14. Demonstrates care and use of common household appliances and equipment—washing machine, dryer, stove, refrigerator, etc.
15. Demonstrates understanding of safety in the home—basic precautions, dangerous areas
16. Demonstrates some inexpensive ways to make an apartment livable and attractive
17. Demonstrates proper use and care of project facilities and equipment—laundry room, refuse-disposal areas, playgrounds, recreation rooms, etc.

This is one of a series of nine training guides for Home and Community Service Occupations.

A. Community-Focused Occupations Which Use Home Economics Knowledge and Skills
   1. Child Day-Care Center Worker
   2. Management Aide in Low-Rent Public Housing Projects
   3. The Visiting Homemaker
   4. Hotel and Motel Housekeeping Aide
   5. The Supervised Food Service Worker

B. Home-Focused Occupations Which Use Home Economics Knowledge and Skills
   1. Clothing Maintenance Specialist
   2. Companion to an Elderly Person
   3. Family Dinner Service Specialist
   4. The Homemaker's Assistant

BIBLIOGRAPHIES, INSTRUCTIONAL MATERIALS, MANPOWER DEVELOPMENT,
MDTA Programs,

Vocational curriculums are suggested for eight electronic business data processing occupations as a guide to training unemployed and underemployed persons. The course outlines and other material were prepared by staff members of the Information and Training Services Division of McGraw-Hill, Inc. Consultants included data processing training specialists from industry, administrators in city and state business education departments, and faculty memebers in high schools, colleges, and vocational training institutions. Curriculums are suggested for the occupations--(1) Tape Librarian, (2) Key-Punch Operator, (3) Clerical Supervisor, (4) Coding Clerk, (5) Machine-Records Unit Supervisor, (6) Statistical Clerk, (7) Tabulating Machine Operator, and (8) Console Operator. Subjects for each occupational course of study are drawn from General Office Education Units, subjects common to two or more occupations, and Specialized Occupation Units, both listed. Program lengths vary from 13 to twenty-two 30-hour weeks. Hours required, unit description, topic outlines for each unit, texts, and other teaching aids are shown for each course of study. Job descriptions and prerequisites for training and employment are given for each occupation. Trainees enrolled in the programs are expected to have completed approximately 10½ years of formal education and to have a working knowledge of English and elementary arithmetic. Instructors should be qualified in business data processing. Suggested standards of achievement and an extensive bibliography of texts and references, periodicals, directories, films and filmstrips, and other instructional aids are included. This document is available for 70 cents from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. (PS)

FOREWORD

THE MANPOWER DEVELOPMENT AND TRAINING ACT OF 1962 established a large-scale training effort to solve the problem of hard-core unemployment. The nationwide program of vocational training proposes to provide marketable job skills for unemployed and underemployed persons, including industrial and business workers whose skills have been rendered obsolete by automation, farm workers no longer needed in an era of mechanized agriculture, and youths who left school without acquiring a marketable job skill. The Nation needs to reduce the number of people dependent on unemployment compensation or public welfare and to increase its reservoir of skilled manpower. The Manpower Development and Training Act of 1962 was designed to meet these objectives.

Training programs are administered by the State Boards for Vocational Education under an agreement with the Secretary of the Department of Health, Education, and Welfare. Applicants for training are screened and referred to the schools by the State Employment Service offices which are affiliated with the United States Employment Service.

The training courses to be offered in any particular community or State are determined by surveys made by the State Employment Service of the job offerings in that locality, and with approval of the teaching content by the State Department of Education. A prime objective of the program is to be reasonably certain that each trainee will be readily absorbed into the labor force when his course is completed. In many areas there are chronic shortages of such workers as key punch operators and computer console operators. Trainees with skills in data processing, peripheral equipment operation, and allied occupations greatly improve their chances for gainful employment.

This publication has been prepared to suggest vocational curricula in certain electronic business data processing occupations. The outlines and other materials are designed to aid administrators, supervisors, and teachers in the promotion and development of these vocational courses. It should be recognized that the material contained herein is for "suggested" curricula, which should, in most instances, be adapted to meet local needs and training facilities.

The course outlines and other materials were prepared by staff members of the Information and Training Services Division of McGraw-Hill, Inc., under a contractual arrangement with the U. S. Office of Education. Consultants to McGraw-Hill included data processing training specialists from industry; administrators in city and State business education departments; and faculty members in high school, college, and university business education departments and vocational training institutions. All the materials were discussed and reviewed by the consultants, by the McGraw-Hill staff, and by the U. S. Office of Education. Many varied suggestions and criticisms were received. The curricula necessarily could not reflect all the suggested approaches, philosophies, and ideas, but each one was carefully considered and, wherever possible, was incorporated into the final document. Since the resulting materials represent many opinions, no approval or endorsement by any one institution, agency, or person should be inferred.

WALTER M. ARNOLD
Assistant Commissioner for
Vocational and Technical Education

ACKNOWLEDGMENTS

THE COMPLETION of the curricula guide depended upon the assistance and cooperation of many persons. The U. S. Office of Education, Division of Vocational and Technical Education, wishes to acknowledge in particular the contributions of the following professional leaders and specialists in the field of business data processing education:

James M. Adams, Jr.
Director of Education
Data Processing Management Association
524 Busse Highway
Park Ridge, Ill. 60068

Leland P. Baldwin
Bureau of Business Education
State Department of Education
721 Capitol Avenue
Sacramento, Calif. 95814

R. D. Balthaser
State Department of Education
220 South Parsons Ave.
Columbus, Ohio 43215

Charles Berlese
Engineering Instructor
American River Junior College
Sacramento, Calif. 95841

Harvey A. Buchen
Business Instructor
School of Vocational and Adult Education
West Allis, Wis. 53214

Cletus A. Clow
Business Education Department
New Rochelle High School
New Rochelle, N.Y. 10804

Ruthetta Krause
Associate Professor of Business
Indiana State College
Terre Haute, Ind. 47807

Rev. George C. McGregor, O.P.
Providence College
Providence, R.I. 02908

Gunder A. Myran
Business Department
Jackson Junior College
Jackson, Mich. 49001

Mary Ellen Oliverio
Business Education Department
Teachers College
Columbia University
New York, N.Y. 10027

W. Leon Pearce
Business Education and Office Management
College of Business Administration
State University of Iowa
Iowa City, Iowa 52001

Paul Pair
Automation Institute
37 South Wabash Avenue
Chicago, Ill. 60603

Elfreda Rusher
Associate Professor
Department of Business Education
Bowling Green State University
Bowling Green, Ohio 43402

Edward E. Scannell
Department of Business Education
State College of Iowa
Cedar Falls, Iowa 50613

W. E. Sparling
Central Missouri State College
Warrensburg, Mo. 64093

Merle W. Wood
Supervisor, Department of Business Education
Des Moines Public Schools
Des Moines, Iowa 50314

Carl B. Zoerner
Dean, School of Education
Rider College
Trenton, N.J. 08608

Representatives of publishers and data processing equipment manufacturers were helpful in reviewing the curricula and suggesting topics and appropriate materials. The U. S. Office of Education wishes to recognize the contributions of the following representatives:

Selwyn Brent
Education Department
UNIVAC Division
Sperry-Rand Corp.
315 Park Ave. South
New York, N.Y. 10010

A. Grace and his staff
Electronic Data Processing
Radio Corporation of America
Camden, N.J. 08102

Herbert Hughes
Director of Education
UNIVAC Division
Sperry-Rand Corp.
Rowayton, Conn. 06853

Joyce Leonard
IBM Systems Engineer
99 Park Avenue
New York, N.Y. 10016

W. M. Mecum
District Field Engineering Manager
Data Processing Group
Burroughs Corporation
219 Park Avenue South
New York, N.Y. 10003

Leonard J. Porter
Business Education Editor
Prentice-Hall, Inc.
Englewood Cliffs, N.J. 07632

John C. Raglan
Director of Marketing
Gregg-Division
McGraw-Hill, Inc.
330 West 42nd St.
New York, N.Y. 10036

John F. Sterling
Assistant Eastern District Manager
South-Western Publishing Co.
New Rochelle, N.Y. 10801

Helen Taft
New York IBM Education Center Manager

GENERAL OFFICE EDUCATION UNITS

SPECIALIZED OCCUPATIONS AND UNITS OF INSTRUCTION

APPENDICES

ELECTRONIC BUSINESS DATA PROCESSING
PERIPHERAL EQUIPMENT OCCUPATIONS

INTRODUCTION

TECHNOLOGICAL AND ECONOMIC DEVELOPMENTS mean changing manpower needs in the United States in the coming years. Expanded training efforts are required to assure that the rapidly growing work force will be trained to meet shifting needs.

To be fully effective, training programs require surveys of manpower resources, community skill requirement studies, training program development, aptitude testing, counseling, trainee selection, referral to training programs, job development, referral to jobs, and follow-up. Training must be directed toward specific employment needs in the area where job openings exist.

One expanding area of employment is the cluster of jobs centered around electronic business data processing. In order to handle the growing volume of business data which must be processed, skilled people are required to operate data processing equipment.

These suggested curricula provide a guide to training unemployed and underemployed persons as qualified workers in several business data processing occupations.

It is envisioned that technical changes in data processing equipment and systems will necessitate periodic review of suggested curricula with a view to deleting units, changing or adding subject content, and even eliminating certain occupations because of technological change.

The "About the Curricula" section of this guide contains information about the design and objectives of the program. Also included are suggestions for making use of the unit outlines and programs for administrative and teaching purposes. Some of these suggestions will be found under "Administrative Options."

The design of the curricula is sufficiently flexible to give local administrators and instructors wide latitude in planning and conducting courses which meet the needs of selected trainees. Local facilities and training needs will, to a large extent, determine how the suggested plans discussed in "About the Curricula" are to be adapted for use in particular programs for effective utilization of instruction time, reduction of schedule planning time, and optimum use of available training facilities.

Appendix A provides suggestions for evaluating trainee achievement. Achievement is matched with selected occupational competencies. Job descriptions from the revised edition of the Dictionary of Occupational Titles and suggested position and training prerequisites are provided for each of eight data processing occupations.

Each subject unit includes a list of suggested texts, references, and other teaching aids. Additional teaching materials that may be helpful to the teacher are listed in Appendix B. These lists include the more commonly used materials in the subject fields. As with the specific course content, the choice of teaching materials rests with local school administrators and instructors. Local business firms may provide additional useful teaching materials and resource persons.

The Sample Suggested Lesson Plan in Appendix B is included to assist the instructors in the preparation of guides for individual lessons. It is not intended as an example to be rigidly followed, but is offered as an illustration of one way to develop an outline topic.

Qualified business data processing instructors may be found in commercial and Government data processing installations, in vocational training schools, and in colleges, universities, and secondary schools.

The basic program goals are the accelerated development of skills used in specific business data processing occupations and the increase in trainee understanding of basic concepts and fundamental principles applicable to business and data processing. In view of the training goals, the teacher should provide useful and rewarding equipment operation experiences for the trainee throughout the program.

CURRICULA OUTLINES

General Office Education Units

Unit Title	Code	Hours
Business Mathematics I	BM-I	30
Business Mathematics II	BM-II	30
Elements of Fiscal Recordkeeping	FA	60
Payroll Records	PR	30
Language Skills	LS	30
Business Communications	BC	30
Personal Development	PD	30
Business Principles and Organization I	BPO-I	30
Business Principles and Organization II	BPO-II	30
Fundamentals of Typing	FT	60
Production Typing	PT	60
Office Calculators	OC	30
Introduction to Business Data Processing	BDP	60
Electro-Mechanical Accounting Machines	EAM	30
Elementary Descriptive Statistics	EDS	60
Principles of Supervision	OS	30
Psychology for Supervisors	PS	30
Classification and Coding	CLC	60
Introduction to Computers	IC	30

Specialized Occupation Units

Elementary Library Systems	ELS	60
Key-Punch Equipment Operation	KP	60
Data Processing Mathematics	DPM	30
Introduction to Programming	IP	30
Tabulating Machine Operation	TM	45
Tabulating Machine Wiring	TMW	45
Control Console Operation	CO	60
Data Processing Systems	DPS	90

CURRICULA SYNOPSES

Each peripheral business data processing occupational training program is shown below with its suggested length in weeks. A week consists of 5 6-hour days totaling 30 hours. Variations in the length of the training day may be made on the basis of trainee caliber and administrative judgment.

Occupation	Length of Program in Weeks
Tape Librarian	13
Key-Punch Operator	15
Supervisor, Clerical	22
Coding Clerk	13
Supervisor, Machine-Records Unit	22
Statistical Clerk	15
Tabulating Machine Operator	15
Console Operator	15

Daily Training Schedules

Since many of the occupational training programs have identical subject units for certain periods of time, trainees may be grouped in order to conserve teaching time, space, and facilities. Suggested daily training schedules are shown in the following tables. The tables show the hours of the day, the subject unit suggested for each hour, and the occupations for which the scheduling is appropriate. The codes used for subject units are to be found in the Curricula Outlines section.

First Period—6 weeks

Occupational Training Group	Suggested subject unit, by hour of the training day					
	1	2	3	4	5	6
Tape Librarian	BDP	BDP	PD	BPO-I	FT	FT
Key-Punch Operator	BDP	BDP	PD	BPO-I	FT	FT
Clerical Supervisor	BDP	BDP	PD	BPO-I	OS	BM-I
Coding Clerk	BDP	BDP	LS	BPO-I	PD	BM-I
Machine Records Unit Supervisor	BDP	BDP	PD	BPO-I	OS	BM-I
Statistical Clerk	BDP	BDP	LS	BPO-I	PD	BM-I
Tabulating Machine Operator	BDP	BDP	LS	BPO-I	PD	BM-I
Console Operator	BDP	BDP	LS	BPO-I	PD	BM-I

Second Period—6 weeks

Occupational Training Group	Suggested subject unit, by hour of the training day					
	1	2	3	4	5	6
Tape Librarian	PT	PT	LS	BC	ELS	ELS
Key-Punch Operator	PT	PT	LS	BC	BPO-II	OC
Clerical Supervisor	BM-II	FA	FA	BC	FT	FT
Coding Clerk	BM-II	FA	FA	CLC	CLC	IC
Machine Records Unit Supervisor	BM-II	FA	FA	BC	BPO-II	IC
Statistical Clerk	BM-II	FA	FA	PR	BPO-II	OC
Tabulating Machine Operator	BM-II	FA	FA	PR	BPO-II	OC
Console Operator	BM-II	FA	FA	BC	BPO-II	IC

Third Period—1 week

During the third period, lasting one week, all occupational training groups will be given the subject, Electro-Mechanical Accounting Machines. Tape Librarian and Coding Clerk groups will have completed their programs of study at the end of the third period.

Fourth Period—2 to 6 Weeks

Occupational Training Group	Period Length (weeks)	Suggested subject unit, by hour of the training day					
		1	2	3	4	5	6
Key-Punch Operator	2	KP	KP	KP	KP	KP	KP
Statistical Clerk	2	EDS	EDS	EDS	EDS	EDS	EDS
Tabulating Machine Operator	2	TM	TM	TM	TMW	TMW	TMW
Console Operator	2	CO	CO	CO	CO	CO	CO
Clerical Supervisor	6	PT	PT	PS	PR	BPO-II	IC
Machine Records Unit Supervisor	6	IP	DPM	PS	DPS	DPS	DPS

Fifth Period—2 Weeks

Occupational Training Group	Suggested subject unit, by hour of the training day					
	1	2	3	4	5	6
Clerical Supervisor	OC	CLC	CLC	EDS	EDS	EDS
Machine Records Unit Supervisor	OC	CLC	CLC	EDS	EDS	EDS

ABOUT THE CURRICULA

These suggested curricula differ from those offered in most educational institutions in that major emphasis is placed upon skill and knowledge development for specific peripheral business data processing occupations described in the revised edition of the Dictionary of Occupational Titles.

The curricula objectives provide a framework of suggested studies qualifying trainees to hold certain jobs in the business data processing field. The suggested framework is sufficiently flexible to permit adaptation of the program at local levels according to community needs and availability of facilities, equipment, and teaching time.

The course of study for each of the eight occupations has been planned to provide the specific skills needed for employment, and to give each trainee a background in general office work. Subjects for each occupational course of study are drawn from two groupings—General Office Education Units and Specialized Occupation Units. The General Office Education Units section is comprised of those subjects common to two or more occupations. The subject content of these units will serve to orient the trainee to office work and provide certain prerequisite skills for particular occupational studies. They can also be used to refresh the trainee with information or skills previously acquired but forgotten through disuse.

Several of the General Office Education Units were included in Clerical and Record Keeping Occupations and Stenographic-Secretarial Occupations, two suggested curricula previously developed by the U. S. Office of Education under the Manpower Development and Training Act. The subject units were reviewed and changed to fit the needs of the Electronic Business Data Processing Peripheral Equipment Occupations. Suggested curricula changes reflect a desire to accelerate the training time.

The Specialized Occupation Unit outlines, texts and other teaching aids are germane to the specific occupation under which they are grouped. Job descriptions and prerequisites for training and employment are shown for each occupation. To the extent possible, the subject content of the Specialized Occupation Units has been generalized to allow adaptation by the teachers to suit the business data processing equipment available at the training location.

The subjects suggested for each occupational program were developed to correspond to job descriptions detailed in the revised edition of the Dictionary of Occupational Titles. Since these job descriptions are general in nature, having been compiled from many sources in different locations, it is envisioned that programs may have to be adjusted to local conditions.

Since some of the special occupational skills learned in the program will become obsolete, programs are sufficiently broad to permit adaptation to changes of data processing equipment and the demand for certain job skills. Each program is planned to strike a balance between general knowledge and acquisition of skills. Skill in operating equipment is a necessity for obtaining employment. An understanding of fundamental principles of data processing provides the flexibility needed for working with varied makes of equipment and for future changes in equipment and nature of business data processing procedures.

The suggested curricula do not attempt to provide detailed subject units to the extent usually found in a teacher's manual. The unit outlines may not in all cases present topics for coverage in chronological order. Because of such factors as trainee group knowledge, extent of review required, and individual methods of presentation, the sequence of topics is left to the discretion of the individual teacher. In addition, local program administrators and teachers are encouraged to develop detailed lesson plans and obtain appropriate teaching aids. Helpful supplemental materials are to be found in the suggested texts, references, films, and other instructional materials lists.

Introduction to Business Data Processing is scheduled early in the course to provide an overview of the field and to help motivate the trainees. This introductory unit presents topics which are expanded and applied in later units. The Language Skills Unit provided for six of the eight occupations should help build essential background for improved communication skills needed in office work and for study purposes. The unit builds vocabulary, improves spelling, and reviews basic English grammar. Most trainees will also take the Business Communications Unit which should provide for further improvement.

When possible, subjects of like character should be massed in order to simulate conditions of office work. Local availability of teachers and facilities will determine the feasibility of this method. One method of unit grouping is shown in the Curricula Synopses section.

Many of the trainees will have had no office or data processing experience prior to this training program. However, trainees enrolled in the program are expected to have completed approximately $10\frac{1}{2}$ years of formal education and to have a working knowledge of English and elementary arithmetic. Several of the units allow for a review of these important basic subjects, but the need for depth of review in each course unit must be assessed by the local instructor.

In the skill development subjects, lectures and discussions should be kept to the minimum required for understanding procedures and operating instructions. As much time as possible should be devoted to actual trainee practice with the available equipment.

In the social area subjects a variety of methods should be used. Role playing, case analysis, group discussion, lectures and motion pictures—all can be used effectively. Varied presentation can serve to heighten interest, participation, and learning. Although a special unit has not been included in the curricula for developing proper study habits, teachers and administrators should stress this area. Many booklets and pamphlets are available for helping trainees with this important know-how.

Periodic progress checks should be made throughout each unit to evaluate trainee progress toward meeting the Suggested Standards of Achievement. In addition, these checks serve as a guide for reviewing material that may not have been fully learned.

The teacher should consider using resources of the community for assistance with training. Guest speakers from business and industry can assist with special topics and, in addition, can help trainees relate their activities to local business needs and standards.

The greatest challenge for teachers may lie in building the morale of the trainees. Motivation and morale building should be a part of every class and practice period. It is suggested that teachers make an effort early in the program toward establishing a teaching climate which will heighten and maintain the trainee's interest. The success of the program can be judged only by the number of trainees who will remain gainfully employed in careers which would otherwise not have been available to them.

Administrative Options

The Curricula Synopses section of the Introduction shows typical programs for each of the occupations. These programs are based on 6-hour days of instruction. It is recognized that variations in this scheduling may have to be made to suit local conditions. To facilitate administration of the programs and hold the required number of teachers and teaching hours to a minimum, subjects have been grouped to enable one teacher to handle combined groups of trainees at the same time. The number of trainees that may meet in a combined session should be compatible with good teaching practice in terms of span of control, instructional methods and equipment availability.

The curricula for the eight occupations have been planned to develop the abilities needed for employment. Before starting the specialized occupational units the trainee should have skills and knowledge equivalent to that gained from those general office education units suggested as pertinent to his occupation. In order to plan an appropriate program, the trainee's previously acquired abilities and educational background should be evaluated against the Standards of Achievement listed for the required basic units. If the trainee already has acceptable skills in some areas, the instructor or administrator may delete units from the trainee's program and substitute units which would have been given at another time. In this way, subject units can be rearranged to form a more appropriate and meaningful sequence for certain trainees, and the time needed for the development of employable skills can be shortened.

For example, a Key-Punch Operator trainee may present a high-school transcript showing completion of courses in typing and bookkeeping. If the trainee's skill in one of these subjects compares favorably with the Suggested Standards of Achievement listed for Fundamentals of Typing, this particular course may be deleted from his program. The training period could thus be shortened for those trainees presenting this type of achievement, and the trainee could be considered employable at an earlier date. Careful screening of the trainee should disclose the nature and extent of his background. Such pertinent information should be made available to the local program administrator.

Due to this possibility of certain courses being deleted from a trainee's program, some topics have been repeated in certain units. This repetition of topics serves two purposes: to expose trainees to areas of subject content that they may have missed and, in other instances, the topic can be used for refresher purposes.

Supervisory Training Information

In view of the requirements for the Clerical Supervisor and Machine Records Unit Supervisor occupations, trainees selected for these supervisory programs should have exhibited considerable potential to the group responsible for selection. Some trainees for supervisory positions may have comparatively more education and experience than some other trainees. However, the suggested programs for these occupations outlined in the Curricula Synopses section of the Introduction assume little prior experience or education in the clerical field except in the Language Skills area. As in the other occupational programs, a trainee who enters with certain demonstrable skills and knowledge may have unnecessary subject units deleted from his program of study.

Clerical supervisors may become responsible for any of several clerical activities such as bookkeeping, filing or typing. Local employment opportunities as listed on the MDT-1, may determine the trainee's specific area of concentration. Since the areas of specialty cannot be foreseen, the curricula provide a general office education to equip the supervisory trainee with basic skills in several areas. These skills can be augmented by on the job training.

Three courses, Classification and Coding, Elementary Descriptive Statistics, and Office Calculators, have been shortened in order to accelerate the supervisory programs. Using the outlines for the three courses, instructors may delete topics or reduce time allotted to some topics to effect this reduction in class time. Emphasis should be placed on application of the subject content.

GENERAL OFFICE EDUCATION UNITS

BUSINESS MATHEMATICS I

Hours Required

Class: 1 hour daily Total: 30 hours

Description

Basic principles of business mathematics with emphasis on the four fundamental operations—addition, subtraction, multiplication, and division—are applied to business situations. The trainee is introduced to the use of simple calculators or adding machines for checking work. Importance of accuracy is stressed. Numerous exercises in applying percentages, discounts, and other mathematical operations should be provided for improving commercial number-handling skills.

Topic Outline

I. Addition Skills
II. Subtraction Skills
III. Multiplication Skills
IV. Division Skills
V. Fractions
VI. Percentage
VII. Sundry Applications

TOPIC I. ADDITION SKILLS

A. Improving skills
   1. Adding whole numbers
   2. Increasing speed
   3. Checking accuracy

B. Types of addition
   1. Horizontal
   2. Horizontal-vertical

C. Addition of decimals

TOPIC II. SUBTRACTION SKILLS

A. Improving skills
   1. Subtracting whole numbers
   2. Checking accuracy

B. Horizontal subtraction

C. Subtraction of decimals

D. Bank reconciliation

E. Making change

TOPIC III. MULTIPLICATION SKILLS

A. Improving skills
   1. Multiplying whole numbers
   2. Checking multiplication accuracy

B. Multiplying decimal numbers (the product of two decimal numbers)

C. Shortcuts in multiplication

D. Horizontal multiplication

E. Extensions

F. Checking multiplication by machine

TOPIC IV. DIVISION SKILLS

A. Improving skills
   1. Division of whole numbers
   2. Checking division accuracy

B. Dividing decimal numbers

C. Shortcuts in division

D. Computing averages

TOPIC V. FRACTIONS

A. Improving skills in using fractions
   1. Changing fractions to equivalent fractions
   2. Addition
   3. Subtraction
   4. Multiplication
   5. Division

B. Aliquot parts

TOPIC VI. PERCENTAGE

A. Improving skills in using percentage
   1. Percentage value in equivalent forms
   2. Decimal numbers and fractions as percentage values
   3. The percentage formula

B. Computing depreciation charges

TOPIC VII. SUNDRY APPLICATIONS

A. Public utility cost computation

B. Linear, scale, area, and cubic computation
   1. Measuring
   2. Computing

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

BUSINESS MATHEMATICS II

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

Basic and specialized principles of business mathematics are applied to payrolls, retailing, financing, insurance, and taxation. The work in the unit should concentrate on practical applications in several fields.

Topic Outline

I. Payrolls
II. Retailing
III. Financing
IV. Insurance
V. Taxation

TOPIC I. PAYROLLS

A. Mathematical preparation
  1. Time payment (hourly wage system)
  2. Straight piecework wage systems
  3. Bonus pay systems
  4. Currency memorandum
  5. Use of withholding tax tables—national and local

TOPIC II. RETAILING

A. Discount computations (trade and cash)
  1. Series of discounts
  2. Single tax rate equivalent to a series of discount rates
  3. Cash discount and net price
  4. Trade discount and net price

B. Sales computation
  1. Consumer discounts
  2. Discount rates
  3. Markup and markdown
  4. Sales and excise taxes

TOPIC III. FINANCING

A. Interest
  1. Monthly rates
  2. Daily periods
  3. Exact interest
  4. Bankers' 60-day method
  5. Time lapses between two dates
  6. Tables
    (a) Interest
    (b) Time
  7. Compound interest

B. Installment buying and selling
  1. Installment charges
  2. Rate of interest on installment purchases
  3. Automobile installment purchases
  4. Interest rates charged by small-loan agencies

TOPIC IV. INSURANCE

A. Fire and theft

B. Automobile

C. Life

TOPIC V. TAXATION

A. Property taxes

B. Federal and State income taxes

C. Social Security
  1. Primary benefits
  2. Family benefits (on retirement and death of insured)

Texts and Other Teaching Materials

Texts and other teaching materials under Business Mathematics I are applicable to this unit.

The teacher may also wish to give consideration to the use of the following suggested texts and materials. Additional references will be found in Appendix B.

ELEMENTS OF FISCAL RECORDKEEPING

Hours Required

Class: 1 hour daily, Laboratory: 1 hour daily   Total: 60 hours

Description

The introductory topics of this course unit include general aspects of recordkeeping for business use, including cash, banking, payroll, social security, and tax records. The third and fourth topics of the unit are devoted to an introduction to elementary bookkeeping, including vouchers, checks, invoices, sales, stock record, and purchase order forms. The final topics emphasize the basic elements of bookkeeping, including business transactions, journalizing, posting, preparing financial statements, and cash transactions. Supervised laboratory sessions include skill development through problem solving and the use of practice sets. Since automated recordkeeping is covered in depth in other units, teachers should use this topic for meaningful association.

Topic Outline

I. Purpose and Use of Records
II. Types of Records
III. Common Business Record Forms
IV. Introduction to Bookkeeping

V. Bookkeeping Fundamentals
VI. Accounts
VII. Business Transactions
VIII. Journalizing and Posting
IX. Trial Balance
X. Work Sheets and Financial Reports
XI. Closing Ledgers

TOPIC I. PURPOSE AND USE OF RECORDS

A. Why records are kept

B. Organizing records for
  1. Ease of access
  2. Ease of interpretation
  3. Legibility

C. Business and records

D. Automated recordkeeping

TOPIC II. TYPES OF RECORDS

A. Cash records

B. Banking records

C. Payroll records

D. Social Security records

E. Tax records

F. Daybook and general journal

G. Time records

TOPIC III. COMMON BUSINESS RECORD FORMS

A. Purchase orders, sales invoices, and receipts

B. Stock records and requisitions

TOPIC IV. INTRODUCTION TO BOOKKEEPING

A. Cash
  1. Receiving
  2. Paying
  3. Forms: vouchers, checks, etc.
  4. Banking

B. Credit
  1. Sales
  2. Purchases

C. Financial records and statements

TOPIC V. BOOKKEEPING FUNDAMENTALS

A. Assets and liabilities

B. Proprietorship

C. Bookkeeping equation

D. Balance sheets

TOPIC VI. ACCOUNTS

A. "T" accounts

B. Recording changes

TOPIC VII. BUSINESS TRANSACTIONS

A. Opening transactions

B. Changes in assets

C. Changes in liabilities

D. Changes in proprietorship

TOPIC VIII. JOURNALIZING AND POSTING

TOPIC IX. TRIAL BALANCE

A. Preparation

B. Locating errors

TOPIC X. WORK SHEETS AND FINANCIAL REPORTS

A. Preparation of work sheets

B. Preparation of financial reports

TOPIC XI. CLOSING LEDGERS

A. Closing entries

B. Balancing the accounts

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commerically available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

PAYROLL RECORDS

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

This unit includes analysis of payroll legislation, intensive practical application of accounting principles to payroll procedures, and coverage of how data processing equipment is used in payroll operations. The unit should include sessions for skill development in which the trainee works with practice sets and uses realistic "write-it-once" forms.

Topic Outline

I. Payroll Accounting
II. Payroll Procedures
III. Payroll and Tax Reports
IV. Other Payroll Deductions

TOPIC I. PAYROLL ACCOUNTING

TOPIC II. PAYROLL PROCEDURES

A. Time cards

B. Payrolls (hourly, weekly, biweekly, monthly)

C. Year-end procedures

D. Pegboard, keysort, accounting machine payroll applications

TOPIC III. PAYROLL AND TAX REPORTS

A. Federal taxes
  1. Old-age tax (F. I. C. A.) and benefits
  2. Unemployment insurance
  3. Income (withholding) tax

B. State taxes

TOPIC IV. OTHER POSSIBLE PAYROLL DEDUCTIONS

A. Saving plans including Credit Unions

B. Insurance plans

C. Other deductions
  1. Garnishments
  2. Union dues

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

Felter, Emma and Reynolds, Marie. Basic Clerical Practice, 2d ed. New York: McGraw-Hill Book Co., Inc., 1959.

________, Payroll Accounting. 5th ed. New York: McGraw-Hill Book Co., Inc., 1962.

Hadley Editorial Staff and Thistlethwaite, Robert L. Payroll Record Keeping, 6th ed. New York: McGraw-Hill Book Co., Inc., 1959.

Enveloped Booklets; Business Papers and Reports; Teacher's Key.

Huffman, Harry. Programmed Business Mathematics, Part II. New York: McGraw-Hill Book Co., Inc., 1962.

Nanassy, Louis C. Standard Payroll Project. 2d ed. New York: Pitman Publishing Corp., 1962.
Pendery, John A. Clerical Payroll Procedures, 3d ed. Cincinnati, Ohio: South-Western Publishing Co., 1959.

Van Voorhis, Robert H.; Palmer, Charles E.; and Archer, Fred C. College Accounting, Theory and Practice, Part I. New York: McGraw-Hill Book Co., Inc., 1963.
Problems and Working Papers for Part I Practice Set I.

It is suggested that the teacher obtain payroll forms from local business firms and reproduce them for classroom use.

LANGUAGE SKILLS

Hours Required

Class: 1 hour daily

Total: 30 hours

Description

This unit is designed to build vocabulary, develop spelling ability, and provide opportunity to apply principles of English grammar. Emphasis should be placed on proper use of word forms and good sentence construction. Trainees should be encouraged to do outside reading and develop an interest in data processing terminology and other new words.

Topic Outline

I. Importance of Spelling and Vocabulary Development
II. Pretest
III. Spelling by Sound and Meaning
IV. Spelling Rules
V. Word Forms
VI. Sentence Structure
VII. Capitalization and Punctuation

TOPIC I. IMPORTANCE OF SPELLING AND VOCABULARY DEVELOPMENT

A. Word meanings and usage

B. General vocabulary

C. Business vocabulary

D. Accounting, personnel, and management vocabulary

E. Banking and insurance vocabulary

F. Data processing vocabulary

TOPIC II. PRETEST

A. Determination of vocabulary level, spelling ability, and grammatical knowledge

TOPIC III. SPELLING BY SOUND AND MEANING

A. Spotting errors

B. Attacking errors

C. Use of dictionary

TOPIC IV. SPELLING RULES

A. Rule errors

B. Carelessness and demon errors

C. Correcting rule errors and other difficulties

D. Abbreviations

TOPIC V. WORD FORMS

A. Nouns

B. Pronouns

C. Verbs

D. Adjectives

E. Adverbs

F. Prepositions

G. Conjunctions

TOPIC VI. SENTENCE STRUCTURE

A. Simple sentences and phrases

B. Clauses in compound and complex sentences

C. Effective sentences and paragraphs

TOPIC VII. CAPITALIZATION AND PUNCTUATION

A. Proper nouns

B. Special uses of capitalization

C. Punctuation
   1. Period, question mark, and exclamation mark
   2. Comma, semicolon, and colon
   3. Apostrophe and hyphen
   4. Quotation mark and italics
   5. Parentheses and dashes

BUSINESS COMMUNICATIONS

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

This unit emphasizes the importance of effective business communication and the need for careful planning and consideration of the reader before beginning to write. The types of business communications covered include letters, postal cards, memoranda, reports, telegrams, and other communications; attention is given also to effective oral communication. Finding and using sources of information on correct English usage are also included. Practice exercises in report writing should be provided frequently.

Topic Outline

- I. Communicating in Business
- II. Fundamentals of Effective Written Communication
- III. Types of Business Correspondence
- IV. Good English in Oral Communications

TOPIC I. COMMUNICATING IN BUSINESS

- A. The importance of written and oral communication in business
- B. The communicating process
  - 1. Some basic semantic principles
  - 2. Brief review of English grammar (as needed)
  - 3. Sources of information on English, special forms of address, etc.
    - a. English handbooks and secretarial handbook
    - b. Dictionaries
    - c. Thesaurus

TOPIC II. FUNDAMENTALS OF EFFECTIVE WRITTEN COMMUNICATION

- A. Goals of business writing; planning the communication
- B. Basic qualities of business letters and reports
- C. Mechanics of the letter
  - 1. Essential parts; other parts
  - 2. Layout, form, most used styles
  - 3. Addressing the envelope
- D. Avoidance of business jargon, stock phrases, etc.

TOPIC III. TYPES OF BUSINESS CORRESPONDENCE

- A. Specific types of business letters
  - 1. Neutral and good-news messages
    - a. Inquiries, orders, answers and acknowledgments, remittances
    - b. Public relations, industrial relations, personnel
  - 2. Persuasive messages
  - 3. Messages of regret or refusal
  - 4. Application letters
- B. Memoranda and reports
  - 1. Simple reports (practice exercises in writing)
  - 2. Complex reports (practice in organization and writing)
- C. Telegrams

TOPIC IV. GOOD ENGLISH IN ORAL COMMUNICATIONS

- A. In an interview
- B. Communicating with people

Texts and Other Teaching Materials

Texts and other teaching materials under Language Skills are applicable to this unit. The teacher may also wish to give consideration to the use of the following suggested texts and materials. Additional references will be found in Appendix B.

Brown, Leland. Communicating Facts and Ideas in Business. Englewood Cliffs, N. J.: Prentice-Hall, Inc., 1961.

Ingram, Karl Culton. Talk That Gets Results—Communication: Key to Success and Harmony with Others. New York: McGraw-Hill Book Co., Inc., 1957.

Schutte, William M. and Steinberg, Erwin R. Communication in Business and Industry. New York: Holt, Rinehart, and Winston, Inc., 1960.

PERSONAL DEVELOPMENT

Hours Required

Class: 1 hour daily Total: 30 hours

Description

The first three topics in this unit are designed to help the trainee establish personal standards of conduct and appearance that conform to general office expectancies. Emphasis is placed on office customs and etiquette and on expected conduct with superiors. Guided group discussion and guest speakers from the business community are suggested to motivate trainees and encourage them to accept general business standards as their own.

Topics IV through VIII are designed to guide the trainee in the establishment of effective human relations in an office situation. The nature and importance of personality and behavior are stressed. The trainee should receive individual guidance in self-appraisal and self-improvement.

Topic Outline

I. Office Etiquette
II. Employee-Employer Relationships
III. Business Customs
IV. The Nature and Importance of Personality
V. Roles of Motives and Emotions
VI. The Role of Intelligence
VII. Personal Efficiency
VIII. Social Efficiency: Human Relations, Teamwork

TOPIC I. OFFICE ETIQUETTE

A. Behavior
  1. Acceptable office behavior
  2. Mannerisms
  3. Speech
  4. Attitude

B. Appearance
  1. Grooming
  2. Wardrobe
  3. Health and posture

C. Good public relations
  1. Customers and callers
  2. Introductions
  3. Telephone etiquette

TOPIC II. EMPLOYEE-EMPLOYER RELATIONSHIPS

A. Seeking a job

B. Orientation on a new job

C. Progress on the job

D. Punctuality, attendance, break periods

E. Performance during office-business emergencies

F. Mutual respect and courtesy

TOPIC III. BUSINESS CUSTOMS

A. In the office

B. While traveling

C. Meetings
  1. Appropriate participation
  2. Parliamentary procedures
  3. Speaking in public

TOPIC IV. THE NATURE AND IMPORTANCE OF PERSONALITY

TOPIC V. ROLES OF MOTIVES AND EMOTIONS

A. Importance and nature of motives

B. Emotional stability
  1. Place of emotions in one's life
  2. Meaning and attainment of emotional maturity

TOPIC VI. THE ROLE OF INTELLIGENCE

A. Understanding ourselves and others

B. Intelligent behavior

C. Problem-solving and decision making

TOPIV VII. PERSONAL EFFICIENCY

A. Methods for self-appraisal

B. Self-development and self-improvement
  1. Improving appearance, voice and speech, manners, etc.
  2. Improving concentration, memory, reading, learning, confidence

C. Procedures for improvement
  1. Improving communication skills
  2. Broadening interests
  3. Developing or changing habits

TOPIC VIII. SOCIAL EFFICIENCY: HUMAN RELATIONS, TEAMWORK

A. Good human relations with co-workers

B. Good human relations with superiors and subordinates

C. Healthful adjustment to groups

BUSINESS PRINCIPLES AND ORGANIZATION I

Hours Required

Class: 1 hour daily Total: 30 hours

Description

This unit provides an introduction to the study of the organization of businesses. Strong emphasis is placed on the principles of economics, governmental activity and the importance of and principles of good management. The trainee should also be given an indication of some of the principal governmental legislation affecting business enterprise.

Topic Outline

I. Business Enterprise
II. Principles of Economics
III. Government and Business
IV. Principles of Management

TOPIC I. BUSINESS ENTERPRISE

A. The nature of business in the American economy
  1. Scope of business enterprises
  2. Opportunities in business

B. Single proprietorship
  1. Legal structure
  2. Nature of businesses of this type
  3. Earmarks of efficiency

C. Partnership
  1. Legal structure
  2. Nature of businesses of this type
  3. Earmarks of efficiency

D. Corporation
  1. Legal structure
  2. Nature of businesses of this type
  3. Earmarks of efficiency

E. Cooperatives

TOPIC II. PRINCIPLES OF ECONOMICS

A. Money and banking systems

B. Economic cycles

C. Role of Government in the economy
  1. Profit objectives
  2. Business cycles

TOPIC III. GOVERNMENT AND BUSINESS

A. Key areas of governmental legislation and taxation

B. Encouragement of business activity

TOPIC IV. PRINCIPLES OF MANAGEMENT

A. Overall responsibilities of management

B. Organization of management

C. Patterns of operation
  1. Planning
  2. Organizing
  3. Directing
  4. Integrating
  5. Controlling

D. Key executives responsible for management functions

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

BUSINESS PRINCIPLES AND ORGANIZATION II

Hours Required

Class: 1 hour daily Total: 30 hours

Description

In this unit emphasis is placed upon financial management, production management, marketing and merchandising, and personnel and human relations in terms of providing the trainee with a deeper awareness and understanding of the complexity of business management and decision-making at upper levels of management which may affect him in his day-to-day activities.

Topic Outline

I. Financial Management
II. Production Management
III. Marketing and Merchandising
IV. Personnel and Human Relations

TOPIC I. FINANCIAL MANAGEMENT

A. Executives and responsibilities

B. Financial decisions

C. Internal financial management
  1. Financial accounting
  2. Determination of profits
  3. Determination and control of costs
  4. Budgets and budgetary control
  5. Taxes and their impact on business
  6. Risks and insurance

D. The role of business data processing in decision making

TOPIC II. PRODUCTION MANAGEMENT

A. Responsibilities of executives and departments
  1. Skills and knowledges needed
  2. Nature of job responsibilities

B. Planning production and scheduling

C. Factors of production

D. Problems of production

E. Control of production and measuring its effectiveness

TOPIC III. MARKETING AND MERCHANDISING

A. The role of marketing in the American economy

B. The extent of the marketing activity—numbers of people and nature of the enterprises

C. Distribution activities
   1. Organization
   2. Implementation

D. Marketing activities
   1. Buying
   2. Pricing
   3. Selling

E. Merchandising activities
   1. Structure
   2. Promotion and advertising
   3. Display and selling
   4. Delivery and shipping

F. The efficiency of marketing and merchandising in the American economy

TOPIC IV. PERSONNEL AND HUMAN RELATIONS

A. Responsibilities of executives and department supervisors

B. Identification of need for workers

C. Recruitment, selection, and training of employees

D. Determination of wage scales, Social Security, and workmen's protection

E. Employer-employee relations

Texts and Other Teaching Materials

All texts and materials listed under Business Principles and Organization I are applicable to this unit.

FUNDAMENTALS OF TYPING

Hours Required

Class: 2 hours daily   Total: 60 hours

Description

This unit is designed to introduce the trainee to touch control of the keyboard and correct operation of all manipulative parts of the typewriter. Supervised skill development sessions are an integral part of the course. Concentration should be on good techniques as well as on the development of speed and accuracy through exercises. (The demonstration of proper techniques by the teacher is vital.) The course also includes a brief orientation to the basic patterns of arranging correspondence, manuscripts, tables, and some business forms.

Topic Outline

I. Machine Fundamentals
II. Typewriting Procedures and Techniques
III. Development of Concepts of Standards
IV. Basic Skill Development
V. Brief Introduction to Application of Typewriting Skill
VI. Auxiliary Knowledges and Skills

TOPIC I. MACHINE FUNDAMENTALS

- A. Knowledge of parts used by the beginning typist
  - 1. Identification (as and when needed)
  - 2. Function and use
- B. Manual and electric typewriters (if both are used)
  - 1. Similarities
  - 2. Differences

TOPIC II. TYPEWRITING PROCEDURES AND TECHNIQUES

- A. Proper position
  - 1. Hand position
  - 2. Arm position
  - 3. Overall posture; relationship of chair and table to correct posture
- B. Paper insertion and removal
- C. Key stroking—manual, electric
- D. Operation of additional service parts—tabulator, backspacer, margin release, variable spacer, etc.

TOPIC III. DEVELOPMENT OF CONCEPTS OF STANDARDS

- A. In speed
- B. In accuracy
  - 1. How to proofread (for content, not typing errors alone)
  - 2. How to correct
    - a. Erasing
    - b. Spreading and crowding
- C. In neatness and attractiveness of typewritten product
  - 1. General
  - 2. Layout—arrangements, spacing, etc.
  - 3. Corrections
  - 4. Mailability
- D. In acceptability of the mechanics of English
  - 1. Language usage
  - 2. Spelling
  - 3. Punctuation, capitalization, etc.

TOPIC IV. BASIC SKILL DEVELOPMENT

- A. Keyboard mastery and an understanding of the principles of touch typewriting
- B. Composing at the typewriter
- C. Areas for improvement
  - 1. Increased accuracy through control, proper techniques
  - 2. Increased speed through proper machine manipulation as well as stroking
  - 3. Product quality

TOPIC V. BRIEF INTRODUCTION TO APPLICATION OF TYPEWRITING SKILL

- A. Simple letters and envelopes
- B. Memos
- C. Simple manuscript typing, including reports
- D. Simple tabulation and centering
- E. Simple business forms and records

TOPIC VI. AUXILIARY KNOWLEDGES AND SKILLS

- A. Proper care of machine
  - 1. Use of dust cover
  - 2. Cleaning type
  - 3. Proper techniques when erasing
  - 4. Changing ribbons
- B. Use of carbon paper
- C. Correct interpretation of edited copy, simple rough drafts

PRODUCTION TYPING

Hours Required

Class: 2 hours daily — Total: 60 hours

Description

This unit provides further supervised speed and accuracy development integrated with basic production of correspondence, business forms, manuscripts, and tabulated material. Emphasis is placed upon following accurately whatever directions are given and using judgment when detailed instructions are lacking. The goal is to help the trainee become a thinking typist, rather than a mechanical copyist. Numerous opportunities should be provided for trainees to evaluate the quality and quantity of their own work. It is recommended that, to the extent practicable, some use be made of forms and stationery from the business community.

Topic Outline

I. Review of Fundamentals
II. Further Development of Concepts of Standards
III. Further Skill Development
IV. Advanced Applications of Typing Skill
V. Auxiliary Knowledges and Skills

TOPIC I. REVIEW OF FUNDAMENTALS

A. Keyboard—touch control

B. Posture

C. Techniques in stroking, shifting, operation of service parts, etc.

D. Machine parts—function and proper operation

E. Care of machine

TOPIC II. FURTHER DEVELOPMENT OF CONCEPTS OF STANDARDS

A. Speed: usable piece of work in reasonable length of time

B. Accuracy; responsibility for correctness of typing, English mechanics, verification of content (dates, quantities, and other facts)

C. Appearance of the typewritten product according to business standards

TOPIC III. FURTHER SKILL DEVELOPMENT

A. Keyboard mastery, including the number and symbol keys

B. More refined control of other manipulative parts

C. Learning to use judgment for letter placement, tabular arrangement, centering, etc.

D. Increased speed, accuracy, and overall product quality

TOPIC IV. ADVANCED APPLICATIONS OF TYPING SKILL

A. Letters and memos, including displayed material, special lines, two pages, etc.

B. Manuscripts and reports

C. Tabulations, including column headings, ruling, etc.

D. Various kinds of business forms and office records

E. Complicated rough drafts

F. Offset masters, stencils, spirit masters

G. Chain feeding of envelopes

TOPIC V. AUXILIARY KNOWLEDGES AND SKILLS (as required)

A. Following written and oral instructions if given; working with a minimum of direction when detailed instructions are not given.

B. Knowing appropriate supplies to use—paper, carbon sets, eraser, stencils, etc.

C. Caring for machine—keeping type clean, using ribbon of suitable intensity, etc.

Texts and Other Teaching Materials

Most of the texts and other teaching materials under Fundamentals of Typing are applicable to this unit.

The teacher may also wish to give consideration to the use of the following suggested texts and materials. Additional references are listed in Appendix B.

OFFICE CALCULATORS

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

The objective of this unit is development of moderate skill in the use of the 10-key and full-key adding machines, and rotary and printing calculators. Considerable emphasis is given to skill development in 10-key machines, operating them by touch. Application is made to business

business documents. When possible, work materials for this unit can be those used in Fundamentals of Accounting.

Topic Outline

I. 10-key Adding Machines and Printing Calculators
II. Full-key Adding Machines
III. Rotary Calculators
IV. Practical Applications

TOPIC I. 10-KEY ADDING MACHINES AND PRINTING CALCULATORS

A. Adding by touch
B. Subtraction
C. Multiplication
D. Decimals and fractions
E. Division on the printing calculator

TOPIC II. FULL-KEY ADDING MACHINES

A. Addition
B. Subtraction
C. Multiplication
D. Decimals and fractions
E. Division

TOPIC III. ROTARY CALCULATORS

A. Addition
B. Multiplication
C. Decimals
D. Subtraction
E. Division

TOPIC IV. PRACTICAL APPLICATIONS

A. Checks
B. Invoices
C. Stock records
D. Sales reports
E. Basic accounting records

INTRODUCTION TO BUSINESS DATA PROCESSING

Hours Required

Class: 2 hours daily Total: 60 hours

Description

This orientation unit is designed to promote understanding of the need for and importance of data in different types of businesses and in other fields. It introduces the trainee to the basic data processing cycle and the current systems, methods, and equipment used for rapid handling of large quantities of business data. Basic office filing procedures are also explained and practiced. The application of the basic cycle to manual, mechanical, electro-mechanical, and electronic systems used for various business purposes is explained and demonstrated. Computer fundamentals should be explained but not treated in depth as in the "Introduction to Computers" course unit. Stress is placed on the importance of the peripheral data processing functions and the use of associated equipment. Trainees should be given the opportunity to see demonstrations of equipment in operation in the school facility and local business data processing installations.

Topic Outline

I. Importance and Uses of Data
II. Evolution and Growth of Data Processing Systems
III. Applications of Data Processing
IV. Basic Data Processing Cycle
V. Input-Output Data Representation
VI. Introduction to Systems and Equipment
VII. Introduction to Computers
VIII. Peripheral Business Data Processing Occupations

TOPIC I. IMPORTANCE AND USES OF DATA

A. History of record-keeping

B. Sources and types of data

C. Needs for data

D. Decisions based on data

E. Growing complexity of data

TOPIC II. EVOLUTION AND GROWTH OF DATA PROCESSING SYSTEMS

A. Definition of terms: data, data processing, technology, automation, etc.

B. Evolution of data processing systems
  1. Early one-man businesses—simple bookkeeping

2. Expansion of business and increasing need for data
3. Early mechanization of the recordkeeping process
4. Development of office machines
5. Development of punched card systems
6. Integrated data processing
7. Electronic data processing systems
8. Future of data processing

C. Data processing in the business organization

D. Filing techniques
   1. Alphabetic files
   2. Numeric files
   3. Subject files
   4. Other types of files—chronological, geographical, etc.
   5. Indexing and filing rules
   6. Filing procedures and materials
   7. Filing correspondence, printed material, department records
   8. Establishing and maintaining filing systems
   9. Filing practice

TOPIC III. APPLICATIONS OF DATA PROCESSING

A. Engineering

B. Science

C. Statistics

D. Military

E. Financial and banking

F. Business and industry
   1. Accounting
   2. Payroll
   3. Reports
   4. Inventory and material control
   5. Production scheduling
   6. Labor distribution
   7. Sales analysis
   8. Market forecasting
   9. Management forecasting

TOPIC IV. BASIC DATA PROCESSING CYCLE

A. Collection of data (original documents—checks, time cards, etc.)

B. Input preparation and entry (preparing ledger pages, punching cards, etc.)

C. Processing
   1. Classifying (by location, production lot, etc.)
   2. Sorting (by code, account number, etc.)
   3. Calculating (total volume, averages, deductions, etc.)
   4. Summarizing (new or reconstructed data)

D. Storage (machine memory, library, paper files)

E. Output (punched cards, magnetic tape, document, statement)

TOPIC V. INPUT-OUTPUT DATA REPRESENTATION

A. Recording media
   1. Punched cards
   2. Punched paper tape
   3. Magnetic tape
   4. Magnetic ink characters
   5. Printed forms
   6. Cathode-ray tube
   7. Other media

B. Coding systems—man-machine communication

TOPIC VI. INTRODUCTION TO SYSTEMS AND EQUIPMENT

A. Flowcharting

B. Manual

C. Machine
   1. Typewriter
   2. Reproducing machines
   3. Calculator
   4. Accounting machine
   5. Key sort

D. Electro-mechanical machine functions and types
    1. Key-punch
    2. Verifier
    3. Reproducer
    4. Collator
    5. Sorter
    6. Interpreter
    7. Calculator
    8. Tabulator
    9. Media converter—tape to card, card to tape

E. Electronic

TOPIC VII. INTRODUCTION TO COMPUTERS

A. Computer applications

B. Components and functions of a computer system

C. Number systems (binary, octal, decimal)

D. Computer characteristics

E. Console and inquiry
    1. Console function
    2. Inquiry function

F. Programming
    1. The programming function
    2. Preparing a problem for processing
    3. Coding and programming fundamentals

TOPIC VIII. PERIPHERAL BUSINESS DATA PROCESSING OCCUPATIONS

A. Job functions and associated equipment
    1. Tape librarian
    2. Coding clerk
    3. Key-punch operator
    4. Tabulating machine operator
    5. Console operator
    6. Supervisor, machine records unit
    7. Supervisor, clerical
    8. Statistical clerk
    9. Possible future occupation—peripheral equipment operator

B. Importance of peripheral business data processing occupations

ELECTRO-MECHANICAL ACCOUNTING MACHINES

Hours Required

Class: 2 hours daily, Laboratory: 4 hours daily Total: 30 hours

Description

This unit provides an orientation to the principles of electro-mechanical accounting machines as part of an independent system and as support of the computer. Trainees are given an opportunity to study application of the equipment to problems in accounting. They should see each piece of equipment in operation as the functions, features, and operating procedures are explained.

Topic Outline

I. The Punched Card
II. Machine Functions
III. Machine Components
IV. Key Punch and Verifier
V. Interpreter
VI. Sorter
VII. Reproducer

VIII. Collator
IX. Accounting Machine—Tabulator
X. Calculator
XI. Basic Housekeeping Procedures
XII. Equipment Used as Computer Support
XIII. Accounting Applications

TOPIC I. THE PUNCHED CARD

A. The source document

B. Card format

C. Card code

D. Card field

E. Card control functions

F. Card movement in the machines

TOPIC II. MACHINE FUNCTIONS

A. Recording

B. Classifying

C. Calculating

D. Reporting

TOPIC III. MACHINE COMPONENTS

A. Feeding

B. Reading

C. Control panels
  1. Types
  2. Wiring

D. Checking

TOPIC IV. KEY PUNCH AND VERIFIER

A. Functions

B. Features

C. Numeric and alphabetic punching

D. The control card

E. Duplicating

F. Verification

TOPIC V. INTERPRETER

A. Functions

B. Features

C. The column split

D. Interpreting

E. The selector

F. Interpreting with selection

TOPIC VI. SORTER

A. Functions

B. Features

C. Operating procedures

D. Numerical and alphabetic sorting

E. Block sorting

TOPIC VII. REPRODUCER

A. Functions

B. Features

C. Operating procedures

D. Reproducing

E. Gang punching

F. Verifying

TOPIC VIII. COLLATOR

A. Functions

B. Features

C. Operating procedures

D. Sequence checking

E. Selection

F. Merging

G. Matching

TOPIC IX. ACCOUNTING MACHINE—TABULATOR

A. Functions

B. Features

C. Control Panel
  1. Detail printing

2. Program control
3. Addition and subtraction
4. Group printing and group indication
5. Selective printing
6. Summary punching

TOPIC X. CALCULATOR

A. Functions

B. Features

C. Control panel
   1. Add
   2. Subtract
   3. Multiply
   4. Divide

TOPIC XI. BASIC HOUSEKEEPING PROCEDURES (Procedures differ with each equipment manufacturer)

TOPIC XII. EQUIPMENT USED AS COMPUTER SUPPORT

A. Data preparation

B. Input function

C. Output function

TOPIC XIII. ACCOUNTING APPLICATIONS

A. Accounts receivable
   1. Functions and objectives
   2. Source documents
   3. Statements and reports
   4. Cards and files
   5. Data processing flow charts

B. Accounts payable
   1. Functions and objectives
   2. Source documents
   3. Checks and reports
   4. Cards and files
   5. Data processing flow charts

C. Payroll
   1. Functions and objectives
   2. Source documents
   3. Statements, checks, reports
   4. Cards and files
   5. Data processing flow charts

ELEMENTARY DESCRIPTIVE STATISTICS

Hours Required

Class: 1 hour daily, Laboratory: 1 hour daily — Total: 60 hours

Description

Designed to provide certain trainees (statistical clerks and supervisors) with basic knowledge and skills required in business applications of elementary descriptive statistics. This course also serves to broaden understanding of routine compilation of data. Statistical theory discussion should be concurrent with the development of proficiency through practice exercises in the laboratory sessions.

Topic Outline

I. The Field of Statistics
II. Organization and Interpretation of Data
III. Graphical Presentation
IV. Measures of Central Tendency
V. Measures of Variability
VI. Frequency Distribution Classifications
VII. Basic Sampling Concepts
VIII. Statistical Reports
IX. Using the Computer for Statistical Analysis (Demonstration)

TOPIC I. THE FIELD OF STATISTICS

A. Statistics defined

B. Origin and history of statistics

C. Growth of statistics in business and industry

D. Sources of statistical data

E. Uses of statistical data

F. Pitfalls in statistics
   1. Bias
   2. Improper sampling
   3. Noncomparative data
   4. Improper assumptions

G. Some modern descriptive statistical methods

TOPIC II. ORGANIZATION AND INTERPRETATION OF DATA

A. Definitions, notations, and symbols

B. Basic rules of computation

C. Class intervals

D. Frequency Distribution
   1. Basic concepts
   2. Grouping
   3. Graphic presentation

E. Tabular presentation
   1. Elements of a table
   2. Rules for construction of a table

TOPIC III. GRAPHICAL PRESENTATION

A. Types of graphs

B. Histograms

C. Pictograms

D. Frequency polygons

E. Cumulative distributions and ogives

TOPIC IV. MEASURES OF CENTRAL TENDENCY

A. The arithmetic mean
   1. Ungrouped data
   2. Grouped data

B. The median
   1. Ungrouped data
   2. Grouped data

C. The mode

D. The weighted arithmetic mean

E. The geometric mean

F. Quartiles, deciles, and percentiles

TOPIC V. MEASURES OF VARIABILITY

A. The range

B. The average deviation

C. The standard deviation
   1. Ungrouped data
   2. Grouped data

TOPIC VI. FREQUENCY DISTRIBUTION CLASSIFICATIONS

A. Normal distribution

B. Skew

C. Other types of frequency distribution (optional)

D. Transformation of data

TOPIC VII. BASIC SAMPLING CONCEPTS

A. Random sampling

B. Stratified sampling

C. Proportional sampling

D. Size of sample

TOPIC VIII. STATISTICAL REPORTS

A. Need for statistical reports in business

B. Types of reports

C. Preparation and processing of reports

TOPIC IX. USING THE COMPUTER FOR STATISTICAL ANALYSIS (DEMONSTRATION)

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

PRINCIPLES OF SUPERVISION

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

In this unit the trainee should gain an understanding of good supervisory principles and practices in the office. Attention in the unit is centered on the responsibilities of supervision and developing good relationships with office employees. Core activities should include the techniques of face-to-face communication, assigning employees, delegating authority and responsibility, and the orientation and training of new employees. The teacher should take every opportunity to use role playing techniques to develop trainee skills and case discussions to widen understanding. Cases, role plays, discussions, and problems should focus on office work situations.

Topic Outline

I. The Function of Management
II. The Supervisory Job: General Responsibilities
III. Communicating with Employees
IV. Interviewing
V. Evaluating Employees
VI. Other Factors Affecting Supervision

TOPIC I. THE FUNCTION OF MANAGEMENT

- A. Major responsibilities in planning and controlling
- B. Nature of office supervision
- C. Supervisory authority and responsibility
  - 1. Authority and responsibility defined
  - 2. Final accountability for actions
  - 3. Relationship with superiors

TOPIC II. THE SUPERVISORY JOB: GENERAL RESPONSIBILITIES

- A. Participating in the selection and placement of office employees
  - 1. Cooperating with personnel department
  - 2. Interviewing prospective employees
  - 3. Evaluating abilities of prospective employees
- B. Indoctrinating and training employees
  - 1. Newly hired employees
  - 2. How to determine training needs
  - 3. How to train
- C. Organizing the work of the section
- D. Obtaining quality work from others
- E. Developing the employee's capacities and interests effectively
- F. Reviewing and evaluating the work performance of employees
- G. Utilizing effective human relations to achieve teamwork and harmony
- H. Improving work methods
- I. Increasing the value of employees
- J. Participation in the formation of objectives
  - 1. Departmental
  - 2. Sectional
  - 3. Personal
- K. Keeping personnel records

TOPIC III. COMMUNICATING WITH EMPLOYEES

- A. Communicating changes in work methods
- B. Communicating changes in policies and procedures
- C. Communicating orders

TOPIC IV. INTERVIEWING

- A. Some interviewing techniques
- B. Interviewing technique practice (role play)

TOPIC V. EVALUATING EMPLOYEES

- A. Appraising employees and prospective employees
- B. Disciplining employees
- C. Rewarding employees

TOPIC VI. OTHER FACTORS AFFECTING SUPERVISION

- A. Union contracts
- B. Problem employees
- C. Accepting supervisory responsibilities

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher material for use in this unit. Additional references are listed in Appendix B.

PSYCHOLOGY FOR SUPERVISORS

Hours Required

Class: 1 hour daily — Total: 30 hours

Description

This unit is designed for those who will supervise others in an office environment. It is an introduction to the understanding of interpersonal relationships, personality, morale, personal efficiency, and leadership as they relate to office work climate and productivity. Trainee participation should be maximized by the employment of case studies, discussion, and role-playing, as they pertain to office situations.

Topic Outline

I. Human Relations and Morale
II. Personality and Emotional Health
III. Improving Personal Efficiency
IV. Personal Leadership

TOPIC I. HUMAN RELATIONS AND MORALE

- A. Human relationships
  - 1. Dimensions of human relations
    - a. Psychological
    - b. Social
  - 2. In personal situations
  - 3. In business situations
- B. Human relations' influence on morale
  - 1. Effect of morale in the work situation
  - 2. Enhancement of morale
  - 3. Deterioration of morale and hostilities
  - 4. Value of praise
- C. Specific human relations situations
  - 1. At time of interview
  - 2. In meeting and working with new people
  - 3. In sustaining good work relationships
  - 4. In handling "problem" situations

TOPIC II. PERSONALITY AND EMOTIONAL HEALTH

- A. The mature personality
  - 1. Key characteristics
  - 2. Development
- B. The mature personality in business life
  - 1. Responding to new demands and environment
  - 2. Assuming responsibility for handling problems

TOPIC III. IMPROVING PERSONAL EFFICIENCY

- A. Identification of job responsibilities
  - 1. Planning appropriate work schedules
  - 2. Organizing work
  - 3. Following through on plans
- B. Maintenance of physical efficiency
  - 1. Planning for adequate rest and recreation
  - 2. Understanding other physical needs of people

TOPIC IV. PERSONAL LEADERSHIP

- A. Levels of leadership responsibility
- B. Development of leadership skills
  - 1. In small group situations
  - 2. In large group situations
  - 3. In supervisory positions
- C. Rewards of good leadership

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available material), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

Russon, Allien. Business Behavior. Cincinnati, Ohio: South-Western Publishing Co., 1964.

CLASSIFICATION AND CODING

Hours Required

Class: 1 hour daily, Laboratory: 1 hour daily　　Total: 60 hours

Description

Emphasis in this unit is on coding skill development. The trainee learns various types of coding systems and should develop a basic understanding of programming and data processing system material preparation. Since some of this material would have been covered in the unit, Introduction to Business Data Processing, instructors should use minimum time for refreshing trainee and concentrate on practice experiences.

Topic Outline

I. Fundamentals of Program Preparation
II. Coding Systems and Coding Practice
III. Flow Charts and Block Diagrams
IV. Elements of Data Processing Systems
V. Types of Computers
VI. Number Systems
VII. Computer Words and Practice Coding
VIII. Computer Address System
IX. Fundamentals of Coding Digital Computers

TOPIC I. FUNDAMENTALS OF PROGRAM PREPARATION

A. Definition and analysis

B. Elements of program design

C. Coding

D. Testing

TOPIC II. CODING SYSTEMS AND CODING PRACTICE

A. Classification codes
    1. Alphabetic
    2. Numeric
    3. Alpha-numeric
    4. Mnemonic

B. Machine language and communication codes
    1. Punched tape (5, 6, 7, 8 channel codes)
    2. Punched card (80 col., 90 col.)
    3. Magnetic tape (5, 6, 7, 8 channel codes)
    4. Character recognition

C. Coding sheet forms

TOPIC III. FLOW CHARTS AND BLOCK DIAGRAMS

A. Types

B. Symbols

C. Organization

TOPIC IV. ELEMENTS OF DATA PROCESSING SYSTEMS

A. Input-Output

B. Storage

C. Processing

D. Control

TOPIC V. TYPES OF COMPUTERS

A. Analog

B. Digital

C. General purpose

D. Special purpose

TOPIC VI. NUMBER SYSTEMS

A. Binary

B. Octal

C. Binary arithmetic

D. Conversion of bases

TOPIC VII. COMPUTER WORDS AND PRACTICE CODING

A. Data words

B. Instruction words

TOPIC VIII. COMPUTER ADDRESS SYSTEM

A. Concept of address system

B. Types of systems

TOPIC IX. FUNDAMENTALS OF CODING DIGITAL COMPUTERS

A. Input-output commands

B. Arithmetic operations

C. Decision-making

D. Editing

E. Loops and indexing

INTRODUCTION TO COMPUTERS

Hours Required

Class: 1 hour daily Total: 30 hours

Description

This unit provides trainees, whose job functions will be closely involved with computer operation, with greater in-depth knowledge of the computer than was given in the orientation unit, "Introduction to Business Data Processing." The teacher should treat certain topics in this unit as "refresher" material. Other topics such as computer characteristics, functions, processing, and programming should be given greater attention and emphasis.

Topic Outline

I. Computer Applications
II. Computer Characteristics
III. Components and Functions of a Computer System
IV. Input-Output Media
V. Central Processing Unit
VI. Internal Processing
VII. Console and Inquiry
VIII. Programming

TOPIC I. COMPUTER APPLICATIONS

A. Commercial and financial

B. Scientific

C. Process control

D. Numerical control

E. Planning and simulation

F. Communications

TOPIC II. COMPUTER CHARACTERISTICS

A. Analog and digital

B. Serial and parallel

C. Buffered and unbuffered

D. Sequential and random

E. Numeric and alphanumeric

F. Variable and fixed

TOPIC III. COMPONENTS AND FUNCTIONS OF A COMPUTER SYSTEM

A. Input-Output

B. Storage

C. Logic

D. Arithmetic

E. Control

TOPIC IV. INPUT-OUTPUT MEDIA

A. Card devices

B. Magnetic tape unit

C. Paper tape devices

D. Magnetic character sensing

E. Optical reader

F. Printers

G. Random access devices

H. Console

TOPIC V. CENTRAL PROCESSING UNIT

A. Storage unit or memory
  1. Purpose
  2. Types of storage
  3. Data representation in storage

B. Arithmetic

- C. Logic
- D. Control

TOPIC VI. INTERNAL PROCESSING

- A. Loading the stored program
- B. Accessing
- C. Registers
- D. Data flow

TOPIC VII. CONSOLE AND INQUIRY

- A. Console function
- B. Inquiry function

TOPIC VIII. PROGRAMMING

- A. Program preparation steps
- B. Types of instruction
- C. Coding
- D. Flow charting and block diagraming
- E. Number systems
- F. Address systems
- G. Computer word format
- H. Housekeeping
- I. Running
- J. Error correction

SPECIALIZED OCCUPATION UNITS

CODING CLERK

Job Description D. O. T. No. 1-36.05

Converts items of information obtained from reports and records to codes for processing on automatic machines, using predetermined coding system. Records codes onto form for subsequent transfer to punchcards. May be designated according to trade name of computer system.

Prerequisites

For Occupation

Work situations involve repetitive activities performed according to set procedures. The coding clerk must work to established standards of accuracy in assigning codes. Since coding is performed according to a predetermined, standardized system, a preference for activities of a routine, concrete, organized nature is preferred. Clerical perception is required in converting data to codes, recognizing omissions, and correcting errors in data used.

For Occupational Course of Study

The occupational unit for this trainee is included under the General Office Education Units. Appropriate units for this trainee are listed below.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

Appropriate General Office Education Units	Hours
Business Mathematics I	30
Business Mathematics II	30
Elements of Fiscal Recordkeeping	60
Language Skills	30
Personal Development	30
Business Principles and Organization I	30
Introduction to Business Data Processing	60
Classification and Coding	60
Introduction to Computers	30
Electro-Mechanical Accounting Machines	30

STATISTICAL CLERK

Job Description

D. O. T. No. 1-36.01

Compiles regular and special reports for the use of management and as a basis for statistical studies, using the regular bookkeeping and accounting records as a source of information. Makes up reports showing information such as amount and type of material ordered, used, and rejected; volume and class of daily sales; number and kind of accumulative pending sales, and average working time and wage rate of company employees. May check material used as a source of information. May operate an adding machine and a calculating machine.

Prerequisites

For Occupation

The statistical clerk works under specific instructions, carrying out set procedures and adhering to established standards of accuracy. The trainee should have a preference for activities of a routine, concrete, organized nature.

Clerical perception is required to perceive pertinent detail in written and tabular material, to proofread words and numbers, and to avoid perceptual errors in arithmetic computation. Form perception is needed to make visual discriminations and comparisons in graphic material. Good visual acuity is required for working with figures, tables, graphs, and written reports.

Numerical aptitude is required to perform arithmetic operations quickly and accurately. Verbal ability is required to understand instructions and to present information clearly.

Since the statistical clerk may operate an adding machine or a calculating machine, motor coordination and finger and manual dexterity are needed.

For Occupational Course of Study

The occupational unit for this trainee is included under the General Office Education Units. Appropriate units for this trainee are listed below.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

Appropriate General Office Education Units	Hours
Business Mathematics I	30
Business Mathematics II	30
Elements of Fiscal Recordkeeping	60
Payroll Records	30
Language Skills	30

Business Principles and Organization I	30
Business Principles and Organization II	30
Office Calculators	30
Introduction to Business Data Processing	60
Electro-Mechanical Accounting Machines	30
Elementary Descriptive Statistics	60

TAPE LIBRARIAN

Job Description — D. O. T. No. 1-20.04

Maintains library of reels of magnetic or punched paper tape used for automatic data processing purposes. Classifies and catalogs reels of tape in accordance with such factors as content of data and type of routine. Assigns code conforming with standardized system. Prepares records for file reference. Stores reels according to classification and catalog designation. Issues reels and maintains charge-out records. Inspects returned reels to determine if tape needs replacing due to wear or damage.

Prerequisites

For Occupation

The activities require performance according to specific procedures. Therefore, the tape librarian should have a preference for activities of a routine, concrete, organized nature.

The work is light, requiring frequent lifting and placing reels of tape (20 pounds reel weight lifted occasionally). Reaching and handling are required to store, issue, and wind reels.

Other requirements are verbal ability to deal with subject matter and clerical ability to perceive pertinent details involved in assigning catalog numbers and classifying reels of tape.

For Occupational Course of Study

As a prerequisite for entering the occupational course the trainee should have skills and knowledge equivalent to that gained from the General Office Education Units suggested as pertinent to this occupation.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

Appropriate General Office Education Units	Hours
Language Skills	30
Business Communications	30
Personal Development	30
Business Principles and Organization I	30
Fundamentals of Typing	60
Production Typing	60
Introduction to Business Data Processing	60
Electro-Mechanical Accounting Machines	30

Specialized Occupation Unit which follows:	
Elementary Library Systems	60

ELEMENTARY LIBRARY SYSTEMS

Hours Required

Class: 1 hour daily, Laboratory: 1 hour daily Total: 60 hours

Description

This unit serves to acquaint trainees with procedures and methods used in maintaining a tape library. Elementary systems for identification and control of stored materials are detailed. Each class of library materials is discussed in terms of the factors which affect its receipt, storage, and issue. Emphasis is on developing skill in originating and maintaining basic tape library records.

Topic Outline

I. The Library in the Organization
II. Factors in Organizing Storage of Library Materials
III. Storing Tapes, Cards, and Materials
IV. Record Systems
V. Classification Systems
VI. The Program Library
VII. Simulation of Setting up a Library

TOPIC I. THE LIBRARY IN THE ORGANIZATION

A. Library services

B. The job of the librarian

C. Advances in library technology

D. Integrating the library with the total data processing system

E. Data processing materials

TOPIC II. FACTORS IN ORGANIZING STORAGE OF LIBRARY MATERIALS

A. Size and types of storage space—racks, cabinets, containers

B. Types of supplies needed—tapes, reels, etc.

C. Receipt, storage, and issue of materials

TOPIC III. STORING TAPES, CARDS, AND MATERIALS

A. Factors in handling magnetic tape
   1. Properties, size, data representation
   2. Temperature and humidity conditions
   3. Tape reconditioning
   4. Cycling tapes in the library
   5. Protective handling
   6. Packing and shipping
   7. Checking for damage
   8. Cleaning
   9. Testing

B. Punched paper tape

C. Cards

D. Other materials

E. Practice in handling stored materials

TOPIC IV. RECORD SYSTEMS

A. Purpose of and need for accurate record systems

B. Types of systems

C. Record formats

D. Records for file references

E. Records for issue and receipt

F. Scratch dates

G. Practice in library clerical activity

TOPIC V. CLASSIFICATION SYSTEMS

A. Purposes of classification

B. Classification systems

C. Process of classification
  1. By content of data
  2. By type of routine

D. Classification of varied types of materials
  1. Magnetic tapes
  2. Punched paper tape
  3. Punched cards
  4. Other materials

E. Labeling Magnetic tapes
  1. Label formats
  2. Types of information needed on labels
  3. External labels
  4. Internal labels

F. Practice in classifying and labeling

TOPIC VI. THE PROGRAM LIBRARY

A. Classification and control of materials
  1. Program card decks
  2. Program master tapes
  3. Utility programs
  4. Subroutines
  5. Control panels
  6. Printer carriage control tapes

TOPIC VII. SIMULATION OF SETTING UP A LIBRARY

(Practice on all library activities)

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available material), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

Gotlieb, C. C. and Hume, J. N. P. High-Speed Data Processing. New York: McGraw-Hill Book Co., Inc., 1958.

McCracken, Daniel D. Digital Computer Programming. New York: John Wiley and Sons, Inc., 1957.

KEY-PUNCH OPERATOR

Job Description

D. O. T. No. 1-25.62

Records accounting and statistical data on tabulating cards by punching a series of holes in the cards in a specified sequence, using a punch machine similar in operation and action to a typewriter. Places card on base of machine by hand or automatically by pressing a lever, and positions carriage for perforating operation. Following written information on records, punches corresponding numbers or symbols on the machine keyboard, thereby transcribing the written information into perforations on the tabulating cards. May operate a tabulating machine, a sorting machine, or a verifying machine.

Prerequisites

For Occupation

The worker must adhere to established standards of accuracy when recording data. Good visual acuity is required to type data rapidly and continuously.

Clerical perception is required to detect errors in recorded data. Recording of data on cards for machine tabulation requires an adjustment to a routine, concrete, organized type of activity.

For Occupational Course of Study

As a prerequisite for entering the occupational course the trainee should have skills and knowledge equivalent to that gained from the General Office Education Units suggested as pertinent to this occupation.

In order to learn key-punch operation, the trainee must have a typing speed of approximately 40 wpm at the time of entry into the specialized course. Reaching, handling, motor coordination, and finger and manual dexterity are involved in operating the keyboard and inserting material into and removing material from the machine.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

KEY-PUNCH EQUIPMENT OPERATION

Hours Required

Class: 2 hours daily, Laboratory: 4 hours daily — Total: 60 hours

Description

This unit is designed to familiarize trainees with the function and operation of key-punch and verifying machines. Emphasis on practice exercises is required to develop speed and accuracy in standard operating procedures to meet employable proficiency standards.

Topic Outline

I. The Unit Record
II. Basic Key-Punch Machine Features and Functions
III. Operating Procedure Practice
IV. Additional Features of the Key-Punch Machine
V. Operating Procedure Practice—Entire Keyboard
VI. Program Control Unit
VII. Program Card and Programming
VIII. Program Control Exercises
IX. Verifying Procedures and Practice

TOPIC I. THE UNIT RECORD

A. Source document
B. Card format
C. Card code
D. Card field
E. Control punches

TOPIC II. BASIC KEY-PUNCH MACHINE FEATURES AND FUNCTIONS

A. Main line switch
B. Hopper
C. Stacker
D. Punching Stations
E. Keyboards
   1. Numeric
   2. Combination (Numeric-alphabetic)
F. Feeding mechanism
G. Reading station
H. Backspace key
I. Column indicator
J. Pressure roll release lever
K. Program unit

TOPIC III. OPERATING PROCEDURE PRACTICE

A. Practice keyboard exercises
B. Simple feeding operations

TOPIC IV. ADDITIONAL FEATURES OF THE KEY-PUNCH MACHINE

A. Auxiliary duplication device
B. Self-checking numbers device
C. Alternate programming
D. Card insertion device
E. Interspersed master card gang punching
F. Card correction feature

TOPIC V. OPERATING PROCEDURE PRACTICE—ENTIRE KEYBOARD

Practice exercises using all key-punch features

TOPIC VI. PROGRAM CONTROL UNIT

A. Function of the program unit

B. Program card codes

TOPIC VII. PROGRAM CARD AND PROGRAMMING

A. Field definition

B. Numeric or alphabetic shift

C. Automatic shift

D. Automatic skipping

E. Duplication

F. Zero print

G. Print suppression

TOPIC VIII. PROGRAM CONTROL EXERCISES

Practice exercises using all program control elements

TOPIC IX. VERIFYING PROCEDURES AND PRACTICE

A. The need for verifying

B. Visual verification procedures—listing, printing, proofreading

C. Visual verification practice

D. Verifier features and functions
   1. Verifying station
   2. Keyboard
   3. Error light
   4. Operating procedures

E. Practice in verifier use

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available materials), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

McGill, Donald A. C. Punched Cards—Data Processing for Profit Improvement. New York: McGraw-Hill Book Co., Inc., 1962.

Van Ness, Robert G. Principles of Punched Card Data Processing. Elmhurst, Ill.: The Business Press, 1963.

TABULATING MACHINE OPERATOR

Job Description D. O. T. No. 1-25.64

Operates a machine that automatically analyzes, makes calculations, and translates or divides information represented by holes punched in groups of tabulating cards, and prints the translated data on form sheets, reports, special cards, or accounting records. Sets or adjusts machine to add, subtract, multiply, and make other calculations. Places cards to be tabulated in feed magazine and starts machine. May file cards after they are tabulated. May sort punched cards, punch information on cards, or verify punched cards.

Prerequisites

For Occupation

The tabulating machine operator trainee should show a preference for working with machines, processes, and techniques, and for activities that are routine and concrete. Motor coordination and finger and manual dexterity are required to wire control panels and operate machines, and use the typewriter.

Other requirements are good vision and clerical perception for error detection in printing and format, and form perception for operating the machine and following wiring diagram details. Some mechanical ability is advantageous.

For Occupational Course of Study

As a prerequisite for entering the occupational course the trainee should have skills and knowledge equivalent to that gained from the General Office Education Units suggested as pertinent to this occupation.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

Specialized Occupation Units which follow:

Tabulating Machine Operation	45
Tabulating Machine Wiring	45

TABULATING MACHINE OPERATION

Hours Required

Class: 1 hour daily, Laboratory: 2 hours daily Total: 45 hours

Description

This unit is designed to acquaint trainees with the functions and features of tabulating machines. Extensive practice in operating procedures is required to assure development of proficiency. Since features vary in different models, it is essential that the instructor concentrate on those features common to most tabulating equipment and show or relate some of the differences which are found.

Topic Outline

I. Functions
II. Operating Features
III. Tape-Controlled Carriage
IV. Form control
V. Operating Procedure Practice

TOPIC I. FUNCTIONS

A. Detail printing (listing)
B. Group printing
C. Addition and subtraction
D. Accumulating
E. Program control
F. Summary punching

TOPIC II. OPERATING FEATURES

A. Control panel
B. Signal lights
C. Hopper
D. Stacker
E. Print unit
F. Reading stations
G. Operating keys and switches
H. Hammerlock levers
I. Hammersplit levers

TOPIC III. TAPE CONTROLLED CARRIAGE

A. Carriage controls
B. Control tape
C. Form thickness adjustment
D. Form stops
E. Pressure release lever
F. Platen shift wheel

TOPIC IV. FORM CONTROL

A. Carriage skips
B. Head control
C. Form to form skipping
D. Overflow skipping
E. Program skipping

TOPIC V. OPERATING PROCEDURE PRACTICE

A. Card handling
B. Operating the machine
C. Operating the carriage
D. Exercises in all machine functions (detail printing, etc.)

Texts and Other Teaching Materials

From the following suggested text and material (or other equivalent commercially available material), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

Wanous, S. J. and Wanous, E. W. Automation Office Practice. Cincinnati, Ohio: South-Western Publishing Co., 1964.
Teachers' Manual. Office Practice set.

TABULATING MACHINE WIRING

Hours Required

Class: 1 hour daily, Laboratory: 2 hours daily Total: 45 hours

Description

This unit serves to acquaint trainees with control panel wiring principles and procedures. Practice in wiring and in wiring control board replacement for the various applications is essential for the development of proficiency.

Topic Outline

I. Principles of Control Panel Wiring
II. Wiring Fundamentals
III. Wiring Practice

TOPIC I. PRINCIPLES OF CONTROL PANEL WIRING

A. Function of control panel

B. Applications

C. Report formats

TOPIC II. WIRING FUNDAMENTALS

A. Printing
  1. Normal printing
  2. Transfer printing
  3. Character emitting
  4. Zero printing

B. Selection
  1. Pilot selector
  2. Co-selector

C. Program control

D. Addition

E. Subtraction

F. Storage units

G. Summary punching

TOPIC III. WIRING PRACTICE

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available material), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

Data Processing Wiring Guide. Detroit Mich.: American Data Processing, Inc., 1962.
Solmon, Lawrence J. IBM Machine Operation and Wiring. Belmont, Calif.: Wadsworth Publishing Co., 1962.

A sufficient number of wiring panels should be provided so that certain phases of this course can be taught using the battery plan of instruction.

CONSOLE OPERATOR

Job Description D. O. T. No. 1-25.17

Monitors and controls an electronic computer that automatically processes data to solve mathematical, engineering, or technical problems or to maintain business records, by operating a central control unit known as a console. Studies program instruction sheet to determine equipment set-up and operating instructions. Mounts reels of tape in designated magnetic tape units which extract input data or record output data. Switches auxiliary equipment, such as automatic typewriter and peripheral machines into circuit, to close loop and effect feedback of data. Manipulates up to 100 or more control switches on console panel to start and operate electronic computer that reads and processes data. Observes continuously as many as 200 lights on control panel and magnetic tape units and action of automatic typewriter to monitor system and determines point of equipment failure. Tears printed sheets from typewriter at designated points to be used for verification. Reports machine malfunctioning to supervisor. Manipulates controls in accordance with standard procedures to rearrange sequence of program steps in order to correct computational errors or to continue operations when individual units of system malfunction. Confers with technical personnel in event errors require change of instructions or sequence of operations. Rewinds and removes tape at completion of processing. Maintains operating records, such as machine performance and production reports.

Prerequisites

For Occupation

Work activities require an adjustment to situations that are scientific and technical in nature, as well as to situations that are related to machines, processes, and techniques, and involve business contact with others. Work is routine, concrete, and organized when following program instructions.

The console operator is required to make proper decisions under emergency conditions resulting from error situations. In such instances the worker is faced with alternatives of repeating runs or salvaging all or part of faulty runs. The worker's actions affect decisions as to costly down-time for maintenance. The console operator also makes decisions in terms of factual data contained in program instructions and on a judgmental basis when altering program instructions in emergency situations. Dealing with people in conference situations is sometimes involved in the work of the console operator.

Clerical perception is needed to recognize pertinent details in program instructions, and to maintain accurate records of machine performance and production.

Motor coordination, finger dexterity, and manual dexterity are needed to learn to mount reels of tape on spindles of magnetic tape units and manipulate switches controlling auxiliary equipment.

Reaching and handling are involved in positioning reels. The work requires unrestricted use of hands and fingers to set any of 100 or more 2- to 5-position switches on the control panel or to manipulate appropriate output selector buttons and switches.

Talking and hearing are involved in exchanging information continuously concerning equipment characteristics and requirements.

Color vision is involved in monitoring as many as 200 indicator lights which show normal machine functioning or error situations.

The work is considered light, requiring frequent lifting of reels of instruction or data tape (maximum reel of 20 pounds lifted occasionally) onto appropriate magnetic tape units.

For Occupational Course of Study

Certain aptitudes are required for successful training. Verbal ability is needed to comprehend the meaning of programming instructions and machine logic as applied to a specific technical or business problem, and to learn to present clearly suggestions and ideas to programmers and other technical personnel which may affect their decisions concerning techniques for solving a problem.

As a prerequisite for entering the occupational course the trainee should have skills and knowledge equivalent to that gained from the General Office Education Units suggested as pertinent to this occupation.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

CONTROL CONSOLE OPERATION

Hours Required

Class: 3 hours daily, Laboratory: 3 hours daily Total: 60 hours

Description

The purpose of this unit is to train the individual in the fundamentals of console operation. Lecture on the basic aspects of operation will be supplemented by laboratory sessions familiarizing the individual with specific equipment. Machine practice will provide actual experience in set-up procedures, manipulation and use of console control, control of peripheral devices, and use of operating aids.

Topic Outline

I. The Control Console in the System
II. Description and Use of the Control Console Features
III. Program Initiation and Operation
IV. Programming and Coding
V. Operating Aids and Procedures
VI. Control Console Practice

TOPIC I. THE CONTROL CONSOLE IN THE SYSTEM

TOPIC II. DESCRIPTION AND USE OF THE CONTROL CONSOLE FEATURES

Since equipment and training will vary at each training location, the description of the specific console is left to the discretion of the teacher. He should cover the location and function of:

A. Lights, switches, and keys
  1. Power source
  2. Power control lights and switches
  3. Emergency lights and switches
  4. Start keys
  5. Alarm control lights and keys
  6. Peripheral equipment control lights and keys
  7. Logic display

B. Register control lights and keys
  1. Register, select, and reset control
  2. Register display lights
  3. Register entry keys
  4. Instruction set-up and execution procedures

C. Memory accessing lights and keys
  1. Memory display lights
  2. Memory entry keys
  3. Procedures for writing to and reading from memory

D. Console typewriter operation

E. Special features

TOPIC III. PROGRAM INITIATION AND OPERATION

A. Program library organization

B. Loading programs from magnetic tape, punch cards, paper tape, or random access devices

C. Automatic program loading routines

D. Error stop procedures

E. Restart procedures

TOPIC IV. PROGRAMMING AND CODING

A. Steps in program preparation

B. Programming fundamentals
   1. Number systems
   2. Word format
   3. Computer address systems
   4. Instruction formats
   5. Flow charting

C. Coding fundamentals
   1. Classification codes
   2. Machine language and communication codes
   3. Coding sheet forms

TOPIC V. OPERATING AIDS AND PROCEDURES

A. Program testing
   1. Error stop information
   2. Debugging aids

B. Operation run books
   1. Organization
   2. Contents
   3. Operating procedures

C. Other operation records
   1. Machine logs
   2. External reel labels
   3. Schedules

D. Utility and assembly programs

E. Executive routing concept

F. Data library organization

G. Housekeeping procedures
   1. Documentation
   2. Tape handling and tape library procedures
   3. Storage of card decks, tapes, and other materials
   4. Neatness and organization

H. Procedures for reporting machine malfunctioning

TOPIC VI. CONTROL CONSOLE PRACTICE

Console practice, or laboratory sessions, which account for 50 percent of the course hours should be closely integrated with the lecture material. When local conditions permit, the first 3 hours of each day should be devoted to lecture and the last 3 hours to console practice. Console exercise should be designed to provide practice related to the preceding lecture material. Console practice should include the following areas:

A. Manipulation of all keys, switches, and lights

B. Data entry to memory

C. Data retrieval from memory

D. Register setting

E. Register display

F. Program loading

G. Running of assembly and utility routines

H. Program running

I. Error correction

J. Use of run books, operating procedures and data library facilities

K. Operation of related peripheral equipment (Magnetic tapes, card and paper-tape printer, console typewriter, on-line printer)

Later practice sessions should build on the knowledge of basic procedures to develop sound judgment in new situations, ability to distinguish machine malfunction from data or program errors, knowledge of restart procedures, and practice in interpreting operating manuals independently to obtain information on procedures.

Texts and Other Teaching Materials

A variety of useful reference manuals and teaching materials can be obtained from local representatives of data processing equipment manufacturers.

RCA 301 Console Operator's Manual and RCA 501 Console Operator's Manual are available at all RCA EDP Branch Sales Offices.

A catalog on console operation texts is available for consultation at any IBM office, although they cannot be distributed generally.

SUPERVISOR, CLERICAL

Job Description **D. O. T. No.***

Supervises a group of workers engaged chiefly in one general type of clerical function, as bookkeeping, typing, and filing: Determines procedures of work. Issues written and verbal orders or instructions. Assigns duties to workers and checks their work for exactness and neatness. Makes up composite reports based on individual reports of subordinates. Maintains harmony among workers. Adjusts errors and complaints. May perform essentially the same duties as the other workers, as a regularly assigned duty, or assist subordinates in performing only the more difficult and complicated duties. May keep time reports and other personnel records of quantity and quality of work performed, and may employ, train, and discharge workers. Must be proficient in the particular type of clerical work in which he functions. Designated according to the group of workers he supervises, as chief cashier; filing supervisor; head bookkeeper.

Prerequisites

For Occupation

The work of the clerical supervisor involves an ability to reason and make judgments. The work situation involves directing, controlling, and planning an entire activity, and directing the activities of others.

Verbal ability is needed to understand and present information or ideas clearly.

Clerical perception is required to perceive pertinent detail in verbal or tabular material—to observe differences in copy, to proofread words and numbers, and to avoid perceptual errors in arithmetic computation.

For Occupational Course of Study

The occupational units for this trainee are included under the General Office Education Units. Appropriate units for this trainee are listed below.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

Appropriate General Office Education Units	Hours
Business Mathematics I	30
Business Mathematics II	30
Elements of Fiscal Recordkeeping	60
Payroll Records	30
Personal Development	30
Business Communications	30
Business Principles and Organization I	30
Business Principles and Organization II	30

Classification and Coding	20
Introduction to Computers	30

SUPERVISOR, MACHINE-RECORDS UNIT

Job Description

D. O. T. No. 1-25.67

Supervises workers engaged in keeping records and tabulating reports, using punch cards and special office machines: Sets up machines for new operations. Directs care and cleaning of machines, sometimes making mechanical adjustments and minor repairs in an emergency. Performs other duties as described under Supervisor. May assist administrative officials in planning new accounting methods and designing cards and forms for new clerical processes. May be designated according to trade name of machines used in office, as IBM supervisor.

Prerequisites

For Occupation

The work of the machine-records unit supervisor involves an ability to reason and make judgments. The work situation involves directing, controlling, and planning an entire activity, and directing the activities of others. Ability to deal with people is important.

Verbal ability is required to understand instructions and to present information clearly. Numerical aptitude is required to perform arithmetic operations quickly and accurately. Good visual acuity is required for working with numbers and written material.

Clerical perception is required to perceive pertinent detail in verbal or tabular material—to observe differences in copy, to proofread words and numbers, and to avoid perceptual errors in arithmetic computation.

Mechanical aptitude is advantageous. Comprehension of data processing systems in detail is a vital need in making procedural explanations to subordinates on the job.

For Occupational Course of Study

As a prerequisite for entering the occupational course the trainee should have skills and knowledge equivalent to that gained from the General Office Education Units suggested as pertinent for this occupation.

The local instructor may check the trainee's previously acquired abilities against the Standards of Achievement for the General Office Education Units in order to plan the curriculum for the trainee.

DATA PROCESSING MATHEMATICS

Hours Required

Class: 1 hour, 3 days/week, Laboratory: 1 hour, 2 days/week Total: 30 hours

Description

This unit provides trainees with a practical foundation in numerical concepts needed for understanding accounting and machine processes as related supervision of machine-records units. Desk calculators may be used. A background in basic mathematics is necessary for starting this course.

Topic Outline

I. Notation
II. Number Systems
III. Number Systems with an Arbitrary Base
IV. Basic Algebra
V. Linear Equations
VI. Fixed and Floating Point Numbers
VII. Elements of Boolean Algebra
VIII. Methods of Numerical Computation
IX. Use of the Computer for Numerical Computation

TOPIC I. NOTATION

A. Concepts of notation
B. Arithmetic progression and series
C. Subscripts
D. Functional notations
E. Exponents
F. Infinite sum
G. Factorials

TOPIC II. NUMBER SYSTEMS

A. Concepts of number systems
B. Base 10 number systems
C. Rational numbers
D. Irrational numbers
E. Powers and roots
F. Logarithms
G. Properties of fractions

TOPIC III. NUMBER SYSTEMS WITH AN ARBITRARY BASE

A. Binary
B. Octal
C. Conversion

TOPIC IV. BASIC ALGEBRA

A. Algebraic expressions
B. Algebraic fractions
C. Factoring
D. Polynomials

TOPIC V. LINEAR EQUATIONS

A. Equations with one unknown
B. Equations with more than one unknown
C. Determinants

TOPIC VI. FIXED AND FLOATING POINT NUMBERS

- A. Fixed point
  - 1. Scaling
  - 2. Advantages
- B. Floating point
  - 1. Mantissa
  - 2. Exponent
  - 3. Advantages

TOPIC VII. ELEMENTS OF BOOLEAN ALGEBRA (Briefly, as needed)

- A. Connectives
- B. Truth tables
- C. Machine implementation of arithmetic operations
- D. Simplification of Boolean algebraic expressions

TOPIC VIII. METHODS OF NUMERICAL COMPUTATION

- A. Computation with powers of 10
- B. Computation with logarithms
- C. Number systems with bases other than 10

TOPIC IX. USE OF THE COMPUTER FOR NUMERICAL COMPUTATION

Texts and Other Teaching Materials

From the following suggested texts and materials (or other equivalent commercially available material), select trainee and teacher materials for use in this unit. Additional references are listed in Appendix B.

INTRODUCTION TO PROGRAMMING

Hours Required

Class: 1 hour daily, Laboratory: 1 hour daily Total: 30 hours

Description

This unit is designed to provide help in understanding the fundamentals of programming for the person who is involved in supervising the day-to-day application of business data processing problems using computers. While stressing fundamentals, the unit also introduces some higher level concepts with which trainees should be acquainted.

Topic Outline

I. Review of Computer Fundamentals
II. Programming Fundamentals
III. Coding Fundamentals
IV. Steps in Program Preparation
V. Instructions to the Machine
VI. Introduction to Symbolic Programming
VII. Subroutines
VIII. Some Programming Systems
IX. Program Testing and Modification
X. Integrating Programming Fundamentals with Accounting Methods

TOPIC I. REVIEW OF COMPUTER FUNDAMENTALS

A. Computer characteristics

B. Components and functions

C. Applications

TOPIC II. PROGRAMMING FUNDAMENTALS

A. Number systems
  1. Decimal, binary, octal
  2. Arithmetic
  3. Conversion

B. Word format
  1. Data words
  2. Instruction words
  3. Fixed and variable word lengths

C. Computer address systems

D. Flow charting

E. Looping and address modification

TOPIC III. CODING FUNDAMENTALS

A. Classification codes
  1. Alphabetic
  2. Numeric
  3. Alpha-numeric
  4. Mnemonic

B. Machine Language and communication codes
  1. Punched tape (5, 6, 7, 8 channel codes)
  2. Punched card (80 col, 90 col.)
  3. Magnetic tape (5, 6, 7, 8 channel codes)
  4. Character recognition

C. Coding sheet forms

TOPIC IV. STEPS IN PROGRAM PREPARATION

A. Definition and analysis

B. Elements of program design

- C. Coding
- D. Running
- E. Error correction

TOPIC V. INSTRUCTIONS TO THE MACHINE

- A. Instruction formats
- B. Input-output
- C. Arithmetic
- D. Logic control
- E. Error indicators
- F. Rearrangement of data

TOPIC VI. INTRODUCTION TO SYMBOLIC PROGRAMMING

- A. Use of symbolic labels
- B. Operation statements
- C. Address arithmetic
- D. Assembly operation

TOPIC VII. SUBROUTINES

- A. The use of subroutines
- B. Library concept
- C. Open subroutine
- D. Closed subroutine

TOPIC VIII. SOME PROGRAMMING SYSTEMS

- A. Macro-instructional
- B. Assembling and compiling systems
- C. Utility
- D. High-level language

TOPIC IX. PROGRAM TESTING AND MODIFICATION

- A. The test deck
- B. Test results and duplication of errors
- C. Kinds of errors
- D. Error correction

TOPIC X. INTEGRATING PROGRAMMING FUNDAMENTALS WITH ACCOUNTING METHODS

Practice case studies

DATA PROCESSING SYSTEMS

Hours Required

Class: 1 hour daily, Laboratory: 2 hours daily Total: 90 hours

Description

This unit is designed to provide the supervisory trainee with an understanding of concepts and procedures in business data processing systems. Applications for basic business accounting operations should be given in detail, and case studies used to illustrate the different applications.

Topic Outline

I. Brief Review of Data Processing
II. Systems Concepts in Business
III. Charts, Forms, and Records
IV. Accounts Receivable Applications
V. Accounts Payable Applications
VI. Payroll Applications
VII. Inventory Control Applications

TOPIC I. BRIEF REVIEW OF DATA PROCESSING

A. Importance and use of data

B. Evolution and growth of data processing

C. Specific applications of business data processing

D. Basic data processing cycle

TOPIC II. SYSTEMS CONCEPTS IN BUSINESS

A. The systems approach

B. Types of systems

C. Parts of a system

D. The business as a system

E. Systems survey, design, and implementation

TOPIC III. CHARTS, FORMS, AND RECORDS

A. Types of systems charts
  1. Organization charts
  2. Work and schedule charts
  3. Statistical tables and graphical charts

B. Flow charts
  1. Types
  2. Applications

C. Record and report layouts

D. Specifications for magnetic encoded checks

E. Forms design requirements
  1. Elements of a form
  2. Forms numbering and classification systems
  3. Steps in forms design
  4. Specification writing

TOPIC IV. ACCOUNTS RECEIVABLE APPLICATIONS

A. Objectives and importance of accounts receivable

B. Making entries—effects on general ledger, journal, and sales records

C. Controls

D. Handling methods
   1. Open item
   2. Balance forward

E. Applications for electromechanical data processing machines
   1. Open item
   2. Balance forward

F. Applications for computing machines
   1. Open item
   2. Balance forward

G. Case studies

TOPIC V. ACCOUNTS PAYABLE APPLICATIONS

A. Objectives and importance of accounts payable

B. Functions of accounts payable department

C. Effect on general ledger and journal

D. Establishing liability accounts
   1. Purchases requisition
   2. Purchasing department functions
   3. Purchase order preparation

E. Validating liability accounts
   1. Internal expenses
   2. Outside charges
   3. Receiving reports
   4. Debit memos

F. Posting liabilities
   1. Ledgers and journals
   2. Discounts

G. Writing checks

H. Applying distributions
   1. Allocating expenses
   2. Analyzing records

I. Accounting controls

J. Applications for electromechanical data processing machines

K. Applications for computing machines

L. Case studies

TOPIC VI. PAYROLL APPLICATIONS

A. Objectives and importance of payroll applications

B. Organization for payroll control

C. Effects on balance sheets and income statements

D. Payroll source data
   1. Attendance documents
   2. Production documents
   3. Deduction documents
   4. Computative data
   5. Classification data
   6. Identification data

E. Controls

F. Types of payroll
   1. Hourly
   2. Salary
   3. Incentive

G. Payroll calculation (practice exercises)

H. Overtime

I. Tax and deduction computation

J. Payroll register

K. Checks and earnings statements

L. Tax reports

M. Payroll cost analysis and distribution

N. Procedure study requirements

O. Applications for electromechanical data processing machines

P. Applications for computing machines

Q. Case studies

TOPIC VII. INVENTORY CONTROL APPLICATIONS

A. Objectives and importance of inventory control

B. Organization for inventory control
   1. Establishing controls
   2. Procedural approaches

C. Applications for electromechanical data processing machines

D. Applications for computing machines

E. Case Studies

APPENDIX A—SUGGESTED STANDARDS OF ACHIEVEMENT

Acceptable vocational competencies in a job classification will vary according to local labor and employer standards. The following suggested standards reflect professional opinion concerning generally accepted achievement levels in the subject areas.

Standards of performance are divided into two areas: those subjects in which objective skill measurement is fairly well standardized, and those subjects in which reliance must be placed on the teacher's business knowledge and previous teaching experience. These latter subjects are primarily concerned with acquisition of knowledge, development of attitudes, and demonstration of acceptable behavior.

The suggested standards should not be considered rigidly minimal. Rather, they should be looked upon as guides in evaluating trainee achievements and class goals.

Evaluation of each trainee by the teacher should include the use of selected class tests, workbook grading, and final tests. In addition, the teacher should note trainee interest, contributions, and motivation.

GENERAL OFFICE EDUCATION UNITS

BUSINESS MATHEMATICS I

Accurately (95% or better) perform calculations of percentages, averages, measurements, and simple money statements involving proficiency in conversion and use of fractions and decimals

BUSINESS MATHEMATICS II

a. Accurate (95% or better) calculation of simple payrolls, discounts and prices, interest rates, and interest yields
b. Accurate (95% or better) calculation of deferred payments and charges, discount and discount rates on notes and drafts
c. Knowledge of the simpler types of insurance and tax computations

ELEMENTS OF FISCAL RECORDKEEPING

a. Knowledge of basic bookkeeping, including simple entries in double entry system
b. Knowledge of the nature and application of common business records
c. Average degree of proficiency in completion of common and simple records
d. Demonstrated ability to handle cash transactions accurately (no errors)
e. Knowledge of double-entry bookkeeping. Simple journal and ledger entries
f. Knowledge of source records required for posting

PAYROLL RECORDS

a. Understand payroll accounting procedures
b. Compute payroll deductions and make required reports
c. Make accurate payroll calculation from source data (100% accuracy)

LANGUAGE SKILLS

a. Correct spelling of the more commonly used business English words
b. Know meaning, use, and spelling of general business terms and most frequently used data processing terms
c. Knowledge of rules of punctuation, capitalization, and abbreviations
d. Ability to construct sentences and use phrases and clauses correctly
e. Test level of achievement. Course unit content knowledge (approximately 90%)

BUSINESS COMMUNICATIONS

a. Knowledge and understanding of the fundamental principles of effective communication
b. Adequate mastery of the mechanics of English
c. Preparation of simple letters from rough notes
d. Handling of appointments, schedules, and acknowledgments
e. Use of source material for information
f.. Ability to compose letters and reports

PERSONAL DEVELOPMENT

a. Knowledge of basic office customs
b. Acceptable appearance and clear, distinct speech
c. Demonstration of good personal habits and application of common sense to routine office work
d. Understanding of self—personality, motives, emotions—and demonstrated willingness to strive for self-improvement
e. Ability to adjust to group work situations: human relations, teamwork
f. Ability to work independently, organize work, and recognize superior-subordinate relationships

BUSINESS PRINCIPLES AND ORGANIZATION I

Knowledge of fundamentals of course unit in regard to types of business organizations and managerial structure and functions (85 to 90% grades on tests of factual material in course content)

BUSINESS PRINCIPLES AND ORGANIZATION II

a. Knowledge of basic techniques and importance of management of finance, personnel, and production
b. Basic understanding of simpler business and government relationships
c. Appreciation of personal relationships in office of superiors, subordinates, and co-workers

FUNDAMENTALS OF TYPING

a. Keyboard mastery; understanding of principles and techniques of touch typing
b. Concept of neatness and attractiveness of typwritten product; knowledge of how to proofread copy and correct errors
c. Ability to make applications of typing skill to basic letter forms, simple tabulations, simple manuscript typing, simple office forms
d. Clean typewriters; change ribbons
e. Type straight copy, average difficulty, 3 minutes—approximately 35 to 50 wpm (gross)—3 errors or fewer

PRODUCTION TYPING

a. Keyboard mastery, including number and symbol keys, and correct operation of service parts
b. Knowledge, skill, and judgment to produce neat, attractive typewritten "jobs" of some complexity with a minimum of direction and with a sense of responsibility for the correctness of the items from all standpoints
c. Ability to produce mailable business letters of approximately 120 words in 5 minutes; manuscript copy, double-spaced, with headings, from plain copy, 200 words in 10 minutes; tabulated material, 4 columns, with headings, from plain copy (10 items per column) in 5 minutes
d. Knowledge of typing common business documents, including fill-in typing on printed forms
e. Ability to type "masters" for reproduction
f. Appropriate care of the machine: cleaning, changing ribbon, etc.
g. Type straight copy, average difficulty, 5 minutes—approximately 45 wpm or more (gross)—3 errors or fewer

OFFICE CALCULATORS

a. Tabulation of 50 handwritten checks in 1 minute or less; No errors
b. Listing from columnar figures 80-to 100-keys-per-minute rate
c. Knowledge and use of reciprocal tables with full-key adding machine
d. Identify basic calculators and know uses in clerical activities
e. Proficiency in touch system with 10-key and full-key adding machines as per (a) and (b)
f. Ability to add, multiply, subtract, and divide on adding machines and calculators

INTRODUCTION TO BUSINESS DATA PROCESSING

a. Knowledge of special vocabulary of data processing
b. Understanding of what data processing is and of its importance to business
c. Understanding of the steps in a data processing cycle
d. Basic knowledge of functions of data processing equipment
e. Knowledge of the functions of a data processing department and of peripheral data processing occupations

ELECTRO-MECHANICAL ACCOUNTING MACHINES

a. Knowledge of basic functions, features, and operating procedures of each piece of equipment
b. Knowledge of basic housekeeping procedures for each piece of equipment
c. Theoretical understanding of the accounting applications of electro-mechanical accounting machines

ELEMENTARY DESCRIPTIVE STATISTICS

a. Understanding of elementary statistics and its uses
b. Knowledge of statistical measurement
c. Knowledge of graphical presentation
d. Understanding of basic sampling concepts
e. Ability to organize and interpret statistical data
f. Knowledge of the use of statistics as a means of communicating business information

PRINCIPLES OF SUPERVISION

a. Understanding of management functions
b. Understanding of the nature of supervisory responsibilities
c. Knowledge of effective use of authority
d. Knowledge of performance evaluation techniques

PSYCHOLOGY FOR SUPERVISORS

Basic understanding of human relations, morale and productivity as affected by work climate

CLASSIFICATION AND CODING

a. Knowledge of various coding systems
b. Ability to read flow charts
c. High degree of skill in coding
d. Knowledge of various machines and systems which can be used in handling data processing problems, and of how to communicate with these machines through various coding systems

INTRODUCTION TO COMPUTERS

a. Knowledge of electronic data processing vocabulary
b. Understanding of the general principles of a computer system
c. Knowledge of computer elements and their purposes
d. Basic knowledge of programming fundamentals

SPECIALIZED OCCUPATION UNITS

ELEMENTARY LIBRARY SYSTEMS

a. Understanding of the organization and function of a data processing library
b. Knowledge of basic recordkeeping systems
c. Knowledge of the classification of data processing materials
d. Knowledge of handling and preservation of data processing materials
e. Knowledge of receipt, storage, and issue procedures

KEY-PUNCH EQUIPMENT OPERATION

a. Knowledge of all operative parts of the key-punch machine
b. Ability to prepare program cards
c. Ability to produce a minimum of 5000 correct key strokes per hour

TABULATING MACHINE OPERATION

a. Mastery of all operating features of the machine
b. Competency in all machine functions
c. Ability to list all steps in the flow of data from the raw source to report with a complete description of the activity performed at each step

TABULATING MACHINE WIRING

Ability to apply control panel wiring principles and procedures pertaining to all functions of tabulating machines

CONTROL CONSOLE OPERATION

a. Display full knowledge of proper tape and card handling and housekeeping procedures
b. Recognize and use the records of a tape library
c. Understand data flow through machine register operation and basic programming concepts and instructions
d. Display thorough understanding of run manual and operating records maintenance
e. Identify the features of a control console and perform basic practice exercises accurately, displaying knowledge of programming runs and tests and error correction
f. Using a run book, set up and monitor the processing of a programming application without supervision
g. Demonstrate understanding of utility and assembly routines, and be able to use their respective operation manuals correctly and independently
h. Identify any unusual console conditions selected by the instructor and take appropriate actions

DATA PROCESSING MATHEMATICS

a. High degree of understanding of number systems
b. Ability to handle various basic mathematical computations necessary for understanding and using data processing equipment
c. Ability to understand application of these numerical concepts to computer programming problems

INTRODUCTION TO PROGRAMMING

a. Knowledge of computer fundamentals
b. Basic understanding of programming techniques for business applications
c. Knowledge of flow charting

DATA PROCESSING SYSTEMS

a. Understanding of the function of data processing systems in business
b. Basic understanding of data processing equipment
c. Knowledge of charts and forms used in business data processing
d. Knowledge of business systems, procedures, and desired outputs

APPENDIX B—TYPICAL MATERIALS FOR INSTRUCTIONAL PURPOSES

SAMPLE SUGGESTED LESSON PLAN

A good unit of instruction provides various kinds of learning activities that should be coordinated with each other for maximum effect, and an effective teacher's guide can aid in such coordination. Among helpful learning activities are demonstrations, lectures, directed study, supervised practice, and examinations. Many approaches are thus made to the problems in the unit, and the trainee takes a basic step in learning as he solves problems through these approaches. A typical teacher's guide may suggest topics for presentation by using various teaching techniques—lecture, audiovisual presentation, individual or group activities or discussion, formal or informal review, and oral or written examination. Each separate activity should contribute its part to the mastery of the content of the unit.

The sample suggested lesson plan of a teacher's guide presented here is illustrative of suggested methods of unitizing material for class presentation under the appropriate subtopic or topic of a typical course outline. The individual teacher may expand or contract the detail contained in his own personal guide as his particular experience dictates. Rigorous adherence to the format is neither recommended nor intended. It is a helpful instructional aid when new or infrequently occurring subject content is to be presented.

CODING AND CLASSIFICATION

Lesson X—Flow Charts, Part I, "Types of Charts"
Review: 5 minutes
Lecture and demonstration: 35 minutes
Discussion and preview: 10 minutes
Materials: Coding sheets, Example flow charts, flow chart symbol sheets

Topic Outline

I. Review of preceding lesson
    A. Codes
    B. Coding sheet forms
    C. Cover any material not covered in prior session plan

II. Flow chart fundamentals
    A. The flow chart defined
    B. Uses of flow charts
    C. Flow charts in manual systems
    D. Flow charts in automatic data processing systems
    E. The flow chart as a means of communication
    F. Elements of a flow chart
    G. The flow charting process
    H. How the coder uses flow charts

III. Types of flow charts
    A. Process
        1. Uses
        2. Examples
            a. Block diagrams: inventory application
            b. Flow charts using symbols: payroll application
    B. Detail
        1. Uses

- B. Detail (cont'd)
  - 2. Examples
    - a. Block diagrams: Social Security computation
    - b. Flow charts using symbols: payroll application
- C. Relationship of detail charting to process charting

IV. Examples of flow charts and flow chart development

V. Discussion and questions

VI. Preview of next lession: Flow Charts, Part II, "Symbols and Organization"

Reading assignment for Lesson XI: Hein, An Introduction to Electronic Data Processing for Business, pages 110 to 129.

INSTRUCTIONAL MATERIALS

The following instructional materials have not been previously listed in the course units. They are included here to assist the teacher in finding appropriate and useful supplementary materials. Although this list is by no means exhaustive, it will serve as a convenient initial source of many helpful materials.

For the further convenience of the teacher who may wish to find materials appropriate to a particular subject area quickly, many of the items have been assigned codes which indicate the subject area(s) for which any particular item appears most appropriate. The codes do not specificially refer to titles of units as they appear in the curricula.

Code	Subject Area
A	Accounting and Recordkeeping
BDP	Business Data Processing
BP&O	Business Principles and Organization
C	Computers
CO	Console Operation
C&P	Coding and Programming
CTO	Card-Tape Converter Operation
DPS	Data Processing Systems
E	English

Code	Subject Area
EAM	Electro-Mechanical Accounting Machines
HSP	High-Speed Printer
I	Instructor's reference (advanced texts, additional source lists, and similar materials)
KP	Key Punch Operation
M&S	Mathematics and Statistics
MT	Machine Tabulating
OC	Office Calculators
OS	Principles of Supervision
PD	Personal Development
PS	Psychology for Supervisors
TL	Tape Library
T	Typing
W	Wiring

NOTE: The addresses of publishers, producers, and additional sources of materials may be found in APPENDIX C.

PERIODICALS, GUIDES, AND DIRECTORIES

It is suggested that the teacher become acquainted with some of the following materials. Their contents are both specific and general, and may be applicable to several areas of business education.

Administrative Management. Geyer-McAllister, Inc., 212 5th Avenue, New York, N.Y. 10010

American Business. 4660 Ravenswood Ave., Chicago, Ill. 60640

American Business Education. University of Connecticut, Storrs, Conn. 06268

Audio-Visual Aids for Data Processing Systems and Automation. 1963, Data Processing Management Association. Park Ridge, Ill. 60068

Automation. A Penton Publication, Penton Building, Cleveland, Ohio. 44013

Balance Sheet. South-Western Publishing Co., 5101 Madison Rd., Cincinnati, Ohio. 45227

Business Automation. OA Business Publications, Inc., 288 Park Avenue West, Elmhurst, Ill. 60126

Business Education World. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York, N.Y. 10036

Business Management. Management Magazines, Inc., 22 West Putnam Ave., Greenwich, Conn. 06830

Business Newsmagazine. The Alsen Publishing Co., 1445 N. Fifth St., Milwaukee, Wis. 53212

Business Screen. Business Screen Magazine, Inc., 7064 Sheridan Rd., Chicago, Ill. 60626

Business Week. McGraw-Hill Publishing Co., Inc., 330 W. 42nd St., New York, N.Y. 10036

Canadian Controls and Instrumentation. A Maclean-Hunter Publication, 481 University Ave., Toronto 2, Ontario, Canada.

Check List of All Available Teaching Aids. Prentice-Hall, Inc., Englewood Cliffs, N.J. 07632

Communications of the A.C.M. Association for Computing Machinery, 211 E. 43rd St., New York, N.Y. 10017

Computer Applications Services. American Data Processing, Inc., 2200 Book Tower, Detroit, Mich. 48226

Computers and Automation. Berkeley Enterprises, Inc., 815 Washington St., New Somerville, Mass. 02143

Computers & Data Processing. 217 Broadway, New York, N.Y. 10007

Control Engineering. McGraw-Hill Publishing Co., 330 W. 42nd St., New York, N.Y. 10036

Data Processing for Education. American Data Processing, Inc., 2200 Book Tower, Detroit, Mich. 48226

Data Processing for Management. American Data Processing, Inc., 2200 Book Tower, Detroit, Mich. 48226

Data Processing Yearbook. American Data Processing, Inc., 2200 Book Tower, Detroit, Mich. 48226

Data Systems Engineering. E.H. Nelson Publishing Co., Inc., 510 Madison Ave., New York, N.Y. 10022

Datamation. F.D. Thompson Publications, Inc., 141 E. 44th St., New York, N.Y. 10017

Directory of Films about Property, Casualty and Surety Insurance. Insurance Information Institute, 110 William St., New York, N.Y. 10038.

Directory of 2660 16mm Film Libraries. Department of Health, Education and Welfare, Washington, D.C. 20202

Educators Guide to Free Films. Educators Progress Service, Dept. AVG. Randolph, Wis. 53956

Educators Guide to Free Slidefilms. Educators Progress Service, Dept. AVG, Randolph, Wis. 53956

Employment Outlook of Electronic Computer Operating Personnel and for Programmers. (BLS Bulletin 1300-34) U.S. Government Printing Office, Washington, D.C. 20402

Financial Executive. Financial Executives Institute, 50 W. 44th St., New York, N.Y. 10036

Instrument and Apparatus News. Instruments Publishing Co., 845 Ridge Ave., Pittsburgh, Pa. 15212

Instruments and Control Systems. Instruments Publishing Co., 845 Ridge Ave., Pittsburgh, Pa. 15212

Instruments and Control Systems Buyers' Guide. Instruments Publishing Co., 845 Ridge Ave., Pittsburgh, Pa. 15212

FILMS AND FILMSTRIPS

Abbreviations Used in Descriptions

BW - Black & White
Col - Color
FS - Filmstrip
Min. - running time in minutes

MP - Motion Picture
Si - Silent
So - Sound

(OC, A) Accounting and Calculating Machines. MP-So-BW-12 min. Teaching Aids Exchange.

(A) Accounting Cycle Direct Ledger Entry, The. FS-Si. Business Education Films.

(A) Accounting Series. 11 FS-Si-BW. McGraw-Hill Book Co., Inc.

(PD, PS) As Others See Us. MP-So-BW-10 min. British Information Service.

(C, BDP) Automatic Computers. MP-So-Col-16 min. International Business Machines.

(BDP, C) Automation. A CBS NEWS "See It Now" Production. MP-So-BW-84 min. McGraw-Hill Book Co., Inc.

(BDP) Automation of B.J. Blurch, Inc., The. MP-So-Col-16 min. DPMA International Headquarters.

(A) Banks and Credit. MP-So-BW-10 min. Coronet Instructional Films.

(C&P, M&S, C) Base and Place. MP-So-BW-30 min. University of Colorado.

(T) Basic Typing - Machine Operation. MP-So-BW-30 min. United World.

(BDP, EAM) Beauty of It, The. FS-So-Col-30 min. Burroughs Corporation.

(T) Better Typing at Your Fingertips. MP-So-Col-30 min. Modern Talking Picture Service.

(A, M&S) Bookkeeping and Accounting. MP-So-BW-11 min. Carl F. Mahnke Productions.

(A) Bookkeeping and Accounting Errors. FS-Si-BW. Business Education Films.

(A) Bookkeeping and You. MP-So-Col/BW-11 min. Coronet Instructional Films.

(A) Bookkeeping Cycle, The. FS-Si. Society for Visual Education, Inc.

(A) Bookkeeping Series. 6 FS-Col. McGraw-Hill Book Co., Inc.

(E) Build Your Vocabulary. MP-So-Col/BW-10 min. Coronet Instructional Films.

(T) Building Typing Skills. MP-So-Col/BW-11 min. Coronet Instructional Films.

(A, E) Business Education Series. 6 FS-Col. McGraw-Hill Book Co., Inc.

(PD, PS) Business Etiquette Series. 11 FS-BW. McGraw-Hill Book Co., Inc.

(C&P, M&S) By the Numbers. MP-So-Col-16 min. International Business Machines.

(BDP) Careers in Business Data Processing. MP-So-Col-16 min. U. of Southern California.

(BDP, EAM) Cards That Count, The. MP-So-Col-15 min. International Business Machines.

(BDP, C)	Census '60. MP-So-BW-13 min. Univac Division of Sperry Rand.
(C&P)	COBOL. FS-So-Col-20 min. Burroughs Corporation.
(M&S)	Collection of Data. FS-So-Col-22 min. City College of New York.
(C&P, CO)	Computer Programming. MP-So-BW-26 min. System Development Corporation.
(EAM)	Control Input for ADP. FS-So-Col-27 min. Burroughs Corporation.
(A)	Controlling Accounts. FS-Si. Business Education Films.
(EAM, BDP)	Costs That Make Sense. MP-So-Col-15 min. International Business Machines.
(EAM, BDP)	Data for Diagnosis. FS-Col-So-22 min. Burroughs Corporation.

APPENDIX D — PHYSICAL FACILITIES LAYOUTS

TYPICAL FACILITIES LAYOUTS

Requirements for physical facilities cannot be estimated in advance for any particular location. These requirements will be affected by trainee populations, available instructional time and present facility adequacy.

Two layouts are shown. One is reprinted by permission of the California State Department of Education from Bulletin No. 68. It is suggestive of a four-room layout of business education facilities. Should the number of trainees be greater or smaller, than these layouts can accommodate, then necessary adjustments are indicated.

*CURRICULUM PLANNING, *HOME ECONOMICS EDUCATION, *TEACHING GUIDES, HIGH SCHOOLS, LESSON PLANS, CURRICULUM, EDUCATIONAL OBJECTIVES, *CONCEPT TEACHING, EVALUATION, INSTRUCTIONAL AIDS, LEARNING EXPERIENCE, RESOURCE UNITS,

In developing teaching plans, (1) scope, the major areas of content, and (2) sequence, the order in which content will be developed, must be considered. Major areas of content for a proposed curriculum plan include "roles of women" core, education for homemaking and family life, education for employment involving home economics knowledges and skills, preprofessional education, and commonalities in vocational education. Essentials of any teaching plan are discussed--objectives, content to be taught including the development of concepts and generalizations, learning experiences, teaching aids, and evaluation techniques. The following instructional materials are included--(1) a lesson using the series of structured questions for developing generalizations, (2) a vocabulary study for developing the ability to think, (3) a resource unit on personal and family relationships, (4) bulletin board ideas, (5) a bibliography, and (6) two units making use of the structured set of questions--Exploring Values That Influence Choices in the Area of Home Furnishings and Communicating Non-Verbally. A scope and sequence chart of a home economics program is given. This article is published in the "Illinois Teacher of Home Economics," volume 9, number 5, 1965. (MS)

PLANNING FOR THE YEAR, THE UNIT, THE DAILY LESSON

Elizabeth Jane Simpson, Professor and Chairman
Division of Home Economics Education
College of Education
University of Illinois

Developing teaching plans is one of the major responsibilities of the teacher. As knowledge of the teaching-learning process develops, as new and more refined teaching aids become available, and as knowledge in the subject fields expands, the tasks of planning for teaching become increasingly complex. There are more choices open to the teacher, more factors to take into account as she plans for the year, the course or unit, and the day.

There will be no attempt in this article to consider all facets of planning for teaching. However, attention will be given some basic guides to action in developing teaching plans.

Scope and Sequence in the Home Economics Program

Scope refers to the major areas of content included in the program. Following are some questions that one might ask in determining the scope of the home economics program:[1]

1. How frequently will the learning be needed?
    - 1.1 The universality of the need at different socio-economic levels?
    - 1.2 The universality of the need in different life-cycle periods?
    - 1.3 The universality of the need in different vocations?
    - 1.4 The universality of the need in different geographical areas?
    - 1.5 How frequently will the learning be needed as a basis for acquiring more knowledge?
2. What are the chances that outcomes will be adequately learned apart from direct instruction in school?
    - 2.1 The difficulty of learning?
    - 2.2 The seriousness of error?

---

[1] As given in "Improved Teaching Through Improved Essay Tests" by Janet Tracy and Letitia Walsh, Illinois Teacher of Home Economics, Vol. III, No. 5, University of Illinois, Urbana, Illinois, p. 208.

3. What is the cruciality of the situations in which it will be used?

    3.1 How far must the learning be developed to meet the present need?
    3.2 What level of mastery might meet foreseeable future needs?
    3.3 What level of over-learning might provide insurance against unforeseeable demands?

4. How far are students capable of extending any given learning?

    4.1 What are the natural limitations of ability?
    4.2 What are the temporary deficiencies due to a lack of maturity?
    4.3 What are the limitations in perceptual background?
    4.4 What deeply emotionalized attitudes might impede learning?

5. What learning experiences can be provided?

    5.1 Which will enrich students' conceptualization?
    5.2 Which are feasible in terms of semantics involved?
    5.3 Which are helpful to students in clarifying and handling their own and others' values?
    5.4 Which promise to provide the most economical and effective practice in thinking?

6. If <u>X</u> is taught, what is to be de-emphasized or omitted?

In determining the sequence, or the order in which content will be developed, the following questions may help guide choices:[1]

1. What is a logical development of content in this field?

    1.1 Logical development of concepts?
    1.2 Sequence of difficulty of concepts?
    1.3 Sequence of difficulty of skills?
    1.4 Sequence of difficulty of projects, considering both number of kind of skills and new understandings called for?
    1.5 Relationship of one content area to another, to provide for smooth transition?

2. What is the usual state of "readiness" for learning at each level?[2]

    2.1 Characteristics of students at each level?

        Maturation levels?
        Needs and interests?

---

[1] Developed by Elizabeth Simpson.

[2] Unless one is critical and cautious, his answers to the questions in Item 2 may be heavily loaded with opinions rather than facts.

        Developmental tasks?
        Experiences?
        Eye-hand and eye-eye coordination?

    2.2 Typical student problems at each level?
    2.3 Likelihood that students will have the prerequisite knowledge?

3. What students are likely to be enrolled in homemaking classes at each level?

    3.1 All levels of ability represented in earlier years?
    3.2 A larger proportion of slow learners in later years?
    3.3 Fast learners in special sections?

4. How may provision for new and interesting challenges be made each year?

    4.1 By teaching a few areas thoroughly each year rather than trying to cover entire scope of field?
    4.2 By deliberately "saving" some new and interesting material and not "taking the cream of" during the first years?

5. How much repetition in an area is justified?

    5.1 Only the repetition that is needed for mastery?
    5.2 Repetition provided in new contexts so pupils do not feel that this is "old stuff"?

6. How may facilities be used most effectively with respect to sequential development?

7. How may teacher's time and energy be most effectively employed with regard to sequence?

Following is an example of a "scope and sequence" chart developed by the author as an extension of her schema for a proposed curriculum in home economics at the secondary level.[1] Preceding the chart, a diagram of the schema and a brief outline of major areas of content for each aspect are presented.

Schema for Proposed Curriculum
in Home Economics
at Secondary Level

<u>Outline of Major Areas of Content for Each Aspect of Proposed Curriculum Plan</u>

I. "Roles of Women" Core

- A. Roles of the girl; roles of the mature woman
- B. Concept of "maturity"--what it means to be a mature woman
- C. Understanding self and others
- D. Personal development--evaluation of own development, goals to work toward, resources
- E. Relationships with others--basic human needs; communication, verbal and nonverbal; sensitivity to others' needs
- F. Preparation for marriage and/or job or career
- G. Understanding and caring for children
- H. Nutrition and food selection
- I. Personal clothing--art aspects; consumer buying
- J. A place to live
- K. Management of personal resources

L. Use of leisure
M. Personal standards and values
N. Continuing education in "womanhood"

II. Education for Homemaking and Family Life

A. Meaning of "home" and "family"
B. The family as a social institution
C. Relationship of family to other social institutions
D. Cultural influences on family life
E. Responsibilities of the family
F. Developmental stages in family life
G. Parenthood
H. Management of the home, including family finances
I. Housing the family, and furnishing the home
J. Food for the family
K. Clothing the family
L. Caring for sick and aging in the family
M. Continuing education in family life

III. Education for Employment in Occupations Involving Home Economics Knowledges and Skills

A. Home economics-related occupations requiring varying levels of training or education
B. Personal traits and habits that make for employability
C. Knowledges and skills needed for certain occupations related to: child care and guidance, food and nutrition, home management and care of the home, home furnishings, clothing and textiles, care of sick and aging

IV. Pre-professional Education

A. Professional opportunities in home economics
B. Meaning of "profession," "professional commitment"
C. Independent studies in depth--problems related to some phase of home economics

V. Commonalities in Vocational Education

See: Van Camp, Donna M., "Commonalities in Vocational Education," *Illinois Teacher of Home Economics*, Vol. VIII, No. 1, pp. 23-32.

Proposed Curriculum in Home Economics at Secondary
Level Areas of Emphasis, Grades 7-12

Grade	Roles of Women	Homemaking	Employment	Pre-professional
7th	x		x	
8th	x		x	
9th	x			
10th	x		x	
11th	x	x	x	x
12th	x	x	x	x

Scope and Sequence Chart: Home Economics Program at Secondary Level, Based on Proposed Curriculum Schema

Grade	Areas of Study		
7th	Understanding Personal Development Physical Emotional Social	Personal Attractiveness Personal hygiene Grooming Manners	Developing Traits for Employability, Friendships
8th	Understanding Personal Development Concept of "femininity" Feminine responsibilities	Understanding Others Friends of same sex Boys Parents and other adults Older persons	Occupations Related to Home Economics Requiring varying levels of preparation
9th	Understanding Self Present roles Basic human needs (self)	Understanding Others--Family and Friends Basic needs (others) Communication, verbal and nonverbal	Personal Standards of Conduct
10th	Looking Forward to Marriage and/or a Job or Career Orientation to world of work	Becoming a Mature Woman Concept of "maturity" Evaluation of own maturity Sensitivity to others' needs Improving communication skills	Understanding and Caring for Children (Self-understanding through understanding children)
11th	EDUCATION FOR HOMEMAKING AND FAMILY LIFE Students: 11th and 12th grade students looking toward marriage. Basic course--for boys and girls (team teaching by man and woman teachers)	Meaning of Home and Family Family Roles	Family as a Social Institution Relationship to other social institutions Cultural influences on family life
12th	Students: 12th graders who have had basic course. May be elected after basic course	Family Financial Management	Housing the Family and Furnishing the Home

Areas of Study

Nutrition and Food Selection	Helping Keep Surroundings Attractive, Safe, Sanitary	Managing Personal Resources Time, energy, money, abilities	Helping Care for Children Guiding children's play
Selecting and Caring for Personal Clothing	Use of Personal Leisure (Analysis of TV programs, movies)	Communications in Social Situations As hostess, guest, entertaining at home	
Becoming an Attractive Woman Grooming (new aspects) Clothing selection (art aspects)	Consumer Buying of Clothing Wardrobe planning Quality features (not covered, grade 8) Ethical shopping practices	Personal Nutrition Problems in nutrition Preparing a quick, nutritious meal	Use of Personal Leisure Concepts of leisure Values related to use of leisure
Planning and Preparing Simple Meals Principles of cookery (basics only)	Personal Clothing (may be omitted) Minimum essentials of construction		
Responsibilities of the Family To its members To society	Developmental Stages of Family Life	Beginning a New Family Husband-wife relationships	Managing a Home Becoming a Parent
Providing for Family Food Needs	Providing for Family Clothing Needs	Meeting Needs of Sick and Aging in the Family	Continuing Education in Family Life

Grade	Areas of Study			
11th 12th	EDUCATION FOR EMPLOYMENT Students: those for whom high school is terminal and those preparing for further vocational education in voc.-tech. school or other specialized training program	<u>Preparation for Employment</u> (Commonalities in Voc. Ed.)	Cooperative Work Experience-Study Program to Prepare for Employment in Occupations Requiring Home Economics Knowledges and Skills and/or Classroom Program to Develop Knowledges and Skills for Employment in One or More Areas or a Combination of These	Group and individual conferences on problems related to job and to management of personal resources. Special units on: 1. Living Away from Home Living arrangements Finding a place to live Relationships at work and away from the job 2. Continued Development for Employability
11th or 12th	PRE-PROFESSIONAL EDUCATION Students: college-bound, particularly those interested in home economics professions	<u>Professions Related to Home Economics</u> <u>Meaning of</u> Profession Professional person Professional commitment	<u>Independent studies in depth</u>--problem related to some phase of home economics	

The example given provides for a total home economics education program which takes into account the home and family living aspect of the program, the occupationally-oriented aspect, and a pre-professional aspect. That the occupational program was not outlined in greater detail was not due to a lack of concern and commitment to the program on the part of the author--but, rather, to the newness of the program and the fact that basic content for this aspect is in the early stages of development.

In the example given, both horizontal and vertical sequence have been considered. Questions regarding sequence which were presented previously were taken into account. Obviously, if all facets of the program were carried out, the services of several teachers would be required; such a program would be possible only in a larger school unit. In the smaller one-teacher department, choices would be made. For example, the teacher might decide to use the outlines for the ninth and eleventh grades with their emphasis on the vitally important areas of management and relationships, and provide for a pre-professional course, with emphasis on individual study, for college-bound girls aiming at careers in home economics or related professions.

Essentials of Any Teaching Plan

Any teaching plan has five major parts, as was pointed out in the first issue of the current series of the Illinois Teacher. These are:

- Objectives--or, if you prefer, goals, aims, purposes, outcomes
- Content--what is to be taught, the subject matter--stated in the form of facts, principles, generalizations or "levels of generalizations," depending on how you were taught and prefer thinking of them
- Learning experiences--the activities and procedures employed to help students progress toward the objectives
- Teaching aids and facilities--the tools used to aid students in progressing toward the objectives
- Means of evaluation--methods employed to help ascertain student progress toward objectives and the effectiveness of the teaching

General procedures in curriculum development were outlined in the Illinois Teacher, Vol. IX, No. 1, pp. 8-9. At this point, it might be helpful to review this section.

Educational Objectives

The following references will be helpful to the teacher in analyzing the behavioral aspects of educational objectives:

Bloom, B. S., editor, Taxonomy of Educational Objectives, Handbook I, Cognitive Domain, New York: David McKay Co., 1956.

Krathwohl, D. R., Bloom, B. S., and Masai, B. B., A Taxonomy of Educational Objectives, Handbook II, Affective Domain, New York: David McKay Co., 1964.

A classification system for educational objectives in the psychomotor domain is being developed under a grant from the U.S. Office of Education.

The following overview of considerations in developing educational objectives in home economics has been prepared by Professor Mary Mather, Division of Home Economics Education, University of Illinois. She has used this guide in working with teacher groups concerned with problems of curriculum development.

Considerations in Developing Educational Objectives

What should a student study? How can I help a student learn? How can I tell when a student has achieved this learning? These are three questions frequently raised by teachers. Well-stated educational objectives can help determine the answers.

An EDUCATIONAL OBJECTIVE is a statement of intent, of hoped for behavior (desired learning, proposed change), on the part of the learner which may result from instruction.

LEARNING is a change in capability which is inferred from a difference in an individual's performance from one time to a later time.

Therefore, it follows that:

1. we must have some type of data in terms of the individual performing in some way in order to infer that learning has taken place, and
2. in order to collect data from which learning is to be judged, statements of hoped for learning (educational objectives) must be specific enough and clear enough that we know what we are looking for;
3. the degree of specificity (how detailed to make the objectives) should be at the level of generality of behavior that one is seeking to help the student to acquire. Identify a performance which can be valued in and of itself as being effective in the student's life. Each objective should express a purpose which

makes sense within the larger purpose of the person's life goals, and this purpose should be distinguishable from others. For example, "ability to combine colors for pleasing combinations in one's home" is more specific than "can use color effectively";

4. since PERFORMANCE seems to be the key, a description of hoped for behavior must contain a good "strong" verb, a verb referring to observable human action.

Well-stated educational objectives guide the BEHAVIOR OF THE TEACHER. They help her COMMUNICATE to herself and to her students (as well as to other teachers sharing her materials and responsibilities).

1. Objectives tell teachers what the intent of instruction is so that: (a) appropriate experiences can be provided to give opportunities for learners to move toward the desired objective, and (b) appropriate evaluation materials can be devised to measure growth toward, and achievement of, the objective (the desired learning).

2. Objectives communicate to students where they should be going. Unless students know what the objectives are they are likely to resort to memorization and mechanical completion of exercise rather than carry out relevant sorts of learning activities. There should be less of the students' trying to guess what the teacher wants, and less surprise on the part of students when they are evaluated on one premise (one the teacher had in mind) when they had studied and learned on another set of assumptions.

Classification of Educational Objectives

Educational objectives are thought of in three major groups:

- those dealing with knowledge and intellectual skills and abilities, i.e., the COGNITIVE domain;

- those dealing with interests, attitudes and values, the motivators of much of human behavior, i.e., the AFFECTIVE domain; and

- those dealing with manipulative skills and abilities, i.e., the PSYCHOMOTOR domain.

All of the above contribute to an ACTION PATTERN on the part of the learner, our old friend PERFORMANCE.

Although there is much relationship among the three classifications, it is useful to be able to identify the domain in which you are primarily teaching and evaluating at any one time.

Each family or class of objectives can be further organized and classified to indicate various levels or steps in learning in the cognitive, affective or psychomotor areas, each step building on the previous one. Just as it is useful to be able to identify in which domain you are endeavoring to achieve changed behavior, it is useful to be able to identify at which level you are working. Thus we are aided in our teaching and evaluating by being

SPECIFIC PRECISE REALISTIC

when stating objectives.

Content

"Content" refers to student learnings, what is taught. It includes facts, principles, and generalizations. Emphasis was given this aspect of curriculum development in home economics in an article by Professor Hazel Spitze in the *Illinois Teacher of Home Economics*, Vol. IX, No. 2.[1]

The following statement on "Teaching for the Development of Concepts and Generalizations" has been prepared to serve as a guide for teachers as they seek to gain skill in using the "concept approach" in teaching. It involves consideration of both content and methodology. As given here, the statement will appear in the Illinois home economics curriculum guide to be published during 1966. The statement is presented by permission of the Illinois State Department of Education.

---

[1] Spitze, Hazel Taylor, "The Structure of Home Economics as a Basis for Curriculum Decisions," *Illinois Teacher of Home Economics*, Vol. IX, No. 2, 1965-66, pp. 62-96.

TEACHING FOR THE DEVELOPMENT OF CONCEPTS AND GENERALIZATIONS*

Why teach for the development of concepts and generalizations?

- The transfer of learnings from the classroom to the home and community, and to employment situations, is more likely to result when students have been guided to draw warranted conclusions in the form of generalizations.
- In a rapidly changing world, the specifics may change; the concepts and generalizations have more enduring value and meaning.
- Teachers and students have more understanding of the material when they have learned to generalize. Generalizations help a person connect, explain, and identify facts and predict what may happen next.
- The ability to generalize is a technique used in everyday living. Quality of living may be improved through development of ability to draw sound generalizations.
- The ability to generalize soundly, once developed, is a time and effort saver. Instead of many isolated facts, a person may have one "big idea" to remember.
- One of the purposes of education is preparation for the future. Meaningful organization of the subject matter of a field is facilitated through understanding the concepts and related generalizations and how they are developed.[1]

What is a concept?

One author said, in effect, that they come in different kinds of packages. They may be in the form of ideas, rules, generalizations, principles or laws, theories, problems, or areas of living.[2]

A concept may be embodied in a word or phrase and this has sometimes been called the concept in its purest form. It is this word or phrase idea of a concept that many people find most useful.

There are several definitions of concepts that may be helpful. One frequently used in connection with the development of curriculum materials in home economics is:

---

*Prepared by Elizabeth J. Simpson.

[1] Adapted from a statement prepared by Lila Jean Eichelberger, Home Economics Teacher, Champaign High School.

[2] Dressel, Paul L., "The Roles of Concepts in Planning the Home Economics Curriculum," Home Economics Seminar, Progress Report, 1961, p. 13.

> Concepts are abstractions which are used to organize the world of objects and events into a smaller number of categories. These, in turn, can be organized into hierarchies.[1]

Burton, Kimball, and Wing, in Education for Effective Thinking, say:[2]

> Some writers make very heavy going in defining a concept. This is probably necessary in technical fields and for advanced thinking. Simple definitions can be made which tell us what we need to know:
>
>> A concept is a defined idea of meaning fixed by and as extensive as, the term used to designate it.
>>
>> A concept is the amount of meaning a person has for any thing, person or process.
>>
>> A concept is a suggested meaning which has been detached from the many specific situations giving rise to it and provided with a name.
>>
>> A concept is a logical construct capable of interpersonal use.
>>
>> A concept is a word or other symbol which stands for the common property of a number of objects or situations.
>>
>> Concepts are established meanings on which we can rely with assurance.

Concepts grow and develop through experience, by reflection upon experience, by abstracting from experience and interrelating various phases of experience.

Let us consider the concept of HAPPINESS. We have the notion of a "pleasurable state," satisfaction, good feelings associated with the word.

In understanding the concept, it might help to consider what it means in terms of childhood experiences. Charles Schultz in Happiness is a Warm Puppy[3] defined happiness as a pile of leaves for jumping in, a string of paper clips--if you are a little girl, and, from the puppy's point of view, a piece of fudge caught on the first bounce. One might add his own notions:

---

[1] From Work Material for Regional Conference, Department of Health, Education, and Welfare, Office of Education, Division of Votec. Education, Home Economics Education Branch, February 1962.

[2] Burton, William H., Kimball, Roland B., and Wing, Richard L., Education for Effective Thinking, Appleton-Century-Crofts, Inc., New York, 1960, p. 154.

[3] Schultz, Charles, Happiness is a Warm Puppy, Determined Productions, Inc., San Francisco, Calif., 1962.

Happiness is a Ruth Welcome recording to dine by in the evening.
Happiness is renewing old friendships.
Happiness is an orange flower in a bud vase.

The happiness concept is enhanced through experience. One soon begins to realize that values are involved in his concept of happiness.

One might generalize that, "What gives one happiness is affected by the values that he holds." This simple generalization adds further meaning to the notion of happiness. <u>One might think of the pure concept as having generalizations that cluster about it</u>. Some people find this way of looking at concepts and generalizations helpful.

<u>What is a concept?--another look at the question</u>

Presented earlier was the simple definition of a concept: "A concept is the amount of meaning a person has for any thing, person, or process." Within this definition there is another term that may need defining. That term is <u>meaning</u>.

> Meaning is the total significance of any thing, person, process, or situation built up by an individual as he has experiences with it. Meaning is the grouping of ideas, knowledges, beliefs, feelings, and impressions of any and all kinds attached to the item.[1]

<u>How do concepts develop? What are the principles governing their development?</u>

Following are the principles of concept development as brought out by Professor William Burton[2] in his work with home economics educators:

1. Concepts grow out of experience in pursuit of a problem or purpose of some sort. The school, therefore, must provide many and varied experiences.

   For example, one might consider the concept of resources. A purpose in the area of management is to help students gain increased understanding of the resources that may be employed in achieving individual, family, and institutional goals. Many learning experiences at all levels may be provided to help students recognize the technological resources having to do with things; social resources having to do with things and people, as a church, a loan company; and the personal resources

---

[1] Burton, Kimball, and Wing, Op. Cit., p. 160.

[2] The principles as stated are based on materials appearing in Burton, William, Kimball, Roland B., and Wing, Richard L., <u>Education for Effective Thinking</u>, New York: Appleton-Century-Crofts, 1960; and Lee, J. Murray and Lee, Doris H., <u>The Child and His Curriculum</u>, 3rd Ed., New York: Appleton-Century-Crofts, 1960.

that have to do with feelings, attitudes, beliefs, emotions, sentiments, and so forth.

2. Opportunities for observation, handling, experimentation, and discovery are necessary.

   For example, the concept of safe food. The meaning of safe food is enhanced through observing sanitary procedures in preparing and storing food, through such experiences as touching unwashed food to an agar plate and watching the development of bacterial growth, through comparing the results of different methods of storing food, through reading....

3. Concepts may be derived from vicarious experiences instead of direct experience.

   For example, the meanings attached to the term personal values may be developed through case situations, through the use of films, through role playing, as well as through one's personal experiences.

4. Concepts may be clarified and extended through reflection, analysis, and discrimination.

   One teacher reported as follows: "Through the years, my concept of communications has grown and developed. At first, I thought of communicating as talking with or corresponding with someone. Then, somewhere in a counseling course we discussed non-verbal communications; and I learned that how I sat, stood, held my hands and arms, smiled or failed to smile communicated something to observers. Still later, doing research on teen magazines I became more and more aware of the power of the mass media of communication. So the whole idea of communications took on more and more meaning as I experienced, reflected on experience, analyzed, and abstracted from these experiences with communication."

5. Concepts are not achieved quickly at a given time. They are never fixed or final. Levels are to be discerned. The process goes on continuously.

   The meaning of this should be apparent, with the possible exception of the idea that "levels are to be discerned." Some concepts in the word or phrase form are quite broad and cover others that are more limited. For example, the concept of "family roles" covers the more limited concepts of "mother role," "father role," "grandparent role," "dual role of women," and so forth. Perhaps Burton was speaking of the concept in the form of the generalization when he said that levels are to be discerned. A discussion of "levels of generalizations" is included in this section of the guide.

6. Concepts are achieved ordinarily through an active, dynamic process, not through a formal or so-called "logical" process (except with very well-informed, mature learners).

However, one may "set the stage" in the classroom for the development of concepts in a more orderly manner than might occur by chance. This is one of the purposes served by the teacher--to help the student to organize and to perceive organization.

7. Concepts gradually evolve, are refined, and change. They evolve from questioning previous concepts.

   Thus, a student who has been taught about color harmony in terms of specific color combinations with names, as "monochromatic," "adjacent," "triad," may develop the notion that no other combinations are harmonious. When he thinks about the idea of color harmony the meaning he attaches is that of certain "accepted" combinations. Later, he is pleased by other combinations. He questions whether his first notions about color harmony were entirely correct. Perhaps he reads in the area of "color" and finds a statement something like this: Any colors may be combined harmoniously provided they are pleasing in respect to value and intensity. His concept of color harmony has been changed and refined as a result of questioning a previously held concept.

8. Concepts to be developed should be carefully selected and then presented through many and varied learning experiences.

   Since we do not have time to teach everything and must make some selections from all that we *might* teach, an important curriculum question that occurs is "if X is included, what must be omitted?" Space does not permit going into all the factors that should be considered in selecting content, but perhaps one could be given. There are certain concepts that have relevance to more than one area of home economics. Perhaps these coordinating concepts should have high priority. Examples might be: Management of time, roles of family members, home safety.

9. Accidental discoveries sometimes produce concepts.

   Perhaps what is needed is a more serendipitous approach on the part of both teacher and student!

What guides may be used in determining what concepts are to be taught?

The following statements may serve as guides in this process. However, it is important to realize that the author was doubtlessly thinking of the concept in forms other than that of the pure concept as expressed in a word or phrase.

1. A useful concept must be accurate, for otherwise it will lead to faulty generalizations and inaccurate thinking.

2. A useful concept must be recent, or of recently demonstrated work, else it may be outmoded when today's learner comes to apply it in tomorrow's world.

3. A useful concept must be permanent--must be built to last. 'Some ideas, some values, some knowledge, some skills, some attitudes are of worth, because of their continuing relevancy to human existence and problems.

4. A useful concept must release the learner's creative instincts, for tomorrow's world will require, above all else, the ability to apply the imagination. And in today's curriculum, those experiences which may tend to narrow the individual's perspective will need to be...eliminated in favor of those which support creativity.[1]

<u>What is a generalization? What is the relationship between concepts and generalizations?</u>

- A "generalization" is a complete thought which expresses an underlying truth, has an element of universality, and usually indicates relationships.[2]

- Any full generalization or principle is a concept. Some limited generalizations may not be concepts, i.e., child-made generalizations. Concepts are bigger, broader, more "fuzzy" and will "cover more ground" than generalizations.[3]

One might consider the concept of "basic human needs." This is a big, broad, "fuzzy" idea. It covers a great deal, including the more limited concepts of "basic mental needs." It also covers a number of generalizations, for example, "A knowledge of basic needs contributes to self-understanding; and families, school, church, community, and peer groups contribute to meeting physical, mental, and social-emotional needs."

In the chapter, "What a Lovely Generalization" in <u>Thurber Country</u>,[4] James Thurber illustrated humorously and well some of the "do nots" in respect to generalizations. This is fun reading for the teacher struggling with the task of helping students draw sound generalizations.

<u>How may one test a generalization for soundness?</u>

The following tests may be used by the teacher developing curriculum materials and as a guide for students in testing their conclusions:

---

[1] By Harold D. Drummond of the University of New Mexico, as given in <u>News Letter</u>, Champaign, Illinois, Community Schools, Vol. 21, No. 36, May 27, 1963, p. 4.

[2] Work material for Regional Conference, Op. Cit.

[3] From presentation by William Burton at Pacific Regional Conference, March 1962.

[4] Thurber, James, <u>Thurber Country</u>, Simon and Schuster: New York, 1962.

1. Is it supported by research or accepted theory?

2. What are the assumptions that underlie this conclusion? Are these sound?

3. Is it applicable to other situations? That is, does it have the "element of universality" mentioned in the definition?

Another question that one might ask has to do with the relationship word selected. Most generalizations will show relationships between or among ideas. For example: "Human relationships are enhanced through the understanding of behavior and its causes." *Enhanced* is the relationship word. "A clear concept of the material to be transmitted facilitates communication." *Facilitates* is the relationship word. "Development results from a continuous interaction of the individual and his environment." *Results* is the relationship word. *Enhances* and *facilitates* are soft relationship words; they denote causation and are quite correctly used in the examples given. *Results* is a stronger, more forceful relationship word and was properly used in the example. It is apparent that the choice of the relationship term is quite important in determining whether the statement can be supported.

What are the "levels of generalizations"?[1]

1. The *first level* is likely to be either a description, definition, analogy, identification, or classification. Statements are simple and may relate to personal experience.

2. The *second level* shows relationships among ideas. They may make comparisons and include more ideas than on the first level. This is the *principle* level.

3. The *third level* usually explains, justifies, interprets, or predicts. Generalizations at this level may be more remote in time or space. They often suggest a direction for behavior.

What are some examples of generalizations at each level?

Concept: Communications

First-level generalization. "Communication includes those processes by which individuals influence one another. Communication takes various forms, both verbal and nonverbal."

Second-level generalization. "A clear concept of the material to be transmitted facilitates communication. Communication with others influences an individual's personality."

Third-level generalization. "Ability to communicate grows with communication experiences. Relationships with others are enhanced through development of the ability to communicate."

---

[1] Work material for Regional Conference, Op. Cit.

Concept: Proteins

First level. Definitions of protein, classification of protein food.

Second level. Principles of preparing protein-rich foods--cheese, eggs, meat, etc.

Third level. Generalizations that apply to protein cookery in general.

It is not necessary always to identify the level of generalization nor force a generalization at each level for every concept considered. But, the idea of levels is helpful. It is quite apparent that understanding terms and classification systems and being able to describe and offer analogies is essential to an understanding of principles and generalizations making use of these ideas. Hence, there is some order in the generalizations that cluster about a concept. And the task of identifying the generalizations is made easier when this order is recognized and understood.

How may teachers help students develop generalizations?

- A generalization is an outcome of teaching. Students should formulate generalizations in their own words. They are not given to the student nor verbalized for him. A student arrives at a generalization inductively and uses it deductively.

- Understanding the concepts included in a generalization is basic to understanding the generalization. Understanding concepts contributes to ability to see relationships between and among them, hence to the ability to develop second- and third-level generalizations. Thus, is the importance of the first-level generalization emphasized.

- To formulate a generalization, the learner must be able to perceive at least two ideas simultaneously with clarity and meaning, put the ideas together, compare and contrast them, and formulate conclusions.[1]

- Comprehension of a generalization is increased as learners use them in different ways and in new situations.[2]

- Student ability to test the soundness of a generalization may be developed through providing repeated opportunities for such activity in the classroom.

---

[1] "Curriculum Planning and Teaching: The Concept Approach," Working papers, National Home Economics Curriculum Development Workshop, University of Missouri, June 1964, p. 4.

[2] Ibid., p. 4.

- Identification of the levels of generalizations clustering about a concept serves to guide planning in respect to organization and sequence in teaching.

- Understanding of individual characteristics of learners is basic to determination of ways of developing concepts and generalizations with them.

In guiding students to develop generalizations, the following list of structured questions has proven helpful:

A Guide to Developing Conclusions in the Form of Principles and Generalizations

Films, minute dramas, case situations, and role playing may be used in order to help students think, examine ideas, and develop understandings. When they are used for these purposes, they serve to stimulate thinking; they may raise questions rather than answer them. They present ideas which may be examined and used as a basis for helping students to clarify their beliefs and draw their own conclusions.

When the above methods have been used for the purposes suggested, the following kinds of questions in the sequence given have been helpful in guiding discussions:

1. Questions for which the answer will be found in the situation.

2. Questions calling for an examination of similar ideas in other situations.

3. Questions asking the student to draw inferences, to begin to see cause and effect relationships, to begin to express their own opinions or ideas in regard to situations.

4. Questions that ask students to formulate a generalization of their own, based on an examination of data from the film, case situation, or drama; from many sources in life situations; and from the opinion of authorities. As a teacher carries on a class discussion, she may want the class to study the many generalizations made by individual students and help them to arrive at generalizations which have a higher degree of agreement within the group.

5. Questions that ask students to examine these ideas as they apply to their present day life; questions that ask what authorities say about certain problems.

6. Questions that ask students to illustrate the meaning of their generalizations. In general, these questions call for students to begin to see how thinking and planning can get some of these ideas into everyday practice.

Adapted from: TEACHING MATERIALS FOR USE IN THE TEACHING OF CHILD DEVELOPMENT AND RELATED ART IN HOMEMAKING EDUCATION IN TENNESSEE, University of Tennessee, Department of Home Economics Education, Knoxville, Tennessee, in cooperation with the State Department of Education, Vocational Education, Nashville, Tennessee.

Following is an example of a lesson using this series of structured questions. Actually, it could serve as a lesson plan. The teacher who developed the plan used it, with variations, in several class situations. In parentheses, she has indicated how the lesson developed with one group. She reported that the series of questions, only slightly revised, were useful regardless of the specific role-playing situation selected by the class.

Example of a Lesson Using the Series of Structured Questions for Developing Generalizations

UNIT: DEVELOPING LOVE AND UNDERSTANDING WITHIN THE FAMILY UNIT

TOPIC: UNDERSTANDING OLDER MEMBERS OF THE FAMILY

OBJECTIVES:

1. Increased understanding of and appreciation and respect for aging members of the family--and aging people in general.
2. Increased understanding of how we may help aging people meet their basic human needs.
3. Increased understanding of how we may live in peace and harmony with aging members of the family.
4. Increased understanding of self.

ACTIVITIES AND PROCEDURES	CONTENT
1. Show pictures of hands of aging person "Can you describe the person who belongs with these hands? Tell me something about the person."	Obviously these are the hands of an aging person because they are wrinkled and the skin is that of an older person. They look like hands that have been very busy--the hands of a person who has known hard work.
2. "Think about the older people you know. Tell us a little about them--without using names." Discuss older people students know--relationship to student, their interests and needs.	

ACTIVITIES AND PROCEDURES	CONTENT
3. "Sometimes it is necessary for three generations of a family to live together--at least for a time. What are some of the problems that sometimes arise in these situations?"	Possible problems Conflicts between needs of aging for peace and quiet and needs of younger people for activity and noise. Difficulties in communication due to different times, different experiences. Lack of understanding of basic needs and how they may be best satisfied at different stages in life cycle. Etc.
4. "Suppose that we role-play one of these problem situations and see if we can gain increased understanding of the older people involved and of ourselves in relation to them." "Which problem seems to you to be the one that most frequently arises in the three-generation family?"	
Class selects problem. (The problem that students choose might have been anticipated--that of the conflicting needs of older people and younger family members. The needs of the older family members are for peace, quiet, and serenity; the needs of younger members are for activity and noise.)	
5. "Who would be involved in this problem situation? Describe those persons involved."	
6. "Where would the action take place? Describe the setting and exactly what has led up to this problem."	
7. "Secure volunteers for the various roles. Ask them to 'get in character.'"	
8. Ask that half of the class observers identify with the older person and try to feel as she feels and half identify with the younger person and try to ascertain what she is feeling.	

ACTIVITIES AND PROCEDURES	CONTENT
9. Role-play the problem situation. (In one class, the action took place in the kitchen. The adolescent daughter was entertaining two girl friends who were dancing to her Beatle records. The grandmother who was the only adult at home entered the kitchen and asked her granddaughter to be quieter, saying, "Young people didn't do this sort of thing when I was young," etc.)	
10. Discussion	
A. "What happened in this situation?" Student gives brief summary of situation that was role-played.	
B. "Do people you know ever behave the way the granddaughter did? Tell us about it."	
"Do older people you know act the way that this grandmother did?" Discuss.	
C. "Why did they behave as they did? The granddaughter? What feelings did she have? What needs did she express?"	Needs--independence, activity, to be like peers, to be popular.
"The grandmother? What feelings did she express?"	Needs--peace and quiet, a feeling of belonging.
D. "What do authorities say about situations like this?"	
Read in Smart and Smart, Living in Families, pp. 95-96; 394-396.	
E. "Now, considering what we have seen in our role-playing situation, what we have experienced in our own contacts with older people, and what we have read, what conclusions might be drawn regarding older members of the family?"	

"Their needs?"	No matter what age a person is, he has certain basic needs, both physical and psychological. The psychological needs are needs for affection, recognition, security, new experience, achievement and feelings of adequacy, dependence and independence, and a satisfying philosophy of life.
"How may we help them meet their needs?"	We may help aging people meet their needs through showing respect for them, planning some time with them, considering their desires, remembering to show appreciation, and keeping the lines of communication open.
"How may we live happily with older people?"	Keeping the lines of communication open among the three generations is one way in which good relationships are promoted. Through practicing empathy we may gain increased understanding of aging members of our family or neighborhood.
"What are the results for ourselves when we begin to increase our understanding of other people and the reasons why they behave as they do?"	As we gain understanding of others, we increase our understanding of self.

F. "Let's review these conclusions that we have drawn." (Read each from board.) "How may we apply them in our own relationships with older people and others?"

Discuss the application of each. Students illustrate how they might apply each generalization in rather specific ways to own life.

MEANS OF EVALUATION: Pencil and paper test requiring the application of the generalizations to problem situations.

Observation of pupils in family situations--on home visits, for example.

Anecdotal records of pupils' relationships with others--particularly older people.

What are some other guides to helping students develop generalizations?

The following statement[1] with only minor revisions was presented in the working papers of the national Home Economics Education Curriculum workshop held at the University of Missouri, June 1964. Some of the suggestions given were included in the structured question guide:

> In helping learners state generalizations and develop concepts, perception should be trained continually and use made of such questions as, 'What do you see in this situation?' Ability to abstract should be developed with questions such as, 'What do you see here that is similar or dissimilar to another situation?' Generalizations should be used in answering the question, 'From what you know about this, what do you think will happen in this new situation just presented to you?' Other questions that may help learners to state generalizations are ones that:
>
> 1. Call for an example of similar ideas in other situations.
> 2. Ask learners to draw inferences, to see cause and effect relationships.
> 3. Bring out dissimilarities of main ideas.
> 4. Ask learners to illustrate meanings of the conclusions as they apply to their own life.
> 5. Ask learners to state the relationship between two concepts.
> 6. Ask what authorities say about certain problems.
> 7. Ask what research evidence regarding the problem is available.
> 8. Ask learners how they can prove an observation.

What is the place of vocabulary study in the development of generalizations?

In the development of generalizations, the first level, as has been stated, is "likely to be either a description, definition, analogy, identification, or classification." The importance of a study of word meanings in developing first-level generalizations is obvious.

Second- and third-level generalizations show relationships among ideas which have been developed at the first level. That is, they are built on the first-level generalizations.

Hence, vocabulary study serves to help prepare students for stating generalizations at these levels.

---

[1] Adapted from "Curriculum Planning and Teaching: The Concept Approach," Op. Cit., p. 5.

The following section on vocabulary study includes many suggestions which have been found helpful by a group of Illinois teachers working over a two-year period in the general area of "teaching for development of the ability to think."

Vocabulary Study

We use language as a tool in thinking. "If students are to think clearly in any area of subject matter, they must understand the terms that are used. Therefore, vocabulary study should be a part of each unit that is taught."[1]

The following are some suggestions for teaching for increased understanding of word meanings:

Define or have students look up meanings of new terms.

Have a place on the chalkboard set aside for terms and their definitions.

Plan with students for a special place in each student notebook for new words and phrases and their meanings.

Where appropriate, use the bulletin board to illustrate the meaning of new terms.

Include on pre-tests, terminology important to the development of understandings within a unit of study. Provide for special study of terms most frequently misunderstood. Evaluate progress in development of understanding of terms with end-test.

Use crossword puzzles, developed by teacher or student, as one means of providing for vocabulary study.

Have each student list all of the words that she does not understand in a reading assignment. Summarize the list and use it as a guide in determining which words to include in vocabulary study assignments.

Have students make sentences using new terms as one way of determining whether they understand word meanings.

Kinds of terms that need defining include:

New terms encountered in a unit of study--for example, such terms as family life cycle, developmental tasks.

Value terms, such as good, bad, attractive, interesting. Students need to know how these terms are being used by others if they are to communicate effectively.

---

[1] Lemmon, Louise and Simpson, Elizabeth, Teaching Process of Thinking in Homemaking Education, Department of Home Economics, NEA, Washington, D.C., p. 4.

Terms with depth of meaning. These are the kinds of words which have emotional significance for individuals. Meanings for individuals may vary according to experiences, attitudes, values and beliefs held. Such terms as the following are included: *home, family, democracy, security, parent*.

Students may have difficulty with:

Synonyms--for example, colors next to each other on the color wheel may be referred to as neighboring, adjacent, or analogous. Different references may use different terms. Students may need help in recognizing that the terms mean the same thing.

In defining words, the dictionary may give synonyms which are only approximate in meaning. A student may need guidance in using the synonyms in appropriate ways.

Homonyms; a homonym is a word having the same pronunciation as another, but differing from it in origin, meaning, and often, in spelling. Examples in the field of home economics include:

baste, as in "baste the seam"
baste, as in "baste the roast"

whip, as in "whip the cream"
whip, as in "whip the raw edge of the seam"

cube, as in "cube the cheese"
cube, as in "ice cube"

fold, as in "fold in the dry ingredients"
fold, as in "fold the towels"

pear, as in "eat the pear"
pair, as in "pair of shoes"
pare, as in "pare the pear"

Words which may be ambiguous in meaning--as value words and certain words which denote quantity, such as *some, many, much, several*.

Ways of clarifying meanings

In helping students to understand word meanings, the following means of defining may be used:[1]

1. *By genus and differentia*. For example, "An orange is a citrus fruit, botanically a berry, that is nearly globose in form and orange in color."
2. *Comparison*. "Like a grapefruit, only, as a usual thing, smaller and orange rather than yellow."
3. *Synonym*. "Ascorbic acid for vitamin C."
4. *Pointing*. "That is an orange."

---

[1] Burton, William H., Kimball, Roland, Wing, Richard L., *Education for Effective Thinking*, Appleton-Century-Crofts, Inc., 1960, p. 184.

5. Example. "A mandarin is one of a group of Chinese oranges."
6. By direct observation or demonstration--quartering and eating an orange.

A closing note

The teacher will doubtless find new and creative ways of helping students to develop concepts and generalizations. The foregoing suggestions may serve as a beginning in this important undertaking!

Learning Experiences

Thus far, we have considered educational objectives and content as aspects of curriculum development. A third major part of any curriculum plan is learning experiences. In their selection, the following guides may be helpful:

- Learning experiences should contribute toward the achievement of the objectives. They should be appropriate to the objectives.

  Let us consider what this means. An educational objective has two aspects, a behavioral aspect and a content aspect. For example, in the objective, "Knowledge of criteria for the evaluation of family television programs," knowledge is the behavioral aspect and criteria for the evaluation of family television programs is the content aspect. Using the taxonomy of educational objectives, cognitive domain, this objective would be classified as 1.24 Knowledge of criteria.[1] This analysis aids in determining what learning experiences may be most meaningful in working toward the objective. Since, in this case, it is knowledge which concerns us, we know that recall is involved. The learning experience, then, may be one which helps the student develop awareness of criteria for evaluating family television programs and recall these when the situation calls for this knowledge.

  Now, on a higher level, an appropriate objective would be, "Ability to evaluate family television programs." Ability to evaluate is the behavioral aspect; family television programs is the content aspect. The objective would be categorized as 6.20 Judgments in terms of external criteria.[2] At this level, one is concerned with "evaluation of material with reference to selected or remembered criteria."[3] The learning experience should be such that the student is afforded the opportunity of applying her knowledge about the criteria as she actually has the experience of evaluating family television programs. Developing ability calls for performance opportunity--in this case, guided performance which is then discussed as the student is helped with the application involved in the situation, all of which should lead toward development of the judgment called for at this advanced level.

- Learning experiences should lead to the development of significant content.

---

[1] Bloom, op. cit., p. 203.

[2] Ibid., p. 207.

[3] Ibid., p. 207.

Students should have opportunities to arrive at their own conclusions. They will need help in understanding the bases for sound conclusions. Such questions as the following may be helpful: Is there evidence in research or accepted theory for the conclusion? Does one's own direct experience or observation tend to support the conclusion? Is it a conclusion that is generally applicable in situations similar to the one where it was developed?

- Learning experiences should be suited to the needs and concerns of students.

  Professor Hazel Spitze dealt with this point in some detail in the *Illinois Teacher*, No. 3 of this volume.

- Learning experiences should provide for continuity and sequential development.

  The discussion of "levels of generalization" in the section of this article on developing concepts and generalizations is relevant here.

- Learning experiences should provide for variety with respect to media and senses employed.

  Thus, provision may be made for individual differences in ways of learning and for greater student interest.

- Resources should be available for carrying out the learning experiences.

  However, one should not easily be daunted by a lack of resources. Frequently these can be obtained with some effort--or one may improvise resource materials that will serve the purpose.

- Learning experiences should provide for student development in ability to think and allow for development of problem-solving ability.

- Learning experiences should contribute to interest in and desire for more learning.

Helpful in planning learning experiences is the reference, *Techniques for Effective Teaching*, a publication of the Department of Home Economics, National Education Association. It is available for 75¢ from the Department of Home Economics, NEA, 1201 Sixteenth Street, NW, Washington, D.C.

Teaching Aids and Facilities

A fourth major factor in planning for teaching is that of teaching aids and facilities. A whole new array of teaching (or, if you prefer, *learning*) tools is available to teacher and student. Teaching machines, films, recordings, educational television--these are among the aids that offer promise for more effective teaching and learning. Lee A. DuBridge, President of the California Institute of Technology, states that:

> We are only beginning to learn how to use these tools effectively. They are too often regarded as devices to replace the teacher--a wholly false conception. A hammer and saw do not replace the carpenter; a typewriter does not replace a secretary. A new tool is a new opportunity for doing a better job, provided only we learn how to use it.[1]

The primary consideration in selecting teaching aids is the contribution they may make toward the attainment of the objectives. Certainly, a teacher who is well-informed regarding the various aids available and who is able to use them effectively will be equipped to select better those that are suited to the objective and the related content and learning experiences.

Professor Mary Mather dealt with the problems of selecting and using teaching aids in her article, "A Look at Resources for Teaching Home Economics," in the Illinois Teacher, Vol. VI, No. 9. Since copies of this publication are still available, a detailed discussion of teaching aids will not be included here.

However, a few comments regarding instructional areas may be appropriate. Certainly it is a truism that "Instructional areas should be planned in terms of the curriculum rather than the curriculum adjusted to fit the space and equipment provided in the instructional areas." Realistically, one has to think--at least to some extent--of the space and equipment available as curriculum plans are developed. But, very real danger lies in making too many concessions to outmoded facilities or (worse yet) using them as an excuse for retaining what is no longer appropriate in the content of the program.

Provocative reading for the teacher taking a long and serious look at teaching aids is Marshall McLuhan's "Understanding Media: The Extensions of Man."[2] It opens new avenues of thought concerning the nature of some of the newer media that we are employing in the teaching-learning situation.

---

[2] McLuhan, Marshall, "Understanding Media: The Extensions of Man," McGraw-Hill Book Co., New York, 1964, 364 pp.

Facilities for today's home economics program were discussed in the Illinois Teacher, Vol. VIII, No. 2.[1] Volume VIII of the publication is being reprinted and copies will be available soon again.

Means of Evaluation

Determining the means of evaluation to be employed is a fifth major task in developing curriculum plans. The seven basic steps[2] involved are:

1. Formulation of a statement of objectives.

2. Classification of objectives in [illegible] major types. (Invaluable tools at this stage are the classification systems for educational objectives developed by Bloom, Krathwohl and others.[3])

3. Defining of each objective in terms of behavior.

4. Suggesting of possible situations in which these behavior patterns may be exhibited.

5. Selection and trial of promising methods for obtaining evidence regarding each objective.

6. Selection on the basis of this preliminary trial the more promising appraisal methods for further development and improvement.

7. Devising of means for interpreting and using the results of the various instruments of evaluation.

Some means of collecting evidences of student progress toward objectives are:

anecdotal records
check lists
conferences with parents and students; notes from parents
diagnostic charts
diaries or "logs" (student records)
discussion
essay-type examinations

Looking at the Five Parts of the Curriculum Plan as an Integrated Whole

Experienced curriculum planners will find it impossible to think of one aspect of the curriculum plan without thinking of the others. In considering educational objectives, one is forced to think of the related content (suggested in the content aspect of the objective), the learning experiences for achievement of the objective, which are implied in the behavioral aspect. Looking at these factors leads naturally to a consideration of the teaching aids and evaluation. All of these considerations are rooted in the bases upon which curriculum decisions are made--such factors as the conditions of society and of families within the society, student needs, the local situation, and the structure of the field of study. In turn, these considerations are related to the curriculum planner's philosophy of home economics education, of home economics, of education, and of life itself.

Thus, curriculum planning is seen as a complex and demanding task. The complexity and challenge add to the fascination to be found in the task--and to the reward of seeing the plans work out in classroom operations.

Examples of Plans for the Home Economics Program

An example of an over-all plan for a home economics program has been given. Following is an example of a unit plan developed by graduate students (Peggy Carroll, Elda Kaufman, Betty McGhee, and Joy Plattner) at the University of Illinois in a class taught by Professor Hazel Spitze. Following the unit plans are examples of lesson plans.

The examples are presented for whatever interest they may have for the busy teacher engaged in her own tasks of planning for the year, the unit, and the day.

Personal and Family Relationships, Example of a Resource Unit

I. To increase understanding of myself

Content (as Generalizations)	Activities to Encourage Learning
1. Understanding self contributes to understanding and accepting others.	Students fill out questionnaire "All About Yourself," Illinois Teacher, Vol. II, No. 2.
	Take interest inventory to determine students' questions or problems related to this area.
	Teacher-student planning of objectives for unit.
	View Understanding Myself, McGraw-Hill Guidance Filmstrips, 330 W. 42nd St., N.Y. 36, N.Y.
2. Fulfillment of physical and psychological needs leads to individual development and satisfaction.	Bulletin Board - Use "pipe cleaner girl" as central figure. Students bring pictures to show how different needs are met; arrange pictures radiating from central figure. Use as basis for discussion.
	Observe a younger child (in elementary grades or at home or while babysitting). Did you see evidences of children's needs being fulfilled or ignored? How does this relate to your family life?
	Read a short story, magazine or a newspaper article, or a book about adults, young people, or children. Which of the basic needs are involved in the actions of the main character?
	Study the ads in popular magazines; find as many as you can whose appeal is to the needs we've discussed. Bring them to class for discussion and analysis.
3. Individuals face certain tasks in development which must be accomplished in order to progress to the next level of development.	Define the concept of "developmental task"; the term itself does not have to be used. One might refer to the tasks as "responsibilities for growing up."

Identify the developmental tasks of a:
baby
toddler
teen-ager
parent
grandparent

Roleplay several situations depicting teen-agers working at their developmental tasks, some of the hurdles which they encounter.

View filmstrip Learning to be Independent, Church Screen Productions.

4. Individuals differ because of heredity and environment.

Students take pretest on heredity and environment.

List the many ways you differ from a classmate of yours. From thinking about your parents and grandparents, which of the above traits might you have inherited?

View and discuss: Heredity and Family Environment, McGraw-Hill (film).

Heredity and Environment, National Repository of Tapes for Teaching, Kent State University, Kent, Ohio. (Send blank tape--tape recording.)

Discuss how certain adults have capitalized on physical characteristics or have overcome physical handicaps.

Stump, Al J., Champions Against Odds. (Macrae Smith Co., Philadelphia, Pa.) pamphlet.

A Desk for Billie, NEA, Washington, D.C.--film concerning environmental handicaps.

5. An understanding of how our bodies grow and change helps us accept our physical development.

Question box for anonymous questions about growing up physically.

Invite a doctor or nurse (possible Red Cross) to discuss physical changes.

	View and discuss film Farewell to Childhood, International Film Bureau, 6 N. Michigan Ave., Chicago 2.
6. Being able to recognize our feelings and control our actions contributes to personal satisfaction and acceptance by others.	Observe in elementary grades; describe any situation involving emotional control or lack of it. Buzz sessions - "Experiences in the family develop emotional control." Write down 3 things that have happened to you lately which aroused your emotions. Were the emotions destructive or constructive? How did you handle the situation? How did you feel when it was all over? Roleplay situations involving problems brought about by emotional immaturity--follow by class discussion: draw conclusions. Films: Control Your Emotions--Coronet Act Your Age--Coronet Toward Emotional Maturity--McGraw-Hill He Acts His Age--McGraw-Hill
7. Recognizing problems is the first step in solving them.	Use case studies from About You (Science Research Associates) to explain use of defense mechanisms. List defense mechanisms commonly used at school. Roleplay situations that illustrate each. Discuss situations in which these mechanisms are harmful. Develop and present a skit showing a teen-ager faced with a difficult situation; divide the class into small groups. Let each group make the decision. Compare results of various groups. Weigh the advantages and disadvantages of each decision. Facing Reality, McGraw-Hill (film).

Summarize unit by forming generalizations which would help a newcomer to our class better understand herself.

Class evaluate their progress toward objectives set up at the beginning of the unit.

II. To improve relationships with others

Content as Generalizations	Activities to Encourage Learning
1. Friends help satisfy basic psychological needs for security, a sense of worth, and mutually agreeable interactions with others.	Checklist to determine students' problems or concerns about family and friends. Teacher-student planning of objectives for the unit. Bulletin Board - "Why Bother With Friends?" Girl's puzzled face in center, question marks surrounding her. Through class discussion, remove the question marks and answer her question.
2. Making and keeping friends is easier if one develops certain attitudes such as: interest in other people, friendliness, cheerfulness.	Students fill out Dr. Laird's check-list, "Traits Which Make Us Liked by Others" (Guide for Teaching Personal and Family Relationships, pp. 35-36). Write a paragraph about a person who fits the following description: a) "You just can't help but love her." b) "She hasn't a friend in the world." Look through and select a story from Reader's Digest's "Most Unforgettable Character" which illustrates qualities which make a person likeable. Use students' selections as a basis for class discussion. Discussion: Is it better to have just one or two close friends or many friends? Discuss the advantages of each. Produce skit, "The Ins and Outs" (National Association for Mental Health, 10 Columbus Circle, N.Y. 19)

Film: Making Friends (Encyclopedia Britannica Films, Inc., 1150 Wilmette Ave., Wilmette, Illinois)

Filmstrips:
- As Others See You, McGraw-Hill
- Making People Like You, Church Screen Productions
- Polish Up Your Personality, Church Screen Productions

3. Manners are based upon consideration of others, kindness and respect.

Discuss the reasons and bases for manners. Maybe students could write their own "rulebook."

Roleplay specific situations such as introductions, eating out, accepting or refusing a date. Compare role-playing with similar situations in the following films.

Films:
- Mind Your Manners, Coronet
- Social Courtesy, Coronet

Filmstrips:
- Developing Social Maturity, McGraw-Hill
- Why Have Manners, Eye Gate House, Inc.
- Table Manners, Eye Gate House, Inc., 2716 Forty First Ave., L.I.C., N.Y.

Collect current articles and cartoons on etiquette from newspapers and magazines. Post them on the bulletin board for reference when writing advice for the etiquette questions that come from hypothetical situations.

4. Understanding family members contributes to the improvement of family relationships.

Panel Discussion - "What Parents and Teen-Agers Expect of Each Other." Invite two parents to participate along with two students.

Students select a committee of class members to prepare a "Declaration of Rights and Responsibilities for Today's Teen-Agers."

Consider ways of developing parent-youth code for our own community. Begin work on such a code.

Skit, "High Pressure Area" (Mental Health Material Center, Inc., 1790 Broadway, N.Y. 19) as a basis for class discussion of parent-teenager relations.

Films:
  You and Your Family, Associated Films, 291 Broadway, N.Y. 17)
  Family Life, Coronet
  Parents Are People Too, McGraw-Hill
  A Date With Your Family, International Films

Filmstrips:
  Your Job as Big Brother or Sister, Chas. A. Bennett Co., Inc.

Conduct a class poll to determine those who are youngest in family. Ask each one to discuss position of youngest as he sees it. Compare agreements and disagreements. Do the same for oldest, middle, and only child. Discuss different ways people feel about their place in their own families.

Film:
  Sibling Relations and Personality, McGraw-Hill

5. Development of special interests by a family promotes personal satisfactions and enriches family living.

Tape Recording: *Family Recreation* describes some ideas for family recreation and the value of doing things together.

Plan, carry out, and evaluate an activity which your family will enjoy together.

Film: *Family Outing* ($1.25 rental from University of Utah). Discuss purposes family vacation serves.

By "Brainstorming" determine a list of things teen-agers could do to make more leisure time for all members of the family.

Discuss advantages and disadvantages of commercial, out-of-the-home entertainment and compare with family entertainment in the home. Plan an evening of entertainment for the family.

6. If responsibilities are accepted, privileges are more likely to be granted.

<u>Skits</u> about family life: (State Director of Home Economics Education, Carson City, Nevada)
"Always the Garbage"
"Mother and Dad Are People Too"
"Bob Disobeys Orders"
"Please Pick Up Your Own Clothes"
Discuss situation, reasons for conflict, ways to solve problems.

Film: <u>Sharing Work at Home</u>, Coronet. Follow with discussion. Plan ways you could make better use of time, money, energy, for greater satisfaction.

Girls answer roll call by naming a family responsibility. Arrange them in chart form as follows:

Responsibility	Father	Mother	Student
1. Wash Dishes			X
2. Make beds	X	X	X

7. Conflict exists in families because of the differences among family members.

Roleplay:
  a) family making decisions as to where to go on vacation
  b) family deciding on how responsibilities will be shared now that Mother has gone back to work.

Film: <u>Age of Turmoil</u> (U. of Utah, $3.25). Discusses causes of conflict.

Write a paper showing how you differ from a brother or sister in functions performed at home, at school, or at work; in your needs and desires; in expressions of emotions. Have these differences led to any conflict you are aware of in your family?

8. There are many patterns for family life; it is the responsibility of each family to develop a pattern which meets its needs.

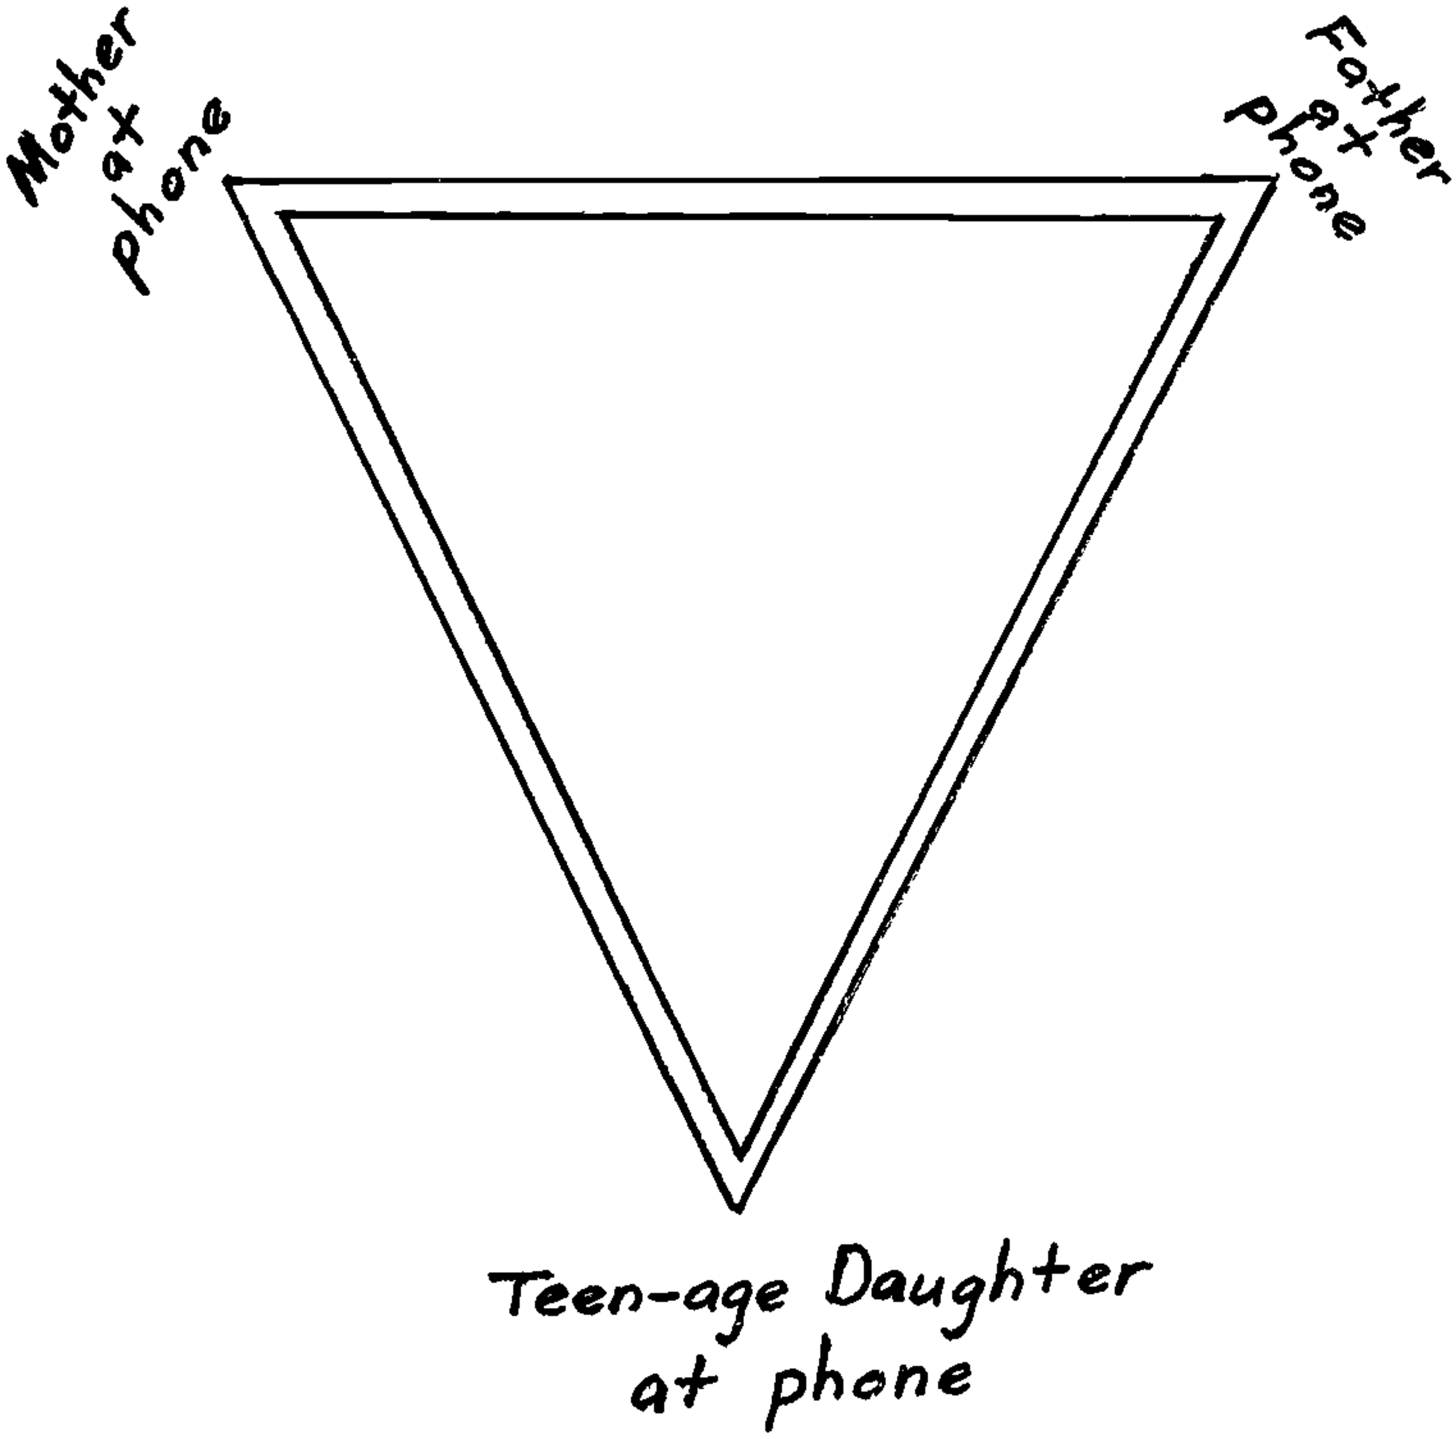
Discuss in buzz groups ways your families differ; each group summarize and report differences. Make list on board. Develop generalizations regarding differences.

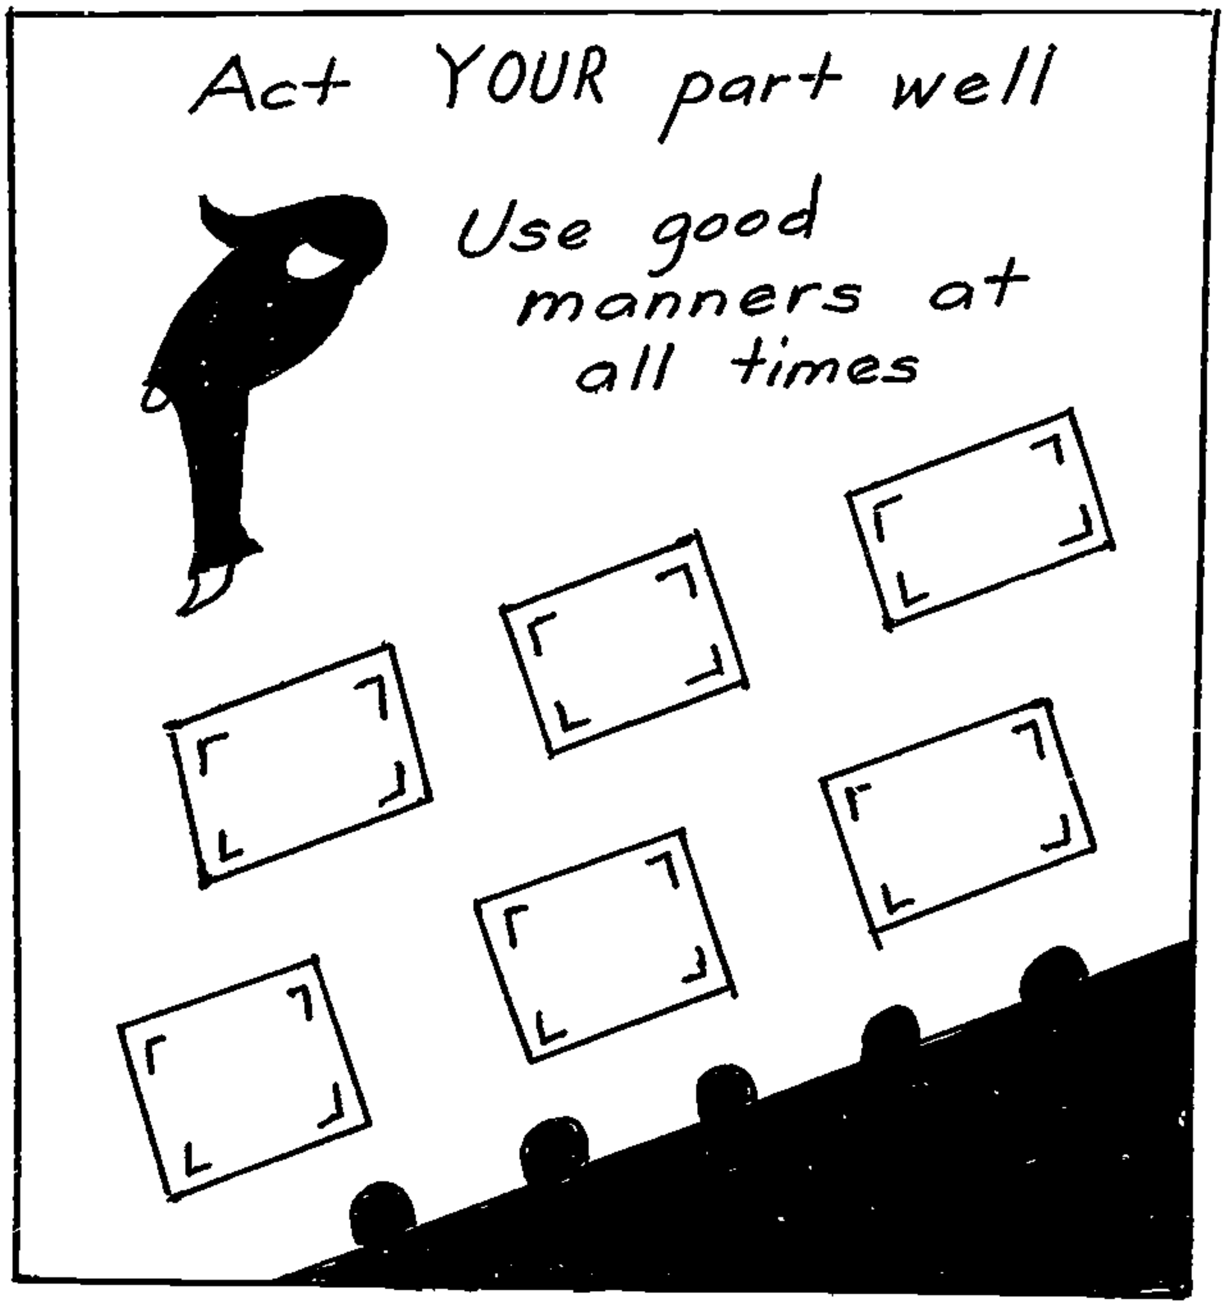
Summarize unit by developing generalizations regarding you and your relationships with others.

Students evaluate growth towards objectives set up at beginning of unit.

BULLETIN BOARD IDEAS

Keep Family Lines of Communication Open





- Use six pictures from books or magazines that illustrate good manners and the occasions where good manners should be practiced.

- Use black sketches for the actor and the theater audience.

- Keep it simple.

Films

Date With Your Family - 10 minutes - Instructional Films. Some relationships within a family are described to show how consideration and kindness can help in developing understanding among family members.

Developing Friendships - 10 minutes - Coronet. Shows how one teenager learned to be a friend and to make friends among others of different backgrounds and personalities.

Dining Together - 11 minutes - Instructional Films. Shows the manners and conduct of two boys at a family Thanksgiving dinner at which guests are present. The pleasure in knowing how to behave correctly is emphasized.

Good Table Manners - 11 minutes - Coronet. Good table manners depend primarily upon attitude. Here this important factor is developed by showing that table manners are matters of courtesy, consideration for others and common sense.

Family Life - 11 minutes - Coronet. Explains how the Miller family manages to have the time and money "to have fun." They plan cooperatively their schedules, responsibilities, privileges, and finances in order to gain the happiness a family should have.

Family Teamwork - 17 minutes - Firth Films. Illustrates the teamwork in the Garman family of five who specialize in raising prize milk goats. Bill, about twelve, and teenage Barbara help with the housework and feed and milk the goats. The parents provide for the family's needs and help the children get their goats ready to show at the 4-H exhibit. Ends by showing the group at a pleasant evening meal followed by an evening of recreation centered in the home.

Friendship Begins at Home - 15 minutes - Coronet. This film presents a boy who learns to appreciate his family. It is directed to the adolescent, illustrating the importance of friendship in the home and the fun of doing things with the family group.

Fun of Making Friends - 11 minutes - Coronet. Introduces Joey first as a social outcast because he does not consider the feelings of his classmates. But, eager for personality development, he has a heart to heart talk with his mother and the next day puts into practice new rules of conduct that bring gratifying results.

Making Friends - 11 minutes - Encyclopedia Britannica. Three high school students learn how to work out their problems in making and keeping friends.

Mind Your Manners - 10 minutes - Coronet. Shows a high school boy and his sister discovering the correct ways to act when with friends, at home, at school and on a date.

The Family - 18 minutes - Herbert Kerkow Production. Presents a day in the life of an American family, with its needs, disagreements, and solutions. The grandmother is very much a part of the family and each member has rights and responsibilities. Shows the importance of a feeling of belonging to a family and that problems may be met by cooperation.

You and Your Friends - 7 minutes - Associated Films. A film showing a teenage party. Friendly cooperation is contrasted with self-centered bad manners. The audience is asked to evaluate different types of behavior and is encouraged to select and remember those qualities needed by one to be a friend and to have a friend.

Other Films

As Others See You - 35 frames - McGraw-Hill
How Can I Understand Other People - 41 frames - McGraw-Hill
Is Your Home Fun - 50 frames - Pilgram

EXAMPLES OF LESSON PLANS MAKING USE OF THE STRUCTURED SET OF QUESTIONS WHICH MAY SERVE AS A GUIDE IN DEVELOPING GENERALIZATIONS WITH STUDENTS

(Please refer to page 246)

EXAMPLE I:

The following lesson plan, developed by Elizabeth Simpson, makes use of minute dramas written by Ann Montgomery Gerteis, formerly research assistant in the Division of Home Economics Education, University of Illinois, and now a full-time homemaker and mother.

EXPLORING VALUES THAT INFLUENCE CHOICES IN THE AREA OF HOME FURNISHINGS

Unit: The Home and Its Furnishing

Lesson Plan

Objectives:

1. Understanding of certain values that affect choices in the area of home furnishings.

2. Some understanding of the sources of these values.

3. Increased understanding of and respect for other peoples' values and ways of expressing them.

4. Increased understanding of own values.

Activities and Procedures:

1. Introduction: "Previously we discussed some of the factors to be considered in planning home furnishings. We mentioned the makeup of the family with respect to (1) number in family, (2) ages, (3) sex of family members, (4) interests, and (5) activities. We discussed the income of the family as a factor to be considered. The art principles and their application have also been discussed as considerations in making home furnishing decisions."

   "Now, there is another very important consideration that we haven't even mentioned. All of us prize certain things or ideas in life. What we prize enters into our choices in all areas of living--whether we are selecting a dress, or a house, or deciding how to discipline a child."

   "Let's look at a typical family situation and see what the mother prizes that will enter into her decisions about home furnishings."

2. Students present Minute Drama I (see page 277)

3. Discussion:

		Discussion guide	Content
(Guide,) pt.1	A.	"What did the mother prize?"	sentiment her relationship with her husband
(Guide,) pt.2	B.	"These things that we prize are also called our values. Have you known people who held values similar to those of the mother? Tell us about them."	
(Guide,) pt.3	C.	"Why do you think that the perfume bottle seemed so important to the mother? Let's speculate about this a little."	Perhaps the husband gave it to her for some special occasion--and, therefore, it has a sentimental attachment for her. The perfume bottle itself is not a value, but it is an expression of a value.
	D.	"Let's explore this matter of values in relation to home furnishing a bit more. Suppose we act out some other situations in which values are involved."	

4. Students present Minute Dramas II-VIII (see pages 277-279)

5. Discussion questions for each:
(Guide,) pt.1 A. "What is the value presented here?" (list on board)
(Guide,) pt.2 B. "Do people you know hold similar values?"

6. Discuss: "Have we omitted from our minute dramas or discussion any values that influence choices in the area of home furnishings?"
(Guide,) pt.2
Aesthetics-Beauty
Relationships

7. "Where do these values come from? How do we get to be people who value beauty, or privacy, or comfort so much that our choices are influenced by these things that we prize?"
(Guide,) pt.3
Our experiences in the family and elsewhere. Values held by those who are models for us--parents, teachers, peers.

8. "Let's now take a more personal view of values related to the home. Let's suppose that you are out of high school and are going to a strange town to work or to go to school. What do you think that you would look for first of all in a room or apartment for yourself?" Discuss:

(Guide,) A. "What values would serve to guide you?"
pt.3 B. "How would these values influence your choices?"
C. "What are the possible sources of these values?"

Discuss--The same value may have a different degree of importance for another class member. Why? How does this affect decisions made in home furnishings?

9. "Suppose we summarize what we have learned up to this point about values in relation to home furnishings." (Write conclusions on board.)

(Guide,) A. What we prize (value) in life enters into our choices of
pt.4 home furnishings.
B. Many people hold the same values, but differences may be found in the relative importance they place on the values and the ways in which they express them.
C. People differ with respect to values because they have different backgrounds of experience; have had different people to imitate and with whom to identify; and have different needs and interests.
D. We gain increased understanding of other people as we gain an appreciation of what they prize (value).

10. "Now, let us look at what authorities in the area of home furnishings say about this matter of values."

(Guide,) Read Craig and Rush, Homes with Character, p. 3 (for example)
pt.5

11. "Do the conclusions that we drew still seem to be sound?" (Discuss)

12. "How may we apply these conclusions to our own lives?" (Discuss each.)

(Guide,)
pt. 6

Means of Evaluation:

Pencil-and-paper test on values that influence choices in area of home furnishings--perhaps, using case situations and having students to identify values held by different persons and discuss the possible influence of these values on choices.

Students' comments regarding their own and others' values and the influence of these on choices in area of home furnishings.

Minute Dramas for the Study of Values in Home Furnishings
by Ann M. Gerteis

Minute Drama I.

Scene: Mother is in the living room cleaning while the daughter cleans a bedroom.

Daughter: (As she runs into the living room) Mom, let us throw this old perfume bottle away. There isn't a thing in it. It's just a dust collector. I'm tired of cleaning it every week. I could see some purpose in keeping it if it were pretty. But, in my opinion, the shape is awful and it hasn't any purpose!

Mother: I wouldn't begin to let you throw that bottle out. Why, your father gave me perfume in it before we were married. It is quite dear to me. I always thought it was rather beautiful. (With a dreamy look in her eyes) I guess you'll just have to put up with my sentimentality.
(Value: Sentiment)

Minute Drama II.

Scene: Mr. Davis is in the living room resting and reading the paper after a hard day's work.

Wife: Dear, this may be the last evening you will be sitting in that old chair. Remember you said I could get some new furnishings? Well, I picked out a lovely chair down at Toble's for you dear. I'll be glad to get rid of that old one. Now, I'll move the couch here and--

Husband: (Interrupts) What did I hear--get rid of this chair? What is life coming to? A man can't even have a comfortable chair in his own home. We have had this chair for years, dear. I just can't see getting another one when this one is so comfortable.
(Value: Comfort)

Minute Drama III.

Scene: A neighbor is visiting in the kitchen.

Neighbor: Oh, I see you have put the washer and dryer in here. I can't understand why you put them in the kitchen. I always thought a person was supposed to do laundering in the basement.

Sue: I thought about putting them in the basement--but with the baby, I have to wash every other day. It is so much more convenient to have the washer and dryer in the kitchen.
(Value: Convenience)

Minute Drama IV.

Scene: Mother and daughter are having a discussion in the bedroom of daughter's new home.

Mother: I just can't see spending all that money for decorating this guest bedroom. My gracious, it's pretty, and I'll bet it is comfortable. But, all that expense for a guest room seems a bit foolish to me. Looks like you would have wanted to spend that money on your own room.

Daughter: Jack and I love having company. You can never tell when one of our friends or family is going to drop in. We enjoy having people, so we want to make their stay as happy and comfortable as possible. Just like when you and Dad drop in--we want to make you feel welcome.
(Value: Hospitality)

Minute Drama V.

Scene: Mrs. Brown is showing her new drapery material to her friend.

Friend: Ruth, I guess I like the fabric. In fact, it is quite nice. The beige color is pretty. It goes with everything. And I understand that it will wear and wear. I read an article in one of the magazines explaining that the fabric will not be hard to clean. But, I still keep thinking of that lovely, lovely piece of silk material I saw downtown at Larson's. It would be just perfect for your room. Oh, the material really had that expensive feel about it! Ruth, I'll bet you could take this material back and get the fabric at Larson's. Why don't you do that? I know you would rather have the silk.

Ruth: Jane, the expensive fabric would be nice. But, I'm very happy with what I bought. I would rather have this manmade fabric at a lower price than the silk. We need to spend the money on something else. I'm just trying to be economical.
(Value: Economy)

Minute Drama VI.

Scene: Aunt Jane is being shown the house for the first time.

Aunt Jane: Linda and Joan have separate rooms. Looks to me like it would be better if they shared a room. If the girls shared a room, there would be only one room to furnish.

Mrs. Liston: I know it would be easier. However, you must understand that both Joan and Linda like to be alone sometimes. We think this is important. They need the privacy that comes from having their own rooms.
(Value: Privacy)

Minute Drama VII.

Scene: It is moving day. John is in the den while his wife is upstairs.

John: Margaret, Margaret where did you put my rock collection? Yes, yes my rock collection. I want it in the den. This house won't seem like home without it.

Margaret: John, I think it is in the box in the basement. Yes, in the basement by the washing machine. It has a green cord around it. It is marked "rock collection." I'll be glad for you to get it in the den too. Having your hobbies around us will make this new house seem like home.
(Value: Special Interests)

Minute Drama VIII.

Scene: Helen and Mary are talking by the stairway of Mary's new home.

Helen: Mary, you know if you would just take down this rail, the appearance of the stairway would be much more pleasing.

Mary: Helen, I think you are right but it would be very unsafe without the rail. I certainly want my home to be safe for my family.
(Value: Safety)

EXAMPLE II:

COMMUNICATING NON-VERBALLY

Unit: Relationships at home, at school, and at work.

(Note: This has been taught as a demonstration lesson with junior high school girls as the students. Slides were used to illustrate the various aspects of non-verbal communication. We have had the color slides converted to 2" by 3" photographs. The photographs follow the lesson plan in the sequence in which they were used in the lesson. The quality is somewhat poor since the process used in duplicating the Illinois Teacher results in another conversion--from color to black and white. Nevertheless, we hope that the idea may be conveyed. Perhaps a teacher will wish to prepare her own slides or drawings using her own students as subjects. This lesson plan also makes use of the article "We Speak--In Silence," which appeared in the Illinois Teacher, Vol. IX, No. 4.

Objectives:

1. Increased understanding of ways of communicating with others at home, at school, and at work.

2. Some understanding of the concept of non-verbal communication.

3. Some appreciation of the role of non-verbal communication in human relationships.

ACTIVITIES AND PROCEDURES	CONTENT
1. Our topic for this lesson is: Communicating Non-verbally.	
2. Perhaps we should first make sure we understand the meaning of the term, communication.	Communication is the act of exchanging thoughts, opinions, and feelings. It means making common to both parties involved the knowledge or quality conveyed, to impart what is known or felt to another.
3. What are some of the ways in which we communicate with others?	Talking, writing letters, giving someone something we want her (him) to read; these are the verbal means of communication.
4. Let us look at some of the ways in which people communicate without words.	
a. Here we have a young woman who is going to a job interview.	
Guide Ques. 1 What feelings is she communicating through her posture?	Slide 1, Dejection, lack of confidence Slide 2, Pleasant anticipation, self-confidence
Ques. 1 Have you noticed people who conveyed certain feelings through the way they stood or walked? Tell us about them.	
5. Ques. 1 Here is a young lady who is showing how some students sit in class. What does her posture say to you?	Slide 3, Disinterested or very tired
Here she is again, but this time her posture says to us that she is eager and interested.	Slide 4, Alert and interested
Ques. 2 Have you noticed that your posture may reflect how you feel in a particular class? Did you notice any examples of posture communicating feelings in your afternoon classes?	
6. The next three slides show a teacher standing before her class.	Slide 5, Sense of authority Slide 6, "Closed up," feeling, distance, aloofness

Activities and Procedures	Content
Ques. 1 What does she seem to be communicating in each case?	Slide 7, Permissiveness
Ques. 3 We are not in complete agreement about what is communicated. Why do you suppose this is true?	We may perceive things differently because of our different experiences, interests, needs, and values.
7. Ques. 1 Here are two pictures of a pleasant couple enjoying each other's company. Then, along comes someone they dislike. What happens?	Slides 8-10, It looks as if the man and woman withdraw and wrap themselves up protectively when the third person joins them.
Ques. 3 Let us suppose that the third person opened the door when she came into the room and let in a blast of cold air. Could we then conclude that the man and woman were necessarily rejecting the woman who joined them?	The context in which communication occurs is a factor in interpreting its meaning.
8. Thus far, we have seen that people may communicate through posture and gestures. This next slide shows how touch may communicate a feeling--perhaps, in this case, reassurance and encouragement.	Slide 11, Encouragement, reassurance
9. Ques. 3 Do dress and makeup tell anything about us?	Slide 12
Of course, communication is a two-way process. We are communicating something of ourselves through our dress and makeup but in receiving impressions, we are also involved in the communication process. And how we "see" these two young women is a reflection of us. As we said earlier..........................	We may perceive things differently because of our different experiences, interests, needs, and values.
10. Another way in which we communicate is through the use we make of time.	Slide 13

Activities and Procedures	Content
Ques. 2 Can you think of any examples you have seen of ways in which people communicated through their use of time?	
11. The use we make of space also conveys meanings. These two slides show North American conversational distance. We are comfortable talking when people are about as far apart as those in the two pictures.	Slides 14 and 15
But, the South American is uncomfortable at that distance. He wants to get closer.	Slide 16
Ques. 3 What feelings are conveyed to the North American when people get very, very close to talk?	They are either very fond of each other, or angry with each other!
12. This last picture shows a charming young teacher with her husband. Through her interested expression and expressions of warm concern she conveys love and support.	Slide 17
13. Let us take a thinking minute. What general conclusions can we Ques. 4 draw from our slides, from our personal observations of people communicating non-verbally, and from our discussions this evening?	People communicate with each other both verbally and non-verbally. We communicate with others by means of posture, gestures, touch, dress and makeup, and use of time and space. How we perceive what is communicated is a function of our experiences, needs, interests, and values. Context is a factor in interpreting the meaning of what is communicated.
Ques. 4 What difference does non-verbal communication make in our relationships with others?	The way in which we communicate non-verbally affects our relationships with others.
14. Our textbooks did not have anything on non-verbal communication, so I wrote something on the subject and had it duplicated for	

Activities and Procedures | Content

you. I did have a source of
some authority for what I
wrote: Hall's little book,
Lead. <u>The Silent Language</u>.
to
Ques. Suppose you read this for tomorrow
5 and we will check our conclusions
and see whether they still seem
sound. For tomorrow, also consider how we might get these
ideas we have developed here
Lead. into our own living.
to
Ques. What difference will it make
6 in your relationships with
your family and friends now
that you have these understandings about non-verbal communications?

MEANS OF EVALUATION: Pencil-and-paper test calling for application of generalizations to problem situations.

Informal comments of students regarding their applications of understandings about non-verbal communication to personal situations.

Slide 1--
dejection, lack of
confidence

Slide 2--
pleasant anticipation,
self-confidence

(posed by Mildred Griggs)

Slide 3--
disinterested,
or very tired

Slide 4--
alert and interested

(posed by Nancy Carlson)

Slide 5--
sense of authority

Slide 6--
"closed up" feeling,
distance, aloofness

Slide 7--
Permissiveness

(posed by Ruth Whitmarsh
Midjaas)

Slides 8-10
They were enjoying each other's company; then they were joined by someone they dislike!

(posed by Alice and Ben Cox and Elizabeth Simpson)

Slide 11--
encouragement and reassurance

(posed by Eva Moore and Mildred Griggs)

Slide 12--
dress as a factor in
non-verbal communication

(posed by Alice Brunner

*PROGRAMED UNITS, *VOCATIONAL AGRICULTURE, *PLANT NUTRITION, *LAND JUDGING, YOUTH CLUBS, FEEDS, *ANIMAL SCIENCE, GRADE 9, GRADE 10,

Programed instruction materials in seven agricultural subject areas for ninth and 10th grade vocational agriculture students were developed by a teacher educator in consultation with subject matter specialists. The material was tested in 10 schools, revised, and pilot tested in 16 schools. Each of the seven units includes a statement of purpose, a pretest, a posttest, the program frames, information panel, and an answer sheet. The units are (1) animal nutrition, (2) feed characteristics, (3) vitamins, (4) minerals, (5) plant nutrition, (6) land judging, and (7) Future Farmers of America. The material is intended as a supplemental instructional aid. It was designed for use in one-half hour blocks of time for a total of 12 to 16 hours. Teachers using the material should be familiar with the proper utilization of programed materials. (JM)

DATE: February 15, 1968

RE: (Author, Title, Publisher, Date) Gilbert A. Long, Programed Instruction For Vocational Agriculture Teachers, Washington State University, 1966

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies: ERIC Only (We will service individual orders for a limited time.
Agency Agricultural Education, Washington State University, Pullman, Wn.
Address Pullman, Washington 99163
Limitation on Available Copies 15 Price/Unit Free
(quantity prices)

(2) Means Used to Develop Material:
Development Group Gilbert A. Long, member of Wn State Research and Development
Level of Group Assistant Professor, Agricultural Education
Method of Design, Testing, and Trial Designed by subject matter specialist-teacher trainer with advice of college subject matter specialist, tested on 10 vocational agriculture teachers' students, revised, pilot tested with 16 schools.

(3) Utilization of Material:
Appropriate School Setting Secondary school vocational agriculture students
Type of Program High school vocational agriculture
Occupational Focus Production agriculture and ag related occupations
Geographic Adaptability No established limits
Uses of Material Student activity to complement lesson presentations
Users of Material Secondary students, junior college students.

(4) Requirements for Using Material:
Teacher Competency familiarity with proper utilization of programed instruction.
Student Selection Criteria Land judging - sophomore minimum feed characteristics - freshmen, vitamins and minerals - sophomore minimum
Time Allotment By 1/2 hour maximums, a total of 12-16 class hours

Supplemental Media -- Transparency Masters for Vocational Agriculture and Transparency Master Supplement

Desirable ______)

Describe

Source (agency) Agricultural Education, Washington State University
(address) Pullman, Washington 99163

(5) The author's experience with this programed instruction indicates the necessity of limiting student exposure to from 20-40 frames per class session. Good students should be allowed to read only--they need not take time to write each answer. This material's impact or demand for it, will not be clear until some way to make it available in quantity is identified.

PREFACE

This group of seven programs is the initial phase of a PROGRAMED INSTRUCTION DEVELOPMENT PROGRAM conducted under the auspices of the Vocational Technical Education Research and Development Project at Washington State University in cooperation with the State Board for Vocational Education.

The purpose of this developmental program is to; 1) develop a supply of up-to-date programed instructional materials 2) establish channels for the early development and adoption of instructional materials, including programed instruction and visual transparency masters to be used in logical systems of instruction. It is the further intent of the project to demonstrate the feasibility of utilizing programed instructional units in vocational agriculture.

The author will coordinate a sixteen-hour workshop on the principles, construction and specific usefulness of programed instruction in the vocational agriculture curriculum. This workshop is to be held July 25-29, 1966, as part of the Washington State Vocational Agriculture Teachers' Conference. This workshop group of approximately thirty teachers will identify felt needs for curriculum development and will begin to prepare instructional units for these areas. The author will edit and pilot test this material following the conference.

The group of programs herein are designed to complement present vocational agriculture curriculum. This material has gone through one pilot test and refinement. The vocational teachers within the "Workshop" will cooperate in a final pilot test. Pre-tests, post-tests, and answer sheets will be returned to the author for scoring, evaluation of the success in meeting stated objectives and for final editing of the programed material.

The foregoing procedure is intended to introduce programmed instructional materials to the vocational agriculture teachers in a useable form, develop basic programed instruction development skills and to identify and orient cooperating pilot testing schools for the programed instructional materials included herein.

INTRODUCTION

Programed instruction will not replace the vocational agriculture teacher, nor will it substitute by itself for a logically developed system of instruction. A system of instruction will employ the best instructional materials available, including texts, references, visuals, models, specimens and programed instructional materials.

Programed instruction does have a good future, according to the literature. Some of the merits claimed are that programs may be effective for use with the slow learner and programs may be used as a supplement for the gifted child. The same program may be effective for different grades at different ages. More specific to the programs included herein is the fact that knowledge can be gained by the student via programed material.

A textbook is written to provide a student with an avenue from start to finish in his study of a new subject. A "programed text" is written more specifically to a level of reading ability and is more explicit about the steps along the road. Each step is a numbered "unit" called a "frame," and care is taken to make sure that each step follows logically from the steps that have preceded it.

Some part of most frames is purposely left incomplete so that the student can supply the missing words from the knowledge he has recently acquired. These missing words are the "answers" which the student is asked to write down.

With this description of programed texts in mind, programed instruction advocates claim the following characteristics to be true:

1. Students move at their own speed.

2. Active participation on the part of the student is required. At least part of the frame requires a student response.

3. The subject matter is divided into small units called frames and small steps in learning result as the program moves from the simple to the complex. This is done in a careful sequence.

4. The student is provided immediate feedback reinforcement because the student is right a high per cent of the time. He is regarded or reinforced.

5. Revisions are based on student responses.

6. Programs are more carefully aimed at a particular ability level of student based on experimentation, not on opinion. This programed unit is designed for use by pilot schools as a part of the evaluation for final editing.

Your cooperation in supplying answer sheets, pre-tests, post-tests and written comments to the author will be appreciated.

TABLE OF CONTENTS

ANIMAL NUTRITION

PURPOSE

This is a programmed instruction unit titled "Animal Nutrition." This program is designed to introduce high school vocational agriculture students to a study of "Livestock Nutrition." This unit should be followed by "Feed Characteristics," "Vitamins," and "Minerals" programs in that order.

This program includes the following knowledges:

1. Chemical composition of plants and animals.
2. The animal nutritional requirements for maintenance, growth, fattening, production and reproduction.
3. Chemical composition of carbohydrates.
4. Feeds that supply carbohydrates.
5. Importance of proteins.
6. Amino Acids.
7. Protein concentrates.
8. Importance of fats as an energy feed.
9. Function of minerals.
10. Function of vitamins.
11. What a feed ration is and what a balanced ration is.
12. Importance of nutrition to fertility of livestock.
13. Some examples of practical "rules of thumb" for feeding different classes of livestock.
14. Economics of feed substitution within balanced rations.
15. The Pearson Square Method of finding the proportion or percentage of two (or more) feeds which, when mixed together, will furnish a desired per cent protein.

Name ________________________

PRE-TEST

NUTRITION

UNDERLINE THE CORRECT ANSWER.

1. Animals require nutrients to sustain life with no loss or gain of weight. This is called

   a. growth
   b. fattening
   c. maintenance
   d. production

2. __________ are the chief sources of heat and energy for animals.

   a. Minerals
   b. Carbohydrates
   c. Proteins
   d. Fats

3. The nutrients to provide milk and wool are called the requirement for

   a. reproduction
   b. fattening
   c. growth
   d. production

4. __________ include starches, sugars, and cellulose.

   a. Carbohydrates
   b. Fats
   c. Proteins
   d. Minerals

5. Feeds that are high in __________ include corn, oats, barley, and wheat middlings.

   a. protein
   b. fats
   c. carbohydrates
   d. minerals

6. The kind and quality of __________ are fully as important as the amounts.

   a. fats
   b. proteins
   c. minerals
   d. carbohydrates

7. __________ are the high energy compounds of feeds.

   a. Proteins
   b. Minerals
   c. Calcium
   d. Carbohydrates

Name ____________________

8. __________ are essential minerals for feeding livestock. (choose two)

a. Gold
b. Platinum
c. Sodium
d. Manganese
e. Silver

9. Fats supply __________ times as much heat energy as do carbohydrates.

a. 2.25
b. 2.50
c. 2.75
d. 2.00

10. __________ requirements vary according to what is created for "sale" by the animal (milk, wool, meat, eggs, etc.).

a. Maintenance
b. Production
c. Reproduction
d. Growth

11. A(n) __________ is the amount of feed nutrients in the proper proportion for a 24-hour period.

a. ration
b. balanced ration
c. adequate supply
d. increment

12. __________ are common protein supplement feeds. (Choose two.)

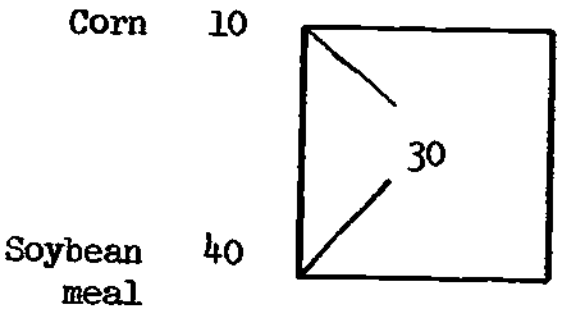
a. Barley
b. Oats
c. Cottonseed meal
d. Bone meal
e. Soybean oil meal
f. Corn

13. To reduce gain of bred sows or gilts, feed more __________ and less __________.

a. roughage
b. vitamins
c. protein
d. grain
e. minerals

Name ______________________________

14.



__________ parts of corn

(Fill in the blanks)

__________ parts of soybean oil meal

a. 10 parts corn
b. 70 parts corn
c. 10 parts soybean oil meal
d. 20 parts soybean oil meal

(underline two)

INFORMATION PANEL

This is a programed instruction unit for "animal nutrition." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.
2. Write your answer on the answer sheet.
3. Move the answer sheet down to expose the next frame and answer to the previous frame.
4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect answer.

Animal Nutrition

If you have not read the information panel, do so now, then proceed to frame 1.

____

water carbohydrates (organic matter) ash	1. Plants and animals are composed of (1) water, (2) organic matter, and (3) mineral matter or ash. Organic matter is composed of carbon united with hydrogen and oxygen and, in some cases, nitrogen and other chemical elements. Mineral matter is neither animal nor vegetable; it is an inorganic homogeneous substance. Plants and animals are composed of ________________, ________________, and ________________.
3/4	2. Carbohydrates make up about <u>three-fourths</u> of all the dry matter in plants, and they are the chief source of energy and heat for animals. Carbohydrates are composed of carbon, hydrogen, and oxygen. Carbohydrates form about ________________ of all dry matter in plants.
(1) water (2) carbohydrates (3) mineral matter or ash	3. Plants and animals are composed of (1) ________________, (2) ________________, and (3) ________________.
carbohydrates	4. Animal nutritional requirements are most conveniently spoken of as requirements for <u>maintenance</u>, <u>growth</u>, <u>fattening</u>, <u>production</u>, and <u>reproduction</u>. ________________ are the chief source of heat and energy for animals.
maintain	5. To sustain life with no loss or gain of weight requires sufficient feed to m________________ the animal

growth	6. In addition to a maintenance ration, an animal requires additional feed to put on weight and increase in muscle and bone. This is called a ________ requirement.
fattening	7. Increased fat deposition is obtained by satisfying a requirement for ________.
production	8. The nutrients to provide milk and wool are called the requirements for ________.
reproduction	9. The required feed nutrients needed for an animal to produce young are called requirements for ________.
maintenance growth production fattening reproduction	10. The nutrient requirements are classified by the functions of ________, ________, ________, ________, and ________.

no	11. A nutrient is any compound or group of compounds having similar chemical composition that aids in the support of life. Is beet pulp a nutrient?
nutrient	12. A compound or group of compounds having similar chemical composition that aids in the support of life is called a ______________.
carbohydrates proteins fats minerals vitamins	13. The different groups of nutrients are carbohydrates, proteins, fats, minerals, and vitamins. Copy these.
carbohydrates	14. Carbohydrates are the starches, cellulose, and sugars. ______________ make up 3/4 of all dry matter of plants.
carbohydrates	15. Feeds high in carbohydrates are the grains and their by-products such as corn, oats, barley, wheat middlings, and wheat bran, and the fiber portions of roughages. These grains and their by-products are high in ______________.

carbohydrates fats minerals vitamins proteins	16. The different groups of nutrients are ____________, ____________, ____________, ____________, and ____________.
protein	17. Proteins are compounds made up of amino acids. Proteins are particularly important nutrients needed for growth. Compounds made up of amino acids and important for growth are ____________. The kind and quality of protein is fully as important as the amount.
protein	18. The common protein supplements are soybean meal, cottonseed meal, linseed meal, tankage, meat and bone scraps, fishmeal and dried skimmilk. All common feeds contain some ____________ but not to the extent that those listed here do.
amino acids	19. Protein are very complex substances, made up of 24 or more different amino acids. In the digestion of food the proteins are split into these amino acids which are absorbed from the digestive system and enter the blood streams. ____________ ____________ are the component parts of protein.
fats	20. Fats in the forms of esters of fatty acids and glycerol are the high-energy compounds of feeds. They are also the carriers of many of the vitamins present in feeds. ____________ are the high-energy compounds of feeds.

blood stream	21. Minerals are the major elements of bones and teeth and a vital part of main tissues, organs, and the body's enzyme system, as well as the soft tissues and the fluids of the body. The amino acids are absorbed by the animal body through the ______________ ______________.
minerals	22. Calcium, phosphorus, sodium, chlorine, potassium, sulfur, magnesium, iron, iodine, copper, cobalt, zinc, manganese, molybdenum, florine, and arsenic are ______________ that are essential for, or affect in some way, livestock feeding.
proteins	23. ______________ are made up of amino acids and are furnished in adequate supplemental forms in soybean meal and fishmeal.
amino acids	24. Proteins are made up of ______________ ______________ and are particularly important to meet the growth requirements.
protein growth maintenance reproduction	25. Young animals require ______________ to meet ______________ requirements. Mature cattle need nutrients to maintain the same weight. This is a ______________ requirement. Bred cattle require an additional ______________ requirement.

growth maintenance production	26. A fattening ration must satisfy g______________, ______________, and ______________ requirements.
carbohydrates	27. C______________ includes starches, sugars, and cellulose.
fats	28. ______________ supply 2.25 times as much energy as carbohydrates. Fats aid in absorption from food of Vitamin A and may help in the absorption of calcium.
organic	29. Vitamins are trace organic nutrients. Essential vitamins to livestock feeding are: A, D, E, K, Thiamin or B_1, niacin or nicotinic acid, B_{12}, and C or ascorbic acid, choline pyridoxin, biotin, and folic acid. Vitamins are trace ______________ nutrients.
green forage crops	30. One of the most important facts in livestock production is that all green forage crops are rich in most of the vitamins required by farm animals. The only exception seems to be Vitamin D and Vitamin B_{12}. Vitamin D and Vitamin B_{12} are not supplied by _____ _____.

Vitamins	31. Water and oxygen provided inadequately, or inconveniently, may affect the performance of livestock. ____________ are trace organic nutrients and must be considered in the balancing of rations.
maintenance growth fattening production reproduction	32. The nutrient requirements are classified by functions as ____________, ____________, ____________, ____________, and ____________.
proteins minerals carbohydrates fats vitamins	33. The different groups of nutrients are ____________, ____________, ____________, ____________, and ____________.
oxygen water	34. ____________ and ____________ are essential for successful performance of livestock but are not expensive to provide in most cases.
maintenance	35. The body can be kept at a constant weight and temperature when carrying on only such activities as digestion, heartbeat, and breathing by providing a ____________ ration. The energy-producing nutrients (carbohydrates and fats) along with small amounts of protein, minerals, and vitamins fulfill this requirement.

proteins minerals vitamins water	36. Animals need proteins, minerals, vitamins, and water for growth, so feeds that are relatively high in these nutrients should be fed. A young growing animal suffers sooner and much more seriously from nutritive deficiencies than does a mature animal. Animals need ______________, ______________, ______________, and ______________ for growth. Proteins are most commonly limiting in a growth ration.
carbohydrates fats	37. Carbohydrates and fats are required for fattening. Little or no protein is necessary, but any extra protein in the ration that is not used otherwise can be used by the body for fattening. Proteins are generally more expensive, however, than carbohydrates and fats. ______________ and ______________ are more economical for fattening purposes than the protein feeds. The purpose of fattening is to cause "marbling" in the lean meat (deposition of fat in the lean meat) and a covering of fat over the carcass.
false	38. The nutrients that are needed for production vary according to the type of production. Milk is high in calcium, protein, and phosphorus, and feeds for milk cows should be high in these elements. All production requirements are the same. True or false?
	39. Eggs are rich in protein, fats, minerals, vitamins, and water. Feeds high in these nutrients need to be fed to laying hens.
calcium phosphorus	40. Milk production requires feeds high in the minerals ______________ and ______________.

nutrition	41. The fertility of breeding stock is dependent on adequate nutrition levels. Small and weak litters of swine and poor hatchability in poultry result from inadequate rations. Flushing of swine and sheep are two examples of the importance of adequate ______________ to fertility of breeding stock.
vitamins	42. Breeding herds or flocks should be provided a liberal supply of protein, minerals, and vitamins. Liberal supplies of proteins, minerals and ______________ are necessary to maintain high fertility.
24	43. A ration is the amount of feed allowed an animal during a 24-hour day. If a ration contains all the nutrients in proportion and amounts necessary for proper nourishment, the ration is said to be balanced. A ration is the amount of feed allowed an animal during a _______-hour period.
balanced	44. A good ration in addition to containing nutrients in the proper amounts should (1) be as economical as possible, (2) not be harmful to the animal, (3) should be palatable, and (4) be in the proper proportion. A ration that agrees with the above requirements is said to be a b______________ ration.
2 3 1	45. The following are some practical "rules of thumb" for feeding livestock. For beef cattle maintenance, feed approximately 2 lbs. of air dry roughage for every 100 lbs. of liveweight. If silage is used, then substitute 3 lbs. of silage for 1 lb. of air dry roughage. Protein and mineral supplements may have to be added to the hay or silage rations. A rule of thumb ration of roughage for beef cattle would be _______ lbs. per 100 lbs. of liveweight. If silage is used, substitute _______ lbs. of silage for each _______ lbs. of air dry roughage.

1 2	46. For beef cattle fattening, feed approximately 3/4 to 1 lb. of air dry roughage and 2 lbs. of concentrate per 100 lbs. liveweight to cattle on full feed. The ratio of roughage to concentrate is _______ to _______.
	47. For dairy cattle feed 2 lbs. of air dry roughage per 100 lbs. of liveweight and concentrate as follows: Jersey and Guernsey, feed 1 lb. concentrate for every 3 lbs. milk produced. Holstein, Brown Swiss, and Ayrshires, feed 1 lb. concentrate for every 4 lbs. of milk produced.
1 3	48. Jersey and Guernsey cattle require a ratio of concentrate to milk of _______ to _______.
1 4	49. Holstein, Brown Swiss, and Ayrshire cattle require a ratio of grain to milk of _______ to _______.
3	50. For sheep maintenance, feed 3 lbs. roughage per 100 lbs. liveweight and supplement with proteins and minerals if needed. Ratio of roughage to 100 lbs. liveweight is _______ lbs. per 100 lbs. liveweight.

1 1/2 2 100	51. For sheep fattening feed 1 1/2 lbs. roughage and 2 lbs. of concentrate per 100 lbs. liveweight. Ratio ________ to ________ to ________.
	52. For bred sows and gilts. If self feeding, provide enough ground roughage to furnish 12-15% fiber. Approximately 1/3 roughage, such as ground legume hay or corn cobs; 1/3 oats; and 1/3 corn supplemented (barley may be substituted for corn) with protein, minerals, and vitamins will be satisfactory. Control the gain in weight by changing the proportion of roughage to concentrate. More concentrate results in more gain and vice versa.
concentrate barley	53. To reduce gain, reduce ________________ and increase ________________ proportionately.
12 15	54. If self feeding sows and gilts, feed enough roughage to provide ________ to ________% of fiber.
roughage oats corn or barley	55. Bred sows and gilts should be fed 1/3 ________________, 1/3 ________________, and 1/3 ________________ with proper supplements.

56. The Pearson Square Method of balancing rations is used to simplify and systematize the procedure.

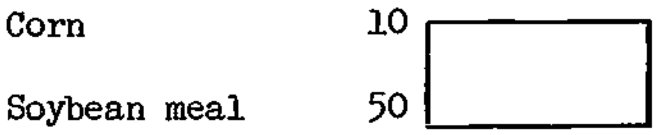
To find the proportion or percentages of two feeds which, when mixed together, will furnish the desired percent of protein (or any other nutrient), use the square as follows:

Calculate the amount of corn (10% crude protein) and soybean oil meal (50% crude protein) that will be needed to furnish 10 lbs. of a mixture containing 20% crude protein.

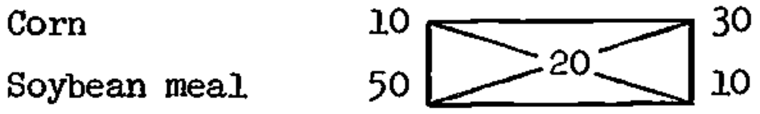
1. Draw a square with line connecting opposite corners.

2. In the center of the square, enter the crude protein percentage desired in the mixture.

3. At the left-hand corners of the square, write the materials mixed together and their crude-protein content.



4. Subtract along the diagonals, the smaller from the larger, and place the difference at the opposite end of the diagonals. Thus 20 minus 10 is 10, and 50 minus 20 is 30.



The 30 then becomes the parts of corn required in the ration and the 10, the parts of soybean meal.

Corn	10		30
		20	
Soybean meal	50		10
			40 total parts

5. To find the percentage of each feed in the desired mixture, divide the parts of <u>each</u> by the <u>total</u> parts.

Corn $30 \div 40 \times 100 = 75\%$

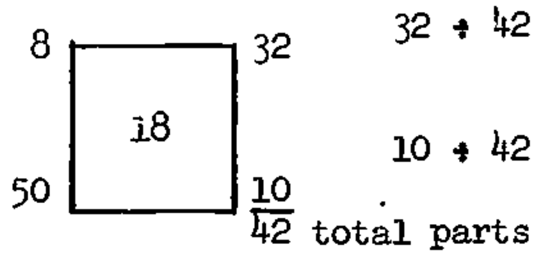
Soybean meal $10 \div 40 \times 100 = 25\%$

6. Since we want 10 lbs. of the mixture, mix (1 lb. x 75%) 7.5 lbs. of corn with (10 lbs. x 25%) 2.5 lbs. of soybean meal.

57. Calculate, using the Pearson Square, the amount of barley (8% crude protein) and soybean oil meal (50% crude protein) that will be needed to furnish 100 lbs. of a mixture containing 18% crude protein.

Barley

Soybean oil meal



32 ÷ 42 = 76 parts or 76% barley

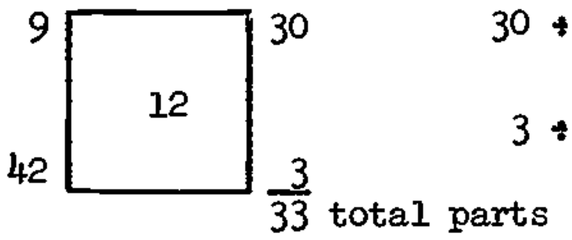
10 ÷ 42 = 24 parts or 24% soybean oil meal

The 100 lb. mixture should be made up of 76 lbs. of barley and 24 lbs. of soybean oil meal.

58. Calculate, using the Pearson Square, the amount of barley (9% protein) and cottonseed cake (42% crude protein) that will be needed to furnish 100 lbs. of a mixture containing 12% crude protein.

Barley

Cottonseed cake



30 ÷ 33 = 90.9 parts or 90.9% barley

3 ÷ 33 = 9.1 parts or 9.1% cottonseed cake

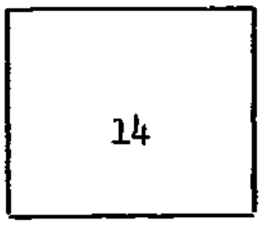
The 100 lb. mixture should be made up of 90.9 lbs. of barley and 9.1 lbs. of cottonseed cake.

59. Suppose you plan to use 20% wheat at 10.5% protein, 40% barley at 9% protein and 40% mill run at 13% protein. You will supplement this grain ration with a 38% protein supplement. You require a 14% mix. Solve using the Pearson Square for 100 lbs. of feed.

Wheat = .105 x 20 = 2.10 Barley = .09 x 40 = 3.60 Mill run = .13 x 40 = 5.20

2.1 + 3.6 + 5.2 = 10.9% protein in the mixture of wheat, barley, and mill run at the percentages given.

mix 10.9 24.0



supplement 38.0 3.1

27.1 total parts

24 ÷ 27.1 = 88.6 parts or 88.6% "mix"

3.1 ÷ 27.1 = 11.4 parts or 11.4% protein supplement

The 100 lb. mixture should be made up of 88.6 lbs. of mixed grain and 11.4 lbs. of cottonseed cake.

Sufficient nutrients in a 24-hour period in proportion to requirements of the animal.	60. The key to profitable livestock feeding is to feed a balanced ration. Define such a ration.

c. Sodium
d. Manganese
e. Silver

9. Fats supply __________ times as much heat energy as do carbohydrates.

a. 2.25
b. 2.50
c. 2.75
d. 2.00

10. __________ requirements vary according to what is created for "sale" by the animal (milk, wool, meat, eggs, etc.).

a. Maintenance
b. Production
c. Reproduction
d. Growth

11. A(n) __________ is the amount of feed nutrients in the proper proportion for a 24-hour period.

a. ration
b. balanced ration
c. adequate supply
d. increment

12. __________ are common protein supplement feeds. (Choose two.)

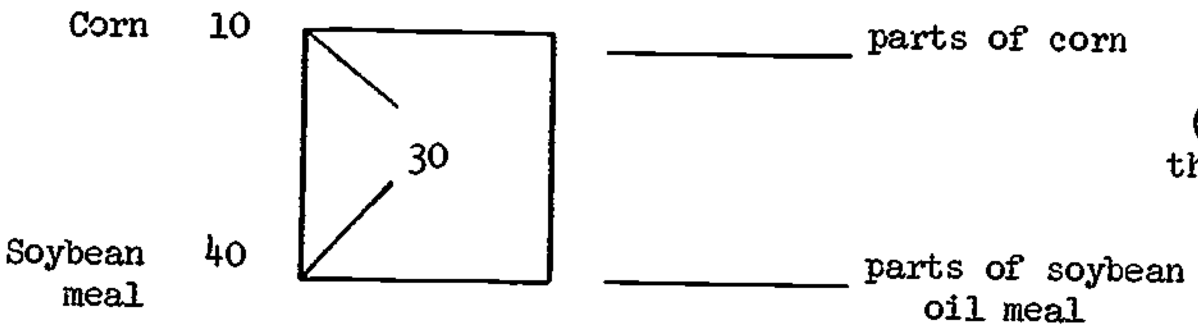
a. Barley
b. Oats
c. Cottonseed meal
d. Bone meal
e. Soybean oil meal
f. Corn

13. To reduce gain of bred sows or gilts, feed more __________ and less __________.

a. roughage
b. vitamins
c. protein
d. grain
e. minerals

Name ______________________________

14.



(Fill in the blanks)

a. 10 parts corn
b. 70 parts corn
c. 10 parts soybean oil meal
d. 20 parts soybean oil meal

(underline two)

FEED CHARACTERISTICS

PURPOSE

This programmed instruction unit titled "Feed Characteristics" is designed to provide an introduction to "Livestock Nutrition." This instrument includes the following knowledges:

1. Classification of feeds into:
    a. total digestible nutrients
    b. net energy
    c. concentrates
    d. protein supplements (animal and plant)
    e. roughages
    f. legumes and non-legumes forage quality.
2. Energy value as a measure of feeding value.
3. Maintenance and production-feed requirements.
4. The importance of forage testing as an economic tool for efficient feeding of livestock.
5. The method of matching forage-test information with grain requirements for dairy cattle.

Name______________________________

PRE-TEST

FEED CHARACTERISTICS

Underline the correct answer(s).

1. Livestock feeds are generally classified according to the amount of ____________ they provide.

   a. nutrients not fat
   b. total digestible nutrients
   c. net energy available
   d. availability
   e. color

2. Feeds that contain relatively large amounts of ______________ are called roughages.

   a. protein
   b. lignin
   c. fiber
   d. minerals
   e. ash

3. Feeds that contain relatively small amounts of ______________ are called concentrates.

   a. protein
   b. carbohydrates
   c. minerals
   d. fiber

4. ______________ are feeds that have a comparatively high digestibility.

   a. Concentrates
   b. Roughages
   c. Protein
   d. Total digestible nutrients

5. ______________ are feeds that have a comparatively low digestibility.

   a. Concentrates
   b. Carbohydrates
   c. Roughages
   d. Protein

6. Protein supplements contain ______________ or more per cent protein.

   a. 10
   b. 15
   c. 20
   d. 30
   e. 40

7. Tankage is classified as a

   a. concentrate
   b. protein supplement
   c. low fiber food
   d. feed additive

8. Protein supplements originate from ______________ or ______________.

   a. animal
   b. fibrous
   c. plant
   d. cereal

9. Fish meal is a

   a. plant derivitive protein supplement
   b. animal derivitive protein supplement
   c. little used protein supplement
   d. unpalatable feed

10. The ______________ derivitive proteins are the best quality proteins of the common protein supplements.

   a. plant
   b. mineral
   c. vegetable
   d. animal
   e. enzyme

11. The small grains are

   a. roughages
   b. concentrates
   c. low energy feeds
   d. protein supplements

12. Feeds ______________ depending upon such things as variety, soil fertility, where grown, methods of harvesting, stage of maturity, and length of time in storage.

   a. vary
   b. do not vary
   c. vary but do so in no particular order

13. The ______________ determines to some extent the quality of the feed.

   a. manufacturing process
   b. distribution methods
   c. price
   d. quantity

14. _______________ losses occur through chewing, digesting, assimilation of feed, and losses through undigested material in the feeds.

   a. Protein
   b. Energy
   c. Mineral
   d. Time
   e. Amino acid

15. It is _______________ to have the farmer obtain a chemical analysis of his home grown feeds.

   a. of little importance
   b. important
   c. of no economic value
   d. a and c

16. Net energy values of feed are commonly expressed as _______________.

   a. calories
   b. pounds
   c. therms
   d. ounces

17. The _______________ represents the amount of energy available for productive purposes, such as growth.

   a. total digestible energy
   b. energy value
   c. real income value
   d. net energy value

18. For purposes of balancing rations we must know _______________ and _______________.

   a. the nutrient content of the feed
   b. the nutrient requirements of the animal
   c. the type of feeding system used
   d. the preferences of the owner
   e. the cost of the feeds.

19. _______________ is only partially digestible (75-85%).

   a. Digestible protein
   b. A mineral
   c. A carbohydrate
   d. Crude protein

20. Net energy requirements are broken down into requirements for _______________ and _______________.

   a. growth
   b. maintenance
   c. production
   d. therms

21. Net energy values of feed for __________ are generally higher than net energy values of feed for maintenance.

a. reproduction
b. production
c. neither a nor b

22. Livestock require about __________ times as much energy as protein.

a. 3
b. 4
c. 5
d. 7
e. 12

23. NEp stands for

a. net energy potential
b. net energy for production
c. net energy power
d. net energy

24. The value of a feed __________ as digestibility decreases and crude fiber increases.

a. increases
b. decreases
c. stays the same

25. Ruminant stomached animals are fed __________ protein feeds because the higher quality animal derivitive proteins are unnecessary and, generally, more expensive.

26. The single most important step in forage testing is __________.

a. accurate size samples
b. a proportional sample
c. a large sample
d. none of the above

27. Home grown grain is __________ adequate when feeding 13 per cent protein hay.

a. probably
b. probably not
c. never

28. Roughages are divided into __________ and non __________. (Fill in

the blanks.) __________ are higher in protein than __________.

INFORMATION PANEL

This is a programed instruction unit for "Feed Characteristics." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.
2. Write your answer on the answer sheet.
3. Move the answer sheet down to expose the next frame and answer to the previous frame.
4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect answer.

Feed
Characteristics

If you have not read the information panel, do so now, then proceed to frame 1.

Feed Characteristics, Continued

Name ______________________

54. ______________

55. ______________

56. ______________

57. ___1. ___2. ___3. ___4.

___5. ___6. ___7.

58. ______________

59. ______________

60. See frames 48, 49.

--	1. Livestock feeds are generally classified according to the amount of total digestible nutrients they provide, or according to the amount of specific nutrients they furnish in the ration.
Roughages	2. Feeds that contain relatively large amounts of fiber or non-digestible material are called roughages. ____________ contain large amounts of fiber.
fiber	3. Concentrates are feeds that have a comparatively high digestibility, and are high energy goods. They are relatively low in ____________. They include all grains and many by-products of grains and animals, such as wheat middlings, tankage, and soybean oil meal.
grains	4. Concentrates include all ____________ such as wheat, corn, oats, and barley.
concentrate	5. Tankage is a protein supplement as is soybean oil meal because it has 20 per cent or more protein. Oats is a ____________.

concentrates	6. Protein concentrates may be classified as a subdivision of concentrates. They contain 20 or more per cent protein. ______________ have a comparatively high digestibility.
20	7. Protein concentrates contain ______________ or more per cent protein.
Animal	8. Protein concentrates are derived from either animal or vegetable substances. Proteins derived from animal or animal by-products are high quality protein feeds valuable for poultry and swine. They are more expensive than plant proteins. ______________ proteins are high quality proteins.
vegetable or plant animal	9. Vegetable or plant proteins are found in the by-products of plants. Soybean oil meal, linseed oil meal, cottonseed meal, and peanut oil meal are ______________ protein concentrates. Tankage, meat scraps and fish meal are ______________ protein concentrates.
animal	10. The ruminant-stomached livestock are fed vegetable proteins because ______________ proteins are more expensive and are not essential feed stuffs for ruminant animals. They synthesize their own protein "quality proteins" whereas swine and poultry cannot.

protein	11. Cottonseed oil meal, soybean oil meal, and linseed oil meal have in excess of 20 per cent protein and are classified as ______________ supplements.
grains or high energy feeds	12. The grains are the best source of energy for the common feed stuffs and they have the best fattening value. Corn and oats are examples of ______________.
non-legume	13. Roughages are divided into legume and non-legume. Legumes are plants that have the ability to use nitrogen which they take from the air. Legumes are higher in protein than are ______________ roughages.
Grains	14. Grains and roughages vary considerably in nutrient values depending upon variety, stage of maturity, soil fertility where grown, methods of harvesting, and length of time in storage. ______________ and roughages vary considerably in nutrient value.
--	15. The manufacturing process determines to some extent the values of feeds. Therefore, average composition of various feeds is often used when planning livestock rations. This is true regarding grains, but forage testing is done chemically and will be discussed later in this program.

important	16. It is (important, unimportant) for the farmer feeding home grown feeds to have a chemical analysis made of his feed because of the variability of these feeds.
--	17. The energy value of a feed is a very good criteria of its feeding value. Energy losses occur through undigested material in the feeds, energy losses in the urea, energy lost (in small amounts) in the combustible gases, and energy lost in the various processes of chewing, digesting, and assimilating food.
less than	18. The animal can be likened to an automobile. There is (less than, nearly perfect) efficiency in utilization of the "fuel."
energy	19. An additional energy loss is through the heat increment produced in the body following and because of the consumption of the food. These losses are higher in feeds that are high in fiber. Fiber content has an effect on ____________ losses.
net energy	20. The net energy value of a feed is the amount of energy left after deducting the losses previously mentioned. The ____________ ____________ value represents the real value of the feed for productive purposes such as growth, production of body fat, milk or wool or performance of work.

therm	21. The net energy values of feeds are commonly expressed as therms in this country. A therm (unit for measuring heat) is the amount of heat required to raise the temperature of 1,000 lbs. of water about 4° Fahrenheit. The unit for measuring heat is the ______________.
1,000	22. In human nutrition the calorie is used as the unit for measuring heat. One therm is 1,000 Calories or 1,000,000 small calories. A therm is the amount of heat required to raise the temperature of ______________ lbs. of water about 4° Fahrenheit.
--	23. Net energy values and total digestible nutrients (T.D.N.) values are available information for balancing rations. Net energy values are generally the most useful. T.D.N. values are most accurate for some particular purposes.
T.D.N. Net energy	24. Two of the categories of information, other than protein, available for ration balancing are ______________ and ______________ values.
--	25. For purposes of balancing rations, we must know (1) the nutrient requirement of the animal, and (2) the nutrient content of the feed. Crude protein and energy are the measurements that we use primarily for the nutrient content of the feed (T.D.N.).

--

26. Net energy is measured as NEm or net energy for maintenance, and NEp or net energy for production. For example:

	Crude Protein	TDN	NE	
			m	p
Alfalfa	15	50	34	24

The net energy value of alfalfa for maintenance is higher than the energy value for production. This is characteristically true as the maintenance ration must be satisfied before the production requirement is met.

---

net energy
maintenance
net energy
production
production
maintenance
energy
T.D.N.

27. NEm stands for ______________.

NEp stands for ______________.

Net energy is calculated in terms of ______________ requirements and ______________ requirements.

______________ is a more sensitive indicator of feeding values than is ______________.

--

28. Maintenance feed requirements furnish the nutrients to provide neither gain nor loss of weight, plus normal nutritional health.

The production requirement is the requirement for wool and milk or fat above the maintenance requirement.

---

seven

29. Livestock require about seven times as much energy as protein in their diets. There is a considerably greater difference between the net energy value of a high grade concentrate and that of a dry roughage than there is between the percentages of total digestible nutrients furnished by the same feed.

Livestock require ______________ times as much energy as protein.

--

30. Dent corn of Grade No. 1 supplies 81.9 therms of net energy per 100 lbs. while timothy hay, all analysis, furnishes but 37.3 therms, or only 46 per cent as much. However, timothy hay has about 60 per cent as much digestible nutrients as does corn. It has 49.1 per cent total digestible nutrients, in comparison with 81.9 per cent of No. 1 dent corn.

<table>
<tr><td>--</td><td>31.
<table>
<tr><th></th><th></th><th>Net Energy
Therms</th><th>TDN
%</th></tr>
<tr><td>Dent Corn</td><td>Grade No. 1</td><td>81.9</td><td>81.9</td></tr>
<tr><td>Timothy Hay</td><td>All Analyses</td><td>37.3</td><td>49.1</td></tr>
</table>
37.3 is 36% of 81.9
49.1 is 60% of 81.9</td></tr>
<tr><td>--</td><td>32. The net energy figures are more meaningful than the TDN (total digestible nutrients) figures in most cases when balancing feed rations.</td></tr>
<tr><td>Forages
grains</td><td>33. The nutrient requirements of dairy cattle are satisfied largely by forages and grains.

F__________ make up 60-80 per cent of the total nutrients and g__________ the other 20-40 per cent of the nutrients for dairy cattle.</td></tr>
<tr><td>low</td><td>34. The protein in the grain mixture should complement the protein supplied by the forage. The grain, of course, is the primary energy feed.

A high protein hay would require a __________ protein grain.</td></tr>
<tr><td>--</td><td>35. A poor quality hay may require a high protein grain costing as much as $15 more per ton. Washington forage tests have resulted in a range of 2.8-14.9% protein for grass hay and 10.6-24% for legume hay.</td></tr>
</table>

errors	36. These quality differences demonstrate differences in harvesting, climate, soils, and variety of seed. Using average values of forages when balancing the protein level in grain mixtures leads to large (advantages, errors).
--	37. Visual estimates of forage quality, as are used for Federal grading of hay, are often in error. Errors as much as 5 per cent in crude protein and 9 per cent TDN (total digestible nutrients) are made by trained individuals.
--	38. The case for forage testing is based upon the relation between the chemical composition of a forage and its feeding value for animals. As a plant matures, its digestibility decreases and its protein content declines. Chemically these changes are reflected by an increase in crude fiber (and lignin) and by a decrease in crude protein. This is the basis of forage testing. Hays that are weathered also show an increase in fiber and a decrease in protein since soluble nutrients are washed out by rain and leaves are lost during harvest.
declines increases fiber protein	39. As a plant matures its digestibility d______________. As a plant matures, crude fiber content i______________. Weathered hay shows an increase in f______________ and a decrease in p______________. Weathered hay loses Vitamin A in large amounts, but does not lose a like amount of energy unless the hay molds.
less	40. As digestibility of a feed declines and its crude fiber content increases, the value of this particular feed becomes ______________.

fiber protein	41. Forage testing tests for the amount of crude f__________, and, therefore, crude p__________.
15	42. Hay varies with the way in which it is grown, cured, and stored. Soils, climate, and variety of plant also affect quality of hay. There are often differences in quality within the same field due to weather changes during harvest. A representative sample is, therefore, important (15% approximately). To sample a 5 ton of hay one should take at least (5, 12, 15) core samples from different bales.
1	43. The purpose of forage testing is to __________. (Choose One.) (1) Establish an accurate feed value for roughage. (2) Establish an accurate feed value for the concentrate fed. (3) Determine how much an animal requires to produce at a certain level.
--	44. The single most important step in forage testing is sampling. Fifteen cores (drill samples) should be taken from one lot of forage. Samples from one bale vary as much as 1.8 per cent protein. Bales in a truckload vary as much as 6.5 per cent protein.
15	45. __________ core samples should be taken from each lot of forage. Samples should be taken each time a change in feed is noticed; for example, change from first cutting to second cutting.

46. We said that we try to balance protein content of our forage by the grain we purchase or mix. In general, we expect our hay to follow the following averages:

Remember a forage test is the only accurate method - the table below is here for use as an example only.

47.

	Average Crude Protein (moisture free)
Alfalfa	16%
Brome Grass	7%
Ladino Clover	18%
Red Clover	9%
Oat Forage	7%
Orchard Grass	8%
Timothy	5%
Corn Silage	5%
Pea Vines	13%

48 and 49. The following tables will tell you what per cent of protein grain to feed with your forage.

% Crude Protein in Forage	% Crude Protein Needed in Grain Mix
2.0 - 3.3	20
3.4 - 4.5	19
4.6 - 5.6	18
5.7 - 6.8	17
6.9 - 7.9	16
8.0 - 9.1	15
9.2 -10.2	14
10.3 -11.4	13
11.5 -12.5	12
12.6 -13.7	11
13.8 +	10

50. What per cent protein grain would you feed if your forage tested 8.3% on a dry matter basis? (See above table.)

And if the forage tested 13.2%

15%
11%

--	51. Many cases where high quality forage is fed require only 10-12% crude protein in the grain mix (as per table). When this occurs economical grain mix may be fed which does not include a protein supplement. Such mixtures as steamed rolled barley, barley-oats, or barley-mill run combinations which contain 1% steamed bone-meal* and 1% iodized or trace mineralized salt are good feeds. *or dicalcium phosphate
does not	52. A high quality forage (does, does not) require a grain mix containing a protein supplement.
--	53. How can we establish how much grain and hay to feed each cow? We need to know what her individual nutrient requirements are. This is determined by her production. Tables are available to conveniently arrive at the correct amounts. (E.M. 2040, Rev., October, 1965, Washington State Cooperation Extension Bulletin).
forage	54. The basis for an economical feeding system for dairy cows is ______________ testing.
are not	55. High quality alfalfa hay requires a mixture of home grown grains plus 1% steamed bonemeal and 1% salt, iodized or trace mineralized. Protein supplements (are, are not) necessary with this kind of forage.

$675.00	56. Through forage testing it was found that a dairy farmer needed 10% protein grain rather than the 13% protein grain he had been feeding. This resulted in a saving of $5 per ton of grain. Over a 10 month period, feeding 60 cows at an average of 15 lbs. per animal, the farmer saved ________________.
2,3,5,-A 1,4,6,7,-P	57. Label the plant derived protein supplements with a P, the animal derived protein supplements with an A. ________1. Soybean oil meal ________2. Tankage ________3. Meat scraps ________4. Cottonseed oil meal ________5. Fish meal ________6. Linseed oil meal ________7. Peanut oil meal
animal	58. (Plant proteins or Animal proteins) are higher quality proteins and are more expensive.
concentrate	59. Barley, wheat and middlings are (protein supplements, concentrates).
See frames 48-49	60. Suppose a forage test indicated a 16% crude protein hay. What per cent protein grain is necessary?

Name____________________________

POST-TEST

FEED CHARACTERISTICS

Underline the correct answer(s).

1. Livestock feeds are generally classified according to the amount of ____________ they provide.

   a. nutrients not fat
   b. total digestible nutrients
   c. net energy available
   d. availability
   e. color

2. Feeds that contain relatively large amounts of ____________ are called roughages.

   a. protein
   b. lignin
   c. fiber
   d. minerals
   e. ash

3. Feeds that contain relatively small amounts of ____________ are called concentrates.

   a. protein
   b. carbohydrates
   c. minerals
   d. fiber

4. ____________ are feeds that have a comparatively high digestibility.

   a. Concentrates
   b. Roughages
   c. Protein
   d. Total digestible nutrients

5. ____________ are feeds that have a comparatively low digestibility.

   a. Concentrates
   b. Carbohydrates
   c. Roughages
   d. Protein

6. Protein supplements contain ____________ or more per cent protein.

   a. 10
   b. 15
   c. 20
   d. 30
   e. 40

7. Tankage is classified as a

   a. concentrate
   b. protein supplement
   c. low fiber food
   d. feed additive

8. Protein supplements originate from ______________ or ______________.

   a. animal
   b. fibrous
   c. plant
   d. cereal

9. Fish meal is a

   a. plant derivitive protein supplement
   b. animal derivitive protein supplement
   c. little used protein supplement
   d. unpalatable feed

10. The ______________ derivitive proteins are the best quality proteins of the common protein supplements.

    a. plant
    b. mineral
    c. vegetable
    d. animal
    e. enzyme

11. The small grains are

    a. roughages
    b. concentrates
    c. low energy feeds
    d. protein supplements

12. Feeds ______________ depending upon such things as variety, soil fertility, where grown, methods of harvesting, stage of maturity, and length of time in storage.

    a. vary
    b. do not vary
    c. vary but do so in no particular order

13. The ______________ determines to some extent the quality of the feed.

    a. manufacturing process
    b. distribution methods
    c. price
    d. quantity

14. _______________ losses occur through chewing, digesting, assimilation of feed, and losses through undigested material in the feeds.

a. Protein
b. Energy
c. Mineral
d. Time
e. Amino acid

15. It is _______________ to have the farmer obtain a chemical analysis of his home grown feeds.

a. of little importance
b. important
c. of no economic value
d. a and c

16. Net energy values of feed are commonly expressed as _______________.

a. calories
b. pounds
c. therms
d. ounces

17. The _______________ represents the amount of energy available for productive purposes, such as growth.

a. total digestible energy
b. energy value
c. real income value
d. net energy value

18. For purposes of balancing rations we must know _______________ and _______________.

a. the nutrient content of the feed
b. the nutrient requirements of the animal
c. the type of feeding system used
d. the preferences of the owner
e. the cost of the feeds.

19. _______________ is only partially digestible (75-85%).

a. Digestible protein
b. A mineral
c. A carbohydrate
d. Crude protein

20. Net energy requirements are broken down into requirements for _______________ and _______________.

a. growth
b. maintenance
c. production
d. therms

21. Net energy values of feed for ______________ are generally higher than net energy values of feed for maintenance.

   a. reproduction
   b. production
   c. neither a nor b

22. Livestock require about ______________ times as much energy as protein.

   a. 3
   b. 4
   c. 5
   d. 7
   e. 12

23. NEp stands for

   a. net energy potential
   b. net energy for production
   c. net energy power
   d. net energy

24. The value of a feed ______________ as digestibility decreases and crude fiber increases.

   a. increases
   b. decreases
   c. stays the same

25. Ruminant stomached animals are fed ______________ protein feeds because the higher quality animal derivitive proteins are unnecessary and, generally, more expensive.

26. The single most important step in forage testing is ______________.

   a. accurate size samples
   b. a proportional sample
   c. a large sample
   d. none of the above

27. Home grown grain is ______________ adequate when feeding 13 per cent protein hay.

   a. probably
   b. probably not
   c. never

28. Roughages are divided into ______________ and non ______________. (Fill in the blanks.) ______________ are higher in protein than ______________.

VITAMINS

PURPOSE

This is the "Vitamins" programmed instruction booklet. It is the third program in the animal nutrition series of programs.

This program includes the knowledges listed below:

1. The importance of vitamins to animal nutrition.
2. What vitamins are.
3. Which vitamins are essential to animal nutrition.
4. How are the individual vitamins provided to livestock.
5. What anti-vitamins are.
6. Symptoms of vitamin deficiency.
7. Which vitamins are commonly deficient within particular classes of livestock.
8. The importance of vitamins to reproduction.

Name ______________________________

PRE-TEST

VITAMINS

Underline the correct answer(s).

1. The chemical make-up and functions of vitamins are ______________.

   a. Similar to each other
   b. similar but distinct
   c. different from each other

2. Vitamin ______________ is required by all animals and must be present in the feeds.

   a. A
   b. B
   c. C
   d. D
   e. B_{12}

3. Research in vitamins is ______________.

   a. extensive
   b. limited
   c. questionable
   d. economical

4. So called "cottonseed meal poisoning" is really a deficiency of vitamin ___________.

   a. A
   b. B_{12}
   c. C
   d. D
   e. F

5. Severe losses of vitamin ______________ occur through oxidation during hay making or long storage periods.

   a. A
   b. B_{12}
   c. D
   d. E
   e. B_2

6. Adequate vitamin D is necessary for the proper assimilation and use of the minerals ______________ and ______________.

   a. phosphorous
   b. Manganese
   c. Calcium
   d. magnesium
   e. iron
   f. zinc

7. Poultry need more vitamin ____________ in their rations than do other farm stock, especially for egg production.

a. A
b. B
c. C
d. D
e. E

8. Deficiency of vitamin ____________ causes rickets.

a. A
b. B
c. B_2
d. D
e. B_{12}

9. Swine need ____________ because they do not synthesize it in their digestive tracts as sheep, beef, and dairy cattle do.

a. Vitamin A
b. Vitamin B-complex
c. Vitamin C
d. Vitamin D

10. All green forages are ____________ sources of vitamins.

a. poor
b. moderate
c. rich
d. inadequate

11. A deficiency of vitamin ____________ accompanied by loosening of the teeth is evidence of scurvy.

a. A
b. B_2
c. C
d. D
e. b_{12}

12. An ____________ prevents the actions of vitamins or kills the vitamins.

a. exovitamin
b. antivitamin
c. killer vitamin
d. antidote

13. Vitamin ____________ is necessary for reproduction in poultry, rats, and perhaps some other animals.

a. A
b. E
d. C
d. D

Name ______________________________

14. Vitamin ______________ seems to cause "white muscle disease."

a. A
b. E
c. C
d. D

15. Slow healing wounds are symptomatic of a deficiency of vitamin ______________.

a. A
b. B_{12}
c. C
d. D

INFORMATION PANEL

This is a programed instruction unit for "Vitamins." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.

2. Write your answer on the answer sheet.

3. Move the answer sheet down to expose the next frame and answer to the previous frame.

4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect answer.

Vitamins

If you have not read the information panel, do so now, then proceed to frame 1.

vitamins	1. Much of our modern efficiency in feeding livestock, particularly swine and poultry, can be attributed to the rapid succession of discoveries concerning vitamins. Research concerning ______________ has increased the efficiency of animal production and has made possible the prevention of serious diseases.
--	2. Previous to 1911 vitamins were unknown. The vitamins that are known are not related chemically to each other, as are proteins, fats or the carbohydrates. The function of the vitamins are also entirely different from each other.
vitamins	3. The ______________ are grouped together because each vitamin is organic in nature and because in many cases it is a nutritive essential required only in an exceedingly small amount.
Vitamins	4. Some vitamins are needed by only a few species of animals. Others are required by all species, but there is no need for a supply in the feed. That is because an adequate supply is synthesized, either in the body tissues or by bacteria in the digestive tract. ______________ are grouped together because they are organic in nature.
Vitamin A Carotene	5. Vitamin A is required by all animals and can be made only from carotene contained in plants. Animals must, therefore, receive in their food an adequate supply of ______________ or ______________.

Carotene	6. The knowledge concerning the different amounts of each vitamin in various feeds is limited compared with our knowledge of the ordinary nutrients. Vitamin A is found in the form of _______________ in many plants. Animals cannot synthesize this vitamin.
A	7. All green <u>forage</u> crops are rich in most of the vitamins required by farm animals. Animals are not able to produce Vitamin _______________. It must be in their feed.
Forage	8. Green _______________ crops are a rich source of vitamins. These crops provide vitamins (and minerals) in proportion to the leafiness of the plant.
	9. The exception to the preceeding statement is lack of Vitamin D and Vitamin B_{12}. These two vitamins, D and B_{12}, are not plentiful in green forage crops.
	10. Swine and poultry on good pasture do not seem to need Vitamin B_{12} even though pasture is not a good provider of Vitamin B_{12}. Vitamin D is supplied by sunlight.

D D, B_{12}	11. Hay and other dry forage cured in the sun supply vitamin ______________. Pasture is not a good source of vitamins ______________ and ______________.
Forages vitamins and minerals	12. <u>Green forages</u> supply undiscovered vitamins as indicated by the fact that sows on dry lot fed a seemingly balanced diet are unable to reproduce--until supplied with green ______________. Legumes have more leaves than grasses and are richer in ______________ and ______________.
D	13. A study of vitamins is not complete without some mention of the antivitamins. Antivitamins are substances that prevent the action of the vitamin or even destroy it. The sun supplies vitamin ______________ to animals directly and indirectly through hay.
Antivitamin	14. Paralysis for foxes raised for fur is caused by an ______________ in certain raw fish that destroys the vitamin thismin. Bracken fern poisoning of cattle also seems to be caused by an antivitamin.
	15. Vitamin ______________ must be included in an animals' feed as carotene. This vitamin is essential for maintenance of mature animals and in greater amounts for growth, reproduction, and lactation.

carotene	16. The so-called "cottonseed-meal poisoning," produced when cattle are fed for lengthy periods on such a ration as cottonseed meal and cottonseed hulls, is due primarily to the lack of Vitamin A. Vitamin A is found in plants as ______________.
Vitamin A	17. Severe losses of vitamin A occur through oxidation during hay making or long storage periods. Hay stored a year or longer has little or no vitamin A feed value. "Cottonseed-meal poisoning" is caused primarily by a shortage of ______________. Rain on drying hay results in severe losses of vitamin A. Energy losses occur if molding occurs.
Antivitamins A	18. The cereal grains with the exception of corn are very low in vitamin A. ______________ are substances that prevent the action of vitamins or even destroy them. Severe losses of vitamin ______________ occur during the hay making process due to the drying action of the sun (oxidation.)
A	19. Adequate vitamin D is necessary for the proper assimilation and use of Calcium and Phosphorous and the development of good bones and teeth. Vitamin D is needed especially during growth. Much less Vitamin D is necessary for maintenance of mature animals. The cereal grains, with corn the one exception, are low in vitamin ______________.
Calcium Phosphorous	20. Poultry need more vitamin D in their rations than do other farm stock, especially for egg production. Vitamin D is necessary for the proper assimilation of the minerals ______________ and ______________.

Poultry D	21. ____________ need more vitamin D than do other livestock. The assimilation of calcium and phosphorous is tied to adequate amounts of vitamin ____________.
growth	22. Deficiency of vitamin D causes rickets. Less severe deficiencies retard growth and produce a weak skeleton. Vitamin D is needed especially during ____________.
rickets	23. A deficiency of vitamin D in mature fowls causes thin-shelled eggs, decreased egg production, and lowered hatchability. Deficiency of vitamin D causes r____________.
A	24. When dairy cows, beef cattle, or sheep receive ordinary rations that include satisfactory roughage, no attention need generally be given to the B-complex vitamins because of the synthesis of these vitamins in the rumen. The cereal grains are low in vitamin ____________ except for corn.
vitamin D	25. Swine need the B-complex vitamins in their feed because there is little synthesis of them in their digestive tracts. Their requirements are met by pasture during the growing season and good well-cured legume hay when not on pasture. Thin shelled eggs may be caused by a deficiency of ____________

Snythesize or produce	26. Sheep, beef, and dairy cattle ______________ the B-complex vitamins in the rumen.
swine	27. Forms of yeast such as brewers dried yeast are sometimes used as a B-complex vitamin supplement. ________________ do not synthesize B-complex vitamins in their digestive tracts and, for this reason, must receive adequate B-complex vitamins in their feed.
Riboflavin	28. Riboflavin or Vitamin B_2 is required in large amounts for poultry. Milk and dairy by-products such as dried skim milk, dried butter milk, and dried whey are especially rich in riboflavin. They are valuable poultry feeds. ________________ is vitamin B_2.
Yeasts Riboflavin Milk products	29. ________________ are sometimes used as B-complex vitamin supplements. Vitamin B_2, ________________, is supplied in good amounts by ________________ ________________.
rich	30. Niacin or nicotinic acid is a B-complex vitamin that is necessary for all animals. Ruminants synthesize their own supply. Humans, dogs, swine, and poultry require a supply in their food. Milk and dairy products are a ________________ source of riboflavin.

Ruminants humans dogs, swine, or poultry	31. Dried yeast, rice polish, rice bran, wheat bran peanut oil meal, and green forage and pasture crops are rich in the vitamin niacin. Good quality hay supplies a fair amount, while corn, grain, oats, rye, and dairy by-products have a rather low content. ______________ synthesize their own supply of niacin; ______________ do not.
rich Ruminants humans, dogs, swine, or poultry	32. Vitamin E is necessary for <u>Reproduction</u> in poultry, rats, and perhaps some other animals. "Stiff lamb disease," can be prevented or cured by vitamin E. A deficiency of vitamin E seems to be the cause of "white muscle disease" also. Green forage is ______________ in niacin. ______________ synthesize their own supply of niacin, ______________ do not.
reproduction	33. A lack of vitamin in poultry feeds causes the disease encephalomalacia, or "crazy chick disease." A prolonged lack causes lowered hatchability of eggs and sterility of males. Vitamin E is necessary for r ______ ________ in poultry.
E	34. Deficiency of vitamin ______________ seems to cause "white muscle disease." "Stiff lamb disease" can be cured by this vitamin. Crazy chick disease is caused by a deficiency of this vitamin.
Vitamin C	35. Only human beings, monkeys, and guinea pigs lack the ability to synthesize ascorbic acid (vitamin C). Sailors in our early history suffered from a deficiency of ______________ ______________.

vitamin C	36. A deficiency of vitamin C (ascorbic acid) in man, monkeys, or guinea pigs causes scurvy. The symptoms are loosening of the teeth, inflammation of the gums, hemorrhages, brittleness of the bones, slow healing of wounds, and loss of vigor. Slow healing of wounds is a symptom of a deficiency of ________________.
scurvy	37. A deficiency of vitamin C evidenced by loosening of the teeth is a sign of _______________.

Name ____________________

POST-TEST

VITAMINS

Underline the correct answer(s).

1. The chemical make-up and functions of vitamins are ____________.

   a. Similar to each other
   b. similar but distinct
   c. different from each other

2. Vitamin ____________ is required by all animals and must be present in the feeds.

   a. A
   b. B
   c. C
   d. D
   e. B_{12}

3. Research in vitamins is ____________.

   a. extensive
   b. limited
   c. questionable
   d. economical

4. So called "cottonseed meal poisoning" is really a deficiency of vitamin _________.

   a. A
   b. B_{12}
   c. C
   d. D
   e. F

5. Severe losses of vitamin ____________ occur through oxidation during hay making or long storage periods.

   a. A
   b. B_{12}
   c. D
   d. E
   e. B_2

6. Adequate vitamin D is necessary for the proper assimilation and use of the minerals ____________ and ____________.

   a. phosphorous
   b. Manganese
   c. Calcium
   d. magnesium
   e. iron
   f. zinc

Name ______________________________

7. Poultry need more vitamin _______________ in their rations than do other farm stock, especially for egg production.

   a. A
   b. B
   c. C
   d. D
   e. E

8. Deficiency of vitamin _______________ causes rickets.

   a. A
   b. B
   c. B_2
   d. D
   e. B_{12}

9. Swine need _______________ because they do not synthesize it in their digestive tracts as sheep, beef, and dairy cattle do.

   a. Vitamin A
   b. Vitamin B-complex
   c. Vitamin C
   d. Vitamin D

10. All green forages are _______________ sources of vitamins.

   a. poor
   b. moderate
   c. rich
   d. inadequate

11. A deficiency of vitamin _______________ accompanied by loosening of the teeth is evidence of scurvy.

   a. A
   b. B_2
   c. C
   d. D
   e. b_{12}

12. An _______________ prevents the actions of vitamins or kills the vitamins.

   a. exovitamin
   b. antivitamin
   c. killer vitamin
   d. antidote

13. Vitamin _______________ is necessary for reproduction in poultry, rats, and perhaps some other animals.

   a. A
   b. E
   d. C
   d. D

Name ______________________________

14. Vitamin _______________ seems to cause "white muscle disease."

a. A
b. E
c. C
d. D

15. Slow healing wounds are symptomatic of a deficiency of vitamin _______________.

a. A
b. B_{12}
c. C
d. D

MINERALS

PURPOSE

This is a programmed instruction unit titled "Minerals." This program is the fourth of the animal nutrition series.

This program is designed for high school students who have successfully completed the first three units in the animal nutrition series.

"Minerals" includes the knowledges listed below:

1. Importance of minerals for animal growth and reproduction.
2. Which minerals are required.
3. Which body functions minerals perform in the body.
4. Adequate mineral nutrition-what it depends upon.
5. Symptoms of mineral deficiencies.
6. Classification of minerals as major or minor elements.
7. Knowledge of information tables available to balance a ration for minerals based upon the minerals supplied by particular feeds.
8. Salt deficiency symptoms.
9. Symptoms of deficiency for the major and minor elements.
10. Specific mineral information for common feeds for different classes of livestock.

Name ______________________________

PRE-TEST

MINERALS

Underline correct answer(s).

1. A ration containing an abundance of protein, carbohydrates, and fat, without minerals will generally result in the death of an animal ______________ than if no food at all is given.

   a. at the same time
   b. sooner
   c. later

2. ______________ minerals are known to be required by animals.

   a. 7
   b. 9
   c. 11
   d. 13
   e. 15

3. Extra minerals fed as "insurance" ______________ as economical supplement to feed.

   a. are
   b. are not

4. Mineral deficiencies are important only if deficiency symptoms can be observed.

   a. True
   b. False

5. Block salt ______________ be depended upon as a lone supply of salt for average to high producing dairy cattle.

   a. should
   b. should not

6. Animals with a craving for salt based upon a lengthy deficiency may eat enough to ______________.

   a. require none for a period of time
   b. catch up on their requirements
   c. injure themselves

7. Alfalfa is classed as ______________ in phosphorus.

   a. poor
   b. moderate
   c. rich

Name ____________________

8. Plenty of ____________ will help prevent rickets.

   a. sunlight
   b. alfalfa hay
   c. protein
   d. milk

9. The important function of ____________ in sheep nutrition is to promote synthesis of Vitamin B_{12} in the rumen.

   a. manganese
   b. iron
   c. cobalt
   d. zinc

10. ____________ cannot get enough block salt to satisfy their requirements.

    a. Swine
    b. Cattle
    c. Sheep

11. "Shot gun" mixtures of minerals ____________ an economical feed supplement for livestock.

    a. are
    b. are not

12. Thumps are an indication of ____________.

    a. too much milk
    b. anemia
    c. too much iron

13. The Pacific Northwest is a(n) ____________ deficient area.

    a. iron
    b. iodine
    c. calcium
    d. phosphorus

14. ____________ is a good source of calcium.

    a. Ground limestone
    b. Bonemeal
    c. Meat scraps
    d. Tankage
    e. Sodium chloride
    f. Dicalcium Phosphate

15. Plenty of ____________ will help prevent rickets and cure it in its early stages.

    a. iron
    b. salt
    c. bleached hay
    d. sunshine

Name ______________________

16. Mineral deficiencies ______________ economic losses even though deficiency symptoms are not visibly apparent.

  a. can cause
  b. cannot cause

17. Anemia in animals results from a deficiency of ______________.

  a. salt
  b. iron
  c. cobalt

18. ______________ is necessary for the formation of thyroxine, a hormone of the thyroid gland.

  a. Iron
  b. Salt
  c. Cobalt
  d. Manganese
  e. Iodine

19. Slipped tendons in growing chickens result from ______________ deficiency.

  a. mangesium
  b. iron
  c. manganese
  d. cobalt

20. Match the following materials with the minerals they provide.

  a. Oystershell ________calcium
  b. Iron sulfate ________salt
  c. Sodium chloride ________iron

21. ______________ ______________ or ______________ ______________ are good sources of calcium and phosphorus.

  a. Oystershell
  b. Dicalcium phosphate
  c. Steamed bone meal
  d. Iron sulfate
  e. Vitamin A

22. The function(s) or phosphorus in the animal is (are) ______________. Choose correct answer(s).

  a. bone formation
  b. regulating body processes
  c. necessary for usage of carbohydrate by animal
  d. necessary for usage of fat by animal
  e. necessary for usage of protein by animal

Name ______________________________

23. ________________ animals have the greatest need for minerals such as calcium and phosphorus.

a. Young
b. Mature
c. Aged

24. Label the following with

A. Major element
B. Minor element
C. Not essential for livestock

________1. Calcium
________2. Gold
________3. Selenium
________4. Cobalt
________5. Platinum
________6. Uranium
________7. Phosphorus
________8. Magnesium
________9. Copper
________10. Potassium

________11. Manganese
________12. Iodine
________13. Chlorine
________14. Sulfur
________15. Zinc
________16. Sodium
________17. Iron
________18. Lead
________19. Tin
________20. Aluminum

25. Studies at WSU indicate adequate amounts of most minerals with the exception of ________________, in the State of Washington.

a. Zinc
b. Copper
c. Selenium
d. Sulfur
e. Calcium

INFORMATION PANEL

This is a programed instruction unit for "Minerals." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.

2. Write your answer on the answer sheet.

3. Move the answer sheet down to expose the next frame and answer to the previous frame.

4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect answer.

If you have not read the information panel, do so now, then proceed to frame 1.

Minerals	1. A ration containing an abundance of protein, carbohydrates, and fat without minerals will generally result in the death of an animal sooner than if no food at all is given. __________ are necessary for many body processes including growth and reproduction.
15	2. Fifteen separate and distinct mineral elements are known to be required by animals. Some of the important functions they perform in the body are: (1) they contribute to the body structure, particularly the bones and teeth, (2) they aid in muscular activities, in the reproduction processes, and in lactation and egg production, and (3) they promote digestion of food, repair the body tissues in maintenance, formation of new tissue in growth, and liberation of energy for muscular work and activity and the production of heat. __________ minerals are known to be required by animals.
minerals	3. Adequate mineral nutrition is dependent on: (1) a sufficient intake of each required element, (2) presence of the elements in forms biologically available to animals, (3) a suitable balance between each of the elements, and (4) adequate supply and balance of other nutrient factors. Sufficient energy and vitamins in balance with other nutrients are necessary to insure adequate absorption of available __________.
3 2 and 3 1 and 4	4. We must know the type of ration and the form in which the mineral is fed based upon item _____ listed in frame 3 above. Fertilizer elements added to a deficient soil might result in a deficiency of a mineral element previously adequate in the feed ration and probably adequately supplied now. This condition could be explained by ________ and ________, listed in frame 3. Irrigation may wash away soluble minerals such as calcium. Calcium might become deficient because of _______ and/or _______ listed in frame 3.
	5. When supplementing rations, only those minerals that are deficient need be added. As necessary as minerals are, an oversupply can reduce performance or in some cases even be toxic. As an example, cobalt is most essential yet when as little as 12 ppm (.1 gram/day) is fed, digestion of roughage is reduced. Consequently, cattle feeders cannot operate on the theory that if a small amount of mineral is good three times this level would be better. Indiscriminate use of minerals may be expensive in cost and in reducing performance.

False	6. Mineral deficiencies may be so slight as to be hardly noticeable or acute enough to cause death. Correct feeding practices must include feeding of the minerals that the animal needs. Nothing is gained in adding a mineral to a ration in which enough of that mineral is already included. Extra minerals fed as "insurance" are an economical supplement to feed. True or False.
False	7. Mineral deficiencies that are not severe enough to result in visible symptoms may represent an economic loss because of reduced growth and inefficient feed utilization. Therefore, mineral deficiencies may result in an economic loss before they are serious enough to cause visible symptoms. Mineral deficiencies are important only if deficiency symptoms can be observed. True or False
Calcium Phosphorus Potassium Sodium Sulfur Chlorine Magnesium False	8. The essential elements are usually classified as either major or minor. The essential major elements are calcium, phosphorus, potassium, sodium, sulfur, chlorine, and magnesium. The essential major elements are: C______, P_________, P_______, S_______, S_______, C_______, and M_______. Mineral supplements should be added to rations according to the theory "if a little is good, a lot is better." True or False.
Iron Zinc Copper Iodine Manganese Cobalt Selenium Molybdenum Fluorine	9. The minor or trace elements usually considered as essential are iron, zinc, copper, iodine, manganese, cobalt, selenum, molybdenum, and fluorine. Write these names on your answer sheet. You should become familiar with them. In addition to these elements known to be required, an animal's body may contain 20 to 30 additional different elements in trace amounts. Some of them may one day prove to be essential.
Cannot	10. Studies at WSU indicate that animals studied at 20 locations throughout Washington state were being fed rations containing an adequate amount of most minerals with the exception of copper on the West side and in the Basin. Certain by-product feeds are exceptionally low in one or more minerals, and a deficiency proportional to the amount of the by-product fed might occur. Also, when rapid gains are expected the stress is likely to increase the requirements over that normally needed for many of the minerals. General recommendations of mineral supplements for all rations (can) or (cannot) be made with assurance, for a state-wide area.

Feed lot operations. No May cause imbalance and thereby cause a deficiency.	11. Mineral deficiency will be more likely with a (Feed lot operation) or (cow and calf operation.) Extra minerals fed liberally as "insurance" are an economical supplement to a ration. True or False. Why or why not?

12. In order to supply the correct amount of minerals, it is necessary first to know the mineral composition of the feeds. Knowing this, one can add the correct minerals and amounts as needed. Some of the commonly used cattle feeds of Washington have the following approximate mineral compositions:

	Calcium	Phosphorus	Salt		Copper	Iodine	Cobalt
	%	%	(Sodium) %	(Chlorine) %	Mg/lb		
Alfalfa	1.50	0.25	.13	.37	2-4	b	b
Barley	0.06	0.35	.06	.15	1-2a	b	b
Beet Pulp	0.62	0.09	.18	.17	5	b	b
Corn silage (dry matter basis)	0.33	0.23	.01	.05	0.6	b	b

a. Estimated
b. Not present, in amounts too small to be detected or contents not known.

If you were feeding a ration composed as follows:

Alfalfa	20%
Beet pulp	30%
Barley	50%

It would contain approximately 0.52 per cent calcium, 0.25 per cent phosphorus, 0.3 per cent salt and 1.4 mg copper per pound. Such a ration is inadequate in iodine, copper, and salt. It will be readily observed that adequate calcium is present. There is enough phosphorus--if it is all available. In this case phosphorus supplementation would be good insurance.

13. A general statement about possible mineral deficiencies* in the State of Washington is that salt and iodine (iodized salt) should be added to rations. There is also a possibility of copper deficiencies. Other minerals should be fed as needed in a form that is most available to cattle.

*beef cattle.

Sodium and chlorine or salt	14. Sodium and chlorine combined as sodium chloride is common <u>salt</u>. The symptoms of a salt deficiency are, an intense craving for salt, rapid weight loss, lusterless eyes, and in the case of dairy cattle, diminished milk production. A rapid weight loss is symptomatic of a ________________ deficiency in cattle.
Salt	15. Calves and sheep require 1/4 to 1/2 ounce of salt per day, while high producing cows may require as much as 3 ounces. Salt may be included in the swine ration (1/2 to 1 per cent) but generally it is advisable to supply animals free choice also. Block salt should not be depended upon as the lone supply of salt for average to high producing dairy cattle. Lusterless eyes, rapid loss of weight and diminished milk production are symptoms of ______________ deficiency.
Kill or make sick	16. Animals that have not had salt for some time should not be given free access to it because they may eat enough to cause digestive disturbances or even death. They should be given small quantities daily until the craving has largely disappeared. Animals with a craving for salt based upon a lengthy deficiency may eat enough to ______________ if given free access to large amounts of it.
regulating body process	17. Phosphorus also is found primarily in the bones and teeth. About 80 per cent of it is used for structural pruposes. Like calcium, it is important in bone formation, but this is not its most important function since it is vitally concerned in regulating various body processes. Protein, fat, and carbohydrates cannot be used by the animal in the absence of phosphorus. This compound serves at least 14 different function in the body. Phosphorus is primarily important for (bone formation) (Regulating body processes).
	18. Potassium has received renewed interest in the last few years. Deficiency symptoms may range from barely noticeable to acute. Slightly reduced feed intake or performance may go unnoticed. A minor stiffness, especially in the front joints that could be mistaken for disease, weather, or effects of age, may actually be due to insufficient potassium intake. One possible reason for a higher incidence of these problems is that rations have been changed to include more feedstuffs with lower potassium content. Most cereal and animal products are, at best, only martinal in potassium content and these ingredients comprise the major part of today's rations for rapidly growing and fattening cattle.

is not	19. One example of comparative availability of minerals is that of calcium. It has been shown that the calcium contained in milk is much more readily available for absorption than is the calcium in other foods. But, even if the calcium available for absorption is high, unless there is a proper ratio of calcium and phosphorus and Vitamin D, the absorption cannot be fulfilled and the calcium will pass through the body and be excreted. Adequate supply of a mineral (is) or (is not) a guarantee of adequate absorption by the animal.
phosphorus	20. Symptoms of a phosphorus deficiency are stiffness and soreness of the joints, listlessness and lack of appetite, and even a depraved appetite causing the animal to eat dirt or chew bones or wood. Thus rate of growth and production are affected. Lack of ______________ can affect rate of growth and production.
moderate poor	21. Feeds are classed as phosphorus poor, moderate, or rich. Most legume hays are moderate in phosphorus while the grass hays are poor. If the dry matter of the feed contains less than .2 per cent, it is classed as phosphorus poor; between .2 per cent and .5 per cent, as moderate amount; and more than .5 per cent, as phosphorus rich. Alfalfa is ______________ in phosphorus. Grass hay is ______________ in phosphorus.
moderate poor	22. The cereal grains are moderate in phosphorus while beet pulp, silage, and early green pastures are poor. The cereal grains are ______________ in phosphorus while beet pulp, silage, and early green pastures are ______________.
rich	23. Wheat bran, cotton seed meal, skimmilk and linseed meal are rich in phosphorus. Wheat bran, cotton seed meal, skimmilk and linseed meal are ______________ in phosphorus.

TABLE 1

PHOSPHORUS

Poor	Moderate	Rich
Dry -.2%	Dry .2 - .5%	Dry .5%+
Grass Hay	Legume Hay	Wheat Bran
Beet Pulp	Cereal Grains	Cottonseed meal
Silage		Skimmilk
Early Green Pasture		Linseed oil meal

TABLE 2

CALCIUM

Poor	Moderate	Rich
Cereal Grains	Bluegrass Pasture	Alfalfa Hay
Legume Feeds	Linseed Oil Meal	Red Clover Hay
Grass Hay*	Cottonseed Oil Meal	Ladino Clover Hay
	Soybean Oil Meal	Tankage
	Dried Beet Pulp	Meat Scraps
	Corn Silage	Fish Meal
	Fodder	Milk Products

*Grown on acid soils

	24. Rations poor in phosphorus should be supplemented with steamed bonemeal, dicalcium phosphate, or defluorinated rock phosphate. Dicalcium phosphate is generally preferred but any one of the three materials will supply phosphorus in a satisfactory form, especially if it doesn't contain fluorine. It becomes a matter of convenience to make available steamed bonemeal and salt in two containers. One container to contain salt, the other to contain 2/3 salt and 1/3 dicalcium phosphate or steamed bonemeal. ________________ is the supplement generally preferred as a source of phosphorus.
calcium	25. Calcium deficiencies result in weakening of the bones, lameness and even fractures. Less serious symptoms include slow growth, poor condition or unsatisfactory milk production. Bones are composed largely of phosphorus and ______________.
gypsum (calcium sulphate), lime	26. An excess of calcium will often decrease absorption of zinc and manganese. What plant fertilizer additive adds calcium to the soil? Calcium is the major mineral in the body. About 99 per cent of this mineral is found in the bones and teeth while the remaining 1 per cent is in the soft tissue. Since calcium is used largely for structural purposes it is needed in greater amounts for younger animals than for feed lot cattle. Calcium has other functions in the body such as blood clotting.
rich poor moderate	27. Calcium Poor feeds include cereal grains, and their by products, legume seeds and all grass hay grown on acid soils. Calcium in moderate amounts is supplied by bluegrass pasture, linseed meal, cottonseed meal, soybean meal, all grass hay grown on non-acid soils, dried beet pulp, and corn silage and fodder. Calcium rich feeds include alfalfa hay, red clover hay, ladino clover hay, tankage, meat scraps, fish meal, and milk products. Alfalfa hay and tankage are calcium ________ feeds. The cereal grains are ________ in calcium and ________ in phosphorus.
limestone, ground oyster shell, steamed bonemeal, dicalcium phosphate	28. Calcium supplements include good grade limestone, dicalcium phosphate, ground oystershell, or steamed bonemeal. Vitamin D, furnished by direct sun rays enables an animal to make better use of the calcium avaialable to it. ________________ is a good calcium supplement.

Practice Review Use Tables 1 and 2

A. Grass hay grown on acid soil is ______________ in calcium and ______________ in phosphorus.

B. Cottonseed meal is ______________ in phosphorus and ______________ in calcium.

C. Ladino hay is a calcium ______________ feed and a ______________ source of phosphorus.

calcium phosphorus	29. Fattening hogs require no additional calcium or phosphorus if fed enough tankage, fishmeal, or milk by products to balance the protein needs of the ration. Soybean meal used as a protein supplement requires additional finely ground limestone or bonemeal fed free choice. Fattening hogs require no additional C______________ or P______________ if fed enough tankage, fishmeal, or milk by products to balance the protein needs of the ration.
milk	30. (Beef Cattle) More calcium and phosphorus is needed by young calves than by older cattle. Nursing calves or calves getting skimmilk need no extra calcium. Should the soil of their pasture be deficient in phosphorus, dicalcium phosphate should be made available. Phosphorus is more of a problem than calcium and dicalcium phosphate has a good balance of calcium and phosphorus. ______________ is an adequate source of calcium for young calves.
anemia	31. Anemia in animals results from a deficiency of iron. It is recognizable by paleness of the skin and especially membranes of the mouth. Thumps in suckling pigs is also an indication of anemia. The problem usually is limited to pigs kept on concrete or wooden floors with no access to soil and calves, lambs or colts kept too long on milk as their only feed. Milk is deficient in iron. A deficiency of iron results in ______________.
iodine	32. Iodine is necessary for the formation of thyroxine which is a hormone of the thyroid gland. When a deficiency of iodine exists, the gland enlarges in an effort to provide more thyroxine. ______________ is necessary for the formation of thyroxine.
iodized salt iodine	33. Iodized salt with stabilized iodine added is a good way to provide iodine. Iodine deficiency in sheep results in the birth of weak, dead or woolless young. Stabilized ______________ is a good way to provide ______________.

stabilized	34. Iodine deficient areas occur locally throughout the Northwest, the Great Lake Region, Indiana, Ohio, Pennsylvania, Illinois, the Dakotas', Nebraska, Utah, Nevada, Colorado, Idaho and Montana. _______________ iodine is necessary to prevent weathering of iodized salt blocks.
copper	35. Copper deficiency may exist as a primary deficiency or in combination with cobalt and possibly iron deficiencies. Copper deficiency seems to be associated with anemia. Anemia is recognizable by paleness of the skin and expecially the membranes of the mouth. _______________ deficiency may exist as a primary deficiency or in combination with cobalt and possible iron deficiencies.
copper	36. Animals suffering from inadequate copper intake appear to be unable to absorb iron at a normal rate, and a defect in hemoglobin synthesis exists. Symptoms of copper deficiency in young lambs are muscular incoordination with partial paralysis of the hindquarters. A defect in hemoglobin symthesis may result from a _______________ deficiency preventing absorption of adequate iron.
Vitamin B_{12}	37. The important function of cobalt in sheep nutrition is to promote synthesis of Vitamin B_{12} in the rumen. Cobalt deficiency causes a loss of appetite, lack of thrift, weakness, anemia and a decrease in fertility and in milk and wool production. Cobalt functions in the rumen to promote synthesis of _______________.
sulfur	38. Sulfur is essential in livestock diets. It functions in the synthesis of sulfur containing amino acids in the rumen and certain other sulfur compounds of the body. Mature grass and grass hays are sometimes low in sulfur and may not furnish adequate amounts for optimum animal performance. _______________ functions in the synthesis of some amino acids in the rumen.

manganese	39. The symptoms of manganese deficiency are poor hatchability of the eggs in the laying flock and slipped tendons in growing chickens. Rations containing wheat or wheat products or a small amount of manganese sulfate will generally prevent the trouble. A deficiency in M_____________ does affect hatchability of eggs and causes slipped tendons in growing chickens.
salt	40. Tankage, milk by products or fishmeal fed to boars in large enough amounts to balance their protein needs satisfies the mineral needs except for salt. _____________ is the only mineral not adequately supplied to boars when protein requirements are satisfied with tankage, milk by products or fishmeal.
sunshine	41. Calves in confinement sometimes get rickets. Feeding a well-balanced ration made up of grain and sun-cured legume hay, and access to sunlight will prevent rickets and cure it in its early stages. Plenty of _____________ will help prevent rickets.
Dicalcium phosphate	42. Cows nursing calves on early spring pasture may need calcium added to their ration. Dicalcium phosphate is a good form to use. Good legume hay fed at the rate of 6 or 7 pounds daily with other roughage should provide enough calcium but phosphorus may be lacking. _____________ _____________ is a good source of phosphorus.
ground limestone or dicalcium phosphate	43. Bulls fed mixed hay and grain during winter need no mineral supplement other than salt. If no legume hay is fed, calcium should be supplied by ground limestone, free choice or dicalcium phosphate. Bulls on pasture and grain, or bulls on grass hay should be supplied with _____________ _____________.

will not	44. Neither calcium or phosphorus are necessary supplements when stocker and feeder cattle are fed a balanced ration of grain and good legume hay. Feeder and stocker cattle on a balanced ration for nutrients other than minerals not including legume hay (will, will not) be adequately supplied with calcium and phosphorus.
pasture legume hay	45. Supplementary minerals are not necessary for young dairy cattle on pasture or legume hay except for salt. It is good practice to keep dicalcium phosphate available to them, however. High producing cows in the early stages of lactation may need additional calcium and phosphorus. Supplementary minerals are not necessary for young dairy cattle on ______________ or ______________ except for salt.
ground limestone steamed bonemeal or dicalcium phosphate phosphorus phosphorus	46. Producing dairy cattle not receiving legume hay should be furnished ground limestone or steamed bonemeal. These may be mixed with the grain at the rate of 1 to 2 pounds for each 100 pounds of grain mixture, or for cows on pasture a mixture consisting of equal parts bonemeal or dicalcium phosphate, limestone, and salt may be supplied in feeders to which the cattle have free access. Dairy cattle not on legume hay should receive ____________. or _________. Dairy cattle fed grass hays are generally deficient in _________. This can be remedied usually by feeding supplements high in ___________.
loose	47. Salt should be available at all times. Swine cannot eat enough block salt to get all that they need, so loose salt should be fed in the ration or free choice. Brood sows and pigs not running on pasture should be self-fed sun-cured legume hay to provide calcium and Vitamins A and D. This is especially true during the winter when pastures are not available. Salt should be provided for swine in the _________ form.
Legume, Iron, Copp Copper NOTE: Iron injection or solution painted on the udder or iron sulfate (iron + copper) or ferrous sulfate fed to the litter.	48. L__________hay is needed to provide calcium and Vitamins A and D for brood sows and pigs not on pastures. It is impossible to give a lactating sow the feeds that will enable her to furnish enough iron and copper in her milk to prevent anemia in her pigs. For this reason young pigs kept on concrete or wooden floors should have ___________ and ___________ provided.

manganese	49. Poor hatchability of the eggs in a laying flock and slipped tendons in growing chickens result from manganese deficiency. Wheat and wheat products or 4 or 5 ounces per ton of manganese sulfate will generally prevent the trouble. Slipped tendons in growing chickens result from____________ deficiency. Manganese deficiencies are common only in the poultry industry.
no	50. Now that you are aware of mineral deficiencies to be concerned about, answer this question again. Should extra minerals be fed as "insurance" to maximize profits?
	51. With the increasing useage of irrigation in the United States mineral supplements will become more necessary. Some of the important minerals are soluble and will become deficient because of irrigation. Commercial fertilization has the effect of adding minerals to the soil. In some cases this could bring about a poor balance of minerals. In other cases the fertilizer elements will compensate for losses through irrigation.

Name ______________________________

POST-TEST

MINERALS

Underline correct answer(s).

1. A ration containing an abundance of protein, carbohydrates, and fat, without minerals will generally result in the death of an animal ________________ than if no food at all is given.

   a. at the same time
   b. sooner
   c. later

2. ________________ minerals are known to be required by animals.

   a. 7
   b. 9
   c. 11
   d. 13
   e. 15

3. Extra minerals fed as "insurance" ________________ as economical supplement to feed.

   a. are
   b. are not

4. Mineral deficiencies are important only if deficiency symptoms can be observed.

   a. True
   b. False

5. Block salt ________________ be depended upon as a lone supply of salt for average to high producing dairy cattle.

   a. should
   b. should not

6. Animals with a craving for salt based upon a lengthy deficiency may eat enough to ________________.

   a. require none for a period of time
   b. catch up on their requirements
   c. injure themselves

7. Alfalfa is classed as ________________ in phosphorus.

   a. poor
   b. moderate
   c. rich

Name ______________________________

8. Plenty of ______________ will help prevent rickets.

   a. sunlight
   b. alfalfa hay
   c. protein
   d. milk

9. The important function of ______________ in sheep nutrition is to promote synthesis of Vitamin B_{12} in the rumen.

   a. manganese
   b. iron
   c. cobalt
   d. zinc

10. ______________ cannot get enough block salt to satisfy their requirements.

    a. Swine
    b. Cattle
    c. Sheep

11. "Shot gun" mixtures of minerals ______________ an economical feed supplement for livestock.

    a. are
    b. are not

12. Thumps are an indication of ______________.

    a. too much milk
    b. anemia
    c. too much iron

13. The Pacific Northwest is a(n) ______________ deficient area.

    a. iron
    b. iodine
    c. calcium
    d. phosphorus

14. ______________ is a good source of calcium.

    a. Ground limestone
    b. Bonemeal
    c. Meat scraps
    d. Tankage
    e. Sodium chloride
    f. Dicalcium Phosphate

15. Plenty of ______________ will help prevent rickets and cure if in its early stages.

    a. iron
    b. salt
    c. bleached hay
    d. sunshine

Name ______________________

16. Mineral deficiencies ______________ economic losses even though deficiency symptoms are not visibly apparent.

- a. can cause
- b. cannot cause

17. Anemia in animals results from a deficiency of ______________.

- a. salt
- b. iron
- c. cobalt

18. ______________ is necessary for the formation of thyroxine, a hormone of the thyroid gland.

- a. Iron
- b. Salt
- c. Cobalt
- d. Manganese
- e. Iodine

19. Slipped tendons in growing chickens result from ______________ deficiency.

- a. mangesium
- b. iron
- c. manganese
- d. cobalt

20. Match the following materials with the minerals they provide.

a. Oystershell	_______calcium
b. Iron sulfate	_______salt
c. Sodium chloride	_______iron

21. ______________ ______________ or ______________ ______________ are good sources of calcium and phosphorus.

- a. Oystershell
- b. Dicalcium phosphate
- c. Steamed bone meal
- d. Iron sulfate
- e. Vitamin A

22. The function(s) or phosphorus in the animal is (are) ______________. Choose correct answer(s).

- a. bone formation
- b. regulating body processes
- c. necessary for usage of carbohydrate by animal
- d. necessary for usage of fat by animal
- e. necessary for usage of protein by animal

Name ______________________________

23. ________________ animals have the greatest need for minerals such as calcium and phosphorus.

a. Young
b. Mature
c. Aged

24. Label the following with

A. Major element
B. Minor element
C. Not essential for livestock

________ 1. Calcium
________ 2. Gold
________ 3. Selenium
________ 4. Cobalt
________ 5. Platinum
________ 6. Uranium
________ 7. Phosphorus
________ 8. Magnesium
________ 9. Copper
________ 10. Potassium

________ 11. Manganese
________ 12. Iodine
________ 13. Chlorine
________ 14. Sulfur
________ 15. Zinc
________ 16. Sodium
________ 17. Iron
________ 18. Lead
________ 19. Tin
________ 20. Aluminum

25. Studies at WSU indicate adequate amounts of most minerals with the exception of ________________, in the State of Washington.

a. Zinc
b. Copper
c. Selenium
d. Sulfur
e. Calcium

PLANT NUTRITION

PURPOSE

This is a "Plant Nutrition" programmed instruction unit designed to provide an introduction to "Soil Fertility" or "Plant Nutrition." This program includes the following knowledges:

1. Chemical elements necessary for plant growth, grouped by:
    a. Sources of air, water and soil.
    b. Major and minor elements.
    c. Primary plant foods.
    d. Secondary plant foods.
2. Functions of nitrogen, phosphorus, and potash for growth and maturity of plants and resistance to disease.
3. The soil amendment to correct acid soil conditions.
4. The function of the "carrier" material in commercial fertilizers.
5. The soil type and its affect on fertilizer utilization by crops.
6. The importance of chemical soil tests to establish fertilizer needs.
7. The importance of field testing the rates of fertilizers recommended by the chemical soil test results.
8. The plant processes; photosynthesis, transpiration and respiration.
9. The physical texture and structure and chemical fertility of soils as these two factors limit or promote plant growth.
10. Barnyard manure as a source of nutrients to the soil.
11. Green manure crops.
12. Commercial fertilizer labeling.
13. The purposes of crop rotation.
14. The nitrogen cycle.
15. The solubility of nitrogen.
16. The carbon-nitrogen ratio.

PRE-TEST Name________________

PLANT NUTRITION

Underline the Correct Answer

1. Water and air furnish three elements for plant growth. They are

   a. Manganese
   b. Phosphoric acid
   c. carbon
   d. oxygen
   e. copper
   f. zinc
   g. hydrogen

2. ______________ is taken from the air by certain groups of bacteria. It is available to plants through these bacteria.

   a. Oxygen
   b. Nitrogen
   c. Carbon
   d. Calcium
   e. Phosphorous

3. Which three are known as primary plant foods?

   a. carbon
   b. zinc
   c. nitrogen
   d. phosphoric acid
   e. iron
   f. potash

4. The "rarer elements" include _______, _______, _______, molybdenum, copper, manganese.

   a. zinc
   b. magnesium
   c. boron
   d. iron
   e. nitrogen

5. ______________ functions to increase growth and slow up maturity.

   a. Phosphorous
   b. Calcium
   c. Nitrogen
   d. Oxygen

6. ______________ hastens maturity of crops.

   a. Nitrogen
   b. Sulphur
   c. Potash
   d. Phosphoric acid

Name ____________________________

7. ______________ appears to aid plants in resisting certain diseases.

   a. Phosphorous
   b. Gypsum
   c. Nitrogen
   d. Potash
   e. Phosphoric acid

8. The term ______________ is used to indicate the material in which the plant nutrient is found (commercial fertilizers).

   a. dryer
   b. carrier
   c. host
   d. conveyer

9. Lime does not furnish nitrogen, phophoric acid or potash and is therefore classified as a

   a. carrier
   b. "helper"
   c. fertilizer
   d. amendment

10. Soil acidity is measured as

   a. tilth
   b. friability
   c. sourness
   d. sweetness
   e. pH

11. ______________ is the process resulting in production of carbohydrates.

   a. Transpiration
   b. Photosynthesis
   c. Respiration
   d. Transportation

12. ______________ is the process of absorption of water by root hairs, movement up through the stems, to the leaves. The remainder of the water is lost by evaporation through the stomata.

   a. Perspiration
   b. Photosynthesis
   c. Respiration
   d. Transportation

13. ______________ is a destructive process by which food is destroyed, with a consequent release of energy, intake of oxygen, and outgo of carbon dioxide and water.

   a. Respiration
   b. Exhalation
   c. Transpiration
   d. Photosynthesis

Name ____________________

14. Barnyard manure is valuable for its nutrient elements and for its

a. phosphoric acid
b. calcium
c. organic matter
d. nitrogen

15. 12-15-7 stands for a commercial fertilizer mixture of 12% ______, 15% ______, and 7% ______.

a. sulfur
b. phosphoric acid
c. potash
d. nitrogen
e. calcium
f. sulfur

(Fill in the blanks with the correct letter)

16. One approach to ____________ includes a cash crop, a cultivated crop, and a legume or hay crop.

a. nitrification
b. crop rotation
c. nutrition
d. a carbon cycle

17. ____________ in the soil is soluble and easily lost to drainage.

a. Phosphoric acid
b. Sulfur
c. Potash
d. Nitrogen

18. Crop residues, commercial fertilizers, and ammonium and nitrate salts by precipitation are forms of

a. phopshorous
b. potash
c. nitrogen
d. calcium

19. ____________ is most readily available and in larger amounts for microorganisms and plant growth.

a. N, nitrogen
b. NH_4, ammonium
c. NO_2, nitrite
d. NO_3, nitrate

20. The relationship between nitrogen and carbon is called the

a. nitrogen-carbon ratio
b. carbon-nitrogen ratio
c. potash cycle
d. carbon-nitrogen equivalent

INFORMATION PANEL

This is a programed instruction unit for "Plant Nutrition." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.
2. Write your answer on the answer sheet.
3. Move the answer sheet down to expose the next frame and answer to the previous frame.
4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect anser.

Plant Nutrition

If you have not read the information panel, do so now, then proceed to frame 1.

REVIEW

____
____
____

______ iron
______ copper
______ calcium
______ boron
______ zinc
______ sulfur
______ molybdenum
______ magnesium
______ manganese

carbon hydrogen oxygen	1. Fourteen elements have been recognized as being necessary for plant growth. Three from air and water are carbon, hydrogen, and oxygen. These elements account for over 90 per cent of the total weight of the plant. The three elements furnished by air and water are ____________, ____________, and ____________.
oxygen hydrogen oxygen	2. The atmosphere provides c____________, h____________ and o____________ to plants.
nitrogen	3. Nitrogen is taken from the air by certain groups of bacteria. The nitrogen assimilated by these organisms undergoes a change before it is used by higher plants. Certain groups of bacteria remove ____________ from the air.
nitrogen	4. The bacteria taking nitrogen from the air may be associated with most, if not all, leguminous plants are nitrogen-fixing plants. Non-legumes do not fix ____________.
oxygen hydrogen carbon	5. The nitrogen which is taken from the air by bacteria is combined in the soil to make soluble compounds before it can ordinarily be used by higher plants. Therefore, it is ordinarily stated that 7 elements come from the soil, and 3 from air and water. The three from air and water (other than nitrogen) are ____________, ____________, and ____________.

nitrogen phosphoric acid potash	6. Twelve elements are provided by the soil. Nitrogen, phosphoric acid, and potash are known as "primary plant foods" and are needed by plants in relatively large amounts and have long been recognized as those most likely to be deficient in soils. Copy them in the answer space.
calcium sulfur magnesium	7. Calcium, sulfur, and magnesium are secondary plant foods. These secondary plant foods are usually needed in relatively large amounts. Copy in the answer space.
nitrogen phosphoric acid potash calcium sulfur magnesium	8. ____________, ____________ and ____________ are "primary plant foods. ____________, ____________ and ____________ are "secondary plant foods."
iron manganese copper zinc boron molybdenum	9. Iron, manganese, copper, zinc, boron, and molybdenum are usually called the "rarer elements" or "minor plant foods." They are needed in minute amount but are essential. Copy them in the answer space.
iron manganese copper zinc boron molybdenum	10. Continuing research is studying some eleven other mineral elements. However, ____________, ____________, ____________, ____________, ____________, and ____________ are the "rarer elements" proven to be essential to plant growth.

growth maturity	11. Nitrogen functions to increase growth and defer maturity. It produces a good leaf and stem development and gives to the plant that luxurious dark-green color which is so desirable in growing crops. Nitrogen increases ____________ and defers ____________.
nitrogen	12. No matter how much phosphoric acid and potash there may be in the soil, the crops can use only quantities in proportion to the growth of the plants, and the growth of the plants will be in proportion to the ____________ in the soil.
phosphoric acid	13. Phosphoric acid hastens maturity of crops and aids in transferring substances from the stalk, leaves, and other growing parts to the seed, making the grains plump and full. ____________ ____________ increases the proportion of grain to straw and also stimulates root development in young plants.
phosphoric acid	14. ____________ ____________ hastens the maturity of crops. <u>Potash</u> appears to aid the plants resisting certain diseases. An insufficiency of potash results in the early ripening or dying of the stems and leaves of plants while the seeds or fruit are still immature.
potash carbon hydrogen oxygen	15. ____________ appears to aid plants in resisting certain diseases. ____________, ____________, and ____________ are elements furnished by air and water. They make up 90 per cent of the plant weight.

nitrogen potash phosphoric acid	16. The term "carrier" is used to indicate the material in which the plant nutrient is found. For instance, sodium nitrate, superphosphate, and potassium sulfate are carriers of the "primary plant foods," ____________, ____________, and ____________.
carrier	17. The term c____________ is used to indicate the material in which the plant nutrient is found. Chemical soil tests have been developed to determine which fertilizer elements are less than adequate in a particular soil.
less	18. Soil type has a marked effect on the results of fertilizer applied to soils having the same chemical test result. Clay soils are usually richer in plant nutrients than sandy soils. Sandy soils leach badly compared to clay soils, therefore, losing nutrients more quickly than clay soils. Certain chemical forms of a fertilizer elements are more quickly available and are more soluble than other forms. A sandy loam is ____________ rich in plant nutrients than a silty clay loam.
clay sandy	19. Chemical soils tests are important to a fertilization program. A <u>field trial</u> based upon the chemical tests results can definitely establish the rate of fertilizer application by applying the amounts of fertilizer indicated by the chemical test to growing crops and by measuring the differences in crop yield. ____________ soils do not leach as badly as do ______ soils, and, therefore, do not lose nutrients as quickly.
amendment	20. Lime is called a soil "amendment" rather than a fertilizer, as it does not carry nitrogen, phosphoric acid or potash. The acidity of the soil determines the kinds of crops that can be grown on a soil. Lime is a soil ____________.

photosynthesis	21. Some knowledge of plant processes are important to the growth and nutrition of crops. Photosynthesis is the process by which green plants combine carbon dioxide and water in the presence of sunlight, to form carbohydrates. ______________ results in formation of carbohydrates.
--	22. Plants need a certain amount of water in carrying on their physiological processes. However, only a small percentage of the water that is absorbed by the root hairs and passes upward to the leaves is used in these processes. The remainder evaporates through the stomata as water vapor. This process is called <u>transpiration</u>.
Respiration	23. Respiration unlike photosynthesis, which is limited to certain cells in the leaves, takes place in every living cell. Respiration is a destructive process by which food is destroyed with a consequent release of energy intake of oxygen and outgo of carbon dioxide and water. R______________ results in release of carbon dioxide and water.
Transpiration Respiration	24. ______________ is the process of absorption of water by the root hairs, and movement up through the stems, to the leaves. ______________ is the process involving release of energy, intake of oxygen and outgo of carbon dioxide and water.
Physical texture chemical fertility	25. Two soil characteristics equally important as limitations to plant growth are the <u>physical texture</u> and structure of the soil and the <u>chemical fertility</u> of the soil. ______________ and ______________ are important soil characteristics to plant growth.

	26. Barnyard manure is valuable for its nutrient elements and for its organic matter content so beneficial to the physical structure of the soil. Manure is not a well-balanced fertilizer. It is low in phosphoric acid and relatively high in nitrogen and potash. Addition of phosphorous to manure adds much to its value.
organic matter phosphoric acid	27. Barnyard manure is valuable for its nutrient elements and for its o__________ m__________ content. Manure is low in __________.
green manure crop	28. A green manure crop is one used for turning into the soil, whether planted for that purpose or not. For supplying organic matter to the soil, the g__________ __________ __________ that will produce the most growth in the time available should be chosen.
(1) (2)	29. Fertilizers are made up of two major groups (1) Manures or organic amendments, and (2) Commercial fertilizers. Group I included barnyard manures, green manures, crop residues and wastes that are plowed under for enrichment of the soil. Group II includes fertilizers produced commercially and sold singly or in combination. A compost of leaves is [(1), or (2)]. Calcium nitrate is group __________.
	30. The mixed fertilizers are commonly referred to by a series of numbers such as 0 - 10 - 10, 5 - 10 - 20, etc. The first number stands for the percentage of nitrogen; the second number, available phosphoric acid; and the third number, the water soluble potash. 10 - 20 - 30 stands for 10 lbs. of nitrogen, 20 lbs. of phosphate, and 30 lbs. of potash.

15 40 10	31. 10 - 40 - 15 stands for ______________ lbs. potash, ______________ lbs. phosphoric acid, and ____________ lbs. nitrogen.
nitrogen phosphorus potash	32. 20 - 10 - 5 stands for 20 lbs. ______________, 10 lbs. ______________, and 5 lbs. ______________.
	33. A crop rotation is any plan that is followed whereby one crop follows another. Usually one thinks of a well-planned program when referring to a crop rotation.
	34. Some advantages of crop rotation are: 1. Maintains fertility of the soil. The same crop grown successively uses more of one nutrient than of the others. 2. Disease, weeds and insects are more easily controlled. 3. Labor is distributed to better advantage. 4. Legumes aid in maintaining soil fertility through nitrogen fixation. 5. Erosion control is promoted through preservation of organic matter by proper rotation. 6. Diversification spreads the financial risk. The farmer with a variety of crops has hedged against losses.
	35. Can you think of any suggestions why any of the above might be true? List them.

crop rotation	36. A fundamental approach to _______ _______ includes cash crop, cultivated crop, legume or hay crop (poorer quality soils would require more than one year in this last category).
--	37. Nitrogen in the soil is soluble and easily lost to drainage. Nitrogen has a rapid effect on plant growth. Such a potent nutrient element should not only be conserved but also regulated. Some of the intake and outgo of nitrogen can be controlled by man; some is beyond man's control.
soluble	38. Nitrogen is _______________ and easily lost to drainage.
20 12 15	39. The nitrogen income of arable soils is derived from such materials as crop residues, green manures, farm manures, commercial fertilizers, and ammonium and nitrate salts brought down by precipitation. In addition, there is fixation of atmospheric nitrogen. 12 - 20 - 15 stands for ________ lbs of phosphorous ________ lbs of nitrogen ________ lbs of potassium
	40. The outgo of nitrogen is due to crop removal, to drainage, to erosion, to loss in a gaseous condition, both elemental and ammonia, and to unavailable forms of nitrogen.

nitrogen	41. ______________ has a rapid effect on plant growth.
crop residue, green manures, commercial fertilizer, ammonium and nitrate salts by percipitation crop removal, drainage, erosion, gaseous losses, unavailable forms	42. One form of nitrogen income in ______________. One form of nitrogen outgo is ______________.
	43. Much of the nitrogen added to the soil undergoes many transformations before it is removed. NH_4 (ammonium) changes to NO_2 (nitrate). This nitrate form is either appropriated by microorganisms and higher plants, or is removed in drainage or volatilization. And so the cycle goes on and on.
	44. Study the nitrogen cycle. 
income outgo	46. Crop residue is considered nitrogen (outgo, income). Drainage is considered nitrogen (outgo, income).
low	47. A close relationship exists between the organic matter and nitrogen contents of soils. This ratio of carbon to nitrogen in the organic matter of the furrow slice ranges from 8:1 to 15:1. This ratio controls the available nitrogen, total organic matter, and rate of organic decay. The relationship is called the carbon-nitrogen ratio. Green manure crops have a (low or high) ratio of carbon to nitrogen.
	48. Competition for available nitrogen results when residues having a high C:N ratio are added to the soil (straw at 90:1 carbon to nitrogen ratio for example). When a high carbon residue is added to a soil having a narrow C:N ratio, the demand for nitrate nitrogen becomes so great by the micro-organisms rapidly decomposing the organic matter that little nitrate nitrogen is available for higher plants. This slows growth of plants.
a	49. A practical example would be the plowing under of wheat straw and planting a crop. Unless the nitrogen content is high the new crop will lack optimum nitrogen for growth. Commercial fertilizer in correct amounts will hasten decomposition of organic matter and release the nitrate nitrogen for the new crop. Moisture often limits the amount of fertilizer useable as a maximum amount. Farmers currently (A. add commercial nitrogen or B. burn stubble) to keep the C:N ratio low for a new growing crop.
30:1	50. 30 parts carbon to 1 part nitrogen is a ratio of ________: ________ carbon to nitrogen.

	51. Western Washington soils react to phosphorous fertilizer by "fixing" about 70 per cent of it into forms not available to plants. Eastern Washington soils do not lose this much nutrient value. More important to the farmer is whether additions of fertilizers result in a profitable increase in production.
field trials	52. The amounts of fertilizer providing the best economic return can best be determined by chemical tests followed by f__________ t__________.
	53. Farming is applied science. This program illustrates this. A farmer needs to make use of chemical test, resource people, and the scientific method in his farming enterprise.
	Review The primary plant foods are _______, _______ _______, and _________. Choose the secondary plant foods by placing the letter "S" in front of them and the "rarer elements" by putting an "R" in front of them. ________ iron ________ copper ________ calcium ________ boron ________ zinc ________ sulfur ________ molybdenum ________ magnesium ________ manganese

PRE-TEST Name______________________

PLANT NUTRITION

Underline the Correct Answer

1. Water and air furnish <u>three</u> elements for plant growth. They are

   a. Manganese
   b. Phosphoric acid
   c. carbon
   d. oxygen
   e. copper
   f. zinc
   g. hydrogen

2. ______________ is taken from the air by certain groups of bacteria. It is available to plants through these bacteria.

   a. Oxygen
   b. Nitrogen
   c. Carbon
   d. Calcium
   e. Phosphorous

3. Which three are known as primary plant foods?

   a. carbon
   b. zinc
   c. nitrogen
   d. phosphoric acid
   e. iron
   f. potash

4. The "rarer elements" include ________, ________, ________, molybdenum, copper, manganese.

   a. zinc
   b. magnesium
   c. boron
   d. iron
   e. nitrogen

5. ______________ functions to increase growth and slow up maturity.

   a. Phosphorous
   b. Calcium
   c. Nitrogen
   d. Oxygen

6. ______________ hastens maturity of crops.

   a. Nitrogen
   b. Sulphur
   c. Potash
   d. Phosphoric acid

Name ____________________________

7. ______________ appears to aid plants in resisting certain diseases.

   a. Phosphorous
   b. Gypsum
   c. Nitrogen
   d. Potash
   e. Phosphoric acid

8. The term ______________ is used to indicate the material in which the plant nutrient is found (commercial fertilizers).

   a. dryer
   b. carrier
   c. host
   d. conveyer

9. Lime does not furnish nitrogen, phophoric acid or potash and is therefore classified as a

   a. carrier
   b. "helper"
   c. fertilizer
   d. amendment

10. Soil acidity is measured as

   a. tilth
   b. friability
   c. sourness
   d. sweetness
   e. pH

11. ______________ is the process resulting in production of carbohydrates.

   a. Transpiration
   b. Photosynthesis
   c. Respiration
   d. Transportation

12. ______________ is the process of absorption of water by root hairs, movement up through the stems, to the leaves. The remainder of the water is lost by evaporation through the stomata.

   a. Perspiration
   b. Photosynthesis
   c. Respiration
   d. Transportation

13. ______________ is a destructive process by which food is destroyed, with a consequent release of energy, intake of oxygen, and outgo of carbon dioxide and water.

   a. Respiration
   b. Exhalation
   c. Transpiration
   d. Photosynthesis

Name ____________________

14. Barnyard manure is valuable for its nutrient elements and for its

a. phosphoric acid
b. calcium
c. organic matter
d. nitrogen

15. 12-15-7 stands for a commercial fertilizer mixture of 12% _______, 15%_______, and 7%_______.

a. sulfur
b. phosphoric acid
c. potash
d. nitrogen
e. calcium
f. sulfur

(Fill in the blanks with the correct letter)

16. One approach to _____________ includes a cash crop, a cultivated crop, and a legume or hay crop.

a. nitrification
b. crop rotation
c. nutrition
d. a carbon cycle

17. _____________ in the soil is soluble and easily lost to drainage.

a. Phosphoric acid
b. Sulfur
c. Potash
d. Nitrogen

18. Crop residues, commercial fertilizers, and ammonium and nitrate salts by precipitation are forms of

a. phopshorous
b. potash
c. nitrogen
d. calcium

19. _____________ is most readily available and in larger amounts for microorganisms and plant growth.

a. N, nitrogen
b. NH_4, ammonium
c. NO_2, nitrite
d. NO_3, nitrate

20. The relationship between nitrogen and carbon is called the

a. nitrogen-carbon ratio
b. carbon-nitrogen ratio
c. potash cycle
d. carbon-nitrogen equivalent

LAND

LAND JUDGING

This program is "Land Judging." It is to follow "Plant Nutrition." "Land Judging" is designed to introduce the subject of soil management. This program includes the following knowledges:

1. Why land is classified.
2. How land is classified.
3. What the classifications are.
4. What pH is and its affect on plant growth.
5. What the seven factors of classification are.

PRE-TEST Name________________________

LAND

Underline the correct answer(s).

1. Land classes suitable for cultivation are _______, _______, _______, and _______.

   a. I
   b. II
   c. III
   d. IV
   e. VI
   f. VII
   g. VIII

2. Land classes not suitable for cultivation are _______, _______, and _______.

   a. I
   b. II
   c. III
   d. IV
   e. VI
   f. VII
   g. VIII

3. Land slope is defined as the number of feet fall per _______.

   a. 10 feet
   b. 100 feet
   c. 25 feet
   d. 1,000 feet

4. Soil depth is the effective depth that roots and _______ can penetrate the soil.

   a. moisture
   b. a drill
   c. a shallow rooted plant
   d. a post hole digger

5. Soil permeability refers to the rate of movement of _______ and _______ through the soil.

   a. roots
   b. moisture
   c. air
   d. fertilizer

6. Soils that feel "sticky" when moist are _______ textured soils.

   a. loam
   b. silt
   c. medium
   d. fine
   e. coarse

Name ____________________

7. "Silty" or "Loamy" textured soils are ____________.

a. fine
b. medium
c. coarse
d. heavy

8. ____________ is the major influence for rate of water run-off.

a. Slope
b. Soil drainage
c. Permeability
d. Flexibility

9. Soil ____________ refers to how rapidly the land drains after snow melt or heavy rains.

a. length of life
b. drainage
c. permeability
d. slope

10. Moderate erosion is a loss of topsoil between ____________ per cent.

a. 10-20
b. 15-30
c. 25-75
d. 30-60

11. The acidity, or alkalinity (sweetness) of a soil are measured in terms of ____________.

a. pH
b. bH
c. sourness
d. cation exchange

12. Land that can be used regularly for crops in a good rotation but needs intensive treatment and is subject to serve limitations in use for crop land is land class ____________.

a. I
b. III
c. IV
d. VI

13. Land that is very deep is greater than ____________ deep.

a. 30"
b. 40"
c. 50"
d. 60"

Name ____________________

14. The individual parts of soil are called soil _____________.

    a. conglomerates
    b. clumps
    c. particles
    d. pieces

15. A common example of a soil profile having limiting permeability is one having a heavy layer of _____________ in the subsoil.

    a. sand
    b. minerals
    c. clay
    d. nutrients

INFORMATION PANEL

This is a programed instruction unit for "Land Judging." You will find it relatively easy to answer the questions in each "frame." This method of instruction will aid you to master the objectives listed if you apply yourself to the material.

You are provided with a program and a combination answer sheet and mask to cover the answers.

1. Place the mask (answer sheet) over the answer in a way that exposes one question (frame) at a time.
2. Write your answer on the answer sheet.
3. Move the answer sheet down to expose the next frame and answer to the previous frame.
4. Should your answer be wrong, write the correct answer above or along side--do not erase your incorrect answer.

Land

If you have not read the information panel, do so now, then proceed to frame 1.

--	1. Before you start the program, you should read the instruction sheet. If you have not already done so, read the instruction sheet now. If you read it, proceed to frame 2.
capability	2. For the most hazard free land usage we classify our soils into "ability to produce" groups, or land capability classes. These eight capability classes are divided according to their c______________.
classify	3. Just as a doctor checks pulse and temperature of a patient before classifying the sickness, so do we learn to check the seven symptoms of our land before attempting to c___________ it.
seven	4. We look for _______________ factors or symptoms before classifying the land and recommending certain crop usage for it.
classifying or classification	5. The reason for c______________ of land is to make the best use of the land. We wish to gain the biggest return from our investment without permanent loss of the soil or its fertility.

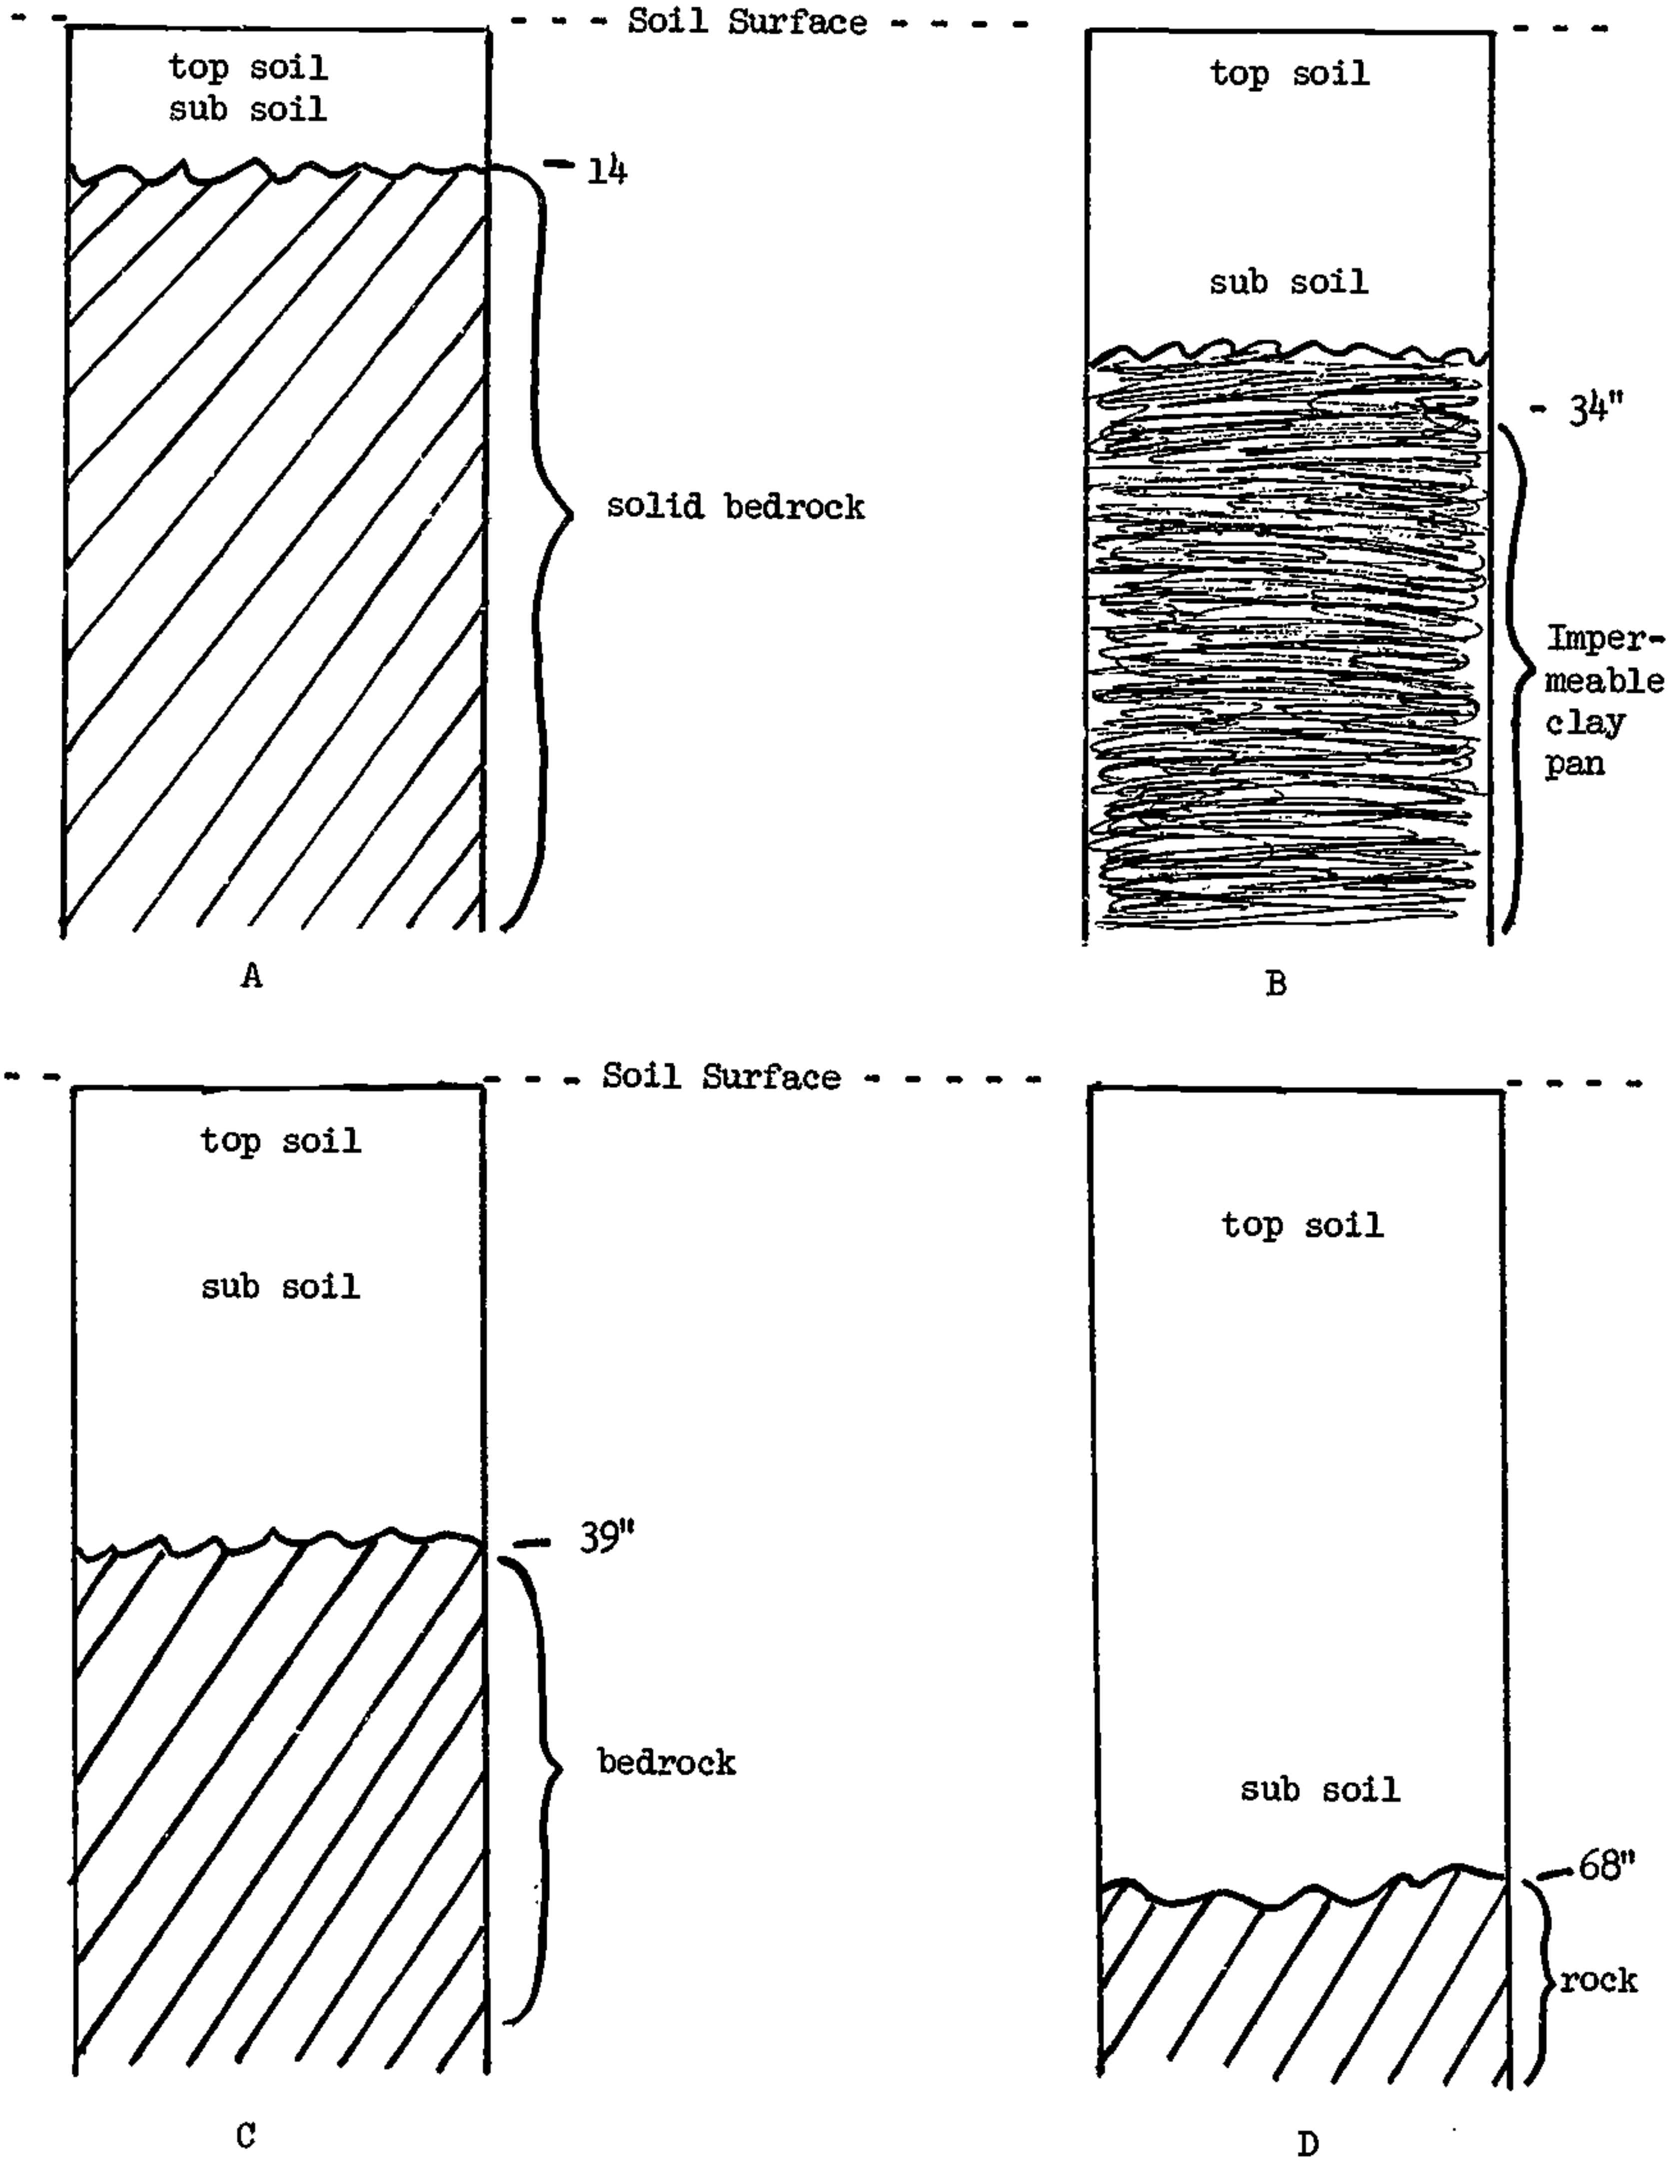
factors or symptoms	6. Efficient classification of the land will require a detailed knowledge of the seven ____________s.
depth	7. Soil depth is the first factor we will consider in detail. Soil d______ is determined by the depth of penetration of roots and moisture.
moisture or root	8. Soil depth may be measured by either ____________ or ____________ penetration.
soil depth	9. We classify soils as very shallow, shallow, moderately deep, deep or very deep. These are divisions or categories of ____________ ____________.
--	10. Soil depths are separated by inches as follows: 0-10" - very shallow 10-19" - shallow 20-35" - moderately deep 36-59" - deep 60" or more - very deep Copy the soil depths.

deep	11. Deep soils are from 36-60 inches deep. Alfalfa roots found at 53 inches depth is an indication of a ____________ soil.
moisture or roots	12. Very deep soils can be identified by evidence of ________ or _________s at 60 inches or deeper.
10	13. Very shallow soils are less than 10 inches deep. Shallow soils are from ____________ to 19 inches deep.
36	14. Moderately deep soils are from 20 to 36 inches deep. Deep soils are from ____________ to 60 inches deep.
60	15. Very deep soils are ____________ inches or deeper.

10	16. Very shallow soils are less than _______ inches deep.
20 36	17. Moderately deep soils are _______ to _______ inches deep.
10 20	18. Shallow soils are from _______ to _______ inches deep.
36 60 60	19. Deep soils are from _______ to _______ inches deep. Very deep soils are _______ inches deep or more.
0-10 Shallow 20-36 36-60 Very deep -- 60 or over	20. If you answer the following questions correctly, move on to question 21. Otherwise, turn back to question 11 for a review. Very shallow --- ___to___" _________ --- 10 to 20" Moderately deep --- ___to___" Deep --- ___to___" ______ ______ --- ___or___"

SOIL PROFILES

Diagrams of vertical profiles showing depths of soils



shallow	Refer to information panel, page 5, to answer frames 21-24. 21. The depth of soil profile "A" would be classified as ________________.
moderately deep	22. The depth of soil profile "B" would be classified as __ ________________.
deep	23. The classification would ________________ for soil profile "C".
very deep	24. Soil profile "D" would be classified as ________ ________.
moderately deep	25. Failure to find evidence of moisture or roots deeper than 22 inches would indicate ________________ soil depth.

Soil surface texture is classified according to the proportion of sand, silt, and clay that make up the soil mass.

The size of individual particles of soil influences the ability of the soil to absorb and store water and air.

After looking at and feeling the soil, we can then classify the surface texture as:

Fine - "clayey" soils that feel stick or slick to the touch.

Medium - "silty" soils that feel smooth or "floury" to the touch.

Coarse - "very sandy" soils that feel gritty or abrasive to the touch.

surface texture	If you have not read information panel on soil surface texture, do so now. 26. Soil ________ ________ refers to the composition of the important top six inches of soil -- the root zone.
by looking at it and feeling it	27. Texture of clothing is sometimes referred to as "coarse." We speak of soils as fine, medium, or coarse textured. We are referring to a six-inch layer. How would you decide whether a soil were fine, medium, or coarse?
soil surface texture	28. Perhaps a series of different sized sieves would work to determine s________ ________ t________.
fine, medium, or coarse	29. Sieves are used in the laboratory, but are awkward for field use. Field men learn to determine soil surface texture by moistening it and rubbing it between the thumb and forefinger. In this way they can determine if the soil surface texture is ________, ________, ________.
sand, silt, clay	30. Soils are composed of ________, ________, and ________, the individual parts being called particles.

particle	31. ________ size determines ability of the soil to hold air and water.
air water	32. Particle size influences the ability of the soil to absorb and store ________ and ________.
coarse	33. Sandy soils feel abrasive and "gritty" to the touch. Sandy soils have a c________ texture.
coarse	34. Coarse soils are predominately sand with some silt and clay. Desert soils are usually ________ in texture due to large proportions of sand.
fine	35. Soils having enough clay to feel "slick" and "sticky" have a f________ texture.

sticky or slick	36. Fine textured soils feel ________ to the touch.
gritty	37. Coarse textured soil feels ________ to the touch.
medium	38. Soils with a large quantity of silt that feel smooth and floury are classified as having a m________ texture.
silt	39. Medium textured soils are composed predominantly of ________. They feel smooth and "floury" to the touch.
smooth or floury	40. Medium textured soils feel ________ to the touch

a-fine b-coarse c-medium	41. a. __________ textured soils feel sticky. b. __________ textured soils feel gritty. c. __________ textured soils feel smooth and floury.
fine - sticky. medium - smooth or floury. coarse - gritty.	42. List the classifications of soil surface texture and indicate how they feel.
soil surface texture	43. The purpose of this classification is to accurately field test a soil as to its __________ __________ __________.
particles	44. The individual parts of these soils are called soil ________, the size of which determines the ability of the soil to hold air and water.
sand, silt, clay	45. Soil is composed of carying proportions of __________, __________, and __________.

10	REVIEW A. Very shallow soils are 0 to _________ inches deep.
10-20	B. Shallow soils are _________ to _________ inches deep.
Moderately deep	C. _________ _________ soils are 20 to 36 inches deep.
deep 35 to 60	D. _________ soils are _________ to _________ inches deep.
60	E. Very deep soils are greater than _________ inches deep.

roots moisture	F. Soil depth is the effective depth that __________ and __________ can penetrate.
	Fine soils characterized by a sticky feeling when moist are chemically fertile but are often a problem physically. They are either too hard for adequate moisture penetration or too moist and sticky to disc and cultivate for seedbed preparation. Soil surface texture is an important consideration in land classification for hazard free land usage.
sand silt, clay	G. Soil is composed of varying proportions of __________, __________, and __________.
fine medium coarse	H. Depending upon the proportions of sand, silt, and clay, we speak of soils in the three textural categories __________, __________, and __________.
	The next section of this program will consider the effects of fine, medium, and coarse textured soils on the movement of air and water through the entire profile (depth) of the soil.

Soil permeability refers to the rate of movement of air and water through the subsoil. Soils may be placed into relative permeability classes through studies of structure, texture, cracking, density and other features. Structure refers to the arrangement of soil particles into granules, clods, columns, or crumbs. We classify permeability as:

Limiting - soils which have dense, heavy clay or clay pan subsoils. Soils under this classification feel sticky and plactic, have the appearance of putty, press out thin between the fingers without crumbling when wet.

Adequate - granular clay loam or silt loam subsoils. Soils with strata cracks usually running perpendicular to the surface. This type of soil is ideal for most agricultural purposes since the water, air, and plant roots can penetrate easily. Yet the soil column is firm and stable.

Excessive - sandy, coarse subsoils through which water and air move freely.

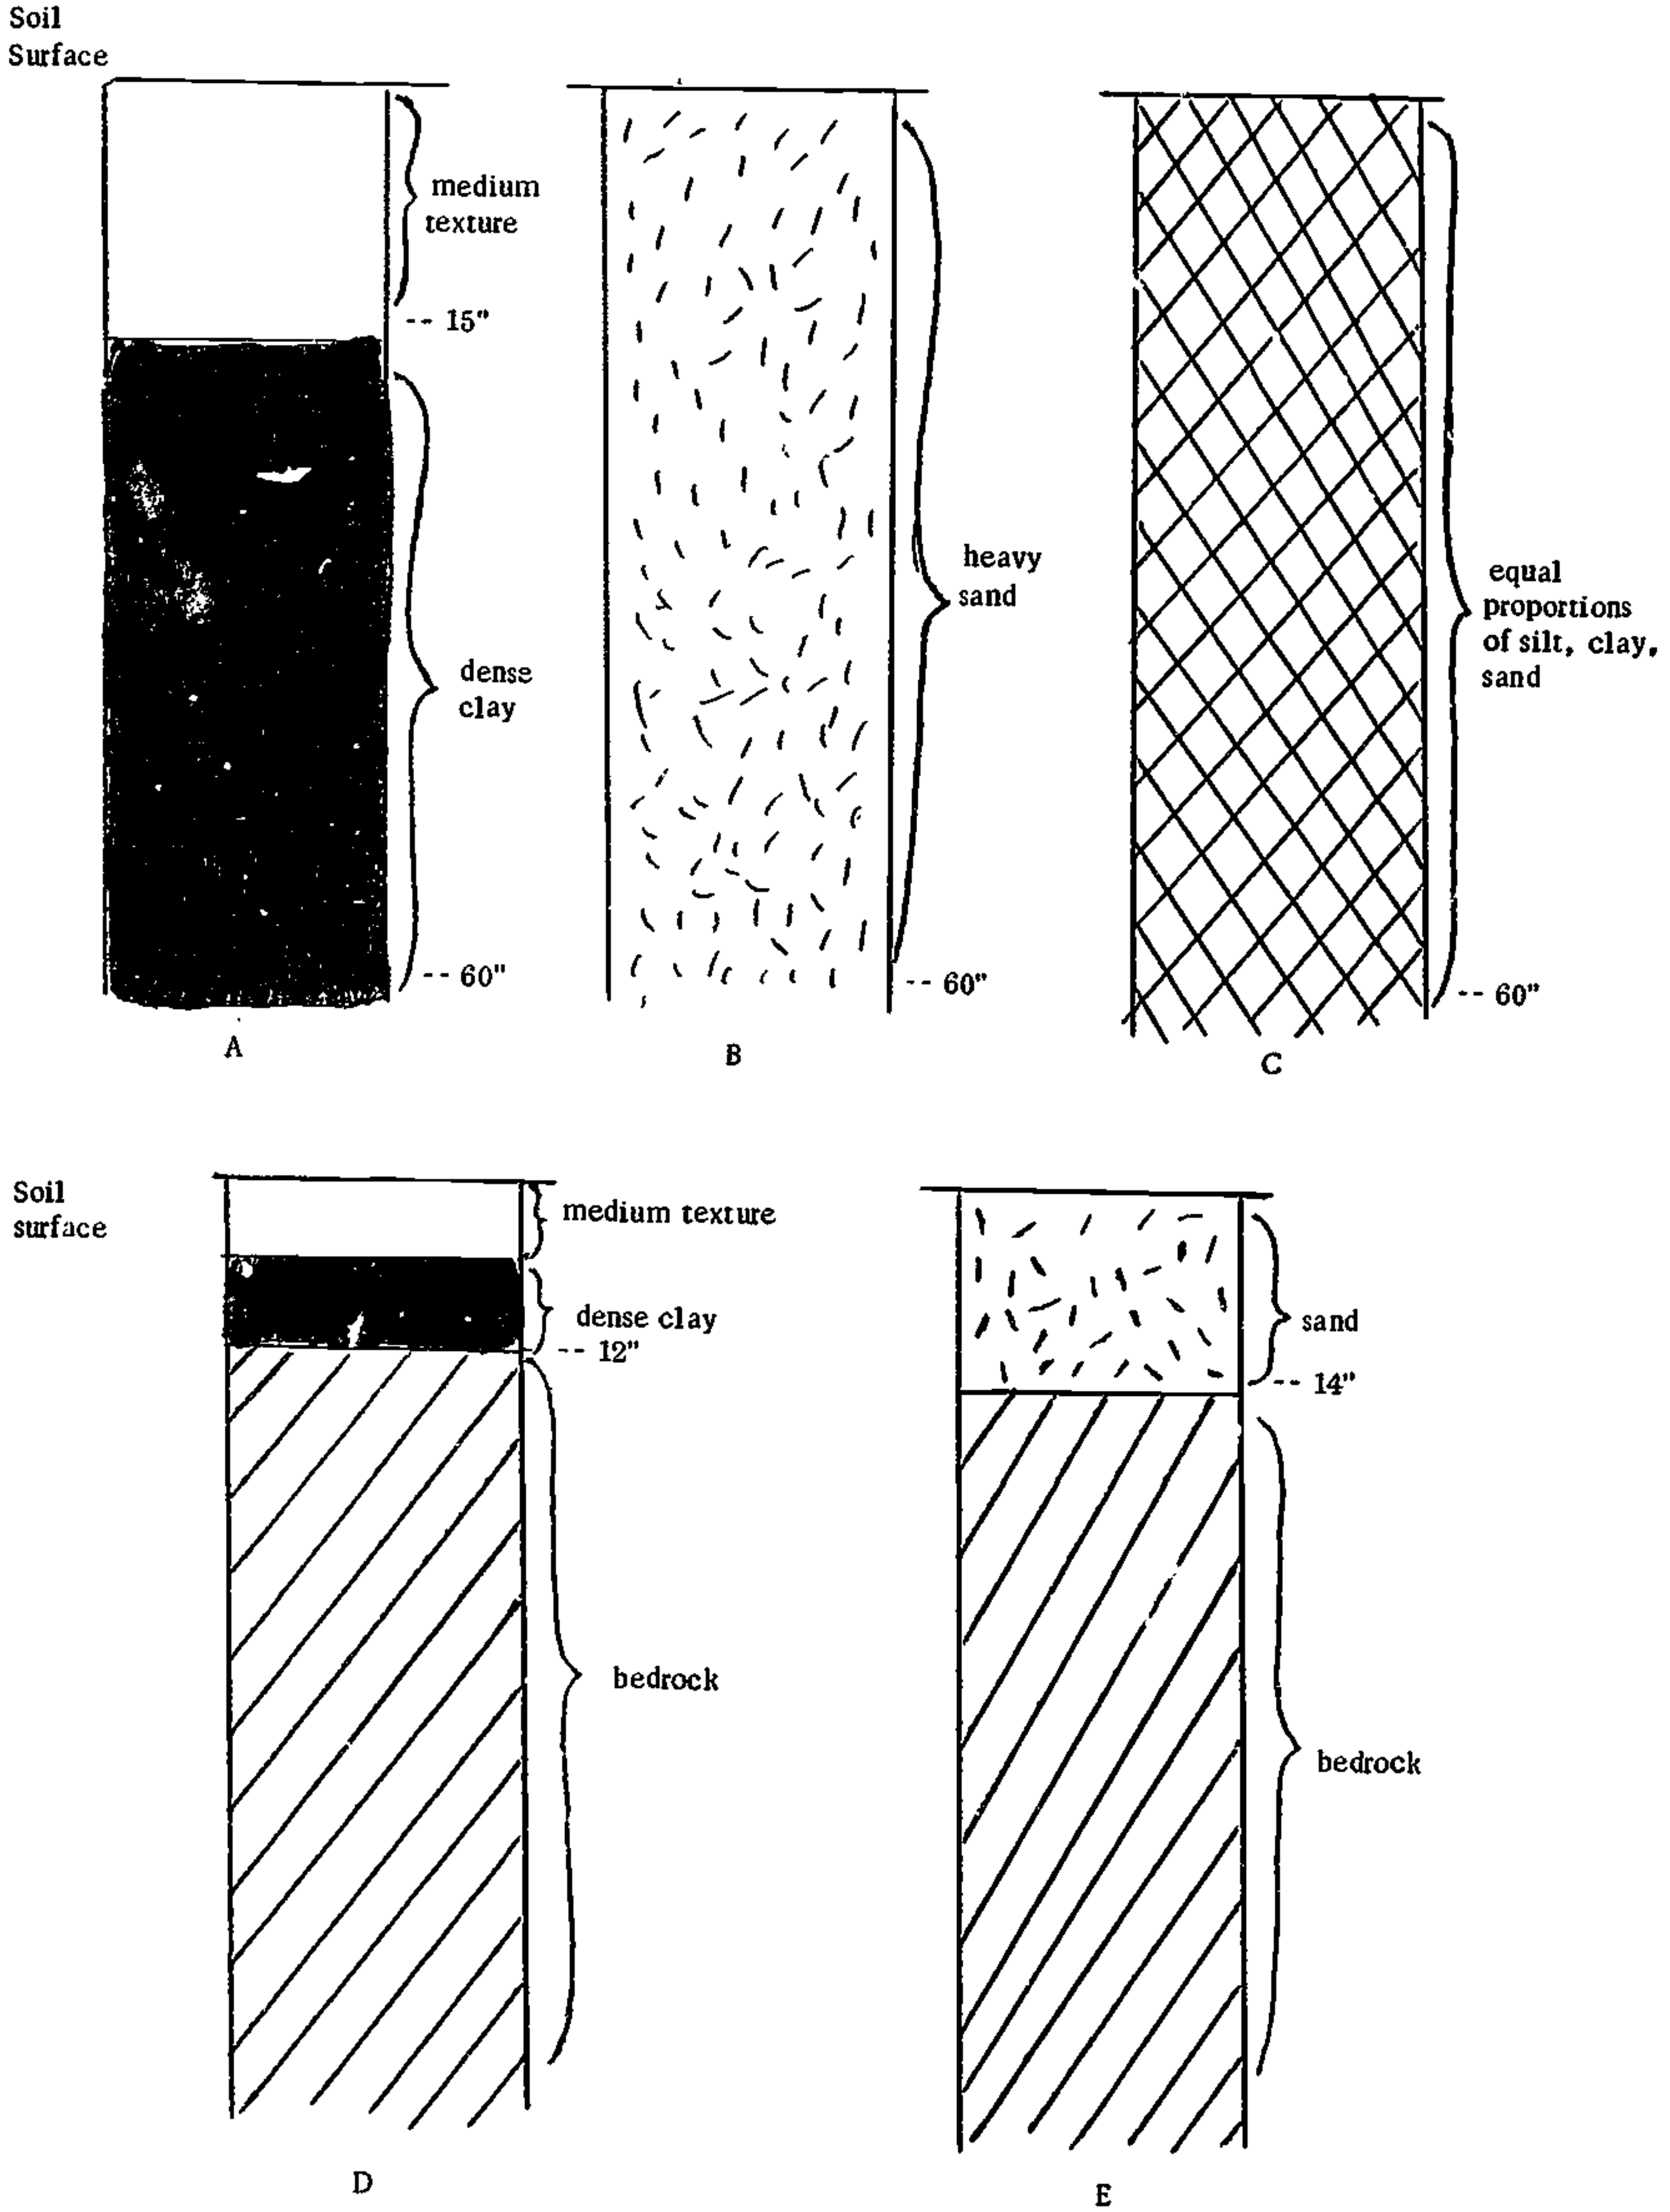
soil permeability	46. Soil depth, you will recall, was important as it affects the amount of moisture available to crops. Soil permeability refers to the rate of movement of air and water through the subsoil. How well excess moisture drains through the soil profile is a function of s________ p________.
permeability	47. Soils may be placed into relative ________ classes through studies of structure, texture, cracking, density, and other features.
moisture air	48. Structure of the soil profile is determined by the "clumping" of individual particles. This affects the movement of ________ and ________ through the entire soil profile. For our system of classification, we will divide soil permeability into limiting, adequate, or excessive.
limiting	49. Soils that have dense clays in their subsoil would limit movement of water through the profile. We would classify their permeability as ________.
clay	50. A common example of a soil profile having limiting permeability is one having a heavy layer of ________ in the subsoil.

adequate	51. A medium texture soil throughout the profile would result in _______________ permeability.
smooth or floury	52. A soil profile having adequate permeability would feel _______________ to the touch throughout the profile.
excessive	53. A deep sandy soil would have excessive drainage of water through the profile. The permeability of this soil would be _________.
sand	54. A soil having excessive permebility would consist largely of _______________.
surface texture	55. Permeability pertains to the effective depth of a soil and not to the surface six inches as does soil __________ __________.

permeability	56. A dense subsoil of a putty-like consistency would be classified as having limiting __________ that would limit water movement through the soil. Obviously a narrow horizontal band of soil of a particular texture can result in a limiting permeability.
excessive permeability	57. A soil that is excessively drained because of a sandy, coarse subsoil has __________ __________.
limiting permeability	58. Very slow movement of air and moisture through the soil indicates __________ __________.
adequate permeability	59. A satisfactory movement of air and moisture through the soil is called __________ __________.
a-limiting b-adequate c-excessive	60. The three classifications of permeability are __________, __________, and __________.

SOIL PROFILES

Diagrams of vertical profiles showing permeability.



limiting	Refer to information panel, page 16, to answer frames 61-65. 61. Profile "A" demonstrates __________ permeability.
excessive	62. Profile "B" is an example of __________ permeability.
adequate	63. Profile "C" is an example of __________ permeability.
limiting	64. "D" profile demonstrates __________ permeability.
excessive	65. "E" profile demonstrates __________ permeability.

light medium dark dark	66. Soil color is a rather subtle clue to the history of a particular soil. Soil color is divided into three divisions: light, medium dark, and dark. Write the three color divisions in the answer box.
high	67. Dark soil is nearly black and is usually (high or low) in inherent fertility.
dark	68. Soil with a high inherent fertility level is usually classified as having a ______________ color.
medium	69. Medium dark soil has a moderate level of inherent fertility. Dark gray to light brown soils indicate a ______________ dark color.
medium	70. Medium dark soil has a (high, medium, low) level of inherent fertility.

light	71. A low or very low inherent fertility is indicated by a ____________ color.
low	72. Light gray to palw brown surface soils usually have a ____________ inherent fertility level.
soil fertility	73. Soil color is not always a reliable clue to inherent fertility. Soil color may or may not indicate inherent ____________ ____________.
dark medium dark light	74. Soil color is divided into three divisions. They are ____________, ____________ ____________, and ____________.
a-medium b-low c-high	75. List the probable inherent fertility level indicated by each of the following soil colors: a. medium dark - ____________ b. light - ____________ c. dark - ____________

Slope. Slope is very important because it influences the rate at which water runs over the soil. This runoff is one of the causes of erosion. Slope also influences the way in which the land can be farmed. Slope is expressed by the number of feet of fall in each 100 linear feet. Slope ranges vary widely in different areas. For instance, land with 8 to 12 feet fall per 100 linear feet might be considered steep or very steep in some climates and soil conditions. It might be considered only moderately sloping under other conditions of less intensive climatic conditions. It is necessary, therefore, that for purposes of judging contests, slope ranges applicable to the contest area be used. The following will give an idea of the manner in which slope ranges are expressed:

(2% means 2 feet fall per 100 linear feet of distance)

Nearly level

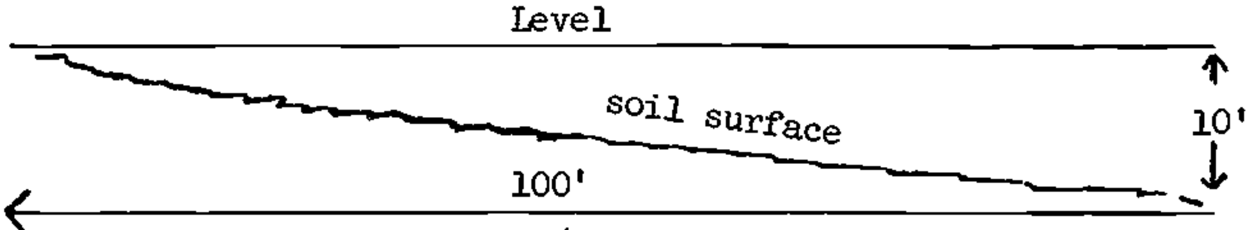
Gently sloping

Moderately sloping

Strongly sloping

Steep

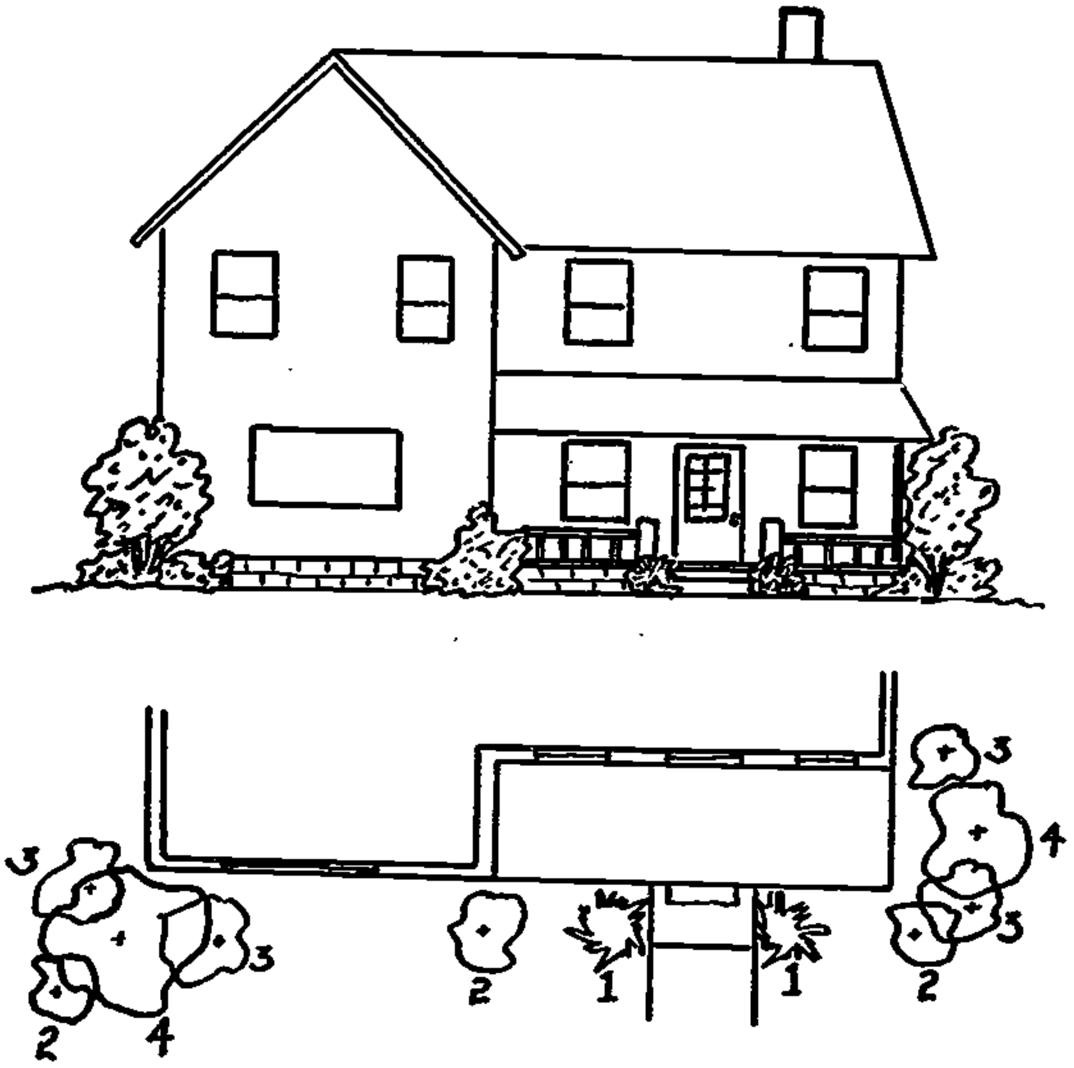
Very steep



10% slope

slope	If you have not read the information panel on soil slope, do so now. 76. Slope is important as it directly influences water run off and erosion. ________ is expressed as the number of feet of fall per 100 linear feet of "run."
nearly level gently sloping moderately sloping strongly sloping steep very steep	77. Slope ranges are expressed as nearly level, gently sloping, moderately sloping, strongly sloping, steep, and very steep. Write the slope ranges in the answer box.
2	78. Two per cent fall means ________ feet fall per 100 linear feet.
slope	79. Erosion is partially caused by water runoff, which is due to per cent of ________. The slope of the land is the major influence on erosion.
level, sloping, sloping, steep	80. Slope is divided into six categories. They are nearly ________, gently s________, moderately s________, strongly sloping, steep, and very ________.

Figure 36. This is a suggested solution to the exercise in Figure 36.



Suggested Planting

1. Compace Taxus Media (3')
2. Cranberry Cotoneaster (4')
3. Dwarf Spreading Yew (2')
4. Doublefile Biburnum (8' - 10')

Figure 35. This is a student exercise in the selection of appropriate plants for corner and porch plantings for tall houses. Have the student list the name and height of the plants.

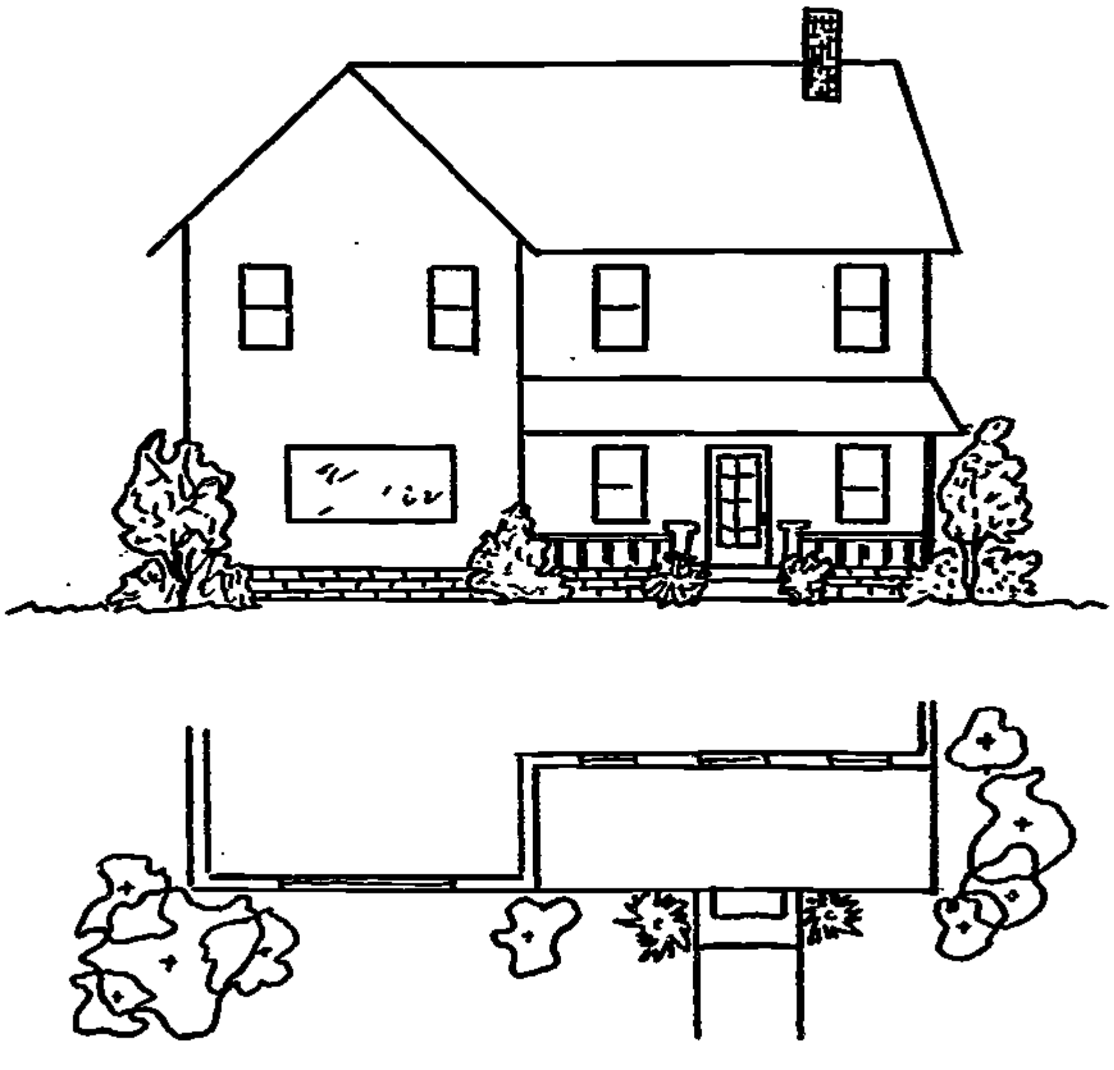


Figure 37. Suggested corner and porch plantings for a tall house with the porch in the center of the house. In this student exercise in selection of appropriate plants, have the students list the name and height of the plants.

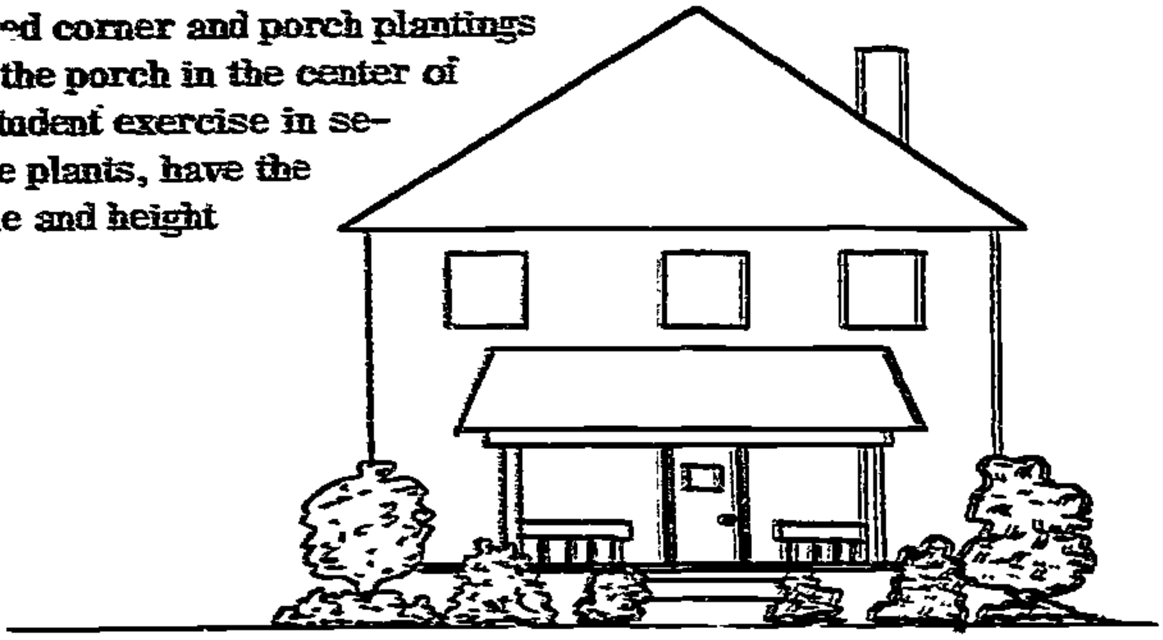

Figure 38. Suggested solution to the student exercise in Figure 37.

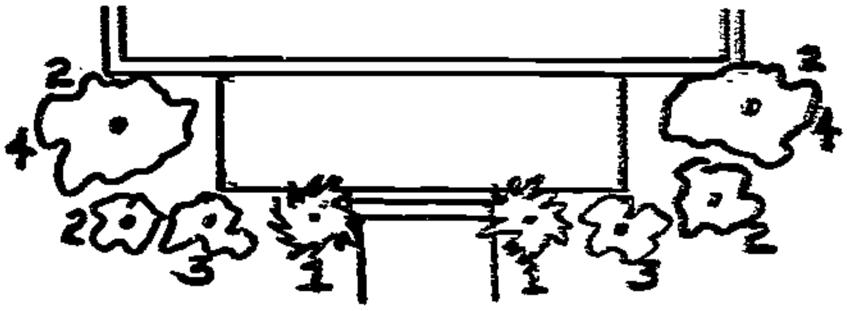
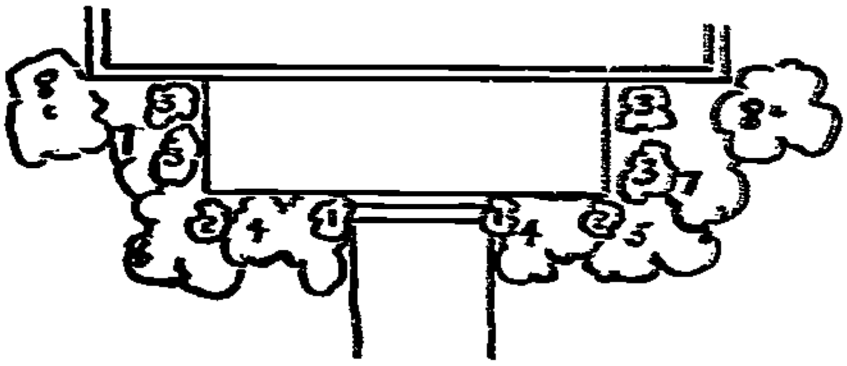


Suggested Planting for a Low Cost Budget

1. Compact Taxus Media
2. Glossy Wintercreeper
3. Koreanspice Viburnum



Suggested Planting for a High Priced Budget

1. Roundleaf Japanese Holly
2. Double Mockorange
3. Alpine Currant
4. Glossy Abelia
5. Common Flowering Quince
6. Cranberry Cotoneaster
7. Spirea Froebeli
8. Doublefile Viburnum

CHAPTER VI

Planting Ornamental Shrubs and Shade Trees.

Problem: What procedures should be followed in transplanting shrubs and trees?

Items to Consider:

1. Time to plant.
2. What size of hole to dig.
3. How to place plant in hole.
4. Use of a mulch.
5. Handling of balled plants.
6. Supporting of trees.
7. Protecting young plants from weather, insects, etc.

Basic Information:

1. Time to plant.

Ornamentals can be transplanted in the fall or spring. In the fall, soil is warm, moisture is usually sufficient, and plants grow better. Plants can become established before hot, dry weather. In the spring, there is more soil moisture, but the soil is cold. The best time to transplant bare root plants is the latter part of September or the early part of October, after the leaves have fallen.

Hard-to-transplant ornamentals should be planted in the spring to assure the longest possible period for the establishment of new roots.

2. Size of hole to dig.

The hole should be big enough so that the roots don't need to be wound around the ball of soil. There is also danger that the roots may girdle themselves with these wound roots. The hole for balled or container plants should be one to two feet wider than the ball, to permit sufficient backfill with good planting soil. Bare root plants should have room for the roots to spread out full-length.

3. Placing plant in hole.

In transplanting the ornamental, keep the soil level, the same on the plant as it was in the nursery. Put loose soil in the bottom of the hole. Manure or peat moss may be used in heavy soil. Don't plant on a moist day because the clay soil becomes packed which destroys air movement. Don't stamp the soil too firmly. Leave a saucer of earth around the edge of the hole. This retains the water to allow it to soak around the plant. Plant first and then let water hose run slowly for about one to two hours. The water also helps to remove any air pockets around the roots.

4. Using a mulch.

Manure, peat moss, etc. can be used on top to conserve moisture after transplanting. Fertilizer can be added to a mulch of corn cobs, straw, sawdust for bacteria growth.

In spring, wait until soil is warm before mulching, usually about May. Mulch can be applied anytime in the fall.

5. Handling of balled plants.

Dig hole about two feet wider than ball of plant. Set top of ball slightly above ground level to compensate for its weight. Take out balling nails and lay burlap back and cover edge with soil. It will eventually rot.

When removing plants from containers, wet down to prevent soil from crumbling. Always take plants out of metal containers, and it is recommended that plants be taken out of paper containers, even though the paper will eventually rot. Roots grow out to the side as well as down. Roots will be required to grow too deep if whole can or container is not removed. See Figure 39.

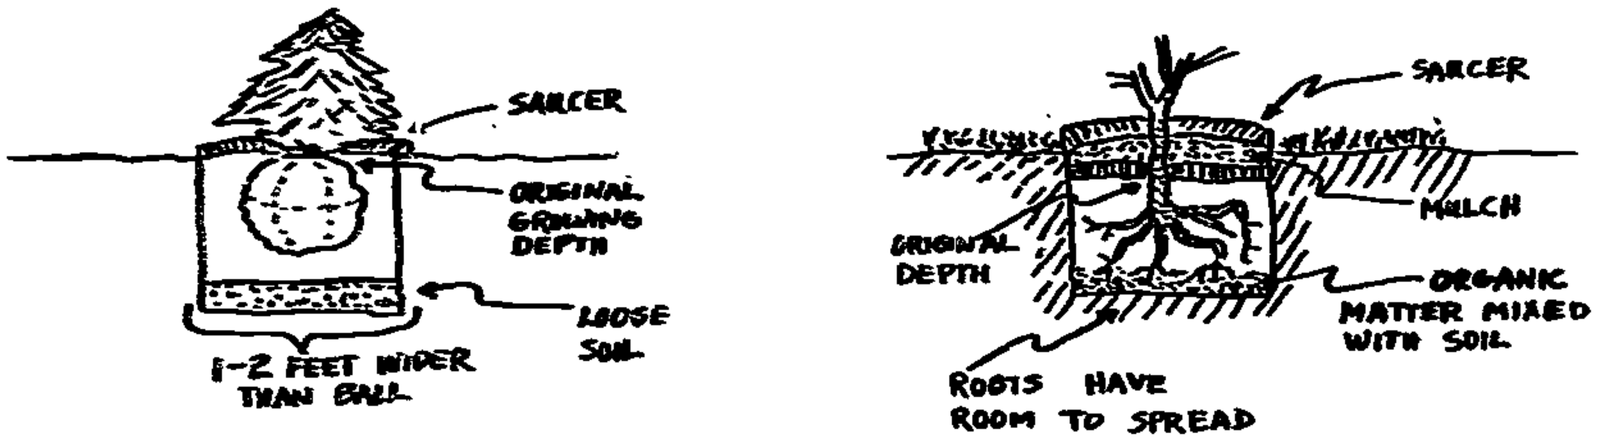


Figure 39. Proper placement of balled and bare-root plants in the ground.

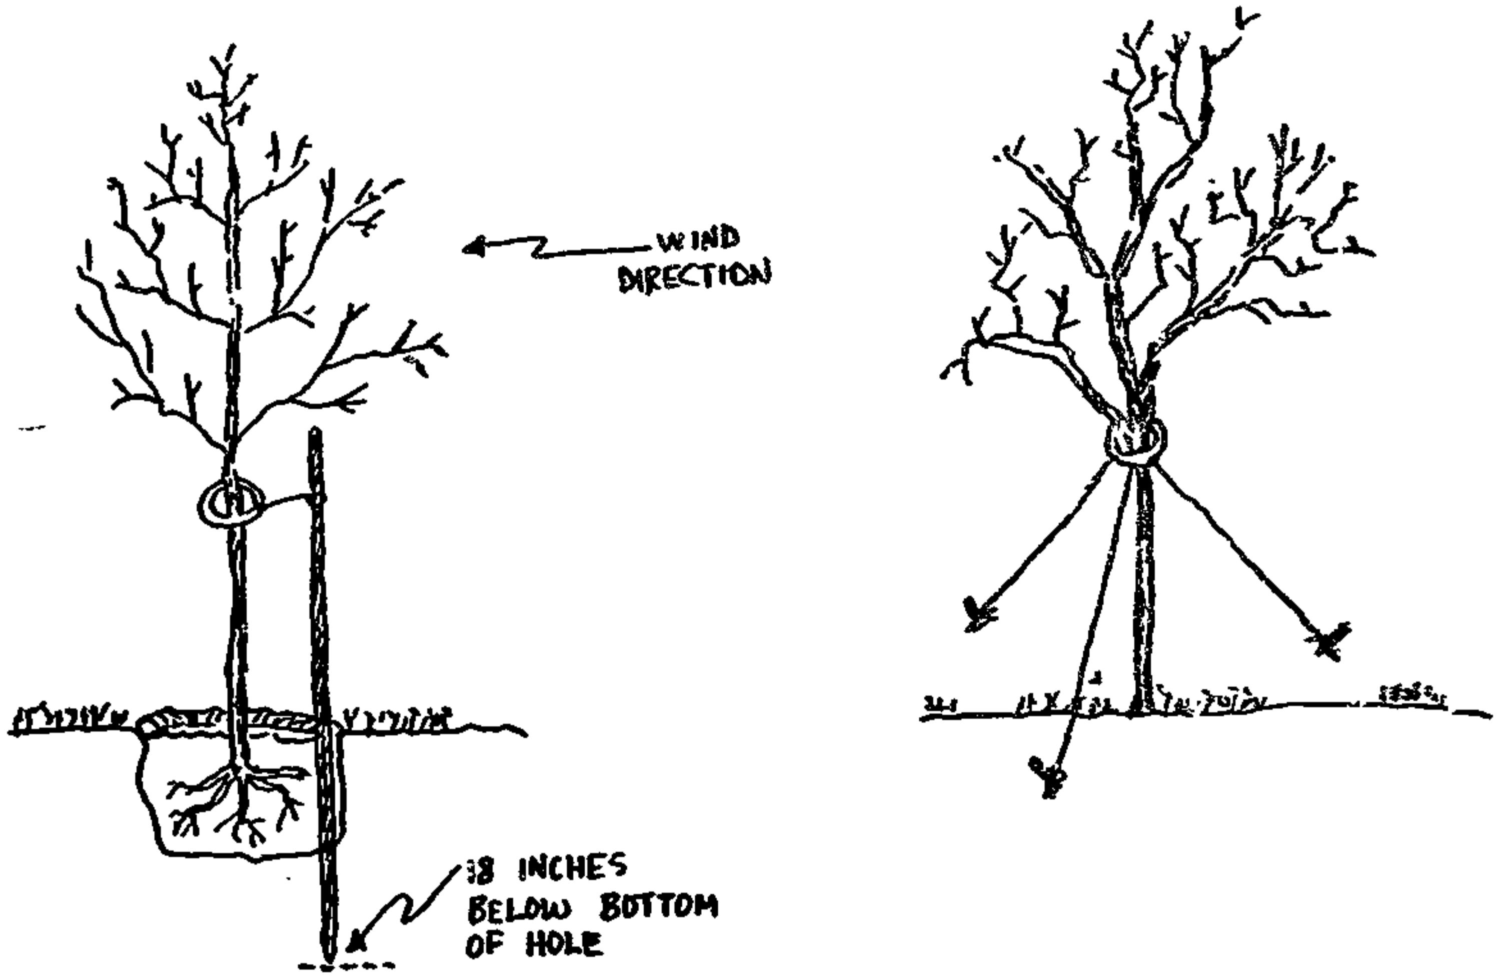
6. Supporting trees after planting.

Put the supporting stake(s) on side of prevailing winds. Set stakes before planting to avoid damaging the roots. Set stake 18 inches deeper than the bottom of the hole, using a 2" x 2" x 8' stake. Any tree or shrub over two inches in diameter needs two to three stakes. Any plant over five inches in diameter needs guy wires. See Figure 40.

Figure 40. Proper method of supporting trees after planting.



7. Protecting young plants from weather, insects, etc.

Regular tree wrap prevents most of these troubles. Leave wrap on for at least two years. Regular tree wrapping is best to use, but burlap in strips is satisfactory. Start wrapping where branches come out.

QUIZ --- PLANTING ORNAMENTAL SHRUBS AND TREES

Completion:

1. Ornamentals can be transplanted in the fall or spring.

2. The best time to transplant bare root plants is latter part of September or early October.

3. The hole should be big enough so that the roots don't need to be wound around ball of soil.

4. The hole for balled plants should be two feet wider than the ball.

5. In transplanting the ornamental, the plant should be set same depth as it was in the nursery.

Essay:

6. Why should a saucer of earth be left around the edge of the hole? (To retain water - to allow it to soak around plant.)

7. Describe the correct procedure for handling the burlap on a balled plant. (Not necessary to remove burlap. Take out balling nails and lay burlap back. Cover edge with soil. It will eventually rot.)

8. Why should container plants be wet down before removing containers? (To prevent soil from crumbling.)

9. Describe the correct procedure for supporting a 2 1/2" diameter tree. (Use three stakes. Set 2" x 2" x 8' stakes 18 inches beyond bottom of hole.)

10. Why should newly transplanted trees be wrapped? (Wrapping trunk prevents insect and weather damage.)

CHAPTER VII

Fertilizing Ornamentals.

Problem: What fertilization practices should be followed in caring for ornamentals?

Items to Consider:

1. Need for shrub and tree fertilization.
2. Type of soil.
3. Time of year to fertilize.
4. Types and amounts of fertilizer to use.
5. Where to put fertilizer.

Basic Information:

1. Need for shrub and tree fertilization.

A deficiency of certain plan nutrients in the soil will cause reduced growth, reduced flowering and fruiting of some ornamentals, more susceptibility to diseases, reduced winter hardiness and off-colored foliage in flowering shrubs.

2. Type of soil.

For an accurate measure of plant nutrient deficiencies, soil should be tested at an approved soil laboratory. Most soils on home grounds are usually deficient in proper levels of mineral elements necessary for maximum plant growth.

3. Time of year to fertilize.

It is easy to damage plants when they are making new roots. If shrub is planted in fall, fertilize in the spring; if planted in spring, fertilize in the fall. Fertilize in April or September or October.

4. Types and amounts of fertilizer to use.

a. Trees.

For trees up to six inches in diameter, use three pounds per inch, of 10-6-4, 10-10-10, 12-12-12. For trees above six inches in diameter, use four to five pounds per inch of diameter. Fertilize annually.

b. Evergreens.

Narrowleaf evergreens require one-half to one pound per plant of 10-6-4, 8-8-4, or 4-12-4 fertilizer or similar analyses in the fall or early spring.

Broadleaf evergreens need applications of a special brand of broadleaf evergreen fertilizers, or 6-10-4, or 4-12-4 in which an organic nitrogen carrier is used to supply one-fourth or one-third of the nitrogen. Rate of application is the same as for narrowleaf evergreens.

c. Deciduous Shrubs.

For specimen plants, use one to two pounds per plant of 10-6-4, 15-10-5, 6-10-4, or 4-12-4.

5. Where to put fertilizer.

When fertilizing trees, it is best to put fertilizer in holes punched in the soil. Holes may be drilled 15 to 18 inches deep with an auger, or if soil is moist, an iron bar can be used to punch the holes. Use 20 holes per inch of tree trunk diameter.

Start holes a little beyond the edge of the branches because more roots are away from the trunk. Punch holes up to within a few feet of the trunk. See Figure 41.

Fertilizer for shrubs can be applied in the same manner. However, since phosphorus is relatively slow moving, it may be added at planting time. Do not use an excessive amount of fertilizer around plant roots as serious injury or death of the plant may occur.

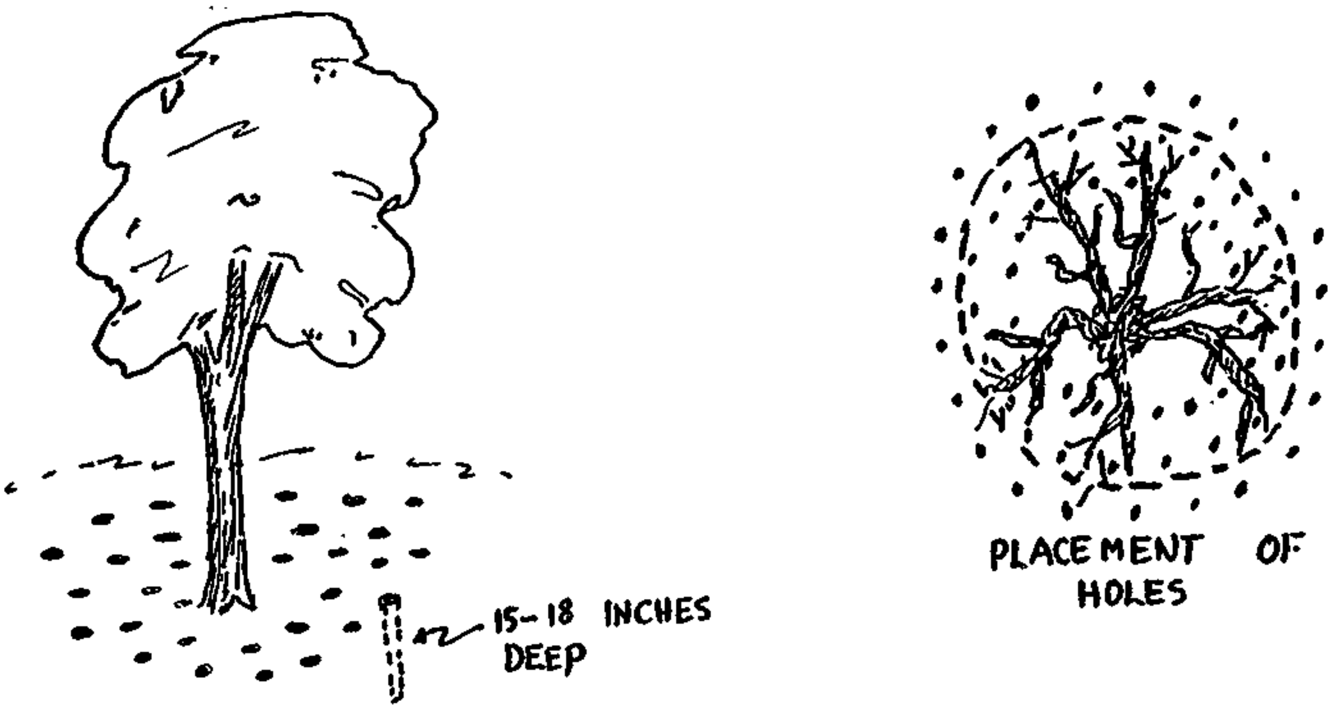


Figure 41. Placement of holes for application of fertilizer.

QUIZ --- FERTILIZING ORNAMENTALS

Multiple Choice:

1. Reduced flowering and fruiting of some ornamentals is caused by:

   *a. deficiency of certain plant nutrients in the soil.
   b. hot weather.
   c. too much watering.
   d. improper planting procedure.

2. The best time of year to fertilize is:

   a. usually in the spring.
   b. usually in the fall.
   c. when the plants are making new roots.
   *d. in the spring if shrub is planted in the fall; fall, if shrub is planted in the spring.

3. For trees up to six inches in diameter, fertilize as follows:

   a. 1 lb. 10-10-10 per inch of diameter.
   b. 2 lbs. 10-6-4 per inch of diameter.
   *c. 3 lbs. 12-12-12 per inch of diameter.
   d. 5 lbs. 12-12-12 per inch of diameter.

4. Broadleaf evergreens need applications of

   a. 10-10-10
   b. 12-12-12
   c. 10-6-4
   *d. 4-12-4

5. When fertilizing trees, it is best to put fertilizer

   a. on top of the ground as to benefit the grass.
   *b. in holes punched in the soil.
   c. on in the spring.
   d. on in the liquid form.

CHAPTER VIII

Pruning of Ornamental Shrubs and Shade Trees.

Problem: What procedures should be followed in pruning ornamentals?

Items to Consider:

1. Why prune ornamentals.
2. When to prune.
3. How to prune.
4. What equipment to use.
5. What special procedures to follow for different kinds of shrubs.

Basic Information:

1. Why prune ornamentals.

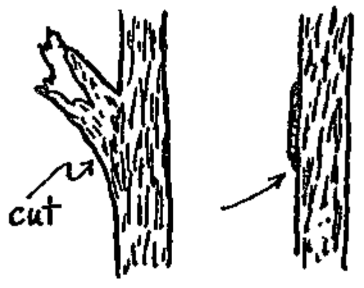
   a. To remove dead, diseased, criss-crossed, injured, or broken wood.
   b. To produce and preserve the desired shape and appearance of the plants.
   c. To keep them vigorous and to improve chance of survival at transplanting time.
   d. To improve flowering or fruiting.
   e. To retain maximum color on colored twig plants.

2. When to prune ornamentals.

Pruning can usually be done at any time of the year. Worst time to prune is the spring when new growth is starting. This weakens the plants, and they may die in the winter. Best time to prune evergreens is at Christman when they are dormant. Cuttings may then be used for decorations. Shrubs and trees may also be pruned in winter while they are dormant. Hedges may be pruned in the summer.

3. How to prune.

Primary rule: Don't leave stubs. Make cuts flush with the adjoining branch. Cuts of terminal shoots should be made just above a bud. Cut branches, don't break them off.



4. What equipment to use.

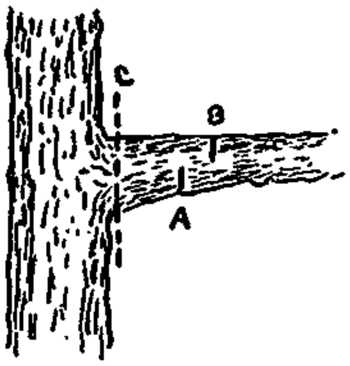
Adequate for most pruning jobs would be hand pruning shears, lopping shears, hedge shears, and a pruning saw. All equipment should be kept sharp, as proper pruning and ideal wound healing are dependent on the use of correct tools that are sharp.

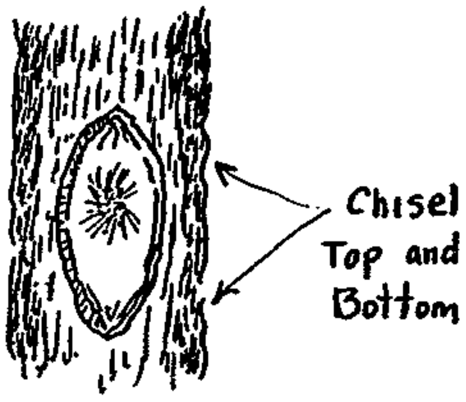
5. What special procedures to follow for different kinds of shrubs.

a. Shade trees.

Prune shade trees only when the tree branches or limbs are damaged, when they interfere with traffic on a walk or drive, or when they cause damage to or interfere with the operation of a building chimney, eaves spouting, etc.

The tree top may be thinned out to open internal branches to light. Do not cut the central leader unless absolutely necessary. Cut any large branches (size requiring a saw) by making three cuts according to diagram below. Treat all wounds one inch or more in diameter with regular tree paint. Do not use house paint. Filling a cavity in a tree does not keep rotting from continuing. It is necessary to get all of the rot out of the cavity. Shape cavity by chiseling it to a point at the top and at the bottom.





b. Flowering trees and shrubs.

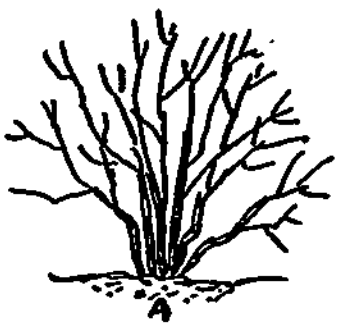
Follow recommendations indicated under shade trees. Old, hard wood won't grow new branches, so flowering trees need carefully planned, regularly scheduled pruning.

1) Forsythia Deutzia, Spirea, Lilacs, and most other early flowering plants bloom from buds formed on last summer's twigs. Prune from one to two weeks after bloom; when plants are through flowering.

2) Hydrangea, Rose of Sharon, Rugosa Rose and such plants produce flowers on new spring growth. Such plants may be pruned during the late fall after stem growth has ceased.

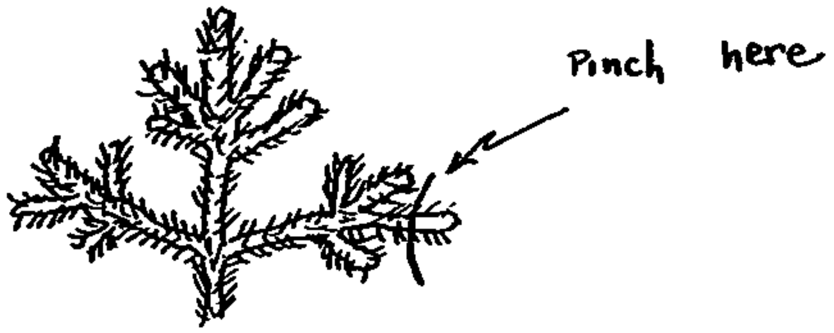
3) Shrubs that have showy colored stems, such as Red and Yellow Dogwood, Kerria and some low-growing shrub roses, produce their most brilliant color on new wood. About one-third of the older wood should be removed every year to retain maximum coloration.

Caution: Don't simply trim back tops on shrubs. Thin out plant by cutting older branches back to ground. Spirea can be cut back to four to six inches of the ground when old and bulky. Mockorange and lilacs can also be cut back the same. Don't cut viburnams clear to the ground.



c. Narrowleaf evergreens.

Narrowleafed evergreens produce new growth in the spring, so pruning should be done either before the new growth starts or after it is nearly complete, in the fall. Evergreens are usually plucked by hand, not sheared, in order to retain natural beauty. Spruces, pines, and firs are pruned by pinching off part of the candle growth (shoots) about half way in June. Pruning must be done every spring in order to have dense, compact plants.



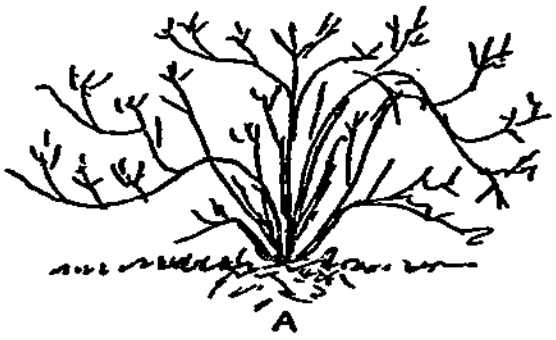
Caution: Cut leader or terminal branch only to stop growth of plant, or to get a spreading of the branches. Do not prune branches at base of tree. This results in an artificial unattractive form.

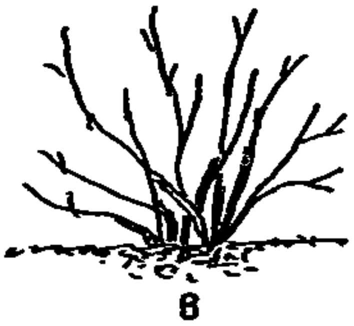
A

B

d. Broadleaf evergreens.

Usually necessary to prune out just the deadwood, broken, diseased or insect infested branches. Straggly, misshapened plants may be cut back one-third to one-half of the terminal growth to a point where there is branching or budding of at least one green shoot or active bud. Rhododendrons may even be cut down to within several inches of the soil, although it may take several years before good height and flowers are attained.





e. Vines and ground covers.

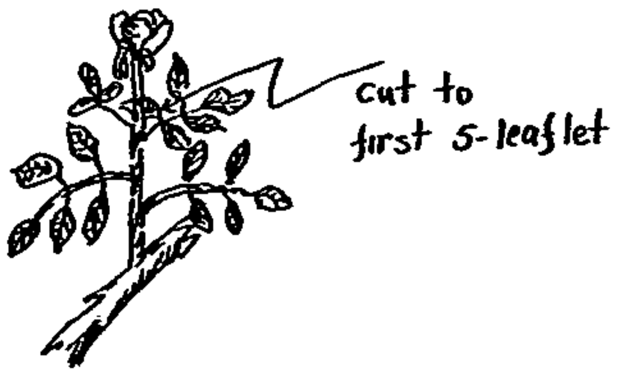
Prune vines to control direction of growth, in order to keep them out of windows, etc. Regrowth starts from buds just below the cut. Vines do not generally renew themselves from shoots at the base.

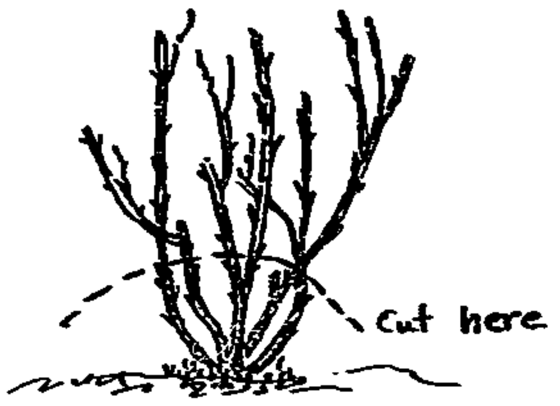
Ground covers may need winter brown tips clipped in the spring after growth has begun. Usually, little pruning is necessary on many of the evergreen ground covers with the exception of some of the Euonumus, English Ivy, Spruge, and Creeping Mahonia.

f. Roses.

Prune roses in March, except climbers, which should be pruned after flowering. "Pencil" size shoots should be cut out. In summer, cut off old flowers. Cut to first 5-leaflet, because bud will grow long and sturdy, producing a bigger flower. If cut back to 3-leaflet, it may get a blind bud.

Remove dead, broken, and disease or insect infested branches, plus criss-crossed or misshapen canes. Cut remaining canes back to 18-24 inches in height.

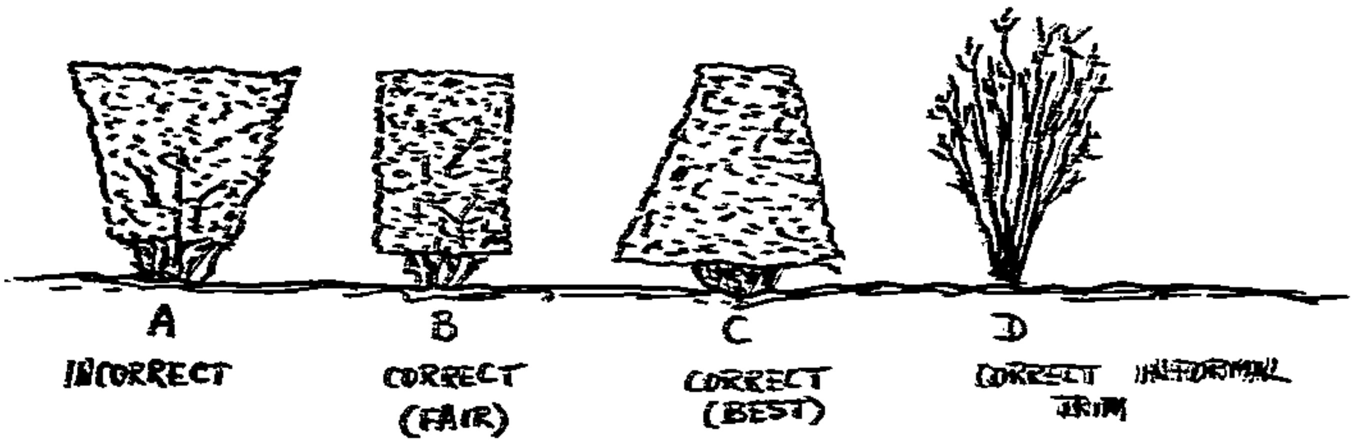




g. Hedges.

Prune prior to growth in spring and again in summer to remove feathery new growth. Caution: Late-summer pruning of hedges is unsafe, as this practice creates a new growth of wood that seldom becomes hardened sufficiently to withstand severe winter weather.

Prune annually to retain size and shape. Prune hedge so that bottom is wider than the top. This prevents lower branches from dying due to loss of sunlight. Prune according to diagram below.



QUIZ: PRUNING ORNAMENTAL SHRUBS AND SHADE TREES

1. Ornamentals are pruned in order to produce and preserve the desired shape and appearance of the plant.

2. Ornamentals can usually be pruned at any time of the year.

3. The primary rule in pruning is: don't leave stubs.

4. In pruning shade trees, do not cut the central leader unless absolutely necessary.

5. Forsythia, Deutzia, Spirea, Lilacs and most other early flowering plants bloom from buds formed on last summer's twigs.

6. In pruning flowering shrubs, thin out the plant by cutting older branches back
A to the ground.

7. The usual procedure in pruning spruces, pines and firs is to pinch off part of the candle growth (one-half) in June.

8. Vines are pruned to control direction of growth.

9. Prune roses in March, except climbers, which should be pruned after flowering.

10. A hedge should be pruned so that the bottom is wider than the top.

Name____________________

UNIT TEST ON LANDSCAPING PRINCIPLES

Write "T" in the blank if the statement is true; "F" if the statement is false.

__T__ 1. Mass, color, line or texture must be equalized on each side of a real or imaginary point to satisfy one's visual sense of balance.

__T__ 2. Symmetrical balance means that plant arrangement on one side of an axis is the exact duplicate of the other side.

__T__ 3. A large tree on one side of the property can be used to balance several small trees on the other side.

__F__ 4. A medium-sized tree on one side of the property will not balance a group of shrubs on the other side.

__T__ 5. Simplicity is destroyed when too many different kinds of plants are used in the design.

__T__ 6. It is usually best to group three of one kind of plant rather than have a single plant.

__T__ 7. Objects such as plantings, fences, screens, etc., in the design should be wider than they are tall.

__T__ 8. If scale is kept constant throughout the design, the design will have proportion.

__F__ 9. Plantings in the front of the house should be higher in the center than on the corners.

__F__ 10. The front door of the house should not be accented by plantings.

Complete the statements with the appropriate word or phrase.

11. Landscaping is the art of arranging and fitting together of __land__, __plants__, and __structures__ for human use and enjoyment.

12. The __front__ __entrance__ is the focal point or center of interest around which public area plantings are grouped.

13. In designing corner plantings for low houses, for a pleasing transition between dominant vertical and horizontal lines, use __irregular__ shrubs with __horizontal__ __branching__ type of growth along with low spreading evergreens.

14. Hardiness of a plant refers to its ability to stand cold temperatures.

15. Proper selection of a plant in terms of habit, growth rate, and ultimate size will reduce much heavy pruning.

16. Fast-growing trees may be short lived.

17. Hardwood trees are usually long lived.

18. The living area should be located so that it is easily reached from the family room or living area of the house and the kitchen

19. The Thornless Honeylocust is replacing the American Elm as a popular shade tree.

20. The open-grassed area in the private lawn should be at least 50 feet by 80 feet to provide room for badminton, croquet, etc.

In the blank at the left of the statement place the letter of the word or phrase that best fits the statement.

c 21. Achieved through repetition of landscape materials.

j 22. Achieved by repeating a few well-arranged forms, colors, or textures in various areas.

h 23. Means the size of units, such as open space, buildings, or plantings.

i 24. A pleasing relationship of one part of the design to another part and to the whole design.

d 25. Achieved by the use of contrast in size, texture, and color of plants.

a 26. Achieved by placing a dark green evergreen plant against a white house.

d 27. Achieved when colors of the various plantings blend with one another and with their surroundings.

m 28. Achieved by planting a large tree on one side of the property and several small trees on the other side.

l 29. Achieved by using a formal design rather than an informal design.

h, i 30. Achieved by placing small to medium sized trees in a design for a low ranch type house.

a. contrast
b. balance
c. simplicity
d. harmony or rythm
e. unity or completeness
f. focal point
g. sequence
h. scale
i. proportion
j. repetition
k. texture
l. symmetrical balance
m. asymmetrical balance
n. condensation

*STUDY GUIDES, *TRADE AND INDUSTRIAL EDUCATION, *CARPENTERS, *CABINETMAKING, GRADE 11, GRADE 12, *COOPERATIVE EDUCATION,

This study guide is to direct the individual study of high school juniors and seniors in cooperative education programs in carpentry and cabinet and mill work. It was developed by a statewide committee of trade and industrial education coordinators and designed by subject matter specialists and teacher educators. The 123 job sheets are grouped into units titled (1) Maintain Hand Tools and Equipment, (2) Maintain Machine Tools and Equipment, (3) Size and Square to Dimensions, (4) Make Joints with Hand and Machine Tools, (5) Miscellaneous Construction, (6) Gluing and Clamping, (7) Metal Fastenings, (8) Wood Turning, (9) Surface Decoration, (10) Upholstery, (11) Wood Finishing, and (12) Millwork Projects. Each job sheet is indexed to an occupational analysis and progression record and provides the job title, related study references, and study questions designed to give the student definite direction in his reference reading. Eleven drawing problems are included. The material is to be used by individual students under teacher supervision for 2 years or 360 hours. This mimeographed document is available for $2.00 from Trade and Industrial Education, State Department of Education, P.O. Box 2847, University, Alabama 35486. (HC)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Trade & Industrial Education
Address Box 2847, University, Alabama 35486
Limitation on Available Copies No limit Price/Unit $2.00
(quantity prices)

(2) Means Used to Develop Material:
Development Group Committee of Trade & Industrial Education Coordinators
Level of Group State
Method of Design, Testing, and Trial Designed by subject matter specialists and teacher educators.

(3) Utilization of Material:
Appropriate School Setting High School or Area Vocational High School
Type of Program High school cooperative class
Occupational Focus Carpentry - Cabinet and Mill Work
Geographic Adaptability All U.S.A.
Uses of Material A record of progress and a guide for individual study.
Users of Material Student

(4) Requirements for Using Material:
Teacher Competency Can be used by any certified teacher
Student Selection Criteria 11th and 12th grade students

Time Allotment 360 hours

HOW TO USE THIS STUDY GUIDE AND RECORD OF PROGRESS

The following study guide is used as a means of guiding and checking the progress of the student.

The correct way to use this study guide is for the student to observe or help do a job in the shop. At the next related study period the student looks up that job in the study guide and studies the references given for that job and answers the questions (in writing) asked about that job.

The following symbols will be used by the student to indicate accomplishment on the job:

JOB PERFORMANCE

⊡ A dot in center of square indicates that the student observed a job being done.

⧄ A diagonal line in square indicates that the student did the job under instruction.

⊠ Two diagonal lines in square indicates that the student completed the job under supervision without instruction.

■ A square filled in solid indicates that the student has reached a satisfactory level of accomplishment. On the date this job accomplishment level has been attained, the student turns to the occupational anaylsis sheet in the front index section and places this date in the "Job Performance" column opposite this job.

REFERENCE READING IN THE RELATED CLASS

The student places a date such as 4/20/53 (in the "date read" column opposite a specific related reference) on a job sheet, to indicate completion of that reference study. When all of the references for a job have been studied and all of the questions have been answered, the student turns to the occupational analysis sheet in the front index section and places the date of this completion in the "Reference Reading" column opposite the job studied.

A quick check of satisfactory attainment in jobs performed and references read can be made by looking through the occupational analysis sheets.

In each instance the job numbers on the occupational analysis index and progression record sheet correspond with the numbers of the pages in the study guide on which the job references and questions appear. For example: Job No. 6 will be found on page 6, with references and questions pertaining to that job.

The questions on a job sheet are to be used as a guide for the student's reading and not as test questions. It gives the student something definite to look for in the reference reading. It points out the more important things that should be found in the reference.

The essay type of answers that are required for most questions have a very definite value as they will help the student to form the habit of giving clear-cut, definite answers or explanations about the jobs.

Only a few references and a few questions have been listed on each job sheet to teach the student how to study the literature pertaining to their occupation. If the student learns how to study according to this plan, a much wider field of study is then open to him. After learning how to study, it is the responsibility of the coordinator to supplement the student's related study with additional material depending on the ability of the student to assimilate it.

An examination may be taken on any job at any time the student feels capable of taking it.

STUDENT'S DAILY RECORD

Date	List the Job Numbers Performed the Previous afternoon	List the References Read in the Related Class by Symbols and Pages	List the Number of the Job Studied Today

Job 1

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
History of Woodworking Tools and Machinery	Inf.	PWH pp 1-14	

1. When were the first woodworking tools made?
2. Of what were they made and where have they been found?
3. Compare woodworking tools of the early and late stone age.
4. In what part of the world were metals first used?
5. What kind of metal was first used for making tools?
6. Explain how bronze and bronze tools were first made?
7. During what period in history were most of our carpenter tools invented?
8. What restriction prevented the use of iron tools during the early days of the Romans?
9. Who were the first people to learn to set saws?
10. Who invented the chisel and the claw hammer?
11. When were the first trade unions formed?
12. Name the three classifications of workmen set up by the guilds during the Middle Ages.
13. Under what conditions did apprentices serve their trade in the early days?
14. When did the development of machinery begin?
15. When were the first attempts at woodworking machinery made?
16. By whom were these first machines used?
17. Who was Samuel Bentham and for what was he noted?

Job 2

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Build a Carpenter's Shop Bench		PWH pp 15-19, 183-185 226-247, 266-271, 287-302	

1. Turn to Fig. 1, p 15, PWH, and make a drawing of the carpenter's bench giving the length, height and width that you think a bench of this kind should have.

2. Make a complete list of the materials that you would need if you were to build this bench.

3. What do the black dots across the end and on the side of the bench indicate?

4. What kind of joints should be used in building the frame of this bench? See PWH, pp 226-247

5. Explain to your instructor how you would proceed to glue and to fasten these joints together. See PWH, pp 287-302

6. Explain how you would proceed to make the top of this bench.

7. What tool should be used to remove surplus glue?

8. Why is it sometimes necessary to chamfer the furthest end of the table top?

9. In which direction should a table top made of cross-grained wood such as birch or mahogany be planed?

10. How is a table top tested for squareness or levelness?

11. When the surface is true over-all, what tools can be used to remove the plane marks?

12. Why is it necessary to plane from both sides towards the center in squaring the table top?

13. How many drawers does this bench have?

Job 3

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Equip Bench with Woodworking Vises		PWH pp 15-19 fig. 6	

1. What is a vise?
2. What are vises used for?
3. Name and describe the different kinds of vises.
4. What is the difference in the"continuous-screw" type vise and the "quick-acting" type vise?
5. What kind is found in your shop?
6. What do we mean by an adjustable dog in reference to vises?
7. How is the adjustable dog on a vise used? See PWH, Fig. 6
8. Of what use is a tail vise?
9. Tell how a bench stop may be used instead of a tail vise.
10. What is the difference in a bench stop and a bench hook?

Job 4

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Joint, Set and File Hand Saws		PWH pp 139-143	

1. What three operations does the sharpening of saws require?

2. What is jointing a saw and why is it necessary?

3. Explain the process of jointing a saw.

4. What determines when a saw is jointed enough?

5. After the jointing or striking of the saw is done, what is done next?

6. How is the file held while sizing the teeth?

7. Explain the process of setting a saw.

8. Why is it necessary to set saws?

9. Are all saws set the same amount? Why?

10. How do we determine how much to set a saw?

11. Explain the process of filing: (a) a ripsaw, (b) a crosscut saw.

NOTE: The information given in this lesson will be of great help to you in learning to keep your saws in good shape, but you will never learn to sharpen saws until you actually do the operations. A good plan is to practice on an old saw, following the instructions given in this lesson.

Job 5

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Sharpen a Plane Iron or Bit		PWH pp 143-145	

1. Why is it sometimes necessary to grind plane bits rather than whet them on the oilstone?
2. What kind of a grinder is best for grinding plane bits? Why?
3. How does burning a bit injure the bit?
4. How can we tell when the bit is burned?
5. Why should dry emery wheels not be used to sharpen plane bits?
6. What should be the length of the bevel on the bit?
7. What makes the best cooling liquid for oilstones?
8. Describe the process of whetting the plane bit on the oilstone
9. How can we tell when the edge of the bit is square across?
10. How can we tell when the plane bit is sharp?
11. What other tools are sharpened the same way as the plane bit?

Job 6

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Sharpen Gouges, Carving and Turning Tools		PWH pp 36-39, 145, 150-153	

1. Describe a gouge.

2. What is the difference between an outside and an inside gouge?

3. Why do some gouges have bent shanks?

4. What are turning tools used for?

5. Explain the sharpening of inside bevel gouges.

6. Describe a "slip stone".

7. How long should the bevel on a gouge be?

8. Describe the sharpening of an outside bevel gouge.

9. Explain why the entire length of the "slip stone" should be in contact with the inside of the outside bevel gouge.

10. What is a skew chisel?

NOTE: For further study of the use of these tools, see PWH p 335

Job 6

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Sharpen Gouges, Carving and Turning Tools		PWH pp 36-39, 145, 150-153	

1. Describe a gouge.

2. What is the difference between an outside and an inside gouge?

3. Why do some gouges have bent shanks?

4. What are turning tools used for?

5. Explain the sharpening of inside bevel gouges.

6. Describe a "slip stone".

7. How long should the bevel on a gouge be?

8. Describe the sharpening of an outside bevel gouge.

9. Explain why the entire length of the "slip stone" should be in contact with the inside of the outside bevel gouge.

10. What is a skew chisel?

NOTE: For further study of the use of these tools, see PWH p 335

Job 7

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Sharpen and Adjust a Cabinet Scraper		PWH pp 34-35, 146-147	

1. What is the difference in the "cabinet scraper" and the "hand scraper"?

2. What is a molding scraper?

3. For what kind of work are scrapers used?

4. Do scrapers produce a finer or a coarser finish than the plane

5. Why should all scraping be done before the surface is sanded?

6. How is the cabinet scraper ground?

7. Why is grinding necessary each time the blade is sharpened?

8. What is a burnisher and for what is it used?

9. Describe the process of turning the edge on the cabinet scraper.

10. Explain how the scraper blade is adjusted.

NOTE: Practice is necessary in order to learn to turn the blade of the cabinet scraper. We would suggest to the learner that he practice at leisure time when he can take time to observe what he does. Experimenting is the best way to learn such jobs as turning the scraper, filing the saw and many other things.

Job 8

TYPE JOB	LABORATORY PERFORMANCE	RELATED STUDY REFERENCES	DATE READ
Sharpen and Adjust a Hand Scraper		PWH pp 34-35, 147-149	

1. Draw an enlarged end view of the edge of a hand scraper that has just been sharpened and turned.

2. What are the advantages of the hand scraper over the cabinet scraper?

3. What is drawfiling?

4. What kind of a file is used in drawfiling a hand scraper?

5. What is a bur, when used relative to filing tools?

6. How may burs be removed?

7. At what angle to the scraper blade should the file be held when drawfiling?

8. Does a hand scraper need drawfiling each time it is sharpened? Why?

9. Explain the complete process of sharpening a hand scraper.

10. Correct the following statement: "In learning the art of sharpening scraper blades, information is required but practice is desired."

Sharpen Boring Tools		PWH pp 38-43, 149	

1. Name the dirrerent parts of an auger bit.

2. How are auger bits sharpened?

3. Complete the following statements:
   (a) The size of the auger bit is indicated in ____________.
   (b) Dowel bits are ____________ long.
   (c) Car bits and ship augers are ______________ long.
   (d) __________________ bits can be adjusted to bore holes of various sizes.

4. A forestner bit cuts with a _________________ and is used for boring holes in ______________ because they do not _________ the wood.

5. (a) Gimlets are used for boring _______ holes in _________ for inserting small ____________.
   (b) The size of gimlets is indicated by ___________ and the size ranges from _________ to _________.

6. (a) The twist bit is very much like the _______ ________.
   (b) It ranges in size from ______ to_______ and the size is indicated in __________ which is stamped on the ___________.
   (c) It has a square _________ for fitting into the__________ of the brace, and is not intended to be used for boring in ____________.

7. (a) Twist drills are used for drilling in ________ but can be used for drilling in ____________.
   (b) Drills that are made for drilling in ________ have round shanks.

8. (a) A ___________ is used for making small holes in wood for screws and nails and should not be used in _______ wood or too close to the edge because of the danger of ______.

9. (a) The ____________ is used for enlarging the end of holes for _____________ screws. There are _______ kinds of them, one of which can be ____________ and one that cannot be ____________.

Joint, Gum, Set and File a Circular Saw		PWH pp 153-158	

1. The purpose of jointing a circular saw is to make all ______ the same __________. In jointing the saw, it is necessary the the longer teeth only be jointed down to the same height as the ________ _________.

2. The grinding out of the gullets with a special grinding wheel is called ___________ the saw. If the saw is not __________ occasionally it _____________ with sawdust.

3. The grinding wheel for gumming a circular saw should be about ______________ inch thick and ____ inches in diameter.

4. The devise that holds the saw while gumming is called the ____________. The front of the teeth should be in line with a tangent to a circle drawn _______________ the distance between the _________ of the saw and the edge. The angle of the teeth is called the ___________.

5. A saw has to be set because ____________________________

   ____

   ____

   ____

6. A _________ _______ ________ _________ file is best for filing a circular saw.

7. Gullets made with square edge files are liable to cause the saw to ____________.

8. In filing circular saws, we file the tooth that is bent ____ ______ the filer and then turn the saw and file the other teeth.

Braze, Set and File Band Saws		PWH pp 159-162	

1. What is scarfing a band saw?

2. Explain the process of scarfing a band saw.

3. Why should a band saw always have an even number of teeth?

4. For what is a brazing clamp used?

5. What is a flux and for what is it used?

6. What are brazing tongs?

7. Explain the complete process of brazing a band saw using the brazing tongs.

8. Explain the process of brazing a band saw using the electric brazer.

9. What is the result if a joint cools too quickly?

10. How can the hardening of a joint be prevented?

11. Name two ways that a band saw may be set.

12. What is meant be the term "set and pawl movement"?

13. Explain the use of fitting wheels in setting or filing a band saw.

14. Explain the filing of band saws by completing the following sentences.
    (a) Band saws may be filed by either ________ or ________.
    (b) Band saw teeth are filed in the same shape as the teeth of a ______________ ______.
